

EL5211T

60MHz Rail-to-Rail Input-Output Operational Amplifier

FN6893  
 Rev 0.00  
 May 12, 2010

The EL5211T is a high voltage rail-to-rail input-output amplifier with low power consumption. The EL5211T contains two amplifiers. Each amplifier exhibits beyond the rail input capability, rail-to-rail output capability and is unity gain stable.

The maximum operating voltage range is from 4.5V to 19V. It can be configured for single or dual supply operation, and typically consumes only 3mA per amplifier. The EL5211T has an output short circuit capability of  $\pm 300\text{mA}$  and a continuous output current capability of  $\pm 65\text{mA}$ .

The EL5211T features a high slew rate of  $100\text{V}/\mu\text{s}$ , and fast settling time. Also, the device provides common mode input capability beyond the supply rails, rail-to-rail output capability, and a bandwidth of 60MHz (-3dB). This enables the amplifiers to offer maximum dynamic range at any supply voltage. These features make the EL5211T an ideal amplifier solution for use in TFT-LCD panels as a  $V_{\text{COM}}$  driver or static gamma buffer, and in high speed filtering and signal conditioning applications. Other applications include battery power and portable devices, especially where low power consumption is important.

The EL5211T is available in a thermally enhanced 8 Ld HMSOP package, and a thermally enhanced 8 Ld DFN package. Both feature a standard operational amplifier pinout. The device operates over an ambient temperature range of  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$ .

Features

- 60MHz (-3dB) Bandwidth
- 4.5V to 19V Maximum Supply Voltage Range
- $100\text{V}/\mu\text{s}$  Slew Rate
- 3mA Supply Current (per Amplifier)
- $\pm 65\text{mA}$  Continuous Output Current
- $\pm 300\text{mA}$  Output Short Circuit Current
- Unity-gain Stable
- Beyond the Rails Input Capability
- Rail-to-rail Output Swing
- Built-in Thermal Protection
- $-40^\circ\text{C}$  to  $+85^\circ\text{C}$  Ambient Temperature Range
- Pb-Free (RoHS Compliant)

Applications\* (see page 13)

- TFT-LCD Panels
- $V_{\text{COM}}$  Amplifiers
- Static Gamma Buffers
- Drivers for A/D Converters
- Data Acquisition
- Video Processing
- Audio Processing
- Active Filters
- Test Equipment
- Battery-powered Applications
- Portable Equipment

## Pin Configuration

## Pin Descriptions

PIN NUMBER (HMSOP, DFN)	PIN NAME	FUNCTION	EQUIVALENT CIRCUIT
1	VOUTA	Amplifier A output	(Reference Circuit 1)
2	VINA-	Amplifier A inverting input	(Reference Circuit 2)
3	VINA+	Amplifier A non-inverting input	(Reference Circuit 2)
4	VS-	Negative power supply	
5	VINB+	Amplifier B non-inverting input	(Reference Circuit 2)
6	VINB-	Amplifier B inverting input	(Reference Circuit 2)
7	VOUTB	Amplifier B output	(Reference Circuit 1)
8	VS+	Positive power supply	
Pad	PD	Functions as a heat sink. Electrically connected to VS-. Connect the thermal pad to VS- plane on the PCB for optimum thermal performance.

## Ordering Information

PART NUMBER (Notes 2, 3)	PART MARKING	PACKAGE (Pb-Free)	PKG. DWG. #
EL5211TILZ-T13 (Note 1)	11T	8 Ld DFN	L8.2x3
EL5211TIYEZ	BBBNA	8 Ld HMSOP	MDP0050
EL5211TIYEZ-T7 (Note 1)	BBBNA	8 Ld HMSOP	MDP0050
EL5211TIYEZ-T13 (Note 1)	BBBNA	8 Ld HMSOP	MDP0050

**NOTES:**

1. Please refer to [TB347](#) for details on reel specifications.
2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. For Moisture Sensitivity Level (MSL), please see device information page for [EL5211T](#). For more information on MSL please see techbrief [TB363](#).

**Absolute Maximum Ratings** ( $T_A = +25^\circ\text{C}$ )

Supply Voltage between $V_{S+}$ and $V_{S-}$ . . . . .	+19.8V
Input Voltage Range ( $V_{INx+}$ , $V_{INx-}$ ) . . . . .	$V_{S-} - 0.5\text{V}$ , $V_{S+} + 0.5\text{V}$
Input Differential Voltage ( $V_{INx+} - V_{INx-}$ ) . . . . .	$(V_{S+} + 0.5\text{V}) - (V_{S-} - 0.5\text{V})$
Maximum Continuous Output Current . . . . .	$\pm 65\text{mA}$
ESD Rating	
Human Body Model . . . . .	3000V

**Thermal Information**

Thermal Resistance (Typical)	$\theta_{JA}$ ( $^\circ\text{C}/\text{W}$ )	$\theta_{JC}$ ( $^\circ\text{C}/\text{W}$ )
8 Ld HMSOP (Notes 4, 5) . . . . .	62	13
8 Ld DFN (Notes 4, 5) . . . . .	58	8
Storage Temperature . . . . .	$-65^\circ\text{C}$ to $+150^\circ\text{C}$	
Ambient Operating Temperature . . . . .	$-40^\circ\text{C}$ to $+85^\circ\text{C}$

**CAUTION:** Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

## NOTES:

- $\theta_{JA}$  is measured in free air with the component mounted on a high effective thermal conductivity test board with "direct attach" features. See Tech Brief TB379.
- For  $\theta_{JC}$ , the "case temp" location is the center of the exposed metal pad on the package underside.

**IMPORTANT NOTE:** All parameters having Min/Max specifications are guaranteed. Typ values are for information purposes only. Unless otherwise noted, all tests are at the specified temperature and are pulsed tests, therefore:  $T_J = T_C = T_A$

**Electrical Specifications**  $V_{S+} = +5\text{V}$ ,  $V_{S-} = -5\text{V}$ ,  $R_L = 1\text{k}\Omega$  to  $0\text{V}$ ,  $T_A = +25^\circ\text{C}$ , Unless Otherwise Specified.

## NOTES:

- Measured over  $-40^\circ C$  to  $+85^\circ C$  ambient operating temperature range. See the typical  $TCV_{OS}$  production distribution shown in the "Typical Performance Curves" on page 6.
- Typical slew rate is an average of the slew rates measured on the rising (20% to 80%) and the falling (80% to 20%) edges of the output signal.
- Settling time measured as the time from when the output level crosses the final value on rising/falling edge to when the output level settles within a  $\pm 0.1\%$  error band. The range of the error band is determined by: Final Value(V)  $\pm$  [Full Scale(V) \* 0.1%].

## Applications Information

### Product Description

The EL5211T is a high voltage rail-to-rail input-output amplifier with low power consumption. The EL5211T contains four amplifiers. Each amplifier exhibits beyond the rail input capability, rail-to-rail output capability and is unity gain stable.

The EL5211T features a high slew rate of  $100\text{V}/\mu\text{s}$ , and fast settling time. Also, the device provides common mode input capability beyond the supply rails, rail-to-rail output capability, and a bandwidth of  $60\text{MHz}$  ( $-3\text{dB}$ ). This enables the amplifiers to offer maximum dynamic range at any supply voltage.

### Operating Voltage, Input and Output Capability

The EL5211T can operate on a single supply or dual supply configuration. The EL5211T operating voltage ranges from a minimum of  $4.5\text{V}$  to a maximum of  $19\text{V}$ . This range allows for a standard  $5\text{V}$  (or  $\pm 2.5\text{V}$ ) supply voltage to dip to  $-10\%$ , or a standard  $18\text{V}$  (or  $\pm 9\text{V}$ ) to rise by  $+5.5\%$  without affecting performance or reliability.

The input common-mode voltage range of the EL5211T extends  $500\text{mV}$  beyond the supply rails. Also, the EL5211T is immune to phase reversal. However, if the common mode input voltage exceeds the supply voltage by more than  $0.5\text{V}$ , electrostatic protection diodes in the input stage of the device begin to conduct. Even though phase reversal will not occur, to maintain optimal reliability it is suggested to avoid input overvoltage conditions. Figure 32 shows the input voltage driven  $500\text{mV}$  beyond the supply rails and the device output swinging between the supply rails.

The EL5211T output typically swings to within  $50\text{mV}$  of positive and negative supply rails with load currents of  $\pm 5\text{mA}$ . Decreasing load currents will extend the output voltage range even closer to the supply rails. Figure 33 shows the input and output waveforms for the device in a unity-gain configuration. Operation is from  $\pm 5\text{V}$  supply with a  $1\text{k}\Omega$  load connected to GND. The input is a  $10\text{V}_{\text{p-p}}$  sinusoid and the output voltage is approximately  $9.9\text{V}_{\text{p-p}}$ .

Refer to the "Electrical Specifications" Table beginning on page 3 for specific device parameters. Parameter variations with operating voltage, loading and/or temperature are shown in the "Typical Performance Curves" on page 6.

### Output Current

The EL5211T is capable of output short circuit currents of  $300\text{mA}$  (source and sink), and the device has built-in protection circuitry which limits the output current to  $\pm 300\text{mA}$  (typical).

FIGURE 32. OPERATION WITH BEYOND-THE-RAILS INPUT

FIGURE 33. OPERATION WITH RAIL-TO-RAIL INPUT AND OUTPUT

To maintain maximum reliability, the continuous output current should never exceed  $\pm 65\text{mA}$ . This  $\pm 65\text{mA}$  limit is determined by the characteristics of the internal metal interconnects. Also, see "Power Dissipation" on page 12 for detailed information on ensuring proper device operation and reliability for temperature and load conditions.

### Unused Amplifiers

It is recommended that any unused amplifiers be configured as a unity gain follower. The inverting input should be directly connected to the output and the non-inverting input tied to the ground.

### Thermal Shutdown

The EL5211T has a built-in thermal protection which ensures safe operation and prevents internal damage to the device due to overheating. When the die temperature reaches  $+165^\circ\text{C}$  (typical), the device automatically shuts OFF the outputs by putting them in a high impedance state. When the die cools by  $+15^\circ\text{C}$  (typical), the device automatically turns ON the outputs by putting them in a low impedance (normal) operating state.

**Driving Capacitive Loads**

As load capacitance increases, the -3dB bandwidth will decrease and peaking can occur. Depending on the application, it may be necessary to reduce peaking and to improve device stability. To improve device stability a snubber circuit or a series resistor may be added to the output of the EL5211T.

A snubber is a shunt load consisting of a resistor in series with a capacitor. An optimized snubber can improve the phase margin and the stability of the EL5211T. The advantage of a snubber circuit is that it does not draw any DC load current or reduce the gain.

Another method to reduce peaking is to add a series output resistor (typically between 1Ω to 10Ω). Depending on the capacitive loading, a small value resistor may be the most appropriate choice to minimize any reduction in gain.

**Power Dissipation**

With the high-output drive capability of the EL5211T amplifiers, it is possible to exceed the +150°C absolute maximum junction temperature under certain load current conditions. It is important to calculate the maximum power dissipation of the EL5211T in the application. Proper load conditions will ensure that the EL5211T junction temperature stays within a safe operating region.

The maximum power dissipation allowed in a package is determined according to Equation 1:

$$P_{DMAX} = \frac{T_{JMAX} - T_{AMAX}}{\theta_{JA}} \quad (EQ. 1)$$

where:

- $T_{JMAX}$  = Maximum junction temperature
- $T_{AMAX}$  = Maximum ambient temperature
- $\theta_{JA}$  = Thermal resistance of the package
- $P_{DMAX}$  = Maximum power dissipation allowed

The total power dissipation produced by an IC is the total quiescent supply current times the total power supply voltage, plus the power dissipation in the IC due to the loads, or:

$$P_{DMAX} = \sum i [V_S \times I_{SMAX} + (V_S + -V_{OUTi}) \times I_{LOADi}] \quad (EQ. 2)$$

when sourcing, and:

$$P_{DMAX} = \sum i [V_S \times I_{SMAX} + (V_{OUTi} - V_{S-}) \times I_{LOADi}] \quad (EQ. 3)$$

when sinking,

where:

- $i = 1$  to 2  
(1, 2 corresponds to Channel A, B respectively)
- $V_S$  = Total supply voltage ( $V_{S+} - V_{S-}$ )
- $V_{S+}$  = Positive supply voltage

- $V_{S-}$  = Negative supply voltage
- $I_{SMAX}$  = Maximum supply current per amplifier  
( $I_{SMAX}$  = EL5211T quiescent current  $\div$  2)
- $V_{OUT}$  = Output voltage
- $I_{LOAD}$  = Load current

Device overheating can be avoided by calculating the minimum resistive load condition,  $R_{LOAD}$ , resulting in the highest power dissipation. To find  $R_{LOAD}$  set the two  $P_{DMAX}$  equations equal to each other and solve for  $V_{OUT}/I_{LOAD}$ . Reference the package power dissipation curves, Figures 34 and 35, for further information.

**FIGURE 34. PACKAGE POWER DISSIPATION vs AMBIENT TEMPERATURE**

**FIGURE 35. PACKAGE POWER DISSIPATION vs AMBIENT TEMPERATURE**

**Power Supply Bypassing and Printed Circuit Board Layout**

The EL5211T can provide gain at high frequency, so good printed circuit board layout is necessary for optimum performance. Ground plane construction is highly recommended, trace lengths should be as short as

possible and the power supply pins must be well bypassed to reduce any risk of oscillation.

For normal single supply operation (the  $V_{S-}$  pin is connected to ground) a 4.7 $\mu$ F capacitor should be placed from  $V_{S+}$  to ground, then a parallel 0.1 $\mu$ F capacitor should be connected as close to the amplifier as possible. One 4.7 $\mu$ F capacitor may be used for multiple devices. For dual supply operation, the same capacitor combination should be placed at each supply pin to ground.

It is highly recommended that EL5211T exposed thermal pad packages should always have the pad connected to the lowest potential,  $V_{S-}$ , to optimize thermal and operating performance. PCB vias should be placed below the device's exposed thermal pad to transfer heat to the  $V_{S-}$  plane and away from the device.

# Package Outline Drawing

## L8.2x3

### 8 LEAD DUAL FLAT NO-LEAD PLASTIC PACKAGE

Rev 1, 3/10

**NOTES:**

1. Dimensions are in millimeters.  
Dimensions in ( ) for Reference Only.
2. Dimensioning and tolerancing conform to ASME Y14.5m-1994.
3. Unless otherwise specified, tolerance : Decimal  $\pm 0.05$
4. Dimension applies to the metallized terminal and is measured between 0.25mm and 0.30mm from the terminal tip.
5. Tiebar shown (if present) is a non-functional feature.
6. The configuration of the pin #1 identifier is optional, but must be located within the zone indicated. The pin #1 identifier may be either a mold or mark feature.
7. Complies to JEDEC MO-229 VCEd-2.
