

The RA6E2 Group delivers up to 200 MHz of CPU performance using an Arm® Cortex®-M33 core with a code flash memory ranging from 128 KB to 256 KB, 4 KB of data flash memory, and 40 KB of SRAM. The RA6E2 Group offers a wide set of peripherals, including USB Full Speed, CANFD, Quad SPI, I3C, and ADC.

## Features

- **Arm® Cortex®-M33 Core**
  - Armv8-M architecture with the main extension
  - Maximum operating frequency: 200 MHz
  - Arm Memory Protection Unit (Arm MPU)
    - Protected Memory System Architecture (PMSAv8)
    - Secure MPU (MPU\_S): 8 regions
    - Non-secure MPU (MPU\_NS): 8 regions
  - SysTick timer
    - Embeds two SysTick timers: Secure and Non-secure instance
    - Driven by LOCO or system clock
  - CoreSight™ ETM-M33
- **Memory**
  - Up to 256-KB code flash memory
  - 4-KB data flash memory (100,000 program/erase (P/E) cycles)
  - 40-KB SRAM
- **Connectivity**
  - Serial Communications Interface (SCI) × 2
    - Asynchronous interfaces
    - 8-bit clock synchronous interface
    - Smart card interface
    - Simple IIC
    - Simple SPI
    - Manchester coding
  - I3C bus interface (I3C)
  - Serial Peripheral Interface (SPI) × 2
  - Quad Serial Peripheral Interface (QSPI)
  - USB 2.0 Full-Speed Module (USBFS)
  - CAN with Flexible Data-rate (CANFD)
  - Serial Sound Interface Enhanced (SSIE)
  - Consumer Electronics Control (CEC)
- **Analog**
  - 12-bit A/D Converter (ADC12)
  - 12-bit D/A Converter (DAC12) × 2
  - Temperature Sensor (TSN)
- **Timers**
  - General PWM Timer 16-bit Enhanced (GPT16E) × 6
  - Low Power Asynchronous General Purpose Timer (AGT) × 2
- **Security**
  - Arm® TrustZone®
    - Up to three regions for the code flash
    - Up to two regions for the data flash
    - Up to three regions for the SRAM
    - Individual secure or non-secure security attribution for each peripheral
  - 128-bit unique ID
  - True Random Number Generator (TRNG)
  - Pin function
    - Secure pin multiplexing
- **System and Power Management**
  - Low power modes
  - RealTime Clock (RTC) with calendar
  - Event Link Controller (ELC)
  - Data Transfer Controller (DTC)
  - DMA Controller (DMAC) × 8
  - Power-on reset
  - Low Voltage Detection (LVD) with voltage settings
  - Watchdog Timer (WDT)
  - Independent Watchdog Timer (IWDT)
- **Multiple Clock Sources**
  - Main clock oscillator (MOSC) (8 to 24 MHz)
  - Sub-clock oscillator (SOSC) (32.768 kHz)
  - High-speed on-chip oscillator (HOCO) (16/18/20 MHz)
  - Middle-speed on-chip oscillator (MOCO) (8 MHz)
  - Low-speed on-chip oscillator (LOCO) (32.768 kHz)
  - IWDT-dedicated on-chip oscillator (15 kHz)
- Clock trim function for HOCO/MOCO/LOCO
- PLL
- Clock out support
- **General-Purpose I/O Ports**
  - 5-V tolerance, open drain, input pull-up, switchable driving ability
- **Operating Voltage**
  - VCC: 2.7 to 3.6 V
- **Operating Temperature and Packages**
  - Ta = -40°C to +105°C
    - 64-pin LQFP (10 mm × 10 mm, 0.5 mm pitch)
    - 48-pin QFN (7 mm × 7 mm, 0.5 mm pitch)
    - 32-pin QFN (5 mm × 5 mm, 0.5 mm pitch)
    - 64-pin BGA (5 mm × 5 mm, 0.5 mm pitch)
    - 36-pin BGA (4 mm × 4 mm, 0.5 mm pitch)

## 1. Overview

The MCU integrates multiple series of software- and pin-compatible Arm<sup>®</sup>-based 32-bit cores that share a common set of Renesas peripherals to facilitate design scalability and efficient platform-based product development.

The MCU in this series incorporates a high-performance Arm Cortex<sup>®</sup>-M33 core running up to 200 MHz with the following features:

- Up to 256 KB code flash memory
- 40 KB SRAM
- Quad Serial Peripheral Interface (QSPI)
- USBFS
- Analog peripherals
- Security and safety features

### 1.1 Function Outline

**Table 1.2 Memory**

Feature	Functional description
Code flash memory	Maximum 256 KB of code flash memory.
Data flash memory	4 KB of data flash memory.
Option-setting memory	The option-setting memory determines the state of the MCU after a reset.
SRAM	On-chip high-speed SRAM with either parity bit or Error Correction Code (ECC).
Standby SRAM	On-chip SRAM that can retain data in Deep Software Standby mode. See section x, Standby SRAM.

**Table 1.3 System (1 of 2)**

Feature	Functional description
Operating modes	Two operating modes: <ul style="list-style-type: none"> <li>• Single-chip mode</li> <li>• SCI/USB/SWD boot mode</li> </ul>
Resets	The MCU provides 14 resets.
Low Voltage Detection (LVD)	The Low Voltage Detection (LVD) module monitors the voltage level input to the VCC pin. The detection level can be selected by register settings. The LVD module consists of three separate voltage level detectors (LVD0, LVD1, LVD2). LVD0, LVD1, and LVD2 measure the voltage level input to the VCC pin. LVD registers allow your application to configure detection of VCC changes at various voltage thresholds.

Feature	Functional description
Clocks	<ul style="list-style-type: none"> <li>• Main clock oscillator (MOSC)</li> <li>• Sub-clock oscillator (SOSC)</li> <li>• High-speed on-chip oscillator (HOCO)</li> <li>• Middle-speed on-chip oscillator (MOCO)</li> <li>• Low-speed on-chip oscillator (LOCO)</li> <li>• IWDT-dedicated on-chip oscillator</li> <li>• PLL</li> <li>• Clock out support</li> </ul>
Clock Frequency Accuracy Measurement Circuit (CAC)	The Clock Frequency Accuracy Measurement Circuit (CAC) counts pulses of the clock to be measured (measurement target clock) within the time generated by the clock selected as the measurement reference (measurement reference clock), and determines the accuracy depending on whether the number of pulses is within the allowable range. When measurement is complete or the number of pulses within the time generated by the measurement reference clock is not within the allowable range, an interrupt request is generated.
Interrupt Controller Unit (ICU)	The Interrupt Controller Unit (ICU) controls which event signals are linked to the Nested Vector Interrupt Controller (NVIC), the DMA Controller (DMAC), and the Data Transfer Controller (DTC) modules. The ICU also controls non-maskable interrupts.
Low power modes	Power consumption can be reduced in multiple ways, including setting clock dividers, stopping modules, selecting power control mode in normal operation, and transitioning to low power modes.
Register write protection	The register write protection function protects important registers from being overwritten due to software errors. The registers to be protected are set with the Protect Register (PRCR).
Memory Protection Unit (MPU)	The MCU has one Memory Protection Unit (MPU).

**Table 1.4 Event link**

Feature	Functional description
Event Link Controller (ELC)	The Event Link Controller (ELC) uses the event requests generated by various peripheral modules as source signals to connect them to different modules, allowing direct link between the modules without CPU intervention.

**Table 1.5 Direct memory access**

Feature	Functional description
Data Transfer Controller (DTC)	A Data Transfer Controller (DTC) module is provided for transferring data when activated by an interrupt request.
DMA Controller (DMAC)	The MCU includes an 8-channel direct memory access controller (DMAC) that can transfer data without intervention from the CPU. When a DMA transfer request is generated, the DMAC transfers data stored at the transfer source address to the transfer destination address.

**Table 1.6 External bus interface**

Feature	Functional description
External buses	<ul style="list-style-type: none"> <li>• QSPI area (EQBIU): Connected to the QSPI (external device interface)</li> </ul>

**Table 1.7 Timers (1 of 2)**

Feature	Functional description
General PWM Timer (GPT)	The General PWM Timer (GPT) is a 16-bit timer with GPT16E × 6 channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or the up- and down-counter. In addition, PWM waveforms can be generated for controlling brushless DC motors. The GPT can also be used as a general-purpose timer.
Port Output Enable for GPT (POEG)	The Port Output Enable (POEG) function can place the General PWM Timer (GPT) output pins in the output disable state
Low Power Asynchronous General Purpose Timer (AGT)	The low power Asynchronous General Purpose Timer (AGT) is a 32-bit timer that can be used for pulse output, external pulse width or period measurement, and counting external events. This timer consists of a reload register and a down counter. The reload register and the down counter are allocated to the same address, and can be accessed with the AGT register.

**Table 1.7 Timers (2 of 2)**

Feature	Functional description
Realtime Clock (RTC)	The realtime clock (RTC) has two counting modes, calendar count mode and binary count mode, that are used by switching register settings. For calendar count mode, the RTC has a 100-year calendar from 2000 to 2099 and automatically adjusts dates for leap years. For binary count mode, the RTC counts seconds and retains the information as a serial value. Binary count mode can be used for calendars other than the Gregorian (Western) calendar.
Watchdog Timer (WDT)	The Watchdog Timer (WDT) is a 14-bit down counter that can be used to reset the MCU when the counter underflows because the system has run out of control and is unable to refresh the WDT. In addition, the WDT can be used to generate a non-maskable interrupt or an underflow interrupt.
Independent Watchdog Timer (IWDT)	The Independent Watchdog Timer (IWDT) consists of a 14-bit down counter that must be serviced periodically to prevent counter underflow. The IWDT provides functionality to reset the MCU or to generate a non-maskable interrupt or an underflow interrupt. Because the timer operates with an independent, dedicated clock source, it is particularly useful in returning the MCU to a known state as a fail-safe mechanism when the system runs out of control. The IWDT can be triggered automatically by a reset, underflow, refresh error, or a refresh of the count value in the registers.

**Table 1.8 Communication interfaces**

Feature	Functional description
Serial Communications Interface (SCI)	The Serial Communications Interface (SCI) × 2 channels have asynchronous and synchronous serial interfaces: <ul style="list-style-type: none"> <li>Asynchronous interfaces (UART and Asynchronous Communications Interface Adapter (ACIA))</li> <li>8-bit clock synchronous interface</li> <li>Simple IIC (master-only)</li> <li>Simple SPI</li> <li>Smart card interface</li> <li>Manchester interface</li> </ul> The smart card interface complies with the ISO/IEC 7816-3 standard for electronic signals and transmission protocol. SCIn (n = 0, 9) has FIFO buffers to enable continuous and full-duplex communication, and the data transfer speed can be configured independently using an on-chip baud rate generator.
I3C bus interface (I3C)	The I3C bus interface (I3C) has one channel. The I3C module conforms with and provides a subset of the NXP I2C (Inter-Integrated Circuit) bus interface functions and a subset of the MIPI I3C.
Serial Peripheral Interface (SPI)	The Serial Peripheral Interface (SPI) has 2 channels. The SPI provides high-speed full-duplex synchronous serial communications with multiple processors and peripheral devices.
Control Area Network with Flexible Data-Rate Module (CANFD)	The CAN with Flexible Data-Rate (CANFD) module can handle classical CAN frames and CANFD frames complied with ISO 11898-1 standard. The module supports 4 transmit buffers and 32 receive buffers.
USB 2.0 Full-Speed module (USBFS)	The USB 2.0 Full-Speed module (USBFS) can operate as a device controller. The module supports full-speed transfer as defined in Universal Serial Bus Specification 2.0. The module has an internal USB transceiver and supports all of the transfer types defined in Universal Serial Bus Specification 2.0. The USB has buffer memory for data transfer, providing a maximum of 5 pipes. Pipe 0 and pipe 4 to pipe 7 can be assigned any endpoint number based on the peripheral devices used for communication or based on your system.
Quad Serial Peripheral Interface (QSPI)	The Quad Serial Peripheral Interface (QSPI) is a memory controller for connecting a serial ROM (nonvolatile memory such as a serial flash memory, serial EEPROM, or serial FeRAM) that has an SPI-compatible interface.
Serial Sound Interface Enhanced (SSIE)	The Serial Sound Interface Enhanced (SSIE) peripheral provides functionality to interface with digital audio devices for transmitting I <sup>2</sup> S/Monaural/TDM audio data over a serial bus. The SSIE supports an audio clock frequency of up to 50 MHz, and can be operated as a slave or master receiver, transmitter, or transceiver to suit various applications. The SSIE includes 32-stage FIFO buffers in the receiver and transmitter, and supports interrupts and DMA-driven data reception and transmission.
Consumer Electronics Control module (CEC)	The CEC transmission/reception module can generate and receive CEC signals complied with the High-Definition Multimedia Interface (HDMI) Version 1.4b. The module can also automatically detect communication states.

**Table 1.9 Analog**

Feature	Functional description
12-bit A/D Converter (ADC12)	A 12-bit successive approximation A/D converter (ADC12) is provided. Up to 12 analog input channels are selectable. Temperature sensor output and internal reference voltage are selectable for conversion.
12-bit D/A Converter (DAC12)	A 12-bit D/A converter (DAC12) is provided.
Temperature Sensor (TSN)	The on-chip Temperature Sensor (TSN) determines and monitors the die temperature for reliable operation of the device. The sensor outputs a voltage directly proportional to the die temperature, and the relationship between the die temperature and the output voltage is fairly linear. The output voltage is provided to the ADC12 for conversion and can be further used by the end application.

**Table 1.10 Data processing**

Feature	Functional description
Cyclic Redundancy Check (CRC) calculator	The Cyclic Redundancy Check (CRC) generates CRC codes to detect errors in the data. The bit order of CRC calculation results can be switched for LSB-first or MSB-first communication. Additionally, various CRC-generation polynomials are available.
Data Operation Circuit (DOC)	The Data Operation Circuit (DOC) compares, adds, and subtracts 16-bit data. When a selected condition applies, 16-bit data is compared and an interrupt can be generated.

**Table 1.11 I/O ports**

## 1.5 Pin Functions

**Table 1.14 Pin functions (1 of 3)**

Function	Signal	I/O	Description
Power supply	VCC	Input	Power supply pin. Connect it to the system power supply. Connect this pin to VSS by a 0.1- $\mu$ F capacitor. The capacitor should be placed close to the pin.
	VCL	I/O	Connect this pin to the VSS pin by the smoothing capacitor used to stabilize the internal power supply. Place the capacitor close to the pin.
	VSS	Input	Ground pin. Connect it to the system power supply (0 V).
Clock	XTAL	Output	Pins for a crystal resonator. An external clock signal can be input through the EXTAL pin.
	EXTAL	Input	
	XCIN	Input	Input/output pins for the sub-clock oscillator. Connect a crystal resonator between XCOU and XCIN.
	XCOU	Output	
	CLKOUT	Output	Clock output pin
Operating mode control	MD	Input	Pin for setting the operating mode. The signal level on this pin must not be changed during operation mode transition on release from the reset state.
System control	RES	Input	Reset signal input pin. The MCU enters the reset state when this signal goes low.
CAC	CACREF	Input	Measurement reference clock input pin
On-chip emulator	SWDIO	I/O	Serial wire debug data input/output pin
	SWCLK	Input	Serial wire clock pin
Interrupt	NMI	Input	Non-maskable interrupt request pin
	IRQn	Input	Maskable interrupt request pins
	IRQn-DS	Input	Maskable interrupt request pins that can also be used in Deep Software Standby mode
GPT	GTETRG, GTETRGB, GTETRG, GTETRGD	Input	External trigger input pins
	GTIOcA, GTIOcB	I/O	Input capture, output compare, or PWM output pins
	GTADSM0, GTADSM1	Output	A/D conversion start request monitoring output pins
	GTIU	Input	Hall sensor input pin U
	GTIV	Input	Hall sensor input pin V
	GTIW	Input	Hall sensor input pin W
	GTOUUP	Output	3-phase PWM output for BLDC motor control (positive U phase)
	GTOULO	Output	3-phase PWM output for BLDC motor control (negative U phase)
	GTOVUP	Output	3-phase PWM output for BLDC motor control (positive V phase)
	GTOVLO	Output	3-phase PWM output for BLDC motor control (negative V phase)
	GTOUWP	Output	3-phase PWM output for BLDC motor control (positive W phase)
	GTOWLO	Output	3-phase PWM output for BLDC motor control (negative W phase)
AGT	AGTEEn	Input	External event input enable signals
	AGTIO	I/O	External event input and pulse output pins
	AGTO	Output	Pulse output pins
	AGTOAn	Output	Output compare match A output pins
	AGTOBn	Output	Output compare match B output pins

Table 1.14 Pin functions (2 of 3)

Function	Signal	I/O	Description
RTC	RTCCOUT	Output	Output pin for 1-Hz or 64-Hz clock
	RTCCn	Input	Time capture event input pins
SCI	SCKn	I/O	Input/output pins for the clock (clock synchronous mode)
	RXDn	Input	Input pins for received data (asynchronous mode/clock synchronous mode)
	TXDn	Output	Output pins for transmitted data (asynchronous mode/clock synchronous mode)
	CTS <sub>n</sub> _RTS <sub>n</sub>	I/O	Input/output pins for controlling the start of transmission and reception (asynchronous mode/clock synchronous mode), active-low.
	CTS <sub>n</sub>	Input	Input for the start of transmission.
	SCL <sub>n</sub>	I/O	Input/output pins for the IIC clock (simple IIC mode)
	SDA <sub>n</sub>	I/O	Input/output pins for the IIC data (simple IIC mode)
	SCK <sub>n</sub>	I/O	Input/output pins for the clock (simple SPI mode)
	MISO <sub>n</sub>	I/O	Input/output pins for slave transmission of data (simple SPI mode)
	MOSI <sub>n</sub>	I/O	Input/output pins for master transmission of data (simple SPI mode)
	SS <sub>n</sub>	Input	Chip-select input pins (simple SPI mode), active-low
I3C	I3C_SCL	I/O	Input/output pins for the I3C clock
	I3C_SDA	I/O	Input/output pins for the I3C data
	SCL0	I/O	Input/output pins for the I2C clock
	SDA0	I/O	Input/output pins for the I2C data
SPI	RSPCKA, RSPCKB	I/O	Clock input/output pin
	MOSIA, MOSIB	I/O	Input or output pins for data output from the master
	MISOA, MISOB	I/O	Input or output pins for data output from the slave
	SSLA0, SSLB0	I/O	Input or output pin for slave selection
	SSLA1 to SSLA3, SSLB1 to SSLB3	Output	Output pins for slave selection
CANFD	CRX0	Input	Receive data
	CTX0	Output	Transmit data
USBFS	VCC_USB	Input	Power supply pin
	VSS_USB	Input	Ground pin
	USB_DP	I/O	D+ pin of the USB on-chip transceiver. Connect this pin to the D+ pin of the USB bus.
	USB_DM	I/O	D- pin of the USB on-chip transceiver. Connect this pin to the D- pin of the USB bus.
	USB_VBUS	Input	USB cable connection monitor pin. Connect this pin to VBUS of the USB bus. The VBUS pin status (connected or disconnected) can be detected when the USB module is operating as a function controller.
QSPI	QSPCLK	Output	QSPI clock output pin
	QSSL	Output	QSPI slave output pin
	QIO0 to QIO3	I/O	Data0 to Data3

**Table 1.14 Pin functions (3 of 3)**

Function	Signal	I/O	Description
SSIE	SSIBCK0	I/O	SSIE serial bit clock pins
	SSILRCK0/SSIFS0	I/O	LR clock/frame synchronization pins
	SSITXD0	Output	Serial data output pin
	SSIRXD0	Input	Serial data input pin
	SSIDATA0	I/O	Serial data input/output pins
	AUDIO_CLK	Input	External clock pin for audio (input oversampling clock)
CEC	CECIO	I/O	CEC data communication
Analog power supply	AVCC0	Input	Analog voltage supply pin. This is used as the analog power supply for the respective modules. Supply this pin with the same voltage as the VCC pin.
	AVSS0	Input	Analog ground pin. This is used as the analog ground for the respective modules. Supply this pin with the same voltage as the VSS pin.
	VREFH	Input	Analog reference voltage supply pin for the D/A Converter.
	VREFL	Input	Analog reference ground pin for the D/A Converter.
	VREFH0	Input	Analog reference voltage supply pin for the ADC12. Connect this pin to AVCC0 when not using the ADC12.

Note: Several pin names have the added suffix of \_A, \_B, \_C, and \_D. The suffix can be ignored when assigning functionality.

Note 1. XCIN cannot be used in QFN32. XCIN must be connected to VSS through a resistor (pull down).

## 2. Electrical Characteristics

Supported peripheral functions and pins differ from one product name to another.

Unless otherwise specified, the electrical characteristics of the MCU are defined under the following conditions:

- $VCC = AVCC0 = VCC\_USB = 2.7$  to  $3.6$
- $2.7 \leq VREFH0/VREFH \leq AVCC0$
- $VSS = AVSS0 = VREFL0/VREFL = VSS\_USB = 0$  V
- $T_a = T_{opr}$

Figure 2.1 shows the timing conditions.

**Figure 2.1** Input or output timing measurement conditions

The recommended measurement conditions for the timing specification of each peripheral provided are for the best peripheral operation. Make sure to adjust the driving abilities of each pin to meet your conditions.

### 2.1 Absolute Maximum Ratings

**Table 2.1** Absolute maximum ratings

Parameter	Symbol	Value	Unit
Power supply voltage	$VCC, VCC\_USB^{*2}$	-0.3 to +4.0	V
Input voltage (except for 5 V-tolerant ports <sup>*1</sup> )	$V_{in}$	-0.3 to $VCC + 0.3$	V
Input voltage (5 V-tolerant ports <sup>*1</sup> )	$V_{in}$	-0.3 to $+VCC + 4.0$ (max. 5.8)	V
Reference power supply voltage	$VREFH/VREFH0$	-0.3 to $VCC + 0.3$	V
Analog power supply voltage	$AVCC0^{*2}$	-0.3 to +4.0	V
Analog input voltage	$V_{AN}$	-0.3 to $AVCC0 + 0.3$	V
Operating temperature <sup>*3 *4 *5</sup>	$T_{opr}$	-40 to +105	°C
Storage temperature	$T_{stg}$	-55 to +125	°C

Note 1. Ports P100, P101, P205, P206, P400, P401 and P407 to P411 are 5 V tolerant.

Note 2. Connect  $AVCC0$  and  $VCC\_USB$  to  $VCC$ .

Note 3. See [section 2.2.1. Tj/Ta Definition](#).

Note 4. Contact a Renesas Electronics sales office for information on derating operation when  $T_a = +85^{\circ}\text{C}$  to  $+105^{\circ}\text{C}$ . Derating is the systematic reduction of load for improved reliability.

Note 5. The upper limit of operating temperature is  $+85^{\circ}\text{C}$  or  $+105^{\circ}\text{C}$ , depending on the product. For details, see section x.x. Part Numbering.

**Caution:** Permanent damage to the MCU might result if absolute maximum ratings are exceeded.

**Table 2.2 Recommended operating conditions**

Parameter	Symbol	Value	Min	Typ	Max	Unit
Power supply voltages	VCC	When USB is not used	2.7	—	3.6	V
		When USB is used	3.0	—	3.6	V
	VSS	—	0	—	V	
USB power supply voltages	VCC_USB	—	VCC	—	V	
	VSS_USB	—	0	—	V	
Analog power supply voltages	AVCC0 <sup>*1</sup>	—	VCC	—	V	
	AVSS0	—	0	—	V	

Note 1. Connect AVCC0 to VCC. When the A/D converter and the D/A converter are not in use, do not leave the AVCC0, VREFH/VREFH0, AVSS0, and VREFL/VREFL0 pins open. Connect the AVCC0 and VREFH/VREFH0 pins to VCC, and the AVSS0 and VREFL/VREFL0 pins to VSS, respectively.

## 2.2 DC Characteristics

### 2.2.1 T<sub>j</sub>/T<sub>a</sub> Definition

**Table 2.3 DC characteristics**

Parameter	Symbol	Typ	Max	Unit	Test conditions
Permissible junction temperature	T <sub>j</sub>	—	125	°C	High-speed mode Low-speed mode Subosc-speed mode
			105 <sup>*1</sup>		

Note: Make sure that  $T_j = T_a + \theta_{ja} \times \text{total power consumption (W)}$ , where total power consumption =  $(V_{CC} - V_{OH}) \times \Sigma I_{OH} + V_{OL} \times \Sigma I_{OL} + I_{CCmax} \times V_{CC}$ .

Note 1. The upper limit of operating temperature is 85°C or 105°C, depending on the product. If the part number shows the operation temperature to 85°C, then T<sub>j</sub> max is 105°C, otherwise, 125°C.

		Other input pins <sup>*4</sup>	$V_{IH}$	$VCC \times 0.8$	—	—	
$V_{IL}$			—	—	$VCC \times 0.2$		

Note 1. RES and peripheral function pins associated with P100, P101, P205, P206, P400, P401, P407 to P411 (total 12 pins).

Note 2. All input pins except for the peripheral function pins already described in the table.

Note 3. P100, P101, P205, P206, P400, P401, P407 to P411 (total 11pins).

Note 4. All input pins except for the ports already described in the table.

Note 5. When VCC is less than 2.7 V, the input voltage of 5 V-tolerant ports should be less than 3.6 V, otherwise breakdown may occur because 5 V-tolerant ports are electrically controlled so as not to violate the break down voltage.

Permissible output current (maxvalue of total of all pins)	Maximum of all output pins	$\Sigma I_{OH} (max)$	—	—	-80	mA
		$\Sigma I_{OL} (max)$	—	—	80	mA

Note 1. This is the value when low driving ability is selected in the Port Drive Capability bit in the PmnPFS register. The selected driving ability is retained in Deep Software Standby mode.

Note 2. This is the value when middle driving ability is selected in the Port Drive Capability bit in the PmnPFS register. The selected driving ability is retained in Deep Software Standby mode.

Note 3. This is the value when high driving ability is selected in the Port Drive Capability bit in the PmnPFS register. The selected driving ability is retained in Deep Software Standby mode.

Note 4. SCL0\_D, SDA0\_D (total 2 pins). This is the value when IIC function is selected.

Note 5. Except for P000 to P003, P200, which is an input port.

**Caution: To protect the reliability of the MCU, the output current values should not exceed the values in this table. The average output current indicates the average value of current measured during 100  $\mu$ s.**

## 2.2.7 Thermal Characteristics

Maximum value of junction temperature ( $T_j$ ) must not exceed the value of “[section 2.2.1.  \$T\_j/T\_a\$  Definition](#)”.

$T_j$  is calculated by either of the following equations.

- $T_j = T_a + \theta_{ja} \times \text{Total power consumption}$
- $T_j = T_t + \Psi_{jt} \times \text{Total power consumption}$ 
  - $T_j$  : Junction Temperature ( $^{\circ}\text{C}$ )
  - $T_a$  : Ambient Temperature ( $^{\circ}\text{C}$ )
  - $T_t$  : Top Center Case Temperature ( $^{\circ}\text{C}$ )
  - $\theta_{ja}$  : Thermal Resistance of “Junction”-to-“Ambient” ( $^{\circ}\text{C}/\text{W}$ )
  - $\Psi_{jt}$  : Thermal Resistance of “Junction”-to-“Top Center Case” ( $^{\circ}\text{C}/\text{W}$ )
- Total power consumption = Voltage  $\times$  (Leakage current + Dynamic current)
- Leakage current of IO =  $\Sigma (I_{OL} \times V_{OL}) / \text{Voltage} + \Sigma (|I_{OH}| \times |VCC - V_{OH}|) / \text{Voltage}$
- Dynamic current of IO =  $\Sigma IO (C_{in} + C_{load}) \times \text{IO switching frequency} \times \text{Voltage}$ 
  - $C_{in}$ : Input capacitance
  - $C_{load}$ : Output capacitance

Regarding  $\theta_{ja}$  and  $\Psi_{jt}$ , refer to [Table 2.11](#).

**Table 2.11 Thermal Resistance**

Parameter	Package	Symbol	Value*1	Unit	Test conditions
Thermal Resistance	32-pin QFN (PWQN0032KE-A)	$\theta_{ja}$	36.8	°C/W	JESD 51-2 and 51-7 compliant
	48-pin QFN (PWQN0048KC-A)		29.7		
	64-pin LQFP (PLQP0064KB-C)		41.3		
	36-pin BGA (PLBG0036KA-A)		53.7		
	64-pin BGA (PLBG0064KB-A)		51.6		
	32-pin QFN (PWQN0032KE-A)	$\Psi_{jt}$	0.36	°C/W	
	48-pin QFN (PWQN0048KC-A)		0.27		
	64-pin LQFP (PLQP0064KB-C)		1.39		
	36-pin BGA (PLBG0036KA-A)		1.70		
	64-pin BGA (PLBG0064KB-A)		1.70		

Note 1. The values are reference values when the 4-layer board is used. Thermal resistance depends on the number of layers or size of the board. For details, refer to the JEDEC standards.

Note 1. The values are guaranteed by design.

Note 2. LDO and Leak are internal voltage regulator's current and MCU's leakage current.  
It is selected according to the temperature of Ta.

Note 3.  $\Delta(T_j - T_a) = 20\text{ }^\circ\text{C}$  is considered to measure the current.

Note 4. To determine the current consumption per channel or unit, divide Current [mA] by the number of channels, groups or units.

Table 2.13 shows the outline of operation for each unit.

**Table 2.13 Outline of operation for each unit (1 of 2)**

Peripheral	Outline of operation
GPT	Operating modes is set to saw-wave PWM mode. GPT is operating with PCLKD.
POEG	Only clear module stop bit.
AGT	AGT is operating with PCLKB.
RTC	RTC is operating with LOCO.
WDT	WDT is operating with PCLKB.
IWDT	IWDT is operating with IWDTCLK.

**Table 2.13 Outline of operation for each unit (2 of 2)**

Peripheral	Outline of operation
USBFS	Transfer types is set to bulk transfer. USBFS is operating using Full-speed transfer (12 Mbps).
SCI	SCI is transmitting data in clock synchronous mode.
I3C	Communication format is set to I3C-bus format. I3C is transmitting data in master mode.
CANFD	CANFD is transmitting and receiving data in self-test mode 1.
SPI	SPI mode is set to SPI operation (4-wire method). SPI master/slave mode is set to master mode. SPI is transmitting 8-bit width data.
QSPI	QSPI is issuing Fast Read Quad I/O Instruction.
SSIE	Communication mode is set to Master. System word length is set to 32 bits. Data word length is set to 20 bits. SSIE is transmitting data using I2S format.
CEC	CEC operation clock is set to CECCLK. CEC is transmitting and receiving header block and data block.
ADC12	Resolution is set to 12-bit accuracy. Data registers is set to A/D-converted value addition mode. ADC12 is converting the analog input in continuous scan mode.
DAC12	DAC12 is outputting the conversion result while updating the value of data register.
TSN	TSN is operating.
ELC	Only clear module stop bit.
TRNG	TRNG is executing built-in self test.
CRC	CRC is generating CRC code using 32-bit CRC32-C polynomial.
DOC	DOC is operating in data addition mode.
CAC	Measurement target clocks is set to PCLKB. Measurement reference clocks is set to PCLKB. CAC is measuring the clock frequency accuracy.
DMAC	Bit length of transfer data is set to 32 bits. Transfer mode is set to block transfer mode. DMAC is transferring data from SRAM0 to SRAM0.
DTC	Bit length of transfer data is set to 32 bits. Transfer mode is set to block transfer mode. DTC is transferring data from SRAM0 to SRAM0.

### 2.2.7.2 Example of $T_j$ calculation

- Note 1. When setting up the main clock oscillator, ask the oscillator manufacturer for an oscillation evaluation, and use the results as the recommended oscillation stabilization time. Set the MOSCWTCR register to a value equal to or greater than the recommended value.  
 After changing the setting in the MOSCCR.MOSTP bit to start main clock operation, read the OSCSF.MOSCSF flag to confirm that it is 1, and then start using the main clock oscillator.
- Note 2. This is the time from release from reset state until the HOCO oscillation frequency ( $f_{HOCO}$ ) reaches the range for guaranteed operation.

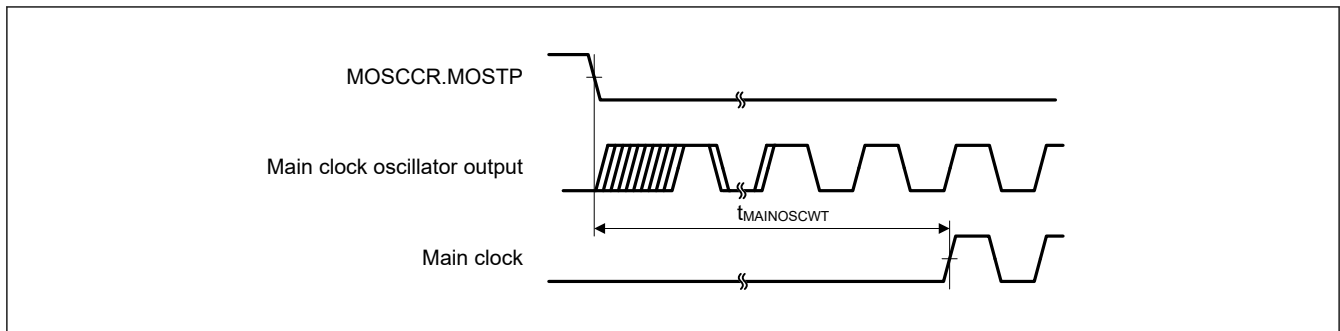

**Table 2.18 Clock timing for the sub-clock oscillator**

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions
Sub-clock frequency	$f_{SUB}$	—	32.768	—	kHz	—
Sub-clock oscillation stabilization wait time	$t_{SUBOSCWT}$	—	—	—*1	s	Figure 2.11

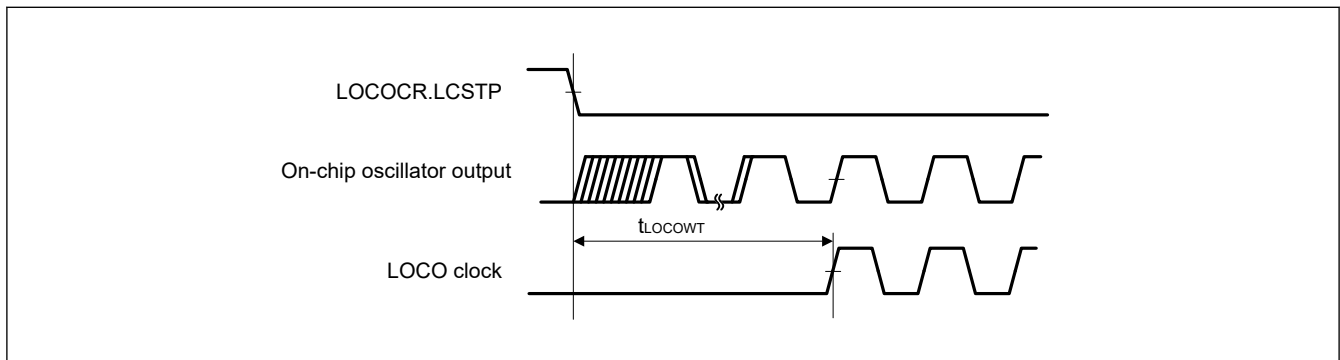

- Note 1. When setting up the sub-clock oscillator, ask the oscillator manufacturer for an oscillation evaluation and use the results as the recommended oscillation stabilization time.  
 After changing the setting in the SOSCCR.SOSTP bit to start sub-clock operation, only start using the sub-clock oscillator after the sub-clock oscillation stabilization time elapses with an adequate margin. A value that is two times the value shown is recommended.

		System clock source is PLL with main clock oscillator <sup>*3</sup>	t <sub>SBYPC</sub> <sup>*13</sup>	—	2.2	2.6	ms	
	External clock input to main clock oscillator	System clock source is main clock oscillator <sup>*4</sup>	t <sub>SBYEX</sub> <sup>*13</sup>	—	45	125	μs	
		System clock source is PLL with main clock oscillator <sup>*5</sup>	t <sub>SBYPE</sub> <sup>*13</sup>	—	170	255	μs	
	System clock source is sub-clock oscillator <sup>*6 *11</sup>	t <sub>SBYSC</sub> <sup>*13</sup>	—	0.7	0.8	ms		
	System clock source is LOCO <sup>*7 *11</sup>	t <sub>SBYLO</sub> <sup>*13</sup>	—	0.7	0.9	ms		
	System clock source is HOCO clock oscillator <sup>*8</sup>	t <sub>SBYHO</sub> <sup>*13</sup>	—	55	130	μs		
	System clock source is PLL with HOCO <sup>*9</sup>	t <sub>SBYPH</sub> <sup>*13</sup>	—	175	265	μs		
	System clock source is MOCO clock oscillator <sup>*10</sup>	t <sub>SBYMO</sub> <sup>*13</sup>	—	35	65	μs

	DPSBYCR.DEEPCUT[1] = 1 and DPSWCR.WTSTS[5:0] = 0x19	t <sub>DSBY</sub>	—	0.55	0.73	ms		
Wait time after cancellation of Deep Software Standby mode	t <sub>DSBYWT</sub>	56	—	57	t <sub>cyc</sub>			

**Table 2.20 Timing of recovery from low power modes (2 of 2)**

Parameter	Symbol	Min	Typ	Max	Unit	Test conditions	
Recovery time from Software Standby mode to Snooze mode	High-speed mode when system clock source is HOCO (20 MHz)	t <sub>SNZ</sub>	—	35*12	70*12	μs	Figure 2.16
	High-speed mode when system clock source is MOCO (8 MHz)	t <sub>SNZ</sub>	—	11*12	14*12	μs	

Note 1. The recovery time is determined by the system clock source. When multiple oscillators are active, the recovery time can be determined with the following equation:

Total recovery time = recovery time for an oscillator as the system clock source + the longest t<sub>SBYOSCWT</sub> in the active oscillators - t<sub>SBYOSCWT</sub> for the system clock + 2 LOCO cycles (when LOCO is operating) + Subosc is oscillating and MSTPC0 = 0 (CAC module stop)

Note 2. When the frequency of the crystal is 24 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 0x05) and the greatest value of the internal clock division setting is 1.

Note 3. When the frequency of PLL is 200 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 0x05) and the greatest value of the internal clock division setting is 4.

Note 4. When the frequency of the external clock is 24 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 0x00) and the greatest value of the internal clock division setting is 1.

Note 5. When the frequency of PLL is 200 MHz (Main Clock Oscillator Wait Control Register (MOSCWTCR) is set to 0x00) and the greatest value of the internal clock division setting is 4.

Note 6. The Sub-clock oscillator frequency is 32.768 KHz and the greatest value of the internal clock division setting is 1.

Note 7. The LOCO frequency is 32.768 kHz and the greatest value of the internal clock division setting is 1.

Note 8. The HOCO frequency is 20 MHz and the greatest value of the internal clock division setting is 1.

Note 9. The PLL frequency is 200 MHz and the greatest value of the internal clock division setting is 4.

Note 10. The MOCO frequency is 8 MHz and the greatest value of the internal clock division setting is 1.

Note 11. In Subosc-speed mode, the sub-clock oscillator or LOCO continues oscillating in Software Standby mode.

Note 12. When the SNZCR.RXDREQEN bit is set to 0, the following time is added as the power supply recovery time: 16 μs (typical), 48 μs (maximum).

Note 13. The recovery time can be calculated with the equation of t<sub>SBYOSCWT</sub> + t<sub>SBYSEQ</sub>. And they can be determined with the following value and equation. For n, the greatest value is selected from among the internal clock division settings.

Wakeup time	TYP		MAX		Unit
	t <sub>SBYOSCWT</sub>	t <sub>SBYSEQ</sub>	t <sub>SBYOSCWT</sub>	t <sub>SBYSEQ</sub>

	OPS output skew GTOUUP, GTOULO, GTOVUP, GTOVLO, GTOWUP, GTOWLO	$t_{GTOSK}$	—	5	ns	Figure 2.23	
AGT	AGTIO, AGTEE input cycle	$t_{ACYC}^{*2}$	100	—	ns	Figure 2.24	
	AGTIO, AGTEE input high width, low width	$t_{ACKWH}$ , $t_{ACKWL}$	40	—	ns		
	AGTIO, AGTO, AGTOA, AGTOB output cycle	$t_{ACYC2}$	62.5	—	ns		
ADC12	ADC12 trigger input pulse width	$t_{TRGW}$	1.5	—	$t_{Pcyc}$	Figure 2.25	

- Note:  $t_{Pcyc}$ : PCLKB cycle,  $t_{PDcyc}$ : PCLKD cycle.
- Note 1. This skew applies when the same driver I/O is used. If the I/O of the middle and high drivers is mixed, operation is not guaranteed.
- Note 2. Constraints on input cycle:

When not switching the source clock:  $t_{P_{cyc}} \times 2 < t_{ACYC}$  should be satisfied.  
 When switching the source clock:  $t_{P_{cyc}} \times 6 < t_{ACYC}$  should be satisfied.

Note: These specification values apply when there is no access to the external bus during A/D conversion. If access occurs during A/D conversion, values might not fall within the indicated ranges.

The use of PORT0 as digital outputs is not allowed when the 12-Bit A/D converter is used.

The characteristics apply when AVCC0, AVSS0, VREFH0, VREFL0, and 12-bit A/D converter input voltage are stable.

Note 1. The conversion time includes the sampling and comparison times. The number of sampling states is indicated for the test conditions.

Note 2. Values in parentheses indicate the sampling time.

### Absolute accuracy

Absolute accuracy is the difference between output code based on the theoretical A/D conversion characteristics, and the actual A/D conversion result. When measuring absolute accuracy, the voltage at the midpoint of the width of the analog input voltage (1-LSB width), which can meet the expectation of outputting an equal code based on the theoretical A/D conversion characteristics, is used as an analog input voltage. For example, if 12-bit resolution is used and the reference voltage  $V_{REFH0} = 3.072$  V, then the 1-LSB width becomes 0.75 mV, and 0 mV, 0.75 mV, and 1.5 mV are used as the analog input voltages. If the analog input voltage is 6 mV, an absolute accuracy of  $\pm 5$  LSB means that the actual A/D conversion result is in the range of 0x003 to 0x00D, though an output code of 0x008 can be expected from the theoretical A/D conversion characteristics.

### Integral nonlinearity error (INL)

Integral nonlinearity error is the maximum deviation between the ideal line when the measured offset and full-scale errors are zeroed, and the actual output code.

### Differential nonlinearity error (DNL)

Differential nonlinearity error is the difference between the 1-LSB width based on the ideal A/D conversion characteristics and the width of the actual output code.

### Offset error

Offset error is the difference between the transition point of the ideal first output code and the actual first output code.

### Full-scale error

Full-scale error is the difference between the transition point of the ideal last output code and the actual last output code.

Note 1. This is the minimum number of times to guarantee all the characteristics after reprogramming. The guaranteed range is from 1 to the minimum value.

Note 2. This indicates the minimum value of the characteristic when reprogramming is performed within the specified range.

Note 3. This result is obtained from reliability testing.

Note 4. The reprogram/erase cycle is the number of erasures for each block. When the reprogram/erase cycle is n times (n = 10,000), erasing can be performed n times for each block. For example, when 128-byte programming is performed 64 times for different addresses in 8-KB blocks, and then the entire block is erased, the reprogram/erase cycle is counted as one. However, programming the same address several times as one erasure is not enabled. Overwriting is prohibited.

Note 5. Time for resumption includes time for reapplying the erasing pulse (up to one full pulse) that was cut off at the time of suspension.

Note 6. The reference value at VCC = 3.3V and room temperature.

## 3.2 Access Cycles

This section provides access cycle information for the I/O registers described in this manual.

- Registers are grouped by associated module.
- The number of access cycles indicates the number of cycles based on the specified reference clock.
- In the internal I/O area, reserved addresses that are not allocated to registers must not be accessed, otherwise operations cannot be guaranteed.
- The number of I/O access cycles depends on bus cycles of the internal peripheral bus, divided clock synchronization cycles, and wait cycles of each module. Divided clock synchronization cycles differ depending on the frequency ratio between ICLK and PCLK.
- When the frequency of ICLK is equal to that of PCLK, the number of divided clock synchronization cycles is always constant.

- When the frequency of ICLK is greater than that of PCLK, at least 1 PCLK cycle is added to the number of divided clock synchronization cycles.
- The number of write access cycles indicates the number of cycles obtained by non-bufferable write access.

Note: This applies to the number of cycles when access from the CPU does not conflict with the instruction fetching to the external memory or bus access from other bus masters such as DTC or DMAC.

- Note 1. If the number of PCLK or FCLK cycles is non-integer (for example 1.5), the minimum value is without the decimal point, and the maximum value is rounded up to the decimal point. For example, 1.5 to 2.5 is 1 to 3.
- Note 2. When accessing a 16-bit register (FTDRHL, FRDRHL, FCR, FDR, LSR, and CDR), access is 2 cycles more than the value shown in [Table 3.2](#). When accessing an 8-bit register (including FTDRH, FTDL, FRDRH, and FRDL), the access cycles are as shown in [Table 3.2](#).
- Note 3. When accessing the 32-bit register (SPDR), access is 2 cycles more than the value in [Table 3.2](#). When accessing an 8-bit or 16-bit register (SPDR\_HA), the access cycles are as shown in [Table 3.2](#).
- Note 4. The access cycles depend on the QSPI bus cycles.

# Revision History

## Revision 1.00 — September 26, 2022

Initial release

## Revision 1.10 — February 28, 2023

### Features:

- Updated the title of Security.

### 1. Overview:

- Updated Figure 1.1 Block diagram.
- Updated Table 1.11 I/O ports.
- Updated Figure 1.2 Part numbering scheme.
- Updated Table 1.13 Function Comparison.
- Updated Table 1.14 Pin functions.
- Updated Figure 1.4 Pin assignment for BGA 64-pin.
- Updated Figure 1.6 Pin assignment for BGA 36-pin

### 2. Electrical Characteristics:

- Updated Table 2.5 I/O  $I_{OH}$ ,  $I_{OL}$ .
- Updated Table 2.6 I/O  $V_{OH}$ ,  $V_{OL}$ , and other characteristics.
- Updated Table 2.34 I3C timing (push-pull timing parameters for SDR mode).
- Updated Table 2.37 USBFS full-speed characteristics (USB\_DP and USB\_DM pin characteristics).

### Appendix 3. I/O Registers:

- Updated Table 3.2 Access cycles.

## Revision 1.20 — July 7, 2023

### 1. Overview:

- Updated Figure 1.2 Part numbering scheme.

## Revision 1.30 — July 31, 2024

### 1. Overview:

- Updated Table 1.13 Product list.
- Updated Figure 1.2 Part numbering scheme.
- Updated Figure 1.5 Pin assignment for QFN 48-pin.
- Updated Figure 1.7 Pin assignment for QFN 32-pin, and added a Note.

### 2. Electrical Characteristics:

- Updated 2.2.4 I/O  $V_{OH}$ ,  $V_{OL}$ , and Other Characteristics.

# General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

## 1. Precaution against Electrostatic Discharge (ESD)

A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity.

Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

## 2. Processing at power-on

The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.

## 3. Input of signal during power-off state

Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

## 4. Handling of unused pins

Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.

## 5. Clock signals

After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.

## 6. Voltage application waveform at input pin

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between  $V_{IL}$  (Max.) and  $V_{IH}$  (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between  $V_{IL}$  (Max.) and  $V_{IH}$  (Min.).

## 7. Prohibition of access to reserved addresses

Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

## 8. Differences between products

Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

## Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
  - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
  - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION ("Vulnerability Issues"). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
