General Description

The 83904-02 is a low skew, high performance 1-to-4 Crystal-to-LVCMOS Fanout Buffer. The 83904-02 has selectable single-ended clock or two crystal-oscillator inputs. There is an output enable to disable the outputs by placing them into a high-impedance state.

Guaranteed output and part-to-part skew characteristics make the 83904-02 ideal for those applications demanding well defined performance and repeatability.

Features

- Four LVCMOS/LVTTL outputs,
  19Ω typical output impedance @ $V_{DD} = V_{DDO} = 3.3V$
- Two Crystal oscillator input pairs
  One LVCMOS/LVTTL clock input
- Crystal input frequencry range: 12MHz – 38.88MHz
- Output frequency: 200MHz (maximum)
- Output Skew: 40ps (maximum) @ $V_{DD} = V_{DDO} = 3.3V$
- RMS phase jitter @ 25MHz output, using a 25MHz crystal (100Hz – 1MHz): 0.16ps (typical) @ $V_{DD} = V_{DDO} = 3.3V$
- RMS phase noise at 25MHz:

Offset	Noise Power
100Hz	-118.4 dBc/Hz
1kHz	-141.5 dBc/Hz
10kHz	-157.2 dBc/Hz
100kHz	-157.2 dBc/Hz

- Supply Voltage Modes:
  (Core/Output)
  3.3V/3.3V
  3.3V/2.5V
  3.3V/1.8V
  2.5V/2.5V
  2.5V/1.8V
- 0°C to 70°C ambient operating temperature
- Available in lead-free (RoHS 6) package

Recommendations for Unused Input and Output Pins

Inputs:

Crystal Inputs

For applications not requiring the use of the crystal oscillator input, both XTAL_IN and XTAL_OUT can be left floating. Though not required, but for additional protection, a 1kΩ resistor can be tied from XTAL_IN to ground.

CLK Input

For applications not requiring the use of the clock input, it can be left floating. Though not required, but for additional protection, a 1kΩ resistor can be tied from the CLK input to ground.

Select Pins

All select pins have internal pull-ups and pull-downs; additional resistance is not required but can be added for additional protection. A 1kΩ resistor can be used.

Outputs:

LVCMOS Outputs

All unused LVCMOS output can be left floating. There should be no trace attached.

Crystal Input Interface

Figure 1 shows an example of 83904-02 crystal interface with a parallel resonant crystal. The frequency accuracy can be fine tuned by adjusting the C1 and C2 values. For a parallel crystal with loading capacitance CL = 18pF, we suggest C1 = 15pF and C2 = 15pF to start with. These values may be slightly fine tuned further to optimize the frequency accuracy for different board layouts. Slightly increasing the C1 and C2 values will slightly reduce the frequency. Slightly decreasing the C1 and C2 values will slightly increase the frequency. For the oscillator circuit below, R1 can be used, but is not required. For new designs, it is recommended that R1 not be used.

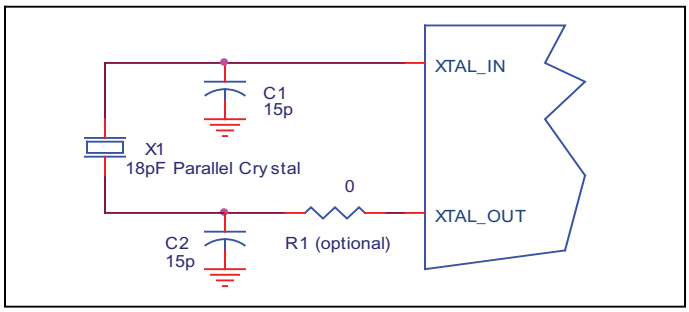

Figure 1. Crystal Input Interface

Overdriving the Crystal Interface

The XTAL_IN input can a single-ended LVCMOS signal through an AC coupling capacitor. A general interface diagram is shown in Figure 2A. The XTAL_OUT pin can be left floating. The maximum amplitude of the input signal should not exceed 2V and the input edge rate can be as slow as 10ns. This configuration requires that the output impedance of the driver (Ro) plus the series resistance (Rs) equals the transmission line impedance. In addition, matched termination at the crystal input will attenuate the signal in half. This can be done in one of two ways. First, R1 and R2 in parallel should equal the transmission line impedance. For most 50Ω applications, R1 and R2 can be 100Ω. This can also be accomplished by removing R1 and making R2 50Ω. By overdring the crystal oscillator, the device will be functional, but note, the device performance is guaranteed by using a quartz crystal.
