

To our customers,

Old Company Name in Catalogs and Other Documents

On April 1st, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: <http://www.renesas.com>

April 1st, 2010
Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (<http://www.renesas.com>)

Send any inquiries to <http://www.renesas.com/inquiry>.

Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: “Standard”, “High Quality”, and “Specific”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as “Specific” without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as “Specific” or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
 - “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
 - “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
 - “Specific”: Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

To all our customers

Regarding the change of names mentioned in the document, such as Mitsubishi Electric and Mitsubishi XX, to Renesas Technology Corp.

The semiconductor operations of Hitachi and Mitsubishi Electric were transferred to Renesas Technology Corporation on April 1st 2003. These operations include microcomputer, logic, analog and discrete devices, and memory chips other than DRAMs (flash memory, SRAMs etc.) Accordingly, although Mitsubishi Electric, Mitsubishi Electric Corporation, Mitsubishi Semiconductors, and other Mitsubishi brand names are mentioned in the document, these names have in fact all been changed to Renesas Technology Corp. Thank you for your understanding. Except for our corporate trademark, logo and corporate statement, no changes whatsoever have been made to the contents of the document, and these changes do not constitute any alteration to the contents of the document itself.

Note : Mitsubishi Electric will continue the business operations of high frequency & optical devices and power devices.

MITSUBISHI MICROCOMPUTERS 38B5 Group

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

DESCRIPTION

The 38B5 group is the 8-bit microcomputer based on the 740 family core technology.

The 38B5 group has six 8-bit timers, a 16-bit timer, a fluorescent display automatic display circuit, 12-channel 10-bit A-D converter, a serial I/O with automatic transfer function, which are available for controlling musical instruments and household appliances.

The 38B5 group has variations of internal memory size and packaging. For details, refer to the section on part numbering.

For details on availability of microcomputers in the 38B5 group, refer to the section on group expansion.

FEATURES

- Basic machine-language instructions 71
- The minimum instruction execution time 0.48 μ s (at 4.19 MHz oscillation frequency)
- Memory size
 - ROM 24K to 60K bytes
 - RAM 512 to 2048 bytes
- Programmable input/output ports 55
- High-breakdown-voltage output ports 36
- Software pull-up resistors (Ports P5, P61 to P65, P7, P84 to P87, P9)
- Interrupts 21 sources, 16 vectors
- Timers 8-bit X 6, 16-bit X 1
- Serial I/O1 (Clock-synchronized) 8-bit X 1 (max. 256-byte automatic transfer function)
- Serial I/O2 (UART or Clock-synchronized) 8-bit X 1

- PWM 14-bit X 1
 8-bit X 1 (also functions as timer 6)
- A-D converter 10-bit X 12 channels
- Fluorescent display function Total 40 control pins
- Interrupt interval determination function 1
- Watchdog timer 20-bit X 1
- Buzzer output 1
- 2 Clock generating circuit
 - Main clock (XIN-XOUT) Internal feedback resistor
 - Sub-clock (XCIN-XCOUT) Without internal feedback resistor (connect to external ceramic resonator or quartz-crystal oscillator)
- Power source voltage
 - In high-speed mode 4.0 to 5.5 V (at 4.19 MHz oscillation frequency and high-speed selected)
 - In middle-speed mode 2.7 to 5.5 V (at 4.19 MHz oscillation frequency and middle-speed selected)
 - In low-speed mode 2.7 to 5.5 V (at 32 kHz oscillation frequency and low-speed selected)
- Power dissipation
 - In high-speed mode 35 mW (at 4.19 MHz oscillation frequency)
 - In low-speed mode 60 μ W (at 32 kHz oscillation frequency, at 3 V power source voltage)
- Operating temperature range -20 to 85 $^{\circ}$ C

APPLICATION

Musical instruments, VCR, household appliances, etc.

PIN CONFIGURATION (TOP VIEW)

GROUP EXPANSION

Mitsubishi plans to expand the 38B5 group as follows:

Memory Type

Support for Mask ROM, One Time PROM and EPROM versions.

Memory Size

ROM/PROM size 24K to 60K bytes

RAM size 1024 to 2048 bytes

Package

80P6N-A 0.8 mm-pitch plastic molded QFP

80D0 0.8 mm-pitch ceramic LCC (EPROM version)

Fig. 4 Memory Expansion Plan

Currently supported products are listed below.

Table 3 List of Supported Products

As of Jan. 1998

Product	(P) ROM size (bytes) ROM size for User ()	RAM size (bytes)	Package	Remarks
M38B57MC-XXXFP	49152 (49022)	1024	80P6N-A	Mask ROM version

PRELIMINARY
 Notice: This is not a final specification.

FUNCTIONAL DESCRIPTION
Central Processing Unit (CPU)

The 38B5 group uses the standard 740 family instruction set. Refer to the table of 740 family addressing modes and machine instructions or the 740 Family Software Manual for details on the instruction set.

Machine-resident 740 Family instructions are as follows:

- The FST and SLW instructions cannot be used.
- The MUL, DIV, WIT and STP instructions can be used.

[CPU Mode Register] CPUM

The CPU mode register contains the stack page selection bit and internal system clock control bits. The CPU mode register is allocated at address 003B16.

Fig. 5 Structure of CPU Mode Register

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

Memory

Special function register (SFR) area

The special function register (SFR) area in the zero page contains control registers such as I/O ports and timers.

RAM

RAM is used for data storage and for stack area of subroutine calls and interrupts.

ROM

The first 128 bytes and the last 2 bytes of ROM are reserved for device testing, and the other areas are user areas for storing programs.

Interrupt vector area

The interrupt vector area contains reset and interrupt vectors.

Zero page

The 256 bytes from addresses 0000₁₆ to 00FF₁₆ are called the zero page area. The internal RAM and the special function registers (SFR) are allocated to this area.

The zero page addressing mode can be used to specify memory and register addresses in the zero page area. Access to this area with only 2 bytes is possible in the zero page addressing mode.

Special page

The 256 bytes from addresses FF00₁₆ to FFFF₁₆ are called the special page area. The special page addressing mode can be used to specify memory addresses in the special page area. Access to this area with only 2 bytes is possible in the special page addressing mode.

I/O Ports

[Direction Registers] PiD

The 38B5 group has 55 programmable I/O pins arranged in eight individual I/O ports (P0, P2, P40–P46, and P5–P9). The I/O ports have direction registers which determine the input/output direction of each individual pin. Each bit in a direction register corresponds to one pin, and each pin can be set to be input port or output port. When “0” is written to the bit corresponding to a pin, that pin becomes an input pin. When “1” is written to that pin, that pin becomes an output pin. If data is read from a pin set to output, the value of the port output latch is read, not the value of the pin itself. Pins set to input (the bit corresponding to that pin must be set to “0”) are floating and the value of that pin can be read. If a pin set to input is written to, only the port output latch is written to and the pin remains floating.

[High-Breakdown-Voltage Output Ports]

The 38B5 group microprocessors have 5 ports with high-breakdown-voltage pins (ports P0–P3 and P80–P83). The high-breakdown-voltage ports have P-channel open-drain output with $V_{cc} - 45\text{ V}$ of breakdown voltage. Each pin in ports P0, P1, and P3 has an internal pull-down resistor connected to V_{EE} . At reset, the P-channel output transistor of each port latch is turned off, so that it goes to V_{EE} level (“L”) by the pull-down resistor.

Writing “1” (weak drivability) to bit 7 of the FLDC mode register (address 0EF4₁₆) shows the rising transition of the output transistors for reducing transient noise. At reset, bit 7 of the FLDC mode register is set to “0” (strong drivability).

[Pull-up Control Register] PULL

Ports P5, P61–P65, P7, P84–P87 and P9 have built-in programmable pull-up resistors. The pull-up resistors are valid only in the case that the each control bit is set to “1” and the corresponding port direction registers are set to input mode.

Fig. 8 Structure of Pull-up Control Registers (PULL1 and PULL2)

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

Table 4 List of I/O Port Functions (1)

Pin	Name	Input/Output	I/O Format	Non-Port Function	Related SFRs	Ref.No.			
P00/FLD8– P07/FLD15	Port P0	Input/output, individual bits	CMOS compatible input level High-breakdown voltage P- channel open-drain output with pull-down resistor	FLD automatic display function	FLDC mode register Port P0FLD/port switch register	(1)

Interrupts

Interrupts occur by twenty one sources: five external, fifteen internal, and one software.

(1) Interrupt Control

Each interrupt except the BRK instruction interrupt have both an interrupt request bit and an interrupt enable bit, and is controlled by the interrupt disable flag. An interrupt occurs if the corresponding interrupt request and enable bits are "1" and the interrupt disable flag is "0." Interrupt enable bits can be set or cleared by software. Interrupt request bits can be cleared by software, but cannot be set by software. The BRK instruction interrupt and reset cannot be disabled with any flag or bit. The I flag disables all interrupts except the BRK instruction interrupt and reset. If several interrupts requests occurs at the same time the interrupt with highest priority is accepted first.

(2) Interrupt Operation

Upon acceptance of an interrupt the following operations are automatically performed:

1. The contents of the program counter and processor status register are automatically pushed onto the stack.
2. The interrupt disable flag is set and the corresponding interrupt request bit is cleared.
3. The interrupt jump destination address is read from the vector table into the program counter.

■Notes on Use

When the active edge of an external interrupt (INT₀–INT₄) is set or when switching interrupt sources in the same vector address, the corresponding interrupt request bit may also be set. Therefore, please take following sequence:

- (1) Disable the external interrupt which is selected.
- (2) Change the active edge in interrupt edge selection register
- (3) Clear the set interrupt request bit to "0."
- (4) Enable the external interrupt which is selected.

PRELIMINARY

Timers
8-Bit Timer

The 38B5 group has six built-in timers : Timer 1, Timer 2, Timer 3, Timer 4, Timer 5, and Timer 6.

Each timer has the 8-bit timer latch. All timers are down-counters. When the timer reaches "0016," an underflow occurs with the next count pulse. Then the contents of the timer latch is reloaded into the timer and the timer continues down-counting. When a timer underflows, the interrupt request bit corresponding to that timer is set to "1."

The count can be stopped by setting the stop bit of each timer to "1." The internal system clock can be set to either the high-speed mode or low-speed mode with the CPU mode register. At the same time, timer internal count source is switched to either $f(X_{IN})$ or $f(X_{CIN})$.

●**Timer 1, Timer 2**

The count sources of timer 1 and timer 2 can be selected by setting the timer 12 mode register. A rectangular waveform of timer 1 underflow signal divided by 2 is output from the P45/T1OUT pin. The waveform polarity changes each time timer 1 overflows. The active edge of the external clock CNTR0 can be switched with the bit 6 of the interrupt edge selection register.

At reset or when executing the STP instruction, all bits of the timer 12 mode register are cleared to "0," timer 1 is set to "FF16," and timer 2 is set to "0116."

●**Timer 3, Timer 4**

The count sources of timer 3 and timer 4 can be selected by setting the timer 34 mode register. A rectangular waveform of timer 3 underflow signal divided by 2 is output from the P46/T3OUT pin. The waveform polarity changes each time timer 3 overflows. The active edge of the external clock CNTR1 can be switched with the bit 7 of the interrupt edge selection register.

●**Timer 5, Timer 6**

The count sources of timer 5 and timer 6 can be selected by setting the timer 56 mode register. A rectangular waveform of timer 6 underflow signal divided by 2 is output from the P44/PWM1 pin. The waveform polarity changes each time timer 6 overflows.

●**Timer 6 PWM1 Mode**

Timer 6 can output a rectangular waveform with "H" duty cycle $n/(n+m)$ from the P44/PWM1 pin by setting the timer 56 mode register (refer to Figure 16). The n is the value set in timer 6 latch (address 002516) and m is the value in the timer 6 PWM register (address 002716). If n is "0," the PWM output is "L," if m is "0," the PWM output is "H" ($n = 0$ is prior than $m = 0$). In the PWM mode, interrupts occur at the rising edge of the PWM output.

16-Bit Timer

Timer X is a 16-bit timer that can be selected in one of four modes by the Timer X mode register 1, 2 and can be controlled the timer X write and the real time port by setting the timer X mode registers.

Read and write operation on 16-bit timer must be performed for both high- and low-order bytes. When reading a 16-bit timer, read from the high-order byte first. When writing to 16-bit timer, write to the low-order byte first. The 16-bit timer cannot perform the correct operation when reading during write operation, or when writing during read operation.

●Timer X

Timer X is a down-counter. When the timer reaches "0000₁₆," an underflow occurs with the next count pulse. Then the contents of the timer latch is reloaded into the timer and the timer continues down-counting. When a timer underflows, the interrupt request bit corresponding to that timer is set to "1."

(1) Timer mode

A count source can be selected by setting the Timer X count source selection bits (bits 1 and 2) of the Timer X mode register 1.

(2) Pulse output mode

Each time the timer underflows, a signal output from the CNTR₂ pin is inverted. Except for this, the operation in pulse output mode is the same as in timer mode. When using a timer in this mode, set the port shared with the CNTR₂ pin to output.

(3) Event counter mode

The timer counts signals input through the CNTR₂ pin. Except for this, the operation in event counter mode is the same as in timer mode. When using a timer in this mode, set the port shared with the CNTR₂ pin to input.

(4) Pulse width measurement mode

A count source can be selected by setting the Timer X count source selection bits (bits 1 and 2) of the Timer X mode register 1. When CNTR₂ active edge switch bit is "0," the timer counts while the input signal of the CNTR₂ pin is at "H." When it is "1," the timer counts while the input signal of the CNTR₂ pin is at "L." When using a timer in this mode, set the port shared with the CNTR₂ pin to input.

■ Note

•Timer X Write Control

If the timer X write control bit is "0," when the value is written in the address of timer X, the value is loaded in the timer X and the latch at the same time.

If the timer X write control bit is "1," when the value is written in the address of timer X, the value is loaded only in the latch. The value in the latch is loaded in timer X after timer X underflows.

When the value is written in latch only, unexpected value may be set in the high-order counter if the writing in high-order latch and the underflow of timer X are performed at the same timing.

•Real Time Port Control

While the real time port function is valid, data for the real time port are output from ports P8₅ and P8₆ each time the timer X underflows. (However, if the real time port control bit is changed from "0" to "1," data are output without the timer X.) When the data for the real time port is changed while the real time port function is valid, the changed data are output at the next underflow of timer X.

Before using this function, set the corresponding port direction registers to output mode.

Serial I/O

Serial I/O1

Serial I/O1 is used as the clock synchronous serial I/O and has an ordinary mode and an automatic transfer mode. In the automatic transfer mode, serial transfer is performed through the serial I/O automatic transfer RAM which has up to 256 bytes (addresses 0F00₁₆ to 0FFF₁₆; addresses 0F60₁₆ to 0FFF₁₆ are also used as

FLD automatic display RAM).

The P62/SRDY1/AN8, P64/INT4/SBUSY1/AN10, and P65/SSTB1/AN11 pins each have a handshake I/O signal function and can select either "H" active or "L" active for active logic.

Fig. 19 Block Diagram of Serial I/O1

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

Fig. 20 Structure of Serial I/O1 Control Registers 1, 2

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

(1) Serial I/O1 Operation

Either the internal synchronous clock or external synchronous clock can be selected by the serial I/O1 synchronous clock selection bits (b2 and b3 of address 001916) of serial I/O1 control register 1 as synchronous clock for serial transfer.

The internal synchronous clock has a built-in dedicated divider where 7 different clocks are selected by the internal synchronous clock selection bits (b5, b6 and b7 of address 001C16) of serial I/O1 control register 3.

The P62/ $\overline{\text{SRDY1}}$ /AN8, P64/INT4/SBUSY1/AN10, and P65/SSTB1/AN11 pins each select either I/O port or handshake I/O signal by the serial I/O1 synchronous clock selection bits (b2 and b3 of address 001916) of serial I/O1 control register 1 as well as the P62/ $\overline{\text{SRDY1}}$ • P64/SBUSY1 pin control bits (b0 to b3 of address 001A16) of serial I/O1 control register 2.

For the SOUT1 being used as an output pin, either CMOS output or N-channel open-drain output is selected by the P51/SOUT1 P-channel output disable bit (b7 of address 001A16) of serial I/O1 control register 2.

Either output active or high-impedance can be selected as a SOUT1 pin state at serial non-transfer by the SOUT1 pin control bit (b6 of address 001A16) of serial I/O1 control register 2. However, when the external synchronous clock is selected, perform the following setup to put the SOUT1 pin into a high-impedance state.

When the SCLK1 input is "H" after completion of transfer, set the SOUT1 pin control bit to "1."

When the SCLK1 input goes to "L" after the start of the next serial transfer, the SOUT1 pin control bit is automatically reset to "0" and put into an output active state.

Regardless of whether the internal synchronous clock or external synchronous clock is selected, the full duplex mode and the transmit-only mode are available for serial transfer, one of which is selected by the transfer mode selection bit (b5 of address 001916) of serial I/O1 control register 1.

Either LSB first or MSB first is selected for the I/O sequence of the serial transfer bit strings by the transfer direction selection bit (b6 of address 001916) of serial I/O1 control register 1.

When using serial I/O1, first select either 8-bit serial I/O or automatic transfer serial I/O by the serial transfer selection bits (b0 and b1 of address 001916) of serial I/O1 control register 1, after completion of the above bit setup. Next, set the serial I/O initialization bit (b4 of address 001916) of serial I/O1 control register 1 to "1" (Serial I/O enable) .

When stopping serial transfer while data is being transferred, regardless of whether the internal or external synchronous clock is selected, reset the serial I/O initialization bit (b4) to "0."

Fig. 21 Structure of Serial I/O1 Control Register 3

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

(2) 8-bit Serial I/O Mode

Address 001B16 is assigned to the serial I/O1 register. When the internal synchronous clock is selected, a serial transfer of the 8-bit serial I/O is started by a write signal to the serial I/O1 register (address 001B16). The serial transfer status flag (b5 of address 001A16) of serial I/O1 control register 2 indicates the shift register status of serial I/O1, and is set to "1" by writing into the serial I/O1 register, which becomes a transfer start trigger and reset to "0" after completion of 8-bit transfer. At the same time, a serial I/O1 interrupt request occurs. When the external synchronous clock is selected, the contents of the serial I/O1 register are continuously shifted while transfer clocks are input to SCLK1. Therefore, the clock needs to be controlled externally.

(3) Automatic Transfer Serial I/O Mode

The serial I/O1 automatic transfer controller controls the write and read operations of the serial I/O1 register, so the function of address 001B16 is used as a transfer counter (1-byte units). When performing serial transfer through the serial I/O automatic transfer RAM (addresses 0F0016 to 0FFF16), it is necessary to set the serial I/O1 automatic transfer data pointer (address 001816) beforehand. Input the low-order 8 bits of the first data store address to be serially transferred to the automatic transfer data pointer set bits. When the internal synchronous clock is selected, the transfer interval for each 1-byte data can be set by the automatic transfer interval set bits (b0 to b4 of address 001C16) of serial I/O1 control register 3 in the following cases:

1. When using no handshake signal
2. When using the SRDY1 output, SBUSY1 output, and SSTB1 output of the handshake signal independently
3. When using a combination of SRDY1 output and SSTB1 output or a combination of SBUSY1 output and SSTB1 output of the handshake signal

It is possible to select one of 32 different values, namely 2 to 33 cycles of the transfer clock, as a setting value. When using the SBUSY1 output and selecting the SBUSY1 output • SSTB1 output function selection bit (b4 of address 001A16) of serial I/O1 control register 2 as the signal for all transfer data, provided

that the automatic transfer interval setting is valid, a transfer interval is placed before the start of transmission/reception of the first data and after the end of transmission/reception of the last data. For SSTB1 output, regardless of the contents of the SBUSY1 output • SSTB1 output function selection bit (b4), the transfer interval for each 1-byte data is longer than the set value by 2 cycles. Furthermore, when using a combination of SBUSY1 output and SSTB1 output as a signal for all transfer data, the transfer interval after the end of transmission/reception of the last data is longer than the set value by 2 cycles. When the external synchronous clock is selected, automatic transfer interval setting is disabled. After completion of the above bit setup, if the internal synchronous clock is selected, automatic serial transfer is started by writing the value of "number of transfer bytes - 1" into the transfer counter (address 001B16). When the external synchronous clock is selected, write the value of "number of transfer bytes - 1" into the transfer counter and input an internal system clock interval of 5 cycles or more. After that, input transfer clock to SCLK1. As a transfer interval for each 1-byte data transfer, input an internal system clock interval of 5 cycles or more from the clock rise time of the last bit. Regardless of whether the internal or external synchronous clock is selected, the automatic transfer data pointer and the transfer counter are decremented after each 1-byte data is received and then written into the automatic transfer RAM. The serial transfer status flag (b5 of address 001A16) is set to "1" by writing data into the transfer counter. Writing data becomes a transfer start trigger, and the serial transfer status flag is reset to "0" after the last data is written into the automatic transfer RAM. At the same time, a serial I/O1 interrupt request occurs. The values written in the automatic transfer data pointer set bits (b0 to b7 of address 001816) and the automatic transfer interval set bits (b0 to b4 of address 001C16) are held in the latch. When data is written into the transfer counter, the values latched in the automatic transfer data pointer set bits (b0 to b7) and the automatic transfer interval set bits (b0 to b4) are transferred to the decrement counter.

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

Fig. 23 Automatic Transfer Serial I/O Operation

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

(4) Handshake Signal

1. S_{STB1} output signal

The S_{STB1} output is a signal to inform an end of transmission/reception to the serial transfer destination. The S_{STB1} output signal can be used only when the internal synchronous clock is selected. In the initial status, namely, in the status in which the serial I/O initialization bit (b4) is reset to "0," the S_{STB1} output goes to "L," or the $\overline{S_{STB1}}$ output goes to "H."

At the end of transmit/receive operation, when the data of the serial I/O1 register is all output from S_{OUT1}, pulses are output in the period of 1 cycle of the transfer clock so as to cause the S_{STB1} output to go "H" or the $\overline{S_{STB1}}$ output to go "L." After that, each pulse is returned to the initial status in which S_{STB1} output goes to "L" or the $\overline{S_{STB1}}$ output goes to "H."

Furthermore, after 1 cycle, the serial transfer status flag (b5) is reset to "0."

In the automatic transfer serial I/O mode, whether the S_{STB1} output is to be active at an end of each 1-byte data or after completion of transfer of all data can be selected by the S_{BUSY1} output • S_{STB1} output function selection bit (b4 of address 001A₁₆) of serial I/O1 control register 2.

Fig. 24 S_{STB1} Output Operation

2. S_{BUSY1} input signal

The S_{BUSY1} input is a signal which receives a request for a stop of transmission/reception from the serial transfer destination.

When the internal synchronous clock is selected, input an "H" level signal into the S_{BUSY1} input and an "L" level signal into the $\overline{S_{BUSY1}}$ input in the initial status in which transfer is stopped.

When starting a transmit/receive operation, input an "L" level signal into the S_{BUSY1} input and an "H" level signal into the $\overline{S_{BUSY1}}$ input in the period of 1.5 cycles or more of the transfer clock. Then, transfer clocks are output from the S_{CLK1} output.

When an "H" level signal is input into the S_{BUSY1} input and an "L" level signal into the $\overline{S_{BUSY1}}$ input after a transmit/receive operation is started, this transmit/receive operation are not stopped immediately and the transfer clocks from the S_{CLK1} output is not stopped until the specified number of bits are transmitted and received.

The handshake unit of the 8-bit serial I/O is 8 bits and that of the automatic transfer serial I/O is 8 bits.

Fig. 25 S_{BUSY1} Input Operation (internal synchronous clock)

When the external synchronous clock is selected, input an "H" level signal into the S_{BUSY1} input and an "L" level signal into the $\overline{S_{BUSY1}}$ input in the initial status in which transfer is stopped. At this time, the transfer clocks to be input in S_{CLK1} become invalid.

During serial transfer, the transfer clocks to be input in S_{CLK1} become valid, enabling a transmit/receive operation, while an "L" level signal is input into the S_{BUSY1} input and an "H" level signal is input into the $\overline{S_{BUSY1}}$ input.

When changing the input values in the S_{BUSY1} input and the $\overline{S_{BUSY1}}$ input at these operations, change them when the S_{CLK1} input is in a high state.

When the high impedance of the S_{OUT1} output is selected by the S_{OUT1} pin control bit (b6), the S_{OUT1} output becomes active, enabling serial transfer by inputting a transfer clock to S_{CLK1}, while an "L" level signal is input into the S_{BUSY1} input and an "H" level signal is input into the $\overline{S_{BUSY1}}$ input.

Fig. 26 S_{BUSY1} Input Operation (external synchronous clock)

3. S_{BUSY1} output signal

The S_{BUSY1} output is a signal which requests a stop of transmission/reception to the serial transfer destination. In the automatic transfer serial I/O mode, regardless of the internal or external synchronous clock, whether the S_{BUSY1} output is to be active at transfer of each 1-byte data or during transfer of all data can be selected by the S_{BUSY1} output • S_{STB1} output function selection bit (b4).

In the initial status, the status in which the serial I/O initialization bit (b4) is reset to "0," the S_{BUSY1} output goes to "H" and the $\overline{S_{BUSY1}}$ output goes to "L."

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

When the internal synchronous clock is selected, in the 8-bit serial I/O mode and the automatic transfer serial I/O mode (SBUSY1 output function outputs in 1-byte units), the SBUSY1 output goes to "L" and the $\overline{\text{SBUSY1}}$ output goes to "H" before 0.5 cycle (transfer clock) of the timing at which the transfer clock from the SCLK1 output goes to "L" at a start of transmit/receive operation.

In the automatic transfer serial I/O mode (the SBUSY1 output function outputs all transfer data), the SBUSY1 output goes to "L" and the $\overline{\text{SBUSY1}}$ output goes to "H" when the first transmit data is written into the serial I/O1 register (address 001B16).

When the external synchronous clock is selected, the SBUSY1 output goes to "L" and the $\overline{\text{SBUSY1}}$ output goes to "H" when transmit

data is written into the serial I/O1 register to start a transmit operation, regardless of the serial I/O transfer mode.

At termination of transmit/receive operation, the SBUSY1 output returns to "H" and the $\overline{\text{SBUSY1}}$ output returns to "L", the initial status, when the serial transfer status flag is set to "0", regardless of whether the internal or external synchronous clock is selected.

Furthermore, in the automatic transfer serial I/O mode (SBUSY1 output function outputs in 1-byte units), the SBUSY1 output goes to "H" and the $\overline{\text{SBUSY1}}$ output goes to "L" each time 1-byte of receive data is written into the automatic transfer RAM.

Fig. 27 SBUSY1 Output Operation
 (internal synchronous clock, 8-bits serial I/O)

Fig. 28 SBUSY1 Output Operation
 (external synchronous clock, 8-bits serial I/O)

Fig. 29 SBUSY1 Output Operation in Automatic Transfer Serial I/O Mode
 (internal synchronous clock, SBUSY1 output function outputs each 1-byte)

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

4. SRDY1 output signal

The SRDY1 output is a transmit/receive enable signal which informs the serial transfer destination that transmit/receive is ready. In the initial status, when the serial I/O initialization bit (b4) is reset to "0," the SRDY1 output goes to "L" and the $\overline{\text{SRDY1}}$ output goes to "H". After transmitted data is stored in the serial I/O1 register (address 001B16) and a transmit/receive operation becomes ready, the SRDY1 output goes to "H" and the $\overline{\text{SRDY1}}$ output goes to "L". When a transmit/receive operation is started and the transfer clock goes to "L", the SRDY1 output goes to "L" and the $\overline{\text{SRDY1}}$ output goes to "H".

5. SRDY1 input signal

The SRDY1 input signal becomes valid only when the SRDY1 input and the SBUSY1 output are used. The SRDY1 input is a signal for receiving a transmit/receive ready completion signal from the serial transfer destination.

When the internal synchronous clock is selected, input a low level signal into the SRDY1 input and a high level signal into the $\overline{\text{SRDY1}}$ input in the initial status in which the transfer is stopped.

When an "H" level signal is input into the SRDY1 input and an "L" level signal is input into the $\overline{\text{SRDY1}}$ input for a period of 1.5 cycles or more of transfer clock, transfer clocks are output from the SCLK1 output and a transmit/receive operation is started.

After the transmit/receive operation is started and an "L" level signal is input into the SRDY1 input and an "H" level signal into the $\overline{\text{SRDY1}}$ input, this operation cannot be immediately stopped.

After the specified number of bits are transmitted and received, the transfer clocks from the SCLK1 output is stopped. The handshake unit of the 8-bit serial I/O and that of the automatic transfer serial I/O are of 8 bits.

When the external synchronous clock is selected, the SRDY1 input becomes one of the triggers to output the SBUSY1 signal.

To start a transmit/receive operation (SBUSY1 output: "L," $\overline{\text{SBUSY1}}$ output: "H"), input an "H" level signal into the SRDY1 input and an "L" level signal into the $\overline{\text{SRDY1}}$ input, and also write transmit data into the serial I/O1 register.

●Serial I/O2

Serial I/O2 can be used as either clock synchronous or asynchronous (UART) serial I/O. A dedicated timer (baud rate generator) is also provided for baud rate generation during serial I/O2 operation.

(1) Clock Synchronous Serial I/O Mode

The clock synchronous serial I/O mode can be selected by setting the serial I/O2 mode selection bit (b6) of the serial I/O2 control reg-

ister (address 001D16) to "1." For clock synchronous serial I/O, the transmitter and the receiver must use the same clock for serial I/O2 operation. If an internal clock is used, transmit/receive is started by a write signal to the serial I/O2 transmit/receive buffer register (TB/RB) (address 001F16).

When P57 (SCLK22) is selected as a clock I/O pin, $\overline{\text{SRDY2}}$ output function is invalid, and P56 (SCLK21) is used as an I/O port.

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

(2) Asynchronous Serial I/O (UART) Mode

The asynchronous serial I/O (UART) mode can be selected by clearing the serial I/O2 mode selection bit (b6) of the serial I/O2 control register (address 001D₁₆) to "0." Eight serial data transfer formats can be selected and the transfer formats used by the transmitter and receiver must be identical.

The transmit and receive shift registers each have a buffer (the two buffers have the same address in memory). Since the shift register cannot be written to or read from directly, transmit data is written to the transmit buffer, and receive data is read from the receive buffer. The transmit buffer can also hold the next data to be transmitted, and the receive buffer can receive 2-byte data continuously.

Fig. 37 Operation of UART Serial I/O2 Function

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

[Serial I/O2 Control Register] SIO2CON (001D16)

The serial I/O2 control register contains eight control bits for serial I/O2 functions.

[UART Control Register] UARTCON (001716)

This is a 5 bit register containing four control bits (b0 to b3), which are valid when UART is selected and set the data format of data receive/transfer, and one control bit (b4), which is always valid and sets the output structure of the P5s/TxD pin.

[Serial I/O2 Status Register] SIO2STS (001E16)

The read-only serial I/O2 status register consists of seven flags (b0 to b6) which indicate the operating status of the serial I/O2 function and various errors. Three of the flags (b4 to b6) are only valid in the UART mode. The receive buffer full flag (b1) is cleared to "0" when the receive buffer is read.

The error detection is performed at the same time data is transferred from the receive shift register to the receive buffer register, and the receive buffer full flag is set. A writing to the serial I/O2 status register clears error flags OE, PE, FE, and SE (b3 to b6, respectively).

Writing "0" to the serial I/O2 enable bit (SIOE : b7 of the serial I/O2 control register) also clears all the status flags, including the error flags.

All bits of the serial I/O2 status register are initialized to "0" at reset, but if the transmit enable bit (b4) of the serial I/O2 control register has been set to "1," the transmit shift register shift completion flag (b2) and the transmit buffer empty flag (b0) become "1."

[Serial I/O2 Transmit Buffer Register/Receive Buffer Register] TB/RB (001F16)

The transmit buffer and the receive buffer are located in the same address. The transmit buffer is write-only and the receive buffer is read-only. If a character bit length is 7 bits, the MSB of data stored in the receive buffer is "0".

[Baud Rate Generator] BRG (001616)

The baud rate generator determines the baud rate for serial transfer. With the 8-bit counter having a reload register, the baud rate generator divides the frequency of the count source by 1/(n+1), where n is the value written to the baud rate generator.

 Some parametric limits are subject to change.

FLD Controller

The 38B5 group has fluorescent display (FLD) drive and control circuits.

The FLD controller consists of the following components:

- 40 pins for FLD control pins
 - FLDC mode register
 - FLD data pointer
 - FLD data pointer reload register
 - Tdisp time set register
 - Toff1 time set register
 - Toff2 time set register
 - Port P0FLD/port switch register
 - Port P2FLD/port switch register
 - Port P8FLD/port switch register
 - Port P8 FLD output control register
 - FLD automatic display RAM (max. 160 bytes)
- A gradation display mode can be used for bright/dark display as a display function.

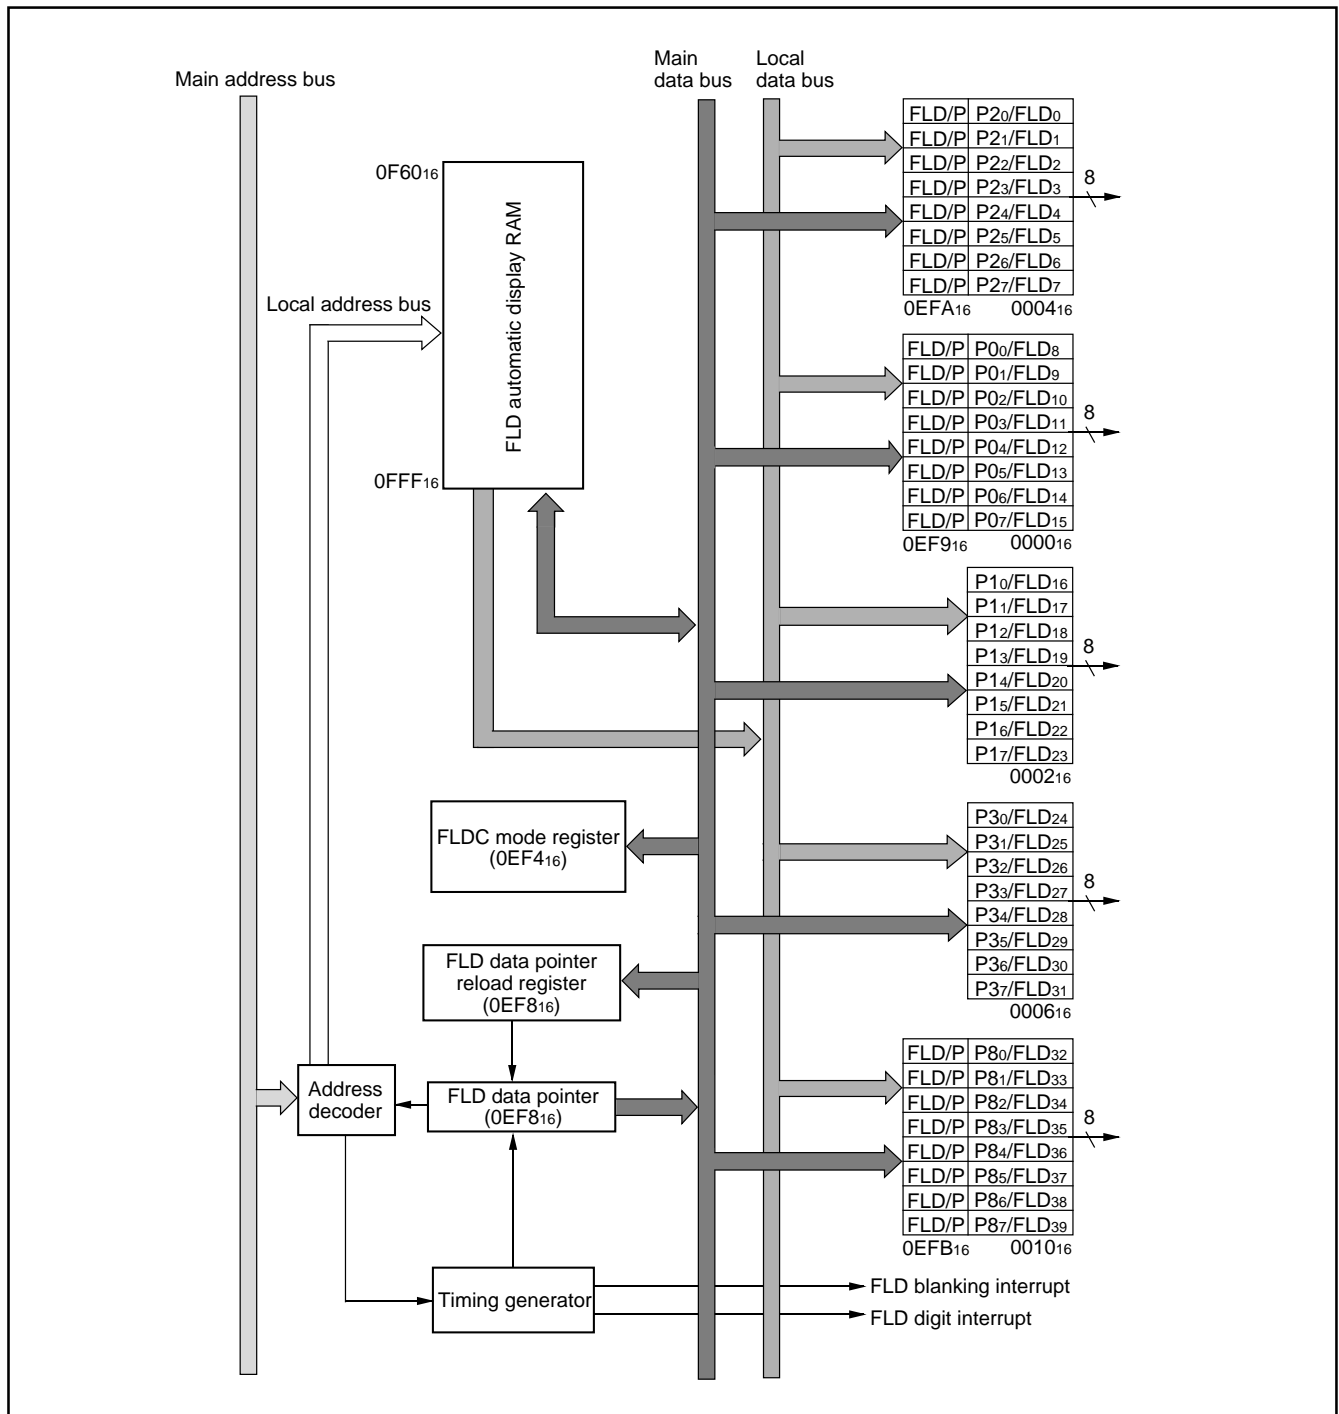

Fig. 39 Block Diagram for FLD Control Circuit

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

[FLDC Mode Register] FLDM

The FLDC mode register is a 8-bit register respectively which is used to control the FLD automatic display and to set the blanking time Tscan for key-scan.

Fig. 40 Structure of FLDC Mode Register

PRELIMINARY
 Notice: This is not a final specification.

FLD automatic display pins

When the automatic display control bits of the FLDC mode register (address 0EF4₁₆) are set to “1,” the ports of P0, P1, P2, P3 and P8 are used as FLD automatic display pins.

When using the FLD automatic display mode, set each port to the FLD pin or the general-purpose port using the respective switch register in accordance with the number of segments and the number of digits.

This setting is performed by writing a value into the FLD/port switch register (addresses 0EF9₁₆ to 0EFB₁₆) of each port.

This setting can be performed in units of bit. When “0” is set, the port is set to the general-purpose port. When “1” is set, the port is set to the FLD pin. There is no restriction on whether the FLD pin is to be used as a segment pin or a digit pin.

Table 7 Pins in FLD Automatic Display Mode

Port Name	Automatic Display Pins	Setting Method
P0, P2, P80–P83	FLD ₀ –FLD ₁₅ FLD ₃₂ –FLD ₃₅	The individual bits of the FLD/port switch register (addresses 0EF9 ₁₆ –0EFB ₁₆) can be set each pin either FLD port (“1”) or general-purpose port (“0”).
P1, P3	FLD ₁₆ –FLD ₃₁	None (FLD only)
P84–P87	FLD ₃₆ –FLD ₃₉	The individual bits of the FLD/port switch register (address 0EFB ₁₆) can be set each pin to either FLD port (“1”) or general-purpose port (“0”). The output can be reversed by the port P8 FLD output control register (address 0EFC ₁₆). The port output format is the CMOS output format. When using the port as a display pin, a driver must be installed externally.

Fig. 41 Segment/Digit Setting Example

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

FLD automatic display RAM

The FLD automatic display RAM uses the 160 bytes of addresses 0F60₁₆ to 0FFF₁₆. For FLD, the 3 modes of 16-timing ordinary mode, 16-timing gradation display mode and 32-timing mode are available depending on the number of timings and the presence/absence of gradation display.

The automatic display RAM in each mode is as follows:

(1) 16-timing Ordinary Mode

The 80 bytes of addresses 0FB0₁₆ to 0FFF₁₆ are used as a FLD display data store area. Because addresses 0F60₁₆ to 0FAF₁₆ are not used as the automatic display RAM, they can be the ordinary RAM or serial I/O automatic reverse RAM.

(2) 16-timing Gradation Display Mode

The 160 bytes of addresses 0F60₁₆ to 0FFF₁₆ are used. The 80 bytes of addresses 0FB0₁₆ to 0FFF₁₆ are used as an FLD display data store area, while the 80 bytes of addresses 0F60₁₆ to 0FAF₁₆ are used as a gradation display control data store area.

(3) 32-timing Mode

The 160 bytes of addresses 0F60₁₆ to 0FFF₁₆ are used as an FLD display data store area.

[FLD Data Pointer and FLD Data Pointer Reload Register] FLDDP (0EF8₁₆)

Both the FLD data pointer and FLD data pointer reload register are 8-bit registers assigned at address 0EF8₁₆. When writing data to this address, the data is written to the FLD data pointer reload register; when reading data from this address, the value in the FLD data pointer is read.

Fig. 42 FLD Automatic Display RAM Assignment

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

Data setup

(1) 16-timing•Ordinary Mode

The area of addresses 0FB0₁₆ to 0FFF₁₆ are used as a FLD automatic display RAM.

When data is stored in the FLD automatic display RAM, the last data of FLD port P2 is stored at address 0FB0₁₆, the last data of FLD port P0 is stored at address 0FC0₁₆, the last data of FLD port P1 is stored at address 0FD0₁₆, the last data of FLD port P3 is stored at address 0FE0₁₆, and the last data of FLD port P8 is stored at address 0FF0₁₆, to assign in sequence from the last data respectively.

The first data of the FLD port P2, P0, P1, P3, and P8 is stored at an address which adds the value of (the timing number – 1) to the corresponding address 0FB0₁₆, 0FC0₁₆, 0FD0₁₆, 0FE0₁₆, and 0FF0₁₆.

Set the FLD data pointer reload register to the value given by the number of digits – 1. "1" is always written to bit 6, and "0" is always written to bit 5. Note that "0" is always read from bits 6 and 5 when reading.

(2) 16-timing•Gradation Display Mode

Display data setting is performed in the same way as that of the 16-timing•ordinary mode. Gradation display control data is arranged at an address resulting from subtracting 0050₁₆ from the display data store address of each timing and pin. Bright display is performed by setting "0," and dark display is performed by setting "1."

(3) 32-timing Mode

The area of addresses 0F60₁₆ to 0FFF₁₆ are used as a FLD automatic display RAM.

When data is stored in the FLD automatic display RAM, the last data of FLD port P2 is stored at address 0F60₁₆, the last data of FLD port P0 is stored at address 0F80₁₆, the last data of FLD port P1 is stored at address 0FA0₁₆, the last data of FLD port P3 is stored at address 0FC0₁₆, and the last data of FLD port P8 is stored at address 0FE0₁₆, to assign in sequence from the last data respectively.

The first data of the FLD port P2, P0, P1, P3, and P8 is stored at an address which adds the value of (the timing number – 1) to the corresponding address 0F60₁₆, 0F80₁₆, 0FA0₁₆, 0FC0₁₆, and 0FE0₁₆.

Set the FLD data pointer reload register to the value given by the number of digits–1. "1" is always written to bit 6, and "0" is always written to bit 5. Note that "0" is always read from bits 6 and 5 when reading.

Digit data protect function

The FLD automatic display RAM is provided with a data protect function that disables the RAM area data to be rewritten as digit data.

This function can disable data from being written in optional bits in the RAM area corresponding to P1 to P3. A programming load can be reduced by protecting an area that requires no change after data such as digit data is written.

Write digit data beforehand; then set "1" in the corresponding bits. With this, the setting is completed.

The data protect area becomes the maximum RAM area of P1 and P3. For example, when bit 0 of P1 is protected in the 16-timing ordinary mode, bits 0 of RAM addresses 0FD0₁₆ to 0FDF₁₆ can be protected. Likewise, in the 16-timing gradation display mode, bits 0 of addresses 0FD0₁₆ to 0FDF₁₆ and 0F80₁₆ to 0F8F₁₆ can be protected. In the 32-timing mode, bits 0 of addresses 0FA0₁₆ to 0FBF₁₆ can be protected.

 Notice: This is not a final specification.
 Some parametric limits are subject to change.

Setting method when using the grid scan type FLD

When using the grid scan type FLD, set "1" in the RAM area corresponding to the digit ports that output "1" at each timing. Set "0" in the RAM area corresponding to the other digit ports.

Fig. 47 Example of Digit Timing Using Grid Scan Type

Fig. 48 Example of Using the FLD Automatic Display RAM Using Grid Scan Type

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

Timing setting

Each timing is set by the FLDC mode register, Tdisp time set register, Toff1 time set register, and Toff2 time set register.

•Tdisp time setting

Set the Tdisp time by the Tdisp counter count source selection bit of the FLDC mode register and the Tdisp time set register. Supposing that the value of the Tdisp time set register is n, the Tdisp time is represented as $T_{disp} = (n+1) \times t$ (t: count source synchronization).

When the Tdisp counter count source selection bit of the FLDC mode register is "0" and the value of the Tdisp time set register is 200 (C8₁₆), the Tdisp time is: $T_{disp} = (200+1) \times 4$ (at $X_{IN} = 4$ MHz) = 804 μ s. When reading the Tdisp time set register, the value in the counter is read out.

•Toff1 time setting

Set the Toff1 time by the Toff1 time set register.

Supposing that the value of the Toff1 time set register is n1, the Toff1 time is represented as $T_{off1} = n1 \times t$.

When the Tdisp counter count source selection bit of the FLDC mode register is "0" and the value of the Toff1 time set register is 30 (1E₁₆), $T_{off1} = 30 \times 4$ (at $X_{IN} = 4$ MHz) = 120 μ s.

•Toff2 time setting

Set the Toff2 time by the Toff2 time set register.

Supposing that the value of the Toff2 time set register is n2, the Toff2 time is represented as $T_{off2} = n2 \times t$.

When the Tdisp counter count source selection bit of the FLDC mode register is "0" and the value of the Toff2 time set register is 180 (B4₁₆), $T_{off2} = 180 \times 4$ (at $X_{IN} = 4$ MHz) = 720 μ s.

This Toff2 time setting is valid only for FLD ports which are in the gradation display mode and whose gradation display control RAM value is "1."

FLD automatic display start

To perform FLD automatic display, set the following registers.

- Port P0FLD/port switch register
- Port P2FLD/port switch register
- Port P8FLD/port switch register
- FLDC mode register
- Tdisp time set register
- Toff1 time set register
- Toff2 time set register
- FLD data pointer

FLD automatic display mode is selected by writing "1" to the bit 0 of the FLDC mode register (address 0EF4₁₆), and the automatic display is started by writing "1" to bit 1. During FLD automatic display, bit 1 of the FLDC mode register (address 0EF4₁₆) always keeps "1," and FLD automatic display can be interrupted by writing "0" to bit 1.

Key-scan

When a key-scan is performed with the segment during key-scan blanking period Tscan, take the following sequence:

1. Write "0" to bit 0 of the FLDC mode register (address 0EF4₁₆).
2. Set the port corresponding to the segment for key-scan to the output port.
3. Perform the key-scan.
4. After the key-scan is performed, write "1" to bit 0 of FLDC mode register (address 0EF4₁₆).

■ Note

When performing a key-scan according to the above steps 1 to 4, take the following points into consideration.

1. Do not set "0" in bit 1 of the FLDC mode register (address 0EF4₁₆).
2. Do not set "1" in the ports corresponding to digits.

P84 to P87 FLD Output Reverse Function

P84 to P87 are provided with a function to reverse the polarity of the FLD output. This function is useful in adjusting the polarity when using an externally installed driver.

The output polarity can be reversed by setting bit 0 of the port P8 FLD output control register to "1."

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

A-D Converter

The 38B5 group has a 10-bit A-D converter. The A-D converter performs successive approximation conversion.

[A-D Conversion Register] AD

One of these registers is a high-order register, and the other is a low-order register. The high-order 8 bits of a conversion result is stored in the A-D conversion register (high-order) (address 0034₁₆), and the low-order 2 bits of the same result are stored in bit 7 and bit 6 of the A-D conversion register (low-order) (address 0033₁₆). During A-D conversion, do not read these registers.

[A-D Control Register] ADCON

This register controls A-D converter. Bits 3 to 0 are analog input pin selection bits. Bit 4 is an AD conversion completion bit and "0" during A-D conversion. This bit is set to "1" upon completion of A-D conversion.

A-D conversion is started by setting "0" in this bit.

[Comparison Voltage Generator]

The comparison voltage generator divides the voltage between AV_{SS} and V_{REF}, and outputs the divided voltages.

[Channel Selector]

The channel selector selects one of the input ports P7₇/AN₇–P7₀/AN₀, and P6₅/SSTB₁/AN₁₁–P6₂/SRDY₁/AN₈ and inputs it to the comparator.

When port P6₄ is selected as an analog input pin, an external interrupt function (INT₄) is invalid.

[Comparator and Control Circuit]

The comparator and control circuit compares an analog input voltage with the comparison voltage and stores the result in the A-D conversion register. When an A-D conversion is completed, the control circuit sets the AD conversion completion bit and the AD

conversion interrupt request bit to "1."

Note that the comparator is constructed linked to a capacitor, so set f(X_{IN}) to at least 250 kHz during A-D conversion. Use a CPU system clock dividing the main clock X_{IN} as the internal system clock.

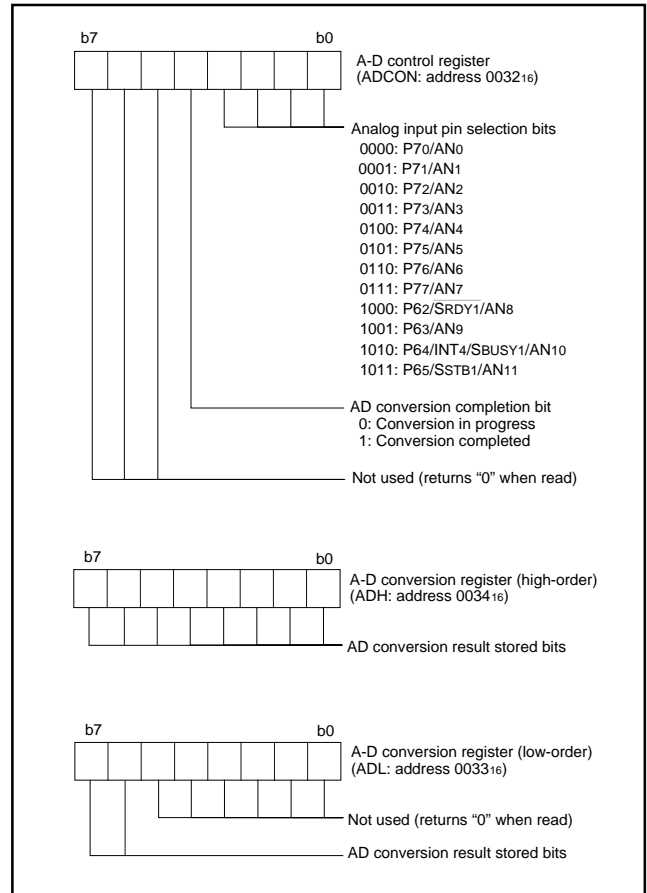

Fig. 51 Structure of A-D Control Register

Fig. 52 Block Diagram of A-D Converter

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

Pulse Width Modulation (PWM)

The 38B5 group has a PWM function with a 14-bit resolution. When the oscillation frequency X_{IN} is 4 MHz, the minimum resolution bit width is 250 ns and the cycle period is 4096 μ s. The PWM timing generator supplies a PWM control signal based on a signal that is the frequency of the X_{IN} clock.

The explanation in the rest of this data sheet assumes $X_{IN} = 4$ MHz.

Fig. 53 PWM Block Diagram

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

1. Data setup

The PWM output pin also function as port P87. Set port P87 to be the PWM output pin by setting bit 0 of the PWM control register (address 0026₁₆) to "1." The high-order 8 bits of output data are set in the high-order PWM register PWMH (address 0014₁₆) and the low-order 6 bits are set in the low-order PWM register PWML (address 0015₁₆).

2. PWM operation

The timing of the 14-bit PWM function is shown in Figure 56. The 14-bit PWM data is divided into the low-order 6 bits and the high-order 8 bits in the PWM latch. The high-order 8 bits of data determine how long an "H" level signal is output during each sub-period. There are 64 sub-periods in each period, and each sub-period t is $256 \times \tau$ ($= 64 \mu\text{s}$) long. The signal's "H" has a length equal to N times τ , and its minimum resolution = 250 ns. The last bit of the sub-period becomes the ADD bit which is specified either "H" or "L," by the contents of PWML. As shown in Table 8, the ADD bit is decided either "H" or "L." That is, only in the sub-period t_m shown in Table 8 in the PWM cycle period $T = 64t$, the "H" duration is lengthened during the minimum resolution width τ period in comparison with the other period. For example, if the high-order eight bits of the 14-bit data are "03₁₆" and the low-order six bits are "05₁₆," the length of the "H" level output in sub-periods $t_8, t_{24}, t_{32}, t_{40}$ and t_{56} is 4τ , and its length 3τ in all other sub-periods. Time at the "H" level of each sub-period almost becomes equal because the time becomes length set in the high-order 8 bits or becomes the value plus τ , and this sub-period t ($= 64 \mu\text{s}$, approximate 15.6 kHz) becomes cycle period approximately.

3. Transfer from register to latch

Data written to the PWML register is transferred to the PWM latch once in each PWM period (every 4096 μs), and data written to the PWMH register is transferred to the PWM latch once in each sub-period (every 64 μs). When the PWML register is read, the contents of the latch are read. However, bit 7 of the PWML register indicates whether the transfer to the PWM latch is completed; the transfer is completed when bit 7 is "0."

Table 8 Relationship between Low-order 6-bit Data and Setting Period of ADD Bit

Low-order 6-bit data	Sub-periods t_m lengthened ($m = 0$ to 63)
0 0 0 0 0 0	None
0 0 0 0 0 1	$m = 32$
0 0 0 0 1 0	$m = 16, 48$
0 0 0 1 0 0	$m = 8, 24, 40, 56$
0 0 1 0 0 0	$m = 4, 12, 20, 28, 36, 44, 52, 60$
0 1 0 0 0 0	$m = 2, 6, 10, 14, 18, 22, 26, 30, 34, 38, 42, 46, 50, 54, 58, 62$
1 0 0 0 0 0	$m = 1, 3, 5, 7, \dots, 57, 59, 61, 63$

Interrupt Interval Determination Function

The 38B5 group has an interrupt interval determination circuit. This interrupt interval determination circuit has an 8-bit binary up counter. Using this counter, it determines a duration of time from the rising edge (falling edge) of an input signal pulse on the P47/INT2 pin to the rising edge (falling edge) of the signal pulse that is input next. How to determine the interrupt interval is described below.

1. Enable the INT2 interrupt by setting bit 2 of the interrupt control register 1 (address 003E16). Select the rising interval or falling interval by setting bit 2 of the interrupt edge selection register (address 003A16).
2. Set bit 0 of the interrupt interval determination control register (address 003116) to "1" (interrupt interval determination operating).
3. Select the sampling clock of 8-bit binary up counter by setting bit 1 of the interrupt interval determination control register. When writing "0," $f(X_{IN})/128$ is selected (the sampling interval: 32 μ s at $f(X_{IN}) = 4.19$ MHz); when "1," $f(X_{IN})/256$ is selected (the sampling interval: 64 μ s at $f(X_{IN}) = 4.19$ MHz).
4. When the signal of polarity which is set on the INT2 pin (rising or falling edge) is input, the 8-bit binary up counter starts counting up of the selected counter sampling clock.
5. When the signal of polarity above 4 is input again, the value of the 8-bit binary up counter is transferred to the interrupt interval determination register (address 003016), and the remote control interrupt request occurs. Immediately after that, the 8-bit binary up counter continues to count up again from "0016."
6. When count value reaches "FF16," the 8-bit binary up counter stops counting up. Then, simultaneously when the next counter sampling clock is input, the counter sets value "FF16" to the interrupt interval determination register to generate the counter overflow interrupt request.

Noise filter

The P47/INT2 pin builds in the noise filter.

The noise filter operation is described below.

1. Select the sampling clock of the input signal with bits 2 and 3 of the interrupt interval determination control register. When not using the noise filter, set "00."
2. The P47/INT2 input signal is sampled in synchronization with the selected clock. When sampling the same level signal in a series of three samplings, the signal is recognized as the interrupt signal, and the interrupt request occurs.
 When setting bit 4 of interrupt interval determination control register to "1," the interrupt request can occur at both rising and falling edges.
 When using the noise filter, set the minimum pulse width of the INT2 input signal to 3 cycles or more of the sample clock.

Note: In the low-speed mode (CM7 = 1), the interrupt interval determination function cannot operate.

Watchdog Timer

The watchdog timer gives a mean of returning to the reset status when a program cannot run on a normal loop (for example, because of a software runaway). The watchdog timer consists of an 8-bit watchdog timer L and a 12-bit watchdog timer H.

Standard operation of watchdog timer

When any data is not written into the watchdog timer control register (address 002B16) after resetting, the watchdog timer is in the stop state. The watchdog timer starts to count down by writing an optional value into the watchdog timer control register (address 002B16) and an internal reset occurs at an underflow of the watchdog timer H. Accordingly, programming is usually performed so that writing to the watchdog timer control register (address 002B16) may be started before an underflow. When the watchdog timer control register (address 002B16) is read, the values of the 6 high-order bits of the watchdog timer H, STP instruction disable bit, and watchdog timer H count source selection bit are read.

(1) Initial value of watchdog timer

At reset or writing to the watchdog timer control register (address 002B16), a watchdog timer H is set to "FFF16" and a watchdog timer L to "FF16."

(2) Watchdog timer H count source selection bit operation

Bit 7 of the watchdog timer control register (address 002B16) permits selecting a watchdog timer H count source. When this bit is set to

"0," the underflow signal of watchdog timer L becomes the count source. The detection time is set then to $f(X_{IN}) = 2.1 \text{ s}$ at 4 MHz frequency and $f(X_{CIN}) = 512 \text{ s}$ at 32 kHz frequency.

When this bit is set to "1," the count source becomes the signal divided by 8 for $f(X_{IN})$ (or divided by 16 for $f(X_{CIN})$). The detection time in this case is set to $f(X_{IN}) = 8.2 \text{ ms}$ at 4 MHz frequency and $f(X_{CIN}) = 2 \text{ s}$ at 32 KHz frequency. This bit is cleared to "0" after resetting.

(3) Operation of STP instruction disable bit

Bit 6 of the watchdog timer control register (address 002B16) permits disabling the STP instruction when the watchdog timer is in operation.

When this bit is "0," the STP instruction is enabled.

When this bit is "1," the STP instruction is disabled.

Once the STP instruction is executed, an internal resetting occurs.

When this bit is set to "1," it cannot be rewritten to "0" by program. This bit is cleared to "0" after resetting.

Note

When releasing the stop mode, the watchdog timer performs its count operation even in the stop release waiting time. Be careful not to cause the watchdog timer H to underflow in the stop release waiting time, for example, by writing data in the watchdog timer control register (address 002B16) before executing the STP instruction.

 Some parametric limits are subject to change.

Buzzer Output Circuit

The 38B5 group has a buzzer output circuit. One of 1 kHz, 2 kHz and 4 kHz (at $X_{IN} = 4.19$ MHz) frequencies can be selected by the buzzer output control register (address $0EFD_{16}$). Either P4₃/BUZ₀₁ or P2₀/BUZ₀₂/FLD₀ can be selected as a buzzer output port by the output port selection bits (b2 and b3 of address $0EFD_{16}$).

The buzzer output is controlled by the buzzer output ON/OFF bit (b4).

 Notice: This is not a final specification.
 Some parametric limits are subject to change.

SINGLE-CHIP 8-BIT CMOS MICROCOMPUTER

Reset Circuit

To reset the microcomputer, $\overline{\text{RESET}}$ pin should be held at an "L" level for 2 μs or more. Then the $\overline{\text{RESET}}$ pin is returned to an "H" level (the power source voltage should be between 2.7 V and 5.5 V, and the oscillation should be stable), reset is released. After the reset is completed, the program starts from the address contained in address FFFD_{16} (high-order byte) and address FFFC_{16} (low-order byte). Make sure that the reset input voltage is less than 0.5 V for V_{CC} of 2.7 V (switching to the high-speed mode, a power source voltage must be between 4.0 V and 5.5 V).

X: Not fixed

Since the initial values for other than above mentioned registers and RAM contents are indefinite at reset, they must be set.

Fig. 67 Internal Status at Reset

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

Clock Generating Circuit

The 38B5 group has two built-in oscillation circuits. An oscillation circuit can be formed by connecting a resonator between X_{IN} and X_{OUT} (X_{CIN} and X_{COU}T). Use the circuit constants in accordance with the resonator manufacturer's recommended values. No external resistor is needed between X_{IN} and X_{OUT} since a feedback resistor exists on-chip. However, an external feedback resistor is needed between X_{CIN} and X_{COU}T.

Immediately after power on, only the X_{IN} oscillation circuit starts oscillating, and X_{CIN} and X_{COU}T pins function as I/O ports.

●Frequency control

(1) Middle-speed mode

The internal system clock is the frequency of X_{IN} divided by 4. After reset, this mode is selected.

(2) High-speed mode

The internal system clock is the frequency of X_{IN}.

(3) Low-speed mode

The internal system clock is the frequency of X_{CIN} divided by 2.

■Note

If you switch the mode between middle/high-speed and low-speed, stabilize both X_{IN} and X_{CIN} oscillations. The sufficient time is required for the sub clock to stabilize, especially immediately after power on and at returning from stop mode. When switching the mode between middle/high-speed and low-speed, set the frequency on condition that $f(X_{IN}) > 3f(X_{CIN})$.

(4) Low power consumption mode

The low power consumption operation can be realized by stopping the main clock X_{IN} in low-speed mode. To stop the main clock, set bit 5 of the CPU mode register to "1." When the main clock X_{IN} is restarted (by setting the main clock stop bit to "0"), set enough time for oscillation to stabilize.

By clearing furthermore the X_{COU}T drivability selection bit (b3) of CPU mode register to "0," low power consumption operation of less than 200 μA ($f(X_{CIN}) = 32 \text{ kHz}$) can be realized by reducing the drivability between X_{CIN} and X_{COU}T. At reset or during STP instruction execution this bit is set to "1" and a strong drivability that has an easy oscillation start is set.

●Oscillation control

(1) Stop mode

If the STP instruction is executed, the internal system clock stops at an "H" level, and X_{IN} and X_{CIN} oscillators stop. Timer 1 is set to "FF₁₆" and timer 2 is set to "0₁₆."

Either X_{IN} divided by 8 or X_{CIN} divided by 16 is input to timer 1 as count source, and the output of timer 1 is connected to timer 2. The bits of the timer 12 mode register are cleared to "0." Set the interrupt enable bits of the timer 1 and timer 2 to disabled ("0") before executing the STP instruction. Oscillator restarts when an external interrupt is received, but the internal system clock is not supplied to the CPU until timer 1 underflows. This allows time for the clock circuit oscillation to stabilize.

(2) Wait mode

If the WIT instruction is executed, the internal system clock stops at an "H" level. The states of X_{IN} and X_{CIN} are the same as the state before executing the WIT instruction. The internal system clock restarts at reset or when an interrupt is received. Since the oscillator does not stop, normal operation can be started immediately after the clock is restarted.

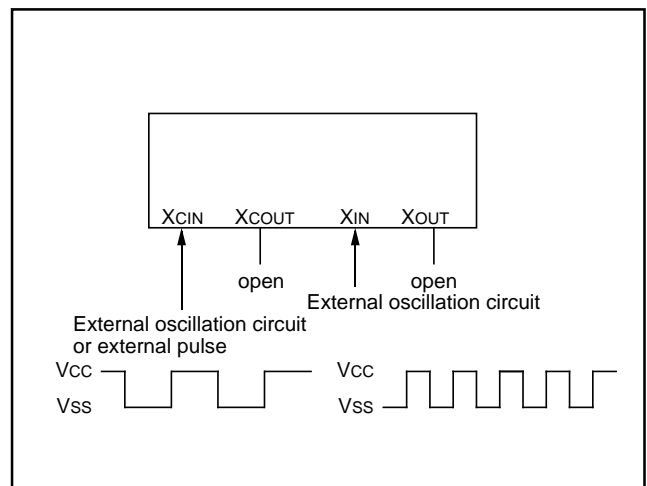

Fig. 69 External Clock Input Circuit

PRELIMINARY
Notice: This is not a final specification.
Some parametric limits are subject to change.

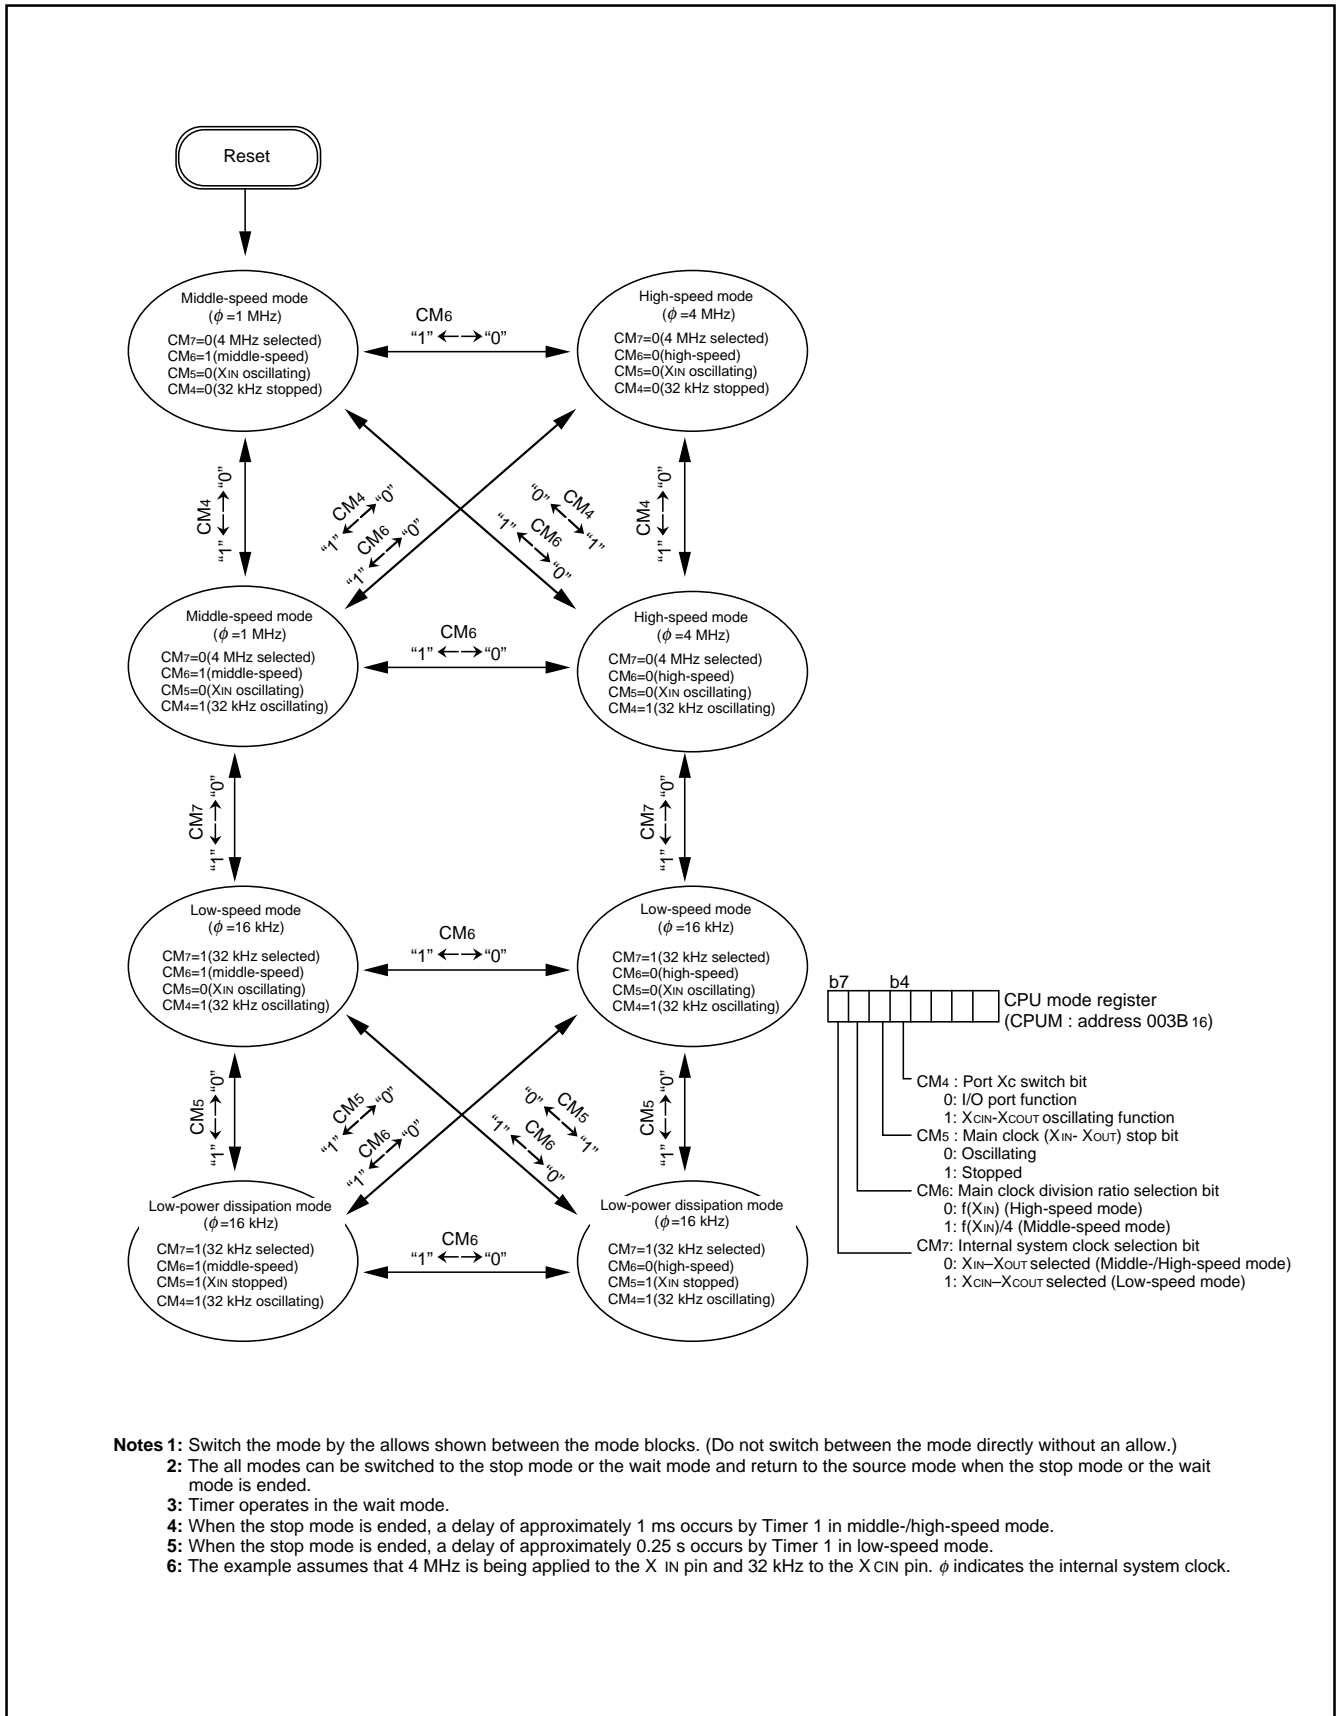

Fig. 70 Clock Generating Circuit Block Diagram

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

- Notes 1:** Switch the mode by the allows shown between the mode blocks. (Do not switch between the mode directly without an allow.)
2: The all modes can be switched to the stop mode or the wait mode and return to the source mode when the stop mode or the wait mode is ended.
3: Timer operates in the wait mode.
4: When the stop mode is ended, a delay of approximately 1 ms occurs by Timer 1 in middle-/high-speed mode.
5: When the stop mode is ended, a delay of approximately 0.25 s occurs by Timer 1 in low-speed mode.
6: The example assumes that 4 MHz is being applied to the X_{IN} pin and 32 kHz to the X_{CIN} pin. φ indicates the internal system clock.

 Some parametric limits are subject to change.

NOTES ON PROGRAMMING

Processor Status Register

The contents of the processor status register (PS) after a reset are undefined, except for the interrupt disable flag (I) which is "1." After a reset, initialize flags which affect program execution. In particular, it is essential to initialize the index X mode (T) and the decimal mode (D) flags because of their effect on calculations.

Interrupts

The contents of the interrupt request bits do not change immediately after they have been written. After writing to an interrupt request register, execute at least one instruction before performing a BBC or BBS instruction.

Decimal Calculations

- To calculate in decimal notation, set the decimal mode flag (D) to "1," then execute an ADC or SBC instruction. Only the ADC and SBC instructions yield proper decimal results. After executing an ADC or SBC instruction, execute at least one instruction before executing a SEC, CLC, or CLD instruction.
- In decimal mode, the values of the negative (N), overflow (V), and zero (Z) flags are invalid.

Timers

If a value n (between 0 and 255) is written to a timer latch, the frequency division ratio is $1/(n+1)$.

Multiplication and Division Instructions

- The index X mode (T) and the decimal mode (D) flags do not affect the MUL and DIV instruction.
- The execution of these instructions does not change the contents of the processor status register.

Ports

The contents of the port direction registers cannot be read. The following cannot be used:

- The data transfer instruction (LDA, etc.)
- The operation instruction when the index X mode flag (T) is "1"
- The addressing mode which uses the value of a direction register as an index
- The bit-test instruction (BBC or BBS, etc.) to a direction register
- The read-modify-write instructions (ROR, CLB, or SEB, etc.) to a direction register.

Use instructions such as LDM and STA, etc., to set the port direction registers.

Serial I/O

- Using an external clock

When using an external clock, input "H" to the external clock input pin and clear the serial I/O interrupt request bit before executing serial I/O transfer and serial I/O automatic transfer.

- Using an internal clock

When using an internal clock, set the synchronous clock to the internal clock, then clear the serial I/O interrupt request bit before executing a serial I/O transfer and serial I/O automatic transfer.

A-D Converter

The comparator uses internal capacitors whose charge will be lost if the clock frequency is too low.

Therefore, make sure that $f(X_{IN})$ is at least on 250 kHz during an A-D conversion.

Do not execute the STP or WIT instruction during an A-D conversion.

Instruction Execution Time

The instruction execution time is obtained by multiplying the frequency of the internal system clock by the number of cycles needed to execute an instruction.

The number of cycles required to execute an instruction is shown in the list of machine instructions.

The frequency of the internal system clock is the same of the X_{IN} frequency in high-speed mode.

At STP Instruction Release

At the STP instruction release, all bits of the timer 12 mode register are cleared.

The X_{COUT} drivability selection bit (the CPU mode register) is set to "1" (high drive) in order to start oscillating.

NOTES ON USE

Notes on Built-in EPROM Version

The P47 pin of the One Time PROM version or the EPROM version functions as the power source input pin of the internal EPROM.

Therefore, this pin is set at low input impedance, thereby being affected easily by noise.

To prevent a malfunction due to noise, insert a resistor (approx. 5 k Ω) in series with the P47 pin.

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

DATA REQUIRED FOR MASK ORDERS

The following are necessary when ordering a mask ROM production:

- (1) Mask ROM Order Confirmation Form
- (2) Mask Specification Form
- (3) Data to be written to ROM, in EPROM form (three identical copies)

ROM PROGRAMMING METHOD

The built-in PROM of the blank One Time PROM version and the EPROM version can be read or programmed with a general purpose PROM programmer using a special programming adapter. Set the address of PROM programmer in the user ROM area.

Table 9 Special Programming Adapter

Package	Name of Programming Adapter
80P6N-A	PCA7438F-80A
80D0	PCA7438L-80A

The PROM of the blank One Time PROM version is not tested or screened in the assembly process and following processes. To ensure proper operation after programming, the procedure shown in Figure 72 is recommended to verify programming.

—	Absolute accuracy (excluding quantization error)	$V_{CC} = V_{REF} = 5.12 V$		±1	±2.5	LSB
T _{CONV}	Conversion time		61		62	tc(φ)
I _{VREF}	Reference input current	$V_{REF} = 5.0 V$	50	150	200	μA
I _{IA}	Analog port input current			0.5	5.0	μA
RLADDER	Ladder resistor			35		kΩ

PRELIMINARY
 Notice: This is not a final specification.
 Some parametric limits are subject to change.

TIMING REQUIREMENTS

Table 16 Timing Requirements ($V_{CC} = 4.0$ to $5.5V$, $V_{SS} = 0V$, $T_a = -20$ to $85^\circ C$, unless otherwise noted)

Symbol	Parameter	Limits			Unit
		Min.	Typ.	Max.	
tw(RESET)	Reset input "L" pulse width	2.0			μs
tc(XIN)	Main clock input cycle time (XIN input)	238			ns
tWH(XIN)	Main clock input "H" pulse width	60			ns
tWL(XIN)	Main clock input "L" pulse width	60			ns
tc(XCIN)	Sub-clock input cycle time (XCIN input)	20			μs
tWH(XCIN)	Sub-clock input "H" pulse width	5.0			μs
tWL(XCIN)	Sub-clock input "L" pulse width	5.0			μs
tc(CNTR)	CNTR0, CNTR1 input cycle time	4.0			μs
tWH(CNTR)	CNTR0, CNTR1 input "H" pulse width	1.6			μs
tWL(CNTR)	CNTR0, CNTR1 input "L" pulse width	1.6			μs
tWH(INT)	INT0 to INT4 input "H" pulse width	80			ns
tWL(INT)	INT0 to INT4 input "L" pulse width	80			ns
tc(SCLK)	Serial I/O clock input cycle time	0.95			μs
tWH(SCLK)	Serial I/O clock input "H" pulse width	400			ns
tWL(SCLK)	Serial I/O clock input "L" pulse width	400			ns
tsu(SCLK-SIN)	Serial I/O input set up time	200			ns
th(SCLK-SIN)	Serial I/O input hold time	200			ns

SWITCHING CHARACTERISTICS

Table 17 Switching Characteristics ($V_{CC} = 4.0$ to $5.5V$, $V_{SS} = 0V$, $T_a = -20$ to $85^\circ C$, unless otherwise noted)

Symbol	Parameter	Test conditions	Limits			Unit
			Min.	Typ.	Max.	
tWH(SCLK)	Serial I/O clock output "H" pulse width	$C_L = 100$ pF	$t_c(SCLK)/2-160$			ns
tWL(SCLK)	Serial I/O clock output "L" pulse width	$C_L = 100$ pF	$t_c(SCLK)/2-160$			ns
td(SCLK-SOUT)	Serial I/O output delay time				$0.2 t_c$	ns
tv(SCLK-SOUT)	Serial I/O output valid time		0			ns
tr(SCLK)	Serial I/O clock output rising time	$C_L = 100$ pF			40	ns
tf(SCLK)	Serial I/O clock output falling time	$C_L = 100$ pF			40	ns
tr(Pch-strg)	P-channel high-breakdown voltage output rising time (Note 1)	$C_L = 100$ pF $V_{EE} = V_{CC}-43$ V		55		ns
tr(Pch-weak)	P-channel high-breakdown voltage output rising time (Note 2)	$C_L = 100$ pF $V_{EE} = V_{CC}-43$ V		1.8		μs

Notes 1: When bit 7 of the FLDC mode register (address 0EF416) is at "0".
2: When bit 7 of the FLDC mode register (address 0EF416) is at "1".

Keep safety first in your circuit designs!

- Mitsubishi Electric Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of non-flammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

- These materials are intended as a reference to assist our customers in the selection of the Mitsubishi semiconductor product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Mitsubishi Electric Corporation or a third party.
- Mitsubishi Electric Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts or circuit application examples contained in these materials.
- All information contained in these materials, including product data, diagrams and charts, represent information on products at the time of publication of these materials, and are subject to change by Mitsubishi Electric Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for the latest product information before purchasing a product listed herein.
- Mitsubishi Electric Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
- The prior written approval of Mitsubishi Electric Corporation is necessary to reprint or reproduce in whole or in part these materials.
- If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.
Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
- Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for further details on these materials or the products contained therein.
