

Security Key Management Tool

User's Manual

All information contained in these materials, including products and product specifications, represents information on the product at the time of publication and is subject to change by Renesas Electronics Corp. without notice. Please review the latest information published by Renesas Electronics Corp. through various means, including the Renesas Electronics Corp. website (<http://www.renesas.com>).

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
 - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
 - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION ("Vulnerability Issues"). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)

A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

2. Processing at power-on

The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.

3. Input of signal during power-off state

Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

4. Handling of unused pins

Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.

5. Clock signals

After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.

6. Voltage application waveform at input pin

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).

7. Prohibition of access to reserved addresses

Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

8. Differences between products

Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

How to Use This Manual

1. Purpose and Target Readers

This manual is intended to help users understand the features of the Security Key Management Tool for CLI. It is intended for users who design and develop systems that use the Security Cryptographic Engine, Trusted Secure IP and RSIP-Exxx, which are security IPs built into Renesas Electronics microcomputers. To use this manual, you need a basic knowledge of microcontrollers and Windows , Linux and macOS.

Use this software after sufficiently confirming the manual of the microcontroller in use.

2. Conventions

Note: Footnote for item marked with "Note" in the text.

Numeral representations: Binary ... xxxx or xxxxB

Decimal ... xxxx

Hexadecimal ... 0xXXXX or xxxxH

“ “: Any character or item on the screen that can be selected or input

[]: Name of a command, dialog box, tabbed page, option, or area on the screen

3. Terminology

Term	Meaning
CLI	Command Line Interface
DLM Key	Key for Device Lifecycle Management. Not supported for all MCUs/MPUs.
DOTF	A function that directly decrypts an encrypted image written to an external flash ROM or other device when reading and executing the image. Some MCUs/MPUs call it Decryption On-The-Fly (DOTF) or On-The-Fly Decryption (OTFD). In this document, it is referred to as DOTF.
Encrypted KUK	Key Update Key wrapped by a UFPK
Encrypted User Key	User Key wrapped by either a UFPK or a KUK
FSBL	First Stage Bootloader Programs to verify the validity of Second Stage Bootloader or OEM_BL.
GUI	Graphic User Interface
HRK	Hardware Root Key Key data set for each MCU family or MCU group.
HUK	Hardware Unique Key Unique key data set for each MCU device.
KUK	Key Update Key Key to update User Key
OEM Bootloader OEM_BL	Programs that are executed after device startup to verify the validity of the application program
PEM	Base64-encoded file of the x509 ASN.1 key. The tool supports reading keys generated by the Openssl command <code>genssa</code> or the <code>ecparam -genkey</code> command.
Renesas key file	Renesas key file Used for key provisioning with the Renesas Flash Programmer (RFP).
Renesas Key Wrap service	A service that wraps a UFPK with a device-specific key to generate a W-UFPK https://dlm.renesas.com/keywrap/
RFP	Renesas Flash Programmer https://www.renesas.com/rfp
RSIP	Renesas Secure IP Security IP implemented in RA Family, RX Family and RZ Family, etc.
RSU	Renesas Secure Update An image file format for program updates defined in Firmware Update Module Using Firmware Integration Technology (R01AN5824).
SCE	Secure Cryptographic Engine Security IP implemented in RA Family and Synergy Platform.
SFP	Secure Factory Programming Ability to write encrypted images to devices while decrypting them, which is a function of Renesas MCU boot firmware
TSIP	Trusted Secure IP Security IP implemented in RX Family

Term	Meaning
UFPK	User Factory Programming Key Key used to wrap User Keys and DLM Keys
User Key	Encryption key used in the user application AES key, RSA public key, RSA private key, etc.
W-UFPK	UFPK wrapped by the Renesas Key Wrapping service
Wrapped User Key	User Key rewrapped with SCE or TSIP to use User Key in SCE Protected Mode or TSIP

1. Renesas Key Management System

1.1 Introduction to Root of Trust

Roots of trust are highly reliable hardware, firmware, and software components that perform specific, critical security functions (<https://csrc.nist.gov/projects/hardware-roots-of-trust>). In an IoT system, a root of trust typically consists of identity and cryptographic keys rooted in the hardware of a device. It establishes a unique, immutable, and unclonable identity to authorize a device to exist in the IoT network.

Secure boot is part of the services provided in the Root of Trust in many security systems. Authentication of the application uses Public Key Encryption. The associated keys are part of the Root of Trust of the system. Device Identity, which consists of Device Private Key and Device Certificate, is part of the Root of Trust for many IoT devices.

From the above Root of Trust discussion, we can see that leakage of cryptographic keys can bring the secure system into a risky state. Protection of the Root of Trust involves limiting key accessibility to within the cryptographic boundary only, with keys that are securely stored and preferably unclonable. The Root of Trust should be locked from read and write access by unauthorized parties.

The Renesas user key management system can provide all of the above desired protection.

1.2 Introduction to Renesas Secure IP and Associated Keys

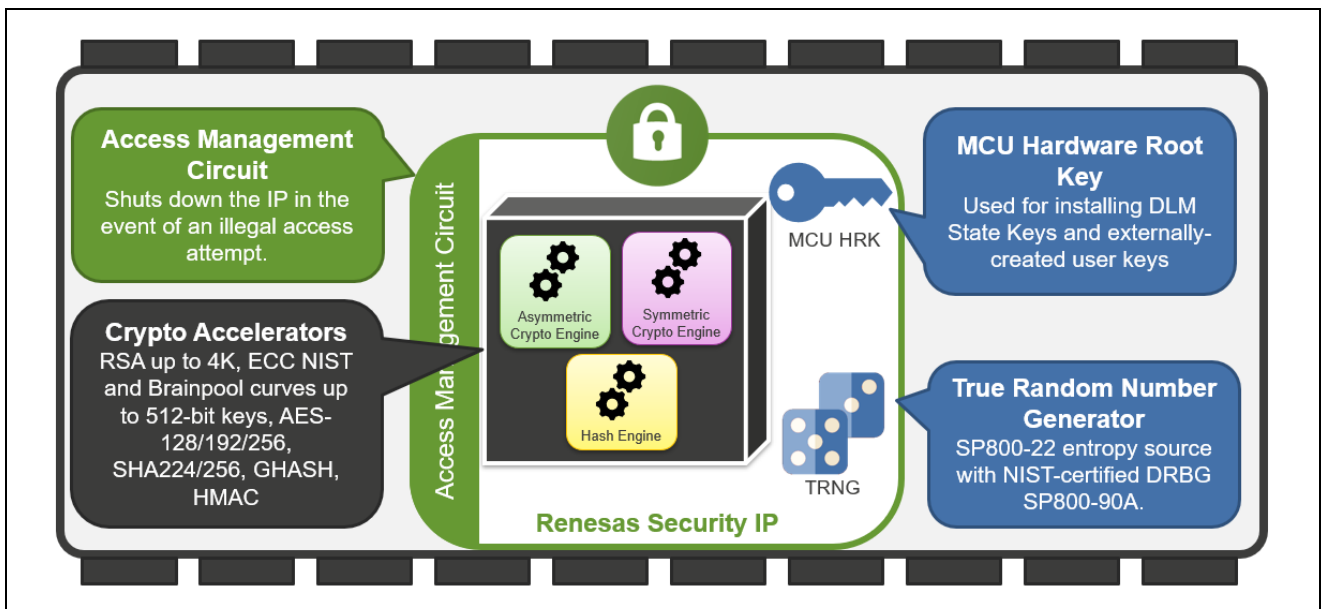

Figure 1-1 Outline of a Typical Renesas Security Engine

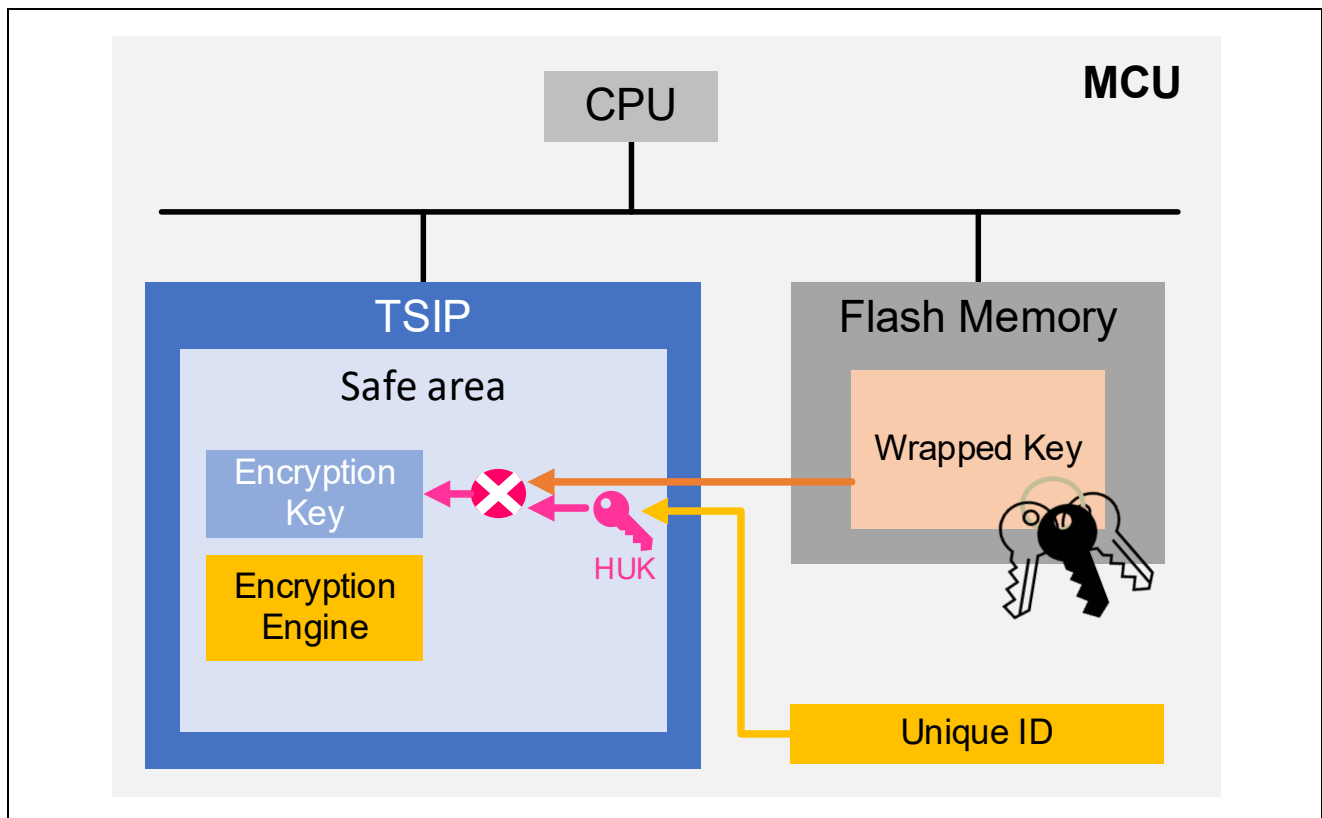

Figure 1-2 Outline of RX Trusted Secure IP

A Renesas Secure IP security engine, such as a Secure Crypto Engine (SCE), Trusted Secure IP (TSIP), or a RSIP-E Type security engine (RSIP), is an isolated subsystem within the MCU. The security engine contains hardware accelerators for both symmetric and asymmetric cryptographic algorithms, as well as various hashes and message authentication codes. It also contains a True Random Number Generator (TRNG), providing an entropy source for the cryptographic operations. The security engine is protected by an Access Management Circuit, which can shut down the security engine in the event of an illegal external access attempt.

Support for specific algorithms, secure key injection, and secure key update depends on the specific MCU/MPU. For more information, refer to the device’s Hardware User Manual plus the following web pages:

Table 1-1 MCU/MPU Related Information

1.3 Renesas Secure Key Injection Advantages

Secure key injection and update, combined with the security engine’s support of wrapped keys, address many vulnerabilities associated with using plaintext keys:

- Plaintext keys are never stored in code flash. In the event of a program memory breach, the sensitive key material is protected.
- Plaintext keys are never stored in RAM. In the event of malicious code executing on the system, the sensitive key material is still protected.
- Keys can be securely stored in code flash, data flash, or even copied into external memory, enabling unlimited secure key storage.

In addition, Renesas key wrapping techniques protect against device cloning, as discussed below.

1.3.1 Advantages of Key Wrapping over Key Encryption

Figure 1-3 Key Wrapping vs. Key Encryption

It is important to understand the difference between wrapping and encrypting for secure asset storage. When data is encrypted and sent to another recipient, if that recipient has the same key, they can decrypt the data. This results in a confidential exchange of information. However, what if there was a problem with the transmission of the encrypted data? If the recipient unknowingly receives corrupted information, the decryption algorithm will generate garbage data, with no indication that the original data has been corrupted.

Wrapping solves this problem by appending a Message Authentication Code to the encrypted output for integrity checking.

1.3.2 Advantages of Key Wrapping using an HUK

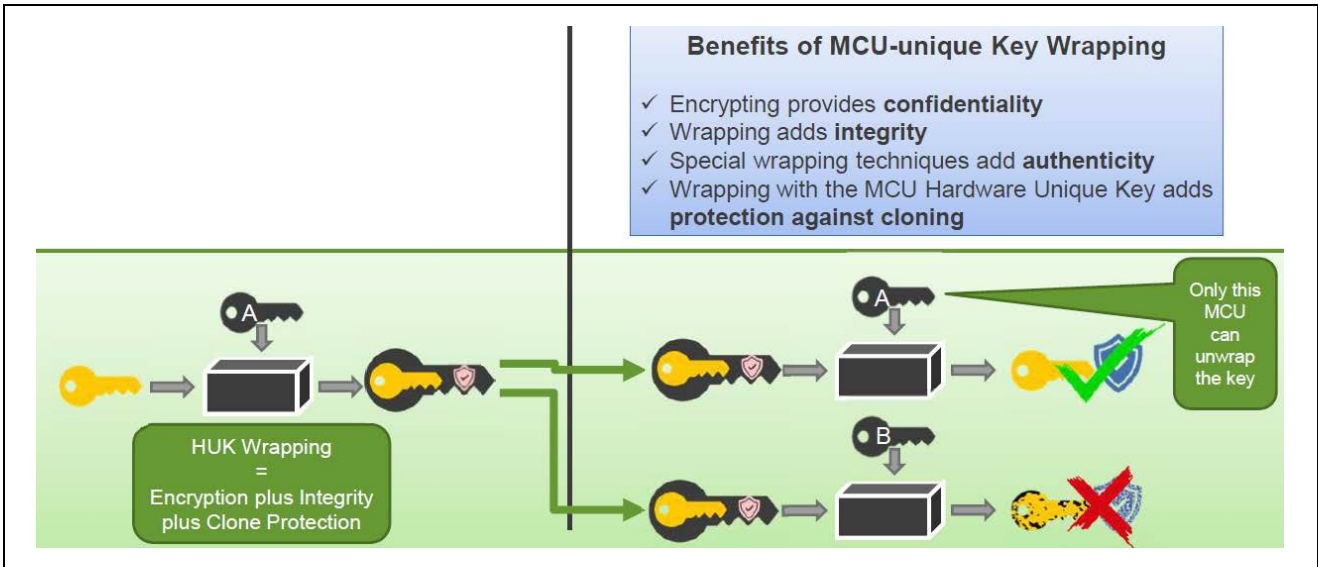

Figure 1-4 Key Wrapping using an HUK

Using a Hardware Unique Key (HUK) to wrap the stored keys adds another protection feature – clone protection. If the wrapped key is transmitted or copied to another MCU/MPU, that MCU/MPU will not be able to unwrap nor use the copied key. Even if the entire MCU contents are copied onto another device, the keys cannot be used nor exposed.

1.4 Wrapped Key Injection Procedure Overview

This section describes the injection procedure for wrapped keys, which requires the capabilities provided by the Security Key Management Tool. The types of keys supported vary by MCU/MPU. Refer to *Table 1-1 MCU/MPU Related Information* for the application notes and drivers for each device.

1.4.1 General Steps for Secure Key Injection

Secure Key Injection is the process by which application keys are stored MCU-uniquely wrapped via a mechanism that enables no plaintext key exposure during the provisioning process. The exact mechanism of this process is dependent on the specific MCU/MPU. Some devices support secure key injection over the programming interface; other devices support secure key injection using firmware running on the device. Note that key preparation steps using the Security Key Management Tool where key material is exposed in plaintext must be performed in a secure environment.

There are three high-level steps for key injection.

1. The first step in the secure key injection process is to use the Renesas Device Lifecycle Management (DLM) key wrap service to wrap an arbitrary User Factory Programming Key (UFPK) using the Renesas Hardware Root Key (HRK), providing a wrapped UFPK (W-UFPK). The UFPK is a 256-bit value selected by the user. The same UFPK can be used to inject any number of keys. The Security Key Management Tool can create a random UFPK and provide it as a key file suitable for sending to the key

wrap service. The Tool can also accept a specified UFPK and create a key file suitable for sending to the key wrap service.

Figure 1-5 Wrapping the UFPK using DLM server

- Next, the user key must be wrapped with UFPK. The Security Key Management Tool can wrap a user key, specified as either raw data or in a binary key file, and generate files that can be used for secure key injection by the selected device. Note that not all output file types are supported by all device Families. For example, the Renesas RA Family supports secure key injection only via the programming interface; therefore, a Renesas Flash Programmer secure key file must be generated.

Figure 1-6 Encrypt the User Key with UFPK

- Finally, the user key is injected via either the serial programming interface or by firmware running on the device, depending on the key injection process supported by the selected device. The input to this process includes both the wrapped UFPK (W-UFPK) and the wrapped user key prepared in the previous steps.

Figure 1-7 Inject a User Key over the Serial Programming Interface

1.4.2 General Steps for Secure Key Update

To enable secure key injection in the field, one or more Key-Update Keys (KUK) must be injected during production programming/provisioning. KUKs, like other cryptographic keys, can be stored in either code flash or data flash (if available on the MCU). Since injecting new keys in the field is usually done to replace older keys (key rotation or re-keying), this process is referred to as “key update”; however, this process can also be used to inject a new key in the field. No previously injected keys are deleted with this process.

Note that if the target device supports key injection via the programming interface, additional KUKs CANNOT be injected after the programming interface is disabled. In this case, once a product is in the field with its programming interface disabled, new keys can ONLY be injected via a pre-existing KUK. Therefore, it is highly recommended that multiple KUKs be injected during production provisioning. This enables the KUK to be rotated or revoked to adhere to an infrastructure security policy or to respond to a key exposure security breach.

There are three steps high-level steps for key update.

1. The first step is to generate and inject a KUK, as described in *Section 1.4.1 General Steps for Secure Key* . The KUK must be injected as a “KUK” key type.

Figure 1-8 Encrypt a KUK with the UFPK

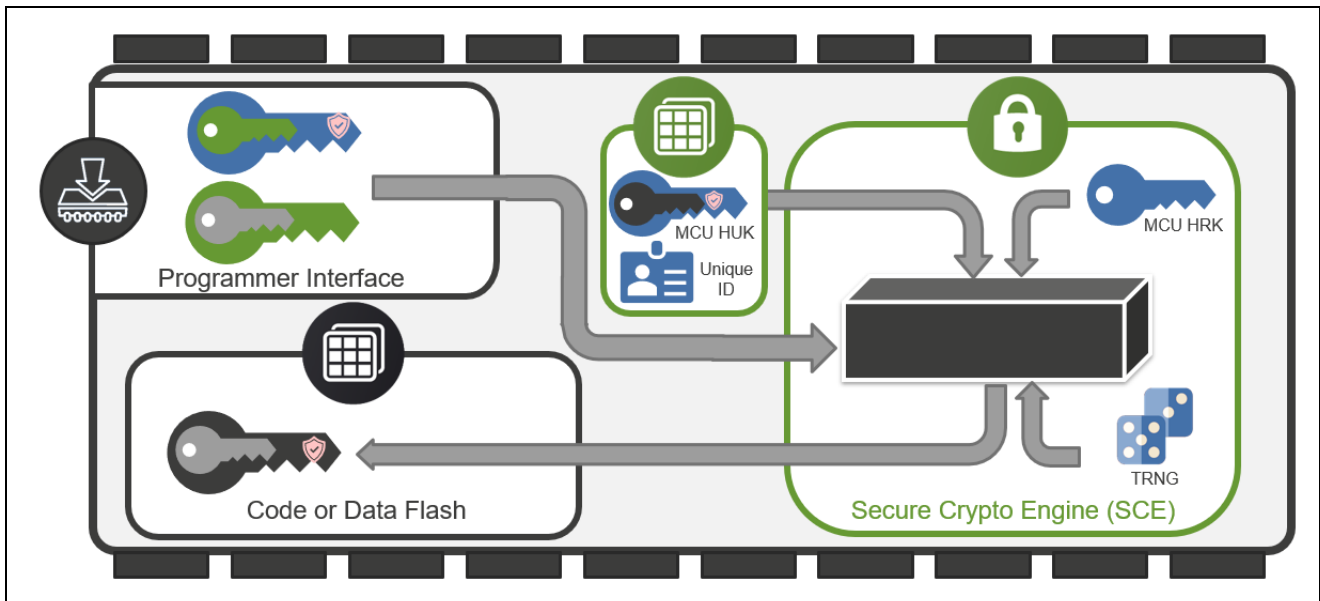

Figure 1-9 Inject a KUK Over the Serial Programming Interface

- The second step is to use the KUK to wrap the new user key. This is similar to secure key injection, but using the KUK instead of the UFPK.

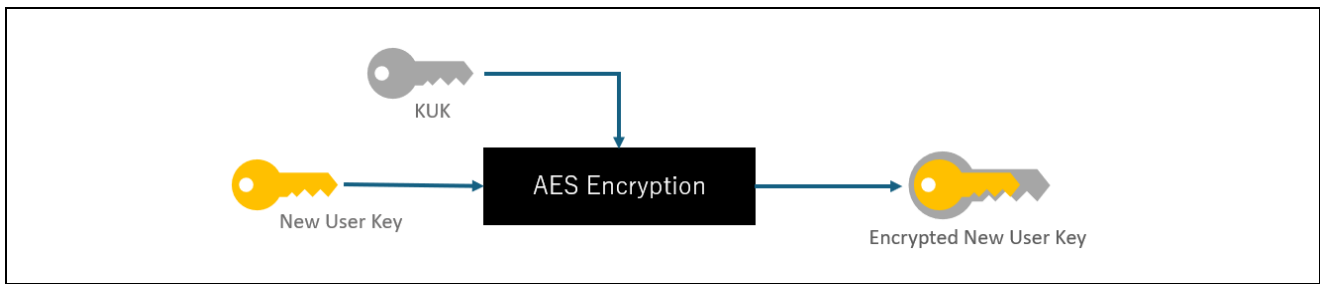

Figure 1-10 Encrypt the New User Key with a KUK

- The last step is to inject a new User Key using the respective device driver and the already-injected KUK. Please refer to the manual of each MCU/MPU device driver for the key update API and how to use it.

Figure 1-11 Update the User Key

1.5 Renesas Security Functions

In addition to key injection and updating, Renesas products provide various security features that utilize Renesas Secure IP. The Security Key Management Tool provides functions to support the use of those security features. Supported features vary by MCU/MPU. Please refer to the application notes and drivers for each device by referring to *Table 1-1 MCU/MPU Related Information*.

1.5.1 First Stage Bootloader

In a secure system, an application program must be executed only after confirming that it has not been altered, either maliciously or inadvertently. This confirmation, typically performed by a boot loader, can be a simple integrity check, or it can involve signature verification to ensure authenticity. However, it is important to note that the legitimacy of the boot loader itself must also be guaranteed. The secure boot sequence is often implemented in stages, starting with an immutable portion to ensure a strong root of trust.

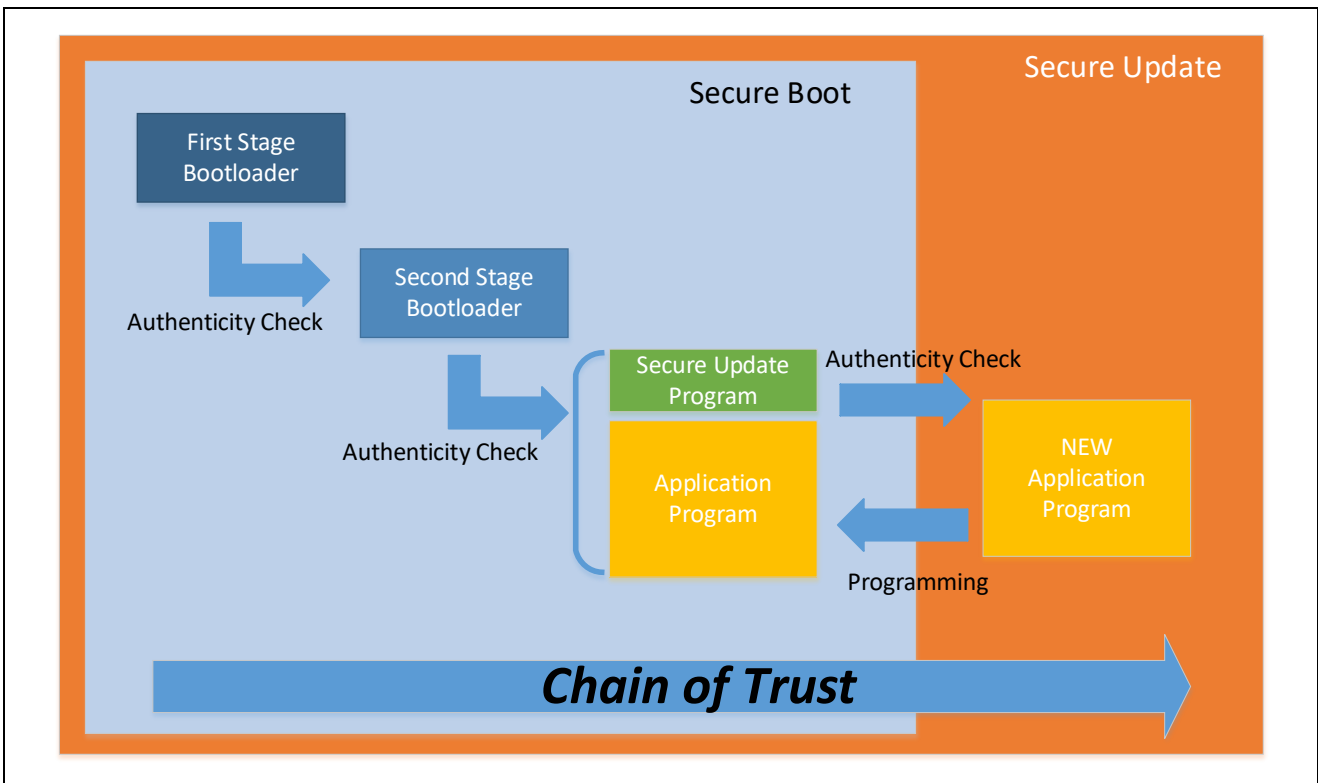

Figure 1-12 Chain of Trust in a secure system.

Some Renesas MCU products include an immutable First Stage Bootloader (FSBL), located in the masked ROM or in the One Time Programmable (OTP) ROM area of the device. An OEM Root Public Key is registered and locked in the device during production programming. The FSBL uses the OEM Root Public Key to authenticate the Second Stage Bootloader’s public key, which is then used to authenticate the Second Stage Bootloader.

The following figures show the flow of the secure boot process for both initial production programming and normal application execution, using the OEM Root Public and Private Keys (OEM_ROOT_PK and

OEM_ROOT_SK), the OEM Bootloader Public and Private Keys (OEM_BL_PK and OEM_BL_SK), and the OEM (second stage) bootloader (OEM_BL).

The Security Key Management Tool can generate the Key Certificate and Code Certificate used during this validation. For more details, please refer to the application notes and drivers for the target MCU/MPU.

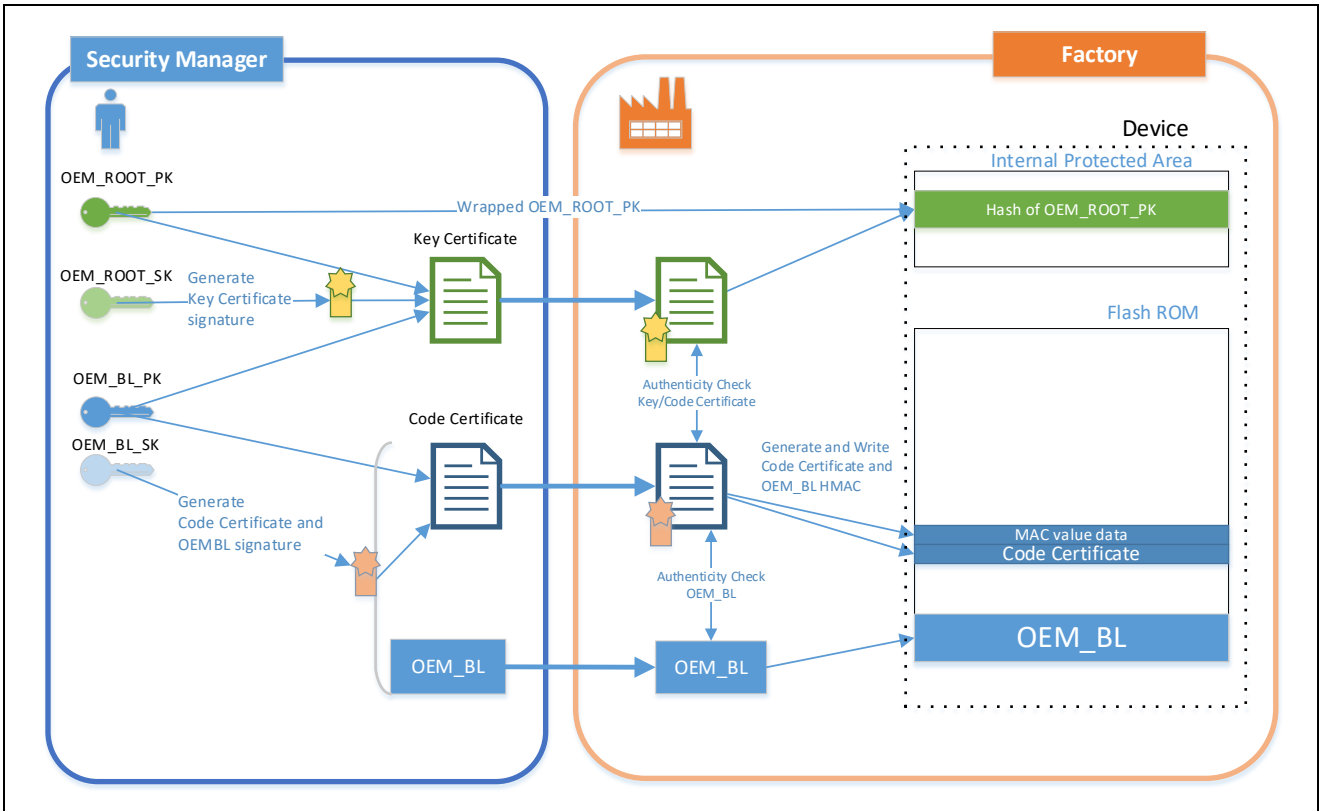

Figure 1-13 Authenticity Check flow performed when programming OEM_BL at the factory.

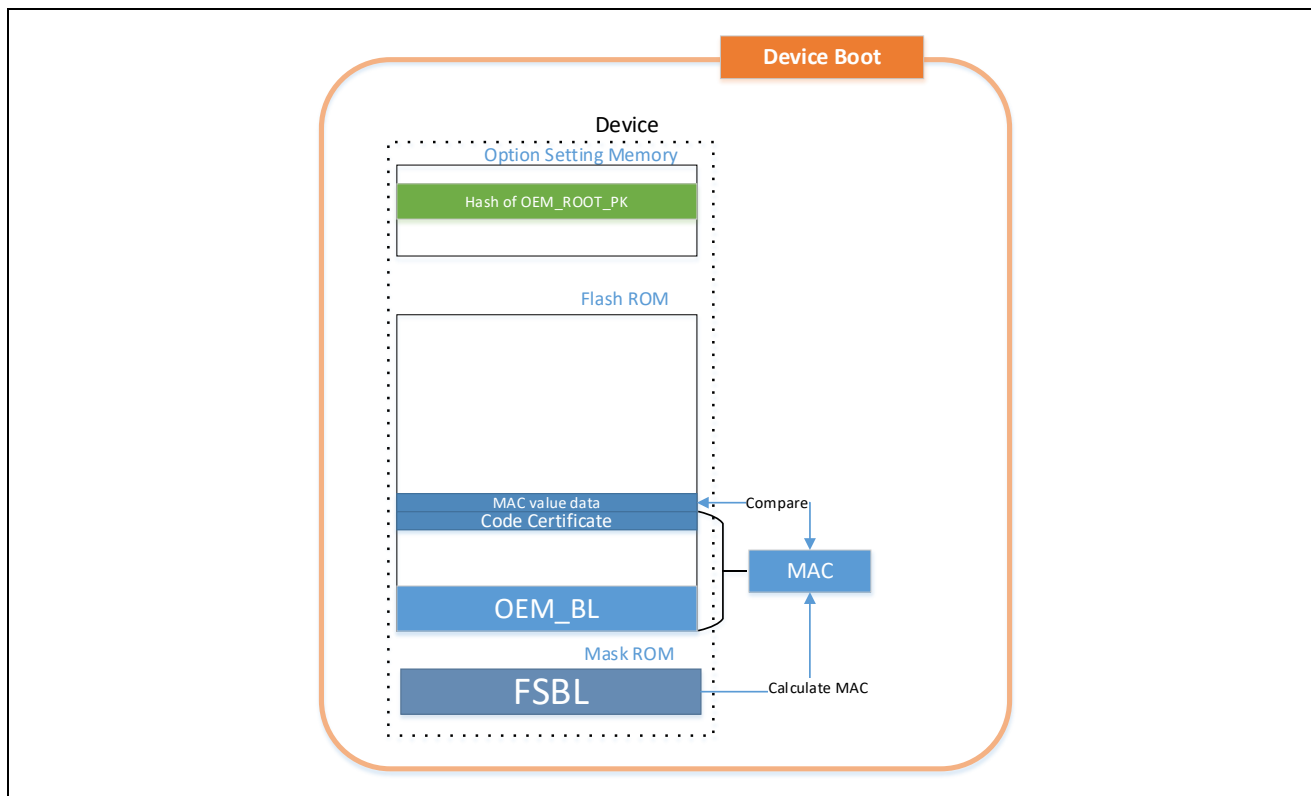

Figure 1-14 FSBL operation at device startup.

1.5.2 Decryption On-The-Fly/On-The-Fly Decryption

To protect application programs and sensitive data stored in external memory, the contents of the external memory should be encrypted. The Decryption On-The-Fly or On-The-Fly Decryption feature (DOTF) supported on select Renesas MCU/MPU products enables transparent decryption of encrypted external memory when executing code or reading data.

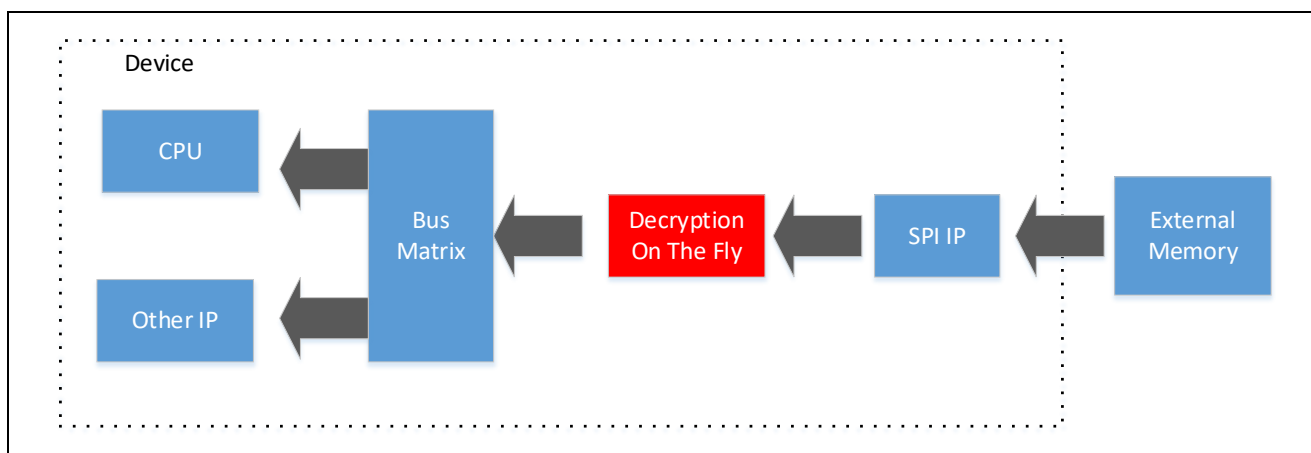

Figure 1-15 Example of internal system bus for DOTF implemented MCU/MPU.

The Security Key Management Tool supports preparing application information (executable code or sensitive data) for use with Renesas DOTF feature.

1.5.3 Secure Factory Programming

The Secure Factory Programming feature supported on select Renesas MCU/MPU products enables secure application programming in a non-secure programming environment.

The complete final content of the MCU (code, data, and keys) is delivered in encrypted format, protected by a Chain of Trust such that no plaintext of the MCU contents is ever exposed outside the MCU. This ensures that even if the application programming file is leaked from the factory at the time of production programming, the confidentiality of the contents of the programming file is maintained.

Figure 1-16 System example of MCU/MPU with Secure Factory Programming function implemented.

The Security Key Management Tool supports the following functions to realize the Secure Factory Programming function:

- Encryption of user application program
- Wrapping of application keys used in the application program
- Injection of Device Lifecycle Management / Authentication Level keys
- First Stage Bootloader setup
- Transition to final DLM state

Please refer to the MCU/MPU documentation for the list of features supported by the specific device and any limitations of Secure Factory Programming, such as support for programming internal memories only.

2. Overview

The Security Key Management Tool supports the security features of Renesas MCUs/MPUs.

Three versions of the tool are available:

- Command Line Interface – Execute single commands from the Operating Systems command line, or include several commands in a batch file or script. Designed to support key managers and group development.
- Standalone Graphical User Interface – An intuitive GUI designed to assist firmware developers. Useful when developing with third party IDEs.
- e² studio plugin – The GUI interface integrated into Renesas's e² studio, for simplified development support.

2.1 Features

The functions and MCU/MPU devices supported by the Security Key Management Tool are summarized below:

2.1.1 Secure Key Injection and Update

The following secure key injection and update related functions are supported. Refer to *Table 2-1* for a list of supported MCUs and MPUs.

- [1] UFPK generation and generation of files in a format suitable for submission to the Renesas Key Wrap Service
- [2] Wrapping DLM keys with a UFPK for secure key injection (if DLM keys are supported on the selected MCU or MPU)
- [3] Wrapping user keys with a UFPK for secure key injection
- [4] Wrapping user keys with a KUK for secure key update

Table 2-1 Supported Key Injection/Update Functions by MCU/MPU Family

Family	Supported Functions			
	[1]	[2]	[3]	[4]
RA Family				
RSIP-E51A Security Function and Protected Mode	✓	✓	✓	✓

Renesas Synergy Platform				
SCE7	✓	-	✓	✓
SCE5	✓	-	✓	✓

Output in the following file formats is supported. (Note that not all MCUs and MPUs support Renesas key files.):

- Renesas key file
- C source file
- Binary data
- Motorola hex file

2.1.2 Security features supported by Security Key Management Tool

In addition to injecting and updating secure keys, the Security Key Management Tool can generate data for use by the following functions of the device. See Table 2-2 for supported MCUs/MPUs.

- (1) Generate Key Certificate and Code Certificate for FSBL
- (2) Encrypt code/data for use with DOTF
- (3) Prepare a file for use with Secure Factory Programming
- (4) Prepare a file for use with the TSIP Update solution

2.2 Operating Environment

2.2.1 Hardware Environment

(1) Host PC

- Processor: 1GHz or faster
- Main memory: 1Gbyte or more
- Display setting : Resolution 1366 x 768 or higher
Display Scale 100% (recommended)

Note:

If the resolution or display scale is not listed above, some options in the GUI may not be displayed

2.2.2 Software Environment

(1) OSes supported

- Windows 10 (64bit)
- Linux (Ubuntu 20.04 LTS, Ubuntu 22.04 TLS)
- macOS 14 Sonoma (Support for Apple Silicon only)

(2) e²studio plugin version e²studio operation check version

- e²studio 2025-01

3. Descriptions of GUI Functions

This chapter describes the screen structure and functions of the GUI version of the Security Key Management Tool.

The Standalone and e²studio plugin versions have the same GUI configuration. The explanation is given for the Standalone version.

3.1 Main Window

The main window after startup consists of the following:

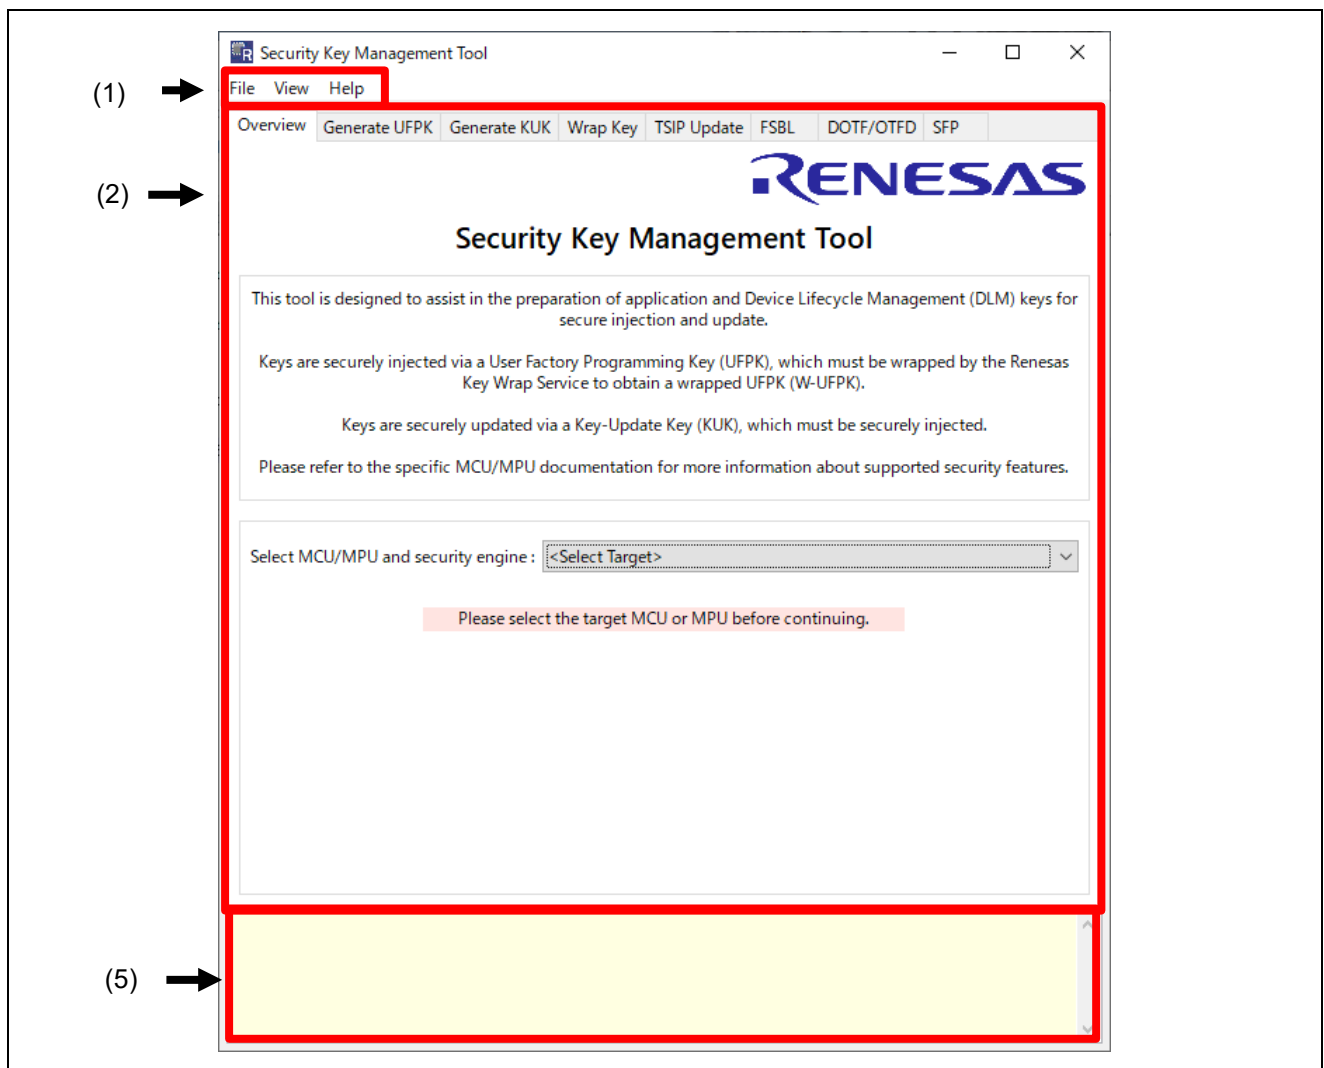

Figure 3-1 Main Window of standalone version

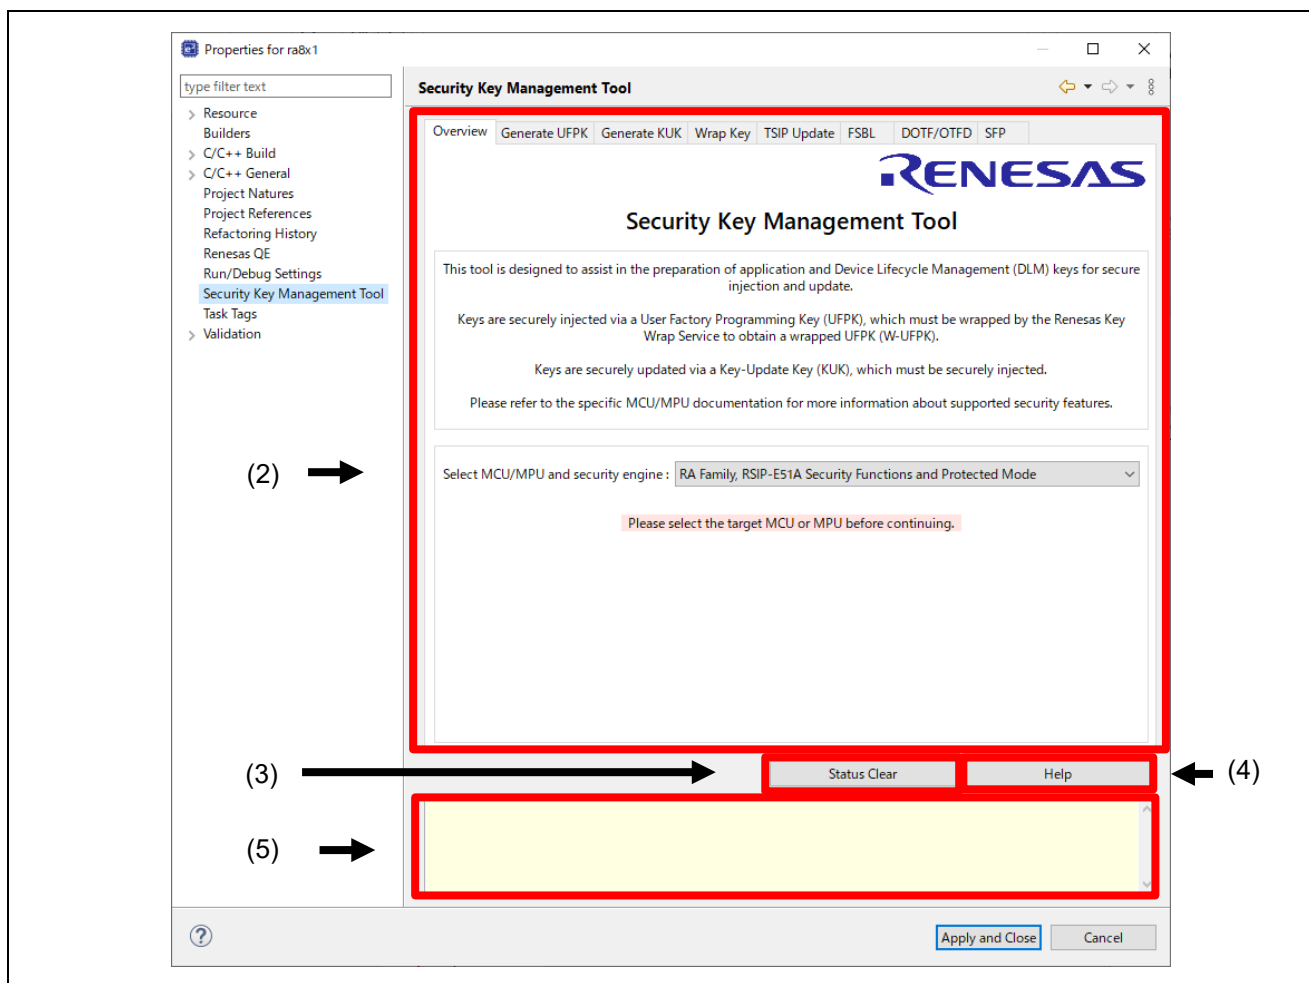

Figure 3-2 Main Window of e²studio plugin version

No	Item	Description
(1)	Menu bar	Function only in the standalone version. See 3.2 Menu bar for details.
(2)	Tab Window	Each tab provides an interface for generating files used as part of the secure key injection and/or update process.
(3)	Status Clear	Clears the execution results displayed in the Status area. For the Standalone version, this function is provided in the Menu bar.
(4)	Help	Shows resources that are useful for understanding the Renesas key management system. For the Standalone version. This function is provided in the Menu bar.
(5)	Status	Displays the status of the requested operation.

3.2 Menu bar

This is a feature of the standalone version only.

3.2.1 [File] menu

Select from a menu of functions related to saving settings.

- **[Save...]**

Saves the input/output file information set in each tab to an XML file format file. Key data is not saved.

- **[Load...]**

The settings file saved in **[Save...]** is loaded and reflected in each tab.

In the case of the e²studio plugin version, pressing the "**Apply and Close**" button saves the configuration information for each tab to the e²studio project.

3.2.2 [View] menu

This menu is related to the GUI display.

- **[Status Clear]**

Clears the execution results displayed in the Status area.

3.2.3 [Help] menu

- **[About Security Key Management Tool...]**

Display the Help dialog. Shows resources that are useful for understanding the Renesas key management system.

3.3 [Overview] Tab

In this tab, select the target MCU/MPU and security engine to be used. Be sure to select the target device prior to performing operations on any other tab. The functionality of the other tabs is dictated by the device selection on this tab.

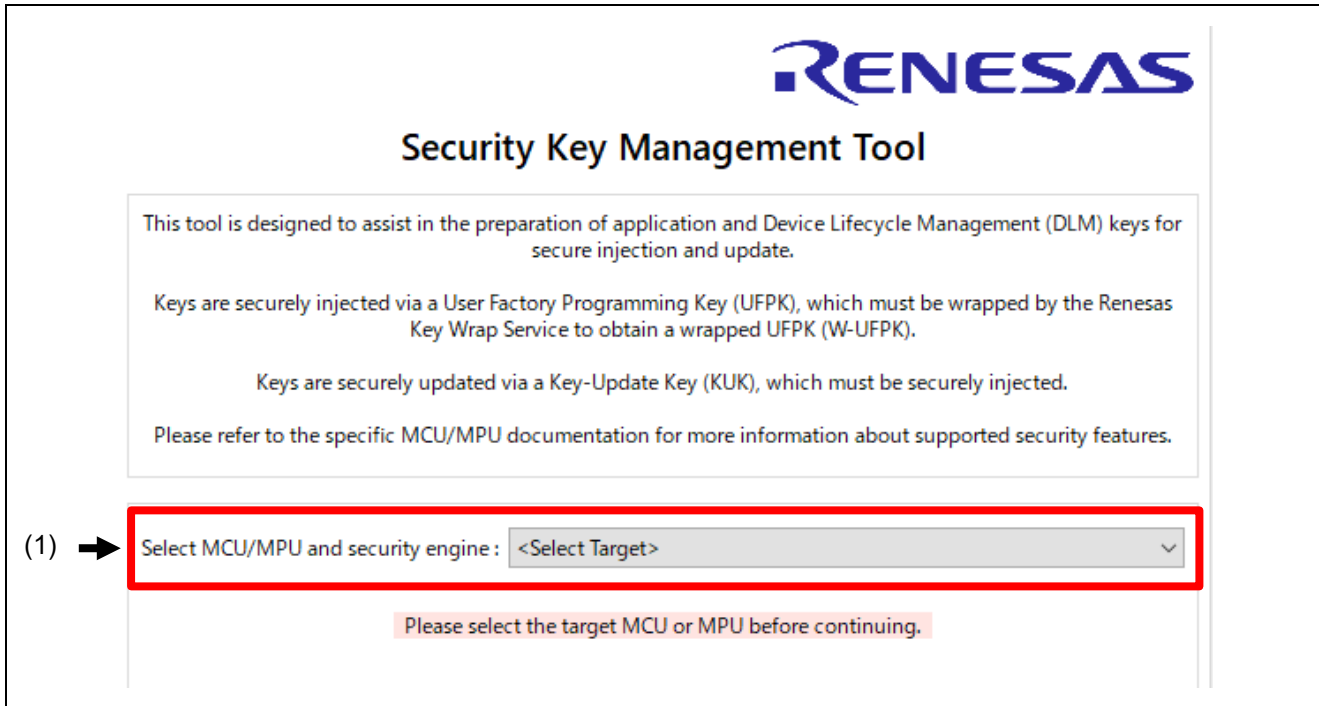

Figure 3-3 [Overview] Tab

No	Item	Description
(1)	Select MPU/MCU and security engine	Select the target MCU/MPU and the cryptographic engine for secure key injection and/or update.

3.4 [Generate UFPK] Tab

This tab generates a User Factory Programming Key (UFPK) file as a binary *.key file. This file must then be sent to the Renesas Key Wrap Service to obtain the wrapped UFPK (W-UFPK). The UFPK file will also be used to prepare keys for secure key injection.

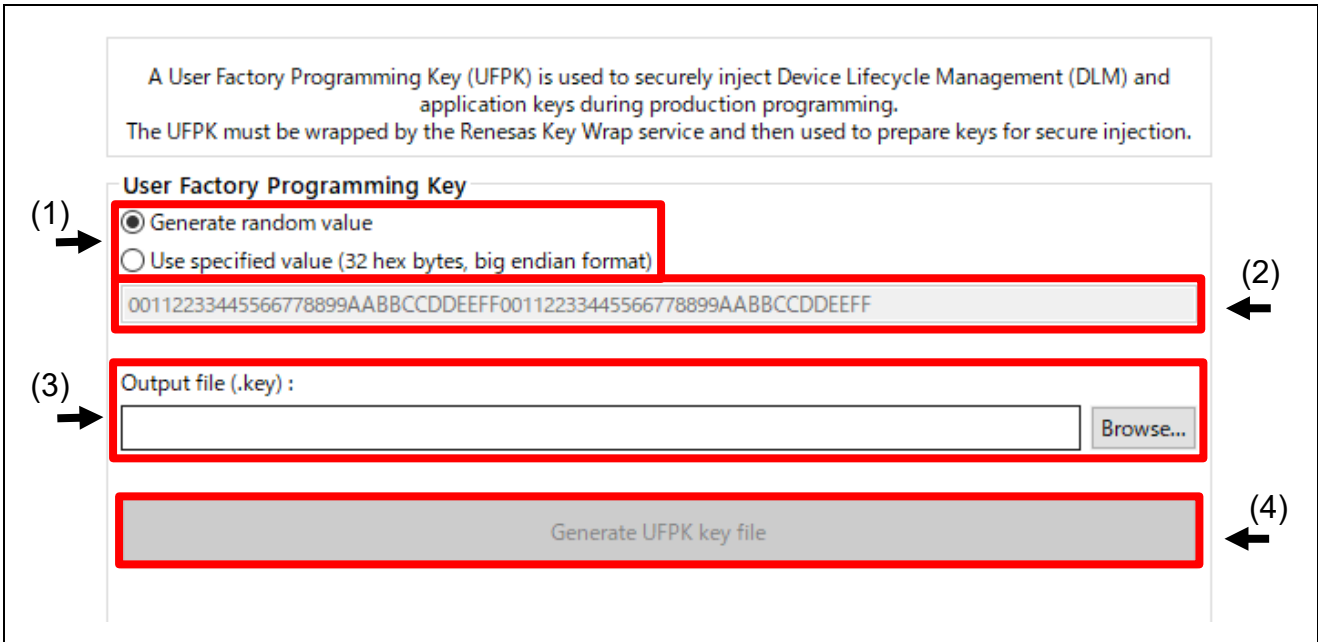

Figure 3-4 [Generate UFPK] Tab

No	Item	Description
(1)	UFPK input format	Select whether to use the input value from (2) for the UFPK value or to use a random number generated by the tool. The specific amount of randomness of the random values generated by this tool is not guaranteed.
(2)	UFPK value	When Use specified value is selected in (1), the value entered in the text box is used as the UFPK value. This value must be specified as 32 hex bytes in big-endian format.
(3)	Output file(.key)	Set the path and file name of the UFPK file to be output. The extension of the output file must be set to .key.
(4)	Generate UFPK key file	Generate a UFPK file based on the information entered above. Enabled when MCU/MPU and security engine is selected on [Overview] tab.

The UFPK file generated in this tab must be sent to the Renesas Key Wrap Service (<https://dlm.renesas.com/keywrap>) to generate the W-UFPK. For more information on the Renesas Key Wrap Service, refer to the FAQ on the Key Wrap Service and additional information for each MCU/MPU (Table 1-1 MCU/MPU Related Information).

3.5 [Generate KUK] Tab

This tab generates the Key-Update Key (KUK) file as a binary *.key file. This file will be used not only for the secure injection of the KUK, but also for preparing other keys for secure key update.

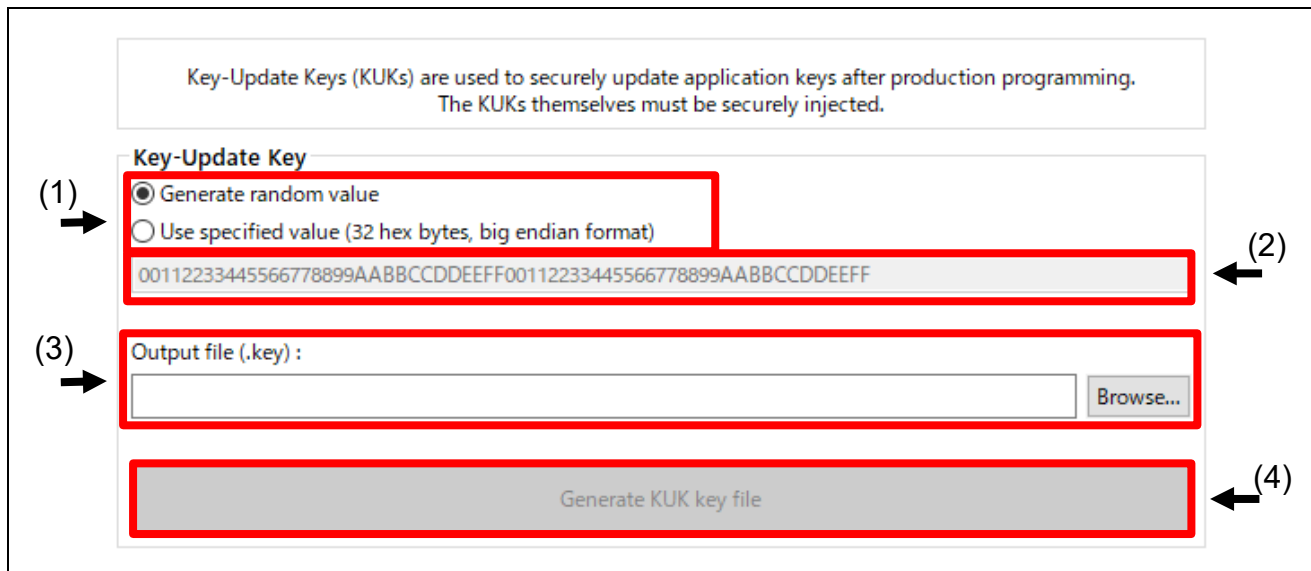

Figure 3-5 [Generate KUK] Tab

No	Item	Description
(1)	KUK input format	Select whether to use the input value from (2) for the KUK value or to use a random number generated by the tool. The specific amount of randomness of the random values generated by this tool is not guaranteed.
(2)	KUK value	When Use specified value is selected in (1), the value entered in the text box is used as the KUK value. This value must be specified as 32 hex bytes in big-endian format.
(3)	Output file (.key)	Set the path and file name of the KUK file to be output. The extension of the output file must be set to .key.
(4)	Generate KUK key file	Generate a KUK file based on the information entered above. Enabled when MCU/MPU and security engine is selected on [Overview] tab.

3.6 [Wrap Key] Tab

Use this tab to encrypt the User Key and generate the files needed for secure injection or update.

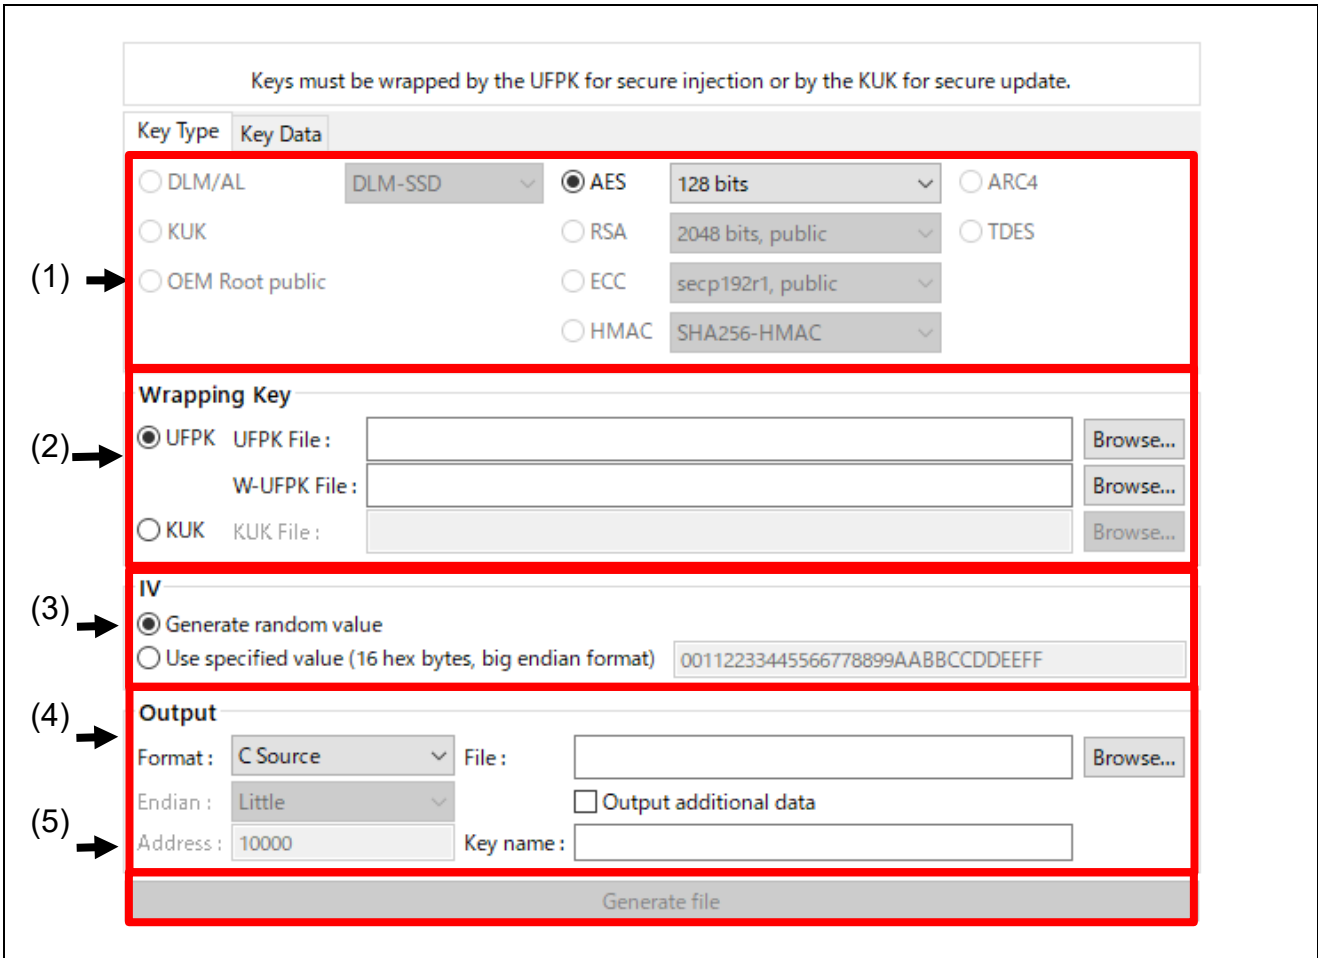

Figure 3-6 [Wrap Key] Tab

No	Items	Description
(1)	[Key Type] and [Key Data] Tabs	After selecting the type of User key to be encrypted in the [Key Type] tab, enter the key data in the [Key Data] tab. For details on the [Key Type] tab, refer to <i>Section 3.5.1 [Key Type] Tab</i> . For details on the [Key Data] tab, refer to <i>Section 3.5.2 [Key Data] Tab</i> .
(2)	Wrapping Key	Set the key to be used for wrapping. For details of the settings, refer to <i>Section 3.5.3 Wrapping Key</i> .
(3)	IV	Set the Initialization Vector (IV) to be used for wrapping. For details of the settings, refer to <i>Section 3.5.4 IV</i> .
(4)	Output	Select the output file format. Note that not all devices support all possible output file formats. Refer to <i>Section 3.5.5 Output</i> for details.
(5)	Generate file	Generate a wrapped key file for injection or update in the format specified in (3) using the information in (1) and (2). Enabled when MCU/MPU and security engine is selected on [Overview] tab.

3.6.1 [Key Type] Tab

Use this tab to specify the type of key that is being prepared for secure injection or update. Not all key types and options are supported by all device families.

Figure 3-7 [Key Type] Tab

No	Item	Description
(1)	Key type and key length selection	Select the algorithm and key length of the key that will be injected/updated.

The following key types and key lengths can be selected. The supported key types and key lengths vary depending on the target MCU/MPU. For details on which keys and key lengths are supported, refer to the device's Hardware User Manual and additional device information (*Table 1-1 MCU/MPU Related Information*).

Table 3-1 Options when DLM is selected

Option	Description
DLM-SSD	Authentication key for SSD state transitions in DLM.
DLM-NSECSD	Authentication key for NSECSD state transitions in DLM.
DLM-RMA-REQ	Authentication key for RMA-REQ state transitions in DLM
AL2-KEY	Key for DLM authentication level AL2 transition
AL1-KEY	Key for DLM authentication level AL1 transition
RMA-KEY	Key for DLM authentication level RMA transition

Table 3-2 Options when AES is selected

Option	Description
128 bits	AES 128-bit key
192 bits	AES 192-bit key
256 bits	AES 256-bit key
128 bits, XTS	AES 128-bit XTS key
256 bits, XTS	AES 256-bit XTS key

Table 3-3 Options when RSA is selected

Option	Description
1024 bits, public	RSA 1024-bit public key
1024 bits, private	RSA 1024-bit private key
2048 bits, public	RSA 2048-bit public key
2048 bits, private	RSA 2048-bit private key
3072 bits, public	RSA 3072-bit public key
3072 bits, private	RSA 3072-bit private key
4096 bits, public	RSA 4096-bit public key
4096 bits, private	RSA 4096-bit private key
RSA-2048-public-TLS	RSA 2048-bit public key for TLS API

Table 3-4 Options when ECC is selected

Options	Description
secp192r1, public	ECC NIST P-192 (secp192r1) public key
secp192r1, private	ECC NIST P-192 (secp192r1) private key
secp224r1, public	ECC NIST P-224 (secp224r1) public key
secp224r1, private	ECC NIST P-224 (secp224r1) private key
secp256r1, public	ECC NIST P-256 (secp256r1) public key
secp256r1, private	ECC NIST P-256 (secp256r1) private key
secp384r1, public	ECC NIST P-384 (secp384r1) public key
secp384r1, private	ECC NIST P-384 (secp384r1) private key
secp521r1, public	ECC NIST P-521 (secp521r1) public key
secp521r1, private	ECC NIST P-521 (secp521r1) private key
brainpool P256, public	ECC brainpoolP256r1 public key
brainpool P256, private	ECC brainpoolP256r1 private key
brainpool P384, public	ECC brainpoolP384r1 public key
brainpool P384, private	ECC brainpoolP384r1 private key
brainpool P512, public	ECC brainpoolP512r1 public key
brainpool P512, private	ECC brainpoolP512r1 private key
secp256k1, public	ECC Koblitz curve secp256k1 public key
secp256k1, private	ECC Koblitz curve secp256k1 private key
Ed25519, public	EdDSA Ed25519 public key
Ed25519, private	EdDSA Ed25519 private key

Table 3-5 Options when HMAC is selected

Option	Description
SHA1-HMAC	HMAC-SHA1 key
SHA224-HMAC	HMAC-SHA224 key
SHA256-HMAC	HMAC-SHA256 key
SHA384-HMAC	HMAC-SHA384 key
SHA512-HMAC	HMAC-SHA512 key
SHA512/244-HMAC	HMAC-SHA512-224 key
SHA512/256-HMAC	HMAC-SHA512-256 key

Please refer to 6 Usage Examples of each key setting.

3.6.2 [Key Data] Tab

Use the [Key Data] tab to specify the plaintext key material to be prepared for secure injection or update. Note that the appearance of this tab depends on the key type that is specified on the [Key Type] tab.

3.6.2.1 When DLM / KUK / AES / TDES / ARC4 / ECC Private Key Selected in [Key Type] Tab

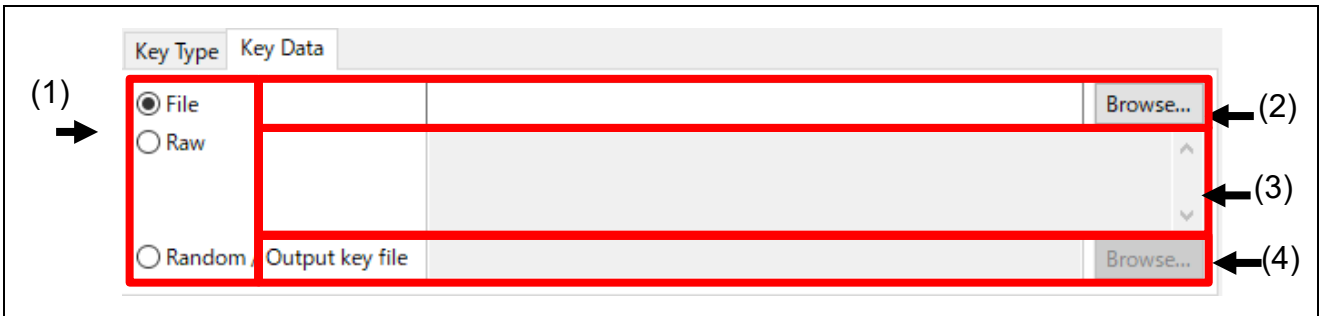

Figure 3-8 [Key Data] Tab when DLM / KUK / AES / TDES / ARC4 / ECC private key is selected

No	Items	Description
(1)	Input format	Select whether to provide a key file containing the key data in (2), to provide the raw plaintext data of the key in (3), or to have the tool generate a key (or key pair) with the output file name specified in (4).
(2)	File name	When File is selected in (1), select the key file that contains the plaintext key. Key files must be binary files and have the extension *.key.
(3)	Raw data	When Raw is selected in (1), enter the plaintext key data in hex format. The amount of data is dependent on the key type that was specified on the [Key Type] tab.
(4)	Output key file	When Random is selected in (1), the tool will generate the key data. Specify the output file of the plaintext key data generated in the tool. The output plaintext key file can be a text file or a binary file. To generate ECC keys, select the “private” key type. Both private and public keys are generated at the same time, and the specified file name is appended with <code>_public</code> for public keys and <code>_private</code> for private keys. Injection/update files are generated only for the private key. The generated public key file can be used as input to create key injection files for the public key. Not all ECC key types are supported. See Table 3-6 Supported ECC key generation. Note: The specific amount of randomness of the random values generated by this tool is not guaranteed. Keys generated by this tool should be used for prototyping and test purposes only.

Table 3-6 Supported ECC key generation

Key type and key length
secp256r1, secp384r1, secp521r1 brainpool P256, brainpool P384, brainpool P512 Ed25519

Note: The macOS version does not support brainpool curve key generation.

3.6.2.2 When RSA Public Key Selected in [Key Type] Tab

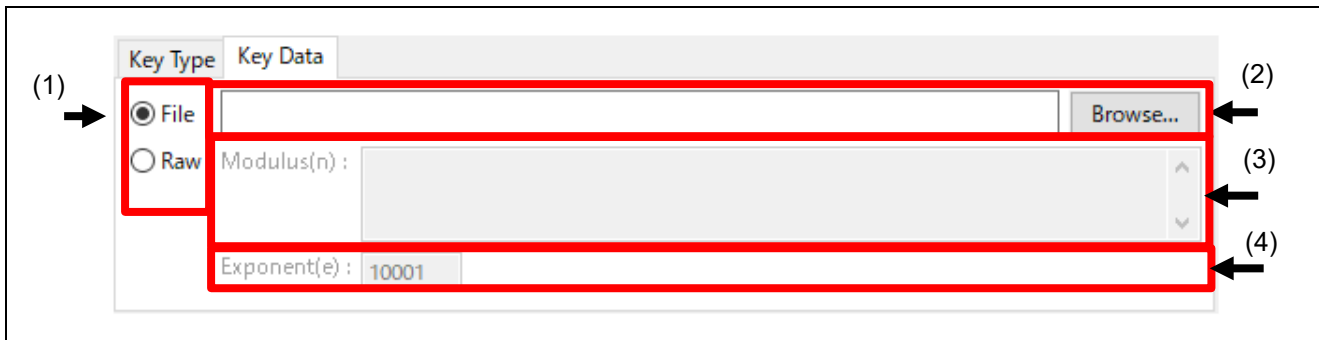

Figure 3-9 [Key Data] Tab when RSA public key is selected

No	Items	Description
(1)	Input format	Select whether to provide a key file containing the key data in (2), or to provide the raw plaintext data of the key in (3) and (4).
(2)	File name	When File is selected in (1), select the key file that contains the plaintext key. Key files must be binary files and have the extension *.key.
(3)	Modulus(n)	When Raw is selected in (1), enter the plaintext data for the RSA modulus n in hex format.
(4)	Exponent (e)	When Raw is selected in (1), enter the plaintext data for the RSA exponent e in hex format.

3.6.2.3 When RSA Private Key Selected in [Key Type] Tab

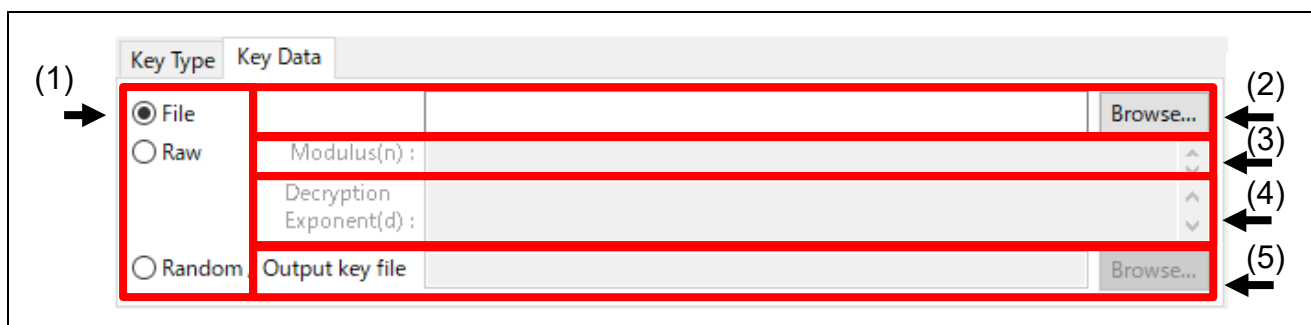

Figure 3-10 [Key Data] Tab when RSA private key is selected

No	Items	Description
(1)	Input format	Select whether to provide a key file containing the key data in (2), to provide the raw plaintext data of the key in (3) and (4), or to have the tool generate a key pair with the output file name specified in (5).
(2)	File name	When File is selected in (1), select the key file that contains the plaintext key. Key files must be binary files and have the extension *.key.
(3)	Modulus(n)	When Raw is selected in (1), enter the plaintext data for the RSA modulus n in hex format.
(4)	Decryption Exponent (d)	When Raw is selected in (1), enter the plaintext data for the RSA decryption exponent d in hex format.
(5)	Output key file	When Random is selected in (1), the tool will generate the key data. Specify the output file of the plaintext key data generated in the tool. The output plaintext key file can be a text file or a binary file. To generate keys, select the “private” key type. Both private and public keys are generated at the same time, and the specified file name is appended with <code>_public</code> for public keys and <code>_private</code> for private keys. Injection/update files are generated only for the private key. The generated public key file can be used as input to create key injection files for the public key. Note: Keys generated by this tool should be used for prototyping and test purposes only.

3.6.2.4 When ECC Public Key Selected in [Key Type] Tab

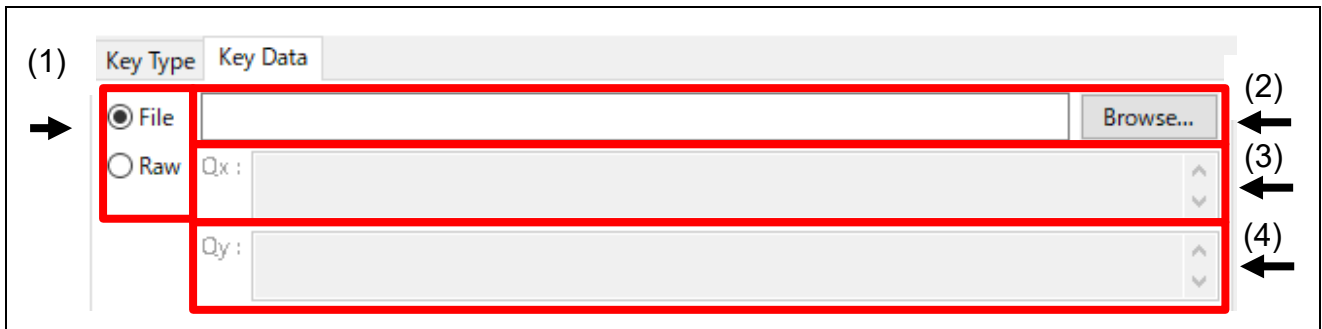

Figure 3-11 [Key Data] Tab when ECC public key is selected

No	Items	Description
(1)	Input format	Select whether to provide a key file containing the key data in (2), or to provide the raw plaintext data of the key in (3) and (4).
(2)	File name	When File is selected in (1), select the key file that contains the plaintext key. Key files must be binary files and have the extension *.key.
(3)	Qx	When Raw is selected in (1), enter the plaintext data of the ECC public key Qx in hex format.
(4)	Qy	When Raw is selected in (1), enter the plaintext data of the ECC public key Qy in hex format.

3.6.2.5 When OEM Root public Selected in [Key Type] Tab

Figure 3-12 [Key Data] Tab when OEM Root public key is selected

No	Items	Description
(1)	Input format	Select whether to provide a key file containing the key data in (2), or to provide the raw plaintext data of the key in (3) and (4), or to have the tool generate a key (or key pair) with the output file name specified in (5).
(2)	File name	When File is selected in (1), select the key file that contains the plaintext key. Key files must be binary files and have the extension * .key.
(3)	Qx	When Raw is selected in (1), enter the plaintext data of the ECC public key Qx in hex format.
(4)	Qy	When Raw is selected in (1), enter the plaintext data of the ECC public key Qy in hex format.
(5)	Output key file	When Random is selected in (1), the tool will generate the key data. Specify the output file of the plaintext key data generated in the tool. The output plaintext key file can be a text file or a binary file. Note: The specific amount of randomness of the random values generated by this tool is not guaranteed. Keys generated by this tool should be used for prototyping and test purposes only.

3.6.3 Wrapping Key

If the new key is being prepared for secure injection, it must be wrapped with the UFPK, and the W-UFPK must be provided. If the new key is being prepared for secure update, it must be wrapped with the KUK.

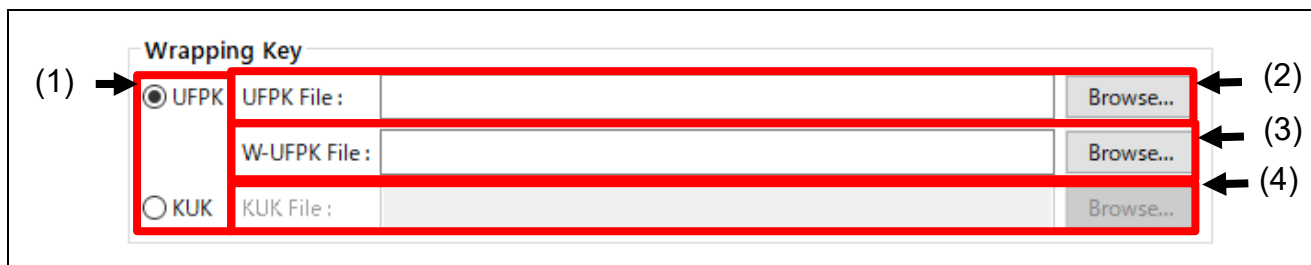

Figure 3-13 Wrapping Key Options

No	Items	Description
(1)	Wrapping Key Type	Select the type of wrapping key. If the new key is being prepared for secure injection, select UFPK and provide the UFPK file in (2) and the W-UFPK file in (3). If the new key is being prepared for secure update, select KUK and provide the KUK file in (4).
(2)	UFPK File	If UFPK is selected in (1), enter the UFPK *.key file. This file is generated in the [Generate UFPK] tab.
(3)	W-UFPK File	If UFPK is selected in (1), enter the W-UFPK *.key file that corresponds to the specified UFPK. This file must be obtained from the Renesas Key Wrap service.
(4)	KUK File	If KUK is selected in (1), enter the KUK *.key file. This file is generated in the [Generate KUK] tab.

3.6.4 IV

If the new key is being prepared for secure injection, it must be wrapped with the UFPK, and the W-UFPK must be provided. If the new key is being prepared for secure update, it must be wrapped with the KUK. In both cases, an Initialization Vector (IV) is required. The IV can either be specified, or the tool can generate one.

Figure 3-14 IV Options

No	Items	Description
(1)	IV format	Select whether to use the input value from (2) for the IV value or to use a random number generated by the tool. The specific amount of randomness of the random values generated by this tool is not guaranteed.
(2)	Use specified value	When Use specified value is selected in (1), the value entered here will be used as the Initialization Vector during encryption. This value must be specified as 16 hex bytes in big-endian format.

3.6.5 Output

This section specifies the type of output file to generate for the secure key injection or update. Note that not all options are supported for all MCU/MPU Families. For example, RA Family SCE9 Protected Mode key injection is supported only via a device programmer, so only the RFP output format is supported if the UFPK is selected as the wrapping key.

Figure 3-15 Output Options

No	Items	Description
(1)	Format	Select the file format for output. Refer to <i>Table 3-7 Output file formats</i> for the possible formats.
(2)	File	Set the output file name and path. When specifying an asymmetric private key and requesting the tool to generate the key pair, the output encrypted key file name is appended with “_private”.
(3)	Endian	This function is enabled when "Motorola Hex" or "Binary" is selected in (1). Determines the data sequence of the output data. See <i>4.5.6 bswap Options</i> for details.
(4)	Output additional data	This function is enabled when "C Source", "Motorola Hex" or "Binary" is selected in (1). If the output file name is an existing file name, the key encryption information is appended to the end of the file. See <i>4.5.5 fileadd Options</i> option for details.
(3)	Address	This setting is enabled when Motorola Hex is selected in (1). Enter the address to be set in the Motorola Hex file.
(4)	Key name	This function is enabled when C source is selected in (1). This specifies the <keyname> portion of the structure, variable, and data size value defined in the C source and header files. See <i>Section 4.5.4.2 csource Option for filetype</i> for a detailed description of how <keyname> is used..

Table 3-7 Output file formats

Option	Description
C Source	Outputs the C source file and header.
Binary	Outputs binary data.
Motorola Hex	Outputs Motorola Hex file.
RFP	Outputs key data in Renesas Key File format.

Table 3-8 Endian option

Option	Description
Little	Outputs a Motorola hex file or binary data with 4 bytes swapped for the data to be output when "Big" is selected.
Big	Outputs Motorola hex file or binary data in byte order with data according to the formats in <i>Table 4-60</i> and <i>Table 4-61</i> .

3.7 [TSIP Update] Tab

This tab is used to encrypt TSIP secure update solution user programs.

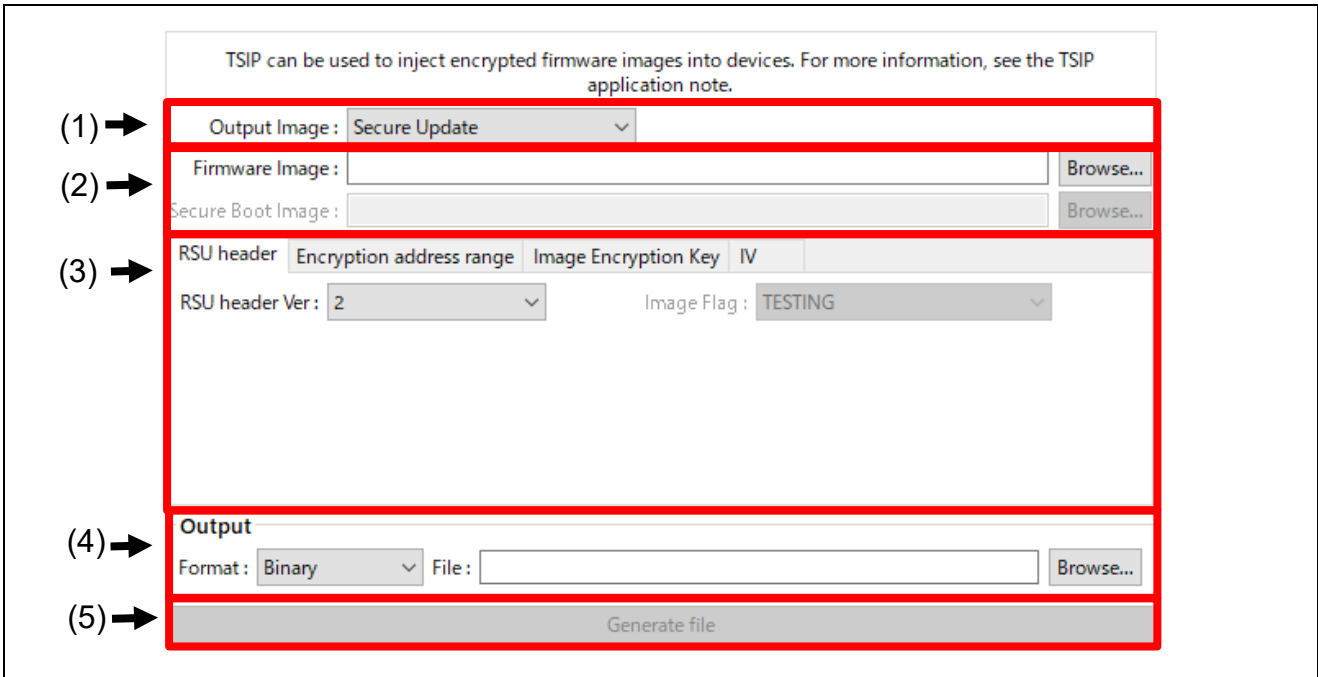

Figure 3-16 [TSIP Update] Tab

No.	Item	Description
(1)	Output image	Select the data type to be output and specify the file to be input. Factory Programming: Generates an image file to be used for programming at the factory. Specify files for both Firmware image and Secure boot image . Secure Update: Generates an image file to be used when performing a firmware update. Specify a file for Firmware image. For details, refer to 3.7.1, <i>Output image</i> .
(2)	Firmware image/ Secure boot image	Enter the program MOT file to be encrypted in the Firmware image . When Factory Programming is selected for Output image, for Secure boot image enter the secure boot program MOT file to be appended to the encrypted firmware update image file.
(3)	Settings tabs	Enter settings related to encryption and the output image. Refer to the following sections for the settings on each tab: 3.7.3 [RSU Header] Tab 3.7.3 [Encrypted Address Range] Tab 3.7.4 [Image Encryption Key] Tab 3.7.5 [IV] Tab
(4)	Output	Specify the file to be output. For details, refer to 3.7.7, <i>Output</i> .
(5)	Generate file	Click this button to generate a file in the format specified by (4).

3.7.1 Output image

Specifies the data format to be output from the tab.

Figure 3-17 Output image

No	Item	Description
(1)	Output image	Select the file type to be created on the tab.

Table 3-9 Output image Options

Option	Description
Factory Programming	Generates a MOT file containing the file specified by Secure boot image and the file specified by Firmware image as encrypted data for use for programming at the factory.
Secure Update	Generates an encrypted MOT file or binary file with RSU header from the specified area of the MOT file entered as Firmware image for use as a firmware update. The secure boot portion is not encrypted. It is recommended that writing be done in a secure environment.

3.7.2 Firmware image and Secure boot image

Specify the firmware image to be encrypted and the secure boot image to be appended to the encrypted data.

Figure 3-18 Firmware image and Secure boot image

No	Item	Description
(1)	Firmware Image	Specify the MOT file of the program to be encrypted. The data in the area of the designated MOT file specified by Encryption Address Range is encrypted for use in a TSIP firmware update solution. For the supported cryptographic algorithms, refer to the application notes covering the TSIP.
(2)	Secure Boot Image	When “Factory Programming” is specified for Output image, specify the secure boot image to accompany the encrypted firmware image. Secure boot images are not encrypted.

3.7.3 [RSU Header] Tab

Specify the file format for outputting the RSU header in this section.

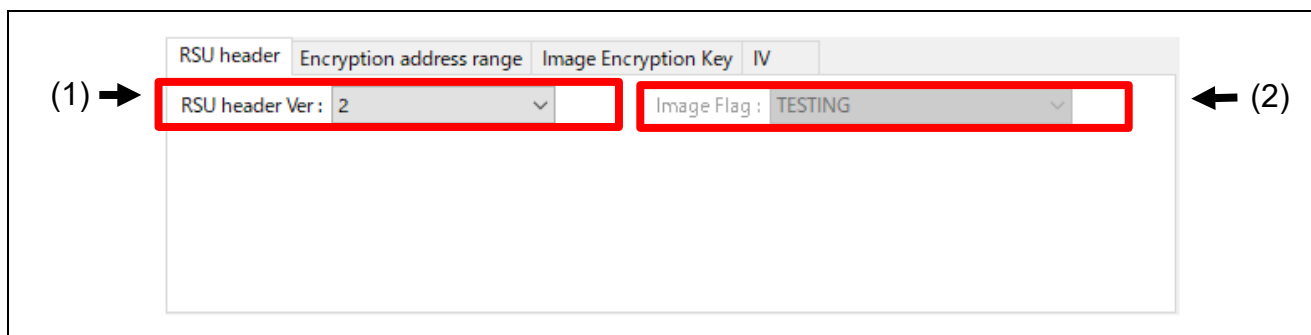

Figure 3-19 [RSU Header] Tab

No	Item	Description
(1)	RSU header Ver	Specify the RSU header version number to be appended to the encrypted firmware image. Version can be 1 or 2. For information on RSU header versions, refer to 4.6.1 <i>ver Option</i> .
(2)	Image Flags	Select the value to be set for the Image Flags RSU header. If "2" is selected in (2), Image Flags cannot be specified because it is not required. Refer to <i>Table 3-10</i> for the available setting values.

Table 3-10 RSU Header Image Flag Values

Option	Description
BLANK	No firmware update image present.
TESTING	Firmware update image being updated, tested.
INSTALLING	Firmware update image is initial image being installed, tested.
VALID	Firmware update image is valid.
INVALID	Firmware update image is invalid.
END_OF_LIFE	Firmware update image has reached end of life.

3.7.4 [Encryption Address Range] Tab

Specifies the area of the firmware image to be encrypted.

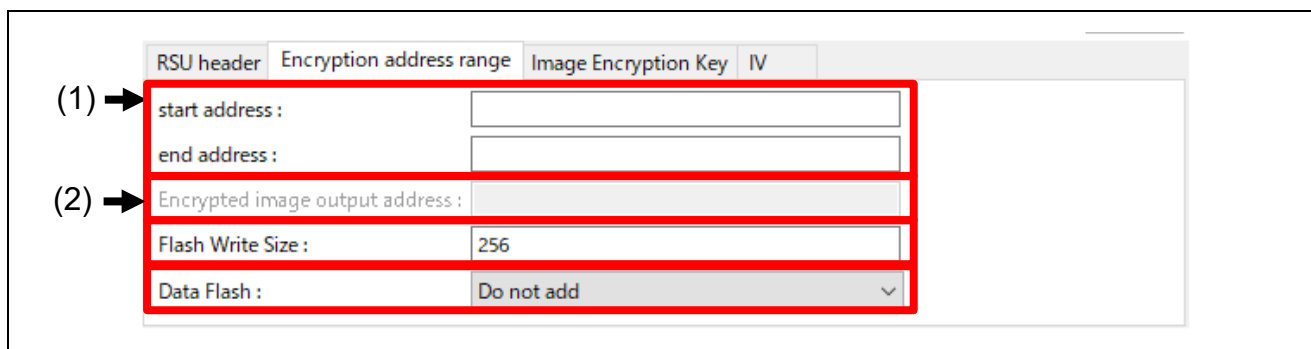

Figure 3-20 [Encrypted Address Range] Tab

No	Item	Description
(1)	start address/ end address	Specify the area of the MOT file specified by Firmware image to be encrypted. The maximum encryption range is 8MB.
(2)	Encrypted image output address	If MOT format is specified for the output file, specify the address to which to output the encrypted firmware image.
(3)	Flash Write Size	Specify the Flash write unit. The size should be specified in units of 16 bytes.
(4)	Data Flash	It is possible to specify whether or not the data flash data included in the firmware image is appended to the output file. See Table 3-11 Data Flash Settings for details.

Table 3-11 Data Flash Settings

Option	Description
Add	Firmware image data flash data is added to the output file. Output image: Selectable when Factory Programming is selected.
Encrypt and append	Encrypts and appends the firmware image data flash data to the output file. selectable only for RSU header Ver2.
Do not add	No firmware image data flash data is appended to the output file.

3.7.5 [Image Encryption Key] Tab

Specify the key data to be used to encrypt the firmware image.

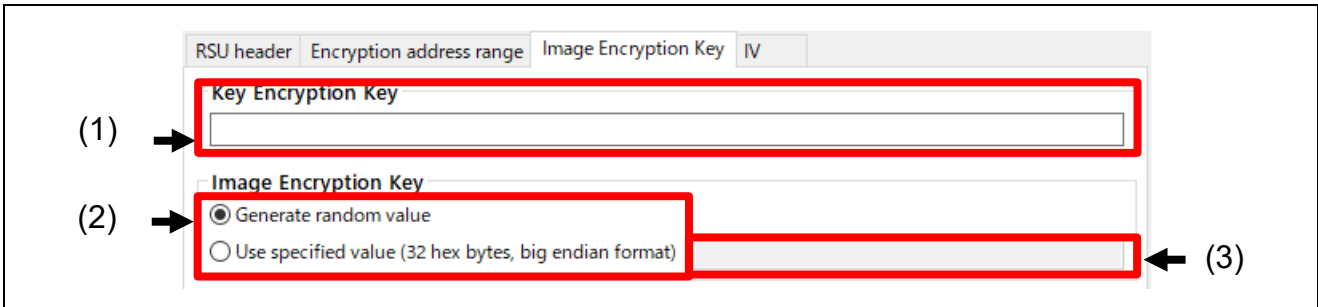

Figure 3-21 [Image Encryption Key] Tab

No	Item	Description
(1)	Key Encryption Key	Specify the key to be used to encrypt the Image Encryption Key (the key used to encrypt the firmware image). Enter a value in hexadecimal big-endian format.
(2)	Format of Image Encryption Key	Select the key value to be used to encrypt the firmware image. Use random number generator: The Security Key Management Tool's random number generator function is used to generate the key. Use specified value: The hex data entered in (3) is used to generate the key.
(3)	Use specified value	When "Use specified value" is selected for (2), the value entered here is used as the encryption key. Enter a value in hexadecimal big-endian format.

3.7.6 [IV] Tab

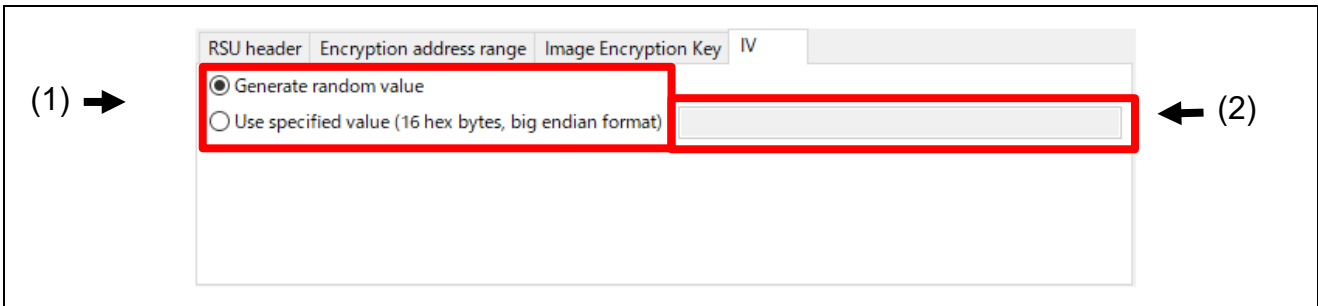

Figure 3-22 [IV] Tab

No	Item	Description
(1)	Format of initialization vector	Select the initialization vector value to be used when encrypting the firmware image. Use random number generator: The Security Key Management Tool's random number generator function is used to generate the initialization vector. Use specified value: The hex data entered in (2) is used to generate the initialization vector.
(2)	Use specified value	When "Use specified value" is selected for (1), the value entered here is used as the initialization vector when encrypting the firmware image. Enter a value in hexadecimal big-endian format.

3.7.7 Output

Specify the output file format in this section.

Figure 3-23 Output

No	Item	Description
(1)	Format	Select the output file format. Refer to <i>Table 3-12</i> for the available formats.
(2)	File	Specify the output file name and path.

Table 3-12 Available Formats

Option	Description
Binary	Outputs binary data with an RSU file header appended. RSU can be specified only when "Secure Update" is selected for "Output image".
Motorola hex	Outputs a Motorola hex (MOT) file.

3.8 [FSBL] tab

This tab is used to generate Key Certificates and Code Certificates that can be used in Renesas devices with First Stage Bootloader (FSBL) functionality.

Figure 3-24 [FSBL] Tab

No.	Item	Description
(1)	OEM Bootloader Image	Specify the Motorola hex file of the OEM Bootloader to be verified by the FSBL.
(2)	Programming Verification Method	Signature: Generate Code Certificate and Key Certificate with ECDSA signature. CRC: Create only Code Certificate for simple verification using CRC. For details, refer to 3.8.1 Programming Verification Method .
(3)	Image version	When selecting Signature in the Programming Verification Method, specify the version of the OEM Bootloader. This version is included in the Code Certificate.
(4)	[Certificate] [OEM Root Keys] [OEM Bootloader Keys] tab	[Certificate] tab: Specify OEM Bootloader information and output file names of the Key Certificate and the Code Certificate. [OEM Root Keys] tab and [OEM Bootloader Keys] tab: Key information is required if Signature is selected for Programming Verification Method . For details, refer to 3.8.2 [Certificate] , 3.8.3 [OEM Root Keys] , and 3.8.4 [OEM Bootloader Keys] .
(5)	Generate File(s)	Generates the Key Certificate and Code Certificate specified in (4).

3.8.1 Programming Verification Method

Specify the OEM Bootloader signing method.

Figure 3-25 Programming Verification Method Options

No	Item	Description
(1)	Signature	The OEM Bootloader is authenticated via a Chain of Trust. A generated Key Certificate authenticates the OEM Bootloader Key (signed by the OEM Root Private Key). A generated Code Certificate authenticates the OEM Bootloader (signed by the OEM Bootloader Private Key). When Signature is selected, the OEM Root Key pair must be entered on the [OEM Root Keys] tab, and the OEM Bootloader Key pair must be entered on the [OEM Bootloader Keys] tab. For the structure of the certificates, please refer to the User Manual of the device that implements the FSBL function.
(2)	CRC	The integrity of the OEM Bootloader is checked using a CRC. When CRC is selected, the tool calculates the CRC value of the OEM Bootloader and generates only a Code Certificate. *Note

Note: When Code Certificate is generated with **CRC** specified, the CRC value is output as a dummy value for Signer ID. If you select "CRC + report measurement" in FSBL operation mode and want to output a measurement report using the OEM Bootloader Key, select **Signature** to generate a Code Certificate.

3.8.2 [Certificate] tab

Specify the OEM Bootloader information and the file names of the Code Certificate and the Key Certificate.

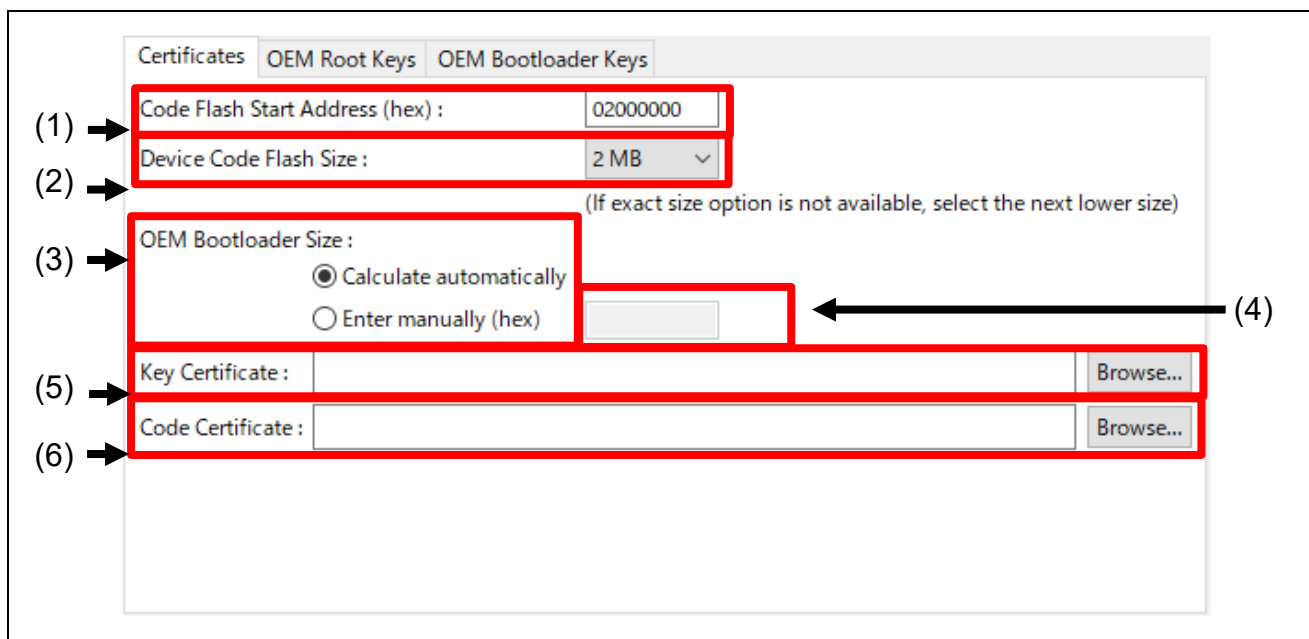

Figure 3-26 [Certificate] Tab

No	Item	Description
(1)	Code Flash Start Address	Specify the starting address of the OEM Bootloader.
(2)	Device Code Flash Size	Specify the Code Flash size of the device to be used. If there is no applicable size, specify a size close to it.
(3)	OEM Bootloader Size	Set the method used to calculate the OEM Bootloader size. Calculate automatically: The size of the OEM Bootloader is calculated from the mot file and the specified Device Code Flash Size . Enter manually: The value entered is the OEM Bootloader size in (4). Please refer to 4.7.2 Area subject to OEM Bootloader signature or CRC calculation .
(4)	OEM Bootloader size value	Enter the OEM Bootloader size in bytes when Enter Manually is selected in (3). Enter a size -1 value where size is a multiple of 16.
(5)	Key Certificate	Specify the output file name of the Key Certificate. Enter this when Signature is selected under Programming Verification Method .
(6)	Code Certificate	Specify the output file name of the Code Certificate.

3.8.3 [OEM Root Keys] tab

Enter the OEM Root Key Pair when **Signature** is selected in **Programming Verification Method**. Confirm the ECC curve that is used by the selected MCU/MPU.

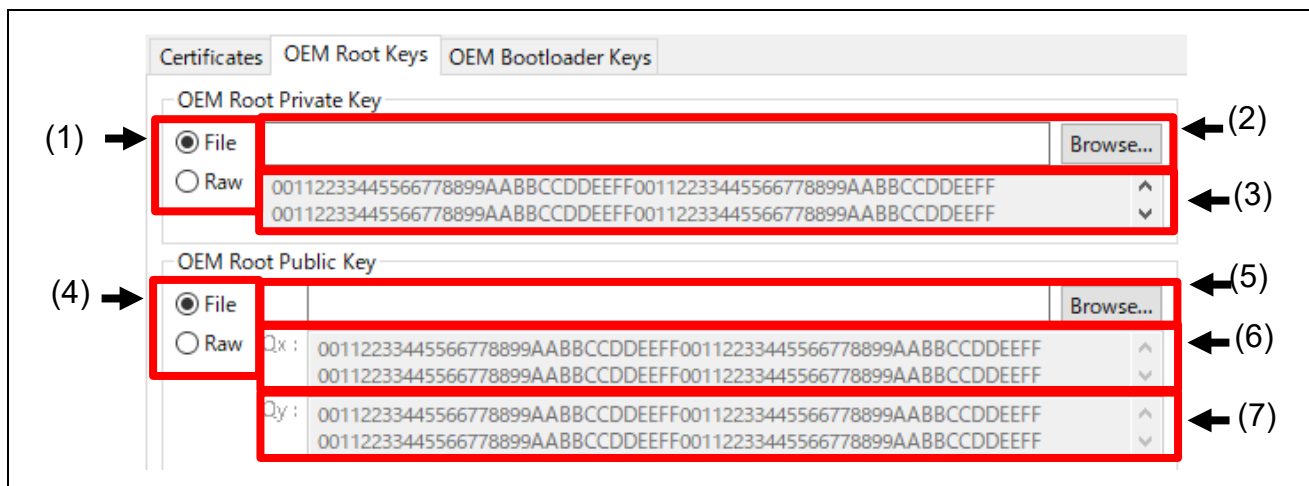

Figure 3-27 [OEM Root Keys] Tab

No	Item	Description
(1)	Input format of OEM Root Private Key	Select whether to provide a key file containing the key data in (2) or to provide the raw plaintext data of the key in (3).
(2)	File name	When File is selected in (1), select the key file that contains the plaintext key. The file can be a binary file with a *.key extension, a text file with a *.txt extension, or a PEM file with a *.pem extension. Note that PEM files also contain public key information. When a PEM file is specified, the OEM Root Public Key is not required.
(3)	Raw data	When Raw is selected in (1), enter the plain text key data in hexadecimal. If the OEM Root Private Key is secp256r1, enter 32 bytes of data.
(4)	Input format of OEM Root Public Key	Select whether to provide a key file containing the key data in (5) or to provide the raw plaintext data of the key in (6).
(5)	File name	When File is selected in (4), select the key file that contains the plaintext key. The file can be a binary file with a *.key extension or a text file with a *.txt extension. Note that if a PEM file was specified for the private key, that file also contains the public key.
(6)	Qx	When Raw is selected in (4), enter the plaintext data of the OEM Root public key Qx in hex format.
(7)	Qy	When Raw is selected in (4), enter the plaintext data of the OEM Root public key Qy in hex format.

3.8.4 [OEM Bootloader Keys] tab

Enter the OEM Bootloader Key Pair when **Signature** is selected under **Programming Verification Method**.

Figure 3-28 [OEM Bootloader Keys] Tab

No	Item	Description
(1)	Input format of OEM Bootloader Private Key	Select whether to provide a key file containing the key data in (2), to provide the raw plaintext data of the key in (3), or to have the tool generate a key pair with the output file name specified in (4).
(2)	File name	When File is selected in (1), select the key file that contains the plaintext key. The file can be a binary file with a *.key extension, a text file with a *.txt extension, or a PEM file with a *.pem extension. Note that PEM files also contain public key information. When a PEM file is specified, the OEM Bootloader Public Key is not required.
(3)	Raw data	When Raw is selected in (1), enter the plaintext key data in hexadecimal. For example, if the OEM Bootloader uses the secp256r1 ECC curve, enter 32 bytes of data.
(4)	Output file name	When Random is selected in (1), the tool will generate the key data. Specify the output file of the plaintext key data generated by the tool. The output plaintext key file can be a text file (*.txt) or a binary file (*.key). Both private and public keys are generated at the same time. The specified file name is appended with <code>_public</code> for public keys and <code>_private</code> for private keys. Injection/update files are generated only for the private key. The generated public key file can be used as input to create key injection files for the public key. Note: The specific amount of randomness of the random values generated by this tool is not guaranteed. Keys generated by this tool should be used for prototyping and test purposes only

No	Item	Description
(5)	Input format of OEM Bootloader Public Key	Select whether to provide a key file containing the key data in (6), or to provide the raw plaintext data of the key in (7) and (8).
(6)	File name	When File is selected in (5), select the key file that contains the plaintext key. The file can be a binary file with a *.key extension or a text file with a *.txt extension. Note that if a PEM file was specified for the private key, that file also contains the public key.
(7)	Qx	When Raw is selected in (5), enter the plaintext data of the OEM Bootloader public key Qx in hex format.
(8)	Qy	When Raw is selected in (5), enter the plaintext data of the OEM Bootloader public key Qy in hex format.

3.9 [DOTF/OTFD] tab

This tab is used to encrypt user data (executable binary code or application data) that can be used with Renesas devices equipped with the DOTF feature.

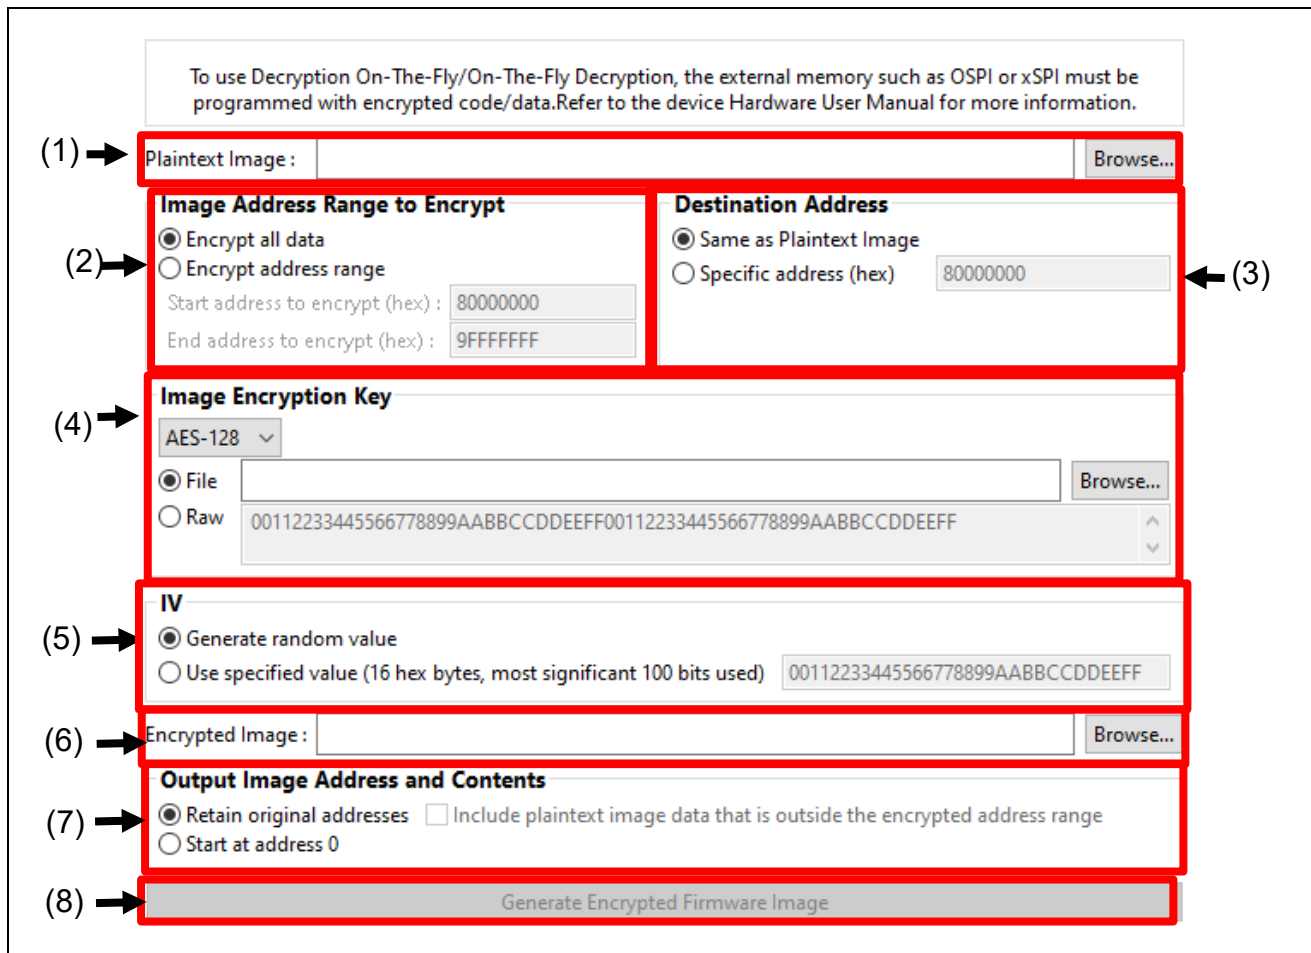

Figure 3-29 [DOTF/OTFD] Tab

No	Items	Description
(1)	Plaintext Image	Specifies the Motorola Hex file containing the image to be encrypted.
(2)	Image Address Range to Encrypt	Specifies the range to encrypt within the file specified in (1). Please refer to 3.9.1 Image Address Range to Encrypt .
(3)	Destination Address	Specifies the address where data will be placed and executed. Please refer to 3.9.2 Destination Address .
(4)	Image Encryption Key	Specifies the key used for encryption. Please refer to 3.9.3 Image Encryption Key .
(5)	IV	Specifies the nonce value to be used for encryption. Please refer to 3.9.4 IV .
(6)	Encrypted Image	Specifies the output file name of the encrypted data.
(7)	Output Image Address and Contents	Specifies options for the output file. Please refer to 3.9.5 Output Image Address and Contents .
(8)	Generate Encrypted Firmware Image	Generates the encrypted image file specified in (6).

3.9.1 Image Address Range to Encrypt

Specifies the range of encryption within the input plaintext image file.

Figure 3-30 Image Address Range to Encrypt Options

No	Items	Description
(1)	Encryption range selection	Encrypt all data: Encrypts all data in files entered in Plaintext Image . *Note1, *Note2 Encrypt address range: Encrypts the range specified in (2) within the file entered in Plaintext Image . *Note2
(2)	Encryption range	Enter the address to start encryption in (1) and the address to end encryption in (2). The address range must be 16-byte aligned.

Note1: If the start and end addresses of the input file are not 16-byte aligned, the input data will be padded with 0x00 for 16-byte alignment.

Note2: Any data gaps within the encryption address range will be filled with 0x00.

3.9.2 Destination Address

Figure 3-31 Destination Address Options

No	Items	Description
(1)	Select Destination address	Same as Plaintext Image: The address entered in the plaintext image is used as the destination address. Specific address: The address specified in (2) is used as the destination address.
(2)	Specific address	When Specific address is selected in (1), specify the address where the encrypted data will be executed/read.

3.9.3 Image Encryption Key

Specify the key data to be used when encrypting the firmware image.

Figure 3-32 Image Encryption Key Options

No	Items	Description
(1)	Key length specification	Specify the key length to be used for encryption. Specify from AES128 , AES192 , or AES256 .
(2)	Input format	Select whether to provide a key file containing the key data in (3), or to provide the raw plaintext data of the key in (4).
(3)	File name	When File is selected in (2), select the key file that contains the plaintext key. Key files must be binary files and have the extension <code>*.key</code> or be text files and have the extension <code>*.txt</code> .
(4)	Raw data	When Raw is selected in (2), enter the plaintext key data in hex format.

3.9.4 IV

Specify the IV (Counter value) to be used when encrypting the firmware image.

Figure 3-33 IV Options

No	Item	Description
(1)	Input format	Select whether to use the input value from (2) for the IV value or to use a random number generated by the tool. The specific amount of randomness of the random values generated by this tool is not guaranteed.
(2)	Use specified value	When Use specified value is selected in (1), the upper 100 bits of the value entered here will be used as the Initialization Vector during encryption. This value must be specified as 16 hex bytes in big-endian format.

3.9.5 Output Image Address and Contents

Figure 3-34 Output Image Address and Contents Options

No	Items	Description
(1)	Specify output file address	Specifies the address of the output image file. When Retain original addresses is selected, the starting address of the output file is set to the same address as the input file. When Start at address 0 is selected, the start address of the output file is set to 0.
(2)	Include Plaintext image	This option can be selected if Retain original addresses is selected in (1). If the check box is checked, data in the input file that is outside the encryption range will be included in the output file as plain text data. Otherwise, only the encrypted data within the specified address range will be included in the output file.

3.10 [SFP] tab

This tab prepares the program and parameter information required by the Secure Factory Programming function and outputs it to a file.

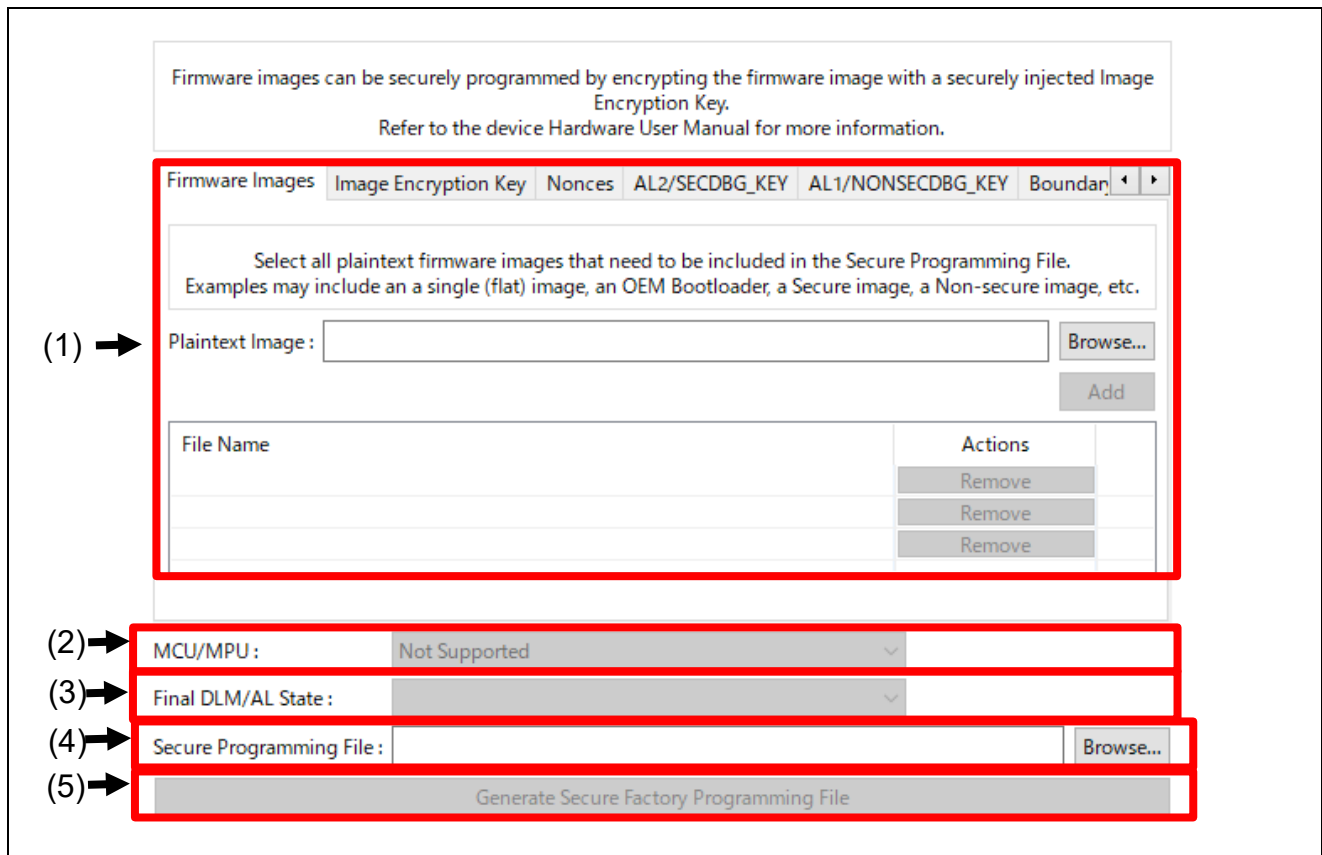

Figure 3-35 [SFP] Tab

No	Items	Description
(1)	[Firmware Images] [Image Encryption Key] [Nonces] [AL2/SECDBG_KEY] [AL1/NONSECDBG_KEY] [Boundary] [External Flash Memory Area] tab	Enter the various data used to generate the Secure Factory Programming file. For more information on each tab, see 3.10.1 [Firmware Images], 3.10.2 [Image Encryption Key], 3.10.3 [Nonces], 3.10.4 [AL2/SECDBG_KEY], 3.10.5[AL1/NONSECDBG_KEY], 3.10.6 [Boundary], 3.10.7[External Flash Memory Area].
(2)	MCU/MPU	Select the MCU/MPU that will use Secure Factory Programming. The MPU/MPU that can be used is determined by the cryptographic engine selected in the Overview tab. Please refer to Table 3-13 MCU/MPU for the MPU/MPU and cryptographic engines that can be selected.
(3)	Final DLM/AL State	Specify the DLM transition destination information. See Table 3-14 for details on the available settings.
(4)	Secure Programming File	Specify the output path and name of the Secure Factory Programming file.
(5)	Generate Secure Factory Programming File	Generate the Secure Factory Programming file.

Table 3-13 MCU/MPU

Option	Overview tab	Final DLM/AL State	Description
RA8D1/M1/T1	RA Family, RSIP-E51A Security functions and Protected Mode	<ul style="list-style-type: none"> • OEM PL0 with AL2_KEY • LCK_BOOT” 	The specified image is encrypted in the Secure Factory Programming format for RA8D1, RA8M1, and RA8T1.
RA4L1	RA Family, RSIP-E11A Security functions and Protected Mode	<ul style="list-style-type: none"> • DPL with SECDBG_KEY and NONSECDBG_KEY • LCK_BOOT 	The specified image is encrypted in the Secure Factory Programming format for RA4L1.
Not supported	A cryptographic engine other than the above was selected.		A cryptographic engine that does not support the Secure Factory Programming function has been selected in the Overview tab.

Table 3-14 Final DLM/AL State

Option	Description
OEM PL0 with AL2_KEY	Transfer DLM to OEM and set protect mode to PL0 and write only AL2_Key. The AL1/NONSECDBG_KEY tab does not need to be filled in.
DPL with SECDBG_KEY and NONSECDBG_KEY	Transfer DLM to DPL and write SECDBG_KEY and NONSECDBG_KEY.
LCK_BOOT	Transfer DLM to LCK_BOOT. The AL2/SECDBG_KEY, AL1/NONSECDBG_KEY tabs do not need to be filled in.

Note: Not all MCUs/MPUs will support all available options.

Please refer to the User's Manual for the specific MCU/MPU for the list of supported options.

3.10.1 [Firmware Images] tab

Specify the firmware image file(s) to be encrypted.

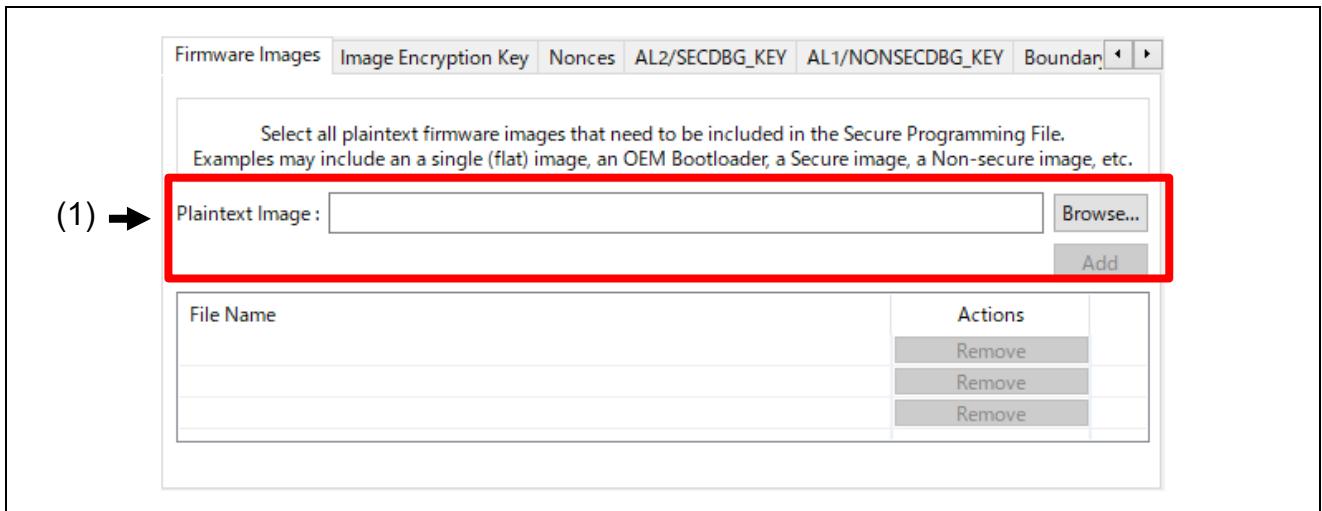

Figure 3-36 [Firmware Images] Tab

No	Item	Description
(1)	Plaintext Image	Specify the user program(s) to be encrypted. Select a file with the Browse button and add it to the list with the Add button. Use the Remove action to delete a file. Up to three files can be specified.

3.10.2 [Image Encryption Key] tab

Specify the key, IV, UFPK, and W-UFPK to be used when encrypting the Firmware Image.

Figure 3-37 [Image Encryption Key] Tab

No	Item	Description
(1)	Key Data Input format	Select whether to provide a key file containing the AES-128 key data in (2), to provide the raw plaintext data of the key in (3), or to have the tool generate a key with the output file name specified in (4).
(2)	File name	When File is selected in (1), select the AES-128 key file that contains the plaintext key. Key files must be binary files and have the extension <code>*.key</code> .
(3)	Raw data	When Raw is selected in (1), enter the plaintext AES-128 key data in hex format.
(4)	Output key file	When Random is selected in (1), the tool will generate the AES-128 key data. Specify the output file of the plaintext key data generated in the tool. The file can be a binary file with a <code>*.key</code> extension or a text file with a <code>*.txt</code> extension. Note: The specific amount of randomness of the random values generated by this tool is not guaranteed. Keys generated by this tool should be used for prototyping and test purposes only.
(5)	IV format	Select whether to use the input value from (6) for the IV value or to use a random number generated by the tool. The specific amount of randomness of the random values generated by this tool is not guaranteed.
(6)	IV value	When Use specified value is selected in (5), the value entered here will be used as the Initialization Vector during encryption. This value must be specified as 16 hex bytes in big-endian format.
(7)	UFPK File	Enter the UFPK <code>*.key</code> file. This file is generated in the [Generate UFPK] tab.
(8)	W-UFPK File	Enter the W-UFPK <code>*.key</code> file that corresponds to the specified UFPK. This file must be obtained from the Renesas Key Wrap service.

3.10.3 [Nonces] tab

Specify the initialization vector values to be used for encryption of parameter information and the user program.

Figure 3-38 [Nonces] Tab

No	Item	Description
(1)	IV format (Programming parameters)	Select whether to use the input value from (2) for the IV value or to use a random number generated by the tool. The specific amount of randomness of the random values generated by this tool is not guaranteed.
(2)	Specified value (Programming parameters)	When Use specified value is selected in (1), the value entered here will be used as the Initialization Vector during Programming parameters encryption. This value must be specified as 16 hex bytes in big-endian format.
(3)	IV format (Firmware Image)	Select whether to use the input value from (4) for the IV value or to use a random number generated by the tool. The specific amount of randomness of the random values generated by this tool is not guaranteed.
(4)	Specified value (Firmware Image)	When Use specified value is selected in (3), the value entered here will be used as the Initialization Vector during Firmware image encryption. This value must be specified as 16 hex bytes in big-endian format.
(5)	IV format (AL/DLM Key)	Select whether to use the input value from (6) for the IV value or to use a random number generated by the tool. The specific amount of randomness of the random values generated by this tool is not guaranteed.
(6)	Specified value (AL/DLM Key)	When Use specified value is selected in (5), the value entered here will be used as the Initialization Vector during Firmware image encryption. This value must be specified as 16 hex bytes in big-endian format.

3.10.4 [AL2/SECDBG_KEY] tab

Specifies the key data to be used when encrypting the AL2_KEY or SECDBG_KEY.

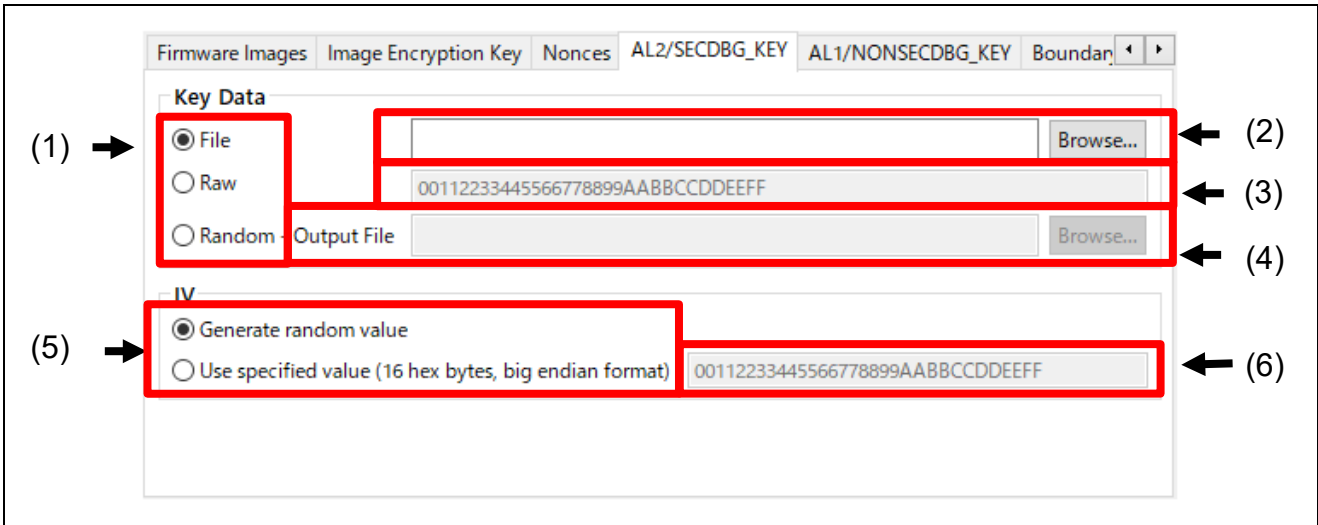

Figure 3-39 [AL2/SECDBG_KEY] Tab

No	Items	Description
(1)	Input format	Select whether to provide a key file containing the AL2_Key or SECDBG_KEY in (2), to provide the raw plaintext data of the key in (3), or to have the tool generate a key with the output file name specified in (4).
(2)	File name	When File is selected in (1), select the key file that contains the plaintext AL2_Key. Key files must be binary files and have the extension *.key.
(3)	Raw data	When Raw is selected in (1), enter the AL2_Key or SECDBG_KEY plaintext key data in hex format.
(4)	Output key file	When Random is selected in (1), the tool will generate the key data. Specify the output file of the plaintext AL2_Key or SECDBG_KEY key data generated by the tool. The file can be a binary file with a *.key extension or a text file with a *.txt extension. Note: The specific amount of randomness of the random values generated by this tool is not guaranteed. Keys generated by this tool should be used for prototyping and test purposes only.
(5)	IV format	Select whether to use the input value from (6) for the IV value or to use a random number generated by the tool. The specific amount of randomness of the random values generated by this tool is not guaranteed.
(6)	Specified value	When Use specified value is selected in (5), the value entered here will be used as the Initialization Vector during AL2_Key or SECDBG_KEY encryption. This value must be specified as 16 hex bytes in big-endian format.

3.10.5 [AL1/NONSECDBG_KEY] tab

Specifies the key data to be used when encrypting with AL1_KEY or NONSECDBG_KEY.

Note: Not all MCUs/MPUs will support this option.

Please refer to the User's Manual for the specific MCU/MPU for the list of supported options.

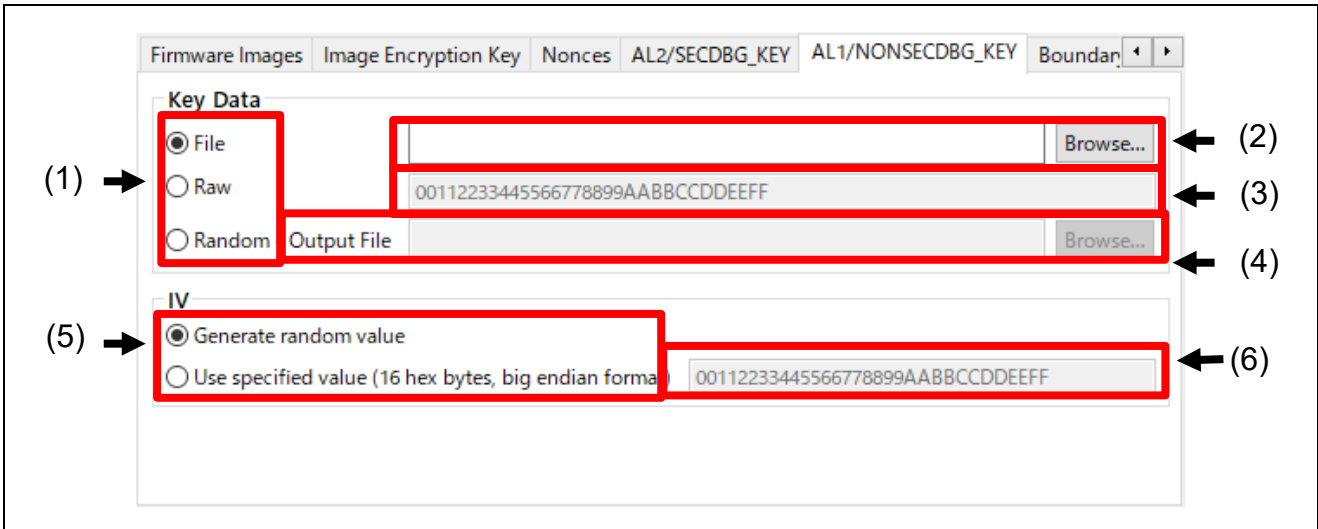

Figure 3-40 [AL1/NONSECDBG_KEY] Tab

No	Items	Description
(1)	Input format	Select whether to provide a key file containing the AL1_Key or NONSECDBG_KEY in (2), to provide the raw plaintext data of the key in (3), or to have the tool generate a key with the output file name specified in (4).
(2)	File name	When File is selected in (1), select the key file that contains the plaintext key. Key files must be binary files and have the extension *.key.
(3)	Raw data	When Raw is selected in (1), enter the AL1_Key or NONSECDBG_KEY plaintext key data in hex format.
(4)	Output key file	When Random is selected in (1), the tool will generate the key data. Specify the output file of the plaintext AL1_Key or NONSECDBG_KEY key data generated by the tool. The file can be a binary file with a *.key extension or a text file with a *.txt extension. Note: The specific amount of randomness of the random values generated by this tool is not guaranteed. Keys generated by this tool should be used for prototyping and test purposes only.
(5)	IV format	Select whether to use the input value from (6) for the IV value or to use a random number generated by the tool. The specific amount of randomness of the random values generated by this tool is not guaranteed.
(6)	Use specified value	When Use specified value is selected in (5), the value entered here will be used as the Initialization Vector during AL1_Key or NONSECDBG_KEY encryption. This value must be specified as 16 hex bytes in big-endian format.

3.10.6 [Boundary] tab

Specify the Boundary information to be sent to the MCU/MPU by the Secure Factory Programming function.

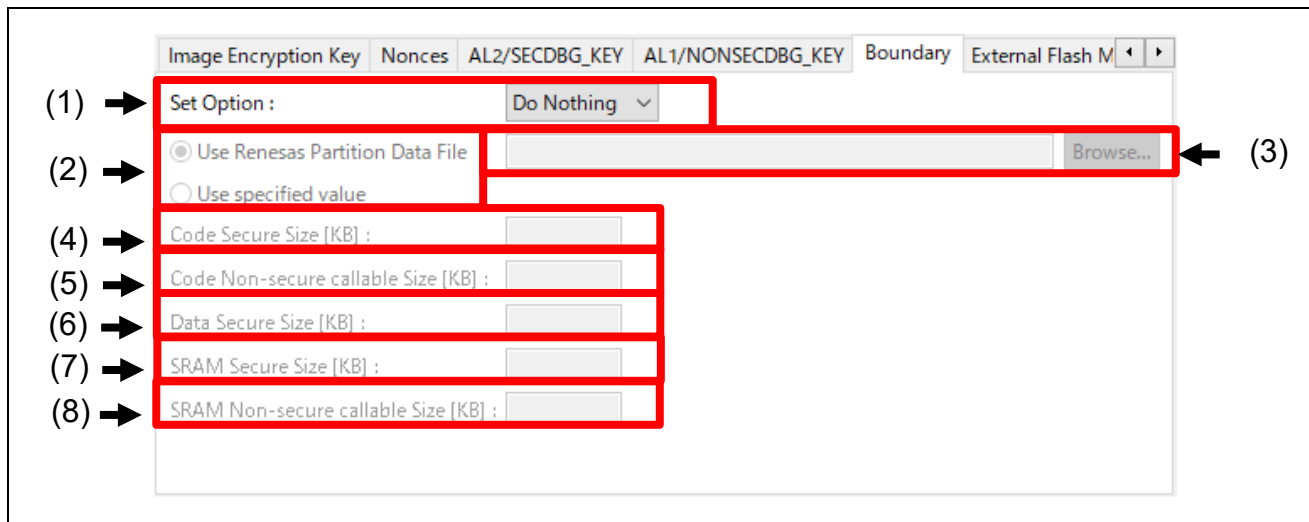

Figure 3-41 [Boundary] Tab

No	Items	Description
(1)	Set Option	For MCU/MPUs that can set Boundary information, specify whether Boundary information is set or not. "Do nothing" : Boundary information is not set. "Set" : Boundary information is set. Select whether to specify the file in (2) or (4)-(8).
(2)	Boundary setting	When "Set" is selected in (1), select how to specify the Boundary information. "Specify Renesas Partition Data File" : Specify the file in (3). "Use specified value" : Specify the size of each area in (4) to (8).
(3)	Use Renesas Partition Data File	When "Specify Renesas Partition Data File" is selected in (2), the Renesas Partition Data File (*.rpd) output from e ² studio can be specified.
(4)	Code Secure Size	When "Use specified value" is selected in (2), specify the size of Code flash secure area in KB.
(5)	Code Non-secure callable Size	When "Use specified value" is selected in (2), specify the size of Code flash Non-secure callable area in KB.
(6)	Data Secure Size	When "Use specified value" is selected in (2), specify the size of Data flash secure area in KB.
(7)	SRAM Secure Size	When "Use specified value" is selected in (2), specify the size of SRAM secure area in KB.
(8)	SRAM Non-secure callable Size	When "Use specified value" is selected in (2), specify the size of SRAM Non-secure callable area in KB.

3.10.7 [External Flash Memory Area] tab

When using the Secure Factory Programming function to encrypt the image of the external flash memory area, specify the external flash memory area and the external flash memory write unit.

Two external flash memory areas can be specified. If you are only using one area, set External Flash Memory Area 0.

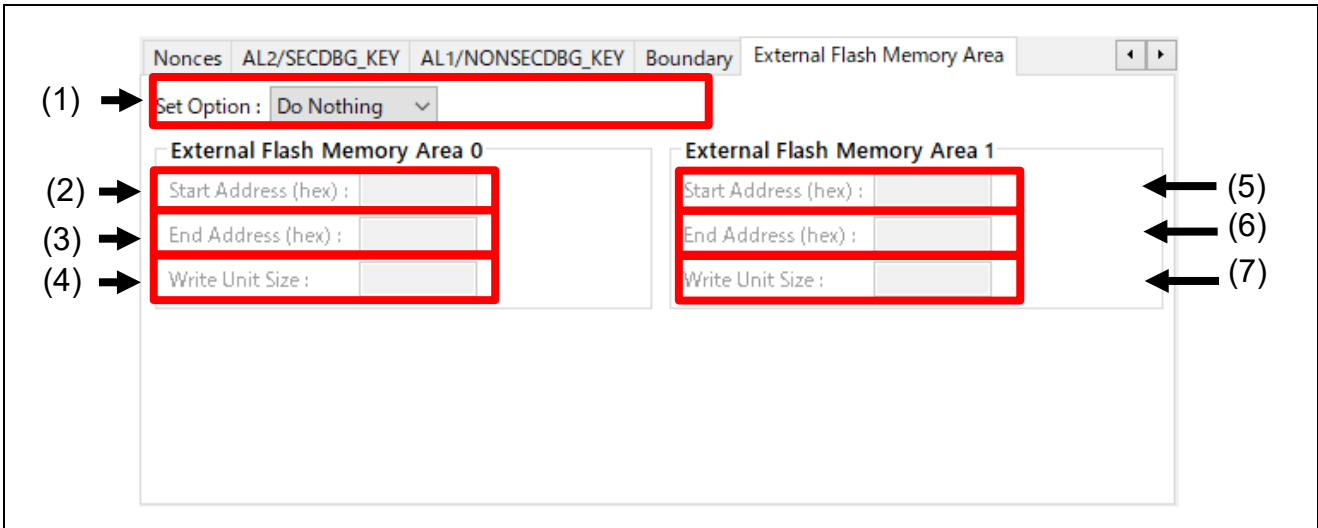

Figure 3-42 [External Flash Memory Area] Tab

No	Items	Description
(1)	Set Option	For MCUs/MPUs that support the Secure Factory Programming function for external flash memory areas, specify whether or not to set the information for the external flash memory area that uses this function. "Do nothing" : Do not set the External Flash Memory Area. "Set one area" : 1 area external flash memory setting. Specify the external flash area with (2) to (4). "Set two area" : 2 area external flash memory setting. Specify the external flash area with (2) to (7).
(2)	External Flash Memory Area 0 Start Address (hex)	When "Set one area" or "Set two areas" is selected in (1), specify the start address of external flash memory area 0.
(3)	External Flash Memory Area 0 End Address (hex)	When "Set one area" or "Set two areas" is selected in (1), specify the end address of external flash memory area 0.
(4)	External Flash Memory Area 0 Write Unit Size	When "Set one area" or "Set two areas" is selected in (1), specify the write unit size of external flash memory area 0. Please specify the write unit in 16-byte units.
(5)	External Flash Memory Area 1 Start Address (hex)	When "Set two areas" is selected in (1), specify the start address of external flash memory area 1.
(6)	External Flash Memory Area 1 End Address (hex)	When "Set two areas" is selected in (1), specify the end address of external flash memory area 1.
(7)	External Flash Memory Area 1 Write Unit Size	When "Set two areas" is selected in (1), specify the write unit size of external flash memory area 1. Please specify the write unit in 16-byte units.

4. Descriptions of CLI Functions

4.1 Command-line Syntax

skmt.exe [command] [options..]

Note: Command, options and parameters are not case sensitive.

Table 4-1 Command-line syntax

Item	Description
skmt.exe	Executable file name.
command	Key generation commands. The command is preceded by "/" or "-".
options ..	Zero or more options for the specified key generation command. Each option is preceded by "/" or "-".

4.2 Commands

Commands are shown in the table below.

Table 4-2 Command List

Command	Description
genufpk	Generate UFPK file. Upon success, the generated UFPK will be displayed on the console.
genkuk	Generate KUK file. Upon success, the generated KUK will be displayed on the console.
genkey	Encrypt User key and output a file. Upon success, the console will display the IV, W-UFPK, and the Encrypted User Key (including MAC).
enctsip	Encrypt a program for use with the TSIP's secure update function or factory programming.
gencert	Generates Key Certificate and Code Certificate that can be used in Renesas devices with First Stage Bootloader (FSBL) functionality.
encdotf	Encrypts user programs that can be used with Renesas devices equipped with the DOTF function.
encsfp	Encrypts user programs that can be used with Renesas devices equipped with Secure Factory Programming (SFP) functionality.
calcreponse	Calculate a response value for challenge and response authentication and output it to the console.
H	Help

This tool supports multiple file types. Specify the desired file type by using the file name extension as shown in *Table 4-3*. Both absolute and relative paths are supported.

Table 4-3 File Types and Extensions

File type	Extension	Description
Binary key data	*.key	Binary data files for plaintext key material
Renesas key file	*.rkey	The file used by RFP for secure user and DLM key injection (if supported by the MCU/MPU).
Motorola hex file	*.mot, *.srec	Motorola hex file
Binary data	*.bin	Binary data file
C source, header file	*.c, *.h	C source and header file
Text file	*.txt	Files written in ASCII characters
PEM file	*.pem	Base64-encoded file of x509 ASN.1 key, used by OpenSSL
RSU file	*.rsu	Image file for use as TSIP firmware update.
Secure Factory Programming file	*.sfp	Image file for use as Secure Flash Programming. See appendix for Format.
Renesas Partition Data File	*.rpd	Boundary information file used by the Secure Factory Programming function.

4.3 **genufpk** Command Options

This command generates a key file containing a User Factory Programming Key (UFPK). The UFPK can either be specified or generated by the tool.

Table 4-4 **genufpk** options

Options	Parameters	Description
ufpk	Hex data	Specifies the 32-byte binary data for the UFPK. This option is optional. If this option is omitted, a random value will be generated for the UFPK.
output	File Path	Specify the output file name. This option is optional. If this option is omitted, the execution result will be output to the console.
nooverwrite	None	This option is optional. When this option is specified, an error will occur if the output file exists.

Note: The specific amount of randomness of the random values generated by this tool is not guaranteed.

Example of omitting ufpk option:

```
> skmt.exe /genufpk /output "D:\example\ufpk.key"
```

Example of using ufpk option:

```
> skmt.exe /genufpk
   /ufpk "00112233445566778899aabbccddeeff00112233445566778899aabbccddeeff"
   /output "D:\example\ufpk.key"
```

4.4 **genkuk** Command Options

This command generates a key file containing a Key-Update Key (KUK). The KUK can either be specified or generated by the tool.

Table 4-5 **genkuk** option

Options	Parameters	Description
kuk	Hex data	Specifies the 32-byte binary data used by KUK. This option is optional. If this option is omitted, the random value generated in the tool will be used as KUK.
output	File Path	Specify the output file name. This option is optional. If this option is omitted, the execution result will be output to the console.
nooverwrite	None	This option is optional. When this option is specified, an error will occur if the output file exists.

Note: The specific amount of randomness of the random values generated by this tool is not guaranteed.

Example of omitting kuk option:

```
> skmt.exe /genkuk /output "D:\example\kuk.key"
```

Example of using kuk option:

```
> skmt.exe /genkuk /output "D:\example\kuk.key"  
/kuk "00112233445566778899aabbccddeeff00112233445566778899aabbccddeeff"
```

4.5 **genkey** Command Options

This command generates files to use for secure key injection or update.

The following options can be used with the **genkey** command. As described in *Table 4-6*, some data inputs can be specified as hex data or by a binary file. When specifying a file, add “file=” at the beginning of the file path.

Table 4-6 **genkey** options(1)

Options	Parameters	Description
iv	Hex data / File Path	Initialization Vector (IV) for encrypting the user or DLM key (16 bytes). This option is optional. If this option is omitted, a random value generated in the tool will be used as the IV.
ufpk	File Path	Key file containing a UFPK to be used for secure key injection. Note that this UFPK must correspond to the specified W-UFPK. When kuk is specified as an option, the ufpk option cannot be specified.
wufpk	File Path	Key file containing a wrapped UFPK provided by the Renesas Key Wrap service. When kuk is specified as an option, the wufpk option cannot be specified.
kuk	Hex data / File Path	KUK to be used for secure key update. When ufpk is specified as an option, the kuk option cannot be specified.
mcu	ASCII	Target MCU/MPU. This value must be one of the options listed in <i>Section 4.5.1 mcu Options</i> .
keytype	ASCII / Hex data	The type of key being prepared for injection or update. Either the key name or its numerical representation can be specified. This value must be one of the options listed in <i>Section 4.5.2 keytype Options</i> .
key	Hex data / File Path	DLM key data or User key data. For the format of the keyed data to be input, refer to <i>Section 4.5.3.1 Hex Data Direct Input</i> . This option is optional. If this option is omitted, the tool may be able to generate key data. However, there are some keys that cannot be generated in the case of public key cryptography. See <i>Section 4.5.3.3 key Option Omitted</i> for details.
filetype	ASCII	Output file type. See <i>Section 4.5.4 filetype Options</i> . This option is optional. If this option is omitted and the output option is specified, it will be output as a bin file. If the filetype and output options are omitted, output will be to the console.

Note: The specific amount of randomness of the random values generated by this tool is not guaranteed.

Table 4-7 **genkey** options(2)

Options	Parameters	Description
address	Hex data	The address where the key is to be injected. This option must be specified when mot is specified for filetype .
fileadd	-	This option can be set when csource , bin , or mot is specified for filetype . When this option is specified, data is appended to the output file if it exists.
bswap	ASCII	This option can be set when bin or mot is specified for filetype . When this option is specified, output data is swapped.
keyname	ASCII	Specify the < keyname > portion of the structure, variable, and data size value defined in the C source and header files. This option must be specified when csource is specified in filetype . See <i>Section 4.5.4.2 csource Option for filetype</i> for a detailed description of how < keyname > is used.
keyfileoutput	File Path	This option is optional. If the key option is omitted, resulting in the DLM or user key being generated by the tool, use this option to specify the output path of the generated key data. Binary data is output.
output	File Path	Specify the output file name. This option is optional. If this option is omitted, the execution result will be output to the console.
nooverwrite	None	This option is optional. When this option is specified, an error will occur if the output file exists.

Note: The specific amount of randomness of the random values generated by this tool is not guaranteed.

Example of using **ufpk** option:

```
> skmt.exe /genkey /ufpk file="D:\example\ufpk.key" /wufpk file="D:\example\ufpk_enc.key"
/mcu "RA-SCE9" /keytype "AES-128" /key "000102030405060708090A0B0C0D0E0F"
/filetype "rfp" /output "D:\example\aes128.rkey"
```

Example of using **kuk** option:

```
> skmt.exe /genkey /kuk file="D:\example\ufpk.key" /mcu "RA-SCE9" /keytype "AES-128"
/key "000102030405060708090A0B0C0D0E0F" /filetype "csource"
/output "D:\example\aes128.c"
```

4.5.1 mcu Options

The **mcu** option specifies the MCU/MPU type and cryptographic engine.

Table 4-8 **mcu** Options

ASCII	Description
RA-RSIP-E51A	Specified when using RA Family RSIP-E51A Security Function and Protected Mode
RA-RSIP-E51A-CM	Specified when using RA Family RSIP-E51A Compatibility Mode
RA-RSIP-E11A	Specified when using RA Family RSIP-E11A Security Function and Protected Mode
RA-RSIP-E11A-CM	Specified when using RA Family RSIP-E11A Compatibility Mode
RA-SCE9	Specified when using RA Family SCE9 Security Function and Protected Mode
RA-SCE9-CM	Specified when using RA Family SCE9 Compatibility Mode
RA-SCE7	Specified when using RA Family SCE7
RA-SCE5_B	Specified when using RA Family SCE5_B
RA-SCE5	Specified when using RA Family SCE5
RX-TSIP	Specified when using RX Family TSIP
RX-TSIPLite	Specified when using RX Family TSIP-Lite
RX-RSIP-E11A	Specified when using RX Family RSIP-E11A
RZ-RSIP-T2M	Specified when using RZ Family RZ/T2M RSIP
RZ-RSIP-T2ME	Specified when using RZ Family RZ/T2ME RSIP
RZ-RSIP-T2L	Specified when using RZ Family RZ/T2L RSIP
RZ-RSIP-N2L	Specified when using RZ Family RZ/N2L RSIP
RZ-TSIP	Specified when using RZ Family TSIP
Synergy-SCE7	Specified when using Synergy Platform SCE7
Synergy-SCE5	Specified when using Synergy Platform SCE5

4.5.2 keytype Options

The **keytype** option specifies the type of key that is being prepared for secure injection or update. Either the ASCII or the hex value can be used with this option. ASCII is recommended for readability.

Note that not all MCUs/MPUs support all key types.

Table 4-9 Authentication key for DLM transition

ASCII	keytype value	Description
DLM-SSD	0x01	Authentication key used in transition to SSD state in DLM.
DLM-NSECSD	0x02	Authentication key used in transition to NSECSD state in DLM.
DLM-RMA-REQ	0x03	Authentication key used in transition to RMA_REQ state in DLM.
DLM-AL2	0x01	Key for DLM authentication level AL2 transition (AL2_Key)
DLM-AL1	0x02	Key for DLM authentication level AL1 transition (AL1_Key)
DLM-RMA	0x03	DLM RMA_REQ Key for state authentication (RMA_Key)

Table 4-10 User Key AES

ASCII	keytype value	Description
AES-128	0x05	AES-128bit key
AES-192	0x06	AES-192bit key
AES-256	0x07	AES-256bit key
AES-128XTS	0x08	AES-128bit XTS key
AES-256XTS	0x09	AES-256bit XTS key

Table 4-11 User Key RSA

ASCII	keytype value	Description
RSA-1024-public	0x0A	RSA 1024bit public key
RSA-1024-private	0x0B	RSA 1024bit private key
RSA-2048-public	0x0C	RSA 2048bit public key
RSA-2048-private	0x0D	RSA 2048bit private key
RSA-3072-public	0x0E	RSA 3072bit public key
RSA-3072-private	0x0F	RSA 3072bit private key
RSA-4096-public	0x10	RSA 4096bit public key
RSA-4096-private	0x11	RSA 4096bit private key
RSA-2048-public-TLS	0xFE	RSA 2048bit public key for TLS

Note: "RSA-2048-public-TLS" cannot be specified by using the **keytype** value. It must be specified using ASCII.

Table 4-12 User Key ECC

ASCII	keytype value	Description
secp192r1-public	0x12	ECC NIST P-192 (secp192r1) public key
secp192r1-private	0x13	ECC NIST P-192 (secp192r1) private key
secp224r1-public	0x14	ECC NIST P-224 (secp224r1) public key
secp224r1-private	0x15	ECC NIST P-224 (secp224r1) private key
secp256r1-public	0x16	ECC NIST P-256 (secp256r1) public key
secp256r1-private	0x17	ECC NIST P-256 (secp256r1) private key
secp384r1-public	0x18	ECC NIST P-384 (secp384r1) public key
secp384r1-private	0x19	ECC NIST P-384 (secp384r1) private key
secp521r1-public	0x24	ECC NIST P-521 (secp521r1) public key
secp521r1-private	0x25	ECC NIST P-521 (secp521r1) private key
brainpoolP256r1-public	0x1C	ECC brainpoolP256r1 public key
brainpoolP256r1-private	0x1D	ECC brainpoolP256r1 private key
brainpoolP384r1-public	0x1E	ECC brainpoolP384r1 public key
brainpoolP384r1-private	0x1F	ECC brainpoolP384r1 private key

HMAC-SHA512-224	0x2a	HMAC-SHA512-224 key
HMAC-SHA512-256	0x2b	HMAC-SHA512-256 key

Note: "HMAC-SHA1" cannot be specified by using the **keytype** value. It must be specified using ASCII.

Table 4-14 User Key ARC4

ASCII	keytype value	Description
ARC4	0x00	ARC4 Key

Note: "ARC4" cannot be specified by using the **keytype** value. It must be specified using ASCII.

Table 4-15 User Key DES

ASCII	keytype value	Description
TDES	0x00	Triple DES key

Note: "TDES" cannot be specified by using the **keytype** value. It must be specified using ASCII.

Table 4-16 OEM Root Public Key

ASCII	keytype value	Description
OEM_ROOT_PK	0xFD	OEM Root public key to be injected into the device when using FSBL

Table 4-17 Key Update Key

ASCII	keytype value	Description
key-update-key	0xFF	Key Update Key

4.5.3 key Options

The **key** option is used to specify the plaintext DLM or user key that needs to be prepared for secure injection or update. The plaintext can be specified by direct input of the hex data, or by a binary *.key file. Some key types can also be generated by the tool.

4.5.3.1 Hex Data Direct Input

If the plaintext key is provided by direct input of the hex data, the required number of bytes as per the specified **keytype** option must be provided, as per the following tables.

Table 4-18 DLM-SSD, DLM-NSECSD, DLM-RMA-REQ, DLM-AL2, DLM-AL1, DLM-RMA

Table 4-51 TDES

Byte	Data
0-7	56bit DES key with odd parity 1
8-15	56bit DES key with odd parity 2
16-23	56bit DES key with odd parity 3

Note: Add odd parity for every 7 bits of key data.

Example:

- DES key data = 0x0000000000000000 -> 0x0101010101010101
- DES key data = 0xFFFFFFFFFFFFFFF -> 0xFEFEFEFEFEFEFEFEFE

Table 4-52 key-update-key

Byte	Data
0-31	Key-Update Key

Example of usage with Hex Data:

```
> skmt.exe /genkey /ufpk file="D:\example\ufpk.key" /wufpk file="D:\example\ufpk_enc.key"  
/mcu "RA-SCE9" /keytype "AES-128" /key "000102030405060708090A0B0C0D0E0F"  
/filetype "rfp" /output "D:\example\aes128.rkey"
```

4.5.3.2 File Input

The key option supports file input for the following file formats

Table 4-53 Key Option Input File

File type	Extension	Format
binary	*.key	Binary data file in the format shown in <i>Section 4.5.3.1 Hex Data Direct Input</i> .
Text	*.txt	Input File representing byte data in hexadecimal ASCII characters in the format shown in <i>Section 4.5.3.1 Hex Data Direct Input</i> .
PEM	*.pem	Key files in PEM file format for asymmetric keys generated by OpenSSL can be read. Only the key types specified in <i>Table 4-54 PEM file support for asymmetric keys</i> are supported

Table 4-54 PEM file support for asymmetric keys

Algorithm	keytype
RSA	RSA-1024-private, RSA-1024-public, RSA-2048-private, RSA-2048-public, RSA-3072-private, RSA-3072-public, RSA-4096-private, RSA-4096-public, RSA-2048-public-TLS
ECC	secp256r1-private, secp256r1-public, secp384r1-private, secp384r1-public, secp521r1-private, secp521r1-public, brainpoolP256r1-private, brainpoolP256r1-public, brainpoolP384r1-private, brainpoolP384r1-public, brainpoolP512r1-private, brainpoolP512r1-public, Ed25519, OEM_ROOT_PK

Note : The macOS version does not support PEM file input for brainpool curves.

Example of specifying a binary file:

```
> skmt.exe /genkey /ufpk file="D:\example\ufpk.key" /wufpk file="D:\example\ufpk_enc.key"
/mcu "RA-SCE9" /keytype "AES-128" /key file="D:\example\aes128.key" /filetype "rfp"
/output "D:\example\aes128.rkey"
```

Example of specifying a text file:

```
> skmt.exe /genkey /ufpk file="D:\example\ufpk.key" /wufpk file="D:\example\ufpk_enc.key"
/mcu "RA-SCE9" /keytype "AES-128" /key file="D:\example\aes128.txt" /filetype "rfp"
/output "D:\example\aes128.rkey"
```

Example of specifying a PEM file:

```
> skmt.exe /genkey /ufpk file="D:\example\ufpk.key" /wufpk file="D:\example\ufpk_enc.key"
/mcu "RA-SCE9" /keytype "RSA-2048-private" /key file="D:\example\rsa2048.pem" /filetype
"rfp" /output "D:\example\rsa2048.rkey"
```

To manually create key data, use a hex editor or binary editor, and create the data in big-endian order in the Hex Editor. An example is shown below.

- Example of manual creation of AES128-bit key file:

AES 128-bit key 00112233445566778899AABBCCDDEEFF

Figure 4-1 Example of manual creation of AES 128-bit key file

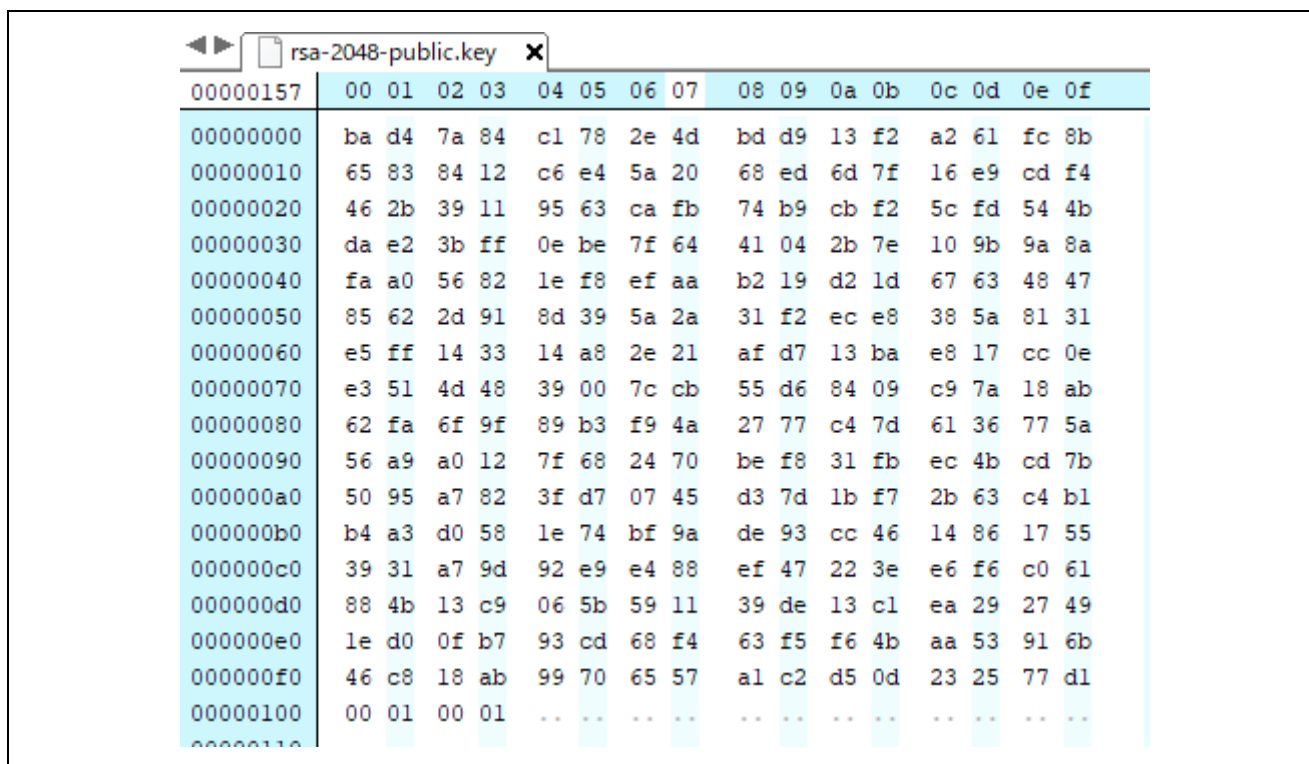

Figure 4-2 Example of manual creation of RSA 2048 public key file

4.5.3.3 key Option Omitted

If the **key** option is omitted from the command line and the specified **keytype** is for either a symmetric algorithm or an asymmetric algorithm that is specified in the table below, the tool will generate a random value for the key.

For asymmetric keys, a key pair is generated. Both private and public keys are generated at the same time, and the specified file name is appended with **_public** for public keys and **_private** for private keys. This option supports the asymmetric **keytype** options shown in the table below.

It is recommended to use the **keyfileoutput** option to create a key file with the plaintext key(s).

The specific amount of randomness of the random values generated by this tool is not guaranteed. Keys generated by this tool should be used for prototyping and test purposes only.

Table 4-55 **keytype** that supports asymmetric key generation functionality

Algorithm	keytype
RSA	RSA-1024-private, RSA-2048-private, RSA-3072-private, RSA-4096-private
ECC	secp256r1-private, secp384r1-private, secp521r1-private brainpoolP256r1-private, brainpoolP384r1-private, brainpoolP512r1-private, Ed25519, OEM_ROOT_PK

Note : The macOS version does not support key generation for brainpool curves.

4.5.4 filetype Options

The **filetype** option allows you to specify the output file format of the prepared key. If this option is omitted, binary data is output. The tool will return an error if the specified **filetype** does not match the file name extension.

Table 4-56 **filetype** options

ASCII	Description
rfp	Output a file in a file format that can be read by the Renesas Flash Programmer (RFP). The output file extension must be *.rkey.
csource	Output C source and header file. The output file extension must be *.c.
bin	Output binary data file. The output file extension must be *.bin.
mot	Output binary data in Motorola hex format. The output file extension must be *.mot. Specify the starting address with 8 hexadecimal digits(32bits) in the address option.

4.5.4.1 rfp Option for filetype

This option outputs key data in Renesas Key File format to be used by the Renesas Flash Programmer.

RFP file output example:

```
> skmt.exe /genkey /ufpk file="D:\example\ufpk.key" /wufpk file="D:\example\ufpk_enc.key"
/mcu "RA-SCE9" /keytype "AES-128" /key file="D:\example\aes128.key" /filetype "rfp"
/output "D:\example\abc.rkey"
```

4.5.4.2 csource Option for filetype

This option outputs C source files and header files.

When the **keyname** option is used, the specified <keyname> will be used as part of the structure name, the global variable name, and the byte size definition. If the **keyname** option is not used, default text will be used. These options are shown by the following table.

Table 4-57 **keyname** option usage

	Setting keyname	Omitting keyname
Structure name	<keyname>_t	encrypted_user_key_data_t
Global variable name	g_<keyname>	g_encrypted_user_key_data
encrypted_user_key bytesize definition value	<KEYNAME>_SIZE *	ENCRYPTED_KEY_BYTE_SIZE

* <keyname> will be converted to uppercase

The output C source structure is as follows, with <keyname> replaced as per *Table 4-57 keyname option usage*.

Table 4-58 Structure output by **csource** when the **ufpk** option is specified

name	Type	Description
g_<keyname>	<keyname>_t	-
keytype	uint32_t	Outputs keytype value for security engines that use keytype values, or 0 for security engines that do not use keytype values.
shared_key_number	uint32_t	0 is output. Not used when the mcu option is "RX-TSIP" or "RX-TSIPLite".
wufpk[32]	uint8_t	Output when the wufpk option is specified. If the wufpk option is not specified, 0 is output.
initial_vector[16]	uint8_t	The Initialization Vector used for user key encryption.
encrypted_user_key [<KEYNAME>_SIZE]	uint8_t	The encrypted user key. <KEYNAME>_SIZE is the size of the encrypted user key. See <i>Table 4-62-Table 4-71</i> for encrypted user key sizes.
crc[4]	uint8_t	CRC-32 value from keytype to encrypted_user_key.

Table 4-59 Structure output by "**csource**" when the **kuk** option is specified

name	Type	Description
g_<keyname>	<keyname>_t	-
keytype	uint32_t	Outputs keytype value for security engines that use keytype values, or 0 for security engines that do not use keytype values.
shared_key_number	uint32_t	0 is output. Not used when the mcu option is "RX-TSIP" or "RX-TSIPLite".
initial_vector[16]	uint8_t	The Initialization Vector used for user key encryption.
encrypted_user_key [<KEYNAME>_SIZE]	uint8_t	The encrypted user key. <KEYNAME>_SIZE is the size of the encrypted user key. See <i>Table 4-62-Table 4-71</i> for encrypted user key sizes.
crc[4]	uint8_t	CRC-32 value from keytype to encrypted_user_key.

C source file output example:

```
> skmt.exe /genkey /ufpk file="D:\example\ufpk.key" /wufpk file="D:\example\ufpk_enc.key"
/mcu "RX-TSIP" /keytype "AES-128" /key file="D:\example\aes128.key" /filetype "csource"
/keyname testKey /output "D:\example\abc.c"
```

4.5.4.3 **bin** Option for **filetype**

This option outputs a file of binary data. The data array of the output binary data is as follows:

Table 4-60 Binary data output by **bin** when the **wufpk** option is specified

Byte	Data
0	keytype Outputs keytype value for security engines that use keytype values, or 0 for security engines that do not use keytype values.
1 - 3	Reserved (0 padding)
4	shared_key number 0 is output. Not used when the mcu option is "RX-TSIP" or "RX-TSIPLite".
5 - 7	Reserved (0 padding)
8 - 39	WUFPK Output when the wufpk option is specified. If the wufpk option is not specified, 0 is output.
40 - 55	initial_vector
56 - (56+N-1)	encrypted_user_key
(56+N) - 56+N +3	crc CRC-32 value from keytype to encrypted_user_key.

Note: "N" is the same as the <KEYNAME>_SIZE value.

Table 4-61 Binary data output by **bin** when the **kuk** option is specified

Byte	Data
0	keytype Outputs keytype value for security engines that use keytype values, or 0 for security engines that do not use keytype values.
1 - 3	Reserved (0 padding)
4	shared_key number 0 is output. Not used when the mcu option is "RX-TSIP" or "RX-TSIPLite".
5 - 7	Reserved (0 padding)
8 - 23	initial_vector
24 - (24+N-1)	encrypted_user_key
(24+N) - 24+N +3	crc CRC-32 value from keytype to encrypted_user_key.

Note: "N" is the same as the <KEYNAME>_SIZE value.

Binary file output example:

```
> skmt.exe /genkey /ufpk file="D:\example\ufpk.key" /wufpk file="D:\example\ufpk_enc.key"
  /mcu "RX-TSIP" /keytype "AES-128" /key file="D:\example\aes128.key" /filetype "bin"
  /output "D:\example\abc.bin"
```

4.5.4.4 mot Option for filetype

This option outputs a Motorola Hex format file. The format of the file is specified in *Table 4-60* and *Table 4-61*. The address for the data must be set by using the **address** option and specifying a hexadecimal 8-digit (32-bit) starting address.

mot file output example:

```
> skmt.exe /genkey /ufpk file="D:\example\ufpk.key" /wufpk file="D:\example\ufpk_enc.key"
  /mcu "RX-TSIP" /keytype "AES-128" /key file="D:\example\aes128.key" /filetype "mot"
  /address "FFF00000" /output "D:\example\abc.mot"
```

The encrypted_user_key size for each **keytype** option is shown below.

Table 4-62 encrypted_user_key size DLM Key

keytype options	Byte size

Table 4-71 encrypted_user_key size Key Update Key

keytype options	Byte size
key-update-key	48

4.5.5 fileadd Options

The **fileadd** option can be set when "**csource**", "**bin**" or "**mot**" is specified for the filetype option. The **fileadd** option can be set when the **filetype** option is "**csource**", "**bin**" or "**mot**".

When the same file name as the output file exists, the generated encrypted key information is appended to the existing data instead of overwriting it.

Note: When "**csource**" is specified in the **filetype** option, it does not check if the same definition values are defined for existing data and newly added data. Use the **keyname** option to ensure that they do not have the same definition value.

fileadd example :

```
> skmt.exe /genkey /ufpk file="D:\example\ufpk.key" /wufpk file="D:\example\ufpk_enc.key"
/mcu "RX-TSIP" /keytype "AES-128" /key file="D:\example\aes128.key" /filetype "csource"
/fileadd /keyname "aes128" /output "D:\example\abc.c"
```

4.5.6 bswap Options

The **bswap** option specifies the sequence of data to be output in ASCII characters. When omitted, the behavior is "**32-big**".

Table 4-72 **bswap** options

ASCII	Description
32-big	Output each of the data in <i>Table 4-60</i> and <i>Table 4-61</i> to a file in big-endian data order.
32-little	Each of the data in <i>Table 4-60</i> and <i>Table 4-61</i> is output to a file in a 4-byte swapped data sequence.

bswap example :

```
> skmt.exe /genkey /ufpk file="D:\example\ufpk.key" /wufpk file="D:\example\ufpk_enc.key"
/mcu "RX-TSIP" /keytype "AES-128" /key file="D:\example\aes128.key" /filetype "csource"
/bswap "32-little" /keyname "aes128" /output "D:\example\abc.c"
```

4.5.7 **keyfileoutput** Options

If the **key** option is omitted from the command line, the tool will generate a random key. The **keyfileoutput** option is used to save the generated key to a binary key file or a text file. The specified file extension may be either `*.key` or `*.txt`.

Only symmetric and some asymmetric key pairs can be generated by this tool. To generate an asymmetric key pair, specify the private key as the **keytype**. The following table shows the asymmetric key pair types that can be generated.

Table 4-73 Asymmetric key types that can be generated

Algorithm	keytype
RSA	RSA-1024, RSA-2048, RSA-3072, RSA-4096
ECC	secp256r1, secp384r1, secp521r1 brainpool P256r1, brainpool P384r1, brainpool P512r1, Ed25519, OEM_ROOT_PK

The specific amount of randomness of the random values generated by this tool is not guaranteed. Keys generated by this tool should be used for prototyping and test purposes only.

When an asymmetric key pair is generated and **/keyfileoutput** is specified, “`_private`” is appended to the file name for the private key and “`_public`” is appended to the file name for the public key. For example, if “`/keyfileoutput abc.key /output abc.rkey`” is specified, the following files are generated:

- `abc_private.key` containing the plaintext private key
- `abc_public.key` containing the plaintext public key
- `abc_private.rkey` containing the encrypted keys for injecting the private key
- `abc_public.rkey` containing the encrypted keys for injecting the public key

To generate a key injection file to inject the public key, run the tool with the appropriate public key **keytype** and use the generated public key file as the key data.

For the output key data format, see the format defined in *Section 4.5.3.1.Hex Data Direct Input*.

Symmetric key file output example:

```
> skmt.exe /genkey /ufpk file="D:\example\ufpk.key" /wufpk file="D:\example\ufpk_enc.key"
  /mcu "RA-SCE9" /keytype "AES-128" /filetype "rfp" /keyfileoutput file="D:\example\aes.key"
  /output "D:\example\abc.rkey"
```

Asymmetric key file output example:

```
> skmt.exe /genkey /ufpk file="D:\example\ufpk.key" /wufpk file="D:\example\ufpk_enc.key"
  /mcu "RX-TSIP" /keytype "RSA-1024-private" /filetype "bin"
  /keyfileoutput file="D:\example\rsa1024.key" /output "D:\example\rsa1024_private.bin"
```

4.6 **enctsip** Command Options

The options listed below can be used with the **enctsip** command. Input can be in the form of hexadecimal data or a binary file.

Table 4-74 enctsip Options

Option	Parameter	Description
mode	ASCII	Specifies the data format of the output file. For details, refer to 4.6.1, <i>mode Option</i> .
ver	Decimal data	Specifies the version of the RSU header appended to the output file. Version 1 or 2 can be specified. If it is omitted, a value of 2 is used. For details, refer to 4.6.2, <i>ver Option</i> .
prg	File Path	Specifies the MOT file to be encrypted.
prg_sb	File Path	When “ factory ” is specified by the mode option, this option specifies the MOT file of the secure boot program to accompany the MOT file to be encrypted.
enckey	Hex data	Specifies the key to be used to encrypt the session key used to encrypt the data in the MOT file specified by the prg option (16 bytes).
session_key	Hex data	Specifies the session key used to encrypt the data in the MOT file specified by the prg option (32 bytes). This option is optional. If it is omitted, a random value generated by the Security Key Management Tool is used as the key data.*1
iv_fw	Hex data	Specifies the initialization vector (IV) used when encrypting the data in the MOT file specified by the prg option (16 bytes). This option is optional. If it is omitted, a random value generated by the Security Key Management Tool is used as the IV.*1
startaddr	Hex data	Specifies the start address of the area of the MOT file specified by the prg option to be encrypted. The address must be aligned to a 16-byte boundary.
endaddr	Hex data	Specifies the end address of the area of the MOT file specified by the prg option to be encrypted. The encryption area specified by the start and end addresses must have a size that is aligned to 16-byte boundaries. The maximum encryption range is 8MB.
destaddr	Hex data	When “ mot ” is specified by the filetype option, this option specifies the address to which the encrypted user program is output.
imgflg	ASCII / Hex data	Specifies the value input for the Image Flags RSU header. For details, refer to 4.6.3, <i>imgflg Option</i> .
filetype	ASCII	Specifies the type of the output file. For details, refer to 4.6.4, <i>filetype Option</i> .
flash_wsize	Decimal data	Can only be specified for ver option 2. Specify a value of 16 bytes or more in increments of 16 bytes. This option can be omitted. If omitted, specify 256.
df_ena	ASCII	This option appends the data in Data Flash area contained in the mot file to be encrypted specified by the prg option to the output file. See 4.6.5 df_ena Option for details.
output	File Path	Specifies the name of the output file.
nooverwrite	None	This option is optional. If it is specified and an output file exists, an error occurs.

Note: 1. Random values generated by the Security Key Management Tool are not guaranteed to provide sufficient randomness.

Example use of mode factory setting:

```
> skmt.exe /enctsip /mode "factory" /ver "1" /prg "D:\example\userprog.mot"  
/prg_sb "D:\example\secureboot.mot" /enckey "0123456789ABCDEF0123456789ABCDEF"  
/startaddr "FFF80300" /endaddr "FFFEFFFF" /destaddr "FFF00300"  
/filetype "mot" /output "D:\example\factory.mot"
```

Example use of mode update setting:

```
> skmt.exe /enctsip /mode "update" /ver "1" /prg "D:\example\userprog.mot"  
/enckey "0123456789ABCDEF0123456789ABCDEF"  
/startaddr "FFF80300" /endaddr "FFFEFFFF" /filetype "rsu" /output "D:\example\update.rsu"
```

4.6.1 ver Option

The ver option specifies the version of the RSU file. version 1 (when the ver option is 1) and version 2 (when the ver option is 2) of the RSU file differ in the RSU header added to the output file and the method of creating the encrypted data.

4.6.1.1 ver option 1

(1) Encrypted data creation method

Encrypts the entire area specified by the **startaddr** and **endaddr** options in the mot file specified by the **prg** option. Areas with no data are padded with 0xFF.

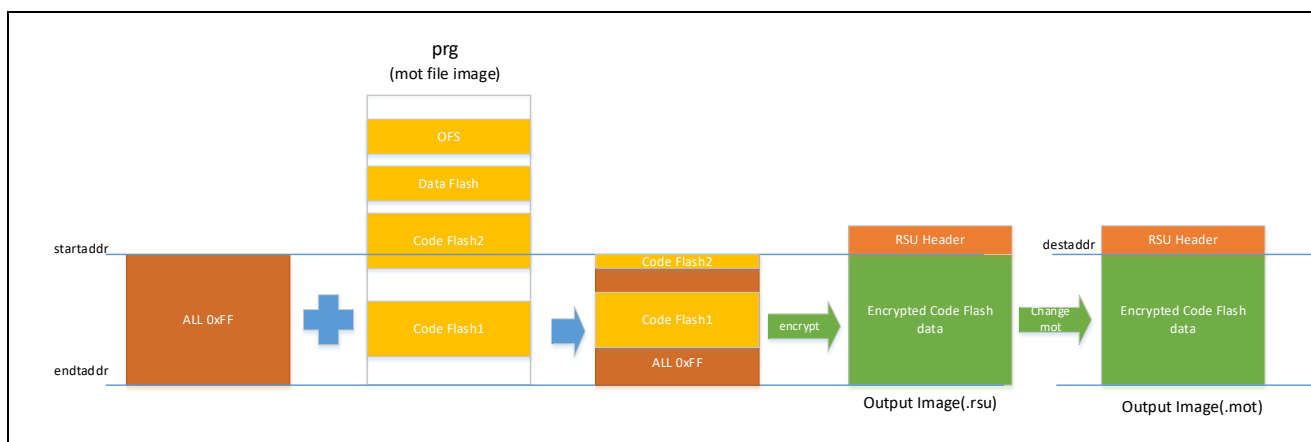

Figure 4-3 Encryption flow when ver option 1 is specified

(2) RSU Header

Table 4-75 RSU Header Version 1 shows the header of Version 1.

Table 4-75 RSU Header Version 1

Offset	Component	Contents Name	Length	Note
0x0000	Header	Magic Code	7	"Renesas"
0x0007		Image Flags	1	Value defined by imgflg option
0x0008	Signature	Firmware Verification Type	32	ASCII "mac-aes128-cmac-with-tsip"
0x0028		Signature size	4	Not used (0x00).
0x002C		Signature	256	Not used (0x00).
0x012C	Option	Dataflash Flag	4	Not used (0x00).
0x0130		Dataflash Start Address	4	Not used (0x00).
0x0134		Dataflash End Address	4	Not used (0x00).
0x0138		Image Size	4	Not used (0x00).
0x013C		Reserved	124	All 0x00
0x01B8		Format Type* ¹	4	Output file format ASCII character string "rsu" (0x72, 0x73, 0x75, 0x00) or "mot" (0x6D, 0x6F, 0x74, 0x00)
0x01BC		IV* ¹	16	IV used when encrypting the user program
0x01CC		SessionKey0* ¹	16	Key, encrypted using enckey, that is used when encrypting the user program
0x01DC		SessionKey1* ¹	16	Key, encrypted using enckey, that is used when encrypting the user program
0x01EC		Encrypted user program + MAC word size* ¹	4	Total word size of the encrypted user program plus the MAC generated when encrypting the user program
0x01F0		MAC* ¹	16	MAC generated when encrypting the user program
0x0200	Descriptor	Sequence Number	4	Always 1
0x0204		Start Address	4	Start address of user program area
0x0208		End Address	4	End address of user program area
0x020C		Execution Address	4	Storage address of user program execution start address (Fixed Value 0xFFFEFFFC)
0x0210		Hardware ID	4	Not used (0x00).
0x0214		Reserved(0x00)	236	—
0x0300	Application Binary		N	Encrypted user program
0x0300+N	Dataflash Binary		M	Not supported.

Note: 1. This parameter is based on the *.rsu file format defined in version 1.x of RX firmware update FIT module and has been modified for the TSIP.

4.6.1.2 **ver** option 2

(1) Encrypted data creation method

The area specified by the **startaddr** and **endaddr** options in the mot file specified by the **prg** option is divided into blocks of the size specified by the **flash_wsize** option, and only the blocks in which data exists are encrypted.

If data exists only in a part of the block divided by the **flash_wsize** option, the area with no data is padded with 0xFF.

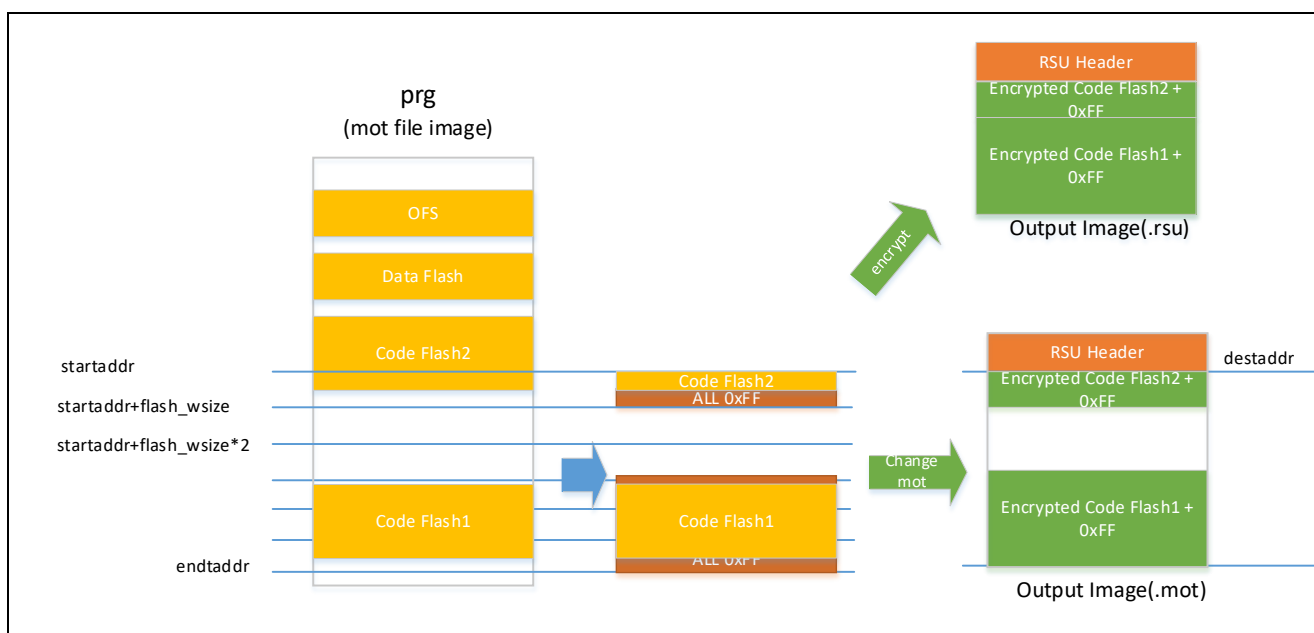

Figure 4-4 Encryption flow when ver option 2 is specified

(2) RSU Header

Table 4-76 RSU Header Version 2 shows the header of Version 2.

Table 4-76 RSU Header Version 2

offset	Component	Contents name	Length	Note	
0x0000	Header	Magic Code	7	"RELFWV2"	
0x0007		Reserved	1	Not used (0x00)	
0x0008	Signature	Firmware Verification Type	32	ASCII "mac-aes128-cmac-with-tsip"	
0x0028		Signature size	4	Not used (0x00)	
0x002C		Signature	64	Not used (0x00)	
0x006C	Option	Reserved(0x00)	332	-	
0x01B8		Format Type *1	4	Output file format ASCII character string "rsu" (0x72, 0x73, 0x75, 0x00) or "mot" (0x6D, 0x6F, 0x74, 0x00)	
0x01BC		IV *1	16	IV used when encrypting the user program	
0x01CC		SessionKey0 *1	16	Key, encrypted using enckey, that is used when encrypting the user program	
0x01DC		SessionKey1 *1	16	Key, encrypted using enckey, that is used when encrypting the user program	
0x01EC		Encrypted user program + MAC word size *1	4	Total word size of the encrypted user program plus the MAC generated when encrypting the user program	
0x01F0		MAC *1	16	MAC generated when encrypting the user program	
0x0200		Descriptor	Number of program data	4	Number of user program data (max. 31)
0x0204			Start address[0]	4	Start address of user program area 1 st
0x0208			Data size[0]	4	Data size of user program area 1 st item
0x020C	Start address[1]		4	Start address of user program area 2 nd	
0x0210	Data size[1]		4	Data size of user program area 2 nd item	
.	.		.	Start address of user program area 3-30 th Data size of user program area 3-30 th item	
.	.		.		
.	.		.		
0x02F4	Start address[30]		4	Start address of user program area 31 th	
0x02F8	Data size[30]	4	Data size of user program area 31 th item		
0x02FC	Reserved(0x00)	4	-		
0x0300	Application Binary		N	The encrypted user program	
0x0300 +N	Dataflash Binary		M	Not support.	

Note:1.This parameter is based on the *.rsu file format defined in version 2.x of RX firmware update FIT module and has been modified for the TSIP.

4.6.2 mode Option

The **mode** option specifies the format of data output as ASCII characters.

Table 4-77 mode Option

ASCII	Description
factory	Outputs a MOT file, to be used for programming at the factory , containing the secure boot program specified by the prg_sb option, the encrypted program, and an appended RSU header. Regarding the file image, refer to <i>Figure 4-3, File Image Generated when factory Is Specified for the mode Option</i> .
update	Outputs a binary file or MOT file, to be used as a firmware update in the field, containing the encrypted program and an appended RSU header. Regarding the file image, refer to <i>Figure 4-4, File Image Generated when update Is Specified for the mode Option and rsu for the filetype Option</i> , or <i>Figure 4-5, File Image Generated when update Is Specified for the mode Option and mot for the filetype Option</i> .

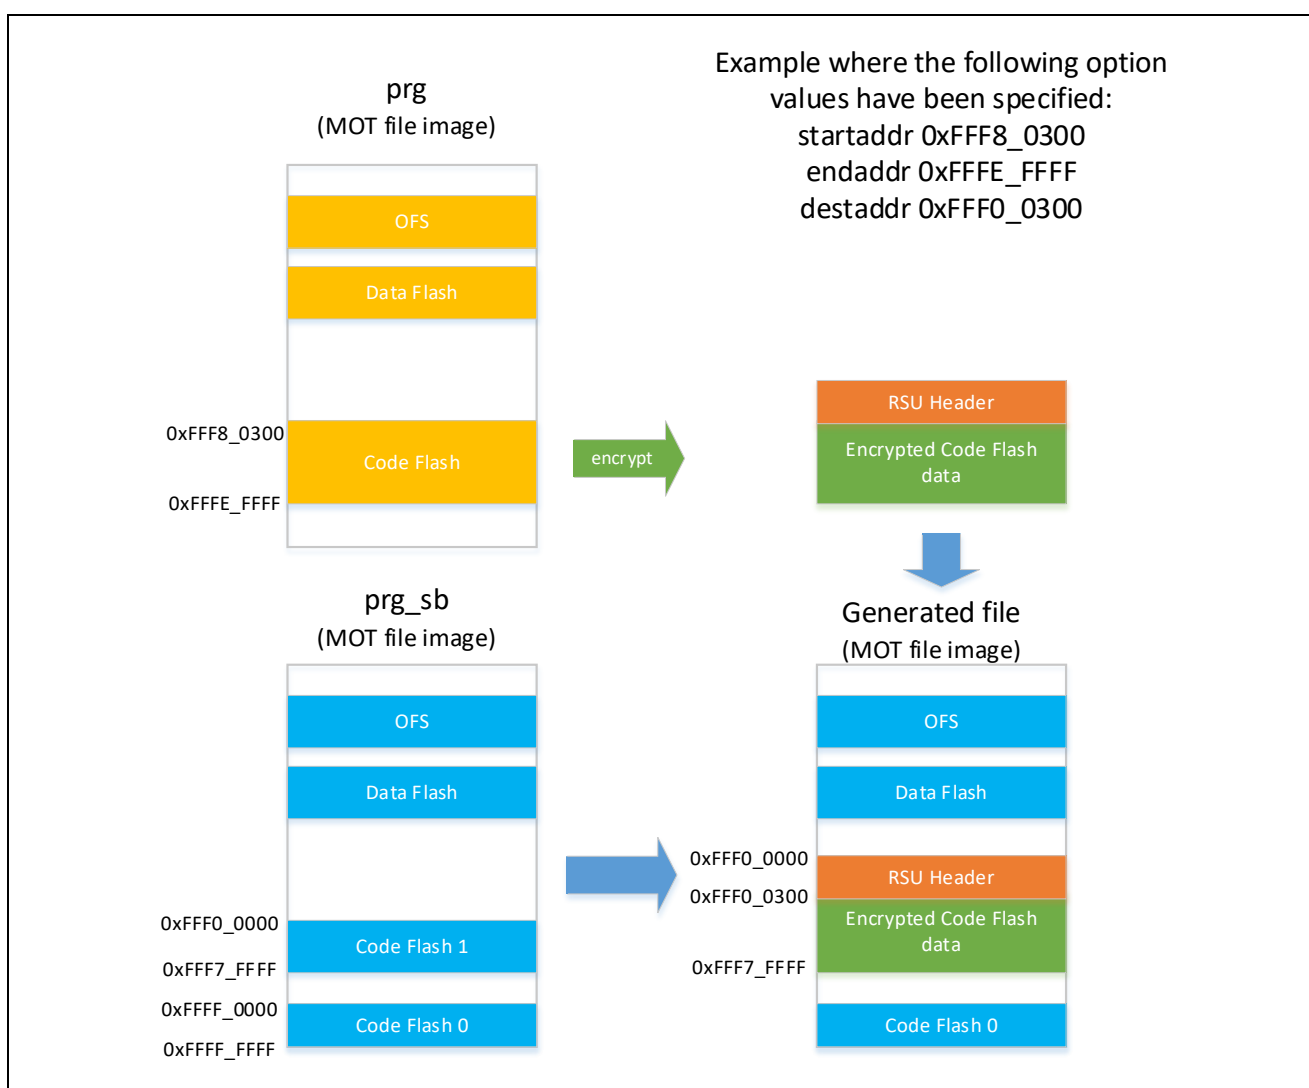

Figure 4-5 File Image Generated when factory Is Specified for the mode Option

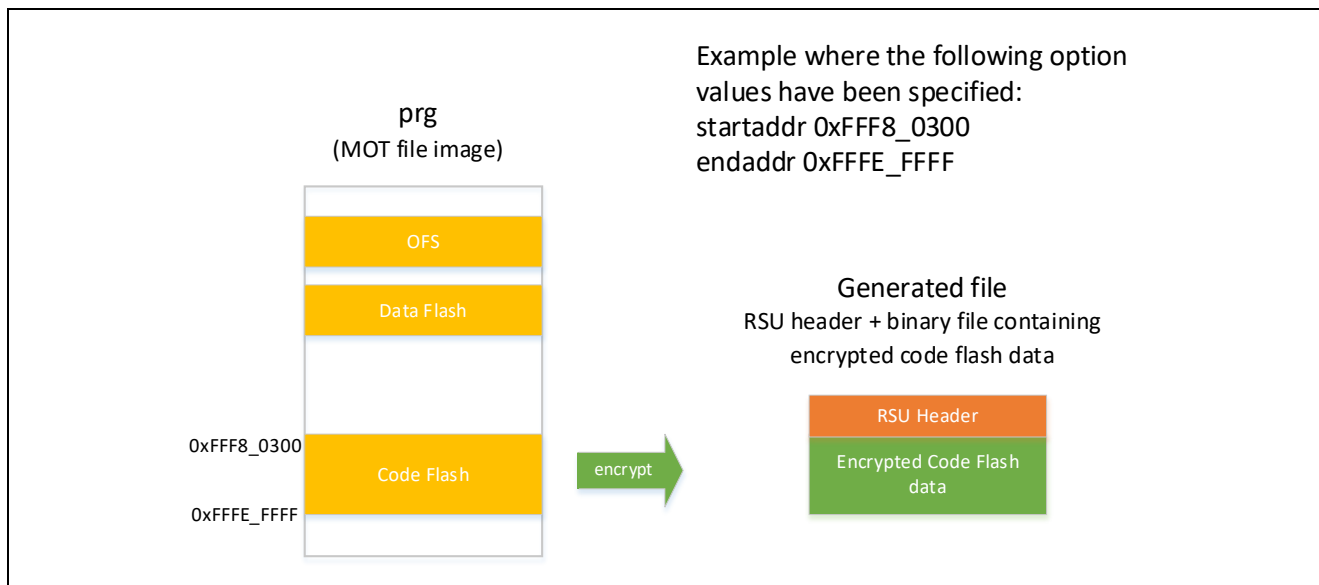

Figure 4-6 File Image Generated when update Is Specified for the mode Option and rsu for the filetype Option

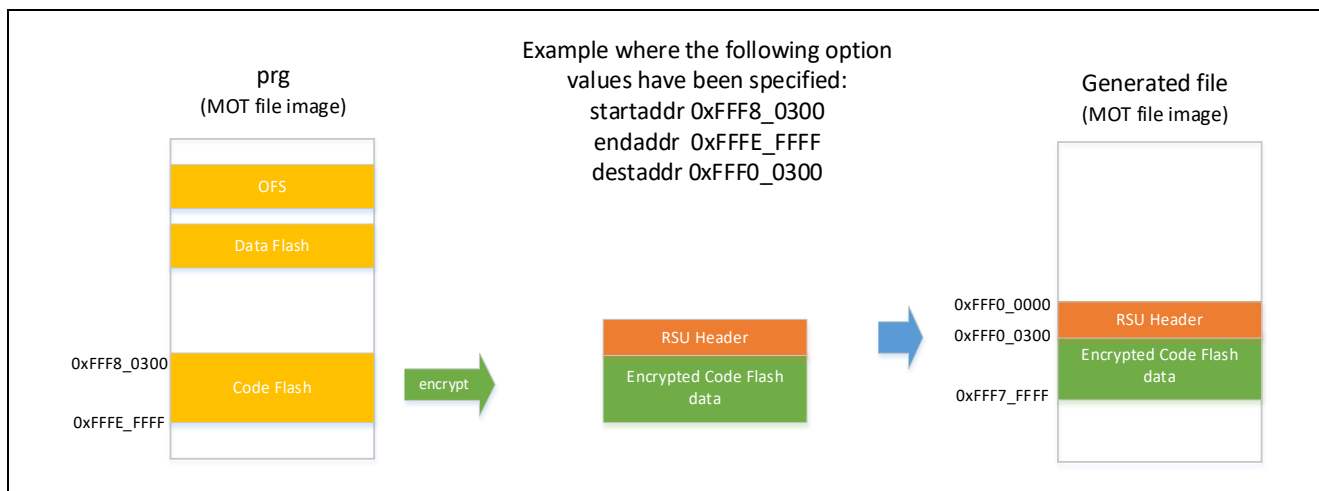

Figure 4-7 File Image Generated when update Is Specified for the mode Option and mot for the filetype Option

4.6.3 **imgflg** Option

The **imgflg** option specifies the value written to the **Image Flags** field of the RSU header appended to the output file. Either an ASCII or a hexadecimal value can be used for this option.

Table 4-78 **imgflg** Option

ASCII	Value	Description
blank	0xFF	No image written.
testing	0xFE	Image being updated, tested.
installing	0xFC	Initial image being installed.
valid	0xF8	Application is valid.
invalid	0xF0	Application is invalid.
end_of_life	0xE0	Application has reached end of life.

4.6.4 **filetype** Option

The **filetype** option specifies the format of the output file in ASCII characters. An error occurs if the specified file type and file name extension do not match.

Table 4-79 **filetype** Option

ASCII	Extension	Description
mot	*.mot	Outputs a file in Motorola hex format.
rsu	*.rsu	Outputs binary data consisting of the encrypted user program and an appended RSU header. This value may only be specified when update is specified for the mode option.

4.6.5 **df_ena** Option

The **df_ena** option specifies that the data in the data flash in the mot file specified by the **prg** option is appended to the output file or encrypted and appended to the output file.

When this option is used, data placed in 0x00100000 to 0x0100FFFF of the file specified by the **prg** option is treated as data in a data flash.

When **factory** is specified with the **mode** option, an error occurs if the address overlaps with the data in the Data Flash in the file specified with the **prg_sb** option.

Table 4-80 **df_ena** Option

ASCII	Description
add	Appends to the output file the data flash data in the mot file specified by the prg option. This can be specified only when factory is specified with the mode option.
enc	Encrypts and appends to the output file the data flash data in the mot file specified by the prg option. This can be specified only when 2 is specified with the ver option.

4.7 **gencert** command option

The following options are available for the **gencert** command. Data input can be specified as hexadecimal data or as a file. To specify a file, prefix the file path with "file=".

Table 4-81 **gencert** options(1)

Options	Parameters	Description
mode	ASCII	Specify the method of signing the certificate to validate the OEM Bootloader. This value must be one of the options listed in <i>Section 4.7.1</i> mode options.
loadaddr	Hex data	Specifies the starting address of the OEM Bootloader.
cfsize	Hex data	Specifies the Code Flash size of the device to be used. When oembl_size is omitted, data within the range from loadaddr option address to cfsize is targeted for signing. Please refer to <i>4.7.2 Area subject to OEM Bootloader signature or CRC calculation</i> .
oembl_size	Hex data	Specify the size of the OEM Bootloader. The size should be 16-byte aligned. Please refer to <i>4.7.2 Area subject to OEM Bootloader signature or CRC calculation</i> .
ver	Decimal data	This option is required only when mode is signature. Specify the version of OEM Bootloader to be listed in Code Certificate. 1-4,294,967,295 can be specified. The actual available version depends on the MCU/MPU specifications; please refer to the Hardware User's Manual or Application Notes of the MCU/MPU.
oembl	File Path	Specify the Motorola hex file of OEM Bootloader to be verified by FSBL.

Table 4-82 **gencert** options(2)

Options	Parameters	Description
oembl_private	Hex data / File Path	This option is required when mode is signature. Specify the OEM Bootloader Private Key. If HEX data is specified, enter 32-byte HEX data. For file input, you can specify a binary (*.key) or text file (*.txt) of the OEM Bootloader Private Key, or a PEM file (*.pem) containing private and public key data. If this option is omitted, the tool internally generates the OEM Bootloader's secp256r1 key pair.
oembl_public	Hex data / File Path	This option is required when mode is signature. Specify the OEM Bootloader Public Key. If HEX data is specified, enter 64-byte HEX data. In case of file input, binary (*.key) or text file (*.txt) of Qx and Qy key data can be specified. No input is required when entering PEM files in oembl_private .
oemroot_private	Hex data / File Path	This option is required when mode is signature. Specify the OEM Root Private Key. If HEX data is specified, enter 32-byte HEX data. For file input, you can specify a binary (*.key) or text file (*.txt) of the OEM Bootloader Private Key, or a PEM file (*.pem) containing private and public key data.
oemroot_public	Hex data / File Path	This option is required when mode is signature. Specify the OEM Root Public Key. If HEX data is specified, enter 64-byte HEX data. In case of file input, binary (*.key) or text file (*.txt) of Qx and Qy key data can be specified. No input is required when entering PEM files in oemroot_private .
output_codecert	File Path	Specify the output file name of Code Certificate.
output_keycert	File Path	This option is required when mode is signature. Specify the output file name of Key Certificate.
keyfileoutput	File Path	If mode is signature and the oembl_private option is omitted, the tool outputs the secp256r1 key pair file generated and used by the tool. Specify the output file name.

Note: The specific amount of randomness of the random values generated by this tool is not guaranteed.

Example of use when mode CRC is set :

```
> skmt.exe /gencert /mode "CRC" /loadaddr "02000000" /oembl_size "1000"
/oembl "D:\example\user.mot" /output_codecert "D:\example\ccert.bin"
```

Example of use when mode signature is set :

```
> skmt.exe /gencert /mode "signature" /loadaddr "02000000" /cfsz "200000" /ver "1"
/oembl "D:\example\user.mot" /oembl_private file="D:\example\is_ec256_priv.pem"
/oemroot_private file="D:\example\ms_ec256_priv.pem"
/output_codecert "D:\example\ccert.bin" /output_keycert " D:\example\kcert.bin"
```

4.7.1 **mode** options

The **mode** option specifies the type of Certificate to output in ASCII characters.

Table 4-83 **mode** options

ASCII	Description
signature	Generate a Key Certificate and Code Certificate using the key to authenticate the OEM Bootloader (OEM Bootloader Key) and the key to authenticate the OEM Bootloader Key (OEM Root Key). OEM ROOT key pair with oemroot_private and oemroot_public options, and OEM Bootloader key pair with oembl_private and oembl_public options.
CRC	Calculates the CRC value of the OEM Bootloader and generates only a Code Certificate.

Note: When Code Certificate is generated with **CRC** specified, the CRC value is output as a dummy value in the Signer ID. If select "CRC + report measurement" in the FSBL operation mode and want to output a measurement report using the OEM Bootloader Key, select **signature** option to generate a Code Certificate.

4.7.2 Area subject to OEM Bootloader signature or CRC calculation

The signature or CRC calculation target of OEM Bootloader is the mot file specified by **oembl** option and the image part extracted from the area specified by **oembl_size** and **cfsize** options.

4.7.2.1 oembl_size option is specified

The image of **oembl_size** from the address specified by **loadaddr** option is signed or subjected to CRC operation. If there is no data for **oembl_size** in the input mot file, it is filled with 0xFF.

As an example, the following examples are illustrated when **loadaddr** "02000000" and **oembl_size** "4000" are specified.

example1: Input mot image is only up to 0x02002FFF

example2: Input mot image is up to 0x02004FFF

example3: No data exists from 0x02002000 to 0x02002FFF in the input mot image.

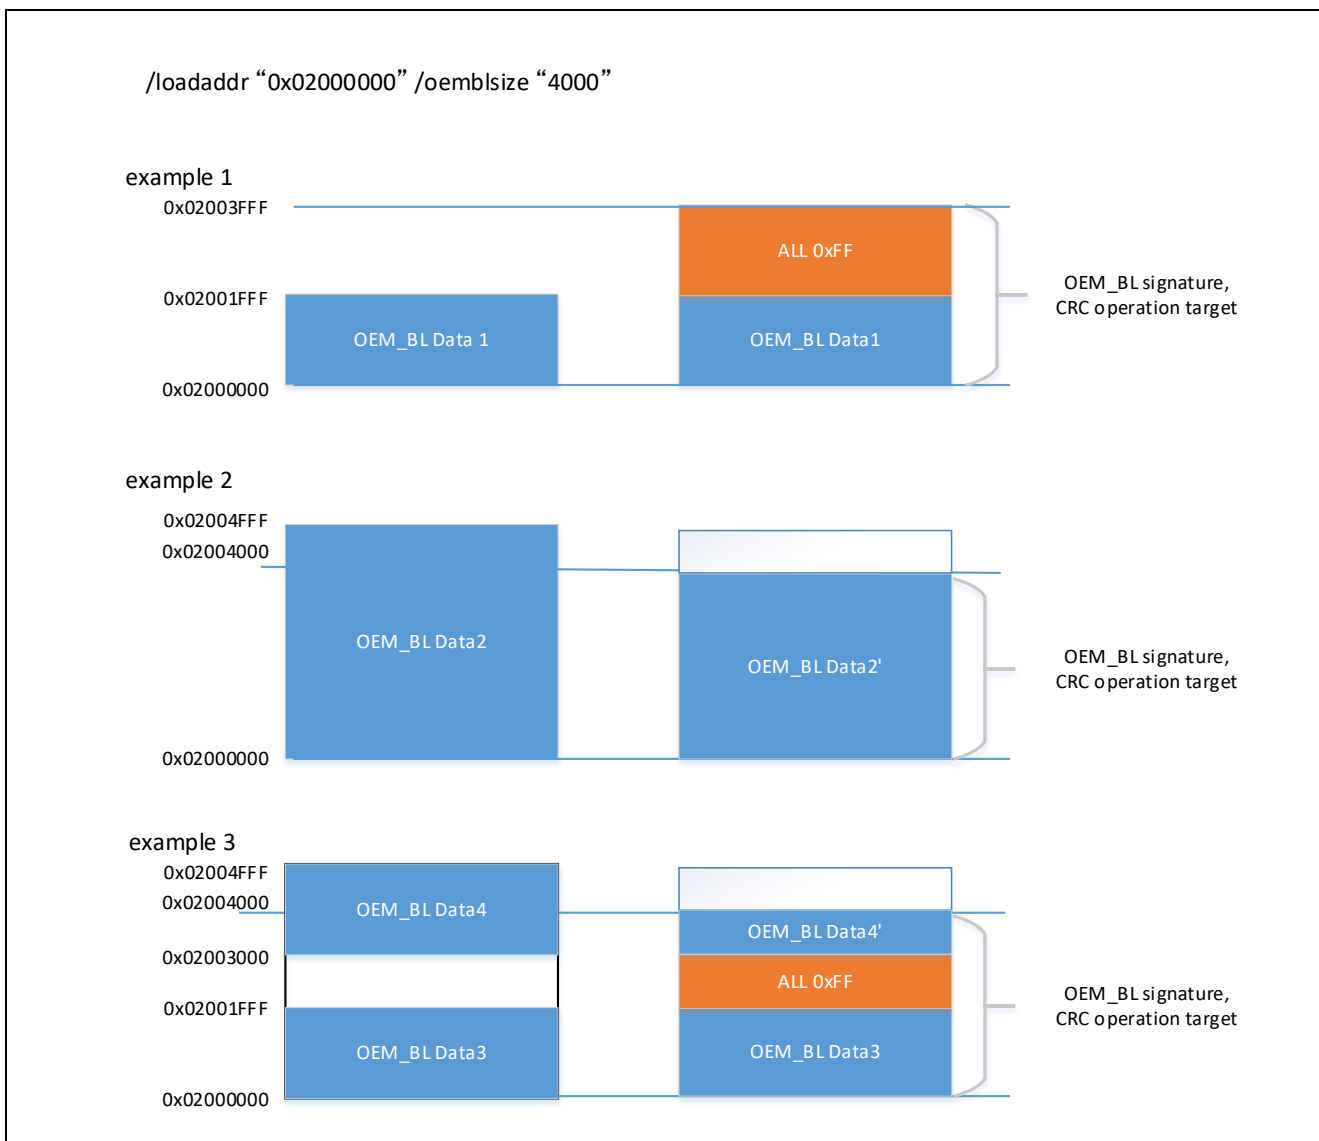

Figure 4-8 Signature and CRC calculation target when oembl_size option is specified

4.7.2.2 only cfsize option is specified

If **oembl_size** option is omitted, data in the mot file specified by **oembl** option, from the address specified by **loadaddr** option to the area specified by **cfsize**, is signed and subject to CRC calculation.

example 1: Input mot image is only up to 0x02001FF8

example 2: Input mot image is up to 0x020014FFF

example 3: Data also exists after 0x02010000 in the input mot image.

example 4: There is an area in the input mot image where no data exists up to 0x02010000.

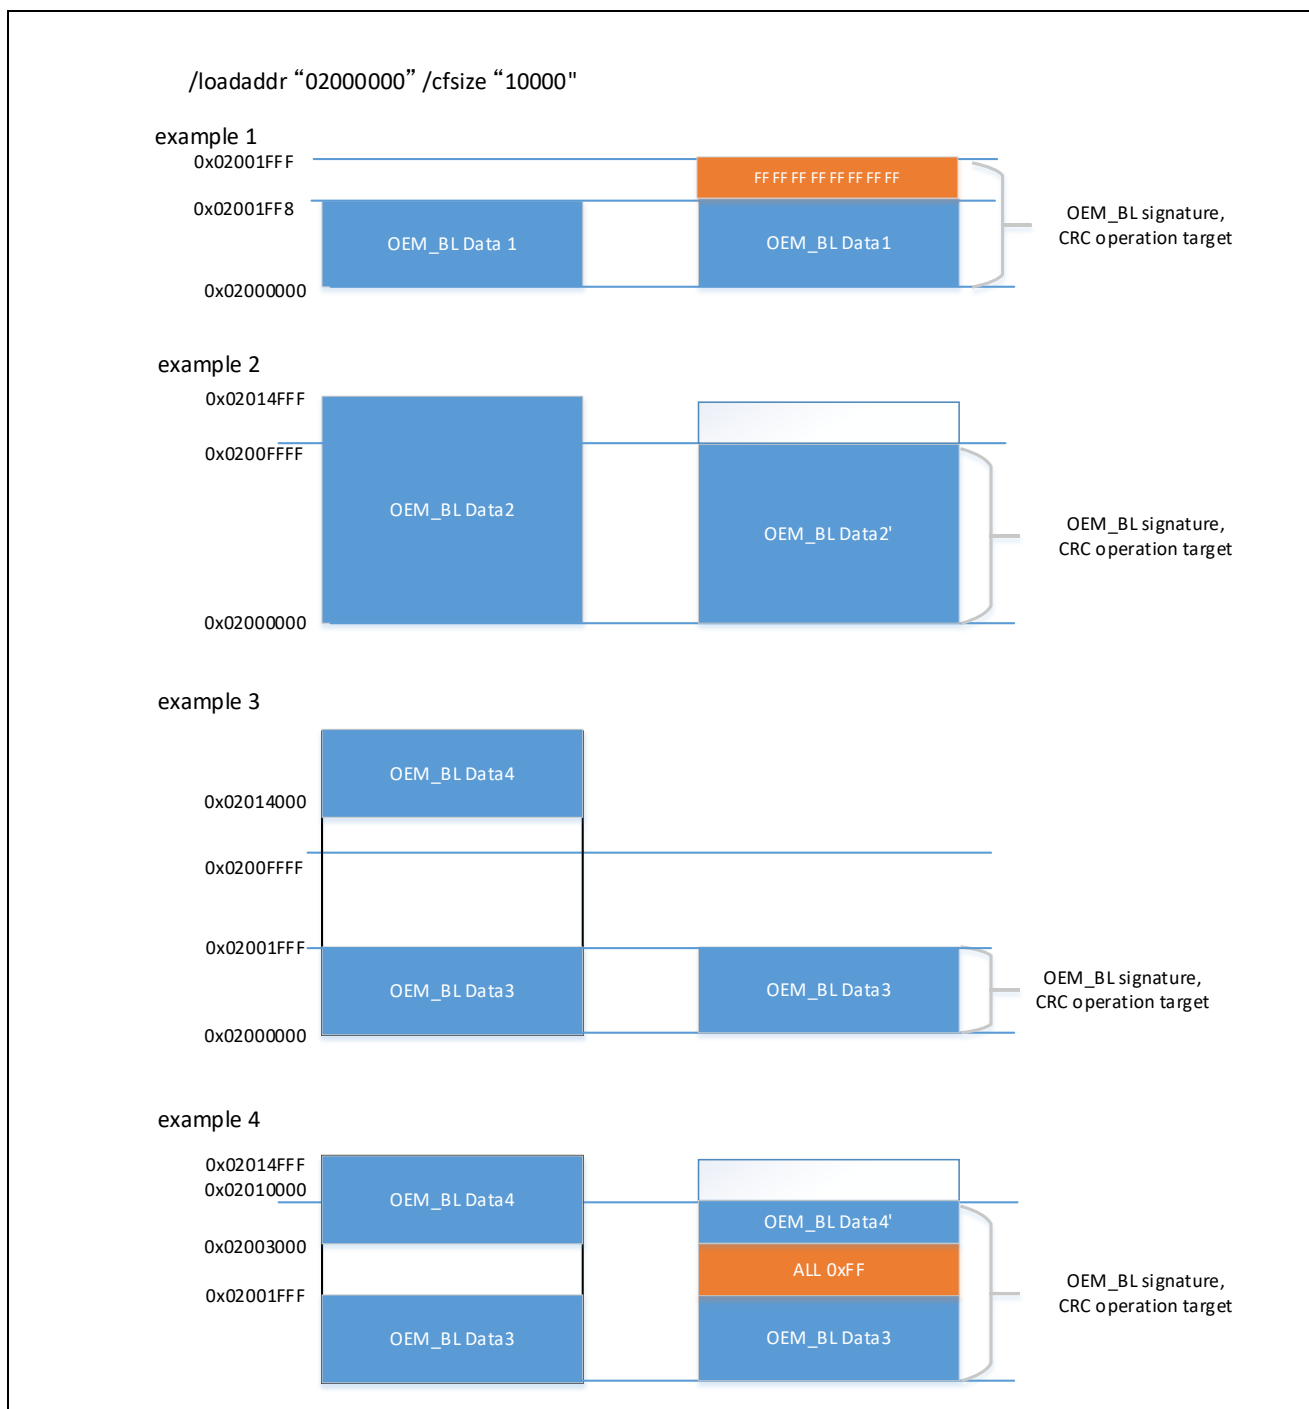

Figure 4-9 Signature and CRC calculation target when only cfsize option is specified

4.8 **encdotf** command option

The following options are available for **encdotf** command. Data input can be specified as hexadecimal data or as a file. To specify a file, prefix the file path with "file=".

Table 4-84 **encdotf** options

Options	Parameters	Description
keytype	ASCII	Specify the bit length of the AES cipher to be used. This value must be one of the options listed in <i>Section 4.8.1 keytype</i> option.
enckey	Hex data/ File Path	Specifies the key data or key file with the bit length specified by keytype option. For details, refer to <i>4.8.2 enckey</i> option.
nonce	Hex data	Specify the nonce data to be used for encryption. Data size is 16 bytes. The upper 100 bits of the input data are used as the nonce. This option is optional. If this option is omitted, a random value generated in the tool will be used as the nonce.
startaddr	Hex data	Specifies the starting address for encryption. The address size is 32 bits. This option can be omitted. If this option is omitted, the entire file is encrypted. The address must be aligned to a 16-byte boundary.
endaddr	Hex data	Specifies the end address for encryption. The address size is 32 bits. This option can be omitted. If this option is omitted, the entire file is encrypted. Specify the address so that the size of the area specified by startaddr option to endaddr option is in units of 16 bytes.
prg	File Path	Specify the file to be encrypted.
output	File Path	Specifies the output file name.
motaddr0	None	When this option is specified, the start address of the output mot file address is set to 0. When this option is specified, the inclairn option or destaddr option cannot be specified.
inclairn	None	When startaddr or endaddr option is specified, data other than that to be encrypted is attached to the output file and output to the file. When this option is specified, motaddr0 option cannot be specified.
destaddr	Hex data	Specifies the destination address of the data to be encrypted. The destination address is used for the lower 28 bits of the counter during encryption. This option can be omitted. If this option is omitted, the first address of the encryption range is used as the destination address. When this option is specified, motaddr0 option cannot be specified.

Note: The specific amount of randomness of the random values generated by this tool is not guaranteed.

Example of encryption range specification :

```
> skmt.exe /encdotf /keytype "AES-128" /enckey "000102030405060708090A0B0C0D0E0F"  
/nonce "00112233445566778890000000" /startaddr "80000000" /endaddr "80000FFF"  
/prg "D:\work\program.srec" /incplain /output "D:\work\dotf_program.srec"
```

Example of not specifying the encryption range :

```
> skmt.exe /encdotf /keytype "AES-128" /enckey "000102030405060708090A0B0C0D0E0F"  
/nonce "00112233445566778890000000" /prg "D:\work\program.srec"  
/output "D:\work\dotf_program.srec"
```

4.8.1 **keytype** option

keytype option specifies the key length, in ASCII, of the key to be used for encryption.

Table 4-85 Key length for encryption

ASCII	Description
AES-128	Set an AES key with a key length of 128 bits.
AES-192	Set an AES key with a key length of 192 bits.
AES-256	Set an AES key with a key length of 256 bits.

4.8.2 **enckey** option

enckey option specifies the hexadata or file.

Input data or a binary file or text file in the following format according to the ASCII characters specified by the **keytype** option. For data or text file input, one byte is represented as a hex ASCII string.

Table 4-86 AES-128

Bytes	Data
0-15	AES-128bit key data

Table 4-87 AES-192

Bytes	Data
0-23	AES-192bit key data

Table 4-88 AES-256

Bytes	Data
0-31	AES-256bit key data

4.9 encsfp command option

The following options are available for **encsfp** command. Data input can be specified as hexadecimal or decimal data or binary/text file or Renesas Partition Data file. To specify a file, prefix the file path with "file=".

Secure Factory Programming is not supported by all MCU/MPUs. Please refer to the user manual of the MCU/MPU and the application note of the boot firmware for support availability or encryption area.

Table 4-89 **encsfp** options(1)

Options	Parameters	Description
mcu	ASCII	Specifies MCU map information that supports Secure Factory Programming. This value must be one of the options listed in <i>Section 4.9.1 mcu</i> .
enckey	Hex data	Specify the AES 128-bit key data to be used for encryption of user program and parameter information. The data size is 16 bytes. This option can be omitted. If this option is omitted, a random value generated in the tool is used as enckey .
nonce_prm	Hex data	Specify the nonce data to be used for encryption of parameter information. The data size is 12 bytes. This option can be omitted. If this option is omitted, a random value generated in the tool is used as nonce_prm .
nonce_prg	Hex data	Specify the nonce data to be used for encryption of parameter information. The data size is 12 bytes. This option can be omitted. If this option is omitted, a random value generated in the tool is used as nonce_prg .
nonce_key	Hex data	When DPL_SECDBG_NONSECDBG is specified with the trn option, specify the nonce data to be used in the encryption of the wrapped secdbgkey and nonsecdbgkey. The data size is 12 bytes. This option can be omitted. If this option is omitted, a random value generated in the tool is used as nonce_key .
trn	ASCII / Hex data	Specifies DLM transition destination information. This value must be one of the options listed in <i>Section 4.9.2 trn option</i> .
prg	File Path	Specify the user program (mot file) to be encrypted. Up to three user programs can be specified. See <i>4.9.3 prg option</i> for details.
al2key	Hex data / File Path	Specify AL2_KEY. Data size is 16 bytes. When OEM_PL0_AL2 is specified with trn option, this option must be entered. If this option is omitted when OEM_PL0_AL2 is specified in trn option, a random value generated in the tool is used as al2key .
secdbgkey	Hex data / File Path	Specify SECDBG_KEY. Data size is 16 bytes. When DPL_SECDBG_NONSECDBG is specified with trn option, this option must be entered. If this option is omitted when DPL_SECDBG_NONSECDBG is specified in trn option, a random value generated in the tool is used as secdbgkey .
nonsecdbgkey	Hex data / File Path	Specify NONSECDBG_KEY. Data size is 16 bytes. When DPL_SECDBG_NONSECDBG is specified with trn option, this option must be entered. If this option is omitted when DPL_SECDBG_NONSECDBG is specified in trn option, a random value generated in the tool is used as nonsecdbgkey .

Table 4-90 **encsfp** options(2)

Options	Parameters	Description
ufpk	Hex data / File Path	Specify the UFPK value to be used when encrypting enckey or al2key , or a UFPK key file generated by the genufpk command.
wufpk	File Path	Specify the W-UFPK file containing the UFPK values wrapped by Renesas Key Wrapping service.
iv_enckey	Hex data	Specify the IV value to be used during enckey encryption. The data size is 16 bytes. This option can be omitted. If this option is omitted, a random value generated in the tool is used as the IV.
iv_al2key	Hex data	When OEM_PL0_AL2 is specified in trn option, specify the IV value to be used when encrypting al2key . The data size is 16 bytes. This option can be omitted. If this option is omitted, a random value generated in the tool is used as IV.
iv_secdbgkey	Hex data	When DPL_SECDBG_NONSECDBG is specified in trn option, specify the IV value to be used when encrypting secdbgkey . The data size is 16 bytes. This option can be omitted. If this option is omitted, a random value generated in the tool is used as IV.
iv_nonsecdbgkey	Hex data	When DPL_SECDBG_NONSECDBG is specified in trn option, specify the IV value to be used when encrypting nonsecdbgkey . The data size is 16 bytes. This option can be omitted. If this option is omitted, a random value generated in the tool is used as IV.
boundary	Decimal data / File Path	Specify the boundary information for code flash, data flash and SRAM (secure, non-secure callable). Specify five decimal arguments or a Renesas Partition Data File (*.rpd). This option can be omitted. If omitted, the boundary information will not be set. For details, see 4.9.4 boundary option
extarea0	Hex data, Decimal data	Specify the address and write unit of the external flash memory area. Following this option, enter the “start address (hexadecimal)”, “end address (hexadecimal)” and “write unit (decimal)” in that order. Specify the external flash memory area and write unit in 16-byte units. This option is not required if the external flash memory is not included in the encryption target. For details, see 4.9.5 extarea0/extarea1 options .
extarea1	Hex data, Decimal data	Specify the address and write unit of the external flash memory area. Following this option, enter the “start address (hexadecimal)”, “end address (hexadecimal)” and “write unit (decimal)” in that order. Specify the external flash memory area and write unit in 16-byte units. This option is not required if the external flash memory is not included in the encryption target. For details, see 4.9.5 extarea0/extarea1 options .

Note: The specific amount of randomness of the random values generated by this tool is not guaranteed.

Table 4-91 **encsfp** options(3)

Options	Parameters	Description
output	File Path	Specify the output file name (sfp file). For the format of the sfp file, see Appendix Secure Factory Programming File Format.
output_al2key	File Path	If OEM_PLO_AL2 is specified with trn option and the al2key option is omitted, the random value generated in the tool used as the key is output as the key file (key file).
output_secdbgkey	File Path	If DPL_SECDBG_NONDECDBG is specified with trn option and the secdbgkey option is omitted, the random value generated in the tool used as the key is output as the key file (key file).
output_nonsecdbgkey	File Path	If DPL_SECDBG_NONDECDBG is specified with trn option and the nonsecdbgkey option is omitted, the random value generated in the tool used as the key is output as the key file (key file).
output_enckey	File Path	If enckey option is omitted, the random value generated within the tool used as the key is output as a key file (key file).

4.9.1 mcu option

mcu option specifies MCU information in ASCII characters.

Table 4-92 **mcu** options

ASCII	Description
RA8D1_M1_T1	Specifies map information for RA8D1/M1/T1.
RA4L1	Specifies map information for RA4L1. The boundary option can be specified.

4.9.2 trn option

trn option specifies DLM transition information in ASCII characters.

Table 4-93 DLM Transition Destination and Authentication Key

ASCII	Description
OEM_PL0_AL2	Write AL2_Key and transfer DLM to OEM, Protection Level to PL0.
DPL_SECDBG_NONSECDBG	Write SECDBG_KEY and NONSECDBG_Key and transfer DLM to DPL.
LCK_BOOT	Transfer DLM to LCK_BOOT

Table 4-94 **trn** option and **mcu** option that can be specified

ASCII	mcu option	
	RA8D1_M1_T1	RA4L1
OEM_PL0_AL2	✓	-
DPL_SECDBG_NONSECDBG	-	✓
LCK_BOOT	✓	✓

✓ : available - : N/A

4.10 **calcreponse** Option

Table 4-96 **calcreponse** Option

Option	Parameter	Description
challenge	Hex data	Specifies the challenge value. (This is usually set to the unique ID of the device.) The data size is 16 bytes.
key	Hex data	Specifies the DLM key data. The data size is 16 bytes.
algorithm	Name	Specifies the calculation algorithm. Select either of the following: HMAC-SHA256 AES-128-CMAC

Example use of calcreponse option:

```
> skmt.exe /calcreponse /challenge "ABCDEFGHIJKLMNOPQRSTUVWXYZ012345"  
/key "000102030405060708090A0B0C0D0E0F" /algorithm HMAC-SHA256
```

5. Operating Procedure

5.1 Standalone

5.1.1 Windows

Run the installer SecurityKeyManagementTool_installer_vXXX.exe and install it in any folder.

Note: Install into a folder with as shallow a hierarchy as possible, with write permission, and with no "blanks". If the hierarchy is too deep or the folder name is too long, it may not run.

5.1.1.1 GUI version

SecurityKeyManagementTool.exe in the installation folder is the executable file.

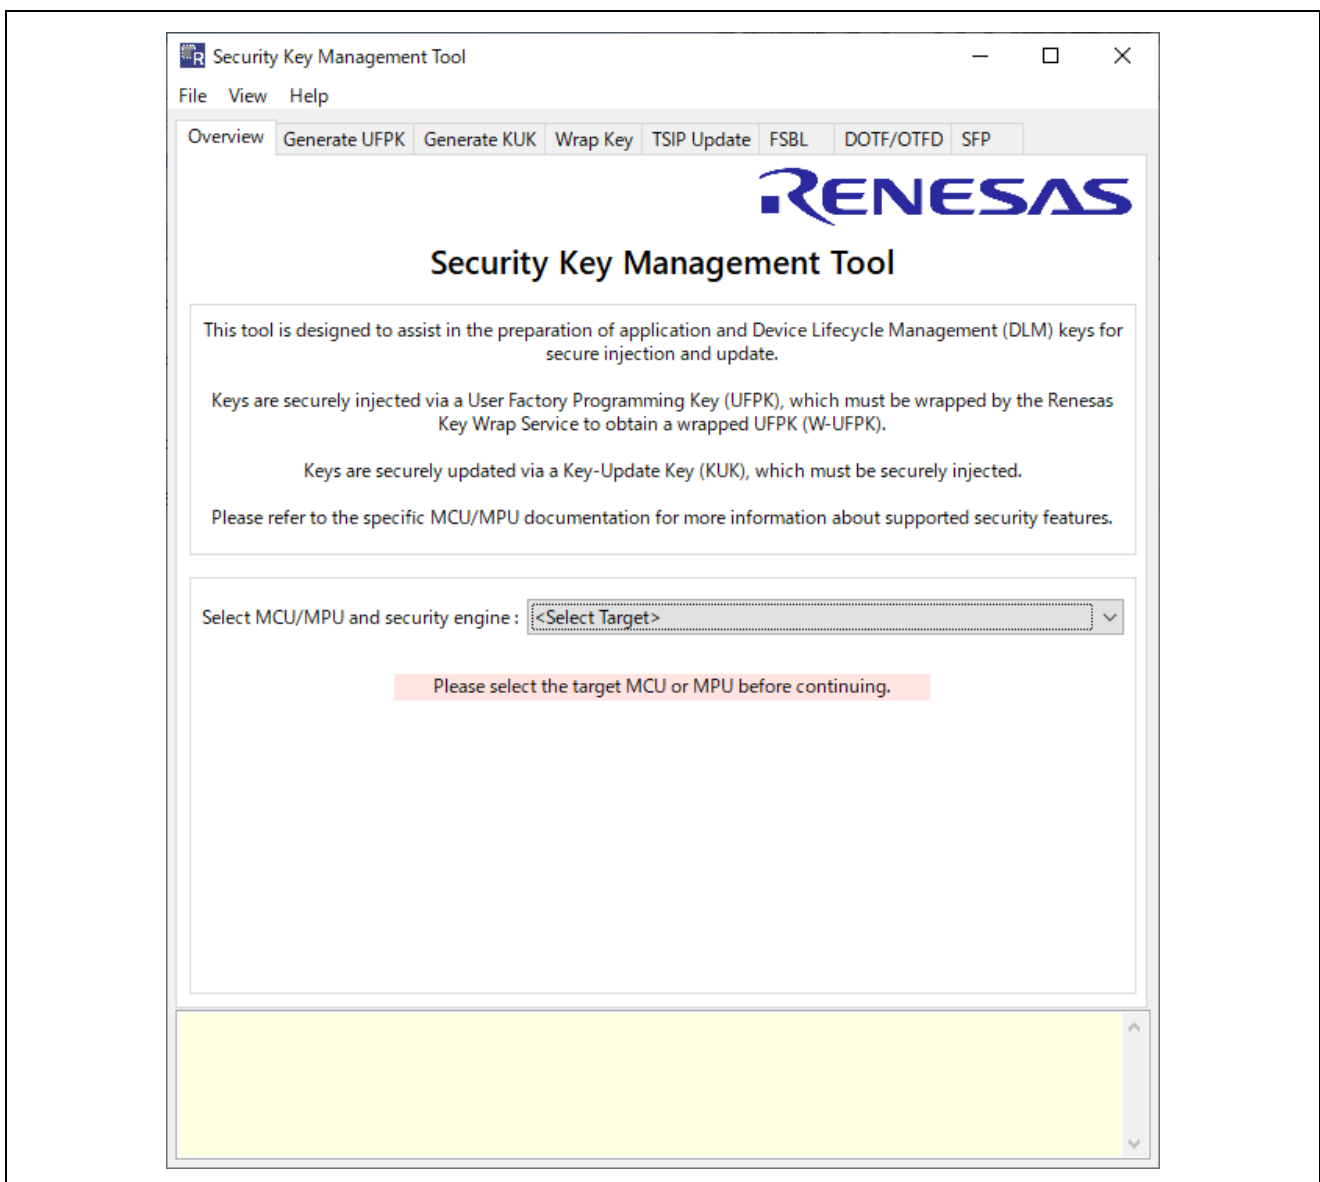

Figure 5-1 Security Key Management Tool – GUI Dialog at startup from Windows

5.1.1.2 CLI version

The files stored in the installed **CLI** folder are the complete set of files required to execute the CLI version of the Security Key Management Tool. If only the CLI version of the tool will be used (for example, in a production environment), these files and folder(**Bold**) can be moved or copied to another folder for convenience. The following is the complete list of files needed to execute the CLI version.

- skmt.exe
- **device**
- **address**

Enter the `skmt.exe` command from command prompt.

```
C:\work\skmt\tool>skmt.exe /genkey /ufpk file="C:\work\ufpk.key" /wufpk file="C:\work\ufpk_enc.key" /mcu "RA-SCE9" /keytype "AES-128" /key "000102030405060708090A0B0C0D0E0F" /filetype "rfp" /output "c:\work\aes128.rkey"
Output File: c:\work\aes128.rkey
UFPK: EC6B8FA5C0D5DA5142CCAF3A31AEBEAE2346CFE7EF644B9B6B70523CBA0F5C5C
W-UFPK: 000000004F4C172DEF2789DE4F041294C6B1218D11DC81DC5B37FB72DB899DCFF4BE7158

C:\work\skmt\tool>
```

Figure 5-2 Security Key Management Tool - CLI execution example from command prompt

5.1.2 Linux version

5.1.2.1 GUI version

After unzipping the Linux version package, place the **SecurityKeyManagementTool** folder in any folder. When decompressing, use the command **tar xvzfp xxxxx.tar.gz** to maintain execute permissions.

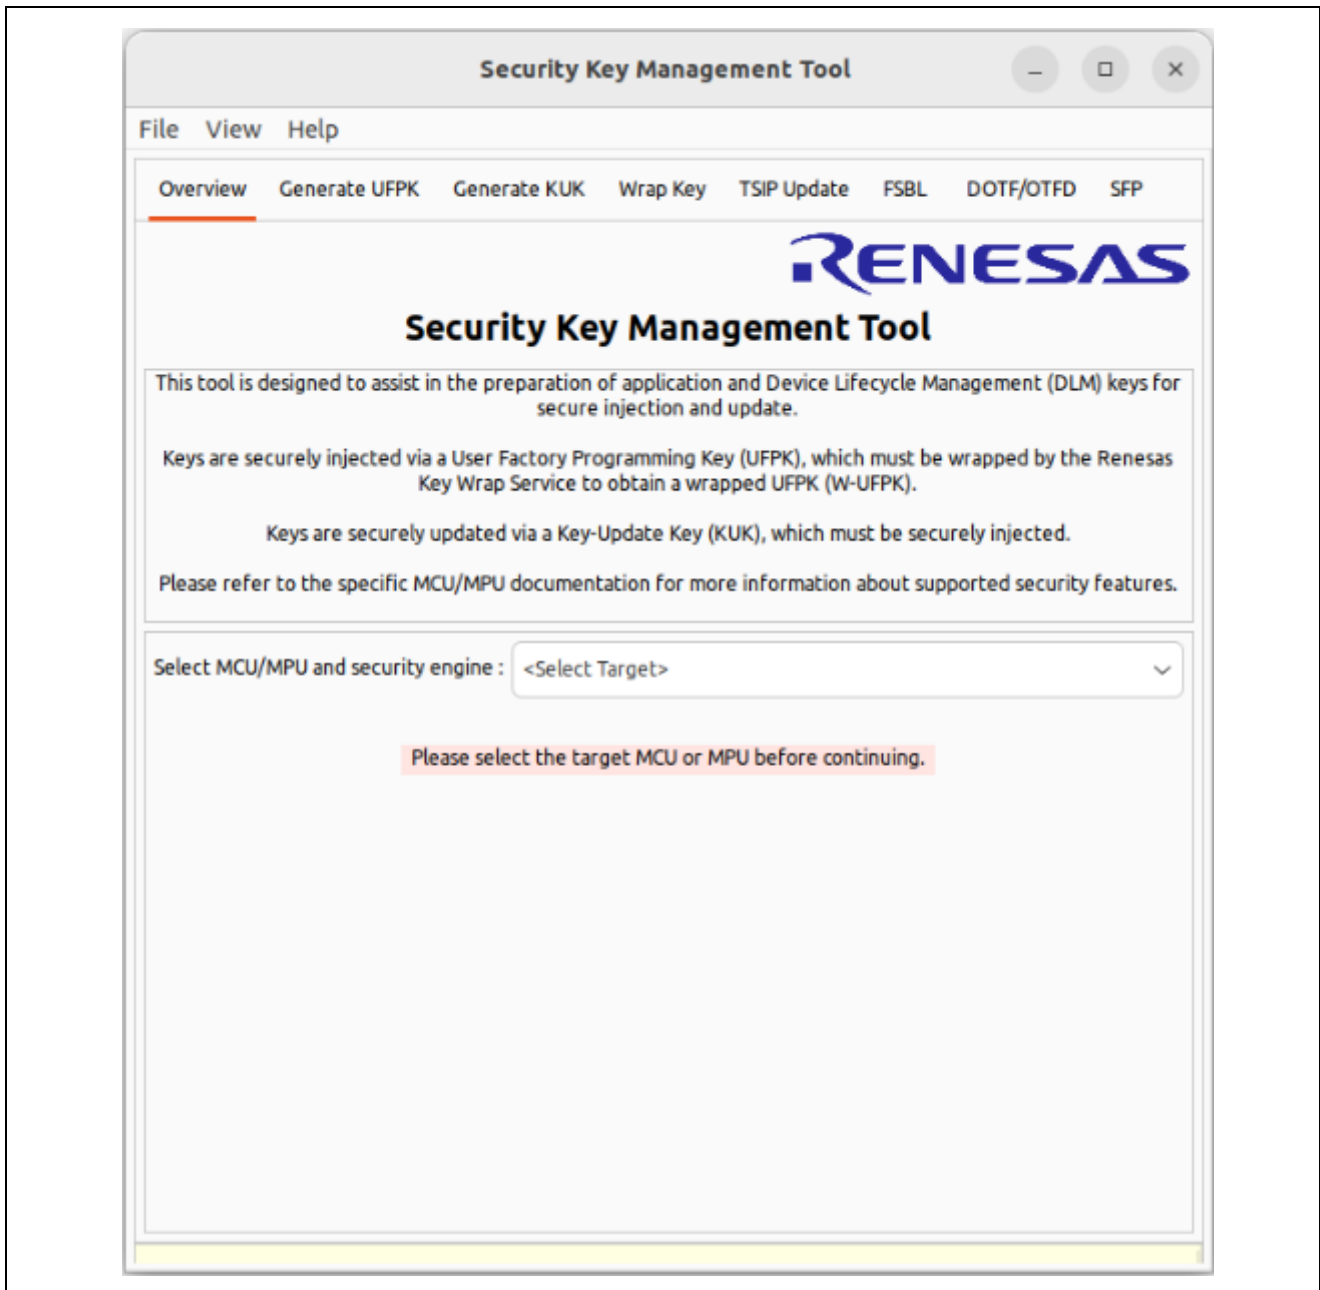

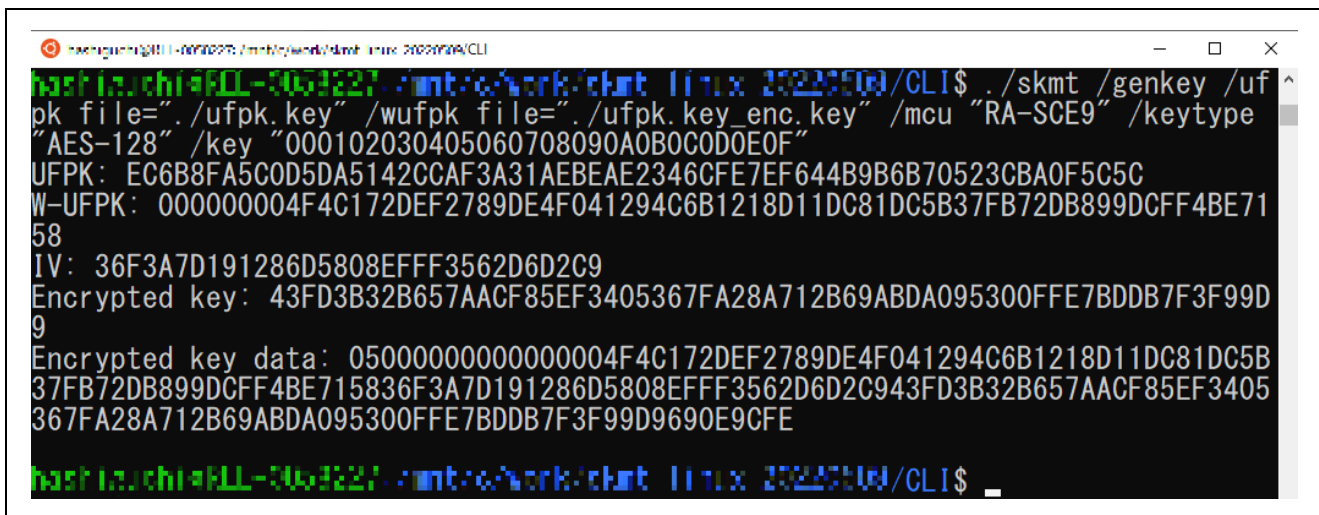

Figure 5-3 Security Key Management Tool – GUI Dialog at startup from Linux

5.1.2.2 CLI version

The files stored in the installed **CLI** folder are the complete set of files required to execute the CLI version of the Security Key Management Tool. If only the CLI version of the tool will be used (for example, in a production environment), these files can be moved or copied to another folder for convenience. The following is the complete list of files needed to execute the CLI version.

- **skmt**
- **device**
- **address**

Enter the `skmt` command from the terminal software.

```
hashi@uchi-kll-063227:~/mnt/work/skmt Linux 3.12.23-001/CLI$ ./skmt /genkey /ufpk file="./ufpk.key" /wufpk file="./ufpk.key_enc.key" /mcu "RA-SCE9" /keytype "AES-128" /key "000102030405060708090A0B0C0D0E0F"
UFPK: EC6B8FA5C0D5DA5142CCAF3A31AEBEAE2346CFE7EF644B9B6B70523CBA0F5C5C
W-UFPK: 000000004F4C172DEF2789DE4F041294C6B1218D11DC81DC5B37FB72DB899DCFF4BE7158

```

Figure 5-4 Security Key Management Tool - CLI execution example from Linux Terminal software

5.1.3 macOS version

Unzip the downloaded package in any folder.

After unzipping, the file structure is as follows

SecurityKeyManagementTool.app.zip : GUI version

SKMT-CLI.zip : CLI version

5.1.3.1 GUI version

Unzip SecurityKeyManagementTool.app.zip in any folder, where SecurityKeyManagementTool.app is the executable file.

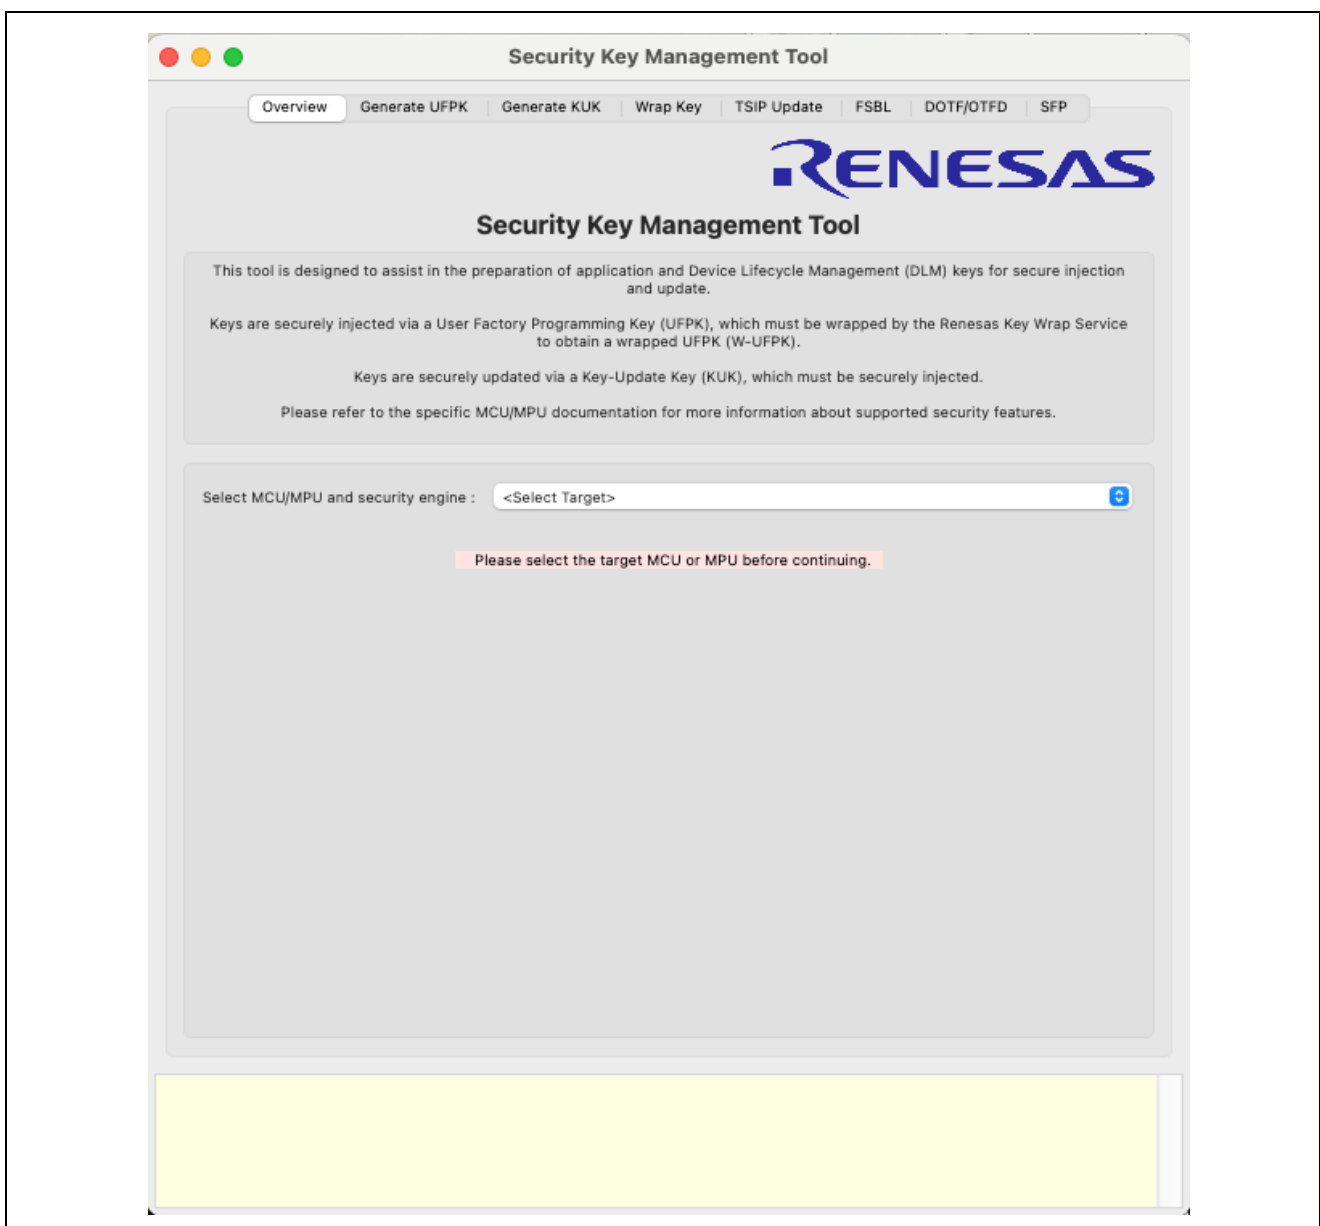

Figure 5-5 Security Key Management Tool – GUI Dialog at startup from macOS

5.2 e²studio plugin

The Windows, Linux and macOS versions follow the same installation and uninstallation procedure. Please follow the steps below to install and uninstall.

5.2.1 Installing e²studio plugin version

1. Download SecurityKeyManagementTool_Plugin_vXXX_Windows.zip
SecurityKeyManagementTool_Plugin_vXXX_mac.zip or
SecurityKeyManagementTool_Plugin_vXXX_Linux.zip from the Renesas Web site and place it in any folder of your choice. vXXX is this tool version.
2. Start e²studio
3. Select e²studio menu **“Help(H)”** – **“Install New Software...”** menu to open the **“Install”** dialog.

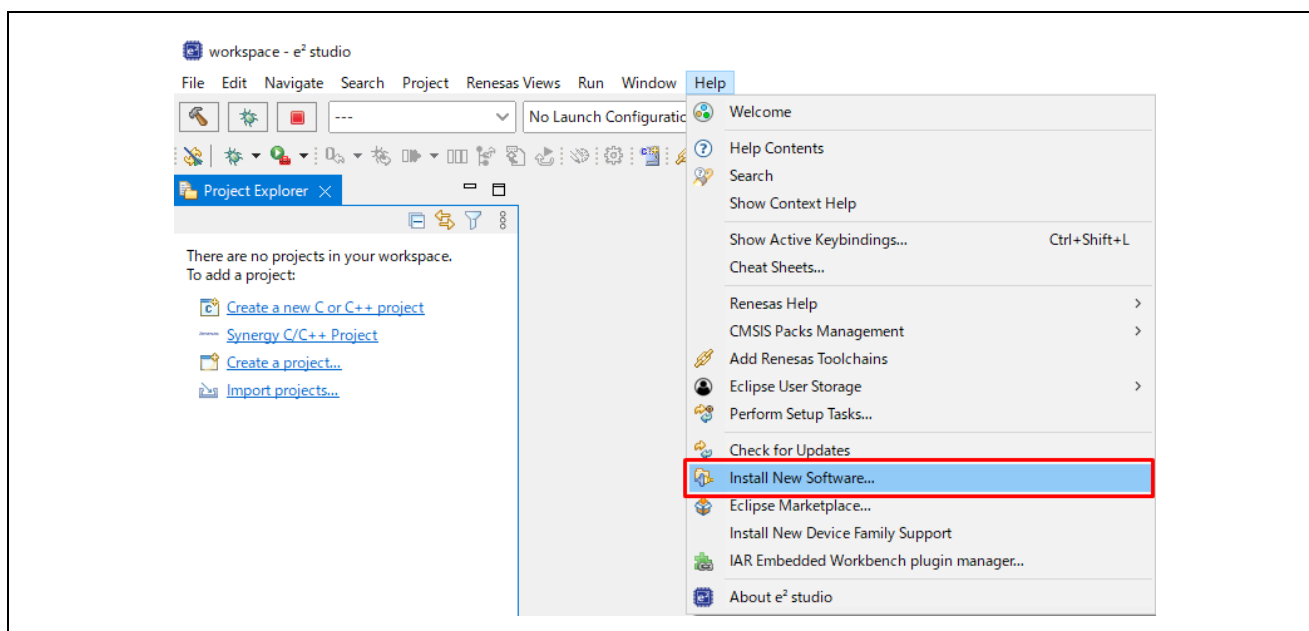

Figure 5-7 e²studio “Help(H)” – “Install New Software...”

4. Press the **“Add”** button in the **“Install”** dialog to open the **“Add Repository”** dialog.

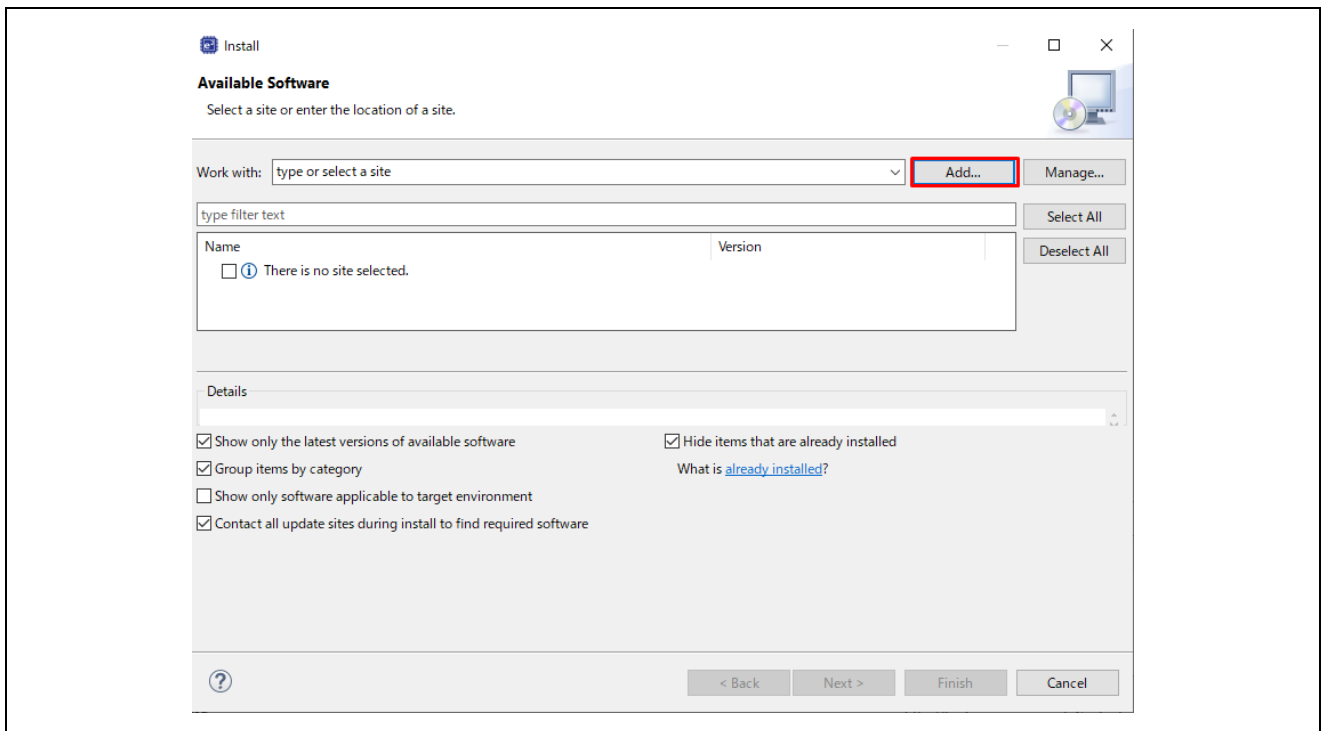

Figure 5-8 “Install” Dialog

5. Click the **“Archive(A)...”** button on the **“Add Repository”** dialog, specify the SecurityKeyManagementTool_Plugin_vXXX_Window/Linux/mac.zip file prepared in step 1, and then click the **“Add”** button.

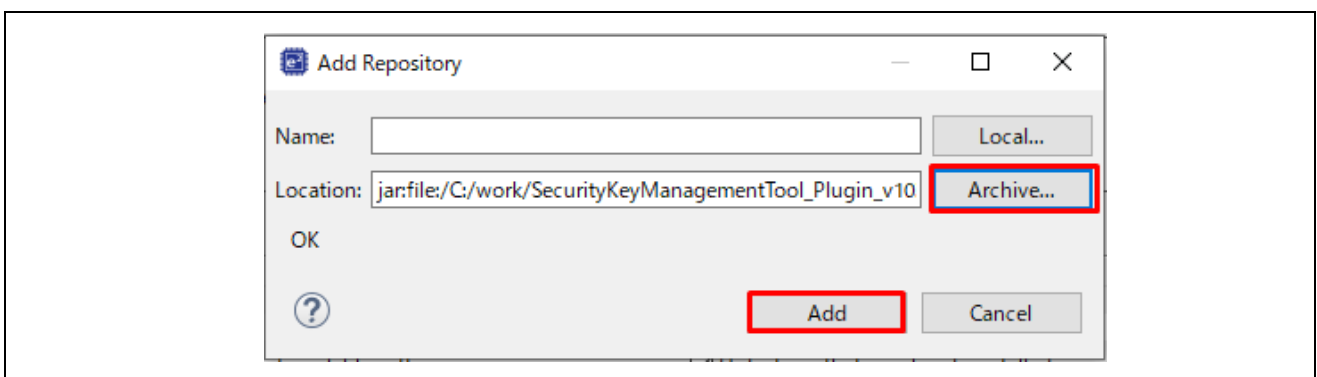

Figure 5-9 “Add Repository” Dialog

6. "Renesas Solution Toolkit" will be added to the "Install" dialog box. Check the checkbox and press the "Next >" button. Uncheck box "Contact all sites during install to find required software.". If left checked, installation will take longer.

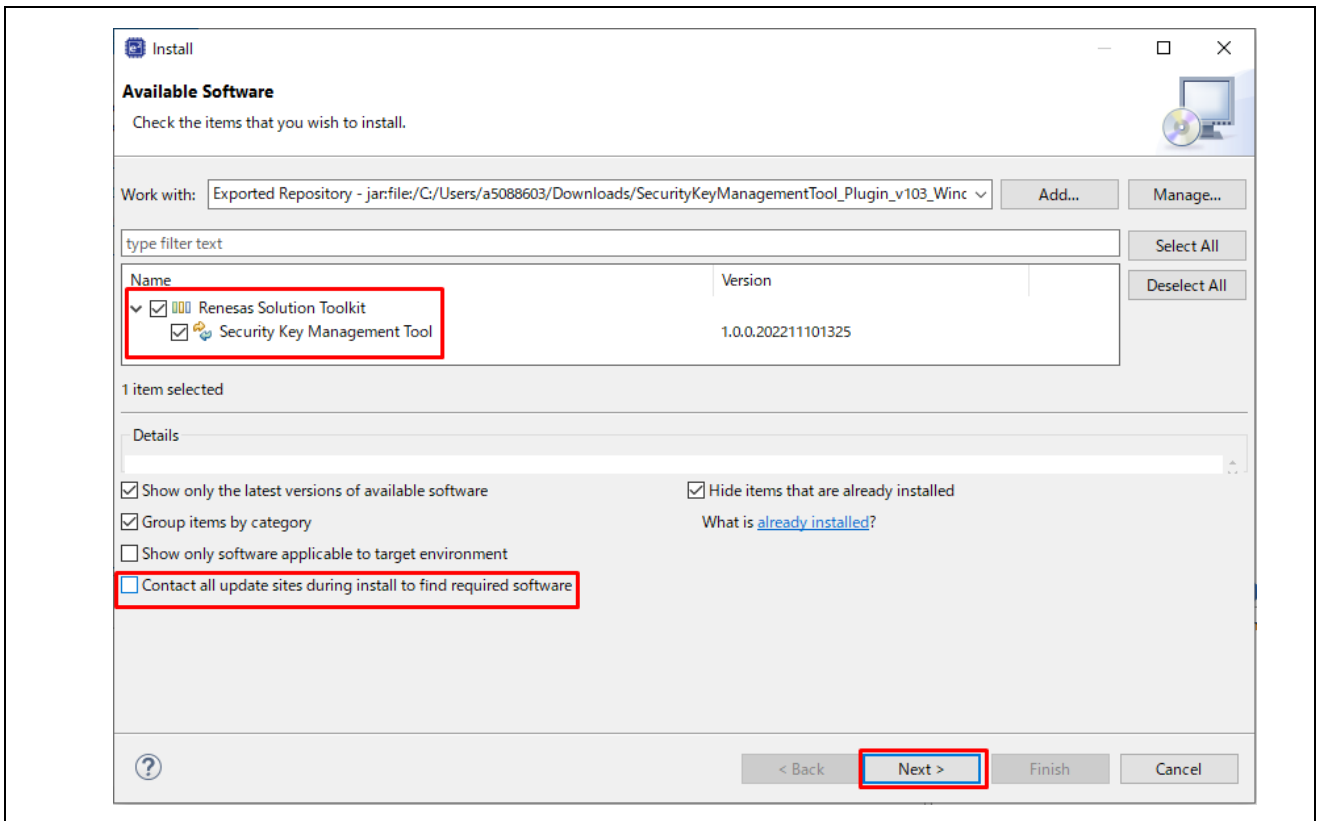

Figure 5-10 "Install" Dialog – Select "Security Key Management Tool"

7. When the "Install" dialog box appears, confirm that the "Security Key Management Tool" is installed and press the "Next >" button.

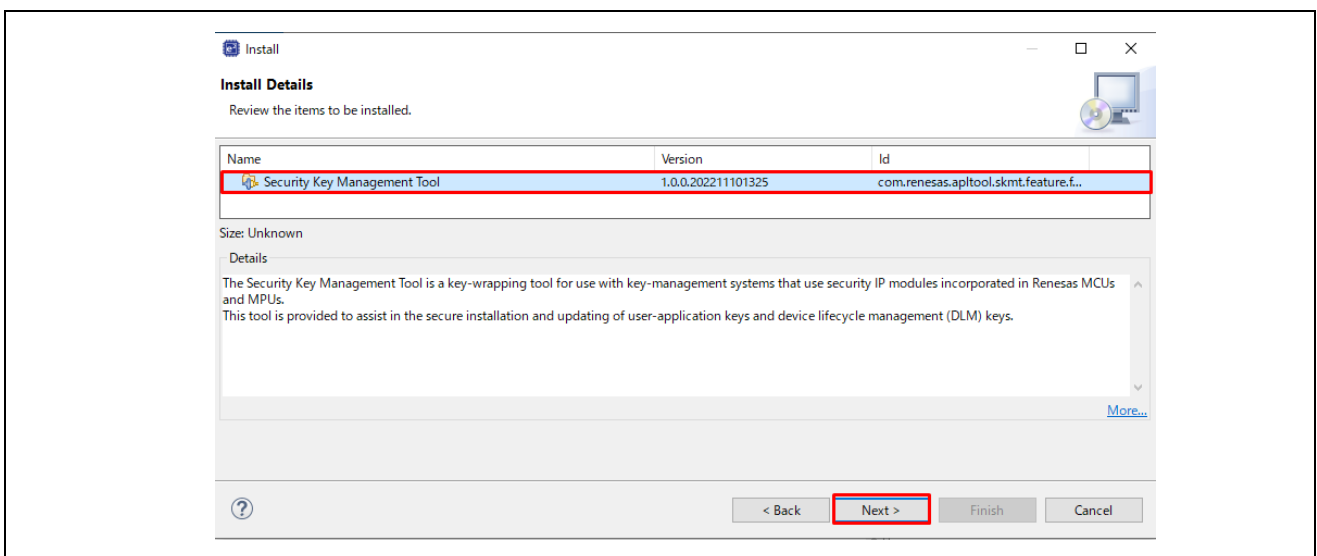

Figure 5-11 "Install" Dialog – Install Details

- This is followed by the license confirmation screen. Accept the terms of the license, which was presented during the Plugin download and can be reviewed at the URL displayed in the dialog box. Select "I accept the terms of the license agreement" and press the Finish button.

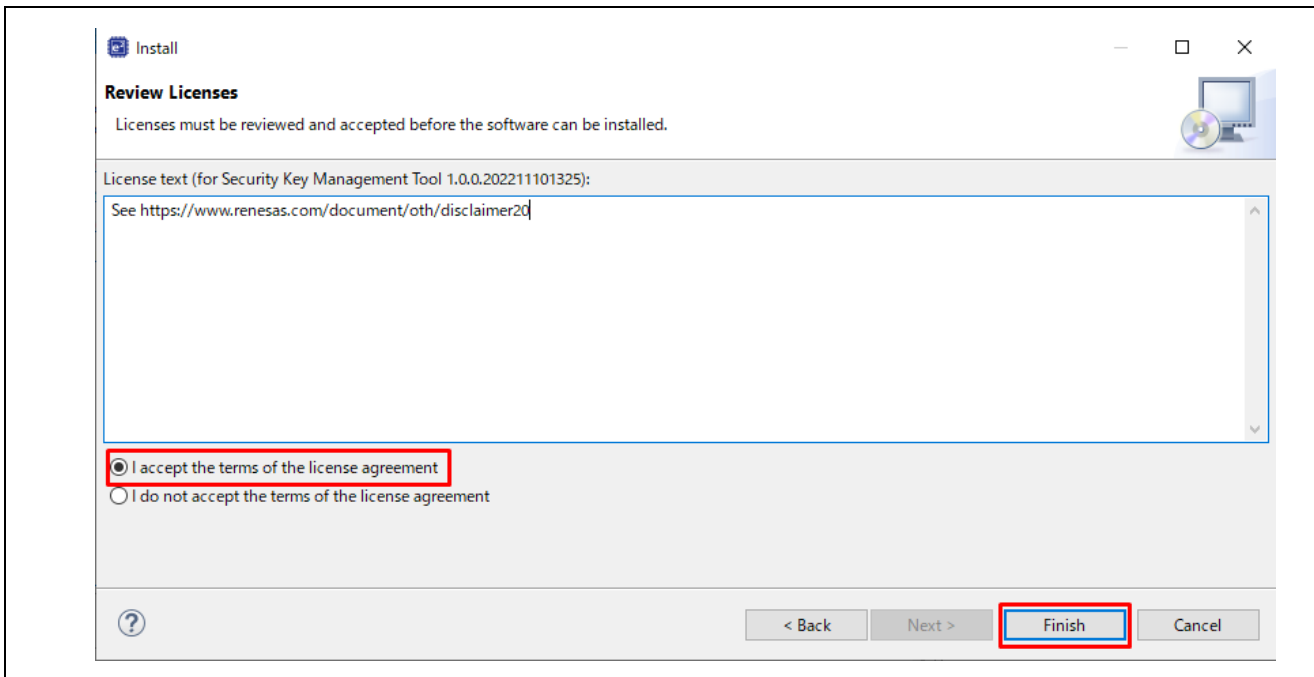

Figure 5-12 "Install" Dialog – Review License

- When the "Trust" dialog box appears, check the displayed certificate and press the "Trust Selected" button to continue the installation.

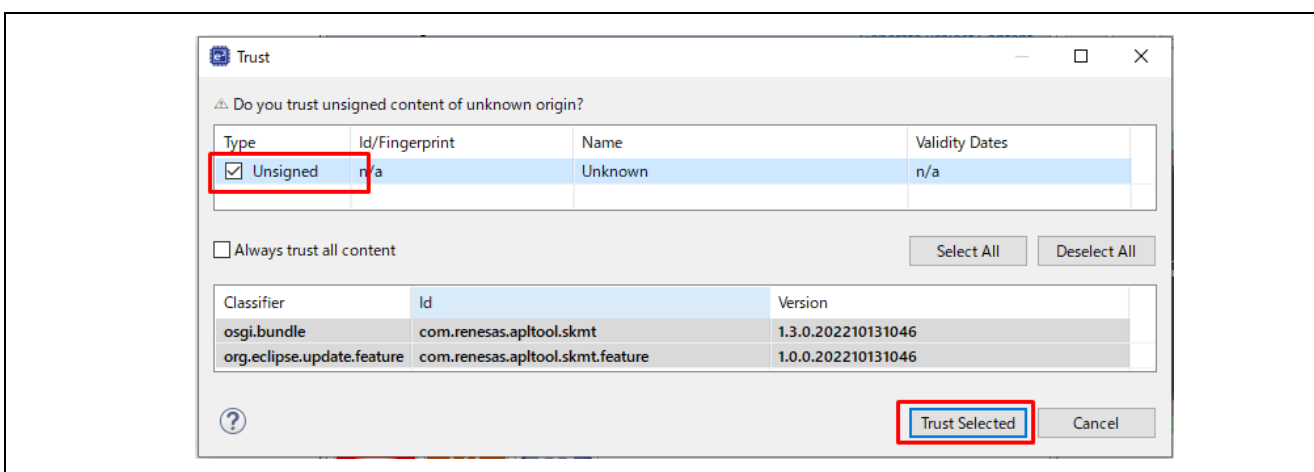

Figure 5-13 "Trust" Dialog

10. Restart e² studio when prompted.
11. After installation is complete, the Security Key Management Tool will be added to the “**Properties**” dialog of the project.

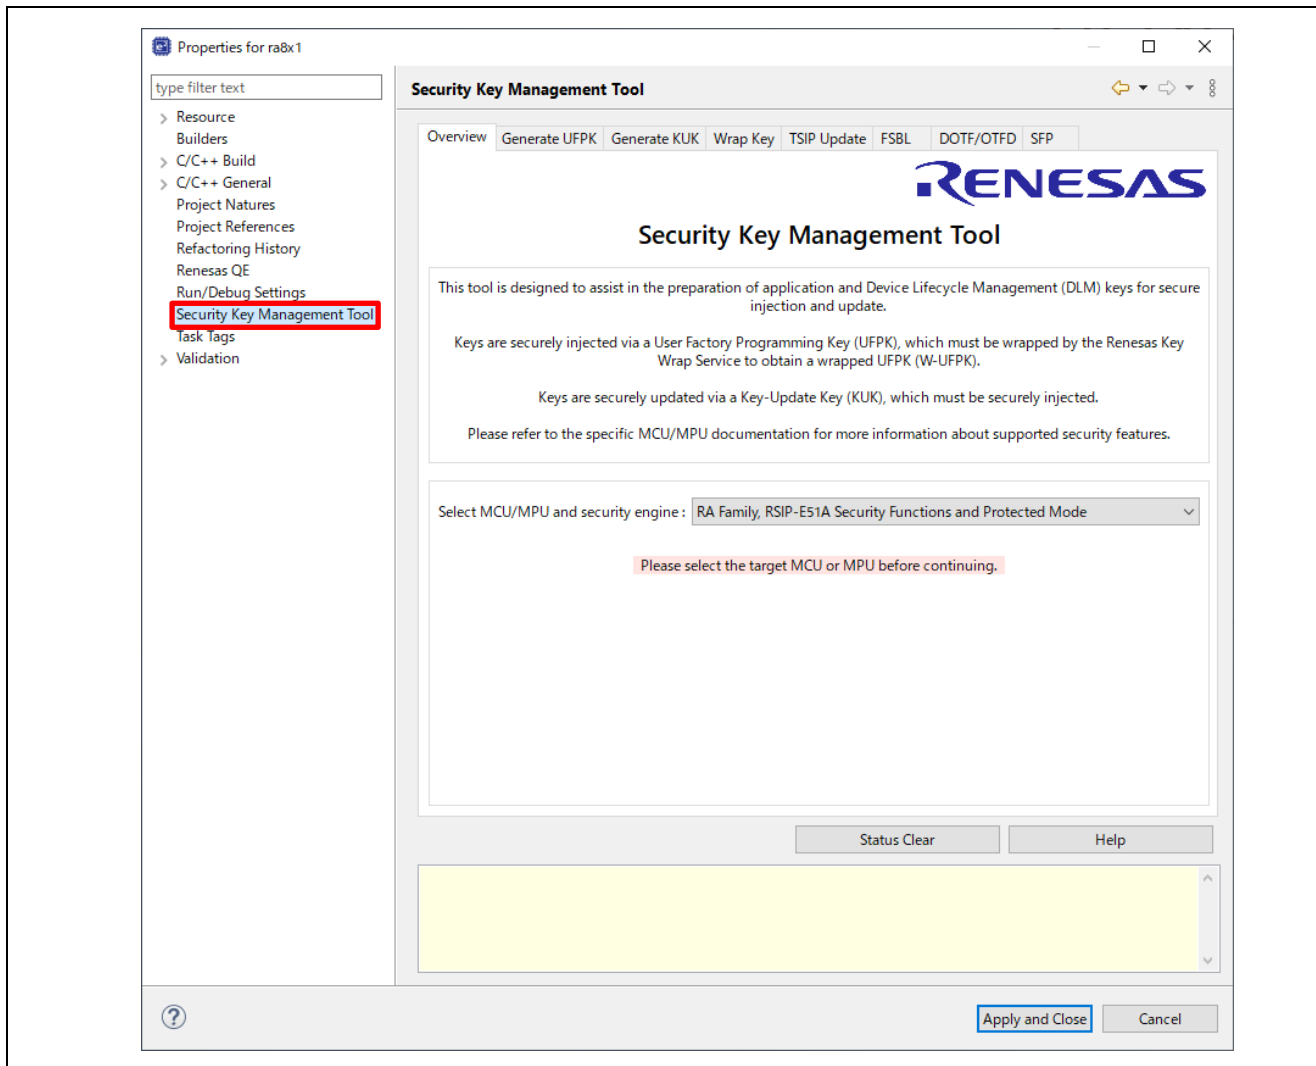

Figure 5-14 Project “Properties” Dialog

5.2.2 Uninstalling e²studio plugin version

1. Select e² studio menu **"Help(H)"** – **"About e² studio"** menu to open the **"About e² studio"** dialog.
2. Press the **"Installation Details"** button in the **"About e² studio"** dialog.

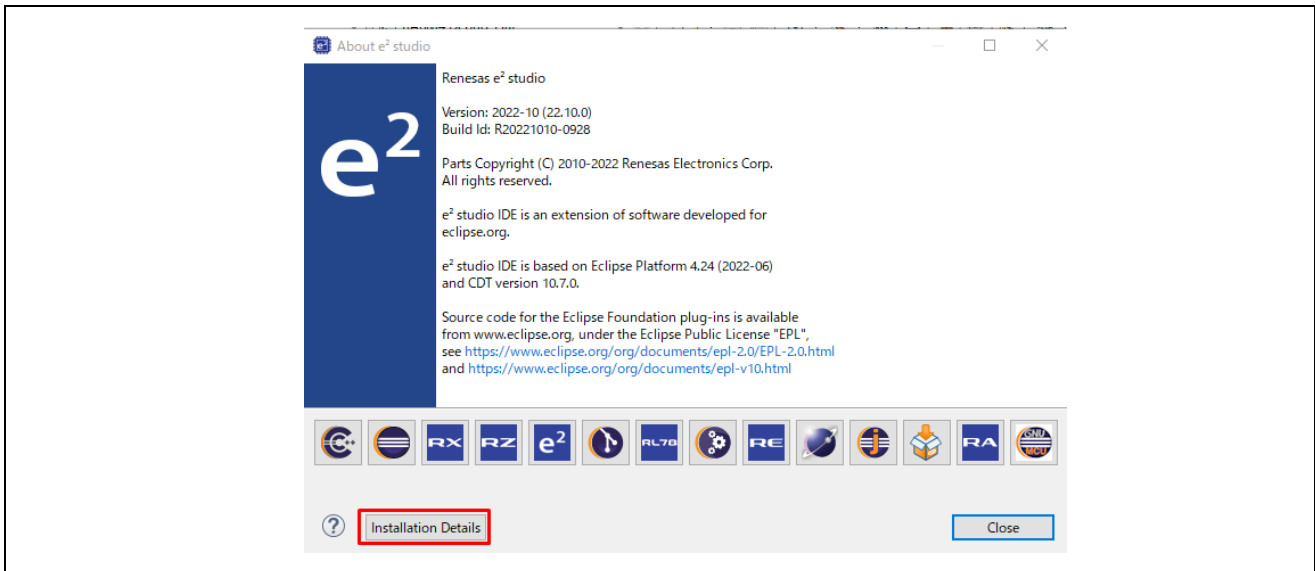

Figure 5-15 "About e²studio" Dialog

3. In the **"e² studio Installation Details"** dialog, select the **"Installed Software"** tab - Security Key Management Tool and press the **"Uninstall..."** button.

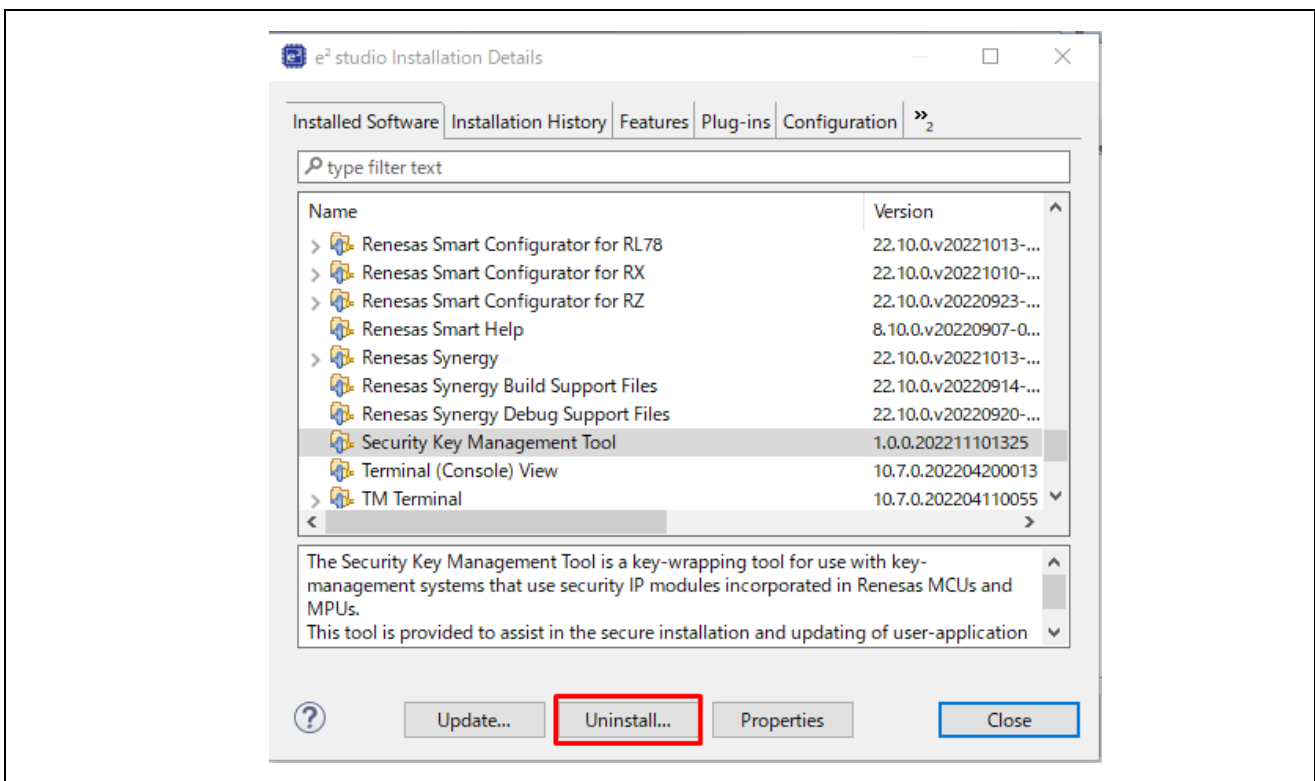

Figure 5-16 "e² studio Installation Details" Dialog

- When the **"Uninstall"** dialog box appears, select the Security Key Management Tool and press the **"Finish"** button.

Figure 5-17 "Uninstall" Dialog

- You will be prompted to restart e² studio.

6. Usage Examples

6.1 Example 1 – Inject an AES128 Key on an RX Family MCU with TSIP

The RX Family TSIP supports secure key injection via firmware executing on the MCU. The required drivers can be found in the TSIP library, as per Table 1-1 MCU/MPU Related Information.

During production, it is often necessary to program groups of devices with identical keys. The key injection information can be embedded in provisioning code, but if there are multiple groups with different keys, it may be desirable to separate the key information from the provisioning code. These steps can be used to create a Motorola Hex file that can be programmed in conjunction with provisioning code to securely inject one or more keys. This example creates a file to inject one AES128 key.

6.1.1 Using the GUI version

1. Select the MCU/MPU and security engine in the [Overview] tab.

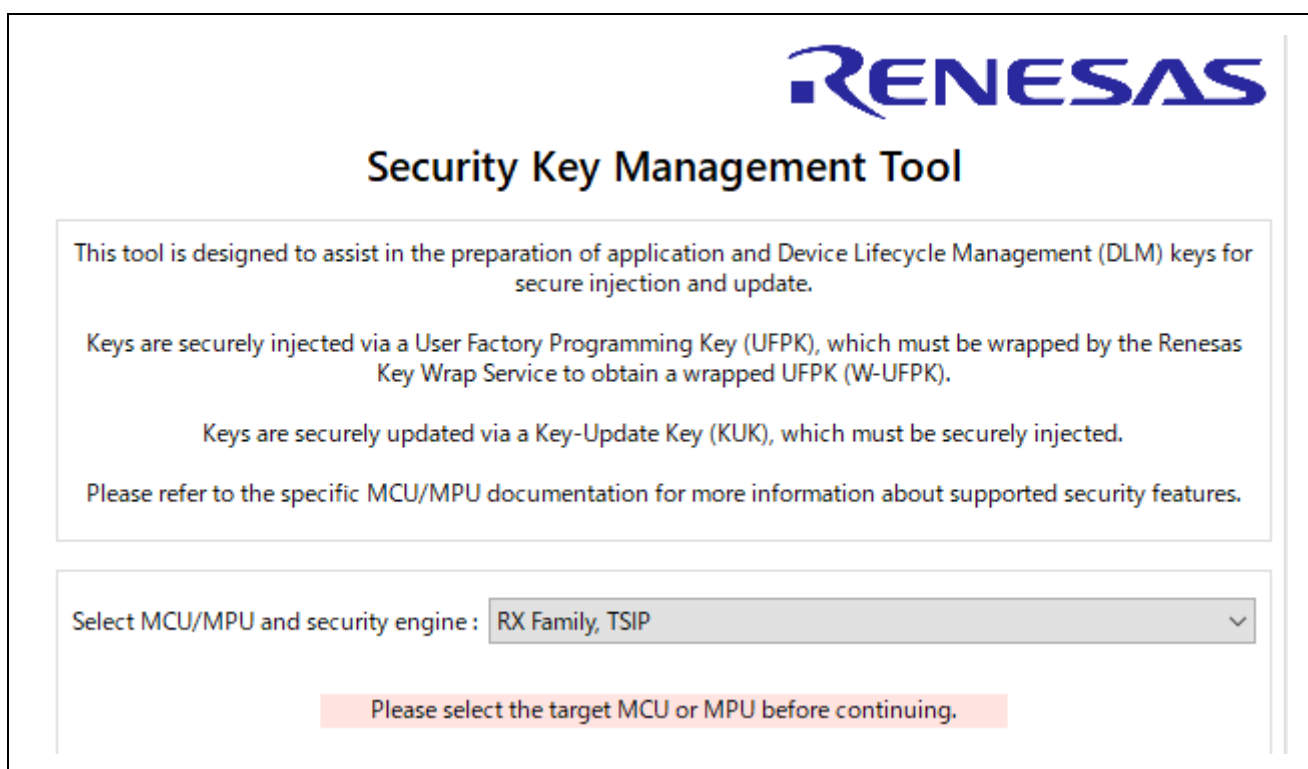

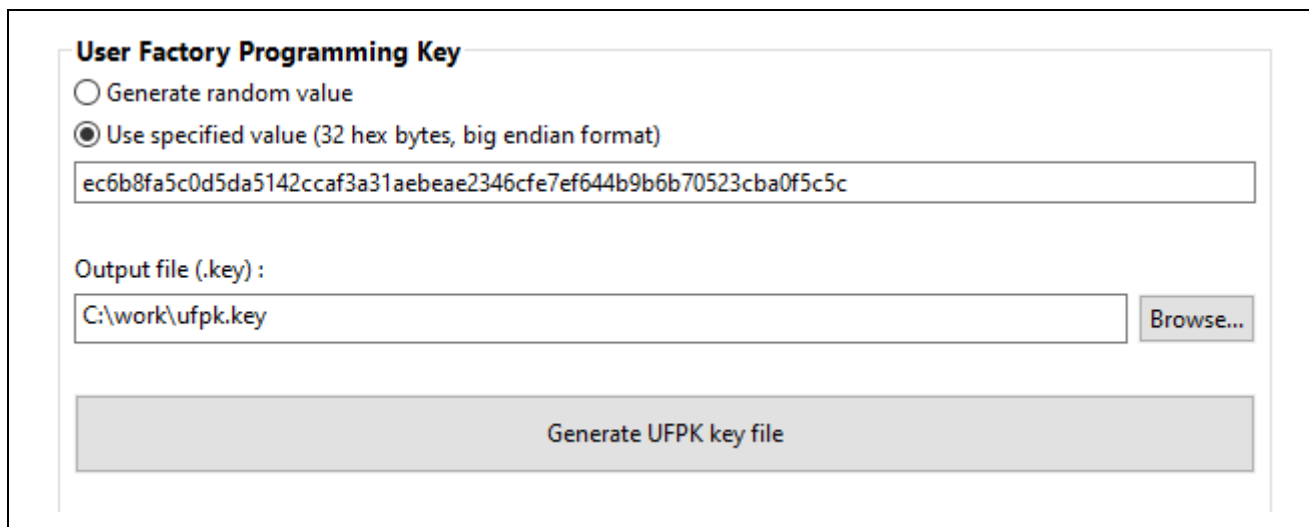

Figure 6-1 [Overview] Tab, Injecting an AES128 Key with RX Family TSIP

2. Create a UFPK. In the **[Generate UFPK]** tab, enter the desired UFPK value and enter the output file name with a *.key extension. This example uses the file name `ufpk.key`.

User Factory Programming Key

Generate random value

Use specified value (32 hex bytes, big endian format)

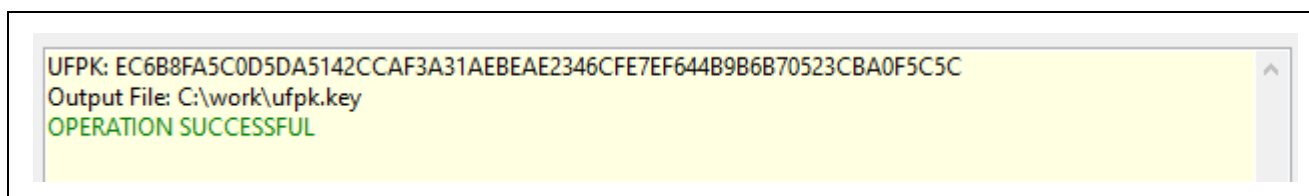

ec6b8fa5c0d5da5142ccaf3a31aebae2346cfe7ef644b9b6b70523cba0f5c5c

Output file (.key):

C:\work\ufpk.key

Figure 6-2 [Generate UFPK] Tab, Example of UFPK generation using specified value

Press the “**Generate UFPK key file**” button to generate the UFPK file. If the file is generated successfully, the tool will output the following execution result.

```
UFPK: EC6B8FA5C0D5DA5142CCAF3A31AEBAE2346CFE7EF644B9B6B70523CBA0F5C5C
Output File: C:\work\ufpk.key
OPERATION SUCCESSFUL
```

Figure 6-3 Example of execution result, UFPK generation using specified value

3. Get the W-UFPK. Send the `ufpk.key` file generated in step 2 to the Renesas Key Wrap service to get the W-UFPK. For more information, refer to the Renesas Key Wrap Service FAQ or the device-specific application note. The URL for the Renesas Key Wrap service is <https://dlm.renesas.com/keywrap>.

4. Create the AES128 key file as a Motorola Hex file. In the **[Wrap Key]** tab, select **AES128** in the **[Key Type]** tab and enter the AES128 data in the **[Key Data]** tab. For the **“Wrapping Key”**, select **“UFPK”** and select the UFPK file generated in step 2 and the W-UFPK file obtained in step 3. For simplicity, this example selects **“Generate random value”** for the IV. In the **“Output”** panel, select **“Motorola Hex”** as the **Format**, enter a file name with a *.mot extension, and set the **Address** field to FFFF0000. Specify **“Little”** as the endian.

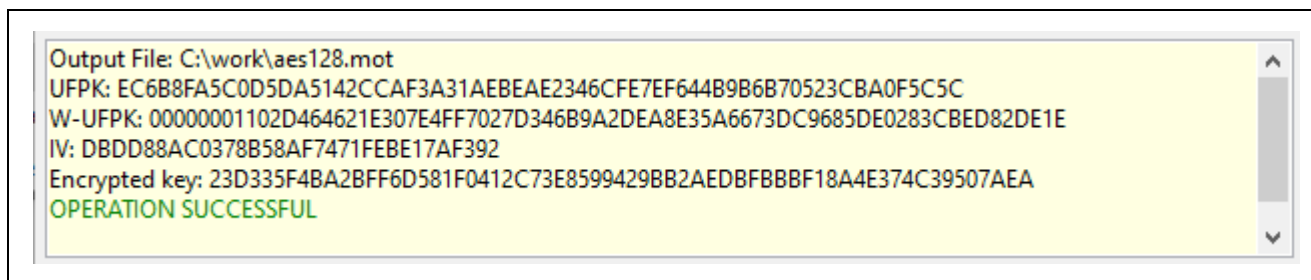

The screenshot shows the 'Key Type' tab of the 'Wrap Key' section. Under 'Key Type', 'AES' is selected with '128 bits' and 'DLM-SSD'. Other options include DLM/AL, KUK, OEM Root public, RSA (2048 bits, public), ECC (secp256r1, public), ARC4, and HMAC (SHA256-HMAC). The 'Wrapping Key' section has 'UFPK' selected, with file paths for UFPK File, W-UFPK File, and KUK File. The 'IV' section has 'Generate random value' selected. The 'Output' section has 'Motorola Hex' selected for Format, 'Little' for Endian, and 'C:\work\aes128.mot' for File. A 'Generate file' button is at the bottom.

Figure 6-4 [Wrap Key] - [Key Type] Tab, Example of creating a AES128 key file as Motorola Hex

The screenshot shows the 'Key Data' tab of the 'Wrap Key' section. Under 'Key Data', 'Raw' is selected, and the text input field contains the hex value '000102030405060708090a0b0c0d0e0f'. There are 'Browse...' buttons for File and Random - Output File.

Figure 6-5 [Wrap Key] - [Key Data] Tab, Example of creating a AES128 key file as Motorola Hex

Click the **“Generate file”** button to generate the specified output file. If the file is generated successfully, the tool will output the following execution result.

A screenshot of a text box with a yellow background and a grey border. The text inside the box is as follows:

```
Output File: C:\work\aes128.mot
UFPK: EC6B8FA5C0D5DA5142CCAF3A31AEBEAE2346CFE7EF644B9B6B70523CBA0F5C5C
W-UFPK: 00000001102D464621E307E4FF7027D346B9A2DEA8E35A6673DC9685DE0283CBED82DE1E
IV: DBDD88AC0378B58AF7471FEBE17AF392
Encrypted key: 23D335F4BA2BFF6D581F0412C73E8599429BB2AEDBFBBBF18A4E374C39507AEA
OPERATION SUCCESSFUL
```

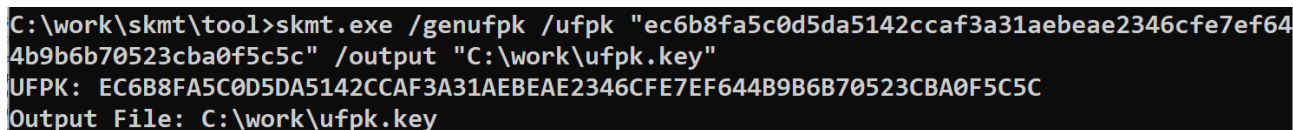

The text is left-aligned. The last line, "OPERATION SUCCESSFUL", is in green. There are small upward and downward arrow icons on the right side of the text box.

Figure 6-6 Example of execution result, creating an AES128 key file as Motorola Hex

6.1.2 Using the CLI version

1. Create the UFPK using the **genufpk** command. This example shows a known value being used for the UFPK:

```
> skmt.exe /genufpk
    /ufpk "ec6b8fa5c0d5da5142ccaf3a31aebeae2346cfe7ef644b9b6b70523cba0f5c5c"
    /output "C:\work\ufpk.key"
```

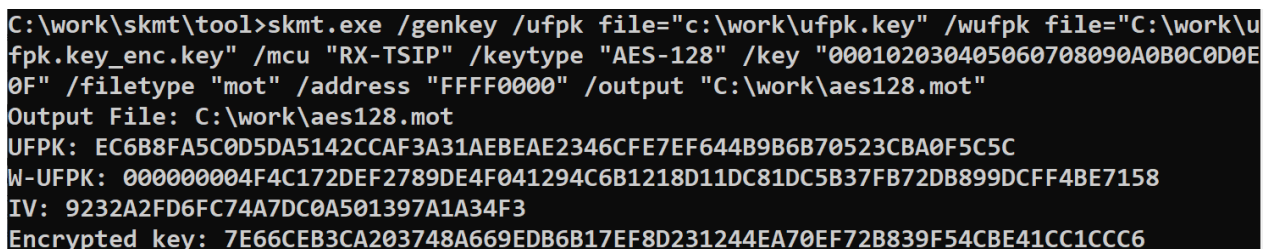

```
C:\work\skmt\tool>skmt.exe /genufpk /ufpk "ec6b8fa5c0d5da5142ccaf3a31aebeae2346cfe7ef644b9b6b70523cba0f5c5c" /output "C:\work\ufpk.key"
UFPK: EC6B8FA5C0D5DA5142CCAF3A31AEBEAE2346CFE7EF644B9B6B70523CBA0F5C5C
Output File: C:\work\ufpk.key
```

Figure 6-7 Execution result of CLI genufpk command

2. Get the W-UFPK. Send the `ufpk.key` file generated in step 1 to the Renesas Key Wrap service to get the W-UFPK. For more information, refer to the Renesas Key Wrap Service FAQ or the device-specific application note. The URL for the Renesas Key Wrap service is <https://dlm.renesas.com/keywrap>.
3. Create the AES128 key file as Motorola Hex by using the **genkey** command using the UFPK file generated in step 1 and the W-UFPK file obtained in step 2:

```
> skmt.exe /genkey /ufpk file="c:\work\ufpk.key" /wufpk file="C:\work\ufpk.key_enc.key"
    /mcu "RX-TSIP" /keytype "AES-128" /key "000102030405060708090A0B0C0D0E0F"
    /filetype "mot" /address "FFFF0000" /output "C:\work\aes128.mot"
```

```
C:\work\skmt\tool>skmt.exe /genkey /ufpk file="c:\work\ufpk.key" /wufpk file="C:\work\ufpk.key_enc.key" /mcu "RX-TSIP" /keytype "AES-128" /key "000102030405060708090A0B0C0D0E0F" /filetype "mot" /address "FFFF0000" /output "C:\work\aes128.mot"
Output File: C:\work\aes128.mot
UFPK: EC6B8FA5C0D5DA5142CCAF3A31AEBEAE2346CFE7EF644B9B6B70523CBA0F5C5C
W-UFPK: 000000004F4C172DEF2789DE4F041294C6B1218D11DC81DC5B37FB72DB899DCFF4BE7158

```

Figure 6-8 CLI example of creating an AES128 key file as Motorola Hex

6.2 Example 2 – Inject a Key-Update Key on an RA Family MCU with SCE9 Security Functions and Protected Mode

The RA Family MCUs with SCE9 in Protected Mode support secure key injection via the programming interface. The Renesas Flash Programmer (RFP) supports this capability.

The advantage of using the programming interface to securely inject keys is that no special provisioning code is needed on the MCU. The keys and application code can be installed as part of the same programming process. This example injects one KUK, enabling key update in the field.

6.2.1 Using the GUI version

1. Select the MCU/MPU and security engine in the **[Overview]** tab.

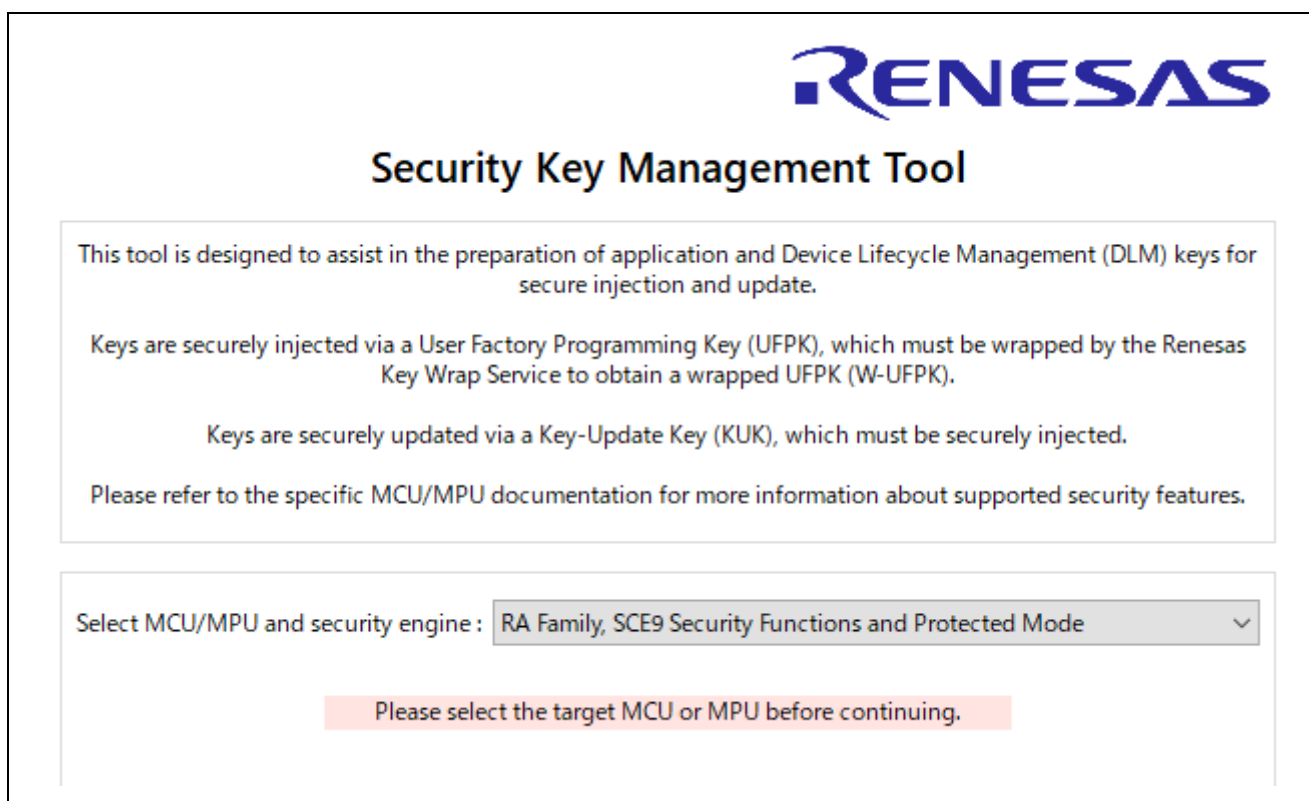

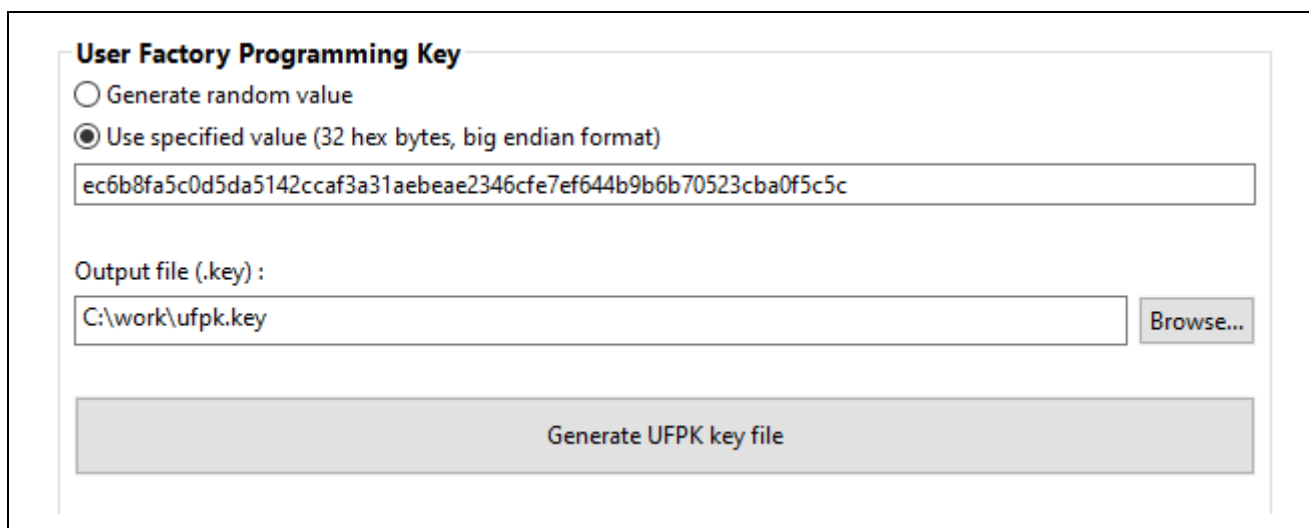

Figure 6-9 [Overview] Tab, Injecting a KUK with RA Family SCE9 Security Functions and Protected Mode

2. Create a UFPK. In the **[Generate UFPK]** tab, enter the desired UFPK value and enter the output file name with a *.key extension. This example uses the file name `ufpk.key`.

User Factory Programming Key

Generate random value

Use specified value (32 hex bytes, big endian format)

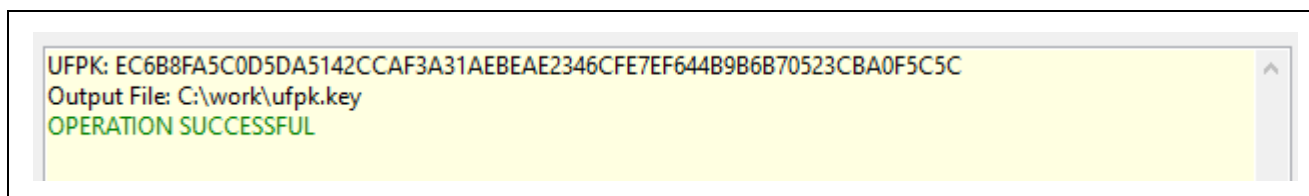

ec6b8fa5c0d5da5142ccaf3a31aebeae2346cfe7ef644b9b6b70523cba0f5c5c

Output file (.key):

C:\work\ufpk.key

Figure 6-10 [Generate UFPK] tab Example of UFPK generation using specified value

Press the “**Generate UFPK key file**” button to generate the UFPK file. If the file is generated successfully, the tool will output the following execution result.:

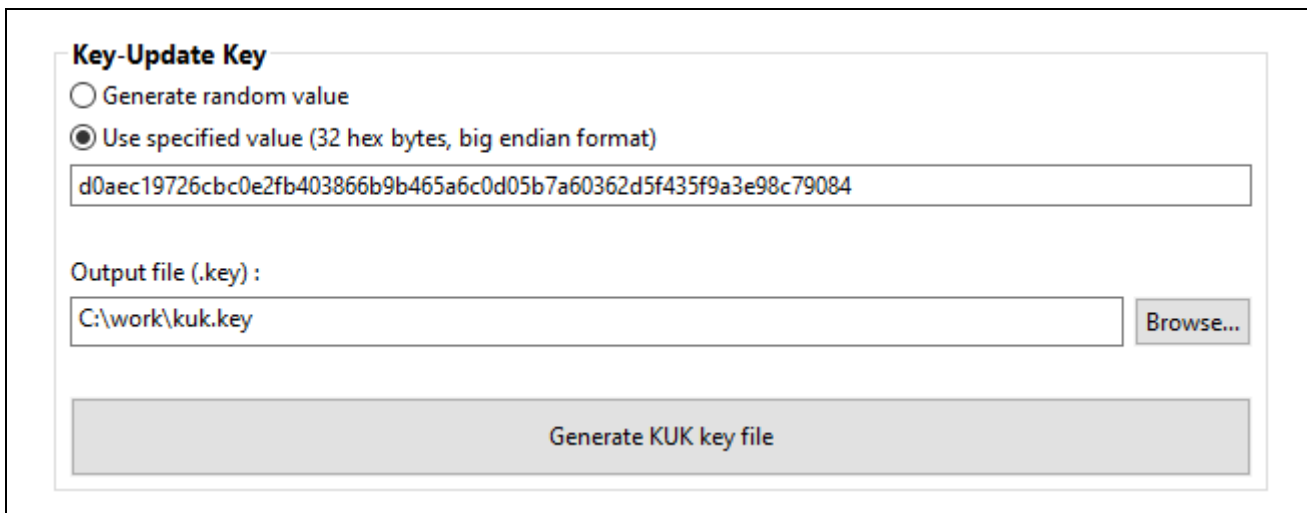

```
UFPK: EC6B8FA5C0D5DA5142CCAF3A31AEBEAE2346CFE7EF644B9B6B70523CBA0F5C5C
Output File: C:\work\ufpk.key
OPERATION SUCCESSFUL
```

Figure 6-11 Example execution result, UFPK generation using specified value

3. Get the W-UFPK. Send the `ufpk.key` file generated in step 2 to the Renesas Key Wrap service to get the W-UFPK. For more information, refer to the Renesas Key Wrap Service FAQ or the device-specific application note. The URL for the Renesas Key Wrap service is <https://d1m.renesas.com/keywrap>.

4. Create the KUK key file. In the **[Generate KUK]** tab, select to either use the tool to generate a random value for the KUK or to enter a 256-bit value for the KUK. Enter the output file name with a *.key extension. This example uses the file name `kuk.key`.

Key-Update Key

Generate random value

Use specified value (32 hex bytes, big endian format)

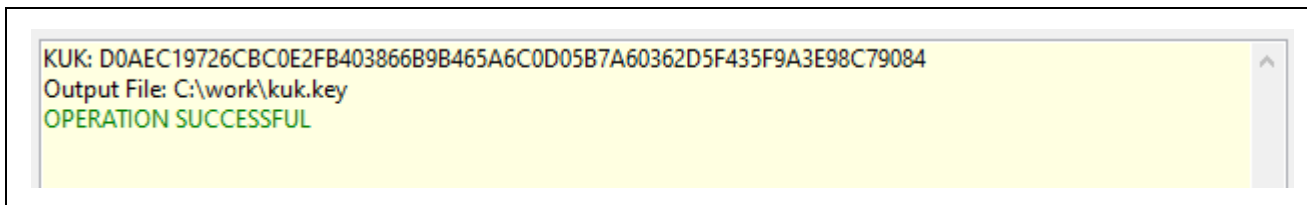

d0aec19726cbc0e2fb403866b9b465a6c0d05b7a60362d5f435f9a3e98c79084

Output file (.key) :

C:\work\kuk.key

Figure 6-12 [Generate KUK] Tab, Example of creating a KUK key file

Click the “**Generate KUK key file**” button to generate the KUK key file. If the file is generated successfully, the tool will output the following execution result.

```
KUK: D0AEC19726CBC0E2FB403866B9B465A6C0D05B7A60362D5F435F9A3E98C79084
Output File: C:\work\kuk.key
OPERATION SUCCESSFUL
```

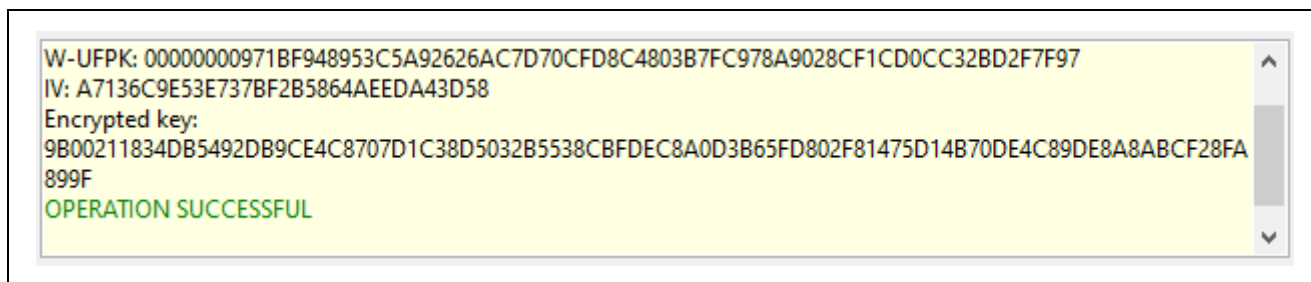

Figure 6-13 Example execution result, creating a KUK file

5. Create an RFP file for KUK injection. In the **[Wrap Key]** tab, select **KUK** in the **[Key Type]** tab. In the **[Key Data]** tab, enter the KUK key file name that was generated in the previous step (`kuk.key` in this example). For the **“Wrapping key”**, select **“UFPK”** and select the UFPK file generated in step 2 and the W-UFPK file obtained in step 3. For simplicity, this example selects **“Generate random value”** for the IV. In the **“Output”** panel, select **“RFP”** as the **Format** and enter a file name with a `*.rkey` extension.

Figure 6-14 [Wrap Key] – [Key Type] Tab, Example of creating a KUK file as an RFP file

Figure 6-15 [Wrap Key] – [Key Data] Tab, Example of creating a KUK file as an RFP file

Click the **“Generate file”** button to generate the specified output file. If the file is generated successfully, the tool will output the following execution result.

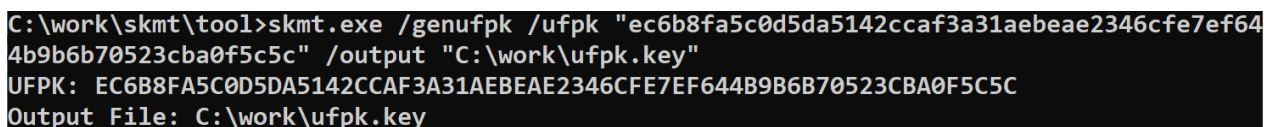

```
W-UFPK: 00000000971BF948953C5A92626AC7D70CFD8C4803B7FC978A9028CF1CD0CC32BD2F7F97

899F
OPERATION SUCCESSFUL
```

Figure 6-16 Example execution result, creating a KUK file as an RFP file

6.2.2 Using the CLI version

1. Create the UFPK by using the **genufpk** command. This example shows a specified value being used for the UFPK:

```
> skmt.exe /genufpk
   /ufpk "ec6b8fa5c0d5da5142ccaf3a31aebeae2346cfe7ef644b9b6b70523cba0f5c5c"
   /output "C:\work\ufpk.key"
```

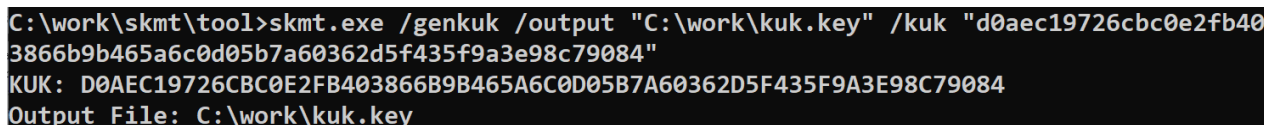

```
C:\work\skmt\tool>skmt.exe /genufpk /ufpk "ec6b8fa5c0d5da5142ccaf3a31aebeae2346cfe7ef644b9b6b70523cba0f5c5c" /output "C:\work\ufpk.key"
UFPK: EC6B8FA5C0D5DA5142CCAF3A31AEBEAE2346CFE7EF644B9B6B70523CBA0F5C5C
Output File: C:\work\ufpk.key
```

Figure 6-17 Execution result of CLI genufpk command

2. Get the W-UFPK. Send the `ufpk.key` file generated in step 1 to the Renesas Key Wrap service to get the W-UFPK. For more information, refer to the Renesas Key Wrap Service FAQ or the device-specific application note. The URL for the Renesas Key Wrap service is <https://dlm.renesas.com/keywrap>.
3. Create the KUK key file by using the **genkuk** command. This example shows a specified value being used for the KUK.

```
> skmt.exe /genkuk /output "C:\work\kuk.key"
   /kuk "d0aec19726cbc0e2fb403866b9b465a6c0d05b7a60362d5f435f9a3e98c79084"
```

```
C:\work\skmt\tool>skmt.exe /genkuk /output "C:\work\kuk.key" /kuk "d0aec19726cbc0e2fb403866b9b465a6c0d05b7a60362d5f435f9a3e98c79084"
KUK: D0AEC19726CBC0E2FB403866B9B465A6C0D05B7A60362D5F435F9A3E98C79084
Output File: C:\work\kuk.key
```

Figure 6-18 Execution result of CLI genkuk command

4. Create the RFP file to use for KUK injection by using the **genkey** command, using the UFPK file generated in step 1, the W-UFPK file obtained in step 2, and the KUK file generated in step 3:

```
> skmt.exe /genkey /ufpk file="c:\work\ufpk.key" /wufpk file="C:\work\ufpk.key_enc.key"  
  /mcu "RA-SCE9" /keytype "key-update-key" /key file="C:\work\kuk.key" /filetype "rfp"  
  /output "C:\work\kuk.rkey"
```

```
C:\work\skmt\tool>skmt.exe /genkey /ufpk file="c:\work\ufpk.key" /wufpk file="C:\work\ufpk.key_enc.key" /mcu "RA-SCE9" /keytype "key-update-key" /key file="C:\work\kuk.key" /filetype "rfp" /output "C:\work\kuk.rkey"  
Output File: C:\work\kuk.rkey  
UFPK: EC6B8FA5C0D5DA5142CCAF3A31AEBEAE2346CFE7EF644B9B6B70523CBA0F5C5C  
W-UFPK: 000000004F4C172DEF2789DE4F041294C6B1218D11DC81DC5B37FB72DB899DCFF4BE7158

```

Figure 6-19 CLI example of creating an AES128 key file as an RFP file

6.3 Example 3 – Update an RSA 2048 Public Key on an RA Family MCU with SCE9 Protected Mode

Keys can be updated in the field using a previously injected KUK. The required drivers can be found in the device's supporting software drivers, as per *Table 1-1 MCU/MPU Related Information*.

Key update in the field can be performed in a variety of ways. One way is to include the KUK-wrapped key as part of a firmware update. A simple way to do this is to embed the data as a C source file. This example updates one RSA 2048 public key using a previously injected KUK, such as the one created and injected in the previous example.

6.3.1 Using the GUI version

1. Select the MCU/MPU and security engine in the [Overview] tab.

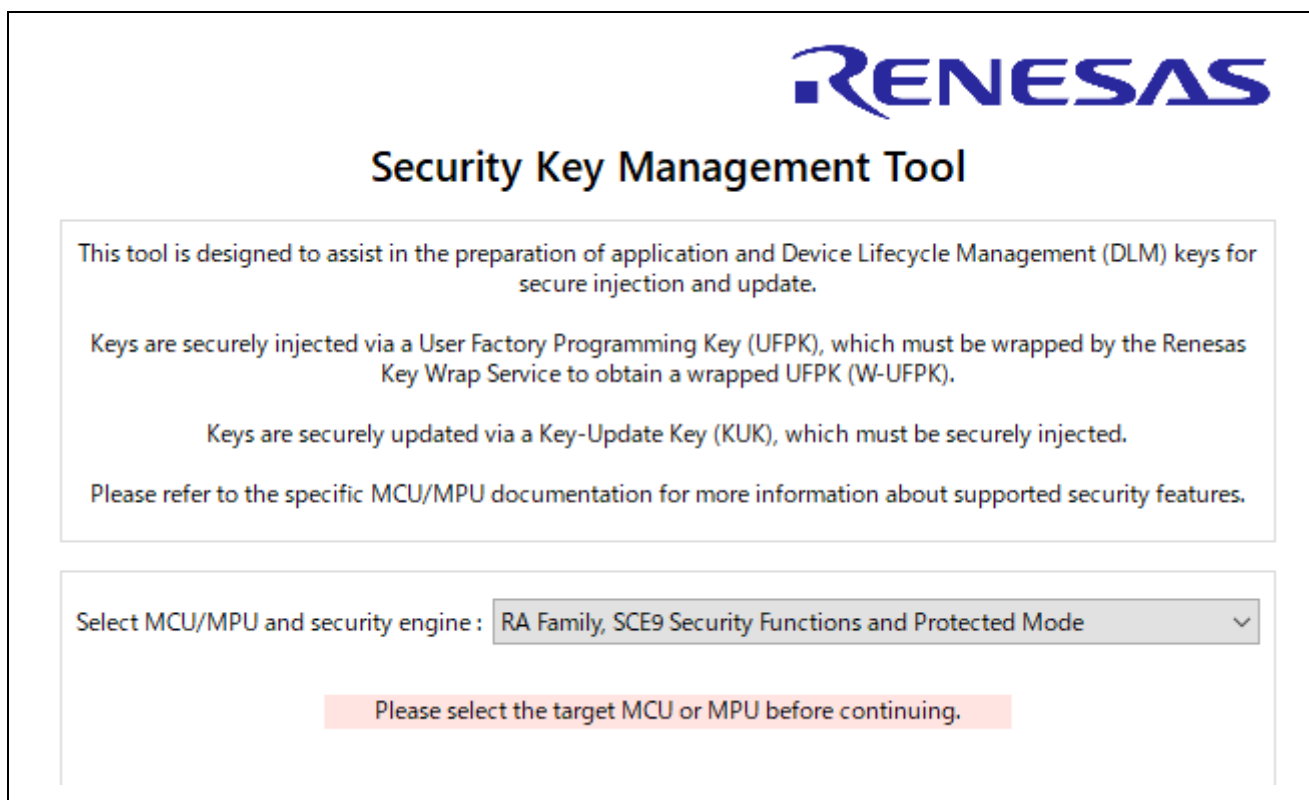

Figure 6-20 [Overview] Tab, Updating an RSA 2048 Public Key, RA Family SCE9 Security Functions and Protected Mode

2. Create the RSA 2048 Public key file as a C source file. In the [Wrap Key] tab, select **RSA** and “**2048 bits, public**” in the [Key Type] tab and enter the RSA 2048 public key data in the [Key Data] tab. For the “**Wrapping key**”, select **KUK** set “**KUK file**” to the file that was generated in section 6.2 Example 2 – Inject a Key-Update Key on an RA Family MCU with SCE9 Protected Mode. For simplicity, this example selects “**Generate random value**” for the IV. In the “**Output**” panel, select “**C Source**” as the **Format** and enter a file name with a *.c extension.

The screenshot shows the [Wrap Key] - [Key Type] Tab. It is divided into several sections:

- Key Type:** Includes radio buttons for DLM/AL, KUK, and OEM Root public. Underneath are dropdown menus for key types: DLM-SSD, AES (128 bits), ARC4, RSA (2048 bits, public), ECC (secp256r1, public), and HMAC (SHA256-HMAC). The RSA option is selected.
- Wrapping Key:** Includes radio buttons for UFPK and KUK. UFPK has fields for UFPK File and W-UFPK File. KUK has a field for KUK File set to C:\work\kuk.key.
- IV:** Includes radio buttons for 'Generate random value' (selected) and 'Use specified value (16 hex bytes, big endian format)' with a text input field containing 00112233445566778899AABBCCDDEEFF.
- Output:** Includes a 'Format' dropdown set to 'C Source', a 'File' field set to C:\work\rsa2048public.c, an 'Endian' dropdown set to 'Little', an 'Address' field set to FFFF0000, and a 'Key name' field set to rsa2048public. There is also an 'Output additional data' checkbox and a 'Generate file' button at the bottom.

Figure 6-21 [Wrap Key] - [Key Type] Tab, Example of creating an RSA 2048 Public key file as C source file

The screenshot shows the [Wrap Key] - [Key Data] Tab. It includes:

- Key Type:** 'Key Data' sub-tab is active. Radio buttons for 'File' and 'Raw' are present, with 'Raw' selected.
- Modulus(n):** A large text area containing the hexadecimal string: a0127f682470bef831fbec4bcd7b5095a7823fd70745d37d1bf72b63c4b1b4a3d0581e74bf9ade93cc46148617553931a79d92e9e488ef47223ee6f6c061884b13c9065b591139de13c1ea2927491ed00fb793cd68f463f5f64baa53916b46c818ab99706557a1c2d50d232577d1.
- Exponent(e):** A text input field containing the value 10001.

Figure 6-22 [Wrap Key] – [Key Data]Tab, Example of creating an RSA 2048 Public key file as C source file

Click the **“Generate file”** button to generate the specified output file. If the file is generated successfully, the tool will output the following execution result.

```
Output File: C:\work\rsa2048public.h
Output File: C:\work\rsa2048public.c
KUK: D0AEC19726CBC0E2FB403866B9B465A6C0D05B7A60362D5F435F9A3E98C79084

```

Figure 6-24 CLI example of creating an RSA 2048 Public key file as C source file

6.4 Example 4 – Use RX Family TSIP Secure Update

A secure firmware update solution employing the TSIP can be used to encrypt the user program, send the encrypted user program to the target device, and then decrypt and update the user program on the device. For how to make use of the required drivers and sample code, refer to the RX TSIP documentation linked to in *Table 1-1, MCU/MPU Related Information*.

6.4.1 Using the GUI Version

1. Selecting the MCU/MPU and Security Engine

Select the MCU/MPU and security engine on the **[Overview]** tab.

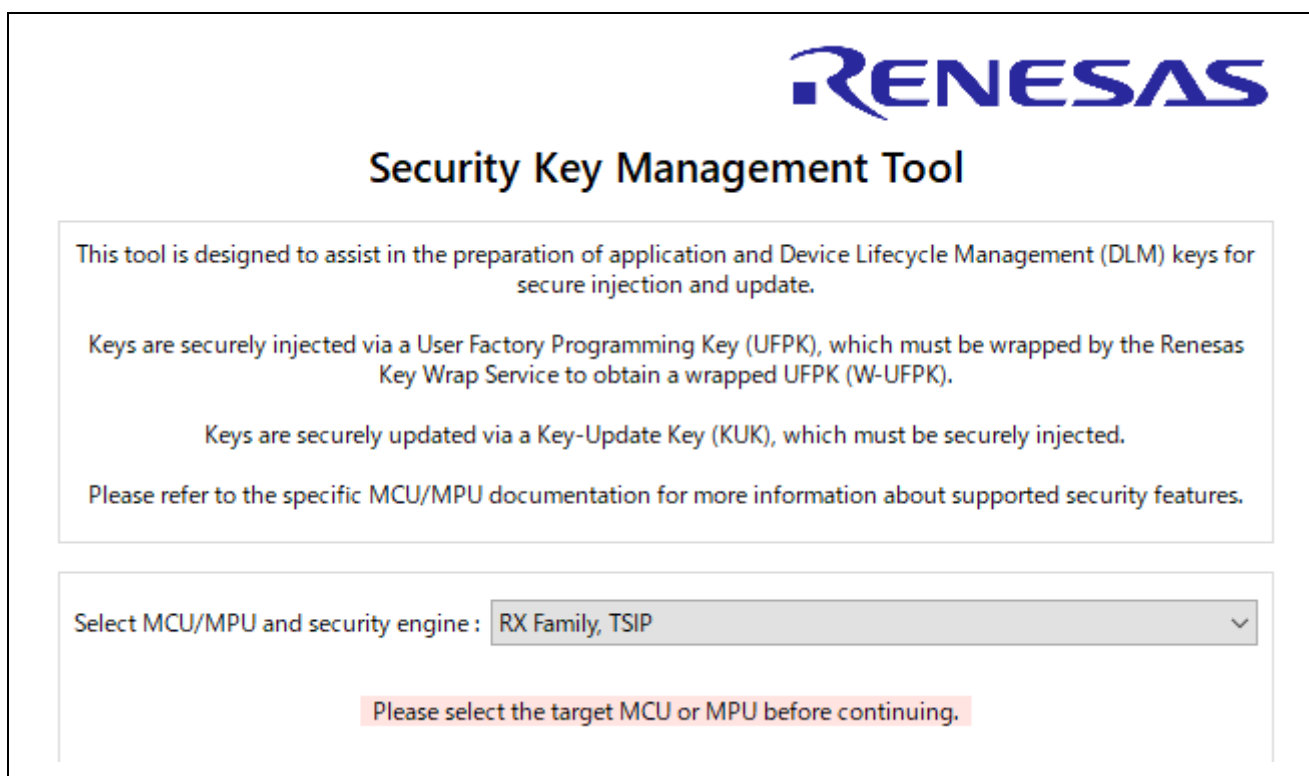

Figure 6-25 [Overview] Tab

2. Generating a Firmware Image File

On the **[TSIP Update]** tab, generate a firmware image with RSU header appended. For **“Output image”** select **“Secure Update”**, and for **“Firmware image”** specify the firmware MOT file to be encrypted.

On the **[RSU Header]** tab, set “Image flags” to TESTING and **“RSU header version”** to 1.

On the **[Encrypted Address Range]** tab, set the address range to be encrypted and whether or not Data Flash data will be added. In this example, “Data Flash” is set to “Do not add”.

For **“Session Key Encryption Key”** on the **[Image Encryption Key]** tab, specify the key for encrypting the encryption key set in the secure boot program. For simplicity, **“Use random number generator”** is selected for **“Image Encryption Session Key”** in this example.

“Use random number generator” is also selected on the **[IV]** tab in this example for simplicity.

Select **“Binary”** as the format under **“Output”**, and specify a file name with the extension *.rsu.

Figure 6-26 [TSIP Update] – [RSU Header] Tab: Example Settings

Figure 6-27 [TSIP Update] – [Encrypted Address Range] Tab: Other Example Settings

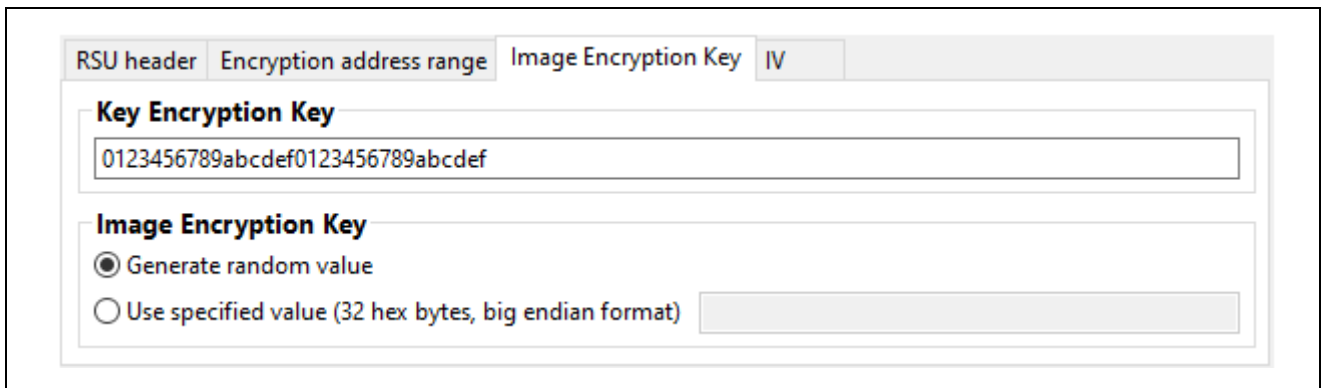

Figure 6-28 [TSIP Update] – [Image Encryption Key] Tab: Example Settings

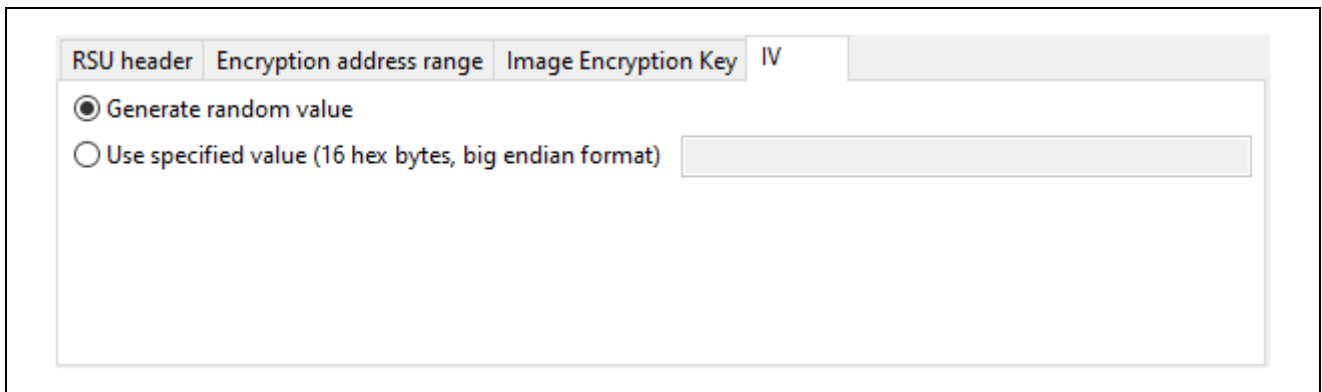

Figure 6-29 [TSIP Update] – [IV] Tab: Example Settings

Output similar to the following appears when the operation completes successfully.

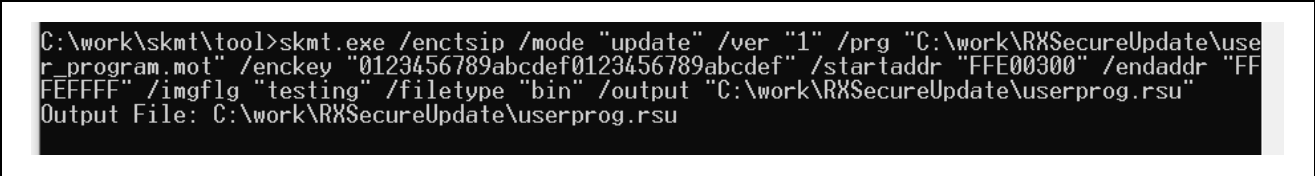

Figure 6-30 [TSIP Update] Tab: Execution Example

6.4.2 Using the CLI Version

1. Run the **enctsip** command in the terminal emulator program.

```
> skmt.exe /enctsip /mode "update" /ver "1" /prg "C:\work\RXSecureUpdate\user_program.mot"  
  /enckey "0123456789abcdef0123456789abcdef"  
  /startaddr "FFE00300" /endaddr "FFFFFFF" /imgflg "testing" /filetype "bin"  
  /output "C:\work\RXSecureUpdate\userprog.rsu"
```

```
C:\work\skmt\tool>skmt.exe /enctsip /mode "update" /ver "1" /prg "C:\work\RXSecureUpdate\use  
r_program.mot" /enckey "0123456789abcdef0123456789abcdef" /startaddr "FFE00300" /endaddr "FF  
FFFFFF" /imgflg "testing" /filetype "bin" /output "C:\work\RXSecureUpdate\userprog.rsu"  
Output File: C:\work\RXSecureUpdate\userprog.rsu
```

Figure 6-31 enctsip Command Execution Example

6.5 Example 5 – RA Family Generate FSBL Key Certificate / Code Certificate

Generates Key Certificate and Code Certificate that can be used in Renesas devices with First Stage Bootloader (FSBL) functionality. The Key Certificate and Code Certificate are used to verify the validity of the OEM Bootloader when it is written to the device using the Renesas Flash Programmer.

Please refer to *Table 1-1* MCU/MPU-related website documents for information on how to utilize the required tools and samples.

6.5.1 Using the GUI Version

1. Selecting the MCU/MPU and Security Engine

Select the MCU/MPU and security engine on the **[Overview]** tab.

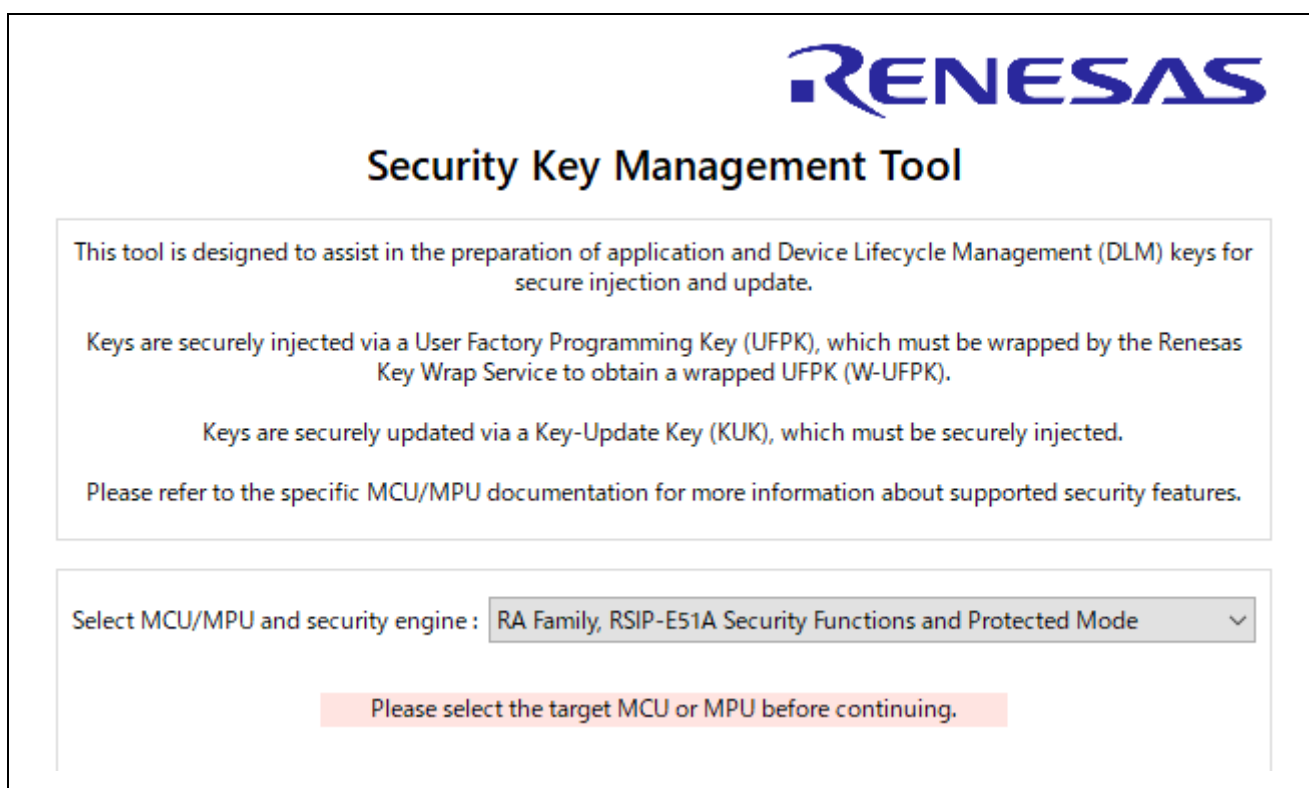

Figure 6-32 [Overview] Tab, Generate Key Certificate and Code Certificate with RA Family RSIP-E51A Security Functions and Protected Mode

2. Generate Key Certificate and Code Certificate

Use [FSBL] tab to generate a Key Certificate and Code Certificate.

In this example, the procedure is described for the case where the Programming Verification Method is “**Signature**”.

Specify the OEM Bootloader mot file to be signed in “**OEM Bootloader Image**”.

Select “**Signature** in **Programming Verification Method**”.

Set “**Image Version**” to “**1**”.

Configure the settings in [Certificates] tab.

Set the starting address of the OEM Bootloader to “**Code Flash Start Address (hex)**”. In our example, set 02000000.

Select the size of the Code Flash for the device to be used in **Device Code Flash Size**. In our example, select “**2MB**”.

Under “**OEM Bootloader Size (16-byte aligned)**”, select **Calculate automatically**”.

Specify the file name of the Key Certificate in “**Key Certificate**”.

Specify the file name of the Code Certificate in “**Code Certificate**”.

The screenshot displays the [Certificates] tab of the FSBL tool. The interface includes the following elements:

- OEM Bootloader Image:** A text box containing the path `C:\work\fsbl\oembl.srec` and a **Browse...** button.
- Programming Verification Method:** Radio buttons for **Signature** (selected) and **CRC**.
- Image Version:** A text box containing the value `1`.
- Tabbed Interface:** Three tabs are visible: **Certificates** (active), **OEM Root Keys**, and **OEM Bootloader Keys**.
- Code Flash Start Address (hex):** A text box containing `02000000`.
- Device Code Flash Size:** A dropdown menu set to `2 MB`. A note below reads: "(If exact size option is not available, select the next lower size)".
- OEM Bootloader Size:** Radio buttons for **Calculate automatically** (selected) and **Enter manually (hex)** (with an empty text box).
- Key Certificate:** A text box containing `C:\work\fsbl\kcert.bin` and a **Browse...** button.
- Code Certificate:** A text box containing `C:\work\fsbl\ccert.bin` and a **Browse...** button.
- Generate File(s):** A large button at the bottom of the window.

Figure 6-33 [FSBL] – [Certificates] Tab, Setting Example

3. Setting [OEM Root Keys] tab.

Select “File” for “OEM Root Private Key” and specify a PEM file containing the public key of the OEM Bootloader Private Key. Since the PEM file is specified in “OEM Root Private Key”, it is not necessary to specify “OEM Root Public Key”.

Figure 6-34 [FSBL] – [OEM Root Keys] Tab, Setting Example

4. Setting [OEM Bootloader Keys] tab.

Select “File” for “OEM Bootloader Private Key” and specify a PEM file containing the public key of the OEM Bootloader Private Key. Since the PEM file is specified in “OEM Bootloader Private Key”, it is not necessary to specify “OEM Bootloader Public Key”.

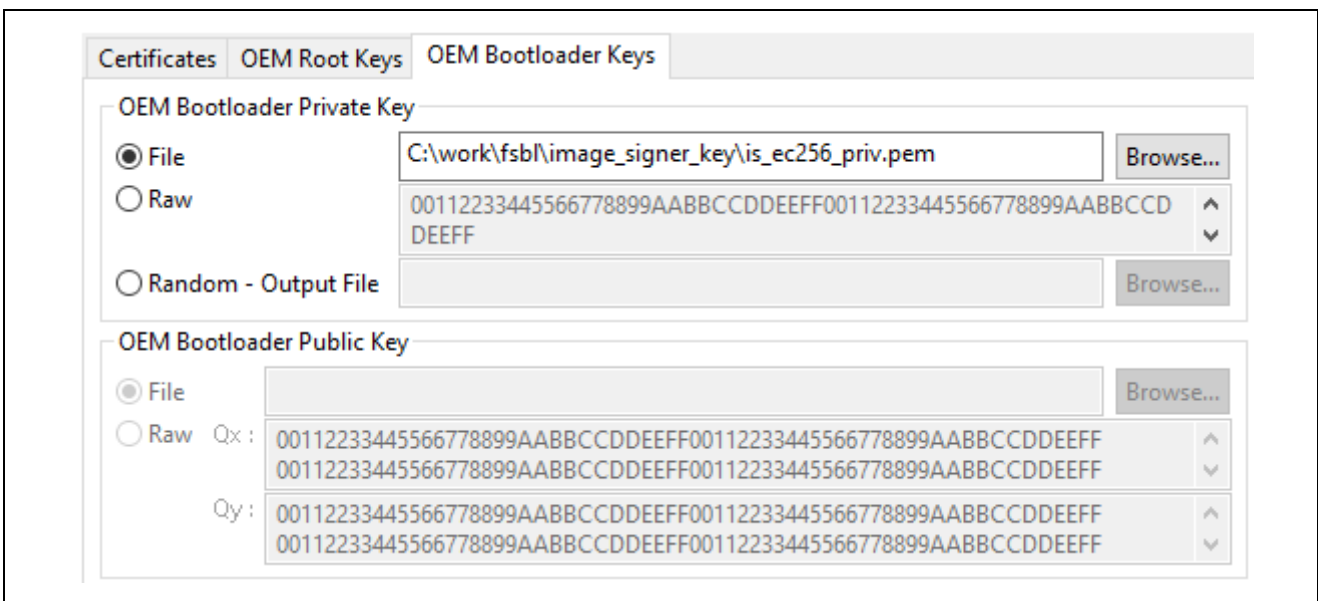

Figure 6-35 [FSBL] – [OEM Bootloader Keys] Tab, Setting Example

5. Generate Key Certificate and Code Certificate

Click the “Generate File(s)” button to generate the Key Certificate and Code Certificate. If the files are

successfully generated, the following results will be output.

A screenshot of a command prompt window with a yellow background. The text displayed is: "Output File: C:\work\fsbl\kcert.bin", "Output File: C:\work\fsbl\ccert.bin", and "OPERATION SUCCESSFUL" in green text. There is a small upward-pointing arrow icon on the right side of the window.

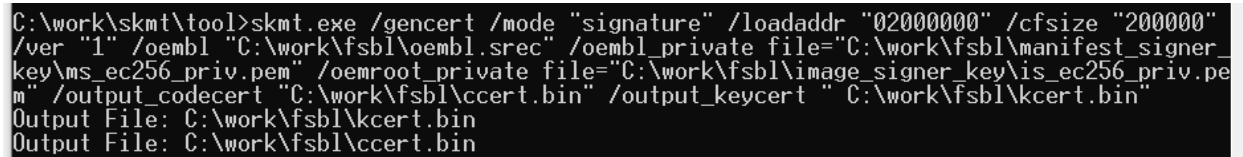

```
Output File: C:\work\fsbl\kcert.bin
Output File: C:\work\fsbl\ccert.bin
OPERATION SUCCESSFUL
```

Figure 6-36 Example of execution result, generate Key Certificate and Code Certificate

6.5.2 Using the CLI version

1. Create Key Certificate and Code Certificate file by using the **gencert** command:

```
> skmt.exe /gencert /mode "signature" /loadaddr "02000000" /cfsz "200000" /ver "1"  
/oembl "C:\work\fsbl\oembl.srec"  
/oembl_private file="C:\work\fsbl\manifest_signer_key\ms_ec256_priv.pem"  
/oemroot_private file="C:\work\fsbl\image_signer_key\is_ec256_priv.pem"  
/output_codecert "C:\work\fsbl\ccert.bin" /output_keycert " C:\work\fsbl\kcert.bin"
```

```
C:\work\skmt\tool>skmt.exe /gencert /mode "signature" /loadaddr "02000000" /cfsz "200000"  
/ver "1" /oembl "C:\work\fsbl\oembl.srec" /oembl_private file="C:\work\fsbl\manifest_signer_  
key\ms_ec256_priv.pem" /oemroot_private file="C:\work\fsbl\image_signer_key\is_ec256_priv.pe  
m" /output_codecert "C:\work\fsbl\ccert.bin" /output_keycert " C:\work\fsbl\kcert.bin"  
Output File: C:\work\fsbl\kcert.bin  
Output File: C:\work\fsbl\ccert.bin
```

Figure 6-37 Execution result of CLI gencert command

6.6 Example 6 – Using DOTF with RA Family

This example shows how to encrypt a portion of a user program that has been configured to use the DOTF functionality of an RA Family MCU.

Please refer to *Table 1-1* MCU/MPU-related website documents for information on how to utilize the required tools and samples.

6.6.1 Using the GUI version

1. Selecting the MCU/MPU and Security Engine

Select the MCU/MPU and security engine on the **[Overview]** tab.

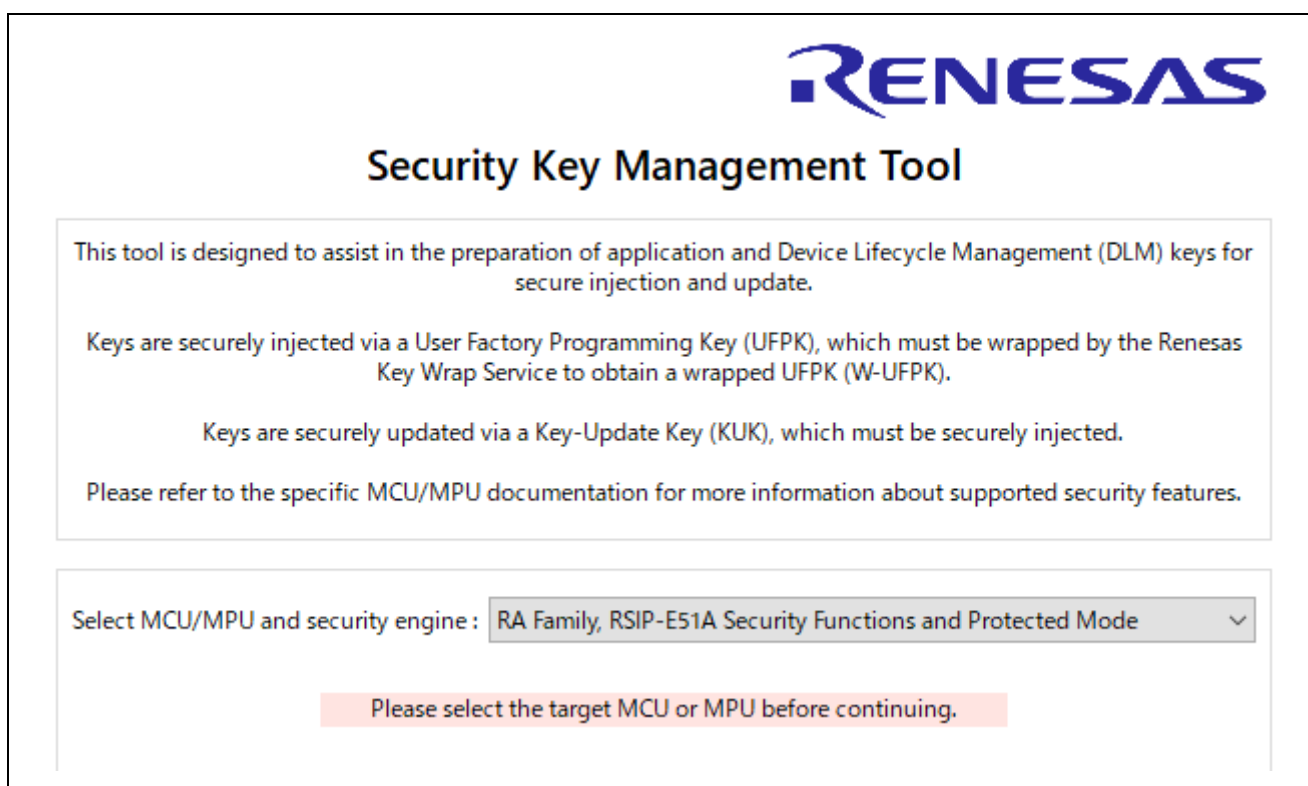

Figure 6-38 [Overview] Tab, Decryption On-The-Fly Encryption with RA Family RSIP-E51A Security Functions and Protected Mode

2. Setting Firmware image

Use [DOTF/OTFD] tab to encrypt the firmware image.

Set the firmware mot file to be encrypted in “Plaintext Image” field.

Specify the address range of the encrypted image entered in “Plaintext Image” in “Encrypted Address Range”.

Set “Destination Address” if the address to encrypt and the address to be placed are different.

In the configuration example, set “Encryption address range” from 90000000 to 90000FFF

“Destination address” is set “Same as Plaintext Image”.

The screenshot shows the configuration interface for the [DOTF/OTFD] tab. At the top, the 'Plaintext Image' field is set to 'C:\work\dotf\userprog.srec' with a 'Browse...' button. Below this, there are two main sections: 'Image Address Range to Encrypt' and 'Destination Address'. In the 'Image Address Range to Encrypt' section, the 'Encrypt address range' radio button is selected. The 'Start address to encrypt (hex)' is '90000000' and the 'End address to encrypt (hex)' is '90000FFF'. In the 'Destination Address' section, the 'Same as Plaintext Image' radio button is selected, and the 'Specific address (hex)' field is empty, showing '80000000' as a placeholder.

Figure 6-39 [DOTF/OTFD] tab - Example settings for Plaintext Image, Encryption Range, and Destination Address

3. Image Encryption Key and IV setting

Set **Image Encryption Key** to the key to be used for encryption. In this example, an AES128 key is used.

Specify the address range of the encrypted image entered in Plaintext Image in **IV** field. In this example, for simplicity, select **Use Random Number Generator** for IV.

The screenshot shows the configuration interface for the [DOTF/OTFD] tab, focusing on the 'Image Encryption Key' and 'IV' settings. The 'Image Encryption Key' section has a dropdown menu set to 'AES-128'. There are two radio buttons: 'File' and 'Raw'. The 'Raw' radio button is selected, and the key value is '000102030405060708090a0b0c0d0e0f'. The 'IV' section has two radio buttons: 'Generate random value' and 'Use specified value (16 hex bytes, most significant 100 bits used)'. The 'Generate random value' radio button is selected.

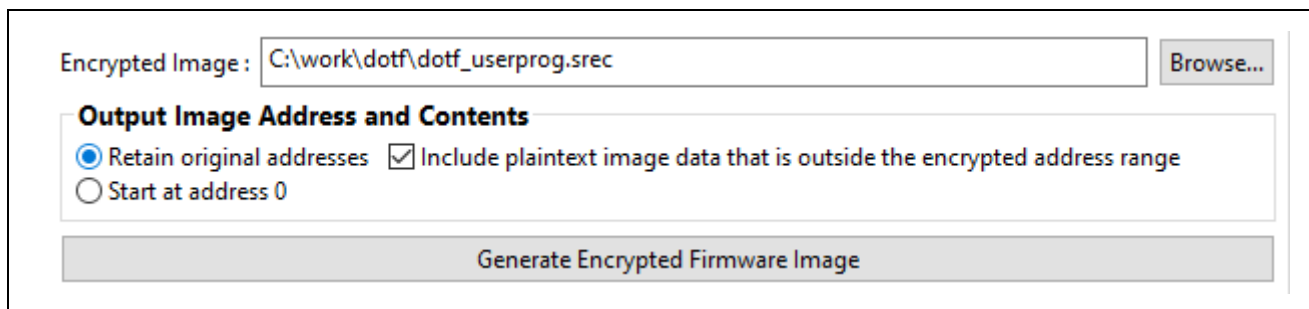

Figure 6-40 [DOTF/OTFD] tab - Image Encryption Key, IV Setting example

4. Setting output file

In “**Encrypted image**” specify the name of the output file.

Output Image Address and Contents specifies the address of the output Motorola hexadecimal and whether to include the unencrypted plaintext data.

For Output Image Address and Contents, select “**Retain Original Address**” and check the check box of “**Include plaintext image data that is outside the encrypted address range**”.

Encrypted Image:

Output Image Address and Contents

Retain original addresses Include plaintext image data that is outside the encrypted address range

Start at address 0

Figure 6-41 [DOTF/OTFD] tab – Encrypted Image and Output Image Address and Contents

Click the **Generate Encrypted Firmware Image** button to generate the specified output file. If the file is generated successfully, the tool will output the following execution result.

```
Output File: C:\work\dotf\dotf_userprog.srec
Key: 000102030405060708090A0B0C0D0E0F
Counter: 108F843E706847F36533BD3339000000
OPERATION SUCCESSFUL
```

Figure 6-42 [DOTF/OTFD] tab – Example of execution result

6.6.2 Using the CLI version

1. Encrypt user programs using **encdotf** command.

```
≥ skmt.exe /encdotf /keytype "AES-128" /enckey "000102030405060708090A0B0C0D0E0F"  
/startaddr "90000000" /endaddr "90000FFF" /incplain  
/prg "C:\work\dotf\userprog.srec" /output "C:\work\dotf\dotf_userprog.srec"
```

```
C:\work\skmt\tool>skmt.exe /encdotf /keytype "AES-128" /enckey "000102030405060708090A0B0C0D0E0F" /startaddr "90000000" /endaddr "90000FFF" /incplain /prg "C:\work\dotf\userprog.srec" /output "C:\work\dotf\dotf_userprog.srec"  
Output File: C:\work\dotf\dotf_userprog.srec  
Key: 000102030405060708090A0B0C0D0E0F  
Counter: E3B9489DD945947EBC3BE98389000000
```

Figure 6-43 Execution result of CLI encdotf command

6.7 Example 7 – RA Family using Secure Factory Programming

Outputs a Secure Factory Programming file (*.sfp) for use with the Secure Factory Programming function.

Please note, the Secure Factory Programming file does **not** contain the information shown in the table below. This information must be provided as a package to enable secure production programming.

Table 6-1 Additional Files Needed for Secure Production Programming

Item	When Needed	How to Provide
User Key Injection Files	If the application requires keys that have been securely injected.	Generate all required *.rkey files using the [Wrap Key] tab of the GUI (<i>Section 3.6 [Wrap Key] Tab</i>) or the genkey CLI command (<i>Section 4.5 genkey Command Options</i>). Note that the UFPK used for user key injection does not need to be the same UFPK used for Secure Factory Programming.
Key Certificate	If the application will use the First Stage Bootloader with signature authentication.	Generate any required binary Key Certificate files using the [FSBL] tab of the GUI (<i>Section 3.8 [FSBL] tab</i>) or the gencert CLI command (<i>Section 4.7 gencert command option</i>)
Code Certificate	If the application will use the First Stage Bootloader with either signature authentication or CRC verification.	Generate any required binary Code Certificate files using the [FSBL] tab of the GUI (<i>Section 3.8 [FSBL] tab</i>) or the gencert CLI command (<i>Section 4.7 gencert command option</i>)

6.7.1 Using the GUI version

1. Selecting the MCU/MPU and Security Engine

Select the MCU/MPU and security engine on the **[Overview]** tab.

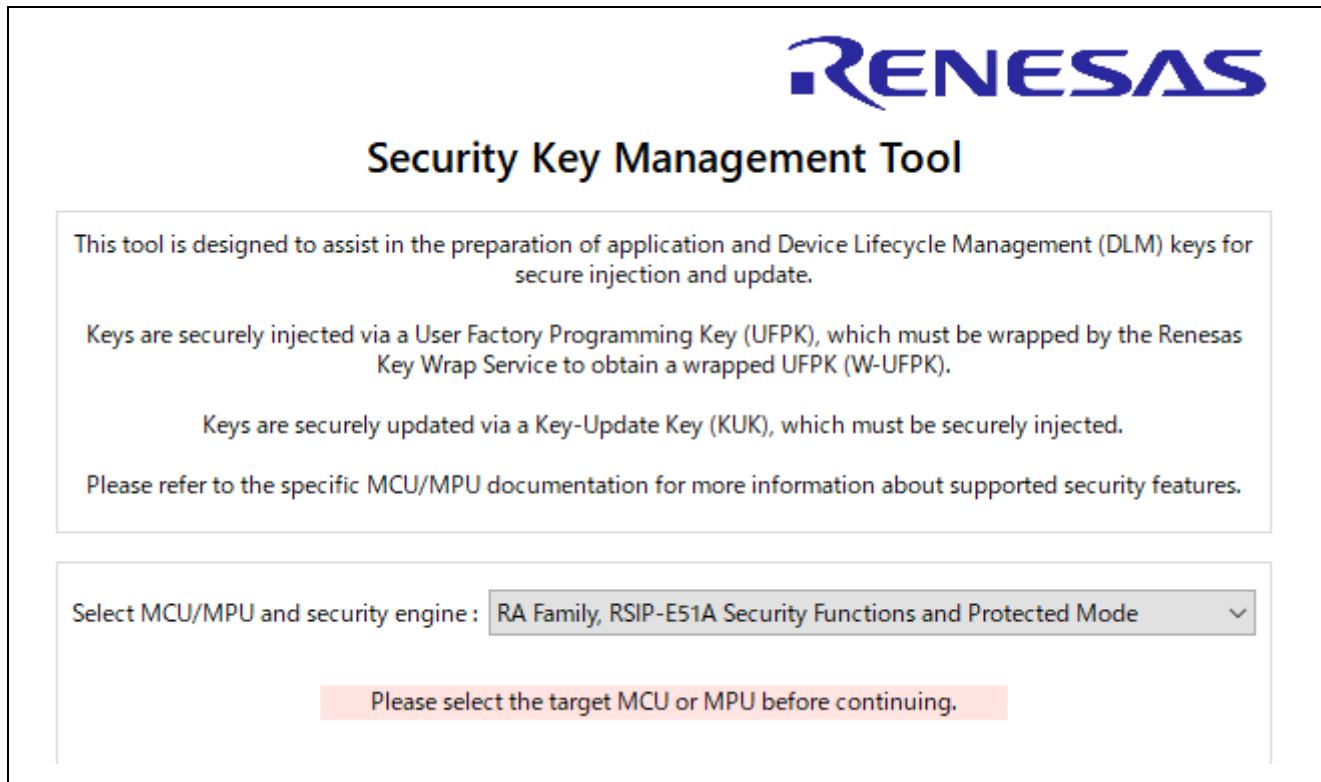

Figure 6-44 [Overview] Tab, Secure Factory Programming with RA Family RSIP-E51A Security Functions and Protected Mode

2. Setting [Firmware Images] tab

Specify the user program to be encrypted in [Firmware Images] tab **Plaintext Image**. Select the file and click the Add button to add the file.

Select the MCU/MPU information to be used in “**MCU/MPU**”. In this example, “**RA8D1/M1/T1**” is selected.

Select the destination DLM/AL state after writing the firmware image in **Final DLM/AL State**.

In this example, select “**OEM PL0 with AL2_KEY**”.

Specify the output file name in **Secure Programming File(*.sfp)**.

The screenshot displays the 'Firmware Images' tab with the following configuration:

- Plaintext Image:** C:\work\sfp\userprog.srec
- MCU/MPU:** RA8D1/M1/T1
- Final DLM/AL State:** OEM PL0 with AL2_KEY
- Secure Programming File:** C:\work\sfp\sfp_userprog.sfp

The 'Add' button is visible next to the Plaintext Image field. The 'Generate Secure Factory Programming File' button is located at the bottom of the interface.

Figure 6-45 [SFP] – [Firmware Images] Tab, Setting Example

3. Setting [Image Encryption Key] tab

Specify the AES 128-bit key data to be used for encryption of the user program and parameter information in “**Key Data (AES-128)**”.

For simplicity, “**IV**” is set to **Generate random value** in this example.

Specify UFPK file for “**UFPK File**” and W-UFPK file for “**WUFPK File**”.

Refer to 6.1.1 Steps 1-3 for how to generate UFPK and W-UFPK files.

The screenshot shows the 'Image Encryption Key' tab in the Security Key Management Tool. The interface includes several sections:

- Key Data (AES-128):** Three radio button options are present: 'File', 'Raw', and 'Random - Output File'. The 'Raw' option is selected. A text input field next to 'Raw' contains the hexadecimal value '000102030405060708090A0B0C0D0E0F'. 'Browse...' buttons are located to the right of the 'File' and 'Random - Output File' options.
- IV:** Two radio button options are present: 'Generate random value' and 'Use specified value (16 hex bytes, big endian format)'. The 'Generate random value' option is selected. A text input field next to the second option contains the hexadecimal value '00112233445566778899AABBCCDDEEFF'.
- UFPK File:** A text input field contains the path 'C:\work\sfp\ufpk.key', with a 'Browse...' button to its right.
- W-UFPK File:** A text input field contains the path 'C:\work\sfp\ufpk.key_enc.key', with a 'Browse...' button to its right.

At the top of the window, there are tabs for 'Firmware Images', 'Image Encryption Key', 'Nonces', 'AL2/SECDBG_KEY', 'AL1/NONSECDBG_KEY', and 'Bounda'. The 'Image Encryption Key' tab is currently selected.

Figure 6-46 [SFP] – [Image Encryption Key] Tab, Setting Example

4. Setting [Nonces] tab.

“IV (Programming parameters)” and “IV (Firmware image)” are for simplicity. “Generate random value” is selected in this example. “IV (AL/DLM key)” is not required to be selected in this example.

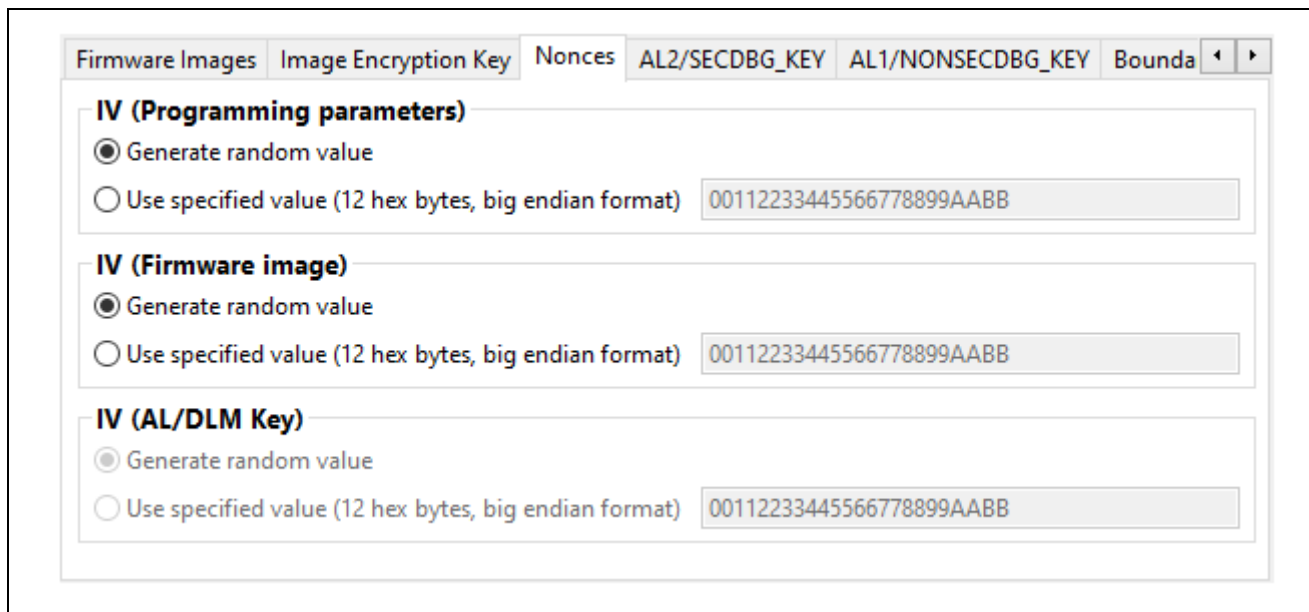

Figure 6-47 [SFP] – [Nonces] Tab, Setting Example

5. Setting [AL2/SECDBG_KEY] tab.

Specify the AES128bit key data to be used as AL2_KEY in "Key Data".

For simplicity, “IV” is set to “Generate random value” in this example.

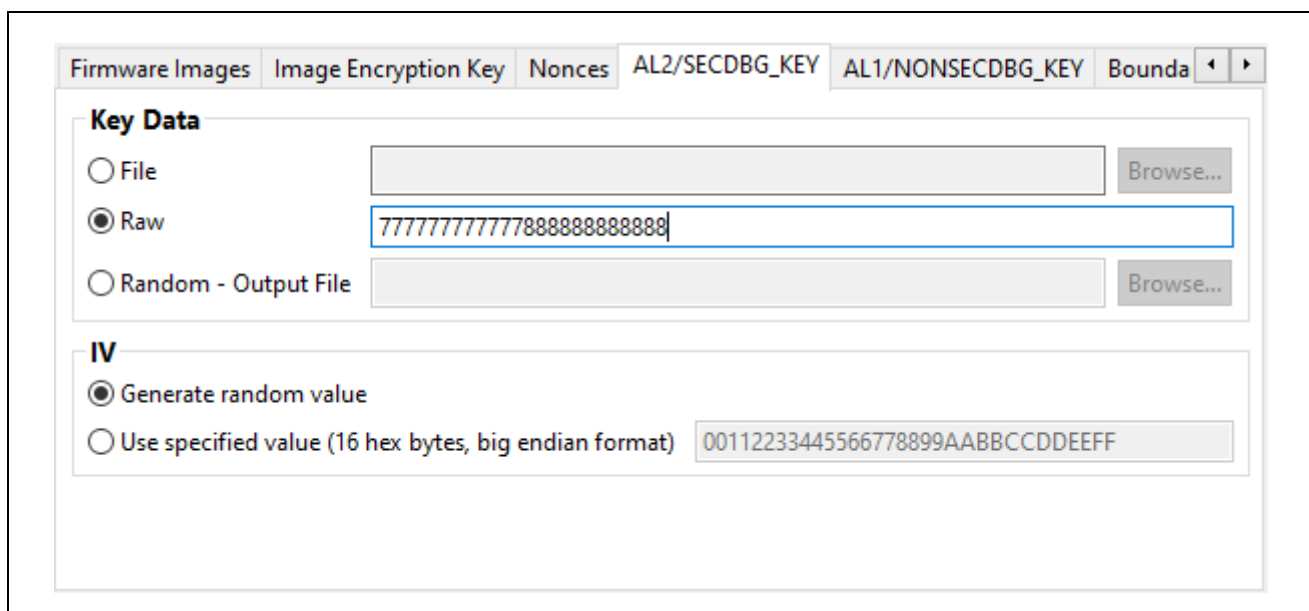

Figure 6-48 [SFP] – [AL2/SECDBG_KEY] Tab, Setting Example

Click the "**Output File**" button to generate the Secure Factory Programming file. If the file is successfully generated, the following results will be output.

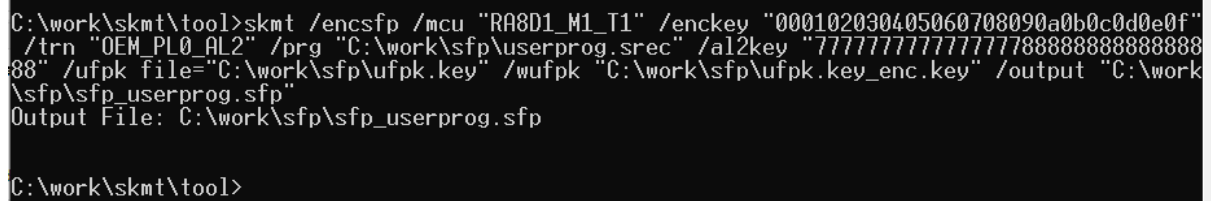

Figure 6-49 [SFP] tab – Example of execution result

6.7.2 Using the CLI version

1. Encrypt user programs using **encsfp** command.

```
>skmt /encsfp /mcu "RA8D1_M1_T1" /enckey "000102030405060708090a0b0c0d0e0f"  
    /trn "OEM_PL0_AL2" /prg "C:\work\sfp\userprog.srec"  
    /al2key "777777777777777788888888888888888888"  
    /ufpk file="C:\work\sfp\ufpk.key" /wufpk "C:\work\sfp\ufpk.key_enc.key"  
    /output "C:\work\sfp\sfp_userprog.sfp"
```

```
C:\work\skmt\tool>skmt /encsfp /mcu "RA8D1_M1_T1" /enckey "000102030405060708090a0b0c0d0e0f"  
    /trn "OEM_PL0_AL2" /prg "C:\work\sfp\userprog.srec" /al2key "777777777777777788888888888888888888"  
    /ufpk file="C:\work\sfp\ufpk.key" /wufpk "C:\work\sfp\ufpk.key_enc.key" /output "C:\work\sfp\sfp_userprog.sfp"  
Output File: C:\work\sfp\sfp_userprog.sfp  
  
C:\work\skmt\tool>
```

Figure 6-50 Execution result of CLI encsfp command

7. Notes

7.1 Display settings when using Windows environment

In the Windows environment, if the standalone GUI or the e² studio plug-in version is set to a display setting other than the recommended setting, the entire dialog may not be displayed.

The display can be improved by the following ways.

1. Right-click on the executable file:
Standalone version : `SecurityKeyManagementTool.exe`
e² studio plugin version : `e2studio.exe`
`e2studio.exe` is located in the **eclipse** folder of e² studio installation.
2. Select **Properties**, and then select the **Compatibility** tab. On the **Compatibility** tab, click the **Change high DPI settings** button.
3. In the **High DPI scaling override** section, check the **Override high DPI scaling behaviour** checkbox and select **System** in the pull-down list. Then click **OK** on both dialog boxes.

Figure 7-1 SecurityKeyManagementTool.exe Properties “High DPI scaling override” settings

7.2 Note on using e²studio plugin version in a Linux environment

If you are using the e²studio plug-in version in a Linux environment, you must set execution permissions on the command line executable file after installation. After installing the plug-in version of the Security Key Management Tool in e²studio, grant execution rights to the following files in the e²studio installation folder.

```
/eclipse/plugins/com.renesas.apltool.skmt_X.X.X.XXXXXXXXXXXXXX/cli/skmt
```

7.3 Note on using e²studio plugin version in a macOS environment

If you are using the e²studio plug-in version in a macOS environment, you must set execution permissions on the command line executable file after installation. After installing the plug-in version of the Security Key Management Tool in e²studio, grant execution rights to the following files in the e²studio installation folder.

```
/eclipse/plugins/com.renesas.apltool.skmt_X.X.X.XXXXXXXXXXXXXX/cli/skmt
```

7.4 Note The macOS version limitation

The macOS version has limitations on the following features of the command line, standalone, and e²studio plug-in versions

Table 7-1 Limitations of the command line version

Command	Options	Limitations
genkey	Key generation by omitting the /key option when the following specific /keytype option is specified. "brainpoolP256r1-private" "brainpoolP384r1-private" "brainpoolP512r1-private"	Not available. The following error message appears "Error: For BRAINPOOLPxxxR1-PRIVATE, key option cannot be omitted when using MAC OS."
	PEM file input with /key option when the following specific /keytype option is specified. "brainpoolP256r1-public", "brainpoolP256r1-private", "brainpoolP384r1-public", "brainpoolP384r1-private", "brainpoolP512r1-public", "brainpoolP512r1-private",	Not available. The following error message appears "Error: For BRAINPOOLPxxxR1-PRIVATE/PUBLIC, PEM file cannot be specified when using MAC OS."

Table 7-2 Limitations of the standalone and the e²studio plugin version

Tab	Options	Limitations
Wrap Key	When the following key types are selected in the [KeyType] tab, select "Random" in the [KeyData] tab for key generation. "brainpoolP256r1-private" "brainpoolP384r1-private" "brainpoolP512r1-private"	Not available. When the Generate file button is pressed, the following error message is displayed. "Error: For BRAINPOOLPxxxR1-PRIVATE, key option cannot be omitted when using MAC OS."
	When the following key types are selected on the [KeyType] tab, select "File" on the [KeyData] tab to use a PEM file as input. "brainpoolP256r1-public", "brainpoolP256r1-private", "brainpoolP384r1-public", "brainpoolP384r1-private", "brainpoolP512r1-public", "brainpoolP512r1-private",	Not available. When the Generate file button is pressed, the following error message is displayed. "Error: For BRAINPOOLPxxxR1-PRIVATE/PUBLIC, PEM file cannot be specified when using MAC OS."

7.5 Limitations of Secure Factory Programming Function

There is an upper limit to the size of the user program image that can be used with the Secure Factory Programming feature.

The user program image is split according to the format defined in the Boot Firmware application note Encrypted Data Write Command - Data Packet [Encrypted User Data] - DAT - User data and write address/size. The maximum total size of the split user program image is 16 MB.

The Security Key Management Tool will output the following error if a user program image larger than the maximum size is entered.

Error: The user program information to be encrypted is too large. The total size of the user program information is less than 16MB.

7.5.1 How to create User data and write address/size in Security Key Management Tool

The Security Key Management Tool adds write address/size information to each write unit (minimum 16 bytes) of each area of the code flash, data flash, and OFS areas of the user program image. When an external flash memory area is specified with extarea0/1, write address/size information is added for each write unit set. The maximum size of the user data section is 1024 bytes.

Example: Image to be encrypted Data exists in the external flash memory area 0x90000000 to 0x9000040F

When **extarea0** "0x90000000" "0x9000FFFF" "16" is set

Encrypted Data Write Command - Data Packet [Encrypted User Data] - as data for DAT

The Security Key Management Tool is

Encrypt the first packet DAT: SAD+SIZE+Reserved+(data in 0x90000000-0x900003FF)

Encrypt the second packet DAT: SAD+SIZE+Reserved+(data in 0x90000400-0x9000040F)

7.6 GUI Version [SFP] Tab Limitations when setting files

When specifying a file for secure programming in the **[Firmware Images]** tab in the **[SFP]** tab, if the operation shown in the Occurrence Condition is performed, the secure programming file cannot be generated.

(1) Conditions

- manually or by using the Security Key Management Tool menu **[File]** – **[Load...]** as shown in the figure below, Set up a file for secure programming.

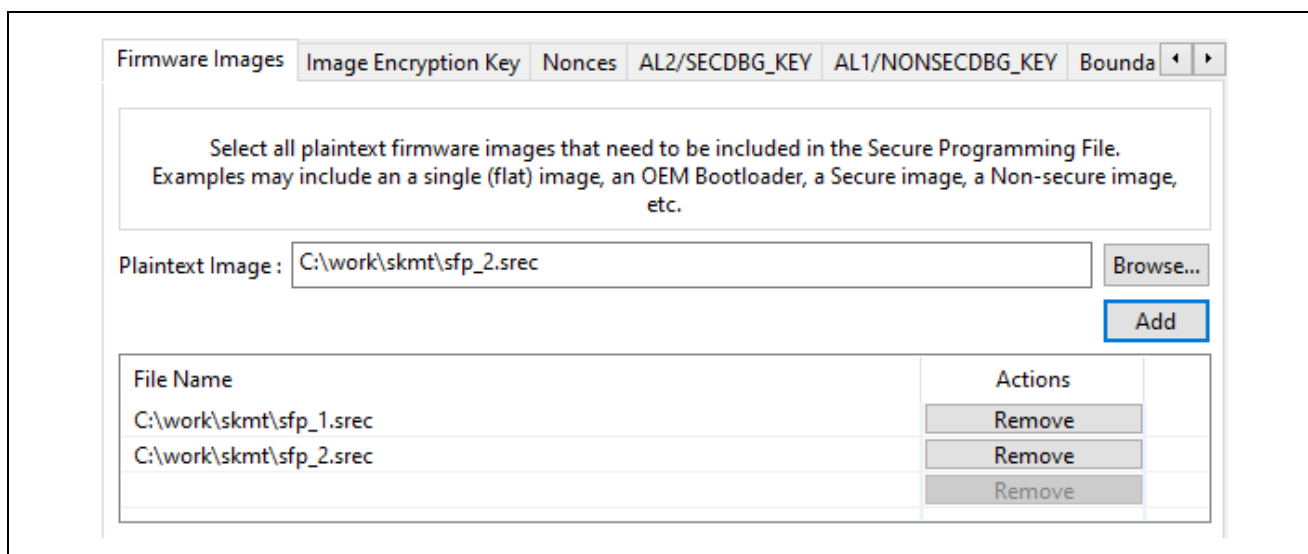

Figure 7-2 [SFP] tab – [Firmware Images] tab to set files

- Use the Security Key Management Tool menu **[File]** – **[Load...]** to load the configuration file that defines the file for secure programming in the **[Firmware Images]** tab in the **[SFP]** tab.

Figure 7-3 [File]-[Load...]

3. If the total number of files for secure programming set in step 1 and the total number of files for secure programming set in the settings file in step 2 are more than 4 files, the “Settings are read” dialog that appears when loading the settings file will not appear. The following error message is displayed when the “Generate Secure Programming File” button is pressed because 4 files are being held internally.

Figure 7-4 Error when specifying more than 4 secure programming files

(2) Workaround

Press the **Remove** button on the [Firmware Images] tab to remove the unused file or all files and re-configure the file.

Figure 7-5 [Firmware Images] tab – Remove button

When **Remove** button is pressed, the following error dialog may appear. In this case, press the **OK** button. The unused file will be deleted.

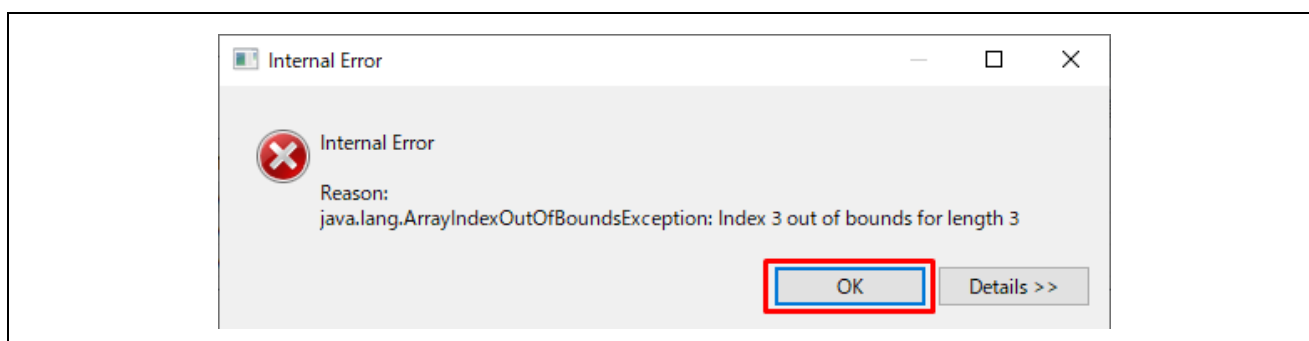

Figure 7-6 Error Dialog

8.2 Renesas Key File Format

8.2.1 Text format

Table 8-1 Renesas Key File Format : Text format

Item	Specification
Character	ASCII code only (Unicode and multi-byte characters cannot be used.)
Space Chapter	TAB(0x09) / Space(0x20)
Maximum length of a line	80 bytes
Line break	CRLF(0x0D,0x0A) / CR(0x0D) / LF(0x0A)
Base64	Chars = Alpha / Digit / "+" / "/" Pad = "=" Line length = 64 chars (except the final line)

8.2.2 File Structure

The file structure is constructed with the following three items.

```
<Header>
<Base64Lines>
<Footer>
```

<Header> and <Footer> are the following fixed strings.

Header = "-----BEGIN RENESAS KEY-----"

Footer = "-----END RENESAS KEY-----"

<Base64Lines> comprises multi-line strings that represent the key data structure, described below. The key data structure is Base64 encoded binary.

Lines after the footer, blank lines, and white space at the end of lines are ignored.

8.2.3 File Extension

".rkey"

8.2.4 Key Data

8.2.4.1 Structure

Key Data is stored in the following order and size. The byte order is big-endian.

Table 8-2 Renesas Key File Format : Key data structure

Name	Type	Size	Description
Magic code	Char[4]	4 Bytes	"REK1"
Suite Version	Integer	4 Bytes	Data format version. Currently Must be 1.
Reserved	Byte[7]	7 Bytes	0.
Key Type	Byte	1 Bytes	[For DLM key] 0. [For user key] Keytype value constant (Refer to 4.5.2 keytype Options)
Encrypted Key Size	Integer	4 Bytes	Size of "Encrypted Key" (= N bytes)
W-UFPK	Byte[36]	36 Bytes	Value of the W-UFPK file sent from the Renesas DLM server The first 4 bytes are Shared Key Number The remaining 32 bytes are the WUFPK value
Initialization Vector	Byte[16]	16 Bytes	Initialization vector value used to Wrap user key.
Encrypted Key	Byte[N]	N Bytes	User key encrypted with UFPK value + MAC value
Data CRC	Byte[4]	4 Bytes	Calculated CRC for all data except this CRC data. Initial Value = 0xFFFFFFFF Magic number = 0x04C11DB7

8.2.5 Encrypted Key Wrapping Formula

The following formula is used for encryption and MAC generation when wrapping a user key with UFPK or KUK.

- Encrypted Key Wrapping Formula for RA Family, RX Family, and Synergy Platform

```
uint32_t i = 0;
uint32_t n          = User key byte size;
uint8_t  IV[16];   // Initial Vector(128bit)
uint8_t  CBCKey[16] = UFPK[0:15] or KUK[0:15]; // CBCKEY in either UFPK or KUK
uint8_t  CBCMACKey[16] = UFPK[16:31] or KUK[16:31]; // CBCMACKEY in either UFPK or KUK
uint8_t  User_Key[n]; // Plain text User key
uint8_t  MAC[16] = {0};
uint32_t encrypted_key[n]; // Encrypted Key

for (i = 0; i < n; i += 16)
{
    MAC[0:15] =
        AES128-Enc(CBCMACKey[0: 15], xor_16byte(User_Key[i: i+15], MAC[0: 15]));
    encrypted_key[i: i+15] =
        AES128-Enc(CBCKey[0: 15], xor_16byte(User_Key [i: i+15], IV[0: 15]));
    IV[0: 15] = encrypted_key [i: i+15];
}
encrypted_key[i: +15] = AES128-Enc(CBCKey[0: 15], xor_16byte(MAC[0: 15], IV[0: 15]));
```

*: AES128-Enc() indicates encryption in AES ECB mode with a key length of 128 bits.

First Argument: Encryption Key, Second Argument: Plaintext Data

- Encrypted Key Wrapping Formula for RZ/T2M, RZ/T2ME, RZ/T2L, RZ/N2L

```
uint32_t n          = User key byte size;
uint8_t  IV[16];   // Initial Vector(128bit)
uint8_t  CBCKey[16] = UFPK[0:15] or KUK[0:15]; // CBCKEY in either UFPK or KUK
uint8_t  CMACKey[16] = UFPK[16:31] or KUK[16:31]; // CMACKEY in either UFPK or KUK
uint8_t  User_Key[n]; // Plain text User key
uint8_t  MAC[16] = {0};
uint32_t encrypted_key[n]; // Encrypted Key

MAC[0:15] = AES128-CMAC(CMACKey[0: 15], IV[0: 15], User_Key[0: n-1]); *1
encrypted_key[0: n-1] = AES128-CBC(CBCKey[0: 15], IV[0: 15], User_Key[0: n-1]); *2
encrypted_key[n: n+15] = MAC[0:15];
```

*1 : AES128-CMAC() indicates encryption in AES CMAC mode with a key length of 128 bits.

First Argument: Encryption Key, Second Argument: Initial Vector Third Argument: Plaintext Data

*2 : AES128-CBC() indicates encryption in AES CBC mode with a key length of 128 bits.

First Argument: Encryption Key, Second Argument: Initial Vector Third Argument: Plaintext Data

8.3 Secure Factory Programming File Format

8.3.1 File Format

A binary file consists of a “Pre-Data Field” that stores unique information other than the TLV field, a “TLV Length Field” that stores the size of the TLV field, and a “TLV (Type-Length-Value) Field” that stores encrypted data.

The format of the “Pre-Data Field” file differs depending on the MCU/MPU. Refer to Table 8 3 to see which file format is used for which MCU/MPU.

Data is arranged in Big-Endian order.

Table 8-3 MCU/MPU and Pre-Data Field Correspondence Table

Format Version	MCU/MPU	Format Image
V1	RA8D1_M1_T1	Figure 8-1
V2	RA4L1	Figure 8-2

Figure 8-1 Secure Factory Programming File V1 Format

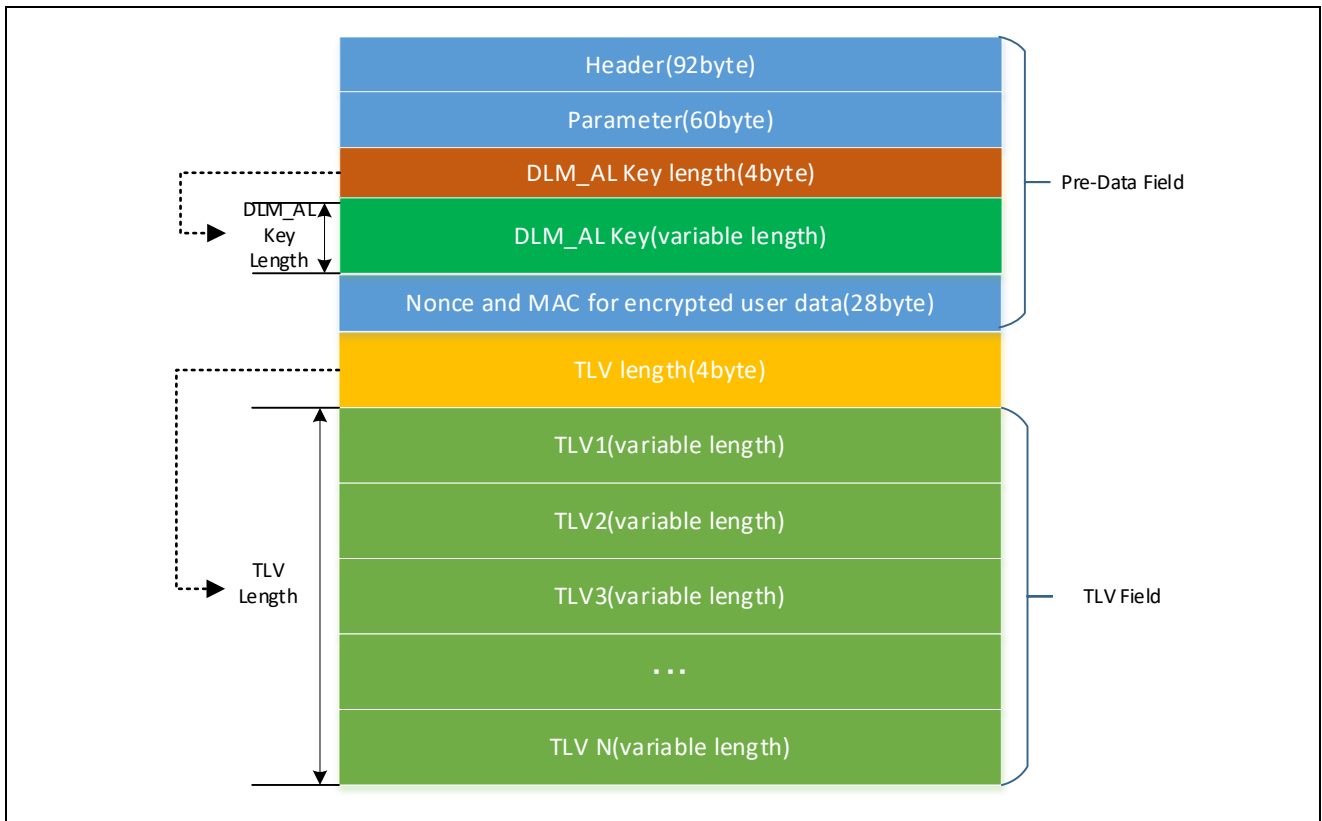

Figure 8-2 Secure Factory Programming File V2 Format

8.3.1.1 Pre-Data Field

(1) Pre-Data Field V1 format

The Pre-Data field in V1 format is a 268-byte fixed-length field that stores unique information.

Table 8-4 Secure Factory Programming File V1 Format : Pre-Data field

Field	Size [byte]	Description
Magic	4	Sets "0x73667072", which is an unsigned 4-byte integer representation of the "sfpr" ASCII code, as the unique magic number.
Version	4	Format Version The upper 2 bytes represent the major version and the lower 2 bytes the minor version. In V.1.00, "0x00010000" is set.
W-UFPK	36	Value of the W-UFPK file sent from the Renesas DLM server The first 4 bytes are Shared Key Number The remaining 32 bytes are the WUFPK value
Initialization Vector used for encrypting ENKY	16	Initialization vector used to wrap the key used to encrypt the user program and parameters
ENKY	32	UFPK-encrypted data with parameter values and the key used to encrypt the user program
Nonce used for encrypting parameters	12	Nonce data used to encrypt parameters
Encrypted Parameter	16	Data with parameter values encrypted with Encryption key
MAC for Encrypted Parameter	16	MAC value generated when the parameter value is encrypted with Encryption key
Reserved	3	0xFF
Encrypted AL2 Key Enable	1	Initialization Vector for used encrypted AL2 Key field and Encrypted AL2 Key with MAC field enable/disable flag 0: Disabled Other: Enabled
Initial Vector used for encrypting AL2 Key	16	Initialization Vector value used during AL2 Key encryption
Encrypted AL2 Key	32	AL2 Key encrypted with UFPK + MAC value
Reserved	52	0xFF
Nonce used for encrypting user data	12	Nonce value used to encrypt the user program
MAC for encrypted user data	16	MAC value generated when encrypting the user program

(2) Pre-Data Field V2 format

The Pre-Data field in V2 format is a field that contains the Header, Parameter, DLM_AL key (including DLM_AL key length), Nonce and MAC for encrypted user data.

DLM_AL key is a variable length field.

(a) Header Field

The Header field is a 92-byte fixed-length field containing the Magic Number, Version, W-UFPK, IV of ENKY and ENKY data.

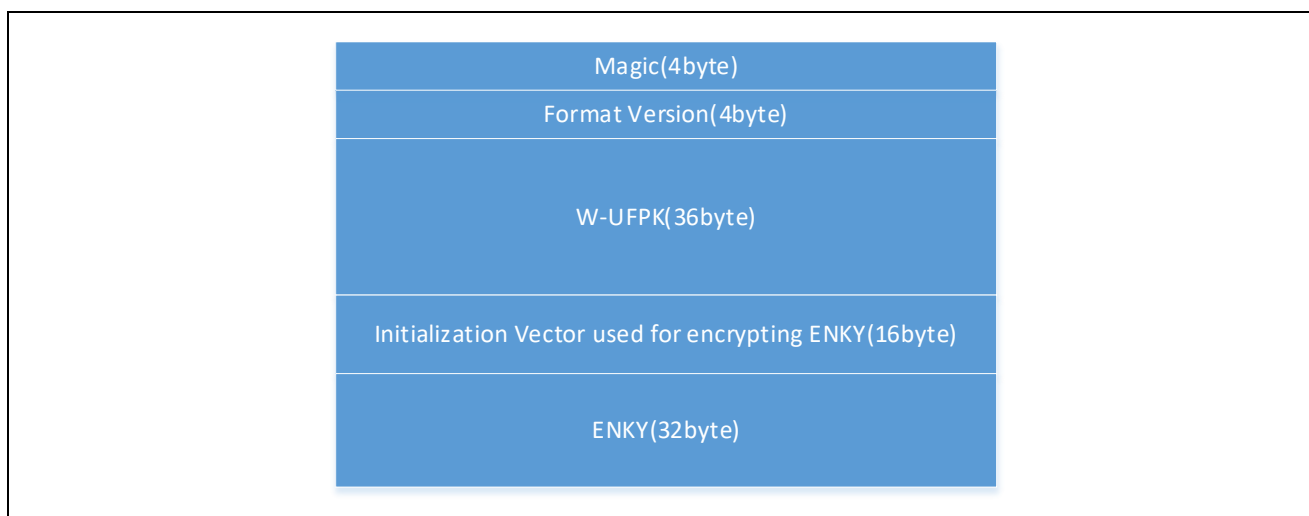

Figure 8-3 Secure Factory Programming File V2 Format : Header Field

Table 8-5 Secure Factory Programming File V2 Format : Header field

Field	Size [byte]	Description
Magic	4	Sets "0x73667072", which is an unsigned 4-byte integer representation of the "sfpr" ASCII code, as the unique magic number.
Version	4	Format Version The upper 2 bytes represent the major version and the lower 2 bytes the minor version. In V.2.00, "0x00020000" is set.
W-UFPK	36	Value of the W-UFPK file sent from the Renesas DLM server The first 4 bytes are Shared Key Number The remaining 32 bytes are the WUFPK value
Initialization Vector used for encrypting ENKY	16	Initialization vector used to wrap the key used to encrypt the user program and parameters
ENKY	32	UFPK-encrypted data with parameter values and the key used to encrypt the user program

(b) Parameter Field

The Parameter field is a 60-byte fixed-length field that contains the encrypted Parameter information, the Nonce and MAC information used during Parameter encryption.

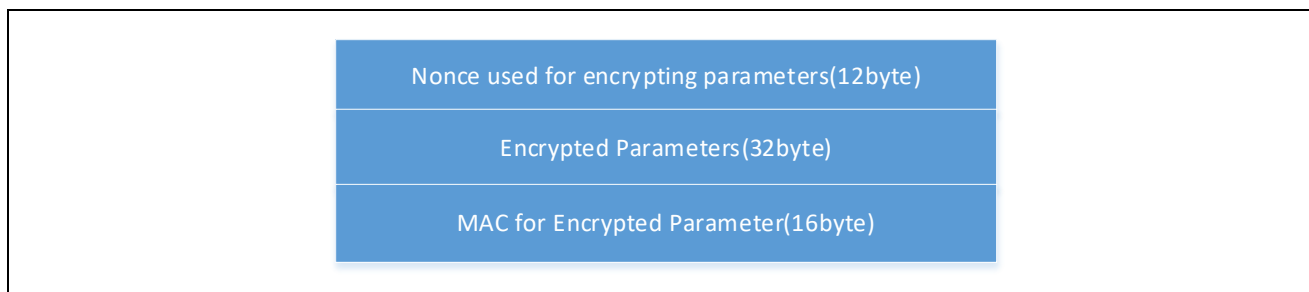

Figure 8-4 Secure Factory Programming File V2 Format : Parameter Field

Table 8-6 Secure Factory Programming File V2 Format : Parameter field

Field	Size [byte]	Description
Nonce used for encrypting parameter	12	Nonce used to encrypt Parameter information
Encrypted Parameters	32	Parameter information encrypted with Encryption key
MAC for Encrypted Parameter	16	MAC value generated when Parameter information is Encryption key encrypted.

(c) DLM_AL Key Field

The DLM_AL Key field is a variable length field that contains the encrypted data of the wrapped DLM_AL key (Encrypted DLM key data), the Nonce used for encrypting the wrapped DLM_AL key (Nonce used for encrypting DLM key data), and the MAC (MAC for Encrypting DLM key data).

DLM_AL Key length is a fixed length field of 4 bytes that stores the number of bytes in the DLM_AL Key field.

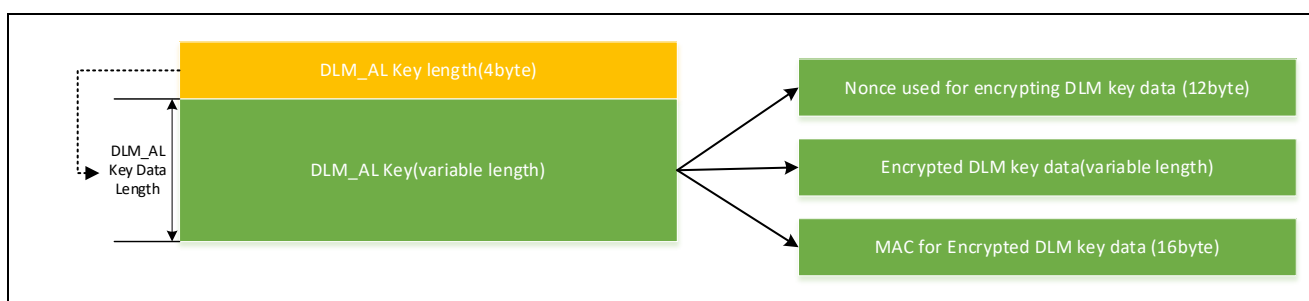

Figure 8-5 Secure Factory Programming File V2 Format : DLM_AL Key Field

Table 8-7 Secure Factory Programming File V2 Format : Parameter field

Field	Size [byte]	Description
DLM_AL Key length	4	DLM_AL Total byte size of Key field
Nonce used for encrypting DLM key data	12	Nonce used to encrypt the Encrypted DLM_AL key data (Encrypted DLM key data) of the wrapped DLM_AL key
Encrypted DLM key data	variable length	Encrypted data of wrapped DLM_AL key
MAC for Encrypted DLM key data	16	MAC used to encrypt the Encrypted DLM_AL key data (Encrypted DLM key data) of the wrapped DLM_AL key.

(3) Nonce and MAC for encrypted user data Field

The Nonce and MAC for encrypted user data field is a 28-byte fixed-length field that stores the nonce used during encryption of the user program and the generated MAC information.

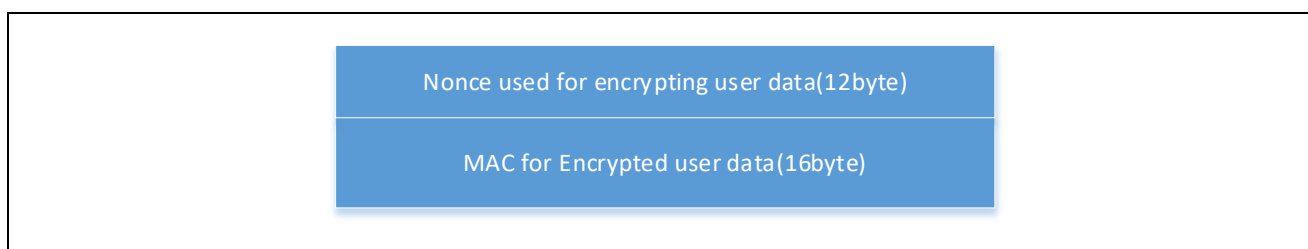

Figure 8-6 Secure Factory Programming File V2 Format : Nonce and MAC for encrypted user data Field

Table 8-8 Secure Factory Programming File V2 Format : Nonce and MAC for encrypted user data field

Field	Size [byte]	Description
Nonce used for encrypting user data	12	Nonce value used to encrypt the user program
MAC for Encrypted user data	16	MAC value generated when encrypting the user program

8.3.1.2 TLV Length Field

TLV Length is a 4-byte fixed-length field that describes the size of the TLV field.

Table 8-9 Secure Factory Programming File Format : TLV Length field

Field	Size [byte]	Description
TLV Length	4	Total byte size of TLV field

8.3.1.3 TLV Field

TLV is a variable-length field that is set to one of the following values in Type-Length-Value format.

- Encrypted User Program

The format of TLV is shown in Figure 8-7 TLV Format.

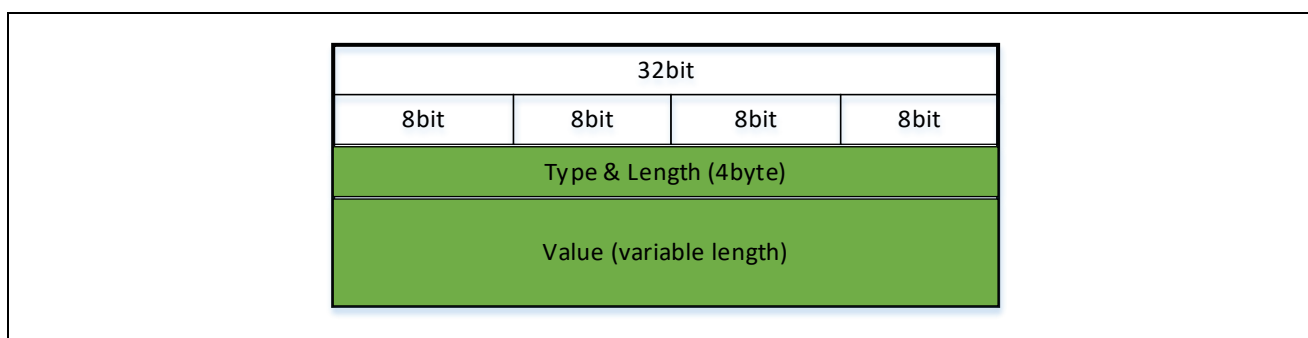

Figure 8-7 TLV Format

Table 8-10 Secure Factory Programming File Format : TLV field

Field	Size [byte]	Description
Type & Length	4	Value type and word (32bit) size
Value	variable length	Data per type Size is 4 times the value specified by Length (Length is for word size specification)

(1) Detail for Type&Length Field

Type&Length field is defined as a 32-bit bit field.

Table 8-11 Secure Factory Programming File Format : TLV Type&Length field

Field	Bit Field	Size(bit)	Bit position	Description
Type	Class	4	31:28	Value Classification bit 31 28 0 0 0 0 : Encrypted User Data ※他は予約
	<Class unique>	4	27:24	Fields for each Class
Length	word size	24	23:0	The word size of Valu(1word = 4byte) [value]0~16,777,215

(2) Unique field for each Class

This section describes the value of the Class unique field for each Class.

If the Class field is "Encrypted User Data"

Table 8-12 Secure Factory Programming File Format : The Class field is "Encrypted User Data"

Bit Field	Size (bit)	Bit position	Description
Use type	4	27:24	Usage Type [value] bit 27 24 0 0 0 0 : Encrypted User Data *Others are reserved

8.3.2 File extensions

".sfp"

8.4 Key Certificate / Code Certificate

8.4.1 Key Certificate File Format

This is a binary file with the following data structure.

For details, please refer to the User Manual of the device that supports the FSBL function.

Table 8-13 Key Certificate data format

Field		Size [byte]	Description
Header	Magic	4	0x6B657963
	Manifest Version	4	0x00010000
	Flags	4	Reserved (0x00000000)
	Reserved	20	Reserved (ALL 0)
TLV Length		4	Data byte length of the TLV field in the Key Certificate 0x000000AC
TLV ECC PUBKEY	Type&Length	4	0x00088010
	Value	64	OEM ROOT public key specified by /gencert /oemroot_public option
TLV KEYHASH	Type&Length	4	0x10144008
	Value	32	SHA2-256 HASH value of the OEM BL public key specified by the /gencert /oembl_public option
TLV EXPECTED_SIG	Type&Length	4	0x20088410
	Value	64	Signature

8.4.2 Code Certificate file format generated by mode "signature"

This is a binary file with the following data structure.

For details, please refer to the User Manual of the device that supports the FSBL function.

Table 8-14 Code Certificate data format generated by mode "signature"

Field		Size [byte]	Description
Header	Magic	4	0x636F6463
	Manifest Version	4	0x00010000
	Flags	4	0x00000000
	Load Addr	4	OEM BL starting address specified by /gencert /loadaddr option
	Dest Addr	4	OEM BL starting address specified by /gencert /loadaddr option
	Image size	4	OEM BL size specified by /gencert /oembl_size option /OEM BL size calculated from OEM BL file entered by /cfszize option and /oembl when /oembl_size is omitted
	Image version	4	Version information specified by /gencert /ver option
	Build number	4	Reserved (ALL 0)
TLV Length		4	Data byte length of TLV field in Code Certificate 0x000000AC
TLV ECC PUBKEY	Type&Length	4	0x00088010
	Value	64	OEM ROOT public key
TLV EXPECTED_CRC	Type&Length	4	0x40000001
	Value	4	CRC32 value of OEM BL
TLV SIGNER_ID	Type&Length	4	0x10144008
	Value	32	SHA2-256 HASH value of the OEM BL public key
TLV EXPECTED_SIG	Type&Length	4	0x25088410
	Value	64	Signature

8.4.3 Code Certificate file format generated by mode "crc"

This is a binary file with the following data structure.

For details, please refer to the User Manual of the device that supports the FSBL function.

Table 8-15 Code Certificate data format generated by mode "crc"

Field	Size [byte]	Description	
Header	Magic	4	0x636F6463
	Manifest Version	4	0x00010000
	Flags	4	0x00000000
	Load Addr	4	OEM BL starting address specified by /gencert /loadaddr option
	Dest Addr	4	OEM BL starting address specified by /gencert /loadaddr option
	Image size	4	OEM BL size specified by /gencert /oembl_size option /OEM BL size calculated from OEM BL file entered by /cfsize option and /oembl when /oembl_size is omitted
	Image version	4	0
	Build number	4	Reserved (ALL 0)
TLV Length	4	Data byte length of TLV field in Code Certificate 0x000000AC	
TLV EXPECTED_CRC	Type&Length	4	0x40000001
	Value	4	CRC32 value of OEM BL
TLV SIGNER_ID	Type&Length	4	0x10144008
	Value	32	FILL with CRC32 value of OEM BL.

8.4.4 CRC32 calculation

The formula for calculating TLV EXPECTED_CRC in Code Certificate is as follows.

- CRC32 ($x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$)

Polynomial : 0xEDB88320(Bit reversed)

Shift direction : right shift

Input bit invert : No

output bit inversion: Yes

Initial Value : 0xFFFFFFFF

8.5 TSIP Update

8.5.1 User program encryption formula

```

uint32_t i = 0;
uint32_t n      = User program byte size;
uint8_t  IV[16] = IV[0:15];                // Initial Vector(128bit)
uint8_t  IEKey[16] = Image Encryption Key[0:15];
uint8_t  IEMACKey[16] = Image Encryption Key[16:31];
uint8_t  KEKey[16] = Key Encryption Key[0:15];
uint8_t  User_Program[n];
uint8_t  MAC[16] = {0};
uint32_t encrypted_user_program[n];        // Encrypted user program

for (i = 0; i < (n-16); i += 16)
{
    MAC[0:15] =
        AES128-Enc(IEMACKey[0: 15], xor_16byte(User_Program[i: i+15], MAC[0: 15]));
    encrypted_user_program[i: i+15] =
        AES128-Enc(IEKey[0: 15], xor_16byte(User_Program[i: i+15], IV[0: 15]));
    IV[0: 15] = encrypted_user_program[i: i+15];
}
encrypted_user_program[i: i+15]
    = AES128-Enc(IEKey[0: 15], xor_16byte(MAC[0: 15], IV[0: 15]));
SessionKey0[0:15] = AES128-Enc(KEKey[0: 15], IEKey[0: 15]);
SessionKey1[0:15] = AES128-Enc(KEKey[0: 15], IEMACKey[0: 15]);

```

* : AES128-Enc() indicates encryption in AES ECB mode with a key length of 128 bits.

First Argument: Encryption Key, Second Argument: Plaintext Data
