User's Manual: Hardware

32-Bit MCU

Renesas Advanced (RA) Family
Renesas RA8 Series

All information contained in these materials, including products and product specifications, represents information on the product at the time of publication and is subject to change by Renesas Electronics Corp. without notice. Please review the latest information published by Renesas Electronics Corp. through various means, including the Renesas Electronics Corp. website (<http://www.renesas.com>).

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
 - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
 - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION ("Vulnerability Issues"). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)

A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity.

Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

2. Processing at power-on

The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.

3. Input of signal during power-off state

Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

4. Handling of unused pins

Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.

5. Clock signals

After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.

6. Voltage application waveform at input pin

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).

7. Prohibition of access to reserved addresses

Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

8. Differences between products

Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Preface

1. About this document

This manual is generally organized into an overview of the product, descriptions of the CPU, system control functions, peripheral functions, electrical characteristics, and usage notes. This manual describes the product specification of the microcontroller (MCU) superset. Depending on your product, some pins, registers, or functions might not exist. Address space that store unavailable registers are reserved.

2. Audience

This manual is written for system designers who are designing and programming applications using the Renesas Microcontroller. The user is expected to have basic knowledge of electrical circuits, logic circuits, and the MCU.

3. Renesas Publications

Renesas provides the following documents. Before using any of these documents, visit www.renesas.com for the most up-to-date version of the document.

Component	Document Type	Description
Microcontrollers	Data sheet	Features, overview, and electrical characteristics of the MCU
	User's Manual: Hardware	MCU specifications such as pin assignments, memory maps, peripheral functions, electrical characteristics, timing diagrams, and operation descriptions
	Application Notes	Technical notes, board design guidelines, and software migration information
	Technical Update (TU)	Preliminary reports on product specifications such as restriction and errata
Software	User's Manual: Software	API reference and programming information
	Application Notes	Project files, guidelines for software programming, and application examples to develop embedded software applications
Tools & Kits, Solutions	User's Manual: Development Tools	User's manual and quick start guide for developing embedded software applications with Development Kits (DK), Starter Kits (SK), Promotion Kits (PK), Product Examples (PE), and Application Examples (AE)
	User's Manual: Software	
	Quick Start Guide	
	Application Notes	Project files, guidelines for software programming, and application examples to develop embedded software applications

4. Numbering Notation

The following numbering notation is used throughout this manual:

Example	Description
011b	Binary number. For example, the binary equivalent of the number 3 is 011b.
0x1F	Hexadecimal number. For example, the hexadecimal equivalent of the number 31 is described 0x1F. In some cases, a hexadecimal number is shown with the suffix "h".
1234	Decimal number. A decimal number is followed by this symbol only when the possibility of confusion exists. Decimal numbers are generally shown without a suffix.

5. Typographic Notation

The following typographic notation is used throughout this manual:

Example	Description
AAA.BBB.CCC	Periods separated a function module symbol (AAA), register symbol (BBB), and bit field symbol (CCC).
AAA.BBB	A period separated a function module symbol (AAA) and register symbol (BBB).
BBB.DDD	A period separated a register symbol (BBB) and bit field symbol (DDD).
EEE[3:0]	Numbers in brackets expresses a bit number. For example, EEE[3:0] occupies bits 3 to 0.

6. Unit and Unit Prefix

The following units and unit prefixes are sometimes misleading. Those unit prefixes are described throughout this manual with the following meaning:

Symbol	Name	Description
b	Binary Digit	Single 0 or 1
B	Byte	This unit is generally used for memory specification of the MCU and address space.
k	kilo-	$1000 = 10^3$. k is also used to denote 1024 (2^{10}) but this unit prefix is used to denote 1000 (10^3) throughout this manual.
K	Kilo-	$1024 = 2^{10}$. This unit prefix is used to denote 1024 (2^{10}) not 1000 (10^3) throughout this manual.

7. Special Terms

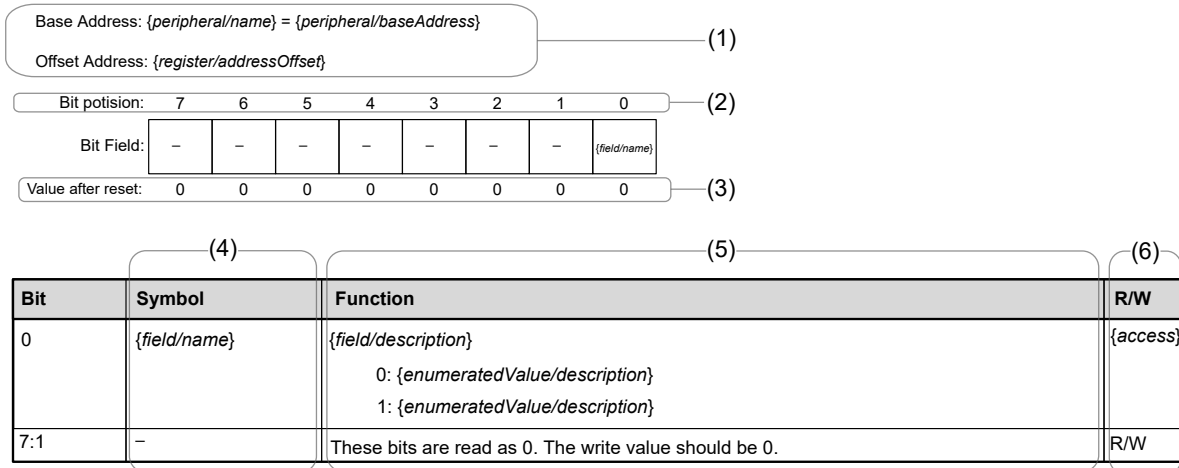

The following terms have special meanings.

Term	Description
NC	Not connected pin. This pin should be left floating unless specified otherwise.
Hi-Z	High impedance.
x	Don't care or undefined.

8. Register Description

Each register description includes both a register diagram that shows the bit assignments and a register bit table that describes the content of each bit. The example of symbols used in these tables are described in the sections that follow. The following is an example of a register description and associated bit field definition.

XX.X.X {register/name} : {register/description}

(1) Function module symbol, register symbol, and address assignment

Function module symbol, {peripheral/name}, register symbol, {register/name}, and address assignment of this register are generally expressed. Base Address and Offset Address mean {register/name} : {register/description} of {peripheral/name} is assigned to address {peripheral/baseAddress} + {register/addressOffset}.

(2) Bit number

This number indicates the bit number. This bits are shown in order from bits 31 to 0 for 32-bit register, from bits 15 to 0 for 16-bit register, and from bits 7 to 0 for 8-bit register.

(3) Value after reset

This symbol or number indicate the value of each bit after a hard reset. The value is shown in binary unless specified otherwise.

- 0: Indicates that the value is 0 after a reset.
- 1: Indicates that the value is 1 after a reset.
- x: Indicates that the value is undefined after a reset.

(4) Symbol

{field/name} indicates the short name of bit field. Reserved bit is expressed with a —.

(5) Function

Function indicates the full name of the bit field, {field/description}, and enumerated values.

(6) R/W

The R/W column indicates access type whether the bit field is readable or writable.

- R/W: The bit field is readable and writable.
- R: The bit field is readable only. Writing to this bit field has no effect.
- W: The bit field is writable only. The read value is the same as after a reset unless specified otherwise.

9. Abbreviations

Abbreviations used in this document are shown in the following table.

Abbreviation	Description
AES	Advanced Encryption Standard
AHB	Advanced High-performance Bus
AHB-AP	AHB Access Port
APB	Advanced Peripheral Bus
ARC	Alleged RC
ATB	Advanced Trace Bus
BCD	Binary Coded Decimal
BSDL	Boundary Scan Description Language
DES	Data Encryption Standard
DSA	Digital Signature Algorithm
ETB	Embedded Trace Buffer
ETM	Embedded Trace Macrocell
FLL	Frequency Locked Loop
FPU	Floating Point Unit
HMI	Human Machine Interface
IrDA	Infrared Data Association
LSB	Least Significant Bit
MSB	Most Significant Bit
NVIC	Nested Vector Interrupt Controller
PC	Program Counter
PFS	Port Function Select
PLL	Phase Locked Loop
POR	Power-on reset
PWM	Pulse Width Modulation
RSA	Rivest Shamir Adleman
SHA	Secure Hash Algorithm
S/H	Sample and Hold
SP	Stack Pointer
SWD	Serial Wire Debug
SW-DP	Serial Wire-Debug Port
TRNG	True Random Number Generator
UART	Universal Asynchronous Receiver/Transmitter
VCO	Voltage Controlled Oscillator

8.10.5	FlashIF Clock (FCLK)	230
8.10.6	External Bus Clock (BCLK, EBCLK)	231
8.10.7	SDRAM Clock (SDCLK)	231
8.10.8	Trace Clock (TRCLK)	231
8.10.9	SCI Clock (SCICLK)	232
8.10.10	SPI Clock (SPICLK)	232
8.10.11	Octal-SPI clock (OCTACLK, OCTADIVCLK)	232
8.10.12	CANFD Core clock (CANFDCLK)	233
8.10.13	USB Clock (USBCLK)	233
8.10.14	LCD Clock (LCDCLK)	233
8.10.15	CAN Clock (CANMCLK)	234
8.10.16	ULPT Clock (ULPTLCLK, ULPTSCLK)	234
8.10.17	CAC Clock (CACCLK)	234
8.10.18	RTC Clock (RTCSCLK, RTCLCLK)	234
8.10.19	IWDT Clock (IWDTCLK)	234
8.10.20	AGT Clock (AGTSCLK, AGTLCLK)	234
8.10.21	SysTick Timer Clock (SYSTICKCLK)	234
8.10.22	External Pin Output Clock (CLKOUT)	234
8.10.23	JTAG Clock (JTAGTCK)	234
8.11	Clock Setting	235
8.11.1	System Clock Setting	235
8.11.2	Peripheral module-dedicated Clock Setting	240
8.11.3	Main Clock Oscillator Setting	242
8.11.4	Sub-Clock Oscillator Setting	243
8.11.5	High-speed On Chip Oscillator Setting	243
8.11.6	PLL Setting	245
8.12	Usage Notes	246
8.12.1	Notes on Clock Generation Circuit	246
8.12.2	Notes on Resonator	247
8.12.3	Notes on Board Design	247
8.12.4	Notes on Resonator Connect Pin	247
8.12.5	Notes on Using Sub-Clock Oscillator	247
9.	Clock Frequency Accuracy Measurement Circuit (CAC)	248

9.1	Overview.....	248
9.2	Register Descriptions	249
9.2.1	CACR0 : CAC Control Register 0	249
9.2.2	CACR1 : CAC Control Register 1	250
9.2.3	CACR2 : CAC Control Register 2	251
9.2.4	CAICR : CAC Interrupt Control Register	252
9.2.5	CASTR : CAC Status Register.....	253
9.2.6	CAULVR : CAC Upper-Limit Value Setting Register	254
9.2.7	CALLVR : CAC Lower-Limit Value Setting Register.....	254
9.2.8	CACNTBR : CAC Counter Buffer Register.....	254
9.3	Operation.....	255
9.3.1	Measuring Clock Frequency	255
9.3.2	Digital Filtering of Signals on CACREF Pin.....	256
9.4	Interrupt Requests	256
9.5	Usage Notes.....	256
9.5.1	Settings for the Module-Stop Function.....	256
10.	Low Power Modes	257
10.1	Overview.....	257
10.2	Register Descriptions	262
10.2.1	LPMSAR : Low Power Mode Security Attribution Register	262
10.2.2	PGCSAR : Power Gating Control Security Attribution Register	263
10.2.3	DPFSAR : Deep Software Standby Interrupt Factor Security Attribution Register	264
10.2.4	RSCSAR : RAM Standby Control Security Attribution Register	266
10.2.5	MSTPCRA : Module Stop Control Register A.....	267
10.2.6	MSTPCRB : Module Stop Control Register B.....	268
10.2.7	MSTPCRC : Module Stop Control Register C.....	270
10.2.8	MSTPCRD : Module Stop Control Register D.....	271
10.2.9	MSTPCRE : Module Stop Control Register E.....	272
10.2.10	SBYCR : Standby Control Register.....	274
10.2.11	OPCCR : Operating Power Control Register	274
10.2.12	PDCTRGD : Graphics Power Domain Control Register	275
10.2.13	PDRAMSCR0 : SRAM Power Domain Standby Control Register 0	276
10.2.14	PDRAMSCR1 : SRAM Power Domain Standby Control Register 1	277
10.2.15	SSCR1 : Software Standby Control Register 1.....	278
10.2.16	LPSCR : Low Power State Control Register	278
10.2.17	DPSBYCR : Deep Software Standby Control Register.....	279
10.2.18	DPSWCR : Deep Software Standby Wait Control Register	280
10.2.19	DPSIER0 : Deep Software Standby Interrupt Enable Register 0.....	281
10.2.20	DPSIER1 : Deep Software Standby Interrupt Enable Register 1.....	281
10.2.21	DPSIER2 : Deep Software Standby Interrupt Enable Register 2.....	282

10.2.22	DPSIER3 : Deep Software Standby Interrupt Enable Register 3.....	283
10.2.23	DPSIFR0 : Deep Software Standby Interrupt Flag Register 0	284
10.2.24	DPSIFR1 : Deep Software Standby Interrupt Flag Register 1	285
10.2.25	DPSIFR2 : Deep Software Standby Interrupt Flag Register 2	286
10.2.26	DPSIFR3 : Deep Software Standby Interrupt Flag Register 3	287
10.2.27	DPSIEGR0 : Deep Software Standby Interrupt Edge Register 0.....	289
10.2.28	DPSIEGR1 : Deep Software Standby Interrupt Edge Register 1.....	289
10.2.29	DPSIEGR2 : Deep Software Standby Interrupt Edge Register 2.....	290
10.2.30	SYOCDRCR : System Control OCD Control Register.....	291
10.2.31	PLL1LDOCR : PLL1-LDO Control Register	291
10.2.32	PLL2LDOCR : PLL2-LDO Control Register	292
10.2.33	HOCOLDOCR : HOCO-LDO Control Register	293
10.3	Reducing Power Consumption by Switching Clock Signals	293
10.4	Module-Stop Function	293
10.5	Function for Lower Operating Power Consumption.....	295
10.5.1	Setting Operating Power Control Mode	295
10.6	Power Gating Control	295
10.6.1	Power Gating Control using power domain control register	295
10.7	Low Power Modes	296
10.7.1	CPU Sleep Mode	296
10.7.2	CPU Deep Sleep mode.....	298
10.7.3	Software Standby Mode.....	299
10.7.4	Deep Software Standby Mode	302
10.8	Usage Notes.....	305
10.8.1	Register Access	305
10.8.2	I/O Port States.....	307
10.8.3	Module-Stop State of DMAC and DTC	307
10.8.4	Internal Interrupt sources	307
10.8.5	Input Buffer Control by DIRQnE Bit.....	307
10.8.6	Transition to Low Power Modes	307
10.8.7	Timing of WFI Instructions.....	307
10.8.8	Writing WDT/IWDT registers by DMAC or DTC.....	308
10.8.9	Module stop bit write timing.....	308
10.8.10	Notes on transitioning to or canceling low power state	308
11.	Battery Backup Function	311
11.1	Overview.....	311
11.1.1	Battery backup function block diagram	311
11.1.2	Features of Battery Backup Function.....	312
11.1.3	Battery Power Supply Switch	313
11.1.4	VBATT_R voltage drop detection function	313

11.1.5	Backup Registers	313
11.1.6	Time Capture Function	313
11.1.7	Tamper Detection Function	313
11.1.8	VBATT Voltage Monitor Function	313
11.2	Register Descriptions	313
11.2.1	BBFSAR : Battery Backup Function Security Attribute Register	313
11.2.2	VBRSEBAR : VBATT Backup Register Security Attribute Boundary Address Register	314
11.2.3	VBRPABARS : VBATT Backup Register Privilege Attribute Boundary Address Register for Secure Region	315
11.2.4	VBRPABARNS : VBATT Backup Register Privilege Attribute Boundary Address Register for Non-secure Region	316
11.2.5	VBATTMNSELR : Battery Backup Voltage Monitor Function Select Register	316
11.2.6	VBTBER : VBATT Backup Enable Register	317
11.2.7	VBTBKR[n] : VBATT Backup Register (n = 0 to 127)	317
11.2.8	VBTICTLR : VBATT Input Control Register	318
11.2.9	VBTICTLR2 : VBATT Input Control Register 2	319
11.2.10	VBTIMONR : VBATT Input Monitor Register	319
11.2.11	VBTBPCR1 : VBATT Battery Power Supply Control Register 1	320
11.2.12	VBTBPCR2 : VBATT Battery Power Supply Control Register 2	320
11.2.13	VBTBPSR : VBATT Battery Power Supply Status Register	321
11.2.14	VBTADSR : VBATT Tamper detection Status Register	322
11.2.15	VBTADCR1 : VBATT Tamper detection Control Register 1	323
11.2.16	VBTADCR2 : VBATT Tamper detection Control Register 2	324
11.3	Operation	324
11.3.1	Battery Backup Function	324
11.3.2	VBATT Battery Power Supply Switch Usage	326
11.3.3	VBATT_R voltage drop detection function Usage	327
11.3.4	VBATT Backup Register Usage	327
11.3.5	Tamper Detection Usage	327
11.3.6	VBATT voltage monitor function Usage	328
11.3.7	Initial Settings Examples	329
11.4	Interrupt Sources	330
11.5	Usage Notes	330
12.	Register Write Protection	331
12.1	Overview	331
12.2	Register Descriptions	331
12.2.1	PRCR_S : Protect Register for Secure (PRCR_S)	331
12.2.2	PRCR_NS : Protect Register for Non-secure (PRCR_NS)	332
13.	Interrupt Controller Unit (ICU)	334
13.1	Overview	334

13.2	Register Descriptions	335
13.2.1	ICUSARA : Interrupt Controller Unit Security Attribution Register A.....	335
13.2.2	ICUSARB : Interrupt Controller Unit Security Attribution Register B.....	336
13.2.3	ICUSARE : Interrupt Controller Unit Security Attribution Register E.....	337
13.2.4	ICUSARF : Interrupt Controller Unit Security Attribution Register F	338
13.2.5	ICUSARG : Interrupt Controller Unit Security Attribution Register G	339
13.2.6	ICUSARH : Interrupt Controller Unit Security Attribution Register H	339
13.2.7	ICUSARI : Interrupt Controller Unit Security Attribution Register I.....	340
13.2.8	TEVTRCR : Trusted Event Route Control Register	340
13.2.9	IRQCRi : IRQ Control Register i (i = 0 to 15)	341
13.2.10	NMISR : Non-Maskable Interrupt Status Register	342
13.2.11	NMIER : Non-Maskable Interrupt Enable Register	345
13.2.12	NMICLR : Non-Maskable Interrupt Status Clear Register.....	346
13.2.13	NMICR : NMI Pin Interrupt Control Register	347
13.2.14	IELSRn : ICU Event Link Setting Register n (n = 0 to 95).....	348
13.2.15	WUPEN0 : Wake Up Interrupt Enable Register 0	350
13.2.16	WUPEN1 : Wake Up interrupt enable register 1	352
13.3	Vector Table.....	354
13.3.1	Interrupt Vector Table	354
13.3.2	Event Number	357
13.4	Maskable Interrupt Operation.....	364
13.4.1	Detecting Interrupts.....	364
13.5	Maskable Interrupt setting procedure.....	365
13.5.1	Operations During an Interrupt.....	365
13.5.2	Enabling Interrupt Requests.....	365
13.5.3	Disabling Interrupt Requests.....	365
13.5.4	Polling for interrupts	366
13.5.5	Selecting Interrupt Request Destinations.....	366
13.5.6	Digital Filter	367
13.5.7	External Pin Interrupts.....	367
13.6	Non-Maskable Interrupt Operation	368
13.6.1	Correspondence to TrustZone-M by NMI.....	368
13.7	Security.....	369
13.7.1	Security Related to CPU Interrupt Inputs	369
13.7.2	Trusted Interrupt Management.....	370
13.7.3	Trusted IELSR Setting Procedure	370
13.8	Return from Low Power Modes	371
13.8.1	Return from CPU Sleep Mode	371
13.8.2	Return from CPU Deep Sleep Mode.....	371
13.8.3	Return from Software Standby Mode.....	372

13.9	Using the WFI Instruction with Non-Maskable Interrupts	372
13.10	Reference	372
14.	Buses.....	373
14.1	Overview.....	373
14.2	Description of Buses.....	376
14.2.1	Arbitration	376
14.2.2	External Bus	376
14.2.3	Parallel Operation	378
14.2.4	Bus Settings	379
14.2.5	Restrictions	379
14.3	Register Descriptions	379
14.3.1	BUSSARA : Bus Security Attribution Register A.....	380
14.3.2	BUSSARB : Bus Security Attribution Register B.....	380
14.3.3	BUSSARC : Bus Security Attribution Register C	381
14.3.4	BUSPARC : Bus Privileged Attribution Register C.....	382
14.3.5	CSnCR : CSn Control Register (n = 0 to 7).....	383
14.3.6	CSnREC : CSn Recovery Cycle Register (n = 0 to 7).....	384
14.3.7	CSRECEN : CS Recovery Cycle Insertion Enable Register	385
14.3.8	CSnMOD : CSn Mode Register (n = 0 to 7).....	387
14.3.9	CSnWCR1 : CSn Wait Control Register 1 (n = 0 to 7)	388
14.3.10	CSnWCR2 : CSn Wait Control Register 2 (n = 0 to 7)	390
14.3.11	SDCCR : SDC Control Register	393
14.3.12	SDCMOD : SDC Mode Register	393
14.3.13	SDAMOD : SDRAM Access Mode Register	394
14.3.14	SDSELF : SDRAM Self-Refresh Control Register	394
14.3.15	SDRFCR : SDRAM Refresh Control Register.....	395
14.3.16	SDRFEN : SDRAM Auto-Refresh Control Register	396
14.3.17	SDICR : SDRAM Initialization Sequence Control Register	396
14.3.18	SDIR : SDRAM Initialization Register	397
14.3.19	SDADR : SDRAM Address Register	398
14.3.20	SDTR : SDRAM Timing Register	398
14.3.21	SDMOD : SDRAM Mode Register	400
14.3.22	SDSR : SDRAM Status Register.....	400
14.3.23	BUSDIVBYP : Bus Divider Bypass Register	401
14.3.24	BUSMABT : Bus Master Arbitration Control Register	402
14.3.25	BUSSABT0<slave> : Bus Slave Arbitration Control Register 0(<slave> = FLBI, STBYSBI, ECBI, EOBI, PBBI, PABI, PIBI, PSBI).....	403
14.3.26	BUSSABT1<slave> : Bus Slave Arbitration Control Register 1(<slave> = FHBI, S0BI, S1BI)	404
14.3.27	BUSnERRADD : BUS Error Address Register (n = 4, 6 to 9)	405

14.3.28	BUSnERRRW : BUS Error Read Write (n = 4, 6 to 9)	406
14.3.29	BMSAnERRADD : Bus Master Security Attribution Unit Error Address (n = 4, 6 to 9)	407
14.3.30	BMSAnERRRW : BUS Master Security Attribution Unit Error Read Write (n = 4, 6 to 9) ...	407
14.3.31	BUSnERRSTAT : BUS Error Status Register (n = 1 to 4, 6 to 9)	408
14.3.32	BUSnERRCLR : BUS Error Clear Register (n = 1 to 4, 6 to 9)	409
14.3.33	BUSOAD : BUS Operation After Detection Register	410
14.3.34	BUSOADPT : BUS Operation After Detection Protect Register	411
14.3.35	MBWERRSTAT : Master Bufferable Write Error Status Register	412
14.3.36	MBWERRCLR : Master Bufferable Write Error Clear Register	413
14.3.37	SBWERRSTAT : Slave Bufferable Write Error Status Register	414
14.3.38	SBWERRCLR : Slave Bufferable Write Error Clear Register	415
14.4	Endian and Data Alignment	416
14.4.1	Data Alignment Control for the CS Area	416
14.4.2	Data Alignment Control for the SDRAM Area	420
14.5	Operation of CS Area Controller	423
14.5.1	Separate Bus	423
14.5.2	Address/Data Multiplexed Bus	435
14.5.3	External Wait Function	437
14.5.4	Insertion of Recovery Cycles	440
14.5.5	No Access State	443
14.5.6	Write Buffer Function (External Bus)	443
14.5.7	Limitations	444

17.2.7	CRB : DTC Transfer Count Register B.....	555

17.2.8	DTCCR : DTC Control Register	556
17.2.9	DTCCR_SEC : DTC Control Register for Secure Region	556
17.2.10	DTCVBR : DTC Vector Base Register	557
17.2.11	DTCVBR_SEC : DTC Vector Base Register for Secure Region	557
17.2.12	DTCST : DTC Module Start Register	557
17.2.13	DTCSTS : DTC Status Register	558
17.2.14	DTEVR : DTC Error Vector Register	559
17.3	Activation Sources	560
17.3.1	Allocating Transfer Information and DTC Vector Table	560
17.4	Operation	563
17.4.1	Transfer Information Read Skip Function	565
17.4.2	Transfer Information Write-Back Skip Function	565
17.4.3	Normal Transfer Mode	566
17.4.4	Repeat Transfer Mode	567
17.4.5	Block Transfer Mode	568
17.4.6	Chain Transfer	569
17.4.7	Operation Timing	570
17.4.8	Vector Security	573
17.4.9	Vector privilege	573
17.5	DTC Setting Procedure	573
17.6	Examples of DTC Usage	574
17.6.1	Normal Transfer	574
17.6.2	Chain transfer	574
17.6.3	Chain Transfer when Counter = 0	576
17.7	Processing on DTC Transfer Error	577
17.8	Interrupt	578
17.8.1	Interrupt Request of Transfer End	578
17.8.2	Interrupt Request of Transfer Error	578
17.9	Event Link	578
17.10	Low Power Consumption Function	578
17.11	Usage Notes	579
17.11.1	Transfer Information Start Address	579
17.11.2	Restriction for OSPI	579
18.	Event Link Controller (ELC)	580
18.1	Overview	580
18.2	Register Descriptions	582
18.2.1	ELCR : Event Link Controller Register	582
18.2.2	ELSEGRn : Event Link Software Event Generation Register n (n = 0, 1)	582
18.2.3	ELSRn : Event Link Setting Register n (n = 0 to 12, 14 to 17)	583
18.2.4	ELCSARA : Event Link Controller Security Attribution Register A	589

18.2.5	ELCSARB : Event Link Controller Security Attribution Register B	590
18.2.6	ELCPARA : Event Link Controller Privilege Attribution Register A.....	590
18.2.7	ELCPARB : Event Link Controller Privilege Attribution Register B.....	591
18.3	Operation.....	591
18.3.1	Relation between Interrupt Handling and Event Linking	591
18.3.2	Linking Events.....	591
18.3.3	Example of Procedure for Linking Events	592
18.4	Usage Notes.....	592
18.4.1	Linking DMAC/DTC Transfer End Signals as Events.....	592
18.4.2	Setting Clocks	592
18.4.3	Module-Stop Function Setting.....	592
18.4.4	ELC Delay Time	593
19.	I/O Ports.....	594
19.1	Overview.....	594
19.2	Register Descriptions	596
19.2.1	PCNTR1/PODR/PDR : Port Control Register 1	596
19.2.2	PCNTR2/EIDR/PIDR : Port Control Register 2	597
19.2.3	PCNTR3/PORR/POSR : Port Control Register 3.....	598
19.2.4	PCNTR4/EORR/EOSR : Port Control Register 4.....	599
19.2.5	PmnPFS/PmnPFS_HA/PmnPFS_BY : Port mn Pin Function Select Register (m = 0 to 9, A, B, n = 00 to 15).....	600
19.2.6	PWPR_NS : Write-Protect Register for Non-secure	602
19.2.7	PWPR_S : Write-Protect Register for Secure	602
19.2.8	PmSAR : Port Security Attribution register (m = 0 to 9, A, B)	603
19.2.9	LVOCR : Low Voltage Operation Control register	603
19.3	Operation.....	604
19.3.1	General I/O Ports	604
19.3.2	Port Function Select.....	604
19.3.3	Port Group Function for ELC.....	604
19.4	Handling of Unused Pins	606
19.5	Usage Notes.....	607
19.5.1	Procedure for Specifying the Pin Functions	607
19.5.2	Procedure for Using Port Group Input.....	607
19.5.3	Port Output Data Register (PODR) Summary.....	608
19.5.4	Notes on Using Analog Functions.....	608
19.5.5	I/O Buffer Specification.....	608
19.5.6	Selecting Pins USB_DP and USB_DM	609
19.5.7	Pull-up/Pull-down Setting for P814 and P815 at USBFS/GPIO Function	610
19.6	Peripheral Select Settings for Each Product	610
20.	Port Output Enable for GPT (POEG).....	620

20.1	Overview.....	620
20.2	Register Descriptions	621
20.2.1	POEGGn : POEG Group n Setting Register (n = A to D).....	621
20.3	Output-Disable Control Operation	622
20.3.1	Pin Input Level Detection Operation	623
20.3.2	Output-Disable Requests from the GPT	624
20.3.3	Comparator Interrupt Detection.....	624
20.3.4	Output-Disable Control Using Detection of Stopped Oscillation	624
20.3.5	Output-Disable Control Using Registers	624
20.3.6	Release from Output-Disable.....	624
20.4	Interrupt Sources	625
20.5	External Trigger Output to the GPT	625
20.6	Usage Notes.....	626
20.6.1	Transition to Software Standby Mode	626
20.6.2	Specifying Pins Associated with the GPT	626
21.	General PWM Timer (GPT).....	627
21.1	Overview.....	627
21.2	Register Descriptions	630
21.2.1	GTWP : General PWM Timer Write-Protection Register.....	630
21.2.2	GTSTR : General PWM Timer Software Start Register	632
21.2.3	GTSTP : General PWM Timer Software Stop Register.....	633
21.2.4	GTCLR : General PWM Timer Software Clear Register	634
21.2.5	GTSSR : General PWM Timer Start Source Select Register	635
21.2.6	GTPSR : General PWM Timer Stop Source Select Register	638
21.2.7	GTCSR : General PWM Timer Clear Source Select Register.....	641
21.2.8	GTUPSR : General PWM Timer Up Count Source Select Register.....	644
21.2.9	GTDNSR : General PWM Timer Down Count Source Select Register	647
21.2.10	GTICASR : General PWM Timer Input Capture Source Select Register A.....	651
21.2.11	GTICBSR : General PWM Timer Input Capture Source Select Register B.....	654
21.2.12	GTCR : General PWM Timer Control Register	657
21.2.13	GTUDDTYC : General PWM Timer Count Direction and Duty Setting Register	659
21.2.14	GTIOR : General PWM Timer I/O Control Register	661
21.2.15	GTINTAD : General PWM Timer Interrupt Output Setting Register	665
21.2.16	GTST : General PWM Timer Status Register	667
21.2.17	GTBER : General PWM Timer Buffer Enable Register	672
21.2.18	GTCNT : General PWM Timer Counter	675
21.2.19	GTCCRk : General PWM Timer Compare Capture Register k (k = A to F)	675
21.2.20	GTPR : General PWM Timer Cycle Setting Register	676
21.2.21	GTPBR : General PWM Timer Cycle Setting Buffer Register	676
21.2.22	GTADTRk : A/D Conversion Start Request Timing Register k (k = A, B).....	676

21.2.23	GTADTBRk : A/D Conversion Start Request Timing Buffer Register k (k = A, B).....	677
21.2.24	GTADTDBRk : A/D Conversion Start Request Timing Double-Buffer Register k (k = A, B)	677
21.2.25	GTDTCR : General PWM Timer Dead Time Control Register	678
21.2.26	GTDVU : General PWM Timer Dead Time Value Register U.....	678
21.2.27	GTADSMR : General PWM Timer A/D Conversion Start Request Signal Monitoring Register.....	679
21.2.28	GTICLF : General PWM Timer Inter Channel Logical Operation Function Setting Register	680
21.2.29	GTPC : General PWM Timer Period Count Register	682
21.2.30	GTSECSR : General PWM Timer Operation Enable Bit Simultaneous Control Channel Select Register	683
21.2.31	GTSECR : General PWM Timer Operation Enable Bit Simultaneous Control Register.....	684
21.3	Operation.....	686
21.3.1	Basic Operation.....	686
21.3.2	Buffer Operation	694
21.3.3	PWM Output Operating Mode.....	704
21.3.4	Automatic Dead Time Setting Function.....	714
21.3.5	Count Direction Changing Function	718
21.3.6	Function of Output Duty 0% and 100%.....	719
21.3.7	Hardware Count Start/Count Stop and Clear Operation	720
21.3.8	Synchronized Operation.....	725
21.3.9	PWM Output Operation Examples	730
21.3.10	Period Count Function	735
21.3.11	Phase Counting Function.....	736
21.3.12	Inter Channel Logical Operation Function.....	746
21.4	Interrupt Sources	748
21.4.1	Interrupt Sources.....	748
21.4.2	DMAC and DTC Activation.....	750
21.5	A/D Conversion Start Request	750
21.6	Operations Linked by ELC.....	753
21.6.1	Event Signal Output to ELC	753
21.6.2	Event Signal Inputs from ELC	753
21.7	Noise Filter Function.....	753
21.8	Protection Function.....	754
21.8.1	Write-Protection for Registers	754
21.8.2	Disabling of Buffer Operation	754
21.8.3	GTIOCNm Pin Output Negate Control (n = 0 to 5, 10 to 13, m = A, B)	756
21.9	Initialization Method of Output Pins	757
21.9.1	Pin Settings after Reset	757
21.9.2	Pin Initialization Due to Error during Operation.....	758
21.10	Usage Notes.....	758

21.10.1	Module-Stop Function Setting.....	758
21.10.2	GTCCRn Settings during Compare Match Operation (n = A to F).....	758
21.10.3	Setting Range for GTCNT Counter.....	759
21.10.4	Starting and Stopping the GTCNT Counter.....	759
21.10.5	Priority Order of Each Event.....	759
21.10.6	Prohibit Invalid Register Setting.....	760
22.	Low Power Asynchronous General Purpose Timer (AGT).....	761
22.1	Overview.....	761
22.2	Register Descriptions.....	763
22.2.1	AGT : AGT Counter Register.....	763
22.2.2	AGTCMA : AGT Compare Match A Register.....	763
22.2.3	AGTCMB : AGT Compare Match B Register.....	764
22.2.4	AGTCR : AGT Control Register.....	764
22.2.5	AGTMR1 : AGT Mode Register 1.....	766
22.2.6	AGTMR2 : AGT Mode Register 2.....	767
22.2.7	AGTIOC : AGT I/O Control Register.....	768
22.2.8	AGTISR : AGT Event Pin Select Register.....	769
22.2.9	AGTCMSR : AGT Compare Match Function Select Register.....	770
22.2.10	AGTIOSEL : AGT Pin Select Register.....	770
22.3	Operation.....	771
22.3.1	Reload Register and Counter Rewrite Operation.....	771
22.3.2	Reload Register and AGT Compare Match A/B Register Rewrite Operation.....	772
22.3.3	Timer Mode.....	773
22.3.4	Pulse Output Mode.....	774
22.3.5	Event Counter Mode.....	775
22.3.6	Pulse Width Measurement Mode.....	776
22.3.7	Pulse Period Measurement Mode.....	777
22.3.8	Compare Match function.....	778
22.3.9	Output Settings for Each Mode.....	779
22.3.10	Standby Mode.....	780
22.3.11	Interrupt Sources.....	781
22.3.12	Event Signal Output to ELC.....	781
22.4	Usage Notes.....	782
22.4.1	Count Operation Start and Stop Control.....	782
22.4.2	Access to Counter Register.....	782
22.4.3	When Changing Mode.....	782
22.4.4	Output pin setting.....	782
22.4.5	Digital Filter.....	782
22.4.6	How to Calculate Event Number, Pulse Width, and Pulse Period.....	782
22.4.7	When Count is Forcibly Stopped by TSTOP Bit.....	783

22.4.8	When Selecting AGT0 Underflow as the Count Source.....	783
22.4.9	Module-stop function.....	783
22.4.10	When Switching Source Clock.....	783
23.	Ultra-Low-Power Timer (ULPT)	784
23.1	Overview.....	784
23.2	Configuration	784
23.3	Register Descriptions	785
23.3.1	ULPTCNT : ULPT Counter Register	785
23.3.2	ULPTCMA : ULPT Compare Match A Register	786
23.3.3	ULPTCMB : ULPT Compare Match B Register	786
23.3.4	ULPTCR : ULPT Control Register.....	787
23.3.5	ULPTMR1 : ULPT Mode Register 1.....	789
23.3.6	ULPTMR2 : ULPT Mode Register 2.....	789
23.3.7	ULPTMR3 : ULPT Mode Register 3.....	790
23.3.8	ULPTIOC : ULPT I/O Control Register.....	792
23.3.9	ULPTISR : ULPT Event Pin Select Register	792
23.3.10	ULPTCMSR : ULPT Compare Match Function Select Register	793
23.4	Operation.....	794
23.4.1	Count operation.....	794
23.4.2	Rewriting the counter and reload register	804
23.4.3	Rewriting the compare circuits and reload registers for compare match A/B	807
23.4.4	Pulse output	808
23.4.5	Compare match function	809
23.4.6	Input and output settings for each mode.....	810
23.4.7	Standby mode	811
23.4.8	Interrupt sources	812
23.4.9	Event output to the ELC	813
23.5	Usage notes	813
23.5.1	Start and stop control of the counter	813
23.5.2	Access to flags (TUNDF, TCMAF, and TCMBF bits in ULPTCR register).....	814
23.5.3	Access to the ULPTCNT, ULPTCMA, and ULPTCMB registers	814
23.5.4	Mode changes.....	814
23.5.5	Setting the ULPTOn, ULPTOAn, and ULPTOBn pins.....	814
23.5.6	Calculating the number of events.....	814
23.5.7	When the counter is stopped forcibly by the TSTOP bit.....	814
23.5.8	Digital filter	814
23.5.9	Restrictions on Event Counting during Deep Software Standby Mode 1.....	814
23.5.10	Module-stop function.....	815
23.5.11	Setting the ULPTEEn and ULPTEVIn pins	815

24. Realtime Clock (RTC)	816
24.1 Overview.....	816
24.2 Register Descriptions	817
24.2.1 R64CNT : 64-Hz Counter.....	818
24.2.2 RSECCNT : Second Counter (in Calendar Count Mode)	818
24.2.3 RMINCNT : Minute Counter (in Calendar Count Mode).....	819
24.2.4 RHRCNT : Hour Counter (in Calendar Count Mode).....	819
24.2.5 RWKCNT : Day-of-Week Counter (in Calendar Count Mode)	820
24.2.6 BCNTn : Binary Counter n (n = 0 to 3) (in Binary Count Mode).....	820
24.2.7 RDAYCNT : Day Counter.....	821
24.2.8 RMONCNT : Month Counter	821
24.2.9 RYRCNT : Year Counter	822
24.2.10 RSECAR : Second Alarm Register (in Calendar Count Mode).....	822
24.2.11 RMINAR : Minute Alarm Register (in Calendar Count Mode).....	823
24.2.12 RHRAR : Hour Alarm Register (in Calendar Count Mode)	823
24.2.13 RWKAR : Day-of-Week Alarm Register (in Calendar Count Mode).....	824
24.2.14 BCNTnAR : Binary Counter n Alarm Register (n = 0 to 3) (in Binary Count Mode)	825
24.2.15 RDAYAR : Date Alarm Register (in Calendar Count Mode).....	825
24.2.16 RMONAR : Month Alarm Register (in Calendar Count Mode).....	826
24.2.17 RYRAR : Year Alarm Register (in Calendar Count Mode)	827
24.2.18 RYRAREN : Year Alarm Enable Register (in Calendar Count Mode).....	827
24.2.19 BCNTnAER : Binary Counter n Alarm Enable Register (n = 0 to 3) (in Binary Count Mode).....	828
24.2.20 RCR1 : RTC Control Register 1	828
24.2.21 RCR2 : RTC Control Register 2 (in Calendar Count Mode).....	829
24.2.22 RCR2 : RTC Control Register 2 (in Binary Count Mode).....	831
24.2.23 RCR4 : RTC Control Register 4	833
24.2.24 RFRL : Frequency Register L	833
24.2.25 RFRH : Frequency Register H	834
24.2.26 RADJ : Time Error Adjustment Register.....	834
24.2.27 RTCCRn : Time Capture Control Register n (n = 0 to 2).....	835
24.2.28 RSECCPn : Second Capture Register n (n = 0 to 2) (in Calendar Count Mode).....	836
24.2.29 RMINCPn : Minute Capture Register n (n = 0 to 2) (in Calendar Count Mode)	836
24.2.30 RHRCPn : Hour Capture Register n (n = 0 to 2) (in Calendar Count Mode).....	837
24.2.31 RDAYCPn : Date Capture Register n (n = 0 to 2) (in Calendar Count Mode).....	837
24.2.32 RMONCPn : Month Capture Register n (n = 0 to 2) (in Calendar Count Mode)	838
24.2.33 BCNTnCPm : BCNTn Capture Register m (n = 0 to 3, m = 0 to 2) (in Binary Count Mode)	838
24.3 Operation.....	839
24.3.1 Outline of Initial Settings of Registers after Power On	839
24.3.2 Clock and Count Mode Setting Procedure	839

24.3.3	Setting the Time	840
24.3.4	30-Second Adjustment	841
24.3.5	Reading 64-Hz Counter and Time	842
24.3.6	Alarm Function	844
24.3.7	Procedure for Disabling Alarm Interrupt	845
24.3.8	Time Error Adjustment Function	845
24.3.9	Capturing the time	847
24.4	Interrupt Sources	848
24.5	Event Link Output	849
24.5.1	Interrupt Handling and Event Linking	850
24.6	Usage Notes	850
24.6.1	Register Writing during Counting	850
24.6.2	Use of Periodic Interrupts	850
24.6.3	RTCOUT (1-Hz/64-Hz) Clock Output	851
24.6.4	Transitions to Low Power Modes after Setting Registers	851
24.6.5	Notes on Writing to and Reading from Registers	851
24.6.6	Changing the Count Mode	851
24.6.7	Initialization Procedure When the RTC Is Not to Be Used	851
24.6.8	When Switching Source Clock	852
24.6.9	When writing to the RTC registers	852
25.	Watchdog Timer (WDT)	853
25.1	Overview	853
25.2	Register Descriptions	854
25.2.1	WDTRR : WDT Refresh Register	854
25.2.2	WDTCR : WDT Control Register	855
25.2.3	WDTSR : WDT Status Register	857
25.2.4	WDTRCR : WDT Reset Control Register	858
25.2.5	WDCSTPR : WDT Count Stop Control Register	859
25.2.6	Option Function Select Register 0 (OFS0)	859
25.3	Operation	859
25.3.1	Count Operation in each Start Mode	859
25.3.2	Controlling Writes to the WDTCR, WDTRCR, and WDCSTPR Registers	863
25.3.3	Refresh Operation	863
25.3.4	Status Flags	864
25.3.5	Reset Output	864
25.3.6	Interrupt Sources	864
25.3.7	Reading the Down-Counter Value	865
25.3.8	Association between Option Function Select Register 0 (OFS0) and WDT Registers	865
25.4	Output to the Event Link Controller (ELC)	866
25.5	Usage Notes	866

25.5.1	ICU Event Link Setting Register n (IELSRn) Setting.....	866
26.	Independent Watchdog Timer (IWDT).....	867
26.1	Overview.....	867
26.1.1	Block diagram	867
26.2	Register specifications.....	868
26.2.1	IWDTRR : IWDT Refresh Register.....	868
26.2.2	IWDTCR : IWDT Control Register.....	869
26.2.3	IWDTSR : IWDT Status Register	871
26.2.4	IWDTRCR : IWDT Reset Control Register.....	872
26.2.5	IWDTCSTPR : IWDT Count Stop Control Register.....	873
26.3	Operation.....	873
26.3.1	Count operation in each start mode	873
26.3.2	Controlling writes to the IWDTCR, IWDTRCR, and IWDTCSTPR registers	876
26.3.3	Refresh operation.....	876
26.3.4	Status flags	879
26.3.5	Reset output.....	879
26.3.6	Interrupt sources	879
26.3.7	Reading the down-counter value	879
26.3.8	Correspondence between Option Function Select Register 0 (OFS0) and IWDT Registers	881
26.4	Link operation by the event link function	881
27.	USB 2.0 Full-Speed Module (USBFS)	882
27.1	Overview.....	882
27.2	Register Descriptions	884
27.2.1	SYSCFG : System Configuration Control Register	884
27.2.2	SYSSTS0 : System Configuration Status Register 0	885
27.2.3	DVSTCTR0 : Device State Control Register 0.....	886
27.2.4	CFIFO/CFIFOL : CFIFO Port Register.....	889
27.2.5	DnFIFO/DnFIFOL : DnFIFO Port Register (n = 0, 1)	890
27.2.6	CFIFOSEL : CFIFO Port Select Register.....	891
27.2.7	DnFIFOSEL : DnFIFO Port Select Register (n = 0, 1)	893
27.2.8	CFIFOCTR : CFIFO Port Control Register.....	894
27.2.9	DnFIFOCTR : DnFIFO Port Control Register (n = 0, 1)	896
27.2.10	INTENB0 : Interrupt Enable Register 0	897
27.2.11	INTENB1 : Interrupt Enable Register 1	898
27.2.12	BRDYENB : BRDY Interrupt Enable Register.....	899
27.2.13	NRDYENB : NRDY Interrupt Enable Register	900
27.2.14	BEMPENB : BEMP Interrupt Enable Register	901
27.2.15	SOFCFG : SOF Output Configuration Register	902
27.2.16	INTSTS0 : Interrupt Status Register 0	903

27.2.17	INTSTS1 : Interrupt Status Register 1	905
27.2.18	BRDYSTS : BRDY Interrupt Status Register	908
27.2.19	NRDYSTS : NRDY Interrupt Status Register	909
27.2.20	BEMPSTS : BEMP Interrupt Status Register	909
27.2.21	FRMNUM : Frame Number Register	910
27.2.22	DVCHGR : Device State Change Register	911
27.2.23	USBADDR : USB Address Register	911
27.2.24	USBREQ : USB Request Type Register	912
27.2.25	USBVAL : USB Request Value Register	913
27.2.26	USBINDX : USB Request Index Register	914
27.2.27	USBLENG : USB Request Length Register	914
27.2.28	DCPCFG : DCP Configuration Register	915
27.2.29	DCPMAXP : DCP Maximum Packet Size Register	916
27.2.30	DCPCTR : DCP Control Register	916
27.2.31	PIPESEL : Pipe Window Select Register	919
27.2.32	PIPECFG : Pipe Configuration Register	920
27.2.33	PEMAXP : Pipe Maximum Packet Size Register	922
27.2.34	PEPERI : Pipe Cycle Control Register	923
27.2.35	PE _n CTR : PIPE _n Control Registers (n = 1 to 5)	924
27.2.36	PE _n CTR : PIPE _n Control Registers (n = 6 to 9)	928
27.2.37	PE _n TRE : PIPE _n Transaction Counter Enable Register (n = 1 to 5)	930
27.2.38	PE _n TRN : PIPE _n Transaction Counter Register (n = 1 to 5)	931
27.2.39	DEVADD _n : Device Address n Configuration Register (n = 0 to 5)	932
27.2.40	DPUSR0R : Deep Software Standby USB Transceiver Control/Pin Monitor Register	932
27.2.41	DPUSR1R : Deep Software Standby USB Suspend/Resume Interrupt Register	934
27.3	Operation	935
27.3.1	System Control	935
27.3.2	Interrupts	944
27.3.3	Interrupt Descriptions	948
27.3.4	Pipe Control	957
27.3.5	FIFO Buffer	961
27.3.6	FIFO Buffer Clearing	961
27.3.7	FIFO Port Functions	962
27.3.8	DMA Transfers (D0FIFO and D1FIFO Ports)	963
27.3.9	Control Transfers Using the DCP	963
27.3.10	Bulk Transfers (Pipes 1 to 5)	965
27.3.11	Interrupt Transfers (Pipes 6 to 9)	965
27.3.12	Isochronous Transfers (Pipes 1 and 2)	966
27.3.13	SOF Interpolation Function	973
27.3.14	Pipe Schedule	973

27.4	Usage Notes.....	974
27.4.1	Settings for the Module-Stop State	974
27.4.2	Clearing the Interrupt Status Register on Canceling Software Standby Mode	975
27.4.3	Clearing the Interrupt Status Register after Setting Up the Port Function	975
27.4.4	Setting Up the Port Function before setting USB function	975
28.	Serial Communications Interface (SCI)	976
28.1	Overview.....	976
28.2	Register Descriptions	981
28.2.1	RSR : Receive Shift Register	981
28.2.2	RDR/RDR_BY : Receive Data Register	982
28.2.3	TDR/TDRLL/TDR LH : Transmit Data Register.....	983
28.2.4	TSR : Transmit Shift Register.....	984
28.2.5	CCR0 : Common Control Register 0.....	984
28.2.6	CCR1 : Common Control Register 1.....	987
28.2.7	CCR2 : Common Control Register 2.....	991
28.2.8	CCR3 : Common Control Register 3.....	1005
28.2.9	CCR4 : Common Control Register 4.....	1011
28.2.10	ICR : Simple IIC Control Register	1013
28.2.11	FCR : FIFO Control Register.....	1015
28.2.12	MCR : Manchester Control Register	1017
28.2.13	DCR : Driver Control Register	1020
28.2.14	XCR0 : Simple LIN Control Register 0	1021
28.2.15	XCR1 : Simple LIN Control Register 1	1023
28.2.16	XCR2 : Simple LIN Control Register 2.....	1025
28.2.17	CSR : Common Status Register	1026
28.2.18	ISR : Simple IIC Status Register	1031
28.2.19	FRSR : FIFO Receive Status Register.....	1032
28.2.20	FTSR : FIFO Transmit Status Register	1033
28.2.21	MSR : Manchester Status Register.....	1034
28.2.22	XSR0 : Simple LIN Status Register 0.....	1036
28.2.23	XSR1 : Simple LIN Status Register 1.....	1038
28.2.24	CFCLR : Common Flag Clear Register.....	1039
28.2.25	ICFCLR : Simple IIC Flag Clear Register.....	1040
28.2.26	FFCLR : FIFO Flag Clear Register	1040
28.2.27	MFCLR : Manchester Flag Clear Register	1041
28.2.28	XFCLR : Simple LIN Flag Clear Register.....	1041
28.2.29	CESR : Communication Enable Status Register	1042
28.3	Operation in Asynchronous Mode	1042
28.3.1	Serial Data Transfer Format.....	1043
28.3.2	Receive Data Sampling Timing and Reception Margin in Asynchronous Mode	1044

28.3.3	Clock	1045
28.3.4	Double-Speed Operation and Frequency of 6 or 4 Times the Bit Rate	1045
28.3.5	CTS and RTS Functions	1046
28.3.6	Address Match (Receive Data Match Detection) Function	1046
28.3.7	SCI Initialization in Asynchronous Mode	1049
28.3.8	Serial Data Transmission in Asynchronous Mode	1051
28.3.9	Serial Data Reception in Asynchronous Mode	1057
28.3.10	The function of adjust receive sampling timing (Asynchronous Mode)	1064
28.3.11	The function of adjust transmit timing (Asynchronous Mode)	1067
28.4	Multi-Processor Communication Function	1072
28.4.1	Multi-Processor Serial Data Transmission	1073
28.4.2	Multi-Processor Serial Data Reception	1076
28.5	Operation in Manchester mode	1082
28.5.1	Frame Format	1083
28.5.2	Clock	1087
28.5.3	Initialization of the SCI in Manchester Mode	1087
28.5.4	Double-speed operation	1088
28.5.5	CTS and RTS functions	1088
28.5.6	Serial data transmission in Manchester mode	1089
28.5.7	Serial Data Reception in Manchester Mode	1092
28.5.8	Operation When Multi-Processor Bit Is Used	1096
28.5.9	Receive Retiming	1096
28.5.10	Polarity Setting for Manchester Code	1097
28.5.11	Errors in Manchester Mode	1098
28.6	Operation in Clock Synchronous Mode	1103
28.6.1	Clock	1103
28.6.2	CTS and RTS Functions	1103
28.6.3	SCI Initialization in Clock Synchronous Mode	1104
28.6.4	Serial Data Transmission in Clock Synchronous Mode	1105
28.6.5	Serial Data Reception in Clock Synchronous Mode	1109
28.6.6	Simultaneous Serial Data Transmission and Reception in Clock Synchronous Mode	1113
28.6.7	Reception Sampling Timing Adjustment Function in Clock Synchronous Mode with internal clock used	1115
28.7	Operation in Smart Card Interface Mode	1116
28.7.1	Example Connection	1116
28.7.2	Data Format (Except in Block Transfer Mode)	1117
28.7.3	Block Transfer Mode	1118
28.7.4	Receive Data Sampling Timing and Reception Margin	1118
28.7.5	SCI Initialization (Smart Card Interface Mode)	1119
28.7.6	Serial Data Transmission (Except in Block Transfer Mode)	1120

28.7.7	Serial Data Reception (Except in Block Transfer Mode)	1123
28.7.8	Clock Output Control	1125
28.8	Operation in Simple IIC Mode	1125
28.8.1	Generation of Start, Restart, and Stop Conditions	1127
28.8.2	Clock Synchronization	1128
28.8.3	SDAn Output Delay	1128
28.8.4	SCI Initialization in Simple IIC Mode	1129
28.8.5	Operation in Master Transmission in Simple IIC Mode	1130
28.8.6	Master Reception in Simple IIC Mode	1133
28.9	Operation in Simple SPI Mode	1135
28.9.1	States of Pins in Master and Slave Modes	1136
28.9.2	SS Function in Master Mode	1137
28.9.3	SS Function in Slave Mode	1137
28.9.4	Relationship between Clock and Transmit/Receive Data	1137
28.9.5	SCI Initialization in Simple SPI Mode	1138
28.9.6	Transmission and Reception of Serial Data in Simple SPI Mode	1138
28.9.7	Reception Sampling Timing Adjustment Function in Simple SPI Mode with internal clock used	1139
28.10	Bit Rate Modulation Function	1139
28.11	Simple LIN mode	1139
28.11.1	Simple LIN Start Frame Transmission	1140
28.11.2	Simple LIN Start Frame Reception	1142
28.11.3	Simple LIN Bus Conflict Detection Function	1147
28.11.4	Simple LIN Bit Rate Measurement Function	1148
28.12	Interrupt Sources	1149
28.12.1	Buffer Operation for SCIn_TXI and SCIn_RXI Interrupts	1149
28.12.2	Interrupts in Asynchronous, Manchester, Clock Synchronous, and Simple SPI Modes	1150
28.12.3	Interrupts in Smart Card Interface Mode	1151
28.12.4	Interrupts in Simple IIC Mode	1152
28.12.5	Interrupts in Simple LIN mode	1152
28.13	Event Linking	1153
28.14	Noise Cancellation Function	1155
28.15	RS-485 Driver Control Function	1156
28.16	Loopback Function	1156
28.17	Half-Duplex communication Function	1157
28.18	Synchronizer Bypass Function	1157
28.19	Usage Notes	1158
28.19.1	Settings for the Module-Stop Function	1158
28.19.2	SCI Operation during Low Power State	1158
28.19.3	Break Detection and Processing	1161

28.19.4	Mark State and Production of Breaks	1162
28.19.5	Receive Error Flags and Transmit Operations (Clock Synchronous Mode and Simple SPI Mode)	1162
28.19.6	Writing Data to TDR	1162
28.19.7	Restrictions on Clock Synchronous Transmission (Clock Synchronous Mode and Simple SPI Mode)	1162
28.19.8	Restrictions on Using DMAC or DTC	1163
28.19.9	Notes on Starting Transfer	1163
28.19.10	Limitations on Simple SPI Mode	1164
28.19.11	Notes on Transmit Enable bit (CCR0.TE)	1164
28.19.12	Notes on Simple LIN mode	1165
28.19.13	Notes on RS-485 Driver Control function	1165
28.19.14	Notes on Loopback function	1165
28.19.15	Notes regarding register access when operation clock (TCLK) is slower than bus clock (PCLK)	1165
28.19.16	Notes on interrupting operation	1165
28.19.17	Notes on CCR3.BPEN bit setting	1165
29.	I²C Bus Interface (IIC).....	1166
29.1	Overview.....	1166
29.2	Register Descriptions	1168
29.2.1	ICCR1 : I ² C Bus Control Register 1	1168
29.2.2	ICCR2 : I ² C Bus Control Register 2	1170
29.2.3	ICMR1 : I ² C Bus Mode Register 1	1173
29.2.4	ICMR2 : I ² C Bus Mode Register 2	1174
29.2.5	ICMR3 : I ² C Bus Mode Register 3	1175
29.2.6	ICFER : I ² C Bus Function Enable Register.....	1177
29.2.7	ICSER : I ² C Bus Status Enable Register	1179
29.2.8	ICIER : I ² C Bus Interrupt Enable Register	1180
29.2.9	ICSR1 : I ² C Bus Status Register 1	1181
29.2.10	ICSR2 : I ² C Bus Status Register 2.....	1183
29.2.11	ICWUR : I ² C Bus Wakeup Unit Register	1187
29.2.12	ICWUR2 : I ² C Bus Wakeup Unit Register 2.....	1188
29.2.13	SARLy : Slave Address Register Ly (y = 0 to 2).....	1189
29.2.14	SARUy : Slave Address Register Uy (y = 0 to 2)	1190
29.2.15	ICBRL : I ² C Bus Bit Rate Low-Level Register.....	1190
29.2.16	ICBRH : I ² C Bus Bit Rate High-Level Register	1191
29.2.17	ICDRT : I ² C Bus Transmit Data Register	1192
29.2.18	ICDRR : I ² C Bus Receive Data Register	1192
29.2.19	ICDRS : I ² C Bus Shift Register	1193

29.3	Operation.....	1193
29.3.1	Communication Data Format	1193
29.3.2	Initial Settings	1194
29.3.3	Master Transmit Operation.....	1195
29.3.4	Master Receive Operation	1199
29.3.5	Slave Transmit Operation.....	1204
29.3.6	Slave Receive Operation	1207
29.4	SCL Synchronization Circuit.....	1209
29.5	SDA Output Delay Function	1210
29.6	Digital Noise Filter Circuits	1210
29.7	Address Match Detection	1211
29.7.1	Slave-Address Match Detection	1211
29.7.2	Detection of General Call Address	1214
29.7.3	Device-ID Address Detection	1215
29.7.4	Host Address Detection	1216
29.8	Wakeup Function.....	1217
29.8.1	Normal Wakeup Mode 1.....	1218
29.8.2	Normal Wakeup Mode 2.....	1221
29.8.3	Command Recovery Mode and EEP Response Mode (Special Wakeup Modes).....	1223
29.9	Automatic Low-Hold Function for SCL	1226
29.9.1	Function to Prevent Wrong Transmission of Transmit Data.....	1226
29.9.2	NACK Reception Transfer Suspension Function	1227
29.9.3	Function to Prevent Failure to Receive Data	1228
29.10	Arbitration-Lost Detection Functions	1229
29.10.1	Master Arbitration-Lost Detection (MALE Bit)	1229
29.10.2	Function to Detect Loss of Arbitration during NACK Transmission (NALE Bit).....	1231
29.10.3	Slave Arbitration-Lost Detection (SALE Bit).....	1232
29.11	Start, Restart, and Stop Condition Issuing Function.....	1233
29.11.1	Issuing a Start Condition	1233
29.11.2	Issuing a Restart Condition	1233
29.11.3	Issuing a Stop Condition	1235
29.12	Bus Hanging	1236
29.12.1	Timeout Function.....	1236
29.12.2	Extra SCL Clock Cycle Output Function	1237
29.12.3	IIC Reset and Internal Reset.....	1238
29.13	SMBus Operation	1238
29.13.1	SMBus Timeout Measurement.....	1238
29.13.2	Packet Error Code (PEC).....	1240
29.13.3	SMBus Host Notification Protocol (Notify ARP Master Command).....	1240
29.14	Interrupt Sources	1240

29.14.1	Buffer Operation for IICn_TXI and IICn_RXI Interrupts.....	1241
29.15	State of Registers When Issuing Each Condition.....	1241
29.16	Event Link Output.....	1242
29.16.1	Interrupt Handling and Event Linking.....	1242
29.17	Usage Notes.....	1242
29.17.1	Settings for the Module-Stop Function.....	1242
29.17.2	Notes on Starting Transfer.....	1242
30.	CAN with Flexible Data-rate (CANFD).....	1244
30.1	Overview.....	1244
30.1.1	CANFD Module.....	1244
30.1.2	Clock restriction.....	1246
30.2	Register Descriptions.....	1246
30.2.1	Register Table.....	1246
30.2.2	CFDC0NCFG : Nominal Bitrate Configuration Register.....	1247
30.2.3	CFDC0CTR : Control Register.....	1248
30.2.4	CFDC0STS : Status Register.....	1253
30.2.5	CFDC0ERFL : Error Flag Register.....	1255
30.2.6	CFDC0DCFG : Data Bitrate Configuration Register.....	1260
30.2.7	CFDC0FDCFG : CANFD Configuration Register.....	1262
30.2.8	CFDC0FDCTR : CANFD Control Register.....	1264
30.2.9	CFDC0FDSTS : CANFD Status Register.....	1265
30.2.10	CFDC0FDCRC : CANFD CRC Register.....	1267
30.2.11	CFDGCFG : Global Configuration Register.....	1268
30.2.12	CFDGCTR : Global Control Register.....	1270
30.2.13	CFDGSTS : Global Status Register.....	1272
30.2.14	CFDGERFL : Global Error Flag Register.....	1273
30.2.15	CFDGTINTSTS : Global TX Interrupt Status Register.....	1274
30.2.16	CFDGTSC : Global Timestamp Counter Register.....	1276
30.2.17	CFDGAFLCTR : Global Acceptance Filter List Entry Control Register.....	1276
30.2.18	CFDGAFLCFG : Global Acceptance Filter List Configuration Register.....	1277
30.2.19	CFDGAFLIDr : Global Acceptance Filter List ID Registers (r = 1 to 16).....	1277
30.2.20	CFDGAFLMr : Global Acceptance Filter List Mask Registers (r = 1 to 16).....	1278
30.2.21	CFDGAFLP0r : Global Acceptance Filter List Pointer 0 Registers (r = 1 to 16).....	1280
30.2.22	CFDGAFLP1r : Global Acceptance Filter List Pointer 1 Registers (r = 1 to 16).....	1282
30.2.23	CFDRMNB : RX Message Buffer Number Register.....	1283
30.2.24	CFDRMND : RX Message Buffer New Data Register.....	1283
30.2.25	CFDRFCCa : RX FIFO Configuration/Control Registers a (a = 0 to 1).....	1284
30.2.26	CFDRFSTSa : RX FIFO Status Registers a (a = 0 to 1).....	1286
30.2.27	CFDRFPCTRa : RX FIFO Pointer Control Registers a (a = 0 to 1).....	1287
30.2.28	CFDCFCC : Common FIFO Configuration/Control Register.....	1288

30.2.29	CFDCFSTS : Common FIFO Status Register.....	1291
30.2.30	CFDCFPCTR : Common FIFO Pointer Control Register	1293
30.2.31	CFDFESTS : FIFO Empty Status Register	1294
30.2.32	CFDFFSTS : FIFO Full Status Register.....	1294
30.2.33	CFDFMSTS : FIFO Message Lost Status Register	1295
30.2.34	CFDRFISTS : RX FIFO Interrupt Flag Status Register.....	1296
30.2.35	CFDCDTCT : DMA Transfer Control Register	1296
30.2.36	CFDCDTSTS : DMA Transfer Status Register.....	1297
30.2.37	CFDTM _{Ci} : TX Message Buffer Control Registers i (i = 0 to 3).....	1298
30.2.38	CFDTM _{STSj} : TX Message Buffer Status Registers j (j = 0 to 3).....	1299
30.2.39	CFDTMTRSTS : TX Message Buffer Transmission Request Status Register.....	1301
30.2.40	CFDTMTARSTS : TX Message Buffer Transmission Abort Request Status Register	1301
30.2.41	CFDTMTCSTS : TX Message Buffer Transmission Completion Status Register	1302
30.2.42	CFDTMTASTS : TX Message Buffer Transmission Abort Status Register	1302
30.2.43	CFDTMIEC : TX Message Buffer Interrupt Enable Configuration Register.....	1303
30.2.44	CFDTXQCC : TX Queue Configuration/Control Register	1304
30.2.45	CFDTXQSTS : TX Queue Status Register	1305
30.2.46	CFDTXQPCTR : TX Queue Pointer Control Register	1306
30.2.47	CFDTHLCC : TX History List Configuration/Control Register	1307
30.2.48	CFDTHLSTS : TX History List Status Register	1308
30.2.49	CFDTHLACC0 : TX History List Access Register 0	1309
30.2.50	CFDTHLACC1 : TX History List Access Register 1	1310
30.2.51	CFDTHLPCTR : TX History List Pointer Control Register	1311
30.2.52	CFDGRSTC : Global SW reset Register.....	1311
30.2.53	CFDGTSTCFG : Global Test Configuration Register.....	1312
30.2.54	CFDGTSTCTR : Global Test Control Register.....	1313
30.2.55	CFDGFDCFG : Global FD Configuration Register.....	1313
30.2.56	CFDGLOCKK : Global Lock Key Register	1314
30.2.57	CFDRPGAC _{Ck} : RAM Test Page Access Registers k (k = 0 to 63).....	1315
30.2.58	CFDGAFLIGNENT : Global AFL Ignore Entry Register.....	1315
30.2.59	CFDGAFLIGNCTR : Global AFL Ignore Control Register	1316
30.2.60	CFDRMIEC : RX Message Buffer Interrupt Enable Configuration Register.....	1316
30.2.61	Message Buffer Component Structure	1317
30.3	Modes of Operation	1337
30.3.1	Overview	1337
30.3.2	Global Modes	1337
30.3.3	Channel Modes	1346
30.3.4	Global Mode and Channel Mode Transition Interactions	1351
30.4	Initialization.....	1353
30.4.1	Initialization of CAN Clock, Bit Timing and Baud Rate	1353

30.4.2	CAN Module Configuration after Hardware Reset	1360
30.5	Acceptance Filtering Function using Global Acceptance Filter List (AFL).....	1361
30.5.1	Overview	1361
30.5.2	Allocation of AFL Entries	1363
30.5.3	AFL Entry Description	1363
30.5.4	Entering Entries in the AFL	1365
30.5.5	Loopback Modes	1367
30.5.6	IDE Masking	1367
30.5.7	Updating AFL Entry during Communication	1368
30.6	FIFO Buffers and Normal Message Buffer Configuration	1370
30.6.1	Normal RX Message Buffers	1371
30.6.2	FIFO Buffers	1371
30.7	Interrupts and DMA	1376
30.7.1	Interrupts	1376
30.7.2	DMA Transfer	1379
30.8	Reception and Transmission	1382
30.8.1	Reception	1382
30.8.2	Transmission	1388
30.9	Test Mode	1402
30.9.1	Channel Specific Test Modes	1403
30.9.2	Global Test Modes	1405
30.10	RAM Area Configuration.....	1409
30.10.1	Examples	1411
30.10.2	OTB Area	1412
30.10.3	RAM Initialization Cycle	1412
30.11	Usage notes	1412
30.11.1	Module-stop function	1412
31.	CANFD ECC (CNECC)	1413

32.2.12	SPPSR : SPI Polling Register	1449
32.2.13	SPSRC : SPI Status Clear Register.....	1449
32.2.14	SPFCR : SPI FIFO Clear Register	1450
32.3	Operation.....	1450
32.3.1	Overview of SPI Operation.....	1451
32.3.2	Controlling the SPI Pins	1452
32.3.3	SPI System Configuration Examples	1453
32.3.4	Data Formats	1459
32.3.5	Transfer Formats.....	1472
32.3.6	Communication Operating Mode	1474
32.3.7	Transmit Buffer Empty and Receive Buffer Full Interrupts	1477
32.3.8	Idle Interrupt	1478
32.3.9	Communication End Interrupt	1480
32.3.10	Error Detection	1489
32.3.11	Initializing the SPI.....	1496
32.3.12	SPI Operation.....	1496
32.3.13	Clock Synchronous Operation	1516
32.3.14	Loopback Mode.....	1522
32.3.15	Self-Diagnosis of Parity Bit Function.....	1523
32.3.16	Interrupt Sources.....	1524
32.4	Event Link Controller Event Output	1525
32.4.1	Receive Buffer Full Event Output.....	1525
32.4.2	Transmit Buffer Empty Event Output.....	1525
32.4.3	Mode-Fault, Underrun, Overrun, Parity Error, or received data ready Event Output	1526
32.4.4	SPI Idle Event Output.....	1526
32.4.5	Communication End Event Output.....	1527
32.4.6	Synchronization bypass function.....	1529

32.5	Usage Notes	1529
32.5.1	Settings for the Module-Stop State	1529
32.5.2	Constraint on Low-Power Functions	1529
32.5.3	Constraints on Starting Transfer	1529
32.5.4	Constraints on Mode-Fault, Underrun, Overrun, Parity Error, or Receive Data Ready Event Output	1529
32.5.5	Constraints on the SPSR.SPRF and SPSR.SPTEF Flags	1530
33.	Octal Serial Peripheral Interface (OSPI)	1531
33.1	Overview	1531
33.2	Register Descriptions	1532
33.2.1	OSPI Configuration Registers	1532
33.2.2	OSPI Control Registers	1539
33.2.3	OSPI Status Registers	1553
33.2.4	OSPI Interrupt Registers	1554
33.3	Operation	1558
33.3.1	xSPI Bus	1558
33.3.2	Manual-command	1570
33.3.3	Memory-mapping	1571
33.3.4	Pattern Control	1578
33.3.5	Integrity Checking	1579
33.3.6	Interrupts	1579
33.3.7	Flows of Operations	1580
33.3.8	Usage Notes	1588
34.	Decryption On The Fly (DOTF)	1590
34.1	Overview	1590
34.2	Block Diagram	1590
34.3	Register Descriptions	1591
34.3.1	CONVAREAST : DOTF Conversion Area Start Address Register	1591
34.3.2	CONVAREAD : DOTF Conversion Area End Address Register	1591
34.4	Operation	1592
34.5	System flow	1592
34.6	Usage notes	1592
34.6.1	Module-stop function	1592
35.	Serial Sound Interface Enhanced (SSIE)	1593
35.1	Overview	1593
35.2	Register Descriptions	1598
35.2.1	SSICR : Control Register	1598
35.2.2	SSISR : Status Register	1608
35.2.3	SSIFCR : FIFO Control Register	1619

35.2.4	SSIFSR : FIFO Status Register	1625
35.2.5	SSIFTDR : Transmit FIFO Data Register	1628
35.2.6	SSIFRDR : Receive FIFO Data Register	1631
35.2.7	SSIOFR : Audio Format Register	1633
35.2.8	SSISCR : Status Control Register	1636
35.3	Communication Formats	1637
35.3.1	I ² S Format	1638
35.3.2	Monaural Format	1638
35.3.3	TDM Format	1640
35.4	Communication Modes	1641
35.4.1	Slave-mode Communication	1641
35.4.2	Master-mode Communication	1642
35.4.3	Transmission	1642
35.4.4	Reception	1642
35.4.5	Transmission and Reception	1642
35.5	Operation	1642
35.5.1	Idle State	1642
35.5.2	Communication States	1644
35.6	Communication Operation	1648
35.6.1	Start Communication	1648
35.6.2	Transmission	1649
35.6.3	Reception	1650
35.6.4	Transmission and Reception	1651
35.6.5	Halt Communication	1651
35.6.6	Error Handling	1652
35.6.7	Resume Communication	1653
35.7	Interrupts	1654
35.7.1	SSIE _n _SSIF Interrupt (n = 0, 1)	1655
35.7.2	SSIE0_SSITXI Interrupt [Full-duplex communication]	1656
35.7.3	SSIE0_SSIRXI Interrupt [Full-duplex communication]	1656
35.7.4	SSIE1_SSIRT Interrupt [Half-duplex communication]	1656
35.8	Software Resets	1657
35.8.1	Software Reset Procedure	1657
35.9	Usage Notes	1658
35.9.1	Notes for Slave-mode Communication	1658
35.9.2	Notes for Master-mode Communication	1659
35.9.3	Notes for Communication Flow	1659
35.9.4	Write Access Restriction	1660
35.9.5	Module-stop function	1661

36. Cyclic Redundancy Check (CRC) 1662

36.1	Overview.....	1662
36.2	Register Descriptions	1663
36.2.1	CRCCR0 : CRC Control Register 0	1663
36.2.2	CRCCR1 : CRC Control Register 1	1663
36.2.3	CRCDIR/CRCDIR_BY : CRC Data Input Register.....	1664
36.2.4	CRCDOR/CRCDOR_HA/CRCDOR_BY : CRC Data Output Register	1664
36.2.5	CRCSAR : Snoop Address Register	1665
36.3	Operation.....	1666
36.3.1	Basic Operation.....	1666
36.3.2	CRC Snoop Function	1669
36.4	Usage Notes.....	1670
36.4.1	Settings for the Module-Stop State	1670
36.4.2	Note on Transmission	1670
37.	Boundary Scan	1672
37.1	Overview.....	1672
37.2	Register Descriptions	1672
37.2.1	JTIR : Instruction Register.....	1673
37.2.2	JTIDR : ID Code Register	1673
37.2.3	JTBPR : Bypass Register.....	1674
37.2.4	JTBSR : Boundary Scan Register.....	1674
37.3	Operation.....	1674
37.3.1	TAP Controller	1674
37.3.2	Commands.....	1675
37.4	Usage Notes.....	1676
38.	Security Features	1678
38.1	Features	1678
38.2	Tamper Detection	1679
38.3	Arm Security Features.....	1679
38.3.1	Arm TrustZone Technology	1679
38.3.2	Privileged Control.....	1680
38.3.3	Security Attribution	1680
38.3.4	TrustZone Access Error	1686
38.4	Device Lifecycle Management.....	1687
38.4.1	Changing the Lifecycle State	1687
38.4.2	Protection and Authentication Level.....	1688
38.4.3	Serial Programming	1689
38.4.4	Device Lifecycle State and PL Change Example.....	1689
38.4.5	Failure Analysis.....	1690
38.5	Secure Key Injection.....	1690

38.6	Secure Factory Programming.....	1692
38.7	Field Updating in Dual Mode	1693
38.8	Register Description	1695
38.8.1	PSARB : Peripheral Security Attribution Register B.....	1695
38.8.2	PSARC : Peripheral Security Attribution Register C	1696
38.8.3	PSARD : Peripheral Security Attribution Register D	1697
38.8.4	PSARE : Peripheral Security Attribution Register E.....	1699
38.8.5	MSSAR : Module Stop Security Attribution Register.....	1700
38.8.6	PPARB : Peripheral Privilege Attribution Register B	1701
38.8.7	PPARC : Peripheral Privilege Attribution Register C.....	1702
38.8.8	PPARD : Peripheral Privilege Attribution Register D.....	1704
38.8.9	PPARE : Peripheral Privilege Attribution Register E	1705
38.8.10	MSPAR : Module Stop Privilege Attribution Register	1707
38.8.11	CFSAMONA : Code Flash Security Attribution Monitor Register A	1707
38.8.12	DFSAMON : Data Flash Security Attribution Monitor Register	1707
38.8.13	DLMMON : Device Lifecycle Management State Monitor Register	1708
38.8.14	MSAOAD : Master Security Attribution Operation After Detection Register	1708
38.8.15	MSAPT : Master Security Attribution Protect Register	1709
38.9	Usage Note.....	1709
38.9.1	Security or Privilege Bit Write Timing	1709
39.	Renesas Secure IP (RSIP-E51A)	1710
39.1	Overview.....	1710
39.2	Operation.....	1712
39.2.1	Symmetric cryptography	1712
39.2.2	Asymmetric Cryptography.....	1713
39.2.3	Hash generator	1714
39.2.4	Encryption and Decryption	1714
39.3	Usage Notes.....	1715
39.3.1	Software Standby Mode	1715
39.3.2	Module-Stop Function Setting.....	1715
39.3.3	SPA/DPA Protections	1715
39.3.4	Restrictions on Open process	1715
40.	12-Bit A/D Converter (ADC12)	1716
40.1	Overview.....	1716
40.2	Register Descriptions	1721
40.2.1	ADDRn : A/D Data Registers n	1721
40.2.2	ADDBLDR : A/D Data Duplexing Register	1722
40.2.3	ADDBLDRn : A/D Data Duplexing Register n (n = A, B)	1723
40.2.4	ADTSDR : A/D Temperature Sensor Data Register	1725

40.2.5	ADOCDR : A/D Internal Reference Voltage Data Register	1726
40.2.6	ADVMDR : A/D VBATT Monitor Data Register	1727
40.2.7	ADRD : A/D Self-Diagnosis Data Register	1728
40.2.8	ADCSR : A/D Control Register	1729
40.2.9	ADANSA0 : A/D Channel Select Register A0	1733
40.2.10	ADANSB0 : A/D Channel Select Register B0	1733
40.2.11	ADADS0 : A/D-Converted Value Addition/Average Channel Select Register 0	1734
40.2.12	ADADC : A/D-Converted Value Addition/Average Count Select Register	1735
40.2.13	ADCER : A/D Control Extended Register	1736
40.2.14	ADSTRGR : A/D Conversion Start Trigger Select Register	1738
40.2.15	ADEXICR : A/D Conversion Extended Input Control Registers	1740
40.2.16	ADSSTRn/ADSSTRT/ADSSTRO/ADSSTRV: A/D Sampling State Register (n = 0 to 8) .	1742
40.2.17	ADSHCR : A/D Sample and Hold Circuit Control Register	1742
40.2.18	ADSHMSR : A/D Sample and Hold Operation Mode Selection Register	1743
40.2.19	ADDISCR : A/D Disconnection Detection Control Register	1744
40.2.20	ADGSPCR : A/D Group Scan Priority Control Register	1744
40.2.21	ADCMPCR : A/D Compare Function Control Register	1746
40.2.22	ADCMPANSR0 : A/D Compare Function Window A Channel Select Register 0	1747
40.2.23	ADCMPANSER : A/D Compare Function Window A Extended Input Select Register	1748
40.2.24	ADCMPLR0 : A/D Compare Function Window A Comparison Condition Setting Register 0	1748
40.2.25	ADCMPLER : A/D Compare Function Window A Extended Input Comparison Condition Setting Register	1750
40.2.26	ADCMPDRn : A/D Compare Function Window A Lower-Side/Upper-Side Level Setting Register (n = 0, 1)	1751
40.2.27	ADWINnLB : A/D Compare Function Window B Lower-Side/Upper-Side Level Setting Register (n = L, U)	1753
40.2.28	ADCMPSR0 : A/D Compare Function Window A Channel Status Register 0	1754
40.2.29	ADCMPSER : A/D Compare Function Window A Extended Input Channel Status Register	1755
40.2.30	ADCMPBNSR : A/D Compare Function Window B Channel Select Register	1756
40.2.31	ADCMPBSR : A/D Compare Function Window B Status Register	1757
40.2.32	ADWINMON : A/D Compare Function Window A/B Status Monitor Register	1758
40.2.33	ADBUFEN : A/D Data Buffer Enable Register	1759
40.2.34	ADBUFPTR : A/D Data Buffer Pointer Register	1760
40.2.35	ADBUFn : A/D Data Buffer Registers n (n = 0 to 15)	1760
40.3	Operation	1761
40.3.1	Scanning Operation	1761
40.3.2	Single Scan Mode	1762
40.3.3	Continuous Scan Mode	1771
40.3.4	Group Scan Mode	1778

40.3.5	Compare Function for Windows A and B	1787
40.3.6	Analog Input Sampling and Scan Conversion Time	1791
40.3.7	Usage Example of A/D Data Register Automatic Clearing Function	1795
40.3.8	A/D-Converted Value Addition/Average Mode	1795
40.3.9	Disconnection Detection Assist Function	1795
40.3.10	Starting A/D Conversion with an Asynchronous Trigger	1797
40.3.11	Starting A/D Conversion with a Synchronous Trigger from a Peripheral Module	1798
40.3.12	Security Attribution between ADCn (n = 0, 1) and PORT (PmSAR (m = 0 to 9, A, B))	1798
40.3.13	Using Data Buffers	1798
40.4	Interrupt Sources and DTC, DMAC Transfer Requests	1799
40.4.1	Interrupt Requests	1799
40.5	Event Link Function	1801
40.5.1	Event Output to the ELC	1801
40.5.2	ADC12 Operation through an Event from the ELC	1801
40.6	Usage Notes	1802
40.6.1	Constraints on Setting the Registers	1802
40.6.2	Constraints on Reading the Data Registers	1802
40.6.3	Constraints on Stopping A/D Conversion	1802
40.6.4	A/D Conversion Restart and Termination Timing	1804
40.6.5	Constraints on Scan End Interrupt Handling	1804
40.6.6	Settings for the Module-Stop Function	1804
40.6.7	Notes on Entering the Low-Power States	1804
40.6.8	Notes on Canceling Software Standby Mode	1804
40.6.9	Error in Absolute Accuracy When Disconnection Detection Assistance Is in Use	1804
40.6.10	Constraints on Operating Modes and Status Bits	1805
40.6.11	Notes on Board Design	1805
40.6.12	Constraints on Noise Prevention	1805
40.6.13	Port Settings When Using the ADC12 Input	1806
40.6.14	Relationship between ADC12 Units 0 and 1 and the ACMPHS	1806
40.6.15	Calculation for Sampling Time	1806
40.6.16	Notes on simultaneous operation with other modules	1807
41.	12-Bit D/A Converter (DAC12)	1808
41.1	Overview	1808
41.2	Register Descriptions	1809
41.2.1	DADRn : D/A Data Register n (n = 0)	1809
41.2.2	DACR : D/A Control Register	1809
41.2.3	DADPR : DADRn Format Select Register	1810
41.2.4	DAADSCR : D/A A/D Synchronous Start Control Register	1810
41.2.5	DAAMPCR : D/A Output Amplifier Control Register	1811
41.2.6	DAASWCR : D/A Amplifier Stabilization Wait Control Register	1811

41.2.7	DAADUSR : D/A A/D Synchronous Unit Select Register	1812
41.3	Operation	1812
41.3.1	Reducing Interference between D/A and A/D Conversion	1813
41.4	Event Link Operation Setting Procedure	1815
41.4.1	DA0 Event Link Operation Setting Procedure	1815
41.5	Analog Output Control by Security Attribution	1815
41.6	Usage Notes on Event Link Operation	1816
41.7	Usage Notes	1816
41.7.1	Settings for the Module-Stop Function	1816
41.7.2	DAC12 Operation in the Module-Stop State	1816
41.7.3	DAC12 Operation in Software Standby Mode	1816
41.7.4	Constraint on Entering Deep Software Standby Mode	1816
41.7.5	Initialization Procedure with the Output Amplifier	1816
41.7.6	Initialization Procedure of the Output to internal modules	1817
41.7.7	Constraint on Usage When Interference Reduction between D/A and A/D Conversion Is Enabled	1817
42.	Temperature Sensor (TSN)	1818
42.1	Overview	1818
42.2	Register Descriptions	1819
42.2.1	TSCR : Temperature Sensor Control Register	1819
42.2.2	TSCDR : Temperature Sensor Calibration Data Register	1819
42.3	Using the Temperature Sensor	1820
42.3.1	Preparation for Using the Temperature Sensor	1820
42.3.2	Procedures for Using the Temperature Sensor	1821
42.4	Usage Notes	1823
42.4.1	Settings for the Module-Stop Function	1823
42.4.2	Settings for the Software Standby Mode	1823
43.	High-Speed Analog Comparator (ACMPHS)	1824
43.1	Overview	1824
43.2	Register Descriptions	1825
43.2.1	CMPCTL : Comparator Control Register	1825
43.2.2	CMPSEL0 : Comparator Input Select Register	1826
43.2.3	CMPSEL1 : Comparator Reference Voltage Select Register	1827
43.2.4	CMPMON : Comparator Output Monitor Register	1827
43.2.5	CPIOC : Comparator Output Control Register	1828
43.2.6	CPINTCTL : Comparator Interrupt Control Register	1828
43.2.7	CPMSKCTL : Comparator Interrupt Mask Control Register	1829
43.3	Operation	1829
43.4	Noise Filter	1831
43.5	ACMPHS Interrupts	1832

43.6	ACMPHS Output to the Event Link Controller (ELC).....	1832
43.7	ACMPHS Pin Output	1832
43.8	Usage Notes.....	1833
43.8.1	Settings for the Module-Stop Function.....	1833
43.8.2	Settings for the DAC12	1833
43.8.3	Relationship with the ADC12	1833
43.8.4	ACMPHS Operation in Module-Stop State	1833
43.8.5	ACMPHS Operation in Software Standby Mode.....	1833
43.8.6	Setting the D/A Converter for Generating Reference Voltage.....	1833
44.	Data Operation Circuit (DOC).....	1834
44.1	Overview.....	1834
44.2	DOC Register Descriptions	1835
44.2.1	DOCR : DOC Control Register.....	1835
44.2.2	DOSR : DOC Flag Status Register	1836
44.2.3	DOSCR : DOC Flag Status Clear Register	1837
44.2.4	DODIR : DOC Data Input Register.....	1837
44.2.5	DODSR0 : DOC Data Setting Register 0	1837
44.2.6	DODSR1 : DOC Data Setting Register 1	1838
44.3	Operation.....	1838
44.3.1	Data Comparison Mode	1838
44.3.2	Data Addition Mode.....	1840
44.3.3	Data Subtraction Mode	1841
44.4	Interrupt Source.....	1841
44.5	Event Link Output.....	1842
44.6	Interrupt Handling and Event Linking	1842
44.7	Usage Notes.....	1842
44.7.1	Settings for the Module-Stop State	1842
45.	SRAM.....	1843
45.1	Overview.....	1843
45.2	Register Descriptions	1843
45.2.1	SRAMSABARn : SRAM Error Address Register (n = 0 to 2).....	1843
45.2.2	SRAMSAR : SRAM Security Attribution Register	1844
45.2.3	SRAMPRCR_S : SRAM Protection Control Register for Secure	1845
45.2.4	SRAMPRCR_NS : SRAM Protection Control Register for Non-secure	1845
45.2.5	SRAMWTSC : SRAM Wait State Control Register	1846
45.2.6	SRAMCR1 : SRAM Control Register 1	1847
45.2.7	SRAMESR : SRAM Error Status Register	1848
45.2.8	SRAMESCLR : SRAM Error Status Clear Register	1848
45.2.9	SRAMEAR2 : SRAM Error Address Register	1849

45.3	Operation.....	1849
45.3.1	Module Stop Function	1849
45.3.2	Parity Calculation Function	1850
45.3.3	TrustZone Filter function	1851
45.3.4	Interrupt Source	1852
45.3.5	Wait state	1852
45.4	Usage Note.....	1852
45.4.1	Instruction fetch from SRAM area	1852
45.4.2	Note of write to SRAMCR1 register	1852
45.4.3	Notes on Using Error Checking of SRAM	1853
46.	Standby SRAM.....	1854
46.1	Overview.....	1854
46.2	Register Descriptions	1854
46.2.1	STBRAMSABAR : Standby SRAM Security Attribute Boundary Address Register	1854
46.2.2	STBRAMPABAR_NS : Standby SRAM Privilege Attribute Boundary Address Register for Non-secure.....	1855
46.2.3	STBRAMPABAR_S : Standby SRAM Privilege Attribute Boundary Address Register for Secure	1855
46.2.4	STBRAMCR : Standby SRAM Control Register	1856
46.2.5	STBRAMEAR : Standby SRAM Error Address Register.....	1856
46.3	Operation.....	1856
46.3.1	Data Retention	1856
46.3.2	Module-stop Function.....	1857
46.3.3	Parity Calculation Function	1857
46.3.4	TrustZone Filter function	1859
46.3.5	Interrupt Source	1860
46.3.6	Wait state	1860
46.4	Usage Notes.....	1861
46.4.1	Instruction Fetch from the Standby SRAM Area	1861
46.4.2	Notes on Self-Diagnosis of the Standby SRAM	1861
47.	Flash Memory	1862
47.1	Overview.....	1862
47.2	Structure of Memory	1864
47.3	Address Space	1867
47.4	Register Descriptions	1867
47.4.1	FCACHEE : Flash Cache Enable Register	1867
47.4.2	FCACHEIV : Flash Cache Invalidate Register	1868
47.4.3	FLWT : Flash Wait Cycle Register	1868
47.4.4	FSAR : Flash Security Attribution Register	1869
47.4.5	UIDRn : Unique ID Registers n (n = 0 to 3).....	1870

47.4.6	PNRn : Part Numbering Register n (n = 0 to 3).....	1870
47.4.7	MCUVER : MCU Version Register	1870
47.4.8	FWEPROR : Flash P/E Protect Register	1871
47.4.9	FASTAT : Flash Access Status Register	1871
47.4.10	FAEINT : Flash Access Error Interrupt Enable Register	1873
47.4.11	FRDYIE : Flash Ready Interrupt Enable Register	1873
47.4.12	FSADDR : FACI Command Start Address Register.....	1874
47.4.13	FEADDR : FACI Command End Address Register	1875
47.4.14	FMEPROT : Flash P/E Mode Entry Protection Register	1875
47.4.15	FCNTSELR : Flash Counter Select Register	1876

High-performance 480 MHz Arm[®] Cortex[®]-M85 core with Helium[™], 1 MB code flash memory with Dual-bank, background and SWAP operation, 12 KB Data flash memory, and 672 KB SRAM with or without Parity. USB 2.0 Full-Speed, CANFD, Octal SPI, Graphics LCD Controller, 2D Drawing Engine, and advanced analog.

Features

- Arm[®] Cortex[®]-M85 core with Helium[™]
 - Armv8.1-M architecture profile
 - Armv8-M Security Extension
 - Maximum operating frequency: 480 MHz
 - Memory Protection Unit (Arm MPU)
 - Protected Memory System Architecture (PMSAv8)
 - Secure MPU (MPU_S): 8 regions
 - Non-secure MPU (MPU_NS): 8 regions
 - SysTick timer
 - Embeds two SysTick timers: Secure and Non-secure instance
 - Driven by CPUCLK or MOCO divided by 8
 - CoreSight[™] ETM-M85
- Memory
 - 1 MB code flash memory
 - 12 KB data flash memory (100,000 program/erase (P/E) cycles)
 - 672 KB SRAM including 32 KB of TCM
- Connectivity
 - Serial Communications Interface (SCI) × 6, up to 60 Mbps
 - Asynchronous interfaces
 - 8 bit clock synchronous interface
 - Smart card interface
 - Simple IIC
 - Simple SPI
 - Manchester coding (SCI0)
 - Simple LIN (SCI0, SCI1)
 - I²C bus interface (IIC) × 2
 - Serial Peripheral Interface (SPI) × 2, up to 60 Mbps
 - Octal Serial Peripheral Interface (OSPI)
 - USB 2.0 Full-Speed Module (USBFS)
 - CAN with Flexible Data-rate (CANFD) × 2
 - Serial Sound Interface Enhanced (SSIE) × 2
- Analog
 - 12-bit A/D Converter (ADC12) × 2
 - 12-bit D/A Converter (DAC12) × 1
 - High-Speed Analog Comparator (ACMPHS) × 2
 - Temperature Sensor (TSN)
- Timers
 - General PWM Timer 32-bit (GPT32) × 6
 - General PWM Timer 16-bit (GPT16) × 4
 - Low Power Asynchronous General Purpose Timer (AGT) × 2
 - Ultra-Low-Power Timer (ULPT) × 2
- Security and Encryption
 - Renesas Secure IP (RSIP-E51A)
 - 128 bit unique ID
 - Arm[®] TrustZone[®]
 - Up to two or four regions for the code flash, depending on the bank mode
 - Up to two regions for the data flash
 - Up to two regions for the SRAM
 - Individual Secure or Non-secure security attribution for each peripheral
 - Privileged control
 - Device lifecycle management
 - Pin function
 - Up to three tamper-resistant pins
 - Secure pin multiplexing
- System and Power Management
 - Low power modes
 - Battery backup function (VBATT)
 - Realtime Clock (RTC) with calendar and VBATT support
 - Event Link Controller (ELC)
 - Data Transfer Controller (DTC)
 - DMA Controller (DMAC) × 8
 - Power-on reset
 - Programable Voltage Detection (PVD) with voltage settings
 - Watchdog Timer (WDT)
 - Independent Watchdog Timer (IWDT)
- Human Machine Interface (HMI)
 - Graphics LCD Controller (GLCDC)
 - 2D Drawing Engine (DRW)
- Multiple Clock Sources
 - Main clock oscillator (MOSC) (8 to 48 MHz)
 - Sub-clock oscillator (SOSC) (32.768 kHz)
 - High-speed on-chip oscillator (HOCO) (16/18/20/32/48 MHz)
 - Middle-speed on-chip oscillator (MOCO) (8 MHz)
 - Low-speed on-chip oscillator (LOCO) (32.768 kHz)
 - Clock trim function for HOCO/MOCO/LOCO
 - PLL1/PLL2
 - Clock out support
- General-Purpose I/O Ports
 - 5-V tolerance, open drain, input pull-up, switchable driving ability
- Operating Voltage
 - VCC: 1.68 to 3.6 V
 - VCC2: 1.65 to 3.6 V
- Operating Junction Temperature and Packages
 - T_j = -40°C to +105°C
 - 224-pin BGA (13 mm × 13 mm, 0.8 mm pitch)

1. Overview

The MCU integrates multiple series of software-compatible Arm[®]-based 32-bit cores that share a common set of Renesas peripherals to facilitate design scalability and efficient platform-based product development.

The MCU in this series incorporates a high-performance Arm[®] Cortex[®]-M85 core with Helium[™] running up to 480 MHz with the following features:

- 1 MB code flash memory
- 672 KB SRAM (32 KB of TCM RAM, 640 KB of user SRAM)
- Octal Serial Peripheral Interface (OSPI)
- USBFS
- Graphics LCD Controller (GLCDC)
- 2D Drawing Engine (DRW)
- Analog peripherals
- Security and safety features

1.1 Function Outline

Table 1.1 Arm core

Feature	Functional description
Arm [®] Cortex [®] -M85 core	<ul style="list-style-type: none"> • Maximum operating frequency: up to 480 MHz • Arm[®] Cortex[®]-M85 core <ul style="list-style-type: none"> – Revision: (r0p2-00rel0) – ARMv8.1-M architecture profile – Armv8-M Security Extension – Floating Point Unit (FPU) compliant with the ANSI/IEEE Std 754-2008 Scalar half, single, and double-precision floating-point operation – M-profile Vector Extension (MVE) Integer, half-precision, and single-precision floating-point MVE (MVE-F) – Helium[™] technology is M-profile Vector Extension (MVE) • Arm[®] Memory Protection Unit (Arm MPU) <ul style="list-style-type: none"> – Protected Memory System Architecture (PMSAv8) – Secure MPU (MPU_S): 8 regions – Non-secure MPU (MPU_NS): 8 regions • SysTick timer <ul style="list-style-type: none"> – Embeds two SysTick timers: Secure instance (SysTick_S) and Non-secure instance (SysTick_NS) – Driven by CPUCLK or MOCO divided by 8 • CoreSight[™] ETM-M85

Table 1.2 Memory

Feature	Functional description
Code flash memory	1 MB of code flash memory. See section 47, Flash Memory .
Data flash memory	12 KB of data flash memory. See section 47, Flash Memory .
Option-setting memory	The option-setting memory determines the state of the MCU after a reset. See section 6, Option-Setting Memory .
SRAM	On-chip high-speed SRAM with or without parity bit. SRAM0 is Non-parity. SRAM1 is Parity check. See section 45, SRAM .
Standby SRAM	On-chip SRAM that can retain data in Deep Software Standby mode 1. See section 46, Standby SRAM .

Table 1.3 System

Feature	Functional description
Operating modes	Three operating modes: <ul style="list-style-type: none"> • Single-chip mode • JTAG boot mode • SCI/USB boot mode See section 3, Operating Modes .
Resets	This MCU provides 13 types of reset. See section 5, Resets .
Programmable Voltage Detection (PVD)	The Programmable Voltage Detection (PVD) module monitors the voltage level input to the VCC pin. The detection level can be selected by register settings. The PVD module consists of three separate voltage level detectors (PVD0, PVD1, PVD2). PVD0, PVD1, and PVD2 measure the voltage level input to the VCC pin. PVD registers allow your application to configure detection of VCC changes at various voltage thresholds. See section 7, Programmable Voltage Detection (PVD) .
Clocks	<ul style="list-style-type: none"> • Main clock oscillator (MOSC) • Sub-clock oscillator (SOSC) • High-speed on-chip oscillator (HOCO) • Middle-speed on-chip oscillator (MOCO) • Low-speed on-chip oscillator (LOCO) • PLL1/PLL2 • Clock out support See section 8, Clock Generation Circuit .
Clock Frequency Accuracy Measurement Circuit (CAC)	The Clock Frequency Accuracy Measurement Circuit (CAC) counts pulses of the clock to be measured (measurement target clock) within the time generated by the clock selected as the measurement reference (measurement reference clock), and determines the accuracy depending on whether the number of pulses is within the allowable range. When measurement is complete or the number of pulses within the time generated by the measurement reference clock is not within the allowable range, an interrupt request is generated. See section 9, Clock Frequency Accuracy Measurement Circuit (CAC) .
Interrupt Controller Unit (ICU)	The Interrupt Controller Unit (ICU) controls which event signals are linked to the Nested Vector Interrupt Controller (NVIC), the DMA Controller (DMAC), and the Data Transfer Controller (DTC) modules. The ICU also controls non-maskable interrupts. See section 13, Interrupt Controller Unit (ICU) .
Low power modes	Power consumption can be reduced in multiple ways, including setting clock dividers, controlling EBCLK output, controlling SDCLK output, stopping modules, power gating control, selecting operating power control modes in normal operation, and transitioning to low power modes and processor low power modes. See section 10, Low Power Modes .
Battery backup function	A battery backup function is provided for partial powering by a battery. The battery-powered area includes the RTC, SOSC, backup register, tamper detection and VBATT_R voltage drop detection and switch between VCC and VBATT. See section 11, Battery Backup Function .
Register write protection	The register write protection function protects important registers from being overwritten due to software errors. The registers to be protected are set with the Protect Register (PRCR_S and PRCR_NS). See section 12, Register Write Protection .
Memory Protection Unit (MPU)	All bus masters have Memory Protection Units (MPUs). See section 15, Memory Protection Unit (MPU) .

Table 1.4 Event link

Feature	Functional description
Event Link Controller (ELC)	The Event Link Controller (ELC) uses the event requests generated by various peripheral modules as source signals to connect them to different modules, allowing direct link between the modules without CPU intervention. See section 18, Event Link Controller (ELC) .

Table 1.5 Direct memory access

Feature	Functional description
Data Transfer Controller (DTC)	A Data Transfer Controller (DTC) module is provided for transferring data when activated by an interrupt request. See section 17, Data Transfer Controller (DTC) .
DMA Controller (DMAC)	The 8-channel direct memory access controller (DMAC) that can transfer data without intervention from the CPU. When a DMA transfer request is generated, the DMAC transfers data stored at the transfer source address to the transfer destination address. See section 16, DMA Controller (DMAC) .

Table 1.6 External bus interface

Feature	Functional description
External buses	<ul style="list-style-type: none"> CS area (ECBI): Connected to the external devices (external memory interface) SDRAM area (ECBI): Connected to the SDRAM (external memory interface) OSPI area (EOBI): Connected to the OSPI (external device interface)

Table 1.7 Timers

Feature	Functional description
General PWM Timer (GPT)	The General PWM Timer (GPT) is a 32-bit timer with GPT32 × 6 channels and a 16-bit timer with GPT16 × 4 channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or the up- and down-counter. The GPT can also be used as a general-purpose timer. See section 21, General PWM Timer (GPT) .
Port Output Enable for GPT (POEG)	The Port Output Enable (POEG) function can place the General PWM Timer (GPT) output pins in the output disable state See section 20, Port Output Enable for GPT (POEG) .
Low Power Asynchronous General Purpose Timer (AGT)	The Low Power Asynchronous General Purpose Timer (AGT) is a 16-bit timer that can be used for pulse output, external pulse width or period measurement, and counting external events. This timer consists of a reload register and a down counter. The reload register and the down counter are allocated to the same address, and can be accessed with the AGT register. See section 22, Low Power Asynchronous General Purpose Timer (AGT) .
Ultra-Low-Power Timer (ULPT)	The Ultra-Low-Power Timer (ULPT) is a 32-bit timer which can be used for outputting pulses or counting external events. This 32-bit timer consists of reload registers and a down-counter. The reload registers and the down-counter are allocated to the same address and can be accessed through the ULPTCNT register. See section 23, Ultra-Low-Power Timer (ULPT) .
Realtime Clock (RTC)	The realtime clock (RTC) has two counting modes, calendar count mode and binary count mode, that are used by switching register settings. For calendar count mode, the RTC has a 100-year calendar from 2000 to 2099 and automatically adjusts dates for leap years. For binary count mode, the RTC counts seconds and retains the information as a serial value. Binary count mode can be used for calendars other than the Gregorian (Western) calendar. See section 24, Realtime Clock (RTC) .
Watchdog Timer (WDT)	The Watchdog Timer (WDT) is a 14-bit down counter that can be used to reset the MCU when the counter underflows because the system has run out of control and is unable to refresh the WDT. In addition, the WDT can be used to generate a non-maskable interrupt or an underflow interrupt. See section 25, Watchdog Timer (WDT) .
Independent Watchdog Timer (IWDT)	The Independent Watchdog Timer (IWDT) has a 14-bit down-counter, which resets the MCU by a reset output when the down-counter underflows. Alternatively, generation of an interrupt request when the counter underflows can be selected. This enables detection of a program runaway taking the refresh interval into account. The IWDT has two start modes: auto start mode, in which counting automatically starts after release from the reset state, and register start mode, in which counting is started by refreshing (writing to a specific register). See section 26, Independent Watchdog Timer (IWDT) .

Table 1.8 Communication interfaces

Feature	Functional description
Serial Communications Interface (SCI)	<p>The Serial Communications Interface (SCI) × 6 channels have asynchronous and synchronous serial interfaces:</p> <ul style="list-style-type: none"> • Asynchronous interfaces (UART and Asynchronous Communications Interface Adapter (ACIA)) • 8-bit clock synchronous interface • Simple IIC (master-only) • Simple SPI • Smart card interface • Manchester interface • Simple LIN interface <p>The smart card interface complies with the ISO/IEC 7816-3 standard for electronic signals and transmission protocol. All channels have FIFO buffers to enable continuous and full-duplex communication, and the data transfer speed can be configured independently using an on-chip baud rate generator.</p> <p>The maximum rate supported on this MCU. Refer to the electrical characteristics for the actual rate.</p> <p>See section 28, Serial Communications Interface (SCI).</p>
I ² C Bus interface (IIC)	<p>The I²C Bus interface (IIC) has 2 channels. The IIC module conforms with and provides a subset of the NXP I²C (Inter-Integrated Circuit) bus interface functions.</p> <p>See section 29, I²C Bus Interface (IIC).</p>
Serial Peripheral Interface (SPI)	<p>The Serial Peripheral Interface (SPI) provides high-speed full-duplex synchronous serial communications with multiple processors and peripheral devices.</p> <p>The maximum rate supported on this MCU. Refer to the electrical characteristics for the actual rate.</p> <p>See section 32, Serial Peripheral Interface (SPI).</p>
Control Area Network with Flexible Data-Rate Module (CANFD)	<p>The CAN with Flexible Data-Rate (CANFD) module can handle classical CAN frames and CANFD frames complied with ISO 11898-1 standard.</p> <p>The module supports 4 transmit buffers per channel and 16 receive buffers per channel.</p> <p>See section 30, CAN with Flexible Data-rate (CANFD).</p>
USB 2.0 Full-Speed module (USBFS)	<p>The USB 2.0 Full-Speed module (USBFS) can operate as a host controller or device controller. The module supports full-speed and low-speed (host controller only) transfer as defined in Universal Serial Bus Specification 2.0. The module has an internal USB transceiver and supports all of the transfer types defined in Universal Serial Bus Specification 2.0. The USB has buffer memory for data transfer, providing a maximum of 10 pipes. Pipes 1 to 9 can be assigned any endpoint number based on the peripheral devices used for communication or based on your system.</p> <p>See section 27, USB 2.0 Full-Speed Module (USBFS).</p>
Octal Serial Peripheral Interface (OSPI)	<p>The Octal Serial Peripheral Interface (OSPI) is a memory controller that supports EXpanded Serial Peripheral Interface (xSPI) (JEDEC Standard JESD251, JESD251-1 and JESD252) . The OSPI supports 1-bit, 2-bit, 4-bit and 8-bit protocols.</p> <p>JESD251 specifies two interface profiles where profile 1.0 is Octal SPI and profile 2.0 is HyperBus™ (HyperRAM™ and HyperFlash™).</p> <p>OSPI supports QSPI protocol.</p> <p>See section 33, Octal Serial Peripheral Interface (OSPI).</p>
Serial Sound Interface Enhanced (SSIE)	<p>The Serial Sound Interface Enhanced (SSIE) peripheral provides functionality to interface with digital audio devices for transmitting I²S/Monaural/TDM audio data over a serial bus. The SSIE supports an audio clock frequency of up to 50 MHz, and can be operated as a slave or master receiver, transmitter, or transceiver to suit various applications. The SSIE includes 32-stage FIFO buffers in the receiver and transmitter, and supports interrupts and DMA-driven data reception and transmission.</p> <p>See section 35, Serial Sound Interface Enhanced (SSIE).</p>

Table 1.9 Analog (1 of 2)

Feature	Functional description
12-bit A/D Converter (ADC12)	<p>A 12-bit successive approximation A/D Converter is provided. Up to 13 analog input channels are selectable. Temperature sensor output, and internal reference voltage and VBATT 1/3 voltage monitor are selectable for conversion.</p> <p>See section 40, 12-Bit A/D Converter (ADC12).</p>
12-bit D/A Converter (DAC12)	<p>A 12-bit D/A Converter (DAC12) is provided.</p> <p>See section 41, 12-Bit D/A Converter (DAC12).</p>

Table 1.9 Analog (2 of 2)

Feature	Functional description
Temperature Sensor (TSN)	The on-chip Temperature Sensor (TSN) determines and monitors the die temperature for reliable operation of the device. The sensor outputs a voltage directly proportional to the die temperature, and the relationship between the die temperature and the output voltage is fairly linear. The output voltage is provided to the ADC12 for conversion and can be further used by the end application. See section 42, Temperature Sensor (TSN) .
High-Speed Analog Comparator (ACMPHS)	The High-Speed Analog Comparator (ACMPHS) can be used to compare an analog input voltage with a reference voltage and to provide a digital output based on the result of conversion. Both the analog input voltage and the reference voltage can be provided to the ACMPHS from internal sources (D/A converter output or internal reference voltage) and an external source. Such flexibility is useful in applications that require go/no-go comparisons to be performed between analog signals without necessarily requiring A/D conversion. See section 43, High-Speed Analog Comparator (ACMPHS) .

Table 1.10 Human machine interfaces

Feature	Functional description
Graphics LCD Controller (GLCDC)	The Graphics LCD Controller (GLCDC) provides multiple functions and supports various data formats and panels. Key GLCDC features include: <ul style="list-style-type: none"> GLCDC0BI/GLCDC1BI master function for accessing graphics data Superimposition of three planes (single-color background plane, graphic 1-plane, and graphic 2-plane) Support for many types of 32-bit or 16-bit per pixel graphics data and 8-bit, 4-bit, or 1-bit LUT data format Digital interface signal output supporting a video image size of WVGA. See section 49, Graphics LCD Controller (GLCDC) .
2D Drawing Engine (DRW)	The 2D Drawing Engine (DRW) provides flexible functions that can support almost any object geometry rather than being bound to only a few specific geometries such as lines, triangles, or circles. The edges of every object can be independently blurred or antialiased. Rasterization is executed at one pixel per clock on the bounding box of the object from left to right and top to bottom. The DRW can also raster from bottom to top to optimize the performance in certain cases. In addition, optimization methods are available to avoid rasterization of many empty pixels of the bounding box. The distances to the edges of the object are calculated by a set of edge equations for every pixel of the bounding box. These edge equations can be combined to describe the entire object. If a pixel is inside the object, it is selected for rendering. If it is outside, it is discarded. If it is on the edge, an alpha value can be chosen proportional to the distance of the pixel to the nearest edge for antialiasing. Every pixel that is selected for rendering can be textured. The resulting ARGB quadruple can be modified by a general raster operation approach independently for each of the four channels. The ARGB quadruples can then be blended with one of the multiple blend modes of the DRW. The DRW provides two inputs (texture read and framebuffer read), and one output (framebuffer write). The internal color format is always ARGB (8888). The color formats from the inputs are converted to the internal format on read and a conversion back is made on write. See section 48, 2D Drawing Engine (DRW) .

Table 1.11 Data processing

Feature	Functional description
Cyclic Redundancy Check (CRC) calculator	The Cyclic Redundancy Check (CRC) calculator generates CRC codes to detect errors in the data. The bit order of CRC calculation results can be switched for LSB-first or MSB-first communication. Additionally, various CRC-generation polynomials are available. The snoop function allows monitoring reads from and writes to specific addresses. This function is useful in applications that require CRC code to be generated automatically in certain events, such as monitoring writes to the serial transmit buffer and reads from the serial receive buffer. See section 36, Cyclic Redundancy Check (CRC) .
Data Operation Circuit (DOC)	The Data Operation Circuit (DOC) compares, adds, and subtracts 32-bits data. When a selected condition applies, 32-bit data is compared and an interrupt can be generated. See section 44, Data Operation Circuit (DOC) .

Table 1.12 Security

Feature	Functional description
Security function	<ul style="list-style-type: none"> ● ARMv8-M TrustZone security ● Privileged control ● Device lifecycle management ● Authentication Level (AL) ● Key injection ● Secure pin multiplexing ● VBATT backup registers zeroization ● Secure boot ● Secure factory programming See section 38, Security Features .

1.5 Pin Functions

Table 1.15 Pin functions (1 of 5)

Function	Signal	I/O	Description
Power supply	VCC, VCC2	Input	Power supply pin. Connect it to the system power supply. Connect this pin to VSS by a 0.1- μ F capacitor. The capacitor should be placed close to the pin.
	VCC_DCDC	Input	Switching regulator power supply pin.
	VLO	I/O	Switching regulator pin.
	VCL	Input	Connect this pin to the VSS pin by the smoothing capacitor used to stabilize the internal power supply. Place the capacitor close to the pin.
	VBATT	Input	Battery Backup power pin
	VSS, VSS_DCDC	Input	Ground pin. Connect it to the system power supply (0 V).
Clock	XTAL	Output	Pins for a crystal resonator. An external clock signal can be input through the EXTAL pin.
	EXTAL	Input	
	XCIN	Input	Input/output pins for the sub-clock oscillator. Connect a crystal resonator between XCOOUT and XCIN.
	XCOOUT	Output	
	EXCIN	Input	External sub-clock input
	CLKOUT	Output	Clock output pin
Operating mode control	MD	Input	Pin for setting the operating mode. The signal level on this pin must not be changed during operation mode transition on release from the reset state.
System control	RES	Input	Reset signal input pin. The MCU enters the reset state when this signal goes low.
CAC	CACREF	Input	Measurement reference clock input pin
On-chip emulator	TMS	Input	On-chip emulator or boundary scan pins
	TDI	Input	
	TCK	Input	
	TDO	Output	
	TCLK	Output	Output clock for synchronization with the trace data
	TDATA0 to TDATA3	Output	Trace data output
	SWO	Output	Serial wire trace output pin
	SWDIO	I/O	Serial wire debug data input/output pin
	SWCLK	Input	Serial wire clock pin
Interrupt	NMI	Input	Non-maskable interrupt request pin
	IRQn	Input	Maskable interrupt request pins
	IRQn-DS	Input	Maskable interrupt request pins that can also be used in Deep Software Standby mode

Table 1.15 Pin functions (2 of 5)

Function	Signal	I/O	Description
External bus interface	EBCLK	Output	Outputs the external bus clock for external devices
	RD	Output	Strobe signal indicating that reading from the external bus interface space is in progress, active-low.
	WR	Output	Strobe signal indicating that writing to the external bus interface space is in progress, in 1-write strobe mode, active-low.
	WRn	Output	Strobe signals indicating that either group of data bus pins (D07 to D00, D15 to D08) is valid in writing to the external bus interface space, in byte strobe mode, active-low.
	BCn	Output	Strobe signals indicating that either group of data bus pins (D07 to D00, D15 to D08) is valid in access to the external bus interface space, in 1-write strobe mode, active-low.
	ALE	Output	Address latch signal when address/data multiplexed bus is selected.
	WAIT	Input	Input pin for wait request signals in access to the external space, active-low.
	CSn	Output	Select signals for CS areas, active-low
	A00 to A23	Output	Address bus
	D00 to D15	I/O	Data bus
	A00/D00 to A15/D15	I/O	Address/data multiplexed bus
SDRAM interface	SDCLK	Output	Outputs the SDRAM-dedicated clock
	CKE	Output	SDRAM clock enable signal
	SDCS	Output	SDRAM chip select signal, active low
	RAS	Output	SDRAM low address strobe signal, active low
	CAS	Output	SDRAM column address strobe signal, active low
	WE	Output	SDRAM write enable signal, active low
	DQMn	Output	SDRAM I/O data mask enable signal for DQ07 to DQ00, DQ15 to DQ08.
	A00 to A16	Output	Address bus
	DQ00 to DQ15	I/O	Data bus
GPT	GTETRG A, GTETRG B, GTETRG C, GTETRG D	Input	External trigger input pins
	GTIOCnA, GTIOCnB	I/O	Input capture, output compare, or PWM output pins
	GTADSM0, GTADSM1	Output	A/D conversion start request monitoring output pins
AGT	AGTEEn	Input	External event input enable signals
	AGTIO n	I/O	External event input and pulse output pins
	AGTO n	Output	Pulse output pins
	AGTOAn	Output	Output compare match A output pins
	AGTOBn	Output	Output compare match B output pins

Table 1.15 Pin functions (3 of 5)

Function	Signal	I/O	Description
ULPT	ULPTEEn	Input	External count control input
	ULPTEVIn	Input	External event input
	ULPTOn	Output	Pulse output
	ULPTOAn	Output	Output compare match A output
	ULPTOBn	Output	Output compare match B output
	ULPTEEn-DS	Input	External count control input that can also be used in Deep Software Standby mode1
	ULPTEVIn-DS	Input	External event input that can also be used in Deep Software Standby mode1
	ULPTOn-DS	Output	Pulse output that can also be used in Deep Software Standby mode1
	ULPTOAn-DS	Output	Output compare match A output that can also be used in Deep Software Standby mode1
	ULPTOBn-DS	Output	Output compare match B output that can also be used in Deep Software Standby mode1
RTC	RTCOUT	Output	Output pin for 1-Hz or 64-Hz clock
	RTCICn	Input	Time capture event input pins
SCI	SCKn	I/O	Input/output pins for the clock (clock synchronous mode)
	RXDn	Input	Input pins for received data (asynchronous mode/clock synchronous mode)
	TXDn	Output	Output pins for transmitted data (asynchronous mode/clock synchronous mode)
	CTS _n _RTS _n	I/O	Input/output pins for controlling the start of transmission and reception (asynchronous mode/clock synchronous mode), active-low.
	CTS _n	Input	Input for the start of transmission.
	DE _n	Output	Driver enable signal for RS-485
	SCLn	I/O	Input/output pins for the IIC clock (simple IIC mode)
	SDAn	I/O	Input/output pins for the IIC data (simple IIC mode)
	SCKn	I/O	Input/output pins for the clock (simple SPI mode)
	MISO _n	I/O	Input/output pins for slave transmission of data (simple SPI mode)
	MOSI _n	I/O	Input/output pins for master transmission of data (simple SPI mode)
	SS _n	Input	Chip-select input pins (simple SPI mode), active-low
IIC	SCLn	I/O	Input/output pins for the clock
	SDAn	I/O	Input/output pins for data
SPI	RSPCKA, RSPCKB	I/O	Clock input/output pin
	MOSIA, MOSIB	I/O	Input or output pins for data output from the master
	MISOA, MISOB	I/O	Input or output pins for data output from the slave
	SSLA0, SSLB0	I/O	Input or output pin for slave selection
	SSLA1 to SSLA3, SSLB1 to SSLB3	Output	Output pins for slave selection
CANFD	CRX _n	Input	Receive data
	CTX _n	Output	Transmit data

Table 1.15 Pin functions (4 of 5)

Function	Signal	I/O	Description
USBFS	VCC_USB	Input	Power supply pin
	VSS_USB	Input	Ground pin
	USB_DP	I/O	D+ pin of the USB on-chip transceiver. Connect this pin to the D+ pin of the USB bus.
	USB_DM	I/O	D- pin of the USB on-chip transceiver. Connect this pin to the D- pin of the USB bus.
	USB_VBUS	Input	USB cable connection monitor pin. Connect this pin to VBUS of the USB bus. The VBUS pin status (connected or disconnected) can be detected when the USB module is operating as a function controller.
	USB_EXICEN	Output	Low-power control signal for external power supply (OTG) chip
	USB_VBUSEN	Output	VBUS (5 V) supply enable signal for external power supply chip
	USB_OVRCURA, USB_OVRCURB	Input	Connect the external overcurrent detection signals to these pins. Connect the VBUS comparator signals to these pins when the OTG power supply chip is connected.
	USB_OVRCURA-DS, USB_OVRCURB-DS	Input	Overcurrent pins for USBFS that can also be used in Deep Software Standby mode1. Connect the external overcurrent detection signals to these pins. Connect the VBUS comparator signals to these pins when the OTG power supply chip is connected.
	USB_ID	Input	Connect the MicroAB connector ID input signal to this pin during operation in OTG mode
OSPI	OM_SCLK	Output	Clock output (OCTACK divided by 2)
	OM_SCLKN	Output	Inverted clock output (OCTACK divided by 2)
	OM_CS _n	Output	Chip select signal for an OctaFlash device, active-low
	OM_DQS	I/O	Read data strobe/write data mask signal
	OM_SIO _n	I/O	Data input/output
	OM_RESET	Output	Reset signal for both slave devices, active-low
	OM_ECSINT1	Input	Error Correction Status and Interrupt for slave1
	OM_RSTO1	Input	Slave reset status for slave1
	OM_WP1	Output	Write Protect for slave1, active-low
SSIE	SSIBCK0, SSIBCK1	I/O	SSIE serial bit clock pins
	SSILRCK0/SSIFS0, SSILRCK1/SSIFS1	I/O	LR clock/frame synchronization pins
	SSITXD0	Output	Serial data output pin
	SSIRXD0	Input	Serial data input pin
	SSIDATA1	I/O	Serial data input/output pins
	AUDIO_CLK	Input	External clock pin for audio (input oversampling clock)

Table 1.15 Pin functions (5 of 5)

Function	Signal	I/O	Description
Analog power supply	AVCC0	Input	Analog voltage supply pin. This is used as the analog power supply for the respective modules.
	AVSS0	Input	Analog ground pin. This is used as the analog ground for the respective modules. Supply this pin with the same voltage as the VSS pin.
	VREFH	Input	Analog reference voltage supply pin for the ADC12 (unit 1) and D/A Converter. Connect this pin to AVCC0 when not using the ADC12 (unit 1) and D/A Converter.
	VREFL	Input	Analog reference ground pin for the ADC12 and D/A Converter. Connect this pin to AVSS0 when not using the ADC12 (unit 1) and D/A Converter.
	VREFH0	Input	Analog reference voltage supply pin for the ADC12 (unit 0). Connect this pin to AVCC0 when not using the ADC12 (unit 0).
	VREFL0	Input	Analog reference ground pin for the ADC12. Connect this pin to AVSS0 when not using the ADC12 (unit 0).
ADC12	ANmn	Input	Input pins for the analog signals to be processed by the A/D converter. (m: ADC unit number, n: pin number)
	ADTRGm	Input	Input pins for the external trigger signals that start the A/D conversion, active-low.
DAC12	DA0	Output	Output pin for the analog signals processed by the D/A converter.
ACMPHS	VCOUT	Output	Comparator output pin
	IVREFn	Input	Reference voltage input pins for comparator
	IVCMPn	Input	Analog voltage input pins for comparator
I/O ports	Pmn	I/O	General-purpose input/output pins (m: port number, n: pin number)
	P200	Input	General-purpose input pin
GLCDC	LCD_DATA23 to LCD_DATA00	Output	Data output pins for panel
	LCD_TCON3 to LCD_TCON0	Output	Output pins for panel timing adjustment
	LCD_CLK	Output	Panel clock output pin
	LCD_EXTCLK	Input	Panel clock source input pin

1.6 Pin Assignments

The following figures show the pin assignments from the top view.

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

Note: Several pin names have the added suffix of _A, _B, and _C. These suffixes have special conditions for electrical characteristics. See [section 51, Electrical Characteristics](#) for detail.

Note 1. NC but the ball exists.

2. CPU

The MCU is based on the Arm[®] Cortex[®]-M85 Processor.

2.1 Overview

2.1.1 CPU

- Arm[®] Cortex[®]-M85 Processor
 - Revision: r0p2-00rel0
 - ARMv8.1-M architecture profile
 - Armv8-M Security Extension
- Extension Processing Unit (EPU)
 - Floating Point Unit (FPU) compliant with the ANSI/IEEE Std 754-2008 Scalar half, single, and double-precision floating-point operation
 - M-profile Vector Extension (MVE) Integer, half-precision, and single-precision floating-point MVE (MVE-F)
- Security Attribution Unit (SAU): 8 regions
- Implementation Defined Attribution Unit (IDAU)
- Memory Protection Unit (MPU)
 - Protected Memory System Architecture (PMSAv8)
 - Secure MPU (MPU_S): 8 regions
 - Non-secure MPU (MPU_NS): 8 regions
- System Timer (SysTick)
 - Reference clock:
 - CPUCLK
 - SYSTICKCLK
 - Two system timers are implemented:
 - Secure instance (SysTick_S)
 - Non-secure instance (SysTick_NS)
- Low power modes
 - CPU Sleep mode
 - CPU Deep Sleep mode
- Cache
 - Instruction cache: 16 KB with ECC
 - Data cache: 16 KB with ECC
- Tightly Coupled Memory (TCM)
 - ITCM: 16 KB with ECC (8 KB × 2 block)
 - DTCM: 16 KB with ECC (8 KB × 2 block)
- Nested Vectored Interrupt Controller (NVIC): 96 IRQs

See [section 2.14. References \[1\], \[2\]](#) for the detail.

2.1.2 Debug

CPU Debug Components

- Arm® CoreSight™ ETM-M85
 - Revision: r0p2-00rel0
 - ARM ETM Architecture version 4.5
- Instrumentation Trace Macrocell (ITM)
- Data Watchpoint and Trace unit (DWT)
 - 8 Data Watchpoint and Trace (DWT) comparators, up to 2 data value comparison
- Breakpoint Unit (BPU)
 - 8 instruction comparators
- Cortex®-M85 Trace Port Interface Unit (TPIU)
 - 4 bits TPIU Formatter output
 - Serial Wire Output (SWO)

Common Debug Components

- Debug Access Port (DAP)
 - CoreSight SoC-400 Debug Access Port
 - JTAG Debug Port and Serial Wire Debug Port (SWJ-DP)
Serial Wire protocol version 2 (target instance is fixed value: 0b0000)
- Timestamp Generator (TSG)
 - CoreSight SoC-400 Timestamp Generator
 - Global Timestamp for ETM and ITM
 - Driven by DCLK
- Cross Trigger Interface (CTI)
 - CoreSight SoC-400 CTI (CTI)
 - Processor CTI (CTI0)
- Embedded Trace Buffer (ETB)
 - CoreSight™ Trace Memory Controller with ETB configuration
 - Buffer size: 8 KB
- Debug Register Module (DBGREG)
- On-Chip Debug Register Module (OCDREG)
- Authentication method through JTAG/SWD: Challenge response

See [section 2.14. References \[1\], \[2\]](#) for the detail.

2.2 Block Diagram

[Figure 2.1](#) shows the block diagram of CPU and CoreSight Debug subsystem (DBGSS).

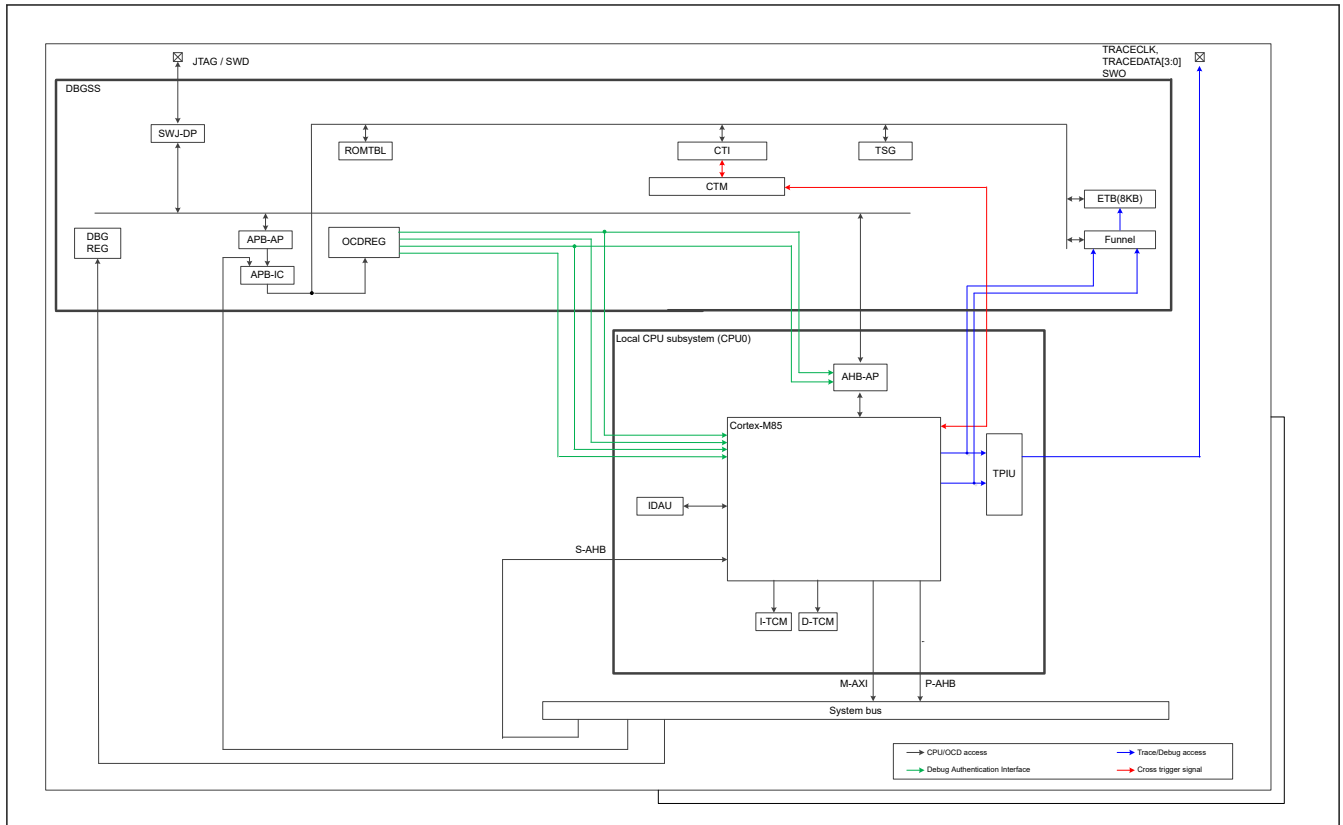

Figure 2.1 Block diagram of CPU and CoreSight Debug subsystem (DBGSS)

Note: See section 2.14. References [2] for detail of Cortex-M85 block diagram. Cortex-M85 block diagram described in this document is just for illustrative purposes only.

2.3 Implementation Options

Table 2.1 shows the implementation options of the MCU.

Table 2.1 Implementation options (1 of 2)

Option	Implementation
SAU	8 regions
IDAU	Included
MPU	MPU_S: 8 regions MPU_NS: 8 regions
MVE	Integer and half and single-precision floating-point MVE
FPU	Scalar half, single, and double-precision floating-point
Interrupts	96
Priority bits	4 bits (16 levels)
Sleep mode power-saving	CPU Sleep mode, CPU Deep Sleep mode
TCM	<ul style="list-style-type: none"> ITCM : 16 KB DTCM : 16 KB ECC enable (determined by OFS1(_SEC).INITECCEN) ITCMCR.EN = 1 and DTCMCR.EN = 1, cannot be rewrite
CACHE	<ul style="list-style-type: none"> I-Cache: 16 KB D-Cache: 16 KB ECC enable (determined by OFS1(_SEC).INITECCEN) Automatic invalidation is enabled During debug, it is controlled by CACHEDBGCR L1RSTDIS

Table 2.1 Implementation options (2 of 2)

Option	Implementation
P-AHB	<ul style="list-style-type: none"> PAHBCR.SZ is 0b011 (256 MB) PAHBCR.EN is always 1
SysTick	Included two system timers, SysTick_S and SysTick_NS External reference clock with frequency = SYSTICKCLK SYST_CALIB = 0x0000270F NOREF, bit[31] = 0: Reference clock is implemented SKEW, bit[30] = 0: TENMS calibration value is exact Bit[29:24] = 0x00: Reserved TENMS, bit[23:0] = 0x00270F: $(0x270F + 1) \times 1 \mu s = 10 \text{ ms}$
PACBTI	Included and Enabled
Software reset request output	AIRCR.SYSRESETREQ bit causes the Software reset
DWT	8 comparators
BPU	8 comparators
CTI	Included, CTI and CTI0
ITM	Included
ETM	Included
TPIU	Included <ul style="list-style-type: none"> 4-bit TPIU formatter output Serial Wire Output (SWO)

Table 2.2 DBGSS implementation options

Option	Implementation
TSG	Included Driven by clock with frequency = ICLK/2
ETB	8 KB
DAP	SWJ-DP AHB-AP : AP0 APB-AP : AP1

2.4 Trace Interface

A Trace Port Interface Unit (TPIU) and Serial Wire Output (SWO) provide trace output. [Table 2.3](#) shows the MCU pins for the function. These pins are multiplexed with other functions.

Table 2.3 Trace function pins

Name	I/O	Width	Function	When not in use
TCLK	Out	1 bit	Trace clock	Open
TDATA0	Out	1 bit	Trace data output	Open
TDATA1	Out	1 bit	Trace data output	Open
TDATA2	Out	1 bit	Trace data output	Open
TDATA3	Out	1 bit	Trace data output	Open
SWO	Out	1 bit	Serial Wire Output	Open

2.5 JTAG/SWD Interface

[Table 2.4](#) shows JTAG/SWD pins.

Table 2.4 JTAG/SWD pins (1 of 2)

Name	I/O	P/N	Width	Function	When not in use
TCK/SWCLK	In	Pos.	1 bit	JTAG Clock pin Serial Wire Data Clock pin	Pull-up

Table 2.4 JTAG/SWD pins (2 of 2)

Name	I/O	P/N	Width	Function	When not in use
TMS/SWDIO	In-Out	Neg.	1 bit	JTAG TMS pin Serial Wire Data In-Out pin	Pull-up
TDI	In	Pos.	1 bit	JTAG TDI pin	Pull-up
TDO	Out	Neg.	1 bit	JTAG TDO pin	Open

2.6 Initial Vector Table Base Address

In the MCU, the secure vector table base address is determined by the operating mode as shown in [Table 2.5](#), and the non-secure vector table base address is fixed at 0x0000_0000.

Table 2.5 Initial vector table base address

Operating mode	CPU INITSVTOR
Single-chip mode	0x0200_0000

2.7 Debug Function

The MCU provides ability to debug software by either external debug or self-hosted debug.

The external debug function can be enabled by JTAG/SWD. See [section 2.7.1. External Debugger Connectivity and Authentication Through JTAG/SWD](#).

Self-hosted debug function can be enabled by software programming. See [section 2.7.2. Debug Protection Mechanism by Software](#) for details.

When debug function is enabled, operation of system can be affected. See [section 2.7.3. Effect of Debug Function](#) for details.

2.7.1 External Debugger Connectivity and Authentication Through JTAG/SWD

When debug function is enabled by performing authentication through JTAG/SWD, the three debug levels that correspond to the three Authentication Level (AL) are AL0, AL1, and AL2.

- AL0: No debug functions*¹ are available.
- AL1: Only non-secure debug functions*¹ is enabled, and debugger can access only defined Non-secure debug accessible regions. It is defined as Non-secure debug in [section 2.14. References \[1\]](#).
- AL2: Non-secure and Secure debug functions*¹ are enabled and accessible from the debugger. It is defined as Secure debug in [section 2.14. References \[1\]](#).

Authentication Level is determined as follows:

- When Device Life Cycle state (DLM state) is not OEM (LCK_BOOT, RMA_RET, RMA_REQ, RMA_ACK), AL is determined by DLM state. See [Table 2.6](#).
- When Device Life Cycle state (DLM state) is equal to OEM, AL can be determined by performing authentication through JTAG/SWD. In the MCU, authentication method is the challenge response method with the authentication key installed by user.
In this case, initial value of AL is determined by PL value (see [Table 2.7](#)).
See [section 2.13.5.2. Connecting Sequence and JTAG/SWD Authentication](#) for authentication sequence.

In addition, using authentication key AL2 and AL1 can be prohibited by setting Protection LCKS and LCKNS respectively. Setting LCKS and LCKNS can be performed by the boot command. After setting, LCKS can only be cleared by the All erase command, LCKNS can be cleared either by the All erase command or secure access.

Note 1. Both of invasive and non-invasive debug. See [section 2.14. References \[1\]](#) for details about invasive and non-invasive debug.

Description in [Table 2.6](#) and [Table 2.7](#) can also be used for serial Flash programmer.

Table 2.6 Authentication Level (1)

Conditions			Available Authentication Level
DLM state	LCKS	LCKNS	
LCK_BOOT	Don't care	Don't care	AL0 (default)
RMA_RET	Don't care	Don't care	AL0 (default)
RMA_REQ	Don't care	Don't care	AL0 (default)
RMA_ACK	Don't care	Don't care	AL2 (default)

Table 2.7 Authentication Level (2)

Condition				Available Authentication Level
DLM state	PL	LCKS	LCKNS	
OEM	PL2	Don't care	Don't care	AL2 (default)
OEM	PL1	0b111	Don't care	AL1 (default) AL2 (authentication using AL2_KEY)
OEM	PL1	0b000 (using AL2_KEY is prohibited)	Don't care	AL1 (default)
OEM	PL0	0b111	0b111	AL0 (default) AL1 (authentication using AL1_KEY) AL2 (authentication using AL2_KEY)
OEM	PL0	0b111	0b000 (using AL1_KEY is prohibited)	AL0 (default) AL2 (authentication using AL2_KEY)
OEM	PL0	0b000 (using AL2_KEY is prohibited)	0b111	AL0 (default) AL1 (authentication using AL1_KEY)
OEM	PL0	0b000 (using AL2_KEY is prohibited)	0b000 (using AL1_KEY is prohibited)	AL0 (default)

Note: When debugging using SWJ-DP, set CDBGPWRUPREQ to 1.

Note: Debug connection from external emulator to CoreSight components through Debug APB is enabled as default setting, don't care is the authentication mechanism. However, this connection can be disabled by software programming. See DBGAUTH0.DEVICEEN for details.

Debug connection while in Boot mode

Debug capability is not available while the MCU is operating in Boot mode.

2.7.2 Debug Protection Mechanism by Software

In this mechanism, the challenge and response authentication procedure does not perform, instead software can program to directly enable debug function of the MCU. In other words, debug function is controlled completely by software.

The debug function can be enabled by setting the following bits:

- DBGAUTH0.NIDEN0 = 1: Non-invasive debug enable
- DBGAUTH0.DBGEN0 = 1: Invasive debug enable
- DAUTHCTRL.INTSPNIDEN = 1: Secure non-invasive debug enable. See Reference [1] for details
- DAUTHCTRL.INTSPIDEN = 1: Secure invasive debug enable. See Reference [1] for details.

In addition, external debug access to processor through AHB-AP can also be enabled by writing 1 to DBGAUTH0.DBGENAP and DBGAUTH1.SPIDENAP for Non-secure and Secure access respectively.

See DBGAUTH0 and DBGAUTH1 in [section 2.8.5.3. DBGSTOPCR : Debug Stop Control Register](#) and [section 2.8.5.4. DBGAUTH0 : Debug Authentication Control Register 0](#) for more details.

Note: Authentication through software programming is controlled by OFS1(_SEC).SWDBG.

Writing 1 to OFS1(_SEC).SWDBG disables authentication through software programming, writing 0 to OFS1(_SEC).SWDBG enables authentication through software programming.

Note: Authentication through software programming is not restricted by DLM state, PL, and LCK(N)S.

Note: Except DAUTHCTRL.INTSPNIDEN and DAUTHCTRL.INTSPIDEN overrides processor external Secure invasive/non-invasive debug authentication interface, debug function enabled by authentication through JTAG/SWD cannot be disabled by software.

2.7.3 Effect of Debug Function

The debug function affects the inside and outside of CPU. This section describes the effects of debug function excluding debug authentication.

2.7.3.1 Low power mode

All CoreSight debug components can store the register settings even when the CPU enters Deep Sleep, Software Standby, or Deep Software Standby mode if SYOCDCR.DBGEN0 is 1 and any of the following is true:

- CDBGPWRUPREQ = 1 and AL is AL2 or AL1
- OFS1(_SEC).SWDBG is 0 and DBGAUTH0.DBGEN0 or DBGAUTH0.NIDEN0 is 1.

However, AHB-AP cannot respond to On-Chip Debug (OCD) access in these low power modes. The OCD must wait for cancellation of the low power mode to access the CoreSight debug components.

The MCU does not response to On-Chip Debug (OCD) when the OCD starts to connect to the MCU while the MCU is in Software Standby mode or Deep Software Standby mode.

2.7.3.2 Resets and interrupts

During On-Chip Debug (OCD) mode, when the CPU enters the break state, IWDT and corresponding WDT are stopped. During OCD mode, the CPU is running the application and debug function AL2 or AL1 is enabled, some resets and interrupts are restrained depending on DBGSTOPPCR setting such as PVDn, WDT, and IWDT. For PVDn (n = 1, 2), interrupt and reset depend on whether DBGSTOPPCR is in the break state or not. Some access errors are not generated by external debugger (DAP) access. For details, see [Table 2.8](#).

Table 2.8 Controlling of resets and interrupts generation in OCD mode

Reset and interrupt name	Break state	Running application
RES pin reset	Same as user mode	
Power-on reset	Same as user mode	
Independent watchdog timer reset/interrupt ^{*2}	Does not occur ^{*1}	Depends on DBGSTOPPCR setting ^{*2}
Watchdog timer reset/interrupt	Does not occur ^{*1}	Depends on DBGSTOPPCR setting ^{*2}
CPU lockup reset/interrupt	Does not occur	Same as user mode
Voltage monitor 0 reset	Same as user mode	
Voltage monitor 1 reset/interrupt	Depends on DBGSTOPPCR setting ^{*3}	
Voltage monitor 2 reset/interrupt	Depends on DBGSTOPPCR setting ^{*3}	
Cache/TCM ECC error BusFaults	Same as user mode	
SRAM parity error reset/interrupt	Same as user mode ^{*3}	
Deep software standby reset	Same as user mode	
Software reset	Same as user mode	
Bus error reset/interrupt	Same as user mode ^{*4}	

Note 1. IWDT and WDT always stop in this mode if any of the following is true:

- CDBGPWRUPREQ is 1, and AL is AL2 or AL1
- OFS1(_SEC).SWDBG is 0, and DBGAUTH0.DBGEN0 is 1

Note 2. IWDT and WDT operation depends on DBGSTOPPCR setting if any of the following is true:

- CDBGPWRUPREQ is 1, and AL is AL2 or AL1
- OFS1(_SEC).SWDBG is 0, and DBGAUTH0.DBGEN0 is 1

Note 3. Reset or interrupt masking depends on DBGSTOPPCR setting.

Note 4. The reset request or interrupt request is not generated when an error is detected for DAP access.

2.8 Registers Description

2.8.1 CPU Control Registers

In addition to Cortex-M85 registers, the MCU also provides additional specific control and status registers that can be considered as CPU control register.

2.8.1.1 CPUSAR : CPU Security Attribution Register

Base address: CPSCU = 0x4000_8000
 CPSCU_NS = 0x5000_8000

Offset address: 0x170

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPUSA0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CPUSA0	CPU Control Registers Security Attribution 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

CPUSA0 bit (CPU Control Registers Security Attribution)

The CPUSA0 bit is Security attributes for CPU Control registers. The target registers are:

- CPU.CPULCKUPCR
- CPU.CPUCRPT

2.8.1.2 CPULCKUPCR : CPU Lockup Control Register

Base address: CPU_CTRL = 0x4000_F000
 CPU_CTRL_NS = 0x5000_F000

Offset address: 0x030

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	OAD
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OAD	Operation after detection of CPU lockup 0: Non-maskable Interrupt 1: CPU Lockup reset	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3 (CPUSAR.CPUSA0), P-TYPE-2

When CPU enters the lockup state, it can be selected to generate either a CPU Lockup reset or an interrupt^{*1} by writing to CPULCKUPCR.OAD.

The CPULCKUPCR security attribution is controlled by CPUSAR. The AIRCR.BFHFNMINS and CPUSAR.CPUSA0 bits are recommended to be set to the same security attribution.

Writing to CPULCKUPCR.OAD bit is protected by CPU Control Register Protect Register (CPUCRPT).

Note 1. If lockup state occurs from a Secure HardFault when AIRCR.BFHFNMINS is set to 1 or the NMI handler, an NMI does not cause the processor exit lockup state. See [section 2.14. References \[4\]](#).

2.8.1.3 CPUCRPT : CPU Control Register Protection Register

Base address: CPU_CTRL = 0x4000_F000 (Secure)
CPU_CTRL_NS = 0x5000_F000 (Non-secure)

Offset address: 0x840

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]														PROTECT	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: Writing to CPULCKUPCR register is permitted. 1: Writing to CPULCKUPCR register is not permitted. Read access is permitted.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 in KEY[7:0] bits at the same time. When values other than 0xA5 are written to KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.	W

Note: S-TYPE-3 (CPUSAR.CPUSA0), P-TYPE-2

The CPUCRPT.PROTECT bit enables writing to CPULCKUPCR.

The security attribution of CPUCRPT is controlled by CPUSAR.

2.8.1.4 CPULOCKCR : CPU Function Lock Control Register

Base address: CPU_CTRL = 0x4000_F000 (Secure)

Offset address: 0x400

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	LCKD CAIC	LCKD TGU	LCKIT GU	LCKS AU	LCKS MPU	LCKS VTAIR
Value after reset :	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	LCKSVTAIR	Disable writes to the following secure registers from software or from a debug agent that is connected to the processor: VTOR_S, AIRCR.PRIS, AIRCR.BFHFNMINS	R/W ¹
1	LCKSMPU	Disable writes to registers that are associated with the Secure MPU region from software or from a debug agent connected to the processor: MPU_CTRL, MPU_RNR, MPU_RBAR, MPU_RLAR, MPU_RBAR_An, MPU_RLAR_An	R/W ¹
2	LCKSAU	Disable writes to registers that are associated with the SAU region from software or from a debug agent connected to the processor: SAU_CTRL, SAU_RNR, SAU_RBAR, SAU_RLAR	R/W ¹
3	LCKITGU	Disable writes to registers that are associated with the ITCM interface security gating from software or from a debug agent connected to the processor: ITGUCTRL, ITGU_LUTn	R/W ¹

Bit	Symbol	Function	R/W
4	LCKDTGU	Disable writes to registers that are associated with the DTCM interface security gating from software or from a debug agent connected to the processor: DTGUCTRL, DTGU_LUTn	R/W ¹
5	LCKDCAIC	Disable access to the instruction cache direct cache access registers DCAICLR and DCAICRR	R/W ¹
7:6	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-6, P-TYPE-2

Note 1. Writing 0 is ignored.

This register controls some miscellaneous processor signals. Reset is the only clear condition.

2.8.1.5 CPULOCKCRNS : CPU Non-secure Function Lock Control Register

Base address CPU_CTRL_NS = 0x5000_F000 (Non-secure)

Offset address: 0x500

Bit	Symbol	Function	R/W
0	LCKNSVTOR	Disable writes to the VTOR_NS register	R/W ¹
1	LCKNSMPU	Disable writes to registers that are associated with the Non-secure MPU region from software or from a debug agent connected to the processor: MPU_CTRL_NS, MPU_RNR_NS, MPU_RBAR_NS, MPU_RLAR_NS, MPU_RBAR_A_NSn, MPU_RLAR_A_NSn	R/W ¹
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-7, P-TYPE-2

Note 1. Writing 0 is ignored.

This register controls some miscellaneous processor signals. Reset is the only clear condition.

2.8.2 Address Spaces for External Debugger

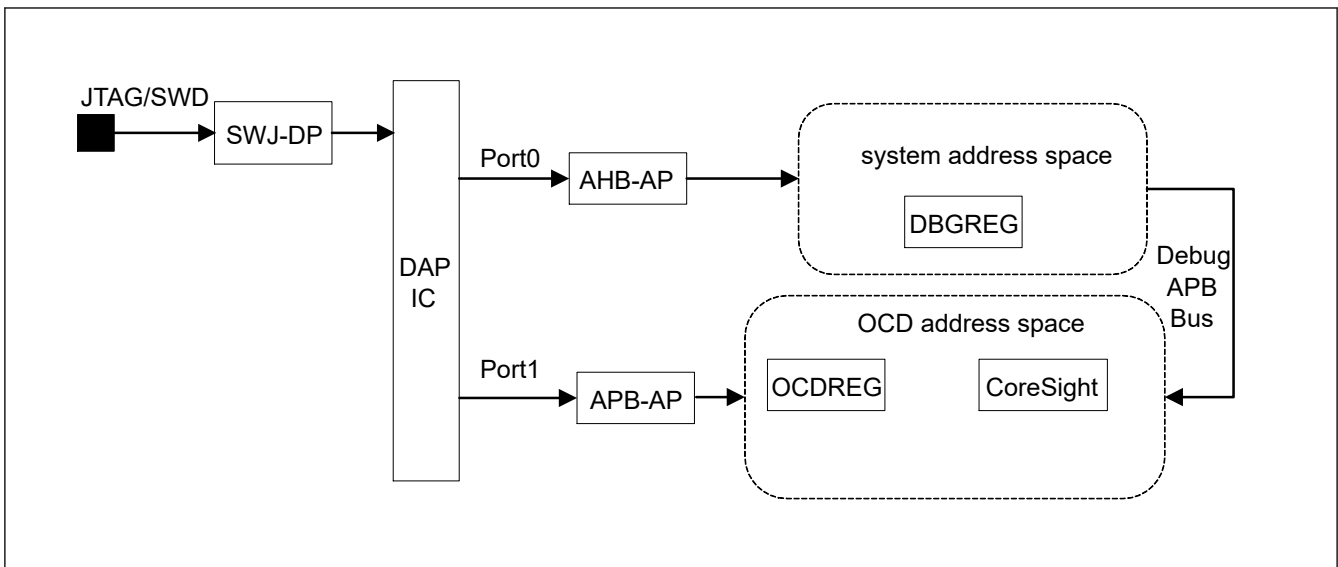

Figure 2.2 Block diagram of the AP connection and address spaces

The MCU debug system includes two CoreSight Access Ports (AP):

- AHB-AP, which is connected to the CPU bus matrix and has the same access to the system address space as the CPU
- APB-AP, which has OCD address space and is connected to the Coresight components and OCDREG registers.

Figure 2.2 shows a block diagram of the AP connection and address spaces. For debug purpose, there are two address spaces, DBGREG and OCDREG.

DBGREG is located in the system address space and can be accessed from an OCD emulator, a CPU, or other bus masters in the MCU.

OCDREG is located in the OCD address space and can be accessed from an OCD emulator, a CPU, or other bus masters in the MCU. See Table 2.10 for details.

2.8.3 CPU Peripheral

CoreSight components are accessible from either CPU or OCD emulator. Table 2.9 shows dedicated Peripheral address of CPU. Table 2.10, Table 2.11, and Table 2.12 describe CoreSight component address.

Table 2.9 CPU peripherals

2.8.4 ROM Table

The MCU has three ROM Tables:

- A processor ROM Table
- An EPPB ROM Table for the Cortex-M85 CPU
- A system ROM Table

The EPPB ROM Table points to the TPIU component and processor ROM Table. The EPPB ROM Table does not point to or be pointed by system ROM Table.

The processor ROM Table contains entries that hold a list of debug components that are implemented in Cortex-M85. The system ROM Table contains entries that hold a list of debug components implemented as CoreSight debug components of the MCU.

2.8.4.1 ROM entries

ROM entries holds a list of CoreSight debug components in the system. The OCD emulator can use the ROM entries to determine which components are implemented in the system.

The entries of Debug components are described as bellow.

[Table 2.13: System ROM entries](#)

[Table 2.14: EPPB ROM entries](#)

[Table 2.15: Processor ROM entries \(see \[section 2.14. References\]\(#\)\).](#)

Table 2.13 System ROM entries

#	Address*1	Access size	R/W	Value	Target module
0	0x4001_0000	32 bits	Read-only	0x00001003	OCDREG
1	0x4001_0004	32 bits	Read-only	0x00002003	CTI
2	0x4001_0008	32 bits	Read-only	0x00003003	Funnel
3	0x4001_000C	32 bits	Read-only	0x00004003	ETB
4	0x4001_0010	32 bits	Read-only	0x00005003	TSG
5	0x4001_0014	32 bits	Read-only	0x00000000	(End of entries)

Note 1. The base address 0x4001_0000 is dedicated for CPU secure access.
 The base address for CPU non-secure access is 0x5001_0000.
 The base address for OCD emulator access is 0x8001_0000.

Table 2.14 EPPB ROM entries (1 of 2)

#	Address	Access size	R/W	Value	Target module
0	0xE00F_E000	32 bits	Read-only	0x00001003	Processor ROM Table
1	0xE00F_E004	32 bits	Read-only	0xFFFF42003	TPIU

Table 2.14 EPPB ROM entries (2 of 2)

Table 2.15 Processor ROM entries

#	Address	Access size	R/W	Value	Target module
0	0xE00F_F000	32 bits	Read-only	0xFFF0F003	SCS
1	0xE00F_F004	32 bits	Read-only	0xFFF02003	DWT
2	0xE00F_F008	32 bits	Read-only	0xFFF03003	BPU
3	0xE00F_F00C	32 bits	Read-only	0xFFF01003	ITM
5	0xE00F_F014	32 bits	Read-only	0xFFF42003	ETM
6	0xE00F_F018	32 bits	Read-only	0xFFF04003	PMU
7	0xE00F_F01C	32 bits	Read-only	0xFFF43003	CTIO
8	0xE00F_F020	32 bits	Read-only	0xFFF47002	PMC
9	0xE00F_F024	32 bits	Read-only	0x00000000	(End of entries)

2.8.4.2 CoreSight Component Registers

ROM Table has CoreSight Component Register defined in Arm CoreSight Architecture.

[Table 2.16](#) shows the registers of system ROM Table.

[Table 2.17](#) shows processor EPPB ROM Table.

[Table 2.18](#) shows processor ROM Table. See [section 2.14. References \[2\]](#).

Table 2.16 Registers of system ROM Table

Name	Address	Access size	R/W	Initial value
PID4	0x8001_0FD0	32 bits	Read-only	0x00000004

2.8.5 DBGREG

Base_Address: CPU_DBG = 0x4001_B000

The DBGREG module controls the debug functionality.

[Table 2.19](#) shows a list of DBGREG registers.

Table 2.19 DBGREG registers

Name	Symbol	DAP port	Address	Access size	R/W
Debug Status Register	DBGSTR	Port 0	0x4001_B000	32 bits	Read-only
Debug Stop Control Register	DBGSTOPCR	Port 0	0x4001_B010	32 bits	Read/Write
Debug Authentication Control Register0	DBGAUTH0	Port 0	0x4001_B020	32 bits	Read/Write
Debug Authentication Control Register1	DBGAUTH1	Port 0	0x4001_B024	32 bits	Read/Write
Trace Port Control Register	TRPORTCR	Port 0	0x4001_B030	32 bits	Read/Write

MOCO Enable Register for Debug	DBGMOCOEN	Port 0	0x4001_B300	32 bits	Read/Write
Flash Sequencer Clock Select Register for Debug	DBGFCLKSEL	Port 0	0x4001_B310	32 bits	Read/Write

2.8.5.1 DEBUGSAR : Debug Security Attribution Register

Base address: CPSCU = 0x4000_8000
 CPSCU_NS = 0x5000_8000

Offset address: 0x180

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DBGS A0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DBGSA0	Debug Resources Security Attribution 0 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

DBGSA0 bit (Debug Resources Security Attribution 0)

Security attributes of registers for Debug Control. The target registers are as follow:

- DBGREG.DBGAUTH0
- The CoreSight registers connected to APB-AP and mapped to the system address space

Note: This does not affect access from external to APB-AP.

2.8.5.2 DBGSTR : Debug Status Register

Base address: CPU_DBG = 0x4001_B000
 CPU_DBG_NS = 0x5001_B000

Offset address: 0x000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	CDBG PWRU PACK	CDBG PWRU PREQ	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	x	x	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
27:0	—	These bits are read as 0.	R
28	CDBGPWRUPREQ	Debug power-up request 0: OCD is not requesting debug power-up 1: OCD is requesting debug power-up	R
29	CDBGPWRUPACK	Debug power-up acknowledge 0: Debug power-up request is not acknowledged 1: Debug power-up request is acknowledged	R
31:30	—	These bits are read as 0.	R

Note: S-TYPE-5, P-TYPE-2

The DBGSTR register is a debug status register to notify OCD status to programs. This register is monitoring Debug connecting state.

2.8.5.3 DBGSTOPCR : Debug Stop Control Register

Base address: CPU_DBG = 0x4001_B000
 CPU_DBG_NS = 0x5001_B000

Offset address: 0x010

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	DBGS TOP_ RER	—	—	—	—	—	—	DBGS TOP_ PVD	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DBGS TOP_ WDT0	DBGS TOP_ I WDT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

Bit	Symbol	Function	R/W
0	DBGSTOP_IWDT	Mask bit for IWDT reset/interrupt in the OCD run mode In the OCD break mode, the reset/interrupt is masked and IWDT counter is stopped, regardless of this bit value. 0: Enable IWDT reset/interrupt 1: Mask IWDT reset/interrupt and stop IWDT counter	R/W
1	DBGSTOP_WDT0	Mask bit for WDT reset/interrupt in the OCD run mode In the OCD break mode, the reset/interrupt is masked and WDT counter is stopped, regardless of this bit value. 0: Enable WDT reset/interrupt 1: Mask WDT reset/interrupt and stop WDT counter	R/W
16:2	—	These bits are read as 0. The write value should be 0.	R/W
17	DBGSTOP_PVD	Mask bit for PVDn (n = 1, 2) reset/interrupt 0: Enable PVDn (n = 1, 2) reset/interrupt 1: Mask PVDn (n = 1, 2) reset/interrupt	R/W
23:18	—	These bits are read as 0. The write value should be 0.	R/W
24	DBGSTOP_RER	Mask bit for SRAM parity error reset/interrupt 0: Enable SRAM parity error reset/interrupt 1: Mask SRAM parity error reset/interrupt	R/W
31:25	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5, P-TYPE-2

Debug Stop Control Register (DBGSTOPCR) specifies functional stop during debugging.

This register is valid only when any of the following conditions are true:

- CDBGPWRUPREQ is 1, and AL is AL2 or AL1
- OFS1(_SEC).SWDBG is 0, and DBGAUTH0.DBGEN0 is 1

When none of the above conditions are true, the MCU ignores this register setting and considers all bits to be 0.

2.8.5.4 DBGAUTH0 : Debug Authentication Control Register 0

Base address: CPU_DBG = 0x4001_B000
CPU_DBG_NS = 0x5001_B000

Offset address: 0x020

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	SWDBG	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEVIC EEN
Value after reset:	OFS1(_SEC) _SWD BG	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DBGE NAP	—	—	—	NIDEN 0	—	—	—	DBGE NO
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DBGEN0*1	CPU invasive debug enable 0: Disabled 1: Enabled	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
4	NIDEN0	CPU non-invasive debug enable 0: Disabled 1: Enabled	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W
8	DBGENAP*1	CPU AHB-AP (AP0) debug enable 0: Disabled 1: Enabled	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W
16	DEVICEEN*2	APB-AP (AP1) authentication 0: Disabled 1: Enabled	R/W
30:17	—	These bits are read as 0. The write value should be 0.	R/W
31	SWDBG	Software control of debug function 0: Disabled 1: Enabled	R/W

Note: S-TYPE-3 (DEBUGSAR.DBGSA0), P-TYPE-2

Note 1. When AL2 or AL1, the MCU ignores this bit and considers as if it is set to 1.

Note 2. When AL2, the MCU ignores this bit and considers as if it is set to 1.

When software control of debug function (OFS1(_SEC).SWDBG=0) is enabled, non-secure invasive and non-invasive debug function of processor enabling can be controlled by DBGEN0 and NIDEN0 bits of the register.

Non-secure AHB-AP access can be enabled by DBGENAP bit of the register.

Access from APB-AP to Coresight components through Debug APB can be enabled by DEVICEEN bit of the register.

When OFS1(_SEC).SWDBG is 1, the MCU ignores this register and considers as if it is set to its initial value.

Note: MCU behaves according to DBGSTOPCR, SYOCD CR, MCUCTRL when DBGEN0 = 1, and also according to TRPORTCR when (DBGEN0 = 1 or NIDEN0 = 1) is true.

2.8.5.5 DBGAUTH1 : Debug Authentication Control Register 1

Base address: CPU_DBG = 0x4001_B000

Offset address: 0x024

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SPIDENAP	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	—	These bits are read as 0. The write value should be 0.	R/W
8	SPIDENAP*1	CPU AHB-AP (AP0) debug enable 0: Disabled 1: Enabled	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-6, P-TYPE-2

Note 1. When AL2, the MCU ignores this bit and considers as if it is set to 1.

When software control of debug function (OFS1(_SEC).SWDBG = 0) is enabled, secure access from AHB-AP port to D-AHB can be enabled by SPIDENAP bit of the register.

When OFS1(_SEC).SWDBG is 1, the MCU ignores this register and considers as if it is set to its initial value.

2.8.5.6 CACHEDBGCR : Cache Debug Control Register

Base address: CPU_DBG = 0x4001_B000

Offset address: 0x040

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	L1RSTDIS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	L1RSTDIS	Disable L1 cache automatic invalidation 0: Enable automatic invalidation of the L1 cache 1: Disable automatic invalidation of the L1 cache	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-6, P-TYPE-2

The CACHEDBGCR register can control Disable L1 cache invalidation out of reset during debugging.

Note: The setting of the register is valid only if any of the following conditions apply:

- CDBGPWRUPREQ = 1 and AL is AL2 or AL1
- OFS1(_SEC).SWDBG is 0 and DBGAUTH0.DBGEN0 or DBGAUTH0.NIDEN0 is 1

Note: See section 4.6 Cache Initialization Signal in [section 2.14. References \[2\]](#) before writing to this bit.

2.8.5.7 TRPORTCR : Trace Port Control Register

Base address: CPU_DBG = 0x4001_B000
CPU_DBG_NS = 0x5001_B000

Offset address: 0x030

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	DRV[1:0]	—	—	OE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0

Bit	Symbol	Function	R/W
0	OE	Data Out Enable bit indicates whether Trace Clock, Trace Data, and SWO outputs are enabled. 0: Output disabled 1: Output enabled	R/W
1	—	This bit is read as 0. The write value should be 0.	R/W
3:2	DRV[1:0]	Port Drive Capability Control indicates trace port buffer speed: 0 0: Low-drive 0 1: Middle-drive 1 0: High-speed high-drive 1 1: High-drive	R/W
31:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5, P-TYPE-2

The TRPORTCR register controls trace port of tracing data.

Note: The setting of the register is valid only if any of the following conditions apply:

- CDBGPWRUPREQ = 1, and AL is AL2 or AL1.
- OFS1(_SEC).SWDBG is 0, and DBGAUTH0.DBGEN0 or DBGAUTH0.NIDEN0 is 1.

2.8.5.8 DBGMOCOEN : MOCO Enable Request Register for Debug

Base address: CPU_DBG = 0x4001_B000
CPU_DBG_NS = 0x5001_B000

Offset address: 0x300

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MOCO EN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MOCOEN	MOCO enable request 0: No request MOCO enable 1: Request MOCO enable	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5, P-TYPE-2

The DBGMOCOEN register enables MOCO operation. When external debugger is not connected, the register does not have any effect. During P/E mode, the value of this register cannot be updated.

Note: Usage of the register:

When only non-secure debug function is enabled, the debugger cannot set clock-related registers that are protected by TrustZone. Therefore, writing to flash memory (by setting software breakpoint) is not available if the FCLK frequency is not at minimum required speed for programming flash operation.

In this case, by setting DBGMOCOEN and DBGFCLKSEL, the flash sequency clock can be changed to MOCO to enable writes to flash memory.

2.8.5.9 DBGFCLKSEL : Flash Sequencer Clock Select Register for Debug

Base address: CPU_DBG = 0x4001_B000
CPU_DBG_NS = 0x5001_B000

Offset address: 0x310

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FCLK SEL
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FCLKSEL	Flash sequencer clock select 0: FCLK 1: MOCO	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5, P-TYPE-2

The DBGFCLKSEL register switches the flash P/E sequencer clock. When external debugger is not connected, the register does not have any effect. During P/E mode, the value of this register cannot be updated.

Flash P/E is available with MOCO instead of FCLK even when FCLK is not in the range to support flash P/E. The following flow shows how to use MOCO instead of FCLK.

1. Wait until CPU is in debug state (DHCSR.S_HALT = 1).
2. Check that the flash is not in P/E mode (when flash is in P/E mode, flash P/E by the external host cannot be performed.)
3. Set DBGMOCOEN.MOCOEN to 1.
4. Wait for MOCO oscillation settling time.
5. Set DBGFCLKSEL.FCLKSEL to 1.
6. Perform flash P/E.
7. Clear DBGFCLKSEL.FCLKSEL to 0.
8. Clear DBGMOCOEN.MOCOEN to 0.
9. Restart the CPU.

Note: Usage of the register:

When only non-secure debug function is enabled, the debugger cannot set clock-related registers that are protected by TrustZone. Therefore, writing to flash memory (by setting software breakpoint) is not available if the FCLK frequency is not at minimum required speed for programming flash operation.

In this case, by setting DBGMOCOEN and DBGFCLKSEL, the flash sequency clock can be changed to MOCO to enable writes to flash memory.

2.8.5.10 CoreSight Component Registers

DBGREG has CoreSight Component Registers defined in ARM CoreSight Architecture. [Table 2.20](#) shows the list of the registers.

Table 2.20 CoreSight component registers

Name	Address	Access size	R/W	Initial value
PID4	0x4001_BFD0	32 bits	Read-only	0x00000004
PID5	0x4001_BFD4	32 bits	Read-only	0x00000000
PID6	0x4001_BFD8	32 bits	Read-only	0x00000000
PID7	0x4001_BFDC	32 bits	Read-only	0x00000000
PID0	0x4001_BFE0	32 bits	Read-only	0x00000005
PID1	0x4001_BFE4	32 bits	Read-only	0x00000030
PID2	0x4001_BFE8	32 bits	Read-only	0x0000000A
PID3	0x4001_BFEC	32 bits	Read-only	0x00000000
CID0	0x4001_BFF0	32 bits	Read-only	0x0000000D
CID1	0x4001_BFF4	32 bits	Read-only	0x000000F0
CID2	0x4001_BFF8	32 bits	Read-only	0x00000005
CID3	0x4001_BFFC	32 bits	Read-only	0x000000B1

Note: S-TYPE-5, P-TYPE-2

2.8.6 OCDREG

OCDREG is a register module provided for OCD (On-Chip Debug) Emulator functionalities. OCDREG is implemented as a CoreSight compliant component. [Table 2.21](#) shows register list of OCDREG.

Table 2.21 Register list of OCDREG

Name	Symbol	DAP port	OCD Address	CPU Address	Access size	R/W
MCU Status Register	MCUSTAT	Port 1	0x8000_0400	Cannot be accessed from CPU	32 bits	Read only
MCU Control Register	MCUCTRL	Port 1	0x8001_1004	0x4001_1004 (Secure) 0x5001_1004 (Non-secure)	32 bits	Read/Write
JTAG Boot Mode Entry Register	JBMDR	Port 1	0x8001_1100	0x4001_1100 (Secure) 0x5001_1100 (Non-secure)	32 bits	Read/Write
JTAG Boot Receive Data Register	JBRDR	Port 1	0x8001_1120	0x4001_1120 (Secure) 0x5001_1120 (Non-secure)	32 bits	Read/Write
JTAG Boot Transmit Data Register	JBTDNR	Port 1	0x8001_1130	0x4001_1130 (Secure) 0x5001_1130 (Non-secure)	32 bits	Read/Write
JTAG Boot Status Register	JBSTR	Port 1	0x8001_1140	0x4001_1140 (Secure) 0x5001_1140 (Non-secure)	32 bits	Read/Write
JTAG Boot Interrupt Control Register	JBICR	Port 1	0x8001_1150	0x4001_1150 (Secure) 0x5001_1150 (Non-secure)	32 bits	Read/Write

Note: Accesses to OCDREG from CPU is only permitted by privileged access.
Accesses to OCDREG from external debug through APB-AP is permitted by either Privileged access or Unprivileged access.

Note: Do not write to MCUCTRL using JTAG/SWD while the CPU is accessing MCUCTRL, JBMDR, JBRDR, JBTDR or JBICR.
 Do not write to JBMDR using JTAG/SWD except during RES pin reset.
 Do not write to JBRDR using JTAG/SWD while the CPU is accessing MCUCTRL, JBMDR, JBRDR, JBTDR or JBICR.
 Do not write to JBTDR using JTAG/SWD.
 Do not write to JBSTR using JTAG/SWD.
 Do not write to JBICR using JTAG/SWD.

2.8.6.1 MCUSTAT : MCU Status Register

Base address: 0x8000_0400*1

Offset address: 0x000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	DSTB Y3	DSTB Y2	DSTB Y1	—	—	—	STBY1
Value after reset:	0	0	0	0	0	0	0	0	0	x	x	x	0	0	x	x
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	AL[1:0]	—	—	—	—	—	—	—	—	—	—	CPUS TOPCLK	SLEEP	—
Value after reset:	1	0	0	0	0	0	0	1	0	0	0	0	0	x	x	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0.	R
1	SLEEP	Indicate CPU is in CPU Sleep mode 0: CPU is not in CPU Sleep mode 1: CPU is in CPU Sleep mode	R
2	CPUSTOPCLK	Indicate CPU clock is stopped 0: CPU clock is not stopped. It indicates that the MCU is in Normal or CPU Sleep mode. 1: CPU clock is stopped. It indicates that the MCU is in CPU Deep Sleep mode, Software Standby mode, or Deep Software Standby mode.	R
7:3	—	These bits are read as 0.	R
8	—	This bit is read as 1.	R
11:9	—	These bits are read as 0.	R
13:12	AL[1:0]	AL monitor 0x0: AL0 0x1: AL1 0x3: AL2	R
14	—	This bit is read as 0.	R
15	—	This bit is read as 1.	R
16	STBY1	Indicate the MCU is in Software Standby mode 0: MCU is not in Software Standby mode 1: MCU is in Software Standby mode	R
19:17	—	These bits are read as 0.	R
20	DSTBY1	Indicate the MCU is in Deep Software Standby mode 1 0: MCU is not in Deep Software Standby mode 1 1: MCU is in Deep Software Standby mode 1	R
21	DSTBY2	Indicate the MCU is in Deep Software Standby mode 2 0: MCU is not in Deep Software Standby mode 2 1: MCU is in Deep Software Standby mode 2	R
22	DSTBY3	Indicate the MCU is in Deep Software Standby mode 3 0: MCU is not in Deep Software Standby mode 3 1: MCU is in Deep Software Standby mode 3	R
31:23	—	These bits are read as 0.	R

Note: S-TYPE-5, P-TYPE-2

Bit	Symbol	Function	R/W
7:0	KEY[7:0]	Mode entry key Pin reset releases after 0xA5 is set, then system enters the JTAG boot mode. MDSR.JBOTS = 1 when system transitions to JTAG boot mode.	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5, P-TYPE-2

Note 1. This address is accessed from external debugger.

The JBMDR register sets command from the debugger.

This register is initialized by the factors listed Table 5.2 in section 5, Resets, but also initialized by debugger disconnection.

2.8.6.3.2 JBRDR : JTAG Boot Receive Data Register

Base address: OCD_CPU = 0x4001_1000
OCD_CPU_NS = 0x5001_1000
OCD_DAP = 0x8001_1000^{*1}

Offset address: 0x120

Bit position: 31 0

Bit field: RDAT[31:0]

Value after reset: 0

Bit	Symbol	Function	R/W
31:0	RDAT[31:0]	Received data register R/W is possible for both the external host and CPU, but the following usage is recommended: W: External host R: CPU (Boot firmware) When JBSTR.RDF = 1, write is not possible and an error occurs.	R/W

Note: S-TYPE-5, P-TYPE-2

Note 1. This address is accessed from external debugger.

The JBRDR register is used for receiving data from the debugger.

2.8.6.3.3 JBTDR : JTAG Boot Transmit Data Register

Base address: OCD_CPU = 0x4001_1000
OCD_CPU_NS = 0x5001_1000
OCD_DAP = 0x8001_1000^{*1}

Offset address: 0x130

Bit position: 31 0

Bit field: TDAT[31:0]

Value after reset: 0

Bit	Symbol	Function	R/W
31:0	TDAT[31:0]	Transmitted data register R/W is possible for both the external host and CPU, but the following usage is recommended: W: CPU (Boot firmware) R: External host When JBSTR.TDE = 1, read is not possible and an error occurs.	R/W

Note: S-TYPE-5, P-TYPE-2

Note 1. This address is accessed from external debugger.

The JBTDR register is used for transmitting data to the debugger.

2.8.6.3.4 JBSTR : JTAG Boot Status Register

Base address: OCD_CPU = 0x4001_1000
 OCD_CPU_NS = 0x5001_1000
 OCD_DAP = 0x8001_1000*1

Offset address: 0x140

Bit position: 31

1 0

Bit field:

Value after reset: 0 1 0

Bit	Symbol	Function	R/W
0	RDF	Receive buffer full 0: No receiving data 1: There is receiving data	R/W
1	TDE	Transmit data empty 0: There is data transmission 1: No data transmission	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5, P-TYPE-2

Note 1. This address is accessed from external debugger.

The JBSTR register is used for monitoring booting status.

RDF flag (Receive buffer full)

The RDF bit indicates receive buffer is full or not.

[Set conditions]

- Read access to JBTDR
- Write 1 to JBSTR.RDF

[Clear conditions]

- Write access to JBTDR
- Write 0 to JBSTR.RDF

TDE flag (Transmit data empty)

The TDE bit indicates transmit data is empty or not.

[Set conditions]

- Read access to JBTDR
- Write 1 to JBSTR.TDE

[Clear conditions]

- Write access to JBTDR
- Write 0 to JBSTR.TDE

2.8.6.3.5 JBICR : JTAG Boot Interrupt Control Register

Base address: OCD_CPU = 0x4001_1000
 OCD_CPU_NS = 0x5001_1000
 OCD_DAP = 0x8001_1000*1

Offset address: 0x150

Bit position: 31

0

Value after reset: 0

Bit	Symbol	Function	R/W
0	RDFIE	Receive buffer full interrupt enabled 0: Interrupt request disabled by RDF = 1 1: Enable interrupt request by RDF = 1	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5, P-TYPE-2

Note 1. This address is accessed from external debugger.

The JBICR register is used for controlling interrupt during JTAG boot.

2.8.6.4 CoreSight Component Registers

OCDREG has CoreSight Component Registers defined in ARM CoreSight Architecture. [Table 2.22](#) shows the list of the registers.

See [section 2.14. References \[7\]](#) for the detail of each register

Table 2.22 CoreSight component registers

Name	Address	Access size	R/W	Initial value
PID4	0x8001_1FD0	32 bits	Read-only	0x00000004
PID5	0x8001_1FD4	32 bits	Read-only	0x00000000
PID6	0x8001_1FD8	32 bits	Read-only	0x00000000
PID7	0x8001_1FDC	32 bits	Read-only	0x00000000
PID0	0x8001_1FE0	32 bits	Read-only	0x00000004
PID1	0x8001_1FE4	32 bits	Read-only	0x00000030
PID2	0x8001_1FE8	32 bits	Read-only	0x0000000A
PID3	0x8001_1FEC	32 bits	Read-only	0x00000000
CID0	0x8001_1FF0	32 bits	Read-only	0x0000000D
CID1	0x8001_1FF4	32 bits	Read-only	0x000000F0
CID2	0x8001_1FF8	32 bits	Read-only	0x00000005
CID3	0x8001_1FFC	32 bits	Read-only	0x000000B1

Note: S-TYPE-5, P-TYPE-2

2.9 CoreSight Cross Trigger Interface (CTI)

Table 2.23 CTI channel

Number of CTI channel	CTITRIGIN		CTITRIGOUT	
	Channel No.	Signal	Channel No.	Signal
CTI	0	ACQCOMP	0	—
	1	FULL	1	—
	2	—	2	ETB FLUSHIN
	3	—	3	ETB TRIGIN
	4	—	4	—
	5	—	5	—
	6	—	6	—
	7	—	7	—
CTI0	0	Processor Halted	0	Processor debug request
	1	DWT Comparator Output 0	1	Processor Restart
	2	DWT Comparator Output 1	2	CTIIRQ[0] (connected to ICU0)
	3	DWT Comparator Output 2	3	CTIIRQ[1] (connected to ICU0)
	4	ETM Event Output 0	4	ETM Event Input 0
	5	ETM Event Output 1	5	ETM Event Input 1
	6	—	6	ETM Event Input 2
	7	—	7	ETM Event Input 3

The MCU supports processor CTI0 and CoreSight Common CTI which are implemented in Debug module. The ICU setting is necessary when CTIIRQ is used.

2.10 CoreSight ATB Funnel

The MCU has one CoreSight ATB funnel. The funnel has two ATB slaves and one ATB master, and it is used to select the debug trace sources from ETM and ITM to ETB. [Figure 2.3](#) shows the CoreSight ATB connection in the MCU.

Figure 2.3 CoreSight ATB connection in the MCU

Table 2.24 shows funnel ATB slave connection.

Table 2.24 Funnel ATB slave connection.

ATB slave number	Connected trace source
#0	CPU-ITM
#1	CPU-ETM

See section 2.14. References [5] for detail of ATB and Funnel.

2.11 SysTick System Timer

The MCU has two SysTick system timers, secure SysTick and non-secure SysTick.

The SysTick source is CPUCLK or SYSTICKCLK (MOCO/8). When the SysTick source is SYSTICKCLK (MOCO/8), the CPUCLK frequency must be 2 MHz or higher.

Figure 2.4 shows the SysTick Timer block diagram.

Figure 2.4 SysTick Timer block diagram

2.12 CoreSight Timestamp Generator

The MCU has a CoreSight Timestamp Generator to provide timestamp to ITM and ETM.

The timestamp is generated by a 64-bit counter operating with ICLK/2.

See [section 2.14. References \[5\]](#) for detail.

2.13 OCD Emulator Connection

In this product, the MCU confirms access permission for MCU resources by checking the current authentication level stored in OCDREG.

There are two ways to control authentication level:

- Through JTAG/SWD. See [Figure 2.5](#).
- Using software. See [Figure 2.6](#).

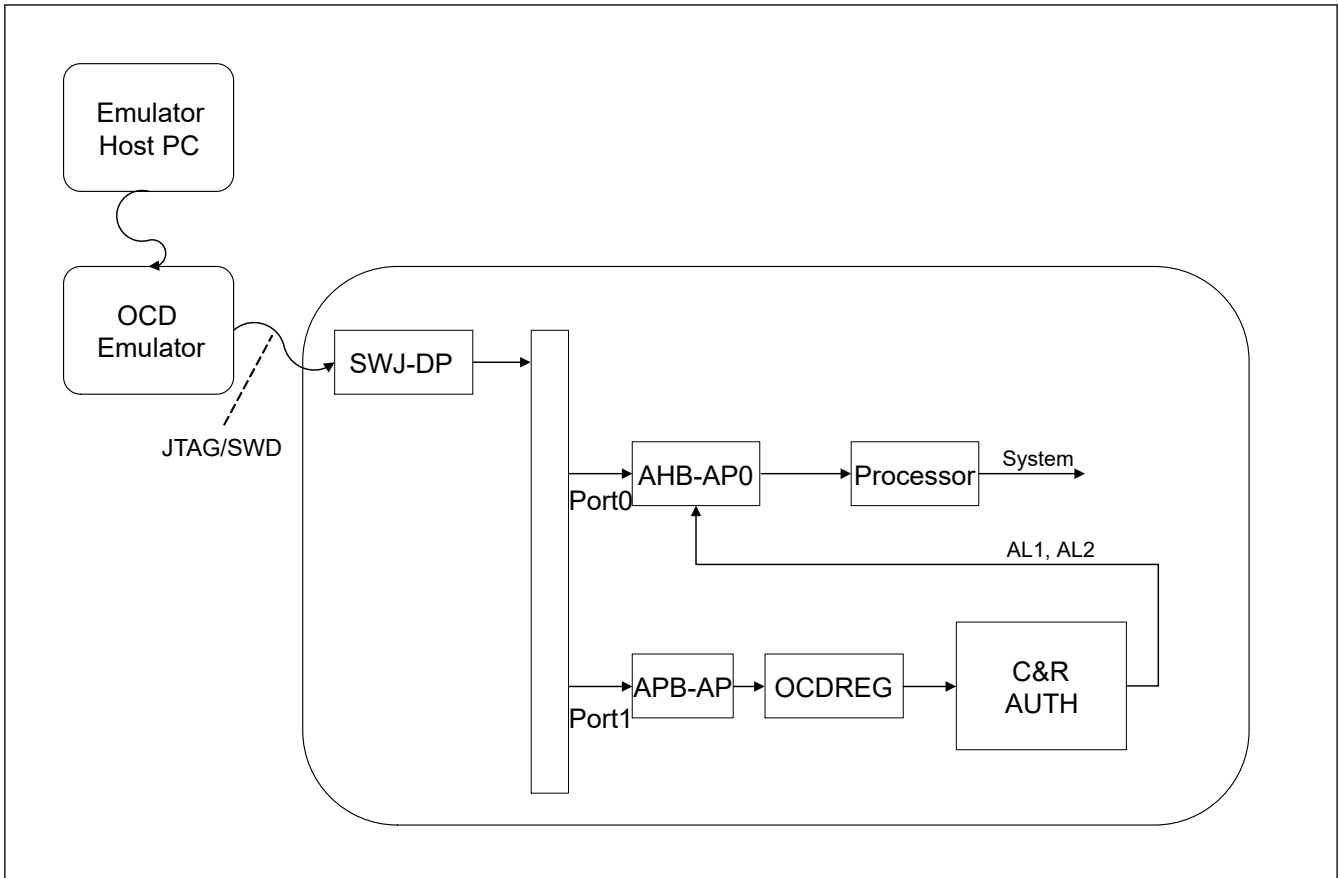

Figure 2.5 Control authentication level through JTAG/SWD

Figure 2.6 Control authentication level using software

2.13.1 SYOCD CR.DBGEN

See [section 2.7.3.1. Low power mode](#) for details.

2.13.2 Restriction in OCD Emulator Connecting

There are some restrictions regarding emulator access. This section describes those restrictions.

2.13.3 Starting Connection While in Low Power Mode

When starting a JTAG/SWD connection from an OCD emulator, the MCU must be in Normal, CPU Sleep, or CPU Deep Sleep mode. If the MCU is in Software Standby or Deep Software Standby mode, the OCD emulator can cause the MCU to hang.

2.13.4 Low Power Mode Change During Debugging

When the MCU is in OCD mode, the low power mode can be changed. However, system bus access from AHB-AP is prohibited in Deep Sleep, Software Standby, or Deep Software Standby mode. Only SWJ-DP, APB-AP, and OCDREG can be accessed from OCD emulator in these modes. [Table 2.25](#) shows the limitations.

Table 2.25 Low power mode change during debugging (1 of 2)

Current mode	Start OCD emulator connection	Change low power mode	Access AHB-AP and system bus	Access APB-AP and OCDREG
Normal	Available	Available	Available	Available
Sleep	Available	Available	Available	Available
Deep Sleep	Available	Available	N/A	Available
Software Standby	N/A	Available	N/A	Available

Table 2.25 Low power mode change during debugging (2 of 2)

Current mode	Start OCD emulator connection	Change low power mode	Access AHB-AP and system bus	Access APB-AP and OCDREG
Deep Software Standby	N/A	Available	N/A	Available

2.13.5 Connecting Sequence and JTAG/SWD Authentication

This section provides steps on how to authenticate the MCU. First, the section introduces which mechanism is used to authenticate the MCU. Next, using the previously described mechanism, the section describes steps for connecting sequence and authenticating the MCU using JTAG/SWD. See [section 2.8.5. DBGREG](#) and [section 2.8.6. OCDREG](#) for details about the registers control JTAG/SWD authentication.

2.13.5.1 JTAG/SWD Authentication Mechanism

The common platform of the MCU supports challenge-response authentication.

For challenge-response authentication, Boot FW authenticates.

2.13.5.2 Connecting Sequence and JTAG/SWD Authentication

For challenge-response authentication:

1. Connect the OCD debugger to the MCU through the JTAG or SWD interface.
2. Set up SWJ-DP to access DAP bus.
In the setup, the OCD emulator must assert CDBGPWRUPREQ in the SWJDP Control Status Register, and then wait until CDBGPWRUPACK in the same register is asserted.
3. Set the APB-AP to access OCDREG. This APB-AP is connected to DAP bus port 1.
4. Set boot mode request.
5. Negate RES.
6. Check MCUSTAT.AL.
If MCUSTAT.AL is higher than or equal to request AL, there is no need to authenticate.
7. Set authentication data.
8. Check MCUSTAT.AL.
 - (a) If MCUSTAT.AL does not request AL, authentication failed.
 - (b) If retry authentication: go to step 7.
9. Assert RES to move to single chip mode.
10. Set up the AHB-AP to access the system address space. The AHB-AP is connected to DAP bus port 0.
11. Start accessing the CPU debug resources using the AHB-AP.

2.15 Usage Notes

2.15.1 Restrictions for OSPI

There are restrictions to using OSPI, see [section 33.3.8.3. Memory Write Combination Mode](#) and [section 33.3.8.5. Restriction in 8D-8D-8D profile 1.0 format](#).

3. Operating Modes

3.1 Overview

[Table 3.1](#) shows the selection of operating modes by the mode-setting pin(MD pin) and JTAG accessible command. For details, see [section 3.3. Details of Operating Modes](#).

Table 3.1 Selection of operating modes by the mode-setting pin

Mode-setting pin (MD)	Operating mode	On-chip Flash	External bus
1	Single chip mode/ JTAG Boot Mode	Enable	Disable
0	SCI / USB boot mode	Enable	Disable

3.2 Operating Mode Types and Selection

[Table 3.1](#) show the relationship between levels on the mode-setting pins (MD) on release from the reset state and the operating mode selected at that time. For details on each of the operating modes, see [section 3.3. Details of Operating Modes](#). Operation starts with the on-chip Flash enabled and the external bus disabled, regardless of the mode in which operation started.

3.3 Details of Operating Modes

3.3.1 Single-Chip Mode

In single-chip mode, all I/O pins are available for use as input or output port, inputs or outputs for peripheral functions, or as interrupt inputs. When a reset is released while the MD pin is high, the MCU starts in single-chip mode and the on-chip flash is enabled.

3.3.2 JTAG Boot Mode

In this mode, the on-chip flash memory programming routine (JTAG boot program), stored in the boot area within the MCU, is used. The on-chip flash, including code flash memory and data flash memory, can be modified from outside the MCU by using the JTAG and SWD interface. CSW.DbgSwEnable bit in APB-AP Control/Status Word register must be 1 in this mode.

To enter this mode, it is necessary to input the request from the JTAG and SWD-I/F during RES-pin reset.

3.3.3 SCI Boot Mode

In this mode, the on-chip flash memory programming routine (SCI boot program), stored in a dedicated area within the MCU, is used. The on-chip flash including the code flash memory and data flash memory can be modified from outside the MCU by using a universal asynchronous receiver/transmitter (UART) SCI. For details, see [section 47, Flash Memory](#). The MCU starts in SCI boot mode if the MD pin is held low on release from the reset state.

3.3.4 USB Boot Mode

In this mode, the on-chip flash memory programming routine (USB boot program), stored in the boot area within the MCU, is used. The on-chip flash, including the code flash memory and data flash memory, can be modified from outside the MCU by using the USB. For details, see [section 47, Flash Memory](#). The MCU starts in USB boot mode if the MD pin is held low on release from the reset state.

3.4 Operating Modes Transitions

3.4.1 Operation modes and the relationship of Mode Transition

[Figure 3.1](#) shows that the operation modes and the relationship of mode transition. Operating mode can be transitioned in the direction of the arrow at the figure.

JTAG Boot mode is not possible using POR.

Figure 3.1 Operation modes and the relationship of mode transition

4. Address Space

4.1 Address Space

The MCU supports a 4 GB linear address space ranging from 0x0000_0000 to 0xFFFF_FFFF that can contain both program and data. In the address from 0x0000_0000 to 0x5FFF_FFFF, secure and non-secure region are isolated by using bit 28 of the address. For detail on the security attributes, see [section 38.3. Arm Security Features](#). [Figure 4.1](#) shows the memory map.

Address Map		IDAU/MSAU Security_Attribution
0xFFFF_FFFF	Arm® Cortex®-M85	
0xE010_0000	Private peripheral bus	
0xE000_0000	Reserved area*2	
0xA000_0000	External address space (OSPI area)	
0x8000_0000	Reserved area*2	
0x7000_0000	External address space (SDRAM area)	Non-secure
0x6800_0000	External address space (CS area)	
0x6000_0000	Reserved area*2	
0x5050_0000	Peripheral I/O registers	
0x5020_0000	Reserved area*2	
0x5012_0000	Flash I/O registers	
0x5010_0000	Peripheral I/O registers	
0x5000_0000	Reserved area*2	
0x4050_0000	Peripheral I/O registers	Secure
0x4020_0000	Reserved area*2	
0x4012_0000	Flash I/O registers	
0x4010_0000	Peripheral I/O registers	
0x4000_0000	Reserved area*2	
0x3703_0400	On-chip flash (option-setting memory)	Non-secure
0x3703_0050	Reserved area*2	
0x3700_3000	On-chip flash (data flash)	
0x3700_0000	Reserved area*2	
0x3600_0400	Standby SRAM	
0x3600_0000	Reserved area*2	
0x320E_0000	On-chip SRAM	
0x3204_0000	Reserved area*2	
0x3000_4000	DTCM	
0x3000_0000	Reserved area*2	
0x2703_0400	On-chip flash (option-setting memory)	Non-secure callable for CPU
0x2703_0050	Reserved area*2	
0x2700_3000	On-chip flash (data flash)	
0x2700_0000	Reserved area*2	
0x2600_0400	Standby SRAM	
0x2600_0000	Reserved area*2	
0x220E_0000	On-chip SRAM	
0x2204_0000	Reserved area*2	
0x2000_4000	DTCM	Secure for other bus masters
0x2000_0000	Reserved area*2	
0x1300_A300	On-chip flash (option-setting memory)	Non-secure
0x1300_A100	Reserved area*2	
0x1300_81B4	On-chip flash (Factory Flash)	
0x1300_80F0	Reserved area*2	
0x1228_0000	On-chip flash (code flash) (read only)*1	
0x1200_0000	Reserved area*2	
0x1000_4000	ITCM	
0x1000_0000	Reserved area*2	
0x0300_A300	On-chip flash (option-setting memory)	Non-secure callable for CPU
0x0300_A100	Reserved area*2	
0x0300_81B4	On-chip flash (Factory Flash)	
0x0300_80F0	Reserved area*2	
0x0228_0000	On-chip flash (code flash) (read only)*1	Secure for other bus masters
0x0200_0000	Reserved area*2	
0x0000_4000	ITCM	
0x0000_0000	ITCM	

Note 1. See Table 4.1 and Table 4.2. The capacity of the flash differs depending on the product.
 Note 2. Do not access reserved areas.

Figure 4.1 Memory map

Table 4.1 Capacity of the code flash memory, data flash memory, and On-chip SRAM in Secure alias

Code flash memory			Data flash memory		On-chip SRAM	
Capacity	Address		Capacity	Address	Capacity	Address
	Linear mode	Dual mode (BANKSEL.BANKSWP[2:0] = 111b)				
1 MB	0x0200_0000 to 0x020F_FFFF	upper side bank 0x0220_0000 to 0x0227_FFFF lower side bank 0x0200_0000 to 0x0207_FFFF	12 KB	0x2700_0000 to 0x2700_2FFF	640 KB	0x2204_0000 to 0x220D_FFFF

Table 4.2 Capacity of the code flash memory, data flash memory, and On-chip SRAM in Non-secure alias

Code flash memory			Data flash memory		On-chip SRAM	
Capacity	Address		Capacity	Address	Capacity	Address
	Linear mode	Dual mode (BANKSEL.BANKSWP[2:0] = 111b)				
1 MB	0x1200_0000 to 0x120F_FFFF	upper side bank 0x1220_0000 to 0x1227_FFFF lower side bank 0x1200_0000 to 0x1207_FFFF	12 KB	0x3700_0000 to 0x3700_2FFF	640 KB	0x3204_0000 to 0x320D_FFFF

4.2 External Address Space

The external address space is divided into CS areas (CS0 to CS7), SDRAM area (SDCS), and OSPI areas (CS0 and CS1). The eight CS areas (CS0 to CS7) each correspond to the CS_n signal output from a CS_n (n = 0 to 7) pin. The two OSPI areas (CS0 and CS1) each correspond to the OM_CS_n signal output from a OM_CS_n (n = 0, 1) pin.

Figure 4.2 shows the address ranges associated with the individual CS areas (CS0 to CS7), SDRAM area (SDCS), and OSPI areas (CS0 and CS1).

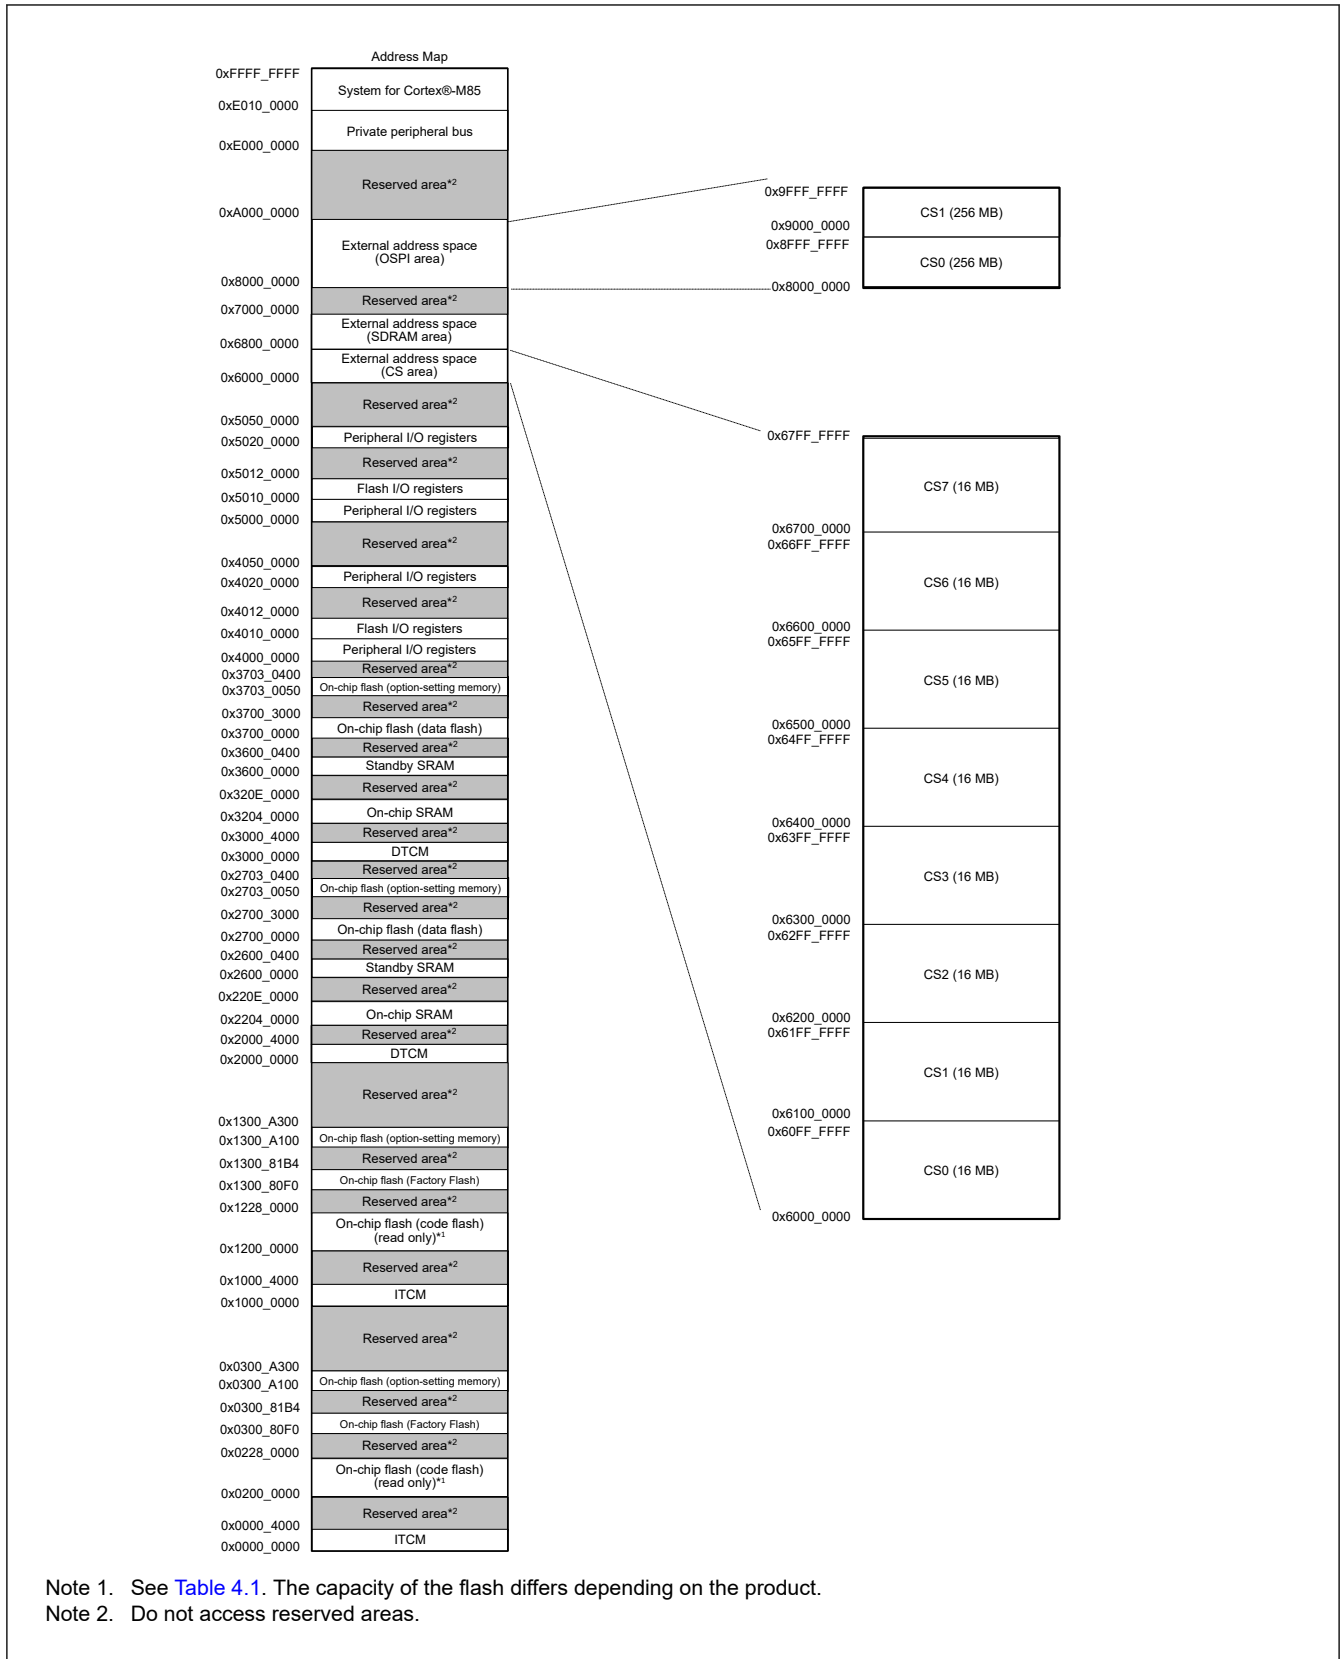

Figure 4.2 Detailed address map for CS area and OSPI area

5. Resets

5.1 Overview

This MCU provides the following 13 types of reset.

It also has a function to control the reset generation by only Secure program access.

System reset is all factors such that can initialize CPU core. All reset factors except VBATT_POR are system reset for this product.

On the other hand, CPU has a reset that initializes itself individually. That reset is not a system reset. See [section 2, CPU](#) for details.

[Table 5.1](#) lists the reset names and sources.

Table 5.1 Reset names and sources

Reset Name	Source	
System reset	RES Pin reset	The RES pin voltage input is driven low
	Power-on reset (POR)	VCC falls (voltage detection: V_{POR}) ^{*1}
	Voltage Monitor 0 reset	VCC falls (voltage detection: V_{det0}) ^{*1}
	Voltage Monitor 1 reset	VCC falls (voltage detection: V_{det1}) ^{*1}
	Voltage Monitor 2 reset	VCC falls (voltage detection: V_{det2}) ^{*1}
	Independent Watchdog Timer reset	IWDT underflow or refresh error
	Watchdog Timer reset	WDT underflow or refresh error for CPU
	CPU Lockup reset	This reset is generated when CPU encounters lockup
	Bus Error reset	BUS error (MSAU error, MMPU error, Illegal address error, STZF error, Slave Bus error, Bufferable write error)
	Common Memory Error reset	RAM error (Parity error of SRAM and Standby SRAM)
	Deep Software Standby reset	Deep Software Standby mode is canceled by an interrupt
	Software reset	Register setting (use the software reset bit AIRCR.SYSRESETREQ)
VBATT_POR reset	VBATT_R falls (voltage detection: $V_{PDR(BATR)}$) ^{*1}	

Note 1. For details on the voltages to be monitored (V_{POR} , V_{det0} , V_{det1} , V_{det2} , and $V_{PDR(BATR)}$), see [section 7, Programmable Voltage Detection \(PVD\)](#), [section 11, Battery Backup Function](#), and [section 51, Electrical Characteristics](#).

The internal state and pins are initialized by a reset. [Table 5.2](#) and [Table 5.3](#) list the targets initialized by resets.

Some of these registers are initialized when returning from Software Standby mode. See [section 10, Low Power Modes](#).

In this table, registers of modules marked as "Undesfined" in Software Standby mode are initialized.

Table 5.2 Reset detect flags initialized by each reset source (1 of 4)

Flag to be initialized	Reset source						
	RES pin reset	Power-on reset	Voltage monitor 0 reset	Independent watchdog timer reset	Watchdog timer reset	CPU Lockup reset	Voltage monitor 1 reset

Other than specified		✓	✓	✓	✓	✓	✓	✓	—

Note: ✓ : Initialized
— : Not initialized

Note 1. RTC has Software reset for RTC. Some control bits are not initialized by all types of resets. For details on the target bits, [section 24, Realtime Clock \(RTC\)](#).

Note 2. Depend on setting of DPSBYCR.IOKEEP.

Note 3. After the debugger authentication passes, setting SYOCDRCR.DBGEN to 1 does not initialize this register or the function. For details, see [section 2, CPU](#).

SOSC and LOCO can be selected as the clock sources of the RTC.

[Table 5.4](#) and [Table 5.5](#) show the states of SOSC and LOCO when a reset occurs.

Table 5.4 States of SOSC when a reset occurs

		Reset source	
		VBATT_POR reset	Other
SOSC	Enable or disable	Initialized to enable	Continue with the state that was selected before the reset occurred
	Drive capability	Initialized to standard drive capability	

Table 5.5 States of LOCO when a reset occurs

		Reset source	
		Power-on reset, Voltage-Monitoring0 reset, Deep software standby 2,3 reset	Other
LOCO	Enable or disable	Initialized to enable	Continue with the accuracy that was trimmed by LOCOUTCR
	Oscillation accuracy*1	Initialized to accuracy before trimming by LOCOUTCR (accuracy: ± 15%)	

Note 1. If the LOCO that is trimmed by LOCOUTCR is selected as the RTC source clock, please be careful that LOCO oscillation accuracy will be initialized by Power-on reset, Voltage-Monitor 0 reset and Deep software standby 2, 3 reset.

When a reset is released, reset exception handling starts. For details on the reset exception handling, see [section 5.3.12. Determination of Reset Generation Source](#).

[Table 5.6](#) lists the pin related to the reset function.

For details on the reset exception handling, see [section 5.3.12. Determination of Reset Generation Source](#).

Table 5.6 Pin related to reset

Pin name	I/O	Function
RES	Input	Reset pin

5.2 Register Descriptions

5.2.1 RSTSAR : Reset Security Attribution Register

Base address: SYSC = 0x4001_E000
 SYSC_NS = 0x5001_E000

Offset address: 0x3C4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	NONS EC2	NONS EC1	NONS EC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NONSEC0	Non-secure Attribute bit 0 Target register: Reset Status Register 0 0: Secure 1: Non-secure	R/W
1	NONSEC1	Non-secure Attribute bit 1 Target register: Reset Status Register 1 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
2	NONSEC2	Non-secure Attribute bit 2 Target register: Reset Status Register 2 0: Secure 1: Non-secure	R/W
31:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

NONSEC0 bit (Non-secure Attribute bit 0)

This bit controls the security attribute of RSTSR0.

NONSEC1 bit (Non-secure Attribute bit 1)

This bit controls the security attribute of RSTSR1.

NONSEC2 bit (Non-secure Attribute bit 2)

This bit controls the security attribute of RSTSR2.

5.2.2 RSTSR0 : Reset Status Register 0

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA40

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DPSR STF	—	—	—	PVD2 RF	PVD1 RF	PVD0 RF	PORF

6:4	—	These bits are read as 0. The write value should be 0.	R/W
7	DPSRSTF	Deep Software Standby Reset Flag 0: Deep Software Standby mode cancellation not requested by an interrupt or a reset ^{*3} . 1: Deep Software Standby mode cancellation requested by an interrupt or a reset ^{*3} .	R/W ²

Note: S-TYPE-3, P-TYPE-2

Note 1. The value after reset depends on the reset source.

Note 2. Only 0 can be written to clear the flag. The flag must be cleared by writing 0 after 1 is read.

Note 3. Independent watchdog timer reset, Voltage Monitor 1 reset, Voltage Monitor 2 reset.

PORF flag (Power-On Reset Detect Flag)

The PORF flag indicates that a power-on reset occurred.

[Setting condition]

- When a power-on reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 0 is written after 1 is read from PORF flag.

PVD0RF flag (Voltage Monitor 0 Reset Detect Flag)

The PVD0RF flag indicates that the Voltage Monitor 0 reset has occurred.

[Setting condition]

- When a voltage monitor 0 reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 0 is written after 1 is read from PVD0RF flag.

PVD1RF flag (Voltage Monitor 1 Reset Detect Flag)

The PVD1RF flag indicates that the Voltage Monitor 1 reset has occurred.

[Setting condition]

- When a voltage monitor 1 reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 0 is written after 1 is read from PVD1RF flag.

PVD2RF flag (Voltage Monitor 2 Reset Detect Flag)

The PVD2RF flag indicates that the Voltage Monitor 2 reset has occurred.

[Setting condition]

- When a voltage monitor 2 reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 0 is written after 1 is read from PVD2RF flag.

DPSRSTF flag (Deep Software Standby Reset Flag)

The DPSRSTF flag indicates that Deep Software Standby mode is canceled by an external or internal interrupt, and that an internal reset (Deep Software Standby reset) occurs when an exception from Deep Software Standby mode occurs.

[Setting condition]

- When Deep Software Standby mode is cancelled by an external or an internal interrupt. For details, see [section 10, Low Power Modes](#).

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs.
- When 0 is written after 1 is read from DPSRSTF flag.

5.2.3 RSTSR1 : Reset Status Register 1

Base address: SYSC = 0x4001_E000
 SYSC_NS = 0x5001_E000

Offset address: 0x0C0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	CMRF	—	—	—	BUSRF	—	—	—	—	—	CLU0RF	—	SWRF	WDT0RF	IWDTRF
Value after reset:	0	x*1	0	0	0	x*1	0	0	0	0	0	x*1	0	x*1	x*1	x*1

Bit	Symbol	Function	R/W
0	IWDTRF	Independent Watchdog Timer Reset Detect Flag 0: Independent watchdog timer reset not detected 1: Independent watchdog timer reset detected	R/W ²
1	WDT0RF	Watchdog Timer Reset Detect Flag 0: Watchdog timer reset not detected 1: Watchdog timer reset detected	R/W ²
2	SWRF	Software Reset Detect Flag 0: Software reset not detected 1: Software reset detected	R/W ²
3	—	This bit is read as 0. The write value should be 0.	
4	CLU0RF	CPU Lockup Reset Detect Flag 0: CPU Lockup reset not detected 1: CPU Lockup reset detected	R/W ²
9:5	—	These bits are read as 0. The write value should be 0.	R/W
10	BUSRF	Bus Error Reset Detect Flag 0: Bus error reset not detected 1: Bus error reset detected	R/W ²
13:11	—	These bits are read as 0. The write value should be 0.	R/W
14	CMRF	Common Memory Error Reset Detect Flag 0: Common memory error reset not detected 1: Common memory error reset detected	R/W ²
31:15	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note 1. The value after reset depends on the reset source.

Note 2. Only 0 can be written to clear the flag. The flag must be cleared by writing 0 after 1 is read.

IWDTRF flag (Independent Watchdog Timer Reset Detect Flag)

The IWDTRF flag indicates that an Independent watchdog timer reset occurred.

[Setting condition]

- When an independent watchdog timer reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 0 is written after 1 is read from IWDTRF flag.

WDT0RF flag (Watchdog Timer Reset Detect Flag)

The WDT0RF flag indicates that a Watchdog timer reset occurred.

[Setting condition]

- When a watchdog timer reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 0 is written after 1 is read from WDTORF flag.

SWRF flag (Software Reset Detect Flag)

The SWRF flag indicates that a Software reset occurred.

[Setting condition]

- When a software reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 0 is written after 1 is read from SWRF flag.

CLU0RF flag (CPU Lockup Reset Detect Flag)

The CLU0RF flag indicates that a CPU Lockup reset occurred.

[Setting condition]

- When a CPU Lockup reset occurs

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 0 is written after 1 is read from CLU0RF flag.

BUSRF flag (Bus Error Reset Detect Flag)

The BUSRF flag indicates that BUS error reset (MSAU error, MMPU error, Illegal address error, Slave TrustZone Filter error, Slave Bus error, Bufferable write error) occurred.

[Setting condition]

- When a bus error reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 0 is written after 1 is read from BUSRF flag.

CMRF flag (Common Memory Error Reset Detect Flag)

The CMRF flag indicates that a Common memory error reset (Parity error of SRAM and Standby SRAM) occurred.

[Setting condition]

- When a Common memory error reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 0 is written after 1 is read from CMRF flag.

There are several causes for setting this reset flag.

If you want to identify the reset factor, see [section 13, Interrupt Controller Unit \(ICU\)](#).

5.2.4 RSTSR2 : Reset Status Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA44

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	CWSF
Value after reset:	0	0	0	0	0	0	0	x ^{*1}

Bit	Symbol	Function	R/W
0	CWSF	Cold/Warm Start Determination Flag 0: Cold start 1: Warm start	R/W ²
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note 1. The value after reset depends on the reset source.

Note 2. Only 1 can be written to set the flag.

RSTSR2 determines whether a power-on reset caused the reset processing (cold start) or a reset signal input during operation caused the reset processing (warm start).

CWSF flag (Cold/Warm Start Determination Flag)

The CWSF flag indicates the type of reset processing, either cold start or warm start. CWSF flag is initialized by a power-on reset. It is not initialized by a reset signal generated by the RES pin.

[Setting condition]

- When 1 is written by software. Writing 0 to CWSF does not set it to 0.

[Clearing condition]

- When a reset listed in [Table 5.2](#) occurs.

5.2.5 SYRSTMSK0 : System Reset Mask Control Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0xAD0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	BUSM ASK	CMMA SK	—	CLU0 MASK	—	SWMA SK	WDT0 MASK	IWDT MASK
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	IWDTMASK	Independent Watchdog Timer Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
1	WDT0MASK	Watchdog Timer Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
2	SWMASK	Software Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	CLU0MASK	CPU Lockup Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W

Bit	Symbol	Function	R/W
5	—	This bit is read as 0. The write value should be 0.	R/W
6	CMMASK	Common Memory Error Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
7	BUSMASK	Bus Error Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W

Note: S-TYPE-6, P-TYPE-2

Note: Set the PRCR.PRC5 bit to 1 (write enabled) before rewriting this register.

The SYRSTMSK0 is a register that controls the occurrence of reset.

The IWDTMASK bit cannot be rewritten while the independent watchdog timer is operating. The WDT0MASK bit cannot be rewritten while the watchdog timer is operating.

5.2.6 SYRSTMSK2 : System Reset Mask Control Register 2

Base address: SYSC = 0x4001_E000

Offset address: 0xAD8

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	PVD2 MASK	PVD1 MASK
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PVD1MASK	Voltage Monitor 1 Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
1	PVD2MASK	Voltage Monitor 2 Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-6, P-TYPE-2

Note: Set the PRCR.PRC5 bit to 1 (write enabled) before rewriting this register.

The SYRSTMSK2 is a register that controls the occurrence of reset.

5.3 Operation

5.3.1 RES Pin Reset

The RES pin generates this reset. When the RES pin is driven low, all the processing in progress is aborted and the MCU enters a reset state. To successfully reset the MCU, the RES pin must be held low for the power supply stabilization time specified at power-on.

When the RES pin is driven high from low, the internal reset is canceled after the post-RES cancellation wait time (t_{RESWT}) elapses. The CPU then starts the reset exception handling.

For details, see [section 51, Electrical Characteristics](#).

5.3.2 Power-On Reset

The power-on reset circuit generates this internal reset. If the RES pin is in a high-level state when power is supplied, a power-on reset is generated.

After VCC exceeds V_{POR} and the specified period (power-on reset time) elapses, the internal reset is canceled, and the CPU starts the reset exception handling. The power-on reset time is the stabilization period for the external power supply and the MCU circuit.

After a power-on reset is generated, the PORF flag in the RSTSR0 is set to 1. The PORF flag is initialized by the RES pin reset.

Figure 5.1 shows examples of operations during a power-on reset and voltage monitor 0 reset.

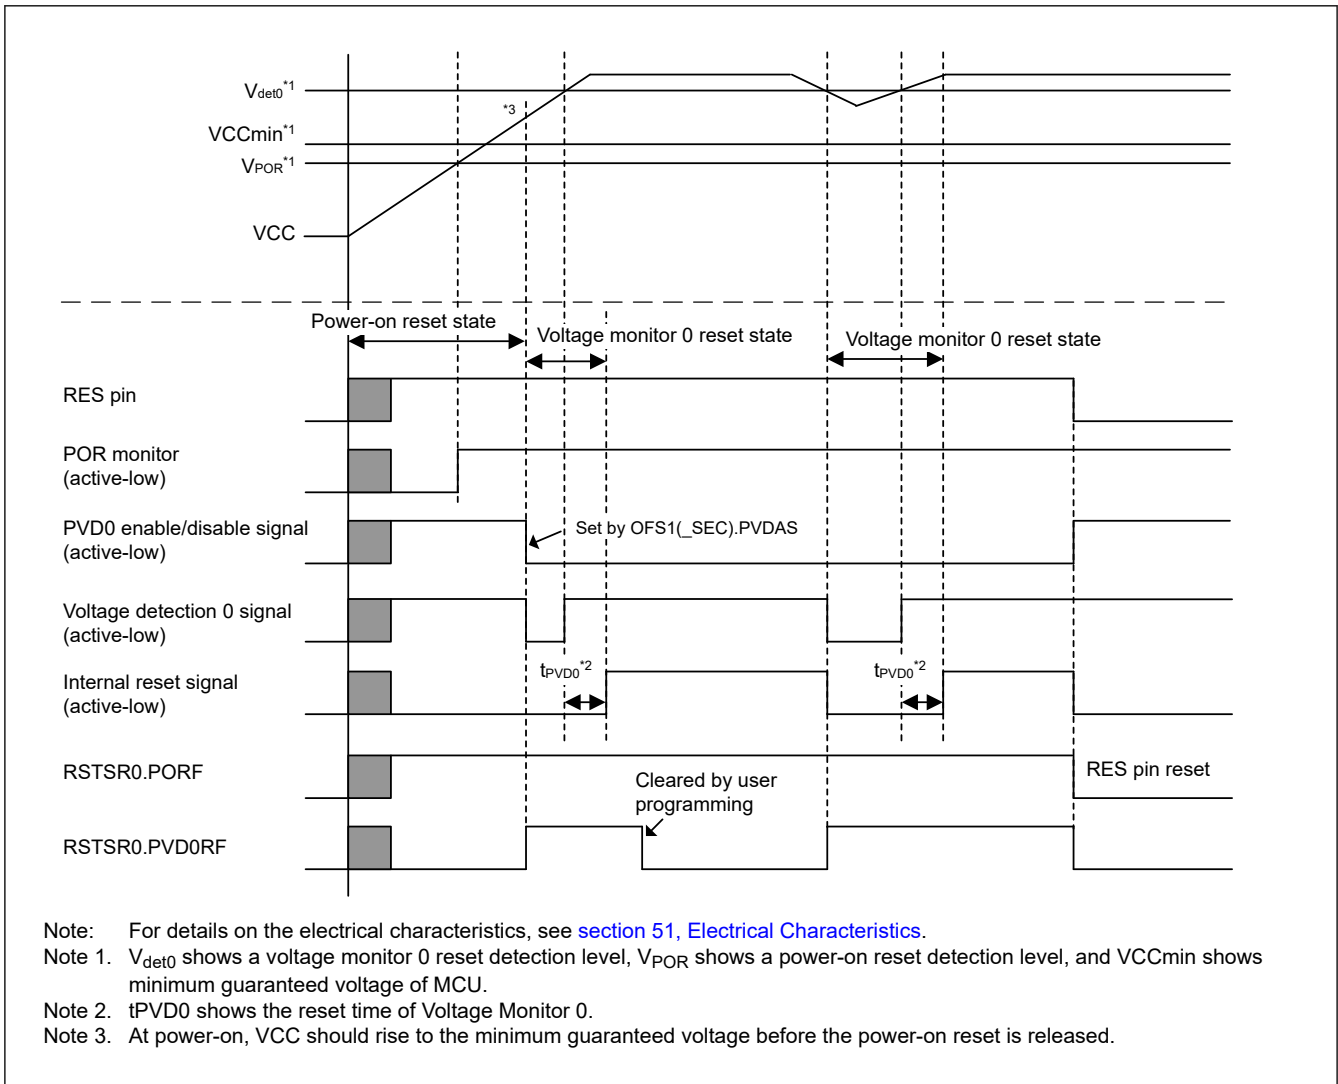

Figure 5.1 Example of operations during a power-on reset and Voltage Monitor 0 Reset

5.3.3 Voltage Monitor Reset

The voltage monitor 0 reset is an internal reset generated by the voltage monitor circuit. If the Voltage Detection 0 Circuit Start bit PVDAS) in Option Function Select Register 1 (OFS1) is 0 (voltage monitor 0 reset is enabled after a reset) and VCC falls below V_{det0}, the RSTSR0.PVD0RF flag is set to 1 and the voltage detection circuit generates a voltage monitor 0 reset. Clear the OFS1(_SEC).PVDAS bit to 0 if the voltage monitor 0 reset is to be used. After VCC exceeds V_{det0} and the voltage monitor 0 reset time (t_{PVD0}) elapses, the internal reset is canceled, and the CPU starts the reset exception handling. The V_{det0} voltage detection level can be changed by the setting in the VDSEL[1:0] bits in Option Function Select Register 1 (OFS1).

- Case of PVDmFCR.RHSEL = 0

When the Voltage Monitor 1 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 1 Circuit Mode Select bit (RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 1 Circuit Control Register 0 (PVD1CR0), the RSTSR0.PVD1RF flag is set to 1 and the voltage detection circuit generates a Voltage Monitor 1 reset if VCC falls to or below V_{det1}.

Similarly, timing for release from the Voltage Monitor 1 reset state is selectable in the Voltage Monitor 1 Reset Negate Select bit (RN) in PVD1CR0. When the RN bit is 0 and VCC falls to or below Vdet1, the CPU is released from the internal reset state and starts reset exception handling when the PVD1 reset time (t_{PVD1}) elapses after VCC rises above Vdet1. When the PVD1CR0.RN bit is 1 and VCC falls to or below Vdet1, the CPU is released from the internal reset state and starts reset exception handling when the PVD1 reset time (t_{PVD1}) elapses.

Likewise, when the Voltage Monitor 2 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 2 Circuit Mode Select bit (RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 2 Circuit Control Register 0 (PVD2CR0), the RSTSR0.PVD2RF flag is set to 1 and the voltage detection circuit generates a Voltage Monitor 2 reset if VCC falls to or below Vdet2.

Similarly, timing for release from the Voltage Monitor 2 reset state is selectable in the Voltage Monitor 2 Reset Negate Select bit (RN) in PVD2CR0. When the RN bit is 0 and VCC falls to or below Vdet2, the CPU is released from the internal reset state and starts reset exception handling when the PVD2 reset time (t_{PVD2}) elapses after VCC rises above Vdet2. When the PVD2CR0.RN bit is 1 and VCC falls to or below Vdet2, the CPU is released from the internal reset state and starts reset exception handling when the PVD2 reset time (t_{PVD2}) elapses.

- Case of PVDmFCR.RHSEL = 1.

When the Voltage Monitor 1 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 1 Circuit Mode Select bit (RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 1 Circuit Control Register 0 (PVD1CR0), the RSTSR0.PVD1RF flag is set to 1 and the voltage detection circuit generates a Voltage Monitor 1 reset if VCC rises above Vdet1.

Then the CPU is released from the internal reset state and starts reset exception handling when the PVD1 reset time (t_{PVD1}) elapses after VCC falls to or below Vdet1.

Likewise, when the Voltage Monitor 2 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 2 Circuit Mode Select bit (RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 2 Circuit Control Register 0 (PVD2CR0), the RSTSR0.PVD2RF flag is set to 1 and the voltage detection circuit generates a Voltage Monitor 2 reset if VCC rises above Vdet2.

Then the CPU is released from the internal reset state and starts reset exception handling when the PVD2 reset time (t_{PVD2}) elapses after VCC falls to or below Vdet2.

Figure 5.2 shows examples of operations during the voltage monitor 1 and 2 reset when PVDmFCR.RHSEL=0.

Figure 5.3 shows examples of operations during the voltage monitor 1 and 2 reset when PVDmFCR.RHSEL=1.

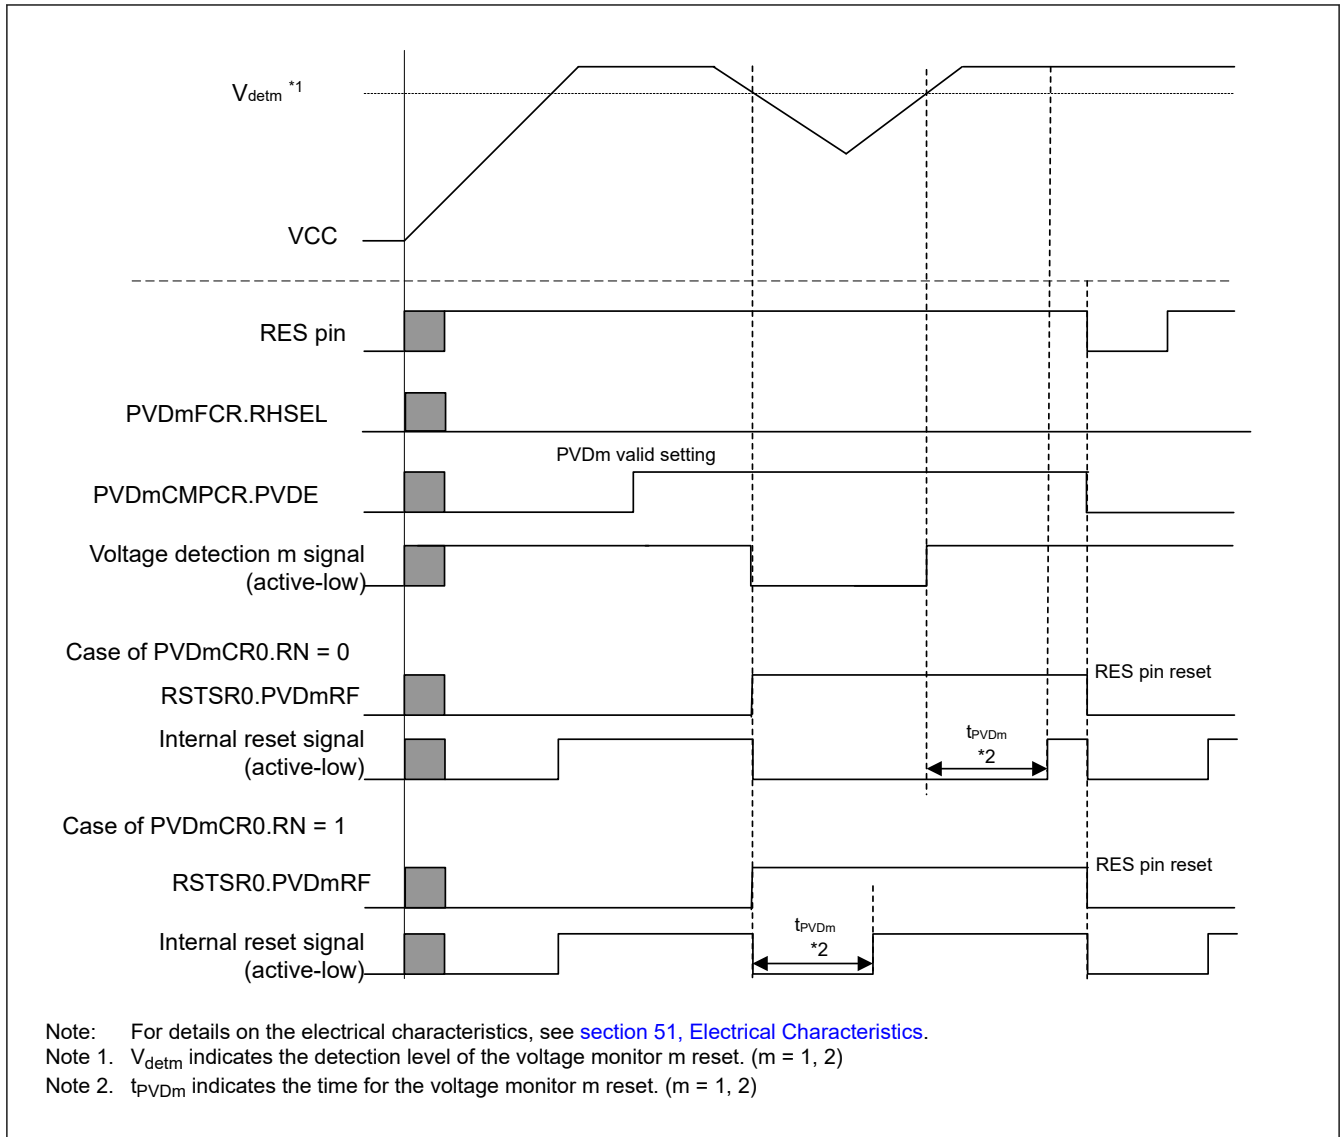

Figure 5.2 Example of operations during voltage monitor m (m = 1, 2) reset when PVDmFCR.RHSEL = 0

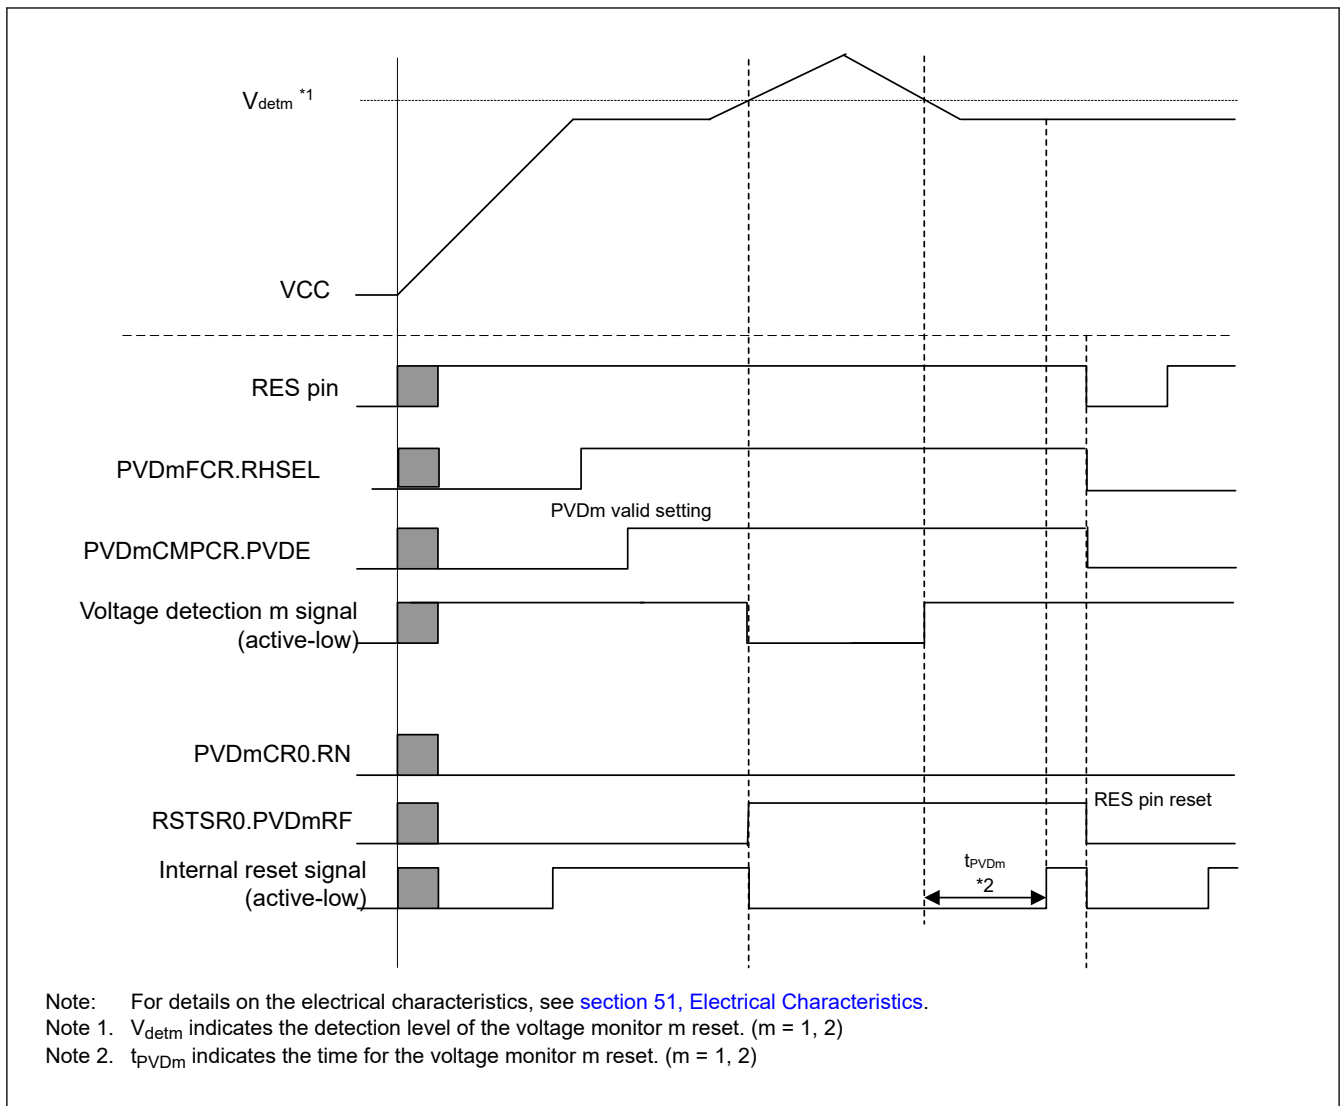

Figure 5.3 Example of operations during voltage monitor m (m = 1, 2) reset when PVDmFCR.RHSEL = 1

5.3.4 Deep Software Standby Reset

These internal resets are generated when either of the Deep Software Standby mode are canceled by an associated interrupt. The Deep Software Standby reset is canceled after t_{DSBY} (return time after Deep Software Standby mode cancellation) elapses. At the same time, Deep Software Standby mode is also canceled.

When t_{DSBYWT} (wait time after Deep Software Standby mode cancellation) elapses after Deep Software Standby mode has been canceled, the internal reset is canceled, and the CPU starts the reset exception handling.

For details of the Deep Software Standby reset, see [section 10, Low Power Modes](#).

5.3.5 Independent Watchdog Timer Reset

The independent watchdog timer reset is an internal reset generated from the Independent Watchdog Timer (IWDT). Output of the reset from the IWDT can be selected in the Option Function Select Register 0 (OFS0).

When output of the independent watchdog timer reset is selected, the reset is generated if the IWDT underflows, or if data is written when refresh operation is disabled. When the internal reset time (t_{RESW2}) elapses after the independent watchdog timer reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the independent watchdog timer reset, see [section 26, Independent Watchdog Timer \(IWDT\)](#).

5.3.6 Watchdog Timer Reset

The watchdog timer reset is an internal reset generated from the Watchdog Timer (WDT). Output of the reset from the WDT can be selected in the WDT Reset Control Register (WDTRCR) or Option Function Select register 0 (OFS0).

When output of the watchdog timer reset is selected, the reset is generated if the WDT underflows, or if data is written when refresh operation is disabled. When the internal reset time (t_{RESW2}) elapses after the watchdog timer reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the watchdog timer reset, see [section 25, Watchdog Timer \(WDT\)](#).

5.3.7 CPU Lockup Reset

The CPU Lockup reset is an internal reset generated by Arm core. Output of the reset from Arm core can be selected by CPULCKUPCR.OAD.

When output of the CPU Lockup reset is selected, CPU generated if Arm core is in the lockup state. When the internal reset time (t_{RESW2}) elapses after the CPU Lockup reset is generated, the internal reset is cancelled, and the CPU starts the reset exception handling.

For details on the CPU Lockup reset, see [section 2, CPU](#).

5.3.8 Software Reset

This internal reset is generated by a software setting of the SYSRESETREQ bit in the AIRCR register in the Arm core. When the SYSRESETREQ bit is set to 1, a software reset is generated. When the internal reset time (t_{RESW2}) elapses after the software reset is generated, the internal reset is canceled, and the CPU starts the reset exception handling.

5.3.9 Bus Error Reset

Bus error reset is an internal reset generated by buses.

It is an integrated reset generated by buses, and it consists of the following:

- Bus error reset (MSAU error, MPU error, Illegal address error, Slave TrustZone Filter error, Slave Bus error, Bufferable write error)

Output of Bus error reset can be selected by OADCFG.OAD.

When the internal reset time (t_{RESW2}) elapses after the Bus error reset is generated, the internal reset is cancelled, and the CPU starts the reset exception handling.

For details on the Bus error reset, see [section 14, Buses](#). Determination of reset generation source in Bus error reset is similar to determination of interrupt generation source, see [section 13, Interrupt Controller Unit \(ICU\)](#).

5.3.10 Common Memory Error Reset

Common memory error reset is an internal reset generated by SRAMs.

It is an integrated reset generated by SRAMs and consists of the following:

- SRAM error reset (Parity error)
- Standby SRAM error reset (Parity error)

Output of SRAM error reset can be selected by SRAMCR1.OAD. Output of Standby SRAM error reset can be selected by STBRAMCR.OAD.

When the internal reset time (t_{RESW2}) elapses after the Common memory error reset is generated, the internal reset is cancelled, and the CPU starts the reset exception handling.

For details on the Common memory error reset, see [section 14, Buses](#). Determination of reset generation source in Common memory error reset is similar to determination of interrupt generation source, see [section 13, Interrupt Controller Unit \(ICU\)](#).

5.3.11 Determination of Cold/Warm Start

Read the CWSF flag in RSTSR2 to determine the cause of reset processing. This flag indicates whether a power-on reset caused the reset processing (cold start) or a reset signal input during operation caused the reset processing (warm start).

The CWSF flag is set to 0 when a power-on reset occurs (cold start), otherwise the flag is not set to 0. The flag is set to 1 when 1 is written to it through software. It is not set to 0 even on writing 0 to it.

Figure 5.4 shows an example of cold/warm start determination operation.

Figure 5.4 Example of cold/warm start determination operation

5.3.12 Determination of Reset Generation Source

Read RSTSR0 and RSTSR1 to determine which reset executes the reset exception handling.

Figure 5.5 shows an example of the flow to identify a reset generation source. The reset flag must be written with 0 after 1 is read.

Figure 5.5 Example of reset generation source determination flow

5.4 Reset Protection from Non-secure Programs

The reset occurrence can be controlled. A reset is generated according to the setting of SYRSTMSK0 and SYRSTMSK2 that can only be accessed from a Secure program.

The reset source is generated but is not propagated to the MCU. The reset flags of RSTSR0 and RSTSR1 bits are not set.

The resets that can be controlled are as follows:

- Independent watchdog timer reset
- Watchdog timer reset
- CPU Lockup reset
- Common memory error reset
- Bus error reset
- Voltage monitor 1 reset
- Voltage monitor 2 reset
- Software reset

6. Option-Setting Memory

6.1 Overview

The option-setting memory determines the state of the MCU after a reset. The option-setting memory is allocated to the configuration setting area of the flash memory.

Figure 6.1 shows the option-setting memory area. The option-setting memory area has Secure region and Non-secure region. Table 6.1 shows the programming condition of the option-setting memory area.

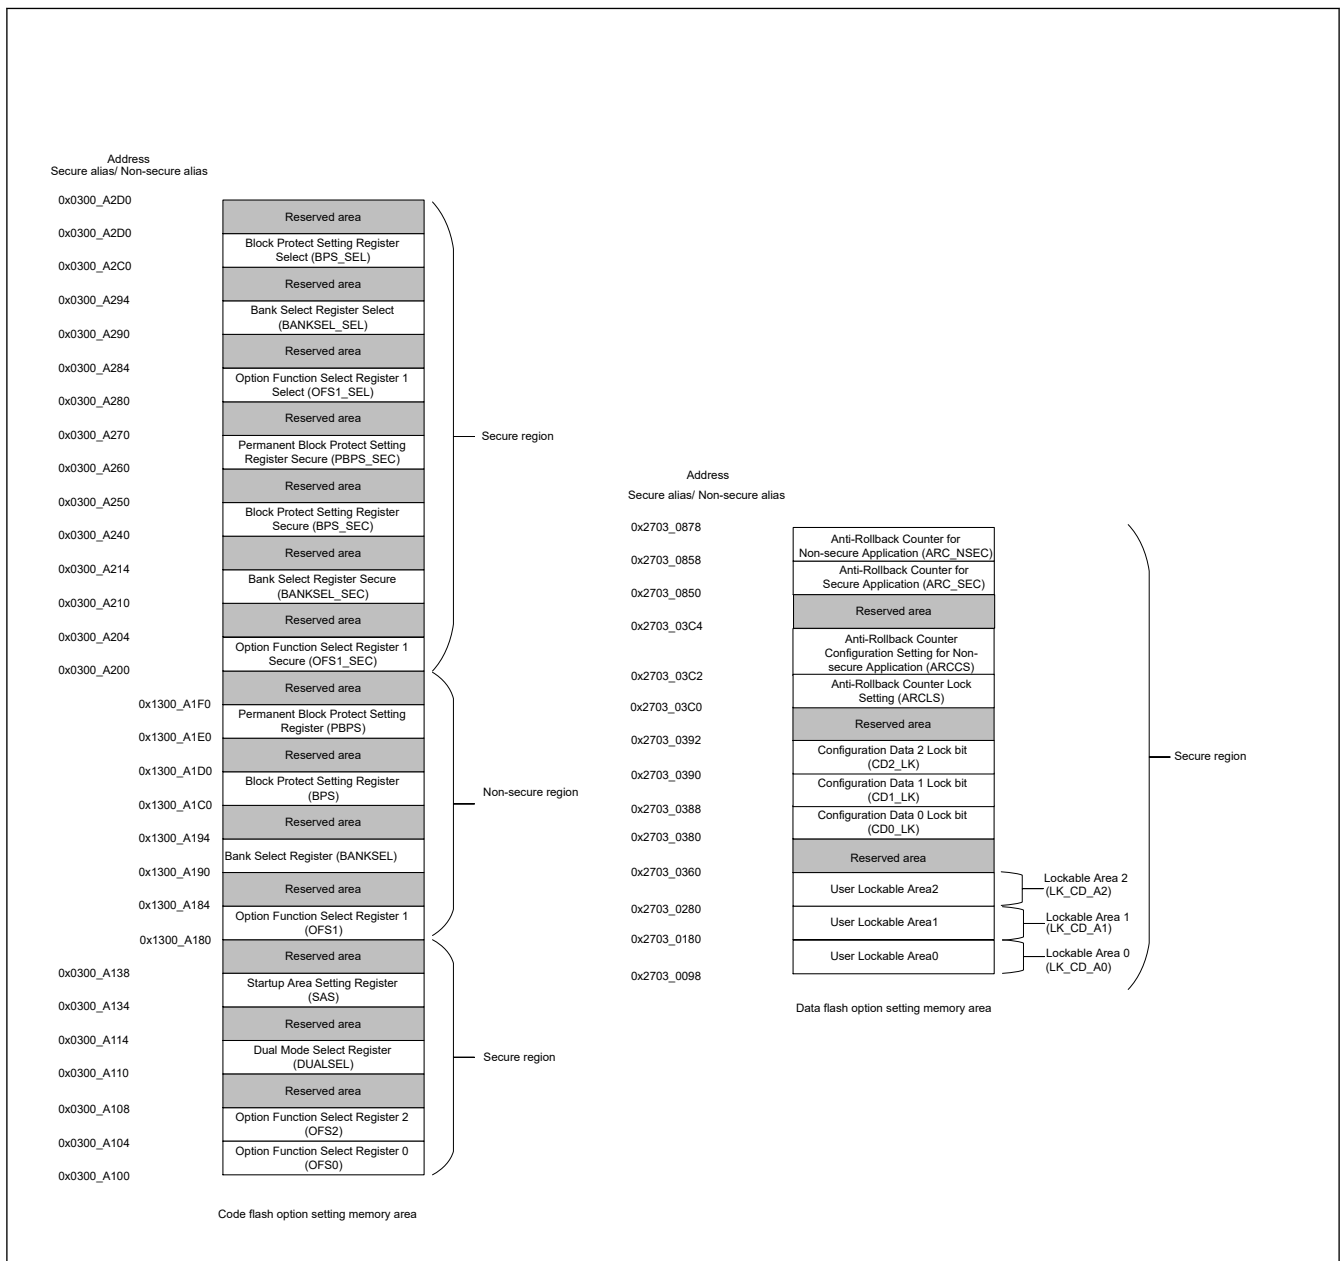

Figure 6.1 Option-setting memory area

Table 6.1 The programming condition of the option-setting memory area (1 of 2)

	Self programming	Serial programming	Programming by the on-chip debugger
Secure region	Programming commands issued via Secure alias access.	Programming commands issued when the authentication level is AL2.	Programming commands issued when the authentication level is AL2.

Table 6.1 The programming condition of the option-setting memory area (2 of 2)

	Self programming	Serial programming	Programming by the on-chip debugger
Non-secure region	Programming commands issued via Non-secure alias access.	Programming commands issued when the authentication level is AL2 or AL1.	Programming commands issued when the authentication level is AL2 or AL1.

6.2 Register Descriptions

6.2.1 OFS0 : Option Function Select Register 0

Address: 0x0300_A100

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	WDT0 STPC TL	—	WDT0 RSTIR QS	WDT0RPSS[1:0]	WDT0RPES[1:0]	WDT0CKS[3:0]			WDT0TOPS[1:0]	WDT0 STRT	—

29	—	The program value is read from this bit.*2	R
30	WDT0STPCTL	WDT Stop Control 0: Continue counting 1: Stop counting when entering CPU Sleep mode or CPU Deep Sleep mode	R
31	—	The program value is read from this bit.*2	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

Note 2. This register can only be programmed by FACI command. When programming, the set value should be 1.

IWDTSTRT bit (IWDT Start Mode Select)

The IWDTSTRT bit selects the mode in which the IWDT is activated after a reset (stopped state or activated state). When IWDT is activated in auto start mode, the OFS0 register setting for the IWDT is valid.

IWDTTOPS[1:0] bits (IWDT Timeout Period Select)

The IWDTTOPS[1:0] bits specify the timeout period, that is, the time it takes for the down counter to underflow, as 128, 512, 1024, or 2048 cycles of the frequency-divided clock set in the IWDTCKS[3:0] bits. The time it takes for the counter to underflow after a refresh operation is determined by the combination of the IWDTCKS[3:0] and IWDTTOPS[1:0] bits.

For details, see [section 26, Independent Watchdog Timer \(IWDT\)](#).

IWDTCKS[3:0] bits (IWDT-Dedicated Clock Frequency Division Ratio Select)

The IWDTCKS[3:0] bits specify the division ratio of the prescaler for dividing the frequency of the clock for the IWDT as 1/1, 1/16, 1/32, 1/64, 1/128, and 1/256. Using this setting combined with the IWDTTOPS[1:0] bits setting, the IWDT counting period can be set from 128 to 524,288 IWDT clock cycles.

For details, see [section 26, Independent Watchdog Timer \(IWDT\)](#).

IWDRPES[1:0] bits (IWDT Window End Position Select)

The IWDRPES[1:0] bits specify the position where the window for the down counter ends as 0%, 25%, 50%, or 75% of the count value. The value of the window end position must be smaller than the value of the window start position, otherwise only the value for the window start position is valid.

The counter values associated with the settings for the start and end positions of the window in the IWDRPSS[1:0] and IWDRPES[1:0] bits vary with the setting in the IWDTTOPS[1:0] bits.

For details, see [section 26, Independent Watchdog Timer \(IWDT\)](#).

IWDRPSS[1:0] bits (IWDT Window Start Position Select)

The IWDRPSS[1:0] bits specify the position where the window for the down counter starts as 25%, 50%, 75%, or 100% of the counted value. The point at which counting starts is 100% and the point at which an underflow occurs is 0%. The interval between the window starts and ends positions becomes the period in which a refresh is possible. Refresh is not possible outside this period.

For details, see [section 26, Independent Watchdog Timer \(IWDT\)](#).

IWDRSTIRQS bit (IWDT Reset Interrupt Request Select)

The IWDRSTIRQS bit selects the operation on an underflow of the down counter or generation of a refresh error. The operation is selectable to an independent watchdog timer reset, a non-maskable interrupt request, or an interrupt request.

For details, see [section 26, Independent Watchdog Timer \(IWDT\)](#).

IWDTSTPCTL bit (IWDT Stop Control)

The IWDTSTPCTL bit specifies whether to stop counting when entering CPU Sleep mode, CPU Deep Sleep mode, Software Standby mode or Deep Software Standby mode1.

For details, see [section 26, Independent Watchdog Timer \(IWDT\)](#).

WDT0STRT bit (WDT Start Mode Select)

The WDT0STRT bit selects the mode in which the WDT is activated after a reset (stopped state or activated in auto start mode). When WDT is activated in auto start mode, the OFS0 register setting for the WDT is valid.

WDT0TOPS[1:0] bits (WDT Timeout Period Select)

The WDT0TOPS[1:0] bits specify the timeout period, that is, the time it takes for the down counter to underflow as 1024, 4096, 8192, or 16384 cycles of the frequency-divided clock set in the WDT0CKS[3:0] bits. The number of PCLKB cycles that takes to underflow after a refresh operation is determined by a combination of the WDT0CKS[3:0] and WDT0TOPS[1:0] bits.

For details, see [section 25, Watchdog Timer \(WDT\)](#).

WDT0CKS[3:0] bits (WDT Clock Frequency Division Ratio Select)

The WDT0CKS[3:0] bits specify the division ratio of the prescaler for dividing the frequency of PCLKB as 1/4, 1/64, 1/128, 1/512, 1/2048, and 1/8192. Using this setting combined with the WDT0TOPS[1:0] bits setting, the WDT counting period can be set from 4,096 to 134,217,728 PCLKB cycles.

For details, see [section 25, Watchdog Timer \(WDT\)](#).

WDT0RPES[1:0] bits (WDT Window End Position Select)

The WDT0RPES[1:0] bits specify the position where the window on the down counter ends as 0%, 25%, 50%, or 75% of the counted value. The value of the window end position must be smaller than the value of the window start position, otherwise only the value for the window start position is valid.

The counter values associated with the settings for the start and end positions of the window in the WDT0RPSS[1:0] and WDT0RPES[1:0] bits vary with the setting of the WDT0TOPS[1:0] bits.

For details, see [section 25, Watchdog Timer \(WDT\)](#).

WDT0RPSS[1:0] bits (WDT Window Start Position Select)

The WDT0RPSS[1:0] bits specify the position where the window for the down counter starts as 25%, 50%, 75%, or 100% of the counted value. The point at which counting starts is 100% and the point at which an underflow occurs is 0%. The interval between the positions where the window starts and ends becomes the period in which a refresh is possible.

Refresh is not possible outside this period.

For details, see [section 25, Watchdog Timer \(WDT\)](#).

WDT0RSTIRQS bit (WDT Reset Interrupt Request Select)

The WDT0RSTIRQS bit selects the operation on an underflow of the down-counter or generation of a refresh error. The operation is selectable to a watchdog timer reset, a non-maskable interrupt request, or an interrupt request.

For details, see [section 25, Watchdog Timer \(WDT\)](#).

WDT0STPCTL bit (WDT Stop Control)

The WDT0STPCTL bit specifies whether to stop counting when entering CPU Sleep mode or CPU Deep Sleep mode.

For details, see [section 25, Watchdog Timer \(WDT\)](#).

6.2.2 OFS2 : Option Function Select Register 2

address: 0x0300_A104

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset: User setting*¹

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DCDC EN

Value after reset: User setting*¹

Bit	Symbol	Function	R/W
0	DCDCEN	DCDC enable 0: Disable DCDC 1: Enable DCDC	R
31:1	—	The program value is read from these bits.* ²	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

Note 2. This register can only be programmed by FACI command. When programming, the set value should be 1.

DCDCEN bit (DCDC enable)

The DCDCEN bit selects whether the DCDC is enabled or disabled.

6.2.3 DUALSEL : Dual Mode Select Register

address: 0x0300_A110

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset: User setting*¹

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	BANKMD[2:0]		

Value after reset: User setting*¹

Bit	Symbol	Function	R/W
2:0	BANKMD[2:0]	Bank Mode Select 0 0 0: Dual mode 1 1 1: Linear mode Others: Reserved	R
31:3	—	The program value is read from these bits. ^{*2}	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application

Note 2. This register can only be programmed by FACI command. When programming, the set value should be 1.

BANKMD[2:0] bit (Bank Mode Select)

The BANKMD[2:0] bits select bank mode of the dual bank function of the code flash memory

6.2.4 SAS : Startup Area Setting Register

Address: 0x0300_A134

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	BTFLG	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	User setting ^{*1}															
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	FSPR	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	User setting ^{*1}															

Bit	Symbol	Function	R/W
14:0	—	The program value is read from these bits. ^{*2}	R
15	FSPR	Protection of Startup Area Select Function This bit controls the programming of the write/erase protection for the Startup Area Select flag (SAS.BTFLG), and the temporary boot swap control. When this bit is set to 0, it cannot be changed to 1. 0: Executing the configuration setting command for programming the Startup Area Select flag (SAS.BTFLG) is invalid. 1: Executing the configuration setting command for programming the Startup Area Select flag (SAS.BTFLG) is valid.	R
30:16	—	The program value is read from these bits. ^{*2}	R
31	BTFLG	Startup Area Select Flag This bit specifies whether the address of the startup area is exchanged for the boot swap function or not. In dual mode (the DUALSEL.BANKMD[2:0] bits are 000b), set 1 to this bit. 0: First 8 KB area (0x0200_0000 to 0x0200_1FFF) and second 8 KB area (0x0200_2000 to 0x0200_3FFF) are exchanged. 1: First 8 KB area (0x0200_0000 to 0x0200_1FFF) and second 8 KB area (0x0200_2000 to 0x0200_3FFF) are not exchanged.	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application

Note 2. This register can only be programmed by FACI command. When programming, the set value should be 1.

6.2.5 OFS1, OFS1_SEC : Option Function Select Register 1 for Non-secure and Secure

Address: OFS1: 0x1300_A180 (Non-secure)
OFS1_SEC: 0x0300_A200 (Secure)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	INITECCEN	SWDBG	—	—	—	—	—	—	—	—

Value after reset: The value set by the user*1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	HOCOFREQ[2:0]			HOCOEN	—	—	PVDLPSEL	—	PVDAS	VDSEL[2:0]		

Value after reset: The value set by the user*1

Bit	Symbol	Function	R/W
2:0	VDSEL[2:0]	Voltage Detection 0 Level Select 0 0 0: Select 2.85 V 0 0 1: Select 2.58 V 0 1 0: Select 2.15 V 0 1 1: Select 2.00 V 1 0 0: Select 1.90 V 1 0 1: Select 1.80 V 1 1 0: Select 1.70 V 1 1 1: Select 1.60 V*3	R
3	PVDAS	Voltage Detection 0 Circuit Start 0: Enable voltage monitor 0 reset after a reset 1: Disable voltage monitor 0 reset after a reset	R
4	—	The program value is read from this bit.*2	R
5	PVDLPSEL	Low Power Consumption Function of PVD0 Select at Deep Software Standby mode 0: Enable low power consumption function of PVD0 during DSTBY1 and DSTBY2. 1: Disable low power consumption function of PVD0 during DSTBY1 and DSTBY2.	R
7:6	—	The program value is read from these bits.*2	R
8	HOCOEN	HOCO Oscillation Enable 0: Enable HOCO oscillation after a reset 1: Disable HOCO oscillation after a reset	R
11:9	HOCOFREQ[2:0]	HOCO Frequency Setting 0 0 0 0: 16 MHz 0 0 1: 18 MHz 0 1 0: 20 MHz 1 0 0: 32 MHz 1 1 1: 48 MHz Others: Reserved.	R
23:12	—	The program value is read from these bits.*2	R
24	SWDBG	Software Debug Control 0: Enable software debug control. The MCU behaves according to DBGAUTH0 and DBGAUTH1, and IWDT and WDT automatically stops when CPU is in the debug state. 1: Disable software debug control. The MCU ignores DBGAUTH0 and DBGAUTH1, and IWDT and WDT continue the operation even when CPU is in the debug state. However, when CDBGPWRUPREQ is 1 and AL is not AL0, IWDT and WDT automatically stops when CPU is in the debug state.	R
25	INITECCEN	Initial ECC Enable 0: Disable ECC function of TCM and CACHE. 1: Enable ECC function of TCM and CACHE.	R
31:26	—	The program value is read from these bits.*2	R

Note 1. The value of OFS1 and OFS1_SEC in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

Note 2. This register can only be programmed by FACL command. When programming, the set value should be 1.

Note 3. Setting prohibited when VBATT function is enabled, OFS1(_SEC).PVDAS and PVDLPSEL bits are 0 and at least one of Deep Software Standby mode 1 and 2 is used.

OFS1 register is for Non-secure developer, and OFS1_SEC register is for Secure developer.

VDSEL[2:0] bits (Voltage Detection 0 Level Select)

The VDSEL[2:0] bits select the voltage detection level of the voltage detection 0 circuit.

PVDAS bits (Voltage Detection 0 Circuit Start)

The PVDAS bit selects whether the voltage monitor 0 reset is enabled or disabled after a reset.

PVDLPSEL bits (Low Power Consumption Function of PVD0 Select at Deep Software Standby mode)

The PVDLPSEL selects whether the low power consumption function of PVD0 is enabled or disabled during DSTBY1 and DSTBY2 mode.

When disable this function, the response time is faster instead of increasing current consumption. When enable this function, the current consumption is smaller instead of response time delay.

See [section 51, Electrical Characteristics](#)

HOCOEN bit (HOCO Oscillation Enable)

The HOCOEN bit selects whether the HOCO oscillation is enabled or disabled after a reset. Setting this bit to 0 allows the HOCO oscillation to start before the CPU starts operation, which reduces the wait time for oscillation stabilization.

Note: When the HOCOEN bit is set to 0, the system clock source is not switched to HOCO. The system clock source is only switched to HOCO by setting the Clock Source Select bits (SCKSCR.CKSEL[2:0]). To use the HOCO clock, Set the OFS1(_SEC).HOCOFRQ0[2:0] bits*¹ to an optimum value.

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1.HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits when OFS1(_SEC).HOCOEN=1.

HOCOFRQ0[2:0] bits (HOCO Frequency Setting 0)

The HOCOFRQ0[2:0] bits specify the HOCO frequency after a reset as 16 to 48 MHz.

SWDBG bit (Software Debug Control)

The SWDBG bit selects whether software debug control is enabled or disabled.

INITECCEN bit (Initial ECC Enable)

The INITECCEN bit selects whether ECC function of TCM and CACHE is enabled or disabled.

When the INITECCEN bit is changed from 1 to 0, be sure to perform a power-on reset after changing it.

6.2.6 OFS1_SEL : Option Function Select Register 1 for Security Attribution

Address: OFS1_SEL: 0x0300_A280

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	INITECCEN	SWDBG	—	—	—	—	—	—	—	—

Value after reset: The value set by the user*¹

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

31:26	—	The program value is read from these bits.	R

Note 1. The value of OFS1_SEL in a blank product is 0x00000000. It is set to the value written by your application

The OFS1_SEL register selects the security attribute. Which security attribute is applied, OFS or OFS_SEC, is determined by the setting value of the corresponding bit in the OFS1_SEL register. For details, see [section 6.3.3. Security attribution of code flash option-setting memory](#).

6.2.7 BANKSEL, BANKSEL_SEC : Bank Select Register for Non-secure and Secure

Address: BANKSEL: 0x1300_A190 (Non-secure)
BANKSEL_SEC: 0x0300_A210 (Secure)

Value after reset: User setting*1

Value after reset: User setting*1

Bit	Symbol	Function	R/W
2:0	BANKSWP[2:0]	Startup Bank Switch This setting is valid in dual mode. 0 0 0: Start address of Bank0 is code flash base address + 0x0020_0000 and Bank is code flash base address + 0x0000_0000 in dual mode 1 1 1: Start address of Bank0 is code flash base address + 0x0000_0000 and Bank is code flash base address + 0x0020_0000 in dual mode Others: Reserved	R
15:3	—	The program value is read from these bits. *1	R
19:16	BLCKSWP[3:0]	Block Swap Select When all bits are set to 1, the block swap is disabled. When at least one bit is set to 0, block swap is enabled and the corresponding blocks of code flash memory are swapped.	R
31:20	—	The program value is read from these bits.*1	R

Note 1. The value of BANKSEL and BANKSEL_SEC in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

BANKSEL register is for Non-secure developer, and BANKSEL_SEC register is for Secure developer.

BANKSWP[2:0] bits (Startup Bank Switch)

The BANKSWP[2:0] bits select the start address of the bank0 and bank1 of code flash memory in dual mode. For details of the startup bank selection, see [section 47, Flash Memory](#).

BLCKSWP[3:0] bits (Block Swap Select)

The BLCKSWP[3:0] bits enable the block swap and select the valid blocks of the code flash memory in linear mode. [Figure 6.2](#) shows the mapping of the flash memory in linear mode. [Table 6.2](#) shows the specification of BLCKSWP bits for each product. Unused bits are reserved and should be set to 1. For details of block swap, see [section 47, Flash Memory](#).

Figure 6.2 Mapping of the flash memory

Table 6.2 Specification of BLCKSWP bits for each product

	BLCKSWP bits	Select 0/1: Start address offset for each Block
1 MB product	BLCKSWP[0]	1 : Block30 start address is 0x000C_0000. Block34 start address is 0x000E_0000. 0 : Block30 start address is 0x000E_0000. Block34 start address is 0x000C_0000.
	BLCKSWP[1]	1 : Block31 start address is 0x000C_8000. Block35 start address is 0x000E_8000. 0 : Block31 start address is 0x000E_8000. Block35 start address is 0x000C_8000.
	BLCKSWP[2]	1 : Block32 start address is 0x000D_0000. Block36 start address is 0x000F_0000. 0 : Block32 start address is 0x000F_0000. Block36 start address is 0x000D_0000.
	BLCKSWP[3]	1 : Block33 start address is 0x000D_8000. Block37 start address is 0x000F_8000. 0 : Block33 start address is 0x000F_8000. Block37 start address is 0x000D_8000.

6.2.8 BANKSEL_SEL : Bank Select Register for Security Attribution

Address: BANKSEL_SEL: 0x0300_A290

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	BLCKSWP[3:0]			

Value after reset: User setting*1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	BANKSWP[2:0]		

Value after reset: User setting*1

Bit	Symbol	Function	R/W
2:0	BANKSWP[2:0]	Security Attributes of Startup Bank Switch 0 0 0: Select BANKSEL_SEC.BANKSWP[2:0] 1 1 1: Select BANKSEL.BANKSWP[2:0] Others: Reserved	R
15:3	—	The program value is read from these bits. *1	R
19:16	BLCKSWP[3:0]	Security Attributes of Block Swap Select BANKSEL_SEL.BLCKSWP[3:0] bits can select Secure or Non-secure access for each bit. The bit positions of BLCKSWP[3:0] in the BANKSEL_SEL register and the bit positions of BLCKSWP[3:0] in the BANKSEL and BANKSEL_SEC registers correspond to indicate the same block. For example, when BANKSEL_SEL.BLCKSWP[0] = 0 and BANKSEL_SEL.BLCKSWP[3] = 1, then BANKSEL_SEC.BLCKSWP[0] and BANKSEL.BLCKSWP[3] are selected.	R
31:20	—	The program value is read from these bits.. *1	R

Note 1. The value of BANKSEL_SEL in a blank product is 0x00000000. It is set to the value written by your application

Note 2. This register can only be programmed by FACI command. When programming, the set value should be 0

The BANKSEL_SEL register selects the security attribute. Which security attribute is applied, BANKSEL or BANKSEL_SEC, is determined by the setting value of corresponding bit in the BANKSEL_SEL register. For details, see

[section 6.3.3. Security attribution of code flash option-setting memory](#)

6.2.9 BPS, BPS_SEC, BPS_SEL : Block Protect Setting Register

address:

BPS: 0x1300_A1C0, 0x1300_A1C4, 0x1300_A1C8 (Non-secure)
 BPS_SEC: 0x0300_A240, 0x0300_A244, 0x0300_A248 (Secure)
 BPS_SEL: 0x0300_A2C0, 0x0300_A2C4, 0x0300_A2C8 (Secure)

Bit position: 31

0

Bit field:

Value after reset:

User setting*1

Note 1. The value of BPS and BPS_SEC in a blank product is 0xFFFFFFFF. The value of BPS_SEL in factory shipment product is 0x00000000. It is set to the value written by your application.

BPS_SEC and BPS_SEL register is for Secure developer, and BPS register is for Non-secure developer.

The BPS and BPS_SEC registers invalidate the programming and erasure to the code flash memory. When the bit of this register is set to 0, the programming and erasure to the corresponding block are invalid. [Figure 6.3](#) shows the code flash block structure of each product. [Figure 6.4](#) shows the relationship between the bit of register and the block number. Unused bits of BPS and BPS_SEC register are reserved and should be programmed to 1.

The BPS_SEL register selects the security attribute. Whether the security attribute BPS or BPS_SEC, PBPS or PBPS_SEC is applied is determined by the setting value of the corresponding bit in the BPS_SEL register. For details, see [section 6.3.3. Security attribution of code flash option-setting memory](#).

Code flash base address is 0x0200_0000 for Secure alias and 0x1200_0000 for Non-secure alias.

Figure 6.4 The relationship between the bit of register and the block number

6.2.10 PBPS, PBPS_SEC : Permanent Block Protect Setting Register

Address: PBPS: 0x1300_A1E0, 0x1300_A1E4, 0x1300_A1E8 (Non-secure)
 PBPS_SEC: 0x0300_A260, 0x0300_A264, 0x0300_A268 (Secure)

Note 1. The value of PBPS and PBPS_SEC in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

PBPS_SEC register is for secure developer, and PBPS register is for non-secure developer. The applied setting value is determined by the setting value of the corresponding bit in BPS_SEL register. For details, see [section 6.3.3. Security attribution of code flash option-setting memory](#). The security attribution register is same BPS_SEL register between the block protection and permanent block protection.

The PBPS and PBPS_SEC registers invalidate writes to bits of BPS and BPS_SEC. The bit of this register can be programmed 0 when corresponding bit of BPS and BPS_SEC is programmed to 0. When the bit of this register is programmed to 0, writing the corresponding bit of BPS and BPS_SEC register is invalid. Once the bit of this register is set to 0, it is impossible to change the bit to 1. [Table 6.3](#) shows the relationship between the bit of applied PBPS and bit of applied BPS.

When the applied setting value of this register selected by BPS_SEL register is 0, corresponding bit of BPS_SEL register cannot be changed.

The relationship between the bit of this register and the block number is same as BPS and BPS_SEC registers ([Figure 6.4](#)). Unused bits are reserved and should be set to 1.

Table 6.3 The relationship between the bit of PBPS, PBPS_SEC and bit of BPS, BPS_SEC

The bit of applied PBPS and PBPS_SEC	The bit of applied BPS and BPS_SEC	Content
1	1	Programming and erasure to the corresponding block is valid.
1	0	Programming and erasure to the corresponding block is invalid. This protection can be canceled by FBPROT0 or FBPROT1 registers.
0	1	Can not set this condition
0	0	Programming and erasure to the corresponding block is invalid permanently

Note: When BPS_SEL = 0, BPS and PBPS correspond. When BPS_SEL = 1, BPS_SEC and PBPS_SEC correspond.

6.2.11 CFGD0LOCK : Configuration Data 0 Lock Bit

Base address: 0x2703_0380

Base address: 0x2703_0384

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	CD0L K63	CD0L K62	CD0L K61	CD0L K60	CD0L K59	CD0L K58	CD0L K57	CD0L K56	CD0L K55	CD0L K54	CD0L K53	CD0L K52	CD0L K51	CD0L K50	CD0L K49	CD0L K48

Value after reset: User setting*1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Symbol	Function	R/W
5:0	—	The program value is read from these bits.	R
31:6	CD0LK31 to CD0LK6	Configuration Data 0 Lock Bit 0: LK_CD_A0 protection is enabled 1: LK_CD_A0 protection is disabled	R
31:0	CD0LK63 to CD0LK32	Configuration Data 0 Lock Bit 0: LK_CD_A0 protection is enabled 1: LK_CD_A0 protection is disabled	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application

CD0LKn bits (Configuration Data 0 Lock Bit)

These bits specify write protection for Lockable Configuration Data Area 0 (LK_CD_A0) in configuration area of data flash. CD0_LK(n) protects 4 bytes data in LK_CD_A0.

CD0_LK bits can be set to "0" by the "Configuration set" command and cannot be changed from "0" to "1".

6.2.12 CFGD1LOCK : Configuration Data 1 Lock Bit

Base address: 0x2703_0388

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CD1L K47	CD1L K46	CD1L K45	CD1L K44	CD1L K43	CD1L K42	CD1L K41	CD1L K40	CD1L K39	CD1L K38	CD1L K37	CD1L K36	CD1L K35	CD1L K34	CD1L K33	CD1L K32

Value after reset: User setting*1

Bit	Symbol	Function	R/W
31:0	CD1LK31 to CD1LK0	Configuration Data 1 Lock Bit 0: LK_CD_A1 protection is enabled 1: LK_CD_A1 protection is disabled	R
31:0	CD1LK63 to CD1LK32	Configuration Data 1 Lock Bit 0: LK_CD_A1 protection is enabled 1: LK_CD_A1 protection is disabled	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application

CD1LK_n bits (Configuration Data 1 Lock Bit)

These bits specify write protection for Lockable Configuration Data Area 1 (LK_CD_A1) in configuration area of data flash. CD1_LK(n) protects 4 bytes data in LK_CD_A1.

CD1_LK bits can be set to "0" by the "Configuration set" command and cannot be changed from "0" to "1"

6.2.13 CFGD2LOCK : Configuration Data 2 Lock Bit

Base address: 0x2703_0390

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	CD2L K13	CD2L K12	CD2L K11	CD2L K10	CD2L K9	CD2L K8	CD2L K7	CD2L K6	CD2L K5	CD2L K4	CD2L K3	CD2L K2	CD2L K1	CD2L K0

Value after reset: User setting*1

Bit	Symbol	Function	R/W
13:0	CD2LK13 to CD2LK0	Configuration Data 2 Lock Bit 0: LK_CD_A2 protection is enabled 1: LK_CD_A2 protection is disabled	R
15:14	—	The program value is read from these bits.	R

Note 1. The value in a blank product is 0xFFFF_FFFF. It is set to the value written by your application

CD2LK_n bits (Configuration Data 2 Lock Bit)

These bits specify write protection for Lockable Configuration Data Area 2 (LK_CD_A2) in configuration area of data flash. CD2_LK(n) protects 16 bytes data in LK_CD_A2. CD2_LK bits can be set to "0" by the "Configuration set" command and cannot be changed from "0" to "1".

Settings for Configuration Data Lock Bit (CD_n_LK) (n = 0 to 2) are shown in [Table 6.4](#)

Table 6.4 The correspondence between the lock bit and lockable are address (1 of 2)

Area	Bit	Address
Lockable area 0	CD0_LK6	0x2703_0098 to 0x2703_009B
	CD0_LK7	0x2703_009C to 0x2703_009F

	CD0_LK _n (n = 6 to 63)	0x2703_0080 + 0x04 × n to 0x2703_0083 + 0x04 × n

	CD0_LK63	0x2703_017C to 0x2703_017F
Lockable area 1	CD1_LK0	0x2703_0180 to 0x2703_0183
	CD1_LK1	0x2703_0184 to 0x2703_0187

	CD1_LK _n (n = 0 to 63)	0x2703_0180 + 0x04 × n to 0x2703_0183 + 0x04 × n

	CD1_LK63	0x2703_00x27C to 0x2703_027F

Table 6.4 The correspondence between the lock bit and lockable are address (2 of 2)

Area	Bit	Address
Lockable area 2	CD2_LK0	0x2703_0280 to 0x2703_028F
	CD2_LK1	0x2703_0290 to 0x2703_029F

	CD2_LKn (n = 0 to 13)	0x2703_0280 + 0x10 × n to 0x2703_028F + 0x10 × n

	CD2_LK13	0x2703_0350 to 0x2703_035F

6.2.14 ARCLS : Anti-Rollback Counter Lock Setting

Base address: 0x2703_03C0

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARCNS_LK[3:0]	ARCS_LK
------------	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---------------	---------

Value after reset: User setting*1

Bit	Symbol	Function	R/W
0	ARCS_LK	ARC_SEC Lock 0: ARC_SEC protection is enabled 1: ARC_SEC protection is disabled	R/W
4:1	ARCNS_LK[3:0]	ARC_NSEC Lock In case of 64 bits x 4 counter setting x x x 0: ARC_NSEC[63:0] protection is enabled x x 0 x: ARC_NSEC[127:64] protection is enabled x 0 x x: ARC_NSEC[191:128] protection is enabled 0 x x x: ARC_NSEC[255:192] protection is enabled 1 1 1 1: ARC_NSEC[255:0] protection is disabled Others Reserved. In case of 256 bits counter setting 0 0 0 0: ARC_NSEC[255:0] protection is enabled 1 1 1 1: ARC_NSEC[255:0] protection is disabled Others Reserved.	R/W
15:5	—	The program value is read from these bits*2	R/W

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application

Note 2. This register can only be programmed by FACI command. When programming, the set value should be 1.

Anti-rollback counter Lock bits setting are located in the data flash configuration area. Anti-rollback counter Lock bits setting can be set to "0" by the "Program" command and cannot be changed from "0" to "1". When the lock bit is 0, the anti-rollback counter corresponding to each bit cannot be updated by the "Increment Counter" command.

6.2.15 ARCCS : Anti-Rollback Counter Configuration Setting for Non-secure Application

Base address: 0x2703_03C2

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CNF_ARCNS[1:0]
------------	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	----------------

Value after reset: User setting*1

Bit	Symbol	Function	R/W
1:0	CNF_ARCNS[1:0]	Configuration setting for ARC_NSEC 0 0: ARC_NSEC configuration is 4 × 64 bits 0 1: ARC_NSEC configuration is 1 × 256 bits Others ARC_NSEC configuration is disable	R/W

Bit	Symbol	Function	R/W
15:2	—	The program value is read from these bits*2	R/W

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application

Note 2. This register can only be programmed by FACI command. When programming, the set value should be 1.

ARC_NSEC configuration setting is located in the data flash configuration area. These bits specify two types of ARC_NSEC configuration: 4×64 bits or 1×256 bits. “Increment Counter” or “Read Counter” command cannot be issued to ARC_NSEC when counter configuration setting is disabled.

6.2.16 ARC_SECN : Anti-Rollback Counter for Secure Application n (n = 0, 1)

Base address: 0x2703_0000

Offset address: $0x850 + 0x004 \times n$ (n = 0, 1)

Bit position: 31

0

Bit field:

ARC_SECN[$32 \times n + 31 : 32 \times n$]

Value after reset:

User setting*1

Bit	Symbol	Function	R/W
31:0	ARC_SECN[$32 \times n + 31 : 32 \times n$]	Anti-Rollback Counter for Secure Application The counter value is obtained by arranging the read values from the upper register (n = 1) to the lower register (n = 0). See section 47.12.5. Anti-Rollback Counter for detail	R/W

Note 1. The value in a blank product is 0x0. It is set to the value written by your application

6.2.17 ARC_NSECn : Anti-Rollback Counter for Non-secure Application n (n = 0 to 7)

Base address: 0x2703_0000

Offset address: $0x858 + 0x004 \times n$ (n = 0 to 7)

Bit position: 31

0

Bit field:

ARC_NSECn[$32 \times n + 31 : 32 \times n$]

Value after reset:

User setting*1

Bit	Symbol	Function	R/W
31:0	ARC_NSECn[$32 \times n + 31 : 32 \times n$]	Anti-Rollback Counter for Non-secure Application The counter value is obtained by arranging the read values from the upper register (n = 7) to the lower register (n = 0). See section 47.12.5. Anti-Rollback Counter for detail	R/W

Note 1. The value in a blank product is 0x0. It is set to the value written by your application

6.3 Setting Option-Setting Memory

6.3.1 Allocation of Data in Option-Setting Memory

Programming data is allocated to the addresses in the option-setting memory shown in [Figure 6.1](#). The allocated data is used by tools such as a flash programming software or an on-chip debugger.

Note: Programming formats vary depending on the compiler. See the compiler manual for details.

6.3.2 Setting Data for Programming Option-Setting Memory

Allocating data according to the procedure described in [section 6.3.1. Allocation of Data in Option-Setting Memory](#), alone does not actually write the data to the option-setting memory. You must also follow one of the actions described in this section.

(1) Changing the option-setting memory by self-programming

Use the configuration setting command to write data to the option-setting memory in the configuration setting area.

The code flash option-setting memory does not support background operations (BGO). When write the option-setting memory, jump to SRAM after copying writing software to SRAM.

For details of the configuration setting command, see [section 47, Flash Memory](#).

(2) Debugging through an OCD or programming by a flash writer

This procedure depends on the tool in use, see the tool manual for details.

The MCU provides two setting procedures:

- Read the data allocated as described in [section 6.3.1. Allocation of Data in Option-Setting Memory](#), from an object file or Motorola S-format file generated by the compiler, and write the data to the MCU
- Use the GUI interface of the tool to program the same data as allocated in [section 6.3.1. Allocation of Data in Option-Setting Memory](#).

6.3.3 Security attribution of code flash option-setting memory

Some functionality has 3 registers for Non-secure (FUNC NAME), and Secure (FUNC NAME_SEC), and security attribution (FUNC NAME_SEL). Only Secure developer can set the registers for Secure and security attribution. As shown in [Figure 6.5](#), when the bit of security attribution register is set to 0, the corresponding bit of Secure register is applied. When the bit of security attribution register is set to 1, the corresponding bit of Non-secure register is applied.

For example, if the Secure developer wants to configure PVD of OFS1 as Secure, HOCO of OFS1 as Non-secure, the Secure developer needs to set OFS1_SEL as follows.

OFS1_SEL = 0xFFFF_FFF0

By this setting, PVDAS and VDSEL[2:0] values of OFS1_SEC and HOCOFRQ0[2:0] and HOCOEN values of OFS1 are applied to MCU. The reserved bits of the security attribution register (FUNC NAME_SEL) should be set to 0.

Figure 6.5 Selection of applied value

6.3.4 Timing of the Setting Value

For SAS, BPS, BPS_SEC, PBPS, PBPS_SEC and BPS_SEL registers, the setting value of the related startup area and block protection is applied immediately after programming. For other registers, the setting value is applied after the MCU is reset.

6.4 Usage Notes

6.4.1 Data for Programming Reserved Areas and Reserved Bits in the Option-Setting Memory

- Security attribution region (0x0300 A280 to 0x0300 A2FF)

When reserved areas and reserved bits in the option-setting memory are within the scope of programming, write 0 to all bits in reserved areas and all reserved bits. Operation is not guaranteed if 1 is written to these bits.

- Other region

When reserved areas and reserved bits in the option-setting memory are within the scope of programming, write 1 to all bits of reserved areas and all reserved bits. If 0 is written to these bits, normal operation cannot be guaranteed.

7. Programmable Voltage Detection (PVD)

7.1 Overview

The Programmable Voltage Detection (PVD) module monitors the voltage level input to the VCC pin and the detection level can be selected using a software program. The PVD module consists of several separate voltage level detectors which measure the voltage level input to the VCC pin. PVD registers allow your application to configure detection of VCC change at various voltage thresholds.

Each voltage level detector has a voltage monitor associated with it. Voltage monitor registers are used to configure the PVD to trigger an interrupt, event link output, or reset when the thresholds are crossed.

Table 7.1 lists the PVD specifications. Figure 7.1 shows a block diagram of the voltage monitor 0 reset generation circuit. Figure 7.2 shows a block diagram of the voltage monitor m interrupt and reset circuit (m = 1, 2).

Table 7.1 PVD specifications

Item		Voltage monitor 0	Voltage monitor m (m = 1, 2)
Voltage Monitoring	Monitored pin	VCC	VCC
	Detected Event	Voltage falls past V_{det0}	Voltage rises or falls past V_{detm}
	Detection Voltage	Selectable from among 8 different levels by using OFS1(_SEC).VDSEL[2:0] bits as V_{det0}	Selectable from among 13 different levels by using PVDmCMPCR.PVDLVL[4:0] bits as V_{detm}
	Monitor Flag	None	PVDmSR.MON flag: Monitors whether voltage is higher or lower than V_{detm} PVDmSR.DET flag: V_{detm} passage detection
Process on voltage detection	Reset	Voltage monitor 0 reset	Voltage monitor m reset
		Reset when $V_{det0} > VCC$ CPU restart after specified time with $VCC > V_{det0}$	Reset condition selectable Reset when $V_{detm} > VCC$ or $V_{detm} < VCC$ CPU restart timing selectable: after specified time with $VCC > V_{detm}$ or $V_{detm} > VCC$
Interrupt	No interrupt	No interrupt	Voltage monitor m interrupt
			Non-maskable interrupt or maskable interrupt selectable
			Interrupt request issued in response to either or both $V_{detm} > VCC$ and $VCC > V_{detm}$
Digital filter	Enable/ Disable Switching	Digital filter function not available	Available
	Sampling Time	—	1/n LOCO frequency × 2 (n: 2, 4, 8, 16)
Event linking		None	Available Output of event signals on detection of V_{detm} crossings

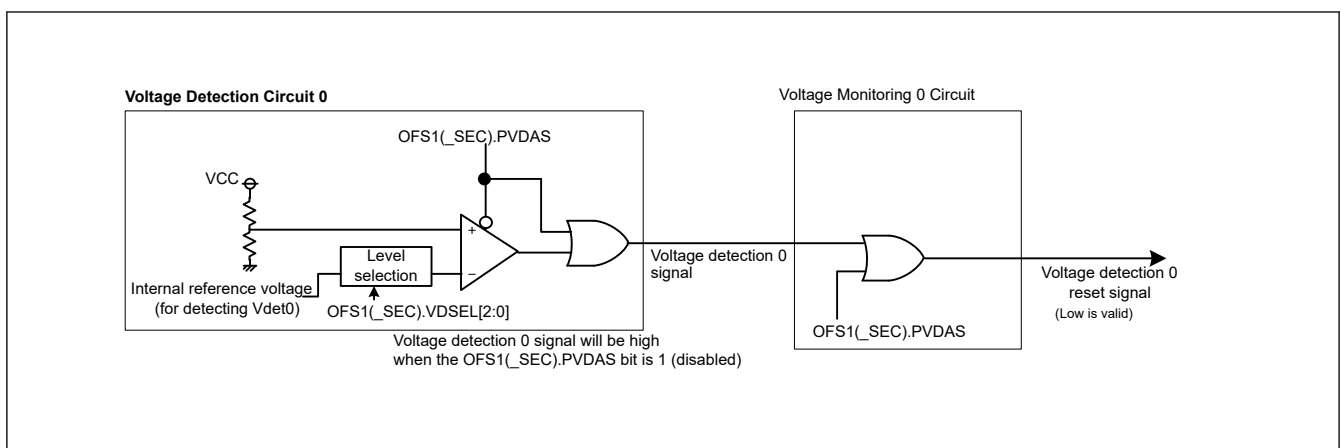

Figure 7.1 Block diagram of voltage monitor 0 reset circuit

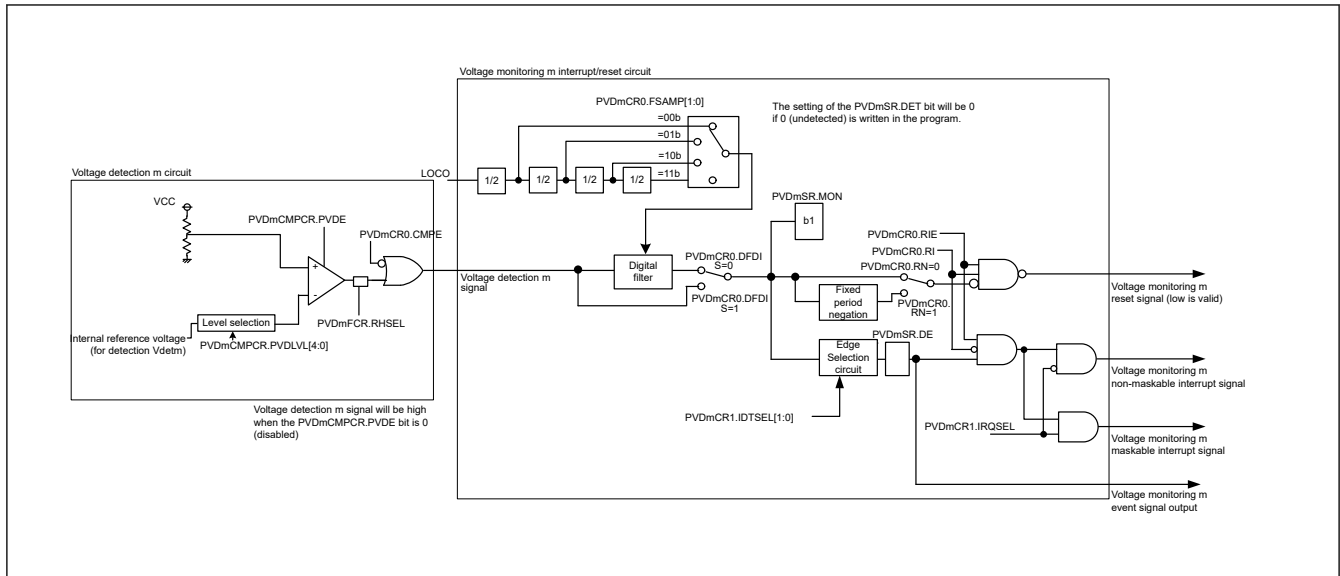

Figure 7.2 Block diagram of voltage monitor m interrupt/reset circuit (m = 1, 2)

7.2 Register Descriptions

7.2.1 PVDSAR : Programable Voltage Detection Security Attribution Register

Base address: SYSC = 0x4001_E000
 SYSC_NS = 0x5001_E000

Offset address: 0x3CC

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	NONSEC1	NONSEC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NONSEC0	Non Secure Attribute bit 0 Target register: registers for PVD1 0: Secure 1: Non Secure	R/W
1	NONSEC1	Non Secure Attribute bit 1 Target register: registers for PVD2 0: Secure 1: Non Secure	R/W
31:2	—	These bits are read as 1. The write value must be 1 when it is possible to write.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: This register is write-protected by PRCR register.

The PVDSAR register controls the secure attribute of PVD registers.

NONSEC0 bit (Non Secure Attribute bit 0)

This bit controls the security attribute of PVD1CMPCR, PVD1CR0, PVD1CR1, PVD1SR and PVD1FCR.

NONSEC1 bit (Non Secure Attribute bit 1)

This bit controls the security attribute of PVD2CMPCR, PVD2CR0, PVD2CR1, PVD2SR and PVD2FCR.

7.2.2 PVDmCMPCR : Voltage Monitor m Comparator Control Register (m = 1, 2)

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA58 + 0x4 × (m - 1)

Bit position: 7 6 5 4 3 2 1 0

Bit field:	PVDE	—	—	PVDLVL[4:0]			
------------	------	---	---	-------------	--	--	--

Value after reset: 0 0 0 0 1 1 1 1

Bit	Symbol	Function	R/W
4:0	PVDLVL[4:0]	Detection Voltage m Level Select Settings other than the following are prohibited. These are standard voltage level during the fall of voltage. For details on standard voltage level during the rise of voltage, see section 51, Electrical Characteristics . 0x03: 3.86 V (Vdetm_3) 0x04: 3.14 V (Vdetm_4) 0x05: 3.10 V (Vdetm_5) 0x06: 3.08 V (Vdetm_6) 0x07: 2.85 V (Vdetm_7) 0x08: 2.83 V (Vdetm_8) 0x09: 2.80 V (Vdetm_9) 0x0A: 2.62V (Vdetm_10) 0x0B: 2.33V (Vdetm_11) 0x0C: 1.90V (Vdetm_12) 0x0D: 1.86V (Vdetm_13) 0x0E: 1.74V (Vdetm_14) 0x0F: 1.71V (Vdetm_15) Others: Setting prohibited	R/W
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	PVDE	Voltage Detection m Enable 0: Voltage detection m circuit disabled 1: Voltage detection m circuit enabled	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

PVDLVL[4:0] bits (Detection Voltage m Level Select)

The PVDmCMPCR.PVDLVL can be changed only if the PVDmCMPCR.PVDE bits are both 0. All the voltage detection circuits should not be set at the same voltage detection level.

Do not change PVDmCMPCR.PVDLVL and PVDmCMPCR.PVDE at the same time.

The PVDmCMPCR.PVDE can be changed only when the PVDmCR0.CMPE is 0.

PVDE bit (Voltage Detection m Enable)

When using voltage detection m interrupt/reset or the PVDmSR.MON bit, set the PVDmCMPCR.PVDE bit to 1. The voltage detection m circuit starts once $t_d(E-A)$ passes after the PVDmCMPCR.PVDE bit value is changed from 0 to 1.

When using the voltage detection m circuit in Deep Software Standby mode, do not transit to Deep Software Standby mode 3.

7.2.3 PVDmCR0 : Voltage Monitor m Circuit Control Register 0 (m = 1, 2)

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA70 + 0x4 × (m - 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	RN	RI	FSAMP[1:0]	—	CMPE	DFDIS	RIE	
Value after reset:	1	0	0	0	x	0	1	0

Bit	Symbol	Function	R/W
0	RIE	Voltage Monitor m Interrupt/Reset Enable 0: Disable 1: Enable	R/W
1	DFDIS	Voltage monitor m Digital Filter Disabled Mode Select 0: Enable the digital filter 1: Disable the digital filter	R/W
2	CMPE	Voltage Monitor m Circuit Comparison Result Output Enable 0: Voltage monitor m circuit comparison result output disabled 1: Voltage monitor m circuit comparison result output enabled	R/W
3	—	The read value is undefined. The write value should be 1.	R/W
5:4	FSAMP[1:0]	Sampling Clock Select 0 0: 1/2 LOCO frequency 0 1: 1/4 LOCO frequency 1 0: 1/8 LOCO frequency 1 1: 1/16 LOCO frequency	R/W
6	RI	Voltage Monitor m Circuit Mode Select (1) case of PVDmFCR.RHSEL = 0 0: Voltage monitor m interrupt during V_{detm} passage 1: Voltage monitor m reset enabled when the voltage falls to and below V_{detm} (2) case of PVDmFCR.RHSEL = 1 0: prohibited 1: Voltage monitoring m reset enabled when the voltage rises to and up V_{detm}	R/W
7	RN	Voltage Monitor m Reset Negate Select (1) case of PVDmFCR.RHSEL = 0 0: Negation follows a stabilization time (t_{pVDm}) after $VCC > V_{detm}$ is detected 1: Negation follows a stabilization time (t_{pVDm}) after assertion of the PVDm reset. (2) case of PVDmFCR.RHSEL = 1 0: Negation follows a stabilization time (t_{pVDm}) after $VCC < V_{detm}$ is detected. 1: Prohibited	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

RIE bit (Voltage Monitor m Interrupt/Reset Enable)

The RIE bit enables or disables voltage monitor m interrupt/reset. Ensure that neither a voltage monitor m interrupt nor a voltage monitor m reset is generated during programming or erasure of the flash memory.

DFDIS bit (Voltage monitor m Digital Filter Disabled Mode Select)

The DFDIS bit disables the digital filter circuit. Set the LOCOCR.LCSTP bit to 0 (the LOCO operates) if the DFDIS bit is 0 (enabling the digital filter circuit). Set the DFDIS bit to 1 (digital filter circuit disabled) when using voltage monitor m circuit in software standby mode or Deep Software Standby mode.

CMPE bit (Voltage Monitor m Circuit Comparison Result Output Enable)

The CMPE bit enables or disables voltage monitor m circuit comparison result output. Set the CMPE bit to 1 after the voltage detection m circuit enables and stabilization time ($t_{d(E-A)}$) elapses. When stopping the voltage detection m circuit, disable the voltage detection m circuit after setting the CMPE bit is 0.

FSAMP[1:0] bits (Sampling Clock Select)

The FSAMP[1:0] bits can be rewritten only when the PVDmCR0.DFDIS bit is 1 (digital filter circuit disabled). The FSAMP[1:0] bits should not be modified when the PVDmCR0.DFDIS bit is 0 (digital filter circuit enabled).

RI bit (Voltage Monitor m Circuit Mode Select)

When the PVDmCR0.RI bit is 1 (voltage monitor m reset selected), a transition to Deep Software Standby mode 2 or 3 cannot be made, instead a transition to Deep Software Standby mode 1 is made. To enter Deep Software Standby mode 2 or 3, set all the PVDmCR0.RI bits to 0 (voltage monitor m interrupt selected).

RN bit (Voltage Monitor m Reset Negate Select)

Case of PVDmFCR.RHSEL = 0

- If the RN bit is set to 1 (negation follows a stabilization time after assertion of the PVDm reset signal), set the LOCOCR.LCSTP bit to 0 (the LOCO operates). Furthermore, if a transition to Software Standby mode or Deep Software Standby mode is to be made, the only possible value for the RN bit is 0 (negation follows a stabilization time after $VCC > V_{detm}$ is detected. Do not set the RN bit to 1 (negation follows a stabilization time after assertion of the PVDm reset signal) when this is the case.

Case of PVDmFCR.RHSEL = 1

- Do not set the RN bit to 1.

7.2.4 PVDmCR1 : Voltage Monitor m Circuit Control Register 1 (m = 1, 2)

Base address: SYSC = 0x4001_E000
 SYSC_NS = 0x5001_E000

Offset address: 0x0E0 + 0x2 × (m-1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	IRQSEL	IDTSEL[1:0]	
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
1:0	IDTSEL[1:0]	Voltage Monitor m Interrupt Generation Condition Select (1) case of PVDmFCR.RHSEL = 0 0 0: When $VCC \geq V_{detm}$ (rise) is detected 0 1: When $VCC < V_{detm}$ (fall) is detected 1 0: When fall and rise are detected 1 1: Settings prohibited (2) case of PVDmFCR.RHSEL = 1 This bit is not applicable.	R/W
2	IRQSEL	Voltage Monitor m Interrupt Type Select 0: Non-maskable interrupt 1: Maskable interrupt*1	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC3 bit to 1 (writing enabled) before rewriting this register.

Note 1. When enabling maskable interrupts, do not change the value of the NMIER.PVDmEN bit on the ICU side from the reset state.

7.2.5 PVDmSR : Voltage Monitor m Circuit Status Register (m = 1, 2)

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0E1 + 0x2 × (m - 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	MON	DET
Value after reset:	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
0	DET	Voltage Monitor m Voltage Change Detection Flag*1 (1) case of PVDmFCR.RHSEL = 0 0: Not detected 1: V_{detm} passage detection (2) case of PVDmFCR.RHSEL = 1 This bit is not applicable.	R/W
1	MON	Voltage Monitor 1 Signal Monitor Flag (1) case of PVDmFCR.RHSEL = 0 0: $VCC \leq V_{detm}$ 1: $VCC > V_{detm}$ or MON is disabled (2) case of PVDmFCR.RHSEL = 1 This bit is not applicable.	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

Note 1. Only 0 can be written to this bit. After writing 0 to this bit, 2 system clock (ICLK) cycles are required for the bit to be read as 0.

DET flag (Voltage Monitor m Voltage Change Detection Flag)

The DET flag is enabled when the PVDmCMPCR.PVDE bit is 1 (voltage detection m circuit enabled) and the PVDmCR0.CMPE bit is 1 (voltage monitor m circuit comparison result output enabled).

The DET flag should be set to 0 after PVDmCR0.RIE is set to 0 (disabled). PVDmCR0.RIE can be set to 1 (enabled) after a period of two or more cycles of PCLKB has elapsed.

Depending on the number of cycles of PCLKB defined for access to read an I/O register, two or more cycles than PCLKB may have to be secured as waiting time.

MON flag (Voltage Monitor 1 Signal Monitor Flag)

The MON flag is enabled when the PVDmCMPCR.PVDE bit is 1 (voltage detection m circuit enabled) and the PVDmCR0.CMPE bit is 1 (voltage monitor m circuit comparison result output enabled).

7.2.6 PVDmFCR : Voltage Monitor m Function Control Register (m = 1, 2)

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xB20 + 0x4 × (m - 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	RHSEL
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RHSEL	Rise Hysteresis Select 0: Hysteresis level for VCC-fall detection is selected. 1: Hysteresis level for VCC-rise detection is selected.	R/W

Bit	Symbol	Function	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

The PVDmFCR.RHSEL can be changed only when all the PVDmCMPCR.PVDE bits are 0.

RHSEL flag (Rise Hysteresis Select)

When RHSEL=0 for VCC-fall detection, the hysteresis level is set above the voltage detection level set by PVDLVL[4:0]. When RHSEL=1 for VCC-rise detection, the hysteresis level is set under the voltage detection level set by PVDLVL[4:0]. Refer to the chapter of electrical characteristics about the detail of hysteresis level of PVDm.

When PVDm reset generated by the VCC-fall detection is required, set RHSEL to 0.

When PVDm reset generated by the VCC-rise detection is required, set RHSEL to 1.

RHSEL must not be set to “1” when PVDmCR0.RI = 0.

RHSEL must not be set to “1” when PVDmCR0.RN = 1.

7.3 VCC Input Voltage Monitor

7.3.1 Monitoring V_{det0}

The comparison results from voltage monitor 0 are not available for reading.

7.3.2 Monitoring V_{detm}

After the settings are completed, results of comparison by voltage Monitor m can be monitored by using the PVDmSR.MON flag.

Table 7.2 Procedures to set up monitoring against V_{detm}

Step	Monitoring the comparison results from voltage monitor 1	
Setting the voltage detection m circuit	1	Set PVDmCMPCR.PVDE = 0 to disable voltage detection m before writing to the PVDmCMPCR.PVDLVL[4:0] bits.
	2	Select the detection voltage in the PVDmCMPCR.PVDLVL[4:0] bits.
	3	Set PVDmCMPCR.PVDE = 1 to enable the voltage detection m circuit.
	4	Wait for at least $t_d (E-A)^{-1}$
Setting the digital filter ²	5	Select the sampling clock for the digital filter in the PVDmCR0.FSAMP[1:0] bits.
	6	Set PVDmCR0.DFDIS = 0 to enable the digital filter.
	7	Wait for at least $2n + 3$ cycles of the LOCO (where $n = 2, 4, 8, 16$, and the sampling clock for the digital filter is the LOCO frequency-divided by n).
Enabling output	8	Set PVDmCR0.CMPE = 1 to enable output of the comparison results from voltage monitor m.

Note 1. Steps 5 to 7 can be performed during the waiting time of step 4.

Note 2. Steps 5 to 7 are not required if the digital filter is not in use.

After configuring the PVDm according to the procedure in the table above, if you change the PVDm setting again, first set PVDmCR0.CMPE to 0, and then configure PVDm again according to the procedure in the table above.

When changing the PVDmCMPCR.PVDLVL, comply with the description of the [section 7.2.2. PVDmCMPCR : Voltage Monitor m Comparator Control Register \(m = 1, 2\)](#).

7.4 Reset from Voltage Monitor 0

When using the reset from voltage monitor 0, clear the OFS1(_SEC).PVDAS bit to 0. (enabling the voltage monitor 0 reset after a reset)

Figure 7.3 shows an example of operations for a voltage monitor 0 reset.

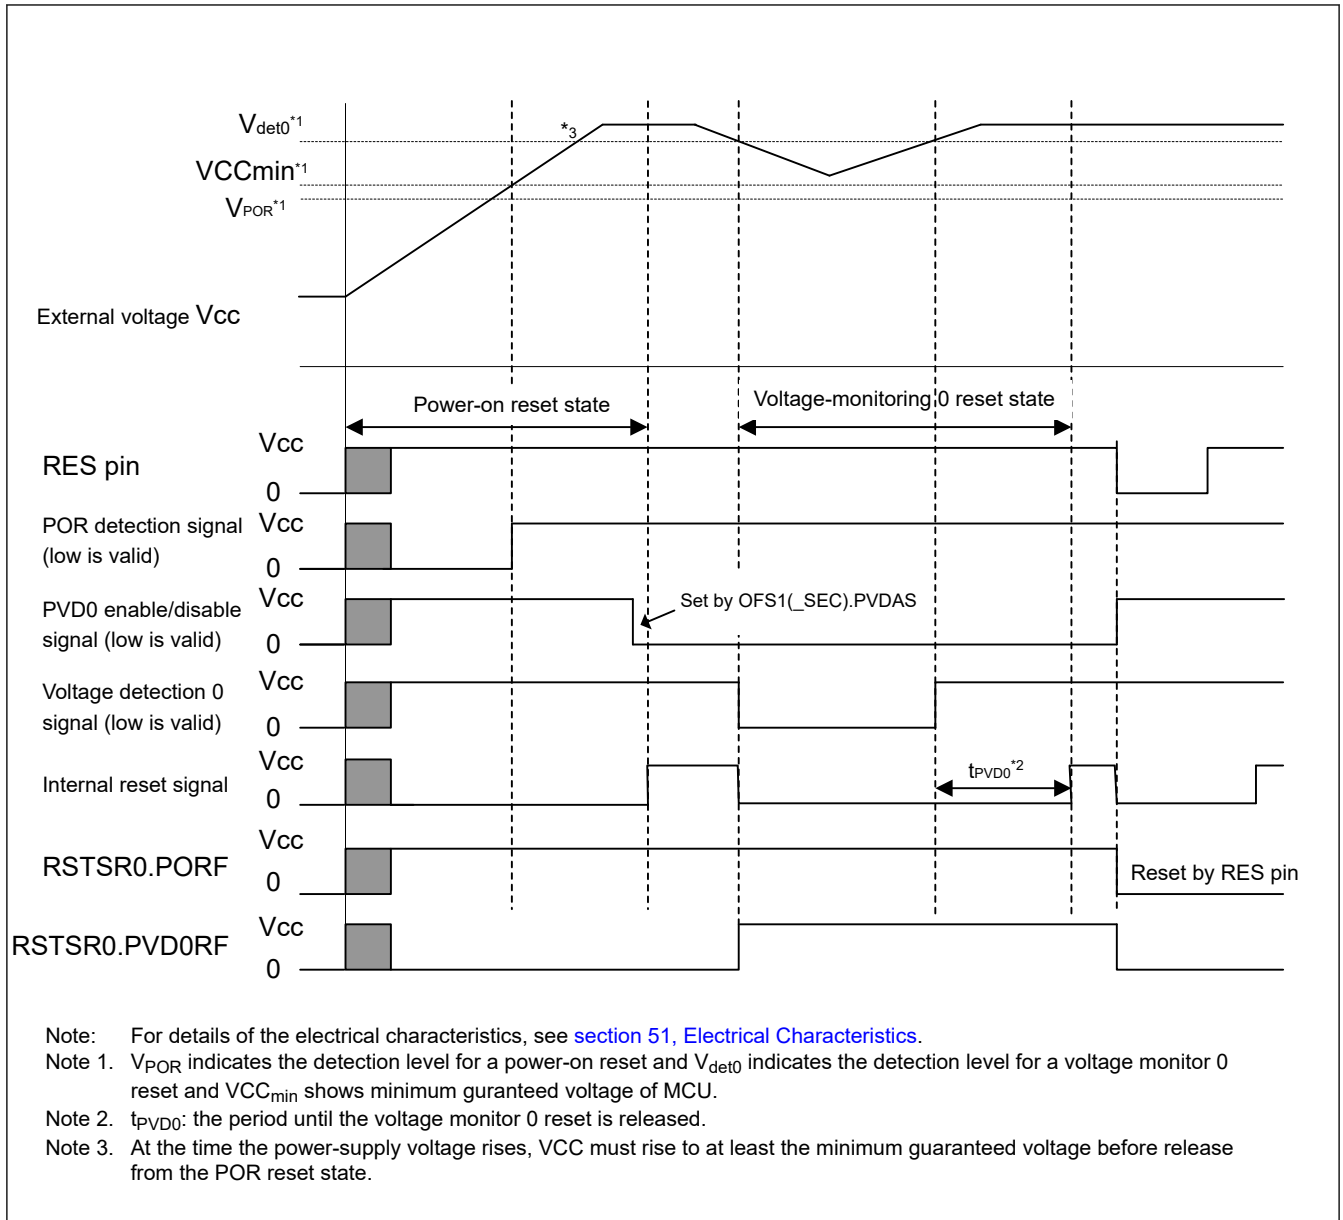

Figure 7.3 Example of voltage monitor 0 reset operation

7.5 Interrupt and Reset from Voltage Monitor m (m = 1, 2)

An interrupt or reset can be generated in response to the results of comparison by the voltage detection m circuit

[Table 7.3](#) shows the procedures for setting bits related to the voltage monitor m interrupt and voltage monitor m reset so that voltage monitoring operates. [Table 7.4](#) shows the procedures for setting bits related to the voltage monitor m interrupt and voltage monitor m reset so that voltage monitoring stops. [Figure 7.4](#) shows an example of operations for a voltage monitor m interrupt. For the operation of the voltage monitor m reset, see [Figure 5.2](#) in [section 5, Resets](#).

Furthermore, if you intend to use the voltage Monitor m circuit in software standby or Deep Software Standby mode, make settings for the voltage Monitor m circuit according to the following procedures.

(1) Setting in Software Standby mode

- Disable the digital filter ($PVDmCR0.DFDIS = 1$).
- Case of $PVDmFCR.RHSEL = 0$
- After $VCC > V_{detm}$ is detected, negate the voltage monitor m reset signal ($PVDmCR0.RN = 0$) following a stabilization time.

(2) Settings in Deep Software Standby mode

- Disable the digital filter (PVDmCR0.DFDIS = 1).
- Enable the voltage monitor m interrupt (PVDmCR0.RI = 0). If the voltage monitor m reset is enabled (PVDmCR0.RI = 1), a transition to Deep Software Standby mode 2 or 3 is not be possible, and the transition will be to Deep Software Standby mode 1 instead.
- During Deep Software Standby mode 3, the voltage Monitor m circuit is stopped. If you intend to use the voltage Monitor m circuit in Deep Software Standby mode, do not transit to Deep Software Standby mode 3.

(3) Disabling at on-chip debug mode

- The function of the voltage Monitor m circuit is disabled by setting DBGSTOPCR.DBGSTOP_PVD at on-chip debug mode.

Table 7.3 Procedures for setting bits related to voltage monitor m interrupt and voltage monitor m reset so that voltage monitoring operates (m = 1, 2)

Step	Voltage monitor m interrupt (voltage monitor m ELC event output)	Voltage monitor m reset
Setting up the voltage detection m circuit	1	Set PVDmCMPCR.PVDE = 0 (disable voltage detection m before writing to the PVDmCMPCR.PVDLVL and PVDmFCR.RHSEL register.)
	2	Select the detection voltage by setting the PVDmCMPCR.PVDLVL bits.
	3	—
	4	Select the type of the reset condition by setting the PVDmFCR.RHSEL bit.
	5	Set PVDmCMPCR.PVDE = 1 (enabling the voltage detection m circuit).
Setting the digital filter*2	6	Wait for at least t_d (E-A). *1
	7	Select the sampling clock for the digital filter by the setting PVDmCR0.FSAMP[1:0] bits.
	8	Set PVDmCR0.DFDIS = 0 (enabling the digital filter).
Setting up the voltage monitor m interrupt or reset	9	Wait for at least $2n + 3$ cycles of the LOCO (where $n = 2, 4, 8, 16$, and the sampling clock for the digital filter is the LOCO frequency-divided by n). *4.
	10	Set PVDmCR0.RI = 0 to select the voltage monitor m interrupt.
Enabling output	11	<ul style="list-style-type: none"> • Set PVDmCR0.RI = 1 (selecting the voltage monitor m reset). • Select the type of the reset negation by setting the PVDmCR0.RN bit.
	12	—
Enabling output	11	Set PVDmSR.DET = 0.
	12	Set PVDmCR0.RIE = 1 (enabling the voltage Monitor m interrupt or reset). *3
13	Set PVDmCR0.CMPE = 1 (enabling output of the results of comparison by voltage monitor m).	

Note 1. Steps 6 to 12 can be performed during the wait time in step 4.

Note 2. Steps 6 to 8 are not required if the digital filter is not in use.

Note 3. Step 12 is not required if only the ELC event signal is to be output.

Note 4. Steps 9 to 12 can be performed during the waiting time of step 8.

After configuring the PVDm according to the procedure in the [Table 7.3](#), if you change the PVDm settings again, stop PVDm according to the procedure in [Table 7.4](#), and then configure PVDm again according to the procedure in the [Table 7.3](#).

When changing the PVDmCMPCR.PVDLVL, comply with the description of the [section 7.2.2. PVDmCMPCR : Voltage Monitor m Comparator Control Register \(m = 1, 2\)](#).

Table 7.4 Procedures for setting bits related to voltage monitor m interrupt and voltage monitor m reset so that voltage monitoring stops (m = 1, 2) (1 of 2)

Step	Voltage monitor m interrupt (voltage monitor m ELC event output), voltage monitor m reset
Stopping the enabling output	1 Set PVDmCR0.CMPE = 0 (disabling output of the results of comparison by voltage Monitor m).

Table 7.4 Procedures for setting bits related to voltage monitor m interrupt and voltage monitor m reset so that voltage monitoring stops (m = 1, 2) (2 of 2)

Step	Voltage monitor m interrupt (voltage monitor m ELC event output), voltage monitor m reset	
	2	Wait for at least $2n + 3$ cycles of the LOCO (where $n = 2, 4, 8, 16$, and the sampling clock for the digital filter is the LOCO frequency-divided by n .) ^{*1}
	3	Set PVDmCR0.RIE = 0 (disabling the voltage monitor m interrupt or reset). ^{*3}
Stopping the digital filter	4	Set PVDmCMPCR.DFDIS = 1 (disabling the digital filter). ^{*1, *2}
Stopping the voltage detection m circuit	5	Set PVDmCMPCR.PVDE = 0 (disabling the voltage detection m circuit).

Note 1. Steps 2 and 4 are not required if the digital filter is not in use.

Note 2. To disable the digital filter from its enabled state and then re-enable it, disable it and wait for at least two cycles of the LOCO before re-enabling it.

Note 3. Step 3 is not required if only the ELC event signal is to be output.

If the voltage monitor m interrupt or voltage monitor m reset setting is to be made again after it has been used and stopped once, the following steps in the procedures for stopping and making the setting can be omitted according to the condition:

- Setting or stopping the voltage detection m circuit is not required if the setting for the voltage detection m circuit is not to be changed
- Setting or stopping the digital filter is not required if the setting for the digital filter is not to be changed
- Setting the voltage monitor m interrupt or reset is not required if the setting for the voltage monitor m interrupt or voltage monitor m reset is not to be changed.

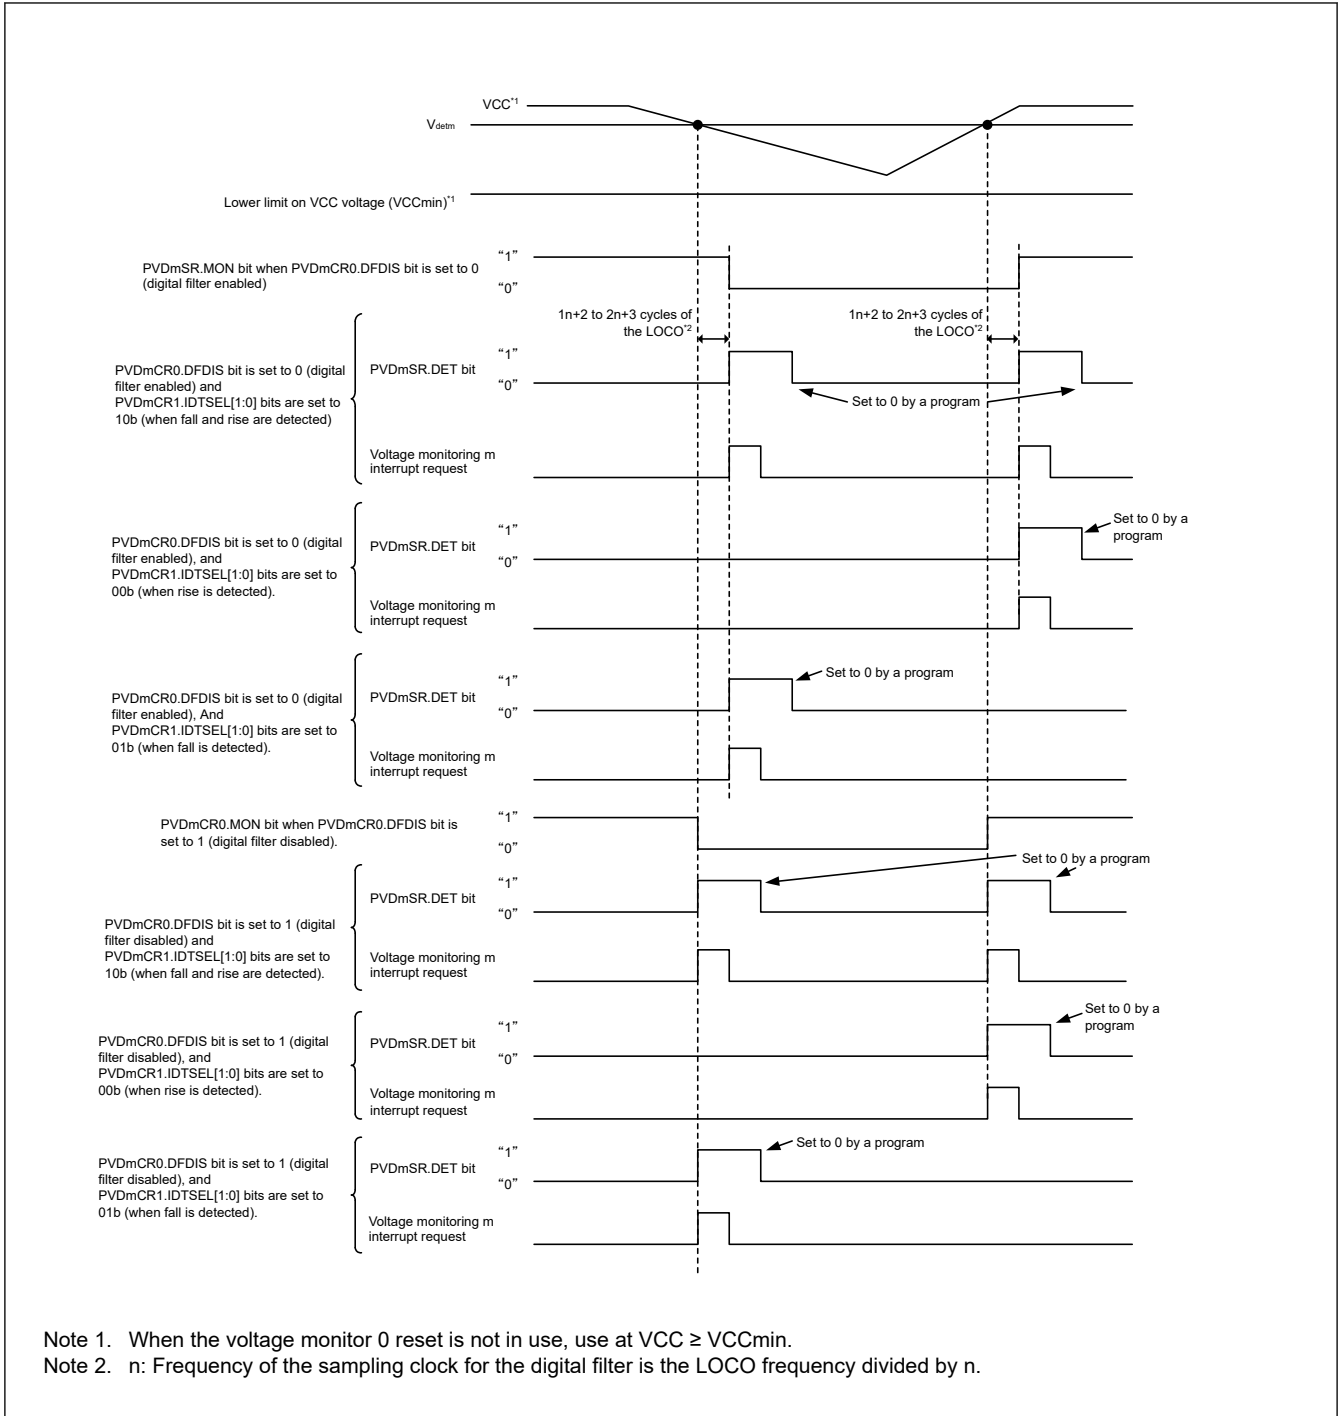

Figure 7.4 Example of voltage monitor m interrupt operation (m = 1, 2)

7.6 Event Link Controller (ELC) Output

The PVDm (m = 1, 2) can output the event signals to the Event Link Controller (ELC).

(1) V_{detm} passage detection event

The PVDm outputs the event signal when it is detected that the voltage has passed the V_{detm} voltage while both the voltage detection m circuit and the voltage monitor m circuit comparison result output are enabled.

When enabling the event link output function of the PVDm, be sure to specify settings to enable the PVDm before enabling the PVDm event link function of the ELC. To stop the event link output function of the PVDm, be sure to specify settings to stop the PVDm before disabling the PVDm event link function of the ELC.

7.6.1 Interrupt Handling and Event Linking

Each PVD has bits to separately enable or disable the voltage monitor m interrupts. When an interrupt source is generated and the interrupt is enabled by the interrupt enable bit, the interrupt signal is output to the CPU.

On the contrary, as soon as an interrupt source is generated, the event link signal is output as the event signal to the other module through the ELC regardless of the state of the interrupt enable bit.

It is possible to output voltage monitor m interrupts in Software Standby mode, Deep Software Standby mode 1, and Deep Software Standby mode 2. The event signals for the ELC in Software Standby mode, Deep Software Standby mode 1, and Deep Software Standby mode 2 are output as follows:

- When the event V_{detm} is detected in Software Standby mode, no event signals are generated for the ELC because no clock is presented in Software Standby mode. Because V_{detm} passage detection flag is preserved, when the supply of the clock is resumed after restoring from Software Standby mode, the event signals for the ELC is output according to the state of the V_{detm} passage detection flag.
- If event of passing V_{detm} is detected in Deep Software Standby mode, no event signal is generated for the ELC.

8. Clock Generation Circuit

8.1 Overview

The MCU provides a clock generation circuit. [Table 8.1](#) and [Table 8.2](#) list the clock generation circuit specifications. [Figure 8.1](#) show a block diagram, and [Table 8.3](#) lists the I/O pins.

Table 8.1 Clock generation circuit specifications for the clock sources (1 of 2)

Clock source	Description	Specification
Main clock oscillator (MOSC)	Resonator frequency	8 MHz to 48 MHz (For frequencies available in USB boot mode, see the application note of the boot firmware)
	External clock input frequency	Up to 48 MHz
	Connectable resonator or additional circuit: ceramic resonator, crystal Connection pins: EXTAL, XTAL	Available
	Drive capability switching	Available
	Automatic Gain Control Function	Available
	Oscillation stop detection function	Available
Sub-clock oscillator (SOSC)	Resonator frequency	32.768 kHz
	Connectable resonator or additional circuit: crystal resonator Connection pin: XCIN, XCOU	Available
	External clock input	Available
	Drive capability switching	Available
PLL1 circuit PLL2 circuit	Input clock source	MOSC/HOCO
	Input pulse frequency division ratio	Selectable from 1/2/3/4
	Input clock frequency	8 MHz to 48 MHz
	Input clock frequency (After input frequency division)	6 MHz to 12 MHz
	Frequency multiplication ratio	Selectable from 53 to 180 (after the decimal point : 0/0.33/0.50/0.66)
	VCO frequency	640 MHz to 1440 MHz
	Number of output clocks	Output 3 different clocks
	PLL Output clock P	40 MHz to 480 MHz (output division ratio : 2/4/6/8/16)
	PLL Output clock Q	71 MHz to 480 MHz (output division ratio : 2/3/4/5/6/8/9)
PLL Output clock R	71 MHz to 480 MHz (output division ratio : 2/3/4/5/6/8/9)	
High-speed on-chip oscillator (HOCO)	Oscillation frequency	16/18/20/32/48 MHz
	FLL function	Available
	User trimming	Available
Middle-speed on-chip oscillator (MOCO)	Oscillation frequency	8 MHz
	User trimming	Available
Low-speed on-chip oscillator (LOCO)	Oscillation frequency	32.768 kHz
	User trimming	Available
External clock input for JTAG (TCK)	Input clock frequency	Up to 25 MHz

Table 8.1 Clock generation circuit specifications for the clock sources (2 of 2)

Clock source	Description	Specification
External clock input for SWD (SWCLK)	Input clock frequency	Up to 25 MHz

Table 8.2 Clock generation circuit specifications for the internal clocks (1 of 2)

Item	Clock source	Clock supply	Specification
CPU clock (CPUCLK)	MOSC/SOSC/HOCO/MOCO/PLL1P	CPU, TCM	Up to 480 MHz Division ratio: 1/2/3/4/6/8/12/16/32/64
System clock (ICLK)	MOSC/SOSC/HOCO/MOCO/PLL1P	DMAC, DTC, Flash (Reading from code flash), SRAM, Standby SRAM, System BUS, I/O Ports, ICU	Up to 240 MHz Division ratio: 1/2/3/4/6/8/12/16/32/64
Debugger clock (DCLK)	1/2 ICLK	Debug Subsystem	Up to 120 MHz
Peripheral module clock A (PCLKA)	MOSC/SOSC/HOCO/MOCO/PLL1P	High-speed peripheral bus (SCI, CANFD, CNECC, SPI, CRC, DOC, ADC12, DAC12, RSIP-E51A, GPT, DRW, LCDC)	Up to 120 MHz Division ratio: 1/2/3/4/6/8/12/16/32/64
Peripheral module clock B (PCLKB)	MOSC/SOSC/HOCO/MOCO/PLL1P	Low-speed peripheral bus (CAC, ELC, POEG, RTC, WDT, IWDI, AGT, ULPT, IIC, USBFS, SSIE, TSN, ACMPHS, OSPI)	Up to 60 MHz Division ratio: 1/2/3/4/6/8/12/16/32/64
Peripheral module clock C (PCLKC)	MOSC/SOSC/HOCO/MOCO/PLL1P	Peripheral module (ADC12 conversion clock)	Up to 60 MHz Division ratio: 1/2/3/4/6/8/12/16/32/64
Peripheral module clock D (PCLKD)	MOSC/SOSC/HOCO/MOCO/PLL1P	Peripheral module(GPT count clock)	Up to 120 MHz Division ratio: 1/2/3/4/6/8/12/16/32/64
Peripheral module clock E (PCLKE)	MOSC/SOSC/HOCO/MOCO/PLL1P	Peripheral module (CNECC)	Up to 240 MHz Division ratio: 1/2/3/4/6/8/12/16/32/64
FlashIF clock (FCLK)	MOSC/SOSC/HOCO/MOCO/PLL1P	FlashIF	4 MHz to 60 MHz (P/E) Up to 60 MHz (read) Division ratio: 1/2/3/4/6/8/12/16/32/64
External bus clock (BCLK)	MOSC/SOSC/HOCO/MOCO/PLL1P	External bus	Up to 120 MHz Division ratio: 1/2/3/4/6/8/12/16/32/64
EBCLK pin output (EBCLK)	BCLK or 1/2 BCLK	EBCLK pin	Up to 60 MHz Division ratio: 1 or 2
SDCLK pin output (SDCLK)	BCLK	SDCLK pin	Up to 120 MHz
Trace clock (TRCLK)	MOSC/SOSC/HOCO/MOCO/PLL1P	CPU-OCD	Up to 120 MHz Division ratio: 1/2/3/4/6/8/12/16/32/64/128/256
SCI clock (SCICLK)	MOSC/SOSC/HOCO/MOCO/ LOCO/PLL1P/ PLL1Q/PLL1R/ PLL2P/PLL2Q/PLL2R	SCI	Up to 120 MHz Division ratio: 1/2/3/4/5/6/8
SPI clock (SPICLK)	MOSC/SOSC/HOCO/MOCO/ LOCO/PLL1P/PLL1Q/PLL1R/ PLL2P/ PLL2Q/PLL2R	SPI	Up to 120 MHz Division ratio: 1/2/3/4/5/6/8
Octal-SPI clock (OCTACLK)	MOSC/SOSC/HOCO/MOCO/ LOCO/PLL1P/PLL1Q/PLL1R/ PLL2P/ PLL2Q/PLL2R	Octal-SPI	Up to 200 MHz Division ratio: 1/2/3/4/5/6/8
Octal-SPI divide clock (OCTADIVCLK)	1/2 OCTACLK	Octal-SPI	Up to 100 MHz
CANFD core clock (CANFDCLK)	MOSC/SOSC/HOCO/MOCO/ LOCO/PLL1P/PLL1Q/PLL1R/ PLL2P/ PLL2Q/PLL2R	CANFD	Up to 80 MHz Division ratio: 1/2/3/4/5/6/8
LCD clock (LCDCLK)	MOCO/PLL1P/ PLL1Q/ PLL1R/PLL2P/PLL2Q/PLL2R	GLCDC	Up to 240 MHz Division ratio: 1/2/3/4/5/6/8

Table 8.2 Clock generation circuit specifications for the internal clocks (2 of 2)

Item	Clock source	Clock supply	Specification
LCD_CLK pin output (LCD_CLK) and graphic LCD pixel clock (PXCLK)	LCD_EXTCLK, LCDCLK	GLCDC	Up to 54 MHz (parallel RGB) Up to 60 MHz (serial RGB) LCD_CLK division ratios: 1, 2, 3, 4, 5, 6, 7, 8, 9, 12, 16, 24, 32 LCD_CLK : PXCLK = 1:1 (parallel RGB) LCD_CLK : PXCLK = 4:1 (serial RGB)
USB clock (USBCLK)	MOSC/HOCO/MOCO/PLL1P/PLL1Q/PLL1R/PLL2P/PLL2Q/PLL2R	USBFS	48 MHz Division ratio: 1/2/3/4/5/6/8
Clock/buzzer output (CLKOUT)	MOSC/SOSC/HOCO/MOCO/LOCO	CLKOUT pin	Up to 60 MHz Division ratio: 1/2/4/8/16/32/64/128
CAN clock (CANMCLK)	MOSC	CANFD	8 MHz to 48 MHz No division
ULPT LOCO clock (ULPTLCLK)	LOCO	ULPT	32.768 kHz No division
ULPT Sub-clock (ULPTSCLK)	SOSC	ULPT	32.768 kHz No division
AGT LOCOclock (AGTLCLK)	LOCO	AGT	32.768 kHz No division
AGT Sub clock (AGTSCLK)	SOSC	AGT	32.768 kHz No division
CAC Main clock (CACMCLK)	MOSC	CAC	Up to 48 MHz No division
CAC Sub clock (CACSCLK)	SOSC	CAC	32.768 kHz No division
CAC HOCO clock (CACHCLK)	HOCO	CAC	16/18/20/32/48 MHz No division
CAC MOCO clock (CACMOCLK)	MOCO	CAC	8 MHz No division
CAC LOCO clock (CACLCLK)	LOCO	CAC	32.768 kHz No division
RTC LOCO clock (RTCLCLK)	LOCO	RTC	32.768 kHz No division
RTC Sub clock (RTCSCLK)	SOCO	RTC	32.768 kHz No division
IWDT clock (IWDTCLK)	1/2 LOCO	IWDT	16.384 kHz No division
SysTick timer clock (SYSTICKCLK)	1/8 MOCO	SysTick timer	1 MHz No division
JTAG clock (JTAGTCK)	TCK	JTAG	Up to 25 MHz No division
Serial wire clock (SWCLK)	TCK	OCD	Up to 25 MHz No division
TCLK pin output (TCLK)	1/2 TRCLK	TCLK pin	Up to 60 MHz

Note: When selecting PLL as the clock source, set the PLL output frequency to 480 MHz or less.

Note: If the PLL reference clock source is HOCO, the PLL multiplication setting must be set within output frequency range of PLL in consideration of HOCO frequency (minimum/maximum).

Note: Restrictions on setting clock frequency: CPUCLK \geq ICLK, ICLK \geq PCLKA \geq PCLKB, ICLK \geq FCLK, ICLK \geq BCLK, PCLKD \geq PCLKA \geq PCLKB

Restrictions on clock frequency ratio: (N: integer, and up to 64)

CPUCLK:ICLK = N:1, ICLK:FCLK = N:1, ICLK:BCLK = N:1, ICLK:PCLKA = N:1, ICLK:PCLKB = N:1, ICLK:PCLKC = N:1 or 1:N,

ICLK:PCLKD = N:1 or 1:N, ICLK:PCLKE = N:1 or 1:N

When one clock selects 3, 6, 12-divisions, the other clocks set by SCKDIVCR and SCKDIVCR2 registers must not select 2, 4, 8, 16, 32, 64- divisions.

If the A/D converter is enabled, the clock frequency ratio is constrained as follows:

PCLKA:PCLKC = 1:1 or 2:1 or 4:1 or 8:1 or 1:2 or 1:4

If the CAN-FD is used, clock frequency ratio is constrained to be PCLKA:PCLKE = 1:2.

Note: Restrictions on the minimum FCLK frequency 4MHz when P/E.

Note: The multiplication of PLL1 and PLL2 should be set to be within the output frequency range of PLL1 and PLL2, taking the frequency of HOCO into consideration when not using the FLL function.

Note: Clocks have a permissible frequency range (See [Table 8.2](#)).

Flash memory and SRAM also have a permissible operating frequency range in each wait cycle setting. (See [section 45, SRAM](#), [section 47, Flash Memory](#))

Those clock frequency ranges must be satisfied even if the HOCO has its maximum or minimum frequency when not using FLL function. (See [section 51, Electrical Characteristics](#)).

Note: PLLCCR.PLSRCSEL bit must be set to 0 when CPUCLK is set to over 360 MHz.

Figure 8.1 Clock generation circuit block diagram

Table 8.3 lists the input/output pins of the clock generation circuit.

Table 8.3 Input/Output Pins of Clock Generation Circuit

Pin name	I/O	Description
XTAL	Output	These pins are used to connect a ceramic resonator or crystal resonator. The EXTAL pin can also be used to input an external clock. For details, see section 8.3.2. External Clock Input .
EXTAL	Input	
XCIN	Input	These pins are used to connect a 32.768-kHz crystal resonator
XCOU	Output	
EXCIN	Input	External sub-clock input
TCK/SWCLK	Input	This pin is used to input the clock for the JTAG/SWD
EBCLK	Output	This pin is used to supply external devices with the external bus clock (EBCLK)
SDCLK	Output	SDRAM clock (SDCLK) supply for external devices
CLKOUT	Output	This pin is used to output the CLKOUT clock
TRCLK	Output	TRACE clock output.

8.2 Register Descriptions

8.2.1 CGFSAR : Clock Generation Function Security Attribute Register

Base address: SYSC = 0x4001_E000
 SYSC_NS = 0x5001_E000

Offset address: 0x3C0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	NONS EC26	—	—	—	NONS EC22	NONS EC21	—	—	NONS EC18	NONS EC17	NONS EC16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	NONS EC13	NONS EC12	NONS EC11	—	NONS EC09	NONS EC08	NONS EC07	NONS EC06	NONS EC05	NONS EC04	NONS EC03	NONS EC02	—	NONS EC00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NONSEC00	Non Secure Attribute bit 00 Target register: SCKDIVCR, SCKDIVCR2, SCKSCR Target factor: system clock control 0: Secure 1: Non Secure	R/W
1	—	This bit is read as 0. The write value should be 0.	R/W
2	NONSEC02	Non Secure Attribute bit 02 Target register: HOCOCCR, HOCOCCR2, FLLCR1, FLLCR2, HOCOUTCR, HOCOSCR Target factor: HOCO 0: Secure 1: Non Secure	R/W
3	NONSEC03	Non Secure Attribute bit 03 Target register: MOCOCCR, MOCOUTCR Target factor: MOCO 0: Secure 1: Non Secure	R/W
4	NONSEC04	Non Secure Attribute bit 04 Target register: LOCOCCR, LOCOUTCR Target factor: LOCO 0: Secure 1: Non Secure	R/W

Bit	Symbol	Function	R/W
5	NONSEC05	Non Secure Attribute bit 05 Target register: MOSCCR, MOSCWTCR, MOMCR, MOSCSCR Target factor: MOSC 0: Secure 1: Non Secure	R/W
6	NONSEC06	Non Secure Attribute bit 06 Target register: OSTDCR, OSTDSR Target factor: oscillation stop detection control 0: Secure 1: Non Secure	R/W
7	NONSEC07	Non Secure Attribute bit 07 Target register: SOSCCR, SOMCR Target factor: SOSC 0: Secure 1: Non Secure	R/W
8	NONSEC08	Non Secure Attribute bit 08 Target register: PLLCCR, PLLCCR2, PLLCR Target factor: PLL 0: Secure 1: Non Secure	R/W
9	NONSEC09	Non Secure Attribute bit 09 Target register: PLL2CCR, PLL2CCR2, PLL2CR Target factor: PLL2 0: Secure 1: Non Secure	R/W
10	—	This bit is read as 0. The write value should be 0.	R/W
11	NONSEC11	Non Secure Attribute bit 11 Target register: CKOCR Target factor: CLKOUT control 0: Secure 1: Non Secure	R/W
12	NONSEC12	Non Secure Attribute bit 12 Target register: BCKCR, EBCKOCR Target factor: EBCLK 0: Secure 1: Non Secure	R/W
13	NONSEC13	Non Secure Attribute bit 13 Target register: SDCKOCR Target factor: SDCLK 0: Secure 1: Non Secure	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W
16	NONSEC16	Non Secure Attribute bit 16 Target register: USBCKDIVCR, USBCKCR Target factor: USBCLK 0: Secure 1: Non Secure	R/W
17	NONSEC17	Non Secure Attribute bit 17 Target register: OCTACKDIVCR, OCTACKCR Target factor: OCTACKL 0: Secure 1: Non Secure	R/W
18	NONSEC18	Non Secure Attribute bit 18 Target register: CANFDCKDIVCR, CANFDCKCR Target factor: CANFDCLK 0: Secure 1: Non Secure	R/W
20:19	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
21	NONSEC21	Non Secure Attribute bit 21 Target register: SCICKDIVCR, SCICKCR Target factor: SCICLK 0: Secure 1: Non Secure	R/W
22	NONSEC22	Non Secure Attribute bit 22 Target register: SPICKDIVCR, SPICKCR Target factor: SPICLK 0: Secure 1: Non Secure	R/W
25:23	—	These bits are read as 0. The write value should be 0.	R/W
26	NONSEC26	Non Secure Attribute bit 26 Target register: LCDCKDIVCR, LCDCKCR Target factor: LCDCLK 0: Secure 1: Non Secure	R/W
31:27	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

Note: Set the PRCR.PRC4 bit to 1 (write enabled) before rewriting this register.

CGFSAR register controls the secure attribute of Clock Generation Function registers.

NONSEC00 bit (Non Secure Attribute bit 00)

This bit controls the security attribute of SCKDIVCR, SCKDIVCR2, SCKSCR.

NONSEC02 bit (Non Secure Attribute bit 02)

This bit controls the security attribute of HOCOCR, HOCOCR2, FLLCR1, FLLCR2, HOCOUTCR, HOCOSCR.

NONSEC03 bit (Non Secure Attribute bit 03)

This bit controls the security attribute of MOCOCR, MOCOUTCR.

NONSEC04 bit (Non Secure Attribute bit 04)

This bit controls the security attribute of LOCOCR, LOCOUTCR.

NONSEC05 bit (Non Secure Attribute bit 05)

This bit controls the security attribute of MOSCCR, MOSCWTCR, MOMCR, MOSCSR.

NONSEC06 bit (Non Secure Attribute bit 06)

This bit controls the security attribute of OSTDCR, OSTDSR.

NONSEC07 bit (Non Secure Attribute bit 07)

This bit controls the security attribute of SOSCCR, SOMCR.

NONSEC08 bit (Non Secure Attribute bit 08)

This bit controls the security attribute of PLLCCR, PLLCCR2, PLLCR.

NONSEC09 bit (Non Secure Attribute bit 09)

This bit controls the security attribute of PLL2CCR, PLL2CCR2, PLL2CR.

NONSEC11 bit (Non Secure Attribute bit 11)

This bit controls the security attribute of CKOCR.

NONSEC12 bit (Non Secure Attribute bit 12)

This bit controls the security attribute of BCKCR, EBCKOCR.

NONSEC13 bit (Non Secure Attribute bit 11)

This bit controls the security attribute of SDCKOCR.

NONSEC16 bit (Non Secure Attribute bit 16)

This bit controls the security attribute of USBCKDIVCR, USBCKCR.

NONSEC17 bit (Non Secure Attribute bit 17)

This bit controls the security attribute of OCTACKDIVCR, OCTACKCR.

NONSEC18 bit (Non Secure Attribute bit 18)

This bit controls the security attribute of CANFDCKDIVCR, CANFDCKCR.

NONSEC21 bit (Non Secure Attribute bit 21)

This bit controls the security attribute of SCICKDIVCR, SCICKCR.

NONSEC22 bit (Non Secure Attribute bit 22)

This bit controls the security attribute of SPICKDIVCR, SPICKCR.

NONSEC26 bit (Non Secure Attribute bit 26)

This bit controls the security attribute of LCDCKDIVCR, LCDCKCR.

8.2.2 SCKDIVCR : System Clock Division Control Register

Base address: SYSC = 0x4001_E000
 SYSC_NS = 0x5001_E000

Offset address: 0x020

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: When one clock selects 3, 6, 12-divisions, the other clocks set by SCKDIVCR and SCKDIVCR2 registers must not select 2, 4, 8, 16, 32, 64- divisions.

Note 1. The following relation is required between the frequencies of the system clock (ICLK) and the FlashIF clock (FCLK).
 ICLK:FCLK=N:1 (N: integer)

Note 2. The following relation is required between the frequencies of the system clock (ICLK) and the external bus clock (BCLK).
 ICLK:BCLK = N:1 (N: integer)

Note 3. The following relation is required between the frequencies of the system clock (ICLK) and the peripheral module clocks (PCLKA, PCLKB)
 ICLK:PCLKA = N:1, ICLK:PCLKB = N:1 (N: integer)

Note 4. The following relation is required between the frequencies of the system clock (ICLK) and the peripheral module clocks (PCLKC, PCLKD, PCLKE):
 ICLK:PCLKC, PCLKD PCLKE = N:1 or 1:N (N: integer)

Note 5. The following relation is required between the frequencies of the CPU clock (CPUCLK) and the system clock (ICLK):
 CPUCLK:ICLK = N:1 (N: integer)

SCKDIVCR selects the frequencies of the system clock (ICLK), peripheral module clock (PCLKA, PCLKB, PCLKC, PCLKD, PCLKE), FlashIF clock (FCLK), and external bus clock (BCLK).

8.2.3 SCKDIVCR2 : System Clock Division Control Register 2

Base address: SYSC = 0x4001_E000
 SYSC_NS = 0x5001_E000

Offset address: 0x24

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
3:0	CPUCK[3:0] ^{*1}	CPU Clock (CPUCLK) Select 0 0 0 0: × 1/1 0 0 0 1: × 1/2 0 0 1 0: × 1/4 0 0 1 1: × 1/8 0 1 0 0: × 1/16 0 1 0 1: × 1/32 0 1 1 0: × 1/64 1 0 0 0: × 1/3 1 0 0 1: × 1/6 1 0 1 0: × 1/12 Others: Setting prohibited.	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: When one clock selects 3, 6, 12-divisions, the other clocks set by SCKDIVCR and SCKDIVCR2 registers must not select 2, 4, 8, 16, 32, 64- divisions.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note 1. The following relation is required between the frequencies of the CPU clock (CPUCLK) and the system clock (ICLK):
 CPUCLK:ICLK = N:1 (N: integer)

SCKDIVCR2 selects the frequencies of the cpu clock (CPUCLK).

8.2.4 SYRACCR : System Register Access Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xCC

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	BUSY

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	BUSY	Access Ready monitor 0: Ready to read/write access 1: Writing in progress	R
7:1	—	These bits are read as 0. The write value should be 0.	R

Note: S-TYPE-5, P-TYPE-5

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

SYRACCR register monitor that the target registers can be accessed.

The target registers are LOCOCR and LOCOUTCR.

BUSY bit (Access Ready monitor)

When SYRACCR.BUSY is 0, you can access the target registers.

Make sure that SYRACCR.BUSY is 0 before accessing the target registers.

When SYRACCR.BUSY is 1, the write access to one of the target registers is in progress. If SYRACCR.BUSY is 1, further writing to one of the target registers is ignored, and the read value from the target registers is not guaranteed.

8.2.5 SCKSCR : System Clock Source Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x026

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	CKSEL[2:0]		

Value after reset: 0 0 0 0 0 0 0 0 1

Bit	Symbol	Function	R/W
2:0	CKSEL[2:0]	Clock Source Select 0 0 0: HOCO 0 0 1: MOCO (Value after reset) 0 1 0: Setting prohibited 0 1 1: Main clock oscillator (MOSC) 1 0 0: Sub-clock oscillator (SOSC) 1 0 1: PLL1 output clock P (PLL1P) 1 1 0: Setting prohibited 1 1 1: Setting prohibited	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: S-TYPE-3, P-TYPE-2

The SCKSCR register selects system clock source.

CKSEL[2:0] bits (Clock Source Select)

The CKSEL[2:0] bits select the source for the following modules:

- CPU clock (CPUCLK)
- System clock (ICLK)
- Peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD and PCLKE)
- FlashIF clock (FCLK)
- external bus clock (BCLK)
- SDRAM clock (SDCLK)

The bits select from one of the following sources:

- Middle-speed on-chip oscillator (MOCO)
- High-speed on-chip oscillator (HOCO)
- Main clock oscillator (MOSC)
- Sub-clock oscillator (SOSC)
- PLL1 output clock P (PLL1P)

The operating state of each clock source is controlled not only by the clock oscillation enable settings but also by the operating modes of the product. Some clock sources might be forcibly stopped depending on the product operating mode being used.

Check the operation state of clock sources in each product operating mode, and do not select the clock source to be stopped in SCKSCR. The clock sources should be switched when there are no occurring internal asynchronous interrupt. For details, see [section 10, Low Power Modes](#).

8.2.6 PLLCCR : PLL Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x028

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PLLMUL[7:0]							PLLMULNF[1:0]		—	PLSRCSEL	—	—	PLIDIV[1:0]		
Value after reset:	0	0	0	1	1	0	0	1	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	PLIDIV[1:0] ^{*1}	PLL1 Input Frequency Division Ratio Select 0 0: 1/1 0 1: 1/2 1 0: 1/3 1 1: 1/4	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	PLSRCSEL	PLL1 Clock Source Select 0: Main clock oscillator ^{*3} 1: HOCO ^{*4}	R/W
5	—	This bit is read as 0. The write value should be 0.	R/W
7:6	PLLMULNF[1:0] ^{*2}	PLL1 Frequency Multiplication Fractional Factor Select 0 0: 0.00 (Value after reset) 0 1: 0.33 (1/3) 1 0: 0.66 (2/3) 1 1: 0.50 (1/2)	R/W

Bit	Symbol	Function	R/W
15:8	PLLMUL[7:0]*2	PLL1 Frequency Multiplication Factor Select 0x19: × 26 (Value after reset) 0x34: × 53 0x35: × 54 ⋮ 0x58: × 89 0x59: × 90 0x5A: × 91 ⋮ 0xB2: × 179 0xB3: × 180 Others: Setting prohibited.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note 1. PLIDIV[1:0] should be set so that the frequency of PLL1 input signal is within the range of [section 8.1. Overview](#).

Note 2. PLLMUL[7:0] and PLLMULNF[1:0] should be set so that the frequency of PLL1 output signal is within the range of [section 8.1. Overview](#).

Note 3. PLSRCSEL must be set to 0 when CPUCLK is set to over 360MHz.

Note 4. The FLL function must be enabled when using USBCLK.

The PLLCCR register sets the operation of the PLL1 circuit.

Writing to the PLLCCR is prohibited when the PLLCR.PLLSTP bit is 0 (the PLL1 operates).

PLIDIV[1:0] bits (PLL1 Input Frequency Division Ratio Select)

These bits select the frequency division ratio of the PLL1 clock source.

PLSRCSEL bit (PLL1 Clock Source Select)

This bit selects the clock source for the PLL1.

PLLMULNF[1:0] bit (PLL1 Frequency Multiplication Fractional Factor Select)

These bits select the fractional part of the frequency multiplication factor for the PLL1 circuit.

PLLMUL[7:0] bits (PLL1 Frequency Multiplication Factor Select)

These bits select the frequency multiplication factor of the PLL1 circuit.

8.2.7 PLLCCR2 : PLL Clock Control Register 2

Base address: SYSC = 0x4001_E000
 SYSC_NS = 0x5001_E000

Offset address: 0x4C

Bit	Symbol	Function	R/W
3:0	PLODIVP[3:0]*1	PLL1 Output Frequency Division Ratio Select for output clock P 0001: × 1/2 0011: × 1/4 0101: × 1/6 (Value after reset) 0111: × 1/8 1111: × 1/16 Others: Setting prohibited.	R/W

Bit	Symbol	Function	R/W
7:4	PLODIVQ[3:0]*1	PLL1 Output Frequency Division Ratio Select for output clock Q 0001: × 1/2 0010: × 1/3 0011: × 1/4 0100: × 1/5 0101: × 1/6 (Value after reset) 0111: × 1/8 1000: × 1/9 Others: Setting prohibited.	R/W
11:8	PLODIVR[3:0]*1	PLL1 Output Frequency Division Ratio Select for output clock R 0001: × 1/2 0010: × 1/3 0011: × 1/4 0100: × 1/5 0101: × 1/6 (Value after reset) 0111: × 1/8 1000: × 1/9 Others: Setting prohibited.	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note 1. It must be set so that the frequency of PLL1 output signal is within the range listed in [Table 8.1](#).

The PLLCCR2 register sets up the operation of the PLL1 circuit. Writing to the PLLCCR2 is prohibited when the PLLCR.PLLSTP bit is 0 (the PLL1 operates).

Even if only one of the PLL1 output clock P, Q, or R is used, PLLCCR2 must be set so that the frequency of PLL1 output signal is within the range listed in [Table 8.1](#).

PLODIVP[3:0] bit (PLL1 Output Frequency Division Ratio Select for output clock P)

These bits select the output frequency division ratio for PLL1 output clock P (PLL1P).

PLODIVQ[3:0] bit (PLL1 Output Frequency Division Ratio Select for output clock Q)

These bits select the output frequency division ratio for PLL1 output clock Q (PLL1Q).

PLODIVR[3:0] bit (PLL1 Output Frequency Division Ratio Select for output clock R)

These bits select the output frequency division ratio for PLL1 output clock R (PLL1R).

8.2.8 PLLCR : PLL Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x02A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	PLLSTP

Value after reset: 0 0 0 0 0 0 0 0 1

Bit	Symbol	Function	R/W
0	PLLSTP	PLL1 Stop Control 0: PLL1 is operating 1: PLL1 is stopped	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The PLLCR register controls the operation of the PLL1 circuit.

PLLSTP bit (PLL1 Stop Control)

This bit runs or stops the PLL1 circuit.

If the main clock oscillator is to be selected as the clock source for the PLL1 by the PLLCCR.PLSRCSEL bit, the Main Clock Oscillator Wait Control Register (MOSCWTCR) must be set.

After the PLLSTP bit setting is changed to run the PLL1, only use the PLL1 clock after confirming that the OSCSF.PLLSF bit is set to 1. That is, a fixed time for stabilization is required after starting the PLL1 operation. A fixed time is also required for oscillation to stop after stopping the PLL1 operation. Additionally, apply the following limitations when starting and stopping the PLL1 operation by the PLLSTP bit:

- After stopping the PLL1, confirm that the OSCSF.PLLSF bit is 0 before restarting the PLL1.
- Confirm that the PLL1 is operating and that the OSCSF.PLLSF bit is 1 before stopping the PLL1.
- Regardless of whether the PLL1 clock is selected as the system clock source, confirm that the OSCSF.PLLSF is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode after operating the PLL1.
- When transitioning to Software Standby or Deep Software Standby mode after stopping the PLL1, confirm that the OSCSF.PLLSF bit is cleared to 0 before executing a WFI instruction.

Writing 1 to the PLLSTP bit is prohibited when SCKSCR.CKSEL[2:0] = 101 (system clock source = PLL1 output clock P (PLL1P)).

Confirm the following conditions before writing 0 to PLLSTP:

- When PLL1 source clock = MOSC: MOSCCR.MOSTP = 0 (MOSC is enabled)
- When PLL1 source clock = HOCO: HOCOCCR.HCSTP = 0 (HOCO is enabled).

8.2.9 PLL2CCR : PLL2 Clock Control Register

Base address: SYSC = 0x4001_E000
 SYSC_NS = 0x5001_E000

Offset address: 0x048

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PLL2MUL[7:0]							PLL2MULNF[1:0]	—	PL2SRCSEL	—	—	PL2IDIV[1:0]			
Value after reset:	0	0	0	1	1	0	0	1	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	PL2IDIV[1:0] ^{*1}	PLL2 Input Frequency Division Ratio Select 0 0: 1/1 (Value after reset) 0 1: 1/2 1 0: 1/3 1 1: 1/4	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	PL2SRCSEL	PLL2 Clock Source Select 0: Main clock oscillator 1: HOCO ^{*3}	R/W
5	—	These bits are read as 0. The write value should be 0.	R/W
7:6	PLL2MULNF[1:0] ^{*2}	PLL2 Frequency Multiplication Fractional Factor Select 00: 0.00 (Value after reset) 01: 0.33 (1/3) 10: 0.66 (2/3) 11: 0.50 (1/2)	R/W

Bit	Symbol	Function	R/W
15:8	PLL2MUL[7:0] ²	PLL2 Frequency Multiplication Factor Select 0x19: × 26 (Value after reset) 0x34: × 53 0x35: × 54 ⋮ 0x58: × 89 0x59: × 90 0x5A: × 91 ⋮ 0xD2: × 179 0xD3: × 180 Others: Setting prohibited.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note 1. PL2DIV[1:0] should be set so that the frequency of PLL2 input signal is within the range of [section 8.1. Overview](#).

Note 2. PLL2MUL[7:0] and PLL2MULNF[1:0] should be set so that the frequency of PLL2 output signal is within the range of [section 8.1. Overview](#).

Note 3. The FLL function must be enabled when using USBCLK.

The PLL2CCR register sets the operation of the PLL2 circuit.

Writing to the PLL2CCR register is prohibited when the PLL2CR.PLL2STP bit is 0 (the PLL2 operates).

PL2DIV[1:0] bits (PLL2 Input Frequency Division Ratio Select)

These bits select the frequency division ratio of the PLL2 clock source.

PL2SRCSEL bit (PLL2 Clock Source Select)

This bit selects the clock source for the PLL2.

PLL2MULNF[1:0] bit (PLL2 Frequency Multiplication Fractional Factor Select)

These bits select the fractional part of the frequency multiplication factor for the PLL2 circuit.

PLL2MUL[7:0] bits (PLL2 Frequency Multiplication Factor Select)

These bits select the frequency multiplication factor of the PLL2 circuit.

8.2.10 PLL2CCR2 : PLL2 Clock Control Register 2

Base address: SYSC = 0x4001_E000
 SYSC_NS = 0x5001_E000

Offset address: 0x4E

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:	—	PL2ODIVR[3:0]	PL2ODIVQ[3:0]	PL2ODIVP[3:0]
------------	---	---------------	---------------	---------------

Value after reset: 0 0 0 0 0 1 0 1 0 1 0 1 0 1 0 1

Bit	Symbol	Function	R/W
3:0	PL2ODIVP[3:0] ¹	PLL2 Output Frequency Division Ratio Select for output clock P 0001: × 1/2 0011: × 1/4 0101: × 1/6 (Value after reset) 0111: × 1/8 1111: × 1/16 Others: Setting prohibited.	R/W

Bit	Symbol	Function	R/W
7:4	PL2ODIVQ[3:0]*1	PLL2 Output Frequency Division Ratio Select for output clock Q 0001: × 1/2 0010: × 1/3 0011: × 1/4 0100: × 1/5 0101: × 1/6 (Value after reset) 0111: × 1/8 1000: × 1/9 Others: Setting prohibited.	R/W
11:8	PL2ODIVR[3:0]*1	PLL2 Output Frequency Division Ratio Select for output clock R 0001: × 1/2 0010: × 1/3 0011: × 1/4 0100: × 1/5 0101: × 1/6 (Value after reset) 0111: × 1/8 1000: × 1/9 Others: Setting prohibited.	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note 1. It must be set so that the frequency of PLL2 output signal is within the range listed in [Table 8.1](#).

The PLL2CCR2 register sets up the operation of the PLL2 circuit. Writing to the PLL2CCR2 is prohibited when the PLL2CR.PLL2STP bit is 0 (the PLL2 operates).

Even if only one of the PLL2 output clock P, Q, or R is used, PLL2CCR2 must be set so that the frequency of PLL2 output signal is within the range listed in [Table 8.1](#).

PL2ODIVP[3:0] bit (PLL2 Output Frequency Division Ratio Select for output clock P)

These bits select the output frequency division ratio for PLL2 output clock P (PLL2P).

PL2ODIVQ[3:0] bit (PLL2 Output Frequency Division Ratio Select for output clock Q)

These bits select the output frequency division ratio for PLL2 output clock Q (PLL2Q).

PL2ODIVR[3:0] bit (PLL2 Output Frequency Division Ratio Select for output clock R)

These bits select the output frequency division ratio for PLL2 output clock R (PLL2R).

8.2.11 PLL2CR : PLL2 Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x04A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	PLL2S TP

Value after reset: 0 0 0 0 0 0 0 0 1

Bit	Symbol	Function	R/W
0	PLL2STP	PLL2 Stop Control 0: PLL2 is operating 1: PLL2 is stopped	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The PLL2CR register controls the operation of the PLL2 circuit.

PLL2STP bit (PLL2 Stop Control)

This bit runs or stops the PLL2 circuit.

If the main clock oscillator is to be selected as the clock source for the PLL2 by the PLL2CCR.PL2SRCSEL bit, the Main Clock Oscillator Wait Control Register (MOSCWTCR) must be set.

After the PLL2STP bit setting is changed to run the PLL2, only use the PLL2 clock after confirming that the OSCSF.PLL2SF bit is set to 1. That is, a fixed time for stabilization is required after starting the PLL2 operation. A fixed time is also required for oscillation to stop after stopping the PLL2 operation. Additionally, apply the following limitations when starting and stopping the PLL2 operation by the PLL2STP bit:

- After stopping the PLL2, confirm that the OSCSF.PLL2SF bit is 0 before restarting the PLL2.
- Confirm that the PLL2 is operating and that the OSCSF.PLL2SF bit is 1 before stopping the PLL2.
- Confirm that the OSCSF.PLL2SF bit is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode after operating the PLL2.
- When transitioning to Software Standby or Deep Software Standby mode after stopping the PLL2, confirm that the OSCSF.PLL2SF bit is cleared to 0 before executing a WFI instruction.

Confirm the following conditions before writing 0 to PLL2STP:

- When the PLL2 source clock = MOSC: MOSCCR.MOSTP = 0 (MOSC is enabled)
- When the PLL2 source clock = HOCO: HOCOCCR.HCSTP = 0 (HOCO is enabled).

8.2.12 BCKCR : External Bus Clock Control Register

Base address: SYSC = 0x4001_E000
 SYSC_NS = 0x5001_E000

Offset address: 0x030

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	BCLK DIV
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BCLKDIV	BCLK Pin Output Select 0: BCLK 1: BCLK/2	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The BCKCR register controls the external bus clock.

BCLKDIV bit (BCLK Pin Output Select)

This bit selects the clock signal for output from the BCLK pin.

Either the BCLK clock with the frequency selected by the BCK[2:0] bits in SCKDIVCR or the BCLK clock divided by 2 can be selected.

8.2.13 MOSCCR : Main Clock Oscillator Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x032

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MOSTP
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	MOSTP	Main Clock Oscillator Stop 0: Operate the main clock oscillator*1 1: Stop the main clock oscillator	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: S-TYPE-3, P-TYPE-2

Note 1. MOMCR register must be set before setting MOSTP to 0.

The MOSCCR register controls the main clock oscillator.

MOSTP bit (Main Clock Oscillator Stop)

The MOSTP bit starts or stops the main clock oscillator.

When changing the value of the MOSTP bit, execute subsequent instructions only after reading the bit to check that the value is updated.

When using the main clock, the Main Clock Oscillator Mode Oscillation Control Register (MOMCR) and the Main Clock Oscillator Wait Control Register (MOSCWTCR) must be set before setting MOSTP to 0. After setting the MOSTP bit to 0, confirm that the OSCSF.MOSCSF bit is set to 1 before using the main clock oscillator.

A fixed stabilization wait time is required after setting the main clock oscillator to start operation. A fixed wait time is also required for oscillation to stop after stopping the main clock oscillator.

The following restrictions apply when starting and stopping operation:

- After stopping the main clock oscillator, confirm that the OSCSF.MOSCSF bit is 0 before restarting the main clock oscillator
- Confirm that the main clock oscillator operates and that the OSCSF.MOSCSF bit is 1 before stopping the main clock oscillator
- Regardless of whether the main clock oscillator is selected as the system clock source, confirm that the OSCSF.MOSCSF bit is set to 1 before executing a WFI instruction to place the MCU in Software standby after operating the main clock oscillator or Deep Software Standby mode after operating the main clock oscillator.
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the main clock oscillator, confirm that the OSCSF.MOSCSF bit is set to 0 before executing the WFI instruction.

Writing 1 to MOSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC)
- PLLCCR.PLSRCSEL = 0 (PLL1 source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL1P)
- PLLCCR.PLSRCSEL = 0 (PLL1 source clock = MOSC) and PLLCR.PLLSTP = 0 (PLL1 is operating)
- PLL2CCR.PL2SRCSEL = 0 (PLL2 source clock = MOSC) and PLL2CR.PLL2STP = 0 (PLL2 is operating).

8.2.14 SOSCCR : Sub-Clock Oscillator Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SOSTP
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	SOSTP	Sub-Clock Oscillator Stop 0: Operate the sub-clock oscillator*1 1: Stop the sub-clock oscillator	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note 1. The SOMCR register must be set before setting SOSTP to 0.

The SOSCCR register controls the sub-clock oscillator.

SOSTP bit (Sub-Clock Oscillator Stop)

The SOSTP bit starts or stops the sub-clock oscillator. When changing the value of the SOSTP bit, only execute subsequent instructions after reading the bit to check that the value is updated. Use the SOSTP bit when using the sub-clock oscillator as the source for a peripheral module, for example the RTC. When using the sub-clock oscillator, set the Sub-Clock Oscillator Mode Control Register (SOMCR) before setting SOSTP to 0.

When selecting External clock input by SOMCR.SOSEL, set SOMCR.SOSEL to 1 and wait 50μs, then set SOSTP to 0.

The following restrictions apply when starting and stopping the operation:

- After stopping the sub-clock oscillator, allow a stop interval of at least 5 SOSC clock cycles before restarting it
- After setting the SOSTP bit to 0, use the sub-clock only after the sub-clock oscillation stabilization time ($t_{SUBOSCWT}$) has elapsed.
- Regardless of whether the sub-clock oscillator is selected as the system clock source, confirm that the sub-clock oscillation is stable before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the sub-clock oscillator, wait for at least 3 SOSC clock cycles before executing the WFI instruction.

Writing 1 to SOSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 100b (system clock source = SOSC).

8.2.15 LOCOCR : Low-Speed On-Chip Oscillator Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x400

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	LCSTP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	LCSTP	LOCO Stop 0: Operate the LOCO clock 1: Stop the LOCO clock	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: Make sure that SYRACCR.BUSY is 0 before accessing LOCOCR. When SYRACCR.BUSY is 1, the write access is ignored and the read value is not guaranteed.

The LOCOCR register controls the LOCO clock.

LCSTP bit (LOCO Stop)

The LCSTP bit starts or stops the LOCO clock.

When changing the value of the bit, only execute subsequent instructions after reading the bit and checking that its value has actually been updated.

8.2.16 HOCOCCR : High-Speed On-Chip Oscillator Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x036

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	HCSTP
Value after reset:	0	0	0	0	0	0	0	0/1*1

Bit	Symbol	Function	R/W
0	HCSTP	HOCO Stop 0: Operate the HOCO clock *2*3 1: Stop the HOCO clock	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note 1. The HCSTP bit value after a reset is 0 when the OFS1(_SEC).HOCOEN bit is 0. It is 1 when the OFS1(_SEC).HOCOEN bit is 1.

Note 2. If you are using the HOCO (HCSTP = 0), set the OFS1(_SEC).HOCOFRQ0[2:0] bit to an optimum value.

Note 3. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCCR2.HCFRQ0[2:0] even if OFS1(_SEC).HOCOFRQ0[2:0] is not appropriate value.

The HOCOCCR register controls the HOCO clock.

HCSTP bit (HOCO Stop)

The HCSTP bit starts or stops the HOCO clock.

After setting the HCSTP bit to 0 to start the HOCO clock, confirm that the OSCSF.HOCOSF is set to 1 before using the clock. When OFS1(_SEC).HOCOEN is set to 0, confirm that OSCSF.HOCOSF is also set to 1 before using the HOCO clock. A fixed stabilization wait time is required after setting the HOCO clock to start operation. A fixed wait time is also required after setting the HOCO clock to stop.

The following limitations apply when starting and stopping operation:

- After stopping the HOCO clock, wait more than HOCO stop width time and confirm that the OSCSF.HOCOSF is 0 before restarting the HOCO clock. See [section 51, Electrical Characteristics](#) for HOCO stop width time.
- Confirm that the HOCO clock operates and that the OSCSF.HOCOSF is 1 before stopping the HOCO clock.
- Regardless of whether the HOCO clock is selected as the system clock source, confirm that the OSCSF.HOCOSF is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode after setting HOCO operation with the HCSTP bit.

- When a transition to Software Standby or Deep Software Standby mode is to follow the setting of the HOCO clock to stop, confirm that the OSCSF.HOCOSF is set to 0 after setting the HOCO clock and before executing the WFI instruction.

Writing 1 to HCSTP is prohibited under the following conditions:

- SCKSCR.CKSEL[2:0] = 000b (system clock source = HOCO)
- PLLCCR.PLSRCSEL = 1 (PLL1 source clock = HOCO) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL1P)
- PLLCCR.PLSRCSEL = 1 (PLL1 source clock = HOCO) and PLLCR.PLLSTP = 0 (PLL1 is operating)
- PLL2CCR.PL2SRCSEL = 1 (PLL2 source clock = HOCO) and PLL2CR.PLL2STP = 0 (PLL2 is operating).

8.2.17 HOCOCR2 : High-Speed On-Chip Oscillator Control Register2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x037

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	HCFRQ0[2:0]		

Value after reset: 0 0 0 0 0 0/1*1 0/1*1 0/1*1

Bit	Symbol	Function	R/W
2:0	HCFRQ0[2:0]	HOCO Frequency Setting 0 0 0 0: 16MHz 0 0 1: 18MHz 0 1 0: 20MHz 1 0 0: 32MHz 1 1 1: 48MHz Others: Setting prohibited.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note 1. Value after reset of the HCFRQ0[2:0] bits depend on OFS1(_SEC).HOCOFRQ0[2:0] bits.

The HOCOCR2 register controls the HOCO clock.

Writing to the HOCOCR2 is prohibited when the HOCOCR.HCSTP bit is 0 (the HOCO operates)

HCFRQ0[2:0] bits (HOCO Frequency Setting 0)

These bits select the frequency of HOCO.

8.2.18 MOCOCR : Middle-Speed On-Chip Oscillator Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x038

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MCSTP

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	MCSTP	MOCO Stop 0: MOCO clock is operating 1: MOCO clock is stopped	R/W

Bit	Symbol	Function	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The MOCOCCR register controls the MOCO clock.

MCSTP bit (MOCO Stop)

This bit starts or stops the MOCO clock.

When changing the value of the bit, only execute subsequent instructions after reading the bit and checking that its value has actually been updated.

There are restrictions on MOCO operation conditions, MOCO stop conditions and the setting of the MCSTP bit. For details, see [section 8.6. Middle speed On Chip Oscillator \(MOCO\)](#).

8.2.19 FLLCR1 : FLL Control Register1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x039

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	FLEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FLEN	FLL Enable 0: FLL function is disabled 1: FLL function is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: HOCO must be stopped (HOCOCCR.HCSTP = 1) before FLLCR1.FLEN is modified.

Note: SOSC must be operating with stabilization while FLL is enabled (FLLCR1.FLEN = 1).

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The FLLCR1 register controls the FLL function of the HOCO.

FLEN bit (FLL Enable)

This bit enables or disables the FLL function of the HOCO.

If FLL is enabled, the frequency accuracy is guaranteed after FLL is stabilized. The FLL stabilization can be checked by the CAC frequency measurement, but it must be executed after HOCO stabilization.

In addition, you must disable FLL by setting the FLEN bit to 0 before transitioning to Software Standby mode.

[Table 8.4](#) show an example flow of the FLL setting for each case.

Table 8.4 FLL setting flow

Step	Operation
After reset release/ Deep Software Standby cancellation	1 Start (After reset release / Deep Software Standby cancellation)
	2 FLL setting (FLLCR2.FLLCNTL)
	3 Enable FLL (FLLCR1.FLLEN = 1) Note: SOSC must be running with the oscillation stabilization.
	4 Enable HOCO (HOCOCCR.HCSTP = 0)
	5 Wait for the FLL stabilization (t_{FLLWT})
	6 Check the HOCO stabilization (OSCSF.HOCOSF = 1)
	7 End (HOCO can be used.)
Software standby transition/ cancellation	1 Start (FLL is being used.)
	2 Stop HOCO (HOCOCCR.HCSTP = 1) Note: If HOCO is used as the system clock source or the PLL reference clock, these clock source must be changed to another clock before HOCO is stopped.
	3 Disable FLL (FLLCR1.FLLEN = 0)
	4 WFI instruction
	5 Software standby mode
	6 Software standby cancellation
	7 Enable FLL (FLLCR1.FLLEN = 1)
	8 Enable HOCO (HOCOCCR.HCSTP = 0)
	9 Wait for the FLL stabilization (t_{FLLWT})
	10 Check the HOCO stabilization (OSCSF.HOCOSF = 1)
	11 End (HOCO can be used.)

8.2.20 FLLCR2 : FLL Control Register2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x03A

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:	—	—	—	—	—	FLLCNTL[10:0]									
------------	---	---	---	---	---	---------------	--	--	--	--	--	--	--	--	--

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
10:0	FLLCNTL[10:0]	FLL Multiplication Control When OFS1(_SEC).HOCOFRQ0[2:0] is 000b (16 MHz) or 100b (32 MHz), these bits must be set to 0x1E9. When OFS1(_SEC).HOCOFRQ0[2:0] is 001b (18 MHz), these bits must be set to 0x226. When OFS1(_SEC).HOCOFRQ0[2:0] is 010b (20 MHz), these bits must be set to 0x263. When OFS1(_SEC).HOCOFRQ0[2:0] is 111b (48 MHz), these bits must be set to 0x1E9. Settings other than above are prohibited.	R/W
15:11	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCCR2.HCFRQ0[2:0] bits.

The FLLCR2 register controls the FLL function of the HOCO.

FLLCNTL[10:0] bits (FLL Multiplication Control)

These bits select the multiplication ratio of the FLL reference clock.

These bits must be set before FLL is enabled (FLLCR1.FLLEN = 1).

8.2.21 OSCSF : Oscillation Stabilization Flag Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x03C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	PLL2S F	PLLSF	—	MOSC SF	—	—	HOCO SF

Value after reset: 0 0 0 0 0 0 0 0/1*1

Bit	Symbol	Function	R/W
0	HOCOSF	HOCO Clock Oscillation Stabilization Flag 0: The HOCO clock is stopped or is not yet stable 1: The HOCO clock is stable, so is available for use as the system clock source	R
2:1	—	These bits are read as 0.	R
3	MOSCSF	Main Clock Oscillation Stabilization Flag 0: The main clock oscillator is stopped or is not yet stable*2 1: The main clock oscillator is stable, so is available for use as the system clock source	R
4	—	This bit is read as 0.	R
5	PLLSF	PLL1 Clock Oscillation Stabilization Flag 0: The PLL1 clock is stopped or is not yet stable. 1: The PLL1 clock is stable, so is available for use as the system clock source	R
6	PLL2SF	PLL2 Clock Oscillation Stabilization Flag 0: The PLL2 clock is stopped or is not yet stable. 1: The PLL2 clock is stable	R
7	—	This bit is read as 0.	R

Note: S-TYPE-5, P-TYPE-5

Note 1. The value after reset depends on the OFS1(_SEC).HOCOEN setting.

When OFS1(_SEC).HOCOEN = 1 (disable HOCO), the value after reset of HOCOSF is 0.

When OFS1(_SEC).HOCOEN = 0 (enable HOCO), the HOCOSF value is set to 0 immediately after reset is released, and the HOCOSF value is set to 1 after the HOCO oscillation stabilization wait time elapses.

Note 2. This is true when an appropriate value is set in the Wait Control register for the main clock oscillator. If the wait time value is not sufficient, the oscillation stabilization flag is set to 1 and supply of the clock signal to the internal circuits starts before oscillation is stable.

This register is not controlled by CGFSAR register.

The OSCSF register contains flags that indicates the operating status of the oscillation stabilization wait circuit of each oscillator. After oscillation starts, these circuits generate a waiting time until the output clock of each oscillator stabilizes. The status of each oscillation stabilization wait flag set to 1 indicates that the clock supply is stable and can be used in related circuits.

HOCOSF flag (HOCO Clock Oscillation Stabilization Flag)

The HOCOSF flag indicates the operating status of the counter that measures the wait time for the high-speed clock oscillator (HOCO). When OFS1(_SEC).HOCOEN is set to 0, confirm that OSCSF.HOCOSF is set to 1 before using the HOCO clock.

[Setting condition]

- After the HOCO clock stops and the HOCOEN.HCSTP bit is set to 0, HOCOSF is set to 1 after HOCO clock is stable to $\pm 10\%$ or less. If the HOCO clock is used at 1.5%, it must wait for wait time specified in the electrical characteristics. (For details, see [section 51, Electrical Characteristics](#).)

The HOCO clock is supplied when HOCOEN.HCSTP bit is set to 0, regardless of the state of HOCOSF.

[Clearing condition]

- When the HOCO clock is operating and then is deactivated because the HOCOEN.HCSTP bit is set to 1.

Note: Even if OFS1(_SEC).HOCOEN has been set to 0, confirm that the OSCSF.HOCOSF has been set to 1 before starting to use the HOCO clock.

Note: In debugging mode, even if HOCO is oscillating, this flag is masked to 0 for the user program debugging when all of following conditions are met simultaneously:

- The Trace Clock is operating enabled by TRCKCR.TRCKEN bit is 1.
- The Trace Clock source is selected HOCO for oscillation in debug mode by TRCKCR.TRCKSEL bit is 1.
- HOCOCR.HCSTP bit is set to 1.

MOSCSF flag (Main Clock Oscillation Stabilization Flag)

The MOSCSF flag indicates the operating status of the counter that measures the wait time for the main clock oscillator.

[Setting condition]

- When the main clock oscillator is stopped and the MOSCCR.MOSTP bit is set to 0, and then the number of LOCO clock cycles corresponding to the setting of the MOSCWTCR register is counted and supply of the main clock within the MCU is started.

[Clearing condition]

- When the main clock oscillator is operating and then is deactivated because the MOSCCR.MOSTP bit is set to 1.

PLLSF flag (PLL1 Clock Oscillation Stabilization Flag)

The PLLSF flag indicates the oscillation stabilization status for the PLL1.

[Setting condition]

- After the PLL1 stops and the PLLCR.PLLSTP bit is set to 0, supply of the PLL1 clock starts after PLL1 clock is stable. If oscillation by the PLL1 clock source selected in the PLLCCR.PLSRCSEL bit is not stable when the PLLSTP bit is set to 0, waiting for the PLL1 oscillation stabilization after the PLL1 clock source oscillation is stabilized.

[Clearing condition]

- When the PLL1 is operating and then is deactivated because the PLLCR.PLLSTP bit is set to 1.

PLL2SF flag (PLL2 Clock Oscillation Stabilization Flag)

This flag indicates the oscillation stabilization status for the PLL2.

[Setting condition]

- After the PLL2 stops and the PLL2CR.PLL2STP bit is set to 0, supply of the PLL2 clock starts after PLL2 clock is stable. If oscillation by the PLL2 clock source selected in the PLLCCR.PLSRCSEL is not stable when the PLL2STP bit is set to 0, waiting for the PLL2 oscillation stabilization after the oscillation of the PLL2 clock source is stabilized.

[Clearing condition]

- When the PLL2 is operating and then is deactivated because the PLL2CR.PLL2STP bit is set to 1.

8.2.22 OSCMONR : Oscillator Monitor Register

Base address: SYSC = 0x4001_E000
 SYSC_NS = 0x5001_E000

Offset address: 0x43

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	LOCO MON	MOCO MON	—

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
1	MOCOMON	MOCO operation monitor 0: MOCO is set to operate. 1: MOCO is set to stop.	R
2	LOCOMON	LOCO operation monitor 0: LOCO is set to operate. 1: LOCO is set to stop.	R
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5, P-TYPE-5

This register is not controlled by CGFSAR register.

MOCOMON bit (MOCO operation monitor)

MOCOMON indicates the operation or stop setting status for MOCO.

[Clearing condition]

- When MOCO operating conditions are met. For details, see [section 8.6.1. MOCO Operating conditions](#).

[Setting condition]

- When MOCO stop conditions are met. For details, see [section 8.6.2. MOCO Stop conditions](#).

LOCOMON bit (LOCO operation monitor)

LOCOMON indicates the operation or stop setting status for LOCO.

[Clearing condition]

- When LOCO operating conditions are met. For details, see [section 8.5.1. LOCO Operating conditions](#).

[Setting condition]

- When LOCO stop conditions are met. For details, see [section 8.5.2. LOCO Stop conditions](#).

8.2.23 OSTDCR : Oscillation Stop Detection Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x040

Bit position:	7	6	5	4	3	2	1	0
Bit field:	OSTD E	—	—	—	—	—	—	OSTDI E
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OSTDIE	Oscillation Stop Detection Interrupt Enable 0: Disable oscillation stop detection interrupt (do not notify the POEG) 1: Enable oscillation stop detection interrupt (notify the POEG)	R/W
6:1	—	These bits are read as 0. The write value should be 0.	R/W
7	OSTDE	Oscillation Stop Detection Function Enable 0: Disable oscillation stop detection function 1: Enable oscillation stop detection function	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The OSTDCR register controls the oscillation stop detection function.

OSTDIE bit (Oscillation Stop Detection Interrupt Enable)

The OSTDIE bit enables the oscillation stop detection function interrupt. It also controls whether oscillation stop detection is reported to the POEG.

If the Oscillation Stop Detection flag in the Oscillation Stop Detection Status Register (OSTDSR.OSTDF) requires clearing, set the OSTDIE bit to 0 before clearing OSTDF. Wait for at least 2 PCLKB cycles before setting the OSTDIE bit to 1. By reading the I/O register whose access cycle number is defined by PCLKB, it is possible to secure waiting time of 2 or more cycles of PCLKB.

OSTDE bit (Oscillation Stop Detection Function Enable)

The OSTDE bit enables the oscillation stop detection function.

When the OSTDE bit is 1 (enabled), the MOCO stop bit (MOCOCCR.MCSTP) is set to 0 and the MOCO operation starts. The MOCO clock cannot be stopped while the oscillation stop detection function is enabled. Writing 1 to the MOCOCCR.MCSTP bit (MOCO stopped) is invalid.

When the Oscillation Stop Detection flag in the Oscillation Stop Detection Status Register (OSTDSR.OSTDF) is 1 (main clock oscillation stop detected), writing 0 to the OSTDE bit is invalid.

The following restrictions apply when using the oscillation stop detection function:

In low-speed mode, selecting division by 1, 2, 4, 8 for ICLK, FCLK, BCLK, PCLKA, PCLKB, PCLKC, PCLKD and PCLKE is prohibited.

8.2.24 OSTDSR : Oscillation Stop Detection Status Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x041

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	OSTDF

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	OSTDF	Oscillation Stop Detection Flag 0: Main clock oscillation stop not detected 1: Main clock oscillation stop detected	R/W ¹
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note 1. This bit can only be set to 0. This bit is cleared to 0 by writing 0 after reading it as 1.

The OSTDSR register indicates the stop detection status of the main clock oscillator.

OSTDF flag (Oscillation Stop Detection Flag)

The OSTDF flag indicates the main clock oscillator status. When this flag is 1, it indicates that the main clock oscillation stop was detected. After this stop is detected, the OSTDF flag is not set to 0 even when the main clock oscillation is restarted. The OSTDF bit is cleared to 0 by writing 0 after reading it as 1.

At least 3 ICLK cycles of wait time are required between writing 0 to OSTDF and reading it as 0. If the OSTDF flag is set to 0 when the main clock oscillation is stopped, the OSTDF flag becomes 0 then returns to 1.

The OSTDF flag cannot be set to 0 under the following conditions:

- SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC)
- PLLCCR.PLSRCSEL = 0 (PLL1 source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (System clock source = PLL1P).

The OSTDF flag must be set to 0 after switching the clock source to sources other than the main clock oscillator and PLL1P.

[Setting condition]

- The main clock oscillator is stopped when OSTDCR.OSTDE = 1 (oscillation stop detection function enabled).

[Clearing condition]

- 1 is read and then 0 is written when the SCKSCR.CKSEL[2:0] bits are neither 011b (system clock source is MOSC) nor, 101b (system clock source is PLL1P) and PLLCCR.PLSRCSEL bit is not 0 (PLL1 source clock is MOSC).

8.2.25 MOSCWTCR : Main Clock Oscillator Wait Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0A2

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	MSTS[3:0]			
Value after reset:	0	0	0	0	0	1	0	1

Bit	Symbol	Function	R/W
3:0	MSTS[3:0]	Main Clock Oscillator Wait Time Setting 0x0: Wait time = 3 cycles (11.4 μ s) 0x1: Wait time = 35 cycles (133.5 μ s) 0x2: Wait time = 67 cycles (255.6 μ s) 0x3: Wait time = 131 cycles (499.7 μ s) 0x4: Wait time = 259 cycles (988.0 μ s) 0x5: Wait time = 547 cycles (2086.6 μ s) 0x6: Wait time = 1059 cycles (4039.8 μ s) 0x7: Wait time = 2147 cycles (8190.2 μ s) 0x8: Wait time = 4291 cycles (16368.9 μ s) 0x9: Wait time = 8163 cycles (31139.4 μ s) Others: Setting prohibited	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

MSTS[3:0] bits (Main Clock Oscillator Wait Time Setting)

The MSTS[3:0] bits specify the oscillation stabilization wait time for the main clock oscillator.

Set the main clock oscillation stabilization time to a period longer than or equal to the stabilization time recommended by the oscillator manufacturer. When the main clock is input externally, set these bits to 0x0 because the oscillation stabilization time is not required.

The wait time set in these bits is counted using: 1 cycle (μ s) = $1/(f_{\text{LOCO}}[\text{MHz}] \times 8) = 1/(0.032768 \times 8) = 3.81$ (μ s) (min.). The LOCO clock automatically oscillates when necessary, regardless of the value of the LOCO.LCSTP bit. After the specified wait time elapses, supply of the main clock starts internally in the MCU, and the OSCSF.MOSCSF flag is set to 1. If the specified wait time is short, supply of the main clock starts before oscillation of the clock becomes stable.

Only rewrite the MOSCWTCR register when the MOSCCR.MOSTP bit is 1 and the OSCSF.MOSCSF flag is 0. Do not rewrite this register under any other conditions.

8.2.26 MOMCR : Main Clock Oscillator Mode Oscillation Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA50

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	MOSE L	—	—	MODRV0[2:0]		—	—
Value after reset:	0	0	0	1	1	0	1	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
3:1	MODRV0[2:0]	Main Clock Oscillator Drive Capability 0 Switching 0 0 0: 8 MHz 0 1 1: 8 MHz to 24 MHz 1 0 1: 8 MHz to 48 MHz Others: Setting prohibited	R/W
4	—	This bit is read as 1. The write value should be 1.	R/W
5	—	This bit is read as 0. The write value should be 0.	R/W
6	MOSEL	Main Clock Oscillator Switching 0: Resonator 1: External clock input	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: The EXTAL/XTAL pins are also used as ports. In the initial state, the pin is set as a port.

Note: The MOSCCR.MOSTP bit must be 1 (MOSC is stopped) before changing this register.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

MODRV0[2:0] bits (Main Clock Oscillator Drive Capability 0 Switching)

The MODRV0[2:0] bits switches the drive capability for the main clock oscillator. The drive capability of Main Clock Oscillator needs to choose suitable drive capability according to the frequency.

MOSEL bit (Main Clock Oscillator Switching)

The MOSEL bit switches the source for the main clock oscillator.

8.2.27 SOMCR : Sub-Clock Oscillator Mode Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC01

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	SOSEL	—	—	—	—	SODRV[1:0]	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	SODRV[1:0]	Sub-Clock Oscillator Drive Capability Switching 0 0: Standard (12.5pf) 0 1: Lowpower mode 1 (9pf) 1 0: Lowpower mode 2 (7pf) 1 1: Lowpower mode 3 (4pf)	R/W
5:2	—	These bits are read as 0. The write value should be 0.	R/W
6	SOSEL	Sub-Clock Oscillator Switching 0: Resonator 1: External clock input	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The SOMCR register must be modified when SOSCCR.SOSTP is 1 (SOSC is stopped).

SODRV[1:0] bits (Sub-Clock Oscillator Drive Capability Switching)

The SODRV[1:0] bits switch the drive capability of the sub-clock oscillator.

SOSEL bit (Sub-Clock Oscillator Switching)

The SOSEL bits switches the source for the Sub-clock oscillator.

For details, see [section 8.4. Sub-Clock Oscillator](#).

If VCC voltage of the MCU is lower than 1.8 V and this bit is set to 1, RTC registers and VBTBKR[n](n = 0 to 127) (VBATT Backup Register) can be accessed 20 μ s after the setting of this bit.

8.2.28 CKOCR : Clock Out Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x03E

Bit position: 7 6 5 4 3 2 1 0

Bit field:	CKOE N	CKODIV[2:0]	—	CKOSEL[2:0]
------------	-----------	-------------	---	-------------

Value after reset: 0 0 0 0 0 0 0 1

Bit	Symbol	Function	R/W
2:0	CKOSEL[2:0]	Clock Out Source Select 0 0 0: HOCO 0 0 1: MOCO (Value after reset) 0 1 0: LOCO 0 1 1: MOSC 1 0 0: SOSC Others: Setting prohibited	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
6:4	CKODIV[2:0]	Clock Output Frequency Division Ratio 0 0 0: $\times 1/1$ 0 0 1: $\times 1/2$ 0 1 0: $\times 1/4$ 0 1 1: $\times 1/8$ 1 0 0: $\times 1/16$ 1 0 1: $\times 1/32$ 1 1 0: $\times 1/64$ 1 1 1: $\times 1/128$	R/W
7	CKOEN	Clock Out Enable 0: Disable clock out 1: Enable clock out	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

CKOSEL[2:0] bits (Clock Out Source Select)

The CKOSEL[2:0] bits select the source of the clock to be output from the CLKOUT pin. When changing the clock source, set the CKOEN bit to 0.

CKODIV[2:0] bits (Clock Output Frequency Division Ratio)

The CKODIV[2:0] bits specify the clock division ratio. Set the CKOEN bit to 0 when changing the division ratio.

CKOEN bit (Clock Out Enable)

The CKOEN bit enables output from the CLKOUT pin.

When this bit is set to 1, the selected clock is output. When this bit is set to 0, low is output. When changing this bit, confirm that the clock out source clock selected in the CKOSEL[2:0] bits is stable. Otherwise, a glitch might be generated in the output.

Clear this bit before entering Software Standby or Deep Software Standby mode if the selecting clock out source clock is stopped in that mode.

8.2.29 EBCKOCR : External Bus Clock Output Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x052

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	EBCK OEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	EBCKOEN	EBCLK Pin Output Control 0: EBCLK pin output is disabled (fixed high) 1: EBCLK pin output is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

8.2.30 SDCKOCR : SDRAM Clock Output Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x053

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SDCK OEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SDCKOEN	SDCLK Pin Output Control 0: SDCLK pin output is disabled. (Fixed high) 1: SDCLK pin output is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

SDCKOEN bit (SDCLK Pin Output Control)

This bit selects controls the output of the SDCLK pin.

8.2.31 LOCOUTCR : LOCO User Trimming Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x402

Bit position:	7	6	5	4	3	2	1	0
Bit field:	LOCOUTRM[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	LOCOUTRM[7:0]	LOCO User Trimming 0x80: -128 0x81: -127 ⋮ 0xFF: -1 0x00: Center Code 0x01: +1 ⋮ 0x7E: +126 0x7F: +127	R/W

- Note: S-TYPE-3, P-TYPE-2
- Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
- Note: Make sure that SYRACCR.BUSY is 0 before accessing LOCOUTCR. When SYRACCR.BUSY is 1, the write access is ignored and the read value is not guaranteed.
- Note: MCU operation is not guaranteed when LOCOUTCR is set to a value that causes the LOCO frequency to be outside of the specification range.
- Note: After changing LOCOUTCR, it takes certain time until the frequency to be stable. The time is same as the oscillation stabilization time in startup.

The LOCOUTCR register is added to the original LOCO trimming data.

When the ratio of the LOCO frequency and the other oscillation frequency is an integer value, changing the LOCOUTCR value is prohibited.

Changing LOCOUTCR during RTC operation is prohibited.

8.2.32 MOCOUTCR : MOCO User Trimming Control Register

Base address: SYSC = 0x4001_E000
 SYSC_NS = 0x5001_E000

Offset address: 0x061

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
7:0	MOCOUTRM[7:0]	MOCO User Trimming 0x80: -128 0x81: -127 ⋮ 0xFF: -1 0x00: Center Code 0x01: +1 ⋮ 0x7E: +126 0x7F: +127	R/W

- Note: S-TYPE-3, P-TYPE-2
- Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
- Note: MCU operation is not guaranteed when MOCOUTCR is set to a value that causes the MOCO frequency to be outside of the specification range.
- Note: After changing MOCOUTCR, it takes certain time until the frequency to be stable. The time is same as the oscillation stabilization time in startup.

The MOCOUTCR register is added to the original MOCO trimming data.

When the ratio of the MOCO frequency and the other oscillation frequency is an integer value, changing the MOCOUTCR value is prohibited.

8.2.33 HOCOUTCR : HOCO User Trimming Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x062

Bit position: 7 6 5 4 3 2 1 0

Bit field:

--	--	--	--	--	--	--	--	--	--

 HOCOUTRM[7:0]

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
7:0	HOCOUTRM[7:0]	HOCO User Trimming 0x80: -128 0x81: -127 ⋮ 0xFF: -1 0x00: Center Code 0x01: +1 ⋮ 0x7E: +126 0x7F: +127	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: MCU operation is not guaranteed when HOCOUTCR is set to a value that causes the HOCO frequency to be outside of the specification range.

Note: After changing HOCOUTCR, it takes certain time until the frequency to be stable. The time is same as the oscillation stabilization time in startup.

Note: These bits must be 0x00 when FLL is enabled (FLLCR1.FLLEN = 1).

The HOCOUTCR register is added to the original HOCO trimming data.

8.2.34 MOSCSCR : Main Clock Oscillator Standby Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x07C

Bit position: 7 6 5 4 3 2 1 0

Bit field:

—	—	—	—	—	—	—	MOSC SOKP
---	---	---	---	---	---	---	--------------

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	MOSCSOKP	Main Clock Oscillator Standby Oscillation Keep select 0: Disable 1: Enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The MOSCSCR must be changed while MOSCCR.MOSTP bit is 1 (MOSC is stopped).

MOSCSOKP bit (Main Clock Oscillator Standby Oscillation Keep select)

This bit controls that Main Clock Oscillator keeps oscillating in Software Standby mode.

If this bit is disabled and MOSCCR.MOSTP bit is 0 (MOSC is run), the Main Clock Oscillator stops in Software Standby mode.

If this bit is enabled and MOSCCR.MOSTP bit is 0 (MOSC is run), the Main Clock Oscillator will keep oscillating in Software Standby mode.

If MOSCCR.MOSTP bit is 1 (MOSC is stopped), the Main Clock Oscillator stops in Software Standby mode regardless of the setting of this bit.

8.2.35 HOCOSCR : High-Speed On-Chip Oscillator Standby Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x07D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	HOCO SOKP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	HOCOSOKP	HOCO Standby Oscillation Keep select. 0: Disable 1: Enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

HOCOSOKP bit (HOCO Standby Oscillation Keep select.)

This bit controls that HOCO keeps oscillating in Software Standby mode.

If this bit is disabled and HOCO.CR.HCSTP bit is 0 (HOCO is run), the HOCO stops in Software Standby mode.

If this bit is enabled and HOCO.CR.HCSTP bit is 0 (HOCO is run), the HOCO will keep oscillating in Software Standby mode.

If HOCO.CR.HCSTP bit is 1 (HOCO is stopped), the HOCO stops in Software Standby mode regardless of the setting of this bit.

8.2.36 USBCKDIVCR : USB Clock Division Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x06C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	USBCKDIV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	USBCKDIV[2:0]	USB Clock (USBCLK) Division Select 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/6 1 0 0: 1/8 1 0 1: 1/3 1 1 0: 1/5 Others: Setting prohibited.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The USBCKDIVCR register controls the USB clock.

USBCKDIV[2:0] bits (USB Clock (USBCLK) Division Select)

These bits select the frequency of the USB clock (USBCLK) and must be modified when USBCKCR.USBCKSRDY = 1.

8.2.37 OCTACKDIVCR : Octal-SPI Clock Division Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x06D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	OCTACKDIV[2:0]		

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
2:0	OCTACKDIV[2:0]	Octal-SPI Clock (OCTACLK) Division Select 0 0 0: 1/1 (Value after reset) 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/6 1 0 0: 1/8 1 0 1: 1/3 1 1 0: 1/5 Others: Setting prohibited.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

OCTACKDIVCR controls the Octal-SPI clock.

OCTACKDIV[2:0] bits (Octal-SPI Clock (OCTACLK) Division Select)

These bits select the frequency of the Octal-SPI clock (OCTACLK) and must be modified when OCTACKCR.OCTACKSRDY = 1.

8.2.38 CANFDCKDIVCR : CANFD Core Clock Division Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x06E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	CANFDCKDIV[2:0]		

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
2:0	CANFDCKDIV[2:0]	CANFD core clock (CANFDCLK) Division Select 0 0 0: 1/1 (Value after reset) 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/6 1 0 0: 1/8 1 0 1: 1/3 1 1 0: 1/5 Others: Setting prohibited	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

CANFDCKDIVCR controls the CANFD core clock.

CANFDCKDIV[2:0] bits (CANFD core clock (CANFDCLK) Division Select)

These bits select the frequency of the CANFD core clock (CANFDCLK) and must be modified when CANFDCKCR.CANFDCKSRDY = 1.

8.2.39 USBCKCR : USB Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x074

Bit position:	7	6	5	4	3	2	1	0
Bit field:	USBC KSRD Y	USBC KSRE Q	—	—	USBCKSEL[3:0]			

Value after reset: 0 0 0 0 0 0 0 0 1

Bit	Symbol	Function	R/W
3:0	USBCKSEL[3:0]	USB Clock (USBCLK) Source Select 0000: HOCO 0001: MOCO (Value after reset) 0011: Main clock oscillator 0101: PLL1P 0110: PLL2P 0111: PLL1Q 1000: PLL1R 1001: PLL2Q 1010: PLL2R Others: Setting prohibited.	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	USBCKSREQ	USB Clock (USBCLK) Switching Request 0: No request 1: Request switching.	R/W
7	USBCKSRDY	USB Clock (USBCLK) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch	R

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The USBCKCR register controls the USB clock.

When switching the clock source, ensure that the clock before the switch and the clock after the switch generate stable output. To change the set value of USBCKDIVCR.USBCKDIV[2:0] and USBCKSEL[3:0], use the following procedure:

1. Write 1 to USBCKSREQ.
2. Poll until USBCKSRDY is read as 1. While USBCKSRDY = 1, no clock is output to USBCLK.
3. Write to USBCKDIVCR.USBCKDIV[2:0] and USBCKSEL[3:0].
4. Write 0 to USBCKSREQ.
5. Poll until USBCKSRDY is read as 0.
6. When USBCKSRDY becomes 0, USBCLK starts to output. Clock switching is complete.

When transitioning to Software Standby or Deep Software Standby mode, do not execute the WFI instruction while performing clock switching. That is, do not execute the WFI instruction when USBCKSREQ = 1 and USBCKSRDY = 0, or when USBCKSREQ = 0 and USBCKSRDY = 1.

USBCKSEL[3:0] bits (USB Clock (USBCLK) Source Select)

These bits select the clock source of the USB clock (USBCLK) and must be modified when USBCKCR.USBCKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

USBCKSREQ bit (USB Clock (USBCLK) Switching Request)

This bit selects the USBCLK switching request.

USBCKSRDY flag (USB Clock (USBCLK) Switching Ready state flag)

This flag indicates the state of switching ready for the USBCLK. When USBCKSRDY = 1, no clock is output to USBCLK.

8.2.40 OCTACKCR : Octal-SPI Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x075

Bit position:	7	6	5	4	3	2	1	0
Bit field:	OCTACKSRDY	OCTACKSRDY	—	—	OCTACKSEL[3:0]			

Value after reset: 0 0 0 0 0 0 0 0 1

Bit	Symbol	Function	R/W
3:0	OCTACKSEL[3:0]	Octal-SPI Clock (OCTACKL) Source Select 0 0 0 0: HOCO 0 0 0 1: MOCO (Value after reset) 0 0 1 0: LOCO 0 0 1 1: Main clock oscillator 0 1 0 0: Sub-clock oscillator 0 1 0 1: PLL1P 0 1 1 0: PLL2P 0 1 1 1: PLL1Q 1 0 0 0: PLL1R 1 0 0 1: PLL2Q 1 0 1 0: PLL2R Others: Setting prohibited.	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	OCTACKSREQ	Octal-SPI Clock (OCTACKL) Switching Request 0: No request 1: Request switching.	R/W
7	OCTACKSRDY	Octal-SPI Clock (OCTACKL) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch	R

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The OCTACKCR register controls the Octal-SPI clock.

When switching the clock source, ensure that the clock before the switch and the clock after the switch generate stable output.

To change the set value of OCTACKDIVCR.OCTACKDIV[2:0] and OCTACKSEL[3:0], use the following procedure:

1. Write 1 to OCTACKSREQ.
2. Poll until OCTACKSRDY is read as 1. While OCTACKSRDY = 1, no clock is output to OCTACKL.
3. Write to OCTACKDIVCR.OCTACKDIV[2:0] and OCTACKSEL[3:0].
4. Write 0 to OCTACKSREQ.
5. Poll until OCTACKSRDY is read as 0.
6. When OCTACKSRDY becomes 0, OCTACKL starts to output. Clock switching is complete.

When transitioning to Software Standby or Deep Software Standby mode, do not execute the WFI instruction while performing clock switching. That is, do not execute the WFI instruction when OCTACKSREQ = 1 and OCTACKSRDY = 0, or when OCTACKSREQ = 0 and OCTACKSRDY = 1.

OCTACKSEL[3:0] bits (Octal-SPI Clock (OCTACLK) Source Select)

These bits select the clock source of the Octal-SPI clock (OCTACLK) and must be modified when OCTACKCR.OCTACKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

OCTACKSREQ bit (Octal-SPI Clock (OCTACLK) Switching Request)

This bit selects the OCTACLK switching request.

OCTACKSRDY flag (Octal-SPI Clock (OCTACLK) Switching Ready state flag)

This flag indicates the state of switching ready for the OCTACLK. When OCTACKSRDY = 1, no clock is output to OCTACLK.

8.2.41 CANFDCKCR : CANFD Core Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x076

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CANFDCKSRDY	CANFDCKSREQ	—	—	CANFDCKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
3:0	CANFDCKSEL[3:0]	CANFD Core Clock (CANFDCLK) Source Select 0 0 0 0: HOCO 0 0 0 1: MOCO (Value after reset) 0 0 1 0: LOCO 0 0 1 1: Main clock oscillator 0 1 0 0: Sub-clock oscillator 0 1 0 1: PLL1P 0 1 1 0: PLL2P 0 1 1 1: PLL1Q 1 0 0 0: PLL1R 1 0 0 1: PLL2Q 1 0 1 0: PLL2R Others: Setting prohibited.	R/W
5:3	—	These bits are read as 0. The write value should be 0.	R/W
6	CANFDCKSREQ	CANFD Core Clock (CANFDCLK) Switching Request 0: No request 1: Request switching	R/W
7	CANFDCKSRDY	CANFD Core Clock (CANFDCLK) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch	R

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The CANFDCKCR register controls the CANFD Core Clock (CANFDCLK).

When switching the clock source, ensure that the clock before the switch and the clock after the switch generate stable output. To change the set value of CANFDCKDIVCR.CANFDCKDIV[2:0] and CANFDCKSEL[3:0], use the following procedure:

1. Write 1 to CANFDCKSREQ.
2. Poll until CANFDCKSRDY is read as 1. While CANFDCKSRDY = 1, no clock is output to CANFDCLK.
3. Write to CANFDCKDIVCR.CANFDCKDIV[2:0] and CANFDCKSEL[3:0].
4. Write 0 to CANFDCKSREQ.
5. Poll until CANFDCKSRDY is read as 0.

6. When CANFDCKSRDY becomes 0, CANFDCLK starts to output. Clock switching is complete.

When transitioning to Software Standby or Deep Software Standby mode, do not execute the WFI instruction while performing clock switching. That is, do not execute the WFI instruction when CANFDCKSREQ = 1 and CANFDCKSRDY = 0, or when CANFDCKSREQ = 0 and CANFDCKSRDY = 1.

CANFDCKSEL[3:0] bits (CANFD Core Clock (CANFDCLK) Source Select)

These bits select the clock source of the CANFD Core clock (CANFDCLK) and must be modified when CANFDCKCR.CANFDCKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

CANFDCKSREQ bit (CANFD Core Clock (CANFDCLK) Switching Request)

This bit selects the CANFDCLK switching request.

CANFDCKSRDY flag (CANFD Core Clock (CANFDCLK) Switching Ready state flag)

This flag indicates the state of switching ready for the CANFDCLK. When CANFDCKSRDY = 1, no clock is output to CANFDCLK.

8.2.42 SCICKDIVCR : SCI clock Division control register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x054

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	SCICKDIV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	SCICKDIV[2:0]	SCI clock (SCICLK) Division Select 0 0 0: 1/1 (Value after reset) 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/6 1 0 0: 1/8 1 0 1: 1/3 1 1 0: 1/5 Others: Setting prohibited.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

SCICKDIVCR controls the SCI clock.

SCICKDIV[2:0] bits (SCI clock (SCICLK) Division Select)

These bits select the frequency of the SCI clock (SCICLK) and must be modified when SCICKCR.CKSRDY = 1.

8.2.43 SPICKDIVCR : SPI clock Division control register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x056

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	SPICKDIV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	SPICKDIV[2:0]	SPI clock (SPICLK) Division Select 0 0 0: 1/1 (Value after reset) 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/6 1 0 0: 1/8 1 0 1: 1/3 1 1 0: 1/5 Others: Setting prohibited.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

SPICKDIVCR controls the SPI clock.

SPICKDIV[2:0] bits (SPI clock (SPICLK) Division Select)

These bits select the frequency of the SPI clock (SPICLK) and must be modified when SPICKCR.CKSRDY = 1.

8.2.44 LCDCKDIVCR : LCD clock Division control register

Base address: SYSC = 0x4001_E000
 SYSC_NS = 0x5001_E000

Offset address: 0x05E

Bit position: 7 6 5 4 3 2 1 0

Bit field:	—	—	—	—	—	LCDCKDIV[2:0]	
------------	---	---	---	---	---	---------------	--

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
2:0	LCDCKDIV[2:0]	LCD clock (LCDCLK) Division Select 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/6 1 0 0: 1/8 1 0 1: 1/3 1 1 0: 1/5 Others: Setting prohibited.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

LCDCKDIVCR controls the LCD clock.

LCDCKDIV[2:0] bits (LCD clock (LCDCLK) Division Select)

These bits select the frequency of the LCD clock (LCDCLK) and must be modified when LCDCKCR.CKSRDY = 1.

8.2.45 SCICKCR : SCI clock control register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x055

Bit position: 7 6 5 4 3 2 1 0

Bit field:	SCICKSRDY	SCICKSREQ	—	—	SCICKSEL[3:0]		
------------	-----------	-----------	---	---	---------------	--	--

Value after reset: 0 0 0 0 0 0 0 1

Bit	Symbol	Function	R/W
3:0	SCICKSEL[3:0]	SCI clock (SCICLK) Source Select 0000: HOCO 0001: MOCO (Value after reset) 0010: LOCO 0011: Main clock oscillator 0100: Sub-clock oscillator 0101: PLL1P 0110: PLL2P 0111: PLL1Q 1000: PLL1R 1001: PLL2Q 1010: PLL2R Others: Setting prohibited.	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	SCICKSREQ	SCI clock (SCICLK) Switching Request 0: No request 1: Request switching	R/W
7	SCICKSRDY	SCI clock (SCICLK) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch	R

Note: S-TYPE-3, P-TYPE-2

SCICKCR controls the SCI clock.

To change the set value of SCICKDIVCR.SCICKDIV[2:0] and SCICKSEL[3:0], follow the procedure below.

When switching the clock source, it is necessary that the clock before switching and the clock after switching are stably output.

Clock selection switching procedure :

1. Write 1 to SCICKSREQ.
2. Polling until SCICKSRDY is read as 1. While SCICKSRDY = 1, no clock is output to SCICLK.
3. Write the setting value to SCICKDIVCR.SCICKDIV[2:0] and SCICKSEL[3:0].
4. Write 0 to SCICKSREQ.
5. Polling until SCICKSRDY is read as 0.
6. When SCICKSRDY becomes 0, SCICLK starts outputting. Clock switching complete.

When a transition to Software Standby or Deep Software Standby, do not execute the WFI instruction while performing clock selection switching. In other words, do not execute the WFI instruction with SCICKSREQ = 1 and SCICKSRDY = 0, or SCICKSREQ = 0 and SCICKSRDY = 1.

SCICKSEL[3:0] bits (SCI clock (SCICLK) Source Select)

These bits select the clock source of the SCI clock (SCICLK) and must be modified when SCICKCR.SCICKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

SPICKSREQ bit (SCI clock (SCICLK) Switching Request)

This bit selects the SCICLK switching request.

SPICKSRDY bit (SCI clock (SCICLK) Switching Ready state flag)

This flag indicates the state of switching ready for the SCICLK.

While SPICKSRDY = 1, no clock is output to SCICLK.

8.2.46 SPICKCR : SPI clock control register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x057

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SPICK SRDY	SPICK SREQ	—	—	SPICKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	SPICKSEL[3:0]	SPI clock (SPICLK) Source Select 0000: HOCO 0001: MOCO (Value after reset) 0010: LOCO 0011: Main clock oscillator 0100: Sub-clock oscillator 0101: PLL1P 0110: PLL2P 0111: PLL1Q 1000: PLL1R 1001: PLL2Q 1010: PLL2R Others: Setting prohibited.	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	SPICKSREQ	SPI clock (SPICLK) Switching Request 0: No request 1: Request switching	R/W
7	SPICKSRDY	SPI clock (SPICLK) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch	R

Note: S-TYPE-3, P-TYPE-2

SPICKCR controls the SPI clock.

To change the set value of SPICKDIVCR.SPICKDIV[2:0] and SPICKSEL[3:0], follow the procedure below.

When switching the clock source, it is necessary that the clock before switching and the clock after switching are stably output.

Clock selection switching procedure :

1. Write 1 to SPICKSREQ.
2. Polling until SPICKSRDY is read as 1. While SPICKSRDY = 1, no clock is output to SPICLK.
3. Write the setting value to SPICKDIVCR.SPICKDIV[2:0] and SPICKSEL[3:0].
4. Write 0 to SPICKSREQ.
5. Polling until SPICKSRDY is read as 0.
6. When SPICKSRDY becomes 0, SPICLK starts outputting. Clock switching complete.

When a transition to Software Standby or Deep Software Standby, do not execute the WFI instruction while performing clock selection switching. In other words, do not execute the WFI instruction with SPICKSREQ = 1 and SPICKSRDY = 0, or SPICKSREQ = 0 and SPICKSRDY = 1.

SPICKSEL[3:0] bits (SPI clock (SPICLK) Source Select)

These bits select the clock source of the SPI clock (SPICLK) and must be modified when SPICKCR.SPICKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

SPICKSREQ bit (SPI clock (SPICLK) Switching Request)

This bit selects the SPICLK switching request.

SPICKSRDY bit (SPI clock (SPICLK) Switching Ready state flag)

This flag indicates the state of switching ready for the SPICLK.

While SPICKSRDY = 1, no clock is output to SPICLK.

8.2.47 LCDCKCR : LCD clock control register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x05F

Bit position:	7	6	5	4	3	2	1	0
Bit field:	LCDC KSRD Y	LCDC KSRE Q	—	—	LCDCKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
3:0	LCDCKSEL[3:0]	LCD clock (LCDCLK) Source Select 0001: MOCO (Value after reset) 0101: PLL1P 0110: PLL2P 0111: PLL1Q 1000: PLL1R 1001: PLL2Q 1010: PLL2R Others: Setting prohibited.	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	LCDCKSREQ	LCD clock (LCDCLK) Switching Request 0: No request 1: Request switching	R/W
7	LCDCKSRDY	LCD clock (LCDCLK) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch	R

Note: S-TYPE-3, P-TYPE-2

LCDCKCR controls the LCD clock.

To change the set value of LCDCKDIVCR.LCDCKDIV[2:0] and LCDCKSEL[3:0], follow the procedure below.

When switching the clock source, it is necessary that the clock before switching and the clock after switching are stably output.

Clock selection switching procedure :

1. Write 1 to LCDCKSREQ.
2. Polling until LCDCKSRDY is read as 1. While LCDCKSRDY = 1, no clock is output to LCDCLK.
3. Write the setting value to LCDCKDIVCR.LCDCKDIV[2:0] and LCDCKSEL[3:0].
4. Write 0 to LCDCKSREQ.

5. Polling until LCDCKSRDY is read as 0.
6. When LCDCKSRDY becomes 0, LCDCLK starts outputting. Clock switching complete.

When a transition to Software Standby or Deep Software Standby, do not execute the WFI instruction while performing clock selection switching. In other words, do not execute the WFI instruction with LCDCKSREQ = 1 and LCDCKSRDY = 0, or LCDCKSREQ = 0 and LCDCKSRDY = 1.

LCDCKSEL[3:0] bits (LCD clock (LCDCLK) Source Select)

These bits select the clock source of the LCD clock (LCDCLK) and must be modified when LCDCKCR.LCDCKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

LCDCKSREQ bit (LCD clock (LCDCLK) Switching Request)

This bit selects the LCDCLK switching request.

LCDCKSRDY bit (LCD clock (LCDCLK) Switching Ready state flag)

This flag indicates the state of switching ready for the LCDCLK.

While LCDCKSRDY = "1", no clock is output to LCDCLK.

8.2.48 TRCKCR : Trace Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x03F

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TRCK EN	—	—	TRCK SEL	TRCK[3:0]			
Value after reset:	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
3:0	TRCK[3:0]	Trace Clock operating frequency select 0000: 1/1 0001: 1/2 0010: 1/4 (Value after reset) 0011: 1/8 0100: 1/16 0101: 1/32 0110: 1/64 0111: 1/128 1000: 1/256 1001: 1/3 1010: 1/6 1011: 1/12 Others: Setting prohibited	R/W
4	TRCKSEL	Trace Clock source select 0: System clock source (Value after reset) 1: HOCO (oscillation in debug mode)	R/W
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	TRCKEN	Trace Clock operating Enable 0: Stop 1: Operation enable	R/W

Note: S-TYPE5, P-TYPE-2

Trace Clock Control Register controls switching the trace clock.

This register is not controlled by CGFSAR register.

When changing the frequency of the Trace Clock, the Trace Clock must be stopped (TRCKCR.TRCKEN = 0).

TRCK[3:0] bit (Trace Clock operating frequency select)

These bits select the frequency of the Trace Clock.

This bit must change when TRCKCR.TRCKEN = 0.

TRCKSEL bit (Trace Clock source select)

This bit selects the clock source of the Trace Clock. According to this bit, the Trace Clock is as follows:

[The Case of this bit is set 0]

- The system clock source is selected as the clock source for the trace clock.
The system clock source is selected by SCKSCR.CKSEL[2:0] bits.
- The clock supply to the trace clock is selected of MOCO divided by 1 when in Software Standby mode or Deep Software Standby mode.

[The Case of this bit is set 1]

- The HOCO is selected as the clock source for the trace clock
- If TRCKSEL is set to 1, HOCO is operated no depending on the state of HOCOCR.HCSTP. However, OSCSF does not confirm that the swing is stable, so wait for the user to wait for the stable wait time
- HOCO continues to oscillate and supply the Trace Clock even if in Software Standby mode or Deep Software Standby mode.

This bit must change when TRCKCR.TRCKEN = 0.

TRCKEN bit (Trace Clock operating Enable)

This bit enables or disables the clock supply of the Trace Clock.

TRCK[3:0] bits and TRCKSEL bit must be set before changing this bit from 0 (stop) to 1 (enable).

When changing this bit from 1 (enable) to 0 (stop), Trace function must be disable.

The trace clock is output with this bit set to 1 and under the following conditions.

$CDBGPWRUPREQ = 1 \ \& \ AL \neq AL0 \mid DBGAUTH0.DBGEN0 = 1 \ \& \ OFS1_SEC.SWDBG = 0$.

8.3 Main Clock Oscillator

To supply the clock signal to the main clock oscillator, use one of the following ways:

- Connect an oscillator
- Connect the input of an external clock signal.

8.3.1 Connecting a Crystal Resonator

Figure 8.2 shows an example of connecting a crystal resonator. A damping resistor (Rd) can be added, if required.

Because the resistor values vary according to the resonator and the oscillation drive capability, use values recommended by the resonator manufacturer. If the manufacturer recommends using an external feedback resistor (Rf), insert an Rf between EXTAL and XTAL by following the instructions.

When connecting a resonator to supply the clock, the frequency of the resonator must be in the frequency range of the resonator for the main clock oscillator as described in Table 8.1.

Figure 8.2 Example of crystal resonator connection

Figure 8.3 shows an equivalent circuit of the crystal resonator.

Figure 8.3 Equivalent circuit of the crystal resonator

8.3.2 External Clock Input

Figure 8.4 shows an example of connecting an external clock input. To operate the oscillator with an external clock signal, set the MOMCR.MOSEL bit to 1. The XTAL pin becomes high impedance.

Figure 8.4 Equivalent circuit for external clock

8.3.3 Notes on External Clock Input

- The frequency of the external clock input can only be changed when the main clock oscillator is stopped. Do not change the frequency of the external clock input when the setting of the Main Clock Oscillator Stop bit (MOSCCR.MOSTP) is 0.
- To reduce current consumption during software standby mode, it is recommended to stop the external clock and keep it pull-up or pull-down.

However, if an external clock is used as the system clock source, it must be supplied while transitioning to and returning from software standby mode.

To do this safely, it is recommended to change the system clock source to another clock source before transitioning to software standby mode, or continue to use the external clock despite current consumption increase.

8.3.4 Note on Oscillation Keep in Software Standby mode

By using the oscillation keep function of the Main Clock Oscillator in Software Standby mode, the Main Clock Oscillator stabilization wait time after canceling Software standby mode can be shortened.

If MCU enters Software Standby mode under the MOSCSCR.MOSCSOKP bit is set to enabled (MOSCSCR.MOSCSOKP bit is 1) and under the Main Clock Oscillator is operating, the Main Clock Oscillator will keep oscillating in Software Standby mode. When canceling Software Standby mode in this state, the Main clock can be used without the oscillator stabilization wait time.

If using this function, confirm that the setting value is written to the register before entering the Software standby mode.

However, even if this function is enabled, the clock supply to the system and peripheral modules during Software Standby mode is stopped.

8.4 Sub-Clock Oscillator

To supply the clock signal to the sub-clock oscillator, use one of the following ways:

- Connect an oscillator
- Connect the input of an external clock signal.

8.4.1 Connecting a 32.768-kHz Crystal Resonator

To supply a clock to the sub-clock oscillator, connect a 32.768-kHz crystal resonator as shown in [Figure 8.5](#). A damping resistor (R_d) can be added, if necessary. Because the resistor values vary according to the resonator and the oscillation drive capability, use values recommended by the resonator manufacturer. If the resonator manufacturer recommends the use of an external feedback resistor (R_f), insert an R_f between XCIN and XCOUT by following the instructions. When connecting a resonator to supply the clock, the frequency of the resonator must be in the frequency range of the resonator for the sub-clock oscillator as described in [Table 8.1](#).

Figure 8.5 Connection example of 32.768-kHz crystal resonator

[Figure 8.6](#) shows an equivalent circuit for the 32.768-kHz crystal resonator.

Figure 8.6 Equivalent circuit for the 32.768-kHz crystal resonator

8.4.2 Pin Handling When the Sub-Clock Oscillator Is Not Used

When the sub-clock oscillator is not in use, connect the XCIN pin to VSS through a resistor (to pull VSS down) and leave the XCOUT pin open as shown in Figure 8.7. In addition, if an oscillator is not connected, set the Sub-Clock Oscillator Stop bit (SOSCCR.SOSTP) to 1 to stop the oscillator.

Figure 8.7 Pin handling when the sub-clock oscillator is not used

8.4.3 External Clock Input

In the external clock input mode, clock is input from EXCIN pin. In this case, set the XCIN/XCOUT pin as shown in as Figure 8.7.

8.5 Low speed On Chip Oscillator (LOCO)

Low speed On Chip Oscillator (LOCO) is the internal oscillator that supplies a low-speed clock.

8.5.1 LOCO Operating conditions

There are restriction on LOCO operation setting. For detail, see [section 8.5.3. Restrictions on LOCO operation and stopping](#)

LOCO oscillates when any of the following conditions is met.*1

[LOCO operating conditions]

- When LOCO is set to operate in the LOCOCR register (LOCOCR.LCSTP bit is 0).
- When IWDT is set to the auto start mode. (OFS0.IWDTSTRT bit is 0)*2
- When IWDT is set to the register start mode (OFS0.IWDTSTRT bit is 1) and counting is started.*3
- \When waiting for the oscillation stabilization of the Main Clock Oscillator (while MOCOCR.MCSTP bit is 0 and OSCSF.MOSCSF bit is 0).*4

Note 1. LOCO stops at Deep Software Standby mode 2 or Deep Software Standby mode 3.

Note 2. When IWDT is set to the auto start mode, regardless of the setting of IWDTSTPCTL bit in OFS0 register ,LOCO continues to oscillate.

Note 3. When IWDT is set to the register start mode, regardless of the setting of SLCSTP bit in IWDTCSTPR register ,LOCO continues to oscillate once IWDT starts counting.

Note 4. Even if the Main Clock Oscillator is set to the external clock input mode, LOCO operates because the oscillation stabilization wait circuit operates when the Main Clock Oscillator starts operating.

8.5.2 LOCO Stop conditions

There are restriction on LOCO stop setting. For detail, see [section 8.5.3. Restrictions on LOCO operation and stopping](#).

There are two ways to top LOCO: stop by transition to Low Power mode or stop by LOCOCR register.

(A) LOCO stop conditions related to Low Power mode

LOCO stops when transitioning to the following Low Power mode

- Deep Software Standby mode 2
- Deep Software Standby mode 3

(B) LOCO stop conditions related to LOCOCR register

When LOCO is stopped using the LOCOCR register, even if the LCSTP bit set to stop (LOCOCR.LCSTP bit is 1), LOCO may not be stopped depending on the operating status of IWDT and oscillator.

LOCO can be stopped when all of the following conditions are met.

- LOCO is set to stop using the LOCOCR register (LOCOCR.LCSTP bit is 1)
- IWDT is not operating. (Include the case of stopping in CPU Sleep mode, CPU Deep Sleep mode, Software Standby mode, and Deep Software Standby mode 1 by setting the OFS0.IWDTSTPCTL bit or the IWDTCSSTPR.SLCSTP bit.)
- Main Clock Oscillator is stopped or Main Clock oscillation is stable. (MOCOCR.MCSTP bit is 1 or OSCSF.MOSCSF bit is 1)

8.5.3 Restrictions on LOCO operation and stopping

After setting the LCSTP bit in LOCOCR to 0 to start the LOCO clock, only use the clock after the LOCO clock oscillation stabilization wait time (tLOCOWT) elapses. A fixed stabilization wait is required after setting the LOCO clock to start operation. A fixed wait for the oscillation to stop is also required.

The following restrictions apply when starting and stopping operation:

- After stopping the LOCO clock, read OSCMONR.LOCOMON, make sure LOCO is stopped, and then set the operation.
- Confirm that LOCO oscillation is stable before stopping the LOCO clock
- Confirm that LOCO oscillation is stable before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode.
- When a transition to Software Standby mode or Deep Software Standby mode after setting LOCO to stop, read OSCMONR.LOCOMON, make sure LOCO is stopped, and executing the WFI instruction.

The LOCO clock is used to measure the oscillation stabilization wait time of the main clock oscillator. While the main clock oscillator is waiting for oscillation stabilization, the LOCO clock oscillates regardless of the LCSTP bit setting. At this time, it is necessary to prevent conflicts between the LOCO stop (or operation) by the LCSTP bit in LOCOCR and the LOCO clock oscillation for the Main clock Oscillator stabilization wait time (or LOCO clock stop after Main clock oscillation stabilization). Therefore, do not change the LOCOCR.LCSTP bit during the period from the 3 LOCO clock cycle before setting the start of main clock oscillator operation until the main clock oscillator stabilization can be confirmed with the oscillation stabilization flag in the OSCSF register.

When using IWDT in the register start mode (OFS0.IWDTSTRT bit is 1), set the LOCO to run (LOCOCR.LCSTP = 0) before IWDT count operation, and use IWDT after LOCO oscillation has stabilized. When IWDT is used in register start mode, do not change the LOCOCR.LCSTP bit during the period from the 3 LOCO clock cycles before IWDT count operation starts until the start of IWDT count operation can be confirmed.

When using the Digital filter or the Reset negate select for Voltage monitor m (m = 1 to 2) in Programmable Voltage Detection (PVDm), set the LOCO to run (LOCOCR.LCSTP = 0) before enabling PVDm and use PVDm after LOCO oscillation has stabilized.

8.6 Middle speed On Chip Oscillator (MOCO)

Middle speed On Chip Oscillator (MOCO) is the internal oscillator that supplies a middle-speed clock.

8.6.1 MOCO Operating conditions

There are restriction on MOCO operation setting. For detail, see [section 8.6.3. Restrictions on MOCO operation and stopping](#).

MOCO oscillates when any of the following conditions is met.

[MOCO operating conditions]

- When MOCO is set to operate in the LOCOCR register (MOCOCCR.MCSTP = 0)
- When waiting for the HOCO oscillation stabilization (while OFS1(_SEC).HOCOEN bit is 0 or HOCOCCR.HCSTP bit is 0, and OSCSF.HOCOSF bit is 0).
- When waiting for the PLL1 oscillation stabilization (while PLLCR.PLLSTP bit is 0, and OSCSF.PLLSF bit is 0).
- When waiting for the PLL2 oscillation stabilization (while PLL2CR.PLL2STP bit is 0, and OSCSF.PLL2SF bit is 0).

Note: MOCO stops at Software Standby mode or Deep Software Standby mode.

8.6.2 MOCO Stop conditions

There are restriction on MOCO stop setting. For detail, see [section 8.6.3. Restrictions on MOCO operation and stopping](#).

There are two ways to top MOCO: stop by transition to Low Power mode or stop by MOCOCCR register.

(A) MOCO stop conditions related to Low Power mode

MOCO stops when transitioning to the following Low Power mode.

- Software Standby mode
- Deep Software Standby mode

Note: When the On-Chip Debugger function is enabled, MOCO does not stop when transitioning to each standby mode.

(B) MOCO stop conditions related to MOCOCCR register

When MOCO is stopped using the MOCOCCR register, even if the MCSTP bit set to stop (MOCOCCR.MCSTP bit is 1), MOCO may not be stopped depending on the operating status of the system.

MOCO can be stopped when all of the following conditions are met.

[MOCO stop conditions]

- MOCO is set to stop using the MOCOCCR register (MOCOCCR.MCSTP bit is 1)
- When HOCO is stopped or HOCO oscillation is stable. (OFS1(_SEC).HOCOEN bit is 1 and HOCOCCR.HCSTP bit is 1, or OSCSF.HOCOSF bit is 1)
- PLL1 circuit is stopped or PLL1 oscillation is stable. (PLLCR.PLSTP bit is 1 or OSCSF.PLLSF bit is 1)
- PLL2 circuit is stopped or PLL2 oscillation is stable. (PLL2CR.PL2STP bit is 1 or OSCSF.PLL2SF bit is 1)

8.6.3 Restrictions on MOCO operation and stopping

After setting the MCSTP bit to 0 to start the MOCO clock, only use the clock after the MOCO clock oscillation stabilization time (tMOCOWT) elapses. A fixed stabilization wait is required after setting the MOCO clock to start operation. A fixed wait for oscillation to stop is also required.

The following restrictions apply when starting and stopping operation.

- After stopping the MOCO clock, read OSCMONR.MOCOMON, make sure MOCO is stopped, and then set the operation.
- Confirm that MOCO oscillation is stable before stopping the MOCO clock.
- Regardless of whether the MOCO clock is selected as the system clock source, confirm that MOCO oscillation is stable before executing a WFI instruction to place the MCU in Software Standby or CPU Deep Software Standby mode. If MOCO is stopped, operate the MOCO.

- Regardless of whether the MOCO clock is selected as the system clock source, confirm that MOCO oscillation is stable before executing the wait instruction to place the CPU in the CPU Deep Sleep mode. If MOCO is stopped, operate the MOCO.
- Confirm that MOCO oscillation is stable before executing a Power Control for each power domain by Software. If MOCO is stopped, operate the MOCO.
- Confirm that MOCO oscillation is stable before programming or erasing Flash Memory. If MOCO is stopped, operate the MOCO.

Writing 1 to MCSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 001b (system clock source = MOCO).
- Oscillation stop detection is enabled (OSTDCR.OSTDE bit is 1).
- While waiting for the HOCO oscillation stabilization (OFS1(_SEC).HOCOEN bit is 0 or HOCOEN.HCSTP bit is 0, and OSCSF.HOCOSF bit is 0)
- While waiting for the PLL1 oscillation stabilization (PLL1CR.PLL1STP bit is 0, and OSCSF.PLL1SF bit is 0)
- While waiting for the PLL2 oscillation stabilization (PLL2CR.PLL2STP bit is 0, and OSCSF.PLL2SF bit is 0)
- While executing a Power Control for each power domain by software (During the Power Gating Control)
- While measuring the Operation Stability wait time for Flash Memory
- While Flash Memory programming or erasure

The MOCO clock is used to measure the oscillation stabilization wait time of the HOCO/PLL1/PLL2 clock. While waiting for the HOCO/PLL1/PLL2 clock to stabilize, the MOCO clock oscillates regardless of the MOCOEN.MCSTP bit setting. At this time, it is necessary to prevent conflicts between the MOCO stop (or operation) by the MCSTP bit in MOCOEN and the MOCO clock oscillation for HOCO/PLL1/PLL2 clock oscillation stabilization wait time (or MOCO clock stop after HOCO/PLL1/PLL2 clock oscillation stabilization). Therefore, do not change the MOCOEN.MCSTP bit during the period from the 3 MOCO clock cycles before the start of HOCO/PLL1/PLL2 clock operation setting until the HOCO/PLL1/PLL2 clock oscillation stability can be confirmed by the HOCOSF/PLL1SF/PLL2SF flag in the OSCSF register.

8.7 High speed On Chip Oscillator (HOCO)

High-speed On Chip Oscillator (HOCO) is the internal oscillator that supplies a high-speed clock.

8.7.1 Frequency Locked Loop Function

HOCO supports the Frequency Locked Loop (FLL) function that corrects the frequency accuracy of the HOCO clock using the Sub-Clock Oscillator. When the FLL function is enabled, the frequency accuracy of the HOCO clock can be improved compared to when the FLL function is disabled.

When using the FLL function, the oscillation of the Sub-Clock Oscillator must be stable. In addition, the sub-clock oscillator must meet the frequency accuracy specified in the electrical characteristics. (For details, [section 51, Electrical Characteristics](#) see section Electrical Characteristics)

When enabling the FLL function and using HOCO, enable the FLL function in advance and enable HOCO (HOCOEN.HCTSP=0) after SOSC has stabilized.

Set FLLCR2.FLLCNTL[10:0] as follows for each HOCO frequency setting. And the HOCO clock reaches the desired frequency after tFLLWT after enabling HOCO.

Table 8.5 FLLCNTL setting for each HOCO frequency setting

FLLCR2.FLLCNTL[10:0]	OFS1(_SEC).HOCOFREQ[2:0]	Target Frequency (FHOCO)
0x1E9	000b	16 MHz
0x226	001b	18 MHz
0x263	010b	20 MHz
0x1E9	100b	32 MHz
0x1E9	111b	48 MHz

8.7.2 Note on Oscillation Keep in Software Standby mode

By using the oscillation keep function of the HOCO in Software Standby mode, the HOCO oscillation stabilization wait time after canceling Software standby mode can be shortened.

To keep the HOCO oscillation in Software Standby mode, make the following settings:

- Enable the HOCO Standby Oscillation Keep function in the HOCOSCR register. (HOCOSCR.HOCOSOKP bit is set to 1)
- The setting of power control for HOCO in HOCOLDOCR.

If MCU enters Software Standby mode under the above settings and under the HOCO is operating, the HOCO will keep oscillating in Software Standby mode. When canceling Software Standby mode in this state, the HOCO clock can be used without the oscillator stabilization wait time.

If using this function, confirm that the setting value is written to the register before entering the Software standby mode.

However, even if this function is enabled, the clock supply to the system and peripheral modules during Software Standby mode is stopped.

8.7.3 Note on using as TRACE clock source

If HOCO is selected as Trace clock source with TRCKCRSEL bit on TRCKCR register, and then Trace clock function is enable (TRCKCR.TRCKEN=1), HOCO oscillates regardless of the value of HCSTP bit on HOCOCR register. In this situation, HOCO will continue to oscillate even if MCU is in Software Standby mode, Deep Software Standby mode, or Reset (except POR and PVD0) to keep supplying the clock to the TRACE module.

If HOCO is used as Trace clock source, Trace clock should be enabled with TRCKEN bit on TRCKCR register while HOCO is stopped (OFS1(_SEC).HOCOEN=1 and HOCOCR.HCSTP=1) or HOCO is oscillating and stable (OSCSF.HOCOSF=1).

8.8 PLL Circuit

The PLL circuit has a function to multiply the frequency from the oscillator.

[Figure 8.8](#) shows the block diagram of PLL1 circuit, and [Figure 8.9](#) shows the PLL2 circuit. PLL1 and PLL2 have the same circuit configuration. The PLL1 circuit is explained the following as an example.

The input clock source selection circuit selects the clock source input to the PLL.

The input clock divider circuit divides the input clock and generates the PLL reference clock.

The frequency control circuit controls the VCO clock to be generated from the PLL reference clock according to the frequency multiplier setting. The frequency multiplication ratio is determined by the combination of the PLLMUL bits and PLLMULNF bits. The PLLMUL bit determines the integer part of the multiplication ratio, and the PLLMULNF bit determines the fractional part of the multiplication ratio. For example, if the PLLMUL bit setting is 26 and the PLLMULNF bit setting is 0.33, the multiplication ratio is 26.33.

The PLL circuit has the 3 output clocks. The output clock divider circuit divides the VCO clock to generate each PLL clock output. The division ratio for generating each output clock can be set independently with the PLODIVP, PLODIVQ, and PLODIVR bits.

The PLL Input clock frequency, the PLL Reference clock frequency, the VCO clock frequency, and each Output clock frequency must be within the specified in [section 51, Electrical Characteristics](#).

The PLL frequency setting can only be changed the PLL circuit is stopped. Do not change the PLL frequency setting when PLL stop control bit (PLLSTP) is 0.

Figure 8.8 PLL1 block diagram

Figure 8.9 PLL2 block diagram

8.9 Oscillation Stop Detection Function

8.9.1 Oscillation Stop Detection and Operation after Detection

The oscillation stop detection function detects the main clock oscillator stop. When oscillation stop is detected, the system clock source switches as follows:

- If an oscillation stop is detected with $SCKSCR.CKSEL[2:0] = 011b$ (system clock source = MOSC), the system clock source switches to the MOCO clock.
- If an oscillation stop is detected with $PLLCCR.PLSRCSEL = 0$ (PLL1 source clock = MOSC) and $SCKSCR.CKSEL[2:0] = 101b$ (system clock source = PLL1P), PLL1 clock remains the system clock source. The frequency becomes free-running, and the setting in the $SCKSCR.CKSEL[2:0]$ bits does not change.

An oscillation stop detection interrupt request can be generated when an oscillation stop is detected. In addition, the General PWM Timer (GPT) output can be forced to stop state on detection.

The main clock oscillation stop is detected when the input clock remains at 0 or 1 for a certain period, for example, when a malfunction occurs in the main clock oscillator. See [section 51, Electrical Characteristics](#).

Switching between the main clock oscillator and the MOCO clock or between the PLL1 clock and PLL1 free-running clock is controlled by the Oscillation Stop Detection Flag (OSTDSR.OSTDF).

OSTDF controls the switched clock as follows:

- When SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC):
 - When OSTDF changes from 0 to 1, the clock source switches to the MOCO clock.
 - When OSTDF changes from 1 to 0, the clock source switches back to MOSC.
- When PLLCCR.PLSRCSEL = 0 (PLL1 source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (System clock source = PLL1P):
 - When OSTDF changes 0 to 1, the clock source switches to the PLL1 free-running oscillation clock.
 - When OSTDF changes 1 to 0, the clock source switches back to PLL1.

To switch the clock source to the main clock or PLL1 clock again after the oscillation stop detection, set the CKSEL[2:0] bits to a clock source other than the main clock or PLL1 clock and clear the OSTDF flag to 0. Also, check that the OSTDF flag is not 1, then set the CKSEL[2:0] bits to the main clock or PLL1 clock after the specified oscillation stabilization time elapses.

After a reset release, the main clock oscillator is stopped and the oscillation stop detection function is disabled. To enable the oscillation stop detection function, activate the main clock oscillator and write 1 to the oscillation stop detection function enable bit (OSTDCR.OSTDE) after a specified oscillation stabilization time elapses.

The oscillation stop detection function detects when the main clock is stopped by an external cause.

The oscillation stop detection function switches the following clocks to the MOCO clock (when the system clock source is MOSC) or the PLL1 free-running clock (when the system clock source is PLL1P) :

- All clocks that can be selected as the MOSC clock or PLL1 except CLKOUT and CACMCLK.
- The system clock (ICLK) frequency during the MOCO (when the system clock source is MOSC) or PLL1 free-running (when the system clock source is PLL1P) operation is specified by the MOCO oscillation frequency and the division ratio set by the system clock select bits (SCKDIVCR.ICK[3:0])

Figure 8.10 Flow of recovery on detection of oscillator stop

8.9.2 Oscillation Stop Detection Interrupts

An oscillation stop detection interrupt (MOSC_STOP) is generated when the Oscillation Stop Detection Flag (OSTDSR.OSTDF) is 1 and the Oscillation Stop Detection Interrupt Enable bit in the Oscillation Stop Detection Control Register (OSTDCR.OSTDIE) is 1 (enabled). The Port Output Enable for GPT (POEG) is notified of the main clock oscillator stop. On receiving the notification, the POEG sets the Oscillation Stop Detection Flag in the POEG Group n Setting Register (POEGGn.OSTPF) to 1 (n = A, B, C, D).

After the oscillation stop is detected, wait at least 10 PCLKB clock cycles before writing to the POEGGn.OSTPF flag. When the OSTDSR.OSTDF flag requires clearing, do so after clearing the Oscillation Stop Detection Interrupt Enable bit in the Oscillation Stop Detection Control Register (OSTDCR.OSTDIE). Wait at least 2 PCLKB clock cycles before setting the OSTDCR.OSTDIE bit to 1 again. A longer PCLKB wait time might be required, depending on the number of cycles required to read a given I/O register.

The oscillation stop detection interrupt is a non-maskable interrupt. Because non-maskable interrupts are disabled in the initial state after a reset release, enable non-maskable interrupts through software before using oscillation stop detection interrupts. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

8.10 Internal Clock

Clock sources for the internal clock signals include:

- Main clock oscillator
- Sub-clock oscillator
- HOCO clock
- MOCO clock
- LOCO clock
- PLL1 clock (PLL1P, PLL1Q and PLL1R)
- PLL2 clock (PLL2P, PLL2Q and PLL2R)
- External clock input for JTAG
- External clock input for SWD

The following internal clocks are produced from these sources.

- Operating clock of the CPU : CPU clock (CPUCLK)
- Operating clock of the DMAC, DTC, Flash, SRAM, System Bus , I/O Port and ICU: System clock (ICLK)
- Operating clock of the Debug Subsystem : Debug clock (DCLK)
- Operating clocks of peripheral modules: Peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD, and PCKE)
- Operating clock of the FlashIF: FlashIF clock (FCLK)
- Clock for the external bus controller and external pin output: External bus clock (BCLK, EBCLK)
- Clock for the external bus controller and external pin output for the SDRAM : SDRAM clock (SDCLK)
- Clock for the trace function and external pin output : Trace clock (TRCLK)
- Operating clock for the SCI : SCI clock (SCICLK)
- Operating clock for the SPI : SPI clock (SPICLK)
- Operating clock for the Octal SPI : Octal-SPI clock (OCTACLK, OCTADIVCLK)
- Operating clock for the CANFD Core : CANFD Core clock (CANFDCLK)
- Operating clock for the USBFS : USB clock (USBCLK)
- Operating clock for the LCD : LCD clock (LCDCLK)
- Clock for external pin output : Clock/Buzzer output (CLKOUT)
- Operating clock for the CAN : CAN clock (CANMCLK)
- Operating clocks for the ULPT : ULPT LOCO clock (ULPTLCLK) and ULPT sub-clock (ULPTSCLK)
- Operating clock for the AGT : AGT LOCO clock (AGTLCLK) and AGT sub-clock (AGTSCLK)
- Operating clocks for the CAC : CAC clock (CACCLK)
- Operating clocks for the RTC : RTC LOCO clock (RTCLCLK) and RTC Sub-clock (RTCSCLK)
- Operating clock for the IWDG : IWDG clock (IWDGCLK)
- Operating clock for the SysTick timer : SysTick timer clock (SYSTICKCLK)
- Operating clock for the JTAG : JTAG clock (JTAGTCK)

For details on the registers used to set the frequencies of the internal clocks, see [section 8.10.2. System Clock \(ICLK\)](#) to [section 8.10.23. JTAG Clock \(JTAGTCK\)](#)

If the value of any of these bits is changed, subsequent operation is at the frequency determined by the new value.

8.10.1 CPU Clock (CPUCLK)

The CPU clock (CPUCLK) is the operating clock for the CPU. Specify the frequency in the following bits:

- CPUCK[3:0] bits in SCKDIVCR2
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], and PLODIVP[3:0] bits in PLLCCR and PLLCCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*¹

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

8.10.2 System Clock (ICLK)

The system clock (ICLK) is the operating clock of the DMAC, DTC, Flash, SRAM, System Bus, I/O Port, and ICU. Specify the frequency in the following bits:

- ICK[3:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*¹

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

When the ICLK clock source is switched, the duration of the ICLK clock cycle becomes longer during the clock source transition period. See [Figure 8.11](#) and [Figure 8.12](#).

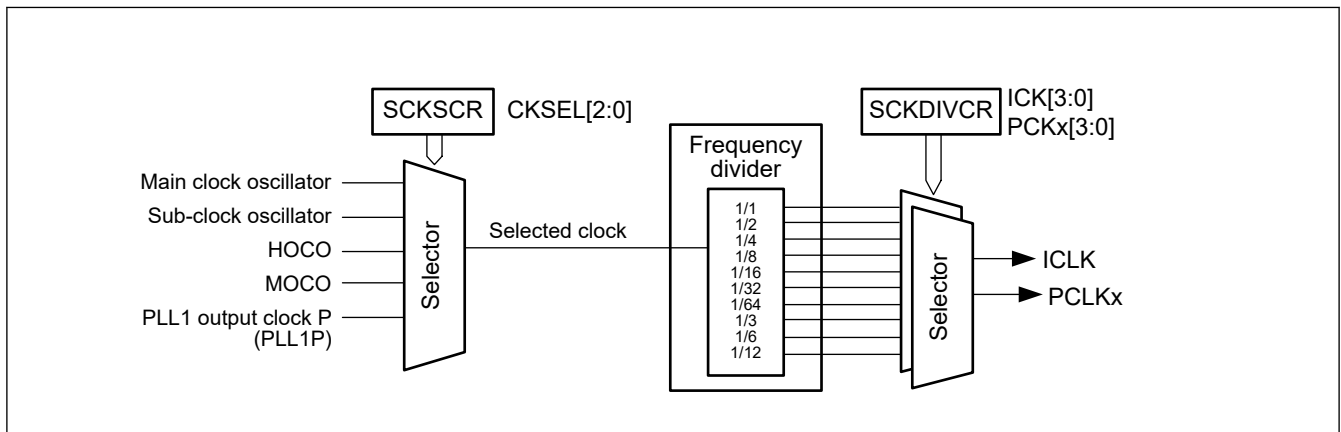

Figure 8.11 Block diagram of clock source selector

Figure 8.12 Timing of clock source switching

8.10.3 Debugger Clock (DCLK)

The Debugger clock (DCLK) is the operating clock for the Debug Subsystem. The frequency is ICLK divided by 2.

8.10.4 Peripheral Module Clock (PCLKA, PCLKB, PCLKC, PCLKD, PCLK E)

The peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD and PCLK E) are the operating clocks for the peripheral modules.

The frequency of the given clock is specified in the following bits:

- PCKA[3:0], PCKB[3:0], PCKC[3:0], PCKD[3:0] and PCKE[3:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1.

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

When the clock source of the peripheral module clock is switched, the duration of the peripheral module clock cycle becomes longer during the clock source transition period. See [Figure 8.11](#) and [Figure 8.12](#).

8.10.5 FlashIF Clock (FCLK)

The flash interface clock (FCLK) is the operating clock for the flash memory interface. In addition to reading from the data flash, FCLK is used for the programming and erasure of the code flash and data flash.

The FCLK frequency is specified in the following bits:

- FCK[3:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2

- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1.

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

8.10.6 External Bus Clock (BCLK, EBCLK)

The external bus clock (BCLK) is an operating clock for the external bus controller. It is also output externally from the EBCLK pin for the external connection bus.

BCLK can be output from the EBCLK pin by setting the EBCKOCR.EBCKOEN bit to 1 and setting the PmnPFS.PSEL[4:0] to 01011b. Make sure that modification of the PmnPFS.PSEL[4:0] to 01011b must always be performed while the EBCKOCR.EBCKOEN bit is 0.

When the BCKCR.BCLKDIV bit is set to 1, the BCLK clock divided by 2 is output from the EBCLK pin.

Specify the frequency in the following bits:

- BCK[3:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1.

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

A frequency higher than the system clock (ICLK) should not be set for the BCLK.

8.10.7 SDRAM Clock (SDCLK)

The SDRAM clock (SDCLK) is an operating clock for the external bus controller. It is output externally from the SDCLK pin for the SDRAM that is connected to the external bus. To output SDCLK on the SDCLK pin, set the SDCKOCR.SDCKOEN bit to 1 and set the PmnPFS.PSEL[4:0] bits to 01011b(enabling SDCLK output). Only change the value in the PmnPFS.PSEL[4:0] bits when the SDCKOCR.SDCKOEN bit is 0. Specify the frequency in the following bits:

- BCK[3:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1.

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

Do not set SDCLK to a frequency higher than that of the system clock (ICLK).

8.10.8 Trace Clock (TRCLK)

The trace clock (TRCLK) is the CPU tracing clock for the On-Chip Debugger function.

The TRCLK frequency is specified by the TRCK[3:0] bits and TRCKSEL bit in TRCKCR (The Trace Clock frequency division ratio and the Trace Clock Source select) . When changing the frequency of the Trace Clock, the Trace Clock must be stopped (TRCKCR.TRCKEN = 0).

8.10.9 SCI Clock (SCICLK)

The SCI clock (SCICLK) is the operating clock for the SCI module.

Specify the frequency in the following bits:

- SCICKDIV[2:0] bits in SCICKDIVCR
- SCICKSEL[3:0] bits in SCICKCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[7:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLL2CCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1.

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

8.10.10 SPI Clock (SPICLK)

The SPI clock (SPICLK) is the operating clock for the SPI module.

Specify the frequency in the following bits:

- SPICKDIV[2:0] bits in SPICKDIVCR
- SPICKSEL[3:0] bits in SPICKCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[7:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLL2CCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1.

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

8.10.11 Octal-SPI clock (OCTACLK, OCTADIVCLK)

The Octal-SPI clock (OCTACLK) is the operating clock for the Octal-SPI module.

Specify the frequency in the following bits:

- OCTACKDIV[2:0] bits in OCTACKDIVCR
- OCTACKSEL[3:0] bits in OCTACKCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[7:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLL2CCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1.

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOCR2.HCFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFRQ0[2:0] bits.

OCTADIVCLK always outputs 2-division of OCTACLK.

8.10.12 CANFD Core clock (CANFDCLK)

The CANFD Core clock (CANFDCLK) is the operating clock for the CANFD module.

Specify the frequency in the following bits:

- CANFDCKDIV[2:0] bits in CANFDCKDIVCR
- CANFDCKSEL[3:0] bits in CANFDCKCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[7:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLL2CCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1.

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOFRQ0[2:0] bits.

8.10.13 USB Clock (USBCLK)

The USB clock (USBCLK) is the operating clock for the USBFS module.

A 48-MHz clock must be supplied when using the USBFS module.

The USBCLK frequency is specified in the following bits:

- USBCKDIV[2:0] bits in USBCKDIVCR
- USBCKSEL[3:0] bits in USBCKCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[7:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLL2CCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1.

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOFRQ0[2:0] bits.

8.10.14 LCD Clock (LCDCLK)

The LCD clock (LCDCLK) is the operating clock for the LCD module.

Specify the frequency in the following bits:

- LCDCKDIV[2:0] bits in LCDCKDIVCR
- LCDCKSEL[3:0] bits in LCDCKCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[7:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLL2CCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)*1.

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFRQ0[2:0] bits is automatically transferred to HOCOFRQ0[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOFRQ0[2:0] bits.

8.10.15 CAN Clock (CANMCLK)

The CAN clock (CANMCLK) is the operating clock for the CAN module. CANMCLK is generated by the main clock oscillator.

8.10.16 ULPT Clock (ULPTLCLK, ULPTSCLK)

The ULPT clocks (ULPTLCLK and ULPTSCLK) are the operating clock for the ULPT module. ULPTLCLK is generated by the LOCO clock and ULPTSCLK is generated by the Sub-clock oscillator.

8.10.17 CAC Clock (CACCLK)

The CAC clock (CACCLK) is the operating clock for the CAC. CACCLK includes the following clocks:

- CAC Main clock (CACMCLK) is generated by the Main clock oscillator
- CAC Sub oscillator clock (CACSCLK) is generated by the Sub-clock oscillator
- CAC HOCO clock (CACHCLK) is generated by the HOCO clock
- CAC MOCO clock (CACMOCLK) is generated by the MOCO clock
- CAC LOCO clock (CACLCLK) is generated by the LOCO clock

8.10.18 RTC Clock (RTCSCLK, RTCLCLK)

The RTC clock (RTCSCLK, RTCLCLK) is the operating clock for the RTC.

RTCSCLK is generated by the sub-clock oscillator, and RTCLCLK is generated by the LOCO clock.

8.10.19 IWDTClock (IWDTCCLK)

The IWDTClock (IWDTCCLK) is the operating clock for the IWDTClock.

IWDTCCLK is internally generated by the LOCO clock which is always divided by 2.

8.10.20 AGT Clock (AGTSCLK, AGTLCLK)

The AGT clocks (AGTSCLK and AGTLCLK) are the operating clocks for the AGT. AGTSCLK is generated by the sub-clock oscillator, and AGTLCLK is generated by the LOCO clock.

8.10.21 SysTick Timer Clock (SYSTICKCLK)

The SysTick timer clock (SYSTICKCLK) is the operating clock for the SysTick timer. SYSTICKCLK is generated by the MOCO clock which is always divided by 8.

8.10.22 External Pin Output Clock (CLKOUT)

The CLKOUT is output externally from the CLKOUT pin for the clock or buzzer output. The CLKOUT is output to the CLKOUT pin when the CKOCR.CKOEN bit is set to 1. Only change the value in the CKODIV[2:0] bits or CKOSEL[2:0] bits in CKOCR when the CKOCR.CKOEN bit is 0.

The CLKOUT clock frequency is specified in the following bits:

- CKODIV[2:0] bits or CKOSEL[2:0] bits in CKOCR
- HOCOFREQ[2:0] bits in OFS1(_SEC)*¹

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1(_SEC).HOCOFREQ[2:0] bits is automatically transferred to HOCOCR2.HCFREQ[2:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFREQ[2:0] bits.

8.10.23 JTAG Clock (JTAGTCK)

The JTAG clock (JTAGTCK) is the clock for the JTAG.

JTAGTCK is generated by the JTAG external clock (TCK).

8.11 Clock Setting

8.11.1 System Clock Setting

8.11.1.1 Initial System Clock Setting

An example of the initial system clock setting procedure is shown in [Table 8.6](#).

Table 8.6 Example of the initial system clock setting procedure after reset release / after Deep Software Standby cancellation

No.	Step	Description
1	Start	After reset release / Deep software standby cancellation (MOCO is selected as system clock source)
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 ^{*1*2} bit in PRCR register
3	Change Operating Power Control Mode to High-Speed mode ^{*1}	Change to High-Speed mode with OPCCR register. ^{*1} For details, see section 10, Low Power Modes .
4	Set a clock source to oscillate	Set a clock source that switches to the system clock source to oscillate.
5	Set Flash Wait Cycle	Set an appropriate access wait count for the flash memory according to the frequency at which it operates after the system clock (ICLK) is set. For details, see section 47, Flash Memory .
6	Set internal clock division ratio	Set the internal clock division ratio with SCKDIVCR register.
7	Set External Bus clock output / SDRAM clock output ^{*3}	Set the EBCLK pin output setting with BCKCR. Set the SDCLK pin output setting with SDCKOCR.
8	Switch the System Clock source	Switch the system clock source with SCKSCR register. Before switching the system clock source, confirm that the clock source oscillation is stable.
9	Change Operating Power Control Mode	Change the Operating Power Control Mode with OPCCR register. ^{*2}
10	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 ^{*1*2} bit in PRCR register
11	End	System clock setting is completed.

Note 1. Setting is not necessary if the operating power control mode is already the High-Speed mode.

Note 2. Setting is not necessary if the operating power control mode is not changed.

Note 3. Setting is not necessary if the External bus or SDRAM are not used.

When the PLL1 is selected as the system clock source, additional procedure is required for procedure No.8. This additional procedure is shown in [Figure 8.13](#). It is recommended to use software to measure the wait time. Be sure to consider the worst-case conditions to ensure that the required wait time elapses. If an interrupt is unavoidably generated during the wait time, retry the measurement after return from the interrupt.

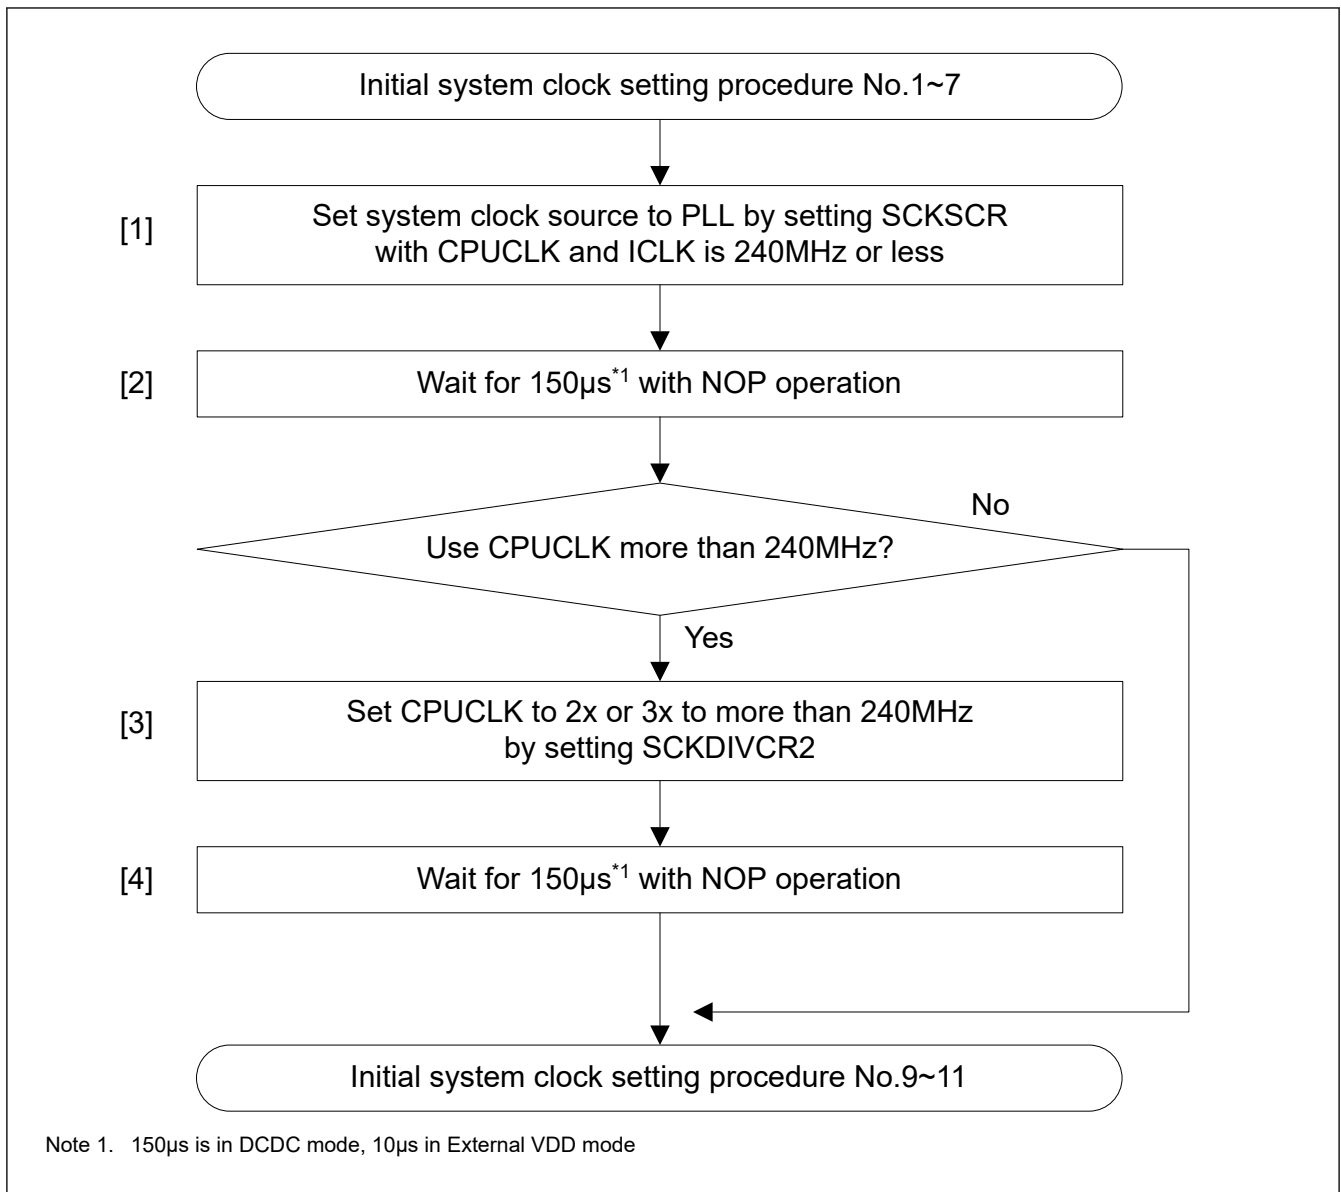

Figure 8.13 Additional flow of initial system clock setting when PLL is used for the system clock source. (assuming all module stop bis are initial value)

8.11.1.2 System Clock Setting for Faster Frequency

An example of setting procedure when changing the current system clock frequency to a faster frequency is shown in [Table 8.7](#)

Table 8.7 Example of Setting Procedure When changing the current system clock frequency to a Faster frequency (1 of 2)

No.	Step	Description
1	Start	
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 ¹ 2 bit in PRCR register
3	Change Operating Power Control Mode to High-Speed mode ^{*1}	Change to High-Speed mode with OPCCR register. ^{*1} For details, see section 10, Low Power Modes .
4	Set a clock source to oscillate ^{*3}	Set a clock source that switches to the system clock source to oscillate. ^{*4}
5	Set Flash Wait Cycle	Set an appropriate access wait count for the flash memory according to the frequency at which it operates after the system clock (ICLK) is set. For details, see section 47, Flash Memory .

Table 8.7 Example of Setting Procedure When changing the current system clock frequency to a Faster frequency (2 of 2)

No.	Step	Description
6	Set internal clock division ratio	Set the internal clock division ratio with SCKDIVCR register.
7	Switch the System Clock source ^{*3}	Switch the system clock source with SCKSCR register. Before switching the system clock source, confirm that the clock source oscillation is stable.
8	Change Operating Power Control Mode	Change the Operating Power Control Mode with OPCCR register. ^{*2}
10	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 ^{*1*2} bit in PRCR register
11	End	System clock is changed to a Faster frequency.

Note 1. Setting is not necessary if the operating power control mode is already the High-Speed mode.

Note 2. Setting is not necessary if the operating power control mode is not changed.

Note 3. Setting is not necessary if the system clock source is not changed.

Note 4. To change the frequency of the PLL selected as the system clock source, it is necessary to change the system clock source to another clock source, stop the PLL, and then change the PLL setting.

When the PLL1 is selected as the system clock source, additional procedure is required for procedure No.7. This additional procedure is shown in [Figure 8.14](#). It is recommended to use software to measure the wait time. Be sure to consider the worst-case conditions to ensure that the required wait time elapses. If an interrupt is unavoidably generated during the wait time, retry the measurement after return from the interrupt

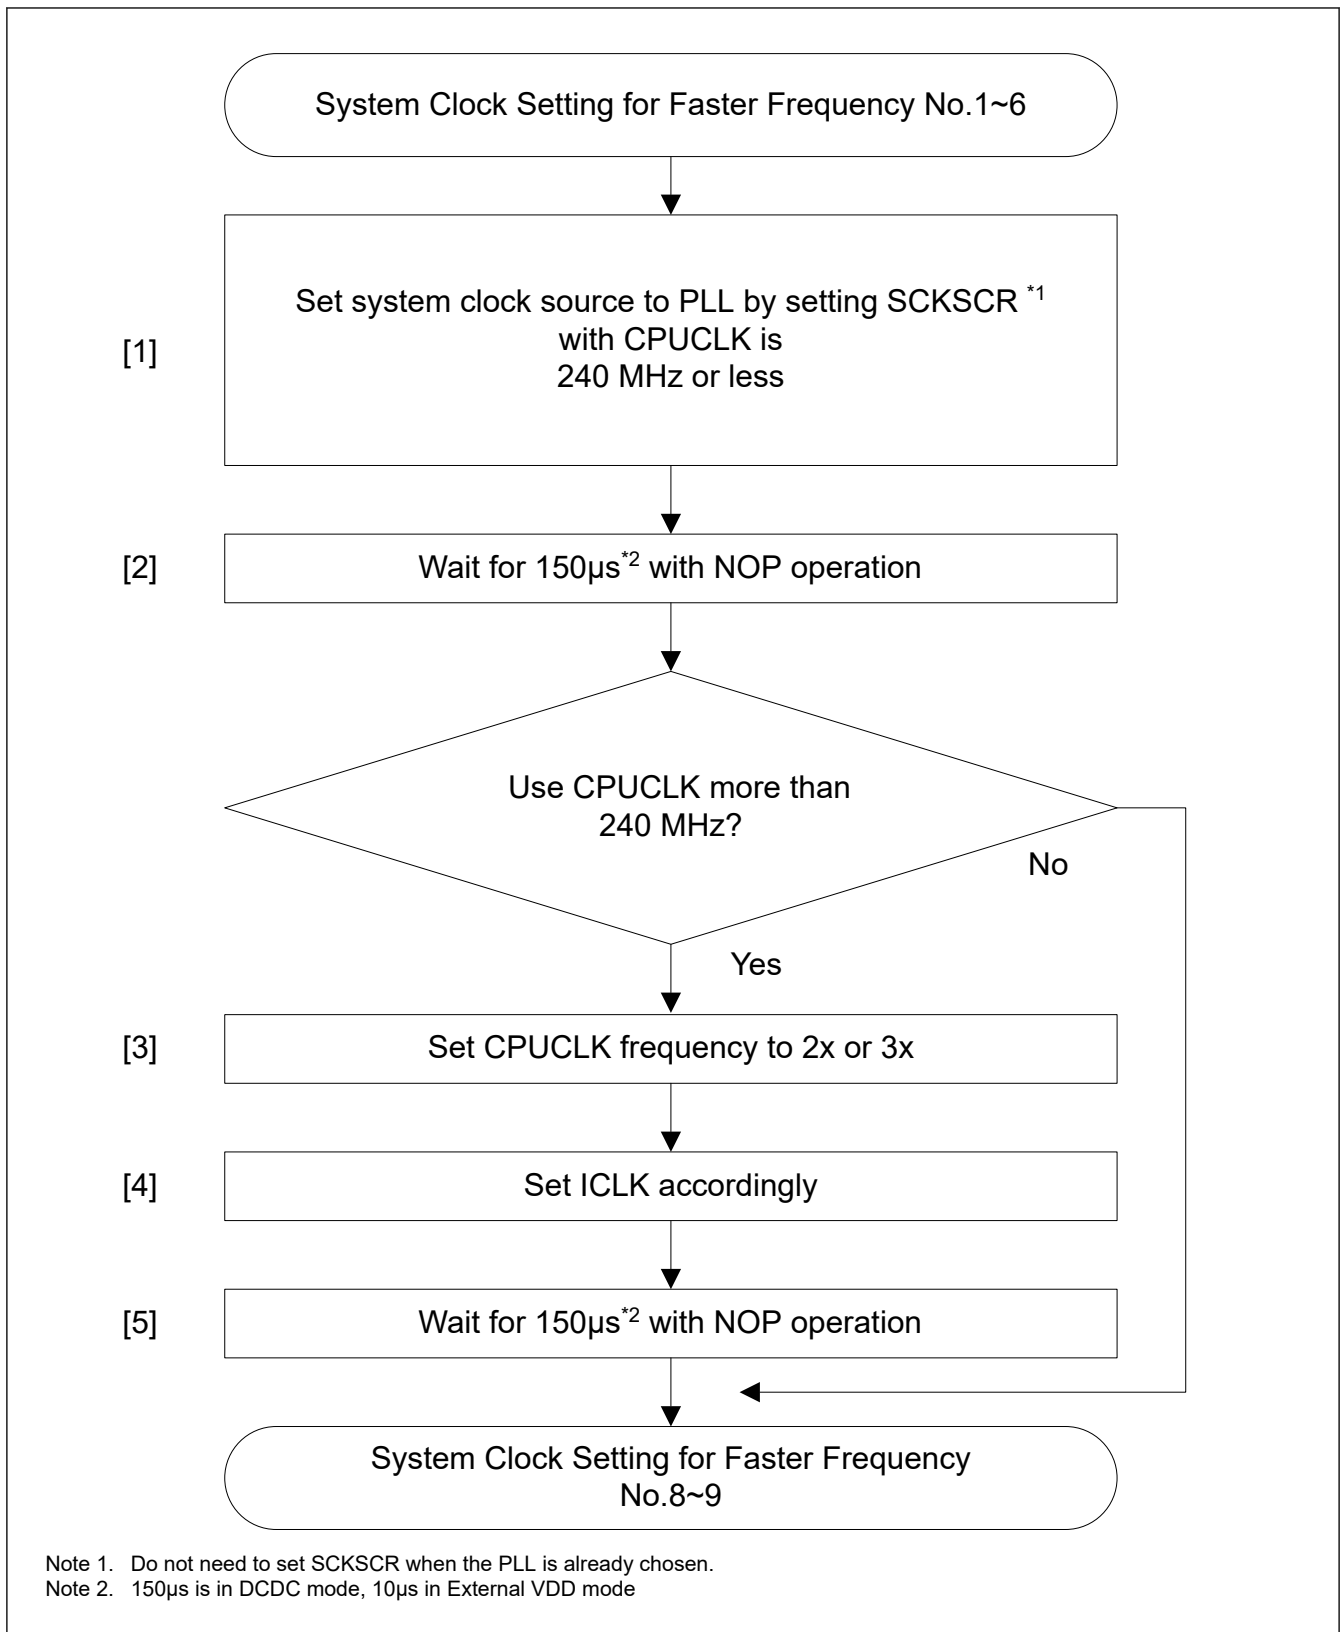

Figure 8.14 Additional flow of system clock setting when PLL is used for the system clock source and CPUCLK to be faster frequency

8.11.1.3 System Clock Setting for Slower frequency

An example of setting procedure when changing the current system clock frequency to a slower frequency is shown in [Table 8.8](#).

Table 8.8 Example of Setting Procedure When changing the current system clock frequency to a Slower frequency

No.	Step	Description
1	Start	
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 ^{*1*2} bit in PRCR register
3	Change Operating Power Control Mode to High-Speed mode ^{*1}	Change to High-Speed mode with OPCCR register. ^{*1} For details, see section 10, Low Power Modes .
4	Set a clock source to oscillate ^{*3}	Set a clock source that switches to the system clock source to oscillate. ^{*4}
5	Set internal clock division ratio	Make the following settings so that the frequency does not exceed the electrical characteristics range when the system clock source is switched in the next step. <ul style="list-style-type: none"> • Set the internal clock division ratio larger than the current division ratio. • Set the internal clock division ratio so that the frequency after switching the system clock source is slower than the current frequency.^{*3}
6	Switch the System Clock source ^{*3}	Switch the system clock source with SCKSCR register. Before switching the system clock source, confirm that the clock source oscillation is stable.
7	Re-set internal clock division ratio	Re-set the internal clock division ratio with SCKDIVCR register according to the frequency after switching the system clock source.
8	Set Flash Wait Cycle	Set an appropriate access wait count for the flash memory according to the frequency at which it operates after the system clock (ICLK) is set. For details, see section 47, Flash Memory .
9	Change Operating Power Control Mode	Change the Operating Power Control Mode with OPCCR register. ^{*2}
10	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 ^{*1*2} bit in PRCR register
11	End	System clock is changed to a Slower frequency.

Note 1. Setting is not necessary if the operating power control mode is already the High-Speed mode.

Note 2. Setting is not necessary if the operating power control mode is not changed.

Note 3. Setting is not necessary if the system clock source is not changed.

Note 4. To change the frequency of the PLL selected as the system clock source, it is necessary to change the system clock source to another clock source, stop the PLL, and then change the PLL setting.

When the PLL1 is selected as the system clock source, additional procedure is required for procedure No.5. This additional procedure is shown in [Figure 8.15](#). It is recommended to use software to measure the wait time. Be sure to consider the worst-case conditions to ensure that the required wait time elapses. If an interrupt is unavoidably generated during the wait time, retry the measurement after return from the interrupt.

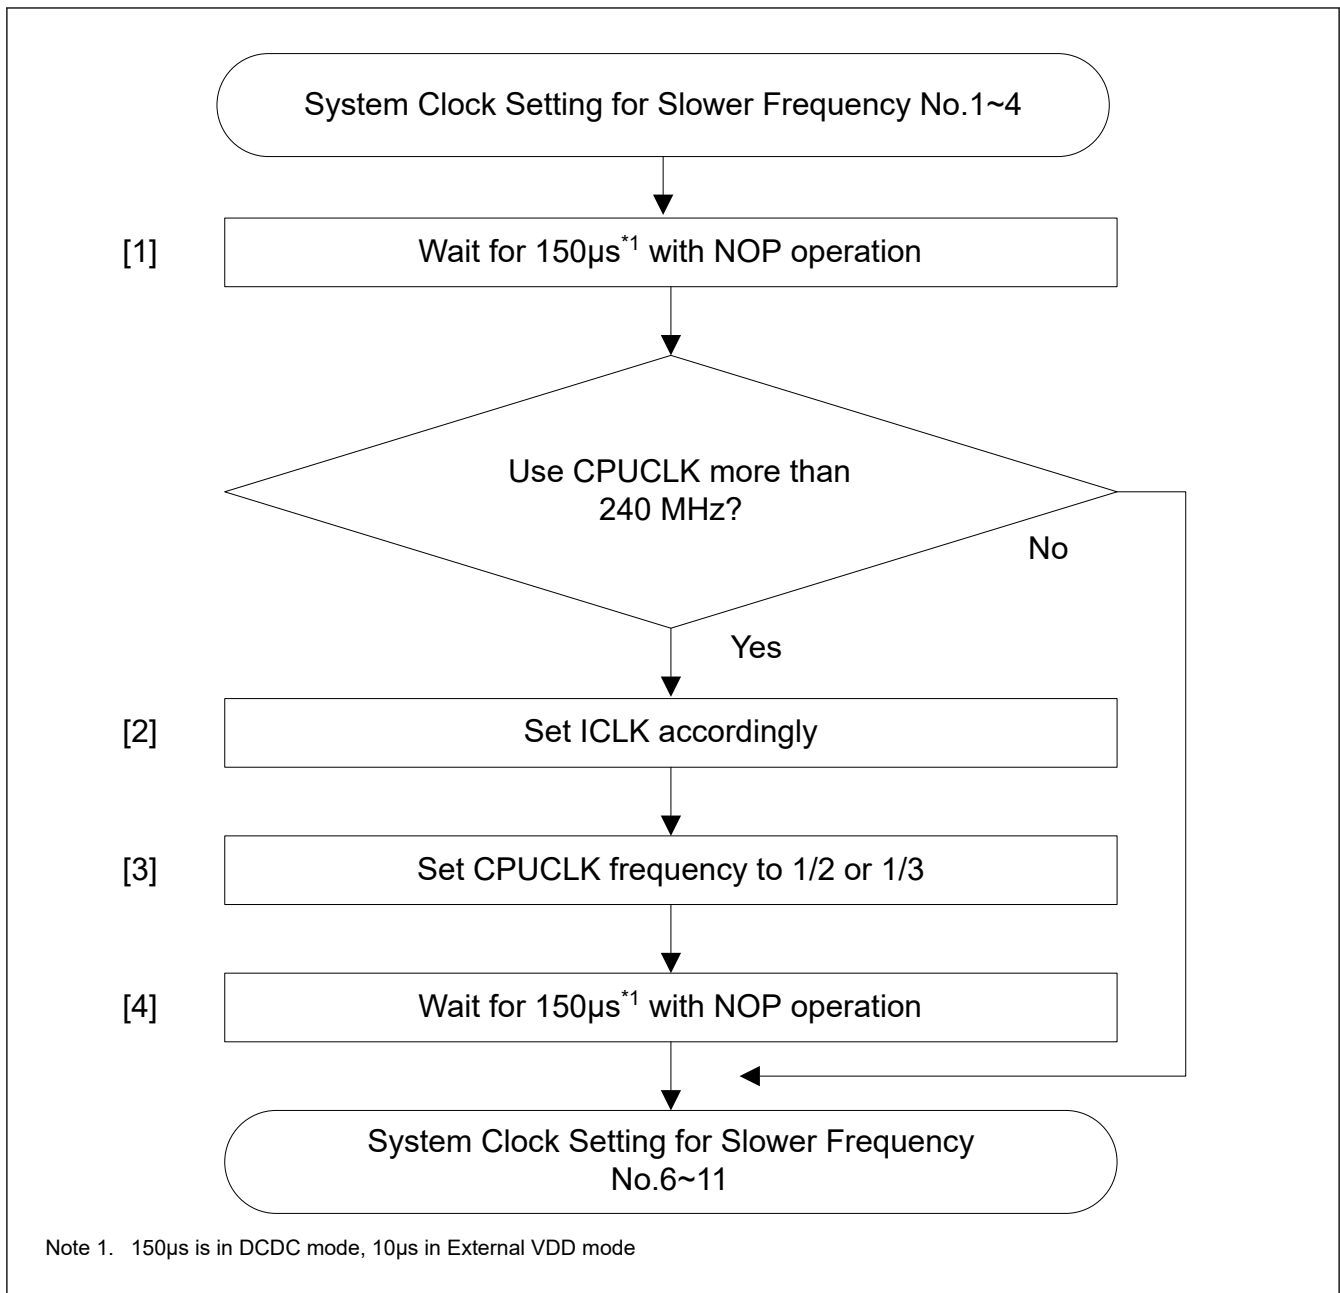

Figure 8.15 Additional flow of system clock setting when PLL is used for the system clock source and CPUCLK to be slower frequency

8.11.2 Peripheral module-dedicated Clock Setting

This section describes the setting procedure of the operating clock for the peripheral module. The target clocks are as follows : SCICLK, SPICLK, OCTACLK, CANFDCLK, USBCLK and LCDCLK.

8.11.2.1 Initial Peripheral module-dedicated Clock Setting

An example of the initial clock setting procedure for peripheral module is shown in [Table 8.9](#).

Table 8.9 Example of the setting procedure of the operating clock for peripheral module after reset release / after Deep Software Standby cancellation (1 of 2)

No.	Step	Description
1	Start	After reset release / Deep software standby cancellation (MOCO is selected as system clock source)

Table 8.9 Example of the setting procedure of the operating clock for peripheral module after reset release / after Deep Software Standby cancellation (2 of 2)

No.	Step	Description
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 ^{*1} *2 bit in PRCR register
3	Change Operating Power Control Mode to High-Speed mode ^{*1}	Change to High-Speed mode with OPCCR register. ^{*1} For details, see section 10, Low Power Modes .
4	Set CKSREQ and wait for setting CKSRDY	Write 1 to CKSREQ bit in each CKCR register. Polling until CKSRDY bit in each CKCR register is read as 1 While CKSRDY is 1, the clock supplying stops.
5	Set a clock source to oscillate	Set a clock source that switches to the peripheral module-dedicated clock source to oscillate.
6	Set the clock division ratio and switch the clock source	Write the setting value to CKDIV[2:0] in each CKDIVCR register. Write the setting value to CKSEL[3:0] in each CKCR register.
7	Clear CKSREQ and wait for clearing CKSRDY	Write 0 to CKSREQ bit in each CKCR register. Polling until CKSRDY bit in each CKCR register is read as 0. After CKSRDY is 0, the clock supplying starts.
8	Cancel the Module Stop Control	Cancel the Module Stop Control in MSTPCRn register (n = A to E) and supply clock to peripheral module.
9	Change Operating Power Control Mode	Change the Operating Power Control Mode with OPCCR register. ^{*2}
10	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register
11	End	Clock setting is completed. And then, set the peripheral modules.

Note 1. Setting is not necessary if the operating power control mode is already the High-Speed mode.

Note 2. Setting is not necessary if the operating power control mode is not changed.

8.11.2.2 Peripheral module-dedicated Clock source changing

[Table 8.10](#) shows an example of the setting change procedure when switching the clock source of the operating clock for peripheral module in use.

Table 8.10 Example of the setting change procedure when switching the clock source of the operating clock for peripheral module in use (1 of 2)

No.	Step	Description
1	Start	The operating clock for the peripheral module is being used.
2	Stop the peripheral module	Stop the operation of the peripheral module that the operating clock is to be changed.
3	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 ^{*1} *2 bit in PRCR register
4	Change Operating Power Control Mode to High-Speed mode ^{*1}	Change to High-Speed mode with OPCCR register. ^{*1} For details, see section 10, Low Power Modes .
5	Set CKSREQ and wait for setting CKSRDY	Write 1 to CKSREQ bit in each CKCR register. Polling until CKSRDY bit in each CKCR register is read as 1. While CKSRDY is 1, the clock supplying stops.
6	Set a clock source to oscillate	Set a clock source that switches to the peripheral module-dedicated clock source to oscillate.
7	Set the clock division ratio and switch the clock source	Write the setting value to CKDIV[2:0] in each CKDIVCR register. Write the setting value to CKSEL[3:0] in each CKCR register.
8	Clear CKSREQ and wait for clearing CKSRDY	Write 0 to CKSREQ bit in each CKCR register. Polling until CKSRDY bit in each CKCR register is read as 0. After CKSRDY is 0, the clock supplying starts.
9	Change Operating Power Control Mode	Change the Operating Power Control Mode with OPCCR register. ^{*2}
10	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register

Table 8.10 Example of the setting change procedure when switching the clock source of the operating clock for peripheral module in use (2 of 2)

No.	Step	Description
11	Restart the peripheral module	Change the peripheral module settings according to the operating clock after the settings are changed. After that, restart the operation of the peripheral module.
12	End	Clock setting is completed.

Note 1. Setting is not necessary if the operating power control mode is already the High-Speed mode.

Note 2. Setting is not necessary if the operating power control mode is not changed.

8.11.2.3 Peripheral module-dedicated Clock division ratio changing

Table 8.11 shows an example of the setting change procedure when switching the switching the division ratio of the operating clock for peripheral module in use.

Table 8.11 Example of the setting change procedure when switching the division ratio of the operating clock for peripheral module in use (without the clock source change)

No.	Step	Description
1	Start	The operating clock for the peripheral module is being used.
2	Stop the peripheral module	Stop the operation of the peripheral module that the operating clock is to be changed.
3	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 ^{*1} *2 bit in PRCR register
4	Change Operating Power Control Mode to High-Speed mode ^{*1}	Change to High-Speed mode with OPCCR register. ^{*1} For details, see section 10, Low Power Modes .
5	Set the clock division ratio	Write the setting value to CKDIV[2:0] in each CKDIVCR register.
6	Change Operating Power Control Mode	Change the Operating Power Control Mode with OPCCR register. ^{*2}
7	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register
8	Restart the peripheral module	Change the peripheral module settings according to the operating clock after the settings are changed. After that, restart the operation of the peripheral module.
9	End	Clock setting is completed.

Note 1. Setting is not necessary if the operating power control mode is already the High-Speed mode.

Note 2. Setting is not necessary if the operating power control mode is not changed.

8.11.3 Main Clock Oscillator Setting

Table 8.12 shows an example of the initial setting procedure for the Main Clock Oscillator.

Table 8.12 Example of the initial setting procedure for Main Clock Oscillator after reset release / after Deep Software Standby cancellation (1 of 2)

No.	Step	Description
1	Start	The Main Clock Oscillator is stopped after reset release / Deep software standby cancellation
2	Cancel Register Write Protection	Set 1 to PRC0 bit in PRCR register
3	Set the mode of Main Clock Oscillator	Set the following Main Clock Oscillator mode with MOMCR register <ul style="list-style-type: none"> • Resonator or Clock input • Auto Gain Control function • Drive Capability
4	Set the oscillation stabilization wait time	Set the Main Clock Oscillator Wait Time in MOSCWTCR register.
5	Set the oscillation keep in Software Standby mode	Set MOSCSCR register if Main Clock Oscillator keeps oscillation in Software Standby mode.
6	Set the Main Clock Oscillator to operate	Set the Main Clock Oscillator to start oscillating with the MOSCCR register.

Table 8.12 Example of the initial setting procedure for Main Clock Oscillator after reset release / after Deep Software Standby cancellation (2 of 2)

No.	Step	Description
7	Wait for Main Clock oscillation to stabilize	Polling until MOSCSF bit in OSCSF register is read as 1 (Oscillation is stable)
8	Apply Register Write Protection	Set 0 to PRC0 bit in PRCR register
9	End	The Main Clock Oscillator setting is completed. The Main Clock is available.

8.11.4 Sub-Clock Oscillator Setting

Table 8.13 shows an example of the initial setting procedure for the Sub-Clock Oscillator.

Table 8.13 Example of the initial setting procedure for Sub-Clock Oscillator after VBAT Power On Reset release

No.	Step	Description
1	Start	The Sub-Clock Oscillator is stopped after VBAT Power On Reset release.
2	Cancel Register Write Protection	Set 1 to PRC0 bit in PRCR register
3	Setting the mode of Sub-Clock Oscillator	Set the following Sub-Clock Oscillator mode with SOMCR register <ul style="list-style-type: none"> Resonator or Clock input Drive Capability
4	Set the Sub-Clock Oscillator to operate	Set the Sub-Clock Oscillator to start oscillating with the SOSCCR register.
5	Wait for Sub-Clock oscillation to stabilize	Wait for sub-clock oscillation stabilization time (tSUBOSCWT). For the sub-clock oscillation stabilization time, see section 51, Electrical Characteristics .
6	Apply Register Write Protection	Set 0 to PRC0 bit in PRCR register
7	End	The Sub-Clock Oscillator setting is completed. The Sub-Clock is available.

8.11.5 High-speed On Chip Oscillator Setting

8.11.5.1 HOCO Initial Clock Setting

Table 8.14 shows an example of the initial setting procedure for the HOCO.

Table 8.14 Example of the HOCO initial setting procedure after reset release / after Deep Software Standby cancellation (OFS1(_SEC).HOCOEN = 1, without FLL)

No.	Step	Description
1	Start	The HOCO is stopped after reset release / Deep software standby cancellation when OFS1(_SEC).HOCOEN is 1.
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 bit in PRCR register
3	Check the HOCO power supply*1	Check the following bit in the HOCOLDOCR register <ul style="list-style-type: none"> LDOSTP bit is 0 (LDO is enabled)
4	Set the HOCO frequency	Set the HOCO frequency with HOCOCCR2 register
5	Set the oscillation keep in Software Standby mode	If HOCO keeps oscillation in Software Standby mode, set the following: <ul style="list-style-type: none"> HOCOSOKP bit in HOCOSCR register SKEEP bit in HOCOLDOCR register
6	Set HOCO to operate	Set HOCO to start oscillating with the HOCOCCR register.
7	Wait for HOCO clock oscillation to stabilize	Polling until HOCOSF bit in OSCSF register is read as 1 (Oscillation is stable)
8	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register
9	End	HOCO clock setting is completed.HOCO Clock is available.

Note 1. When HOCOLDOCR.LDOSTP bit is 1, do not operate HOCO. If HOCOLDOCR.LDOSTP is switched from 1 to 0, waiting for the HOCO power supply to stabilize is required. See [section 51, Electrical Characteristics](#) on waiting time for the HOCO power supply to stabilize.

8.11.5.2 HOCO Setting with FLL function

Table 8.15 shows an example of the initial setting procedure for HOCO with FLL function.

Table 8.16 shows the FLL function setting flow for the Software Standby mode transition and cancellation.

Table 8.15 Example of the HOCO setting procedure with FLL function after reset release / after Deep Software Standby cancellation (OFS1(_SEC).HOCOEN = 1)

No.	Step	Description
1	Start	The HOCO is stopped after reset release / Deep software standby cancellation when OFS1(_SEC).HOCOEN is 1.
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 bit in PRCR register
3	Check the HOCO power supply ^{*1}	Check the following bit in the HOCOLDOCR register. <ul style="list-style-type: none"> LDOSTP bit is 0 (LDO is enabled)
4	Set the HOCO frequency	Set the HOCO frequency with HOCOCCR2 register
5	Set the FLL function to enable ^{*2}	Set the FLL Multiplication Control with FLLCR2 register. Set the FLL function to enable with FLLCR1 register.
6	Set HOCO to operate	Set HOCO to start oscillating with the HOCOCCR register.
7	Wait for HOCO clock oscillation to stabilize	Polling until HOCOSF bit in OSCSF register is read as 1 (Oscillation is stable)
8	Wait for FLL stabilization	Wait for FLL stabilization wait time (t_{FLLWT}), or wait until the HOCO clock is measured to confirm that the frequency accuracy is stable.
9	Check the HOCO stabilization	Check that HOCOSF bit in OSCSF register is read as 1
10	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register
11	End	FLL setting is completed. HOCO Clock is available.

Note 1. When HOCOLDOCR.LDOSTP bit is 1, do not operate HOCO.

If HOCOLDOCR.LDOSTP is switched from 1 to 0, waiting for the HOCO power supply to stabilize is required. See [section 51, Electrical Characteristics](#) on waiting time for the HOCO power supply to stabilize.

Note 2. Sub-Clock Oscillator must be oscillating with the stabilization.

Table 8.16 FLL setting flow for Software Standby mode transition and cancellation

No.	Step	Description
1	Start	The HOCO is oscillating with FLL is enabled
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 bit in PRCR register
3	Stop HOCO ^{*1}	Set HOCO to stop with HOCOCCR register.
4	Disable FLL	Set the FLL function to disable with FLLCR1 register.
5	WFI instruction ^{*2}	Transition to Software Standby mode with WFI instruction
6	Software Standby mode ^{*2}	MCU is in Software Standby mode
7	Cancellation Software Standby mode ^{*2}	Software Standby mode is cancelled
8	Set the FLL function to enable ^{*3}	Set the FLL Multiplication Control with FLLCR2 register. Set the FLL function to enable with FLLCR1 register.
9	Set HOCO to operate	Set HOCO to start oscillating with the HOCOCCR register.
10	Wait for FLL stabilization	Wait for FLL stabilization wait time (t_{FLLWT}), or wait until the HOCO clock is measured to confirm that the frequency accuracy is stable.
11	Check the HOCO stabilization	Check that HOCOSF bit in OSCSF register is read as 1.
12	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register
13	End	HOCO Clock is available.

Note 1. If HOCO is used as the system clock source or the clock source of PLL, these clock source must be changed to another clock before HOCO is stopped.

Note 2. See [section 10, Low Power Modes](#) for detail of Software Standby mode.

Note 3. Sub-Clock Oscillator must be oscillating with the stabilization.

8.11.6 PLL Setting

8.11.6.1 PLL Initial Clock Setting

Table 8.17 shows an example of the initial setting procedure for the PLL.

Table 8.17 Example of the PLL initial setting procedure after reset release / after Deep Software Standby cancellation (PLL1 or PLL2)

No.	Step	Description
1	Start	The PLL1 is stopped after reset release / Deep software standby cancellation. The PLL2 is stopped after reset release / Deep software standby cancellation.
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 bit in PRCR register.
3	Change Operating Power Control Mode to High-Speed mode*1	Change to High-Speed mode with OPCCR register. For details, see section 10, Low Power Modes .
4	Check the PLL power supply*2	[PLL1] Check the following bit in the PLL1LDOCR register. <ul style="list-style-type: none"> LDOSTP bit is 0 (LDO is enabled). [PLL2] Check the following bit in the PLL2LDOCR register. <ul style="list-style-type: none"> LDOSTP bit is 0 (LDO is enabled).
5	Configure the PLL settings	[PLL1] Configure the following PLL1 settings in PLLCCR and PLLCCR2 registers. [PLL2] Configure the following PLL2 settings in PLL2CCR and PLL2CCR2 registers. [Setting Items] <ul style="list-style-type: none"> PLL input frequency division ratio PLL clock source Frequency Multiplication Factor Frequency Multiplication Fractional Factor PLL Output Frequency Division Ratio (P/Q/R)
6	Set PLL to operate	[PLL1] Set PLL1 to start oscillating with the PLLCR register. [PLL2] Set PLL2 to start oscillating with the PLL2CR register.
7	Wait for PLL clock oscillation to stabilize	[PLL1] Polling until PLLSF bit in OSCSF register is read as 1 (Oscillation is stable). [PLL2] Polling until PLL2SF bit in OSCSF register is read as 1 (Oscillation is stable).
8	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register
9	End	PLL1 or PLL2 clock setting is completed. [PLL1] PLL1P, PLL1Q, PLL1R clocks are available. [PLL2] PLL2P, PLL2Q, PLL2R clocks are available.

Note 1. Setting is not necessary if the operating power control mode is already the High-Speed mode.

Note 2. When PLL1LDOCR.LDOSTP bit is 1, do not operate PLL1.

If PLL1LDOCR.LDOSTP is switched from 1 to 0, waiting for the PLL1 power supply to stabilize is required. See [section 51, Electrical Characteristics](#) on waiting time for the PLL1 power supply to stabilize.

When PLL2LDOCR.LDOSTP bit is 1, do not operate PLL2.

If PLL2LDOCR.LDOSTP is switched from 1 to 0, waiting for the PLL2 power supply to stabilize is required. See [section 51, Electrical Characteristics](#) on waiting time for the PLL2 power supply to stabilize.

8.11.6.2 PLL Clock Setting Change

Table 8.18 shows an example of the initial setting procedure for the PLL.

Table 8.18 Example of the PLL setting change procedure (PLL1 or PLL2)

No.	Step	Description
1	Start	PLL1 is oscillating and the PLL1 clocks (PLL1P, PLL1Q, PLL1R) are being used. PLL2 is oscillating and the PLL2 clocks (PLL2P, PLL2Q, PLL2R) are being used.
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 bit in PRCR register.
3	Stop PLL *1	[PLL1] Set PLL1 to stop with PLLCR register. [PLL2] Set PLL2 to stop with PLL2CR register.
4	Change the PLL settings	[PLL1] Configure the following PLL1 settings in PLLCCR and PLLCCR2 registers. [PLL2] Configure the following PLL2 settings in PLL2CCR and PLL2CCR2 registers. [Setting Items] <ul style="list-style-type: none"> ● PLL input frequency division ratio ● PLL clock source ● Frequency Multiplication Factor ● Frequency Multiplication Fractional Factor ● PLL Output Frequency Division Ratio (P/Q/R)
5	Set PLL to operate	[PLL1] Set PLL1 to start oscillating with the PLLCR register. [PLL2] Set PLL2 to start oscillating with the PLL2CR register.
6	Wait for PLL clock oscillation to stabilize	[PLL1] Polling until PLLSF bit in OSCSF register is read as 1 (Oscillation is stable). [PLL2] Polling until PLL2SF bit in OSCSF register is read as 1 (Oscillation is stable).
7	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register.
8	End	PLL1 or PLL2 clock setting change is completed. [PLL1] PLL1P, PLL1Q, PLL1R clocks are available. [PLL2] PLL2P, PLL2Q, PLL2R clocks are available.

Note 1. If PLL1P clock is used as the system clock source, the system clock source must be changed to another clock source before PLL1 is stopped.

8.12 Usage Notes

8.12.1 Notes on Clock Generation Circuit

The frequency of the following clocks supplied to each module changes according to the setting of the SCKDIVCR and SCKDIVCR2 register:

- CPU clock (CPUCLK)
- System clock (ICLK)
- Peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD and PCLKE)
- FlashIF clock (FCLK)
- external bus clock (BCLK)

Each frequency must meet the following conditions:

- Each frequency must be selected within the operation-guaranteed range of the operating frequency (f) specified in the AC characteristics. See [section 51, Electrical Characteristics](#).
- Each clock must be set according to [Table 8.2](#).

- Do not change the clock frequency during external bus access. Furthermore, when access via the external bus is to start after a change to the clock frequency, only start access via the bus after confirming that the change to the frequencies has been completed.

To ensure correct processing after the clock frequency changes, first write to the relevant Clock Control register to change the frequency, then read the value from the register, and finally perform the subsequent processing.

8.12.2 Notes on Resonator

Because various resonator characteristics relate closely to your board design, adequate evaluation is required before use. See the resonator connection example in [Figure 8.5](#). The circuit constants for the resonator depend on the resonator to be used and the stray capacitance of the mounting circuit. Therefore, consult the resonator manufacturer when determining the circuit constants. The voltage to be applied between the resonator pins must be within the absolute maximum rating.

8.12.3 Notes on Board Design

When using a crystal resonator, place the resonator and its load capacitors as close to the XTAL and EXTAL pins as possible. Other signal lines should be routed away from the oscillation circuit as shown in [Figure 8.16](#) to prevent electromagnetic induction from interfering with correct oscillation. [Figure 8.16](#) shows the case which the main clock oscillator is used. In case of sub-clock oscillator, it is also the same as [Figure 8.16](#).

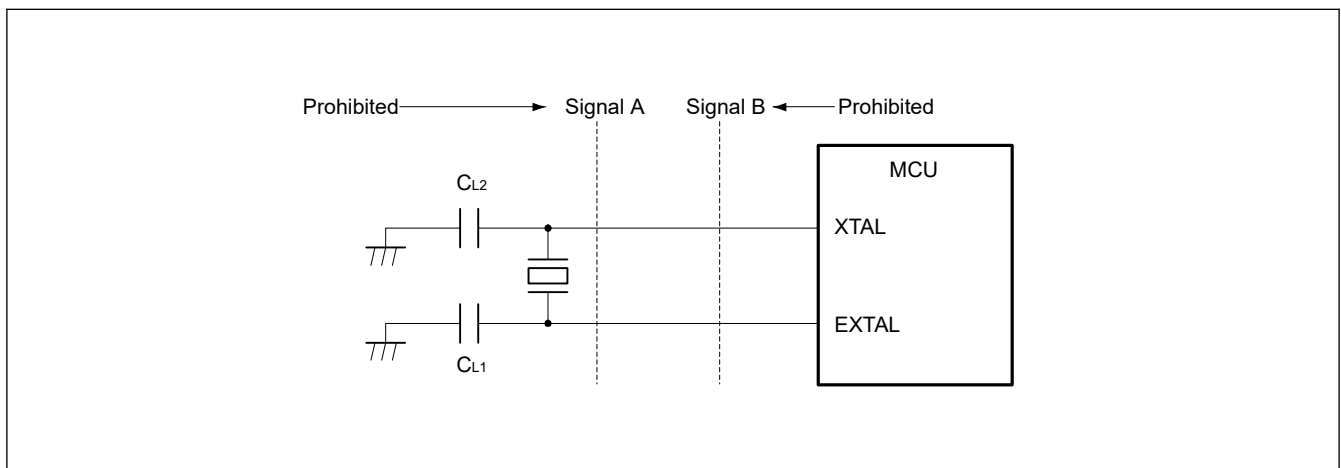

Figure 8.16 Signal routing in board design for oscillation circuit

8.12.4 Notes on Resonator Connect Pin

When the main clock is not used, the EXTAL and XTAL pins can be used as general ports. When these pins are used as general ports, the main clock must be stopped (MOSCCR.MOSTP bit should be set to 1).

8.12.5 Notes on Using Sub-Clock Oscillator

The output of the P212 (EXTAL), P213 (XTAL) and P706 pins may affect the oscillation by the sub-clock oscillator.

If the sub-clock oscillator is used, implement board design so as not to affect the oscillation. Renesas strongly recommends setting the PmnPFS.DSCR[1:0] bits to 00b or 01b when using the P212 (EXTAL), P213 (XTAL) and P706 as output pins and using the sub-clock oscillator.

In addition, when using the sub-clock oscillator in Low power mode drive capability (SOMCR.SODRV[1:0]= 01b, 10b and 11b), Renesas recommends setting the PmnPFS.DSCR[1:0] bits to 00b when using the P212 (EXTAL), P213 (XTAL) and P706 as output pins and using the sub-clock oscillator.

9. Clock Frequency Accuracy Measurement Circuit (CAC)

9.1 Overview

The Clock Frequency Accuracy Measurement Circuit (CAC) counts pulses of the clock to be measured (measurement target clock) within the time generated by the clock selected as the measurement reference (measurement reference clock), and determines the accuracy depending on whether the number of pulses is within the allowable range. When measurement is complete or the number of pulses within the time generated by the measurement reference clock is not within the allowable range, an interrupt request is generated.

[Table 9.1](#) lists the CAC specifications, [Figure 9.1](#) shows the CAC block diagram, and [Table 9.2](#) lists the CAC I/O pin.

Table 9.1 CAC specifications

Parameter	Specifications
Measurement target clocks	Frequency can be measured for: <ul style="list-style-type: none"> • Main clock oscillator (CACMCLK) • Sub-clock oscillator (CACCLK) • HOCO clock (CACHCLK) • MOCO clock (CACMOCLK) • LOCO clock (CACLCLK) • Peripheral module clock B (PCLKB)
Measurement reference clocks	Frequency can be referenced to: <ul style="list-style-type: none"> • External clock input to the CACREF pin • Main clock oscillator (CACMCLK) • Sub-clock oscillator (CACCLK) • HOCO clock (CACHCLK) • MOCO clock (CACMOCLK) • LOCO clock (CACLCLK) • Peripheral module clock B (PCLKB)
Selectable function	Digital filter
Interrupt sources	<ul style="list-style-type: none"> • Measurement end • Frequency error • Overflow
Module-stop function	Module-stop state can be set to reduce power consumption
TrustZone Filter	Security and Privilege attribution can be set

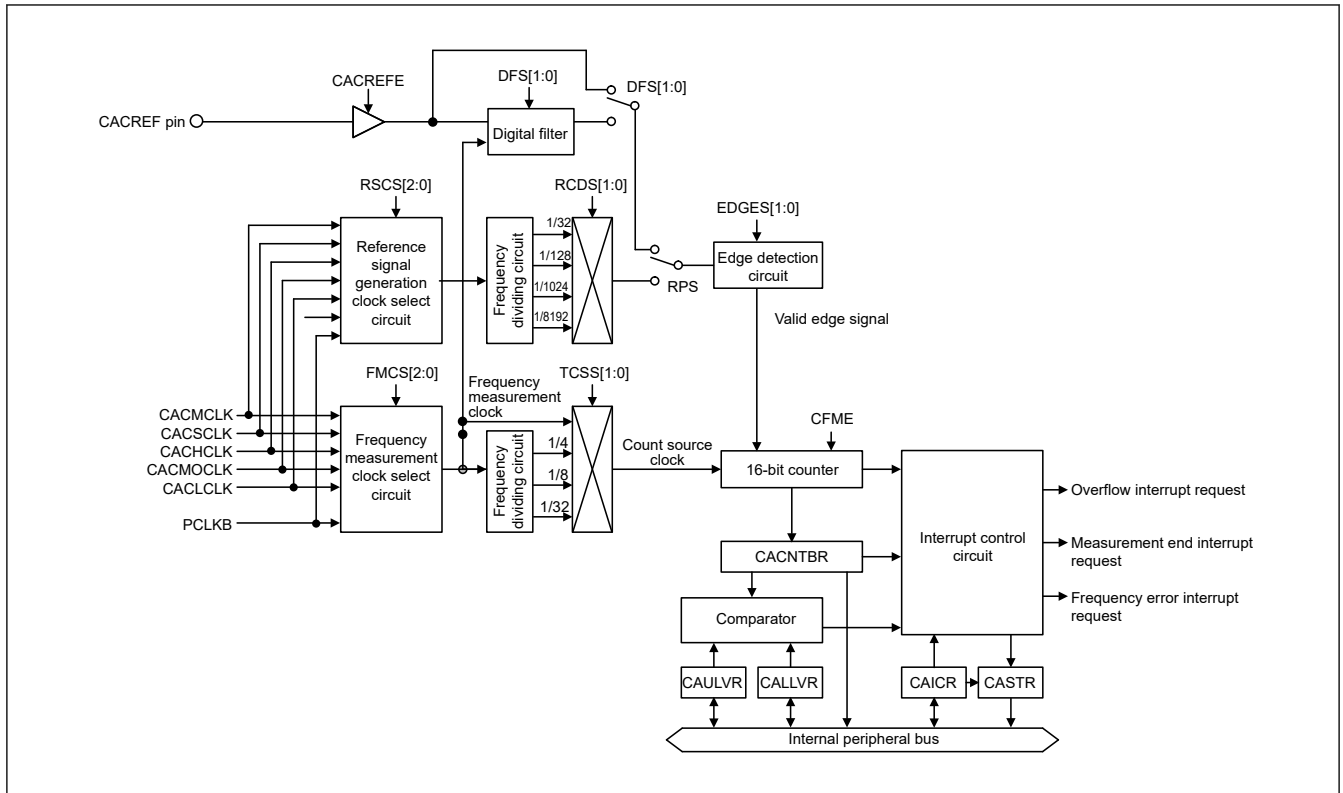

Figure 9.1 CAC block diagram

Table 9.2 CAC I/O pin

Function	Pin name	I/O	Description
CAC	CACREF	Input	Measurement reference clock input pin

9.2 Register Descriptions

9.2.1 CACR0 : CAC Control Register 0

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	CFME

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	CFME	Clock Frequency Measurement Enable 0: Disable 1: Enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

CFME bit (Clock Frequency Measurement Enable)

The CFME bit enables clock frequency measurement. Changes made to this bit are not immediately reflected to the internal circuit. Read the bit to confirm that the change has been reflected.

9.2.2 CACR1 : CAC Control Register 1

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x01

Bit position: 7 6 5 4 3 2 1 0

Bit field:	EDGES[1:0]	TCSS[1:0]	FMCS[2:0]	CACR EFE
------------	------------	-----------	-----------	-------------

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	CACREFE	CACREF Pin Input Enable 0: Disable 1: Enable	R/W
3:1	FMCS[2:0]	Measurement Target Clock Select 0 0 0: Main clock oscillator (CACMCLK) 0 0 1: Sub-clock oscillator (CACSCCLK) 0 1 0: HOCO clock (CACHCLK) 0 1 1: MOCO clock (CACMOCLK) 1 0 0: LOCO clock (CACLCLK) 1 0 1: Peripheral module clock B (PCLKB) 1 1 0: Setting prohibited 1 1 1: Setting prohibited	R/W
5:4	TCSS[1:0]	Timer Count Clock Source Select 0 0: No division 0 1: × 1/4 clock 1 0: × 1/8 clock 1 1: × 1/32 clock	R/W
7:6	EDGES[1:0]	Valid Edge Select 0 0: Rising edge 0 1: Falling edge 1 0: Both rising and falling edges 1 1: Setting prohibited	R/W

Note: S-TYPE3, P-TYPE3

Note: Set the CACR1 register when the CACR0.CFME bit is 0.

CACREFE bit (CACREF Pin Input Enable)

The CACREFE bit enables the CACREF pin input.

FMCS[2:0] bits (Measurement Target Clock Select)

The FMCS[2:0] bits select the measurement target clock whose frequency is to be measured.

TCSS[1:0] bits (Timer Count Clock Source Select)

The TCSS[1:0] bits select the division ratio of the measurement target clock.

EDGES[1:0] bits (Valid Edge Select)

The EDGES[1:0] bits select the valid edge for the reference signal.

9.2.3 CACR2 : CAC Control Register 2

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x02

Bit position: 7 6 5 4 3 2 1 0

Bit field:	DFS[1:0]	RCDS[1:0]	RSCS[2:0]	RPS
------------	----------	-----------	-----------	-----

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	RPS	Reference Signal Select 0: CACREF pin input 1: Internal clock (internally generated signal)	R/W
3:1	RSCS[2:0]	Measurement Reference Clock Select 0 0 0: Main clock oscillator (CACMCLK) 0 0 1: Sub-clock oscillator (CACSCCLK) 0 1 0: HOCO clock (CACHCLK) 0 1 1: MOCO clock (CACMOCLK) 1 0 0: LOCO clock (CACLCLK) 1 0 1: Peripheral module clock B (PCLKB) 1 1 0: Setting prohibited 1 1 1: Setting prohibited	R/W

R/W

Note: S-TYPE3, P-TYPE3

Note: Set the CACR2 register when the CACR0.CFME bit is 0.

RPS bit (Reference Signal Select)

The RPS bit selects whether to use the CACREF pin input or an internal clock (internally generated signal) as the reference signal.

RSCS[2:0] bits (Measurement Reference Clock Select)

The RSCS[2:0] bits select the reference clock for measurement.

RCDS[1:0] bits (Measurement Reference Clock Frequency Division Ratio Select)

The RCDS[1:0] bits select the frequency-divisor of the reference clock for measurement when an internal reference clock is selected. When RPS = 0 (CACREF pin is used as the reference clock source), the reference clock is not divided.

DFS[1:0] bits (Digital Filter Select)

The DFS[1:0] bits enable or disable the digital filter and selects its sampling clock.

9.2.4 CAICR : CAC Interrupt Control Register

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x03

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	OVFF CL	MEND FCL	FERR FCL	—	OVFIE	MEND IE	FERRI E

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	FERRIE	Frequency Error Interrupt Request Enable 0: Disable 1: Enable	R/W
1	MENDIE	Measurement End Interrupt Request Enable 0: Disable 1: Enable	R/W
2	OVFIE	Overflow Interrupt Request Enable 0: Disable 1: Enable	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	FERRFCL	FERRF Clear 0: No effect 1: The CASTR.FERRF flag is cleared	W
5	MENDFCL	MENDF Clear 0: No effect 1: The CASTR.MENDF flag is cleared	W
6	OVFFCL	OVFF Clear 0: No effect 1: The CASTR.OVFF flag is cleared.	W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

FERRIE bit (Frequency Error Interrupt Request Enable)

The FERRIE bit enables or disables the frequency error interrupt request.

MENDIE bit (Measurement End Interrupt Request Enable)

The MENDIE bit enables or disables the measurement end interrupt request.

OVFIE bit (Overflow Interrupt Request Enable)

The OVFIE bit enables or disables the overflow interrupt request.

FERRFCL bit (FERRF Clear)

Setting the FERRFCL bit to 1 clears the CASTR.FERRF flag.

MENDFCL bit (MENDF Clear)

Setting the MENDFCL bit to 1 clears the CASTR.MENDF flag.

OVFFCL bit (OVFF Clear)

Setting the OVFFCL bit to 1 clears the CASTR.OVFF flag.

9.2.5 CASTR : CAC Status Register

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x04

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	OVFF	MEND F	FERR F
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FERRF	Frequency Error Flag 0: Clock frequency is within the allowable range 1: Clock frequency has deviated beyond the allowable range (frequency error).	R
1	MENDF	Measurement End Flag 0: Measurement is in progress 1: Measurement ended	R
2	OVFF	Overflow Flag 0: Counter has not overflowed 1: Counter overflowed	R
7:3	—	These bits are read as 0.	R

Note: S-TYPE3, P-TYPE3

FERRF flag (Frequency Error Flag)

The FERRF flag indicates a deviation of the clock frequency from the set value (frequency error).

[Setting condition]

- The clock frequency is outside the allowable range defined in the CAULVR and CALLVR registers.

[Clearing condition]

- 1 is written to the FERRFCL bit.

MENDF flag (Measurement End Flag)

The MENDF flag indicates the end of measurement.

[Setting condition]

- Measurement ends.

[Clearing condition]

- 1 is written to the MENDFCL bit.

OVFF flag (Overflow Flag)

The OVFF flag indicates that the counter overflowed.

[Setting condition]

- The counter overflows.

[Clearing condition]

- 1 is written to the CAICR.OVFFCL bit.

9.2.6 CAULVR : CAC Upper-Limit Value Setting Register

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x06

Bit position: 15 0

Bit field:

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
15:0	n/a	The Upper Value of the Allowable Range The CAULVR register is a 16-bit read/write register that specifies the upper value of the allowable range. When the counter value exceeds the value specified in this register, a frequency error is detected. Write to this register when the CACR0.CFME bit is 0. The counter value stored in CACNTBR can vary depending on the difference between the phases of the digital filter and edge-detection circuit, and the signal on the CACREF pin. Ensure that this setting allows an adequate margin.	R/W

Note: S-TYPE3, P-TYPE3

9.2.7 CALLVR : CAC Lower-Limit Value Setting Register

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x08

Bit position: 15 0

Bit field:

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
15:0	n/a	The Lower Value of the Allowable Range The CALLVR register is a 16-bit read/write register that specifies the lower value of the allowable range. When the counter value falls below the value specified in this register, a frequency error is detected. Write to this register when the CACR0.CFME bit is 0. The counter value stored in CACNTBR can vary depending on the difference between the phases of the digital filter and edge-detection circuit, and the signal on the CACREF pin. Ensure that this setting allows an adequate margin.	R/W

Note: S-TYPE3, P-TYPE3

9.2.8 CACNTBR : CAC Counter Buffer Register

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x0A

Bit position: 15 0

Bit field:

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
15:0	n/a	The Measurement Result The CACNTBR register is a 16-bit read-only register that stores the measurement result.	R

Note: S-TYPE3, P-TYPE3

9.3 Operation

9.3.1 Measuring Clock Frequency

The CAC measures the clock frequency using the CACREF pin input or an internal clock as a reference. Figure 9.2 shows an operating example of the CAC.

Figure 9.2 CAC operating example

The events in Figure 9.2 are:

1. When the CACREF pin input is used as reference (CACR1.CACREFE = 1), frequency measurement is enabled by writing 1 to the CACR0.CFME bit while the CACR2.RPS bit is set to 0 and the CACR1.CACREFE bit is set to 1. When the internal clock is used as reference (CACR1.CACREFE = 0), frequency measurement is enabled by writing 1 to the CACR0.CFME bit while the CACR2.RPS bit is set to 1.
2. When the CACREF pin input is used as reference, after 1 is written to the CFME bit, the timer starts up-counting if the valid edge selected by the CACR1.EDGES[1:0] bits (rising edge (CACR1.EDGES[1:0] = 00b) in Figure 9.2) is input from the CACREF pin. When the internal clock is used as reference, after 1 is written to the CFME bit, the timer starts up-counting if the valid edge selected by the CACR1.EDGES[1:0] bits (rising edge (CACR1.EDGES[1:0] = 00b) in Figure 9.2) is input based on the clock source selected by the CACR2.RSCS[2:0] bits.
3. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If both $CACNTBR \leq CAULVR$ and $CACNTBR \geq CALLVR$ are true, only the MENDF flag in CASTR is set to 1, because the clock frequency is correct. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
4. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If $CACNTBR > CAULVR$, the FERRF flag in CASTR is set to 1, because the clock frequency is erroneous. If the FERRIE bit in CAICR is 1, a frequency error interrupt is generated. The MENDF flag in CASTR is set to 1 at the end of measurement. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
5. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If $CACNTBR < CALLVR$, the FERRF flag in CASTR is set to 1, because the clock frequency

is erroneous. If the FERRIE bit in CAICR is 1, a frequency error interrupt is generated. The MENDF flag in CASTR is set to 1 at the end of measurement. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.

6. When the CFME bit in CACR0 is 1, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR every time a valid edge is input. Writing 0 to the CFME bit in CACR0 clears the counter and stops up-counting.

9.3.2 Digital Filtering of Signals on CACREF Pin

The CACREF pin has a digital filter, and levels on the CACREF pin are transmitted to the internal circuitry after three consecutive matches in the selected sampling interval. The same level continues to be transmitted internally until the level on the pin has three consecutive matches again. Enabling or disabling of the digital filter and its sampling clock are selectable.

The counter value transferred to CACNTBR might be in error by up to 1 cycle of the sampling clock because of the difference between the phases of the digital filter and the signal input to the CACREF pin. When a frequency dividing clock is selected as a count source clock, the counter value error is obtained using the following formula:

$$\text{Counter value error} = (1 \text{ cycle of the count source clock}) / (1 \text{ cycle of the sampling clock})$$

9.4 Interrupt Requests

The CAC generates three types of interrupt requests:

- Frequency error interrupt
- Measurement end interrupt
- Overflow interrupt

When an interrupt source is generated, the associated status flag is set to 1. [Table 9.3](#) provides information on the CAC interrupt requests.

Table 9.3 CAC interrupt requests

Interrupt request	Interrupt enable bit	Status flag	Interrupt sources
Frequency error interrupt	CAICR.FERRIE	CASTR.FERRF	The result of comparing CACNTBR with CAULVR and CALLVR is either CACNTBR > CAULVR or CACNTBR < CALLVR
Measurement end interrupt	CAICR.MENDIE	CASTR.MENDF	<ul style="list-style-type: none"> • Valid edge is input from the CACREF pin or internal clock • Measurement end interrupt does not occur at the first valid edge after writing 1 to the CACR0.CFME bit
Overflow interrupt	CAICR.OVFIE	CASTR.OVFF	Counter overflows

9.5 Usage Notes

9.5.1 Settings for the Module-Stop Function

The Module Stop Control Register C (MSTPCRC) can enable or disable CAC operation. The CAC module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see [section 10, Low Power Modes](#).

10. Low Power Modes

10.1 Overview

The MCU has several functions for reducing power consumption, such as setting clock dividers, EBCLK output control, SDCLK output control, stopping modules, power gating control, selecting operating power control mode in Normal mode, and transitioning to low power modes.

[Table 10.1](#) lists the specifications of the low power mode functions. [Table 10.2](#) to [Table 10.4](#) lists the conditions to transition to low power modes, the states of the CPU and peripheral modules, and the method for canceling each mode. After a reset, the MCU enters the program execution state, but only the DMAC, DTC and SRAM operate.

Table 10.1 Specifications of the low power mode functions

Item	Specification
Reducing power consumption by switching clock signals	The frequency division ratio can be selected independently for the CPU clock (CPUCLK), system clock (ICLK), peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD, PCLKE), external bus clock (BCLK), and flash interface clock (FCLK). *1
EBCLK output control	BCLK output or high-level output can be selected. *1
SDCLK output control	SDCLK output or high-level output can be selected.
Module stop	Functions can be stopped independently for each peripheral module
Power gating control	This function can be controlled the power state of the power domain. <ul style="list-style-type: none"> Control the turning On/OFF for the power domain Control the retention of specific circuits during power gating
Processor low power modes	<ul style="list-style-type: none"> CPU Sleep mode CPU Deep Sleep mode
Low-power modes	<ul style="list-style-type: none"> Software Standby mode*2 Deep Software Standby mode 1, 2, 3*2
Operating power control modes	<ul style="list-style-type: none"> Power consumption can be reduced in Normal and Processor low power mode by selecting an appropriate operating power control mode according to the operating frequency. Two operating power control modes are available: <ul style="list-style-type: none"> High-speed mode Low-speed mode*2
TrustZone Filter	Security and Privilege attribution can be set

Note 1. For details, see [section 8, Clock Generation Circuit](#)

Note 2. This mode is not supported in external VDD mode.

Table 10.2 Operating state of processor low power mode

Item	CPU Sleep mode	CPU Deep Sleep mode
Transition condition	WFI instruction after set CPU0.SCR. SLEEPDEEP = 0.	WFI instruction after set CPU0.SCR. SLEEPDEEP = 1
Canceling method	All interrupts. Any reset available in the mode.	Interrupts shown in Table 10.4 Any reset available in the mode.
State after cancellation by an interrupt	Program execution state (interrupt processing)	Program execution state (interrupt processing)
State after cancellation by a reset	Reset state	Reset state

Watchdog Timer (WDT)	Selectable*1	Selectable*1
Independent Watchdog Timer (IWDT)	Selectable*1	Selectable*1
ARM Debug function	Stop*2	Stop*2
Trace function	Stop*3	Stop*3
Other peripheral modules	—	—

Note: Selectable means that operating or not operating can be selected by setting the control registers before entering Processor Low Power Mode.

Stop (Retained) means that the contents of the internal registers are retained but the operations are suspended.

Stop (Undefined) means that the contents of the internal registers are undefined and power to the internal circuit is cut off.
 “ — ” means that the operation is not affected.

Note 1. In IWDT, operating or stopping is selected by setting the IWDT Stop Control bit (IWDTSTPCTL) in Option Function Select register 0 (OFS0) in IWDT auto start mode.

In WDT, operating or stopping is selected by setting the WDT Stop Control bit (WDTSTPCTL) in Option Function Select Register 0 (OFS0) in WDT auto start mode. Also, operating or stopping is selected by setting the WDT.WDTCSTPR.SLCSTP bit in WDT register start mode.

Note 2. This function is operating if debugger is connecting (DBGSTR.CDBGPWRUPREQ = 1 and SYOCDRCR.DBGEN = 1) before entering this mode.

Note 3. This function is operating if debugger is connecting (DBGSTR.CDBGPWRUPREQ = 1 and SYOCDRCR.DBGEN = 1) and TRCKCR.TRCKEN = 1 before entering this mode.

Power-on reset circuit	Operating	Operating	Operating	Operating* ⁸
I/O Ports	Retained* ⁹	Retained* ⁹		

Note: Selectable means that operating or not operating can be selected by setting the control registers before low power mode.

Stop (Retained) means that the contents of the internal registers are retained but the operations are suspended.

Stop (Undefined) means that the contents of the internal registers are undefined and power to the internal circuit is cut off. After canceling from each low power mode, the internal registers are initialized.

- Note 1. In IWDT, operating or stopping is selected by setting the IWDT Stop Control bit (IWDTSTPCTL) in Option Function Select register 0 (OFS0) in IWDT auto start mode. Also, operating or stopping is selected by setting the IWDT.IWDTCSTPR.SLCSTP bit in IWDT register start mode.
- Note 2. If IWDT is not used and LOCOCR.LCSTP = 0, LOCO is not stopped in Software Standby mode or Deep Software Standby mode 1. If IWDT is used and IWDT Stop Control bit is 0 (OFS.IWDTSTPCTL = 0 or IWDT.IWDTCSTPR.SLCSTP = 0), LOCO is not stopped regardless the value of LOCOCR.LCSTP in Software Standby mode or Deep Software Standby mode 1. If IWDT is used and IWDT Stop Control bit is 1 (OFS.IWDTSTPCTL = 1 or IWDT.IWDTCSTPR.SLCSTP = 1), LOCO is not stopped with LOCOCR.LCSTP = 0 in Software Standby mode or Deep Software Standby mode 1. In other cases, LOCO is stopped in Software Standby mode or Deep Software Standby mode 1.
- Note 3. Stopped when the clock output source select bits (CKOCR.CKOSEL[2:0]) are set to a value other than 010b (LOCO) and 100b (SOSC).
- Note 4. Only sub clock oscillator can be selected as the count source clock for RTC. When the RCR4.RCKSEL bit set to 1 (LOCO), the LPSCR must set to Deep Software Standby mode 1 before entering Deep Software Standby mode.
- Note 5. AGT0 operation is possible when 100b (AGTLCLK) or 110b (AGTSClk) is selected by the AGT0.AGTMR1.TCK[2:0] bits.

AGT1 operation is possible when 100b (AGTLCLK), 110b (AGTSCLK) or 101b (Underflow event signal from AGT0) is selected by the AGT1.AGTM1.TCK[2:0] bits.

keeping the output state or changing to the

Note 6. Only IIC0 wakeup function is available.

Note 7. When using PVD in Deep Software Standby mode, LPSCR must be set to DSTBY1 or DSTBY2 before entering Deep Software Standby mode.

Note 8. When the MCU enters Deep Software Standby mode 3, the PVD circuit stops and the low-power function of the power-on reset circuit is enabled.

Note 9. For SRAM: [A00 to A23, CS0 to CS7, RD, WR0, WR1, WR, BC0, BC1 and ALE], and for SDRAM: [A00 to A16, DQM0, DQM1, SDCS, RAS, CAS, WE and CKE].

Note 10. When MOSCSCR.MOSCSOKP = 1 while MOSC is oscillated, MOSC continues to oscillate in Software Standby mode.

Note 11. When HOCOSCR.HOCOSOKP = 1 while HOCO is oscillated, HOCO continues to oscillate in Software Standby mode.

Note 12. The function is depending on the setting value of the MOSCSCR.MOSCSOKP bit.

Note 13. If PDRAMSCR0.RKEEPn bit is set to 0, the contents of the target User SRAM is not retained.

Note 14. If DPSBYCR.SRKEEP bit is set to 0, the contents of Standby RAM is not retained.

Note 15. If PDRAMSCR1.RKEEPn bit is set to 0, the contents of the target TCM is not retained.

Note 16. This function is operating if debugger is connecting before entering this mode.

Note 17. This function is operating if debugger is connecting and TRCKCR.TRCKEN = 1 before entering this mode.

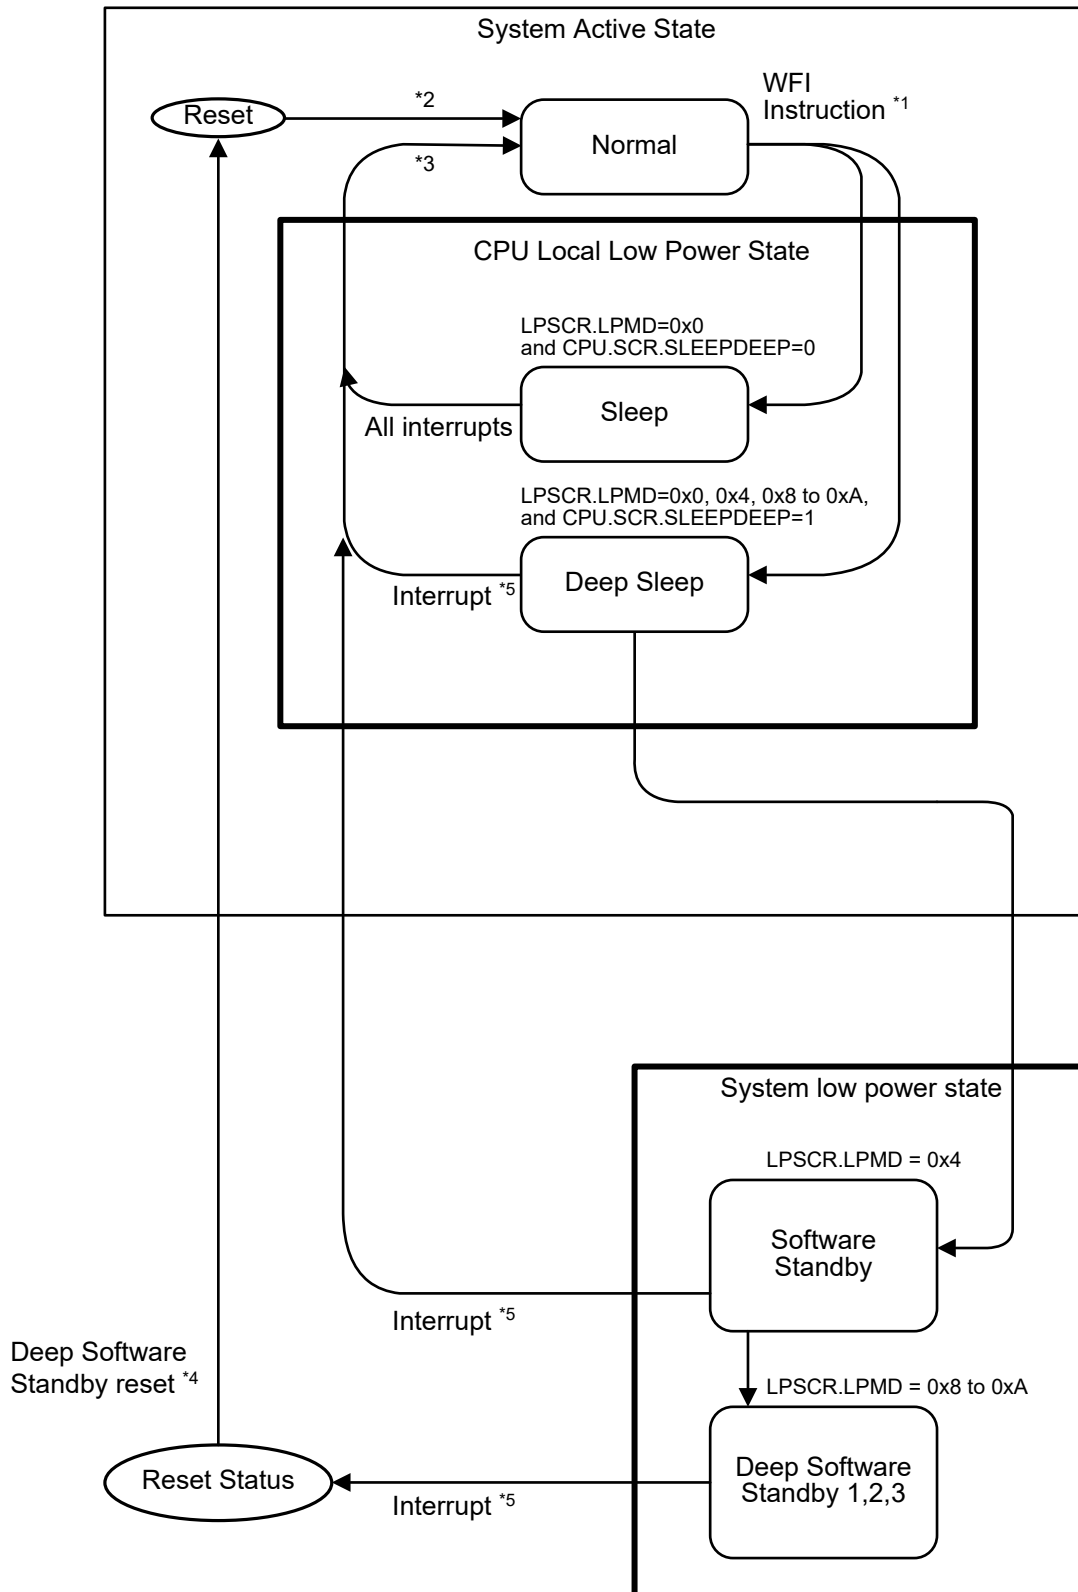

Note 18. When OFS1(_SEC).PVDAS = 0 and OFS1(_SEC).PVDLPSEL = 0, low power consumption function of PVD0 is enabled during DSTBY1 and DSTBY2. When OFS1(_SEC).PVDAS = 0 and OFS1(_SEC).PVDLPSEL = 1, low power consumption function of PVD0 is disabled during DSTBY1 and DSTBY2. See [section 51, Electrical Characteristics](#).

Note 19. When the on-chip debugger function is valid, MOCO does not stop in this mode.

Note 20. Only VCOOUT function is permitted. The VCOOUT pin operates when ACMPHS uses no digital filter. For details on digital filter, see [section 43, High-Speed Analog Comparator \(ACMPHS\)](#).

Table 10.4 Interrupt source for canceling CPU Deep Sleep, Software Standby and Deep Software Standby modes

Interrupt source	Name	CPU Deep Sleep Mode	Software Standby Mode	Deep Software Standby mode		
				DSTBY1	DSTBY2	DSTBY3

BBF (Battery Backup Function)	VBATT_TADI	Yes	Yes	Yes	Yes	Yes

Note 1. When an interrupt as a trigger for cancel is received during a transition to the program-stopped state after the execution of a WFI instruction, the MCU executes interrupt exception handling instead of transitioning to low power mode. When entering to Deep Software Standby mode, if an interrupt occurs after the state has transitioned, after mode transition is completed, returning with Deep Software Standby reset.

- Note 2. The MOCO clock is the source of the operating clock following a transition from the reset state to Normal mode.
- Note 3. When the transition to Normal mode is done because of an interrupt from CPU Sleep mode, CPU Deep Sleep mode or Software Standby mode, the clock source is the same as before entering the each low power modes.
- Note 4. When an available interrupt request is generated, an internal reset (Deep Software Standby reset) is generated over a fixed period. Canceling of Deep Software Standby mode accompanies release from the internal reset state, and then the MCU transitions to Normal mode and executes reset exception processing with the MOCO clock as the source of the operating clock.
- Note 5. For interrupt sources for canceling each low power modes, see [Table 10.4](#)

Figure 10.1 Mode Transitions

10.2 Register Descriptions

10.2.1 LPMSAR : Low Power Mode Security Attribution Register

Base address: SYSC = 0x4001_E000
 SYSC_NS = 0x5001_E000

Offset address: 0x3C8

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	NONS EC21	—	NONS EC19	NONS EC18	NONS EC17	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	NONS EC8	—	—	—	—	—	NONS EC2	NONS EC1	NONS EC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NONSEC0	Non-secure Attribute bit 0 Target register: OPCCR 0: Secure 1: Non-secure	R/W
1	NONSEC1	Non-secure Attribute bit 1 Target register: LPSCR, DPSWCR 0: Secure 1: Non-secure	R/W
2	NONSEC2	Non-secure Attribute bit 2 Target register: SBYCR, SSCR1 0: Secure 1: Non-secure	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W
8	NONSEC8	Non-secure Attribute bit 8 Target register: DPSBYCR 0: Secure 1: Non-secure	R/W
16:9	—	These bits are read as 0. The write value should be 0.	R/W
17	NONSEC17	Non-secure Attribute bit 17 Target register: HOCOLDOCR 0: Secure 1: Non-secure	R/W
18	NONSEC18	Non-secure Attribute bit 18 Target register: PLL1LDOCR 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
19	NONSEC19	Non-secure Attribute bit 19 Target register: PLL2LDOCR 0: Secure 1: Non-secure	R/W
20	—	This bit is read as 0. The write value should be 0.	R/W
21	NONSEC21	Non-secure Attribute bit 21 Target register: LVOCR 0: Secure 1: Non-secure	R/W
31:22	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

Note: Set the PRCR.PRC4 bit to 1 (write enabled) before rewriting this register.

The LPMSAR register controls the secure attribute of Low Power Mode registers.

NONSEC0 bit (Non-secure Attribute bit 0)

This bit controls the security attribute of OPCCR.

NONSEC1 bit (Non-secure Attribute bit 1)

This bit controls the security attribute of LPSCR, DPSECR.

NONSEC2 bit (Non-secure Attribute bit 2)

This bit controls the security attribute of SBYCR, SSCR1.

NONSEC8 bit (Non-secure Attribute bit 8)

This bit controls the security attribute of DPSBYCR.

NONSEC17 bit (Non-secure Attribute bit 17)

This bit controls the security attribute of HOCOLDOCR.

NONSEC18 bit (Non-secure Attribute bit 18)

This bit controls the security attribute of PLL1LDOCR.

NONSEC19 bit (Non-secure Attribute bit 19)

This bit controls the security attribute of PLL2LDOCR.

NONSEC21 bit (Non-secure Attribute bit 21)

This bit controls the security attribute of LVOCR.

10.2.2 PGCSAR : Power Gating Control Security Attribution Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x3D8

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	NONS EC1	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W
1	NONSEC1	Non-secure Attribute bit 1 Target register: PDCTRGD 0: Secure 1: Non-secure	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

Note: Set the PRCR.PRC4 bit to 1 (write enabled) before rewriting this register.

The PGCSAR register controls the secure attribute of power gating registers.

NONSEC1 bit (Non-secure Attribute bit 1)

This bit controls the security attribute of PDCTRGD.

10.2.3 DPFSAR : Deep Software Standby Interrupt Factor Security Attribution Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x3E0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	DPFS A31	—	DPFS A29	—	DPFS A27	DPFS A26	—	DPFS A24	—	—	—	DPFS A20	DPFS A19	DPFS A18	DPFS A17	DPFS A16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DPFS A15	DPFS A14	DPFS A13	DPFS A12	DPFS A11	DPFS A10	DPFS A9	DPFS A8	DPFS A7	DPFS A6	DPFS A5	DPFS A4	DPFS A3	DPFS A2	DPFS A1	DPFS A0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	DPFSA7 to DPFSA0	Deep Software Standby Interrupt Factor Security Attribute bit n (n = 0 to 7) Target register: DPSIER0.bn, DPSIFR0.bn, DPSIEGR0.bn (n = 0 to 7) Target factor : IRQn-DS Pin (n = 0 to 7) 0: Secure 1: Non-secure	R/W
15:8	DPFSA15 to DPFSA8	Deep Software Standby Interrupt Factor Security Attribute bit n (n = 8 to 15) Target register: DPSIER1.bn, DPSIFR1.bn, DPSIEGR1.bn (n = 0 to 7) Target factor : IRQn-DS Pin (n = 8 to 15) 0: Secure 1: Non-secure	R/W
16	DPFSA16	Deep Software Standby Interrupt Factor Security Attribute bit 16 Target register: DPSIER2.b0, DPSIFR2.b0, DPSIEGR2.b0 Target factor : PVD1 0: Secure 1: Non-secure	R/W
17	DPFSA17	Deep Software Standby Interrupt Factor Security Attribute bit 17 Target register: DPSIER2.b1, DPSIFR2.b1, DPSIEGR2.b1 Target factor : PVD2 0: Secure 1: Non-secure	R/W
18	DPFSA18	Deep Software Standby Interrupt Factor Security Attribute bit 18 Target register: DPSIER2.b2, DPSIFR2.b2 Target factor : RTC Interval 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
19	DPFSA19	Deep Software Standby Interrupt Factor Security Attribute bit 19 Target register: DPSIER2.b3, DPSIFR2.b3 Target factor : RTC Alarm 0: Secure 1: Non-secure	R/W
20	DPFSA20	Deep Software Standby Interrupt Factor Security Attribute bit 20 Target register: DPSIER2.b4, DPSIFR2.b4, DPSIEGR2.b4 Target factor : NMI Pin 0: Secure 1: Non-secure	R/W
23:21	—	These bits are read as 0. The write value should be 0.	R/W
24	DPFSA24	Deep Software Standby Interrupt Factor Security Attribute bit 24 Target register: DPSIER3.b0, DPSIFR3.b0 Target factor : USBFS Suspend/Resume 0: Secure 1: Non-secure	R/W
25	—	This bit is read as 0. The write value should be 0.	R/W
26	DPFSA26	Deep Software Standby Interrupt Factor Security Attribute bit 26 Target register: DPSIER3.b2, DPSIFR3.b2 Target factor : ULPT0 0: Secure 1: Non-secure	R/W
27	DPFSA27	Deep Software Standby Interrupt Factor Security Attribute bit 27 Target register: DPSIER3.b3, DPSIFR3.b3 Target factor : ULPT1 0: Secure 1: Non-secure	R/W
28	—	This bit is read as 0. The write value should be 0.	R/W
29	DPFSA29	Deep Software Standby Interrupt Factor Security Attribute bit 29 Target register: DPSIER3.b5, DPSIFR3.b5 Target factor : IWDT Underflow 0: Secure 1: Non-secure	R/W
30	—	This bit is read as 0. The write value should be 0.	R/W
31	DPFSA31	Deep Software Standby Interrupt Factor Security Attribute bit 31 Target register: DPSIER3.b7, DPSIFR3.b7 Target factor : Tamper Detection 0: Secure 1: Non-secure	R/W

Note: S-TYPE-1, P-TYPE-1

Note: Set the PRCR.PRC4 bit to 1 (write enabled) before rewriting this register.

The DPFSAR register controls the secure attribute of Deep Software Standby Interrupt Factor control registers.

DPFSA bit (Deep Software Standby Interrupt Factor Security Attribute bit n (n = 0 to 7))

This bit controls the security attribute of DPSIER0.bn, DPSIFR0.bn, DPSIEGR0.bn (n = 0 to 7) .

Target factor is IRQn-DS Pin (n = 0 to 7).

DPFSA bit (Deep Software Standby Interrupt Factor Security Attribute bit n (n = 8 to 15))

This bit controls the security attribute of DPSIER1.bn, DPSIFR1.bn, DPSIEGR1.bn (n = 0 to 7) .

Target factor is IRQn-DS Pin (n = 8 to 15).

DPFSA16 bit (Deep Software Standby Interrupt Factor Security Attribute bit 16)

This bit controls the security attribute of DPSIER2.b0, DPSIFR2.b0, DPSIEGR2.b0 .

Target factor is PVD1.

DPFSA17 bit (Deep Software Standby Interrupt Factor Security Attribute bit 17)

This bit controls the security attribute of DPSIER2.b1, DPSIFR2.b1, DPSIEGR2.b1.

Target factor is PVD2.

DPFSA18 bit (Deep Software Standby Interrupt Factor Security Attribute bit 18)

This bit controls the security attribute of DPSIER2.b2, DPSIFR2.b2.

Target factor is RTC Interval.

DPFSA19 bit (Deep Software Standby Interrupt Factor Security Attribute bit 19)

This bit controls the security attribute of DPSIER2.b3, DPSIFR2.b3.

Target factor is RTC Alarm.

DPFSA20 bit (Deep Software Standby Interrupt Factor Security Attribute bit 20)

This bit controls the security attribute of DPSIER2.b4, DPSIFR2.b4, DPSIEGR2.b4.

Target factor is NMI Pin.

DPFSA24 bit (Deep Software Standby Interrupt Factor Security Attribute bit 24)

This bit controls the security attribute of DPSIER3.b0, DPSIFR3.b0.

Target factor is USBFS Suspend/Resume.

DPFSA26 bit (Deep Software Standby Interrupt Factor Security Attribute bit 26)

This bit controls the security attribute of DPSIER3.b2, DPSIFR3.b2.

Target factor is ULPT0.

DPFSA27 bit (Deep Software Standby Interrupt Factor Security Attribute bit 27)

This bit controls the security attribute of DPSIER3.b3, DPSIFR3.b3.

Target factor is ULPT1.

DPFSA29 bit (Deep Software Standby Interrupt Factor Security Attribute bit 29)

This bit controls the security attribute of DPSIER3.b5, DPSIFR3.b5.

Target factor is IWDT Underflow.

DPFSA31 bit (Deep Software Standby Interrupt Factor Security Attribute bit 31)

This bit controls the security attribute of DPSIER3.b7, DPSIFR3.b7.

Target factor is Tamper Detection.

10.2.4 RSCSAR : RAM Standby Control Security Attribution Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x3E4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RSCS A16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	RSCS A6	RSCS A5	RSCS A4	RSCS A3	RSCS A2	RSCS A1	RSCS A0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	RSCSA1 to RSCSA0	Unnecessary Circuit Control Security Attribution bit n (n = 0 to 1) Target register: PDRAMSCR0.bn (n = 0 to 1) 0: Secure 1: Non-secure	R/W
6:2	RSCSA6 to RSCSA2	RAM Standby Control Security Attribute bit n (n = 2 to 6) Target register: PDRAMSCR0.bn (n = 2 to 6) 0: Secure 1: Non-secure	R/W
15:7	—	These bits are read as 0. The write value should be 0.	R/W
16	RSCSA16	RAM Standby Control Security Attribute bit n (n = 16) Target register: PDRAMSCR1.bn (n = 0) 0: Secure 1: Non-secure	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

Note: Set the PRCR.PRC4 bit to 1 (write enabled) before rewriting this register.

The RSCSAR register controls the secure attribute of RAM Standby Control registers.

RSCSAn (n = 0 to 1) bit (Unnecessary Circuit Control Security Attribution bit n)

This bit controls the security attribute of PDRAMSCR0.bn (n = 0 to 1).

RSCSAn (n = 2 to 6) bit (RAM Standby Control Security Attribute bit n)

This bit controls the security attribute of PDRAMSCR0.bn (n = 2 to 6).

RSCSAn (n = 16) bit (RAM Standby Control Security Attribute bit n)

This bit controls the security attribute of PDRAMSCR1.bn (n = 0).

10.2.5 MSTPCRA : Module Stop Control Register A

Base address: MSTP = 0x4020_3000
MSTP_NS = 0x5020_3000

Offset address: 0x000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	MSTP A22	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	0	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	MSTP A15	—	—	—	—	—	—	—	—	—	—	—	—	—	MSTP A1	MSTP A0
Value after reset:	0	1	1	1	1	1	1	1	1	1	1	1	1	1	0	0

Bit	Symbol	Function	R/W
0	MSTPA0	SRAM0 Module Stop*2 Target module: SRAM0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
1	MSTPA1	SRAM1 Module Stop*2 Target module: SRAM1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
14:2	—	These bits are read as 1. The write value should be 1.	R/W

Bit	Symbol	Function	R/W
15	MSTPA15	Standby SRAM Module Stop Target module: Standby SRAM 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
21:16	—	These bits are read as 1. The write value should be 1.	R/W
22	MSTPA22	DMA Controller and Data Transfer Controller Module Stop ^{*1} Target module: DMAC, DTC 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
31:23	—	These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-4, P-TYPE-2

Note 1. When rewriting the MSTPA22 bit from 0 to 1, disable the DMAC and DTC before setting the MSTPA22 bit.

Note 2. When changing the value of this bit, only execute subsequent instructions after reading this bit to check that the value was updated.

10.2.6 MSTPCRB : Module Stop Control Register B

Base address: MSTP = 0x4020_3000
MSTP_NS = 0x5020_3000

Offset address: 0x004

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	MSTP B31	MSTP B30	MSTP B29	MSTP B28	MSTP B27	—	—	—	—	MSTP B22	—	—	MSTP B19	MSTP B18	—	MSTP B16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	MSTP B11	—	MSTP B9	MSTP B8	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
7:0	—	These bits are read as 1. The write value should be 1.	R/W
8	MSTPB8	I ² C Bus Interface 1 Module Stop Target module: IIC1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
9	MSTPB9	I ² C Bus Interface 0 Module Stop Target module: IIC0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
10	—	This bit is read as 1. The write value should be 1.	R/W
11	MSTPB11	Universal Serial Bus 2.0 FS Interface Module Stop ^{*1} Target module: USBFS 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
15:12	—	These bits are read as 1. The write value should be 1.	R/W
16	MSTPB16	Octal Serial Peripheral Interface Module Stop ^{*2} Target module: OSPI 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
17	—	This bit is read as 1. The write value should be 1.	R/W
18	MSTPB18	Serial Peripheral Interface 1 Module Stop ^{*3} Target module: SPI1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W

Bit	Symbol	Function	R/W
19	MSTPB19	Serial Peripheral Interface 0 Module Stop* ³ Target module: SPI0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
21:20	—	These bits are read as 1. The write value should be 1.	R/W
22	MSTPB22	Serial Communication Interface 9 Module Stop* ⁴ Target module: SCI9 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
26:23	—	These bits are read as 1. The write value should be 1.	R/W
27	MSTPB27	Serial Communication Interface 4 Module Stop* ⁴ Target module: SCI4 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
28	MSTPB28	Serial Communication Interface 3 Module Stop* ⁴ Target module: SCI3 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
29	MSTPB29	Serial Communication Interface 2 Module Stop* ⁴ Target module: SCI2 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
30	MSTPB30	Serial Communication Interface 1 Module Stop* ⁴ Target module: SCI1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
31	MSTPB31	Serial Communication Interface 0 Module Stop* ⁴ Target module: SCI0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W

Note: S-TYPE-4, P-TYPE-4

- Note 1. The MSTPB_i bit must be written while the oscillation of the clock controlled by this bit is stabilized. For entering Software Standby mode after writing the MSTPB_i bit, wait for two USB clock (USBCLK) cycles after writing, and then execute a WFI instruction (i = 11 to 12).
- Note 2. The MSTPB₁₆ bit must be written while the oscillation of the clock controlled by this bit is stabilized. For entering Software Standby mode after writing the MSTPB₁₆ bit, wait for two Octal-SPI clock (OCTACLK) cycles after writing, and then execute a WFI instruction. When changing the value of this bit, only execute subsequent instructions after reading this bit to check that the value was updated.
- Note 3. The MSTPB_i bit must be written while the oscillation of the clock controlled by this bit is stabilized. For entering Software Standby mode after writing the MSTPB_i bit, wait for two SPI clock (SPICLK) cycles after writing, and then execute a WFI instruction (i = 18 to 19).
- Note 4. The MSTPB_i bit must be written while the oscillation of the clock controlled by this bit is stabilized. For entering Software Standby mode after writing the MSTPB_i bit, wait for two SCI clock (SCICLK) cycles after writing, and then execute a WFI instruction (i = 22, 27 to 31).

10.2.7 MSTPCRC : Module Stop Control Register C

Base address: MSTP = 0x4020_3000
 MSTP_NS = 0x5020_3000

Offset address: 0x008

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	MSTP C31	—	—	—	MSTP C27	MSTP C26	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	MSTP C14	MSTP C13	—	—	—	—	MSTP C8	MSTP C7	MSTP C6	—	MSTP C4	—	—	MSTP C1	MSTP C0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	MSTPC0	Clock Frequency Accuracy Measurement Circuit Module Stop* ¹ Target module: CAC 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
1	MSTPC1	Cyclic Redundancy Check Calculator Module Stop Target module: CRC 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
3:2	—	These bits are read as 1. The write value should be 1.	R/W
4	MSTPC4	Graphics LCD Controller Module Stop* ² Target module: GLCDC 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
5	—	This bit is read as 1. The write value should be 1.	R/W
6	MSTPC6	2D Drawing Engine Module Stop Target module: DRW 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
7	MSTPC7	Serial Sound Interface Enhanced 1 Module Stop Target module: SSIE1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
8	MSTPC8	Serial Sound Interface Enhanced 0 Module Stop Target module: SSIE0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
12:9	—	These bits are read as 1. The write value should be 1.	R/W
13	MSTPC13	Data Operation Circuit Module Stop Target module: DOC 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
14	MSTPC14	Event Link Controller Module Stop Target module: ELC 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
25:15	—	These bits are read as 1. The write value should be 1.	R/W
26	MSTPC26	Controller Area Network with Flexible Data-Rate 1 Module Stop* ³ Target module: CANFD1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W

Bit	Symbol	Function	R/W
27	MSTPC27	Controller Area Network with Flexible Data-Rate 0 Module Stop ^{*3} Target module: CANFD0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
30:28	—	These bits are read as 1. The write value should be 1.	R/W
31	MSTPC31	Renesas Secure IP Module Stop Target module: RSIP-E51A 0: Cancel the module-stop state 1: Enter the module-stop state	R/W

Note: S-TYPE-4, P-TYPE-4

Note 1. The MSTPC0 bit must be written while the oscillation of the clock to be controlled by this bit is stable. To enter Software Standby mode after writing this bit, wait for 2 cycles of the slowest clock from the clocks output by the oscillators, then execute a WFI instruction.

Note 2. The MSTPC4 bit must be written while the oscillation of the clock controlled by this bit is stabilized. For entering Software Standby mode after writing the MSTPC4 bit, wait for two GLCDC clock (GLCDCCLK) cycles after writing, and then execute a WFI instruction.

Note 3. The MSTPCi bit must be written while the oscillation of the clock controlled by this bit is stabilized. For entering Software Standby mode after writing the MSTPCi bit, wait for two CANFD clock (CANFDCLK) cycles after writing, and then execute a WFI instruction(i = 26 to 27)

10.2.8 MSTPCRD : Module Stop Control Register D

Base address: MSTP = 0x4020_3000
MSTP_NS = 0x5020_3000

Offset address: 0x00C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	MSTP D28	MSTP D27	—	—	—	—	MSTP D22	—	MSTP D20	—	—	—	MSTP D16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

26:23	—	These bits are read as 1. The write value should be 1.	R/W
27	MSTPD27	High-Speed Analog Comparator 1 Module Stop Target module: ACMPHS1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
28	MSTPD28	High-Speed Analog Comparator 0 Module Stop Target module: ACMPHS0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
31:29	—	These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-4, P-TYPE-4

Note 1. When the count source is sub-clock oscillator or LOCO, AGTn counting does not stop even if MSTPDi is set to 1. If the count source is the sub-clock oscillator or LOCO, this bit must be set to 1 except when accessing the AGTn registers. (n = 0, 1) (i = 4, 5)

10.2.9 MSTPCRE : Module Stop Control Register E

Base address: MSTP = 0x4020_3000
MSTP_NS = 0x5020_3000

Offset address: 0x010

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	MSTP E31	MSTP E30	MSTP E29	MSTP E28	MSTP E27	MSTP E26	—	—	—	—	MSTP E21	MSTP E20	MSTP E19	MSTP E18	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	MSTP E9	MSTP E8	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
7:0	—	These bits are read as 1. The write value should be 1.	R/W
8	MSTPE8	Ultra-Low Power Timer 1 Module Stop* ¹ Target module: ULPT1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
9	MSTPE9	Ultra-Low Power Timer 0 Module Stop* ¹ Target module: ULPT0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
17:10	—	These bits are read as 1. The write value should be 1.	R/W
18	MSTPE18	General PWM Timer 13 Module* ² Target module: GPT13 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
19	MSTPE19	General PWM Timer 12 Module* ² Target module: GPT12 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
20	MSTPE20	General PWM Timer 11 Module* ² Target module: GPT11 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
21	MSTPE21	General PWM Timer 10 Module* ² Target module: GPT10 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
25:22	—	These bits are read as 1. The write value should be 1.	R/W
26	MSTPE26	General PWM Timer 5 Module* ² Target module: GPT5 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
27	MSTPE27	General PWM Timer 4 Module* ² Target module: GPT4 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
28	MSTPE28	General PWM Timer 3 Module* ² Target module: GPT3 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
29	MSTPE29	General PWM Timer 2 Module* ² Target module: GPT2 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
30	MSTPE30	General PWM Timer 1 Module* ² Target module: GPT1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
31	MSTPE31	General PWM Timer 0 Module* ² Target module: GPT0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W

Note: S-TYPE-4, P-TYPE-4

Note 1. When the count source is sub-clock oscillator or LOCO, ULPTn counting does not stop even if MSTPEi is set to 1. If the count source is the sub-clock oscillator or LOCO, this bit must be set to 1 except when accessing the ULPTn registers. (n = 1, 0) (i = 8, 9)

Note 2. The MSTPEi bit must be written while the oscillation of the clock controlled by this bit is stabilized. For entering Software Standby mode after writing the MSTPEi bit, wait for two GPT clock (GPTCLK) cycles after writing, and then execute a WFI instruction (i = 18 to 21, 26 to 31).

10.2.10 SBYCR : Standby Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x00C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	OPE	—	—	—	—	—	—
Value after reset:	0	1	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W
6	OPE	Output Port Enable 0: In Software Standby mode or Deep Software Standby mode, set the address bus and other bus control signal to the high-impedance state. 1: In Software Standby mode or Deep Software Standby mode, address bus and other bus control signal retain the output state.	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The SBYCR register controls the bus signal output in Software Standby mode and Deep Software Standby mode.

OPE bit (Output Port Enable)

The OPE bit specifies whether to set to the high-impedance state or to retain the output of the address bus and bus control signals. For SRAM: A00 to A23, CS0 to CS7, RD, WR0 to WR3, WR, BC0 to BC3 and ALE, and for SDRAM: A00 to A16, DQM0 to DQM3, SDCS, RAS, CAS, WE and CKE in Software Standby mode or Deep Software Standby mode.

10.2.11 OPCCR : Operating Power Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0A0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	OPCM TSF	—	—	OPCM[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	OPCM[1:0]	Operating Power Control Mode Select 0 0: High-speed mode 0 1: Setting prohibited 1 0: Setting prohibited 1 1: Low-speed mode	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	OPCMTSF	Operating Power Control Mode Transition Status Flag 0: Transition completed 1: During transition	R
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The OPCCR register is used to reduce power consumption in Normal and Processor low power mode by specifying a lower operating frequency. For the procedure to change the operating power control modes, see [section 10.5. Function for Lower Operating Power Consumption](#).

When transitioning from Software Standby mode to Normal mode, the setting in the OPCCR.OPCM[1:0] bits are as follows, regardless of the setting before entering Software Standby mode:

- OPCCR.OPCM[1:0] = 00b (High-speed mode)

If Software Standby mode is canceled by interrupt before the transition to Software Standby completes, the OPCCR.OPCM[1:0] bits retain the setting from before the WFI instruction is executed. If this causes any problem, set the MCU to High-speed mode during the exception handling procedure when canceling Software Standby mode.

OPCM[1:0] bits (Operating Power Control Mode Select)

The OPCM[1:0] bits select the operating power control mode in Normal and Processor low power mode. [Table 10.5](#) shows the relationship between the operating power control modes and the OPCM[1:0] settings.

OPCMTSF flag (Operating Power Control Mode Transition Status Flag)

The OPCMTSF flag indicates the switching control state when the operating power control mode is switched. This flag becomes 1 when the OPCM bit is written, and 0 when mode transition completes. Read this flag and confirm that it is 0 before proceeding.

Table 10.5 The operating power control modes

Operating power control mode	OPCM[1:0] bits	Power consumption
High-speed mode	00b	High
Low-speed mode	11b	Low

Operating frequency range and voltage range are shown in Electrical characteristics.

Each operating power control mode is described below.

- High-speed mode
After a reset cancellation, the MCU is activated in this mode.
- Low-speed mode
The following restrictions apply in Low-speed mode:
 - P/E operations for flash memory are prohibited.
 - Using the PLL1/PLL2 is prohibited. See [section 10.8.1. Register Access](#)
 - Writing to PLL1LDOCR, PLL2LDOCR and HOCOLDOCR is prohibited.

In this mode, lower power consumption is possible than in high-speed mode when the same operation is performed under the same conditions (operating frequency, operating voltage).

10.2.12 PDCTRGD : Graphics Power Domain Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x110

Bit position:	7	6	5	4	3	2	1	0
Bit field:	PDPG SF	PDCS F	—	—	—	—	—	PDDE

Value after reset: 1 0 0 0 0 0 0 0 1

Bit	Symbol	Function	R/W
0	PDDE	Power control enable 0: Power on the target domain 1: Power off the target domain	R/W
5:1	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
6	PDCSF	Power control status flag 0: Power gating control is not executed (idle) 1: Power gating control is in progress	R
7	PDPGSF	Power gating status flag 0: Target domain is power on (not gating) 1: Target domain is power off (during Gating)	R

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The PDCTRGD register controls power gating for Graphics power domain.

For restrictions on this register, not only in this section, please also refer to [section 10.6.1. Power Gating Control using power domain control register](#).

PDDE bit (Power control enable)

The PDDE bit controls the power gating of the target domain. The PDDE bit should be set from 0 to 1, after confirmed that the PDCSF=0 and PDPGSF=0. On the other hand, the PDDE bit should be set from 1 to 0, after confirmed that the PDCSF=0 and PDPGSF=1.

PDCSF bit (Power control status flag)

The PDCSF bit indicates the power control status of the target domain.

PDPGSF bit (Power gating status flag)

The PDPGSF bit indicates whether the target domain is power gated.

10.2.13 PDRAMSCR0 : SRAM Power Domain Standby Control Register 0

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x140

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	RKEE P6	RKEE P5	RKEE P4	RKEE P3	RKEE P2	RKEE P1	RKEE P0

Value after reset: 0 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

Bit	Symbol	Function	R/W
1:0	RKEEP1 to RKEEP0	Unnecessary Circuit Retention*1 0: When entering the Software Standby mode, the contents of unnecessary circuit are not kept. 1: When entering the Software Standby mode, the contents of unnecessary circuit are kept.	R/W
6:2	RKEEP6 to RKEEP2	RAM Retention 0: When entering the Software Standby mode, the contents of the target RAM are not kept. 1: When entering the Software Standby mode, the contents of the target RAM are kept.	R/W
14:7	—	These bits are read as 1. The write value should be 1.	R/W
15	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-4, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Note 1. This bit has an initial value of 0. Set this bit to 1 to reduce power consumption.

The PDRAMSCR0 register controls the target memory in Software Standby mode.

RKEEPn bit (RAM Retention) (n = 0 to 6)

The RKEEPn (n = 0 to 6) 7bits controls whether to retain the contents of the target memory or unnecessary circuit in Software Standby mode.

Table 10.6 shows the relationship between each bit and the target memory.

Table 10.6 Relationship between each bit and the target memory

PDRAMSCR0 register bit	Target memory
PDRAM.b2	SRAM0: 0x2204_0000 to 0x2205_FFFF (Secure alias) 0x3204_0000 to 0x3205_FFFF (Non-secure alias)
PDRAM.b3	SRAM1: 0x2206_0000 to 0x2207_FFFF (Secure alias) 0x3206_0000 to 0x3207_FFFF (Non-secure alias)
PDRAM.b4	SRAM1: 0x2208_0000 to 0x2209_FFFF (Secure alias) 0x3208_0000 to 0x3209_FFFF (Non-secure alias)
PDRAM.b5	SRAM1: 0x220A_0000 to 0x220B_FFFF (Secure alias) 0x320A_0000 to 0x320B_FFFF (Non-secure alias)
PDRAM.b6	SRAM1: 0x220C_0000 to 0x220D_FFFF (Secure alias) 0x320C_0000 to 0x320D_FFFF (Non-secure alias)

10.2.14 PDRAMSCR1 : SRAM Power Domain Standby Control Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x142

Bit	Symbol	Function	R/W
0	RKEEP0	RAM Retention 0: When entering the CPU Deep Sleep and Software Standby mode, the contents of the target RAM are not kept. 1: When entering the CPU Deep Sleep and Software Standby mode, the contents of the target RAM are kept.	R/W
1	—	This bit is read as 1. The write value should be 1.	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-4, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The PDRAMSCR1 register controls the target memory in CPU Deep Sleep and Software Standby mode.

RKEEP0 bit (RAM Retention)

The RKEEP0 bit controls whether to retain the contents of the target memory in CPU Deep Sleep and Software Standby mode.

Table 10.7 shows the relationship between each bit and the target memory.

Table 10.7 Relationship between each bit and the target memory

PDRAM register bit	Target memory
PDRAM.b0	ITCM and DTCM

10.2.15 SSCR1 : Software Standby Control Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA98

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SS1FR

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	SS1FR	Software Standby Fast Return 0: When returning from Software Standby mode, fast return function is disabled 1: When returning from Software Standby mode, fast return function is enabled	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

SS1FR bit (Software Standby Fast Return)

When the SS1FR bit is 1, the recovery time from Software Standby mode is shorter.

Refer to the chapter of electrical characteristics on the detail of the recovery time.

Note: It is recommended to set this bit to 1. Otherwise it just increases the recovery time.

10.2.16 LPSCR : Low Power State Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA90

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	LPMD[3:0]			

Value after reset: 0 0 0 0 0 1 0 0 0

Bit	Symbol	Function	R/W
3:0	LPMD[3:0]	Low power mode setting bit 0x0: System Active 0x4: Software Standby mode 0x8: Deep Software Standby mode 1 0x9: Deep Software Standby mode 2 0xA: Deep Software Standby mode 3 Others: Setting prohibited	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The LPSCR register controls the transition destination of low power mode.

LPSCR is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see [section 5, Resets](#).

LPMD[3:0] bit (Low power mode setting bit)

The LPMD[3:0] bit indicate the destination of low power mode. Actual low power mode transition is executed by WFI instruction in CPU.

The transition of Software Standby mode and Deep Software Standby mode does not occur unless the WFI instruction of each CPU is executed.

When the low power mode is canceled by an interrupt, The LPMD[3:0] bit remains the value before transition. Writing 0 to this bit clears the bit itself.

While FENTRYR.FENTRYi (i = 0 to 3) is 1 or FENTRYR.FENTRYD bit is 1, the setting to Software Standby and Deep Software Standby mode is ineffective. Even if LPMD is any of 0x4, 0x8 to 0xA, the MCU is keep to System active state on execution of a WFI instruction. Refer to [Table 10.10](#) for the detail.

While OFS0.IWDTSTPCTL bit is 0 (counting continues), the setting to Deep software Standby 2 and 3 mode is ineffective. Even if LPMD is any of 0x9 or 0xA, the MCU enters Deep Software Standby 1 mode on execution of a WFI instruction.

While IWDTCSTPR.SLCSTP is 0 (counting continues), the setting to Deep software Standby 2 and 3 mode is ineffective. Even if LPMD is any of 0x9 or 0xA, the MCU enters Deep Software Standby 1 mode on execution of a WFI instruction.

Refer to [Table 10.10](#) for the detail.

While the voltage monitor n (n=1, 2) reset is enabled (PVDnCR0.RI=1), the setting to Deep Software Standby mode 2, 3 is ineffective. Even if LPMD is any of 0x9 or 0xA the MCU enters Deep Software Standby 1 mode on execution of a WFI instruction. Refer to [Table 10.10](#) for the detail.

10.2.17 DPSBYCR : Deep Software Standby Control Register

Base address: SYSC = 0x4001_E000
 SYSC_NS = 0x5001_E000

Offset address: 0xA00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	IOKEEP	—	SRKEEP	—	DCSSMODE	—	—
Value after reset:	0	0	0	1	0	0	0	0

Bit	Symbol	Function	R/W
1:0	—	These bits are read as 0. The write value should be 0.	R/W
2	DCSSMODE	DCDC Soft Start Mode 0: When the Deep Software Standby mode is canceled, the time required to recover is the standard time. 1: When the Deep Software Standby mode is canceled, the time required to recover is shortened.	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	SRKEEP	Standby SRAM Retention 0: When entering the Software Standby mode or the Deep Software Standby mode 1, the contents of Standby SRAM are not kept. 1: When entering the Software Standby mode or the Deep Software Standby mode 1, the contents of Standby SRAM are kept.	R/W
5	—	This bit is read as 0. The write value should be 0.	R/W
6	IOKEEP	I/O Port Rentention 0: When the Deep Software Standby mode is canceled, the I/O ports are in the reset state. 1: When the Deep Software Standby mode is canceled, the I/O ports are in the same state as in the Deep Software Standby mode.	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The DPSBYCR register controls the Deep Software Standby mode.

DPSBYCR is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see [section 5, Resets](#).

DCSSMODE bit (DCDC Soft Start Mode)

The DCSSMODE bit specifies whether to shorten the time required to recover from the Deep Software Standby mode. For details, see [section 51, Electrical Characteristics](#).

SRKEEP bit (Standby SRAM Retention)

The SRKEEP bit specifies whether to keep the contents of Standby SRAM or not when entering the Software Standby mode or the Deep Software Standby mode 1.

IOKEEP bit (I/O Port Retention)

In Deep Software Standby mode, I/O ports keep the same states as in the Software Standby mode. The IOKEEP bit specifies whether to reset the state of the I/O ports or not when the Deep Software Standby mode is canceled.

10.2.18 DPSWCR : Deep Software Standby Wait Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA04

Value after reset: 0 0 0 0 1 0 1 1

Bit	Symbol	Function	R/W
7:0	WTSTS[7:0]	Deep Software Wait Standby Time Setting Bit 0x0B: Wait cycle for fast recovery 0x9A: Wait cycle for slow recovery*1 Others: Setting prohibited	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Note 1. Only Deep Software Standby mode 2 is supported.

The DPSWCR register is a register appointing waiting stabilization time when a Deep Software Standby mode is canceled by certain pins which are sources of external pin interrupts or peripheral interrupts.

During a waiting stabilization period appointed in this register, Deep Software Standby reset occurs, and this MCU is initialized.

The DPSWCR is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see [section 5, Resets](#)

WTSTS[7:0] bits (Deep Software Wait Standby Time Setting Bit)

Set only 2 following values to WTSTS.

1. WTSTS = 0x0B:

The DSTBY recovery time is set to be fast. In this case, after returning from Deep Software Standby mode 2, it is necessary to be secured 700μs in the program before transition to next Software Standby mode or next Deep Software Standby mode.

For details of this fast recovery time, see [section 51, Electrical Characteristics](#)

2. WTSTS = 0x9A:

The DSTBY recovery time is set to be slow for Deep Software Standby mode 2. In this case, there is not the time constraint as the case of WTSTS = 0x0B.

For details of this slow recovery time, see [section 51, Electrical Characteristics](#)

Note: When you use Deep Software Standby mode 1 or Deep Software Standby mode 3, you should set 0x0B to WTSTS to avoid extra waiting time.

10.2.19 DPSIER0 : Deep Software Standby Interrupt Enable Register 0

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA08

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ7 E	DIRQ6 E	DIRQ5 E	DIRQ4 E	DIRQ3 E	DIRQ2 E	DIRQ1 E	DIRQ0 E
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ0E	IRQ0-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
1	DIRQ1E	IRQ1-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
2	DIRQ2E	IRQ2-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
3	DIRQ3E	IRQ3-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
4	DIRQ4E	IRQ4-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
5	DIRQ5E	IRQ5-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
6	DIRQ6E	IRQ6-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
7	DIRQ7E	IRQ7-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W

Note: S-TYPE-4, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIER0 is not initialized by the internal reset signal used as Deep Software Standby mode Canceling source. For details, see [section 5, Resets](#).

After the setting of DPSIER0 is modified, an edge may be internally generated depending on the state of the pin, resulting in DPSIFR0 being set to 1. Therefore, DPSIFR0 should be cleared to 0 before entering Deep Software Standby mode.

Refer to [Table 10.4](#) to know the relation between this register and interrupt source for canceling Deep Software Standby mode.

10.2.20 DPSIER1 : Deep Software Standby Interrupt Enable Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA0C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ1 5E	DIRQ1 4E	DIRQ1 3E	DIRQ1 2E	DIRQ1 1E	DIRQ1 0E	DIRQ9 E	DIRQ8 E
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ8E	IRQ8-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
1	DIRQ9E	IRQ9-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
2	DIRQ10E	IRQ10-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
3	DIRQ11E	IRQ11-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
4	DIRQ12E	IRQ12-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
5	DIRQ13E	IRQ13-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
6	DIRQ14E	IRQ14-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
7	DIRQ15E	IRQ15-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W

Note: S-TYPE-4, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIER1 is not initialized by the internal reset signal used as Deep Software Standby mode Canceling source. For details, see [section 5, Resets](#).

After the setting of DPSIER1 is modified, an edge may be internally generated depending on the state of the pin, resulting in DPSIFR1 being set to 1. Therefore, DPSIFR1 should be cleared to 0 before entering Deep Software Standby mode.

Refer to [Table 10.4](#) to know the relation between this register and interrupt source for canceling Deep Software Standby mode.

10.2.21 DPSIER2 : Deep Software Standby Interrupt Enable Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	DNMI E	DRTC AIE	DRTC IE	DPVD 2IE	DPVD 1IE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DPVD1IE	PVD1 Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
1	DPVD2IE	PVD2 Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
2	DRTCIE	RTC Interval interrupt Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W

Bit	Symbol	Function	R/W
3	DRTCAIE	RTC Alarm interrupt Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
4	DNMIE	NMI Pin Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W ¹
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-4, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Note 1. 1 can be written only once. Once 1 is written to this bit, subsequent write accesses are disabled.

DPSIER2 is not initialized by the internal reset signal used as Deep Software Standby mode Canceling source. For details, see [section 5, Resets](#).

After the setting of DPSIER2 is modified, an edge may be internally generated depending on the state of the pin, resulting in DPSIFR2 being set to 1. Therefore, DPSIFR2 should be cleared to 0 before entering Deep Software Standby mode.

Refer to [Table 10.4](#) to know the relation between this register and interrupt source for canceling Deep Software Standby mode.

10.2.22 DPSIER3 : Deep Software Standby Interrupt Enable Register 3

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA14

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DVBATTADIE	—	DIWD TIE	—	DULPT1IE	DULPT0IE	—	DUSBFSIE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DUSBFSIE	USBFS Suspend/Resume Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
1	—	This bit is read as 0. The write value should be 0.	R/W
2	DULPT0IE	ULPT0 Overflow Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
3	DULPT1IE	ULPT1 Overflow Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
4	—	This bit is read as 0. The write value should be 0.	R/W
5	DIWD TIE	IWDT Underflow Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
6	—	This bit is read as 0. The write value should be 0.	R/W
7	DVBATTADIE	VBATT Tamper Detection Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W

Note: S-TYPE-4, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIER3 is not initialized by the internal reset signal used as Deep Software Standby mode Canceling source. For details, see [section 5, Resets](#).

After the setting of DPSIER3 is modified, an edge may be internally generated depending on the state of the pin, resulting in DPSIFR3 being set to 1. Therefore, DPSIFR3 should be cleared to 0 before entering Deep Software Standby mode.

Refer to [Table 10.4](#) to know the relation between this register and interrupt source for canceling Deep Software Standby mode.

10.2.23 DPSIFR0 : Deep Software Standby Interrupt Flag Register 0

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA18

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ7 F	DIRQ6 F	DIRQ5 F	DIRQ4 F	DIRQ3 F	DIRQ2 F	DIRQ1 F	DIRQ0 F
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ0F	IRQ0-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
1	DIRQ1F	IRQ1-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
2	DIRQ2F	IRQ2-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
3	DIRQ3F	IRQ3-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
4	DIRQ4F	IRQ4-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
5	DIRQ5F	IRQ5-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
6	DIRQ6F	IRQ6-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
7	DIRQ7F	IRQ7-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹

Note: S-TYPE-4, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Note 1. Only 0 can be written to clear flag. The flag must be cleared by writing 0 after 1 is read.

Each flag is set to 1 when a cancel request specified by DPSIEGR0 is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not only in Deep Software Standby mode) or when the setting of DPSIER0 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR0 is cleared to 0x00.

To clear DPSIFR0 to 0x00 after modifying DPSIER0, wait for at least 6 PCLKB cycles, read DPSIFR0, and then write 0 to DPSIFR0. Six or more PCLKB cycles can be secured, for example, by reading DPSIER0.

DPSIFR0 is not initialized by the internal reset signal used as Deep Software Standby mode Canceling source.

For details, see [section 5, Resets](#).

DIRQnF flag (IRQn-DS Pin Deep Software Standby Cancel Flag) (n = 0 to 7)

The DIRQnF flag indicates that a cancel request by the IRQn-DS pin has been generated.

[Setting condition]

A cancel request by the IRQn-DS pin specified by DPSIEGR0 is generated.

[Clearing condition]

Writing 0 to each flag after 1 is read.

10.2.24 DPSIFR1 : Deep Software Standby Interrupt Flag Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA1C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ1 5F	DIRQ1 4F	DIRQ1 3F	DIRQ1 2F	DIRQ1 1F	DIRQ1 0F	DIRQ9 F	DIRQ8 F
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ8F	IRQ8-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
1	DIRQ9F	IRQ9-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
2	DIRQ10F	IRQ10-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
3	DIRQ11F	IRQ11-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
4	DIRQ12F	IRQ12-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
5	DIRQ13F	IRQ13-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
6	DIRQ14F	IRQ14-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
7	DIRQ15F	IRQ15-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹

Note: S-TYPE-4, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Note 1. Only 0 can be written to clear flag. The flag must be cleared by writing 0 after 1 is read.

Each flag is set to 1 when a cancel request specified by DPSIEGR1 is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not only in Deep Software Standby mode) or when the setting of DPSIER1 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR1 is cleared to 0x00.

To clear DPSIFR1 to 0x00 after modifying DPSIER1, wait for at least 6 PCLKB cycles, read DPSIFR1, and then write 0 to DPSIFR1. Six or more PCLKB cycles can be secured, for example, by reading DPSIER1.

DPSIFR1 is not initialized by the internal reset signal used as Deep Software Standby mode Canceling source. For details, see [section 5, Resets](#).

DIRQnF flag (IRQn-DS Pin Deep Software Standby Cancel Flag) (n = 8 to 15)

The DIRQnF flag indicates that a cancel request by the IRQn-DS pin has been generated.

[Setting condition]

A cancel request by the IRQn-DS pin specified by DPSIEGR1 is generated.

[Clearing condition]

Writing 0 to each flag after 1 is read.

10.2.25 DPSIFR2 : Deep Software Standby Interrupt Flag Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA20

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	DNMIF	DRTC AIF	DRTC IIF	DPVD 2IF	DPVD 1IF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DPVD1IF	PVD1 Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
1	DPVD2IF	PVD2 Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
2	DRTC IIF	RTC Interval Interrupt Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
3	DRTCAIF	RTC Alarm Interrupt Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
4	DNMIF	NMI Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-4, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Note 1. Only 0 can be written to clear flag. The flag must be cleared by writing 0 after 1 is read.

Each flag is set to 1 when a cancel request specified by DPSIEGR2 is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not only in Deep Software Standby mode) or when the setting of DPSIER2 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR2 is cleared to 0x00.

To clear DPSIFR2 to 0x00 after modifying DPSIER2, wait for at least 6 PCLKB cycles, read DPSIFR2, and then write 0 to DPSIFR2. Six or more PCLKB cycles can be secured, for example, by reading DPSIER2.

DPSIFR2 is not initialized by the internal reset signal used as Deep Software Standby mode Canceling source. For details, see [section 5, Resets](#).

DPVDMIF flag (PVDm Deep Software Standby Cancel Flag) (m = 1 to 2)

The DPVDMIF flag indicates that a cancel request by the voltage monitor m signal has been generated.

[Setting condition]

A cancel request is generated by the voltage monitor m signal that is selected in DPSIEGR2.

[Clearing condition]

Writing 0 to each flag after 1 is read.

DRTC IIF flag (RTC Interval Interrupt Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the RTC interval interrupt signal has been generated.

[Setting condition]

A cancel request by the RTC interval interrupt signal is generated

[Clearing condition]

Writing 0 to each flag after 1 is read.

DRTCAIF flag (RTC Alarm Interrupt Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the RTC alarm interrupt signal has been generated.

[Setting condition]

A cancel request by the RTC alarm interrupt signal is generated

[Clearing condition]

Writing 0 to each flag after 1 is read.

DNMIF flag (NMI Pin Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the NMI pin has been generated.

[Setting condition]

A cancel request by the NMI pin specified by DPSIEGR2 is generated

[Clearing condition]

Writing 0 to each flag after 1 is read.

10.2.26 DPSIFR3 : Deep Software Standby Interrupt Flag Register 3

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA24

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DVBA TTADI F	—	DIWD TIF	—	DULP T1IF	DULP T0IF	—	DUSB FSIF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DUSBFSIF	USBFS Suspend/Resume Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
1	—	This bit is read as 0. The write value should be 0.	R/W
2	DULPT0IF	ULPT0 Overflow Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
3	DULPT1IF	ULPT1 Overflow Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
4	—	This bit is read as 0. The write value should be 0.	R/W
5	DIWDTIF	IWDT Underflow Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹
6	—	This bit is read as 0. The write value should be 0.	R/W
7	DVBATTADIF	VBATT Tamper Detection Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W ¹

Note: S-TYPE-4, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Note 1. Only 0 can be written to clear flag. The flag must be cleared by writing 0 after 1 is read.

Each flag is set to 1 when the corresponding cancel request is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not only in Deep Software Standby mode) or when the setting of DPSIER3 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR3 is cleared to 0x00.

To clear DPSIFR3 to 0x00 after modifying DPSIER3, wait for at least 6 PCLKB cycles, read DPSIFR3, and then write 0 to DPSIFR3. Six or more PCLKB cycles can be secured, for example, by reading DPSIER3.

DPSIFR3 is not initialized by the internal reset signal used as Deep Software Standby mode Canceling source. For details, see [section 5, Resets](#).

DUSBFSIF flag (USBFS Suspend/Resume Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the USBFS suspend/resume has been generated.

The DUSBFSIF flag is a flag for USBFS.

[Setting condition]

A cancel request by the USBFS suspend/resume is generated.

[Clearing condition]

Writing 0 to each bit after reading the bit as 1.

DULPT0IF flag (ULPT0 Overflow Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the ULPT0 overflow has been generated.

[Setting condition]

A cancel request by the ULPT0 is generated.

[Clearing condition]

Writing 0 to each bit after reading the bit as 1.

DULPT1IF flag (ULPT1 Overflow Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the ULPT1 overflow has been generated.

[Setting condition]

A cancel request by the ULPT1 is generated.

[Clearing condition]

Writing 0 to each bit after reading the bit as 1.

DIWDTIF bit (IWDT Underflow Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the IWDT underflow has been generated.

[Setting condition]

A cancel request by the IWDT is generated.

[Clearing condition]

Writing 0 to each bit after reading the bit as 1.

DVBATTADIF bit (VBATT Tamper Detection Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the VBATT tamper detection has been generated.

[Setting condition]

A cancel request by the VBATT tamper detection is generated.

[Clearing condition]

Writing 0 to each bit after reading the bit as 1.

10.2.27 DPSIEGR0 : Deep Software Standby Interrupt Edge Register 0

Base address: SYSC = 0x4001_E000
 SYSC_NS = 0x5001_E000

Offset address: 0xA28

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ7 EG	DIRQ6 EG	DIRQ5 EG	DIRQ4 EG	DIRQ3 EG	DIRQ2 EG	DIRQ1 EG	DIRQ0 EG
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ0EG	IRQ0-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
1	DIRQ1EG	IRQ1-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
2	DIRQ2EG	IRQ2-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
3	DIRQ3EG	IRQ3-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
4	DIRQ4EG	IRQ4-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
5	DIRQ5EG	IRQ5-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
6	DIRQ6EG	IRQ6-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
7	DIRQ7EG	IRQ7-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W

Note: S-TYPE-4, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIEGR0 is not initialized by the internal reset signal that is the source to cancel the Deep Software Standby mode. For details, see [section 5, Resets](#).

10.2.28 DPSIEGR1 : Deep Software Standby Interrupt Edge Register 1

Base address: SYSC = 0x4001_E000
 SYSC_NS = 0x5001_E000

Offset address: 0xA2C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ1 5EG	DIRQ1 4EG	DIRQ1 3EG	DIRQ1 2EG	DIRQ1 1EG	DIRQ1 0EG	DIRQ9 EG	DIRQ8 EG
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ8EG	IRQ8-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge.	R/W

Bit	Symbol	Function	R/W
1	DIRQ9EG	IRQ9-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge.	R/W
2	DIRQ10EG	IRQ10-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge.	R/W
3	DIRQ11EG	IRQ11-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge.	R/W
4	DIRQ12EG	IRQ12-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge.	R/W
5	DIRQ13EG	IRQ13-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge.	R/W
6	DIRQ14EG	IRQ14-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge.	R/W
7	DIRQ15EG	IRQ15-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge.	R/W

Note: S-TYPE-4, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIEGR1 is not initialized by the internal reset signal that is the source to cancel the Deep Software Standby mode. For details, see [section 5, Resets](#).

10.2.29 DPSIEGR2 : Deep Software Standby Interrupt Edge Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA30

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	DNMI EG	—	—	DPVD 2EG	DPVD 1EG
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DPVD1EG	PVD1 Edge Select 0: A cancel request is generated when $VCC < V_{det1}$ (fall) is detected 1: A cancel request is generated when $VCC \geq V_{det1}$ (rise) is detected	R/W
1	DPVD2EG	PVD2 Edge Select 0: A cancel request is generated when $VCC < V_{det2}$ (fall) is detected 1: A cancel request is generated when $VCC \geq V_{det2}$ (rise) is detected	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	DNMIEG	NMI Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-4, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIEGR2 is not initialized by the internal reset signal that is the source to cancel the Deep Software Standby mode. For details, see [section 5, Resets](#).

10.2.30 SYOCDCCR : System Control OCD Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA38

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DBGEN	—	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	x

Bit	Symbol	Function	R/W
0	—	The read value is undefined. The write value should be 0.	R/W
6:1	—	These bits are read as 0. The write value should be 0.	R/W
7	DBGEN	Debugger Enable bit 0: On-chip debugger is disabled 1: On-chip debugger is enabled*1	R/W

Note: S-TYPE-5, P-TYPE-2

Note 1. The value of DBGEN can be set by software. However, it is not until the debugger authentication passes that the on-chip debugger function is valid. That is, even if the DBGEN is 1, the on-chip debugger function is invalid unless the debugger authentication passes. For detail, see [section 2, CPU](#).

This register is not controlled by any security attribute register (eg. LPMSAR, DPFSAR).

DBGEN bit (Debugger Enable bit)

The DBGEN bit enables the on-chip debugger function.

[Setting condition]

- Power-on reset is generated
- Voltage Monitor 0 reset is generated.
- Writing 1 to the bit.

[Clearing condition]

- Writing 0 to the bit.

Note: Certain restrictions apply in terms of the MCU states in which the DBGEN bit can be set to 1. For details, see [section 2.13.2. Restriction in OCD Emulator Connecting](#).

10.2.31 PLL1LDOCR : PLL1-LDO Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xB04

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	SKEEP	LDOSTP
Value after reset:	0	0	0	0	0	x	0	0

Bit	Symbol	Function	R/W
0	LDOSTP	LDO Stop 0: PLL1-LDO is enabled 1: PLL1-LDO is stopped	R/W
1	SKEEP	STBY Keep 0: PLL1-LDO is stopped during Software Standby mode. 1: PLL1-LDO state before Software Standby mode is retained during Software Standby mode.	R/W

Bit	Symbol	Function	R/W
2	—	The read value is undefined.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

It can be controlled the operation of the LDO dedicated for PLL1(PLL1-LDO) by using this register.

Writing to this register is prohibited in low-speed mode.

LDOSTP bit (LDO Stop)

The PLL1-LDO state during Normal mode is controlled by this bit. After setting 1 to this bit, do not set 0 to this bit for at least 1 μ s. This bit can be set 0 to this bit only when 1 μ s has elapsed after setting 1 to this bit.

When this bit is changed from 1 to 0, it takes 25 μ s for the power supply to stabilize.

Allow the power supply to stabilize before operating the PLL1.

SKEEP bit (STBY Keep)

The PLL1-LDO state during Software Standby mode is controlled by this bit. If the PLL1-LDO operation is stopped during Software Standby mode, the power consumption during Software Standby mode can be reduced.

10.2.32 PLL2LDOCR : PLL2-LDO Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xB08

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	SKEEP P	LDOSTP
Value after reset:	0	0	0	0	0	x	0	0

Bit	Symbol	Function	R/W
0	LDOSTP	LDO Stop 0: PLL2-LDO is enabled 1: PLL2-LDO is stopped	R/W
1	SKEEP	STBY Keep 0: PLL2-LDO is stopped during Software Standby mode. 1: PLL2-LDO state before Software Standby mode is retained during Software Standby mode.	R/W
2	—	The read value is undefined.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

It can be controlled the operation of the LDO dedicated for PLL2 (PLL2-LDO) by using this register.

Writing to this register is prohibited in low-speed mode.

LDOSTP bit (LDO Stop)

The PLL2-LDO state during Normal mode is controlled by this bit. After setting 1 to this bit, do not set 0 to this bit for at least 1 μ s. This bit can be set 0 to this bit only when 1 μ s has elapsed after setting 1 to this bit.

When this bit is changed from 1 to 0, it takes 25 μ s for the power supply to stabilize.

Allow the power supply to stabilize before operating the PLL2.

SKEEP bit (STBY Keep)

The PLL2-LDO state during Software Standby mode is controlled by this bit. If the PLL2-LDO operation is stopped during Software Standby mode, the power consumption during Software Standby mode can be reduced.

10.2.33 HOCOLDOCR : HOCO-LDO Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xB0C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	SKEE P	LDOS TP
Value after reset:	0	0	0	0	0	x	0	0

Bit	Symbol	Function	R/W
0	LDOSTP	LDO Stop 0: HOCO-LDO is enabled 1: HOCO-LDO is stopped	R/W
1	SKEEP	STBY Keep 0: HOCO-LDO is stopped during Software Standby mode. 1: HOCO-LDO state before Software Standby mode is retained during Software Standby mode.	R/W
2	—	The read value is undefined.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

It can be controlled the operation of the LDO dedicated for HOCO (HOCO-LDO) by using this register.

Writing to this register is prohibited in low-speed mode.

LDOSTP bit (LDO Stop)

The HOCO-LDO state during Normal mode is controlled by this bit. After setting 1 to this bit, do not set 0 to this bit for at least 2 μ s. This bit can be set 0 to this bit only when 2 μ s has elapsed after setting 1 to this bit.

When this bit is changed from 1 to 0, it takes 5 μ s for the power supply to stabilize.

Allow the power supply to stabilize before operating the HOCO.

SKEEP bit (STBY Keep)

The HOCO-LDO state during Software Standby mode is controlled by this bit. If the HOCO-LDO operation is stopped during Software Standby mode, the power consumption during Software Standby mode can be reduced.

10.3 Reducing Power Consumption by Switching Clock Signals

The clock frequency changes when the SCKDIVCR and SCKDIVCR2 registers are set.

For information on module and clock associations, see [section 8.2.2. SCKDIVCR : System Clock Division Control Register](#) and [section 8.2.3. SCKDIVCR2 : System Clock Division Control Register 2](#).

10.4 Module-Stop Function

The module stop function can stop the clock supply set for each peripheral module.

When the MSTPmi bit ($m = A$ to E , $i = 31$ to 0) in MSTPCRn ($n = A$ to E) is set to 1, the specified module stops operating and enters the module-stop state, but the CPU continues to operate independently. Setting the MSTPmi bit to 0 cancels the module-stop state, allowing the module to resume operation at the end of the bus cycle.

After a reset is canceled, all modules other than the DMAC, DTC and SRAMn ($n = 0, 1$) modules are placed in the module-stop state. Do not access the module while the corresponding MSTPmi bit is 1. Additionally, do not set 1 to the MSTPmi bit while the corresponding module is accessed.

If the CPU clock is faster than 120 MHz, after the MSTPmi bit is changed, a wait time should be provided according to the flow shown in [Figure 10.2](#). It is recommended to use software to measure the wait time. Be sure to consider the worst-case conditions to ensure that the required wait time elapses. If an interrupt is unavoidably generated during the wait time, retry the measurement after return from the interrupt.

Figure 10.2 Setting flow of module stop control registers in case of CPUCLK is higher than 120MHz

10.5 Function for Lower Operating Power Consumption

By selecting an appropriate operating power consumption control mode according to the operating frequency, power consumption can be reduced in Normal mode and Processor low power mode.

10.5.1 Setting Operating Power Control Mode

Ensure the operating condition such as the frequency range is always within the specified range before and after switching the operating power control modes.

In External VDD mode, make sure to set OPCCR.OPCM is 00b.

This section provides example procedures for switching operating power control modes.

Table 10.8 Available oscillators in each mode

Mode	Oscillator					
	PLL1, PLL2	High-speed on-chip oscillator	Middle-speed on-chip oscillator	Low-speed on-chip oscillator	Main clock oscillator	Sub-clock oscillator
High-speed	Available	Available	Available	Available	Available	Available
Low-speed	Not Available	Available	Available	Available	Available	Available

(1) Switching from a higher power mode to a lower power mode

Example : From High-speed mode to Low-speed mode:

(Operation begins in High-speed mode)

1. Change the oscillator to what is used in Low-speed mode. Set the frequency of each clock lower than or equal to the maximum operating frequency in Low-speed mode.
2. Turn off the oscillator that is not required in Low-speed mode.
3. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).
4. Set the OPCCR.OPCM[1:0] bits to 11b (Low-speed mode).
5. Confirm that OPCCR.OPCMTSF flag is 0 (indicates transition completed).

(2) Switching from a lower power mode to a higher power mode

Example : From Low-speed mode to High-speed mode

(Operation begins in Low-speed mode)

1. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).
2. Set the OPCCR.OPCM[1:0] bits to 00b (High-speed mode).
3. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).
4. Turn on any required oscillator in High-speed mode.
5. Set the frequency of each clock lower than or equal to the maximum operating frequency for High-speed mode.

(Operation is now in High-speed mode)

10.6 Power Gating Control

The MCU supports the power gating function of the power domain.

User can individually control the power on/off of the divided power domains.

The power domain is consist of normal operation-area and retention-area.

10.6.1 Power Gating Control using power domain control register

Table 10.9 shows the relationship Power gating control register and the target power domain.

When the Power gating control register is set, power gating control is executed.

In addition, when using the power gating function, it should be set MOCOCCR.MCSTP to 0 (MOCO is operated) in advance.

Table 10.9 Relationship between the Power gating control register and the target power domain

Control register				Target Power Domain name	Implemented module name
Register name	PDDE	PDCSF	PDPGSF		
PDCTRGD	Available	Available	Available	Graphic domain	DRW, GLCDC

Examples of the procedures for power gating control:

(1) Power OFF by PDCTRGD.PDDE*1

STEP1 : Confirm that the target domain is not performing the Power gating process

Check PDCTRGD.PDCSF = 0

STEP2 : Set the module stop control register to stop.

Write MSTPCR* = 1 (*:all register for target domain)

STEP3 : Set PDCTRGD.PDDE bit and start the power control.

Write PDCTRGD.PDDE = 1

STEP4 : Confirm that the power gating process is completed and the powered off

Check PDCTRGD.PDCSF = 0 & PDCTRGD.PDPGSF = 1

(2) Power ON by PDCTRGD.PDDE*1

STEP1 : Confirm that the target domain is not performing the Power gating process

Check PDCTRGD.PDCSF = 0

STEP2 : Set PDCTRGD.PDDE bit and start the power control.

Write PDCTRGD.PDDE = 0

STEP3 : Confirm that the power gating process is completed and the powered on

Check PDCTRGD.PDCSF = 0 & PDCTRGD.PDPGSF = 0

STEP4 : Set the module stop control register to operate.

Write MSTPCR* = 0 (*:all register for target domain)

Note 1. When PDCTRGD.PDCSF bit is 1 (during power gating control processing) , PDCTRGD register must not be changed.

10.7 Low Power Modes

10.7.1 CPU Sleep Mode

10.7.1.1 Transition to CPU Sleep mode

When a WFI instruction is executed while SCR.SLEEPDEEP bit is 0, the MCU enters CPU Sleep mode. In this mode, the CPU stops operating but the contents of its internal registers are retained. Other peripheral functions do not stop. Available resets or interrupts in CPU Sleep mode cause the MCU to cancel CPU Sleep mode. All interrupt sources are available. If using an interrupt to cancel CPU Sleep mode, you must set the associated IELSRn register before executing a WFI instruction. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

Counting by IWDT stops when the MCU enters CPU Sleep mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 1 (IWDT stops in CPU Sleep mode or CPU Deep Sleep mode). Similarly, counting by IWDT stops when the MCU enters CPU Sleep mode while the IWDT is in register start mode and the SLCSTP bit in IWDCSTPR is 1 (IWDT stops in CPU Sleep mode or CPU Deep Sleep mode).

Counting by IWDT continues when the MCU enters CPU Sleep mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 0 (IWDT does not stop in CPU Sleep mode or CPU Deep Sleep mode). Similarly, counting by IWDT continues when the MCU enters CPU Sleep mode while the IWDT is in register start mode and the SLCSTP bit in IWDCSTPR is 0 (IWDT does not stop in CPU Sleep mode or CPU Deep Sleep mode).

Counting by WDT stops when the MCU enters CPU Sleep mode while the WDT is in auto start mode and the OFS0.WDTSTPCTL bit is 1 (WDT stops in CPU Sleep mode or CPU Deep Sleep mode). Similarly, counting by WDT

stops when the MCU enters CPU Sleep mode while the WDT is in register start mode and the SLCSTP bit in WDTCSSTPR is 1 (WDT stops in CPU Sleep mode or CPU Deep Sleep mode).

Counting by WDT continues when the MCU enters CPU Sleep mode while the WDT is in auto start mode and the OFS0.WDTSTPCTL bit is 0 (WDT does not stop in CPU Sleep mode or CPU Deep Sleep mode). Similarly, counting by WDT continues when the MCU enters CPU Sleep mode while the WDT is in register start mode and the SLCSTP bit in WDTCSSTPR is 0 (WDT does not stop in CPU Sleep mode or CPU Deep Sleep mode).

WFI instruction and sleep-on-exit function for entering CPU Sleep mode purpose.

For the transition to CPU Sleep mode, there is a procedure according to the CPUCLK frequency. For details, see [section 10.8.10. Notes on transitioning to or canceling low power state](#).

10.7.1.2 Canceling CPU Sleep mode

CPU Sleep mode is canceled by:

- An interrupt
- A reset:
 - RES pin reset
 - Power-on reset
 - Voltage Monitor 0 reset
 - Independent watchdog timer reset
 - Watchdog timer reset
 - Voltage Monitor m reset (m = 1, 2)
 - Common memory error reset
 - Bus error reset

The operations are as follows:

1. Canceling by an interrupt
When an available interrupt request is generated, CPU Sleep mode is canceled and the MCU starts the interrupt handling.
2. Canceling by RES pin reset
When the RES pin is driven low, the MCU enters the reset state. Be sure to keep the RES pin low for the time period specified in [section 51, Electrical Characteristics](#) section 50, Electrical Characteristics. When the RES pin is driven high after the specified time period, the CPU starts the reset exception handling.
3. Canceling by IWDT reset
CPU Sleep mode is canceled by an internal reset generated by an IWDT underflow and the MCU starts the reset exception handling. However, IWDT stops in CPU Sleep mode and an internal reset for canceling CPU Sleep mode is not generated in the following conditions:
 - OFS0.IWDTSTRT = 0 (auto start mode) and OFS0.IWDTSTPCTL = 1
 - OFS0.IWDTSTRT = 1 (register start mode) and OFS0.IWDTSTPCTL = 1
4. Canceling by WDT reset
CPU Sleep mode is canceled by an internal reset generated by a WDT underflow and the MCU starts the reset exception handling. However, WDT stops in CPU Sleep mode even when counting in Normal mode and an internal reset for canceling CPU Sleep mode is not generated in the following conditions:
 - OFS0.WDTSTRT = 0 (auto start mode) and OFS0.WDTSTPCTL = 1
 - OFS0.WDTSTRT = 1 (register start mode) and WDTCSSTPR.SLCSTP = 1
5. Canceling by other resets available in CPU Sleep mode
CPU Sleep mode is canceled by other resets and the MCU starts the reset exception handling.

Note: For details on proper setting of the interrupts, see [section 13, Interrupt Controller Unit \(ICU\)](#)

10.7.2 CPU Deep Sleep mode

10.7.2.1 Transition to CPU Deep Sleep mode

When a WFI instruction is executed while SCR.SLEEPDEEP is set as 1, the MCU enters CPU Deep Sleep mode. In this mode, the CPU stops operating but the contents of its internal registers are retained. Other peripheral functions do not stop. However, accessing to TCM is not available and SysTick also stops in this mode. Available resets or wakeup enabled interrupts in CPU Deep Sleep mode cause the MCU to cancel CPU Deep Sleep mode. Not all interrupt sources are available, in detail user must also set WUPEN0 and WUPEN1 registers located in ICU to enable wakeup from CPU Deep Sleep mode. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

IWDT and WDT operation in CPU Deep Sleep mode is same with CPU Sleep mode.

For the transition to CPU Deep Sleep mode, there is a procedure according to the CPUCLK frequency. For details, see [section 10.8.10. Notes on transitioning to or canceling low power state](#).

10.7.2.2 Canceling CPU Deep Sleep mode

CPU Deep Sleep mode is canceled by:

- An available interrupt shown in [Table 10.4](#).
- A reset:
 - RES pin reset
 - Power-on reset
 - Voltage Monitor 0 reset
 - Independent watchdog timer reset
 - Watchdog timer reset
 - Voltage Monitor m reset (m = 1, 2)
 - Common memory error reset
 - Bus error reset

The operations are as follows:

1. Canceling by an interrupt

When an available interrupt request (for available interrupt, See [Table 10.4](#)) is generated, each oscillator which was operating before the transition to CPU Deep Sleep mode restarts. After all these oscillators have been stabilized, the MCU returns from CPU Deep Sleep mode to Normal mode and starts interrupt handling. When canceling the CPU Deep Sleep mode by interrupt, each power domain returns to the same power state as the state before entering the Deep Sleep state
(For available interrupt, See [Table 10.4](#))
2. Canceling by RES pin reset

When the RES pin is driven low, the MCU enters the reset state. Be sure to keep the RES pin low for the time period specified in [section 51, Electrical Characteristics](#). When the RES pin is driven high after the specified time period, the CPU starts the reset exception handling.
3. Canceling by IWDT reset

CPU Deep Sleep mode is canceled by an internal reset generated by an IWDT underflow and the MCU starts the reset exception handling. However, IWDT stops in CPU Deep Sleep mode and an internal reset for canceling CPU Deep Sleep mode is not generated in the following conditions:

 - OFS0.IWDTSTRT = 0 (auto start mode) and OFS0.IWDTSTPCTL = 1
 - OFS0.IWDTSTRT = 1 (register start mode) and IWDTCSSTPR.SLCSTP = 1
4. Canceling by WDT reset

CPU Deep Sleep mode is canceled by an internal reset generated by a WDT underflow and the MCU starts the reset exception handling. However, WDT stops in CPU Deep Sleep mode even when counting in Normal mode and an internal reset for canceling CPU Deep Sleep mode is not generated in the following conditions:

 - OFS0.WDTSTRT = 0 (auto start mode) and OFS0.WDTSTPCTL = 1

- `OFS0.WDTSTRT = 1` (register start mode) and `WDTCSSTPR.SLCSTP = 1`
5. Canceling by other resets available in CPU Deep Sleep mode
CPU Deep Sleep mode is canceled by other resets and the MCU starts the reset exception handling.

Note: For details on proper setting of the interrupts, see [section 13, Interrupt Controller Unit \(ICU\)](#)

For CPU Deep Sleep mode cancellation, there is a procedure according to the CPUCLK frequency. For details, see [section 10.8.10. Notes on transitioning to or canceling low power state.](#)

10.7.3 Software Standby Mode

10.7.3.1 Transition to Software Standby Mode

When a WFI instruction is executed while `LPSCR.LPMD` bit is 0x4 and `CPU0.SCR.SLEEPDEEP` bit is 1, the MCU enters Software Standby mode depending on `LPSCR.LPMD` setting. It must be set `MOCOCR.MCSTP` to 0 (MOCO is operated) before executed the WFI instruction to entry this mode.

In this mode, the CPU, most of the on-chip peripheral functions and most of the oscillators stop^{*1}. However, the contents of the CPU internal registers and SRAM data, the states of on-chip peripheral functions and the I/O ports are retained. Software Standby mode allows significant reduction in power consumption because most of the oscillators stops^{*1} in this mode. [Table 10.3](#) shows the status of each on-chip peripheral functions and oscillators. Available resets or interrupts in Software Standby mode make the MCU to return to Normal mode. See [Table 10.4](#) for available interrupt sources for each mode. In case of using an interrupt to return to Normal mode, corresponding `IELSRn` register must be set before executing a WFI instruction. For the detail, see [section 13, Interrupt Controller Unit \(ICU\)](#).

Note 1. The state of the oscillators depends on the setting of the control register for each oscillator. For details, refer to the chapter of clock generation circuit.

The status of address bus and bus control signals in Software Standby mode can be selected by `SBYCR.OPE` bit. The `SBYCR.OPE` bit specifies whether to set to the high-impedance state or to retain the output of the address bus and bus control signals in Software Standby mode.

Clear `DMAST.DMST` bit and `DTCST.DTCST` bit to 0 before executing WFI instruction.

Counting by `IWDT` stops when the MCU enters Software Standby mode while the `IWDT` is in auto start mode and the `OFS0.IWDTSTPCTL` bit is 1 (`IWDT` stops in Software Standby mode). Similarly, counting by `IWDT` stops when the MCU enters Software Standby mode while the `IWDT` is in register start mode and the `SLCSTP` bit in `IWDTCSSTPR` is 1 (`IWDT` stops in Software Standby mode).

Counting by `IWDT` continues when the MCU enters Software Standby mode while the `IWDT` is in auto start mode and the `OFS0.IWDTSTPCTL` bit is 0 (`IWDT` does not stop in Software Standby mode). Similarly, counting by `IWDT` continues when the MCU enters Software Standby mode while the `IWDT` is in register start mode and the `SLCSTP` bit in `IWDTCSSTPR` is 0 (`IWDT` does not stop in Software Standby mode).

`WDT` stops counting when the MCU enters Software Standby mode because the `PCLK` stops.

Do not enter Software Standby mode while the flash memory is in programming or erasing procedure. In order to enter Software Standby mode, execute a WFI instruction after programming or erasing procedure completes.

In External VDD mode, do not enter Software Standby Mode.

[Table 10.10](#) shows the setting of the related control bits and the modes to enter after executing WFI instruction.

Table 10.10 Setting of the bits what affect the mode after executing WFI instruction

		Setting mode of LPSCR.LPMD bit and CPU.SCR.SLEEPDEEP bit			
		Software Standby	Deep Software Standby 1	Deep Software Standby 2	Deep Software Standby 3
		(LPSCR.LPMD = 0x4, CPU0.SCR.SLEEPDEEP = 1)	(LPSCR.LPMD = 0x8, CPU0.SCR.SLEEPDEEP = 1)	(LPSCR.LPMD = 0x9, CPU0.SCR.SLEEPDEEP = 1)	(LPSCR.LPMD = 0xA, CPU0.SCR.SLEEPDEEP = 1)
FENTRYR.FENTRYC FENTRYR.FENTRYD	0	Software Standby	Deep Software Standby 1	Deep Software Standby 2	Deep Software Standby 3
	1	CPU Deep Sleep mode and Keep System Active	CPU Deep Sleep mode and Keep System Active	CPU Deep Sleep mode and Keep System Active	CPU Deep Sleep mode and Keep System Active
OFS0.IWDTSTPCTL (auto-start mode) IWDCSTPR.SLCSTP (register start mode)	0	Software Standby	Deep Software Standby 1	Deep Software Standby 1	Deep Software Standby 1
	1			Deep Software Standby 2	Deep Software Standby 3
PVD1CR0.RI PVD2CR0.RI	0	Software Standby	Deep Software Standby 1	Deep Software Standby 2	Deep Software Standby 3
	1			Deep Software Standby 1	Deep Software Standby 1

Note: When multiple mode transition conditions conflict, mode transition is performed according to the following priority order.
 CPU Deep Sleep mode and Keep System Active > Software Standby > Deep Software Standby 1 > Deep Software Standby 2 > Deep Software Standby 3.

For the transition to Software Standby mode, there is a procedure according to the CPUCLK frequency. For details, see [section 10.8.10. Notes on transitioning to or canceling low power state.](#)

10.7.3.2 Canceling Software Standby Mode

Software Standby mode is canceled by:

- An available interrupt shown in [Table 10.4](#)
- A reset:
 - RES pin reset
 - Power-on reset
 - Voltage monitor reset
 - Reset caused by an IWDT underflow

On exiting Software Standby mode, the oscillators that operate before the transition to the mode restart. After all the oscillators are stabilized, the MCU returns to Normal mode from Software Standby mode. See [section 13.2.15. WUPEN0 : Wake Up Interrupt Enable Register 0](#), [section 13.2.16. WUPEN1 : Wake Up interrupt enable register 1](#) for information on how to wake up the MCU from Software Standby mode.

You can cancel Software Standby mode in any of the following ways:

1. Canceling by an interrupt

When an available interrupt request (see [Table 10.4](#)) is generated, an oscillator that operates before the transition to Software Standby mode restarts. After all the oscillators are stabilized, the MCU returns to Normal mode from Software Standby mode and starts the interrupt handling.

When canceling the software standby mode by interrupt, each power domain returns to the same power state as the state before entering the software standby state.
2. Canceling by a RES pin reset

When the RES pin is driven low, the MCU enters the reset state, and the oscillators whose default status is operating, start the oscillation. Be sure to keep the RES pin low for the time period specified in [section 51, Electrical Characteristics](#). When the RES pin is driven high after the specified time period, the CPU starts the reset exception handling.
3. Canceling by a power-on reset

Software Standby mode is canceled by a power-on reset and the MCU starts the reset exception handling.

4. Canceling by a voltage monitor reset

Software Standby mode is canceled by a voltage monitor reset from the voltage detection circuit and the MCU starts the reset exception handling.

5. Canceling by IWDTC reset

Software Standby mode is canceled by an internal reset generated by an IWDTC underflow and the MCU starts the reset exception handling. However, IWDTC stops in Software Standby mode and an internal reset for canceling Software Standby mode is not generated in the following condition:

- OFS0.IWDTCSTRT = 0 (auto start mode) and OFS0.IWDTCSTPCTL = 1
- OFS0.IWDTCSTRT = 1 (register start mode) and IWDTCSTPR.SLCSTP = 1

For Software Standby mode cancellation, there is a procedure according to the CPUCLK frequency. For details, see [section 10.8.10. Notes on transitioning to or canceling low power state](#)

10.7.3.3 Example of Software Standby Mode Application

[Figure 10.3](#) shows an example of entry to Software Standby mode on detection of a falling edge of the IRQn pin, and exit from Software Standby mode by a rising edge of the IRQn pin.

In this example, an IRQn pin interrupt is accepted with the IRQCRi.IRQMD[1:0] (i = 0 to 15) bits of the ICU set to 00b (falling edge) in Normal mode, and the IRQCRi.IRQMD[1:0] bits are set to 01b (rising edge). Then, if MOCO is not operated, it must set MOCO.CR.MCSTP to 0 (MOCO is operated). After that, the LPSCR.LPMD bit is set to 0x4 and CPU.SCR.SLEEPDEEP bit is set to 1, and then a WFI instruction is executed. As a result, entry to Software Standby mode completes and exit from Software Standby mode is initiated by a rising edge of the IRQn pin.

Setting the ICU is also required to exit Software Standby mode. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#). The oscillation stabilization time in [Figure 10.3](#) is specified in [section 51, Electrical Characteristics](#).

Figure 10.3 Example of Software Standby mode application

10.7.4 Deep Software Standby Mode

10.7.4.1 Transition to Deep Software Standby Mode

When a WFI instruction is executed while LPSCR.LPMD bit is 0x8, 0x9, 0xA and CPU.SCR.SLEEPDEEP bit is 1, the MCU enters Deep Software Standby mode 1 or 2 or 3 depending on LPSCR.LPMD setting. It must be set MOCO.CR.MCSTP to 0 (MOCO is operated) before executed the WFI instruction to entry this mode. See [Table 10.10](#) for the setting of the related control bits.

In these mode, the CPU, on-chip peripheral functions, SRAM, and oscillators are almost stopped as shown in [Table 10.3](#). Furthermore, since the internal power supply to these inactive modules is stopped, power consumption is remarkably reduced. The contents of all the registers of the CPU and specific internal peripheral modules become undefined. [Table 10.3](#) shows the status of each on-chip peripheral functions and oscillators.

Data in the standby SRAM are preserved in Deep Software Standby mode 1. When OFS1(_SEC).PVDAS = 0 and OFS1(_SEC).PVDLPSEL = 0, the low-power-consumption function of PVD0 is enabled, so power consumption is further reduced. In Deep Software Standby mode 2, the internal supply of power to the standby SRAM, the USB resume detecting unit and IWDT are cut off, reducing power consumption. Data in the standby SRAM become undefined at this time. When OFS1(_SEC).PVDAS = 0 and OFS1(_SEC).PVDLPSEL = 0, the low-power-consumption function of PVD0 is enabled, so power consumption is further reduced. In Deep Software Standby mode 3, the PVD is also stopped. For details, see [section 51, Electrical Characteristics](#).

Clear DMAST.DMST bit and DTCST.DTCST bit to 0 before executing WFI instruction.

When the MCU enters Deep Software Standby mode 2 or 3 while the IWDT is in auto-start mode and the OFS0.IWDTSTPCTL bit is 1, power supply to the LOCO and the IWDT is cut off. Counting by the IWDT also stops.

When the IWDT is in auto-start mode and the OFS0.IWDTSTPCTL bit is 0, the MCU enters Deep Software Standby mode 1 instead of Deep Software Standby mode 2 or 3, regardless of the setting in the LPSCR.LPMD.

When the IWDT is in register start mode and the IWDTCSTPR.SLCSTP is 0, the MCU enters Deep Software Standby mode 1 instead of Deep Software Standby mode 2 or 3, regardless of the setting in the LPSCR.LPMD.

Do not enter Deep Software Standby mode while the flash memory is in programming or erasing procedure. In order to enter Deep Software Standby mode, execute a WFI instruction after programming or erasing procedure completes.

In External VDD mode, do not enter Deep Software Standby mode.

When PVDnCR0.RI (n = 1, 2) = 1 (selecting the voltage monitor n reset), the MCU enters Deep Software Standby mode 1 instead of Deep Software Standby mode 2 or 3, regardless of the setting in the LPSCR.LPMD. The I/O port states are same as Software Standby mode.

For the transition to Deep Software Standby mode, there is a procedure according to the CPUCLK frequency. For details, see [section 10.8.10. Notes on transitioning to or canceling low power state](#)

10.7.4.2 Canceling Deep Software Standby Mode

Deep Software Standby mode is canceled by:

- An available interrupt shown in [Table 10.4](#)
- A reset:
 - RES pin reset
 - Power-on reset
 - Voltage monitor reset
 - Reset caused by an IWDT underflow

1. Canceling by an interrupt

Canceling by interrupts is controlled by DPSIERn (n = 0 to 3) and DPSIFRn (n = 0 to 3). When a Deep Software Standby Canceling interrupt is generated, the corresponding flag in DPSIFRn is set to 1. If the interrupt is enabled in DPSIERn, Deep Software Standby mode is canceled. Rising edge or falling edge can be selected by DPSIEGRn (n = 0 to 2). The interrupts for which an edge can be selected are the NMI, IRQ0-DS to IRQ15-DS, voltage monitor n (n = 1, 2) interrupts. When a Deep Software Standby mode canceling request occurs, the internal power is supplied and MOCO starts oscillating, and then the internal reset (Deep Software Standby reset) is generated for the entire MCU.

The stable MOCO clock is then supplied to the entire MCU and Deep Software Standby reset is canceled. And the MCU starts reset exception handling.

When Deep Software Standby mode is canceled by an external interrupt pin or internal interrupt signal, the RSTSR0.DPSRSTF flag is set to 1.

2. Canceling by RES pin reset

When the RES pin is driven low, the MCU cancels Deep Software Standby mode and enters the reset state. Make sure to keep RES pin low for the time period specified in the chapter of Electrical Specification. When RES pin is driven high after the specified time period, the CPU starts the reset exception handling.

3. Canceling by a power-on reset

Deep Software Standby mode is canceled by a power-on reset and the MCU starts the reset exception handling.

4. Canceling by a voltage monitor 0 reset

Deep Software Standby mode is canceled by a voltage monitor 0 reset from the voltage detection circuit and the MCU starts the reset exception handling.

5. Canceling by a voltage monitor n reset (n = 1, 2)

Deep Software Standby mode 1 is canceled by a voltage monitor n reset (n= 1,2) from the voltage detection circuit and the MCU starts the reset exception handling.

6. Canceling by a IWDTC reset

Deep Software Standby mode 1 is canceled by a IWDTC reset (an internal reset generated by IWDTC underflow) and the MCU starts the reset exception handling.

However, IWDTC stops in Deep Software Standby mode 1 and a IWDTC reset for Canceling Deep Software Standby mode 1 is not generated in the following conditions:

- OFS0.IWDTCSTRT = 0 (auto start mode) and OFS0.IWDTCSTPCTL = 1
- OFS0.IWDTCSTRT = 1 (register start mode) and IWDTCSTPR.SLCSTP = 1

10.7.4.3 Pin States when Deep Software Standby mode is Canceled

In Deep Software Standby mode, the I/O ports retain the same states as before transition to the Deep Software Standby mode. The MCU is initialized by an internal reset generated when Deep Software Standby mode is canceled. Upon cancellation of Deep Software Standby mode, the reset exception handling starts immediately.

Whether to initialize the I/O ports or to retain the I/O port states as before transition to the Deep Software Standby mode can be selected by the DPSBYCR.IOKEEP bit.

- When the DPSBYCR.IOKEEP bit = 0

I/O ports are initialized by an internal reset generated when Deep Software Standby mode is canceled.

- When the DPSBYCR.IOKEEP bit = 1

Although the MCU is initialized by an internal reset generated when Deep Software Standby mode is canceled, I/O ports retain their states as before transition to the Deep Software Standby mode regardless of the MCU internal state. At this time, the I/O port states remain unchanged as before transition to the Deep Software Standby mode even if settings of I/O ports or peripheral modules are made. Then, the retained I/O port states are released by clearing the DPSBYCR.IOKEEP bit to 0, and the MCU operates according to the internal state.

The DPSBYCR.IOKEEP bit is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode.

10.7.4.4 Example of Deep Software Standby Mode Application

(1) Entering and exiting Deep Software Standby mode

Figure 10.4 shows an example where a transition to Deep Software Standby mode is made at the falling edge of the IRQn-DS pin, and exiting Deep Software Standby mode is made at the rising edge of the IRQn-DS pin. In this example, an IRQn interrupt is accepted with the IRQCRi.IRQMD[1:0] bits of the ICU set to 00b (falling edge). If MOCO is not operated, it must set MOCO.CR.MCSTP to 0 (MOCO is operated).

Then, after the DPSIEGRy.DIRQnEG (y = 0 or 1, n = 0 to 15) bit is set to 1 (rising edge) and the LPSCR.LPMD bit is set to 0x8 or 0x9 or 0xA and CPU.SCR.SLEEPDEEP bit is set to 1, the WFI instruction is executed. Thus a transition to Deep Software Standby mode is made. After that, exiting Deep Software Standby mode is made at the rising edge of the IRQn-DS pin.

Figure 10.4 Example of Deep Software Standby mode application

10.7.4.5 Usage Flow for Deep Software Standby Mode

Figure 10.5 shows an example flow for using Deep Software Standby mode.

In this example, the RSTSR0.DPSRSTF flag of the reset function is read after the reset exception handling to determine whether a reset was generated by the RES pin or by the cancellation of Deep Software Standby mode.

For a reset by the RES pin, the MCU transitions to Deep Software Standby mode after the required register settings are made.

For a reset by cancellation of Deep Software Standby mode, the DPSBYCR.IOKEEP bit is cleared to 0 after the I/O port settings are made.

Figure 10.5 Example flow for using Deep Software Standby mode

10.8 Usage Notes

10.8.1 Register Access

(1) Invalid register write accesses during specific modes or transitions:

Do not write to registers under any of the conditions listed in this section.

[Registers]

- All registers with a peripheral name of “SYSTEM”.

[Conditions]

- OPCCR.OPCMTSF = 1 (during transition of operating power control mode)

- FENTRYR.FENTRYi = 1 (i = 0 to 3) or FENTRYR.FENTRYD = 1 (Flash P/E mode, dataFlash P/E mode)
- During the time period from executing a WFI instruction to returning to Normal mode

(2) Valid setting for the clock-related registers

Table 10.11 and Table 10.12 shows the valid setting of the clock related registers in each operating power control mode. Do not write any value other than the valid setting. Also, each register has some prohibited settings under certain condition other than the operating power control modes. See section 8, [Clock Generation Circuit](#) for another condition of each register.

Table 10.11 Valid setting of the clock related registers(1)

Mode	Valid settings		
	SCKSCR.CKSEL[2:0] CKOCR.CKOSEL[2:0]	PLLCR.PLLSTP	PLL2CR.PLL2STP
High-speed	000b (HOCO) 001b (MOCO) 010b (LOCO) ^{*2} 011b (MOSC) 100b (SOSC) 101b (PLL1P) ^{*1}	0 (operating) 1 (stop)	0 (operating) 1 (stop)
Low-speed	000b (HOCO) 001b (MOCO) 010b (LOCO) ^{*2} 011b (MOSC) 100b (SOSC)	1 (stop)	1 (stop)

Note 1. SCKSCR.CKSEL[2:0] only

Note 2. CKOCR.CKOSEL[2:0] only

Table 10.12 Valid setting of the clock related registers (2)

Operating oscillator	Valid settings
	OPCCR.OPCM[1:0]
PLL1, PLL2	00b
High-speed on-chip oscillator	00b, 11b
Middle-speed on-chip oscillator	
Main clock oscillator	
Low-speed on-chip oscillator	
Sub-clock oscillator	

(3) Invalid register write accesses by the DTC or DMAC

Do not write to registers listed in this section by the DTC or DMAC.

[Registers]

- MSTPCRA
- MSTPCRB
- MSTPCRC
- MSTPCRD
- MSTPCRE

(4) Invalid write access when PRCR.PRC1 is 0

Write access to the registers listed below is invalid when PRCR.PRC1 bit is 0.

[Registers]

- OPCCR
- PDCTRGD
- PDRAMSCRn

- SBYCR
- SSCR1
- LPSCR
- DPSBYCR
- DPSIER_n
- DPSIFR_n
- DPSIEGR_n
- PLL1LDOSCR
- PLL2LDOSCR
- HOCOLDOSCR
- LVOCR

(5) Invalid write access when PRCR.PRC4 is 0

Write access to the registers listed below is invalid when PRCR.PRC4 bit is 0.

[Registers]

- LPMSAR
- PGCSAR
- DPFSAR
- RSCSAR

10.8.2 I/O Port States

I/O port states in Software Standby mode, Deep Software Standby mode are as same as before entering the modes. Therefore, the supply current is not reduced while output signals are held high.

10.8.3 Module-Stop State of DMAC and DTC

Before writing 1 to MSTPCRA.MSTPA22, clear the DMAST.DMST bit of the DMAC and the DTCST.DTCST bit of the DTC to 0. For details, see [section 16, DMA Controller \(DMAC\)](#) and [section 17, Data Transfer Controller \(DTC\)](#)

10.8.4 Internal Interrupt sources

Interrupts do not operate in the module-stop state. If setting module-stop bit while an interrupt request is generated, a CPU interrupt source or a DMAC or DTC startup source cannot be cleared. For this reason, make sure to disable the corresponding interrupts before setting the module-stop bits.

10.8.5 Input Buffer Control by DIRQnE Bit

Setting the DPSIER_y.DIRQnE ($y = 0$ or 1 , $n = 0$ to 15) bit to 1 enables the input buffer of the IRQ0-DS to IRQ15-DS pins. Note that, although inputs to these pins are sent to the DPSIFR_y.DIRQnF ($y = 0$ or 1 , $n = 0$ to 15) bits, they are not sent to the interrupt controller, peripheral modules, and I/O ports.

10.8.6 Transition to Low Power Modes

Since the MCU does not support wakeup by event, do not enter low power modes (CPU Sleep mode, CPU Deep Sleep mode, Software Standby mode, or Deep Software Standby mode) by executing a WFE instruction.

10.8.7 Timing of WFI Instructions

It is possible for the WFI instruction to be executed before I/O register and CS/SDRAM area writes are complete, in which case operation may not be as intended. This can happen if the WFI is placed immediately after a write to a I/O register and CS/SDRAM area. To avoid this problem it is advisable to read back the register and CS/SDRAM area that was written to confirm that the write has completed.

10.8.8 Writing WDT/IWDT registers by DMAC or DTC

Do not write registers in WDT or IWDT by DMAC or DTC while WDT or IWDT stops by entering Processor low power mode.

10.8.9 Module stop bit write timing

It is possible that the access to I/O register may be executed before the corresponding module stop bit write is completed. In this case, the access to I/O register may not proceed as intended. To avoid this issue, before accessing I/O register, read back the module stop bit that was written to confirm that the write completed.

10.8.10 Notes on transitioning to or canceling low power state

Transitioning to/returning from the low power state requires procedures according to the CPUCLK frequency.

These flows are shown in [Figure 10.6](#), [Figure 10.7](#) and [Figure 10.8](#). It is recommended to use software to measure the wait time. Be sure to consider the worst-case conditions to ensure that the required wait time elapses. If an interrupt is unavoidably generated during the wait time, retry the measurement after return from the interrupt

Figure 10.6 Additional flow for the transition to CPU Sleep mode, CPU Deep Sleep mode, Software Standby mode and Deep Software Standby mode 1/2/3 according to CPUCLK frequency

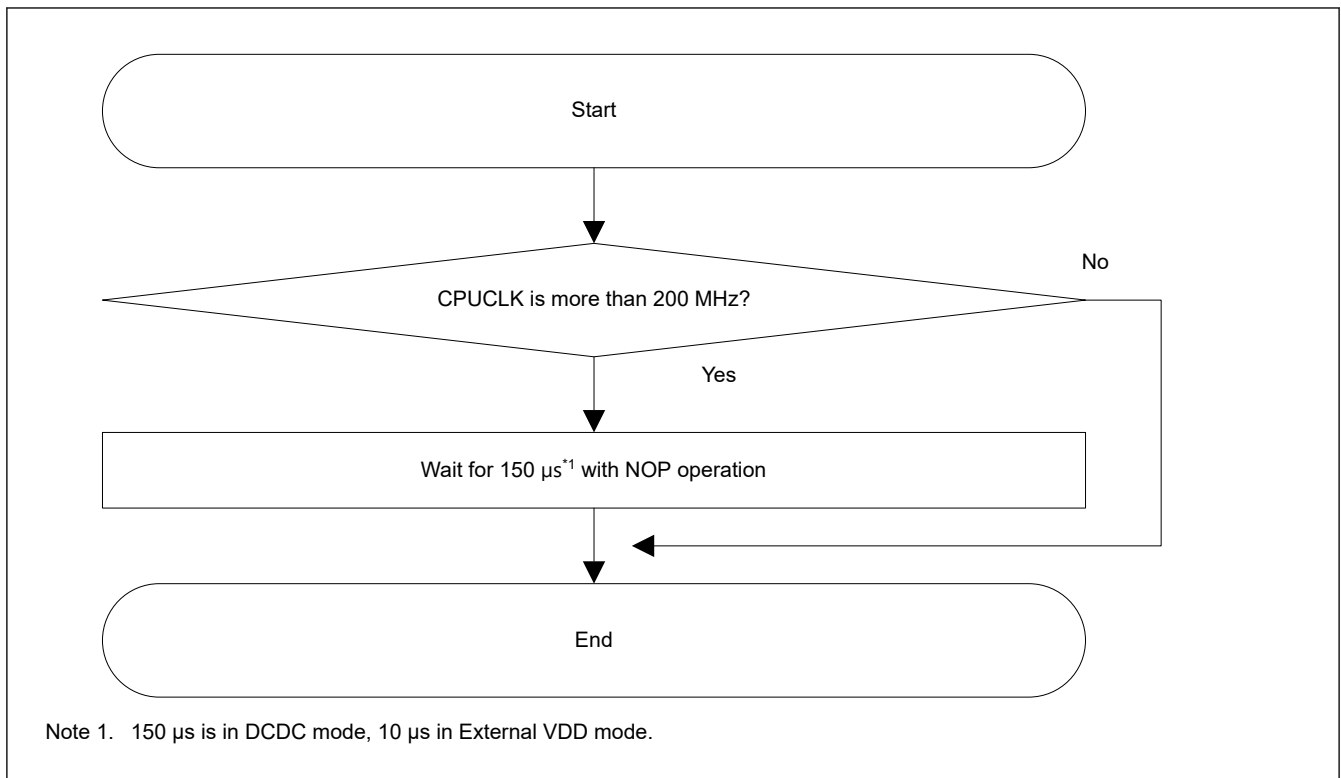

Figure 10.7 Additional flow for the return from CPU Deep Sleep mode according to CPUCLK frequency

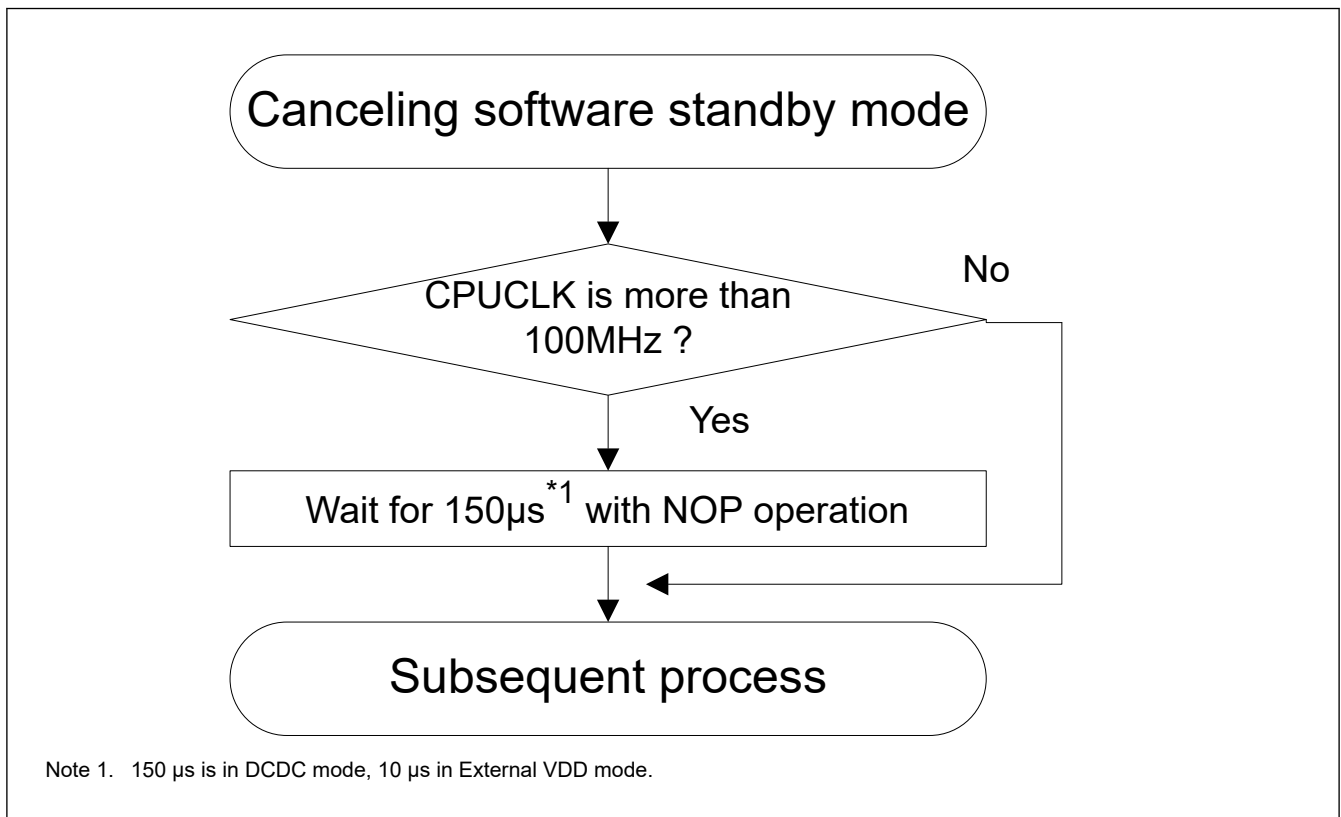

Figure 10.8 Additional flow for the canceling software standby mode

11. Battery Backup Function

11.1 Overview

The MCU provides a battery backup function that maintains partial battery powering in the event of a power loss. Switching between VCC and VBATT, the battery-powered area includes RTC, SOSC, backup register, tamper detection and VBATT_R voltage drop detection. VBATT_R is the output voltage of the battery power supply switch. This is the power supply of the battery powered area.

During normal operation, the battery-powered area is powered by the main power supply, the VCC pin. When a VCC voltage drop is detected, the power source switches to the dedicated battery backup power pin, the VBATT pin. When the voltage rises again, the power source switches back from VBATT to VCC.

11.1.1 Battery backup function block diagram

[Figure 11.1](#) shows the configuration of the battery backup function.

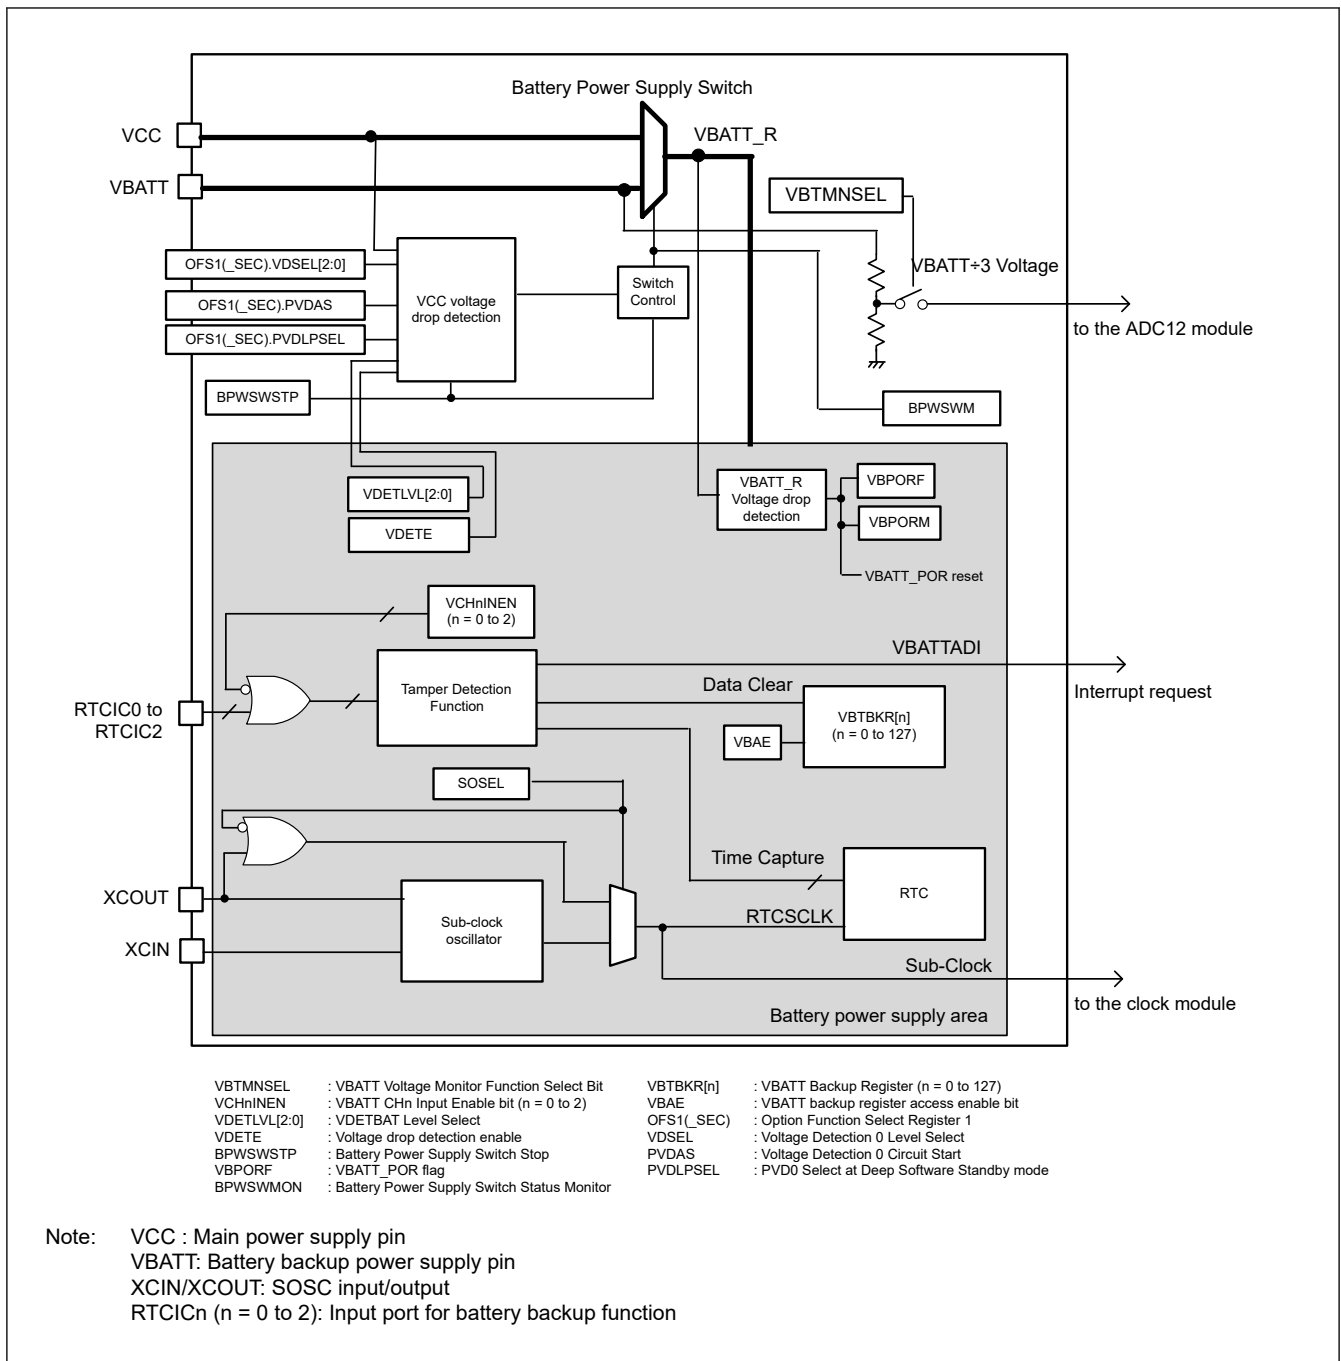

Figure 11.1 Battery Backup Function block diagram

11.1.2 Features of Battery Backup Function

The features include:

- Battery power supply switch
- VBATT_R voltage drop detection function
- Backup registers
- Time capture pin detection
- Tamper Detection function
- VBATT voltage monitor function

11.1.3 Battery Power Supply Switch

When the voltage applied to the VCC pin drops, this feature switches the power supply from the VCC pin to the VBATT pin. When the voltage rises, it switches the power supply from the VBATT pin back to the VCC pin.

When VCC is lower than VDET_{BATT}, and VCC is higher than VBAT, the injected current connects from the VCC to the VBATT pin through an internal diode. If the power supply battery connected to the VBATT pin cannot support this current injection, for example if the battery is not rechargeable, Renesas strongly recommends that you connect through a low-voltage threshold diode between the power supply battery and the VBATT pin.

It is necessary to enable voltage monitor 0 resets to use the battery backup function. The voltage monitor 0 level must be higher than the VBATT switch level.

11.1.4 VBATT_R voltage drop detection function

VBATT_R voltage drop detection function supports the battery-powered area. This function monitors the VBATT_R voltage level. VBATT_R is the output voltage of the battery power supply switch. This voltage drop detection causes a VBATT_POR reset and initializes the battery-powered area. See details in each register description. The VBATT status register includes a flag to check for this voltage drop detections.

11.1.5 Backup Registers

The battery-powered area provides 128-byte backup registers. These registers retain data when VBATT is supplied and VCC is powered off. When tampering is detected, data of backup register can be cleared to 0x00.

11.1.6 Time Capture Function

The RTC detects RTCIC_n (n = 0 to 2) pin input level change. For more information, see [section 24, Realtime Clock \(RTC\)](#).

11.1.7 Tamper Detection Function

The tamper detection function detects the RTCIC_n (n = 0 to 2) pin input event. The input event is defined as a change of RTCIC_n (n = 0 to 2) pin input level. The tamper detection flag is set to 1 by the input event. When interrupt is enabled and flag is set to 1, tamper detection interrupt is generated. When backup registers clear is enabled and flag is set to 1, the data of backup registers is cleared. Time Capture Function can select this flag as the source of the time capture trigger.

11.1.8 VBATT Voltage Monitor Function

VBATT voltage monitor function is to monitor the input voltage level to the VBATT pin. The voltage level can be monitored as analog signal. For more information, see [section 40, 12-Bit A/D Converter \(ADC12\)](#).

11.2 Register Descriptions

11.2.1 BBFSAR : Battery Backup Function Security Attribute Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x3D0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	NONS EC4	NONS EC3	NONS EC2	NONS EC1	NONS EC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NONSEC0	Non Secure Attribute bit 0 Target register: VBATTMNSCLR 0: Secure 1: Non Secure	R/W
1	NONSEC1	Non Secure Attribute bit 1 Target register: VBTBER 0: Secure 1: Non Secure	R/W
2	NONSEC2	Non Secure Attribute bit 2 Target register: VBTICTLR, VBTICTLR2, VBTIMONR 0: Secure 1: Non Secure	R/W
3	NONSEC3	Non Secure Attribute bit 3 Target register: VBTBPCR1, VBTBPCR2, VBTBPSR 0: Secure 1: Non Secure	R/W
4	NONSEC4	Non Secure Attribute bit 4 Target register: VBTADSR, VBTADCR1, VBTADCR2 0: Secure 1: Non Secure	R/W
31:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

Note: This register is write-protected by PRCR register.

The BBFSAR register controls the secure attribute of the battery backup function registers.

NONSEC0 bit (Non Secure Attribute bit 0)

This bit controls the security attribute of VBATTMNSCLR.

NONSEC1 bit (Non Secure Attribute bit 1)

This bit controls the security attribute of VBTBER.

NONSEC2 bit (Non Secure Attribute bit 2)

This bit controls the security attribute of VBTICTLR, VBTICTLR2, and VBTIMONR.

NONSEC3 bit (Non Secure Attribute bit 3)

This bit controls the security attribute of VBTBPCR1 and VBTADCR2.

NONSEC4 bit (Non Secure Attribute bit 4)

This bit controls the security attribute of VBTADSR, VBTADCR1 and VBTADCR2.

11.2.2 VBR SABAR : VBATT Backup Register Security Attribute Boundary Address Register

Base address: SYSC = 0x4001_E000

Offset address: 0x3B0

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Value after reset: 1 1 1 1 1 1 1 1 1 1 1 1 0 0 0 0

Bit	Symbol	Function	R/W
15:0	SABA[15:0]	Boundary address between secure and non-secure	R/W

Note: S-TYPE-6, P-TYPE-2

VBRSABAR specify the boundary address between Secure and Non-secure regions of VBATT Backup Register. This register specifies lower 16 bits of VBATT Backup Register address. Secure region is less than SABA. non-secure region is SABA or higher. The boundary address can set in units of 32 byte, so the value written from b4 to b0 should be 0. SABA has no effect other than VBATT backup register.

VBATT Backup register is separated as follows.

Secure region : $0x4001_ED00 \leq \text{Address} < 0x4001_0000 + \text{SABA}$

Non-secure region : $0x4001_0000 + \text{SABA} \leq \text{Address}$

The initial value specifies an address greater than the end address of VBATT Backup Register, so all area is Secure.

If you specify all area of the VBATT Backup Register as non-secure, specify the top address in the VBATT Backup Register area.

11.2.3 VBRPABARS : VBATT Backup Register Privilege Attribute Boundary Address Register for Secure Region

Base address: SYSC = 0x4001_E000

Offset address: 0x3B4

Bit	Symbol	Function	R/W
15:0	PABAS[15:0]	Boundary address between privileged and unprivileged.	R/W

Note: S-TYPE-6, P-TYPE-2

VBRPABARS specify the boundary address between Privileged and Unprivileged areas in Secure region of VBATT Backup Register. This register further separates the Secure region of VBATT Backup Register set by VBRSABAR register into Privileged and Unprivileged areas. This register specifies lower 16 bits of VBATT Backup Register address. Privileged area is less than PABAS. Unprivileged area is PABAS or higher. The boundary address can set in units of 32byte, so the value written from b4 to b0 should be 0. PABAS has no effect other than VBATT backup register.

VBATT Backup register is separated as follows.

Privileged area in Secure region : $0x4001_ED00 \leq \text{Address} < 0x4001_0000 + \text{PABAS}$
 $0x4001_ED00 \leq \text{Address} < 0x4001_0000 + \text{SABA}$

This area that satisfies both address conditions.

Unprivileged area in Secure region : $0x4001_0000 + \text{PABAS} \leq \text{Address} < 0x4001_0000 + \text{SABA}$

The initial value specifies before the top address of the VBATT Backup Register, so all the Secure region is Unprivileged. In this case, the setting of this register is actually ignored.

If you specify Privileged for the entire VBATT Backup Register that you have set as the Secure region, specify VBRPABARS register to the 0xFFE0 .

This is to narrow the verification space of the target specification base verification.

11.2.4 VBRPABARNS : VBATT Backup Register Privilege Attribute Boundary Address Register for Non-secure Region

Base address: SYSC_NS = 0x5001_E000

Offset address: 0x3B8

Bit	Symbol	Function	R/W
15:0	PABANS[15:0]	Boundary address between privileged and unprivileged.	R/W

Note: S-TYPE-7, P-TYPE-2

VBRPABARNS specify the boundary address between Privileged area and Unprivileged area in Non-secure region of VBATT Backup Register. This register further separates the Non-secure region of VBATT Backup Register set by VBRPABAR into Privileged and Unprivileged areas. This register specifies lower 16 bits of VBATT Backup Register address. Privileged area is less than PABANS. Unprivileged area is PABANS or higher. The boundary address can set in units of 32byte, so the value written from b4 to b0 should be 0. PABANS has no effect other than VBATT backup register.

VBATT Backup register is separated as follows.

Privileged area in Secure region : $0x5001_0000 + SABA \leq \text{Address} < 0x5001_0000 + PABANS$

Unprivileged area in Secure region : $0x5001_0000 + PABANS \leq \text{Address}$
 $0x5001_0000 + SABA \leq \text{Address}$

This area that satisfies both address conditions

The initial value specifies before the top address of VBATT Backup Register, so all the Non-secure region is Unprivileged. In this case, the setting of this register is actually ignored.

If you specify Privileged for the entire VBATT Backup Register that you have set as the Non-secure region, specify VBRPABARNS register to the 0xFFE0 .

This is to narrow the verification space of the target specification base verification

11.2.5 VBATTMNSCLR : Battery Backup Voltage Monitor Function Select Register

Base address: SYSC = 0x4001_E000
 SYSC_NS = 0x5001_E000

Offset address: 0xA84

Bit	Symbol	Function	R/W
0	VBTMNSEL	VBATT Voltage Monitor Function Select Bit 0: Disables VBATT voltage monitor function 1: Enables VBATT voltage monitor function	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

VBATTMNSCLR is the register which controls VBATT voltage monitor function.

This register is initialized by all reset sources except VBATT_POR reset.

VBTMNSEL bit (VBATT Voltage Monitor Function Select Bit)

Select VBATT low voltage monitor function. After setting this bit to 1, it is necessary to wait t_{MONWT} for the monitor level to stabilize.

Consumption current increases while $VBTMNSEL = 1$. So, after monitoring the VBATT voltage level, clear $VBTMNSEL$ to 0 in order to reduce power consumption of VBATT power supply.

For more information on t_{MONWT} , see [section 51, Electrical Characteristics](#)

11.2.6 VBTBER : VBATT Backup Enable Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC40

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	VBAE	—	—	—

Value after reset: 0 0 0 0 1 0 0 0

Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0. The write value should be 0.	R/W
3	VBAE	VBATT backup register access enable bit 0: Disable to access VBTBKR[n] 1: Enable to access VBTBKR[n]	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

VBAE bit is initialized by the power on reset of VCC or after transition to VBATT mode.

VBAE bit (VBATT backup register access enable bit)

You must write 1 to VBAE before accessing $VBTBKR[n]$ ($n = 0$ to 127) and you must write 0 to VBAE after finishing all access (write or read) to $VBTBKR[n]$. If you do not write 0 to VBAE, the data of $VBTBKR[n]$ is not kept in VBATT mode.

Also, while VBAE is set to 0, the value of $VBTBKR[n]$ can be retained even if the VDD power supply and VCC power supply are powered off.

To access $VBTBKR[n]$, wait for at least 500 ns after writing 1 to VBAE, and then access $VBTBKR[n]$.

Before entering the Deep Software Standby mode, you must write 0 to VBAE.

Wait at least 250 ns after writing 0 to VBAE, before entering the Deep Software Standby mode.

If it is not used $VBTBKR[n]$, It should be changed VBAE to 0 to reduce power consumption of $VBTBKR[n]$.

11.2.7 VBTBKR[n] : VBATT Backup Register (n = 0 to 127)

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xD00 + 0x001 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:								

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
7:0	n/a	VBATT Backup Register The value of this register is retained even in VBATT mode. This register is not initialized by any reset sources.	R/W

Note: S-TYPE-3, P-TYPE-3

VBTBKR[n] bits (VBATT Backup Register)

The value of this register is retained even in VBATT mode.

You can use 32, 16 or 8-bit access instruction when accessing the VBTBKR[n] register. When accessing, please note that the byte order of the data stored in the VBTBKR[n] register is little endian.

The data of VBTBKR[n] register is cleared to 0x00 by VBATT_POR reset or tamper detection function.

Table 11.1 Address of VBATT Backup Register for Secure Region

Address	Symbol
0x4001_ED00 to 0x4001_ED0F	VBTBKR[0] to VBTBKR[15]
0x4001_ED10 to 0x4001_ED1F	VBTBKR[16] to VBTBKR[31]
0x4001_ED20 to 0x4001_ED2F	VBTBKR[32] to VBTBKR[47]
0x4001_ED30 to 0x4001_ED3F	VBTBKR[48] to VBTBKR[63]
0x4001_ED40 to 0x4001_ED4F	VBTBKR[64] to VBTBKR[79]
0x4001_ED50 to 0x4001_ED5F	VBTBKR[80] to VBTBKR[95]
0x4001_ED60 to 0x4001_ED6F	VBTBKR[96] to VBTBKR[111]
0x4001_ED70 to 0x4001_ED7F	VBTBKR[112] to VBTBKR[127]

11.2.8 VBTICTLR : VBATT Input Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC4C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	VCH2INEN	VCH1INEN	VCH0INEN

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	VCH0INEN	VBATT CH0 Input Enable 0: RTCIC0 input disable 1: RTCIC0 input enable	R/W
1	VCH1INEN	VBATT CH1 Input Enable 0: RTCIC1 input disable 1: RTCIC1 input enable	R/W
2	VCH2INEN	VBATT CH2 Input Enable 0: RTCIC2 input disable 1: RTCIC2 input enable	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: Note: S-TYPE-3, P-TYPE-2

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

VBTICTLR is the register that can select RTCICn (n = 0 to 2) pin as input. This register is only initialized by VBATT_POR reset.

VCHnINEN bits (VBATT CHn Input Enable Bits) (n = 0 to 2)

The VCHnINEN bits enable the input direction on the RTCICn. A wait time of 50 μs is required for the operation to stabilize after the RTCICn pin input is enabled. If VCC voltage of the MCU is lower than 1.8V and these bits are set to 1, RTC registers and VBTBKR[n] (n = 0 to 127) can be accessed 20 μs after the setting of this bit.

11.2.9 VBTICTLR2 : VBATT Input Control Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC4D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	VCH2 EG	VCH1 EG	VCH0 EG	—	VCH2 NCE	VCH1 NCE	VCH0 NCE

Value after reset: 0 1 1 1 0 0 0 0

Bit	Symbol	Function	R/W
0	VCH0NCE	VBATT CH0 Input Noise Canceler Enable 0: RTCIC0 pin input noise canceler disable 1: RTCIC0 pin input noise canceler enable	R/W
1	VCH1NCE	VBATT CH1 Input Noise Canceler Enable 0: RTCIC1 pin input noise canceler disable 1: RTCIC1 pin input noise canceler enable	R/W
2	VCH2NCE	VBATT CH2 Input Noise Canceler Enable 0: RTCIC2 pin input noise canceler disable 1: RTCIC2 pin input noise canceler enable	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	VCH0EG	VBATT CH0 Input Edge Select 0: RTCIC0 pin input event is detected on falling edge 1: RTCIC0 pin input event is detected on rising edge	R/W
5	VCH1EG	VBATT CH1 Input Edge Select 0: RTCIC1 pin input event is detected on falling edge 1: RTCIC1 pin input event is detected on rising edge	R/W
6	VCH2EG	VBATT CH2 Input Edge Select 0: RTCIC2 pin input event is detected on falling edge 1: RTCIC2 pin input event is detected on rising edge	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

VBTICTLR2 is the register that can select RTCICn (n = 0 to 2) pin input mode. This register is only initialized by VBATT_POR reset.

VCHnNCE bits (VBATT CHn Input Noise Canceler Enable) (n = 0 to 2)

The VCHnNCEN bit enables the input noise canceler on the RTCICn (n = 0 to 2) pin input.

VCHnEG bits (VBATT CHn Input Edge Select) (n = 0 to 2)

The VCHnEG bit selects input event detection edge to set VBTADF_n flag.

11.2.10 VBTIMONR : VBATT Input Monitor Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC4E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	VCH2 MON	VCH1 MON	VCH0 MON

Value after reset: 0 0 0 0 0 0 x x x

Bit	Symbol	Function	R/W
0	VCH0MON	VBATT CH0 Input monitor 0: RTCIC0 pin input is low level 1: RTCIC0 pin input is high level.	R
1	VCH1MON	VBATT CH1 Input monitor 0: RTCIC1 pin input is low level 1: RTCIC1 pin input is high level.	R
2	VCH2MON	VBATT CH2 Input monitor 0: RTCIC2 pin input is low level 1: RTCIC2 pin input is high level.	R
7:3	—	These bits are read as 0.	R

Note: S-TYPE-3, P-TYPE-2

VBTIMONR is the register that can monitor RTCICn (n = 0 to 2) pin input level.

VCHnMON bits (VBATT CHn Monitor) (n = 0 to 2)

The VCHnMON bit indicates input level on the RTCICn (n = 0 to 2) pin.

11.2.11 VBTBPCR1 : VBATT Battery Power Supply Control Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA88

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	BPWS WSTP

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	BPWSWSTP	Battery Power Supply Switch Stop 0: Battery power supply switch enable 1: Battery power supply switch stop	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The VBTBPCR1 register controls battery power supply switch. This register is initialized by all reset sources except Deep Software Standby reset and VBATT_POR reset.

BPWSWSTP bit (Battery Power Supply Switch Stop)

The BPWSWSTP bit can enable switching the backup module supply power source from VCC to VBATT when the voltage applied to the VCC pin drops.

When stop is selected, the battery backup module power supply is always from VCC. Set the VDETE bit to 0 after setting the BPWSWSTP bit to 1. The BPWSWSTP bit must not be set from 1 to 0 while the VDETE bit is 1. If this setting is made, the state of the backup power area cannot be guaranteed.

11.2.12 VBTBPCR2 : VBATT Battery Power Supply Control Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC45

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	VDET E	—	VDETLVL[2:0]		

Value after reset: 0 0 0 0 0 1 1 0

Bit	Symbol	Function	R/W
2:0	VDETLVL[2:0]	V _{DETBAT} Level Select 0 0 0: 2.80 V 0 0 1: 2.53 V 0 1 0: 2.10 V 0 1 1: 1.95 V 1 0 0: 1.85 V 1 0 1: 1.75 V 1 1 0: setting prohibited 1 1 1: setting prohibited	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	VDETE	Voltage drop detection enable 0: VCC Voltage drop detection disable 1: VCC Voltage drop detection enable	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The VBTBPCR2 register controls battery power supply switch. This register is only initialized by VBATT_POR reset.

VDETLVL[2:0] bits (V_{DETBAT} Level Select)

The VDETLVL[2:0] bit selects V_{DETBAT} level. When the voltage of the VCC pin drops below V_{DETBAT}, the power supply source switches from the VCC pin to the VBATT pin. The V_{DETBAT} level should be below Voltage monitoring 0 level.

This MCU can reduce power consumption of the Deep Software Standby mode 1 or 2. When the MCU enters the Deep Software Standby mode 1 or 2 and the low power consumption function of voltage monitor 0 is enabled by OFS1(_SEC).PVDLPSEL bit and OFS1(_SEC).PVDAS bit, the battery power supply switch is controlled by the voltage monitor 0.

The VDETLVL[2:0] bit should change while the VDETE bit is 0. The VCC voltage detection function needs t_{DETWT} wait time for stabilization at the change of V_{DETBAT} level. The VDETE bit should be set to 1 after this wait time.

For details on VDETLVL[2:0] bit, see [section 11.3.2. VBATT Battery Power Supply Switch Usage](#).

For more information on t_{DETWT}, see [section 51, Electrical Characteristics](#).

VDETE bit (Voltage drop detection enable)

The VDETE bit enables the VCC voltage drop detection function for the battery power supply switch. The initial value of the VDETE bit is 0, at this time, the VCC voltage drop detection function for the battery power supply switch is disabled. If you use the battery power supply switch function, you must select V_{DETBAT} level and enables the VCC voltage drop detection function.

For details on VDETE bit, see [section 11.3.2. VBATT Battery Power Supply Switch Usage](#).

11.2.13 VBTBPSR : VBATT Battery Power Supply Status Register

Base address: SYSC = 0x4001_E000
 SYSC_NS = 0x5001_E000

Offset address: 0xC46

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	BPWS WM	VBPO RM	—	—	—	VBPO RF
Value after reset:	0	0	x	x	0	0	0	x

Bit	Symbol	Function	R/W
0	VBPORF	VBATT_POR Flag 0: VBATT_R voltage drop is not detected 1: VBATT_R voltage drop is detected	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
4	VBPORM	VBATT_POR Monitor 0: VBATT_R voltage < V_{PDR} (BATR) 1: VBATT_R voltage > V_{PDR} (BATR)	R
5	BPWSWM	Battery Power Supply Switch Status Monitor 0: VCC voltage < $V_{DET\text{BATT}_m}$ 1: VCC voltage > $V_{DET\text{BATT}_m}$	R
7:6	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The VBTBPSR register indicate battery power supply status.

VBPORF bit (VBATT_POR Flag)

The VBPORF flag indicates that VBATT_R voltage drop was detected and VBATT_POR reset was asserted.

[Setting condition]

- When VBATT_R voltage drops below V_{PDR} (BATR).

[Clearing conditions]

- When 0 is written.

VBPORM bit (VBATT_POR Monitor)

The VBPORM bit indicates comparison result between VBATT_R and V_{PDR} (BATR).

BPWSWM bit (Battery Power Supply Switch Status Monitor)

The BPWSWM bit indicates comparison result between VCC and $V_{DET\text{BATT}_m}$ ($m = 0$ to 6).

11.2.14 VBTADSR : VBATT Tamper detection Status Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC48

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	VBTA DF2	VBTA DF1	VBTA DF0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	VBTADF0	VBATT Tamper Detection flag 0 0: RTCIC0 input edge is not detected 1: RTCIC0 input edge is detected	R/W
1	VBTADF1	VBATT Tamper Detection flag 1 0: RTCIC1 input edge is not detected 1: RTCIC1 input edge is detected	R/W
2	VBTADF2	VBATT Tamper Detection flag 2 0: RTCIC2 input edge is not detected 1: RTCIC2 input edge is detected	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The VBTADSR register indicate tamper detection function status. This register is only initialized by VBATT_POR reset.

VBTADF_n flags (VBATT Tamper Detection flag n) (n = 0, 1, 2)

The VBTADF_n ($n = 0, 1, 2$) flag indicates that RTCIC_n ($n = 0, 1, 2$) input edge is detected. The edge type of RTCIC_n ($n = 0, 1, 2$) input can be selected by VCH_nEG ($n = 0, 1, 2$) bit.

[Setting condition]

- When RTCICn (n = 0, 1, 2) input edge is detected.

[Clearing conditions]

- When 0 is written after 1 is read from VBTADFn (n = 0, 1, 2) flag.

11.2.15 VBTADCR1 : VBATT Tamper detection Control Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC49

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	VBTA DCE2	VBTA DCE1	VBTA DCE0	—	VBTA DIE2	VBTA DIE1	VBTA DIE0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	VBTDIE0	VBATT Tamper Detection Interrupt Enable 0 0: Interrupt by VBTADF0 flag is disable 1: Interrupt by VBTADF0 flag is enable	R/W
1	VBTDIE1	VBATT Tamper Detection Interrupt Enable 1 0: Interrupt by VBTADF1 flag is disable 1: Interrupt by VBTADF1 flag is enable	R/W
2	VBTDIE2	VBATT Tamper Detection Interrupt Enable 2 0: Interrupt by VBTADF2 flag is disable 1: Interrupt by VBTADF2 flag is enable	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	VBTDCE0	VBATT Tamper Detection Backup Register Clear Enable 0 0: Clear Backup Register by VBTADF0 flag is disable 1: Clear Backup Register by VBTADF0 flag is enable	R/W
5	VBTDCE1	VBATT Tamper Detection Backup Register Clear Enable 1 0: Clear Backup Register by VBTADF1 flag is disable 1: Clear Backup Register by VBTADF1 flag is enable	R/W
6	VBTDCE2	VBATT Tamper Detection Backup Register Clear Enable 2 0: Clear Backup Register by VBTADF2 flag is disable 1: Clear Backup Register by VBTADF2 flag is enable	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The VBTADCR1 register control tamper detection functions. This register is only initialized by VBATT_POR reset.

VBTDIE_n bits (VBATT Tamper Detection Interrupt Enable) (n = 0, 1, 2)

The VBTDIE_n (n = 0, 1, 2) bit enables Tamper detection interrupt.

VBTDCE_n bits (VBATT Tamper Detection Backup Register Clear Enable) (n = 0, 1, 2)

The VBTDCE_n (n = 0, 1, 2) bit enables backup register clearing by tamper detection flag.

11.2.16 VBTADCR2 : VBATT Tamper detection Control Register 2

Base address: SYSC = 0x4001_E000
 SYSC_NS = 0x5001_E000

Offset address: 0xC4A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	VBRT CES2	VBRT CES1	VBRT CES0

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	VBRTCES0	VBATT RTC Time Capture Event Source Select 0 0: RTCIC0 1: VBTADF0	R/W
1	VBRTCES1	VBATT RTC Time Capture Event Source Select 1 0: RTCIC1 1: VBTADF1	R/W
2	VBRTCES2	VBATT RTC Time Capture Event Source Select 2 0: RTCIC2 1: VBTADF2	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The VBTADCR2 register control tamper detection functions. This register is only initialized by VBATT_POR reset.

VBRTCESn bits (VBATT RTC Time Capture Event Source Select) (n = 0, 1, 2)

The VBRTCESn (n = 0, 1, 2) bit selects RTC time capture event source.

11.3 Operation

11.3.1 Battery Backup Function

When the voltage on the VCC pin drops, power can be supplied to the VBATT_R backup power area from the VBATT pin. The power supply from the VCC pin is resumed when the voltage on the VCC pin exceeds $V_{DET_BATT_m}$ (m = 0 to 6). When a drop of power supply from VCC pin is detected, backup power area enter the VBATT Mode. In the VBATT Mode, power supply is switched to VBATT pin. The power supply from the VCC pin is resumed when the voltage on the VCC pin exceeds $V_{DET_BATT_m}$ (m = 0 to 6). This power supply change does not affect the VBATT_R backup power area function.

It is necessary to enable voltage monitor 0 reset to use the battery backup

The VBATT_R backup power area include following functions:

- RTC (including time capture detection, triggered by a change of the time capture pin input level)
- Sub-clock oscillator (including XCIN and XCOOUT pins)
- VBATT Backup Register
- Tamper Detection Function
- VBATT Voltage Monitor Function

Table 11.2 shows the operating states in VBATT mode.

Table 11.2 Operating States in VBATT Mode (1 of 2)

Operating state	VBATT Mode
Transition condition	Detection of VCC voltage drop
Canceling method other than reset	Detection of VCC voltage rise
State after cancellation by an interrupt	—

Table 11.2 Operating States in VBATT Mode (2 of 2)

Operating state	VBATT Mode
State after cancellation by a reset	—
Main clock oscillator	Stop
Sub-clock oscillator	Operating or not operating can be selected by SOSCCR.SOSTP bit. The status of the oscillator is same as before entering VBATT mode.
High-speed on-chip oscillator	Stop
Middle-speed on-chip oscillator	Stop
Low-speed on-chip oscillator	Stop
PLL1	Stop
PLL2	Stop
CPU	Stop (Undefined)
SRAM	Stop (Undefined)
Standby SRAM	Stop (Undefined)
VBATT Backup Register	Stop (Retained or zeroized is selectable when Tamper input was detected.)
Flash memory	Stop (Retained)
Realtime clock (RTC)	Selectable when selecting clock which is operating as the count source.
Programmable voltage detection circuit (PVD)	Stop
Power-on reset circuit	Stop
Other Peripheral modules	Stop (Undefined)
I/O ports	RTCICn ports (n = 0 to 2): Selectable EXCIN: Selectable All ports not specified here: Undefined

Note: Stop (Retained) means that the contents of the internal registers are retained but the operations are suspended.

Note: Stop (Undefined) means that the contents of the internal registers are undefined and power to the internal circuit is cut off.

Figure 11.2 shows switching sequence of Battery backup function.

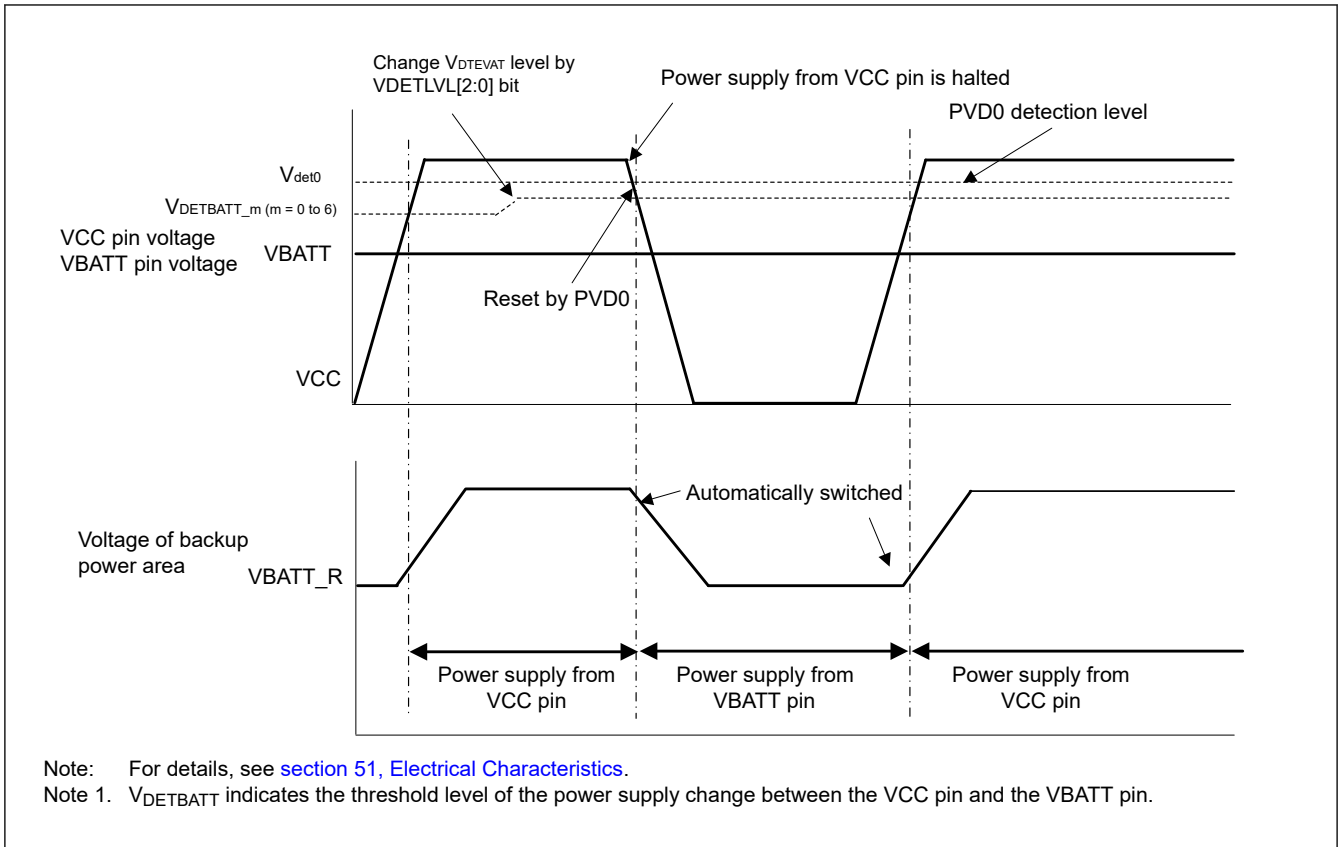

Figure 11.2 Switching sequence of battery backup function

11.3.2 VBATT Battery Power Supply Switch Usage

The battery power supply switch can switch the power supply from the VCC pin to the VBATT pin when the voltage being applied to the VCC pin drops. When the voltage rises, this switch changes the power supply from the VBATT pin to the VCC pin.

The VCC voltage drop detection function for the battery power supply switch in "Figure 11.1" consists of two voltage drop detectors. One is a VCC drop detector for normal operation of the battery power supply switch that operates according to the settings of the VDETTLVL[2:0] bit and the VDETE bit. The other is voltage monitoring 0 to reduce power consumption during the Deep Software Standby mode 1 or 2.

In cold start, VDETE bit is initialized by VBATT_POR reset and the VCC voltage drop detection function for the battery power supply switch is disabled.

To use the battery power supply switch, the proper V_{DET_BATT_m} (m = 0 to 6) level must be selected by VDETLVL[2:0] bits and wait t_{DETWT} for stabilization. After wait, the VCC voltage drop detection function is enabled by VDETE bit. The battery power supply switch has a constraint that the V_{DET_BATT_m} (m = 0 to 6) level selected by VDETLVL[2:0] bits should be below Voltage monitoring 0 level.

When the MCU transitions to the Deep Software Standby mode 1 or 2 and the low power consumption function of voltage monitor 0 is enabled, the VCC drop detector for normal operation of the battery power supply switch is stopped to reduce power consumption. At this time, the power supply switch is controlled by the voltage monitor 0. This control by voltage monitor 0 continues until it returns from Deep Software Standby mode.

The battery backup function should be used after the voltage monitoring 0 reset is enabled (OFS1(_SEC).PVDAS bit is 0).

When the low power consumption function of voltage monitor 0 is enabled by OFS1(_SEC).PVDLPSEL bit, the voltage monitor 1 and 2 must be disabled before enter the Deep Software Standby mode 1 or 2.

If you don't use battery power supply switch. You must set BPWSWSTP bit to 1 and short the VCC and VBATT pins. When BPWSWSTP bit is 1, switch is stop, and power is always supplied from VCC pin.

11.3.3 VBATT_R voltage drop detection function Usage

This function enables to detect VBATT_R voltage drop. When VBATT_R voltage is drop and lower than $V_{PDR(BATR)}$, VBATT_POR reset is asserted. The VBPFORF flag is set to 1 by VBATT_POR reset. If VBPFORF flag is 1, RTC counter and register is invalid and Battery Backup Function registers are reset. You must initialize the functions included backup power area.

Figure 11.3 shows VBATT_R voltage drop detection function.

Figure 11.3 VBATT_R voltage drop detection function

11.3.4 VBATT Backup Register Usage

You can use 32, 16 or 8-bit access instruction when accessing the VBATT backup registers.

However, for example, when a 32bit access instruction is executed, 8-bit read or write operation is executed with 4 consecutive times. When accessing, please note that the byte order of the data stored in the VBTBKR[n] (n = 0 to 127) register is little endian.

The data of VBATT backup register is cleared to 0x00 by VBATT_POR reset or tamper detection function.

The tamper detection function starts clearing operation of the VBATT backup register when the clear function is enabled and the tamper detection flag is set to 1. Do not cancel the clearing operation for 100ns after starting. To cancel the clearing operation, disable the clear function or clear the tamper detection flag to 0. After canceling the clearing operation, do not access the VBATT backup register for 500ns.

11.3.5 Tamper Detection Usage

The tamper detection function detects the RTCICn (n = 0 to 2) pin input event. The input event is defined as a change of RTCICn pin input level. The VBTADF_n (n = 0 to 2) flag is set to 1 by the input event. When generate interrupt is enabled and the flag is set to 1, tamper detection interrupt is generated. When backup register clear function is enabled and flag is set to 1, the data of VBATT backup register is cleared. RTC time capture event source can select RTCICn pin input or the VBTADF_n flag. If you need to synchronize time capture with a set of VBTADF_n flags to 1, select the VBTADF_n flag as the RTC time capture event source is recommended.

Figure 11.4 shows Tamper detection function.

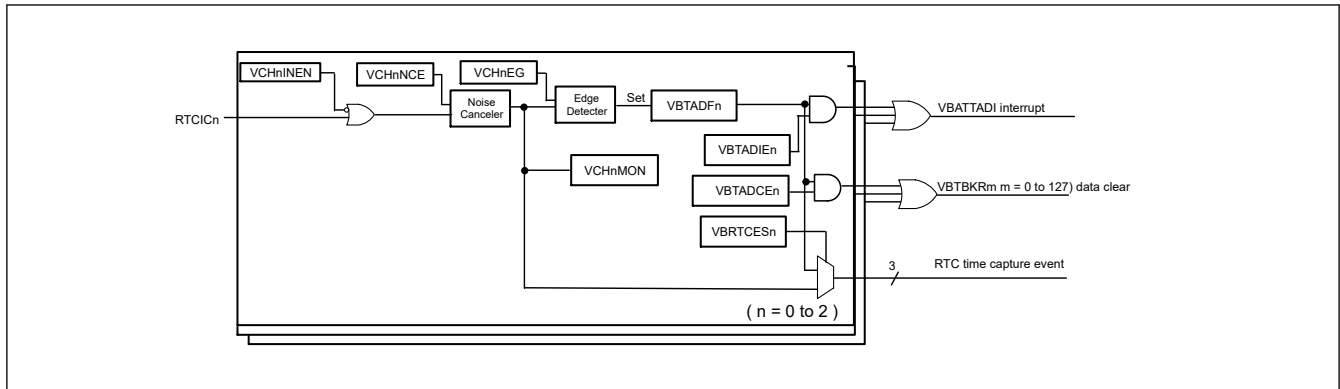

Figure 11.4 Tamper detection function

RTCICn pin inputs is enabled by the VCHnINEN (n = 0 to 2) bit. A wait time of 50us is required for the operation to stabilize after the RTCICn input is enabled.

The VCHnNCE (n = 0 to 2) bit enables noise canceler. The noise canceler samples input signals at the Sub-Clock (RTCSCLK) and removes the pulses whose length is less than three sampling cycles. Figure 11.5 shows noise canceler circuit block diagram.

Figure 11.5 Tamper detection function

After enabling this noise canceler, a stabilization time of 5 clocks is required.

The VCHnEG (n = 0 to 2) bit enables to select Tamper detection edge. The edge detector operate asynchronously. When these control registers are changed, The VBTADFn flag may be set to 1 in a pseudo. The VBTADFn flag need check and clear to 0 after initialization of control registers . The VCHNnMON (n = 0 to 2) bit enables to monitor current input status. This bit also need check for inactive level after initialization of control registers .

The VBATTADI interrupt is asserted when 1 or more of 3 channels are flagged and interrupt is enabled.

The VBTBK Rm(m = 0 to 127) register data is cleared to 0x00 when 1 or more of 3 channels are flagged and the VBATT backup register clear function is enabled.

11.3.6 VBATT voltage monitor function Usage

You can monitor the input voltage level of VBATT pin. 1/3 of VBATT pin voltage level can be monitored as analog signal. After setting the VBTMNSEL bit to 1, it is necessary to wait t_{MONWT} for the monitor level to stabilize. For details on t_{MONWT}, see section 51, Electrical Characteristics.

Figure 11.6 shows VBATT voltage monitor function.

Figure 11.6 VBATT voltage monitor function

Note: For more information, see [section 40, 12-Bit A/D Converter \(ADC12\)](#).

Note: When VBTMNSEL bit is 1, VBAT power consumption is increased. It is recommended that VBTMNSEL bit sets to 1 only monitor timing.

11.3.7 Initial Settings Examples

11.3.7.1 Cold start and using the power supply switch flow example

When turning on VCC pin and VBATT pin power for the first time, use the following flow to initialize.

1. Check VBPORM bit. If VBPORM flag is 0, wait until it changes to 1.
2. Clear VBPORF flag to 0.
3. Set the VDETLVL[2:0] bit to appropriate value. The $V_{DET\text{BATT}_m}$ level is Selected.
4. Wait t_{DETWT} for the VCC voltage detection function stabilization.
5. Set the VDETE bit to 1. The VCC voltage detection function is enabled.
6. Enable Sub-Clock Oscillator if needed.
7. Set Other Battery Backup Function and RTC registers.

For details on t_{DETWT} , see [section 51, Electrical Characteristics](#).

For details on Sub-Clock Oscillator, see [section 8, Clock Generation Circuit](#).

11.3.7.2 Warm start and using the power supply switch flow example

The MCU transitions to VBATT mode when the power of the VCC pin is turned off while the power of the VBATT pin is on. In this section, warm start means when the power supply of the VCC pin is turned on in VBATT mode. When the MCU starts processing with a warm start, execute the following flow in order to check the VBATT_R voltage drop before executing other process.

1. Check VBPORM flag. If VBPORM flag is 0, wait until it changes to 1.
2. Check VBPORF flag. If VBPORF flag is 1, the VBATT_R voltage drop is detected. Branch "[section 11.3.7.1. Cold start and using the power supply switch flow example 2](#)" to re-initialize the backup power area. If not, it means that the VBATT_R voltage does not drop and the state of the backup power area is retained. So, you do not need to re-initialize the backup power area.

11.3.7.3 Not using the power supply switch flow example

When not using the power supply switch, VCC pin and VBATT pin should be shorted. In this case, the VBATT_POR reset cannot follow the power on reset of VCC and VBATT_R voltage drop may not be detected. So, initialize the backup power supply area with the following flow.

1. Set the BPWSWSTP bit to 1. The power supply switch is stopped.
2. Check VBPORM flag. If VBPORM flag is 1, wait until it changes to 0.
3. Clear the VDETE bit to 0. The VCC voltage drop detection function is stopped.

4. Clear the VDETLVL[2:0] bit to 110b. The initial value is selected.
5. Check VBPORF flag. When VBPORF flag is 1, clear it to 0.
6. Set the SOSTP bit to 1 regardless of its value. Stop Sub-Clock Oscillator.
7. Initialize the VBTICTLR register and SOMCR.SOSEL bit. Initialization is recommended because these registers are related to the control of the IO port.
8. Initialize Other Battery Backup Function registers if need. Other Battery Backup Function registers are VBTICTLR2, VBTADSR, VBTADCR1, VBTADCR2, and VBTBKR[n].
9. Enable Sub-Clock Oscillator if needed.
10. Set RTC registers.

For details on Sub-Clock Oscillator, see [section 8, Clock Generation Circuit](#).

11.3.7.4 Tamper detection function initialization setting flow example

If using the tamper detection function, it is recommended to initialize according to the following flow example.

1. Set the VCHnINEN to appropriate value.
2. Wait 50us to stabilize after the RTCICn input.
3. Set the VCHnNCE bit and the VCHnEG bit.
4. Wait 5 RTC-clocks to stabilize , if noise canceler is enabled.
5. Checking the VCHnMON bit indicates inactive is recommended. If it is active, it may not be possible to detect the tamper.
6. Initialize the invalid status of VBTADFn flag by clear to 0 after reading dummy read.
7. Set VBTADCR1, VBTADCR2 to enable interrupt, backup register clear, and RTC time capture event.
8. nables RTC time capture function if needed.

11.4 Interrupt Sources

The Battery Backup Function has two interrupt sources and are listed in [Table 11.3](#).

Table 11.3 Battery Backup Function interrupt Sources

Symbol	Interrupt source	Interrupt flag	Interrupt conditions
VBATTADI	VBATT Tamper detection	VBTADF0	VBTADF0 = 1, VBTADIE0 = 1
		VBTADF1	VBTADF1 = 1, VBTADIE1 = 1
		VBTADF2	VBTADF2 = 1, VBTADIE2 = 1

11.5 Usage Notes

1. Operation of the sub-clock oscillator and RTC are not guaranteed when the voltage level on VBATT is lower than the guaranteed operation range. Initialize the RTC when the VBATT pin falls below the guaranteed operating voltage and then powers up again.
2. A reset generated while writing to registers described in this section might destroy the register value.
3. When VCC is higher than $V_{DET_BATT_m}$, the VCC pin and VBATT pin are separated. When VCC is lower than V_{DET_BATT} and the switch is connected to the VBATT pin, and if the voltage on VBATT drops lower than VCC, current might flow into the VBATT pin through the parasitic diode between the VCC and VBATT pins.
4. During RTC operation using the voltage from the VBATT pin and the I/O ports within the backup, the power supply area can only be used as time capture event input pins for the RTC.

12. Register Write Protection

12.1 Overview

The register write protection function protects important registers from being overwritten due to software errors. The registers to be protected are set with the Protect Register (PRCR_S and PRCR_NS).

The two protected registers work on one Secure set registers/bits and the other for Non-secure set registers/bits. They are collectively mentioned as PRCR.

Table 12.1 lists the association between the bits in the PRCR register and the registers to be protected.

The register information to which the PRCR bit is applied is provided in the description of each register.

Table 12.1 Association between the bits in the PRCR register and registers to be protected

PRCR bit	Register to be protected
PRC0	<ul style="list-style-type: none"> Registers related to the clock generation circuit: SCKDIVCR, SCKDIVCR2, SCKSCR, PLLCCR, PLLCR, BCKCR, MOSCCR, HOCOCCR, HOCOCCR2, MOCOCCR, FLLCR1, FLLCR2, CKOCCR, OSTDCR, OSTDSR, PLL2CCR, PLL2CR, PLLCCR2, PLL2CCR2, EBCKOCCR, SDCKOCCR, SCICKDIVCR, SCICKCR, SPICKDIVCR, SPICKCR, LCDCKDIVCR, LCDCKCR, MOCOUTCR, HOCOUTCR, USBCKDIVCR, CANFDCKDIVCR, USBCKCR, CANFDCKCR, MOSCSCR, HOCOSCR, MOSCWTCR, MOMCR, SOSCCR, SOMCR, LOCOCR, LOCOUTCR, SYRACCR
PRC1	<ul style="list-style-type: none"> Registers related to the low power modes: SBYCR, OPCCR, PDCTRGD, PDRAMSCR0, PDRAMSCR1, SSCR1, LPSCR, DPSBYCR, DPSWCR, DPSIER0-3, DPSIFR0-3, DPSIEGR0-2, PLL1LDOCR, PLL2LDOCR, HOCOLDOCR, LVOCR Register related to the battery backup function: VBTBER, VBTICTLR, VBTBKR[n] (n = 0 to 127), VBTBPCR1, VBTBPCR2, VBTBPSR, VBTADSR, VBTADCR1, VBTADCR2, VBTICTLR2
PRC3	<ul style="list-style-type: none"> Registers related the PVD: PVD1CR1, PVD1SR, PVD2CR1, PVD2SR, PVD1CMPCR, PVD2CMPCR, PVD1CR0, PVD2CR0, PVD1FCR, PVD2FCR, VBATTMNSLR

PRC5 ^{†1}	<ul style="list-style-type: none"> Registers related to the reset control SYRSTMSK0, SYRSTMSK2

Note 1. Only PRCR_S is supported.

12.2 Register Descriptions

12.2.1 PRCR_S : Protect Register for Secure (PRCR_S)

Base address: SYSC = 0x4001_E000

Offset address: 0x3FA

Bit	Symbol	Function	R/W
0	PRC0	Enable writing to the registers related to the clock generation circuit 0: Disable writes 1: Enable writes	R/W

Bit	Symbol	Function	R/W
1	PRC1	Enable writing to the registers related to the low power modes, and the battery backup function 0: Disable writes 1: Enable writes	R/W
2	—	This bit is read as 0. The write value should be 0.	R/W
3	PRC3	Enable writing to the registers related to the PVD 0: Disable writes 1: Enable writes	R/W
4	PRC4	Enables writing to the registers related to the security and privilege setting registers. 0: Disable writes 1: Enable writes	R/W
5	PRC5	Enables writing to the registers related to the reset control. 0: Disable writes 1: Enable writes	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
15:8	PRKEY[7:0]	0xA5: Enables writing to the PRCR_S register. Other than the above: Disables writing to the PRCR_S register. 0x00 are readable if these bits are read.	W

Note: S-TYPE6, P-TYPE2

PRCR_S is used to protect registers that are always Secure or configured as Secure.

PRCn bits (Protect bit n) (n = 0, 1, 3, 4, 5)

The PRCn bits enable or disable writing to the protected registers listed in [Table 12.1](#). Setting the PRCn bits to 1 enables writing, and to 0 disables writing.

The register controlled by PRC4 may not reflect the PRC4 change when PRCR_S and its controlled registers are continuously written access. Avoid continuous write access or read the PRCR_S after PRC4 change, and then write to the register controlled by PRC4.

PRKEY[7:0] (Register write protection key bit)

These bits control permission and prohibition of writing to the PRCR_S register. To write PRCn bits of PRCR_S register, write 0xA5 to the PRKEY[7:0]. In case of writing other than 0xA5 to PRKEY[7:0], PRCn bits do not be changed even if writing to the PRCR_S register.

12.2.2 PRCR_NS : Protect Register for Non-secure (PRCR_NS)

Base address: SYSC_NS = 0x5001_E000

Offset address: 0x3FE

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PRKEY[7:0]							—	—	—	PRC4	PRC3	—	PRC1	PRC0	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PRC0	Enable writing to the registers related to the clock generation circuit 0: Disable writes 1: Enable writes	R/W
1	PRC1	Enable writing to the registers related to the low power modes, and the battery backup function 0: Disable writes 1: Enable writes	R/W
2	—	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
3	PRC3	Enable writing to the registers related to the PVD 0: Disable writes 1: Enable writes	R/W
4	PRC4	Enables writing to the registers related to the security and pprivilege setting registers. 0: Disable writes 1: Enable writes	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W
15:8	PRKEY[7:0]	0xA5: Enables writing to the PRCR_NS register. Other than the above: Disables writing to the PRCR_NS register. 0x00 are readable if these bits are read.	W

Note: S-TYPE7, P-TYPE2

PRCR_NS is used to protect registers that are configured as Non-secure.

PRCn bits (Protect bit n) (n = 0, 1, 3, 4)

The PRCn bits enable or disable writing to the protected registers listed in [Table 12.1](#). Setting the PRCn bits to 1 enables writing, and to 0 disables writing.

The register controlled by PRC4 may not reflect the PRC4 change when PRCR_NS and its controlled registers are continuously written access. Avoid continuous write to that registers or read the PRCR_NS after PRC4 change, and then write to the register controlled by PRC4.

PRKEY (Register write protection key bit)

These bits control permission and prohibition of writing to the PRCR_NS register. To write PRCn bits of PRCR_NS register, write 0xA5 to the PRKEY[7:0]. In case of writing other than 0xA5 to PRKEY[7:0], PRCn bits do not be changed even if writing to the PRCR_NS register.

13. Interrupt Controller Unit (ICU)

13.1 Overview

The Interrupt Controller Unit (ICU) controls which event signals are linked to the Nested Vector Interrupt Controller (NVIC), the DMA Controller (DMAC), and the Data Transfer Controller (DTC) modules. The ICU also controls non-maskable interrupts.

Table 13.1 lists the ICU specifications, Figure 13.1 shows a block diagram, and Table 13.2 lists the I/O pins.

Table 13.1 ICU specifications

Parameter		Description
Maskable interrupts	Peripheral function interrupts	<ul style="list-style-type: none"> Interrupts from peripheral modules Number of sources: 236 (select factor within event list numbers 17 to 511)
	External pin interrupts	<ul style="list-style-type: none"> Interrupt detection on low level^{*4}, falling edge, rising edge, rising and falling edges. One of these detection methods can be set for each source Digital filter function supported 16 sources, with interrupts from IRQi (i = 0 to 15) pins.
	Interrupt requests to CPU (NVIC)	<ul style="list-style-type: none"> 96 interrupt requests are output to NVIC.^{*5}
	DMAC control	<ul style="list-style-type: none"> The DMAC can be activated using interrupt sources^{*1} The target interrupt source can be selected individually for every DMAC channels.
	DTC control	<ul style="list-style-type: none"> The DTC can be activated using interrupt sources^{*1} The method for selecting an interrupt source is the same as that of the interrupt request to NVIC.
Non-maskable interrupts ^{*2}	NMI pin interrupt	<ul style="list-style-type: none"> Interrupt from the NMI pin Interrupt detection on falling edge or rising edge Digital filter function supported
	Oscillation stop detection interrupt ^{*3}	Interrupt on detecting that the main oscillation has stopped
	WDT underflow/refresh error ^{*3}	Interrupt on an underflow of the down-counter or occurrence of a refresh error
	IWDT underflow/refresh error ^{*3}	Interrupt on an underflow of the down-counter or occurrence of a refresh error
	Voltage-monitoring 1 interrupt ^{*3}	Voltage monitor 1 interrupt of the voltage monitor 1 circuit (PVD_PVD1)
	Voltage-monitoring 2 interrupt ^{*3}	Voltage monitor 2 interrupt of the voltage monitor 2 circuit (PVD_PVD2)
	Common memory error interrupt	Common memory errors include SRAM parity error, or Standby SRAM parity error
	Bus error Interrupt	Bus error includes MPU and TZF error
	CPU Lockup error interrupt	CPU Lockup error
Security	Secure	Some registers have Security Attribution
	Privilege	Each register of the ICU can only be accessed with Privilege access
Low power modes	<ul style="list-style-type: none"> CPU Sleep mode: return is initiated by non-maskable interrupts or any other interrupt source CPU Deep Sleep and Software Standby mode: Return is initiated by non-maskable interrupts. Interrupt can be selected as WUPEN register. <p>See section 13.2.15. WUPEN0 : Wake Up Interrupt Enable Register 0, section 13.2.16. WUPEN1 : Wake Up interrupt enable register 1.</p>	
TrustZone Filter	Available	

Note 1. For the DMAC and DTC activation sources, see section 13.3.2. Event Number.

Note 2. Non-maskable interrupts can be enabled only once after a reset release.

Note 3. These non-maskable interrupts can also be used as maskable interrupts. When used as maskable interrupts, do not change the value of the NMIER register from the reset state. To enable voltage monitor 1 and voltage monitor 2 interrupts, set the PVD1CR1.IRQSEL and PVD2CR1.IRQSEL bits to 1.

Note 4. Low level: interrupt detection is not canceled if you do not clear it after a detection.

Note 5. Appropriate alignment of the vector table according to the number of interrupts to be used is required. For example, in case of using maximum number of interrupts available in this products, at least 128-words alignment must be set.

Figure 13.1 shows the ICU block diagram.

Note 1. For more information on DELSR settings, see section 16, DMA Controller (DMAC)

Figure 13.1 ICU block diagram

Table 13.2 lists the ICU input/output pins.

Table 13.2 ICU I/O pins

Pin name	I/O	Description
NMI	Input	Non-maskable interrupt request pin
IRQi (i = 0 to 15)	Input	External interrupt request pins

13.2 Register Descriptions

This chapter does not describe the Arm® NVIC internal registers. For information about these registers, see Arm Limited., Arm® Cortex®-M85 Processor Technical Reference Manual (101924_0002_05_en).

13.2.1 ICUSARA : Interrupt Controller Unit Security Attribution Register A

Base address: CPSCU = 0x4000_8000
 CPSCU_NS = 0x5000_8000

Offset address: 0x40

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SAIRQ CR15	SAIRQ CR14	SAIRQ CR13	SAIRQ CR12	SAIRQ CR11	SAIRQ CR10	SAIRQ CR9	SAIRQ CR8	SAIRQ CR7	SAIRQ CR6	SAIRQ CR5	SAIRQ CR4	SAIRQ CR3	SAIRQ CR2	SAIRQ CR1	SAIRQ CR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	SAIRQCR15 to SAIRQCR0	Security attributes of registers for the IRQCRn register 0: Secure 1: Non-secure	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE1, P-TYPE1

Note: This register is write-protected by PRCR_S.PRC4 register

SAIRQCRn bits (Security attributes of registers for the IRQCRn register)

The target registers are as follows:

- IRQCR0 to IRQCR15 registers
- WUPEN0.IRQWUPEN[15:0] bits

13.2.2 ICUSARB : Interrupt Controller Unit Security Attribution Register B

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x44

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SANMI
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SANMI	Security attributes of registers for nonmaskable interrupt 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE1, P-TYPE1

Note: This register is write-protected by PRCR_S.PRC4 register

SANMI bit (Security attributes of registers for nonmaskable interrupt)

Security attributes of registers for non-maskable interrupt. The target registers are as follows:

- NMISR
- NMIER
- NMICLR
- NMICR

The value of AIRCR.BFHFNMINS bit [13] in Application Interrupt and Reset Control Register of Arm CPU should be the same as the value of security attribution. The initial values of AIRCR.BFHFNMINS and the SANMI bits are different. AIRCR.BFHFNMINS is secure and SANMI is non-secure. Polarity has the same meaning so program these to match.

Note: Only one of Secure and Non-secure can set security attribution for non-maskable interrupt-related registers. If you program the Secure attribute as secure, it always goes to the Secure interrupt handler. To release any of the Non-maskable interrupt sources to the non-secure user, write a function to execute a nonsecure program from the interrupt handler for Secure.

13.2.3 ICUSARE : Interrupt Controller Unit Security Attribution Register E

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Note: This register is write-protected by PRCR_S.PRC4 register

SAIELSRn bits (Security attributes of registers for IELSR31 to IELSR0)

The Secure Attribute managed within the Arm CPU NVIC must match the security attribution of IELSEn (n = 0 to 31). NVIC internal registers are in NVIC_ITNS0[31:0]. Polarity has the same meaning so program these to match.

13.2.6 ICUSARH : Interrupt Controller Unit Security Attribution Register H

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x74

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	SAIEL SR63	SAIEL SR62	SAIEL SR61	SAIEL SR60	SAIEL SR59	SAIEL SR58	SAIEL SR57	SAIEL SR56	SAIEL SR55	SAIEL SR54	SAIEL SR53	SAIEL SR52	SAIEL SR51	SAIEL SR50	SAIEL SR49	SAIEL SR48
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	SAIELSR63 to SAIELSR32	Security attributes of registers for IELSR63 to IELSR32 0: Secure 1: Non-secure	R/W

Note: S-TYPE1, P-TYPE1

Note: This register is write-protected by PRCR_S.PRC4 register

SAIELSRn bits (Security attributes of registers for IELSR63 to IELSR32)

The Secure Attribute managed within the Arm CPU NVIC must match the security attribution of IELSEn (n = 32 to 63). NVIC internal registers are in NVIC_ITNS1[31:0]. Polarity has the same meaning so program these to match.

13.2.7 ICUSARI : Interrupt Controller Unit Security Attribution Register I

Base address: CPSCU = 0x4000_8000
 CPSCU_NS = 0x5000_8000

Offset address: 0x78

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	SAIEL SR95	SAIEL SR94	SAIEL SR93	SAIEL SR92	SAIEL SR91	SAIEL SR90	SAIEL SR89	SAIEL SR88	SAIEL SR87	SAIEL SR86	SAIEL SR85	SAIEL SR84	SAIEL SR83	SAIEL SR82	SAIEL SR81	SAIEL SR80
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SAIEL SR79	SAIEL SR78	SAIEL SR77	SAIEL SR76	SAIEL SR75	SAIEL SR74	SAIEL SR73	SAIEL SR72	SAIEL SR71	SAIEL SR70	SAIEL SR69	SAIEL SR68	SAIEL SR67	SAIEL SR66	SAIEL SR65	SAIEL SR64
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	SAIELSR95 to SAIELSR64	Security attributes of registers for IELSR95 to IELSR64 0: Secure 1: Non-secure	R/W

Note: S-TYPE1, P-TYPE1

Note: This register is write-protected by PRCR_S.PRC4 register

SAIELSRn bits (Security attributes of registers for IELSR95 to IELSR64)

The Secure Attribute managed within the Arm CPU NVIC must match the security attribution of IELSEn (n = 64 to 95). NVIC internal registers are in NVIC_ITNS2[31:0]. Polarity has the same meaning so program these to match.

13.2.8 TEVTRCR : Trusted Event Route Control Register

Base address: CPSCU = 0x4000_8000
 CPSCU_NS = 0x5000_8000

Offset address: 0x600

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TEVTE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TEVTE	Trusted Event Route Control Register for IELSRn, DELSRn and ELCSRn 0: Disable 1: Enable	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE1, P-TYPE1

Note: This register is write-protected by PRCR_S.PRC4

TEVTE bit (Trusted Event Route Control Register for IELSRn, DELSRn and ELCSRn)

When TEVTE = 1, the IELS [8:0] bits of IELSRn (n = 0 to 95), all DELS [8:0] bits of DMAC.DELSRn (n = 0 to 7), and all ELS [8:0] bits of ELC.ELSRn (n = 0 to 18) are allowed secure access write. non-secure access write is protected. Additionally, when TEVTE = 1, if the Security Attribution of the target register (IELS[31:16] bits of IELSRn (n = 0 to 95)) is non-secure, then secure access is not allowed. At this time, the upper level [31:16] cannot be read and write, but the response is OK, and no error occurs.

- IELSRn.IELS[8:0] (n = 0 to 95)
- DMAC.DELSRn.DELS[7:0] (n = 0 to 7)
- ELC.ELSRn.IELS[8:0] (n = 0 to 18)

13.2.9 IRQCRi : IRQ Control Register i (i = 0 to 15)

Base address: ICU_COMMON = 0x4000_6000
ICU_COMMON_NS = 0x5000_6000

Offset address: 0x000 + 0x1 × i

Bit position:	7	6	5	4	3	2	1	0
Bit field:	FLTEN	—	FCLKSEL[1:0]	—	—	—	IRQMD[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	IRQMD[1:0]	IRQi Detection Sense Select 0 0: Falling edge 0 1: Rising edge 1 0: Rising and falling edges 1 1: Low level	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
5:4	FCLKSEL[1:0]	IRQi Digital Filter Sampling Clock Select 0 0: PCLKB 0 1: PCLKB/8 1 0: PCLKB/32 1 1: PCLKB/64	R/W
6	—	This bit is read as 0. The write value should be 0.	R/W
7	FLTEN	IRQi Digital Filter Enable 0: Digital filter is disabled 1: Digital filter is enabled.	R/W

Note: S-TYPE3, P-TYPE2

IRQCRi register changes must satisfy the following conditions:

- For a CPU interrupt or DTC trigger:
Change the IRQCRi register value before setting the target IELSRn register (n = 0 to 95).
The register value should be changed only when the value of the target IELSRn register is 0x0000.
- For a DMAC trigger:
Change the IRQCRi register value before setting the target DMAC.DELSRn register (n = 0 to 7).
The register value should be changed only when the value of the target DELSRn register is 0x0000.
- For a wakeup enable signal:
Change the IRQCRi register setting before setting the target WUPEN0.IRQWUPEN[n] (n = 0 to 15). The register value should be changed when the target WUPEN0.IRQWUPEN[n] is 0.

IRQMD[1:0] bits (IRQi Detection Sense Select)

The IRQMD[1:0] bits set the detection sensing method for the IRQi external pin interrupt sources. For setting method when using external pin interrupt, see [section 13.5.7. External Pin Interrupts](#).

FCLKSEL[1:0] bits (IRQi Digital Filter Sampling Clock Select)

The FCLKSEL[1:0] bits select the digital filter sampling clock for the IRQi external pin interrupt request pins, selectable to:

- PCLKB (every cycle)
- PCLKB/8 (once every 8 cycles)
- PCLKB/32 (once every 32 cycles)
- PCLKB/64 (once every 64 cycles)

For details of the digital filter, see [section 13.5.6. Digital Filter](#).

FLTEN bit (IRQi Digital Filter Enable)

The FLTEN bit enables the digital filter used for the IRQi external pin interrupt sources. The digital filter is enabled when the IRQCRi.FLTEN bit is 1 and disabled when the IRQCRi.FLTEN bit is 0. The IRQi pin level is sampled at the clock cycle specified in the IRQCRi.FCLKSEL[1:0] bits. When the sampled level matches three times, the output level from the digital filter changes. For details of the digital filter, see [section 13.5.6. Digital Filter](#).

13.2.10 NMISR : Non-Maskable Interrupt Status Register

Base address: ICU = 0x4000_C000
 ICU_NS = 0x5000_C000

Offset address: 0x120

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	LUST	—	CMST	BUSST	—	—	—	—	NMIST	OSTST	—	—	PVD2ST	PVD1ST	WDTST	IWDTST
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	IWDTST	IWDT Underflow/Refresh Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
1	WDTST	WDT Underflow/Refresh Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
2	PVD1ST	Voltage Monitor 1 Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
3	PVD2ST	Voltage Monitor 2 Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
5:4	—	These bits are read as 0.	R
6	OSTST	Main Clock Oscillation Stop Detection Interrupt Status Flag 0: Interrupt not requested for main clock oscillation stop 1: Interrupt requested for main clock oscillation stop	R
7	NMIST	NMI Pin Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
11:8	—	These bits are read as 0.	R
12	BUSST	Bus Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
13	CMST	Common Memory Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
14	—	This bit is read as 0.	R
15	LUST	CPU Lockup Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R

Note: S-TYPE3, P-TYPE2

The NMISR register monitors the status of non-maskable interrupt sources. Writes to the NMISR register are ignored. The setting in the Non-Maskable Interrupt Enable Register (NMIER) does not affect the status flags in this register. Before the end of the non-maskable interrupt handler, check that all of the bits in this register are set to 0 to confirm that no other NMI requests are generated during handler processing.

IWDTST flag (IWDT Underflow/Refresh Error Interrupt Status Flag)

The IWDTST flag indicates an IWDT underflow/refresh error interrupt request. It is read-only and cleared by the NMICLR.IWDTCLR bit.

[Setting condition]

When the IWDT underflow/refresh error interrupt is generated and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.IWDTCLR bit.

WDTST flag (WDT Underflow/Refresh Error Interrupt Status Flag)

The WDTST flag indicates a WDT underflow/refresh error interrupt request. It is read-only and cleared by the NMICLR.WDTCLR bit.

[Setting condition]

When the WDT underflow/refresh error interrupt is generated.

[Clearing condition]

When 1 is written to the NMICLR.WDTCLR bit.

PVD1ST flag (Voltage Monitor 1 Interrupt Status Flag)

The PVD1ST flag indicates a request for voltage monitor 1 interrupt. It is read-only and cleared by the NMICLR.PVD1CLR bit.

[Setting condition]

When the voltage monitor 1 interrupt is generated and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.PVD1CLR bit.

PVD2ST flag (Voltage Monitor 2 Interrupt Status Flag)

The PVD2ST flag indicates a request for voltage monitor 2 interrupt. It is read-only and cleared by the NMICLR.PVD2CLR bit.

[Setting condition]

When the voltage monitor 2 interrupt is generated and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.PVD2CLR bit.

OSTST flag (Main Clock Oscillation Stop Detection Interrupt Status Flag)

The OSTST flag indicates a main clock oscillation stop detection interrupt request. It is read-only and cleared by the NMICLR.OSTCLR bit.

[Setting condition]

When the main clock oscillation stop detection interrupt is generated.

[Clearing condition]

When 1 is written to the NMICLR.OSTCLR bit.

NMIST flag (NMI Pin Interrupt Status Flag)

The NMIST flag indicates an NMI pin interrupt request. It is read-only and cleared by the NMICLR.NMISTCLR bit.

[Setting condition]

When an edge specified by the NMICR.NMIMD bit is input to the NMI pin.

[Clearing condition]

When 1 is written to the NMICLR.NMISTCLR bit.

BUSST flag (Bus Error Interrupt Status Flag)

The BUSST flag indicates a bus error interrupt request. It is read-only and cleared by the NMICLR.BUSCLR bit.

Bus error includes MPU and TZF errors.

[Setting condition]

When the bus error detection interrupt is generated.

[Clearing condition]

When 1 is written to the NMICLR.SPECLR bit.

Be sure to clear the error status of the request source before clearing. If CPU does not clear the error status of the request source, the NMI status is set again even if this status is cleared, and an NMI request is issued to the CPU. If the CPU returns from the NMI handler, the CPU jumps back to the NMI handler.

In the case of level detection, use the following steps to clear the Status flag.

- (1) Negate the level of an input factor.
- (2) Perform a peripheral read access once and make sure the level interrupt is cleared.
- (3) Clear the status flag by NMICLR.BUSCLR.

CMST flag (Common Memory Error Interrupt Status Flag)

The CMST flag indicates common memory error interrupt request. It is read-only and cleared by the NMICLR.CMCLR bit.

Common memory errors include SRAM Parity or StandbyRAM Parity.

[Setting condition]

When the common memory error detection interrupt is generated.

[Clearing condition]

When 1 is written to the NMICLR.CMCLR bit.

Be sure to clear the error status of the request source before clearing. If CPU does not clear the error status of the request source, the NMI status is set again even if this status is cleared, and an NMI request is issued to the CPU. If the CPU returns from the NMI handler, the CPU jumps back to the NMI handler.

In the case of level detection, use the following steps to clear the Status flag.

- (1) Negate the level of an input factor.
- (2) Perform a peripheral read access once and make sure the level interrupt is cleared.
- (3) Clear the status flag by NMICLR.CMCLR.

LUST flag (CPU Lockup Error Interrupt Status Flag)

The LUST flag indicates a CPU Lockup error interrupt request. It is read-only and cleared by the NMICLR.LUCLR bit.

[Setting condition]

When the CPU Lockup error interrupt is generated.

[Clearing condition]

Be sure to clear the error status of the request source before clearing. If CPU does not clear the error status of the request source, the NMI status is set again even if this status is cleared, and an NMI request is issued to the CPU. If the CPU returns from the NMI handler, the CPU jumps back to the NMI handler.

In the case of level detection, use the following steps to clear the Status flag.

- (1) Negate the level of an input factor.
- (2) Perform a peripheral read access once and make sure the level interrupt is cleared.
- (3) Clear the status flag by NMICLR.LUSTCLR.

13.2.11 NMIER : Non-Maskable Interrupt Enable Register

Base address: ICU = 0x4000_C000
ICU_NS = 0x5000_C000

Offset address: 0x100

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	LUEN	—	CMEN	BUSEN	—	—	—	—	NMIEN	OSTEN	—	—	PVD2EN	PVD1EN	WDTEN	IWDTEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	IWDTEN	IWDT Underflow/Refresh Error Interrupt Enable 0: Disabled 1: Enabled	R/W ^{*1 *2}
1	WDTEN	WDT Underflow/Refresh Error Interrupt Enable 0: Disabled 1: Enabled	R/W ^{*1 *2}
2	PVD1EN	Voltage monitor 1 Interrupt Enable 0: Disabled 1: Enabled	R/W ^{*1 *2}
3	PVD2EN	Voltage monitor 2 Interrupt Enable 0: Disabled 1: Enabled	R/W ^{*1 *2}
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	OSTEN	Main Clock Oscillation Stop Detection Interrupt Enable 0: Disabled 1: Enabled	R/W ^{*1 *2}
7	NMIEN	NMI Pin Interrupt Enable 0: Disabled 1: Enabled	R/W ^{*1}
11:8	—	These bits are read as 0. The write value should be 0.	R/W
12	BUSEN	Bus Error Interrupt Enable 0: Disabled 1: Enabled	R/W ^{*1}
13	CMEN	Common Memory Error Interrupt Enable 0: Disabled 1: Enabled	R/W ^{*1}
14	—	This bit is read as 0. The write value should be 0.	R/W
15	LUEN	CPU Lockup Error Interrupt Enable 0: Disabled 1: Enabled	R/W ^{*1}

Note: S-TYPE3, P-TYPE2

Note 1. You can write 1 to this bit only once after reset. Subsequent write accesses are invalid. Writing 0 to this bit is invalid.

Note 2. Do not write 1 to this bit when the source is used as an interrupt signal.

IWDTEN bit (IWDT Underflow/Refresh Error Interrupt Enable)

The IWDTEN bit enables IWDT underflow/refresh error interrupt as an NMI trigger.

WDTEN bit (WDT Underflow/Refresh Error Interrupt Enable)

The WDTEN bit enables WDT underflow/refresh error interrupt as an NMI trigger.

PVD1EN bit (Voltage monitor 1 Interrupt Enable)

The PVD1EN bit enables voltage monitor 1 interrupt as an NMI trigger.

PVD2EN bit (Voltage monitor 2 Interrupt Enable)

The PVD2EN bit enables voltage monitor 2 interrupt as an NMI trigger.

OSTEN bit (Main Clock Oscillation Stop Detection Interrupt Enable)

The OSTEN bit enables main clock oscillation stop detection interrupt as an NMI trigger.

NMIEN bit (NMI Pin Interrupt Enable)

The NMIEN bit enables NMI pin interrupt as an NMI trigger.

BUSEN bit (Bus Error Interrupt Enable)

The BUSEN bit enables bus error interrupt as an NMI trigger. Bus error includes MPU and TZF errors.

CMEN bit (Common Memory Error Interrupt Enable)

The CMEN bit enables common memory error interrupt as an NMI trigger. Common memory errors include SRAM Parity or Standby RAM Parity.

LUEN bit (CPU Lockup Error Interrupt Enable)

LUEN bit enables CPU Lockup error interrupt as an NMI trigger.

13.2.12 NMICLR : Non-Maskable Interrupt Status Clear Register

Base address: ICU = 0x4000_C000
ICU_NS = 0x5000_C000

Offset address: 0x110

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	LUCL R	—	CMCL R	BUSC LR	—	—	—	—	NMICL R	OSTC LR	—	—	PVD2 CLR	PVD1 CLR	WDTC LR	IWDT CLR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	IWDTCLR	IWDT Underflow/Refresh Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.IWDTST flag	R/W ¹
1	WDTCLR	WDT Underflow/Refresh Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.WDTST flag	R/W ¹
2	PVD1CLR	Voltage Monitor 1 Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.PVD1ST flag	R/W ¹
3	PVD2CLR	Voltage Monitor 2 Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.PVD2ST flag.	R/W ¹
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	OSTCLR	Oscillation Stop Detection Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.OSTST flag	R/W ¹
7	NMICLR	NMI Pin Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.NMIST flag	R/W ¹
11:8	—	These bits are read as 0. The write value should be 0.	R/W
12	BUSCLR	Bus Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.BUSST flag	R/W ¹

Bit	Symbol	Function	R/W
13	CMCLR	Common Memory Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.CMST flag	R/W ¹
14	—	This bit is read as 0. The write value should be 0.	R/W
15	LUCLR	CPU Lockup Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.LUST flag	R/W ¹

Note: S-TYPE3, P-TYPE2

Note: here may be a difference in processing speed between the CPU and ICU, and the CPU may exit the interrupt handler before clearing the NMISR. Then the CPU will accidentally jump to the NMI handler again. To avoid this, be sure to read NMISR before exiting the NMI handler and make sure that NMISR is cleared before exiting the NMI handler.

Note 1. Only write 1 to this bit.

IWDTCLR bit (IWDT Underflow/Refresh Error Interrupt Status Flag Clear)

Writing 1 to the IWDTCLR bit clears the NMISR.IWDTST flag. This bit is read as 0.

WDTCLR bit (WDT Underflow/Refresh Error Interrupt Status Flag Clear)

Writing 1 to the WDTCLR bit clears the NMISR.WDTST flag. This bit is read as 0.

PVD1CLR bit (Voltage Monitor 1 Interrupt Status Flag Clear)

Writing 1 to the PVD1CLR bit clears the NMISR.PVD1ST flag. This bit is read as 0.

PVD2CLR bit (Voltage Monitor 2 Interrupt Status Flag Clear)

Writing 1 to the PVD2CLR bit clears the NMISR.PVD2ST flag. This bit is read as 0.

OSTCLR bit (Oscillation Stop Detection Interrupt Status Flag Clear)

Writing 1 to the OSTCLR bit clears the NMISR.OSTST flag. This bit is read as 0.

NMICLR bit (NMI Pin Interrupt Status Flag Clear)

Writing 1 to the NMICLR bit clears the NMISR.NMIST flag. This bit is read as 0.

BUSCLR bit (Bus Error Interrupt Status Flag Clear)

Writing 1 to the BUSCLR bit clears the NMISR.BUSST flag. This bit is read as 0.

CMCLR bit (Common Memory Error Interrupt Status Flag Clear)

Writing 1 to the CMCLR bit clears the NMISR.CMST flag. This bit is read as 0.

LUCLR bit (CPU Lockup Error Interrupt Status Flag Clear)

Writing 1 to the LUCLR bit clears the NMISR.LUST flag. This bit is read as 0.

13.2.13 NMICR : NMI Pin Interrupt Control Register

Base address: ICU_COMMON = 0x4000_6000
ICU_COMMON_NS = 0x5000_6000

Offset address: 0x10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	NFLTE N	—	NFCLKSEL[1:0]	—	—	—	—	NMIM D
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NMIMD	NMI Detection Set 0: Falling edge 1: Rising edge	R/W

Bit	Symbol	Function	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
5:4	NFCLKSEL[1:0]	NMI Digital Filter Sampling Clock Select 0 0: PCLKB 0 1: PCLKB/8 1 0: PCLKB/32 1 1: PCLKB/64	R/W
6	—	This bit is read as 0. The write value should be 0.	R/W
7	NFLTEN	NMI Digital Filter Enable 0: Disabled 1: Enabled	R/W

Note: S-TYPE3, P-TYPE2

Change the NMICR register settings before enabling NMI pin interrupts, that is, before setting NMIER.NMIEN to 1.

NMIMD bit (NMI Detection Set)

The NMIMD bit selects the detection sensing method for the NMI pin interrupts.

NFCLKSEL[1:0] bits (NMI Digital Filter Sampling Clock Select)

The NFCLKSEL[1:0] bits select the digital filter sampling clock for the NMI pin interrupts, selectable to:

- PCLKB (every cycle)
- PCLKB/8 (once every 8 cycles)
- PCLKB/32 (once every 32 cycles)
- PCLKB/64 (once every 64 cycles)

For details of the digital filter, see [section 13.5.6. Digital Filter](#).

NFLTEN bit (NMI Digital Filter Enable)

The NFLTEN bit enables the digital filter used for NMI pin interrupts. The filter is enabled when NFLTEN is 1, and disabled when NFLTEN is 0. The NMI pin level is sampled at the clock cycle specified in NFCLKSEL[1:0]. When the sampled level matches three times, the output level from the digital filter changes. For details of the digital filter, see [section 13.5.6. Digital Filter](#).

13.2.14 IELSRn : ICU Event Link Setting Register n (n = 0 to 95)

Base address: ICU = 0x4000_C000
ICU_NS = 0x5000_C000

Offset address: 0x300 + 0x4 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	DTCE	—	—	—	—	—	—	—	IR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	IELS[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	IELS[8:0]	ICU Event Link Select 0x00: Disable interrupts to the associated NVIC or DTC module Others: Event signal number to be linked. For details, see section 13.3.2. Event Number .	R/W ¹
15:9	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
16	IR	Interrupt Status Flag 0: No interrupt request generated. 1: An interrupt request is generated.	R/W ²
23:17	—	These bits are read as 0. The write value should be 0.	R/W
24	DTCE	DTC Activation Enable 0: DTC activation is disabled. 1: DTC activation is enabled.	R/W
31:25	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note 1. The [15:0] bits in this register can only be accessed in halfword or word access. Byte access is ignored.

Note 2. Writing 1 to the IR flag is prohibited.

This register has different secure access permission depending on the setting of Trusted Event Route Control Register (TEVTRCR).
If the security attribution is configured as secure,

- Secure access is allowed.
- Non-secure write access is ignored and non-secure read access is read as 0. TrustZone access error is generated.

If the security attribution is configured as non-secure and the trusted event route is disabled:

- Secure write access is ignored and secure read access is read as 0. TrustZone access error is generated.
- Non-secure access is allowed.

If the security attribution is configured as non-secure and the trusted event route is enabled:

- Secure access to IELS bit is allowed.
- Non-secure write access is ignored and non-secure read access is allowed.
- Secure write access to other bits is ignored and secure read access to other bits is read as 0.
- Non-secure access to other bits is allowed.
- TrustZone access error is not generated.

P-TYPE-2

The IELSRn register selects the interrupt source used by the NVIC. For details, see [Table 13.3](#). IELSRn corresponds to the NVIC interrupt input source number, where n = 0 to 95.

IELS[8:0] bits (ICU Event Link Select)

The IELS[8:0] bits link an event signal to the associated NVIC or DTC module. Event options are classified into 8 groups (groups 0 to 7). For details, see [section 13.3. Vector Table](#). All IELS[8:0] bits must be written at the same time.

IR flag (Interrupt Status Flag)

The IR status flag indicates an individual interrupt request from the event specified in IELS[8:0].

[Setting condition]

When an interrupt request is received from the associated peripheral module or IRQi pin.

[Clearing condition]

- The IR flag is cleared to 0 by writing 0.
- In the case of DTC.DISEL = 0. At the time other than the final transfer end in DTC transfer during DTCE = 1, IR flag repeat set and cleared by Hardware.
- In the case of DTC.DISEL = 1. For DTC transfers during DTCE = 1, the hardware does not clear the IR flag. Should be cleared by the CPU writing 0.

When DTC transfer except last transfer is completed (DTCE bit is changed from 1 to 0).

During DTCE = 1, write 0 to IR register is prohibited.

In the case of level detection, clear of the IR flag should follow the steps below.

1. Negate the input interrupt signal.
2. Run the peripheral read access once and wait for 2 clock cycles of the target module clock.
3. Clear the IR flag by writing 0.

Note: There may be a difference in processing speed between the CPU and ICU, and the CPU may exit the interrupt handler before clearing the IR. Then the CPU will accidentally jump to the interrupt handler again. To avoid this, be sure to read this register before exiting the interrupt handler and make sure that IR is cleared before exiting the interrupt handler.

DTCE bit (DTC Activation Enable)

When the DTCE bit is set to 1, the associated event is selected as the source for DTC activation.

[Setting condition]

- When 1 is written to the DTCE bit.

[Clearing condition]

- When the specified number of transfers is complete. For chain transfers, when the specified number of transfers for the last chain transfer is complete.
- When 0 is written to the DTCE bit.

Note: The secure attribution managed within the Arm CPU NVIC must match the SA (Security Attribution) of IELSEn (n = 0 to 95).

Note: Error during DTC transfer

If an error response occurs during DTC transfer, the DTC notifies the ICU that an error has occurred. ICU clears all bits of the target IELSRn (n = 0 to 95). IELSRn that is not the target is not cleared.

13.2.15 WUPEN0 : Wake Up Interrupt Enable Register 0

Base address: ICU = 0x4000_C000

Note: S-TYPE4, P-TYPE2

Note 1. Description is a description of each bit.

IRQWUPEN[15:0] bits (IRQn Interrupt Deep Sleep/Software Standby Mode Returns Enable(n = 0 to 15))

The IRQWUPEN[15:0] are the enable bits to control the use of the IRQn pin as a Deep Sleep/Software Standby mode return factor. n= 0 to 15

IWDTWUPEN bit (IWDT Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The IWDTWUPEN is the enable bit to control the use of the IWDT interrupt as a Deep Sleep/Software Standby mode return factor.

PVD1WUPEN bit (PVD1 Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The PVD1WUPEN is the enable bit to control the use of the PVD1 interrupt as a Deep Sleep/Software Standby mode return factor.

PVD2WUPEN bit (PVD2 Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The PVD2WUPEN is the enable bit to control the use of the PVD2 interrupt as a Deep Sleep/Software Standby mode return factor.

VBATTWUPEN bit (VBATT Monitor Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The VBATTWUPEN is the enable bit to control the use of the VBATT monitor interrupt as a Deep Sleep/Software Standby mode return factor.

RTCALMWUPEN bit (RTC Alarm Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The RTCALMWUPEN is the enable bit to control the use of the RTC alarm interrupt as a Deep Sleep/Software Standby mode return factor.

RTCPRDWUPEN bit (RTC Period Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The RTCPRDWUPEN is the enable bit to control the use of the RTC period interrupt as a Deep Sleep/Software Standby mode return factor.

USBFS0WUPEN bit (USBFS Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The USBFS0WUPEN is the enable bit to control the use of the USBFS interrupt as a Deep Sleep/Software Standby mode return factor.

AGT1UDWUPEN bit (AGT1 Underflow Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The AGT1UDWUPEN is the enable bit to control the use of the AGT1 underflow interrupt as a Deep Sleep/Software Standby mode return factor.

AGT1CAWUPEN bit (AGT1 Compare Match A Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The AGT1CAWUPEN is the enable bit to control the use of the AGT1 compare match A interrupt as a Deep Sleep/Software Standby mode return factor.

AGT1CBWUPEN bit (AGT1 Compare Match B Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The AGT1CBWUPEN is the enable bit to control the use of the AGT1 compare match B interrupt as a Deep Sleep/Software Standby mode return factor.

IIC0WUPEN bit (IIC0 Address Match Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The IIC0WUPEN is the enable bit to control the use of the IIC0 interrupt as a Deep Sleep/Software Standby mode return factor.

Note: The security attribution of this register is set for each wakeup event.

To avoid the occurrence of a security hole, the target event of a wakeup and the security attribution added to this bit must match.

13.2.16 WUPEN1 : Wake Up interrupt enable register 1

Base address: ICU = 0x4000_C000

31:15	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE4, P-TYPE2

COMPHS0WUPEN bit (Comparator-HS0 Interrupt Deep Sleep/Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the Comparator-HS0 interrupt as a Deep Sleep/Software Standby return factor.

ULP0UWUPEN bit (ULPT0 Underflow Interrupt Deep Sleep/Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the ULPT0 Underflow interrupt as a Deep Sleep/Software Standby return factor.

ULP0AWUPEN bit (ULPT0 Compare Match A Interrupt Deep Sleep/Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the ULPT0 Compare match A interrupt as a Deep Sleep/Software Standby return factor.

ULP0BWUPEN bit (ULPT0 Compare Match B Interrupt Deep Sleep/Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the ULPT0 Compare match B interrupt as a Deep Sleep/Software Standby return factor.

ULP1UWUPEN bit (ULPT1 Underflow Interrupt Deep Sleep/Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the ULPT1 Underflow interrupt as a Deep Sleep/Software Standby return factor.

ULP1AWUPEN bit (ULPT1 Compare Match A Interrupt Deep Sleep/Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the ULPT1 Compare match A interrupt as a Deep Sleep/Software Standby return factor.

ULP1BWUPEN bit (ULPT1 Compare Match B Interrupt Deep Sleep/Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the ULPT1 Compare match B interrupt as a Deep Sleep/Software Standby return factor.

Note: The security attribution of this register is set for each wakeup event.

To avoid the occurrence of a security hole, the target event of a wakeup and the security attribution added to this bit must match.

13.3 Vector Table

The ICU detects maskable and non-maskable interrupts. Interrupt priorities are set up in the Arm NVIC. For information about these registers, see [section 13.10. Reference](#).

13.3.1 Interrupt Vector Table

[Table 13.3](#) describes the interrupt vector table. The interrupt vector addresses conform to the NVIC specifications.

Table 13.3 Interrupt vector table (1 of 4)

Exception number	IRQ number	Vector offset	Source	Description
0	—	0x000	Arm	Initial stack pointer
1	—	0x004	Arm	Initial program counter (reset vector)
2	—	0x008	Arm	Non-Maskable Interrupt (NMI)
3	—	0x00C	Arm	HardFault

13.3.2 Event Number

The following table lists heading details for [Table 13.4](#), which describes each event number.

Heading	Description
Interrupt request source	Name of the source generating the interrupt request
Name	Name of the interrupt
Connect to NVIC	“✓” indicates the interrupt can be used as a CPU interrupt
Invoke DTC	“✓” indicates the interrupt can be used to request DTC activation
Invoke DMAC	“✓” indicates the interrupt can be used to request DMAC activation
Canceling CPU Deep Sleep	“✓” indicates the interrupt can be used to request a return from CPU Deep Sleep mode
Canceling Software Standby	“✓” indicates the interrupt can be used to request a return from Software Standby mode
Canceling Deep Software Standby	“✓” indicates the interrupt can be used to request a return from Deep Software Standby mode

Note 1. Only supported when CMPCTL.CSTEN = 1.

Note 2. Only the first edge detection is valid.

Note 3. Support only interrupt after DTC transfer.

Note 4. Only supported in Deep Software Standby mode 1 and Deep Software Standby mode 2.

Note 5. Only supported in Deep Software Standby mode 1.

13.4 Maskable Interrupt Operation

The ICU performs the following functions:

- Detecting interrupts
- Enabling and disabling interrupts
- Selecting interrupt request destinations such as CPU interrupt, DTC activation.

13.4.1 Detecting Interrupts

The ICU selects an event source input from a peripheral function interrupt or an external pin interrupt with IELSRn.IELS [8:0].

The accepted interrupt source sets the IELSRn.IR to 1 and sends an interrupt request to the NVIC.

External pin interrupt requests are detected by either:

- Edges (falling edge, rising edge, or rising and falling edges)
- Level (low level) of the interrupt signal.

Set the IRQCRi.IRQMD[1:0] bits to select the detection mode for the IRQi pins. For interrupt sources associated with peripheral modules, see [Table 13.3](#) and [Table 13.4](#). Events must be accepted by the NVIC before an interrupt occurs and is accepted by the CPU.

Figure 13.2 Interrupt path of the ICU and CPU (NVIC)

13.5 Maskable Interrupt setting procedure

13.5.1 Operations During an Interrupt

-When an interrupt is generated: except for software interrupts:

The IELSRn.IR ($n = 0$ to 95) flag and Interrupt Set Pending Register (NVIC_ISPRn) are set.

- When an interrupt is generated: software interrupts:

Interrupt Set Pending Register (NVIC_ISPRn) are set.

- When an interrupt is complete:

Clear the IELSRn.IR ($n = 0$ to 95) flag by software. The Interrupt Set Pending Register (NVIC_ISPRn) is automatically cleared.

Note: There may be a difference in processing speed between the CPU and ICU, and the CPU may exit the interrupt handler before clearing the IR. Then the CPU will accidentally jump to the interrupt handler again. To avoid this, be sure to read IELSRn ($n = 0$ to 95) register before exiting the interrupt handler and make sure that IR is cleared before exiting the interrupt handler.

13.5.2 Enabling Interrupt Requests

The procedure for enabling an interrupt request is as follows:

1. Set the Interrupt Set-Enable register (NVIC_ISER).
2. Set the IELSRn.IELS[8:0] bits as the interrupt source.
3. Specify the operation settings for the event source, such as Deep Sleep/Software Standby mode cancellation (WUPEN register setting).

13.5.3 Disabling Interrupt Requests

The procedure to disable the interrupt request is as follows:

1. Disable the operation settings for the event source, such as Deep Sleep/Software Standby mode cancellation (WUPEN register setting).
2. Clear the interrupt source setting (IELSRn.IELS[8:0] = 0x00).
3. Clear the interrupt status flag (IELSRn.IR = 0).
4. Clear the interrupt Clear-Enable register (NVIC_ICER) and interrupt Clear-Pending register (NVIC_ICPR).

13.5.4 Polling for interrupts

The procedure for polling for interrupt requests is as follows:

1. Set the Interrupt Clear-Enable register (NVIC_ICER).
2. Set the IELSRn.IELS[8:0] bits as the interrupt source.
3. Specify the operation settings for the event source, such as DMAC activation (DELSRn.DELS[8:0]), Deep Sleep/ Software Standby mode cancellation (WUPEN register setting).
4. Poll the interrupt Set-Pending register (NVIC_ISPR).

13.5.5 Selecting Interrupt Request Destinations

The available destinations are fixed for each interrupt, as described in [Table 13.3](#), [Table 13.4](#).

The interrupt output destination, CPU and DTC can be independently selected for each interrupt source.

Use an interrupt request destination setting that is indicated by a “✓” in the event list (see [section 13.3.2. Event Number](#)).

Note: Setting the same interrupt source for IELSRn and DELSRn is prohibited.

If the DMAC or DTC is selected as the destination for requests from an IRQi pin, you must set the IRQCRi.IRQMD[1:0] bits for that interrupt to select edge detection.

13.5.5.1 CPU interrupt request

When IELSRn.DTCE = 0, the event specified in the IELSRn register is output to the NVIC.

13.5.5.2 DTC activation

When IELSRn.DTCE = 1, the event specified in the IELSRn register is output to the DTC. Use the following procedure:

1. Set the IELSRn.IELS[8:0] bits to the target event and set the IELSRn.DTCE bit to 1.
2. Set the DTC Module Start bit (DTCST.DTCST) to 1.

[Table 13.5](#) shows operation when the DTC is the interrupt request destination.

Table 13.5 Operation when DTC becomes interrupt request destination

Interrupt request destination	DISEL*1	Remaining transfer operations	Operation per request	IR*2	Interrupt request destination after transfer
DTC*3	1	≠ 0	DTC transfer → CPU interrupt	Cleared on interrupt acceptance by the CPU	DTC
		= 0	DTC transfer → CPU interrupt	Cleared on interrupt acceptance by the CPU	CPU (IELSRn.DTCE bit is automatically cleared)
	0	≠ 0	DTC transfer	Cleared at the start of DTC data transfer after reading DTC transfer data	DTC
		= 0	DTC transfer → CPU interrupt	Cleared on interrupt acceptance by the CPU	CPU (IELSRn.DTCE bit is automatically cleared)

Note 1. DTC.MRB.DISEL bit controls the interrupt generates timing from DTC to CPU.

Note 2. When the IELSRn.IR flag is 1, an interrupt request (DTC activation request) that occurs again is ignored.

Note 3. For chain transfers, DTC transfer continues until the last chain transfer ends. The DISEL bit state and the remaining transfer count determine whether a CPU interrupt occurs, the IELSRn.IR flag clear timing, and the interrupt request destination after transfer. See [Table 17.2](#) in [section 17, Data Transfer Controller \(DTC\)](#).

Note: Error during DTC transfer

If an error response occurs during DTC transfer, the DTC notifies the ICU that an error has occurred. ICU clears all bits of the target IELSRn (n = 0 to 95). IELSRn that is not the target is not cleared.

13.5.6 Digital Filter

A digital filter function is provided for the external interrupt request pins IRQ_i , ($i = 0$ to 15) and the NMI pin interrupt. It samples input signals on the filter PCLKB sampling clock and removes any signal with a pulse width less than 3 sampling cycles.

To use the digital filter for an IRQ_i pin:

1. Set the sampling clock cycle to PCLKB, PCLKB/8, PCLKB/32, or PCLKB/64 in the $IRQCR_i.FCLKSEL[1:0]$ bits ($i = 0$ to 15).
2. Set the $IRQCR_i.FLTEN$ bit ($i = 0$ to 15) to 1 (digital filter enabled).

To use the digital filter for an NMI pin:

1. Set the sampling clock cycle to PCLKB, PCLKB/8, PCLKB/32, or PCLKB/64 in the $NMICR.NFCLKSEL[1:0]$ bits.
2. Set the $NMICR.NFLTEN$ bit to 1 (digital filter enabled).

Figure 13.3 shows an example of digital filter operation.

Figure 13.3 Digital filter operation example

During Software Standby mode or Deep Software Standby mode, the digital filter is forcibly turned off by Hardware. After returning to normal mode from Software Standby mode or Deep Software Standby mode, follow the values of $IRQCR_i.FLTEN$ ($i = 0$ to 15) and $NMICR.NFLTEN$. Once the filter is disabled, the event information sampled up to that point will be lost.

13.5.7 External Pin Interrupts

To use external pin interrupts: Configure I/O ports settings.

1. Clear the $IRQCR_i.FLTEN$ bit ($i = 0$ to 15) to 0 (digital filter disabled).
2. Specify or confirm the I/O port settings.
3. Set the $IRQMD[1:0]$ the $FCLKSEL[1:0]$ bits, and the $FLTEN$ bit of the $IRQCR_i$ register ($i = 0$ to 15) register.
4. Select the IRQ pin as follows:
 - If the IRQ pin is to be used for CPU interrupt requests, set the $IELSR_n.IELS[8:0]$ ($n = 0$ to 95) bits and the $IELSR_n.DTCE$ ($n = 0$ to 95) bit to 0.
 - If the IRQ pin is to be used for DTC activation, set the $IELSR_n.IELS[8:0]$ ($n = 0$ to 95) bits and the $IELSR_n.DTCE$ ($n = 0$ to 95) bit to 1

- If the IRQ pin is to be used for DMAC activation, set the DMAC. DELSRn.DELS[8:0] (n = 0 to 7) bits.

13.6 Non-Maskable Interrupt Operation

The following sources can trigger a non-maskable interrupt:

- NMI pin interrupt
- Oscillation stop detection interrupt
- WDT underflow/refresh error interrupt
- IWDT underflow/refresh error interrupt
- Voltage monitor 1 interrupt
- Voltage monitor 2 interrupt
- Common memory error interrupt
- Bus error interrupt
- CPU Lockup error interrupt

Non-maskable interrupts can only be used with the CPU, not to activate the DTC. Non-maskable interrupts take precedence over all other interrupts. The non-maskable interrupt states can be verified in the Non-Maskable Interrupt Status Register (NMISR). Confirm that all bits in the NMISR are 0 before returning from the NMI handler.

There may be a difference in processing speed between the CPU and ICU, and the CPU may exit the interrupt handler before clearing the NMISR. Then the CPU will accidentally jump to the NMI handler again. To avoid this, be sure to read NMISR before exiting the NMI handler and make sure that NMISR is cleared before exiting the NMI handler.

Non-maskable interrupts are disabled by default. To use non-maskable interrupts:

1. Clear the NMICR.NFLTEN bit to 0 (digital filter disabled).
2. Set the NMIMD bit, NFCLKSEL[1:0] bits, and NFLTEN bit of NMICR register.
3. Write 1 to the NMICLR.NMICLR bit to clear the NMISR.NMIST flag to 0.
4. Enable the non-maskable interrupt by writing 1 to the associated bit in the Non-Maskable Interrupt Enable Register (NMIER).

After 1 is written to the NMIER register, subsequent write access to the NMIEN bit in NMIER is ignored. An NMI cannot be disabled when enabled, except by a reset.

13.6.1 Correspondence to TrustZone-M by NMI

The NMI security is set by AIRCR.BFHFNMIN.

Although there is only one NMI per CPU, multiple factors can be set. This section describes the procedure for mixing Secure and NonSecure programs of NMI. When doing so, the NMI-related registers of the ICU are set to Secure.

Register related to Non-Maskable Interrupt :

- NMISR
- NMIER
- NMICLR
- NMICR

Figure 13.4 shows the flow.

Figure 13.4 Correspondence to TrustZone-M by NMI

13.7 Security

13.7.1 Security Related to CPU Interrupt Inputs

Non-maskable interrupt

Arm CPU NMI Secure is modified by AIRCR.BFHFNMINs and is managed by the software developer who manages Secure.

The following registers must follow the secure attribution set in AIRCR.BFHFNMINs.

- ICU.NMISR
- ICU.NMIER

- ICU.NMICLR

Therefore, the secure attribute set by ICUSARB must match the secure attribute set by AIRCR.BFHFNMINS.

Maskable interrupts

The secure of maskable interrupts are set in the Arm CPU NVIC internal registers (NVIC_ITNS0 to NVIC_ITNS15).

Which maskable interrupts are secured is controlled by the software developer who manages secure.

The following registers must follow the secure attribution set in NVIC_ITNS0 to NVIC_ITNS15.

- ICU.IELSRn (n = 0 to 95)

Therefore, the secure attribute set by ICUSARG, ICUSARH, and ICUSARI must match the secure attribute set by NVIC_ITNS0 to NVIC_ITNS15.

13.7.2 Trusted Interrupt Management

The secure-interrupt should not be visible to non-secure-operation. Because there is a risk that vital information will be leaked to the attacker, the on-chip interrupt network can route any interrupt to secure or non-secure world. However, secure interrupt routing must be suppressed so that it can only be configured from a secure world.

When set TEVTRCR.TEVTE = 1, secure program manages the selection of interrupt factors. It protects non-secure programs from using and monitoring secure interrupt factors without permission. Specifically, when TEVTRCR.TEVTE = 1, the write permission of IELSR.IELS [8:0] is limited to the secure attribute, and the write by the non-secure attribute is ignored. TEVTRCR.TEVTE protects only IELS [8:0], and the security attributes of IR and DTCE follow the settings of ICUSARG, ICUSARH, and ICUSARI. If TEVTRCR.TEVTE = 1, it is necessary to set all IELS including non-secure interrupts in the secure program or prepare a secure API to set IELS in response to the request from the non-secure program.

13.7.3 Trusted IELSR Setting Procedure

13.7.3.1 Case where Secure program sets all IELSRs

Case where all settings are performed in the secure initial sequence.

Initial IELSR setting procedure after system reset release

1. Secure program sets TEVTE=1
2. Secure program sets security attributes of all interrupts (NVIC_ITNS, Security Attribution of ICU.IELSRn.IELS)
3. Secure program selects all interrupt source (ICU.IELSRn.IELS)
4. Secure program allows secure interrupts (NVIC_ISER for secure interrupt)
5. Secure program jumps to non-secure program
6. Non-secure program allows non-secure interrupts (NVIC_ISER for non-secure interrupt)

13.7.3.2 Case where Non-secure program sets IELSRn by Secure API

Case of setting upon receiving a request from a non-secure program.

Initial IELSR setting procedure after system reset release

1. Secure program sets TEVTE=1
2. Secure program sets security attributes of all interrupts (NVIC_ITNS, Security Attribution of ICU.IELSRn.IELS)
3. Secure program selects secure interrupt source (ICU.IELSRn.IELS)
4. Secure program enables secure interrupt (NVIC_ISER for secure interrupt)
5. Secure program jumps to non-secure program
6. Non-secure program calls secure program (API call)
7. Secure program selects the cause of non-secure interrupt (ICU.IELSRn.IELS)
8. Secure program returns to non-secure program
9. Non-secure program allows non-secure interrupt (NVIC_ISER for non-secure interrupt)

13.7.3.3 IELSR release procedure when TEVTE=1

< When clearing interrupt settings of secure attribute by the secure program >

1. Clear the interrupt source setting (IELSRn.IELS = 0x00)
2. Clear the interrupt status flag (ICU.IELSRn.IR = 0)
3. Clear the Interrupt Clear Enable register (NVIC_ICPR)

<When clearing interrupt settings of non-secure attribute by the secure program >

1. Clear the interrupt source setting (IELSRn.IELS = 0x00)
2. Clear the interrupt status flag by using the non-secure alias address (IELSRn.IR = 0)
3. Clear the Interrupt Clear Enable register (NVIC_ICPR)

Secure can also rewrite NVIC_ICPRn_NS .

< When clearing interrupt settings of secure attribute by the non-secure program >

It cannot be canceled.

< When clearing interrupt settings of non-secure attribute by non-secure program >

1. Non-secure program calls secure program (API call)
2. Clear the interrupt source setting (IELSRn.IELS = 0x00)
3. Return from secure program to non-secure program
4. Clear the interrupt status flag (IELSRn.IR = 0)
5. Clear the Interrupt Clear Enable register (NVIC_ICPR)

13.8 Return from Low Power Modes

Table 13.4 lists the interrupt sources that can be used to exit Sleep, Deep Sleep, Software Standby mode or Deep Software Standby mode. For more information, see [section 10, Low Power Modes](#).

Note: The return factor from low power mode must have a priority that the CPU can accept.

13.8.1 Return from CPU Sleep Mode

To return from CPU Sleep mode in response to an interrupt:

non-maskable interrupt

- Use the NMIER register to enable the target interrupt request.

maskable interrupt

- Select the CPU as the interrupt request destination.
- Enable the interrupt in the NVIC.

13.8.2 Return from CPU Deep Sleep Mode

The ICU returns from CPU Deep Sleep mode using a non-maskable interrupt or a maskable interrupt. For maskable interrupt of canceling source, see [Table 13.4](#).

To return from CPU Deep Sleep mode:

Non-maskable interrupt

Use the NMIER register to enable the target interrupt request.

Maskable interrupt

1. Select the interrupt source that enables return from CPU Deep Sleep mode.

2. Use the WUPEN register to enable the target interrupt request.
3. Select the CPU as the interrupt request destination.
4. Enable the interrupt in the NVIC.

Interrupt requests through the IRQ_i (i = 0 to 15) pins that do not satisfy these conditions are not detected while the clock is stopped in CPU Deep Sleep mode. Similarly, it cannot detect a request for a non-maskable interrupt from a request source whose clock is stopped in CPU Deep Sleep mode. Therefore, those events cannot be used as return factors. For example, the CPU cannot return from software standby mode because the following NMI events do not occur.

- CPU Lockup error interrupt

13.8.3 Return from Software Standby Mode

MCU goes to the Software Standby mode via CPU Deep sleep state.

The ICU returns from Software Standby mode using a non-maskable interrupt or a maskable interrupt. For maskable interrupt of canceling source, see [Table 13.4](#).

Waking up from Software Standby mode is triggered by the same event as CPU Deep Sleep mode. No event occurs from the function that stops in Software Standby mode. Therefore, those events cannot be used as return factors. For example, the CPU cannot return from Software Standby mode because the following NMI events do not occur.

- WDT underflow/refresh error
- Common memory error interrupt
- Bus error interrupt
- CPU Lockup error interrupt

13.9 Using the WFI Instruction with Non-Maskable Interrupts

Whenever a WFI instruction is executed, confirm that all status flags in the NMISR register are 0.

14. Buses

14.1 Overview

Table 14.1 lists the bus masters and bus slaves, Figure 14.1 shows the system bus configuration, and Table 14.3 lists the addresses assigned for each bus.

Table 14.1 Bus specifications

Classification	Bus master/ slave name	Sync clock	Description
Bus masters	CPUMAXIBI (Arm® Cortex®-M85)	CPUCLK	Connected to the CPU Master-AXI (M-AXI) Interface
	CPUPAHBI (Arm® Cortex®-M85)	CPUCLK	Connected to the CPU Peripheral AHB (P-AHB) Interface
	DMAC/DTCBI	ICLK	Connected to the DMAC/DTC Interface
	GLCDC0BI	PCLKA	Connected to the GLCDC0 Interface
	GLCDC1BI	PCLKA	Connected to the GLCDC1 Interface
	DRW0BI	PCLKA	Connected to the DRW0 Interface
	DRW1BI	PCLKA	Connected to the DRW1 Interface
Bus slaves	FHBI	ICLK	Connected to Code Flash memory and Configuration area
	FLBI	FCLK	Connected to Data Flash memory and FACI
	CPUSAHBI	CPUCLK	Connected to CPU S-AHB
	S0BI	ICLK	Connected to SRAM0
	S1BI	ICLK	Connected to SRAM1
	STBYSBI	ICLK	Connected to Standby SRAM
	ECBI	BCLK	Connected to the external devices (External Memory Interface)
	EOBI	PCLKA	Connected to the OSPI (External Memory Interface)
	PBBI	PCLKB	Connected to peripheral modules synchronizes with PCLKB
	PABI	PCLKA	Connected to peripheral modules synchronizes with PCLKA
	PIBI	ICLK	Connected to peripheral modules synchronizes with ICLK
	ICUBI	ICLK	Connected to ICU controller
	PSBI	ICLK	Connected to peripheral system modules (MPU, CSC/SDRAM, SRAM, Debug component, Flash controller, Bus controller, common ICU controller, DMAC/DTC, CPU controller and security attribution controller)
		PCLKB	Connected to peripheral system module. (system controller)
	DCLK	Connected to peripheral system module. (debug controller)	

Note: BCLK (external bus clock) : 120 MHz (max.) (The CSC (CS area controller) operates in synchronization with the BCLK).
 BCLK pin output: The frequency is the same as the default of BCLK. Half of BCLK can be supplied by setting the EBCLK pin and the output select bit (BCKCR.BCLKDIV) in the External Bus Clock Control register. For details, see [section 8, Clock Generation Circuit](#)

CPUMAXIBI : CPU M-AXI Bus Interface
 CPUPAHBI : CPU P-AHB Bus Interface
 DMAC/DTCBI : DMAC/DTC Bus Interface
 GLCDC0BI : GLCDC (graphic 1) Bus Interface
 GLCDC1BI : GLCDC (graphic 2) Bus Interface
 DRW0BI : DRW (texture) Bus Interface
 DRW1BI : DRW (data) Bus Interface
 FHBI : Flash High-speed Bus Interface
 FLBI : Flash Low-speed Bus Interface
 CPUSAHBI : CPU S-AHB Interface
 S0BI : SRAM0 Bus Interface
 S1BI : SRAM1 Bus Interface
 STBYSBI : Standby SRAM Bus Interface
 ECBI : External memory CSC and SDRAM Bus Interface

EOBI : External memory OSPI Bus Interface
 PBBI : Peripheral synchronizes with PCLKB Bus Interface
 PABI : Peripheral synchronizes with PCLKA Bus Interface
 PIBI : Peripheral synchronizes with ICLK Bus Interface
 ICUBI : ICU Controller Bus Interface
 PSBI : Peripheral System Bus Interface

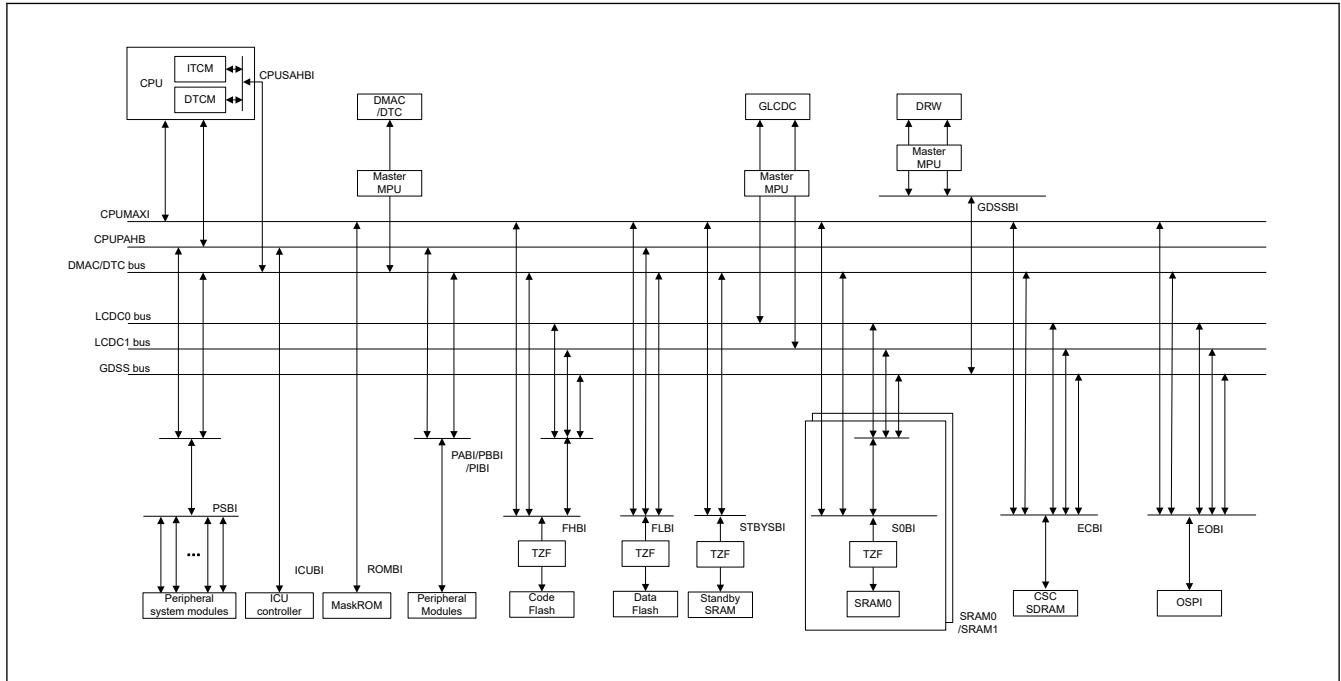

Figure 14.1 System bus connection

Table 14.2 System bus access path

	Name	Master					
		CPUMAXIBI	CPUPAHBI	DMAC/DTCBI	GLCDC0BI	GLCDC1BI	GDSSBI*1
Slave	PSBI	F	T	T	F	F	F
	ICUBI	F	T	F	F	F	F
	CPUSAHBI	F	F	T	F	F	F
	PIBI	F	T	T	F	F	F
	PABI	F	T	T	F	F	F
	PBBI	F	T	T	F	F	F

	0x4030_0000 to 0x403F_FFFF (Secure) 0x5030_0000 to 0x503F_FFFF (Non-secure)	PABI	Peripheral synchronizes with PCLKA
0x4040_0000 to 0x404F_FFFF (Secure) 0x5040_0000 to 0x504F_FFFF (Non-secure)	PIBI	Peripheral synchronizes with ICLK	
External RAM	0x6000_0000 to 0x6FFF_FFFF	ECBI	CSC/SDRAM (external bus)
	0x8000_0000 to 0x9FFF_FFFF	EOBI	OSPI

14.2 Description of Buses

14.2.1 Arbitration

For arbitration between masters in each slave, fixed-priority and round-robin methods can be selected. For details, see [section 14.3.24. BUSMABT : Bus Master Arbitration Control Register](#), [section 14.3.25. BUSSABT0<slave> : Bus Slave Arbitration Control Register 0\(<slave> = FLBI, STBYSBI, ECBI, EOBI, PBBI, PABI, PIBI, PSBI\)](#) and [section 14.3.26. BUSSABT1<slave> : Bus Slave Arbitration Control Register 1\(<slave> = FHBI, S0BI, S1BI\)](#).

14.2.2 External Bus

The external bus controller arbitrates requests for bus access on the external address space from the CPU M-AXI bus, DMAC/DTC bus, GLCDC0 bus, GLCDC1 bus, DRW0 bus and DRW1 bus. See [section 14.2.1. Arbitration](#) for the priority and arbitration method of each master to the External bus.

The bus system provides an external space for the OSPI (EOBI). See [section 33, Octal Serial Peripheral Interface \(OSPI\)](#).

Table 14.4 lists the external bus specifications and Table 14.5 lists the I/O pins.

Table 14.4 External bus specifications

Parameter	Specifications
External address space	<ul style="list-style-type: none"> The external address space is divided into 8 CS areas (CS0 to CS7) and the SDRAM area (SDCS) for management. Chip select signals can be output for each area. The bus width can be set for each area. <ul style="list-style-type: none"> Separate bus: Selectable to 8-bit or 16-bit bus space Address/data multiplexed bus: Selectable to 8-bit or 16-bit bus space Endian mode can be specified for each area.
CS area controller	<ul style="list-style-type: none"> Recovery cycles can be inserted: <ul style="list-style-type: none"> Read recovery: Up to 15 cycles Write recovery: Up to 15 cycles Cycle wait function: Wait for up to 31 cycles (for page access, up to 7 cycles) Use wait control to set up: <ul style="list-style-type: none"> Assertion and negation timing of chip select signals (CS0 to CS7) Assertion timing of the read signal (RD) and write signals (WR0/WR and WR1) Timing of data output starts and ends Write access modes: <ul style="list-style-type: none"> Single-write strobe mode and byte strobe mode <p>Separate bus or address/data multiplexed bus can be set for each area.</p>
SDRAM area controller	<ul style="list-style-type: none"> Multiplexed output of row address and column address (8, 9, 10, or 11 bits) Self-refresh and auto-refresh selectable CAS latency can be specified from 1 to 3 cycles.
Write buffer function	When write data from the bus master is written to the write buffer, write access by the bus master is complete.
Frequency	<ul style="list-style-type: none"> The CS area controller (CSC) operates in synchronization with the external bus clock (BCLK)^{*1} The frequency of the EBCLK pin output is the same as BCLK by default. Half of the BCLK cycles can be supplied by setting the EBCLK Pin Output Select bit, BCKCR.BCLKDIV, in the External Bus Clock Control Register. For more information, see section 8, Clock Generation Circuit. The SDRAM area controller (SDRAMC) operates in synchronization with the SDRAM clock (SDCLK).

Note 1. BCLK and SDCLK must operate at the same frequency when the SDRAM is in use.

Table 14.5 External bus I/O pins (1 of 2)

Pin name	I/O	Related functions	Description
EBCLK, SDCLK ^{*1}	Output	CSC, SDRAMC	Clock output pin
A23 to A00 ^{*2}	Output	CSC, SDRAMC	Address output pins
D15 to D00 DQ15 to DQ00	I/O	CSC, SDRAMC	D15 to D00 are CSC data input/output pins. DQ15 to DQ00 are SDRAMC data input/output pins. <ul style="list-style-type: none"> D15 to D00, DQ15 to DQ00 pins are enabled when the 16-bit bus space is specified. D07 to D00, DQ07 to DQ00 pins are enabled when the 8-bit bus space is specified.
BC0	Output	CSC	<ul style="list-style-type: none"> Strobe signal that indicates (when low) that D07 to D00 are valid during access to an external address space in single-write strobe mode, active-low. When an 8-bit bus space is specified, this output pin is always held low regardless of the write access mode.
BC1	Output	CSC	<ul style="list-style-type: none"> Strobe signal that indicates (when low) that D15 to D08 are valid during access to an external address space in single-write strobe mode, active-low. This pin is not used when the 8-bit bus space is specified.
CS0 ^{*3}	Output	CSC	Chip select signal for area 0 (CS0), active-low
CS1 ^{*3}	Output	CSC	Chip select signal for area 1 (CS1), active-low
CS2 ^{*3}	Output	CSC	Chip select signal for area 2 (CS2), active-low
CS3 ^{*3}	Output	CSC	Chip select signal for area 3 (CS3), active-low
CS4	Output	CSC	Chip select signal for area 4 (CS4), active-low
CS5	Output	CSC	Chip select signal for area 5 (CS5), active-low

Table 14.5 External bus I/O pins (2 of 2)

Pin name	I/O	Related functions	Description
CS6	Output	CSC	Chip select signal for area 6 (CS6), active-low
CS7	Output	CSC	Chip select signal for area 7 (CS7), active-low
RD	Output	CSC	Strobe signal that indicates that a read from an external address space (CS0 to CS7) is in progress, active-low.
WR0/WR ^{*4}	Output	CSC	<ul style="list-style-type: none"> WR0 signal is a strobe signal that indicates that a write to an external address space is in progress in byte strobe mode, and D07 to D00 are valid, active-low. WR signal is a strobe signal that indicates that a write to an external address space is in progress in single-write strobe mode, active-low. When an 8-bit bus space is specified, this output pin is held low during a write access regardless of the write access mode.
WR1	Output	CSC	<ul style="list-style-type: none"> Strobe signal that indicates that D15 to D08 are valid during a write to an external address space in byte strobe mode, active-low. This signal is invalid in single-write strobe mode. This pin is not used when the 8-bit bus space is specified.
ALE	Output	CSC	Address latch signal when address/data multiplexed bus is selected.
WAIT	Input	CSC	Wait request signal used when accessing the external address space (CS0 to CS7), active-low
CKE	Output	SDRAMC	Clock enable signal
SDCS	Output	SDRAMC	Chip select signal, active-low
RAS	Output	SDRAMC	Row address strobe signal, active-low
CAS	Output	SDRAMC	Column address strobe signal, active-low
WE	Output	SDRAMC	Write enable signal, active-low
DQM0	Output	SDRAMC	I/O data mask enable signal for DQ07 to DQ00
DQM1	Output	SDRAMC	I/O data mask enable signal for DQ15 to DQ08

Note 1. The EBCLK and the SDCLK pin functions are shared by the CS area controller (CSC) and the SDRAM area controller (SDRAMC). When using the CSC and the SDRAMC simultaneously, the SDCLK pin function is valid.

Note 2. The A23 to A00 pin functions are shared by the CSC and the SDRAMC.

When using the CSC only:

The A00 and BC0 pin functions share the same pin, and either becomes valid according to the area, with the function being A00 in byte strobe mode and BC0 in single-write strobe mode. Setting the 8-bit external bus width is prohibited in single-write strobe mode.

When using the SDRAMC only:

The A16 to A00 pin functions are valid.

The A00 and DQM1 pin functions share the same pin, and either pin function becomes valid according to the external bus width.

When selecting 8-bit bus width, the pin function is A00 and A01. When selecting 16-bit bus width, the pin function is A0 and DQM1.

When using the CSC and the SDRAMC simultaneously:

The A23 to A17 pin functions are valid for CSC. The A16 to A00 pin functions are shared by the CSC and the SDRAMC. In the SDRAMC functions, the A00 and the DQM1 pin functions work as described.

In the CSC functions, the A00 and the BC0 pin function works as described.

Note 3. The CS0 to CS3 (CSC) and SDRAMC pin functions share the same pin. When using the CSC and the SDRAMC simultaneously, the CS0 to CS3 pin functions are invalid.

Note 4. The WR0 signal and WR signal are identical. The WR0 signal is referred to as WR in single-write strobe mode.

14.2.3 Parallel Operation

Parallel operation is possible when different bus-master modules are requesting access to different slave interface. For example, if the CPU is fetching an instruction from Code Flash and an operand from SRAM0, the DMAC can handle transfers between a peripheral module and the external memory interface at the same time.

Figure 14.2 shows an example of parallel operations. In this example, the CPU uses CPUMAXIBI to access FHBI. Furthermore, the DMAC/DTC simultaneously accesses the peripheral bus or the external bus during access to FHBI and S0BI by the CPU.

Figure 14.2 Example of parallel operations

14.2.4 Bus Settings

Set up the external bus with the following registers :

- Mode settings :
 - CSn Mode Register (CSnMOD)
 - CSn Wait Control Register 1 (CSnWCR1)
 - CSn Wait Control Register 2 (CSnWCR2)
 - CSn Control Register (CSnCR)
 - CSn Recovery Cycle Setting Register (CSnREC)
 - CS Recovery Cycle Insertion Enable Register (CSRECEN)
 - Bus Master Arbitration Control Register (BUSMABT)
 - Bus Slave Arbitration Control Register 2 (BUSSABT2)
- I/O port assignments :
 - PmnPFS.PMR = 1 and PmnPFS.PSEL[4:0] = 0x0B
- Frequency of the external bus clock (BCLK) and SDRAM clock (SDCLK) :
 - SCKDIVCR register.

See [section 19, I/O Ports](#), for information on PmnPFS and section Clock Generation Function for information on SCKDIVCR.

14.2.5 Restrictions

14.2.5.1 Endianness constraint

Memory space must be little-endian to execute code of the Arm[®] Cortex[®]-M85 core.

14.2.5.2 Bufferable write access

If an access violation occurs due to bufferable write access, an error response is not returned to the bus master, but an NMI or RESET request is issued depending on the setting of the BUSOAD register. For more information, see [section 14.7.2. Operations When a Bus Error Occurs](#).

14.2.5.3 Access to the reserved area of FLBI

Access to the reserved area of FLBI is prohibited. Operation is not guaranteed if accessed.

14.3 Register Descriptions

14.3.1 BUSSARA : Bus Security Attribution Register A

Base address: CPSCU = 0x4000_8000
 CPSCU_NS = 0x5000_8000

Offset address: 0x100

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BUSS A0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BUSSA0	Bus Security Attribution A0 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

BUSSA0 bit (Bus Security Attribution A0)

Security attributes of registers for Slave Bus Control Register. The target registers are as follows:

- BUSMABT
- BUSSABT0<slave>
 <slave> = FLBI/STBYSBI/ECBI/EOBI/PBBI/PABI/PIBI/PSBI
- BUSSABT1<slave>
 <slave> = FHBI/S0BI/S1BI
- BUSDIVBYP

14.3.2 BUSSARB : Bus Security Attribution Register B

Base address: CPSCU = 0x4000_8000
 CPSCU_NS = 0x5000_8000

Offset address: 0x104

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BUSS B0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BUSSB0	Bus Security Attribution B0 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

BUSSB0 bit (Bus Security Attribution B0)

Security attributes of bus error related registers. The target registers are as follows:

- BUSnERRCLR
- MBWERRCLR
- SBWERRCLR
- BUSOAD
- BUSOADPT

14.3.3 BUSSARC : Bus Security Attribution Register C

Base address: CPSCU = 0x4000_8000
 CPSCU_NS = 0x5000_8000

Offset address: 0x110

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BUSSC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BUSSC0	Bus Security Attribution C0 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

BUSSC0 bit (Bus Security Attribution C0)

Security attributes of registers for bus (SDRAMC/CSC) Control. The target registers are as follows:

- BUS.CSnCR (n = 0 to 7)
- BUS.CSnREC (n = 0 to 7)
- BUS.CSRECEN
- BUS.CSnMOD (n = 0 to 7)
- BUS.CSnWCR1 (n = 0 to 7)
- BUS.CSnWCR2 (n = 0 to 7)
- BUS.SDCCR
- BUS.SDCMOD
- BUS.SDAMOD
- BUS.SDSELF
- BUS.SDRFCR
- BUS.SDRFEN
- BUS.SDICR
- BUS.SDIR
- BUS.SDADR
- BUS.SDTR

- BUS.SDMOD
- BUS.SDSR
- BUS.BUSPARC

14.3.4 BUSPARC : Bus Privileged Attribution Register C

Base address: CPSCU = 0x4000_8000
 CPSCU_NS = 0x5000_8000

Offset address: 0x114

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BUSPA0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	BUSPA0	External bus controller privilege attribution 0: Privileged 1: Unprivileged	R/W
31:1	—	These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-2, P-TYPE-1

BUSPA0 bit (External bus controller privilege attribution)

Privileged attributes of registers for Bus (SDRAMC/CSC) Control. The target registers are as follows:

- BUS.CSnCR (n = 0 to 7)
- BUS.CSnREC (n = 0 to 7)
- BUS.CSRECEN
- BUS.CSnMOD (n = 0 to 7)
- BUS.CSnWCR1 (n = 0 to 7)
- BUS.CSnWCR2 (n = 0 to 7)
- BUS.SDCCR
- BUS.SDCMOD
- BUS.SDAMOD
- BUS.SDSELF
- BUS.SDRFCR
- BUS.SDRFEN
- BUS.SDICR
- BUS.SDIR
- BUS.SDADR
- BUS.SDTR
- BUS.SDMOD
- BUS.SDSR

14.3.5 CSnCR : CSn Control Register (n = 0 to 7)

Base address: BUS = 0x4000_3000
 BUS_NS = 0x5000_3000

Offset address: 0x802 + 0x10 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	MPXEN	—	—	—	EMODE	—	—	BSIZE[1:0]	—	—	—	—	EXENB
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	EXENB	Operation Enable 0: Disable operation 1: Enable operation	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
5:4	BSIZE[1:0]	External Bus Width Select 0 0: 16-bit bus space 1 0: 8-bit bus space Others: Setting prohibited	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
8	EMODE	Endian Mode 0: Little endian 1: Big endian	R/W
11:9	—	These bits are read as 0. The write value should be 0.	R/W
12	MPXEN	Address/Data Multiplexed I/O Interface Select 0: Separate bus interface is selected for area n. 1: Address/data multiplexed I/O interface is selected for area n.	R/W
15:13	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Do not attempt to write the CSnCR register while the external bus is being accessed.

EXENB bit (Operation Enable)

The EXENB bit enables operation of the associated CS area. On MCU reset, operation is enabled (EXENB = 1) only for area 0. Operation in other areas is disabled (EXENB = 0). Attempts to access disabled areas have no effect.

When the CSC and SDRAMC are in use at the same time, EBCLK and SDCLK must operate at the same frequency.

BSIZE[1:0] bits (External Bus Width Select)

The BSIZE[1:0] bits specify the data bus width for the associated area.

EMODE bit (Endian Mode)

The EMODE bit specifies the endianness for the associated area. The Arm[®] Cortex[®]-M85 core is fixed at little-endian order, so instruction code can only be allocated to external spaces with little-endian specified. If an area is specified as big-endian, no instruction code can be allocated to it. Only CPU, DMAC and DTC can access to big-endian area. Memory type of big-endian area must be Device-Memory. For changing the memory type, see [section 14.8. References\[1\]](#). CPU can't access to big-endian area when using M-profile Vector Extension(MVE).

MPXEN bit (Address/Data Multiplexed I/O Interface Select)

The MPXEN bit specifies separate bus interface or address/data multiplexed I/O interface of each area.

14.3.6 CSnREC : CSn Recovery Cycle Register (n = 0 to 7)

Base address: BUS = 0x4000_3000
 BUS_NS = 0x5000_3000

Offset address: 0x80A + 0x10 × n

Bit	Symbol	Function	R/W
3:0	RRCV[3:0]	Read Recovery 0 0 0 0: Do not insert any recovery cycles. 0 0 0 1: Insert 1 recovery cycle. 0 0 1 0: Insert 2 recovery cycles. 0 0 1 1: Insert 3 recovery cycles. 0 1 0 0: Insert 4 recovery cycles. 0 1 0 1: Insert 5 recovery cycles. 0 1 1 0: Insert 6 recovery cycles. 0 1 1 1: Insert 7 recovery cycles. 1 0 0 0: Insert 8 recovery cycles. 1 0 0 1: Insert 9 recovery cycles. 1 0 1 0: Insert 10 recovery cycles. 1 0 1 1: Insert 11 recovery cycles. 1 1 0 0: Insert 12 recovery cycles. 1 1 0 1: Insert 13 recovery cycles. 1 1 1 0: Insert 14 recovery cycles. 1 1 1 1: Insert 15 recovery cycles.	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W
11:8	WRCV[3:0]	Write Recovery 0 0 0 0: Do not insert any recovery cycles. 0 0 0 1: Insert 1 recovery cycle. 0 0 1 0: Insert 2 recovery cycles. 0 0 1 1: Insert 3 recovery cycles. 0 1 0 0: Insert 4 recovery cycles. 0 1 0 1: Insert 5 recovery cycles. 0 1 1 0: Insert 6 recovery cycles. 0 1 1 1: Insert 7 recovery cycles. 1 0 0 0: Insert 8 recovery cycles. 1 0 0 1: Insert 9 recovery cycles. 1 0 1 0: Insert 10 recovery cycles. 1 0 1 1: Insert 11 recovery cycles. 1 1 0 0: Insert 12 recovery cycles. 1 1 0 1: Insert 13 recovery cycles. 1 1 1 0: Insert 14 recovery cycles. 1 1 1 1: Insert 15 recovery cycles.	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Do not attempt to write to the CSnREC register while the external bus is being accessed.

When the preceding bus access is from a separate bus, CSnREC is valid when the recovery cycle insertion is enabled in the Separate Bus Recovery Cycle Insertion Enable bit (RCVEN_i (i = 0 to 7)) in CSRECEN. When the preceding bus access is an address/data multiplexed bus access, CSnREC is valid when the recovery cycle insertion is enabled with the Multiplexed Bus Recovery Cycle Insertion Enable bit (RCVENM_j (j = 0 to 7)) in CSRECEN. For more information, see [section 14.5.4. Insertion of Recovery Cycles](#).

RRCV[3:0] bits (Read Recovery)

The RRCV[3:0] bits specify the number of recovery cycles inserted after a read access on the external bus for CSn (n = 0 to 7). When recovery cycle insertion is enabled and a value other than 0000 is set, 1 to 15 recovery cycles are inserted when:

- After a read access to the external bus, a read access is made to the external bus in the same area.

- After a read access to the external bus, a read access is made to the external bus in a different area.
- After a read access to the external bus, a write access is made to the external bus in the same area.
- After a read access to the external bus, a write access is made to the external bus in a different area.

WRCV[3:0] bits (Write Recovery)

The WRCV[3:0] bits specify the number of recovery cycles inserted after a write access on the external bus for CSn (n = 0 to 7). When recovery cycle insertion is enabled and a value other than 0000 is set, 1 to 15 recovery cycles are inserted when:

- After a write access to the external bus, a read access is made to the external bus in the same area.
- After a write access to the external bus, a read access is made to the external bus in a different area.
- After a write access to the external bus, a write access is made to the external bus in the same area.
- After a write access to the external bus, a write access is made to the external bus in a different area.

14.3.7 CSRECEN : CS Recovery Cycle Insertion Enable Register

Base address: BUS = 0x4000_3000
 BUS_NS = 0x5000_3000

Offset address: 0x880

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	RCVE NM7	RCVE NM6	RCVE NM5	RCVE NM4	RCVE NM3	RCVE NM2	RCVE NM1	RCVE NM0	RCVE N7	RCVE N6	RCVE N5	RCVE N4	RCVE N3	RCVE N2	RCVE N1	RCVE N0
Value after reset:	0	0	1	1	1	1	1	0	0	0	1	1	1	1	1	0

Bit	Symbol	Function	R/W
0	RCVEN0	Separate Bus Recovery Cycle Insertion Enable 0 0: Disabled 1: Enabled	R/W
1	RCVEN1	Separate Bus Recovery Cycle Insertion Enable 1 0: Disabled 1: Enabled	R/W
2	RCVEN2	Separate Bus Recovery Cycle Insertion Enable 2 0: Disabled 1: Enabled	R/W
3	RCVEN3	Separate Bus Recovery Cycle Insertion Enable 3 0: Disabled 1: Enabled	R/W
4	RCVEN4	Separate Bus Recovery Cycle Insertion Enable 4 0: Disabled 1: Enabled	R/W
5	RCVEN5	Separate Bus Recovery Cycle Insertion Enable 5 0: Disabled 1: Enabled	R/W
6	RCVEN6	Separate Bus Recovery Cycle Insertion Enable 6 0: Disabled 1: Enabled	R/W
7	RCVEN7	Separate Bus Recovery Cycle Insertion Enable 7 0: Disabled 1: Enabled	R/W
8	RCVENM0	Multiplexed Bus Recovery Cycle Insertion Enable 0 0: Disabled 1: Enabled	R/W
9	RCVENM1	Multiplexed Bus Recovery Cycle Insertion Enable 1 0: Disabled 1: Enabled	R/W

Bit	Symbol	Function	R/W
10	RCVENM2	Multiplexed Bus Recovery Cycle Insertion Enable 2 0: Disabled 1: Enabled	R/W
11	RCVENM3	Multiplexed Bus Recovery Cycle Insertion Enable 3 0: Disabled 1: Enabled	R/W
12	RCVENM4	Multiplexed Bus Recovery Cycle Insertion Enable 4 0: Disabled 1: Enabled	R/W
13	RCVENM5	Multiplexed Bus Recovery Cycle Insertion Enable 5 0: Disabled 1: Enabled	R/W
14	RCVENM6	Multiplexed Bus Recovery Cycle Insertion Enable 6 0: Disabled 1: Enabled	R/W
15	RCVENM7	Multiplexed Bus Recovery Cycle Insertion Enable 7 0: Disabled 1: Enabled	R/W

Note: S-TYPE-3, P-TYPE-3

Do not attempt to write the CSRECEN register while the external bus is being accessed. For more information on insertion recovery cycles, see [section 14.5.4. Insertion of Recovery Cycles](#).

RCVEN_i Bit (Separate Bus Recovery Cycle Insertion Enable *i*) (*i* = 0 to 7)

This bit enables the insertion of read or write recovery cycles when, after a read or write access on the external bus, a read or write access is made on the external bus to the same or different area.

RCVENM_j Bit (Multiplexed Bus Recovery Cycle Insertion Enable *j*) (*j* = 0 to 7)

This bit enables the insertion of read or write recovery cycles when, after a read or write access on the external bus, a read or write access is made on the external bus to the same or different area.

Table 14.6 Access type associations with the RCVEN_n bits

Access type	External Address Space	Insertion of recovery cycles	Associated bits (Separate/Multiplexed)
Read access after read access	Same area	Recovery cycles specified in the RRCV[3:0] bits are inserted for the priority access area	RCVEN0/RCVENM0
	Different area	Recovery cycles specified in the RRCV[3:0] bits are inserted for the priority access area	RCVEN1/RCVENM1
Write access after read access	Same area	Recovery cycles specified in the RRCV[3:0] bits are inserted for the priority access area	RCVEN2/RCVENM2
	Different area	Recovery cycles specified in the RRCV[3:0] bits are inserted for the priority access area	RCVEN3/RCVENM3
Read access after write access	Same area	Recovery cycles specified in the WRCV[3:0] bits are inserted for the priority access area	RCVEN4/RCVENM4
	Different area	Recovery cycles specified in the WRCV[3:0] bits are inserted for the priority access area	RCVEN5/RCVENM5
Write access after write access	Same area	Recovery cycles specified in the WRCV[3:0] bits are inserted for the priority access area	RCVEN6/RCVENM6
	Different area	Recovery cycles specified in the WRCV[3:0] bits are inserted for the priority access area	RCVEN7/RCVENM7

14.3.8 CSnMOD : CSn Mode Register (n = 0 to 7)

Base address: BUS = 0x4000_3000
 BUS_NS = 0x5000_3000

Offset address: 0x002 + 0x10 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PRMOD	—	—	—	—	—	PWENB	PRENB	—	—	—	—	EWENB	—	—	WRMOD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	WRMOD	Write Access Mode Select 0: Byte strobe mode 1: Single-write strobe mode	R/W
2:1	—	These bits are read as 0. The write value should be 0.	R/W
3	EWENB	External Wait Enable 0: Disabled 1: Enabled	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W
8	PRENB	Page Read Access Enable 0: Disabled 1: Enabled	R/W
9	PWENB	Page Write Access Enable 0: Disabled 1: Enabled	R/W
14:10	—	These bits are read as 0. The write value should be 0.	R/W
15	PRMOD	Page Read Access Mode Select 0: Normal access compatible mode 1: External data read continuous assertion mode	R/W

Note: S-TYPE-3, P-TYPE-3

Do not write to the CSnMOD register while access to the CSn area is in progress.

WRMOD bit (Write Access Mode Select)

The WRMOD bit selects the write access operating mode. Writing 0 selects byte strobe mode, in which data writes are controlled by the WRn signals (n = 0 to 1) associated with the respective byte positions. Writing 1 selects single-write strobe mode, in which data writes are controlled by the BCn (n = 0 to 1) and WR signals associated with the respective byte positions.

Note: Setting the external bus width to 8 bits is prohibited in single-write strobe mode.

Table 14.7 Control signals for write access mode

Mode	Pin name			
	WR1	WR0/WR	BC1	BC0
Byte strobe mode	✓	✓ (WR0)	—	—
Single write strobe mode	—	✓ (WR)	✓	✓

✓ : Enabled, — : Disabled

EWENB bit (External Wait Enable)

The EWENB bit enables external waits. Writing 0 disables the WAIT signal. Writing 1 selects external wait and allows the WAIT signal to control the number of waits per cycle. In this state, wait cycles are inserted when the WAIT signal is low.

PRENB bit (Page Read Access Enable)

The PRENB bit enables page read accesses.

Note: When the address/data multiplexed I/O interface is selected with the CSnCR.MPXEN bit, PRENB should not be set to enable page read accesses. Page read accesses are not supported in the address/data multiplexed I/O interface.

PWENB bit (Page Write Access Enable)

The PWENB bit enables page write accesses.

Note: When the address/data multiplexed I/O interface is selected with the CSnCR.MPXEN bit, PWENB should not be set to enable page write accesses. Page write accesses are not supported in the address/data multiplexed I/O interface.

PRMOD bit (Page Read Access Mode Select)

The PRMOD bit selects the operating mode for page read accesses. Writing 0 selects normal access compatible mode, in which the RD signal is negated and an RD assert wait is inserted each time a unit of data is read. When there is no RD assert wait, the RD signal is negated only in the final transfer of the external bus access.

Writing 1 selects external data read continuous assertion mode, in which an RD assert wait is inserted and the RD signal is continuously asserted during the wait.

14.3.9 CSnWCR1 : CSn Wait Control Register 1 (n = 0 to 7)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x004 + 0x10 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	CSRWAIT[4:0]				—	—	—	CSWWAIT[4:0]

R/W
31:29	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. The CSPWWAIT[2:0] value is only valid when the CSnMOD.PWENB bit is set to 1.

Note 2. The CSPRWAIT[2:0] value is only valid when the CSnMOD.PRENB bit is set to 1.

Do not attempt to write to the CSnWCR1 register while the external bus is being accessed. Set each of these bits within a range of the restrictions described in (1) [Constraints on using separate bus interface](#) or (2) [Constraints on using address/data multiplexed bus interface](#), according to the bus interface used.

CSPWWAIT[2:0] bits (Page Write Cycle Wait Select)

The CSPWWAIT[2:0] bits specify the number of wait cycles to be inserted into the second and subsequent accesses during a page write cycle. The setting is enabled when the CSnMOD.PWENB bit is set to 1.

Note: The settings must satisfy $1 \leq \text{CSnWCR2.WDON}[2:0] \text{ value} \leq \text{CSnWCR2.WRON}[2:0] \text{ value} \leq \text{CSnWCR1.CSPWWAIT}[2:0] \text{ value}$, and $\text{CSnWCR2.CSON}[2:0] \text{ value} \leq \text{CSnWCR2.WRON}[2:0] \text{ value} \leq \text{CSnWCR1.CSPWWAIT}[2:0] \text{ value}$.

CSPRWAIT[2:0] bits (Page Read Cycle Wait Select)

The CSPRWAIT[2:0] bits specify the number of wait cycles to be inserted into the second and subsequent accesses during a page read cycle. The setting is enabled when the CSnMOD.PRENB bit is set to 1.

Note: The settings must satisfy $\text{CSnWCR2.CSON}[2:0] \text{ value} \leq \text{CSnWCR2.RDON}[2:0] \text{ value} \leq \text{CSnWCR1.CSPRWAIT}[2:0] \text{ value}$.

CSWWAIT[4:0] bits (Normal Write Cycle Wait Select)

The CSWWAIT[4:0] bits specify the number of wait cycles to be inserted into the first access during a normal write cycle or page write cycle.

Note: The settings must satisfy $1 \leq \text{CSnWCR2.WDON}[2:0] \text{ value} \leq \text{CSnWCR2.WRON}[2:0] \text{ value} \leq \text{CSnWCR1.CSWWAIT}[4:0] \text{ value}$, and $\text{CSnWCR2.CSON}[2:0] \text{ value} \leq \text{CSnWCR2.WRON}[2:0] \text{ value} \leq \text{CSnWCR1.CSWWAIT}[4:0] \text{ value}$.

CSRWAIT[4:0] bits (Normal Read Cycle Wait Select)

The CSRWAIT[4:0] bits specify the number of wait cycles to be inserted into the first access during a normal read cycle or page read cycle.

Note: The settings must satisfy $\text{CSnWCR2.CSON}[2:0] \text{ value} \leq \text{CSnWCR2.RDON}[2:0] \text{ value} \leq \text{CSnWCR1.CSRWAIT}[4:0] \text{ value}$.

14.3.10 CSnWCR2 : CSn Wait Control Register 2 (n = 0 to 7)

Base address: BUS = 0x4000_3000
 BUS_NS = 0x5000_3000

Offset address: 0x008 + 0x10 × n

R/W
31	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Do not attempt to write to the CSnWCR2 register while the external bus is being accessed. Set each of these bits within a range of the restrictions described in [\(1\) Constraints on using separate bus interface](#) or [\(2\) Constraints on using address/data multiplexed bus interface](#), according to the bus interface used.

CSROFF[2:0] bits (Read Access CS Extension Cycle Select)

The CSROFF[2:0] bits specify the number of wait cycles to be inserted during the period from the end of a wait cycle (RD signal negated) until the CSn signal (n = 0 to 7) is negated in read access mode.

CSWOFF[2:0] bits (Write Access CS Extension Cycle Select)

The CSWOFF[2:0] bits specify the number of wait cycles to be inserted during the period from the end of a wait cycle (WRn signal (n = 0 to 1) negated) until the CSn signal (n = 0 to 7) is negated in write access mode.

Note: The settings must satisfy CSnWCR2.WDOFF[2:0] value ≤ CSnWCR2.CSWOFF[2:0] value.

WDOFF[2:0] bits (Write Data Output Extension Cycle Select)

The WDOFF[2:0] bits specify the number of wait cycles to be inserted during the period from the end of a wait cycle (WRn signal (n = 0 to 1) negated) until the write-data output is complete in write access mode.

Note: The settings must satisfy $\text{CSnWCR2.WDOFF}[2:0]$ value \leq $\text{CSnWCR2.CSWOFF}[2:0]$ value.

AWAIT[1:0] bits (Address Cycle Wait Select)

AWAIT[1:0] bits specify the number of wait cycles to be inserted into an address output cycle with the address/data multiplexed I/O interface.

Note: $\text{CSnWCR2.CSON}[2:0]$ value \leq $\text{CSnWCR2.AWAIT}[1:0]$ value.

For read access, satisfy $\text{CSnWCR2.AWAIT}[1:0]$ value + 2 \leq $\text{CSnWCR2.RDON}[2:0]$ value \leq $\text{CSnWCR1.CSRWAIT}[4:0]$ value.

For write access, satisfy $\text{CSnWCR2.AWAIT}[1:0]$ value + 2 \leq $\text{CSnWCR2.WRON}[2:0]$ value \leq $\text{CSnWCR1.CSWWAIT}[4:0]$ value and $\text{CSnWCR2.AWAIT}[1:0]$ value + 2 \leq $\text{CSnWCR2.WDON}[2:0]$ value \leq $\text{CSnWCR1.CSWWAIT}[4:0]$ value.

RDON[2:0] bits (RD Assert Wait Select)

RDON[2:0] bits specify the number of wait cycles to be inserted before the RD signal is asserted.

Note: For normal read access, satisfy $\text{CSnWCR2.CSON}[2:0]$ value \leq $\text{CSnWCR2.RDON}[2:0]$ value \leq $\text{CSnWCR1.CSRWAIT}[4:0]$ value.

For page read access, satisfy $\text{CSnWCR2.CSON}[2:0]$ value \leq $\text{CSnWCR2.RDON}[2:0]$ value \leq $\text{CSnWCR1.CSPRWAIT}[2:0]$ value.

When the address/data multiplexed I/O interface is selected, satisfy $\text{CSnWCR2.AWAIT}[1:0]$ value + 2 \leq $\text{CSnWCR2.RDON}[2:0]$ value \leq $\text{CSnWCR1.CSRWAIT}[4:0]$ value.

WRON[2:0] bits (WR Assert Wait Select)

The WRON[2:0] bits specify the number of wait cycles to be inserted before the WR_n signal (n = 0 to 1) is asserted.

Note: For normal write access, satisfy $1 \leq \text{CSnWCR2.WDON}[2:0]$ value \leq $\text{CSnWCR2.WRON}[2:0]$ value \leq $\text{CSnWCR1.CSWWAIT}[4:0]$ value, and $\text{CSnWCR2.CSON}[2:0]$ value \leq $\text{CSnWCR2.WRON}[2:0]$ value \leq $\text{CSnWCR1.CSWWAIT}[4:0]$ value.

For page write access, satisfy $1 \leq \text{CSnWCR2.WDON}[2:0]$ value \leq $\text{CSnWCR2.WRON}[2:0]$ value \leq $\text{CSnWCR1.CSPWAIT}[2:0]$ value, and $\text{CSnWCR2.CSON}[2:0]$ value \leq $\text{CSnWCR2.WRON}[2:0]$ value \leq $\text{CSnWCR1.CSPWAIT}[2:0]$ value.

When the address/data multiplexed I/O interface is selected, satisfy $\text{CSnWCR2.AWAIT}[1:0]$ value + 2 \leq $\text{CSnWCR2.WRON}[2:0]$ value \leq $\text{CSnWCR1.CSWWAIT}[4:0]$ value.

WDON[2:0] bits (Write Data Output Wait Select)

The WDON[2:0] bits specify the number of wait cycles to be inserted before the write data is output.

Note: For normal write access, satisfy $1 \leq \text{CSnWCR2.WDON}[2:0]$ value \leq $\text{CSnWCR2.WRON}[2:0]$ value \leq $\text{CSnWCR1.CSWWAIT}[4:0]$ value.

For page write access, satisfy $1 \leq \text{CSnWCR2.WDON}[2:0]$ value \leq $\text{CSnWCR2.WRON}[2:0]$ value \leq $\text{CSnWCR1.CSPWAIT}[2:0]$ value.

When the address/data multiplexed I/O interface is selected, satisfy $\text{CSnWCR2.AWAIT}[1:0]$ value + 2 \leq $\text{CSnWCR2.WDON}[2:0]$ value \leq $\text{CSnWCR1.CSWWAIT}[4:0]$ value.

CSON[2:0] bits (CS Assert Wait Select)

The CSON[2:0] bits specify the number of wait cycles to be inserted before the CS_n signal (n = 0 to 7) is asserted.

Note: For normal read access, satisfy $\text{CSnWCR2.CSON}[2:0]$ value \leq $\text{CSnWCR2.RDON}[2:0]$ value \leq $\text{CSnWCR1.CSRWAIT}[4:0]$ value.

For page read access, satisfy $\text{CSnWCR2.CSON}[2:0]$ value \leq $\text{CSnWCR2.RDON}[2:0]$ value \leq $\text{CSnWCR1.CSPRWAIT}[2:0]$ value.

For normal write access, satisfy $\text{CSnWCR2.CSON}[2:0]$ value \leq $\text{CSnWCR2.WRON}[2:0]$ value \leq $\text{CSnWCR1.CSWWAIT}[4:0]$ value.

For page write access, satisfy $\text{CSnWCR2.CSON}[2:0]$ value \leq $\text{CSnWCR2.WRON}[2:0]$ value \leq $\text{CSnWCR1.CSPWAIT}[2:0]$ value.

When the address/data multiplexed I/O interface is selected, satisfy $\text{CSnWCR2.CSON}[2:0]$ value \leq $\text{CSnWCR2.AWAIT}[1:0]$ value.

14.3.11 SDCCR : SDC Control Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	BSIZE[1:0]	—	—	—	—	EXENB

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	EXENB	Operation Enable 0: Disable 1: Enable	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
5:4	BSIZE[1:0]	SDRAM Bus Width Select 0 0: 16-bit bus space 1 0: 8-bit bus space Others: Setting prohibited	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

EXENB bit (Operation Enable)

The EXENB bit enables the operation of the SDRAM address space. On reset, operation is disabled (EXENB = 0). Attempts to access disabled areas have no effect.

When CSC and SDRAMC are in use at the same time, EBCLK and SDCLK must operate at the same frequency.

BSIZE[1:0] bits (SDRAM Bus Width Select)

The BSIZE[1:0] bits specify the data bus width for the associated area.

14.3.12 SDCMOD : SDC Mode Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC01

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	EMODE

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	EMODE	Endian Mode 0: Endian order of SDRAM address space is the same as the endian order of the operating mode. 1: Endian order of SDRAM address space is not the endian order of the operating mode.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Writing to this register is possible only once after release from reset. The second and subsequent writes to this register are prohibited. SDRAM access operation is not guaranteed if more than one write access is attempted.

EMODE bit (Endian Mode)

The EMODE bit specifies the endianness for the SDRAM address space. The Arm® Cortex®-M85 core is fixed at little-endian order, so instruction code can only be allocated to external spaces with little-endian specified. If an area is specified as big-endian, no instruction code can be allocated to it.

14.3.13 SDAMOD : SDRAM Access Mode Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC02

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	BE

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	BE	Continuous Access Enable 0: Continuous access is disabled 1: Continuous access is enabled	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Set SDAMOD while the conditions listed in [Table 14.30](#) are satisfied. The operation is not guaranteed if this register is set while these conditions are not satisfied.

BE bit (Continuous Access Enable)

This bit enables or disables continuous access to the SDRAM access space.

14.3.14 SDSELF : SDRAM Self-Refresh Control Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SFEN

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	SFEN	SDRAM Self-Refresh Enable 0: Disable 1: Enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Set the SDSELF register only when the conditions in [Table 14.30](#) are satisfied. Otherwise, operation of SDRAM I/F function is not guaranteed.

SFEN bit (SDRAM Self-Refresh Enable)

The SFEN bit controls the self-refresh operation. Setting this bit to 1 initiates an auto-refresh cycle, after which self-refresh begins. Clearing this bit to 0 ends the self-refresh, and auto-refresh resumes. When the bit is set to 1, the write value takes effect when the self-refresh operation starts. When it is cleared to 0, if the self-refresh operation has already finished, the write value takes effect before the auto-refresh starts. If the self-refresh operation is in progress, the write value takes effect after the self-refresh is finished and before the auto-refresh is started.

14.3.15 SDRFCR : SDRAM Refresh Control Register

Base address: BUS = 0x4000_3000
 BUS_NS = 0x5000_3000

Offset address: 0xC14

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 1

Bit	Symbol	Function	R/W
11:0	RFC[11:0]	Auto-Refresh Request Interval Setting 0 0 0 0 0 0 0 0 0 0 0 0: Setting prohibited 0 0 0 0 0 0 0 0 0 0 0 1: 2 cycles 0 0 0 0 0 0 0 0 0 0 1 0: 3 cycles ⋮ 1 1 1 1 1 1 1 1 1 1 1 1: 4096 cycles	R/W
15:12	REFV[3:0]	Auto-Refresh Cycle/Self-Refresh Clearing Cycle Count Setting 0 0 0 0: 1 cycle 0 0 0 1: 2 cycles 0 0 1 0: 3 cycles 0 0 1 1: 4 cycles 0 1 0 0: 5 cycles 0 1 0 1: 6 cycles 0 1 1 0: 7 cycles 0 1 1 1: 8 cycles 1 0 0 0: 9 cycles 1 0 0 1: 10 cycles 1 0 1 0: 11 cycles 1 0 1 1: 12 cycles 1 1 0 0: 13 cycles 1 1 0 1: 14 cycles 1 1 1 0: 15 cycles 1 1 1 1: 16 cycles	R/W

Note: S-TYPE-3, P-TYPE-3

RFC[11:0] bits (Auto-Refresh Request Interval Setting)

The RFC[11:0] bits specify the auto-refresh request interval. They can be written to at any time, regardless of the state of the Auto-Refresh Operation Enable bit (RFEN) in SDRFEN. If auto-refresh is enabled, the write value takes effect after the end of the auto-refresh cycles. The refresh counter uses SDCLK.

REFV[3:0] bits (Auto-Refresh Cycle/Self-Refresh Clearing Cycle Count Setting)

The REFV[3:0] bits specify the number of auto-refresh cycles and the number of self-refresh clearing cycles. They can be written to at any time, regardless of the state of the Auto-Refresh Operation Enable bit (RFEN) in SDRFEN. If an auto-refresh cycle is in progress, the value written to the bits while auto-refresh is enabled takes effect after the cycle completes.

Note: Auto-refresh requests are not accepted while the SDRAM is being accessed. This means they must sometimes wait until the access completes for the auto-refresh interval to be extended. Set the RFC[11:0] bits to an auto-refresh request interval value that meets the specifications of the SDRAM being used. Additionally, make sure to set the auto-refresh request interval to a duration longer than the auto-refresh cycle. The auto-refresh interval cannot be automatically adjusted when the frequency is changed during operation. In this case, perform a self-refresh operation and set the auto-refresh interval to an appropriate value for the frequency again.

14.3.15.1 Auto-refresh request interval and RFC set value

The SDRAMC (SDRAM area controller) includes a 12-bit refresh counter that generates auto-refresh requests at fixed intervals. Use the following equation to calculate the set value for the RFC[11:0] bits from the auto-refresh request interval:

$$RFC = (\text{Auto-refresh request interval} / \text{SDCLK cycle}) - 1$$

Note: Auto-refresh requests are not accepted while the SDRAM is being accessed. They must wait until the access completes. However, the counter value is updated regardless of whether or not the request was accepted. If two or more auto-refresh requests are generated while the SDRAM is being accessed, the second and subsequent requests are ignored.

14.3.16 SDRFEN : SDRAM Auto-Refresh Control Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC16

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	RFEN

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	RFEN	Auto-Refresh Operation Enable 0: Disable 1: Enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

RFEN bit (Auto-Refresh Operation Enable)

The RFEN bit enables auto-refresh operation. When auto-refresh is required, set the RFEN bit to 1 before SDRAM access.

Clearing this bit to 0 while auto-refreshing is enabled causes RFEN to be cleared to 0 and auto-refresh operation to halt after the end of the auto-refresh cycle. The interval at which refresh requests are generated is determined by the value in the Auto-Refresh Request Interval Setting bits (RFC[11:0]) in the SDRAM Refresh Control Register (SDRFCR).

14.3.17 SDICR : SDRAM Initialization Sequence Control Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC20

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	INIRQ

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	INIRQ	Initialization Sequence Start 0: Invalid 1: Start initialization sequence	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted.

INIRQ bit (Initialization Sequence Start)

Setting the INIRQ bit to 1 starts the SDRAM initialization sequence and automatically sets the Initialization Status bit (INIST) in the SDRAM Status Register (SDSR) to 1. The INIST bit clears automatically after the initialization sequence ends. The value written to the INIRQ bit is not retained.

Note: Set the INIRQ bit to start the SDRAM initialization sequence only when the conditions in [Table 14.30](#) are satisfied. Otherwise, operation is not guaranteed.

14.3.18 SDIR : SDRAM Initialization Register

Base address: BUS = 0x4000_3000
 BUS_NS = 0x5000_3000

Offset address: 0xC24

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:	—	—	—	—	—	PRC[2:0]			ARFC[3:0]			ARFI[3:0]		
------------	---	---	---	---	---	----------	--	--	-----------	--	--	-----------	--	--

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 1 0 0 0 0

Bit	Symbol	Function	R/W
3:0	ARFI[3:0]	Initialization Auto-Refresh Interval 0 0 0 0: 3 cycles 0 0 0 1: 4 cycles 0 0 1 0: 5 cycles 0 0 1 1: 6 cycles 0 1 0 0: 7 cycles 0 1 0 1: 8 cycles 0 1 1 0: 9 cycles 0 1 1 1: 10 cycles 1 0 0 0: 11 cycles 1 0 0 1: 12 cycles 1 0 1 0: 13 cycles 1 0 1 1: 14 cycles 1 1 0 0: 15 cycles 1 1 0 1: 16 cycles 1 1 1 0: 17 cycles 1 1 1 1: 18 cycles	R/W
7:4	ARFC[3:0]	Initialization Auto-Refresh Count 0 0 0 0: Setting prohibited 0 0 0 1: 1 time 0 0 1 0: 2 times 0 0 1 1: 3 times 0 1 0 0: 4 times 0 1 0 1: 5 times 0 1 1 0: 6 times 0 1 1 1: 7 times 1 0 0 0: 8 times 1 0 0 1: 9 times 1 0 1 0: 10 times 1 0 1 1: 11 times 1 1 0 0: 12 times 1 1 0 1: 13 times 1 1 1 0: 14 times 1 1 1 1: 15 times	R/W
10:8	PRC[2:0]	Initialization Precharge Cycle Count 0 0 0: 3 cycles 0 0 1: 4 cycles 0 1 0: 5 cycles 0 1 1: 6 cycles 1 0 0: 7 cycles 1 0 1: 8 cycles 1 1 0: 9 cycles 1 1 1: 10 cycles	R/W
15:11	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted.

ARFI[3:0] bits (Initialization Auto-Refresh Interval)

The ARFI[3:0] bits specify the interval at which the auto-refresh commands are issued in the SDRAM initialization sequence.

ARFC[3:0] bits (Initialization Auto-Refresh Count)

The ARFC[3:0] bits specify the number of times auto-refresh is to be performed in the SDRAM initialization sequence.

PRC[2:0] bits (Initialization Precharge Cycle Count)

The PRC[2:0] bits specify the number of precharged cycles in the SDRAM initialization sequence.

Note: Implement settings that satisfy the specifications of the connected SDRAM before starting the initialization sequence.

14.3.19 SDADR : SDRAM Address Register

Base address: BUS = 0x4000_3000
 BUS_NS = 0x5000_3000

Offset address: 0xC40

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	MXC[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	MXC[1:0]	Address Multiplex Select 0 0: 8-bit shift 0 1: 9-bit shift 1 0: 10-bit shift 1 1: 11-bit shift	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Set SDADR only when the conditions in [Table 14.30](#) are satisfied. Otherwise, operation is not guaranteed.

MXC[1:0] bits (Address Multiplex Select)

The MXC[1:0] bits select the size of the shift towards the lower half of the row address in row address/column address multiplexing. For details, see [Table 14.35](#).

14.3.20 SDTR : SDRAM Timing Register

Base address: BUS = 0x4000_3000
 BUS_NS = 0x5000_3000

Offset address: 0xC44

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	RAI[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	RCD[1:0]		RP[2:0]			WR	—	—	—	—	—	CL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
2:0	CL[2:0]	SDRAMC Column Latency 0 0 0: Setting prohibited 0 0 1: 1 cycle 0 1 0: 2 cycles 0 1 1: 3 cycles 1 0 0: Setting prohibited 1 0 1: Setting prohibited 1 1 0: Setting prohibited 1 1 1: Setting prohibited	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W
8	WR	Write Recovery Interval 0: 1 cycle 1: 2 cycles	R/W
11:9	RP[2:0]	Row Precharge Interval 0 0 0: 1 cycle 0 0 1: 2 cycles 0 1 0: 3 cycles 0 1 1: 4 cycles 1 0 0: 5 cycles 1 0 1: 6 cycles 1 1 0: 7 cycles 1 1 1: 8 cycles	R/W
13:12	RCD[1:0]	Row Column Latency 0 0: 1 cycle 0 1: 2 cycles 1 0: 3 cycles 1 1: 4 cycles	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W
18:16	RAI[2:0]	Row Active Interval 0 0 0: 1 cycle 0 0 1: 2 cycles 0 1 0: 3 cycles 0 1 1: 4 cycles 1 0 0: 5 cycles 1 0 1: 6 cycles 1 1 0: 7 cycles 1 1 1: Setting prohibited	R/W
31:19	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

The SDTR register specifies the timing for read and write accesses to the SDRAM. For more information, see [section 14.6.12.3. Timing register settings and access timing.](#)

Set the SDTR register only when the conditions in [Table 14.30](#) are satisfied. Otherwise, operation is not guaranteed.

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted

CL[2:0] bits (SDRAMC Column Latency)

The CL[2:0] bits specify the column latency of the SDRAM controller. This setting only affects the latency setting on the SDRAM controller side. To specify the column latency for externally connected SDRAM, use the SDRAM mode register (SDMOD).

WR bit (Write Recovery Interval)

The WR bit specifies the interval that must elapse between the SDRAM write command (WRIT) and deactivation (PALL).

RP[2:0] bits (Row Precharge Interval)

The RP[2:0] bits specify the minimum number of cycles that must elapse between the SDRAM deactivation command (PALL) and the next valid command.

RAI[2:0] bits (Row Active Interval)

The RAI[2:0] bits specify the minimum interval that must elapse between the SDRAM row activation command (ACTV) and deactivation (PALL). The value specified in these bits must be less than or equal to the sum of the row column latency (RCD[1:0]) and column latency (CL[2:0]) settings.

14.3.21 SDMOD : SDRAM Mode Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC48

Bit	Symbol	Function	R/W
14:0	MR[14:0]	Mode Register Setting Writing to these bits triggers a mode register set command	R/W
15	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

The SDMOD register specifies the value to be written to the SDRAM mode register. Writing to SDMOD causes a mode register set command to be issued automatically to the SDRAM. Set SDMOD only when the conditions in [Table 14.30](#) are satisfied. Otherwise, operation is not guaranteed.

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted.

MR[14:0] bits (Mode Register Setting)

Writing to the MR[14:0] bits causes a mode register set command to be issued to the SDRAM, and the setting in the MR[14:0] bits is output to the lower bits of the address. For more information, see [section 14.6.11. Setting the Mode Register](#).

- Note:
1. Set a burst length of 1 for the SDRAM. Operation is not guaranteed with any other burst length setting.
 2. The SDRAM column latency must match the setting in the SDRAMC Column Latency setting (CL[2:0]) in the SDRAM Timing Register (SDTR). Operation is not guaranteed if the latency settings do not agree.
 3. Make sure the SRFST, INIST, and MRSST status bits in the SDRAM Status Register (SDSR) are all 0.

14.3.22 SDSA : SDRAM Status Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC50

Bit	Symbol	Function	R/W
0	MRSST	Mode Register Setting Status 0: Mode register setting not in progress 1: Mode register setting in progress	R
2:1	—	These bits are read as 0.	R

Bit	Symbol	Function	R/W
3	INIST	Initialization Status 0: Initialization sequence not in progress 1: Initialization sequence in progress	R
4	SRFST	Self-Refresh Transition/Recovery Status 0: Transition/recovery not in progress 1: Transition/recovery in progress	R
7:5	—	These bits are read as 0.	R

Note: S-TYPE-3, P-TYPE-3

MRSST bit (Mode Register Setting Status)

When set to 1, the MRSST bit indicates that SDRAM mode register setting is in progress.

INIST bit (Initialization Status)

When set to 1, the INIST bit indicates that the SDRAM initialization sequence is in progress.

SRFST bit (Self-Refresh Transition/Recovery Status)

When set to 1, the SRFST bit indicates that a transition to or recovery from a self-refresh operation is in progress for the SDRAM. The in progress interval begins when the bits in [Table 14.8](#) are written to and lasts until the associated commands are issued.

Note: Execution of a self-refresh, initialization sequence, or mode register setting can only be performed when all the status bits are 0. Do not rewrite the registers and bits in [Table 14.8](#) when any of the SRFST, INIST, or MRSST status bits is set to 1.

Table 14.8 Registers and bits requiring status bit checking

Function	Register	Bits
Self-refresh	SDSELF	SFEN
Initialization sequence	SDICR	INIRQ
Mode register setting	SDMOD	MR[14:0]

14.3.23 BUSDIVBYP : Bus Divider Bypass Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1300

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPU0 SBPE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	GDSS BPE	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0. The write value should be 0.	R/W
3	GDSSBPE	Divider for GDSSBI bypass enable 0: Disable 1: Enable	R/W
15:4	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
16	CPU0SBPE	Divider for CPUSAHBI bypass enable 0: Disable 1: Enable	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

GDSSBPE bit (Divider for GDSSBI bypass enable)

This bit enables the through transfer between master and slave by bypassing the frequency divider implemented for GDSSBI. It can reduce the waiting time of 1 PCLKA cycle. This bit can be set to 1 only when ICLK frequency is the same as PCLKA frequency. This bit cannot be switched during GDSSBI operation.

CPU0SBPE bit (Divider for CPUSAHBI bypass enable)

This bit enables the through transfer between master and slave by bypassing the frequency divider implemented for CPUSAHBI. It can reduce the waiting time of 1 ICLK cycle. This bit can be set to 1 only when CPUCLK frequency is the same as ICLK frequency. This bit cannot be switched during CPUSAHBI operation.

14.3.24 BUSMABT : Bus Master Arbitration Control Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1100

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARBS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ARBS	Arbitration Select for GDSSBI 0: Fixed priority 1: Round-robin	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

This register specifies the arbitration method for GDSSBI that DRW (texture) and DRW (data) connect to.

ARBS bit (Arbitration Select for GDSSBI)

This bit specifies the priority between bus masters connected to GDSSBI . For fixed priority, see [Table 14.9](#). For round-robin, see [Table 14.10](#).

Table 14.9 Bus priorities with fixed-priority arbitration (ARBS = 0)

Bus Master Arbitration Control Register	Bus interface	Priority order*1
BUSMABT	GDSSBI	DRW (texture) > DRW (data)

Note 1. ">" represents left side has high priority.

Table 14.10 Bus priorities with round-robin arbitration (ARBS = 1)

Bus Master Arbitration Control Register	Bus interface	Priority order*1
BUSMABT	GDSSBI	DRW (texture) <-> DRW (data)

Note 1. "<->" represents round-robin.

14.3.25 BUSSABT0<slave> : Bus Slave Arbitration Control Register 0(<slave> = FLBI, STBYSBI, ECBI, EOBI, PBBI, PABI, PIBI, PSBI)

Base address: BUS = 0x4000_3000
 BUS_NS = 0x5000_3000

Offset address: 0x1210 (BUSSABT0FLBI)
 0x1248 (BUSSABT0STBYSBI)
 0x1250 (BUSSABT0ECBI)
 0x1258 (BUSSABT0EOBI)
 0x1260 (BUSSABT0PBBI)
 0x1268 (BUSSABT0PABI)
 0x1270 (BUSSABT0PIBI)
 0x1278 (BUSSABT0PSBI)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARBS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ARBS	Arbitration Select for <slave> 0: Fixed priority 1: Round-robin	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

<slave> is bus interface unit name for slave.

This register specifies the arbitration method for <slave> buses.

(<slave> =FLBI/STBYSBI/PBBI/PABI/PIBI/PSBI)

ARBS bit (Arbitration Select for <slave>)

The ARBS bit specifies the priority between bus masters connected to <slave>. For fixed priority, see [Table 14.11](#). For round-robin, see [Table 14.12](#).

Table 14.11 Bus priorities with fixed-priority arbitration (ARBS = 0)

Bus Slave Arbitration Control Register	Slave interface	Priority order*1
BUSSABT0FLBI	FLBI	DMAC/DTC > CPU M-AXI > CPU P-AHB
BUSSABT0STBYSBI	STBYSBI	DMAC/DTC > CPU M-AXI
BUSSABT0PBBI	PBBI	DMAC/DTC > CPU P-AHB
BUSSABT0PABI	PABI	DMAC/DTC > CPU P-AHB
BUSSABT0PIBI	PIBI	DMAC/DTC > CPU P-AHB
BUSSABT0PSBI	PSBI	DMAC/DTC > CPU P-AHB

Note 1. ">" represents left side has high priority.

Table 14.12 Bus priorities with round-robin arbitration (ARBS = 1) (1 of 2)

Bus Slave Arbitration Control Register	Slave interface	Priority order*1

Note 1. “<->” represents round-robin.

14.3.26 BUSSABT1<slave> : Bus Slave Arbitration Control Register 1(<slave> = FHBI, S0BI, S1BI)

Base address: BUS = 0x4000_3000
 BUS_NS = 0x5000_3000

Offset address: 0x1200 (BUSSABT1FHBI)
 0x1218 (BUSSABT1S0BI)
 0x1220 (BUSSABT1S1BI)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARBS[1:0]
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	ARBS[1:0]	Arbitration Select for <slave> 0 0: Fixed priority 0 1: Setting prohibited 1 0: Combination of round-robin and fixed priority 1 1: Round-robin	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

<slave> is bus interface unit name for slave.

This register specifies the arbitration method for <slave> buses.

(<slave> = FHBI/S0BI/S1BI)

ARBS[1:0] bits (Arbitration Select for <slave>)

The ARBS bits specify the priority between bus masters connected to <slave>. For priority of each setting, see [Table 14.13](#), [Table 14.14](#) and [Table 14.15](#).

Table 14.13 Bus priorities with fixed-priority arbitration (ARBS[1:0] = 00)

Bus Slave Arbitration Control Register	Slave interface	Priority order*1
BUSSABT1FHBI	FHBI	GLCDC (graphic 1) > GLCDC (graphic 2) > GDSSBI > DMAC/DTC > CPU M-AXI
BUSSABT1S0BI	S0BI	GLCDC (graphic 1) > GLCDC (graphic 2) > GDSSBI > DMAC/DTC > CPU M-AXI
BUSSABT1S1BI	S1BI	GLCDC (graphic 1) > GLCDC (graphic 2) > GDSSBI > DMAC/DTC > CPU M-AXI

Note 1. “>” represents left side has high priority.

Table 14.14 Bus priorities with combination of round-robin and fixed priority arbitration (ARBS[1:0] = 10)

Bus Slave Arbitration Control Register	Slave interface	Priority order*1
BUSSABT1FHBI	FHBI	(GLCDC (graphic 1) <-> GLCDC (graphic 2) <-> GDSSBI) > DMAC/DTC > CPU M-AXI
BUSSABT1S0BI	S0BI	(GLCDC (graphic 1) <-> GLCDC (graphic 2) <-> GDSSBI) > DMAC/DTC > CPU M-AXI
BUSSABT1S1BI	S1BI	(GLCDC (graphic 1) <-> GLCDC (graphic 2) <-> GDSSBI) > DMAC/DTC > CPU M-AXI

Note 1. "<->" represents round-robin. ">" represents left side has high priority.

Table 14.15 Bus priorities with round-robin arbitration (ARBS[1:0] = 11)

Bus Slave Arbitration Control Register	Slave interface	Priority order*1
BUSSABT1FHBI	FHBI	GLCDC (graphic 1) <-> GLCDC (graphic 2) <-> GDSSBI <-> DMAC/DTC <-> CPU M-AXI
BUSSABT1S0BI	S0BI	GLCDC (graphic 1) <-> GLCDC (graphic 2) <-> GDSSBI <-> DMAC/DTC <-> CPU M-AXI
BUSSABT1S1BI	S1BI	GLCDC (graphic 1) <-> GLCDC (graphic 2) <-> GDSSBI <-> DMAC/DTC <-> CPU M-AXI

Note 1. "<->" represents round-robin.

14.3.27 BUSnERRADD : BUS Error Address Register (n = 4, 6 to 9)

Base address: BUS = 0x4000_3000
 BUS_NS = 0x5000_3000

Offset address: 0x1800 + 0x10 × (n-1)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	BERAD[31:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	BERAD[31:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	BERAD[31:0]	Bus Error Address When a bus error occurs, it stores an error address.	R

Note: S-TYPE-5, P-TYPE-2

Table 14.16 shows the register numbers associated with each bus type.

This register is cleared by set the BUSnERRCLR.ILERRCLR, BUSnERRCLR.MMERRCLR, or BUSnERRCLR.SLERRCLR bits or reset other than Bus error reset and Common memory error reset.

BERAD[31:0] bits (Bus Error Address)

The BERAD[31:0] bits indicates the address, when an error occurs on the associated bus. For detail of error that occurs by bus, see section 14.3.31. BUSnERRSTAT : BUS Error Status Register (n = 1 to 4, 6 to 9) and section 14.7. Bus Error Monitoring Section.

When an error occurs on the bus, the corresponding bit of ILERRSTAT, MMERRSTAT, SLERRSTAT in BUSnERRSTAT (n = 1 to 4, 6 to 9) is set to 1, at the same time, the BERAD[31:0] bits stores the address of the bus error access.

When the error address is set once, it is not updated until the value is cleared by the BUSnERRCLR Register.

When all of ILERRSTAT, MMERRSTAT, SLERRSTAT, MSERRSTAT in BUSnERRSTAT (n = 1 to 4, 6 to 9) are set to 0, the BERAD[31:0] bits are indefinite.

Table 14.16 Associations between bus types and registers

Bus type	Bus error status register	Bus error clear register	Bus error address register	Bus error RW register
CPUMAXIBI_R channel	BUS1ERRSTAT	BUS1ERRCLR	—	—
CPUMAXIBI_W channel	BUS2ERRSTAT	BUS2ERRCLR	—	—
CPUPAHBI	BUS3ERRSTAT	BUS3ERRCLR	—	—
DMAC/DTCBI	BUS4ERRSTAT	BUS4ERRCLR	BUS4ERRADD BMSA4ERRADD	BUS4ERRRW BMSA4ERRRW
GLCDC0BI	BUS6ERRSTAT	BUS6ERRCLR	BUS6ERRADD BMSA6ERRADD	BUS6ERRRW BMSA6ERRRW
GLCDC1BI	BUS7ERRSTAT	BUS7ERRCLR	BUS7ERRADD BMSA7ERRADD	BUS7ERRRW BMSA7ERRRW
DRW0BI	BUS8ERRSTAT	BUS8ERRCLR	BUS8ERRADD BMSA8ERRADD	BUS8ERRRW BMSA8ERRRW
DRW1BI	BUS9ERRSTAT	BUS9ERRCLR	BUS9ERRADD BMSA9ERRADD	BUS9ERRRW BMSA9ERRRW

14.3.28 BUSnERRRW : BUS Error Read Write (n = 4, 6 to 9)

Base address: BUS = 0x4000_3000
 BUS_NS = 0x5000_3000

Offset address: 0x1804 + 0x10 × (n-1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	RWSTAT

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	RWSTAT	Error access Read/Write Status The status at the time of the error. 0: Read access 1: Write access	R
7:1	—	These bits are read as 0.	R

Note: S-TYPE-5, P-TYPE-2

This register is cleared by a reset other than the Bus error reset and Common memory error reset, and the BUSnERRCLR.ILERRCLR, BUSnERRCLR.MMERRCLR and BUSnERRCLR.SLERRCLR.

Table 14.16 shows the register numbers associated with each bus type.

RWSTAT bit (Error access Read/Write Status)

The RWSTAT bit indicates the access status, write access or read access, when an error occurs on the associated bus.

For detail of error that occurs by bus, see section 14.3.31. BUSnERRSTAT : BUS Error Status Register (n = 1 to 4, 6 to 9) and section 14.7. Bus Error Monitoring Section.

When an error occurs on the bus, the corresponding bit of ILERRSTAT, MMERRSTAT, SLERRSTAT, in BUSnERRSTAT (n = 1 to 4, 6 to 9) is set to 1, at the same time, the RWSTAT bits stores the read/write status of the bus error access.

When all of ILERRSTAT, MMERRSTAT, SLERRSTAT in BUSnERRSTAT (n = 1 to 4, 6 to 9) are set to 0, the RWSTAT bit is indefinite.

When the RWSTAT bit is set once, it is not updated until the value is cleared by the BUSnERRCLR Register.

14.3.29 BMSAnERRADD : Bus Master Security Attribution Unit Error Address (n = 4, 6 to 9)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1900 + 0x10 × (n-1)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	MSERAD[31:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	MSERAD[31:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	MSERAD[31:0]	Bus Master Security Attribution Unit Error Address When a Master Security Attribution Unit error occurs, It stores an error address.	R

Note: S-TYPE-5, P-TYPE-2

Note: This register is cleared by set the BUSnERRCLR.MSERRCLR bit or reset other than Bus error reset and Common memory error reset.

Table 14.16 lists the registers associated with each bus type.

MSERAD[31:0] bits (Bus Master Security Attribution Unit Error Address)

The MSERAD[31:0] bits indicates the address, when an error occurs on the associated bus.

For detail of error that occurs by bus, see [section 14.3.31. BUSnERRSTAT : BUS Error Status Register \(n = 1 to 4, 6 to 9\)](#) and [section 14.7. Bus Error Monitoring Section](#).

When an error occurs on the bus, the corresponding bit of MSERRSTAT in BUSnERRSTAT (n = 1 to 4, 6 to 9) is set to 1, at the same time, the MSERAD[31:0] bits stores the address of the bus error access.

When the error address is set once, it is not updated until the value is cleared by the BUSnERRCLR (n = 1 to 4, 6 to 9).

When all of MSERRSTAT in BUSnERRSTAT (n = 1 to 4, 6 to 9) is set to 0, the MSERAD[31:0] bits are indefinite.

14.3.30 BMSAnERRRW : BUS Master Security Attribution Unit Error Read Write (n = 4, 6 to 9)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1904 + 0x10 × (n-1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MSAR WSTA T
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MSARWSTAT	Master Security Attribution Unit error access Read/Write Status The status at the time of the error. 0: Read access 1: Write access	R
7:1	—	These bits are read as 0.	R

Note: S-TYPE-5, P-TYPE-2

Note: This register is cleared by set the BUSnERRCLR.MSERRCLR bits or reset other than Bus error reset and Common memory error reset.

Table 14.16 shows the register numbers associated with each bus type.

MSARWSTAT bit (Master Security Attribution Unit error access Read/Write Status)

The MSARWSTAT bit indicates the access status, write access or read access, when an error occurs on the associated bus.

For detail of error that occurs by bus, see section 14.3.31. BUSnERRSTAT : BUS Error Status Register (n = 1 to 4, 6 to 9) and section 14.7. Bus Error Monitoring Section.

When an error occurs on the bus, the corresponding bit of MSERRSTAT in BUSnERRSTAT (n = 1 to 4, 6 to 9) is set to 1, at the same time, the MSARWSTAT bits stores the read/write status of the bus error access.

When the MSARWSTAT bit is set once, it is not updated until the value is cleared by the BUSnERRCLR (n = 1 to 4, 6 to 9).

When all of MSERRSTAT in BUSnERRSTAT (n = 1 to 4, 6 to 9) are set to 0, the MSARWSTAT bit is indefinite.

14.3.31 BUSnERRSTAT : BUS Error Status Register (n = 1 to 4, 6 to 9)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1A00 + 0x10 × (n - 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	MSERRSTAT	ILERRSTAT	MMERRSTAT	—	—	SLERRSTAT
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SLERRSTAT	Slave Bus Error Status 0: No error occurred 1: Error occurred	R
2:1	—	These bits are read as 0.	R
3	MMERRSTAT	Master MPU Error Status 0: No error occurred 1: Error occurred	R
4	ILERRSTAT	Illegal Address Access Error Status 0: No error occurred 1: Error occurred	R
5	MSERRSTAT	Master Security Attribution Unit Error Status 0: No error occurred 1: Error occurred	R
7:6	—	These bits are read as 0.	R

Note: S-TYPE-5, P-TYPE-2

This register is cleared by reset other than Bus error reset and Common memory error reset.

Table 14.16 shows the register numbers associated with each bus type.

When the bus error occurred to plural at the same time, the STAT bit becomes effective only 1 by the following order of priority. The left side is high priority.

Master Security attribution unit > Master-MPU Error > Illegal access Error, Slave TrustZone filter, Slave bus Error
Illegal access Error, Slave TrustZone filter Error and Slave bus Error don't occur at the same time.

After one of MSERRSTAT, ILERRSTAT, MMERRSTAT, and SLERRSTAT are set once, MSERRSTAT, ILERRSTAT, MMERRSTAT, and SLERRSTAT are not renewed.

SLERRSTAT bit (Slave Bus Error Status)

When slave error or TrustZone filter error occurs by bus, BUSnERRSTAT.SLERRSTAT (n = 1 to 4, 6 to 9) is set to 1.

There is clearing conditions.

- Set BUSnERRCLR.SLERRCLR to 1.

Slave error is an error that occurs on a slave such as Time-out.

The SLERRSTAT bit is not set when debugger violate.

For detail of slave error that occurs by bus, see [section 14.7. Bus Error Monitoring Section](#).

MMERRSTAT bit (Master MPU Error Status)

When master mpu error occurs by bus, BUSnERRSTAT.MMERRSTAT (n = 1 to 4, 6 to 9) is set to 1.

There is clearing conditions.

- Set BUSnERRCLR.MMERRCLR to 1.

For detail of master mpu error that occurs by bus, see [section 15, Memory Protection Unit \(MPU\)](#).

ILERRSTAT bit (Illegal Address Access Error Status)

When illegal address access error occurs by bus and write access to FHBI occurs, BUSnERRSTAT.ILERRSTAT (n = 1 to 4, 6 to 9) is set to 1.

There is clearing conditions.

- Set BUSnERRCLR.ILLERRCLR to 1.

The ILERRSTAT bit is not set when debugger violate.

For detail of illegal address access error that occurs by bus, see [section 14.7. Bus Error Monitoring Section](#).

MSERRSTAT bit (Master Security Attribution Unit Error Status)

When MSAU error occurs by bus, BUSnERRSTAT.MSERRSTAT (n = 1 to 4, 6 to 9) is set to 1.

There is clearing conditions.

- Set BUSnERRCLR.MSERRCLR to 1.

For detail of MSAU error that occurs by bus, see [section 14.7. Bus Error Monitoring Section](#).

14.3.32 BUSnERRCLR : BUS Error Clear Register (n = 1 to 4, 6 to 9)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1A08 + 0x10 × (n - 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	MSER RCLR	ILERR CLR	MMER RCLR	—	—	SLER RCLR

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	SLERRCLR	Slave Bus Error Clear Writing 1 to this bit clears the BUSnERRSTAT.SLERRSTAT, BUSnERRADD.BERAD and BUSnERRRW.RWSTAT.	R/W ¹
2:1	—	These bits are read as 0. The write value should be 0.	R/W
3	MMERRCLR	Master MPU Error Clear Writing 1 to this bit clears the BUSnERRSTAT.MMERRSTAT, BUSnERRADD.BERAD and BUSnERRRW.RWSTAT.	R/W ¹
4	ILERRCLR	Illegal Address Access Error Clear Writing 1 to this bit clears the BUSnERRSTAT.ILERRSTAT, BUSnERRADD.BERAD and BUSnERRRW.RWSTAT.	R/W ¹
5	MSERRCLR	Master Security Attribution Unit Error Clear Writing 1 to this bit clears the BUSnERRSTAT.MSERRSTAT, BUSnERRADD.BERAD and BUSnERRRW.RWSTAT.	R/W ¹
7:6	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note 1. Only 1 can be written to this bit. This bit is read as 0. Writing 0 to this bit has no effect.

Table 14.16 shows the register numbers associated with each bus type.

When writing 1 to BUSnERRCLR (n = 1 to 4, 6 to 9), stop the bus access that causes an error in the corresponding bus master.

SLERRCLR bit (Slave Bus Error Clear)

Writing 1 to the SLERRCLR bit clears the BUSnERRSTAT.SLERRSTAT, BMSAnERRADD.MSERAD and BMSAnERRRW.MSARWSTAT (n = 1 to 4, 6 to 9).

This bit is read as 0.

MMERRCLR bit (Master MPU Error Clear)

Writing 1 to the MMERRCLR bit clears the BUSnERRSTAT.MMERRSTAT, BUSnERRADD.BERAD and BUSnERRRW.RWSTAT (n = 1 to 4, 6 to 9).

This bit is read as 0.

ILERRCLR bit (Illegal Address Access Error Clear)

Writing 1 to the ILERRCLR bit clears the BUSnERRSTAT.ILERRSTAT, BUSnERRADD.BERAD and BUSnERRRW.RWSTAT (n = 1 to 4, 6 to 9).

This bit is read as 0.

MSERRCLR bit (Master Security Attribution Unit Error Clear)

Writing 1 to the MSERRCLR bit clears the BUSnERRSTAT.MSERRSTAT, BUSnERRADD.BERAD and BUSnERRRW.RWSTAT (n = 1 to 4, 6 to 9).

This bit is read as 0.

14.3.33 BUSOAD : BUS Operation After Detection Register

Base address: BUS = 0x4000_3000
 BUS_NS = 0x5000_3000

Offset address: 0x1000

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	BWERROAD	SLERROAD	ILERR OAD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ILERR OAD	Illegal address access error operation after detection CPU 0: Only error response is returned. 1: Reset Other master 0: NMI 1: Reset	R/W
1	SLERR OAD	Slave bus error operation after detection CPU 0: Only error response is returned. 1: Reset Other master 0: NMI 1: Reset	R/W
2	BWERROAD	Bufferable write error operation after detection All bus master 0: NMI 1: Reset	R/W

Bit	Symbol	Function	R/W
15:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note: When an error occurs in a speculative access issued by CPU with OAD bit is set to 1, a system reset request may occur. In that case, it can be avoided by using Arm-MPU. See [section 14.8. References\[3\]](#) for the detail.

ILERROAD bit (Illegal address access error operation after detection)

The OAD bit specify operation when the illegal address access error is detected. When OAD bit is 0, the operation differs depending on the bus master. If CPU causes access violation, only error response is returned and NMI is not generated. If master other than CPU causes access violation, error response is returned and NMI is generated.

When OAD bit is 1, reset request is generated.

SLERROAD bit (Slave bus error operation after detection)

The OAD bit specify operation when the slave bus error is detected. When OAD bit is 0, the operation differs depending on the bus master. If CPU causes access violation, only error response is returned and NMI is not generated. If master other than CPU causes access violation, error response is returned and NMI is generated.

When OAD bit is 1, reset request is generated.

BWERROAD bit (Bufferable write error operation after detection)

The OAD bit specify operation when the bufferable write error is detected.

When OAD bit is 0, error response is returned and NMI is generated.

When OAD bit is 1, reset request is generated.

14.3.34 BUSOADPT : BUS Operation After Detection Protect Register

Base address: BUS = 0x4000_3000
 BUS_NS = 0x5000_3000

Offset address: 0x1004

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:	KEY[7:0]														—	—	—	—	—	—	—	—	PROTECT
------------	----------	--	--	--	--	--	--	--	--	--	--	--	--	--	---	---	---	---	---	---	---	---	---------

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: BUSOAD register writing is possible. 1: BUSOAD register writing is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key code These bits enable or disable writes to the PROTECT bit.	W

Note: S-TYPE-3, P-TYPE-2

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the associated registers to be protected.

BUSOADPT.PROTECT controls the following registers:

- BUSOAD

When the PROTECT bit is set simultaneously, write 0xA5 to the KEY[7:0] bits using half word access.

KEY[7:0] bits (Key code)

The KEY[7:0] bits enable or disable writes to the PROTECT bit. When writing to the PROTECT bit simultaneously, write 0xA5 to the KEY[7:0] bits. When other values are written to the KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

14.3.35 MBWERRSTAT : Master Bufferable Write Error Status Register

Base address: BUS = 0x4000_3000
 BUS_NS = 0x5000_3000

Offset address: 0x1B00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	MBWE RR23	—	—	MBWE RR20	MBWE RR19	MBWE RR18	MBWE RR17	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MBWE RR8	—	—	—	—	—	—	MBWE RR1	MBWE RR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MBWERR0	Master Bufferable Write Error 0: No bufferable write error in Master #0 1: Bufferable write error occurs in Master #0	R
1	MBWERR1	Master Bufferable Write Error 0: No bufferable write error in Master #1 1: Bufferable write error occurs in Master #1	R
7:2	—	These bits are read as 0.	R
8	MBWERR8	Master Bufferable Write Error 0: No bufferable write error in Master #8 1: Bufferable write error occurs in Master #8	R
16:9	—	These bits are read as 0.	R
17	MBWERR17	Master Bufferable Write Error 0: No bufferable write error in Master #17 1: Bufferable write error occurs in Master #17	R
18	MBWERR18	Master Bufferable Write Error 0: No bufferable write error in Master #18 1: Bufferable write error occurs in Master #18	R
19	MBWERR19	Master Bufferable Write Error 0: No bufferable write error in Master #19 1: Bufferable write error occurs in Master #19	R
20	MBWERR20	Master Bufferable Write Error 0: No bufferable write error in Master #20 1: Bufferable write error occurs in Master #20	R
22:21	—	These bits are read as 0.	R
23	MBWERR23	Master Bufferable Write Error 0: No bufferable write error in Master #23 1: Bufferable write error occurs in Master #23	R
31:24	—	These bits are read as 0.	R

Note: S-TYPE-5, P-TYPE-2

Note: This register is cleared by reset other than Bus error reset and Common memory error reset.

MBWERRn bit (Master Bufferable Write Error Clear n)

When bufferble write access error occurs by MBWERRSTAT. MBWERRn is set to 1.

There are clearing conditions.

- Set MBWERRCLR. MBWERRCn to 1

Table 14.17 lists the registers associated with each bus master type.

Table 14.17 Associations between bus master types and bits

Bus master type	Master bufferable write error status bit	Master bufferable write error clear bit
CPUMAXIBI_W channel	MBWERR0	MBWECLR0
CPUPAHBI	MBWERR1	MBWECLR1
DMAC/DTCBI	MBWERR8	MBWECLR8
GLCDC0BI	MBWERR17	MBWECLR17
GLCDC1BI	MBWERR18	MBWECLR18
DRW0BI	MBWERR19	MBWECLR19
DRW1BI	MBWERR20	MBWECLR20
GDSSBI	MBWERR23	MBWECLR23

Note: GDSSBI is a BUS interface that combines DRW0BI and DRW1BI. See [Table 14.2](#) for details.

14.3.36 MBWERRCLR : Master Bufferable Write Error Clear Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1B08

Note 1. Only 1 can be written to this bit.

SBWECLRn bit (Slave Bufferable Write Error Clear n)

Writing 1 to this bit clears the SBWERRSTAT.SBWERRn flag.

This bit is read as 0.

14.4 Endian and Data Alignment

The external bus has a data alignment function to control which byte of the data bus (D15 to D08, D07 to D00) is used when accessing the external address space (the CS and SDRAM areas). Alignment is based on the bus specifications of the area to be accessed (8-bit or 16-bit bus space), the data size, and the endian order.

14.4.1 Data Alignment Control for the CS Area

14.4.1.1 16-Bit Bus Space

When a 16-bit bus space is selected in the BSIZE[1:0] bits in CSnCR, address buses A23 to A01 are enabled to output address signals in 16-bit units, and the address bus A00 is disabled (always outputs low).

When byte strobe mode is selected (WRMOD = 0 in CSnMOD), the WR0 and WR1 pins are enabled. The BC0 and BC1 pins are not used.

When single-write strobe mode is selected (WRMOD = 1 in CSnMOD), only the WR0 pin is enabled, and it always outputs low during write access, regardless of the data size. The WR1 pin is invalid (always outputs high). The valid byte position is indicated by the BC0 and BC1 pins.

The valid positions of control signals and data external to the MCU differ depending on the endian order. See [Table 14.19](#) and [Table 14.20](#).

Page access can occur for accesses to data in 32-bit units. Page access can only occur when an access does not extend over a 32-bit boundary and causes no change in the BC0 and BC1 signals. The conditions in which page access occurs are indicated by the letter (p) in [Table 14.19](#) and [Table 14.20](#).

Table 14.19 Data alignment (little-endian) in 16-bit bus space

Data size	Accessed address	Number of accesses	Bus cycle	Unit of data	Address	WR1/BC1		WR0/BC0		
						RD				
						Data bus				
						D15	D08	D07	D00	
8 bits	4n	One	First	8 bits	4n			7	0	
	4n + 1	One	First	8 bits	4n	7			0	
	4n + 2	One	First	8 bits	4n + 2			7	0	
	4n + 3	One	First	8 bits	4n + 2	7			0	
16 bits	4n	One	First	16 bits	4n	15		8	7	0
	4n+2	One	First	16 bits	4n + 2	15		8	7	0

			Second	16 bits	4n + 2	(p)	31		24	23

(p):Page access (only when page access is enabled in the PRENB and PWENB bits in CSnMOD)

Table 14.20 Data alignment (big-endian) in 16-bit bus space

Data size	Accessed address	Number of accesses	Bus cycle	Unit of data	Address	WR1/BC1		WR0/BC0		
						RD				
						Data bus				
						D15	D08	D07	D00	
8 bits	4n	One	First	8 bits	4n			7	0	
	4n + 1	One	First	8 bits	4n			7	0	
	4n + 2	One	First	8 bits	4n + 2	7			0	
	4n + 3	One	First	8 bits	4n + 2			7	0	
16 bits	4n	One	First	16 bits	4n	15		8	7	0
	4n+2	One	First	16 bits	4n + 2	15		8	7	0
32 bits	4n	Two	First	16 bits	4n	31		24	23	16
			Second	16 bits	4n + 2	(p)	15		8	7

(p):Page access (only when page access is enabled in the PRENB and PWENB bits in CSnMOD)

14.4.1.2 8-Bit Bus Space

When an 8-bit bus space is selected by the BSIZE[1:0] bits in CSnCR, the address buses A23 to A0 are enabled to output address signals in byte units.

In 8-bit bus space, only the WR0# pin is valid regardless of write access mode, and always outputs the low level during write access. The WR1# pin and the BC0# and BC1# pins are not used.

Page access can occur in access to data in 16- or 32-bit units. Specifically, page access can occur when an access does not spread over a 32-bit boundary. The conditions in which page access occurs are indicated by the letter (p) in Table 14.21 and Table 14.22.

In 8-bit bus space, the valid positions of data external to the MCU are D7 to D0 and WR0# is used as the control signal, regardless of the endian mode.

When an 8-bit bus space is selected in the BSIZE[1:0] bits in CSnCR, the address buses A23 to A00 are enabled to output address signals in byte units.

In 8-bit bus space, only the WR0 pin is valid, regardless of the write access mode, and it always outputs low during write access. The WR1 pin and the BC0 and BC1 pins are not used.

The valid positions of data external to the MCU are D07 to D00, and WR0 is used as the control signal, regardless of the endian mode. See Table 14.21 and Table 14.22.

Page access can occur for accesses to data in 16-bit or 32-bit units. Page access can only occur when an access does not extend over a 32-bit boundary. The conditions in which page access occurs are indicated by the letter (p) in Table 14.21 and Table 14.22.

(p):Page access (only when page access is enabled in the PRENB and PWENB bits in CSnMOD)

14.4.2 Data Alignment Control for the SDRAM Area

14.4.2.1 16-Bit Bus Space

When a 16-bit bus space is selected in the BSIZE[1:0] bits in SDCCR, address buses A26 to A01 are enabled to output address signals in 16-bit units, and the address bus A00 is disabled (always outputs low). The valid byte position is indicated by the DQM0 and DQM1 signals.

External data is accessed using the DQ15 to DQ08 and DQ07 to DQ00 pins and DQM0 and DQM1 control signals. Data can be accessed in either 8-bit or 16-bit units at a time.

The valid positions of control signals and data external to the MCU differ depending on the endian order. See [Table 14.23](#) and [Table 14.24](#).

For divided access, continuous access is possible by setting SDAMOD.BE = 1.

Table 14.23 Data alignment in 16-bit bus space with little-endian order for SDRAM area

			Second	16 bits	4n + 2	15		8	7 0

14.4.2.2 8-Bit Bus Space

When an 8-bit width is selected in the BSIZE[1:0] bits in SDCCR, address buses A26 to A00 are enabled to output address signals in 8-bit units.

External data is accessed using the DQ07 to DQ00 pins and DQM0 control signal. Eight-bit data is accessed in single 8-bit access, 16-bit data with two 8-bit accesses, and 32-bit data with four 8-bit accesses.

The valid positions of control signals and data external to the MCU differ depending on the endian order. See [Table 14.25](#) and [Table 14.26](#).

For divided access, continuous access is possible by setting SDAMOD.BE = 1.

14.5 Operation of CS Area Controller

14.5.1 Separate Bus

This section describes the periods shown in the timing diagrams. The CS area controller (CSC) operates in synchronization with the external bus clock, BCLK. Operation cycles, such as wait cycles, specified in the CSC register, are counted on BCLK. In the following description, the frequencies of BCLK and EBCLK pin output are the same, unless otherwise noted. Access through the external bus starts at the same point as the output of a rising edge on the EBCLK pin. However, if the external bus clock, BCLK, and the output on the EBCLK pin are at different frequencies, the wait settings can cause the start of access for the second and subsequent rounds to coincide with the falling edge of the output on the EBCLK pin. See [Figure 14.8](#) to [Figure 14.12](#). If recovery cycles are inserted for bus access, the setting for the number of recovery cycles can also cause the start of access for the second and subsequent rounds to coincide with the falling edge of the output on the EBCLK pin. See [Figure 14.30](#).

Tw1 to Twn (Clock Cycles of Wait for a Normal Read Cycle or Normal Write Cycle)

The period from Tw1 to Twn is the number of clock cycles from the start of access through the external bus clock to 1 cycle before the strobe signal is valid. The number of cycles is selectable from 0 to 31. Within this period, the timing of CSn, RD, and WRn assertion (driving the signals low) is determined by the respective wait settings. The wait periods are controlled by the following bits in the CSn Wait Control Register 2 (CSnWCR2).

- CS Assert Wait Select bits (CSON)
- RD Assert Wait Select bits (RDON)
- WR Assert Wait Select bits (WRON)
- Write-Data Output Wait Select bits (WDON)

The number of clock cycles for each of these wait periods is selectable as a value from 0 to 7, counted from the start of external bus access. The selectable number of cycles is also within the overall number of clock cycles required for waiting read or write.

Tend (Clock Cycle where the Strobe Signal is Valid)

Tend is the next clock cycle after completion of the wait period for a normal cycle of read or write, or for a cycle of page read or page write. If the wait select bit for these cycles is 0, bus access starts on the clock cycle where the strobe signal is valid. The RD and WRn signals are negated in the next clock cycle. For a read access, the clock cycle where the strobe signal is valid is where the data to be read is sampled. If an external wait is enabled, the wait signal is sampled on the cycle where the strobe signal is valid. The bus cycle is extended if the wait signal is low. The bus cycle completes in the next clock cycle if the wait signal is high. Tend indicates the cycle where sampling of the wait signal starts.

After the first cycle where the strobe signal is valid during page access, second and subsequent page access operations (see [Tpwl to TpwN \(Page-Read Cycle Wait or Page-Write Cycle Wait\)](#)) start in the next cycle, except during write access with a setting other than 0 for write-data output extension clock cycles (see [Tdw1 to Tdwn \(Write-Data Output Extension Clock](#)

Cycles)). If the setting for the RD or WR assertion wait is any value other than 0, the RD and WRn signals are negated in the next clock cycle. If the setting is 0, assertion continues. Additionally, the CSn signal continues to be asserted rather than negated.

Tn1 to Tnm (Clock Cycles of CS Extension)

For normal access, Tn1 to Tnm represent the clock cycles of the period following the cycle where the strobe signal is valid (Tend) up to negation of the CSn signal. For read or write access, the negation timing can be controlled by the read-access CS Extension Cycle Select bits (CSROFF) and the write-access CS Extension Cycle Select bits (CSWOFF) in the CSn Wait Control Register 2 (CSnWCR2). The number of cycles is counted from the cycle following the cycle where the strobe signal is valid.

For page access, Tn1 to Tnm represent the clock cycles of the period following the last cycle where the strobe signal is valid up to negation of the CSn signal.

For write access, setting the Write Data Output Extension Cycle Select bits (WDOFF) controls extension of the period where the address and output data is valid.

Tdw1 to Tdwn (Write-Data Output Extension Clock Cycles)

For write access, if the wait setting for the write-data output extension is any value other than 0, the specified clock cycles are inserted from the cycle following the cycle where the strobe signal is valid (Tend).

For normal access, this period is inserted within the clock cycle period for CS extension (Tn1 to Tnm).

For page access, this period is inserted within the clock cycle period where the strobe signal is valid and subsequent page accesses, or within the clock cycle period for the CS extension (Tn1 to Tnm). Valid address and data output are extended over this period, and the WRn signal is negated.

Tpw1 to Tpwn (Page-Read Cycle Wait or Page-Write Cycle Wait)

For the second and subsequent bus cycles during page access, the values for a page-read cycle wait or page-write cycle wait are used instead of the settings for a normal read or write cycle wait. The settings in the WR Assert Wait Select bits become enabled in the same way as for the first access. The RD assertion control operation depends on the page read access mode setting (the PRMOD bit in CSnMOD) as follows:

- CSnMOD.PRMOD = 0: A wait for RD assertion is inserted in the same way as for the first access, and the RD signal is negated
- CSnMOD.PRMOD = 1: Although a wait for RD assertion is inserted in the same way as for normal-access compatibility mode, the RD signal continues to be asserted over this period.

Tr1 to Trn (Recovery Cycles)

Recovery cycles can be inserted from the point where a bus cycle is complete (CSn signal negation). The number of recovery cycles can be controlled by setting the Read Recovery (RRCV) or Write Recovery (WRCV) bits in the CSn Recovery Cycle Register (CSnREC). Both numbers of recovery cycles are counted from the end of a bus cycle (CSn negation) and can be selected from 0 to 15 cycles. For more information, see [section 14.5.4. Insertion of Recovery Cycles](#).

(1) Normal Access

When the PRENB and PWENB bits in CSnMOD are set to 0 to disable page read and page write access, all bus accesses take the form of normal read and write operations. Even when these bits are set to 1 to enable page read and page write access, bus access other than page access takes the form of normal read and write operations. [Figure 14.3](#) to [Figure 14.5](#) show the normal access operations.

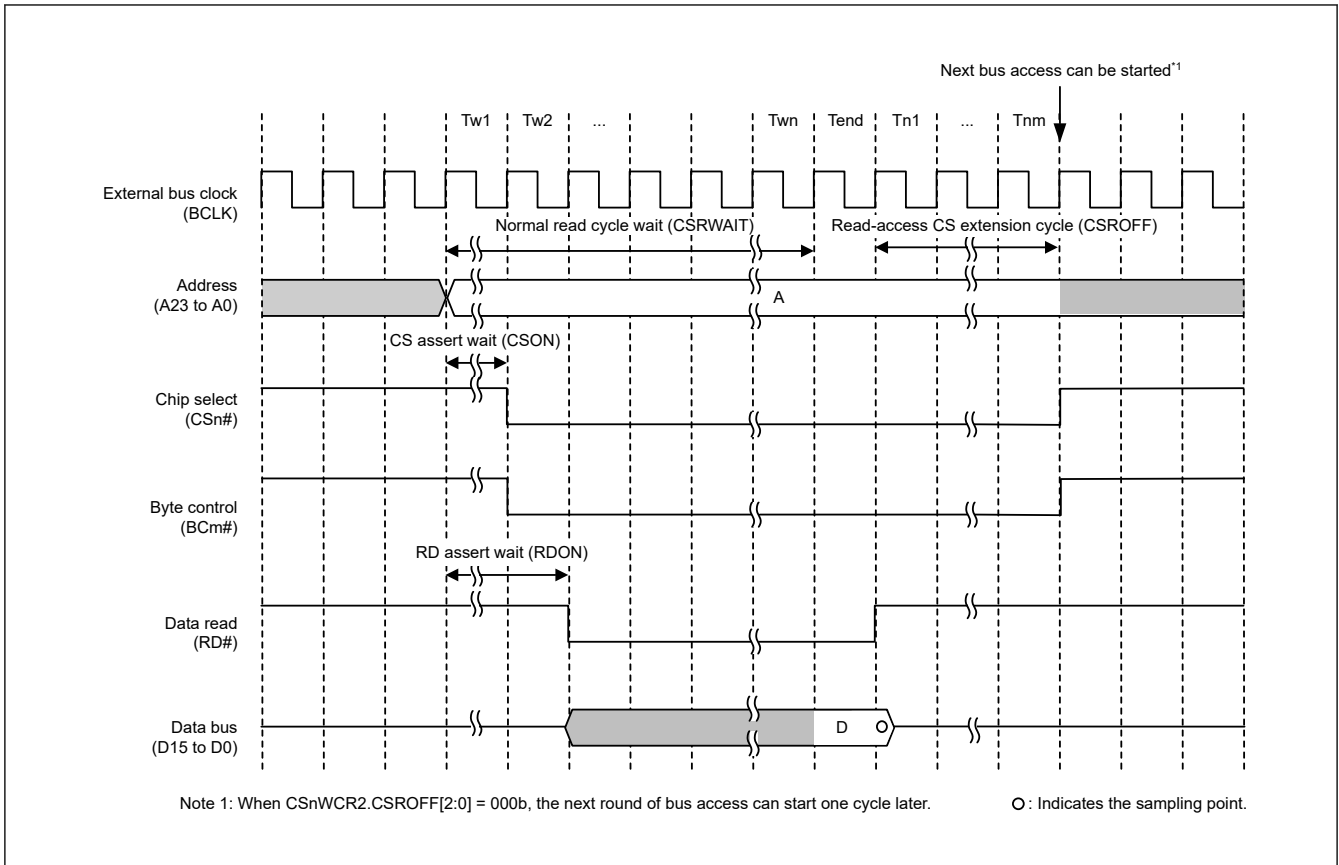

Figure 14.3 Bus timing for normal read operation (n = 0 to 7, m = 0, 1)

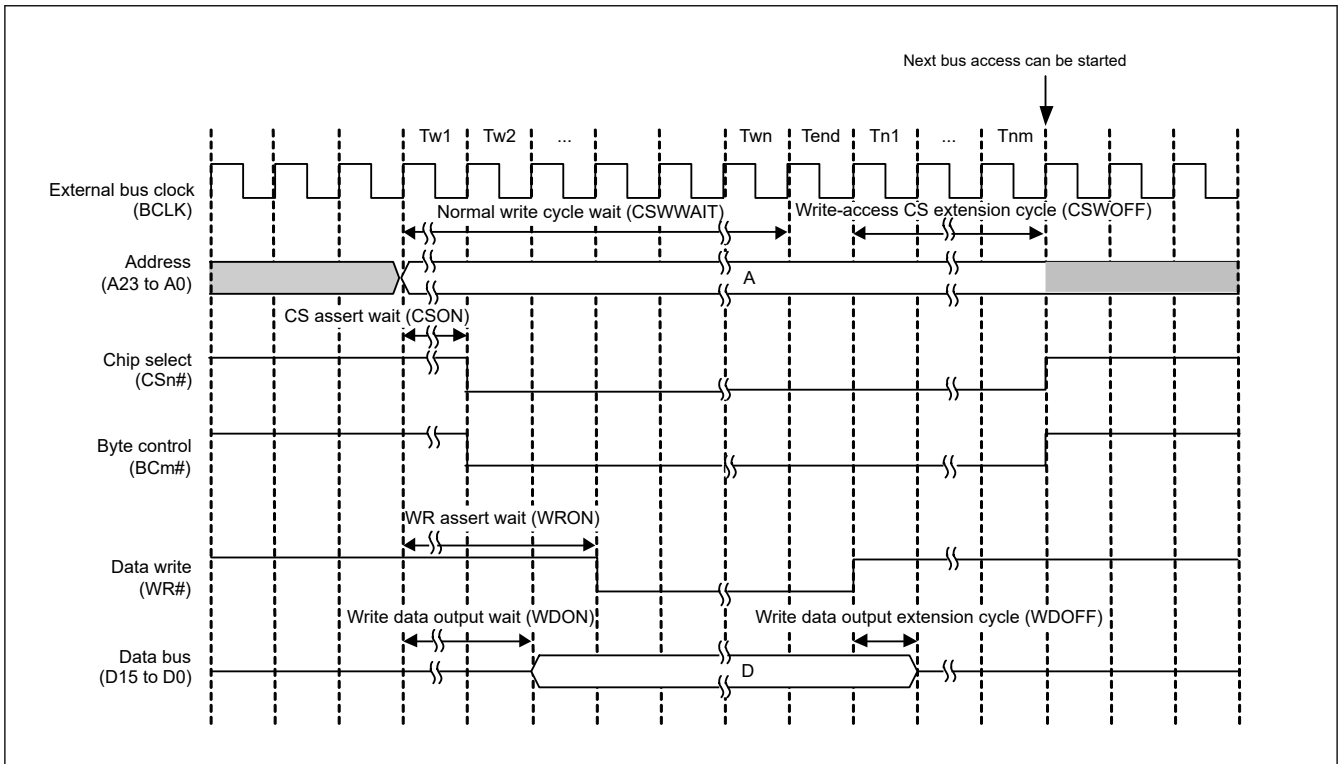

Figure 14.4 Bus timing for normal write operation in single-write strobe mode (n = 0 to 7, m = 0, 1)

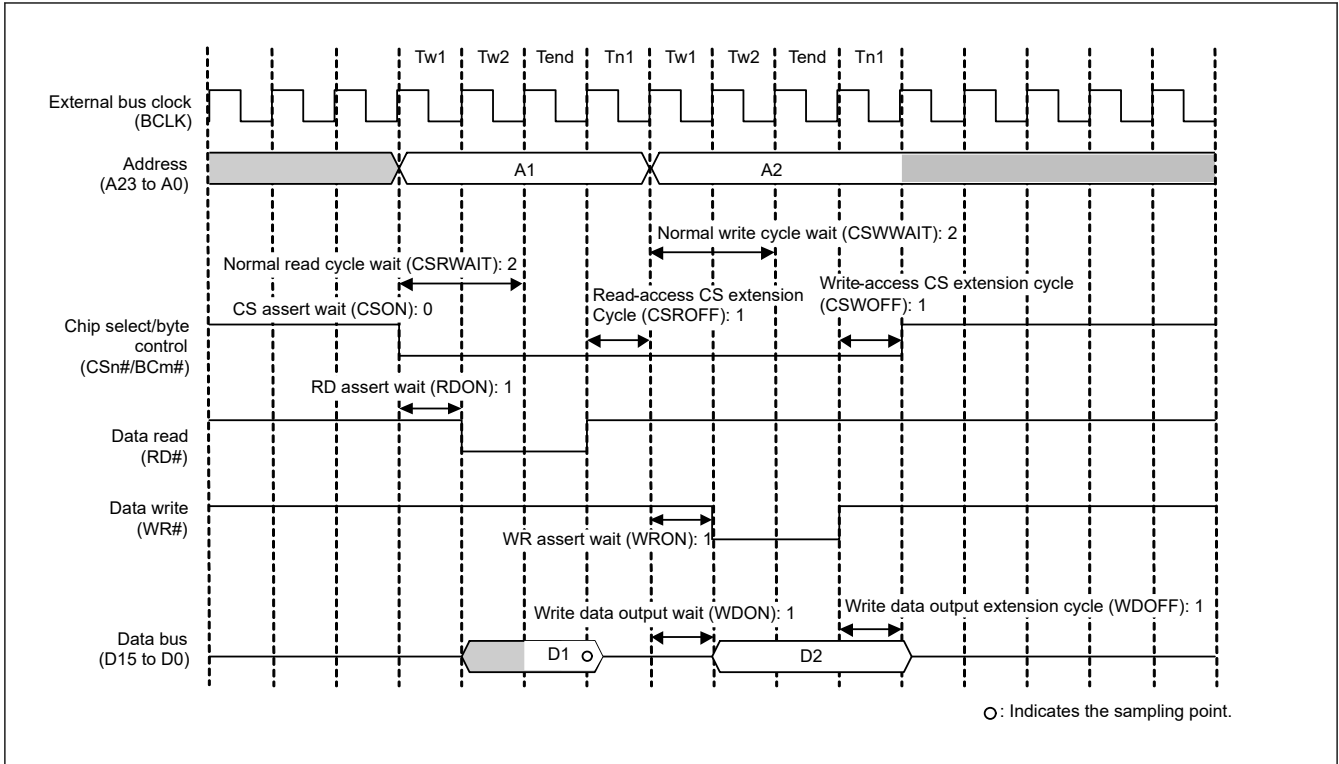

Figure 14.5 Example of normal access operation for read and write (n = 0 to 7, m = 0, 1)

When two or more rounds of external bus access are required in response to a single request for transfer from a bus master, normal access operations are repeated. See [Tw1 to Twn \(Clock Cycles of Wait for a Normal Read Cycle or Normal Write Cycle\)](#) to [Tdw1 to Tdwn \(Write-Data Output Extension Clock Cycles\)](#). [Figure 14.6](#) and [Figure 14.7](#) show examples of operations when two rounds of bus access are generated in response to a single transfer request. If the recovery cycle insertion condition is satisfied, recovery cycles [Tr1 to Trm \(Recovery Cycles\)](#) are also inserted in the second and subsequent external bus accesses. See [Figure 14.28](#).

The values in the wait control registers shown in the figures are example settings. In your application, set the registers appropriately for the specifications of connected devices.

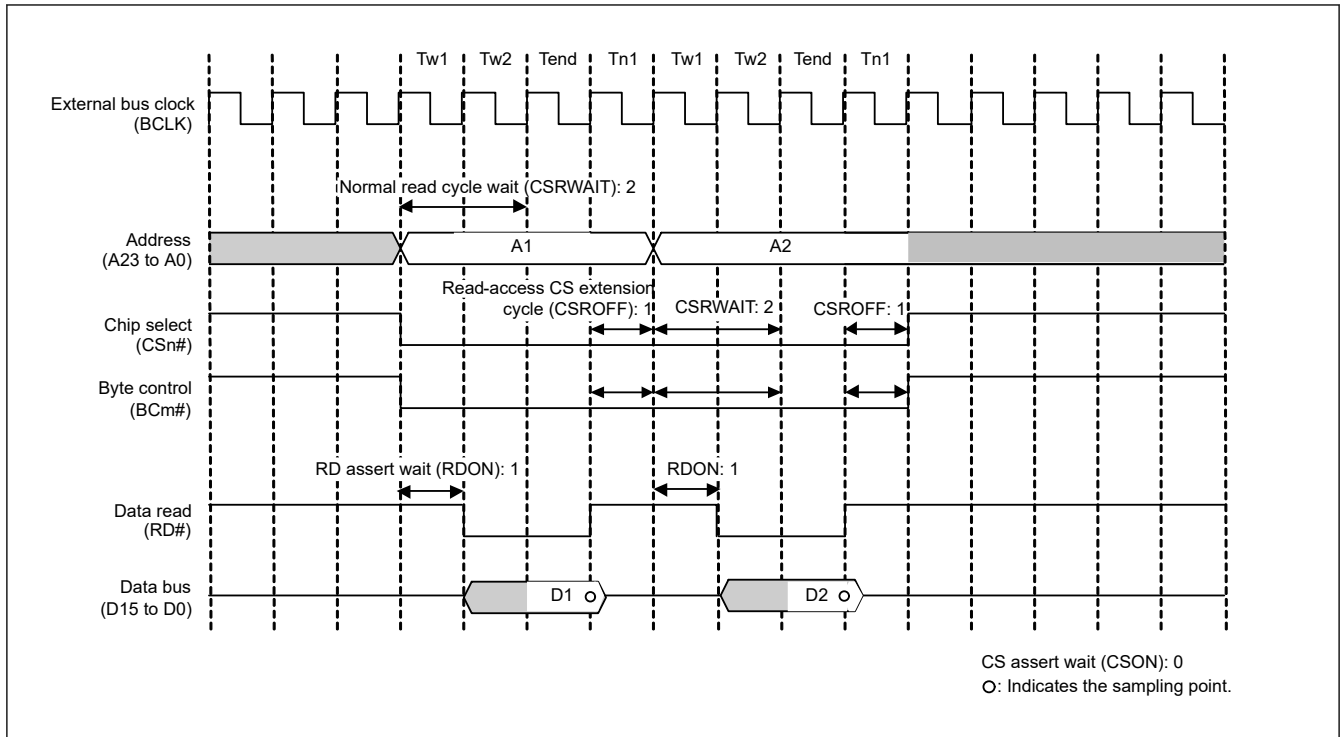

Figure 14.6 Example of normal read operation when two rounds of bus access are generated in response to a single transfer request ($n = 0$ to 7 , $m = 0$, 1)

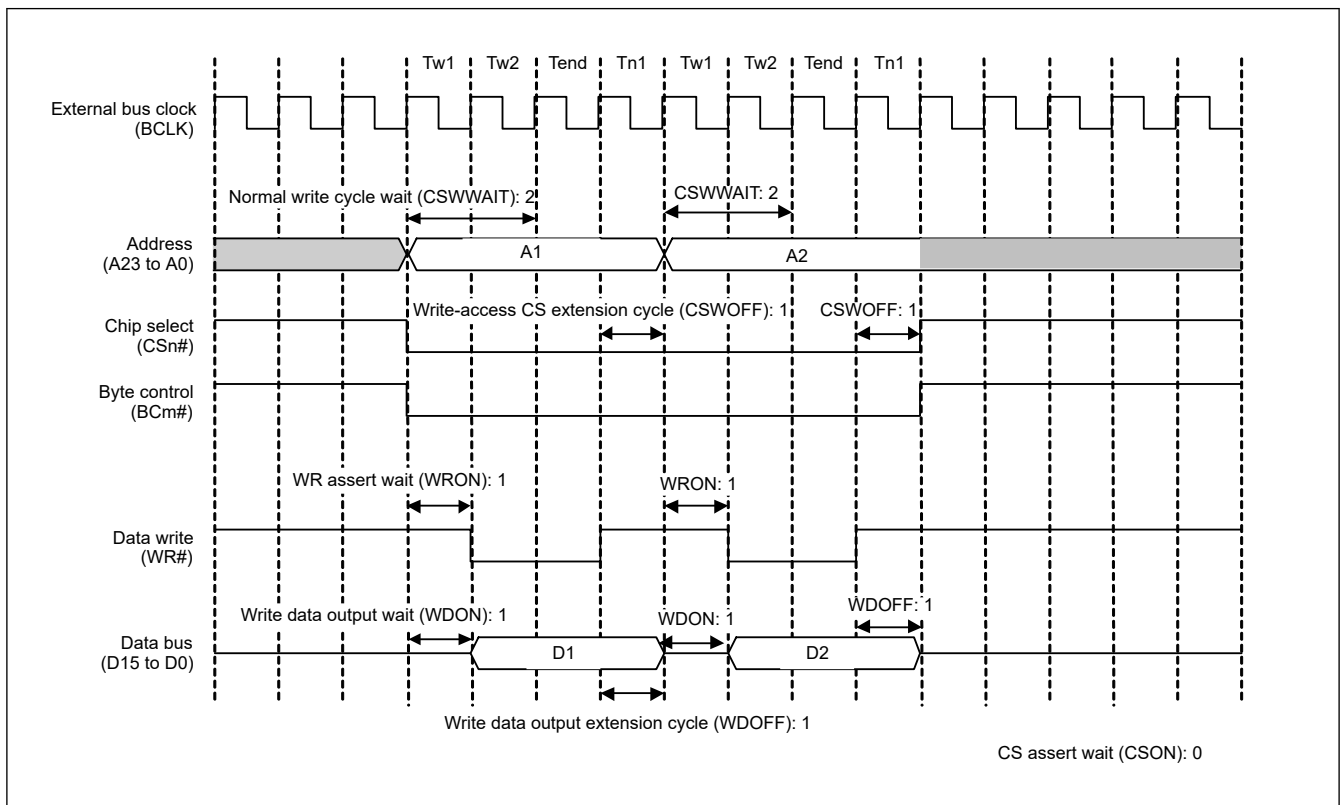

Figure 14.7 Example of normal write operation when two rounds of bus access are generated in response to a single transfer request in single-write strobe mode ($n = 0$ to 7 , $m = 0$, 1)

Figure 14.8 to Figure 14.12 show examples of normal accesses made with the 1/2 BCLK selected with the EBCLK pin output select bit.

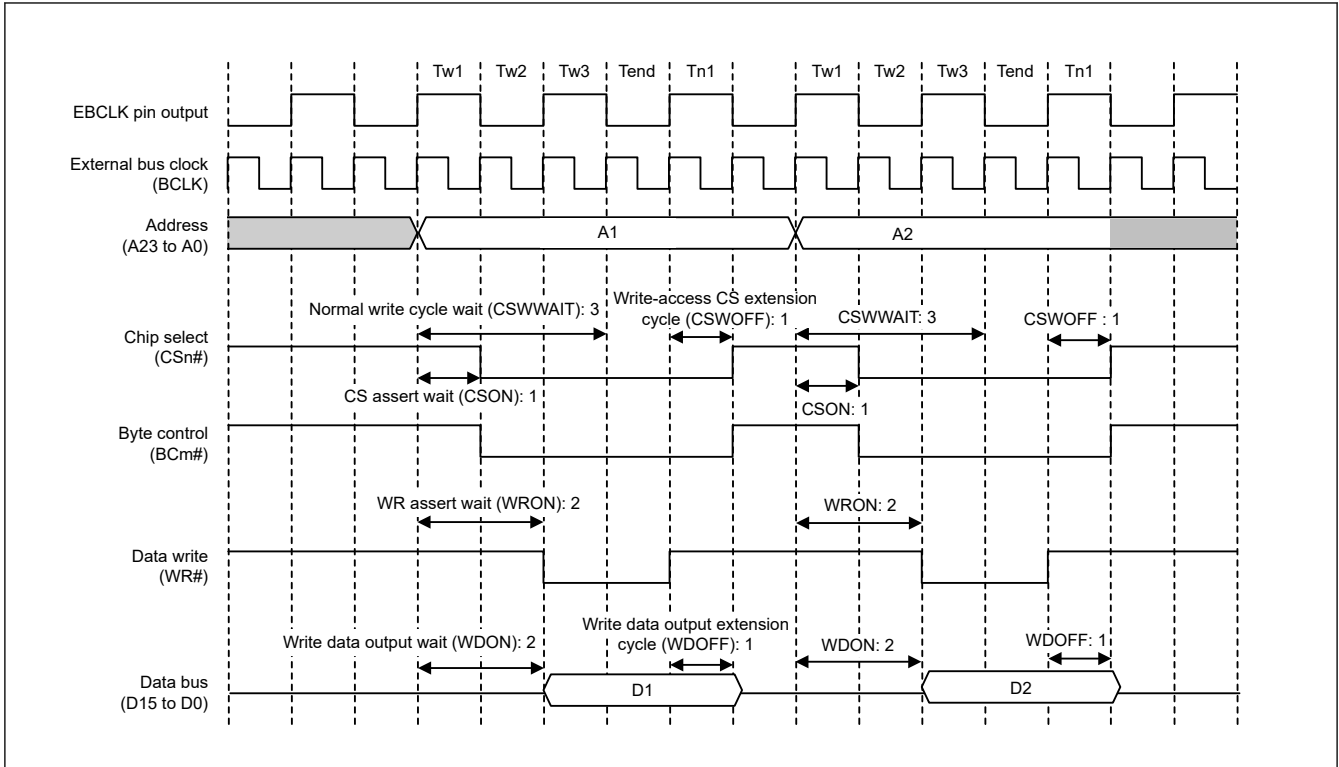

Figure 14.10 Example of normal write operation when BCLK/2 is selected in the EBCLK Pin Output Select bit (n = 0 to 7, m = 0, 1)

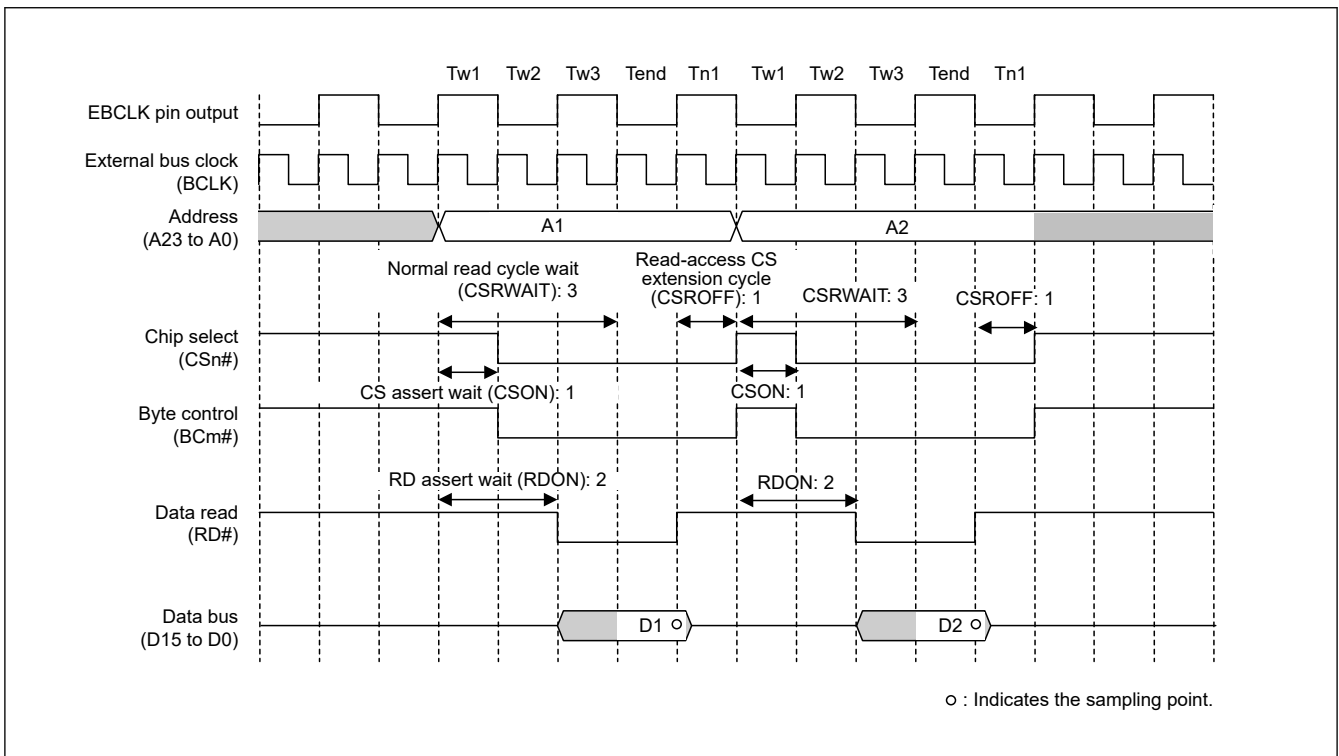

Figure 14.11 Example of normal read operation when BCLK/2 is selected in the EBCLK Pin Output Select bit and two rounds of bus access are generated in response to a single transfer request (n = 0 to 7, m = 0, 1)

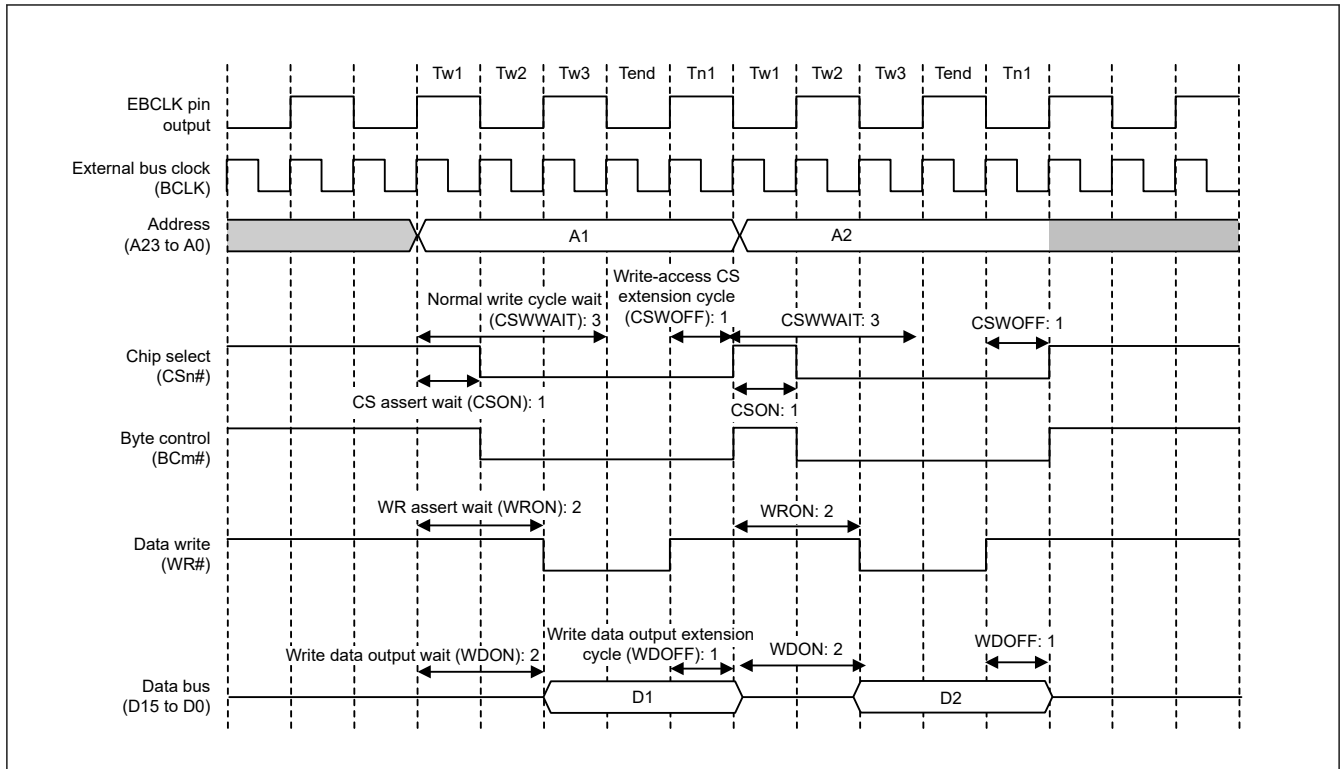

Figure 14.12 Example of normal write operation when BCLK/2 is selected in the EBCLK Pin Output Select bit and two rounds of bus access are generated in response to a single transfer request ($n = 0$ to 7 , $m = 0, 1$)

(2) Page Access

When the PRENB and PWENB bits in CSnMOD are set to 1 to enable page read and page write access, the bus access for page access operations becomes page read and write. Page access can only occur when two or more rounds of external bus access are required for a single transfer request from the bus master. However, normal access is made when split accesses are not aligned or access extends across the 32-bit boundary. See Table 14.19 to Table 14.22 for the conditions under which page access occurs.

Figure 14.13 and Figure 14.14 show examples of page access operations.

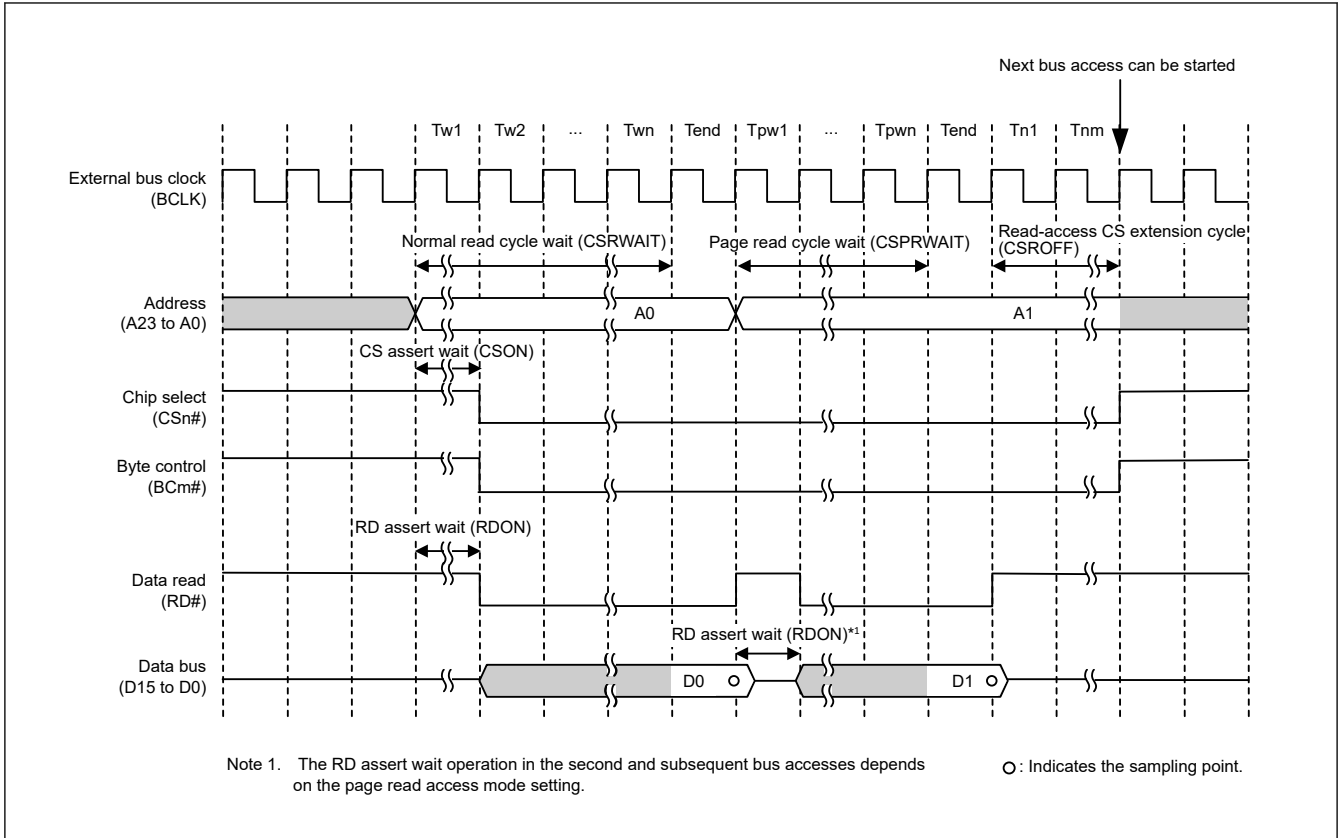

Figure 14.13 Page read access timing (n = 0 to 7, m = 0, 1)

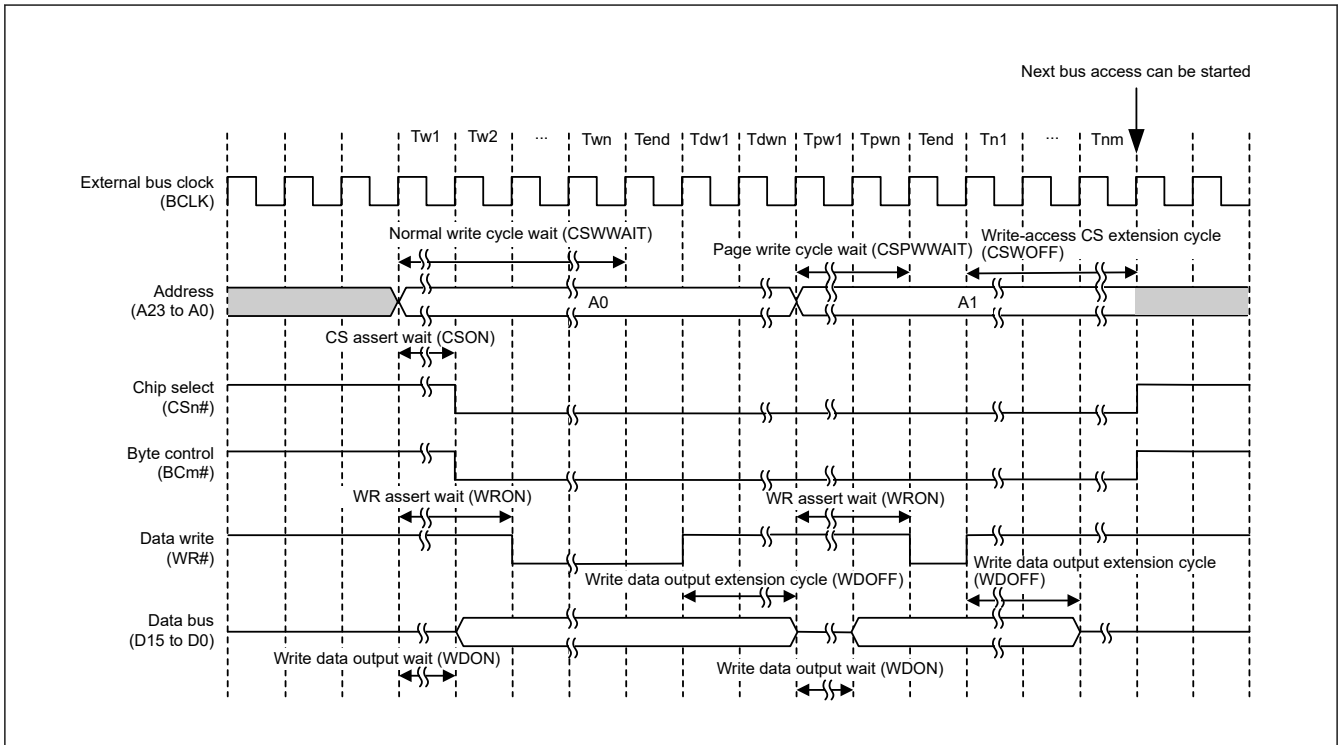

Figure 14.14 Page write access timing (n = 0 to 7, m = 0, 1)

Figure 14.15 and Figure 14.16 show examples of operations for access to a 16-bit bus space in 32 bits. The values of the wait control registers shown in the figures are example settings. In your application, set the registers appropriately for the specifications of connected devices.

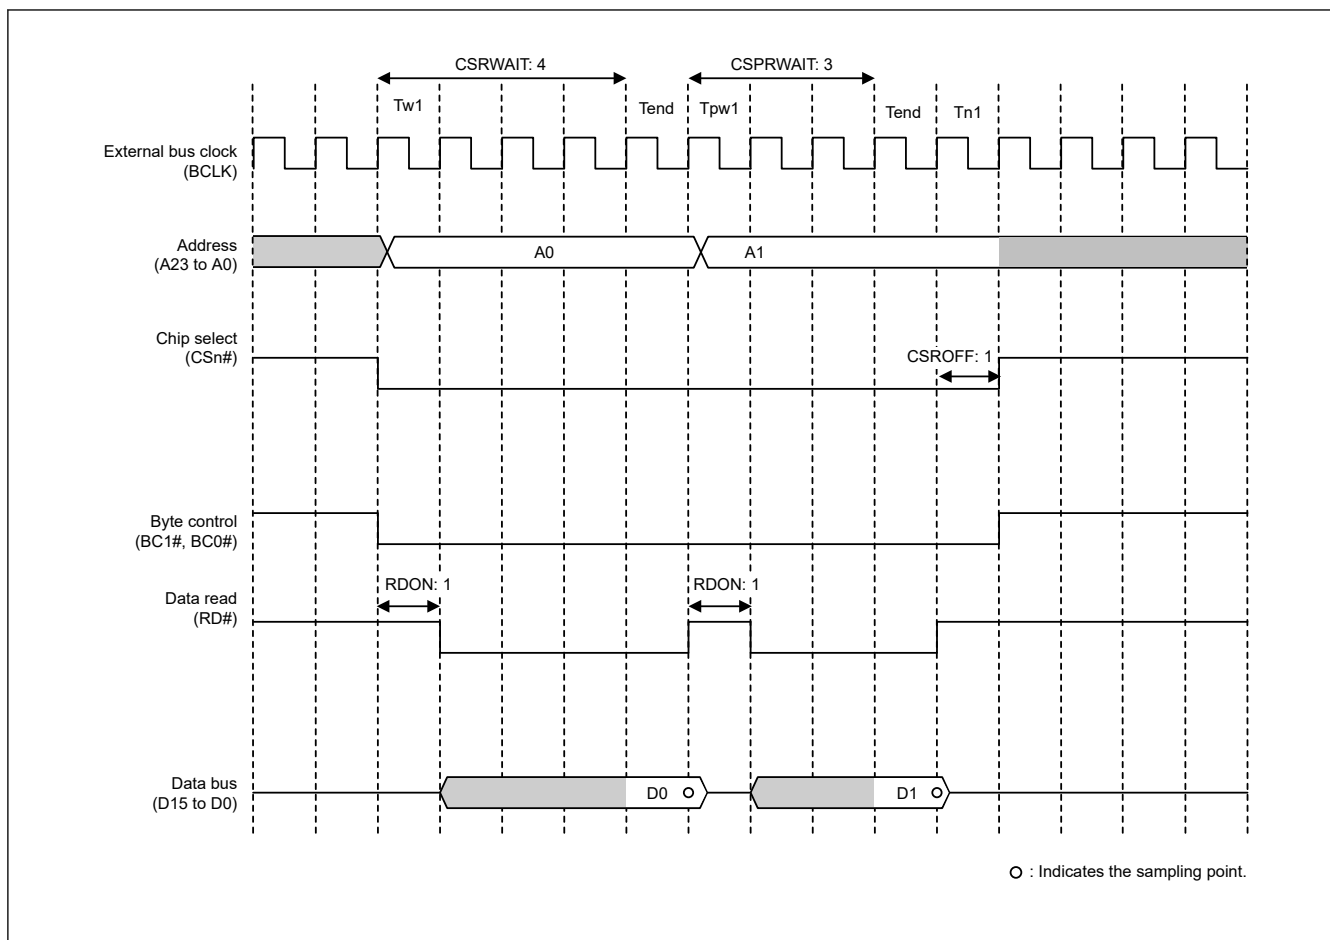

Figure 14.15 Example page read access operation when 16-bit bus space is accessed in 32 bits (n = 0 to 7)

Figure 14.17 and Figure 14.18 show examples of page access operations when BCLK/2 is selected as the frequency division in the EBCLK Pin Output Select bit.

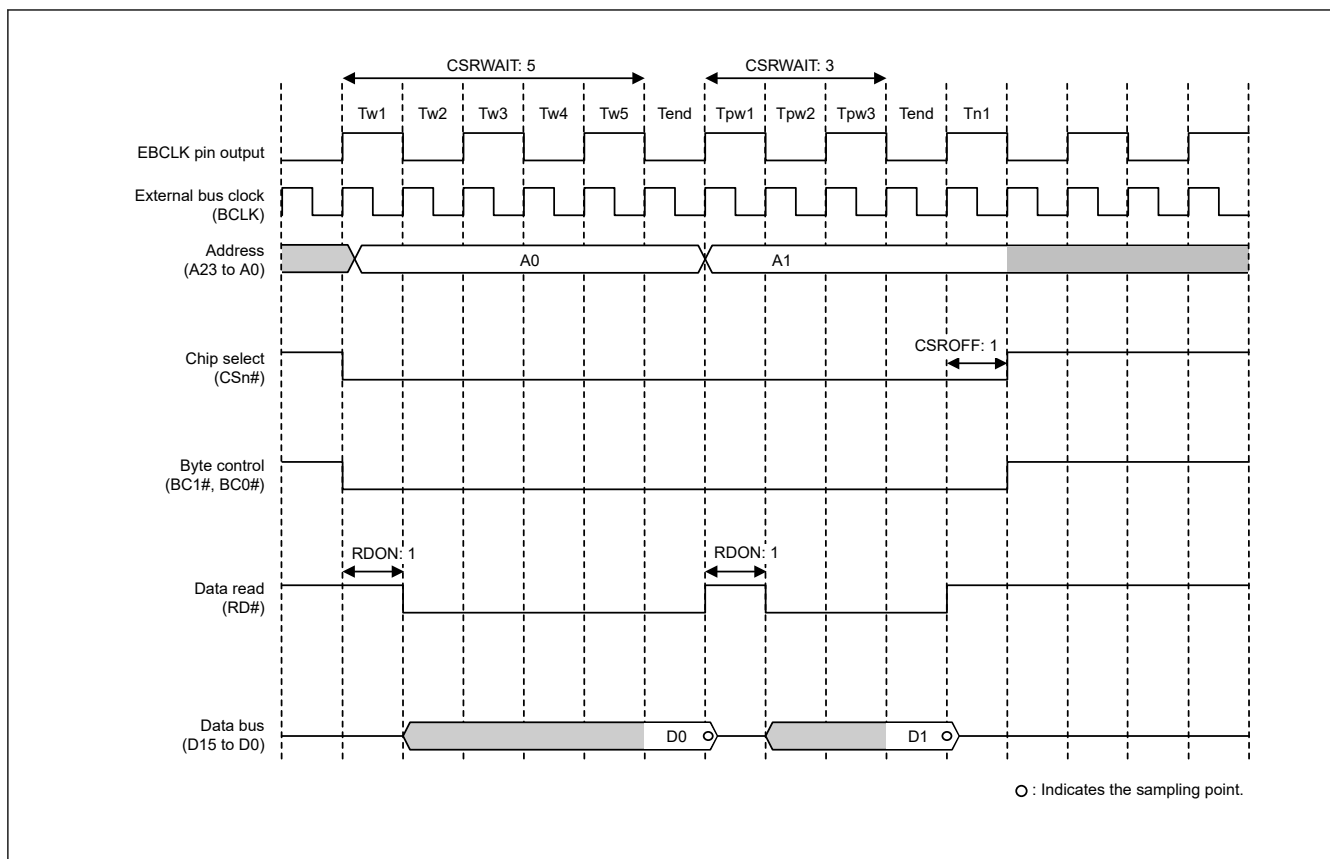

Figure 14.17 Example page read access operation when BCLK/2 is selected in the EBCLK Pin Output Select bit and two rounds of bus access are generated in response to a single transfer request (n = 0 to 7)

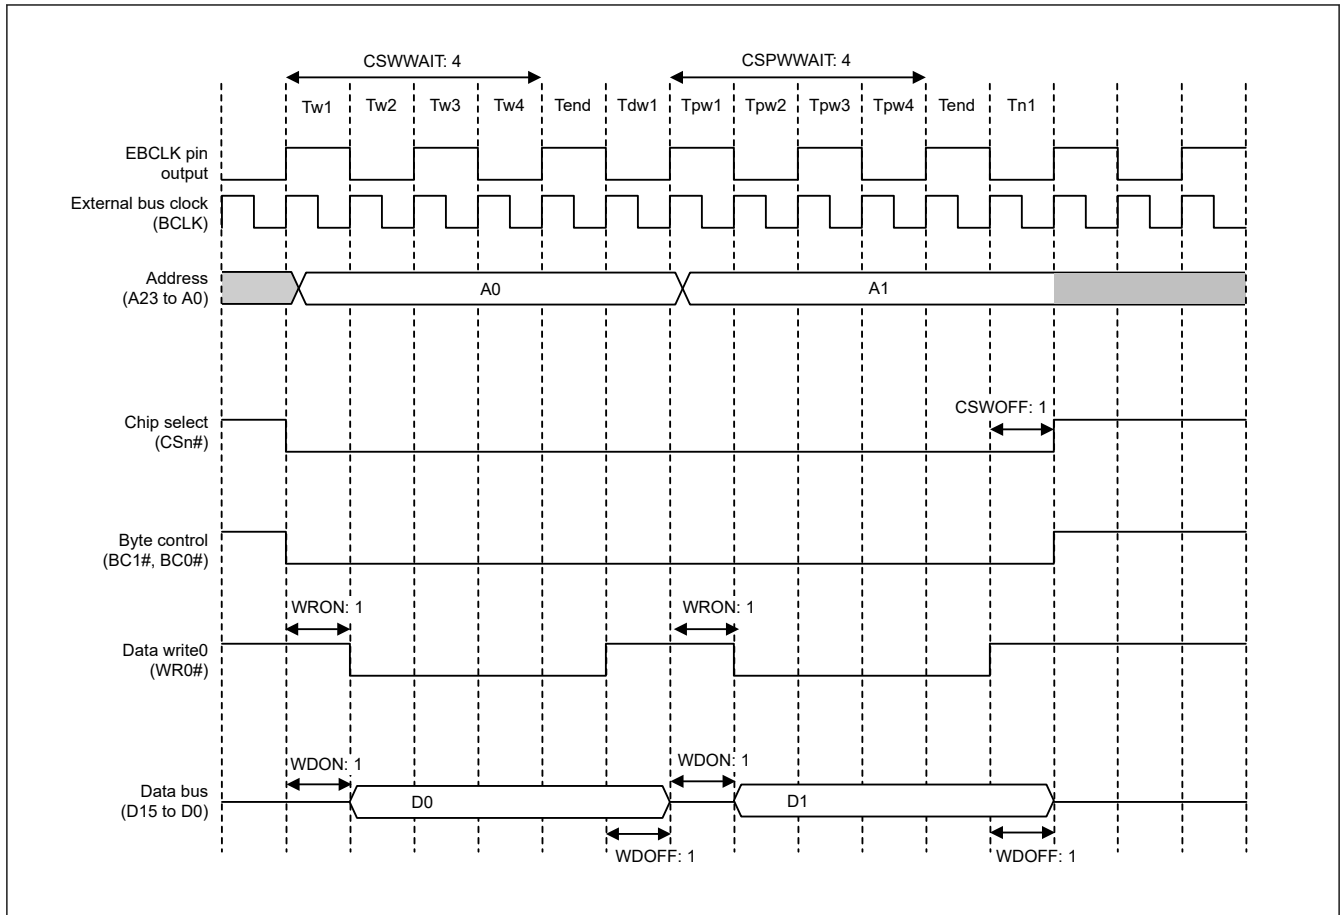

Figure 14.18 Example page write access operation when BCLK/2 is selected in the EBCLK Pin Output Select bit and two rounds of bus access are generated in response to a single transfer request, in single-write strobe mode (n = 0 to 7)

14.5.2 Address/Data Multiplexed Bus

When the address/data Multiplexed I/O Interface Select bit (MPXEN) in CSnCR is set to 1, addresses and data can be multiplexing input/output to/from the D15 to D00 pins in the corresponding area. Using this function enables direct connection of this MCU to peripherals of the MCU requiring address/data multiplexing. When 8-bit width is selected with the BSIZE[1:0] bits in CSnCR, D7 to D00 are multiplexed with A07 to A00. When 16-bit width is selected, D15 to D00 are multiplexed with A15 to A00. In the address/data multiplexed I/O space, accesses are controlled with the ALE, RD, WRn, and BCn signals.

Byte strobe mode or single-write strobe mode is selectable in the same way as for a separate bus. However, with regard to the BCn signals within the address cycle, the byte-control signal is output for the data being read or written.

During the address/data multiplexed I/O space access, after the number of wait cycles specified by the Address Cycle Wait Select bits (AWAIT[1:0]) in CSnWCR2 is inserted in the address output cycle, data access is performed.

Ta1 to Tan (Address Cycle Wait)

The period Ta1 to Tan is valid only when the address/data multiplexed I/O space is specified. This period is made up of the number of clock cycles between the start of external bus access and 1 cycle before the address latch (ALE) signal is negated. The number of cycles are selectable within the range from 0 to 3. Addresses are output until the next cycle of ALE signal negation (address cycle). The timing of ALE signal is the same as that of CS assertion. After the address cycle, a data cycle is started. CSnWCR1 and CSnWCR2 should be set so that an address cycle and a data cycle do not overlap.

Page access to the address/data multiplexed I/O space is invalid. When the PRENB or PWENB bit in CSnMOD is set to 1 to enable page-read or page-write access, these settings are ignored and normal read or write operation is performed.

Figure 14.19 to Figure 14.21 show examples of operations with the address/data multiplexed I/O interface

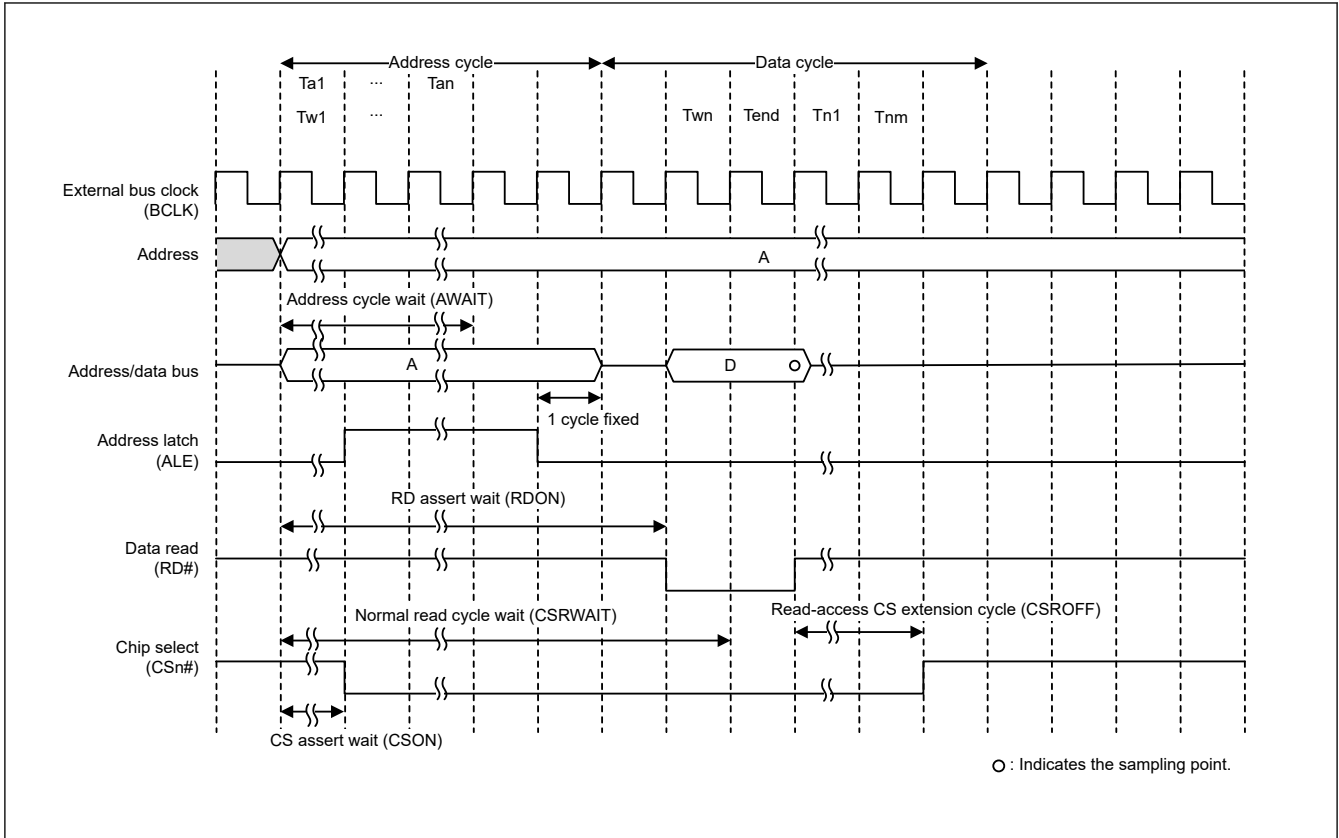

Figure 14.19 Example of read access operation with address/data multiplexed I/O interface (n = 0 to 7)

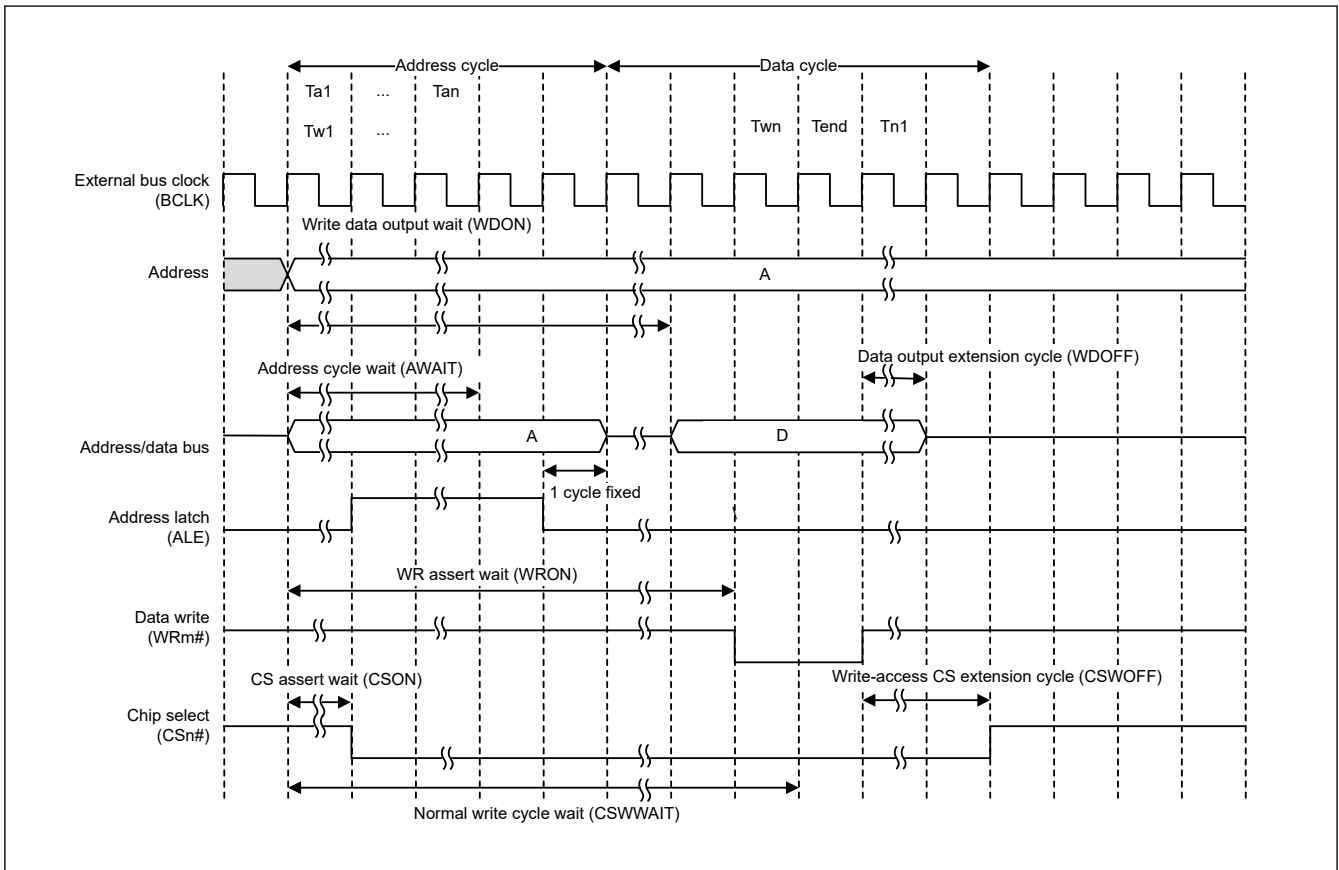

Figure 14.20 Example of write access operation with address/data multiplexed I/O interface (n = 0 to 7, m = 0, 1)

Figure 14.21 Example of bus timing with address/data multiplexed I/O interface (n = 0 to 7, m = 0, 1)

14.5.3 External Wait Function

Wait cycles can be extended by the WAIT signal beyond the length of the normal access cycle wait specified in the CSRWAIT[4:0] and CSWAIT[4:0] bits in CSnWCR1, and the page access cycle wait specified in the CSPRWAIT[2:0] and CSPWAIT[2:0] bits in CSnWCR1.

When external wait is enabled (EWENB = 1 in CSnMOD), wait cycles are inserted while the WAIT signal is held low. When external wait is disabled (EWENB = 0 in CSnMOD), the WAIT signal has no effect. All wait cycles specified in CSnWCR1 are inserted independently of the WAIT signal.

(1) Normal Access

Sampling of the WAIT signal begins on completion of the wait cycle (Tend) specified in CSnWCR1. The bus cycle is extended while the WAIT signal is held low. The wait cycle ends (Tend) at the next cycle after the WAIT signal goes high.

(2) Page Access

The first access operation is the same as the normal access operation. Sampling of the WAIT signal begins on completion of the wait cycle (Tend) specified in the CSnWCR1 register. The bus cycle is extended while the WAIT signal is held low. The wait cycle (Tend) ends at the next cycle after the WAIT signal goes high.

For the second and subsequent accesses, sampling of the WAIT signal begins on completion of the page access wait cycle (Tend). The page access wait cycle is extended while the WAIT signal is held low, and ends (Tend) at the next cycle after the WAIT signal goes high.

Figure 14.22 to Figure 14.25 show examples of external wait insertion timing with the separate bus interface.

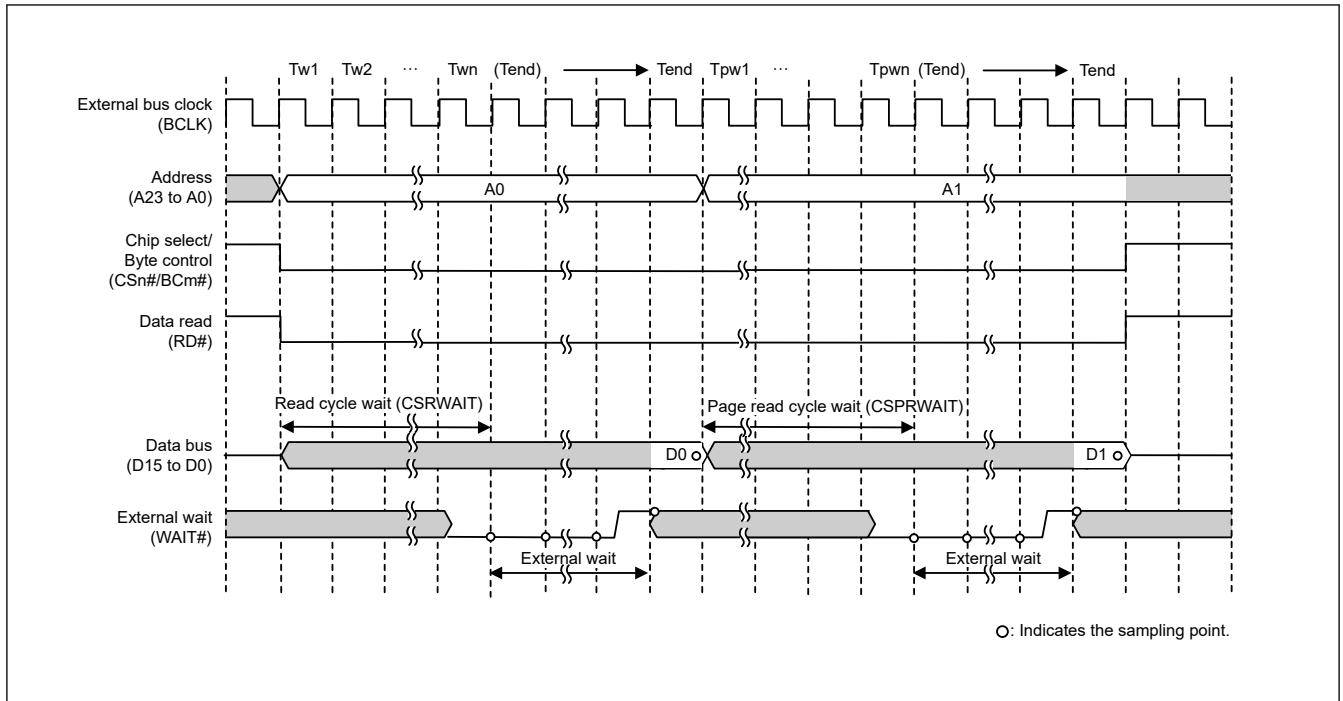

Figure 14.22 Example external wait timing for page read access to 16-bit bus space (when 1/1 BCLK is selected with the BCLK Pin Output Select bit) ($n = 0$ to 7, $m = 0, 1$)

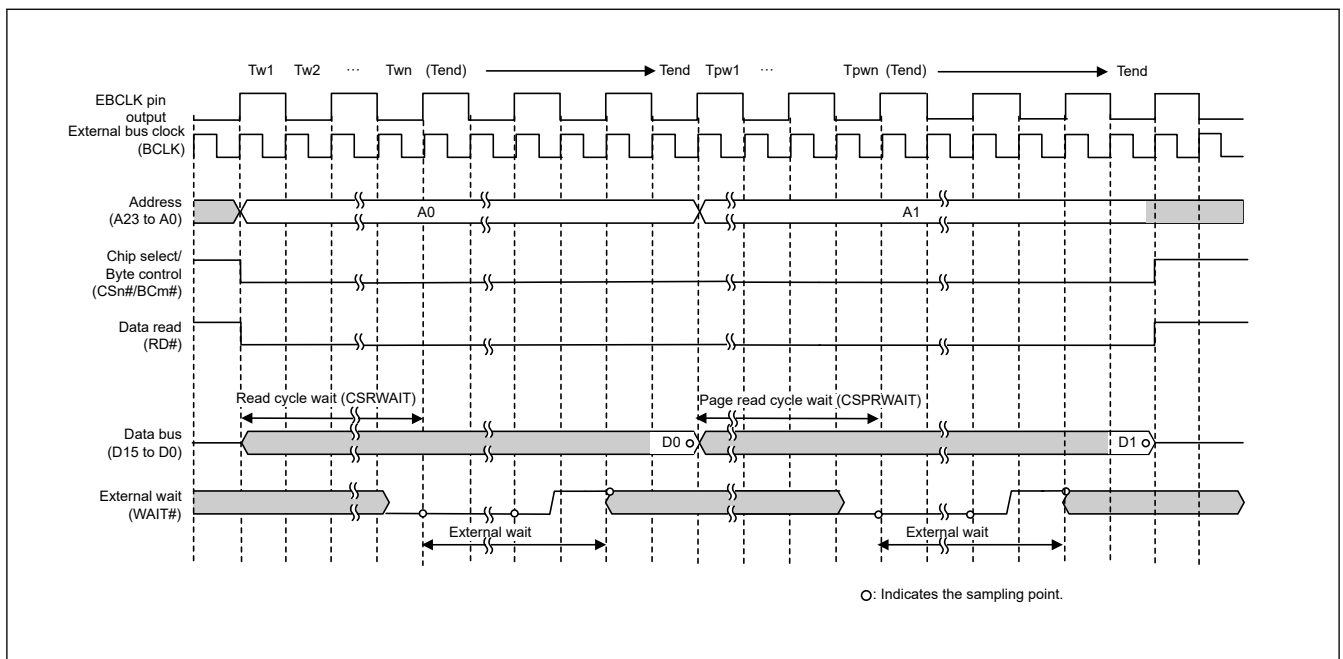

Figure 14.23 Example external wait timing for page read access to 16-bit bus space (when 1/2 BCLK is Selected with the EBCLK Pin Output Select bit) ($n = 0$ to 7, $m = 0, 1$)

Figure 14.24 Example external wait timing for page write access to 16-bit bus space in byte strobe mode (when 1/1 BCLK is selected with the BCLK Pin Output Select bit) (n = 0 to 7, m = 0, 1)

Figure 14.25 Example external wait timing for page write access to 16-bit bus space in byte strobe mode (when 1/2 EBCLK is selected with the EBCLK Pin Output Select bit) (n = 0 to 7, m = 0, 1)

(3) Address/Data Multiplexed I/O Interface

In a data cycle with the address/data multiplexed I/O interface, programmed waits and pin waits using the WAIT pin can be inserted in the same way as that with the separate bus interface.

Address cycles are not affected by the wait control settings. Figure 14.26 shows an example of external wait insertion timing with the address/data multiplexed I/O interface.

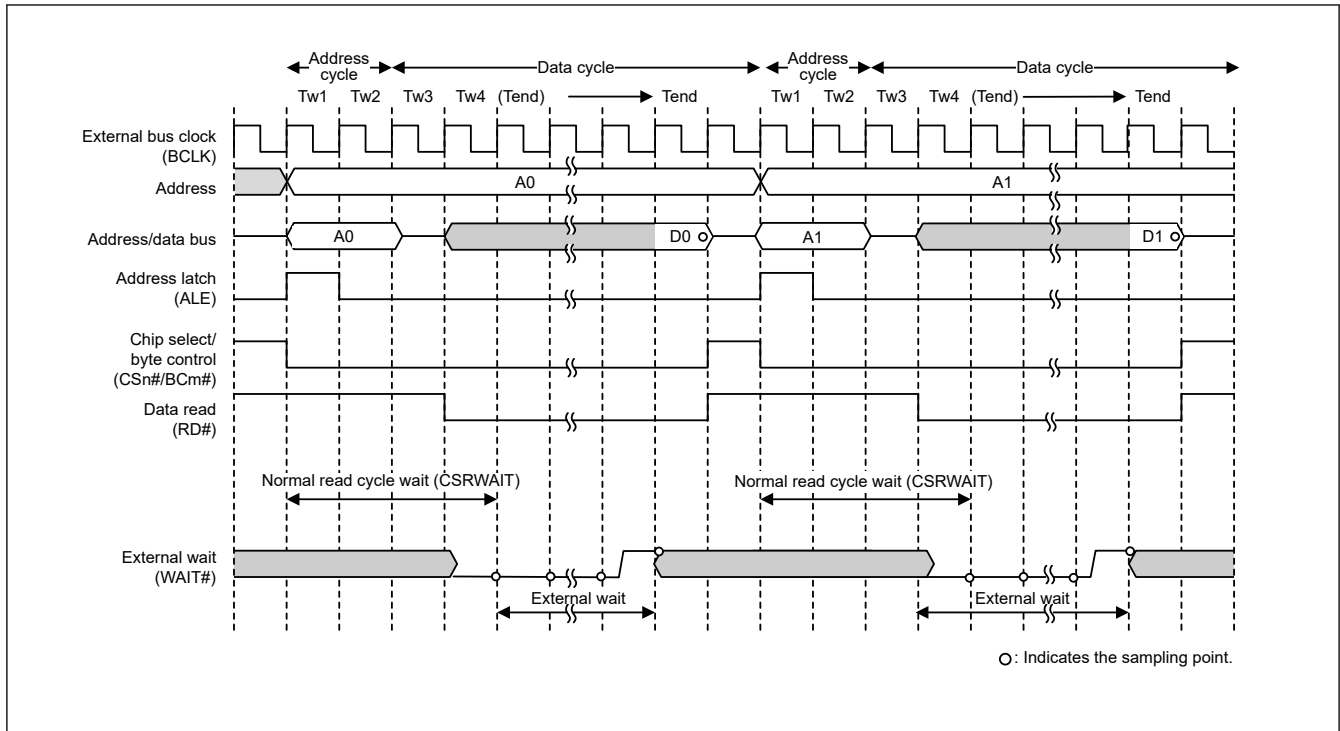

Figure 14.26 Example external wait insertion timing with address/data multiplexed I/O interface (n = 0 to 7, m = 0, 1)

14.5.4 Insertion of Recovery Cycles

Recovery cycles can be inserted between consecutive rounds of external bus access by setting the Recovery Cycle Insertion Enable bit in CSRECEN to 1.

The number of recovery cycles to be inserted after read cycles and write cycles can be independently set for each area using CSnREC. When the preceding bus cycle is a write access, the number of write recovery cycles must be set with the WRCV[3:0] bits for the associated area. When the preceding bus cycle is a read access, the number of read recovery cycles must be set with the RRCV[3:0] bits for the associated area. For example, when a CS1 read access occurs after a CS0 read access, the number of recovery cycles to be inserted between them is set in the RRCV[3:0] bits in CS0REC.

Recovery cycle insertion can be enabled or disabled with RCVENi (i = 0 to 7) in CSRECEN when the preceding bus access is a separate bus access, and with RCVENMj (j = 0 to 7) when the preceding bus access is an address/data multiplexed bus access.

Recovery cycles can be inserted on any of the following conditions:

- After a read access to the external bus, a read access is made to the external bus in the same area.
- After a read access to the external bus, a read access is made to the external bus in a different area.
- After a read access to the external bus, a write access is made to the external bus in the same area.
- After a read access to the external bus, a write access is made to the external bus in a different area.
- After a write access to the external bus, a read access is made to the external bus in the same area.
- After a write access to the external bus, a read access is made to the external bus in a different area.
- After a write access to the external bus, a write access is made to the external bus in the same area.
- After a write access to the external bus, a write access is made to the external bus in a different area.

The recovery cycle starts at the end of the preceding bus cycle, for example when the CSn signal (n = 0 to 7) is negated. A high-level period of the CSn signal is inserted for the specified recovery cycle period starting from this point.

In the fastest case, the CSn signal for the next round of bus access is asserted immediately after the end of the recovery cycles. Even if the next request for access to an external address space is generated during the recovery period, the next access over the external bus starts immediately after the end of the recovery cycles.

When two or more external bus access cycles are required for a single transfer request from a bus master, and the recovery cycle insertion condition is satisfied, recovery cycles are also inserted between these bus access cycles. However, when page read access is enabled (CSnMOD.PRENB = 1) or page write access is enabled (CSnMOD.PWENB = 1), recovery cycles are not inserted except after the last bus access cycle of the transfer, even if the recovery cycle insertion condition is satisfied. See Figure 14.30.

Similarly, during normal access with page access enabled, recovery cycles are not inserted between bus access cycles but only after the last bus access cycle of the transfer. With the address/data multiplexed I/O interface, when the recovery cycle insertion condition is satisfied, recovery cycles are inserted between bus access cycles regardless of the page access enable setting.

Figure 14.27 to Figure 14.30 show examples of recovery cycle insertion with the separate bus interface.

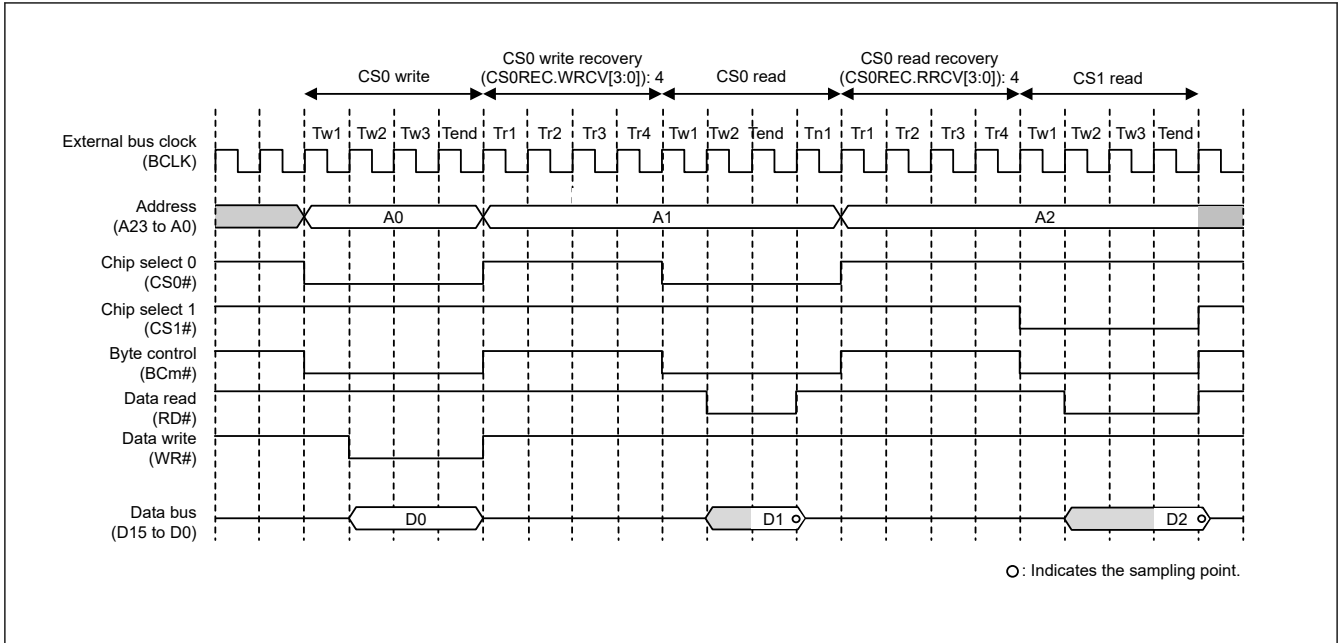

Figure 14.27 Example recovery cycle insertion with separate bus interface (m = 0, 1)

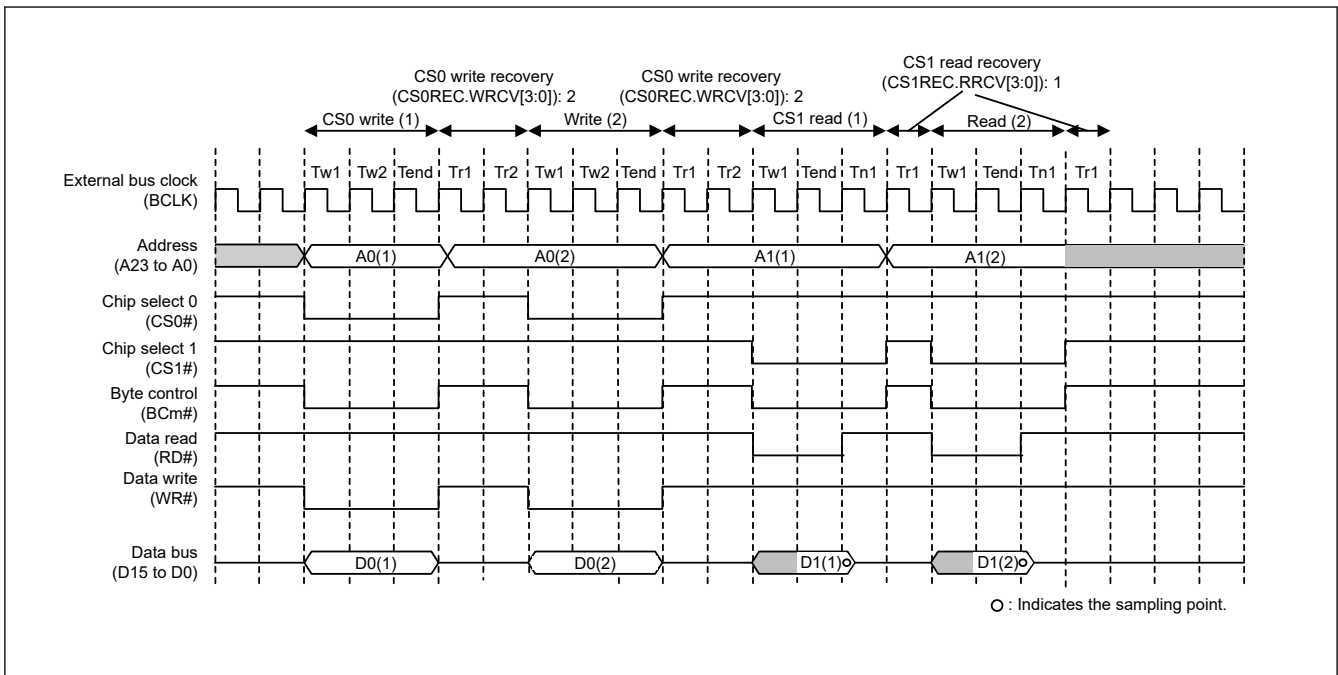

Figure 14.28 Example recovery cycle insertion when bus access is split, with separate bus interface and normal access (m = 0, 1)

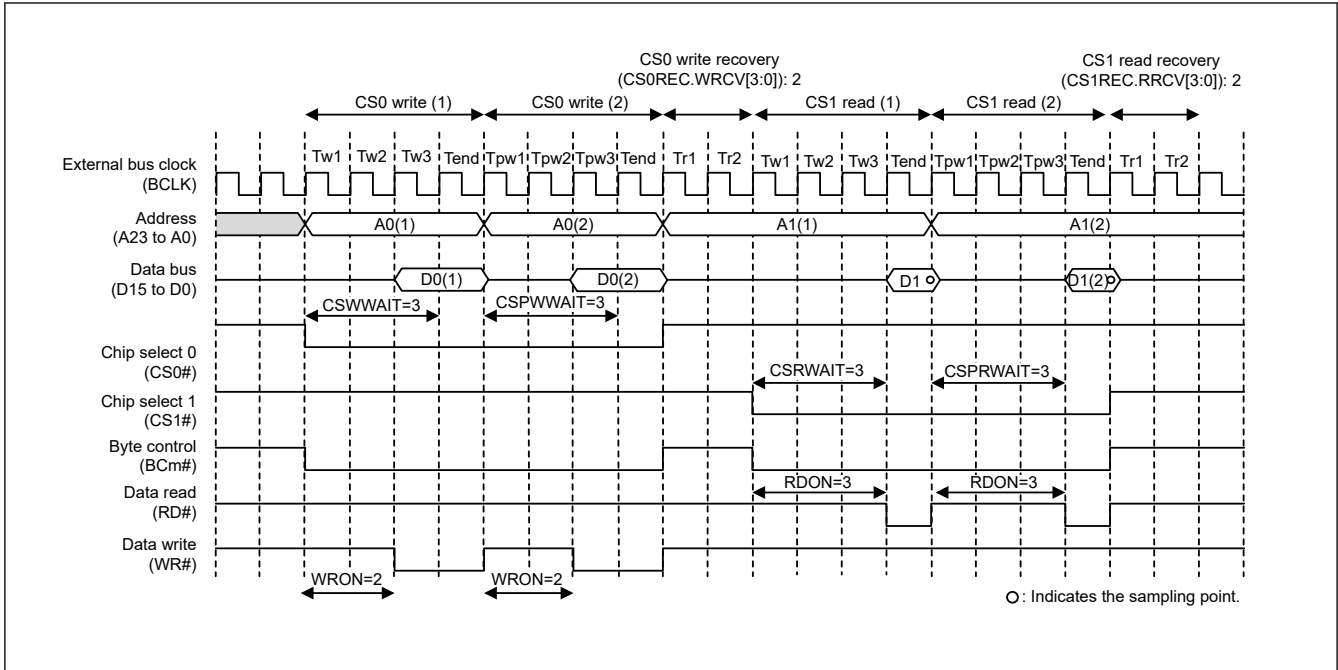

Figure 14.29 Example recovery cycle insertion when bus access is split, with separate bus interface and page access (m = 0, 1)

Figure 14.30 shows an example operation when BCLK/2 is selected as the frequency division in the EBCLK Pin Output Select bit.

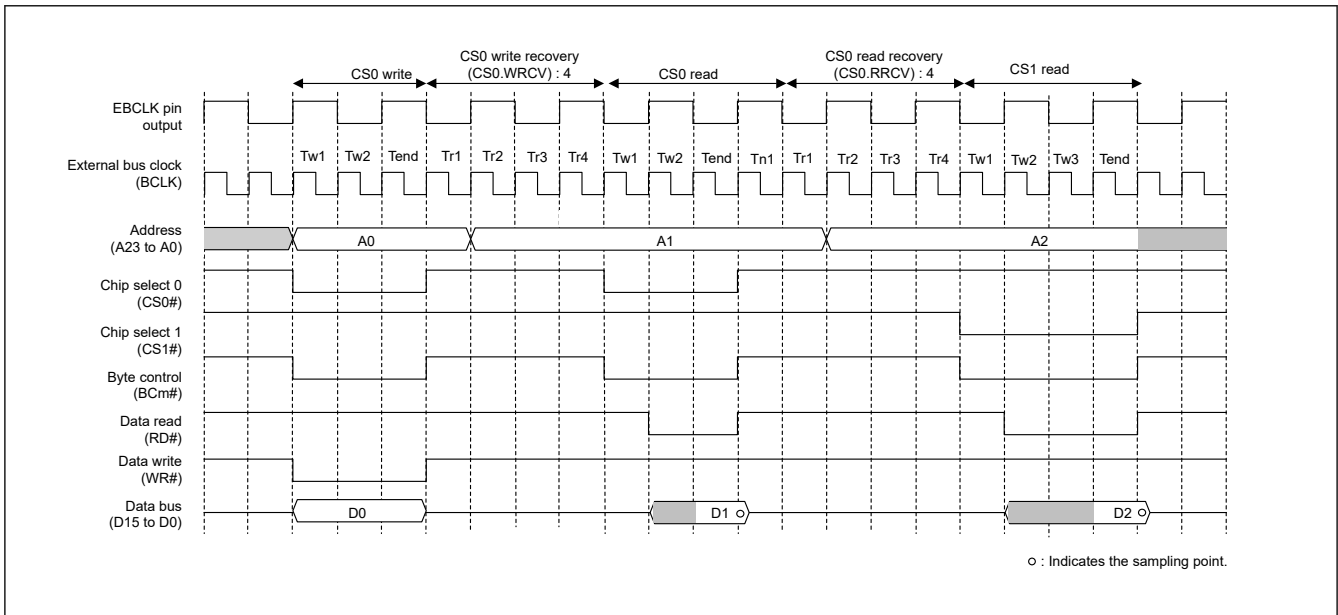

Figure 14.30 Example operation for recovery cycles when BCLK/2 is selected in the EBCLK Pin Output Select bit, with normal access through a separate bus interface (m = 0, 1)

With the address/data multiplexed I/O interface, recovery cycles are inserted in the same way as that with the separate bus interface. Figure 14.31 and Figure 14.32 show examples of recovery cycle insertion with the address/data multiplexed I/O interface.

Figure 14.31 Example of recovery cycle insertion with address/data multiplexed I/O interface (m = 0, 1)

Figure 14.32 Example of recovery cycle insertion when a bus access is split with address/data multiplexed I/O interface (m = 0, 1)

14.5.5 No Access State

When no external address space is accessed, CSn, BCn, WRn, and RDn signals are high, ALE signal is low, and D15 to D00 are in the high-impedance state.

14.5.6 Write Buffer Function (External Bus)

In write access, the main bus is released by writing data to the write buffer before the access is complete. This allows the next round of bus access to start. However, if the next access is to an external address space or to a register of the external bus controller, it is suspended until the external bus operations already in progress are complete.

Figure 14.33 shows an example of operation when the write buffer function is in use. When this function is in use, if the next operation after an external write is an internal access, the internal access is executed in parallel with the external write, for example without waiting for completion of the latter operation.

Figure 14.33 Example operation when the write buffer function is in use

14.5.7 Limitations

(1) Constraints on using separate bus interface

Table 14.27 lists the constraints that apply to bits in the CSn Wait Control Register 1 (CSnWCR1) and CSn Wait Control Register 2 (CSnWCR2) when normal and page accesses occur.

Even if the Page Read Access Enable bit or Page Write Access Enable bit in the CSn Mode Register is set to enable (CSnMOD.PRENB = 1 or CSnMOD.PWENB = 1), the first page access or access that does not fall within the scope of a page access is a normal access operation. Because of this, constraints on normal access must be satisfied.

Table 14.27 Constraints on normal access and page access

Limitations at the time of normal access		Limitations at the time of page access	
Reading	Writing	Reading	Writing
$CSON[2:0] \leq CSRWAIT$ $RDON[2:0] \leq CSRWAIT$ $CSON[2:0] \leq RDON$	$1 \leq WDON[2:0]$ $CSON[2:0] \leq CSWWAIT$ $WRON[2:0] \leq CSWWAIT$ $WDON[2:0] \leq CSWWAIT$ $WDOFF[2:0] \leq CSWOFF$ $WDON[2:0] \leq WRON$ $CSON[2:0] \leq WRON$	$CSON[2:0] \leq CSPRWAIT$ $RDON[2:0] \leq CSPRWAIT$ $CSON[2:0] \leq RDON$	$1 \leq WDON[2:0]$ $CSON[2:0] \leq CSPWWAIT$ $WRON[2:0] \leq CSPWWAIT$ $WDON[2:0] \leq CSPWWAIT$ $WDOFF[2:0] \leq CSWOFF$ $WDON[2:0] \leq WRON$ $CSON[2:0] \leq WRON$

Note: When 2 or more external bus access cycles are required for a single transfer request from a bus master, and the recovery cycle insertion condition is satisfied, with page read access enabled (CSnMOD.PRENB = 1) or page write access enabled (CSnMOD.PWENB = 1), recovery cycles are not inserted between bus access cycles and are inserted only after the last bus access cycle of the transfer.

(2) Constraints on using address/data multiplexed bus interface

In the address/data multiplexed I/O space, page accesses are invalid. If a page access setting is specified, the setting is ignored and the normal read or write operation is performed.

Table 14.28 Constraints at the time of normal access

Reading	Writing
$CSON[2:0] \leq CSRWAIT$ $RDON[2:0] \leq CSRWAIT$ $CSON[2:0] \leq RDON$ $AWAIT[1:0] + 2 \leq RDON$ $CSON[2:0] \leq AWAIT$	$CSON[2:0] \leq CSWWAIT$ $WRON[2:0] \leq CSWWAIT$ $WDON[2:0] \leq CSWWAIT$ $WDOFF[2:0] \leq CSWOFF$ $WDON[2:0] \leq WRON$ $CSON[2:0] \leq WRON$ $AWAIT[1:0] + 2 \leq WRON$ $AWAIT[1:0] + 2 \leq WDOFF$ $CSON[2:0] \leq AWAIT$

(3) Constraint on pin multiplexing between the A00 and BC0 functions

Setting the single-write strobe mode is prohibited in the 8-bit bus space.

(4) Constraints when BCLK/2 is selected in the EBCLK Pin Output Select bit

When 1/2 cycle of BCLK is selected in the EBCLK Pin Output Select bit, the external bus access cycle starts on the rising edge of the EBCLK pin output. However, when 2 or more external bus access cycles are generated for a single transfer request from a bus master, the second or subsequent external bus access cycle can start on the falling edge of the EBCLK pin output, depending on the wait cycle settings. Set the registers appropriately for the specifications of connected devices.

(5) Instruction code constraints

You must fix the instruction code to little-endian order.

14.6 SDRAM Area Controller Operation

This section describes how the SDRAM area controller (SDRAMC) is enabled and the SDRAM bus width is set, followed by a description of the SDRAMC operations, including read, write, auto-refresh, self-refresh, initialization sequence, and mode register settings.

14.6.1 Enabling/Disabling SDRAM Access and Setting the SDRAM Bus Width

SDRAM access can be enabled or disabled using the SDC Control Register (SDCCR). The SDRAM bus width can also be set using SDCCR. The refresh operation is available even when the operation of the SDRAM address space is disabled, as long as self-refresh or auto-refresh is enabled.

14.6.2 No Access State

When no external address space is accessed, the SDCCS, WE, RAS and CAS signals are high.

14.6.3 Insertion of Recovery Cycles

When access to the SDRAM area follows access to the CS area, data recovery cycles are inserted for the CS area controller (CSC). If the number of recovery cycles for the CSC is 0, the ACT command for the next SDRAM access is issued immediately after negation of CSn signal at the earliest. If the number of recovery cycles are not 0, the ACT command is issued 2 cycles after the specified recovery cycle period elapsed after negation of CSn signal at the earliest. Because no data conflicts can occur during access to the SDRAM area, there is no need to set data recovery cycles for the SDRAM (fixed to 0 cycle).

Figure 14.34 Example of recovery timing for SDRAM access

14.6.4 Write Buffer Function

In write access, the main bus is released by writing data to the write buffer before access is complete. This allows the next round of bus access to start. However, if the next access is to an external address space or to a register of the external bus controller, it is suspended until the external bus operations already in progress are complete.

14.6.5 SDRAM Commands

To control the SDRAM, the SDRAMC issues a command for each bus cycle. Commands are defined by a combination of the SDCS, RAS, CAS, WE, CKE, and other signals. [Table 14.29](#) lists the commands issued by the SDRAMC.

Table 14.29 SDRAMC commands

Name	Abbreviation	Command	SDCS	RAS	CAS	WE	CKE		BA1	BA0
							n-1	n		
DESL	DSL	Device deselect	H	x	x	x	H	x	x	x
ACTV	ACT	Bank active	L	L	H	H	H	x	V	V
READ	RD	Read	L	H	L	H	H	x	V	V
WRIT	WRI	Write	L	H	L	L	H	x	V	V
PALL	PRA	All bank precharge	L	L	H	L	H	x	x	x
REF	RFA	Auto-refresh	L	L	L	H	H	x	x	x
MRS	MRS	Mode register set	L	L	L	L	H	x	L	L
SELF	RFS	Self-refresh entry	L	L	L	H	H	L	x	x
SELF	RFX	Self-refresh end	H	x	x	x	L	H	x	x

Note: H = High level, L = Low level, V = Valid, x = Don't care.
n = Command issue cycle, n - 1 = 1 cycle before the command is issued.

14.6.6 Conditions for Setting the SDRAMC Registers

The SDRAMC registers must only be modified when all the conditions shown in [Table 14.30](#) are satisfied.

Table 14.30 Conditions for register modification

Function or operation	Registers	Conditions
Self-refresh	SDSELF* ¹	<ul style="list-style-type: none"> SDRAM access is disabled (SDCCR.EXENB = 0*²) Auto-refresh operation is enabled (SDRFEN.RFEN = 1).
Auto-refresh	SDRFCR	Self-refresh operation is disabled (SDSELF.SFEN = 0)
	SDRFEN	<ul style="list-style-type: none"> SDRAM access is disabled (SDCCR.EXENB = 0*²) Self-refresh operation is disabled (SDSELF.SFEN = 0).
Initialization sequence	SDIR* ¹	SDICR is not set yet, and the same conditions as for SDICR modification are satisfied
	SDICR* ¹	<ul style="list-style-type: none"> SDRAM access is disabled (SDCCR.EXENB = 0*²) Auto-refresh operation is disabled (SDRFEN.RFEN = 0) Self-refresh operation is disabled (SDSELF.SFEN = 0).
Address register	SDADR	<ul style="list-style-type: none"> SDRAM access is disabled (SDCCR.EXENB = 0*²) Auto-refresh operation is disabled (SDRFEN.RFEN = 0) Self-refresh operation is disabled (SDSELF.SFEN = 0).
Timing register	SDTR	<ul style="list-style-type: none"> Self-refresh operation is in progress (SDSELF.SFEN = 1) or <ul style="list-style-type: none"> SDRAM access is disabled (SDCCR.EXENB = 0*²) Auto-refresh operation is disabled (SDRFEN.RFEN = 0) Self-refresh operation is disabled (SDSELF.SFEN = 0).
Mode register	SDMOD* ¹	<ul style="list-style-type: none"> SDRAM access is disabled (SDCCR.EXENB = 0*²) Self-refresh operation is disabled (SDSELF.SFEN = 0).

Note 1. Before modifying this register, confirm that all the status bits in SDSR are 0.

Note 2. After writing 0 to the EXENB bit, confirm that it is cleared to 0.

14.6.7 Self-Refresh

Transition to or recovery from self-refresh mode is controlled with the SDRAM Self-Refresh Control Register (SDSELF). Immediately before the transition to self-refresh mode, an auto-refresh operation is performed. In self-refresh mode, the CKE signal is low. Immediately after recovery from self-refresh mode, the auto-refresh cycle starts.

Figure 14.35 and Figure 14.36 show timing examples of the transition to and recovery from self-refresh mode.

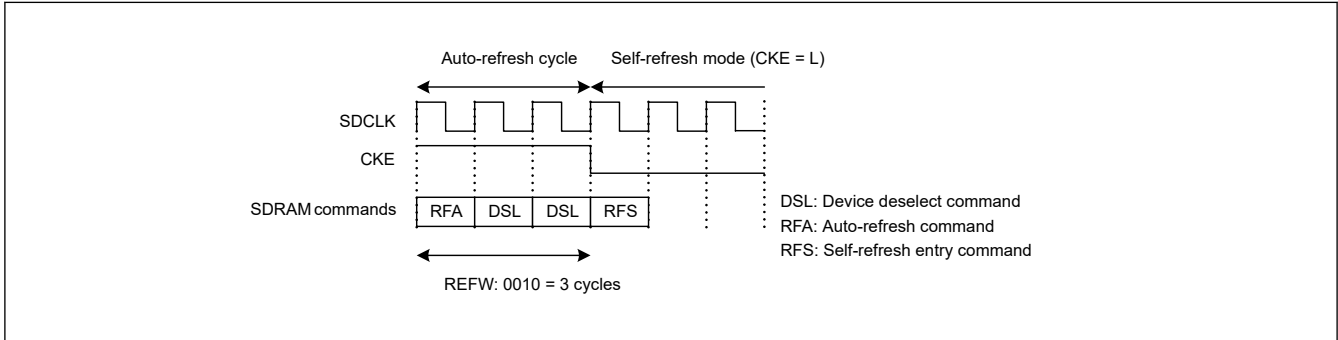

Figure 14.35 Example timing for transition to self-refresh mode when SDRFCR.REFW[3:0] = 0010 (3 cycles)

Figure 14.36 Example timing for recovery from self-refresh mode

(1) Self-refresh in Software Standby mode

When invoking self-refresh in Software Standby mode, first follow the procedure shown in [section 14.6.12.2. Procedure for transitioning to and recovering from self-refresh mode](#). Next, set up the transition to Software Standby mode. In this mode, set the Output Port Enable bit (OPE) in the Standby Control Register (SBYCR) to 1 to hold the output state of the address bus and bus control signals.

After canceling Software Standby mode, follow the procedure shown in [section 14.6.12.2. Procedure for transitioning to and recovering from self-refresh mode](#). For details on invoking and canceling Software Standby mode, see [section 10, Low Power Modes](#).

(2) Self-refresh in Deep Software Standby mode

Deep Software Standby mode is invoked from within Software Standby mode. On this transition, the pin states remain unchanged. Therefore, invoking of self-refresh in Deep Software Standby mode can be handled the same as for Software Standby mode with one additional setting. You must also set the I/O Port Keep bit (IOKEEP) in the Deep Software Standby mode Control Register (DPSBYCR) to 1.

Because the SDRAMC is reset internally when Deep Software Standby mode is canceled, the SDRAM control registers must be set again. After canceling Software Standby mode, follow the procedure in this section to cancel self-refresh.

Figure 14.37 shows self-refresh timing in Deep Software Standby mode. For details on invoking and canceling Deep Software Standby mode, see [section 10, Low Power Modes](#).

To cancel self-refresh mode:

1. Set DPSBYCR.IOKEEP to 1 to keep the CKE signal output low in Deep Software Standby mode.

2. Start the clock supply to the SDRAMC.
3. Set the SDRAM control registers (SDCMOD, SDADR, and SDTR) again. These registers were initialized by an internal reset on entering Deep Software Standby mode.
4. Enable an auto-refresh operation by setting SDRFEN.RFEN to 1.
5. Check that all the status bits in SDSR are cleared to 0 and set SDSELF.SFEN to 1 to select self-refresh mode again.
6. Modify the port settings for the SDRAM interface.
7. Set SDCKOCR.SDCKOEN to 1 to start the clock supply to the SDRAM with the SDCLK pin.
8. Check that all the status bits in SDSR are cleared to 0 and set SDSELF.SFEN to 0 to cancel self-refresh mode.

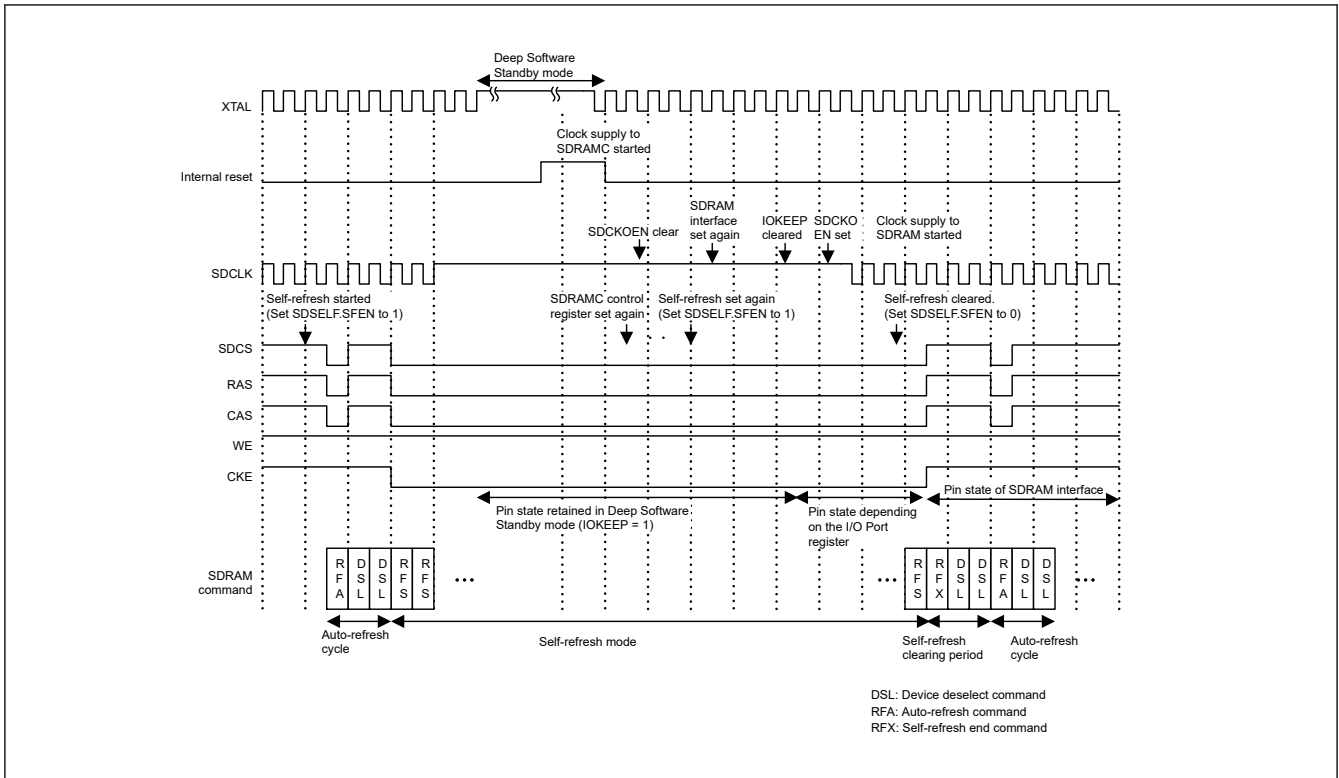

Figure 14.37 Example timing for self-refresh cycle in Deep Software Standby mode

14.6.8 Auto-Refresh

The auto-refresh cycle can be started by setting the Auto-Refresh Operation Enable bit (RFEN) in the SDRAM Auto-Refresh Control Register (SDRFEN) to 1. After the cycle starts, refresh requests are generated at fixed intervals determined by the refresh counter. However, because refresh requests are not accepted during read or write access, the auto-refresh cycle might be suspended.

If an SDRAM access and a refresh request are generated at the same time, the refresh request takes precedence. A CS area access and a refresh request can be made at the same if the SDCS, RAS, CAS, WE, and CKE signals, which are required for issuing the refresh command, are exclusively provided for SDRAM access.

The refresh counter is halted during a self-refresh operation. After recovery from the self-refresh mode, the auto-refresh cycle starts and the counter value is reset, resuming the counter operation.

Figure 14.38 shows a timing example of an auto-refresh cycle.

Figure 14.38 Example timing for auto-refresh cycle (1)

Figure 14.39 shows examples of operation when an auto-refresh request is generated during single access.

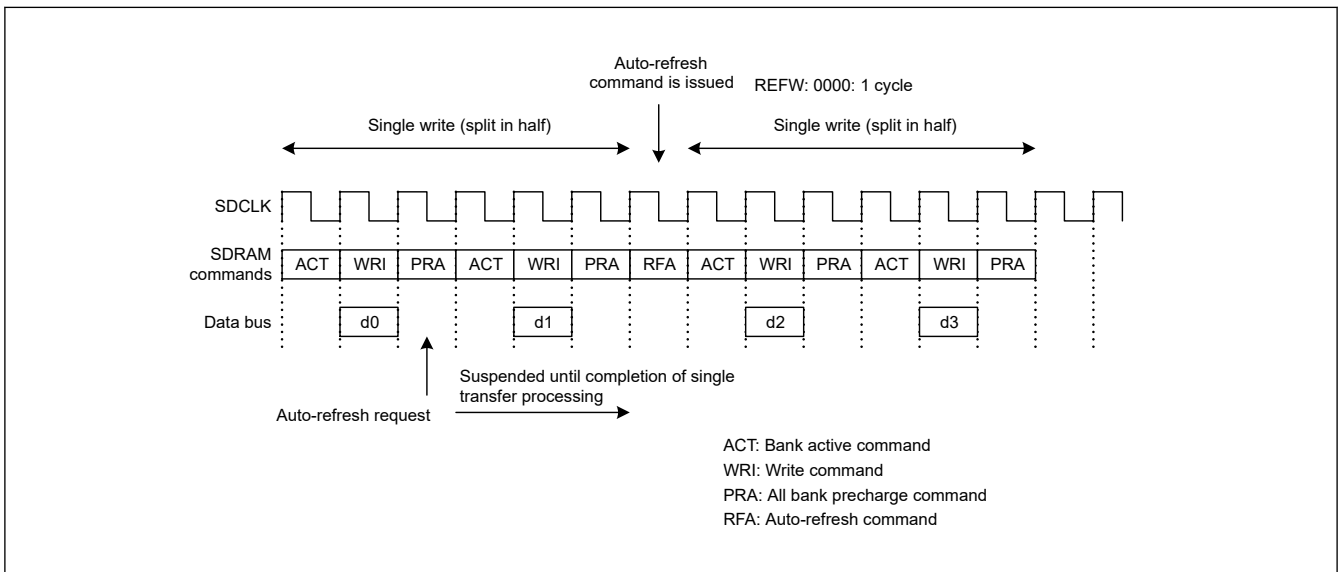

Figure 14.39 Example timing for auto-refresh cycle (2), when the auto-refresh request is made during single access

14.6.9 Initialization Sequencer

The SDRAMC has a sequencer to issue SDRAM initialization commands. After a reset, the initialization sequencer must be activated without fail. Operation is not guaranteed if the SDRAM is not initialized.

The SDRAM initialization sequencer issues an all-bank precharge command followed by auto-refresh commands n times, where $n = 1$ to 15. The SDRAM initialization sequence timing can be set using the SDRAM Initialization Register (SDIR). The SDRAM initialization sequence can be activated using the SDRAM Initialization Sequence Control Register (SDICR). These registers must be set only when the conditions listed in Table 14.30 are satisfied.

Figure 14.40 shows a timing example of the SDRAM initialization sequence. When the ARFC[3:0] bits in SDIR are set so that auto-refresh operation is performed two or more times, auto-refresh cycles are repeated in the initialization sequence accordingly.

Figure 14.40 Example timing for SDRAM initialization sequence

14.6.10 Read/Write Access

The SDRAMC controls read/write access in the following two modes.

- Single access mode: the row address is output each time data is accessed
- Consecutive access mode: when the same row address is accessed consecutively, only the column address is changed after the row address is output, enabling quick data access.

Consecutive SDRAM access is enabled by setting the continuous access enable bit (BE) in SDRAM access mode register (SDAMOD) to 1. Consecutive SDRAM access targets burst transfers from bus master and transfers divided by the relationship between data size and SDRAM bus width.

Furthermore, setting the SDRAMC column-latency setting bits (CL[2:0]) in SDTR to 1 (CL = 1) in consecutive-access mode is prohibited, and operation is not guaranteed if this setting is made.

When the BE bit in SDAMOD is 0, single access is used in all transfers.

Note: WRAP (Wrapping Burst) of CPU does not result in consecutive SDRAM access.

14.6.10.1 Single Access

Figure 14.41 and Figure 14.42 show timing examples of single read and Figure 14.43 show timing examples of single write, respectively. The specific access timing depends on the SDRAM timing register (SDTR) settings. For details, see section 14.6.12.3. Timing register settings and access timing.

Figure 14.41 Timing Example of Single Read (SDTR.CL[2:0] = 010b: 2 Cycles)

Figure 14.42 Timing Example of Single Read (Burst transfer from bus master with SDAMOD.BE = 0 and SDTR.CL[2:0] = 010b: 2 Cycles)

Figure 14.43 Timing Example of Single Write (when the Shortest Timing is Set)

14.6.10.2 Consecutive Access

Figure 14.44 and Figure 14.45 show timing examples of consecutive read and consecutive write for four data, respectively. The specific access timing depends on the SDRAM timing register (SDTR) settings. For details, see [section 14.6.12.3. Timing register settings and access timing.](#)

Figure 14.44 Timing Example of Consecutive Read (SDAMOD.BE = 1 and SDTR.CL[2:0] = 010b: 2 Cycles)

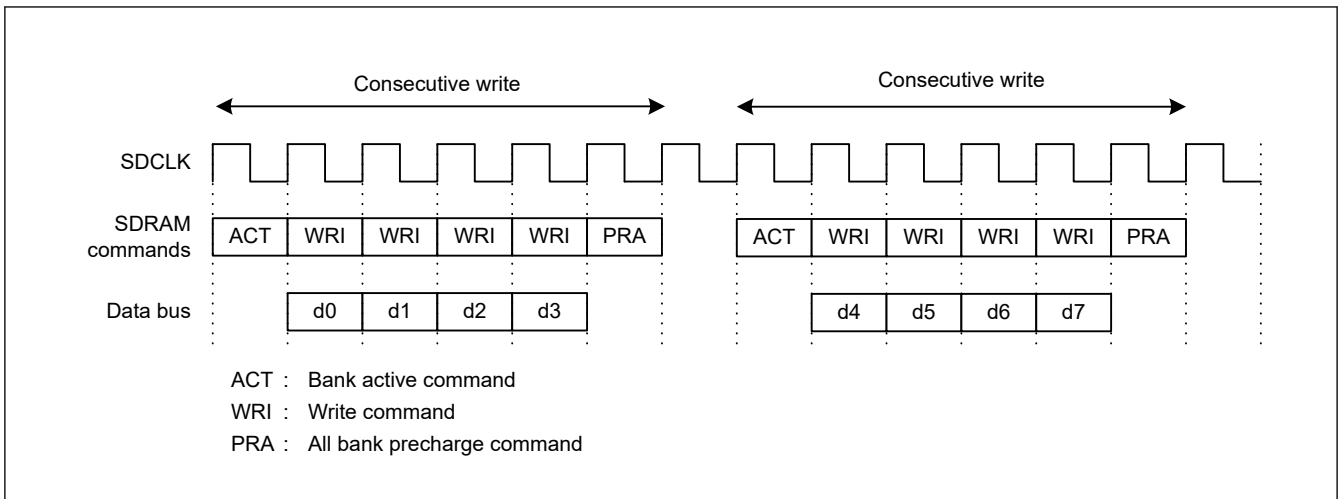

Figure 14.45 Timing Example of Consecutive Write (SDAMOD.BE = 1, when the Earliest Timing is Set)

14.6.11 Setting the Mode Register

Setting the SDRAM Mode Register (SDMOD) allows the mode register set command to be issued to the SDRAM and the value set in the MR[14:0] bits in SDMOD to be output to the lower bits of the address, specifically to A14 to A00 for 8-bit bus width, and A15 to A01 for 16-bit bus width. Before setting the mode register, set the SDRAM Bus Width Select bits in the SDC Control Register (SDCCR.BSIZE[1:0]) to determine the data bus width of the SDRAM.

Figure 14.46 shows the mode register setting timing.

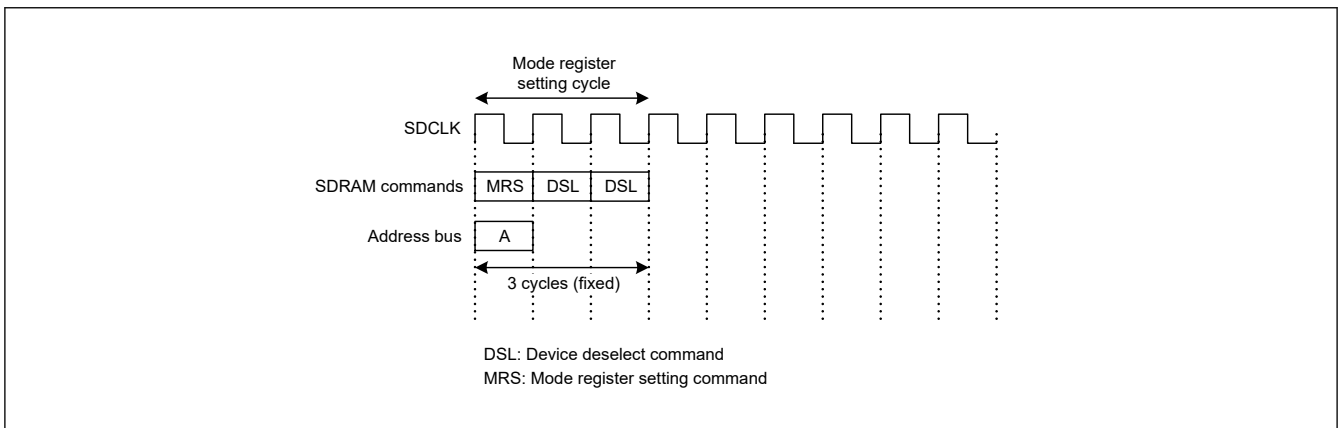

Figure 14.46 Mode register setting timing

14.6.12 SDRAMC Setting Examples

This section describes the following:

- SDRAMC setting procedure
- Timing register setting examples
- Procedure for transitioning to and recovering from self-refresh mode.

14.6.12.1 SDRAMC access procedure

Figure 14.47 shows the SDRAMC setting procedure.

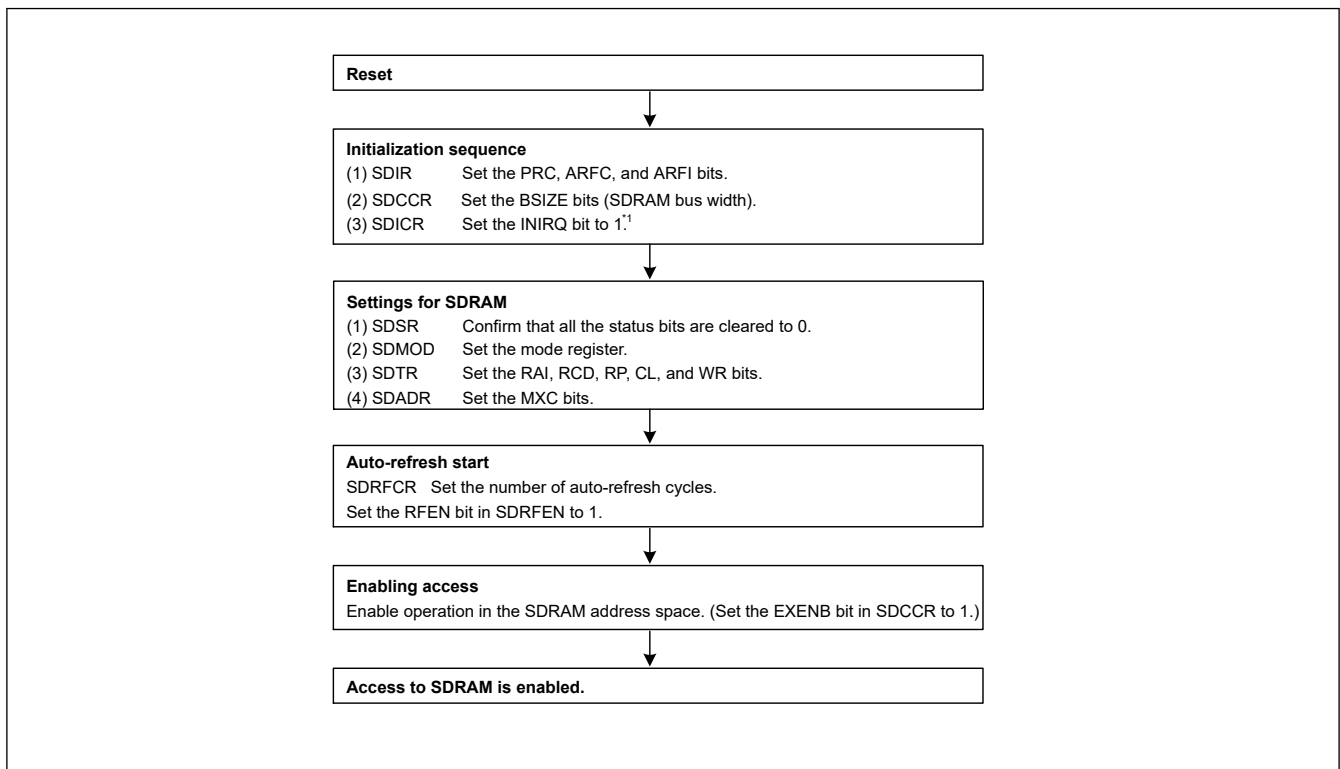

Figure 14.47 SDRAMC setting procedure

14.6.12.2 Procedure for transitioning to and recovering from self-refresh mode

Figure 14.48 shows the procedure for transitioning to and recovering from self-refresh mode.

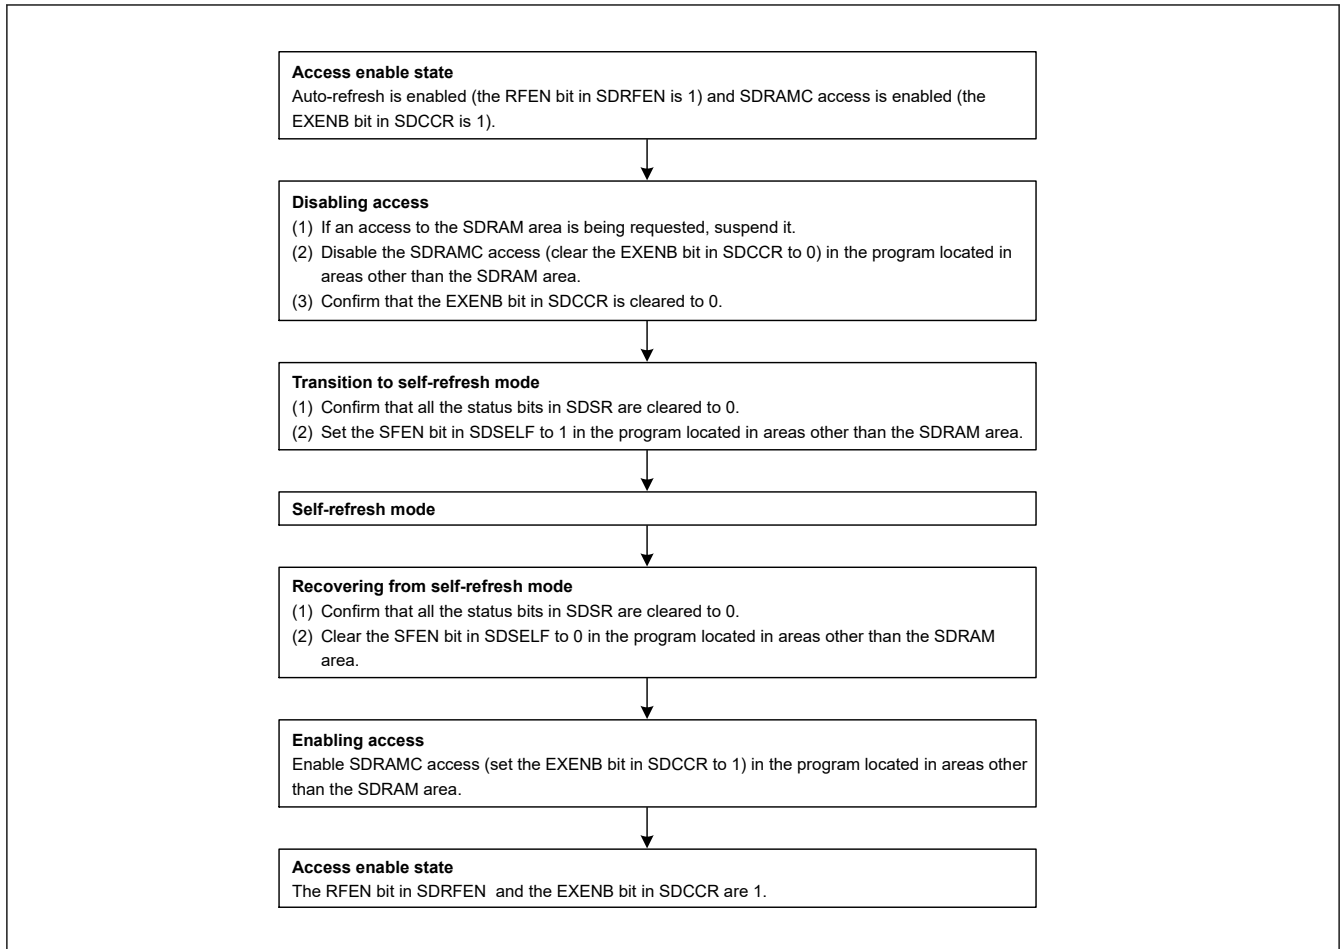

Figure 14.48 Procedure for transitioning to and recovering from self-refresh mode

Note: Self-refresh mode cannot be invoked during SDRAM access. SDRAM access must be disabled during both transition to and recovery from self-refresh mode. Follow the programming instructions shown in [Figure 14.49](#).

Before transitioning to self-refresh mode, disable access to the SDRAM area.

During transition to self-refresh mode, self-refresh operation, and recovery from self-refresh mode, do not allow any operand access or instruction fetch, including prefetch to the SDRAM area, to be generated.

[Figure 14.49](#) shows the procedure for transitioning to and recovering from self-refresh mode in Deep Software Standby mode.

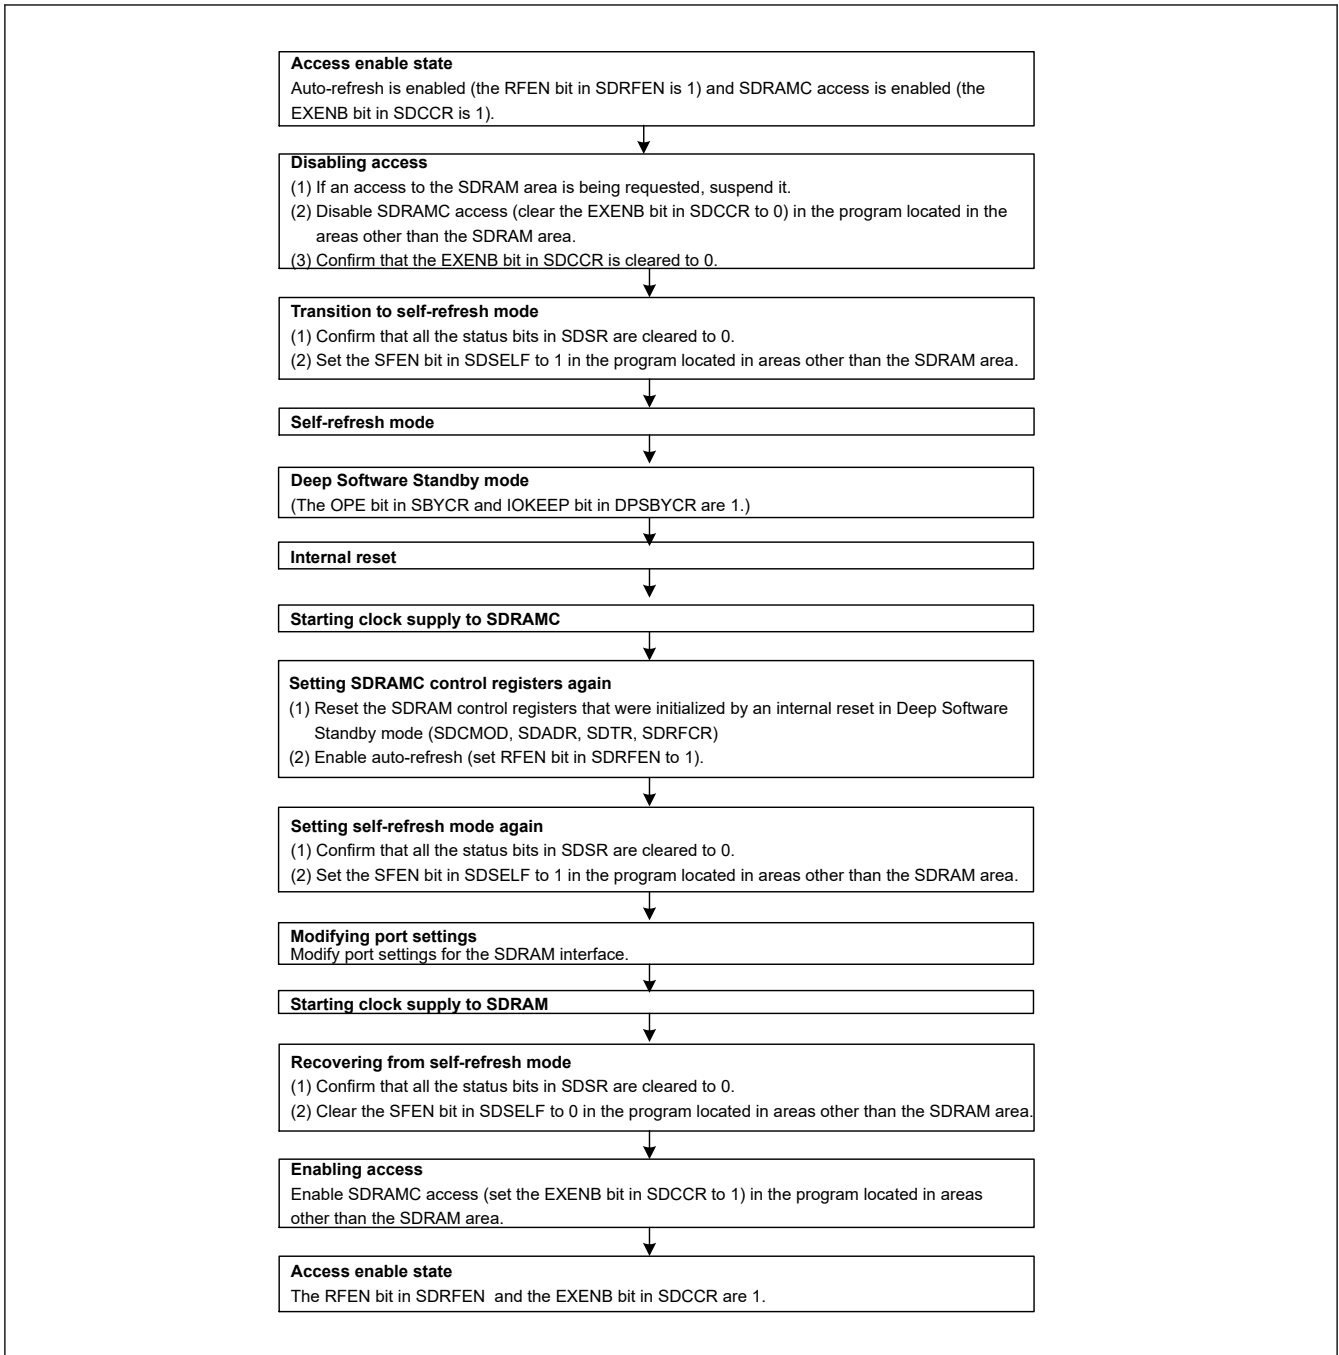

Figure 14.49 Procedure for transitioning to and recovering from self-refresh mode in Deep Software Standby mode

14.6.12.3 Timing register settings and access timing

This section describes the relationship between read and write timing and the settings in the SDRAM Timing Register (SDTR).

(1) Single read timing examples

Figure 14.50 to Figure 14.54 show the relationship between single read timing and the SDTR register settings. Table 14.31 shows the correspondence between the figures and the SDTR register settings.

During read access, the next bus access is enabled at the earliest 2 cycles after the read data becomes valid. However, if two or more accesses occur for one transfer request, the next bus access is enabled at the earliest 1 cycle after the read data becomes valid, as shown in Figure 14.54.

Table 14.31 Correspondence between timing figures and STDR register settings for single read timing

Figure number	RAI[2:0] settings	Number of cycles	RCD[1:0] settings	Number of cycles	RP[2:0] settings	Number of cycles	CL[2:0] settings	Number of cycles

Figure 14.52 Example timing for single read (3)

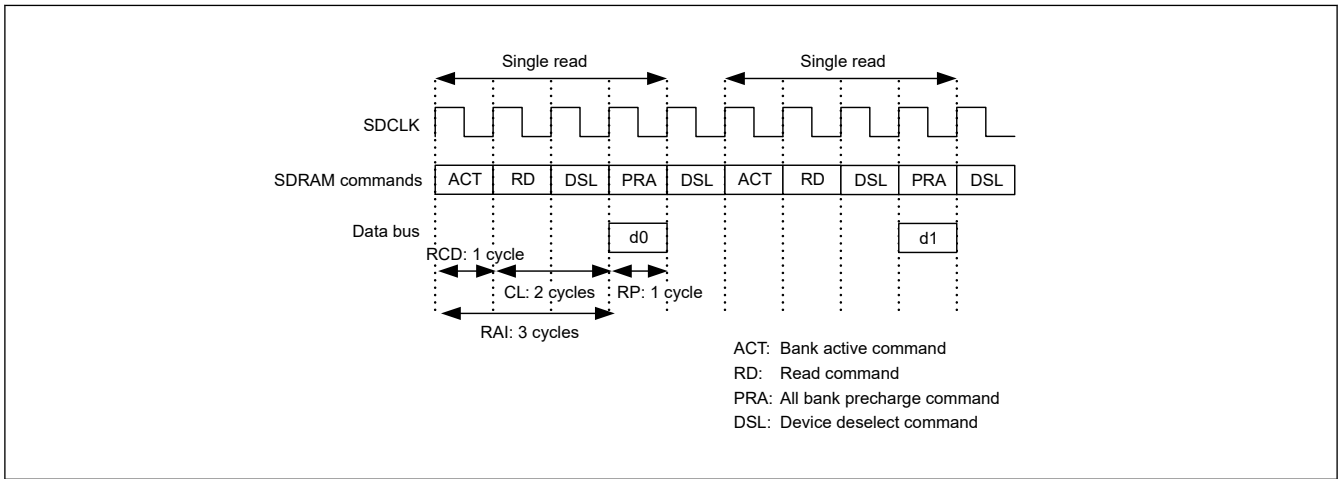

Figure 14.53 Example timing for single read (4)

Figure 14.54 Example timing for single read (5), when two bus accesses occur for one transfer request

(2) Single write timing examples

Figure 14.55 to Figure 14.59 show the relationship between the single write timing and the SDTR register settings. Table 14.32 shows the association between the figures and the SDTR register settings. During write access, the next bus access is enabled at the earliest 2 cycles after an all bank precharge command (PRA) is issued. However, if two or more accesses occur for one transfer request, the next bus access is enabled at the earliest 1 cycle after the PRA is issued, as shown in Figure 14.59.

Table 14.32 Association between timing figures and STDR register settings for single write timing

14.6.13 Address Multiplexing

In the SDRAM space, row and column addresses are multiplexed. The size of the shift in a row address must be specified in the Address Multiplex Select bits (SDADR.MXC[1:0]) in the SDRAM Address Register (SDADR). Additionally, in the SDRAM space, the address precharge-select command (Precharge-sel) is output to the upper bits of column addresses. Table 14.35 shows the relationship between the SDADR.MXC[1:0] settings and the shift amount.

Table 14.35 Address multiplexing

MXC [1:0]	Shift amount	Data bus width	Address	Address pins external to the MCU																
				A16	A15	A14	A13	A12	A11	A10	A09	A08	A07	A06	A05	A04	A03	A02	A01	A00

25	DQ07 to DQ00			↔	DQ[7:0]			

14.6.15 Constraints

(1) Constraints on using separate bus interface

In Software Standby and Deep Software Standby modes, auto-refresh operation is not available because the clock supply to the SDRAMC is stopped. To retain the data in the SDRAM when the SDRAM is externally connected, use the self-refresh function. For the procedure for transitioning to and recovering from self-refresh mode, see [section 14.6.7. Self-Refresh](#).

(2) Setting the SDRAM Timing Register

Set the RAI[2:0] bits in the SDRAM Timing Register (SDTR) to a value less than or equal to the sum of the row column latency (SDTR.RCD[1:0]) and column latency (SDTR.CL[2:0]) settings. Operation is not guaranteed if this condition is not satisfied.

(3) Instruction code constraint

It should be fixed the instruction code to little-endian order.

(4) Consecutive-Access Mode

For consecutive access mode, the setting CL = 1 is prohibited, and operation is not guaranteed if this setting is made.

14.7 Bus Error Monitoring Section

This monitoring system monitors each individual area, and whenever it detects an error, it returns the error to the requesting master using the AHB-Lite error response protocol.

14.7.1 Bus Error Types

The following types of errors can occur on each bus:

- Master Security Attribution Unit error
- Bus master MPU error.
- Illegal address access.
- Slave TrustZone Filter error
- Bus error transmitted from each slave module.

[Table 14.42](#) lists the address ranges where access leads to illegal address access errors. The reserved area in the slave does not trigger an illegal address access error. For more information on the bus master MPU, see [section 15, Memory Protection Unit \(MPU\)](#).

14.7.2 Operations When a Bus Error Occurs

In the following bufferable write access, the write response can be given from the midpoint in the following cases.

1. CPU M-AXI accesses ECBI, FLBI, ROMBI and STBYSBI.
2. CPU P-AHB accesses an accessible area.
3. CPU P-AHB accesses illegal address.
4. DMA accesses ECBI, EOBI, FLBI, PABI, PBBI, S0BI, S1BI and PSBI.

If an access violation occurs due to these bufferable write accesses, an error response may not be returned to the bus master.

When a bufferable write access error that does not return an error response is detected, access is blocked and 1 is set in the bit corresponding to the error occurrence location of MBWERRSTAT or SBWERRSTAT. Furthermore, NMI request or Reset request is generated according to the setting of the BUSOAD.BWERROAD. Since MBWERRSTAT or SBWERRSTAT are held until reset other than Bus and Memory Error Reset or cleared by MBWERRCLR or SBWERRCLR, they can be confirmed in the BusFault Handler or Interrupt handler. Error address information and Error R/W information is not remain with a bufferable write access. If error information is required, please set the BUS Master to Non-bufferable access.

A bufferable write access error can occur in the following cases. In this case, BUSnERRSTAT is not set and NMI request or Reset request is not generated according to the setting of the BUSOAD.ILERROAD or BUSOAD.SLERROAD.

1. CPU M-AXI accesses ECBI, FLBI, ROMBI and STBYSBI and a slave error or slave TrustZone Filter error occurs.
2. CPU P-AHB accesses an accessible area and a slave error or slave TrustZone Filter error occurs.
3. CPU P-AHB accesses illegal address and a illegal address access error occurs.
4. DMA accesses ECBI, EOBI, FLBI, PABI, PBBI, S0BI, S1BI and PSBI and a slave error or slave TrustZone Filter error occurs.

Table 14.39 Bus error notice method for Bufferable write access

	DAP	CPU	DMAC/DTC	DRW0/1	GLCDC0/1
BUSOAD.BWERROAD = 0	BUSERR.NMI	BUSERR.NMI	BUSERR.NMI	BUSERR.NMI	BUSERR.NMI
BUSOAD.BWERROAD = 1	Reset	Reset	Reset	Reset	Reset

When a bus error occurs for an access other than the bufferable write, error access is blocked, and error operations determine by OAD setting and the bus master are performed. Table 14.40 shows OAD setting corresponding to the each error. Table 14.41 shows how to notify when a bus error occurs.

When OAD setting is NMI.

If CPU is the bus master, it only returns an error response to bus master. CPU generates BusFault when it receives error response. If master other than CPU is the bus master, error response is returned to the master and NMI is generated.

When OAD setting is Reset.

Error response is returned to the bus master and reset request is generated.

Table 14.40 OAD setting corresponding to the each error

Error type	OAD bit
MSAU Error	MSAOAD.OAD
MPU Error	MMPUOAD.OAD
Illegal access Error	BUSOAD.ILERRROAD
Slave Bus Error	BUSOAD.SLERROAD
Slave TrustZone Filter error	BUSOAD.SLERROAD

Table 14.41 Bus error notice method for Non-bufferable write access

OAD setting	DAP*2	CPU*1	DMAC/DTC	DRW0/1	GLCDC0/1
NMI	Error response only	CPU.BusFault	DMA0_TRANSERR*1 BUSERR.NMI	DRW_IRQ*1 BUSERR.NMI	BUSERR.NMI
Reset	Error response only	Reset	Reset	Reset	Reset

Note 1. DMAC/DTC and DRW can issue interrupt when it receives error response. This NMI is output to ICU and transmitted from ICU to CPU.

Note 2. Only when the bus master is DAP, only an error response is returned regardless of the BUSOAD.ILERRROAD or the BUSOAD.SLERROAD settings, and NMI and RESET requests are not generated.

Figure 14.66 shows the OAD setting flow after reset. During this register setting, stop the Bus Master.

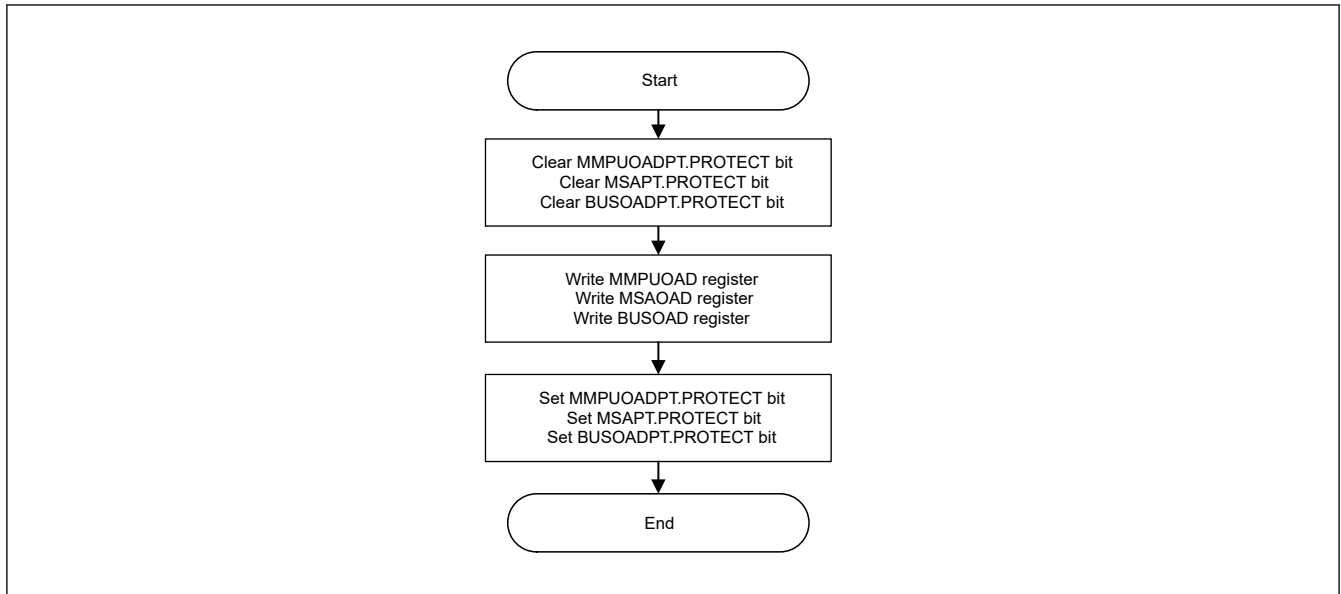

Figure 14.66 OAD setting flow after reset

See for details of [section 15.3.1.23. MMPUOADPT : MMPU Operation After Detection Protect Register](#) and [section 15.3.1.22. MMPUOAD : MMPU Operation After Detection Register](#).

See for details of [section 38.8.15. MSAPT : Master Security Attribution Protect Register](#) and [section 38.8.14. MSAOAD : Master Security Attribution Operation After Detection Register](#).

(1) Master Security Attribution Unit Error

The bus master of other than CPU and DAP has MSAU to block access to Secure alias address from Non-secure masters. The CPU does not have MSAU since it has IDAU and SAU. When MSAU Error is detected, an Error response is returned to the Master. At the same time, store the address when MSAU Error occurs in BMSAnERRADD (n = 4, 6 to 9), store the RW information when MSAU Error occurs in BMSAnERRRW (n = 4, 6 to 9), set 1 to MSERRSTAT bit of BUSnERRSTAT (n = 1 to 4, 6 to 9). Furthermore, NMI request or Reset request is generated according to the setting of the MSAOAD.OAD. Since BMSAnERRADD (n = 4, 6 to 9), BMSAnERRRW (n = 4, 6 to 9), BUSnERRSTAT (n = 1 to 4, 6 to 9) are held until reset other than Bus error reset and Common memory error reset, or cleared by BUSnERRCLR (n = 1 to 4, 6 to 9), they can be confirmed in the NMI handler or after reset. NMI request is generated only at the first MSAU Error after reset or clearing BUSnERRSTAT (n = 1 to 4, 6 to 9). MSERRSTAT bit by BUSnERRCLR (n = 1 to 4, 6 to 9).

(2) Bus Master MPU Error

The bus master of other than CPU and DAP has Master-MPU for access control of the set address area. The CPU does not have Master-MPU since it has Arm MPU. When Master-MPU Error is detected, an Error response is returned to the Master. At the same time, store the address when Master-MPU Error occurs in BUSnERRADD (n = 4, 6 to 9), store the RW information when Master-MPU Error occurs in BUSnERRRW (n = 4, 6 to 9), set 1 to MMERRSTAT bit of BUSnERRSTAT (n = 1 to 4, 6 to 9). Furthermore, NMI request or Reset request is generated according to the setting of the MMPUOAD.OAD. Since BUSnERRADD (n = 4, 6 to 9), BUSnERRRW (n = 4, 6 to 9), BUSnERRSTAT (n = 1 to 4, 6 to 9) are held until reset other than Bus error reset and Common memory error reset, or cleared by BUSnERRCLR (n = 1 to 4, 6 to 9), they can be confirmed in the NMI handler or after reset. NMI request is generated only at the first Master-MPU Error after reset or clearing BUSnERRSTAT (n = 1 to 4, 6 to 9). MMERRSTAT bit by BUSnERRCLR (n = 1 to 4, 6 to 9).

(3) Illegal Access Error

According to [section 14.7.3. Conditions Leading to Illegal Address Access Errors](#), Illegal Access Error occurs. When Illegal Access Error is detected, an Error response is returned to the Master. When a master other than DAP caused Illegal address access error, store the Illegal Access Error occurrence address in BUSnERRADD (n = 4, 6 to 9), store the Illegal Access Error occurrence RW information in BUSnERRRW (n = 4, 6 to 9), set 1 to ILERRSTAT bit of BUSnERRSTAT (n = 1 to 4, 6 to 9). Furthermore, NMI request or Reset request is generated according to the setting of the BUSOAD.ILERROAD. Since BUSnERRADD (n = 4, 6 to 9), BUSnERRRW (n = 4, 6 to 9), BUSnERRSTAT (n = 1 to 4, 6 to 9) are held until reset other than Bus error reset and Common memory error reset, or cleared by BUSnERRCLR (n = 1 to 4, 6 to 9), they can be

confirmed in the BusFault Handler or the NMI handler. NMI request is generated only at the first Illegal Error after reset or clearing BUSnERRSTAT (n = 1 to 4, 6 to 9). ILERRSTAT bit by BUSnERRCLR (n = 1 to 4, 6 to 9).

(4) Slave TrustZone Filter Error

When Slave TrustZone Filter Error is detected, an Error response is returned to the Master. When a master other than DAP caused Slave TrustZone Filter error, store the Slave TrustZone Filter error occurrence address in BMSAnERRADD (n = 4, 6 to 9), store the Slave TrustZone Filter error occurrence RW information in BMSAnERRRW (n = 4, 6 to 9), set 1 to SLERRSTAT bit of BUSnERRSTAT (n = 1 to 4, 6 to 9). Furthermore, NMI request or Reset request is generated according to the setting of the BUSOAD.SLERROAD. Since BMSAnERRADD (n = 4, 6 to 9), BMSAnERRRW (n = 4, 6 to 9) and BUSnERRSTAT (n = 1 to 4, 6 to 9) are held until reset other than Bus error reset and Common memory error reset, or cleared by BUSnERRCLR (n = 1 to 4, 6 to 9), they can be confirmed in the NMI handler or after reset. NMI request is generated only at the first Slave TrustZone Filter Error after reset or clearing BUSnERRSTAT (n = 1 to 4, 6 to 9). SLERRSTAT bit by BUSnERRCLR (n = 1 to 4, 6 to 9).

(5) Slave Bus Error

Slave Bus Error occurs in the slave. When Slave Bus Error is detected, an Error response is returned to the Master. When a master other than DAP caused Slave Bus error, store the Slave Bus error occurrence address in BUSnERRADD (n = 4, 6 to 9), store the Slave Bus error Occurrence RW information in BUSnERRRW (n = 4, 6 to 9), set 1 to SLERRSTAT bit of BUSnERRSTAT (n = 1 to 4, 6 to 9). Furthermore, NMI request or Reset request is generated according to the setting of the BUSOAD.SLERROAD. Since BUSnERRADD (n = 4, 6 to 9), BUSnERRRW (n = 4, 6 to 9), BUSnERRSTAT (n = 1 to 4, 6 to 9) are held until reset other than Bus error reset and Common memory error reset, or cleared by BUSnERRCLR (n = 1 to 4, 6 to 9), they can be confirmed in the BusFault Handler or NMI handler. NMI request is generated only at the first Slave-Bus Error after reset or clearing BUSnERRSTAT (n = 1 to 4, 6 to 9). SLERRSTAT bit by BUSnERRCLR (n = 1 to 4, 6 to 9).

14.7.3 Conditions Leading to Illegal Address Access Errors

Illegal address access error by bus access occurs in the address space shown in [Table 14.42](#).

Table 14.42 Conditions leading to illegal address access errors (1 of 3)

Address		SLAVE bus	MASTER bus			
Start	End		CPU MAXI	CPU PAHB	DMAC/DTC	GLCDC0/GLCDC1/DRW0/DRW1

0x6000_0000	0x6FFF_FFFF	ECBI	—	N/A	—	—
0x7000_0000	0x7FFF_FFFF	Reserved	E	N/A	E	E
0x8000_0000	0x9FFF_FFFF	EOBI	—	N/A	—	—
0xA000_0000	0xFFFF_FFFF	Reserved	E	N/A	E	E

Note: "E" : A bus error is occurred.

"N/A" : Transfer does not occur.

"—" : A bus error has not occurred. Even if there is reserved area, a bus error has not occurred.

Do not access the reserved area in FLB, S0B and S1B. If accessed, a slave TZF error may occur.

Note 1. If CPU issues bufferable write accesses, a bufferable write access error occur instead of an illegal address access error.

14.7.4 Timeout

As for some peripheral module, a timeout error can occur in the module-stop function.

When there is no response from the slave for a certain time period, a timeout error is detected.

Timeout error is returned to the request master by Error response of the AHB-Lite protocol.

15. Memory Protection Unit (MPU)

15.1 Overview

All bus masters have Memory Protection Units (MPUs).

[Table 15.1](#) lists the MPU specifications, and [Table 15.2](#) shows the behavior on detection of each MPU error.

Table 15.1 MPU specifications

Classification	Module/Function	Specifications
Memory protection	Arm MPU	Memory protection function for the CPU: <ul style="list-style-type: none"> • CPU: Secure MPU 8 regions and Non-secure MPU 8 regions
	Bus master MPU	Memory protection function for each bus master except for the CPU: <ul style="list-style-type: none"> • DMAC (DMAC/DTC): 8 regions • GLCDC (GLCDC0/GLCDC1): 2 regions • DRW (DRW0/DRW1): 3 regions

Table 15.2 Behavior on MPU Error detection

MPU type	Access permissions setting	Boundary address setting minimum unit	Error response for the MPU error notification	Bus access at error detection	Hold the information of error access
Arm MPU	Read access Write access Execution	32 bytes	Supported*1	<ul style="list-style-type: none"> • Incorrectly write access • Incorrectly read access 	Hold in CPU
Bus master MPU	Read access Write access Privileged access (DMAC/DTC only)	DMAC: 32 bytes GLCDC: 1 KB DRW: 1 KB	Supported	<ul style="list-style-type: none"> • Write access ignored • Read access is read as 0 	Hold

Note 1. A privileged DAP request through the unprivileged debug extension mechanism is demoted to an unprivileged access and is subject to MPU checks. Both privileged and unprivileged requests are subject to MPU checks.

For information on error access for the Arm MPU, see [section 15.4. References](#). For information on error access for other MPUs, see [section 15.3.1. Register Descriptions](#) and [section 14.7. Bus Error Monitoring Section](#).

15.2 Arm MPU

The Arm MPU provides full support for:

- CPU: 8 secure regions and 8 non-secure regions
- Access permissions
- Export of memory attributes to the system

Arm MPU mismatches and permission violations invoke the programmable-priority MemManage fault (Hard Fault) handler. For details, see [section 15.4. References](#).

15.3 Bus master MPU

The bus master MPU monitors the addresses accessed by the bus masters in the entire address space (0x0000_0000 to 0xFFFF_FFFF). The access control information can be set up to:

- 8 regions in DMAC/DTC
- 2 regions in GLCDC
- 3 regions in DRW

The bus master MPU monitors access to each region based on these settings.

If accesses violate the access permissions that are configured in bus master MPU, the bus master MPU returns an error response. For information on error access, see [section 15.3.1. Register Descriptions](#) and [section 14.7.2. Operations When a Bus Error Occurs](#).

[Table 15.3](#) lists the specifications of the bus master MPU.

Table 15.3 Bus master MPU specifications

Parameter	Description
Master groups	(Group name: Corresponding bus master) <ul style="list-style-type: none"> • DMAC: DMAC/DTC • GLCDC: GLCDC0/GLCDC1 • DRW: DRW0/DRW1
Protected regions	0x0000_0000 to 0xFFFF_FFFF
Number of regions	<ul style="list-style-type: none"> • DMAC: 8 regions • GLCDC: 2 regions • DRW: 3 regions
Address specification for individual regions	<ul style="list-style-type: none"> • Region start and end addresses configurable
Enable or disable setting for memory protection in individual regions	<ul style="list-style-type: none"> • Settings enabled or disabled for the associated region
Access-control settings for individual regions	<ul style="list-style-type: none"> • Permission to read and write • Permission to unprivileged access
Operation on error detection	<ul style="list-style-type: none"> • Reset or error response
Register protection	<ul style="list-style-type: none"> • Register can be protected from illegal writes

15.3.1 Register Descriptions

Register writes processing should be performed after stopping the corresponding master group bus access.

SA (Secure Attribution) is set in each register and the SA is used to determine whether the target register is a secure register or a non-secure register.

15.3.1.1 MMPUSARA : Master Memory Protection Unit Security Attribution Register A

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x130

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit field:	—	—	—	—	—	—	—	—	MMPUASAn[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	MMPUASAn[7:0]	MMPUA Security Attribution n (n = 0 to 7) 0: Secure 1: Non-secure	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1
P-TYPE-1

MMPUASAn[7:0] bits (MMPUA Security Attribution n (n = 0 to 7))

Security attributes of bus master MPU Region Setting register. The target registers are as follows:

- MMPUSDMAcN (n = 0 to 7)
- MMPUEDMAcN (n = 0 to 7)
- MMPUACDMAcN (n = 0 to 7)

15.3.1.6 MMPUEDMACn : MPU End Address Register for DMAC (n = 0 to 7)

Base address: RMPU = 0x4000_0000
 RMPU_NS = 0x5000_0000

Offset address: 0x0208 + 0x010 × n

Bit position: 31 0

Bit field:

Value after reset: x 1 1 1 1

Bit	Symbol	Function	R/W
31:0	n/a	Region end address register Address where the region end, for use in region determination. The ending address of the MPU area must be set in the range of 0x0000_001F to 0xFFFF_FFFF. Writing is ignored for bit 0 to bit 4. These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-3
 P-TYPE-2

The MMPUEDMACn (n = 0 to 7) register specifies the end address where the region ends.

This register requires word access. Byte access and halfword access is prohibited. When byte access and halfword access is executed, operation is not guaranteed.

15.3.1.7 MMPUEGLCDCn : MPU End Address Register for GLCDC (n = 0 to 1)

Base address: RMPU = 0x4000_0000
 RMPU_NS = 0x5000_0000

Offset address: 0x0808 + 0x010 × n

Bit position: 31 0

Bit field:

Value after reset: x 1 1 1 1 1 1 1 1 1 1

Bit	Symbol	Function	R/W
31:0	n/a	Region end address register for GLCDC Address where the region ends, for use in region determination. The ending address of the MPU area must be set in the range of 0x0000_03FF to 0xFFFF_FFFF. Writing is ignored for bit 0 to bit 9. These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-3
 P-TYPE-2

The MMPUEGLCDCn (n = 0 to 1) register specifies the end address where the region ends.

This register requires word access. Byte access and halfword access is prohibited. When byte access and halfword access is executed, operation is not guaranteed.

15.3.1.8 MMPUEDRWn : MPU End Address Register for DRW (n = 0 to 2)

Base address: RMPU = 0x4000_0000
 RMPU_NS = 0x5000_0000

Offset address: 0x0A08 + 0x010 × n

Bit position: 31 0

Bit field:

Value after reset: x 1 1 1 1 1 1 1 1 1 1

Bit	Symbol	Function	R/W
31:0	n/a	Region end address register for DRW Address where the region ends, for use in region determination. The ending address of the MPU area must be set in the range of 0x0000_03FF to 0xFFFF_FFFF. Writing is ignored for bit 0 to bit 9. These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-3
P-TYPE-2

The MMPUEDRW_n (n = 0 to 2) register specifies the end address where the region ends.

This register requires word access. Byte access and halfword access is prohibited. When byte access and halfword access is executed, operation is not guaranteed.

15.3.1.9 MMPUACDMAC_n : MPU Access Control Register for DMAC (n = 0 to 7)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0200+ 0x010 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	PP	WP	RP	ENAB LE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENABLE	Region Enable 0: DMAC region n unit is disabled. 1: DMAC region n unit is enabled.	R/W
1	RP	Read protection 0: Read permission 1: Read protection	R/W
2	WP	Write protection 0: Write permission 1: Write protection	R/W
3	PP	Privilege protection 0: Unprivileged access permission 1: Unprivileged access protection	R/W
15:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

ENABLE bit (Region Enable)

The ENABLE bit enables or disables the DMAC region n (n = 0 to 7) unit.

When the ENABLE bit is set to 1, the RP bit, the WP bit and the PP bit are enabled for permit or protect access to the region that is set in MMPUSDMAC_n (n = 0 to 7) and MMPUEDMAC_n (n = 0 to 7).

When the ENABLE bit is set to 0, the access to DMAC region n (n = 0 to 7) is not specified.

RP bit (Read protection)

The RP bit enables or disables read protection for DMAC region n (n = 0 to 7).

When the ENABLE bit is set to 1, the RP bit is available.

WP bit (Write protection)

The WP bit enables or disables write protection for DMAC region n (n = 0 to 7).

When the ENABLE bit is set to 1, the WP bit is available.

PP bit (Privilege protection)

The PP bit enables or disables unprivileged access protection for DMAC region n (n = 0 to 7).

When the ENABLE bit is set to 1, the PP bit is available.

15.3.1.10 MMPUACGLCDCn : MPU Access Control Register for GLCDC (n = 0, 1)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0800 + 0x010 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	WP	RP	ENAB LE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENABLE	Region Enable 0: GLCDC region n unit is disabled. 1: GLCDC region n unit is enabled.	R/W
1	RP	Read protection 0: Read permission 1: Read protection	R/W
2	WP	Write protection 0: Write permission 1: Write protection	R/W
15:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

ENABLE bit (Region Enable)

The ENABLE bit enables or disables the GLCDC region n (n = 0, 1) unit.

When the ENABLE bit is set to 1, the RP bit and the WP bit are enabled for permit or protect access to the region that is set in MMPUSGLCDCn (n = 0, 1) and MMPUEGLCDCn (n = 0, 1).

When the ENABLE bit is set to 0, the access to GLCDC region n (n = 0, 1) is not specified.

RP bit (Read protection)

The RP bit enables or disables read protection for GLCDC region n (n = 0, 1).

When the ENABLE bit is set to 1, the RP bit is available.

WP bit (Write protection)

The WP bit enables or disables write protection for GLCDC region n (n = 0, 1).

When the ENABLE bit is set to 1, the WP bit is available.

15.3.1.11 MMPUACDRWn : MPU Access Control Register for DRW (n = 0 to 2)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0A00 + 0x010 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	WP	RP	ENAB LE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENABLE	Region Enable 0: DRW region n unit is disabled. 1: DRW region n unit is enabled.	R/W
1	RP	Read protection 0: Read permission 1: Read protection	R/W
2	WP	Write protection 0: Write permission 1: Write protection	R/W
15:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

ENABLE bit (Region Enable)

The ENABLE bit enables or disables the DRW region n (n = 0 to 2) unit.

When the ENABLE bit is set to 1, the RP bit and the WP bit are enabled for permit or protect access to the region that is set in MMPUSDRWn (n = 0 to 2) and MMPUEDRWn (n = 0 to 2).

When the ENABLE bit is set to 0, the access to DRW region n (n = 0 to 2) is not specified.

RP bit (Read protection)

The RP bit enables or disables read protection for DRW region n (n = 0 to 2).

When the ENABLE bit is set to 1, the RP bit is available.

WP bit (Write protection)

The WP bit enables or disables write protection for DRW region n (n = 0 to 2).

When the ENABLE bit is set to 1, the WP bit is available.

15.3.1.12 MMPUENDMAC : MPU Enable Register for DMAC

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0100

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:	KEY[7:0]											—	—	—	—	—	—	—	ENAB LE
------------	----------	--	--	--	--	--	--	--	--	--	--	---	---	---	---	---	---	---	------------

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	ENABLE	Bus master MPU of DMAC Enable 0: Bus master MPU of DMAC is disabled. 1: Bus master MPU of DMAC is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing of the ENABLE bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access. Byte-write access is prohibited.

When byte-write access is executed, operation is not guaranteed.

ENABLE bit (Bus master MPU of DMAC Enable)

The ENABLE bit enables or disables the bus master MPU function for DMAC.

When the ENABLE bits is set to 1, MMPUACDMAC_n (n = 0 to 7) is available.

When the ENABLE bits is set to 0, MMPUACDMAC_n (n = 0 to 7) is unavailable, including permission for all regions.

The bus master MPU function of each master group sets the ENABLE bit.

When the ENABLE bit is set, write 0xA5 in KEY[7:0] at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing of the ENABLE.

When writing the ENABLE bit, write 0xA5 in KEY[7:0] at the same time.

When a value other than 0xA5 is written in KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.13 MMPUENGLCDC : MPU Enable Register for GLCDC

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0700

Bit	Symbol	Function	R/W
0	ENABLE	Bus master MPU of GLCDC Enable 0: Bus master MPU of GLCDC is disabled. 1: Bus master MPU of GLCDC is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the ENABLE bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.

Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

ENABLE bit (Bus master MPU of GLCDC Enable)

The ENABLE bit enables or disables the bus master MPU function of each master group.

When the ENABLE bit is set to 1, MMPUACGLCDC_n (n = 0, 1) is available.

When the ENABLE bit is set to 0, MMPUACGLCDC_n (n = 0, 1) is unavailable, and permission for all regions.

The bus master MPU function of each master group sets the ENABLE bit.

When the ENABLE bit is set, write 0xA5 to the KEY[7:0] bits at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing to the ENABLE bit.

When writing the ENABLE bit, write 0xA5 to the KEY[7:0] bits at the same time.

When a value other than 0xA5 is written to the KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.14 MMPUENDRW : MPU Enable Register for DRW

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0900

Bit position: 15 8 0

Bit field:

KEY[7:0]	—	—	—	—	—	—	—	—	ENAB LE
----------	---	---	---	---	---	---	---	---	------------

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	ENABLE	Bus master MPU of DRW Enable 0: Bus master MPU of DRW is disabled. 1: Bus master MPU of DRW is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the ENABLE bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.

Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

ENABLE bit (Bus master MPU of DRW Enable)

The ENABLE bit enables or disables the bus master MPU function of each master group.

When the ENABLE bit is set to 1, MMPUACDRW_n (n = 0 to 2) is available.

When the ENABLE bit is set to 0, MMPUACDRW_n (n = 0 to 2) is unavailable, and permission for all regions.

The bus master MPU function of each master group sets the ENABLE bit.

When the ENABLE bit is set, write 0xA5 to the KEY[7:0] bits at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing to the ENABLE bit.

When writing the ENABLE bit, write 0xA5 to the KEY[7:0] bits at the same time.

When a value other than 0xA5 is written to the KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.15 MMPUENPTDMAC : MPU Enable Protect Register for DMAC

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0104

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:

KEY[7:0]	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PROT ECT
----------	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	-------------

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: MMPUENDMAC register write is possible. 1: MMPUENDMAC register write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing of the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.

Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit controls protection of MMPUENDMAC register.

When the PROTECT bit is set, write 0xA5 in KEY[7:0] at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing of the PROTECT.

When writing the PROTECT bit, write 0xA5 in KEY[7:0] at the same time.

When a value other than 0xA5 is written in KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.16 MMPUENPTGLCDC : MMPU Enable Protect Register for GLCDC

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0704

Bit position: 15 8 0

Bit field:	KEY[7:0]														—	—	—	—	—	—	—	—	PROTECT
------------	----------	--	--	--	--	--	--	--	--	--	--	--	--	--	---	---	---	---	---	---	---	---	---------

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: MMPUENGLCDC register write is possible. 1: MMPUENGLCDC register write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.

Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit controls protection of MMPUENGLCDC register.

When the PROTECT bit is set, write 0xA5 to the KEY[7:0] bits at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing to the PROTECT bit.

When writing the PROTECT bit, write 0xA5 to the KEY[7:0] bits at the same time.

When a value other than 0xA5 is written to the KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.17 MMPUENPDRW : MMPU Enable Protect Register for DRW

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0904

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: MMPUENDRW register write is possible. 1: MMPUENDRW register write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.

Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit controls protection of MMPUENDRW register.

When the PROTECT bit is set, write 0xA5 to the KEY[7:0] bits at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing to the PROTECT bit.

When writing the PROTECT bit, write 0xA5 to the KEY[7:0] bits at the same time.

When a value other than 0xA5 is written to the KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.18 MMPURPTDMAC : MMPU Regions Protect Register for DMAC Non-secure

Base address: RMPU_NS = 0x5000_0000

Offset address: 0x0108

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: Bus master MPU register for DMAC write is possible. 1: Bus master MPU register for DMAC write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing of the PROTECT bit.	W

Note: S-TYPE-7
P-TYPE-2

Note: It is necessary to write by halfword access.

Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the associated registers to be protected.

MMPURPTDMAC.PROTECT controls the following registers:

- MMPUSDMAC_n (n = 0 to 7) of non-secure
- MMPUEDMAC_n (n = 0 to 7) of non-secure
- MMPUACDMAC_n (n = 0 to 7) of non-secure

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits, using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. When a value other than 0xA5 is written in KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.19 MMPURPTDMAC_SEC : MPU Regions Protect register for DMAC Secure

Base address: RMPU = 0x4000_0000

Offset address: 0x010C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Bit field:	KEY[7:0]										—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: Bus master MPU register for DMAC Secure write is possible. 1: Bus master MPU register for DMAC Secure write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing of the PROTECT bit.	W

Note: S-TYPE-6
P-TYPE-2

Note: It is necessary to write by halfword access.

Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the associated registers to be protected.

MMPURPTDMAC_SEC.PROTECT controls the following registers:

- MMPUSDMAC_n (n = 0 to 7) of Secure
- MMPUEDMAC_n (n = 0 to 7) of Secure
- MMPUACDMAC_n (n = 0 to 7) of Secure

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits, using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. When a value other than 0xA5 is written in KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.20 MMPURPTGLCDC : MPU Regions Protect Register for GLCDC

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0708

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: Bus master MPU register for GLCDC write is possible. 1: Bus master MPU register for GLCDC write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.

Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writing to the associated registers to be protected.

MMPURPTGLCDC.PROTECT controls the following registers:

- MMPUSGLCDC_n (n = 0, 1)
- MMPUEGLCDC_n (n = 0, 1)
- MMPUACGLCDC_n (n = 0, 1)

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. When a value other than 0xA5 is written to the KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.21 MMPURPTDRW : MPU Regions Protect Register for DRW

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0908

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: Bus master MPU register for DRW write is possible. 1: Bus master MPU register for DRW write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.

Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writing to the associated registers to be protected.

MMPURPDRW.PROTECT controls the following registers:

- MMPUSDRW_n (n = 0 to 2)
- MMPUEDRW_n (n = 0 to 2)
- MMPUACDRW_n (n = 0 to 2)

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. When a value other than 0xA5 is written to the KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.22 MMPUOAD : MMPU Operation After Detection Register

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0000

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	OAD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OAD	Operation after detection 0: NMI 1: Reset	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing of the OAD bit.	R/W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.

Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

OAD bit (Operation after detection)

The OAD bit specify operation when the access violation is detected.

When OAD bit is 0, error response is returned and NMI is generated.

When OAD bit is 1, reset request is generated.

When writing to the OAD bit, write 0xA5 simultaneously to the KEY[7:0] bits using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the OAD bit. When writing to the OAD bit, write 0xA5 simultaneously to the KEY[7:0] bits. When other values are written, the OAD bit is not updated.

The KEY[7:0] bits always read as 0x00.

15.3.1.23 MMPUOADPT : MPU Operation After Detection Protect Register

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0004

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: MMPUOAD register writing is possible. 1: MMPUOAD register writing is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code These bits enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.

Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writing to the associated registers to be protected.

MMPUOAD.PROTECT controls the following registers:

- MMPUOAD

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. When other values are written to the KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.2 Operation**15.3.2.1 Memory protection**

The bus master MPU monitors memory access using control settings made individually for the access control regions. If accesses violate the access permissions that are configured in bus master MPU, the bus master MPU generates a memory protection error.

Bus master MPU has master groups of DMAC, GLCDC and DRW. The memory protection function checks the address of the bus for a unified master group, and blocks illegal access of the master group to the protected region by bus master MPU.

The region setting registers of the bus master MPU for DMAC can be set for secure master and non-secure master using the MMPUSARA register. The MPU region setting with MMPUSARA.MMPUASAn = 0 applies only to access from the secure master, and the MPU region setting with MMPUSARA.MMPUASAn = 1 applies only to access from the non-secure master. [Figure 15.1](#) shows an example of access authorization for the secure master and non-secure master when both secure and non-secure MPU settings are configured.

	Memory attributes for Secure DMAC		Memory attributes for Non-secure DMAC	Secure DMAC access authorization	Non-secure DMAC access authorization
Non-secure alias region	Protect region		Protect region	All access blocked	All access blocked
	Region 1 (MMPUASA1 = Secure) Read/Write permit Unprivileged permit		Region 2 (MMPUASA2 = Non-secure) Read only (Write protect) Unprivileged protect	All access permitted (No effect from Region 2)	Unprivileged Read access blocked Unprivileged Write access blocked Privileged Read access permitted Privileged Write access blocked (No effect from Region 1)
				All access blocked	All access blocked
Secure alias region	Protect region		Protect region	All access blocked	All access protected (Security violation)
	Region0 (MMPUASA0 = Secure) Read/Write permit Unprivileged protect			Unprivileged R/W access blocked Privileged R/W access permitted	All access blocked (Security violation) (No effect from Region 0)

Figure 15.1 Example of access authority when both secure and non-secure region of MPUs are set

Bus master MPU permit of all regions after reset. If MMPUENXXXX.ENABLE is 1 and there is no MPU region setting for the corresponding bus master, all regions are protected. (XXXX = Master Group name)

Figure 15.2 shows the access permission or protection by the overlapping bus master MPU regions.

Access control for the overlapping regions is as follows:

- The region is handled as a protected region when output of one or more region units is a protected region
- The region is handled as a protected region when output of all region units is outside of the regions
- Other cases are handled as permitted regions.

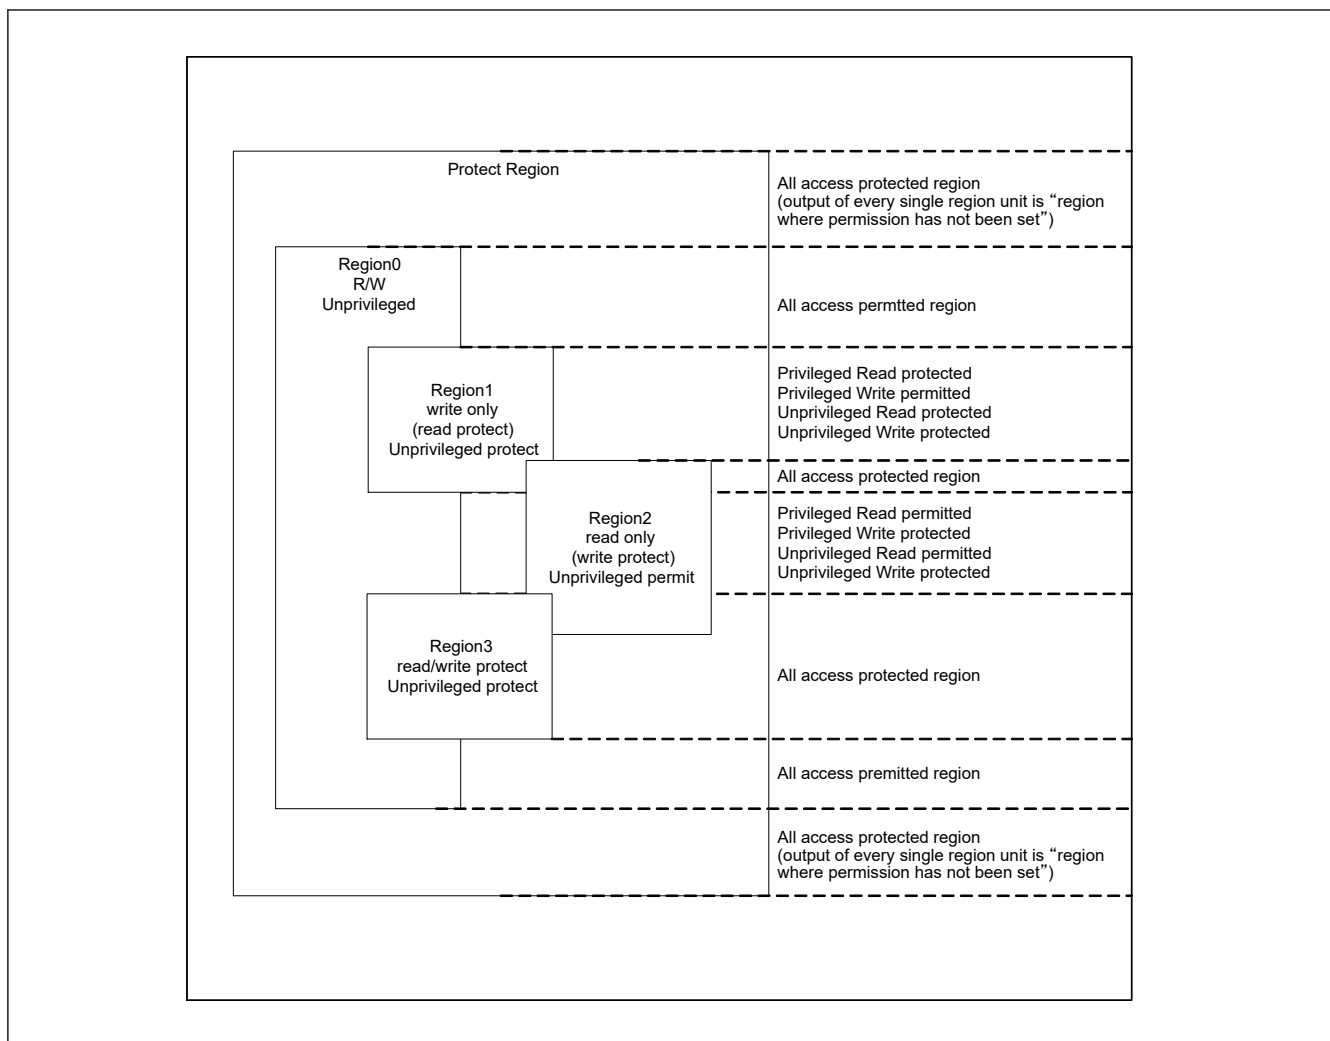

Figure 15.2 Access permission or protection by overlap of the bus master MPU regions

Figure 15.3 shows the register setting flow after reset. During this register setting, stop the bus master except the CPU.

Figure 15.3 Register setting flow after reset

Figure 15.4 shows the register setting flow for adding regions. During this register setting, stop the master except the CPU.

Figure 15.4 Register setting flow for region addition

15.3.2.2 Protecting the registers

Registers related to the bus master MPU can be protected with the PROTECT bit as shown in Table 15.4.

Table 15.4 PROTECT bit and protect target registers (1 of 2)

PROTECT bit	Protect target registers
MMPUENPTDMAC.PROTECT	MMPUENDMAC

Table 15.4 PROTECT bit and protect target registers (2 of 2)

PROTECT bit	Protect target registers
MMPUENPTGLCDC.PROTECT	MMPUENGLCDC
MMPUENPDRW.PROTECT	MMPUENDRW
MMPURPTDMAC.PROTECT	The following registers set to Non-secure by MMPUSARA.MMPUASAn (n = 0 to 7). MMPUSDMACn (n = 0 to 7) MMPUEDMACn (n = 0 to 7) MMPUACDMACn (n = 0 to 7)
MMPURPTDMAC_SEC.PROTECT	The following registers set to Secure by MMPUSARA.MMPUASAn (n = 0 to 7). MMPUSDMACn (n = 0 to 7) MMPUEDMACn (n = 0 to 7) MMPUACDMACn (n = 0 to 7)
MMPURPTGLCDC.PROTECT	MMPUSGLCDCn (n = 0 to 1) MMPUEGLCDCn (n = 0 to 1) MMPUACGLCDCn (n = 0 to 1)
MMPURPDRW.PROTECT	MMPUSDRWn (n = 0 to 2) MMPUEDRWn (n = 0 to 2) MMPUACDRWn (n = 0 to 2)
MMPUOADPT.PROTECT	MMPUOAD.OAD

15.3.2.3 Memory Protection error

If access to a protected region is detected, the bus master MPU generates an error. Set the MMPUOAD bit to select whether the error is reported as a non-maskable interrupt or a reset.

See [section 14, Buses](#) for details of bus master MPU error.

The non-maskable interrupt status is indicated in ICU.NMISR.BUSST. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#). The reset status is indicated in SYSC.RSTSR1.BUSRF. For details, see [section 5, Resets](#).

16. DMA Controller (DMAC)

16.1 Overview

The 8-channel direct memory access controller (DMAC) that can transfer data without intervention from the CPU. When a DMA transfer request is generated, the DMAC transfers data stored at the transfer source address to the transfer destination address.

Table 16.1 lists the DMAC specifications, and Figure 16.1 shows a block diagram of the DMAC.

Table 16.1 DMAC specifications (1 of 2)

Item		Description
Number of channels		8 channels (DMACn (n = 0 to 7))
Transfer space		4 GB (0x00000000 to 0xFFFFFFFF excluding reserved areas)
Maximum transfer volume		64 M data (Maximum number of transfers in block transfer mode: 1,024 data × 65,536 blocks)
DMAC activation source		Selectable for each channel: <ul style="list-style-type: none"> • Software trigger • Interrupt requests from peripheral modules or trigger from external interrupt input pins.*1
Channel priority		Channel 0 > Channel 1 > Channel 2 > Channel 3... > Channel 7 (Channel 0: Highest)
Transfer data	Single data	Bit length: 8, 16, 32 bits
	Block size	Number of data: 1 to 1,024
Transfer mode	Normal transfer mode	<ul style="list-style-type: none"> • One data transfer by one DMA transfer request • Free running function (setting in which total number of data transfers is not specified) settable
	Repeat transfer mode	<ul style="list-style-type: none"> • One data transfer by one DMA transfer request • Program returns to the transfer start address on completion of the repeat size of data transfer specified for the transfer source or destination. • Maximum settable repeat size: 1,024 • Selectable free running function
	Repeat-block transfer mode	<ul style="list-style-type: none"> • One block data transfer by one DMA transfer request • Maximum settable block size: 1,024 • Block transfer can be repeated • Maximum settable repeat size: 64K • Selectable free running function
	Block transfer mode	<ul style="list-style-type: none"> • One block data transfer by one DMA transfer request • Maximum settable block size: 1,024 data • Selectable free running function
Selective functions	Extended repeat area function	<ul style="list-style-type: none"> • Function in which data can be transferred by repeating the address values in the specified range with the upper bit values in the transfer address register fixed • Area of 2 bytes to 128 Mbytes separately settable as extended repeat area for transfer source and destination
Processing on DMAC transfer error		<ul style="list-style-type: none"> • When the DMAC transfer error occurs, it is stop the transfer that caused the error channel • Request to clear the register for activation request of DMAC error channel to ICU
Interrupt (DMAC0n_INT)	Transfer end interrupt	Generated on completion of transferring data volume specified by the transfer counter.
	Transfer escape end interrupt	<ul style="list-style-type: none"> • Generated when the repeat size of data transfer is completed. • Generated when the source address extended repeat area overflows. • Generated when the destination address extended repeat area overflows.
Interrupt (DMA0_TRANS_ERR)	Error response detection interrupt	<ul style="list-style-type: none"> • Generated when the DMAC transfer error occurs
Event link activation (DMAC0n_INT)		An event link request is generated after each data transfer (for block transfer, after each block is transferred).
Module-stop function		Module-stop state can be set to reduce power consumption.

Table 16.1 DMAC specifications (2 of 2)

Item	Description
TrustZone Filter	Security and Privilege can be set for each channels

Note: Security attribution Register of DMAC channel is described in ICU.ICUSARC

Note 1. For details on DMAC activation sources, see [Table 13.4](#) in [section 13, Interrupt Controller Unit \(ICU\)](#).

Figure 16.1 Block Diagram of DMAC

16.2 Register Descriptions

16.2.1 DMACCHSAR : DMA channel Security Attribution Register

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x1A0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	SADM AC7	SADM AC6	SADM AC5	SADM AC4	SADM AC3	SADM AC2	SADM AC1	SADM AC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	SADMAC7 to SADMAC0	Security attributes of output and registers for DMAC channel 0: Secure 1: Non-secure	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

SADMACn (n = 0 to 7)

Security attributes registers for DMAC channel.

This bit determines the security attribute of the output as the master for each DMAC channel.

The controlled channel of DMAC registers are shown below.

- CPSCU.DMACCHPAR.PADMACn
- DMAC.DELSR channel n
- DMAC.DMSAR channel n
- DMAC.DMSRR channel n
- DMAC.DMDAR channel n
- DMAC.DMDRR channel n
- DMAC.DMCRA channel n
- DMAC.DMCRB channel n
- DMAC.DMTMD channel n
- DMAC.DMINT channel n
- DMAC.DMAMD channel n
- DMAC.DMOFR channel n
- DMAC.DMCNT channel n
- DMAC.DMREQ channel n
- DMAC.DMSTS channel n
- DMAC.DMSBS channel n
- DMAC.DMDBS channel n
- DMAC.DMBWR channel n

16.2.2 DMACCHPAR : DMA channel Privilege Attribution Register

Base address: CPSCU = 0x4000_8000
 CPSCU_NS = 0x5000_8000

Offset address: 0x1F0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	PADM AC7	PADM AC6	PADM AC5	PADM AC4	PADM AC3	PADM AC2	PADM AC1	PADM AC0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
7:0	PADMAC7 to PADMAC0	Privilege attributes of outputs and registers for DMAC channel 0: Privileged. 1: Unprivileged.	R/W
31:8	—	These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-2, P-TYPE-1

PADMACn (n = 0 to 7)

Privilege attributes of output and registers for DMAC channel.

This bit determines the Privilege attribute of the output as the master for each DMAC channel. It also determines the privileged attributes of DMAC registers for each channel. (See [section 16.3.14. Channel Privilege](#).)

The controlled the channel of DMAC registers are shown below.

- DMAC.DMSAR channel n
- DMAC.DMSRR channel n
- DMAC.DMDAR channel n
- DMAC.DMDRR channel n
- DMAC.DMCRA channel n
- DMAC.DMCRB channel n
- DMAC.DMTMD channel n
- DMAC.DMINT channel n
- DMAC.DMAMD channel n
- DMAC.DMOFR channel n
- DMAC.DMCNT channel n
- DMAC.DMREQ channel n
- DMAC.DMSTS channel n
- DMAC.DMSBS channel n
- DMAC.DMDBS channel n
- DMAC.DMBWR channel n

16.2.3 DMAC SAR : DMAC Controller Security Attribution Register

Base address: CPSCU = 0x4000_8000
 CPSCU_NS = 0x5000_8000

Offset address: 0x34

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMAS TSA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DMASTSA	DMAST Security Attribution 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

For DMAC, security attribution is set for each channel. However, this register only sets the DMAST register security attribute.

DMASTSA bit (DMAST Security Attribution)

Security attributes of registers for DMAST. Do not write to DMASTSA bit while DMA transfer is enabled or a bus master is writing to the DMA registers.

16.2.4 DELSRn : DMAC Event Link Setting Register n (n = 0 to 7)

Base address: DMA0 = 0x4000_A800
 DMA0_NS = 0x5000_A800

Offset address: 0x080+ 0x04 × n (n = 0 to 7)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16		
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IR		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
Bit field:	—	—	—	—	—	—	—	DELS[8:0]									—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		

Bit	Symbol	Function	R/W
8:0	DELS[8:0]	DMAC Event Link Select 0x00: Disable interrupts to the associated DMAC module Others: Event signal number to be linked. For details, see Table 13.4 .	R/W ¹
15:9	—	These bits are read as 0. The write value should be 0.	R/W
16	IR	DMAC Activation Request Status flag 0: No DMAC activation request occurred. 1: DMAC activation request occurred.	R/W ²
31:17	—	These bits are read as 0. The write value should be 0.	R/W ¹

Note: P-TYPE-2 See below for access by security attribution.

Note 1. This register must be accessed by half-word or word.

Note 2. Writing 1 to the IR flag is prohibited.

This register has different secure access permission depending on the setting of Trusted Event Route Control Register (TEVTRCR).

If the security attribution is configured as Secure,

- Secure access is allowed.
- Non-secure write access is ignored and Non-secure read access is read as 0, TrustZone access error is generated.

If the security attribution is configured as Non-secure and the trusted event route is disabled,

- Secure write access is ignored and Secure read access is read as 0, TrustZone access error is generated.
- Non-secure access is allowed.

If the security attribution is configured as Non-secure and the trusted event route is enabled,

- Secure access to DELS bit is allowed.
- Non-secure write access to DELS bit is ignored and Non-secure read access to DELS bit is allowed.
- Secure write access to other bits is ignored and Secure read access to other bits is read as 0.
- Non-secure access to other bits is allowed.
- TrustZone access error is not generated.

DELS[8:0] bits (DMAC Event Link Select)

The DELS[8:0] bits link an event signal to the associated DMAC module. All DELS[8:0] bits must be written to simultaneously. Do not set the same event number in multiple DELSRn registers.

[Setting condition]

- When value is written to these bits.

[Clearing conditions]

- When 0 is written to these bits.
- When DMA transfer is stopped by the access error occurs. See [section 16.5. Processing on DMA Transfer Error](#).

IR flag (DMAC Activation Request Status flag)

This flag is a status flag for a DMAC activation request.

This flag is associated with the DELS[8:0] bits of this register.

[Setting condition]

- When a DMAC activation request occurs from the associated peripheral module or IRQi pin.

[Clearing conditions]

- When 0 is written to the flag
- When the DMA transfer is started after a DMAC activation request occurs.
- When DMA transfer is stopped by the access error occurs. See [section 16.5. Processing on DMA Transfer Error](#).

Note: IR Flag is automatically cleared after completion of DMA transfer, so do not write "0" except in case of emergency, such as when an abort occurs. DMA transfer operation when "0" is written during DMA transfer can not be guaranteed.

16.2.5 DMSAR : DMA Source Address Register

Base address: $DMAC0n = 0x4000_A000 + 0x0040 \times n$ (n = 0 to 7)
 $DMAC0n_NS = 0x5000_A000 + 0x0040 \times n$ (n = 0 to 7)

Offset address: 0x00

Bit position: 31 0

Bit field:

Value after reset: 0

Bit	Symbol	Function	R/W
31:0	n/a	Specifies the transfer source start address Setting range is 0x00000000 to 0xFFFFFFFF (4 GB).	R/W

Note: S-TYPE-3, P-TYPE-3

Set DMSAR while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0).

Note: Address alignment in this register must match the Transfer Data Size value selected in the DMTMD.SZ bit.

16.2.6 DMSRR : DMA Source Reload Address Register

Base address: $DMAC0n = 0x4000_A000 + 0x0040 \times n$ (n = 0 to 7)
 $DMAC0n_NS = 0x5000_A000 + 0x0040 \times n$ (n = 0 to 7)

Offset address: 0x20

Bit position: 31 0

Bit field:

Value after reset: 0

Bit	Symbol	Function	R/W
31:0	n/a	Specifies the transfer source reload address 0x0000 0000 to 0xFFFF FFFF (4 GB)	R/W

Note: S-TYPE-3, P-TYPE-3

Set DMSRR while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer of the corresponding channel is disabled (DMCNT.DTE = 0).

DMSRR is used to store the start address of the buffer size set in DMSBS during repeat-block transfer mode. In repeat-block transfer mode, DMSAR reloads value of DMSRR after specified transfer finished.

In normal transfer mode, repeat transfer mode and block transfer mode, DMSRR is not used. The setting is invalid.

Note: Address alignment in this register must match the Transfer Data Size value selected in the DMTMD.SZ bit.

16.2.7 DMDAR : DMA Destination Address Register

Base address: $DMAC0n = 0x4000_A000 + 0x0040 \times n$ (n = 0 to 7)
 $DMAC0n_NS = 0x5000_A000 + 0x0040 \times n$ (n = 0 to 7)

Offset address: 0x04

Bit position: 31 0

Bit field:

Value after reset: 0

Bit	Symbol	Function	R/W
31:0	n/a	Specifies the transfer destination start address Setting range is 0x0000_0000 to 0xFFFF_FFFF (4 GB).	R/W

Note: S-TYPE-3, P-TYPE-3

Set DMDAR while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer of the corresponding channel is disabled (DMCNT.DTE = 0).

Note: Address alignment in this register must match the Transfer Data Size value selected in the DMTMD.SZ bits.

16.2.8 DMDRR : DMA Destination Reload Address Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
 DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x24

Bit position: 31 0

Value after reset: 0

Bit	Symbol	Function	R/W
31:0	n/a	Specifies the transfer destination reload address Setting range is 0x0000_0000 to 0xFFFF_FFFF (4 GB).	R/W

Note: S-TYPE-3, P-TYPE-3

Set DMDRR while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer of the corresponding channel is disabled (DMCNT.DTE = 0).

DMDRR is used to store the start address of the buffer size set in DMDBS during repeat-block transfer mode. In repeat-block transfer mode, DMDAR reloads the value of DMDRR after the specified transfer is finished.

In normal transfer mode, repeat transfer mode and block transfer mode, DMDRR is not used. The setting is invalid.

Note: Address alignment in this register must match the Transfer Data Size value selected in the DMTMD.SZ bits.

16.2.9 DMCRA : DMA Transfer Count Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
 DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x08

Bit position: 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
15:0	DMCRAL[15:0]	Lower bits of transfer count Specifies the number of transfer operations.	R/W
25:16	DMCRAH[9:0]	Upper bits of transfer count Specifies the number of transfer operations.	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Set the same value for DMCRAH and DMCRAL in repeat transfer mode, block transfer mode, and repeat-block transfer mode. Bits 15 to 10 are fixed to 0 in repeat transfer mode, block transfer mode, and repeat-block transfer mode.

(1) Normal Transfer Mode (DMTMD.MD[1:0] = 00b)

DMCRAL functions as a 16-bit transfer counter.

The number of transfer operations is one when the setting is 0x0001, and 65,535 when it is 0xFFFF. The value is decremented by one each time data is transferred.

When the setting is 0x0000, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped (free running function).

Free running function is not selected by DMTMD.TKP bit in normal transfer mode.

DMCRAH is not used in normal transfer mode. Write 0x0000 to DMCRAH.

(2) Repeat Transfer Mode (DMTMD.MD[1:0] = 01b)

DMCRAH specifies the repeat size and DMCRAL functions as a 10-bit transfer counter.

The number of transfer operations is one when the setting is 0x001, 1023 when it is 0x3FF, and 1024 when it is 0x000. In repeat transfer mode, a value in the range of 0x000 to 0x3FF (1 to 1024) can be set for DMCRAH and DMCRAL.

Setting bits 15 to 10 in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 0x000, at which the value in DMCRAH is loaded into DMCRAL.

(3) Block Transfer Mode (DMTMD.MD[1:0] = 10b)

DMCRAH specifies the block size and DMCRAL functions as a 10-bit block size counter.

The block size is one when the setting is 0x001, 1023 when it is 0x3FF, and 1024 when it is 0x000. In block transfer mode, a value in the range of 0x000 to 0x3FF can be set for DMCRAH and DMCRAL.

Setting bits 15 to 10 in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 0x000, at which the value in DMCRAH is loaded into DMCRAL.

(4) Repeat-Block Transfer Mode (DMTMD.MD[1:0] = 11b)

DMCRAH specifies the block size and DMCRAL functions as a 10-bit block size counter.

The block size is one when the setting is 0x001, 1023 when it is 0x3FF, and 1024 when it is 0x000. In repeat-block transfer mode, a value in the range of 0x000 to 0x3FF can be set for DMCRAH and DMCRAL.

Setting bits 15 to 10 in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 0x000, at which the value in DMCRAH is loaded into DMCRAL.

16.2.10 DMCRB : DMA Block Transfer Count Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x0C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	DMCRBH[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DMCRBL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	DMCRBL[15:0]	Functions as a number of block, repeat or repeat-block transfer counter. 0x0001 to 0xFFFF (1 to 65535) 0x0000 (65536)	R/W
31:16	DMCRBH[15:0]	Specifies the number of block, repeat or repeat-block transfer operations. 0x0001 to 0xFFFF (1 to 65535) 0x0000 (65536)	R/W

Note: S-TYPE-3, P-TYPE-3

Set the same value for DMCRBH and DMCRBL in repeat transfer mode, block transfer mode and repeat-block transfer mode.

DMCRBH specifies the number of block, repeat and repeat-block transfer operations, and DMCRBL functions as a 16-bit the number of block counter in block, repeat, and repeat-block transfer mode, respectively.

The number of transfer operations is one when the setting is 0x0001, 65535 when it is 0xFFFF, and 65536 when it is 0x0000.

In repeat transfer mode, the value is decremented by one when the final data of one repeat size is transferred.

In block transfer mode and repeat-block transfer mode, the value is decremented by one when the final data of one block size is transferred.

In normal transfer mode, DMCRB is not used. The setting is invalid.

When DMTMD.TKP is 1 and the final data of one repeat size or one block size is transferred, DMCRBL reloads the value of DMCRBH automatically.

16.2.11 DMTMD : DMA Transfer Mode Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x10

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	MD[1:0]		DTS[1:0]		—	TKP	SZ[1:0]		—	—	—	—	—	—	DCTG[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	DCTG[1:0]	Transfer Request Source Select 0 0: Software request 0 1: Hardware request*1 1 0: Setting prohibited 1 1: Setting prohibited	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W
9:8	SZ[1:0]	Transfer Data Size Select 0 0: 8 bits 0 1: 16 bits 1 0: 32 bits 1 1: Setting prohibited	R/W
10	TKP	Transfer Keeping 0: Transfer is stopped by completion of specified total number of transfer operations. 1: Transfer is not stopped by completion of specified total number of transfer operations (free-running).	R/W
11	—	This bit is read as 0. The write value should be 0.	R/W
13:12	DTS[1:0]	Repeat Area Select 0 0: The destination is specified as the repeat area or block area. 0 1: The source is specified as the repeat area or block area. 1 0: The repeat area or block area is not specified. 1 1: Setting prohibited.	R/W

Bit	Symbol	Function	R/W
15:14	MD[1:0]	Transfer Mode Select 0 0: Normal transfer 0 1: Repeat transfer 1 0: Block transfer 1 1: Repeat-block transfer	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. To select the DMAC activation source, use the DELSRn registers. For details on DMAC activation sources, see [Table 13.4](#) in [section 13, Interrupt Controller Unit \(ICU\)](#).

DTS[1:0] bits (Repeat Area Select)

DTS[1:0] select either the source or destination as the repeat area in repeat or block transfer mode. In normal or repeat-block transfer mode, setting these bits is invalid.

TKP bit (Transfer Keeping)

TKP selects either stopping transfer or keeping transfer by completion of specified total number of transfer operations in repeat, block or repeat-block transfer mode. In normal transfer mode, setting this bit is invalid.

16.2.12 DMINT : DMA Interrupt Setting Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x13

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	DTIE	ESIE	RPTIE	SARIE	DARIE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DARIE	Destination Address Extended Repeat Area Overflow Interrupt Enable 0: Disables an interrupt request for an extended repeat area overflow on the destination address. 1: Enables an interrupt request for an extended repeat area overflow on the destination address.	R/W
1	SARIE	Source Address Extended Repeat Area Overflow Interrupt Enable 0: Disables an interrupt request for an extended repeat area overflow on the source address. 1: Enables an interrupt request for an extended repeat area overflow on the source address.	R/W
2	RPTIE	Repeat Size End Interrupt Enable 0: Disables the repeat size end interrupt request. 1: Enables the repeat size end interrupt request.	R/W
3	ESIE	Transfer Escape End Interrupt Enable 0: Disables the transfer escape end interrupt request. 1: Enables the transfer escape end interrupt request.	R/W
4	DTIE	Transfer End Interrupt Enable 0: Disables the transfer end interrupt request. 1: Enables the transfer end interrupt request.	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

DARIE bit (Destination Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow on the destination address occurs while DARIE bit is set to 1, the DMCNT.DTE bit is cleared to 0. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that an interrupt by an extended repeat area overflow on the destination address is requested.

When block transfer mode is used with the extended repeat area function, an interrupt is requested after completion of a 1-block size transfer. When setting 1 in the DMCNT.DTE bit of the channel for which a transfer has been stopped, the transfer is resumed from the state when the transfer is stopped.

When the extended repeat area is not specified for the destination address, this bit is ignored.

When set to repeat-block transfer mode, do not use this bit.

SARIE bit (Source Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow on the source address occurs while SARIE bit is set to 1, the DMCNT.DTE bit is cleared to 0. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that an interrupt by an extended repeat area overflow on the source address is requested.

When block transfer mode is used with the extended repeat area function, an interrupt is requested after completion of a 1-block size transfer. When setting 1 in the DMCNT.DTE bit of the channel for which a transfer has been stopped, the transfer is resumed from the state when the transfer is stopped.

When the extended repeat area is not specified for the source address, this bit is ignored.

When set to repeat-block transfer mode, do not use this bit.

RPTIE bit (Repeat Size End Interrupt Enable)

When RPTIE bit is set to 1 in repeat transfer mode, the DMCNT.DTE bit is cleared to 0 after completion of a 1-repeat size data transfer. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that the repeat size end interrupt request has been generated. The repeat size end interrupt request can be generated even when the DMTMD.DTS[1:0] bits are 10b (= repeat area or block area is not specified).

When this bit is set to 1 in block transfer mode, the DMCNT.DTE bit is cleared to 0 after completion of a 1-block data transfer in the same way as repeat transfer mode. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that the repeat size end interrupt request has been generated. The repeat size end interrupt request can be generated even when the DMTMD.DTS[1:0] bits are 10b (= repeat area or block area is not specified).

When set to repeat-block transfer mode, do not use this bit.

ESIE bit (Transfer Escape End Interrupt Enable)

ESIE bit enables or disables the transfer escape end interrupt requests (repeat size end interrupt request and extended repeat area overflow interrupt request) that are generated during DMA transfer.

The transfer escape end interrupt is generated when the DMSTS.ESIF flag is set to 1 with this bit set to 1. The transfer escape end interrupt is cleared by clearing this bit or the DMSTS.ESIF flag to 0.

DTIE bit (Transfer End Interrupt Enable)

DTIE bit enables or disables the transfer end interrupt request to be generated on completion of a specified number of data transfers.

The transfer end interrupt is generated when the DMSTS.DTIF flag is set to 1 with this bit set to 1. The transfer end interrupt is cleared by clearing this bit or the DMSTS.DTIF flag to 0.

16.2.13 DMAMD : DMA Address Mode Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x14

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SM[1:0]		SADR	SARA[4:0]				DM[1:0]	DADR	DARA[4:0]						
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
4:0	DARA[4:0]	Destination Address Extended Repeat Area Specifies the extended repeat area on the destination address. For details on the settings, see Table 16.2 .	R/W

Bit	Symbol	Function	R/W
5	DADR	Destination Address Update Select After Reload 0: Only reloading. 1: Add index after reloading.	R/W
7:6	DM[1:0]	Destination Address Update Mode 0 0: Destination address is fixed. 0 1: Offset addition. 1 0: Destination address is incremented. 1 1: Destination address is decremented.	R/W
12:8	SARA[4:0]	Source Address Extended Repeat Area Specifies the extended repeat area on the source address. For details on the settings, see Table 16.2 .	R/W
13	SADR	Source Address Update Select After Reload 0: Only reloading. 1: Add index after reloading.	R/W
15:14	SM[1:0]	Source Address Update Mode 0 0: Source address is fixed. 0 1: Offset addition. 1 0: Source address is incremented. 1 1: Source address is decremented.	R/W

Note: S-TYPE-3, P-TYPE-3

DARA[4:0] bits (Destination Address Extended Repeat Area)

DARA[4:0] bits specify the extended repeat area on the destination address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 Mbytes.

When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set.

When the repeat area or block area is specified as a transfer destination, do not specify the extended repeat area on the destination address. When repeat transfer or block transfer is selected, and when DMTMD.DTS[1:0] = 00b (the transfer destination is specified as the repeat area or block area), write 00000b in the DARA[4:0] bits.

In repeat-block transfer mode, write 00000b in the DARA[4:0] bits.

An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the DMINT.DARIE bit set to 1. [Table 16.2](#) lists the settings and the corresponding extended repeat areas.

DADR bits (Destination Address Update Select After Reload)

In repeat-block transfer mode, this bit specifies the behavior of DMDAR after reloading DMDRR.

When this bit is set to 1, an index value ((DMDBSH-DMDBSL) × DataSize) is added to DMDAR after reloading DMDRR.

When this bit is set to 0, DMDAR only reloads DMDRR. This behavior is described in [Table 16.13](#).

In normal, repeat or block transfer mode, this bit is ignored.

DM[1:0] bits (Destination Address Update Mode)

DM[1:0] bits select the mode of updating the destination address.

When increment is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, or 10b, the destination address is incremented by 1, 2, or 4, respectively.

When decrement is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, or 10b, the destination address is decremented by 1, 2, or 4, respectively.

When offset addition is selected, the offset specified by the DMOFR register is added to the address.

SARA[4:0] bits (Source Address Extended Repeat Area)

SARA[4:0] bits specify the extended repeat area on the source address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 Mbytes.

When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set.

When the repeat area or block area is specified as a transfer source, do not specify the extended repeat area on the source address. When repeat transfer or block transfer is selected, and when DMTMD.DTS[1:0] = 01b (the transfer source is specified as the repeat area or block area), write 00000b in the SARA[4:0] bits.

In repeat-block transfer mode, write 00000b in the SARA[4:0] bits.

An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the DMINT.SARIE bit set to 1. Table 16.2 lists the settings and the corresponding extended repeat areas.

SADR bits (Source Address Update Select After Reload)

In repeat-block transfer mode, this bit specifies the behavior of DMSAR after reloading DMSRR.

When this bit is set to 1, an index value $((\text{DMSBSH}-\text{DMSBSL}) \times \text{DataSize})$ is added to DMSAR after reloading DMSRR.

When this bit is set to 0, DMSAR only reloads DMSRR. This behavior is described in Table 16.12.

In normal, repeat or block transfer mode, this bit is ignored.

SM[1:0] bits (Source Address Update Mode)

SM[1:0] bits select the mode of updating the source address.

When increment is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, or 10b, the source address is incremented by 1, 2, or 4, respectively.

When decrement is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, or 10b, the source address is decremented by 1, 2, or 4, respectively.

When offset addition is selected, the offset specified by the DMOFR register is added to the address.

Table 16.2 SARA[4:0] or DARA[4:0] settings and corresponding repeat areas (1 of 2)

SARA[4:0] or DARA[4:0] settings	Extended repeat area
00000b	Not specified
00001b	2 bytes specified as extended repeat area by the lower 1 bit of the address
00010b	4 bytes specified as extended repeat area by the lower 2 bits of the address
00011b	8 bytes specified as extended repeat area by the lower 3 bits of the address
00100b	16 bytes specified as extended repeat area by the lower 4 bits of the address
00101b	32 bytes specified as extended repeat area by the lower 5 bits of the address
00110b	64 bytes specified as extended repeat area by the lower 6 bits of the address
00111b	128 bytes specified as extended repeat area by the lower 7 bits of the address
01000b	256 bytes specified as extended repeat area by the lower 8 bits of the address
01001b	512 bytes specified as extended repeat area by the lower 9 bits of the address
01010b	1 Kbyte specified as extended repeat area by the lower 10 bits of the address
01011b	2 Kbytes specified as extended repeat area by the lower 11 bits of the address
01100b	4 Kbytes specified as extended repeat area by the lower 12 bits of the address
01101b	8 Kbytes specified as extended repeat area by the lower 13 bits of the address
01110b	16 Kbytes specified as extended repeat area by the lower 14 bits of the address
01111b	32 Kbytes specified as extended repeat area by the lower 15 bits of the address
10000b	64 Kbytes specified as extended repeat area by the lower 16 bits of the address
10001b	128 Kbytes specified as extended repeat area by the lower 17 bits of the address
10010b	256 Kbytes specified as extended repeat area by the lower 18 bits of the address
10011b	512 Kbytes specified as extended repeat area by the lower 19 bits of the address

Table 16.2 SARA[4:0] or DARA[4:0] settings and corresponding repeat areas (2 of 2)

SARA[4:0] or DARA[4:0] settings	Extended repeat area
10100b	1 Mbyte specified as extended repeat area by the lower 20 bits of the address
10101b	2 Mbytes specified as extended repeat area by the lower 21 bits of the address
10110b	4 Mbytes specified as extended repeat area by the lower 22 bits of the address
10111b	8 Mbytes specified as extended repeat area by the lower 23 bits of the address
11000b	16 Mbytes specified as extended repeat area by the lower 24 bits of the address
11001b	32 Mbytes specified as extended repeat area by the lower 25 bits of the address
11010b	64 Mbytes specified as extended repeat area by the lower 26 bits of the address
11011b	128 Mbytes specified as extended repeat area by the lower 27 bits of the address
11100b to 11111b	Setting prohibited.

16.2.14 DMOFR : DMA Offset Register

Base address: $DMAC0n = 0x4000_A000 + 0x0040 \times n$ (n = 0 to 7)
 $DMAC0n_NS = 0x5000_A000 + 0x0040 \times n$ (n = 0 to 7)

Offset address: 0x18

Bit position: 31 0

Bit field:

Value after reset: 0

Bit	Symbol	Function	R/W
31:0	n/a	Specifies the offset when offset addition is selected as the address update mode for transfer source or destination. 0x00000000 to 0x00FFFFFF (0 bytes to (16 M – 1) bytes) 0xFF000000 to 0xFFFFFFFF (–16 Mbytes to –1 byte)	R/W

Note: S-TYPE-3, P-TYPE-3

Write to this register while the DMAC operation is stopped or DMA transfer is disabled (not during data transfer).

Setting bits 31 to 25 is invalid; a value of bit 24 is extended to bits 31 to 25. Reading DMOFR returns the extended value.

In repeat-block transfer mode, the offset is not specified by DMOFR when offset addition is selected, write 0 to DMOFR.

16.2.15 DMCNT : DMA Transfer Enable Register

Base address: $DMAC0n = 0x4000_A000 + 0x0040 \times n$ (n = 0 to 7)
 $DMAC0n_NS = 0x5000_A000 + 0x0040 \times n$ (n = 0 to 7)

Offset address: 0x1C

Bit position: 7 6 5 4 3 2 1 0

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	DTE	DMA Transfer Enable 0: Disables DMA transfer. 1: Enables DMA transfer.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

DTE bit (DMA Transfer Enable)

When the DMAST.DMST bit is set to 1 (DMAC activation is enabled) and this bit is set to 1 (DMA transfer is enabled), DMA transfer can be started for the corresponding channel.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When 0 is written to this bit.
- When the specified total volume of data transfer is completed.
- When DMA transfer is stopped by the repeat size end interrupt.
- When DMA transfer is stopped by the extended repeat area overflow interrupt.
- When DMA transfer is stopped by the access error occurs. See [section 16.5. Processing on DMA Transfer Error](#).

If the DTE of the corresponding channel is set to 0 during DMA transfer, no new transfer requests will be accepted after the transfer ends.

16.2.16 DMREQ : DMA Software Start Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x1D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	CLRS	—	—	—	SWREQ
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SWREQ	DMA Software Start 0: DMA transfer is not requested. 1: DMA transfer is requested.	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
4	CLRS	DMA Software Start Bit Auto Clear Select 0: SWREQ bit is cleared after DMA transfer is started by software. 1: SWREQ bit is not cleared after DMA transfer is started by software.	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

SWREQ bit (DMA Software Start)

When 1 is written to SWREQ bit, a DMA transfer request is generated. After DMA transfer is started in response to the request, this bit is cleared to 0 if the CLRS bit is set to 0. This bit is not cleared to 0 while the CLRS bit is set to 1. In this case, a DMA transfer request can be issued again after completion of a transfer.

Note that, however, setting this bit is valid and DMA transfer by software is enabled only when the DMTMD.DCTG[1:0] bits are set to 00b (DMAC activation source is software).

Setting this bit is invalid when the DMTMD.DCTG[1:0] bits are set to a value other than 00b.

To start DMA transfer by software with the CLRS bit being 0, ensure that the SWREQ bit is 0, and then write 1 to the SWREQ bit.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When a DMA transfer request by software is accepted and DMA transfer is started while the CLRS bit is set to 0 (the SWREQ bit is cleared after DMA transfer is started by software).
- When 0 is written to this bit.

When DMA transfer is stopped by the access error occurs. See [section 16.5. Processing on DMA Transfer Error](#)

CLRS bit (DMA Software Start Bit Auto Clear Select)

CLRS bit specifies whether to clear the SWREQ bit to 0 after DMA transfer is started in response to the DMA transfer request generated by setting the SWREQ bit to 1. With this bit set to 0, the SWREQ bit is cleared to 0 after DMA transfer is started. With this bit set to 1, the SWREQ bit is not cleared to 0. In this case, a DMA transfer request can be issued again after completion of a transfer.

16.2.17 DMSTS : DMA Status Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x1E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	ACT	—	—	DTIF	—	—	—	ESIF

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	ESIF	Transfer Escape End Interrupt Flag 0: A transfer escape end interrupt has not been generated. 1: A transfer escape end interrupt has been generated.	R/W ¹
3:1	—	These bits are read as 0. The write value should be 0.	R/W
4	DTIF	Transfer End Interrupt Flag 0: A transfer end interrupt has not been generated. 1: A transfer end interrupt has been generated.	R/W ¹
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	ACT	DMAC Active Flag 0: DMAC is in the idle state. 1: DMAC is operating.	R

Note: S-TYPE-3, P-TYPE-3

Note 1. Only 0 can be written to clear the flag.

ESIF flag (Transfer Escape End Interrupt Flag)

This flag indicates that the transfer escape end interrupt has been generated.

[Setting conditions]

- When 1-repeat size data transfer is completed in repeat transfer mode with the DMINT.RPTIE bit set to 1.
- When 1-block data transfer is completed in block transfer mode with the DMINT.RPTIE bit set to 1.
- When an extended repeat area overflow on the source address occurs while the DMINT.SARIE bit is set to 1 and the DMAMD.SARA[4:0] bits are set to a value other than 00000b (extended repeat area is specified on the transfer source address).
- When an extended repeat area overflow on the destination address occurs while the DMINT.DARIE bit is set to 1 and the DMAMD.DARA[4:0] bits are set to a value other than 00000b (extended repeat area is specified on the transfer destination address).

[Clearing conditions]

- When 0 is written to this bit.
- When 1 is written to the DMCNT.DTE bit.

DTIF flag (Transfer End Interrupt Flag)

This flag indicates that the transfer end interrupt has been generated.

[Setting conditions]

- When the specified number of unit-transfers are completed in normal transfer mode (the value of DMCRAL becoming 0 on completion of transfer).
- When the specified number of repeat transfer operations are completed in repeat transfer mode (the value of DMCRBL becoming 0 on completion of transfer with DMTMD.TKP = 0 or the value of DMCRBL reloading DMCRBH with DMTMD.TKP = 1).
- When the specified number of blocks have been transferred in block transfer mode and repeat-block transfer mode (the value of DMCRBL becoming 0 on completion of transfer with DMTMD.TKP = 0 or the value of DMCRBL reloading DMCRBH with DMTMD.TKP = 1).

[Clearing conditions]

- When 0 is written to this bit.
- When 1 is written to the DMCNT.DTE bit.

ACT flag (DMAC Active Flag)

This flag indicates whether the DMAC is in the idle or active state.

[Setting condition]

- When the DMAC starts data transfer operation.

[Clearing condition]

- When data transfer in response to one transfer request is completed.

16.2.18 DMSBS : DMA Source Buffer Size Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x28

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	DMSBSH[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DMSBSL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	DMSBSL[15:0]	Functions as data transfer counter in repeat-block transfer mode See Table 16.3 for available settings.	R/W
31:16	DMSBSH[15:0]	Specifies the repeat-area size in repeat-block transfer mode See Table 16.3 for available settings.	R/W

Note: S-TYPE-3, P-TYPE-3

Set the same value for DMSBSH and DMSBSL in repeat-block transfer mode. Write 0x00000000 to DMSBS in normal, repeat and block transfer mode.

DMSBSH specifies buffer size and DMSBSL functions as a 16-bit buffer size counter in repeat-block transfer mode. In repeat-block transfer mode, source repeat area is specified by DMSBSH.

When address update mode is incremented address or decremented address, this register means the numbers of data of whole buffer. When address update mode is offset addition, this register means the numbers of data of an individual buffer. In offset addition, setting DMSBSH and DMSBSL to 0x0000 is prohibited. When final data of one buffer size is transferred,

DMSBSL reloads value of DMSBSH. When address update mode is fixed address, this register is ignored. Table 16.3 shows the setting values of DMA Source Buffer Size Register corresponding to Transfer Data Size in Source Address Update Mode.

Table 16.3 Available setting for DMSBS register in repeat-block transfer mode

Source address update mode (DMAMD.SM)	Transfer data size (DMTMD.SZ)	Available setting for DMSBSH and DMSBSL bits
Source address is fixed (SM = 00b)	Don't care	0x0000 (DMSBS is not used)
Offset addition (SM = 01b)	8 bits (SZ = 00b)	0x0001 to 0xFFFF (1 to 65535)
	16 bits (SZ = 01b)	0x0001 to 0x7FFF (1 to 32767)
	32 bits (SZ = 10b)	0x0001 to 0x3FFF (1 to 16383)
Source address is incremented or decremented (SM = 1xb)	Don't care	0x0000 (infinite) 0x0001 to 0xFFFF (1 to 65535)

In normal, repeat and block transfer mode, DMSBS is not used. The setting is invalid.

16.2.19 DMDBS : DMA Destination Buffer Size Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x2C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	DMDBSH[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DMDBSL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	DMDBSL[15:0]	Functions as data transfer counter in repeat-block transfer mode. See Table 16.4 for available settings.	R/W
31:16	DMDBSH[15:0]	Specifies the repeat-area size in repeat-block transfer mode. See Table 16.4 for available settings.	R/W

Note: S-TYPE-3, P-TYPE-3

Set the same value for DMDBSH and DMDBSL in repeat-block transfer mode. Write 0x00000000 to DMDBS in normal, repeat and block transfer mode.

DMDBSH specifies buffer size and DMDBSL functions as a 16-bit buffer size counter in repeat-block transfer mode. In repeat-block transfer mode, destination repeat area is specified by DMDBSH.

When address update mode is incremented address or decremented address, this register means the numbers of data of whole buffer. When address update mode is offset addition, this register means the numbers of data of an individual buffer. In offset addition, setting DMDBSH and DMDBSL to 0x0000 is prohibited. When final data of one buffer size is transferred, DMDBSL reloads value of DMDBSH. When address update mode is fixed address, this register is ignored. Table 16.4 shows the setting values of Destination Buffer Size Register corresponding to Transfer Data Size in Destination Address Update Mode.

Table 16.4 Available setting for DMDBS register in repeat-block transfer mode (1 of 2)

Destination address update mode (DMAMD.DM)	Transfer data size (DMTMD.SZ)	Available setting for DMDBSH and DMDBSL bits
Destination address is fixed (DM = 00b)	Don't care	0x0000 (DMDBS is not used)

Table 16.4 Available setting for DMDBS register in repeat-block transfer mode (2 of 2)

Destination address update mode (DMAMD.DM)	Transfer data size (DMTMD.SZ)	Available setting for DMDBSH and DMDBSL bits
Offset addition (DM = 01b)	8 bits (SZ = 00b)	0x0001 to 0xFFFF (1 to 65535)
	16 bits (SZ = 01b)	0x0001 to 0x7FFF (1 to 32767)
	32 bits (SZ = 10b)	0x0001 to 0x3FFF (1 to 16383)
Destination address is incremented or decremented (DM = 1xb)	Don't care	0x0000 (infinite) 0x0001 to 0xFFFF (1 to 65535)

In normal, repeat and block transfer mode, DMDBS is not used. The setting is invalid.

16.2.20 DMBWR : DMA Bufferable Write Enable Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x30

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	BWE	Bufferable Write Enable 0: Disables Bufferable Write 1: Enables Bufferable Write	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

BWE bit (Bufferable Write Enable)

BWE bit indicates bufferable write is either enabled or disabled.

If this bit is 1, even if the write access as DMAC is completed, the actual slave write may not have ended.

When this bit is 1, it requests an early response by writing write data to the temporary buffer if possible to the slave. Therefore, even if write access as DMAC is completed, the actual slave write may not be finished. If an error occurs during write access to the target slave, the error may not be detected and the transfer may not be automatically stopped. In such cases, the error response detection interrupt (DMA_TRANSERR) will not occur.

See [section 14.7.2. Operations When a Bus Error Occurs](#) for slave groups that support bufferable writes and slave groups for which error response detection interrupts cannot be generated.

Some individual slave modules also support bufferable writes, so Refer to the respective module chapters.

[Setting condition]

- When 1 is written to this bit

[Clearing conditions]

- When 0 is written to this bit

16.2.21 DMAST : DMA Module Activation Register

Base address: DMA0 = 0x4000_A800
DMA0_NS = 0x5000_A800

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DMST

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	DMST	DMAC Operation Enable 0: DMAC activation is disabled. 1: DMAC activation is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE2

DMST bit (DMAC Operation Enable)

Setting the DMAST.DMST to 1 enables DMAC activation for all channels. When the DMST bit is set to 1 (DMAC activation is enabled), and 1 is written to the DMCNT.DTE bit (DMA transfer is enabled) for multiple channels, all associated channels can be placed in the transfer request ready state at the same time.

When the DMST bit clears to 0 during DMA transfer, DMA transfer is suspended after the current data transfer associated with a single transfer request completes. To resume DMA transfer, set the DMST bit to 1 again.

[Setting condition]

- When 1 is written to this bit.

[Clearing condition]

- When 0 is written to this bit.

16.2.22 DMECHR : DMAC Error Channel Register

Base address: DMA0 = 0x4000_A800
DMA0_NS = 0x5000_A800

Offset address: 0x40

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMES TA

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DMEC HSAM	—	—	—	—	—	—	—	DMECH

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
2:0	DMECH	DMAC Error channel Indicates the channel number causing the error 0 0 0: Error occurred on Channel 0 0 0 1: Error occurred on Channel 1 0 1 0: Error occurred on Channel 2 ⋮ 1 1 1: Error occurred on Channel 7	R
7:3	—	These bits are read as 0. The write value should be 0.	R

Bit	Symbol	Function	R/W
8	DMECHSAM	DMAC Error channel Security Attribution Monitor Indicates the security attribution of a channel causing the error 0: secure channel 1: non-secure channel	R
15:9	—	These bits are read as 0. The write value should be 0.	R
16	DMESTA	DMAC Error Status 0: No DMA transfer error occurred 1: DMA transfer error occurred	R/W ¹
31:17	—	These bits are read as 0. The write value should be 0.	R

Note: P-TYPE-2 See below for access by security attribution.

Note 1. Writing to DMESTA depends on the value of DMECHSAM

When reading this register, it can be accessed from both secure and non-secure access.

When writing this register, it depends on DMECHR.DMESA.

- When DMESA = 1, it can be accessed from secure and non-secure access.
- When DMESA = 0, it can be accessed from secure. An error is returned when write access is performed in a non-secure access.

This register is cleared by a reset caused by a transfer error. Please select interrupt (DMA0_TRANSERR) in BUS.OADC.FG.OAD when you want to debug the program.

DMECH[2:0] bit (DMAC Error channel)

When a transfer error due to DMA transfer occurs, it stores the channel of DMAC that was violated.

When reset was selected in MMPUOAD.OAD and MSAOAD.OAD, Since this register is also reset. Please select NMI when you want to debug the program.

[Set condition]

- When the DMAC transfer error occurs and DMESTA = 0.

[Clearing condition]

- When 1 is written to DMESTA.

DMECHSAM bit (DMAC Error channel Security Attribution Monitor)

When a transfer error due to DMA transfer occurs, it indicates the security attribution of the violating DMAC channel.

When reset was selected in MMPUOAD.OAD and MSAOAD.OAD, Since this register is also reset. Please select NMI when you want to debug the program.

[Set condition]

- When the DMAC transfer error occurs and DMESTA = 0.

[Clearing condition]

- When 1 is written to DMESTA.

DMESTA bit (DMAC Error Status)

Indicates whether or not a DMA transfer error occurred.

DMECH, DMECHSAM, DMESTA are cleared by writing 1 to DMESTA. Writing 0 to DMESTA is ignored.

When reset was selected in MMPUOAD.OAD and MSAOAD.OAD, Since this register is also reset. Please select NMI when you want to debug the program.

[Set condition]

- When the DMAC transfer error occurs.

[Clearing condition]

- When 1 is written to DMESTA.

Note: When DMECHSAM = 1, it can be cleared in the secure state and non-secure state. DMECHSAM = 0, it can not be cleared in the non-secure state.

16.3 Operation

16.3.1 Transfer Mode

16.3.1.1 Normal Transfer Mode

In normal transfer mode, one data is transferred by one transfer request. A maximum of 65535 can be set as the number of transfer operations using the DMCRAL register. When these bits are set to 0x0000, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped (free-running function). Setting DMCRB register is invalid in normal transfer mode. Except in free-running function, a transfer end interrupt request can be generated after completion of the specified number of transfer operations.

Table 16.5 summarizes the register update operation in normal transfer mode, and Figure 16.2 shows the operation in normal transfer mode.

Table 16.5 Register update operation in normal transfer mode

Register	Function	Update operation after completion of a transfer by one transfer request
DMSAR	Transfer source address	Increment/decrement/fixd/offset addition
DMDAR	Transfer destination address	Increment/decrement/fixd/offset addition
DMCRAL	Transfer count	Decrementd by one/not updated (in free running function)
DMCRAH	—	Not updated (Not used in normal transfer mode)
DMCRB	—	Not updated (Not used in normal transfer mode)

Figure 16.2 Operation in normal transfer mode

16.3.1.2 Repeat Transfer Mode

In repeat transfer mode, one data is transferred by one transfer request.

A maximum of 1K data can be set as a total repeat transfer size using DMCRB register.

A maximum of 64K can be set as the number of repeat transfer operations using DMCRB register; therefore, a maximum of 64M data (1K data × 64K counts of repeat transfer operations) can be set as a total data transfer size.

Either the transfer source or transfer destination can be specified as a repeat area. When transfer of the repeat size data is completed, the address of the specified repeat area (DMSAR or DMDAR) returns to the transfer start address. When data of the specified repeat size has all been transferred in repeat transfer mode, DMA transfer can be stopped, and the repeat size end interrupt can be requested. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the repeat size end interrupt handling.

A transfer end interrupt request can be generated after completion of the specified number of repeat transfer operations.

Table 16.6 summarizes the register update operation in repeat transfer mode, and Figure 16.3 shows the operation in repeat transfer mode.

Table 16.6 Register update operation in repeat transfer mode

Register	Function	Update operation after completion of a transfer by one transfer request	
		When DMCRAL register is not 1	When DMCRAL register is 1 (Transfer of the last data in repeat size)
DMSAR	Transfer source address	Increment/decrement/fixed/offset addition	<ul style="list-style-type: none"> • DMTMD.DTS[1:0] = 00b Increment/decrement/fixed/offset addition • DMTMD.DTS[1:0] = 01b Initial value of DMSAR • DMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition
DMDAR	Transfer destination address	Increment/decrement/fixed/offset addition	<ul style="list-style-type: none"> • DMTMD.DTS[1:0] = 00b Initial value of DMDAR • DMTMD.DTS[1:0] = 01b Increment/decrement/fixed/offset addition • DMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition
DMCRAH	Repeat size	Not updated	Not updated
DMCRAL	Transfer count	Decrement by one	DMCRAH
DMCRBH	Number of repeat transfer operations	Not updated	Not updated
DMCRBL	Count of repeat transfer operations	Not updated	Decrement by one

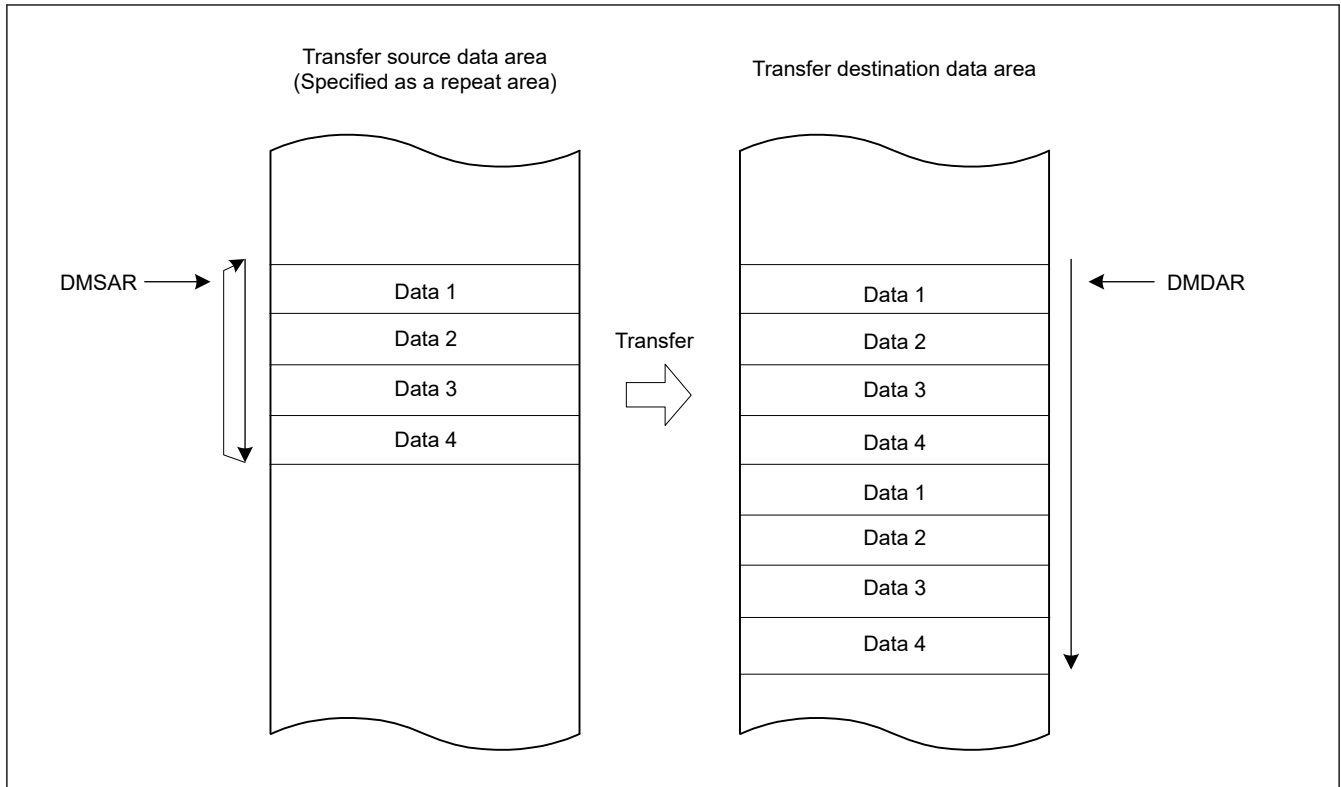

Figure 16.3 Operation in repeat transfer mode

16.3.1.3 Block Transfer Mode

In block transfer mode, a single block data is transferred by one transfer request.

A maximum of 1K data can be set as a total block transfer size using DMCRA register.

A maximum of 64K can be set as the number of block transfer operations using DMCRB register; therefore, a maximum of 64M data (1K data × 64K counts of block transfer operations) can be set as a total data transfer size.

Either the transfer source or transfer destination can be specified as a block area. When transfer of a single block data is completed, the address of the specified block area (DMSAR or DMDAR) returns to the transfer start address. When a single block data has all been transferred in block transfer mode, DMA transfer can be stopped, and the repeat size end interrupt can be requested. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the repeat size end interrupt handling.

Transfer end interrupt request can be generated after completion of the specified number of block transfer operations.

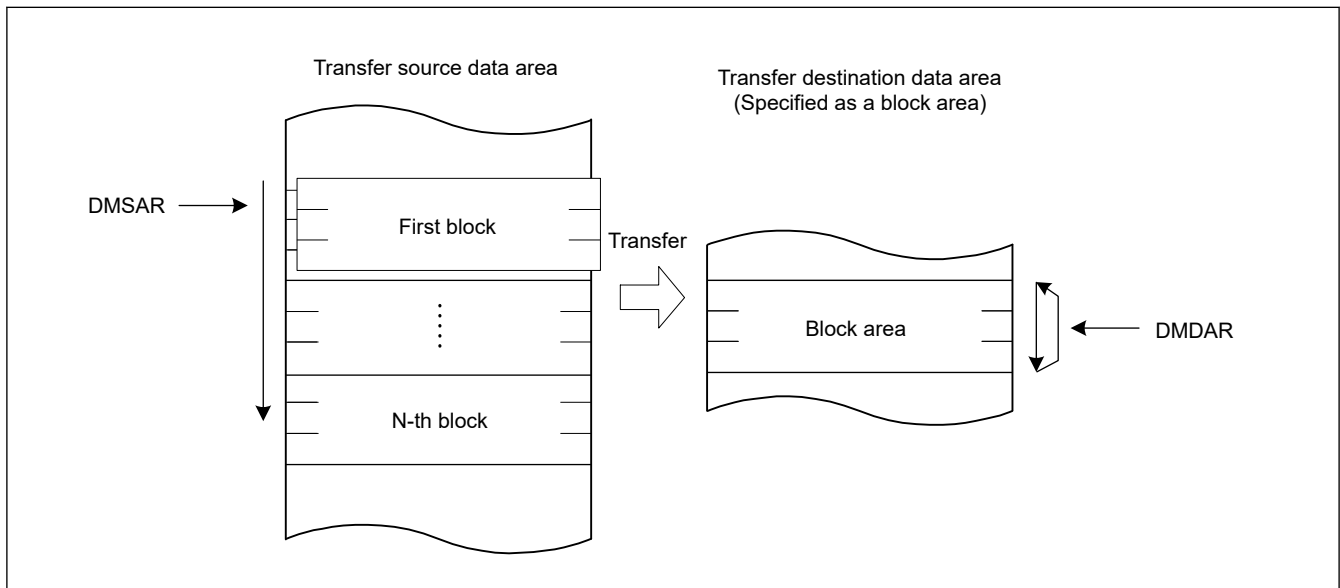

Table 16.7 summarizes the register update operation in block transfer mode, and Figure 16.4 shows the operation in block transfer mode.

Table 16.7 Register update operation in block transfer mode (1 of 2)

Register	Function	Update operation after completion of single-block transfer by one transfer request
DMSAR	Transfer source address	<ul style="list-style-type: none"> DMTMD.DTS[1:0] = 00b Increment/decrement/offset addition DMTMD.DTS[1:0] = 01b Initial value of DMSAR DMTMD.DTS[1:0] = 10b Increment/decrement/offset addition
DMDAR	Transfer destination address	<ul style="list-style-type: none"> DMTMD.DTS[1:0] = 00b Initial value of DMDAR DMTMD.DTS[1:0] = 01b Increment/decrement/offset addition DMTMD.DTS[1:0] = 10b Increment/decrement/offset addition

Table 16.7 Register update operation in block transfer mode (2 of 2)

Register	Function	Update operation after completion of single-block transfer by one transfer request
DMCRAH	Block size	Not updated
DMCRAL	Transfer count	DMCRAH
DMCRBH	Number of block transfer operations	Not updated
DMCRBL	Count of block transfer operations	Decremented by one

**Figure 16.4 Operation in block transfer mode**

16.3.1.4 Repeat-Block Transfer Mode

Repeat-block transfer is the operation mode with the following functions added to the block transfer function.

Repeat function: Added function (ring buffer) to repeat specified address area.

Offset function: Multiple areas with offset can be specified within one block transfer.

The repeat function and the offset function can be used for both the transfer source and the transfer destination of repeat-block transfer.

Figure 16.5 shows an example of adding a repeat function to the transfer destination.

Figure 16.6 shows repeat-block transfer with an offset to the transfer destination.

In repeat-block transfer mode, a single block data is transferred by one transfer request.

A maximum of 1K data can be set as a total block transfer size using DMCRA of the DMACn.

A maximum of 64K can be set as the number of block transfer operations using DMCRB of the DMACn; therefore, a maximum of 64M data (1K data × 64K counts of block transfer operations) can be set as a total data transfer size.

Figure 16.5 Operation in repeat block transfer mode

Figure 16.6 Operation in repeat-block transfer mode with offset addition

Table 16.8 to Table 16.13 summarize the register update operations in repeat-block transfer mode.

For more information about address update function in repeat-block transfer mode, see section 16.3.5. Address Update Function in Repeat-Block Transfer Mode.

Table 16.8 Register update operation associated with source area in repeat-block transfer mode (fixed address DMAMD.SM[1:0] = 00b) (1 of 2)

16.3.2 Extended Repeat Area Function

The DMAC supports a function to specify the extended repeat areas on the transfer source and destination addresses. With the extended repeat areas set, the address registers repeatedly indicate the addresses of the specified extended repeat areas.

The extended repeat areas can be specified separately to the transfer source address register (DMSAR) and transfer destination address register (DMDAR).

The extended repeat area on the source address is specified by the DMAMD.SARA[4:0] bits. The extended repeat area on the destination address is specified by the DMAMD.DARA[4:0] bits. The size can be specified separately for the source and destination sides.

However, the area (of transfer source or transfer destination) which is specified as the repeat area or block area should not be specified as the extended repeat area.

When the address register value reaches the end address of the extended repeat area and the extended repeat area overflows, DMA transfer is stopped and an interrupt by an extended repeat area overflow can be requested. When an overflow occurs in the extended repeat area on the transfer source while the DMINT.SARIE bit is set to 1, the DMSTS.ESIF flag is set to 1 and the DMCNT.DTE bit is cleared to 0 to stop DMA transfer. At this time, if the DMINT.ESIE bit is set to 1, an interrupt by an extended repeat area overflow is requested. When the DMINT.DARIE bit is set to 1, the destination address register becomes a target to apply the function. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the interrupt handling.

Figure 16.7 shows an example of the extended repeat area operation.

Eight bytes are specified as an extended repeat area by the lower three bits of DMSAR (DMAMD.SARA[4:0] bits = 00011b). The data size is eight bits (DMTMD.SZ[1:0] = 00b).

Figure 16.7 Example of extended repeat area operation

When an interrupt by an extended repeat area overflow is used in block transfer mode, the following should be taken into consideration.

When a transfer is stopped by an interrupt by an extended repeat area overflow, the address register must be set so that the block size is a power of 2 or the block size boundary is aligned with the extended repeat area boundary. When an overflow on the extended repeat area occurs during a transfer of one block, the interrupt by the overflow is suspended until transfer of the block is completed, and the transfer overruns.

Figure 16.8 shows an example when the extended repeat area function is used in block transfer mode.

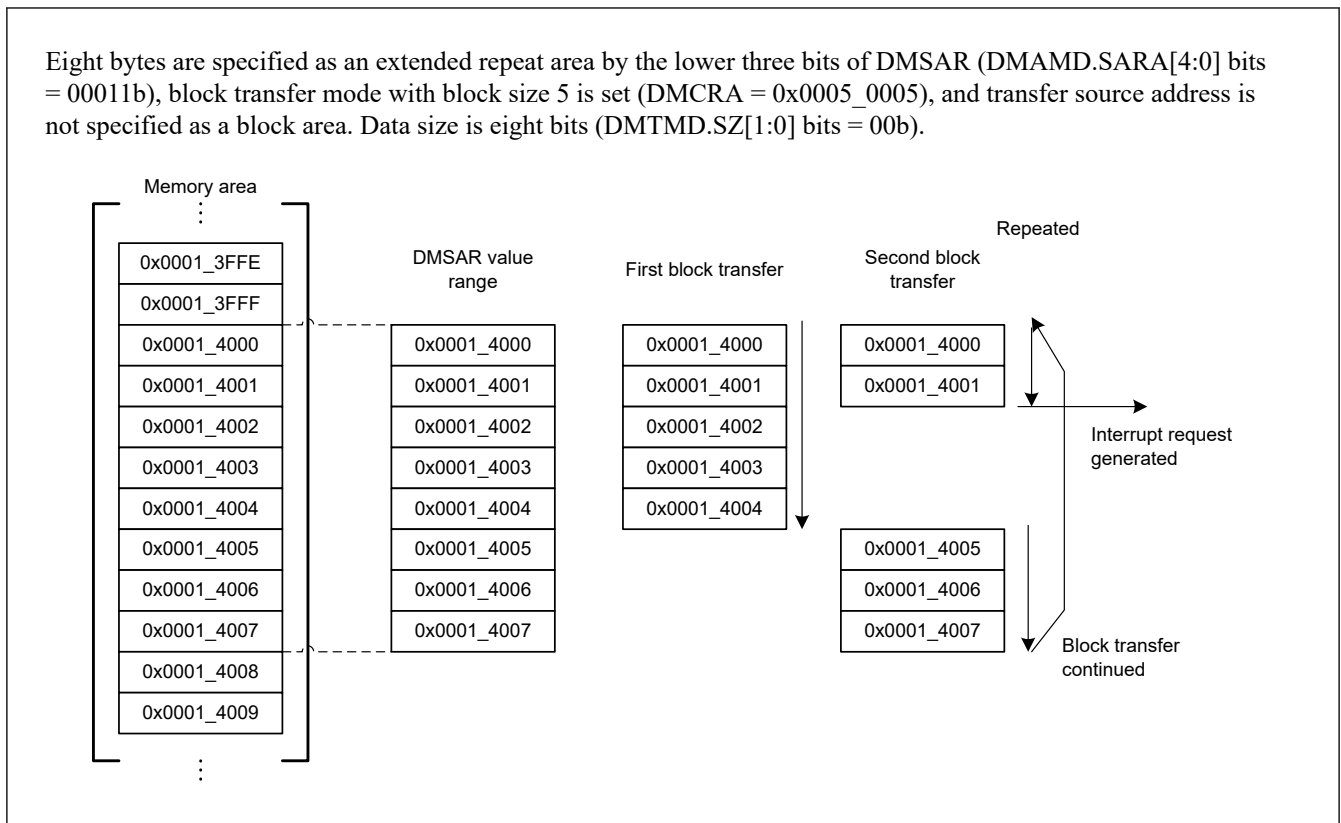

Figure 16.8 Example of extended repeat area function in block transfer mode

16.3.3 Free-running Function

The DMAC supports free-running function. This function allows to transfer repeatedly without reconfiguring in interrupt handler.

16.3.3.1 In Normal Transfer Mode

In normal transfer mode, when DMCRA.DMCRAL bits are set to 0x0000, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped.

For more information, see [section 16.3.1.1. Normal Transfer Mode](#).

16.3.3.2 In Other Transfer Modes

In repeat, block and repeat-block transfer mode, the DMAC supports free-running function using the DMTMD.TKP bit. If the DMTMD.TKP bit is to be set to 1, the transfer is not stopped by completion of specified total number of transfer operations and reloads DMCRBH repeatedly.

Figure 16.9 show an example of block transfer operation without free-running function.

Figure 16.9 Operation in block transfer mode when DMTMD.TKP bit is set to 0

Figure 16.10 show an example of block transfer operation with free-running function.

Figure 16.10 Operation in block transfer mode when DMTMD.TKP bit is set to 1

16.3.4 Address Update Function using Offset

The source and destination addresses can be updated by fixing, increment, decrement, or offset addition. In normal, repeat and block transfer mode, when the offset addition is selected, the offset specified by the DMA offset register (DMOFR) is added to the address every time the DMAC performs one data transfer. This function realizes a data transfer where addresses are allocated to separated areas.

Offset subtraction can also be realized by setting a negative value in DMOFR. In this case, the negative value must be 2's complement.

DMSBS or DMDBS are used instead of DMOFR in repeat-block transfer mode. For more information [section 16.3.1.4. Repeat-Block Transfer Mode](#)

Table 16.14 shows the address update method in each address update mode.

Table 16.14 Address update method in each address update mode

Address update mode	Settings of DMAMD.SM[1:0] and DMAMD.DM[1:0] for address update modes	Address update method (for different SZ[1:0] settings in DMTMD)		
		SZ[1:0] = 00b	SZ[1:0] = 01b	SZ[1:0] = 10b
Address fixed	00b	Fixed		
Offset addition	01b	+DMOFR*1		
Increment	10b	+1	+2	+4
Decrement	11b	-1	-2	-4

Note 1. When setting a negative value in the DMA Offset Register, the value must be in two's complement, obtained by the following formula:
 two's complement of a negative offset value = $\sim(\text{offset}) + 1$ (\sim = bit inversion)

16.3.4.1 Basic Transfer Using Offset Addition

Figure 16.11 shows an example of address updating using offset addition.

Figure 16.11 Example of address updating by offset addition

Figure 16.11 shows the setting of the following.

- The transfer data is 32 bits long.
- Offset addition is set as the transfer source address update mode.

- Increment is set as the transfer destination address update mode.

The second and subsequent data is each read from the transfer source address obtained by adding the offset value to the previous address. The data read from the addresses at the specified intervals is written to the continuous locations on the destination.

16.3.4.2 Example of XY Conversion Using Offset Addition

Figure 16.12 shows the XY conversion using offset addition in repeat transfer mode.

Settings are as follows:

- DMAMD.SM — Transfer source address update mode: Offset addition.
- DMAMD.DM — Transfer destination address update mode: Destination address is incremented.
- DMTMD.SZ — Transfer data size select: 32 bits.
- DMTMD.MD — Transfer mode select: Repeat transfer.
- DMTMD.DTS — Repeat area select: The source is specified as the repeat area.
- DMOFR — Offset address: 0x10.
- DMCRA — Repeat size: 0x4.
- DMINT.RPTIE — The repeat size end interrupt is enabled.

Figure 16.12 XY conversion operation using offset addition in repeat transfer mode

When a transfer starts, the offset value is added to the transfer source address every time data is transferred. The transfer data is written to continuous transfer destination addresses. When data 4 is transferred:

- The repeat size of data transfer is complete.
- The transfer source address returns to the transfer start address (the address of data 1 on the transfer source).
- A repeat size end interrupt is requested.

During the time this interrupt pauses the transfer, the following operations are performed.

- DMSAR — Rewrite the DMA transfer source address to the address of data 5 (with the above example, the data 1 address + 4).
- DMCNT — Set the DTE bit to 1.

The DMA transfer is resumed from the state when the DMA transfer is stopped. After that, the operations described above are repeated until the transfer source data is transposed to the destination area (XY conversion).

[Figure 16.13](#) shows a flowchart of the XY conversion.

Figure 16.13 XY conversion flowchart using offset addition in repeat transfer mode

16.3.5 Address Update Function in Repeat-Block Transfer Mode

Repeat-block transfer mode is an extension of repeat transfer mode and block transfer mode. However, the detailed behavior of the address update is different from these two modes. Here are the details of the address update function in repeat-block transfer mode.

16.3.5.1 Fixed Address Mode

When DMAMD.SM[1:0] is set to 00b, the address update mode of the source is fixed address. And when DMAMD.DM[1:0] is set to 00b, the address update mode of the destination is fixed address.

In fixed address, the address is not updated from the initial value of DMSAR and DMDAR. If the block size (DMCRA) is larger than 1, the same data will be transferred multiple times for one request.

Figure 16.14 shows address update in fixed address.

Figure 16.14 Address update in fixed address

16.3.5.2 Incremental and Decremental Address Mode

When DMAMD.SM[1:0] is set to 10b, the address update mode of the source is incremental address. And when DMAMD.DM[1:0] is set to 10b, the address update mode of the destination is incremental address. When DMAMD.SM[1:0] is set to 11b, the address update mode of the source is decremental address. And when DMAMD.DM[1:0] is set to 11b, the address update mode of the destination is decremental address.

In these update modes, the address is incremented or decremented according to the setting of DMTMD.SZ[1:0].

In these update modes DMSBS and DMDBS indicates a reload area. The unit of DMSBS and DMDBS is "number of data". At the start of transfer, DMSBSL and DMDBSL, which is the lower 16 bits of DMSBS and DMDBS, operates as a down counter and decrements each time one data transfer is performed. When the value becomes 1, DMSAR and DMDAR reloads the value of DMSRR and DMDRR.

Figure 16.15 shows address update in incremental address.

Figure 16.15 Address update in incremental address

16.3.5.3 Offset Addition Mode

When DMAMD.SM[1:0] is set to 01b, the address update mode of the source is offset addition. And when DMAMD.DM[1:0] is set to 01b, the address update mode of the destination is offset addition.

In offset addition, DMSBS and DMDBS indicates reload area and also works as an access offset value. Unlike other transfer modes, DMOFR register is not used in repeat-block transfer mode. In offset addition, the unit of DMSBS and DMDBS is the number of blocks. When the transfer starts, DMCRAL operates as a down counter, DMSAR and DMDAR reloads the value of DMSRR and DMDRR every time one block is transferred. In addition, DMSBSL and DMDBSL, which is the lower 16 bits of DMSBS and DMDBS, also operates as a down counter and decrements every time one block is transferred. When the DMSBS and DMDBS value becomes 1, DMSAR and DMDAR reloads the value of DMSRR and DMDRR.

When DMAMD.SADR and DMAMD.DADR is set to 0, offset addition operation of the same area is repeated. DMDAR only reloads DMDRR. [Figure 16.16](#) shows address update in offset addition with DMAMD.SADR and DMAMD.DADR=0.

Figure 16.16 Address update in offset addition with DMAMD.SADR and DMAMD.DADR = 0

When DMAMD.SADR and DMAMD.DADR is set to 1, the address is incremented by one data unit after DMSRR and DMDRR is reloaded by DMCRAL=1. In other words, an index value ((DMDBSH-DMDBSL) × DataSize) is added to DMDAR after DMDRR is reloaded. This behavior is used to implement multiple ring buffers. Figure 16.17 shows address update in offset addition with DMAMD.SADR and DMAMD.DADR=1.

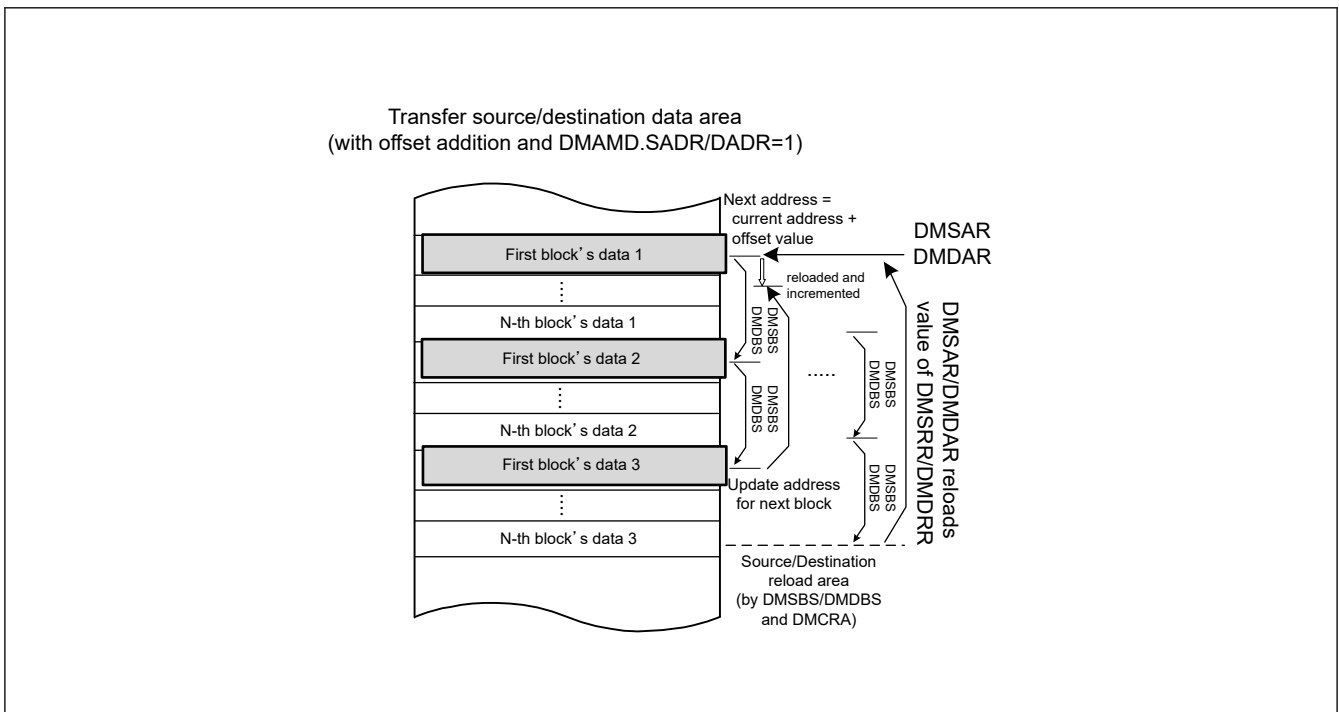

Figure 16.17 Address update in offset addition with DMAMD.SADR and DMAMD.DADR = 1

16.3.6 Example of Using Repeat-Block Transfer Mode

In repeat-block transfer mode, it is possible to realize repeated access to interval data and single or multiple ring buffers by combining the above address update modes. Following sections shows some usage examples.

16.3.6.1 Interval Address to Single Ring Buffer

Figure 16.18 shows an example of reading interval ADDRn registers (data register) of ADC12 module and storing it in single ring buffer. It transfers 2 data every 4 halfwords per 1 request. DMSAR is incremented by one data every one request. This can be achieved by setting the transfer source to offset addition and DMAMD.SADR=1, the block size (DMCRA) to 2, and the transfer source offset (DMSBS) to 4. Table 16.15 shows setting of this example.

Table 16.15 Setting of use case: from interval address to single ring buffer

Register	Value	Description
DMSAR, DMSRR	0x4033_2020	Initial source address
DMDAR, DMDRR	0x2000_0000	Initial destination address
DMTMD.SZ[1:0]	01b	Data size is halfword
DMAMD.SADR	1	Incremental source address after reloading
DMAMD.SM[1:0]	01b	Source update mode is offset addition
DMAMD.DM[1:0]	10b	Destination update mode is incremental address
DMCRAH, DMCRAL	2	Transfer block size
DMSBSH, DMSBSL	4	Source whole buffer size (unit is 'blocks') and Source access offset (unit is 'data')
DMDBSH, DMDBSL	N × 2 (DMCRA)	Destination buffer size (unit is 'data')

Figure 16.18 Example of use case: from interval address to single ring buffer

16.3.6.2 Unaligned Ring Buffer to Single Ring Buffer

Figure 16.19 shows an example of reading ADBUFn registers of ADC12 module (conversion result storage ring buffer) incrementally and storing it in single ring buffer. In this example, wrapping occurs because ADBUFn overflows in the fourth scan, but transfer source address of DMAC is also updated accordingly. This can be realized by setting the transfer source to incremental address and setting the DMSBS register to 16 which is the length of ADBUFn. This makes it possible to continue transfer without performing CPU processing using interrupts. Table 16.16 shows setting of this example.

Table 16.16 Setting of use case: from unaligned ring buffer to single ring buffer (1 of 2)

Register	Value	Description
DMSAR, DMSRR	0x4033_20B0	Initial source address
DMDAR, DMDRR	0x2000_0000	Initial destination address
DMTMD.SZ[1:0]	01b	Data size is halfword
DMAMD.SM[1:0]	10b	Source update mode is incremental address
DMAMD.DM[1:0]	10b	Destination update mode is incremental address

Table 16.16 Setting of use case: from unaligned ring buffer to single ring buffer (2 of 2)

Register	Value	Description
DMCRAH, DMCRAL	5	Transfer block size
DMSBSH, DMSBSL	16	Source buffer size (unit is 'data')
DMDBSH, DMDBSL	$N \times 5(\text{DMCRA})$	Destination buffer size (unit is 'data')

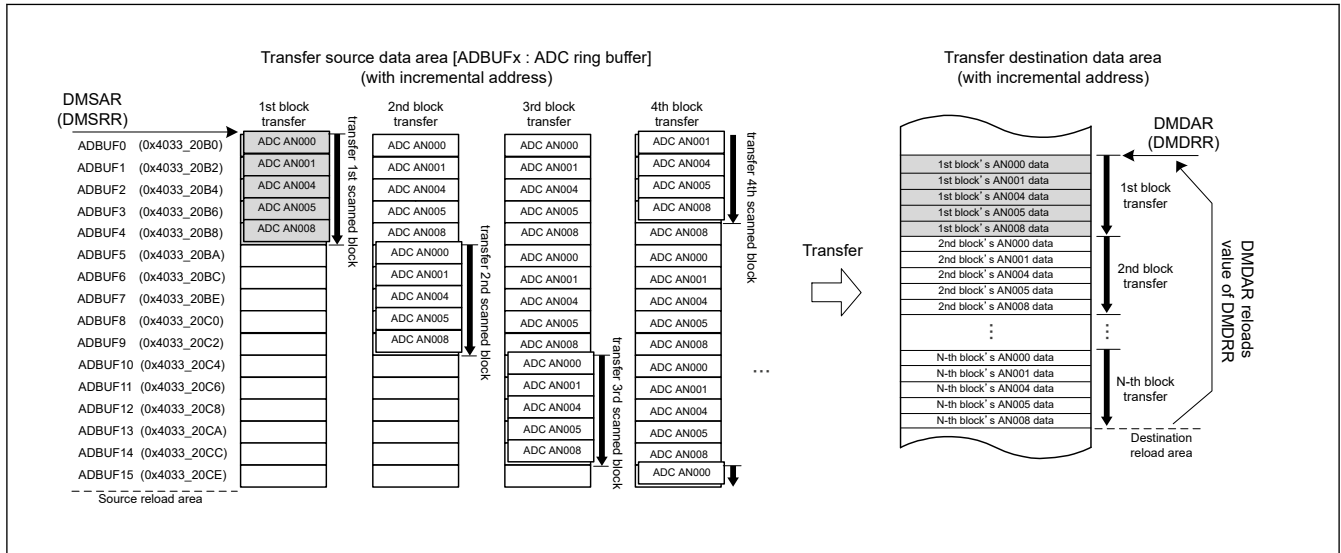

Figure 16.19 Example of use case: from unaligned ring buffer to single ring buffer

16.3.6.3 Single Block to Multi Ring Buffer

Figure 16.20 shows an example of storing the continuous ADDRn registers (data register) of ADC12 module individually in multiple ring buffers. In this example, a ring buffer in which only the first element (ADDR0) in a single block is arranged in transfer order is created at the destination. Also, in the next area, create a ring buffer in which only the second element (ADDR1) is arranged in transfer order. In the following case, create a ring buffer of length N, which is defined by DMDBS. And the number of data elements in the block is 3, which is defined by DMCRA. Table 16.17 shows setting of this example.

Table 16.17 Setting of use case: from single block to multi ring buffer

Register	Value	Description
DMSAR, DMSRR	0x4033_2020	Initial source address
DMDAR, DMDRR	0x2000_0000	Initial destination address
DMTMD.SZ[1:0]	01b	Data size is halfword
DMAMD.DADR	1	Incremental destination address after reloading
DMAMD.SM[1:0]	10b	Source update mode is incremental address
DMAMD.DM[1:0]	01b	Destination update mode is offset addition
DMCRAH, DMCRAL	3	Transfer block size
DMSBSH, DMSBSL	3	Source buffer size (unit is 'data')
DMDBSH, DMDBSL	N	Destination whole buffer size (unit is 'blocks') and Destination access offset (unit is 'data')

Figure 16.20 Example of use case: from single block to multi ring buffer

16.3.7 Activation Sources

Software, interrupt requests from the peripheral modules, and external interrupt requests can all be specified as DMAC activation sources. Set the DMTMD.DCTG[1:0] bits to select the activation source.

16.3.7.1 DMAC Activation by Software

When DMA transfer is started by software, follow below procedure.

1. Set the DMTMD.DCTG[1:0] bits to 00b.
2. Set the DMCNT.DTE bit to 1 (DMA transfer is enabled).
3. Set the DMAST.DMST bit set to 1 (DMAC activation enabled).
4. Set the DMREQ.SWREQ bit to 1 (DMA requested).

When the DMAC is activated by software while the DMREQ.CLRS bit is 0, the DMREQ.SWREQ bit is cleared to 0 after data transfer is started in response to a DMA transfer request.

When the DMAC is activated by software while the CLRS bit is 1, the SWREQ bit is not cleared to 0 after data transfer is started. In this case, a DMA transfer request is issued again after completion of a transfer.

16.3.7.2 DMAC Activation through Interrupt Requests from On-Chip Peripheral Modules or External Interrupt Requests

You can specify interrupt requests from on-chip peripheral modules and external interrupt requests as DMAC activation sources. The activation sources can be selected individually for each channel in DELSRn.DELS[8:0] (n = 0 to 7).

To start DMA transfer through an interrupt request from an on-chip peripheral module or an external interrupt request, follow the procedures as indicated below.

1. Set the DELSR.DELS[8:0] bits to the event number (select the DMAC event link).
2. Set the DMTMD.DCTG[1:0] bits to 01b (interrupts from the peripheral modules and the external interrupt pins).
3. Set the DMCNT.DTE bit to 1 (enable DMA transfer).
4. Set the DMAST.DMST bit set to 1 (DMAC activation enabled)

For interrupt requests specified as DMAC activation sources, see [Table 13.3](#), in [section 13, Interrupt Controller Unit \(ICU\)](#).

16.3.8 Operation Timing

The following timing charts show the minimum number of execution cycles.

[Figure 16.21](#) and [Figure 16.22](#) show DMAC operation timing examples.

Figure 16.21 DMAC operation timing example 1 with DMAC activation by Interrupt from peripheral module or external interrupt input pin, in normal transfer mode or repeat transfer mode

Figure 16.22 DMAC operation timing example 2 with DMAC activation by interrupt from peripheral module or external interrupt input pin, in block transfer mode with block size = 4

16.3.9 Activating the DMAC

Table 16.18 shows the register setting procedure of normal, repeat and block transfer mode and Table 16.19 shows register setting procedure of repeat-block transfer mode.

Table 16.18 Register Setting Procedure of Normal Transfer Mode, Repeat Transfer Mode and Block Transfer Mode (1 of 2)

No.	Step Name	Description
1	Disable the peripheral function as the DMAC request source.	To use peripheral function interrupts as DMAC activation sources. Disable the control register for the peripheral function.
2	Disable the IRQn pin as the DMAC request source.	To use external pin interrupts as DMAC activation sources.
3	Set the DELSR.DELS[8:0] bits to 0x00.	Disable the DMAC request.

Table 16.18 Register Setting Procedure of Normal Transfer Mode, Repeat Transfer Mode and Block Transfer Mode (2 of 2)

No.	Step Name	Description
4	Clear the DMCNT.DTE bit to 0	Disable DMA transfer.
5	Set the interrupt request as a DMAC request source in the DELSR register.	To use internal peripheral interrupts or external pin interrupts as DMAC activation sources. Enable the interrupt bit for the activation source. Set the DMAC activation source.
6	Set the peripheral module as a DMAC request source	To use peripheral function interrupt as a DMAC activation source. Set the control register for the peripheral function without starting it.
7	Set the IRQn pin function by using the ICU.	To use external pin interrupt as a DMAC activation source. Set the IRQn pin function by using the Interrupt Controller Unit.
8	Set the DMAMD.DM[1:0] bits Set the DMAMD.SM[1:0] bits Set the DMAMD.DARA[4:0] bits Set the DMAMD.SARA[4:0] bits	Set the Transfer destination address update mode bits Set the Transfer source address update mode bits Set the Transfer destination address extended repeat area bits Set the Transfer source address extended repeat area bits
9	Set the DMTMD.DCTG[1:0] bits Set the DMTMD.SZ[1:0] bits Set the DMTMD.DTS[1:0] bits Set the DMTMD.MD[1:0] bits Set the DMTMD.TKP bit	Set the Transfer request select bits Set the Data transfer size bits Set the Repeat area select bits Set the Transfer mode select bits Set the transfer keeping select bit
10	Set the DMSAR register Set the DMDAR register Set the DMCRA register	Set the transfer source start address. Set the transfer destination start address. Set the number of transfer operations.
11	Set the DMCRB register	To use block transfer mode or repeat transfer mode. Set the number of block transfer operations.
12	Set the DMOFR register	To use the address update function with offset. Set the offset value.
13	Set the DMINT.DTIE bit to 1	To use the DMA transfer end interrupts. Enable DMAC transfer end interrupts.
14	Set the DMINT.RPTIE bit Set the DMINT.SARIE bit Set the DMINT.DARIE bit Set the DMINT.ESIE bit to 1	To use the DMA transfer escape end interrupts Set the repeat size end interrupt. Set the transfer source address extended repeat area overflow interrupt. Set the transfer destination address extended repeat area overflow interrupt. Enable the DMA transfer escape end interrupt.
15	Set the DMCNT.DTE bit to 1	Enable DMA transfer.
16	Set the DMAST.DMST bit to 1	Enable DMAC operation. *1 Common settings for DMAC
17	Start the peripheral function as a DMAC request source	To use peripheral function interrupt as a DMAC activation source
18	Enable the IRQn pin as a DMAC request source	To use external pin interrupt as a DMAC activation source
19	End of initial settings	For activation by software On completion of the initial settings, writing 1 to the DMA software start bit (DMREQ.SWREQ) starts DMA transfer.

Note 1. The DMAST.DMST bit setting does not necessarily have to follow the settings for the individual activation sources.

Table 16.19 Register Setting Procedure of Repeat-Block Transfer Mode (1 of 2)

No.	Step Name	Description
1	Disable the peripheral function as the DMAC request source.	To use peripheral function interrupts as DMA activation sources. Disable the control register for the peripheral function.
2	Disable the IRQ pin as the DMAC request source.	To use external pin interrupts as DMA activation sources.
3	Set the DELSR.DELS[8:0] bits to 0x00.	Disable the DMAC request.
4	Clear the DMCNT.DTE bit to 0	Disable DMAC transfer.

Table 16.19 Register Setting Procedure of Repeat-Block Transfer Mode (2 of 2)

No.	Step Name	Description
5	Set the interrupt request as a DMAC request source in the DELSR register.	To use internal peripheral interrupts or external pin interrupts as DMA activation sources. Enable the interrupt bit for the activation source. Set the DMAC activation source.
6	Set the peripheral module as a DMAC request source	To use peripheral function interrupt as a DMA activation source. Set the control register for the peripheral function without starting it.
7	Set the IRQ pin function by using the Interrupt Controller Unit.	To use external pin interrupt as a DMA activation source. Set the IRQ pin function by using the Interrupt Controller Unit.
8	Set the DMAMD.DM[1:0] bits Set the DMAMD.SM[1:0] bits Set the DMAMD.DADR bit Set the DMAMD.SADR bit	Set the Transfer destination address update mode bits Set the Transfer source address update mode bits Set the Transfer destination address update select after reload Set the Transfer source address update select after reload
9	Set the DMTMD.DCTG[1:0] bits Set the DMTMD.SZ[1:0] bits Set the DMTMD.MD[1:0] bits Set the DMTMD.TKP bit	Set the Transfer request select bits Set the Data transfer size bits Set the Transfer mode to repeat-block transfer mode Set the transfer keeping select bit
10	Set the DMSAR register Set the DMDAR register Set the DMSRR register Set the DMDRR register Set the DMCRA register Set the DMCRB register	Set the transfer source start address Set the transfer destination start address Set the initial value of source start address Set the initial value of destination start address Set the number of transfer operations Set the number of block transfer operations
11	Set the DMSBS register Set the DMDBS register	To use the address update function with incremental, decremental or offset Set the source buffer size and access offset Set the destination buffer size and access offset
12	Set the DMINT.DTIE bit to 1	To use DMA transfer end interrupts. Enable DMAC transfer end interrupts.
13	Set the DMCNT.DTE bit to 1	Enable DMAC transfer
14	Set the DMAST.DMST bit to 1	Enable DMAC operation. *1
15	Start the peripheral function as a DMAC request source	To use peripheral function interrupt as a DMA activation source
16	Enable the IRQ pin as a DMAC request source	To use external pin interrupt as a DMA activation source
17	End of initial settings	For activation by software On completion of the initial settings, writing 1 to the DMA software start bit (DMREQ.SWREQ) starts DMA transfer.

Note 1. The DMAST.DMST bit setting does not necessarily have to follow the settings for the individual activation sources.

16.3.10 Starting DMA Transfer

To enable the DMA transfer, set the DMCNT.DTE bit to 1 (enable the DMA transfer), and then set the DMAST.DMST bit to 1 (enable the DMAC activation).

New activation requests are not accepted during the transfer of another DMAC channel or DTC. When the preceding transfer is complete, channel arbitration selects the DMA transfer request of the highest priority channel, and the DMA transfer of that channel starts. When the DMA transfer starts, the DMSTS.ACT flag is set to 1 (the DMAC is in the active state).

16.3.11 Registers during DMA Transfer

The DMAC registers are updated by a DMA transfer. The value to be updated differs according to the other settings and the transfer state. The registers to be updated are DMSAR, DMDAR, DMCRA, DMCRB, DMSBS, DMDBS, DMCNT, and DMSTS.

DMA Source Address Register (DMSAR)

When data has been transferred in response to one transfer request, the contents of DMSAR are updated to the address to be accessed by the next transfer request.

For details on register update operation in each transfer mode, see [Table 16.5](#) to [Table 16.13](#).

DMA Destination Address Register (DMDAR)

When data has been transferred in response to one transfer request, the contents of DMDAR are updated to the address to be accessed by the next transfer request.

For details on register update operation in each transfer mode, see [Table 16.5](#) to [Table 16.13](#).

DMA Transfer Count Register (DMCRA)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see [Table 16.5](#) to [Table 16.13](#).

DMA Block Transfer Count Register (DMCRB)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see [Table 16.5](#) to [Table 16.13](#).

DMA Source Buffer Size Register (DMSBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see [Table 16.8](#) to [Table 16.13](#).

DMA Destination Buffer Size Register (DMDBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see [Table 16.8](#) to [Table 16.13](#).

DMA Transfer Enable Bit (DMCNT.DTE)

Although the DMCNT.DTE bit enables or disables data transfer by the register write access, it is automatically cleared to 0 by the DMAC according to the DMA transfer state.

The conditions for clearing this bit by the DMAC are as follows:

- When the specified total volume of data transfer is completed
- When DMA transfer is stopped by the repeat size end interrupt
- When DMA transfer is stopped by the extended repeat area overflow interrupt
- When DMA transfer error occurs

Writing to the registers for the channels when the corresponding DMCNT.DTE bit is set to 1 is prohibited (except for DMCNT). In this case, writing must be performed after the bit is cleared to 0.

DMAC Active Flag (DMSTS.ACT)

The DMSTS.ACT flag indicates whether the DMACn is in the idle or active state.

This flag is set to 1 when the DMAC starts data transfer, and is cleared to 0 when data transfer in response to one transfer request is completed.

Even when DMA transfer is stopped by writing 0 to the DMCNT.DTE bit during DMA transfer, this flag remains 1 until DMA transfer is completed.

Transfer End Interrupt Flag (DMSTS.DTIF)

The DMSTS.DTIF flag is set to 1 after DMA transfer of the total transfer size of data is completed.

When both this flag and the DMINT.DTIE bit are set to 1, a transfer end interrupt is requested.

This flag is set to 1 when the DMA transfer bus cycle is completed and the DMSTS.ACT flag is cleared to 0 indicating the DMA transfer end.

This flag is automatically cleared to 0 when the DMCNT.DTE bit is set to 1 during the interrupt handling.

Transfer Escape End Interrupt Flag (DMSTS.ESIF)

The DMSTS.ESIF flag is set to 1 when a repeat size end interrupt or extended repeat area overflow interrupt is requested. When this bit and the DMINT.ESIE bit are set to 1, a transfer escape end interrupt is requested.

This flag is set to 1 when the bus cycle of the DMA transfer having caused the interrupt request is completed and the DMSTS.ACT flag is cleared to 0 indicating the DMA transfer end.

This flag is automatically cleared to 0 when the DMCNT.DTE bit is set to 1 during an interrupt handling.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set.

For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

16.3.12 Channel Priority

When multiple DMA transfer requests are present, the DMAC determines the priority of channels that have DMA transfer requests.

- The channel priority is fixed as follows: Channel 0 > Channel 1 > Channel 2 > Channel 3... > Channel 7 (Channel 0: Highest).

When a DMA transfer request is generated during data transfer, channel arbitration is started after the final data has been transferred, and DMA transfer of the higher-priority channel starts.

16.3.13 Channel Security

The secure attribute can be set with CPSCU.DMACCHSAR.SADMACn for each DMAC channel.

When the CPSCU.DMACCHSAR.SADMACn bit is 0.

- When the corresponding channel transfers, it behaves as a secure master.
- The register of corresponding channel has a secure attribute.

When the CPSCU.DMACCHSAR.SADMACn bit is 1.

- When the corresponding channel transfers, it behaves as a non-secure master.
- The register of corresponding channel has a non-secure attribute.

Refer to the Security chapter and BUS chapter for areas accessible to secure and non-secure masters.

Do not change to the CPSCU.DMACCHSAR while DMA transfer.

16.3.14 Channel Privilege

The privileged attribute can be set with CPSCU.DMACCHPAR.DMACCHPARn for each DMAC channel n.

When the CPSCU.DMACCHPAR.DMACCHPARn bit is 0.

- When the corresponding channel transfers, it behaves as a privileged master.
- The registers of channel are protected from a unprivileged access.

When the CPSCU.DMACCHPAR.DMACCHPARn bit is 1.

- The transfer of DMAC channel is unprivileged access for both read and write.
- The registers of channel are unprivileged attributes.

Do not change to the CPSCU.DMACCHPAR while DMA transfer.

16.4 Ending DMA Transfer

The operation for ending DMA transfer depends on the transfer end conditions. When DMA transfer ends, the DMCNT.DTE bit and the DMSTS.ACT flag are changed from 1 to 0, indicating that DMA transfer has ended.

16.4.1 Transfer End by Completion of Specified Total Number of Transfer Operations

(1) In Normal Transfer Mode (DMTMD.MD[1:0] = 00b)

When the value of DMCRAL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, a transfer end interrupt request is issued to the CPU or the DTC.

(2) In Repeat Transfer Mode (DMTMD.MD[1:0] = 01b)

When the value of DMCRBL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

If the DMTMD.TKP bit is 1 (in free-running function), the DMSTS.DTIF bit is set to 1, but the DMCNT.DTE bit is not cleared to 0.

(3) In Block Transfer Mode (DMTMD.MD[1:0] = 10b)

When the value of DMCRBL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set.

For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

If the DMTMD.TKP bit is 1 (in free-running function), the DMSTS.DTIF bit is set to 1, but the DMCNT.DTE bit is not cleared to 0.

(4) In Repeat-Block Transfer Mode (DMTMD.MD[1:0] = 11b)

When the value of DMCRBL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

If the DMTMD.TKP bit is 1 (in free-running function), the DMSTS.DTIF bit is set to 1, but the DMCNT.DTE bit is not cleared to 0.

16.4.2 Transfer End by Repeat Size End Interrupt

In repeat transfer mode, a repeat size end interrupt is requested when transfer of a 1-repeat size of data is completed while the DMINT.RPTIE bit is set to 1. When the interrupt is requested to complete DMA transfer, the DMCNT.DTE bit is cleared to 0 and the DMSTS.ESIF flag is set to 1 even if the DMTMD.TKP bit is 1 (in free-running function). If the DMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC. Here, the transfer can be resumed by writing 1 to the DMCNT.DTE bit.

A repeat size end interrupt can be requested also in block transfer mode. In block transfer mode, the interrupt is requested in the same way as in repeat transfer mode when transfer of a 1-block size data is completed.

Repeat size end interrupt cannot be requested in repeat-block transfer mode.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

16.4.3 Transfer End by Interrupt on Extended Repeat Area Overflow

When an overflow on the extended repeat area occurs while the extended repeat area is specified and the DMINT.SARIE or DMINT.DARIE bit is set to 1 even if the DMTMD.TKP bit is 1 (in free-running function), an interrupt by an extended repeat area overflow is requested. When the interrupt is requested, the DMA transfer is terminated, the DMCNT.DTE bit is cleared to 0, and the ESIF flag in DMSTS is set to 1. If the DMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

Even if an interrupt by an extended repeat area overflow is requested during a read cycle, the following write cycle is performed.

In block transfer mode, even if an interrupt by an extended repeat area overflow is requested during a 1-block transfer, the remaining data in the block is transferred; transfer is terminated after a block transfer.

An interrupt by an extended repeat area overflow cannot be requested in repeat-block transfer mode.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

16.5 Processing on DMA Transfer Error

DMA transfer error occurs with MSAU error, the Slave TrustZone Filter error, the Master MPU error, the Slave Bus Error or the Illegal Access Error. If the access error occurs during the DMA transfer, the DMAC immediately stops the transfer of error occurred channel. At this time, the ICU setting of the corresponding channel is also cleared. If there is a request other than the channel which caused the error, it will be re-arbitration as it is.

When the transfer error occurs, DMCNT.DTE of the error causing channel is set to 0. Also, the error response is informed to the DELSRn of the corresponding channel is cleared. Write back to each register is not performed. The information of the channel that caused the error is set in DMECHR.

16.6 Interrupts

16.6.1 Transfer End Interrupt

Each DMAC channel can output an interrupt request (DMAC0n_INT) to the CPU or the DTC after transfer in response to one request is completed.

When the transfer destination is the external bus, an interrupt request is generated upon completion of data write to the write buffer not to the actual transfer destination.

In repeat-block transfer mode, do not enable escape transfer end interrupt.

[Table 16.20](#) lists the relation among the interrupt sources, the interrupt status flags, and the interrupt enable bits. [Figure 16.23](#) shows the schematic logic diagram of interrupt outputs (DMACn (n = 0 to 7)). [Figure 16.24](#) shows the DMAC interrupt handling routine to resume/terminate DMA transfer.

Table 16.20 Relation among interrupt sources, interrupt status flags, and interrupt enable bits

Interrupt sources		Interrupt enable bits	Interrupt status flags	Request output enable bits
Transfer end		—	DMSTS.DTIF	DMINT.DTIE
Escape transfer end	Repeat size end	DMINT.RPTIE	DMSTS.ESIF	DMINT.ESIE
	Source address extended repeat area overflow	DMINT.SARIE		
	Destination address extended repeat area overflow	DMINT.DARIE		

Figure 16.23 Schematic logic diagram of interrupt output source (DMACn)

Specifically, the different procedures are used for canceling an interrupt to restart DMA transfer in the following two cases:

- When terminating a DMA transfer
- When continuing a DMA transfer

16.6.1.1 When Discontinuing or Terminating a DMA Transfer

Write 0 to the DMSTS.DTIF flag to clear a transfer end interrupt, and to the DMSTS.ESIF flag to clear a repeat size interrupt and an extended repeat area overflow interrupt. The corresponding DMACn channel remains in the stop state. When starting another DMA transfer after that, set the appropriate registers, and set the DMCNT.DTE bit to 1 (DMA transfer enabled).

16.6.1.2 When Continuing a DMA Transfer

Write 1 to the DMCNT.DTE bit. The DMSTS.ESIF flag is automatically cleared to 0 (interrupt source cleared), and DMA transfer is resumed.

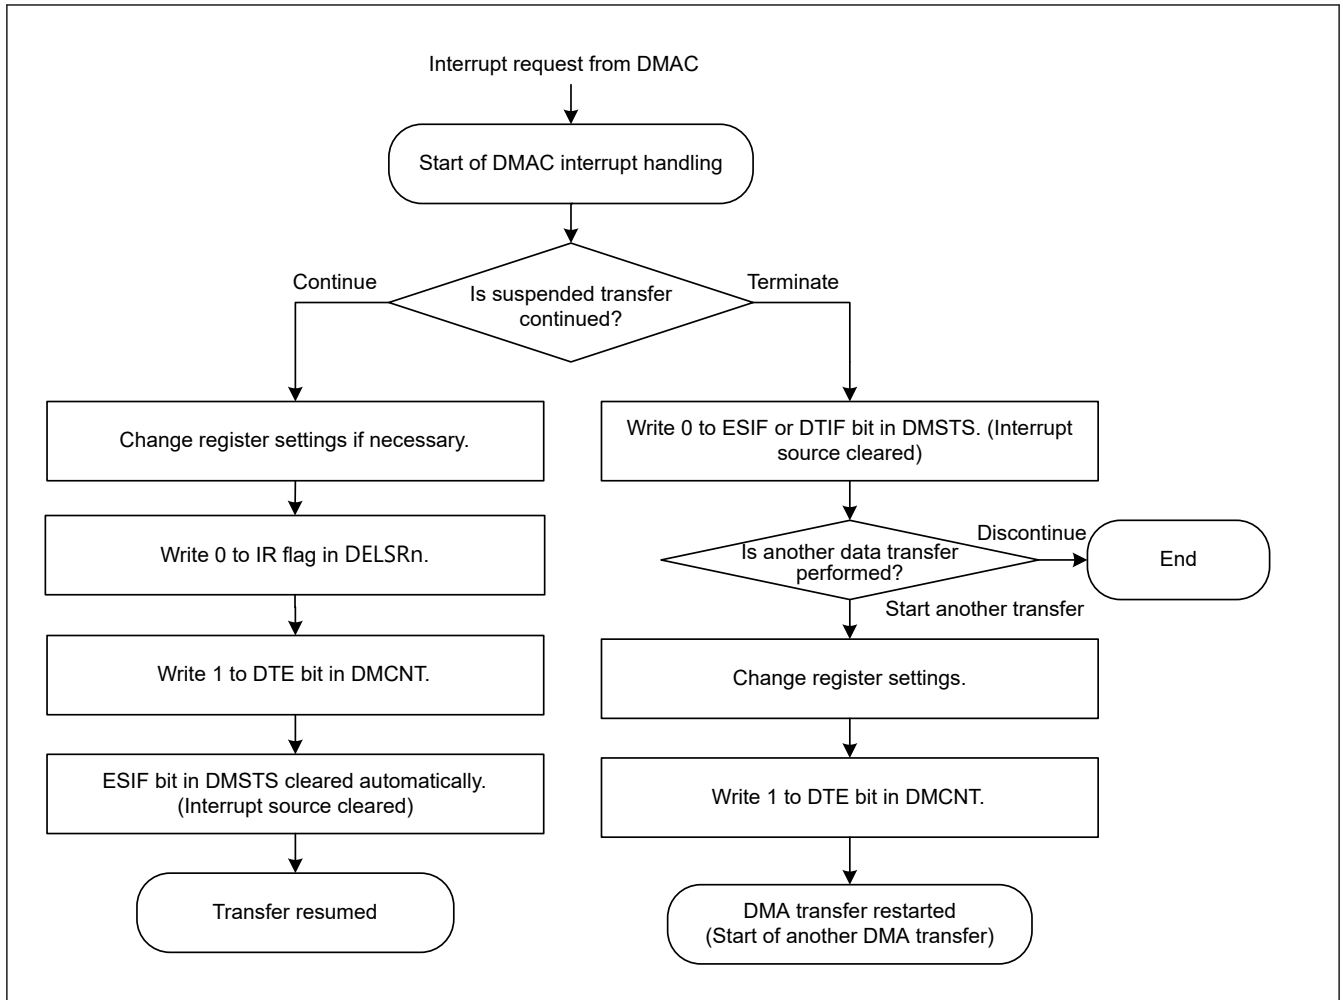

Figure 16.24 DMAC Interrupt Handling Routine to Resume/Terminate DMA Transfer

16.6.2 Transfer Error Interrupt

Error response detection interrupt request (DMA0_TRANSERR) is generated from the DMAC/DTC when the transfer error is detected during DMAC transfer.

The types of interrupts that occur when a DMAC transfer error occurs are listed in the Table 16.21. The Table 16.21 also shows error information stored when a transfer error occurs.

Table 16.21 Interrupt and error information due to DMAC transfer error cause

Transfer error factor	NMI/RESET*1 Request	Interrupt Request	Bus Error Status	Error Address Error R/W	Error Channel Information
MSAU Error	ICU.NMISR.BUSST	DMA0_TRANSERR*1	BUS.BUS4ERRSTAT. MSERRSTAT	BUS.BMSA4ERRADD BUS.BMSA4ERRRW	DMAC. DMECHR
Master MPU Error	ICU.NMISR.BUSST	DMA0_TRANSERR*1	BUS.BUS4ERRSTAT. MMERRSTAT	BUS.BUS4ERRADD BUS.BUS4ERRRW	DMAC. DMECHR
Illegal Access Error	ICU.NMISR.BUSST	DMA0_TRANSERR*1	BUS.BUS4ERRSTAT. ILERRSTAT	BUS.BUS4ERRADD BUS.BUS4ERRRW	DMAC. DMECHR
Slave Bus Error	ICU.NMISR.BUSST	DMA0_TRANSERR*1	BUS.BUS4ERRSTAT. SLERRSTAT	BUS.BUS4ERRADD BUS.BUS4ERRRW	DMAC. DMECHR
TrustZone Filter error	ICU.NMISR.BUSST	DMA0_TRANSERR*1	BUS.BUS4ERRSTAT. STERRSTAT	BUS.BUS4ERRADD BUS.BUS4ERRRW	DMAC. DMECHR

Note 1. If ICU.NMIER.BUSEN is enabled with DMA0_TRANSERR set in ICU.IELSR, NMI and an interrupt will occur due to a transfer error caused by DMA. Only NMI can be generated by not setting DMA_TRANSERR to ICU.IELSR.

16.7 Event Link

Each DMAC channel outputs an event link request signal (DMAC0n_INT) every time it completes a data transfer, or a block transfer in block transfer mode.

When the transfer destination is the external bus, an event link request signal is generated when the writing to the write buffer is accepted.

For details, see [section 18, Event Link Controller \(ELC\)](#).

16.8 Low-Power Consumption Function

Before entering the module-stop state, Software Standby mode or Deep Software Standby mode, you must first set the DMAST.DMST bit to 0 (the DMAC module suspended) and use the settings in the sections that follow.

(1) Module-stop function

Writing 1 to the MSTPCRA.MSTPA22 bit enables the module-stop function of the DMAC. If a DMA transfer is in progress when 1 is written to the MSTPA22 bit, the transition to the module-stop state proceeds after the DMA transfer ends. Access to the DMAC registers is prohibited while the MSTPA22 bit is 1. Writing 0 to the MSTPA22 bit releases the DMAC from the module-stop state.

(2) Software Standby mode and Deep Software Standby mode

Use the settings described in [section 10.7.3.1. Transition to Software Standby Mode](#), or in [section 10.7.4.1. Transition to Deep Software Standby Mode](#).

If DMA transfer operations are in progress when the WFI instruction is executed, the DMA transfer completes before the transition to Software Standby mode or Deep Software Standby mode.

(3) Notes on low power consumption function

For information on the WFI instruction and register settings, see [section 10.8.7. Timing of WFI Instructions](#).

To perform a DMA transfer after returning from a low power mode, set the DMAST.DMST bit to 1 again. To use a request that is generated in Software Standby mode as an interrupt request to the CPU but not as a DMAC startup request, specify the CPU as the interrupt request destination, as described in [section 13.5.5. Selecting Interrupt Request Destinations](#), and then execute the WFI instruction.

16.9 Usage Notes

16.9.1 DMA Transfer to External Devices

In a DMA transfer to an external device, the DMSTS.ACT flag may change to 0 (the DMAC suspended) before the external bus access ends after the final data write is started.

16.9.2 Access to the Registers during DMA Transfer

Do not write to the following registers while the DMSTS.ACT flag of the same channel is set to 1 (DMAC active state) or the DMCNT.DTE bit of the same channel is set to 1 (DMA transfer enabled):

- DELSR
- DMSAR
- DMDAR
- DMCRA
- DMCRB
- DMTMD
- DMINT
- DMAMD
- DMOFR
- DMSBS

- DMDBS
- DMSRR
- MDRR
- DMBWR
- ICUSARC
- DMACSAR

16.9.3 DMA Transfer to Reserved Areas

DMA transfer to the reserved areas is prohibited. If such an access is made, transfer results are not guaranteed. For details on the reserved areas, see [section 4, Address Space](#).

16.9.4 Setting of DMAC Event Link Setting Register of the Interrupt Controller Unit (DELSRn)

The DMAC event link setting register (DELSRn) should be set while the DMA transfer enable bit (DMCNT.DTE) is cleared to 0 (DMA transfer is disabled). Moreover, the DTC activation enable register (ICU.IELSRn.DTCE (n = 0 to 95)) that corresponds to the same event number that has been set by the DELSRn register should not be set to 1. For details on the ICU.IELSRn.DTCE, see [section 13, Interrupt Controller Unit \(ICU\)](#).

16.9.5 Suspending or Restarting DMAC Activation

To suspend a DMAC activation request, write 0x00 to the DMAC Event Link select bits (DELSRn.DELS[8:0]). To restart the DMA transfer, write the event number to the DELSRn.DELS[8:0] bits following the settings shown in [section 16.3.9, Activating the DMAC](#).

16.9.6 Precautions for Resuming DMA Transfer

A DMAC activation request might occur in the next request after a DMA transfer completes. If this happens, the DMA transfer starts and the DMAC activation request is held in the DMAC. To prevent this, stop the DMAC activation requests by setting the DELSRn.DELS[8:0] bits to 0.

When a DMAC activation request occurs after the last round of the DMA transfer is generated, clear the DMAC activation request with either of the following approaches.

- Clear the DMAC activation request with a DMA dummy transfer.
- Set the DMCNT.DTE bit to 0 and then set the DELSRn.IR flag to 0.

See [Figure 16.25](#).

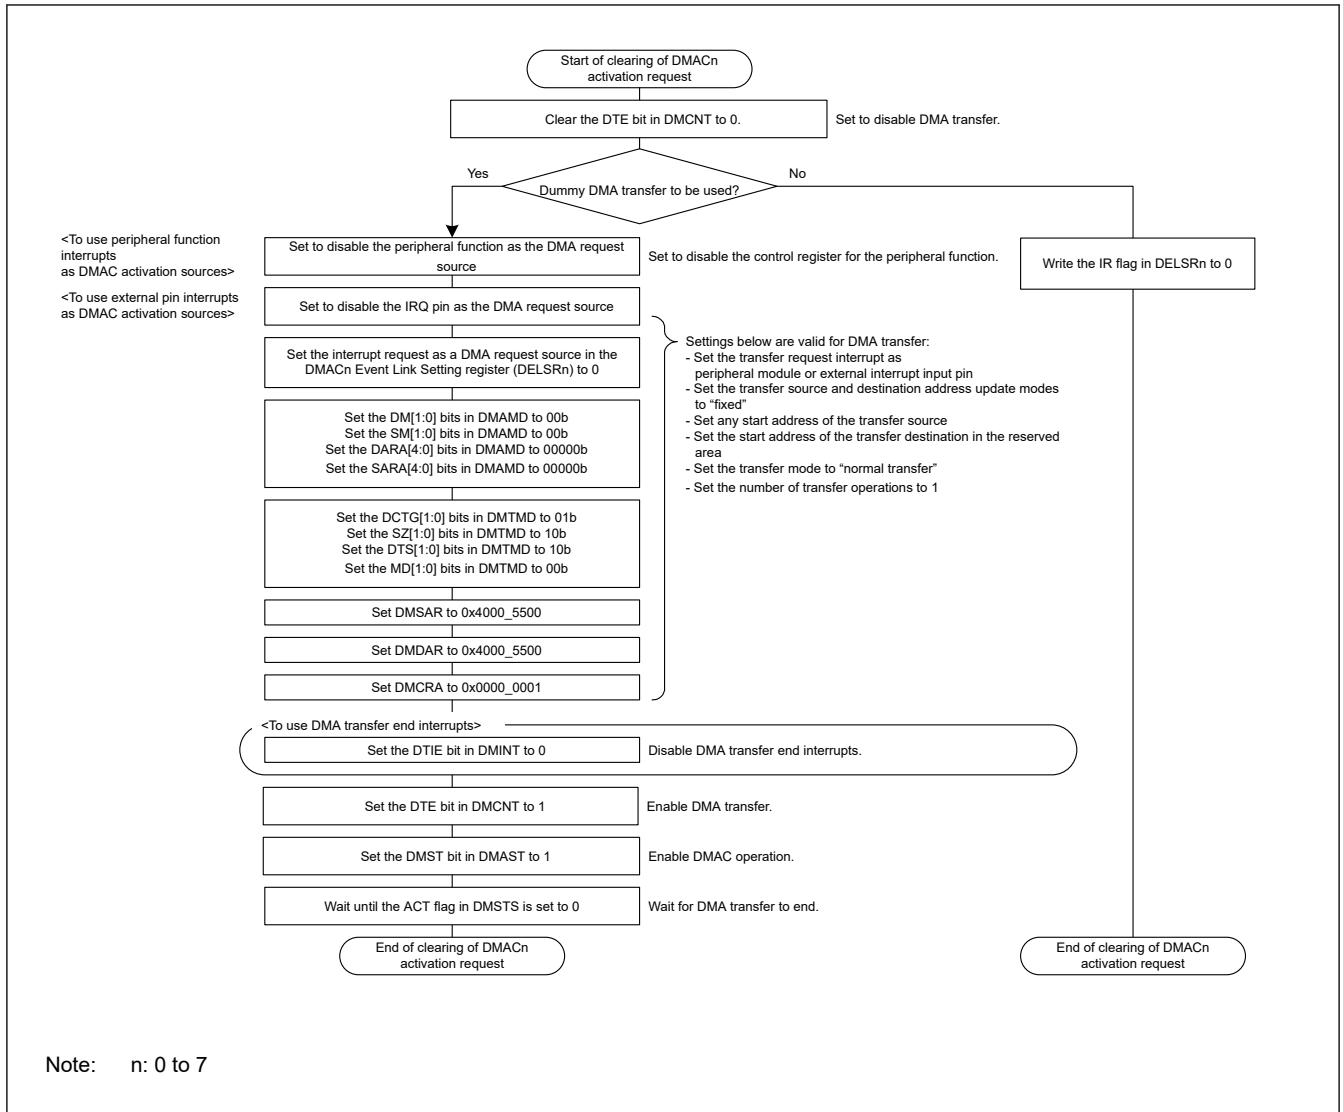

Figure 16.25 Example of register setting procedure to clear the DMAC activation interrupt

16.9.7 Restriction for OSPI

There is a restriction to using OSPI, see [section 33.3.8.5. Restriction in 8D-8D-8D profile 1.0 format.](#)

17. Data Transfer Controller (DTC)

17.1 Overview

A Data Transfer Controller (DTC) module is provided for transferring data when activated by an interrupt request.

[Table 17.1](#) lists the DTC specifications and [Figure 17.1](#) shows DTC block diagram.

Table 17.1 DTC specifications

Parameter	Description
Transfer modes	<ul style="list-style-type: none"> Normal transfer mode A single activation leads to a single data transfer. Repeat transfer mode A single activation leads to a single data transfer. The transfer address returns to the start address after the number of data transfers reaches the specified repeat size. The maximum number of repeat transfers is 256 and the maximum data transfer size is 256 × 32 bits (1024 bytes) Block transfer mode A single activation leads to a transfer of a single block. The maximum block size is 256 × 32 bits = 1024 bytes.
Transfer channel	<ul style="list-style-type: none"> Channel transfer can be associated with the interrupt source (transferred by a DTC activation request from the ICU) Multiple data units can be transferred on a single activation source (chain transfer) Chain transfers are selectable to either execute when the counter is 0, or always execute.
Transfer space	<ul style="list-style-type: none"> 4 GB area from 0x0000_0000 to 0xFFFF_FFFF, excluding reserved areas
Data transfer units	<ul style="list-style-type: none"> Single data unit: 1 byte (8 bits), 1 halfword (16 bits), 1 word (32 bits) Single block size: 1 to 256 data units.
CPU interrupt source	<ul style="list-style-type: none"> An interrupt request can be generated to the CPU on a DTC activation interrupt An interrupt request can be generated to the CPU after a single data transfer An interrupt request can be generated to the CPU after a data transfer of a specified volume.
Processing on DTC transfer error	<ul style="list-style-type: none"> When the DTC transfer error occurs, it stops the transfer that caused the error Request to clear the register for activation request of DTC error number to ICU
Error response detection interrupt	Generated when the DTC transfer error occurs
Event link function	An event link request is generated after one data transfer (for block, after one block transfer)
Read skip	Read of transfer information can be skipped
Write-back skip	When the transfer source or destination address is specified as fixed, a write-back of transfer information can be skipped
Module-stop function	Module-stop state can be set to reduce power consumption
TrustZone Filter	Security and Privilege attribution can be set for each activation source

Note: Security attribution Register of DTC is described in ICU.ICUSARG, ICU.ICUSARH and ICU.ICUSARI

Figure 17.1 DTC block diagram

See section 13.1. Overview in section 13, Interrupt Controller Unit (ICU) for the connections between the DTC and NVIC in the CPU.

17.2 Register Descriptions

MRA, MRB, SAR, DAR, CRA, and CRB are all DTC internal registers that cannot be directly accessed from the CPU. Values to be set in these DTC internal registers are placed in the SRAM area as transfer information. When an activation request is generated, the DTC reads the transfer information from the SRAM area and sets it in its internal registers. After the data transfer ends, the internal register contents are written back to the SRAM area as transfer information.

17.2.1 DTCSAR : DTC Controller Security Attribution Register

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x30

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DTCS TSA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DTCS TSA	DTC Security Attribution 0: Secure. 1: Non-secure.	R/W

Bit	Symbol	Function	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

This register only sets the DTCST security attribute.

DTCSTSA bit (DTC Security Attribution)

Security attributes of registers for DTCST and DTCSTS.

Do not write to the DTCSTSA bit while DTC transfer is enabled or a bus master is writing to the DTC registers.

17.2.2 MRA : DTC Mode Register A

Base address: DTCVBR_SEC
DTCVBR

Offset address: 0x03 + 0x4 × Vector number
(Inaccessible directly from the CPU. See [section 17.3.1. Allocating Transfer Information and DTC Vector Table.](#))

Bit	Symbol	Function	R/W
1:0	—	The read values are undefined. The write value should be 0.	—
3:2	SM[1:0]	Transfer Source Address Addressing Mode 0 0: Address in the SAR register is fixed (write-back to SAR is skipped.) 0 1: Address in the SAR register is fixed (write-back to SAR is skipped.) 1 0: SAR value is incremented after data transfer: +1 when SZ[1:0] = 00b +2 when SZ[1:0] = 01b +4 when SZ[1:0] = 10b 1 1: SAR value is decremented after data transfer: -1 when SZ[1:0] = 00b -2 when SZ[1:0] = 01b -4 when SZ[1:0] = 10b	—
5:4	SZ[1:0]	DTC Data Transfer Size 0 0: Byte (8-bit) transfer 0 1: Halfword (16-bit) transfer 1 0: Word (32-bit) transfer 1 1: Setting prohibited	—
7:6	MD[1:0]	DTC Transfer Mode Select 0 0: Normal transfer mode 0 1: Repeat transfer mode 1 0: Block transfer mode 1 1: Setting prohibited	—

The MRA register cannot be accessed directly from the CPU, however the CPU can access the SRAM area (transfer information (n) start address + 0x03) and DTC transfers it automatically to and from the MRA register. See [section 17.3.1. Allocating Transfer Information and DTC Vector Table.](#)

17.2.3 MRB : DTC Mode Register B

Base address: DTCVBR_SEC
DTCVBR

Offset address: $0x02 + 0x4 \times \text{Vector number}$
(Inaccessible directly from the CPU. See [section 17.3.1. Allocating Transfer Information and DTC Vector Table.](#))

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CHNE	CHNS	DISEL	DTS	DM[1:0]	—	—	
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
1:0	—	The read values are undefined. The write value should be 0.	—
3:2	DM[1:0]	Transfer Destination Address Addressing Mode 0 0: Address in the DAR register is fixed (write-back to DAR is skipped) 0 1: Address in the DAR register is fixed (write-back to DAR is skipped) 1 0: DAR value is incremented after data transfer: +1 when MRA.SZ[1:0] = 00b +2 when SZ[1:0] = 01b +4 when SZ[1:0] = 10b 1 1: DAR value is decremented after data transfer: -1 when MRA.SZ[1:0] = 00b -2 when SZ[1:0] = 01b -4 when SZ[1:0] = 10b	—
4	DTS	DTC Transfer Mode Select 0: Select transfer destination as repeat or block area. 1: Select transfer source as repeat or block area.	—
5	DISEL	DTC Interrupt Select 0: Generate an interrupt request to the CPU when specified data transfer is complete. 1: Generate an interrupt request to the CPU each time DTC data transfer is performed.	—
6	CHNS	DTC Chain Transfer Select 0: Chain transfer is continuous. 1: Chain transfer occurs only when the transfer counter changes from 1 to 0 or 1 to CRAH.	—
7	CHNE	DTC Chain Transfer Enable 0: Chain transfer is disabled. 1: Chain transfer is enabled.	—

The MRB register cannot be accessed directly from the CPU, however the CPU can access the SRAM area (transfer information (n) start address + 0x02) and DTC transfers it automatically to and from the MRB register. See [section 17.3.1. Allocating Transfer Information and DTC Vector Table.](#)

DM[1:0] bits (Transfer Destination Address Addressing Mode)

The DM[1:0] bits are to fix the address of the DAR register or specify increment / decrement of the DAR register after transfer.

DTS bit (DTC Transfer Mode Select)

The DTS bit specifies whether the transfer source or destination is the repeat or block area in repeat or block transfer mode.

DISEL bit (DTC Interrupt Select)

The DISEL bit specifies the condition for generating an interrupt request to the CPU.

CHNS bit (DTC Chain Transfer Select)

The CHNS bit selects the chain transfer condition. When CHNE is 0, the CHNS setting is ignored. For details on the conditions for chain transfer, see [Table 17.3.](#)

When the next transfer is chain transfer, completion of the specified number of transfers is not determined, the activation source flag is not cleared, and an interrupt request to the CPU is not generated.

CHNE bit (DTC Chain Transfer Enable)

The CHNE bit enables chain transfer. The chain transfer condition is selected by the CHNS bit. For details on chain transfer, see section 17.4.6. Chain Transfer. When the chain transfer settings are CHNE = 1 and CHNS = 0, the transfer count according to the transfer settings will be -1 for each transfer request. Therefore, the transfer count for each transfer information must match.

17.2.4 SAR : DTC Transfer Source Register

Base address: DTCVBR_SEC
DTCVBR

Offset address: 0x04 + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 17.3.1. Allocating Transfer Information and DTC Vector Table.)

Bit position: 31

0

Bit field:

Value after reset: x

The SAR sets the transfer source start address and cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x04) and DTC transfers it automatically to and from the SAR register. See section 17.3.1. Allocating Transfer Information and DTC Vector Table.

Misalignment is prohibited for DTC transfers. Bit[0] must be 0 when MRA.SZ[1:0] = 01b, and bit[1] and bit[0] must be 0 when MRA.SZ[1:0] = 10b.

17.2.5 DAR : DTC Transfer Destination Register

Base address: DTCVBR_SEC
DTCVBR

Offset address: 0x08 + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 17.3.1. Allocating Transfer Information and DTC Vector Table.)

Bit position: 31

0

Bit field:

Value after reset: x

The DAR sets the transfer destination start address and cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x08) and DTC transfers it automatically to and from the DAR register. See section 17.3.1. Allocating Transfer Information and DTC Vector Table.

Misalignment is prohibited for DTC transfers. Bit[0] must be 0 when MRA.SZ[1:0] = 01b, and bit[1] and bit[0] must be 0 when MRA.SZ[1:0] = 10b.

17.2.6 CRA : DTC Transfer Count Register A

Base address: DTCVBR_SEC
DTCVBR

Offset address: 0x0E + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 17.3.1. Allocating Transfer Information and DTC Vector Table.)

Bit position:

15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:

Value after reset: x x x x x x x x x x x x x x x x x

Bit	Symbol	Function	R/W
7:0	CRAL	Transfer Counter A Lower Register Specify the transfer count.	—
15:8	CRAH	Transfer Counter A Upper Register Specify the transfer count.	—

Note: The function depends on the transfer mode.

Note: Set CRAH and CRAL to the same value in repeat transfer mode and block transfer mode.

The CRA register consists of 16 bits. CRAL is the lower 8 bits and CRAH is the upper 8 bits. CRA is used in normal mode.

CRAL and CRAH are used in repeat transfer mode and block transfer mode.

The CRA register cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x0E) and DTC transfers it automatically to and from the CRA register. See [section 17.3.1. Allocating Transfer Information and DTC Vector Table](#).

(1) Normal transfer mode (MRA.MD[1:0] = 00b)

In normal transfer mode, CRA functions as a 16-bit transfer counter. The transfer count is 1, 65535, and 65536 when the set value is 0x0001, 0xFFFF, and 0x0000, respectively. The CRA value is decremented (-1) on each data transfer.

(2) Repeat transfer mode (MRA.MD[1:0] = 01b)

In repeat transfer mode, the CRAH register holds the transfer count and the CRAL register functions as an 8-bit transfer counter. The transfer count is 1, 255, and 256 when the set value is 0x01, 0xFF, and 0x00, respectively. The CRAL value is decremented (-1) on each data transfer. When it reaches 0x00, the CRAH value is transferred to CRAL.

(3) Block transfer mode (MRA.MD[1:0] = 10b)

In block transfer mode, the CRAH register holds the block size and the CRAL register functions as an 8-bit block size counter. The transfer count is 1, 255, and 256 when the set value is 0x01, 0xFF, and 0x00, respectively. The CRAL value is decremented (-1) on each data transfer. When it reaches 0x00, the CRAH value is transferred to CRAL.

17.2.7 CRB : DTC Transfer Count Register B

Base address: DTCVBR_SEC
DTCVBR

Offset address: 0x0C + 0x4 × Vector number
(Inaccessible directly from the CPU. See [section 17.3.1. Allocating Transfer Information and DTC Vector Table](#).)

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:

--

Value after reset: x x x x x x x x x x x x x x x x

The CRB sets the block transfer count for block transfer mode. The transfer count is 1, 65535, and 65536 when the set value is 0x0001, 0xFFFF, and 0x0000, respectively. The CRB value is decremented (-1) when the final data of a single block size is transferred. When normal transfer mode or repeat transfer mode is selected, this register is not used, and the set value is ignored.

The CRB cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x0C) and DTC transfers it automatically to and from the CRB register. See [section 17.3.1. Allocating Transfer Information and DTC Vector Table](#).

17.2.8 DTCCR : DTC Control Register

Base address: DTC0_NS = 0x5000_AC00

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	RRS	—	—	—	—
Value after reset:	0	0	0	0	1	0	0	0

Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0. The write value should be 0.	R/W
3	—	This bit is read as 1. The write value should be 1.	R/W
4	RRS	DTC Transfer Information Read Skip Enable for Non-secure 0: Transfer information read is not skipped 1: Transfer information read is skipped when vector numbers match	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE7, P-TYPE2

RRS bit (DTC Transfer Information Read Skip Enable for Non-secure)

The RRS bit enables skipping of transfer information reads when vector numbers match. The DTC vector number is compared with the vector number in the previous activation process. When these vector numbers match and the RRS bit is set to 1, DTC data transfer is performed without reading the transfer information. However, when the previous transfer is a chain transfer, the transfer information is read regardless of the RRS bit.

When the transfer counter (CRA register) becomes 0 during the previous normal transfer and when the transfer counter (CRB register) becomes 0 during the previous block transfer, the transfer information is read regardless of the RRS bit value.

17.2.9 DTCCR_SEC : DTC Control Register for Secure Region

Base address: DTC0 = 0x4000_AC00

Offset address: 0x10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	RRSS	—	—	—	—
Value after reset:	0	0	0	0	1	0	0	0

Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0. The write value should be 0.	R/W
3	—	This bit is read as 1. The write value should be 1.	R/W
4	RRSS	DTC Transfer Information Read Skip Enable for Secure 0: Transfer information read is not skipped. 1: Transfer information read is skipped when vector numbers match.	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE6, P-TYPE2

RRSS bit (DTC Transfer Information Read Skip Enable for Secure)

The RRSS bit enables skipping of transfer information reads when vector numbers match. The DTC vector number is compared with the vector number in the previous activation process. When these vector numbers match and the RRSS bit is set to 1, DTC data transfer is performed without reading the transfer information. However, when the previous transfer is a chain transfer, the transfer information is read regardless of the RRSS bit.

When the transfer counter (CRA register) becomes 0 during the previous normal transfer and when the transfer counter (CRB register) becomes 0 during the previous block transfer, the transfer information is read regardless of the RRSS bit value.

17.2.10 DTCVBR : DTC Vector Base Register

Base address: DTC0_NS = 0x5000_AC00

Offset address: 0x04

Bit position: 31 0

Bit field:

Value after reset: 0

Bit	Symbol	Function	R/W
31:0	n/a	DTC Vector Base Address for Non-secure region Set the DTC vector base address. The lower 10 bits should be 0.	R/W

Note: S-TYPE7, P-TYPE2

The DTCVBR sets the base address for calculating the DTC vector table address, which can be set in the range of 0x0000_0000 to 0xFFFF_FFFF (4 GB) in 1 KB units.

17.2.11 DTCVBR_SEC : DTC Vector Base Register for Secure Region

Base address: DTC0 = 0x4000_AC00

Offset address: 0x14

Bit position: 31 0

Bit field:

Value after reset: 0

Bit	Symbol	Function	R/W
31:0	n/a	DTC Vector Base Address for Secure region Set DTC Vector Base Address for Secure region. The lower 10 bits should be 0.	R/W

Note: S-TYPE6, P-TYPE2

The DTCVBR_SEC sets the base address for calculating the DTC vector table address, which can be set in the range of 0x0000_0000 to 0xFFFF_FFFF (4 GB) in 1-KB units.

17.2.12 DTCST : DTC Module Start Register

Base address: DTC0 = 0x4000_AC00
DTC0_NS = 0x5000_AC00

Offset address: 0x0C

Bit position: 7 6 5 4 3 2 1 0

Bit field:

—	—	—	—	—	—	—	DTCS T
---	---	---	---	---	---	---	-----------

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	DTCST	DTC Module Start 0: DTC module stopped 1: DTC module started	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE2

DTCST bit (DTC Module Start)

Set the DTCST bit to 1 to enable the DTC to accept transfer requests. When this bit is set to 0, transfer requests are no longer accepted. If this bit is set to 0 during a data transfer, the accepted transfer request is active until processing completes.

DTCST must be set to 0 before transitioning to one of the following state or mode:

- Module-stop state
- Software Standby mode
- Deep Software Standby mode

For details on these transitions, see [section 17.10. Low Power Consumption Function](#) and [section 10, Low Power Modes](#).

17.2.13 DTCSTS : DTC Status Register

Base address: DTC0 = 0x4000_AC00
 DTC0_NS = 0x5000_AC00

Offset address: 0x0E

Bit	Symbol	Function	R/W
7:0	VECN[7:0]	DTC-Activating Vector Number Monitoring These bits indicate the vector number for the activation source when a DTC transfer is in progress. The value is only valid if a DTC transfer is in progress (ACT flag is 1).	R
14:8	—	These bits are read as 0.	R
15	ACT	DTC Active Flag 0: DTC transfer operation is not in progress. 1: DTC transfer operation is in progress.	R

Note: S-TYPE3, P-TYPE2

VECN[7:0] bits (DTC-Activating Vector Number Monitoring)

While transfer by the DTC is in progress, the VECN[7:0] bits indicate the vector number associated with the activation source for the transfer. The value read from the VECN[7:0] bits is valid if the ACT flag is 1, indicating a DTC transfer in progress, and invalid if the ACT flag is 0, indicating no DTC transfer is in progress.

ACT flag (DTC Active Flag)

The ACT flag indicates the state of the DTC transfer operation.

[Setting condition]

- When the DTC is activated by a transfer request.

[Clearing condition]

- When transfer by the DTC, in response to a transfer request, is complete.

17.2.14 DTEVR : DTC Error Vector Register

Base address: DTC0 = 0x4000_AC00
DTC0_NS = 0x5000_AC00

Offset address: 0x20

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DTESTA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DTEVSAM	DTEV[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	DTEV[7:0]	DTC Error Vector Number These bits represent error vector of the DTC.	R
8	DTEVSAM	DTC Error Vector Number SA Monitor Indicates the SA of vector number causing the error. 0: Secure vector number 1: Non-secure vector number	R
15:9	—	These bits are read as 0. The write value should be 0.	R
16	DTESTA	DTC Error Status Flag 0: No DTC transfer error occurred 1: DTC transfer error occurred	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R

Note: P-TYPE2 See below for access by security attribution.

Note: Writing to DTESTA depends on the value of DTEVSAM

When reading this register, it can be accessed from both Secure and Non-secure access.

When writing this register, it depends on DTEVR.DTESTA.

- When DMESA = 1, it can be accessed from Secure and Non-secure access.
- When DMESA = 0, it can be accessed from Secure. An error is returned when write access is performed in a Non-secure access.

This register is cleared by a reset caused by a transfer error. Please select interrupt (DMA0_TRANSERR) in BUS.OADCFG.OAD when you want to debug the program.

DTEV[7:0] bit (DTC Error Vector Number)

When a transfer error due to DTC transfer occurs, it stores the channel of DTC that was violated.

When reset was selected in MMPUOAD.OAD and MSAOAD.OAD, Since this register is also reset. Please select NMI when you want to debug the program.

[Setting condition]

- When the DTC transfer error occurs and DTESTA = 0.

[Clearing condition]

- When 1 is written to DTEVR.DTESTA.

DTEVSAM bit (DTC Error Vector Number SA Monitor)

When a transfer error due to DTC transfer occurs, it indicates the SA of the violating DTC vector number.

When reset was selected in MMPUOAD.OAD and MSAOAD.OAD, Since this register is also reset. Please select NMI when you want to debug the program.

[Setting condition]

- When the DTC transfer error occurs and DTESTA = 0.

[Clearing condition].

- When 1 is written to DTEVR.DTESTA.

DTESTA bit (DTC Error Status Flag)

Indicates whether or not a DTC transfer error occurred.

DTEV, DTEVSAM, DTESTA are cleared by writing 1 to DTESTA.

Writing 0 to DTESTA is ignored.

When reset was selected in MMPUOAD.OAD and MSAOAD.OAD, Since this register is also reset. Please select NMI when you want to debug the program.

[Setting condition]

- When the DTC transfer error occurs.

[Clearing condition]

- When 1 is written to DTEVR.DTESTA.

Note: When DTEVSAM = 1, it can be cleared in the Secure state and Non-secure state. DTEVSAM = 0, it cannot be cleared in the Non-secure state.

17.3 Activation Sources

The DTC is activated by an interrupt request. Setting the ICU.IELSRn.DTCE bit to 1 enables activation of the DTC by the associated interrupt. The selector output n number set in ICU.IELSRn is defined as the interrupt vector number, where $n = 0$ to 95. For an enabled interrupt, the specific DTC interrupt source associated with each interrupt vector number n is selected in ICU.IELSRn.IELS[8:0] where $n = 0$ to 95, as listed in [section 13.3.2. Event Number](#) in [section 13, Interrupt Controller Unit \(ICU\)](#). For activation by software, see [section 18.2.2. ELSEGRn : Event Link Software Event Generation Register n \(n = 0, 1\)](#).

The interrupt vector number is equivalent to the DTC vector table number. After the DTC accepted an activation request, it does not accept another activation request until the transfer for that single request is complete, regardless of the priority of the requests. When multiple activation requests are generated during a DTC transfer, the highest priority request is accepted on completion of the transfer. When multiple activation requests are generated while the DTC Module Start bit (DTCST.DTCST) is 0, the DTC accepts the highest priority request when DTCST.DTCST is subsequently set to 1. The smaller interrupt vector number has higher priority.

The DTC performs the following operations at the start of a single data transfer or for a chain transfer, after the last of the consecutive transfers:

- On completion of a specified round of data transfer, the ICU.IELSRn.DTCE bit is set to 0, and an interrupt request is sent to the CPU.
- If the MRB.DISEL bit is 1, an interrupt request is sent to the CPU on completion of a data transfer.
- For other transfers, the ICU.IELSRn.IR flag of the activation source is set to 0 at the start of the data transfer.

17.3.1 Allocating Transfer Information and DTC Vector Table

The DTC reads the start address of the transfer information associated with each activation source from the vector table and reads the transfer information starting at that address.

DTC has two vector tables, Non-secure side or Secure side. Because the interrupt vector number that serves as a trigger for DTC is divided into Non-secure or Secure. Place the vector table of the interrupt vector number of SA = 1 in DTCVBR which is the Non-secure side. Place the vector table of interrupt number SA = 0 in DTCVBR_SEC which is the Secure side.

The vector table must be located so that the lower 10 bits of the base address (start address) are 0. Use the DTC Vector Base Register (DTCVBR) to set the base address of the DTC vector table. Transfer information is allocated in the SRAM area. In the SRAM area, the start address of the transfer information n with vector number n must be $4n$ added to the base address in the vector table.

When setting the DTC transfer attribution for the privilege access or non-privileged access, allocating the vector table and transfer information as follows. The vector table should be located in the privileged area. Transfer information with the privileged attribution is located in the privileged area. Transfer information with the unprivileged attribution is located in the Unprivileged area. Privileged area is set by MMPU (see section 15, Memory Protection Unit (MPU)). Privileged and non-privileged access settings are located at bit 0 of the address corresponding to each vector number in the vector table.

Figure 17.2 shows the relationship between the DTC vector table and transfer information.

Figure 17.3 shows the bit arrangement in the vector table.

Figure 17.4 shows the allocation of transfer information in the SRAM area.

Figure 17.2 DTC vector table and transfer information

Figure 17.3 Bit arrangement in the vector table

Figure 17.4 Allocation of transfer information in the SRAM area

17.4 Operation

The DTC transfers data according to the transfer information. Storage of the transfer information in the SRAM area is required before a DTC operation. When the DTC is activated, it reads the DTC vector associated with the vector number. The DTC reads the transfer information from the transfer information store address referenced by the DTC vector and transfers the data. After the data transfer, the DTC writes back the transfer information. Storing the transfer information in the SRAM area allows data transfer of any number of channels.

The transfer modes include:

- Normal transfer mode
- Repeat transfer mode
- Block transfer mode.

The DTC specifies a transfer source address in the SAR register and a transfer destination address in the DAR register. The values of these registers are incremented, decremented, or address-fixed independently after the data transfer.

Table 17.2 describes the DTC transfer modes.

Table 17.2 DTC transfer modes

Transfer mode	Data size transferred on single transfer request	Increment or decrement of memory address	Settable transfer count
Normal transfer mode	1 byte (8 bit), 1 halfword (16 bit), 1 word (32 bit)	Incremented or decremented by 1, 2, or 4 or address-fixed	1 to 65536
Repeat transfer mode*1	1 byte (8 bit), 1 halfword (16 bit), 1 word (32 bit)	Incremented or decremented by 1, 2, or 4 or address-fixed	1 to 256*3
Block transfer mode*2	Block size specified in CRAH (1 to 256 bytes, 1 to 256 halfwords (2 to 512 bytes), or 1 to 256 words (4 to 1024 bytes))	Incremented or decremented by 1, 2, or 4 or address-fixed	1 to 65536

Note 1. Set the transfer source or transfer destination as the repeat area.

Note 2. Set the transfer source or transfer destination as the block area.

Note 3. After a data transfer of the specified count, the initial state is restored and operation restarts.

Setting the MRB.CHNE bit to 1 allows multiple transfers or chain transfer on a single activation source. It also enables a chain transfer when the specified data transfer is complete.

Figure 17.5 shows the operation flow of the DTC. Table 17.3 lists the chain transfer conditions. The combination of control information for the second and subsequent transfers are omitted in this table.

Figure 17.5 DTC operation flow

Table 17.3 Chain transfer conditions

First transfer				Second transfer ^{*3}				DTC transfer
CHNE bit	CHNS bit	DISEL bit	Transfer counter ^{*1 *2}	CHNE bit	CHNS bit	DISEL bit	Transfer counter ^{*1 *2}	
0	—	0	Other than (1 → 0)	—	—	—	—	Ends after the first transfer
0	—	0	(1 → 0)	—	—	—	—	Ends after the first transfer with an interrupt request to the CPU
0	—	1	—	—	—	—	—	
1	0	—	—	0	—	0	Other than (1 → 0)	Ends after the second transfer
				0	—	0	(1 → 0)	Ends after the second transfer with an interrupt request to the CPU
				0	—	1	—	
1	1	0	Other than (1 → *)	—	—	—	—	Ends after the first transfer
1	1	—	(1 → *)	0	—	0	Other than (1 → 0)	Ends after the second transfer
				0	—	0	(1 → 0)	Ends after the second transfer with an interrupt request to the CPU
				0	—	1	—	
1	1	1	Other than (1 → *)	—	—	—	—	Ends after the first transfer with an interrupt request to the CPU

Note 1. The transfer counter used depends on the transfer modes as follows:

- Normal transfer mode — CRA register
- Repeat transfer mode — CRAL register
- Block transfer mode — CRB register

Note 2. On completion of a data transfer, the counters operate as follows:

- 1 → 0 in normal and block transfer modes
- 1 → CRAH in repeat transfer mode
- (1 → *) in the table indicates both of these two operations, depending on the mode.

Note 3. Chain transfer can be selected for the second or subsequent transfers. The conditions for the combination of the second transfer and CHNE = 1 is omitted.

17.4.1 Transfer Information Read Skip Function

Reading of vector addresses and transfer information can be skipped by setting the DTCCR.RRS bit. When a DTC activation request is generated, the current DTC vector number is compared with the DTC vector number in the previous activation process. When these vector numbers match and the RRS bit is set to 1, the DTC data transfer is performed without reading the vector address and transfer information. However, when the previous transfer is a chain transfer, the vector address and transfer information are read. Additionally, when the transfer counter (CRA register) becomes 0 during the previous normal transfer, and when the transfer counter (CRB register) becomes 0 during the previous block transfer, transfer information is read regardless of the RRS bit. [Figure 17.13](#) shows an example when reading the transfer information is skipped.

To update the vector table and transfer information, set the RRS bit to 0, update the vector table and transfer information, then set the RRS bit to 1. The stored vector number is discarded by setting the RRS bit to 0. The updated DTC vector table and transfer information are read in the next activation process.

17.4.2 Transfer Information Write-Back Skip Function

When the MRA.SM[1:0] bits or the MRB.DM[1:0] bits are set to address fixed, a part of the transfer information is not written back. [Table 17.4](#) lists the transfer information write-back skip conditions and the associated registers. The CRA and CRB registers are written back, and the write-back of the MRA and MRB registers is skipped.

Table 17.4 Transfer information write-back skip conditions and applicable registers

MRA.SM[1:0] bits		MRB.DM[1:0] bits		SAR register	DAR register
b3	b2	b3	b2		
0	0	0	0	Skip	Skip
0	0	0	1		
0	1	0	0		
0	1	0	1		
0	0	1	0	Skip	Write-back
0	0	1	1		
0	1	1	0		
0	1	1	1		
1	0	0	0	Write-back	Skip
1	0	0	1		
1	1	0	0		
1	1	0	1		
1	0	1	0	Write-back	Write-back
1	0	1	1		
1	1	1	0		
1	1	1	1		

17.4.3 Normal Transfer Mode

The normal transfer mode allows a 1-byte (8 bit), 1-halfword (16 bit), 1-word (32 bit) data transfer on a single activation source. The transfer count can be set from 1 to 65536. Transfer source and destination addresses can be independently set to increment, decrement, or fixed. This mode enables an interrupt request to the CPU to be generated at the end of a specified-count transfer.

[Table 17.5](#) lists register functions in normal transfer mode, and [Figure 17.6](#) shows the memory map of normal transfer mode.

Table 17.5 Register functions in normal transfer mode

Register	Description	Value written back by writing transfer information
SAR	Transfer source address	Increment, decrement, or fixed*1
DAR	Transfer destination address	Increment, decrement, fixed*1
CRA	Transfer counter A	CRA - 1
CRB	Transfer counter B	Not updated

Note 1. Write-back operation is skipped in address-fixed mode.

Figure 17.6 Memory map of normal transfer mode (MRA.SM[1:0] = 10b, MRB.DM[1:0] = 10b, CRA = 0x0006)

17.4.4 Repeat Transfer Mode

The repeat transfer mode allows a 1-byte (8-bit), 1-halfword (16-bit), or 1-word (32-bit) data transfer on a single activation source. Transfer source or transfer destination for the repeat area must be specified in the MRB.DTS bit. The transfer count can be set from 1 to 256. When the specified transfer count is complete, the initial value of the address register specified in the repeat area is restored, the initial value of the transfer counter is restored, and transfer is repeated. The other address register is incremented or decremented continuously or remains unchanged.

When the transfer counter CRAL decrements to 0x00 in repeat transfer mode, the CRAL value is updated to the value set in the CRAH register. As a result, the transfer counter does not clear to 0x00, which disables interrupt requests to the CPU when the MRB.DISEL bit is set to 0. An interrupt request to the CPU is generated when the specified data transfer completes.

Table 17.6 lists the register functions in repeat transfer mode, and Figure 17.7 shows the memory map of repeat transfer mode.

Table 17.6 Register functions in repeat transfer mode

Register	Description	Value written back by writing transfer information	
		When CRAL is not 1	When CRAL is 1
SAR	Transfer source address	Increment, decrement, fixed ^{*1}	<ul style="list-style-type: none"> When the MRB.DTS bit is 0 Increment, decrement, or fixed^{*1} When the MRB.DTS bit is 1 SAR register initial value
DAR	Transfer destination address	Increment, decrement, or fixed ^{*1}	<ul style="list-style-type: none"> When the MRB.DTS bit is 0 DAR register initial value When the MRB.DTS bit is 1 Increment, decrement, or fixed^{*1}
CRAH	Retains transfer counter	CRAH	CRAH
CRAL	Transfer counter A	CRAL - 1	CRAH
CRB	Transfer counter B	Not updated	Not updated

Note 1. Write-back is skipped in address-fixed mode.

Figure 17.7 Memory map of repeat transfer mode when transfer source is a repeat area (MRA.SM[1:0] = 10b, MRB.DM[1:0] = 10b, CRAH = 0x04)

17.4.5 Block Transfer Mode

The block transfer mode allows single-block data transfer on a single activation source. Transfer source or transfer destination for the block area must be specified in the MRB.DTS bit. The block size can be set from 1 to 256 bytes, 1 to 256 halfwords (2 to 512 bytes), or 1 to 256 words (4 to 1024 bytes). When transfer of the specified block completes, the initial values of the block size counter CRAL and the address register (the SAR register when the MRB.DTS = 1 or the DAR register when the DTS = 0) specified in the block area are restored. The other address register is incremented or decremented continuously or remains unchanged.

The transfer count (block count) can be set from 1 to 65536. This mode enables an interrupt request to the CPU to be generated at the end of the specified-count block transfer.

Table 17.7 lists the register functions in block transfer mode, and Figure 17.8 shows the memory map for block transfer mode.

Table 17.7 Register functions in block transfer mode

Register	Description	Value written back by writing transfer information
SAR	Transfer source address	<ul style="list-style-type: none"> When MRB.DTS bit is 0 Increment, decrement, or fixed*1 When MRB.DTS bit is 1 SAR register initial value.
DAR	Transfer destination address	<ul style="list-style-type: none"> When MRB.DTS bit is 0 DAR register initial value When MRB.DTS bit is 1 Increment, decrement, or fixed*1.
CRAH	Holds block size	CRAH
CRAL	Block size counter	CRAH
CRB	Block transfer counter	CRB - 1

Note 1. Write-back is skipped in address-fixed mode.

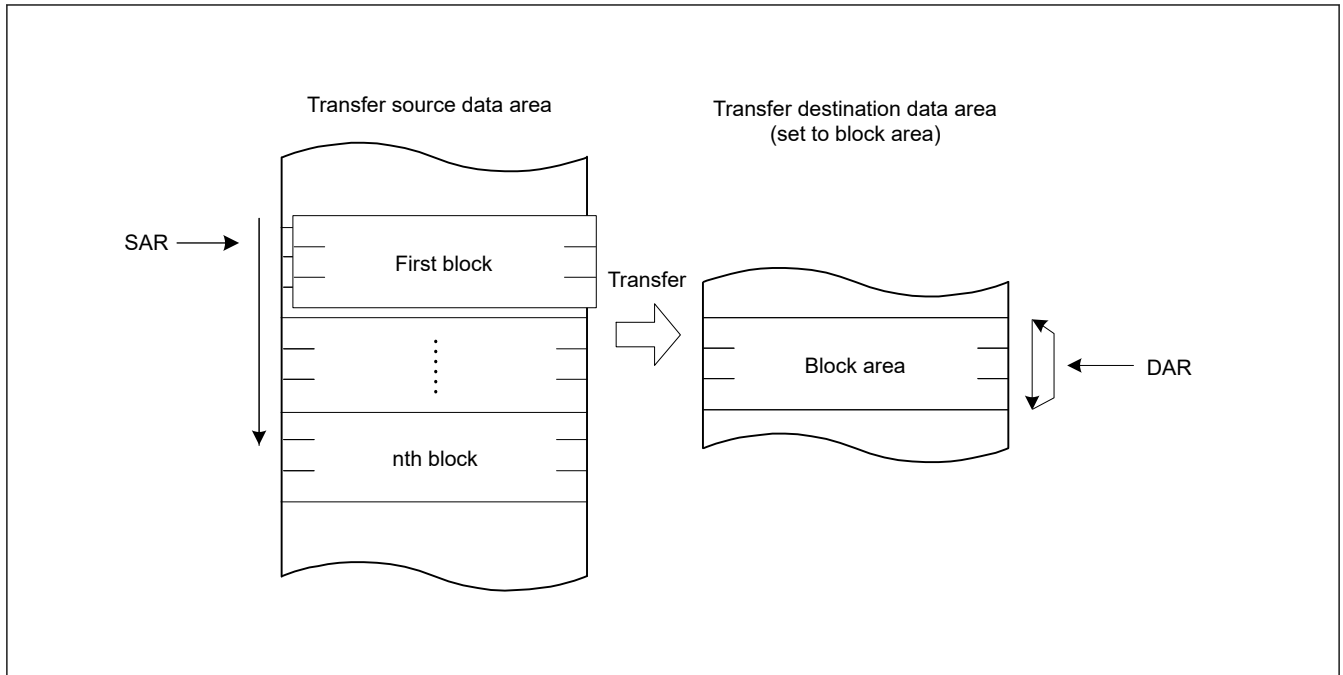

Figure 17.8 Memory map of block transfer mode

17.4.6 Chain Transfer

Setting the MRB.CHNE bit to 1 allows chain transfer to be performed continuously on a single activation source. If the MRB.CHNE is set to 1 and CHNS to 0, an interrupt request to the CPU is not generated on completion of the specified number of rounds of transfer or by setting the MRB.DISEL bit to 1. An interrupt request is sent to the CPU each time DTC data transfer is performed. Data transfer has no effect on the ICU.IELSRn.IR flag of the activation source.

The SAR, DAR, CRA, CRB, MRA, and MRB registers can be set independently of each other to define the data transfer. [Figure 17.9](#) shows a chain transfer operation.

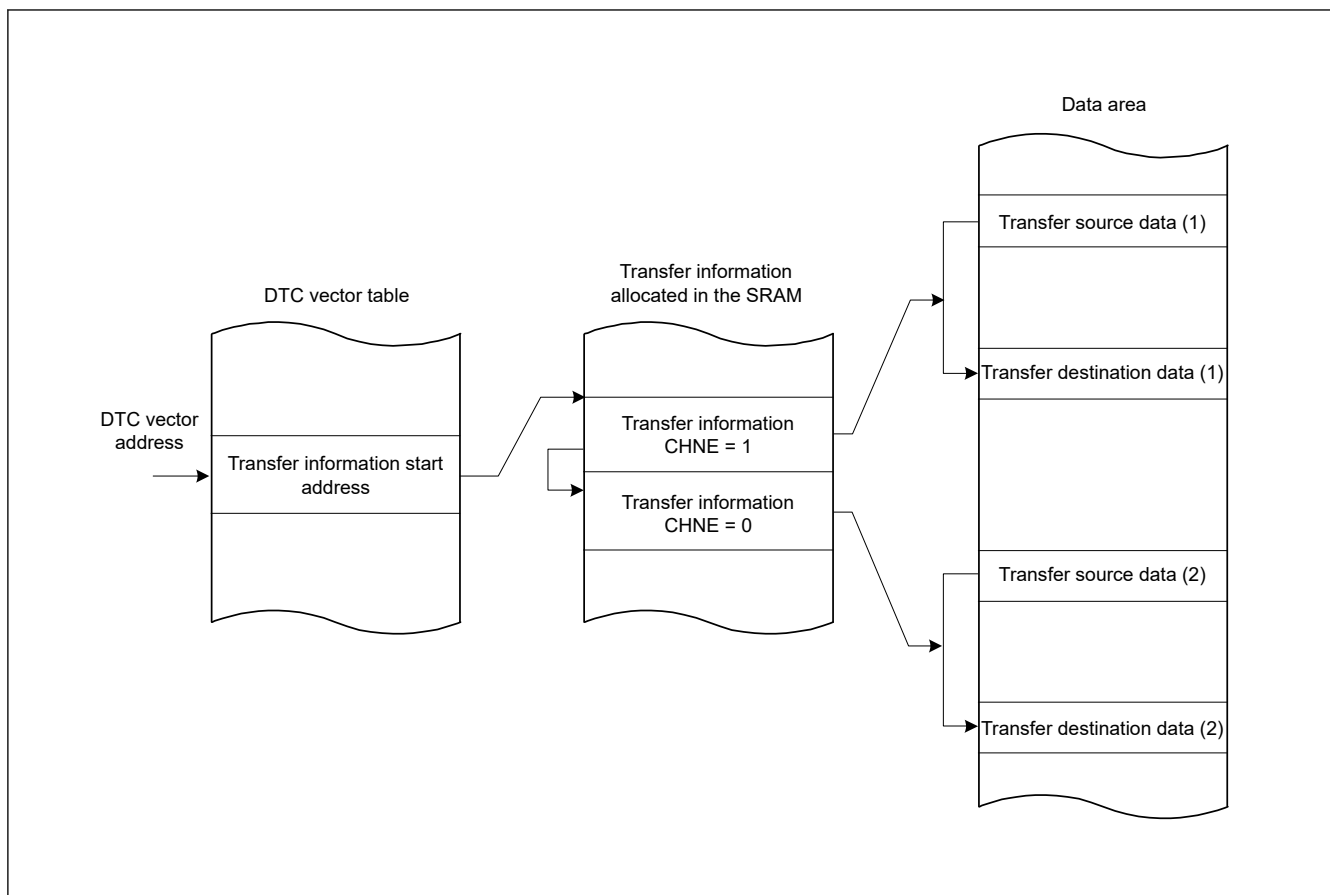

Figure 17.9 Chain transfer operation

Writing 1 to the MRB.CHNE and CHNS bits enables chain transfer to be performed only after completion of the specified data transfer. In repeat transfer mode, chain transfer is performed after completion of the specified data transfer. For details on chain transfer conditions, see [Table 17.3](#).

17.4.7 Operation Timing

[Figure 17.10](#) to [Figure 17.13](#) are timing diagrams that show the minimum number of execution cycles.

Figure 17.10 Example 1 of DTC operation timing in normal transfer and repeat transfer modes

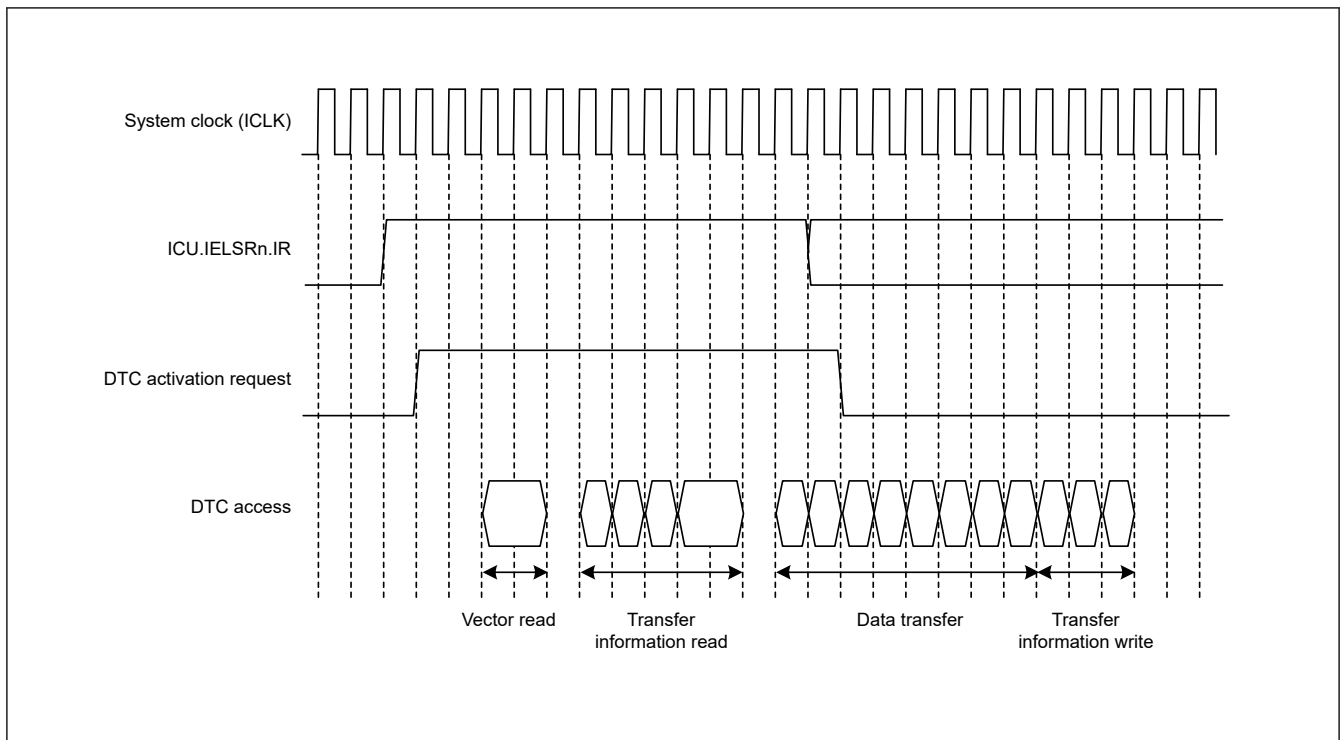

Figure 17.11 Example 2 of DTC operation timing in block transfer mode when the block size = 4

Figure 17.12 Example 3 of DTC operation timing for chain transfer

Figure 17.13 Example of operation when a transfer information read is skipped with the vector, transfer information, and transfer destination data on the SRAM, and the transfer source data on the peripheral module

17.4.8 Vector Security

The security attribute of transfer access of DTC vector n and security attribute of access to the IELSR n ($n = 0$ to 95) register of ICU are controlled by SAIELSR n bit of ICUSAR x ($x = G, H$ or I) registers in CPSCU. For details on the CPSCU.ICUSAR x registers, see [section 13, Interrupt Controller Unit \(ICU\)](#).

When the CPSCU.ICUSAR x .IELSR n SA bit is 0

- IELSR n register have security attribute
- The vector number of DTC activated by the interrupt request set in IELS behaves as a Secure master.

When the CPSCU.ICUSAR x .IELSR n SA bit is 1

- IELSR n register have non-security attribute
- The vector number of DTC activated by the interrupt request set in IELS behaves as a Non-secure master.

For areas accessible to Secure or Non-secure masters, See [section 14, Buses](#), and [section 38, Security Features](#).

17.4.9 Vector privilege

The privileged attribute of transfer access of DTC vector n is controlled bit0 in vector table.

If bit0 corresponding to each vector number in the vector table is set to 0, DTC transfer is privileged access.

If bit0 is set to 1, DTC transfers are unprivileged access.

Refer to for vector table and transfer information.

17.5 DTC Setting Procedure

Before using the DTC, set the DTC Vector Base Register (DTCVBR). Set the ICU.IELSR n .IELS[8:0] bits to 0 to disable the interrupt in the NVIC and follow the procedure in [Table 17.8](#) to set the DTC.

Table 17.8 DTC setting procedure

No.	Step Name	Description
1	Set the DTCCR ^{*1} .RRS bit to 0	Set the DTCCR ^{*1} .RRS bit to 0 to reset the transfer information read skip flag. After that, the transfer information read is not skipped while the DTC is activated. Be sure to specify this setting when the transfer information is updated.
2	Set transfer information (MRA, MRB, SAR, DAR, CRA, and CRB)	Allocate transfer information (MRA, MRB, SAR, DAR, CRA, and CRB) in the data area. To set transfer information, see section 17.2, Register Descriptions . To allocate transfer information, see section 17.3.1, Allocating Transfer Information and DTC Vector Table .
3	Set transfer information start addresses in the DTC vector table	Set the transfer information start addresses in the DTC vector table. To set the DTC vector table, see section 17.3.1, Allocating Transfer Information and DTC Vector Table .
4	Set the DTCCR ^{*1} .RRS bit to 1	Set the DTCCR ^{*1} .RRS bit to 1 to enable skipping of the second and subsequent transfer information read cycles for continuous DTC activation from the same interrupt source. The RRS bit can be set to 1, but if this is set during DTC transfer, it becomes valid from the next transfer.
5	Set the ICU.IELSR n .DTCE bit to 1. Set the ICU.IELSR n .IELS[8:0] as interrupt source. The interrupt should be enabled in the NVIC.	Set the ICU.IELSR n .DTCE bit to 1. Set ICU.IELSR n .IELS[8:0] as interrupt sources that trigger DTC. The interrupt must be enabled in the NVIC. See section 13.3.2, Event Number in section 13, Interrupt Controller Unit (ICU) .
6	Set the enable bit for an activation source interrupt	Set the enable bit for the activation source interrupts to 1. When a source interrupt is generated, the DTC is activated. To set the interrupt source enable bit, see the settings for the modules that are to be the activation sources.
7	Set the DTCST.DTCST bit to 1	Set the DTC Module Start bit (DTCST.DTCST) to 1.

Note: The DTCST.DTCST bit can be set even if the setting for each activation source is not completed.

Note: When DTCSAR.DTCSTSA = 0 is set, DTCST.DTCST = 1 must be set in the Secure state to use DTC in the Non-secure state.

Note 1. When used in Secure state, access DTCCR_SEC instead of DTCCR.

17.6 Examples of DTC Usage

17.6.1 Normal Transfer

This section provides an example of DTC usage and its application when receiving 128 bytes of data from an SCI.

(1) Transfer information settings

In the MRA register, select a fixed source address (MRA.SM[1:0] = 00b), normal transfer mode (MRA.MD[1:0] = 00b), and byte-sized transfer (MRA.SZ[1:0] = 00b). In the MRB register, specify incrementation of the destination address (MRB.DM[1:0] = 10b) and single data transfer by a single interrupt (MRB.CHNE = 0 and MRB.DISEL = 0). The MRB.DTS bit can be set to any value. Set the RDR register address of the SCI in the SAR register, the start address of the SRAM area for data storage in the DAR register, and 128 (0x0080) in the CRA register. The CRB register can be set to any value.

(2) DTC vector table settings

The start address of the transfer information for the RXI interrupt is set in the vector table for the DTC.

(3) ICU settings and DTC module activation

Set the ICU.IELSRn.DTCE bit to 1 and set ICU.IELSRn.IELS[8:0] as the SCI interrupt. The interrupt must be enabled in the NVIC. Set the DTCST.DTCST bit to 1.

(4) SCI settings

Enable the SCIn_RXI (n = 0 to 4, 9) interrupt by setting the SCR.RIE bit in the SCI to 1. If a reception error occurs during the SCI receive operation, reception stops. To manage this, use settings that allow the CPU to accept receive error interrupts.

(5) DTC transfer

Each time a reception of 1 byte by the SCI is complete, an SCIn_RXI interrupt is generated to activate the DTC. The DTC transfers the received byte from the RDR of the SCI to the SRAM, after which the DAR register is incremented and the CRA register is decremented.

(6) Interrupt handling

After 128 rounds of data transfer are complete and the value in the CRA register becomes 0, an SCIn_RXI interrupt request is generated for the CPU. Complete the process in the handling routine for this interrupt.

17.6.2 Chain transfer

This section provides an example of chain transfer by the DTC and describes its use in the output of pulses by the General PWM Timer (GPT). You can use chain transfer to transfer PWM timer compare data and change the period of the PWM timer for the GPT.

For the first of the chain transfers, normal transfer mode is specified for transfer to the GPT32n.GTCCRC register (n = 0 to 5) or GPT16m.GTCCRC register (m = 10 to 13). For the second transfer, normal transfer mode is specified for transfer to the GPT32n.GTCCRE register (n = 0 to 5) or GPT16m.GTCCRE register (m = 10 to 13). For the third transfer of the chained transfer, normal transfer mode for transfer to the GPT32n.GTPBR register (n = 0 to 5) or GPT16m.GTPBR register (m = 10 to 13) is specified. This is because clearing of the activation source and generation of an interrupt on completion of the specified number of transfers are restricted to the third of the chain transfers, that is, transfer while MRB.CHNE = 0.

The following example shows how to use the counter overflow interrupt with the GPT320.GTPR register as an activating source for the DTC.

(1) First transfer information setting

Set up transfer to the GPT320.GTCCRC register.

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up chain transfer (MRB.CHNE = 1 and MRB.CHNS = 0).

4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT320.GTCCRC register.
6. Set the CRAH and CRAL registers to the size of the data table. The CRB register can be set to any value.

(2) Second transfer information setting

Set up for transfer to the GPT320.GTCCRE register.

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up chain transfer (MRB.CHNE = 1, MRB.CHNS = 0).
4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT320.GTCCRE register.
6. Set the CRAH and CRAL registers to the size of the data table. The CRB register can be set to any value.

(3) Third transfer information set

Set up transfer to the GPT320.GTPBR register.

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up single data transfer per interrupt (MRB.CHNE = 0, MRB.DISEL = 0). The MRB.DTS bit can be set to any value.
4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT320.GTPBR register.
6. Set the CRA register to the size of the data table. The CRB register can be set to any value.

(4) Transfer information assignment

Place the transfer information for use in the transfer to the GPT320.GTPBR immediately after the transfer control information for use in the GPT320.GTCCRC and GPT320.GTCCRE registers.

(5) DTC vector table

In the DTC vector table, set the address where the transfer control information for use in transfer to the GPT320.GTCCRC and GPT320.GTCCRE registers starts.

(6) ICU setting and DTC module activation

1. Set the ICU.IELSRn.DTCE bit associated with the GPT320 counter overflow interrupt.
2. Set the ICU.IELSRn.IELS[8:0] bits and specify the GPT320 counter overflow.
3. Set the DTCST.DTCST bit to 1.

(7) GPT settings

1. Set the GPT320.GTIOR register so that the GTCCRA and GTCCRB registers operate as output compare registers.
2. Set the default PWM timer compare values in the GPT320.GTCCRA and GPT320.GTCCRB registers and the next PWM timer compare values in the GPT320.GTCCRC and GPT320.GTCCRE registers.
3. Set the default PWM timer period values in the GPT320.GTPR register and the next PWM timer period values in the GPT320.GTPBR register.
4. Set 1 to the output bit in PmnPFS.PDR, and set 00011b to the Peripheral Select bits in PmnPFS.PSEL[4:0].

(8) GPT activation

Set the GPT320.GTSTR.CSTRT bits to 1 to start the GPT320.GTCNT counter.

(9) DTC transfer

Each time a GPT320 counter overflow is generated with the GPT320.GTPR register, the next PWM timer compare values are transferred to the GPT320.GTCCRC and GPT320.GTCCRE registers. The setting for the next PWM timer period is transferred to the GPT320.GTPBR register.

(10) Interrupt handling

After the specified rounds of data transfer are complete, for example when the value in the CRA register for GPT transfer becomes 0, a GPT320 counter overflow interrupt request is issued for the CPU. Complete the process for this interrupt in the handling routine.

17.6.3 Chain Transfer when Counter = 0

The second data transfer is performed only when the transfer counter is set to 0 in the first data transfer, and the first data transfer information is repeatedly changed in the second transfer. Chain transfer enables transfers to be repeated 256 times or more.

The following procedure shows an example of configuring a 1-KB input buffer, where the input buffer is set so that its lower address starts with 0x00. [Figure 17.14](#) shows a chain transfer when the counter = 0.

1. Set the normal transfer mode to input data for the first data transfer. Set the following:
 - (a) Transfer source address = fixed.
 - (b) CRA register = 0x0200 (512) times.
 - (c) MRB.CHNE bit = 1 (chain transfer is enabled).
 - (d) MRB.CHNS bit = 1 (chain transfer is performed only when the transfer counter is 0).
 - (e) MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
2. Prepare the upper 8-bit address of the start address at every 512 times of the transfer destination address for the first data transfer in different area such as the flash. For example, when setting the input buffer to 0x8000 to 0x83FF, prepare 0x82 and 0x80.
3. For the second data transfer:
 - (a) Set the repeat transfer mode (with transfer source and destination address = fixed.) to reset the transfer counter of the first data transfer.
 - (b) Specify the CRA register in the first transfer information area for the transfer destination.
 - (c) Set the MRB.CHNE bit = 1 (chain transfer is enabled).
 - (d) Set the MRB.CHNS bit = 0 (select continuous chain transfer).
 - (e) Set the MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
 - (f) CRA register = 0x0101 (The transfer count is 1).
4. For the third data transfer:
 - (a) Set the repeat transfer mode (with the source as the repeat area) to reset the transfer destination address of the first data transfer.
 - (b) Specify the upper 8 bits of the DAR register in the first transfer information area for the transfer destination.
 - (c) Set the MRB.CHNE bit = 0 (chain transfer is disabled).
 - (d) Set the MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
 - (e) When setting the input buffer to 0x8000 to 0x83FF, also set the transfer counter to 2.
5. The first data transfer is performed by an interrupt 512 times. When the transfer counter of the first data transfer becomes 0, the second data transfer starts. Set the transfer counter of the first data transfer to 0x0200. The lower 8 bits of the transfer destination address and the transfer counter of the first data transfer becomes 0x0200.
6. The second data transfer is performed by an interrupt 1 times. When the transfer counter of the first data transfer becomes 0, the third data transfer starts. Set the upper 8 bits of the transfer destination address of the first data transfer to

- 0x82. The lower 8 bits of the transfer destination address becomes 0x00 and the transfer counter of the first data transfer becomes 0x0200.
7. In succession, the first data transfer is performed by an interrupt 512 times as specified for the first data transfer. When the transfer counter of the first data transfer becomes 0, the second data transfer starts. Set the transfer counter of the first data transfer to 0x0200. The lower 8 bits of the transfer destination address and the transfer counter of the first data transfer becomes 0x0200.
 8. The second data transfer is performed by an interrupt 1 times. When the transfer counter of the first data transfer becomes 0, the third data transfer starts. Set the upper 8 bits of the transfer destination address of the first data transfer to 0x80. The lower 8 bits of the transfer destination address becomes 0x00 and the transfer counter of the first data transfer becomes 0x0200.
 9. Steps 5 to 8 are repeated indefinitely. Because the second data transfer is in repeat transfer mode, no interrupt request to the CPU is generated.

Figure 17.14 Chain transfer when counter = 0

17.7 Processing on DTC Transfer Error

If the access error occurs during DTC transfer, the DTC immediately stops access during transfer. DTC is stopped only for the vector number that caused the error. Therefore, inform the vector number that caused the error to the ICU and cleared the corresponding ICU setting (IELSR). After that, if there is a request other than the vector number which caused the error, it will be re-arbitration as it is.

The error response is informed to ICU when the transfer error occurs. ICU clears the ICU.IELSRn of the corresponding vector number which caused the transfer error. Write back to SRAM is not performed.

17.8 Interrupt

17.8.1 Interrupt Request of Transfer End

When the DTC completes data transfer of the specified count or when data transfer with MRB.DISEL set to 1 is complete, a DTC activation source generates an interrupt to the CPU. Two types of interrupt are available: interrupts triggered by a DTC activation (per channel) and an interrupt triggered by the event signal DTC0_COMPLETE (common to all channels). Interrupts to the CPU are controlled according to the settings in the NVIC and the ICU.IELSRn.IELS[8:0] bits. See [section 13, Interrupt Controller Unit \(ICU\)](#). The DTC prioritizes activation sources by granting the smaller interrupt vector numbers higher priority. The priority of interrupts to the CPU is determined by the NVIC priority.

When the transfer destination is the external bus, an interrupt request is generated upon completion of data write to the write buffer not to the actual transfer destination.

17.8.2 Interrupt Request of Transfer Error

The error response detection interrupt request (DMA0_TRANSERR) is generated from the DMAC/DTC when the transfer error is detected during DTC transfer.

The types of interrupts that occur when the DTC transfer error occurs are listed in [Table 17.9](#). The [Table 17.9](#) also shows error information stored when a transfer error occurs.

Table 17.9 Interrupt and error information due to DTC transfer error cause

Transfer error factor	NMI/RESET*1 Request	Interrupt Request	Bus Error Status	Error Address Error R/W	Error Channel Information
MSAU Error	ICU.NMISR.BUSST	DMA0_TRANSERR*1	BUS.BUS4ERRSTAT. MSERRSTAT	BUS.BMSA4ERRADD BUS.BMSA4ERRRW	DTC.DTEVR
Master MPU Error	ICU.NMISR.BUSST	DMA0_TRANSERR*1	BUS.BUS4ERRSTAT. MMERRSTAT	BUS.BUS4ERRADD BUS.BUS4ERRRW	DTC.DTEVR
Illegal Access Error	ICU.NMISR.BUSST	DMA0_TRANSERR*1	BUS.BUS4ERRSTAT. ILERRSTAT	BUS.BUS4ERRADD BUS.BUS4ERRRW	DTC.DTEVR
Slave Bus Error	ICU.NMISR.BUSST	DMA0_TRANSERR*1	BUS.BUS4ERRSTAT. SLERRSTAT	BUS.BUS4ERRADD BUS.BUS4ERRRW	DTC.DTEVR
TrustZone Filter error	ICU.NMISR.BUSST	DMA0_TRANSERR*1	BUS.BUS4ERRSTAT. STERRSTAT	BUS.BUS4ERRADD BUS.BUS4ERRRW	DTC.DTEVR

Note 1. If ICU.NMIER.BUSEN is enabled with DMA0_TRANSERR set in ICU.IELSR, NMI and an interrupt will occur due to a transfer error caused by DMA. It is able to be generated only NMI by not setting DMA0_TRANSERR to ICU.IELSR.

17.9 Event Link

The DTC can produce an event link request on completion of one transfer request. When the destination for transfer is an external bus, however, the event link request will be issued after completion of writing to the write buffer rather than after completion of writing to the actual destination for transfer.

17.10 Low Power Consumption Function

Before transitioning to the module-stop state, Software Standby mode or Deep Software Standby mode, set the DTCST.DTCST bit to 0, and then perform the operations described in the following sections.

(1) Module-stop function

Writing 1 to the MSTPCRA.MSTPA22 bit enables the module-stop function of the DTC. If a DTC transfer is in progress when 1 is written to the MSTPCRA.MSTPA22 bit, the transition to the module-stop state proceeds after the DTC transfer ends. While the MSTPCRA.MSTPA22 bit is 1, accessing the DTC registers is prohibited. Writing 0 to the MSTPCRA.MSTPA22 bit releases the DTC from the module-stop state.

(2) Software Standby mode and Deep Software Standby mode

Use the settings described in [section 10.7.3.1. Transition to Software Standby Mode](#) or [section 10.7.4.1. Transition to Deep Software Standby Mode](#).

If DTC transfer operations are in progress when the WFI instruction is executed, the transition to Software Standby mode or Deep Software Standby mode follows the completion of the DTC transfer.

(3) Notes on Low Power Consumption Function

For the WFI instruction and the register setting procedure, see [section 10, Low Power Modes](#).

To perform a DTC transfer after returning from a low power mode.

To use a request that is generated in Software Standby mode as an interrupt request to the CPU but not as a DTC activation request, specify the CPU as the interrupt request destination as described in [section 13.5.5. Selecting Interrupt Request Destinations](#), then execute the WFI instruction.

17.11 Usage Notes

17.11.1 Transfer Information Start Address

You must set multiples of 4 for the transfer information start addresses in the vector table. Otherwise, such addresses are accessed with their lowest 2 bits regarded as 00b.

17.11.2 Restriction for OSPI

There is a restriction to using OSPI, see [section 33.3.8.5. Restriction in 8D-8D-8D profile 1.0 format](#).

18. Event Link Controller (ELC)

18.1 Overview

The Event Link Controller (ELC) uses the event requests generated by various peripheral modules as source signals to connect them to different modules, allowing direct link between the modules without CPU intervention.

[Table 18.1](#) lists the ELC specifications, and [Figure 18.1](#) shows a block diagram.

Table 18.1 ELC Specifications

Item	Description
Event link function	196 types of event signals can be directly connected to modules. The ELC generates the ELC event signal, and events that activate the DTC.
Module-stop function	Module-stop state can be set to reduce power consumption
TrustZone Filter	Security and Privilege attribution can be set for each registers

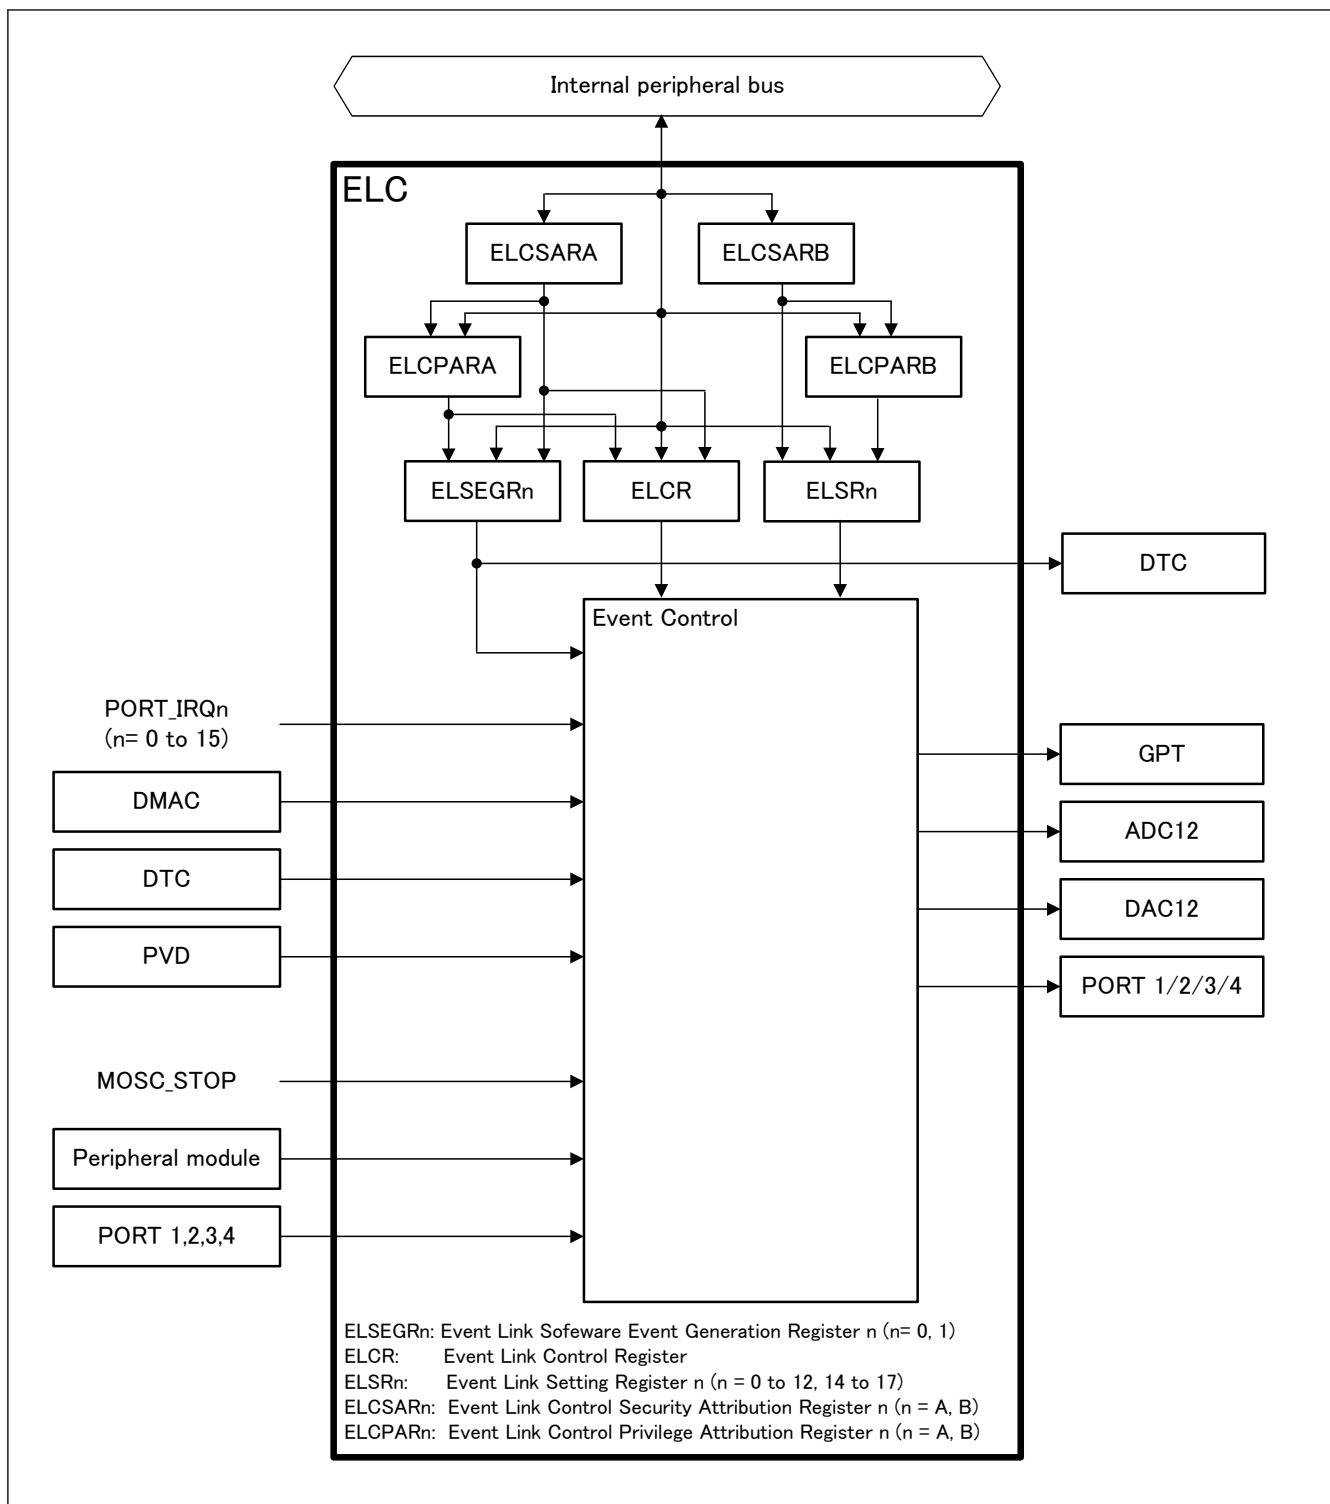

Figure 18.1 ELC block diagram

18.2 Register Descriptions

18.2.1 ELCR : Event Link Controller Register

Base address: ELC = 0x4020_1000
 ELC_NS = 0x5020_1000

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	ELCON	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	—	These bits are read as 0. The write value should be 0.	R/W
7	ELCON	All Event Link Enable 0: ELC function is disabled. 1: ELC function is enabled.	R/W

Note: S-TYPE-3, P-TYPE-3

The ELCR register controls the ELC operation.

18.2.2 ELSEGRn : Event Link Software Event Generation Register n (n = 0, 1)

Base address: ELC = 0x4020_1000
 ELC_NS = 0x5020_1000

Offset address: 0x04 + 0x04 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	WI	WE	—	—	—	—	—	SEG
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SEG	Software Event Generation 0: Normal operation 1: Software event is generated.	W
5:1	—	These bits are read as 0. The write value should be 0.	R/W
6	WE	SEG Bit Write Enable 0: Write to SEG bit disabled. 1: Write to SEG bit enabled.	R/W
7	WI	ELSEGR Register Write Disable 0: Write to ELSEGR register enabled. 1: Write to ELSEGR register disabled.	W

Note: S-TYPE-3, P-TYPE-3

SEG bit (Software Event Generation)

When 1 is written to the SEG bit while the WE bit is 1, a software event is generated. This bit is read as 0. Even when 1 is written to this bit, data is not stored. The WE bit must be set to 1 before writing to this bit.

A software event can trigger a linked DTC event.

WE bit (SEG Bit Write Enable)

The SEG bit can only be written to when the WE bit is 1. Clear the WI bit to 0 before writing to this bit.

[Setting condition]

- If 1 is written to this bit while the WI bit is 0, this bit becomes 1.

[Clearing condition]

- If 0 is written to this bit while the WI bit is 0, this bit becomes 0.

WI bit (ELSEGR Register Write Disable)

The ELSEGR register can only be written to when the write value to the WI bit is 0. This bit is read as 1. Before setting the WE or SEG bit, the WI bit must be set to 0.

18.2.3 ELSRn : Event Link Setting Register n (n = 0 to 12, 14 to 17)

Base address: ELC = 0x4020_1000
 ELC_NS = 0x5020_1000

Offset address: 0x20 + 0x04 × n

Bit	Symbol	Function	R/W
8:0	ELS[8:0]	Event Link Select 0x000: Event output disabled for the associated peripheral module 0x001: Number setting for the event signal to be linked ⋮ 0x1BA: Number setting for the event signal to be linked Others: Settings prohibited	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W

Note: P-TYPE-3

Note: This register has different secure access permission depending on the setting of Trusted Event Route Control Register (TEVTRCR). If the security attribution is configured as Secure,

- Secure access is allowed.
- Non-secure write access is ignored and Non-secure read access is read as 0, TrustZone access error is generated.

If the security attribution is configured as Non-secure and the trusted event route is disabled,

- Secure write access is ignored and Secure read access is read as 0, TrustZone access error is generated.
- Non-secure access is allowed.

If the security attribution is configured as Non-secure and the trusted event route is enabled,

- Secure access is allowed.
- Non-secure write access is ignored and Non-secure read access is allowed.
- TrustZone access error is not generated.

The register specifies an event signal to be linked to each peripheral module. Table 18.2 shows the association between the register and the peripheral modules. Table 18.3 shows the association between the event signal names set in the register and the signal numbers.

Table 18.2 Association between the registers and peripheral functions (1 of 2)

Register name	Peripheral function (module)	Event name
ELSR0	GPT (A)	ELC_GPTA
ELSR1	GPT (B)	ELC_GPTB
ELSR2	GPT (C)	ELC_GPTC
ELSR3	GPT (D)	ELC_GPTD
ELSR4	GPT (E)	ELC_GPTE
ELSR5	GPT (F)	ELC_GPTF
ELSR6	GPT (G)	ELC_GPTG
ELSR7	GPT (H)	ELC_GPTH

Table 18.2 Association between the registers and peripheral functions (2 of 2)

Register name	Peripheral function (module)	Event name
ELSR8	ADC12A0	ELC_AD00
ELSR9	ADC12B0	ELC_AD01
ELSR10	ADC12A1	ELC_AD10
ELSR11	ADC12B1	ELC_AD11
ELSR12	DAC12 channel 0	ELC_DA0
ELSR14	PORT1	ELC_PORT1
ELSR15	PORT2	ELC_PORT2
ELSR16	PORT3	ELC_PORT3
ELSR17	PORT4	ELC_PORT4

Table 18.3 Association between event signal names set in .ELS[8:0] bits and signal numbers (1 of 6)

Event number	Interrupt request source	Name	Description

Bit	Symbol	Function	R/W
0	ELCR	Event Link Controller Register Privilege Attribution Target register: ELCR 0: Privileged 1: Unprivileged	R/W
1	ELSEGR0	Event Link Software Event Generation Register 0 Privilege Attribution Target register: ELSEGR0 0: Privileged 1: Unprivileged	R/W

Bit	Symbol	Function	R/W
2	ELSEGR1	Event Link Software Event Generation Register 1 Privilege Attribution Target register: ELSEGR1 0: Privileged 1: Unprivileged	R/W
31:3	—	These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-2, P-TYPE-1

Note: This register is write-protected by PRPCR_S and PRPCR_NS register.

This register specifies the privilege attribution for the Register ELCR, ELSEGR0 and ELSEGR1 registers.

18.2.7 ELCPARB : Event Link Controller Privilege Attribution Register B

Base address: ELC = 0x4020_1000
ELC_NS = 0x5020_1000

Offset address: 0xF4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ELSR[17:16]	
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ELSR[15:14]		—	ELSR[12:0]												
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
12:0	ELSR[12:0]	Event Link Setting Register n Privilege Attribution Target register: ELSRn (n = 0 to 12) 0: Privileged 1: Unprivileged	R/W
13	—	This bit is read as 1. The write value should be 1.	R/W
17:14	ELSR[17:14]	Event Link Setting Register n Privilege Attribution Target register: ELSRn (n = 14 to 17) 0: Privileged 1: Unprivileged	R/W
31:18	—	These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-2, P-TYPE-1

Note: This register is write-protected by PRPCR_S and PRPCR_NS register.

This register specifies the privilege attribution for the Register ELSRn (n = 0 to 12, 14 to 17) registers.

18.3 Operation

18.3.1 Relation between Interrupt Handling and Event Linking

Event number for an event link is the same as that for the associated interrupt source. For information on generating event signals, see the explanation in the chapter for each event source module.

18.3.2 Linking Events

When an event occurs and that event is already set as a trigger in the Event Link Setting Register (ELSRn), the associated module is activated. The operation of the module must be set up in advance. [Table 18.4](#) lists the operations of modules when an event occurs.

Table 18.4 Module operations when event occurs

Module	Operations When Event is Input
GPT	<ul style="list-style-type: none"> • Start counting • Stop counting • Clear counting • Up counting • Down counting • Input capture
DAC12	Start D/A conversion
I/O Ports	<ul style="list-style-type: none"> • Change pin output based on the EORR (reset) or EOSR (set) • Latch pin state to EIDR • The following ports can be used for the ELC: PORT 1 PORT 2 PORT 3 PORT 4
ADC12	Start A/D conversion
DTC	Start DTC data transfer

18.3.3 Example of Procedure for Linking Events

To link events:

1. Set the operation of the module for which an event is to be linked.
2. Set the appropriate ELSRn.ELS[8:0] bits for the module to be linked.
3. Set the ELCR.ELCON bit to 1 to enable linkage of all events.
4. Configure the module from which an event is output and activate the module. The link between the two modules is now active.
5. To stop event linkage of modules individually, set 0 to the ELSRn.ELS[8:0] bit associated with the modules. To stop linkage of all the events, set the ELCR.ELCON bit to 0.

If event link output from the RTC is to be used, set the ELC after the RTC settings, for example, for initialization and time setting. Unintended events may be generated if RTC settings are made after the ELC settings.

If event link output from the PVD is to be used, set the ELC after setting the PVD. To disable the PVD, do so after setting 0x00 to the associated ELSRn register.

18.4 Usage Notes

18.4.1 Linking DMAC/DTC Transfer End Signals as Events

When linking the DMAC/DTC transfer end signals as events, do not set the same peripheral module as the DMAC/DTC transfer destination and event link destination. If set, the peripheral module might be started before DMAC/DTC transfer to the peripheral module is complete.

18.4.2 Setting Clocks

To link events, you must enable the ELC and the related modules. The modules cannot operate if the related modules are in the module-stop state or in low power mode in which the module is stopped (CPU Deep Sleep mode, Software Standby mode or Deep Software Standby mode). For more information, see [Table 18.3](#) and [section 10, Low Power Modes](#).

18.4.3 Module-Stop Function Setting

The Module Stop Control Register C (MSTPCRC) can enable or disable ELC operation. The ELC is initially stopped after reset. Releasing the module-stop state enables access to the registers. The ELCON bit must be set to 0 before disabling ELC operation using the Module Stop Control Register. For more information, see [Table 18.3](#) and [section 10, Low Power Modes](#).

18.4.4 ELC Delay Time

In [Figure 18.2](#), module A accesses module B through the ELC. There is a delay time in the ELC between module A and module B. [Table 18.5](#) shows the ELC delay time.

[Table 18.6](#) shows the clock domain of each module A. [Table 18.7](#) shows the clock domain of each module B.

Figure 18.2 ELC delay time

Table 18.5 ELC delay time

Clock domain*1	Clock frequency	ELC delay time
clock_A = clock_B	clock_A = clock_B	0 cycle
clock_A ≠ clock_B	clock_A = clock_B	1 cycle to 2 cycles
	clock_A > clock_B	1 cycle to 2 cycles of clock_B
	clock_A < clock_B	1 cycle to 2 cycles of clock_A

Note 1. When PORT_IRQ, PVD, MOSC, DMAC, DTC, I/O Ports is selected as event source module, the ELC delay time is 2 cycles to 4 cycles of PCLKB.

Table 18.6 Clock domain of each module A

Module A	Clock domain of clock_A
PORT_IRQ, PVD, MOSC	ASYNC
DMAC, DTC, I/O Ports	ICLK
ULPT, AGT, IWDT, CWDT, IIC, ACMPHS, ELC, RTC	PCLKB
GPT	PCLKD
SCI, SPI, ADC12, DOC	PCLKA

Table 18.7 Clock domain of each module B

Module B	Clock domain of clock_B
ADC12, DAC12	PCLKA
DTC, I/O Ports	ICLK
GPT	PCLKD

19. I/O Ports

19.1 Overview

The I/O port pins operate as general I/O port pins, I/O pins for peripheral modules, interrupt input pins, analog I/O, port group function for the ELC, or bus control pins.

All pins except P209 (as TDO of JTAG ports) operate as input pins immediately after a reset, and pin functions are switched by register settings. The I/O ports and peripheral modules for each pin are specified in the associated registers.

Figure 19.1 shows a connection diagram for the I/O port registers. The configuration of the I/O ports differs for different packages. Table 19.1 lists the I/O port specifications by package, and Table 19.2 lists the port functions.

Figure 19.1 Connection diagram for I/O port registers

Table 19.1 I/O port specifications (1 of 2)

Port	Package	Number of pins
	224 pins	
PORT0	P000 to P011, P014, P015	14
PORT1	P100 to P107, P112 to P115	12
PORT2	P200 to P213	14
PORT3	P300 to P315	16

Table 19.1 I/O port specifications (2 of 2)

Port	Package	Number of pins
	224 pins	
PORT4	P400 to P415	16
PORT5	P500 to P515	16
PORT6	P600 to P607, P609 to P615	15
PORT7	P700 to P715	16
PORT8	P800 to P815	16
PORT9	P900 to P915	16
PORTA	PA00 to PA15	16
PORTB	PB00 to PB07	8

Table 19.2 I/O port functions (1 of 2)

Port	Port name	Input pull-up	Open-drain output	Drive capability switching	5Vtolerant	I/O	Power supply
PORT0	P000 to P011, P014, P015	✓	✓	Low	—	Input / Output	AVCC0
PORT1	P100 to P103	✓	✓	Low, middle, high, high-speed high-drive	—	Input / Output	VCC2
	P104 to P107	✓	✓	Low, middle, high	—	Input / Output	VCC2
	P112 to P115	✓	✓	Low, middle, high	—	Input / Output	VCC

19.2 Register Descriptions

19.2.1 PCNTR1/PODR/PDR : Port Control Register 1

Base address: PORTm = 0x4040_0000 + 0x0020 × m (m = 0 to 9, A, B)
 PORTm_NS = 0x5040_0000 + 0x0020 × m (m = 0 to 9, A, B)

Offset address: 0x000 (PCNTR1/PDR)
 0x002 (PODR)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	PODR 15	PODR 14	PODR 13	PODR 12	PODR 11	PODR 10	PODR 09	PODR 08	PODR 07	PODR 06	PODR 05	PODR 04	PODR 03	PODR 02	PODR 01	PODR 00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PDR1 5	PDR1 4	PDR1 3	PDR1 2	PDR11	PDR1 0	PDR0 9	PDR0 8	PDR0 7	PDR0 6	PDR0 5	PDR0 4	PDR0 3	PDR0 2	PDR0 1	PDR0 0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	PDR15 to PDR00	Pmn Direction 0: Input (functions as an input pin) 1: Output (functions as an output pin)	R/W
31:16	PODR15 to PODR00	Pmn Output Data 0: Low output 1: High output	R/W

Note: S-TYPE-4, P-TYPE-5
 Note: m = 0 to 9, A, B, n = 00 to 15

The Port Control Register 1 (PCNTR1/PODR/PDR) is a 32-bit or 16-bit read/write register that controls port direction and port output data. The PCNTR1 specifies the port direction and output data, and is accessed in 32-bit units. The PDRn (bits [15:0] in PCNTR1) and PODRn (bits [31:16] in PCNTR1) respectively, are accessed in 16-bit units.

PDRn bits (Pmn Direction)

The PDRn bits select the input or output direction for individual pins on the associated port when the pins are configured as general I/O pins. Each pin on port m is associated with a PORTm.PCNTR1.PDRn bit. The I/O direction can be specified in 1-bit unit. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0. In the case of input only ports, PDRn bits are reserved. See [section 19.1. Overview](#). The PDRn bit in the PORTm.PCNTR1 register serves the same function as the PDR bit in the PFS.PmnPFS register.

PODRn bits (Pmn Output Data)

The PODRn bits hold data to be output from the general I/O pins. Bits of non-existent port m are reserved. Reserved bits are read as 0. The write value should be 0. In the case of input only ports, PODRn bits are reserved. See [section 19.1. Overview](#). The PODRn bit in the PORTm.PCNTR1 register serves the same function as the PODR bit in the PFS.PmnPFS register.

19.2.2 PCNTR2/EIDR/PIDR : Port Control Register 2

Base address: PORTm = 0x4040_0000 + 0x0020 × m (m = 0 to 9, A, B)
 PORTm_NS = 0x5040_0000 + 0x0020 × m (m = 0 to 9, A, B)

Offset address: 0x004 (PCNTR2/PIDR)
 0x006 (EIDR)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	EIDR1 5	EIDR1 4	EIDR1 3	EIDR1 2	EIDR1 1	EIDR1 0	EIDR0 9	EIDR0 8	EIDR0 7	EIDR0 6	EIDR0 5	EIDR0 4	EIDR0 3	EIDR0 2	EIDR0 1	EIDR0 0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PIDR1 5	PIDR1 4	PIDR1 3	PIDR1 2	PIDR1 1	PIDR1 0	PIDR0 9	PIDR0 8	PIDR0 7	PIDR0 6	PIDR0 5	PIDR0 4	PIDR0 3	PIDR0 2	PIDR0 1	PIDR0 0
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
15:0	PIDR15 to PIDR00	Pmn State 0: Low level 1: High level	R
31:16	EIDR15 to EIDR00 *2	Port Event Input Data*1 When an ELC_PORTx signal occurs 0: Low input 1: High input	R

Note: S-TYPE-4, P-TYPE-5

Note: m = 0 to 9, A, B, n = 00 to 15

Note 1. x = 1, 2, 3 or 4 for EIDR only

Note 2. Supported by ports 1, 2, 3 or 4.

The Port Control Register 2 (PCNTR2/EIDR/PIDR) allows read access to the Pmn state and the port event input data using 32-bit or 16-bit access.

The PCNTR2 represents the Pmn state and the port event input data, and is accessed in 32-bit units.

The PIDRn (bits [15:0] in PCNTR2) and EIDRn (bits [31:16] in PCNTR2) respectively, are accessed in 16-bit units. Bits associated with non-existent pins are reserved. Reserved bits are read as undefined.

PIDRn bits (Pmn State)

The PIDRn bits reflect the individual pin states of the port, regardless of the values set in PmnPFS.PMR and PORTm.PCNTR1.PDRn. The PIDRn bit in the PORTm.PCNTR2 register serves the same function as the PIDR bit in the PFS.PmnPFS register.

A pin state cannot be reflected in PIDRn when one of the following functions is enabled:

- RTC Time Capture input and tamper detection (RTCIC)
- CS area controller (CSC)
- Analog function (ASEL = 1)
- Trace interface (TCLK, TDATA_n (n = 0 to 3), SWO)

EIDRn bits (Port Event Input Data)

The EIDRn bits latch a pin state when an ELC_PORTx signal occurs. Pin states can only be input to EIDRn when PmnPFS.PMR and PORTm.PCNTR1.PDRn are 0. When the PmnPFS.ASEL bit is set to 1, the associated pin state is not reflected in EIDRn.

19.2.3 PCNTR3/PORR/POSR : Port Control Register 3

Base address: $PORTm = 0x4040_0000 + 0x0020 \times m$ ($m = 0$ to 9, A, B)
 $PORTm_NS = 0x5040_0000 + 0x0020 \times m$ ($m = 0$ to 9, A, B)

Offset address: 0x008 (PCNTR3/POSR)
 0x00A (PORR)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	PORR 15	PORR 14	PORR 13	PORR 12	PORR 11	PORR 10	PORR 09	PORR 08	PORR 07	PORR 06	PORR 05	PORR 04	PORR 03	PORR 02	PORR 01	PORR 00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	POSR 15	POSR 14	POSR 13	POSR 12	POSR 11	POSR 10	POSR 09	POSR 08	POSR 07	POSR 06	POSR 05	POSR 04	POSR 03	POSR 02	POSR 01	POSR 00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	POSR15 to POSR00	Pmn Output Set 0: No effect on output 1: High output	W
31:16	PORR15 to PORR00	Pmn Output Reset 0: No effect on output 1: Low output	W

Note: S-TYPE-4, P-TYPE-5

Note: $m = 0$ to 9, A, B, $n = 00$ to 15

The Port Control Register 3 (PCNTR3/PORR/POSR) is a 32-bit or 16-bit write register that controls the setting or resetting of the port output data.

The PCNTR3 controls the setting or resetting of the port output data, and is accessed in 32-bit units.

The POSR n (bits [15:0] in PCNTR3) and the PORR n (bits [31:16] in PCNTR3) respectively, are accessed in 16-bit units.

POSR n bits (Pmn Output Set)

POSR changes PODR when set by a software write. For example, for P100, when $PORT1.PCNTR3.POSR00 = 1$, $PORT1.PCNTR1.PODR00$ outputs 1. Bits associated with non-existent pins are reserved. The write value should always be 0. In the case of input only ports, POSR n bits are reserved. See [section 19.1. Overview](#).

PORR n bits (Pmn Output Reset)

PORR changes PODR when reset by a software write. For example, for P100, when $PORT1.PCNTR3.PORR00 = 1$, $PORT1.PCNTR1.PODR00$ outputs 0. Bits associated with non-existent pins are reserved. The write value should always be 0. In the case of input only ports, PORR n bits are reserved. See [section 19.1. Overview](#).

Note: When EORR n or EOSR n is set, writing is prohibited to PODR n , PORR n , and POSR n .

Note: PORR n and POSR n should not be set at the same time.

19.2.4 PCNTR4/EORR/EOSR : Port Control Register 4

Base address: PORTm = 0x4040_0000 + 0x0020 × m (m = 1 to 4)
 PORTm_NS = 0x5040_0000 + 0x0020 × m (m = 1 to 4)

Offset address: 0x00C (PCNTR4/EOSR)
 0x00E (EORR)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	EORR 15	EORR 14	EORR 13	EORR 12	EORR 11	EORR 10	EORR 09	EORR 08	EORR 07	EORR 06	EORR 05	EORR 04	EORR 03	EORR 02	EORR 01	EORR 00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	EOSR 15	EOSR 14	EOSR 13	EOSR 12	EOSR 11	EOSR 10	EOSR 09	EOSR 08	EOSR 07	EOSR 06	EOSR 05	EOSR 04	EOSR 03	EOSR 02	EOSR 01	EOSR 00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	EOSR15 to EOSR00	Pmn Event Output Set When an ELC_PORTx signal occurs 0: No effect on output 1: High output	R/W
31:16	EORR15 to EORR0	Pmn Event Output Reset When an ELC_PORTx signal occurs 0: No effect on output 1: Low output	R/W

Note: S-TYPE-4, P-TYPE-5

Note: m = 1 to 4, n = 00 to 15, x = 1 to 4

The Port Control Register 4 (PCNTR4/EORR/EOSR) is a 32-bit or 16-bit read/write register that controls the setting or resetting of the port output data by an event input from the ELC.

The PCNTR4 controls the setting or resetting of the port output data by an event input from the ELC, and is accessed in 32-bit units.

The EOSRn (bits [15:0] in PCNTR4) and EORRn (bits [31:16] in PCNTR4) respectively, are accessed in 16-bit units.

EOSRn bits (Pmn Event Output Set)

EOSR changes PODR when set because an ELC_PORTx signal occurs. For example, for P100 if PORT1.PCNTR4.EOSR00 is set to 1 when the ELC_PORTx occurs, PORT1.PCNTR1.PODR00 outputs 1. Bits associated with non-existent pins are reserved. The write value should always be 0. For input only ports, EOSRn bits are reserved. See [section 19.1. Overview](#).

EORRn bits (Pmn Event Output Reset)

EORR changes PODR when reset because an ELC_PORTx signal occurs. For example, for P100 if PORT1.PCNTR4.EORR00 = 1 when the ELC_PORTx occurs, PORT1.PCNTR1.PODR00 outputs 0. Bits associated with non-existent pins are reserved. The write value should always be 0. For input only ports, EORRn bits are reserved. See [section 19.1. Overview](#).

Note: When EORRn or EOSRn is set, writing is prohibited to PODRn, PORRn, and POSRn.

Note: EORRn and EOSRn should not be set at the same time.

19.2.5 PmnPFS/PmnPFS_HA/PmnPFS_BY : Port mn Pin Function Select Register (m = 0 to 9, A, B, n = 00 to 15)

Base address: PFS = 0x4040_0800
PFS_NS = 0x5040_0800

Offset address: 0x000 + 0x040 × m + 0x004 × n (PmnPFS/PmnPFS_HA/PmnPFS_BY)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
Bit field:	—	—	—	PSEL[4:0]				—	—	—	—	—	—	—	—	—	PMR
Value after reset:	0	0	0	0 ^{*1}	0	0	0 ^{*1}	0 ^{*1}	0	0	0	0	0	0	0	0	0 ^{*1}
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Bit field:	ASEL	ISEL	EOFR[1:0]		DSCR[1:0]		—	—	—	NCOD R	—	PCR	—	PDR	PIDR	PODR	
Value after reset:	0	0	0	0	0	0 ^{*1}	0	0	0	0	0	0 ^{*1}	0	0	x	0	

Bit	Symbol	Function	R/W
0	PODR	Port Output Data 0: Low output 1: High output	R/W
1	PIDR	Pmn State 0: Low level 1: High level	R
2	PDR	Port Direction 0: Input (functions as an input pin) 1: Output (functions as an output pin)	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	PCR	Pull-up Control 0: Disable input pull-up 1: Enable input pull-up	R/W
5	—	This bit is read as 0. The write value should be 0.	R/W
6	NCODR	N-Channel Open-Drain Control 0: CMOS output 1: NMOS open-drain output	R/W
9:7	—	These bits are read as 0. The write value should be 0.	R/W
11:10	DSCR[1:0]	Port Drive Capability 0 0: Low drive 0 1: Middle drive 1 0: High-speed high-drive 1 1: High drive	R/W
13:12	EOFR[1:0]	Event on Falling/Event on Rising ^{*2} 0 0: Don't care 0 1: Detect rising edge 1 0: Detect falling edge 1 1: Detect both edges	R/W
14	ISEL	IRQ Input Enable 0: Not used as an IRQn input pin 1: Used as an IRQn input pin	R/W
15	ASEL	Analog Input Enable 0: Not used as an analog pin 1: Used as an analog pin	R/W
16	PMR	Port Mode Control 0: Used as a general I/O pin 1: Used as an I/O port for peripheral functions	R/W
23:17	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
28:24	PSEL[4:0]	Peripheral Select These bits select the peripheral function. For individual pin functions, see the associated tables in this chapter.	R/W
31:29	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Note 1. The initial value of P201, P208, P209, P210, P211, P814 and P815 is not 0x0000_0000. P201 is 0x0000_0010, P208 is 0x0001_0010, P209 is 0x0001_0400, P210 is 0x0001_0410, P211 is 0x0001_0010, P814 is 0x1301_0000 and P815 is 0x1301_0000.

Note 2. Supported by PORTn (n = 1 to 4).

Port mn Pin Function Select Register (PmnPFS/PmnPFS_HA/PmnPFS_BY) is a 32-bit, 16-bit, or 8-bit read/write control register that selects the port mn pin function, and is accessed in 32-bit units. PmnPFS_HA (PmnPFS [15:0] bits) is accessed in 16-bit units. PmnPFS_BY (PmnPFS[7:0] bits) is accessed in 8-bit units.

The available Port mn pin depends on the product. For details, see [Table 19.1](#)

PODR bit (Port Output Data), PIDR bit (Port State), PDR bit (Port Direction)

The PDR, PIDR, and PODR bits serve the same function as the PCNTR. When these bits are read, the PCNTR value is read.

PCR bit (Pull-up Control)

The PCR bit enables or disables an input pull-up resistor on the individual port pins. When a pin is in the input state with the associated bit in PmnPFS.PCR set to 1, the pull-up resistor connected to the pin is enabled. When a pin is set as a general port output pin, or a peripheral function output pin, the pull-up resistor for the pin is disabled regardless of the PCR setting. The pull-up resistor is also disabled in the reset state. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

NCODR bit (N-Channel Open-Drain Control)

The NCODR bit specifies the output type for the port pins. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

DSCR[1:0] bits (Port Drive Capability)

The DSCR[1:0] bits switches the capability of the port. If the capability of a pin is fixed, the associated bit is a read/write bit, but the capability cannot be changed. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

EOFR[1:0] bits (Event on Falling/Event on Rising)

The EOFR[1:0] bits select the edge detection method for the port group input signal. These bits support rising, falling, or both edge detections. When the EOFR[1:0] bits are set to 01b, 10b, or 11b, the input enable of the I/O cell is asserted. Following that, the event pulse is input from the external pin, and the GPIO outputs the event pulse to the ELC. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

ISEL bit (IRQ Input Enable)

The ISEL bit specifies IRQ input pins. This setting can be used in combination with the peripheral functions, although an IRQn (external pin interrupt) of the same number must only be enabled for one pin. The ISEL bit for an unspecified IRQn is reserved.

ASEL bit (Analog Input Enable)

The ASEL bit specifies analog pins. When a pin is set as an analog pin by this bit:

1. Specify it as a general I/O port in the Port Mode Control bit (PmnPFS.PMR).
2. Disable the pull-up resistor in the Pull-up Control bit (PmnPFS.PCR).
3. Specify the input in the Port Direction bit (PmnPFS.PDR). The pin state cannot be read at this point. The PmnPFS register is protected by the Write-Protect Register for Non-secure (PWPR_NS). Release write-protect before modifying the register.

The ASEL bit for an unspecified analog I/O pin is reserved.

PMR bit (Port Mode Control)

The PMR bit specifies the port pin function. Bits associated with non-existent pins are reserved. The write value should be 0.

PSEL[4:0] bits (Peripheral Select)

The PSEL[4:0] bits assign the peripheral function.

19.2.6 PWPR_NS : Write-Protect Register for Non-secure

Base address: PFS_NS = 0x5040_0800

Offset address: 0x50C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	B0WI	PFSWE	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W
6	PFSWE	PmnPFS Register Write Enable 0: Writing to the PmnPFS register is disabled 1: Writing to the PmnPFS register is enabled	R/W
7	B0WI	PFSWE Bit Write Disable 0: Writing to the PFSWE bit is enabled 1: Writing to the PFSWE bit is disabled	R/W

Note: S-TYPE-7, P-TYPE-2

Note: The access to this register is not controlled by any security attribution register.

PFSWE bit (PmnPFS Register Write Enable)

Writing to the PmnPFS register is enabled only when the PFSWE bit is set to 1. You must first write 0 to the B0WI bit before setting PFSWE to 1.

B0WI bit (PFSWE Bit Write Disable)

Writing to the PFSWE bit is enabled only when the B0WI bit is set to 0.

19.2.7 PWPR_S : Write-Protect Register for Secure

Base address: PFS = 0x4040_0800

Offset address: 0x514

Bit position:	7	6	5	4	3	2	1	0
Bit field:	B0WI	PFSWE	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W
6	PFSWE	PmnPFS Register Write Enable 0: Disable writes to the PmnPFS register 1: Enable writes to the PmnPFS register	R/W
7	B0WI	PFSWE Bit Write Disable 0: Enable writes the PFSWE bit 1: Disable writes to the PFSWE bit	R/W

Note: S-TYPE-6, P-TYPE-2

PFSWE bit (PmnPFS Register Write Enable)

Writing to the PmnPFS register of the IO port pin set as secure by the PmSAR register is enabled only when the PFSWE bit is set to 1. You must first write 0 to the B0WI bit before setting PFSWE to 1.

B0WI bit (PFSWE Bit Write Disable)

Writing to the PFSWE bit is enabled only when the B0WI bit is set to 0.

19.2.8 PmSAR : Port Security Attribution register (m = 0 to 9, A, B)

Base address: PFS = 0x4040_0800
PFS_NS = 0x5040_0800

Offset address: 0x530 + 0x004 × m

Bit	Symbol	Function	R/W
15:0	PMNSA[15:0]	Pmn Security Attribution Target I/O port pin : Pmn 0: Secure 1: Non Secure	R/W

Note: S-TYPE-1, P-TYPE-1

Note: This register is write-protected by PRCR register.

Note: m = 0 to 9, A, B, n = 00 to 15

Port Security Attribution Register is a 16-bit register that setting the Security Attribution of the each port, the registers are accessed only in 16-bit units.

PMNSA[15:0] bits (Pmn Security Attribution)

The PmnSA bit specifies the Security Attribution of Pmn.

19.2.9 LVOCR : Low Voltage Operation Control register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xAB0

Bit	Symbol	Function	R/W
0	LVO0E	Low Voltage Operation 0 Enable 0: Disable 1: Enable	R/W
1	LVO1E	Low Voltage Operation 1 Enable 0: Disable 1: Enable	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Low voltage operation control register controls the IO when VCC/VCC2 is lower than 2.7V.

LVO0E bit (Low Voltage Operation 0 Enable)

When VCC is lower than 2.7V, set the LVO0E bit to 1.

LVO1E bit (Low Voltage Operation 1 Enable)

When VCC2 is lower than 2.7V, set the LVO1E bit to 1.

19.3 Operation

19.3.1 General I/O Ports

All pins except P208 to P211, P814 and P815 operate as general I/O ports after reset. General I/O ports are organized as 16 bits per port and can be accessed by port with the Port Control Registers (PCNTRn, where n = 1 to 4), or by individual pins with the Port mn Pin Function Select register. For details on these registers, see [section 19.2. Register Descriptions](#).

Each port has the following bits:

- Port Security Attribution register (PmSAR)(m = 0 to 9, A, B), which indicates the security attribution.
- Port Direction bit (PDRn), which selects input or output direction
- Port Output Data bit (PODRn), which holds data for output
- Port Input Data bit (PIDRn), which indicates the pin states
- Event Input Data bit (EIDRn), which indicates the pin state when an ELC_PORTn (n = 1, 2, 3 or 4) signal occurs
- Port Output Set bit (POSRn), which indicates the output value when a software write occurs
- Port Output Reset bit (PORRn), which indicates the output value when a software write occurs
- Event Output Set bit (EOSRn), which indicates the output value when an ELC_PORTn (n = 1, 2, 3 or 4) signal occurs
- Event Output Reset bit (EORRn), which indicates the output value when an ELC_PORTn (n = 1, 2, 3 or 4) signal occurs.

19.3.2 Port Function Select

The following port functions are available for configuring each pin:

- Security function: Security attribution for each pins
- I/O configuration: CMOS output or NMOS open-drain output, pull-up control, and drive capability
- General I/O port: Port direction, output data setting, and read input data
- Alternate function: Configured function mapping to the pin.

Each pin is associated with a Port mn Pin Function Select register (PmnPFS), which includes the associated PODR, PIDR, and PDR bits. In addition, the PmnPFS register includes the following:

- PCR: Pull-up resistor control bit that turns the input pull-up MOS on or off
- NCODR: N-channel open-drain control bit that selects the output type for each pin
- DSCR[1:0]: Drive capability control bit that selects the drive capability
- EOFR[1:0]: For selecting the edge of the event that input from the port group
- ISEL: IRQ input enable bit to specify an IRQ input pin
- ASEL: Analog input enable bit to specify an analog pin
- PMR: Port mode bit to specify the pin function of each port
- PSEL[4:0]: Port function select bits to select the associated peripheral function.

These configurations can be made by a single-register access to the Port mn Pin Function Select register. For details, see [section 19.2.5. PmnPFS/PmnPFS_HA/PmnPFS_BY : Port mn Pin Function Select Register \(m = 0 to 9, A, B, n = 00 to 15\)](#).

19.3.3 Port Group Function for ELC

In the MCU, Port 1 are assigned for the ELC port group function.

19.3.3.1 Behavior When ELC_PORTn (n = 1, 2, 3 or 4) is Input from ELC

The MCU supports the two functions described in this section when an ELC_PORTn (n = 1, 2, 3 or 4) signal comes from the ELC.

(1) Input to EIDR

For the GPI function (PDR = 0 and PMR = 0 in the PmnPFS register), when an ELC_PORTn (n = 1, 2, 3 or 4) signal comes from the ELC, the input enable of the I/O cell is asserted, and data from the external pins is read into the EIDR bit. See [Figure 19.2](#)

For the GPO function (PDR = 1) or the peripheral mode (PMR = 1), 0 is input into the EIDR bit from the external pins.

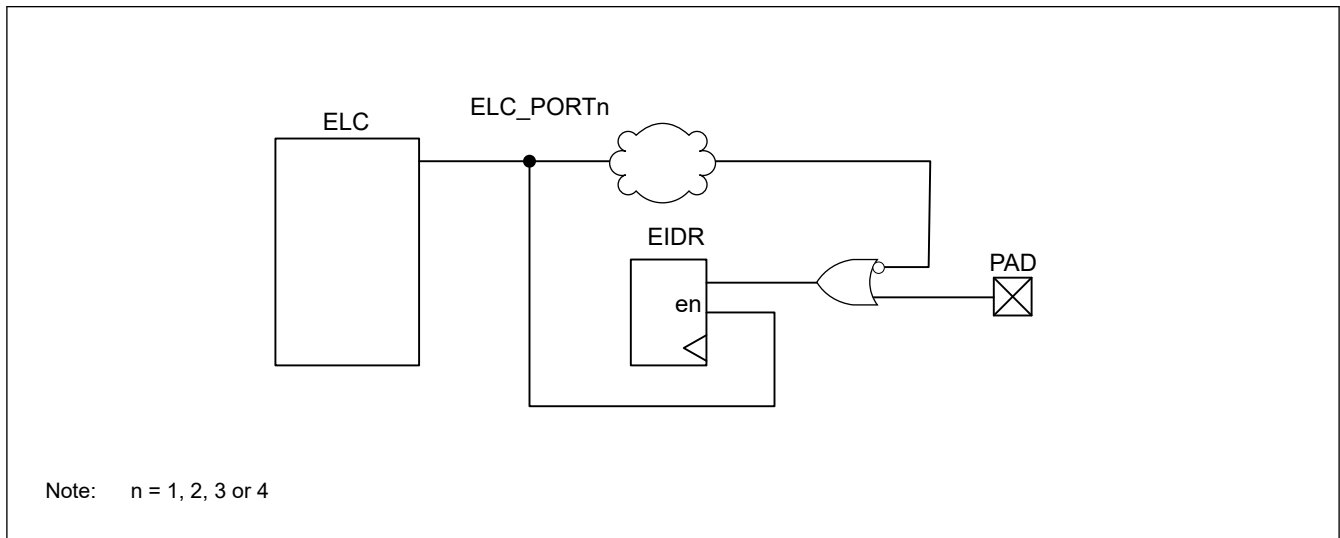

Figure 19.2 Event ports input data

(2) Output from PODR by EOSR and EORR

When an ELC_PORTn (n = 1, 2, 3 or 4) signal occurs, the data is output from the PODR to the external pin based on the settings in the EOSR and EORR registers.

- If EOSR is set to 1, when an ELC_PORTn (n = 1, 2, 3 or 4) signal occurs, the PODR register outputs 1 to the external pin. Otherwise, when EOSR = 0, the PODR value is retained.
- If EORR is set to 1, when ELC_PORTn (n = 1, 2, 3 or 4) signal occurs, the PODR register outputs 0 to the external pin. Otherwise, when EORR = 0, the PODR value is retained.

Figure 19.3 Event ports output data

19.3.3.2 Behavior When an Event Pulse is Output to ELC

To output the event pulse from the external pins to the ELC, set the EOFR[1:0] bits in the PmnPFS register. For details, see [section 19.2.5. PmnPFS/PmnPFS_HA/PmnPFS_BY : Port mn Pin Function Select Register \(m = 0 to 9, A, B, n = 00 to 15\)](#). When the EOFR[1:0] bits are set, the input enable of the I/O cell is asserted.

Data from the external pin is the input. For example, for Port 1, when the data is input from P100 to P115, the data of those 16 pins is organized by OR logic. This data is formed into a one-shot pulse that goes to the ELC. The operation of Port n (n = 2 to 4) is also the same as Port 1. See [Figure 19.4](#).

Figure 19.4 Generation of event pulse

19.4 Handling of Unused Pins

[Table 19.3](#) shows how to handle unused pins.

Table 19.3 Handling of unused pins

Pin name	Description
MD	Use as a mode selection pin
RES	Connect to VCC through a resistor
USB_DP, USB_DM	When both P814PFS.PMR and P815PFS.PMR bits are set to 1, keep these pins open. When P814PFS.PMR or P815PFS.PMR bit is set to 0, configure it in the same way as Other ports.
P200/NMI	Connect to VCC through a resistor
EXTAL	When the main clock oscillator is not used, set the MOSCCR.MOSTP bit to 1 (general port P212). When this pin is not used as port P212, configure it in the same way as ports 1 to B.
XTAL	When the main clock oscillator is not used, set the MOSCCR.MOSTP bit to 1 (general port P213). When the external clock is input to the EXTAL pin, the XTAL pin functions as P213. When this pin is not used as port P213, configure it in the same way as ports 1 to B.
XCIN	Connect to VSS through a resistor
XCOU	Keep pin open
P000 to P015	<ul style="list-style-type: none"> If the direction is set to input (PCNTR1.PDRn = 0), connect the associated pin to AVCC0 through a resistor or to AVSS0 through a resistor *1 If the direction is set to output (PCNTR1.PDRn = 1), keep pin open *1
P100 to P107, P500 to P502, P600, P800 to P804, P808 to P812	<ul style="list-style-type: none"> If the direction is set to input (PCNTR1.PDRn = 0), connect the associated pin to VCC2 through a resistor or to VSS through a resistor *1 If the direction is set to output (PCNTR1.PDRn = 1), keep pin open *1
Other ports	<ul style="list-style-type: none"> If the direction is set to input (PCNTR1.PDRn = 0), connect the associated pin to VCC through a resistor or to VSS through a resistor *1 *2 If the direction is set to output (PCNTR1.PDRn = 1), keep pin open *1 *3
VREFH0, VREFH	Connect to AVCC0
VREFL0, VREFL	Connect to AVSS0
VLO	Keep pin open*4
VBATT	Connect to VCC

Note 1. Clear the PmnPFS.PMR, PmnPFS.ISEL, PmnPFS.PCR, and PmnPFS.ASEL bits to 0.

Note 2. P208, P210 and P211 are recommended for pull up VCC through a resistor, because these pins are input pull-up enabled from the initial value (PmnPFS.PCR = 1).

Note 3. P209 is recommended for setting the direction to output (PCNTR1.PDRn = 1), because this pin is output from the initial value.

Note 4. For more information, see [section 50, Internal Voltage Regulator](#)

19.5 Usage Notes

19.5.1 Procedure for Specifying the Pin Functions

To specify the I/O pin functions:

1. Clear the B0WI bit in the PWPR_NS register. This enables writing to the PFSWE bit in the PWPR_NS register.*1
2. Set 1 to the PFSWE bit in the PWPR_NS register. This enables writing to the PmnPFS register.*1
3. Clear the Port Mode Control bit in the PMR to 0 for the target pin to select the general I/O port.
4. Specify the I/O function for the pin through the PSEL[4:0] bits settings in the PmnPFS register.
5. Set the PMR bit to 1 as required to switch to the selected I/O function for the pin.
6. Clear the PFSWE bit in the PWPR_NS register. This disables writing to the PmnPFS register.*1
7. Set 1 to the B0WI bit in the PWPR_NS register. This disables writing to the PFSWE bit in the PWPR_NS register.*1

Note 1. When the security attribution of Pmn is set to 0, set the PWPR_S register to write to the PmnPFS register.

19.5.2 Procedure for Using Port Group Input

To use the port group input (port n (n = 1 to 4)):

1. Set the ELSRx.ELS[8:0] bits to all 0 to ignore unexpected pulses. For more information, see [section 18, Event Link Controller \(ELC\)](#).
2. Set the EOFR[1:0] bits of the PmnPFS register to specify the rising, falling, or both edge detections.
3. Execute a dummy read or wait for a short time, for example 100 ns. Ignoring of unexpected pulses depends on the initial value of the external pin.
4. Set the ELSRx.ELS[8:0] bits to enable the event signals.

19.5.3 Port Output Data Register (PODR) Summary

This register outputs data as follows:

1. Outputs 0 if PCNTR4.EORR is set to 1 when ELC_PORTn (n = 1, 2, 3 or 4) signal occurs.
2. Outputs 1 if PCNTR4.EOSR is set to 1 when ELC_PORTn (n = 1, 2, 3 or 4) signal occurs.
3. Outputs 0 if PCNTR3.PORR is set to 1.
4. Outputs 1 if PCNTR3.POSR is set to 1.
5. Outputs 0 or 1 because PCNTR1.PODRn is set.
6. Outputs 0 or 1 because PmnPFS.PODRn is set.

Numbers in this list correspond to the priority for writing to the PODRn. For example, if 1. and 3. from the list occur at the same time, the higher priority event 1. is executed.

19.5.4 Notes on Using Analog Functions

To use an analog function, set the Port Mode Control bit (PMR) and the Port Direction bit (PDRn) to 0 so that the pin acts as a general input port. Next, set the Analog Input Enable bit (ASEL) in the Port mn Pin Function Select Register (PmnPFS.ASEL) to 1.

19.5.5 I/O Buffer Specification

The P402, P403, and P404 can be used as the RTC input, tamper detection and other peripheral functions. [Table 19.4](#) lists the P402, P403, P404 specifications.

Table 19.4 P402, P403, P404 specifications

I/O port	RTC and tamper detection			Other peripheral	
	RTC and tamper detection input enable register	RTC	Tamper detection	Other peripheral enable register	CAC GPT, CAN, SCI, SSIE, and interrupt
P402	VBTICTLR.VCH0INEN	RTCIC0	RTCIC0	P402PFS.PSEL and PMR	For details, see section 19.6. Peripheral Select Settings for Each Product .
P403	VBTICTLR.VCH1INEN	RTCIC1	RTCIC1	P403PFS.PSEL and PMR	
P404	VBTICTLR.VCH2INEN	RTCIC2	RTCIC2	P404PFS.PSEL and PMR	

These RTC inputs and tamper detection are controlled by the VBTICTLR register and this register has the highest priority for selecting the functions.

P402, P403, and P404 can be used as IRQn-DS (n = 4, 14, 15) whether RTC inputs and tamper detection are selected or not. When using these interrupts, set the interrupt procedure after setting the VBTICTLR register. See [section 11.2.8. VBTICTLR : VBATT Input Control Register](#).

See [Figure 19.5](#).

The VBTICTLR register is only initialized by VBATT_POR reset. Therefore, when not using the RTC inputs and tamper detection, the associated bit of VBTICTLR register must be set to 0 after except VBATT_POR reset.

Figure 19.5 P402, P403, P404 diagram

19.5.6 Selecting Pins USB_DP and USB_DM

Pins USB_DP and USB_DM are shared with pins P814 and P815, respectively. Pins USB_DP and P814 can be set with the PFS.P814PFS.PMR bit, and pins USB_DM and P815 can be set with the PFS.P815PFS.PMR bit. Table 19.5 shows setting values of bits PFS.P814PFS.PMR and PFS.P815PFS.PMR with each selected pin.

Table 19.5 Selecting the USB/PORT pins

PMR Bits Settings		Pins Selected	
P814PFS.PMR bit	P815PFS.PMR bit	P814/USB_DP Pin	P815/USB_DM Pin
0	0	P814	P815
0	1	P814	P815
1	0	P814	P815
1	1	USB_DP	USB_DM

Note: When using P814/USB_DP and P815/USB_DM as GPIO pins (P814 and P815), use the USB related registers with their initial values.

Note: When using P814/USB_DP and P815/USB_DM as USB pins (USB_DP and USB_DM), use the GPIO related registers for P814 and P815 with their initial values.
 Note: When using P814/USB_DP and P815/USB_DM as GPIO pins or USB pins, set these pins only once after a reset.

19.5.7 Pull-up/Pull-down Setting for P814 and P815 at USBFS/GPIO Function

When the GPIO function of P814 and P815 is used, the Pull-up/Pull-down function of USBFS register affects to P814 and P815. Therefore, before using GPIO function, the pull-up and pull-down control of USBFS needs to be disabled. The control register is SYSCFG.DPRPU and SYSCFG.DRPD bits.

19.6 Peripheral Select Settings for Each Product

This section describes the pin function select configuration using the PmnPFS register. Some pin names have added _A, _B, or _C suffixes. When assigning IIC, SPI and SSIE functionality, select the functional pins having the same suffix. The other pins can be selected regardless of the suffix. Assigning the same function to two or more pins simultaneously is prohibited.

- In Pmn pin function select register(PmnPFS), the PSEL bits have to be set when the PMR bit of the target pin is 0. If the PSEL bits are set when the PMR bit is 1, the unexpected edges may be input at the input function or the unexpected pulses may be output to the external pin at the output function.
- Only the allowed values (functions) should be specified in the PSEL bits of PmnPFS register. If a value which is not allowed for the register is specified, the correct operation is not guaranteed.
- The single function should not be assigned to the multiple pins by PmnPFS register. When the GPT1, GPT5, SCI3, IIC0 or SPI0 are configured as secure and these pin function is being assigned to the pin which security attribution is set as secure by the PmSAR register, the write access to the PSEL bits for setting same function as secure pin in other pins is ignored when the security attribution of that pin is non-secure. For example, if the PSARE.PSARE30 bit is 0 (GPT1 is secure) and the P209PFS.PSEL bits is 00011b (pin function is GTIOC1A) and the P2SAR.109SA bit is 0 (P209 is secure), the write 00011b to the P405PFS.PSEL bits is ignored when the P4SAR.405SA bit is 1 (P405 is non-secure).
- The PORT0, PORT5 and PORT8 have the analog functions such as A/D converter. When these pins are used as an analog function, for avoiding the loss of resolution, the PMR bit should be set to 0 and PDR bit should be set to 0. After that, ASEL bit should be set to 1

Table 19.6 Register settings for input/output pin function (PORT0)

PSEL[4:0] settings	Function	pin														
		P000	P001	P002	P003	P004	P005	P006	P007	P008	P009	P010	P011	P014	P015

Note 1. Recommend using pins that have a letter appended to their names, for instance “_A”, “_B”, or “_C” to indicate group membership. For the interface, the AC portion of the electrical characteristics is measured for each group.

Note 2. There are 2 types output buffer which are middle drive and high drive. Recommend using same drive buffer for output skew spec (t_{GTISK}).

20. Port Output Enable for GPT (POEG)

20.1 Overview

The Port Output Enable (POEG) function can place the General PWM Timer (GPT) output pins in the output disable state in one of the following ways:

- Input level detection of the GTETR_{Gn} (n = A to D) pins
- Output-disable request from the GPT
- Comparator interrupt request detection
- Oscillation stop detection of the clock generation circuit
- Register settings

The GTETR_{Gn} (n = A to D) pins can be used as GPT external trigger input pins.

Table 20.1 lists the POEG specifications, Figure 20.1 shows a block diagram, and Table 20.2 lists the input pins.

Table 20.1 POEG specifications

Parameter	Specifications
Output-disable control through input level detection	The GPT output pins can be disabled when a GTETR _{Gn} rising edge or high level is sampled after polarity and filter selection.
Output-disable request from the GPT	When the GTIOCxA pin and the GTIOCxB pin are driven to an active level simultaneously, the GPT generates an output-disable request to the POEG. Through reception of these requests, the POEG can control whether the GTIOCxA and GTIOCxB pins are output-disabled.
Output-disable control through the comparator (ACMPHS) interrupt request detection	The GPT output pins can be disabled when an interrupt request is generated by a change in the output results of any of the comparators.
Output-disable control through oscillation stop detection	The GPT output pins can be disabled when oscillation of the clock generation circuit stops.
Output-disable control by software (registers)	The GPT output pins can be disabled by modifying the register settings.
Interrupt	Interrupts can be generated by detecting the input level of external trigger input pins (GTETR _{Gn} pins). Interrupts can be generated when all GPT or ACMPHS output pins are driven to an active level simultaneously.
External trigger output to the GPT	The GTETR _{Gn} signals can be output to the GPT after polarity and filter selection. (count start, count stop, count clear, up-count, down-count, or input capture function)
Noise filtering	For input from the GTETR _{Gn} pins, PCLKB/1, PCLKB/8, PCLKB/32, or PCLKB/128 can be selected as the noise filtering clock. (Filtering is performed by sampling the input signals three times using the selected clock.) Positive or negative polarity can be selected for any of the GTETR _{Gn} input pins. Signal state after polarity and filter selection can be monitored.
Module-stop function	Module-stop state can be set for each groups to reduce power consumption.
TrustZone Filter	Security and Privilege attribution can be set for each groups.

Note: n = A to D, x = 0 to 5, 10 to 13

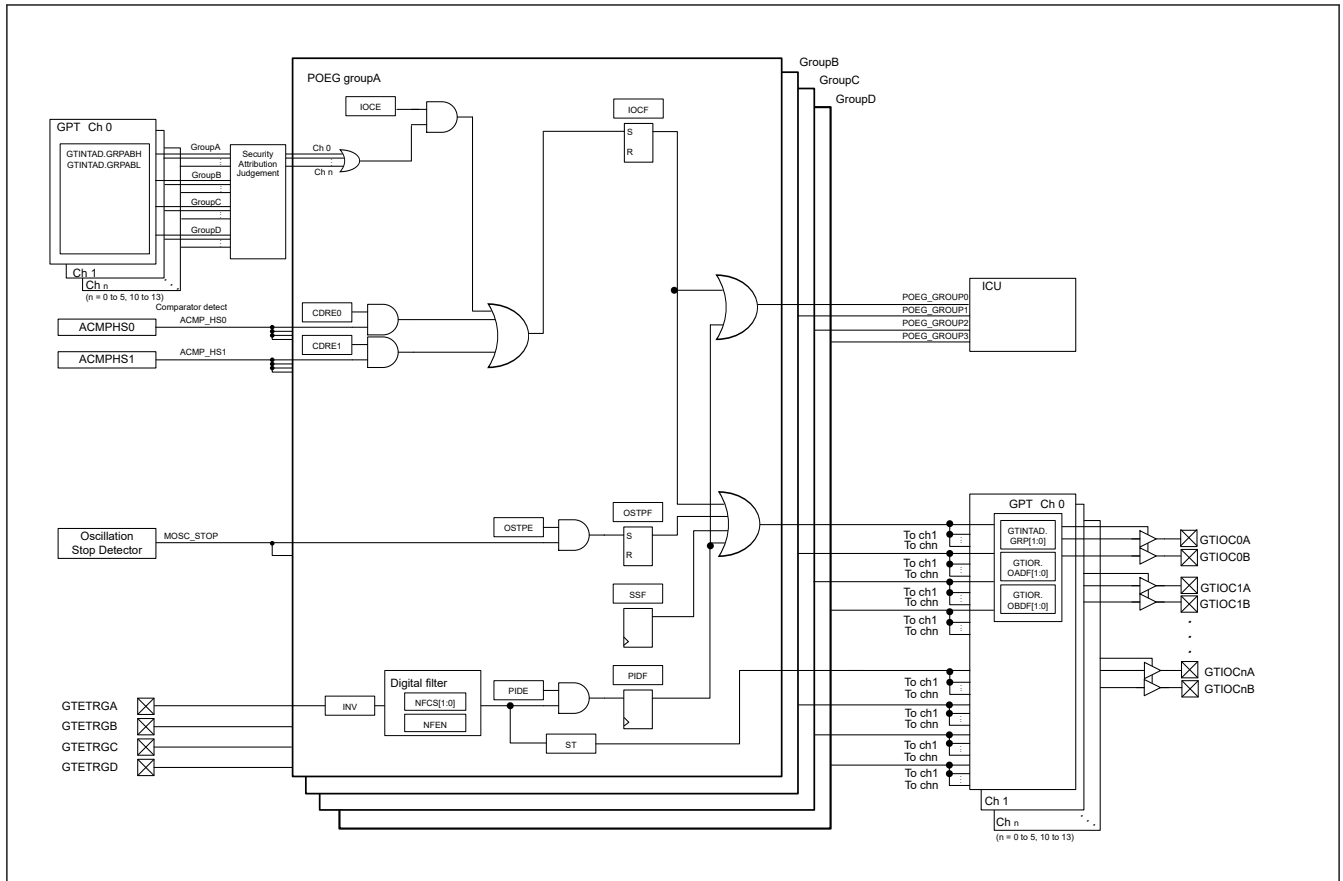

Figure 20.1 POEG block diagram

Table 20.2 POEG input pins

Pin name	I/O	Description
GTETRGA	Input	GPT output pin output-disable request signal or GPT external trigger input pin A
GTETRGB	Input	GPT output pin output-disable request signal or GPT external trigger input pin B
GTETRGC	Input	GPT output pin output-disable request signal or GPT external trigger input pin C
GTETRGD	Input	GPT output pin output-disable request signal or GPT external trigger input pin D

Note: S-TYPE3, P-TYPE3

Note 1. Only 0 can be written to clear the flag.

Note 2. Can be modified only once after a reset.

The POEGn (n = A to D) registers control the output-disable state of the GPT pins, interrupts, and the external trigger input to the GPT.

In the descriptions, POEGn represents the POEGn (n = A to D) registers.

20.3 Output-Disable Control Operation

If any of the following conditions is satisfied, the GTIOCxA, GTIOCxB, and the 3-phase PWM output for BLDC motor control pins can be set to output-disable:

- Input level or edge detection of the GTETR_{Gn} pins
When POEG_{Gn}.PIDE is 1, the POEG_{Gn}.PIDF flag is set to 1.
- Output-disable request from the GPT
When POEG_{Gn}.IOCE is 1, the POEG_{Gn}.IOCF flag is set to 1 if the disable request is enabled by GTINTAD. The GTINTAD.GRPABH and GTINTAD.GRPABL settings apply to the group selected by the GPT register GTINTAD.GRP[1:0] or OPSCR.GRP[1:0].

Note: The disable request is valid only when the security attributions of GPT and POEG are same. The disable request from GPT with a security attribution different from the security attribution of POEG is invalidated by the security attribution judgment.
- Comparator (ACMPHS) interrupt request detection
Comparator interrupt detection is activated when any of the POEG_{Gn}.CDRE_i (i = 0, 1) is 1. When the associated comparator interrupt is generated, the GPT output pins are disabled. POEG_{Gn}.IOCF indicates the detection status.
- Oscillation stop detection for the clock generation circuit
While POEG_{Gn}.OSTPE is 1, the halt status of the main clock oscillator is detected and the POEG_{Gn}.OSTPF flag is set to 1.
- SSF bit setting
When POEG_{Gn}.SSF is set to 1, the GPT and PWM output are disabled.

The output-disable state is controlled in the GPT module. The output-disable of the GTIOC_xA and GTIOC_xB pins is set in the GTINTAD.GRP[1:0], GTIOR.OADF[1:0], and GTIOR.OBDF[1:0] bits in GPT_x. The output-disable of the 3-phase PWM output for BLDC motor control pins is set in the OPSCR.GRP[1:0] bits and OPSCR.GODF bit in GPT_OPS.

20.3.1 Pin Input Level Detection Operation

If the input conditions set in POEG_{Gn}.PIDE, POEG_{Gn}.NFCS[1:0], POEG_{Gn}.NFEN, and POEG_{Gn}.INV occur on the GTETR_{Gn} pins, the GPT output pins are output-disabled.

20.3.1.1 Digital Filter

Figure 20.2 shows high-level detection by the digital filter. When a high level associated with the POEG_{Gn}.INV polarity setting is detected three times consecutively with the sampling clock selected in POEG_{Gn}.NFCS[1:0] and POEG_{Gn}.NFEN, the detected level is recognized as high, and the GPT output pins are output-disabled. If even one low level is detected during this interval, the detected level is not recognized as high. In addition, in an interval where the sampling clock is not output, changes of the levels on the GTETR_{Gn} pins are ignored.

Figure 20.2 Example of digital filter operation

20.3.2 Output-Disable Requests from the GPT

For details on the operation, see the description for GTIOC Pin Output Negate Control in [section 21, General PWM Timer \(GPT\)](#).

20.3.3 Comparator Interrupt Detection

If POEGGn.CDREi (i = 0, 1) is 1 when an associated comparator interrupt request is generated, the GPT output pins are output-disabled for each group. The status flag is POEGGn.IOCF which is shared with GPT output-disable detection.

20.3.4 Output-Disable Control Using Detection of Stopped Oscillation

When the oscillation stop detection function in the clock generation circuit detects stopped oscillation while POEGGn.OSTPE is 1, the GPT output pins are output-disabled for each group.

20.3.5 Output-Disable Control Using Registers

The GPT output pins can be directly controlled by writing 1 to the Software Stop flag, POEGGn.SSF.

20.3.6 Release from Output-Disable

To release the GPT output pins placed in the output-disable state, either return them to their initial state with a reset or clear all of the following flags:

- POEGGn.PIDF
- POEGGn.IOCF
- POEGGn.OSTPF
- POEGGn.SSF

Writing 0 to the POEGGn.PIDF flag is ignored (the flag is not cleared) if the external input pins, GTETRGN are not disabled and the POEGGn.ST bit is not set to 0.

Writing 0 to the POEGGn.IOCF flag is valid (the flag is cleared) only if all of the GTST.OABHF and GTST.OABLF flags in the GPT are set to 0.

Writing 0 to the POEGGn.OSTPF flag is ignored (the flag is not cleared) if the OSTDSR.OSTDF flag in the clock generation circuit is not set to 0. In addition, when the flag set and release occur at the same time, the flag set takes precedence.

[Figure 20.3](#) shows the release timing for output-disable. The output-disable is released at the beginning of the next count cycle of the GPT after the flag is cleared.

Figure 20.3 Output-disable release timing for GPT pin outputs

20.4 Interrupt Sources

The POEG generates an interrupt request for the following factors:

- Output-disable control by the input level detection
- Output-disable request from the GPT or the comparator (ACMPHS) interrupt request detection

Table 20.3 lists the conditions for interrupt requests.

Table 20.3 Interrupt sources and conditions

Interrupt source	Symbol	Associated flag	Trigger conditions
POEG group A interrupt	POEG_GROUPA	POEGGA.IOCF	An output-disable request from a GPT disable request occurred
			An output-disable request from ACMPHS interrupt occurred
		POEGGA.PIDF	An output-disable request from the GTETRGA pin occurred
POEG group B interrupt	POEG_GROUPB	POEGGB.IOCF	An output-disable request from a GPT disable request occurred
			An output-disable request from ACMPHS interrupt occurred
		POEGGB.PIDF	An output-disable request from the GTETRGB pin occurred
POEG group C interrupt	POEG_GROUPC	POEGGC.IOCF	An output-disable request from a GPT disable request occurred
			An output-disable request from ACMPHS interrupt occurred
		POEGGC.PIDF	An output-disable request from the GTETRGC pin occurred
POEG group D interrupt	POEG_GROUPD	POEGGD.IOCF	An output-disable request from a GPT disable request occurred
			An output-disable request from ACMPHS interrupt occurred
		POEGGD.PIDF	An output-disable request from the GTETRGD pin occurred

20.5 External Trigger Output to the GPT

The POEG outputs signals generated by filtering and level detection of GTETRGN pins input signals as the GPT operation trigger signal for the following:

- Count start
- Count stop

- Count clear
- Up-count
- Down-count
- Input capture

For the POEGGn.INV polarity setting signal, when the same level is input three times continuously with the sampling clock selected in POEGGn.NFCS[1:0] and POEGGn.NFEN, that value is output. Set the control registers the same as for the input level detection operation described in section 20.3.1. Pin Input Level Detection Operation. The state after filtering can be monitored in POEGGn.ST.

Figure 20.4 shows the output timing of an external trigger to the GPT.

Figure 20.4 Output timing of external trigger to the GPT

20.6 Usage Notes

20.6.1 Transition to Software Standby Mode

When using the POEG, do not invoke Software Standby mode. In this mode, the POEG stops and therefore output disable of the pins cannot be controlled.

20.6.2 Specifying Pins Associated with the GPT

The POEG controls output-disable only when a pin is associated with the GPT in the PmnPFS.PMR and PmnPFS.PSEL settings. When the pin is specified as a general I/O pin, the POEG does not perform output-disable control.

21. General PWM Timer (GPT)

21.1 Overview

The General PWM Timer (GPT) is a 32-bit timer with $GPT32 \times 6$ channels and a 16-bit timer with $GPT16 \times 4$ channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or the up- and down-counter. This GPT provides the A/D conversion start request function. The GPT can also be used as a general-purpose timer.

Table 21.1 lists the GPT specifications, Table 21.2 shows the GPT functions, and Figure 21.1 shows a block diagram.

Table 21.1 GPT specifications

Parameter	Description
Functions	<ul style="list-style-type: none"> • 32 bits \times 6 channels (GPT32n (n = 0 to 5)) • 16 bits \times 4 channels (GPT16m (m = 10 to 13)) • Up-counting or down-counting (saw waves) or up/down-counting (triangle waves) for each counter • Clock sources independently selectable for each channel • Two input/output pins per channel • Two output compare/input capture registers per channel • For the two output compare/input capture registers of each channel, four registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use • In output compare operation, buffer switching can be at crests or troughs, enabling the generation of laterally asymmetric PWM waveforms • Registers for setting up frame cycles in each channel with capability for generating interrupts at overflow or underflow • Generation of dead times in PWM operation • Synchronous starting, stopping and clearing counters for arbitrary channels • Count start, count stop, count clear, up-count, down-count, or input capture operation in response to a maximum of 8 ELC events • Count start, count stop, count clear, up-count, down-count, or input capture operation in response to the status of two input pins • Count start, count stop, count clear, up-count, down-count, or input capture operation in response to a maximum of 4 external triggers • Control output disable request from the POEG • A/D conversion start request generation function • Compare match A to F event and overflow/underflow event can be output to the ELC • Enables the noise filter for input capture • Period count function • Logical operation between the channel output • Bus clock: PCLKA, Core clock: PCLKD • Frequency ratio: PCLKA:PCLKD = 1:N (N = 1/2/4/8/16/32/64)

Table 21.2 GPT functions (1 of 2)

31:16	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

GTWP enables or disables writing to registers to prevent accidental modification. Protection by the GTWP register is only for the writes by the CPU. GTWP does not protect registers from updates that occur in association with CPU writes.

WP bit (Register Write Disable)

The following is a list of write enabled or disabled registers:

GTSSR, GTPSR, GTCSSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTCNT, GTCORA, GTCORB, GTCORC, GTCORD, GTCORE, GTCORF, GTPR, GTPBR, GTADTRA, GTADTBRA, GTADTBRA, GTADTRB, GTADTRBR, GTADTDBRB, GTDTCR, GTDVU, GTADSMR, GTICLF, GTPC.

STRWP bit (GTSTR.CSTRT Bit Write Disable)

The STRWP bit enables or disables starting the updating of counter values by writing to the CSTRTn bit (n = 0 to 5, 10 to 13) corresponding to a channel number in the GTSTR register.

The bit position of each CSTRTn bit in the GTSTR register is allocated to the channel with the corresponding number, and writing to the GTSTR register for any channel results in writing to the registers of all channels. The STRWP bit for each channel does not control writing but only controls updating of the CSTRT bit for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the CSTRT bits of a channel for which the setting of the STRWP bit is 1 (disabling writing), the CSTRT bit for the given channel is not updated, but the CSTRT bits corresponding to channel for which the setting of the STRWP bit is 0 (enabling writing) are updated. For example, when the setting of the GPT320.GTWP.STRWP bit is 0 (enabling writing), writing 1 to the GPT321.GTSTR.CSTRT0 bit when its current setting is 0 causes the value to be updated, and the GPT320.GTCNT counter starts to run. When the setting of the GPT320.GTWP.STRWP bit is 1 (disabling writing), writing 1 to the GPT321.GTSTR.CSTRT0 bit when its current setting is 0 leaves the bit with the value 0, and the GPT320.GTCNT counter does not run.

If you want to protect all bits in the GTSTR register from being updated, set the STRWP bits of all channels to 1.

STPWP bit (GTSTP.CSTOP Bit Write Disable)

The STPWP bit enables or disables starting the updating of counter values by writing to the CSTOPn bit (n = 0 to 5, 10 to 13) corresponding to a channel number in the GTSTP register.

The bit position of each CSTOPn bit in the GTSTP registers is allocated to the channel with the corresponding number, and the writing to the GTSTP register for any channel results in writing to the registers of all channels. The STPWP bit for each channel does not control writing but only controls updating of the CSTOP bit for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the CSTOP bits of a channel for which the setting of the STPWP bit is 1 (disabling writing), the CSTOP bit for the given channel is not updated, but the CSTOP bits corresponding to channel for which the setting of the STPWP bit is 0 (enabling writing) are updated. For example, when the setting of the GPT320.GTWP.STPWP bit is 0 (enabling writing), writing 1 to the GPT321.GTSTP.CSTOP0 bit when its current setting is 0 causes the value to be updated, and the GPT320.GTCNT counter is stopped. When the setting of the GPT320.GTWP.STPWP bit is 1 (disabling writing), writing 1 to the GPT321.GTSTP.CSTOP0 bit when its current setting is 0 leaves the bit with the value 0, and the GPT320.GTCNT counter is not stopped.

If you want to protect all bits in the GTSTP register from being updated, set the STPWP bits of all channels to 1.

CLRWP bit (GTCLR.CCLR Bit Write Disable)

CLRWP bit enables or disables starting the updating of counter values by writing to the CCLRn bit (n = 0 to 5, 10 to 13) corresponding to a channel number in the GTCLR register.

The bit position of each CCLRn bit in the GTCLR registers is allocated to the channel with the corresponding number, and the writing to the GTCLR register for any channel results in writing to the registers of all channels. The CLRWP bit for each channel does not control writing but only controls updating of the CCLR bit for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the CCLR bits of a channel for which the setting of the CLRWP bit is 1 (disabling writing), the CCLR bit for the given channel is not updated, but the CCLR bits corresponding to channel for which the setting of the CLRWP bit is 0 (enabling writing) are updated. For example, when the setting of the GPT320.GTWP.CLRWP bit is 0 (enabling writing), writing 1 to the GPT321.GTCLR.CCLR0 bit when its current setting is 0 causes the value to be updated, and the GPT320.GTCNT counter is cleared. When the setting of the GPT320.GTWP.CLRWP bit is 1 (disabling writing), writing 1 to the GPT321.GTCLR.CCLR0 bit when its current setting is 0 leaves the bit with the value 0, and the GPT320.GTCNT counter is not cleared.

If you want to protect all bits in the GTCLR register from being updated, set the CLRWP bits of all channels to 1.

CMNWP bit (Common Register Write Disabled)

CMNWP bit enables or disables starting the updating of counter values by writing to the SECSELn bit (n = 0 to 5, 10 to 13) corresponding to a channel number in the GTSECSR register or to the GTSECR register.

The bit position of each SECSEL bit in the GTSECSR registers is allocated to the channel with the corresponding number, and the writing to the GTSECSR register for any channel results in writing to the registers of all channels. Writing to the

GTSECR register of any channel leads to writing to the registers of all channels. The CMNWP bit for each channel does not control writing but only controls updating of the SECSEL bit and the GTSECR register value for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the SECSEL bit and the GTSECR register value of a channel for which the setting of the CMNWP bit is 1 (disabling writing), the SECSEL bit and the GTSECR register value for the given channel is not updated, but the SECSEL bit and the GTSECR register value corresponding to channel for which the setting of the CMNWP bit is 0 (enabling writing) are updated.

For example, when the setting of the GPT320.GTWP.CMNWP bit is 0 (enabling writing), writing to the GPT321.GTSECSR.SECSEL0 bit causes the value of the GPT320.GTSECSR.SECSEL0 bit to be updated. In the same way, writing to the GPT321.GTSECR register updates the value of the GPT320.GTSECR register. When the setting of the GPT320.GTWP.CMNWP bit is 1 (disabling writing), writing to the GPT321.GTSECSR.SECSEL0 bit does not cause the value of the GPT320.GTSECSR.SECSEL0 bit to be updated. In the same way, writing to the GPT321.GTSECR register does not update the value of the GPT320.GTSECR register.

If you want to protect all bits in the GTSECSR and GTSECR registers from being updated, set the CMNWP bits of all channels to 1.

PRKEY[7:0] bit (GTWP Key Code)

This bit controls whether the WP, STRWP, STPWP, CLRWP, and CMNWP bits can be overwritten.

21.2.2 GTSTR : General PWM Timer Software Start Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 5)
 GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 5)
 GPT16m = 0x4032_2000 + 0x0100 × m (m = 10 to 13)
 GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 10 to 13)

Offset address: 0x04

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	CSTR T13	CSTR T12	CSTR T11	CSTR T10	—	—	—	—	CSTR T5	CSTR T4	CSTR T3	CSTR T2	CSTR T1	CSTR T0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	CSTR0 to CSTR5	Channel n GTCNT Count Start (n : the same as bit position value) 0: GTCNT counter not start 1: GTCNT counter start	R/W
9:6	—	These bits are read as 0. The write value should be 0.	R/W
13:10	CSTR10 to CSTR13	Channel n GTCNT Count Start (n : the same as bit position value) 0: GTCNT counter not start 1: GTCNT counter start	R/W
31:14	—	These bits are read as 0. The write value should be 0.	R/W

The GTSTR starts the GTCNT counter operation for each channel n, where n = 0 to 5, 10 to 13.

The GTSTR bit number represents the channel number. The GTSTR register of each channel is shared by all of the channels. The GTCNT counter starts for the channel associated with the GTSTR bit number where 1 is written. Writing 0 has no effect on the status of GTCNT counter and the value of GTSTR register.

For the association between module names and channel numbers, see [Figure 21.2](#).

Contrary to a security attribute for write or read access, if the security and privilege attributes set on each channel has the security violation or the privilege violation, the bit of the channel number that violates security cannot be written or read, and the read value of the bit is "0".

CSTRn bits (Channel n GTCNT Count Start (n = 0 to 5, 10 to 13))

The CSTRn bits start channel n of the GTCNT counter operation. Writing to the GTSTR.CSTRn bit (n = 0 to 5, 10 to 13) has no effect unless the GTSSR.CSTRT bit is set to 1.

The read data shows the counter status of each channel (GTCR.CST bit). A value of 0 means the counter is stopped and 1 means the counter is running.

21.2.3 GTSTP : General PWM Timer Software Stop Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 5)
 GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 5)
 GPT16m = 0x4032_2000 + 0x0100 × m (m = 10 to 13)
 GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 10 to 13)

Offset address: 0x08

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	CSTO P13	CSTO P12	CSTO P11	CSTO P10	—	—	—	—	CSTO P5	CSTO P4	CSTO P3	CSTO P2	CSTO P1	CSTO P0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
5:0	CSTOP0 to CSTOP5	Channel n GTCNT Count Stop (n : the same as bit position value) 0: GTCNT counter not stop 1: GTCNT counter stop	R/W
9:6	—	These bits are read as 0. The write value should be 0.	R/W
13:10	CSTOP10 to CSTOP13	Channel n GTCNT Count Stop (n : the same as bit position value) 0: GTCNT counter not stop 1: GTCNT counter stop	R/W
31:14	—	These bits are read as 0. The write value should be 0.	R/W

The GTSTP stops the GTCNT counter operation for each channel n, where n = 0 to 5, 10 to 13.

The GTSTP bit number represents the channel number. The GTSTP register of each channel is shared by all the channels. The GTCNT counter stops for the channel associated with the GTSTP bit number where 1 is written. Writing 0 has no effect on the status of the GTCNT counter and the value of GTSTP register.

For the association between module names and channel numbers, see [Figure 21.2](#).

Contrary to a security attribute for write or read access, if the security and privilege attributes set on each channel has the security violation or the privilege violation, the bit of the channel number that violates security cannot be written or read, and the read value of the bit is "0".

CSTOPn bits (Channel n GTCNT Count Stop (n = 0 to 5, 10 to 13))

The CSTOPn bits stop channel n of the GTCNT counter operation. Writing to the GTSTP.CSTOPn bit (n = 0 to 5, 10 to 13) has no effect unless the GTPSR.CSTOP bit is set to 1. The read data shows the counter status of each channel (invert of GTCR.CST bit). A value of 0 means the counter is running and 1 means the counter is stopped.

21.2.4 GTCLR : General PWM Timer Software Clear Register

Base address: $GPT32n = 0x4032_2000 + 0x0100 \times n$ (n = 0 to 5)
 $GPT32n_NS = 0x5032_2000 + 0x0100 \times n$ (n = 0 to 5)
 $GPT16m = 0x4032_2000 + 0x0100 \times m$ (m = 10 to 13)
 $GPT16m_NS = 0x5032_2000 + 0x0100 \times m$ (m = 10 to 13)

Offset address: 0x0C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	CCLR0 to CCLR5	Channel n GTCNT Count Clear (n : the same as bit position value) 0: GTCNT counter is not cleared 1: GTCNT counter is cleared	W
9:6	—	These bits are read as 0. The write value should be 0.	W
13:10	CCLR10 to CCLR13	Channel n GTCNT Count Clear (n : the same as bit position value) 0: GTCNT counter is not cleared 1: GTCNT counter is cleared	W
31:14	—	These bits are read as 0. The write value should be 0.	W

The GTCLR is a write-only register that clears the GTCNT counter operation for each channel n, where n = 0 to 5, 10 to 13. The GTCLR bit number represents the channel number. The GTCLR register of each channel is shared by all the channels. The GTCNT counter is cleared for the channel associated with the GTCLR bit number where 1 is written. Writing 0 has no effect on the status of GTCNT counter.

For the association between module names and channel numbers, see [Figure 21.2](#).

Contrary to a security attribute for write or read access, if the security and privilege attributes set on each channel has the security violation or the privilege violation, the bit of the channel number that violates security cannot be written or read, and the read value of the bit is "0".

CCLRn bits (Channel n GTCNT Count Clear (n = 0 to 5, 10 to 13))

When the counting direction flag is set for decrement (GTST.TUCF flag = 0) with saw-wave mode selected in the GTCR.MD[2:0] bits, the value of the GTCNT counter becomes that of the corresponding GTPR register in response to writing 1 to the CCLRn bit. The value of the counter becomes 0x0000 0000 with other settings. These bits are read as 0.

30:24	—	These bits are read as 0. The write value should be 0.	R/W
31	CSTRT	Software Source Counter Start Enable 0: Counter start disabled by the GTSTR register 1: Counter start enabled by the GTSTR register	R/W

Note: n = 0 to 5, 10 to 13

The GTSSR sets the source to start the GTCNT counter.

Input from GTETR Gn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

SSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Start Enable)

The SSGTRGAR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGA pin input.

SSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Start Enable)

The SSGTRGAF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGA pin input.

SSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Start Enable)

The SSGTRGBR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGB pin input.

SSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Start Enable)

The SSGTRGBF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGB pin input.

SSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Start Enable)

The SSGTRGCR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGC pin input.

SSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Start Enable)

The SSGTRGCF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGC pin input.

SSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Start Enable)

The SSGTRGDR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGD pin input.

SSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Start Enable)

The SSGTRGDF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGD pin input.

SSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Start Enable)

The SSCARBL bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

SSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Start Enable)

The SSCARBH bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

SSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Start Enable)

The SSCAFBL bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

SSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Start Enable)

The SSCAFBH bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

SSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Start Enable)

The SSCBRAL bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

SSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Start Enable)

The SSCBRAH bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

SSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Start Enable)

The SSCBFAL bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

SSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Start Enable)

The SSCBFAH bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

SSELCm bit (ELC_GPTm Event Source Counter Start Enable) (m = A to H)

The SSELCm bit enables or disables the GTCNT counter start at the ELC_GPTm event input.

CSTRT bit (Software Source Counter Start Enable)

The CSTRT bit enables or disables the GTCNT counter start by GTSTR register.

21.2.6 GTPSR : General PWM Timer Stop Source Select Register

Bit	Symbol	Function	R/W
30:24	—	These bits are read as 0. The write value should be 0.	R/W
31	CSTOP	Software Source Counter Stop Enable 0: Counter stop disabled by the GTSTP register 1: Counter stop enabled by the GTSTP register	R/W

Note: n = 0 to 5, 10 to 13

The GTPSR sets the source to stop the GTCNT counter.

Inputs from GTETR_{Gn} (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

PSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Stop Enable)

The PSGTRGAR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGA pin input.

PSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Stop Enable)

The PSGTRGAF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGA pin input.

PSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Stop Enable)

PSGTRGBR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGB pin input.

PSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Stop Enable)

The PSGTRGBF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGB pin input.

PSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Stop Enable)

PSGTRGCR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGC pin input.

PSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Stop Enable)

The PSGTRGCF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGC pin input.

PSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Stop Enable)

PSGTRGDR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGD pin input.

PSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Stop Enable)

The PSGTRGDF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGD pin input.

PSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Stop Enable)

The PSCARBL bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

PSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Stop Enable)

The PSCARBH bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

PSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Stop Enable)

The PSCAFBL bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

PSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Stop Enable)

The PSCAFBH bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

PSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Stop Enable)

The PSCBRAL bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

PSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Stop Enable)

The PSCBRAH bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

PSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Stop Enable)

The PSCBFAL bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

PSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Stop Enable)

The PSCBFAH bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

PSELCm bit (ELCm Event Source Counter Stop Enable) (m = A to H)

The PSELCm bit enables or disables the GTCNT counter stop at the ELC_GPTm event input.

CSTOP bit (Software Source Counter Stop Enable)

The CSTOP bit enables or disables the GTCNT counter stop by the GTSTP register.

22	CSELCG	ELC_GPTG Event Source Counter Clear Enable 0: Counter clear disabled at the ELC_GPTG input 1: Counter clear enabled at the ELC_GPTG input	R/W
23	CSELCH	ELC_GPTH Event Source Counter Clear Enable 0: Counter clear disabled at the ELC_GPTH input 1: Counter clear enabled at the ELC_GPTH input	R/W
30:24	—	These bits are read as 0. The write value should be 0.	R/W
31	CCLR	Software Source Counter Clear Enable 0: Counter clear disabled by the GTCLR register 1: Counter clear enabled by the GTCLR register	R/W

Note: n = 0 to 5, 10 to 13

The GTCSCR sets the source to clear the GTCNT counter.

Counter clearing can be executed whether the counter is running (GTCR.CST = 1) or stopped (GTCR.CST = 0).

Inputs from GTETRGN (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

CSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Clear Enable)

The CSGTRGAR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGA pin input.

CSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Clear Enable)

The CSGTRGAF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGA pin input.

CSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Clear Enable)

The CSGTRGBR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGB pin input.

CSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Clear Enable)

The CSGTRGBF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGB pin input.

CSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Clear Enable)

The CSGTRGCR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGC pin input.

CSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Clear Enable)

The CSGTRGCF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGC pin input.

CSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Clear Enable)

The CSGTRGDR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGD pin input.

CSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Clear Enable)

The CSGTRGDF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGD pin input.

CSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Clear Enable)

The CSCARBL bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

CSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Clear Enable)

The CSCARBH bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

CSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Clear Enable)

The CSCAFBL bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

CSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Clear Enable)

The CSCAFBH bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

CSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Clear Enable)

The CSCBRAL bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

CSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Clear Enable)

The CSCBRAH bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

CSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Clear Enable)

The CSCBFAL bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

CSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Clear Enable)

The CSCBFAH bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

CSELCm bit (ELCm Event Source Counter Clear Enable) (m = A to H)

The CSELCm bit enables or disables the GTCNT counter clear at the ELC_GPTm event input.

CCLR bit (Software Source Counter Clear Enable)

The CCLR bit enables or disables the GTCNT counter clear by the GTCLR register.

31:24	—	These bits are read as 0. The write value should be 0.	R/W

Note: n = 0 to 5, 10 to 13

The GTUPSR sets the source to count up the GTCNT counter.

When at least one bit in the GTUPSR register is set to 1, the GTCNT counter is counted up by the source that is set to 1 in this register. In this case, GTCR.TPCS has no effect.

Number of increment in counting is one even when multiple sources are generated simultaneously.

Inputs from GTETRGN (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

USGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Up Enable)

The USGTRGAR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGA pin input.

USGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Up Enable)

The USGTRGAF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGA pin input.

USGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Up Enable)

The USGTRGBR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGB pin input.

USGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Up Enable)

The USGTRGBF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGB pin input.

USGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Up Enable)

The USGTRGCR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGC pin input.

USGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Up Enable)

The USGTRGCF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGC pin input.

USGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Up Enable)

The USGTRGDR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGD pin input.

USGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Up Enable)

The USGTRGDF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGD pin input.

USCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Count Up Enable)

The USCARBL bit enables or disables GTCNT counter count up on the rising edge of GTIOCnA pin input, when GTIOCnB input is 0.

USCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Count Up Enable)

The USCARBH bit enables or disables the GTCNT counter count up on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

USCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Count Up Enable)

The USCAFBL bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

USCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Count Up Enable)

The USCAFBH bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

USCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Count Up Enable)

The USCBRAL bit enables or disables the GTCNT counter count up on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

USCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Count Up Enable)

The USCBRAH bit enables or disables the GTCNT counter count up on the rising edge of the GTIOCnB pin input, when the GTIOCnA input is 1.

USCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Count Up Enable)

The USCBFAL bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnB pin input, when the GTIOCnA input is 0.

USCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Count Up Enable)

The USCBFAH bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnB pin input, when the GTIOCnA input is 1.

USELCm bit (ELC_GPTm Event Source Counter Count Up Enable) (m = A to H)

The USELCm bit enables or disables the GTCNT counter count up at the ELC_GPTm event input.

31:24	—	These bits are read as 0. The write value should be 0.	R/W

Note: n = 0 to 5, 10 to 13

The GTDNSR sets the source to count down the GTCNT counter.

When at least one bit in the GTDNSR register is set to 1, the GTCNT counter is counted down by the source that is set to 1 in this register. In this case, GTCR.TPCS has no effect.

Number of decrement in counting is one even when multiple sources are generated simultaneously.

Inputs from GTETRn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

DSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Down Enable)

The DSGTRGAR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGA pin input.

DSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Down Enable)

The DSGTRGAF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGA pin input.

DSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Down Enable)

The DSGTRGBR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGB pin input.

DSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Down Enable)

The DSGTRGBF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGB pin input.

DSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Down Enable)

The DSGTRGCR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGC pin input.

DSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Down Enable)

The DSGTRGCF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGC pin input.

DSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Down Enable)

The DSGTRGDR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGD pin input.

DSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Down Enable)

The DSGTRGDF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGD pin input.

DSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Count Down Enable)

The DSCARBL bit enables or disables the GTCNT counter count down on the rising edge of the GTIOCnA pin input, when the GTIOCnB input is 0.

DSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Count Down Enable)

The DSCARBH bit enables or disables the GTCNT counter count down on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

DSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Count Down Enable)

The DSCAFBL bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

DSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Count Down Enable)

The DSCAFBH bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

DSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Count Down Enable)

The DSCBRAL bit enables or disables the GTCNT counter count down on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

DSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Count Down Enable)

The DSCBRAH bit enables or disables the GTCNT counter count down on the rising edge of GTIOCnB pin input, when GTIOCnA input is 1.

DSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Count Down Enable)

The DSCBFAL bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

DSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Count Down Enable)

The DSCBFAH bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

DSELCm bit (ELC_GPTm Event Source Counter Count Down Enable) (m = A to H)

The DSELCm bit enables or disables the GTCNT counter count down at the ELC_GPTm event input.

Note: n = 0 to 5, 10 to 13

The GTICASR sets the source of input capture for GTCCRA.

When at least one bit among bits in the GTICASR register is set to 1, input capture operation making the GTCCRA register as an input capture register is performed.

Inputs from GTETRGN (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

ASGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGAR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGA pin input.

ASGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGAF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGA pin input.

ASGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGBR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGB pin input.

ASGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGBF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGB pin input.

ASGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGCR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGC pin input.

ASGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGCF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGC pin input.

ASGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGDR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGD pin input.

ASGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGDF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGD pin input.

ASCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source GTCCRA Input Capture Enable)

The ASCARBL bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

ASCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source GTCCRA Input Capture Enable)

The ASCARBH bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

ASCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source GTCCRA Input Capture Enable)

The ASCAFBL bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

ASCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source GTCCRA Input Capture Enable)

The ASCAFBH bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnA pin input, when the GTIOCnB input is 1.

ASCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source GTCCRA Input Capture Enable)

The ASCBRAL bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnB pin input, when the GTIOCnA input is 0.

ASCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source GTCCRA Input Capture Enable)

The ASCBRAH bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

ASCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source GTCCRA Input Capture Enable)

The ASCBFAL bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

ASCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source GTCCRA Input Capture Enable)

The ASCBFAH bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

ASELCm bit (ELC_GPTm Event Source Counter GTCCRA Input Capture Enable) (m = A to H)

The ASELCm bit enables or disables the input capture for GTCCRA at the ELC_GPTm event input.

31:24	—	These bits are read as 0. The write value should be 0.	R/W

Note: n = 0 to 5, 10 to 13

The GTICBSR sets the source of input capture for GTCCRB.

When at least one bit among bits in the GTICBSR register is set to 1, input capture operation making the GTCCRB register as an input capture register is performed.

Inputs from GTETR Gn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

BSGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGAR bit enables or disables the input capture for GTCCRB on the rising edge of the GTETRGA pin input.

BSGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGAF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGA pin input.

BSGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGBR bit enables or disables the input capture for GTCCRB on the rising edge of GTETRGB pin input.

BSGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGBF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGB pin input.

BSGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGCR bit enables or disables the input capture for GTCCRB on the rising edge of GTETRGC pin input.

BSGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGCF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGC pin input.

BSGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGDR bit enables or disables the input capture for GTCCRB on the rising edge of GTETRGD pin input.

BSGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGDF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGD pin input.

BSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source GTCCRB Input Capture Enable)

The BSCARBL bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnA pin input, when the GTIOCnB input is 0.

BSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source GTCCRB Input Capture Enable)

The BSCARBH bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

BSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source GTCCRB Input Capture Enable)

The BSCAFBL bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

BSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source GTCCRB Input Capture Enable)

The BSCAFBH bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

BSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source GTCCRB Input Capture Enable)

The BSCBRAL bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

BSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source GTCCRB Input Capture Enable)

The BSCBRAH bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

BSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source GTCCRB Input Capture Enable)

The BSCBFAL bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

BSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source GTCCRB Input Capture Enable)

The BSCBFAH bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

BSELCm bit (ELC_GPTm Event Source Counter GTCCRB Input Capture Enable) (m = A to H)

The BSELCm bit enables or disables the input capture for GTCCRB at the ELC_GPTm event input.

31:27	—	These bits are read as 0. The write value should be 0.	R/W

The GTCR controls GTCNT.

CST bit (Count Start)

The CST bit controls the GTCNT counter start and stop.

[Setting conditions]

- The GTSTR value where the channel number associated with the bit number is set to 1 with the GTSSR.CSTR bit at 1
- The ELC event input, the external trigger, or the GTIOCN_A/GTIOCN_B input that are enabled by GTSSR for the starting counter source, occurs (n = 0 to 5, 10 to 13)
- 1 is written by software directly.

[Clearing conditions]

- The GTSTP value where the channel number associated with the bit number is set to 1 with the GTPSR.CSTOP bit at 1

- The ELC event input, the external trigger, or the GTIOCnA/GTIOCnB input enabled by GTPSR as the counter stop source, occurs (n = 0 to 5, 10 to 13)
- 0 is written by software directly.
- When the period count function is finished while the GTPC.ASTP bit is 1.

MD[2:0] bits (Mode Select)

The MD[2:0] bits select the GPT operating mode.

Only the MD[2] bit is valid at input capture. Counting in saw-wave mode is performed with 0 for the MD[2] bit, and counting in triangle-wave mode is performed with 1 for the MD[2] bit. The MD bits must be set while the GTCNT operation is stopped. During the event count operation (when at least one bit among the bits for the GTUPSR and GTDNSR registers is set to 1), setting of the MD bits are ignored, where counting in saw-wave or triangle-wave modes is not performed. Instead, up-counting or down-counting by a source set by the GTUPSR and GTDNSR registers is performed.

TPCS[3:0] bits (Timer Prescaler Select)

The TPCS[3:0] bits select the clock for GTCNT. A clock prescaler can be selected independently for each channel. The TPCS[3:0] bits must be set while the GTCNT operation is stopped. When the GTETRGA, GTETRGB, GTETRCG, or GTETRGD is selected, output for the POEG at rising becomes a clock source. Set the polarity of these signals with the POEG.

21.2.13 GTUDDTYC : General PWM Timer Count Direction and Duty Setting Register

Base address: $GPT32n = 0x4032_2000 + 0x0100 \times n$ (n = 0 to 5)
 $GPT32n_NS = 0x5032_2000 + 0x0100 \times n$ (n = 0 to 5)
 $GPT16m = 0x4032_2000 + 0x0100 \times m$ (m = 10 to 13)
 $GPT16m_NS = 0x5032_2000 + 0x0100 \times m$ (m = 10 to 13)

Offset address: 0x30

R/W
23:20	—	These bits are read as 0. The write value should be 0.	R/W
25:24	OBDTY[1:0]	GTIOCN _B Output Duty Setting 0 0: GTIOCN _B pin duty depends on the compare match 0 1: GTIOCN _B pin duty depends on the compare match 1 0: GTIOCN _B pin duty 0% 1 1: GTIOCN _B pin duty 100%	R/W
26	OBDTYF	Forcible GTIOCN _B Output Duty Setting 0: Not forcibly set 1: Forcibly set	R/W
27	OBDTYR	GTIOCN _B Output Value Selecting after Releasing 0%/100% Duty Setting 0: The function selected by the GTIOB[3:2] bits is applied to the output value when the duty cycle is set after release from the 0 or 100% duty-cycle setting. 1: The function selected by the GTIOB[3:2] bits is applied to the compare match output value which is masked after release from the 0 or 100% duty-cycle setting.	R/W
31:28	—	These bits are read as 0. The write value should be 0.	R/W

Note: n = 0 to 5, 10 to 13

The GTUDDTYC sets the direction in which the GTCNT counts (up-counting or down-counting), and sets the duty of the GTIOCN_A/GTIOCN_B pin output.

The setting is invalid during the event count operation.

Count Direction:

- In saw-wave mode.
When the UD value is set to 0 during up-counting, the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes the GTPR value). When the UD value is set to 1 during down-counting, the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).
When the UD value changes from 1 to 0 with the UDF bit being 0 and while counting stops, the counter starts up-counting and the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes the GTPR value). When the UD value changes from 0 to 1 with the UDF bit being 0 and while counting stops, the counter starts down-counting and the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).
When the UDF bit is set to 1 while counting stops, the UD bit value is reflected in the count direction when counting starts.
- In triangle-wave mode.
When the UD value changes during counting, the count direction does not change. When the UD value changes while the UDF bit is 0 and counting stops, the change is not reflected in the count direction when counting starts.
When the UDF bit is set to 1 while counting is stopped, the UD value is reflected in the count direction when counting starts.

UD bit (Count Direction Setting)

The UD bit sets the count direction (up-counting or down-counting) for GTCNT.

UDF bit (Forcible Count Direction Setting)

The UDF bit forcibly sets the count direction when GTCNT starts operation as the UD value. Only 0 should be written to this bit during counter operation. When 1 is written to this bit while counting stops, return this bit to 0 before counting starts.

Output duty

- In saw-wave mode.

When the OADTY/OBDTY value changes during up-counting, the duty is reflected at an overflow (GTCNT = GTPR). When the OADTY/OBDTY value is changed during down-counting, the duty is reflected at an underflow (GTCNT = 0).

When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 0 and while counting stops the output duty is not reflected at the starting counter operation. When the count direction is up, the output duty is reflected at an overflow (GTCNT = GTPR). When the count direction is down, the output duty is reflected at an underflow (GTCNT = 0).

When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at starting counter operation.

- In triangle-wave mode.

When the OADTY/OBDTY value changes during counting, the duty is reflected at an underflow.

When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 0 and while counting stops, the output duty is not reflected at the starting counter operation. The output duty is reflected at an underflow.

When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at starting counter operation.

In both saw-wave mode and triangle-wave mode, when the OADTYF/OBDTYF bit is set back to 0 and the OADTY[1:0]/OBDTY[1:0] bits are set after setting the OADTYF/OBDTYF bit to 1 and setting the OADTY[1:0]/OBDTY[1:0] bits for the duty of first cycle while count operation is stopped, these duty-cycle set during stopping count operation are reflected in the first cycle and the second cycle after starting count operation.

OmdTY[1:0] bits (GTIOCnm Output Duty Setting) (m = A, B)

The OmdTY[1:0] bits set the output duty (0%, 100% or compare match control) of the GTIOCnm pin.

OmdTYF bit (Forcible GTIOCnm Output Duty Setting) (m = A, B)

The OmdTYF bit forcibly sets the output duty cycle to the OmdTY setting. Set this bit to 0 during counter operation.

OmdTYR bit (GTIOCnm Output Value Selecting after Releasing 0%/100% Duty Setting) (m = A, B)

The OmdTYR bit selects the value that is the object of output retained or toggled at cycle end, when the control changes from 0% or 100% duty setting to compare match for the GTIOCnm pin and GTIOR.GTIOm[3:2] bits are set to 00b (output retained at cycle end) or the GTIOR.GTIOm[3:2] bits are set to 11b (output toggled at cycle end).

The GPT internally continues to perform compare match operation during duty-cycle 0% or 100% operation. When the OmdTYR bit is 1, the value after the period has elapsed due this compare match operation is target for the GTIOm[3:2] bits.

21.2.14 GTIOR : General PWM Timer I/O Control Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 5)
 GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 5)
 GPT16m = 0x4032_2000 + 0x0100 × m (m = 10 to 13)
 GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 10 to 13)

26:25	OBDF[1:0]	GTIOCnB Pin Disable Value Setting 0 0: None of the below options are specified 0 1: GTIOCnB pin is set to Hi-Z in response to controlling the output negation 1 0: GTIOCnB pin is set to 0 in response to controlling the output negation 1 1: GTIOCnB pin is set to 1 in response to controlling the output negation	R/W
28:27	—	These bits are read as 0. The write value should be 0.	R/W
29	NFBEN	Noise Filter B Enable 0: The noise filter for the GTIOCnB pin is disabled 1: The noise filter for the GTIOCnB pin is enabled	R/W
31:30	NFCSB[1:0]	Noise Filter B Sampling Clock Select 0 0: PCLKD/1 0 1: PCLKD/4 1 0: PCLKD/16 1 1: PCLKD/64	R/W

Note: n = 0 to 5, 10 to 13

The GTIOR sets the functions of the GTIOCnA and GTIOCnB pins. (n = 0 to 5, 10 to 13)

GTIOA[4:0] bits (GTIOCnA Pin Function Select)

The GTIOA[4:0] bits select the GTIOCnA pin function. For details, see [Table 21.4](#).

OADFLT bit (GTIOCnA Pin Output Value Setting at the Count Stop)

The OADFLT bit sets whether the GTIOCnA pin outputs high or low when counting stops.

OAHLD bit (GTIOCnA Pin Output Setting at the Start/Stop Count)

The OAHLD bit specifies whether the GTIOCnA pin output level is retained or the level at the start or stop of counting depends on the register setting.

When the OAHLD bit is set to 0:

- The value specified in bit [4] of the GTIOA[4:0] bits is output when counting starts
- The value specified in the OADFLT bit is output when counting stops
- If the OADFLT bit is modified while counting stops, the new value is immediately reflected in the output.

When the OAHLD bit is set to 1:

- The output is retained when counting starts or stops.

OAE bit (GTIOCnA Pin Output Enable)

The OAE bit disables or enables the GTIOCnA pin output.

When GTCCRA register is used as the input capture register (at least one bit in the GTICASR register is set to 1), the GTIOCnA pin does not output regardless of the OAE bit value.

OADF[1:0] bits (GTIOCnA Pin Disable Value Setting)

The OADF[1:0] bits select the output value of the GTIOCnA pin in response to a request to disable output from the POEG.

NFAEN bit (Noise Filter A Enable)

The NFAEN bit disables or enables the noise filter for input from the GTIOCnA pin. Because changing the value of the bit might lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

NFCSA[1:0] bits (Noise Filter A Sampling Clock Select)

The NFCSA[1:0] bits set the sampling interval for the noise filter of the GTIOCnA pin. When setting these bits, wait for 2 cycles of the selected sampling interval before setting the input capture function.

GTIOB[4:0] bits (GTIOCnB Pin Function Select)

The GTIOB[4:0] bits select the GTIOCnB pin function. For details, see [Table 21.4](#).

OBDFLT bit (GTIOCnB Pin Output Value Setting at the Count Stop)

The OBDFLT bit sets whether the GTIOCnB pin outputs high or low when counting stops.

OBHLD bit (GTIOCnB Pin Output Setting at the Start/Stop Count)

The OBHLD bit specifies whether the GTIOCnB pin output level is retained or the level at the start or stop of counting depends on the register setting.

When the OBHLD bit is set to 0:

- The value specified in bit [4] of the GTIOB[4:0] bits is output when counting starts
- The value specified in the OBDFLT bit is output when counting stops
- If the OBDFLT bit is modified while counting stops, the new value is immediately reflected in the output.

When the OBHLD bit is set to 1:

- The output is retained when counting starts or stops.

OBE bit (GTIOCnB Pin Output Enable)

The OBE bit disables or enables the GTIOCnB pin output.

When GTCCRB register is used as the input capture register (at least one bit in the GTICBSR register is set to 1), the GTIOCnB pin does not output regardless of the OBE bit value.

OBDF[1:0] bits (GTIOCnB Pin Disable Value Setting)

The OBDF[1:0] bits select the output value of the GTIOCnB pin in response to a request to disable output from the POEG.

NFBEN bit (Noise Filter B Enable)

The NFBEN bit disables or enables the noise filter for input from the GTIOCnB pin. Because changing the value of the bit might lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

NFCBSB[1:0] bits (Noise Filter B Sampling Clock Select)

The NFCBSB[1:0] bits set the sampling interval for the noise filter of the GTIOCnB pin. When setting these bits, wait for 2 cycles of the selected sampling interval before setting the input capture function.

Table 21.4 Settings of GTIOA[4:0] and GTIOB[4:0] bits (1 of 2)

GTIOA/GTIOB[4:0] bits					Function		
b4	b3	b2	b1	b0	b4	b3, b2 ^{*1} *2 *3	b1, b0 ^{*2}
0	0	0	0	0	Initial output is low	Output retained at cycle end	Output retained at GTCCRA/GTCCRB compare match
0	0	0	0	1			Low output at GTCCRA/GTCCRB compare match
0	0	0	1	0			High output at GTCCRA/GTCCRB compare match
0	0	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	0	1	0	0		Low output at cycle end	Output retained at GTCCRA/GTCCRB compare match
0	0	1	0	1			Low output at GTCCRA/GTCCRB compare match
0	0	1	1	0			High output at GTCCRA/GTCCRB compare match
0	0	1	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	1	0	0	0		High output at cycle end	Output retained at GTCCRA/GTCCRB compare match
0	1	0	0	1			Low output at GTCCRA/GTCCRB compare match
0	1	0	1	0			High output at GTCCRA/GTCCRB compare match
0	1	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	1	1	0	0		Output toggled at cycle end	Output retained at GTCCRA/GTCCRB compare match
0	1	1	0	1			Low output at GTCCRA/GTCCRB compare match
0	1	1	1	0			High output at GTCCRA/GTCCRB compare match
0	1	1	1	1			Output toggled at GTCCRA/GTCCRB compare match

Table 21.4 Settings of GTIOA[4:0] and GTIOB[4:0] bits (2 of 2)

GTIOA/GTIOB[4:0] bits					Function		
b4	b3	b2	b1	b0	b4	b3, b2*1 *2 *3	b1, b0*2
1	0	0	0	0	Initial output is high	Output retained at cycle end	Output retained at GTCCRA/GTCCRB compare match
1	0	0	0	1			Low output at GTCCRA/GTCCRB compare match
1	0	0	1	0			High output at GTCCRA/GTCCRB compare match
1	0	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	0	1	0	0		Low output at cycle end	Output retained at GTCCRA/GTCCRB compare match
1	0	1	0	1			Low output at GTCCRA/GTCCRB compare match
1	0	1	1	0			High output at GTCCRA/GTCCRB compare match
1	0	1	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	1	0	0	0		High output at cycle end	Output retained at GTCCRA/GTCCRB compare match
1	1	0	0	1			Low output at GTCCRA/GTCCRB compare match
1	1	0	1	0			High output at GTCCRA/GTCCRB compare match
1	1	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	1	1	0	0		Output toggled at cycle end	Output retained at GTCCRA/GTCCRB compare match
1	1	1	0	1			Low output at GTCCRA/GTCCRB compare match
1	1	1	1	0			High output at GTCCRA/GTCCRB compare match
1	1	1	1	1			Output toggled at GTCCRA/GTCCRB compare match

- Note 1. The cycle end means an overflow (GTCNT changes from GTPR to 0 in up-counting), an underflow (GTCNT changes from 0 to GTPR in down-counting), or counter clearing for saw-wave mode, and means a trough (GTCNT changes from 0 to 1) for triangle-wave mode.
- Note 2. When the timing of a cycle end and the timing of a GTCCRA/GTCCRB compare match are the same in a compare-match operation, the b3 and b2 settings are given priority in saw-wave PWM mode, and the b1 and b0 settings are given priority in any other mode.
- Note 3. In event count operation where at least one bit in GTUPSR or GTDNSR is set to 1, the setting of b3 and b2 is ignored.

21.2.15 GTINTAD : General PWM Timer Interrupt Output Setting Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 5)

25:24	GRP[1:0]	Output Disable Source Select 0 0: Group A output disable source is selected 0 1: Group B output disable source is selected 1 0: Group C output disable source is selected 1 1: Group D output disable source is selected	R/W
28:26	—	These bits are read as 0. The write value should be 0.	R/W
29	GRPABH	Same Time Output Level High Disable Request Enable 0: Same time output level high disable request disabled 1: Same time output level high disable request enabled	R/W
30	GRPABL	Same Time Output Level Low Disable Request Enable 0: Same time output level low disable request disabled 1: Same time output level low disable request enabled	R/W
31	—	This bit is read as 0. The write value should be 0.	R/W

The GTINTAD enables or disables interrupt requests, A/D conversion start request, and output disable requests.

ADTRAUEN bit (GTADTRA Register Compare Match (Up-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by GTADTRA register compare matches during GTCNT counter up-counting.

The setting is invalid during the event count operation, and A/D conversion start request is not generated.

ADTRADEN bit (GTADTRA Register Compare Match (Down-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by GTADTRA register compare matches during GTCNT counter down-counting.

The setting is invalid during the event count operation, and A/D conversion start request is not generated.

ADTRBUEN bit (GTADTRB Register Compare Match (Up-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by GTADTRB register compare matches during GTCNT counter up-counting.

The setting is invalid during the event count operation, and A/D conversion start request is not generated.

ADTRBDEN bit (GTADTRB Register Compare Match (Down-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by GTADTRB register compare matches during GTCNT counter down-counting.

The setting is invalid during the event count operation, and A/D conversion start request is not generated.

GRP[1:0] bits (Output Disable Source Select)

These bits select the group of output disable request from GPT to POEG and the group of output disable for GTIOCnA pin and GTIOCnB pin from POEG to GPT.

The output disable request to POEG is output to the group selected in the GRP[1:0] bit, with dead-time errors, simultaneous high output, and simultaneous low output factors following their respective disable request enable bits.

GTST.ODF shows the request of the output disable source group that is selected with the GRP[1:0] bits. Set the GRP[1:0] bits when both GTIOR.OAE and GTIOR.OBE bits are 0.

If the POEG other than the group connected to GPT is selected in the GRP[1:0] bits, ODF flag is always 0, and the status never change to the output disable state.

GRPABH bit (Same Time Output Level High Disable Request Enable)

The GRPABH bit enables or disables the output disable request when the GTIOCnA pin and GTIOCnB pin output 1 at the same time.

GRPABL bit (Same Time Output Level Low Disable Request Enable)

The GRPABL bit enables or disables the output disable request when the GTIOCnA pin and GTIOCnB pin output 0 at the same time.

21.2.16 GTST : General PWM Timer Status Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 5)
 GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 5)
 GPT16m = 0x4032_2000 + 0x0100 × m (m = 10 to 13)

Note 1. Only 0 can be written to this bit. Do not write 1.

When clearing the ADTRAUF, ADTRADF, ADTRBUF, or ADTRBDF flag, be sure to write 0 only to the target flag or flags for clearing and to write 1 to the other flags not for clearing.

Note 2. This bit is only available in GPT320 to GPT323, GPT1610. In GPT324, GPT325, GPT1611 to GPT1613, this bit is read as 0. The write value should be 0.

The GTST indicates the status of the GPT.

TCFA flag (Input Capture/Compare Match Flag A)

The TCFA flag indicates the status for the input capture or compare match of GTCCRA.

[Setting conditions]

- GTCNT = GTCCRA, when the GTCCRA register functions as a compare match register
- GTCNT counter value is transferred to GTCCRA by the input capture signal when the GTCCRA register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

TCFB flag (Input Capture/Compare Match Flag B)

The TCFB flag indicates the status for the input capture or compare match of GTCCRB.

[Setting conditions]

- $GTCNT = GTCCRB$, when the GTCCRB register functions as a compare match register
- GTCNT counter value is transferred to GTCCRB by the input capture signal when the GTCCRB register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

TCFC flag (Input Compare Match Flag C)

The TCFC flag indicates the status for the compare match of GTCCRC.

When GTCCRC performs buffer operation, GTCCRC doesn't perform compare match.

[Setting condition]

- $GTCNT = GTCCRC$.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- $GTCR.MD[2:0] = 001b$ (saw-wave one-shot pulse mode)
- $GTCR.MD[2:0] = 110b$ (triangle-wave PWM mode 3)
- $GTBER.CCRA[1:0] = 01b, 10b, 11b$ (GTCCRC performs buffer operation).

TCFD flag (Input Compare Match Flag D)

The TCFD flag indicates the status for the compare match of GTCCRD.

When GTCCRD performs buffer operation, GTCCRD doesn't perform compare match.

[Setting condition]

- $GTCNT = GTCCRD$.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- $GTCR.MD[2:0] = 001b$ (saw-wave one-shot pulse mode)
- $GTCR.MD[2:0] = 110b$ (Triangle-wave PWM mode 3)
- $GTBER.CCRA[1:0] = 10b, 11b$ (GTCCRD performs buffer operation).

TCFE flag (Input Compare Match Flag E)

The TCFE flag indicates the status for the compare match of GTCCRE.

When GTCCRE performs buffer operation, GTCCRE doesn't perform compare match.

[Setting condition]

- $GTCNT = GTCCRE$.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (GTCCRE performs buffer operation).

TCFF flag (Input Compare Match Flag F)

The TCFF flag indicates the status for the compare match of GTCCRF.

When GTCCRF performs buffer operation, GTCCRF doesn't perform compare match.

[Setting condition]

- GTCNT = GTCCRF.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (GTCCRF performs buffer operation).

TCFPO flag (Overflow Flag)

The TCFPO flag indicates when an overflow or crest has occurred.

[Setting conditions]

- In saw-wave mode, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred
- In triangle-wave mode, a crest (GTCNT changes from GTPR to GTPR - 1) has occurred
- In counting by hardware sources, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred.

[Clearing condition]

- 0 is written to this flag.

TCFPU flag (Underflow Flag)

The TCFPU flag indicates when an underflow or trough has occurred.

[Setting conditions]

- In saw-wave mode, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred
- In triangle-wave mode, a trough (GTCNT changes from 0 to 1) has occurred
- In counting by hardware sources, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred.

[Clearing condition]

- 0 is written to this bit.

TUCF flag (Count Direction Flag)

The TUCF flag indicates the count direction of GTCNT. In event count operation, this flag is set to 1 in up-counting and to 0 in down-counting.

ADTRAUF flag (GTADTRA Register Compare Match (Up-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRA register compare match in up-counting.

[Setting condition]

- The GTCNT counter matches the GTADTRA register in up-counting.

[Clearing condition]

- 0 is written to the ADTRAUF flag.

ADTRADF flag (GTADTRA Register Compare Match (Down-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRA register compare match in down-counting.

[Setting condition]

- The GTCNT counter matches the GTADTRA register in down-counting.

[Clearing condition]

- 0 is written to the ADTRADF flag.

ADTRBUF flag (GTADTRB Register Compare Match (Up-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRB register compare match in up-counting.

[Setting condition]

- The GTCNT counter matches the GTADTRB register in up-counting.

[Clearing condition]

- 0 is written to the ADTRBUF flag.

ADTRBDF flag (GTADTRB Register Compare Match (Down-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRB register compare match in down-counting.

[Setting condition]

- The GTCNT counter matches the GTADTRB register in down-counting.

[Clearing condition]

- 0 is written to the ADTRBDF flag.

ODF flag (Output Disable Flag)

The ODF flag shows the request of the output disable source group that is selected in the GRP[1:0] bits.

When output is disabled, an output disable control is not released within the same cycle in which an output disable request is negated. It is released in the next cycle.

OABHF flag (Same Time Output Level High Flag)

The OABHF flag indicates that the GTIOCnA pin and GTIOCnB pin output 1 at the same time.

When the GTIOCnA or GTIOCnB pin outputs 0, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is prohibited.

When the output disable request by the OABHF flag is enabled (GTINTAD.GRPABH = 1), the OABHF flag is output to POEG as an output disable request. The GPT does not have an interrupt to indicate that outputs have been simultaneous driven to the high level. Use the interrupt function in the POEG if this is necessary.

[Setting condition]

- The GTIOCnA and GTIOCnB pins output 1 at the same time when both OAE and OBE bits are set to 1.

[Clearing conditions]

- The GTIOCnA pin output value is different from the GTIOCnB pin output value when both OAE and OBE bits are set to 1
- The GTIOCnA and GTIOCnB pins output 0 at the same time when both OAE and OBE bits are set to 1
- Either the OAE bit or OBE bit is set to 0.

OABLF flag (Same Time Output Level Low Flag)

The OABLF flag indicates that the GTIOCnA and GTIOCnB pins output 0 at the same time.

When the GTIOCnA pin or GTIOCnB pin outputs 1, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is prohibited.

When the output disable request by the OABLF flag is enabled (GTINTAD.GRPABL = 1), the OABLF flag is output to POEG as an output disable request. The GPT does not have an interrupt to indicate that outputs have been simultaneous driven to the low level. Use the interrupt function in the POEG if this is necessary.

[Setting condition]

- The GTIOCnA and GTIOCnB pins output 0 at the same time when both OAE and OBE bits are set to 1.

[Clearing conditions]

- The GTIOCnA pin output value is different from the GTIOCnB pin output value when both OAE and OBE bits are set to 1
- The GTIOCnA and GTIOCnB pins output 1 at the same time when both OAE and OBE bits are set to 1
- Either the OAE bit or the OBE bit is set to 0.

The compare-target signals to generate the OABHF/OABLF flag are the compare match outputs (PWM outputs) signals before they are masked by the output disable function. Even during the output disable condition, compare match operation continues internally, where the OABHF or OABLF flag is updated based on the operation results.

PCF flag (Period Count Function Finish Flag)

This bit is status flag of period count function finish.

[Setting condition]

- The GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 1 at the end of cycle.
- The GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 0 at the count clock.

[Clearing condition]

- 0 is written to this bit.

21.2.17 GTBER : General PWM Timer Buffer Enable Register

Base address: $GPT32n = 0x4032_2000 + 0x0100 \times n$ (n = 0 to 5)
 $GPT32n_NS = 0x5032_2000 + 0x0100 \times n$ (n = 0 to 5)

In saw-wave mode, transfer at underflow (in down-counting), overflow (in up-counting), or counter clearing. 1 0: In triangle wave mode, transfer at trough. In saw-wave mode, transfer at underflow (in down-counting), overflow (in up-counting), or counter clearing. 1 1: In triangle wave mode, transfer at both crest and trough. In saw-wave mode, transfer at underflow (in down-counting), overflow (in up-counting), or counter clearing.	R/W
30	ADTDB	GTADTRB Register Double Buffer Operation 0: Single buffer operation (GTADTB RB → GTADTRB) 1: Double buffer operation (GTADTB RB → GTADTB RB → GTADTRB)	R/W
31	—	This bit is read as 0. The write value should be 0.	R/W

The GTBER register provides settings for the buffer operation. Set the GTBER register while the GTCNT counter is stopped.

BD0 bit (GTCCR Buffer Operation Disable)

The BD0 bit disables the buffer operation using GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, and GTCCRF combined.

When GTDTCR.TDE is 1 and when BD0 is set to 0, GTCCRB does not perform buffer operation. The GTCCRB register is automatically set to a compare match value for negative-phase waveform with dead time.

A value for the BD0 bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the GTSECR.SBDCE or GTSECR.SBDCE.

BD1 bit (GTPR Buffer Operation Disable)

The BD1 bit disables the buffer operation using GTPR and GTPBR combined.

A value for the BD1 bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the GTSECR.SBDPE or GTSECR.SBDPE.

BD2 bit (GTADTRA/GTADTRB Registers Buffer Operation Disable)

This bit disables buffer operation using the GTADTRA, GTADTBRA, and GTADTDBRA registers together and buffer operation using the GTADTRB, GTADTBRB, and GTADTDBRB registers together.

The setting is invalid during the event count operation, and the buffer operation using the GTADTRA and GTADTRB registers is not performed.

A value for the BD2 bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the SBDAE or SBDAD bit in the GTSECR register.

CCRA[1:0] bits (GTCCRA Buffer Operation)

The CCRA[1:0] bits set the buffer operation with GTCCRA, GTCCRC, and GTCCRD combined. When the buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.

The buffer operation mode is fixed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3 (64-bit transfer at trough).

CCRB[1:0] bits (GTCCRB Buffer Operation)

The CCRB[1:0] bits set the buffer operation using GTCCRB, GTCCRE, and GTCCRF combined. When the buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.

The buffer operation mode is fixed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3 (64-bit transfer at trough).

PR[1:0] bits (GTPR Buffer Operation)

The PR[1:0] bits set the buffer operation with GTPR and GTPBR combined.

CCRSWT bit (GTCCRA and GTCCRB Forcible Buffer Operation)

Writing 1 to the CCRSWT bit forces a buffer transfer of GTCCRA and GTCCRB. This bit automatically returns to 0 after the 1 is written. This bit is read as 0, and is valid only when counting is stopped with a compare match operation specified.

ADTTA[1:0] bits (GTADTRA Register Buffer Transfer Timing Select)

These bits set the transfer timing for buffer operation of the GTADTRA, GTADTBRA, and GTADTDBRA registers.

The setting is invalid during the event count operation.

ADTDA bit (GTADTRA Register Double Buffer Operation)

These bits set buffer operation with the GTADTRA, GTADTBRA, and GTADTDBRA registers combined.

The setting is invalid during the event count operation.

ADTTB[1:0] bits (GTADTRB Register Buffer Transfer Timing Select)

These bits set the transfer timing for buffer operation of the GTADTRB, GTADTBRB, and GTADTDBRB registers.

The setting is invalid during the event count operation.

ADTDB bit (GTADTRB Register Double Buffer Operation)

These bits set buffer operation with the GTADTRB, GTADTBRB, and GTADTDBRB registers combined.

The setting is invalid during the event count operation.

21.2.18 GTCNT : General PWM Timer Counter

Base address: $GPT32n = 0x4032_2000 + 0x0100 \times n$ ($n = 0$ to 5)
 $GPT32n_NS = 0x5032_2000 + 0x0100 \times n$ ($n = 0$ to 5)
 $GPT16m = 0x4032_2000 + 0x0100 \times m$ ($m = 10$ to 13)
 $GPT16m_NS = 0x5032_2000 + 0x0100 \times m$ ($m = 10$ to 13)

Offset address: 0x48

Bit position: 31 0

Bit field:

Value after reset: 0

Bit	Symbol	Function	R/W
31:0	n/a	GTCNT is a 32-bit read/write counter for GPT32n ($n = 0$ to 5). For GPT16m ($m = 10$ to 13), GTCNT is a 16-bit register. GTCNT can only be written to after counting stops. For GPT16m ($m = 10$ to 13), the upper 16 bits for access in a 32-bit unit are always read as 0x0000, and writing to these bits is ignored. GTCNT must be set within the range of $0 \leq GTCNT \leq GTPR$.	R/W

21.2.19 GTCCRk : General PWM Timer Compare Capture Register k ($k = A$ to F)

Base address: $GPT32n = 0x4032_2000 + 0x0100 \times n$ ($n = 0$ to 5)
 $GPT32n_NS = 0x5032_2000 + 0x0100 \times n$ ($n = 0$ to 5)
 $GPT16m = 0x4032_2000 + 0x0100 \times m$ ($m = 10$ to 13)
 $GPT16m_NS = 0x5032_2000 + 0x0100 \times m$ ($m = 10$ to 13)

Offset address: 0x4C (GTCCRA)
 0x50 (GTCCRB)
 0x54 (GTCCRC)
 0x58 (GTCCRE)
 0x5C (GTCCRD)
 0x60 (GTCCRF)

Bit position: 31 0

Bit field:

Value after reset:^{*1} 1

Bit	Symbol	Function	R/W
31:0	n/a	GTCCRk registers are read/write registers. The effective size of GTCCRk is the same as GTCNT (16- or 32-bit). If the effective size of GTCCRk is 16 bits, the upper 16 bits for access in a 32-bit unit are always read as 0x0000, and writing to these bits is ignored. GTCCRA and GTCCRB are registers used for both output compare and input capture. GTCCRC and GTCCRE are compare match registers, and can also function as buffer registers for GTCCRA and GTCCRB. GTCCRD and GTCCRF are compare match registers, and can also function as buffer registers for GTCCRC and GTCCRE (double-buffer registers for GTCCRA and GTCCRB).	R/W

Note 1. For GPT16m ($m = 10$ to 13), the value of the upper 16 bits after reset is 0x0000.

21.2.20 GTPR : General PWM Timer Cycle Setting Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 5)
 GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 5)
 GPT16m = 0x4032_2000 + 0x0100 × m (m = 10 to 13)
 GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 10 to 13)

Offset address: 0x64

Bit	Symbol	Function	R/W
31:0	n/a	GTPR is a read/write register that sets the maximum count value of GTCNT. The effective size of GTPR is the same as GTCNT (16- or 32-bit). If the effective size of GTPR is 16 bits, the upper 16 bits for access in a 32-bit unit are always read as 0x0000, and writing to these bits is ignored. For saw waves, the value of (GTPR + 1) is the cycle. For triangle waves, the value of (GTPR value × 2) is the cycle.	R/W

Note 1. For GPT16m (m = 10 to 13), the value of the upper 16 bits after reset is 0x0000.

21.2.21 GTPBR : General PWM Timer Cycle Setting Buffer Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 5)
 GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 5)
 GPT16m = 0x4032_2000 + 0x0100 × m (m = 10 to 13)
 GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 10 to 13)

Offset address: 0x68

Bit	Symbol	Function	R/W
31:0	n/a	GTPBR is a read/write register that functions as a buffer register for GTPR. The effective size of GTPBR is the same as GTCNT (16- or 32-bit). If the effective size of GTPBR is 16 bits, the upper 16 bits for access in a 32-bit unit are always read as 0x0000, and writing to these bits is ignored.	R/W

Note 1. For GPT16m (m = 10 to 13), the value of the upper 16 bits after reset is 0x0000.

21.2.22 GTADTRk : A/D Conversion Start Request Timing Register k (k = A, B)

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 5)
 GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 5)

Offset address: 0x70 (GTADTRA)
 0x7C (GTADTRB)

Bit	Symbol	Function	R/W
31:0	n/a	Set the timing of A/D conversion start request generation Access in 8-bit or 16-bit units to the GTADTRk register is prohibited, and it should be accessed in 32-bit units. When the GTADTRk register value matches the GTCNT counter value, an A/D conversion start request is generated.	R/W

21.2.23 GTADTBRk : A/D Conversion Start Request Timing Buffer Register k (k = A, B)

Base address: $GPT32n = 0x4032_2000 + 0x0100 \times n$ (n = 0 to 5)
 $GPT32n_NS = 0x5032_2000 + 0x0100 \times n$ (n = 0 to 5)

Offset address: 0x74 (GTADTBRA)
 0x80 (GTADTBRB)

Bit position: 31 0

Bit field:

Value after reset: 1

Bit	Symbol	Function	R/W
31:0	n/a	The buffer registers for the GTADTRk register Access in 8-bit or 16-bit units to the GTADTBRk register is prohibited, and it should be accessed in 32-bit units.	R/W

21.2.24 GTADTDBRk : A/D Conversion Start Request Timing Double-Buffer Register k (k = A, B)

Base address: $GPT32n = 0x4032_2000 + 0x0100 \times n$ (n = 0 to 5)
 $GPT32n_NS = 0x5032_2000 + 0x0100 \times n$ (n = 0 to 5)

Offset address: 0x78 (GTADTDBRA)
 0x84 (GTADTDBRB)

Bit position: 31 0

Bit field:

Value after reset: 1

Bit	Symbol	Function	R/W
31:0	n/a	The buffer registers for the GTADTBRk register (double buffer registers for the GTADTRk register) Access in 8-bit or 16-bit units to the GTADTDBRk register is prohibited, and it should be accessed in 32-bit units.	R/W

Bit	Symbol	Function	R/W
31:0	n/a	GTDVU is a read/write register that sets the dead time for generating PWM waveforms with dead time. The effective size of GTDVU is the same as GTCNT (16 or 32 bits). If the effective size of GTDVU is 16 bits, the upper 16 bits for access in a 32-bit unit are always read as 0x0000, and writing to these bits is ignored. Setting a GTDVU value greater than or equal to GTPR is prohibited. When using the automatic dead time setting function, do not set a value that makes a change point of the waveform exceeding the count period. The change point of the negative-phase waveform, which is automatically calculated, is obtained by reading the GTCCRB register. When GTDVU is used, writing to GTCCRB is prohibited. When this register is set to 0, waveforms without dead time are output.	R/W

Note 1. For GPT16m (m = 10 to 13), the value of the upper 16 bits after reset is 0x0000.

21.2.27 GTADSMR : General PWM Timer A/D Conversion Start Request Signal Monitoring Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 5)
 GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 5)
 GPT16m = 0x4032_2000 + 0x0100 × m (m = 10 to 13)
 GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 10 to 13)

Offset address: 0xA4

24	ADSMEN1	A/D Conversion Start Request Signal Monitor 1 Output Enabling 0: Output of A/D conversion start request signal monitor 1 is disabled. 1: Output of A/D conversion start request signal monitor 1 is enabled.	R/W

Bit	Symbol	Function	R/W
31:25	—	These bits are read as 0. The write value should be 0.	R/W

The GTADSMR register is used to control monitors for the A/D conversion start request signal that is synchronized with a frame period.

ADSMSk[1:0] bits (A/D Conversion Start Request Signal Monitor k Selection) (k = 0, 1)

These bits are used to select A/D conversion start request signal synchronized with a frame period which is monitored by the GTASMk pin.

In triangle-wave PWM mode, the following settings are prohibited:

- Set ADSMSk[1:0] bit to 00b (A/D conversion start request during up-counting) when GTADTRA = 0
- Set ADSMSk[1:0] bit to 10b (A/D conversion start request during up-counting) when GTADTRB = 0
- Set ADSMSk[1:0] bit to 01b (A/D conversion start request during down-counting) when GTADTRA = GTPR
- Set ADSMSk[1:0] bit to 11b (A/D conversion start request during down-counting) when GTADTRB = GTPR

ADSMENk bit (A/D Conversion Start Request Signal Monitor k Output Enabling) (k = 0, 1)

This bit enables or disables the monitor output to the GTADSMk pin.

When the output is disabled, the GTADSMk pin goes to the low level.

When the bit is 1, the signal on the GTADSMk pin goes to the high level on assertion of the signal to request to the start of A/D conversion selected by the ADSMSk[1:0] bits and returns to the low level at the end of the current cycle of the timer for the channel that generated the given signal to request the start of A/D conversion. When the counter stops, the value when the counter stopped is retained for output. Set the ADSMENk bit to 0 to output the low level.

When a signal to request the start of A/D conversion is generated at the end of a timer period, the generation of this signal has priority in terms of monitoring output and the output remains at the high level till the end of the next period.

When the output of the same A/D conversion start request signal monitoring output is enabled for multiple channels, ORed signals will be output from the GPT.

21.2.28 GTICLF : General PWM Timer Inter Channel Logical Operation Function Setting Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 5)
 GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 5)
 GPT16m = 0x4032_2000 + 0x0100 × m (m = 10 to 13)
 GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 10 to 13)

Offset address: 0xB8

31:26	—	These bits are read as 0. The write value should be 0.	R/W

Note: n = 0 to 5, 10 to 13

Note 1. The signal before performing output disable control is selected.

Note 2. When channel's own GTIOCnA is selected, C is treated as "1".

Note 3. When channel's own GTIOCnB is selected, D is treated as "1".

The GTICLF register sets the logical operation function between compare match outputs. The logical operation is performed with the signals that the duty 0%/100% control is performed after compare match control. (The output disable control is performed with the signal after logical operation.)

Access in 8-bit units to GTICLF is prohibited.

ICLFm[2:0] bit (GTIOCnm Output Logical Operation Function Select) (m = A, B)

These bits select the logical operation function between signals before performing output disable control for GTIOCnm. To prevent hazard to the GPT output, the signal after logical operation is latched with PCLKD. After latching, the output disable control is performed. When the logical operation function which causes the delay of 1 PCLKD is selected, the output enable signal is also delayed with 1 PCLKD and input to the output disable control.

When the same signal to operate logical function AND, OR, EXOR and NOR is selected, one signal is treated as “1”.

ICLFSELk[5:0] bit (Inter Channel Signal k Select) (k = C, D)

These bits select the signal k that the logical operation is performed with the signal before performing output disable control for GTIOCnm.

21.2.29 GTPC : General PWM Timer Period Count Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 3)
 GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 3)
 GPT16m = 0x4032_2000 + 0x0100 × m (m = 10)
 GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 10)

Offset address: 0xBC

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	PCNT[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	ASTP	—	—	—	—	—	—	—	PCEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PCEN	Period Count Function Enable 0: Period count function is disabled 1: Period count function is enabled	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
8	ASTP	Automatic Stop Function Enable 0: Automatic stop function is disabled 1: Automatic stop function is enabled	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W
27:16	PCNT[11:0]	Period Counter Counter for the number of period	R/W
31:28	—	These bits are read as 0. The write value should be 0.	R/W

The GTPC register counts the number of period.

PCEN bit (Period Count Function Enable)

This bit enables or disables period count function.

Writing is available when counting is both in progress and stopped.

When 1 is written to either the GTSECR.SPCE bit or the GTSECR.SPCD bit, the value is simultaneously set to the PCEN bit in the channels set to 1 by the GTSECSR register.

ASTP bit (Automatic Stop Function Enable)

This bit enables or disables the GTCNT counter automatic stopping after finishing counting the number of period.

When the PCEN bis is 0, writing is available.

When the PCEN bit is 1, writing is disabled.

When the PCEN bit is 1, the ASTP bit is 1, and the PCNT counter is stopped at PCNT = 0, the GTCNT counter is also stopped. When the ASTP bit is 0, the GTCNT counter continues to count.

PCNT[11:0] bits (Period Counter)

This counter counts the number of period.

When the PCEN bis is 0, writing the number of period is available.

When the PCEN bit is 1, writing is disabled, and down-counting is performed at the end of period. In saw-wave mode, the end of period refers to overflow, underflow, or counter clearing. In triangle-wave mode, it refers to trough.

When the PCNT counter is 1 at the end of period, it becomes 0 and counting is stopped.

When the GTCNT counter is stopped while period count function is enabled, the PCNT counter keeps its value. When the GTCNT counter restarts counting and the PCEN bit is 1, the PCNT counter restarts down-counting from the hold value.

When the PCEN bit is changed from 0 to 1 while the PCNT counter is 0 and the ASTP bit is 1, the GTCNT counter is stopped at the count clock immediately after that.

21.2.30 GTSECSR : General PWM Timer Operation Enable Bit Simultaneous Control Channel Select Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 5)
 GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 5)

31:14	—	These bits are read as 0. The write value should be 0.	R/W

The GTSECSR register selects an intended channel n (n = 0 to 5, 10 to 13) for updating an operation enable bit by the GTSECR register. A bit position for the GTSECSR register indicates a channel number. The GTSECSR register of each channel is a common register, and writing 1 to a bit in the GTSECSR register in any channel and updating it changes a channel, related to the position of the bit written with 1 by the GTSECSR register, to be simultaneously controlled of the operation enable bit by the GTSECR register.

Contrary to a security attribute for write or read access, if the security and privilege attributes set on each channel has the security violation or the privilege violation, the bit of the channel number that violates security cannot be written or read, and the read value of the bit is "0".

For the association between the GTSECSR bit number and a channel number, see [Figure 21.2](#).

Access in 8-bit or 16-bit units to GTSECSR is prohibited, and it should be accessed in 32-bit units.

SECSELn bit (Operation Enable Bit Simultaneous Control Channel Select) (n = 0 to 5, 10 to 13)

This bit enables or disables the simultaneous control of operation enable in channel n.

When the bit is set to 1, the simultaneous control is enabled, and disabled when the bit is 0.

21.2.31 GTSECR : General PWM Timer Operation Enable Bit Simultaneous Control Register

15:11	—	These bits are read as 0. The write value should be 0.	R/W
16	SPCE	Period Count Function Simultaneous Enable*1 0: Disable simultaneous enabling period count function 1: Enable period count function simultaneously	R/W
23:17	—	These bits are read as 0. The write value should be 0.	R/W
24	SPCD	Period Count Function Simultaneous Disable*1 0: Disable simultaneous disabling period count function 1: Disable period count function simultaneously	R/W
31:25	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. This bit is only available in GPT320 to GPT323, GPT1610.

In GPT324, GPT325, GPT1611 to GPT1613, this bit is read as 0. The write value should be 0.

The GTSECR register simultaneously updates the value for operation enable bits of a channel set by the GTSECSR register. Writing 1 to a bit in the GTSECR register in any channel and updating it updates an operation enable bit for all channels, related to the position of the bit written with 1 by the all GTSECSR registers.

Setting enable and disable bits for the same operation enable bit to 1 in the GTSECR is prohibited.

Contrary to a security attribute for write or read access, if the security and privilege attributes set on each channel has the security violation or the privilege violation, the bit of the channel number that violates security cannot be written or read, and the read value of the bit is "0".

A bit written to 1 is automatically cleared. When the GTSECR is read, 0 is read.

Access in 8-bit or 16-bit units to the GTSECR register is prohibited, and it should be accessed in 32-bit units.

SBDCE bit (GTCCR Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[0] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTCCRA, GTCCRC, and GTCCRD registers and using the GTCCRB, GTCCRE, and GTCCRF registers are enabled.

Simultaneous setting of SBDCE and SBDCE bits to 1 is prohibited.

SBDPE bit (GTPR Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[1] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTPR and GTPBR registers are enabled.

Simultaneous setting of SBDPE and SBDPE bits to 1 is prohibited.

SBDAE bit (GTADTR Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[2] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTADTRA, GTADTBRA, and GTADTDBRA registers and using the GTADTRB, GTADTBRB, and GTADTDBRB registers are enabled.

Simultaneous setting of SBDAE and SBDAD bits to 1 is prohibited.

SBDCE bit (GTCCR Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[0] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTCCRA, GTCCRC, and GTCCRD registers and using the GTCCRB, GTCCRE, and GTCCRF registers are disabled.

Simultaneous setting of SBDCE and SBDCE bits to 1 is prohibited.

SBDPE bit (GTPR Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[1] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTPR and GTPBR registers are disabled.

Simultaneous setting of SBDPE and SBDPE bits to 1 is prohibited.

SBDAD bit (GTADTR Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[2] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTADTRA, GTADTBRA, and GTADTDBRA registers and using the GTADTRB, GTADTRBR, and GTADTDBRB registers are disabled.

Simultaneous setting of SBDAD and SBDAD bits to 1 is prohibited.

SPCE bit (Period Count Function Simultaneous Enable)

When 1 is written to this bit, 1 is simultaneously set to GTPC.PCEN bit in the channels set to 1 by the GTSECSR register, and period count function is enabled.

Simultaneous setting of SPCE and SPCD bits to 1 is prohibited.

SPCD bit (Period Count Function Simultaneous Disable)

When 1 is written to this bit, 0 is simultaneously set to GTPC.PCEN bit in the channels set to 1 by the GTSECSR register, and period count function is disabled.

Simultaneous setting of SPCE and SPCD bits to 1 is prohibited.

21.3 Operation

21.3.1 Basic Operation

Each channel has a 32-bit and 16-bit timer that performs a periodic count operation using the count clock and hardware sources. The count function provides both up-counting and down-counting. The GTPR controls the count cycle.

When the GTCNT counter value matches the value in GTCCRA or GTCCRB, the output from the associated GTIOCnA or GTIOCnB can be changed (n = 0 to 5, 10 to 13). GTCCRA or GTCCRB can be used as an input capture register with hardware resources.

GTCCRC and GTCCRD can function as buffer registers for GTCCRA. GTCCRE and GTCCRF can function as buffer registers for GTCCRB.

21.3.1.1 Counter operation

(1) Counter start and stop

The counter of each channel starts the count operation when GTCR.CST is set to 1, and stops counting when the bit is set to 0. The GTCR.CST bit value is changed by the following sources:

- Writing to GTCR register
- Writing 1 to the bit in GTSTR associated with the GPT channel number when the GTSSR.CSTRT bit set to 1
- Writing 1 to the bit in GTSTP associated with the GPT channel number when the GTPSR.CSTOP bit set to 1
- The hardware source selected in the GTSSR register
- The hardware source selected in the GTPSR register
- Completion of the period count function while the GTPC.ASTP bit is 1

(2) Periodic count operation in up-counting by count clock

The GTCNT counter in each channel starts up-counting when the associated GTCR.CST bit is set to 1 with GTUPSR and GTDNSR registers set to 0x00000000. When the GTCNT value changes from the GTPR value to 0 (overflow), the GTST.TCFPO flag is set to 1, and the overflow interrupt (GPTn_OVF) is also generated. After GTCNT overflows, up-counting resumes from 0x00000000.

Figure 21.3 shows an example of a periodic count operation in up-counting by the count clock.

Figure 21.3 Example of periodic count operation in up-counting by the count clock

Table 21.5 shows an example for setting periodic count operation in up-counting by the count clock.

Table 21.5 Example for setting a periodic count operation in up-counting by the count clock

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.3, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.3, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In Figure 21.3, 0x00000000 is set.
6	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

(3) Periodic count operation in down-counting by count clock

The GTCNT counter in each channel can perform down-counting by setting GTUDDTYC.UD with GTUPSR and GTDNSR registers set to 0x00000000. When GTCNT changes from 0 to the GTPR value (underflow), GTST.TCFPU is set to 1, and the underflow interrupt(GPTn_UDF) is also generated. After the GTCNT counter underflows, down-counting resumes from the GTPR value.

Figure 21.4 shows an example of periodic count operation in down-counting by the count clock.

Figure 21.4 Example of periodic count operation in down-counting by the count clock

Table 21.6 shows an example for setting periodic count operation in down-counting by the count clock.

Table 21.6 Example for setting periodic count operation in down-counting by count clock

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.4, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction with the GTUDDTYC register. In Figure 21.4, after 10b is set in the GTUDDTYC[1:0] bits, 00b is set in the GTUDDTYC[1:0] bits (down-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In Figure 21.4, the GTPR register value is set.
6	Start count operation	Set the GTCR.CST bit to 1 to start count operation. In Figure 21.4, 1 is set in the CST bit.

(4) Event count operation in up-counting using hardware sources

The GTCNT counter in each channel can perform up-counting using hardware sources as set in GTUPSR.

When GTUPSR is set to enable, the count clock selected in GTCR.TPCS[3:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, the GTCNT counter value does not change. The overflow behavior when up-counting using hardware sources is the same as when up-counting by the count clock.

If you are using a hardware source to count up, set the GTCR.CST bit to 1 to enable the counting operation. After GTCR.CST is set to 1, the counter cannot count up for 1 clock cycle as specified in GTCR.TPCS[3:0] because the count operation is synchronized by the count clock selected in GTCR.TPCS[3:0]. Set GTCR.TPCS[3:0] to 000b to count up with a 1 PCLKD delay after GTCR.CST is set to 1.

Figure 21.5 shows an example of an event count operation in up-counting by a hardware resource (the rising edge of GTETRGA pin input).

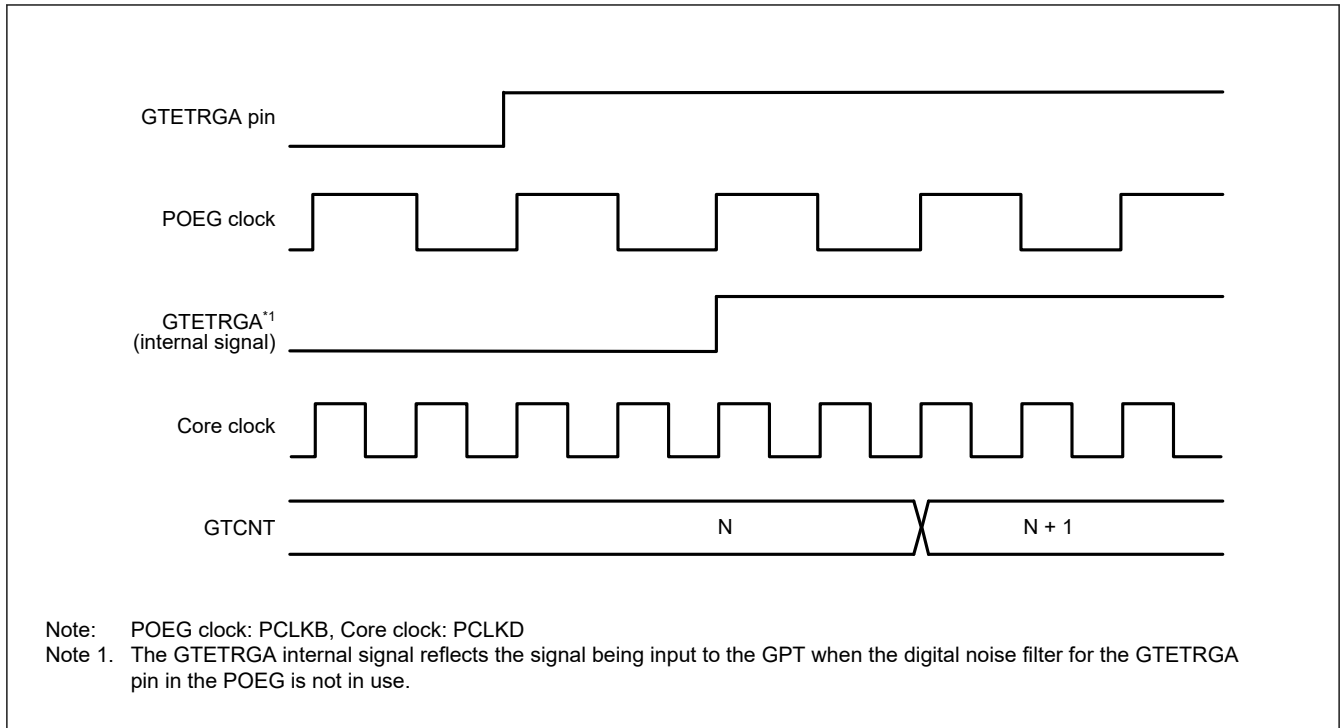

Figure 21.5 Example of event count operation in up-counting using hardware sources

Table 21.7 shows an example for setting event count operation in up-counting by a hardware source.

Table 21.7 Example for setting an event count operation in up-counting using hardware sources

No.	Step Name	Description
1	Set count source	Select the counting-up hardware source with the GTUPSR register.
2	Set cycle	Set the cycle in the GTPR register.
3	Set initial value for counter	Set the initial value in the GTCNT counter.
4	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

(5) Event count operation in down-counting using hardware sources

The GTCNT counter in each channel can perform down-counting using hardware sources set in the GTDNSR.

When GTDNSR is set to enable, the count clock selected in GTCR.TPCS[3:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, the GTCNT counter value does not change. The underflow behavior when down-counting using hardware sources is the same as when down-counting by the count clock.

When GTCR.CST bit is set to 1 to count down using hardware sources, the count operation is enabled. After GTCR.CST is set to 1, the counter cannot count down for 1 clock cycle as specified in GTCR.TPCS[3:0] because the count operation is synchronized with the count clock selected in GTCR.TPCS[3:0]. Set GTCR.TPCS[3:0] to 000b to count down with a 1 PCLKD delay after GTCR.CST is set to 1.

Figure 21.6 shows an example of a event count operation in down-counting by a hardware resource (rising edge of GTETRGA pin).

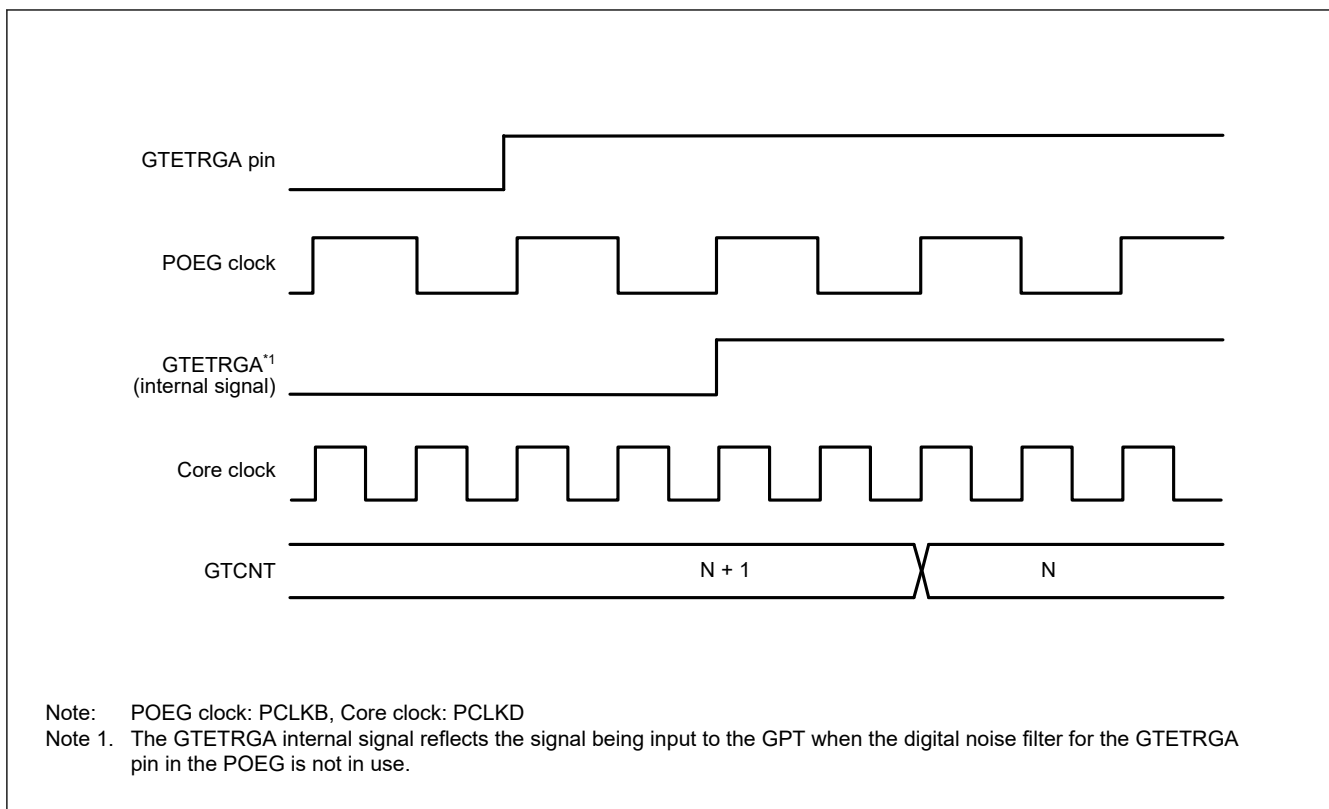

Figure 21.6 Example of event count operation in down-counting using hardware sources

Table 21.8 shows an example for setting a periodic count operation in down-counting using a hardware resource.

Table 21.8 Example for setting an event count operation in down-counting using hardware sources

No.	Step Name	Description
1	Set count source	Select the counting-down hardware source with the GTDNSR register.
2	Set cycle	Set the cycle in the GTPR register.
3	Set initial value for counter	Set the initial value in the GTCNT counter.
4	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

(6) Counter clear operation

The counter of each channel is cleared by following sources:

- Writing 0 to GTCNT register
- Writing 1 to the bit in GTCLR associated with the GPT channel number when the GTCSR.CCLR bit set to 1
- The hardware source selected in GTCSR register.

Writing to the GTCNT register is prohibited during count operation. The GTCNT counter can be cleared both by writing 1 to the GTCLR and by the clear request of hardware sources, whether GTCNT is counting (GTCR.CST is 1) or not (GTCR.CST is 0).

When the count direction flag is set as decrement (GTST.TCUF flag = 0) in saw-wave mode selected with GTCR.MD[2:0] bits, the GTCNT register is set to the value of the GTPR register when writing 1 to the GTCLR register and when clearing by hardware sources are performed.

When not in saw-waves mode and down-counting, the GTCNT register is set to 0 when writing 1 to the GTCLR register and when clearing by hardware sources are performed.

In event count operation when at least 1 bit in the GTUPSR or GTDNSR is set to 1, after clear sources occur, both writing to GTCLR register and clearing by hardware sources are performed immediately to synchronize with PCLKD. If other settings are used, clear is synchronized with the counter clock selected in GTCR.TPCS[3:0].

21.3.1.2 Waveform output by compare match

Compare match means that the GTCNT counter value matches the value of GTCCRA or GTCCRB. When a compare match occurs, the compare match flag is generated synchronously with the count clock, including the event count. At the same time, the GPT can output low, high, or toggled output from the associated GTIOCnA or GTIOCnB output pin (n = 0 to 5, 10 to 13). In addition, the GTIOCnA or GTIOCnB pin output can be low, high, or toggled at the cycle end which is determined by GTPR.

The cycle end is:

- For saw waves in up-counting – when GTCNT changes from the GTPR value to 0 (overflow)
- For saw waves in down-counting – when GTCNT changes from 0 to GTPR value (underflow)
- For saw waves – when the GTCNT counter is cleared
- For triangle waves – when the GTCNT changes from 0 to 1 (trough).

(1) Low output and high output

Figure 21.7 shows an example of low output and high output operation by a compare match of GTCCRA and GTCCRB.

In this example, the GTCNT counter performs up-counting, and settings are made so that high is output from the GTIOCnA pin by a GTCCRA compare match, and low is output from the GTIOCnB pin by a GTCCRB compare match. The pin level does not change when the specified level and pin level match.

Figure 21.7 Example of low output and high output operation

Table 21.9 shows an example for setting low output and high output operation.

Table 21.9 Example for setting low output and high output operation (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.7, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.7, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.

Table 21.9 Example for setting low output and high output operation (2 of 2)

No.	Step Name	Description
6	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.7 , GTIOA[4:0] = 00010b, GTIOB[4:0] = 10001b.
7	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8	Set compare match value	Set compare match values in the GTCCRA and GTCCRB registers.
9	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

Note: n: 0 to 5, 10 to 13
m: A, B

(2) Toggled output

[Figure 21.8](#) and [Figure 21.9](#) show examples of toggled output operation by compare matches of GTCCRA and GTCCRB.

In [Figure 21.8](#), the GTCNT counter performs up-counting, and settings are made so that the GTIOCnA pin output by a GTCCRA compare match and GTIOCnB pin output by a GTCCRB compare match are toggled.

In [Figure 21.9](#), the GTCNT counter performs up-counting, and settings are made so that a GTCCRA compare match toggles the GTIOCnA pin output level and a cycle end toggles the GTIOCnB pin output level.

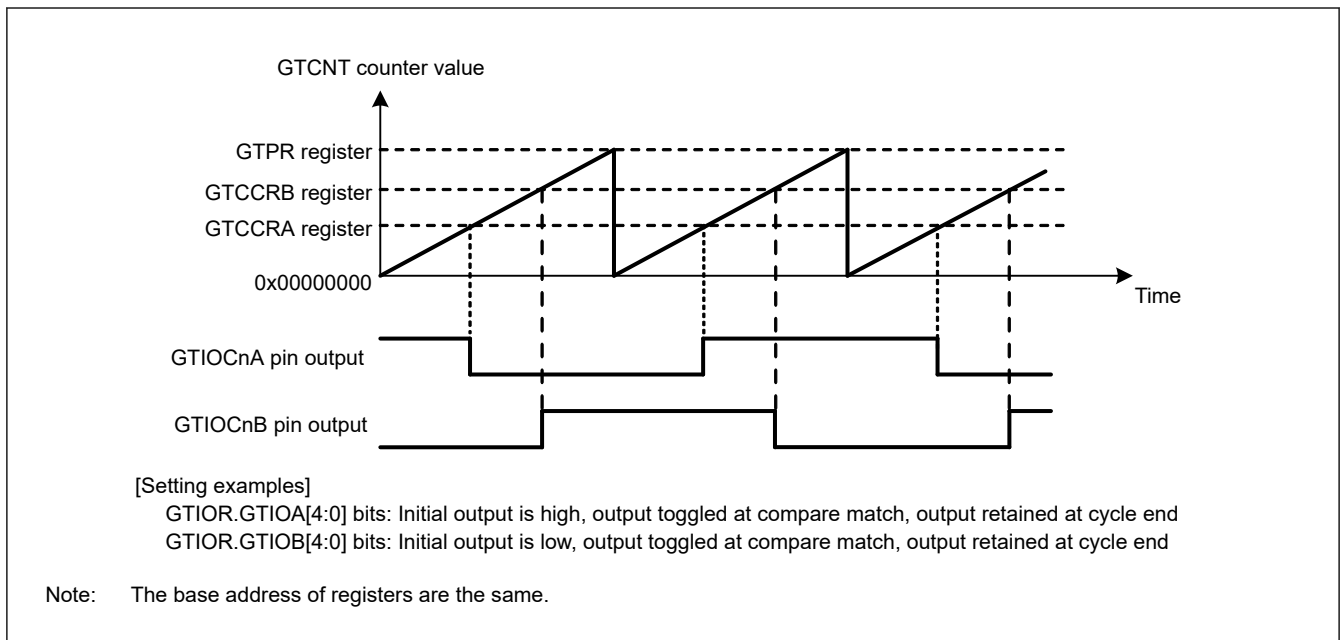

Figure 21.8 Example of toggled output operation (1)

Figure 21.9 Example of toggled output operation (2)

Table 21.10 shows an example for setting toggled output operation.

Table 21.10 Example for setting toggled output operation

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.8 and Figure 21.9, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.8 and Figure 21.9, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set GTIOcNm pin function	Set the GTIOcNm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.8, GTIOA[4:0] = 10011b, GTIOB[4:0] = 00011b, and in Figure 21.9, GTIOA[4:0] = 10011b, GTIOB[4:0] = 01100b.
7	Enable GTIOcNm pin output	Set to enable the GTIOcNm pin output with the OAE and OBE bits in the GTIOR register.
8	Set compare match value	Set compare match values in the GTCCRA and GTCCRB registers.
9	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

Note: n: 0 to 5, 10 to 13
 m: A, B

21.3.1.3 Input Capture Function

The GTCNT counter value can be transferred to either GTCCRA or GTCCRB on detection of the hardware source that is set in GTICASR and GTICBSR.

Figure 21.10 shows an example of the input capture function.

In this example, the GTCNT counter performs up-counting by the count clock, and settings are made so that an input capture is performed to GTCCRA at both edges of the GTIOcNA input pin and to GTCCRB on the rising edge of the GTIOcNB input pin.

Figure 21.10 Example of input capture operation

Table 21.11 and Table 21.14 show the example for setting an input capture operation with count operation by the count clock.

Table 21.11 Example for setting input capture operation

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.10, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.10, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Select input capture source	Select the input capture source in the GTICASR and GTICBSR registers. In Figure 21.10, GTICASR = 0x00000F00, GTICBSR = 0x00003000.
7	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

21.3.2 Buffer Operation

The following buffer operations can be set with GTBER:

- GTPR and GTPBR
- GTCCRA, GTCCRC, and GTCCRD
- GTCCRB, GTCCRE, and GTCCRF
- GTADTRA, GTADTBRA, and GTADTDBRA
- GTADTRB, GTADTBRB, and GTADTDBRB

21.3.2.1 GTPR Register Buffer Operation

GTPBR can function as a buffer register for GTPR.

The buffer transfer is performed at an overflow (during up-counting) or an underflow (during down-counting) in saw-wave mode or in event count, and at a trough in triangle-wave mode.

In saw-wave mode or in event count, the buffer transfer is performed when the following counter clear operations occur during counting:

- Clear by hardware sources (the clear source is selected in GTCSR register)
- Clear by software (when GTCSR.CCLR bit is 1 and GTCLR.CCLRn bit is set to 1, n = 0 to 5, 10 to 13).

To set GTPR to function as a buffer, set the GTBER.PR bit to 1. To set GTPR not to function as a buffer, set the GTBER.PR bit to 0.

Figure 21.11 to section 21.3.2.1. GTPR Register Buffer Operation show examples of GTPR buffer operation and Table 21.12 shows an example for setting GTPR buffer operation.

Figure 21.11 Example of GTPR buffer operation with saw waves in up-counting

Figure 21.12 Example of GTPR buffer operation with saw waves in down-counting

Table 21.12 Example for setting GTPR register buffer operation

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.11 and Figure 21.12 , 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.11 , after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). In Figure 21.12 , after 10b is set in the GTUDDTYC[1:0] bits, 00b is set in the GTUDDTYC[1:0] bits (down-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set buffer operation	Set buffer operation with the GTBER.PR[1:0] bits. In Figure 21.11 , Figure 21.12 , and section 21.3.2.1. GTPR Register Buffer Operation , PR[1:0] = 01b.
7	Set buffer value	For buffer operation, set a value in one cycle after the current cycle in the GTPBR register.
8	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
9	Set buffer value for each cycle	For buffer operation, set a value in one cycle after the current cycle in the GTPBR register.

21.3.2.2 Buffer Operation for GTCCRA and GTCCRB Registers

GTCCRC can function as the GTCCRA buffer register and GTCCRD can function as the GTCCRC buffer register (double-buffer register for GTCCRA). Similarly, GTCCRE can function as the GTCCRB buffer register and GTCCRF can function as the GTCCRE buffer register (double-buffer register for GTCCRB).

To set GTCCRA or GTCCRB to function as a double buffer, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 10b or 11b. For single buffer operation, set 01b. To set GTCCRA or GTCCRB to not function as a buffer, set 00b.

In saw-wave one-shot pulse mode, triangle-wave PWM mode 3, the buffer operations that specific each PWM output operation mode are performed regardless of the setting of GTBER.CCRA [1:0] bits and GTBER.CCRB [1:0] bits.

(1) When GTCCRA or GTCCRB Functions as Output Compare Register

In saw-wave one-shot pulse mode, triangle-wave PWM mode 3, the buffer operations that specific each PWM output operation mode are performed regardless of the setting of GTBER.CCRA [1:0] bits and GTBER.CCRB [1:0] bits. For details, see [section 21.3.3. PWM Output Operating Mode](#). Other than above PWM output operation mode, Buffer transfer occurs in the following situations:

Buffer transfer occurs in the following situations:

- Buffer transfer by overflow or underflow
Buffer transfer is performed at an overflow (during up-counting) or an underflow (during down-counting) in saw-wave mode or in event count operation. In triangle-wave mode, buffer transfer is performed at a trough (triangle-wave PWM mode 1) or a crest and trough (triangle-wave PWM mode 2).
- Buffer transfer by counter clear
In saw-wave mode or in event count operation, during counting, buffer transfer (which is the same as an overflow during up-counting or an underflow during down-counting) is performed by the counter clear sources similar to the case shown in [section 21.3.2.1. GTPR Register Buffer Operation](#).
In triangle-wave mode, buffer transfer is not performed by the counter clear.
- Forcible buffer transfer
When GTBER.CCRSWT bit is set to 1 while the count operation is stopped, the GTCCRA and the GTCCRB register buffer transfer are performed forcibly in saw-wave mode, in event count operation and in triangle-wave mode.
Additionally buffer transfer from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B are performed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3.

[Figure 21.13](#) to [Figure 21.15](#) show examples of GTCCRA and GTCCRB buffer operation and [Table 21.13](#) shows an example for setting GTCCRA and GTCCRB buffer operation.

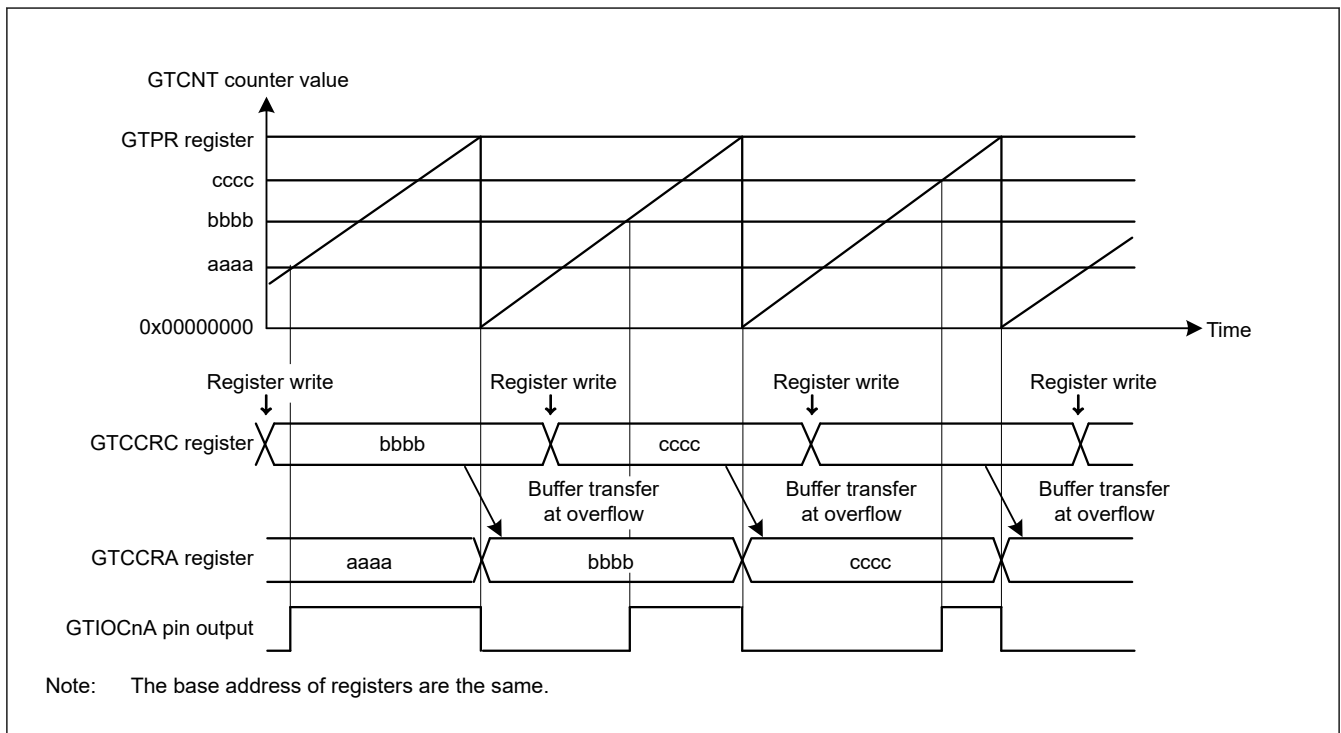

Figure 21.13 Example of GTCCRA and GTCCRB buffer operation with output compare, saw waves in up-counting, high output at GTCCRA compare match, and low output at cycle end

Figure 21.14 Example of GTCCRA and GTCCRB double buffer operation with output compare, triangle waves, buffer operation at trough, output toggled at GTCCRA compare match, and output retained at cycle end

Figure 21.15 Example of GTCCRA and GTCCRB double buffer operation with output compare, triangle waves, buffer operation at both troughs and crests, output toggled at GTCCRB compare match, and output retained at cycle end

Table 21.13 Example for setting GTCCRA and GTCCRB buffer operation for output compare

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.13 , 000b (saw-wave PWM mode) is set, in Figure 21.14 , 100b (triangle-wave PWM mode 1) is set, and in Figure 21.15 , 101b (triangle-wave PWM mode 2) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.13 , after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set GTIOCNm pin function	Set the GTIOCNm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.13 , GTIOA[4:0] = 00110b, in Figure 21.14 , GTIOA[4:0] = 00011b, and in Figure 21.15 , GTIOB[4:0] = 00011b.
7	Enable GTIOCNm pin output	Set to enable the GTIOCNm pin output with the OAE and OBE bits in the GTIOR register.
8	Set buffer operation	Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTCR register. In Figure 21.13 , CCRA[1:0] = 01b, in Figure 21.14 , CCRA[1:0] = 1xb, and in Figure 21.15 , CCRB[1:0] = 1xb.
9	Set compare match value	Set the GTIOCNm pin transition in the GTCCRA register and the GTIOCNm pin transition in the GTCCRB register.
10	Set buffer value	For buffer operation, set the GTIOCNm and GTIOCNm pins transitions in 1 cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCNm and GTIOCNm pins transitions in 2 cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or 1 cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRD and GTCCRF registers, respectively.
11	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
12	Set buffer value for each cycle	For buffer operation, set the GTIOCNm and GTIOCNm pins transitions in 1 cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCNm and GTIOCNm pins transitions in 2 cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or 1 cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRD and GTCCRF registers, respectively.

Note: n: 0 to 5, 10 to 13
m: A, B

(2) When GTCCRA or GTCCRB Functions as Input Capture Register

When an input capture is generated, the GTCNT counter value is transferred to GTCCRA and GTCCRB and the stored GTCCRA and GTCCRB register values are transferred to the buffer registers. In input capture operation, the buffer transfer is not performed by the counter clear.

[Figure 21.16](#) and [Figure 21.17](#) show examples of GTCCRA and GTCCRB buffer operation and [Table 21.14](#) shows an example for setting GTCCRA and GTCCRB buffer operation.

Figure 21.16 Example of GTCCRA and GTCCRB buffer operation with input capture at both edges of GTIOcNA input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOcNA input

Figure 21.17 Example of GTCCRA and GTCCRB double buffer operation with input capture at both edges of GTIOcNB input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOcNB input

Table 21.14 Example for setting GTCCRA and GTCCRB buffer operation for input capture

No.	Step Name	Description
1	Set operating mode and counter clear sources	Set the operating mode with the GTCR.MD[2:0] bits and count clear source with the GTCSCR register. In Figure 21.16 , MD[2:0] = 000b (saw-wave PWM mode) and GTCSCR = 0x00000F00, and in Figure 21.17 , MD[2:0] = 000b (saw-wave PWM mode) and GTCSCR = 0x0000F000.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.16 , after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Select input capture source	Select input capture source in the GTICASR register and GTICBSR register. In Figure 21.16 , GTICASR = 0x00000F00, and in Figure 21.17 , GTICBSR = 0x0000F000.
7	Set buffer operation	Set buffer operation with the CCRA and CCRB bits in the GTBER register. In Figure 21.16 , CCRA[1:0] = 01b, and in Figure 21.17 , CCRB[1:0] = 1xb.
8	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

21.3.2.3 Buffer Operation for GTADTRA and GTADTRB Registers

The GTADTBRA register can function as the GTADTRA buffer register and the GTADTDBRA register can function as the GTADTBRA buffer register (double buffer register for the GTADTRA register). Similarly, the GTADTBRB register can function as the GTADTRB buffer register and the GTADTDBRB register can function as the GTADTBRB buffer register (double buffer register for the GTADTRB register).

To set the GTADTRA or GTADTRB register to function as a double buffer, set the GTBER.ADTDA or ADTDB bit to 1. For single buffer operation, set 0. Not to function as buffer, set the GTBER.ADTTA[1:0] or ADTTB[1:0] bits to 00b.

The buffer transfer timing can be set with the ADTTA[1:0] and ADTTB[1:0] bits to an overflow (in up-counting) or an underflow (in down-counting) in saw-wave mode, with ADTTA[1:0] and ADTTB[1:0] bits to 01b for a crest, to 10b for a trough, or to 11b for both crest and trough in triangle-wave mode.

In saw-wave mode, when the ADTTA[1:0] and ADTTB[1:0] bits are set to value other than 00b and in count operation, the buffer transfer, by similar counter clearing sources in [section 21.3.2.1. GTPR Register Buffer Operation](#), is performed in the same way at an overflow (in up-counting) or an underflow (in down-counting).

[Figure 21.18](#) to [section 21.3.2.3. Buffer Operation for GTADTRA and GTADTRB Registers](#) show examples of buffer operation of the GTADTRA and GTADTRB registers, and [Table 21.15](#) shows an example for setting buffer operation of the GTADTRA and GTADTRB registers.

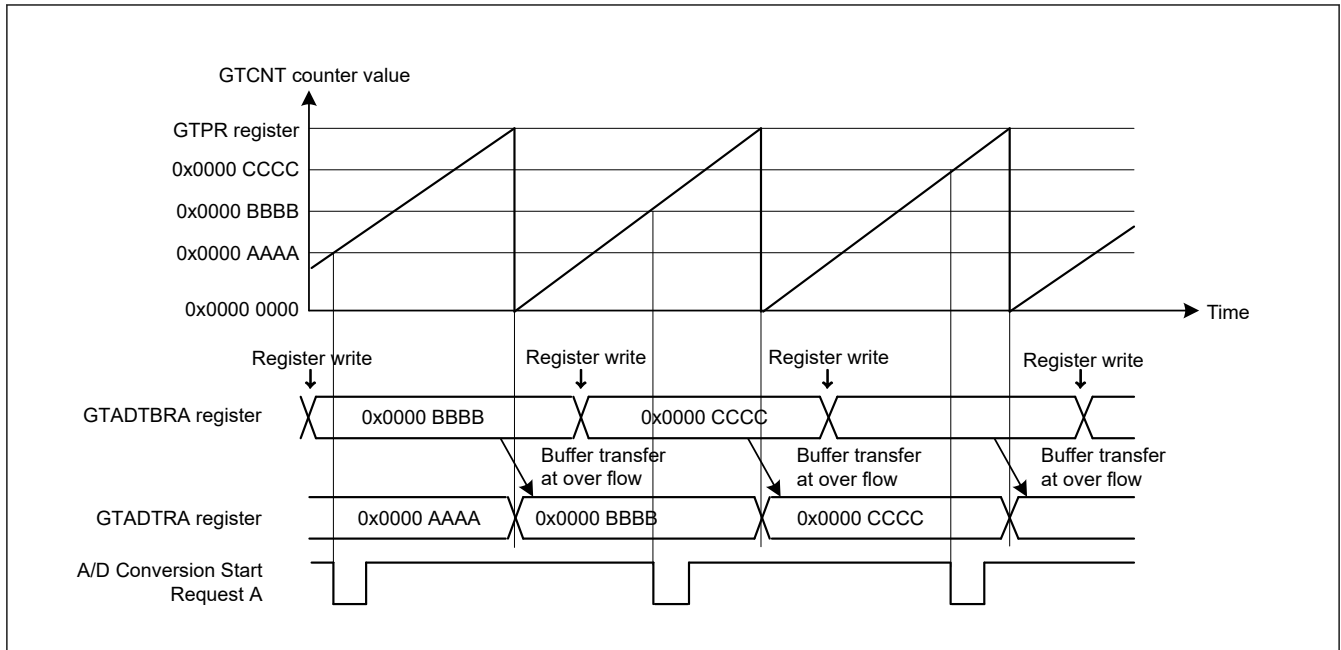

Figure 21.18 Example of Buffer Operation of the GTADTRA and GTADTBRA Registers (Saw Waves in Up-Counting, A/D Conversion Start Request Generated by Up-Counting)

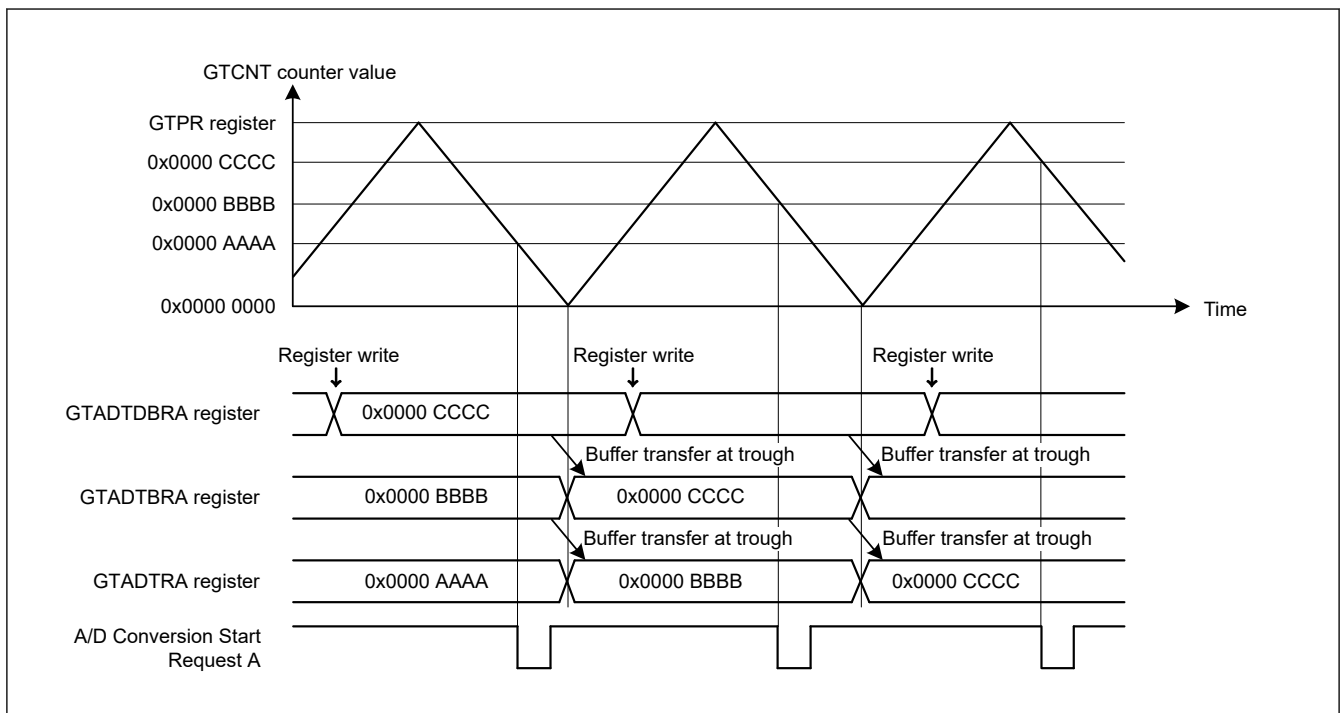

Figure 21.19 Example of Double Buffer Operation of the GTADTRA and GTADTBRA Registers (Triangle Waves, Buffer Transfer at Troughs, A/D Conversion Start Request Generated by Down-Counting)

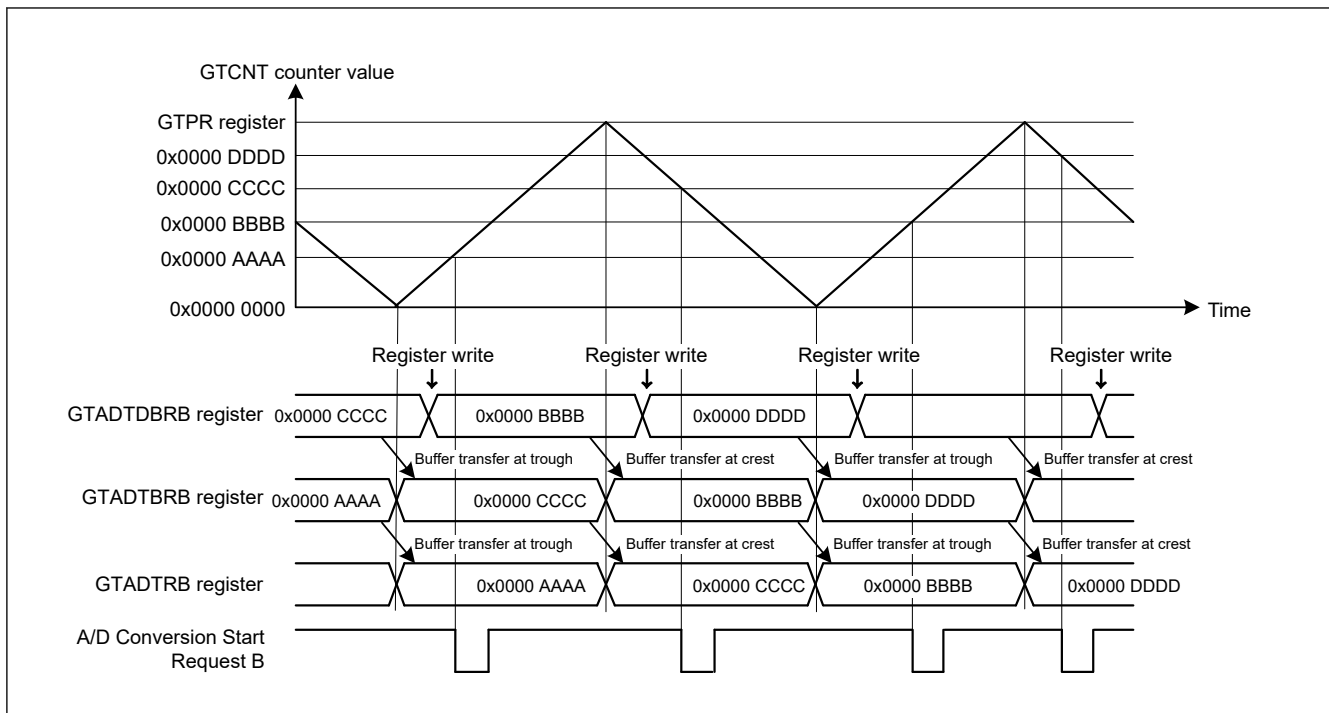

Figure 21.20 Example of Double Buffer Operation of the GTADTRA and GTADTRB Registers (Triangle Waves, Buffer Transfer at Both Troughs and Crests, A/D Conversion Start Request Generated by Both Up- and Down-Counting)

Table 21.15 Example for Setting Buffer Operation of the GTADTRA and GTADTRB registers (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. (In Figure 21.18 000b (saw-wave PWM mode) is set, in Figure 21.19 and Figure 21.20, 100b, 101b, 110b (triangle-wave PWM mode) is set.)
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. (In Figure 21.18, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).)
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set buffer operation	Set buffer operation with the ADTTA[1:0], ADTTB[1:0], ADTDA, and ADTDB bits in GTCR register. (In Figure 21.18, ADTTA[1:0] bits = 01b, 10b, or 11b and ADTDA bit = 0, in Figure 21.19, ADTTA[1:0] bits = 10b and ADTDA bit = 1, and in Figure 21.20, ADTTB[1:0] bits = 11b and ADTDB bit = 1.)
7	Set compare match value	Set the A/D conversion start request point in the GTADTRA and GTADTRB registers.
8	Set buffer value	For buffer operation, set the A/D conversion start request point in one cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTBRB registers. For double buffer operation, also set the A/D conversion start request point in two cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTDBRA and GTADTDBRB registers.
9	Enable A/D conversion start request	Set to enable A/D conversion start request with the ADTRAUEN, ADTRADEN, ADTRBUEN, and ADTRBDEN bits in the GTINTAD register. (In Figure 21.18, ADTRAUEN bit = 1, in Figure 21.19, ADTRADEN bit = 1, and in Figure 21.20, ADTRBUEN bit = 1 and ADTRBDEN bit = 1.)
10	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

Table 21.15 Example for Setting Buffer Operation of the GTADTRA and GTADTRB registers (2 of 2)

No.	Step Name	Description
11	Set buffer value of each cycle	For buffer operation, set the A/D conversion start request point in one cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTBRB registers. For double buffer operation, also set the A/D conversion start request point in two cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTBRB registers.

21.3.3 PWM Output Operating Mode

The GPT can output PWM waveforms to the GTIOcNA or GTIOcNB pin (n = 0 to 5, 10 to 13) by a compare match between the GTCNT counter and GTCCRA or GTCCRB.

By setting GTDTCR and GTDVU, the compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

21.3.3.1 Saw-Wave PWM Mode

In saw-wave PWM mode, GTCNT performs saw-wave (half-wave) operation by setting the cycle in GTPR and a PWM waveform is output to the GTIOcNA or GTIOcNB pin (n = 0 to 5, 10 to 13) when a GTCCRA or GTCCRB compare match occurs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end according to the GTIOR setting.

When the timing of the end of cycle and the timing of GTCCRk register compare match are the same time, the output pin performs along the PWM output setting for the end of cycle set by the GTIOR.GTIOx[3:2] bits (x = A, B).

[Figure 21.21](#) shows an example of saw-wave PWM mode operation, and [Table 21.16](#) shows an example for setting saw-wave PWM mode.

Figure 21.21 Example of saw-wave PWM mode operation with up-counting, buffer operation, high output at GTCCRA/GTCCRB compare match, and low output at cycle end

Table 21.16 Example for setting saw-wave PWM mode (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.21, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.21, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.21, GTIOA[4:0] = 00110b and GTIOB[4:0] = 00110b.
7	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8	Set buffer operation	Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTBER register. In Figure 21.21, CCRA[1:0] = 01b and CCRB[1:0] = 01b.
9	Set compare match value	Set the GTIOCnA pin transition in the GTCCRA register and the GTIOCnB pin transition in the GTCCRB register.

Table 21.16 Example for setting saw-wave PWM mode (2 of 2)

No.	Step Name	Description
10	Set buffer value	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.
11	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
12	Set buffer value for each cycle	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.

Note: n: 0 to 5, 10 to 13
m: A, B

21.3.3.2 Saw-Wave One-Shot Pulse Mode

The saw-wave one-shot pulse mode is a mode in which the cycle is set in GTPR, the GTCNT counter performs saw-wave (half-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin ($n = 0$ to 5, 10 to 13) at a compare match of GTCCRA or GTCCRB with buffer operation fixed.

Buffer operation in saw-wave one-shot pulse mode is different from the usual buffer operation. Buffer transfer is performed from:

- GTCCRC to GTCCRA at the cycle end
- GTCCRE to GTCCRB at the cycle end
- GTCCRD to temporary register A at the cycle end
- GTCCRF to temporary register B at the cycle end
- Temporary register A to GTCCRA at a GTCCRA compare match
- Temporary register B to GTCCRB at a GTCCRB compare match.

The pin output value can be selected from low output, high output, or toggled output separately for a compare match and the cycle end according to the GTIOR setting. When the GTBER.CCRSWT bit is set to 1 while count operation is stopped, the buffer is transferred forcibly from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B. By setting GTDTCR and GTDVU, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 21.22 shows an example of saw-wave one-shot pulse mode operation, and Table 21.17 shows an example for setting saw-wave one-shot pulse mode.

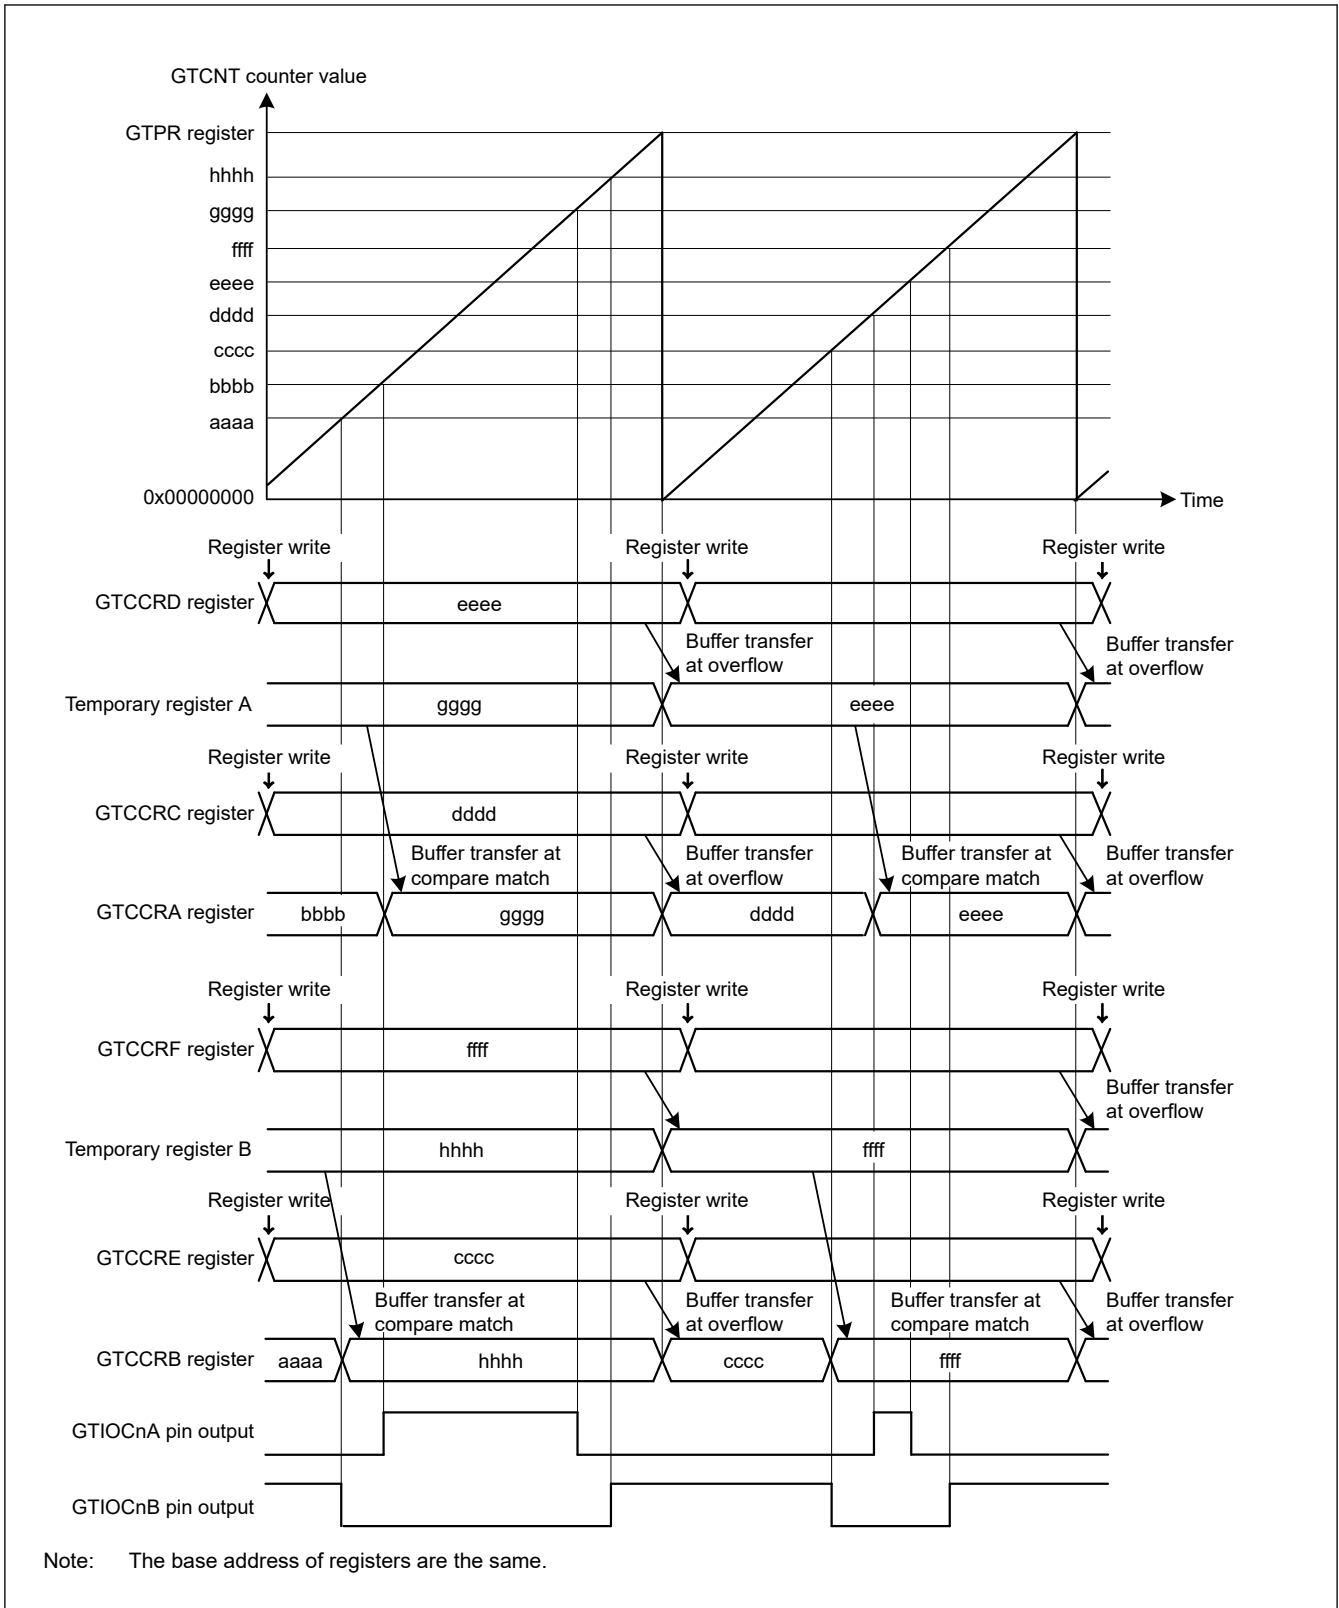

Figure 21.22 Example of saw-wave one-shot pulse mode operation with up-counting, low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/ GTCCRB compare match, and output retained at cycle end

Table 21.17 Example setting for saw-wave one-shot pulse mode

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.22 , 001b (saw-wave one-shot pulse mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.22 , after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set GTIOCn pin function	Set the GTIOCn pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.22 , GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.
7	Enable GTIOCn pin output	Set to enable the GTIOCn pin output with the OAE and OBE bits in the GTIOR register.
8	Set compare match value	Set the GTIOCnA pin transition immediately after the count start in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers.
9	Set forcible buffer transfer	Set the GTBER.CCRSWT bit to 1 to transfer buffer register data forcibly.
10	Set buffer value	For buffer operation, set the GTIOCnA pin transition in one cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers.
11	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
12	Set buffer value for each cycle	For buffer operation, set the GTIOCnA pin transition in one cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers.

Note: n: 0 to 5, 10 to 13
m: A, B

21.3.3.3 Triangle-Wave PWM Mode 1 (32-Bit Transfer at Trough)

The triangle-wave PWM mode 1 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 5, 10 to 13) when a GTCCRA or GTCCRB compare match occurs. Buffer transfer is performed at the trough. The pin output value can be selected from low output, high output, or toggled output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR and GTDVU, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

[Figure 21.23](#) shows an example of a triangle-wave PWM mode 1 operation, and [Table 21.18](#) shows an example for setting a triangle-wave PWM mode 1.

Figure 21.23 Example of triangle-wave PWM mode 1 operation with buffer operation, low output from the GTIOcNA pin and high output from the GTIOcNB pin at count start, output toggled at GTCCRA/ GTCCRB register compare match, and output retained at cycle end

Table 21.18 Example setting for triangle-wave PWM mode 1 (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.23 , 100b (triangle-wave PWM mode 1) is set.
2	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
3	Set cycle	Set the cycle in the GTPR register.
4	Set initial value for counter	Set the initial value in the GTCNT counter.
5	Set GTIOcNm pin function	Set the GTIOcNm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.23 , GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.
6	Enable GTIOcNm pin output	Set to enable the GTIOcNm pin output with the OAE and OBE bits in the GTIOR register.
7	Set buffer operation	Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTCR register. In Figure 21.23 , CCRA[1:0] = 01b and CCRB[1:0] = 01b.
8	Set compare match value	Set the GTIOcNA and GTIOcNB pins transitions in the GTCCRA and GTCCRB registers, respectively.
9	Set buffer value	For buffer operation, set the GTIOcNA and GTIOcNB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOcNA and GTIOcNB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.

Table 21.18 Example setting for triangle-wave PWM mode 1 (2 of 2)

No.	Step Name	Description
10	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
11	Set buffer value for each cycle	For buffer operation, set the GTIOcNA and GTIOcNB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOcNA and GTIOcNB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.

Note: n: 0 to 5, 10 to 13
m: A, B

21.3.3.4 Triangle-Wave PWM Mode 2 (32-Bit Transfer at Crest and Trough)

Similarly to triangle-wave PWM mode 1, in triangle-wave PWM mode 2 the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOcNA or GTIOcNB pin (n = 0 to 5, 10 to 13) when a GTCCRA or GTCCRB compare match occurs. The buffer transfer is performed at both crests and troughs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR and GTDVU, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

[Figure 21.24](#) shows an example of triangle-wave PWM mode 2 operation, and [Table 21.19](#) shows an example for setting triangle-wave PWM mode 2.

Figure 21.24 Example of triangle-wave PWM mode 2 operation with buffer operation, low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/ GTCCRB compare match, and output retained at cycle end

Table 21.19 Example for setting triangle-wave PWM mode 2 (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.24 , 101b (triangle-wave PWM mode 2) is set.
2	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
3	Set cycle	Set the cycle in the GTPR register.
4	Set initial value for counter	Set the initial value in the GTCNT counter.
5	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.24 , GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.
6	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
7	Set buffer operation	Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTCR register. In Figure 21.24 , CCRA[1:0] = 01b and CCRB[1:0] = 01b.
8	Set compare match value	Set the GTIOCnA and GTIOCnB pins transitions in the GTCCRA and GTCCRB registers, respectively.

Table 21.19 Example for setting triangle-wave PWM mode 2 (2 of 2)

No.	Step Name	Description
9	Set buffer value	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in half cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRD and GTCCRF registers, respectively.
10	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
11	Set buffer value for each half cycle	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in half cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in GTCCRD and GTCCRF registers, respectively.

Note: n: 0 to 5, 10 to 13
m: A, B

21.3.3.5 Triangle-Wave PWM Mode 3 (64-Bit Transfer at Trough)

The triangle-wave PWM mode 3 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 5, 10 to 13) at a compare match of GTCCRA or GTCCRB with buffer operation fixed. Buffer operation in triangle-wave PWM mode 3 is different from the usual buffer operation. Buffer transfer is performed from the following:

- GTCCRC to GTCCRA at the trough
- GTCCRE to GTCCRB at the trough
- GTCCRD to temporary register A at the trough
- GTCCRF to temporary register B at the trough
- Temporary register A to GTCCRA at the crest
- Temporary register B to GTCCRB at the crest.

The pin output value can be selected from low output, high output, or toggled output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR and GTDVU, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

[Figure 21.25](#) shows an example of triangle-wave PWM mode 3 operation, and [Table 21.20](#) shows an example for setting triangle-wave PWM mode 3.

Figure 21.25 Example of triangle-wave PWM mode 3 operation with low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/GTCCRB compare match, and output retained at cycle end

Table 21.20 Example setting for triangle-wave PWM mode 3 (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.25 , 110b (triangle-wave PWM mode 3) is set.
2	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.

Table 21.20 Example setting for triangle-wave PWM mode 3 (2 of 2)

No.	Step Name	Description
3	Set cycle	Set the cycle in the GTPR register.
4	Set initial value for counter	Set the initial value in the GTCNT counter.
5	Set GTIOcnm pin function	Set the GTIOcnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.25 , GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.
6	Enable GTIOcnm pin output	Set to enable the GTIOcnm pin output with the OAE and OBE bits in the GTIOR register.
7	Set compare match value	Set the GTIOcnA pin transition immediately after the count start in the GTCCRC and GTCCRD registers and the GTIOcnB pin transition in the GTCCRE and GTCCRF registers.
8	Set forcible buffer transfer	Set the GTBER.CCRSWT bit to 1 to transfer buffer register data forcibly.
9	Set buffer value	Set the GTIOcnA pin transition in 1 cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOcnB pin transition in the GTCCRE and GTCCRF registers.
10	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
11	Set buffer value for each cycle	Set the GTIOcnA pin transition in 1 cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOcnB pin transition in the GTCCRE and GTCCRF registers.

Note: n: 0 to 5, 10 to 13
m: A, B

21.3.4 Automatic Dead Time Setting Function

By setting GTDTCR, a compare match value for a negative waveform with dead time obtained by a compare match value for a positive waveform (GTCCRA value) and specified dead time value (GTDVU value) can automatically be set to GTCCRB.

The automatic dead time setting function can be used in saw-wave one-shot pulse mode and all the triangle PWM modes.

Dead time for the changing point of a negative waveform is set in the GTDVU register.

The change point of the negative-phase waveform, which is automatically calculated, is obtained by reading the GTCCRB register. Writing to GTCCRB is prohibited when the automatic dead time setting function is used.

Do not set the dead time that makes the change point of the waveform exceeding the count period. When any dead-time setting which would generate a dead-time error is made, adjust the change points of the positive- and negative-phase waveforms to generate waveforms with secured dead-time as shown in [Table 21.21](#). The adjusted change point of the negative-phase waveform is automatically set in the GTCCRB register. An internal signal is used to judge the change point of the positive-phase waveform, thus the value of the GTCCRA register is not updated by the adjusted value.

In saw-wave one-shot pulse mode, if the order of the change point becomes inconsistent by adjustment of the waveform change point due to occurrence of dead time errors, or if the change point exceeds the count period even after the adjustment, the complementary relation between the positive- and negative-phases cannot be guaranteed.

Automatic setting for a dead time value to the GTCCRB register is performed at the next count clock after the register value for calculating the automatic setting value is updated. In triangle-wave mode, it also can be done at the next count clock from the current crest.

Table 21.21 Adjustment of the Waveform Change Point When a Dead-Time Error Occurs

Mode	Count Direction	Period	Condition for Dead Time Error	Change Point of the Positive-Phase Waveform after Adjustment	Change Point of the Negative-Phase Waveform after Adjustment
Sawtooth-wave one-shot pulse mode	Up-counting	First half	$GTCCRA - GTDVU < 0$	GTDVU	0
		Second half	$GTCCRA + GTDVU > GTPR$	$GTPR - GTDVU$	GTPR
	Down-counting	First half	$GTCCRA + GTDVU > GTPR$	$GTPR - GTDVU$	GTPR
		Second half	$GTCCRA - GTDVU < 0$	GTDVU	0
Triangle-wave PWM mode 1/2/3	Up-counting	(First half)	$GTCCRA - GTDVU \leq 0$	$GTDVU + 1$	1
	Down-counting	(Second half)	$GTCCRA - GTDVU < 0$	GTDVU	0

Figure 21.26 to Figure 21.29 show examples of automatic dead time setting function operation. Table 21.22 and Table 21.23 show the setting examples.

Figure 21.26 Example of automatic dead time setting function operation in saw-wave one-shot pulse mode, up-counting, and active-high

Figure 21.27 Example of automatic dead time setting function operation in saw-wave one-shot pulse mode, down-counting, and active-high

Figure 21.29 Example of automatic compare-match value setting function with dead time in triangle-wave PWM mode 2 or 3, and active-high

Table 21.22 Example setting for automatic dead time setting function in saw-wave one-shot pulse mode, and triangle-wave PWM mode 3 (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.26 and Figure 21.27, 001b (saw-wave one-shot pulse mode) is set. In Figure 21.29, 110b (triangle-wave PWM mode 3) is set.

Table 21.22 Example setting for automatic dead time setting function in saw-wave one-shot pulse mode, and triangle-wave PWM mode 3 (2 of 2)

No.	Step Name	Description
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.26 , 01b is set after 11b is set in the GTUDDTYC[1:0] bits (up count). In Figure 21.27 , 00b is set after 10b is set in the GTUDDTYC[1:0] bits (down count).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.26 , Figure 21.27 , and Figure 21.29 , GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.
7	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8	Set buffer value for compare match	Set the GTIOCnA pin transition immediately after the count start in the GTCCRC and GTCCRD registers.
9	Set forcible buffer transfer for compare match	Set the GTBER.CCRSWT bit to 1 to transfer buffer register data forcibly to the GTCCRA register.
10	Set buffer value for compare match	Set the GTIOCnA pin transition in 1 cycle after the current cycle in the GTCCRC and GTCCRD registers.
11	Set automatic dead time setting function	Set the GTDTCR.TDE bit to 1 to enable the automatic dead time setting function.
12	Set dead time value	Set the first half dead time value in GTDVU.
13	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
14	Set buffer value for each cycle	Set the GTIOCnA pin transition in 1 cycle after the current cycle in GTCCRC and GTCCRD.

Note: n: 0 to 5, 10 to 13
m: A, B

Table 21.23 Example setting for automatic dead time setting function in triangle-wave PWM mode 1 or 2 (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.28 , 100b (triangle-wave PWM mode 1) is set. In Figure 21.29 , 101b (triangle-wave PWM mode 2) is set.
2	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
3	Set cycle	Set the cycle in the GTPR register.
4	Set initial value for counter	Set the initial value in the GTCNT counter.
5	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.28 and Figure 21.29 , GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.
6	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
7	Set buffer operation for compare match	Set buffer operation with the CCRA[1:0] bits in the GTBER register.
8	Set compare match value	Set the GTIOCnA pin transition in the GTCCRA register.
9	Set buffer value for compare match	For buffer operation, set the GTIOCnA pin transition in 1 cycle after the current cycle (in triangle-wave PWM mode 1) or half cycle after the current cycle (in triangle-wave PWM mode 2) in the GTCCRC register. For double buffer operation, also set the GTIOCnA pin transition in 2 cycles after the current cycle (in triangle-wave PWM mode 1) or 1 cycle after the current cycle (in triangle-wave PWM mode 2) in the GTCCRD registers.
10	Set automatic dead time setting function	Set the GTDTCR.TDE bit to 1 to enable the automatic dead time setting function.
11	Set dead time value	Set the first half dead time value in GTDVU.
12	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

Table 21.23 Example setting for automatic dead time setting function in triangle-wave PWM mode 1 or 2 (2 of 2)

No.	Step Name	Description
13	Set buffer value for each cycle	When the compare match register is used for buffer operation, set the GTIOCnA pin transition in 1 cycle after the current cycle (in triangle-wave PWM mode 1) or half cycle after the current cycle (in triangle-wave PWM mode 2) in GTCCRC. When the compare match register is used for double-buffered operation, set the GTIOCnA pin changing point in two cycles after the current cycle (in triangle-wave PWM mode 1) or one cycle after the current cycle (in triangle-wave PWM mode 2) in GTCCRD.

Note: n: 0 to 5, 10 to 13
m: A, B

21.3.5 Count Direction Changing Function

The count direction of the GTCNT counter can be changed by modifying the UD bit in GTUDDTYC.

In saw-wave mode, if the UD bit in GTUDDTYC is modified during count operation, the count direction is changed at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.UD bit is modified while the count operation stops and the GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit modification is not reflected at the start of counting and the count direction is changed at an overflow or an underflow. If the UDF bit is set to 1 while the count operation stops, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

In triangle-wave mode, the count direction does not change even though the UD bit in GTUDDTYC is modified during the count operation. Similarly, even though the GTUDDTYC.UD bit is modified while the count operation stops and GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit value is not reflected to the count operation. If the GTUDDTYC.UDF bit is set to 1 while the count operation is stopped, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

If the count direction changes during a saw-wave count operation, the GTPR value after the start of up-counting is reflected in the count cycle during up-counting and the GTPR value after the start of down-counting is reflected in the count cycle during down-counting.

Figure 21.30 shows an example of count direction changing function operation.

Figure 21.30 Example of a count direction changing function operation during buffer operation

21.3.6 Function of Output Duty 0% and 100%

The output duty of the GTIOCnA pin and the GTIOCnB pin (n = 0 to 5, 10 to 13) are set to 0% or 100% by changing the GTUDDTYC.OADTY bit or GTUDDTYC.OBDTY bit.

In saw-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation is stopped and the GTUDDTYC.OADTYF bit or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an overflow or an underflow. If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation is stopped and the GTUDDTYC.OADTYF bit or the GTUDDTYC.OBDTYF bit is 1, the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit value at that time is reflected at the start of counting.

In triangle-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected an underflow.

If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation is stopped and the GTUDDTYC.OADTYF bit or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an underflow. If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation stops and the GTUDDTYC.OADTYF bit or the GTUDDTYC.OBDTYF bit is 1, the output duty modification is reflected at the start of counting.

In performing 0% or 100% duty operation, GPT internally continues to:

- Perform compare match operation
- Set compare match flag
- Output interrupt
- Perform buffer operation.

When the control is changed from 0% or 100% duty setting to compare match, the output value of GTIOCnA pin at cycle end is decided by GTIOR.GTIOA[3:2] and GTUDDTYC.OADTYR. The output value of GTIOCnB pin at cycle end is decided by GTIOR.GTIOB[3:2] and GTUDDTYC.OBDTYR.

When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 01b, the output pins output low at cycle end. When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 10b, the output pins output high at cycle end.

GTUDDTYC.OADTYR selects the value that is the object of output retained/toggled at cycle end, when GTIOR.GTIOm[3:2] are set to 00b (output retained at cycle end) or when GTIOR.GTIOm[3:2] are set to 11b (output toggled at cycle end). [Table 21.24](#) shows the values of GTIOCnA and GTIOCnB pin output at cycle end.

Table 21.24 Output values after releasing 0% or 100% duty setting (m = A, B)

GTIOR.GTIOm[3:2]	Compare match value at cycle end masked by 0% or 100% duty setting	GTUDDTYC.OmDTYR in duty 0% setting		GTUDDTYC.OmDTYR in duty 100% setting	
		0	1	0	1
00 (output retained at cycle end)	0	0	0	1	0
	1	0	1	1	1
01 (low output at cycle end)	—	0	0	0	0
10 (high output at cycle end)	—	1	1	1	1
11 (output toggled at cycle end)	0	1	1	0	1
	1	1	0	0	0

[Figure 21.31](#) shows an example of output duty 0% and 100% function.

Figure 21.31 Example of output duty 0% and 100% function

21.3.7 Hardware Count Start/Count Stop and Clear Operation

The GTCNT counter can be started, stopped, or cleared by the following hardware sources:

- External trigger input
- ELC event input
- GTIOCnA and GTIOCnB pin input (n = 0 to 5, 10 to 13).

21.3.7.1 Hardware Start Operation

The GTCNT counter can be started by selecting a hardware source using GTSSR.

Figure 21.32 shows an example of a count start operation by a hardware source. Table 21.25 shows the setting example.

Figure 21.32 Example of count start operation by a hardware source started at the input of the signal from the ELCA event

Table 21.25 Example setting for count start operation by a hardware source

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.32, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.32, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In Figure 21.32, 0x00000000 is set.
6	Set hardware count start	Select a hardware source for starting count operation in the GTSSR register. In Figure 21.32, GTSSR.SSELCA = 1
7	Set hardware source operation	Set operation of the hardware source selected by the GTSSR register and start counting. In Figure 21.32, the ELCA event input operation is set.

21.3.7.2 Hardware Stop Operation

The GTCNT counter can be stopped by selecting a hardware source using GTPSR.

Figure 21.33 shows an example of a count stop operation by a hardware source. Table 21.26 shows the setting example. In this example, the count operation stops at the ELCA event input and restarts at the ELCB event input.

Figure 21.33 Example of count stop operation by hardware source started by software, stopped at ELCA input, and restarted at ELCB input

Table 21.26 Example setting for count stop operation by a hardware source

No.	Step Name	Description
1	Set operating mode	Set the operating mode with GTCR.MD[2:0] bits. In Figure 21.33 , 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.33 , after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting).
3	Select count clock	Select the count clock with GTCR.TPCS[3:0].
4	Set cycle	Set the cycle in GTPR.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In Figure 21.33 , 0x00000000 is set.
6	Set hardware count start	Select a hardware source for starting count operation in GTSSR register, and wait for count start by the hardware source. In Figure 21.33 , GTSSR.SSELCB = 1.
7	Set hardware count stop	Select a hardware source for stopping count operation in GTPSR register and wait for count stop by the hardware source. In Figure 21.33 , GTPSR.PSELCA = 1.
8	Set hardware source operation	Set operation of the hardware source selected in GTSSR register or GTPSR register, and start or stop counting. In Figure 21.33 , ELCA input operation and ELCB input operation are set.

[Figure 21.34](#) shows an example of a count start/stop operation by a hardware source. [Table 21.27](#) shows the setting example. In this example, the counter operates during the high-level periods of the external trigger input GTETRGA.

Figure 21.34 Example of count start/stop operation by a hardware source started on the rising edge of GTETRGA pin input, and stopped on the falling edge of GTETRGA pin input

Table 21.27 Example setting for count start/stop operation by a hardware source

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.34, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.34, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In Figure 21.34, 0x00000000 is set.
6	Set hardware count start	Select a hardware source for starting count operation with the GTSSR register, and wait for count start by the hardware source. In Figure 21.34, GTSSR.SSGTRGAR = 1.
7	Set hardware count stop	Select a hardware source for stopping count operation with the GTPSR register, and wait for count stop by the hardware source. In Figure 21.34, GTPSR.PSGTRGAF = 1.
8	Set hardware source operation	Set operation of the hardware source selected in the GTSSR register or GTPSR register and start or stop counting. In Figure 21.34, the GTETRGA pin operation is set.

21.3.7.3 Hardware Clear Operation

The GTCNT counter can be cleared by selecting a hardware source using GTCSR. The GPTn_OVF/GPTn_UDF (n = 0 to 5, 10 to 13) interrupt (overflow/underflow interrupt) is not generated when the GTCNT counter is cleared by a hardware source or by software.

Figure 21.35 and Figure 21.36 show examples of the GTCNT counter clearing operation by a hardware source. Table 21.28 shows the setting example. In this example, the GTCNT counter starts at the ELCA input, and the counter stops and clears at the ELCB input.

Figure 21.35 Examples of count clearing operation by hardware source in saw wave up-counting, started at ELCA input, and stopped/cleared at ELCB input

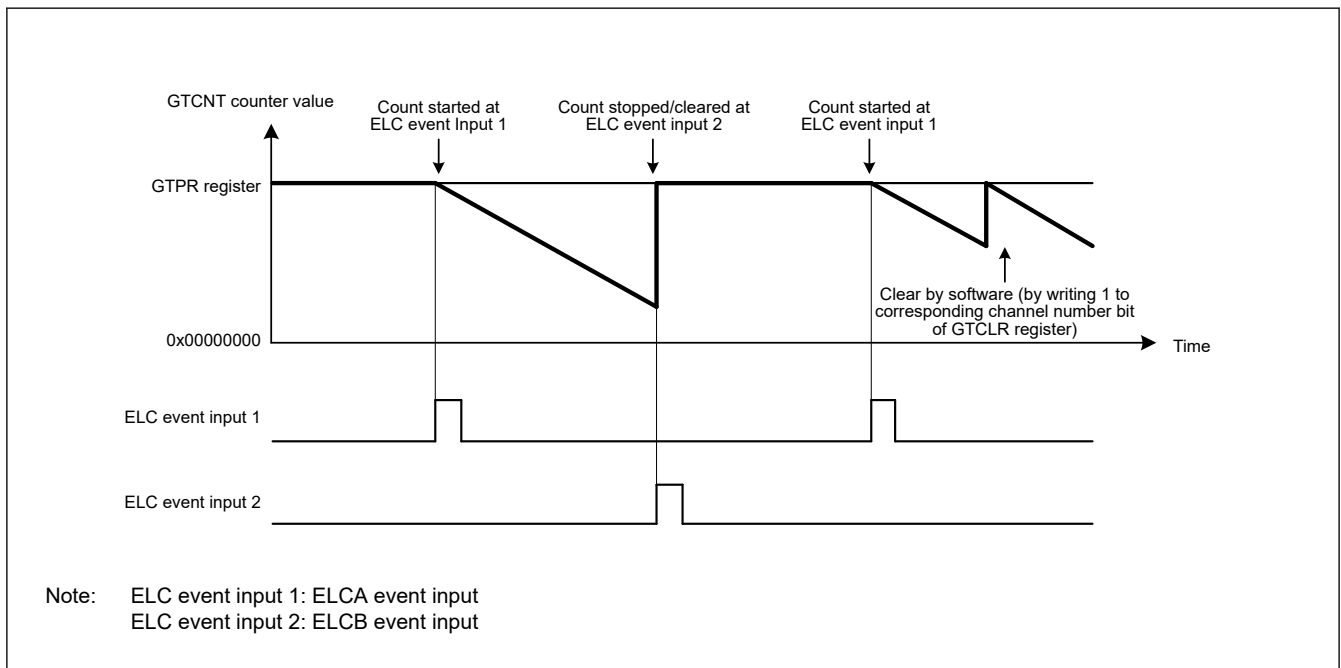

Figure 21.36 Examples of count clearing operation by hardware source in saw wave down-counting, started at ELCA input, and stopped/cleared at ELCB input

Table 21.28 Example setting for count clearing operation by a hardware source (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.35 and Figure 21.36 , 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.35 , after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). In Figure 21.36 , after 10b is set in the GTUDDTYC[1:0] bits, 00b is set in the GTUDDTYC[1:0] bits (down-counting).

Table 21.28 Example setting for count clearing operation by a hardware source (2 of 2)

No.	Step Name	Description
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In Figure 21.35, 0x00000000 is set. In Figure 21.36, the GTPR register value is set.
6	Set hardware count start	Select a hardware source for starting count operation in the GTSSR register, and wait for count start by the hardware source. In Figure 21.35 and Figure 21.36, GTSSR.SSELCA = 1.
7	Set hardware count stop	Select a hardware source for stopping count operation in the GTPSR register, and wait for count stop by the hardware source. In Figure 21.35 and Figure 21.36, GTPSR.PSELCB = 1.
8	Set hardware count clear	Select a hardware source for clearing count operation in the GTCSR register, and wait for count clear by the hardware source. In Figure 21.35 and Figure 21.36, GTCSR.CSELCB = 1.
9	Set hardware source operation	Set operation of the hardware source selected in the GTSSR register, GTPSR register or GTCSR register and start, stop or clear counting. In Figure 21.35 and Figure 21.36, the ELCA input and ELCB input are set.

The GPTn_OVF/GPTn_UDF (n = 0 to 5, 10 to 13) interrupt (overflow/underflow interrupt) is not generated when the counter is cleared by a hardware source or by software.

Figure 21.37 shows the relationship between the counter clearing by a hardware source and the GPTn_OVF (n = 0 to 5, 10 to 13) interrupt.

Figure 21.37 Relationship between counter clearing by hardware source and GPTn_OVF (n = 0 to 5, 10 to 13) interrupt

21.3.8 Synchronized Operation

Synchronized operation on channels such as a synchronized start, stop, and clear operation can be performed.

21.3.8.1 Synchronized Operation by Software

The GTCNT counters can be started, stopped, and cleared on multiple channels by setting the associated GTSTR, GTSTP, or GTCLR bits simultaneously to 1.

Count start with a phase difference is possible by setting the initial value in the GTCNT counter and setting the associated GTSTR bits simultaneously to 1.

Because the clock of count operation is selected by GTCR.TPCS[3:0] bits in respective channels, if the clock period of each channel that performs synchronous operation (count start/stop/clear) is different from others, the synchronous operation timings of every channels are not exact same.

Figure 21.38 shows an example of a simultaneous start, stop, and clear by software. Figure 21.39 shows an example of phase start operation by software. Figure 21.40, Figure 21.41, Figure 21.42 show an example of simultaneous start/stop/clearing with different count period.

Figure 21.38 Example of a simultaneous start, stop, and clear by software with the same count cycle (GTPR register value)

Figure 21.39 Example of software phase start with the same count cycle (GTPR register value)

Figure 21.40 Example of Simultaneous Start Operation by Software (with Different Count Period)

Figure 21.41 Example of Simultaneous Stop Operation by Software (with Different Count Period)

Figure 21.42 Example of Simultaneous Clearing Operation by Software (with Different Count Period)

21.3.8.2 Synchronized Operation by Hardware

The counters for multiple channels can be started, stopped, and cleared simultaneously by ELC event input.

Figure 21.43 shows an example of a simultaneous start, stop, and clear operation by a hardware source. Table 21.29 shows the setting example.

Figure 21.43 Example of a simultaneous start, stop, and clear by a hardware source with the same count cycle (GTPR register value)

Table 21.29 Example setting for simultaneous start by a hardware source (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.43 , 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.43 , after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In Figure 21.43 , 0x00000000 is set.
6	Set hardware count start	Select a hardware source for starting count operation with the GTSSR register, and wait for count start by the hardware source. In Figure 21.43 , GTSSR.SSELCA = 1.

Table 21.29 Example setting for simultaneous start by a hardware source (2 of 2)

No.	Step Name	Description
7	Set hardware count stop	Select a hardware source for stopping count operation with the GTPSR register, and wait for count stop by the hardware source. In Figure 21.43, GTPSR.PSELCB = 1.
8	Set hardware count clear	Select a hardware source for clearing count operation with the GTCSR register, and wait for count clear by the hardware source. In Figure 21.43, GTCSR.CSELCB = 1.
9	Set hardware source operation	Set operation of the hardware source selected in the GTSSR, GTPSR, or GTCSR registers, and start, stop, or clear counting. In Figure 21.43, ELCA input and ELCB input are set.

21.3.9 PWM Output Operation Examples

(1) Synchronized PWM output

The GPT outputs 10×2 phases of linked PWM waveforms for a maximum of $GPT \times 10$ channels.

Figure 21.44 shows an example in which four channels perform synchronized operation in saw-wave PWM mode and eight phases of PWM waveforms are output. The GTIOCnA is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCnB is set so that it outputs low as the initial value, high at a GTCCRB compare match, and low at the cycle end.

Figure 21.44 Example of synchronized PWM output

(2) 3-phase saw-wave complementary PWM output

Figure 21.45 shows an example in which three channels perform synchronized operation in saw-wave PWM mode and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, low at a GTCCRB compare match, and high at the cycle end.

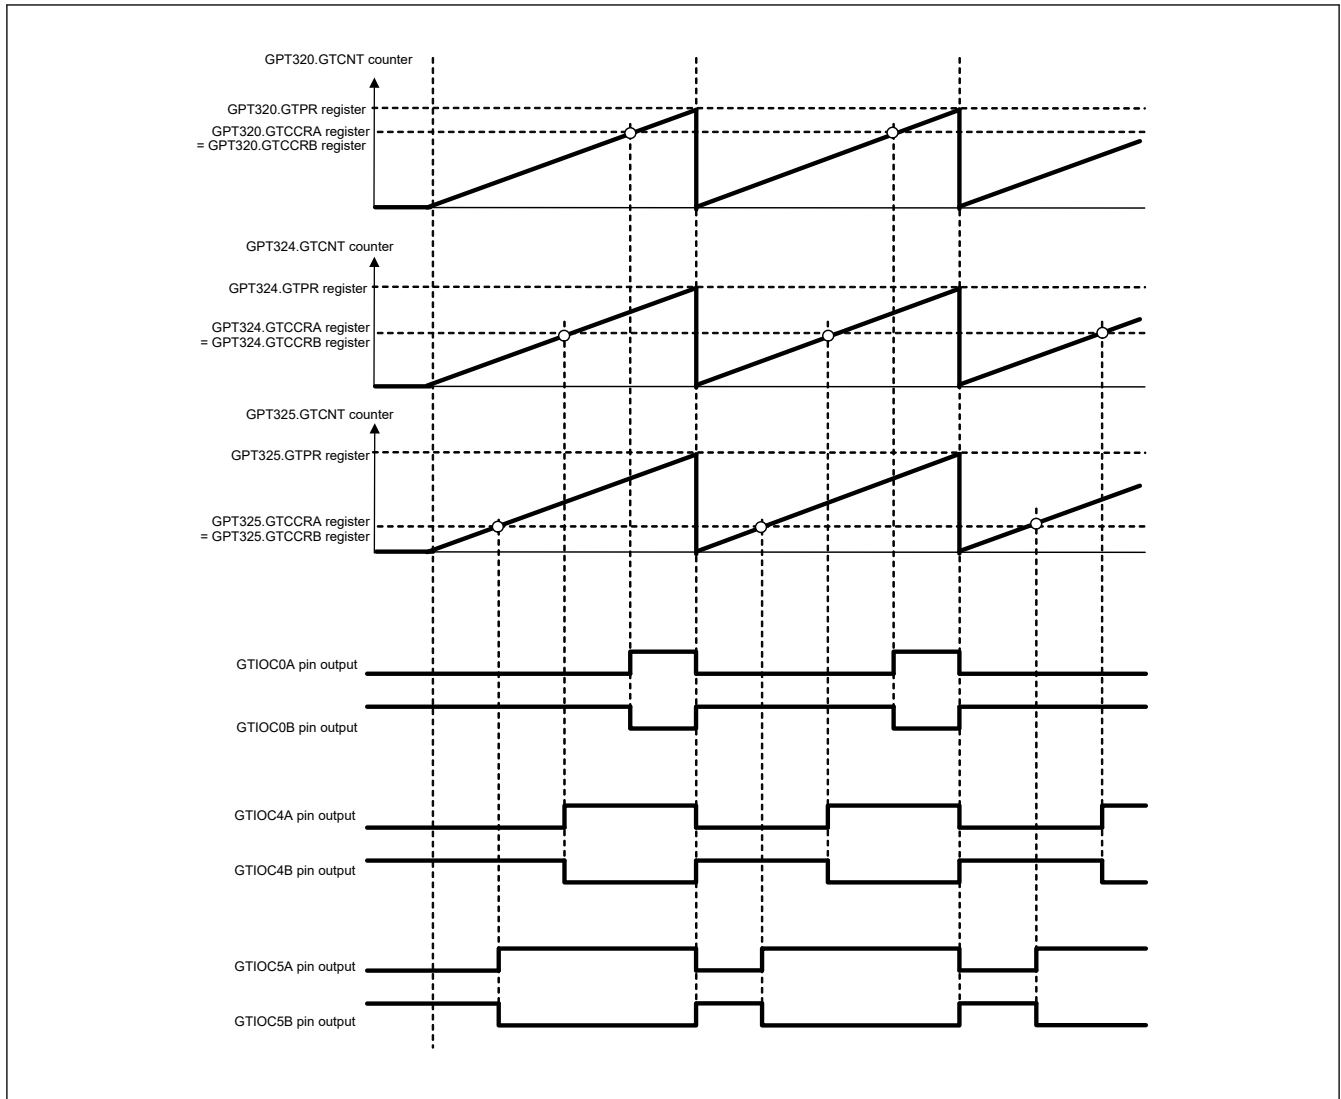

Figure 21.45 Example of 3-phase saw-wave complementary PWM output

(3) 3-phase saw-wave complementary PWM output with automatic dead time setting

Figure 21.46 shows an example in which three channels perform synchronized operation in saw-wave one-shot pulse mode with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, toggles the output at a GTIOCnB compare match, and retains the output at the cycle end.

Figure 21.46 Example of 3-phase saw-wave complementary PWM output with automatic dead time setting

(4) 3-phase triangle-wave complementary PWM output

Figure 21.47 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

Figure 21.47 Example of 3-phase triangle-wave complementary PWM output

(5) 3-phase triangle-wave complementary PWM output with automatic dead time setting

Figure 21.48 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

Figure 21.48 Example of 3-phase triangle-wave complementary PWM output with automatic dead time setting

(6) 3-phase asymmetric triangle-wave complementary PWM output with automatic dead time setting

Figure 21.49 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 3 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCnB is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

Figure 21.49 Example of 3-phase asymmetric triangle-wave complementary PWM output with automatic dead time setting

21.3.10 Period Count Function

By setting the GTPC register, the end of period can be counted.

The number of period to be counted should be set into the GTPC.PCNT counter when the GTPC.PCEN bit is 0. When the PCEN bit is 1, the PCNT counter can be read, but writing is disabled. When the PCEN bit is 1, down-counting is performed at the end of period. When the PCNT counter is 1 at the end of period, it becomes 0 and counting is stopped to finish the period count function. At that time, the GTST.PCF flag is set, and the period count function finish interrupt request GPTn_PC is generated. When the GTPC.ASTP bit is 1, the GTCNT counter is also stopped at the same time that the period count function is finished.

When the GTCNT counter is stopped while period count function is enabled, the PCNT counter keeps its value. When the GTCNT counter restarts counting and the PCEN bit is 1, the PCNT counter restarts down-counting from the hold value.

When the PCEN bit is changed from 0 to 1 while the PCNT counter is 0 and the ASTP bit is 1, the GTCNT counter is stopped at the count clock immediately after that.

When either GTSECR.SPCE bit or GTSECR.SPCD bit is set to 1, the PCEN bit in the channels set to 1 by the GTSECSR register is simultaneously set the value to enable or disable the period count function for multiple channels.

Figure 21.50 and Figure 21.51 show examples of PWM cycle count function.

Figure 21.50 Example of PWM cycle count function (saw-wave one-shot pulse mode)

Figure 21.51 Example of the timing of operations for PWM cycle count function (saw-wave one-shot pulse mode, up-counting)

21.3.11 Phase Counting Function

The phase difference between the GTIOcNA and GTIOcNB pin (n = 0 to 5, 10 to 13) inputs is detected and the associated GTCNT counts up or counts down. The detectable phase difference is available in any combination with the relationship between the edge and the level of GTIOcNA and GTIOcNB pin inputs being set in the GTUPSR and GTDNSR registers. For details on count operation, see [section 21.3.1.1. Counter operation](#).

[Figure 21.52](#) to [Figure 21.61](#) show an example of phase counting modes 1 to 5 operation when the GTIOcNA, GTIOcNB pins are used. [Table 21.30](#) to [Table 21.39](#) show conditions of up-counting or down-counting and list settings for the GTUPSR and GTDNSR registers which is corresponding to [Figure 21.52](#) to [Figure 21.61](#).

21.3.12 Inter Channel Logical Operation Function

The logical operation function between compare match outputs can be performed.

Figure 21.62 shows the block diagram of inter channel logical operation.

To prevent hazard to the GPT output, the signal after logical operation is latched with PCLKD. After latching, the output disable control is performed.

When the logical operation function which causes the delay of 1 PCLKD is selected, the output enable signal is also delayed with 1 PCLKD and input to the output disable control.

When the same signal ($C = A$ or $D = B$) to operate logical function AND, OR, EXOR and NOR is selected, C or D is treated as 1. In the case of GTIOCnA pin output, when A of same channel is selected for C, the result of AND is A, the result of OR is 1, the result of EXOR is NOT A, and the result of NOR is 0.

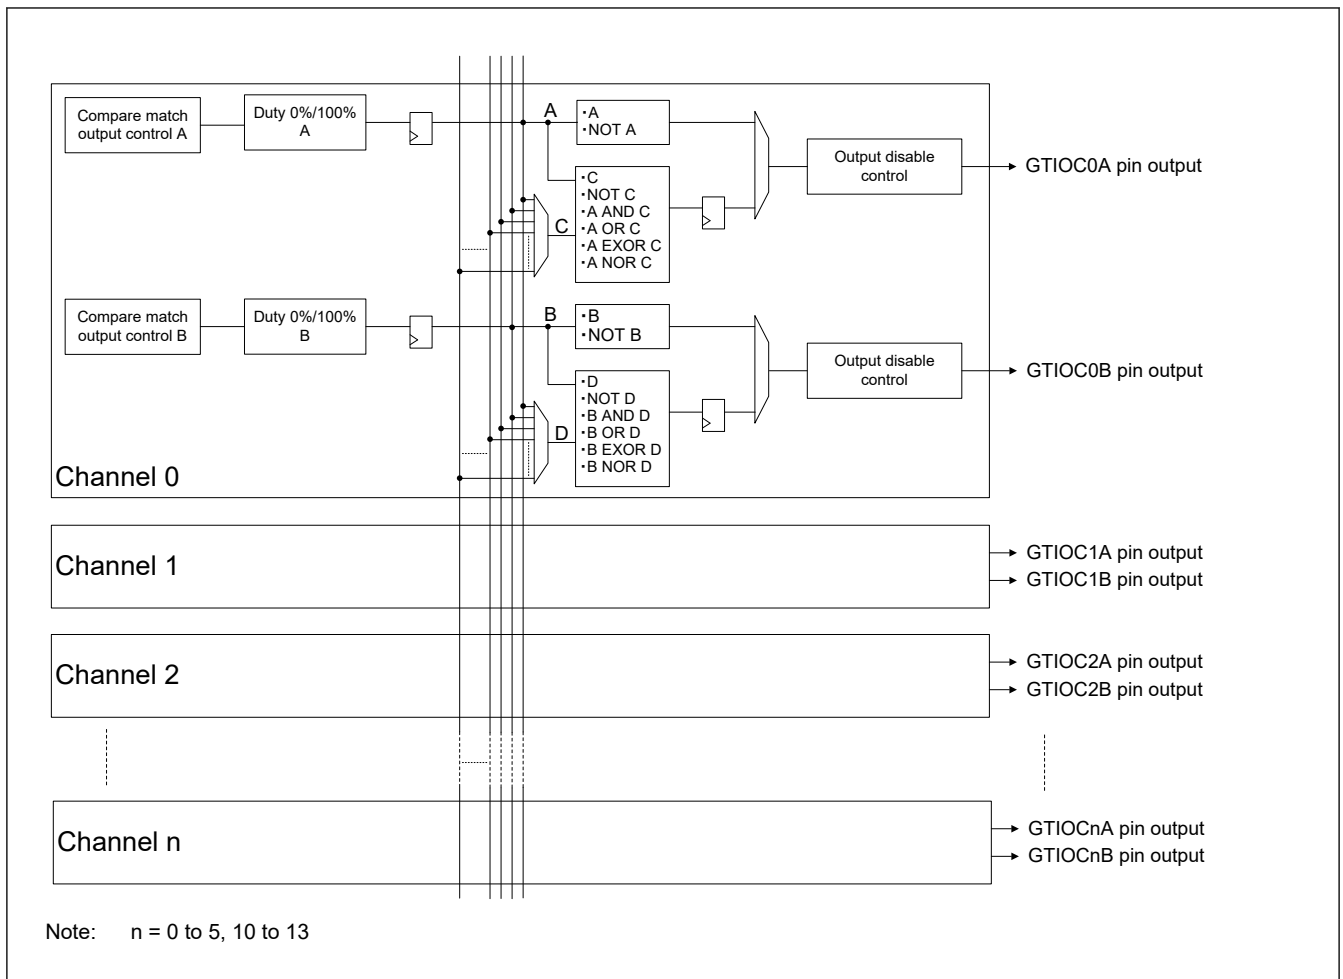

Figure 21.62 Block Diagram of Inter Channel Logical Operation

Figure 21.63 shows an example of inter channel logical operation.

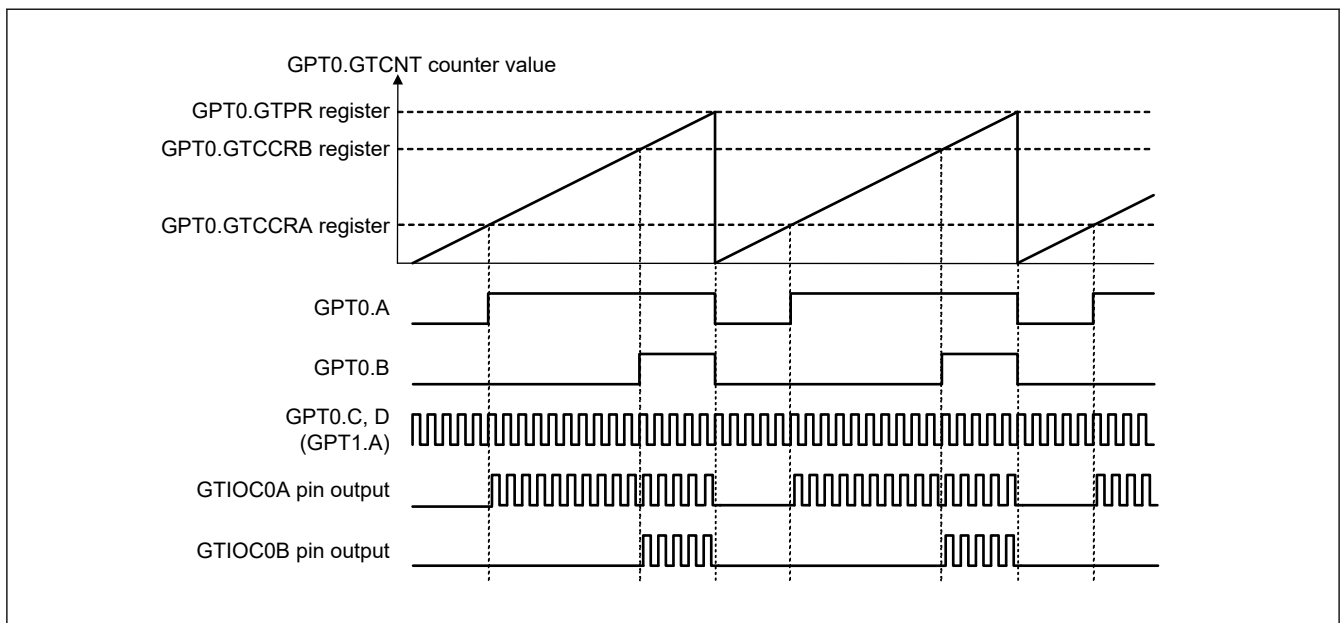

Figure 21.63 Example of Inter Channel Logical Operation

21.4 Interrupt Sources

21.4.1 Interrupt Sources

The GPT provides the following interrupt sources:

- GTCCR input capture/compare match
- GTCNT counter overflow (GTPR compare match)/underflow.
- Period count function finish

Each interrupt source has its own status flag. When an interrupt source signal is generated, the associated status flag in GTST is set to 1, and an interrupt request is generated. The associated status flag in GTST can be cleared by writing 0. If flag set and flag clear occur at the same time, flag clear takes priority over flag set. These flags are automatically updated by the internal state. The Interrupt Controller Unit can change the relative channel priorities. However, the priority within a channel is fixed. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

[Table 21.40](#) lists the GPT interrupt sources.

Table 21.40 Interrupt sources

Channel	Name	Interrupt source	Interrupt flag	DTC activation
n = 0 to 5	GPTn_CCMPA	GPT32n.GTCCRA input capture/compare match	GTST[0] (TCFA)	Possible
	GPTn_CCMPB	GPT32n.GTCCRB input capture/compare match	GTST[1] (TCFB)	Possible
	GPTn_CMPC	GPT32n.GTCCRC compare match	GTST[2] (TCFC)	Possible
	GPTn_CMPD	GPT32n.GTCCRD compare match	GTST[3] (TCFD)	Possible
	GPTn_CMPE	GPT32n.GTCCRE compare match	GTST[4] (TCFE)	Possible
	GPTn_CMPF	GPT32n.GTCCRF compare match	GTST[5] (TCFF)	Possible
	GPTn_OVF	GPT32n.GTCNT overflow (GPT32n.GTPR compare match)	GTST[6] (TCFPO)	Possible
	GPTn_UDF	GPT32n.GTCNT underflow	GTST[7] (TCFPU)	Possible
	GPTn_PC	Period count function finish (n = 0 to 3)	GTST[31] (PCF)	Possible
n = 10 to 13	GPTn_CCMPA	GPT16n.GTCCRA input capture/compare match	GTST[0] (TCFA)	Possible
	GPTn_CCMPB	GPT16n.GTCCRB input capture/compare match	GTST[1] (TCFB)	Possible
	GPTn_CMPC	GPT16n.GTCCRC compare match	GTST[2] (TCFC)	Possible
	GPTn_CMPD	GPT16n.GTCCRD compare match	GTST[3] (TCFD)	Possible
	GPTn_CMPE	GPT16n.GTCCRE compare match	GTST[4] (TCFE)	Possible
	GPTn_CMPF	GPT16n.GTCCRF compare match	GTST[5] (TCFF)	Possible
	GPTn_OVF	GPT16n.GTCNT overflow (GPT32n.GTPR compare match)	GTST[6] (TCFPO)	Possible
	GPTn_UDF	GPT16n.GTCNT underflow	GTST[7] (TCFPU)	Possible
	GPTn_PC	Period count function finish (n = 10)	GTST[31] (PCF)	Possible

(1) GPTn_CCMPA interrupt (n = 0 to 5, 10 to 13)

An interrupt request is generated under the following conditions:

- When the GTCCRA register functions as a compare match register, the GTCNT counter value matches with the GTCCRA register
- When the GTCCRA register functions as an input capture register, the input-capture signal causes transfer of the GTCNT counter value to the GTCCRA register.

(2) GPTn_CCMPB interrupt (n = 0 to 5, 10 to 13)

An interrupt request is generated under the following conditions:

- When the GTCCRB register functions as a compare match register, the GTCNT counter value matches with the GTCCRB register

- When the GTCCRB register functions as an input capture register, the input-capture signal causes transfer of the GTCNT counter value to the GTCCRB register.

(3) GPTn_CMPC interrupt (n = 0 to 5, 10 to 13)

An interrupt request is generated under the following condition:

- When the GTCCRC register functions as a compare match register, the GTCNT counter value matches with the GTCCRC register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRC register).

(4) GPTn_CMPD interrupt (n = 0 to 5, 10 to 13)

An interrupt request is generated under the following condition:

- When the GTCCRD register functions as a compare match register, the GTCNT counter value matches with the GTCCRD register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (buffer operation with the GTCCRD register).

(5) GPTn_CMPE interrupt (n = 0 to 5, 10 to 13)

An interrupt request is generated under the following condition:

- When the GTCCRE register functions as a compare match register, the GTCNT counter value matches with the GTCCRE register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRE register).

(6) GPTn_CMPF interrupt (n = 0 to 5, 10 to 13)

An interrupt request is generated under the following condition:

- When the GTCCRF register functions as a compare match register, the GTCNT counter value matches with the GTCCRF register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (buffer operation with the GTCCRF register).

(7) GPTn_OVF interrupt (n = 0 to 5, 10 to 13)

An interrupt request is generated in the following conditions:

- In saw-wave mode, interrupt requests are enabled at overflows (when the GTCNT counter value changes from GTPR to 0 during up-counting)
- In triangle-wave mode, interrupt requests are enabled at crests (the GTCNT changes from GTPR to GTPR-1)

- In counting by hardware sources, an overflow (GTCNT changes from GTPR to 0 in up count) has occurred.

(8) GPTn_UDF interrupt (n = 0 to 5, 10 to 13)

An interrupt request is generated in the following conditions.

- In saw-wave mode, interrupt requests are enabled at underflows (when the GTCNT counter value changes from 0 to GTPR during down-counting)
- In triangle-wave mode, interrupt requests are enabled at troughs (the GTCNT changes from 0 to 1)
- In counting by hardware sources, underflow (GTCNT changes from 0 to GTPR in down count) has occurred.

About Interrupt signals and interrupt status flags, see [section 21.2.16. GTST : General PWM Timer Status Register](#).

(9) GPTn_PC Interrupt (n = 0 to 3, 10)

When the GTCNT counter value matches with GTADTRA, an interrupt request is generated under the following condition.

- In Up-counting, the interrupt enable bit (ADTRAUEN) in GTINTAD is 1.
- In Down-counting, the interrupt enable bit (ADTRADEN) in GTINTAD is 1. In event count operation performing, this interrupt request isn't generated.

21.4.2 DMAC and DTC Activation

The DMAC and DTC can be activated by the interrupt in each channel. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#), [section 16, DMA Controller \(DMAC\)](#), and [section 17, Data Transfer Controller \(DTC\)](#).

21.5 A/D Conversion Start Request

The A/D conversion start request can be issued at a compare match between the GTCNT counter and the GTADTRA or GTADTRB register. Up-counting only, down-counting only, or both up-counting and down-counting can be specified by setting the GTINTAD register.

During event count operation, the A/D conversion start request can not be generated.

The A/D conversion start request is directly output to ADC12.

The GTADTRA and GTADTRB registers each has two buffer registers. Buffer operation with the GTADTRA register used together with the GTADTBRA and GTADTDBRA registers, and buffer operation with the GTADTRB register used together with the GTADTBRB and GTADTDBRB registers can be performed.

The timing of the generation of requests to start A/D conversion can be monitored by an external pin. When the A/D conversion start request signal to be monitored is selected in the GTADSMR.ADSMSk bit (k = 0, 1) and when the output is enabled in the ADSMENk bit, a signal is output synchronized with a cycle frame of the timer used to generate the A/D conversion start request signal, of which the output is driven high at the generation of the A/D conversion start request signal by the GTADSMk pin, or at the end of the cycle of which the output is driven low. When a signal to request the start of A/D conversion is generated at the end of the cycle, the generation of this signal has priority in terms of monitoring output and the output remains at the high level till the end of the next cycle. The registers (GTADTRA and GTADTRB) that are sources of generating the A/D conversion start request signals and their counting directions can be checked by the A/D conversion start request flags (ADTRAUF, ADTRADF, ADTRBUF, and ADTRBDF) in the GTST register. When the output of the same A/D conversion start request signal monitoring output is enabled for multiple channels, ORed signals will be output from the GPT32.

[Figure 21.64](#) shows an example of A/D conversion start request operation, [Table 21.41](#) shows example for setting A/D conversion start request operation.

Figure 21.64 Example of A/D Conversion Start Request Timing Operation (Triangle Waves, Double Buffer Operation, Buffer Transfer at Both Troughs and Crests, A/D Conversion Start Request by GTADTRA Register at Both Up-Counting and Down-Counting, A/D Conversion Start Request by GTADTRB Register at Down-Counting)

Table 21.41 Example for Setting A/D Conversion Start Request Timing Operation

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.64 , 100b, 101b, or 110b (triangle-wave PWM mode) is set.
2	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
3	Set cycle	Set the cycle in the GTPR register.
4	Set initial value for counter	Set the initial value in the GTCNT counter.
5	Set buffer operation	Set buffer operation with the ADTTA[1:0], ADTTB[1:0], ADTDA, and ADTDB bits in the GTER register. In Figure 21.64 , ADTTA[1:0] = 11b, ADTTB[1:0] = 11b, ADTDA = 1, and ADTDB = 1.
6	Set compare match value	Set the A/D conversion start request point in the GTADTRA and GTADTRB registers.
7	Set buffer value	For buffer operation, set the A/D conversion start request point in one cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTBRB registers. For double buffer operation, also set the A/D conversion start request point in two cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTDBRA and GTADTDBRB registers.
8	Enable A/D conversion start request	Set to enable A/D conversion start request with the ADTRAUEN, ADTRADEN, ADTRBUEN, and ADTRBDEN bits in the GTINTAD register. In Figure 21.64 , ADTRAUEN = 1, ADTRADEN = 1, ADTRBUEN = 0, and ADTRBDEN = 1.
9	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
10	Set buffer value for each cycle	For buffer operation, set the A/D conversion start request point in one cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTBRB registers. For double buffer operation, also set the A/D conversion start request point in two cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTDBRA and GTADTDBRB registers.

[Figure 21.65](#) shows an example for A/D conversion start request timing operation.

This shows an example of the output of A/D conversion start request A for the A/D converter. The A/D conversion start request A signal is output in response to a match in comparison with the GTADTRA register.

If GPT is operating with PCLKD and ADC is operating with PCLKA, A/D conversion start request A is passed to synchronizer on the next rising edge of PCLKA.

A/D conversion start request A is synchronized and passed to ADC.

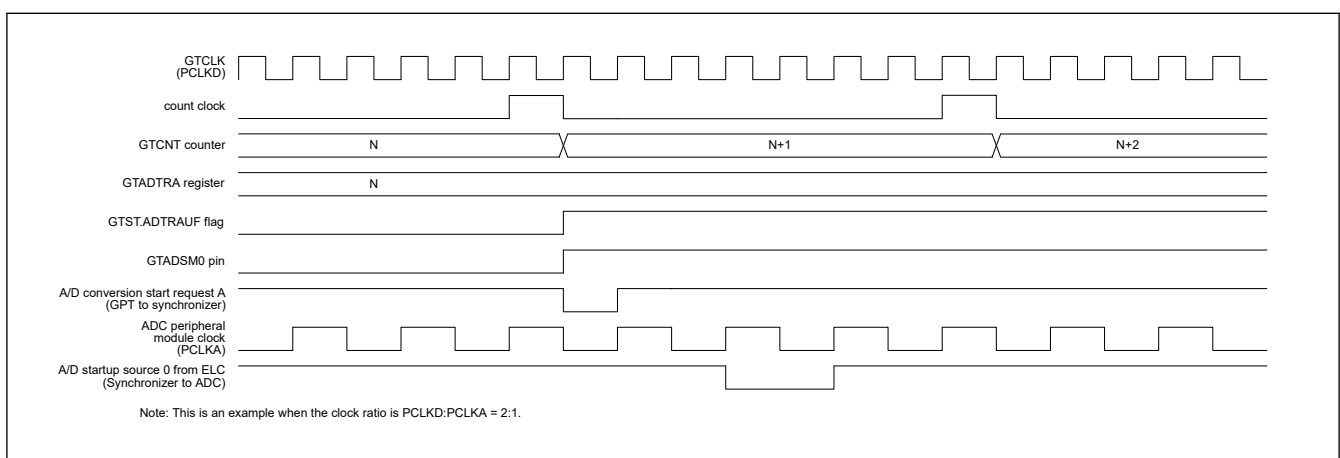

Figure 21.65 Example of A/D Conversion Start Request Timing Operation

21.6 Operations Linked by ELC

21.6.1 Event Signal Output to ELC

The GPT can perform operation linked with another module set in advance when its interrupt request signal is used as an event signal by the Event Link Controller (ELC).

The A/D conversion start request during up-counting/down-counting can be enabled/disabled individually with the A/D conversion start request enable bit to output events output to ELC.

The GPT has the following ELC event signals:

- Generation of compare match and input capture A interrupt (GPTn_CCMPA)
- Generation of compare match and input capture B interrupt (GPTn_CCMPB)
- Generation of compare match C interrupt (GPTn_CMPC)
- Generation of compare match D interrupt (GPTn_CMPD)
- Generation of compare match E interrupt (GPTn_CMPE)
- Generation of compare match F interrupt (GPTn_CMPF)
- Generation of overflow interrupt (GPTn_OVF)
- Generation of underflow interrupt (GPTn_UDF)
- Finish of period count function (GPTm_PC)

Note: n = 0 to 5, 10 to 13
m = 0 to 3, 10

21.6.2 Event Signal Inputs from ELC

The GPT can perform the following operations in response to a maximum of 8 events from the ELC:

- Start counting, stop counting, clear counting
- Up-counting, down-counting
- Input capture.

See [section 18, Event Link Controller \(ELC\)](#) for the connection between the ELC and the event signal input.

21.7 Noise Filter Function

Each pin for use in input capture and Hall sensor input to the GPT is equipped with a noise filter. The noise filter samples input signals at the sampling clock and removes the pulses whose length is less than 3 sampling cycles.

The noise filter functionality includes enabling and disabling the noise filter for each pin and setting of the sampling clock for each channel.

[Figure 21.66](#) shows the timing of noise filtering.

Figure 21.66 Timing of noise filtering

If noise filtering is enabled, the input capture operation or hall sensor input operation is performed on the edges of the noise filtered signal after a delay of $(\text{sampling interval} \times 2 + \text{PCLKD})$ at the shortest. This is due to the noise filtering for the input capture input or hall sensor input.

21.8 Protection Function

21.8.1 Write-Protection for Registers

To prevent registers from being accidentally modified, registers can be write-protected in channel units by setting GTWP.WP. Write-protection can be set for the following registers:

GTSSR, GTPSR, GTCSSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTCNT, GTCORA, GTCORB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTADTRA, GTADTBRA, GTADTBRA, GTADTRB, GTADTRBR, GTADTDBRB, GTDTCR, GTDVU, GTADSMR, GTICLF, GTPC.

Every bit in registers GTSTR, GTSTP and GTCLR which can update the corresponding registers in other channels and can be updated by any of the corresponding registers in other channels conversely, can be protected by setting the GTWP.STRWP, STPWP, and CLRWP bits, respectively, per channel.

Likewise, writing to the GTSECSR and GTSECR registers, which can control all channels by writing to the GTSECSR and GTSECR registers of a given channel, can be enabled or disabled by the setting of the GTWP.CMNWP bit.

Protection using the GTWP register is only for write operations by the CPU. This protection does not cover updates to registers that occur in association with CPU writes.

21.8.2 Disabling of Buffer Operation

If the timing of the buffer register write is delayed relative to the timing for the buffer transfer, buffer operation can be suspended with the GTBER.BD[2], BD[1] and BD[0] bits settings. Specifically, buffer transfer can be temporarily disabled even though a buffer transfer condition is generated during buffer register write, by setting the BD[2], BD[1] and BD[0] bits to 1 (buffer operation disabled) before buffer register write, and setting the bits to 0 (buffer operation enabled) after completion of writing to all the buffer registers.

The BD[2], BD[1] and BD[0] bits can be set on channel basis by writing directly to the GTBER register or it can be set to 0 simultaneously by setting the GTSECR register for multiple channels which were set by the GTSECSR register.

Figure 21.67 shows an example of operation for disabling buffer operation by writing to the GTBER register.

Figure 21.67 Example of operation for disabling buffer operation with triangle waves, double buffer operation, and buffer transfer at both troughs and crests

21.8.2.1 Simultaneous Control of Buffer Operations of Multiple Channels

The GTBER.BD bit can be set by writing directly to the GTBER register per channel or by making settings in the GTSECR register for multiple channels that have already set in the GTSECSR register.

Follow the procedure below to simultaneously set the GTBER.BD bits of multiple channels.

1. Select the channels for simultaneously setting by the GTSECSR register
Set the GTSECSR register so that the values at the bit positions for the corresponding channels for simultaneously setting of the GTBER.BD bits become 1. All GTSECSR registers can be updated by writing to the GTSECSR register of any channel.
2. Simultaneously set the GTBER.BD bits by updating the GTSECR register
In the GTSECR register, set the operation of the GTBER.BD bits (enabling or disabling of buffer operation) which are to be simultaneously set. Writing to a GTSECR register from any channel updates the GTBER.BD bits in all channels corresponding to the bits set as 1 in the GTSECSR register, in accordance with the value of the GTSECR register.

Figure 21.68 show examples of simultaneously controlling the enabling or disabling of buffer operation for multiple channels.

Figure 21.68 Example of Multiple Channel Operation for Disabling Buffer Operation (Saw Waves, Single Buffer Operation)

21.8.3 GTIOCnm Pin Output Negate Control (n = 0 to 5, 10 to 13, m = A, B)

For protection from system failure, the output disable control that changes the GTIOCnm pin output value forcibly is provided for GTIOCnm pin output by the request of output disable from POEG. Output protection is required when the same output level being on the GTIOCnA and GTIOCnB pins is detected. GPT detects this condition and generates output disable requests to POEG according to the setting of the output disable request permission bits, such as GTINTAD.GRPABH, GTINTAD.GRPABL. After the POEG performs the logical OR of the output disable request from each channel and the output disable request from the external input, the POEG generates output disable requests to GPT.

One output disable signal (representing the shared output disable request signal of the GTIOCnA pin and the GTIOCnB pin) out of 4 output disable requests generated by the POEG is selected by setting GTINTAD.GRP[1:0]. The status of the selected disable output request is monitored by reading the GTST.ODF bit. The output level during output disable is set based on the GTIOR.OADF[1:0] bits for the GTIOCnA pin and the GTIOR.OBDF[1:0] setting for the GTIOCnB pin.

The change to the output disable state is performed asynchronously by generating the output disable request from the POEG. The release of the output disable state is performed at end of cycle by terminating the output disable request. It is after 3 PCLKD at shortest when the output disable condition is released after the output disable request becomes no longer satisfied. To reliably control output disabling, clear the flag of POEG for which the condition for the request to disable the output is no longer satisfied after 4 cycles of PCLKD.

When event count is performed or when the output disable state should be released immediately without waiting for end of cycle, GTIOR.OADF[1:0] should be set to 00b (for GTIOCnA pin) or GTIOR.OBDF[1:0] should be set to 00b (for the GTIOCnB pin).

Figure 21.69 shows an example of the GTIOCnm pin output disable control operation. (n = 0 to 5, 10 to 13, m = A, B)

Figure 21.69 Example of GTIOcNm pin output disable control operation in saw-wave up-counting, buffer operation, active level 1, high output at GTCCRA compare match, low output at cycle end, and low output at output disable (n = 0 to 5, 10 to 13, m = A, B)

21.9 Initialization Method of Output Pins

21.9.1 Pin Settings after Reset

The GPT registers are initialized at a reset. Start counting after selecting the port pin function with the PmnPFS register, setting GTIOR.OAE and GTIOR.OBE bits, and outputting the GPT function to external pins.

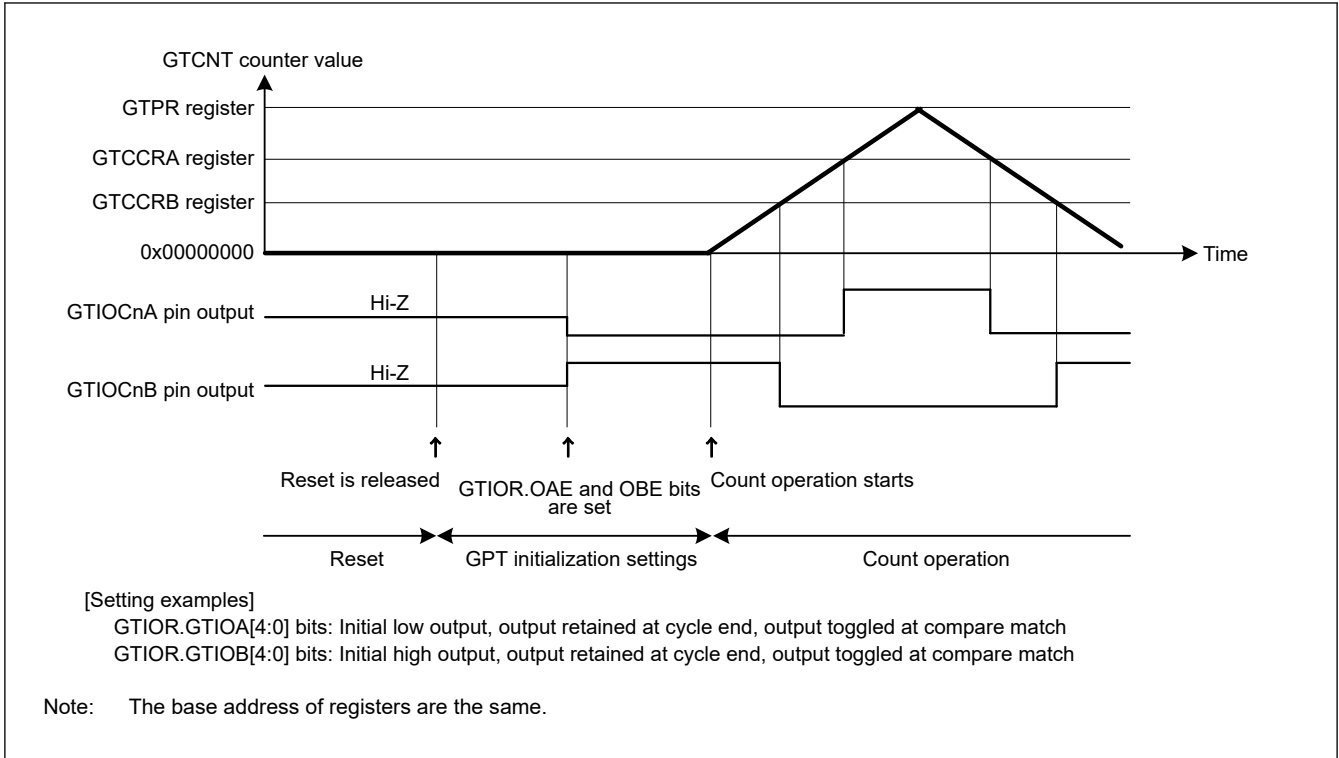

Figure 21.70 Example of pin settings after reset

21.9.2 Pin Initialization Due to Error during Operation

If an error occurs during GPT operation, the following four types of pin control can be performed before pin initialization:

- Set the OAHLD and OBHLD bits in GTIOR to 1 and retain the outputs at count stop
- Set the OAHLD and OBHLD bits in GTIOR to 0, specify arbitrary output values at OADFLT and OBDFLT in GTIOR, and output the arbitrary values at count stop
- Set the pin to output an arbitrary value as a general output port by setting the PDR, PODR registers and PmnPFS.PMR bit of the I/O port in advance. Set the OAE and OBE bits in GTIOR to 0, and the control bit associated with the pin in the PMR to 0 to allow arbitrary values to be output from the pin set as a general output port when an error occurs.
- Drive the output to a high impedance state using the POEG function.

If the automatic dead time setting is made, clear the GTDTCR.TDE bit to 0 after counting stops. When counting stops, only the values of registers that are changed by a GPT external source change. If counting is resumed, operation continues from where it stopped. If counting is stopped, the registers must be initialized before counting starts.

21.10 Usage Notes

21.10.1 Module-Stop Function Setting

The Module Stop Control Register can enable or disable GPT operation. The GPT is initially stopped after a reset. Releasing the module-stop state enables access to the registers. For details, see [section 10, Low Power Modes](#).

21.10.2 GTCCRn Settings during Compare Match Operation (n = A to F)

(1) When automatic dead time setting is made in triangle-wave PWM mode

The GTCCRn register must satisfy all of the following conditions:

- $GTDVU < GTCCRA$
- $0 < GTCCRA < GTPR$

(2) When automatic dead time setting is not made in triangle-wave PWM mode

The GTCCRA register must be set within the range of $0 < GTCCRA < GTPR$. If $GTCCRA = 0$ or $GTCCRA = GTPR$ is set, a compare match occurs within the cycle only when $GTCCRA = 0$ or $GTCCRA = GTPR$ is satisfied. When $GTCCRA > GTPR$, no compare match occurs.

Similarly, GTCCRB must be set within the range of $0 < GTCCRB < GTPR$. If $GTCCRB = 0$ or $GTCCRB = GTPR$ is set, a compare match occurs within the cycle only when $GTCCRB = 0$ or $GTCCRB = GTPR$ is satisfied. When $GTCCRB > GTPR$, no compare match occurs.

(3) When automatic dead time setting is made in saw-wave one-shot pulse mode

The GTCCRC and GTCCRD registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, the correct output waveforms with secured dead time may not be obtained.

- In up-counting: $GTCCRC < GTCCRD$, $GTCCRC > GTDVU$, $GTCCRD < GTPR - GTDVU$
- In down-counting: $GTCCRC > GTCCRD$, $GTCCRC < GTPR - GTDVU$, $GTCCRD > GTDVU$

(4) When automatic dead time setting is not made in saw-wave one-shot pulse mode

The GTCCRC and GTCCRD registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: $0 < GTCCRC < GTCCRD < GTPR$
- In down-counting: $GTPR > GTCCRC > GTCCRD > 0$

Similarly, GTCCRE and GTCCRF must be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: $0 < GTCCRE < GTCCRF < GTPR$
- In down-counting: $GTPR > GTCCRE > GTCCRF > 0$.

(5) In saw-wave PWM mode

The GTCCRA register must be set with the range of $0 < GTCCRA < GTPR$. If $GTCCRA = 0$ or $GTCCRA = GTPR$ is set, a compare match occurs within the cycle only when $GTCCRA = 0$ or $GTCCRA = GTPR$ is satisfied. If $GTCCRA > GTPR$ is set, no compare match occurs.

Similarly, GTCCRB must be set with the range of $0 < GTCCRB < GTPR$. If $GTCCRB = 0$ or $GTCCRB = GTPR$ is set, a compare match occurs within the cycle only when $GTCCRB = 0$ or $GTCCRB = GTPR$ is satisfied. If $GTCCRB > GTPR$ is set, no compare match occurs.

21.10.3 Setting Range for GTCNT Counter

The GTCNT counter register must be set with the range of $0 \leq GTCNT \leq GTPR$.

21.10.4 Starting and Stopping the GTCNT Counter

The control timing of starting and stopping the GTCNT counter by the GTCR.CST bit synchronizes the count clock that is selected in GTCR.TPCS[3:0]. When GTCR.CST is updated, the GTCNT counter starts/stops after a count clock that is selected in GTCR.TPCS[3:0]. Therefore, an event generated before the GTCNT counter actually starts is ignored, resulting in situations in which an event is accepted or an interrupt occurs after GTCR.CST is set to 0.

21.10.5 Priority Order of Each Event**(1) GTCNT register**

Table 21.42 shows a priority order of events updating the GTCNT register.

Table 21.42 Priority order of sources updating GTCNT

Source updating GTCNT	Priority order
Writing by CPU (writing to GTCNT/GTCLR)	High
Clear by hardware sources set in GTCR	↑
Count up or down by hardware sources set in GTUPSR/GTDNSR	↑
Count operation	Low

If up-counting and down-counting by hardware sources occur at the same time, the GTCNT counter value does not change. When there is a conflict between updating the GTCNT register and reading by the CPU, pre-update data is read.

(2) GTCR.CST bit

When there is a conflict between starting/stopping by hardware sources set in the GTSSR/GTPSR registers and writing by the CPU (writing to GTCR/GTSTR/GTSTP registers), the writing by CPU has priority over the starting/stopping by hardware sources.

In case that stop by the period count function conflicts with start by the CPU writing (GTCR register writing/GTSTR register writing), the period count function is finished with setting the GTST.PCF flag. The CST bit is not changed and the GTCNT continues to count.

When there is a conflict between starting by hardware sources set in the GTSSR register and stopping by hardware sources set in GTPSR register, the GTCR.CST bit value does not change. When there is a conflict between updating the GTCR.CST bit and reading by the CPU (reading from GTCR/GTSTR/GTSTP registers), pre-update data is read.

(3) GTCCRm registers (m = A to F)

When there is a conflict between input capture/buffer transfer operation and writing to the GTCCRm registers, the writing to GTCCRm registers has priority over input capture/buffer transfer operation. When there is a conflict between input capture and writing to the counter register by the CPU or updating the counter register by hardware sources, the pre-update counter value is captured. When there is a conflict between updating the GTCCRm registers and reading by the CPU, pre-update data is read.

(4) GTPR register

When there is a conflict between buffer transfer operation and writing to the GTPR register, writing to GTPR register has priority over buffer transfer operation. When there is a conflict between updating GTPR register and reading by the CPU, pre-update data is read.

(5) GTADTRm registers (m = A, B)

When there is a conflict between buffer transfer operation and writing to GTADTRm register, writing to GTADTRm register has priority over buffer transfer operation.

When there is a conflict between updating the GTADTRm register and reading by the CPU, pre-update data is read.

(6) GTDVU registers

When there is a conflict between buffer transfer operation and writing to GTDVU register, writing to GTDVU register has priority over buffer transfer operation.

When there is a conflict between updating the GTDVU register and reading by the CPU, pre-update data is read.

(7) GTIOR.GTIOm registers (m = A, B)

When there is a conflict between buffer transfer operation and writing to GTIOR.GTIOm register, writing to GTIOR.GTIOm register has priority over buffer transfer operation.

When there is a conflict between updating the GTIOR.GTIOm and reading by the CPU, pre-update data is read.

21.10.6 Prohibit Invalid Register Setting

The register settings that are instructed to be invalid, such as "The setting is invalid during event counting operation", are not guaranteed. These setting is prohibited.

22. Low Power Asynchronous General Purpose Timer (AGT)

22.1 Overview

The Low Power Asynchronous General Purpose Timer (AGT) is a 16-bit timer that can be used for pulse output, external pulse width or period measurement, and counting external events. This timer consists of a reload register and a down counter. The reload register and the down counter are allocated to the same address, and can be accessed with the AGT register.

Table 22.1 lists the AGT specifications, Figure 22.1 shows a block diagram, and Table 22.2 lists the I/O pins.

Table 22.1 AGT specifications

Parameter		Description
Operating modes	Timer mode	The count source is counted
	Pulse output mode	The count source is counted and the output is inverted at each timer underflow
	Event counter mode	An external event is counted
	Pulse width measurement mode	An external pulse width is measured
	Pulse period measurement mode	An external pulse period is measured
Number of Channels		16 bits × 2 channels (AGTn (n = 0, 1))
Count source (operating clock) ²	Timer mode	PCLKB, PCLKB/2, PCLKB/8, AGTLCLK/d, AGTSCLK/d (d = 1, 2, 4, 8, 16, 32, 64, or 128), or underflow signal of AGT0 selectable.* ¹
	Pulse output mode	
	Pulse width measurement mode	
	Pulse period measurement mode	
	Event counting mode	External event input
Interrupt and Event Link function		<ul style="list-style-type: none"> • Underflow event signal or measurement complete event signal <ul style="list-style-type: none"> – When the counter underflows – When the measurement of the active width of the external input pin (AGTIOn) completes in pulse width measurement mode – When the set edge of the external input pin (AGTIOn) is input in pulse period measurement mode. • Compare match A event signal <ul style="list-style-type: none"> – When the values of AGT register and AGTCMA register matched (compare match A function enabled). • Compare match B event signal <ul style="list-style-type: none"> – When the values of AGT and AGTCMB registers matched (compare match B function enabled). • Return from Software Standby mode can be performed with AGT1_AGTI, AGT1_AGTCMAI, or AGT1_AGTCMBI*³
Selectable functions		<ul style="list-style-type: none"> • Compare match function One or two of the AGT Compare Match A register and AGT Compare Match B register is selectable.
Module-stop function		Module-stop state can be set for each channel to reduce power consumption.
TrustZone Filter		Security and Privilege attribution can be set for each channels.

Note 1. AGT0 cannot use underflow signal. AGT1 connects directly with the underflow event signal from the AGT0 timer.

Note 2. Satisfy the frequency of the peripheral module clock (PCLKB) ≥ the frequency of the count source clock.

Note 3. For details, see section 10, Low Power Modes.

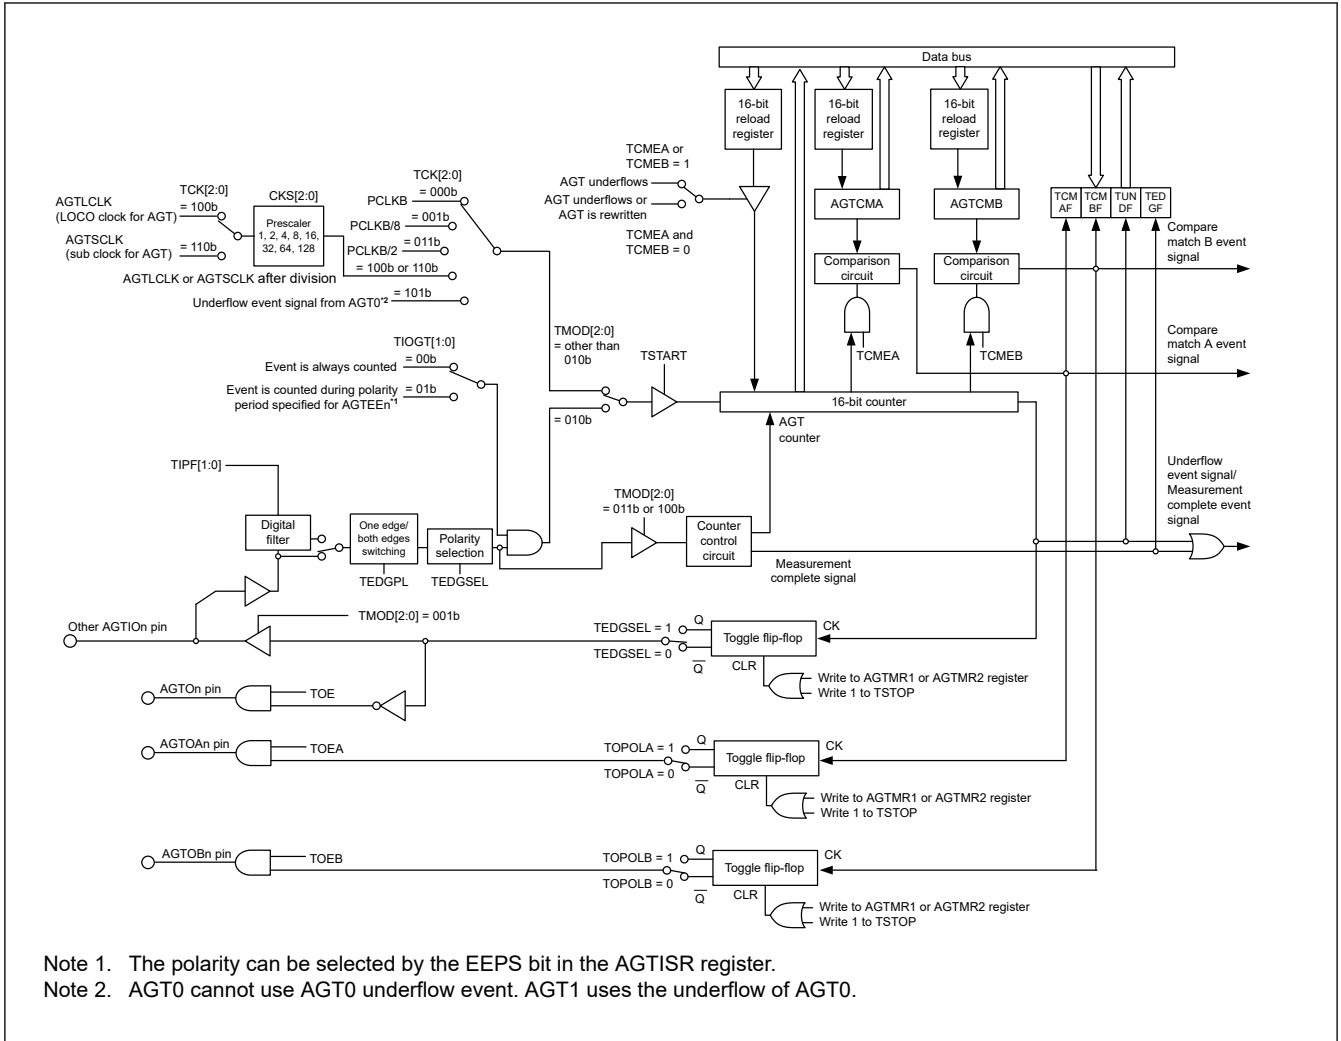

Figure 22.1 AGT block diagram

Table 22.2 AGT I/O pins

Pin name	I/O	Function
AGTEEn	Input	External event input enable for AGT
AGTIOn	Input/output	External event input and pulse output for AGT
AGTOn	Output	Pulse output for AGT
AGTOAn	Output	Compare match A output for AGT
AGTOBn	Output	Compare match B output for AGT

Note: Channel number: n = 0, 1

22.2 Register Descriptions

22.2.1 AGT : AGT Counter Register

Base address: $AGTn = 0x4022_1000 + 0x0100 \times n$ ($n = 0, 1$)
 $AGTn_NS = 0x5022_1000 + 0x0100 \times n$ ($n = 0, 1$)

Offset address: 0x00

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	[16-bit counter and reload register]															
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	n/a	16-bit counter and reload register Setting range : 0x0000 to 0xFFFF	R/W

Note: S-TYPE-3, P-TYPE-3

AGTn.AGT is a 16-bit register. The write value is written to the reload register and the read value is read from the counter.

The states of the reload register and the counter change according to the TSTART bit in the AGTCR register and TCMEA/TCMEB bit in the AGTCMSR register. For details, see [section 22.3.1. Reload Register and Counter Rewrite Operation](#).

When 1 is written to the TSTOP bit in the AGTCR register, AGT counter is forcibly stopped and set to 0xFFFF.

When the TCK[2:0] bits setting in the AGTMR1 register are a value other than 001b (PCLKB/8) or 011b (PCLKB/2), if the AGT register is set to 0x0000, a request signal to the ICU, the DTC, the DMAC, and the ELC is generated once immediately after the count starts. The AGTOn, AGTIO pin output are toggled.

When the AGT register is set to 0x0000 in event counter mode, regardless of the value of TCK[2:0] bits, a request signal to the ICU, the DTC, the DMAC, and the ELC is generated once immediately after the count starts.

In addition, the AGTOn pin output is toggled even during a period other than the specified count period. When the AGT register is set to 0x0001 or more, a request signal is generated each time AGT underflows.

22.2.2 AGTCMA : AGT Compare Match A Register

Base address: $AGTn = 0x4022_1000 + 0x0100 \times n$ ($n = 0, 1$)
 $AGTn_NS = 0x5022_1000 + 0x0100 \times n$ ($n = 0, 1$)

Offset address: 0x02

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	[16-bit compare match A data]															
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	n/a	16-bit compare match A data is stored.*1 Setting range : 0x0000 to 0xFFFF	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. Set the AGTCMA register to 0xFFFF when compare match A is not used.

The AGTCMA register is a read/write register to set a value for compare match with the AGT counter. The states of the reload register and compare register A change according to the TSTART bit in the AGTCR register. For details, see [section 22.3.2. Reload Register and AGT Compare Match A/B Register Rewrite Operation](#).

22.2.3 AGTCMB : AGT Compare Match B Register

Base address: $AGT_n = 0x4022_1000 + 0x0100 \times n$ ($n = 0, 1$)
 $AGT_n_NS = 0x5022_1000 + 0x0100 \times n$ ($n = 0, 1$)

Offset address: 0x04

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:

--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

Value after reset: 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

Bit	Symbol	Function	R/W
15:0	n/a	16-bit compare match B data is stored.*1 Setting range : 0x0000 to 0xFFFF	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. Set the AGTCMB register to 0xFFFF when compare match B is not used.

The AGTCMB register is a read/write register to set a value for compare match with the AGT counter. The states of the reload register and compare register B change according to the TSTART bit in the AGTCR register. For details, see [section 22.3.2. Reload Register and AGT Compare Match A/B Register Rewrite Operation](#).

22.2.4 AGTCR : AGT Control Register

Base address: $AGT_n = 0x4022_1000 + 0x0100 \times n$ ($n = 0, 1$)
 $AGT_n_NS = 0x5022_1000 + 0x0100 \times n$ ($n = 0, 1$)

Offset address: 0x08

Bit position: 7 6 5 4 3 2 1 0

TCMB	TCMA	TUNDF	TEDGF	—	TSTO	TCST	TSTART
F	F	F	F		P	F	RT

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	TSTART	AGT Count Start*2 0: Count stops 1: Count starts	R/W
1	TCSTF	AGT Count Status Flag*2 0: Count stopped 1: Count in progress	R
2	TSTOP	AGT Count Forced Stop*1 0: Writing is invalid 1: The count is forcibly stopped	W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	TEDGF	Active Edge Judgment Flag 0: No active edge received 1: Active edge received	R/(W)*3
5	TUNDF	Underflow Flag 0: No underflow 1: Underflow	R/(W)*3
6	TCMAF	Compare Match A Flag 0: No match 1: Match	R/(W)*3
7	TCMBF	Compare Match B Flag 0: No match 1: Match	R/(W)*3

Note: S-TYPE-3, P-TYPE-3

Note 1. When 1 (count is forcibly stopped) is written to the TSTOP bit, the TSTART bit and TCSTF flag are initialized at the same time. The pulse output level is also initialized. The read value is 0.

Note 2. For information on using the TSTART bit and TCSTF flag, see [section 22.4.1. Count Operation Start and Stop Control](#).

Note 3. Only 0 can be written to clear the flag.

TSTART bit (AGT Count Start)

The count operation is started by writing 1 to the TSTART bit and stopped by writing 0. When the TSTART bit is set to 1 (count starts), the TCSTF flag is set to 1 (count in progress) in synchronization with the count source. Also, after 0 is written to the TSTART bit, the TCSTF flag is set to 0 (count stops) in synchronization with the count source. For details, see [section 22.4.1. Count Operation Start and Stop Control](#).

TCSTF flag (AGT Count Status Flag)

The TCSTF flag indicates the AGT count status.

[Setting condition]

- When 1 is written to the TSTART bit (the TCSTF flag is set to 1 in synchronization with the count source).

[Clearing conditions]

- When 0 is written to the TSTART bit (the TCSTF flag is set to 0 in synchronization with the count source)
- When 1 is written to the TSTOP bit.

TSTOP bit (AGT Count Forced Stop)

When 1 is written to the TSTOP bit, the count is forcibly stopped. The read value is 0.

TEDGF flag (Active Edge Judgment Flag)

The TEDGF flag indicates that an active edge was detected.

[Setting condition]

- When the measurement of the active width of the external input pin (AGTIO_n) is complete in pulse width measurement mode
- When the set edge of the external input pin (AGTIO_n) is input in pulse period measurement mode.

[Clearing condition]

- When 0 is written to this flag by software.

TUNDF flag (Underflow Flag)

The TUNDF flag indicates that the counter underflowed.

[Setting condition]

- When the counter underflows.

[Clearing condition]

- When 0 is written to this flag by software.

TCMAF flag (Compare Match A Flag)

The TCMAF flag indicates that compare match A was detected.

[Setting condition]

- When the value in the AGT register matches the value in the AGTCMA register.

[Clearing condition]

- When 0 is written to this flag by software.

TCMBF flag (Compare Match B Flag)

The TCMBF flag indicates that compare match B was detected.

[Setting condition]

- When the value in the AGT register matches the value in the AGTCMB register.

[Clearing condition]

- When 0 is written to this flag by software.

22.2.5 AGTMR1 : AGT Mode Register 1

Base address: AGTn = 0x4022_1000 + 0x0100 × n (n = 0, 1)
AGTn_NS = 0x5022_1000 + 0x0100 × n (n = 0, 1)

Offset address: 0x09

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	TCK[2:0]			TEDG PL	TMOD[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TMOD[2:0]	Operating Mode*3 0 0 0: Timer mode 0 0 1: Pulse output mode 0 1 0: Event counter mode 0 1 1: Pulse width measurement mode 1 0 0: Pulse period measurement mode Others: Setting prohibited	R/W
3	TEDGPL	Edge Polarity*4 0: Single-edge 1: Both-edge	R/W
6:4	TCK[2:0]	Count Source*1 *2 *5 *7 0 0 0: PCLKB 0 0 1: PCLKB/8 0 1 1: PCLKB/2 1 0 0: Divided clock AGTLCLK specified by CKS[2:0] bits in the AGTMR2 register 1 0 1: Underflow event signal from AGT0*6 1 1 0: Divided clock AGTSCLK specified by CKS[2:0] bits in the AGTMR2 register Others: Setting prohibited	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Note: Write access to the AGTMR1 register initializes the output from the AGTOn, AGTIOOn, AGTOAn, and AGTOBn pins. For details on the output level at initialization, see [section 22.2.7. AGTIOC : AGT I/O Control Register](#).

Note 1. When event counter mode is selected, the external input pin (AGTIOOn) is selected as the count source regardless of the setting of TCK[2:0] bits.

Note 2. Do not switch count sources during count operation. Only switch count sources when both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count stops).

Note 3. The operating mode can only be changed when the count is stopped while both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count is stopped). Do not change the operating mode during count operation.

Note 4. The TEDGPL bit is enabled only in event counter mode.

Note 5. To run AGT in Software Standby mode, select AGTLCLK or AGTSCLK (TCK[2:0] = 100b, 110b).

Note 6. AGT0 cannot use AGT0 underflow (setting prohibited). AGT1 uses the AGT0 underflow.

Note 7. Do not change the TCK[2:0] bits when the CKS[2:0] bits in the AGTMR2 register is not 000b. First, change the CKS[2:0] bits in the AGTMR2 register to 000b. Then change the TCK[2:0] bits and wait for one cycle of the count source.

22.2.6 AGTMR2 : AGT Mode Register 2

Base address: AGTn = 0x4022_1000 + 0x0100 × n (n = 0, 1)
AGTn_NS = 0x5022_1000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	LPM	—	—	—	—	CKS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	CKS[2:0]	AGTLCLK or AGTSCLK Count Source Clock Frequency Division Ratio*1 *2 *3 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128	R/W
6:3	—	These bits are read as 0. The write value should be 0.	R/W
7	LPM	Low Power Mode 0: Normal mode 1: Low power mode	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. Do not rewrite the CKS[2:0] bits during count operation. Only rewrite the CKS[2:0] bits when both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count stops).

Note 2. When count source is AGTLCLK or AGTSCLK, the switch of CKS[2:0] bits is valid.

Note 3. Do not switch the TCK[2:0] bits in the AGTMR1 register when CKS[2:0] bits are not 000b. Switch the TCK[2:0] bits in the AGTMR1 register after CKS[2:0] bits are set to 000b, and wait for 1 cycle of the count source.

CKS[2:0] bit (AGTLCLK or AGTSCLK Count Source Clock Frequency Division Ratio)

CKS[2:0] bits select the Count Source Clock Frequency Division Ratio for AGTLCLK or AGTSCLK.

LPM bit (Low Power Mode)

The LPM bit sets the low power operation, which impacts access to certain AGT registers. Set this bit to 1 to operate in low power.

When this bit is 1, access to the following registers is prohibited:

- AGT/AGTCMA/AGTCMB/AGTCR.

After this bit is switched from 1 to 0, the first access to the register is constrained as follows:

- When reading from the AGT register, read AGT register twice. Only the second reading of data is valid.
- When writing to the AGT, AGTCMA, AGTCMB, and AGTCR register, allow at least 2 cycles of the count source clock when writing to the register.
- When confirm the value written to the AGT, AGTCMA, AGTCMB, and AGTCR registers.
 - When the count operation is stopped; after writing data, it can be read in the next cycle.
 - When the count operation is operating; after writing data, it can be read 4 cycles after the count source clock.

Figure 22.2 shows the flow of how to write LPM bit

Figure 22.2 LPM how to write flow chart

22.2.7 AGTIOC : AGT I/O Control Register

Base address: AGTn = 0x4022_1000 + 0x0100 × n (n = 0, 1)
 AGTn_NS = 0x5022_1000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TIOGT[1:0]		TIPF[1:0]		—	TOE	—	TEDGSEL

Value after reset: 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	TEDGSEL	I/O Polarity Switch Function varies depending on the operating mode (see Table 22.3 and Table 22.4).	R/W
1	—	This bit is read as 0. The write value should be 0.	R/W
2	TOE	AGTOn pin Output Enable 0: AGTOn pin output disabled 1: AGTOn pin output enabled	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
5:4	TIPF[1:0]	Input Filter*3 These bits specifies the sampling frequency of the filter for the AGTIOOn input. If the input to the AGTIOOn pin is sampled and the value matches three successive times, that value is taken as the input value. 0 0: No filter 0 1: Filter sampled at PCLKB 1 0: Filter sampled at PCLKB/8 1 1: Filter sampled at PCLKB/32	R/W
7:6	TIOGT[1:0]	Count Control*1 *2 0 0: Event is always counted 0 1: Event is counted during polarity period specified for AGTEEn pin Others: Setting prohibited	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. When AGTEEn pin is used, the polarity to count an event can be selected with the EEPS bit in the AGTISR register.

Note 2. TIOGT[1:0] bits are enabled only in event counter mode.

Note 3. When event counter mode operation is performed during Software Standby mode, the digital filter function cannot be used.

TEDGSEL bit (I/O Polarity Switch)

The TEDGSEL bit switches the AGTOn pin output polarity and the AGTIOOn pin input/output edge and polarity.

In pulse output mode, it only controls polarity of the AGTOn pin output and AGTIO pin output. AGTOn pin output and AGTIO pin output are initialized when the AGTMR1 register is written or the TSTOP bit in the AGTCR register is written with 1.

TOE bit (AGTOn pin Output Enable)

The TOE bit selects whether the AGTOn pin output is disabled or enabled.

TIPF[1:0] bits (Input Filter)

The TIPF[1:0] bits specify the sampling frequency of the AGTIO pin input filter. When the input to the AGTIO pin is sampled and the values match three times in succession, the value is regarded as the input value.

TIOGT[1:0] bits (Count Control)

The TIOGT[1:0] bits control the event count.

Table 22.3 AGTIO pin I/O edge and polarity switching

Operating mode	Function
Timer mode	Not used
Pulse output mode	0: Output is started at high (initialization level: high) i.e. inverted output 1: Output is started at low (initialization level: low). i.e. normal output
Event counter mode	0: Count on rising edge 1: Count on falling edge.
Pulse width measurement mode	0: Low-level width is measured 1: High-level width is measured.
Pulse period measurement mode	0: Measure from one rising edge to the next rising edge 1: Measure from one falling edge to the next falling edge.

Table 22.4 AGTOn pin output polarity switching

Operating mode	Function
All modes	0: Output is started at low (initial level: low): Normal output 1: Output is started at high (initial level: high): Inverted output

22.2.8 AGTISR : AGT Event Pin Select Register

Base address: AGTn = 0x4022_1000 + 0x0100 × n (n = 0, 1)
AGTn_NS = 0x5022_1000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	EEPS	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	—	These bits are read as 0. The write value should be 0.	R/W
2	EEPS	AGTEEn Polarity Selection 0: An event is counted during the low-level period 1: An event is counted during the high-level period	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

EEPS bit (AGTEEn Polarity Selection)

The EEPS bit selects the polarity of events to be counted.

22.2.9 AGTCMSR : AGT Compare Match Function Select Register

Base address: $AGTn = 0x4022_1000 + 0x0100 \times n$ ($n = 0, 1$)
 $AGTn_NS = 0x5022_1000 + 0x0100 \times n$ ($n = 0, 1$)

Offset address: 0x0E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	TOPO LB	TOEB	TCME B	—	TOPO LA	TOEA	TCME A
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TCMEA	AGT Compare Match A Register Enable ^{*1 *2} 0: AGT Compare match A register disabled 1: AGT Compare match A register enabled	R/W
1	TOEA	AGTOAn Pin Output Enable ^{*1 *2} 0: AGTOAn pin output disabled 1: AGTOAn pin output enabled	R/W
2	TOPOLA	AGTOAn Pin Polarity Select ^{*1 *2} 0: AGTOAn pin output is started on low. i.e. normal output 1: AGTOAn pin output is started on high. i.e. inverted output	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	TCMEB	AGT Compare Match B Register Enable ^{*1 *2} 0: Compare match B register disabled 1: Compare match B register enabled	R/W
5	TOEB	AGTOBn Pin Output Enable ^{*1 *2} 0: AGTOBn pin output disabled 1: AGTOBn pin output enabled	R/W
6	TOPOLB	AGTOBn Pin Polarity Select ^{*1 *2} 0: AGTOBn pin output is started on low. i.e. normal output 1: AGTOBn pin output is started on high. i.e. inverted output	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. Do not rewrite the AGTCMSR register during a count operation. Only rewrite the AGTCMSR register when both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count stops).

Note 2. Do not set 1 when in pulse width measurement mode or pulse period measurement mode.

22.2.10 AGTIOSEL : AGT Pin Select Register

Base address: $AGTn = 0x4022_1000 + 0x0100 \times n$ ($n = 0, 1$)
 $AGTn_NS = 0x5022_1000 + 0x0100 \times n$ ($n = 0, 1$)

Offset address: 0x0F

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	TIES	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
4	TIES	AGTIOn Pin Input Enable 0: External event input is disabled during Software Standby mode 1: External event input is enabled during Software Standby mode	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

The AGTIOSEL register sets the AGTIO pin when using the AGTIO pin in Software Standby mode.

TIES bit (AGTIO Pin Input Enable)

The TIES bit enables or disables an external event input.

22.3 Operation

22.3.1 Reload Register and Counter Rewrite Operation

Regardless of the operating mode, the timing of the rewrite operation to the reload register and the counter differs depending on the value of the TSTART bit in the AGTCR register and of the TCMEA or TCMEB bit in the AGTCMSR register. When the TSTART bit is 0 (count stops), the count value is directly written to the reload register and the counter. When the TSTART bit is 1 (count starts) and the TCMEA bit and TCMEB bit are 0 (AGT compare match A/B register are invalid), the value is written to the reload register in synchronization with the count source, and then to the counter in synchronization with the next count source. When the TSTART bit is 1 (count starts) and the TCMEA bit or the TCMEB bit is 1 (AGT compare match A register or compare match B register is valid), the value is written to the reload register in synchronization with the count source, and then to the counter in synchronization with the underflow of the counter.

Figure 22.3 and Figure 22.4 show the timing of rewrite operation with TSTART bit value and TCMEA/TCMEB bit value.

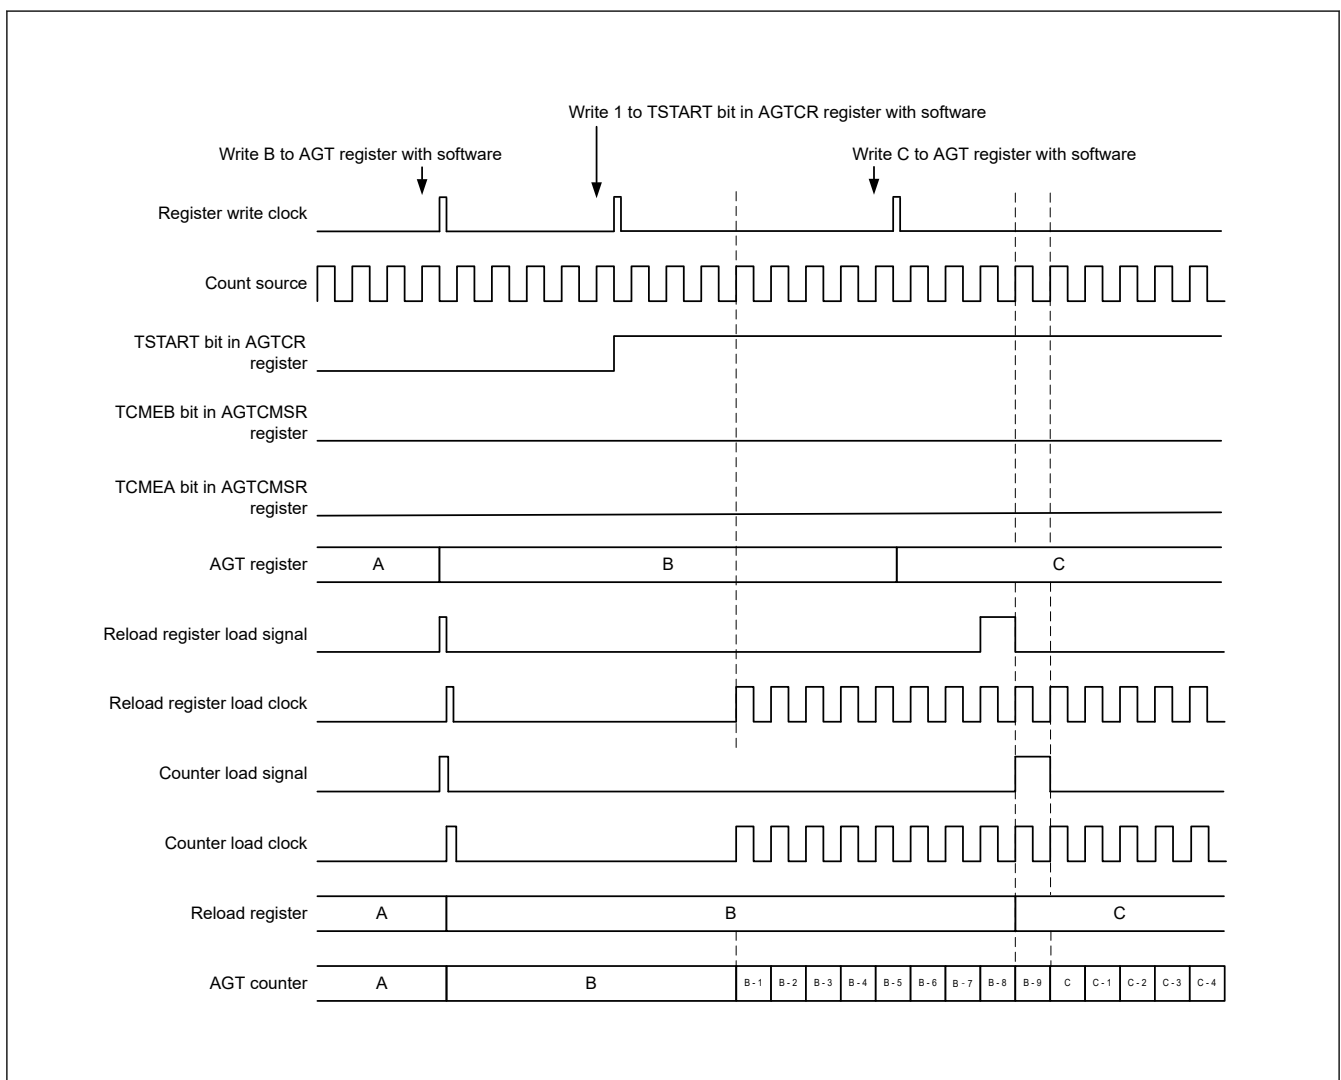

Figure 22.3 Timing of rewrite operation with TSTART, TCMEA, and TCMEB bit value when AGT compare match A register and AGT compare match B register is invalid

Figure 22.4 Timing of rewrite operation with TSTART bit value and TCMEA or TCMEB bit value when AGT compare match A register or AGT compare match B register is valid

22.3.2 Reload Register and AGT Compare Match A/B Register Rewrite Operation

Regardless of the operating mode, the timing of the rewrite operation to the reload register and AGT compare register A/B depends on the value of the TSTART bit in the AGTCR register. When the TSTART bit is 0 (count stops), the count value is directly written to the reload register and AGT compare register A/B. When the TSTART bit is 1 (count starts), the value is written to the reload register in synchronization with the count source, and then to the compare register in synchronization with the underflow of the counter.

Figure 22.5 shows the timing of rewrite operation with TSTART bit value for compare register A. AGT Compare register B is of the same timing as AGT compare register A.

Figure 22.5 Timing of rewrite operation with the TSTART bit value for AGT compare register A

22.3.3 Timer Mode

In this mode, the AGT counter is decremented by the count source selected with the TCK[2:0] bits in the AGTMR1 register. In timer mode, the count value is decremented by 1 on each rising edge of the count source. When the count value reaches 0x0000 and the next count source is input, an underflow occurs and an interrupt request is generated.

Figure 22.6 shows the operation example in timer mode.

Figure 22.6 Operation example in timer mode

22.3.4 Pulse Output Mode

In pulse output mode, the counter is decremented by the count source selected with the TCK[2:0] bits in the AGTMR1 register, and the output level of the AGTIO_n and AGTON pins inverted each time an underflow occurs.

In pulse output mode, the count value is decremented by 1 on each rising edge of the count source. When the count value reaches 0x0000 and the next count source is input, an underflow occurs and an interrupt request is generated. In addition, a pulse can be output from the AGTIO_n and AGTON pins. The output level is inverted each time an underflow occurs. The pulse output from the AGTON pin can be stopped with the TOE bit in the AGTIOC register. The output level can be selected with the TEDGSEL bit in the AGTIOC register.

Figure 22.7 shows the operation example in pulse output mode.

Figure 22.7 Operation example in pulse output mode

22.3.5 Event Counter Mode

In event counter mode, the counter is decremented by an external event signal (count source) input to the AGTIO pin. Various periods for counting events can be set with the TIOGT[1:0] bits in the AGTIOC register and AGTISR registers. In addition, the filter function for the AGTIO pin input can be specified with bits TIPF[1:0] in the AGTIOC register. The output from the AGTOn pin can be toggled even in event counter mode.

Figure 22.8 shows the operation example in event counter mode.

Figure 22.8 Operation example 1 in event counter mode

Figure 22.9 shows an operation example for counting during the specified period in event counter mode (TIOGT[1:0] bits in the AGTIOC register are set to 01b).

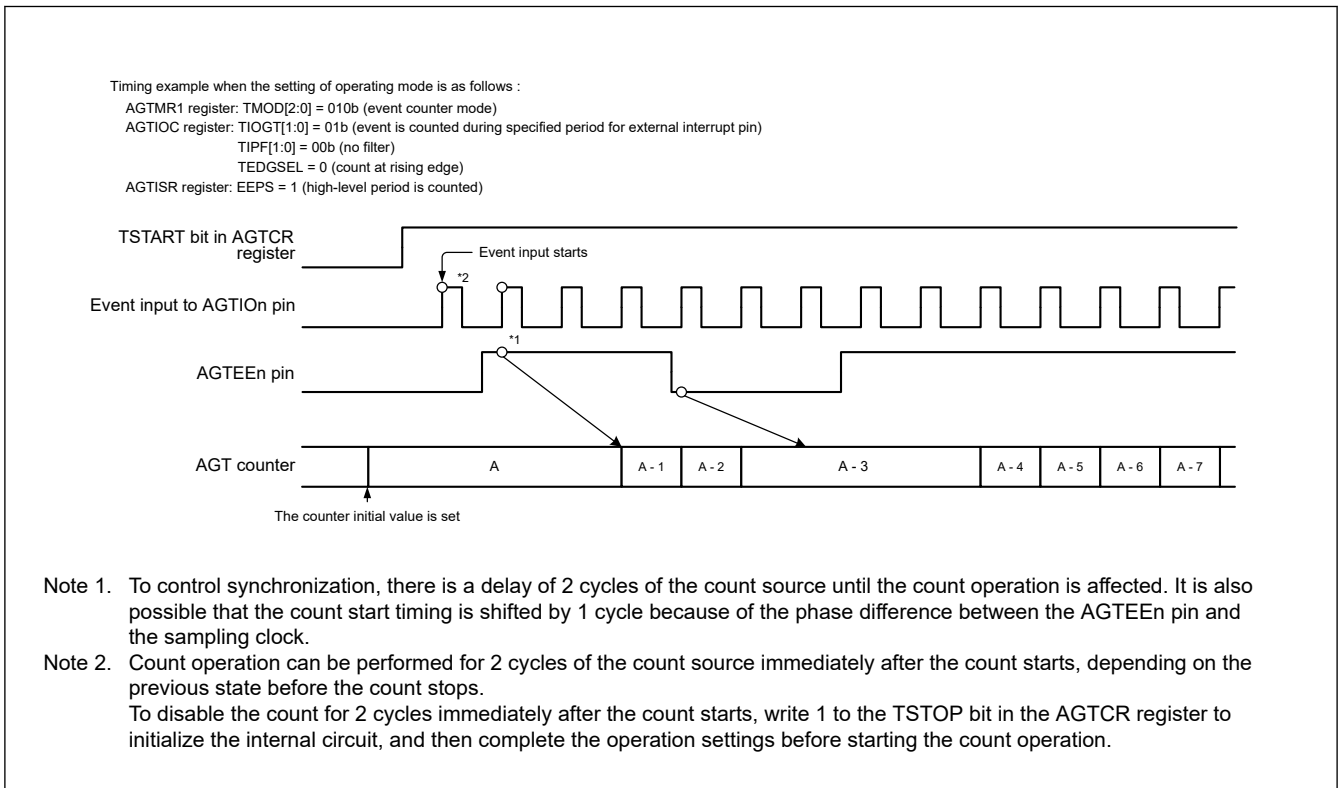

Figure 22.9 Operation example 2 in event counter mode

22.3.6 Pulse Width Measurement Mode

In pulse width measurement mode, the pulse width of an external signal input to the AGTIO pin is measured. When the level specified by the TEDGSEL bit in the AGTIOC register is input to the AGTIO pin, the counter is decremented by the

count source selected with the TCK[2:0] bits in the AGTMR1 register. When the specified level on the AGTIO pin ends, the counter is stopped, the TEDGF flag in the AGTCR register is set to 1 (active edge received), and an interrupt request is generated. The measurement of pulse width data is performed by reading the count value while the counter is stopped. Also, when the counter underflows during measurement, the TUNDF flag in the AGTCR register is set to 1 and an interrupt request is generated.

Figure 22.10 shows the operation example in pulse width measurement mode.

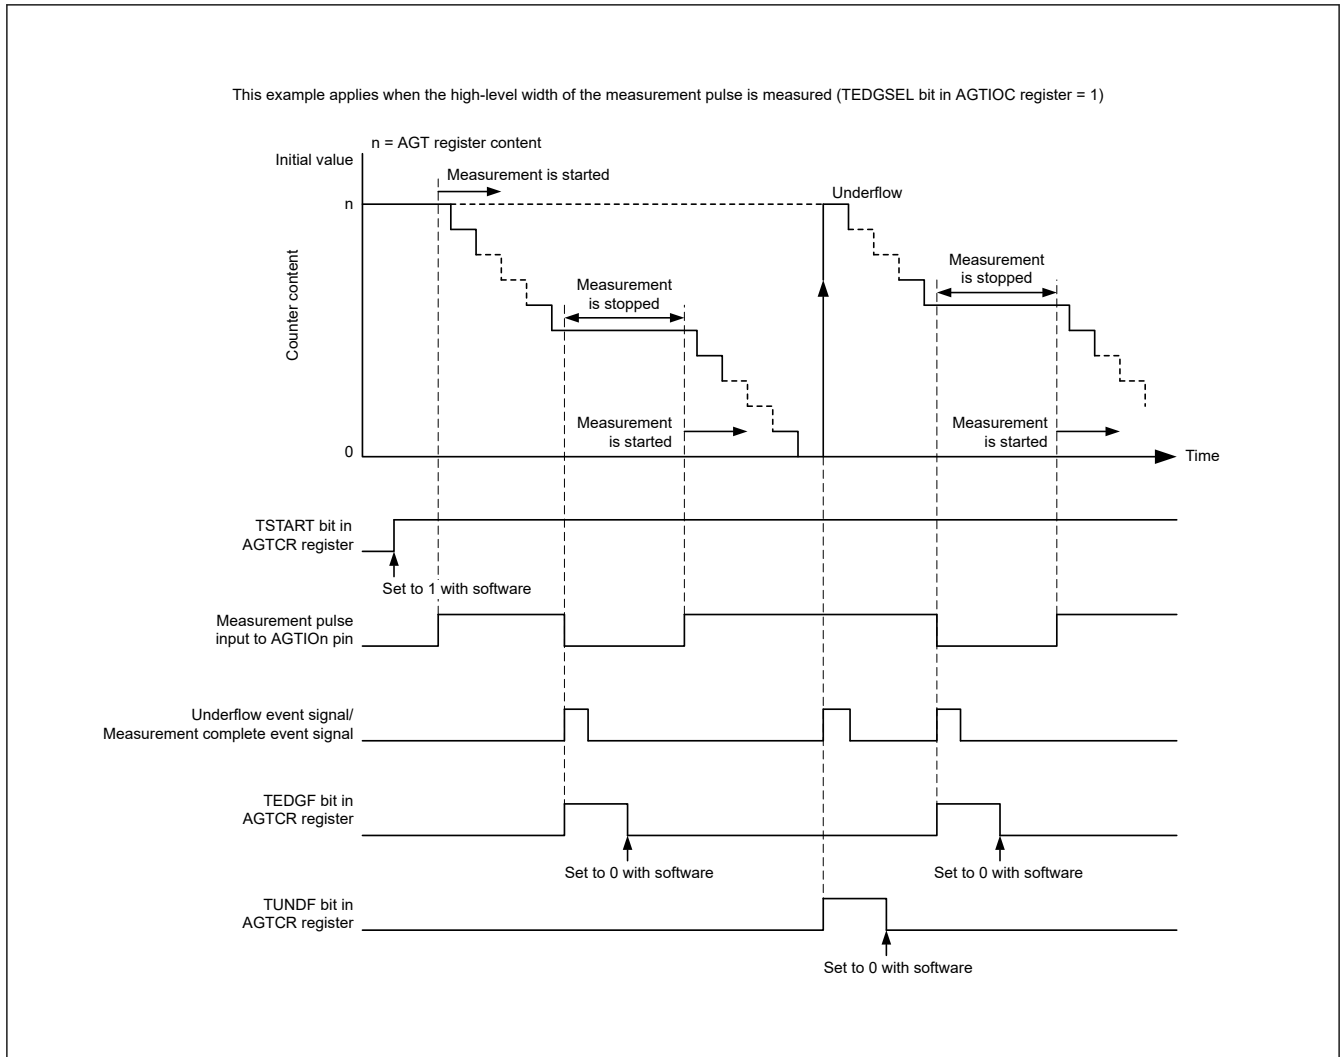

Figure 22.10 Operation example in pulse width measurement mode

22.3.7 Pulse Period Measurement Mode

In pulse period measurement mode, the pulse period of an external signal input to the AGTIO pin is measured. The counter is decremented by the count source selected with TCK[2:0] bits in the AGTMR1 register. When a pulse with the period specified by the TEDGSEL bit in the AGTIOC register is input to the AGTIO pin, the count value is transferred to the read-out buffer on the rising edge of the count source. The value in the reload register is loaded to the counter at the next rising edge. Simultaneously, the TEDGF flag in the AGTCR register is set to 1 (active edge received) and an interrupt request is generated. The read-out buffer (AGT register) is read at this time and the difference from the reload value (see section 22.4.6. How to Calculate Event Number, Pulse Width, and Pulse Period) is the period data of the input pulse. The period data is retained until the read-out buffer is read. When the counter underflows, the TUNDF flag in the AGTCR register is set to 1 (underflow) and an interrupt request is generated.

Figure 22.11 shows the operation example in pulse period measurement mode.

Only input pulses with a period longer than twice the period of the count source are measured. Also, the low-level and high-level widths must both be longer than the period of the count source. If a pulse period shorter than these conditions is input, the input might be ignored.

Figure 22.11 Operation example in pulse period measurement mode

22.3.8 Compare Match function

The compare match function detects matches (compare match) between the content of the AGTCMA or AGTCMB register and the content of the AGT register. This function is enabled when the TCMEA or TCMEB bit in the AGTCMSR register is 1 (compare match A register or compare match B register is valid). The counter is decremented by the count source selected with the TCK[2:0] bits in the AGTMR1 register, and when the values of AGT and AGTCMA or AGTCMB match, the TCMAF/TCMBF flag in the AGTCR register is set to 1 (match), and an interrupt request is generated.

When the compare match function is enabled, the timing of the rewrite operation to the reload register and the counter differs. See [section 22.3.1. Reload Register and Counter Rewrite Operation](#) for details. In addition, the output level of the AGTOAn, AGTOBn pins is inverted by the match and by the underflow. The output level can be selected with the TOPOLA or TOPOLB bit in the AGTCMSR register.

[Figure 22.12](#) shows the operation example in compare match function.

Figure 22.12 Operation example in compare match function (TOPOLA = 0, TOPOLB = 0)

22.3.9 Output Settings for Each Mode

Table 22.5 to Table 22.8 list the states of pins AGTON, AGTION, AGTOAn, and AGTOBn pins in each mode.

Table 22.5 AGTON pin setting

Operating mode	AGTIOC register		AGTON pin output
	TOE bit	TEDGSEL bit	
All modes	1	1	Inverted output
		0	Normal output
	0	0 or 1	Output disabled

Table 22.6 AGTIO_n pin setting

Operating mode	AGTIOC register	
	TEDGSEL bit	AGTIO _n pin I/O
Timer mode	0 or 1	Input (not used)
Pulse output mode	1	Normal output
	0	Inverted output
Event counter mode	0 or 1	Input
Pulse width measurement mode		
Pulse period measurement mode		

Table 22.7 AGTOA_n pin setting

Operating mode	AGTCMSR register		AGTOA _n pin output
	TOEA bit	TOPOLA bit	
Timer mode	1	1	Inverted output
		0	Normal output
	0	0 or 1	Output disabled (not used)
Pulse output mode	1	1	Inverted output
		0	Normal output
	0	0 or 1	Output disabled (not used)
Event counter mode	1	1	Inverted output
		0	Normal output
	0	0 or 1	Output disabled (not used)
Pulse width measurement mode	0	0	Prohibited
Pulse period measurement mode

		0	Normal output
	0	0 or 1	Output disabled (not used)
Pulse width measurement mode	0	0	Prohibited
Pulse period measurement mode			

22.3.10 Standby Mode

The AGT can operate in Software Standby mode. Set it to Software Standby mode with count operation start (TSTART = 1, TCSTF = 1).

[Table 22.9](#) and [Table 22.10](#) show the setting that can be used in Software Standby mode.

Table 22.9 Usable settings in Software Standby mode (AGT0)

Operating mode	AGTMR1.TCK[2:0]	Operating clock	Resurgence factor of CPU
Timer mode	100b or 110b	AGTLCLK or AGTSCLK	—
Pulse output mode	100b or 110b	AGTLCLK or AGTSCLK	—
Event counter mode ^{*2}	—	AGTIO0 ^{*1}	—
Pulse width measurement mode	100b or 110b	AGTLCLK or AGTSCLK	—
Pulse period measurement mode	100b or 110b	AGTLCLK or AGTSCLK	—

Note: —: invalid

Note 1. When using the AGTIO0 pin for external event input in Software Standby mode, set AGTIOSEL.TIES = 1.

Note 2. AGTEE pin is not available during Software Standby mode. External events are always enabled.

Table 22.10 Usable settings in Software Standby mode (AGT1)

Operating mode	AGTMR1.TCK[2:0]	Operating clock	Resurgence factor of CPU
Timer mode	100b or 110b or 101b ^{*1}	AGTLCLK or AGTSCLK or AGT0 underflow	<ul style="list-style-type: none"> Underflow Compare match A/B
Pulse output mode	100b or 110b or 101b ^{*1}	AGTLCLK or AGTSCLK or AGT0 underflow	<ul style="list-style-type: none"> Underflow Compare match A/B
Event counter mode ^{*3}	—	AGTIO1 ^{*2}	<ul style="list-style-type: none"> Underflow Compare match A/B
Pulse width measurement mode	100b or 110b or 101b ^{*1}	AGTLCLK or AGTSCLK or AGT0 underflow	<ul style="list-style-type: none"> Underflow Active edge
Pulse period measurement mode	100b or 110b or 101b ^{*1}	AGTLCLK or AGTSCLK or AGT0 underflow	<ul style="list-style-type: none"> Underflow Active edge

Note: —: invalid

Note: Release of Software Standby mode is only AGT1.

Note: Compare match A/B is resurgence factor of CPU from Software Standby mode.

Note 1. Only when AGT0 operates in [Table 22.9](#)

Note 2. When using the AGTIO1 pin for external event input in Software Standby mode, set AGTIOSEL.TIES = 1.

Note 3. AGTEE pin is not available during Software Standby mode. External events are always enabled

22.3.11 Interrupt Sources

The AGTn has three interrupt sources as listed in [Table 22.11](#).

Table 22.11 AGT interrupt sources

Name	Interrupt source	DMAC/DTC activation
AGTn_AGTI	<ul style="list-style-type: none"> When the counter underflows When measurement of the active width of the external input pin (AGTIO_n) is complete in pulse width measurement mode When the set edge of the external input pin (AGTIO_n) is input in pulse period measurement mode. 	Possible
AGTn_AGTCMAI	<ul style="list-style-type: none"> When the values of AGT register and AGTCMA register match 	Possible
AGTn_AGTCMBI	<ul style="list-style-type: none"> When the values of AGT register and AGTCMB register match 	Possible

Note: Channel number (n = 0, 1)

22.3.12 Event Signal Output to ELC

The AGT uses the Event Link Controller (ELC) to perform a link operation to a specified module using the interrupt request signal as the event signal. The AGT outputs compare match A, compare match B, and underflow/measurement complete signals as event signals. For details, see [section 18, Event Link Controller \(ELC\)](#).

22.4 Usage Notes

22.4.1 Count Operation Start and Stop Control

- When the operating mode (see [Table 22.1](#)) is set to other than the event counter mode, or the count source is set to other than AGTn underflow event signal (TCK[2:0] = 101b):
 - After 1 (count starts) is written to the TSTART bit in the AGTCR register while the count is stopped, the TCSTF flag in the AGTCR register remains 0 (count stops) for 3 cycles of the count source. Do not access the registers associated with AGT other than the TCSTF flag until this flag is set to 1 (count in progress).
 - After 0 (count stops) is written to the TSTART bit during a count operation, the TCSTF flag remains 1 for 3 cycles of the count source. When the TCSTF flag is set to 0, the count is stopped. Do not access the registers associated with AGT other than the TCSTF flag until this flag is set to 0.
- When the operating mode (see [Table 22.1](#)) is set to event counter mode, or the count source is set to AGT1 underflow event signal (TCK[2:0] = 101b):
 - After 1 (count starts) is written to the TSTART bit in the AGTCR register while the count is stopped, the TCSTF flag in the AGTCR register remains 0 (count stops) for 2 PCLKB cycles. Do not access the registers associated with AGT other than the TCSTF flag until this flag is set to 1 (count in progress).
 - After 0 (count stops) is written to the TSTART bit during a count operation, the TCSTF flag remains 1 for 2 PCLKB cycles. When the TCSTF flag is set to 0, the count is stopped. Do not access the registers associated with AGT other than the TCSTF flag until this flag is set to 0.

22.4.2 Access to Counter Register

When the TSTART bit and TCSTF flag in the AGTCR register are both 1 (count starts), allow at least 3 cycles of the count source clock between writes when writing to the AGT register successively.

22.4.3 When Changing Mode

The registers associated with AGT operating mode (AGTMR1, AGTMR2, AGTIOC, AGTISR, and AGTCMSR) can be changed only when the count is stopped with both the TSTART bit and TCSTF flag set to 0 (count stops). Do not change these registers during count operation.

When the registers associated with AGT operating mode are changed, the values of TEDGF, TUNDF, TCMAF, and TCMBF flags are undefined. Before starting the count, write 0 to the following flags:

- TEDGF (no active edge received)
- TUNDF (no underflow)
- TCMAF (no match)
- TCMBF (no match).

22.4.4 Output pin setting

When using the AGTOn, AGTIOAn, AGTOAn, or AGTOBn as an output pin, set up the Operation and determine the initial output values. Then set PmnPFS.PMR bit to 1.

When using the AGTIOAn as an input pin in pulse width measurement mode or pulse period measurement mode, set up the Operation and start count operation. Then start to enter external events from the AGTIOAn pin. Invalidate the first measurement and validate the second and later completed measurements.

22.4.5 Digital Filter

When using the digital filter, do not start the timer operation for 5 cycles of the digital filter clock after setting TIPF[1:0] bits and when the TEDGSEL bit in the AGTIOC register changes.

22.4.6 How to Calculate Event Number, Pulse Width, and Pulse Period

- In event counter mode, event number is expressed mathematically as follows:
Event number = initial value of counter [AGT register] - counter value of active event end

- In pulse width measurement mode, pulse width is expressed mathematically as follows:
Pulse width = counter value of stopping measurement - counter value of next stopping measurement
- In pulse period measurement mode, input pulse period is expressed mathematically as follows:
Period of input pulse = (initial value of counter [AGT register] - reading value of the read-out buffer) + 1.

22.4.7 When Count is Forcibly Stopped by TSTOP Bit

After the counter is forcibly stopped by the TSTOP bit in the AGTCR register, do not access the following I/O registers for 1 cycle of the count source:

- AGT
- AGTCMA
- AGTCMB
- AGTCR
- AGTMR1
- AGTMR2.

22.4.8 When Selecting AGT0 Underflow as the Count Source

Operate according to the following procedures described in this section when selecting the underflow event signal as the count source.

(1) Procedure for starting operation

1. Set AGT.
2. Start the count operation of AGT1.
3. Start the count operation of AGT0.

(2) Procedure for stopping operation

1. Stop the count operation of AGT0.
2. Stop the count operation of AGT1.
3. Stop the count source clock of AGT1 (write 000b in the AGTMR1.TCK[2:0] bits).

22.4.9 Module-stop function

AGT operation can be disabled or enabled using Module Stop Control Register D (MSTPCRD). The AGT module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see [section 10, Low Power Modes](#)

22.4.10 When Switching Source Clock

When switching a clock source by changing SCKSCR.CKSEL[2:0], the clock output from the selector stops for 4 cycles of the switched clock. Therefore, when using the AGTIO_n, AGTEEn, or both input as external event input, the clock source should not be switched. If switching the clock source while using the external event input, extend the input pulse width by 4 clock cycles of the switched source clock cycles.

23. Ultra-Low-Power Timer (ULPT)

23.1 Overview

This ultra-low-power timer (ULPT) is a 32-bit timer that can output pulses or count external events.

This 32-bit timer consists of reload registers and a down-counter. The reload registers and the down-counter are allocated to the same address and can be accessed through the ULPTCNT register.

Table 23.1 lists the ULPT specifications.

Table 23.1 ULPT specifications

Item		Description
Operating mode	Timer mode	Count the internal clock.
	Event counter mode	Count external events.
Number of Channels		32 bits × 2 channels (ULPTn (n = 0, 1))
Count source (operating clock)*1		The following signals can be selected: <ul style="list-style-type: none"> Internal clock: ULPTLCLK/d or ULPTSCLK/d (d = 1, 2, 4, 8, 16, 32, 64, 128) External event: ULPTEVIn pin
Count operation		The following functions can be selected: <ul style="list-style-type: none"> Selection between continuous mode and one-shot mode Selection among count enable mode, count start mode, and count restart mode
Interrupt/event link function (output)		<ul style="list-style-type: none"> Underflow signal <ul style="list-style-type: none"> When the counter underflows Compare match A signal <ul style="list-style-type: none"> When the ULPTCNT value matches the ULPTCMA value (The compare match A function is enabled.) Compare match B signal <ul style="list-style-type: none"> When the ULPTCNT value matches the ULPTCMB value (The compare match B function is enabled.)
Selectable functions		<ul style="list-style-type: none"> Pulse output function <ul style="list-style-type: none"> Inverts the output each time the counter underflows. Compare match function <ul style="list-style-type: none"> Either or both compare match A register and compare match B register are selectable. Module-stop function		Module-stop state can be set for each channels to reduce power consumption
TrustZone Filter		Security and Privilege attribution can be set for each channels.

Note 1. Make sure that the frequency of the peripheral module clock (PCLKB) ≥ the frequency of the count source clock.

Note 2. For details, see [section 10, Low Power Modes](#).

23.2 Configuration

Figure 23.1 shows the ULPT block diagram. Table 23.2 lists the I/O pins of the ULPT.

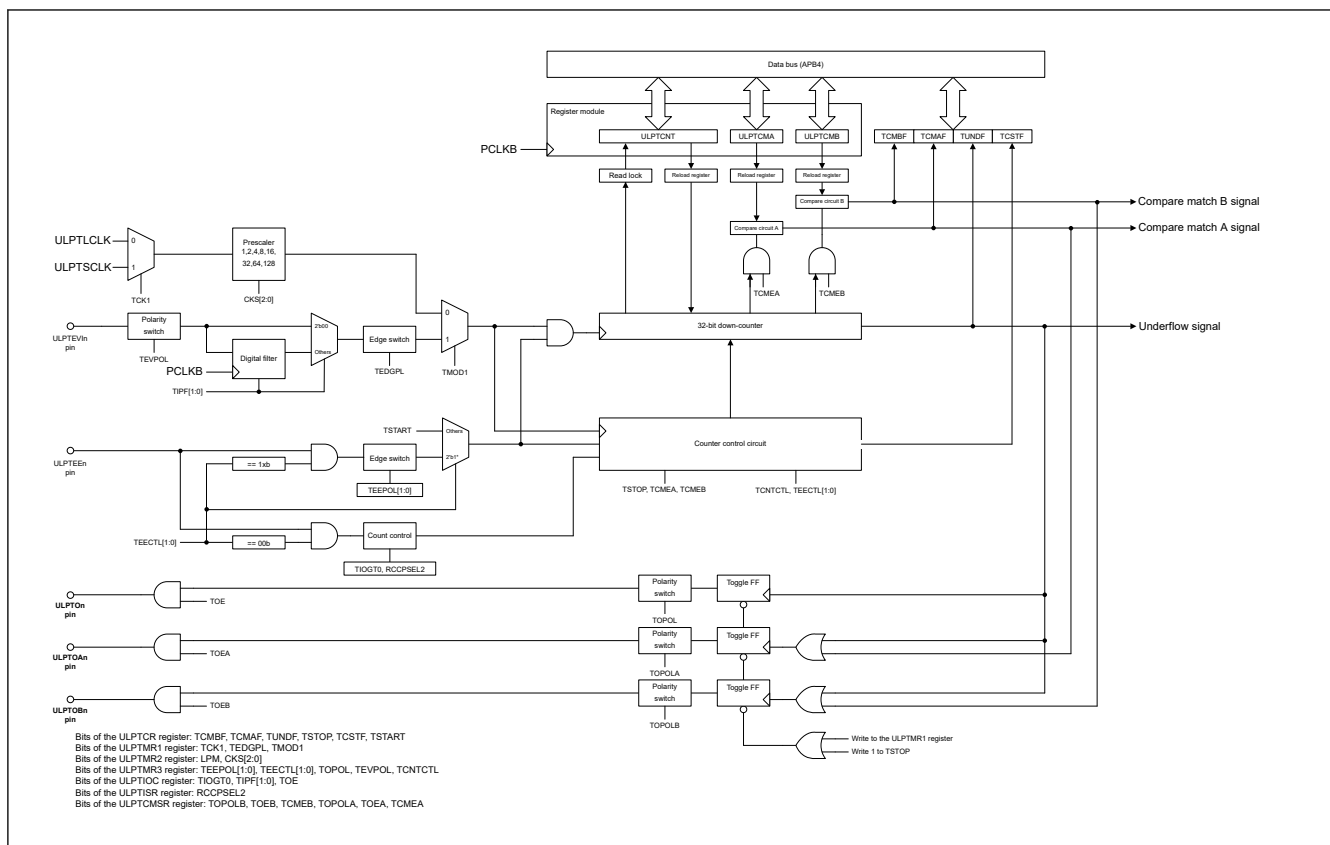

Figure 23.1 ULPT block diagram

Table 23.2 ULPT I/O pins

Pin name	I/O	Function
ULPTEEn ^{*2}	Input	External count control input ^{*1}
ULPTEVIn ^{*2}	Input	External event input
ULPTOn ^{*2}	Output	Pulse output
ULPTOAn ^{*2}	Output	Output compare match A output
ULPTObn ^{*2}	Output	Output compare match B output

Note: Channel number: n = 0, 1

Note 1. The function of the ULPTEEn pin can be selected by the ULPTMR3.TEECTL[1:0] bits. For more details, see [section 23.3.7. ULPTMR3 : ULPT Mode Register 3.](#)

Note 2. Only pins marked "-DS" can be used in Deep Software Standby mode1.

23.3 Register Descriptions

23.3.1 ULPTCNT : ULPT Counter Register

Base address: $ULPTn = 0x4022_0000 + 0x0100 \times n \ (n = 0, 1)$
 $ULPTn_NS = 0x5022_0000 + 0x0100 \times n \ (n = 0, 1)$

Offset address: 0x00

Bit position: 31 0

Bit field:

Value after reset: 1

Bit	Symbol	Function	R/W
31:0	ULPTCNT	32-bit counter and reload register ^{*1*2} Setting range : 0x00000000 to 0xFFFFFFFF	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. When 1 is written to the ULPTCR.TSTOP bit, the counter is forcibly stopped and set to 0xFFFFFFFF. The reload register is set to 0xFFFFFFFF

Note 2. When 0x00000000 is set in the ULPTCNT register, a request signal to the ICU, DTC, and ELC occurs only once immediately after the start of count operation (when the ULPTCR.TSTART bit is set to 1). However, the pulse output at the ULPTOn pin continues to be toggled.

The pulse output from the ULPTOn pin can be enabled or disabled by the ULPTIOC.TOE bit.

When the ULPTCNT register is set to a value equal to or greater than 0x00000001, a request signal is generated each time the counter underflows.

The ULPTCNT is a 32-bit register. The register value is written to the reload register and is read from the counter.

The states of the counter and reload register change according to the TSTART/TCSTF bit in the ULPTCR register and TCMEA/TCMEB bit in the ULPTCMSR register. For details, see [section 23.4.2. Rewriting the counter and reload register](#).

The ULPTCNT register is only available for 32-bit read/write access.

23.3.2 ULPTCMA : ULPT Compare Match A Register

Base address: $ULPTn = 0x4022_0000 + 0x0100 \times n$ (n = 0, 1)
 $ULPTn_NS = 0x5022_0000 + 0x0100 \times n$ (n = 0, 1)

Offset address: 0x04

Bit position: 31 0

Value after reset: 1

Bit	Symbol	Function	R/W
31:0	ULPTCMA	32-bit Compare Match A Data ^{*1*2} Setting range : 0x00000000 to 0xFFFFFFFF	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. When 1 is written to the ULPTCR.TSTOP bit, 0xFFFFFFFF is set in the ULPTCMA register.

Note 2. Set the ULPTCMA register to 0xFFFFFFFF when compare match A is not used (ULPTCMSR.TCMEA bit = 0).

The ULPTCMA register is a readable/writable register to set a value for compare match with the counter.

The states of compare circuit A and the reload register change according to the TSTART and TCSTF bits in the ULPTCR register. For details, see [section 23.4.3. Rewriting the compare circuits and reload registers for compare match A/B](#).

The ULPTCMA register is only available for 32-bit read/write access.

23.3.3 ULPTCMB : ULPT Compare Match B Register

Base address: $ULPTn = 0x4022_0000 + 0x0100 \times n$ (n = 0, 1)
 $ULPTn_NS = 0x5022_0000 + 0x0100 \times n$ (n = 0, 1)

Offset address: 0x08

Bit position: 31 0

Value after reset: 1

Bit	Symbol	Function	R/W
31:0	ULPTCMB	32-bit Compare Match B Data ^{*1*2} Setting range : 0x00000000 to 0xFFFFFFFF	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. When 1 is written to the ULPTCR.TSTOP bit, 0xFFFFFFFF is set in the ULPTCMB register.

Note 2. Set the ULPTCMB register to 0xFFFFFFFF when compare match B is not used (ULPTCMSR.TCMEB bit = 0).

The ULPTCMB register is a readable/writable register to set a value for compare match with the counter.

The states of compare circuit B and the reload register change according to the TSTART and TCSTF bits in the ULPTCR register. For details, see [section 23.4.3. Rewriting the compare circuits and reload registers for compare match A/B](#).

The ULPTCMB register is only available for 32-bit read/write access.

23.3.4 ULPTCR : ULPT Control Register

Base address: $ULPTn = 0x4022_0000 + 0x0100 \times n$ ($n = 0, 1$)
 $ULPTn_NS = 0x5022_0000 + 0x0100 \times n$ ($n = 0, 1$)

Offset address: 0x0C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TCMB F	TCMA F	TUNDF F	—	—	TSTOP P	TCSTF F	TSTART RT
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TSTART	Counter Start 0: Stop the counter. 1: Start the counter.	R/W
1	TCSTF	Counter Status Flag* ² 0: Counter stopped 1: Counter running	R
2	TSTOP	Counter Forcible Stop* ¹ 0: Writing is invalid. 1: Stop the counter forcibly.	W
4:3	—	These bits are read as 0. The write value should be 0.	R/W
5	TUNDF	Underflow Flag 0: No underflow occurred (counter \neq 0x00000000). 1: Underflow occurred (counter = 0x00000000).	R/W ³
6	TCMAF	Compare Match A Flag 0: Not matched (counter \neq ULPTCMA[31:0]) 1: Matched (counter = ULPTCMA[31:0])	R/W ³
7	TCMBF	Compare Match B Flag 0: Not matched (counter \neq ULPTCMB[31:0]) 1: Matched (counter = ULPTCMB[31:0])	R/W ³

Note: S-TYPE-3, P-TYPE-3

Note 1. When 1 (stop the counter forcibly) is written to the TSTOP bit, the TSTOP, TSTART, and TCSTF bits are initialized. The pulse output, compare match A output and compare match B output are also initialized. This bit is read as 0.

Note 2. For precautions on using the TCSTF bit, see [section 23.5.1. Start and stop control of the counter](#).

Note 3. Only 0 can be written to clear the flag.

The ULPTCR register controls the start and stop of the counter and indicates the status of the ULPT.

The ULPTCR register is only available for 8-bit read/write access.

It is recommended to set 1 to the TUNDF, TCMAF and TCMBF bits when changing the TSTART or TSTOP bits to prevent clearing TUNDF, TCMAF, or TCMBF by mistake. At this time, setting 1 to TUNDF, TCMAF and TCMBF bits is ignored.

TSTART bit (Counter Start)

When and how the counter is started depends on the setting of the ULPTMR3.TEECTL[1:0] bits.

The counter is stopped in the same way in any mode.

For details, see [section 23.4.1. Count operation](#).

[Starting the counter]

- In count enable mode (ULPTMR3.TEECTL[1:0] bits = 00)
When 1 is written to the TSTART bit.
- In count start mode or count restart mode (ULPTMR3.TEECTL[1:0] bits = 10 or 11)

When 1 is written to the TSTART bit, and then an edge at the ULPTEEn pin is input.

[Stopping the counter]

- When 0 is written to the TSTART bit.
- When 1 is written to the TSTOP bit.

TCSTF bit (Counter Status Flag)

The operation of this bit depends on the settings of the TCNTCTL and TEECTL[1:0] bits of the ULPTMR3 register.

For details, see [section 23.4.1. Count operation](#).

[Setting conditions]

- In timer mode (ULPTMR1.TMOD1 = 0) and count enable mode (ULPTMR3.TEECTL[1:0] bits = 00)
When 1 is written to the TSTART bit (with the TCSTF bit set to 1 in synchronization with the count source).
- In event counter mode (ULPTMR1.TMOD1 = 1) and count enable mode (ULPTMR3.TEECTL[1:0] bits = 00)
When 1 is written to the TSTART bit (with the TCSTF bit set to 1 in synchronization with the count source).
- In count start mode or count restart mode (ULPTMR3.TEECTL[1:0] bits = 10 or 11)
When 1 is written to the TSTART bit, and then an edge at the ULPTEEn pin is input (with the TCSTF bit set to 1 in synchronization with the count source).

[Clearing conditions]

- When 0 is written to the TSTART bit (with the TCSTF bit set to 0 in synchronization with the count source).
- When 1 is written to the TSTOP bit.
- When the counter underflows in one-shot mode (ULPTMR3.TCNTCTL = 1).
Only under this condition, the TSTART bit does not change from 1.

TSTOP bit (Counter Forcible Stop)

When 1 is written to this bit, the counter is forcibly stopped. This bit is read as 0.

TUNDF bit (Underflow Flag)

[Setting condition]

- When the counter underflows (counter = 0x00000000).

[Clearing condition]

- When 0 is written to this bit.

TCMAF bit (Compare Match A Flag)

[Setting condition]

- When the ULPTCNT register value matches the ULPTCMA register value (counter = ULPTCMA[31:0]).

[Clearing condition]

- When 0 is written to this bit.

TCMBF bit (Compare Match B Flag)

[Setting condition]

- When the ULPTCNT register value matches the ULPTCMB register value (counter = ULPTCMB[31:0]).

[Clearing condition]

- When 0 is written to this bit.

23.3.5 ULPTMR1 : ULPT Mode Register 1

Base address: $ULPTn = 0x4022_0000 + 0x0100 \times n$ ($n = 0, 1$)
 $ULPTn_NS = 0x5022_0000 + 0x0100 \times n$ ($n = 0, 1$)

Offset address: 0x0D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	TCK1	—	TEDGPL	—	TMOD1	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W
1	TMOD1	Operating Mode*1 0: Timer mode 1: Event counter mode	R/W
2	—	This bit is read as 0. The write value should be 0.	R/W
3	TEDGPL	ULPTEVIn Edge Polarity 0: Either edge (rising) 1: Both edges This bit is valid only in event counter mode (TMOD1 = 1).	R/W
4	—	This bit is read as 0. The write value should be 0.	R/W
5	TCK1	Count Source*2 0: Divided clock specified by the ULPTMR2.CKS[2:0] bits (ULPTLCLK) 1: Divided clock specified by the ULPTMR2.CKS[2:0] bits (ULPTSCLK) This bit is valid only in timer mode (TMOD1 = 0).	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Note: Do not rewrite this register while the counter is running. Rewrite this register only when the counter is stopped (both the TSTART and TCSTF bits of the ULPTCR register are set to 0).

Note: A write access to this register initializes the output from pins ULPTOn, ULPTOAn, and ULPTOBn. For details on the output level at initialization, see [section 23.3.7. ULPTMR3 : ULPT Mode Register 3](#) and [section 23.3.8. ULPTIOC : ULPT I/O Control Register](#).

Note 1. Timer mode: The internal clock (ULPTLCLK or ULPTSCLK) is used as the count source. The counter is decremented by 1 on each rising edge of the count source.

Event counter mode: The external event input (ULPTEVIn pin) is used as the count source. The counter is decremented on each edge of the count source. The edge polarity can be selected by the TEDGPL bit and the ULPTMR3.TEVPOL bit.

For details, see [section 23.4.1. Count operation](#).

Note 2. The TCK1 bit can be changed only when the ULPTMR2.CKS[2:0] bits are 000. Otherwise, do not change the bit. Set the ULPTMR2.CKS[2:0] bits to 000, and then change the TCK1 bit after one cycle of the count source.

The ULPTMR1 register sets the operating mode of the ULPT.

The ULPTMR1 register is only available for 8-bit read/write access.

23.3.6 ULPTMR2 : ULPT Mode Register 2

Base address: $ULPTn = 0x4022_0000 + 0x0100 \times n$ ($n = 0, 1$)
 $ULPTn_NS = 0x5022_0000 + 0x0100 \times n$ ($n = 0, 1$)

Offset address: 0x0E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	LPM	—	—	—	—	CKS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	CKS[2:0]	ULPTLCLK/ULPTSCLK Count Source Clock Division Ratio ^{*1*2} 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128 This bit is valid only in timer mode (ULPTMR1.TMOD1 = 0)	R/W
6:3	—	These bits are read as 0. The write value should be 0.	R/W
7	LPM	Low Power Mode 0: Normal mode 1: Low power mode	R/W

Note: S-TYPE-3, P-TYPE-3

Note: Do not rewrite this register while the counter is running. Rewrite this register only when the counter is stopped (both the TSTART and TCSTF bits of the ULPTCR register are set to 0).

Note 1. The CKS[2:0] bits can be changed only in timer mode (ULPTMR1.TMOD1 = 0).
 Set the CKS[2:0] bits to 000 in event counter mode (ULPTMR1.TMOD1 = 1).

Note 2. The ULPTMR1.TCK1 bit can be changed only when the CKS[2:0] bits are 000. Set the CKS[2:0] bits to 000, and then change the ULPTMR1.TCK1 bit after one cycle of the count source.

The ULPTMR2 register sets the operating mode of the ULPT.

The ULPTMR2 register is only available for 8-bit read/write access.

LPM bit (Low Power Mode)

This bit implements low power consumption by restricting the register access. Set this bit to 1 for low-power mode operation.

When this bit is 1, access to the following registers is prohibited:

- ULPTCNT, ULPTCMA, ULPTCMB, and ULPTCR

After this bit is switched from 1 to 0, the first access to an access-prohibited register is restricted as follows:

- ULPTCNT: The register must be read twice. Only the second reading of data is valid.
- ULPTCNT, ULPTCMA, ULPTCMB, ULPTCR: In write access, leave two cycles of the count source.

23.3.7 ULPTMR3 : ULPT Mode Register 3

Base address: ULPTn = 0x4022_0000 + 0x0100 × n (n = 0, 1)
 ULPTn_NS = 0x5022_0000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0F

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TEEPOL[1:0]	TEECTL[1:0]	—	TOPO L	TEVP OL	TCNT CTL		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TCNTCTL	Count Function Select ^{*1*2} 0: Continuous mode 1: One-shot mode	R/W
1	TEVPOL	ULPTEVIn Polarity Switch 0: External event input (ULPTEVIn pin) 1: External event input (ULPTEVIn pin) in reverse This bit is valid only in event counter mode (ULPTMR1.TMOD1 = 1).	R/W

Bit	Symbol	Function	R/W
2	TOPOL	ULPTOn Polarity Select* ³ 0: Start the ULPTOn output with low level. 1: Start the ULPTOn output with high level.	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
5:4	TEECTL[1:0]	ULPTEEn Function Select* ¹ 0 0: Count enable mode 1 0: Count start mode 1 1: Count restart mode Other settings are prohibited. The count enable mode is valid only in event counter mode (ULPTMR1.TMOD1 = 1).	R/W
7:6	TEEPOL[1:0]	ULPTEEn Edge Polarity Select 0 0: Rising edge 0 1: Falling edge 1 0: Both edges Other settings are prohibited. This bit is valid only in count start mode or count restart mode. (TEECTL[1:0] = 10 or 11)	R/W

Note: S-TYPE-3, P-TYPE-3

Note: Do not rewrite this register while the counter is running. Rewrite this register only when the counter is stopped (both the TSTART and TCSTF bits of the ULPTCR register are set to 0).

Note 1. For details, see [section 23.4.1. Count operation](#).

Note 2. Continuous mode: After starting counting, the counter continues to count down (reload value to underflow) repeatedly until the counter stops.

One-shot mode: After starting counting, the counter counts down once (reload value to underflow).

Note 3. When data is set to the ULPTMR1 register or 1 is set to the ULPTCR.TSTOP bit, the ULPTOn output is initialized.

The ULPTMR3 register sets the operating mode of the ULPT.

The ULPTMR3 register is only available for 8-bit read/write access.

TEECTL[1:0] bits (ULPTEEn Function Select)

The ULPTEEn pin functions differently depending on the mode. For details, see [section 23.4.1. Count operation](#).

In count enable mode, external events are counted while the ULPTEEn pin is valid. (The duration can be selected by the ULPTIOC.TIOGT0 bit, and the polarity can be selected by the ULPTISR.RCCPSEL2 bit.)

In count start mode, the counter starts counting at an edge trigger at the ULPTEEn pin. The operation of the ULPTEEn pin differs depending on the TSTART and TCSTF bits of the ULPTCR register.

In count restart mode, the counter starts counting at the first edge trigger at the ULPTEEn pin and resets the count at the second or following edge trigger. The operation of the ULPTEEn pin differs depending on the TSTART and TCSTF bits of the ULPTCR register.

[Table 23.3](#) shows the operation of the ULPTEEn pin in count start or count restart mode.

Table 23.3 Operation of the ULPTEEn pin in count start mode or count restart mode

TEECTL[1:0]	ULPTCR.TSTART	ULPTCR.TCSTF	Function of the ULPTEEn pin and counter operation
10 (count start mode)	0 (stop the counter)	—	The edge input at the ULPTEEn pin is invalid. The counter remains stopped.
	1 (start the counter)	0 (counter stopped)	The counter starts counting from the reload value on the edge input at the ULPTEEn pin.
	1 (start the counter)	1 (counter running)	The edge input at the ULPTEEn pin is invalid. The counter continues to count.
11 (count restart mode)	0 (stop the counter)	—	The edge input at the ULPTEEn pin is invalid. The counter remains stopped.
	1 (start the counter)	0 (counter stopped)	The counter starts counting from the reload value on the edge input at the ULPTEEn pin.
	1 (start the counter)	1 (counter running)	The counter is reset on the edge input at the ULPTEEn pin, and it starts counting again from the reload value.

Note: The edge polarity of the ULPTEEn pin can be selected by the TEEPOL[1:0] bits.

23.3.8 ULPTIOC : ULPT I/O Control Register

Base address: ULPTn = 0x4022_0000 + 0x0100 × n (n = 0, 1)
 ULPTn_NS = 0x5022_0000 + 0x0100 × n (n = 0, 1)

Offset address: 0x10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	TIOGT 0	TIPF[1:0]	—	TOE	—	—	—

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
1:0	—	These bits are read as 0. The write value should be 0.	R/W
2	TOE	ULPTOn Output Enable 0: Disable the ULPTOn output. 1: Enable the ULPTOn output.	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
5:4	TIPF[1:0]	ULPTEVIn Input Filter*2 0 0: No filter 0 1: Filter sampling at PCLKB 1 0: Filter sampling at PCLKB/8 1 1: Filter sampling at PCLKB/32 This bit is valid only in event counter mode (ULPTMR1.TMOD1 = 1).	R/W
6	TIOGT0	ULPTEVIn Count Control*1 0: Always count external events. 1: Count external events while the ULPTEVIn pin is valid. This bit is valid only in event counter mode (ULPTMR1.TMOD1 = 1) and count enable mode (ULPTMR3.TEECTL[1:0] = 00).	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Note: Do not rewrite this register while the counter is running. Rewrite this register only when the counter is stopped (both the TSTART and TCSTF bits of the ULPTCR register are set to 0).

Note 1. The polarity for counting external events can be selected by the ULPTISR.RCCPSEL2 bit.

Note 2. Set the TIPF[1:0] bits to 00 before entering Software Standby mode or Deep Software Standby mode1.

The ULPTIOC register controls the input/output of the ULPT.

The ULPTIOC register is only available for 8-bit read/write access.

TIPF[1:0] bits (ULPTEVIn Input Filter)

These bits are used to specify the sampling frequency of the ULPTEVIn input filter. Input to the ULPTEVIn pin is sampled. When a value matches three consecutive times, the value is regarded as the input value.

23.3.9 ULPTISR : ULPT Event Pin Select Register

Base address: ULPTn = 0x4022_0000 + 0x0100 × n (n = 0, 1)
 ULPTn_NS = 0x5022_0000 + 0x0100 × n (n = 0, 1)

Offset address: 0x11

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	RCCP SEL2	—	—

Value after reset: 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
1:0	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
2	RCCPSEL2	ULPTEEn Polarity Select 0: Count external events when low level. 1: Count external events when high level. This bit is valid only in event counter mode (ULPTMR1.TMOD1 = 1), count enable mode (ULPTMR3.TEECTL[1:0] = 00), and when ULPTIOC.TIOGT0 = 1.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Note: Do not rewrite this register while the counter is running. Rewrite this register only when the counter is stopped (both the TSTART and TCSTF bits of the ULPTCR register are set to 0).

The ULPTISR register sets the polarity of the ULPTEEn pin.

The ULPTISR register is only available for 8-bit read/write access.

23.3.10 ULPTCMSR : ULPT Compare Match Function Select Register

Base address: $ULPTn = 0x4022_0000 + 0x0100 \times n$ ($n = 0, 1$)
 $ULPTn_NS = 0x5022_0000 + 0x0100 \times n$ ($n = 0, 1$)

Offset address: 0x12

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	TOPO LB	TOEB	TCME B	—	TOPO LA	TOEA	TCME A
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TCMEA	Compare Match A Register Enable* ¹ 0: Disable compare match A register. 1: Enable compare match A register.	R/W
1	TOEA	ULPTOAn Output Enable 0: Disable the ULPTOAn output. 1: Enable the ULPTOAn output.	R/W
2	TOPOLA	ULPTOAn Polarity Select* ² 0: Start the ULPTOAn output with low. 1: Start the ULPTOAn output with high.	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	TCMEB	Compare Match B Register Enable* ¹ 0: Disable compare match B register. 1: Enable compare match B register.	R/W
5	TOEB	ULPTOBn Output Enable 0: Disable the ULPTOBn output. 1: Enable the ULPTOBn output.	R/W
6	TOPOLB	ULPTOBn Polarity Select* ² 0: Start the ULPTOBn output with low. 1: Start the ULPTOBn output with high.	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Note: Do not rewrite this register while the counter is running. Rewrite this register only when the counter is stopped (both the TSTART and TCSTF bits of the ULPTCR register are set to 0).

Note 1. When 1 (stop the counter forcibly) is set to the ULPTCR.TSTOP bit, the TCMEA, and TCMEB bits are set to 0.

Note 2. When data is set to the ULPTMR1 register or 1 is set to the ULPTCR.TSTOP bit, the ULPTOAn and ULPTOBn output is initialized.

The ULPTCMSR register controls the interrupt request signal and input/output of compare match A and compare match B.

The ULPTCMSR register is only available for 8-bit read/write access.

23.4 Operation

23.4.1 Count operation

The counter is decremented by one on each edge of the count source. When the count value reaches 0x00000000 and the next edge of the count source is input, an interrupt request of underflow is generated. The count operation is set by the ULPTMR1 register and the ULPTMR3 register. [Table 23.4](#) lists the count operations.

Table 23.4 Count operation

Section No.	Count operation			Count source	ULPTMR1 register		ULPTMR3 register					
	Mode 1	Mode 2	Mode 3		TMOD1	TCK1	TCNTCTL	TEECTL[1:0]				
section 23.4.1.1. Timer & continuous mode	Timer	Continuous	—	ULPTLCLK/ ULPTSCLK	0	0 : ULPTLCLK 1 : ULPTSCLK	0	00				
section 23.4.1.5. Common & continuous & count start mode			Count start					10				
section 23.4.1.6. Common & continuous & count restart mode			Count restart					11				
section 23.4.1.2. Timer & one-shot mode		One-shot	—					ULPTEVIn pin	1	Don't care	0	00

section 23.4.1.3. Event counter & continuous & count enable mode	Event counter	Continuous	Count enable	ULPTEVIn pin	1	Don't care	0					00
section 23.4.1.5. Common & continuous & count start mode			Count start									10
section 23.4.1.6. Common & continuous & count restart mode			Count restart									11
section 23.4.1.4. Event counter & one-shot & count enable mode		One-shot	Count enable					ULPTEVIn pin	1	Don't care	1	00
section 23.4.1.7. Common & one-shot & count start mode			Count start									10
section 23.4.1.8. Common & one-shot & count restart mode			Count restart									11

Note: For details about register settings, see [section 23.3.5. ULPTMR1 : ULPT Mode Register 1](#) and [section 23.3.7. ULPTMR3 : ULPT Mode Register 3](#).

[Mode 1]

The clock used as the count source is selected by the TMOD1 and TCK1 bits of the ULPTMR1 register.

Timer mode: The internal clock (ULPTLCLK or ULPTSCLK) is used as the count source.

The counter is decremented on each rising edge of the count source.

Event counter mode: The external event input (ULPTEVIn pin) is used as the count source.

The counter is decremented on each edge of the count source.

The edge polarity can be selected by the ULPTMR1.TEDGPL bit and the ULPTMR3.TEVPOL bit.

[Mode 2]

The counter behavior is selected by the TCNTCTL bit of the ULPTMR3 register.

Continuous mode: After starting counting, the counter continues to count down (reload value to underflow) repeatedly until the counter stops.

One-shot mode: After starting counting, the counter counts down once (reload value to underflow).

[Mode 3]

The function of the ULPTEEn pin is selected by the TEECTL[1:0] bits of the ULPTMR3 register.

Count enable mode: External events are counted while the ULPTEEn pin is valid.

(This bit is valid only in event counter mode.)

Note: Because the ULPTEEn pin is synchronized with the count source, external events are counted after three cycles of the count source.

Count start mode: The counter starts counting at an edge trigger of the ULPTEEn pin.

The edge polarity of the ULPTEEn pin can be selected by the ULPTMR3.TEEPOL[1:0] bits.

Note: Because the ULPTEEn pin is synchronized and held with the count source, external events are counted after four cycles of the count source.

Count restart mode: The counter starts counting at the first edge trigger of the ULPTEEn pin.

The counter resets the count at the second or following edge trigger.

The edge polarity of the ULPTEEn pin can be selected by the ULPTMR3.TEEPOL[1:0] bits.

Note: Because the ULPTEEn pin is synchronized and held with the count source, external events are counted after four cycles of the count source.

23.4.1.1 Timer & continuous mode

This mode operates in timer mode only.

The counter continues to count down (reload value to underflow) repeatedly in synchronization with the count source.

When 1 is set to the ULPTCR.TSTART bit, the counter is started (with the ULPTCR.TCSTF bit set to 1).

When an underflow occurs, the counter counts down again from the reload value.

When 0 is set to the ULPTCR.TSTART bit, the counter is stopped (with the ULPTCR.TCSTF bit set to 0).

Figure 23.2 shows an operation example.

Figure 23.2 Operation example in timer & continuous mode

23.4.1.2 Timer & one-shot mode

This mode operates in timer mode only.

The counter counts down (reload value to underflow) once in synchronization with the count source.

When 1 is set to the ULPTCR.TSTART bit, the counter is started (with the ULPTCR.TCSTF bit set to 1).

When an underflow occurs, the counter is stopped (with the ULPTCR.TSTART bit set to 1 and the ULPTCR.TCSTF bit set to 0).

To restart the counter after the counter is stopped, perform the following procedure:

1. Read the ULPTCR.TUNDF bit to confirm that it is set to 1 (underflow occurred). This is to make sure that counting down is finished.
2. Write 0 to the ULPTCR.TSTART bit to stop the counter.
3. Write 1 to the ULPTCR.TSTART bit to start the counter.

When 0 is set to the ULPTCR.TSTART bit, the counter is stopped (with the ULPTCR.TCSTF bit set to 0).

Figure 23.3 shows an operation example.

Figure 23.3 Operation example in timer & one-shot mode

23.4.1.3 Event counter & continuous & count enable mode

This mode operates in event counter mode only.

The counter continues to count down (reload value to underflow) repeatedly in synchronization with the count source. The duration in which the count source is counted can be specified by the ULPTIOC.TIOGT0 bit and ULPTISR.RCCPSEL2 bit.

When 1 is set to the ULPTCR.TSTART bit, the counter is started (with the ULPTCR.TCSTF bit set to 1).

When an underflow occurs, the counter counts down again from the reload value.

When 0 is set to the ULPTCR.TSTART bit, the counter is stopped (with the ULPTCR.TCSTF bit set to 0).

Figure 23.4 shows an operation example when the ULPTIOC.TIOGT0 bit is set to 0, and Figure 23.5 and Figure 23.6 show operation examples when the ULPTIOC.TIOGT0 bit is set to 1.

Figure 23.4 Operation example in event counter & continuous & count enable mode (with the ULPTIOC.TIOGT0 bit set to 0)

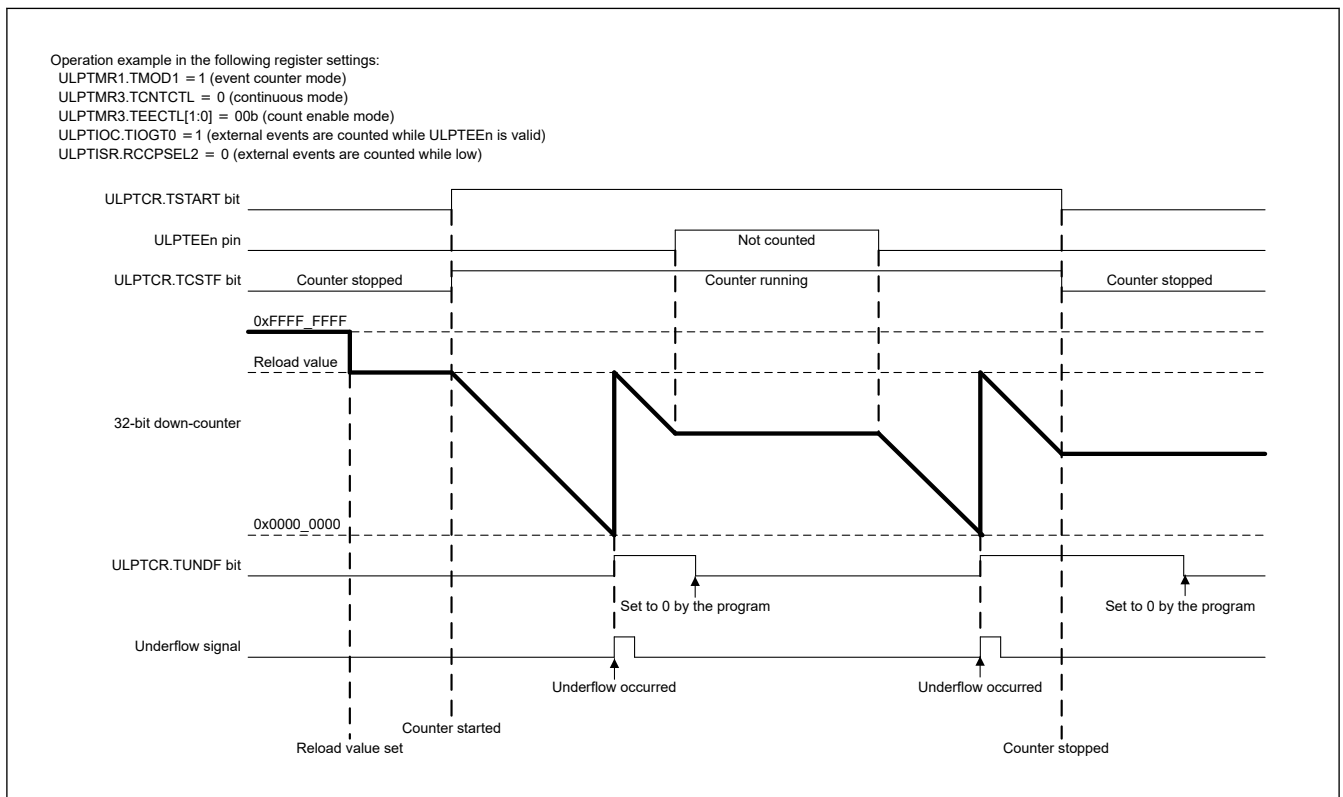

Figure 23.5 Operation example 1 in event counter & continuous & count enable mode (with the ULPTIOC.TIOGT0 bit set to 1)

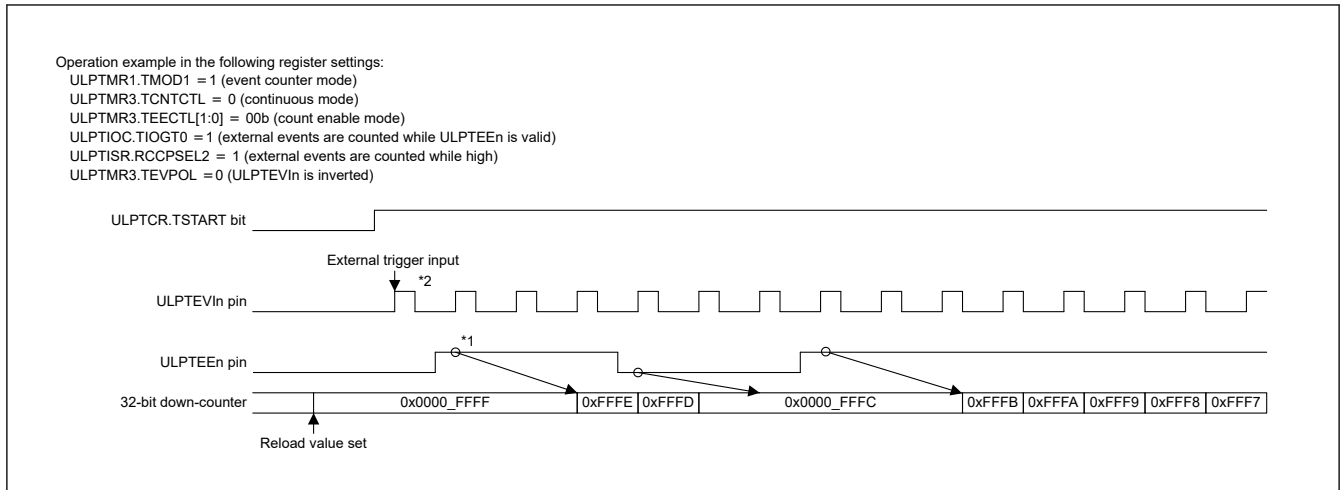

Figure 23.6 Operation example 2 in event counter & continuous & count enable mode (with the ULPTIOC.TIOGT0 bit set to 1)

Note 1. When synchronization is controlled, there is a delay by two cycles of count source until external events are actually counted. In addition, the count start timing may be shifted by one cycle due to the phase difference between the ULPTEEn pin and the sampling clock.

Note 2. Depending on the state before the counter is stopped, counting may be performed during two cycles of the count source immediately after the counter is started.

To disable the counting operation during two cycles immediately after the counter is started, set 1 to the ULPTCR.TSTOP bit to initialize the internal circuits, and then finish the operation settings before starting the counter.

23.4.1.4 Event counter & one-shot & count enable mode

This mode operates in event counter mode only.

The counter counts down (reload value to underflow) once in synchronization with the count source. The duration in which the count source is counted can be specified by the ULPTIOC.TIOGT0 bit and ULPTISR.RCCPSEL2 bit.

When 1 is set to the ULPTCR.TSTART bit, the counter is started (with the ULPTCR.TCSTF bit set to 1).

When an underflow occurs, the counter is stopped (with the ULPTCR.TSTART bit set to 1 and the ULPTCR.TCSTF bit set to 0).

To restart the counter after the counter is stopped, perform the following procedure:

1. Read the ULPTCR.TUNDF bit to confirm that it is set to 1 (underflow occurred). This is to make sure that counting down is finished.
2. Write 0 to the ULPTCR.TSTART bit to stop the counter.
3. Write 1 to the ULPTCR.TSTART bit to start the counter.

When 0 is set to the ULPTCR.TSTART bit, the counter is stopped (with the ULPTCR.TCSTF bit set to 0).

Figure 23.7 shows an operation example when the ULPTIOC.TIOGT0 bit is set to 00, and Figure 23.8 shows an operation example when the ULPTIOC.TIOGT0 bit is set to 01.

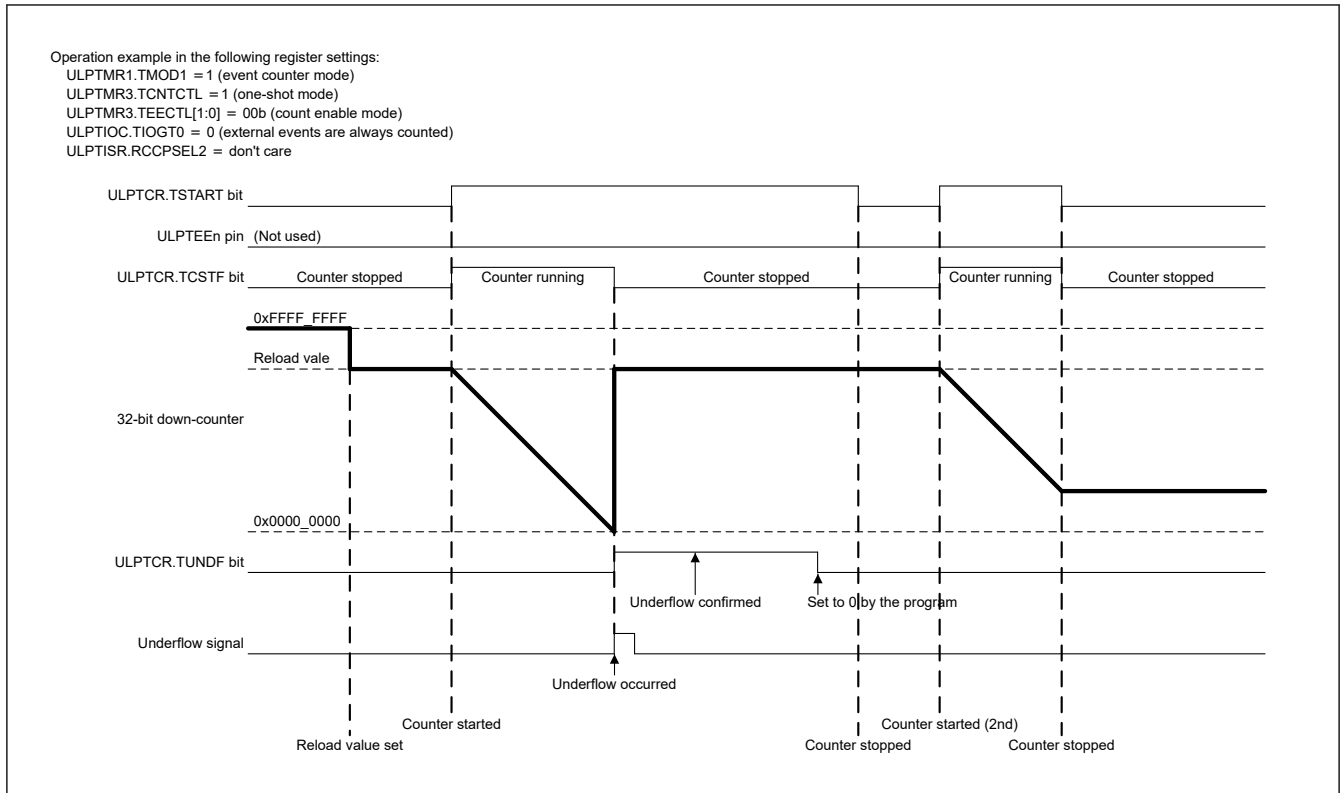

Figure 23.7 Operation example in event counter & one-shot & count enable mode (with the ULPTIOC.TIOGT0 bit set to 0)

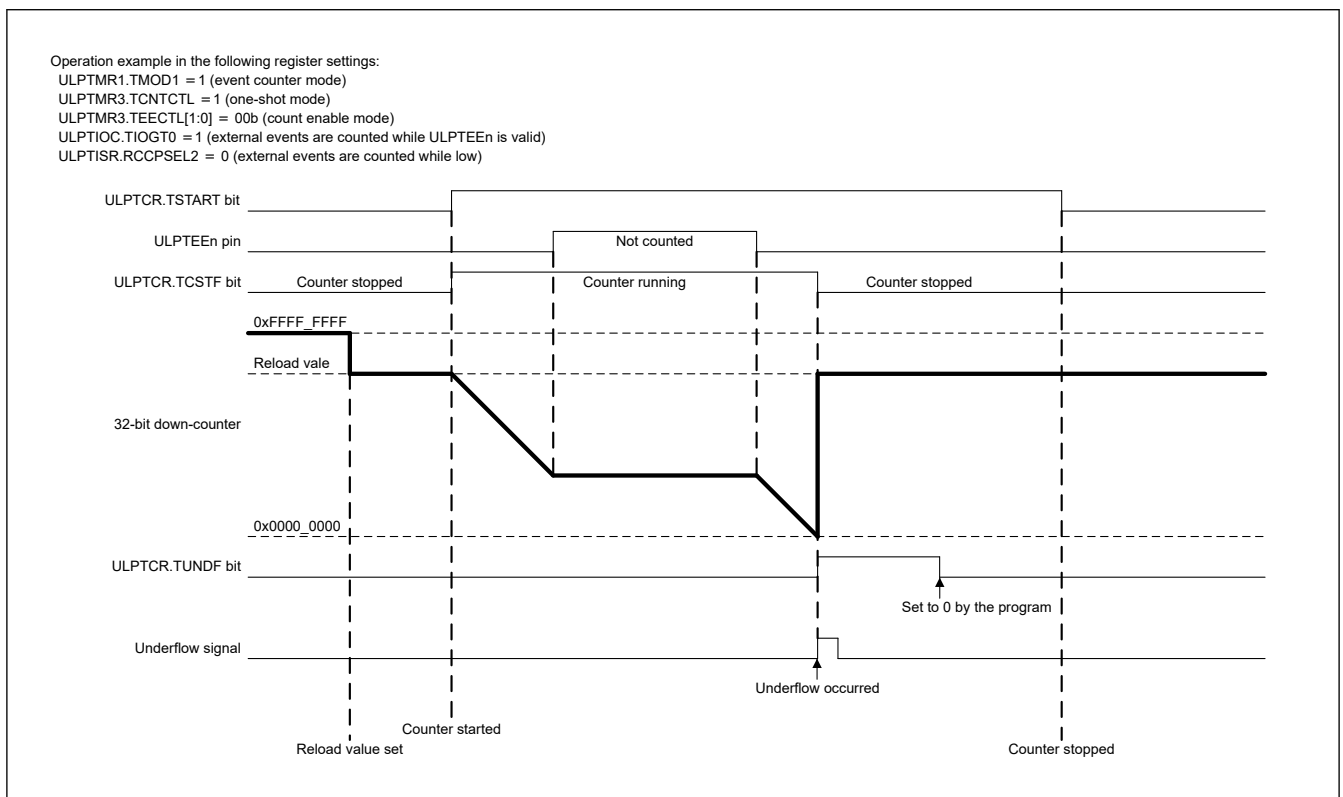

Figure 23.8 Operation example in event counter & one-shot & count enable mode (with the ULPTIOC.TIOGT0 bit set to 1)

23.4.1.5 Common & continuous & count start mode

This mode operates in both timer mode and event counter mode.

The counter continues to count down (reload value to underflow) repeatedly in synchronization with the count source.

After 1 is set to the ULPTCR.TSTART bit, the counter is started (with the ULPTCR.TCSTF bit set to 1) by an edge trigger at the ULPTEEn pin.

When an underflow occurs, the counter counts down again from the reload value.

When 0 is set to the ULPTCR.TSTART bit, the counter is stopped (with the ULPTCR.TCSTF bit set to 0).

Figure 23.9 shows an operation example.

Figure 23.9 Operation example in common & continuous & count start mode

23.4.1.6 Common & continuous & count restart mode

This mode operates in both timer mode and event counter mode.

The counter continues to count down (reload value to underflow) repeatedly in synchronization with the count source.

After 1 is set to the ULPTCR.TSTART bit, the counter is started (with the ULPTCR.TCSTF bit set to 1) by an edge trigger at the ULPTEEn pin.

On an edge trigger input at the ULPTEEn pin when the counter is running (with ULPTCR.TCSTF bit set to 1), the counter is reset and it starts counting again from the reload value.

If no edge trigger is input from the ULPTEEn pin and an overflow occurs, the counter starts counting again from the reload value.

When 0 is set to the ULPTCR.TSTART bit, the counter is stopped (with the ULPTCR.TCSTF bit set to 0).

Figure 23.10 shows an operation example.

Figure 23.10 Operation example in common & continuous & count restart mode

23.4.1.7 Common & one-shot & count start mode

This mode operates in both timer mode and event counter mode.

The counter counts down (reload value to underflow) once in synchronization with the count source.

After 1 is set to the ULPTCR.TSTART bit, the counter is started (with the ULPTCR.TCSTF bit set to 1) by an edge trigger at the ULPTEEn pin.

When an underflow occurs, the counter is stopped (with the ULPTCR.TSTART bit set to 1 and the ULPTCR.TCSTF bit set to 0).

On an edge trigger input at the ULPTEEn pin when the counter is running (with ULPTCR.TSTART bit set to 1 and the ULPTCR.TCSTF bit set to 0), the counter starts counting down again from the reload value.

When 0 is set to the ULPTCR.TSTART bit, the counter is stopped (with the ULPTCR.TCSTF bit set to 0).

Figure 23.11 shows an operation example.

Figure 23.11 Operation example in common & one-shot & count start mode

23.4.1.8 Common & one-shot & count restart mode

This mode operates in both timer mode and event counter mode.

The counter counts down (reload value to underflow) once in synchronization with the count source.

After 1 is set to the ULPTCR.TSTART bit, the counter is started (with the ULPTCR.TCSTF bit set to 1) by an edge trigger of the ULPTEEn pin.

On an edge trigger input at the ULPTEEn pin when the counter is running (with ULPTCR.TCSTF bit set to 1), the counter is reset and it starts counting again from the reload value.

If no edge trigger is input at the ULPTEEn pin and an underflow occurs, the counter is stopped (with the ULPTCR.TSTART bit set to 1 and the ULPTCR.TCSTF bit set to 0).

On an edge trigger input at the ULPTEEn pin when the counter is running (with ULPTCR.TSTART bit set to 1 and the ULPTCR.TCSTF bit set to 0), the counter starts counting down again from the reload value.

When 0 is set to the ULPTCR.TSTART bit, the counter is stopped (with the ULPTCR.TCSTF bit set to 0).

Figure 23.12 shows an operation example.

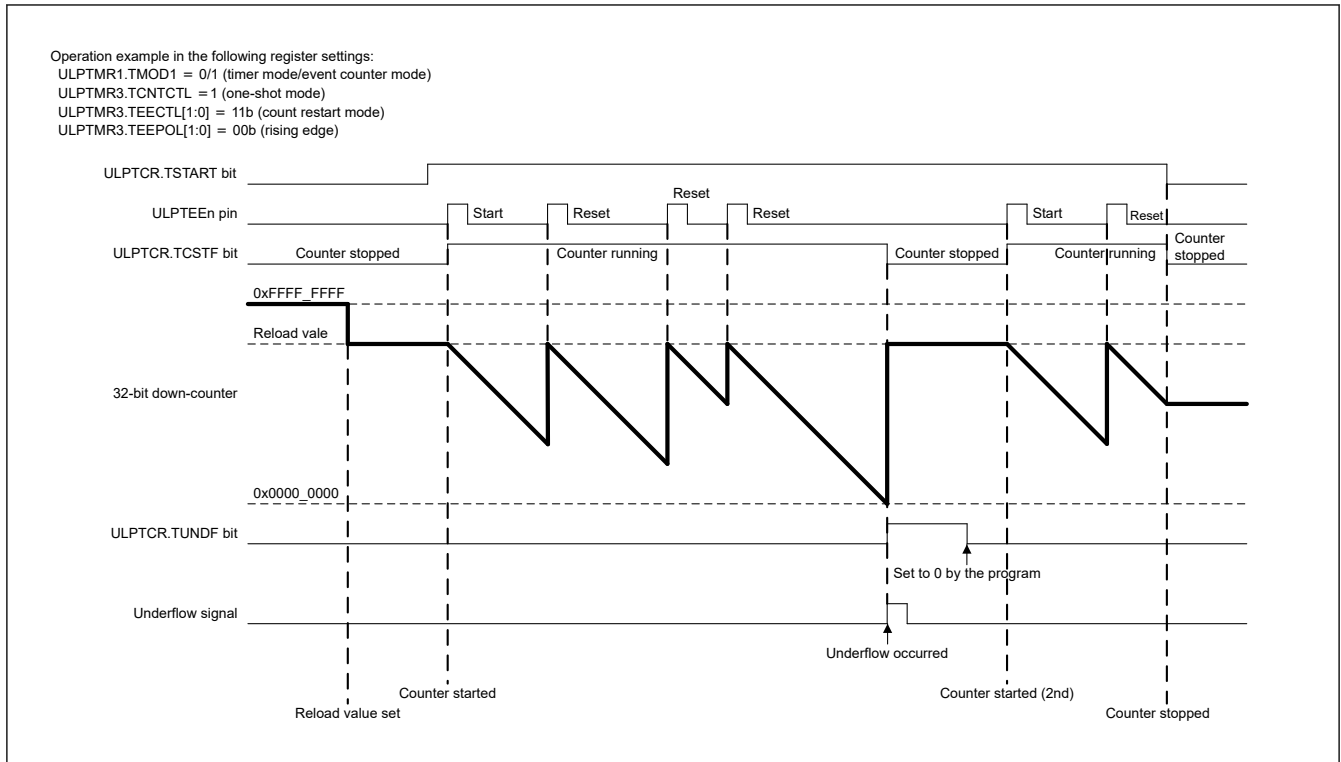

Figure 23.12 Operation example in common & one-shot & count restart mode

23.4.2 Rewriting the counter and reload register

Regardless of the operating mode, the counter and reload register rewrite timing changes depending on the TSTART and TCSTF bits of the ULPTCR register, the TCMEA and TCMEB bits of the ULPTCMSR register, and the TEECTL[1:0] bits of the ULPTMR3 register.

Condition A: When the counter is stopped (both the TSTART and TCSTF bits of the ULPTCR register are set to 0)

A reload value is written directly to the counter and the reload register.

Condition B: When the counter is running (with the ULPTCR.TCSTF bit set to 1) and the compare match A/B registers are disabled (with both the TCMEA and TCMEB bits of the ULPTCR register set to 0)

After a reload value is written to the ULPTCNT register, the reload value is set first to the reload register, then to the counter in synchronization with the count source.

Condition C: When the counter is running (with the ULPTCR.TCSTF bit set to 1) and the compare match A/B registers are enabled (with either the TCMEA bit or the TCMEB bit of the ULPTCR register set to 1)

After a reload value is written to the ULPTCNT register, the reload value is written to the reload register in synchronization with the count source. Then, the reload value is set to the counter in synchronization with an underflow.

Condition D: When the counter is running (with ULPTCR.TCSTF bit set to 1) and when the count restart mode is enabled (with the ULPTMR3.TEECTL[1:0] bits set to 11)

After an edge trigger is an input from the ULPTEEn pin, the reload value set in the reload register is set to the counter in synchronization with the count source. In this condition, the reload register is not rewritten.

Figure 23.13 to Figure 23.15 show the counter and reload register rewrite timing.

Figure 23.13 Counter and reload rewrite timing (under condition A or B)

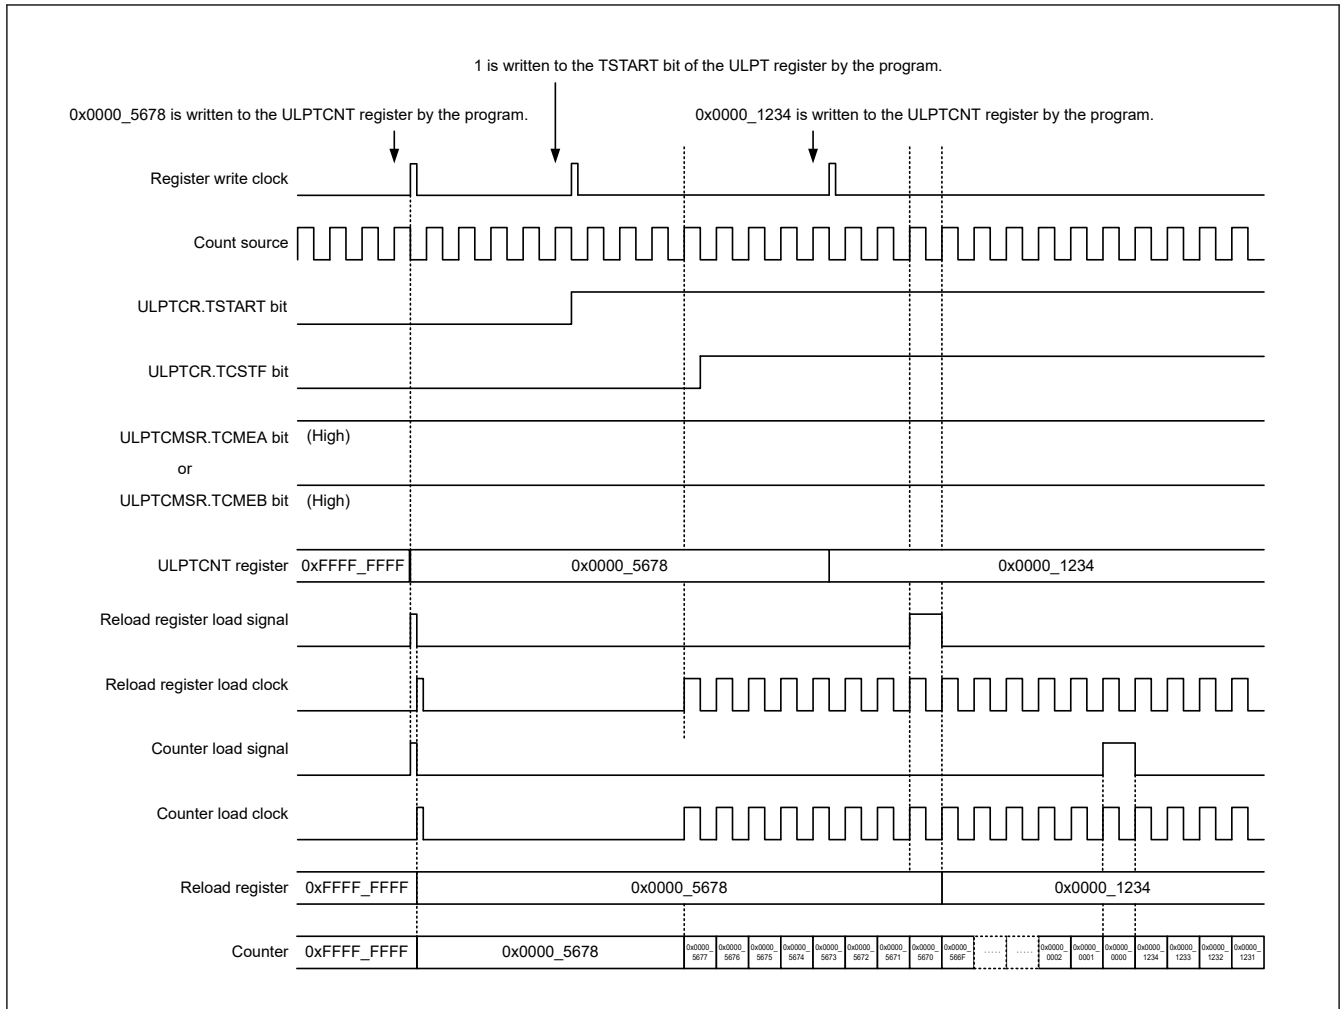

Figure 23.14 Counter and reload rewrite timing (under condition A or C)

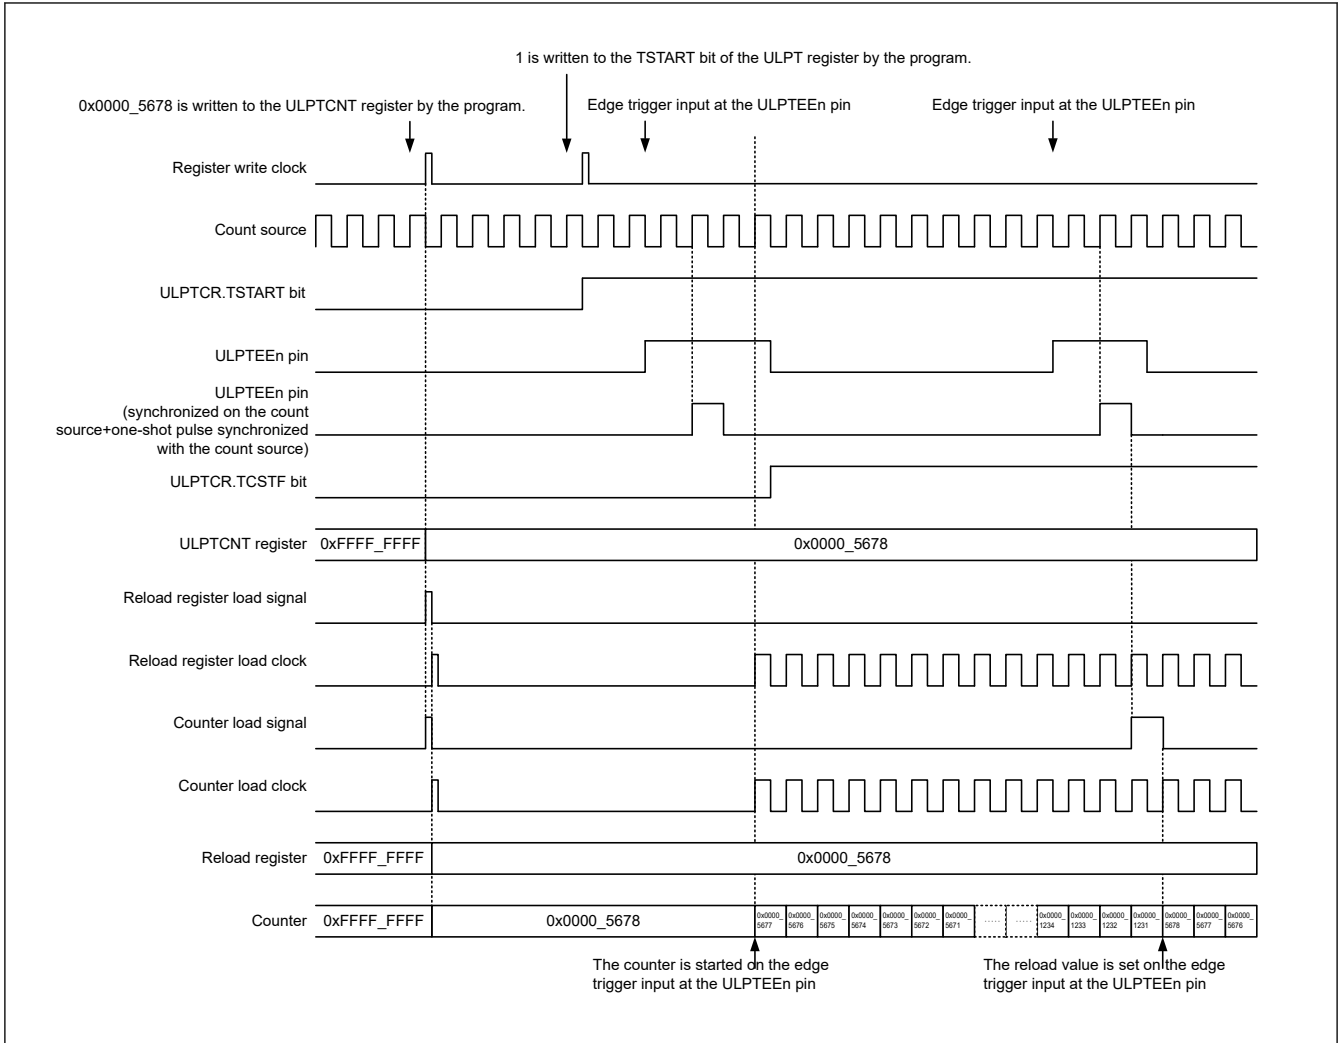

Figure 23.15 Counter and reload rewrite timing (under condition D)

23.4.3 Rewriting the compare circuits and reload registers for compare match A/B

Regardless of the operating mode, the rewrite timing for the compare circuits and reload registers for compare match A/B changes depending on the TSTART and TCSTF bits of the ULPTCR register.

Condition A: When the counter is stopped (both the TSTART and TCSTF bits of the ULPTCR register are set to 0)

Compare match A/B values are written directly to the compare circuits and reload registers.

Condition B: When the counter is running (with the ULPTCR.TCSTF bit set to 1)

After compare match A/B values are written to the ULPTCMA and ULPTCMB registers, the compare match A/B values are written to the reload registers in synchronization with the count source. Then, the compare match A/B values are written to the compare circuits in synchronization with an underflow.

Figure 23.16 shows the rewrite timing for the compare circuit and reload register for compare match A.

The timing for compare match B is similar to that for compare match A.

Figure 23.16 Rewrite timing for the compare circuit and reload register for compare match A

23.4.4 Pulse output

Regardless of the operating mode, the ULPTOn pin can output pulses. The output level is inverted each time the counter underflows. The pulse output from the ULPTOn pin can be stopped by the ULPTIOC.TOE bit. The initial value of the output level can be selected by the ULPTMR3.TOPOL bit.

Figure 23.17 shows an operation example of pulse output.

Figure 23.17 Operation example of pulse output

23.4.5 Compare match function

This function detects a match (compare match) between the ULPTCMA/ULPTCMB register contents and the ULPTCNT register contents. This function is enabled when the TCMEA or TCMEB bit of the ULPTCMSR register is set to 1 (the compare match A/B registers are enabled).

The counter is decremented in synchronization with the count source selected by the TMOD1/TCK1 bits of the ULPTMR1 register. When the ULPTCNT register value matches the ULPTCMA or ULPTCMB register value, the TCMAF or TCMBF bit of the ULPTCR register is set to 1 and an interrupt request is generated.

The counter and reload register rewrite timing differs depending on whether the compare match function is enabled. For details, see [section 23.4.2. Rewriting the counter and reload register](#).

The output level of the ULPTOAn/ULPTOBn pin is inverted upon a match or underflow. The output level can be selected by the ULPTOAn/ULPTOBn bit of the ULPTCMSR register.

Figure 23.18 shows an operation example of the compare match function.

Figure 23.18 Operation example of the compare match function (both the TOPOLA and TOPOLB bits of the ULPTCMSR register are set to 0)

23.4.6 Input and output settings for each mode

Table 23.5 to Table 23.9 show the states of the input pins (ULPTEEn and ULPTEVIn) and output pins (ULPTOn, ULPTOAn, and ULPTOBn) in each mode.

Table 23.5 ULPTEEn pin settings

Operating mode		ULPTMR1 register	ULPTMR3 register	ULPTEEn pin input
		TMOD1 bit	TEECTL[1:0] bit	
Timer mode	-	0	00	Input disabled
	Count start		10	Normal input
	Count restart		11	
Event counter mode	Count enable	1	00	
	Count start		10	
	Count restart		11	

Table 23.6 ULPTEVIn pin settings

Operating mode	ULPTMR1 register	ULPTMR3 register	ULPTEVIn pin input
	TMOD1 bit	TEVPOL bit	
Timer mode	0	0 or 1	Input disabled
Event counter mode	1	0	Normal input
		1	Inverted input

Table 23.7 ULPTOn pin settings

Operating mode	ULPTIOC register	ULPTMR3 register	ULPTOn pin output
	TOE bit	TOPOL bit	
All modes	1	1	Inverted output
		0	Normal output
	0	0 or 1	Output disabled

Table 23.8 ULPTOAn pin settings

Operating mode	ULPTCMSR register		ULPTOAn pin output
	TOEA bit	TOPOLA bit	
All modes	1	1	Inverted output
		0	Normal output
	0	0 or 1	Output disabled

Table 23.9 ULPTOBn pin settings

Operating mode	ULPTCMSR register		ULPTOBn pin output
	TOEB bit	TOPOLB bit	
All modes	1	1	Inverted output
		0	Normal output
	0	0 or 1	Output disabled

23.4.7 Standby mode

The ULPT can operate in Software Standby mode or Deep Software Standby mode¹. Set it to each Standby mode with count operation start (ULPTCR.TSTART = 1, ULPTCR.TCSTF = 1).

[Table 23.10](#) lists the settings available in Software Standby mode or Deep Software Standby mode¹.

Table 23.10 Settings available in Software Standby mode or Deep Software Standby mode1

Section No.	Count operation			Count source	CPU recovery source
	Mode 1	Mode 2	Mode 3		
section 23.4.1.1. Timer & continuous mode	Timer	Continuous	—	ULPTLCLK, ULPTSCLK	<ul style="list-style-type: none"> • Underflow • Compare match A/B
section 23.4.1.5. Common & continuous & count start mode			Count start		
section 23.4.1.6. Common & continuous & count restart mode			Count restart		
section 23.4.1.2. Timer & one-shot mode		One-shot	—		
section 23.4.1.7. Common & one-shot & count start mode			Count start		
section 23.4.1.8. Common & one-shot & count restart mode			Count restart		
section 23.4.1.3. Event counter & continuous & count enable mode	Event counter	Continuous	Count enable	ULPTEVIn pin ^{*1}	<ul style="list-style-type: none"> • Underflow • Compare match A/B
section 23.4.1.5. Common & continuous & count start mode			Count start		
section 23.4.1.6. Common & continuous & count restart mode			Count restart		
section 23.4.1.4. Event counter & one-shot & count enable mode		One-shot	Count enable		
section 23.4.1.7. Common & one-shot & count start mode			Count start		
section 23.4.1.8. Common & one-shot & count restart mode			Count restart		

Note: The ULPT can operate in all modes even in Software Standby mode or Deep Software Standby mode1. For details about the count operations and register settings, see [section 23.4.1. Count operation](#).

Note 1. Only ULPTEVIn pin can be used in Deep Software Standby mode1.

Only in event counter mode (ULPTMR1.TMOD1 = 1), set the ULPTIOC.TIPF[1:0] bits to 00 (no filter) before entering standby mode.

In Software Standby mode or Deep Software Standby mode1, the digital filter clock (PCLKB) stops (the digital filter does not function).

It is prohibited to rewrite the ULPTCNT, ULPTCMA, and ULPTCMB registers immediately before setting each standby mode.

If the ULPTCNT, ULPTCMA, and ULPTCMB registers are rewritten while the counter is running, set each standby mode after four or more cycles of the count source.

23.4.8 Interrupt sources

The ULPT has three interrupt sources: ULPTI, ULPTCMAI, and ULPTCMBI.

[Table 23.11](#) lists the interrupt sources.

Table 23.11 ULPT interrupt sources

Name	Interrupt source	DMAC/DTC activation
ULPTn_ULPTI	When the counter underflows	Possible
ULPTn_ULPTCMAI	When the ULPTCNT value matches the ULPTCMA value	Possible
ULPTn_ULPTCMBI	When the ULPTCNT value matches the ULPTCMB value	Possible

23.4.9 Event output to the ELC

The ULPT is capable of link operation for a specified module via the event link controller (ELC) by using the interrupt request signal as an event signal.

The ULPT outputs an event signal when compare match A/compare match B or an underflow occurs. For details, see [section 18, Event Link Controller \(ELC\)](#).

23.5 Usage notes

23.5.1 Start and stop control of the counter

Condition A: In timer mode (ULPTMR1.TMOD1 = 0), continuous mode (ULPTMR3.TCNTCTL = 0), and count enable mode (ULPTMR3.TEECTL[1:0] = 00)

When the counter is stopped (with the TCSTF bit of the ULPTCR register set to 0), even if 1 (start the counter) is set to the TSTART bit of the ULPTCR register, the TCSTF bit remains at 0 (counter stopped) for five cycles of the count source.

Do not access the registers^{*1} related to the ULPT other than the TCSTF bit until the TCSTF bit is set to 1 (counter running).

When the counter is running (with the TCSTF bit set to 1), even if 0 (stop the counter) is set to the TSTART bit, the TCSTF bit remains at 1 (counter running) for five cycles of the count source.

Do not access the registers^{*1} related to the ULPT other than the TCSTF bit until the TCSTF bit is set to 0 (counter stopped).

Before changing the TSTART bit from 0 to 1, clear the interrupt register. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

Note 1. Registers related to the ULPT: ULPTCNT, ULPTCMA, ULPTCMB, ULPTCR, ULPTMR1, ULPTMR2, ULPTMR3, ULPTIOC, ULPTISR, and ULPTCMSR

Condition B: In event counter mode (ULPTMR1.TMOD1 = 1), continuous mode (ULPTMR3.TCNTCTL = 0), and count enable mode (ULPTMR3.TEECTL[1:0] = 00)

When the counter is stopped (with the TCSTF bit of the ULPTCR register set to 0), even if 1 (start the counter) is set to the TSTART bit of the ULPTCR register, the TCSTF bit remains at 0 (counter stopped) for two cycles of the count source.

Do not access the registers^{*1} related to the ULPT other than the TCSTF bit until the TCSTF bit is set to 1 (counter running).

When the counter is running (with the TCSTF bit set to 1), even if 0 (stop the counter) is set to the TSTART bit, the TCSTF bit remains at 1 (counter running) for two cycles of the count source.

Do not access the registers^{*1} related to the ULPT other than the TCSTF bit until the TCSTF bit is set to 0 (counter stopped).

Before changing the TSTART bit from 0 to 1, clear the interrupt register. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

Note 1. Registers related to the ULPT: ULPTCNT, ULPTCMA, ULPTCMB, ULPTCR, ULPTMR1, ULPTMR2, ULPTMR3, ULPTIOC, ULPTISR, and ULPTCMSR

Condition C: In count start mode or count restart mode (ULPTMR3.TEECTL[1:0] bits = 10 or 11)

When the counter is stopped (with the TCSTF bit of the ULPTCR register set to 0), even if 1 is set to the TSTART bit of the ULPTCR register and then the counter is started on an edge trigger of the ULPTEEn pin, the TCSTF bit remains at 0 (counter stopped) for five cycles of the count source.

Do not access the registers^{*1} related to the ULPT other than the TCSTF bit until the TCSTF bit is set to 1 (counter running).

When the counter is running (with the TCSTF bit set to 1), even if 0 (stop the counter) is set to the TSTART bit, the TCSTF bit remains at 1 (counter running) for five cycles of the count source.

Do not access the registers^{*1} related to the ULPT other than the TCSTF bit until the TCSTF bit is set to 0 (counter stopped).

Before changing the TSTART bit from 0 to 1, clear the interrupt register. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

Note 1. Registers related to the ULPT: ULPTCNT, ULPTCMA, ULPTCMB, ULPTCR, ULPTMR1, ULPTMR2, ULPTMR3, ULPTIOC, ULPTISR, and ULPTCMSR

23.5.2 Access to flags (TUNDF, TCMAF, and TCMBF bits in ULPTCR register)

It is recommended to set 1 to the TUNDF, TCMAF and TCMBF bits when changing the TSTART or TSTOP bits to prevent clearing TUNDF, TCMAF, or TCMBF by mistake. At this time, setting 1 to TUNDF, TCMAF and TCMBF bits is ignored.

23.5.3 Access to the ULPTCNT, ULPTCMA, and ULPTCMB registers

When setting to the same register sequentially while the counter is running (ULPTCR.TCSTF bit = 1), leave three or more cycles of count source between writes. The following registers are applicable:

- ULPTCNT
- ULPTCMA
- ULPTCMB

23.5.4 Mode changes

Registers related to the operating mode of the ULPT (ULPTMR1, ULPTMR2, ULPTMR3, ULPTIOC, ULPTISR, and ULPTCMSR) can be changed only while the counter is stopped (both the TSTART and TCSTF bits of the ULPTCR register are set to 0). Do not change these registers while the counter is running.

If a register related to the operating mode of the ULPT is changed, the values of the TUNDF, TCMAF, and TCMBF bits of the ULPTCR register are undefined. Before starting the counter, write 0 to the TUNDF, TCMAF, and TCMBF bits.

- TUNDF (no underflow)
- TCMAF (no match for compare match A)
- TCMBF (no match for compare match B)

23.5.5 Setting the ULPTOn, ULPTOAn, and ULPTOBn pins

To use the ULPTOn, ULPTOAn, and ULPTOBn pins as output pins, set up the ULPT, and then set PmnPFS.PMR bit to 1 after determining the initial output values.

23.5.6 Calculating the number of events

In event counter mode, the number of events is calculated by using the following formula:

Number of events = Initial counter value (ULPTCNT register write value) – Counter value at the end of a valid event

23.5.7 When the counter is stopped forcibly by the TSTOP bit

Do not access the ULPTCNT, ULPTCMA, ULPTCMB, ULPTCR, ULPTMR1, ULPTMR2, or ULPTMR3 register during one cycle of the count source after stopping the counter forcibly by the ULPTCR.TSTOP bit.

23.5.8 Digital filter

When using a digital filter, do not start the timer within five cycles of the digital filter clock after setting the ULPTIOC.TIPF[1:0] bits.

Also, when ULPTMR3.TEVPOL bit is changed while a digital filter is in use, do not start the timer within five cycles of the digital filter clock after setting the bit.

In Software Standby mode or Deep Software Standby mode1, the digital filter clock (PCLKB) stops and the digital filter does not function. Before entering Software standby mode or Deep Software Standby mode1, set the ULPTIOC.TIPF[1:0] bits to 00 (no filter).

23.5.9 Restrictions on Event Counting during Deep Software Standby Mode 1

If external events are to be counted continuously during Deep Software Standby mode 1, the ULPTEEn-DS and ULPTEVIn-DS pins should be held low during the transition to Deep Software Standby mode 1.

The device that generates the external events must be notified of the transition to Deep Software Standby mode 1 using the general I/O port.

An example of the procedure is shown below.(Examples of flow)

(a) Procedure on the MCU

1. During initial setup, set the port for notifying the external device as a general output port and output low.
2. Before transitioning to Deep Software Standby mode 1, set the PODR bit of the above port to 1.
3. Read the PODR bit and confirm that it is set to 1.
4. After 10 μ s has passed, execute the WFI instruction.

(b) Procedure on the External Device

1. When the above port goes high, hold the ULPTEEn-DS and ULPTEVIn-DS pins low within 10 μ s. If the time exceeds 10 μ s, add the excess time to the time in 4 above. If the time is less than 10 μ s, subtract the reduced time.
2. After 1 ms or more has passed, resume the event output.

23.5.10 Module-stop function

ULPT operation can be disabled or enabled using Module Stop Control Register E (MSTPCRE). The ULPT module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see [section 10, Low Power Modes](#).

23.5.11 Setting the ULPTEEn and ULPTEVIn pins

To use the ULPTEEn and ULPTEVIn pins as input pins, set up the ULPT, and then set PmnPFS.PMR bit to 1.

24. Realtime Clock (RTC)

24.1 Overview

The realtime clock (RTC) has two counting modes, calendar count mode and binary count mode, that are used by switching register settings. For calendar count mode, the RTC has a 100-year calendar from 2000 to 2099 and automatically adjusts dates for leap years. For binary count mode, the RTC counts seconds and retains the information as a serial value. Binary count mode can be used for calendars other than the Gregorian (Western) calendar.

The sub-clock oscillator or LOCO can be selected as the count source of the time counters. The RTC uses a 128-Hz clock acquired by dividing the count source by a prescaler. Year, month, date, day-of-week, a.m. /p.m. (in 12-hour mode), hour, minute, second, or 32-bit binary is counted by 1/128 second.

Table 24.1 lists the RTC specifications, Figure 24.1 shows a block diagram, and Table 24.2 lists the I/O pins.

Table 24.1 RTC specifications

Parameter	Specifications
Count mode	Calendar count mode/binary count mode
Count source*1	Sub-clock(XCIN), External clock input(EXCIN) or LOCO
Clock and calendar functions	<ul style="list-style-type: none"> • Calendar count mode <ul style="list-style-type: none"> – Year, month, date, day of week, hour, minute, second are counted, BCD display – 12 hours/24 hours mode switching function – 30 seconds adjustment function (a number less than 30 is rounded down to 00 seconds, and 30 seconds or more are rounded up to 1 minute) – Automatic adjustment function for leap years • Binary count mode <ul style="list-style-type: none"> – Count seconds in 32 bits, binary display • Shared by both modes <ul style="list-style-type: none"> – Start/stop function – The sub-second digit is displayed in binary units (1 Hz, 2 Hz, 4 Hz, 8 Hz, 16 Hz, 32 Hz, or 64 Hz) – Clock error correction function – Clock (1-Hz/64-Hz) output
Interrupts	<ul style="list-style-type: none"> • Alarm interrupt (RTC_ALM) <ul style="list-style-type: none"> – As an alarm interrupt condition, selectable for comparison with the following: <ul style="list-style-type: none"> • Calendar count mode: Year, month, date, day-of-week, hour, minute, or second can be selected • Binary count mode: Each bit of the 32-bit binary counter • Periodic interrupt (RTC_PRD) <ul style="list-style-type: none"> – 2 seconds, 1 second, 1/2 second, 1/4 second, 1/8 second, 1/16 second, 1/32 second, 1/64 second, 1/128 second, or 1/256 second can be selected as an interrupt period. • Carry interrupt (RTC_CUP) <ul style="list-style-type: none"> – An interrupt is generated at either of the following conditions: <ul style="list-style-type: none"> • When a carry from the 64-Hz counter to the second counter is generated. • When the 64-Hz counter is changed and the R64CNT register is read at the same time. (32-KHz count mode is only for 64-Hz counter reading) • Return from Software Standby or Deep Software Standby mode can be performed by the alarm interrupt or periodic interrupt
Time capture function	<ul style="list-style-type: none"> • Times can be captured when the edge of the time capture event input pin is detected. For every event input, month, date, hour, minute, and second are captured or the 32-bit binary counter value is captured. • Interrupt can be generated when the edge of the time capture event input is detected. The time capture event input pin and IRQ are shared.
Event link function	Periodic event output (RTC_PRD)
TrustZone filter	Security and Privilege attribution can be set

Note 1. The frequency of the peripheral module clock (PCLKB) \geq the frequency of the count source should be satisfied.

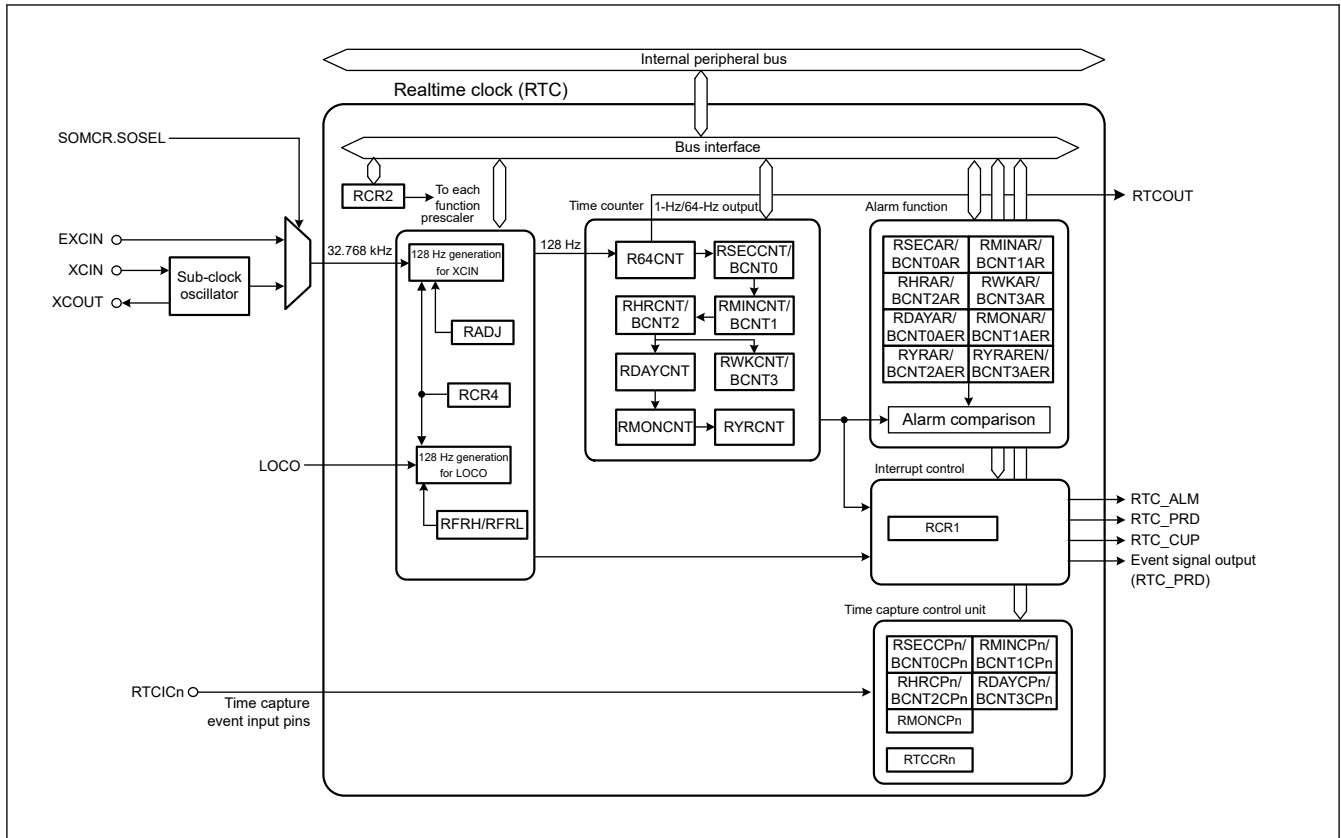

Figure 24.1 RTC block diagram

Table 24.2 RTC I/O pins

Pin name	I/O	Description
XCIN	Input	Connect a 32.768-kHz crystal to these pins
XCOU	Output	
EXCIN	Input	External sub-clock input
RTCOUT	Output	This pin is used to output a 1-Hz/64-Hz waveform, but not in Deep Software Standby mode
RTCICn (n = 0 to 2)	Input	Time capture event input pins RTCICn can be controlled by the VBTICTLR register. For more information, see section 11, Battery Backup Function and section 19, I/O Ports .

24.2 Register Descriptions

Write or read from the RTC registers as described in [section 24.6.5. Notes on Writing to and Reading from Registers](#).

If the value in an RTC register after a reset is given as x (undefined bits) in the list, it is not initialized by a reset. When RTC enters the reset state or a low power state during counting operations, for example, while the RCR2.START bit is 1, the year, month, day of the week, date, hours, minutes, seconds, and 64-Hz counters continue to operate.

Note: A reset generated while writing to a register might destroy the register value. In addition, do not allow the MCU to enter Software Standby mode, Deep Software Standby mode, or battery backup state immediately after setting any of these registers. For details, see [section 24.6.4. Transitions to Low Power Modes after Setting Registers](#).

24.2.1 R64CNT : 64-Hz Counter

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	F1HZ	F2HZ	F4HZ	F8HZ	F16HZ	F32HZ	F64HZ
Value after reset:	0	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
0	F64HZ	64-Hz Flag This bit indicates the 64-Hz state of the sub-second digit.	R
1	F32HZ	32-Hz Flag This bit indicates the 32-Hz state of the sub-second digit.	R
2	F16HZ	16-Hz Flag This bit indicates the 16-Hz state of the sub-second digit.	R
3	F8HZ	8-Hz Flag This bit indicates the 8-Hz state of the sub-second digit.	R
4	F4HZ	4-Hz Flag This bit indicates the 4-Hz state of the sub-second digit.	R
5	F2HZ	2-Hz Flag This bit indicates the 2-Hz state of the sub-second digit.	R
6	F1HZ	1-Hz Flag This bit indicates the 1-Hz state of the sub-second digit.	R
7	—	This bit is read as 0.	R

Note: S-TYPE3, P-TYPE3

The R64CNT counter is used in both calendar count mode and binary count mode. The 64-Hz counter (R64CNT) generates the period for a second by counting up periods of the 128-Hz clock. The state in the sub-second range can be confirmed by reading this counter.

This counter is set to 0x00 by an RTC software reset or an execution of a 30-second adjustment. To read this counter, follow the procedure in [section 24.3.5. Reading 64-Hz Counter and Time](#).

24.2.2 RSECCNT : Second Counter (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x02

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	SEC10[2:0]			SEC1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	SEC1[3:0]	1-Second Count Counts from 0 to 9 every second. When a carry is generated, 1 is added to the tens place.	R/W
6:4	SEC10[2:0]	10-Second Count Counts from 0 to 5 for 60-second counting.	R/W
7	—	The read value is undefined. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The RSECCNT counter sets and counts the BCD-coded second value. It counts the carries generated once per second in the 64-Hz counter.

The setting range is decimal 00 to 59. The RTC does not operate normally if any other value is set. Before writing to this register, you must stop the count operation using the START bit in RCR2.

To read this counter, follow the procedure in [section 24.3.5. Reading 64-Hz Counter and Time](#).

24.2.3 RMINCNT : Minute Counter (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x04

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—		MIN10[2:0]			MIN1[3:0]		
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	MIN1[3:0]	1-Minute Count Counts from 0 to 9 every minute. When a carry is generated, 1 is added to the tens place.	R/W
6:4	MIN10[2:0]	10-Minute Count Counts from 0 to 5 for 60-minute counting.	R/W
7	—	The read value is undefined. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The RMINCNT counter sets and counts the BCD-coded minute value. It counts the carries generated once every minute in the second counter.

A value from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 24.3.5. Reading 64-Hz Counter and Time](#).

24.2.4 RHRCNT : Hour Counter (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x06

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	PM	HR10[1:0]		HR1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	HR1[3:0]	1-Hour Count Counts from 0 to 9 once per hour. When a carry is generated, 1 is added to the tens place.	R/W
5:4	HR10[1:0]	10-Hour Count Counts from 0 to 2 once per carry from the ones place.	R/W
6	PM	AM/PM select for time counter setting. 0: AM 1: PM	R/W
7	—	The read value is undefined. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The RHRCNT counter sets and counts the BCD-coded hour value. It counts the carries generated once per hour in the minute counter. The specifiable time differs based on the setting in the hours mode bit (RCR2.HR24):

- When the RCR2.HR24 bit is 0 – from 00 to 11 (in BCD).
- When the RCR2.HR24 bit is 1 – from 00 to 23 (in BCD).

If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. The PM bit is only enabled when the RCR2.HR24 bit is 0.

Otherwise, the setting in the PM bit has no effect. To read this counter, follow the procedure in [section 24.3.5. Reading 64-Hz Counter and Time](#).

24.2.5 RWKCNT : Day-of-Week Counter (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x08

Value after reset: x x x x x x x x

Bit	Symbol	Function	R/W
2:0	DAYW[2:0]	Day-of-Week Counting 0 0 0: Sunday 0 0 1: Monday 0 1 0: Tuesday 0 1 1: Wednesday 1 0 0: Thursday 1 0 1: Friday 1 1 0: Saturday 1 1 1: Setting prohibited	R/W
7:3	—	The read values are undefined. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The RWKCNT counter sets and counts in the coded day-of-week value. It counts the carries generated once per day in the hour counter. A value from 0 through 6 can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 24.3.5. Reading 64-Hz Counter and Time](#).

24.2.6 BCNTn : Binary Counter n (n = 0 to 3) (in Binary Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x02 + 0x02 × n

Value after reset: x x x x x x x x

Bit	Symbol	Function	R/W
7:0	BCNT[7:0]	Binary Counter	R/W

Note: S-TYPE3, P-TYPE3

BCNTn is a read/write 8-bit register to access BCNT[31:0] that is a 32-bit binary counter. BCNT3 is assigned to the BCNT[31:24] bits, BCNT2 is assigned to the BCNT[23:16] bits, BCNT1 is assigned to the BCNT[15:8] bits, and BCNT0 is assigned to the BCNT[7:0] bits. BCNTn performs count operation by a carry generated for each second of the 64-Hz counter. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 24.3.5. Reading 64-Hz Counter and Time](#).

24.2.7 RDAYCNT : Day Counter

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x0A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	DATE10[1:0]	DATE1[3:0]				
Value after reset:	0	0	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	DATE1[3:0]	1-Day Count Counts from 0 to 9 once per day. When a carry is generated, 1 is added to the tens place.	R/W
5:4	DATE10[1:0]	10-Day Count Counts from 0 to 3 once per carry from the ones place.	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The RDAYCNT counter is used in calendar count mode to set and count the BCD-coded date value. It counts the carries generated once per day in the hour counter. The count operation depends on the month and whether the year is a leap year. Leap years are determined according to whether the year counter (RYRCNT) value is divisible by 400, 100, and 4.

A value from 01 through 31 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. When specifying a value, the range of specifiable days depends on the month and whether the year is a leap year. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 24.3.5. Reading 64-Hz Counter and Time](#).

24.2.8 RMONCNT : Month Counter

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x0C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	MON10	MON1[3:0]			
Value after reset:	0	0	0	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	MON1[3:0]	1-Month Count Counts from 0 to 9 once per month. When a carry is generated, 1 is added to the tens place.	R/W
4	MON10	10-Month Count Counts from 0 to 1 once per carry from the ones place.	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The RMONCNT counter is used in calendar count mode to set and count the BCD-coded month value. It counts the carries generated once per month in the date counter.

A value from 01 through 12 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 24.3.5. Reading 64-Hz Counter and Time](#).

24.2.9 RYRCNT : Year Counter

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x0E

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	YR10[3:0]				YR1[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	YR1[3:0]	1-Year Count Counts from 0 to 9 once per year. When a carry is generated, 1 is added to the tens place.	R/W
7:4	YR10[3:0]	10-Year Count Counts from 0 to 9 once per carry from ones place. When a carry is generated in the tens place, 1 is added to the hundreds place.	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The RYRCNT counter is used in calendar count mode to set and count the BCD-coded year value. It counts the carries generated once per year in the month counter.

A value from 00 through 99 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in [section 24.3.5. Reading 64-Hz Counter and Time](#).

24.2.10 RSECAR : Second Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	ENB	SEC10[2:0]			SEC1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	SEC1[3:0]	1 Second Value for the ones place of seconds.	R/W
6:4	SEC10[2:0]	10 Seconds Value for the tens place of seconds.	R/W
7	ENB	ENB 0: Do not compare register value with RSECCNT counter value 1: Compare register value with RSECCNT counter value	R/W

Note: S-TYPE3, P-TYPE3

RSECAR is an alarm register associated with the BCD-coded second counter RSECCNT. When the ENB bit is set to 1, the RSECAR value is compared with the RSECCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR

- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. RSECAR values from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

24.2.11 RMINAR : Minute Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
 RTC_NS = 0x5020_2000

Offset address: 0x12

Bit	Symbol	Function	R/W
3:0	MIN1[3:0]	1 Minute Value for the ones place of minutes.	R/W
6:4	MIN10[2:0]	10 Minutes Value for the tens place of minutes.	R/W
7	ENB	ENB 0: Do not compare register value with RMINCNT counter value 1: Compare register value with RMINCNT counter value	R/W

Note: S-TYPE3, P-TYPE3

RMINAR is an alarm register associated with the BCD-coded minute counter RMINCNT. When the ENB bit is set to 1, the RMINAR value is compared with the RMINCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. RMINAR values from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

24.2.12 RHRAR : Hour Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
 RTC_NS = 0x5020_2000

Offset address: 0x14

Bit	Symbol	Function	R/W
3:0	HR1[3:0]	1 Hour Value for the ones place of hours.	R/W
5:4	HR10[1:0]	10 Hours Value for the tens place of hours.	R/W
6	PM	AM/PM select for alarm setting. 0: AM 1: PM	R/W
7	ENB	ENB 0: Do not compare register value with RHRCNT counter value 1: Compare register value with RHRCNT counter value	R/W

Note: S-TYPE3, P-TYPE3

RHRAR is an alarm register associated with the BCD-coded hour counter RHRCNT. When the ENB bit is set to 1, the RHRAR value is compared with the RHRCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. The specifiable time differs according to the setting in the hours mode bit (RCR2.HR24):

- When the RCR2.HR24 bit is 0 – From 00 to 11 (in BCD).
- When the RCR2.HR24 bit is 1 – From 00 to 23 (in BCD).

If a value outside of this range is specified, the RTC does not operate correctly. When the RCR2.HR24 bit is 0, you must set the PM bit. When the RCR2.HR24 bit is 1, the setting in the PM bit has no effect. This register is set to 0x00 by an RTC software reset.

24.2.13 RWKAR : Day-of-Week Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x16

Bit	Symbol	Function	R/W
2:0	DAYW[2:0]	Day-of-Week Setting 0 0 0: Sunday 0 0 1: Monday 0 1 0: Tuesday 0 1 1: Wednesday 1 0 0: Thursday 1 0 1: Friday 1 1 0: Saturday 1 1 1: Setting prohibited	R/W
6:3	—	The read values are undefined. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
7	ENB	ENB 0: Do not compare register value with RWKCNT counter value 1: Compare register value with RWKCNT counter value	R/W

Note: S-TYPE3, P-TYPE3

RWKAR is an alarm register associated with the coded day-of-week counter RWKCNT. When the ENB bit is set to 1, the RWKAR value is compared with the RWKCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. RWKAR values from 0 through 6 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

24.2.14 BCNTnAR : Binary Counter n Alarm Register (n = 0 to 3) (in Binary Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x10 + 0x02 × n

Bit	Symbol	Function	R/W
7:0	BCNTAR	Alarm register associated with the 32-bit binary counter	R/W

Note: S-TYPE3, P-TYPE3

BCNTnAR is a read/write alarm register associated with the 32-bit binary counter. BCNT3AR is assigned to the BCNTAR[31:24] bits, BCNT2AR is assigned to the BCNTAR[23:16] bits, BCNT1AR is assigned to the BCNTAR[15:8] bits, and BCNT0AR is assigned to the BCNTAR[7:0]. This register is set to 0x00 by an RTC software reset.

24.2.15 RDAYAR : Date Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x18

Bit	Symbol	Function	R/W
3:0	DATE1[3:0]	1 Day Value for the ones place of days.	R/W

Bit	Symbol	Function	R/W
5:4	DATE10[1:0]	10 Days Value for the tens place of days.	R/W
6	—	The read value is undefined. The write value should be 0.	R/W
7	ENB	ENB 0: Do not compare register value with RDAYCNT counter value 1: Compare register value with RDAYCNT counter value	R/W

Note: S-TYPE3, P-TYPE3

RDAYAR is an alarm register associated with the BCD-coded date counter RDAYCNT. When the ENB bit is set to 1, the RDAYAR value is compared with the RDAYCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. The RDAYAR values from 01 through 31 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

24.2.16 RMONAR : Month Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x1A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	ENB	—	—	MON1 0	MON1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	MON1[3:0]	1 Month Value for the ones place of months.	R/W
4	MON10	10 Months Value for the tens place of months.	R/W
6:5	—	The read values are undefined. The write value should be 0.	R/W
7	ENB	ENB 0: Do not compare register value with RMONCNT counter value 1: Compare register value with RMONCNT counter value	R/W

Note: S-TYPE3, P-TYPE3

RMONAR is an alarm register associated with the BCD-coded month counter RMONCNT. When the ENB bit is set to 1, the RMONAR value is compared with the RMONCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR

- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. The RMONAR values from 01 through 12 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

24.2.17 RYRAR : Year Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
 RTC_NS = 0x5020_2000

Offset address: 0x1C

Bit	Symbol	Function	R/W
3:0	YR1[3:0]	1 Year Value for the ones place of years.	R/W
7:4	YR10[3:0]	10 Years Value for the tens place of years.	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

RYRAR is an alarm register associated with the BCD-coded year counter RYRCNT. The RYRAR values from 00 through 99 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x0000 by an RTC software reset.

24.2.18 RYRAREN : Year Alarm Enable Register (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
 RTC_NS = 0x5020_2000

Offset address: 0x1E

Bit	Symbol	Function	R/W
6:0	—	The read values are undefined. The write value should be 0.	R/W
7	ENB	ENB 0: Do not compare register value with the RYRCNT counter value 1: Compare register value with the RYRCNT counter value	R/W

Note: S-TYPE3, P-TYPE3

When the ENB bit in the RYRAREN register is set to 1, the RYRAR value is compared with the RYRCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR

- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. This register is set to 0x00 by an RTC software reset.

24.2.19 BCNTnAER : Binary Counter n Alarm Enable Register (n = 0 to 3) (in Binary Count Mode)

Base address: RTC = 0x4020_2000
 RTC_NS = 0x5020_2000

Offset address: 0x18 + 0x02 × n

Bit	Symbol	Function	R/W
7:0	ENB[7:0]	Setting the alarm enable associated with the 32-bit binary counter	R/W

Note: S-TYPE3, P-TYPE3

BCNTnAER is a read/write register for setting the alarm enable (BCNTAER) associated with the 32-bit binary counter. BCNT3AER is assigned to the BCNTAER.ENB[31:24] bits, BCNT2AER register is assigned to the BCNTAER.ENB[23:16] bits, BCNT1AER is assigned to the BCNTAER.ENB[15:8] bits, and BCNT0AER is assigned to the BCNTAER.ENB[7:0] bits. The binary counter (BCNT[31:0]) associated with the BCNTAER.ENB[31:0] bits that are set to 1 is compared with the binary alarm register (BCNTAR) and, when all match, the IR flag associated with the RTC_ALM interrupt is set to 1. This register is set to 0x00 by an RTC software reset.

24.2.20 RCR1 : RTC Control Register 1

Base address: RTC = 0x4020_2000
 RTC_NS = 0x5020_2000

Offset address: 0x22

Bit	Symbol	Function	R/W
0	AIE	Alarm Interrupt Enable 0: Disable alarm interrupt requests 1: Enable alarm interrupt requests	R/W
1	CIE	Carry Interrupt Enable 0: Disable carry interrupt requests 1: Enable carry interrupt requests	R/W
2	PIE	Periodic Interrupt Enable 0: Disable periodic interrupt requests 1: Enable periodic interrupt requests	R/W
3	RTCOS	RTCOUT Output Select 0: Outputs 1 Hz on RTCOUT 1: Outputs 64 Hz RTCOUT	R/W

Bit	Symbol	Function	R/W
7:4	PES[3:0]	Periodic Interrupt Select 0x6: Generate periodic interrupt every 1/256 second*1 0x7: Generate periodic interrupt every 1/128 second 0x8: Generate periodic interrupt every 1/64 second 0x9: Generate periodic interrupt every 1/32 second 0xA: Generate periodic interrupt every 1/16 second 0xB: Generate periodic interrupt every 1/8 second 0xC: Generate periodic interrupt every 1/4 second 0xD: Generate periodic interrupt every 1/2 second 0xE: Generate periodic interrupt every 1 second 0xF: Generate periodic interrupt every 2 seconds Others: Do not generate periodic interrupts	R/W

Note: S-TYPE3, P-TYPE3

Note 1. When LOCO is selected (RCR4.RCKSEL = 1) while PES[3:0] = 0x6, a periodic interrupt is generated every 1/128 second.

The RCR1 register is used in both calendar count mode and binary count mode. Bits AIE, PIE, and PES[3:0] are updated synchronously with the count source. When the RCR1 register is modified, check that all the bits are updated before proceeding.

AIE bit (Alarm Interrupt Enable)

The AIE bit enables or disables alarm interrupt requests.

If the times indicated in the counters and alarm settings match in Deep Software Standby mode, the MCU returns from Deep Software Standby mode regardless of the AIE bit value.

CIE bit (Carry Interrupt Enable)

The CIE bit enables or disables interrupt requests when a carry to the RSECCNT/BCNT0 register occurs, or when a carry to the 64-Hz counter (R64CNT) occurs while reading the 64-Hz counter.

PIE bit (Periodic Interrupt Enable)

The PIE bit enables or disabled a periodic interrupt.

If the periods indicated in the counters and PES[3:0] settings match in Deep Software Standby mode, the MCU returns from Deep Software Standby mode regardless of the PIE bit value.

RTCOS bit (RTCOU Output Select)

The RTCOS bit selects the RTCOUT output period. The RTCOS bit must be rewritten while the count operation is stopped (RCR2.START = 0) and the RTCOUT output is disabled (RCR2.RTCOE = 0). When RTCOUT is output to an external pin, the RCR2.RTCOE bit must be enabled.

PES[3:0] bits (Periodic Interrupt Select)

The PES[3:0] bits specify the period for the periodic interrupt. A periodic interrupt is generated with the period specified in these bits.

24.2.21 RCR2 : RTC Control Register 2 (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
 RTC_NS = 0x5020_2000

Offset address: 0x24

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CNTM D	HR24	AADJ P	AADJ E	RTCO E	ADJ30	RESE T	START

Value after reset: x x x x 0 0 0 x

Bit	Symbol	Function	R/W
0	START	Start 0: Stop prescaler and time counter 1: Operate prescaler and time counter normally	R/W

Bit	Symbol	Function	R/W
1	RESET	RTC Software Reset 0: In writing: Invalid (writing 0 has no effect). In reading: Normal time operation in progress, or an RTC software reset has completed. 1: In writing: Initialize the prescaler and target registers for RTC software reset*1. In reading: RTC software reset in progress.	R/W
2	ADJ30	30-Second Adjustment 0: In writing: Invalid (writing 0 has no effect). In reading: Normal time operation in progress, or 30-second adjustment has completed. 1: In writing: Execute 30-second adjustment. In reading: 30-second adjustment in progress.	R/W
3	RTCOE	RTCOUT Output Enable 0: Disable RTCOUT output 1: Enable RTCOUT output	R/W
4	AADJE	Automatic Adjustment Enable*2*3 0: Disable automatic adjustment 1: Enable automatic adjustment	R/W
5	AADJP	Automatic Adjustment Period Select*2*3 0: The RADJ.ADJ[5:0] setting from the count value of the prescaler every minute. 1: The RADJ.ADJ[5:0] setting value is adjusted from the count value of the prescaler every 10 seconds.	R/W
6	HR24	Hours Mode*3 0: Operate RTC in 12-hour mode 1: Operate RTC in 24-hour mode	R/W
7	CNTMD	Count Mode Select*4 0: Calendar count mode 1: Binary count mode	R/W

Note: S-TYPE3, P-TYPE3

Note 1. R64CNT, RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, RYRAR, RYRAREN, RADJ, RTCCRN, RSECCPN, RMINCPN, RHRCPN, RDAYCPN, RMONCPN, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP.

Note 2. When LOCO is selected, the setting of this bit is disabled.

Note 3. When rewriting this bit, confirm that the value has been rewritten before performing the following processing. See [section 24.6.5. Notes on Writing to and Reading from Registers](#) for notes on register writing/reading.

Note 4. When rewriting this bit, confirm that the value has been rewritten before performing the following processing.

The RCR2 register is related to hours mode, automatic adjustment function, enabling RTCOUT output, 30-second adjustment, RTC software reset, and controlling count operation.

START bit (Start)

The START bit stops or restarts the prescaler or time counter operation. This bit is updated in synchronization with the next cycle of the count source. When the START bit is modified, check that the bit is updated before proceeding.

RESET bit (RTC Software Reset)

The RESET bit initializes the prescaler and registers to be reset by RTC software. When 1 is written to this bit, initialization starts in synchronization with the count source. When the initialization is complete, the RESET bit is automatically set to 0. Check that this bit is 0 before proceeding.

ADJ30 bit (30-Second Adjustment)

The ADJ30 bit is for 30-second adjustment.

When 1 is written to the ADJ30 bit, the RSECCNT value of less than 30 seconds is rounded down to 00 second and the value of 30 seconds or more is rounded up to 1 minute.

The 30-second adjustment is performed in synchronization with the count source. When 1 is written to this bit, the ADJ30 bit is automatically set to 0 after the 30-second adjustment completes. If 1 is written to the ADJ30 bit, check that the bit is 0 before proceeding. When the 30-second adjustment is performed, the prescaler and R64CNT are also reset. The ADJ30 bit is set to 0 by an RTC software reset.

RTCOE bit (RTCOUT Output Enable)

The RTCOE bit enables output of a 1-Hz/64-Hz clock signal from the RTCOUT pin.

Use the START bit to stop counting before changing the value of the RTCOE bit. Do not stop counting (write 0 to the START bit) and change the value of the RTCOE bit at the same time.

When RTCOUT is to be output from an external pin, enable the RTCOE bit and set up the port control for the pin.

AADJE bit (Automatic Adjustment Enable)

The AADJE bit controls (enables or disables) automatic adjustment.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJE bit.

The AADJE bit is set to 0 by an RTC software reset.

AADJP bit (Automatic Adjustment Period Select)

The AADJP bit selects the automatic-adjustment period.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJP bit.

The AADJP bit is set to 0 by an RTC software reset.

HR24 bit (Hours Mode)

The HR24 bit specifies whether the RTC operates in 12- or 24-hour mode.

Use the START bit to stop counting before changing the value of the HR24 bit. Do not stop counting (write 0 to the START bit) and change the value of the HR24 bit at the same time.

CNTMD bit (Count Mode Select)

The CNTMD bit specifies whether the RTC count mode operates in calendar count mode or in binary count mode.

When setting the count mode, execute an RTC software reset and start again from the initial settings. This bit is updated in synchronization with the count source. However, the count mode switches only after the RTC software reset. (Bit switches before RTC reset, mode switches after RTC reset.)

For details on initial settings, see [section 24.3.1. Outline of Initial Settings of Registers after Power On](#).

24.2.22 RCR2 : RTC Control Register 2 (in Binary Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x24

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CNTM D	—	AADJ P	AADJ E	RTCO E	—	RESE T	START
Value after reset:	x	x	x	x	0	0	0	x

Bit	Symbol	Function	R/W
0	START	Start 0: Stop the 32-bit binary counter, 64-Hz counter, and prescaler 1: Operate the 32-bit binary counter, 64-Hz counter, and prescaler normally	R/W
1	RESET	RTC Software Reset 0: In writing: Invalid (writing 0 has no effect). In reading: Normal time operation in progress, or an RTC software reset has completed. 1: In writing: Initialize the prescaler and target registers for RTC software reset* ¹ . In reading: RTC software reset in progress.	R/W
2	—	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
3	RTCOE	RTCOUT Output Enable 0: Disable RTCOUT output 1: Enable RTCOUT output	R/W
4	AADJE	Automatic Adjustment Enable ^{*2*3} 0: Disable automatic adjustment 1: Enable automatic adjustment	R/W
5	AADJP	Automatic Adjustment Period Select ^{*2*3} 0: Add or subtract RADJ.ADJ [5:0] bits from prescaler count value every 32 seconds 1: Add or subtract RADJ.ADJ [5:0] bits from prescaler count value every 8 seconds.	R/W
6	—	The read value is undefined. The write value should be 0.	R/W
7	CNTMD	Count Mode Select ^{*4} 0: Calendar count mode 1: Binary count mode	R/W

Note: S-TYPE3, P-TYPE3

Note 1. R64CNT, BCNTnAR, BCNTnAER, RADJ, RTCCRN, BCNTnCPm, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP.

Note 2. When LOCO is selected, the setting of this bit is disabled.

Note 3. When rewriting this bit, confirm that the value has been rewritten before performing the following processing. See [section 24.6.5. Notes on Writing to and Reading from Registers](#) for notes on register writing/reading.

Note 4. When rewriting this bit, confirm that the value has been rewritten before performing the following processing.

RCR2 in the binary count mode is a register related to the automatic correction function, RTCOUT output enable, RTC software reset, and count mode control.

START bit (Start)

The START bit stops or restarts the prescaler or counter (clock) operation. This bit is updated in synchronization with the count source. When the START bit is modified, check that the bit is updated before proceeding.

RESET bit (RTC Software Reset)

The RESET bit initializes the prescaler and registers to be reset by RTC software. When 1 is written to this bit, initialization starts in synchronization with the count source. When the initialization is complete, the RESET bit is automatically set to 0. When 1 is written to the RESET bit, check that the bit is 0 before proceeding.

RTCOE bit (RTCOUT Output Enable)

The RTCOE bit enables output of a 1-Hz/64-Hz clock signal from the RTCOUT pin.

Use the START bit to stop counting before changing the value of the RTCOE bit. Do not stop counting (write 0 to the START bit) and change the value of the RTCOE bit at the same time. When an RTCOUT signal is to be output from an external pin, enable the port control in addition to setting this bit.

AADJE bit (Automatic Adjustment Enable)

The AADJE bit controls (enables or disables) automatic adjustment.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJE bit. The AADJE bit is set to 0 by an RTC software reset.

AADJP bit (Automatic Adjustment Period Select)

The AADJP bit selects the automatic-adjustment period.

Correction period can be selected from 32 second units or 8 second units in binary count mode.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJP bit. The AADJP bit is set to 0 by an RTC software reset.

CNTMD bit (Count Mode Select)

The CNTMD bit specifies whether the RTC count mode operates in calendar count mode or in binary count mode.

When setting the count mode, execute an RTC software reset and start again from the initial settings. This bit is updated in synchronization with the count source. However, the count mode switches only after the RTC software reset. (Bit switches before RTC reset, mode switches after RTC reset.)

For details on initial settings, see [section 24.3.1. Outline of Initial Settings of Registers after Power On](#).

24.2.23 RCR4 : RTC Control Register 4

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x28

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	RCKSEL
Value after reset:	0	0	0	0	0	0	0	x

Bit	Symbol	Function	R/W
0	RCKSEL	Count Source Select 0: Sub-clock oscillator is selected 1: LOCO is selected	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The RCR4 register is used in both calendar count mode and binary count mode.

RCKSEL bit (Count Source Select)

The RCKSEL bit selects the count source from the sub-clock oscillator and LOCO.

The RCKSEL bit is only used in normal operation mode. When the RCKSEL bit is set to 0, the time is counted with the sub-clock oscillator. When the bit is set to 1, the time is counted with LOCO.

For details on count source setting, see [section 24.3.1. Outline of Initial Settings of Registers after Power On](#) and [section 24.3.2. Clock and Count Mode Setting Procedure](#). The count source must be selected only once before specifying the initial settings of the RTC registers at power on.

24.2.24 RFRL : Frequency Register L

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x2C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	RFC[15:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
15:0	RFC[15:0]	Frequency Comparison Value Write 0x00FF to this register when using the LOCO.	R/W

Note: S-TYPE3, P-TYPE3

RFRL is a register for controlling the prescaler when LOCO is selected.

The RTC time counter operates on a 128-Hz clock signal as the base clock. Therefore, when LOCO is selected, LOCO is divided by the prescaler to generate a 128-Hz clock signal. Set the frequency comparison value in the RFC[15:0] bits to generate a 128-Hz clock from the LOCO frequency. Before writing to RFC[15:0] after a cold start, write 0x0000 to the RFRH register.

A value from 0x0007 through 0x01FF can be specified as the frequency comparison value. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2. The operating frequency of the peripheral module clock and the LOCO should be such that the peripheral module clock is \geq LOCO.

Calculation method of frequency comparison value:

$RFC[15:0] = (\text{LOCO clock frequency}) / 128 - 1$

When the LOCO frequency is 32.768 kHz, the RFRL register should be set to 0x00FF.

24.2.25 RFRH : Frequency Register H

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x2A

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RFC16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x

Bit	Symbol	Function	R/W
0	RFC16	Write 0 before writing to the RFRL register after a cold start.	R/W
15:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

Before writing to RFRHL.RFC[15:0] after a cold start, write 0x0000 to the RFRH register.

24.2.26 RADJ : Time Error Adjustment Register

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x2E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	PMADJ[1:0]		ADJ[5:0]					
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
5:0	ADJ[5:0]	Adjustment Value These bits specify the adjustment value from the prescaler.	R/W
7:6	PMADJ[1:0]	Plus-Minus 0 0: Do not perform adjustment. 0 1: Adjustment is performed by the addition to the prescaler 1 0: Adjustment is performed by the subtraction from the prescaler 1 1: Setting prohibited.	R/W

Note: S-TYPE3, P-TYPE3

The RADJ register is used in both calendar count mode and binary count mode. Adjustment is performed by the addition to or subtraction from the prescaler or 64-Hz counter. If the Automatic Adjustment Enable (RCR2.AADJE) bit is 0, adjustment is performed when writing to the RADJ. If the RCR2.AADJE bit is 1, adjustment is performed in the interval specified in the Automatic Adjustment Period Select (RCR2.AADJP) bit.

The current adjustment by software (disabling automatic adjustment) may be invalid if the following adjustment value is specified within 320 cycles of the count source after the register setting. To perform adjustment consecutively, wait for 320 cycles or more of the count source after the register setting, then specify the next adjustment value.

RADJ is updated in synchronization with the count source. When RADJ is modified, check that all the bits are updated before continuing with more processing. This register is set to 0x00 by an RTC software reset. The setting of this register is enabled only when the sub-clock oscillator is selected. When LOCO is selected, adjustment is not performed.

ADJ[5:0] bits (Adjustment Value)

The ADJ[5:0] bits specify the adjustment value (number of sub-clock cycles) from the prescaler.

PMADJ[1:0] bits (Plus-Minus)

The PMADJ[1:0] bits select whether the clock is set ahead or back depending on the error-adjustment value set in the ADJ[5:0] bits.

24.2.27 RTCCRn : Time Capture Control Register n (n = 0 to 2)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x40 + 0x02 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TCEN	—	TCNF[1:0]	—	TCST	TCCT[1:0]		

Value after reset: x 0 x x 0 x x x

Bit	Symbol	Function	R/W
1:0	TCCT[1:0]	Time Capture Control 0 0: Do not detect events 0 1: Detect rising edge 1 0: Detect falling edge 1 1: Detect both edges	R/W
2	TCST	Time Capture Status 0: No event detected 1: Event detected ^{*1}	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
5:4	TCNF[1:0]	Time Capture Noise Filter Control 0 0: Turn noise filter off 0 1: Setting prohibited 1 0: Turn noise filter on (count source) 1 1: Turn noise filter on (count source by divided by 32)	R/W
6	—	This bit is read as 0. The write value should be 0.	R/W
7	TCEN	Time Capture Event Input Pin Enable 0: Disable the RTCICn pin as the time capture event input pin 1: Enable the RTCICn pin as the time capture event input pin	R/W

Note: S-TYPE3, P-TYPE3

Note 1. Indicates that an event is detected. Writing 1 to this bit has no effect. Writing 0 sets this bit to 0.

The RTCCRn register is used both in calendar count mode and in binary count mode. RTCCR0, RTCCR1, and RTCCR2 control the RTCIC0, RTCIC1, and RTCIC2 pins, respectively.

RTCCRn is updated in synchronization with the count source. When RTCCRn is modified, check that all the bits except the TCST bit are updated before continuing with additional processing. This register is cleared to 0x00 by an RTC software reset. When RTCICm is used as the time capture pin, VBTICTLR.VCHnIEN (n = 0 to 2) must be set to 1.

TCCT[1:0] bits (Time Capture Control)

The TCCT[1:0] bits control the edge detection of the time capture event input pins, RTCIC0, RTCIC1, and RTCIC2. The detection edge is selectable. The TCCT[1:0] bits must be set while the VBTICTLR.VCHnIEN bit is 1.

TCST bit (Time Capture Status)

The TCST bit indicates that an event on the time capture event input pins, RTCIC0, RTCIC1, and RTCIC2, was detected. When the TCST bit is 0, no event is detected. When the TCST bit is 1, this bit indicates that an event was detected on the associated pin and the capture register is valid. When multiple events are detected, the capture time for the first event is retained.

The event is detected only during count operation (RCR2.START bit = 1). Before reading the capture register, make sure that this bit is set to 1.

Set the TCST bit while the TCCT[1:0] bits are 00b (no event is detected). The TCST bit is set to 0 in synchronization with the count source. When the TCST bit is set to 0, check that the bit is updated before continuing with additional processing.

TCNF[1:0] bits (Time Capture Noise Filter Control)

The TCNF[1:0] bits control the noise filter of the time capture event input pins (RTCIC0, RTCIC1, and RTCIC2).

When the noise filter is on, the count source divided by 1 or divided by 32 is selectable. In this case, when the input level on the time capture event input pin matches three consecutive times at the set sampling period, the input level is determined.

Set the TCNF[1:0] bits while the TCCT[1:0] bits are 00b (no event is detected). When the noise filter is used, set the TCNF[1:0] bits, wait for 3 cycles of the specified sampling period, then set the TCCT[1:0] bits. Set the TCNF[1:0] bits when the VBTICTLR.VCHnIEN bit is 1.

TCEN bit (Time Capture Event Input Pin Enable)

The TCEN bit enables or disables the time capture event input pins RTCIC0, RTCIC1, and RTCIC2. When the functions of the time capture event input pins are multiplexed, set VBTICTLR first. If the TCEN bit is set to 0, also set the TCCT[1:0] bits to 00b.

Before setting this bit to 1, be sure to set the count source setting bit (RCR4.RCKSEL), RTC time capture event enable bit (RCPE.RTCEN), port control setting bits (PmnPFS.PDR, and PmnPFS.PMR). For details on the port control setting bits (PmnPFS.PDR and PmnPFS.PMR), see [section 19, I/O Ports](#).

24.2.28 RSECCPn : Second Capture Register n (n = 0 to 2) (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x52 + 0x10 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—		SEC10[2:0]			SEC1[3:0]		
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	SEC1[3:0]	1-Second Capture Capture value for the ones place of seconds.	R
6:4	SEC10[2:0]	10-Second Capture Capture value for the tens place of seconds.	R
7	—	The read value is undefined.	R

Note: S-TYPE3, P-TYPE3

RSECCPn is a read-only register that captures the RSECCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RSECCP0, RSECCP1, and RSECCP2 registers, respectively. This register is cleared to 0x00 by an RTC software reset. Before reading from this register, the time capture event detection should be stopped using the RTCCRn.TCCT[1:0] bits.

24.2.29 RMINCPn : Minute Capture Register n (n = 0 to 2) (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x54 + 0x10 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—		MIN10[2:0]			MIN1[3:0]		
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	MIN1[3:0]	1-Minute Capture Capture value for the ones place of minutes.	R

Bit	Symbol	Function	R/W
6:4	MIN10[2:0]	10-Minute Capture Capture value for the tens place of minutes.	R
7	—	The read value is undefined.	R

Note: S-TYPE3, P-TYPE3

RMINCPn is a read-only register that captures the RMINCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RMINCP0, RMINCP1, and RMINCP2 registers, respectively.

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, the time capture event detection should be stopped using the RTCCRn.TCCT[1:0] bits.

24.2.30 RHRCPn : Hour Capture Register n (n = 0 to 2) (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x56 + 0x10 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	PM	HR10[1:0]	HR1[3:0]				
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	HR1[3:0]	1-Hour Capture Capture value for the ones place of hours	R
5:4	HR10[1:0]	10-Hour Capture Capture value for the tens place of hours	R
6	PM	PM 0: AM 1: PM	R
7	—	The read value is undefined.	R

Note: S-TYPE3, P-TYPE3

RHRCPn is a read-only register that captures the RHRCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RHRCP0, RHRCP1, and RHRCP2 registers, respectively.

The PM bit is only enabled when the RCR2.HR24 bit is 0 (in 12-hour mode).

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, you must stop the time capture event detection using the RTCCRn.TCCT[1:0] bits.

24.2.31 RDAYCPn : Date Capture Register n (n = 0 to 2) (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x5A + 0x10 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	DATE10[1:0]	DATE1[3:0]				
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	DATE1[3:0]	1-Day Capture Capture value for the ones place of days.	R

Bit	Symbol	Function	R/W
5:4	DATE10[1:0]	10-Day Capture Capture value for the tens place of days.	R
7:6	—	The read value is undefined.	R

Note: S-TYPE3, P-TYPE3

RDAYCPn is a read-only register that captures the RDAYCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RDAYCP0, RDAYCP1, and RDAYCP2 registers, respectively.

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, the time capture event detection should be stopped using the RTCCRn.TCCT[1:0] bits.

24.2.32 RMONCPn : Month Capture Register n (n = 0 to 2) (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x5C + 0x10 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	MON1 0	MON1[3:0]			
Value after reset:	0	0	0	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	MON1[3:0]	1-Month Capture Capture value for the ones place of months.	R
4	MON10	10-Month Capture Capture value for the tens place of months.	R
7:5	—	These bits are read as 0.	R

Note: S-TYPE3, P-TYPE3

RMONCPn is a read-only register that captures the RMONCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RMONCP0, RMONCP1, and RMONCP2 registers, respectively.

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, the time capture event detection should be stopped using the RTCCRn.TCCT[1:0] bits.

24.2.33 BCNTnCPm : BCNTn Capture Register m (n = 0 to 3, m = 0 to 2) (in Binary Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x52 + 0x10 × m (BCNT0CPm)
0x54 + 0x10 × m (BCNT1CPm)
0x56 + 0x10 × m (BCNT2CPm)
0x5A + 0x10 × m (BCNT3CPm)

Bit position:	7	6	5	4	3	2	1	0
Bit field:								
Value after reset:	x	x	x	x	x	x	x	x

BCNTnCPm is a read-only register that captures the BCNTn value when a time capture event is detected. BCNT3CPm is assigned to the BCNTCPm[31:24] bits, BCNT2CPm is assigned to the BCNTCPm[23:16] bits, BCNT1CPm is assigned to the BCNTCPm[15:8] bits and BCNT0CPm is assigned to the BCNTCPm[7:0] bits. The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the BCNTnCP0, BCNTnCP1, and BCNTnCP2 registers, respectively.

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, you must stop the time capture event detection using the RTCCRn.TCCT[1:0] bits.

24.3 Operation

24.3.1 Outline of Initial Settings of Registers after Power On

After the power is turned on, perform the initial settings for the clock, count mode, time error adjustment, time, alarm, interrupts, and time capture.

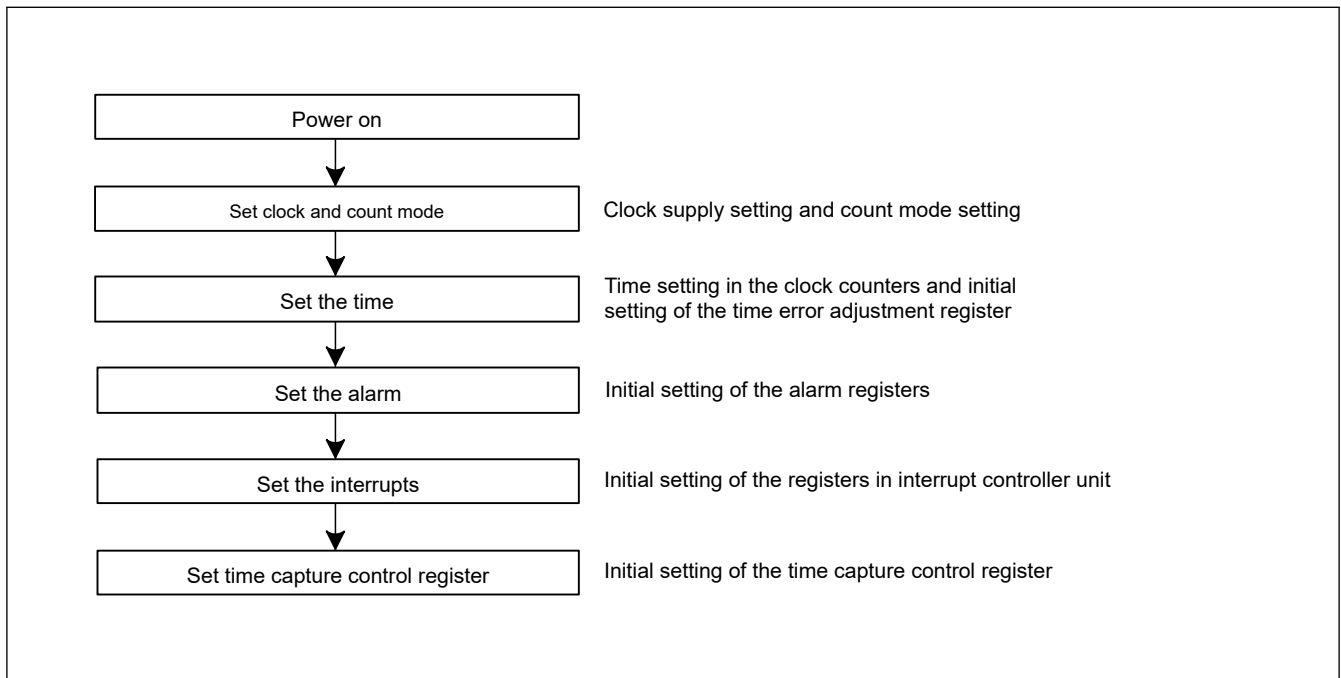

Figure 24.2 Outline of initial settings after a power on

24.3.2 Clock and Count Mode Setting Procedure

[Figure 24.3](#) shows how to set the clock and the count mode.

Figure 24.3 Clock and count mode setting procedure

24.3.3 Setting the Time

Figure 24.4 shows how to set the time.

Figure 24.4 Setting the time

24.3.4 30-Second Adjustment

Figure 24.5 shows how to execute a 30-second adjustment.

Figure 24.5 30-second adjustment

24.3.5 Reading 64-Hz Counter and Time

[Figure 24.6](#) shows how to read a 64-Hz counter and time.

Figure 24.6 Reading time

If a carry occurs while the 64-Hz counter and time are read, the correct time is not obtained, therefore they must be read again. The procedure for reading the time without using interrupts is shown in (a) in Figure 24.6, and the procedure using carry interrupts is shown in (b). To keep the program simple, method (a) should be used in most cases.

24.3.6 Alarm Function

Figure 24.7 shows how to use the alarm function.

Figure 24.7 Using the alarm function

In calendar count mode, an alarm can be generated by any one of year, month, date, day-of-week, hour, minute or second, or any combination of those. Write 1 to the ENB bit in the alarm registers involved in the alarm setting, and set the alarm time in the lower bits. Write 0 to the ENB bit in registers not involved in the alarm setting.

In binary count mode, an alarm can be generated in any bit combination of 32 bits. Write 1 to the ENB bit of the Alarm Enable register associated with the target bit of the alarm, and set the alarm time in the alarm register. For bits that are not the target of the alarm, write 0 to the ENB bit of the Alarm Enable register.*1

For any of the ENB[31:0] bits that are set to 1, the bits in the corresponding positions in the binary counter (BCNT[31:0]) are compared with the values of the corresponding bits in the binary alarm registers*1. When all such bits match, the IR flag associated with the RTC_ALM interrupt is set to 1 and the corresponding bits in the Interrupt Set-Pending/Clear-Pending Registers are set to 1. Alarm detection can be confirmed by reading the Interrupt Set-Pending Register associated with the RTC_ALM interrupt, but an interrupt should be used in most cases. If 1 is set in the Interrupt Set-Enable Register associated with the RTC_ALM interrupt, an alarm interrupt is generated in the event of the alarm, enabling the alarm to be detected.

Writing 0 sets the IELSRn.IR flag associated with the RTC_ALM interrupt to 0. If interrupt is enabled, the Interrupt Set-Pending/Clear-Pending Register associated with the RTC_ALM interrupt is cleared automatically after exiting the interrupt handler. Otherwise, write 1 to the Interrupt Clear-Pending Register associated with the RTC_ALM interrupt to clear it.

When the counter and the alarm time match in a low power state, the MCU returns from the low power state.

Note 1. For any bits in the ENB bits that are set to 1, the values in the corresponding positions in the alarm registers from the following registers are compared with the corresponding bits of the counted values.

Counter registers: RSECCNT, RMINCNT, RHRCNT, RWKCNT, RDAYCNT, RMONCNT, RYRCNT

Alarm registers: RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, RYRAREN

24.3.7 Procedure for Disabling Alarm Interrupt

Figure 24.8 shows the procedure for disabling the enabled alarm interrupt request.

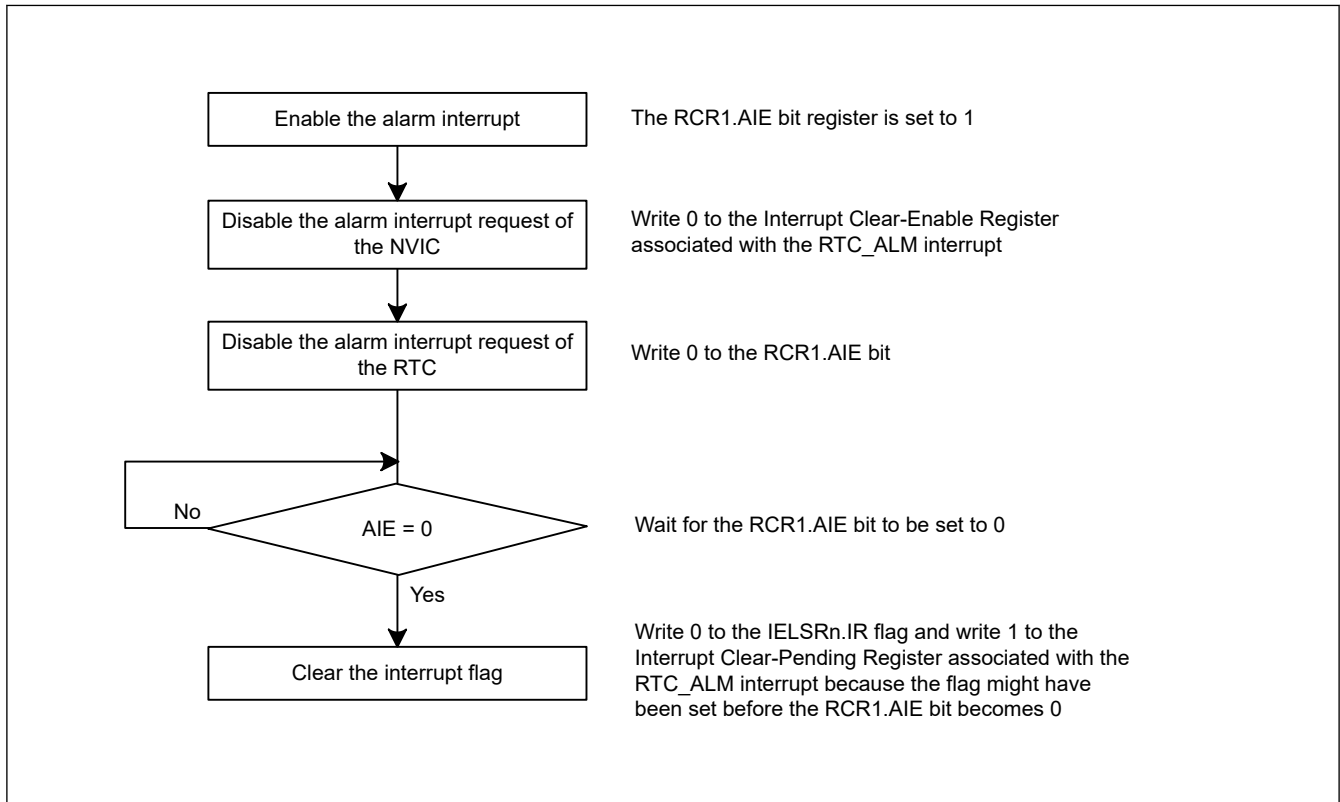

Figure 24.8 Procedure for disabling alarm interrupt request

24.3.8 Time Error Adjustment Function

The time error adjustment function is used to correct errors, running fast or slow, in the time caused by variation in the precision of oscillation by the sub-clock oscillator. Because 32768 cycles of the sub-clock oscillator constitute 1 second of operation when the sub-clock oscillator is selected, the clock runs fast if the sub-clock frequency is high and slow if the sub-clock frequency is low.

The time error adjustment functions include:

- Automatic adjustment
- Adjustment by software

Use the RCR2.AADJE bit to select automatic adjustment or adjustment by software.

24.3.8.1 Automatic adjustment

Enable automatic adjustment by setting the RCR2.AADJE bit to 1.

Automatic adjustment is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ register every time the adjustment period selected by the RCR2.AADJP bit elapses.

(1) Example 1: Sub-clock oscillator running at 32.769 kHz**Adjustment procedure**

When the sub-clock oscillator is running at 32.769 kHz, 1 second elapses every 32769 clock cycles. The RTC is meant to run at 32768 clock cycles, so the clock runs fast by 1 clock cycle every second. The time on the clock is fast by 60 clock cycles per minute, so adjustment can take the form of setting the clock back by 60 cycles every minute.

Register settings when RCR2.CNTMD = 0:

- RCR2.AADJP = 0 (adjustment every minute)
- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the prescaler)
- RADJ.ADJ[5:0] = 60 (0x3C)

(2) Example 2: Sub-clock oscillator running at 32.766 kHz**Adjustment procedure**

When the sub-clock oscillator is running at 32.766 kHz, 1 second elapses every 32766 clock cycles. The RTC is meant to run at 32768 clock cycles, so the clock runs slow by 2 clock cycles every second. The time on the clock is slow by 20 clock cycles every 10 seconds, so adjustment can take the form of setting the clock forward by 20 cycles every 10 seconds.

Register settings when RCR2.CNTMD = 0:

- RCR2.AADJP = 1 (adjustment every 10 seconds)
- RADJ.PMADJ[1:0] = 01b (adjustment is performed by the addition to the prescaler)
- RADJ.ADJ[5:0] = 20 (0x14)

(3) Example 3: Sub-clock oscillator running at 32.764 kHz**Adjustment procedure**

When the sub-clock oscillator is running at 32.764 kHz, 1 second elapses on 32764 clock cycles. Because the RTC operates for 32768 clock cycles as 1 second, the clock is delayed for 4 clock cycles per second. In 8 seconds, the delay is 32 clock cycles, therefore correction can be made by advancing the clock 32 clock cycles every 8 seconds.

Register settings when RCR2.CNTMD = 1:

- RCR2.AADJP = 1 (adjustment every 8 seconds)
- RADJ.PMADJ[1:0] = 01b (adjustment is performed by the addition to the prescaler)
- RADJ.ADJ[5:0] = 32 (0x20)

24.3.8.2 Adjustment by software

Enable adjustment by software by setting the RCR2.AADJE bit to 0. Adjustment by software is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ register on execution of a write instruction to the RADJ register.

(1) Example 1: Sub-clock oscillator running at 32.769 kHz**Adjustment procedure**

When the sub-clock oscillator is running at 32.769 kHz, 1 second elapses every 32769 clock cycles. The RTC is meant to run at 32768 clock cycles, so the clock runs fast by 1 clock cycle every second. The time on the clock is fast by 1 clock cycle per second, so adjustment can take the form of setting the clock back by 1 cycle every second.

Register settings

- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the prescaler)
- RADJ.ADJ[5:0] = 1 (0x01)
This is written to the RADJ register once per 1-second interrupt.

24.3.8.3 Procedure to change the mode of adjustment

When changing the mode of adjustment, change the value of the AADJE bit in RCR2 after setting the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

To change adjustment by software to automatic adjustment:

1. Set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).
2. Set the RCR2.AADJE bit to 1 (automatic adjustment is enabled).
3. Use the RCR2.AADJP bit to select the period of adjustment.
4. In RADJ, set the PMADJ[1:0] bits for addition or subtraction and the ADJ[5:0] bits to the value for use in time error adjustment.

To change automatic adjustment to adjustment by software:

1. Set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).
2. Set the RCR2.AADJE bit to 0 (adjustment by software is enabled).
3. Proceed with the adjustment by setting the RADJ.PMADJ[1:0] bits for addition or subtraction and the RADJ.ADJ[5:0] bits to the value for use in time error adjustment at the wanted time. After that, the time is adjusted every time a value is written to the RADJ register.

24.3.8.4 Procedure to stop adjustment

Stop the adjustment by setting the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

24.3.9 Capturing the time

The RTC is capable of storing the month, date, hour, minute and second/binary counters 3 to 0 by detecting an edge of a signal on a time capture event input pin in calendar count mode or binary count mode.

A noise filter can also be used on a time capture event input pin. If the noise filter is enabled, the RTCCRn.TCST bit is set to 1 when the input level on the pin matches three times.

The noise filter can be switched on or off for each of the time capture event input pins. Set VBTICTLR.VCHnIEN (n = 0 to 2) to 1 to enable the RTCICn input. Operation when the noise filter is off is shown in [Figure 24.9](#) and operation when the noise filter is on is shown in [Figure 24.10](#).

Figure 24.9 Timing of a time capture operation with the noise filter off

Figure 24.10 Timing of a time capture operation with the noise filter on

24.4 Interrupt Sources

The RTC has three interrupt sources, as listed in [Table 24.3](#).

Table 24.3 RTC interrupt sources

Name	Interrupt source
RTC_ALM	Alarm interrupt
RTC_PRD	Periodic interrupt
RTC_CUP	Carry interrupt

(1) Alarm interrupt (RTC_ALM)

This interrupt is generated based on the comparison result between the alarm registers and RTC counters. For details, see [section 24.3.6. Alarm Function](#).

Because there is a possibility that the interrupt flag might be set to 1 when the settings of the alarm registers match the clock counters, wait for the alarm time settings to be confirmed and clear the IELSRn.IR flag and the interrupt Set-Pending Register associated with the RTC_ALM interrupt to 0 again after modifying values of the alarm registers. After the interrupt flag for the alarm interrupt is set to 1 and the state is returned to mismatching of the alarm registers and clock counters, the flag is not 1 again until there is another match or the values of the alarm registers are modified again.

Figure 24.11 Timing for the alarm interrupt (RTC_ALM)

(2) Periodic interrupt (RTC_PRD)

This interrupt is generated at intervals of 2 seconds, 1 second, 1/2 second, 1/4 second, 1/8 second, 1/16 second, 1/32 second, 1/64 second, 1/128 second, or 1/256 second. The interrupt interval can be selected in the RCR1.PES[3:0] bits.

(3) Carry interrupt (RTC_CUP)

This interrupt is generated when a carry to the second counter/binary counter 0 occurred or a carry to the R64CNT counter occurred during read access to the 64-Hz counter.

Figure 24.12 shows the timing of the carry interrupt (RTC_CUP).

Figure 24.12 Timing for the carry interrupt (RTC_CUP)

24.5 Event Link Output

The RTC generates periodic event output (RTC_PRD) event signal for the ELC that can be used to initiate operations by other modules selected in advance.

The periodic event signal is output at the interval selected from 1/256, 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2, 1, and 2 seconds by setting the RCR1.PES[3:0] bits.

The event generation period immediately after the event generation is selected is not guaranteed.

Note: If event linking from the RTC is used, only set the ELC after setting the RTC, for example initialization and time settings. Setting the RTC after the ELC can lead to output of unexpected event signals.

24.5.1 Interrupt Handling and Event Linking

The RTC has a bit to enable or disable periodic interrupts. An interrupt request signal is output to the CPU when an interrupt source is generated while the associated enable bit is enabled.

In contrast, an event link output signal is sent to other modules as an event signal through the ELC when an interrupt source is generated, regardless of the setting of the associated interrupt enable bit.

Note: Although alarm and periodic interrupts can still be output during Software Standby or Deep Software Standby mode, the periodic event signals for the ELC are not output.

24.6 Usage Notes

24.6.1 Register Writing during Counting

The following registers should not be written to during counting, that is, while the RCR2.START bit is 1:

- RSECCNT/BCNT0
- RMINCNT/BCNT1
- RHRCNT/BCNT2
- RDAYCNT
- RWKCNT/BCNT3
- RMONCNT
- RYRCNT
- RCR1.RTCOS
- RCR2.RTCOE
- RCR2.HR24
- RFRL

The counter should be stopped before writing to any of these registers.

24.6.2 Use of Periodic Interrupts

[Figure 24.13](#) shows the procedure for using periodic interrupts.

The generation and period of the periodic interrupt can be changed by setting the RCR1.PES[3:0] bits. However, because the prescaler R64CNT and RSECCNT/BCNT0 are used to generate interrupts, the interrupt period is not guaranteed immediately after setting the RCR1.PES[3:0] bits.

In addition, any of the following operation can affect the interrupt period:

- Stopping/restarting or resetting counter operation
- Reset by RTC software
- 30-second adjustment by changing the RCR2 value

When the time error adjustment function is used, the interrupt generation period after adjustment is added or subtracted based on the adjustment value.

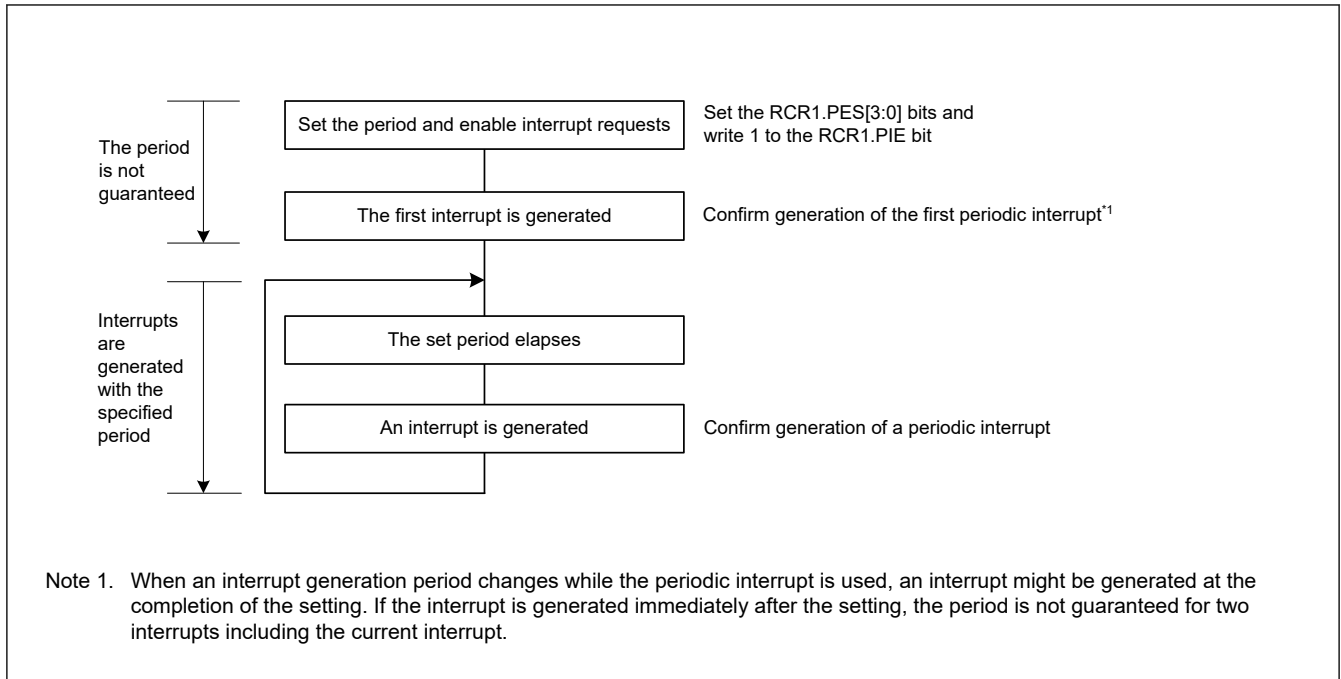

Figure 24.13 Using the periodic interrupt function

24.6.3 RTCOUT (1-Hz/64-Hz) Clock Output

Stopping/restarting or resetting counter operation, reset by RTC software, and the 30-second adjustment by changing the RCR2 value affects the period of RTCOUT (1-Hz/64-Hz) output. When the time error adjustment function is used, the period of RTCOUT (1-Hz/64-Hz) output after adjustment is added or subtracted based on the adjustment value.

24.6.4 Transitions to Low Power Modes after Setting Registers

A transition to a low power state (Software Standby mode, Deep Software Standby mode, or battery backup state) during a write to an RTC register might corrupt the value of the register. After setting the register, confirm that the setting is in place before initiating a transition to a low power state.

24.6.5 Notes on Writing to and Reading from Registers

- When reading a counter register such as the second counter after writing to the counter register, follow the procedure in [section 24.3.5. Reading 64-Hz Counter and Time](#).
- The value written to the count registers, alarm registers, year alarm enable register, bits RCR2.AADJE, AADJP, and HR24, RCR4 register, or frequency register is reflected when fourth read operations are performed after writing.
- The values written to the RCR1.CIE, RCR1.RTCOS, and RCR2.RTCOE bits can be read immediately after writing.
- To read the value from the timer counter after returning from a reset or a period in Software Standby mode, Deep Software Standby mode, or battery backup state, wait for 1/128 second while the clock is operating (RCR2.START bit = 1).
- After a reset is generated, write to the RTC register after 6 cycles of the count source clock have elapsed.

24.6.6 Changing the Count Mode

When changing the count mode (calendar count mode/binary count mode), set the RCR2.START bit to 0, stop the counting operation, then start it again from the initial setting. For details on the initial setting, see [section 24.3.1. Outline of Initial Settings of Registers after Power On](#).

24.6.7 Initialization Procedure When the RTC Is Not to Be Used

Registers in the RTC are not initialized by a reset. Depending on the initial state, the generation of an unintentional interrupt request or operation of the counter might lead to increased power consumption.

For applications that do not require a realtime clock, initialize the registers by following the initialization procedure shown in [Figure 24.14](#).

Alternatively, when the sub-clock oscillator is not used as the system clock source, realtime clock, operating clock of each peripheral modules or FLL function of HOCO, the counter can be stopped by writing 0 (sub-clock oscillator is selected) to the RCR4.RCKSEL bit and stopping the sub-clock oscillator. To stop the sub-clock oscillator, write 1 to the SOSCCR.SOSTP bit.

For details on the setting of the SOSCCR.SOSTP bit, see [section 8, Clock Generation Circuit](#).

Figure 24.14 Initialization procedure

24.6.8 When Switching Source Clock

When switching a clock source by changing SCKSCR.CKSEL[2:0], the clock output from the selector stops for 4 cycles of the switched clock. If the RTC periodical interrupt or RTC periodical event output was generated at this time, the interrupt or event is invalid.

24.6.9 When writing to the RTC registers

If VCC voltage of the MCU is lower than 1.8V and write access to the RTC registers is performed, read access should be performed at least once after one write access is performed, or for the consecutive write access, leave an interval of 167ns for each access.

25. Watchdog Timer (WDT)

25.1 Overview

The Watchdog Timer (WDT) is a 14-bit down counter that can be used to reset the MCU when the counter underflows because the system has run out of control and is unable to refresh the WDT. In addition, the WDT can be used to generate a non-maskable interrupt or an underflow interrupt.

Table 25.1 lists the WDT specifications and Figure 25.1 shows a block diagram.

Table 25.1 WDT specifications

Parameter	Specifications
Count source*1	Peripheral clock (PCLKB)
Clock division ratio	Division by 4, 64, 128, 512, 2048, or 8192
Counter operation	Counting down using a 14-bit down-counter
Condition for starting the counter	<ul style="list-style-type: none"> Auto start mode: Counting automatically starts after a reset or after an underflow or refresh error occurs Register start mode: Counting is started with a refresh by writing to the WDTRR register Only secure developer can select Auto-start mode or Register-start mode
Conditions for stopping the counter	<ul style="list-style-type: none"> Reset (the down-counter and other registers return to their initial values) A counter underflows or a refresh error is generated
Window function	Window start and end positions can be specified (refresh-permitted and refresh-prohibited periods)
Watchdog timer reset sources	<ul style="list-style-type: none"> Down-counter underflows Refreshing outside the refresh-permitted period (refresh error)
Non-maskable interrupt/interrupt sources	<ul style="list-style-type: none"> Down-counter underflows Refreshing outside the refresh-permitted period (refresh error)
Reading of the counter value	The down-counter value can be read by the WDTSR register
Event link function (output)	<ul style="list-style-type: none"> Down-counter underflow event output Refresh error event output

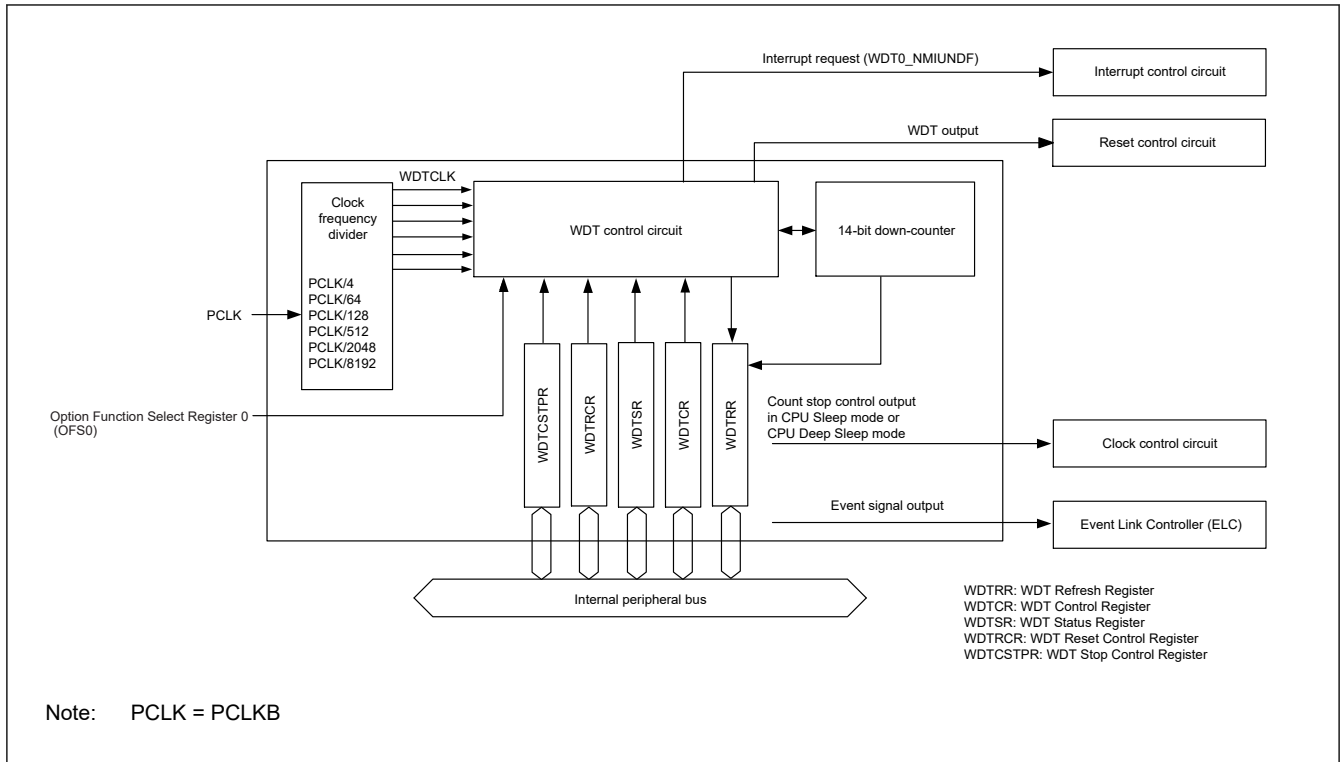

Figure 25.1 WDT block diagram

25.2 Register Descriptions

25.2.1 WDTRR : WDT Refresh Register

Base address: WDT0 = 0x4020_2600
 WDT0_NS = 0x5020_2600

Offset address: 0x00

Value after reset: 1 1 1 1 1 1 1 1

Bit	Symbol	Function	R/W
7:0	n/a	The down-counter is refreshed by writing 0x00 and then writing 0xFF to this register.	R/W

Note: S-TYPE-3, P-TYPE-3

The WDTRR register refreshes the down-counter of the WDT.

The down-counter of the WDT is refreshed by writing 0x00 and then writing 0xFF to WDTRR register (refresh operation) within the refresh-permitted period.

After the down-counter is refreshed, it starts counting down from the value selected by setting the WDT Timeout Period Select bits (OFS0.WDTPOPS[1:0]) in the Option Function Select Register 0 in auto start mode. In register start mode, counting down starts from the value selected by setting the Timeout Period Select bits (WDTCR.TOPS[1:0]) in the WDT Control Register.

When 0x00 is written, the read value is 0x00. When a value other than 0x00 is written, the read value is 0xFF. For details of the refresh operation, see [section 25.3.3. Refresh Operation](#).

25.2.2 WDTCR : WDT Control Register

Base address: WDT0 = 0x4020_2600
WDT0_NS = 0x5020_2600

Offset address: 0x02

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	RPSS[1:0]	—	—	RPES[1:0]	CKS[3:0]			—	—	TOPS[1:0]				
Value after reset:	0	0	1	1	0	0	1	1	1	1	1	1	0	0	1	1

Bit	Symbol	Function	R/W
1:0	TOPS[1:0]	Timeout Period Select 0 0: 1024 cycles (0x03FF) 0 1: 4096 cycles (0x0FFF) 1 0: 8192 cycles (0x1FFF) 1 1: 16384 cycles (0x3FFF)	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
7:4	CKS[3:0]	Clock Division Ratio Select 0 0 0 1: PCLKB/4 0 1 0 0: PCLKB/64 1 1 1 1: PCLKB/128 0 1 1 0: PCLKB/512 0 1 1 1: PCLKB/2048 1 0 0 0: PCLKB/8192 Others: Setting prohibited	R/W
9:8	RPES[1:0]	Window End Position Select 0 0: 75% 0 1: 50% 1 0: 25% 1 1: 0% (do not specify window end position).	R/W
11:10	—	These bits are read as 0. The write value should be 0.	R/W
13:12	RPSS[1:0]	Window Start Position Select 0 0: 25% 0 1: 50% 1 0: 75% 1 1: 100% (do not specify window start position).	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

The WDTCR register is used to set the clock division ratio, and window start and end positions for refresh, and the timeout period until the down-counter underflows in register start mode.

Some constraints apply to writes to the WDTCR register. For details, see [section 25.3.2. Controlling Writes to the WDTCR, WDTRCR, and WDTCSR Registers](#).

In auto start mode, the settings in the WDTCR register are disabled, and the settings in the Option Function Select Register 0 (OFS0) are enabled. The settings for the WDTCR register can also be made in the OFS0 register. For details, see [section 25.3.8. Association between Option Function Select Register 0 \(OFS0\) and WDT Registers](#).

TOPS[1:0] bits (Timeout Period Select)

The TOPS[1:0] bits select the timeout period, the period until the down-counter underflows, from 1024, 4096, 8192, and 16384 cycles, taking the divided clock specified in the CKS[3:0] bits as 1 cycle. After the down-counter is refreshed, the combination of the CKS[3:0] and TOPS[1:0] bits determines the number of PCLKB cycles until the counter underflows.

[Table 25.2](#) lists the relationship between the CKS[3:0] and TOPS[1:0] bit settings, the timeout period, and the number of PCLKB cycles.

Table 25.2 Timeout period settings

CKS[3:0] bits	TOPS[1:0] bits	Clock division ratio	Timeout period (number of cycles)	PCLKB clock cycles
0x1	00b	PCLKB/4	1024	4096
	01b		4096	16384
	10b		8192	32768
	11b		16384	65536
0x4	00b	PCLKB/64	1024	65536
	01b		4096	262144
	10b		8192	524288
	11b		16384	1048576
0xF	00b	PCLKB/128	1024	131072
	01b		4096	524288
	10b		8192	1048576
	11b		16384	2097152
0x6	00b	PCLKB/512	1024	524288
	01b		4096	2097152
	10b		8192	4194304
	11b		16384	8388608
0x7	00b	PCLKB/2048	1024	2097152
	01b		4096	8388608
	10b		8192	16777216
	11b		16384	33554432
0x8	00b	PCLKB/8192	1024	8388608
	01b		4096	33554432
	10b		8192	67108864
	11b		16384	134217728

CKS[3:0] bits (Clock Division Ratio Select)

The CKS[3:0] bits specify the division ratio of the clock used for the down-counter. The division ratio can be selected from the PCLKB divided by 4, 64, 128, 512, 2048, and 8192. Combined with the TOPS[1:0] bit setting, this allows the WDT to be configured to a count period between 4096 and 134217728 PCLKB clock cycles.

RPES[1:0] bits (Window End Position Select)

The RPES[1:0] bits specify the window end position that indicates the refresh-permitted period. 75%, 50%, 25%, or 0% of the timeout period can be selected for the window end position. Set the window end position to a value less than the value for the window start position (window start position > window end position). If the window start position is set to a value less than or equal to the window end position, the window start position setting is enabled and the window end position is set to 0%.

RPSS[1:0] bits (Window Start Position Select)

The RPSS[1:0] bits specify the window start position that indicates the refresh-permitted period. 100%, 75%, 50%, or 25% of the timeout period can be selected for the window start position. Set the window start position to a value greater than the value for the window end position. If the window start position is set to a value less than or equal to the window end position, the window start position setting is enabled and the window end position is set to 0%.

[Table 25.3](#) lists the counter values for the window start and end positions, and [Figure 25.2](#) shows the refresh-permitted period set in the RPSS[1:0], RPES[1:0], and TOPS[1:0] bits.

Table 25.3 Relationship between the timeout period and window start and end counter values

TOPS[1:0]	Timeout period		Window start and end counter value			
	Cycles	Counter value	100%	75%	50%	25%
00b	1024	0x03FF	0x03FF	0x02FF	0x01FF	0x00FF
01b	4096	0x0FFF	0x0FFF	0x0BFF	0x07FF	0x03FF
10b	8192	0x1FFF	0x1FFF	0x17FF	0x0FFF	0x07FF
11b	16384	0x3FFF	0x3FFF	0x2FFF	0x1FFF	0x0FFF

Figure 25.2 RPSS[1:0] and RPES[1:0] bits setting and refresh-permitted period

25.2.3 WDTSR : WDT Status Register

Base address: WDT0 = 0x4020_2600
 WDT0_NS = 0x5020_2600

Offset address: 0x04

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:	REFE F	UNDF F	CNTVAL[13:0]												
------------	--------	--------	--------------	--	--	--	--	--	--	--	--	--	--	--	--

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
13:0	CNTVAL[13:0]	Down-Counter Value Value counted by the down-counter	R
14	UNDF	Underflow Flag 0: No underflow occurred 1: Underflow occurred	R/W ¹

Bit	Symbol	Function	R/W
15	REFEF	Refresh Error Flag 0: No refresh error occurred 1: Refresh error occurred	R/W ¹

Note: S-TYPE-3, P-TYPE-3

Note 1. Only 0 can be written to clear the flag.

The WDTSR register indicates the counter value of the down-counter and the status of whether an underflow or refresh error occurred in the down-counter.

CNTVAL[13:0] bits (Down-Counter Value)

Read the CNTVAL[13:0] bits to confirm the value of the down-counter. The read value might differ from the actual count by 1.

UNDFE flag (Underflow Flag)

Read the UNDFE flag to confirm whether an underflow occurred in the counter. A value of 1 indicates that the down counter underflowed. Write 0 to the flag to set the value to 0. Writing 1 has no effect.

Clearing of the UNDFE flag takes (N + 1) PCLKB cycles. In addition, clearing of the flag is ignored for (N + 1) PCLKB cycles after an underflow. N is specified in the WDTCCR.CKS[3:0] bits as follows:

- When WDTCCR.CKS[3:0] = 0x1, N = 4
- When WDTCCR.CKS[3:0] = 0x4, N = 64
- When WDTCCR.CKS[3:0] = 0xF, N = 128
- When WDTCCR.CKS[3:0] = 0x6, N = 512
- When WDTCCR.CKS[3:0] = 0x7, N = 2048
- When WDTCCR.CKS[3:0] = 0x8, N = 8192

REFEF flag (Refresh Error Flag)

Read the REFEF flag to confirm whether a refresh error occurred, indicating that a refresh operation was performed during a prohibited period. A value of 1 indicates that a refresh error occurred. Write 0 to the flag to set the value to 0. Writing 1 has no effect.

Clearing of the REFEF flag takes (N + 1) PCLKB cycles. In addition, clearing of the flag is ignored for (N + 1) PCLKB cycles after a refresh error. N is specified in the WDTCCR.CKS[3:0] bits as follows:

- When WDTCCR.CKS[3:0] = 0x1, N = 4
- When WDTCCR.CKS[3:0] = 0x4, N = 64
- When WDTCCR.CKS[3:0] = 0xF, N = 128
- When WDTCCR.CKS[3:0] = 0x6, N = 512
- When WDTCCR.CKS[3:0] = 0x7, N = 2048
- When WDTCCR.CKS[3:0] = 0x8, N = 8192

25.2.4 WDTRCR : WDT Reset Control Register

Base address: WDT0 = 0x4020_2600
WDT0_NS = 0x5020_2600

Offset address: 0x06

Bit position: 7 6 5 4 3 2 1 0

Bit field:	RSTIR QS	—	—	—	—	—	—
------------	-------------	---	---	---	---	---	---

Value after reset: 1 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
6:0	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
7	RSTIRQS	WDT Behavior Selection 0: Interrupt 1: Reset	R/W

Note: S-TYPE-3, P-TYPE-3

The WDTRCR register controls reset output by a WDT down-counter underflow or interrupt request output.

Some constraints apply to writes to the WDTRCR register. For details, see [section 25.3.2. Controlling Writes to the WDTCSR, WDTRCR, and WDTCSNPR Registers](#).

In auto start mode, the WDTRCR register settings are disabled, and the settings in the Option Function Select register 0 (OFS0) are enabled. The settings for the WDTRCR register can also be made for the OFS0 register. For details, see [section 25.3.8. Association between Option Function Select Register 0 \(OFS0\) and WDT Registers](#).

25.2.5 WDTCSNPR : WDT Count Stop Control Register

Base address: WDT0 = 0x4020_2600
WDT0_NS = 0x5020_2600

Offset address: 0x08

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SLCS TP	—	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	—	These bits are read as 0. The write value should be 0.	R/W
7	SLCSTP	CPU Sleep-Mode Count Stop Control Register 0: Disable count stop 1: Stop count on transition to CPU Sleep mode or CPU Deep Sleep mode	R/W

Note: S-TYPE-3, P-TYPE-3

The WDTCSNPR register controls whether to stop the WDT counter in CPU Sleep mode or CPU Deep Sleep mode. Some constraints apply to writes to the WDTCSNPR register. For details, see [section 25.3.2. Controlling Writes to the WDTCSR, WDTRCR, and WDTCSNPR Registers](#).

In auto start mode, the WDTCSNPR register settings are disabled, and the settings in the Option Function Select register 0 (OFS0) are enabled. The settings for the WDTCSNPR register can also be made for the OFS0 register. For details, see [section 25.3.8. Association between Option Function Select Register 0 \(OFS0\) and WDT Registers](#).

SLCSTP bit (CPU Sleep-Mode Count Stop Control Register)

The SLCSTP bit selects whether to stop counting on transition to CPU Sleep mode or CPU Deep Sleep mode.

25.2.6 Option Function Select Register 0 (OFS0)

For information on the OFS0 register, see [section 25.3.8. Association between Option Function Select Register 0 \(OFS0\) and WDT Registers](#).

25.3 Operation

25.3.1 Count Operation in each Start Mode

The WDT has two start modes:

- Auto start mode, in which counting automatically starts after a release from the reset state
- Register start mode, in which counting starts with a refresh by writing to the register.

In auto start mode, counting automatically starts after a release from the reset state according to the settings in the Option Function Select register 0 (OFS0) in the flash.

In register start mode, counting starts with a refresh by writing to the WDTRR register after the respective registers are set after a release from the reset state.

Select auto start mode or register start mode by setting the WDT Start Mode Select bit (OFS0.WDTSTRT) in the OFS0 register.

When the auto start mode is selected, the settings in the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSSTPR) are disabled while the settings in the OFS0 register are enabled.

When the register start mode is selected, the setting for the OFS0 register is disabled while the settings for the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSSTPR) are enabled.

25.3.1.1 Register start mode

When the WDT Start Mode Select bit (OFS0.WDTSTRT) is 1, register start mode is selected, the OFS0 register setting is invalid, and the WDT control register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSSTPR) are enabled.

After the reset state is released, set the following:

- Clock division ratio in the WDTCR register
- Window start and end positions in the WDTCR register
- Timeout period in the WDTCR register
- Reset output or interrupt request output in the WDTRCR register
- Counter stop control during transitions to CPU Sleep mode or CPU Deep Sleep mode in the WDTCSSTPR register

The WDT refresh register (WDTRR) refreshes the down counter. As a result, the downcount starts at the value set by the timeout period selection bit (WDTCR.TOPS[1:0]).

Thereafter, as long as the counter is refreshed in the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and counting down continues. The WDT does not output the reset signal or non-maskable interrupt request/interrupt request as long as counting continues. However, if the down-counter underflows because the down-counter cannot be refreshed due to a program runaway, or if a refresh error occurs because the counter was refreshed outside the refresh-permitted period, the WDT outputs the reset signal or a non-maskable interrupt request/interrupt request (WDT0_NMIUNDF). Reset output or interrupt request output can be selected in the WDT Reset Interrupt Request Select bit (WDTRCR.RSTIRQS). The interrupt enabled for operating the NMI can be selected in the WDT Underflow/Refresh Error Interrupt Enable bit (NMIER.WDTEN).

Figure 25.3 shows an example of operation under the following conditions:

- Register start mode (OFS0.WDTSTRT = 1)
- WDT reset interrupt request selection (WDTRCR.RSTIRQS = 1)
- The window start position is 75% (WDTCR.RPSS[1:0] = 10b)
- The window end position is 25% (WDTCR.RPES[1:0] = 10b)

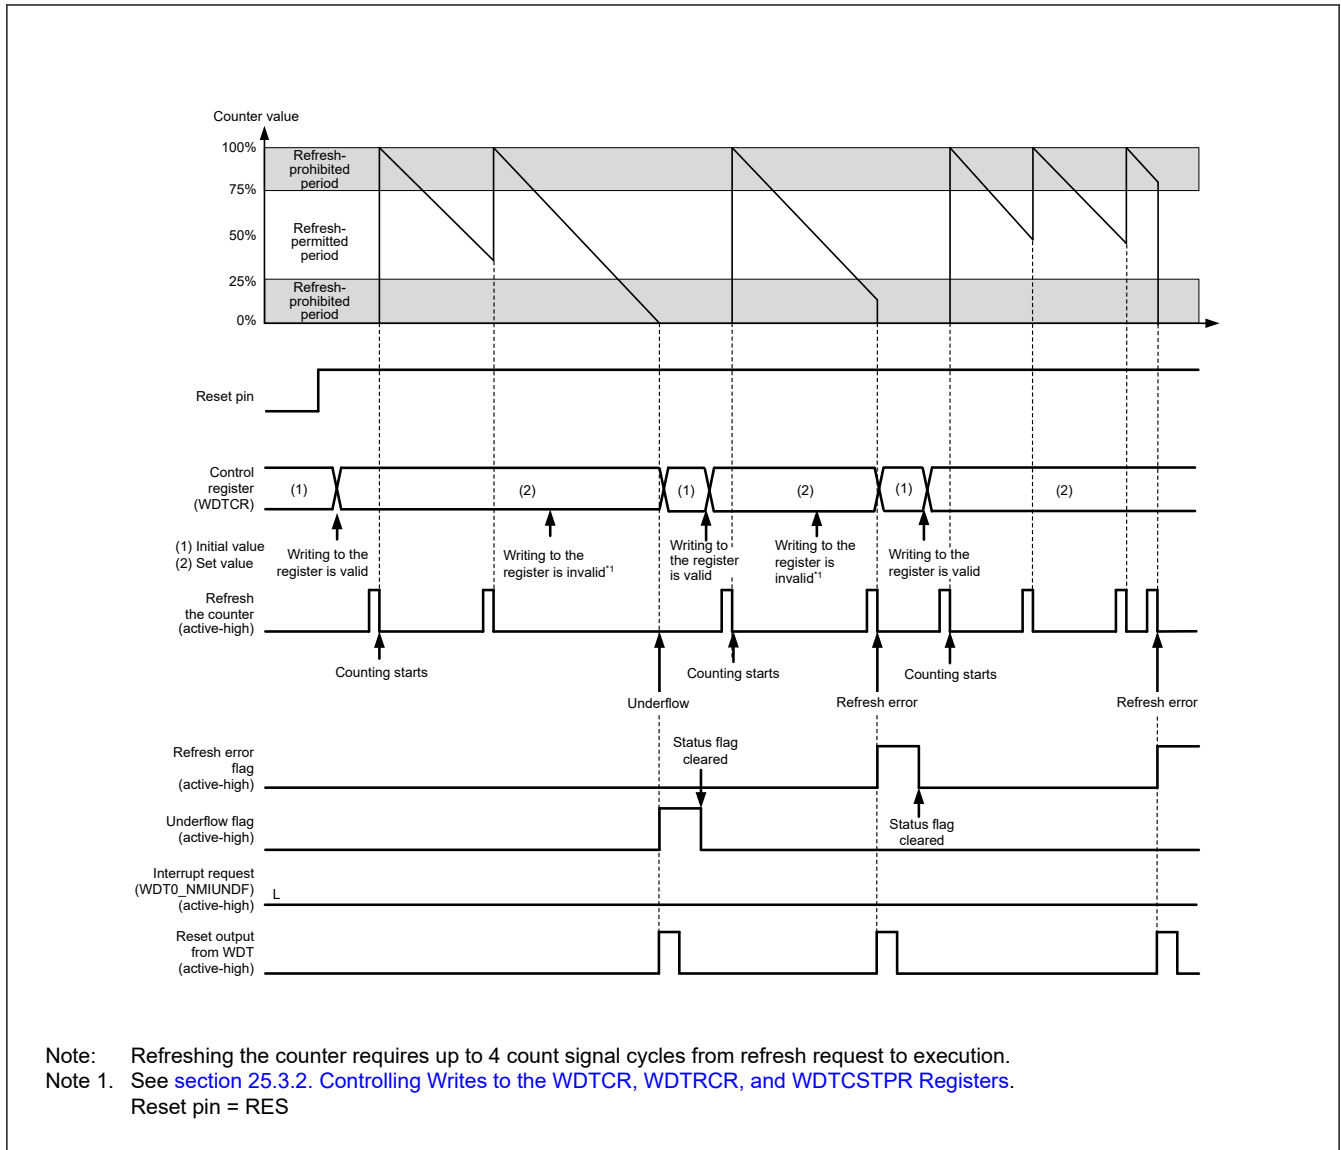

Figure 25.3 Operation example in register start mode

25.3.1.2 Auto start mode

When the WDT Start Mode Select bit (OFS0.WDTSTRT) in the Option Function Select Register 0 (OFS0) is 0, auto start mode is selected, the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSPTPR) are disabled, and the settings in the OFS0 register are enabled.

Within the reset state, the setting values for the following in the Option Function Select Register 0 (OFS0) are set in the WDT registers:

- Clock division ratio
- Window start and end positions
- Timeout period
- Reset output or interrupt request
- Counter stop control during transition to CPU Sleep mode or CPU Deep Sleep mode

When the reset state is released, the down-counter automatically starts counting down from the value set in the WDT Timeout Period Select bits (OFS0.WDTPOPS[1:0]).

Thereafter, as long as the counter is refreshed in the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and counting down continues. The WDT does not output the reset signal or non-maskable interrupt

request/interrupt request (WDT0_NMIUNDF) as long as the counting continues. However, if the down-counter underflows because refreshing of the down-counter is not possible due to a runaway program or if a refresh error occurs due to refreshing outside the refresh-permitted period, the WDT outputs the reset signal or non-maskable interrupt request/interrupt request (WDT0_NMIUNDF).

After the reset signal or non-maskable interrupt request/interrupt request is generated, the counter reloads the timeout period after counting for 1 cycle. The value of the timeout period is set in the down-counter and counting restarts.

Reset output or interrupt request output can be selected by setting the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS). Non-maskable interrupt request or interrupt request can be selected in the WDT Underflow/Refresh Error Interrupt Enable bit (NMIER.WDTEN).

Figure 25.4 shows an example of operation (non-maskable interrupt) under the following conditions:

- Auto start mode (OFS0.WDTSTRT = 0)
- WDT behavior selection: interrupt (OFS0.WDTRSTIRQS = 0)
- Non-maskable Interrupt: WDT Underflow/Refresh Error Interrupt Enabled (NMIER.WDTEN = 1)
- The window start position is 75% (OFS0.WDTRPSS[1:0] = 10b)
- The window end position is 25% (OFS0.WDTRPES[1:0] = 10b)

Figure 25.4 Operation example in auto start mode

25.3.2 Controlling Writes to the WDTCR, WDTRCR, and WDTCSSTPR Registers

Writing to the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), or WDT Count Stop Control Register (WDTCSSTPR) is possible once each between the release from the reset state and the first refresh operation.

After a refresh (counting starts) or a write to WDTCR, WDTRCR or WDTCSSTPR register, the protection signal in the WDT becomes 1 to protect WDTCR, WDTRCR and WDTCSSTPR register against subsequent write attempts. This protection is released by the reset source of the WDT. With other reset sources, the protection is not released.

Figure 25.5 shows control waveforms produced in response to writing to the WDTCR.

Figure 25.5 Control waveforms produced in response to writes to the WDTCR register

25.3.3 Refresh Operation

The down-counter is refreshed and starts counting operation on a write of the values 0x00 and then 0xFF to the WDT Refresh Register (WDTRR).

If a value other than 0xFF is written after 0x00, the down-counter is not refreshed.

If an invalid value is written, correct refreshing resumes on a write of 0x00 and then 0xFF to the WDTRR register.

Correct refreshing is also performed when a register other than WDTRR is accessed or WDTRR is read between writing 0x00 and writing 0xFF to WDTRR. Writes to refresh the counter must be made within the refresh-permitted period, and this is determined by the 0xFF write. For this reason, correct refreshing is performed even when 0x00 is written outside the refresh-permitted period.

[Example write sequences that are valid for refreshing the counter]

- 0x00 → 0xFF
- 0x00 ((n-1)th time) → 0x00 (nth time) → 0xFF
- 0x00 → access to another register or read from WDTRR → 0xFF

[Example write sequences that are invalid for refreshing the counter]

- 0x23 (a value other than 0x00) → 0xFF
- 0x00 → 0x54 (a value other than 0xFF)
- 0x00 → 0xAA (0x00 and a value other than 0xFF) → 0xFF

After 0xFF is written to the WDT Refresh Register (WDTRR), refreshing the down-counter requires up to 4 cycles of the signal for counting. To meet this requirement, complete writing 0xFF to WDTRR 4 count cycles before the down-counter underflows.

Figure 25.6 shows the WDT refresh-operation waveforms when the clock division ratio is PCLKB/64.

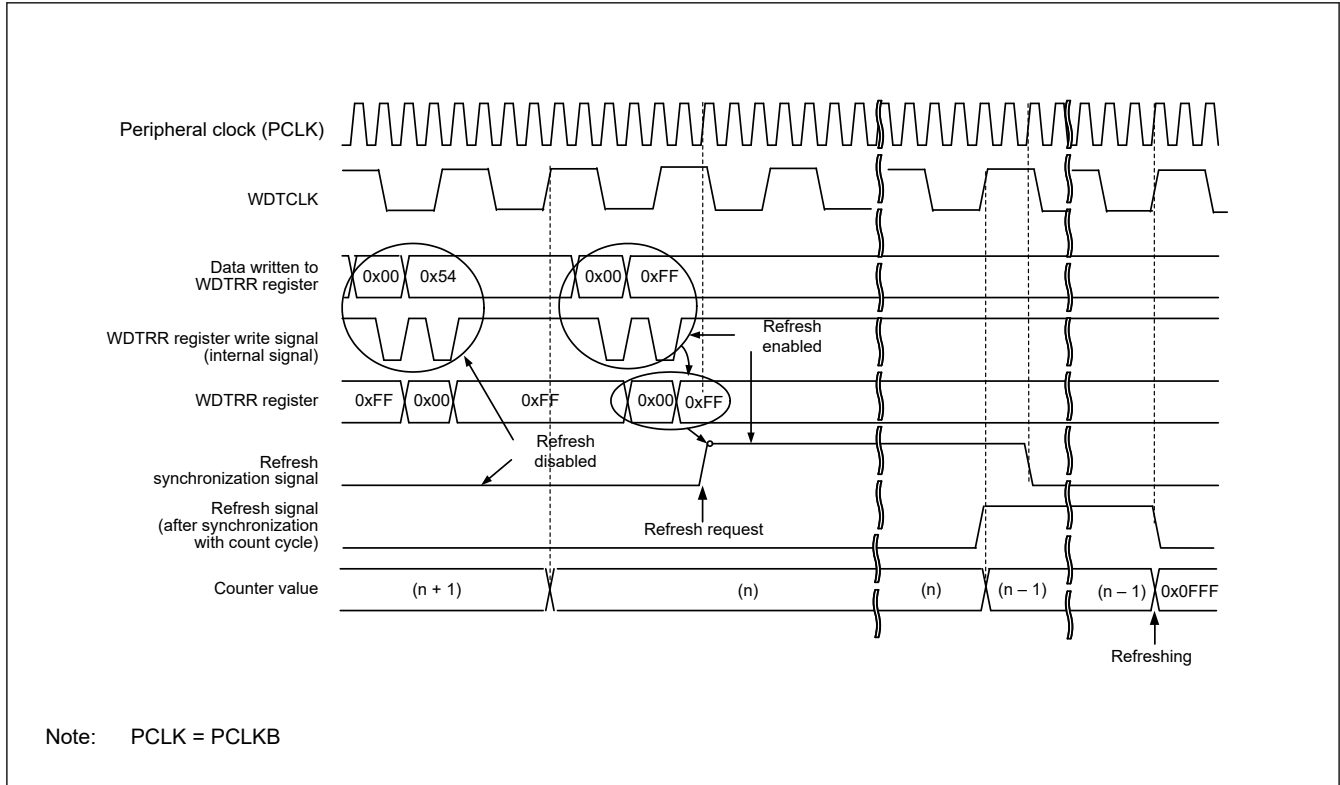

Figure 25.6 WDT refresh operation waveforms when WDTCR.CKS[3:0] = 0x4 and WDTCR.TOPS[1:0] = 01b

Note: When setting the refresh time, consider the oscillation accuracy of the clock sources of the PCLKB and WDTCLK. Set values which ensure that refreshing is possible even when the frequency varies in the range of error of the oscillation accuracy.

25.3.4 Status Flags

The refresh error (WDTSR.REFEF) and underflow (WDTSR.UNDF) flags retain the source of the interrupt request from the WDT. After a release from the interrupt request generation, read the WDTSR.REFEF and WDTSR.UNDF flags to check for the interrupt source. For each flag, writing 0 clears the bit. Writing 1 has no effect. Leaving the status flags unchanged does not affect operation. If the flags are not cleared at the next interrupt request from the WDT, the earlier interrupt source is cleared and the new interrupt source is written. For the time period between when 0 is written in each flag and when its value is reflected, see section 25.2.3. WDTSR : WDT Status Register.

25.3.5 Reset Output

When the Reset Interrupt Select bit (WDTRCR.RSTIRQS) is set to 1 in register start mode, or when the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 1 in auto start mode, a reset signal is output for 1 cycle count when an underflow in the down-counter or a refresh error occurs.

In register start mode, the down-counter is initialized (all bits set to 0) and stopped in that state after output of a reset signal. After the reset state is released and the program is restarted, the counter is set up again and counting down starts again with a refresh. In auto start mode, counting down starts automatically after the reset state is released.

25.3.6 Interrupt Sources

When the Reset Interrupt Select bit (WDTRCR.RSTIRQS) is set to 0 in register start mode or when the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 0 in auto start

mode, an interrupt (WDT0_NMIUNDF) signal is generated when an underflow in the counter or a refresh error occurs. This interrupt can be used as a non-maskable interrupt or an interrupt. For details, see [section 13, Interrupt Controller Unit \(ICU\)](#).

Table 25.4 WDT interrupt source

Name	Interrupt source	Interrupt to CPU	Start DMAC or DTC
WDT0_NMIUNDF	<ul style="list-style-type: none"> Down-counter underflow Refresh error 	Possible	Not possible

25.3.7 Reading the Down-Counter Value

The WDT stores the counter value in the down-counter value bits (WDTSR.CNTVAL[13:0]) of the WDT Status Register. Check these bits to obtain the counter value. The read value of the down-counter might differ from the actual count by one.

[Figure 25.7](#) shows the processing for reading the WDT down-counter value when the clock division ratio is PCLKB/64.

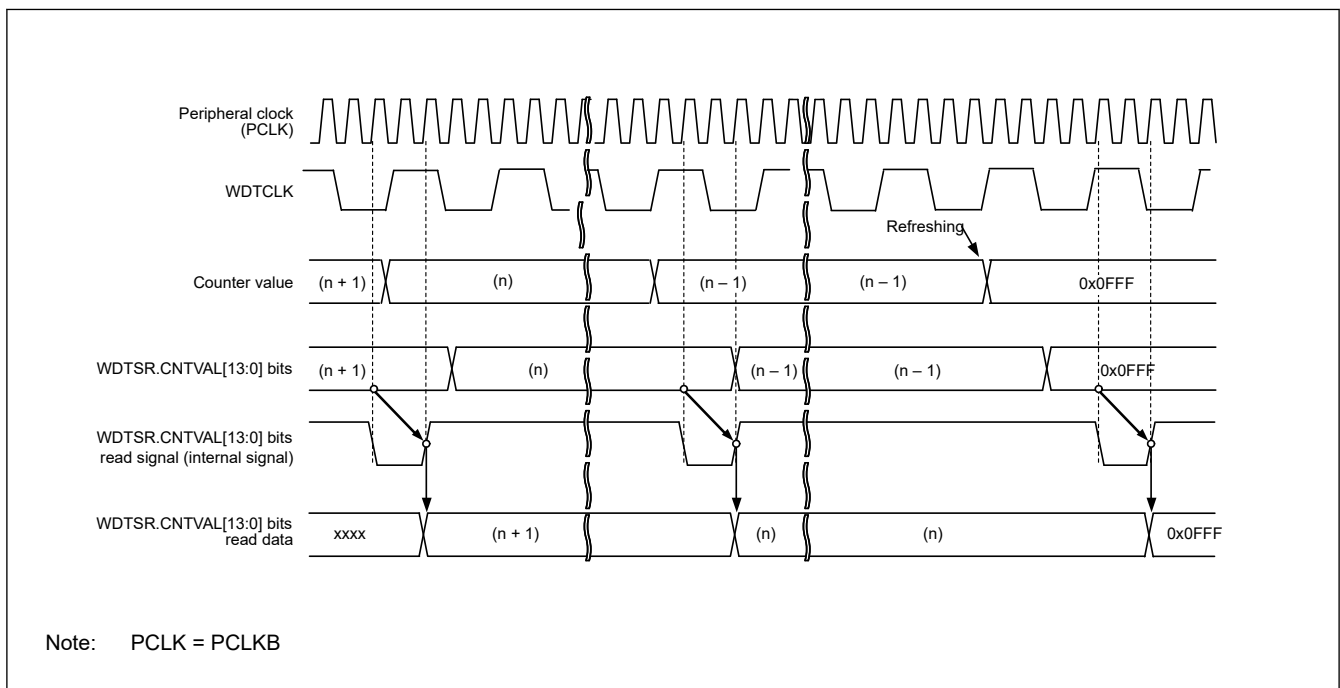

Figure 25.7 Processing for reading WDT down-counter value when WDTCR.CKS[3:0] = 0x4 and WDTCR.TOPS[1:0] = 01b

25.3.8 Association between Option Function Select Register 0 (OFS0) and WDT Registers

[Table 25.5](#) lists the association between the Option Function Select Register 0 (OFS0) used in auto start mode, and the registers used in register start mode. For details on the Option Function Select Register 0 (OFS0), see [section 6.2.1. OFS0 : Option Function Select Register 0](#).

Table 25.5 Association between Option Function Select Register 0 (OFS0) and the WDT registers (1 of 2)

Control target	Function	OFS0 register (enabled in auto start mode) OFS0.WDTSTRT = 0	WDT registers (enabled in register start mode) OFS0.WDTSTRT = 1
Down-counter	Timeout period selection	OFS0.WDTPS[1:0]	WDTCR.TOPS[1:0]
	Clock division ratio selection	OFS0.WDTCKS[3:0]	WDTCR.CKS[3:0]
	Window start position selection	OFS0.WDTRPSS[1:0]	WDTCR.RPSS[1:0]
	Window end position selection	OFS0.WDTRPES[1:0]	WDTCR.RPES[1:0]

Table 25.5 Association between Option Function Select Register 0 (OFS0) and the WDT registers (2 of 2)

Control target	Function	OFS0 register (enabled in auto start mode) OFS0.WDTSTRT = 0	WDT registers (enabled in register start mode) OFS0.WDTSTRT = 1
Reset output or interrupt request output	Select a reset interrupt request	OFS0.WDTRSTIRQS	WDTRCR.RSTIRQS
Count stop	CPU Sleep mode or CPU Deep Sleep mode count stop control	OFS0.WDTSTPCTL	WDTCSR.SLCSTP

25.4 Output to the Event Link Controller (ELC)

The WDT is capable of a link operation for the previously specified module when interrupt request signal is used as an event signal by the ELC. The event signal is output by the counter underflow and refresh error. An event signal is output regardless of the setting of the Reset Interrupt Request Select bit (WDTRCR.RSTIRQS) in register start mode or auto start mode. An event signal can also be output when the next interrupt source is generated while the Refresh Error flag (WDTSR.REFEF) or Underflow flag (WDTSR.UNDF) is 1. For details, see [section 18, Event Link Controller \(ELC\)](#).

25.5 Usage Notes

25.5.1 ICU Event Link Setting Register n (IELSRn) Setting

Setting 0x53 to ICU Event Link Setting Register n (ICU.IELSRn) is prohibited when WDT reset interrupt request selection resets (OFS0.WDTRSTIRQS = 0 or WDTRCR.RSTIRQS = 0) or when enabling event link operation (ELSRn.ELS[8:0] = 0x53).

26. Independent Watchdog Timer (IWDT)

26.1 Overview

The Independent Watchdog Timer (IWDT) consists of a 14-bit down counter that must be serviced periodically to prevent counter underflow. The IWDT provides functionality to reset the MCU or to generate a non-maskable interrupt or an underflow interrupt. Because the timer operates with an independent clock from CPU clock (CPUCLK) and System clock (ICLK), it is particularly useful in returning the MCU to a known state as a fail-safe mechanism when the system runs out of control. The IWDT can be triggered automatically by a reset, underflow, refresh error, or a refresh of the count value in the registers.

The IWDT functions differ from those of the WDT in the following respects:

The divided IWDT clock (IWDTCLK) is used as the count source (not affected by PCLKB)

Table 26.1 lists the IWDT specifications.

Table 26.1 IWDT specifications

Parameter	Specifications
Count source*1	IWDT clock (IWDTCLK)
Clock division ratio	Division by 1, 16, 32, 64, 128, or 256
Counter operation	Counting down using a 14-bit down-counter
Conditions for starting the counter	<ul style="list-style-type: none"> Auto start mode: Counting automatically starts after a reset or after an underflow or refresh error occurs. Register start mode: Counting is started with a refresh by writing to the IWDTRR register. Only secure developer can select Auto-start mode or Register-start mode.
Conditions for stopping the counter	<ul style="list-style-type: none"> Reset (the down-counter and other registers return to their initial values). A counter underflows or a refresh error is generated.
Window function	Window start and end positions can be specified (refresh-permitted and refresh-prohibited periods).
Independent watchdog timer reset sources	<ul style="list-style-type: none"> Down-counter underflows Refreshing outside the refresh-permitted period (refresh error)
Non-maskable interrupt/interrupt sources	<ul style="list-style-type: none"> Down-counter underflows Refreshing outside the refresh-permitted period (refresh error)
Reading of the counter value	The down-counter value can be read by the IWDTSR register.
Event link function (output)	<ul style="list-style-type: none"> Down-counter underflow event output Refresh error event output
Output signal (internal signal)	<ul style="list-style-type: none"> Reset output Interrupt request output CPU Sleep mode, CPU Deep Sleep mode, Software Standby mode and Deep Software Standby mode count stop control output.
Trust Zone Filter	Security and Privilege attribution can be set.

Note 1. Satisfy the frequency of the peripheral module clock (PCLKB) $\geq 4 \times$ (the frequency of the count clock source after division).
The bus interface and registers operate with PCLKB, and the 14-bit counter and control circuits operate with IWDTCLK.

26.1.1 Block diagram

In addition to the peripheral clock (PCLKB), an MCU needs the IWDT clock (IWDTCLK) that does not stop even in low power modes so that the MCU runs even in low power modes in which the peripheral clock (PCLKB) stops. The bus interface and registers operate with the peripheral clock (PCLKB), and the 14-bit down-counter and control circuits operate with the IWDT clock (IWDTCLK).

Signals are connected between the block operating with the peripheral clock (PCLKB) and the block operating with the IWDT clock (IWDTCLK) via a synchronization circuit.

Figure 26.1 shows a block diagram.

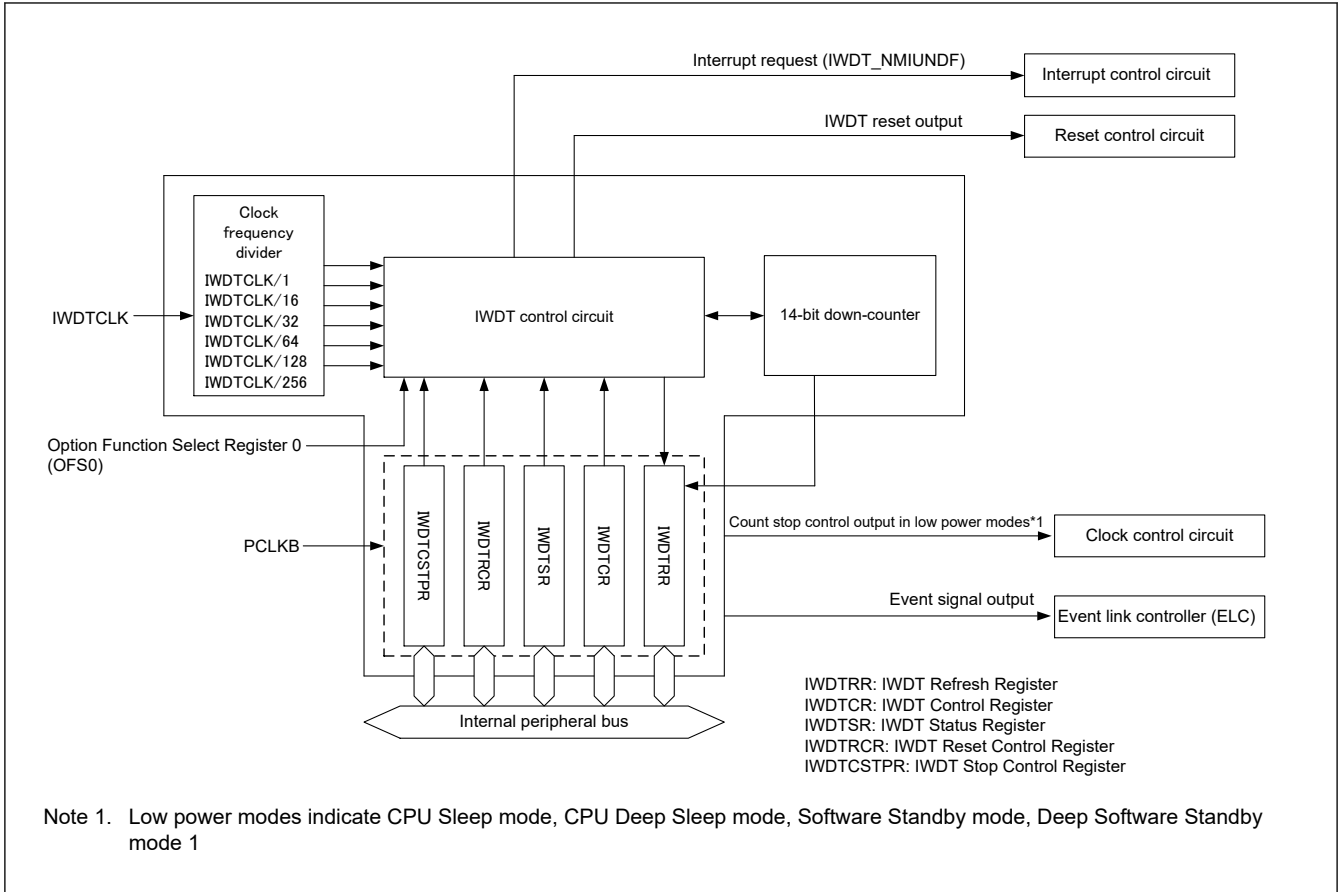

Figure 26.1 IWDT block diagram

26.2 Register specifications

26.2.1 IWDTRR : IWDT Refresh Register

Base address: IWDT = 0x4020_2200
 IWDT_NS = 0x5020_2200

Offset address: 0x0

Bit position: 7 6 5 4 3 2 1 0

Bit field: REFRESH[7:0]

Value after reset: 1 1 1 1 1 1 1 1

Bit	Symbol	Function	R/W
7:0	REFRESH[7:0]	Refresh Register The counter is refreshed by writing 0x00 and then writing 0xFF to this register.	R/W

Note: S-TYPE-3, P-TYPE-3

The IWDTRR register refreshes the down-counter of the IWDT.

REFRESH[7:0] bits (Refresh Register)

The down-counter of the IWDT is refreshed by writing 0x00 and then writing 0xFF to IWDTRR(refresh operation) within the refresh-permitted period. After the down-counter is refreshed, it starts counting down from the value selected by the IWDT time-out period selection bits (OFS0.IWDTTOPS[1:0]) in the auto start mode.

In the register start mode, counting down starts from the value set by the TOPS[1:0] bits in the IWDT Control Register (IWDTCR).

Also in the register start mode, counting down starts from the value set by the IWDTCR.TOPS[1:0] bits by the first refresh operation after the release from the reset state.

When 0x00 is written, the read value is always 0x00. When a value other than 0x00 is written, the read value is always 0xFF.

For details of the refresh operation, see [section 26.3.3. Refresh operation.](#)

26.2.2 IWDTCR : IWDT Control Register

Base address: IWDT = 0x4020_2200
 IWDT_NS = 0x5020_2200

Offset address: 0x2

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Bit field:	—	—	RPSS[1:0]	—	—	RPES[1:0]	CKS[3:0]			—	—	TOPS[1:0]					
Value after reset:	0	0	1	1	0	0	1	1	1	1	1	1	1	0	0	1	1

Bit	Symbol	Function	R/W
1:0	TOPS[1:0]	Timeout Period Select 0 0: 128 cycles (0x007F) 0 1: 512 cycles (0x01FF) 1 0: 1024 cycles (0x03FF) 1 1: 2048 cycles (0x07FF) Each value in parentheses () denotes a start value of down-counting.	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
7:4	CKS[3:0]	Clock Division Ratio Select 0 0 0 0: IWDTCLK 0 0 1 0: IWDTCLK/16 0 0 1 1: IWDTCLK/32 0 1 0 0: IWDTCLK/64 1 1 1 1: IWDTCLK/128 0 1 0 1: IWDTCLK/256 Other settings are prohibited.	R/W
9:8	RPES[1:0]	Window End Position Select 0 0: 75% 0 1: 50% 1 0: 25% 1 1: 0% (No window end position setting)	R/W
11:10	—	These bits are read as 0. The write value should be 0.	R/W
13:12	RPSS[1:0]	Window Start Position Select 0 0: 25% 0 1: 50% 1 0: 75% 1 1: 100% (No window start position setting)	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

The IWDTCR register is used to specify the timeout period (time until the down-counter underflows in the register start mode), clock division ratio, and the window start and end positions of refresh-permitted period. Some restrictions apply to writes to this register. For details, see [section 26.3.2. Controlling writes to the IWDTCR, IWDTRCR, and IWDTCSR registers.](#)

In auto start mode, the settings of this register are disabled and the settings for the option function select register 0 (OFS0) are enabled. The same settings as in the bits in this register can be performed at the option function select register 0 (OFS0). For details, see [section 26.3.8. Correspondence between Option Function Select Register 0 \(OFS0\) and IWDT Registers.](#)

TOPS[1:0] bits (Timeout Period Select)

The TOPS[1:0] bits select the timeout period, the period until the down-counter underflows, from 128, 512, 1024, and 2048 cycles, taking the divided clock specified in the CKS[3:0] bits as one cycle.

After the down-counter is refreshed, the combination of the CKS[3:0] and TOPS[1:0] bits determines the time (number of IWDT clock (IWDTCLK) cycles) until the counter underflows.

[section 26.2.2. IWDTCR : IWDT Control Register](#) shows the relationship among the CKS[3:0] and TOPS[1:0] bits settings, the timeout period, and the number of IWDT clock (IWDTCLK) cycles.

Table 26.2 IWDT timeout period settings

CKS[3:0]				TOPS[1:0]		Clock division ratio	Timeout period (Number of cycles)	Number of IWDT clock (IWDTCLK) cycles
0	0	0	0	0	0	IWDTCLK	128	128
				0	1		512	512
				1	0		1024	1024
				1	1		2048	2048
0	0	1	0	0	0	IWDTCLK/16	128	2048
				0	1		512	8192
				1	0		1024	16384
				1	1		2048	32768
0	0	1	1	0	0	IWDTCLK/32	128	4096
				0	1		512	16384
				1	0		1024	32768
				1	1		2048	65536
0	1	0	0	0	0	IWDTCLK/64	128	8192
				0	1		512	32768
				1	0		1024	65536
				1	1		2048	131072
1	1	1	1	0	0	IWDTCLK/128	128	16384
				0	1		512	65536
				1	0		1024	131072
				1	1		2048	262144
0	1	0	1	0	0	IWDTCLK/256	128	32768
				0	1		512	131072
				1	0		1024	262144
				1	1		2048	524288

CKS[3:0] bits (Clock Division Ratio Select)

These bits select IWDT clock (IWDTCLK) division ratio from among division by 1, 16, 32, 64, 128, and 256.

Combined with the TOPS[1:0] bits setting, a count period between 128 and 524288 cycles of the IWDT clock (IWDTCLK) can be selected for the IWDT.

Note: In order to read the down-counter value correctly, the relationship between the peripheral clock (PCLKB) frequency and the count clock (IWDTCLK) frequency must be set appropriately. For the setting, see Note1 in [Table 26.1](#)

RPES[1:0] bits (Window End Position Select)

These bits select 75%, 50%, 25% or 0% of the count period for the window end position of the down-counter. The selected window end position should be a value smaller than the value for the window start position (that is, window start position > window end position). If the value for the window end position is greater than the value for the window start position, only the value for the window start position is effective.

The counter values for the window start and end positions selected by setting the RPES[1:0] and RPSS[1:0] bits change depending on the TOPS[1:0] bits setting.

[Table 26.3](#) lists the counter values for the window start and end positions corresponding to TOPS[1:0] bits values.

Table 26.3 Relationship between timeout periods and window start and end counter values

TOPS[1:0]		Timeout period		Window start and end counter value			
		Number of cycles	Counter value	100%	75%	50%	25%
0	0	128	0x007F	0x007F	0x005F	0x003F	0x001F
0	1	512	0x01FF	0x01FF	0x017F	0x00FF	0x007F
1	0	1024	0x03FF	0x03FF	0x02FF	0x01FF	0x00FF
1	1	2048	0x07FF	0x07FF	0x05FF	0x03FF	0x01FF

RPSS[1:0] bits (Window Start Position Select)

These bits select a counter window start position from 100%, 75%, 50%, or 25% of the count period (100% when the count starts and 0% when the counter underflows). The interval between the window start position and window end position is the refresh-permitted period and the other periods are refresh-prohibited periods.

Figure 26.2 shows the relationship between the RPSS[1:0] and RPES[1:0] bits settings and the refresh-permitted and refresh-prohibited periods.

Figure 26.2 RPSS[1:0] and RPES[1:0] bits settings and refresh-permitted and refresh-prohibited periods

26.2.3 IWDTSR : IWDT Status Register

Base address: IWDT = 0x4020_2200
 IWDT_NS = 0x5020_2200

Offset address: 0x4

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:	REFE F	UNDF F	CNTVAL[13:0]												
------------	-----------	-----------	--------------	--	--	--	--	--	--	--	--	--	--	--	--

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
13:0	CNTVAL[13:0]	Down-Counter Value Counter value of the down-counter	R
14	UNDFE	Underflow Flag 0: No underflow occurred. 1: Underflow occurred.	R/W
15	REFEF	Refresh Error Flag 0: No refresh error occurred. 1: Refresh error occurred.	R/W

Note: S-TYPE-3, P-TYPE-3

The IWDTSR register indicates the counter value of the down-counter and whether an underflow or refresh error occurred in the down-counter.

It is initialized by the reset source of the IWDT. IWDTSR is not initialized by other reset sources.

CNTVAL[13:0] bits (Down-Counter Value)

Read these bits to confirm the counter value of the down-counter.

Note: The read value might differ from the actual count by 1.

UNDFE flag (Underflow Flag)

Read the UNDFE flag to confirm whether an underflow occurred in the down-counter.

A value of 1 indicates that the down-counter underflowed. A value of 0 indicates that the down-counter has not underflowed.

Write 0 to the UNDFE flag to clear the value. Writing 1 has no effect.

REFEF flag (Refresh Error Flag)

Read the REFEF flag to confirm whether a refresh error (a refresh operation was performed during the prohibited period) occurred.

A value of 1 indicates that a refresh error occurred. A value of 0 indicates that no refresh error has occurred.

Write 0 to the REFEF flag to clear the value. Writing 1 has no effect.

26.2.4 IWDTRCR : IWDT Reset Control Register

Base address: IWDT = 0x4020_2200
IWDT_NS = 0x5020_2200

Offset address: 0x6

Bit position:	7	6	5	4	3	2	1	0
Bit field:	RSTIR QS	—	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	—	These bits are read as 0. The write value should be 0.	R/W
7	RSTIRQS	Reset Interrupt Request Select 0: Enable non-maskable interrupt requests or interrupt request output. 1: Enable reset output.	R/W

Note: S-TYPE-3, P-TYPE-3

IWDTRCR register controls the reset output or interrupt request output when the down-counter of the IWDT underflows. Some restrictions apply to writes to this register. For details, see [section 26.3.2. Controlling writes to the IWDTCR, IWDTRCR, and IWDTCSIPR registers](#).

In auto start mode, the settings of this register are disabled and the settings for the input ports (OFS0) are enabled. The same settings as in the bits in this register can be performed at the input ports (OFS0). For details, see [section 26.3.8. Correspondence between Option Function Select Register 0 \(OFS0\) and IWDT Registers](#).

RSTIRQS bit (Reset Interrupt Request Select)

The RSTIRQS bit selects the reset output or interrupt request output when the down-counter underflows or a refresh error occurs.

26.2.5 IWDTCSSTPR : IWDT Count Stop Control Register

Base address: IWDT = 0x4020_2200
IWDT_NS = 0x5020_2200

Offset address: 0x8

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SLCS TP	—	—	—	—	—	—	—
Value after reset:	1	1	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W
6	—	This bit is read as 1. The write value should be 1.	R/W
7	SLCSTP	CPU Sleep-Mode Count Stop Select 0: Disable count stop. 1: Stop the counter when the CPU enters CPU Sleep mode, CPU Deep Sleep mode, Software Standby mode, or Deep Software Standby mode 1.	R/W

Note: S-TYPE-3, P-TYPE-3

The IWDTCSSTPR register is used to stop the down-counter of the IWDT in case the CPU enters low-power modes. Some restrictions apply to writes to this register. For details, see [section 26.3.2. Controlling writes to the IWDTCSR, IWDTRCR, and IWDTCSSTPR registers](#).

In auto start mode, the settings of this register are disabled and the settings for the option function select register 0 (OFS0) are enabled. The same settings as in the bits in this register can be performed at the option function select register 0 (OFS0). For details, see [section 26.3.8. Correspondence between Option Function Select Register 0 \(OFS0\) and IWDT Registers](#).

SLCSTP bit (CPU Sleep-Mode Count Stop Select)

The SLCSTP bit selects whether to stop the counter in case the CPU enters CPU Sleep mode, CPU Deep Sleep mode, Software Standby mode, or Deep Software Standby mode 1.

26.3 Operation**26.3.1 Count operation in each start mode**

The start mode of the IWDT is selected by setting the IWDT start mode selection (OFS0.IWDTSTRT) bit during a reset.

When the IWDT start mode selection (OFS0.IWDTSTRT) bit is 1 (register start mode), the IWDT Control Register (IWDTCSR), IWDT Reset Control Register (IWDTRCR), and IWDT Count Stop Control Register (IWDTCSSTPR) are enabled, and counting is started by writing to the IWDT Refresh Register (IWDTRR) to refresh the counter. When the IWDT start mode selection (OFS0.IWDTSTRT) bit is 0 (auto start mode), the settings of the option function select register 0 (OFS0) are enabled, and counting automatically starts after a reset.

(1) Register start mode

When the register start mode is selected by setting the IWDT start mode selection (OFS0.IWDTSTRT) bit to 1 during a reset, the IWDT Control Register (IWDTCSR), IWDT Reset Control Register (IWDTRCR), and IWDT Count Stop Control Register (IWDTCSSTPR) are enabled.

After the reset state is released, set the clock division ratio, window start and end positions, and timeout period in the IWDTCSR register, the reset output or interrupt request output in the IWDTRCR register, and the IWDT down-counter stop control at transitions to low power modes in the IWDTCSSTPR register. Then, refresh the down-counter to set the value specified by the IWDTCSR.TOPS[1:0] bits in the counter and start counting down.

After that, as long as the program continues normal operation and the counter is refreshed in the refresh permitted period, the value in the counter is reset each time the counter is refreshed and counting down continues. The IWDT does not output a reset signal as long as this continues.

However, if the down counter underflows because the down-counter cannot be refreshed due to a program runaway, or if a refresh error occurs because the counter was refreshed outside the refresh-permitted period, the IWDT outputs a reset signal or a non-maskable interrupt request (IWDT_NMIUNDF).

The reset output or interrupt request output is selected by setting the IWDTRCR.RSTIRQS bit.

Figure 26.3 shows an example of operation under the following conditions:

- Register start mode (OFS0.IWDTSTRT = 1)
- Reset output is enabled (IWDTRCR.RSTIRQS = 1)
- The window start position is 75% (IWDTCR.RPSS[1:0] = 10b)
- The window end position is 25% (IWDTCR.RPES[1:0] = 10b)

Figure 26.3 Operation example in register start mode

(2) Auto start mode

When the auto start mode is selected by setting the IWDT start mode selection (OFS0.IWDTSTRT) bit to 0 during a reset, the IWDT Control Register (IWDTCR), IWDT Reset Control Register (IWDTRCR), and IWDT Count Stop Control Register (IWDTCSTPR) are disabled.

During a reset, the clock division ratio, window start and end positions, timeout period, reset output or interrupt request output, and counter stop control at transitions to low power modes should be set through the the option function select register 0 (OFS0). Then, when the reset state is released, the timeout period set through the option function select register 0 (OFS0) is set in the down-counter, and then the down-counter automatically starts counting down.

After that, as long as the program continues normal operation and the counter is refreshed in the refresh permitted period, the value in the counter is reset each time the counter is refreshed and counting down continues. The IWDT does not output a reset signal as long as this continues.

However, if the down-counter underflows because the down counter cannot be refreshed due to a program runaway, or if a refresh error occurs because the counter was refreshed outside the refresh-permitted period, the IWDT outputs a reset signal or a non-maskable interrupt request (IWDT_NMIUNDF).

The reset output or interrupt request output is selected by setting the IWDT reset interrupt request select bit (OFS0.IWDTRSTIRQS).

Figure 26.4 shows an example of operation under the following conditions:

- Auto start mode (OFS0.IWDTSTRT = 0)
- Non-maskable interrupt request output is enabled (OFS0.IWDTRSTIRQS = 0)
- The window start position is 75% (OFS0.IWDTRPSS[1:0] = 10b)
- The window end position is 25% (OFS0.IWDRPES[1:0] = 10b)

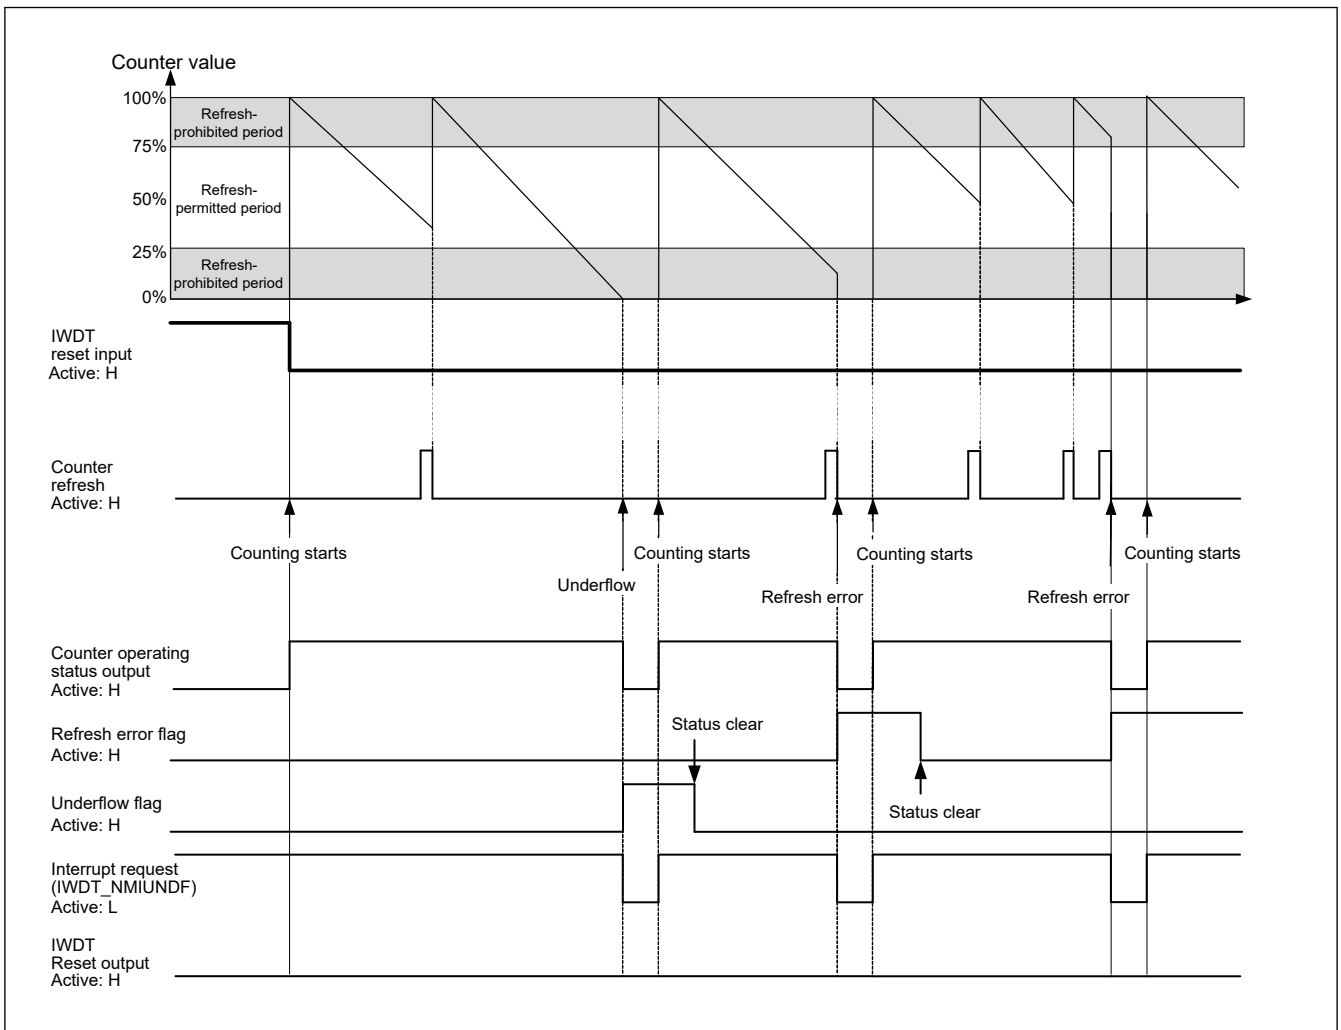

Figure 26.4 Operation example in auto start mode

26.3.2 Controlling writes to the IWDTCR, IWDTRCR, and IWDTCSSTPR registers

Writing to the IWDT Control Register (IWDTCR) is possible only once between the release from the reset state and the first refresh operation.

After a refresh operation (counting starts) or by writing to the IWDTCR register, the protection signal in the IWDT becomes 1 to protect the IWDTCR register against subsequent attempts of writing.

The IWDT Reset Control Register (IWDTRCR) and the IWDT Count Stop Control Register (IWDTCSSTPR) are also controlled in the same way.

This protection is released by a reset source to the IWDT. With other reset sources, the protection is not released.

Figure 26.5 shows control waveforms produced in response to writing to the IWDTCR register.

Figure 26.5 Control waveforms produced in response to writes to the IWDTCR register

26.3.3 Refresh operation

The down-counter is refreshed and starts operation (counting is started by refreshing) by writing the values 0x00 and then 0xFF to the IWDT Refresh Register (IWDTRR). If a value other than 0xFF is written after 0x00, the counter is not refreshed. After such invalid writing, correct refreshing is performed by writing 0x00 and then 0xFF again to the IWDT Refresh Register (IWDTRR).

When writing is done in the order of 0x00 (first time) → 0x00 (second time), and if 0xFF is written after that, the writing order 0x00 → 0xFF is satisfied; writing 0x00 ((n-1) th time) → 0x00 (nth time) → 0xFF is valid and correct refreshing will be done. Even when the first value written before 0x00 is not 0x00, correct refreshing will be done if the operation contains the sequence of writing 0x00 → 0xFF. Correct refreshing is also performed when a register other than IWDTRR is accessed or IWDTRR is read between writing 0x00 and writing 0xFF to IWDTRR.

[Example write sequences that are valid for refreshing the counter]

- 0x00 → 0xFF
- 0x00 ((n-1) th time) → 0x00 (nth time) → 0xFF
- 0x00 → access to another register or read from IWDTRR → 0xFF

[Example write sequences that are invalid for refreshing the counter]

- 0x23 (a value other than 0x00) → 0xFF

- 0x00 → 0x54 (a value other than 0xFF)
- 0x00 → 0xAA (0x00 and a value other than 0xFF) → 0xFF

Even when 0x00 is written to IWDTRR outside the refresh-permitted period, if 0xFF is written to IWDTRR in the refresh-permitted period, the writing sequence is valid and refreshing will be done.

After 0xFF is written to the IWDTRR register, refreshing the counter requires up to four cycles of the signal for counting (the clock division ratio select bits (IWDTCR.CKS[3:0]) determine how many cycles of the IWDT clock (IWDTCLK) make up one cycle for counting).

Therefore, writing 0xFF to the IWDTRR register should be completed four count cycles before the end position of the refresh-permitted period or the down-counter underflow. The value of the down-counter can be checked using the down-counter value bits (IWDTSR.CNTVAL[13:0]).

[Example refreshing timings]

- When the window start position is set to 0x1FFF, even if 0x00 is written to IWDTRR before 0x1FFF is reached (at 0x2002, for example), refreshing occurs if 0xFF is written to the IWDTRR register after the value of the IWDTSR.CNTVAL[13:0] bits reaches 0x1FFF.
- When the window end position is set to 0x1FFF, refreshing is done if 0x2003 (four count cycles before 0x1FFF) or a greater value is read from the IWDTSR.CNTVAL[13:0] bits immediately after writing 0x00 → 0xFF to the IWDTRR register.
- When the refresh-permitted period continues until count 0x0000, refreshing can be done immediately before an underflow. In this case, if 0x0003 (four count cycles before an underflow) or a greater value is read from the IWDTSR.CNTVAL[13:0] bits immediately after writing 0x00 → 0xFF to the IWDTRR register, no underflow occurs and refreshing is done.

Figure 26.6 shows the IWDT refresh operation waveforms when the peripheral clock (PCLKB) > IWDT clock (IWDTCLK) and the clock division ratio = IWDTCLK/1. Figure 26.7 shows the IWDT refresh operation waveforms when the peripheral clock (PCLKB) < IWDT clock (IWDTCLK) and the clock division ratio = IWDTCLK/16.

When transitioning to Software Standby mode or Deep Software Standby mode 1, the refresh procedure must be completed before the transitioning (0xFF is written after 0x00 is written to the IWDTRR register).

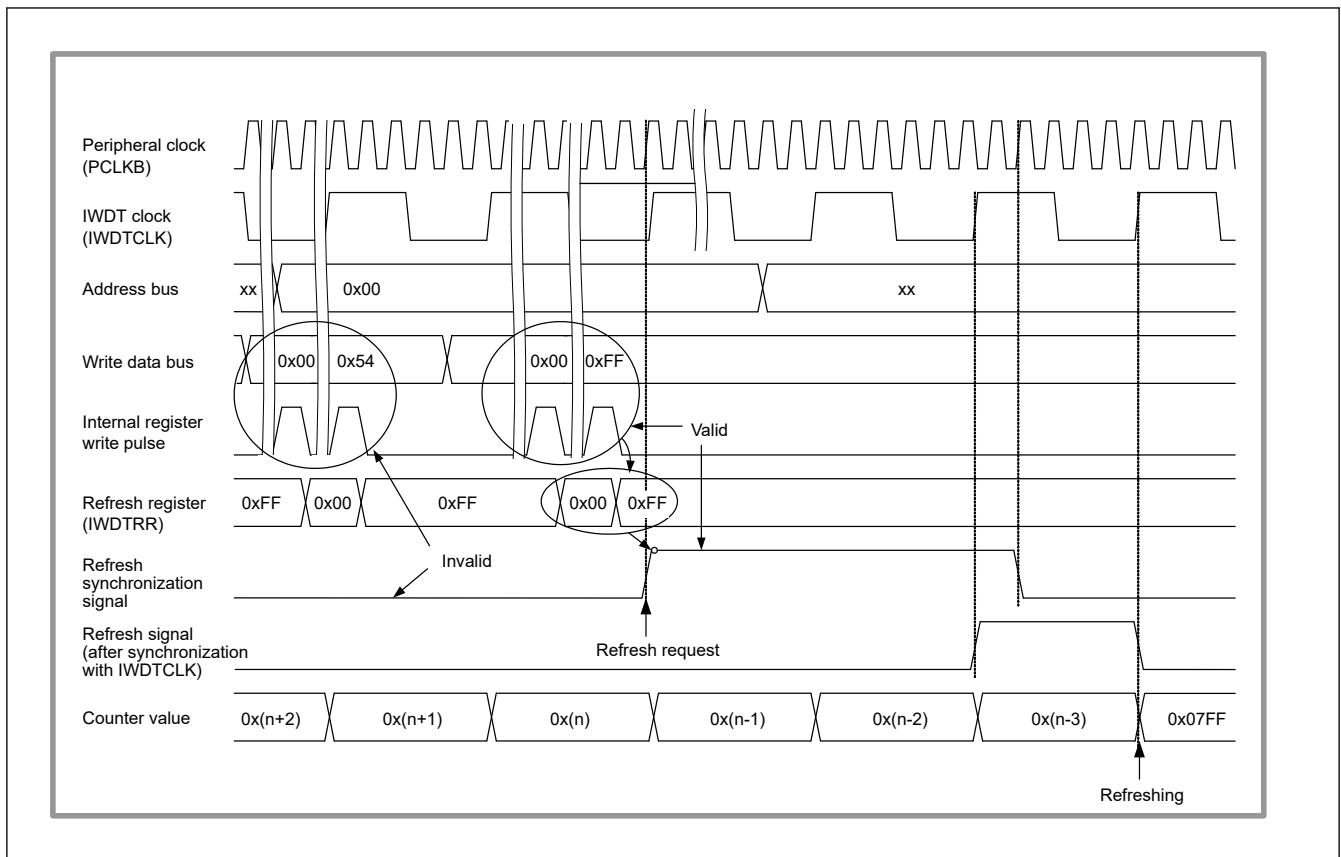

Figure 26.6 IWDT refresh operation waveforms (IWDTCR.CKS[3:0] = 0000b, IWDTCR.TOPS[1:0] = 11b)

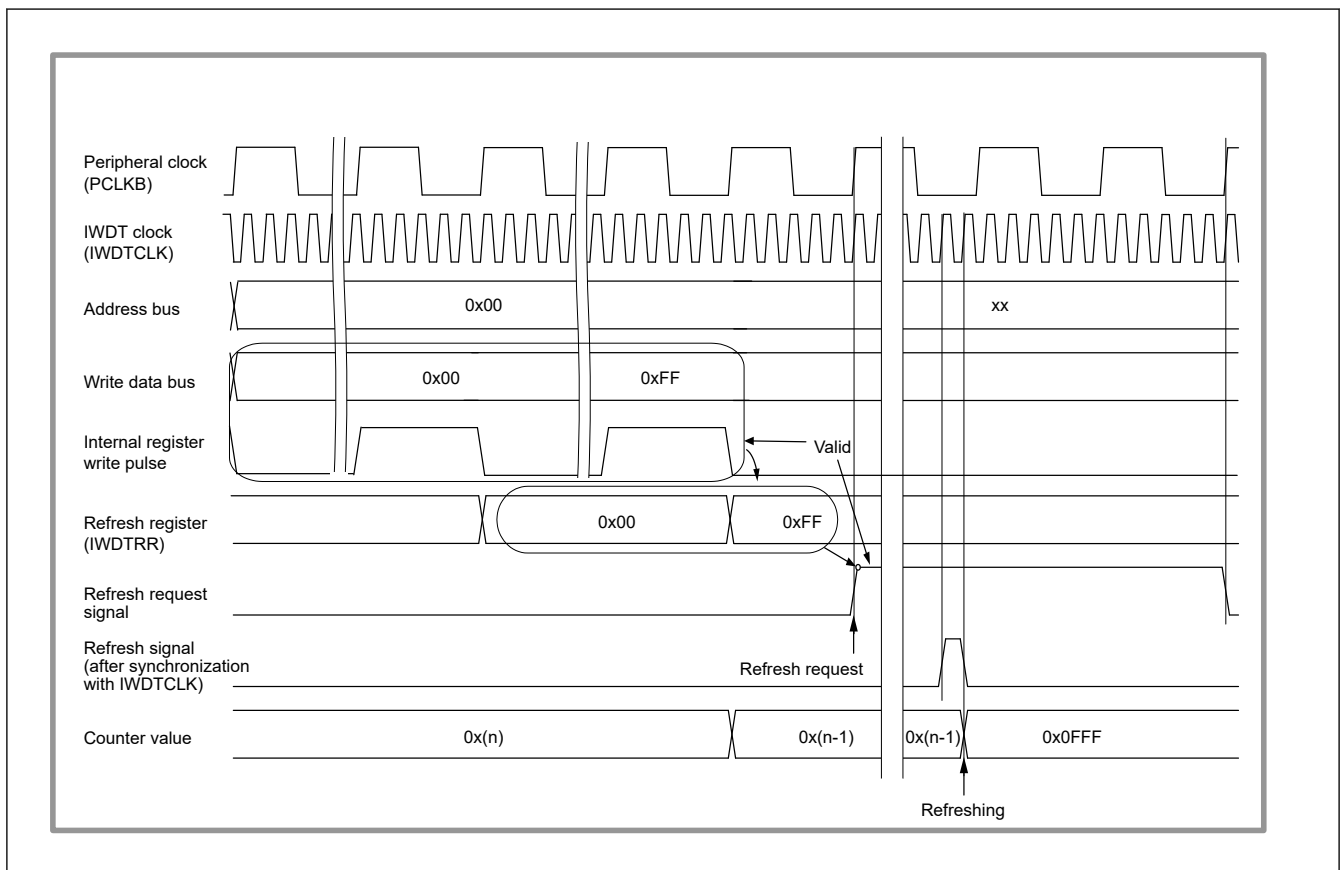

Figure 26.7 IWDT refresh operation waveforms (IWDTCR.CKS[3:0] = 0010b, IWDTCR.TOPS[1:0] = 01b)

26.3.4 Status flags

The refresh error flag (IWDTSR.REFEF) and underflow flag (IWDTSR.UNDF) retain the source of the reset output from the IWDT or the source of the interrupt request from the IWDT.

Thus, after release from the reset state or interrupt request generation, read the IWDTSR.REFEF and IWDTSR.UNDF flags to check for the reset or interrupt source.

For each flag, writing 0 clears the bit and writing 1 has no effect.

Leaving each flag unchanged does not affect operation. If the flags are not cleared, the earlier reset or interrupt source is cleared and the new reset or interrupt source is written when the IWDT outputs a reset signal next.

26.3.5 Reset output

When the reset interrupt select bit (IWDTRCR.RSTIRQS) is set to 1 in register start mode or when the IWDT reset interrupt request select bit (OFS0.IWDTRSTIRQS) is set to 1 in auto start mode, a reset signal is output for one count cycle when the down counter overflows or a refresh error occurs. In register start mode, the down counter is initialized (all bits set to 0) and kept in that state after assertion of the reset signal. After the reset is released and the program is restarted, the counter is set up again and counting down is started by refreshing. In auto start mode, counting down automatically starts after the reset output.

26.3.6 Interrupt sources

When the reset interrupt select bit (IWDTRCR.RSTIRQS) is set to 0 in register start mode or when the IWDT reset interrupt request select bit (OFS0.IWDTRSTIRQS) is set to 0 in auto start mode, a non-maskable interrupt (IWDT_NMIUNDF) is generated for one-count cycle when the down-counter overflows or a refresh error occurs.

26.3.7 Reading the down-counter value

Because the down-counter in the IWDT operates on the IWDT clock (IWDTCLK), the counter value cannot be read directly.

Therefore, the IWDT synchronizes the counter value with the peripheral clock (PCLKB) and stores it in the down-counter value bits (CNTVAL[13:0]) of the IWDT Status Register (IWDTSR). The counter value can be checked indirectly by reading the value stored in the IWDTSR.CNTVAL[13:0] bits.

Reading the counter value requires multiple peripheral clock (PCLKB) cycles (up to four clock cycles), and the read counter value may differ from the actual counter value by a value of one count.

Figure 26.8 shows the processing for reading the IWDT counter value when the peripheral clock (PCLKB) > IWDT clock (IWDTCLK) and the clock division ratio = IWDTCLK/1. Figure 26.9 shows the processing for reading the IWDT counter value when the peripheral clock (PCLKB) < IWDT clock (IWDTCLK) and the clock division ratio = IWDTCLK/16.

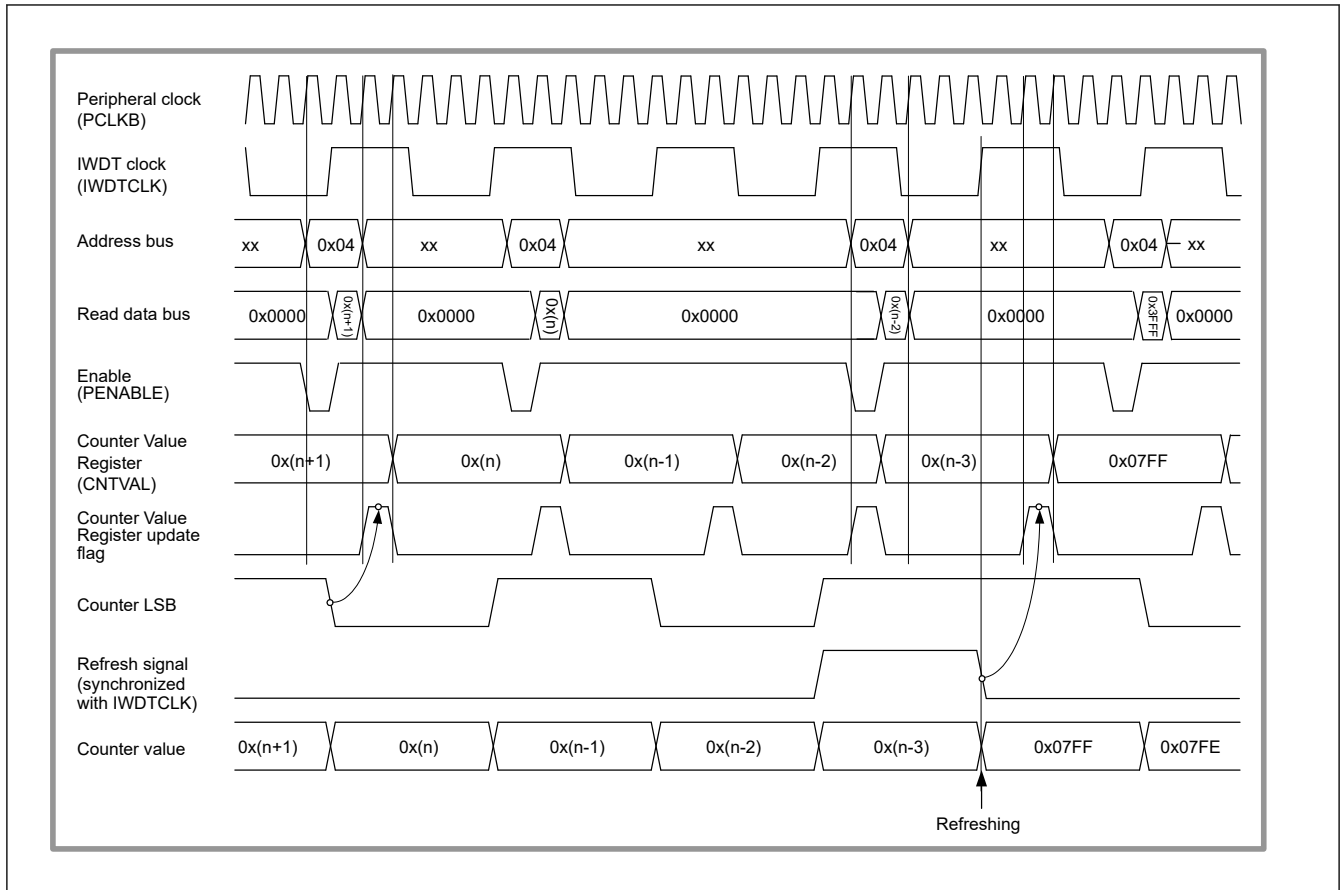

Figure 26.8 Processing for reading IWDT counter value when IWDTCR.CKS[3:0] = 0000b and IWDTCR.TOPS[1:0] = 11b

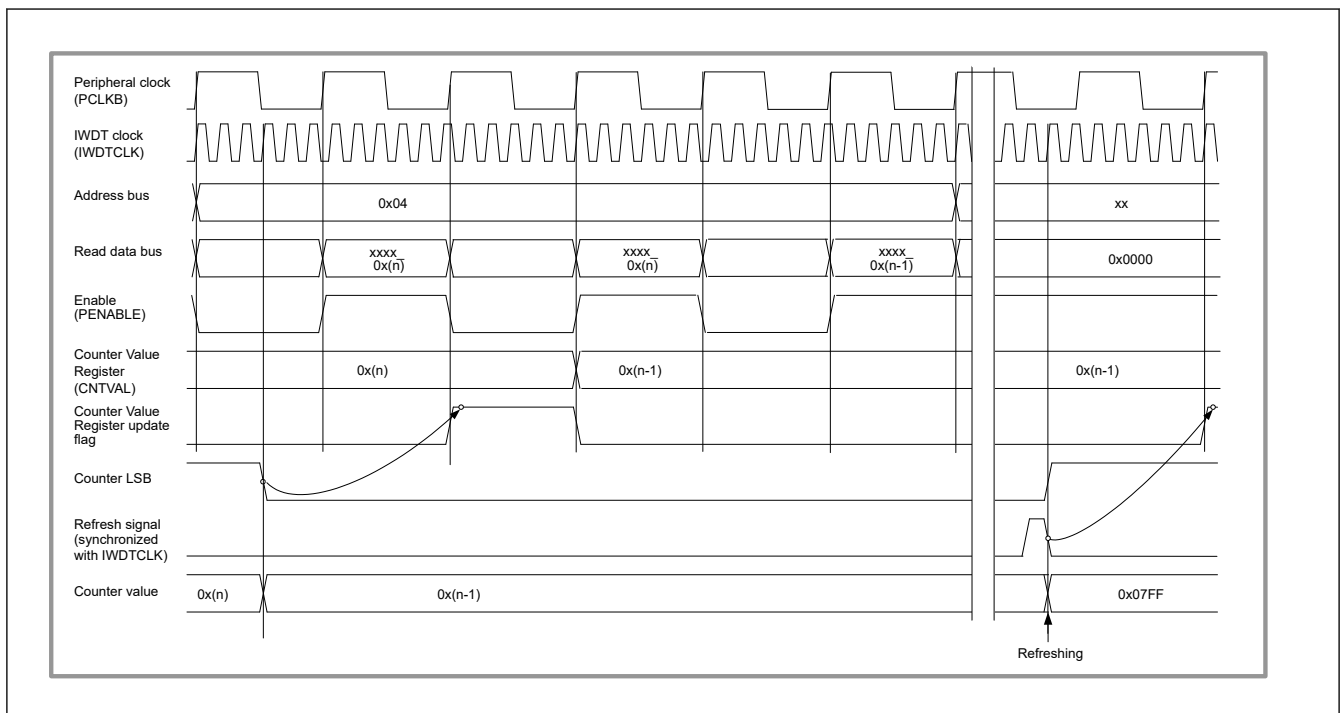

Figure 26.9 Processing for reading IWDT counter value when IWDTCR.CKS[3:0] = 0010b and IWDTCR.TOPS[1:0] = 11b

26.3.8 Correspondence between Option Function Select Register 0 (OFS0) and IWDT Registers

Table 26.4 lists the correspondence between the option function select register 0 (OFS0) and the IWDT registers (IWDT control register (IWDTCR), IWDT reset control register (IWDTRCR), and IWDT count stop control register (IWDTCSTPR)) regarding control of the down-counter, reset or interrupt request output, and count stop function.

Control can be switched between the option function select register 0 (OFS0) and the IWDT registers (IWDTCR, IWDTRCR, and IWDTCSTPR) through the setting of the IWDT start mode selection (OFS0.IWDTSTRT) bit.

Note that the option function select register 0 (OFS0) setting should be kept unchanged during IWDT operation.

Table 26.4 Association between Option Function Select Register 0 (OFS0) and the IWDT register

Control	Function	OFS0 register (enabled in auto start mode) OFS0.IWDTSTRT = 0	IWDT register (enabled in register start mode) OFS0.IWDTSTRT = 1
Down-counter	Timeout period selection	OFS0.IWDTTOPS[1:0]	IWDTCR.TOPS[1:0]
	Clock division ratio selection	OFS0.IWDTCKS[3:0]	IWDTCR.CKS[3:0]
	Window start position selection	OFS0.IWDRPSS[1:0]	IWDTCR.RPSS[1:0]
	Window end position selection	OFS0.IWDRPES[1:0]	IWDTCR.RPES[1:0]
Reset output/ interrupt request output	Reset output/ interrupt request output select	OFS0.IWDRSTIRQS	IWDTRCR.RSTIRQS
Stop the counter	CPU Sleep-mode count stop selection	OFS0.IWDTSLCSTP	IWDTCSTPR.SLCSTP

26.4 Link operation by the event link function

The IWDT is capable of link operation for a specified module when an interrupt request signal is used as an event signal. The IWDT outputs an event signal on an underflow of the down-counter or generation of a refresh error.

It outputs an event signal regardless of the setting of the reset interrupt request select bit (IWDTRCR.RSTIRQS) in register start mode or the IWDT reset interrupt request select bit (OFS0.IWDRSTIRQS) in auto start mode. It can output an event signal at generation of the next interrupt source while retaining the refresh error flag (IWDTSR.REFEF) or underflow flag (IWDTSR.UNDFE).

27. USB 2.0 Full-Speed Module (USBFS)

27.1 Overview

The USB 2.0 Full-Speed module (USBFS) operates as a host or device controller compliant with the Universal Serial Bus (USB) specification revision 2.0. The host controller supports USB 2.0 full-speed and low-speed transfers, and the device controller supports USB 2.0 full-speed transfers. The USBFS has an internal USB transceiver and supports all of the transfer types defined in the USB 2.0 specification

The USBFS has FIFO buffer for data transfers, providing a maximum of 10 pipes. Any endpoint number can be assigned to pipes 1 to 9, based on the peripheral devices or the communication requirements for your system.

Table 27.1 lists the USBFS specifications, Figure 27.1 shows a block diagram, and Table 27.2 lists the I/O pins.

Table 27.1 USBFS specifications

Parameter	Specifications
Features	<ul style="list-style-type: none"> • USB Device Controller (UDC) and USB 2.0 transceiver supporting host controller, and device controller, and On-The-Go (OTG) functions • Host and device controller can be switched by software • Self-power or bus power mode selectable
	Host controller features: <ul style="list-style-type: none"> • Full-speed transfer (12 Mbps) and low-speed transfer (1.5 Mbps) • Automatic scheduling for SOF and packet transmissions • Programmable intervals for isochronous and interrupt transfers • Communications with multiple peripheral devices connected through a single hub
	Device controller features: <ul style="list-style-type: none"> • Full-speed transfer (12 Mbps)^{*1} • Control transfer stage control function • Device state control function • Auto response function for SET_ADDRESS request • SOF interpolation
Supported transfer types	<ul style="list-style-type: none"> • Control transfer • Bulk transfer • Interrupt transfer • Isochronous transfer
Pipe configuration	<ul style="list-style-type: none"> • FIFO buffer for USB communication • Up to 10 pipes selectable, including the Default Control Pipe (DCP) • Pipes 1 to 9 assignable to any endpoint number
	Transfer conditions specifiable for each pipe: <ul style="list-style-type: none"> • Pipe 0: Control transfer with 64-byte single buffer • Pipes 1 and 2: Selectable to bulk transfer with 64-byte double buffer or isochronous transfer with 256-byte double buffer • Pipes 3 to 5: Bulk transfer with 64-byte double buffer • Pipes 6 to 9: Interrupt transfer with 64-byte single buffer
Other features	<ul style="list-style-type: none"> • Reception end function using transaction count • Function that changes the BRDY interrupt event notification timing (BFRE) • Automatic clearing of the FIFO buffer after the data for the pipe specified in the DnFIFO port (n = 0, 1) is read (DCLRM) • NAK setting function for response PID generated on transfer end (SHTNAK) • On-chip pull-up and pull-down resistors for D+ and D-
Module-stop function	Module-stop state can be set to reduce power consumption
TrustZone Filter	Security and Privilege attribution can be set

Note 1. Low-speed transfer (1.5 Mbps) is not supported.

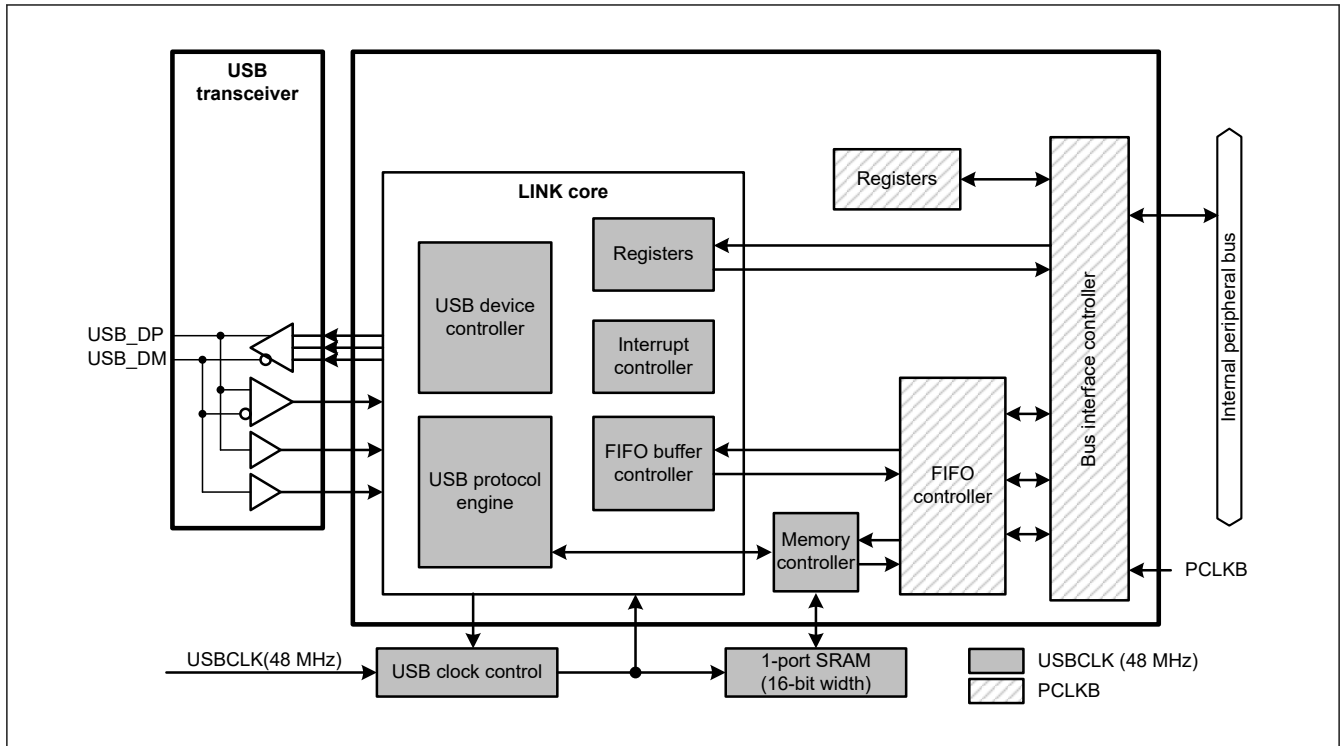

Figure 27.1 USBFS block diagram

Table 27.2 USBFS pin configuration

Function	Pin name	I/O	Description
USBFS	USB_DP	I/O	D+ I/O pin of the USB on-chip transceiver. This pin should be connected to the D+ pin of the USB bus.
	USB_DM	I/O	D- I/O pin of the USB on-chip transceiver. This pin should be connected to the D- pin of the USB bus.
	USB_VBUS	Input	USB cable connection monitor pin. This pin should be connected to VBUS of the USB bus. The VBUS pin status (connected or disconnected) can be detected when the USB module is operating as a function controller.
	USB_EXICEN	Output	Low-power control signal for external power supply (OTG) chip.
	USB_VBUSEN	Output	VBUS (5 V) supply enable signal for external power supply chip.
	USB_OVRCURA, USB_OVRCURB, USB_OVRCURA-DS, USB_OVRCURB-DS	Input	External overcurrent detection signals should be connected to these pins. VBUS comparator signals should be connected to these pins when the OTG power supply chip is connected. USB_OVRCURA or USB_OVRCURB pins can be used in Software standby mode or in normal mode. USB_OVRCURA-DS, USB_OVRCURB-DS are dedicated pins that can generate interrupt in Software standby mode or in normal mode as well as for cancel Deep Software Standby mode 1.
	USB_ID	Input	MicroAB connector ID input signal should be connected to this pin during operation in OTG mode.
	VCC_USB	Input	Power supply pins.
VSS_USB	Input	Ground pins.	

27.2 Register Descriptions

27.2.1 SYSCFG : System Configuration Control Register

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x000

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	SCKE	—	—	—	DCFM	DRPD	DPRP U	—	—	—	USBE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	USBE	USBFS Operation Enable 0: Disable 1: Enable	R/W
2:1	—	These bits are read as 0. The write value should be 0.	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	DPRPU	D+ Line Resistor Control 0: Disable line pull-up 1: Enable line pull-up	R/W
5	DRPD	D+/D– Line Resistor Control 0: Disable line pull-down 1: Enable line pull-down	R/W
6	DCFM	Controller Function Select 0: Select device controller 1: Select host controller	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W
9:8	—	These bits are read as 0. The write value should be 0.	R/W
10	SCKE	USB Clock Enable 0: Stop clock supply to the USBFS 1: Enable clock supply to the USBFS	R/W
15:11	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Note: After writing 1 to the SCKE bit, read it to confirm that it is set to 1.

USBE bit (USBFS Operation Enable)

The USBE bit enables or disables operation of the USBFS.

Changing the USBE bit from 1 to 0 initializes the bits listed in [Table 27.3](#). Only change this bit while the SCKE bit is 1. In host controller mode, this bit must be set to 1 after setting the DRPD bit to 1, eliminating SYSSTS0.LNST[1:0] flags chattering, and confirming that the USB bus state is stable.

Table 27.3 Registers initialized by writing 0 to the SYSCFG.USBE bit

Selected function	Register	Bit	Remarks
Device controller	SYSSTS0	LNST[1:0]	Value is saved in host controller mode
	DVSTCTR0	RHST[2:0]	—
	INTSTS0	DVSQ[2:0]	Value is saved in host controller mode
	USBADDR	USBADDR[6:0]	Value is saved in host controller mode
	USBREQ	BREQUEST[7:0], BMREQUESTTYPE[7:0]	Value is saved in host controller mode
	USBVAL	WVALUE[15:0]	Value is saved in host controller mode
	USBINDX	WINDEX[15:0]	Value is saved in host controller mode
	USBLENG	WLENTUH[15:0]	Value is saved in host controller mode
Host controller	DVSTCTR0	RHST[2:0]	—
	FRMNUM	FRNM[10:0]	Value is saved in device controller mode

DPRPU bit (D+ Line Resistor Control)

The DPRPU bit enables or disables pulling up the D+ line in device controller mode.

When the DPRPU bit is set to 1 in device controller mode, the USBFS pulls up the D+ line to notify the USB host that it attached. Changing the DPRPU bit from 1 to 0 releases the pull-up, thereby notifying the USB host that it detached.

Set this bit to 1 in device controller mode and to 0 in host controller mode.

DRPD bit (D+/D- Line Resistor Control)

TheDRPD bit enables or disables pulling down D+ and D- lines in host controller mode.

Set this bit to 1 in host controller mode and to 0 in device controller mode.

DCFM bit (Controller Function Select)

The DCFM bit selects the host or device function of the USBFS.

Only change this bit when the DPRPU and DRPD bits are both 0.

SCKE bit (USB Clock Enable)

The SCKE bit stops or enables the 48-MHz clock supply to the USBFS.

When this bit is 0, only SYSCFG is permitted to be read from and written to; the other registers related to the USB should not be read from or written to.

27.2.2 SYSSTS0 : System Configuration Status Register 0

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x004

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:	OVCMON[1:0]	—	—	—	—	—	—	—	HTAC T	SOFE A	—	—	IDMO N	LNST[1:0]
------------	-------------	---	---	---	---	---	---	---	-----------	-----------	---	---	-----------	-----------

Value after reset: x x 0 0 0 0 0 0 0 0 0 0 0 0 x 0 0

Bit	Symbol	Function	R/W
1:0	LNST[1:0]	USB Data Line Status Monitor Indicates the status of the USB data lines, see Table 27.4	R
2	IDMON	External ID0 Input Pin Monitor 0: USB_ID pin is low 1: USB_ID pin is high	R
4:3	—	These bits are read as 0.	R

Bit	Symbol	Function	R/W
5	SOFEA	Active Monitor When the Host Controller Is Selected 0: SOF output stopped 1: SOF output operating	R
6	HTACT	USB Host Sequencer Status Monitor 0: Host sequencer completely stopped 1: Host sequencer not completely stopped	R
13:7	—	These bits are read as 0.	R
15:14	OVCMON[1:0]	External USB_OVRCURA, USB_OVRCURA-DS, USB_OVRCURB or USB_OVRCURB-DS Input Pin Monitor OVCMON[1] indicates the USB_OVRCURA or USB_OVRCURA-DS pin status. OVCMON[0] indicates the USB_OVRCURB or USB_OVRCURB-DS pin status.	R

Note: S-TYPE-3, P-TYPE-3

Note: The values of the OVCMON[1:0] and IDMON bits depend on the status of the USB_OVRCURA, USB_OVRCURA-DS, USB_OVRCURB or USB_OVRCURB-DS and USB_ID pins.

LNST[1:0] bits (USB Data Line Status Monitor)

The LNST[1:0] bits indicate the state of the USB data lines, D+ and D-. For details, see [Table 27.4](#).

In device controller mode, read the LNST[1:0] bits after connection processing (SYSCFG.DPRPU bit = 1). In host controller mode, read them after enabling pull-down of the lines (SYSCFG.DRPD bit = 1).

Table 27.4 Status of the USB data bus lines (D+ and D-)

LNST[1:0] bits	During full-speed operation	During low-speed operation
00b	SE0	SE0
01b	J-State	K-State
10b	K-State	J-State
11b	SE1	SE1

SOFEA bit (Active Monitor When the Host Controller Is Selected)

The SOFEA bit is used in host controller mode to check whether the output of the last SOF is complete when the USBFS is suspended because of a 0 setting to the DVSTCTR0.UACT bit.

In host controller mode, check that both the HTACT and SOFEA bits are 0 before setting the SYSCFG.USBE bit to 0 to stop the USBFS or setting the SYSCFG.SCKE bit to 0 to stop the clock signal supply during communication.

HTACT bit (USB Host Sequencer Status Monitor)

The HTACT bit is set to 0 when the host sequencer of the USBFS is completely stopped.

In host controller mode, check that the HTACT bit is 0 before setting the DVSTCTR0.UACT bit to 0 to place the USBFS in the suspended state or setting the SYSCFG.SCKE bit to 0 to stop the clock signal supply during communication.

OVCMON[1:0] bits (External USB_OVRCURA, USB_OVRCURA-DS, USB_OVRCURB or USB_OVRCURB-DS Input Pin Monitor)

The OVCMON[1:0] bits indicate the status of the overcurrent signals from an external power supply IC.

27.2.3 DVSTCTR0 : Device State Control Register 0

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x008

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	HNPB TOA	EXICE N	VBUS EN	WKUP	RWUP E	USBR ST	RESU ME	UACT	—	RHST[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	RHST[2:0]	USB Bus Reset Status 0 0 0: In host controller mode: Communication speed indeterminate (powered state or no connection) In device controller mode: Communication speed indeterminate 0 0 1: In host controller mode: Low-speed connection In device controller mode: USB bus reset in progress 0 1 0: In host controller mode: Full-speed connection In device controller mode: USB bus reset in progress or full-speed connection 0 1 1: Setting prohibited Others: In host controller mode: USB bus reset in progress In device controller mode: Setting prohibited	R
3	—	This bit is read as 0. The write value should be 0.	R/W
4	UACT	USB Bus Enable 0: Disable downstream port (disable SOF transmission) 1: Enable downstream port (enable SOF transmission)	R/W
5	RESUME	Resume Output 0: Do not output resume signal 1: Output resume signal	R/W
6	USBRST	USB Bus Reset Output 0: Do not output USB bus reset signal 1: Output USB bus reset signal	R/W
7	RWUPE	Wakeup Detection Enable 0: Disable downstream port remote wakeup 1: Enable downstream port remote wakeup	R/W
8	WKUP	Wakeup Output 0: Do not output remote wakeup signal 1: Output remote wakeup signal	R/W
9	VBUSEN	USB_VBUSEN Output Pin Control 0: Output low on external USB_VBUSEN pin 1: Output high on external USB_VBUSEN pin	R/W
10	EXICEN	USB_EXICEN Output Pin Control 0: Output low on external USB_EXICEN pin 1: Output high on external USB_EXICEN pin	R/W
11	HNPBTOA	Host Negotiation Protocol (HNP) Control Use this bit when switching from device B to device A in OTG mode. If the HNPBTOA bit is 1, the internal function control remains in the Suspend state until the HNP processing ends even if SYSCFG.DPRPU = 0 or SYSCFG.DCFM = 1.	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

The USBFS controller does not support low-speed connections in device controller mode. When this value is read, abnormal connection processing must be executed in higher level application software.

RHST[2:0] bits (USB Bus Reset Status)

RHST[2:0] bits indicate the status of the USB bus reset.

In host controller mode, writing 1 to the USBRST bit causes the RHST[2:0] bits to set to 100b. When 0 is written to the USBRST bit and the USBFS ends the SE0 state, the RHST[2:0]bits update to a new value.

In device controller mode, if the USBFS detects a USB bus reset, the RHST[2:0] bits indicate 010b if the DPRPU bit is 1, and a DVST interrupt is generated.

UACT bit (USB Bus Enable)

When set to 1 in host controller mode, the UACT bit enables USB bus operation by controlling SOF packet transmission to the USB bus in addition to data and reception. The USBFS starts SOF packet output within one frame period after the UACT bit is set to 1. When UACT is set to 0, the USBFS enters the idle state after the SOF packet output.

The USBFS sets the UACT bit to 0 on any of the following conditions:

- A DTCH interrupt is detected during communication (when UACT = 1)

- An EOFERR interrupt is detected during communication (when UACT = 1)

Always write 1 to the UACT bit at the end of the USB bus reset processing (writing 0 to the USBRST bit) or at the end of resume processing from the suspended state (writing 0 to the RESUME bit).

In device controller mode, always set this bit to 0.

RESUME bit (Resume Output)

The RESUME bit controls the resume signal output in host controller mode.

When this bit is set to 1, the USBFS drives the USB port to the K-state and outputs the resume signal. The USBFS sets the bit to 1 on detection of a remote wakeup signal while the RWUPE bit is 1 and in the USB Suspend state.

The USBFS continues outputting the K-state while the RESUME bit is 1, until the bit is cleared to 0 by software. The RESUME bit must be 1 (resume period) for the time defined in the USB 2.0 specification. Only set this bit to 1 while the interface is in the Suspend state. Write 1 to the UACT bit simultaneously with the end of the resume processing (writing 0 to the RESUME bit).

Always set this bit to 0 in device controller mode.

USBRST bit (USB Bus Reset Output)

The USBRST bit controls the output of the USB bus signal in host controller mode. When this bit set to 1, the USBFS drives the USB port to the SE0 state to reset the USB bus. The USBFS continues outputting SE0 while the USBRST bit is 1, until the bit is cleared to 0 by software. The USBRST bit must be 1 (USB bus reset period) for the time defined in the USB 2.0 specification. Writing 1 to the USBRST bit during communication (UACT = 1) or during resume processing (RESUME = 1) prevents the USBFS from starting USB bus reset processing until both the UACT and RESUME bits become 0. Write 1 to the UACT bit simultaneously with the end of the USB bus reset processing (writing 0 to the USBRST bit).

Always set this bit to 0 in device controller mode.

RWUPE bit (Wakeup Detection Enable)

The RWUPE bit enables or disables remote wakeup signals (resume signals) from downstream peripheral devices in host controller mode. When this bit is set to 1, the USBFS detects a remote wakeup signal (K-state for 2.5 μ s) from a downstream peripheral device, and performs resume processing, driving the K-state. When the RWUPE bit is set to 0, the USBFS ignores remote wakeup signals (K-states) from peripheral devices connected to the USB port.

Do not stop the internal clock when the RWUPE bit is 1, even in the Suspend state (SYSCFG.SCKE bit must be set to 1).

Always set this bit to 0 in device controller mode.

WKUP bit (Wakeup Output)

The WKUP bit enables or disables remote wakeup signals (resume signals) to the USB bus in device controller mode.

The USBFS controls the output timing of the remote wakeup signals. When this bit is set to 1, the USBFS clears it to 0 after outputting the K-state for 10 ms. The USB 2.0 specification specifies that the USB bus idle state must be kept for 5 ms or longer before a remote wakeup signal is sent. If the USBFS writes 1 to the WKUP bit immediately after detecting the Suspend state, the K-state is output after 2 ms.

Only write 1 to the WKUP bit when the device is in the Suspend state (INTSTS0.DVSSQ[2:0] = 1xxb) and the USB host enables the remote wakeup signal. Do not stop the internal clock while this bit is 1, even in the Suspend state (SYSCFG.SCKE bit must be set to 1).

Always set this bit to 0 in host controller mode.

HNPBTOA bit (Host Negotiation Protocol (HNP) Control)

The HNPBTOA bit is used when switching from device B to device A while in OTG mode.

If the HNPBTOA bit is 1, the internal function control maintains the Suspend state until HNP processing ends, even if the SYSCFG.DPRPU bit is set to 0 or the SYSCFG.DCFM bit is set to 1. Resume interrupts (RESM) are not generated even if a falling edge of D+ is detected.

After this bit is set to 1, the HNP processing ends when a host attach event is detected, because of a pull-up by the initiating party, or the HNPBTOA bit is cleared to 0 by software because the HNP processing times out.

27.2.4 CFIFO/CFIFOL : CFIFO Port Register

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x014

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field: FIFOPORT[15:0]

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
15:0	FIFOPORT[15:0] ^{*1}	FIFO Port Read receive data from the FIFO buffer or write transmit data to the FIFO buffer by accessing these bits	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. The valid bits depend on the MBW settings (CFIFOSEL.MBW) and BIGEND settings (CFIFOSEL.BIGEND) in the associated port selection register. See [Table 27.5](#) and [Table 27.6](#).

Three FIFO ports are available:

- CFIFO
- D0FIFO
- D1FIFO

Each FIFO port is configured with:

- A port register (CFIFO, D0FIFO, or D1FIFO) that handles reading of data from the FIFO buffer and writing of data to the FIFO buffer
- A port selection register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL) that selects the pipe assigned to the FIFO port
- A port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR)

Each FIFO port has the following constraints:

- Access to the FIFO buffer for DCP control transfers is through the CFIFO port
- Access to the FIFO buffer for DMA or DTC transfers is through the D0FIO or D1FIFO port
- The D0FIFO and D1FIFO ports can also be accessed by the CPU
- When using functions specific to the FIFO port, such as the DMA or DTC transfer function, you cannot change the pipe number selected in the CURPIPE[3:0] bits of the port selection register
- Registers configuring a FIFO port do not affect other FIFO ports
- The same pipe must not be assigned to two or more FIFO ports
- There are two FIFO buffer states, one giving access rights to the CPU and the other to the serial interface engine (SIE). When the SIE has access rights, the FIFO buffer cannot be accessed by the CPU

FIFOPORT[15:0] bits (FIFO Port)

When the FIFOPORT[15:0] bit is accessed, the USBFS reads the received data from the FIFO buffer or writes the transmit data to the FIFO buffer. The FIFO port register can be accessed only when the FRDY bit in the associated port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR) is 1.

The valid bits in the FIFO port register depend on the MBW and BIGEND settings in the port selection register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL). See [Table 27.5](#) and [Table 27.6](#).

Table 27.5 Endian operation in 16-bit access

CFIFOSEL.BIGEND bit	Bits [15:8]	Bits [7:0]

1	N + 0 data	N + 1 data

Table 27.6 Endian operation in 8-bit access

CFIFOSEL.BIGEND bit	Bits [15:8]	Bits [7:0]
0	Access prohibited*1	N + 0 data
1	Access prohibited*1	N + 0 data

Note 1. Writing to or reading from these areas is not allowed.

27.2.5 DnFIFO/DnFIFOL : DnFIFO Port Register (n = 0, 1)

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x018 + 0x4 × n

Bit	Symbol	Function	R/W
15:0	FIFOPORT[15:0]*1	FIFO Port Read receive data from the FIFO buffer or write transmit data to the FIFO buffer by accessing these bits	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. The valid bits depend on the MBW settings (CFIFOSEL.MBW, D0FIFOSEL.MBW, and D1FIFOSEL.MBW) and BIGEND settings (CFIFOSEL.BIGEND, D0FIFOSEL.BIGEND, and D1FIFOSEL.BIGEND) in the associated port selection register. See [Table 27.7](#) and [Table 27.8](#).

Three FIFO ports are available:

- CFIFO
- D0FIFO
- D1FIFO

Each FIFO port is configured with:

- A port register (CFIFO, D0FIFO, or D1FIFO) that handles reading of data from the FIFO buffer and writing of data to the FIFO buffer
- A port selection register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL) that selects the pipe assigned to the FIFO port
- A port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR)

Each FIFO port has the following constraints:

- Access to the FIFO buffer for DCP control transfers is through the CFIFO port
- Access to the FIFO buffer for DMA or DTC transfers is through the D0FIO or D1FIFO port
- The D0FIFO and D1FIFO ports can also be accessed by the CPU
- When using functions specific to the FIFO port, such as the DMA or DTC transfer function, you cannot change the pipe number selected in the CURPIPE[3:0] bits of the port selection register
- Registers configuring a FIFO port do not affect other FIFO ports
- The same pipe must not be assigned to two or more FIFO ports
- There are two FIFO buffer states, one giving access rights to the CPU and the other to the serial interface engine (SIE). When the SIE has access rights, the FIFO buffer cannot be accessed by the CPU

FIFOPORT[15:0] bits (FIFO Port)

When the FIFOPORT bit is accessed, the USBFS reads the received data from the FIFO buffer or writes the transmit data to the FIFO buffer. The FIFO port register can be accessed only when the FRDY bit in the associated port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR) is 1.

The valid bits in the FIFO port register depend on the MBW and BIGEND settings in the port selection register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL). See [Table 27.7](#) and [Table 27.8](#).

Table 27.7 Endian operation in 16-bit access

CFIFOSEL.BIGEND bit D0FIFOSEL.BIGEND bit D1FIFOSEL.BIGEND bit	Bits [15:8]	Bits [7:0]
0	N + 1 data	N + 0 data
1	N + 0 data	N + 1 data

Table 27.8 Endian operation in 8-bit access

CFIFOSEL.BIGEND bit D0FIFOSEL.BIGEND bit D1FIFOSEL.BIGEND bit	Bits [15:8]	Bits [7:0]
0	Access prohibited*1	N + 0 data
1	Access prohibited*1	N + 0 data

Note 1. Writing to or reading from these areas is not allowed.

27.2.6 CFIFOSEL : CFIFO Port Select Register

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x020

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:	RCNT	REW	—	—	—	MBW	—	BIGEND	—	—	ISEL	—	CURPIPE[3:0]		
------------	------	-----	---	---	---	-----	---	--------	---	---	------	---	--------------	--	--

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
3:0	CURPIPE[3:0]	CFIFO Port Access Pipe Specification 0x0: Default Control Pipe 0x1: Pipe 1 0x2: Pipe 2 0x3: Pipe 3 0x4: Pipe 4 0x5: Pipe 5 0x6: Pipe 6 0x7: Pipe 7 0x8: Pipe 8 0x9: Pipe 9 Others: Setting prohibited	R/W
4	—	This bit is read as 0. The write value should be 0.	R/W
5	ISEL	CFIFO Port Access Direction When DCP Is Selected 0: Select reading from the FIFO buffer 1: Select writing to the FIFO buffer	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
8	BIGEND	CFIFO Port Endian Control 0: Little endian 1: Big endian	R/W
9	—	This bit is read as 0. The write value should be 0.	R/W
10	MBW	CFIFO Port Access Bit Width 0: 8-bit width 1: 16-bit width	R/W
13:11	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
14	REW	Buffer Pointer Rewind 0: Do not rewind buffer pointer 1: Rewind buffer pointer	W*1
15	RCNT	Read Count Mode 0: The DTLN[8:0] bits (CFIFOCTR.DTLN[8:0], D0FIFOCTR.DTLN[8:0], D1FIFOCTR.DTLN[8:0]) are cleared when all receive data is read from the CFIFO. In double buffer mode, the DTLN[8:0] value is cleared when all data is read from only a single plane. 1: The DTLN[8:0] bits are decremented each time the receive data is read from the CFIFO.	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. Only 0 can be read.

Do not specify the same pipe number in the CURPIPE[3:0] bits in the CFIFOSEL, D0FIFOSEL, and D1FIFOSEL registers. When the CURPIPE[3:0] bits in the D0FIFOSEL and D1FIFOSEL registers are set to 0000b, no pipe is selected.

Do not change the pipe number while DMA or DTC transfer is enabled.

CURPIPE[3:0] bits (CFIFO Port Access Pipe Specification)

The CURPIPE[3:0] bits specify the pipe number to use for reading or writing data through the CFIFO port. After writing to these bits, read them to check that the written value agrees with the read value before proceeding to the next process. Do not set the same pipe number to the CURPIPE[3:0] bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL.

During FIFO buffer access, even when an attempt is made to change the CURPIPE[3:0] setting, the current access setting is retained until access is complete.

ISEL bit (CFIFO Port Access Direction When DCP Is Selected)

After writing a new value to the ISEL bit with the DCP as the selected pipe, read the ISEL bit to check that the written value agrees with the read value before proceeding to the next process. Set the ISEL and CURPIPE[3:0] bits simultaneously.

MBW bit (CFIFO Port Access Bit Width)

The MBW bit specifies the bit width for accessing the CFIFO port.

When the selected pipe is receiving, set the CURPIPE[3:0] and MBW bits simultaneously. After a write to these bits starts a data read from the FIFO buffer, do not change the MBW bit until all of the data is read.

When the selected pipe is transmitting, the bit width cannot be changed from 8-bit to 16-bit while data is being written to the FIFO buffer.

An odd number of bytes can also be written through byte-access control even when 16-bit width is selected.

REW bit (Buffer Pointer Rewind)

The REW bit specifies whether to rewind the buffer pointer.

When the selected pipe is receiving, setting this bit to 1 while the FIFO buffer is being read allows re-reading of the FIFO buffer from the first data. In double buffering, this setting enables re-reading of the currently-read FIFO buffer plane from the first entry.

Do not set this bit to 1 while simultaneously changing the CURPIPE[3:0] bits. Before setting the REW bit to 1, be sure to check that the FRDY bit is 1.

To rewrite to the FIFO buffer from the first data for the transmitting pipe, use the BCLR bit.

27.2.7 DnFIFOSEL : DnFIFO Port Select Register (n = 0, 1)

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x028 + 0x4 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	RCNT	REW	DCLRM	DREQE	—	MBW	—	BIGEND	—	—	—	—	CURPIPE[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	CURPIPE[3:0]	FIFO Port Access Pipe Specification 0x0: Default Control Pipe 0x1: Pipe 1 0x2: Pipe 2 0x3: Pipe 3 0x4: Pipe 4 0x5: Pipe 5 0x6: Pipe 6 0x7: Pipe 7 0x8: Pipe 8 0x9: Pipe 9 Others: Setting prohibited	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W
8	BIGEND	FIFO Port Endian Control 0: Little endian 1: Big endian	R/W
9	—	This bit is read as 0. The write value should be 0.	R/W
10	MBW	FIFO Port Access Bit Width 0: 8-bit width 1: 16-bit width	R/W
11	—	This bit is read as 0. The write value should be 0.	R/W
12	DREQE	DMA/DTC Transfer Request Enable 0: Disable DMA/DTC transfer request 1: Enable DMA/DTC transfer request	R/W
13	DCLRM	Auto Buffer Memory Clear Mode Accessed after Specified Pipe Data is Read 0: Disable auto buffer clear mode 1: Enable auto buffer clear mode	R/W
14	REW	Buffer Pointer Rewind 0: Do not rewind buffer pointer 1: Rewind buffer pointer	W
15	RCNT	Read Count Mode 0: Clear DTLN[8:0] bits in (CFIFOCTR.DTLN[8:0], D0FIFOCTR.DTLN[8:0], D1FIFOCTR.DTLN[8:0]) when all receive data is read from DnFIFO (after read of a single plane in double buffer mode) 1: Decrement DTLN[8:0] bits each time receive data is read from DnFIFO	R/W

Note: S-TYPE-3, P-TYPE-3

The same pipe must not be specified in the CURPIPE[3:0] bits in the CFIFOSEL, D0FIFOSEL, and D1FIFOSEL registers. When the CURPIPE[3:0] bits in the D0FIFOSEL and D1FIFOSEL registers are set to 0000b, no pipe is selected. The pipe number must not be changed while DMA or DTC transfer is enabled.

CURPIPE[3:0] bits (FIFO Port Access Pipe Specification)

The CURPIPE[3:0] bits specify the pipe number to use for reading or writing data through the DnFIFO port. After writing to these bits, read them to check that the written value agrees with the read value before proceeding to the next process. Do not set the same pipe number to the CURPIPE[3:0] bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL.

During FIFO buffer access, even when an attempt is made to change the CURPIPE[3:0] setting, the current access setting is retained until access is complete.

MBW bit (FIFO Port Access Bit Width)

The MBW bit specifies the bit width for accessing the DnFIFO port.

When the selected pipe is receiving, after a write to these bits starts a data read from the FIFO buffer, do not change the MBW bit until all of the data is read. Set the CURPIPE[3:0] and MBW bits simultaneously.

When the selected pipe is transmitting, the bit width cannot be changed from 8-bit to 16-bit while data is being written to the FIFO buffer.

An odd number of bytes can also be written through byte-access control even when 16-bit width is selected.

DREQE bit (DMA/DTC Transfer Request Enable)

The DREQE bit enables or disables issuing of DMA or DTC transfer requests. To enable DMA or DTC transfer requests, set this bit to 1 after setting the CURPIPE[3:0] bits. To change the CURPIPE[3:0] setting, first set this bit to 0.

DCLRM bit (Auto Buffer Memory Clear Mode Accessed after Specified Pipe Data is Read)

The DCLRM bit enables or disables automatic FIFO buffer clearing after data in the selected pipe is read.

When this bit is set to 1, on receiving a zero-length packet while the FIFO buffer assigned to the selected pipe is empty, or when reading of a received short packet is complete while the PIPECFG.BFRE bit is 1, the USBFS sets the BCLR bit in the FIFO port control register to 1.

When using the USBFS with the SOFCFG.BRDYM bit set to 1, set this bit to 0.

REW bit (Buffer Pointer Rewind)

The REW bit specifies whether to rewind the buffer pointer.

When the selected pipe is receiving, setting this bit to 1 while the FIFO buffer is being read allows re-reading of the FIFO buffer from the first data. In double buffering, this setting enables re-reading of the currently-read FIFO buffer plane from the first entry.

Do not set this bit to 1 while simultaneously changing the CURPIPE[3:0] bits. Before setting the bit to 1, be sure to check that the FRDY bit is 1.

To rewrite to the FIFO buffer from the first data for the transmitting pipe, use the BCLR bit.

RCNT bit (Read Count Mode)

The RCNT bit specifies the read mode for the value in the D0FIFOCTL.DTLN bit and D1FIFOCTL.DTLN bit. When accessing DnFIFO with the PIPECFG.BFRE bit set to 1, set the RCNT bit to 0.

27.2.8 CFIFOCTR : CFIFO Port Control Register

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x022

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	BVAL	BCLR	FRDY	—	—	—	—	DTLN[8:0]								

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
8:0	DTLN[8:0]	Receive Data Length Indicates the receive data length. The meaning of the values differs depending on the RCNT bit setting in the port select register. For details, see the description of the DTLN[8:0] bits.	R
12:9	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
13	FRDY	FIFO Port Ready 0: FIFO port access disabled 1: FIFO port access enabled	R
14	BCLR	CPU Buffer Clear 0: No operation 1: Clear FIFO buffer on the CPU side	W
15	BVAL	Buffer Memory Valid Flag 0: Invalid (writing 0 has no effect) 1: Writing ended	R/W

Note: S-TYPE-3, P-TYPE-3

The CFIFOCTR, D0FIFOCTR, and D1FIFOCTR registers correspond to the CFIFO, D0FIFO, and D1FIFO buffers.

DTLN[8:0] bits (Receive Data Length)

The DTLN[8:0] bits indicate the length of the receive data.

While the FIFO buffer is being read, the DTLN[8:0] bits indicate different values depending on the DnFIFOSEL.RCNT bit ($n = 0, 1$), as follows:

- RCNT = 0

The USBFS sets the DTLN[8:0] bits to indicate the length of the receive data until the CPU or DMA/DTC has read all of the received data from a single FIFO buffer plane.

While the PIPECFG.BFRE bit = 1, the USBFS retains the length of the receive data until the BCLR bit is set to 1, even after all the data is read.

- RCNT = 1

The USBFS decrements the value indicated in the DTLN[8:0] bits each time data is read from the FIFO buffer. The value is decremented by 1 when MBW = 0, and by 2 when MBW = 1.

The USBFS sets these bits to 0 when all the data is read from one FIFO buffer plane. In double buffer mode, if data is received in one FIFO buffer plane before all of the data is read from the other plane, the USBFS sets these bits to indicate the length of the receive data in the former plane when all of the data is read from the latter plane.

FRDY bit (FIFO Port Ready)

The FRDY bit indicates whether the FIFO port can be accessed by the CPU or DMA/DTC.

In the following cases, the USBFS sets the FRDY bit to 1 but data cannot be read through the FIFO port because there is no data to be read:

- A zero-length packet is received when the FIFO buffer assigned to the selected pipe is empty
- A short packet is received and the data is completely read while the PIPECFG.BFRE bit = 1

In these cases, set the BCLR bit to 1 to clear the FIFO buffer, and enable transmission and reception of the next data.

BCLR bit (CPU Buffer Clear)

Set the BCLR bit to 1 to clear the FIFO buffer on the CPU side for the selected pipe.

When double buffer mode is set for the FIFO buffer assigned to the selected pipe, the USBFS clears only one plane of the FIFO buffer even when both planes are read-enabled.

When the DCP is the selected pipe, setting the BCLR bit to 1 allows the USBFS to clear the FIFO buffer regardless of whether the CPU or SIE has access rights. To clear the buffer when the SIE has access rights, set the DCPCTR.PID[1:0] bits to 00b (NAK response) before setting the BCLR bit to 1.

When the selected pipe is transmitting, if 1 is written to the BVAL flag and the BCLR bit simultaneously, the USBFS clears the data that is already written, enabling transmission of a zero-length packet.

When the selected pipe is not the DCP, only write 1 to the BCLR bit while the FRDY bit in the FIFO port control register is 1 (set by the USBFS).

BVAL flag (Buffer Memory Valid Flag)

Set the BVAL flag to 1 when data is completely written to the FIFO buffer on the CPU side for the pipe selected in CURPIPE[3:0].

When the selected pipe is transmitting, set this flag to 1 in the following cases:

- To transmit a short packet, set this flag to 1 after data is written
- To transmit a zero-length packet, set this flag to 1 before data is written to the FIFO buffer

The USBFS then switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.

When data of the maximum packet size is written for the pipe in continuous transfer mode, the USBFS sets the BVAL flag to 1 and switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.

Only write 1 to the BVAL flag while the FRDY bit is 1 (set by the USBFS). When the selected pipe is receiving, do not set the BVAL flag to 1.

27.2.9 DnFIFOCTR : DnFIFO Port Control Register (n = 0, 1)

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x02A + 0x4 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	BVAL	BCLR	FRDY	—	—	—	—	DTLN[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	DTLN[8:0]	Receive Data Length Indicates the receive data length. The meaning of the values differs depending on the RCNT bit setting in the port select register. For details, see the description of the DTLN[8:0] bits.	R
12:9	—	These bits are read as 0. The write value should be 0.	R/W
13	FRDY	FIFO Port Ready 0: FIFO port access disabled 1: FIFO port access enabled	R
14	BCLR	CPU Buffer Clear 0: No operation 1: Clear FIFO buffer on the CPU side	R/W ¹
15	BVAL	Buffer Memory Valid Flag 0: Invalid (writing 0 has no effect) 1: Writing ended	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. Only 0 can be read.

The CFIFOCTR, D0FIFOCTR, and D1FIFOCTR registers correspond to the CFIFO, D0FIFO, and D1FIFO buffers.

DTLN[8:0] bits (Receive Data Length)

The DTLN[8:0] bits indicate the length of the receive data.

While the FIFO buffer is being read, the DTLN[8:0] bits indicate different values depending on the DnFIFOSEL.RCNT bit (n = 0, 1), as follows:

- RCNT = 0

The USBFS sets the DTLN[8:0] bits to indicate the length of the receive data until the CPU or DMA/DTC has read all of the received data from a single FIFO buffer plane.

While the PIPECFG.BFRE bit = 1, the USBFS retains the length of the receive data until the BCLR bit is set to 1, even after all the data is read.

- RCNT = 1

The USBFS decrements the value indicated in the DTLN[8:0] bits each time data is read from the FIFO buffer. The value is decremented by 1 when MBW = 0, and by 2 when MBW = 1.

The USBFS sets these bits to 0 when all the data is read from one FIFO buffer plane. In double buffer mode, if data is received in one FIFO buffer plane before all of the data is read from the other plane, the USBFS sets these bits to indicate the length of the receive data in the former plane when all of the data is read from the latter plane.

FRDY bit (FIFO Port Ready)

The FRDY bit indicates whether the FIFO port can be accessed by the CPU or DMA/DTC.

In the following cases, the USBFS sets the FRDY bit to 1 but data cannot be read through the FIFO port because there is no data to be read:

- A zero-length packet is received when the FIFO buffer assigned to the selected pipe is empty
- A short packet is received and the data is completely read while the PIPECFG.BFRE bit = 1

In these cases, set the BCLR bit to 1 to clear the FIFO buffer, and enable transmission and reception of the next data.

BCLR bit (CPU Buffer Clear)

Set the BCLR bit to 1 to clear the FIFO buffer on the CPU side for the selected pipe.

When double buffer mode is set for the FIFO buffer assigned to the selected pipe, the USBFS clears only one plane of the FIFO buffer even when both planes are read-enabled.

When the DCP is the selected pipe, setting the BCLR bit to 1 allows the USBFS to clear the FIFO buffer regardless of whether the CPU or SIE has access rights. To clear the buffer when the SIE has access rights, set the DCPCTR.PID[1:0] bits to 00b (NAK response) before setting the BCLR bit to 1.

When the selected pipe is transmitting, if 1 is written to the BVAL flag and the BCLR bit simultaneously, the USBFS clears the data that is already written, enabling transmission of a zero-length packet.

When the selected pipe is not the DCP, only write 1 to the BCLR bit while the FRDY bit in the FIFO port control register is 1 (set by the USBFS).

BVAL flag (Buffer Memory Valid Flag)

Set the BVAL flag to 1 when data is completely written to the FIFO buffer on the CPU side for the pipe selected in CURPIPE[3:0].

When the selected pipe is transmitting, set this flag to 1 in the following cases:

- To transmit a short packet, set this flag to 1 after data is written
- To transmit a zero-length packet, set this flag to 1 before data is written to the FIFO buffer

The USBFS then switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.

When data of the maximum packet size is written for the pipe in continuous transfer mode, the USBFS sets the BVAL flag to 1 and switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.

Only write 1 to the BVAL flag while the FRDY bit is 1 (set by the USBFS). When the selected pipe is receiving, do not set the BVAL flag to 1.

27.2.10 INTENB0 : Interrupt Enable Register 0

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x030

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	VBSE	RSME	SOFE	DVSE	CTRE	BEMPE	NRDYE	BRDYE	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	—	These bits are read as 0. The write value should be 0.	R/W
8	BRDYE	Buffer Ready Interrupt Enable 0: Disable interrupt request 1: Enable interrupt request	R/W
9	NRDYE	Buffer Not Ready Response Interrupt Enable 0: Disable interrupt request 1: Enable interrupt request	R/W
10	BEMPE	Buffer Empty Interrupt Enable 0: Disable interrupt request 1: Enable interrupt request	R/W
11	CTRE	Control Transfer Stage Transition Interrupt Enable *1 0: Disable interrupt request 1: Enable interrupt request	R/W
12	DVSE	Device State Transition Interrupt Enable *1 0: Disable interrupt request 1: Enable interrupt request	R/W
13	SOFE	Frame Number Update Interrupt Enable 0: Disable interrupt request 1: Enable interrupt request	R/W
14	RSME	Resume Interrupt Enable*1 0: Disable interrupt request 1: Enable interrupt request	R/W
15	VBSE	VBUS Interrupt Enable 0: Disable interrupt request 1: Enable interrupt request	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. The RSME, DVSE, and CTRE bits can only be set to 1 in device controller mode. Do not set these bits to 1 in host controller mode.

When a status flag in the INTSTS0 register sets to 1 and the associated interrupt request enable bit setting in the INTENB0 register is 1, the USBFS issues a USBFS interrupt request.

Regardless of the INTENB0 register setting, the status flag in the INTSTS0 register sets to 1 in response to a state change that satisfies the associated condition.

When an interrupt request enable bit in the INTENB0 register is switched from 0 to 1 while the associated status flag in the INTSTS0 register is set to 1, a USBFS interrupt is requested.

27.2.11 INTENB1 : Interrupt Enable Register 1

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x032

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:	OVRC RE	BCHG E	—	DTCH E	ATTC HE	—	—	—	—	EOFE RRE	SIGNE	SACK E	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
4	SACK E	Setup Transaction Normal Response Interrupt Enable 0: Disable interrupt request 1: Enable interrupt request	R/W
5	SIGNE	Setup Transaction Error Interrupt Enable 0: Disable interrupt request 1: Enable interrupt request	R/W

Bit	Symbol	Function	R/W
6	EOFERRE	EOF Error Detection Interrupt Enable 0: Disable interrupt request 1: Enable interrupt request	R/W
10:7	—	These bits are read as 0. The write value should be 0.	R/W
11	ATTCHE	Connection Detection Interrupt Enable 0: Disable interrupt request 1: Enable interrupt request	R/W
12	DTCHE	Disconnection Detection Interrupt Enable 0: Disable interrupt request 1: Enable interrupt request	R/W
13	—	This bit is read as 0. The write value should be 0.	R/W
14	BCHGE	USB Bus Change Interrupt Enable 0: Disable interrupt request 1: Enable interrupt request	R/W
15	OVRCRE	Overcurrent Input Change Interrupt Enable 0: Disable interrupt request 1: Enable interrupt request	R/W

Note: S-TYPE-3, P-TYPE-3

Note: The bits in INTENB1 can only be set to 1 in host controller mode. Do not set these bits to 1 in device controller mode.

INTENB1 specifies the interrupt masks in host controller mode and for the setup transaction.

When a status flag in the INTSTS1 register sets to 1 and the associated interrupt request enable bit setting in the INTENB1 register is 1, the USBFS issues a USBFS interrupt request.

Regardless of the INTENB1 register setting, the status flag in the INTSTS1 register sets to 1 in response to a state change that satisfies the associated condition.

When an interrupt request enable bit in the INTENB1 register is switched from 0 to 1 while the associated status flag in the INTSTS1 register is set to 1, a USBFS interrupt is requested.

Do not enable interrupts in device controller mode.

27.2.12 BRDYENB : BRDY Interrupt Enable Register

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x036

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	PIPE9 BRDY E	PIPE8 BRDY E	PIPE7 BRDY E	PIPE6 BRDY E	PIPE5 BRDY E	PIPE4 BRDY E	PIPE3 BRDY E	PIPE2 BRDY E	PIPE1 BRDY E	PIPE0 BRDY E

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	PIPE0BRDYE	BRDY Interrupt Enable for Pipe 0 0: Disable interrupt request 1: Enable interrupt request	R/W
1	PIPE1BRDYE	BRDY Interrupt Enable for Pipe 1 0: Disable interrupt request 1: Enable interrupt request	R/W
2	PIPE2BRDYE	BRDY Interrupt Enable for Pipe 2 0: Disable interrupt request 1: Enable interrupt request	R/W
3	PIPE3BRDYE	BRDY Interrupt Enable for Pipe 3 0: Disable interrupt request 1: Enable interrupt request	R/W

Bit	Symbol	Function	R/W
4	PIPE4BRDYE	BRDY Interrupt Enable for Pipe 4 0: Disable interrupt request 1: Enable interrupt request	R/W
5	PIPE5BRDYE	BRDY Interrupt Enable for Pipe 5 0: Disable interrupt request 1: Enable interrupt request	R/W
6	PIPE6BRDYE	BRDY Interrupt Enable for Pipe 6 0: Disable interrupt request 1: Enable interrupt request	R/W
7	PIPE7BRDYE	BRDY Interrupt Enable for Pipe 7 0: Disable interrupt request 1: Enable interrupt request	R/W
8	PIPE8BRDYE	BRDY Interrupt Enable for Pipe 8 0: Disable interrupt request 1: Enable interrupt request	R/W
9	PIPE9BRDYE	BRDY Interrupt Enable for Pipe 9 0: Disable interrupt request 1: Enable interrupt request	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

The BRDYENB register enables or disables the INTSTS0.BRDY bit to be set to 1 when a BRDY interrupt is detected for each pipe.

When a status flag in the BRDYSTS register sets to 1 and the associated PIPE_nBRDYE bit (n = 0 to 9) setting in the BRDYENB register is 1, the INTSTS0.BRDY flag sets to 1. In this case, if the BRDYE bit in INTENB0 is 1, the USBFS generates a BRDY interrupt request. While at least one PIPE_nBRDY bit indicates 1, the USB generates the BRDY interrupt request when the associated interrupt request enable bit in the BRDYENB register is changed from 0 to 1 by software.

27.2.13 NRDYENB : NRDY Interrupt Enable Register

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x038

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:	—	—	—	—	—	—	PIPE9 NRDY E	PIPE8 NRDY E	PIPE7 NRDY E	PIPE6 NRDY E	PIPE5 NRDY E	PIPE4 NRDY E	PIPE3 NRDY E	PIPE2 NRDY E	PIPE1 NRDY E	PIPE0 NRDY E
------------	---	---	---	---	---	---	--------------------	--------------------	--------------------	--------------------	--------------------	--------------------	--------------------	--------------------	--------------------	--------------------

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	PIPE0NRDYE	NRDY Interrupt Enable for Pipe 0 0: Disable interrupt request 1: Enable interrupt request	R/W
1	PIPE1NRDYE	NRDY Interrupt Enable for Pipe 1 0: Disable interrupt request 1: Enable interrupt request	R/W
2	PIPE2NRDYE	NRDY Interrupt Enable for Pipe 2 0: Disable interrupt request 1: Enable interrupt request	R/W
3	PIPE3NRDYE	NRDY Interrupt Enable for Pipe 3 0: Disable interrupt request 1: Enable interrupt request	R/W
4	PIPE4NRDYE	NRDY Interrupt Enable for Pipe 4 0: Disable interrupt request 1: Enable interrupt request	R/W

Bit	Symbol	Function	R/W
5	PIPE5NRDYE	NRDY Interrupt Enable for Pipe 5 0: Disable interrupt request 1: Enable interrupt request	R/W
6	PIPE6NRDYE	NRDY Interrupt Enable for Pipe 6 0: Disable interrupt request 1: Enable interrupt request	R/W
7	PIPE7NRDYE	NRDY Interrupt Enable for Pipe 7 0: Disable interrupt request 1: Enable interrupt request	R/W
8	PIPE8NRDYE	NRDY Interrupt Enable for Pipe 8 0: Disable interrupt request 1: Enable interrupt request	R/W
9	PIPE9NRDYE	NRDY Interrupt Enable for Pipe 9 0: Disable interrupt request 1: Enable interrupt request	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

The NRDYENB register enables or disables the INTSTS0.NRDY bit to be set to 1 when a NRDY interrupt is detected for each pipe.

When a status flag in the NRDYSTS register sets to 1 and the associated PIPE_nNRDYE (n = 0 to 9) bit setting in the NRDYENB register is 1, the INTSTS0.NRDY flag sets to 1. In this case, if the NRDYE bit in INTENB0 is 1, the USBFS generates a NRDY interrupt request. While at least one PIPE_nNRDYE bit indicates 1, the USBFS generates the NRDY interrupt request when the associated interrupt request enable bit in the NRDYENB register is changed from 0 to 1 by software.

27.2.14 BEMPENB : BEMP Interrupt Enable Register

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x03A

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:	—	—	—	—	—	—	PIPE9 BEMP E	PIPE8 BEMP E	PIPE7 BEMP E	PIPE6 BEMP E	PIPE5 BEMP E	PIPE4 BEMP E	PIPE3 BEMP E	PIPE2 BEMP E	PIPE1 BEMP E	PIPE0 BEMP E
------------	---	---	---	---	---	---	--------------------	--------------------	--------------------	--------------------	--------------------	--------------------	--------------------	--------------------	--------------------	--------------------

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
0	PIPE0BEMPE	BEMP Interrupt Enable for Pipe 0 0: Disable interrupt request 1: Enable interrupt request	R/W
1	PIPE1BEMPE	BEMP Interrupt Enable for Pipe 1 0: Disable interrupt request 1: Enable interrupt request	R/W
2	PIPE2BEMPE	BEMP Interrupt Enable for Pipe 2 0: Disable interrupt request 1: Enable interrupt request	R/W
3	PIPE3BEMPE	BEMP Interrupt Enable for Pipe 3 0: Disable interrupt request 1: Enable interrupt request	R/W
4	PIPE4BEMPE	BEMP Interrupt Enable for Pipe 4 0: Disable interrupt request 1: Enable interrupt request	R/W

Bit	Symbol	Function	R/W
5	PIPE5BEMPE	BEMP Interrupt Enable for Pipe 5 0: Disable interrupt request 1: Enable interrupt request	R/W
6	PIPE6BEMPE	BEMP Interrupt Enable for Pipe 6 0: Disable interrupt request 1: Enable interrupt request	R/W
7	PIPE7BEMPE	BEMP Interrupt Enable for Pipe 7 0: Disable interrupt request 1: Enable interrupt request	R/W
8	PIPE8BEMPE	BEMP Interrupt Enable for Pipe 8 0: Disable interrupt request 1: Enable interrupt request	R/W
9	PIPE9BEMPE	BEMP Interrupt Enable for Pipe 9 0: Disable interrupt request 1: Enable interrupt request	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

The BEMPENB register enables or disables the INTSTS0.BEMP bit to be set to 1 when a BEMP interrupt is detected for each pipe.

When a status flag in the BEMPSTS register sets to 1 and the associated PIPE_nBEMPE (n = 0 to 9) bit setting in the BEMPENB register is 1, the INTSTS0.BEMP flag sets to 1. In this case, if the BEMPE bit in INTENB0 is 1, the USBFS generates a BEMP interrupt request. While at least one PIPE_nBEMP bit indicates 1, the USBFS generates the BEMP interrupt request when the associated interrupt request enable bit in the BEMPENB register is changed from 0 to 1 by software.

27.2.15 SOFCFG : SOF Output Configuration Register

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x03C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	TRNE NSEL	—	BRDY M	—	EDGE STS	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
4	EDGESTS	Edge Interrupt Output Status Monitor*1 Indicates 1 during the edge processing of an edge interrupt output signal.	R
5	—	This bit is read as 0. The write value should be 0.	R/W
6	BRDYM	BRDY Interrupt Status Clear Timing 0: Clear BRDY flag by software 1: Clear BRDY flag by the USBFS through a data read from the FIFO buffer or data write to the FIFO buffer	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W
8	TRNENSEL	Transaction-Enabled Time Select*1 0: Not low-speed communication 1: Low-speed communication	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. Confirm that the EDGESTS flag is 0 before stopping the clock supply to the USBFS.

EDGESTS bit (Edge Interrupt Output Status Monitor)

The EDGESTS bit indicates 1 during the edge processing of an edge interrupt output signal. Confirm that this bit is 0 before stopping the clock supply to the USBFS.

BRDYM bit (BRDY Interrupt Status Clear Timing)

The BRDYM bit specifies how the BRDY interrupt status flags for the pipes are cleared.

TRNENSEL bit (Transaction-Enabled Time Select)

When the USB port is in use for full- or low-speed communications, the TRNENSEL bit specifies the timing with which the USBFS issues tokens in a frame (transaction-enabled time).

Set this bit to 1 when a low-speed device is connected. The bit is only valid in host controller mode. Set this bit to 0 in device controller mode.

27.2.16 INTSTS0 : Interrupt Status Register 0

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x040

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	VBINT	RESM	SOFR	DVST	CTRT	BEMP	NRDY	BRDY	VBST S	DVSQ[2:0]			VALID	CTSQ[2:0]		
Value after reset:	0	0	0	x	0	0	0	0	x	0	0	x	0	0	0	0

Bit	Symbol	Function	R/W
2:0	CTSQ[2:0]	Control Transfer Stage 0 0 0: Idle or setup stage 0 0 1: Control read data stage 0 1 0: Control read status stage 0 1 1: Control write data stage 1 0 0: Control write status stage 1 0 1: Control write (no data) status stage 1 1 0: Control transfer sequence error	R
3	VALID	USB Request Reception 0: Setup packet not received 1: Setup packet received	R/W
6:4	DVSQ[2:0]	Device State Indicates the device state. 0 0 0: Powered state 0 0 1: Default state 0 1 0: Address state 0 1 1: Configured state Others: Suspend state	R
7	VBSTS	VBUS Input Status 0: USB_VBUS pin is low 1: USB_VBUS pin is high	R
8	BRDY	Buffer Ready Interrupt Status 0: No BRDY interrupt occurred 1: BRDY interrupt occurred	R
9	NRDY	Buffer Not Ready Interrupt Status 0: No NRDY interrupt occurred 1: NRDY interrupt occurred	R
10	BEMP	Buffer Empty Interrupt Status 0: No BEMP interrupt occurred 1: BEMP interrupt occurred	R
11	CTRT	Control Transfer Stage Transition Interrupt Status*2 0: No control transfer stage transition interrupt occurred 1: Control transfer stage transition interrupt occurred	R/W*1

Bit	Symbol	Function	R/W
12	DVST	Device State Transition Interrupt Status* ² 0: No device state transition interrupt occurred 1: Device state transition interrupt occurred	R/W* ¹
13	SOFR	Frame Number Refresh Interrupt Status 0: No SOF interrupt occurred 1: SOF interrupt occurred	R/W* ¹
14	RESM	Resume Interrupt Status* ² * ³ 0: No resume interrupt occurred 1: Resume interrupt occurred	R/W* ¹
15	VBINT	VBUS Interrupt Status* ³ 0: No VBUS interrupt occurred 1: VBUS interrupt occurred	R/W* ¹

Note: S-TYPE-3, P-TYPE-3

Note: The value of the DVST bit is 0 when the MCU is reset and 1 after a USB bus reset.

Note: The value of the VBSTS bit is 1 when the USB_VBUS pin is high and 0 when the USB_VBUS pin is low.

Note: The value of the DVSQ[2:0] bits is 000b when the MCU is reset and 001b after a USB bus reset.

Note 1. To clear the VBINT, RESM, SOFR, DVST, CTRT, or VALID bits, write 0 only to the bits to be cleared. Write 1 to the other bits. Do not write 0 to the status bits indicating 0.

Note 2. The status of the RESM, DVST, and CTRT bits are changed only in device controller mode. Set the associated interrupt enable bits to 0 (disabled) in host controller mode.

Note 3. The USBFS detects a change in the status indicated in the VBINT and RESM bits even while the clock supply is stopped (SYSCFG.SCKE bit = 0), and it requests the interrupt when the associated interrupt request bit is 1. Enable the clock supply before clearing the status by software.

CTSQ[2:0] bits (Control Transfer Stage)

In host controller mode, the read value of the CTSQ[2:0] bits is invalid.

VALID bit (USB Request Reception)

In host controller mode, the read value of the VALID bit is invalid.

DVSQ[2:0] bits (Device State)

The DVSQ[2:0] bits are initialized by a USB bus reset. In host controller mode, the read value is invalid.

BRDY flag (Buffer Ready Interrupt Status)

The BRDY flag indicates the BRDY interrupt status.

The USBFS sets the BRDY bit to 1 when it detects a BRDY interrupt status (PIPE_nBRDY = 1, n = 0 to 9) on at least one pipe for which BRDY interrupts are enabled (BRDYENB.PIPE_nBRDYE = 1).

For the conditions that cause the PIPE_nBRDY status to be asserted, see [section 27.3.3.1. BRDY interrupt](#).

The USBFS sets the BRDY bit to 0 when the software writes 0 to all of the PIPE_nBRDY bits associated with the PIPE_nBRDYE bits that are set to 1. Writing 0 to the BRDY flag in the software does not clear the flag.

NRDY flag (Buffer Not Ready Interrupt Status)

The NRDY flag indicates the NRDY interrupt status.

The USBFS sets the NRDY bit to 1 when it detects a NRDY interrupt status (PIPE_nNRDY = 1, n = 0 to 9) on at least one pipe for which NRDY interrupts are enabled (NRDYENB.PIPE_nNRDYE = 1).

For the conditions that cause the PIPE_nNRDY status to be asserted, see [section 27.3.3.2. NRDY interrupt](#).

The USBFS sets the NRDY bit to 0 when the software writes 0 to all of the PIPE_nNRDY bits associated with the PIPE_nNRDYE bits that are set to 1. Writing 0 to the NRDY flag in the software does not clear the flag.

BEMP flag (Buffer Empty Interrupt Status)

The BEMP flag indicates the BEMP interrupt status.

The USBFS sets the BEMP bit to 1 when it detects a BEMP interrupt status (PIPE_nBEMP = 1, n = 0 to 9) on at least one pipe for which BEMP interrupts are enabled (BEMPENB.PIPE_nBEMPE = 1).

For the conditions that cause the PIPE_nBEMP status to be asserted, see [section 27.3.3.3. BEMP interrupt](#).

The USBFS sets the BEMP bit to 0 when the software writes 0 to all of the PIPE_nBEMP bits associated with the PIPE_nBEMPE bits that are set to 1. Writing 0 to the BEMP flag in the software does not clear the flag.

CTRT flag (Control Transfer Stage Transition Interrupt Status)

In device controller mode, the USBFS updates the value of the CTSQ[2:0] bits and sets the CTRT flag to 1 on detecting a transition in the control transfer stage. When a control transfer stage transition interrupt occurs, clear the CTRT flag before the USBFS detects the next control transfer stage transition.

Values read from the CTRT flag in host controller mode are invalid.

DVST flag (Device State Transition Interrupt Status)

In device controller mode, the USBFS updates the value of the DVSQ[2:0] bits and sets the DVST flag to 1 on detecting a change in the device state. When a device state transition interrupt occurs, clear the DVST flag before the USBFS detects the next device state transition.

Values read from the DVST flag in host controller mode are invalid.

SOFR flag (Frame Number Refresh Interrupt Status)

In host controller mode, the USBFS sets the SOFR flag to 1 on updating the frame number when the DVSTCTR0.UACT bit is set to 1 by software. A SOFR interrupt is detected every 1 ms.

In device controller mode, the USBFS sets the SOFR flag to 1 on updating the frame number. A frame number refresh interrupt is detected every 1 ms.

The USBFS can detect an SOFR interrupt through the internal interpolation function even when a corrupted SOF packet is received from the USB host.

RESM flag (Resume Interrupt Status)

In device controller mode, the USBFS sets the RESM flag to 1 on detecting the falling edge of the signal on the USB_DP pin in the Suspend state (DVSQ[2:0] = 1xxb). Values read from the RESM flag in host controller mode are invalid.

VBINT flag (VBUS Interrupt Status)

The USBFS sets the VBINT flag to 1 on detecting a level change (high to low or low to high) in the USB_VBUS pin input value. The USBFS sets the VBSTS flag to indicate the USB_VBUS pin input value. When a VBUS interrupt occurs, eliminate transient elements by reading the VBSTS flag at least three times through software processing and check that the values read are the same.

27.2.17 INTSTS1 : Interrupt Status Register 1

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x042

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	OVRC R	BCHG	—	DTCH	ATTC H	—	—	—	—	EOFE RR	SIGN	SACK	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
4	SACK	Setup Transaction Normal Response Interrupt Status 0: No SACK interrupt occurred 1: SACK interrupt occurred	R/W ¹
5	SIGN	Setup Transaction Error Interrupt Status 0: No SIGN interrupt occurred 1: SIGN interrupt occurred	R/W ¹
6	EOFERR	EOF Error Detection Interrupt Status 0: No EOFERR interrupt occurred 1: EOFERR interrupt occurred	R/W ¹

Bit	Symbol	Function	R/W
10:7	—	These bits are read as 0. The write value should be 0.	R/W
11	ATTCH	ATTCH Interrupt Status 0: No ATTCH interrupt occurred 1: ATTCH interrupt occurred	R/W ^{*1}
12	DTCH	USB Disconnection Detection Interrupt Status 0: No DTCH interrupt occurred 1: DTCH interrupt occurred	R/W ^{*1}
13	—	This bit is read as 0. The write value should be 0.	R/W
14	BCHG	USB Bus Change Interrupt Status ^{*2} 0: No BCHG interrupt occurred 1: BCHG interrupt occurred	R/W ^{*1}
15	OVRRCR	Overcurrent Input Change Interrupt Status ^{*2} 0: No OVRRCR interrupt occurred 1: OVRRCR interrupt occurred	R/W ^{*1}

Note: S-TYPE-3, P-TYPE-3

Note 1. To clear the bits in INTSTS1, write 0 only to the bits to be cleared. Write 1 to the other bits.

Note 2. The USBFS detects a change in the status in the OVRRCR or BCHG bit even when the clock supply is stopped (SYSCFG.SCKE = 0), and it requests the interrupt when the associated interrupt request bit is 1. Enable the clock supply (SYSCFG.SCKE = 1) before clearing the status through the software. No other interrupts can be detected while the clock supply is stopped (SYSCFG.SCKE bit = 0).

INTSTS1 is used to confirm the status of each interrupt in host controller mode. Only enable the status change interrupts indicated in the bits in INTSTS1 in host controller mode.

SACK flag (Setup Transaction Normal Response Interrupt Status)

The SACK flag indicates the status of the setup transaction normal response interrupt in host controller mode.

The USBFS detects the SACK interrupt and sets this flag to 1 when an ACK response is returned from a peripheral device during the setup transactions issued by the USBFS. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

Values read from the SACK flag in device controller mode are invalid.

SIGN flag (Setup Transaction Error Interrupt Status)

The SIGN flag indicates the status of setup transaction error interrupts in host controller mode.

The USBFS detects the SIGN interrupt and sets this flag to 1 when an ACK response is not returned from a peripheral device three consecutive times during the setup transactions issued by the USBFS. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

The USBFS detects the SIGN interrupt when any of the following response conditions occur for three consecutive setup transactions:

- Timeout is detected by the USBFS when the peripheral device has returned no response
- A corrupted ACK packet is received
- A handshake other than ACK (NAK, NYET, or STALL) is received

Values read from the SIGN flag in device controller mode are invalid.

EOFERR flag (EOF Error Detection Interrupt Status)

The EOFERR flag indicates the status of EOF error detection interrupts in host controller mode.

The USBFS detects the EOFERR interrupt and sets this flag to 1 on detecting that communication did not complete at the EOF2 timing defined in the USB 2.0 specification. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

After detecting the EOFERR interrupt, the USBFS controls the hardware as follows, regardless of the associated interrupt enable bit setting:

- Sets the DVSTCTR0.UACT bit for the port in which the EOFERR interrupt was detected to 0
- Puts the port in which the EOFERR interrupt occurred into the idle state

The software must terminate all pipes in which communications are being carried out and re-enumerate the USB port. Values read from the EOFERR flag in device controller mode are invalid.

ATTCH flag (ATTCH Interrupt Status)

The ATTCH flag indicates the status of USB attach detection interrupts in host controller mode.

The USBFS detects the ATTCH interrupt and sets this flag to 1 on detecting a J- or K-state on the full- or low-speed signal level for 2.5 μ s. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

The USBFS detects the ATTCH interrupt on any of the following conditions.

- K-state, SE0, or SE1 changes to J-state, and J-state continues for 2.5 μ s
- J-state, SE0, or SE1 changes to K-state, and K-state continues for 2.5 μ s

Values read from the ATTCH flag in device controller mode are invalid.

DTCH flag (USB Disconnection Detection Interrupt Status)

The DTCH flag indicates the status of USB disconnection detection interrupts in host controller mode.

The USBFS detects the DTCH interrupt and sets this flag to 1 on detecting a USB bus detach event. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

The USBFS detects bus detach events based on the USB 2.0 specification.

After detecting the DTCH interrupt, the USBFS controls hardware as follows, regardless of the associated interrupt enable bit setting:

- Sets the DVSTCTR0.UACT bit for the port in which the DTCH interrupt was detected to 0
- Puts the port in which the DTCH interrupt occurred into the idle state

The software must terminate all pipes in which communications are being carried out and transition to a wait state for connecting to the USB port (waiting for ATTCH interrupt generation).

Values read from the DTCH flag in device controller mode are invalid.

BCHG flag (USB Bus Change Interrupt Status)

The BCHG flag indicates the status of USB bus change interrupts in host controller mode.

The USBFS detects the BCHG interrupt and sets this flag to 1 when a change in the full- or low-speed signal level occurs on the USB port. This includes any change from J-state, K-state, or SE0 to J-state, K-state, or SE0. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

The USBFS sets the LNST[1:0] flags to indicate the input state of the USB port. When a BCHG interrupt occurs, eliminate transient elements by repeat reading the LNST[1:0] flags by software until the same value is read at least three times.

Change in the USB bus state can be detected while the internal clock is stopped.

Values read from the BCHG flag in device controller mode are invalid.

OVRCCR flag (Overcurrent Input Change Interrupt Status)

The OVRCCR flag indicates the status of USB_OVRCURA, USB_OVRCURA-DS, USB_OVRCURB or USB_OVRCURB-DS input pin change interrupts.

The USBFS detects the OVRCCR interrupt and sets this flag to 1 when a change (high to low or low to high) occurs in at least one of the input values to the USB_OVRCURA, USB_OVRCURA-DS, USB_OVRCURB or USB_OVRCURB-DS pins. If the associated interrupt enable bit is set to 1 by software, the USBFS generates the interrupt.

27.2.18 BRDYSTS : BRDY Interrupt Status Register

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x046

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	PIPE9 BRDY	PIPE8 BRDY	PIPE7 BRDY	PIPE6 BRDY	PIPE5 BRDY	PIPE4 BRDY	PIPE3 BRDY	PIPE2 BRDY	PIPE1 BRDY	PIPE0 BRDY
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PIPE0BRDY	BRDY Interrupt Status for Pipe 0 *2 0: No BRDY interrupt occurred 1: BRDY interrupt occurred	R/W*1
1	PIPE1BRDY	BRDY Interrupt Status for Pipe 1 *2 0: No BRDY interrupt occurred 1: BRDY interrupt occurred	R/W*1
2	PIPE2BRDY	BRDY Interrupt Status for Pipe 2 *2 0: No BRDY interrupt occurred 1: BRDY interrupt occurred	R/W*1
3	PIPE3BRDY	BRDY Interrupt Status for Pipe 3 *2 0: No BRDY interrupt occurred 1: BRDY interrupt occurred	R/W*1
4	PIPE4BRDY	BRDY Interrupt Status for Pipe 4 *2 0: No BRDY interrupt occurred 1: BRDY interrupt occurred	R/W*1
5	PIPE5BRDY	BRDY Interrupt Status for Pipe 5 *2 0: No BRDY interrupt occurred 1: BRDY interrupt occurred	R/W*1
6	PIPE6BRDY	BRDY Interrupt Status for Pipe 6 *2 0: No BRDY interrupt occurred 1: BRDY interrupt occurred	R/W*1
7	PIPE7BRDY	BRDY Interrupt Status for Pipe 7 *2 0: No BRDY interrupt occurred 1: BRDY interrupt occurred	R/W*1
8	PIPE8BRDY	BRDY Interrupt Status for Pipe 8 *2 0: No BRDY interrupt occurred 1: BRDY interrupt occurred	R/W*1
9	PIPE9BRDY	BRDY Interrupt Status for Pipe 9 *2 0: No BRDY interrupt occurred 1: BRDY interrupt occurred	R/W*1
15:10	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. When the SOFCFG.BRDYM bit is set to 0, to clear the status indicated in the bits in BRDYSTS, write 0 only to the bits to be cleared. Write 1 to the other bits.

Note 2. When the SOFCFG.BRDYM bit is set to 0, clear BRDY interrupts before accessing the FIFO.

27.2.19 NRDYSTS : NRDY Interrupt Status Register

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x048

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	PIPE9 NRDY	PIPE8 NRDY	PIPE7 NRDY	PIPE6 NRDY	PIPE5 NRDY	PIPE4 NRDY	PIPE3 NRDY	PIPE2 NRDY	PIPE1 NRDY	PIPE0 NRDY
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PIPE0NRDY	NRDY Interrupt Status for Pipe 0 0: No NRDY interrupt occurred 1: NRDY interrupt occurred	R/W ¹
1	PIPE1NRDY	NRDY Interrupt Status for Pipe 1 0: No NRDY interrupt occurred 1: NRDY interrupt occurred	R/W ¹
2	PIPE2NRDY	NRDY Interrupt Status for Pipe 2 0: No NRDY interrupt occurred 1: NRDY interrupt occurred	R/W ¹
3	PIPE3NRDY	NRDY Interrupt Status for Pipe 3 0: No NRDY interrupt occurred 1: NRDY interrupt occurred	R/W ¹
4	PIPE4NRDY	NRDY Interrupt Status for Pipe 4 0: No NRDY interrupt occurred 1: NRDY interrupt occurred	R/W ¹
5	PIPE5NRDY	NRDY Interrupt Status for Pipe 5 0: No NRDY interrupt occurred 1: NRDY interrupt occurred	R/W ¹
6	PIPE6NRDY	NRDY Interrupt Status for Pipe 6 0: No NRDY interrupt occurred 1: NRDY interrupt occurred	R/W ¹
7	PIPE7NRDY	NRDY Interrupt Status for Pipe 7 0: No NRDY interrupt occurred 1: NRDY interrupt occurred	R/W ¹
8	PIPE8NRDY	NRDY Interrupt Status for Pipe 8 0: No NRDY interrupt occurred 1: NRDY interrupt occurred	R/W ¹
9	PIPE9NRDY	NRDY Interrupt Status for Pipe 9 0: No NRDY interrupt occurred 1: NRDY interrupt occurred	R/W ¹
15:10	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. To clear the status indicated in the bits in NRDYSTS, write 0 only to the bits to be cleared. Write 1 to the other bits.

27.2.20 BEMPSTS : BEMP Interrupt Status Register

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x04A

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	PIPE9 BEMP	PIPE8 BEMP	PIPE7 BEMP	PIPE6 BEMP	PIPE5 BEMP	PIPE4 BEMP	PIPE3 BEMP	PIPE2 BEMP	PIPE1 BEMP	PIPE0 BEMP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PIPE0BEMP	BEMP Interrupt Status for Pipe 0 0: No BEMP interrupt occurred 1: BEMP interrupt occurred	R/W ¹
1	PIPE1BEMP	BEMP Interrupt Status for Pipe 1 0: No BEMP interrupt occurred 1: BEMP interrupt occurred	R/W ¹
2	PIPE2BEMP	BEMP Interrupt Status for Pipe 2 0: No BEMP interrupt occurred 1: BEMP interrupt occurred	R/W ¹
3	PIPE3BEMP	BEMP Interrupt Status for Pipe 3 0: No BEMP interrupt occurred 1: BEMP interrupt occurred	R/W ¹
4	PIPE4BEMP	BEMP Interrupt Status for Pipe 4 0: No BEMP interrupt occurred 1: BEMP interrupt occurred	R/W ¹
5	PIPE5BEMP	BEMP Interrupt Status for Pipe 5 0: No BEMP interrupt occurred 1: BEMP interrupt occurred	R/W ¹
6	PIPE6BEMP	BEMP Interrupt Status for Pipe 6 0: No BEMP interrupt occurred 1: BEMP interrupt occurred	R/W ¹
7	PIPE7BEMP	BEMP Interrupt Status for Pipe 7 0: No BEMP interrupt occurred 1: BEMP interrupt occurred	R/W ¹
8	PIPE8BEMP	BEMP Interrupt Status for Pipe 8 0: No BEMP interrupt occurred 1: BEMP interrupt occurred	R/W ¹
9	PIPE9BEMP	BEMP Interrupt Status for Pipe 9 0: No BEMP interrupt occurred 1: BEMP interrupt occurred	R/W ¹
15:10	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. To clear the status indicated in the bits in BEMPSTS, write 0 only to the bits to be cleared. Write 1 to the other bits.

27.2.21 FRMNUM : Frame Number Register

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x04C

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
10:0	FRNM[10:0]	Frame Number Latest frame number.	R
13:11	—	These bits are read as 0. The write value should be 0.	R/W
14	CRCE	Receive Data Error 0: No error occurred 1: Error occurred	R/W ¹
15	OVRN	Overflow/Underflow Detection Status 0: No error occurred 1: Error occurred	R/W ¹

Note: S-TYPE-3, P-TYPE-3

Note 1. To clear the status, write 0 only to the bits to be cleared. Write 1 to the other bits.

FRNM[10:0] flags (Frame Number)

The USBFS sets the FRNM[10:0] flags to indicate the latest frame number, which is updated every 1 ms, when an SOF packet is issued or received.

CRCE flag (Receive Data Error)

The CRCE flag sets to 1 when a CRC error or bit stuffing error occurs during isochronous transfer. On detecting a CRC error in host controller mode, the USBFS generates an internal NRDY interrupt.

To clear the CRCE flag, write 0 to it while writing 1 to the other bits in the FRMNUM register.

OVRN flag (Overrun/Underrun Detection Status)

The OVRN flag sets to 1 when an overrun or underrun error occurs during isochronous transfer. To clear the flag, write 0 to it while writing 1 to the other bits in the FRMNUM register.

In host controller mode, the OVRN flag sets to 1 on any of the following conditions:

- For a transmitting isochronous pipe, the time to issue an OUT token comes before all of the transmit data is written to the FIFO buffer
- For a receiving isochronous pipe, the time to issue an IN token comes when no FIFO buffer planes are empty

In device controller mode, the OVRN flag sets to 1 on any of the following conditions:

- For a transmitting isochronous pipe, the IN token is received before all of the transmit data is written to the FIFO buffer
- For a receiving isochronous pipe, the OUT token is received when no FIFO buffer planes are empty

27.2.22 DVCHGR : Device State Change Register

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x04E

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DVCHG	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
14:0	—	These bits are read as 0. The write value should be 0.	R/W
15	DVCHG	Device State Change 0: Disable writes to the USBADDR.STSRECOV[3:0] and USBADDR.USBADDR[6:0] bits 1: Enable writes to the USBADDR.STSRECOV[3:0] and USBADDR.USBADDR[6:0] bits	R/W

Note: S-TYPE-3, P-TYPE-3

For details, see [section 27.3.1.5. Release from Deep Software Standby mode1 because of USB suspend/resume interrupts.](#)

27.2.23 USBADDR : USB Address Register

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x050

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	STSRECOV[3:0]			—	USBADDR[6:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	USBADDR[6:0]	USB Address In device controller mode, these bits indicate the USB address assigned by the host when the USBFS processed the SET_ADDRESS request successfully.	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W
11:8	STSRECOV[3:0]	Status Recovery 0x4: Recovery in device controller mode: Setting prohibited Recovery in host controller mode: Return to the low-speed state (bits DVSTCTR0.RHST[2:0] = 001b) 0x8: Recovery in device controller mode: Setting prohibited Recovery in host controller mode: Return to the full-speed state (bits DVSTCTR0.RHST[2:0] = 010b) 0x9: Recovery in device controller mode: Return to the full-speed state (bits DVSTCTR0.RHST[2:0] = 010b), bits INTSTS0.DVSQ[2:0] = 001b (default state) Recovery in host controller mode: Setting prohibited 0xA: Recovery in device controller mode: Return to the full-speed state (bits DVSTCTR0.RHST[2:0] = 010b), bits INTSTS0.DVSQ[2:0] = 010b (address state) Recovery in host controller mode: Setting prohibited 0xB: Recovery in device controller mode: Return to the full-speed state (bits DVSTCTR0.RHST[2:0] = 010b), bits INTSTS0.DVSQ[2:0] = 011b (configured state) Recovery in host controller mode: Setting prohibited Others: Setting prohibited	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

USBADDR[6:0] bits (USB Address)

In device controller mode, the USBADDR[6:0] flags indicate the USB address received when the USBFS processed a SetAddress request successfully. The USBFS sets the USBADDR[6:0] bits to 0x00 on detecting a USB bus reset.

Writing to these bits is enabled while the DVCHGR.DVCHG bit is set to 1. On recovering from a USB power shut-off, the operation can resume from the USB address set before the software shut-off.

In host controller mode, the USBADDR[6:0] bits are invalid.

STSRECOV[3:0] bits (Status Recovery)

Use the STSRECOV[3:0] bits to resume the state of the internal sequencer on recovering from USB power shut-off. For details, see [section 27.3.1.5. Release from Deep Software Standby mode1 because of USB suspend/resume interrupts.](#)

Writing to these bits is enabled while the DVCHGR.DVCHG bit is set to 1.

27.2.24 USBREQ : USB Request Type Register

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x054

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
7:0	BMREQUESTTYPE[7:0]	Request Type USB request bmRequestType value	R/W ¹
15:8	BREQUEST[7:0]	Request USB request bRequest value	R/W ¹

Note: S-TYPE-3, P-TYPE-3

Note 1. In device controller mode, these bits can be read, but writing to them has no effect. In host controller mode, these bits are both read/write bits.

USBREQ stores setup requests for control transfers.

In device controller mode, the USBREQ stores the received bRequest and bmRequestType values. In host controller mode, it sets to the bRequest and bmRequestType values to be transmitted.

USBREQ is initialized by a USB bus reset.

BMREQUESTTYPE[7:0] bits (Request Type)

The BMREQUESTTYPE[7:0] bits hold the bmRequestType value of USB requests.

- In host controller mode:
Set these bits to the value of the USB request data in transmission setup transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.
- In device controller mode:
These bits indicate the value of the USB request data in reception setup transactions. Writing to the bits has no effect.

BREQUEST[7:0] bits (Request)

The BREQUEST[7:0] bits store bRequest value of the USB request.

- In host controller mode:
Set these bits to the value of the USB request data in setup transmission transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.
- In device controller mode:
These bits indicate the value of the USB request data in reception setup transactions. Writing to the bits has no effect.

27.2.25 USBVAL : USB Request Value Register

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x056

Bit	Symbol	Function	R/W
15:0	WVALUE[15:0]	Value USB request wValue value	R/W ¹

Note: S-TYPE-3, P-TYPE-3

Note 1. In device controller mode, these bits can be read, but writing to them has no effect. In host controller mode, these bits are both read/write bits.

In device controller mode, USBVAL stores the received wValue value. In host controller mode, it sets to the wValue value to be transmitted is set.

USBVAL is initialized by a USB bus reset.

WVALUE[15:0] bits (Value)

The WVALUE[15:0] bits store wValue value of the USB request.

- In host controller mode:
Set these bits to the value of the wValue field in USB requests of transmission setup transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.
- In device controller mode:

These bits indicate the wValue value of USB requests in reception setup transactions. Writing to the bits has no effect.

27.2.26 USBINDX : USB Request Index Register

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x058

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	WINDEX[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	WINDEX[15:0]	Index USB request wIndex value	R/W ¹

Note: S-TYPE-3, P-TYPE-3

Note 1. In device controller mode, these bits can be read, but writing to them has no effect. In host controller mode, these bits are both read/write bits.

USBINDX stores setup requests for control transfers.

In device controller mode, it stores the received wIndex value. In host controller mode, it sets to the wIndex value to be transmitted.

USBINDX is initialized by a USB bus reset.

WINDEX[15:0] bits (Index)

The WINDEX[15:0] bits hold the wIndex value of a USB request.

- In host controller mode:

Set these bits to the wIndex value in USB requests in transmission setup transactions. Do not change the value of the bits while the DPCCTR.SUREQ bit is 1.
- In device controller mode:

These bits indicate the wIndex value in USB requests received in reception setup transactions. Writing to the bits has no effect.

27.2.27 USBLENG : USB Request Length Register

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x05A

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	WLENTUH[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	WLENTUH[15:0]	Length USB request wLength value	R/W ¹

Note: S-TYPE-3, P-TYPE-3

Note 1. In device controller mode, these bits can be read, but writing to them has no effect. In host controller mode, these bits are both read/write bits.

USBLENG stores setup requests for control transfers.

In device controller mode, the value of wLength that is received is stored. In host controller mode, the value of wLength to be transmitted is set.

USBLENG is initialized by a USB bus reset.

WLENTUH[15:0] bits (Length)

The WLENTUH[15:0]bits hold the wLength value of a USB request.

- In host controller mode:
Set these bits to the wLength value in USB requests in transmission setup transactions. Do not change the value of the bits while the DCPCTR.SUREQ bit is 1.
- In device controller mode:
These bits indicate the wLength value in USB requests received in reception setup transactions. Writing to the bits has no effect.

27.2.28 DCPCFG : DCP Configuration Register

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x05C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	SHTN AK	—	—	DIR	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
4	DIR	Transfer Direction*1 0: Data receiving direction 1: Data transmitting direction	R/W
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	SHTNAK	Pipe Disabled at End of Transfer*1 0: Keep pipe open after transfer ends 1: Disable pipe after transfer ends	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. Only set this bit while the PID is NAK. Before setting this bit, check that the DCPCTR.PBUSY bit is 0, and then change the DCPCTR.PID[1:0] bits for the DCP from BUF to NAK. If the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary.

DIR bit (Transfer Direction)

In host controller mode, the DIR bit sets the transfer direction of the data stage and status stage for control transfers. In device controller mode, set the DIR bit to 0.

SHTNAK bit (Pipe Disabled at End of Transfer)

The SHTNAK bit specifies whether to change PID to NAK on transfer end when the selected pipe is receiving. It is only valid when the selected pipe is receiving.

When the SHTNAK bit is 1, the USBFS changes the DCPCTR.PID[1:0] bits for the DCP to NAK on determining that a transfer has ended. The USBFS determines transfer end on the following condition:

- A short packet, including a zero-length packet, is successfully received.

27.2.29 DCPMAXP : DCP Maximum Packet Size Register

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x05E

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DEVSEL[3:0]			—	—	—	—	—	MXPS[6:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	MXPS[6:0]	Maximum Packet Size*1 Maximum data payload specification (maximum packet size) for the DCP	R/W
11:7	—	These bits are read as 0. The write value should be 0.	R/W
15:12	DEVSEL[3:0]	Device Select*2 0x0: Address 0000b 0x1: Address 0001b 0x2: Address 0010b 0x3: Address 0011b 0x4: Address 0100b 0x5: Address 0101b Others: Setting prohibited	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. Only set the MXPS[6:0] bits while PID is NAK. Before setting these bits, check that the DCPCTR.PBUSY bit is 0, and then change the DCPCTR.PID[1:0] bits for the DCP from BUF to NAK. If the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary. After the MXPS[6:0] bits are set and the DCP is set to the CURPIPE[3:0] bits in a port select register, clear the buffer by setting the BCLR bit in the port control register to 1.

Note 2. Only set the DEVSEL[3:0] bits while PID is NAK and the DCPCTR.SUREQ bit is 0. Before setting these bits, check that the DCPCTR.PBUSY bit is 0, and then change the DCPCTR.PID[1:0] bits for the DCP from BUF to NAK. If the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary.

MXPS[6:0] bits (Maximum Packet Size)

The MXPS[6:0] bits specify the maximum data payload (maximum packet size) for the DCP. The initial value is 0x40 (64 bytes). Set the bits to a USB 2.0-compliant value. Do not write to the FIFO buffer or set PID = BUF while MXPS[6:0] is set to 0.

DEVSEL[3:0] bits (Device Select)

In host controller mode, the DEVSEL[3:0] bits specify the address of the target peripheral device for a control transfer. Set up the associated DEVADDn (n = 0 to 5) register first, and then set these bits to the corresponding value. To set the DEVSEL[3:0] bits to 0010b, for example, first set the address in the DEVADD2 register.

In device controller mode, set these bits to 0000b.

27.2.30 DCPCTR : DCP Control Register

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x060

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	BSTS	SUREQ	—	—	SUREQLR	—	—	SQCLR	SQSET	SQMON	PBUSY	—	—	CCPL	PID[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	PID[1:0]	Response PID 0 0: NAK response 0 1: BUF response (depends on the buffer state) 1 0: STALL response 1 1: STALL response	R/W
2	CCPL	Control Transfer End Enable 0: Disable control transfer completion 1: Enable control transfer completion	R/W
4:3	—	These bits are read as 0. The write value should be 0.	R/W
5	PBUSY	Pipe Busy 0: DCP not used for the USB bus 1: DCP in use for the USB bus	R
6	SQMON	Sequence Toggle Bit Monitor 0: DATA0 1: DATA1	R
7	SQSET	Sequence Toggle Bit Set* ² Sets the sequence toggle bit in DCP transfers. 0: Invalid (writing 0 has no effect) 1: Set the expected value for the next transaction to DATA1	R/W* ¹
8	SQCLR	Sequence Toggle Bit Clear* ² Clears the sequence toggle bit in DCP transfers. 0: Invalid (writing 0 has no effect) 1: Clear the expected value for the next transaction to DATA0	R/W* ¹
10:9	—	These bits are read as 0. The write value should be 0.	R/W
11	SUREQCLR	SUREQ Bit Clear Clears the SUREQ bit in host controller mode. 0: Invalid (writing 0 has no effect) 1: Clear SUREQ to 0	R/W* ¹
13:12	—	These bits are read as 0. The write value should be 0.	R/W
14	SUREQ	Setup Token Transmission Sets up token transmission in host controller mode. 0: Invalid (writing 0 has no effect) 1: Transmit setup packet	R/W
15	BSTS	Buffer Status 0: Buffer access disabled 1: Buffer access enabled	R

Note: S-TYPE-3, P-TYPE-3

Note 1. This bit is read as 0.

Note 2. Only set the SQSET and SQCLR bits while PID is NAK. Before setting these bits, check that the PBUSY bit is 0, and then change the PID[1:0] bits for the DCP from BUF to NAK. If the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary.

PID[1:0] bits (Response PID)

The PID[1:0] bits control the USB response type during control transfers.

In host controller mode, to change the PID[1:0] setting from NAK to BUF:

- When the transmitting direction is set:
 - a. Write all of the transmit data to the FIFO buffer while the DVSTCTR0.UACT bit is 1 and PID is NAK.
 - b. Set PID[1:0] bits to 01b (BUF).
The USBFS then executes the OUT transaction.
- When the receiving direction is set:
 - a. Check that the FIFO buffer is empty (or empty the buffer) while the DVSTCTR0.UACT bit is 1 and PID is NAK.
 - b. Set PID[1:0] bits to 01b (BUF).
The USBFS then executes the IN transaction.

The USBFS changes the PID[1:0] setting as follows:

- When the PID[1:0] bits are set to BUF (01b) by software and the USBFS has received data exceeding MaxPacketSize, the USBFS sets the PID[1:0] to STALL (11b)
- When a reception error, such as a CRC error, is detected three times consecutively, the USBFS sets the PID[1:0] bits to NAK (00b)
- On receiving the STALL handshake, the USBFS sets PID[1:0] to STALL (11b)

In device controller mode, the USBFS changes the PID[1:0] setting as follows:

- On receiving a setup packet, the USBFS sets PID[1:0] to NAK (00b). The USBFS then sets the INTSTS0.VALID flag to 1, and the PID[1:0] setting cannot be changed until the software clears the VALID flag to 0.
- When the PID[1:0] bits are set to BUF (01b) by software and the USBFS has received data exceeding MaxPacketSize, the USBFS sets PID[1:0] to STALL (11b)
- On detecting a control transfer sequence error, the USBFS sets PID[1:0] to STALL (1xb)
- On detecting a USB bus reset, the USBFS sets PID[1:0] to NAK

The USBFS does not check the PID[1:0] setting while processing a SET_ADDRESS request.

The PID[1:0] bits are initialized by a USB bus reset.

CCPL bit (Control Transfer End Enable)

In device controller mode, setting the CCPL bit to 1 enables the status stage of the control transfer to be completed. When the bit is set to 1 by software while the associated PID[1:0] bits are set to BUF, the USBFS completes the control transfer status stage.

During control read transfers, the USBFS transmits the ACK handshake in response to the OUT transaction from the USB host. During control write or no-data control transfers, it transmits the zero-length packet in response to the IN transaction from the USB host. On detecting a SET_ADDRESS request, the USBFS operates in auto response mode from the setup stage up to status stage completion regardless of the CCPL bit setting.

The USBFS changes the CCPL bit from 1 to 0 on receiving a new setup packet. The software cannot write 1 to the bit while the INTSTS0.VALID bit is 1. The bit is initialized by a USB bus reset.

In host controller mode, always write 0 to the CCPL bit.

PBUSY bit (Pipe Busy)

The PBUSY bit indicates whether DCP is used for the transaction when USBFS changes the PID[1:0] bits from BUF to NAK. The USBFS changes the PBUSY bit from 0 to 1 on start of a USB transaction for the selected pipe. It changes the PBUSY bit from 1 to 0 on completion of one transaction.

After PID is set to NAK by software, the value in the PBUSY bit indicates whether changes to pipe settings can proceed.

For details, see [section 27.3.4.1. Pipe control register switching procedures](#).

SQMON bit (Sequence Toggle Bit Monitor)

The SQMON bit indicates the expected value of the sequence toggle bit for the next transaction during a DCP transfer.

The USBFS toggles the bit on normal completion of the transaction. It does not toggle the bit, however, when a DATAPID mismatch occurs during a transfer in the receiving direction.

In device controller mode, the USBFS sets the SQMON bit to 1 (specifies DATA1 as the expected value) on successful reception of the setup packet.

In device controller mode, the USBFS does not reference this bit during IN or OUT transactions at the status stage, and it does not toggle the bit on normal completion.

SQSET bit (Sequence Toggle Bit Set)

The SQSET bit specifies DATA1 as the expected value of the sequence toggle bit for the next transaction during a DCP transfer.

Do not set the SQCLR and SQSET bits to 1 simultaneously.

SQCLR bit (Sequence Toggle Bit Clear)

The SQCLR bit specifies DATA0 as the expected value of the sequence toggle bit for the next transaction during a DCP transfer. It is read as 0.

Do not set the SQCLR and SQSET bits to 1 simultaneously.

SUREQCLR bit (SUREQ Bit Clear)

In host controller mode, setting the SUREQCLR bit to 1 clears the SUREQ bit to 0. The bit is read as 0.

If transfer stops while the SUREQ bit is set to 1 in a setup transaction, set the SUREQCLR bit to 1 by software. This is not necessary at the end of a normal setup transaction, because the USBFS automatically clears the SUREQ bit to 0.

Only control the SUREQ bit through the SUREQCLR bit while the DVSTCTR0.UACT bit is 0. When UACT is 0, communication is halted or no transfer is occurring because a bus disconnection was detected.

In device controller mode, always write 0 to this bit.

SUREQ bit (Setup Token Transmission)

In host controller mode, setting the SUREQ bit to 1 triggers the USBFS to transmit the setup packet. After completing the setup transaction process, the USBFS generates either the SACK or SIGN interrupt and clears the SUREQ bit to 0. The USBFS also clears the SUREQ bit to 0 when the software sets the SUREQCLR bit to 1.

Before setting the SUREQ bit to 1, set the DCPMAXP.DEVSEL[3:0] bits, USBREQ, USBVAL, USBINDX, and USBLENG appropriately to transmit the target USB request in the setup transaction. Also check that the PID[1:0] bits for the DCP are set to NAK. After setting the SUREQ bit to 1, do not change the DCPMAXP.DEVSEL[3:0] bits, USBREQ, USBVAL, USBINDX, or USBLENG until the setup transaction is complete (SUREQ bit = 1). Write 1 to the SUREQ bit only when transmitting the setup token. Otherwise, write 0.

In device controller mode, always write 0 to this bit.

BSTS flag (Buffer Status)

The BSTS flag indicates the status of access to the DCP FIFO buffer. The meaning of this flag varies as follows depending on the CFIFOSEL.ISEL setting:

- When ISEL = 0, the bit indicates whether receive data can be read from the buffer
- When ISEL = 1, the bit indicates whether transmit data can be written to the buffer

27.2.31 PIPESEL : Pipe Window Select Register

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x064

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	PIPESEL[3:0]		
------------	---	---	---	---	---	---	---	---	---	---	---	---	--------------	--	--

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
3:0	PIPESEL[3:0]	Pipe Window Select 0x0: No pipe selected 0x1: Pipe 1 0x2: Pipe 2 0x3: Pipe 3 0x4: Pipe 4 0x5: Pipe 5 0x6: Pipe 6 0x7: Pipe 7 0x8: Pipe 8 0x9: Pipe 9 Others: Setting prohibited	R/W
15:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Set pipes 1 to 9 using the PIPESEL, PIPECFG, PIPEMAXP, PIPEPERI, PIPEnCTR, PIPEnTRE, and PIPEnTRN registers (n = 1 to 9).

After selecting the pipe in the PIPESEL register, pipe functions must be set in the associated PIPECFG, PIPEMAXP, and PIPEPERI registers. PIPEnCTR, PIPEnTRE, and PIPEnTRN can be set independently of the pipe selection in this register.

PIPESEL[3:0] bits (Pipe Window Select)

The PIPESEL[3:0] bits select the pipe number associated with the PIPECFG, PIPEMAXP, and PIPEPERI registers used for data writing and reading. Selecting a pipe number in the PIPESEL[3:0] bits allows writing to and reading from PIPECFG, PIPEMAXP, and PIPEPERI associated with the selected pipe number.

When PIPESEL[3:0] = 0000b, 0 is read from all of the bits in PIPECFG, PIPEMAXP, and PIPEPERI. Writing to these bits has no effect.

27.2.32 PIPECFG : Pipe Configuration Register

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x068

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	TYPE[1:0]		—	—	—	BFRE	DBLB	—	SHTN AK	—	—	DIR	EPNUM[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	EPNUM[3:0]	Endpoint Number* ¹ Specifies the endpoint number for the selected pipe. Setting 0000b indicates that the pipe is not used.	R/W

Note: S-TYPE-3, P-TYPE-3

- Note 1. Only set the TYPE[1:0], SHTNAK, and EPNUM[3:0] bits while PID is NAK. Before setting these bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.
- Note 2. Only set the BFRE, DBLB, and DIR bits while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting these bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.
- Note 3. To change the BFRE, DBLB, or DIR bits after completing USB communication on the selected pipe, in addition to the constraints described in Note 2, write 1 and 0 to the PIPEnCTR.ACLRM bit continuously through the software and clear the FIFO buffer assigned to the pipe.

PIPECFG specifies the transfer type, FIFO buffer access direction, and endpoint numbers for pipes 1 to 9. It also selects single or double buffer mode, and whether to continue or disable pipe operation at the end of transfer.

EPNUM[3:0] bits (Endpoint Number)

The EPNUM[3:0] bits specify the endpoint number for the selected pipe. Setting 0000b indicates the pipe not used.

Set these bits so that the combination of the DIR and EPNUM[3:0] settings is different from those for other pipes. The EPNUM[3:0] bits can be set to 0000b for all pipes.

DIR bit (Transfer Direction)

The DIR bit specifies the transfer direction for the selected pipe.

When the software sets this bit to 0, the USBFS uses the selected pipe for receiving. When the software sets this bit to 1, the USBFS uses the selected pipe for transmitting.

SHTNAK bit (Pipe Disabled at End of Transfer)

The SHTNAK bit specifies whether to change the PIPEnCTR.PID[1:0] bits to 00b (NAK) at the end of transfer when the selected pipe is set in the receiving direction. The bit is valid for pipes 1 to 5 in the receiving direction.

When the software sets this bit to 1 for a receiving pipe, the USBFS changes the associated PIPEnCTR.PID[1:0] bits to 00b (NAK) on determining the transfer end. The USBFS determines that the transfer has ended on the following conditions:

- A short packet data (including a zero-length packet) was successfully received
- The transaction counter is used and the number of packets specified for the transaction counter are successfully received

DBLB bit (Double Buffer Mode)

The DBLB bit selects either single or double buffer mode for the FIFO buffer used by the selected pipe. The bit is valid for pipes 1 to 5.

BFRE bit (BRDY Interrupt Operation Specification)

The BFRE bit specifies the BRDY interrupt generation timing from the USBFS to the CPU for the selected pipe.

When the software sets the BFRE bit to 1 and the selected pipe is in the receiving direction, the USBFS detects the transfer completion and generates the BRDY interrupt on reading the packet.

When a BRDY interrupt is generated with this setting, the software must write 1 to the BCLR bit in the port control register. The FIFO buffer assigned to the selected pipe is not enabled for reception until 1 is written to the BCLR bit.

When the BFRE bit is set to 1 by software and the selected pipe is in the transmitting direction, the USBFS does not generate the BRDY interrupt. For details, see [section 27.3.3.1. BRDY interrupt](#).

TYPE[1:0] bits (Transfer Type)

The TYPE[1:0] bits specify the transfer type for the pipe selected in the PIPESEL.PIPESEL[3:0] bits. Before setting PID to BUF and starting USB communication on the selected pipe, set the TYPE[1:0] bits to a value other than 00b.

27.2.33 PIPEMAXP : Pipe Maximum Packet Size Register

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x06C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DEVSEL[3:0]				—	—	—	MXPS[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	x	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	MXPS[8:0]	Maximum Packet Size*1 <ul style="list-style-type: none"> Pipes 1 and 2 1 byte (0x001) to 256 bytes (0x100) (Bit [9] not supported.) Pipes 3 to 5 8 bytes (0x008), 16 bytes (0x010), 32 bytes (0x020), 64 bytes (0x040) (Bits [9:7] and [2:0] not supported.) Pipes 6 to 9 1 byte (0x001) to 64 bytes (0x040) (Bits [9:7] not supported.) 	R/W
11:9	—	These bits are read as 0. The write value should be 0.	R/W
15:12	DEVSEL[3:0]	Device Select*2 <ul style="list-style-type: none"> 0x0: Address 0000b 0x1: Address 0001b 0x2: Address 0010b 0x3: Address 0011b 0x4: Address 0100b 0x5: Address 0101b Others: Setting prohibited 	R/W

Note: S-TYPE-3, P-TYPE-3

Note: The value of the MXPS[8:0] bits is 0x000 when no pipe is selected in the PIPESEL.PIPESEL[3:0] bits and 0x040 when a pipe is selected.

Note 1. Only set the MXPS[8:0] bits while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting these bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

Note 2. Only set the DEVSEL[3:0] bits while PID is NAK. Before setting these bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00b (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

PIPEMAXP specifies the maximum packet size for pipes 1 to 9.

MXPS[8:0] bits (Maximum Packet Size)

The MXPS[8:0] bits specify the maximum data payload (maximum packet size) for the selected pipe.

Set these bits to the appropriate value for each transfer type based on the USB 2.0 specification. When MXPS[8:0] = 0, do not write to the FIFO buffer or set PID to BUF. These writes have no effect.

DEVSEL[3:0] bits (Device Select)

In host controller mode, the DEVSEL[3:0] bits specify the address of the target device for USB communication. Set up the device address in the associated DEVADDn (n = 0 to 5) register first, and then set these bits to the corresponding value. To set the DEVSEL[3:0] bits to 0x2, for example, first set the address in the DEVADD2 register.

In device controller mode, set these bits to 0x0.

27.2.34 PIPEPERI : Pipe Cycle Control Register

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x06E

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	IFIS	—	—	—	—	—	—	—	—	—	IITV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	IITV[2:0] ¹	Interval Error Detection Interval Specifies the interval error detection timing for the selected pipe as the n-th power of 2 of the frame timing	R/W
11:3	—	These bits are read as 0. The write value should be 0.	R/W
12	IFIS	Isochronous IN Buffer Flush 0: Do not flush buffer 1: Flush buffer	R/W
15:13	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Note 1. Only set the IITV[2:0] bits while PID is NAK. Before setting these bits, check that the PBUSY bit is 0, and then change the PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

PIPEPERI selects whether the buffer is flushed or not when an interval error occurred during isochronous IN transfers, and sets the interval error detection interval for pipes 1 to 9.

IITV[2:0] bits (Interval Error Detection Interval)

To change the IITV[2:0] bits to another value after they are set and USB communication is performed, set the PIPEnCTR.PID[1:0] bits to 00b (NAK) and then set the PIPEnCTR.ACLRM bit to 1 to initialize the interval timer.

The IITV[2:0] bits are not provided for pipes 3 to 5. Write 000b to bit positions of the IITV[2:0] bits associated with pipes 3 to 5.

IFIS bit (Isochronous IN Buffer Flush)

The IFIS bit specifies whether to flush the buffer when the pipe selected in the PIPESEL.PIPESEL[3:0] bits is used for isochronous IN transfers.

In device controller mode when the selected pipe is for isochronous IN transfers, the USBFS automatically clears the FIFO buffer if the USBFS fails to receive the IN token from the USB host within the interval set in the IITV[2:0] bits in terms of frames.

When double buffering is specified (PIPECFG.DBLB = 1), the USBFS only clears the data in the previously used plane.

The USBFS clears the FIFO buffer on receiving the SOF packet immediately after the frame in which the USBFS expected to receive the IN token. Even if the SOF packet is corrupted, the FIFO buffer is cleared at the time the SOF packet is expected to be received by using the internal interpolation function.

When the host controller function is selected, set this bit to 0.

Set this bit to 0 when the selected pipe is not for isochronous transfer.

27.2.35 PIPEnCTR : PIPEn Control Registers (n = 1 to 5)

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x070 + 0x2 × (n - 1)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	BSTS	INBUF M	—	—	—	ATRE PM	ACLR M	SQCL R	SQSE T	SQMO N	PBUS Y	—	—	—	PID[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	PID[1:0]	Response PID 0 0: NAK response 0 1: BUF response (depends buffer state) 1 0: STALL response 1 1: STALL response	R/W
4:2	—	These bits are read as 0. The write value should be 0.	R/W
5	PBUSY	Pipe Busy 0: Pipe n not in use for the transaction 1: Pipe n in use for the transaction	R
6	SQMON	Sequence Toggle Bit Confirmation 0: DATA0 1: DATA1	R
7	SQSET	Sequence Toggle Bit Set ^{*2} Sets the sequence toggle bit for pipe n. 0: Invalid (writing 0 has no effect) 1: Set the expected value for the next transaction to DATA1	R/W ^{*1}
8	SQCLR	Sequence Toggle Bit Clear ^{*2} Clears the sequence toggle bit for pipe n. 0: Invalid (writing 0 has no effect) 1: Clear the expected value for the next transaction to DATA0	R/W ^{*1}
9	ACLRM	Auto Buffer Clear Mode ^{*3} 0: Disable 1: Enable (initialize all buffers)	R/W
10	ATREPM	Auto Response Mode ^{*2} 0: Disable auto response mode 1: Enable auto response mode	R/W
13:11	—	These bits are read as 0. The write value should be 0.	R/W
14	INBUFM	Transmit Buffer Monitor 0: No data to be transmitted is in the FIFO buffer 1: Data to be transmitted is in the FIFO buffer	R
15	BSTS	Buffer Status 0: Buffer access by the CPU disabled 1: Buffer access by the CPU enabled	R

Note: S-TYPE-3, P-TYPE-3

Note 1. This bit is read as 0.

Note 2. Only set the ATREPM bit or write 1 to the SQCLR or SQSETbit while PID is NAK. Before setting these bits, check that the PBUSY bit is 0, and then change the PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSYbit through the software is not necessary.

Note 3. Only set the ACLRM bit while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting this bit, check that the PBUSY bit is 0, and then change the PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00 (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

PIPEnCTR can be set for any pipe selection in the PIPESEL register.

PID[1:0] bits (Response PID)

The PID[1:0]bits specify the response type for the next transaction on the selected pipe.

The default PID[1:0] setting is NAK. Change the PID[1:0] setting to BUF to use the associated pipe for USB transfer. [Table 27.9](#) and [Table 27.10](#) show the basic operations of the USBFS (when there are no errors in the communication packets) based on the PID[1:0] bit setting.

After changing the PID[1:0] setting from BUF to NAK through the software during USB communication on the selected pipe, check that the PBUSY bit is 1 to see if USB transfer on the pipe has actually entered the NAK state. If the USBFS changes the PID[1:0] bits to NAK, checking the PBUSY bit through the software is not necessary.

The USBFS changes the PIPEnCTR.PID[1:0] setting in the following cases:

- The USBFS sets PID to NAK on recognizing completion of the transfer when the selected pipe is in the receiving direction and the PIPECFG.SHTNAK bit for the selected pipe is set to 1 by software
- The USBFS sets PID to STALL (11b) on receiving a data packet with a payload exceeding the maximum packet size of the selected pipe
- The USBFS sets PID to NAK on detecting a USB bus reset in device controller mode
- The USBFS sets PID to NAK on detecting a reception error, such as a CRC error, three consecutive times in host controller mode
- The USBFS sets PID to STALL (11b) on receiving the STALL handshake in host controller mode

To specify the response type, set the PID[1:0] bits as follows:

- To transition from NAK (00b) to STALL, set 10b
- To transition from BUF (01b) to STALL, set 11b
- To transition from STALL (11b) to NAK, set 10b and then 00b
- To transition from STALL to BUF, set 00b (NAK) and then 01b (BUF)

Table 27.9 Operation of the USBFS based on the PID[1:0] setting in host controller mode

PID[1:0] value	Transfer type	Transfer direction (DIR bit)	USBFS operation
00b (NAK)	Does not depend on the setting	Does not depend on the setting	Does not issue tokens
01b (BUF)	Bulk or interrupt	Does not depend on the setting	Issues tokens when the DVSTCTR0.UACT bit is 1 and the FIFO buffer associated with the selected pipe is ready for transmission and reception. Does not issue tokens when the DVSTCTR0.UACT bit is 0 or the FIFO buffer associated with the selected pipe is not ready for transmission or reception.
	Isochronous	Does not depend on the setting	Issues tokens regardless of the status of the FIFO buffer associated with the selected pipe.
10b (STALL) or 11b (STALL)	Does not depend on the setting	Does not depend on the setting	Does not issue tokens.

Table 27.10 Operation of the USBFS based on the PID[1:0] setting in device controller mode (1 of 2)

PID[1:0] value	Transfer type	Transfer direction (DIR bit)	USBFS operation
00b (NAK)	Bulk or interrupt	Does not depend on the setting	Returns NAK in response to the token from the USB host
	Isochronous	Does not depend on the setting	Returns nothing in response to the token from the USB host

Table 27.10 Operation of the USBFS based on the PID[1:0] setting in device controller mode (2 of 2)

PID[1:0] value	Transfer type	Transfer direction (DIR bit)	USBFS operation
01b (BUF)	Bulk	Receiving direction (DIR = 0)	Receives data and returns ACK in response to the OUT token from the USB host if the FIFO buffer associated with the selected pipe is ready for reception
	Interrupt	Receiving direction (DIR = 0)	Receives data and returns ACK in response to the OUT token from the USB host if the FIFO buffer associated with the selected pipe is ready for reception
	Bulk or interrupt	Transmitting direction (DIR = 1)	Transmits data in response to the token from the USB host if the FIFO buffer associated with the selected pipe is ready for transmission. Otherwise, returns NAK.
	Isochronous	Receiving direction (DIR = 0)	Receives data in response to the OUT token from the USB host if the FIFO buffer associated with the selected pipe is ready for reception. Otherwise, discards the data.
	Isochronous	Transmitting direction (DIR = 1)	Transmits data in response to the token from the USB host if the associated FIFO buffer is ready for transmission. Otherwise, transmits a zero-length packet.
10b (STALL) or 11b (STALL)	Bulk or interrupt	Does not depend on the setting	Returns STALL in response to the token from the USB host
	Isochronous	Does not depend on the setting	Returns nothing in response to the token from the USB host

PBUSY bit (Pipe Busy)

The PBUSY bit indicates whether the selected pipe is being used for the current transaction.

The USBFS changes the PBUSY bit from 0 to 1 on start of the USB transaction for the selected pipe, and changes the PBUSY bit from 1 to 0 on completion of one transaction.

Reading the PBUSY bit by software after PID is set to NAK allows you to check whether changing the pipe setting is possible. For details, see [section 27.3.4.1. Pipe control register switching procedures](#).

SQMON bit (Sequence Toggle Bit Confirmation)

The SQMON bit indicates the expected value of the sequence toggle bit for the next transaction of the selected pipe.

When the selected pipe is not the isochronous transfer type, the USBFS toggles the SQMON flag on successful completion of the transaction. However, the USBFS does not toggle the SQMON flag when a DATA-PID mismatch occurs during transfer in the receiving direction.

SQSET bit (Sequence Toggle Bit Set)

Setting the SQSET bit to 1 through the software causes the USBFS to set DATA1 as the expected value of the sequence toggle bit for the next transaction on the selected pipe. The USBFS clears the SQSET bit to 0.

SQCLR bit (Sequence Toggle Bit Clear)

Setting the SQCLR bit to 1 through the software causes the USBFS to clear the expected value of the sequence toggle bit for the next transaction on the selected pipe to DATA0. The USBFS clears the SQCLR bit to 0.

ACLRM bit (Auto Buffer Clear Mode)

The ACLRM bit enables or disables auto buffer clear mode for the selected pipe. To completely clear the data in the FIFO buffer allocated to the selected pipe, write 1 and then 0 to the ACLRM bit continuously.

[Table 27.11](#) shows the data cleared by writing 1 and 0 to the ACLRM bit continuously and the cases in which this processing is required.

Table 27.11 Data cleared by the USBFS when ACLRM = 1 (1 of 2)

Number	Data cleared by setting the ACLRM bit	Situations requiring data clear
1	All data in the FIFO buffer allocated to the selected pipe (two FIFO buffers in double buffer mode)	When initializing the selected pipe

Table 27.11 Data cleared by the USBFS when ACLRM = 1 (2 of 2)

Number	Data cleared by setting the ACLRM bit	Situations requiring data clear
2	Interval count value when the selected pipe is the isochronous transfer type	When resetting the interval count value
3	Internal flags related to the PIPECFG.BFRE bit	When changing the PIPECFG.BFRE setting
4	FIFO buffer toggle control	When changing the PIPECFG.DBLB setting
5	Internal flags related to the transaction count	When forcing the transaction count function to terminate

ATREPM bit (Auto Response Mode)

The ATREPM bit enables or disables auto response mode for the selected pipe.

This bit can be set to 1 in device controller mode when the selected pipe is the bulk transfer type. When the bit is set to 1, the USBFS responds to the token from the USB host as follows:

- When the selected pipe is set for bulk IN transfers (PIPECFG.TYPE[1:0] = 01b and PIPECFG.DIR = 1):
 - a. When the ATREPM bit = 1 and PID = BUF, the USBFS transmits a zero-length packet in response to the IN token.
 - b. The USBFS updates the sequence toggle bit (DATA-PID) each time the USBFS receives ACK from the USB host. In a single transaction, the IN token is received, a zero-length packet is transmitted, and then ACK is received. The USBFS does not generate the BRDY or BEMP interrupt.
- When the selected pipe is set for bulk OUT transfers (PIPECFG.TYPE[1:0] = 01b and PIPECFG.DIR = 0):

When the ATREPM bit = 1 and PID = BUF, the USBFS returns NAK in response to the OUT token and generates an NRDY interrupt.

For USB communication in auto response mode, set the ATREPM bit to 1 while the FIFO buffer is empty. Do not write to the FIFO buffer during USB communication in auto response mode. When the selected pipe uses isochronous transfer, always set this bit to 0.

In host controller mode, always set the ATREPM bit to 0.

INBUFM bit (Transmit Buffer Monitor)

The INBUFM bit indicates the FIFO buffer status for the selected pipe in the transmitting direction.

When the selected pipe is set in the transmitting direction (PIPECFG.DIR = 1), the USBFS sets this bit to 1 when the CPU or DMA/DTC completes writing data to at least one FIFO buffer plane.

The USBFS sets this bit to 0 when the USBFS completes transmission of the data from the FIFO buffer plane to which all the data is written. In double buffer mode (PIPECFG.DBLB = 1), the USBFS sets the INBUFM bit to 0 when the USBFS completes transmission of the data from the two FIFO buffer planes before the CPU or DMA/DTC completes writing data to one FIFO buffer plane.

The INBUFM bit indicates the same value as the BSTS bit when the selected pipe is in the receiving direction (PIPECFG.DIR = 0).

BSTS bit (Buffer Status)

The BSTS bit indicates the FIFO buffer status for the selected pipe.

The meaning of the BSTS bit depends on the PIPECFG.DIR, PIPECFG.BFRE, and DnFIFOSEL.DCLRM settings, as shown in [Table 27.12](#).

Table 27.12 BSTS bit operation

DIR value	BFRE value	DCLRM value	BSTS bit function
0	0	0	Sets to 1 when receive data can be read from the FIFO buffer, and clears to 0 on completion of data read
		1	Setting prohibited
	1	0	Sets to 1 when receive data can be read from the FIFO buffer, and clears to 0 when the software sets the BCLR bit in the port control register to 1 after the data read is complete
		1	Sets to 1 when receive data can be read from the FIFO buffer, and clears to 0 on completion of data read
1	0	0	Sets to 1 when transmit data can be written to the FIFO buffer, and clears to 0 on completion of data write
		1	Setting prohibited
	1	0	Setting prohibited
		1	Setting prohibited

27.2.36 PIPEnCTR : PIPEn Control Registers (n = 6 to 9)

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x07A + 0x2 × (n - 6)

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:	BSTS	—	—	—	—	—	ACL M	SQCL R	SQSE T	SQM ON	PBUS Y	—	—	—	PID[1:0]
------------	------	---	---	---	---	---	----------	-----------	-----------	-----------	-----------	---	---	---	----------

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	Symbol	Function	R/W
1:0	PID[1:0]	Response PID 0 0: NAK response 0 1: BUF response (depends buffer state) 1 0: STALL response 1 1: STALL response	R/W
4:2	—	These bits are read as 0. The write value should be 0.	R/W
5	PBUSY	Pipe Busy 0: Pipe n not in use for the transaction 1: Pipe n in use for the transaction	R
6	SQMON	Sequence Toggle Bit Confirmation 0: DATA0 1: DATA1	R
7	SQSET	Sequence Toggle Bit Set* ¹ Sets the sequence toggle bit for pipe n. 0: Invalid (writing 0 has no effect) 1: Set the expected value for the next transaction to DATA0	W
8	SQCLR	Sequence Toggle Bit Clear* ¹ Clears the sequence toggle bit for pipe n. 0: Invalid (writing 0 has no effect) 1: Clear the expected value for the next transaction to DATA0	W
9	ACLRM	Auto Buffer Clear Mode* ² 0: Disable 1: Enable (all buffers initialized)	R/W
14:10	—	These bits are read as 0. The write value should be 0.	R/W
15	BSTS	Buffer Status 0: Buffer access disabled 1: Buffer access enabled	R

Note: S-TYPE-3, P-TYPE-3

Note 1. Only write 1 to the SQCLR or SQSET bit while PID is NAK. Before setting these bits, check that the PBUSY bit is 0, and then change the PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00b (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

Note 2. Only set the ACLRM bit while PID is NAK and before the pipe is selected in the CURPIPE[3:0] bits in the port select register. Before setting this bits, check that the PIPEnCTR.PBUSY bit is 0, and then change the PIPEnCTR.PID[1:0] bits from 01b (BUF) to 00b (NAK). If the PID[1:0] bits are changed to 00b (NAK) by the USBFS, checking the PBUSY bit through the software is not necessary.

PID[1:0] bits (Response PID)

The PID[1:0]bits specify the response type for the next transaction of the selected pipe.

The default PID[1:0] setting is NAK. Change the PID[1:0] setting to BUF to use the associated pipe for USB transfer. [Table 27.9](#) and [Table 27.10](#) show the basic operation (when there are no errors in the transmitted and received packets) of the USBFS depending on the PID[1:0] setting.

After changing the PID[1:0] setting from BUF to NAK through the software during USB communication on the selected pipe, check that the PBUSY bit is 1 to see if USB transfer on the selected pipe has actually entered the NAK state. If the USBFS changes the PID[1:0] bits to NAK, checking the PBUSY bit through the software is not necessary.

The USBFS changes the PIPEnCTR.PID[1:0] setting in the following cases:

- The USBFS sets PID to STALL (11b) on receiving a data packet with a payload exceeding the maximum packet size of the selected pipe
- The USBFS sets PID to NAK on detecting a USB bus reset in device controller mode
- The USBFS sets PID to NAK on detecting a reception error, such as a CRC error, three consecutive times in host controller mode
- The USBFS sets PID to STALL (11b) on receiving the STALL handshake in host controller mode

To specify each response type, set the PID[1:0] bits as follows:

- To transition from NAK (00b) to STALL, set 10b
- To transition from BUF (01b) to STALL, set 11b
- To transition from STALL (11b) to NAK, set 10b and then 00b
- To transition from STALL to BUF, set 00b (NAK) and then 01b (BUF)

PBUSY bit (Pipe Busy)

The PBUSY bit indicates whether the selected pipe is being used for the current transaction.

The USBFS changes the PBUSY bit from 0 to 1 on start of the USB transaction for the selected pipe, and changes the PBUSY bit from 1 to 0 on completion of one transaction.

Reading the PBUSY bit by software after PID is set to NAK allows you to check whether changing the pipe setting is possible.

SQMON bit (Sequence Toggle Bit Confirmation)

The SQMON bit indicates the expected value of the sequence toggle bit for the next transaction of the selected pipe.

The USBFS toggles the SQMON bit on successful completion of the transaction. However, the USBFS does not toggle the SQMON bit when a DATA-PID mismatch occurs during transfer in the receiving direction.

SQSET bit (Sequence Toggle Bit Set)

Setting the SQSET bit to 1 through the software causes the USBFS to set DATA1 as the expected value of the sequence toggle bit for the next transaction on the selected pipe. The USBFS sets the SQSET bit to 0.

SQCLR bit (Sequence Toggle Bit Clear)

Setting the SQCLR bit to 1 through the software causes the USBFS to clear the expected value of the sequence toggle bit for the next transaction on the selected pipe to DATA0. The USBFS sets the SQCLR bit to 0.

ACLRM bit (Auto Buffer Clear Mode)

The ACLRM bit enables or disables auto buffer clear mode for the selected pipe. To completely clear the data in the FIFO buffer allocated to the selected pipe, write 1 and then 0 to the ACLRM bit continuously.

Table 27.13 shows the data cleared by writing 1 and 0 continuously to the ACLRM bit and the cases in which this processing is required.

Table 27.13 Data cleared by the USBFS when ACLRM = 1

Number	Data cleared by setting the ACLRM bit	Situations requiring data clear
1	All data in the FIFO buffer allocated to the selected pipe	When initializing the selected pipe
2	Interval count value when the selected pipe is the isochronous transfer type	When resetting the interval count value
3	Internal flags related to the PIPECFG.BFRE bit	When changing the PIPECFG.BFRE setting
4	Internal flags related to the transaction count	When forcing the transaction count function to terminate

BSTS bit (Buffer Status)

The BSTS bit indicates the FIFO buffer status for the selected pipe.

The meaning of the BSTS bit depends on the PIPECFG.DIR, PIPECFG.BFRE, and DnFIFOSEL.DCLRM settings, as shown in Table 27.12.

27.2.37 PIPEnTRE : PIPEn Transaction Counter Enable Register (n = 1 to 5)

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x090 + 0x4 × (n - 1)

Bit	Symbol	Function	R/W
7:0	—	These bits are read as 0. The write value should be 0.	R/W
8	TRCLR	Transaction Counter Clear 0: Invalid (writing 0 has no effect) 1: Clear counter value	R/W
9	TRENB	Transaction Counter Enable 0: Disable transaction counter 1: Enable transaction counter	R/W
15:10	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Note: Set each bit in PIPEnTRE while PID is NAK. Before setting these bits after changing the PIPEnCTR.PID[1:0] bits for the selected pipe from BUF to NAK, check that the PIPEnCTR.PBUSY bit is 0. However, if the PID[1:0] bits are changed to NAK by the USBFS, checking the PBUSY bit through the software is not necessary.

TRCLR bit (Transaction Counter Clear)

When the TRCLR bit sets to 1, the USBFS clears the value of the transaction counter associated with the selected pipe and then sets the TRCLR bit to 0.

TRENB bit (Transaction Counter Enable)

The TRENB bit enables or disables the transaction counter.

For receiving pipes, setting the TRENB bit to 1 after setting the total number of the packets to be received in the PIPEnTRN.TRNCNT[15:0] bits through the software allows the USBFS to control hardware on having received the number of packets equal to the TRNCNT[15:0] setting, as follows:

- When the PIPECFG.SHTNAK bit is 1, the USBFS changes the PID bits to NAK for the associated pipe on having received the number of packets equal to the TRNCNT[15:0] setting
- When the PIPECFG.BFRE bit is 1, the USBFS asserts the BRDY interrupt on having received the number of packets equal to the TRNCNT[15:0] setting and then reading the last received data

For transmitting pipes, set the TRENB bit to 0.

When the transaction counter is not used, set this bit to 0. When the transaction counter is used, set the TRNCNT[15:0] bits before setting this bit to 1. Set this bit to 1 before receiving the first packet to be counted by the transaction counter.

27.2.38 PIPEnTRN : PIPEn Transaction Counter Register (n = 1 to 5)

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x092 + 0x4 × (n - 1)

Bit	Symbol	Function	R/W
15:0	TRNCNT[15:0]	Transaction Counter When written to, this bit specifies the total packets (number of transactions) to be received by the selected pipe. When read from, when PIPEnTRE.TRENB is 0, this bit indicates the specified number of transactions. When PIPEnTRE.TRENB is 1, this bit indicates the current transaction count.	R/W

Note: S-TYPE-3, P-TYPE-3

The PIPEnTRN registers retain their settings during a USB bus reset.

TRNCNT[15:0] bits (Transaction Counter)

The USBFS increments the value of the TRNCNT[15:0] bits by 1 when all of the following conditions are satisfied on receiving the packet:

- The PIPEnTRE.TRENB bit = 1
- (TRNCNT[15:0] set value ≠ current counter value + 1) on receiving the packet
- The payload of the received packet agrees with the PIPEMAXP.MXPS[9:0] setting

The USBFS clears the value of the TRNCNT[15:0] bits to 0 when any of the following conditions are satisfied:

All of the following conditions are satisfied:

- The PIPEnTRE.TRENB bit = 1
- (TRNCNT[15:0] set value = current counter value + 1) on receiving the packet
- The payload of the received packet agrees with the PIPEMAXP.MXPS[9:0] setting

Both of the following conditions are satisfied:

- The PIPEnTRE.TRENB bit = 1
- The USBFS received a short packet

Both of the following conditions are satisfied:

- The PIPEnTRE.TRENB bit = 1
- The PIPEnTRE.TRCLR bit was set to 1 by software

For transmitting pipes, set the TRNCNT[15:0] bits to 0. When the transaction counter is not used, set the TRNCNT[15:0] bits to 0.

Setting the number of transactions to be transferred to the TRNCNT[15:0] bits is only enabled when the PIPEnTRE.TRENB bit is 0. To set the number of transactions to be transferred, set the TRCLR bit to 1 to clear the current counter value before setting the PIPEnTRE.TRENB bit to 1.

27.2.39 DEVADDn : Device Address n Configuration Register (n = 0 to 5)

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x0D0 + 0x2 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	USBSPD[1:0]	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W
7:6	USBSPD[1:0]	Transfer Speed of Communication Target Device 0 0: Do not use DEVADDn 0 1: Low-speed 1 0: Full-speed 1 1: Setting prohibited	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

The DEVADDn register specifies the transfer speed of the peripheral device that is the communication target for pipes 0 to 9.

In host controller mode, set all DEVADDn bits before starting communication to any pipes. Only change the bits in DEVADDn when no valid pipes are using the bit settings. A valid pipe is defined as one that satisfies both of the following conditions:

- The target device of the DEVADDn register is selected in the DEVSEL[3:0] bits
- The PID[1:0] bits are set to BUF for the selected pipe, or the selected pipe is the DCP with the DCPCTR.SUREQ bit set to 1

In device controller mode, set all bits in this register to 0.

USBSPD[1:0] bits (Transfer Speed of Communication Target Device)

The USBSPD[1:0] bits specify the USB transfer speed of the target peripheral device. Set these bits to 10b when a full-speed device is connected through the hub. In host controller mode, the USBFS generates packets based on the USBSPD[1:0] setting. In device controller mode, set these bits to 00b.

27.2.40 DPUSR0R : Deep Software Standby USB Transceiver Control/Pin Monitor Register

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x400

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	DVBS TS0	—	DOVC B0	DOVC A0	—	—	DM0	DP0
Value after reset:	0	0	0	0	0	0	0	0	x	0	x	x	0	0	x	x
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	FIXPH Y0	DRPD 0	—	RPUE 0	SRPC 0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SRPC0*1	USB Single-ended Receiver Control 0: Disable input through DP and DM inputs 1: Enable input through DP and DM inputs	R/W
1	RPUE0*1	DP Pull-Up Resistor Control 0: Disable DP pull-up resistor 1: Enable DP pull-up resistor	R/W
2	—	This bit is read as 0. The write value should be 0.	R/W
3	DRPD0*1	D+/D- Pull-Down Resistor Control 0: Disable DP/DM pull-down resistor 1: Enable DP/DM pull-down resistor	R/W
4	FIXPHY0	USB Transceiver Output Fix 0: Fix outputs in Normal mode and on return from Deep Software Standby mode 1 1: Fix outputs on transition to Deep Software Standby mode 1	R/W
15:5	—	These bits are read as 0. The write value should be 0.	R/W
16	DP0	USB D+ Input Indicates D+ input signal on the USBFS side	R
17	DM0	USB D- Input Indicates D- input signal on the USBFS side	R
19:18	—	These bits are read as 0. The write value should be 0.	R/W
20	DOVCA0	USB OVRCURA-DS Input*2 Indicates OVRCURA-DS input signal on the USBFS side	R
21	DOVCB0	USB OVRCURB-DS Input*2 Indicates OVRCURB-DS input signal on the USBFS side	R
22	—	The read value is undefined. The write value should be 0.	R/W
23	DVBST0	USB VBUS Input Indicates VBUS input signal on the USBFS side	R
31:24	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Note: This register is accessed by the clock of PCLKB/64 to reduce current consumption in Deep Software Standby mode1.

Note 1. Use this bit during operation in Deep Software Standby mode 1. For details, see [section 27.3.1.5. Release from Deep Software Standby mode1 because of USB suspend/resume interrupts.](#)

Note 2. OVRCURA or OVRCURB can not be used. Only OVRCURA-DS or OVRCURB-DS can be used in Deep software standby mode1.

SRPC0 bit (USB Single-ended Receiver Control)

The SRPC0 bit controls the D+ and D- inputs of the USB transceiver. In host controller mode, set this bit to 1. In device controller mode, set this bit to 0 when disconnected, set to 1 when suspended. This bit is only valid when the FIXPHY0 bit is 1.

FIXPHY0 bit (USB Transceiver Output Fix)

The FIXPHY0 bit keeps the outputs of the USB transceiver disabled.

27.2.41 DPUSR1R : Deep Software Standby USB Suspend/Resume Interrupt Register

Base address: USBFS = 0x4025_0000
 USBFS_NS = 0x5025_0000

Offset address: 0x404

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	DVBIN T0	—	DOVR CRB0	DOVR CRA0	—	—	DMINT 0	DPINT 0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	DVBS E0	—	DOVR CRBE 0	DOVR CRAE 0	—	—	DMINT E0	DPINT E0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DPINTE0	USB DP Interrupt Enable/Clear 0: Disable recovery from Deep Software Standby mode 1 by DP input 1: Enable recovery from Deep Software Standby mode 1 by DP input	R/W
1	DMINTE0	USB DM Interrupt Enable/Clear 0: Disable recovery from Deep Software Standby mode 1 by DM input 1: Enable recovery from Deep Software Standby mode 1 by DM input	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	DOVRCRAE0	USB OVRCURA-DS Interrupt Enable/Clear*1 0: Disable recovery from Deep Software Standby mode 1 by OVRCURA-DS input 1: Enable recovery from Deep Software Standby mode 1 by OVRCURA-DS input	R/W
5	DOVRCRBE0	USB OVRCURB-DS Interrupt Enable/Clear*1 0: Disable recovery from Deep Software Standby mode 1 by OVRCURB-DS input 1: Enable recovery from Deep Software Standby mode 1 by OVRCURB-DS input	R/W
6	—	This bit is read as 0. The write value should be 0.	R/W
7	DVBSE0	USB VBUS Interrupt Enable/Clear 0: Disable recovery from Deep Software Standby mode 1 by VBUS input 1: Enable recovery from Deep Software Standby mode 1 by VBUS input	R/W
15:8	—	These bits are read as 0. The write value should be 0..	R/W
16	DPINT0	USB DP Interrupt Source Recovery 0: System has not recovered from Deep Software Standby mode 1 1: System recovered from Deep Software Standby mode 1 because of DP	R
17	DMINT0	USB DM Interrupt Source Recovery 0: System has not recovered from Deep Software Standby mode 1 1: System recovered from Deep Software Standby mode 1 because of DM input	R
19:18	—	These bits are read as 0. The write value should be 0.	R/W
20	DOVRCRA0	USB OVRCURA-DS Interrupt Source Recovery*1 0: System has not recovered from Deep Software Standby mode 1 1: System recovered from Deep Software Standby mode 1 because of OVRCURA-DS input	R
21	DOVRCRB0	USB OVRCURB-DS Interrupt Source Recovery*1 0: System has not recovered from Deep Software Standby mode 1 1: System recovered from Deep Software Standby mode 1 because of OVRCURB-DS input	R
22	—	This bit is read as 0. The write value should be 0.	R/W
23	DVBINT0	USB VBUS Interrupt Source Recovery 0: System has not recovered from Deep Software Standby mode 1 1: System recovered from Deep Software Standby mode 1 because of VBUS input	R
31:24	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Note: This register is accessed by the clock of PCLKB/64 to reduce current consumption in Deep Software Standby mode1.

Note 1. OVRCURA or OVRCURB can not be used. Only OVRCURA-DS or OVRCURB-DS can be used in Deep Software Standby mode1.

DPINTE0 bit (USB DP Interrupt Enable/Clear)

The DPINTE0 bit enables or disables triggering of recovery from Deep Software Standby mode 1 by the DP input of the USBFS. Writing 0 to this bit while the DPINT0 bit is 1 sets the DPINT0 bit to 0.

DMINTE0 bit (USB DM Interrupt Enable/Clear)

The DMINTE0 bit enables or disables triggering of recovery from Deep Software Standby mode 1 by the DM input of the USBFS. Writing 0 to this bit while the DMINT0 bit is 1 clears the DMINT0 bit to 0.

DOVRCRAE0 bit (USB OVRCURA-DS Interrupt Enable/Clear)

The DOVRCRAE0 bit enables or disables triggering of recovery from Deep Software Standby mode 1 by the OVRCURA-DS input of the USBFS. Writing 0 to this bit while the DOVRCRA0 bit is 1 clears the DOVRCRA0 bit to 0.

DOVRCRBE0 bit (USB OVRCURB-DS Interrupt Enable/Clear)

The DOVRCRBE0 bit enables or disables triggering of recovery from Deep Software Standby mode 1 by the OVRCURB-DS input of the USBFS. Writing 0 to this bit while the DOVRCRB0 bit is 1 clears the DOVRCRB0 bit to 0.

DVBSE0 bit (USB VBUS Interrupt Enable/Clear)

The DVBSE0 bit enables or disables triggering of recovery from Deep Software Standby mode 1 by the VBUS input of the USBFS. Writing 0 to this bit while the DVBINT0 bit is 1 clears the DVBINT0 bit to 0.

DPINT0 bit (USB DP Interrupt Source Recovery)

The DPINT0 bit indicates that the system has returned from Deep Software Standby mode 1 because of the DP input of the USBFS. This recovery is only enabled when the DPINTE0 bit is 1. Writing 0 to the DPINTE0 bit while this bit is 1 clears this bit to 0.

DMINT0 bit (USB DM Interrupt Source Recovery)

The DMINT0 bit indicates that the system has returned from Deep Software Standby mode 1 because of the DM input of the USBFS. This recovery is only enabled when the DMINTE0 bit is 1. Writing 0 to the DMINTE0 bit while this bit is 1 clears this bit to 0.

DOVRCRA0 bit (USB OVRCURA-DS Interrupt Source Recovery)

The DOVRCRA0 bit indicates that the system has returned from Deep Software Standby mode 1 because of the OVRCURA-DS input of the USBFS. This recovery is only enabled when the DOVRCRAE0 bit is 1. Writing 0 to the DOVRCRAE0 bit while this bit is 1 clears this bit to 0.

DOVRCRB0 bit (USB OVRCURB-DS Interrupt Source Recovery)

The DOVRCRB0 bit indicates that the system has returned from Deep Software Standby mode 1 because of the OVRCURB-DS input of the USBFS. This recovery is only enabled when the DOVRCRBE0 bit is 1. Writing 0 to the DOVRCRBE0 bit while this bit is 1 clears this bit to 0.

DVBINT0 bit (USB VBUS Interrupt Source Recovery)

The DVBINT0 bit indicates that the system has returned from Deep Software Standby mode 1 because of the VBUS input of the USBFS. This recovery is only enabled when the DVBSE0 bit is 1. Writing 0 to the DVBSE0 bit while this bit is 1 clears this bit to 0.

27.3 Operation

27.3.1 System Control

This section describes register settings required for initializing the USBFS and controlling power consumption.

27.3.1.1 Setting data to the USBFS registers

Setting the SYSCFG.USBE bit to 1 after starting the clock supply (SYSCFG.SCKE bit = 1) enables and starts USBFS operation.

27.3.1.2 Selecting the controller function

The USBFS can operate as either a host or device controller.

Use the SYSCFG.DCFM bit to select one of these USBFS functions. The DCFM bit must be changed in the initial settings immediately after a reset or in the D+ pull-up-disabled state (SYSCFG.DPRPU bit = 0) and D+ and D- pull-down-disabled state (SYSCFG.DRPD bit = 0).

27.3.1.3 Controlling the USB data bus using resistors

The USBFS provides pull-up and pull-down resistors for the D+ and D- lines. Pull these lines up or down by setting the SYSCFG.DPRPU and DRPD bits.

In device controller mode, confirm that connection to the USB host is made, and then set the SYSCFG.DPRPU bit to 1 and pull up the D+ line (in full-speed communication).

When the SYSCFG.DPRPU bit is set to 0 during communication with a PC, the USBFS disables the pull-up resistor of the USB data line, thereby notifying the USB host of disconnection.

In host controller mode, set the SYSCFG.DRPD bit to 1 to pull down the D+ and D- lines.

Table 27.14 USB data bus resistor control

SYSCFG register settings		USB data bus control		Function
DRPD bit	DPRPU bit	D-	D+	
0	0	Open	Open	When resistors not used
0	1	Open	Pull-up	When operating as a device controller at full-speed
1	0	Pull-down	Pull-down	When operating as a host controller
1	1	—	—	Setting prohibited

27.3.1.4 Example external connection circuits

[Figure 27.2](#) shows an example OTG connection in the self-powered system. The USBFS controls the pull-up resistor of the D+ line and the pull-down resistor of D+ and D- lines. Select pull-up and pull-down for the lines in the SYSCFG.DPRPU and SYSCFG.DRPD bits. In device controller mode, the pull-up resistor of USB data line is disabled if SYSCFG.DPRPU bit is set to 0 while communicating with the USB host. The USBFS can use this to notify the USB host of a device disconnect.

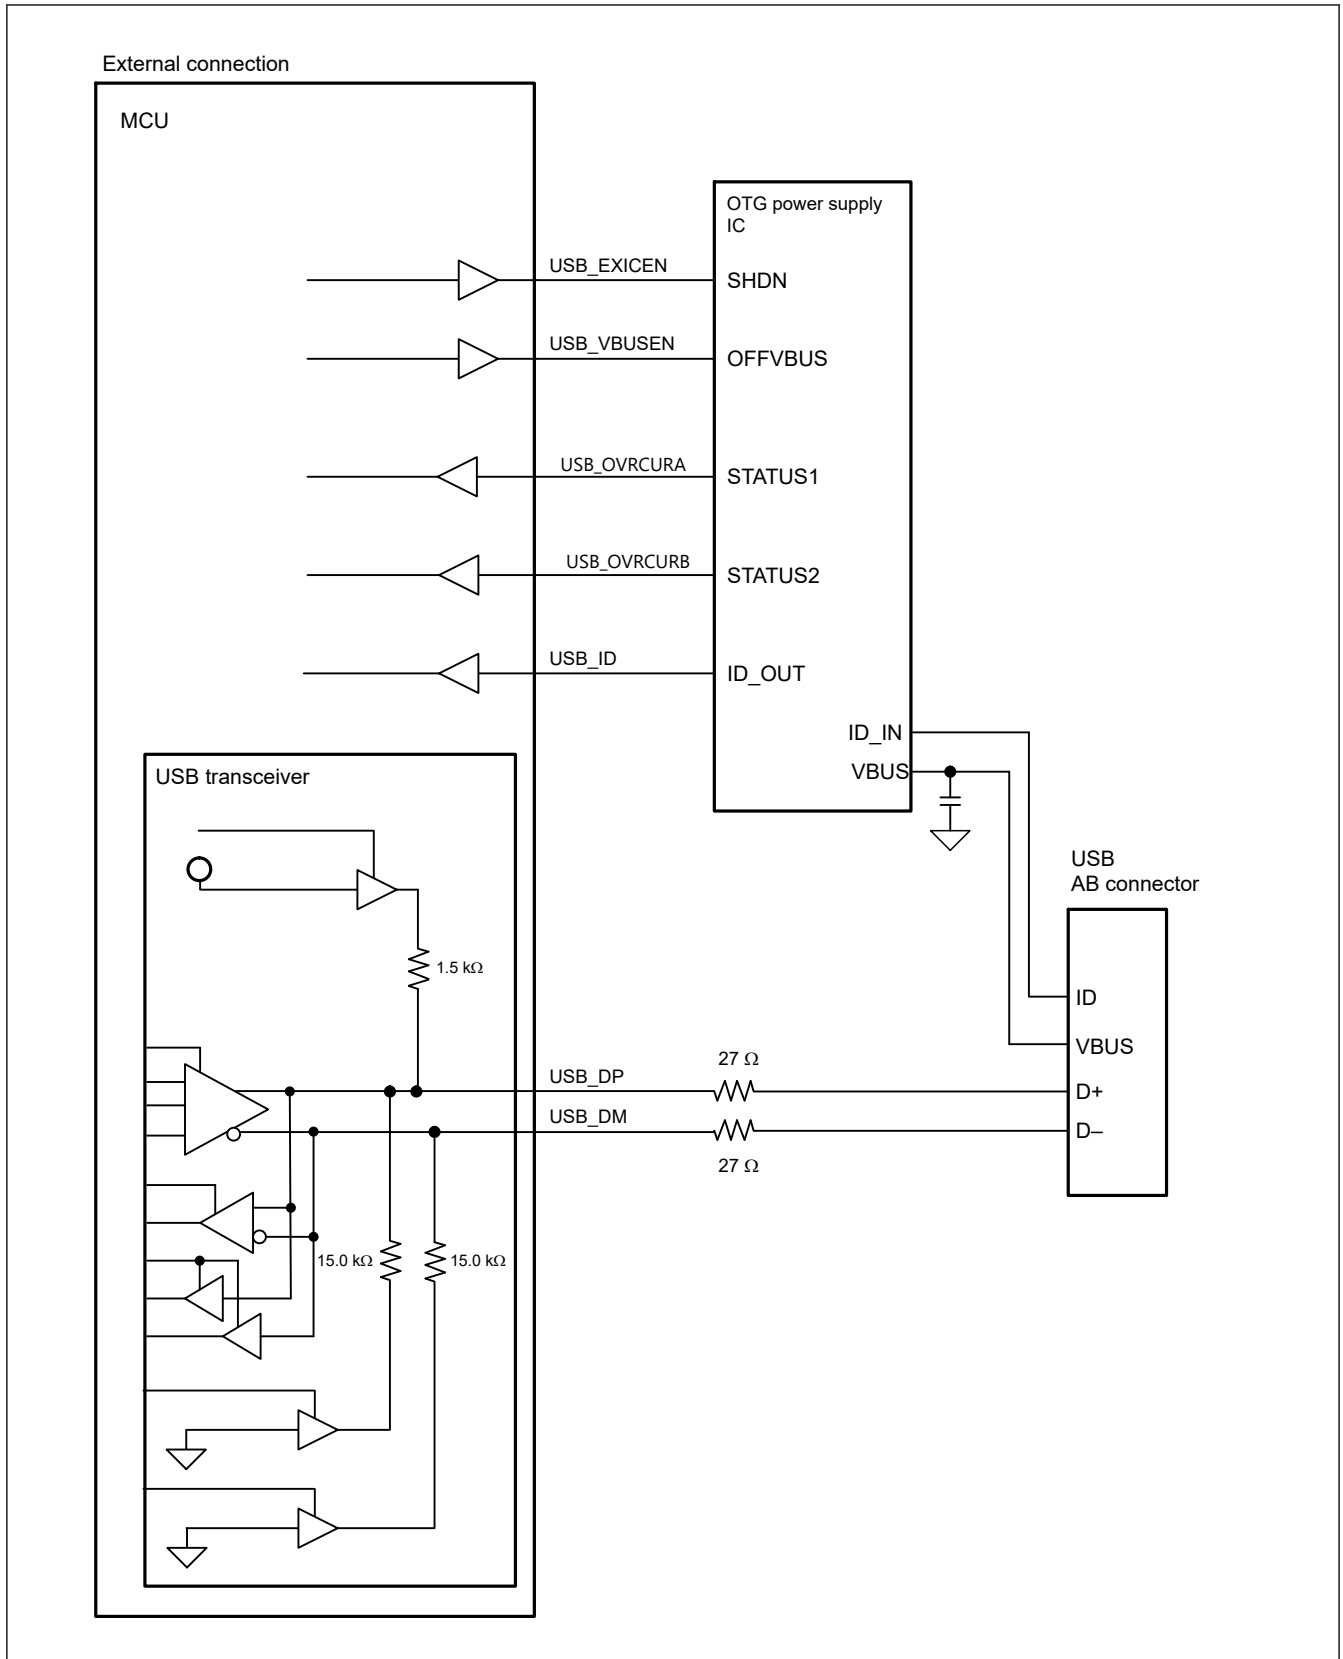

Figure 27.2 Example OTG connection in a self-powered system

Figure 27.4 shows an example host connection.

Figure 27.4 Example host connection

Figure 27.5 shows an example device connection in a bus-powered system.

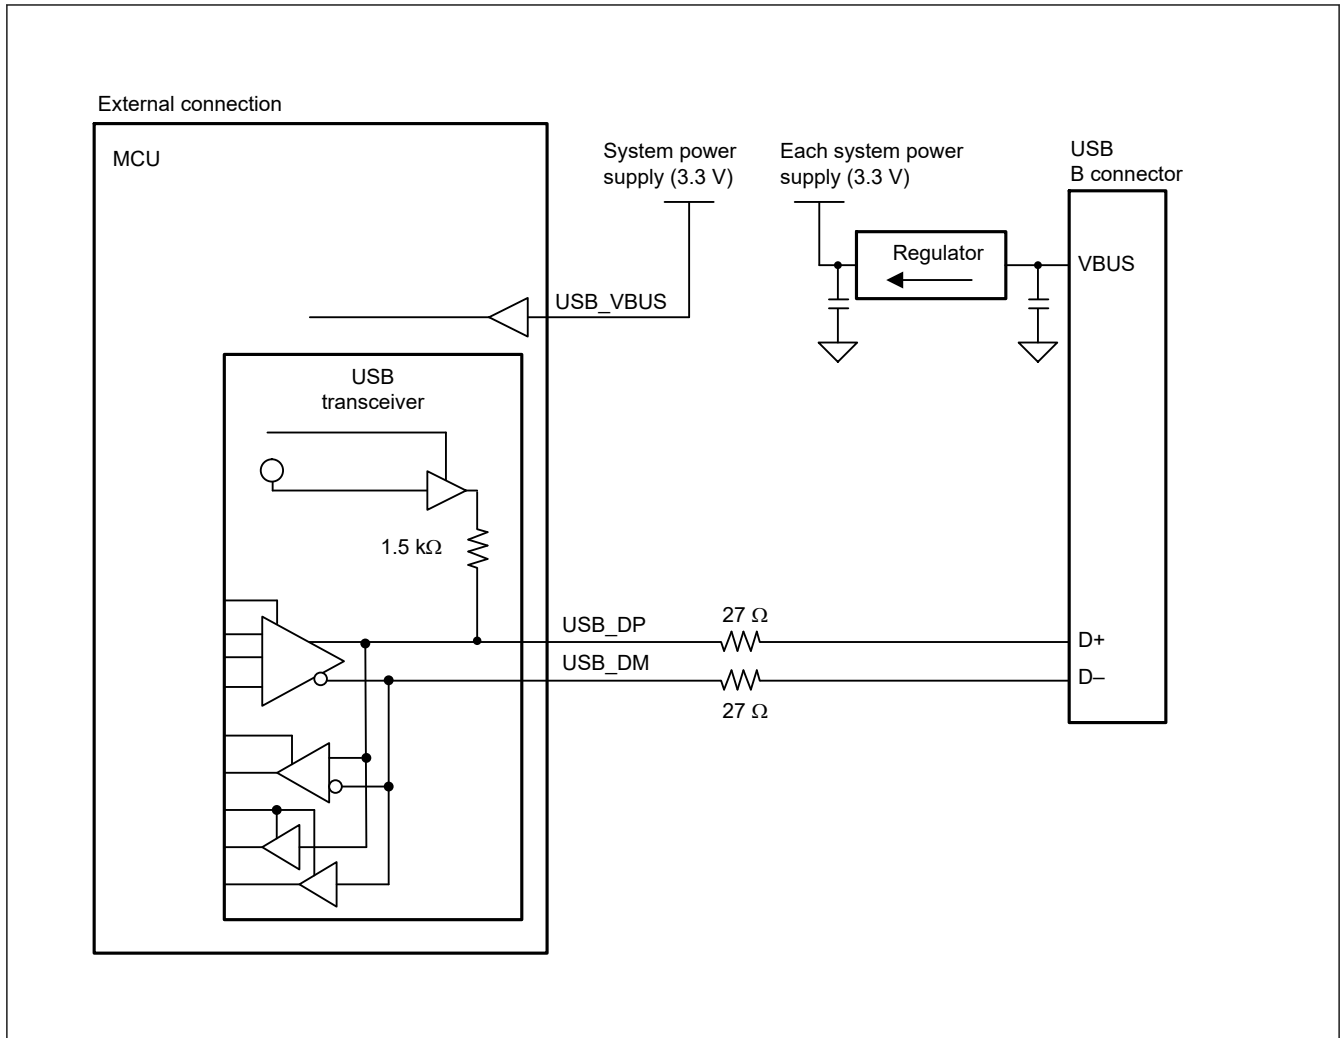

Figure 27.5 Example device connection in a bus-powered state

The examples of external circuits given in this section are simplified circuits, and their operation in every system is not guaranteed.

27.3.1.5 Release from Deep Software Standby mode1 because of USB suspend/resume interrupts

Deep Software Standby mode1 can be canceled by a USB suspend/resume interrupt. USB suspend/resume interrupts are detected by the USB resume detecting unit, which controls and monitors the USB I/O pins to detect the interrupts.

Figure 27.6 shows a schematic diagram of the connection between the USB resume detecting unit and the USB I/O pins.

Figure 27.6 Connection between the USB resume detecting unit and the USB I/O pins

Table 27.15 shows the USB suspend and resume interrupt sources and their associated I/O pins.

Table 27.15 USB suspend and resume interrupt sources and their associated I/O pins

USB operating mode	Source	Pin name
Device, OTG	Resume	USB_DP
Host, OTG	Attach or detach	USB_DP, USB_DM
Device	Attach or detach	USB_VBUS
Host	Overcurrent detection	USB_OVRCURA-DS
OTG	Overcurrent detection	USB_OVRCURA-DS, USB_OVRCURB-DS

Figure 27.7 shows the flow for setting the USBFS when entering Deep Software Standby mode 1 from either host or device controller mode. 27.3.2 Interrupts

Table 27.16 lists the interrupt sources in the USBFS. When an interrupt generation condition is satisfied and the interrupt output is enabled using the associated interrupt enable register, a USBFS interrupt request is issued to the Interrupt Controller Unit (ICU) and an USBFS interrupt is generated.

Table 27.16 Interrupt sources (1 of 2)

Bit to be set to 1	Name	Interrupt source	Applicable controller function	Status flag
VBINT	VBUS interrupt	<ul style="list-style-type: none"> A change in the state of the USB_VBUS input pin was detected (low to high or high to low) 	Host or device* ¹	INTSTS0.VBSTS
RESM	Resume interrupt	<ul style="list-style-type: none"> A change in the state of the USB bus was detected in the Suspend state (J-state to K-state or J-state to SE0) 	Device	—
SOFR	Frame number update interrupt	<p>In host controller mode:</p> <ul style="list-style-type: none"> An SOF packet with a different frame number was transmitted <p>In device controller mode:</p> <ul style="list-style-type: none"> An SOF packet with a different frame number was received 	Host or device	—
DVST	Device state transition interrupt	<ul style="list-style-type: none"> One of the following device state transitions was detected: <ul style="list-style-type: none"> USB bus reset was detected Suspend state was detected SET_ADDRESS request was received SET_CONFIGURATION request was received 	Device	INTSTS0.DVSQ[2:0]
CTRT	Control transfer stage transition interrupt	<ul style="list-style-type: none"> A control transfer stage transition was detected because of one of the following: <ul style="list-style-type: none"> Setup stage completed Control write transfer status stage transition occurred Control read transfer status stage transition occurred Control transfer completed Control transfer sequence error occurred 	Device	INTSTS0.CTSQ[2:0]
BEMP	Buffer empty interrupt	<ul style="list-style-type: none"> The buffer is empty after all FIFO buffer data was transmitted A packet larger than the maximum packet size was received 	Host or device	BEMPSTS.PIPEnBEMP
NRDY	Buffer not ready interrupt	<p>In host controller mode</p> <ul style="list-style-type: none"> A STALL response was received from the peripheral device in response to the issued token The response from the peripheral device in response to the issued token was not received successfully (no response three times consecutively or packet reception error three times consecutively) An overrun or underrun error occurred during isochronous transfer <p>In device controller mode</p> <ul style="list-style-type: none"> NAK was returned for an IN or OUT token while the PID[1:0] bits were set to 01b (BUF) A CRC error or bit stuffing error occurred during data reception in isochronous transfer An overrun or underrun occurred during data reception in isochronous transfer 	Host or device	NRDYSTS.PIPEnNRDY
BRDY	Buffer ready interrupt	<ul style="list-style-type: none"> The buffer is ready (readable or writable state) 	Host or device	BRDYSTS.PIPEnBRDY
OVRRCR	Overcurrent input change interrupt	<ul style="list-style-type: none"> USB_OVRCURA, USB_OVRCURA-DS, USB_OVRCURB or USB_OVRCURB-DS input pin state change was detected (low to high or high to low) 	Host	INTSTS1.OVRRCR
BCHG	Bus change interrupt	<ul style="list-style-type: none"> USB bus state change was detected 	Host or device	SYSSTS0.LNST[1:0]
DTCH	Disconnect detection during full-speed operation	Peripheral device disconnect was detected in full-speed operation	Host	DVSTCTR0.RHST[2:0]
ATTCH	Device connect detection interrupt	<ul style="list-style-type: none"> J-state or K-state was detected on the USB bus for 2.5 μs continuously <p>This interrupt can be used to check whether peripheral devices are connected</p>	Host	—

Table 27.16 Interrupt sources (2 of 2)

Bit to be set to 1	Name	Interrupt source	Applicable controller function	Status flag
EOFERR	EOF error detection interrupt	<ul style="list-style-type: none"> An EOF error was detected for a peripheral device 	Host	—
SACK	Setup normal interrupt	<ul style="list-style-type: none"> A setup transaction normal response (ACK) was received 	Host	—
SIGN	Setup error interrupt	<ul style="list-style-type: none"> A setup transaction error (no response or ACK packet corruption) was detected three consecutive times 	Host	—

Note 1. Although this interrupt can be generated in host controller mode, it is not usually used in this mode.

Figure 27.10 shows the circuits related to the USBFS interrupts.

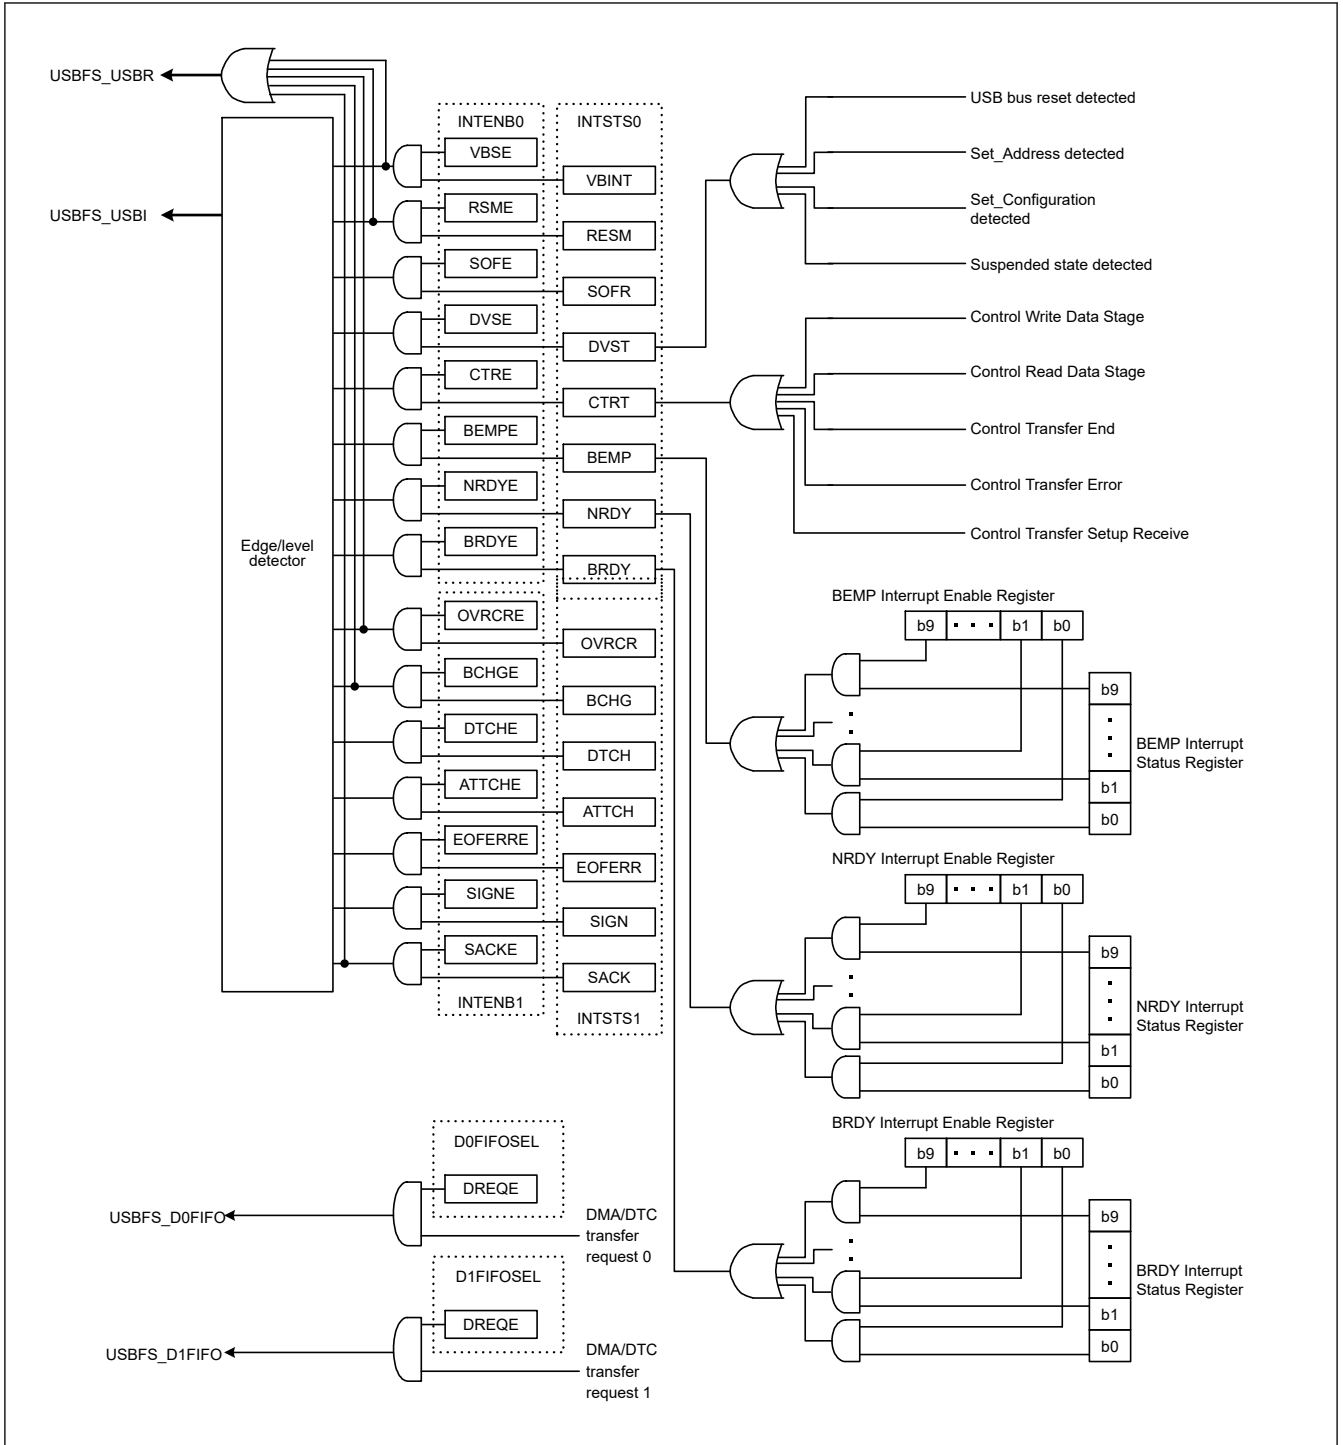

Figure 27.10 USBFS interrupt-related circuits

Table 27.17 shows the interrupts generated by the USBFS.

Table 27.17 USBFS interrupts

Interrupt name	Interrupt status flag	DTC activation	DMAC activation	Priority
USBFS_D0FIFO	DMA transfer request 0	Possible	Possible	High
USBFS_D1FIFO	DMA transfer request 1	Possible	Possible	↑
USBFS_USBI	VBUS interrupt, resume interrupt, frame number update interrupt, device state transition interrupt, control transfer stage transition interrupt, buffer empty interrupt, buffer not ready interrupt, buffer ready interrupt, overcurrent input change interrupt, bus change interrupt, disconnect detection interrupt during full-speed operation, device connect detection interrupt, EOF error detection interrupt, normal setup operation interrupt, and setup error interrupt	Not possible	Not possible	Low
USBFS_USBR*1	VBUS interrupt, resume interrupt, overcurrent input change interrupt and setup error interrupt	Not possible	Not possible	—

Note 1. Software Standby mode can be canceled. And Deep Software Standby mode 1 also can be canceled, but only dedicated pin (OVRCURA-DS, OVRCURB-DS) can be used for overcurrent pins.

27.3.3 Interrupt Descriptions

27.3.3.1 BRDY interrupt

The BRDY interrupt is generated in both host and device controller modes. This section describes the conditions in which the USBFS sets the associated bit in BRDYSTS to 1. Under these conditions, the USBFS generates a BRDY interrupt if the software has set the bit in BRDYENB associated with the given pipe to 1 and the INTENB0.BRDYE bit to 1.

The conditions for generating and clearing the BRDY interrupt depend on the SOFCFG.BRDYM and PIPECFG.BFRE settings for each pipe as follows:

(1) When SOFCFG.BRDYM = 0 and PIPECFG.BFRE = 0

With these settings, the BRDY interrupt indicates that the FIFO port is accessible.

On any of the following conditions, the USBFS generates an internal BRDY interrupt request trigger and sets the BRDYSTS.PIPEnBRDY bit associated with the selected pipe to 1.

For transmitting pipes

- When the DIR bit is changed from 0 to 1 by software
- When packet transmission is complete for a pipe while write-access from the CPU to the FIFO buffer for the pipe is disabled (when the BSTS bit is read as 0)
- When one FIFO buffer is empty on completion of writing data to the other FIFO buffer in double buffer mode
- No request trigger is generated until completion of writing data to the currently-written FIFO buffer even if transmission to the other FIFO buffer is complete
- When the hardware flushes the buffer of the pipe for isochronous transfers
- When 1 is written to the PIPEnCTR.ACLRM bit, which causes the FIFO buffer to transition from the write-disabled to write-enabled state

No request trigger is generated for the DCP, that is, during data transmission for control transfers.

For receiving pipes

- When packet reception is successfully complete, enabling the FIFO buffer to be read while read-access from the CPU to the FIFO buffer for the given pipe is disabled (when the BSTS bit is read as 0). No request trigger is generated for transactions in which a DATA-PID mismatch has occurred.
- When one FIFO buffer is read-enabled on completion of reading data from the other FIFO buffer in double buffer mode. No request trigger is generated until completion of reading data from the currently-read FIFO buffer, even if reception by the other FIFO buffer is complete.

In device controller mode, the BRDY interrupt is not generated in the status stage of control transfers. The PIPEBRDY interrupt status of the selected pipe can be set to 0 by writing 0 to the associated PIPEnBRDY bit through software. In this case, the other PIPEBRDY bit should be set to 1.

Clear the BRDY status before accessing the FIFO buffer.

(2) When SOFCFG.BRDYM = 0 and PIPECFG.BFRE = 1

With these settings, the USBFS generates a BRDY interrupt on completion of reading all data for a single transfer using the receiving pipe, and sets the bit in BRDYSTS associated with the pipe to 1.

On any of the following conditions, the USBFS determines that the last data for a single transfer was received.

- When a short packet including a zero-length packet is received
- When the PIPEn transaction counter register (PIPEnTRN) is used and the number of packets specified in the PIPEnTRN.TRNCNT[15:0] bits are completely received

When the data is completely read after any of these conditions is satisfied, the USBFS determines that all data for a single transfer is completely read.

When a zero-length packet is received while the FIFO buffer is empty, the USBFS determines that all data for a single transfer is completely read when the FRDY bit in the FIFO port control register is 1 and the DTLN[8:0] bits are 0. In this case, to start the next transfer, write 1 to the BCLR bit in the associated port control register through the software. With these settings, the USBFS does not detect a BRDY interrupt for the transmitting pipe.

The PIPEBRDY interrupt status of a pipe can be set to 0 by writing 0 to the associated BRDYSTS.PIPEnBRDY bit through the software. In this case, 1 must be written to the PIPEBRDY bits for the other pipes.

In this mode, do not change the PIPECFG.BFRE bit setting until all data for a single transfer is processed. When it is necessary to change the PIPECFG.BFRE bit before completion of processing, all FIFO buffers for the pipe must be cleared using the PIPEnCTR.ACLRM bit.

(3) When SOFCFG.BRDYM = 1 and PIPECFG.BFRE = 0

With these settings, the BRDYSTS.PIPEnBRDY values are linked to the BSTS bit setting for each pipe. In other words, the BRDY interrupt status bits (PIPEBRDY) are set to 1 or 0 by the USB depending on the FIFO buffer status.

For transmitting pipes

The BRDY interrupt status bits are set to 1 when the FIFO buffer is ready for write access, and are set to 0 when it is not ready. The BRDY interrupt is not generated for the DCP in the transmitting direction even when it is ready for write access.

For receiving pipes

The BRDY interrupt status bits set to 1 when the FIFO buffer is ready for read access, and set to 0 when all data is read (not ready for read access).

When a zero-length packet is received while the FIFO buffer is empty, the associated bit is set to 1 and the BRDY interrupt is continuously generated until the software writes 1 to BCLR. With this setting, the PIPEnBRDY bit cannot be set to 0 by software.

When the SOFCFG.BRDYM bit is set to 1, set the PIPECFG.BFRE bit for all pipes to 0.

Figure 27.11 shows the timing of BRDY interrupt generation.

Figure 27.11 Timing of BRDY interrupt generation

The condition for clearing the INTSTS0.BRDY bit depends on the SOFCFG.BRDYM bit setting, as shown in [Table 27.18](#).

Table 27.18 Conditions for clearing the BRDY bit

BRDYM bit	Condition for clearing BRDY bit
0	The USBFS clears the BRDY bit to 0 when all bits in BRDYSTS are set to 0 by software.
1	The USBFS clears the BRDY bit to 0 when the BSTS bits for all pipes have cleared to 0.

27.3.3.2 NRDY interrupt

On generating an internal NRDY interrupt request for the pipe whose PID bits are set to BUF by software, the USBFS sets the associated PIPEnNRDY bit in NRDYSTS to 1. If the associated bit in NRDYENB is set to 1 by software, the USBFS sets the INTSTS0.NRDY bit to 1 and generates a USBFS interrupt.

This section describes the conditions in which the USBFS generates the internal NRDY interrupt request for a given pipe. The internal NRDY interrupt request is not generated during setup transaction execution in host controller mode. During setup transactions in host controller mode, the SACK or SIGN interrupt is detected.

The internal NRDY interrupt request is not generated during status stage execution of the control transfer in device controller mode.

(1) In host controller mode

For transmitting pipes

On any of the following conditions, the USBFS detects an NRDY interrupt:

- For isochronous transfer pipes, when the time to issue an OUT token comes while there is no data to be transmitted in the FIFO buffer. In this case, the USBFS transmits a zero-length packet following the OUT token and sets the associated NRDYSTS.PIPE_nNRDY bit and the FRMNUM.OVRN bit to 1.
- During communications other than setup transactions on pipes not used for isochronous transfers, when any combination of the following two cases occur three consecutive times:
 - No response is returned from the peripheral device (when timeout is detected before detection of the handshake packet from the peripheral device)
 - An error is detected in the packet from the peripheral device. In this case, the USBFS sets the associated PIPE_nNRDY bit to 1 and changes the associated PID[1:0] setting for the pipe to NAK
- During communications other than setup transactions, when the STALL handshake is received from the peripheral device. In this case, the USBFS sets the associated PIPE_nNRDY bit to 1 and changes the PID[1:0] setting for the associated pipe to STALL (11b).

For receiving pipes

- For isochronous transfer pipes, when the time to issue an IN token comes but there is no space available in the FIFO buffer. In this case, the USBFS discards the received data for the IN token and sets the PIPE_nNRDY bit associated with the pipe and the OVRN bit to 1. When a packet error is detected in the received data for the IN token, the USBFS also sets the FRMNUM.CRCE bit to 1.
- For non-isochronous transfer pipes, when any combination of the following two cases occur three consecutive times:
 - No response is returned from the peripheral device for the IN token issued by the USBFS (when timeout is detected before detection of the DATA packet from the peripheral device)
 - An error is detected in the packet from the peripheral device. In this case, the USBFS sets the associated PIPE_nNRDY bit to 1 and changes the associated PID[1:0] setting for the pipe to NAK
- For isochronous transfer pipes, when no response is returned from the peripheral device for the IN token (when timeout is detected before detection of the DATA packet from the peripheral device) or an error is detected in the packet from the peripheral device. In this case, the USBFS sets the PIPE_nNRDY bit associated with the pipe to 1. The PID[1:0] setting for the pipe is not changed.
- For isochronous transfer pipes, when a CRC error or a bit stuffing error is detected in the received data packet. In this case, the USBFS sets the PIPE_nNRDY bit associated with the pipe and the CRCE bit to 1.
- When the STALL handshake is received. In this case, the USBFS sets the PIPE_nNRDY bit associated with the pipe to 1 and changes the PID[1:0] setting for the associated pipe to STALL.

(2) In device controller mode

For transmitting pipes

- When an IN token is received while there is no data to be transmitted in the FIFO buffer. In this case, the USBFS generates a NRDY interrupt request on reception of the IN token and sets the NRDYSTS.PIPE_nNRDY bit to 1. For an isochronous transfer pipe in which an interrupt is generated, the USBFS transmits a zero-length packet and sets the FRMNUM.OVRN bit to 1.

For receiving pipes

- When an OUT token is received but there is no space available in the FIFO buffer. For an isochronous transfer pipe in which an interrupt is generated, the USBFS generates a NRDY interrupt request on reception of the OUT token and sets the PIPE_nNRDY bit to 1 and OVRN bit to 1. For a non-isochronous transfer pipe in which an interrupt is generated, the USBFS generates a NRDY interrupt request when a NAK handshake is transferred after the data following the OUT token is received, and sets the PIPE_nNRDY bit to 1. The NRDY interrupt request is not generated during retransmission

because of a DATA-PID mismatch. In addition, the NRDY interrupt request is not generated if an error occurs in the DATA packet.

- For isochronous transfer pipes, when a token is not received successfully within an interval frame. In this case, the USBFS generates an NRDY interrupt request when the SOF is received, and sets the PIPEnNRDY bit to 1.

Figure 27.12 shows the timing of NRDY interrupt generation in device controller mode.

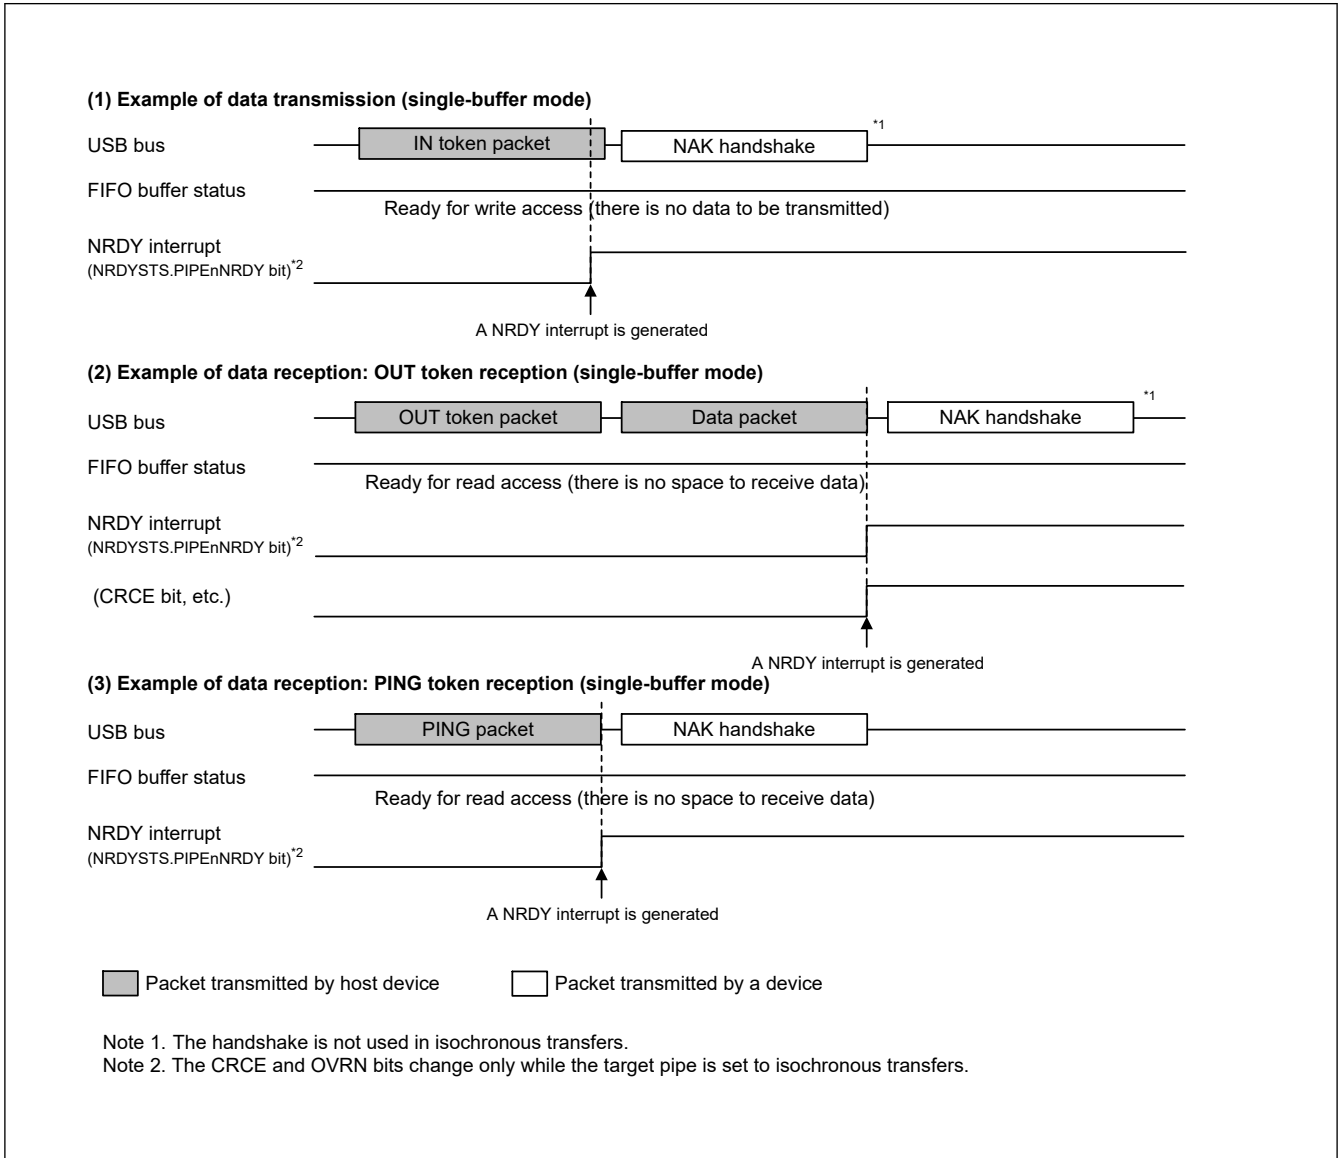

Figure 27.12 Timing of NRDY interrupt generation in device controller mode

27.3.3.3 BEMP interrupt

On detecting a BEMP interrupt for the pipe whose PID bits are set to BUF by software, the USBFS sets the associated BEMPSTS.PIPEnBEMP bit to 1. If the associated bit in BEMPENB is set to 1 by software, the USBFS sets the INTSTS0.BEMP bit to 1 and generates a USBFS interrupt. This section describes the conditions in which the USBFS generates an internal BEMP interrupt request.

(1) For transmitting pipes

When the FIFO buffer of the associated pipe is empty on completion of transmission, including zero-length packet transmission, and in single buffer mode, an internal BEMP interrupt request is generated simultaneously with the BRDY interrupt for a non-DCP pipe. The internal BEMP interrupt request is not generated in any of the following conditions:

- When the CPU or DMA/DTC has already started writing data to the FIFO buffer of the CPU on completion of transmitting data from one FIFO buffer in double buffer mode
- When the buffer is cleared (emptied) by setting the PIPEnCTR.ACLRM or the BCLR bit to 1 in the port control register
- When an IN transfer (zero-length packet transmission) is performed during the control transfer status stage in device controller mode

(2) For receiving pipes

When a successfully-received data packet size exceeds the specified maximum packet size. In this case, the USBFS generates a BEMP interrupt request, sets the associated BEMPSTS.PIPEnBEMP bit to 1, discards the received data, and changes the associated PID[1:0] setting for the pipe to STALL (11b). The USBFS returns no response in host controller mode, and returns STALL response in device controller mode.

The internal BEMP interrupt request is not generated in any of the following conditions:

- When a CRC error or a bit stuffing error is detected in the received data
- When a setup transaction is being performed:
 - Writing 0 to the BEMPSTS.PIPEnBEMP bit clears the status
 - Writing 1 to the BEMPSTS.PIPEnBEMP bit has no effect

Figure 27.13 shows the timing of BEMP interrupt generation in device controller mode.

Figure 27.13 Timing of BEMP interrupt generation in device controller mode

27.3.3.4 Device state transition interrupt (device controller mode)

Figure 27.14 shows a diagram of the USBFS device state transitions. The USBFS controls device states and generates device state transition interrupts. However, recovery from the Suspend state (resume signal detection) is detected by means of the resume interrupt. Device state transition interrupts can be enabled or disabled independently in INTENB0. Devices whose states have changed can be checked in the INTSTS0.DVSQ[2:0] bits.

When a transition is made to the default state, a device state transition interrupt is generated after a USB bus reset is detected.

The USBFS controls device states, and device state transition interrupts can be generated, only in device controller mode.

Figure 27.14 Device state transitions

27.3.3.5 Control transfer stage transition interrupt (device controller mode)

Figure 27.15 shows a diagram of the control transfer stage transitions of the USBFS. The USBFS controls the control transfer sequence and generates control transfer stage transition interrupts. Control transfer stage transition interrupts can be enabled or disabled independently in INTENB0. Transfer stages that have transitioned can be checked in the INTSTS0.CTSQ[2:0] bits.

Control transfer stage transition interrupts are generated only in device controller mode. This section describes control transfer sequence errors. If an error occurs, the DCPCTR.PID[1:0] bits are set to 1xb (STALL response).

(1) Control read transfer errors

- An OUT token is received but no data is transferred in response to the IN token at the data stage
- An IN token is received at the status stage
- A data packet with DATAPID = DATA0 is received at the status stage

(2) Control write transfer errors

- An IN token is received but no ACK is returned in response to the OUT token at the data stage
- A data packet with DATAPID = DATA0 is received as the first data packet at the data stage
- An OUT token is received at the status stage

(3) Control write no data transfer errors

- An OUT token is received at the status stage

At the control write transfer data stage, if the receive data length exceeds the wLength value of the USB request, it is not recognized as a control transfer sequence error. At the control read transfer status stage, packets other than zero-length packets are received by an ACK response and the transfer ends normally.

When a CTRT interrupt occurs in response to a sequence error (INTSTS0.CTRT = 1), the CTSQ[2:0] = 110b value is saved until the CTRT bit is set to 0, clearing the interrupt status. While CTSQ[2:0] = 110b is being saved, no CTRT interrupt for ending the setup stage is generated, even if a new USB request is received. The USBFS saves the setup stage completion status, and it generates a CTRT interrupt after the interrupt status is cleared by software.

Figure 27.15 Control transfer stage transitions

27.3.3.6 Frame update interrupt

In host controller mode, an interrupt is generated when the frame number is updated.

In device controller mode, an SOFR interrupt is generated when the frame number is updated. The USBFS updates the frame number and generates an SOFR interrupt if it detects a new SOF packet during full-speed operation.

27.3.3.7 VBUS interrupt

When the USB_VBUS pin level changes, a VBUS interrupt is generated. The level of the USB_VBUS pin can be checked with the INTSTS0.VBSTS bit. Whether the host controller is connected or disconnected can be confirmed using the VBUS interrupt. If the system is activated with the host controller connected, the first VBUS interrupt is not generated, because there is no change in the USB_VBUS pin level.

27.3.3.8 Resume interrupt

In device controller mode, a resume interrupt is generated when the device state is the Suspend state and the USB bus state has changed (from J-state to K-state, or from J-state to SE0). Recovery from the Suspend state is detected by means of the resume interrupt.

In host controller mode, no resume interrupt is generated. Use the BCHG interrupt to detect a change in the USB bus state.

27.3.3.9 OVRCCR interrupt

An OVRCCR interrupt is generated when the USB_OVRCURA, USB_OVRCURA-DS, USB_OVRCURB or USB_OVRCURB-DS pin level has changed. The levels of the USB_OVRCURA, USB_OVRCURA-DS, USB_OVRCURB and USB_OVRCURB-DS pins can be checked in the SYSSTS0.OVCMON[1:0] flags. The external power supply IC can check whether overcurrent is detected using the OVRCCR interrupt.

For OTG connections, the OVRCCR interrupt allows you to check whether a change is detected in the VBUS comparator.

27.3.3.10 BCHG interrupt

A BCHG interrupt is generated when the USB bus state has changed. The BCHG interrupt can be used to detect whether a peripheral device is connected and can also be used to detect a remote wakeup in host controller mode. The BCHG interrupt is generated in both host and device controller modes.

27.3.3.11 DTCH interrupt

A DTCH interrupt occurs when a USB bus disconnect is detected in host controller mode. The USBFS detects bus disconnects in compliance with the USB 2.0 specification.

On interrupt detection, all pipes in which communications are being carried out for the relevant port must be terminated by software. The pipes enter the wait state for a bus connection to the port, waiting for an ATTCH interrupt to occur. Regardless of the value set in the associated interrupt enable bit, the USBFS hardware:

- Sets the DVSTCTR0.UACT bit for the port in which the DTCH interrupt is detected to 0
- Puts the port in which the DTCH interrupt occurred into the idle state

27.3.3.12 SACK interrupt

A SACK interrupt is generated when an ACK response for the transmitted setup packet is received from the peripheral device in host controller mode. The SACK interrupt can be used to confirm that the setup transaction is successfully complete.

27.3.3.13 SIGN interrupt

A SIGN interrupt is generated when an ACK response for the transmitted setup packet is not correctly received from the peripheral device three consecutive times in host controller mode. The SIGN interrupt can be used to detect no ACK response transmitted from the peripheral device or corruption of an ACK packet.

27.3.3.14 ATTCH interrupt

An ATTCH interrupt is generated when J-state or K-state of the full-speed signal level is detected on the USB port for 2.5 μ s in host controller mode. To be more specific, an ATTCH interrupt is detected on any of the following conditions:

- When K-state, SE0, or SE1 changes to J-state, and J-state continues 2.5 μ s
- When J-state, SE0, or SE1 changes to K-state, and K-state continues 2.5 μ s

27.3.3.15 EOFERR interrupt

An EOFERR interrupt occurs when the USBFS detects that communication is not complete at the EOF2 timing defined in the USB 2.0 specification.

On interrupt detection, all pipes in which communications are being carried out for the relevant port must be terminated by software, and the port must be re-enumerated. Regardless of the value set in the associated interrupt enable bit, the USBFS hardware:

- Sets the DVSTCTR0.UACT bit for the port in which the EOFERR interrupt is detected to 0
- Puts the port in which the EOFERR interrupt is generated into the idle state

27.3.4 Pipe Control

[Table 27.19](#) lists the pipe settings for the USBFS. USB data transfer is performed through logical pipes that the software associates with endpoints. The USBFS provides 10 pipes that are used for data transfer. Set up the pipes based on your system specifications.

Table 27.19 Pipe settings

Register name	Bit name	Setting	Notes
DCPCFG PIPECFG	TYPE	Transfer type	Pipes 1 to 9: Settable
	BFRE	BRDY interrupt mode	Pipes 1 to 5: Settable
	DBLB	Double buffer select	Pipes 1 to 5: Settable
	DIR	Transfer direction select	IN or OUT settable
	EPNUM	Endpoint number	Pipes 1 to 9: Settable A value other than 0000b must be set when the pipe is used.
	SHTNAK	Selects disabled state for pipe when transfer ends	Pipes 1 and 2: Settable only for bulk transfers Pipes 3 to 5: Settable
DCPMAXP PIPEMAXP	DEVSEL	Device select	Referenced only in host controller mode.
	MXPS	Maximum packet size	Compliant with the USB 2.0 specification.
PIPEPERI	IFIS	Buffer flush	Pipes 1 and 2: Settable only for isochronous transfers Pipes 3 to 9: Setting disabled
	IITV	Interval counter	Pipes 1 and 2: Settable only for isochronous transfers Pipes 3 to 5: Setting disabled Pipes 6 to 9: Settable only in host controller mode
DCPCTR PIPE _n CTR	BSTS	Buffer status	For the DCP, receive buffer status and transmit buffer status are switched with the ISEL bit.
	INBUFM	IN buffer monitor	Available only for pipes 1 to 5.
	SUREQ	Setup request	Settable only for the DCP and controlled in host controller mode
	SUREQCLR	SUREQ clear	Settable only for the DCP and controlled in host controller mode
	ATREPM	Auto response mode	Pipes 1 to 5: Settable only in device controller mode
	ACLRM	Auto buffer clear	Pipes 1 to 9: Settable
	SQCLR	Sequence clear	Clears the data toggle bit
	SQSET	Sequence set	Sets the data toggle bit
	SQMON	Sequence monitor	Monitors the data toggle bit
	PBUSY	Pipe busy status	—
	PID	Response PID	See section 27.3.4.6. Response PID .
PIPE _n TRE	TRENB	Transaction counter enable	Pipes 1 to 5: Settable
	TRCLR	Current transaction counter clear	Pipes 1 to 5: Settable
PIPE _n TRN	TRNCNT	Transaction counter	Pipes 1 to 5: Settable

27.3.4.1 Pipe control register switching procedures

The following bits in the pipe control registers can be changed only when USB communication is prohibited (PID = NAK).

Do not change the following registers and bits when USB communication is enabled (PID = BUF):

- Bits in DCPCFG and DCPMAXP
- SQCLR and SQSET bits in DCPCTR
- Bits in PIPECFG, PIPEMAXP, and PIPEPERI
- ATREPM, ACLRM, SQCLR, and SQSET bits in PIPEnCTR
- Bits in PIPEnTRE and PIPEnTRN

To set these bits when USB communication is enabled (PID = BUF):

1. A request to change the bits in the pipe control register occurs.
2. Set the PID[1:0] bits associated with the pipe to NAK.
3. Wait until the associated PBUSY bit clears to 0.
4. Set the bits in the pipe control register.

The following bits in the pipe control registers can be changed only when the selected pipe information is not set in the CURPIPE[3:0] bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL.

Do not set the following registers when the CURPIPE[3:0] bits are set:

- Bits in DCPCFG and DCPMAXP
- Bits in PIPECFG, PIPEMAXP and PIPEPERI

To change pipe information, you must set the CURPIPE[3:0] bits in the port select registers to a pipe other than the one to be changed. For the DCP, the buffer must be cleared using the BCLR bit in the Port Control Register after the pipe information is changed.

27.3.4.2 Transfer types

The PIPECFG.TYPE[1:0] bits specify the following transfer types for each pipe:

- DCP: No setting is necessary (fixed at control transfer)
- Pipes 1 and 2: Set to bulk or isochronous transfer
- Pipes 3 to 5: Set to bulk transfer
- Pipes 6 to 9: Set to interrupt transfer

27.3.4.3 Endpoint number

The PIPECFG.EPNUM[3:0] bits are used to set the endpoint number for each pipe. The DCP is fixed at endpoint 0. The other pipes can be set from endpoint 1 to 15.

- DCP: No setting is necessary (fixed at endpoint 0)
- Pipes 1 to 9: Select and set the endpoint numbers from 1 to 15 so that the combination of the PIPECFG.DIR and EPNUM[3:0] bits is unique

27.3.4.4 Maximum packet size setting

Specify the maximum packet size for each pipe in the DCPMAXP.MXPS[6:0] and PIPEMAXP.MXPS[9:0] bits. The DCP and pipes 1 to 5 can be set to any of the maximum pipe sizes defined in the USB 2.0 specification. For pipes 6 to 9, the maximum packet size is 64 bytes. Set the maximum packet size as follows before starting a transfer (PID = BUF):

- DCP: Set to 8, 16, 32, or 64
- Pipes 1 to 5: Set to 8, 16, 32, or 64 for bulk transfers
- Pipes 1 and 2: Set between 1 and 256 for isochronous transfers
- Pipes 6 to 9: Set between 1 and 64

27.3.4.5 Transaction counter for pipes 1 to 5 in the receiving direction

When the specified number of transactions is complete in the data packet receiving direction, the USBFS recognizes that the transfer ended. Two transaction counters are provided: one is the PIPEnTRN register, which specifies the number of transactions to be executed, and the other is the current counter, which internally counts the number of executed transactions. If the PIPECFG.SHTNAK bit is set to 1, when the current counter value matches the specified number of transactions, the associated PIPEnCTR.PID[1:0] bits are set to NAK and the subsequent transfer is disabled. The transactions can be counted again from the beginning by initializing the current counter of the transaction counter function through the PIPEnTRE.TRCLR bit. The data read from PIPEnTRN differs depending on the PIPEnTRE.TRENB setting as follows:

- The TRENB bit = 0: Specified transaction counter value can be read
- The TRENB bit = 1: Current counter value indicating the internally counted number of executed transactions can be read

The following constraints apply when working with the TRCLR bit:

- If the transactions are being counted and PID = BUF, the current counter cannot be cleared
- If there is any data left in the buffer, the current counter cannot be cleared

27.3.4.6 Response PID

Specify the response PID for each pipe in the PID[1:0] bits in DCPCTR and PIPEnCTR. This section describes the USBFS operation with different response PID settings.

(1) Software response PID settings in host controller mode

Select the response PID to specify the execution of transactions as follows:

- NAK setting: Using pipes is disabled and no transactions are executed
- BUF setting: Transactions are executed based on the FIFO buffer state:
 - OUT direction: An OUT token is issued if the FIFO buffer contains transmit data.
 - IN direction: An IN token is issued if the FIFO buffer is not full and can receive data.
- STALL setting: Using pipes is disabled and no transactions are executed

Note: Use the DCPCTR.SUREQ bit to execute setup transactions for the DCP.

(2) Software response PID settings in device controller mode

Select the response PID to respond as follows to transactions from the host:

- NAK setting: A NAK response is returned to all generated transactions
- BUF setting: A response is returned to transactions based on the FIFO buffer
- STALL setting: A STALL response is returned to all generated transactions

Note: For setup transactions, an ACK response is always returned, regardless of the PID[1:0] bits setting, and the USB request is stored in the register.

Sections (3) and (4) describe situations in which the USBFS writes to the PID[1:0] bits because of specific transaction results.

(3) Hardware response PID settings in host controller mode

- NAK setting: PID = NAK is set in the following cases, and issuing of tokens is automatically stopped:
 - When a non-isochronous transfer is performed and an NRDY interrupt is generated
(For details, see [section 27.3.3.2. NRDY interrupt](#).)
 - If a short packet is received when the PIPECFG.SHTNAK bit is set to 1 for bulk transfers
 - If transaction counting ends when the SHTNAK bit is set to 1 for bulk transfers
- BUF setting: The USBFS does not write this setting.

- STALL setting: PID = STALL is set in the following cases, and issuing of tokens is automatically stopped:
 - When STALL is received in response to a transmitted token
 - When a received data packet exceeds the maximum packet size

(4) Hardware response PID settings in device controller mode

- NAK setting: PID = NAK is set in the following cases, and a NAK response is returned to transactions:
 - When the setup token is received normally (DCP only)
 - If transaction counting ends or a short packet is received when the PIPECFG.SHTNAK bit is set to 1 for bulk transfers
- BUF setting: There is no BUF writing by the USBFS.
- STALL setting: PID = STALL is set in the following cases, and a STALL response is returned to transactions:
 - When a received data packet exceeds the maximum packet size
 - When a control transfer sequence error is detected (DCP only)

27.3.4.7 Data PID sequence bit

The USBFS automatically toggles the sequence bit in the data PID when data is transferred successfully in the control transfer data stage, bulk transfer, and interrupt transfer. The sequence bit of the next data PID to be transmitted can be confirmed with the SQMON bit in DCPCTR and PIPEnCTR. When data is transmitted, the sequence bit toggles on ACK handshake reception. When data is received, the sequence bit toggles on ACK handshake transmission. The SQCLR bit in DCPCTR and the SQSET bit in PIPEnCTR can be used to change the data PID sequence bit.

In device controller mode when control transfers are used, the USBFS automatically sets the sequence bit for stage transitions. DATA1 is returned when the setup stage ends. The sequence bit is not referenced and PID = DATA1 is returned in the status stage. Therefore, no software settings are required. However, in host controller mode when control transfers are used, the sequence bit must be set by software for the stage transitions.

For ClearFeature requests for transmission or reception, the data PID sequence bit must be set by software in both host and device controller modes.

27.3.4.8 Response PID = NAK function

The USBFS provides a function for disabling pipe operation (PID response = NAK) when the final data packet of a transaction is received. The USBFS automatically distinguishes this based on reception of a short packet or the transaction counter. Enable this function by setting the PIPECFG.SHTNAK bit to 1.

When the double buffer mode is being used for the FIFO buffer, using this function enables reception of data packets in transfer units. If pipe operation is disabled, the software must enable the pipe again (PID response = BUF).

The response PID = NAK function can be used only for bulk transfers.

27.3.4.9 Auto response mode

For bulk transfer pipes (1 to 5), when the PIPEnCTR.ATREPM bit is set to 1, a transition is made to auto response mode. During an OUT transfer (PIPECFG.DIR = 0), OUT-NAK mode is invoked, and during an IN transfer (DIR = 1), null auto response mode is invoked.

27.3.4.10 OUT-NAK mode

For bulk OUT transfer pipes, NAK is returned in response to an OUT token, and an NRDY interrupt is output when the PIPEnCTR.ATREPM bit is set to 1. To transition from normal mode to OUT-NAK mode, specify OUT-NAK mode while pipe operation is disabled (PID[1:0] = 00b for NAK response). Next enable pipe operation (PID[1:0] = 01b for BUF response), on which OUT-NAK mode becomes valid. If an OUT token is received immediately before pipe operation is disabled, the token data is normally received, and an ACK is returned to the host.

To transition from OUT-NAK mode to normal mode, cancel OUT-NAK mode while pipe operation is disabled (NAK). Next enable pipe operation (BUF). In normal mode, reception of OUT data is enabled.

27.3.4.11 Null auto response mode

For bulk IN transfer pipes, zero-length packets are continuously transmitted when the PIPEnCTR.ATREPM bit is set to 1.

To transition from normal mode to null auto response mode, specify null auto response mode while pipe operation is disabled (response PID = NAK). Next enable pipe operation (response PID = BUF) on which null auto response mode becomes valid. Before setting null auto response mode, check that PIPEnCTR.INBUFM = 0, because the mode can be set only when the buffer is empty. If the INBUFM bit is 1, empty the buffer using the PIPEnCTR.ACLRM bit. Do not write data from the FIFO port while a transition to null auto response mode is being made.

To transition from null auto response mode to normal mode, keep pipe operation disabled (response PID = NAK) for the period of the zero-length packet transmission (about 10 μ s) before canceling the null auto response mode. In normal mode, data can be written from the FIFO port, so packet transmission to the host is enabled by enabling pipe operation (response PID = BUF).

27.3.5 FIFO Buffer

The USBFS provides a FIFO buffer for data transfers, and it manages the memory area used for each pipe. The FIFO buffer has two states depending on whether the access right is assigned to the system (CPU side) or the USBFS (SIE side).

(1) Buffer status

Table 27.20 and Table 27.21 show the buffer status in the USBFS. The FIFO buffer status can be confirmed using the DCPCTR.BSTS and PIPEnCTR.INBUFM bits. The transfer direction for the FIFO buffer can be specified in either the PIPECFG.DIR or CFIFOSEL.ISEL bit (when DCP is selected).

The INBUFM bit is valid for pipes 1 to 5 in the transmitting direction.

When a transmitting pipe uses double buffering, the software can read the BSTS bit to monitor the FIFO buffer status on the CPU side and the INBUFM bit to monitor the FIFO buffer status on the SIE side. When write access to the FIFO port by the CPU or DMA/DTC is slow and the buffer empty status cannot be determined using the BEMP interrupt, the software can use the INBUFM bit to confirm the end of transmission.

Table 27.20 Buffer status indicated in the BSTS bit

ISEL or DIR	BSTS	FIFO buffer status
0 (receiving direction)	0	There is no received data, or data is being received. Reading from the FIFO port is disabled.
0 (receiving direction)	1	There is received data, or a zero-length packet is received. Reading from the FIFO port is allowed. When a zero-length packet is received, reading is not possible and the buffer must be cleared.
1 (transmitting direction)	0	Transmission has not completed. Writing to the FIFO port is disabled.
1 (transmitting direction)	1	Transmission is complete. CPU write is allowed.

Table 27.21 Buffer status indicated in the INBUFM bit

DIR	INBUFM	FIFO buffer status
0 (receiving direction)	Invalid	Invalid
1 (transmitting direction)	0	Transmission is complete. There is no data waiting to be transmitted.
1 (transmitting direction)	1	The FIFO port has written data to the buffer. There is data to be transmitted.

27.3.6 FIFO Buffer Clearing

Table 27.22 shows the methods for clearing the FIFO buffer. The FIFO buffer can be cleared using BCLR bit in the port control register, DnFIFOSEL.DCLRM, or the PIPEnCTR.ACLRM bit.

Single or double buffering can be selected for pipes 1 to 5 in the PIPECFG.DBLB bit.

Table 27.22 Buffer clearing methods

FIFO buffer clearing mode	Clearing FIFO buffer on the CPU side	Mode for automatically clearing the FIFO buffer after reading the specified pipe data	Auto buffer clear mode for discarding all received packets
Register used	CFIFOCTR DnFIFOCTR	DnFIFOSEL	PIPEnCTR
Bit used	BCLR	DCLRM	ACLRM
Clearing condition	Cleared by writing 1	1: Mode valid 0: Mode invalid	1: Mode valid 0: Mode invalid

(1) Auto buffer clear mode function

The USBFS discards all received data packets if the PIPEnCTR.ACLRm bit is set to 1. If a correct data packet is received, the ACK response is returned to the host controller. The auto buffer clear mode function can only be set in the FIFO buffer reading direction.

Setting the ACLRM bit to 1 and then to 0 clears the FIFO buffer of the selected pipe regardless of the access direction. An access cycle of at least 100 ns is required for the internal hardware sequence processing between ACLRM = 1 and ACLRM = 0.

27.3.7 FIFO Port Functions

Table 27.23 shows the settings for the FIFO port functions. In write access, writing data until the maximum packet size is reached automatically enables transmission of the data. To enable transmission before the maximum packet size is reached, set the BVAL flag in the port control register to end writing. To send a zero-length packet, use the BCLR bit to clear the buffer, and then set the BVAL flag to end writing.

In reading, reception of new packets is automatically enabled when all data is read. Data cannot be read when a zero-length packet is received (DTLN[8:0] = 0), so the buffer must be cleared with the BCLR bit. The length of the receive data can be confirmed in the DTLN[8:0] bits in the port control register.

Table 27.23 FIFO port function settings

Register name	Bit name	Description
CFIFOSEL, DnFIFOSEL (n = 0, 1)	RCNT	Selects DTLN[11:0] read mode
	REW	FIFO buffer rewind (re-read, rewrite)
	DCLRM	Automatically clears receive data for a specified pipe after the data is read (only for DnFIFO)
	DREQE	Enables DMA/DTC transfers (only for DnFIFO)
	MBW	FIFO port access bit width
	BIGEND	Selects FIFO port endian
	ISEL	FIFO port access direction (only for DCP)
	CURPIPE	Selects the current pipe
CFIFOCTR, DnFIFOCTR (n = 0, 1)	BVAL	Ends writing to the FIFO buffer
	BCLR	Clears the FIFO buffer on the CPU side
	DTLN	Checks the length of receive data

(1) FIFO port selection

Table 27.24 shows the pipes that can be selected with the different FIFO ports. The pipe to be accessed must be selected in the CURPIPE[3:0] bits in the port select register. After the pipe is selected, the software must check whether the written value can be read correctly from the CURPIPE[3:0] bits. (If the previous pipe number is read, it indicates that the USBFS is modifying the pipe.) Next, the software checks that the FRDY bit in the port control register is 1.

In addition, the software must specify the bus width to be accessed in the MBW bit in the port select register. The FIFO buffer access direction conforms to the PIPECFG.DIR setting. For the DCP only, the ISEL bit in the port select register determines the direction.

Table 27.24 FIFO port access by pipe

Pipe	Access method	Ports that can be used
DCP	CPU access	CFIFO port register
Pipes 1 to 9	CPU access	<ul style="list-style-type: none"> • CFIFO port register • D0FIFO/D1FIFO port register
	DMA/DTC access	D0FIFO/D1FIFO port register

(2) REW bit

It is possible to temporarily stop access to a pipe currently being accessed, access a different pipe, and then continue processing for the first pipe again. The REW bit in the port select register is used for this processing.

If a pipe is selected in the CURPIPE[3:0] bits in the port select register with the REW bit set to 1, the pointer used for reading from and writing to the FIFO buffer is reset, and reading or writing can be carried out from the first byte. If a pipe is selected with 0 set for the REW bit, data can be read and written in continuation from the previous selection, without the pointer being reset.

To access the FIFO port, the software must check that the FRDY bit in the port control register is 1 after selecting a pipe.

27.3.8 DMA Transfers (D0FIFO and D1FIFO Ports)

(1) Overview of DMA transfers

For pipes 1 to 9, the FIFO port can be accessed using the DMAC. When buffer access for a pipe targeted for DMA transfer is enabled, a DMA transfer request is issued.

Select the unit of transfer to the FIFO port in the DnFIFOSEL.MBW bit, and select the pipe targeted for the DMA transfer in the DnFIFOSEL.CURPIPE[3:0] bits. Do not change the selected pipe during the DMA transfer.

(2) DnFIFO auto clear mode (D0FIFO and D1FIFO port reading direction)

If 1 is set in the DnFIFOSEL.DCLRM bit, the USBFS automatically clears the FIFO buffer of the selected pipe when reading of data from the FIFO buffer is complete.

[Table 27.25](#) shows the packet reception and FIFO buffer clearing processing by software for each of the settings. As shown in the table, the buffer clearing conditions depend on the value set in the PIPECFG.BFRE bit. Using the DnFIFOSEL.DCLRM bit eliminates the need for the buffer to be cleared by software in any situation that requires buffer clearing. This enables DMA transfers without involving software.

The DnFIFO auto clear mode can only be set in the FIFO buffer reading direction.

Table 27.25 Packet reception and FIFO buffer clearing processing by software

Buffer status when packet is received	Register setting			
	DCLRM = 0		DCLRM = 1	
	BFRE = 0	BFRE = 1	BFRE = 0	BFRE = 1
Buffer full	No clearing required	No clearing required	No clearing required	No clearing required
Zero-length packet reception	Clearing required	Clearing required	No clearing required	No clearing required
Normal short packet reception	No clearing required	Clearing required	No clearing required	No clearing required
Transaction count end	No clearing required	Clearing required	No clearing required	No clearing required

27.3.9 Control Transfers Using the DCP

The DCP is used for data transfers in the control transfer data stage. The FIFO buffer of the DCP is a 64-byte single buffer with a fixed area for both control reads and control writes. The FIFO buffer can be accessed only through the CFIFO port.

27.3.9.1 Control transfers in host controller mode

(1) Setup stage

The USQREQ, USBVAL, USBINDEX, and USBLENG registers are used to transmit USB requests for setup transactions. Writing the setup packet data to the registers and then writing 1 to the DCPCTR.SUREQ bit transmits the specified data for the setup transaction. On completion of the transaction, the SUREQ bit clears to 0. Do not change these USB request registers while SUREQ = 1.

When an attached function device is detected, the software must issue the first setup transaction for the device using this sequence with the DCPMAXP.DEVSEL[3:0] bits cleared to 0 and the DEVADD0.USBSPD[1:0] bits set appropriately.

When an attached function device is shifted to the Address state, the software must issue setup transactions using this sequence with the assigned USB address set in the DEVSEL[3:0] bits and the bits in DEVADDn corresponding to the specified USB address set appropriately. For example, when PIPEMAXP.DEVSEL[3:0] = 0010b, make appropriate settings in DEVADD2. When PIPEMAXP.DEVSEL[3:0] = 0101b, make appropriate settings in DEVADD5.

When the setup transaction data is sent, an interrupt request is generated based on the response from the peripheral device (SIGN or SACK bit in INTSTS1). This interrupt request allows the software to check the setup transaction result.

A DATA0 data packet (USB request) for the setup transaction is always transmitted regardless of the status of the DCPCTR.SQMON bit.

(2) Data stage

The data stage is used to transfer data using the DCP FIFO buffer.

Before accessing the DCP FIFO buffer, specify the access direction in the CFIFOSEL.ISEL bit. Specify the transfer direction in the DCPCFG.DIR bit.

For the first data packet of the data stage, the data PID must be transferred as DATA1. Set data PID = DATA1 in the DCPCTR.SQSET bit and set the PID bits = BUF. Completion of data transfer is detected using the BRDY or BEMP interrupt.

For control write transfers, when the number of data bytes to be sent is an integer multiple of the maximum packet size, the software must send a zero-length packet at the end.

(3) Status stage

The status stage is used for zero-length packet data transfers in the reverse direction of the data stage. As in the data stage, data is transferred using the DCP FIFO buffer. Transactions are executed using the same procedure as the data stage.

Data packets in the status stage must be transmitted and received with the data PID set to DATA1 using the DCPCTR.SQSET bit.

When a zero-length packet is received, check the receive-data length in the CFIFOCTR.DTLN[8:0] bits after a BRDY interrupt is generated, and then clear the FIFO buffer using the BCLR bit.

27.3.9.2 Control transfers in device controller mode

(1) Setup stage

The USBFS sends an ACK response to a normal setup packet for the USBFS. The USBFS operates in the setup stage as follows:

On receiving a new setup packet, the USBFS sets the following bits:

- Sets the INTSTS0.VALID bit to 1
- Sets the DCPCTR.PID[1:0] bits to NAK
- Sets the DCPCTR.CCPL bit to 0

When the USBFS receives a data packet following a setup packet, it stores the USB request parameters in USBREQ, USBVAL, USBINDEX, and USBLENG.

Before performing the response processing for a control transfer, set the VALID flag to 0. When the VALID bit = 1, PID = BUF cannot be set, and the data stage cannot be terminated.

Using the VALID bit function, the USBFS can suspend a request being processed when it receives a new USB request during a control transfer and return a response to the latest request.

In addition, the USBFS automatically detects the direction bit (bmRequestType bit [8]) and the request data length (wLength) in the received USB request. It distinguishes between control read transfers, control write transfers, and no-data control transfers, and it controls stage transitions. For an incorrect sequence, a sequence error occurs in the control transfer stage transition interrupt, and the interrupt is reported to the software. For a diagram of the stage control by the USBFS, see [Figure 27.15](#).

(2) Data stage

The DCP must be used to execute data transfers for received USB requests. Before accessing the DCP FIFO buffer, specify the access direction in the CFIFOSEL.ISEL bit.

If the transfer data is larger than the size of the DCP FIFO buffer, execute the data transfer using the BRDY interrupt for control write transfers and the BEMP interrupt for control read transfers.

(3) Status stage

Control transfers are terminated by setting the DCPCTR.CCPL bit to 1 while the DCPCTR.PID[1:0] bits are set to BUF.

After this setting is made, the USBFS automatically executes the status stage based on the data transfer direction determined at the setup stage. The procedure is as follows:

- For control read transfers
The USBFS receives a zero-length packet from the USB host and transmits an ACK response.
- For control write transfers and no-data control transfers
The USBFS transmits a zero-length packet and receives an ACK response from the USB host.

(4) Control transfer auto response function

The USBFS automatically responds to a correct SET_ADDRESS request. If any of the following errors occurs in the SET_ADDRESS request, a response from the software is necessary.

- bmRequestType is not 0x00: Any transfer other than a control write transfer
- wIndex is not 0x00: Request error
- wLength is not 0x00: Any transfer other than a no-data control transfer
- wValue is larger than 0x7F: Request error
- INTSTS0.DVSQ[2:0] are 011b (Configured state): Control transfer of a device state error

For all requests other than the SET_ADDRESS request, a response is required from the corresponding software.

27.3.10 Bulk Transfers (Pipes 1 to 5)

The FIFO buffer usage (single/double buffer setting) is configurable for bulk transfers. The USBFS provides the following functions for bulk transfers:

- BRDY interrupt function (PIPECFG.BFRE bit), see [section 27.3.3.1. BRDY interrupt](#)
- Transaction count function (PIPEnTRE.TRENB, TRCLR, and PIPEnTRN.TRNCNT[15:0] bits), see [section 27.3.4.5. Transaction counter for pipes 1 to 5 in the receiving direction](#)
- Response PID = NAK function (PIPECFG.SHTNAK bit), see [section 27.3.4.8. Response PID = NAK function](#)
- Auto response mode (PIPEnCTR.ATREPM bit), see [section 27.3.4.9. Auto response mode](#)

27.3.11 Interrupt Transfers (Pipes 6 to 9)

In device controller mode, the USBFS performs interrupt transfers based on the timing dictated by the host controller.

In host controller mode, the software can set the timing for issuing tokens using the interval counter.

27.3.11.1 Interval counter for interrupt transfers in host controller mode

Specify the transaction interval for interrupt transfers in the PIPEPERI.IITV[2:0] bits. The USBFS issues interrupt transfer tokens based on this interval.

(1) Counter initialization

The USBFS initializes the interval counter under the following conditions:

- Power-on reset
This initializes the IITV[2:0] bits.
- FIFO buffer initialization using the PIPEnCTR.ACLRM bit:
This does not initialize the IITV[2:0] bits, but does initialize the count value. Setting the PIPEnCTR.ACLRM bit to 0 starts counting from the value set in IITV[2:0].

The interval counter is not initialized in the following case:

- USB bus reset or USB suspended
The IITV[2:0] bits are not initialized. Setting 1 to the DVSTCTR0.UACT bit starts counting from the value saved before entering the USB bus reset state or USB suspend state.

(2) Operation when tokens cannot be transmitted or received even on token generation

No token is generated in the following cases even at token generation time. In these cases, the USBFS tries to execute the transaction in the next interval.

- When the PID is set to NAK or STALL
- When the FIFO buffer is full at token transmit time in the receiving (IN) direction
- When there is no data to be transmitted in the FIFO buffer at token transmit time in the transmitting (OUT) direction

27.3.12 Isochronous Transfers (Pipes 1 and 2)

The USBFS provides the following functions for isochronous transfers:

- Notification of isochronous transfer error
- Interval counter specified in the PIPEPERI.IITV[2:0] bits
- Isochronous IN transfer data setup control (IDLY function)
- Isochronous IN transfer buffer flush function specified in the PIPEPERI.IFIS bit

27.3.12.1 Error detection in isochronous transfers

The USBFS provides a function for detecting the errors described in this section, so that when errors occur in isochronous transfers, they can be controlled by software. [Table 27.26](#) and [Table 27.27](#) show the priority order for errors detected by the USBFS and the associated interrupts.

PID errors

- The PID value of the received packet is invalid.

CRC errors and bit stuffing errors

- A CRC error is found in a received packet or the bit stuffing is illegal.

Maximum packet size exceeded

- The data size of the received packet exceeds the specified maximum packet size.

Overrun and underrun errors

In host controller mode:

- The FIFO buffer is full at token transmit time in the IN (receiving) direction
- There is no data to be sent in the FIFO buffer at token transmit time in the OUT (transmitting) direction

In device controller mode:

- There is no data to be sent in the FIFO buffer at token receive time in the IN (transmitting) direction
- The FIFO buffer is full at token receive time in the OUT (receiving) direction

Interval errors

In device controller mode, the following cases are treated as an interval error:

- Failure to receive an IN token in the interval frame during an isochronous IN transfer
- Failure to receive an OUT token in the interval frame during an isochronous OUT transfer

Table 27.26 Error detection for token transmission and reception

Detection priority	Error	Generated interrupt and status
1	PID error	No interrupts are generated in either host or device controller mode (ignored as a corrupted packet)
2	CRC or bit stuffing error	No interrupts are generated in either host or device controller mode (ignored as a corrupted packet)
3	Overflow or underflow error	An NRDY interrupt is generated to set the FRMNUM.OVRN bit to 1 in both host and device controller modes. In device controller mode, a zero-length packet is transmitted in response to an IN token. No data packets are received in response to OUT token.
4	Interval error	An NRDY interrupt is generated in device controller mode. No interrupt is generated in host controller mode.

Table 27.27 Error detection for data packet reception

Detection priority	Error	Generated interrupt and status
1	PID error	No interrupts are generated (ignored as a corrupted packet)
2	CRC or bit stuffing error	An NRDY interrupt is generated and the FRMNUM.CRCE bit sets to 1 in both host and device controller modes
3	Maximum packet size exceeded error	A BEMP interrupt is generated and the PID[1:0] bits set to STALL in both host and device controller modes

27.3.12.2 DATA-PID

In device controller mode, the USBFS responds to a received PID as follows:

(1) IN direction

- DATA0: Transmitted as data packet PID
- DATA1: Not transmitted
- DATA2: Not transmitted

27.3.12.3 Interval counter

The isochronous transfer interval can be set in the PIPEPERI.IITV[2:0] bits. In device controller mode, the interval counter enables the functions as shown in [Table 27.28](#). In host controller mode, the USBFS generates the token issuance timing, and the interval counter operation is the same as that for interrupt transfers.

Table 27.28 Interval counter functions in device controller mode

Transfer direction	Function	Conditions for detection
IN	Transmit buffer flush	Failure to receive an IN token successfully in the interval frame during an isochronous IN transfer.
OUT	Notification of no reception of token	Failure to receive an OUT token successfully in the interval frame during an isochronous OUT transfer.

The interval count is performed when an SOF is received or for interpolated SOFs, so the isochronism can be maintained even if an SOF is corrupt. The frame interval can be set to 2^{IITV} frames.

(1) Counter initialization in device controller mode

The USBFS initializes the interval counter under the following conditions:

- Power-on reset
This initializes the PIPEPERI.IITV[2:0] bits.
- FIFO buffer initialization using the ACLRM bit
This does not initialize the IITV[2:0] bits, but does initialize the count value.

After the interval counter is initialized, the interval count starts under one of the following conditions when a packet is transferred successfully:

- An SOF is received after data is transmitted in response to an IN token when PID = BUF
- An SOF is received after data is received in response to an OUT token when PID = BUF

The interval counter is not initialized in the following conditions:

- When the PID[1:0] bits are set to NAK or STALL
This does not stop the interval timer. The USBFS attempts the transaction in the next interval.
- When the USB bus is reset or USBFS is suspended
This does not initialize the IITV[2:0] bits. When an SOF is received, the interval counter starts counting from the value set before SOF was received.

(2) Interval counting and transfer control in host controller mode

The USBFS controls the interval between token issuance operations based on the PIPEPERI.IITV[2:0] bits settings. Specifically, the USBFS issues a token for a selected pipe once every 2^{IITV} frames.

The USBFS starts counting the token issuance interval at the frame following the frame in which the PID[1:0] bits are set to BUF by software.
