

F0448

Dual Matched Broadband RF DVGA 3.3GHz to 4.2GHz

The F0448 is a 3.3GHz to 4.2GHz dual RF digital variable gain amplifier (DVGA) designed for use in receivers.

This dual RF DVGA provides two independent receiver channels each with 13dB typical maximum gain and 6dB noise figure designed to operate with a single +5V supply. For each channel, gain control is split into three separate attenuators: DSA0, a single 6dB step using a single control pin; DSA1, a 23dB SPI-controlled gain adjustment in 1dB steps; and DSA2, includes 18dB attenuation in 6dB steps controlled using two control pins. The F0448 offers +37dBm nominal output IP3 using 220mA total ICC.

This device is packaged in a 6 x 6 mm, 36-QFN with 50Ω single-ended RF input and RF output impedances for ease of integration into the signal-channel lineup for each of the two channels.

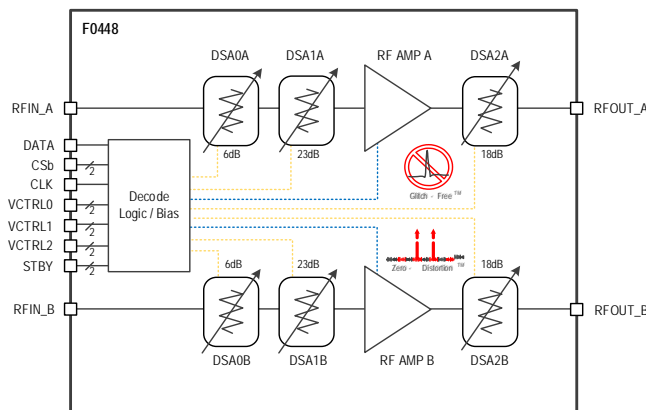

Figure 1. Block Diagram

Features

- RF Frequency Range: 3.3GHz to 4.2GHz
- Dual Channel RF amp and DSAs for Diversity / MIMO Receivers
- < 2dB overshoot between DSA transitions
- 13dB typical maximum gain at 3.6GHz
- DSA0: Single 6dB coarse step
- DSA1: 23dB total gain range in 1dB steps
- DSA2: 18dB gain range in 6dB steps
- +37dBm OIP3 at 3.6GHz
- 6dB Noise figure at 3.6GHz
- +5V Supply voltage
- I<sub>CC</sub> = 220mA
- Independent standby: 7mA standby current
- SPI interface for DSA1
- 1-bit control for DSA0
- 2-bit control for DSA2
- 50Ω input and output impedance
- Internally matched
- Temperature range: -40°C to +105°C
- 6 x 6 x 0.75 mm, 36-QFN package

Applications

- Multi-mode, Multi-carrier Receivers
- PHS/PAS Base Stations
- Distributed Antenna Systems
- Digital Radio

## 1.2 Pin Descriptions

Number	Name	Description
1	RFIN_A	Input RF port for channel A which is internally matched to 50Ω. Must use external DC block.
2, 8, 15, 16, 17, 29, 30, 31	GND	Internally grounded. This pin must be grounded with a via as close to the pin as possible.

Number	Name	Description
3	VCTRL0_A	1-bit DSA0 6dB attenuator control for channel A. Logic HIGH is for 6dB attenuated and logic LOW is for 0dB attenuated.
4	DATA	Data input: 3.3V or 1.8V CMOS compatible.
5	CLK	Clock input: 3.3V or 1.8V CMOS compatible.
6, 21, 23, 25	V <sub>CC</sub>	Power Supply. Use bypass capacitors as close to pin as possible.
7	VCTRL0_B	1-bit DSA0 6dB attenuator control for channel B. Logic HIGH is for 6dB attenuated and logic LOW is for 0dB attenuated.
9	RFIN_B	Input RF port for channel B that is internally matched to 50Ω. Must use external DC block.
10, 18, 20, 26, 28, 36	NC	No internal connection. These pins can be left unconnected or be connected to ground (recommended). Use a via as close to the pin as possible if grounded.
11	CSb_B	Chip Select bar input for channel B: 3.3V or 1.8V CMOS compatible. Logic LOW allows data to be shifted in.
12	STBY_B	Standby pin for channel B (LOW/Open = device power ON, HIGH = device power OFF with SPI still powered ON). An internal pull-down resistor of 57kΩ connects between this pin and GND.
13	VCTRL1_B	Bit 0 for DSA2 channel B attenuator. Logic HIGH is for 6dB attenuated and logic LOW is for 0dB attenuated.
14	VCTRL2_B	Bit 1 for DSA2 channel B attenuator. Logic HIGH is for 12dB attenuated and logic LOW is for 0dB attenuated.
19	RFOUT_B	Output RF port for channel B. Use external DC block as close to the pin as possible.
22	RDSET	Connect external resistor to GND to optimize amplifier bias. Used with pin 24.
24	RSET	Connect external resistor to GND to optimize amplifier bias. Used with pin 22.
27	RFOUT_A	Output RF port for channel A. Use external DC block as close to the pin as possible.
32	VCTRL2_A	Bit 1 for DSA2 channel A attenuator. Logic HIGH is for 12dB attenuated and logic LOW is for 0dB attenuated.
33	VCTRL1_A	Bit 0 for DSA2 channel A attenuator. Logic HIGH is for 6dB attenuated and logic LOW is for 0dB attenuated.
34	STBY_A	Standby pin for channel A (LOW/Open = device power ON, HIGH = device power OFF with SPI still powered ON). An internal pull-down resistor of 57kΩ connects between this pin and GND.
35	CSb_A	Chip Select bar input for channel A: 3.3V or 1.8V CMOS compatible. Logic LOW allows data to be shifted in.
	— EPAD	Exposed paddle. Internally connected to ground. Solder this exposed paddle to a printed circuit board (PCB) pad that uses multiple ground vias to provide heat transfer out of the device into the PCB ground planes. These multiple ground vias are also required to achieve the specified RF performance.

## 2. Specifications

### 2.1 Absolute Maximum Ratings

The absolute maximum ratings are stress ratings only. Stresses greater than those listed below can cause permanent damage to the device. Functional operation of the F0448 at absolute maximum ratings is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

**Table 1. Absolute Maximum Ratings**

Parameter	Symbol	Minimum	Maximum	Unit
V <sub>CC</sub> to GND	V <sub>CC</sub>	-0.3	+5.5	V
DATA, CSb_A, CSb_B, CLK, VCTRL0_A, VCTRL0_B	V <sub>LOGIC1</sub>	-0.3	Lower of (V <sub>CC</sub> , 3.6)	V
STBY_A, STBY_B, VCTRL1_A, VCTRL1_B, VCTRL2_A, VCTRL2_B	V <sub>LOGIC2</sub>	-0.3	V <sub>CC</sub> + 0.25	V
RFIN_A, RFIN_B externally applied DC voltage	V <sub>RFIN</sub>	+1.4	+3.6	V
RFOUT_A, RFOUT_B, externally applied DC voltage	V <sub>RFOUT</sub>	+1.4	+3.6	V
RF Input Power (RFIN_A or RFIN_B) applied for 24 hours max. <sup>[1]</sup>	P <sub>MAX</sub>		+22	dBm
Continuous Power Dissipation	P <sub>DISS</sub>		1.5	W
Storage Temperature Range	T <sub>ST</sub>	-65	150	°C
Lead Temperature (soldering, 10s)			260	°C
ElectroStatic Discharge – HBM (JEDEC/ESDA JS-001-2012)			2000 Class 2	V
ElectroStatic Discharge – CDM (JEDEC 22-C101F)			1000 Class C3	V

1. Exposure to these maximum RF levels can result in significant V<sub>CC</sub> current draw due to overdriving the amplifier stage.

### 2.2 Recommended Operating Conditions

**Table 2. Recommended Operating Conditions**

Parameter	Symbol	Condition	Minimum	Typical	Maximum	Unit
Supply Voltage	V <sub>CC</sub>	All V <sub>CC</sub> pins	4.75	5.00	5.25	V
Operating Temperature Range	T <sub>EPAD</sub>	Exposed paddle	-40		+105	°C
Junction Temperature	T <sub>J</sub>				+125	°C
RF Frequency Range	f <sub>RF</sub>		3.3		4.2	GHz
Maximum RF Input Power	P <sub>IP</sub>	DSA0 = DSA1 = 0dB			0	dBm
RF Source Impedance	Z <sub>RFI</sub>	Single ended		50		Ω
RF Load Impedance	Z <sub>RFO</sub>	Single ended		50		Ω

## 2.3 Electrical Characteristics (3.4GHz to 3.8GHz)

See F0448 Typical Application Circuit.  $V_{CC} = +5V$ ,  $T_C = +25^\circ C$ ,  $f_{RF} = 3.6GHz$  specifications apply when operated as a dual-channel RF DVGA, maximum gain setting,  $P_{OUT} = 0dBm$ ,  $Z_{RFI} = Z_{RFO} = 50\Omega$ , Evaluation Board (EVKit) traces and connectors are de-embedded, unless otherwise stated. For BOM details of this specific band, see Table 11.

### 3. Typical Performance Graphs

Unless otherwise noted, for the typical performance graphs on the following pages, the following conditions apply:

- $V_{CC} = 5.0V$
- $Z_L = Z_S = 50\Omega$  Single ended
- $f_{RF} = 3.6GHz$
- $T_{EPAD} = +25^{\circ}C$
- Gain setting = Maximum gain
- STBY = LOW
- $P_{OUT} = 0dBm/$ tone
- 1MHz Tone Spacing
- ATTN setting = 0dB (Maximum gain; DSA0 = DSA1 = DSA2 = 0dB)
- All temperatures are referenced to the exposed paddle
- Evaluation Kit traces and connector losses are de-embedded

## 4. Programming

The F0448 is programmed in both the serial and parallel. The 23dB attenuator (DSA1) is programmed using a three-wire serial control line. You choose which channel is programmed by using either or both CSb lines. Parallel pins are used for the one-bit 6dB attenuator ((DSA0\_A, DSA0\_B) and two-bit 18dB (6dB step) attenuator (DSA2\_A, DSA2\_B). The standby pins are also controlled by the parallel pin. All logic is both 1.8V and 3.3V compatible.

### 4.1 Serial Control – DSA1

The serial interface uses an 8-bit word with only 5 bits used. The serial word is shifted in LSB (D0) first.

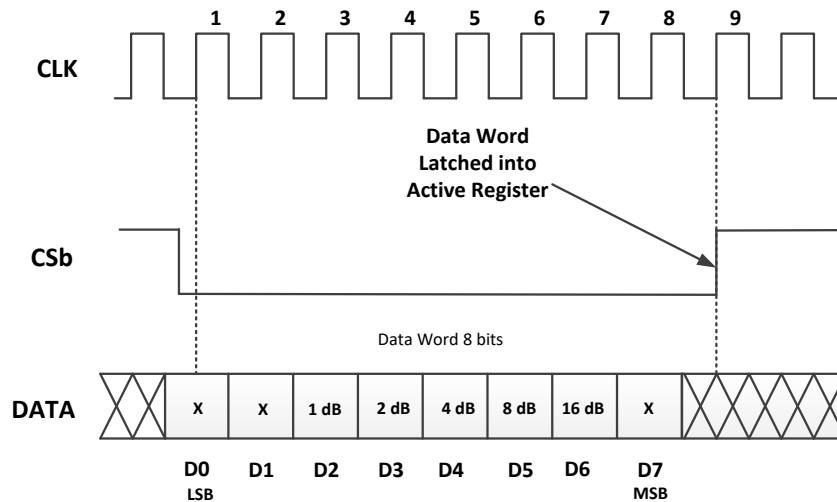

Figure 68. Serial Register Data Flow Diagram (LSB Clock in First)

When the device is first powered up, DSA1 will default to the **Maximum Attenuation** setting as shown.

## Default Register Setting

x	x	1	1	1	1	1	x
D0 LSB	D1	D2	D3	D4	D5	D6	D7 MSB

Figure 69. DSA1 Default Condition

The F0448 includes a CLK inhibit feature designed to minimize sensitivity to CLK bus noise when the device is not being programmed. When CSb is high ( $> V_{IH}$ ), the CLK input is disabled and serial data (DATA) is not clocked into the shift register. It is recommended that CSb be pulled high ( $> V_{IH}$ ) when the device is not being programmed.

## 7.4 Evaluation Board Operation

### 7.4.1. Power Supply Setup

Set up a power supply in the voltage range of 4.75V to 5.25V with the power supply output disabled. The voltage is applied via the SMA connector, J1, shown in Figure 75 and Figure 76.

Figure 75. Power Supply Connections – Top View

Figure 76. Power Supply Connections – Bottom View

### 7.4.2. GND Jumpers

Headers J6 and J10 must be jumped (grounded) for optimum RF performance. Figure 77 shows the header locations.

Figure 77. Two Ground Jumper Connections

### 7.4.3. Standby (STBY) Pin

The Evaluation Board can control the F0448 for standby operation. The standby pin is the center pin of the J4 and J11 header as shown in Figure 78. VCC (logic HIGH) and ground (logic LOW) pins are available to make a connection with a jumper.

Figure 78. Two Standby Pin Connections

To place channel A in the normal operation mode (on), use one of these options:

- Make no connections on J4.
- Apply a logic LOW signal to STBY (pin 2 of J4 or the middle pin).
- Make a connection between pin 1 (GND) and pin 2 (STBY, the middle pin) of J4.

To place channel A in the standby mode (off), use one of these options:

- Apply a logic HIGH signal to the STBY (pin 2 of J4 or the middle pin).
- Make a connection between pin 3 (VCC) and pin 2 (STBY, the middle pin) of J4.

To place channel B in the normal operation mode (on), use one of these options:

- Make no connections on J11.
- Apply a logic LOW signal to STBY (pin 2 of J11 or the middle pin).
- Make a connection between pin 1 (GND) and pin 2 (STBY, the middle pin) of J11.

To place channel B in the standby mode (off), use one of these options:

- Apply a logic HIGH signal to the STBY (pin 2 of J11 or the middle pin).
- Make a connection between pin 3 (VCC) and pin 2 (STBY, the middle pin) of J11.

### 7.4.4. Serial Control

Both channels have a digital controlled attenuator, DSA1\_A and DSA1\_B, which share the serial control word. The serial control pins are on header J13 and are shown in Figure 79. Table 13 lists the pin functions on header J13.

Figure 79. Two Jumpers for Serial Programming Connections

Table 13. J13 Header Pins

Pin	Label	Pin	Label
1	GND	2	GND
3	DATA	4	GND
5	CLK	6	GND
7	CSb_A	8	GND
9	CSb_B	10	GND
11	VCTRL0_A	12	GND
13	VCTRL0_B	14	GND
15	VCTRL1_A	16	GND
17	VCTRL1_B	18	GND
19	VCTRL2_A	20	GND
21	VCTRL2_B	22	GND

Each channel has its own latch pins, CSB\_A and CSB\_B (pin 7 of J13 and pin 9 of J13) so each channel attenuator can be independently controlled. If you only have one latch signal, the ability to control each channel attenuator achieved using headers J12 and J15. The latch signal must be applied to CSb\_A (pin 7 of J13). Table 14 lists the operation for the connections on these headers. Figure 54 shows the J12 and J15 headers.

Table 14. Attenuator Control Using One Latch Signal

CSb_A (J12)	CSb_B (J15)	Function
OPEN	OPEN	No control of attenuators
OPEN	CLOSED	DSA1_B attenuator is controlled
CLOSED	OPEN	DSA1_A attenuator is controlled
CLOSED	CLOSED	DSA1_A attenuator is controlled DSA1_B attenuator is controlled

Figure 80. Jumpers for Serial Programming Connections

### 7.4.5. Parallel Control Pins

Both channels have two other attenuators, DSA0 and DSA2, which are parallel controlled. These parallel pins are located on header J13 shown in Figure 81. Table 14 lists the pin functions on header J13.

Figure 81. Parallel Pin Connections

See Table 8 and Table 9 for the attenuation control.

### 7.4.6. Power-On Procedure

Set up the voltage supplies and Evaluation Board as described in “Power Supply Setup” with the “Standby Pin” set for logic LOW, then enable the power supply.

### 7.4.7. Power-Off Procedure

Disable the power supply.

## 8. Application Information

The F0448 is optimized for use in high-performance RF applications from 3.3GHz to 4.2GHz.

### 8.1 Power Supplies

Bypass supply pins with external capacitors to minimize noise and fast transients. Supply noise can degrade noise figure and fast transients can trigger ESD clamps and cause them to fail. Supply voltage change or transients should have a slew rate smaller than  $1V/20\mu S$ . In addition, all control pins should remain at 0V ( $\pm 0.3V$ ) while the supply voltage ramps or while it returns to zero.

### 8.2 RSET and RDSET

The F0448 is optimized for gain and intermodulation products by adjusting the bias resistors RSET and RDSET. For the optimized setting, RSET (R26) and RDSET (R25) are 4.42k $\Omega$ .

### 8.3 Control Pin Interface

If control signal integrity is a concern and clean signals cannot be guaranteed due to overshoot, undershoot, ringing, etc., the following circuit at the input of each control pin is recommended. This applies to control pins 3-7, 11-14, and 32-35 as shown below. Note the recommended resistor and capacitor values do not necessarily match the EVKit BOM for the case of poor control signal integrity.
