

### Features

- Free positioning TX-A6 3xCoil Charging system
- Enhanced EMI and meets WPC1.1 Specifications
- Wireless Charging active area – 745mm<sup>2</sup>
- WPC compatibility
- Foreign Object Detection (FOD) and indication
- Input voltage range - 11.5V~15V
- Output power - upon the receiver capability up to 5W
- Efficiency - Up to 70%
- Status indication LEDs
- Firmware which enables system monitoring
- Easy programmability by I<sup>2</sup>C

### Evaluation Kit Contents

- IDTP9036A-A6-Demo PCB Rev3.1
- 12V AC-to-DC Power Adapter
- JM60 USB-to-I<sup>2</sup>C Programmer and USB Cable
- CD containing:
  - IDTP9036A-TX-A6 firmware
  - Reference schematic in Orcad
  - Reference layout Cadence Allegro board files
  - Electronic copy of IDTP9036A-TX-A6 UG
  - Electronic copy of IDTP9036A Datasheet

### General Description

The IDTP9036A-TX-A6 evaluation board serves to demonstrate the features and performance of the IDTP9036A Wireless Power Charging solution for Base Stations with a TX-A6 Coil Transmitter. The three coil transmitter system enables a large active power area with high efficiency transfer and enables power to only one coil at a time when the Receiver is detected. The board provides numerous test points to allow detail signal inspection access at different nodes of the circuit to better understand the key functionality of the system.

The evaluation module is a stand-alone application; all it needs is a 12V/1A DC power adapter and a WPC certified power receiver.

Optionally the EVM's activity can be monitored by I<sup>2</sup>C communication and GUI (graphical user interface) software through a USB cabled programmer JM60 dongle board, which interfaces the EVM to the computer. The MAIN tab of the software tool provides real time plots of Coil Current, PWM Frequency, and Duty Cycle including different states of the microcontroller and FOD (foreign object detection).

The evaluation board utilizes an external EEPROM which contains Tx firmware to enable programmability. The external EEPROM memory chip is pre-programmed with a standard start-up program that is automatically loaded when 12V power is applied. The EEPROM can be reprogrammed to suit the needs of a specific application using the IDTP9036A software tool.

## 1. EVK Hardware

### 1.1. Input Power Connection

A 12V/1A wall adapter plugged into J3 connector may be used to supply the EVM board, but for measurements, the SMD testing points VIN and GND next to J3 can be used to connect to a lab bench power supply

Figure 2 – AC Adaptor input jack.

### 1.2. EEPROM Programmer Connection

Using the I<sup>2</sup>C adapter is optional and the main purpose is to upload the firmware into the EEPROM (U3). Also the I<sup>2</sup>C adapter may be used to interface the IDTP9036A and the PC GUI – see detailed description on “I<sup>2</sup>C INTERFACE ADAPTER AND GUI” section

Figure 3 – Keyed JM60 Programmer input 10pin header.

### 1.3. Testing points

There are two types of test points as shown below: SDA, SCL, EN are through hole for probe tips and SMD clip types which may be used for connecting a probe ground lead or probe clip.

Figure 4 – Surface mount test points.

### 1.4. LED and Buzzer Indicators

Figure 5 – LED indicators and buzzer connected to GPIOs.

## LED FUNCTIONS

Two GPIOs are used to drive LEDs which indicate, through various on/off and illumination options, the state of charging and some possible fault conditions.

A red LED indicates various Fault and FOD (“Foreign Object Detection”) states. The green LED indicates Power Transfer and Charge Complete state information. Upon power up, the two LEDs together may optionally indicate the Standby State and remain in this state until another of the defined Operational States occurs

As shown in Figure 6, one or two resistors configure the defined LED option combinations. The DC voltage set in this way is read one time during power-on to determine the LED configuration. As not to interfere with the LED operation, the useful voltage range for the DC optioning value must be limited to not greater than 1Vdc.

Figure 6. IDTP9036A LED Resistor Options.

Upon power-up, the two LEDs reflect the Standby State and remain in this state until another of the defined Operational States occurs.

There are 10 valid LED option combinations which are selected through the use of two 1% resistors that create a resistor divider value that are read from the GPIOs – two of the LED options are achieved through pull down or pull up (no resistors required). The LED configuration options are detailed in the Table 11.

**LED Pattern Operational Status Definitions:**

Blink Slow: 1s ON, 1s OFF, repeat

Blink Fast: 400ms ON, 800ms OFF, 400ms ON, 800ms OFF, repeat

The red FOD warning LED is synchronized with the buzzer (if implemented) such that a 400ms tone corresponds with FOD red LED illumination and 800ms off (no sound) corresponds with LED being off. During the 30s that the buzzer is off/silenced, the FOD LED must continue to blink.

Table 1 – IDTP9036A LED Resistor Optioning (Not all options supported, shaded rows are for future development).

LED Control Option	LED Select Resistor Value	Description	LED #/ Color	Operational Status				FOD Warning
				Standby	Power Transfer	Charge Complete	Fault Condition	
1	Pull Down	Standby LEDs ON	LED1- Green	ON	BLINK SLOW	ON	OFF	OFF
			LED2- Red	ON	OFF	OFF	ON	BLINK FAST
2	R1	Standby LEDs ON plus	LED1- Green	ON	BLINK SLOW	ON	OFF	OFF
			LED2- Red	ON	OFF	OFF	ON	BLINK FAST
3	R2	Standby LEDs ON plus	LED1- Green	ON	BLINK SLOW	ON	OFF	OFF
			LED2- Red	ON	OFF	OFF	ON	BLINK FAST
4	R3	Standby LEDs ON plus	LED1- Green	ON	BLINK SLOW	ON	OFF	OFF
			LED2- Red	ON	OFF	OFF	ON	BLINK FAST
5	R4	Standby LEDs ON plus	LED1- Green	ON	BLINK SLOW	ON	OFF	OFF
			LED2- Red	ON	OFF	OFF	ON	BLINK FAST
6	Pull Up	Standby LEDs OFF	LED1- Green	OFF	BLINK SLOW	ON	OFF	OFF
			LED2- Red	OFF	OFF	OFF	ON	BLINK FAST
7	R5	Standby LEDs OFF plus	LED1- Green	OFF	BLINK SLOW	ON	OFF	OFF
			LED2- Red	OFF	OFF	OFF	ON	BLINK FAST
8	R6	Standby LEDs OFF plus	LED1- Green	OFF	BLINK SLOW	ON	OFF	OFF
			LED2- Red	OFF	OFF	OFF	ON	BLINK FAST
9	R7	Standby LEDs OFF plus	LED1- Green	OFF	BLINK SLOW	ON	OFF	OFF
			LED2- Red	OFF	OFF	OFF	ON	BLINK FAST
10	R8	Standby LEDs OFF plus	LED1- Green	OFF	BLINK SLOW	ON	OFF	OFF
			LED2- Red	OFF	OFF	OFF	ON	BLINK FAST

R1-R8 are created using combination of two 1% resistors.

Shaded Area Designates Future Option

**Buzzer Function**

An optional buzzer feature is supported on GPIO4. The default configuration is an “AC” buzzer. The signal is created by toggling GPIO4 active-high/active-low at a 2KHz frequency.

**Buzzer Action: Power Transfer Indication**

The IDTP9036A supports audible notification when the device operation successfully reaches the Power Transfer state. The duration of the power transfer indication sound is 400ms.

The latency between reaching the Power Transfer state and the actual buzzer sounding does not exceed 500ms. Additionally, the buzzer sound is concurrent within  $\pm 250\text{ms}$  of any change to the LED configuration indicating the start of power transfer.

**Buzzer Action: No Power Transfer due to Foreign Object Detected (FOD)**

When a major FOD case is detected such that for safety reasons, power transfer is not initiated, or that power transfer is terminated, the buzzer is sounded in a repeating sequence:

For 30 seconds: 400ms ON, 800ms OFF, 400ms ON, 800ms OFF, repeat

Next 30 seconds: Off/silence (but no change to LED on/off patterns)

The pattern is repeated while the error condition exists

The buzzer is synchronized with the FOD LED such that the 400ms on tone corresponds with the Red LED illumination and 800ms off (no sound) corresponds with Red LED being off.

**Decoupling/Bulk Capacitors**

As with any high-performance mixed-signal IC, the IDTP9036A must be isolated from the system power supply noise to perform optimally. A decoupling capacitor of  $0.1\mu\text{F}$  must be connected between each power supply and the PCB ground plane as close to these pins as possible. For optimum device performance, the decoupling capacitor must be mounted on the component side of the PCB. Avoid the use of vias in the decoupling circuit. Additionally, medium value capacitors in the  $22\mu\text{F}$  range must be used at the VIN input to minimize ripple current and voltage droop due to the large current requirements of the resonant half Half-Bridge driver. At least four  $22\mu\text{F}$  capacitors must be used close to the IN pins of the device. Since the operating voltage is 12V, the capacitance value of the capacitors will decrease due to voltage derating characteristics. For example, a  $22\mu\text{F}$  X7R 25V capacitor's value is actually  $10\mu\text{F}$  when operating at 12V.

There must also be a low ESR  $82\mu\text{F}$  to  $100\mu\text{F}$  bulk capacitor connected at the node where the input voltage is applied to the board. A 16V POSCON-type or aluminum electrolytic must be connected between the input supply and ground as shown in Figure 8. POSCON capacitors have much lower ESR than aluminum electrolytic capacitors and will reduce voltage ripple.

**1.5. External Temperature sensing**

The firmware will support external temperature sensing using the circuit shown below. See the IDTP9036A Data Sheet Application Information section about the external temperature sensing (coil temperature) using a 10K thermistor.

Figure 6 – IDTP9036A GPIO2 connection to external thermistor..

**Note 1:** Recommended capacitor temperature/dielectric and voltage ratings: 100V capacitors are recommended because 100Vp-p voltage transients may appear on the resonance capacitors as stated in the WPC specification. COG/NPO-type capacitor values stay relatively constant with voltage while X7R and X5R ceramic capacitor values de-rate from 40% to over 80%. The decision to use lower voltage 50V capacitors or other type temperature/dielectric capacitors is left to the end user.

## 2. PERFORMANCE EVALUATION

### 2.1. IDTP9036A Switching frequency

Use a universal RX module to receive power from the IDTP9036AEVM and plot the switching frequency versus load current.

There are various power receiver models found on the market, and the plot may also vary.

Below is an example of a typical frequency characteristic versus varying load requirements.

Figure 14 – IDTP9036A Switching frequency versus power.

### 2.2. Power transfer efficiency

The efficiency is measured by comparing the input power to the output power

$$\eta = \frac{P_{out}}{P_{in}} = \frac{V_{out} \cdot I_{out}}{V_{in} \cdot I_{in}}$$

The chart below shows a typical efficiency characteristic versus load current

Figure 15 – TX to RX efficiency versus output current.

### 2.3. Load Transient

Figure 16 – TX to RX load transient.

### 2.4. Coil Waveforms

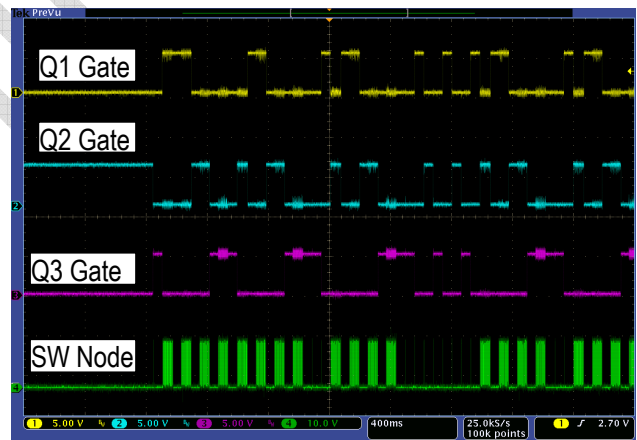

Figure 17 – TX-A6 three coil waveforms during detect mode..

### 3. I<sup>2</sup>C INTERFACE ADAPTER AND GUI

This IDTP9036A-TX-A6 EVM is designed to demonstrate the performance and functionality of the IDTP9036A wireless transmitter in a lab bench test environment. In most cases, this board can be wired into an existing system for evaluation. For complex or electrically sensitive situations, it is recommended to use the reference layout to integrate this design into the final system to eliminate hardware limitations or signal degradation introduced by long leads.

With no computer interface, this evaluation board can function in its pre-programmed mode of operation using a 12V power supply or AC adaptor. To evaluate the full potential of this device, a PC with USB output is required. Everything you need is included in this evaluation kit.

#### 3.1. Installation guide

Follow these simple steps to power-up and enable the power management features of the IDTP9036A:

1. Connect the USB cable from a PC to the 1" x 2" JM60 programming board. The JM60 board has already been programmed at the factory.
2. Connect the JM60 to the connector of the IDTP9036A-TX-A6 EVM board (J1 Figure 18).
3. Plug the AC adaptor into the wall (120 VAC) and connect the other end (12 VDC) into the adapter plug on the EVM board (J3 Figure 18).
4. Next, install the Wireless Power Demo Windows GUI software by executing the Setup.exe file in the folder "9036Tool\_final" (Figure 19).
5. Click Start >> All Programs >> Integrated Device Technology (Folder) >> Wireless Power Demo (Application Icon) to open the GUI for IDTP9036A Wireless Power Transmitter Demo software Fig 20.

Figure 18. IDTP9036A-EVAL JM60, AC Adaptor connections.

6. Without an RX load on the coil, note which LEDs are lit up on the eval board. Now place a load onto the coil and observe the different LEDs that light up depending upon where the RX load is placed onto the coils. The LEDs are defined in Figure 5. Also observe the different real time signals propagating on the GUI (Figure 21). Any problems see Troubleshooting page 19.

Figure 19. File folder structure on the CDROM.

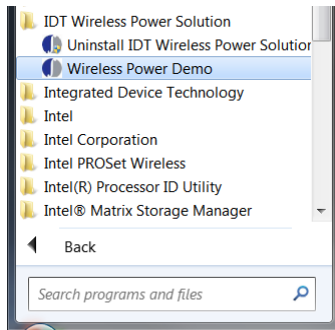

Figure 20. Starting the Graphical User Interface

### 3.2. Verifying Connectivity

You can verify that the IDTP9036A is properly connected to your computer and able to communicate with the evaluation board by looking at the lower left of Figure 21. It should state “USB Connected”. Otherwise it will state in Red letters: “USB Disconnected – Check Connection”.

If it states **USB Disconnected**, it might be that the driver was not properly installed on the PC. Check that a USB Connector icon appears and disappears, at the lower right of the Windows Taskbar, as the Cable’s USB Connector is plugged and unplugged from the USB port. If it does not appear, then proceed to Troubleshooting section, item 5.

- 1) The MAIN tab of the GUI provides 3 real time signals: PWM Frequency, Coil Current, and Duty Cycle.
- 2) Placing different Rx objects and loads onto the coils will change the real time signals, and it will change the location of the Blue “dot” at the left side of the GUI’s MAIN tab (Figure 21). For example, when the system is first turned-on, and without a load on the coil, the Blue “dot” will flash, i.e. “ping”, at the WPC Ping text location, at the very top left hand side of GUI. Then, when a load is placed on the coil, the flashing Blue “dot” at WPC Ping will cease and a solid Blue dot will appear at the Power Transfer Line text location on the left hand side of the GUI. Also, it should be noted that the red LEDs D3 and D4 will flash on/off on the eval board without an RX. Note, however, that if the load is connected to one of the three coils, the red LEDs will turn on as shown in Figure 5 and Table 1. Also, once the RX has established good communication with the evaluation board, the Rx Detected and Power Transfer “non flashing” solid Blue dots located just below the real time signals on the MAIN tab of the GUI will appear, Figure 21. Moving the RX on the coils will change the Coil Selection LEDs as shown in Table 1.

Figure 21. Windows GUI Main tab

### 3.3. Installing the Windows GUI

For the first time use of the IDTP9036A-TX-A6 EVM board or to write a new binary file into the EEPROM, the Windows Drivers and GUI must be installed to communicate with the JM60 USB to I<sup>2</sup>C controller that is located on the JM60 Programmer Dongle board. The JM60 Dongle board is attached to the left side of the DEMO board, and is connected via a 10pin keyed header on the top side of the board. The purpose of this controller is to be able to write different ".bin" files into the EEPROM on the DEMO board, and to be able to acquire real time signals showing system operation. Different .bin files can be made available, for example, when a different output power setting test is desired.

Example installation of the Windows USB-to I<sup>2</sup>C-Drivers on a Win7 32-bit or 64-bit system is shown in the following steps:

To install the GUI, open the IDTP9036A-DEMO CD and run the file: setup-1.0.0.11.exe within the 9036Tool\_final folder. I.e. the path is 9036Tool\_final/setup-1.0.0.11.exe shown in figure 19 or 22. Follow the Setup Wizard instruction shown in Figure 23. This will install the GUI and driver automatically. After the installation process is complete, you may connect the evaluation board to the computer with the USB cable, via the Dongle, and use the software tool. *At this point, a little USB icon should appear at the lower right of the desktop screen. If it does not, then the machine being used should be rebooted. Now connect the JM60 dongle board into the evaluation board and then connect the 12V supply. Now plug the USB cable into the dongle board, and plug the USB cable into the PC.*

Figure 22. Path to driver setup.exe

Figure 23. Setup Wizard

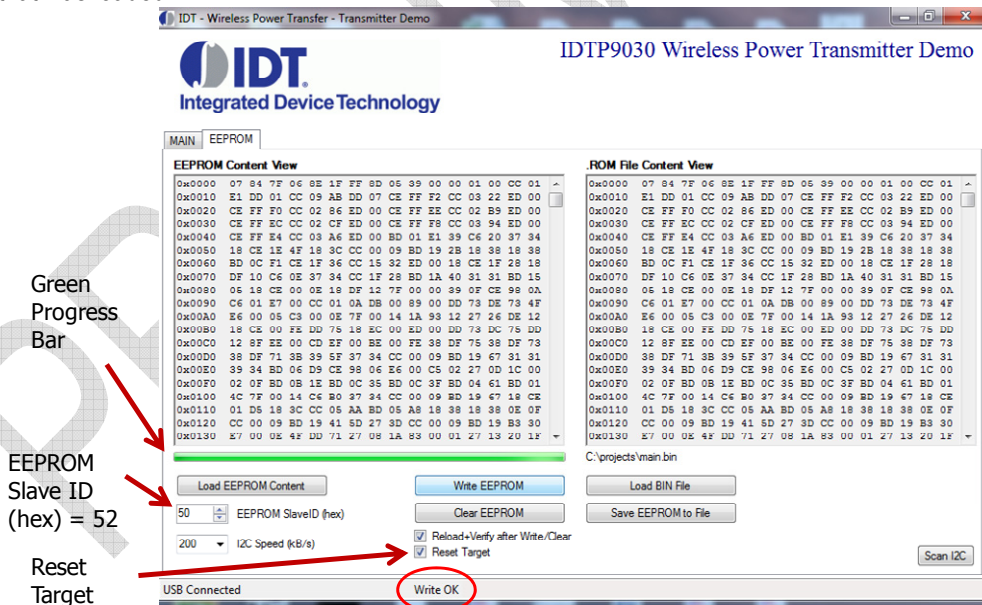

### 3.4. Writing to the EEPROM

#### Loading the .bin File

The EEPROM already comes with a standard BIN file programmed into it, which gets downloaded to the IDTP9036A upon power up. However, if another one has been provided by the factory, the way to write it into the EEPROM is as follows:

- 1) Plug the USB cable from the computer to the dongle's USB type B connector.
- 2) Plug the dongle into the IDTP9036A-TX-A6 EVM board. Make sure only a jumper exists on J4 of the dongle in a position closest to the USB connector.
- 3) Plug the 12V power supply into the IDTP9036A-TX-A6 EVM Board.
- 4) Click Start >> All Programs >> Integrated Device Technology (Folder) >> Wireless Power Demo.
- 5) Click on the EEPROM tab directly right of the MAIN tab.
- 6) Click on the Load Bin file and browse to the path where the new bin file is located, for example, on the CD (type .bin).
- 7) Referencing Figure 24, click the Reset Target box so it shows a check mark
- 8) Set the EEPROM Slave ID to 52 and select the Scan I2C button (Fig 24 lower right) and check that the slave address for the EEPROM appears as 0x52 and then.
- 9) Click the Write EEPROM button, the green progress bar should increase in size from left to right and two **green passes** should be observed as the file is written to the EEPROM and then the Write OK should appear at the bottom of the screen. If not, click the Write EEPROM button again until Write OK appears.
- 10) Finally, to get the LEDs on the DEMO board to start flashing, the Reset Target check mark has to be unchecked. Uncheck it and the various LEDs will start flashing.

If a Write OK is not shown in step 8, then refer to the Troubleshooting section on page 19. "Error Writing" is what should be shown in place of "Write OK", and it should be easily visible that FF's will be shown across the entire 0x0000 address row or simply that the EEPROM Content View doesn't match the .ROM File Content View. Note: The left Content view shows the current EEPROM contents and can be seen by clicking on the Load EEPROM Content. The Right side Content view is the Bin file that was loaded.

Load BIN file from the CDROM in the '9030tool\_final' folder.

Click Write EEPROM and wait for the two **green passes**. Now the left side view should match the right side view, and Write OK should appear. Reset Target is used when programming the EEPROM and can also be used to Reset the Demo Board.

### 3.5. Troubleshooting

The IDTP9036A demo board was designed to quickly show the performance of the IDTP9036A. However, if you are experiencing trouble getting started, here are some tips to help accelerate setup and connectivity.

1. Check to make sure that the PC shows it is connected to the demo board. USB connected should always show at the lower left of the Dongle GUI. If it doesn't it is always good practice to disconnect and reconnect the USB cable, and to disconnect and reconnect the 12V power supply. Unplugging and plugging the USB cable should show an icon appearing and disappearing at the lower right of your computer screen.
2. Depress and release the Reset button. This is the RED button on the demo board. If everything in 1 above is connected and the real time signals are still not streaming across the screen, depress the Red button. Also, enabling then disabling the "Reset Target" box on, and then off, in the EEPROM Tab (Figure 24) will restart the device. Target field box can be used for clearing GUI I<sup>2</sup>C Read Errors or other system errors.
3. Reload the .bin file and re-write it. Make sure WRITE OK shows at the middle of the display after a write takes place.
4. Select the Scan I2C button (Fig 24 lower right) and check that the slave address for the EEPROM appears as 0x52
5. **Update the Driver.** If you have a previous version of the eval tool, the driver will probably need to be updated. The way to check on the version of the driver is to open up the Device Manager as shown in Figure 23. Expand the USB Bridge Devices and double click on it. Click on the Driver Tab, and be sure its' Driver Date is 7/5/2009 and Version is 7.0.0.0. See Figure 25 through 28. If it is not version 7.0.0.0 then go to directory C:\Program Files\IDT Wireless Power Solution\Drv as shown in Figure 11 and double click the DPInst.exe file. The system will then go through a driver update install. Be sure to reboot your machine once the install is complete.

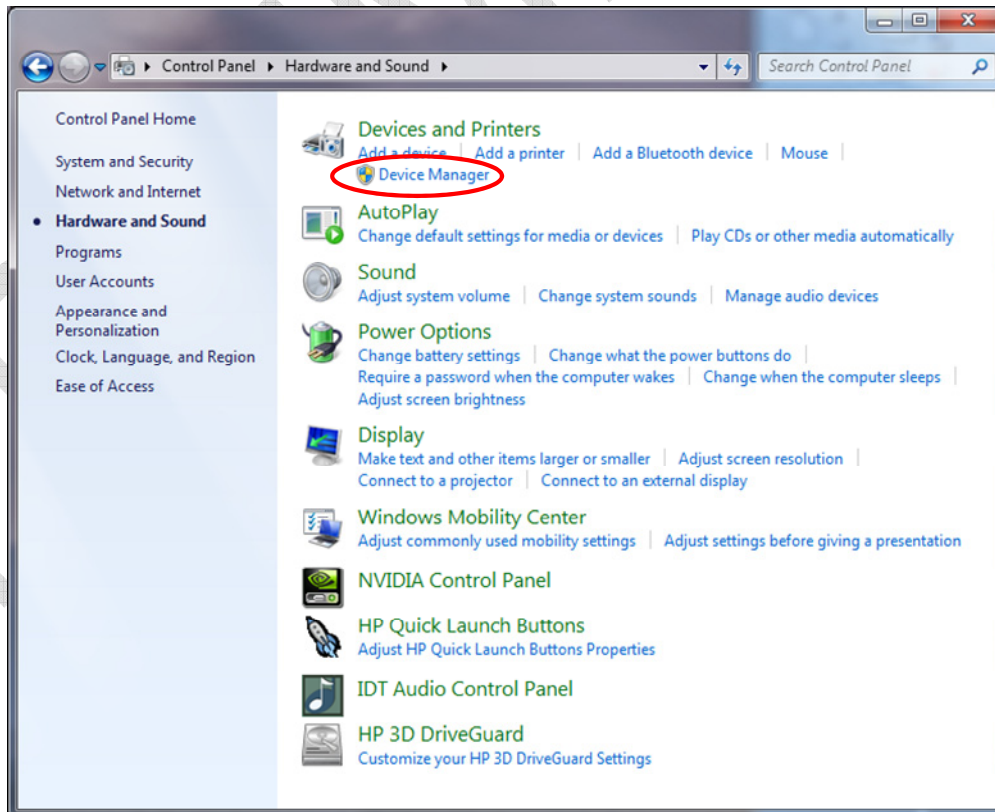

Figure 25. Checking the revision of the driver using Device Manager shown is a Win 7 PC

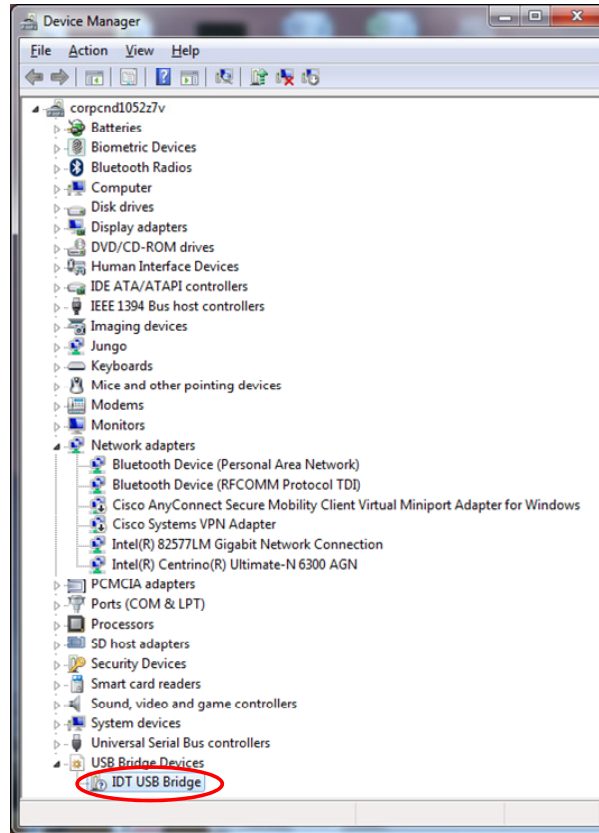

Figure 26 Checking the revision of the driver in Device Manager

Figure 27. Checking that the revision of the driver is correct

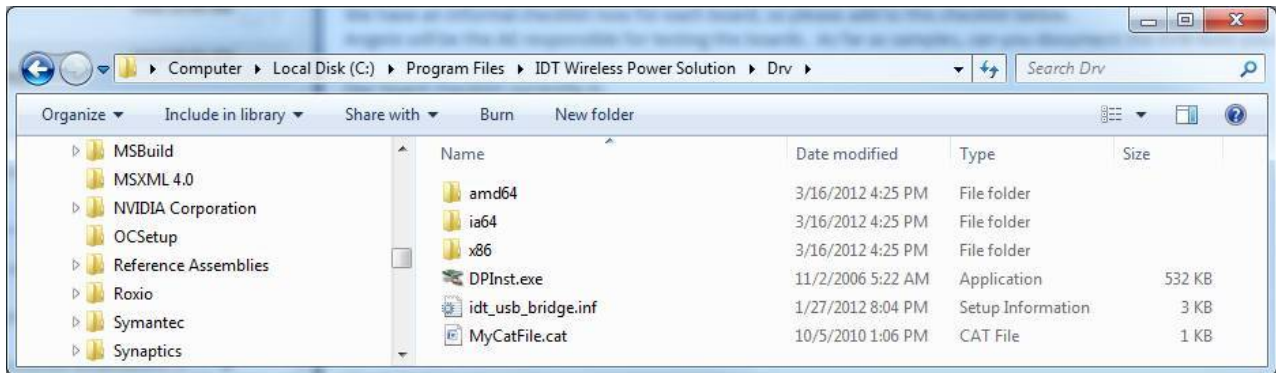

Figure 28. Installed Device Driver Directory

**Reference: Debug and Configuration Tabs**

These Tabs are for development purposes. One of the features of the Debug tab is the ability to view Real Time System Messages depending upon which of the three fields at the left of the message window is chosen. The Config and Status Tab indicate the status register readings from the device.
