

HI-5051/883

Dual SPDT CMOS Analog Switch

FN8289
Rev.0.00
May 3, 2012

This CMOS analog switch offers low resistance switching performance for analog voltages up to the supply rails and for signal currents up to 70mA. "ON" resistance is low and stays reasonably constant over the full range of operating signal voltage and current. R_{ON} remains exceptionally constant for input voltages between +5V and -5V and currents up to 50mA. Switch impedance also changes very little over temperature, particularly between 0°C and +75°C. R_{ON} is nominally 25Ω.

The HI-5051/883 provides break-before-make switching and is TTL and CMOS compatible for maximum application versatility. Performance is further enhanced by Dielectric Isolation processing which insures latch-free operation with very low input and output leakage currents (0.8nA at +25°C). The HI-5051/883 switch also features very low power operation (1.5mW at +25°C). The HI-5051/883 is available in a 20 Ld CLCC package and operates over the -55°C to +125°C temperature range.

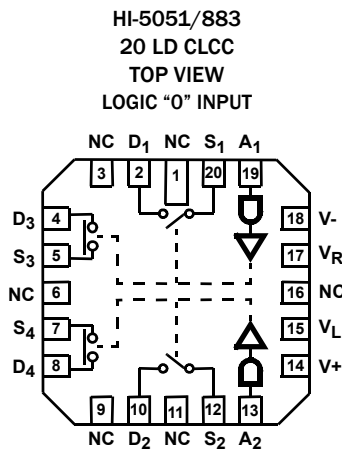

Features

- This Circuit is Processed in Accordance to MIL-STD-883 and is Fully Conformant Under the Provisions of Paragraph 1.2.1.
- Wide Analog Signal Range ±15V
- Low "ON" Resistance 25Ω (Typ), 50Ω (Max)
- High Current Capability 70mA (Max)
- Break-Before-Make Switching
 - Turn-On Time 370ns (Typ), 800ns (Max)
 - Turn-Off Time 280ns (Typ), 400ns (Max)
- No Latch-Up
- Input MOS Gates are Protected from Electrostatic Discharge
- DTL, TTL, CMOS, PMOS Compatible

Applications

- High Frequency Switching
- Sample and Hold
- Digital Filters
- Operational Amplifier Gain Switching

Pin Configuration

NOTE: Unused pins may be internally connected. Ground all unused pins.

NOTE:

- Parameters listed in Table 3 are controlled via design or process parameters and are not directly tested at final production. These parameters are lab characterized upon initial design release, or upon design changes. These parameters are guaranteed by characterization based upon data from multiple production runs which reflect lot to lot and within lot variation.

NOTES:

1. Metallized castellations shall be connected to plane 1 terminals and extend toward plane 2 across at least two layers of ceramic or completely across all of the ceramic layers to make electrical connection with the optional plane 2 terminals.
2. Unless otherwise specified, a minimum clearance of 0.015 inch (0.38mm) shall be maintained between all metallized features (e.g., lid, castellations, terminals, thermal pads, etc.)
3. Symbol "N" is the maximum number of terminals. Symbols "ND" and "NE" are the number of terminals along the sides of length "D" and "E", respectively.
4. The required plane 1 terminals and optional plane 2 terminals (if used) shall be electrically connected.
5. The corner shape (square, notch, radius, etc.) may vary at the manufacturer's option, from that shown on the drawing.
6. Chip carriers shall be constructed of a minimum of two ceramic layers.
7. Dimension "A" controls the overall package thickness. The maximum "A" dimension is package height before being solder dipped.
8. Dimensioning and tolerancing per ANSI Y14.5M-1982.
9. Controlling dimension: INCH.
