

## High Efficiency Advanced Feature 4-Channel PMIC

### General Description

The PV88080 power management integrated circuit (PMIC) provides one PWM buck controller and three adjustable synchronous buck regulators. The high voltage buck controller can optionally be used to generate the supply for the other three buck converters. Two pass devices (NMOS FET) for the high side and low side of the high voltage buck controller are external which allows the majority of the buck controller power dissipation to be outside the PV88080. This high voltage buck controller uses a constant on time (COT) control scheme with integrated bootstrap PMOS switch. In certain applications, multiple PV88080s can be used together to provide enough power rails to power the larger systems. There are three buck converters that can be used to generate the supplies for CPUs, DDR memory and other Auxiliary functions in a typical application. The pass devices of these buck converters are fully integrated, so no external FETs or Schottky diodes are needed. This results in optimized power efficiency and a reduced external component count. PV88080 provides Dynamic Voltage Control (DVC) via I2C command to support adaptive adjustment of the supply voltage based on the processor. All power blocks have over current circuit protection and the start-up timing can be controlled through the I<sup>2</sup>C interface. Soft start-up limits the inrush current from the input node and secures a slope controlled activation of the rail. The PV88080 is available in a 32-pin QFN package and is specified from -40 °C to 85 °C ambient temperature.

### Key Features

- One synchronous buck controller
  - V<sub>IN</sub> input voltage range : 7 V to 26 V
  - Programmable output voltage :  
0.8 V~5.25 V when V<sub>IN</sub> <13.2 V or  
1.8 V~5.25 V when V<sub>IN</sub> >13.2 V
  - Supports all ceramic output capacitors
  - Switching frequency up to 1 Mhz
  - Reference voltage with ±1% tolerance
  - Provide OVP, OCP and OTP
- Three synchronous buck converters with integrated low R<sub>ON</sub> FET
  - Buck1, programmable output voltage from 0.75 V to 3.3 V with 5-A continuous output current. Peak current 6 A if standalone.
  - Buck2, programmable output voltage from 0.9 V to 3.6 V with 2-A continuous output current. Peak current 3 A if standalone.
  - Buck3, programmable output voltage from 0.9 V to 3.6 V with 2-A continuous output current. Peak current 3 A if standalone.
- Light load efficiency improved > 85%
- Boot up selectable output voltage through GPIO
- Dynamic Voltage Control (DVC) on all buck converters
- Constant on time (COT) control with selectable frequencies
- Auto mode on all three buck converters
- Adjustable soft start
- Two GPIO, one nIRQ and I<sup>2</sup>C compatible interface
- Mute function: eliminates audio popping noise in power plug OFF scenario.
- Power fail detect function to alert the application processor.
- External thermal sense function: establish the remote temperature sensing ability on the system.
- -40 to 85 °C ambient temperature range
- Custom 32-pin QFN package with thermal pad, 0.5 mm pin pitch

### Applications

- Supply for digital television processor
- Networking home terminal
- Power supply for digital Set Top Box (STB)

### 2 Pinout

The pin outs are subject to change during the detailed design and floor planning stages.

**Table 1: PV88080 Pin Description**

Pin No.	Pin Name	Type (Table 2)	Description
1	FB_BK1 (VBK1)	AI	Feedback node for Buck1
2	STBY	DI	System standby signal or acting as power enable
3	SWBK1	AO	Switching node for Buck1 To be connected to output inductor
4	nIRQ	DO	Interrupt line towards the host Option role can be set by OTP: Buck2 voltage selection; MUTE flag; Power fail detect function flag; GPO.
5	PGNDBK2	VSS	Power Ground for Buck2
6	SWBK2	AO	Switching node for Buck2 To be connected to output inductor
7	VINBK2	PS	Supply voltage for Buck2 To be connected to VDD after Input Capacitor
8	FB_BK2 (VBK2)	AI	Feedback node for Buck2
9	VPP	VSS	Connect to VSS in application
10	GPIO2	DIO	General Purpose I/O Option roles can be set by OTP: Buck2 voltage selection; MUTE flag; TS source current output.
11	GPIO1	DIO	General Purpose I/O Option roles can be set by OTP: Buck2 voltage selection; MUTE flag.
12	SCL	DI	2-WIRE clock
13	SDA	DIO	2-WIRE data Option role can be set by OTP: GPO
14	LDO2P5V	AO	Supply for internal digital circuit.
15	AGND2	VSS	Analog Ground. Connected directly to the PCB ground plane.
16	AVDD	PS	Analog Supply Voltage, internally short to LDO5V and externally shorted by PCB trace.
17	FB_BK3 (VBK3)	AI	Feedback node for Buck3
18	VINBK3	PS	Supply voltage for Buck3 To be connected to VDD after Input Capacitor
19	SWBK3	AO	Switching node for Buck3 To be connected to output inductor
20	PGNDBK3	VSS	Power Ground for Buck3

## High Efficiency Advanced Feature 4-Channel PMIC

Pin No.	Pin Name	Type (Table 2)	Description
21	VINBK1	PS	Supply voltage for Buck1 To be connected to VDD after Input Capacitor
22	PGNDBK1	VSS	Power Ground for Buck1
23	LDO5V	AO	Analog Supply Voltage, internally short to AVDD
24	AGND1	VSS	Analog Ground. Connected directly to the PCB ground plane.
25	VIN_Supply	PS	High voltage supply for the HV buck controller
26	VBST	AO	Bootstrap node external cap
27	DRVH	AO	High side driver pin to drive external MOS
28	SW_HVBK	AO	Switching node for HV buck controller
29	DRVL	AO	Low side driver pin to drive external MOS
30	PGND_HVBK	VSS	Ground for HV buck controller
31	AVDD_HVBK	PS	Supply for HV buck controller driver block
32	FB_HVBK	AI	Feedback node for HV buck controller

**Table 2: Pin Type Definition**

Pin Type	Description	Pin Type	Description
DI	Digital Input	AI	Analog Input
DO	Digital Output	AO	Analog Output
DIO	Digital Input / Output	AIO	Analog Input / Output
PS	Power Supply	VSS	Ground

## High Efficiency Advanced Feature 4-Channel PMIC

### 3 Characteristics

#### 3.1 Absolute Maximum Ratings

Absolute Maximum Ratings indicate limits beyond which damage to the device may occur.

Recommended Operating Conditions are conditions for which the device is intended to be functional, but parameter specifications may not be guaranteed. For guaranteed specifications and associated test conditions, see the Min and Max limits and Conditions in the Electrical Characteristics tables. Electrical Characteristics table limits are guaranteed by production testing, design or correlation using standard Statistical Quality Control methods. Typical (Typ) specifications are mean or average values from characterization at 25 °C and are not guaranteed.

**Table 3: Absolute Maximum Ratings**

Parameter	Description	Conditions	Min	Max	Unit
T <sub>STG</sub>	Storage temperature		-60	+165	°C
T <sub>J</sub>	Junction temperature		-40	+125	°C
	Voltage at pins	Pins: FB_BK1, STBY, SWBK1, SWBK2, VINBK2, FB_BK2, SCL, AVDD, FB_BK3, VINBK3, SWBK3, VINBK1, LDO5V, DRVL, AVDD_HVBK, FB_HVBK	-0.3	5.5	V
		Pins: nIRQ, GPIO2, GPIO1, SDA, LDO2P5V,	-0.3	2.75	V
		Pins: VIN_Supply, SW_HVBK	-0.3	26	V
		Pins: VBST, DRVH	-0.3	31.5	V
		Pins: VBST-SW_HVBK, DRVH-SW_HVBK.	-0.3	5.5	V
	ESD compliance	Human body model		2	kV
		CDM		500	V

**Note 1** Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, so functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specification are not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## High Efficiency Advanced Feature 4-Channel PMIC

### 3.2 Recommended Operating Conditions

**Table 4: Recommended Operating Conditions**

Parameter	Description	Conditions	Min	Max	Unit
T <sub>A</sub>	Operating temperature		-40		+85

All voltages are referenced to VSS unless otherwise stated. Currents flowing into PV88080 are deemed positive, currents flowing out are deemed negative. Unless otherwise stated, all parameters are valid over the recommended temperature range and power supply range. Please note that the power dissipation must be limited to avoid overheating of PV88080. The maximum power dissipation should not be reached at maximum ambient temperature.

### 3.3 Electrical Characteristics

#### 3.3.1 Power Dissipation

The power that can be dissipated by this circuit is limited by the package, PCB technology and ambient temperature. The load on the various outputs must be limited to stay below the power dissipation limit for the PCB/ambient conditions.

An integrated over temperature protection circuit is provided to prevent the chip exceeding the safe operating range. The over temperature protection threshold is guaranteed to be a maximum junction temperature of T<sub>J</sub>=125 °C.

Use cases specified for the power dissipation are given in [Table 5](#).

**Table 5: Power Dissipation Use Cases**

Use Case			High Power Dissipation 1	High Power Dissipation 2	Low Power Dissipation 1
Package			QFN	QFN	QFN
Board Technology			4 layer 100mm*100mm	4 layer 100mm*100mm	2 layer 100mm*100mm
Block	Function	Voltage (V)	Current (mA)	Current (mA)	Current (mA)
Buck 1	CORE	1.2	5000	6000	3000
Buck 2	MEMORY	1.8	2000	3000	3000
Buck 3	AUX	3.3	2000	1000	3000
HV Buck Controller	Supply Buck1-3	5.0	20000	20000	10000

## High Efficiency Advanced Feature 4-Channel PMIC

### 3.3.2 Buck Converters / Controller

Buck1 to Buck3 are high efficiency synchronous step down regulators operating at 1 MHz frequency and providing individual output voltages with +/- 3% accuracy.

The default output voltages of these regulators are loaded from OTP and can be programmed in 5 mV steps. The switching frequency is chosen to be high enough to allow the use of a 1.5 uH inductor.

The buck converter has an automatic mode where it switches between synchronous mode (PWM) and sleep mode (PFM) depending on the load current. An internal zero crossing comparator is used to time the turn-off of the internal MOSFET, thereby removing the need for an external Schottky diode. The quiescent current for all these buck converters in PFM mode is 25 uA.

Each one of the three buck converters can be individually controlled (through I<sup>2</sup>C) by dedicated registers. All buck converter pins deliver high currents except the feedback pin.

Each one of the three buck converters contains a P-MOSFET on the high side and N-MOSFET on the low side. These two MOSFET devices are integrated inside the PV88080.

All PV88080 buck converters feature a programmable pull down resistors, which can be either enabled or disabled when the buck converters is powered down.

**Table 6: Bucks Summary**

Block	V <sub>OUT</sub>	I <sub>OUT</sub>	External Components	Control
Buck1	0.75 V - 3.3 V	PWM: 5000 mA	L=1.5 uH / C <sub>OUT</sub> > 60 uF	I <sup>2</sup> C
Buck2	0.9 V - 3.6 V	PWM: 2000 mA	L=1.5 uH / C <sub>OUT</sub> > 34 uF	I <sup>2</sup> C
Buck3	0.9 V - 3.6 V	PWM: 2000 mA	L=1.5 uH / C <sub>OUT</sub> > 34 uF	I <sup>2</sup> C
HV Buck Controller	0.8 V - 5.25V (V <sub>IN</sub> < 13.2 V) 1.8 V - 5.25 V (V <sub>IN</sub> > 13.2 V)	>10 A	L=1.5 uH / C <sub>OUT</sub> >130 uF	I <sup>2</sup> C

## High Efficiency Advanced Feature 4-Channel PMIC

### 3.3.3 Buck1 Core Voltage

Buck1 is a high efficiency synchronous step down regulators operating at 1 MHz frequency and providing individual output voltages with +/- 3% accuracy. The default output voltage of the regulator is loaded from OTP and can be programmed. The switching frequency is chosen to be high enough to allow the use of a 1.5 uH inductor. The standalone Buck1 can support the output load up to 6 A continuous current at nominal output voltage of 1.2 V. Maximum current depends on the system power dissipation calculation. Switch sizes are optimized for 1.2 V. The Buck1 converter supports dynamic voltage control (DVC) at the output voltage range of 0.75 V to 3.3 V.

The Buck1 converter has an automatic mode where it switches between synchronous mode (PWM) and sleep mode (PFM) depending on the load current. An internal zero crossing comparator is used to time the turn-off of the internal MOSFET, thereby removing the need for an external Schottky diode. The quiescent current for all these buck converters in PFM mode is 25 uA.

**Table 7: Electrical Characteristics  $V_{DD} = 4.75$  to  $5.25$  V**

Parameter	Description	Conditions	Min	Typ	Max	Unit
$V_{DD}$	Input voltage		4.75		5.25	V
$C_{OUT}$	Output capacitance	(including voltage and temperature coefficient)	60		200	$\mu$ F
LBK1	Inductor value		-20 %	1.5	20 %	$\mu$ H
VBUCK1	Output voltage	$I_{OUT} = 5$ A	0.75		3.3	V
	Output voltage accuracy	$V_{DD} = 5$ V $V_{OUT} = 1.01$ V, $I_{OUT} = 0$ A PWM operation	-3		3	%
	Load regulation	$V_{DD} = 5$ V, $V_{OUT} = 1.2$ V, $I_{OUT} = 0$ A~5 A PWM operation		1.67		%/A
	Line regulation	$V_{DD} = 4.75$ V ~ $5.25$ V $V_{OUT} = 1.2$ V, $I_{OUT} = 0$ A PWM operation		0.33		%/V
	Output Current			5000	6000	mA
$I_{Q\_OFF}$	Quiescent current in OFF mode				2	$\mu$ A
Fsw	Switching frequency			1		MHz
	Switching duty cycle		10		95	%

### 3.3.4 Buck2 Memory

Buck2 is a high efficiency synchronous step down regulators operating at 1 MHz frequency and providing individual output voltages with +/- 3% accuracy. The default output voltage of the regulator is loaded from OTP and can be programmed. The switching frequency is chosen to be high enough to allow the use of a 1.5 uH inductor. The standalone Buck2 can support the output load up to 3 A continuous current at nominal output voltage of 1.8 V. Maximum current depends on the system power dissipation calculation.

The Buck2 converter supports dynamic voltage control (DVC) at the output voltage range of 0.9 V to 3.6 V. The Buck2 converter has an automatic mode where it switches between synchronous mode

## High Efficiency Advanced Feature 4-Channel PMIC

(PWM) and sleep mode (PFM) depending on the load current. An internal zero crossing comparator is used to time the turn-off of the internal MOSFET, thereby removing the need for an external Schottky diode. The quiescent current for all these buck converters in PFM mode is 25  $\mu$ A.

**Table 8: Electrical Characteristics  $V_{DD} = 4.75$  to  $5.25$  V**

Parameter	Description	Conditions	Min	Typ	Max	Unit
$V_{DD}$	Input voltage		4.75		5.25	V
$C_{OUT}$	Output capacitance	(including voltage and temperature coefficient)	34	60	200	$\mu$ F

## High Efficiency Advanced Feature 4-Channel PMIC

### 3.3.5 Buck3 Aux

Buck3 is a high efficiency synchronous step down regulators operating at 1 MHz frequency and providing individual output voltages with +/- 3% accuracy. The default output voltage of the regulator is loaded from OTP and can be programmed. The switching frequency is chosen to be high enough to allow the use of a 1.5 uH inductor. The standalone Buck3 can support the output load up to 3 A continuous current at nominal output voltage of 3.3 V. Maximum current depends on the system power dissipation calculation. The Buck3 converter supports dynamic voltage control (DVC) at the output voltage range of 0.9 V to 3.6 V. The Buck3 converter has an automatic mode where it switches between synchronous mode (PWM) and sleep mode (PFM) depending on the load current.

An internal zero crossing comparator is used to time the turn-off of the internal MOSFET, thereby removing the need for an external Schottky diode. The quiescent current for all these buck converters in PFM mode is 25 uA.

**Table 9: Electrical Characteristics  $V_{DD} = 4.75$  to  $5.25$  V**

Parameter	Description	Conditions	Min	Typ	Max	Unit
$V_{DD}$	Input voltage		4.75		5.25	V
$C_{OUT}$	Output capacitance	(including voltage and temperature coefficient)	34	60	200	$\mu$ F
LBK3	Inductor value		-20 %	1.5	20 %	$\mu$ H
VBUCK3	Output voltage		0.9		3.6	V
	Output voltage accuracy	$V_{DD} = 5$ V $V_{OUT} = 3.25$ V, $I_{OUT} = 0$ A PWM operation	-3		3	%
	Load regulation	$V_{DD} = 5$ V, $V_{OUT} = 3.3$ V, $I_{OUT} = 0$ A~2 A PWM operation		1.21		%/A
	Line regulation	$V_{DD} = 4.75$ V ~ 5.25 V $V_{OUT} = 3.3$ V, $I_{OUT} = 0$ A PWM operation		0.6		%/V
	Output Current			2000	3000	mA
$I_{QFF}$	Quiescent current in OFF mode				2	$\mu$ A
Fsw	Switching frequency			1		MHz
	Switching duty cycle		10		95	%

## High Efficiency Advanced Feature 4-Channel PMIC

### 3.3.6 HV Buck Controller

The HV buck controller is a high efficiency synchronous step down controller. The Constant On Time (COT) control scheme enables the fast transient response with no external compensation components. The HV buck controller allows wide input voltage range (9 V to 26 V) and can support the output load up to 20 A. It operates at pseudo constant frequency at CCM and can support DCM operation. The default output voltage of the controller is loaded from OTP and can be programmed.

The switching frequency is chosen to be high enough to allow the use of a 1.5  $\mu$ H inductor. The high side and low side drivers are integrated internally and designed to drive the gate of the external N-MOSFET. The HV buck controller requires a bootstrap capacitor from SW\_HVBK to VBST to provide a floating voltage supply for the high side driver. The boot charging PMOS switch is integrated internally. There is an 8-bit internal DAC in HV buck controller.

The LSB of the DAC is 5 mV with output ranges from 0.8 V to 1.275 V. When the HV buck controller output voltage is set at 1.0 V, the controller regulates the VFB\_HVBK pin to DAC, such that  $V_{FB\_HVBK} = V_{OUT}$ . When the HV buck controller output voltage is set at 5.0 V, the controller regulates the VFB\_HVBK pin. The HV buck controller is designed to be very flexible to fit into various market applications. Therefore, several parameters are designed to be configurable including:

- OV, UV, OC, negative OC, zero current detection threshold,
- Soft-start / soft-stop slew rate,
- External MOSFET driver dead time,
- External MOSFET switching ringing suppression,
- Constant-on time and ramp characteristics.

**Table 10: Electrical Characteristics  $V_{DD} = 4.75$  to  $5.25$  V**

Parameter	Description	Conditions	Min	Typ	Max	Unit
$V_{DD}$	Supply voltage		4.75		5.25	V
$V_{IN}$	Input voltage		7		26	V

	DRVL-low to DRVH-high dead time			20		ns

**NOTE:**

A minimum RDS<sub>on</sub> of 3 milli-ohms for the low side MOSFET is recommend when utilizing mode switching.

## High Efficiency Advanced Feature 4-Channel PMIC

### 3.3.7 Core LDO

The core LDO generates the 2.5 V core supply for the digital.

**Table 11: Electrical Characteristics  $V_{DD} = 4.75$  to  $5.25$  V**

Parameter	Description	Conditions	Min	Typ	Max	Unit
$V_{DD}$	Supply voltage		4.75		5.25	V
$C_{IN}$	Decoupling capacitor			1		$\mu$ F
$C_{OUT}$	Stabilization capacitor	(including voltage and temperature coefficient at 2.5 V)	-55 %	1	+35 %	$\mu$ F
	ESR resistance	F=1 MHz			0.1	$\Omega$
$I_{OUT\_MAX}$	Max output current				4	mA

$V_{OUT\_TR\_LOAD}$	Load transient response	$V_{IN} = 9$ V, 12 V, 26 V $I_{OUT} = 1$ $\mu$ A to $I_{MAX}$ $t_r = t_f = 0.1$ $\mu$ s			90	mV
$V_{OUT\_TR\_LINE}$	Line transient response	$V_{IN} = 10.8$ V to 13.2 V 21.6 to 26.4 V $I_{OUT} = I_{MAX}$ $t_r = t_f = 10$ $\mu$ s			13	mV
$T_{ON}$	Turn on time	$V_{IN}=9$ V, 12 V, 26 V $V_{OUT}=10$ % to 90 % $I_{OUT}=0$ A		150	435	$\mu$ s

## High Efficiency Advanced Feature 4-Channel PMIC

Parameter	Description	Conditions	Min	Typ	Max	Unit
I <sub>OFF</sub>	Shut down current	V <sub>IN</sub> = 9 V			2.2	μA
OVP	Over voltage protection			5.1		V
OCP	Over current protection			225		mA

### 3.3.9 Power on Reset

PV88080 POR is generated when the Vin\_Supply pin voltage rises to 6.5 V. A POR event returns the chip to the NO POWER condition. All registers are cleared and the OTP is reloaded on the next start.

The hysteresis voltage of 500 mV maximum is implemented in PV88080.

**Table 13: Electrical Characteristics**

Parameter	Description	Conditions	Min	Typ	Max	Unit
V <sub>IN</sub>	Input voltage		7		26	V
V <sub>DD</sub>	Supply voltage		4.0		5.65	V
V <sub>REF</sub>	Reference voltage		-1%	1.2	1%	V
	IBIAS current accuracy		-3		3	%
V <sub>POR_HI</sub>	Upper POR threshold		6.5			V
V <sub>POR_HYS</sub>	POR hysteresis voltage				500	mV

### 3.3.10 Supply Monitoring

The 5 V V<sub>DD</sub> supply is monitored by the VDD fault comparator.

The circuits remain in the RESET state until 5 V has been established (V<sub>DD\_FLT\_LO</sub>).

If the 5 V V<sub>DD</sub> supply falls below V<sub>DD\_FLT\_TR</sub> the input supply is too low, and a fault condition is generated.

**Table 14: Electrical Characteristics V<sub>DD</sub> = 4.75 to 5.25 V**

Parameter	Description	Conditions	Min	Typ	Max	Unit
V <sub>POR_HI</sub>	Upper POR threshold	Digital core supply	2.25	2.375	2.5	V
V <sub>POR_LO</sub>	Lower POR threshold	Digital core supply		2.0		V
V <sub>DD_FLT</sub>	V <sub>DD</sub> fault			4.5		V
V <sub>DD_FLT_HYS</sub>	V <sub>DD</sub> fault hysteresis			100		mV
OT	Critical temperature		125	140	155	°C

## High Efficiency Advanced Feature 4-Channel PMIC

### 3.3.11 Fault Condition

A fault condition is generated by:

- An over temperature event,
- An under voltage of the 5 V supply

If a fault condition is detected the chip will signal an alert to the other chip, then follow its power down sequence without waiting for the other chip. At the end of the power down sequence the chip moves to the RESET state.

In the RESET state the registers, apart from the fault log, are reset and the OTP is reloaded at start-up.

**Table 15: Electrical Characteristics  $V_{DD} = 4.75$  to  $5.25$  V**

Parameter	Description	Conditions	Min	Typ	Max	Unit
$V_{DD}$	Supply voltage		4.75		5.25	V
$V_{DD\_FLT\_UPPER}$	$V_{DD}$ fault upper			4.5		V
$V_{DD\_FLT\_LWR}$	$V_{DD}$ fault lower			4.4		V
$V_{DD\_FLT\_CRIT}$	$V_{DD}$ fault critical			4.2		V

### 3.3.12 Digital I/O Signals

#### Standby Pin (STBY)

The STBY pin is an input which controls the power up sequence of a system containing PV88080. If STBY=0 the power up sequence is followed to ACTIVE mode. If STBY=1 the power down sequence is followed to STANDBY mode. STBY should be 0 at power up so that the system boots when power is applied.

#### Interrupt Request (nIRQ)

The nIRQ is an active low output signal which indicates that an interrupt causing event has occurred and status information is available in the related registers. Such information can be temperature, voltage and over current fault conditions.

When an event bit is set the nIRQ signal is asserted (unless masked by a bit in the IRQ mask register), the nIRQ is not released until the event registers have been cleared by writing to the related register with an assigned '1' for the bit to be cleared. The event registers should be written in PAGE/REPEATED mode because the nIRQ is not cleared until all registers with an asserted event have been reset. New events that occur during writing to the registers are held until all the event registers have been written. Then they are passed to the event register, ensuring the SOC does not miss them.

There are also some reserved options for the digital pins function/definition which are programmable by the OTP memory. [Table 16](#) shows the list of the options, and the functionality can be realized for different applications with proper role combinations of the pins.

High Efficiency Advanced Feature 4-Channel PMIC

Table 16: GPIO Functions Summary

	Sequencer Control GPO	Voltage Selection for Buck1/2/3 (digital in)	MUTE flag (digital out)	TS 10 uA source current (analog in/out)	TS flag (digital out)	Normal GPIO (digital in/out)

### 5 Functional Description

#### 5.1 Operating Modes

##### 5.1.1 NORMAL Mode - Default Power On Status

The default power up state is entered at start-up when VIN. Supply exceeds the POR threshold.

After start-up the SOC will either enable STANDBY mode, or configure the NORMAL operation mode via the I<sup>2</sup>C interface.

##### 5.1.2 STANDBY Mode

STANDBY mode is entered when the STBY input pin is driven to 2.5 V.

In STANDBY mode the device enters a low power state.

The standby and I/O 5.0 V supplies are maintained by HVBUCK controller, HVLDO and LDO\_Core.

The memory supplies from Buck 2, 3 are optionally maintained depending on OTP/I<sup>2</sup>C setting.

When the STBY pin is driven to 0 volts the system restarts NORMAL mode.

**Table 18: Functional Block Mode of Operation**

Block	Function	NORMAL Mode	STANDBY Mode
Buck 1	CORE	Enabled Voltage I <sup>2</sup> C Default 1.2 V	Off
Buck 2	MEMORY	Enabled Voltage I <sup>2</sup> C Default 1.8 V	I <sup>2</sup> C Default Off Voltage I <sup>2</sup> C Default 1.8 V
Buck 3	AUX	I <sup>2</sup> C Default Off Voltage I <sup>2</sup> C Default 3.3V	I <sup>2</sup> C Default Off Voltage I <sup>2</sup> C Default 3.3V

### 5.1.3 Power Sequence

The start-up sequence for a single PV88080 is summarized in [Table 19](#).

**Table 19: PV88080 Start-Up Sequence**

	Event	Action
1	VIN_Supply > 6.5 V	1. PV88080 POR, reset all register. 2. HVLDO generate 5 V supply.
2	HVLDO = 5.0 V	1. HVLDO = 5.0 V supplies bandgap reference voltage and bias current. 2. HVLDO = 5.0 V supply LDO_CORE to generate 2.5 V.
3	LDO_CORE = 2.5 V	LDO_CORE = 2.5 V supplies oscillator and entire digital IP
4	Digital circuitry is ready	1. Load OTP. 2. Enable / Disable block under I <sup>2</sup> C control. 3. Digital circuitry turns on AVDD_HVBK pre-regulator and HV buck loop. 4. AVDD_HVBK pre-regulator POR triggered.
5	AVDD_HVBK pre-regulator POR triggered	Digital circuitry turns on HV buck driver -> generating 5 V supply
6	HV buck controller 5 V buck supply OK	Turn on the switch between VINBK1 and AVDD_HVBK -> Switch HV buck driver supply to controller 5 V supply
7	Digital turn on analog IP	After all LV buck V <sub>IN</sub> UVLO, digital turns on the LV bucks sequentially determined by OTP or user application cases

The start-up sequence for multiple PV88080s are summarized in [Table 20](#).

**Table 20: Start-Up sequence for multiple PV88080s**

	Event	Action
1	VIN_Supply > 6.5 V	1. All PV88080 POR. Reset all registers in all PV88080. 2. HVLDO in each PV88080 generate 5 V supply.
2	HVLDO = 5.0 V	1. HVLDO = 5.0 V supplies bandgap reference voltage and bias current. 2. HVLDO = 5.0 V supply LDO_CORE to generate 2.5 V.
3	LDO_CORE = 2.5 V	LDO_CORE = 2.5 V supplies oscillator and entire digital IP
4	Digital circuitry is ready	1. Load OTP individually for all PV88080. 2. Enable / Disable block under I <sup>2</sup> C control.
5	PV88080-1 ONLY	1. Digital circuitry turns on AVDD_HVBK pre-regulator and HV buck loop. 2. AVDD_HVBK pre-regulator POR triggered. 3. Digital circuitry turns on HV buck driver -> generating 5 V supply. 4. HV buck controller 5 V buck supply OK -> Turn on the switch between VINBK1 and AVDD_HVBK -> Switch HV buck driver supply to controller 5 V supply.
6	Digital turn on analog IP in ALL PV88080	Digital circuitry turns on the LV bucks sequentially determined by OTP or user application cases in ALL PV88080

High Efficiency Advanced Feature 4-Channel PMIC

Figure 20: PV88080 Boot Sequence

High Efficiency Advanced Feature 4-Channel PMIC

5.2 Multiple PV88080 Power On/Off Behavior

For multiple PV88080 application, PV88080-1 acts as the master and the others act as the slaves.

The first PV88080 (PV88080-1) HV buck  $V_{OUT}$  range is 4.75 V to 5.25 V and supplies all the LV buck converters in all PV88080. The HVBUCK  $V_{OUT}$  from other PV88080 can be programmed to 0.9 V to 5.25 V. The PV88080-1 could configure one GPIO pin as the sequence control GPIO to connect the other PV88080's STDBY pin. Figure 20 shows the example of three PV88080 working together.

Figure 20: Proposal for mPV88080 Connection

## High Efficiency Advanced Feature 4-Channel PMIC

**Figure 21: Multiple PV88080 Connection Power on Sequence**

### 5.3 Multiple PV88080 Power On/Off Behavior

If a fault condition occurs when multiple PV88080 are connected, the behavior differs according to where the fault condition is. If a fault condition occurs in:

- PV88080-1 (master), all PV88080 are powered down and re-booted,
- other PV88080 (slaves), the power down and re-boot only happens in the PV88080 with the fault, the un-affected PV88080s stay powered up.

In the second example, however, the CPU or system can decide to power down and re-boot all PV88080s by asserting the PV88080-1 (master) standby pin.

### 5.4 HV Buck Controller Protection Behavior

#### 5.4.1 Over-Voltage (OV) Protection

HVBUCK controller over-voltage protection is performed by comparing the VFB with internal DAC output.

Once the OV signal is triggered, the digital core sequentially soft stops all the rails and then the HVBUCK controller is also turned off.

After a short period of time (around ~10 ms), HVBUCK controller is automatically re-started and turns on all the rails. The OV detection / protection function is disabled during DVC stage.

For the OV register bit and threshold voltage, see Section 6.

## High Efficiency Advanced Feature 4-Channel PMIC

### 5.4.2 Under-Voltage (UV) Protection

HVBUCK controller under-voltage protection is performed by comparing the VFB with internal DAC output.

Once the UV signal is triggered, the digital core sequentially soft stops all the rails and then the HVBUCK controller is also turned off.

After a short period of time (around ~10 ms), HVBUCK controller is automatically re-started and turns on all the rails.

The UV detection / protection function is disabled during DVC stage.

The UV filter time also applies to output Short Circuit Protection (SCP).

For the UV register bit and threshold voltage, see Section 6.

### 5.4.3 Positive Over-Current (P-OC) Protection

The positive over-current protection is achieved by detecting the voltage across the low side external NMOS  $V_{sd}$  ( $=-I_L \cdot R_{DS\_on}$ ) and compares this voltage to a pre-defined threshold. The inductor valley current is limited to the positive over-current threshold.

The positive over-current enable and threshold are configurable.

For the P-OC register bit and threshold voltage, see Section 6.

### 5.4.4 Negative Over-Current (N-OC) Protection

The negative over-current protection is achieved by detecting the voltage across the low side external NMOS  $V_{sd}$  ( $=-I_L \cdot R_{DS\_on}$ ) and compares this voltage to a pre-defined threshold. The inductor valley current is limited to the negative over-current threshold.

When the negative over-current is triggered, the buck controller IP turns off the low side external NMOS and turns on the high side external NMOS with normal on-time. This behavior is designed to avoid the inductor current flowing through the high side body diode.

The negative over-current enable and threshold are configurable.

For the N-OC register bit and threshold voltage, see Section 6.

### 5.4.5 Output Short Circuit Protection (SCP)

In the event of an output short, the PV88080 automatically enters SCP operation. There are several scenarios that can cause the device to enter SCP operation, which are shown in Figure 22 to Figure 27.

During normal start up, the output of the DAC ramps from 0V to 0.5V. Once the DAC output reaches 0.5 V, it stays at 0.5 V for 1 ms in order to check the SCP condition.

If  $V_{FB} < 0.3 \text{ V}$   $\Rightarrow$  output short is valid  $\Rightarrow$   $SCP=1$ , set DAC output to 0 V. Digital core to shut down and then power up the PV88080.

If  $V_{FB} > 0.3 \text{ V}$ , DAC continue to ramp up to target  $V_{OUT}$ . Once the target  $V_{OUT}$  is reached, PowerGood signal is enabled and the protection threshold is changed from 0.3 V to UV threshold.

For the SCP, DAC and UV threshold related register bit, see Section 6.

5.5 Buck Converter Output Voltage Selection Function

This function allows the output voltage of the Buck converter to be changed through the digital pins GPIO1, GPIO2, or nIRQ without changing the OTP setting. Additionally the digital register GPIO\_VBUCK\_CONF can be used to determine which output voltage is applied to which GPIO pin.

For converter Buck2, there is another feature for voltage selection throughout the digital pins, see Table 21.

Table 21: Output Voltage Selection Function Summary of Buck2 Converter

Output Voltage Selection		
Buck2 Output Voltage	GPIO1 Pull Low	GPIO1 Pull High
GPIO2 Pull Low	VBuck2	VBuck2_ALT
GPIO2 Pull High	VBuck1_ALT	VBuck3_ALT

For the related register bits see Section 6.

High Efficiency Advanced Feature 4-Channel PMIC

5.6 MUTE Function

This feature provides detection of a low system supply voltage.. The PV88080 sends out a flag signal with programmable polarity through the digital pins GPIO1, GPIO2, or nIRQ according to the OTP settings. This flag signal can be used to control any audio related components as a shutdown signal to prevent any unwanted audio "popping" noise from occurring in the system.

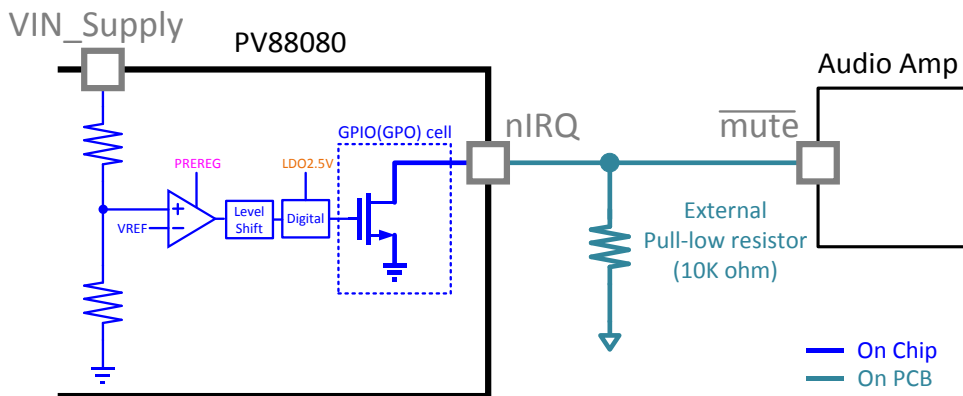

Figure 28: Typical Application of Mute Function

Figure 29: Mute Function Operation Level

## High Efficiency Advanced Feature 4-Channel PMIC

### 5.6.1 MUTE Levels

**Table 22: Electrical Characteristics  $V_{DD} = 4.75$  to  $5.25$  V**

Parameter	Description	Conditions	Min	Typ	Max	Unit
$V_{MUTE}$	MUTE detection level at VIN_Supply pin	mutelvl_sel = 00		8.5		V
		mutelvl_sel = 01		8		
		mutelvl_sel = 10		7.5		
		mutelvl_sel = 11		7		

### 5.6.2 Sequence of Power and Signals

For the typical application VIN\_Supply and rise time, the PMIC keeps the MUTE flag for approximately 20 msec from digital reset/OT load start. This is to create a deglitch time period for the slow power ramp up. Then the MUTE level detection is enabled and the MUTE flag is set accordingly.

**Figure 30: Sequence of Power and Signal - Condition I**

Figure 32 depicts a condition where the input supply is not capable of reaching the desired voltage level and is held below the OTP programmed Mute level. In this situation, the Mute signal will be continuously asserted.

High Efficiency Advanced Feature 4-Channel PMIC

Figure 31: Sequence of Power and Signal - Condition II

The MUTE function has 200 us one-way deglitch time. Once the VIN\_SUPPLY drops below MUTE level, the PMIC sends out the MUTE flag immediately. Only when VIN\_SUPPLY returns higher than the MUTE level continuously over the 200 us deglitch time, will the PMIC release the MUTE flag signal.

Figure 32: Sequence of Power and Signal - Condition III

The Mute function can also be used for power fail detection if the input supply voltage drops to levels programmed in Table 22.

High Efficiency Advanced Feature 4-Channel PMIC

5.7 Thermal Sensing and Power Fail Function

The internal comparator shown in Figure 33 and Figure 34 can be used to support multiple functions. Among these are power fail and thermal sensing. Figure 33 and Figure 34 illustrate how to connect GPIO2 pin to external passives to implement these two functions.

Figure 33 shows a typical NTC interface connected to the PV88080. This function provides thermal sensing for the system with an external NTC thermistor mounted on the system PCB where thermal conditions need to be sensed. With proper OTP setting, the PV88080 PMIC can source a 10 uA current through the GPIO2 pin. The voltage generated by the 10uA current source multiplied by the resistance (external resistor + external thermistor) at the pin GPIO2 is compared to the internal 1.2 V VREF, the PMIC will assert the nIRQ pin to the SOC system as an alert signal. The GPIO2 pin can also support power fail detection when configured as shown in Figure 34.

Figure 33: Typical application schematic of Thermal Sense Function

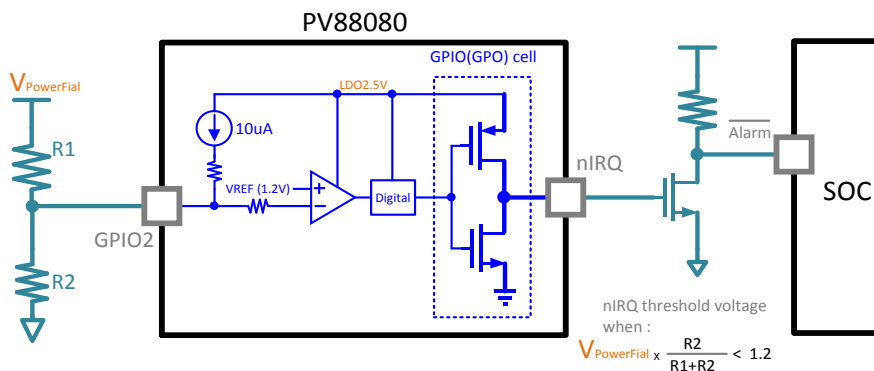

Figure 34: Typical application schematic of Power fail function

5.7.1 Function Description with Related Signals

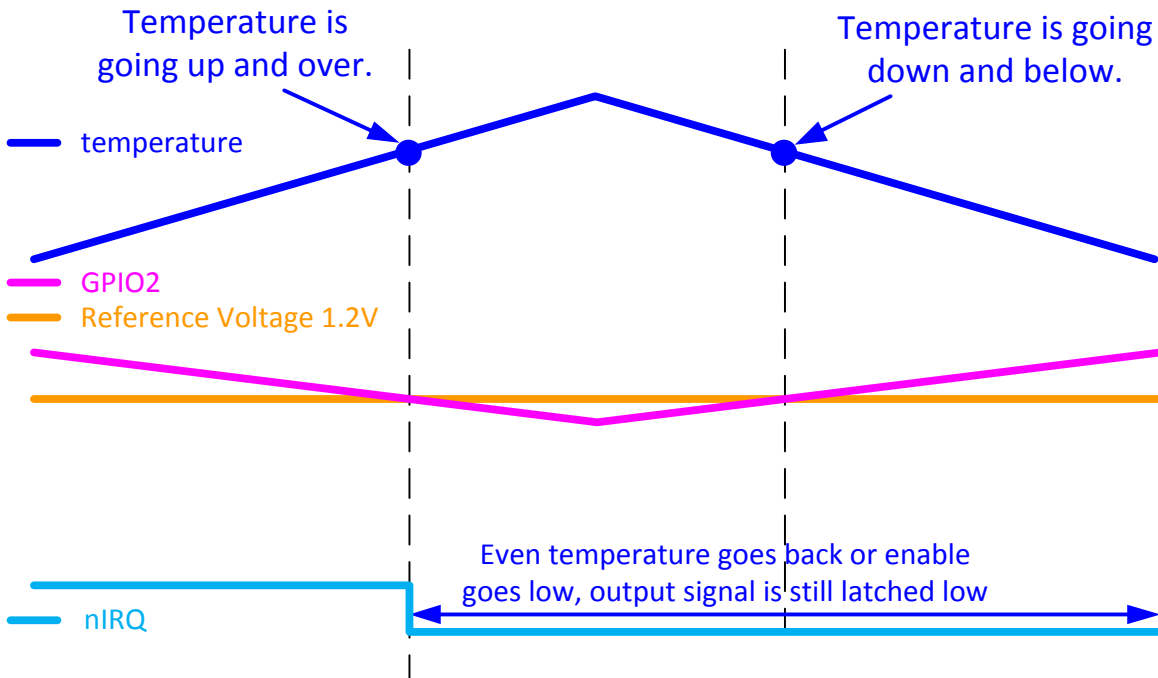

Figure 35: Thermal Sense Function Waveform

Table 23: Electrical Characteristics  $V_{DD} = 4.75$  to  $5.25$  V

Parameter	Description	Conditions	Min	Typ	Max	Unit
ISRC	Source current for the external thermal sensing function		9.7	10	10.3	uA
VOT_THR	Over temperature threshold		1.164	1.2	1.236	V

## High Efficiency Advanced Feature 4-Channel PMIC

### 5.8 2-Wire Interface

The 2-wire interface provides access to control and status registers. The interface supports operations compatible to standard, fast, fast-plus and high-speed mode of the I<sup>2</sup>C bus specification.

Communication on the 2-wire bus always takes place between two devices, one acting as the master and the other as the slave. The PV88080 will only operate as a slave. The 2-wire interface has direct access to two pages of the PV88080 register map (up to 256 addresses).

SCL carries the 2-wire clock and SDA carries the bi-directional data. The 2-wire interface is open-drain supporting multiple devices on a single line. The bus lines have to be pulled high by external pull-up resistors (2 kΩ to 20 kΩ). The attached devices only drive the bus lines low by connecting them to ground. As a result, two devices cannot conflict if they drive the bus simultaneously. In standard/fast mode the highest frequency of the bus is 400 kHz. The exact frequency can be determined by the application and it does not have any relation to the PV88080 internal clock signals. PV88080 follows the host clock speed within the described limitations and does not initiate any clock arbitration or slow down.

#### 5.8.1 Details of the 2-Wire Protocol

All data is transmitted across the 2-wire bus in groups of 8 bits. To send a bit the SDA line is driven at the intended state while the SCL is low. Once the SDA has settled, the SCL line is brought high and then low. This pulse on SCL clocks the SDA bit into the receivers shift register.

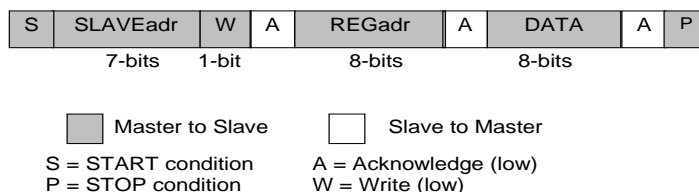

A two-byte serial protocol is used containing one byte for address and one byte data. Data and address transfer is transmitted MSB first for both read and write operations. All transmission begins with the START condition from the master during which the bus is in IDLE state (the bus is free). It is initiated by a high-to-low transition on the SDA line while the SCL is in the high state. A STOP condition is indicated by a low-to-high transition on the SDA line while the SCL is in the high state. The START and STOP conditions are illustrated in [Figure 36](#).

**Figure 36: Timing of the START and STOP Conditions**

The 2-wire bus will be monitored by PV88080 for a valid slave address whenever the interface is enabled. It responds immediately when it receives its own slave address. These acknowledge is done by pulling the SDA line low during the following clock cycle (white blocks marked with 'A' in the following figures).

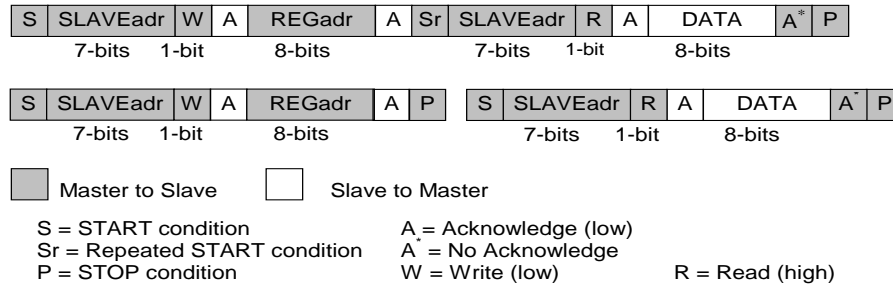

The protocol for a register write from master to slave consists of a START condition, a slave address, a read/write-bit, 8-bit address, 8-bit data, and a STOP condition. All bytes are responded by PV88080 with an ACK. A register write operation is illustrated in [Figure 37](#).

**Figure 37: Byte Write Operation**

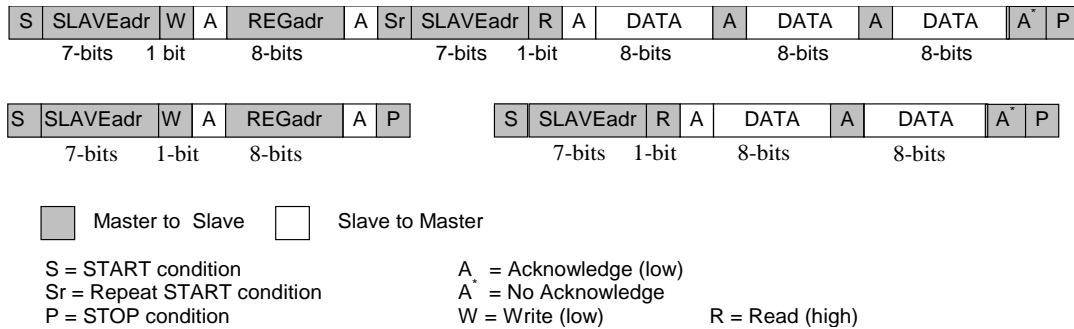

## High Efficiency Advanced Feature 4-Channel PMIC

When the host reads data from a register it first has to write access PV88080 with the target register address and then read access PV88080 with a repeated START or alternatively a second START condition. After receiving the data the host sends NACK and terminates the transmission with a STOP condition. This is illustrated in [Figure 38](#).

**Figure 38: Examples of Byte Read Operations**

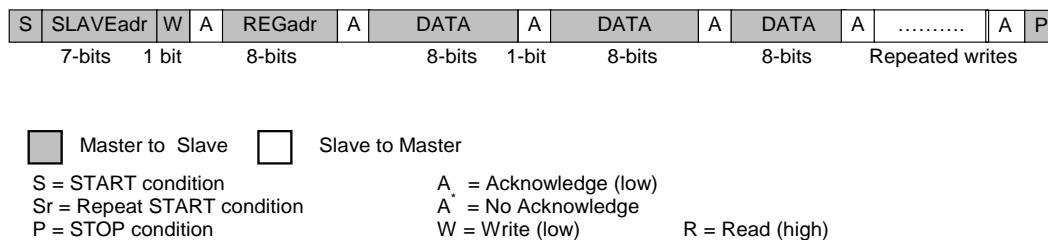

Consecutive (page) read out mode is initiated from the master by sending an ACK instead of NACK after receiving a byte. This is illustrated in [Figure 39](#). The 2-wire control block then increments the address pointer to the next register address and sends the data to the master. This enables an unlimited read of data bytes until the master sends a NACK directly after receiving the data, followed by a subsequent STOP condition. If a non-existent 2-wire address is read out then the PV88080 will return code zero.

**Figure 39: 2-Wire Page Read**

The slave address after the Repeated START condition must be the same as the previous slave address.

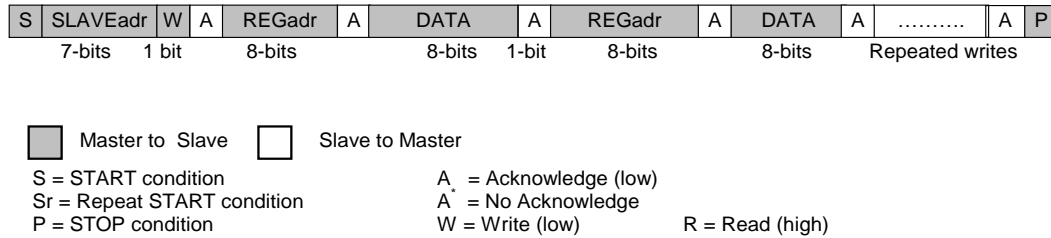

Consecutive (page) write mode is supported if the master sends several data bytes following a slave register address. The 2-wire control block then increments the address pointer to the next 2-wire address, stores the received data and sends an ACK until the master sends a STOP condition. The page write mode is illustrated in [Figure 40](#).

**Figure 40: 2-Wire Page Write**

## High Efficiency Advanced Feature 4-Channel PMIC

Using the control WRITE\_MODE a repeated write mode can be enabled. In this mode, the master can execute back-to-back write operations to non-consecutive addresses. This is achieved by transmitting register address and data pairs. The data is stored in the address specified by preceding byte. The repeated write mode is illustrated in [Figure 41](#).

**Figure 41: 2-Wire Repeated Write**

If a new START or STOP condition occurs within a message, the bus returns to IDLE-mode.

GPIO_NIRQ_PP	[1]	RW OTP	0x0	Push Pull	
				Value	Description
				0x0	0: Open Drain

## High Efficiency Advanced Feature 4-Channel PMIC

Field Name	Bits	Type	POR	Description	
				(POR) 0x1 1: Push-Pull	
GPIO_NIRQ_OUT_EN	[0]	RW OTP	0x0	Output Enable	
				Value	Description
				0x0 (POR)	0: GPI
				0x1	1: GPO

### 6.2.6 Register GPIO\_VBUCK\_CONF

Address	Name	POR value
0x001C	GPIO_VBUCK_CONF	0x00

7	6	5	4	3	2	1	0
VBUCK2_USE_2GPIO_SEL	GPO_SDA_ACTIVE_LOW	VBUCK3_GPIO_SEL	VBUCK2_GPIO_SEL	VBUCK1_GPIO_SEL			

Field Name	Bits	Type	POR	Description	
VBUCK2_USE_2GPIO_SEL	[7]	RW OTP	0x0	Buck2 use both GPIO_1, GPIO_0 to select the VBUCK_ALT, Buck1,3 will lost VBUCK_SEL function. Case({gpio_1, gpio_0}) 2'b00 : VBUCK2; 2'b01 : VBUCK2_ALT; 2'b10 : VBUCK1_ALT; 2'b11 : VBUCK3_ALT;	
				Value	Description
				0x0 (POR)	0: Disable
				0x1	1: Enable
GPO_SDA_ACTIVE_LOW	[6]	RW OTP	0x0	SDA use as GPO Active Low	
				Value	Description
				0x0 (POR)	0: Default (active high)
VBUCK3_GPIO_SEL	[5:4]	RW OTP	0x0	Over-ride VBUCK3 value with VBUCK2_ALT	
				Value	Description
				0x0 (POR)	00: Do Not Over-ride the value
				0x1	01: Over-ride the value when GPIO_0 is high
				0x2	10: Over-ride the value when GPIO_1 is high
0x3	11: Over-ride the value when NIRQ is high				
VBUCK2_GPIO_SEL	[3:2]	RW OTP	0x0	Over-ride VBUCK2 value with VBUCK2_ALT	
				Value	Description
				0x0 (POR)	00: Do Not Over-ride the value
				0x1	01: Over-ride the value when GPIO_0 is high

## High Efficiency Advanced Feature 4-Channel PMIC

Field Name	Bits	Type	POR	Description										
				0x2 10: Over-ride the value when GPIO_1 is high 0x3 11: Over-ride the value when NIRQ is high										
VBUCK1_GPIO_SEL	[1:0]	RW OTP	0x0	Over-ride VBUCK1 value with VBUCK1_ALT <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0x0 (POR)</td> <td>00: Do Not Over-ride the value</td> </tr> <tr> <td>0x1</td> <td>01: Over-ride the value when GPIO_0 is high</td> </tr> <tr> <td>0x2</td> <td>10: Over-ride the value when GPIO_1 is high</td> </tr> <tr> <td>0x3</td> <td>11: Over-ride the value when NIRQ is high</td> </tr> </tbody> </table>	Value	Description	0x0 (POR)	00: Do Not Over-ride the value	0x1	01: Over-ride the value when GPIO_0 is high	0x2	10: Over-ride the value when GPIO_1 is high	0x3	11: Over-ride the value when NIRQ is high
Value	Description													
0x0 (POR)	00: Do Not Over-ride the value													
0x1	01: Over-ride the value when GPIO_0 is high													
0x2	10: Over-ride the value when GPIO_1 is high													
0x3	11: Over-ride the value when NIRQ is high													

### 6.2.7 Register GPIO\_UP\_SEQ\_CONF

Address	Name	POR value
0x001D	GPIO_UP_SEQ_CONF	0x00

7	6	5	4	3	2	1	0
GPIO_1_UP_STEP				GPIO_0_UP_STEP			

Field Name	Bits	Type	POR	Description
GPIO_1_UP_STEP	[7:4]	RW OTP	0x0	Power Up Sequencer STEP for GPIO_1
				<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0x0 (POR)</td> <td></td> </tr> </tbody> </table>
Value	Description			
0x0 (POR)				
GPIO_0_UP_STEP	[3:0]	RW OTP	0x0	Power Up Sequencer STEP for GPIO_0
				<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0x0 (POR)</td> <td></td> </tr> </tbody> </table>
Value	Description			
0x0 (POR)				

## High Efficiency Advanced Feature 4-Channel PMIC

### 6.2.8 Register GPIO\_DN\_SEQ\_CONF

Address	Name	POR value
0x001E	GPIO_DN_SEQ_CONF	0x00

7	6	5	4	3	2	1	0
GPIO_1_DN_STEP				GPIO_0_DN_STEP			

Field Name	Bits	Type	POR	Description	
GPIO_1_DN_STEP	[7:4]	RW OTP	0x0	Power Down Sequencer STEP for GPIO_1	
				Value	Description
				0x0 (POR)	
GPIO_0_DN_STEP	[3:0]	RW OTP	0x0	Power Dn Sequencer STEP for GPIO_0	
				Value	Description
				0x0 (POR)	

### 6.2.9 Register GPO\_SDA\_SEQ\_CONF

Address	Name	POR value
0x001F	GPO_SDA_SEQ_CONF	0x00

7	6	5	4	3	2	1	0
GPO_SDA_DN_STEP				GPO_SDA_UP_STEP			

Field Name	Bits	Type	POR	Description	
GPO_SDA_DN_STEP	[7:4]	RW OTP	0x0	Power Down Sequencer STEP for GPO_SDA	
				Value	Description
				0x0 (POR)	
GPO_SDA_UP_STEP	[3:0]	RW OTP	0x0	Power Up Sequencer STEP for GPO_SDA	
				Value	Description
				0x0 (POR)	

## High Efficiency Advanced Feature 4-Channel PMIC

### 6.2.10 Register GPIO\_NIRQ\_SEQ\_CONF

Address	Name	POR value
0x0020	GPIO_NIRQ_SEQ_CONF	0x00

7	6	5	4	3	2	1	0
GPIO_NIRQ_DN_STEP				GPIO_NIRQ_UP_STEP			

Field Name	Bits	Type	POR	Description
GPIO_NIRQ_DN_STEP	[7:4]	RW OTP	0x0	Power Down Sequencer STEP for GPIO_NIRQ
				Value Description
				0x0 (POR)
GPIO_NIRQ_UP_STEP	[3:0]	RW OTP	0x0	Power Up Sequencer STEP for GPIO_NIRQ
				Value Description
				0x0 (POR)

## High Efficiency Advanced Feature 4-Channel PMIC

### 6.3 Sequencer

#### 6.3.1 Register ID\_0

Address	Name	POR value
0x0021	ID_0	0x01

7	6	5	4	3	2	1	0
Reserved	Reserved	Reserved	Reserved	WAIT_ID_ALWAYS	Reserved 0	Reserved 0	Reserved 1

Field Name	Bits	Type	POR	Description	
WAIT_ID_ALWAYS	[3]	RW OTP	0x0	WAIT_ID Configuration: 0: Only Perform the WAIT_ID Step on First Use of Sequencer, 1: Perform the WAIT_ID Step on Subsequent Uses of Sequencer.	
				Value	Description
				0x0 (POR)	0:First Use
				0x1	1:Always

#### 6.3.2 Register HV\_BUCK\_STEP

Address	Name	POR value
0x0022	HV_BUCK_STEP	0x00

7	6	5	4	3	2	1	0
HV_BUCK_STDBY_STEP				HV_BUCK_STEP			

Field Name	Bits	Type	POR	Description	
HV_BUCK_STDBY_STEP	[7:4]	RW OTP	0x0	Power Sequencer Time for HV Buck STDBY Voltage change	
				Value	Description
				0x0 (POR)	
HV_BUCK_STEP	[3:0]	RW OTP	0x0	Power Sequencer Time for HV Buck	
				Value	Description
				0x0 (POR)	

## High Efficiency Advanced Feature 4-Channel PMIC

### 6.3.3 Register BUCK\_1\_2\_STEP

Address	Name	POR value
0x0024	BUCK_1_2_STEP	0x00

7	6	5	4	3	2	1	0
BUCK2_STEP				BUCK1_STEP			

Field Name	Bits	Type	POR	Description
BUCK2_STEP	[7:4]	RW OTP	0x0	Power Sequencer Time forBUCK2
				Value Description
				0x0 (POR)
BUCK1_STEP	[3:0]	RW OTP	0x0	Power Sequencer Time forBUCK1
				Value Description
				0x0 (POR)

### 6.3.4 Register BUCK\_3\_STEP

Address	Name	POR value
0x0025	BUCK_3_STEP	0x00

7	6	5	4	3	2	1	0
Reserved	Reserved	Reserved	Reserved	BUCK3_STEP			

Field Name	Bits	Type	POR	Description
BUCK3_STEP	[3:0]	RW OTP	0x0	Power Sequencer Time forBUCK3
				Value Description
				0x0 (POR)

### 6.3.5 Register SEQ\_STATUS

Address	Name	POR value
0x0026	SEQ_STATUS	0x00

7	6	5	4	3	2	1	0
SEQ_POINTER				WAIT_STEP			

Field Name	Bits	Type	POR	Description
SEQ_POINTER	[7:4]	RW	0x0	Actual Pointer Position (Time Slot) of Power Sequencer
				Value Description
				0x0 (POR)
WAIT_STEP	[3:0]	RW	0x0	Power Sequencer Time for Wait Step

## High Efficiency Advanced Feature 4-Channel PMIC

		OTP		Value	Description
				0x0 (POR)	

### 6.3.6 Register SEQ\_A

Address	Name	POR value
0x0027	SEQ_A	0x96

7	6	5	4	3	2	1	0
POWER_END				SYSTEM_END			

Field Name	Bits	Type	POR	Description
POWER_END	[7:4]	RW OTP	0x9	OTP Pointer - Last Supply of Domain POWER
				Value
				0x9 (POR)
SYSTEM_END	[3:0]	RW OTP	0x6	OTP Pointer - Last Supply of Domain SYSTEM
				Value
				0x6 (POR)

### 6.3.7 Register SEQ\_B

Address	Name	POR value
0x0028	SEQ_B	0x49

7	6	5	4	3	2	1	0
Reserved 0	Reserved 1	Reserved 0	Reserved 0	MAX_COUNT			

Field Name	Bits	Type	POR	Description
MAX_COUNT	[3:0]	RW OTP	0x9	OTP Pointer - Last Supply of Domain POWER1
				Value
				0x9 (POR)

## High Efficiency Advanced Feature 4-Channel PMIC

### 6.3.8 Register SEQ\_TIMER

Address	Name	POR value
0x0029	SEQ_TIMER	0x3D

7	6	5	4	3	2	1	0
SEQ_DUMMY				SEQ_TIME			

Field Name	Bits	Type	POR	Description	
SEQ_DUMMY	[7:4]	RW OTP	0x3	Time for empty Sequence slots	
				Value	Description
				0x0	0000: 32usec
				0x1	0001: 64usec
				0x2	0010: 96usec
				0x3 (POR)	0011: 128usec
				0x4	0100: 160usec
				0x5	0101: 192usec
				0x6	0110: 224usec
				0x7	0111: 256usec
				0x8	1000: 288usec
				0x9	1001: 384usec
				0x10	1010: 448usec
				0x11	1011: 512usec
				0x12	1100: 1.024msec
				0x13	1101: 2.048msec
SEQ_TIME	[3:0]	RW OTP	0xd	Time for each non-empty Sequence slot	
				Value	Description
				0x0	0000: 32usec
				0x1	0001: 64usec
				0x2	0010: 96usec
				0x3	0011: 128usec
				0x4	0100: 160usec
				0x5	0101: 192usec
				0x6	0110: 224usec
				0x7	0111: 256usec
				0x8	1000: 288usec
				0x9	1001: 384usec
				0x10	1010: 448usec
				0x11	1011: 512usec
0x12	1100: 1.024msec				
0x13	1101: 2.048msec				

## High Efficiency Advanced Feature 4-Channel PMIC

			0x14	1110: 4.096msec
			0x15	1111: 8.192msec

### 6.4 Supplies

#### 6.4.1 Register BUCK1\_CONF0

Address	Name	POR value
0x002A	BUCK1_CONF0	0x50

7	6	5	4	3	2	1	0
BUCK1_EN	VBUCK1						

Field Name	Bits	Type	POR	Description	
BUCK1_EN	[7]	RW OTP	0x0	BUCK Enable	
				Value	Description
				0x0 (POR)	0:Disabled
				0x1	1:Enabled
VBUCK1	[6:0]	RW OTP	0x50	Buck Target Voltage. $V_{out} = (1+v_{range\_gain}) * (((0.8 * v_{dac\_range}) + 0.6) + 0.003125 * 2 * V_{Buck}[6:0])$	
				Value	Description
				0x0	

#### 6.4.2 Register BUCK1\_CONF0\_ALT

Address	Name	POR value
0x002B	BUCK1_CONF0_ALT	0x50

7	6	5	4	3	2	1	0
Reserved	VBUCK1_ALT						

Field Name	Bits	Type	POR	Description	
VBUCK1_ALT	[6:0]	RW OTP	0x50	ALT. Buck Target Voltage. $V_{out} = (1+v_{range\_gain}) * (((0.8 * v_{dac\_range}) + 0.6) + 0.003125 * 2 * V_{Buck}[6:0])$	
				Value	Description
				0x0	

## High Efficiency Advanced Feature 4-Channel PMIC

### 6.4.3 Register BUCK1\_CONF1

Address	Name	POR value
0x002C	BUCK1_CONF1	0x29

7	6	5	4	3	2	1	0
BUCK1_PD_DIS	Reserved 0	Reserved 1	Reserved	BUCK1_SYNC_ILIM		BUCK1_MODE	

Field Name	Bits	Type	POR	Description	
BUCK1_PD_DIS	[7]	RW OTP	0x0	Pull down disable	
				<b>Value</b>	<b>Description</b>
				0x0 (POR)	0: Enable PD in OFF Mode
				0x1	1: Disable PD in OFF Mode
BUCK1_SYNC_ILIM	[3:2]	RW OTP	0x2	BUCK Current Limit:	
				<b>Value</b>	<b>Description</b>
				0x0	00: 3230mA
				0x1	01: 5130mA
				0x2 (POR)	10: 6960mA
BUCK1_MODE	[1:0]	RW OTP	0x1	BUCK Operating Mode:	
				<b>Value</b>	<b>Description</b>
				0x0	00: Sleep Mode (PFM)
				0x1 (POR)	01: Automatic Mode
				0x2	10: Synchronous Mode (PWM)
0x3	11: Reserved				

### 6.4.4 Register BUCK2\_CONF0

Address	Name	POR value
0x002D	BUCK2_CONF0	0x50

7	6	5	4	3	2	1	0
BUCK2_EN	VBUCK2						

Field Name	Bits	Type	POR	Description	
BUCK2_EN	[7]	RW OTP	0x0	BUCK Enable	
				<b>Value</b>	<b>Description</b>
				0x0 (POR)	0: Disabled
				0x1	1: Enabled
VBUCK2	[6:0]	RW OTP	0x50	Buck Target Voltage. $V_{out} = (1+v_{range\_gain}) * ((0.8 * v_{dac\_range} + 0.6) + 0.003125 * 2 * V_{Buck}[6:0])$	

## High Efficiency Advanced Feature 4-Channel PMIC

Value	Description
0x0	

### 6.4.5 Register BUCK2\_CONF0\_ALT

Address	Name	POR value
0x002E	BUCK2_CONF0_ALT	0x50

7	6	5	4	3	2	1	0
Reserved	VBUCK2_ALT						

Field Name	Bits	Type	POR	Description
VBUCK2_ALT	[6:0]	RW OTP	0x50	ALT. Buck Target Voltage. $V_{out} = (1+v_{range\_gain}) * (((0.8 * v_{dac\_range}) + 0.6) + 0.003125 * 2 * V_{Buck}[6:0])$
				Value Description
				0x0

### 6.4.6 Register BUCK2\_CONF1

Address	Name	POR value
0x002F	BUCK2_CONF1	0x29

7	6	5	4	3	2	1	0
BUCK2_PD_DIS	Reserved 0	Reserved 1	Reserved	BUCK2_SYNC_ILIM		BUCK2_MODE	

Field Name	Bits	Type	POR	Description
BUCK2_PD_DIS	[7]	RW OTP	0x0	Pull down disable
				Value Description
				0x0 (POR) 0: Enable PD in OFF Mode 0x1 1: Disable PD in OFF Mode
BUCK2_SYNC_ILIM	[3:2]	RW OTP	0x2	BUCK Current Limit:
				Value Description
				0x0 00: 1496mA 0x1 01: 2393mA 0x2 (POR) 10: 3291mA 0x3 11: 4189mA
BUCK2_MODE	[1:0]	RW OTP	0x1	BUCK Operating Mode:
				Value Description
				0x0 00: Sleep Mode (PFM) 0x1 (POR) 01: Automatic Mode 0x2 10: Synchronous Mode (PWM)

High Efficiency Advanced Feature 4-Channel PMIC

				0x3	11: Reserved
--	--	--	--	-----	--------------

6.4.7 Register BUCK3\_CONF0

Address	Name	POR value
0x0030	BUCK3_CONF0	0x50

7	6	5	4	3	2	1	0
BUCK3_EN	VBUCK3						

Field Name	Bits	Type	POR	Description
BUCK3_EN	[7]	RW OTP	0x0	BUCK Enable
				Value Description
				0x0 (POR) 0:Disabled
				0x1 1:Enabled
VBUCK3	[6:0]	RW OTP	0x50	Buck Target Voltage. $V_{out} = (1+v_{range\_gain}) * (((0.8 * v_{dac\_range}) + 0.6) + 0.003125 * 2 * V_{Buck}[6:0])$
				Value Description
				0x0

6.4.8 Register BUCK3\_CONF0\_ALT

Address	Name	POR value
0x0031	BUCK3_CONF0_ALT	0x50

7	6	5	4	3	2	1	0
Reserved	VBUCK3_ALT						

Field Name	Bits	Type	POR	Description
VBUCK3_ALT	[6:0]	RW OTP	0x50	ALT. Buck Target Voltage. $V_{out} = (1+v_{range\_gain}) * (((0.8 * v_{dac\_range}) + 0.6) + 0.003125 * 2 * V_{Buck}[6:0])$
				Value Description
				0x0

## High Efficiency Advanced Feature 4-Channel PMIC

### 6.4.9 Register BUCK3\_CONF1

Address	Name	POR value
0x0032	BUCK3_CONF1	0x29

7	6	5	4	3	2	1	0
BUCK3_PD_DIS	Reserved 0	Reserved 1	Reserved	BUCK3_SYNC_ILIM		BUCK3_MODE

High Efficiency Advanced Feature 4-Channel PMIC

7.1.4 MOSFET

Ref	RDSON at VGS=4.5 V (mOhm)	Size (WxLxH) [mm]	VDS Rating [V]	Part Number
HVBuck	3.6	5.3x6.15x1	40	AON6232

## High Efficiency Advanced Feature 4-Channel PMIC

### 7.2 PCB Layout Guide

#### 7.2.1 LVBUCK converter

- Put all the power components  $C_{in}$ ,  $L$  and  $C_{out}$  as close to chip as possible.
- Make the trace SWBK as thick and short as possible for lower parasitic impedances and lower EMI.
- Keep the trace FB\_BK away from noisy trace for example: SWBK. And the start point of the FB\_BK trace should be capacitor pad.
- Make the PGND loop trace as thick and short as possible to minimize the parasitic impedances.
- Make sure the power trace to load is thick enough or not too long when using the remote sensing topology. The parasitic inductance of the power trace should be lower than the equation as below.

$$\frac{1}{2\pi\sqrt{L_p \times C_{load}}} > 5 \times (\text{unit gain bandwidth})$$

where the unit gain bandwidth is around 100KHz for PV88080 LVBUCKs. For example, if the  $C_{load}$  is  $4.7\mu\text{F}$ , the  $L_p$  should lower than 21nH.

Figure 42: LVBuck Converter Block

## High Efficiency Advanced Feature 4-Channel PMIC

### 7.2.2 HVBUCK controller

- Put the capacitors CBST and CAVDD\_HV as close to the chip as possible.
- Put the feedback divider RFB1 and RFB2 and feedforward capacitor CFF close to the chip.
- Keep the trace FBBK and FB\_HVBK away from noisy trace for example: DRVH, DRVL, SW\_HVBK. And the start point of the FBBK trace should be Cout capacitor pad.
- Put all the power components Cin, M1, M2, L and Cout as close as possible to minimize the power loop. And make sure all the power trace be thick and short.
- Do not cross over the trace DRVH with DRVL, adding GND between them.
- Do not cross over the trace DRVL with SW\_HVBK, adding GND between them.

Figure 43: HVBUCK Controller Block

## High Efficiency Advanced Feature 4-Channel PMIC

### 7.2.3 Other Stages

- Put the capacitors CHVLDO\_in, CLDO\_out, CAVDD\_in and CLDO2\_out as close to the chip as possible.
- Keep the I2C trace away from noisy trace, adding GND between SDA and SCL trace.
- Keep the trace GPIO2 away from noisy trace and keep RT as close to the chip when it be set to thermal sensing mode.
- Do not connect AGND to PGND directly. Using a 0R resistor or bead to connect them would be better.

## 9 Ordering Information

The ordering number consists of the part number followed by a suffix indicating the packing method. The xxx represents a placeholder for the specific OTP variant. For details and availability, please consult Dialog Semiconductor’s customer support portal or your local sales representative.

**Table 24: Ordering Information**

Part Number (Note 1)	Package Information	Package Description	Pack Outline
PV88080-xxxFR1	32 pin FC-MQFN	Waffle Tray	Figure 46
PV88080-xxxFR2	32 pin FC-MQFN	Tape and Reel	Figure 46

Note 1 xxx is the OTP variant. Please refer the detail information in OTP variant application note.

Package Marking (Laser)				
	Marking Content			
			Logo	
1st	P	V	8 8 0 8 0	Part No.
2nd	X	X	X	OTP Variant
3rd	y	y	w w z z z z	Date Code
Pin 1 Corner >	•			
Date Code Format: yy = Year, ww = Week, zzzz = see below				

**Figure 47: PV88080 Package Marking**

Where zzzz = first z is wafer fab, second z is assembly supplier, third and fourth z are unique lot identifiers.

### Status Definitions

Revision	Datasheet Status	Product Status	Definition
1.<n>	Target	Development	This datasheet contains the design specifications for product development. Specifications may be changed in any manner without notice.
2.<n>	Preliminary	Qualification	This datasheet contains the specifications and preliminary characterization data for products in pre-production. Specifications may be changed at any time without notice in order to improve the design.
3.<n>	Final	Production	This datasheet contains the final specifications for products in volume production. The specifications may be changed at any time in order to improve the design, manufacturing and supply. Major specification changes are communicated via Customer Product Notifications. Datasheet changes are communicated via <a href="http://www.dialog-semiconductor.com">www.dialog-semiconductor.com</a> .
4.<n>	Obsolete	Archived	This datasheet contains the specifications for discontinued products. The information is provided for reference only.

### RoHS Compliance

Dialog Semiconductor's suppliers certify that its products are in compliance with the requirements of Directive 2011/65/EU of the European Parliament on the restriction of the use of certain hazardous substances in electrical and electronic equipment. RoHS certificates from our suppliers are available on request.
