

### Features

- Logic & Mixed Signal Circuits
- Highly Versatile Macrocells
- Read Back Protection (Read Lock)
- 1.8 V (±5 %) to 5 V (±10 %) Supply
- Operating Temperature Range: -40 °C to 85 °C
- RoHS Compliant / Halogen-Free
- 20-pin STQFN: 2 x 3 x 0.55 mm, 0.4 mm pitch

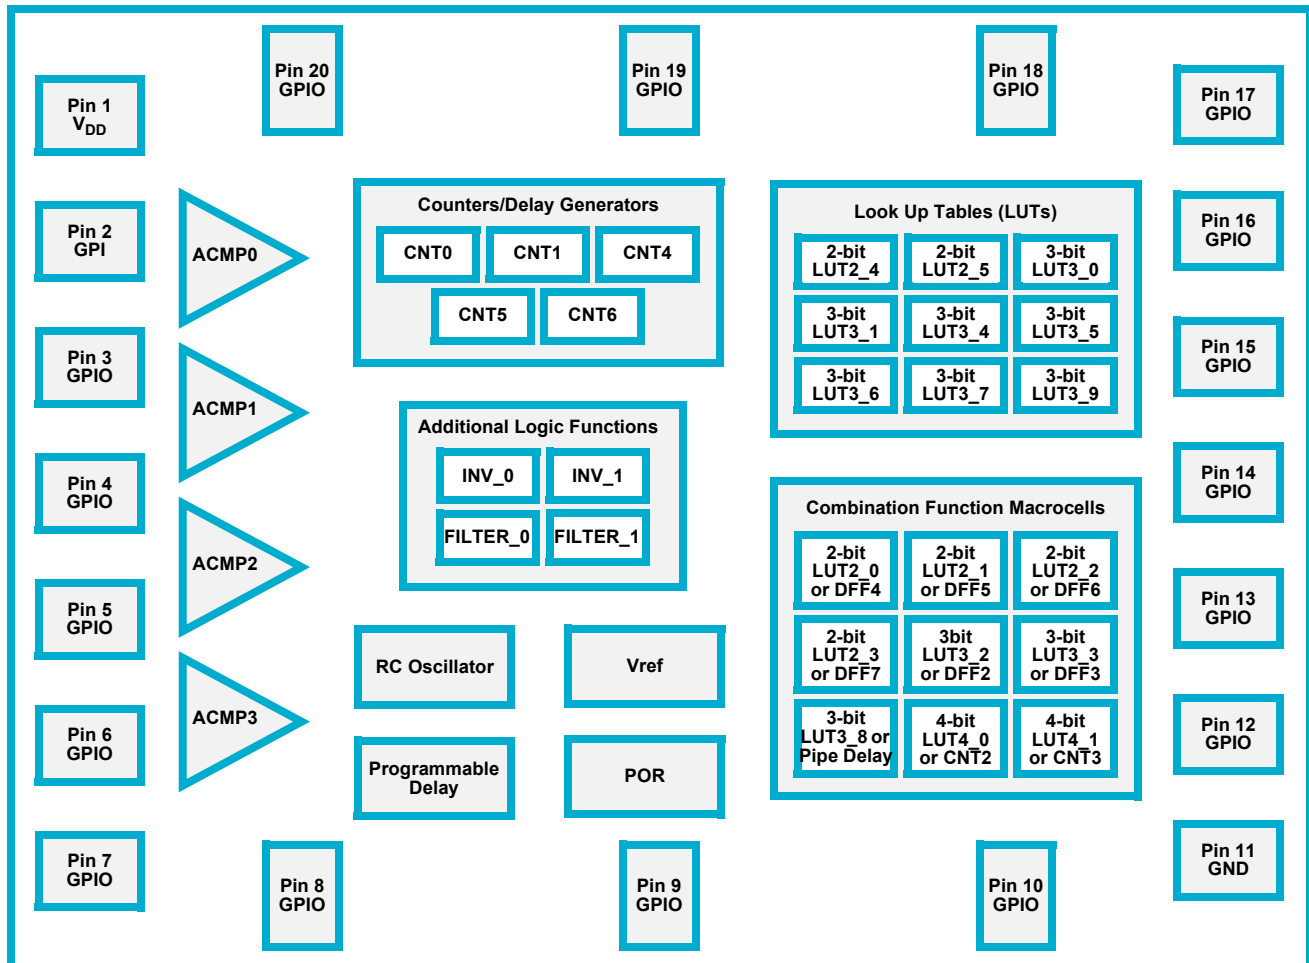

### Applications

- Personal Computers and Servers
- PC Peripherals
- Consumer Electronics
- Data Communications Equipment
- Handheld and Portable Electronics

### Pin Configuration

### Block Diagram

## 1.0 Overview

The SLG46721 provides a small, low power component for commonly used mixed-signal functions. The user creates their circuit design by programming the one time Non-Volatile Memory (NVM) to configure the interconnect logic, the I/O Pins and the macrocells of the SLG46721. This highly versatile device allows a wide variety of mixed-signal functions to be designed within a very small, low power single integrated circuit. The macrocells in the device include the following:

- Four Analog Comparators (ACMP)
- Two Voltage References (Vref)
- Nine Combinatorial Look Up Tables (LUTs)
  - Two 2-bit LUTs
  - Seven 3-bit LUTs
- Nine Combination Function Macrocells
  - Four Selectable DFF/Latch or 2-bit LUTs
  - Two Selectable DFF/Latch or 3-bit LUTs
  - One Selectable Pipe Delay or 3-bit LUT
  - Two Selectable CNT/DLY or 4-bit LUTs
- Five Counter / Delay Generators (CNT/DLY)
  - One 14-bit delay/counter
  - One 14-bit delay/counter with external clock/reset
  - Three 8-bit delays/counters
- Pipe Delay – 16 stage/3 output (Part of Combination Function Macrocell)
- Programmable Delay
- Additional Logic Functions
  - Two Inverters
  - Two Deglitch Filters
- RC Oscillator (RC OSC)

## 2.0 Pin Description

### 2.1 Functional and Programming Pin Description

Pin #	Pin Name	Function	Programming Function
1	V <sub>DD</sub>	Power Supply	Power Supply
2	GPI	General Purpose Input	V <sub>PP</sub> (Programming Voltage)
3	GPIO	General Purpose I/O with OE	Reset
4	GPIO	General Purpose I/O	N/A
5	GPIO	General Purpose I/O with OE	N/A
6	GPIO	General Purpose I/O or Analog Comparator 0 (+)	N/A
7	GPIO	General Purpose I/O with OE or Analog Comparator 0 (-)	N/A
8	GPIO	General Purpose I/O	N/A
9	GPIO	General Purpose I/O with OE	N/A
10	GPIO	General Purpose I/O or Analog Comparator 1 (+)	N/A
11	GND	Ground	Ground
12	GPIO	General Purpose I/O or External Vref (ACMP1 IN-)	N/A
13	GPIO	General Purpose I/O with OE or Analog Comparator 2 (+)	N/A
14	GPIO	General Purpose I/O with OE or Analog Comparator 2 (-) (ACMP3 IN-)	N/A
15	GPIO	General Purpose I/O or Analog Comparator 3 (+)	N/A
16	GPIO	General Purpose I/O with OE	Programming Mode Control
17	GPIO	General Purpose I/O	Programming ID Pin
18	GPIO	General Purpose I/O with OE and Vref output (VREF1)	Programming SDIO Pin
19	GPIO	General Purpose I/O with OE and Vref output (VREF0)	Programming SRDWB Pin
20	GPIO	General Purpose I/O or External Clock Input	Programming SCL Pin

### 3.0 User Programmability

The SLG46721 is a user programmable device with One-Time-Programmable (OTP) memory elements that are able to construct combinatorial logic elements. Three of the I/O Pins provide a connection for the bit patterns into the OTP on board memory. A programming development kit allows the user the ability to create initial devices. Once the design is finalized, the programming code (.gpx file) is forwarded to Renesas Electronics Corporation to integrate into a production process.

Figure 1. Steps to create a custom GreenPAK device

## 4.0 Ordering Information

Part Number	Type
SLG46721V	20-pin STQFN
SLG46721VTR	20-pin STQFN - Tape and Reel (3k units)

*Note 1: Use SLG46721V to order. Shipments are automatically in Tape and Reel.*

*Note 2: "TR" suffix is no longer used. It is a legacy naming convention shown here only for informational purposes.*

## 5.0 Electrical Specifications

### 5.1 Absolute Maximum Conditions

Parameter		Min.	Max.	Unit
Supply Voltage on $V_{DD}$ relative to GND		-0.5	7	V
DC Input Voltage		GND - 0.5	$V_{DD} + 0.5$	V
Maximum Average or DC Current (Through pin)	Push-Pull 1x	--	8	mA
	Push-Pull 2x	--	10	
	OD 1x	--	8	
	OD 2x	--	12	
	OD 4x	--	25	
Current at Input Pin		-1.0	1.0	mA
Storage Temperature Range		-65	150	°C
Junction Temperature		--	150	°C
ESD Protection (Human Body Model)		2000	--	V
ESD Protection (Charged Device Model)		1300	--	V
Moisture Sensitivity Level		1		

### 5.2 Electrical Characteristics (1.8 V $\pm$ 5 % $V_{DD}$ )

Symbol	Parameter	Condition/Note	Min.	Typ.	Max.	Unit
$V_{DD}$	Supply Voltage		1.71	1.80	1.89	V
$T_A$	Operating Temperature		-40	25	85	°C
$V_{AIR}$	Analog Input Voltage Range	Positive Input	0	--	$V_{DD}$	V
		Negative Input	0	--	1.1	V
$V_{IH}$	HIGH-Level Input Voltage	Logic Input	1.100	--	--	V
		Logic Input with Schmitt Trigger	1.270	--	--	V
		Low-Level Logic Input	0.980	--	--	V
$V_{IL}$	LOW-Level Input Voltage	Logic Input	--	--	0.690	V
		Logic Input with Schmitt Trigger	--	--	0.440	V
		Low-Level Logic Input	--	--	0.520	V
$I_{LKG}$	Input Leakage (Absolute Value)		--	1	1000	nA
$V_{OH}$	HIGH-Level Output Voltage	Push-Pull 1X, Open Drain PMOS 1X, $I_{OH} = 100 \mu A$	1.690	1.789	--	V
		Push-Pull 2X, Open Drain PMOS 2X, $I_{OH} = 100 \mu A$	1.700	1.794	--	V

Symbol	Parameter	Condition/Note	Min.	Typ.	Max.	Unit
$V_{OL}$	LOW-Level Output Voltage	Push-Pull 1X, $I_{OL} = 100 \mu A$	--	0.008	0.030	V
		Push-Pull 2X, $I_{OL} = 100 \mu A$	--	0.004	0.010	V
		Open Drain NMOS 1X, $I_{OL} = 100 \mu A$	--	0.005	0.020	V
		Open Drain NMOS 2X, $I_{OL} = 100 \mu A$	--	0.003	0.010	V
		Open Drain NMOS 4X, $I_{OL} = 100 \mu A$	--	0.003	0.004	V
$I_{OH}$	HIGH-Level Output Current (see Note 1)	Push-Pull 1X, Open Drain PMOS 1X, $V_{OH} = V_{DD} - 0.2 V$	1.066	1.703	--	mA
		Push-Pull 2X, Open Drain PMOS 2X, $V_{OH} = V_{DD} - 0.2 V$	2.216	3.406	--	mA
$I_{OL}$	LOW-Level Output Current (see Note 1)	Push-Pull 1X, $V_{OL} = 0.15 V$	0.917	1.689	--	mA
		Push-Pull 2X, $V_{OL} = 0.15 V$	1.834	3.378	--	mA
		Open Drain NMOS 1X, $V_{OL} = 0.15 V$	1.375	2.534	--	mA
		Open Drain NMOS 2X, $V_{OL} = 0.15 V$	2.750	5.068	--	mA
		Open Drain NMOS Super Drive, $V_{OL} = 0.15 V$	5.500	10.136	--	mA
$I_{VDD}$	Maximum Average or DC Current Through $V_{DD}$ Pin (Per chip side, see Note 2)	$T_J = 85 \text{ }^\circ C$	--	--	45	mA
		$T_J = 110 \text{ }^\circ C$	--	--	22	mA
$I_{GND}$	Maximum Average or DC Current Through GND Pin (Per chip side, see Note 2)	$T_J = 85 \text{ }^\circ C$	--	--	84	mA
		$T_J = 110 \text{ }^\circ C$	--	--	40	mA
$V_O$	Maximal Voltage Applied to any PIN in High-Impedance State		--	--	$V_{DD} + 0.3$	V
$T_{SU}$	Startup Time	From $V_{DD}$ rising past $PON_{THR}$	--	0.3	--	ms
$PON_{THR}$	Power On Threshold	$V_{DD}$ Level Required to Start Up the Chip	1.180	1.353	1.516	V
$POFF_{THR}$	Power Off Threshold	$V_{DD}$ Level Required to Switch Off the Chip	0.730	0.914	1.103	V
$R_{PULL}$	Pull Up or Pull Down Resistance	1 M for Pull Up: $V_{IN} = GND$ ; for Pull Down: $V_{IN} = V_{DD}$	--	1	--	M $\Omega$
		100 k for Pull Up: $V_{IN} = GND$ ; for Pull Down: $V_{IN} = V_{DD}$	--	100	--	k $\Omega$
		10 k for Pull Up: $V_{IN} = GND$ ; for Pull Down: $V_{IN} = V_{DD}$	--	10	--	k $\Omega$
$C_{VDD}$	Decoupling Capacitor	Capacitor Value at $V_{DD}$	--	0.1	--	$\mu F$

Note 1: DC or average current through any pin should not exceed value given in Absolute Maximum Conditions.  
 Note 2: The GreenPAK's power rails are divided in two sides. Pins 2, 3, 4, 5, 6, 7, 8, 9 and 10 are connected to one side, pins 12, 13, 14, 15, 16, 17, 18, 19 and 20 to another.

**5.3 Electrical Characteristics (3.3 V ±10 % V<sub>DD</sub>)**

Symbol	Parameter	Condition/Note	Min.	Typ.	Max.	Unit
V <sub>DD</sub>	Supply Voltage		3.0	3.3	3.6	V
T <sub>A</sub>	Operating Temperature		-40	25	85	°C
V <sub>AIR</sub>	Analog Input Voltage Range	Positive Input	0	--	V <sub>DD</sub>	V
		Negative Input	0	--	1.2	V
V <sub>IH</sub>	HIGH-Level Input Voltage	Logic Input	1.780	--	--	V
		Logic Input with Schmitt Trigger	2.130	--	--	V
		Low-Level Logic Input	1.130	--	--	V

time1	Width, 4 cell	mode: delayed (any)edge detect, delayed edge detect output	1340	600	450	ns
time2	Delay, 1 cell	mode: delayed (any)edge detect, delayed edge detect output	570	220	140	ns
time2	Delay, 2 cell	mode: delayed (any)edge detect, delayed edge detect output	570	220	140	ns
time2	Delay, 3 cell	mode: delayed (any)edge detect, delayed edge detect output	570	220	140	ns
time2	Delay, 4 cell	mode: delayed (any)edge detect, delayed edge detect output	570	220	140	ns
time2	Delay, 1 cell	mode: both edge delay, edge detect output	382	375	126	ns
time2	Delay, 2 cell	mode: both edge delay, edge detect output	713	169	237	ns
time2	Delay, 3 cell	mode: both edge delay, edge detect output	1045	318	350	ns
time2	Delay, 4 cell	mode: both edge delay, edge detect output	1370	466	460	ns
time2	Delay, 1 cell	mode: both edge delay, delayed edge detect output	900	613	250	ns
time2	Delay, 2 cell	mode: both edge delay, delayed edge detect output	1250	520	360	ns

**Table 4. Expected Delays and Widths for Programmable Delay (typical).**

Symbol	Parameter	Note	V <sub>DD</sub> = 1.8 V	V <sub>DD</sub> = 3.3 V	V <sub>DD</sub> = 5.0 V	Unit
time2	Delay, 3 cell	mode: both edge delay, delayed edge detect output	1600	680	480	ns
time2	Delay, 4 cell	mode: both edge delay, delayed edge detect output	1900	815	600	ns

## 5.9 Typical Pulse Width Performance

**Table 5. Typical Pulse Width Performance.**

Parameter	V <sub>DD</sub> = 1.8 V	V <sub>DD</sub> = 3.3 V	V <sub>DD</sub> = 5.0 V	Unit
Filtered Pulse Width	< 150	< 55	< 35	ns

## 6.0 Summary of Macrocell Function

### 6.1 I/O Pins

- Digital Input (low voltage or normal voltage, with or without Schmitt Trigger)
- Open Drain Outputs
- Push Pull Outputs
- Analog I/O
- 10 k $\Omega$ /100 k $\Omega$ /1 M $\Omega$  pull-up/pull-down resistors
- 40 mA Open Drain Superdrive output

### 6.2 Connection Matrix

- Digital matrix for circuit connections based on user design

### 6.3 Analog Comparators (4 total)

- Selectable hysteresis 0 mV/25 mV/50 mV/200 mV

### 6.4 Voltage Reference

- Used for references on Analog Comparators
- Can also be driven to external pins

### 6.5 Combinational Logic Look Up Tables (LUTs – 9 total)

- Two 2-bit Lookup Tables
- Seven 3-bit Lookup Tables

### 6.6 Combination Function Macrocells (9 total)

- Four Selectable DFF/Latch or 2-bit LUTs
- Two Selectable DFF/Latch or 3-bit LUTs
- One Selectable Pipe Delay or 3-bit LUT
- Two Selectable CNT/DLY or 4-bit LUTs

### 6.7 Delays/Counters (5 total)

- One 14-bit delay/counter: Range 1-16384 clock cycles
- One 14-bit delay/counter with external clock/reset: Range 1-16384 clock cycles
- Three 8-bit delays/counters: Range 1-255 clock cycles

### 6.8 Pipe Delay (Part of Combination Function Macrocell)

- 16 stage / 3 output
- One 1 stage fixed output
- Two 1-16 stage selectable outputs.

### 6.9 Programmable Delay

- 125 ns/250 ns/375 ns/500 ns @ 3.3 V
- Includes Edge Detection function

### 6.10 Additional Logic Functions (4 total)

- Two Inverter macrocells
- Two Deglitch filter macrocells

**6.11 RC Oscillator**

- 25 kHz and 2 MHz selectable frequency
- First stage divider (4): OSC/1, OSC/2, OSC/4, and OSC/8
- Second stage divider (5): OSC/1, OSC/4, selectable (OSC/8, OSC/12, OSC/24, or OSC/64), OSC/3, and additional OSC/3 (from selectable output)

## 7.0 I/O Pins

The SLG46721 has a total of 18 multi-function I/O pins which can function as either a user defined Input or Output, as well as serving as a special function (such as outputting the voltage reference), or serving as a signal for programming of the on-chip Non Volatile Memory (NVM).

Normal Mode pin definitions are as follows:

- Pin 1:  $V_{DD}$  power supply
- Pin 2: general purpose input
- Pin 3: general purpose input or output with OE
- Pin 4: general purpose input or output
- Pin 5: general purpose input or output with OE
- Pin 6: general purpose input or output or analog comparator 0(+)
- Pin 7: general purpose input or output with OE or analog comparator 0(-)
- Pin 8: general purpose input or output
- Pin 9: general purpose input or output with OE
- Pin 10: general purpose input or output or analog comparator 1(+)
- Pin 11: ground
- Pin 12: general purpose input or output or analog comparator 1(-)
- Pin 13: general purpose input or output with OE or analog comparator 2(+)
- Pin 14: general purpose input or output with OE or analog comparator 2(-)
- Pin 15: general purpose input or output or analog comparator 3(+)
- Pin 16: general purpose input or output with OE
- Pin 17: general purpose input or output
- Pin 18: general purpose input or output with OE and Vref output (VREF2)
- Pin 19: general purpose input or output with OE and Vref output (VREF1)
- Pin 20: general purpose input or output or external clock input

Programming Mode pin definitions are as follows:

- Pin 1:  $V_{DD}$  power supply
- Pin 2:  $V_{PP}$  programming voltage
- Pin 11: ground
- Pin 16: programming mode control
- Pin 17: programming ID pin
- Pin 18: programming SDIO pin
- Pin 19: programming SRDWB pin
- Pin 20: programming SCL pin

Of the 18 user defined I/O pins on the SLG46721, all but one of the pins (Pin 2) can serve as both digital input and digital output. Pin 2 can only serve as a digital input pin.

### 7.1 Input Modes

Each I/O pin can be configured as a digital input pin with/without buffered Schmitt Trigger, or can also be configured as a low voltage digital input. Pins 6, 7, 10, 12, 13, 14, and 15 can also be configured to serve as analog inputs to the on-chip comparators. Pins 18 and 19 can also be configured as analog reference voltage inputs.

### 7.2 Output Modes

Pins 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 14, 15, 16, 17, 18, 19, and 20 can all be configured as digital output pins.

### 7.3 Pull Up/Down Resistors

All I/O pins have the option for user selectable resistors connected to the input structure. The selectable values on these resistors are 10 k $\Omega$ , 100 k $\Omega$  and 1 M $\Omega$ . In the case of Pin 2, the resistors are fixed to a pull-down configuration. In the case of all other I/O pins, the internal resistors can be configured as either pull-up or pull-downs.

8.0 Connection Matrix

The Connection Matrix in the SLG46721 is used to create the internal routing for internal functions of the device once it is programmed. The registers are programmed from the one-time NVM cell during Test Mode Operation. All of the connection point for each logic cell within the SLG46721 has a specific digital bit code assigned to it that is either set to active “High” or inactive “Low” based on the design that is created. Once the 1024 register bits within the SLG46721 are programmed a fully custom circuit will be created.

The Connection Matrix has 64 inputs and 92 outputs. Each of the 64 inputs to the Connection Matrix is hard-wired to a particular source macrocell, including I/O pins, LUTs, analog comparators, other digital resources and V<sub>DD</sub> and V<sub>SS</sub>. The input to a digital macrocell uses a 6-bit register to select one of these 64 input lines.

For a complete list of the SLG46721’s register table, see Section 20.0 Appendix A - SLG46721 Register Definition.

## 9.0 Combinatorial Logic

Combinatorial logic is supported via nine Lookup Tables (LUTs) within the SLG46721. There are two 2-bit LUTs and seven 3-bit LUTs. The device also includes eight Combination Function Macrocells that can be used as LUTs. For more details, please see Section 10.0 Combination Function Macrocells.

Inputs/Outputs for the nine LUTs are configured from the connection matrix with specific logic functions being defined by the state of NVM bits. The outputs of the LUTs can be configured to any user defined function, including the following standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR).

### 9.1 2-Bit LUT

The two 2-bit LUTs each take in two input signals from the connection matrix and produce a single output, which goes back into the connection matrix.

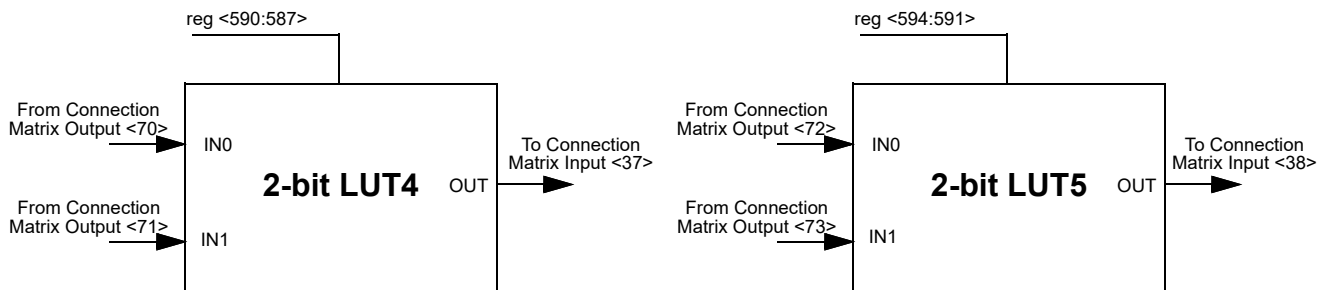

Figure 7. 2-bit LUTs

Table 26. 2-bit LUT4 Truth Table.

IN1	IN0	OUT
0	0	reg <587>
0	1	reg <588>
1	0	reg <589>
1	1	reg <590>

Table 27. 2-bit LUT5 Truth Table.

IN1	IN0	OUT
0	0	reg <591>
0	1	reg <592>
1	0	reg <593>
1	1	reg <594>

Each 2-bit LUT uses a 4-bit register signal to define their output functions;

*2-Bit LUT4 is defined by reg<590:587>*

*2-Bit LUT5 is defined by reg<594:591>*

The table below shows the register bits for the standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR) that can be created within each of the two 2-bit LUT logic cells.

Table 28. 2-bit LUT Standard Digital Functions.

Function	MSB			LSB
AND-2	1	0	0	0
NAND-2	0	1	1	1
OR-2	1	1	1	0
NOR-2	0	0	0	1
XOR-2	0	1	1	0
XNOR-2	1	0	0	1

9.2 3-Bit LUT

The seven 3-bit LUTs each take in three input signals from the connection matrix and produce a single output, which goes back into the connection matrix.

1	0	0	reg <958>
1	0	1	reg <959>
1	1	0	reg <960>
1	1	1	reg <961>

Each 3-bit LUT uses a 8-bit register signal to define their output functions;

*3-Bit LUT0 is defined by reg<606:599>*

*3-Bit LUT1 is defined by reg<614:607>*

*3-Bit LUT4 is defined by reg<638:631>*

*3-Bit LUT5 is defined by reg<646:639>*

*3-Bit LUT6 is defined by reg<654:647>*

*3-Bit LUT7 is defined by reg<662:655>*

*3-Bit LUT9 is defined by reg<961:954>*

The table below shows the register bits for the standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR) that can be created within each of the six 3-bit LUT logic cells.

**Table 36. 3-bit LUT Standard Digital Functions.**

Function	MSB							LSB
AND-3	1	0	0	0	0	0	0	0
NAND-3	0	1	1	1	1	1	1	1
OR-3	1	1	1	1	1	1	1	0
NOR-3	0	0	0	0	0	0	0	1
XOR-3	1	0	0	1	0	1	1	0
XNOR-3	0	1	1	0	1	0	0	1

**10.0 Combination Function Macrocells**

The SLG46721 has nine combination function macrocells that can serve more than one logic or timing function. In each case, they can serve as a Look Up Table (LUT), or as another logic or timing function. See the list below for the functions that can be implemented in these macrocells;

- Four macrocells that can serve as either 2-bit LUTs or as D Flip Flops.
- Two macrocells that can serve as either 3-bit LUTs or as D Flip Flops.
- One macrocell that can serve as either 3-bit LUT or as Pipe Delay
- Two macrocells that can serve as either 4-bit LUTs or as 8-Bit Counter / Delays

Inputs/Outputs for the nine combination function macrocells are configured from the connection matrix with specific logic functions being defined by the state of NVM bits.

When used as a LUT to implement combinatorial logic functions, the outputs of the LUTs can be configured to any user defined function, including the following standard digital logic devices (AND, NAND, OR, NOR, XOR, XNOR).

When used as a D Flip Flop / Latch, the source and destination of the inputs and outputs for the DFF/Latches are configured from the connection matrix. All DFF/Latch macrocells have user selection for initial state, and all have the option to connect both the Q and Q Bar outputs to the connection matrix. The macrocells DFF2, DFF3 have an additional input from the matrix that can serve as a nSet or nReset function to the macrocell.

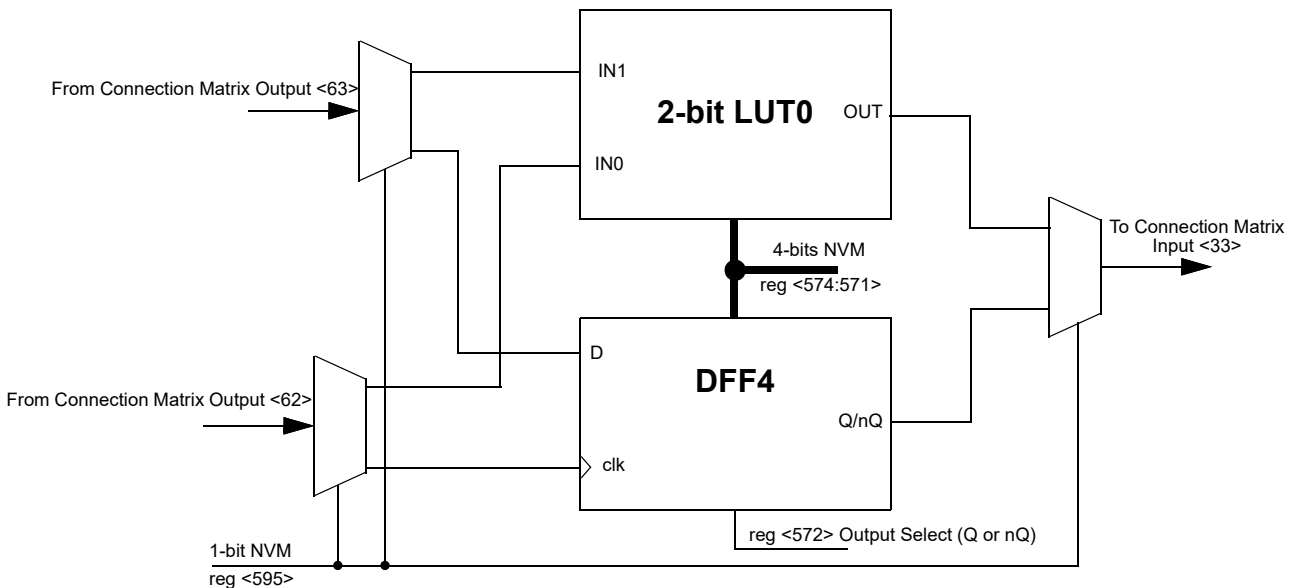

The operation of the D Flip-Flop and Latch will follow the functional descriptions below:

DFF: CLK is rising edge triggered, then Q = D; otherwise Q will not change

Latch: if CLK = 0, then Q = D

**10.1 2-Bit LUT or D Flip Flop Macrocells**

There are four macrocells that can serve as either 2-bit LUTs or as D Flip Flops. When used to implement LUT functions, the 2-bit LUTs each take in two input signals from the connection matrix and produce a single output, which goes back into the connection matrix. When used to implement D Flip Flop function, the two input signals from the connection matrix go to the data (d) and clock (clk) inputs for the Flip Flop, with the output going back to the connection matrix.

**Figure 9. 2-bit LUT0 or DFF4**

1	1	reg <586>

Each Macrocell, when programmed for a LUT function, uses a 4-bit register to define their output function:

*2-Bit LUT0 is defined by reg<574:571>*

*2-Bit LUT1 is defined by reg<578:575>*

*2-Bit LUT2 is defined by reg<582:579>*

*2-Bit LUT3 is defined by reg<586:583>*

DFF7 Initial Polarity Select	585	0: Low 1: High

10.2 3-Bit LUT or D Flip Flop with Set/Reset Macrocells

There are two macrocells that can serve as either 3-bit LUTs or as D Flip Flops. When used to implement LUT functions, the 3-bit LUTs each take in three input signals from the connection matrix and produce a single output, which goes back into the connection matrix. When used to implement D Flip Flop function, the three input signals from the connection matrix go to the data (d) and clock (clk) and Set/Reset (rRST/nSET) inputs for the Flip Flop, with the output going back to the connection matrix.

Figure 13. 3-bit LUT2 or DFF2

Figure 14. 3-bit LUT3 or DFF3

## 10.2.1 3-Bit LUT or D Flip Flop Macrocells Used as 3-Bit LUTs

**Table 45. 3-bit LUT2 Truth Table.**

IN2	IN1	IN0	OUT
0	0	0	reg <615>
0	0	1	reg <616>
0	1	0	reg <617>
0	1	1	reg <618>
1	0	0	reg <619>
1	0	1	reg <620>
1	1	0	reg <621>
1	1	1	reg <622>

**Table 46. 3-bit LUT3 Truth Table.**

1	0	0	reg <627>
1	0	1	reg <628>
1	1	0	reg <629>
1	1	1	reg <630>

Each Macrocell, when programmed for a LUT function, uses a 8-bit register to define their output function:

*3-Bit LUT2 is defined by reg<622:615>*

*3-Bit LUT3 is defined by reg<630:623>*

10.3 3-Bit LUT or Pipe Delay Macrocell

There is one macrocell that can serve as either a 3-bit LUT or as a Pipe Delay.

When used to implement LUT functions, the 3-bit LUT take in three input signals from the connection matrix and produces a single output, which goes back into the connection matrix.

When used as a pipe delay, there are three inputs signals from the matrix, Input (IN), Clock (CLK) and Reset (RST). The pipe delay cell is built from 16 D Flip-Flop logic cells that provide the three delay options, two of which are user selectable. The DFF cells are tied in series where the output (Q) of each delay cell goes to the next DFF cell. The first delay option (OUT2) is fixed at the output of the first flip-flop stage. The other two outputs (OUT0 and OUT1) provide user selectable options for 1 – 16 stages of delay There are delay output points for each set of the OUT0 and OUT1 outputs to a 4-input mux that is controlled by reg <666:663> for OUT0 and reg <670:667> for OUT1. The 4-input mux is used to control the selection of the amount of delay.

The overall time of the delay is based on the clock used in the SLG46721 design. Each DFF cell has a time delay of the inverse of the clock time (either external clock or the RC Oscillator within the SLG46721). The sum of the number of DFF cells used will be the total time delay of the Pipe Delay logic cell.

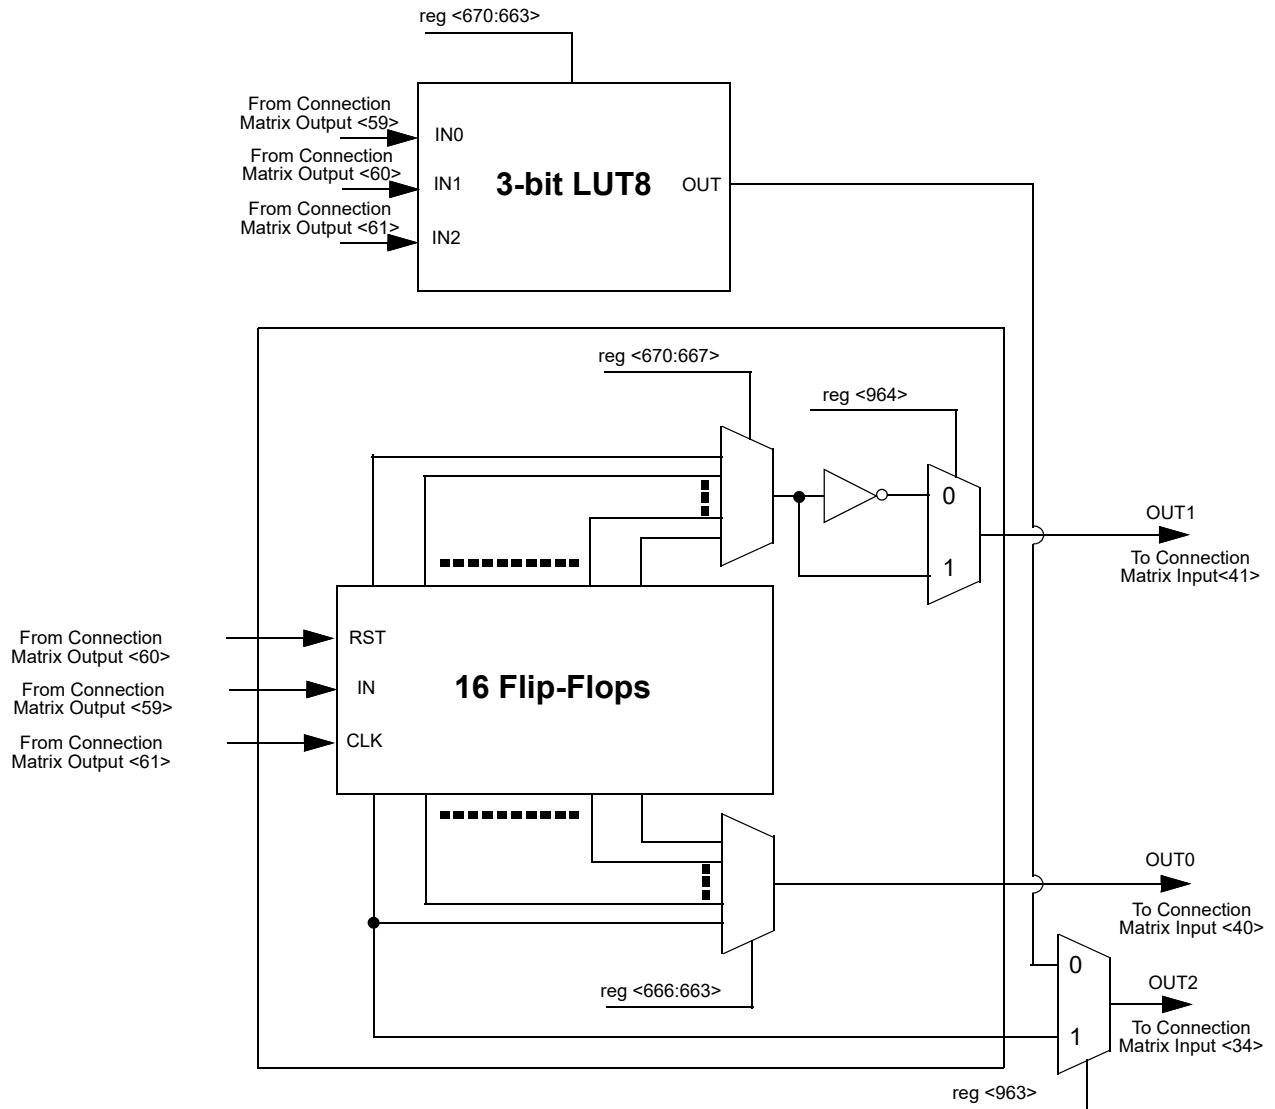

Figure 15. 3-bit LUT8 or Pipe Delay

10.3.1 3-Bit LUT or Pipe Delay Macrocells Used as 3-Bit LUTs

Table 49. 3-bit LUT8 Truth Table.

IN2	IN1	IN0	OUT

Pipe delay OUT1 Polarity Select Bit	reg<964>	0: Non-inverted 1: Inverted

10.4 4-Bit LUT or 8- Bit Counter / Delay Macrocells

There are two macrocells that can serve as either 4-bit LUTs or as Counter / Delays. When used to implement LUT functions, the 4-bit LUTs each take in four input signals from the connection matrix and produce a single output, which goes back into the connection matrix. When used to implement 8-Bit Counter / Delays function, two of the four input signals from the connection matrix go to the external clock (ext\_clk) and reset (DLY\_n/CNT\_Reset) for the counter/delay, with the output going back to the connection matrix.

Note: Counters initialize with counter data=0 after POR.

### 11.0 Analog Comparators (ACMP)

There are four Analog Comparator (ACMP) macrocells in the SLG46721. In order for the ACMP cells to be used in a GreenPAK design, the power up signals (ACMP0\_pdb, ACMP1\_pdb, ACMP2\_pdb and ACMP3\_pdb) need to be active. By connecting to signals coming from the Connection Matrix, it is possible to have each ACMP be on continuously, off continuously, or switched on periodically based on a digital signal coming from the Connection Matrix. When ACMP is powered down, output is low.

Each of the ACMP cells has a positive input signal that can be provided by a variety of external sources, and can also have a selectable gain stage before connection to the analog comparator. Each of the ACMP cells has a negative input signal that is either created from an internal VREF or provided by way of the external sources.

PWR UP = 1 => ACMP is powered up.  
 PWR UP = 0 => ACMP is powered down.

During powerup, the ACMP output will remain low, and then become valid 120 μs (max) after POR signal goes high. If Low Bandwidth option enabled, then the ACMP output initializes in the high state.

Vref accuracy is optimized near 1000 mV selection.

Input bias current < 1 nA (typ). The Gain divider is unbuffered and consists of 1 MΩ resistors. IN- voltage range: 0 - 1.2 V. Can use Vref selection  $V_{DD}/4$  and  $V_{DD}/3$  to maintain this input range.

For high input impedance when using the gain divider (x0.25, x0.33, x0.5), it is possible to use the input buffer. However, this will affect input voltage range, see *Figure 18*. It also will add the offset in a range of -24.5 mV to 12.6 mV. It is not recommended to use the input buffer when the gain divider is not used.

Figure 18. Maximum Analog Buffer Input Voltage vs. V<sub>DD</sub>

Note: the input buffer gain depends on V<sub>DD</sub>, see Figure 19.

Figure 19. Input Buffer Gain Error vs. V<sub>DD</sub>

Each of the ACMP cells has a selection for the bandwidth of the input signal, which can be used to save power when low bandwidth signals are input into the analog comparator.

**Low bandwidth:** For V<sub>DD</sub> 1.8 V or less, this option will connect a low pass filter with 180 kHz upper frequency. And if input frequency > 200 kHz, the output will retain its previous value.

Enabling the Analog buffer will influence the ACMP response time.

*Note that power supply control options have influence on Analog macrocells operation.*

*Note: Any ACMP powered ON enables the BandGap circuit as well, and an analog voltage will appear on Vref (even when Force BandGap is disabled).*

Each cell also has a hysteresis selection, to offer hysteresis of 0 mV, 25 mV, 50 mV or 200 mV.

**Hysteresis:** Input signal hysteresis options are disable, 25mV, 50mV, 200mV.

- ACMP0 IN+ options are pin 6, buffered pin6, V<sub>DD</sub>
- ACMP1 IN+ options are pin 10, buffered pin10, ACMP0 IN+
- ACMP2 IN+ options are pin 13, ACMP0 IN+
- ACMP3 IN+ options are pin 15, ACMP0 IN+, ACMP2 IN+

## 12.0 Digital Storage Elements (DFFs/Latches)

There are six Combination Function macrocells that can be used to implement D-Flip Flop or Latch functions. Please see Section 10.1 2-Bit LUT or D Flip Flop Macrocells and Section 10.2 3-Bit LUT or D Flip Flop with Set/Reset Macrocells for the description of this Combination Function macrocell.

### 12.1 Initial Polarity Operations

Figure 24. DFF Polarity Operations

### 13.0 Counters/Delay Generators (CNT/DLY)

There are five configurable counters/delay generators in the SLG46721. Two of these counters/delay generators (CNT/DLY 0 and 1) are 14-bit, and three of the counters/delay generators (CNT/DLY 4, 5, 6) are 8-bit. For flexibility, each of these macrocells has a large selection of internal and external clock sources, as well as the option to chain from the output of the previous (N-1) CNT/DLY macrocell, to implement longer count / delay circuits.

One of the counter/delay generator macrocells (CNT/DLY 1) has two inputs from the connection matrix, one for Delay Input/Reset Input (Delay\_In/Reset\_In), and one for an external counter/clock source. Four of the counter/delay generator macrocells (CNT/DLY 0, 4, 5, 6) have one input from the connection matrix, which has a shared function of either a Delay Input or an external clock input.

CNT/DLY6 has one extra output on which a short pulse will be generated according to the configured edge on the input signal if detected.

Note that there are also two Combination Function Macrocells that can implement either 4-bit LUTs or 8-bit counter / delays, For more information please see Section 10.4 4-Bit LUT or 8- Bit Counter / Delay Macrocells.

*Note: Counters initialize with counter data=0 after POR.*

## 14.0 Pipe Delay (PD)

The SLG46721 has a pipe delay logic cell that is shared with the LUT3\_8 in one of the Combination Function macrocells. The user can select one of these functions to use in a design, but not both. Please see Section 10.3 3-Bit LUT or Pipe Delay Macrocell for the description of this Combination Function macrocell.

**15.0 Programmable Delay / Edge Detector**

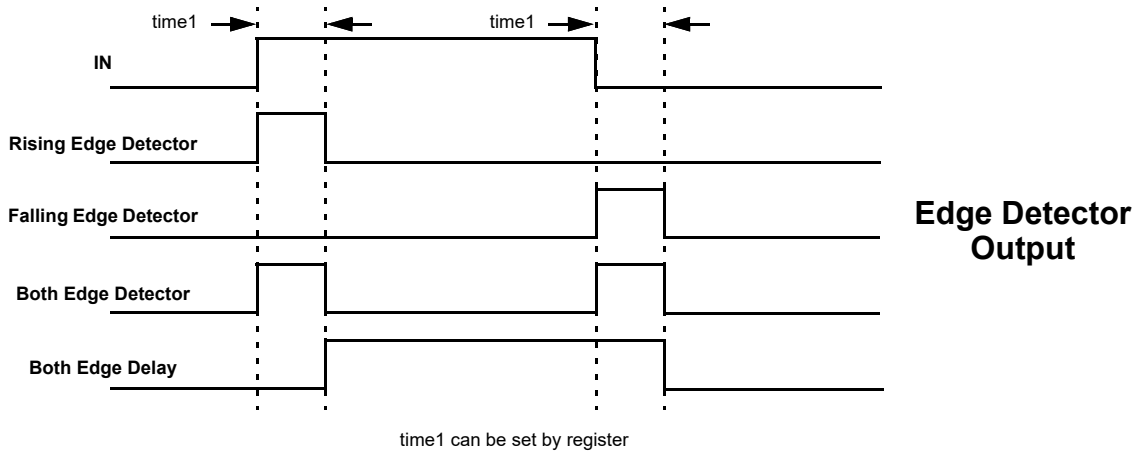

The SLG46721 has a programmable time delay logic cell available that can generate a delay that is selectable from one of four timings (time1) configured in the GreenPAK Designer. The programmable time delay cell can generate one of four different delay patterns, rising edge detection, falling edge detection, both edge detection and both edge delay. These four patterns can be further modified with the addition of delayed edge detection, which adds an extra unit of delay as well as glitch rejection during the delay period. See the timing diagrams below for further information.

*Note: The input signal must be longer than the delay, otherwise it will be filtered out.*

**Figure 32. Programmable Delay**

### 16.0 Additional Logic Functions

The SLG46721 has four additional logic functions that are connected directly to the Connection Matrix inputs and outputs. There are two inverters, which can switch the polarity of any Connection Matrix signal, and there are also two deglitch filters.

## 17.0 Voltage Reference (VREF)

### 17.1 Voltage Reference Overview

The SLG46721 has a Voltage Reference Macrocell to provide references to the four analog comparators. This macrocell can supply a user selection of fixed voltage references,  $/3$  and  $/4$  reference off of the  $V_{DD}$  power supply to the device, and externally supplied voltage references from pins 7, 12 and 14. The macrocell also has the option to output reference voltages on pins 18 and 19. See table below for the available selections for each analog comparator. Also see *Figure 39*. below, which shows the reference output structure.

### 17.2 VREF Selection Table

**Table 66. VREF Selection Table.**

SEL<4:0>	CMP0_VREF	CMP1_VREF	CMP2_VREF	CMP3_VREF
11011	vref_ext_acmp0	vref_ext_acmp1	vref_ext_acmp2	vref_ext_acmp2
11010	vref_ext_acmp1	vref_ext_acmp1	vref_ext_acmp1	vref_ext_acmp1
11001	$V_{DD} / 4$	$V_{DD} / 4$	$V_{DD} / 4$	$V_{DD} / 4$
11000	$V_{DD} / 3$	$V_{DD} / 3$	$V_{DD} / 3$	$V_{DD} / 3$
10111	1.20	1.20	1.20	1.20
10110	1.15	1.15	1.15	1.15
10101	1.10	1.10	1.10	1.10
10100	1.05	1.05	1.05	1.05
10011	1.00	1.00	1.00	1.00
10010	0.95	0.95	0.95	0.95
10001	0.90	0.90	0.90	0.90

01111	0.80	0.80	0.80	0.80
01110	0.75	0.75	0.75	0.75
01101	0.70	0.70	0.70	0.70
01100	0.65	0.65	0.65	0.65
01011	0.60	0.60	0.60	0.60
01010	0.55	0.55	0.55	0.55
01001	0.50	0.50	0.50	0.50
01000	0.45	0.45	0.45	0.45
00111	0.40	0.40	0.40	0.40
00110	0.35	0.35	0.35	0.35
00101	0.30	0.30	0.30	0.30
00100	0.25	0.25	0.25	0.25
00011	0.20	0.20	0.20	0.20
00010	0.15	0.15	0.15	0.15
00001	0.10	0.10	0.10	0.10
00000	0.05	0.05	0.05	0.05

$V_{DD}$	Practical VREF Range	Note
2.0 V - 5.5 V	50 mV ~1.2 V	
1.7 V - 2.0 V	50 mV ~1.1 V	Higher than 1.1 V negative input, the comparator may show wrong result

17.3 VREF Block Diagram

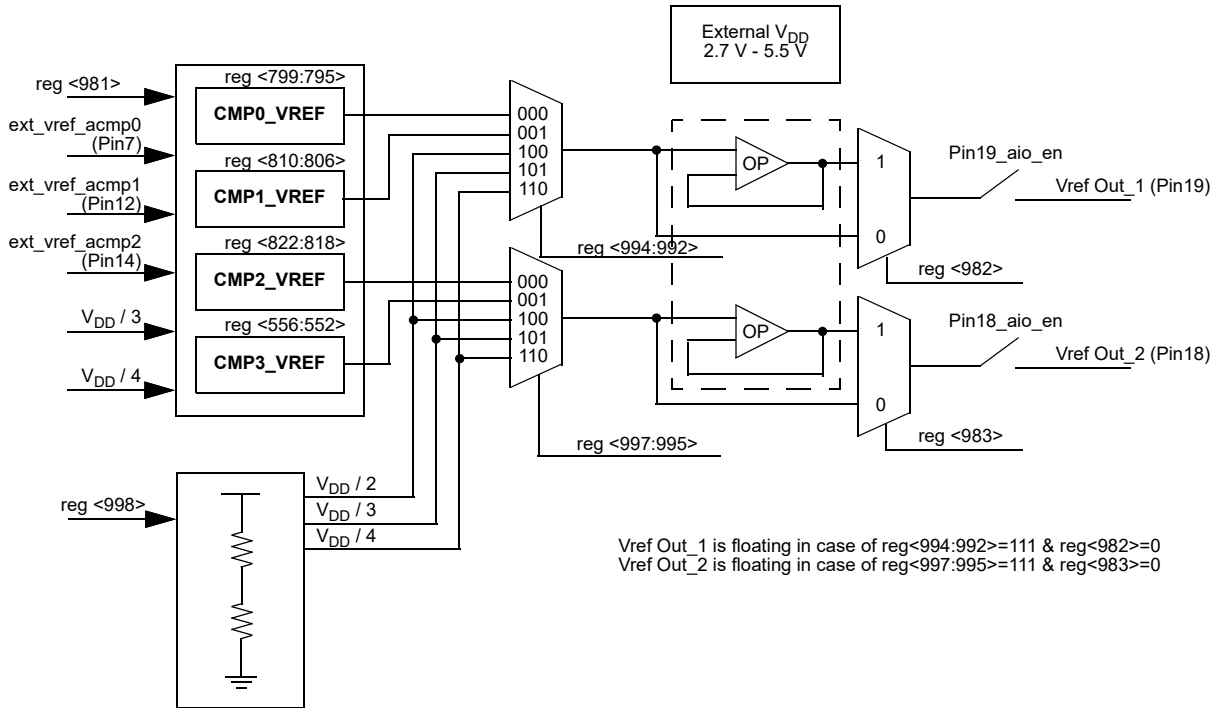

Figure 39. Voltage Reference Block Diagram

18.0 RC Oscillator (RC Osc)

18.1 RC Oscillator Overview

The SLG46721 has two internal RC oscillators, one that runs at 25 kHz and one that runs at 2 MHz. The user can select one of these fundamental frequencies for the RC OSC Macrocell, or the fundamental frequency can also come from an external clock input (Pin 20). There are two divider stages that allow the user flexibility for introducing clock signals on various Connection Matrix Input lines. The first stage divider allows the selection of /1, /2, /4 or /8 divide down frequency from the fundamental. The second stage divider has an input of one frequency from the first stage divider, and outputs five different frequencies on Connection Matrix Input lines <45>, <46>, <47>, <48>, and <49>. See Figure 40. below for details of the frequencies for each of these five Connection Matrix Inputs.

If PWR DOWN input of oscillator is LOW, the oscillator will be turned on. If PWR DOWN input of oscillator is HIGH the oscillator will be turned off. The PWR DOWN signal has the highest priority.

18.2 RC OSC Block Diagram

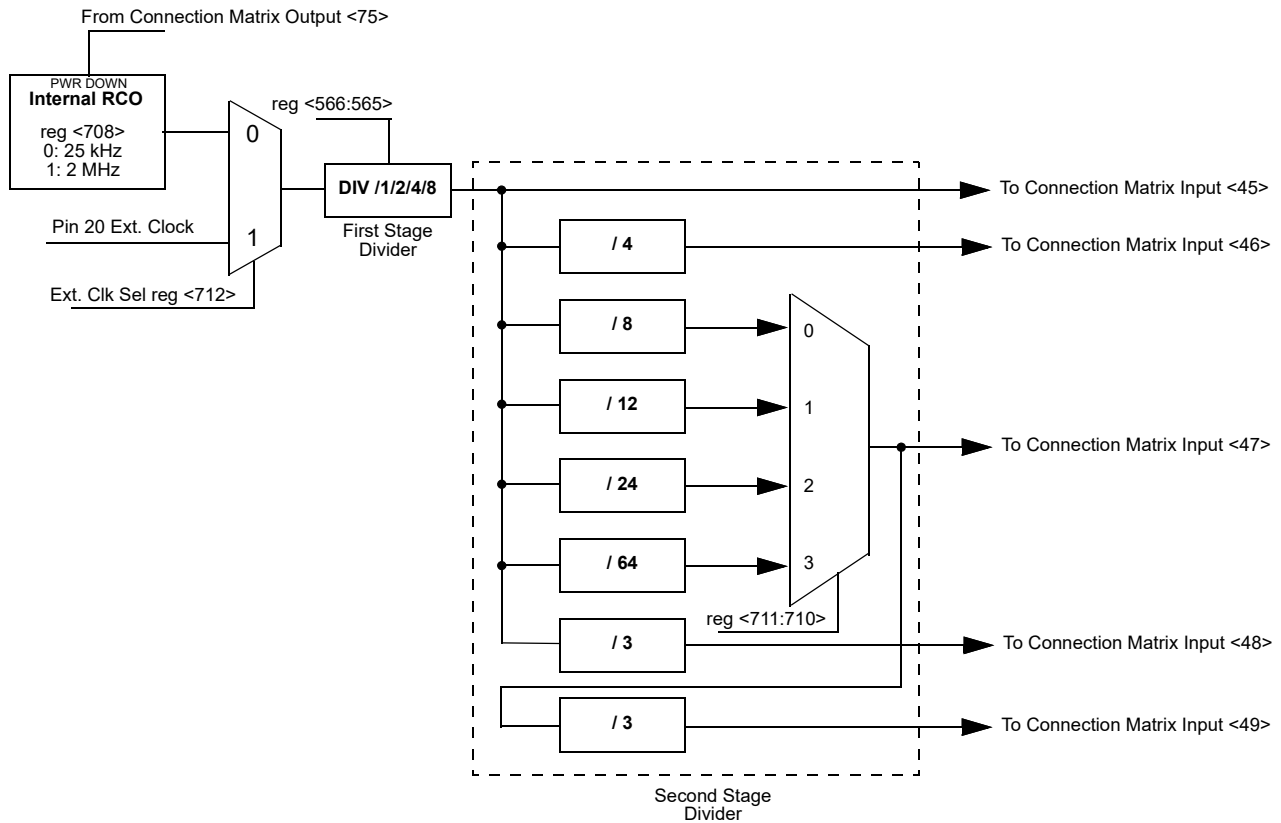

Figure 40. RC OSC Block Diagram

19.0 Power On Reset (POR)

19.1 POR Overview

The Power On Reset (POR) Macrocell will produce a high or “1” signal as an output when the device power supply ( $V_{DD}$ ) rises to approximately 1.4 V. The typical internal delay for POR to release POR\_IO will be  $1\text{ ms} + \alpha$  depending on the power slope, because there is adaptive power-up sequence. The next internal signal will be POR\_CORE and then POR\_IO\_DLY, each of which is further delayed by approximately  $1\ \mu\text{s}$ . The rise of POR\_IO\_DLY will trigger the I/O pins to exit tri-state, and the device will become active.

19.2 POR Timing Diagram

Figure 41. POR Timing Diagram

19.2.1 Initialization

All internal macrocells by default have initial low level. Starting from indicated powerup time of 1.15 V - 1.6 V, macrocells in GPAK3 are powered on while forced to the reset state, All outputs are in Hi-Z and chip starts loading data from NVM. Then the reset signal is released for internal macrocells and they start to initialize according to the following sequence:

1. Input PINs, ACMP, pull up/down;
2. LUTs;
3. DFFs, Delays/Counters, Pipe Delay;
4. POR output to matrix;
5. Output PIN corresponds to the internal logic

The VREF output pin driving signal can precede POR output signal going high by  $3\ \mu\text{s} - 5\ \mu\text{s}$ . The POR signal going high indicates the mentioned powerup sequence is complete.

Note: The maximum voltage applied to any PIN should not be higher than the  $V_{DD}$  level. There are ESD Diodes between PIN  $\rightarrow V_{DD}$  and PIN  $\rightarrow$  GND on each PIN. So if the input signal applied to PIN is higher than  $V_{DD}$ , then current will sink through the diode to  $V_{DD}$ . Exceeding  $V_{DD}$  results in leakage current on the input PIN, and  $V_{DD}$  will be pulled up, following the voltage on the input PIN. There is no effect from input pin when input voltage is applied at the same time as  $V_{DD}$ .

19.2.2 Power Down

Figure 42. Power Down

During powerdown, macrocells in SLG46721 are powered off and logic macrocells may switch states after falling below 1.4 V. The I/O buffers are disabled when POR goes low at  $V_{DD} \sim 1$  V. Please note that during a slow rampdown, outputs can possibly switch state during this time.

## 20.0 Appendix A - SLG46721 Register Definition

25.0 Recommended Reflow Soldering Profile

Please see IPC/JEDEC J-STD-020: latest revision for reflow profile based on package volume of 3.30 mm<sup>3</sup> (nominal). More information can be found at [www.jedec.org](http://www.jedec.org).

## 26.0 Revision History

Date	Version	Change
8/15/2023	1.22	Updated tables Electrical Characteristics Fixed typos
3/10/2023	1.21	Added notes to section Ordering Information
3/4/2022	1.20	Added R <sub>PUP</sub> and R <sub>PDWN</sub> in section Electrical Specifications Renesas rebranding
11/16/2021	1.19	Updated tables CNT/DLY Register Settings Corrected registers [684:677], [700:693], [730:717], [750:737], [764:757], [778:771], [792:785] in Appendix A - SLG46721 Register Definition Added note for CNTs Corrected registers [792:782], [778:768], [764:754], [750:734], [730:714], [700:690], [684:674]
10/29/2019	1.18	Updated disclaimer
4/22/2019	1.17	Fixed typos
4/16/2019	1.16	Updated Chip Quiescent Value
11/13/2018	1.15	Updated to Dialog style
12/5/2017	1.14	Fixed typos
10/10/2017	1.13	Updated Electrical Spec Fixed typos
7/5/2017	1.12	Fixed typos Removed references to GPAK families Updated Silego Website & Support Updated Section Programmable Delay / Edge Detector Updated Electrical Spec
5/30/2016	1.11	Updated Silego Website & Support Updated Programmable Delay information Added PON <sub>THR</sub> and POFF <sub>THR</sub> in Electrical Spec
10/28/2015	1.10	Updated Absolute maximum conditions
6/16/2015	1.09	Fixed DFF Polarity Operations Diagram
4/9/2015	1.08	Updated Tsu condition and value
2/9/2015	1.07	Updated ACMP section
1/21/2015	1.06	Updated Chip Quiescent values
12/3/2014	1.05	Updated Electrical Characteristics VIH/VIL/VOH/VOL values
8/29/2014	1.04	Added Emulator Reset description for Pin 3. Fixed table formatting for some tables
8/06/2014	1.03	Updated Electrical Characteristics VIH/VIL/VOH/VOL values
7/29/2014	1.02	Fixed ESD information
7/7/2014	1.01	Clarified Register OE IO Structure with Super Driver diagram Fixed typos and Cleanup Added POR to Block Diagram Removed Power Supply range when using 2M internal OSC (fixed) Fixed Package Outline Drawing (removed incorrect side view)
4/15/2014	1.0	Production Release
3/18/2014	0.54	Updated block diagrams and timing diagrams for clarity Moved items from Appendix B into their respective sections and removed Appendix B
2/3/2014	0.53	Fixed typos and Cleanup
11/21/2013	0.52	Added ESD Ratings and MSL to Absolute Maximum Conditions

Date	Version	Change
11/20/2013	0.51	Updated Package Outline Drawing Updated Tape and Reel Specifications Added Recommended Land pattern
10/21/2013	0.5	Updated Electrical Specifications
10/9/2013	0.41	Updated VIH for Logic Input
10/2/2013	0.4	Updated VIH/VIL values
9/11/13	0.31	Adjusted RC OSC Block Diagram
7/17/2013	0.3	Added IO Structures
5/7/2013	0.2	Added new sections Updated Tape and Reel spec
11/14/2012	0.1	Initial release

---

## RoHS Compliance

Renesas Electronics Corporation's suppliers certify that its products are in compliance with the requirements of Directive 2011/65/EU of the European Parliament on the restriction of the use of certain hazardous substances in electrical and electronic equipment. RoHS certificates from our suppliers are available on request.

## IMPORTANT NOTICE AND DISCLAIMER

RENESAS ELECTRONICS CORPORATION AND ITS SUBSIDIARIES (“RENESAS”) PROVIDES TECHNICAL SPECIFICATIONS AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES “AS IS” AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT OF THIRD-PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for developers who are designing with Renesas products. You are solely responsible for (1) selecting the appropriate products for your application, (2) designing, validating, and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, or other requirements. These resources are subject to change without notice. Renesas grants you permission to use these resources only to develop an application that uses Renesas products. Other reproduction or use of these resources is strictly prohibited. No license is granted to any other Renesas intellectual property or to any third-party intellectual property. Renesas disclaims responsibility for, and you will fully indemnify Renesas and its representatives against, any claims, damages, costs, losses, or liabilities arising from your use of these resources. Renesas' products are provided only subject to Renesas' Terms and Conditions of Sale or other applicable terms agreed to in writing. No use of any Renesas resources expands or otherwise alters any applicable warranties or warranty disclaimers for these products.
