## Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
1. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
2. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
3. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
4. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
5. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
6. Renesas Electronics products are classified according to the following three quality grades: "Standard", "High Quality", and "Specific". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as "Specific" without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as "Specific" or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics.

The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.

- “Standard”:
- Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
- “High Quality”:
- Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
- “Specific”:
- Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.

7. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
8. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
9. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
10. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
11. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

## General Precautions in the Handling of MPU/MCU Products

The following usage notes are applicable to all MPU/MCU products from Renesas. For detailed usage notes on the products covered by this manual, refer to the relevant sections of the manual. If the descriptions under General Precautions in the Handling of MPU/MCU Products and in the body of the manual differ from each other, the description in the body of the manual takes precedence.

### 1. Handling of unused Pins

Handle unused pins in accord with the directions given under Handling of Unused Pins in the manual.

- The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.

### 2. Processing at power-on

The state of the product is undefined at the moment when power is supplied.

- The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied.

In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed.

In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.

### 3. Prohibition of access to reserved addresses

Access to reserved addresses is prohibited.

- The reserved addresses are provided for the possible future expansion of functions. Do not access these addresses; the correct operation of LSI is not guaranteed if they are accessed.

### 4. Clock signals

After applying a reset, only release the reset line after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.

- When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.

### 5. Differences between products

Before changing from one product to another, i.e. to one with a different part number, confirm that the change will not lead to problems.

- The characteristics of MPU/MCU in the same group but having different part numbers may differ because of the differences in internal memory capacity and layout pattern. When changing to products of different part numbers, implement a system-evaluation test for each of the products.

# Chapter 1 Overview

The V850E/Dx3 - DJ3/DL3 is a product in Renesas Electronics V850 family of single-chip microcontrollers designed for Automotive applications.

## 1.1 General

The V850E/Dx3 - DJ3/DL3 single-chip microcontroller is a member of Renesas Electronics V850 32-bit RISC family, which match the performance gains attainable with RISC-based controllers to the needs of embedded control applications. The V850 CPU offers easy pipeline handling and programming, resulting in compact code size comparable to 16-bit CISC CPUs.

The V850E/Dx3 - DJ3/DL3 provides an excellent combination of general purpose peripheral functions, like serial communication interfaces (UART, clocked SI), Timers and measurement inputs (A/D converter), with dedicated CAN network support. Control and driver for 6 stepper motors are included.

The device offers power-saving modes to manage the power consumption effectively under varying conditions.

Thus equipped, the V850E/Dx3 - DJ3/DL3 is ideally suited for automotive applications, like dashboard or body. It is also an excellent choice for other applications where a combination of sophisticated peripheral functions and CAN network support is required.

This specification covers the following devices of the family:

Family Code	Product Code	Internal Flash	Internal RAM	LCD Control	Other Peripherals
DL3	μPD70F3427GD(A)-LML-QS-AX	1024 KB	60 KB	LCD I/F	Full set + ext. Mem I/F

a) For the DJ3 derivative  $\mu$ PD70F3426A, the upper 1MB of the flash memory is connected to the internal system bus (VSB). In case of performing consecutive accesses to that part of the flash-memory, a 32-bit data access requires two cycles.

In case a random access is applied to that part of the flash-memory, this access requires four cycles.

b) For the DJ3 derivative  $\mu$ PD70F3426A, the upper 24kB of the internal RAM is connected to the internal system bus (VSB). In case of performing consecutive accesses to that part of the internal RAM, a 32-bit data access requires two cycles.

In case a random access is applied to that part of the internal RAM area that access requires two cycles.

- a) Average currents are average current over the given life time. Transient currents are not relevant as long as the average of transient is below the given value.
- b) The peak current sets the limit for short term current flows.
- c)  $\mu$ PD70F3426A,  $\mu$ PD70F3425,  $\mu$ PD70F3424,  $\mu$ PD70F3423,  $\mu$ PD70F3422,  $\mu$ PD70F3421
- d)  $\mu$ PD70F3427 only
- e) Group 5 and group 8 have no output capability. This value is needed as reference, because injected current can influence the device in the same way as an output stage. Injected currents that may flow through any or both input pins of the Voltage-Comparators VCMP0, VCMP1 are included within the given parameter.

- b) No device damage and no flash data loss.
- c) ( $\mu$ PD70F3427).

- Note**
1. A low resistive connection of all VSS pins on the PCB has to be ensured. This specification denotes this as:  
 $V_{SS5} = BV_{SS5} = DV_{SS5} = SMV_{SS5} = AV_{SS5} = MV_{SS5}$  ( $\mu$ PD70F3427) = 0 V
  2. A low resistive connection of all  $V_{DD5x}$  pins among each other has to be ensured.

## Chapter 4 General Characteristics

### 4.1 Requirements for external connections

A low resistive connection of all VSS pins on the PCB has to be ensured. In the following this specification denotes this as:

$$V_{SS5} = BV_{SS5} = DV_{SS5} = SMV_{SS5} = MV_{SS5} \text{ Note} = AV_{SS} = 0 \text{ V}$$

A low resistive connection of the following supply pins has to be ensured:

- all  $V_{DD5x}$  pins among each other
- all  $BV_{DD5x}$  pins among each other
- all  $SMV_{DD5x}$  pins among each other
- all  $DV_{DD5x}$  pins among each other
- all  $MV_{DD5x}$  pins among each other **Note**

**Note**  $\mu$ PD70F3427 only

### 4.2 Capacitance connected to REGCx

The device requires to connect capacitors with the following parameters to each of the pins REGC0, REGC1 and REGC2 individually.

The pins REGC0, REGC1, REGC2 must not be connected externally.

**Table 4-1 External Capacitance Requirement**

Parameter	Symbol	Test Conditions	Min.	Typ	Max.	Unit
Capacitance	$C_{REG}$		3.3	4.7	10	$\mu$ F
ESR of capacitance	$C_{ESR}$	F0 = 100kHz			0.6	$\Omega$

### 4.3 Main Oscillator Characteristics

**Conditions**  $T_A = -40^\circ\text{C} \sim +85^\circ\text{C}$ ,  
 $DV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,  $BV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,  
 $MV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$  ( $\mu\text{PD70F3427}$  only),  
 $AV_{DD} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  $SMV_{DD5} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  
 $V_{DD5} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  
 $V_{SS5} = BV_{SS5} = DV_{SS5} = SMV_{SS5} = AV_{SS} = MV_{SS5}$  ( $\mu\text{PD70F3427}$  only) = 0 V

A ceramic or crystal resonator has to be connected to the main clock input pins as shown in *Figure 4-1*.

- Note**
1. Refer to "Power On Clear" on page 81 for further functional restriction.
  2. Values of  $C_1$ ,  $C_2$  and R depend on the used crystal or resonator and must be specified in cooperation with crystal/resonator manufacturer.

**Figure 4-1 Recommended Main Oscillator Circuit**

- Caution**
1. External clock input is prohibited.
  2. When using the main system clock oscillator, wire as follows in the area enclosed by the broken lines in the above figure to avoid an adverse effect from wiring capacitance.
    - Keep the wiring length as short as possible.
    - Do not cross the wiring with the other signal lines.
    - Do not route the wiring near a signal line through which a high fluctuating current flows.
    - Always make the ground point of the oscillator capacitor the same potential as  $V_{SS}$ .
    - Do not ground the capacitor to a ground pattern through which a high current flows.
    - Do not fetch signals from the oscillator.

**Table 4-2 Main Oscillator Characteristics**

Parameter	Symbol	Test Conditions	MIN.	TYP.	MAX.	Unit
Oscillation stabilization time	T <sub>OST</sub>	OSC MODE			16 <sup>a</sup>	ms
X1, X2 Oscillator Frequency	f <sub>OSC</sub>		3.6	4.0	4.4	MHz

a) T<sub>OST</sub> depends on the external crystal. Value might be improved after evaluation

**Remark** These values are valid only for crystal operation.

Parameter	Symbol	Test Conditions	MIN.	TYP.	MAX.	Unit
Oscillation stabilization time	T <sub>OST</sub>	OSC MODE			10 <sup>a</sup>	ms
X1, X2 Oscillator Frequency	f <sub>OSC</sub>		3.6	4.0	4.4	MHz

a) The given oscillation stabilization time is valid exclusively in case the below mentioned crystal-type from the manufacturer NDK is used for the main-oscillator operation. Beside the application of this specific crystal type, the PCB-design and capacitance configuration must ensure proper operation of the crystal enabling a load capacitance of about C<sub>L</sub>=12 pF. This parameter has to be verified by a dedicated crystal-evaluation based on the final PCB.

## 4.4 Sub-Oscillator Characteristics

**Conditions**  $T_A = -40^\circ\text{C} \sim +85^\circ\text{C}$ ,  
 $DV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,  $BV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,  
 $AV_{DD} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  $SMV_{DD5} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  
 $MV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$  ( $\mu\text{PD70F3427}$  only),  
 $V_{DD5} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  
 $V_{SS5} = BV_{SS5} = DV_{SS5} = SMV_{SS5} = AV_{SS} = MV_{SS5}$  ( $\mu\text{PD70F3427}$  only) = 0 V

A crystal resonator has to be connected to the sub clock input pins as shown in Figure 4-2.

- Note**
1. Refer to "Power On Clear" on page 81 for further functional restriction.
  2. Values of  $C_{S1}$ ,  $C_{S2}$  and  $R_S$  depend on the used crystal and must be specified in cooperation with crystal manufacturer.

### 5.3 AC Load Condition - Single Pin Switching

**Conditions**  $T_A = -40^{\circ}\text{C} \sim +85^{\circ}\text{C}$ ,  
 $DV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,  $BV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,  
 $AV_{DD} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  $SMV_{DD5} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  
 $MV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$  ( $\mu\text{PD70F3427}$  only),  
 $V_{DD5} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  
 $V_{SS5} = BV_{SS5} = DV_{SS5} = SMV_{SS5} = AV_{SS} = MV_{SS5} = (\mu\text{PD70F3427 only}) = 0\text{ V}$

**Note** Full device operation is only available, when the supply voltage  $V_{DD5}$  is above the maximum threshold voltage. The device may stop operation due to reset condition generated by POC, if the supply voltage drops below the given max threshold voltage. Refer to "Power On Clear" on page 81. on page 95 for further details.

#### 5.3.1 Output Pins - Single Pin Switching

- Note**
1. Not tested in production. Specified by design.
  2. Special care must be taken for the power supply when high capacitive loads are switched. The buffers change from limited to unlimited mode when the output voltage is near to the supply or ground. At that time a current peak is driven to the load thus drawing a peak current on the supply. This will generate noise and may deteriorate the observed slopes at neighbor pins in the same pin group, when they switch at the same time.

**Table 5-3 AC Load Condition - Single Pin Switching**

Parameter	Pin Group	Symbol	Test Conditions	Min.	Typ	Max.	Unit
Capacitive load per pin (Single pin) <sup>a</sup>	1, 2 <sup>b</sup> , 3, 4, 6 <sup>c</sup>	$C_{LS}$	$f_{\text{switch}} < 100\text{ kHz}$			1	nF
Capacitive load per pin (Multiple pins) <sup>d</sup>		$C_{LM}$	$f_{\text{switch}} < 1\text{ MHz}$			300	pF

- a) The specified parameter does represent the maximum capacitive load one pin of one pin group is able to drive in case only that single pin is driving the specified capacitive load by switching its output level. In case more than one pin within one pin group need to drive that capacitive load dynamically they must be switched consecutively. Do not switch more than one port-pin at a given time. The given specification is valid for the condition the concerned pin is operating in Limit2 drive-strength-control-mode (5mA. Except Pin Group 4).
- b) The condition is only valid for pin P07 of pin group 2.
- c) Pin group 6 exists for the derivative  $\mu\text{PD70F3427}$  only.
- d) Multiple pins may switch simultaneously.

---

### 5.3.2 Input Pins - Capacitive Loading

**Note** The maximum capacitive load that is allowed to be applied to a single ADC-Input channel, a voltage comparator input or a single port-input can be derived by examining the given parameters of:

- Injected Current
- Supply Voltage ramp down (refer to “*Power Supply Restrictions*“ on page 16)
- Absolute Maximum Ratings

---

**Caution** When determining the maximum capacitive load according to the given parameters mentioned above, it must be secured that a possible back current being supplied by the external capacitor must never exceed the given maximum ratings.

## Chapter 6 DC Characteristics

### 6.1 General DC Characteristics

**Conditions**  $T_A = -40^\circ\text{C} \sim +85^\circ\text{C}$ ,  
 $DV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,  $BV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,  
 $AV_{DD} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  $SMV_{DD5} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  
 $MV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$  ( $\mu\text{PD70F3427}$  only),  
 $V_{DD5} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  
 $V_{SS5} = BV_{SS5} = DV_{SS5} = SMV_{SS5} = AV_{SS} = MV_{SS5} = (\mu\text{PD70F3427 only}) = 0\text{ V}$

**Note** Refer to “Power On Clear” on page 81 for further functional restriction.

**Table 6-1 Input Leakage Current**

Parameter	Pin Group	Symbol	Test Conditions	Min.	Typ	Max.	Unit
Input leakage	1 <sup>a</sup>	$I_{LI1}$	$0 \leq V_1 \leq BV_{DD5}$	-1		+1	$\mu\text{A}$
	2	$I_{LI2}$	$0 \leq V_1 \leq V_{DD52}$	-1		+1	$\mu\text{A}$
	3	$I_{LI3}$	$0 \leq V_1 \leq DV_{DD5}$	-1		+1	$\mu\text{A}$
	5	$I_{LIA}$	$0 \leq V_1 \leq AV_{DD}$	-0.2		+0.2	$\mu\text{A}$
	6	$I_{LI6}$	$0 \leq V_1 \leq MV_{DD5}$	-1		+1	$\mu\text{A}$
	8	$I_{LIAD}$	$0 \leq V_1 \leq AV_{DD}$	-2		+1	$\mu\text{A}$
	4	$I_{LIS}$	$0 \leq V_1 \leq SMV_{DD5}$	-10		+10	$\mu\text{A}$
Injected Current per pin <sup>b, c</sup>	All	$I_{INJ}$		-2		+2	$\text{mA}$
Injected Current All pins <sup>b, c</sup>	5	$I_{INJ}$		-15		+32	$\text{mA}$

- a) The pull-down resistor of P05 is active during RESET and must be switched-off during input leakage current measurement. Otherwise the pull-down resistor cause unintended current flow.
- b) The injected current will not be tested during production. Value will be verified by evaluation.  
 The total current per pin group (injected plus operating) has to be in the limits of the absolute maximum ratings for output currents (values for output current low and output current high).  
 The operation voltage must stay in the limits of the operating conditions. The user has to make sure that the injected current does not pull the supplied voltage outside of the operating conditions.
- c) The accuracy of the ADC specified in this document is only valid when the sum of all curenths of pin group 5 is in the range of -15 mA to +32 mA.

## 6.5 Analog Input

This chapter describes the digital functions available at the pins supplied by AV<sub>DD</sub>. The number of available analog conversion channels differ between the devices. VCMP0/1 have no digital function.

- Pin Group 5: Pins supplied by AV<sub>DD</sub>  
5: (P70 .. P715)  
Digital buffer function is only available for P70..P715.
- Pin Group 8: Pins supplied by AV<sub>DD</sub>  
8: (VCMP0, VCMP1)  
VCMP0 and VCMP1 have only analog comparator function.

**Conditions** T<sub>A</sub> = -40°C ~ +85°C,  
DV<sub>DD5</sub> = 3.0 V ~ 5.5 V, BV<sub>DD5</sub> = 3.0 V ~ 5.5 V,  
AV<sub>DD</sub> = 3.2 V ~ 5.5 V, SMV<sub>DD5</sub> = 3.2 V ~ 5.5 V,

Output voltage low	No Limit		$V_{OL}$	$I_{OL} = 5.0\text{ mA}$			0.45	V

<sup>a)</sup> CMOS1 denotes the fixed non-schmitt input characteristics of these device pins. This pin group does not support current limitation.

## 6.8 Pin Group 6: External Memory Interface (μPD70F3427)

- Pin Group 6: External Memory Interface supplied by  $MV_{DD5}$   
6: (A0-23, D0-15,  $\overline{CS0-1}$ , CS3-4,  $\overline{WAIT}$ ,  $\overline{RD}$ ,  $\overline{WR}$ ,  $\overline{BE0-1}$ , P140)

**Conditions**  $T_A = -40^\circ\text{C} \sim +85^\circ\text{C}$ ,  
 $DV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,  $BV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,

Input voltage low	CMOS1		$V_{IL6}$		0		$0.3 MV_{DD5}$	V
Output voltage high	No Limit		$V_{OH}$	$I_{OH} = -5.0\text{ mA}$	$MV_{DD5} - 0.45$			V
Output voltage low	No Limit		$V_{OL}$	$I_{OL} = 5.0\text{ mA}$			0.45	V

<sup>a)</sup> CMOS1 denotes the fixed non-schmitt input characteristics of the device pins. This pin group does not support current limitation.

## 6.9 LCD Common and Segment Lines

**Note** The LCD common and segment function is only available in  $\mu$ PD70F3423,  $\mu$ PD70F3422 and  $\mu$ PD70F3421.

**Conditions**  $T_A = -40^\circ\text{C} \sim +85^\circ\text{C}$ ,  
 $DV_{DD5} = BV_{DD5} = 4.5\text{ V} \sim 5.5\text{ V}$ ,  
 $AV_{DD} = 3.2\text{ V} \sim 4.0\text{ V}$ ,  $SMV_{DD5} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  
 $V_{DD5} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  
 $V_{SS5} = BV_{SS5} = DV_{SS5} = SMV_{SS5} = AV_{SS} = 0\text{ V}$

- Note**
1. Refer to "Power On Clear" on page 81 for further functional restriction.
  2. The power supply configuration is restricted, when the LCD is used. The LCD voltages are generated centrally. Since the LCD output buffers are supplied by different supplies ( $BV_{DD5}$  and  $DV_{DD5}$ ) it is necessary that  $BV_{DD5}$  is equal to  $DV_{DD5}$ .

**Table 6-14 DC Characteristics LCD Common and Segment Lines**

Parameter	Symbol	TestConditions	Min.	Typ	Max	Unit
LCD Segment Output Voltage (unloaded)	$V_{ODS}$	$IO = \pm 1\mu\text{A}$	$V_{LCDn} - 0.2$	$V_{LCDn}^a$	$V_{LCDn} + 0.2$	V
LCD Common Output Voltage (unloaded)	$V_{ODC}$	$IO = \pm 1\mu\text{A}$	$V_{LCDn} - 0.2$	$V_{LCDn}$	$V_{LCDn} + 0.2$	V
LCD split voltage <sup>b</sup>	$V_{LC0}$	$IO = \pm 1.5\text{ mA}$	$V_{LCD0} - 0.1$	$V_{LCD0}$	$V_{LCD0} + 0.1$	V
	$V_{LC1}$	$IO = \pm 1.0\text{ mA}$	$V_{LCD1} - 0.1$	$V_{LCD1}$	$V_{LCD1} + 0.1$	V
	$V_{LC2}$	$IO = \pm 1.0\text{ mA}$	$V_{LCD2} - 0.1$	$V_{LCD2}$	$V_{LCD2} + 0.1$	V
	$V_{LC3}$	$IO = \pm 1.5\text{ mA}$	$V_{LCD3} - 0.1$	$V_{LCD3}$	$V_{LCD3} + 0.1$	V
LCD Series resistance <sup>c</sup>	$R_{LCDS}$	Segment lines, $V_{LCDn}$ to pin			1.8	$k\Omega$
	$R_{LCDC}$	Common lines, $V_{LCDn}$ to pin			1.8	$k\Omega$
LCD operation current	$IDD_{LCD}$	Frame frequency 244Hz, all segment and common lines set to LCD mode and open.			280	$\mu\text{A}$

a)  $V_{LCDn}$  ( $n=0..3$ ) represents one of the four possible voltage levels at the LCD pins. See table below for reference.

b) The split voltage is an internal design value. Direct measurement is not possible.

c) The series resistance is an internal design value. Direct measurement is not possible.

**Caution** Do not operate buffers of pin group 3 in current limit state, when the LCD function is used. Failing to do so may lead to a decreased accuracy of the LCD waveforms.

**Table 6-15** Definitions for  $V_{LCD}$ 

Parameter	Voltage <sup>a</sup>
VLCD0	$DV_{DD5}$
VLCD1	$2/3 \times DV_{DD5}$
VLCD2	$1/3 \times DV_{DD5}$
VLCD3	$0 \times DV_{DD5} = DV_{SS5}$

a) The LCD voltage is always derived from one central supply  $DV_{DD5}$ , even when the pin is supplied by a different supply in port or special function mode.

## 6.10 Stepper Motor Driver IO

- Pin Group 4: Stepper Motor outputs supplied by  $SMV_{DD5}$   
 4A: (P110-117, P120-123)  
 4B: (P124-127, P130-137)

**Conditions**  $T_A = -40^{\circ}\text{C} \sim +85^{\circ}\text{C}$ ,  
 $DV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,  $BV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,  
 $AV_{DD} = 3.2\text{ V} \sim 4.0\text{ V}$ ,  $SMV_{DD5} = 4.0\text{ V} \sim 5.5\text{ V}$ ,  
 $MV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$  ( $\mu\text{PD70F3427}$  only),  
 $V_{DD5} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  
 $V_{SS5} = BV_{SS5} = DV_{SS5} = SMV_{SS5} = AV_{SS} = 0\text{ V}$   
 $MV_{SS5} = 0\text{ V}$  ( $\mu\text{PD70F3427}$  only)

**Note** Refer to “Power On Clear” on page 81 for further functional restriction.

- Note**
1. Refer to "Power On Clear" on page 81 for further functional restriction.
  2. The stepper output drivers have no current limitation and are not protected regarding short circuit.

**Table 6-18 DC Characteristics Stepper Motor Driver Output Normal Operation**

Parameter	Pin mode	Symbol	Test Conditions	Min	Typ	Max	Unit
Output Voltage High		$V_{OH}$	$I_{OH} = -40\text{ mA}$ , $T_A = -40^\circ\text{C}$	$SMV_{DD5} - 0.5$		$SMV_{DD5}$	V
		$V_{OH}$	$I_{OH} = -30\text{ mA}$ , $T_A = +25^\circ\text{C}$	$SMV_{DD5} - 0.5$		$SMV_{DD5}$	V
		$V_{OH}$	$I_{OH} = -27\text{ mA}$ , $T_A = +85^\circ\text{C}$	$SMV_{DD5} - 0.5$		$SMV_{DD5}$	V

		$V_{OL}$	$I_{OL} = 30\text{ mA}$ , $T_A = +25^\circ\text{C}$	0		0.5	V
		$V_{OL}$	$I_{OL} = 27\text{ mA}$ , $T_A = +85^\circ\text{C}$	0		0.5	V
Output voltage deviation <sup>a</sup>		$V_{DEV}$		0		50	mV
Output Slew rate <sup>b</sup>		$t_{RF}$	10% - 90%	12	25	70	ns
Peak Cross Current <sup>c</sup>		$I_{CROSS}$				50	mA
Output Pulse width <sup>d</sup>		$t_{MO}$		125			ns
Output Pulse length deviation <sup>e</sup>		$t_{SMDEV}$		-10	+5	+45	ns

- a) Output voltage deviation defines the difference of the outputs levels of the same stepper motor.  
 $V_{DEV} = \max(|V_{OHx} - V_{OHy}|, |V_{OLx} - V_{OLy}|) @ I_{OHx} = I_{OHy}, I_{OLx} = I_{OLy}$ .  
 x and y denote any combination of two pins of the following pin groups: (P110-P113, P114-117, P120-123, P124-P127, P130-P133, P134-P137)  
 The output voltage deviation is not tested, but specified by design.
- b) The slew rate is not tested, but derived from simulation.
- c) The slew rate control generates a cross current in the output stage to control the energy of the external inductive load. The cross current flows only during the output transition time  $t_{RF}$ . It flows in addition to the output current. The cross current is not tested, but derived from simulation.
- d) The output buffer can not generate high or low pulses shorter than this time, because of its slew rate control system. This value is not tested, but derived from simulation.
- e) The slew rate control function causes a deviation of output pulse time compared to the ideal selected output pulse setting. This value is not tested, but derived from simulation.

**Conditions**  $T_A = -40^{\circ}\text{C} \sim +85^{\circ}\text{C}$ ,  
 $DV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,  $BV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,

## 6.11 Current Limit Function of I/O buffers

The output buffers of following pin groups incorporate a current limiting function:

- $\mu$ PD70F3426A,  $\mu$ PD70F3425,  $\mu$ PD70F3424,  $\mu$ PD70F3423,  $\mu$ PD70F3422,  $\mu$ PD70F3421:  
pin groups 1, 3 and P07 of pin group 2
- $\mu$ PD70F3427: pin group 1 and P07 of pin group 2

This function limits the output current of the buffer to a certain value during output signal switching.

The limit is disabled when the buffer output voltage is near to its target voltage, thus providing full drivability. During full drivability the current may reach values given in absolute maximum ratings for a single pin.

The user can select different limit ranges by software (refer to User's Manual for details).

The limit function is independent from the operation mode of the device.

A permanent short circuit of these outputs is not permitted.

The stepper motor driver outputs do not support a current limiting function.

Figure 6-1 Current Limit Function Principle

**Note** The current limit function of the I/O buffers needs additional bias current to control the output stage. The additional bias current depend on the status of each buffer. Each buffer with either high or low output and in the stage of current limiting will draw this bias current.

**Table 6-21 Buffer status for bias current**

Intended Output	Current limit	additional current
L	No	No
L	Yes	Yes
H	No	No
H	Yes	Yes

**Conditions**  $T_A = -40^\circ\text{C} \sim +85^\circ\text{C}$ ,  
 $DV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,  $BV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,  
 $AV_{DD} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  $SMV_{DD5} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  
 $MV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$  ( $\mu\text{PD70F3427}$  only),  
 $V_{DD5} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  
 $V_{SS5} = BV_{SS5} = DV_{SS5} = SMV_{SS5} = AV_{SS} = 0\text{ V}$   
 $MV_{SS5} = 0\text{ V}$  ( $\mu\text{PD70F3427}$  only)

- Note**
1. Refer to “Power On Clear” on page 81 for further functional restriction.
  2. The function of the current limiting operation is sensitive against inductive loads under a certain condition:
    - The load of the pin is below the selected current limit and the device could reach a sufficient output voltage. The device changed to full drivability.
    - The external circuitry sinks/sources more and more current.
    - The current creates an increasing voltage drop in the output stage of the device.
    - The increasing voltage drop enables the current limiting function.
    - The enabling of the current limit together with an external inductance may lead to an oscillation of the output between the limited and unlimited state. The external inductance creates voltage peaks that change the state of the output buffers current limiting function.
    - Recommendation: keep external inductance small (keep external wiring short).
  3. The pin group 3 of the derivative  $\mu\text{PD70F3427}$  does not include a current limit function.

- Operation modes setting as described in table below.
- All functional pins with output possibility are set to output with alternating high and low output levels.
- Testequipment is disconnected from output pins.
- $I_{DD}$  is the total sum of currents to the device supply pins  $V_{DD5}$ ,  $BV_{DD5}$ ,  $DV_{DD5}$ ,  $SMV_{DD5}$ ,  $AV_{DD}$
- Device drives its own leakage currents by its output stages.
- The leakage current is included in the given  $I_{DD}$  values.

Capacitive load of each bus line		C <sub>b</sub>	—	400	—	400	pF

- a) At the start condition, the first clock pulse is generated after the hold time
- b) The system requires a minimum of 300ns hold time Internally for the SDA<sub>n</sub> signal ( at V<sub>IHmin</sub> of SCL<sub>n</sub> signal ) in order to occupy the undefined area at the falling edge of SCL<sub>n</sub>.
- c) If the system does not extend the SCL<sub>n</sub> signal low hold time ( t<sub>low</sub> ), only the maximum data hold time ( t<sub>HD:DAT</sub> ) needs to be satisfied.
- d) The fast-speed-mode IIC bus can be used In a normal-mode IIC bus system.  
In this case, set the fast-speed-mode IIC bus so that It meets the following conditions:  
- If the system does not extend the SCL<sub>n</sub> signal's low state hold time: t<sub>SU:DAT</sub> ≥ 250ns  
- If the system extends the SCL<sub>n</sub> signal's low state hold time:  
Transmit the following data bit to the SDA<sub>n</sub> line prior to releasing the SCL<sub>n</sub> line  
(t<sub>Rmax</sub> + t<sub>SU:DAT</sub> = 1000 + 250 = 1250ns: Normal mode IIC bus specification ).
- e) Noise suppression is only available in Fast-speed mode.
- f) t<sub>IICLK</sub> is the period of the IICLK supplied by the clock controller.

**Note** n = 0, 1

Figure 7-10 I<sup>2</sup>C Timing

- Remarks**
1. P: Stop condition
  2. S: Start condition
  3. Sr: Restart condition
  4. Rise and Fall time depend on the actual load of the signal and the selected output current limit. For a capacitive load the time can be roughly calculated from:  
 $(t_R = V_{OH} / I_{OH} * C_L)$ ,  
 $(t_F = V_{OH} / I_{OL} * C_L)$

## Chapter 8 Analog Functions

### 8.1 A/D Converter

The number of available analog input channels depends on the device:

- $\mu$ PD70F3427,  $\mu$ PD70F3426A,  $\mu$ PD70F3425,  $\mu$ PD70F3424: 16 channels input P70..P715.
- $\mu$ PD70F3423,  $\mu$ PD70F3422,  $\mu$ PD70F3421: 12 channels input P70..P711.

**Conditions**  $T_A = -40^\circ\text{C} \sim +85^\circ\text{C}$ ,  
 $DV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,  $BV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,  
 $AV_{DD} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  $SMV_{DD5} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  
 $MV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$  ( $\mu$ PD70F3427 only),  
 $V_{DD5} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  
 $V_{SS5} = BV_{SS5} = DV_{SS5} = SMV_{SS5} = AV_{SS} = 0\text{ V}$   
 $MV_{SS5} = 0\text{ V}$  ( $\mu$ PD70F3427 only)

**Note** Refer to “Power On Clear” on page 81 for further functional restriction.

- a) Quantization error of  $\pm 0.5$  LSB is not included  
 b) This value is not tested during production.  
 c)  $T_{CONV}$  depends on register setting  
 d) The reference current is mainly a transient current that is influenced by the conversion time. The given value is the maximum value. Value is not tested during production.

## 8.2 Power On Clear

**Conditions**  $T_A = -40^\circ\text{C} \sim +85^\circ\text{C}$ ,  
 $V_{DD5} = 0 \sim 5.5 \text{ V}$ ,  
 $V_{SS} = 0 \text{ V}$

Detection time <sup>a</sup>	$T_{DETP}$	$V_{DD5}$ slope > $25\text{mV}/\mu\text{s}$			2	$\mu\text{s}$

- a) Not tested in production.

- Note**
1. The POC ensures that the device stops operation (RESET condition) when the device is outside the operation voltage range, under the condition that the supply voltage slope on  $V_{DD5}$  is  $\leq 25\text{mV}/\mu\text{s}$ .
  2. Full device operation is only available, when the supply voltage is above the maximum threshold voltage. The device may stop operation due to reset condition generated by POC, if the supply voltage drops below the given max threshold voltage.

### 8.3 Voltage Comparator

The voltage comparator is supplied by  $A_{VDD}$ .

**Conditions**  $T_A = -40^\circ\text{C} \sim +85^\circ\text{C}$ ,  
 $DV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,  $BV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,  
 $AV_{DD} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  $SMV_{DD5} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  
 $MV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$  ( $\mu\text{PD70F3427}$  only),  
 $V_{DD5} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  
 $V_{SS5} = BV_{SS5} = DV_{SS5} = SMV_{SS5} = AV_{SS} = 0\text{ V}$   
 $MV_{SS5} = 0\text{ V}$  ( $\mu\text{PD70F3427}$  only)

**Note** Refer to “Power On Clear” on page 81 for further functional restriction.

**Table 8-3 Voltage Comparator Characteristics**

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
Threshold Voltage (calibrated)	$V_{IV}$		1.73 -0.065	1.73	1.73 +0.065	V

	$T_{DETV2}$	step = 100mV, overdrive = 5mV			2	$\mu\text{s}$
Power-On Stabilization Time <sup>b</sup>	$T_S$				2	ms

a) Not tested in production.

b) That time must be passed after having enabled a voltage-comparator (Set VCEn bit) and before being able to read the correct status of the concerned voltage-comparator status flag (VCFn).

## Chapter 9 Flash Memory

### 9.1 Basic Characteristics

**Conditions**  $T_A = -40^{\circ}\text{C} \sim +85^{\circ}\text{C}$ ,  
 $DV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,  $BV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$ ,  
 $AV_{DD} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  $SMV_{DD5} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  
 $MV_{DD5} = 3.0\text{ V} \sim 5.5\text{ V}$  ( $\mu\text{PD70F3427}$  only),  
 $V_{DD5} = 3.2\text{ V} \sim 5.5\text{ V}$ ,  
 $V_{SS5} = BV_{SS5} = DV_{SS5} = SMV_{SS5} = AV_{SS} = 0\text{ V}$   
 $MV_{SS5} = 0\text{ V}$  ( $\mu\text{PD70F3427}$  only)

**Note** Refer to “Power On Clear” on page 81 for further functional restriction.

## Chapter 10 Special Conditions for Device Operation at extended Operating Temperature Range

**Condition**  $T_A = -40^{\circ}\text{C} \sim +105^{\circ}\text{C}$

---

**Caution** For any device's operation within the extended operating temperature range ( $T_A = -40^{\circ}\text{C} \sim +105^{\circ}\text{C}$ ), the device's total power consumption must be reduced. The following tables within this chapter describe additional device conditions securing the requested decrease of the device's power consumption.

In case any device may operate within the extended operating temperature range ( $T_A = -40^{\circ}\text{C} \sim +105^{\circ}\text{C}$ ) all of the below mentioned conditions must never be exceeded at any time.

All of the below mentioned device conditions must be applied in addition to any other parameter that is described within this document.

---

**Note** The operation conditions for an extended temperature range ( $T_A = -40^{\circ}\text{C} \sim +105^{\circ}\text{C}$ ) mentioned in this chapter are valid for all parameters which were described within this document.  
In all conditions in this document the normal temperature range ( $T_A = -40^{\circ}\text{C} \sim +85^{\circ}\text{C}$ ) is replaced by the extended temperature range of  $T_A = -40^{\circ}\text{C} \sim +105^{\circ}\text{C}$  in case the operating conditions mentioned in this chapter are applied.

# Chapter 12 Recommended Soldering Conditions

## 12.1 Description of Recommended Conditions

The recommended soldering conditions by item are indicated by a combination of the soldering process, peak temperature, baking time, and exposure limit all abbreviated as shown below.

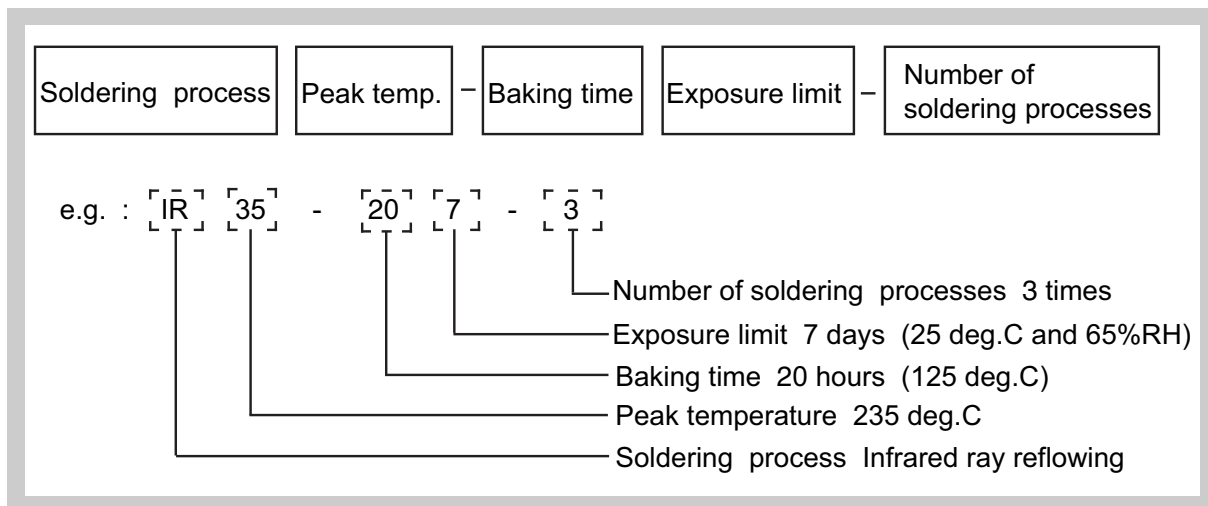

Figure 12-1 Soldering conditions indication

### 12.1.1 Soldering process

The soldering process is indicated by the following symbols:

Soldering process	Symbol
Infrared Reflow Soldering	IR
Vapour Phase Soldering	VP
Wave Soldering	WS

### 12.1.2 Peak temperature

The peak temperature is indicated by the two least significant digits (two characters) of the peak value. The peak temperature of the VPS and the infrared ray reflowing process is indicated by the package surface temperature. The wave soldering is indicated by the solder temperature.

Peak temperature	Symbol
215 deg.C	15
220 deg.C	20
230 deg.C	30
235 deg.C	35
260 deg.C	60

### 12.1.3 Baking time

The baking time is indicated by the following symbols:

Baking time (stored at 125 deg.C)	Symbol
No baking required (0 hours)	00
10 hours	10
16 hours	16
20 hours	20
36 hours	36

### 12.1.4 Exposure limit

Exposure limit means the maximum limit with which the device can be soldered without problem after unpack. The limit is indicated by the following symbols:

Exposure limit (Temperature 25 deg.C and humidity 65%RH or less)	Symbol
One day (24 hours)	1
Two days (48 hours)	2
Three days (72 hours)	3
Seven days (168 hours)	7
Eight hours	B
Twelve hours	C

### 12.1.5 Number of soldering process

Number of soldering process is indicated by the following symbols:

Number of soldering processes	Symbol
Once	1
Twice	2

## 12.2 Recommended Conditions of IR60-207-3

The following is recommended soldering conditions. (Moisture sensitive device)

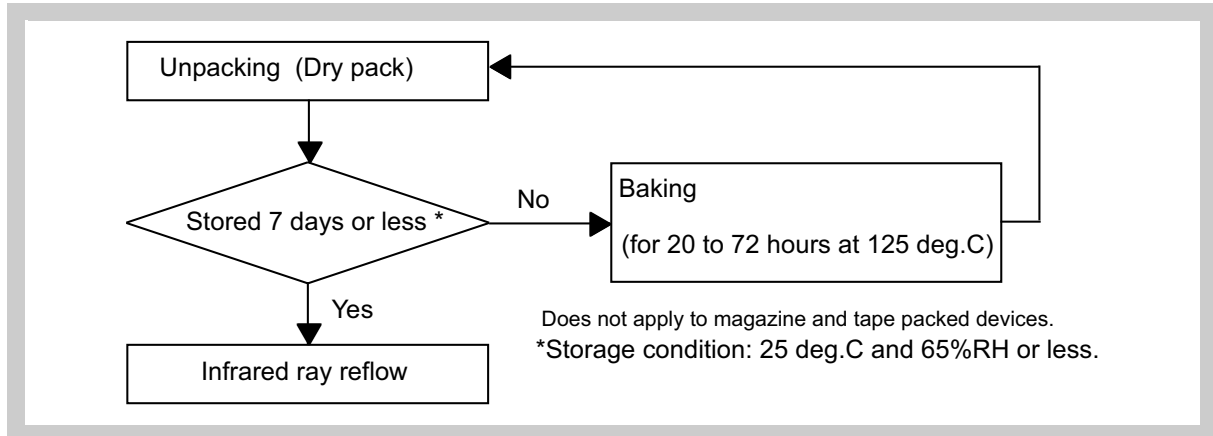

Figure 12-2 Recommended Handling of Unpacked Devices

Peak temperature:	260 deg.C or below (Package's surface temperature)
Reflow time:	60 seconds or less (at 220 deg.C)
Maximum number of reflow processes:	3 times
Exposure limit (Store until the final reflow process starts):	7 days or less
Flux:	Rosin flux containing small amount of chlorine (Flux with a maximum chlorine content of 0.2 Wt% is recommended.)

Item	Date published	Document No.	Comment
3	Dec 13, 2005	EASE-PL-8007-0V3	Flash Memory: - Included the derivatives $\mu$ PD70F3427 and $\mu$ PD70F3426.
			Package: - Included the derivatives $\mu$ PD70F3427 and $\mu$ PD70F3426 - Added the package drawings for the derivatives $\mu$ PD70F3427 and $\mu$ PD70F3426.
4	Sep 4, 2006	EASE-PL-8007-1V0	Redefinition of that document "Electrical Target Specification" to "Preliminary Data Sheet".
			Family Overview: - Updated operating clock.
			Operation Conditions: - Update the CPU clock frequencies.
			DC-Characteristics: - Updated the supply-currents for all derivatives. - Completion of table 6-23.
			AC-Characteristics: - Updated the AC-Characteristics for the ext. mem. I/F ( $\mu$ PD70F3427).
5	Jan 18, 2007	EASE-PL-8007-1V1	DC-Characteristics: - Included the values for the LCD split voltages - Updated the supply-currents for the derivatives $\mu$ PD70F3424, $\mu$ PD70F3426 and $\mu$ PD70F3427.
			AC- Characteristics: - CSIB updated and expanded characteristics. - LCD Bus Interface updated. - External memory access updated.
			Analog Functions: - Added the Voltage Comparator Characteristics stabilization time.
			Flash Memory: - Updated parameters for End-of-Line programming. Included parameters for missing derivatives.
			Special Conditions for Device Operation at extended Operating Temperature Range ( $T_A = -40^\circ\text{C} \dots +105^\circ\text{C}$ ) - Included a new chapter describing the operating conditions when device is operating within the extended operating temperature range.
6	Oct. 29, 2009	U20110EE1V0DS00	Overview: - Updated device list.
			Peripherals: - added Memory interface extension for $\mu$ PD70F3427GD - added 3rd CAN channel for $\mu$ PD70F3421/22/23/24/25/27 - added Timer Y (TMY) for all devices - corrected number of voltage comparators from 3 to 2
			Internal RAM: - Increased from 16kbytes to 20kbytes for $\mu$ PD70F3422GJ
			General Characteristics: - Updated the parameters regarding the SSCG modulation range and frequency. - Added input leakage parameters for pin group 6.
