This function sets the PHY preferences for the connection. The result of this API call is notified in BLE\_GAP\_EVENT\_PHY\_SET\_COMP event. When the PHY has been updated, BLE\_GAP\_EVENT\_PHY\_UPD event is notified to the application layer.

After PHY update, the PHY accept configuration of local device is the same as the values in BLE\_GAP\_EVENT\_PHY\_UPD event.

For example, after calling R\_BLE\_GAP\_SetPhy(), if tx\_phy, rx\_phy by BLE\_GAP\_EVENT\_PHY\_UPD event are updated to 2M PHY, the PHY accept configuration is 2M PHY only.

Therefore after receiving BLE\_GAP\_EVENT\_PHY\_UPD event, if local device wants to accept the other PHY configuration, it needs to call R\_BLE\_GAP\_SetPhy() with the desired PHY accept configuration.

Because the maximum transmission packet size or the maximum transmission time might be updated by PHY update, if the same packet size or transmission time as the previous one is desired, change the maximum transmission packet size or the maximum transmission time by R\_BLE\_GAP\_SetDataLen().

Set advertising data/scan response data/periodic advertising data.

This function sets advertising data/scan response data/periodic advertising data to the advertising set. Set advertising data/scan response data/periodic advertising data, after allocating the memory for the data. The following shall be applied regarding the adv\_prop\_type field and the data\_type field in st\_ble\_gap\_adv\_param\_t parameter specified in [R\\_BLE\\_GAP\\_SetAdvParam\(\)](#).

The following shall be applied regarding the adv\_prop\_type field and the data\_type field in st\_ble\_gap\_adv\_param\_t parameter specified in [R\\_BLE\\_GAP\\_SetAdvParam\(\)](#).

- When `adv_prop_type` is Legacy Advertising PDU type,
  - it's possible to set advertising data/scan response data up to 31 bytes.
  - advertising data/scan response data can be updated by this function in advertising.
- When `adv_prop_type` is Extended Advertising PDU type,
  - it's possible to set at most 1650 bytes of data as advertising data/scan response data per 1 advertising set.
  - the total buffer size in Controller for advertising data/scan response data is 4250 bytes. Therefore please note that more than 4250 bytes of advertising data/scan response data can not be set to all the advertising sets. Please refer to Figure 1.1 and Figure 1.2 about examples of setting advertising data/scan response data.
  - it's possible to update advertising data/scan response data in advertising, if the `data_length` field in `st_ble_gap_adv_data_t` parameter is up to 251 bytes.

Figure 309: Figure 1.1

Figure 310: Figure 1.2

◆ **R\_BLE\_ISO\_SendDataNoCopy()**

```
ble_status_t R_BLE_ISO_SendDataNoCopy ( st_ble_iso_sdu_t* p_sdu_info)

The maximum size of SDU payload defined by [BLE\\_ISO\\_DATA\\_MAX\\_SDU](#).

```
ble_status_t R_BLE_ISO_ReadTestCounters ( uint16_t conn_hdl)
```

Read the test counters (see [Vol 6] Part B, Section 7) in the Controller which is configured in ISO Receive Test mode for a CIS or BIS specified by the Connection\_Handle. Reading the test counters does not reset the test counters.

Specify the `cb_num` parameter to a value between 1 and `BLE_GATTC_MAX_CB`.

[R\\_BLE\\_GATTC\\_RegisterCb\(\)](#) registers the callback.

The result of this API call is returned by a return value.

------	---------------------	---

#### Return values

<code>BLE_SUCCESS(0x0000)</code>	Success
<code>BLE_ERR_INVALID_ARG(0x0003)</code>	The <code>cb_num</code> parameter is out of range.

The maximum writable size to a Long Characteristic with this function is 512 bytes.

When all of the contents has been written to the Long Characteristic,

BLE\_GATTC\_EVENT\_LONG\_CHAR\_WRITE\_COMP event is notified to the application layer.

**Parameters**

[in]	conn_hdl	Connection handle identifying the GATT Server to be written.
[in]	p_write_data	Value to be written to the Long Characteristic.
[in]	offset	Offset that indicates the location to be written. Normally, set 0 to this parameter. If this parameter sets to a value other than 0, adjust the offset parameter and the length of the value to be written not to exceed the length of the Long Characteristic.

**Return values**

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The p_write_data parameter or the p_value field in the value field in the p_write_data parameter is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The reason for this error is as follows: <ul style="list-style-type: none"> <li>• The value_len field in the value field in the p_write_data parameter is 0.</li> <li>• The sum of the value_len field in the value field in the p_write_data parameter and the offset parameter larger than 512.</li> <li>• The attr_hdl field in the p_write_data parameter is 0.</li> </ul>
BLE_ERR_INVALID_OPERATION(0x0009)	While processing other request, this function was called.

◆ **R\_BLE\_GATTC\_ReliableWrites()**

```
ble_status_t R_BLE_GATTC_ReliableWrites ( uint16_t conn_hdl,
st_ble_gattc_reliable_writes_char_pair_t* p_char_pair, uint8_t pair_num, uint8_t auto_flag )
```

This function performs the Reliable Writes procedure described in GATT Specification.

When the data written to the Characteristic has been transmitted, BLE\_GATTC\_EVENT\_CHAR\_PART\_WRITE\_RSP event is notified to the application layer. If the data included in the event is different from the data that GATT Client has sent, host stack automatically cancels the Reliable Writes.

After all of the contents has been sent to the GATT Server, if the auto\_flag parameter has been set to BLE\_GATTC\_EXEC\_AUTO, the GATT Server automatically writes the data to the Characteristic. If the auto\_flag parameter has been set to BLE\_GATTC\_EXEC\_NOT\_AUTO, BLE\_GATTC\_EVENT\_RELIABLE\_WRITES\_TX\_COMP event notifies the application layer in GATT Client that all of the contents has been sent to the GATT Server. Then GATT Client requests for writing the data to the Characteristic to the GATT Server with R\_BLE\_GATTC\_ExecWrite(). When the write has been done, BLE\_GATTC\_EVENT\_RELIABLE\_WRITES\_COMP event is notified to the application layer.

**Parameters**

[in]	conn_hdl	Connection handle identifying the GATT Server to be written.						
[in]	p_char_pair	Pair of Characteristic Value and Characteristic Value Handle identifying the Characteristic to be written by Reliable Writes.						
[in]	pair_num	The number of the pairs specified by the p_char_pair parameter. Valid range is 0 < pair_num <= BLE_GATTC_RELIABLE_WRITES_MAX_CHAR_PAIR.						
[in]	auto_flag	The flag that indicates whether auto execution or not. <table border="1" data-bbox="1074 1570 1469 1861"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GATTC_EXEC_AUTO(0x01)</td> <td>Auto execution.</td> </tr> <tr> <td>BLE_GATTC_EXEC_NOT_AUTO(0x02)</td> <td>Not auto execution.</td> </tr> </tbody> </table>	macro	description	BLE_GATTC_EXEC_AUTO(0x01)	Auto execution. macro	description							
BLE_GATTC_EXEC_AUTO(0x01)	Auto execution.

**Return values**

BLE_SUCCESS(0x0000)	Success

	<ul style="list-style-type: none"> <li>• The p_char_pair parameter is specified as NULL.</li> <li>• The p_value field in the value field in the write_data field in the p_char_pair parameter is specified as NULL.</li> </ul>

BLE_ERR_INVALID_OPERATION(0x0009)	While processing other request, this function was called.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function or to store the temporary write data.
BLE_ERR_INVALID_HDL(0x000E)	The GATT Server specified by conn_hdl was not found.

## ◆ R\_BLE\_GATTC\_ExecWrite()

```
ble_status_t R_BLE_GATTC_ExecWrite ( uint16_t conn_hdl, uint8_t exe_flag )
```

If the auto execute of Reliable Writes is not specified by [R\\_BLE\\_GATTC\\_ReliableWrites\(\)](#), this function is used to execute a write to Characteristic.

When all of the contents has been sent to the GATT Server, BLE\_GATTC\_EVENT\_RELIABLE\_WRITES\_TX\_COMP event notifies the application layer. After this event has been received, execute the write by this function. The result of the write is notified by BLE\_GATTC\_EVENT\_RELIABLE\_WRITES\_COMP event.

### Parameters

[in]	conn_hdl	Connection handle identifying the target GATT Server.						
[in]	exe_flag	The flag that indicates whether execution or cancellation. <table border="1" data-bbox="1072 898 1469 1299"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td><a href="#">BLE_GATTC_EXECUTE_WRITE_CANCEL_FLAG(0x00)</a></td> <td>Execute the write.</td> </tr> <tr> <td><a href="#">BLE_GATTC_EXECUTE_WRITE_FLAG(0x01)</a></td> <td>Cancel the write.</td> </tr> </tbody> </table>	macro	description	<a href="#">BLE_GATTC_EXECUTE_WRITE_CANCEL_FLAG(0x00)</a>	Execute the write.	<a href="#">BLE_GATTC_EXECUTE_WRITE_FLAG(0x01)</a>	Cancel the write.

ble_status_t R_BLE_L2CAP_RegisterCfPsm ( ble_l2cap_cf_app_cb_t cb, uint16_t psm, uint16_t lwm )
```

This function registers PSM that uses L2CAP CBFC Channel and a callback for L2CAP event.

Only one callback is available per PSM. Configure in each PSM the Low Water Mark of the LE-Frames that the local device can receive.

When the number of the credit reaches the Low Water Mark, BLE\_L2CAP\_EVENT\_CF\_LOW\_RX\_CRD\_IND event is notified to the application layer.

The number of PSM is defined as BLE\_L2CAP\_MAX\_CBFC\_PSM.

The result of this API call is returned by a return value.

**Parameters**

Call this function before the notification(BLE\_VS\_EVENT\_TX\_FLOW\_STATE\_CHG event) has been started by [R\\_BLE\\_VS\\_StartTxFlowEvtNtf\(\)](#).

The result is returned from this API.

Vendor Specific API supports the flow control function(TxFlow) for the transmission on L2CAP fixed channel in Basic Mode such as GATT.

Host stack has 10 transmission packet buffers for the transmission.

When the number of the available transmission packet buffers has been less than Low Water Mark, the state of TxFlow transmits into the TxFlow OFF state from the TxFlow ON state that is the initial state and host stack notifies the application layer of timing to stop packet transmission.

When host stack has sent the transmission packets to Controller and the number of the available transmission packet buffers has been more than High Water Mark, the state of TxFlow transmits into the TxFlow ON state from the TxFlow OFF state and host stack notifies the application layer of

timing to restart packet transmission.

It is possible to perform flow control on a fixed channel by using the event notification.

### Parameters

[in]	tx_queue_lwm	Low Water Mark. Set 0-9 less than tx_queue_hwm to the parameter. When the number of the available transmission packet buffers has been less than the value specified by the tx_queue_lwm parameter, host stack notifies the application layer of the timing to stop packet transmission.
[in]	tx_queue_hwm	High Water Mark. Set 1-10 more than tx_queue_lwm to the parameter. When the number of the available transmission packet buffers has been more than the value specified by the tx_queue_hwm parameter, host stack notifies the application layer of the timing to restart packet transmission.

### Return values

Interface for accessing low power modes.

**5.3.12.1 Low Power Modes Interface****Interfaces » Power**

## Detailed Description

Interface for accessing low power modes.

## Summary

This section defines the API for the LPM (Low Power Mode) Driver. The LPM Driver provides functions for controlling power consumption by configuring and transitioning to a low power mode. The LPM driver supports configuration of MCU low power modes using the LPM hardware peripheral. The LPM driver supports low power modes deep standby, standby, sleep, and snooze.

### Note

*Not all low power modes are available on all MCUs.*

## Field Documentation

### ◆ open

`fsp_err_t(* rsip_api_t::open) (rsip_ctrl_t *const p_ctrl, rsip_cfg_t const *const p_cfg)`

Enables use of Renesas Secure IP functionality.

#### Parameters

[in,out]	p_ctrl	Pointer to control block.
[in]	p_cfg	Pointer to configuration structure.

### ◆ close

`fsp_err_t(* rsip_api_t::close) (rsip_ctrl_t *const p_ctrl)`

Disables use of Renesas Secure IP functionality.

#### Parameters

[in,out]	p_ctrl	Pointer to control block.
----------	--------	---------------------------

◆ **randomNumberGenerate**

```
fsp_err_t(* rsip_api_t::randomNumberGenerate) (rsip_ctrl_t *const p_ctrl, uint8_t *const p_random)
```

Generates a 128-bit random number.

**Parameters**

[in,out]	p_ctrl	Pointer to control block.
[out]	p_random	128bit random numbers.

◆ **keyGenerate**

```
fsp_err_t(* rsip_api_t::keyGenerate) (rsip_ctrl_t *const p_ctrl, rsip_key_type_t const key_type, rsip_wrapped_key_t *const p_wrapped_key)
```

Generate a wrapped symmetric key from a random number. In this API, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

**Parameters**

[in,out]	p_ctrl	Pointer to control block.
[in]	key_type	Outputs key type.
[out]	p_wrapped_key	Pointer to destination of wrapped key. The length depends on key type. Refer "Key Size Table".

◆ **keyPairGenerate**

```
fsp_err_t(* rsip_api_t::keyPairGenerate) (rsip_ctrl_t *const p_ctrl, rsip_key_pair_type_t const key_pair_type, rsip_wrapped_key_t *const p_wrapped_public_key, rsip_wrapped_key_t *const p_wrapped_private_key)
```

Generate a wrapped asymmetric key pair from a random number. In this API, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

**Parameters**

[in,out]	p_ctrl	Pointer to control block.
[in]	key_pair_type	Output key pair type.
[out]	p_wrapped_public_key	Key index for Public Key. The length depends on the key type. Refer "Key Size Table".
[out]	p_wrapped_private_key	Key index for Private Key. The length depends on the key type. Refer "Key Size Table".

#### Parameters

[in,out]	p_ctrl	Pointer to control block.
[in]	p_key_update_key	Pointer to Key Update Key.
[in]	p_initial_vector	Initialization vector when generating encrypted_key. The length is 16 bytes.
[in]	key_type	Inputs/Outputs key type.
[in]	p_encrypted_key	Encrypted user key. The length depends on the key type. Refer "Key Size Table".
[out]	p_wrapped_key	Pointer to destination of wrapped key. The length depends on key type. Refer "Key Size Table".

## Field Documentation

### ◆ open

`fsp_err_t(* flash_api_t::open) (flash_ctrl_t *const p_ctrl, flash_cfg_t const *const p_cfg)`

Open FLASH device.

#### Parameters

[out]	<code>p_ctrl</code>	Pointer to FLASH device control. Must be declared by user. Value set here.
[in]	<code>flash_cfg_t</code>	Pointer to FLASH configuration structure. All elements of this structure must be set by the user.

## ◆ write

```
fsp_err_t(* flash_api_t::write) (flash_ctrl_t *const p_ctrl, uint32_t const src_address, uint32_t const flash_address, uint32_t const num_bytes)
```

Write FLASH device.

**Parameters**

[in]	p_ctrl	Control for the FLASH device context.
[in]	src_address	Address of the buffer containing the data to write to Flash.
[in]	flash_address	Code Flash or Data Flash address to write. The address must be on a programming line boundary.
[in]	num_bytes	The number of bytes to write. This number must be a multiple of the programming size. For Code Flash this is FLASH_MIN_PGM_SIZE_CF. For Data Flash this is FLASH_MIN_PGM_SIZE_DF.

**Warning**

Specifying a number that is not a multiple of the programming size will result in SF\_FLASH\_ERR\_BYTES being returned and no data written.

## ◆ erase

```
fsp_err_t(* flash_api_t::erase) (flash_ctrl_t *const p_ctrl, uint32_t const address, uint32_t const num_blocks)
```

Erase FLASH device.

**Parameters**

[in]	p_ctrl	Control for the FLASH device.
[in]	address	The block containing this address is the first block erased.
[in]	num_blocks	Specifies the number of blocks to be erased, the starting block determined by the block_erase_address.

◆ **blankCheck**

```
fsp_err_t(* flash_api_t::blankCheck) (flash_ctrl_t *const p_ctrl, uint32_t const address, uint32_t const num_bytes, flash_result_t *const p_blank_check_result)
```

**Parameters**

[in]	p_ctrl	Control for the FLASH device context.
[in]	address	The starting address of the Flash area to blank check.
[in]	num_bytes	Specifies the number of bytes that need to be checked. See the specific handler for details.
[out]	p_blank_check_result	Pointer that will be populated by the API with the results of the blank check operation in non-BGO (blocking) mode. In this case the blank check operation completes here and the result is returned. In Data Flash BGO mode the blank check operation is only started here and the result obtained later when the supplied callback routine is called. In this case FLASH_RESULT_BGO_ACTIVE will be returned in p_blank_check_result.

### 5.3.16.1 CGC Interface

[Interfaces](#) » [System](#)

#### Detailed Description

Interface for clock generation.

## Summary

The CGC interface provides the ability to configure and use all of the CGC module's capabilities. Among the capabilities is the selection of several clock sources to use as the system clock source. Additionally, the system clocks can be divided down to provide a wide range of frequencies for various system and peripheral needs.

Clock stability can be checked and clocks may also be stopped to save power when not needed. The API has a function to return the frequency of the system and system peripheral clocks at run time. There is also a feature to detect when the main oscillator has stopped, with the option of calling a user provided callback function.

**5.3.17.4 Timer Interface**

[Interfaces](#) » [Timers](#)

**Detailed Description**

Interface for timer functions.

**Summary**

The general timer interface provides standard timer functionality including periodic mode, one-shot mode, PWM output, and free-running timer mode. After each timer cycle (overflow or underflow), an

interrupt can be triggered.

If an instance supports output compare mode, it is provided in the extension configuration `timer_on_<instance>_cfg_t` defined in `r_<instance>.h`.

Enable transfer. Transfers occur after the activation source event (or when [transfer\\_api\\_t::softwareStart](#) is called if no peripheral event is chosen as activation source).

**Parameters**

[in]	p_ctrl	Control block set in <a href="#">transfer_api_t::open</a> call for this transfer.
------	--------	---

◆ **disable**

```
fsp_err_t(* transfer_api_t::disable) (transfer_ctrl_t *const p_ctrl)
```

Disable transfer. Transfers do not occur after the activation source event (or when `transfer_api_t::softwareStart` is called if no peripheral event is chosen as the DMAC activation source).

**Note**

------	--------	--

◆ **softwareStart**

```
fsp_err_t(* transfer_api_t::softwareStart) (transfer_ctrl_t *const p_ctrl, transfer_start_mode_t mode)
```

Start transfer in software.

**Warning**

Only works if no peripheral event is chosen as the DMAC activation source.

```

Transfer control block. Allocate an instance specific control block to pass into the transfer API calls.

**Enumeration Type Documentation**

◆ **transfer\_mode\_t**

enum <code>transfer_mode_t</code>	
Transfer mode describes what will happen when a transfer request occurs.	
Enumerator	
<code>TRANSFER_MODE_NORMAL</code>	In normal mode, each transfer request causes a transfer of <code>transfer_size_t</code> from the source pointer to the destination pointer. The transfer length is decremented and the source and address pointers are updated according to <code>transfer_addr_mode_t</code> . After the transfer length reaches 0, transfer requests will not cause any further transfers.
<code>TRANSFER_MODE_REPEAT</code>	Repeat mode is like normal mode, except that when the transfer length reaches 0, the pointer to the repeat area and the transfer length will be reset to their initial values. If DMAC is used, the transfer repeats only <code>transfer_info_t::num_blocks</code> times. After the transfer repeats <code>transfer_info_t::num_blocks</code> times, transfer requests will not cause any further transfers. If DTC is used, the transfer repeats continuously (no limit to the number of repeat transfers).
<code>TRANSFER_MODE_BLOCK</code>	In block mode, each transfer request causes <code>transfer_info_t::length</code> transfers of <code>transfer_size_t</code> . After each individual transfer, the source and destination pointers are updated according to <code>transfer_addr_mode_t</code> . After the block transfer is complete, <code>transfer_info_t::num_blocks</code> is decremented. After the <code>transfer_info_t::num_blocks</code> reaches 0, transfer requests will not cause any further transfers.
<code>TRANSFER_MODE_REPEAT_BLOCK</code>	In addition to block mode features, repeat-block mode supports a ring buffer of blocks and offsets within a block (to split blocks into arrays of their first data, second data, etc.)

◆ **transfer\_size\_t**

enum <a href="#">transfer_size_t</a>	
Transfer size specifies the size of each individual transfer. Total transfer length = <code>transfer_size_t * transfer_length_t</code>	
Enumerator	
TRANSFER_SIZE_1_BYTE	Each transfer transfers a 8-bit value.
TRANSFER_SIZE_2_BYTE	Each transfer transfers a 16-bit value.
TRANSFER_SIZE_4_BYTE	Each transfer transfers a 32-bit value.

◆ **transfer\_addr\_mode\_t**

enum <a href="#">transfer_addr_mode_t</a>	
Address mode specifies whether to modify (increment or decrement) pointer after each transfer.	
Enumerator	
TRANSFER_ADDR_MODE_FIXED	Address pointer remains fixed after each transfer.
TRANSFER_ADDR_MODE_OFFSET	Offset is added to the address pointer after each transfer.
TRANSFER_ADDR_MODE_INCREMENTED	Address pointer is incremented by associated <a href="#">transfer_size_t</a> after each transfer.
TRANSFER_ADDR_MODE_DECREMENTED	Address pointer is decremented by associated <a href="#">transfer_size_t</a> after each transfer.

◆ **transfer\_repeat\_area\_t**

enum <a href="#">transfer_repeat_area_t</a>	
Repeat area options (source or destination). In <a href="#">TRANSFER_MODE_REPEAT</a> , the selected pointer returns to its original value after <a href="#">transfer_info_t::length</a> transfers. In <a href="#">TRANSFER_MODE_BLOCK</a> and <a href="#">TRANSFER_MODE_REPEAT_BLOCK</a> , the selected pointer returns to its original value after each transfer.	
Enumerator	
<a href="#">TRANSFER_REPEAT_AREA_DESTINATION</a>	Destination area repeated in <a href="#">TRANSFER_MODE_REPEAT</a> or <a href="#">TRANSFER_MODE_BLOCK</a> or <a href="#">TRANSFER_MODE_REPEAT_BLOCK</a> .
<a href="#">TRANSFER_REPEAT_AREA_SOURCE</a>	Source area repeated in <a href="#">TRANSFER_MODE_REPEAT</a> or <a href="#">TRANSFER_MODE_BLOCK</a> or <a href="#">TRANSFER_MODE_REPEAT_BLOCK</a> .

◆ **transfer\_chain\_mode\_t**

enum <a href="#">transfer_chain_mode_t</a>	
Chain transfer mode options.	
<i>Note</i> <i>Only applies for DTC.</i>	
Enumerator	
<a href="#">TRANSFER_CHAIN_MODE_DISABLED</a>	Chain mode not used.
<a href="#">TRANSFER_CHAIN_MODE_EACH</a>	Switch to next transfer after a single transfer from this <a href="#">transfer_info_t</a> .
<a href="#">TRANSFER_CHAIN_MODE_END</a>	Complete the entire transfer defined in this <a href="#">transfer_info_t</a> before chaining to next transfer.

◆ **transfer\_irq\_t**

enum <code>transfer_irq_t</code>	
Interrupt options.	
Enumerator	
TRANSFER_IRQ_END	<p>Interrupt occurs only after last transfer. If this transfer is chained to a subsequent transfer, the interrupt will occur only after subsequent chained transfer(s) are complete.</p> <p><b>Warning</b> DTC triggers the interrupt of the activation source. Choosing TRANSFER_IRQ_END with DTC will prevent activation source interrupts until the transfer is complete.</p>
TRANSFER_IRQ_EACH	<p>Interrupt occurs after each transfer.</p> <p><i>Note</i> <i>Not available in all HAL drivers. See HAL driver for details.</i></p>

◆ **transfer\_start\_mode\_t**

enum <code>transfer_start_mode_t</code>	
Select whether to start single or repeated transfer with software start.	
Enumerator	
TRANSFER_START_MODE_SINGLE	Software start triggers single transfer.
TRANSFER_START_MODE_REPEAT	Software start transfer continues until transfer is complete.

## 5.4 BSP\_SDRAM

### Detailed Description

SDRAM initialization.

This file contains code that the initializes SDRAMC and SDR SDRAM device memory.

## Macros

```
#define BSP_PRV_SDRAM_MR_WB_SINGLE_LOC_ACC
```

### Macro Definition Documentation

#### ◆ **BSP\_PRV\_SDRAM\_MR\_WB\_SINGLE\_LOC\_ACC**

```
#define BSP_PRV_SDRAM_MR_WB_SINGLE_LOC_ACC
```

Due to hardware limitations of the SDRAM peripheral, it is not expected any of these need to be changable by end user. Only sequential, single access at a time is supported.
