

ISL97676

6-Channel LED Driver with Phase Shift Control

FN7600
Rev.2.00
Sep 12, 2017

The [ISL97676](#) is an LED driver that drives six channels of LED current for TFT-Display. The ISL97676 drives six channels of LED to support 78 LEDs from 4.5V to 26V or 48 LEDs from a boost supply of 2.7V to 26V and a separate 5V bias supply on the ISL97676 VIN pin.

The ISL97676 compensates for non-uniformity of the forward voltage drops in the LED strings with its 6 voltage controlled-current source channels. Its headroom control monitors the highest LED forward voltage string for output regulation, to minimize the voltage headroom and power loss in the typical multi-string operation.

Intersil offers two PWM Dimming modes. In the first mode, the ISL97676 digitizes the incoming PWM signal and provides 8-bit dimming. The PWM frequency is set by a resistor providing dimming frequency between 100Hz to 30kHz. The second mode offers direct PWM mode without phase shift, where the dimming follows the input PWM signal.

The ISL97676 features channel phase shift control to minimize the input, output ripple characteristics and load transients as well as spreading the light output to help eliminate or reduce the video and audio noise interference from the backlight driver operation.

Related Literature

- [ISL97676](#) product page

Features

- 6 channels
- Channel phase shift PWM dimming
- Direct PWM dimming without phase shift
- 4.5V to 26V input
- 45V output max
- Up to 30mA LED current per channel
- Drive up to 78 (3.2V/20mA each) LEDs
- Current matching of $\pm 1.5\%$ from 1% ~ 100% dimming
- Dynamic headroom control
- Protections
 - String open/short circuit, V_{OUT} short circuit overvoltage, and over-temperature protections
 - Optional master fault protection
- Selectable 600kHz or 1.2MHz switching frequency
- 20 Ld QFN 4mmx4mm package

Applications

- Netbook displays LED backlighting
- Notebook displays LED backlighting

Ordering Information

PART NUMBER (Notes 1, 2, 3)	PART MARKING	TEMP RANGE (°C)	PACKAGE (RoHS COMPLIANT)	PKG. DWG. #
ISL97676IRZ	976 76IRZ	-40 to +85	20 Ld 4x4 QFN	L20.4x4C

NOTES:

1. Add "-T" suffix for 6k unit or "-TK" for 1k unit tape and reel options. Refer to [TB347](#) for details on reel specifications.
2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. For Moisture Sensitivity Level (MSL), see the product information page for [ISL97676](#). For more information on MSL, see [TB363](#).

Pin Configuration

Pin Descriptions

(I = Input, O = Output, S = Supply)

PIN NAME	PIN NO.	TYPE	DESCRIPTION
VDDIO	1	S	Decouple with capacitor for internally generated supply rail.
EN	2	I	Enable
FSW/PhaseShift	3	I	FSW = 0 ~ 0.25 * VDDIO, Boost Switching Frequency = 1.2MHz with phase shift. FSW = 0.25 * VDDIO ~ 0.5 * VDDIO, Boost Switching Frequency = 1.2MHz without phase shift. FSW = 0.5 * VDDIO ~ 0.75 * VDDIO, Boost Switching Frequency = 600kHz without phase shift. FSW = 0.75 * VDDIO ~ VDDIO, Boost Switching Frequency = 600kHz with phase shift.
ISET	4	I	Resistor connection for setting LED current (see Equation 3 for calculating the $I_{LEDpeak}$).
NC	5	I	No Connect.
FB6	6	I	Input 6 to current source, FB, and monitoring.
FB5	7	I	Input 5 to current source, FB, and monitoring.
FB4	8	I	Input 4 to current source, FB, and monitoring.
AGND	9	S	Analog Ground for precision circuits.
FB3	10	I	Input 3 to current source, FB, and monitoring.
FB2	11	I	Input 2 to current source, FB, and monitoring.
FB1	12	I	Input 1 to current source, FB, and monitoring.
RFPWM/DirectPWM	13	I	External PWM dimming with frequency modulation or Direct PWM dimming without frequency modulation. When this pin is not biased and a resistor is connected to ground, the dimming frequency will be set by the Setting Resistor. When this pin is floating, the part enters Direct PWM mode such that the dimming follows the input PWM signal without frequency modulation.
OVP	14	I	Overvoltage protection input.
PGND	15	S	Power ground (LX Power return).
SW	16	O	Input to boost switch.
FAULT	17	O	Gate drive signal for external fault MOSFET. This pin should be left floating when fault mosfet is omitted in the application.
COMP	18	I	External compensation pin.
VIN	19	S	LED driver supply voltage.
PWM	20	I	PWM brightness control pin.
PAD	21	I	Connect EPAD to junction of AGND and PGND with adequate vias to form a star ground.

Absolute Maximum Ratings ($T_A = +25^\circ\text{C}$)

VIN	-0.3V to 28V
FAULT, EN	-0.3V to min(28, VIN + 0.3)V
FSW/PhaseShift, RFPWM/DirectPWM, OVP	-0.3V to 5.5V
VDDIO, PWM, COMP	-0.3V to min(5.5, VIN + 0.3)V
ISET	-0.3V to min(VDDIO + 0.3, 5.5)V
FB1, FB2, FB3, FB4, FB5, FB6	-0.3V to 45V
SW	-0.3V to 46V
PGND, AGND	-0.3V to +0.3V

Above voltage ratings are all with respect to AGND pin

ESD Rating

Human Body Model (Tested per JESD22-A114E)	3kV
Machine Model (Tested per JESD22-A115-A)	300V
Charged Device Model	1kV

Thermal Information

Thermal Resistance (Typical)	θ_{JA} ($^\circ\text{C}/\text{W}$)	θ_{JC} ($^\circ\text{C}/\text{W}$)
20 Ld QFN Package (Notes 4, 5, 7)	39	2.5
Thermal Characterization (Typical)	PSI _{JT} ($^\circ\text{C}/\text{W}$)	
20 Ld QFN Package (Note 6)	3	
Maximum Continuous Junction Temperature	+125 $^\circ\text{C}$	
Storage Temperature	-65 $^\circ\text{C}$ to +150 $^\circ\text{C}$	
Pb-free reflow profile	see TB493	

Operating Conditions

Temperature Range	-40 $^\circ\text{C}$ to +85 $^\circ\text{C}$
-------------------	--

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:

- θ_{JA} is measured in free air with the component mounted on a high-effective thermal conductivity test board with "direct attach" features. See [TB379](#).
- For θ_{JC} , the "case temp" location is the center of the exposed metal pad on the package underside.
- PSI_{JT} is the PSI junction-to-top thermal characterization parameter. If the package top temperature can be measured with this rating then the die junction temperature can be estimated more accurately than the θ_{JC} and θ_{JC} thermal resistance ratings.
- Refer to JESD51-7 high effective thermal conductivity board layout for proper via and plane designs.

NOTES:

- Parameters with MIN and/or MAX limits are 100% tested at $+25^\circ\text{C}$, unless otherwise specified. Temperature limits established by characterization and are not production tested.
- At minimum V_{IN} of 4.5V, the maximum output is limited by the V_{OUT} specifications. Also at maximum V_{IN} of 26V, the minimum V_{OUT} is 28V but minimum V_{OUT} can be lower at lower V_{IN} . In general, the V_{IN} and V_{OUT} relationship is bounded by D_{MAX} and D_{MIN} .
- Varies within range specified by $V_{HEADROOM_RANGE}$.

Theory of Operation

PWM Boost Converter

The current mode PWM boost converter produces the minimal voltage needed to enable the LED stack with the highest forward voltage drop to run at the programmed current. The ISL97676 employs current mode control boost architecture that has a fast current sense loop and a slow voltage feedback loop. Such architecture achieves a fast transient response that is essential for the notebook backlight application. The input power may instantly change when the user switches from a drained battery to a AC/DC adapter without causing any flicker in the display backlight. The ISL97676 is capable of boosting up to 45V and typically can drive 13 (3.2V/20mA) LEDs in series on each of the 6 channels from a 4.5V input.

OVP

The Overvoltage Protection (OVP) pin has a function of setting the overvoltage trip level as well as limiting the V_{OUT} regulation range.

The ISL97676 OVP threshold is set by R_{UPPER} and R_{LOWER} such that:

$$V_{OUT_OVP} = 1.21V \times (R_{UPPER} + R_{LOWER}) / R_{LOWER} \quad (EQ. 1)$$

and V_{OUT} can only regulate between 64% and 100% of the V_{OUT_OVP} such that:

$$\text{Allowable } V_{OUT} = 64\% \text{ to } 100\% \text{ of } V_{OUT_OVP} \quad (EQ. 2)$$

For example, if 10 LEDs are used with the worst case V_{OUT} of 35V, and R_{UPPER} and R_{LOWER} are chosen such that the OVP level is set at 40V, then the allowed V_{OUT} range is between 25.6V and 40V. If the requirement is changed to 6 LEDs/channel for a maximum V_{OUT} of 21V, then the OVP level must be reduced according to Equation 2 to accommodate the new reduced output voltage. Otherwise, the headroom control will be disturbed and the channel voltage may be higher and prevent the driver from operating properly.

The ratio of the OVP capacitors should be the inverse of the OVP resistors. For example, if $R_{UPPER} / R_{LOWER} = 33/1$, then $C_{UPPER} / C_{LOWER} = 1/33$. For example, if $C_{UPPER} = 100pF$ then $C_{LOWER} = 3.3nF$.

Enable

An EN signal is required to enable the internal regulator for normal operation. If there is no signal longer than 28ms, the device will enter shutdown.

Power Sequence

There is no specific power sequence requirement for the ISL97676. The EN signal can be tied to V_{IN} but not the V_{DDIO} as it will prevent the device from powering up.

Current Matching and Current Accuracy

Each channel of the LED current is regulated by the current source circuit, as shown in Figure 20.

The LED peak current is set by translating the R_{ISET} current to the output with a scaling factor of $392/R_{ISET}$. The sink terminals of the current source MOSFETs are designed to operate within a range at about 500mV to optimize power loss versus accuracy requirements. The sources of errors for the channel-to-channel current matching are due to internal mismatches, offsets and

the external R_{ISET} resistor. To minimize this external offset, a 1% tolerance resistor is recommended.

FIGURE 20. SIMPLIFIED CURRENT SOURCE CIRCUIT

Dynamic Headroom Control

The ISL97676 features a proprietary Dynamic Headroom Control circuit that detects the highest forward voltage string or effectively the lowest voltage from any of the FB1-6 pins digitally. This lowest FB voltage is used as the feedback signal for the boost regulator. Since all LED stacks are connected in parallel to the same output voltage, the other FB pins will have a higher voltage, but the regulated current source circuit on each channel will ensure that each channel has the same current. The output voltage will regulate cycle by cycle and it is always referenced to the highest forward voltage string in the architecture.

Dimming Controls

The ISL97676 allows two ways of controlling the LED current, and therefore, the brightness. They are:

1. DC current adjustment.
2. PWM chopping of the LED current defined in Step 1.

Maximum DC Current Setting

The initial brightness should be set by choosing an appropriate value for R_{ISET} . This should be chosen to fix the maximum possible LED current:

$$I_{LEDmax} = \frac{(392)}{R_{ISET}} \quad (EQ. 3)$$

For example, if the maximum required LED current ($I_{LED(max)}$) is 20mA, rearranging Equation 3 yields Equation 4:

$$R_{ISET} = (392)/0.02 = 19.6k\Omega \quad (EQ. 4)$$

PWM Control

The ISL97676 has a high speed 8-bit digitizer that decodes an incoming PWM signal and converts it into six channels of 8-bit PWM current with a phase shift function that will be described later. During the PWM On period, the LED peak current is defined by the value of R_{ISET} resistor, the average LED current of each

channel is controlled by I_{LEDmax} and the PWM duty cycle in percent as:

$$I_{LED(ave)} = I_{LEDmax} \times PWM \quad (EQ. 5)$$

When the PWM input = 0, all channels are disconnected and the I_{LED} is guaranteed to be $<10\mu A$ in this state.

The PWM dimming frequency is adjusted by a resistor at the RFPWM pin, which will be described in [“PWM Dimming Frequency Adjustment”](#) on page 12.

FIGURE 21. CONVENTIONAL LED DRIVER WITH 10% PWM DIMMING CHANNEL CURRENT (UPPER) AND TOTAL CURRENT (LOWER)

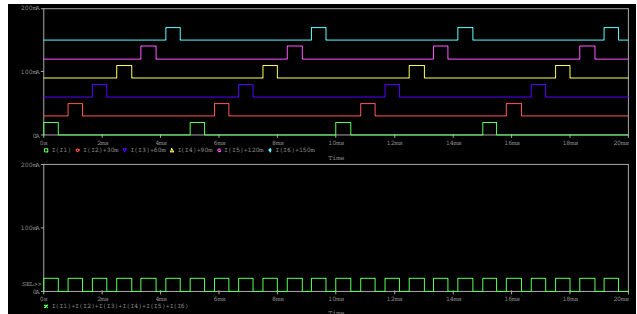

FIGURE 22. PHASE SHIFT LED DRIVER WITH 10% PWM DIMMING CHANNEL CURRENT (UPPER) AND TOTAL CURRENT (LOWER)

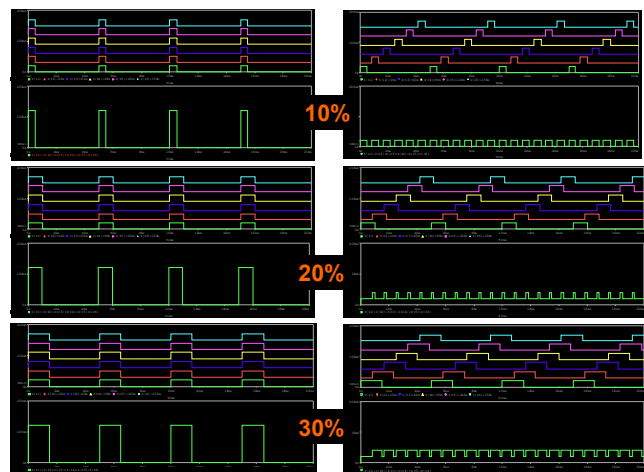

FIGURE 23. CONVENTIONAL LED DRIVER vs PHASE SHIFT LED DRIVER PWM DIMMING CHANNEL AND TOTAL CURRENT AT 10% TO 30%

FIGURE 24. CONVENTIONAL LED DRIVER vs PHASE SHIFT LED DRIVER PWM DIMMING TOTAL CURRENT AT 40% TO 100%

Phase Shift Control

The ISL97676 is capable of delaying the phase of each current source. Conventional LED drivers pose the worst load transients to the boost circuit by turning on all channels simultaneously as shown in Figure 21. In contrast, the ISL97676 phase shifts each channel by turning them on once during each PWM dimming period as shown in Figure 22. At each dimming duty cycle except at 100%, the sum of the phase shifted channel currents will be less than a conventional LED driver as shown in Figure 23 and 24. Equal phase means there is fixed delay between channels and such delay can be calculated as:

$$t_{D1} = \frac{t_{FPWM}}{(255)} \times \left(\frac{255}{N}\right) \tag{EQ. 6}$$

$$t_{D2} = \frac{t_{FPWM}}{255} \times \left((255) - (N - 1) \left(\frac{255}{N}\right)\right) \tag{EQ. 7}$$

where $(255/N)$ in Equation 6 and Equation 7 can only be an integer because the PWM dimming is controlled by an internal 8-bit digital counter. As a result, any decimal value of $(255/N)$ will be discarded. For example for $N = 6$, $(255/N) = 42$, thus:

$$t_{D1} = t_{FPWM} \times \frac{42}{255} \tag{EQ. 8}$$

$$t_{D2} = t_{FPWM} \times \frac{45}{255}$$

where t_{FPWM} is the sum of t_{ON} and t_{OFF} . N is the number of active channels. The ISL97676 will detect the numbers of active channels automatically and is illustrated in Figure 26 for 6 channels and Figure 27 for 4 channels.

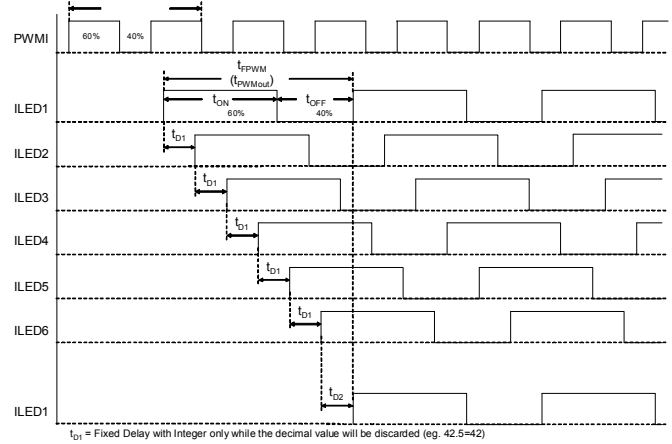

FIGURE 25. 6 EQUAL PHASE CHANNELS PHASE SHIFT ILLUSTRATION

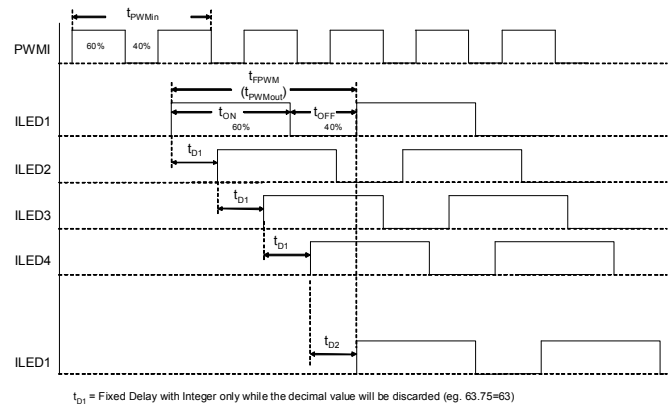

FIGURE 26. 4 EQUAL PHASE CHANNELS PHASE SHIFT ILLUSTRATION

PWM Dimming Frequency Adjustment

The dimming frequency is set by an external resistor at the RFPWM/DirectPWM pin to GND:

$$F_{PWM} = \frac{6.66 \times 10^7}{R_{FPWM}} \tag{EQ. 9}$$

where F_{PWM} is the desirable PWM dimming frequency and R_{FPWM} is the setting resistor. Do not bias RFPWM/DirectPWM if direct PWM dimming is used; see Table 1 for clarifications.

The PWM dimming frequency can be set or applied up to 30kHz with duty cycle from 0.4% to 100%.

Direct PWM Dimming

The ISL97676 can also operate in direct PWM dimming mode such that the output follows the input PWM signal without phase shifting and dimming frequency modifications. To use Direct PWM mode, users should float RFPWM/DirectPWM pin. The input PWM frequency should be limited to 30kHz.

TABLE 1. PWM DIMMING

RFWM/DIRECTPWM	FUNCTION	PHASESHIFT
Connects with Resistor	PWM Dimming with frequency adjust	Yes
Floating	DirectPWM without frequency adjust	No

Switching Frequency

When the FSW/PhaseShift pin is biased from VDDIO with a resistor divider R_{UPPER} and R_{LOWER} , the switching frequency and phase shift function will change according to the following FSW/PhaseShift levels shown in Table 2 with the recommended R_{UPPER} and R_{LOWER} values.

TABLE 2. PHASE SHIFT

FSW/PHASE SHIFT LEVEL	SWITCHING FREQUENCY	PHASE SHIFT	R_{UPPER}	R_{LOWER}
$0 \sim 0.25 * VDDIO$	1.2MHz	Yes	Open	0
$0.25 * VDDIO \sim 0.5 * VDDIO$	1.2MHz	No	150k Ω	100k Ω
$0.5 * VDDIO \sim 0.75 * VDDIO$	600kHz	No	100k Ω	150k Ω
$0.75 * VDDIO \sim VDDIO$	600kHz	Yes	0	Open

Inrush Control and Soft-Start

The ISL97676 has separate built-in independent inrush control and soft-start functions. The inrush control function is built around the short circuit protection FET, and is only available in applications which include this device.

After an initial delay from the point where the master Fault Protection FET is turned on, it is assumed that inrush has completed. At this point, the boost regulator will begin to switch and the current in the inductor will ramp-up. The current in the boost power switch is monitored and the switching is terminated in any cycle where the current exceeds the current limit. The ISL97676 includes a soft-start feature where this current limit starts at a low value (275mA). This is stepped up to the final 2.2A current limit in 7 further steps of 275mA. These steps will happen over at least 8ms, and will be extended at low LED PWM frequencies if the LED duty cycle is low. This allows the output capacitor to be charged to the required value at a low current limit and prevents high input current for systems that have only a low to medium output current requirement.

For systems with no master fault protection FET, the inrush current will flow towards C_{OUT} when V_{IN} is applied and it is determined by the ramp rate of V_{IN} and the values of C_{OUT} and boost inductor, L.

Fault Protection and Monitoring

The ISL97676 features extensive protection functions to cover all the perceivable failure conditions. The failure mode of an LED can be either open circuit or as a short. The behavior of an open circuited LED can additionally take the form of either infinite resistance or, for some LEDs, a zener diode, which is integrated into the device in parallel with the now opened LED.

For basic LEDs (which do not have built-in zener diodes), an open circuit failure of an LED will only result in the loss of one channel of LEDs without affecting other channels. Similarly, a LED short circuit condition which causes the FB voltage to rise to $\sim 4V$, will result in that channel turning off. This does not affect any other channels.

Due to the lag in boost response to any load change at its output, certain transient events (such as LED current steps or significant step changes in LED duty cycle) can transiently look like LED fault modes. The ISL97676 uses feedback from the LEDs to determine when it is in a stable operating region and prevents apparent faults during these transient events from allowing any of the LED stacks to fault out. See Table 3 for more details.

A fault condition that results in high input current due to a short on V_{OUT} with master fault protection switch will result in a shutdown of all output channels. The control device logic will remain functional.

Short Circuit Protection (SCP)

The short circuit detection circuit monitors the voltage on each channel and disables faulty channels which are detected above the programmed short circuit threshold. When an LED becomes shorted, the action taken is described in Table 3. The short circuit threshold is 4V.

Open Circuit Protection (OCP)

When one of the LEDs becomes open circuit, it can behave as either an infinite resistance or a gradually increasing finite resistance. The ISL97676 monitors the current in each channel such that any string which reaches the intended output current is considered "good". Should the current subsequently fall below the target, the channel will be considered an "open circuit". Furthermore, should the boost output of the ISL97676 reach the OVP limit or should the lower over-temperature threshold be reached, all channels which are not "good" will immediately be considered as "open circuit". Detection of an "open circuit" channel will result in a time-out before disabling of the affected channel. This time-out is run when the device is above the lower over-temperature threshold in an attempt to prevent the upper over-temperature trip point from being reached.

Some users employ special types of LEDs that have zener diode structure in parallel with the LED for ESD enhancement, thus enabling open circuit operation. When this type of LED goes open circuit, the effect is as if the LED forward voltage has increased, but no light is emitted. Any affected string will not be disabled, unless the failure results in the boost OVP limit being reached, allowing all other LEDs in the string to remain functional. Care should be taken in this case that the boost OVP limit and SCP limit are set properly, to make sure that multiple failures on one string do not cause all other good channels to be faulted out. This is due to the increased forward voltage of the faulty channel making all other channels look as if they have LED shorts. See Table 3 for details for responses to fault conditions.

Overvoltage Protection (OVP)

The integrated OVP circuit monitors the output voltage and keeps the voltage at a safe level. The OVP threshold is set as:

$$OVP = 1.21V \times (R_{UPPER} + R_{LOWER}) / R_{LOWER} \quad (EQ. 10)$$

These resistors should be large to minimize the power loss. For example, a 1MΩ R_{UPPER} and 30kΩ R_{LOWER} sets OVP to 41.2V. Large OVP resistors also allow C_{OUT} discharges slowly during the PWM Off time. Parallel capacitors should also be placed across the OVP resistors such that R_{UPPER}/R_{LOWER} = C_{LOWER}/C_{UPPER}. Using a C_{UPPER} value of at least 30pF is recommended. These capacitors reduce the AC impedance of the OVP node, which is important when using high value resistors.

Undervoltage Lockout

If the input voltage falls below the UVLO level of 3.1V, the device will stop switching and be reset. Operation will restart once the input voltage is back in the normal operating range.

Master Fault Protection

During normal switching operation, the current through the internal boost power FET is monitored. If the input current exceeds the current limit due to output shorted to ground or excessive loading, the internal switch will be turned off. This

monitoring happens on a cycle by cycle basis in a self protecting way.

Additionally, the ISL97676 monitors the voltage at the LX and OVP pins. At start-up, a fixed current is injected out of the LX pins and into the output capacitor. The device will not start up unless the voltage at LX exceeds 1.2V. The OVP pin is also monitored such that if it rises above and subsequently falls below 20% of the target OVP level, the input protection FET will be switched off.

Over-Temperature Protection (OTP)

The ISL97676 includes two over-temperature thresholds. The lower threshold is set to +130 °C. When this threshold is reached, any channel which is outputting current at a level below the regulation target will be treated as “open circuit” and disabled after a time-out period. The intention of the lower threshold is to allow bad channels to be isolated and disabled before they cause enough power dissipation (as a result of other channels having large voltages across them) to hit the upper temperature threshold.

The upper threshold is set to +150 °C. Each time this is reached, the boost will stop switching and the output current sources will be switched off.

For the extensive fault protection conditions, please refer to Figure 27 and Table 3 for details.

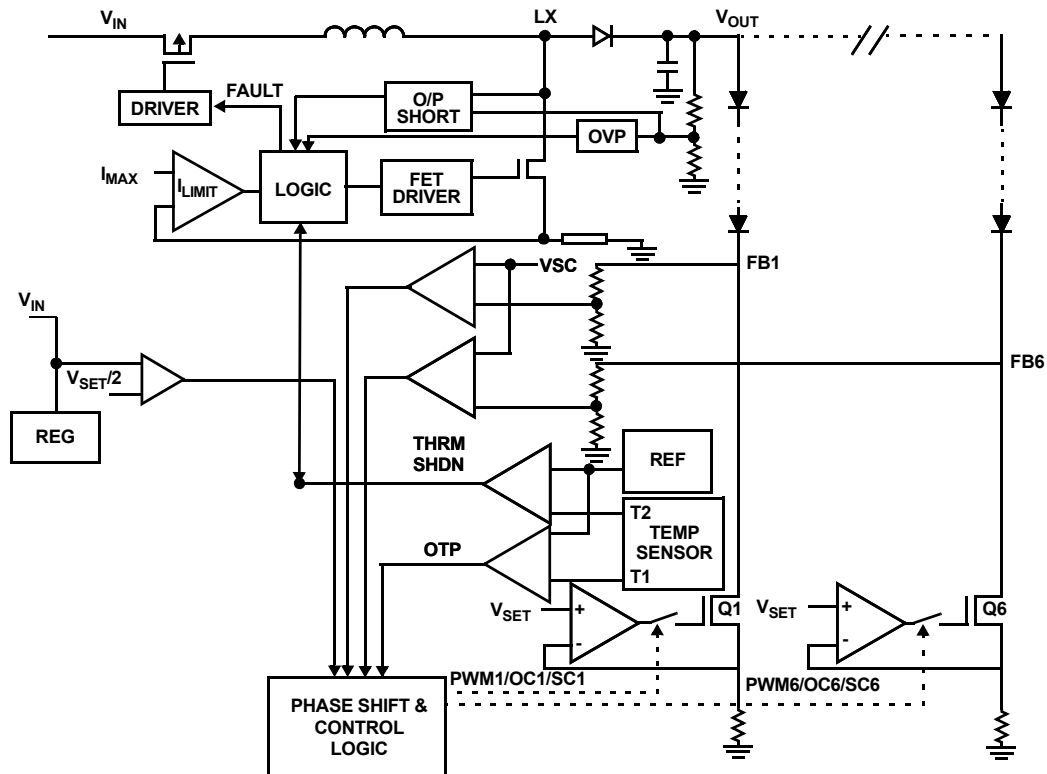

FIGURE 27. SIMPLIFIED FAULT PROTECTIONS

TABLE 3. PROTECTIONS TABLE

CASE	FAILURE MODE	DETECTION MODE	FAILED CHANNEL ACTION	GOOD CHANNELS ACTION	V _{OUT} REGULATED BY
1	FB1 Short Circuit	Upper Over-Temperature Protection limit (OTP) not triggered and FB1 < 4V	FB1 ON and burns power.	FB2 through FB6 Normal	Highest VF of FB2 through FB6
2	FB1 Short Circuit	Upper OTP triggered but VFB1 < 4V	All channels go off until chip cooled and then comes back on with current reduced to 76%. Subsequent OTP triggers will reduce I _{OUT} further.	Same as FB1	Highest VF of FB2 through FB6
3	FB1 Short Circuit	Upper OTP not triggered but FB1 > 4V	FB1 disabled after 6 PWM cycle timeout.	FB2 through FB6 Normal	Highest VF of FB2 through FB6
4	FB1 Open Circuit with infinite resistance	Upper OTP not triggered and FB1 < 4V	V _{OUT} will ramp to OVP. FB1 will time-out after 6 PWM cycles and switch off. V _{OUT} will drop to normal level.	FB2 through FB6 Normal	Highest VF of FB2 through FB6
5	FB1 LED Open Circuit but has paralleled Zener	Upper OTP not triggered and FB1 < 4V	FB1 remains ON and has highest VF, thus V _{OUT} increases.	FB2 through FB6 ON, Q2 through Q6 burn power	VF of FB1
6	FB1 LED Open Circuit but has paralleled Zener	Upper OTP triggered but FB1 < 4V	All channels go off until chip cooled and then comes back on with current reduced to 76%. Subsequent OTP triggers will reduce I _{OUT} further	Same as FB1	VF of FB1
7	FB1 LED Open Circuit but has paralleled Zener	Upper OTP not triggered but FBx > 4V	FB1 remains ON and has highest VF, thus V _{OUT} increases.	V _{OUT} increases, then FB-X switches OFF after 6 PWM cycles. This is an unwanted shut off and can be prevented by setting OVP at an appropriate level.	VF of FB1
8	Channel-to-Channel ΔVF too high	Lower OTP triggered but FBx < 4V	Any channel at below the target current will fault out after 6 PWM cycles. Remaining channels driven with normal current.		Highest VF of FB1 through FB6
9	Channel-to-Channel ΔVF too high	Upper OTP triggered but FBx < 4V	All channels go off until chip cooled and then comes back on with current reduced to 76%. Subsequent OTP triggers will reduce I _{OUT} further		Highest VF of FB1 through FB6
10	Output LED stack voltage too high	V _{OUT} > VOVP	Any channel that is below the target current will time-out after 6 PWM cycles, and V _{OUT} will return to the normal regulation voltage required for other channels.		Highest VF of FB1 through FB6
11	V _{OUT} /LX shorted to GND at start-up or V _{OUT} shorted in operation	LX current and timing are monitored. OVP pins monitored for excursions below 20% of OVP threshold.	The chip is permanently shutdown 31mS after powerup if V _{OUT} /Lx is shorted to GND.		

Components Selections

According to the inductor Voltage-Second Balance principle, the change of inductor current during the switching regulator On-time is equal to the change of inductor current during the switching regulator Off-time. Since the voltage across an inductor is:

$$V_L = L \times \Delta I_L / \Delta t \quad (\text{EQ. 11})$$

and $\Delta I_L @ T_{ON} = \Delta I_L @ T_{OFF}$, therefore:

$$(V_1 - 0) / L \times D \times t_S = (V_0 - V_D - V_1) / L \times (1 - D) \times t_S \quad (\text{EQ. 12})$$

where D is the switching duty cycle defined by the turn-on time over the switching period. V_D is Schottky diode forward voltage which can be neglected for approximation.

Rearranging the terms without accounting for V_D gives the boost ratio and duty cycle respectively as:

$$V_0 / V_1 = 1 / (1 - D) \quad (\text{EQ. 13})$$

$$D = (V_0 - V_1) / V_0 \quad (\text{EQ. 14})$$

Input Capacitor

Switching regulators require input capacitors to deliver peak charging current and to reduce the impedance of the input supply. This reduces interaction between the regulator and input supply, thereby improving system stability. The high switching frequency of the loop causes almost all ripple current to flow in the input capacitor, which must be rated accordingly.

A capacitor with low internal series resistance should be chosen to minimize heating effects and improve system efficiency, such as X5R or X7R ceramic capacitors, which offer small size and a lower value of temperature and voltage coefficient compared to other ceramic capacitors.

In boost mode, input current flows continuously into the inductor; AC ripple component is only proportional to the rate of the inductor charging, thus, smaller value input capacitors may be used. It is recommended that an input capacitor of at least 10 μ F be used. Ensure the voltage rating of the input capacitor is suitable to handle the full supply range.

Inductor

The selection of the inductor should be based on its maximum current (I_{SAT}) characteristics, power dissipation (DCR), EMI susceptibility (shielded vs unshielded), and size. Inductor type and value influence many key parameters, including ripple current, current limit, efficiency, transient performance and stability.

The inductor's maximum current capability must be large enough to handle the peak current at the worst case condition. If an inductor core is chosen with a lower current rating, saturation in the core will cause the effective inductor value to fall, leading to an increase in peak to average current level, poor efficiency and overheating in the core. The series resistance, DCR, within the inductor causes conduction loss and heat dissipation. A shielded inductor is usually more suitable for EMI susceptible applications, such as LED backlighting.

The peak current can be derived from the voltage across the inductor during the off period, as expressed in Equation 15:

$$I_{L_{peak}} = (V_0 \times I_0) / (85\% \times V_1) + 1/2 [V_1 \times (V_0 - V_1) / (L \times V_0 \times f_{SW})] \quad (\text{EQ. 15})$$

The choice of 85% is just an average term for the efficiency approximation. The first term is the average current, which is inversely proportional to the input voltage. The second term is the inductor current change, which is inversely proportional to L and F_{SW} . As a result, for a given switching frequency, minimum input voltage must be used to calculate the input/inductor current as shown in Equation 15. For a given inductor size, the larger the inductance value, the higher the series resistance because of the extra number of turns required, thus, higher conductive losses. The ISL97676 current limit should be less than the inductor saturation current.

Output Capacitors

The output capacitor acts to smooth the output voltage and supplies load current directly during the conduction phase of the power switch. Output ripple voltage consists of the discharge of

the output capacitor during the FET ton period and the voltage drop due to load current flowing through the ESR of the output capacitor. The ripple voltage is shown in Equation 16:

$$\Delta V_{CO} = (I_0 / C_0 \times D / f_s) + ((I_0 \times \text{ESR}) \quad (\text{EQ. 16})$$

The above equation shows the importance of using a low ESR output capacitor for minimizing output ripple.

The choice of X7R over Y5V ceramic capacitors is highly recommended because the former capacitor is less sensitive to capacitance change over voltage as shown in Figure 28. Y5V's absolute capacitance can be reduced to 10%~20% of its rated capacitance at the maximum voltage. In any case, Y5V type of ceramic capacitor should be avoided.

Here are some recommendations for various applications:

For 20mA applications with $V_{IN} > 7V$, 1 x 4.7 μ F (X7R type) is sufficient.

For 20mA applications with $V_{IN} < 7V$, 2 x 4.7 μ F (X7R type) is required in some configurations.

FIGURE 28. X7R AND Y5V TYPES CERAMIC CAPACITORS

Channel Capacitor

It is recommended to use at least 1.5nF capacitors from CH pins to V_{OUT} . Larger capacitors will reduce LED current ripple at boost frequency, but will degrade transient performance at high PWM frequencies. The best value is dependant on PCB layout. Up to 4.7nF is sufficient for most configurations.

Output Ripple

ΔV_{CO} can be reduced by increasing C_0 or F_{SW} , or using small ESR capacitors as shown in Equation 16. In general, Ceramic capacitors are the best choice for output capacitors in small to medium sized LCD backlight applications due to their cost, form factor, and low ESR.

A larger output capacitor will also ease the driver response during PWM dimming off period due to the longer sample and hold effect of the output drooping. The driver does not need to boost as much on the next on period which minimizes transient current. The output capacitor is also needed for compensation, and, in general one to two 4.7 μ F/50V ceramic capacitors are needed for netbook or notebook display backlight applications.

Schottky Diode

A high speed rectifier diode is necessary to prevent excessive voltage overshoot, especially in the boost configuration. Low forward voltage and reverse leakage current will minimize losses, making Schottky diodes the preferred choice. Although the Schottky diode turns on only during the boost switch off period, it carries the same peak current as the inductor, therefore, a suitable current rated Schottky diode must be used.

Applications

High Current Applications

Each channel of the ISL97676 can support up to 30mA. For applications that need higher current, multiple channels can be grouped to achieve the desirable current. For example, the cathode of the last LED can be connected to FB1 to FB3, this configuration can be treated as a single string with 90mA current driving capability.

Revision History

The revision history provided is for informational purposes only and is believed to be accurate, but not warranted. Please visit our website to make sure you have the latest revision.

DATE	REVISION	CHANGE
9/12/17	FN7600.2	Added $V_{\text{HEADROOM_RANGE}}$ spec to the Electrical Specifications table. Added Note 10. In " Current Matching and Current Accuracy " on page 10, updated the second sentence in the second paragraph for clarification. Replaced Products section with About Intersil section. Applied new header/footer.
3/1/11	FN7600.1	Corrected grammar in third paragraph of first page. Added "Related Literature" to page 1 In "Pin Descriptions" on page 4, changed the FSW/PhaseShift Description from: "FSW = 0 ~ 0.25 * VDDIO, Boost Switching Frequency = 600kHz with phase shift. FSW = 0.25 * VDDIO ~ 0.5 * VDDIO, Boost Switching Frequency = 600kHz without phase shift. FSW = 0.5 * VDDIO ~ 0.75 * VDDIO, Boost Switching Frequency = 1.2MHz without phase shift. FSW = 0.75 * VDDIO ~ VDDIO, Boost Switching Frequency = 1.2MHz with phase shift." to: "FSW = 0 ~ 0.25 * VDDIO, Boost Switching Frequency = 1.2MHz with phase shift. FSW = 0.25 * VDDIO ~ 0.5 * VDDIO, Boost Switching Frequency = 1.2MHz without phase shift. FSW = 0.5 * VDDIO ~ 0.75 * VDDIO, Boost Switching Frequency = 600kHz without phase shift. FSW = 0.75 * VDDIO ~ VDDIO, Boost Switching Frequency = 600kHz with phase shift." Updated Tape & Reel note in "Ordering Information" on page 3 by adding new standard "Add "-T*" suffix for tape and reel." The "*" covers all possible tape and reel options. In Table 2 on page 13, changed the first 2 rows in the second column from 600kHz to 1.2MHz. Changed the last 2 rows in the second column from 1.2MHz to 600kHz.
3/12/10	FN7600.0	Initial release

About Intersil

Intersil Corporation is a leading provider of innovative power management and precision analog solutions. The company's products address some of the largest markets within the industrial and infrastructure, mobile computing, and high-end consumer markets.

For the most updated datasheet, application notes, related documentation, and related parts, see the respective product information page found at www.intersil.com.

For a listing of definitions and abbreviations of common terms used in our documents, visit www.intersil.com/glossary.

You can report errors or suggestions for improving this datasheet by visiting www.intersil.com/ask.

Reliability reports are also available from our website at www.intersil.com/support.

© Copyright Intersil Americas LLC 2010-2017. All Rights Reserved.

All trademarks and registered trademarks are the property of their respective owners.

For additional products, see www.intersil.com/en/products.html

Intersil products are manufactured, assembled and tested utilizing ISO9001 quality systems as noted in the quality certifications found at www.intersil.com/en/support/qualandreliability.html

Intersil products are sold by description only. Intersil may modify the circuit design and/or specifications of products at any time without notice, provided that such modification does not, in Intersil's sole judgment, affect the form, fit or function of the product. Accordingly, the reader is cautioned to verify that datasheets are current before placing orders. Information furnished by Intersil is believed to be accurate and reliable. However, no responsibility is assumed by Intersil or its subsidiaries for its use; nor for any infringements of patents or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of Intersil or its subsidiaries.
