

Description

The F4482 is a 1300MHz to 2800MHz Quad Path TX DVGA outfitted with 100Ω differential inputs and 50Ω single-ended outputs. The device is part of a complete family of VGAs targeting FDD and TDD applications within the 400MHz to 4200MHz frequency range.

Using a single 3.3V power supply and only 500mA of I_{CC} , the F4482 provides four independent transmit paths, each with 28dB typical maximum gain, +34dBm OIP3, +17dBm output P1dB, and 5.7dB NF. Each channel includes a glitch-free digital step attenuator that reduces gain by up to 31.5dB in precise 0.5dB steps.

The F4482 is packaged in an 8 × 8 mm 56-LGA, with matched 100Ω differential input and 50Ω single-ended output impedances for ease of integration into the signal path.

Competitive Advantage

- Combines four independent TX channels consisting of an LPF, LNA, DSA, and Driver in a compact 8 × 8 LGA package
- Low DC power
- High linearity
- High reliability
- Uses Renesas' patented *Zero-Distortion™* and *Glitch-Free™* technologies, providing superior performance and PA damage protection over the entire RF gain range

Typical Applications

- 4G and 5G Multi-mode, Multi-carrier Transmitters
- LTE and UMTS/WCDMA Base Stations
- Active Antenna Systems
- Digital Radio

Features

- Independent Quad Channels for FDD TX applications
- RF Range: 1300MHz to 2800MHz
 - F4481: 400MHz to 1100MHz
- 28dB Typical Maximum Gain at 2100MHz
- Precise SPI-Controlled *Glitch-Free™* Gain Adjustment
 - 31.5dB Gain Range with 0.5dB Step Size
- 5.7dB NF at 2100MHz
- +34dBm OIP3 at 2100MHz
- +17dBm Output P1dB at 2100MHz
- 3.3V Supply Voltage
- $I_{CC} = 500\text{mA}$
- 100Ω Differential Input Impedances
- 50Ω Single-ended Output Impedances
- 1.8V and 3.3V Logic Support
- Independent Channel Standby Modes for Power Savings
- Operating Temperature (T_{EP}) Range: -40°C to +105°C
- 8 × 8 mm, 56-LGA package

Pin Descriptions

Table 1. Pin Descriptions

Number	Name	Description
1, 4, 8, 11, 14, 15, 26, 28, 29, 31, 33, 38, 40, 42, 43, 45, 56	GND	Internally grounded. These pins must be grounded as close to the device as possible.
2	RFIN_A+	Channel A RF differential input. Internally matched to 100Ω. Must use external DC blocks.
3	RFIN_A-	
5	RFIN_B-	Channel B RF differential input. Internally matched to 100Ω. Must use external DC blocks.
6	RFIN_B+	
7	NC	No internal connection. It is highly recommended that these pins be connected to a ground via that is located as close to the pin as possible.
9	RFIN_C+	Channel C RF differential input. Internally matched to 100Ω. Must use external DC blocks.
10	RFIN_C-	
12	RFIN_D-	Channel D RF differential input. Internally matched to 100Ω. Must use external DC blocks.
13	RFIN_D+	
16, 17, 21, 23, 25, 46, 48, 50, 54, 55	V _{CC}	Power Supply. Must place the bypass capacitor as close to the pin as possible.
18	RSET_3	Connect external resistor to GND to optimize amplifier performance. Refer to Table 12, Bill of Materials (BOM).
19	RDSET_3	Connect external resistor to GND to optimize amplifier performance. Refer to Table 12, Bill of Materials (BOM).
20	STBY_D	Standby channel D. With Logic LOW applied to this pin (or if the pin is left unconnected), channel D enters STBY mode and is powered off. With Logic HIGH applied to this pin, channel D is powered on and is fully operational.
22	RSET_4	Connect external resistor to GND to optimize amplifier performance. Refer to Table 12, Bill of Materials (BOM).
24	RDSET_4	Connect external resistor to GND to optimize amplifier performance. Refer to Table 12, Bill of Materials (BOM).
27	RFOUT_D	RF output D internally matched to 50Ω. Must use external DC block.
30	STBY_C	Standby channel C. With Logic LOW applied to this pin (or if the pin is left unconnected), channel C enters STBY mode and is powered off. With Logic HIGH applied to this pin, channel C is powered on and is fully operational.
32	RFOUT_C	RF output C internally matched to 50Ω. Must use external DC block.
34	CSb	Serial Chip Select. CSb pin can be pulled up to V _{CC} and down to GND. 1.8 V and 3.3 V logic compatible.

Number	Name	Description
35	CLK	Serial Clock Input. 1.8 V and 3.3 V logic compatible.
36	DATA	Data write for the 3-wire serial interface. 1.8V and 3.3V logic compatible.
37	V _{CC_DIG}	Digital Power Supply. Must place the bypass capacitor as close to the pin as possible.
39	RFOUT_B	RF output B internally matched to 50Ω. Must use external DC block.
41	STBY_B	Standby channel B. With Logic LOW applied to this pin (or if the pin is left unconnected), channel B enters STBY mode and is powered off. With Logic HIGH applied to this pin, channel B is powered on and is fully operational.
44	RFOUT_A	RF output A internally matched to 50Ω. Must use external DC block.
47	RDSET_2	Connect external resistor to GND to optimize amplifier performance. Refer to Table 12, Bill of Materials (BOM).
49	RSET_2	Connect external resistor to GND to optimize amplifier performance. Refer to Table 12, Bill of Materials (BOM).
51	STBY_A	Standby channel A. With Logic LOW applied to this pin (or if the pin is left unconnected), channel A enters STBY mode and is powered off. With Logic HIGH applied to this pin, channel A is powered on and is fully operational.
52	RDSET_1	Connect external resistor to GND to optimize amplifier performance. Refer to Table 12, Bill of Materials (BOM).
53	RSET_1	Connect external resistor to GND to optimize amplifier performance. Refer to Table 12, Bill of Materials (BOM).
	- EPAD	Exposed paddle. Internally connected to ground. Solder this exposed paddle to a printed circuit board (PCB) pad that uses multiple ground vias to provide heat transfer out of the device into the PCB ground planes. These multiple ground vias are also required to achieve the specified RF performance.

Absolute Maximum Ratings

The absolute maximum ratings are stress ratings only. Stresses greater than those listed below can cause permanent damage to the device. Functional operation of the F4482 at absolute maximum ratings is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

Table 2. Absolute Maximum Ratings

Parameter	Symbol	Minimum	Maximum	Units
V _{CC} to GND	V _{CC}	-0.3	+3.6	V
DATA, CSb, CLK	V _{CTL}	-0.3	V _{CC} + 0.25	V
STBY	V _{CTL}	-0.3	V _{CC} + 0.25	V
STBY minus V _{CC} voltage (voltage difference)	V _{STBY-VCC}		0.3	V
RSET_1, RSET_2, RSET_3, RSET_4 pin maximum output DC current [a]	I _{RSET}		+1	mA
RDSET_1, RDSET_2, RDSET_3, RDSET_4 pin maximum output DC current [a]	I _{RDSET}		+1	mA
RFIN_A, RFIN_B, RFIN_C, RFIN_D to GND externally applied DC voltage	V _{RFIN}	-0.3	+0.3	V
RFOUT_A, RFOUT_B, RFOUT_C, RFOUT_D to GND externally applied DC voltage	V _{RFOUT}	V _{CC} - 0.15	V _{CC} + 0.15	V
RF Input Power (RFIN_A, RFIN_B, RFIN_C, RFIN_D) Applied for 24 Hours Maximum [b]	P _{IN_MAX24}		+17	dBm
Storage Temperature Range	T _{STOR}	-65	+150	°C
Lead Temperature (soldering, 10s)	T _{LEAD}		+260	°C
Electrostatic Discharge – HBM (JEDEC/ESDA JS-001-2012)	V _{ESDHBM}		2000 (Class 2)	V
Electrostatic Discharge – CDM (JEDEC 22-C101F)	V _{ESDCDM}		250 (Class C1)	V

[a] RSET_1, RSET_2, RSET_3, RSET_4, RDSET_1, RDSET_2, RDSET_3, and RDSET_4 pins MUST be connected to ground with resistors; otherwise, damage to the part may result. For suggested resistor values, see Table 12.

[b] Exposure to these maximum RF levels can result in significant VCC current draw due to overdriving the amplifier stages.

Recommended Operating Conditions

Table 3. Recommended Operating Conditions

Parameter	Symbol	Condition	Minimum	Typical	Maximum	Units
Power Supply Voltage ^[a]	V _{CC}	All V _{CC} pins	3.15	3.3	3.45	V
Operating Temperature Range	T _{EP}	Exposed Paddle Temperature	-40		+105	°C
Junction Temperature	T _{JMAX}				+125	°C
RF Frequency Range ^[b]	f _{RF}	Band 1 Tuning	1300		1700	MHz
		Band 2 Tuning	1700		2800	
Maximum CW Input Power	P _{IN_MAX}	Z _S = 100 Ω, Z _L = 50Ω			Note ^[c]	dBm
RF Input Port Impedance	Z _{RFI}	Differential Impedance		100		Ω
RF Output Port Impedance	Z _{RFO}	Single-ended Impedance		50		Ω

[a] Power-on resets will only occur for V_{CC} < 3V. The device is designed to function with any supply voltage ≥ 3V, although performance may be degraded when operated outside the recommended voltage range.

[b] To optimize RF performance, different matching components might be used as described in the BOM. Using external matching, gain flatness is optimized from either 1300MHz to 1700MHz (band 1) or 1700MHz to 2800MHz (band 2).

[c] Level = Lower of (-7.5dBm + attenuation setting) or 5dBm.

Electrical Characteristics – General

See the F4482 Typical Application Circuit. Unless stated otherwise, specifications apply when operated with $V_{CC} = +3.3V$, $T_{EP} = +25^{\circ}C$, $f_{RF} = 2100MHz$, $STBY_A = STBY_B = STBY_C = STBY_D = HIGH$, $Z_S = 100\Omega$ differential, $Z_L = 50\Omega$ single-ended, maximum gain setting, and output power = 0dBm/tone. EVKit trace and connector losses are de-embedded.

Table 4. Electrical Characteristics – General

Parameter	Symbol	Condition	Minimum	Typical	Maximum	Units
Logic Input HIGH	V_{IH}	Supports both 1.8V and 3.3V logic	1.07 [a]			V
Logic Input LOW	V_{IL}				0.63	V
SPI Logic Current (CSb, CLK, DATA)	I_{CTL}	3.3V Logic	-5		5	μA
		1.8V Logic	-5		5	
Standby Logic Current (STBY_A, STBY_B, STBY_C, STBY_D)	I_{IH}, I_{IL}	3.3V Logic	5		50	μA
		1.8V Logic	5		30	
Supply Current [b]	I_{CC_4}	Four channels on		490	600	mA
	I_{CC_3}	Three channels on		374		
	I_{CC_2}	Two channels on		252		
	I_{CC_1}	One channel on		135		
Standby Current	I_{CC_STBY}	All channels off		13	18	mA
Power ON Switching Time	t_{ON}	50% STBY to RF output settled to within $\pm 0.5dB$			1	μs
Power OFF Switching Time	t_{OFF}	50% STBY to 35 dBc reduction of output power			1	μs
Lineup Out-of-Band Rejection at Max Gain	$f_{REJECTION}$	Total gain variation over $f_{RF} = 1300MHz$ to $1700MHz$. Referred to $f_{RF} = 1450MHz$. DSA 0dB attenuation.			3	dBc
		Total gain variation over $f_{RF} = 1700MHz$ to $2800MHz$. Referred to $f_{RF} = 2100MHz$. DSA 0dB attenuation.			3	
		$6GHz < f_{RF} < 11.75GHz$. Referred to $f_{RF} = 2100MHz$. DSA 0dB attenuation.	50			
Gain Settling Time [c]	G_{ST}	Any 2dB step in the 0dB to 31.5dB range. 50% of CSb to 1% / 99% RF.		0.4	1	μs

Parameter	Symbol	Condition		Minimum	Typical	Maximum	Units
DSA Adjustment Range	G _{RANGE}				31.5		dB
DSA Step Resolution	G _{STEP}	LSB			0.5		dB
Adjacent State Attenuator Glitching	ATTN _G	DSA step: 5.5dB to 6dB.			0.7		dB
		DSA step: 6dB to 5.5dB.			0.7		
		DSA step: 11.5dB to 12dB.			0.7		
		DSA step: 12dB to 11.5dB.			0.7		
		DSA step: 17.5dB to 18dB.			0.7		
		DSA step: 18dB to 17.5dB.			0.7		
		DSA step: 23.5dB to 24dB.			0.7		
		DSA step: 24dB to 23.5dB.			0.7		
		DSA step: 29.5dB to 30dB.			1		
		DSA step: 30dB to 29.5dB.			1		
		All Other 0.5dB DSA steps.			0.6		
		All Other 2dB DSA steps.			1		
Common Mode Rejection	CMR	f _{RF} = 1300MHz to 1800MHz		30			dB
		f _{RF} = 1800MHz to 2800MHz		20			
Amplitude Imbalance	IMBAL _{AMP}	Measures RFIN- to RFOUT and compares RFOUT to RFIN+ amplitude.	Worst Case Over f _{RF} = 1300MHz to 1800MHz		0.25		dB
			Worst Case Over f _{RF} = 1800MHz to 2800MHz		0.5		
Phase Imbalance	IMBAL _{PH}	Measures RFIN- to RFOUT and compares RFOUT to RFIN+ phase. Deviation is from ideal 180 degrees	Worst Case Over f _{RF} = 1300MHz to 1800MHz		0.75		deg
			Worst Case Over f _{RF} = 1800MHz to 2800MHz		4		

Parameter	Symbol	Condition	Minimum	Typical	Maximum	Units
Serial Clock Speed	f_{CLK}				50	MHz
CSb to First Serial Clock Rising Edge	t_{LS}	SPI 3 wire bus. 50% of CSb falling edge to 50% of CLK rising edge	10			ns
Serial Data Hold Time	t_H	SPI 3 wire bus. 50% of CLK rising edge to 50% of DATA falling edge	10			ns
Final Serial Clock Rising Edge to CSb	t_{LCS}	SPI 3 wire bus. 50% of CLK rising edge to 50% of CSb rising edge	10			ns
Stability K Factor	K_{FACTOR}	$T_{EP} = -40^{\circ}C$ to $+105^{\circ}C$ 10MHz to 9GHz	1			

- [a] Specifications in the minimum/maximum columns that are shown in bold italics are guaranteed by test. Specifications in these columns that are not shown in bold italics are confirmed by design characterization.
- [b] For input signal power level equal to P1dB, expect DC current to increase above typical value.
- [c] Timing is measured after SPI programming is completed (data latched with CSb = HIGH).

Electrical Characteristics – Band 1 (1300MHz to 1700MHz)

See the F4482 Typical Application Circuit. Unless stated otherwise, specifications apply when operated with $V_{CC} = +3.3V$, $T_{EP} = +25^{\circ}C$, $f_{RF} = 1450MHz$, $STBY_A = STBY_B = STBY_C = STBY_D = HIGH$, $Z_S = 100\Omega$ differential, $Z_L = 50\Omega$ single-ended, maximum gain setting, and output power = 0dBm/tone. EVKit trace and connector losses are de-embedded.

Table 5. Electrical Characteristics – Band 1 (1300MHz to 1700MHz)

Parameter	Symbol	Condition	Minimum	Typical	Maximum	Units
RF Input Return Loss	RL_{IN}		13 ^[a]	19		dB
RF Output Return Loss	RL_{OUT}		12	18		dB
Maximum Gain	G_{MAX}	DSA = 0dB	26	28	30	dB
Mid-Range Gain	G_{MID}	DSA = 14dB	11.5	14	16	dB
Minimum Gain	G_{MIN}	DSA = 31.5dB	-6	-3.5	-1.5	dB
Gain Variation Over Temperature	G_{TEMP}	DSA = 0dB Over $T_{EP} = -40^{\circ}C$ to $+105^{\circ}C$, and relative to $25^{\circ}C$		+0.8 / -1.5		dB
		DSA = 14dB Over $T_{EP} = -40^{\circ}C$ to $+105^{\circ}C$, and relative to $25^{\circ}C$		+0.8 / -1.1		
Gain Flatness	G_{FLAT}	Any 400MHz BW		0.4		dB
Gain Ripple	G_{RIPPLE}	In any 20MHz range		0.2		dB
Intra-die Channel-to-Channel Differences in Gain	$G_A - G_B$	Worst case difference in Gain for any 2dB step over the 0dB to 30dB attenuation range (with channels A and B both set to identical DSA attenuation levels).		0.2		dB
Reverse Isolation	G_{REV}	DSA = 0dB		-47		dB
		DSA = 31.5dB		-73		
Intra-die Channel Isolation ^[b]	$ISOL_{A-B}$	Any RF input/output combination involving channel A paired with channel B DSA 0dB Attenuation	50	60		dB
Inter-die Channel Isolation ^[b]	$ISOL_{B-C}$	Any RF input/output combination involving channel B (die 1) paired with channel C (die 2). DSA 0dB Attenuation	50	60		dB

Parameter	Symbol	Condition	Minimum	Typical	Maximum	Units
Group Delay in Passband	τ	$f_{RF} = 1300\text{MHz to } 1700\text{MHz}$		1	2	ns
Group Delay Ripple	τ_{RIPPLE}	Any 280MHz band within $f_{RF} = 1300\text{MHz to } 1700\text{MHz}$		0.1	1	ns
Intra-die Channel-to-Channel Differences in Group Delay	$\tau_A - \tau_B$	Worst case difference in Group Delay for any 2dB step over the 0dB to 30dB attenuation range (with channels A and B both set to identical DSA attenuation levels).		0.1		ns
Cross Channel Group Delay in Passband vs. Channel Group Delay in Passband	$\tau_{\text{CHANNEL}} - \tau$	$f_{RF} = 1300\text{MHz to } 1700\text{MHz}$ Worst case cross-channel leakage combinations (A to B) - B; (B to A) - A; (B to C) - C; (C to B) - B; (C to D) - D; (D to C) - C	DSA = 0dB	0.6		ns
			DSA = 14dB	0.4		
			DSA = 28dB	0.4		
Step Error (DNL)	$\text{ERROR}_{\text{STEP}}$	Maximum error between adjacent steps		± 0.1		dB
Absolute Error (INL)	$\text{ERROR}_{\text{ABS}}$	Over attenuation range referenced to maximum gain state		Note [c]		dB
Phase Shift Over Any 5°C Temperature Change Over the -40°C to 105°C Range	$\Phi_{\Delta\text{Temp at } 0\text{dB}}$	DSA 0dB Attenuation		0.5		deg
	$\Phi_{\Delta\text{Temp at } 14\text{dB}}$	DSA 14dB Attenuation		0.5		
	$\Phi_{\Delta\text{Temp at } 28\text{dB}}$	DSA 28dB Attenuation		0.5		
Phase Shift Between Startups	$\Phi_{\text{ON-OFF-ON}}$	Channel A or Channel B Phase Shifts. Measuring "On State" phase shifts occurring over time as the device is powered on/off via STBY mode or via PORs (power-on resets).			2	
	$[\Phi_A - \Phi_B]_{\text{ON-OFF-ON}}$	Channel A - Channel B Phase Shifts. Measuring "On State" phase shifts occurring over time as the device is powered on/off via STBY mode or via PORs (power-on resets).			10	
Phase Shift Between Any 2dB Step	$\Phi_{2\text{dB Step}}$	Worst case, any 2dB step		1.2		deg

Thermal Characteristics

Table 7. Package Thermal Characteristics

Parameter	Symbol	Value	Units
Junction to Ambient Thermal Resistance	θ_{JA}	26.89	°C/W
Junction to Case Thermal Resistance (Case is defined as the exposed paddle)	θ_{JC-BOT}	3.33	°C/W
Moisture Sensitivity Rating (Per J-STD-020)		MSL 3	

Typical Operating Conditions (TOC)

Unless otherwise noted, for the TOC graphs on the following pages, the following conditions apply:

- $V_{CC} = 3.3V$
- $Z_S = 100\Omega$ Differential
- $Z_L = 50\Omega$ Single Ended
- $f_{RF} = 1.45GHz$ (set 1)
- $f_{RF} = 2.1GHz$ (set 2)
- $T_{EP} = +25^{\circ}C$
- $STBY_A = STBY_B = STBY_C = STBY_D = HIGH$ (All channels enabled)
- $P_{OUT} = 0dBm$ / Tone unless otherwise specified for multi-tone tests
- 5MHz Tone Spacing
- Gain setting = Maximum Gain
- All temperatures are referenced to the exposed paddle
- Evaluation Kit traces and connector losses are de-embedded

Programming

The F4482 uses a variety of programming options that can control the on-chip attenuators and band-select functions. The following sections provide specific details on each unique programming mode.

Serial Programming

The F4482 includes a SPI interface that is primarily used to program the device's on-chip attenuators.

Device Register Maps

Each channel of the VGA uses an 8-bit addressing word followed by an 8-bit data word to execute the attenuation level commands. Figure 76 shows the various bit assignments for each channel register.

Figure 76. Register Bit Map for Each Channel

The register address word (Bits A7-A0) includes five reserve bits (A7-A3) followed by three channel addressing bits (A2-A0). The "Channel Select" truth table is provided in Table 8.

Table 8. Channel Select Truth Table

Channel Select	Reserve					Address Bits		
	A7	A6	A5	A4	A3	A2	A1	A0
Channel A	X	X	X	X	X	0	0	0
Channel B	X	X	X	X	X	0	0	1
Channel C	X	X	X	X	X	0	1	0
Channel D	X	X	X	X	X	0	1	1
Channel A and B (Simultaneous Programming)	X	X	X	X	X	1	0	X
Channel C and D (Simultaneous Programming)	X	X	X	X	X	1	1	X

Note that address bit A2 is used to select either individual channel programming (logic LOW) or dual channel programming (logic HIGH). Simultaneous programming of channels A and B is achieved when setting bit A2 to a logic HIGH and A1 a logic LOW. Simultaneous programming of channels C and D occurs when bits A2 and A1 are both logic HIGHS.

Table 9 represents the truth table for the attenuator control bits. A full scale DSA setting of 000000 drives the channel DSA into its *minimum* attenuation state. Conversely, a setting of 111111 drives the channel DSA into its *maximum* attenuation state. Note that D5 is defined as the Most Significant Bit (MSB) for the attenuator control function within each respective channel.

Table 9. DVGA Attenuation Word Truth Table

Attenuation Setting (dB)	Reserve		Control Bits					
	D7	D6	D5	D4	D3	D2	D1	D0
0.0	X	X	0	0	0	0	0	0
0.5	X	X	0	0	0	0	0	1
1.0	X	X	0	0	0	0	1	0
2.0	X	X	0	0	0	1	0	0
4.0	X	X	0	0	1	0	0	0
8.0	X	X	0	1	0	0	0	0
16.0	X	X	1	0	0	0	0	0
31.5	X	X	1	1	1	1	1	1

It should also be noted that the listing above represents an *abbreviated* version of the complete 6-bit attenuator control truth table. Any attenuator combination of 0.5dB, 1dB, 2dB, 4dB, 8dB, and 16dB can be achieved by simply assigning a logic HIGH in the respective control bit. For instance, to achieve an attenuation setting of 21.5dB within a given channel, assign a logic HIGH to bits D0, D1, D3, and D5 while assigning a logic LOW to bits D2 and D4. Doing so selects a combination of 0.5dB (D0) + 1dB (D1) + 4dB (D3) + 16dB (D5) = 21.5dB. Setting all of the control bits to logic HIGH will step in all of the attenuator stages.

Serial Mode Default Condition

When the device is **first powered on**, each channel's DSA will default to its **Maximum Attenuation** setting as shown in Figure 77. These settings apply to a hard reset when first applying V_{CC}.

Figure 77. Serial Mode Default Condition Upon Initial Power-Up

Timing Associated with Programming the Serial Registers

To program each channel, the Address Word and Data Word must be clocked in sequentially with the Most Significant Bit (MSB) first (see Figure 78).

Figure 78. Timing Diagram Associated with Programming the Serial Register

SPI Timing Intervals

Figure 79 shows the relevant SPI timing intervals which are specified in Table 10.

Note: The F4482 includes a CLK inhibit feature designed to minimize sensitivity to CLK bus noise when the device is not being programmed. When CSb is high ($> V_{IH}$), the CLK input is disabled and serial data (DATA) is not clocked into the shift register. It is recommended that CSb be pulled high ($> V_{IH}$) when the device is not being programmed.

Figure 79. Serial Register Timing Diagram (Timing Spec Intervals are denoted in Blue)

Table 10. SPI Timing Diagram Values for the Serial Mode

Parameter	Symbol	Test Condition	Minimum	Typical	Maximum	Units
CLK Frequency	f_c				20	MHz
CLK High Duration Time	t_{CH}		20			ns
CLK Low Duration Time	t_{CL}		20			ns
DATA to CLK Setup Time	t_s		10			ns
CLK Period [a]	t_p		40			ns
CLK to DATA Hold Time	t_H		10			ns
Final CLK Rising Edge to CSb Rising Edge	t_{CLS}		10			ns
CSb to CLK Setup Time	t_{LS}		10			ns
CSb Trigger Pulse Width	t_L		10			ns
CSb Trigger to CLK Setup Time [b]	t_{LC}		10			ns

[a] $(T_{CH} + T_{CL}) \geq 1/F_c$

[b] Once all desired DATA is clocked in, t_{LC} represents the time a CSb high needs to occur before any subsequent CLK signals.

Standby Mode Programming

Each F4482 channel can be placed into a standby mode via the dedicated Channel STBY pins (STBY_A, STBY_B, STBY_C, and STBY_D); for information, see truth table shown in Table 11). Note that when a channel is disabled, the serial register for that channel will hold the last enabled DSA state.

Table 11. STBY Logic Truth Table

Channel	STBY_X Pin Logic	Channel Power State
A	0	Channel A Standby (SPI still active)
	1	Channel A Power On
B	0	Channel B Standby (SPI still active)
	1	Channel B Power On
C	0	Channel C Standby (SPI still active)
	1	Channel C Power On
D	0	Channel D Standby (SPI still active)
	1	Channel D Power On

Control Pin Interface

If control signal integrity is a concern and clean signals cannot be guaranteed due to overshoot, undershoot, ringing, etc., the following circuit at the input of each control pin is recommended. This applies to all control pins. Note: The recommended resistor and capacitor values do not necessarily match the EV kit BOM for the case of poor control signal integrity.

Figure 80. Control Pin Interface for Signal Integrity

Evaluation Kit Operation

Power Supplies

A common V_{CC} power supply should be used for all pins requiring DC power. All supply pins should be bypassed with external capacitors to minimize noise and fast transients. Supply noise can degrade noise figure and fast transients can trigger ESD clamps and cause them to fail. Supply voltage change or transients should have a slew rate smaller than $1V/20\mu s$. In addition, all control pins should remain at 0V ($\pm 0.3V$) or floating while the supply voltage ramps or while it returns to zero.

Power Supply Setup

1. Connect pin 2 to pin 4, and pin 1 to pin 3 of J26-29. This ensures operation of the Distortion and Bias resistors.
2. Set up a power supply in the voltage range of 3.15V to 3.45V with the power supply output disabled. The voltage can be applied directly to the J14 SMA.

Power-On Procedure

Set up the voltage supplies and Evaluation Board as described in the "Power Supply Setup" and enable the V_{CC} supply.

Power-Off Procedure

1. Disable the RF input signal on all channels.
2. Disable the V_{CC} supply.

Application Information

The F4482 is optimized for use in high-performance RF applications ranging from 1.3GHz to 2.8GHz.

Startup Condition

Upon device power-up, all channels will default to the standby mode ON. For logic levels, see Table 11.

Default Channel Power On

The default attenuation state will be 31.5dB attenuation upon powering ON each channel (i.e., standby mode OFF). For default levels, see Figure 77.

Chip Select (CSb)

When CSb is set to logic high, the CLK input is disabled. When CSb is set to logic low, the CLK input is enabled and the DATA word can be programmed into the shift registers. The programmed word is then latched into the F4482 on the CSb rising edge (see Figure 79).

Standby Mode (STBY)

The F4482 has a power-down feature for power savings. The SPI bus is used to operate each channel in Standby On/Off mode (see Table 11).

Package Outline Drawings

The [package outline drawings](#) are appended at the end of this document.

Ordering Information

Orderable Part Number	Package	MSL Rating	Shipping Packaging	Temperature
F4482LKGI	8 × 8 × 0.65 mm 56-LGA	3	Tray	-40° to +105°C
F4482LKG18	8 × 8 × 0.65 mm 56-LGA	3	Reel	-40° to +105°C
F4482EVS-1P5	Evaluation Board (Band 1)			
F4482EVS-2P1	Evaluation Board (Band 2)			

Marking Diagram

- Line 1 is the manufacturer (IDT/Renesas).
- Line 2 is the part number.
- Line 3 indicates the following:
 - # denotes device stepping
 - "YY" is the last two digits of the year; "WW" is the work week that the part was assembled.
 - "\$" denotes the mark code
- Line 4 is the lot number.

Revision History

Revision Date	Description of Change
December 15, 2020	Removed references to F4483.
October 15, 2020	Updated Ordering Information.
October 5, 2020	Updated Electrical Characteristics tables and Typical Performance Characteristics.
August 28, 2020	Updated Electrical Characteristics table.
August 14, 2020	Initial release.

NOTES:

1. ALL DIMENSIONS ARE IN MM.

LEGEND:

RECOMMENDED LAND PATTERN DIMENSION

- NOTES:
 1. ALL DIMENSIONS ARE IN MM.
 2. TOP DOWN VIEW. AS VIEWED ON PCB.

Package Revision History		
Date Created	Rev No.	Description
June 21, 2018	Rev 00	Initial Release
