DA16200MOD Datasheet

General Description

The DA16200MOD is a fully integrated Wi-Fi® module with ultra-low power consumption, best RF performance and easy development environment. Such low power operation can extend the battery life as longer as a year or more depending on the application.

This module series included DA16200-00000A32, 40 MHz crystal oscillator, 32.768 KHz RTC clock, Lumped RF filter, 4-Mbyte flash memory and chip antenna or u.FL connector. The DA16200MOD has chip antenna type (DA16200MOD-AAC4WA32) and u.FL connector type (DA16200MOD-AAE4WA32) for external antenna.

The Module is built from the ground up for the Internet of Things (IoT) and is ideal for door locks, thermostats, sensors, pet trackers, asset trackers, sprinkler systems, connected lighting, video cameras, video doorbells, wearables and other IoT devices.

The modules certified Wi-Fi alliance for IEEE802.11b/g/n, Wi-Fi Direct, WPS functionalities and it has been approved by many countries including the United States (FCC), Canada (IC) and China (SRRC). Using the Wi-Fi Alliance transfer policy, the Wi-Fi Certifications can be transferred without being tested again. For more information on DA16200MOD, see DA16200-00000A32 datasheet.

5.8　Clock Electrical Characteristics

DA16200MOD has two clock sources, one is the 32.768 kHz clock used by the RTC block, and the other is the 40 MHz clock for the internal processor and Wi-Fi system. More specifically, the 40 MHz clock is used as a source clock for the internal PLL while the PLL output is used for the internal processor and Wi-Fi system block.

5.8.1　RTC Clock Source

The 32.768 kHz RTC clock source is necessary for the free-running counter in the RTC block. The RTC block of the SoC contains an internal 32.768 kHz RC oscillator as well, which is used as a clock for chip initialization before the external 32.768 kHz crystal reaches the stable time in the initial stage. It is necessary to convert it into an external clock for accurate clock counting after the initialization stage. This process is executed through the register setting.

5.8.2　Main Clock Source

DA16200MOD contains a crystal oscillator for the main clock source which supports the external crystal clock. Basically, the external clock is 40 MHz.

6 Power-on Sequence

The sequence after the initial switching from power-off to power-on is shown in Figure 5. The RTC_PWR_KEY of DA16200 is a pin that enables the RTC block. Once RTC_PWR_KEY is enabled after VBAT power is supplied, all the internal regulators are switched on automatically in the sequence pre-defined by the RTC block.

Once RTC_PWR_KEY is switched on, LDOs for both XTAL and digital I/O are switched on shortly and then the DC-DC regulator is switched on according to the pre-defined interval. The enabling intervals can also be modified in the register settings after initial power-up.
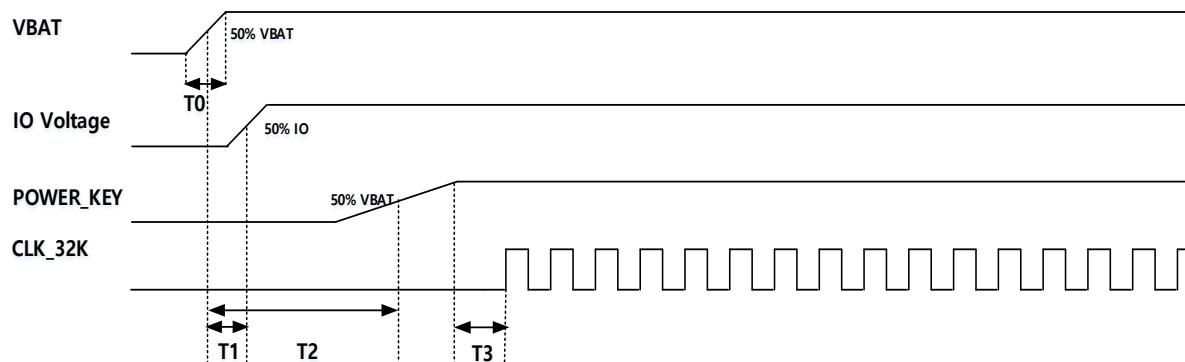

Figure 5: Power-on Sequence

Table 15: Power-on Sequence Timing Requirements

Name	Description	Min	Typ	Max	Unit
T0	VBAT power-on time from 10% to 90 % of VBAT	-		-	ms
T1	IO voltage and VCC supply	-	0	-	ms
T2	RTC_PWR_KEY switch-on time from 50% VBAT to 50% POWER_KEY * (Note 1)	-	5*T0	-	ms
T3	Internal RC oscillator wake-up time	-	217	-	µs

Note 1 If the T0 = 10 ms to switch on VBAT, the recommended T2 is 50 ms for the safe booting operation. It can be externally controlled by MCU or it can be implemented using RC filter at the input of RTC_PWR_KEY. The recommended C is 470 nF or 1 uF (not to exceed 1 uF) and R value is chosen to have T2 delay. For example, R and C values will be 82 kΩ and 1 uF when T0 = 10 ms.

Table 16: Component for RTC Power Key

Quantity	Part Reference	Value	Description
1	R1	470 kΩ	Remove when MCU control 'RTC_PWR_KEY'. This value should be chosen by customer application to achieve the enough delay time depending on the power-on time of VBAT.
1	C1	1 uF	Remove when MCU control 'RTC_PWR_KEY'. This value should be chosen by customer application to achieve the enough delay time depending on the power-on time of VBAT. Not to exceed 1 uF.

10 Soldering

Figure 13 shows the typical process flow for mounting surface mount packages to PCB.

The reflow profile depends on the solder paste being used and the recommendations from the paste manufacture should be followed to determine the proper reflow profile. Figure 14 shows a typical reflow profile when a no-clean paste is used. Oven time above liquidus (260 °C for lead-free solder) is 20 to 40 seconds.

The rework process involves the following steps:

- Component removal
- Site redress
- Solder paste application
- Component placement
- Component attachment
