

RTKA211230DE0020BU

The [RAA211230](#) is an integrated 24V, 3A synchronous buck regulator with constant on-time (COT) current mode control. It supports a wide input voltage range from 4.5V to 24V. The RTKA211230DE0020BU evaluation board provides a quick and comprehensive platform for evaluating the performance features of RAA211230 buck regulator.

The RTKA211230DE0020BU evaluation board operates from a supply voltage of 4.5V to 24V_{DC} with the capability of delivering continuous load of 3A and 3.3V output voltage.

Specifications

The board is configured and optimized for the following operating conditions:

- Input voltage range: 4.5V to 24V
- Output voltage: 3.3V
- Up to 3A output current capability
- Operating temperature range: -40°C to +125°C

Features

- 4.5V to 24V input supply range.
- Integrated high-side (85mΩ) and low-side (45mΩ) MOSFETs
- I_q = 400μA, no switching
- Minimum on-time 90ns typical, minimum off-time 300ns typical
- Reference voltage 0.765V with 2% tolerance for room temperature
- V_{OUT} programmable by changing the FB voltage divider
- 500kHz nominal switching frequency
- Current mode COT control with internal compensation
- Internal 0.8ms soft-start
- Protections: LSOC Limit, VIN UVLO, OTP, UVP with Hiccup mode

1. Functional Description

The RTKA211230DE0020BU provides a comprehensive and versatile platform to evaluate functionality and prototype an application of the integrated 24V, 3A synchronous buck regulator RAA211230. This evaluation board includes the options to evaluate most of the features of RAA211230. Test points have been included for easy probing to evaluate the features.

1.1 Operating Range

The RTKA211230DE0020BU evaluation board evaluates RAA211230 with VIN from 4.5V to 24V and continuous load of 3A. For proper functioning of the evaluation board, Renesas recommends operating the board within these specifications.

The inductance, capacitance and feedback resistor values of the regulator were chosen for 3.3V V_{OUT} and 500kHz switching frequency. You can replace these components with different values if a different operating condition is required.

EN is connected to VIN through a 0Ω resistor. You can also connect EN to an external logic voltage to enable and disable by disconnecting jumper JP1. Alternatively, you can replace R1 with an appropriate resistor to obtain V_{IN} UVLO protection (JP1 connected between 2 and 3).

Updates on the FB resistor divider, inductor, and output capacitor may be required with changes in the operating load and output voltage.

1.2 Connectors, Test Points, Selection Switches, and Jumper Descriptions

The RTKA211230DE0020BU evaluation board includes I/O connectors, test points, selection switch, and jumpers to provide a comprehensive and versatile platform for evaluation of RAA211230. [Table 1](#) shows the description of them.

Table 1. Connectors, Test Points, Selection Switches, and Jumper Descriptions

| Ref DES | Description |
|---------|------------------------------------|
| J1 | Input voltage positive connection |
| J2 | Input voltage return connection |
| J3 | Output voltage positive connection |
| J4 | Output voltage return connection |
| TP1 | Vin test point |
| TP2 | Ground test point |
| TP3 | ENABLE test point |
| TP4 | VSW test point |
| TP5 | VOUTN test point |
| TP6 | VOUT test point |
| TP7 | Ground test point |
| TP8 | Ground test point |
| JP1 | Jumper pin for Enable/Disable |

1.2.1 Enable

When JP1 is connected between terminals 2 and 3, VIN gets connected to EN through a 0Ω resistor (R1). Connecting JP1 to terminals 1 and 2 causes EN to connect to ground and the part becomes disabled.

The default VIN UVLO (R1 = 0Ω) is set to 4.3V with hysteresis of 350mV. To obtain programmable V_{IN} UVLO protection, JP1 can be connected to terminals 2 and 3, and R1 is selected using [Equation 1](#) where V_{INUVLO} is the required UVLO point.

$$(EQ. 1) \quad R1 = \left(\frac{V_{INUVLO} - 1.3}{1.3} \right) \times 10^4$$

1.2.2 Soft-Start

The RTKA211230DE0020BU is set for an internal soft-start of 0.8ms.

1.2.3 Switching Frequency

The RTKA211230DE0020BU is set for a nominal switching frequency of 500kHz. Under light load conditions, the part operates in PFM mode (variable frequency).

1.2.4 VOUT Programming

The output voltage can be programmed by adjusting the values of the feedback resistors (R5 and R6) as in [Equation 2](#) where V_{OUT} is the required output voltage.

$$(EQ. 2) \quad \frac{R5}{R6} = \frac{V_{OUT} - 0.765}{0.765}$$

1.3 Recommended Equipment

- Power supply that can deliver 4.5V or higher with at least 3A source current capability
- Electronic load capable of sinking at least 3A current
- 4-channel oscilloscope with voltage and current probes

1.4 Quick Start Guide

Use the following Quick Setup Guide to configure and power-up the board for proper operation.

1. Set the power supply voltage to 24V and turn off the power supply. Connect the positive output of the power supply to J1 (VIN) and the negative output to J2 (GND).
2. Connect a jumper connector across jumper pins 2 and 3 (JP1). (Disconnect jumper connector if using external logic for enable).
3. Connect an electronic load to J3 (V_{OUT}) for the positive connection and J4 (GND) for the negative connection.
4. Place scope probes to VOUT (TP6), VSW (TP3), and/or other test points of interest.
5. Set the load current to 0.1A and turn on the power supply. The output voltage should be in regulation with nominal 3.3V output.
6. Slowly increase the load up to 3A. The output voltage should remain in regulation with nominal 3.3V output.
7. Slowly sweep VIN from 24V to 4.5V. The output voltage should remain in regulation with nominal 3.3V output.
8. Decrease the input voltage to 0V to shut down the regulator.

2. Board Design

Figure 2. RTKA211230DE0020BU Evaluation Board (Top)

2.1 PCB Layout Guidelines

The printed circuit board (PCB) layout is critical for proper operation of the RAA211230. The following guidelines are recommended to achieve good performance.

1. Renesas recommends using a double-sided (two layer) PCB. 2oz copper is recommended. Use the bottom side as ground. Place the ceramic input capacitors on the same side of the PCB as the IC.
2. Use a combination of a bulk capacitor and smaller ceramic capacitors with low ESL for input capacitors and place them as close as possible to the IC.
3. Place bootstrap capacitors close to the IC between BST and SW pins on the same side of the PCB as the IC. Renesas recommends using a 0.1 μ F ceramic capacitor.
4. Route the output voltage feedback signal away from SW and BST. Place feedback resistors close to the FB pin of the regulator.
5. The copper area of the SW node should not be more than needed. Place the inductor close to regulator.
6. Place an output capacitor close to the inductor.
