

Description

The 9DBL09x1 devices are 3.3V members of IDT's Full-Featured PCIe clock family. The 9DBL09x1 devices support PCIe Gen1–4 Common Clocked (CC) and PCIe Separate Reference Independent Spread (SRIS) systems. They offer a choice of integrated output terminations providing direct connection to 85Ω or 100Ω transmission lines. The 9DBL09P1 can be factory programmed with a user-defined power up default SMBus configuration.

Recommended Application

PCIe Gen1–4 clock distribution for Riser Cards, Storage, Networking, JBOD, Communications, Access Points

Output Features

- 9 – 1-200 MHz Low-Power (LP) HCSL DIF pairs
 - 9DBL0941 default Zout = 100Ω
 - 9DBL0951 default Zout = 85Ω
 - 9DBL09P1 factory programmable defaults
- Easy AC-coupling to other logic families, see IDT application note [AN-891](#).

Key Specifications

- DIF *additive* cycle-to-cycle jitter < 5ps
- DIF output-to-output skew < 50ps
- *Additive* phase jitter is 0ps (typical rms) for PCIe Gen1–4 CC, SRIS
- *Additive* phase jitter 111fs rms typical at 156.25M (1.5M to 10M)

Block Diagram

Note: Resistors default to internal on 41/51 devices. P1 devices have programmable default impedances on an output-by-output basis.

Features/Benefits

- Direct connection to 100Ω (xx41) or 85Ω (xx51) transmission lines; saves 36 resistors compared to standard PCIe devices
- 165mW typical power consumption (at 3.3V); eliminates thermal concerns
- VDDIO allows 50% power savings at optional 1.05V; maximum power savings
- SMBus-selectable features allows optimization to customer requirements:
 - control input polarity
 - control input pull up/downs
 - slew rate for each output
 - differential output amplitude
 - output impedance for each output
- Customer defined SMBus power up default can be programmed into P1 device; allows exact optimization to customer requirements
- OE# pins; support DIF power management
- HCSL differential input; can be driven by common clock sources
- Spread spectrum tolerant; allows reduction of EMI
- Device contains default configuration; SMBus interface not required for device operation
- Three selectable SMBus addresses; multiple devices can easily share an SMBus segment
- Space saving 48-pin 6 x 6mm VFQFPN; minimal board space

Pin Configuration

48-pin VFQFPN, 6x6 mm, 0.4mm pitch

^v prefix indicates internal 120KOhm pull up *AND* pull down resistor (biased to VDD/2)

v prefix indicates internal 120KOhm pull down resistor

^ prefix indicates internal 120KOhm pull up resistor

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the 9DBL09x1. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

² Measured from differential waveform

³ Slew rate is measured through the V_{swing} voltage range centered around differential 0V. This results in a +/-150mV window around differential 0V.

⁴ Matching applies to rising edge rate for Clock and falling edge rate for Clock#. It is measured using a +/-75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations.

⁵ V_{cross} is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e. Clock rising and Clock# falling).

⁶ The total variation of all V_{cross} measurements in any particular system. Note that this is a subset of V_{cross_min/max} (V_{cross} absolute) allowed. The intent is to limit V_{cross} induced modulation by setting Δ -V_{cross} to be smaller than V_{cross} absolute.

⁷ At default SMBus settings.

Marking Diagrams

Notes:

1. "LOT" is the lot sequence number.
2. "COO" denotes country of origin.
3. "YYWW" is the last two digits of the year and week that the part was assembled.
4. Line 2: truncated part number
5. "I" denotes industrial temperature range device.
