

## High Current, Highly Configurable System PMIC

### General Description

DA9083 is a six-channel, advanced, system power management IC (PMIC) that integrates four buck converters, one LDO, and one load switch. This high current, integrated PMIC is ideal for Client and Enterprise SSD Modules, Hybrid Drives, and other memory management applications. Due to its highly configurable and flexible design, it supports a wide variety of other applications with integrated microcontrollers, DSPs, and FPGAs in embedded applications and a host of other Internet of Things (IoT) and consumer applications.

DA9083 includes many robust protection features, a dedicated I<sup>2</sup>C interface, and programmable output voltages. Dynamic voltage control (DVC) enables supply voltage controllability based on the application requirements. This PMIC is capable of achieving high efficiencies and fast transient responses to line and load changes while keeping the overall board space to a minimum. All of these features and functionality is offered in a compact 36-lead CSP package.

### Key Features

- Power supply voltage ( $V_{IN}$ ) 2.9 V to 5.5 V
- 4 buck converters
- Selectable output voltage range for all bucks:
  - 1.5 V to 2.7 V, 20 mV step
  - 0.55 V to 1.9 V, 10 mV step
- Maximum output current:
  - CH1, CH2, CH3 Bucks: 2.5 A
  - CH4 Buck: 5.0 A
- Interleaving of switching phases of bucks
- LDO:
  - $V_{OUT}$ : 1.4 V to 1.9 V, 20 mV step
  - $I_{OUT}$ : 0.1 A (max)
- Load switch (LSW)
  - $R_{DS\_ON}$ : 20 m $\Omega$  (typ)
  - Current limit at soft start: 100 mA
  - Current limit: 4 A
- Protection functions:
  - Over-current protection
  - Over/Under-voltage protection
  - Thermal shutdown protection
- I<sup>2</sup>C control interface:
  - Standard mode (100 kbit/s)
  - Fast mode (400 kbit/s)
  - Fast mode+ (1 Mbit/s)
  - High-speed mode (3.4 Mbit/s)

### Applications

- SSD (solid state drive) module
- Portable devices
- Home entertainment equipment

## High Current, Highly Configurable System PMIC

### 1 Terms and Definitions

CDM	Charged-Device Model
CH	Channel
DVC	Dynamic voltage control
ESD	Electrostatic discharge
HBM	Human Body Model
HPM	High Power mode
LPM	Low Power mode
OTP	One-time programmable
OVP	Over-voltage protection
POR	Power-on reset
PMIC	Power management integrated circuit
PWM	Pulse width modulation
PFM	Pulse frequency modulation
TSD	Thermal shut down
UVLO	Under-voltage lock out
UVP	Under-voltage protection

4 Pinout

Figure 3: WLCSP Pinout Diagram (Top View)

Table 1: Pin Description

Pin #	Pin Name	Type (Table 2)	Description
A1	PGND3	GND	CH3 DCDC buck converter ground
A2	LDOOUT	AO	LDO output, bypass to ground with ceramic capacitor
A3	VOUT	AO	Load Switch output
A4	VOUT	AO	Load Switch output
A5	VIN	PWR	Load Switch input
A6	VIN	PWR	Load Switch input
B1	LX3	AIO	CH3 DCDC buck converter switching node
B2	LDOIN	PWR	LDO input, bypass to ground with a ceramic capacitor

## High Current, Highly Configurable System PMIC

Pin #	Pin Name	Type (Table 2)	Description
B3	SCL	DI	I <sup>2</sup> C interface data, connect SCL to the logic rail through a pull-up resistor
B4	VOUT	AO	Load Switch output
B5	VIN	PWR	Load Switch input
B6	PGND1	GND	CH1 Buck converter power ground
C1	PVIN3	PWR	CH3 Buck converter input
C2	FB3	AI	CH3 Buck output voltage feedback connection
C3	POR	DOD	Power-on-Reset release output signal (Power Good), output open-drain
C4	SDA	DIOD	I <sup>2</sup> C interface data. Connect SDA to the logic rail through a pull-up resistor
C5	CH1SEL	DI	Reserved. Needs to be tied to ground
C6	LX1	AIO	CH1 Buck converter switching node
D1	PVIN4	PWR	CH4 Buck converter power
D2	VSEL	DI	Reserved. Needs to be tied to ground
D3	FB4	AI	CH4 Buck output voltage feedback connection
D4	AGND	GND	Quiet ground connection, Connect to a quiet ground area
D5	FB1	AI	CH1 Buck output voltage feedback connection
D6	PVIN1	PWR	CH1 Buck converter input
E1	LX4	AIO	CH4 Buck converter switching node
E2	LX4	AIO	CH4 Buck converter switching node
E3	PGND4	GND	CH4 Buck converter power ground
E4	PGND4	GND	CH4 Buck converter power ground
E5	FB2	AI	CH2 Buck output voltage feedback connection
E6	PVIN2	PWR	CH2 Buck converter input
F1	LX4	AIO	CH4 Buck converter switching node
F2	LX4	AIO	CH4 Buck converter switching node
F3	PGND4	GND	Power ground for the CH4 Buck converter
F4	PGND2	GND	Power ground for the CH2 Buck converter
F5	LX2	AIO	CH2 Buck converter switching node
F6	LX2	AIO	CH2 Buck converter switching node

**Table 2: Pin Type Definition**

Pin Type	Description	Pin Type	Description
DI	Digital input	AI	Analog input
DO	Digital output	AO	Analog output
DIOD	Digital input/output open drain	AIO	Analog input/output
DOD	Digital output open drain	GND	Ground
PWR	Power		

## High Current, Highly Configurable System PMIC

### 5 Characteristics

#### 5.1 Absolute Maximum Ratings

Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, so functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specification are not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

**Table 3: Absolute Maximum Ratings**

Parameter	Description	Conditions	Min	Max	Unit
T <sub>STG</sub>	Storage temperature		-60	150	°C
V <sub>SYS</sub>	System supply voltage	Referenced to AGND	-0.3	6	V
V <sub>PIN</sub>	All other terminals	Referenced to AGND	-0.3	6	V

#### 5.2 Electrostatic Discharge Ratings

**Table 4: Electrostatic Discharge Ratings**

Parameter	Description	Conditions	Value	Unit
ESD <sub>HBM</sub>	Maximum ESD protection	Human body model (HBM) All exposed pins	2	kV
ESD <sub>CDM</sub>	Maximum ESD protection	Charged device model (CDM)	0.5	kV

#### 5.3 Recommended Operating Conditions

**Table 5: Recommended Operating Conditions**

Parameter	Description	Conditions	Min	Typ	Max	Unit
T <sub>A</sub>	Operating ambient temperature		-40		85	°C
T <sub>J</sub>	Operating junction temperature		-40		125	°C
V <sub>IN</sub>	Input Supply voltage		2.9		5.5	V
V <sub>PIN</sub>	Voltage on pins		-0.3		V <sub>IN</sub> +0.3	V
V <sub>IO</sub>	IO voltage <a href="#">Note 1</a>	SDA and SCL		1.8		V

**Note 1** IO voltage is 3.3 V compatible as long as V<sub>IN</sub> is within the recommended operating range.

#### 5.4 Thermal Characteristics

**Table 6: Package Ratings**

Parameter	Description	Conditions	Min	Typ	Max	Unit
R <sub>θ_JA</sub>	Package thermal resistance <a href="#">Note 1</a>			28.6		°C/W
P <sub>D</sub>	Power dissipation	Derating factor above T <sub>A</sub> = 70°C, 35 mW/°C (1/R <sub>θ_JA</sub> )		2450		mW

## High Current, Highly Configurable System PMIC

**Note 1** Obtained from package thermal simulation, 4-layer board (JEDEC). Influenced by PCB technology and layout.

### 5.5 CH1 Buck Converter Characteristics

Unless otherwise noted, the following is valid for  $-40\text{ °C} \leq T_A \leq +85\text{ °C}$ ,  $2.9\text{ V} \leq V_{IN} \leq 5.5\text{ V}$ ,  $f_{sw} = 2\text{ MHz}$ .

**Table 7: CH1 Buck Converter Electrical Characteristics**

Parameter	Description	Conditions	Min	Typ	Max	Unit
<b>External electrical conditions</b>						
$V_{IN}$	Input voltage of power stage		2.7	3.3	5.5	V
$C_{OUT}$	Output capacitance, including voltage and temperature coefficient	Only local capacitor without decoupling capacitor at load side.	11	22	29	$\mu\text{F}$
$ESR_{COUT}$	Output capacitor series resistance	$f > 100\text{ kHz}$		3		$\text{m}\Omega$
L	Inductor value, including current and temperature dependence		0.23	0.47	0.61	$\mu\text{H}$
$DCR_L$	Inductor DC resistance			20	50	$\text{m}\Omega$
<b>Electrical performance</b>						
$I_{Q\_LPM}$	Quiescent current in Low Power mode (no switching)	$V_{IN} = 3.3\text{ V}$ $T_A = 27\text{ °C}$		18		$\mu\text{A}$
$I_{Q\_AUTO}$	Quiescent current in Auto mode (no switching)	$V_{IN} = 3.3\text{ V}$ $T_A = 27\text{ °C}$		42		$\mu\text{A}$
$f_{sw}$	Switching frequency		1.9	2	2.1	MHz
$V_{DROPOUT}$	Voltage drop from $PV_{IN}$ to $V_{OUT}$			1		V
$V_{OUT\_DIV}$	Range of output voltage with divider (OTP option), programmable in 20 mV steps.	$PV_{IN1} = 2.7\text{ V to } 5.5\text{ V}$	1.5		2.7	V
$V_{OUT\_NO\_DIV}$	Range of output voltage without divider (OTP option), programmable in 10 mV steps.	$PV_{IN1} = 2.7\text{ V to } 5.5\text{ V}$	0.5		1.9	V
$SR_{SS}$	Soft start slew rate			2.5		$\text{mV}/\mu\text{s}$
$V_{OUT\_ACC}$	Output voltage accuracy, including static line and load regulation	$V_{OUT} \geq 1\text{ V}$ $T_A = 27\text{ °C}$	-1		1	%
$V_{OUT\_ACC}$	Output voltage accuracy, including static line and load regulation	$V_{OUT} < 1\text{ V}$	-10		10	mV

## High Current, Highly Configurable System PMIC

Parameter	Description	Conditions	Min	Typ	Max	Unit
R <sub>ON_P</sub> MOS	On resistance of switching PMOS	V <sub>IN</sub> = 3.3 V T <sub>A</sub> = 27 °C		62		mΩ
R <sub>ON_N</sub> MOS	On resistance of switching NMOS	V <sub>IN</sub> = 3.3 V T <sub>A</sub> = 27 °C		28		mΩ
I <sub>POSLIM</sub>	Positive current limit threshold	With default setting V <sub>IN</sub> = 3.3 V T <sub>A</sub> = 27 °C	3	4		A
V <sub>THR_OVP_RISE</sub>	Over-voltage protection threshold		+200	+300	+400	mV
V <sub>THR_UVP_FALL</sub>	Under-voltage protection threshold		-400	-300	-200	mV
R <sub>DCHG</sub>	Discharge resistance for LX node	V <sub>IN</sub> = 3.3 V T <sub>A</sub> = 27 °C		10		Ω
t <sub>ON_MIN</sub>	Buck minimum On-time	V <sub>IN</sub> = 3.3 V T <sub>A</sub> = 27 °C		20		ns

### 5.6 CH2 Buck Converter Characteristics

Unless otherwise noted, the following is valid for -40 °C ≤ T<sub>A</sub> ≤ +85 °C, 2.9 V ≤ V<sub>IN</sub> ≤ 5.5 V, f<sub>sw</sub> = 2 MHz.

**Table 8: CH2 Buck Converter Electrical Characteristics**

Parameter	Description	Conditions	Min	Typ	Max	Unit
<b>External electrical conditions</b>						
V <sub>IN</sub>	Input voltage of power stage		2.7	3.3	5.5	V
C <sub>OUT</sub>	Output capacitance, including voltage and temperature coefficient	Only local capacitor without decoupling capacitor at load side.	11	22	29	μF
ESR <sub>COUT</sub>	Output capacitor series resistance	f > 100 kHz		3		mΩ
L	Inductor value, including current and temperature dependence		0.23	0.47	0.61	μH
DCR <sub>L</sub>	Inductor DC resistance			20	50	mΩ
<b>Electrical performance</b>						
I <sub>Q_LPM</sub>	Quiescent current in Low Power mode (no switching)	V <sub>IN</sub> = 3.3 V T <sub>A</sub> = 27 °C		17		μA
I <sub>Q_AUTO</sub>	Quiescent current in Auto mode (no switching)	V <sub>IN</sub> = 3.3 V T <sub>A</sub> = 27 °C		42		μA
f <sub>sw</sub>	Switching frequency		1.9	2	2.1	MHz

## High Current, Highly Configurable System PMIC

Parameter	Description	Conditions	Min	Typ	Max	Unit
V <sub>DROPOUT</sub>	Voltage drop from P <sub>VIN</sub> to V <sub>OUT</sub>			1		V
V <sub>OUT_DIV</sub>	Range of output voltage with divider (OTP option), programmable in 20 mV steps.	P <sub>VIN2</sub> = 2.7 V to 5.5 V	1.5		2.7	V
V <sub>OUT_NO_DIV</sub>	Range of output voltage with no divider (OTP option), programmable in 10 mV steps.	P <sub>VIN2</sub> = 2.7 V to 5.5 V	0.5		1.9	V
SR <sub>SS</sub>	Soft start slew rate			2.5		mV/μs
V <sub>OUT_ACC</sub>	Output voltage accuracy, including static line and load regulation	V <sub>OUT</sub> ≥ 1 V T <sub>A</sub> = 27 °C	-1		1	%
V <sub>OUT_ACC</sub>	Output voltage accuracy, including static line and load regulation	V <sub>OUT</sub> < 1 V	-10		10	mV
R <sub>ON_P MOS</sub>	On resistance of switching PMOS	V <sub>IN</sub> = 3.3 V T <sub>A</sub> = 27 °C		62		mΩ
R <sub>ON_N MOS</sub>	On resistance of switching NMOS	V <sub>IN</sub> = 3.3 V T <sub>A</sub> = 27 °C		28		mΩ
I <sub>POSLIM</sub>	Positive current limit threshold	With default setting V <sub>IN</sub> = 3.3 V T <sub>A</sub> = 27 °C	3	4		A
V <sub>THR_OVP_RISE</sub>	Over-voltage protection threshold		+200	+300	+400	mV
V <sub>THR_UVP_FALL</sub>	Under-voltage protection threshold		-400	-300	-200	mV
R <sub>DCHG</sub>	Discharge resistance for LX node	V <sub>IN</sub> = 3.3 V T <sub>A</sub> = 27 °C		20		Ω
t <sub>ON_MIN</sub>	Buck minimum On-time	V <sub>IN</sub> = 3.3 V T <sub>A</sub> = 27 °C		20		ns

## High Current, Highly Configurable System PMIC

### 5.7 CH3 Buck Converter Characteristics

Unless otherwise noted, the following is valid for  $-40\text{ °C} \leq T_A \leq +85\text{ °C}$ ,  $2.9\text{ V} \leq V_{IN} \leq 5.5\text{ V}$ ,  $f_{sw} = 2\text{ MHz}$ .

**Table 9: CH3 Buck Converter Electrical Characteristics**

Parameter	Description	Conditions	Min	Typ	Max	Unit
<b>External electrical conditions</b>						
$V_{IN}$	Input voltage of power stage		2.7	3.3	5.5	V
$C_{OUT}$	Output capacitance, including voltage and temperature coefficient	Only local capacitor without decoupling capacitor at load side.	11	22	29	$\mu\text{F}$
$ESR_{COUT}$	Output capacitor series resistance	$f > 100\text{ kHz}$		5		$\text{m}\Omega$
L	Inductor value, including current and temperature dependence		0.23	0.47	0.61	$\mu\text{H}$
$DCR_L$	Inductor DC resistance			20	50	$\text{m}\Omega$
<b>Electrical performance</b>						
$I_{Q\_LPM}$	Quiescent current in Low Power mode (no switching)	$V_{IN} = 3.3\text{ V}$ $T_A = 27\text{ °C}$		17		$\mu\text{A}$
$I_{Q\_AUTO}$	Quiescent current in Auto mode (no switching)	$V_{IN} = 3.3\text{ V}$ $T_A = 27\text{ °C}$		42		$\mu\text{A}$
$f_{sw}$	Switching frequency		1.9	2	2.1	MHz
$V_{DROPOUT}$	Voltage drop from $PV_{IN}$ to $V_{OUT}$			1		V
$V_{OUT\_DIV}$	Range of output voltage with divider (OTP option), programmable in 20 mV steps.	$PV_{IN3} = 2.7\text{ V to } 5.5\text{ V}$	1.5		2.7	V
$V_{OUT\_NO\_DIV}$	Range of output voltage with no divider (OTP option), programmable in 10 mV steps.	$PV_{IN3} = 2.7\text{ V to } 5.5\text{ V}$	0.5		1.9	V
$SR_{SS}$	Soft start slew rate			2.5		$\text{mV}/\mu\text{s}$
$V_{OUT\_ACC}$	Output voltage accuracy, including static line and load regulation	$V_{OUT} \geq 1\text{ V}$ $T_A = 27\text{ °C}$	-1		1	%
$V_{OUT\_ACC}$	Output voltage accuracy, including static line and load regulation	$V_{OUT} < 1\text{ V}$	-10		10	mV
$R_{ON\_PMOS}$	On resistance of switching PMOS	$V_{IN} = 3.3\text{ V}$ $T_A = 27\text{ °C}$		62		$\text{m}\Omega$

## High Current, Highly Configurable System PMIC

Parameter	Description	Conditions	Min	Typ	Max	Unit
R <sub>ON_NMOS</sub>	On resistance of switching NMOS	V <sub>IN</sub> = 3.3 V T <sub>A</sub> = 27 °C		28		mΩ
I <sub>POSLIM</sub>	Positive current limit threshold	With default setting V <sub>IN</sub> = 3.3 V T <sub>A</sub> = 27 °C	3	4		A
V <sub>THR_OVP_RISE</sub>	Over-voltage protection threshold		+200	+300	+400	mV
V <sub>THR_UVP_FALL</sub>	Under-voltage protection threshold		-400	-300	-200	mV
R <sub>DCHG</sub>	Discharge resistance for LX node	V <sub>IN</sub> = 3.3 V T <sub>A</sub> = 27 °C		30		Ω
t <sub>ON_MIN</sub>	Buck minimum On-time	V <sub>IN</sub> = 3.3 V T <sub>A</sub> = 27 °C		20		ns

### 5.8 CH4 Buck Converter Characteristics

Unless otherwise noted, the following is valid for -40 °C ≤ T<sub>A</sub> ≤ +85 °C, 2.9 V ≤ V<sub>IN</sub> ≤ 5.5 V, f<sub>sw</sub> = 2 MHz.

**Table 10: CH4 Buck Converter Electrical Characteristics**

Parameter	Description	Conditions	Min	Typ	Max	Unit
<b>External electrical conditions</b>						
V <sub>IN</sub>	Input voltage of power stage		2.7	3.3	5.5	V
C <sub>OUT</sub>	Output capacitance, including voltage and temperature coefficient	Only local capacitor without decoupling capacitor at load side.	11	22	29	μF
ESR <sub>COUT</sub>	Output capacitor series resistance	f > 100 kHz		3		mΩ
L	Inductor value, including current and temperature dependence		0.23	0.47	0.61	μH

High Current, Highly Configurable System PMIC

## 6 Functional Description

### 6.1 Function State

The function state flow is described in Figure 4 and Table 16. Normal sequences such as start-up and shut-down are controlled by this flow. Fault protection also follows this flow.

Figure 4: Function State Control Flow

Table 16: Function State

State Name	Function
CPOR	Enter this state when VIN < CPOR (2.0 V). All registers are cleared. (Digital hardware reset)
OTP	Initialize registers by loading OTP contents. Clear all the fault event bits (VOUT POR, OVPs, UVPs and TSD) for transition from Hiccup-VIN_UVLO.
VIN CHECK	Check VIN level and wait until it is within the appropriate range.

## High Current, Highly Configurable System PMIC

State Name	Function
LSW	Activate LSW
SEQ	Activate Buck CH<x> and LDO. Then assert POR pin.
ACTIVE	All rails active, wait for SLEEP command.
SLEEP	Shutdown rails by SLEEP command.
WAKE	Activate rails by WAKE command.
Latch-Off-ALL	Latch-off all rails (CH<x>, LDO, LSW, and POR = L).
Latch-Off-VOUT_POR	Latch-off rails except for LSW (CH<x>, LDO, and POR = L).
Hiccup-VIN_UVLO	Hiccup all rails (CH<x>, LDO, LSW, and POR = L) and go to RESET (OTP) state.
Hiccup-TSD/VIN_OVP	Hiccup all rails (CH<x>, LDO, LSW, and POR = L) and go to Non Reset (VIN CHECK).

## 6.2 Normal Sequence

### 6.2.1 Power On and Power Off Sequence

Power on and power off sequence can be configured by OTP. Wake-up timings of all buck converters and the LDO during power-on sequence are selectable from 15 time slots by PMC\_CH<x>CH<y>\_WAKEUP\_TIME and PMC\_LDO\_WAKEUP\_TIME registers. Each time slot is approximately 0.5 ms.

POR delay timing is programmed from 3 ms to 6 ms with 1 ms step.

For an example power on and power off sequence, see [Figure 5](#). This sequence only works at start-up by power on.

Figure 5: Power On and Off Sequence

## High Current, Highly Configurable System PMIC

### 6.2.2 Sleep Mode Enter and Exit Sequence

DA9083 enters Sleep mode immediately when SLEEP bit of PMC\_SLEEP\_REG0 register is asserted. All the buck converters and the LDO move to their SLEEP state according to CH<x>\_ALIVE and LDO\_ALIVE bits of PMC\_SLEEP\_REG0. Some of them are disabled and the others are in Low Power mode (LPM).

DA9083 exits Sleep mode when SLEEP bit of PMC\_SLEEP\_REG0 register is negated. Wake-up delays of disabled buck converters and LDO are the same as power-on sequence.

For an example sleep enter and exit sequence, see Figure 6. CH2 wakes up in TS02 and CH1 wakes up in TS03.

Figure 6: Sleep Enter and Exit Sequence

### 6.3 Fault and Protection

Protection functions are triggered by fault events. The behavior depends on type of fault event, see Table 17.

Table 17: Fault Events and Protection Functions

Fault Events	Shut-Down Blocks	Recovery from Shut-Down	Register
OCP	None	N/A	N/A
POR (LSW VOUT)	CH1-4 Buck, LDO	Latch-off	Keep
OVP (Buck)	CH1 Buck to CH4 Buck, LDO, LSW	Latch-off	Keep
UVP (Buck and LDO)	CH1 Buck to CH4 Buck, LDO, LSW	Latch-off	Keep

## High Current, Highly Configurable System PMIC

Fault Events	Shut-Down Blocks	Recovery from Shut-Down	Register
VIN OVP	CH1 Buck to CH4 Buck, LDO, LSW	Hiccup	Keep
VIN UVLO	CH1 Block to CH4 Block, LDO, LSW	Hiccup	Reset
TSD	CH1 Block to CH4 Block, LDO, LSW	Hiccup	Keep

As an OTP option, POR pin can be assigned as IRQ output. In this case, fault events such as over-current, over-voltage, under-voltage, and/or over-temperature can be set to trigger IRQ.

NOTE
When DA9083 is in Latch-Off-ALL or Latch-Off-VOUT_POR state, a VIN UVLO event is necessary to send the device back to ACTIVE.

### 6.4 Buck Converters

DA9083 has four channels of switching buck converters, CH1 Buck to CH4 Buck. Each of the bucks has an I<sup>2</sup>C programmable voltage register, PMC\_CH<x>\_SEL\_REG, which defines the output voltage.

When a buck is enabled, its output voltage gradually goes up with soft-start. When the buck output reaches the target voltage, Power Good condition is shown via the CH<x>\_NT\_UV\_OV status bit in PMC\_RAIL\_STATUS\_REG1 register.

When the buck output drops below  $V_{THR\_UVP\_FALL}$ , the device sets the CH<x>\_UV bit in the PMC\_RAIL\_STATUS\_REG2 register to 0x1. When the buck output increases above  $V_{THR\_OVP\_RISE}$  the device sets the CH<x>\_OV bit in the PMC\_RAIL\_STATUS\_REG3 register to 0x1. The status of the Power Good indicator, for both a UVP event and an OVP event and for each of the buck converters, can be read back via I<sup>2</sup>C from the CH<x>\_NT\_UV\_OV, CH<x>\_UV, and CH<x>\_OV bits.

The Power Good status on each of buck converter is masked during the buck start-up period.

The buck converters support DVC, with the following features:

- When the value of the target voltage (PMC\_CH<x>\_SEL\_REG) changes, the output voltage updates to the new target value.
- The DVC controller operates in pulse width modulation (PWM) mode with synchronous rectification. During DVC operation the PMC\_RAIL\_STATUS\_REG1 register remains at 0xFC to indicate a Power Good condition.
- The slew rate of the DVC transition for each channel is programmed in bits CH<x>\_TSTEP<1:0> in registers PMC\_CH<x>\_CFG\_REG.

Each of the bucks has current limit and its threshold is programmable with CH<x>\_ILMAX<1:0> and OTP option.

A pull-down resistor for each channel is enabled when the channel is disabled. This feature can be disabled by setting register bits CH<x>\_DIS to 0x0 (register PMC\_DISCHARGE\_REG0).

#### 6.4.1 Buck Operation Mode

Buck operation modes are selected, via I<sup>2</sup>C, by bits CH<X>\_ALIVE, LDO\_ALIVE and SLEEP in the PMC\_SLEEP\_REG0 register. Operation mode of CH<X> during High Power mode is selected by CH<X>\_PWM. See [Table 18](#).

## High Current, Highly Configurable System PMIC

**Table 18: Buck Operation Mode**

Operation Mode	Buck Mode	
Normal mode	High Power mode (HPM)	Auto mode
		Force PWM mode
	Low Power mode (LPM)	
	Disable	
Sleep mode	Low Power mode (LPM)	
	Disable	

### 6.5 LDO

DA9083 has one LDO. It has an I<sup>2</sup>C programmable voltage register (PMC\_LDO\_SEL\_REG) which defines the output voltage. It has soft-start function and its output voltage gradually increases when the LDO is enabled.

When the output voltage reaches the target, a Power Good condition is shown via the LDO\_NT\_UV\_OV status bit in the PMC\_RAIL\_STATUS\_REG1 register. It indicates that the output voltage is higher than the under-voltage protection level ( $V_{THR\_UVP\_FALL}$ ) and lower than the over-voltage protection threshold level ( $V_{THR\_OVP\_RISE}$ ).

When the output drops below  $V_{THR\_UVP\_FALL}$ , the device sets the LDO\_UV bit in the PMC\_RAIL\_STATUS\_REG2 register to 0x1. When the output exceeds  $V_{THR\_OVP\_RISE}$ , the device sets the LDO\_OV bit in the PMC\_RAIL\_STATUS\_REG3 register to 0x1.

The status of the Power Good indicator, UVP event, and OVP event of the LDO can be read via I<sup>2</sup>C from the LDO\_NT\_UV\_OV, LDO\_UV, and LDO\_OV bits respectively.

The Power Good status on LDO is masked during the buck start-up period.

### 6.6 I<sup>2</sup>C Communication

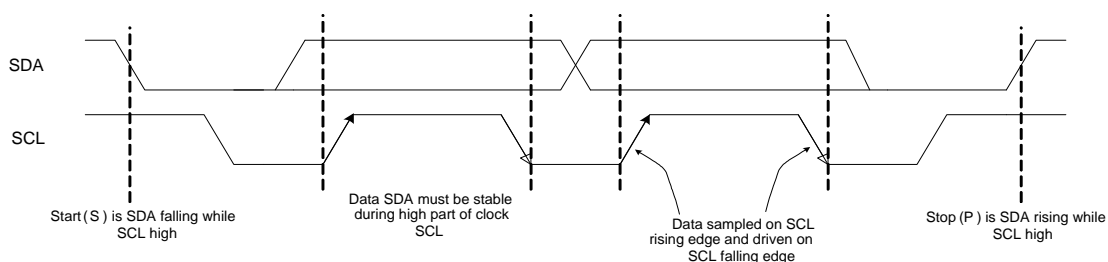

DA9083 includes an I<sup>2</sup>C-compatible 2-wire serial interface to access the internal registers. Through the I<sup>2</sup>C interface, the host processor controls each channel and reads back system status. The DA9083 only operates as a slave device. For detailed information about each register, refer to Section 7 and Section 8.

The host processor provides the serial clock at the SCL pin. DA9083 supports I<sup>2</sup>C Standard-mode at 100 kHz and Fast-mode at 400 kHz, see [1].

DA9083 SLAVE address (7-bit) is 0x1B (or 0x36 on 8-bit)

The I<sup>2</sup>C data pin, SDA, is open drain which allows multiple devices to share a communication line.

All transmissions begin with a START condition issued from the Master while the bus is in an IDLE state (the bus is free). The START condition is initiated by a high to low transition on SDA while SCL is high. Alternately, a STOP condition is indicated by a low to high transition on SDA while SCL is high, see Figure 7.

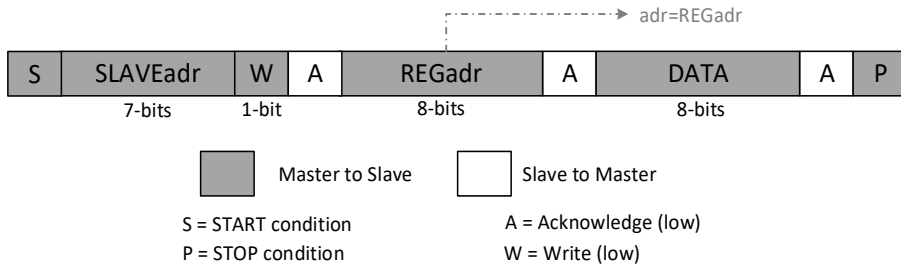

**Figure 7: I<sup>2</sup>C Start (S) and Stop (P)**

## High Current, Highly Configurable System PMIC

The I<sup>2</sup>C interface uses a two-byte serial protocol containing one byte for address and one byte for data. The data and address are transferred with MSB transmitted first for both read and write operations.

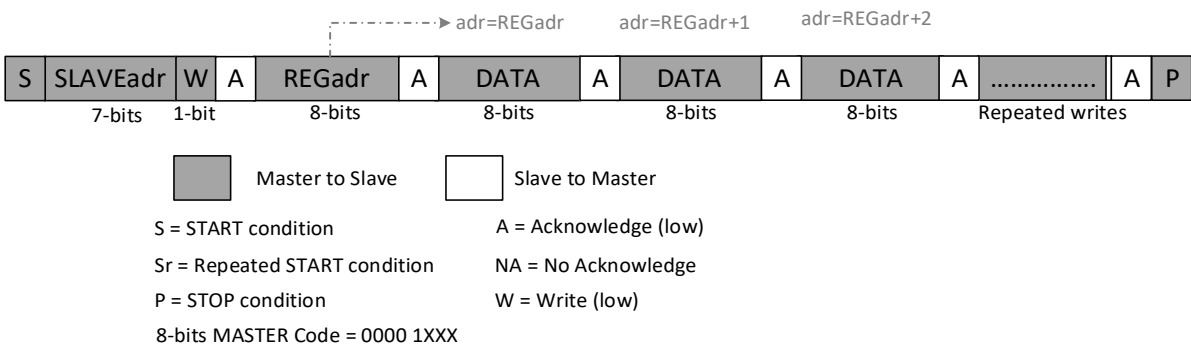

DA9083 monitors the serial bus for a valid SLAVE address when the interface is enabled. When it receives its own slave address, DA9083 immediately gives an Acknowledge signal to the host by pulling SDA low during the following clock cycle. A Not Acknowledge signal is given by a logic 1, not pulling down the SDA line.

A single-byte write is shown in Figure 8. Here the slave address is followed by a write bit (low), the register address, and the write data. Finally, the transaction is terminated with a STOP.

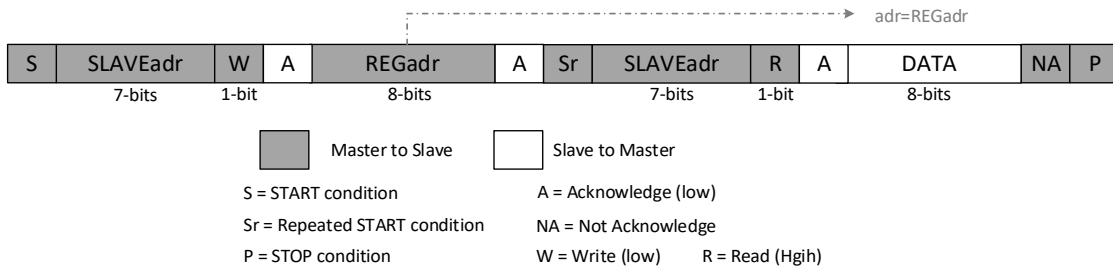

**Figure 8: Single Write Command**

DA9083 also supports multiple byte writes, shown in Figure 9. By not sending the STOP command, data is written to consecutive addresses.

**Figure 9: Consecutive Write Command**

The data read protocol differs from the write protocol. A read does not have a register address immediately preceding it. To read from a specific address, the register address is given by using a write command followed by a Repeated START. A single-byte read is shown in Figure 10. A Repeated START is followed by the slave address and a read bit. After the read data is returned to the host, the host then responds with a Not Acknowledge and a STOP.

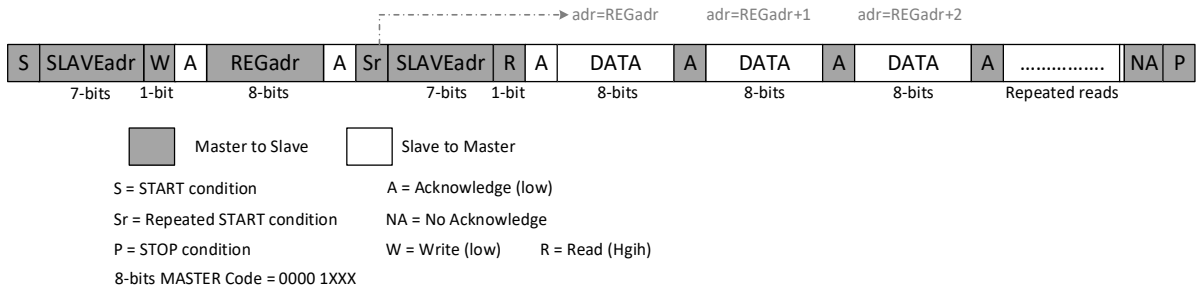

**Figure 10: Single Read Command**

The DA9083 also supports a multiple byte read protocol. If the host responds to the returned data with an Acknowledge rather than Not Acknowledge and STOP, data will be read from sequential addresses until a Not Acknowledge and STOP command is given, as shown in Figure 11. If a read

## High Current, Highly Configurable System PMIC

address is given with a write and Repeated START, consecutive addresses are read from the write address.

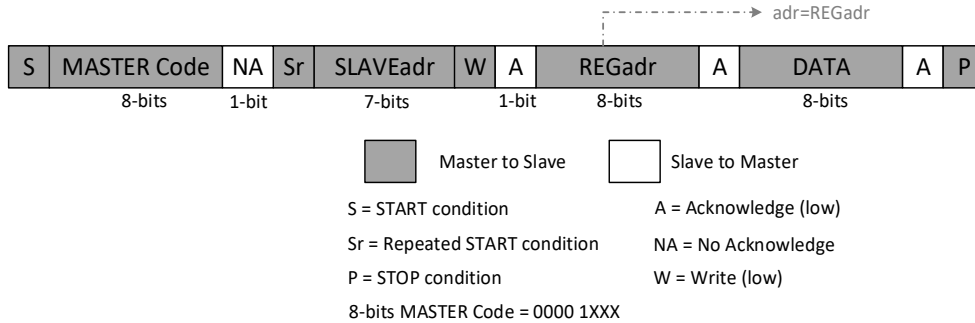

**Figure 11: Consecutive Read Command**

DA9083 also supports I<sup>2</sup>C High-Speed mode (HS-mode), which can transfer information at bit rates of up to 3.4 Mbit/s, see [1].

Operation in High Speed mode at 3.4 MHz requires a mode change to enable spike suppression and slope control characteristics compatible with the I<sup>2</sup>C-bus specification. High-Speed mode can be enabled on a transfer-by-transfer basis by sending the master code (0000 1XXX) at the beginning of the transfer. DA9083 does not make use of clock stretching and delivers read data without additional delay up to 3.4 MHz.

## High Current, Highly Configurable System PMIC

A single-byte write with High-Speed mode is shown in Figure 12. Here the slave address is followed by a write bit (low), the register address, and the write data. Finally, the transaction is terminated with a STOP.

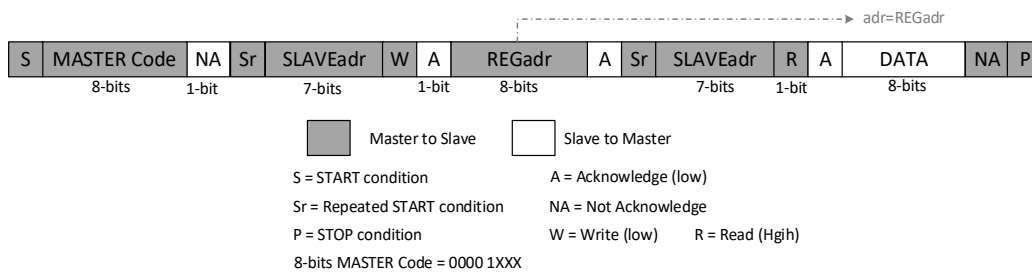

**Figure 12: High-Speed-Mode Single Write Command**

DA9083 also supports multiple byte writes in High-Speed mode, see Figure 13. By not sending the STOP command, data is written to consecutive addresses.

**Figure 13: HS-Mode Consecutive Write Command**

The data read protocol in High-Speed mode differs in that a read does not have a register address, immediately preceding it. To read from a specific address, the register address is given by using a write command followed by a Repeated START. A single byte read is shown in Figure 14. A Repeated START is followed by the slave address and a read bit. After the read data is returned to the host, the host then responds with a Not Acknowledge and a STOP.

**Figure 14: HS-Mode Single Read Command**

## High Current, Highly Configurable System PMIC

The DA9083 also supports a multiple byte read protocol in High-Speed mode. If the host responds to the returned data with an Acknowledge rather than Not Acknowledge and STOP, data will be read from sequential addresses until a Not Acknowledge and STOP command is given, see Figure 15. If a read address is given with a write and Repeated START, consecutive addresses are read from the write address.

**Figure 15: High-Speed Mode Consecutive Read Command**

## High Current, Highly Configurable System PMIC

## 7 Register Definitions

**NOTE**

The following register fields are password protected.

- PMC\_IRQ\_MASK0
- PMC\_IRQ\_MASK1
- PMC\_IRQ\_MASK2
- PMC\_OPTION\_06
- CH1\_EN\_DIVIDER
- CH2\_EN\_DIVIDER
- CH3\_EN\_DIVIDER
- CH4\_EN\_DIVIDER

I<sup>2</sup>C access is required to unlock those bits. Send this succession of writes:

WRITE DA9083\_I2C 0x005D 0x00

WRITE DA9083\_I2C 0x005E 0xB0

WRITE DA9083\_I2C 0x005E 0xA9

WRITE DA9083\_I2C 0x005E 0x8A

WRITE DA9083\_I2C 0x005E 0xA7

WRITE DA9083\_I2C 0x005E 0xA8

WRITE DA9083\_I2C 0x005E 0xB1

To lock those register fields, send this succession of writes:

WRITE DA9083\_I2C 0x005D 0x00

WRITE DA9083\_I2C 0x005E 0x00

### 8 Register Descriptions

#### 8.1.1 PMIC Function Registers

**Table 19: PMC\_RAIL\_STATUS\_REG1 (0x0000)**

Bit	Type	Field Name	Description	Reset
[7]	R	CH1_NT_UV_OV	Status bit. Indicates UV/OV not triggered on CH1 <b>Value</b> <b>Description</b> 0x0        CH1 OV or UV triggered. 0x1        CH1 OV and UV not triggered.	0x0
[6]	R	CH2_NT_UV_OV	Status bit. Indicates UV/OV not triggered on CH2 <b>Value</b> <b>Description</b> 0x0        CH2 OV or UV triggered. 0x1        CH2 OV and UV not triggered.	0x0
[5]	R	CH3_NT_UV_OV	Status bit. Indicates UV/OV not triggered on CH3 <b>Value</b> <b>Description</b> 0x0        CH3 OV or UV triggered. 0x1        CH3 OV and UV not triggered.	0x0
[4]	R	CH4_NT_UV_OV	Status bit. Indicates UV/OV not triggered on CH4 <b>Value</b> <b>Description</b> 0x0        CH4 OV or UV triggered. 0x1        CH4 OV and UV not triggered.	0x0
[3]	R	LDO_NT_UV_OV	Status bit. Indicates UV/OV not triggered on LDO <b>Value</b> <b>Description</b> 0x0        LDO OV or UV triggered. 0x1        LDO OV and UV not triggered.	0x0
[2]	R	POR	Status bit. Indicates POR pin output. <b>Value</b> <b>Description</b> 0x0        POR pin low 0x1        POR pin high	0x0

**Table 20: PMC\_RAIL\_STATUS\_REG2 (0x0001)**

Bit	Type	Field Name	Description	Reset
[7]	RW1C	CH1_UV	Status bit. Indicates UV on CH1 <b>Value</b> <b>Description</b> 0x0        CH1 UV not breached 0x1        CH1 UV breached	0x0

## High Current, Highly Configurable System PMIC

Bit	Type	Field Name	Description	Reset
[6]	RW1C	CH2_UV	Status bit. Indicates UV on CH2 <b>Value</b> <b>Description</b> 0x0        CH2 UV not breached 0x1        CH2 UV breached	0x0
[5]	RW1C	CH3_UV	Status bit. Indicates UV on CH3 <b>Value</b> <b>Description</b> 0x0        CH3 UV not breached 0x1        CH3 UV breached	0x0
[4]	RW1C	CH4_UV	Status bit. Indicates UV on CH4 <b>Value</b> <b>Description</b> 0x0        CH4 UV not breached 0x1        CH4 UV breached	0x0
[3]	RW1C	LDO_UV	Status bit. Indicates UV on LDO <b>Value</b> <b>Description</b> 0x0        LDO UV not breached 0x1        LDO UV breached	0x0

**Table 21: PMC\_RAIL\_STATUS\_REG3 (0x0002)**

Bit	Type	Field Name	Description	Reset
[7]	RW1C	CH1_OV	Status bit. Indicates OV on CH1 <b>Value</b> <b>Description</b> 0x0        CH1 OV not breached 0x1        CH1 OV breached	0x0
[6]	RW1C	CH2_OV	Status bit. Indicates OV on CH2 <b>Value</b> <b>Description</b> 0x0        CH2 OV not breached 0x1        CH2 OV breached	0x0
[5]	RW1C	CH3_OV	Status bit. Indicates OV on CH3 <b>Value</b> <b>Description</b> 0x0        CH3 OV not breached 0x1        CH3 OV breached	0x0
[4]	RW1C	CH4_OV	Status bit. Indicates OV on CH4 <b>Value</b> <b>Description</b> 0x0        CH4 OV not breached 0x1        CH4 OV breached	0x0

## High Current, Highly Configurable System PMIC

Bit	Type	Field Name	Description	Reset
[3]	RW1C	LDO_OV	Status bit. Indicates OV on LDO <b>Value</b> <b>Description</b> 0x0        LDO OV not breached 0x1        LDO OV breached	0x0
[2]	RW1C	VIN_OV	Status bit. Indicates OV on VIN <b>Value</b> <b>Description</b> 0x0        VIN OV not breached 0x1        VIN OV breached	0x0
[1]	RW1C	PMIC_OT	Status bit. Indicates OT on PMIC <b>Value</b> <b>Description</b> 0x0        PMIC OT not breached 0x1        PMIC OT breached	0x0

**Table 22: PMC\_CH1\_CFG\_REG (0x0003)**

Bit	Type	Field Name	Description	Reset
[7:6]	RW	CH1_ILMAX	CH1 ILMAX setting (A) <b>Value</b> <b>Description</b> 0x0        3.0 0x1        4.0 0x2        5.0 0x3        6.0	0x1
[5:4]	RW	CH1_TSTEP	CH1 TSTEP setting <b>Value</b> <b>Description</b> 0x0        up: 20 mV/μs, down: 5m V/μs 0x1        up: 15 mV/μs, down: 5mV/μs 0x2        up: 10mV/μs, down: 5mV/μs 0x3        up: 5mV/μs, down: 5mV/μs	0x2
[3:1]	RW	CH1_FREQ	CH1 FREQ is fixed to 2 MHz	0x5

**Table 23: PMC\_CH2\_CFG\_REG (0x0005)**

Bit	Type	Field Name	Description	Reset
[7:6]	RW	CH2_ILMAX	CH2 ILMAX setting (A) <b>Value</b> <b>Description</b> 0x0        3.0 0x1        4.0 0x2        5.0 0x3        6.0	0x1

## High Current, Highly Configurable System PMIC

Bit	Type	Field Name	Description	Reset
[5:4]	RW	CH2_TSTEP	CH2 TSTEP setting <b>Value</b> <b>Description</b> 0x0        up: 20 mV/μs, down: 5 mV/μs 0x1        up: 15mV/μs, down: 5mV/μs 0x2        up: 10mV/μs, down: 5mV/μs 0x3        up: 5mV/μs, down: 5mV/μs	0x2
[3:1]	RW	CH2_FREQ	CH2 FREQ is fixed to 2 MHz	0x5

**Table 24: PMC\_CH3\_CFG\_REG (0x0007)**

Bit	Type	Field Name	Description	Reset
[7:6]	RW	CH3_ILMAX	CH3 ILMAX setting (A) <b>Value</b> <b>Description</b> 0x0        3.0 0x1        4.0 0x2        5.0 0x3        6.0	0x1
[5:4]	RW	CH3_TSTEP	CH3 TSTEP setting <b>Value</b> <b>Description</b> 0x0        up: 20 mV/μs, down: 5 mV/μs 0x1        up: 15 mV/μs, down: 5 mV/μs 0x2        up: 10 mV/μs, down: 5 mV/μs 0x3        up: 5 mV/μs, down:5 mV/μs	0x2
[3:1]	RW	CH3_FREQ	CH3 FREQ is fixed to 2 MHz	0x5

**Table 25: PMC\_CH4\_CFG\_REG (0x0009)**

Bit	Type	Field Name	Description	Reset
[7:6]	RW	CH4_ILMAX	CH4 ILMAX setting (A) <b>Value</b> <b>Description</b> 0x0        5.5 0x1        7.0 0x2        8.5 0x3        10.0	0x2
[5:4]	RW	CH4_TSTEP	CH4 TSTEP setting <b>Value</b> <b>Description</b> 0x0        up: 20 mV/μs, down: 5 mV/μs 0x1        up: 15 mV/μs, down: 5 mV/μs 0x2        up: 10 mV/μs, down: 5 mV/μs 0x3        up: 5 mV/μs, down: 5 mV/μs	0x2

High Current, Highly Configurable System PMIC

9 Package Information

Figure 16: Package Outline Diagram

## High Current, Highly Configurable System PMIC

### 9.1 Moisture Sensitivity Level

The Moisture Sensitivity Level (MSL) is an indicator for the maximum allowable time period (floor lifetime) in which a moisture sensitive plastic device, once removed from the dry bag, can be exposed to an environment with a specified maximum temperature and a maximum relative humidity before the solder reflow process. The MSL classification is defined in [Table 48](#).

For detailed information on MSL levels refer to the IPC/JEDEC standard J-STD-020, which can be downloaded from <http://www.jedec.org>.

The package is qualified for MSL 1.

**Table 48: MSL Classification**

MSL Level	Floor Lifetime	Conditions
MSL 4	72 hours	30 °C / 60 % RH
MSL 3	168 hours	30 °C / 60 % RH
MSL 2A	4 weeks	30 °C / 60 % RH
MSL 2	1 year	30 °C / 60 % RH
MSL 1	Unlimited	30 °C / 85 % RH

### 9.2 WLCSP Handling

Manual handling of WLCSP packages should be reduced to the absolute minimum. In cases where it is still necessary, a vacuum pick-up tool should be used. In extreme cases plastic tweezers could be used, but metal tweezers are not acceptable, since contact may easily damage the silicon chip.

Removal of a WLCSP package will cause damage to the solder balls. Therefore, a removed sample cannot be reused.

WLCSP packages are sensitive to visible and infrared light. Precautions should be taken to properly shield the chip in the final product.

### 9.3 Soldering Information

Refer to the IPC/JEDEC standard J-STD-020 for relevant soldering information. This document can be downloaded from <http://www.jedec.org>.

---

## High Current, Highly Configurable System PMIC

### 10 Ordering Information

The ordering number consists of the part number followed by a suffix indicating the packing method. For details and availability, please consult your Renesas [local sales representative](#).

**Table 49: Ordering Information**

Part Number (Note 1)	Package	Size (mm)	Shipment Form	Pack Quantity
DA9083-xxUUC	36 WLCSP	2.5 x 2.5	Tape & Reel	3000
DA9083-xxUU6	36 WLCSP	2.5 x 2.5	Waffle Tray	500

**Note 1** xx represents the OTP variant.

## High Current, Highly Configurable System PMIC

### 11 Application Information

The following recommended components are references selected from requirements of a typical application.

Figure 17: Applications Diagram

#### 11.1 Capacitor Selection

Ceramic capacitors are used as bypass capacitors at all VDD and output rails. When selecting a capacitor, especially for types with high capacitance at smallest physical dimension, the DC bias characteristic has to be taken into account.

Table 50: Recommended Capacitor Types

Application	Value	Size	Temp Char	Tol (%)	Rated (V)	Type
$C_{VIN}$	100 nF	0201	X5R $\pm 15\%$	$\pm 10$	6.3	Murata GRM033R60J104KE19#
$C_{VOUT}$ (Optional)	10 $\mu$ F	0402	X5R $\pm 15\%$	$\pm 20$	6.3	Murata GRM155R60J106ME15#

## High Current, Highly Configurable System PMIC

Application	Value	Size	Temp Char	Tol (%)	Rated (V)	Type
C <sub>PVIN1</sub> , C <sub>PVIN2</sub> , C <sub>PVIN3</sub> , C <sub>PVIN4</sub>	10 $\mu$ F	0402	X5R $\pm$ 15 %	$\pm$ 20	6.3	Murata GRM155R60J106ME15#
C <sub>VOUT1</sub> , C <sub>VOUT2</sub> , C <sub>VOUT3</sub> , C <sub>VOUT4</sub>	22 $\mu$ F	0402	X6S $\pm$ 22 %	$\pm$ 20	4V	Murata GRM158C80G226ME01#
C <sub>LDOIN</sub>	10 $\mu$ F	0402	X5R $\pm$ 15 %	$\pm$ 20	6.3	Murata GRM155R60J106ME15#
C <sub>LDOOUT</sub>	4.7 $\mu$ F	0402	X5R $\pm$ 15 %	$\pm$ 20	6.3	Murata GRM155R60J475ME47#

### 11.2 Inductor Selection

Inductors should be selected based on the following parameters:

- Rated maximum current
- Usually, a coil provides two current limits: ISAT specifies the maximum current at which the inductance drops by 30 % of the nominal value, and IMAX is defined by the maximum power dissipation and is applied to the effective current.
- DC resistance
- Critical for the converter efficiency and should therefore be minimized.

Fully shielded inductor is highly recommended to use. The typical recommended output inductance is 0.1  $\mu$ H per phase. Use of larger output inductance degrades the load transient performance of the buck converter.

**Table 51: Recommended Inductor Types**

Application	Value	Size (WxLxH) (mm)	I <sub>MAX</sub> (DC) (A)	I <sub>SAT</sub> (A)	Tol (%)	DC Resistance (m $\Omega$ )	Type
L <sub>OUT1</sub> , L <sub>OUT2</sub> , L <sub>OUT3</sub> ,	470 nH	1.6 x 2.0 x 1.2	5.1	5.8	$\pm$ 20	20	Cyntec HMLQ20161B-R47MDR
L <sub>OUT4</sub>	470 nH	2.0 x 2.5 x 1.0	5.5	7.2	$\pm$ 20	20	Cyntec HMLR25201T-R47MSR

### Status Definitions

Revision	Datasheet Status	Product Status	Definition
1.<n>	Target	Development	This datasheet contains the design specifications for product development. Specifications may be changed in any manner without notice.
2.<n>	Preliminary	Qualification	This datasheet contains the specifications and preliminary characterization data for products in pre-production. Specifications may be changed at any time without notice in order to improve the design.
3.<n>	Final	Production	This datasheet contains the final specifications for products in volume production. The specifications may be changed at any time in order to improve the design, manufacturing and supply. Major specification changes are communicated via Customer Product Notifications. Datasheet changes are communicated via <a href="http://www.renesas.com/">http://www.renesas.com/</a> .
4.<n>	Obsolete	Archived	This datasheet contains the specifications for discontinued products. The information is provided for reference only.

### RoHS Compliance

Renesas Electronics' suppliers certify that its products are in compliance with the requirements of Directive 2011/65/EU of the European Parliament on the restriction of the use of certain hazardous substances in electrical and electronic equipment. RoHS certificates from our suppliers are available on request.

## IMPORTANT NOTICE AND DISCLAIMER
