FFCD 8450$_H$	APEC61STEADR0	1st Error Address Register0	R	0000 0000$_H$	32/16/8	PBG4#0.PG4-Startup	—

Note 1. P1H-CE and P1H-C devices only. P1M-C device doesn't have these registers.

Note 2. This register doesn't have any functions.

CFECCCTL_* and CFSTSCTL_* indicate control registers on each access port: "_VCI2CFBA" represents access from the system interconnect to the Code Flash, "_PE1", and "_PE2" represents access from the CPU1 respectively CPU2 to the Code Flash.

28.2.9.5 Details of Registers

(1) CFECCCTL_VCI2CFBB — FLI (Code-Flash) Address ECC Control Register

CFECCCTL_VCI2CFBB registers control the address ECC error detection/correction and 1-bit error correction on bus width conversion between code flash interface and system interconnection. Writing ECC control registers must be executed with PROT[1:0] = 01_B.

Access: These registers can be read/written in 32/16-bit units.

Address: FFC6 $2C00_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	ASECDIS	AECCDIS	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R

Table 28.90 CFECCCTL_VCI2CFBB register contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15, 14	PROT[1:0]	Protection Bit 01: write is enable Other: write is disable These bits are always read as 0.
13 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	ASECDIS	Address ECC 1-bit error correction enable bit When using Address ECC error detection/correction (AECCDIS = 0), setting 1-bit error correction to enable/disable. 0: Correction is carried out when 1-bit is detected 1: Correction is not carried out when 1-bit is detected
2	AECCDIS	Address ECC disable bit Setting Address ECC error detection/correction to enable/disable. 0: Address ECC error detection/correction is enable 1: Address ECC error detection/correction is disable
1, 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

(2) CFERRINT_VCI2CFBB — FLI (Code-Flash) Address Error Information Control Register

CFERRINT_VCI2CFBB register controls whether error information is reported to ECM, when address ECC 2-bit error and address ECC 1-bit error are detected.

Access: These registers can be read/written in 32/16/8-bit units.

Address: FFC6 2C04$_H$

Value after reset: 0000 0030$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R	R

Table 28.91 CFERRINT_VCI2CFBB register contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5	ADEDIE	Address ECC 2-bit error report enable bit Control error report of 2-bit error detection when Address ECC error detection/ correction is enabled 0: Address ECC 2-bit error report disabled 1: Address ECC 2-bit error report enabled
4	ASEDIE	Address ECC 1-bit error report enable bit Control error report of 1-bit error detection when Address ECC error detection/ correction is enabled 0: Address ECC 1-bit error report disabled 1: Address ECC 1-bit error report enabled
3 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

(3) CFERSTCLR_VCI2CFBB — FLI (Code-Flash) Address ECC SED/DED Status Clear Register

CFERSTCLR_VCI2CFBB register is used to clear error flag in CFERSTR_VCI2CFBB, error overflow flag in CFOVFSTR_VCI2CFBB, and error address in CFEADR0_VCI2CFBB. These are write only registers and read value is always “0”.

Access: These registers can be written only in 32/16/8-bit units.

Address: FFC6 2C08$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SSTCLR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 28.92 CFERSTCLR_VCI2CFBB register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	SSTCLR	Clear the error status flags Clear ADEDF/ASEDF in CFERSTR_VCI2CFBB, ERROVF in CFOVFSTR_VCI2CFBB, and CFEADR0_VCI2CFBB writing “1” to this bit.

(4) CFOVFSTR_VCI2CFBB — FLI (Code-Flash) Address Error Count Overflow Status Register

CFOVFSTR_VCI2CFBB register monitors if address error overflow occurs. Overflow occurs when different error*1 is detected in the case that error status has been already set. If the error in error status is the same error (same error cause and same error address) with the errors already stored, this flag is not set. ERROVF flag is cleared by system reset or SSTCLR in CFERSTCLR_VCI2CFBB register.

Note 1. Different means that the error satisfying one of the following conditions.

- Detected address is different
- Detected error status flag is different.

Access: These registers can be read only in 32/16/8-bit units.

Address: FFC6 2C0C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 28.93 CFOVFSTR_VCI2CFBB register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read.
0	ERROVF	Error overflow flag If an error flag (ADEDF/ASEDF in CFERSTR_VCI2CFBB) is set and a different error is detected, this bit is set.

(5) CFERSTR_VCI2CFBB — FLI (Code-Flash) Address ECC SED/DED Status Register

CFERSTR_VCI2CFBB is the address error monitor register. When all error flag is “0” for each bank and a new the error occurs, error status flag is set. If address ECC 1-bit error monitor flag is set and the new error is address ECC 2 bit error, the new error is set (does not clear the previous error flag). If a multiple error causes are detected, detected errors are all set (e.g. if ADED is detected at the same access, ADEDF is set.). This register is cleared by system reset or SSTCLR in CFERSTCLR_VCI2CFBB register.

Access: These registers can be read only in 32/16/8-bit units.

Address: FFC6 2C10$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 28.94 CFERSTR_VCI2CFBB register contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is read.
7	ADEDF	Address ECC 2-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in CFERSTCLR_VCI2CFBB Condition for “1”: ADEDF is “0” and ECC 2-bit error is detected.
6	ASEDF	Address ECC 1-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in CFERSTCLR_VCI2CFBB Condition for “1”: ASEDF is “0” and ECC 1-bit error is detected.
5 to 0	Reserved	When read, the value after reset is read.

(6) CFEADR0_VCI2CFBB — FLI (Code-Flash) Address ECC SED/DED Address Register

CFEADR0_VCI2CFBB register is used to hold the address when all error flags are not set and an error is detected. If ASEDF in CFERSTR_VCI2CFBB is set and address ECC 2-bit error is detected. This register stores a corrected address in case of 1-bit error when address correction is enabled. But when address correction is disabled or address has error on bits to exceed 2 bits the address with error is stored.

CFEADR0_VCI2CFBB is cleared by system reset or SSTCLR in CFERSTCLR_VCI2CFBB register.

Access: These registers can be read only in 32-bit units.

Address: FFC6 2C50$_H$

Value after reset: 0000 0000$_H$

(7) IFECCCTL_PE1/PE2 — IFU Data ECC Control Register

IFECCCTL_PE1/PE2 registers control the ECC error detection/correction and 1-bit error correction on master port in instruction fetch unit that is used to fetch an instruction to global or local RAM. Writing ECC control registers must be executed with PROT[1:0] = 01.

Access: These registers can be read/written in 32/16-bit units.

Address: IFECCCTL_PE1: FFC6 3400$_H$
IFECCCTL_PE2: FFC6 3600$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 28.96 IFECCCTL_PE1/PE2 register contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15	PROT1	Enables or disables modification of the ECCDIS and SECDIS bits. The value written is not retained. These bits are always read as 0. Set (PROT1, PROT0) = (0, 1) when writing to IFECCCTL_PE1/PE2.
14	PROT0	
13 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. Write a value to this bit simultaneously with setting (PROT1, PROT0) = (0, 1). 0: Enables correction of the 1-bit error detected. 1: Disables correction of the 1-bit error detected.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. Write a value to this bit simultaneously with setting (PROT1, PROT0) = (0, 1). 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(8) IFERRINT_PE1/PE2 — IFU Data Error Information Control Register

IFERRINT_PE1/PE2 registers control whether error information is reported to ECM, when data ECC 2-bit error and data ECC 1-bit error are detected.

Access: These registers can be read/written in 32/16/8-bit units.

Address: IFERRINT_PE1: FFC6 3404$_H$
IFERRINT_PE2: FFC6 3604$_H$

Value after reset: 0000 0003$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 28.97 IFERRINT_PE1/PE2 register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	DEDIE	ECC 2-bit error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 2-bit error. 1: Enables notification of the ECC 2-bit error.
0	SEDIE	ECC 1-bit error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the ECC 1-bit error. 1: Enables notification of the ECC 1-bit error.

(9) IFERSTCLR_PE1/PE2 — IFU Data ECC SED/DED Status Clear Register

IFERSTCLR_PE1/PE2 registers are used to clear SEDF and DEDF in IFERSTR_PE1/PE2 and ERROVF in IFOVFSTR_PE1/PE2, and error address in IFERADR_PE1/PE2. These are write only registers and read value is always “0”.

Access: These registers can be written only in 32/16/8-bit units.

Address: IFERSTCLR_PE1: FFC6 3408$_H$
IFERSTCLR_PE2: FFC6 3608$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 28.98 IFERSTCLR_PE1/PE2 register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	STCLR	Clear the error status flags Writing 1 to this bit clears the DEDF and SEDF flags in IFERSTR_PE1/PE2; ERROVF flag in IFOVFSTR_PE1/PE2; and IFERADR_PE1/PE2.EADR.

(10) IFOVFSTR_PE1/PE2 — IFU Data Error Count Overflow Status Register

IFOVFSTR_PE1/PE2 registers monitor if error overflow occurs. Overflow occurs when different error *1 is detected in the case that error status has been already set. If the error in error status is the same error (same error cause and same error address) with the errors already stored, this flag is not set. ERROVF flag is cleared by system reset or STCLR in IFERSTCLR_PE1/PE2 register.

Note 1. Different means that the error satisfying one of the following conditions.

- Detected address is different
- Detected error status flag is different.

Access: These registers can be read only in 32/16/8-bit units.

Address: IFOVFSTR_PE1: FFC6 340C$_H$
IFOVFSTR_PE2: FFC6 360C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERROVF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.99 IFOVFSTR_PE1/PE2 register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read.
0	ERROVF	Error Overflow Flag ERROVF is set if the second error occurs while any of the error flags (DEDF and SEDF) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error.

(11) IFERSTR_PE1/PE2 — IFU Data ECC SED/DED Status Register

IFERSTR_PE1/PE2 are the error monitor registers. When all error flag is “0” and a new error occurs, error status flag is set. If data ECC 1 bit is set and the new error is data ECC 2 bit, the new error is set (does not clear the previous error flag).

IFERSTR_PE1/PE2 register is cleared by system reset or STCLR in IFERSTCLR_PE1/PE2 register.

Access: These registers can be read only in 32/16/8-bit units.

Address: IFERSTR_PE1: FFC6 3410$_H$
IFERSTR_PE2: FFC6 3610$_H$

Value after reset: 0000 0000$_H$

Table 28.100 IFERSTR_PE1/PE2 register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read.
1	DEDF	ECC 2-bit error Monitor Flag 0: Cleared to 0 by setting the STCLR bit to 1 in IFERSTCLR_PE1/PE2. 1: Indicates that an ECC 2-bit error has occurred while the error flag DEDF is 0.
0	SEDF	ECC 1-bit error Monitor Flag 0: Cleared to 0 by setting the STCLR bit to 1 in IFERSTCLR_PE1/PE2. 1: Indicates that an ECC 1-bit error has occurred while the error flags DEDF and SEDF are 0.

(12) IFERADR_PE1/PE2 — IFU Data ECC SED/DED Address Register

IFERADR_PE1/PE2 registers are used to hold the address when all error flags are not set and an error is detected. If SEDF in IFERSTR_PE1/PE2 is set and data ECC 2-bit error is detected.

IFERADR_PE1/PE2 is cleared by system reset or STCLR in IFERSTCLR_PE1/PE2 register.

Access: These registers can be read only in 32-bit units.

Address: IFERADR_PE1: FFC6 3450$_H$
IFERADR_PE2: FFC6 3650$_H$

Value after reset: 0000 0000$_H$

Table 28.105 LSSOVFSTR_PE1/PE2 register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read.
0	ERROVF	Error overflow flag If an error flag (ADEDF, ASEDF, DEDF, SEDF in LSERSTR_PE1/PE2) is set and a different error is detected, this bit is set.

(17) LSSERSTR_PE1/PE2 — LSU Slave Data and Address ECC SED/DED Status Register

LSSERSTR_PE1/PE2 are the error monitor registers. When all error flag is “0” and a new the error occurs, error status flag is set. If address ECC 1 bit, data ECC 1 bit is set and the new error is address ECC 2 bit, data ECC 2 bit, the new error is set (does not clear the previous error flag). If a multiple error causes are detected, detected errors are all set (e.g. if DED and ADED are detected at the same access, DEDF and ADEDF are both set.). LSSERSTR_PE1/PE2 registers are cleared by system reset or SSTCLR in LSSERSTCLR_PE1/PE2 register.

Access: These registers can be read only in 32/16/8-bit units.

Address: LSSERSTR_PE1: FFC6 6010_H
LSSERSTR_PE2: FFC6 6210_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.106 LSSERSTR_PE1/PE2 register contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is read.
7	ADEDF	Address ECC 2-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in LSSERSTCLR_PE1/PE2 Condition to “1”: ADEDF is “0” and ECC 2-bit error is detected.
6	ASEDF	Address ECC 1-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in LSSERSTCLR_PE1/PE2 Condition to “1”: ASEDF is “0” and ECC 1-bit error is detected.
5 to 2	Reserved	When read, the value after reset is read.
1	DEDF	Data ECC 2-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in LSSERSTCLR_PE1/PE2 Condition to “1”: DEDF is “0” and ECC 2-bit error is detected.
0	SEDF	Data ECC 1-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in LSSERSTCLR_PE1/PE2 Condition to “1”: SEDF is “0” and ECC 1-bit error is detected.

(18) LSSEADR_PE1/PE2 — LSU Slave Data and Address ECC SED/DED Address Register

LSSEADR_PE1/PE2 registers are used to hold the address when all error flags are not set and an error is detected. If ASEDF/SEDF in LSSERSTR_PE1/PE2 is set and address ECC 2 bit/data ECC 2-bit error is detected. This register stores a corrected address in case of 1- bit error when address correction is enabled. But when address correction is disabled or address has error on bits to exceed 2 bits the address with error is stored.

LSSEADR_PE1/PE2 are cleared by system reset or SSTCLR in LSSERSTCLR_PE1/PE2 register.

Access: These registers can be read only in 32-bit units.

Address: LSSEADR_PE1: FFC6 6050_H
LSSEADR_PE2: FFC6 6250_H

Value after reset: 0000 0000_H

(19) LSMECCCTL_PE1/PE2 — LSU Master Data ECC Control Register

LSMECCCTL_PE1/PE2 registers control the ECC error detection/correction and 1-bit error correction on master port in load store unit that is used to access into data in RAM or peripheral registers. Writing ECC control registers must be executed with PROT[1:0] = 01_B.

Access: These registers can be read/written in 32/16-bit units.

Address: LSMECCCTL_PE1: FFC6 6400_H
LSMECCCTL_PE2: FFC6 6600_H

Value after reset: 0000 0000_H

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15, 14	PROT[1:0]	Protection Bit 01: write is enable Other: write is disable These bits are always read as 0.
13 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	SECDIS	Data ECC 1-bit error correction enable bit When using Data ECC error detection/correction (ECCDIS = 0), setting 1-bit error correction to enable/disable. 0: Correction is done when 1-bit error is detected 1: No Correction is done when 1-bit error is detected
0	ECCDIS	Data ECC disable bit Setting Data ECC error detection/correction to enable/disable. 0: Data ECC error detection/correction is enable 1: Data ECC error detection/correction is disable

(20) LSMERRINT_PE1/PE2 — LSU Master Data Error Information Control Register

LSMERRINT_PE1/PE2 registers control whether error information is reported to ECM, when data ECC 2-bit error and data ECC 1-bit error are detected.

Access: These registers can be read/written in 32/16/8-bit units.

Address: LSMERRINT_PE1: FFC6 6404$_H$
LSMERRINT_PE2: FFC6 6604$_H$

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	DEDIE	Data ECC 2-bit error report enable bit Control error report of 2-bit error detection when Data ECC error detection/ correction is enabled 0: Data ECC 2-bit error report disabled 1: Data ECC 2-bit error report enabled
0	SEDIE	Data ECC 1-bit error report enable bit Control error report of 1-bit error detection when Data ECC error detection/ correction is enabled 0: Data ECC 1-bit error report disabled 1: Data ECC 1-bit error report enabled

(21) LSMERSTCLR_PE1/PE2 — LSU Master Data ECC SED/DED Status Clear Register

LSMERRSTCLR_PE1/PE2 registers are used to clear error flag in LSMERSTR_PE1/PE2, error overflow flag in LSMOVFSTR_PE1/PE2, and error address in LSMEADR_PE1/PE2. These are write only registers and read value is always “0”.

Access: These registers can be written only in 32/16/8-bit units.

Address: LSMERSTCLR_PE1: FFC6 6408$_H$
LSMERSTCLR_PE2: FFC6 6608$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 28.110 LSMERSTCLR_PE1/PE2 register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	SSTCLR	Clear the error status flags Clear DEDF / SEDF in LSMERSTR_PE1/PE2, ERROVF in LSMOVFSTR_PE1/PE2, and LSMEADR_PE1/PE2 writing “1” to this bit.

(22) LSMOVFSTR_PE1/PE2 — LSU Master Data Error Count Overflow Status Register

LSMOVFSTR_PE1/PE2 registers monitor if error overflow occurs. Overflow occurs when different error*1 is detected in the case that error status has been already set. If the error in error status is the same error (same error cause and same error address) with the errors already stored, this flag is not set. ERROVF flag is cleared by system reset or SSTCLR in LSMERSTCLR_PE1/PE2 register.

Note 1. Different means that the error satisfying one of the following conditions.

- Detected address is different
- Detected error status flag is different.

Access: These registers can be read only in 32/16/8-bit units.

Address: LSMOVFSTR_PE1: FFC6 640C$_H$
LSMOVFSTR_PE2: FFC6 660C$_H$

Value after reset: 0000 0000$_H$

Table 28.111 LSMOVFSTR_PE1/PE2 register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read.
0	ERROVF	Error overflow flag If an error flag (DEDF, SEDF in LSMERSTR_PE1/PE2) is set and a different error is detected, this bit is set.

(23) LSMERSTR_PE1/PE2 — LSU Master Data ECC SED/DED Status Register

LSMERSTR_PE1/PE2 are the error monitor registers. When all error flag is “0” for each bank and a new the error occurs, error status flag is set. If data ECC 1 bit is set and the new error is data ECC 2 bit, the new error is set (does not clear the previous error flag). LSMERSTR_PE1/PE2 register is cleared by system reset or SSTCLR in LSMERSTCLR_PE1/PE2 register.

Access: These registers can be read only in 32/16/8-bit units.

Address: LSMERSTR_PE1: FFC6 6410$_H$
LSMERSTR_PE2: FFC6 6610$_H$

Value after reset: 0000 0000$_H$

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read.
1	DEDF	Data ECC 2-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in LSMERSTCLR_PE1/PE2 Condition to “1”: DEDF is “0” and ECC 2-bit error is detected.
0	SEDF	Data ECC 1-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in LSMERSTCLR_PE1/PE2 Condition to “1”: SEDF is “0” and ECC 1-bit error is detected.

(24) LSMEADR_PE1/PE2 — LSU Master Data ECC SED/DED Address Register

LSMEADR_PE1/PE2 registers are used to hold the address when all error flags are not set and an error is detected. If SEDF in LSMERSTR_PE1/PE2 is set and data ECC 2-bit error is detected.

LSMEADR_PE1/PE2 is cleared by system reset or SSTCLR in LSMERSTCLR_PE1/PE2 register.

Access: These registers can be read only in 32-bit units.

Address: LSMEADR_PE1: FFC6 6450_H
LSMEADR_PE2: FFC6 6650_H

Value after reset: 0000 0000_H

(25) VPECCCTL_SG*n* — System Interconnect (PBus I/F) Data ECC Control Register (*n* = 0 to 3, 5)

VPECCCTL_SGn (n = 0 to 3, 5) register control the ECC error detection/correction and 1-bit error correction on ECC modules that are used only when the bit operation is executed to a PBus peripheral register. Writing ECC control registers must be executed with PROT[1:0] = 01_B.

NOTE

These registers can be written and read. However even if these registers are set, the setting doesn't affect the operation. ECC and 1 bit error correction can not be disabled.

Access: These registers can be read/written in 32/16-bit units.

Address: VPECCCTL_SG0: FFC6 7000_H
VPECCCTL_SG1: FFC6 7400_H
VPECCCTL_SG2: FFC6 7800_H

0	SSTCLR	Clear the error status flags Clear DEDF / SEDF in VPERSTR_SGn, ERROVF in VPOVFSTR_SGn, and VPEADR_SGn writing “1” to this bit.

(28) VPOVFSTR_SG*n* — System Interconnect (PBus I/F) Data Error Count Overflow Status Register (*n* = 0 to 3, 5)

VPOVFSTR_SG*n* registers monitor if error overflow occurs. Overflow occurs when different error*[1] is detected in the case that error status has been already set. If the error in error status is the same error (same error cause and same error address) with the errors already stored, this flag is not set. ERROVF flag is cleared by system reset or SSTCLR in VPERSTCLR_SG*n* register.

Note 1. Different means that the error satisfying one of the following conditions.

- Detected address is different
- Detected error status flag is different.

Access: These registers can be read only in 32/16/8-bit units.

Address: VPOVFSTR_SG0: FFC6 700C$_H$
VPOVFSTR_SG1: FFC6 740C$_H$
VPOVFSTR_SG2: FFC6 780C$_H$
VPOVFSTR_SG3: FFC6 7C0C$_H$
VPOVFSTR_SG5: FFC6 840C$_H$

Value after reset: 0000 0000$_H$

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read.
0	ERROVF	Error overflow flag If an error flag (DEDF, SEDF in VPERSTR_SGn) is set and a different error is detected, this bit is set.

(29) VPERSTR_SGn — System Interconnect (PBus I/F) Data ECC Status Register (*n* = 0 to 3, 5)

VPERSTR_SG*n* is the error monitor register. If the error flag is “0” for each bank and a new error occurs, the error status flag is set. If address ECC 1 bit, data ECC 1 bit is set and the new error is address ECC 2 bit, data ECC 2 bit, the new error is set (does not clear the previous error flag). VPERSTR_SG*n* register is cleared by system reset or SSTCLR in VPERSTCLR_SG*n* register.

Access: These registers can be read only in 32/16/8-bit units.

Address: VPERSTR_SG0: FFC6 7010$_H$
VPERSTR_SG1: FFC6 7410$_H$
VPERSTR_SG2: FFC6 7810$_H$

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read.
1	DEDF	Data ECC 2-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in VPERSTCLR_SGn Condition to “1”: DEDF is “0” and ECC 2-bit error is detected.
0	SEDF	Data ECC 1-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in VPERSTCLR_SGn Condition to “1”: SEDF is “0” and ECC 1-bit error is detected

(30) VPEADR_SG*n* — System Interconnect (PBus I/F) Data ECC SED/DED Address Register (*n* = 0 to 3, 5)

VPEADR_SGn register is used to hold the address when all error flags are not set and an error is detected. If SEDF in VPERSTR_SGn is set and data ECC 2-bit error is detected.

VPEADR_SGn is cleared by system reset or SSTCLR in VPERSTCLR_SGn register.

Access: These registers can be read only in 32-bit units.

Address: VPEADR_SG0: FFC6 7050$_H$
VPEADR_SG1: FFC6 7450$_H$
VPEADR_SG2: FFC6 7850$_H$

(31) VPECCCTL_TERM_SG7 — PBus Data and Address ECC Control Register

VPECCCTL_TERM_SG7 register control the ECC error detection/correction and 1-bit error correction on the terminal of peripheral bus. There is no available peripheral for the area covered by this ECC module. Writing ECC control registers must be executed with PROT[1:0] = 01_B.

NOTE

This register can be written and read. However even if this register is set, the setting doesn't affect the operation. ECC and 1 bit error correction can not be disabled.

Access: This register can be read/written in 32/16-bit units.

Address: VPECCCTL_TERM_SG7: FFC6 8E00$_H$

Value after reset: 0000 0000$_H$

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15, 14	PROT[1:0]	Protection Bit 01: write is enable Other: write is disable These bits are always read as 0.
13 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	ASECDIS	Address ECC 1-bit error correction enable bit When using Address ECC error detection/correction (AECCDIS = 0), setting 1-bit error correction to enable/disable. 0: Correction is done when 1-bit error is detected 1: No Correction is done when 1-bit error is detected
2	AECCDIS	Address ECC disable bit Setting Address ECC error detection/correction to enable/disable. 0: Address ECC error detection/correction is enable 1: Address ECC error detection/correction is disable
1	SECDIS	Data ECC 1-bit error correction enable bit When using Data ECC error detection/correction (ECCDIS = 0), setting 1-bit error correction to enable/disable. 0: Correction is done when 1-bit error is detected 1: No Correction is done when 1-bit error is detected
0	ECCDIS	Data ECC disable bit Setting Data ECC error detection/correction to enable/disable. 0: Data ECC error detection/correction is enable 1: Data ECC error detection/correction is disable

(32) VPERRINT_TERM_SG7 — System Interconnect (PBus I/F) Data and Address Error Information Control Register

VPERRINT_TERM_SG7 register controls whether error information is reported to ECM, when data/address ECC 2-bit error and data/address ECC 1-bit error are detected.

Access: This register can be read/written in 32/16/8-bit units.

Address: VPERRINT_TERM_SG7: FFC6 8E04$_H$

Value after reset: 0000 0003$_H$

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5	ADEDIE	Address ECC 2-bit error report enable bit Control error report of 2-bit error detection when Address ECC error detection/correction is enabled 0: Address ECC 2-bit error report disabled 1: Address ECC 2-bit error report enabled
4	ASEDIE	Address ECC 1-bit error report enable bit Control error report of 1-bit error detection when Address ECC error detection/correction is enabled 0: Address ECC 1-bit error report disabled 1: Address ECC 1-bit error report enabled
3, 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	DEDIE	Data ECC 2-bit error report enable bit Control error report of 2-bit error detection when Data ECC error detection/correction is enabled 0: Data ECC 2-bit error report disabled 1: Data ECC 2-bit error report enabled
0	SEDIE	Data ECC 1-bit error report enable bit Control error report of 1-bit error detection when Data ECC error detection/correction is enabled 0: Data ECC 1-bit error report disabled 1: Data ECC 1-bit error report enabled

(33) VPERSTCLR_TERM_SG7 — System Interconnect (PBus I/F) Data and Address ECC SED/DED Status Clear Register

VPERSTCLR_TERM_SG7 register is used to clear error flag in VPERSTR_TERM_SG7, error overflow flag in VPOVFSTR_TERM_SG7, and error address in VPEADR_TERM_SG7. This is write only register and read value is always “0”.

Access: This register can be written only in 32/16/8-bit units.

Address: VPERSTCLR_TERM_SG7: FFC6 8E08$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 28.122 VPERSTCLR_TERM_SG7 register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	SSTCLR	Clear the error status flags Clear ADEDF / ASEDF / DEDF / SEDF in VPERSTR_TERM_SG7, ERROVF in VPOVFSTR_TERM_SG7, and VPEADR_TERM_SG7 writing “1” to this bit.

(34) VPOVFSTR_TERM_SG7 — System Interconnect (PBus I/F) Data Error Count Overflow Status Register

VPOVFSTR_TERM_SG7 register monitor if error overflow occurs. Overflow occurs when different error*1 is detected in the case that error status has been already set. If the error in error status is the same error (same error cause and same error address) with the errors already stored, this flag is not set. ERROVF flag is cleared by system reset or SSTCLR in VPERSTCLR_TERM_SG7 register.

Note 1. Different means that the error satisfying one of the following conditions.

- Detected address is different
- Detected error status flag is different.

Access: This register can be read only in 32/16/8-bit units.

Address: VPOVFSTR_TERM_SG7: FFC6 8E0C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.123 VPOVFSTR_TERM_SG7 register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read.
0	ERROVF	Error overflow flag If an error flag (ADEDF, ASEDF, DEDF, SEDF in VPERSTR_TERM_SG7) is set and a different error is detected, this bit is set.

(35) VPERSTR_TERM_SG7 — System Interconnect (PBus I/F) Data and Address ECC SED/DED Status Register

VPERSTR_TERM_SG7 is the error monitor register. If the error flag is “0” for each bank and a new error occurs, the error status flag is set. If address ECC 1 bit, data ECC 1 bit is set and the new error is address ECC 2 bit, data ECC 2 bit, the new error is set (does not clear the previous error flag). If a multiple error causes are detected, detected errors are all set (e.g. if DED and ADED are detected at the same access, DEDF and ADEDF are both set.). VPERSTR_TERM_SG7 register is cleared by system reset or SSTCLR in VPERSTCLR_TERM_SG7 register.

Access: This register can be read only in 32/16/8-bit units.

Address: VPERSTR_TERM_SG7: FFC6 8E10$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 28.124 VPERSTR_TERM_SG7 register contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is read.
7	ADEDF	Address ECC 2-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in VPERSTCLR_TERM_SG7 Condition to “1”: ADEDF is “0” and ECC 2-bit error is detected.
6	ASEDF	Address ECC 1-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in VPERSTCLR_TERM_SG7 Condition to “1”: ASEDF is “0” and ECC 1-bit error is detected.
5 to 2	Reserved	When read, the value after reset is read.
1	DEDF	Data ECC 2-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in VPERSTCLR_TERM_SG7 Condition to “1”: DEDF is “0” and ECC 2-bit error is detected.
0	SEDF	Data ECC 1-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in VPERSTCLR_TERM_SG7 Condition to “1”: SEDF is “0” and ECC 1-bit error is detected.

(36) VPEADR_TERM_SG7 — System Interconnect (PBus I/F) Data ECC SED/DED Address Register

VPEADR_TERM_SG7 register is used to hold the address when all error flags are not set and an error is detected. If ASEDF/SEDF in VPERSTR_TERM_SG7 is set and address ECC 2 bit/data ECC 2-bit error is detected. This register stores a corrected address in case of 1- bit error when address correction is enabled. But when address correction is disabled or address has error on bits to exceed 2 bits the address with error is stored.

VPEADR_TERM_SG7 is cleared by system reset or SSTCLR in VPERSTCLR_TERM_SG7 register.

Access: This register can be read only in 32-bit units.

Address: VPEADR_TERM_SG7: FFC6 8E50$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 0	EADR[31:0]	Error detection address

(37) VPECCCTL_VCI2VPI — System Interconnect Address ECC Control Register

VPECCCTL_VCI2VPI register control the ECC error detection/correction and 1-bit error correction on bus width conversion between system interconnection and PBus that is used only when data to exceed 64 bits is transferred to PBus peripheral from DMA. Writing ECC control registers must be executed with PROT[1:0] = 01_B.

Access: These registers can be read/written in 32/16-bit units.

Address: VPECCCTL_VCI2VPI: FFC6 9000_H

Value after reset: 0000 0000_H

NOTE

This register can be written and read. However even if this register is set, the setting doesn't affect the operation. ECC and 1 bit error correction can not be disabled.

4	ASEDIE	Address ECC 1bit error report enable bit Control error report of 1bit error detection when Address ECC error detection/ correction is enabled 0: Address ECC 1bit error report disabled 1: Address ECC 1bit error report enabled
3 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

(39) VPERSTCLR_VCI2VPI — System Interconnect Address ECC SED/DED Status Clear Register

VPERRSTCLR_VCI2VPI registers are used to clear error flag in VPERSTR_VCI2VPI, error overflow flag in VPOVFSTR_VCI2VPI, and error address in VPERADR0_VCI2VPI. These are write only registers and read value is always “0”.

Access: These registers can be written only in 32/16/8-bit units.

Address: VPERSTCLR_VCI2VPI: FFC6 9008_H

Value after reset: $0000\ 0000_H$

Table 28.128 VPERSTCLR_VCI2VPI register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	SSTCLR	Clear the error status flags Clear ADEDF / ASEDF in VPERSTR_VCI2VPI, ERROVF in VPOVFSTR_VCI2VPI, and VPEADR_VCI2VPI writing “1” to this bit.

(40) VPOVFSTR_VCI2VPI —System Interconnect Address Error Count Overflow Status Register

VPOVFSTR_VCI2VPI registers monitor if error overflow occurs. Overflow occurs when different error*1 is detected in the case that error status has been already set. If the error in error status is the same error (same error cause and same error address) with the errors already stored, this flag is not set. ERROVF flag is cleared by system reset or SSTCLR in VPERSTCLR_VCI2VPI register.

Note 1. Different means that the error satisfying one of the following conditions.

- Detected address is different
- Detected error status flag is different.

Access: These registers can be read only in 32/16/8-bit units.

Address: VPOVFSTR_VCI2VPI: FFC6 900C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.129 VPOVFSTR_VCI2VPI register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read.
0	ERROVF	Error overflow flag If an error flag (ADEDF, ASEDF in VPERSTR_VCI2VPI) is set and a different error is detected, this bit is set.

(41) VPERSTR_VCI2VPI — System Interconnect Address ECC Status Register

VPERSTR_VCI2VPI is the error monitor register. If the error flag is “0” for each bank and a new error occurs, the error status flag is set. If address ECC 1 bit is set and the new error is address ECC 2 bit, the new error is set (does not clear the previous error flag). VPERSTR_VCI2VPI register is cleared by system reset or SSTCLR in VPERSTCLR_VCI2VPI register.

Access: These registers can be read only in 32/16/8-bit units.

Address: VPERSTR_VCI2VPI: FFC6 9010_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 28.130 VPERSTR_VCI2VPI register contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is read.
7	ADEDF	Address ECC 2-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in VPERSTCLR_VCI2VPI Condition to “1”: ADEDF is “0” and ECC 2-bit error is detected.
6	ASEDF	Address ECC 1-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in VPERSTCLR_VCI2VPI Condition to “1”: ASEDF is “0” and ECC 1-bit error is detected
5 to 0	Reserved	When read, the value after reset is read.

(42) VPERADR0_VCI2VPI — System Interconnect Address ECC SED/DED Address Register

VPERADR0_VCI2VPI register is used to hold the address when all error flags are not set and an error is detected. If SEDF in VPERSTR_VCI2VPI is set and data ECC 2-bit error is detected.

VPERADR0_VCI2VPI is cleared by system reset or SSTCLR in VPERSTCLR_VCI2VPI register.

Access: These registers can be read only in 32/16/8-bit units.

Address: VPERADR0_VCI2VPI: FFC6 9050$_H$

Value after reset: 0000 0000$_H$

Bit Position	Bit Name	Function
31 to 0	EADR[31:0]	Error detection address

(43) VCECCCTL_PDMA — System Interconnect Data ECC Control Register

VCECCCTL_PDMA register control the ECC error detection/correction and 1-bit error correction on master port of DMA that is used to read to a source from DMA. Writing ECC control registers must be executed with PROT[1:0] = 01_B.

Access: This register can be read/written in 32/16-bit units.

Address: FFC6 $A000_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.132 VCECCCTL_PDMA register contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15, 14	PROT[1:0]	Protection Bit 01: write is enable Other: write is disable These bits are always read as 0.
13 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	SECDIS	Data ECC 1-bit error correction enable bit When using Data ECC error detection/correction (ECCDIS = 0), setting 1-bit error correction to enable/disable. 0: Correction is done when 1-bit error is detected 1: No Correction is done when 1-bit error is detected
0	ECCDIS	Data ECC disable bit Setting Data ECC error detection/correction to enable/disable. 0: Data ECC error detection/correction is enable 1: Data ECC error detection/correction is disable

(44) VCERRINT_PDMA — System Interconnect Data Error Information Control Register

VCERRINT_PDMA register controls whether error information is reported to ECM, when data ECC 2-bit error and data ECC 1-bit error are detected.

Access: This register can be read/written in 32/16/8-bit units.

Address: FFC6 A004$_H$

Value after reset: 0000 0003$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 28.133 VCERRINT_PDMA register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	DEDIE	Data ECC 2-bit error report enable bit Control error report of 2-bit error detection when Data ECC error detection/ correction is enabled 0: Data ECC 2-bit error report disabled 1: Data ECC 2-bit error report enabled
0	SEDIE	Data ECC 1-bit error report enable bit Control error report of 1-bit error detection when Data ECC error detection/ correction is enabled 0: Data ECC 1-bit error report disabled 1: Data ECC 1-bit error report enabled

(45) VCERSTCLR_PDMA — System Interconnect Data ECC SED/DED Status Clear Register

VCERSTCLR_PDMA register is used to clear error flag in VCERSTR_PDMA, error overflow flag in VCOVFSTR_PDMA, and error address in VCEADR_PDMA. This is write only register and read value is always “0”.

Access: This register can be written only in 32/16/8-bit units.

Address: FFC6 A008$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 28.134 VCERSTCLR_PDMA register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	SSTCLR	Clear the error status flags Clear DEDF / SEDF in VCERSTR_PDMA, ERROVF in VCOVFSTR_PDMA, and VCEADR_PDMA writing “1” to this bit.

(46) VCOVFSTR_PDMA — System Interconnect Data Error Count Overflow Status Register

VCOVFSTR_PDMA register monitor if error overflow occurs. Overflow occurs when different error *[1] is detected in the case that error status has been already set. If the error in error status is the same error (same error cause and same error address) with the errors already stored, this flag is not set. ERROVF flag is cleared by system reset or SSTCLR in VCERSTCLR_PDMA register.

Note 1. Different means that the error satisfying one of the following conditions.

- Detected address is different
- Detected error status flag is different.

Access: This register can be read only in 32/16/8-bit units.

Address: FFC6 A00C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 28.135 VCOVFSTR_PDMA register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read.
0	ERROVF	Error overflow flag If an error flag (DEDF, SEDF in VCERSTR_PDMA) is set and a different error is detected, this bit is set.

(47) VCERSTR_PDMA — System Interconnect Data ECC SED/DED Status Register

VCERSTR_PDMA is the error monitor register. If the error flag is “0” and a new error occurs, the error status flag is set. If data ECC 1-bit error monitor flag is set and the new error is data ECC 2-bit error, the new error is set (does not clear the previous error flag). VCERSTR_PDMA register is cleared by system reset or SSTCLR in VCERSTCLR_PDMA register.

Access: This register can be read only in 32/16/8-bit units.

Address: FFC6 A010$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 28.136 VCERSTR_PDMA register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read.
1	DEDF	Data ECC 2-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in VCERSTCLR_PDMA Condition to “1”: DEDF is “0” and ECC 2-bit error is detected.
0	SEDF	Data ECC 1-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in VCERSTCLR_PDMA Condition to “1”: SEDF is “0” and ECC 1-bit error is detected.

(48) VCEADR_PDMA — System Interconnect Data ECC SED/DED Address Register

VCEADR_PDMA register is used to hold the address when all error flags are not set and an error is detected. If SEDF in VCERSTR_PDMA is set and data ECC 2-bit error is detected. VCEADR_PDMA is cleared by system reset or SSTCLR in VCERSTCLR_PDMA register.

Access: This register can be read only in 32-bit units.

Address: FFC6 A050$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 28.139 APERRINT_PFSS register contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5	ADEDIE	Address ECC 2-bit error report enable bit Control error report of 2-bit error detection when Address ECC error detection/ correction is enabled 0: Address ECC 2-bit error report disabled 1: Address ECC 2-bit error report enabled
4	ASEDIE	Address ECC 1-bit error report enable bit Control error report of 1-bit error detection when Address ECC error detection/ correction is enabled 0: Address ECC 1-bit error report disabled 1: Address ECC 1-bit error report enabled
3, 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	DEDIE	Data ECC 2-bit error report enable bit Control error report of 2-bit error detection when Data ECC error detection/ correction is enabled 0: Data ECC 2-bit error report disabled 1: Data ECC 2-bit error report enabled
0	SEDIE	Data ECC 1-bit error report enable bit Control error report of 1-bit error detection when Data ECC error detection/ correction is enabled 0: Data ECC 1-bit error report disabled 1: Data ECC 1-bit error report enabled

(51) APERSTCLR_PFSS — P-Bus Data and Address ECC SED/DED Status Clear Register

APERSTCLR_PFSS register is used to clear error flag in APERSTR_PFSS, error overflow flag in APOVFSTR_PFSS, and error address in APEADR_PFSS. This is write only register and read value is always “0”.

Access: This register can be written only in 32/16/8-bit units.

Address: FFC6 C008$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 28.140 APERSTCLR_PFSS register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	SSTCLR	Clear the error status flags Clear ADEDF / ASEDF / DEDF / SEDF in APERSTR_PFSS, ERROVF in APOVFSTR_PFSS, and APEADR_PFSS writing “1” to this bit.

(52) APOVFSTR_PFSS — P-Bus Data and Address Error Count Overflow Status Register

APOVFSTR_PFSS register monitor if error overflow occurs. Overflow occurs when different error*1 is detected in the case that error status has been already set. If the error in error status is the same error (same error cause and same error address) with the errors already stored, this flag is not set. ERROVF flag is cleared by system reset or SSTCLR in APERSTCLR_PFSS register.

Note 1. Different means that the error satisfying one of the following conditions.

- Detected address is different
- Detected error status flag is different.

Access: This register can be read only in 32/16/8-bit units.

Address: FFC6 C00C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 28.141 APOVFSTR_PFSS register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read.
0	ERROVF	Error overflow flag If an error flag (ADEDF, ASEDF, DEDF, SEDF in APERSTR_PFSS) is set and a different error is detected, this bit is set.

(53) APERSTR_PFSS — P-Bus Data and Address ECC SED/DED Status Register

APERSTR_PFSS is the error monitor register. If the error flag is “0” for each bank and a new error occurs, the error status flag is set. If address ECC 1 bit, data ECC 1 bit is set and the new error is address ECC 2 bit, data ECC 2 bit, the new error is set (does not clear the previous error flag). If a multiple error causes are detected, detected errors are all set (e.g. if DED and ADED are detected at the same access, DEDF and ADEDF are both set.). APERSTR_PFSS register is cleared by system reset or SSTCLR in APERSTCLR_PFSS register.

Access: This register can be read only in 32/16/8-bit units.

Address: FFC6 C010$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 28.142 APERSTR_PFSS register contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is read.
7	ADEDF	Address ECC 2-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in APERSTCLR_PFSS Condition to “1”: ADEDF is “0” and ECC 2-bit error is detected.
6	ASEDF	Address ECC 1-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in APERSTCLR_PFSS Condition to “1”: ASEDF is “0” and ECC 1-bit error is detected.
5 to 2	Reserved	When read, the value after reset is read.
1	DEDF	Data ECC 2-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in APERSTCLR_PFSS Condition to “1”: DEDF is “0” and ECC 2-bit error is detected.
0	SEDF	Data ECC 1-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in APERSTCLR_PFSS Condition to “1”: SEDF is “0” and ECC 1-bit error is detected.

(54) APEADR_PFSS — P-Bus Data and Address ECC SED/DED Address Register

APEADR_PFSS register is used to hold the address when all error flags are not set and an error is detected. If ASEDF/SEDF in APERSTR_PFSS is set and address ECC 2 bit/data ECC 2-bit error is detected. This register stores a corrected address in case of 1- bit error when address correction is enabled. But when address correction is disabled or address has error on bits to exceed 2 bits the address with error is stored.

APEADR_PFSS is cleared by system reset or SSTCLR in APERSTCLR_PFSS register.

Access: This register can be read only in 32-bit units.

Address: FFC6 C050$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

(55) APECnECCCTL — P-Bus Data and Address ECC Control Register

APECnECCCTL (n = 0 to 6) register control the ECC error detection/correction and 1-bit error correction on peripheral group 1 to 4 (see **Table 28.145**). Writing ECC control registers must be executed with PROT[1:0] = 01_B.

Access: This register can be read/written in 32/16-bit units.

Address: APEC0ECCCTL: FFCB 8000_H APEC1ECCCTL: FFE8 8000_H APEC2ECCCTL: FFE8 8200_H
APEC3ECCCTL: FFF9 8000_H APEC4ECCCTL: FFCD 8000_H APEC5ECCCTL: FFCD 8200_H
APEC6ECCCTL: FFCD 8400_H

Value after reset: 0000 0000_H

(56) APECnERRINT — P-Bus Data and Address Error Information Control Register

APECnERRINT (n = 0 to 6) register controls whether error information is reported to ECM, when address/data ECC 2-bit error, address/data ECC 1bit error, and ECC error overflow are detected.

Access: This register can be read/written in 32/16/8-bit units.

Address: APEC0ERRINT: FFCB 8004$_H$ APEC1ERRINT: FFE8 8004$_H$ APEC2ERRINT: FFE8 8204$_H$
APEC3ERRINT: FFF9 8004$_H$ APEC4ERRINT: FFCD 8004$_H$ APEC5ERRINT: FFCD 8204$_H$

(57) APECnSTCLR — P-Bus Data and Address ECC SED/DED Status Clear Register

APECnSTCLR (n = 0 to 6) register is used to clear error flag in APECn1STERSTR, error overflow flag in APECnOVFSTR, and error address in APECn1STEADR0. This is write only register and read value is always “0”.

Access: This register can be written only in 32/16/8-bit units.

Address: APEC0STCLR: FFCB 8008$_H$ APEC1STCLR: FFE8 8008$_H$ APEC2STCLR: FFE8 8208$_H$
APEC3STCLR: FFF9 8008$_H$ APEC4STCLR: FFCD 8008$_H$ APEC5STCLR: FFCD 8208$_H$
APEC6STCLR: FFCD 8408$_H$

Value after reset: 0000 0000$_H$

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 28.147 APECnSTCLR register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	SSTCLR	Clear the error status flags Clear ADEDF / ASEDF / DEDF / SEDF in APECn1STERSTR, ERROVF in APECnOVFSTR, and APECn1STEADR0 writing “1” to this bit.

(58) APECnOVFSTR — P-Bus Data and Address Error Count Overflow Status Register

APECnOVFSTR (n = 0 to 6) register monitor if error overflow occurs. Overflow occurs when different error*1 is detected in the case that error status has been already set. If the error in error status is the same error (same error cause and same error address) with the errors already stored, this flag is not set. ERROVF flag is cleared by system reset or SSTCLR in APECnSTCLR register.

Note 1. Different means that the error satisfying one of the following conditions.

- Detected address is different
- Detected error status flag is different.

Access: This register can be read only in 32/16/8-bit units.

Address: APEC0OVFSTR: FFCB 800C$_H$ APEC1OVFSTR: FFE8 800C$_H$ APEC2OVFSTR: FFE8 820C$_H$
APEC3OVFSTR: FFF9 800C$_H$ APEC4OVFSTR: FFCD 800C$_H$ APEC5OVFSTR: FFCD 820C$_H$
APEC6OVFSTR: FFCD 840C$_H$

Value after reset: 0000 0000$_H$

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.148 APECnOVFSTR register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read.
0	ERROVF	Error overflow flag If an error flag (ADEDF, ASEDF, DEDF, SEDF in APECn1STERSTR) is set and a different error is detected, this bit is set.

(59) APECn1STERSTR — P-Bus Data and Address ECC SED/DED Status Register

APECn1STERSTR (n = 0 to 6) is the error monitor register. If the error flag is “0” for each bank and a new error occurs, the error status flag is set. If address ECC 1-bit error monitor flag or data ECC 1-bit error monitor flag is set and the new error is address ECC 2-bit error or data ECC 2-bit error, the new error is set (does not clear the previous error flag). If a multiple error causes are detected, detected errors are all set (e.g. if DED and ADED are detected at the same access, DEDF and ADEDF are both set.). APECn1STERSTR register is cleared by system reset or SSTCLR in APECnSTCLR register.

Access: This register can be read only in 32/16/8-bit units.

Address: APEC01STERSTR: FFCB 8010$_H$ APEC11STERSTR: FFE8 8010$_H$ APEC21STERSTR: FFE8 8210$_H$
APEC31STERSTR: FFF9 8010$_H$ APEC41STERSTR: FFCD 8010$_H$ APEC51STERSTR: FFCD 8210$_H$

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.149 APECn1STERSTR register contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is read.
7	ADEDF	Address ECC 2-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in APECnSTCLR Condition to “1”: ADEDF is “0” and ECC 2-bit error is detected.
6	ASEDF	Address ECC 1-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in APECnSTCLR Condition to “1”: ASEDF is “0” and ECC 1-bit error is detected.
5 to 2	Reserved	When read, the value after reset is read.
1	DEDF	Data ECC 2-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in APECnSTCLR Condition to “1”: DEDF is “0” and ECC 2-bit error is detected.
0	SEDF	Data ECC 1-bit error monitor flag Condition to “0”: system reset or write “1” to SSTCLR in APECnSTCLR Condition to “1”: SEDF is “0” and ECC 1-bit error is detected.

(60) APECn1STEADR0 — P-Bus Data and Address ECC SED/DED Address Register

APECn1STEADR0 (n = 0 to 6) register is used to hold the address when all error flags are not set and an error is detected. If ASEDF/SEDF in APECn1STERSTR is set and address ECC 2 bit/data ECC 2-bit error is detected. This register stores a corrected address in case of 1- bit error when address correction is enabled. But when address correction is disabled or address has error on bits to exceed 2 bits the address with error is stored.

APECn1STEADR0 is cleared by system reset or SSTCLR in APECnSTCLR register.

Access: This register can be read only in 32/16/8-bit units.

Address: APEC01STEADR0: FFCB 8050$_H$ APEC11STEADR0: FFE8 8050$_H$ APEC21STEADR0: FFE8 8250$_H$
APEC31STEADR0: FFF9 8050$_H$ APEC41STEADR0: FFCD 8050$_H$ APEC51STEADR0: FFCD 8250$_H$
APEC61STEADR0: FFCD 8450$_H$

Value after reset: 0000 0000$_H$

Table 28.150 APECn1STEADR0 register contents

Bit Position	Bit Name	Function
31 to 0	EADR[31:0]	Error detection address

28.2.9.6 Test Function

The self-diagnosis operation is different by the target ECC decoder.

Error injection is not supported for VPxxxx_SGn that is used only when the bit operation is executed.

(1) Self-diagnosis of the Data ECC check function (Slave)

(a) Prepare data with an error to check a data ECC decoder on bus in global RAM (see **28.2.5.4** about how to set an error data into global RAM).

(b) Set ECCDIS bit in GRECCCTL_VCI2GRAM to 1 to transfer data with error into ECC decoder on bus. Also Set ECCDIS bit in VCECCCTL_PDMA to 1 to pass through DMA ECC decoder on bus if DMA ECC decoder is out of target of self-diagnosis.

(c) For a channel of DMA, Set up an address of error data in global RAM in a source address register and an address of area covered by target ECC decoder in the destination address register (For the detail of channel setup, see **Section 7, DMA**).

After that, self-diagnosis of the data ECC decoder is possible by setting software DMA transfer request flag of the channel.

This operation can be used for the following ECC decoders:

- LSU Slave data ECC: LSSxxxx of module BECCPE1 and BECCPE2 (local RAM)
- P-Bus data ECC: module BECCPBAm (a peripheral on each P-Bus group)
- DMA Data ECC on Bus: xxxx_PDMA of module BECCSIC

A word in ( ) indicates the area that should be appointed as the destination.

(2) Self-diagnosis of the Data ECC check function (Master)

(a) Prepare data with an error to check a data ECC decoder on bus in global RAM (see **28.2.5.4** about how to set an error data into global RAM).

(b) Set ECCDIS bit in GRECCCTL_GRAMC to transfer data with error into ECC decoder on bus.

After that, self-diagnosis of the data ECC decoder in instruction fetch unit is possible by fetching instruction from global RAM.

This operation can be used for the following ECC decoders:

- LSU Master data ECC: LSMxxxx of module BECCPE1 and BECCPE2
- IFU data ECC: IFxxxx of module BECCPE1 and BECCPE2

(3) Self-diagnosis of the Address ECC check function

(a) Set the ECCTST bit in the address ECC test control register (see **Section 7.9.2.20**) to 1 to set test mode.

(b) Set the RWSEL bit in the address ECC test control register to select the DMA cycle to inject an error into address ECC bit.

(c) Set the ECCDAT[6:0] in the address ECC test data register (see **Section 7.9.2.21**) to an error data.

(d) For a channel of DMA,
In case of RWSEL= 0, Set up an address of area covered by target ECC decoder in a source address register. The destination address can be arbitrarily defined.
In case of RWSEL= 1, Set up an address of area covered by target ECC decoder in the destination address register. The source address can be arbitrarily defined.

After that, self-diagnosis of the address ECC decoder is possible by setting software DMA transfer request flag of the channel.

This operation can be used for the following ECC decoders:

- LSU Slave address ECC: LSSxxxx of module BECCPE1 and BECCPE2 (local RAM)
- P-Bus address ECC: module BECCPBAm (a peripheral on each P-Bus group)
- global RAM address ECC: xxxx_GRAMC in module ECCGRC (global RAM)
- address ECC for the bus width conversion in SIC: xxxx_VCI2VPI of module BECCSIC (a peripheral)
- address ECC for the bus width conversion in Flash interface: module BECCFLI (Code Flash)

A word in ( ) indicates the area that should be appointed as the destination or source.

28.2.10 ECC Function

28.2.10.1 ECC code for RAM Modules except Instruction cache RAM (data)

(1) Generating an Error Correcting Code

The following formulas are used to generate 7-bit error correcting codes (ecc6 to ecc2, ecc1z and ecc0z) for 32-bit data (d32 to d0). The lowest 2-bit of Error Correcting Code are inverted. With this measure, all 0s and all 1s of data and error correcting code is not a legal combination.

- ecc6 = (d13 ^ d12 ^ d11 ^ d10 ^ d9 ^ d8 ^ d7 ^ d6 ^ d5 ^ d4 ^ d3 ^ d2 ^ d1 ^ d0)
- ecc5 = (d23 ^ d22 ^ d21 ^ d20 ^ d19 ^ d18 ^ d17 ^ d16 ^ d15 ^ d14 ^ d3 ^ d2 ^ d1 ^ d0)
- ecc4 = (d29 ^ d28 ^ d27 ^ d26 ^ d25 ^ d24 ^ d17 ^ d16 ^ d15 ^ d14 ^ d7 ^ d6 ^ d5 ^ d4)
- ecc3 = (d31 ^ d30 ^ d26 ^ d25 ^ d24 ^ d20 ^ d19 ^ d18 ^ d14 ^ d10 ^ d9 ^ d8 ^ d4 ^ d0)
- ecc2 = (d31 ^ d30 ^ d28 ^ d27 ^ d24 ^ d22 ^ d21 ^ d18 ^ d15 ^ d12 ^ d11 ^ d8 ^ d5 ^ d1)
- ecc1z = ! (d30 ^ d29 ^ d27 ^ d25 ^ d23 ^ d21 ^ d19 ^ d16 ^ d13 ^ d11 ^ d9 ^ d6 ^ d2 ^ d0)
- ecc0z = ! (d31 ^ d29 ^ d28 ^ d26 ^ d23 ^ d22 ^ d20 ^ d17 ^ d13 ^ d12 ^ d10 ^ d7 ^ d3 ^ d0)

Where ^ denotes an exclusive OR.

(2) Error Correction

According to the following equation, 7-bit syndrome (synd6 to synd0) is generated through 32-bit data (d31 to d0) and 7-bit error correcting code (ecc6 to ecc2, ecc1z and ecc0z) which are read from the RAM.

$$\begin{pmatrix} 1000000\ 00000000\ 00000000\ 00111111\ 11111111 \\ 0100000\ 00000000\ 11111111\ 11000000\ 00001111 \\ 0010000\ 00111111\ 00000011\ 11000000\ 11110000 \\ 0001000\ 11000111\ 00011100\ 01000111\ 00010001 \\ 0000100\ 11011001\ 01100100\ 10011001\ 00100010 \\ 0000010\ 01101010\ 10101001\ 00101010\ 01000101 \\ 0000001\ 10110100\ 11010010\ 00110100\ 10001001 \end{pmatrix} \times \begin{pmatrix} ecc6 \\ ecc5 \\ : \\ !ecc1z \\ !ecc0z \\ d31 \\ d30 \\ : \\ d1 \\ d0 \end{pmatrix} = \begin{pmatrix} synd6 \\ synd5 \\ synd4 \\ synd3 \\ synd2 \\ synd1 \\ synd0 \end{pmatrix}$$

Figure 28.2 Matrix for ECC Decoding.

When synd6 to synd0 are all0, error correction is not performed. When some of synd6 to synd0 are 1, the target bit for correction is identified according to and the error bit is corrected. When synd6 to synd0 are the value not to indicate in, 2-bit error is detected.

Table 28.151 Correspondence between Correction Target and Syndrome

synd[6:0]	Error Bit Position	synd[6:0]	Error Bit Position
1000000	ECC data bit 6	0101100	RAM data bit 18

28.2.10.3 ECC Function for Code Flash

(1) Generating an Error Detecting Code

The following formulas are used to generate 9-bit error detecting codes (ecc8z, ecc7, ecc6z, ecc5, ecc4, ecc3z, ecc2, ecc1z and ecc0z) for 128-bit data (d127 to d0). 5-bits (ecc8, ecc6, ecc3, ecc1 and ecc0) of Error Correcting Code are inverted. With this measure, all 0s and all 1s of data and error correcting code is not a legal combination.

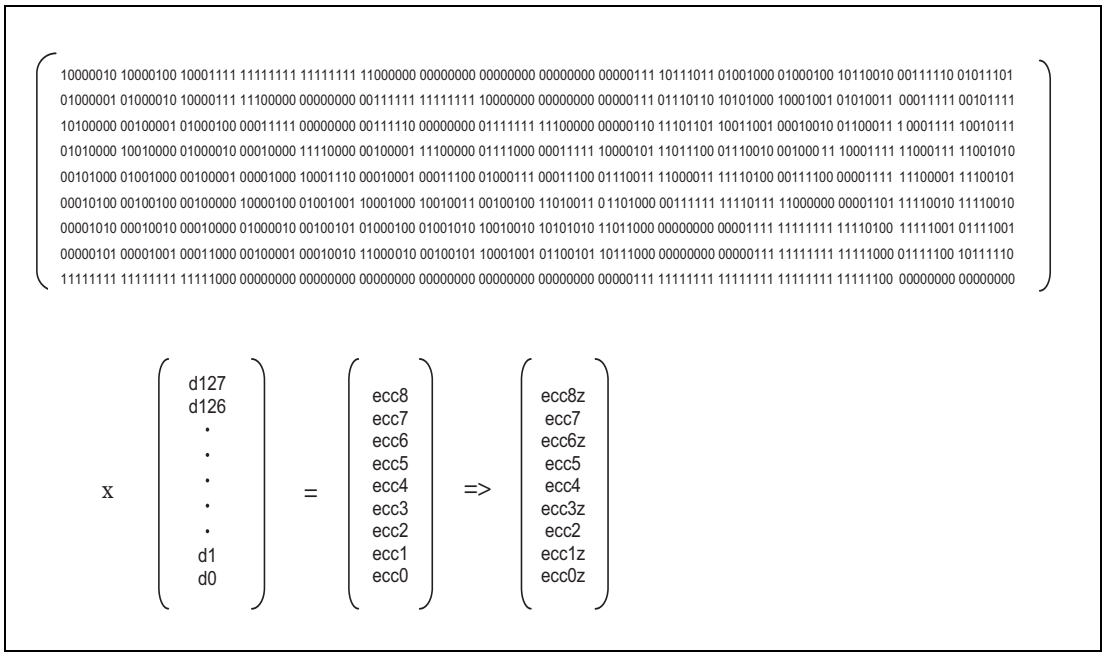

Figure 28.4 Matrix for ECC Encoding.

(2) Error Detection

According to the following equation, 9-bit syndrome (synd8 to synd0) is generated through 128-bit data (d127 to d0) and 9-bit error detecting code (ecc8z, ecc7, ecc6z, ecc5, ecc4, ecc3z, ecc2, ecc1z and ecc0z) which are read from the Code Flash.

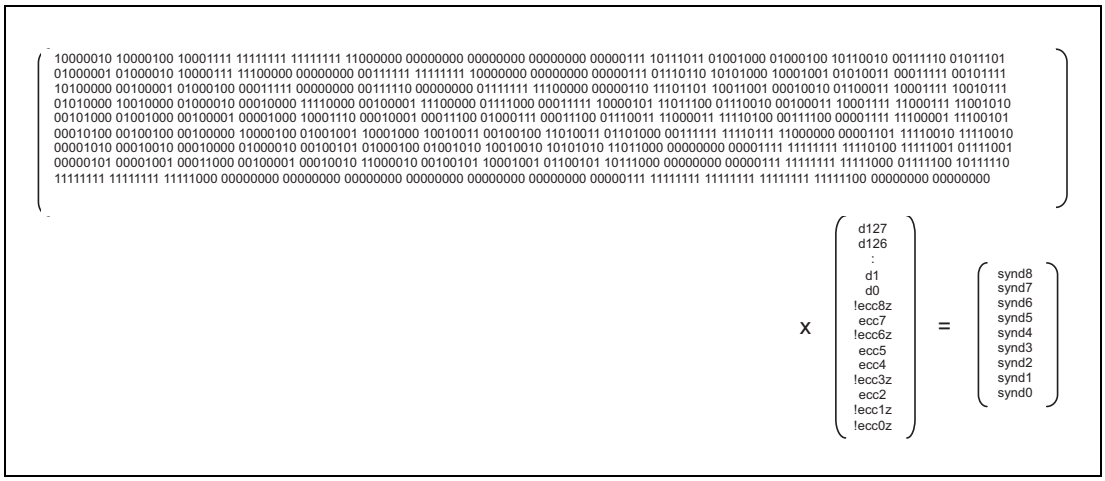

Figure 28.5 Matrix for ECC Decoding

When synd8 to synd0 are all0, error correction is not performed. When some of synd8 to synd0 are 1, the target bit for correction is identified according to **Table 28.153** and the error bit is corrected. When synd8 to synd0 are the value not to indicate in **Table 28.153**, 2-bit error is detected.

Table 28.153 Correspondence between Correction Target and Syndrome (1/2)

synd[8:0]	Error Bit Position	synd[8:0]	Error Bit Position	synd[8:0]	Error Bit Position

28.2.10.4 ECC Function for Data Flash

(1) Generating an Error Detecting Code

The following formulas are used to generate 7-bit error detecting codes (ecc6z to ecc0z) for 32-bit data (d31 to d0). All bits of Error Correcting Code are inverted. With this measure, all 0s of data and error correcting code is not a legal combination.

- ecc6z = !(d13 ^ d12 ^ d11 ^ d10 ^ d9 ^ d8 ^ d7 ^ d6 ^ d5 ^ d4 ^ d3 ^ d2 ^ d1 ^ d0)
- ecc5z = !(d23 ^ d22 ^ d21 ^ d20 ^ d19 ^ d18 ^ d17 ^ d16 ^ d15 ^ d14 ^ d3 ^ d2 ^ d1 ^ d0)
- ecc4z = !(d29 ^ d28 ^ d27 ^ d26 ^ d25 ^ d24 ^ d17 ^ d16 ^ d15 ^ d14 ^ d7 ^ d6 ^ d5 ^ d4)
- ecc3z = !(d31 ^ d30 ^ d26 ^ d25 ^ d24 ^ d20 ^ d19 ^ d18 ^ d14 ^ d10 ^ d9 ^ d8 ^ d4 ^ d0)
- ecc2z = !(d31 ^ d30 ^ d28 ^ d27 ^ d24 ^ d22 ^ d21 ^ d18 ^ d15 ^ d12 ^ d11 ^ d8 ^ d5 ^ d1)
- ecc1z = !(d30 ^ d29 ^ d27 ^ d25 ^ d23 ^ d21 ^ d19 ^ d16 ^ d13 ^ d11 ^ d9 ^ d6 ^ d2 ^ d0)
- ecc0z = !(d31 ^ d29 ^ d28 ^ d26 ^ d23 ^ d22 ^ d20 ^ d17 ^ d13 ^ d12 ^ d10 ^ d7 ^ d3 ^ d0)

  Where ^ denotes an exclusive OR.

(2) Error Detection

According to the following equation, 7-bit syndrome (synd6 to synd0) is generated through 32-bit data (d31 to d0) and 7-bit error detecting code (ecc6z to ecc0z) which are read from the Data Flash.

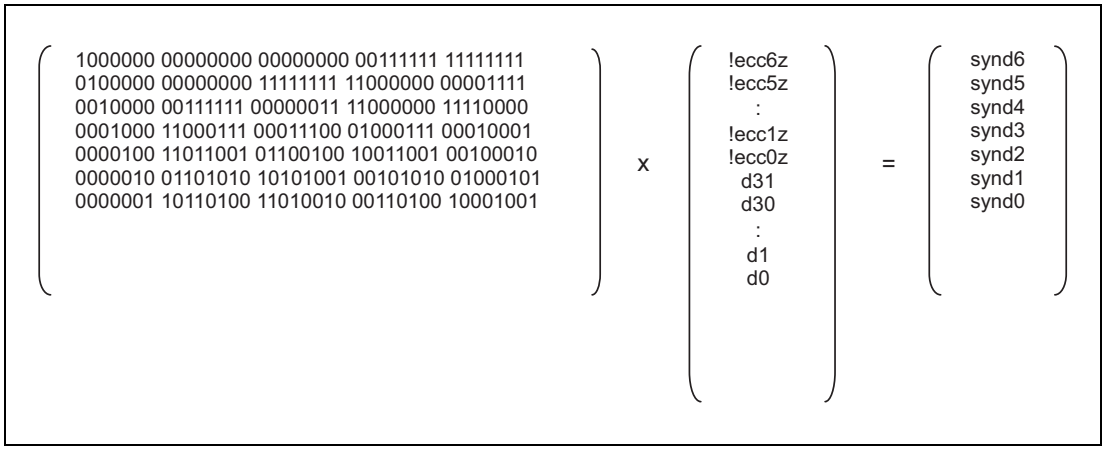

Figure 28.6 Matrix for ECC Decoding

When synd6 to synd0 are all0, error correction is not performed. When some of synd6 to synd0 are 1, the target bit for correction is identified according to **Table 28.154** and the error bit is corrected. When synd6 to synd0 are the value not to indicate in **Table 28.154**, 2-bit error is detected.

Table 28.154 Correspondence between Correction Target and Syndrome

synd[6:0]	Error Bit Position	synd[6:0]	Error Bit Position
1000000	ECC data bit 6	0101100	FLASH data bit 18
0100000	ECC data bit 5	0110001	FLASH data bit 17
0010000	ECC data bit 4	0110010	FLASH data bit 16
0001000	ECC data bit 3	0110100	FLASH data bit 15
0000100	ECC data bit 2	0111000	FLASH data bit 14
0000010	ECC data bit 1	1000011	FLASH data bit 13
0000001	ECC data bit 0	1000101	FLASH data bit 12
0001101	FLASH data bit 31	1000110	FLASH data bit 11
0001110	FLASH data bit 30	1001001	FLASH data bit 10
0010011	FLASH data bit 29	1001010	FLASH data bit 9
0010101	FLASH data bit 28	1001100	FLASH data bit 8

0101010	FLASH data bit 19	0000000	No error

28.3 Lockstep

This product incorporates the CPU1/2 and DMA with the lockstep function to quickly detect failures without software interaction. The CPU1/2 and DMA executes the program using two different cores, that is, master core and checker core, and constantly compares the execution results of the two cores. When the results do not match, an error notification to the ECM takes place.

The lockstep function of the CPU1/2 and DMA features failure insertion, with which errors can be intentionally caused and thus self-diagnosis of the lockstep operation is possible.

28.3.1 List of Registers

Table 28.155 List of Registers

Address	Symbol	Register Name	R/W	Value after reset	Access Size
FFFE ED00	CMPTST0	Comparator test register 0	R/W	0000 0000_H	8/16/32
FFFE ED04	CMPTST1	Comparator test register 1	R/W	0000 0000_H	8/16/32
FFC4 CA00	PDMA_COMP_CNTRL	PDMA Comparator Error Injection Control Register	R/W	0000 0000_H	32

CMPTST0 and CMPTST1 are placed in the CPU Peripheral of the CPU1/2. These registers can only be accessed by the CPU1/2.

28.3.2 Details of Registers

28.3.2.1 CMPTST0 — Comparator test register 0

CMPTST0 is test register 0 used for the lockstep function of the CPU1/2.

Combining CMPTST0 with CMPTST1 enables self-diagnosis of the lockstep function. The following gives an example of self-diagnosis procedure.

(1) Write arbitrary value to CMPTST0.

(2) Write a different value to CMPTST1.

(3) Read CMPTST0. The different values are read and sent to the master core and checker core.

(4) Using the values read, run the comparator to be diagnosed.

Access: This register can be Read/written in 32/16/8-bit units.

Address: FFFE ED00$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMPTST0[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMPTST0[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 28.156 CMPTST0 register contents

Bit Position	Bit Name	Function
31 to 0	CMPTST0[31:0]	Write: Data is written to each byte. Read: PE1/PE2: CMPTST0[31:0] value is read. PE1C/PE2C: CMPTST1[31:0] value is read.

28.3.2.2 CMPTST1 — Comparator test register 1

CMPTST1 is test register 1 used for the lockstep function of the CPU1/2.

Combining CMPTST1 with CMPTST0 enables self-diagnosis of the lockstep function.

Access: This register can be Read/written in 32/16/8-bit units.

Address: FFFE ED04$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMPTST1[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 28.157 CMPTST1 register contents

Bit Position	Bit Name	Function
31 to 0	CMPTST1[31:0]	Write: Data is written to each byte. Read: PE1/PE2: CMPTST1[31:0] value is read. PE1C/PE2C: CMPTST0[31:0] value is read.

28.3.2.3 PDMA_COMP_CNTRL — PDMA Comparator Error Injection Control Register

This register (PDMA_COMP_CNTRL) can control the output signals on the checker side of the DMA.

A DMA comparison error can be generated by setting this register.

Access: This register can be read/written in 32-bit units.

Address: FFC4 CA00$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PROT1	PROT0	DMACMPERR[29:16]													
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DMACMPERR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 28.158 PDMA_COMP_CNTRL register contents

Bit Position	Bit Name	Function
31, 30	PROT[1:0]	Protection Bit 10: write is enable Other: write is disable These bits are always read as 0.
29 to 0	DMACMPERR [29:0]	A DMA comparison error can be generated by writing 111111_11111111_01111111_01111111 to DMACMPERR together with the PROT bit. Clear all these bits to 0 if there is no need to generate this error.

28.3.3 Usage Notes

Reading a register with a value that is undefined after a reset without initializing the register may lead to a CPU comparison error. Accordingly, such registers must be initialized with the desired settings.

CAUTION

Be sure to use the startup routine to initialize these registers before referring to them since they are implicitly used by the C compiler.

refer to Section 3.4.6 register Initialization.

28.4 Memory Protection

28.4.1 Overview

The overall memory protection architecture is shown in **Figure 28.7**. Each programmable core (bus master) has a Memory Protection Unit (MPU) that defines the access protection against the software. In addition, each resource (bus slave) has a guard that control the access by any bus master, including ones that do not have a MPU such as the DMA or the Flexray.

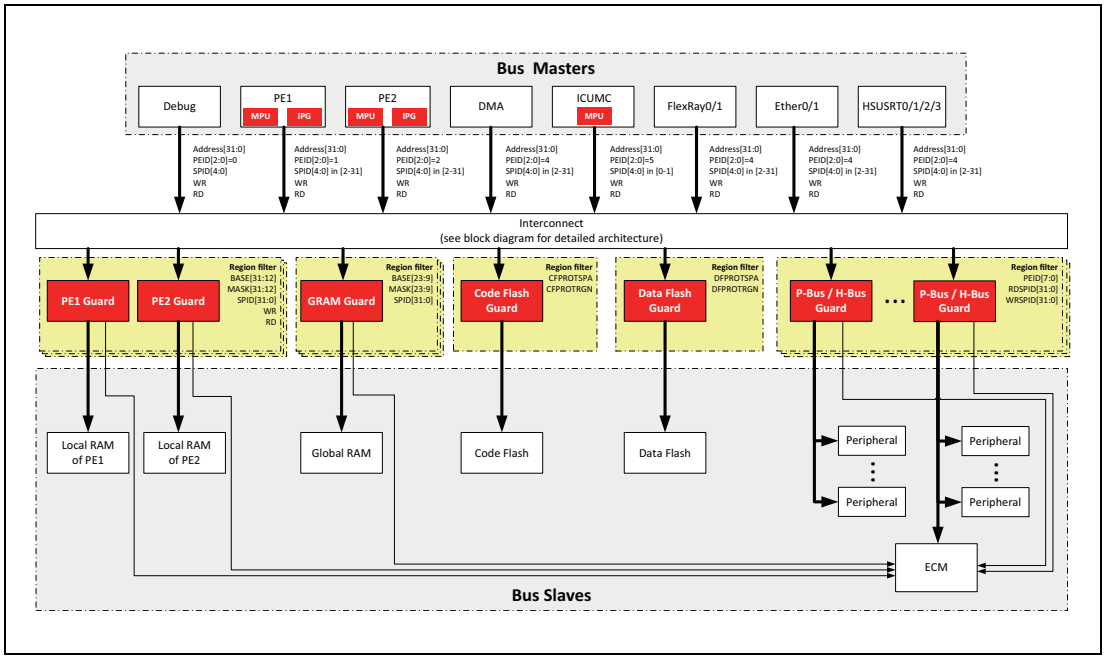

Figure 28.7 Architecture of the memory protection.

For this purpose, each bus access contains the following context information that identifies the bus master.

- Address: Memory location to access
- PEID: Processor Element ID (PEID)
- SPID: System Protection ID of the bus master
- WR: Access is a write request if set to 1
- RD: Access is a read request if set to 1

Table 28.159 Bus Master Identifier

Identifier	Function
SPID	When the CPU makes an access, the system protection identifier SPID that is assigned to the CPU is indicated. When the DMAC or DTS makes an access, the value of this identifier is the value in the channel master setting register. When the other master makes an access, the value of this identifier is defined by each SPID register. As 0 and 1 are reserved for the ICUMC, others except the ICUMC are limited to 2 to 31.
PEID	The access source bus master is indicated. 000_B: Reserved 001_B: PE1 010_B: PE2 011_B: Reserved 100_B: DMAC, DTS, Ethernet, FlexRay, HS-USRT 101_B: ICUMC 110_B: Reserved 111_B: Reserved

Usage of the SPID is restricted depending if the bus master is secure or insecure. The security core ICUMC can only use the values 0 or 1. All other insecure cores can only use a value between 2 and 31. Therefore, it is not possible that PE1/2 identifies itself as a secure core, or that ICUMC identifies itself as a safe core. If a bus master is using a value that is not within its allowed range, the bus system overrides it by a value within its valid range. Please note that the register used to configure the SPID is not reflecting the overwritten value. It will still contain the original value. For the PE1, PE2 and ICUMC cores, the SPID is configured in the MCFG0 machine configuration register. It is initialized to 1 for ICUMC and to 2 for PE1/2 after reset.

For the peripherals that can act as bus masters (i.e., flexray, ethernet and high speed USART), there exists a register where the SPID can be configured and locked until next release. This registers will also not indicate the changed SPID value in case the bus system overrides it due to a violation of the allowed range. This registers can be read by the ICUMC or PE1/2, to check if the chosen SPID is correct.

The debug sub system can use any SPID. However, it cannot interfere with any function during normal operation, as it requires a secure handshake for activation.

Finally, the SPID that the DMA core uses can also be configured for each DMA/DTS channel by changing the channel master setting registers DMnnCM/DTSnnnCM. For all DMnnCM/DTSnnnCM registers, there exists one dedicated guard region. It can be used to disallow write access to all channel master setting registers by any bus master after the initial configuration has been performed. Similar to the peripheral bus masters, the chosen SPID can be controlled if the guard region allows read access by the given bus master.

Guards control the access to the resources based on the described bus access context information. Each guard supports a number of regions. Each region defines a filter which bus context is allowed to access.

There exist different types of guards depending on the memory resource: local RAM, global RAM, peripheral registers and flash. Each of those memory resources is protected by a guard. Hence, no bus master can access a resource without proper configuration of the guard. All guards except the flash guards support access protection based on SPID. Hence, read and write accesses to peripherals whose registers are located in P-Bus area and the H-Bus area can be protected. All registers located in the Local Peripheral Bus (LPB) area cannot be accessed by an external bus master.

The configuration registers of the guards are connected to the P-Bus. Access to this registers is also protected by a P-Bus guard. In order to disallow reconfiguration of any guard in user mode, a dedicated

SPID can be reserved that is only used by the cores in supervisor mode. The SPIDs of the peripherals and the DMA can be locked in hardware and checked such that they do not use the supervisor SPID. PE1/2 and ICUMC can only change their SPID in supervisor mode.

If a guard detects an illegal access, it reports it to the ECM. Additionally, information about the access context is stored in dedicated registers. The bus cycle is completed with an error response.

In case of an illegal write access, the data is not written. In case of an illegal read access, undefined data is returned.

28.4.1.1 Protection mechanisms inside the processors

The PE has three mechanisms to protect its resources. The first mechanism is the Memory Protection Unit (MPU). It protects memory regions against illegal accesses by software. The second mechanism is the Internal Peripheral Guard (IPG). It protects registers of internal peripherals against accesses by software or external bus masters. The last mechanism is the PE Guard. It protects the whole PE against accesses by external bus masters.

(1) Memory Protection Unit (MPU)

Each CPU core has a dedicated Memory Protection Unit (MPU) to prevent unauthorized accesses to instruction and data. It is shown in red boxes with the label “MPU” in **Figure 28.7**. The MPU separates memory spaces, so that operation errors are constrained to the configured address space. Any unpermitted access to a protected memory area will raise a memory protection exception. As the MPU is integrated into the CPU core, it is aware of its pipeline and so it can generate precise exceptions on access violation.

If memory protection is enabled, all accesses which are not specifically enabled by an MPU area are prevented. The number of MPU areas is device dependent and generally between four and sixteen. Each MPU area is configured by writing dedicated system registers. Configuration of the MPU can only be performed in supervisor mode. Each CPU can only access and configure its own MPU.

Reconfiguration of MPU areas is typically done by the scheduler during context switch. One area may be setup to watch for stack overflows and underflows. Some MPU settings will usually apply globally to all threads and therefore these settings are not changed by the scheduler.

The CPU can operate in two privilege modes, user mode or supervisor mode. Privileges in user mode are restricted, while the supervisor mode permits all operations and accesses. There may be restrictions even in supervisor mode, but the CPU has the privilege to remove them if required. User mode does not permit to remove any restrictions.

The MPU provides up to 16 individual unified protection areas. The start and end address of each area can be specified with a granularity of one word (32-bit) and the size of each area may cover the whole address space. The access permissions for each area can be set to permit or prevent read accesses, write accesses and/or execute accesses. These access privileges can be specified independently for user mode and for supervisor mode. Areas may overlap, in which case permissions take precedence, i.e. if one of the areas permits the access, it is granted.

If the MPU detects an access which is not permitted, the access is not executed and a precise exception is raised. The exception handler can then decide to stop the violating thread or remove the restriction and resume execution.

The MPU only checks the addresses of the instruction and involved data for the currently executed instruction. Therefore, speculative access to instructions or data (e.g., during a cache prefetch) can only

trigger an illegal access if the instruction or data is used during instruction execution. All addresses that are not used by the CPU pipeline are also not checked by the MPU.

The peripheral address space is also part of the space, which is supervised by the MPU. Therefore the MPU must protect or unprotect a specific peripheral address space as needed. However, the MPU supervises only memory accesses of its own CPU core, not the accesses of other bus masters.

For a detailed functional description of the MPU, see **Section 3, CPU System** for PE1 and PE2, and Section X for ICUMC.

(2) Internal Peripheral Guard (IPG)

Each PE has an internal peripheral guard (IPG) that protects the registers of peripherals inside the PE against invalid accesses. It is shown in red boxes with the label “IPG” in **Figure 28.7**. The protection granularity is based on a fixed number of peripheral groups. The assignment of peripherals to a group is also fixed.

The configuration is done via six registers IPGENUM and IPGPMTUM0 to 4.

If the guard detects an illegal access, it does not forward it to the peripheral. But the access context is stored in the two registers IPGECRUM and IPGADRUM. Additionally, a SYSERR exception is generated with the exception source code 0x18.

The IPGECRUM and IPGADRUM registers can be reset by writing a 0 to them.

For a detailed functional description of the IPG and the detailed register description, see **Section 3.2.4.2**.

(3) PE Guard

Each PE has a guard that controls the access to the local RAM by other bus masters. It is shown as a red box with the label “PE Guard” in **Figure 28.7**. The access by bus masters can be controlled via their bus context for eight regions. Bus masters can only access the local RAM area if permission is granted. This includes the ICUMC (PEID = 5). So if ICUMC needs to read the local RAM, read allowance for SPID 0 or 1 must be configured. There is no hard-coded PEID filter for PEID = 5 available anymore. The address range and allowed bus masters of the region n are defined by the three registers PEGGnBA, PEGGnSPID and PEGGnMK. The PEGGnBA register defines the base address of the region n. The PEGGnMK register defines which bits of PEGGnBA are compared with the access address. If bit MASKm is cleared, bit BASEm is compared with bit m of the access address. Otherwise, the bit is ignored during the access check. Expressed in C notation, the address lies within the region if (address&(~MASK)&0xFFFFF000)) == (BASE&(~MASK)&0xFFFFF000)). Please note that the lower bit 11 to 0 of BASE and MASK are always zero.

Finally, the register PEGGnSPID defines the SPIDs that are allowed to access.

Each set bit k of PEGGnSPID register allows the access to the region n by the SPID k. Setting more than one bit allows to enable more than one SPID value at a time. For example, setting SPID to 0b0101 allows access with SPID = 0 and SPID = 2. The bits WR and RD of PEGGnBA control if write access or read access are allowed for region n. Finally, the bit EN decides if the region is considered during the access.

In case regions have overlapping address ranges, the resulting access permission is a union of the individual permissions. For example, if one region allows access for SPID 1 only, and the other one for SPID 2 only, the overlapping address ranges can be accessed by SPID 1 and 2.

The LOCK bit of PEGGnBA controls for each region n individually if the registers PEGGnBA, PEGGnMK and PEGGnSPID of region n can be changed. After reset, the registers can be re-written as long as LOCK remains zero. Once a one is written, all further write accesses are ignored.

Reconfiguration is only possible after the next reset. Access protection to the PE-Guard registers can be done via the LOCK bit, the MPU and the IPG.

After reset, region 0 is enabled and allows read only access to local RAM by SPID 0 and 1 (ICUMC).

If the guard detects an illegal access, it reports the violation to the Error Control Module (ECM) and reports the details about the access in three registers ERRSTATCTL, ERRSTAT, and ERRINFO. No exception is triggered. The register ERRSTAT indicates if an access violation has occurred. The register ERRINFO describes the context of the first access that triggered a violation. Finally, the register ERRSTATCTL is used to reset the ERRSTAT register. Please note that any further access violations are not stored as long as the ERR bit of ERRSTAT is set to one.

For a detailed functional description of the PE Guard, see **Section 3, CPU System** for PE1 and PE2. And please note that the ICUMC does not allow accesses by external bus masters. Hence, it also has no PE guard.

28.4.1.2 Peripheral register protection with H-Bus Guard (HBG) and P-Bus Guard (PBG)

Each bus has slave guards that control which core can access the bus. The slave guards are shown in red boxes with the label H-Bus Guard (HBG) and P-Bus Guard (PBG) in **Figure 28.7**. Both types of slave guards use the same register interface. The region of protection is a peripheral instance, i.e., the configuration applies to all registers of the given peripheral instance. For each region n, there exists for each direction d (d = “RD” for reads or d = “WR” for writes) two registers FSGDxPRdPn and FSGDxPRdSn that configure the protection. The LOCK bit controls if these registers can be changed. After reset, the registers can be re-written as long as LOCK remains zero. Once a one is written, all further write accesses are ignored. Reconfiguration is only possible after the next reset.

The guard uses two filters in sequence to check if a core is allowed to access. The first filter checks the PEID. Each set bit k of PEID[k] allows access to the peripheral by the PEID k. After this filter is passed, the guard checks if the SPID matches the SPID filter. Each set bit k of SPID[k] allows access by SPID k. It is possible to set more than one bit in all filters, to enable more than one SPID/PEID value at a time. For example, setting PEID to 0b0110 allows access with PEID = 1 and PEID = 2.

If a guard detects an illegal access, it reports the violation to the Error Control Module (ECM) and reports the details about the access in three registers ERRSLVxCTL, ERRSLVxSTAT, and ERRSLVxTYPE. Depending on the bus topology, there exist multiple sets x of these three registers. The register ERRSLVxSTAT indicates if an access violation has occurred. The register ERRSLVxTYPE describes the context of the first access that triggered a violation. Finally, the register ERRSLVxCTL is used to reset the ERRSLVxSTAT register. Please note that any further access violations are not stored in ERRSLVxTYPE as long as the ERR bit of ERRSLVxSTAT is set to one.

For a detailed functional description of the peripheral register protection, see **Section 28.4.3** for PBG and **Section 28.4.4** for HBG.

28.4.1.3 Global RAM protection

The global RAM is protected by a memory guard. It is shown as a red box with the label GRAM Guard in **Figure 28.7**. The guard can only protected against write accesses. Read accesses are always allowed by any bus master. The guard has eight memory regions that can be protected. The granularity of each region is 512 bytes. Each device has sufficient RAM to allow a fine granular control of the region size. For each region n, there exists four configuration registers MGDGRPROTn, MGDGRSPIDn, MGDGRBADn and MGDGRADVn. The register MGDGRPROTn configures the

contexts that are allowed to access. The LOCK bit controls if the registers of region n can be changed. After reset, the four registers can be re-written as long as LOCK remains zero. Once a one is written, all further write accesses are ignored. Reconfiguration is only possible after the next reset. The bit EN activates the protection for the given region n.

Each set bit k of MGDGRSPIDn allows the access to the peripheral by the SPID k. Setting more than one bit allows to enable more than one SPID value at a time. For example, setting SPID to 0b0101 allows access with SPID = 0 and SPID = 2. The UM bit defines for which modes the access is allowed.

The address range of the region n is defined by the two registers MGDGRBADn and MGDGRADVn. The MGDGRBADn register defines the base address of the region n. The MGDGRADVn register defines which bits of MGDGRBADn are compared with the access address. If bit ADV[m] is set, bit AD[m] is compared with bit m of the access address. Otherwise, the bit is ignored during the access check. Expressed in C notation, the address lies within the region if (address&ADV) == (AD&ADV).

Access to memory region n is granted if the access context passes the filter defined by this four registers. In case regions have overlapping address ranges, each region will be individually guarded. For example, if one region allows access for SPID 1 only, and the other one for SPID 2 only, the overlapping address regions cannot be accessed neither by SPID 1 nor 2.

After reset, no region is enabled. As long as no region is enabled, the GRAM guard allows read/write access by any bus master with any SPID.

If the guard detects an illegal access, it forwards it to the Error Control Module (ECM). The access context is stored in three registers MGDGRSCTL_, MGDGRSSTAT_, and MGDGRSTYPE_. The register MGDGRSSTAT indicates if an access violation has occurred. The register MGDGRSTYPE_ describes the context of the first access that triggered a violation. Finally, the register MGDGRSCTL_ is used to reset the MGDGRSSTAT_ register.

The registers of the memory guard are protected by a P-Bus guard.

For a detailed functional description of the GRAM Guard, see **Section 28.4.2**.

28.4.1.4 Other Protection mechanisms

(1) External RAM protection

Protection of the external RAM is performed by a H-Bus guard. The external RAM supports four chip selects. For each chip select, there exists an own address range in the H-Bus area of the memory map. For each address range resp. chip select, one region is available in the H-Bus guard. The register interface of the H-Bus guard has already been described. For more information about the external memory controller, see **Section 15**.

(2) Flash memory protection

The code and data flash have their own guard. They are shown as red boxes with the label “Flash Guard” in **Figure 28.7**. From security point of view, these are not described in this section. Therefore see *Section for ICUMC* to get more information.

28.4.1.5 Protectable memory regions

The number of supported memory regions and their granularity for each resource is summarized in **Table 28.160**.

Table 28.160 Protection Region and Granularity

Protected resource	Protection mechanism	Number of memory regions	Minimum granularity of memory region [Byte]
Software access to address space of PE1 and PE2	MPU	16	4
Access by other bus masters to local resources of PE1 and PE2	PE Guard	8	4096
Peripherals on P-Bus and H-Bus	P-Bus / H-Bus guard	See **Section 4, Address Map**	Peripheral instance (chip select)
Global RAM	GRAM Guard	8	512
External RAM	H-Bus guard	4	512
Code and data flash	Flash Guard	1	N/A

28.4.1.6 Default MPU and guard configuration

The MPU of each PE and the ICUMC is disabled after reset. The H-Bus and P-Bus guard allow read and write access by PE1/2 only. Any SPID value is allowed to access. In case the P-Bus guard controls the access to the registers of another guard, it additionally allows access by ICUMC. All other guards require a configuration of the region first to define the protected address range. Therefore, their regions are disabled by default. See the reset values of the registers in the related sections for more information.

After reset, the ICUMC is the first core that starts software execution. It controls when the reset of the other cores is released. Hence, it can configure the guards as required before any other bus master can perform accesses.

Please note that all guards can be reconfigured during runtime, as long as configuration is not prevented by a lock bit or a slave guard. The configuration of the PE guard, the GRAM guard and all P-Bus guards can be changed while accesses are performed on the resource. The new configuration will not result in an undefined filter state. But the new filter configuration can get active at any time during an access to the protected resource. So it cannot be guaranteed if the current access is handled according to the old or the new filter configuration. However, the access itself is not corrupted or does result in a deadlock. Dynamic reconfiguration of the H-Bus guards (including the external memory interface) is not supported.This mean during reconfiguration accesses to the H-Bus peripherals from all bus masters is not allowed

28.4.2 GRG

This product is provided with 4-channel GRG, which is described in detail in the following sections.

28.4.2.1 List of Registers

Table 28.161 List of Registers (1/2)

Address	Symbol	Register Name	R/W	Value after reset	Access Size	PBG	Refer to Register	Note
FFC4 9000_H	MGDGRPROT0	Global-RAM FS Guard Protection Setting Register0	R/W	07FF $FE10_H$	8/16/32	APBGRD_PFSS1.SP4	**28.4.2.2 (1)**

- MGDGRPROTn, MGDGRSPIDn, MGDGRBADn, and MGDGRADVn set the protection specifications for each channel (n: 0 to 7).
- MGDGRSCTL_*, MGDGRSSTAT_*, and MGDGRSTYPE_* indicate error information on each access port: “_VCI2GRAM” represents access from the system interconnect to the Global RAM, “_PE1”, and “_PE2” represents access from the CPU1 respectively CPU2 to the Global RAM, “_AXI2GRAM” represents access from the H-Bus to the Global RAM,

28.4.2.2 Details of Registers

(1) MGDGRPROT*n* — Global-RAM FS Guard Protection Setting Register *n* (*n* = 0 to 7)

Access: This register can be Read/written in 32/16/8-bit units.

Address: MGDGRPROT0: FFC4 9000$_H$
MGDGRPROT1: FFC4 9010$_H$
MGDGRPROT2: FFC4 9020$_H$
MGDGRPROT3: FFC4 9030$_H$
MGDGRPROT4: FFC4 9040$_H$
MGDGRPROT5: FFC4 9050$_H$
MGDGRPROT6: FFC4 9060$_H$
MGDGRPROT7: FFC4 9070$_H$

Value after reset: 07FF FE10$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LOCK	EN	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	1	1	1	1	1	1	1	0	0	0	0	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.162 MGDGRPROT*n* register contents

Bit Position	Bit Name	Function
31	LOCK	Lock Bit 0: Registers can be-written 1: Any further write to MGDGRPROTn and MGDGRSPIDn are ignored. This bit can only be cleared by reset.
30	EN	Guard Enable 0: Guard Disable 1: Guard Enable
29 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

(2) MGDGRSPID*n* — Global-RAM FS Guard SPID Setting Register *n* (*n* = 0 to 7)

Access: This register can be Read/written in 32/16/8-bit units.

Address: MGDGRSPID0: FFC4 9004_H
MGDGRSPID1: FFC4 9014_H
MGDGRSPID2: FFC4 9024_H
MGDGRSPID3: FFC4 9034_H
MGDGRSPID4: FFC4 9044_H
MGDGRSPID5: FFC4 9054_H
MGDGRSPID6: FFC4 9064_H
MGDGRSPID7: FFC4 9074_H

Value after reset: FFFF $FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SPID[31:16]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPID[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 28.163 MGDGRSPID*n* register contents

Bit Position	Bit Name	Function
31 to 0	SPID[31:0]	In the case of SPID[x] = 0: Access with SPID = x is not allowed. In the case of SPID[x] = 1: Access with SPID = x is allowed.

(3) MGDGRBAD*n* — Global-RAM FS Guard Base Address Register *n* (*n* = 0 to 7)

Access: This register can be Read/written in 32/16/8-bit units.

Address: MGDGRBAD0: FFC4 9008_H
MGDGRBAD1: FFC4 9018_H
MGDGRBAD2: FFC4 9028_H
MGDGRBAD3: FFC4 9038_H
MGDGRBAD4: FFC4 9048_H
MGDGRBAD5: FFC4 9058_H
MGDGRBAD6: FFC4 9068_H
MGDGRBAD7: FFC4 9078_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	AD[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AD[15:9]							—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R

Table 28.164 MGDGRBAD*n* register contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is read. When writing, write the value after reset.
20 to 9	AD[20:9]	Compare Base Address
8 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

(4) MGDGRADV*n* — Global-RAM FS Guard Address Valid Register *n* (*n* = 0 to 7)

Access: This register can be Read/written in 32/16/8-bit units.

Address: MGDGRADV0: FFC4 900C$_H$
MGDGRADV1: FFC4 901C$_H$
MGDGRADV2: FFC4 902C$_H$
MGDGRADV3: FFC4 903C$_H$
MGDGRADV4: FFC4 904C$_H$
MGDGRADV5: FFC4 905C$_H$
MGDGRADV6: FFC4 906C$_H$
MGDGRADV7: FFC4 907C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	ADV[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADV[15:9]							—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R

Table 28.165 MGDGRADV*n* register contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is read. When writing, write the value after reset.
20 to 9	ADV[20:9]	Compare Address Valid MGDGRADVn[x] = 0 indicates that the bit is not to be compared. So, all “0” of MGDGRADVn[x] means that the access is the scope of access protection in any address.
8 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

(5) MGDGRSCTL_VCI2GRAM/PE1/PE2/AXI2GRAM — Global-RAM FS Guard Control Register

Access: These registers can be Read/written in 32-bit units.

Address: MGDGRSCTL_VCI2GRAM: FFC4 9100_H
MGDGRSCTL_PE1: FFC4 9200_H
MGDGRSCTL_PE2: FFC4 9300_H
MGDGRSCTL_AXI2GRAM: FFC4 9700_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLRO	CLRE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 28.166 MGDGRSCTL_VCI2GRAM/PE1/PE2/AXI2GRAM register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	CLRO	Clear the OVF bit of MGDGRSSTAT_VCI2GRAM/PE1/PE2/AXI2GRAM by writing this bit to “1”. Read value: 0: Clear is completed 1: Clear is on execution
0	CLRE	Clear the ERR bit of MGDGRSSTAT_ VCI2GRAM/PE1/PE2/AXI2GRAM by writing this bit to “1”. Read value: 0: Clear is completed 1: Clear is on execution

CLRO	CLRE	Function
0	0	Not Clear both bit
0	1	Not Clear both bit (This setting is ignore)
1	0	OVF bit is Cleared
1	1	Both bit is Cleared

(6) MGDGRSSTAT_VCI2GRAM/PE1/PE2/AXI2GRAM — Global-RAM FS Guard Error Status Register

Access: These registers can be read only in 32-bit units.

Address: MGDGRSSTAT_VCI2GRAM: FFC4 9104_H
MGDGRSSTAT_PE1: FFC4 9204_H
MGDGRSSTAT_PE2: FFC4 9304_H
MGDGRSSTAT_AXI2GRAM: FFC4 9704_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVF	ERR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.167 MGDGRSSTAT_VCI2GRAM/PE1/PE2/AXI2GRAM register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	OVF	Error Overflow Status Flag 0: No Overflow 1: Error Overflow
0	ERR	Error Status Flag 0: No Error 1: Error

(7) MGDGRSTYPE_VCI2GRAM/PE1/PE2/AXI2GRAM — Global-RAM FS Guard Error Access Type Register

Access: These registers can be read only in 32/16/8-bit units.

Address: MGDGRSTYPE_VCI2GRAM: FFC4 910C$_H$
MGDGRSTYPE_PE1: FFC4 920C$_H$

Table 28.168 MGDGRSTYPE_VCI2GRAM/PE1/PE2/AXI2GRAM register contents

Bit Position	Bit Name	Function
31 to 29	Reserved	When read, the value after reset is read.
28	ERRCAUSE	This bit indicates if error cause was guard or illegal access 0: guard error 1: unmapped area access
27 to 25	Reserved	When read, the value after reset is read.
24 to 20	SPID[4:0]	SPID at Guard / unmapped area access error has occurred
19, 18	Reserved	When read, the value after reset is read.
17, 16	Reserved	These bits are undefined.
15 to 13	PEID[2:0]	PEID at Guard / unmapped area access error has occurred
12 to 8	Reserved	When read, the value after reset is read. When writing, write the value after reset.
7, 6	Reserved	These bits are undefined.
5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 0	Reserved	These bits are undefined.

28.4.3 PBG

The PBG module is divided into several PBG groups, each of which is provided with a maximum of 16 protection channels.When more than 16 modules belong to the same PBG group. The PBG group is divide into an additional PBG group, for example PBG1 #0 and PBG1 #1. Both PBG groups still share the same Error Status Register. A single PBG channel can designate the access against which a single peripheral circuit should be protected. Each PBG group can hold the information of the access that has been rejected.

The following table lists the peripheral circuits to be protected, the corresponding PBG group names, and the PBG channel numbers.

Table 28.169 PBG Group (1/8)

PBG group	PBG channel number	Guard Group	purpose (R or W)	Module to be protected	Guard Register	Error status of PBG group	Note
APBGRD_PFSS1	0	PBG	R	• P-Bus guard control (APBGRD_PFSS1, APBGRD_PFSS0)	APBFSGDPROT_PBG_A APBFSGDSPID_PBG_A	ERRSLVCTL_PFSS1 ERRSLVSTAT_PFSS1 ERRSLVTYPE_PFSS1 (Included in SP4)	
	1		W		APBFSGDPROT_PBG_B APBFSGDSPID_PBG_B		
	2	SP1	R	• Code Flash guard for PE1 • Global RAM guard for PE1 • ECC Controller for PE1 • PEG Error capture for PE1	APBFSGDPROT_SP1_A APBFSGDSPID_SP1_A		
	3		W		APBFSGDPROT_SP1_B APBFSGDSPID_SP1_B

28.4.3.2 Details of Registers

(1) APBFSGDPROT_PDMACM_A/PDMACH_A/INTC2_A/SP*n*_A — P-bus FS Guard Protection Setting Register (*n* = 1, 2, 4)

These registers are setting for P-bus guard at read cycle.

Access: These registers can be Read/written in 32/16/8-bit units.

Address: APBFSGDPROT_PDMACM_A: FFC4 C000$_H$
APBFSGDPROT_PDMACH_A: FFC4 C010$_H$
APBFSGDPROT_INTC2_A: FFC4 C020$_H$
APBFSGDPROT_SP1_A: FFC4 C050$_H$
APBFSGDPROT_SP2_A: FFC4 C060$_H$
APBFSGDPROT_SP4_A: FFC4 C070$_H$

Value after reset: 060D FE1B$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LOCK	—	—	—	—	—	—	—	—	PEID5	PEID4	—	PEID2	PEID1	—	—
Value after reset	0	0	0	0	0	1	1	0	0	0	0	0	1	1	0	1
R/W	R/W	R	R	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	1	1	1	1	1	1	1	0	0	0	0	1	1	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.171 APBFSGDPROT_PDMACM_A/PDMACH_A/INTC2_A/SP*n*_A register contents

Bit Position	Bit Name	Function
31	LOCK	Lock Bit 0: Registers can be-written 1: Any further write to APBFSGDPROT_* and APBFSGDSPID_* are ignored. This bit can only be cleared by reset.
30 to 23	Reserved	When read, the value after reset is read. When writing, write the value after reset.
22, 21	PEID[5:4]	Access with PEID PEID is a bit list where each bit represents one PEID value. Setting more than one bit allows to enable more than one virtual Processor ID value at a time. 0: Access with PEID n is not allowed. 1: Access with PEID n is allowed.
20	Reserved	When read, the value after reset is read. When writing, write the value after reset.
19, 18	PEID[2:1]	Access with PEID PEID is a bit list where each bit represents one PEID value. Setting more than one bit allows to enable more than one virtual Processor ID value at a time. 0: Access with PEID n is not allowed. 1: Access with PEID n is allowed.
17 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

(2) APBFSGDPROT_PDMACM_B/PDMACH_B/INTC2_B/SP*n*_B — P-bus FS Guard Protection Setting Register (*n* = 1, 2, 4)

These registers are setting for P-Bus guard at write cycle.

Access: These registers can be Read/written in 32/16/8-bit units.

Address: APBFSGDPROT_PDMACM_B: FFC4 C008$_H$
APBFSGDPROT_PDMACH_B: FFC4 C018$_H$
APBFSGDPROT_INTC2_B: FFC4 C028$_H$
APBFSGDPROT_SP1_B: FFC4 C058$_H$
APBFSGDPROT_SP2_B: FFC4 C068$_H$
APBFSGDPROT_SP4_B: FFC4 C078$_H$

Value after reset: 060D FE17$_H$

Table 28.172 APBFSGDPROT_PDMACM_B/PDMACH_B/INTC2_B/SP*n*_B register contents

Bit Position	Bit Name	Function
31	LOCK	Lock Bit 0: Registers can be-written 1: Any further write to APBFSGDPROT_* and APBFSGDSPID_* are ignored. This bit can only be cleared by reset
30 to 23	Reserved	When read, the value after reset is read. When writing, write the value after reset.
22, 21	PEID[5:4]	Access with PEID PEID is a bit list where each bit represents one PEID value. Setting more than one bit allows to enable more than one virtual Processor ID value at a time. 0: Access with PEID n is not allowed. 1: Access with PEID n is allowed.
20	Reserved	When read, the value after reset is read. When writing, write the value after reset.
19, 18	PEID[2:1]	Access with PEID PEID is a bit list where each bit represents one PEID value. Setting more than one bit allows to enable more than one virtual Processor ID value at a time. 0: Access with PEID n is not allowed. 1: Access with PEID n is allowed.
17 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

(3) APBFSGDPROT_PBG_A — P-bus FS Guard Protection Setting Register

This register is setting for P-bus guard at read cycle.

Access: This register can be Read/written in 32/16/8-bit units.

Address: FFC4 C040$_H$

Value after reset: 064D FE1B$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.173 APBFSGDPROT_PBG_A register contents

Bit Position	Bit Name	Function
31	LOCK	Lock Bit 0: Registers can be-written 1: Any further write to APBFSGDPROT_PBG_A and APBFSGDSPID_PBG_A are ignored. This bit can only be cleared by reset
30 to 23	Reserved	When read, the value after reset is read. When writing, write the value after reset.
22, 21	PEID[5:4]	Access with PEID PEID is a bit list where each bit represents one PEID value. Setting more than one bit allows to enable more than one virtual Processor ID value at a time. 0: Access with PEID n is not allowed. 1: Access with PEID n is allowed.
20	Reserved	When read, the value after reset is read. When writing, write the value after reset.
19, 18	PEID[2:1]	Access with PEID PEID is a bit list where each bit represents one PEID value. Setting more than one bit allows to enable more than one virtual Processor ID value at a time. 0: Access with PEID n is not allowed. 1: Access with PEID n is allowed.
17 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

(4) APBFSGDPROT_PBG_B — P-bus FS Guard Protection Setting Register

This register is setting for P-bus guard at write cycle.

Access: This register can be Read/written in 32/16/8-bit units.

Address: FFC4 C048$_H$

Value after reset: 064D FE17$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LOCK	—	—	—	—	—	—	—	—	PEID5	PEID4	—	PEID2	PEID1	—	—
Value after reset	0	0	0	0	0	1	1	0	0	1	0	0	1	1	0	1
R/W	R/W	R	R	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R	R

Value after reset	1	1	1	1	1	1	1	0	0	0	0	1	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.174 APBFSGDPROT_PBG_B register contents

Bit Position	Bit Name	Function
31	LOCK	Lock Bit 0: Registers can be-written 1: Any further write to APBFSGDPROT_PBG_B and APBFSGDSPID_PBG_B are ignored. This bit can only be cleared by reset
30 to 23	Reserved	When read, the value after reset is read. When writing, write the value after reset.
22, 21	PEID[5:4]	Access with PEID PEID is a bit list where each bit represents one PEID value. Setting more than one bit allows to enable more than one virtual Processor ID value at a time. 0: Access with PEID n is not allowed. 1: Access with PEID n is allowed.
20	Reserved	When read, the value after reset is read. When writing, write the value after reset.
19, 18	PEID[2:1]	Access with PEID PEID is a bit list where each bit represents one PEID value. Setting more than one bit allows to enable more than one virtual Processor ID value at a time. 0: Access with PEID n is not allowed. 1: Access with PEID n is allowed.
17 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

(5) APBFSGDSPID_PDMACM_x/PDMACH_x/INTC2_x/PBG_x/SPy_x — P-bus FS Guard SPID Setting Register (x = A or B, y = 1, 2, 4)

"A" is setting for "Read Cycle", "B" is setting for "Write Cycle".

Access: These registers can be Read/written in 32/16/8-bit units.

Address:

APBFSGDSPID_INTC2_A:	FFC4 C024$_H$
APBFSGDSPID_INTC2_B:	FFC4 C02C$_H$
APBFSGDSPID_PDMACM_A:	FFC4 C004$_H$
APBFSGDSPID_PDMACM_B:	FFC4 C00C$_H$
APBFSGDSPID_PDMACH_A:	FFC4 C014$_H$
APBFSGDSPID_PDMACH_B:	FFC4 C01C$_H$
APBFSGDSPID_PBG_A:	FFC4 C044$_H$
APBFSGDSPID_PBG_B:	FFC4 C04C$_H$
APBFSGDSPID_SP1_A:	FFC4 C054$_H$
APBFSGDSPID_SP1_B:	FFC4 C05C$_H$
APBFSGDSPID_SP2_A:	FFC4 C064$_H$
APBFSGDSPID_SP2_B:	FFC4 C06C$_H$
APBFSGDSPID_SP4_A:	FFC4 C074$_H$
APBFSGDSPID_SP4_B:	FFC4 C07C$_H$

Value after reset: FFFF FFFF$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SPID[31:16]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPID[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 28.175 APBFSGDSPID_PDMACM_x/PDMACH_x/INTC2_x/PBG_x/SPy_x register contents

Bit Position	Bit Name	Function
31 to 0	SPID[31:0]	Access with SPID SPID is a bit list where each bit represents one SPID value. Setting more than one bit allows to enable more than one SPID value at a time. E.g. setting SPID to "00000110" allows access with SPID = 1 and SPID = 2. 0: Access with SPID n is not allowed. 1: Access with SPID n is allowed.

(6) ERRSLVCTL_PFSS0/1 — ERRSLV Control Register for PFSS P-bus FS Guard Slave0/1

Access: These registers can be written only in 32-bit units.

Address: ERRSLVCTL_PFSS0: FFC4 C800$_H$
ERRSLVCTL_PFSS1: FFC4 C810$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLRO	CLRE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 28.176 ERRSLVCTL_PFSS0/1 register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	The write value should also be 0.
1	CLRO	Clear the OVF bit of ERRSLVSTAT_PFSS0/1 by writing this bit to “1”.
0	CLRE	Clear the ERR bit of ERRSLVSTAT_PFSS0/1 by writing this bit to “1”

(7) ERRSLVSTAT_PFSS0/1 — ERRSLV Status Register for PFSS P-bus FS Guard Slave0/1

Access: These registers can be read in 32-bit units.

Address: ERRSLVSTAT_PFSS0: FFC4 C804$_H$
ERRSLVSTAT_PFSS1: FFC4 C814$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVF	ERR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.177 ERRSLVCTL_PFSS0/1 register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	This bit is always read as 0.
1	OVF	Error Overflow Status Flag 0: No Overflow 1: Error Overflow
0	ERR	Error Status Flag 0: No Error 1: Error

(8) ERRSLVTYPE_PFSS0/1 — ERRSLV Error Transfer Type Register for PFSS P-bus FS Guard Slave0/1

Access: These registers can be read in 32-bit units.

Address: ERRSLVTYPE_PFSS0: FFC4 C80C$_H$
ERRSLVTYPE_PFSS1: FFC4 C81C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	SPID[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 28.178 ERRSLVTYPE_PFSS0/1 register contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is read.
20 to 16	SPID[4:0]	SPID at P-bus Guard error has occurred
15 to 13	PEID[2:0]	PEID at P-bus Guard error has occurred
12 to 10	Reserved	These bits are undefined.
9, 8	Reserved	When read, the value after reset is read.
7, 6	Reserved	These bits are undefined.
5	Reserved	When read, the value after reset is read.
4 to 1	Reserved	These bits are undefined.
0	WRITE	Access type at P-bus Guard error 0: read access 1: write access

(9) xxxPROT*x* — P-Bus Guard Protection Setting Register

Access: These registers can be Read/written in 32/16/8-bit units.

Address: See **Table 28.170, List of Registers** (P-bus Guard)

Value after reset: See **Table 28.170, List of Registers** (P-bus Guard)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 28.179 xxxPROTx register contents

Bit Position	Bit Name	Function
31	LOCK	Lock Bit 0: Registers can be-written 1: Any further write to xxxPROTx and xxxSPIDx are ignored. This bit can only be cleared by reset
30 to 23	Reserved	When read, the value after reset is read. When writing, write the value after reset.
22, 21	PEID[5:4]	Access with PEID PEID is a bit list where each bit represents one PEID value. Setting more than one bit allows to enable more than one virtual Processor ID value at a time. 0: Access with PEID n is not allowed. 1: Access with PEID n is allowed.
20	Reserved	When read, the value after reset is read. When writing, write the value after reset.
19, 18	PEID[2:1]	Access with PEID PEID is a bit list where each bit represents one PEID value. Setting more than one bit allows to enable more than one virtual Processor ID value at a time. 0: Access with PEID n is not allowed. 1: Access with PEID n is allowed.
17 to 5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset. See the **Table 28.170** the read values of these bits.

(10) xxxSPIDx — P-bus Guard SPID Setting Register

Access: These registers can be Read/written in 32-bit units.

Address: See **Table 28.170, List of Registers**(P-bus Guard)

Value after reset: FFFF $FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SPID[31:16]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPID[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 28.180 xxxSPIDx register contents

Bit Position	Bit Name	Function
31 to 0	SPID[31:0]	Access with SPID SPID is a bit list where each bit represents one SPID value. Setting more than one bit allows to enable more than one SPID value at a time. E.g. setting SPID to “00000110” allows access with SPID = 1 and SPID = 2. 0: Access with SPID n is not allowed. 1: Access with SPID n is allowed.

(11) ERRSLVxCTL — ERRSLV Control Register for P-bus Guard

Access: These registers can be written only in 8-bit units.

Address: See **Table 28.170, List of Registers** (P-bus Guard)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CLRO	CLRE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	W

Table 28.181 ERRSLVxCTL register contents

Bit Position	Bit Name	Function
7 to 2	Reserved	The write value should also be 0.
1	CLRO	Clear the OVF bit of ERRSLVxSTAT by writing this bit to “1”.
0	CLRE	Clear the ERR bit of ERRSLVxSTAT by writing this bit to “1”

(12) ERRSLVxSTAT — ERRSLV Status Register for P-Bus Guard

Access: These registers can be read in 32-bit units.

Address: See **Table 28.170, List of Registers** (P-bus Guard)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVF	ERR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.182 ERRSLV1STAT register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	This bit is always read as 0.
1	OVF	Error Overflow Status Flag 0: No Overflow 1: Error Overflow
0	ERR	Error Status Flag 0: No Error 1: Error

(13) ERRSLVxTYPE — ERRSLV Error Transfer Type Register for P-Bus Guard

Access: These registers can be read in 32-bit units.

Address: See **Table 28.170, List of Registers** (P-bus Guard)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	SPID[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PEID[2:0]			—	—	—	—	—	—	—	—	—	—	—	—	WRITE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.183 ERRSLVxTYPE register contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is read.
20 to 16	SPID[4:0]	SPID at P-bus Guard error has occurred
15 to 13	PEID[2:0]	PEID at P-bus Guard error has occurred
12 to 10	Reserved	Reserved. These bits are undefined.
9, 8	Reserved	When read, the value after reset is read.
7, 6	Reserved	Reserved. These bits are undefined.
5	Reserved	When read, the value after reset is read.
4 to 1	Reserved	Reserved. These bits are undefined.
0	WRITE	Access type at P-bus Guard error 0: read access 1: write access

28.4.4 HBG

HBUS guard can protect respectively the read and write access against which a peripheral circuit on HBUS should be protected. If HBUS guard detects illegal access, guard error notification is signaled to ECM.

Table 28.184 List of Registers (1/3)

Address	Symbol	Register Name	R/W	Value after reset	Access Size	HBG	Refer to Register	Note

28.4.4.1 Details of Registers

(1) FSGDxxPROTn (n = 00, 02, 04, 06, 08)

Access: These registers can be Read/written in 32/16/8-bit units.

Address: See Table 28.183, HBus Guard.

Value after reset: 060D FE1B$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LOCK	—	—	—	—	—	—	—	—	PEID[5:4]		—	PEID[2:1]		—	—
Value after reset	0	0	0	0	0	1	1	0	0	0	0	0	1	1	0	1

Table 28.185 FSGDxxPROTnn register contents

Bit Position	Bit Name	Function
31	LOCK	Lock Bit 0: Registers can be-written 1: Any further write to FSGDxxPROTn and FSGDxxSPIDn are ignored. This bit can only be cleared by reset
30 to 23	Reserved	When read, the value after reset is read. When writing, write the value after reset.
22, 21	PEID[5:4]	0: Access with PEID n is not allowed. 1: Access with PEID n is allowed.
20	Reserved	When read, the value after reset is read. When writing, write the value after reset.
19, 18	PEID[2:1]	0: Access with PEID n is not allowed. 1: Access with PEID n is allowed.
17 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

(2) FSGDxxPROTn (n = 01, 03, 05, 07, 09)

Access: These registers can be Read/written in 32/16/8-bit units.

Address: See Table 28.183, HBus Guard.

Value after reset: 060D FE17$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.186 FSGDxxPROTnn register contents

Bit Position	Bit Name	Function
31	LOCK	Lock Bit 0: Registers can be-written 1: Any further write to FSGDxxPROTn and FSGDxxSPIDn are ignored. This bit can only be cleared by reset
30 to 23	Reserved	When read, the value after reset is read. When writing, write the value after reset.
22, 21	PEID[5:4]	0: Access with PEID n is not allowed. 1: Access with PEID n is allowed.
20	Reserved	When read, the value after reset is read. When writing, write the value after reset.
19, 18	PEID[2:1]	0: Access with PEID n is not allowed. 1: Access with PEID n is allowed.
17 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

(3) FSGDxxSPIDnn

Access: These registers can be Read/written in 32/16/8-bit units.

Address: See Table 28.183, HBus Guard.

Value after reset: FFFF FFFF$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SPID[31:16]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 28.187 FSGDxxSPIDnn register contents

Bit Position	Bit Name	Function
31 to 0	SPID[31:0]	Access with SPID SPID is a bit list where each bit represents one SPID value. Setting more than one bit allows to enable more than one SPID value at a time. E.g. setting SPID to “00000110” allows access with SPID = 1 and SPID = 2. 0: Access with SPID n is not allowed. 1: Access with SPID n is allowed.

(4) ERRSLVxxCTL

Access: These registers can be written in 8-bit units.

Address: See Table 28.183, HBus Guard.

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CLRO	CLRE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	W

Table 28.188 ERRSLVxxCTL register contents

Bit Position	Bit Name	Function
7 to 2	Reserved	The write value should also be 0.
1	CLRO	0: Ignored 1: Clears the OVF bit of ERRSLVxxSTAT Always read “0”
0	CLRE	0: Ignored 1: Clears the ERR bit of ERRSLVxxSTAT Always read “0”

(5) ERRSLVxxSTAT

Access: These registers can be read in 32-bit units.

Address: See Table 28.183, HBus Guard.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.189 ERRSLVxxSTAT register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	This bit is always read as 0.
1	OVF	Error Overflow Status Flag 0: No Overflow 1: Error Overflow
0	ERR	Error Status Flag 0: No Error 1: Error

(6) ERRSLVxxTYPE

Access: These registers can be read in 32-bit units.

Address: See Table 28.183, HBus Guard.

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	SPID[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PEID[2:0]			—	—	—	—	—	—	—	—	—	—	—	—	WRITE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.190 ERRSLVxxTYPE register contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is read.
20 to 16	SPID[4:0]	SPID at H-Bus Guard error has occurred
15 to 13	PEID[2:0]	PEID at H-Bus Guard error has occurred
12 to 10	Reserved	These bits are undefined.
9, 8	Reserved	When read, the value after reset is read.
7, 6	Reserved	These bits are undefined.
5, 4	Reserved	When read, the value after reset is read.
3 to 1	Reserved	These bits are undefined.
0	WRITE	Access type at H-bus Guard error 0: read access 1: write access

(7) HSSPIDRGn (n = 0 to 7)

This register is setting SPID for each HBUS master IP(Flexray0/1,Ethernet0/1,HS-USRT0-3).The HBUS master IPs can only use a value of SPID between 2 and 31.

Access: These registers can be Read/written in 32-bit units.

Address: HSSPIDRG0: FFFA 1000_H
HSSPIDRG1: FFFA 1004_H
HSSPIDRG2: FFFA 1008_H
HSSPIDRG3: FFFA $100C_H$
HSSPIDRG4: FFFA 1010_H
HSSPIDRG5: FFFA 1014_H
HSSPIDRG6: FFFA 1018_H
HSSPIDRG7: FFFA $101C_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SPID[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 28.191 HSSPIDRGn register contents

Bit Position	Bit Name	Function
31 to 5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 0	SPID[4:0]	System Protection ID. In case that this value is “0” or “1”, SPID of the master is “2” instead of register value.

Table 28.192 Target IP

Register Symbol	target IP
HSSPIDRG0	FlexRay0
HSSPIDRG1	FlexRay1
HSSPIDRG2	Ethernet0
HSSPIDRG3	Ethernet1
HSSPIDRG4	HS-USRT0
HSSPIDRG5	HS-USRT1
HSSPIDRG6	HS-USRT2
HSSPIDRG7	HS-USRT3

28.5 BIST

This product incorporates the function to detect failures of the failure detection function itself, which is referred to as BIST. The Memory BIST is implemented for all RAMs except Emulation RAM and Trace RAM.

BIST execution results can be identified by the field BIST result register (BSEQ0ST).

When the internal oscillator is selected as clock source of system clocks (CKSC0S = 2_H), Field BIST fails because BIST sequence does not finished in the range of time.

28.5.1 List of Registers

Table 28.193 List of Registers

Address	Symbol	Register Name	R/W	Value after reset	Access Size	PBG	Other Protection	Note
FFCD A000$_H$	LBISTREF1	Logic BIST reference value register 1	R	*1	32	PBG4#0.PG4-Startup		
FFCD A004$_H$	LBISTREF2	Logic BIST reference value register 2	R	*1	32	PBG4#0.PG4-Startup		
FFCD A008$_H$	MBISTREF1	Memory BIST reference value register 1	R	*1	32	PBG4#0.PG4-Startup		
FFCD A00C$_H$	MBISTREF2	Memory BIST reference value register 2	R	*1	32	PBG4#0.PG4-Startup		
FFCD A010$_H$	LBISTSIG1	Logic BIST signature value register 1	R	*1	32	PBG4#0.PG4-Startup		
FFCD A014$_H$	LBISTSIG2	Logic BIST signature value register 2	R	*1	32	PBG4#0.PG4-Startup		
FFCD A018$_H$	MBISTSIG1	Memory BIST signature value register 1	R	*1	32	PBG4#0.PG4-Startup		
FFCD A01C$_H$	MBISTSIG2	Memory BIST signature value register 2	R	*1	32	PBG4#0.PG4-Startup		
FFCD A020$_H$	MBISTFTAGL1	Memory BIST FTAG signature value register L 1	R	*1	32	PBG4#0.PG4-Startup		
FFCD A024$_H$	MBISTFTAGH1	Memory BIST FTAG signature value register H 1	R	*1	32	PBG4#0.PG4-Startup		
FFCD A028$_H$	MBISTFTAGL2	Memory BIST FTAG signature value register L 2	R	*1	32	PBG4#0.PG4-Startup		
FFCD A02C$_H$	MBISTFTAGH2	Memory BIST FTAG signature value register H 2	R	*1	32	PBG4#0.PG4-Startup		
FFCD A030$_H$	BSEQ0ST	BIST Sequence status register	R	*1	32	PBG4#0.PG4-Startup		
FFCD A034$_H$	BSEQ0STB	BIST Sequence inverted status register	R	*1	32	PBG4#0.PG4-Startup		
FFCD A038$_H$	BISTST	Field BIST Result register	R	*1	32	PBG4#0.PG4-Startup		
FFF8 0200$_H$	BSEQ0CTL	Field BIST control register	R/W	0000 0001$_H$	32	PBG4#0.PG4-SC3		

Note 1. This register doesn't show the fixed value.

28.5.2 Details of Registers

(1) LBISTREF1 — Logic BIST reference value register 1

This register indicates the reference value of the Logic BIST.

Access: This register can be read only in 32-bit units.

Address: FFCD A000$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	LBISTREF1[19:16]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LBISTREF1[15:0]															
Value after reset	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.194 LBISTREF1 register contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is read.
19 to 0	LBISTREF1 [19:0]	Reference signature (expected signature)

Note 1. When the Field BIST is skipped, the value is shown as below.
[BSEQ0CTL.HWBISTEXE = 0 and System reset2]
[Debug mode(TRSTZ = 1)]
It is not matched with the value of corresponding signature register.
[Application reset1]
The previous value is kept.

(2) LBISTREF2 — Logic BIST reference value register 2

This register indicates the reference value of the Logic BIST.

Access: This register can be read only in 32-bit units.

Address: FFCD A004$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	LBISTREF2[19:16]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.196 MBISTREF1 register contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is read.
19 to 0	MBISTREF1 [19:0]	Reference signature (expected signature)

Note 1. When the Field BIST is skipped, the value is shown as below.
[BSEQ0CTL.HWBISTEXE = 0 and System reset2]
[Debug mode (TRSTZ = 1)]
It is not matched with the value of corresponding signature register.
[Application reset1]
The previous value is kept.

(4) MBISTREF2 — Memory BIST reference value register 2

This register indicates the reference value of the Memory BIST.

Access: This register can be read only in 32-bit units.

Address: FFCD A00C$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	MBISTREF2[19:16]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.197 MBISTREF2 register contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is read.
19 to 0	MBISTREF2 [19:0]	Reference signature (expected signature)

Note 1. When the Field BIST is skipped, the value is shown as below.
[BSEQ0CTL.HWBISTEXE = 0 and System reset2]
[Debug mode (TRSTZ = 1)]
It is not matched with the value of corresponding signature register.
[Application reset1]
The previous value is kept.

(5) LBISTSIG1 — Logic BIST signature value register 1

This register indicates the signature value of the Logic BIST. The user shall compare the reference signature of LBISTREF1 against the resulting signature LBISTSIG1. The LBIST is passed if these are equal.

Access: This register can be read only in 32-bit units.

Address: FFCD A010$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	LBISTSIG1[19:16]

Value after reset	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.198 LBISTSIG1 register contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is read.
19 to 0	LBISTSIG1 [19:0]	LBIST1 signature result

Note 1. When the Field BIST is skipped, the value is shown as below.
[BSEQ0CTL.HWBISTEXE = 0 and System reset2]
[Debug mode (TRSTZ = 1)]
It is not matched with the value of corresponding reference register.
[Application reset1]
The previous value is kept.

(6) LBISTSIG2 — Logic BIST signature value register 2

This register indicates the signature value of the Logic BIST. The user shall compare the reference signature of LBISTREF2 against the resulting signature LBISTSIG2. The LBIST is passed if these are equal.

Access: This register can be read only in 32-bit units.

Address: FFCD A014$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	LBISTSIG2[19:16]

Table 28.201 MBISTSIG2 register contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is read.
19 to 0	MBISTSIG2 [19:0]	MBIST2 signature result

Note 1. When the Field BIST is skipped, the value is shown as below.
[BSEQ0CTL.HWBISTEXE = 0 and System reset2]
[Debug mode(TRSTZ = 1)]
It is not matched with the value of corresponding reference register.
[Application reset1]
The previous value is kept.

(9) MBISTFTAGL1 — Memory BIST FTAG signature value register L1

This register indicates the Memory BIST status of each RAM group (bridge).

Access: This register can be read only in 32-bit units.

Address: FFCD A020$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 28.202 MBISTFTAGL1 register contents

Bit Position	Bit Name	Function
31 to 0	MBISTFTAGL1 [31:0]	The state of self-diagnostic MBIST of Bridge No.n 0: MBIST status is PASS. 1: MBIST status is FAIL. Refer to **Table 28.203** for mapping of each RAM.

Note 1. When the Field BIST is skipped, the value is shown as below.
[BSEQ0CTL.HWBISTEXE = 0 and System reset2] or [Debug mode (TRSTZ = 1)]
This register shows FFFF FFFF$_H$.
[Application reset1]
The previous value is kept.

Table 28.203 mapping of MBISTFTAGL1 register (1/3)

Bit Position	Bit Name	Function			
		P1M-C	P1H-C (4MB)	P1H-C (8MB)	P1H-CE
31	MBISTFTAGL1 [31]	Reserved Bit*1	The state of self-diagnostic MBIST of Global RAM which address is from FEF3_0000$_H$ to FEF3_FFFC$_H$ and is 4bit of address LSB is 0$_H$ or 8$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.		
30	MBISTFTAGL1 [30]	Reserved Bit*1	The state of self-diagnostic MBIST of Global RAM which address is from FEEB_0000$_H$ to FEEB_FFFC$_H$ and is 4bit of address LSB is 0$_H$ or 8$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.		
29	MBISTFTAGL1 [29]	The state of self-diagnostic MBIST of Global RAM which address is from FEEF_0000$_H$ to FEEF_FFFC$_H$ and is 4bit of address LSB is 0$_H$ or 8$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.			
28	MBISTFTAGL1 [28]	The state of self-diagnostic MBIST of ICUMC Instruction cache RAM (data). 0: MBIST status is PASS. 1: MBIST status is FAIL.			
27	MBISTFTAGL1 [27]	The state of self-diagnostic MBIST of ICUMC Instruction cache RAM (tag). 0: MBIST status is PASS. 1: MBIST status is FAIL.			
26	MBISTFTAGL1 [26]	The state of self-diagnostic MBIST of ICUMC Instruction cache RAM (data). 0: MBIST status is PASS. 1: MBIST status is FAIL.			
25	MBISTFTAGL1 [25]	The state of self-diagnostic MBIST of ICUMC Instruction cache RAM (data). 0: MBIST status is PASS. 1: MBIST status is FAIL.			

Table 28.203 mapping of MBISTFTAGL1 register (2/3)

Bit Position	Bit Name	Function			
		P1M-C	P1H-C (4MB)	P1H-C (8MB)	P1H-CE
24	MBISTFTAGL1 [24]	The state of self-diagnostic MBIST of MCAN RAM (MTTCAN0, MCAN1). 0: MBIST status is PASS. 1: MBIST status is FAIL.	The state of self-diagnostic MBIST of MCAN RAM (MTTCAN0). 0: MBIST status is PASS. 1: MBIST status is FAIL.		
23	MBISTFTAGL1 [23]	The state of self-diagnostic MBIST of GTM RAM. 0: MBIST status is PASS. 1: MBIST status is FAIL.			
22	MBISTFTAGL1 [22]	The state of self-diagnostic MBIST of Ethernet RAM (Retry RAM for port0). 0: MBIST status is PASS. 1: MBIST status is FAIL.	The state of self-diagnostic MBIST of Ethernet RAM (Retry RAM for port0 and port1). 0: MBIST status is PASS. 1: MBIST status is FAIL.		
21	MBISTFTAGL1 [21]	The state of self-diagnostic MBIST of Ethernet RAM (Receive/Transmit FIFO for port0). 0: MBIST status is PASS. 1: MBIST status is FAIL.	The state of self-diagnostic MBIST of Ethernet RAM (Receive/Transmit FIFO for port0 and port1). 0: MBIST status is PASS. 1: MBIST status is FAIL.		
20	MBISTFTAGL1 [20]	The state of self-diagnostic MBIST of CSIH RAM. 0: MBIST status is PASS. 1: MBIST status is FAIL.			
19	MBISTFTAGL1 [19]	The state of self-diagnostic MBIST of FlexRay RAM (Temporary buffer RAM for FLX0). 0: MBIST status is PASS. 1: MBIST status is FAIL.	The state of self-diagnostic MBIST of FlexRay RAM (Temporary buffer RAM for FLX0 and FLX1). 0: MBIST status is PASS. 1: MBIST status is FAIL.		
18	MBISTFTAGL1 [18]	The state of self-diagnostic MBIST of FlexRay RAM(Message RAM for FLX0) or MCAN RAM(MCAN0). 0: MBIST status is PASS. 1: MBIST status is FAIL.	The state of self-diagnostic MBIST of FlexRay RAM (Message RAM for FLX0 and FLX1) or MCAN RAM(MCAN0/1). 0: MBIST status is PASS. 1: MBIST status is FAIL.		
17	MBISTFTAGL1 [17]	The state of self-diagnostic MBIST of Local RAM (ICUMC). 0: MBIST status is PASS. 1: MBIST status is FAIL.			
16	MBISTFTAGL1 [16]	The state of self-diagnostic MBIST of DTS RAM. 0: MBIST status is PASS. 1: MBIST status is FAIL.			
15	MBISTFTAGL1 [15]	The state of self-diagnostic MBIST of FCU RAM. 0: MBIST status is PASS. 1: MBIST status is FAIL.			
14	MBISTFTAGL1 [14]	Reserved Bit*1	Reserved Bit*1	Reserved Bit*1	Reserved Bit*1
13	MBISTFTAGL1 [13]	Reserved Bit*1	Reserved Bit*1	Reserved Bit*1	Reserved Bit*1
12	MBISTFTAGL1 [12]	Reserved Bit*1	Reserved Bit*1	Reserved Bit*1	Reserved Bit*1
11	MBISTFTAGL1 [11]	Reserved Bit*1	The state of self-diagnostic MBIST of Local RAM (PE2) which 4bit of address LSB is 0_H or 4_H. 0: MBIST status is PASS. 1: MBIST status is FAIL.		
10	MBISTFTAGL1 [10]	Reserved Bit*1	The state of self-diagnostic MBIST of Local RAM (PE2) which 4bit of address LSB is 8_H or C_H. 0: MBIST status is PASS. 1: MBIST status is FAIL.		
9	MBISTFTAGL1 [9]	Reserved Bit*1	The state of self-diagnostic MBIST of Instruction cache RAM (tag) (PE2). 0: MBIST status is PASS. 1: MBIST status is FAIL.		
8	MBISTFTAGL1 [8]	The state of self-diagnostic MBIST of Instruction cache RAM (data) (PE1). 0: MBIST status is PASS. 1: MBIST status is FAIL.			
7	MBISTFTAGL1 [7]	The state of self-diagnostic MBIST of Instruction cache RAM (data) (PE1). 0: MBIST status is PASS. 1: MBIST status is FAIL.			

Table 28.203 mapping of MBISTFTAGL1 register (3/3)

Bit Position	Bit Name	Function			
		P1M-C	P1H-C (4MB)	P1H-C (8MB)	P1H-CE
6	MBISTFTAGL1 [6]	Reserved Bit*1	The state of self-diagnostic MBIST of Instruction cache RAM (data) (PE2). 0: MBIST status is PASS. 1: MBIST status is FAIL.		
5	MBISTFTAGL1 [5]	Reserved Bit*1	The state of self-diagnostic MBIST of Instruction cache RAM (data) (PE2). 0: MBIST status is PASS. 1: MBIST status is FAIL.		
4	MBISTFTAGL1 [4]	The state of self-diagnostic MBIST of Local RAM (PE1) which address is from FEBF_0000$_H$ to FEBF_FFFC$_H$ and 4bit of address LSB is 0$_H$ or 4$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.			
3	MBISTFTAGL1 [3]	The state of self-diagnostic MBIST of Local RAM (PE1) which address is from FEBF_0000$_H$ to FEBF_FFFC$_H$ and 4bit of address LSB is 8$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.			
2	MBISTFTAGL1 [2]	The state of self-diagnostic MBIST of Instruction cache RAM(tag)(PE1). 0: MBIST status is PASS. 1: MBIST status is FAIL.			
1	MBISTFTAGL1 [1]	Reserved Bit*1	Reserved Bit*1	Reserved Bit*1	Reserved Bit*1
0	MBISTFTAGL1 [0]	Reserved Bit*1	Reserved Bit*1	The state of self-diagnostic MBIST of MCAN RAM (MCAN2). 0: MBIST status is PASS. 1: MBIST status is FAIL.	

Note 1. When Field BIST is executed, the value is 0.

(10) MBISTFTAGH1 — Memory BIST FTAG signature value register H1

This register indicates the Memory BIST status of each RAM group (bridge).

Access: This register can be read only in 32-bit units.

Address: FFCD A024$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

22	MBISTFTAGH1 [22]	Reserved Bit*1	The state of self-diagnostic MBIST of Global RAM which address is from FEF6_0000$_H$ to FEF6_FFFC$_H$ and is 4bit of address LSB is 4$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.		
21	MBISTFTAGH1 [21]	Reserved Bit*1	The state of self-diagnostic MBIST of Global RAM which address is from FEE8_8000H to FEE8_FFFCH and is 4bit of address LSB is 0H or 8H. 0: MBIST status is PASS. 1: MBIST status is FAIL.		
20	MBISTFTAGH1 [20]	The state of self-diagnostic MBIST of Global RAM which address is from FEF1_0000$_H$ to FEF1_FFFC$_H$ and is 4bit of address LSB is 4$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.			
19	MBISTFTAGH1 [19]	The state of self-diagnostic MBIST of Global RAM which address is from FEF2_0000$_H$ to FEF2_7FFC$_H$ and is 4bit of address LSB is 4$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.	The state of self-diagnostic MBIST of Global RAM which address is from FEF2_0000$_H$ to FEF2_FFFC$_H$ and is 4bit of address LSB is 4$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.		
18	MBISTFTAGH1 [18]	The state of self-diagnostic MBIST of Global RAM which address is from FEED_8000$_H$ to FEED_FFFC$_H$ and is 4bit of address LSB is 4$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.	The state of self-diagnostic MBIST of Global RAM which address is from FEED_0000$_H$ to FEED_FFFC$_H$ and is 4bit of address LSB is 4$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.		
17	MBISTFTAGH1 [17]	Reserved Bit*1	The state of self-diagnostic MBIST of Global RAM which address is from FEE8_8000$_H$ to FEE8_FFFC$_H$ and is 4bit of address LSB is 4$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.		
16	MBISTFTAGH1 [16]	Reserved Bit*1	The state of self-diagnostic MBIST of Global RAM which address is from FEF6_0000$_H$ to FEF6_FFFC$_H$ and is 4bit of address LSB is 0$_H$ or 8$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.		
15	MBISTFTAGH1 [15]	Reserved Bit*1	The state of self-diagnostic MBIST of Global RAM which address is from FEE9_0000$_H$ to FEE9_FFFC$_H$ and is 4bit of address LSB is 0$_H$ or 8$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.		
14	MBISTFTAGH1 [14]	The state of self-diagnostic MBIST of Global RAM which address is from FEF1_0000$_H$ to FEF1_FFFC$_H$ and is 4bit of address LSB is 0$_H$ or 8$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.			
13	MBISTFTAGH1 [13]	The state of self-diagnostic MBIST of Global RAM which address is from FEED_8000$_H$ to FEED_FFFC$_H$ and is 4bit of address LSB is 0$_H$ or 8$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.	The state of self-diagnostic MBIST of Global RAM which address is from FEED_0000$_H$ to FEED_FFFC$_H$ and is 4bit of address LSB is 0$_H$ or 8$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.		

Table 28.205 mapping of MBISTFTAGH1 register (3/3)

Bit Position	Bit Name	Function			
		P1M-C	P1H-C (4MB)	P1H-C (8MB)	P1H-CE
12	MBISTFTAGH1 [12]	Reserved Bit*1	The state of self-diagnostic MBIST of Global RAM which address is from FEF5_0000$_H$ to FEF5_FFFC$_H$ and is 4bit of address LSB is 4$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.		
11	MBISTFTAGH1 [11]	Reserved Bit*1	The state of self-diagnostic MBIST of Global RAM which address is from FEE9_0000$_H$ to FEE9_FFFC$_H$ and is 4bit of address LSB is 4$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.		
10	MBISTFTAGH1 [10]	Reserved Bit*1	The state of self-diagnostic MBIST of Global RAM which address is from FEEA_0000$_H$ to FEEA_FFFC$_H$ and is 4bit of address LSB is 4$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.		
9	MBISTFTAGH1 [9]	The state of self-diagnostic MBIST of Global RAM which address is from FEF0_0000$_H$ to FEF0_FFFC$_H$ and is 4bit of address LSB is 4$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.			
8	MBISTFTAGH1 [8]	The state of self-diagnostic MBIST of Global RAM which address is from FEEE_0000$_H$ to FEEE_FFFC$_H$ and is 4bit of address LSB is 4$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.			
7	MBISTFTAGH1 [7]	Reserved Bit*1	The state of self-diagnostic MBIST of Global RAM which address is from FEF5_0000$_H$ to FEF5_FFFC$_H$ and is 4bit of address LSB is 0$_H$ or 8$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.		
6	MBISTFTAGH1 [6]	Reserved Bit*1	The state of self-diagnostic MBIST of Global RAM which address is from FEEA_0000$_H$ to FEEA_FFFC$_H$ and is 4bit of address LSB is 0$_H$ or 8$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.		
5	MBISTFTAGH1 [5]	The state of self-diagnostic MBIST of Global RAM which address is from FEF0_0000$_H$ to FEF0_FFFC$_H$ and is 4bit of address LSB is 0$_H$ or 8$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.			
4	MBISTFTAGH1 [4]	The state of self-diagnostic MBIST of Global RAM which address is from FEEE_0000$_H$ to FEEE_FFFC$_H$ and is 4bit of address LSB is 0$_H$ or 8$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.			
3	MBISTFTAGH1 [3]	Reserved Bit*1	The state of self-diagnostic MBIST of Global RAM which address is from FEF4_0000$_H$ to FEF4_FFFC$_H$ and is 4bit of address LSB is 4$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.		
2	MBISTFTAGH1 [2]	Reserved Bit*1	The state of self-diagnostic MBIST of Global RAM which address is from FEEB_0000$_H$ to FEEB_FFFC$_H$ and is 4bit of address LSB is 4$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.		
1	MBISTFTAGH1 [1]	The state of self-diagnostic MBIST of Global RAM which address is from FEEF_0000$_H$ to FEEF_FFFC$_H$ and is 4bit of address LSB is 4$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.			
0	MBISTFTAGH1 [0]	Reserved Bit*1	The state of self-diagnostic MBIST of Global RAM which address is from FEF4_0000$_H$ to FEF4_FFFC$_H$ and is 4bit of address LSB is 0$_H$ or 8$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.		

Note 1. When Field BIST is executed, the value is 0.

(11) MBISTFTAGL2 — Memory BIST FTAG signature value register L2

This register indicates the Memory BIST status of each RAM group (bridge).

Access: This register can be read only in 32-bit units.

Address: FFCD A028$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 28.208 MBISTFTAGH2 register contents

Bit Position	Bit Name	Function
31 to 0	MBISTFTAGH2 [31:0]	The state of self-diagnostic MBIST of Bridge No.n 0: MBIST status is PASS. 1: MBIST status is FAIL. Refer to **Table 28.209** for mapping of each RAM.

Note 1. When the Field BIST is skipped, the value is shown as below.
[BSEQ0CTL.HWBISTEXE = 0 and System reset2] or [Debug mode (TRSTZ = 1)]
This register shows FFFF FFFF$_H$.
[Application reset1]
The previous value is kept.

Table 28.209 mapping of MBISTFTAGH2 register

Bit Position	Bit Name	Function		
		P1M-C	P1H-C (4MB)	P1H-C (8MB)
31:0	MBISTFTAGH2 [31:0]	Reserved Bit*1		

Note 1. When Field BIST is executed, the value is 0.

(13) BSEQ0ST — BIST Sequencer Status Register

This register indicates the state of the BIST sequencer

Access: This register can be read only in 32-bit units.

Address: FFCD A030$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.210 BSEQ0ST register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read.
1	BISTEND	0: BIST sequence has not finished in the rage of time 1: BIST sequence has finished in the rage of time
0	CMPERR	0: BIST normal end 1: BIST abnormal end.

Note 1. When the Field BIST is skipped, the value is shown as below.
[BSEQ0CTL.HWBISTEXE = 0 and System reset2]
This register shows 0000 0001$_H$.
[Debug mode(TRSTZ = 1)]
This register shows 0000 0002$_H$.
[Application reset1]
The previous value is kept.

(14) BSEQ0STB — BIST Sequencer Inverted Status Register

This register indicates the inverted state of the BIST sequencer

Access: This register can be read only in 32-bit units.

Address: FFCD A034$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.211 BSEQ0STB register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read.
1	BISTENDB	0: BIST sequence has finished in the range of time 1: BIST sequence has not finished in the range of time
0	CMPERRB	0: BIST abnormal end 1: BIST normal end

Note 1. When the Field BIST is skipped, the value is shown as below.
[BSEQ0CTL.HWBISTEXE = 0 and System reset2]
This register shows 0000 0002$_H$.
[Debug mode(TRSTZ = 1)]
This register shows 0000 0001$_H$.
[Application reset1]
The previous value is kept.

(15) BISTST— Field BIST result register

This register indicates the result of the field BIST.

Access: This register can be read only in 32-bit units.

Address: FFCD A038$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	MBIST2ST	MBIST1ST	LBIST2ST	LBIST1ST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 28.212 BISTST register contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is read.
3	MBIST2ST	0: MBIST2 passed successfully 1: MBIST2 has detected an error
2	MBIST1ST	0: MBIST1 passed successfully 1: MBIST1 has detected an error
1	LBIST2ST	0: LBIST2 passed successfully 1: LBIST2 has detected an error
0	LBIST1ST	0: LBIST1 passed successfully 1: LBIST1 has detected an error

Note 1. When the Field BIST is skipped, the value is shown as below.
[BSEQ0CTL.HWBISTEXE = 0 and System reset2]
[Debug mode(TRSTZ = 1)]
This register shows 0000 000F$_H$.
[Application reset1]
The previous value is kept.

(16) BSEQ0CTL — Field BIST control register

This register is used to control the field BIST.

Access: This register can be Read/written in 32-bit units.

Address: FFF8 0200_H

Value after reset: 0000 0001_H This register is reset by a Power On Reset or a System Reset1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HWBISTEXE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 28.213 BSEQ0CTL register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	HWBISTEXE	The user can select by this bit if BIST shall be skip or not by next system reset2. 0: BIST is skipped by next system reset 2 1: BIST is executed

28.6 ECM

The ECM monitors various failure detection states in the LSI chip, and defines the operation to be carried out upon failure detection. For the details of the ECM, see **Section 29, Error Control Module (ECM)**.

28.7 CVM

The core voltage monitor (CVM) detects over and under voltage of the core voltage. For the details of the CVM, see **Section 10, Core Voltage Monitor (CVM)**.

28.8 CLMA

The clock monitors detect abnormal frequency of internal clocks related to the safety of the device. For the details of the CLMA, see **Section 13, Clock Monitor (CLMA)**.

28.9 WDTA

The window watchdog timer (WDTA) detects deadlock of CPU operation. For the details of the WDTA, see **Section 23, Window Watchdog Timer A (WDTA)**.

28.10 DCRB

The Data CRC Function B can be used to verify or generate CRC protected data streams of arbitrary length and different bit widths. For the details of the DCRB, see **Section 30, Data CRC Function B (DCRB)**.

28.11 Difference among P1M-C, P1H-C and P1H-CE

ISO26262 is out of scope about P1H-CE.

Table 28.214 Required ISO26262 ASIL on each device.

P1M-C	P1H-C (4MB)	P1H-C (8MB)	P1H-CE
ASIL-D Capable	ASIL-D Capable	ASIL-D Capable	N/A

Difference among P1M-C and P1H-C registers can be referred in note of each table of list of registers.

Section 29 Error Control Module (ECM)

29.1 Features of RH850/P1x-C Group ECM

29.1.1 Units

This microcontroller has the following number of ECM units.

Each ECM unit has one channel interface.

Table 29.1 Unit Configurations and Channels

Unit Name (Channel Name) ECMn	Channels per Unit	Product	
		P1M-C	P1H-C, P1H-CE
ECM0	1	√	√
ECM1	1	—	√

Table 29.2 Index

Index	Meaning
n	Throughout this section, the individual ECM units are identified by the index “n” (n = 0, 1): for example, ECMnEPCFG is the ECM n error pulse configuration register.
m	Throughout this section, the individual ECM Master and ECM Checker are identified by the index “m” (m = M, C): for example, ECMmEST bit is the ECM m Error set trigger bit.

29.1.2 Register Base Address

ECM base addresses are listed in the following table.

ECM register addresses are given as offsets from the base addresses in general.

Table 29.3 Register Base Address

Base Address Name	Base Address	Supporting Device	
		P1M-C	P1H-C, P1H-CE
<ECMM0_base>	FFD6 0000_H	√	√
<ECMC0_base>	FFD6 1000_H	√	√
<ECM0_base>	FFD6 2000_H	√	√
<ECMM1_base>	FFCB 0000_H	—	√
<ECMC1_base>	FFCB 1000_H	—	√
<ECM1_base>	FFCB 2000_H	—	√

29.1.3 Clock Supply

Clock supply by and to ECM is listed in the following table.

Table 29.4 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
ECMn	P-Bus interface clock (PCLK)	CLK_HSB
	Delay timer clock (cntclk)	CLK_IOSC/2

29.1.4 Interrupt Requests

ECM interrupt requests are listed in the following table. The interrupt request signal is driven to the high level with a pulse width of one cycle of PCLK when error source status that interrupt generation is enabled is set.

Table 29.5 Interrupt Requests

Unit Interrupt Name	Outline	Interrupt Number
INTECM0MI	ECM0 mask-able interrupt (EI level)	0
INTECMT0NMI	ECM0 mask-able interrupt (FE level)	FEINT
INTECM1MI	ECM1 mask-able interrupt (EI level)	0
INTECMT1NMI	ECM1 mask-able interrupt (FE level)	FEINT

29.1.5 External Output Signals

External output signals of ECM are listed below.

Table 29.6 External Output Signals

Unit Signal Name	Outline	Alternative port pin signal
ERROROUTZ	Error output signal	ERROROUTZ

29.2 Overview

29.2.1 Specification Overview

ECM (Error Control Module) collects error signals coming from different error sources and monitoring circuits. It also outputs error signals from the error pins (ERROROUTZ) and generates interrupts and Error Control Module Reset signals. **Table 29.7** shows the specification overview of ECM.

Table 29.7 Specification Overview

Item	Description
Safety processing	ECM can handle the following processing in response to error signal inputs from individual modules. • Error flag set • EI level interrupt generation EI level interrupt generation can be controlled (enabled/disabled) for individual errors. • FE level interrupt generation FE level interrupt generation can be controlled (enabled/disabled) for individual errors. • Internal reset generation System reset 2 generation can be controlled (enabled/disabled) for individual errors. • Error pin output Pin output mask can be controlled (enabled/disabled) for individual errors. Output can be toggled in response to a timer input or made at a fixed level.
Error status	ECM incorporates the error status register, which can be used to confirm the error status from the error flag. The error flags are only cleared by software or an power on reset. In case of reset except for power on reset, the error flags are kept and the reset generation source can be confirmed by reading the status register after reset.
Debug, self-diagnosis	• Pseudo errors can be generated for debug and self-diagnosis. The operation during injection of pseudo errors is identical to that for the occurrence of real errors. All configurations for the mask to the error pin output, interrupt, or Error Control Module Reset apply in the same way. • ECM incorporates a loop-back function of the error pin output that is used to diagnose the path to the error output pin. The status of the error output pin is reflected to an internal register and can be confirmed by reading the register.
Timeout function	ECM incorporates a function that generates an error signal output or Error Control Module Reset when the count value of the delay timer matches with the delay timer compare register because the delay timer was not stopped during the interrupt processing after being started simultaneously with the occurrence of an interrupt request.
Register protection	A write-protection with a special sequence is incorporated to protect registers from inadvertent write access.
ERROROUTZ clear masking	ECM incorporates a function that can mask software clearance for ERROROUTZ until the time which is counted from error occurrence reaches with the Error Output Clear Invalidation Configuration register. If another error occurs during time counting, then the time count is reset and restarted from the beginning.
Hi-Z control signal trigger	ECM triggers Hi-Z control signal into PIC. Hi-Z control signal is triggered at the same condition when ECM activates ERROROUTZ pin. Regarding of enabling of Hi-Z control, see **Section 26.4.4, Hi-Z control function over external pin for GTM output**.
Others	ECM is duplexed. ECM incorporates the error output pin.

29.3 Block diagram

ECM0 and ECM1 are implemented redundant from ECM Master and ECM Checker. See **Figure 29.1** Connection of two ECM and **Figure 29.2** Connection among ECMn Master, ECMn Checker and peripherals.

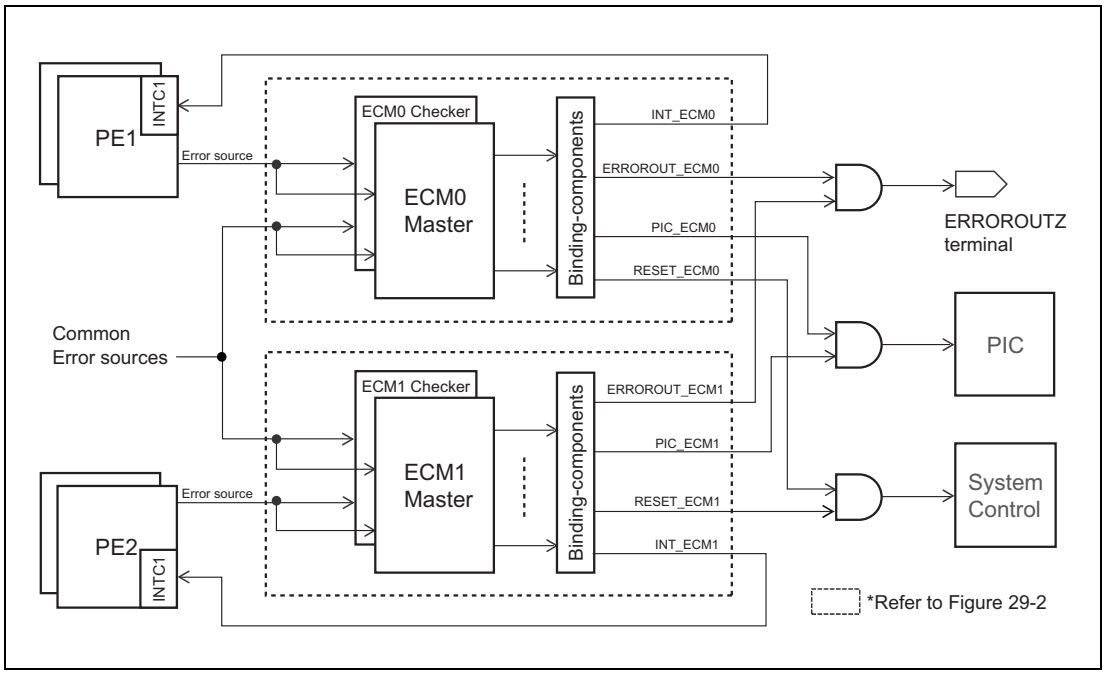

Figure 29.1 Connection of two ECM

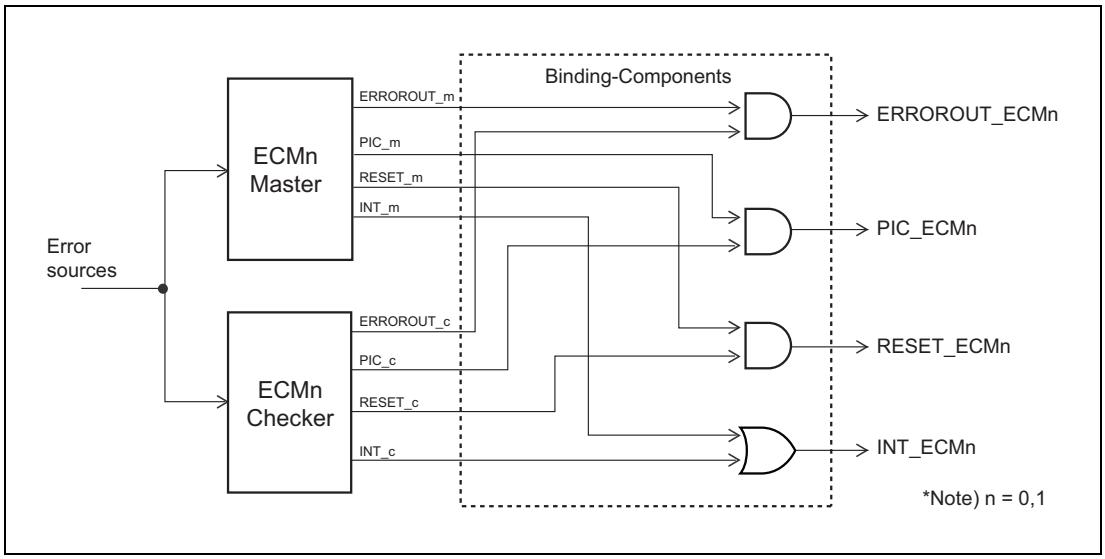

Figure 29.2 Connection among ECMn Master, ECMn Checker and peripherals

29.3.1 Error Input

Table 29.8 shows the error inputs to ECM of RH850/P1x-C.

Table 29.8 List of Error Inputs (1/10)

No.	Error sources	Error source explanation	Error type		Product				
			PE related	Common	P1M-C	P1H-C (4MB, BGA-292)	P1H-C (4MB, BGA-156)	P1H-C (8MB)	P1H-CE

89	Mode error - Unintended activation of Code Flash Programming mode	This error is issued when operating mode of the device becomes serial programming mode regardless of mode pin setting is normal operating mode.*3		√	√	√	√	√	√
90	Mode error - Unintended Debug Enable detection	This error is issued when CPU operating mode (PE1) transits to debug mode without authentication from debugger.*4	√		√	√	√	√	√
		This error is issued when CPU operating mode (PE2) transits to debug mode without authentication from debugger.*4							
91	Mode error - Unintended activation of Test Mode	This error is issued when operating mode of the device becomes test mode regardless of mode pin setting is normal operating mode.*3		√	√	√	√	√	√
92	ECM compare error	ECM0 compare error	√		√	√	√	√	√
		ECM1 compare error							

Note 1. If correction is disabled, single bit errors are still reported as correctable errors to the ECM

Note 2. CLMA3 supervises PE1 clock. CLMA4 supervises PE2 clock. P1M-C device doesn’t have CLMA4.

Note 3. For details of regarding each mode, see the **Section 5, Operating Modes**.

Note 4. For details of regarding debug mode, see the **Section 31, On-Chip Debugging Unit (OCD)**.

29.3.2 Operations for Error Output

After reset release, the ERROROUTZ pin outputs the low (error) level. Follow the procedure described in **Section 29.4.3, ECMmnECLR — ECM Master/Checker n Error Clear Trigger Register (m = M/C)**, to clear the error before using ECM.

The error output can be configured for two different modes of operation, non-dynamic or dynamic.

Error Status ECMmSSE031 to ECMmSSE000 ECMmSSE131 to ECMmSSE100 ECMmSSE230 to ECMmSSE200	Operating Mode ECMSL0 Bit	Error Output Operating Mode	Error Output Level	Error Status
0	0	Non-dynamic	H	No error
	1	Dynamic	Toggles (according to timer input)	No error
1	0	Non-dynamic	L	Error
	1	Dynamic	L	Error

29.3.3 ERROROUTZ behavior at reset

Below table explains the behavior of the error output logic and the ERROROUTZ pin at reset. Also the level of the ERROROUTZsignal during and after reset is explained.

Table 29.9 ERROROUTZ behavior at reset

	Reset signal for initialize			
Category	Power on reset	System reset 1	System reset 2	Application reset 1
Error Pin Logic	√	√	√	—
Error Pin Buffer	√	√	√	—
ERROROUT pin level during reset	Hi-Z	Hi-Z*1	Low level	—
ERROROUT pin level after reset	Low level	Low level	Low level	Level according to error status before reset

Note 1. In case of the debugger disconnect reset, the ERROROUT pin outputs a low level signal during reset.

29.3.3.1 Dynamic Mode Enable

1. Initialize the related timer GTMAT0O5.
2. Set the error output to high level by setting the ECMmECT (m = M/C) bit in the ECM master/checker error clear trigger register to 1.
3. Set the ECMnEPCFG.ECMSL0 bit to 1 for dynamic mode.
4. Start the timer GTMAT0O5.

29.3.3.2 Dynamic Mode Disable

1. Set the error output to low level by setting the ECMmEST bit (m = M/C) in the ECM master/checker error set trigger register to 1.
2. Stop the timer GTMAT0O5.

3. Clear the ECMSL0 bit in the ECM error pulse configuration register to 0 to specify non-dynamic mode.

29.3.4 Error Status

The error status is indicated by ECM master/checker error source status register 0 and ECM master/checker error source status register 1 and ECM master/checker error source status register 2. The error status is only cleared by software or a power on reset. In case of reset except for power on reset, the error status is kept and the error of the reset source can be confirmed by reading the ECM master/checker error source status register 0 and ECM master/checker error source status register 1 and ECM master/checker error source status register 2 after reset release.

29.3.5 Writing to Protected Registers

Write protected registers are protected from inadvertent write access due to erroneous program execution, etc. An overview of the related registers is shown in **Section 29.4, Register Specification**, Overview of ECM Registers. In this context all ECM master registers belong to the protection command register ECMMnPCMD0, while the ECM checker registers belong to ECMCnPCMD0. The ECM common registers are protected by ECMnPCMD1.

29.3.5.1 Protection Unlock Sequence

Write access to a write protected register is only possible within a special protection unlock sequence.

1. Write the fixed value 0000 $00A5_H$ to the protection command registers ECMnPCMD1 or ECMmnPCMD0.
2. Write the desired value to the registers protected by ECMnPCMD1 and ECMmnPCMD0.
3. Write the bitwise inversion of desired value to the registers protected by ECMnPCMD1 or ECMmnPCMD0.
4. Write the desired value to the registers protected by ECMnPCMD1 or ECMmnPCMD0.
5. Check successful write of the desired value to the protected register by checking that ECMnPS.ECMPRERR = 0.

In case of any access to another register between step 1 to step 4 of the above sequence, the protection mechanism behaves as follows:

- If the second register belongs to the ECM, the write to the protected register fails (indicated by ECMnPS.ECMPRERR = 1). The entire sequence has to be restarted at step 1.
- If the second register does not belong to the ECM, the protection unlock sequence is not disrupted and the write to the first register can be completed successfully.

NOTE

Note: For sequences of ECMnPCMD1 and ECMmnPCMD0 registers, the status of the protection unlock sequence is commonly indicated by the ECMnPS.ECMPRERR flag. Therefore, it is recommended not to intermix protection unlock sequences of ECMnPCMD1 and ECMmnPCMD0.

In case the protection unlock sequence is interrupted, the protection mechanism behaves as follows:

- Interrupts during protection unlock sequence
  If an interrupt is acknowledged within the above protection unlock sequence and the interrupt service routine does not access any register of the ECM, the protection unlock sequence is not

disrupted and the write to the protected register can be successfully completed after returning from the interrupt service routine.

CAUTION

All protected registers as well as the ECM protection command registers ECMnPCMD1 and ECMmnPCMD0 must be accessed in 32-bit units.

29.3.6 Timeout Function for Interrupt Processing

The delay timer incorporated to ECM can be started simultaneously with the occurrence of an interrupt request. ECM incorporates a function that generates an error signal output or Error Control Module Reset when the count value of the delay timer matches with the value of the delay timer compare register because the delay timer was not stopped during the interrupt processing. The timer counting is not stopped when a break occurs.

The counting of the delay timer always starts from 0. Configure the duration until a Error Control Module Reset or error output is generated with the settings of the delay timer compare register.

29.3.7 Configuration lock

The following configuration registers in ECM are protected by a special sequence and slave guard.

- Error Set Trigger Register (**Section 29.4.2**)
- Error Clear Trigger Register (**Section 29.4.3**)
- Error Pulse Configuration Register (**Section 29.4.8**)
- Interrupt configuration Register (**Section 29.4.9**, **Section 29.4.10**, **Section 29.4.11**, **Section 29.4.12**, **Section 29.4.13**, **Section 29.4.14**)
- Internal Reset configuration Register (**Section 29.4.15**, **Section 29.4.16**, **Section 29.4.17**)
- Error Mask Register (**Section 29.4.18**, **Section 29.4.19**, **Section 29.4.20**)
- Error Source Status Clear Trigger Register (**Section 29.4.21**, **Section 29.4.22**, **Section 29.4.23**)
- Pseudo Error Trigger Register (**Section 29.4.26**, **Section 29.4.27**, **Section 29.4.28**)
- Delay Timer Control Register (**Section 29.4.29**)
- Delay Timer Compare Register (**Section 29.4.31**)
- Delay Timer Configuration Register (**Section 29.4.32**, **Section 29.4.33**, **Section 29.4.34**, **Section 29.4.35**, **Section 29.4.36**, **Section 29.4.37**)
- Error Output Clear Invalidation Configuration Register (**Section 29.4.38**)

The detail of special protection sequence is described in **Section 29.3.5, Writing to Protected Registers.**

Slave guard is described in **Section 28, Functional Safety**.

29.3.8 Masking of “Error clear trigger register”

The active error output status must be cleared by software via the Error clear trigger register (ECMMECLR/ECMCECLR). A minimum activation time of the error output is achieved by the Error output clear invalidation counter. This counter is (re)started each time a new error event is triggered at the ECM. It counts up from 0000_H to $FFFF_H$. Error output clear by software is not possible unless this counter reaches the compare value configured in the ECMnEOCCFG register. If Error output clear invalidation counter is still running, Error output clear is masked and Error output clear request by software is not memorized.

29.4 Register Specification

29.4.1 List of Registers

ECM consists of three address areas: common part, ECM master, and ECM checker.

The following shows the register map of the ECM master and checker registers.

Table 29.10 Address List of ECM Master and Checker Registers

Address	Register Symbol	Register Name	R/W	Access Width	Value after reset	Access Protection	
						PBG	Protection by Sequence
ECM Master Registers						**<ECMM0_base: FFD6 0000$_H$>** **<ECMM1_base: FFCB 0000$_H$>**	
<ECMMn_base>	ECMMnESET	ECM master n error set trigger register	W	32	0000 0000$_H$	*1	Protected
<ECMMn_base> + 04$_H$	ECMMnECLR	ECM master n error clear trigger register	W	32	0000 0000$_H$	*1	Protected

Note 1. ECM0_base Registers:PBG3#0.PG3-ECM0
ECM1_base Registers:PBG1#0.PG1-ECM1

The ECM registers are the register areas common to the redundancy area to be implemented. Writes to the common register areas are conducted simultaneously. The common area for ECM master is read by reading access to the common area. The ECM master register and the ECM checker register represent the address areas which can be written separately.

ECM Register reset condition is shown in **Table 29.12** and **Table 29.13**.

Table 29.12 Reset condition of ECM Master and Checker Registers (1/2)

		Reset condition

29.4.2 ECMmnESET — ECM Master/Checker n Error Set Trigger Register (m = M/C)

The ECM master/checker n error set trigger register is for setting the error signal from the error pin to the low level. When the ECMmEST bit is set to 1, the error pin immediately outputs the low level. The output cannot be masked. You have to follow a predetermined sequence for writing data to this register. See **Section 29.3.5, Writing to Protected Registers**, for the details of the write protection sequence. This register maintains “1” only 1 PCLK cycle.

This register is always read as $0000\ 0000_H$.

Access: This register can be written in 32-bit units.

Address: <ECMMn_base>
<ECMCn_base>

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ECMmEST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 29.14 ECMmnESET register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	The write value must always be 0.
0	ECMmEST	Error set trigger bit 0: Writing 0 is invalid 1: Set the output level from the error pin to the active (low) level.

CAUTIONS

Setting or clearing the error output from the error pin via the ECMmnESET or ECMmnECLR register will set the ECMmSSE228 bit of the ECMmnESSTR2 register (ECM compare error). Therefore, the ECMmnESET register has to be set following the sequence below.

1. Set the MSKM bit and MSKC bit of the ECMnPEM register to “masked”.
2. Set the ECMmEST bit in the ECMmnESET register.
3. Wait until ERROROUTZ becomes low by checking that the ECMmSSE231 bit of the ECMmnESSTR2 register is “0” .
4. Set the MSKM bit and MSKC bit of the ECMnPEM register to “not masked”.

29.4.3 ECMmnECLR — ECM Master/Checker n Error Clear Trigger Register (m = M/C)

The ECM master/checker n error clear trigger register is for setting the error signal from the error pin to the high level (toggle). When the ECMmECT bit is set to 1, the error pin outputs the high level (toggle) as long as there are no other sources that set the error pin to the low level. You have to follow a predetermined sequence for writing data to this register. See **Section 29.3.5, Writing to Protected Registers**, for the details of the write protection sequence. This register is always read as 0000 0000_H.

Access: This register can be written in 32-bit units.

Address: <ECMMn_base> + 04_H
<ECMCn_base> + 04_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ECMmECT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 29.15 ECMmnECLR register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	The write value must always be 0.
0	ECMmECT	Error clear trigger bit 0: Writing 0 is invalid 1: Set the output level from the error pin to the inactive (high) level.

CAUTIONS

Clearing of the error pin is only possible if all errors, not masked by ECMnEMK0/1/2, are cleared beforehand.

Setting or clearing the error output via the ECMmnECLR register will generate the error. Therefore, the following has to be set in advance. The sequence below shall be executed by either CPU.

1. Set the MSKM bit and MSKC bit of the ECMnPEM register to “masked”.
2. Set the ECMmECT bit in the ECMmnECLR registers.
3. Wait until ERROROUTZ becomes high by reading ECMmSSE231 bit of ECMm0ESSTR2 or ECMm1ESSTR2 register 30 times. After that, check that the ECMmSSE231 bit of the ECMmnESSTR2 register ”is “1”. If the ECMmSSE231 bit of the ECMmnESSTR2 register is not “1”, a new error may occur.
4. Set the MSKM bit and MSKC bit of the ECM0nPEM register to “not masked”.

Note: This procedure is in case of not setting ECMnEOCCFG register.

Setting both ECMmnECLR (n = 0,1) registers are required even PE2 is disabled on P1H-C (4MB), P1H-C (8MB) and P1H-CE except P1M-C/P1M-C ED mode.

NOTE

If the ErrorPin Low Time counter is still running, the Error Output clear function is masked. The Error Output clear request will not be memorized. Error Output clear function is executed, if the ErrorPin Low Time Counter is expired and the Error Output clear register is written.

29.4.4 ECMmnESSTR0 — ECM Master/Checker n Error Source Status Register 0 (m = M/C)

The ECM master/checker n error source status register 0 is a read-only register.

This register represents the status of individual internal error sources, which is irrelevant to the setting of the error mask. The status can be cleared only by software and power on reset. Other reset will not affect the status.

Access: This register can be read in 32-bit units.

Address: <ECMMn_base> + 08_H
<ECMCn_base> + 08_H

Value after reset: 0000 0000_H

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 29.18 ECMmnESSTR2 register contents

Bit Position	Bit Name	Function
31	ECMmSSE231	The status of the ERROROUTZ pin 0: ERROROUTZ is low level 1: ERROROUTZ is high level
30	ECMmSSE230	The status of the ECMmnESET writing 0: No Error 1: Error is set by ECMmnESET
29	ECMmSSE229	The status of the delay timer overflow 0: No overflow 1: Overflow
28 to 0	ECMmSSE228 to ECMmSSE200	Error source status bit ECMmSSE228 to ECMmSSE200 correspond to error sources 92 to 64. 0: Error not occurred 1: Error occurred

NOTE

After Field-BIST executes whether it is unintended execution or not, ECMmnESSTR2.bit 27 will be always “1”. In the startup (after reset release), Field-BIST will be always executed and “1” will be captured in ECMmnESSTR2.bit27.

Therefore confirm ECMmnESSTR2.bit27 is “1” and clear ECMmnESSTR2.bit27 by software before user operation runs.

29.4.7 ECMmnPCMD0 — ECM Master/Checker n Protection Command Register (m = M/C)

The ECM master/checker n protection command register is a write-only register and can be written in 32-bit units. See **Section 29.4.1, List of Registers**, for the protected registers.

See **Section 29.3.5, Writing to Protected Registers**, for the details of the write protection sequence. The value after reset is undefined.

Access: This register can be written in 32-bit units.

Address: <ECMMn_base> + 14_H
<ECMCn_base> + 14_H

Value after reset: Undefined

7 to 0	ECMmREG0 [7:0]	Protection command that enables writing to write protected ECMm registers.

29.4.8 ECMnEPCFG — ECM n Error Pulse Configuration Register

The ECM n error pulse configuration register is a read/write register. Writing to this register is protected by a sequence of instructions.

For details on the write protection sequence, see **Section 29.3.5, Writing to Protected Registers**.

Access: This register can be read/written in 32-bit units.

Address: <ECMn_base>

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 29.20 ECMnEPCFG register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	
0	ECMSL0	Error pin operation configuration bit Error output operation setting for the error pin 0: Non-dynamic mode 1: Dynamic mode

In Dynamic mode the timer output GTMAT0O5 determines the output wave of the error terminal in case of no error.

CAUTION

After setting the dynamic mode, it is recommended not to change to non-dynamic mode again, because there is a possibility of a glitch at the error output.

29.4.9 ECMnMICFG0 — ECM n Maskable Interrupt Configuration Register 0

The ECM n maskable interrupt configuration register 0 is used to set the generation of the INTECMnMI interrupts (EI level interrupts). The generation of EI level interrupts in response to errors is selectable. Writing to this register is protected by a sequence of instructions. For details on the write protection sequence, see **Section 29.3.5, Writing to Protected Registers**.

Access: This register can be read/written in 32-bit units.

Address: <ECMn_base> + 04_H

Value after reset: $0000\ 0000_H$

Table 29.27 ECMnIRCFG0 register contents

Bit Position	Bit Name	Function
31 to 0	ECMIRE031 to ECMIRE000	ECM internal reset generation control bit ECMIRE031 to ECMIRE000 correspond to error sources 31 to 0. 0: Error Control Module Reset generation disabled 1: Error Control Module Reset generation enabled

NOTE

Only watch dog timer error, default setting of Error Control Module Reset configuration is “Enabled”. See **Table 29.8, List of Error Inputs.** This is mandatory to support the automatic start mode of the WDTA. The start mode is selectable by flash option setting. The WDTA provides two modes for the counter start after reset release:

- Software trigger start mode: The counter value remains 0000_H after reset release. The counter is started with the first WDTA trigger. The first trigger can occur any time after reset release.
- Automatic start mode: The counter starts automatically after reset release. The first trigger must occur before the counter overflows.

29.4.16 ECMnIRCFG1 — ECM n Internal Reset Configuration Register 1

The ECM n internal reset configuration register 1 is used to set the generation of Error Control Module Reset in response to internal errors. Writing to this register is protected by a sequence of instructions. For details on the write protection sequence, see **Section 29.3.5, Writing to Protected Registers**.

Access: This register can be read/written in 32-bit units.

Address: <ECMn_base> + 20_H

Value after reset: $0000\ 0000_H$

Table 29.30 ECMnEMK0 register contents

Bit Position	Bit Name	Function
31 to 0	ECMEMK031 to ECMEMK000	ECM error output signal mask control bit ECMEMK031 to ECMEMK000 correspond to error sources 31 to 0. 0: Error signal output not masked 1: Error signal output masked

NOTE

If a error flag is set but masked, clearing the mask will set the ERROROUTZ to active level. This happens independently from the time of the error occurrence. In other words, the flag is evaluated statically.

When PE2 is disabled within P1H-C (4MB), P1H-C (8MB) and P1H-CE (except P1M-C/P1M-C ED mode), all error of ECM1 can be masked by ECM1EMK0/1/2 to prevent unexpected error output.

29.4.19 ECMnEMK1 — ECM n Error Mask Register 1

The ECM n error mask register 1 is used to mask the individual error sources of the error pin output. Writing to this register is protected by a sequence of instructions. For details on the write protection sequence, see **Section 29.3.5, Writing to Protected Registers**.

Access: This register can be read/written in 32-bit units.

Address: <ECMn_base> + $2C_H$

Value after reset: $0000\ 0000_H$

Table 29.32 ECMnEMK2 register contents

Bit Position	Bit Name	Function
31, 30	Reserved	The write value must always be 0.
29	ECMEMK229	Corresponds to delay timer overflow. 0: Error signal output is not masked. 1: Error signal output is masked.
28 to 0	ECMEMK228 to ECMEMK200	ECM error output signal mask control bit ECMEMK228 to ECMEMK200 correspond to error sources 92 to 64. 0: Error signal output not masked 1: Error signal output masked

NOTE

If a error flag is set but masked, clearing the mask will set the ERROROUTZ to active level. This happens independently from the time of the error occurrence. In other words, the flag is evaluated statically.

When PE2 is disabled within P1H-C (4MB), P1H-C (8MB) and P1H-CE (except P1M-C/P1M-C ED mode), all error of ECM1 can be masked by ECM1EMK0/1/2 to prevent unexpected error output.

29.4.21 ECMnESSTC0 — ECM n Error Source Status Clear Trigger Register 0

The ECM n error source status clear trigger register 0 is a write-only register and can be written in 32-bit units. This register is used to clear the individual error source status of the ECM master/checker error source status register 0. Both the error status of the ECM master and the ECM checker are cleared simultaneously.

Writing to this register is protected by the instruction sequence. For details on the write protection sequence, see **Section 29.3.5, Writing to Protected Registers**.

Access: This register can be written in 32-bit units.

Address: <ECMn_base> + 34_H

Value after reset: $0000\ 0000_H$

29.4.22 ECMnESSTC1 — ECM n Error Source Status Clear Trigger Register 1

The ECM n error source status clear trigger register 1 is a write-only register and can be written in 32-bit units. This register is used to clear the individual error source status of the ECM master/checker error source status register 1. Both the error status of the ECM master and the ECM checker are cleared simultaneously.

Writing to this register is protected by the instruction sequence. For details on the write protection sequence, see **Section 29.3.5, Writing to Protected Registers**.

Access: This register can be written in 32-bit units.

Address: <ECMn_base> + 38_H

Value after reset: $0000\ 0000_H$

29.4.23 ECMnESSTC2 — ECM n Error Source Status Clear Trigger Register 2

The ECM n error source status clear trigger register 2 is a write-only register and can be written in 32-bit units. This register is used to clear the individual error source status of the ECM master/checker error source status register 2. Both the error status of the ECM master and the ECM checker are cleared simultaneously.

Writing to this register is protected by the instruction sequence. For details on the write protection sequence, see **Section 29.3.5, Writing to Protected Registers**.

Access: This register can be written in 32-bit units.

29.4.24 ECMnPCMD1 — ECM n Protection Command Register

The ECM n protection command register is a write-only register and can be written in 32-bit units. See **Section 29.4.1, List of Registers**, for the protected registers. See **Section 29.3.5, Writing to Protected Registers**, for the details of the write protection sequence. The value after reset is undefined.

Access: This register can be written in 32-bit units.

Address: <ECMn_base> + 40_H

Value after reset: Undefined

Bit Position	Bit Name	Function
7 to 1	Reserved	The write value must always be 0.
0	ECMPRERR	ECM protection status bit Indicates whether writing to a write protected register was failed or was successful. 0: Writing was successfully completed. 1: Writing failed

29.4.26 ECMnPE0 — ECM n Pseudo Error Trigger Register 0

The ECM n pseudo error trigger register 0 is a write-only register. This register is used to generate a pseudo error for test purposes. The ECM operation in response to the generation of a pseudo error is identical to that in response to a real error source. Writing to this register is protected by a sequence of instructions. For details on the write protection sequence, see **Section 29.3.5, Writing to Protected Registers**.

Access: This register can be written in 32-bit units.

Address: <ECMn_base> + 48_H

Value after reset: $0000\ 0000_H$

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 29.40 ECMnPE2 register contents

Bit Position	Bit Name	Function
31, 30	Reserved	The write value must always be 0.
29	ECMPE229	ECM pseudo error trigger bit. Corresponds to delay timer overflow. 0: Pseudo error is not generated. 1: Pseudo error is generated.
28	ECMPE228	ECM pseudo error trigger bit. Corresponds to ECM compare error. 0: Pseudo error is not generated. 1: Pseudo error is generated.
27	Reserved	The write value must always be 0.
26 to 0	ECMPE226 to ECMPE200	ECM pseudo error trigger bit ECMPE226 to ECMPE200 correspond to error sources 90 to 64. 0: Pseudo error is not generated. 1: Pseudo error is generated.

NOTE

After Field-BIST executes whether it is unintended execution or not, ECMmnESSTR2.bit 27 will be always “1” In the startup (after reset release), Field-BIST will be always executed and “1” will be captured in ECMmnESSTR2.bit27. If “1” is not captured in ECMmnESSTR2.bit27 after Field-BIST execution, then ECMmnESSTR2.bit 27 is out of order. Therefore, ECMnPE2.bit27 is reserved bit because it is possible to detect the failure of ECMmnESSTR2.bit27 without self-diagnosis by using ECMnPE2.

29.4.29 ECMnDTMCTL — ECM n Delay Timer Control Register

The ECM n delay timer control register is a read/write register. This register is used to control the delay timer. Writing to this register is protected by the instruction sequence. For details on the write protection sequence, see **Section 29.3.5, Writing to Protected Registers**.

Access: This register can be read/written in 32-bit units.

Address: <ECMn_base> + 54_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	DTMSTACNTCLK	—	—	DTMSTP	DTMSTA
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	R/W

Table 29.41 ECMnDTMCTL register contents

Bit Position	Bit Name	Function
31 to 5	Reserved	The write value must always be 0.
4	DTMSTACNTCLK	Delay timer start confirmation status. 0: Delay timer does not start. 1: Delay timer starts.
3 to 2	-	Reserved. The write value must always be 0
1	DTMSTP	Delay timer stop bit By writing “1” to this bit, delay timer is stopped (0 write is ignored). Simultaneously, DTMSTA bit will be 0. 0: Delay timer is completed or not executed. 1: Stop request for delay timer is on execution.
0	DTMSTA	Delay timer start bit Specifies the operation of the delay timer when any error event is occurred. 0: Delay timer does not start 1: Delay timer starts

NOTES

1. ECMnDTMCTL register can be accessed via P-Bus but delay timer runs with not P-Bus clock butdedicated counter clock.
   Therefore, time rag exists between writing of ECMnDTMCTL and running of delay timer.
   DTMSTACNTCLK can be used to confirm whether delay timer is enabled or not. Please confirm again whether DTMSTA is updated or not after your write action.
2. ECMnDTMCTL register can be written only when (DTMSTA, DTMSTACNTCLK) = (0, 0) or (1,1)
   Please confirm the combination of DTMSTA and DTMSTACNTCLK before your write action.

29.4.30 ECMnDTMR — ECM n Delay Timer Register

The ECM n delay timer register is a read-only register. The ECM n delay timer register is initialized by setting the DTMSTA bit of the ECM n delay timer control register from 1 (timer in operation) to 0 (timer stops).

Access: This register can be read in 16-bit units.

Address: <ECMn_base> + 58_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECMDTMR[15:0]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

29.4.31 ECMnDTMCMP — ECM n Delay Timer Compare Register

The ECM n delay timer compare register is a read/write register. The ECMmSSE229 bit is set when this register matches with the value of the ECM n delay timer register. Writing data to this register has to be conducted while the delay timer is stopped. Writing to this register is protected by the instruction sequence. For details on the write protection sequence, see **Section 29.3.5, Writing to Protected Registers**.

Access: This register can be read/written in 32-bit units.

Address: <ECMn_base> + $5C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CMPW
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECMDTMCMP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 29.42 ECMnDTMCMP register contents

Bit Position	Bit Name	Function
31 to 17	Reserved	The write value must always be 0.
16	CMPW	Indicates on execution of ECMnDTMCMP register setting to counter clock domain 0: Not executed 1: On execution of setting ECMnDTMCMP
15 to 0	ECMDTMCMP [15:0]	Delay timer compare value

NOTES

1. ECMDTMCMP can be accessible via P-Bus. But delay timer is run with not P-Bus clock but dedicated counter clock. When ECMDTMCMP is configured, this value is moved to dedicated counter clock domain to be able to be used by delay timer. CMPW indicates the current status of ECMDTMCMP setting on dedicated counter clock domain.
2. While CMPW is “1”, writing of ECMDTMCMP is ignored. Please confirm CMPW = 0 before writing of ECMDTMCMP.

29.4.32 ECMnDTMCFG0 — ECM n Delay Timer Configuration Register 0

The ECM n delay timer configuration register 0 is used to set enable/disable of the delay timer start caused by EI level interrupts in response to errors. Writing to this register is protected by a sequence of instructions. For details on the write protection sequence, see **Section 29.3.5, Writing to Protected Registers**.

Access: This register can be read/written in 32-bit units.

Address: <ECMn_base> + 60_H

Value after reset: $0000\ 0000_H$

31 to 0	ECMTE131 to ECMTE100	ECM delay timer start control bit ECMTE131 to ECMTE100 correspond to EI level interrupts generated by error sources 63 to 32. 0: Delay timer start disabled 1: Delay timer start enabled

29.4.34 ECMnDTMCFG2 — ECM n Delay Timer Configuration Register 2

The ECM n delay timer configuration register 2 is used to set enable/disable of the delay timer start caused by EI level interrupts in response to errors. Writing to this register is protected by a sequence of instructions. For details on the write protection sequence, see **Section 29.3.5, Writing to Protected Registers**.

Access: This register can be read/written in 32-bit units.

Address: <ECMn_base> + 68_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

29.4.35 ECMnDTMCFG3 — ECM n Delay Timer Configuration Register 3

The ECM delay timer configuration register 3 is a read/write register and can be written in 32-bit units. This register is used to set enable/disable of the delay timer start caused by FE level interrupts in response to errors. Writing to this register is protected by a sequence of instructions. For details on the write protection sequence, see **Section 29.3.5, Writing to Protected Registers**.

Access: This register can be read/written in 32-bit units.

Address: <ECMn_base> + $6C_H$

Value after reset: $0000\ 0000_H$

NOTE

Do not enable delay timer for clock monitor error events (ECMTE312 to ECMTE308).

29.4.36 ECMnDTMCFG4 — ECM n Delay Timer Configuration Register 4

The ECM n delay timer configuration register 4 is a read/write register and can be written in 32-bit units. This register is used to set enable/disable of the delay timer start caused by FE level interrupts in response to errors. Writing to this register is protected by a sequence of instructions. For details on the write protection sequence, see **Section 29.3.5, Writing to Protected Registers**.

Access: This register can be read/written in 32-bit units.

29.4.37 ECMnDTMCFG5 — ECM n Delay Timer Configuration Register 5

The ECM n delay timer configuration register 5 is a read/write register and can be written in 32-bit units. This register is used to set enable/disable of the delay timer start caused by FE level interrupts in response to errors. Writing to this register is protected by a sequence of instructions. For details on the write protection sequence, see **Section 29.3.5, Writing to Protected Registers**.

Access: This register can be read/written in 32-bit units.

29.4.38 ECMnEOCCFG — ECM n Error Output Clear Invalidation Configuration Register

This register is readable/writable register. Access by 32-bit units is possible.

After counter for Error Output clear invalidation exceed the value which is configured to this register, it is possible to clear non-safe status of error output by SW.

Configure to this register only if error output status is safe.

This register initialized by a reset from Power on Reset or System Reset 1 or System Reset 2.

Access: This register can be read/written in 32-bit units.

Address: <ECMn_base> + 78_H

Value after reset: $0000\ 0000_H$ This register is initialized by a reset from Power on Reset or System Reset 1 or System Reset 2.

Table 29.49 ECMnEOCCFG register contents

Bit Position	Bit Name	Function
31 to 17	Reserved	The write value must always be 0.
16	CMPW	Indicates on execution of ECMnEOCCFG register setting to counter clock domain 0: Not executed 1: On execution of setting ECMnEOCCFG
15 to 0	ECMEOUTCLRT[15:0]	The number of clock cycles after which it is possible to clear error output by SW.

NOTES

1. ECMnEOCCFG can be accessible via P-Bus. But Errorout release timer is run with not P-Bus clock(PCLK) but dedicated counter clock (cntclk). When ECMnEOCCFG is configured, this value is moved to dedicated counter clock domain to be able to be used by Errorout release timer. CMPW indicates the current status of ECMnEOCCFG setting on dedicated counter clock domain.
2. While CMPW is “1”, writing of ECMnEOCCFG is ignored. Please confirm CMPW = 0 before writing of ECMnEOCCFG.

29.4.39 ECMnPEM — ECM n Pseudo error mask register

This register can mask the pseudo error of “ECM compare error” to support self-diagnosis of Errorout binder.

Access: This register can be read/written in 32-bit units.

Address: <ECMn_base> + $7C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 29.50 ECMnPEM register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	The write value must always be 0.
1	MSKM	0: Pseudo error of “ECM compare error” for ECM master is NOT masked. 1: Pseudo error of “ECM compare error” for ECM master is masked.
0	MSKC	0: Pseudo error of “ECM compare error” for ECM checker is NOT masked. 1: Pseudo error of “ECM compare error” for ECM checker is masked.

29.5 Difference among P1M-C, P1H-C and P1H-CE

- Number of ECM Units is different between P1M-C, P1H-C, P1H-CE shown in **Table 29.1**.
- Error inputs to ECM is different between P1M-C, P1H-C (4MB, BGA-292), P1H-C (4MB, BGA-156), P1H-C (8MB), P1H-CE shown in **Table 29.8**.

Section 30 Data CRC Function B (DCRB)

This section contains a generic description of the Data CRC Function B (DCRB).

The first part of this section describes all RH850/P1x-C specific properties, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of the DCRB.

30.1 Feature

30.1.1 Number of Units and Channels

This microcontroller has the following number of DCRB units.

Each DCRB unit has one channel DCRB.

Table 30.1 Units and Channels

Product	P1M-C	P1H-C, P1H-CE
Number of Units	4	8
Name	DCRBn (n = 0 to 3)	DCRBn (n = 0 to 7)

Note: Regarding the unit index “n” in this section, the individual DCRB units are identified by the index “n”; for example, DCRBnCTL indicates the DCRBn control register.

30.1.2 Register Base Address

DCRBn base addresses are listed in the following table.

DCRBn register addresses are given as offsets from the base addresses in general.

Table 30.2 Register Base Address

		Supporting Device	
Base Address Name	Base Address	P1M-C	P1H-C, P1H-CE
<DCRB0_base>	FFD5 0000_H	√	√
<DCRB1_base>	FFF7 0000_H	√	√
<DCRB2_base>	FFD5 1000_H	√	√
<DCRB3_base>	FFF7 1000_H	√	√
<DCRB4_base>	FFD5 2000_H	—	√
<DCRB5_base>	FFF7 2000_H	—	√
<DCRB6_base>	FFD5 3000_H	—	√
<DCRB7_base>	FFF7 3000_H	—	√

30.1.3 Clock Supply

Clock supply by and to DCRBn is listed in the following table.

Table 30.3 Clock Supply

Explanation	Specification
All of each module operations	High speed system clock: CLK_HSB

30.1.4 Interrupt and DMA/DTS Requests

This module has no interrupt and DMA/DTS requests.

30.1.5 External Input and Output Pins

This module has no external input/output pins.

30.2 Overview

30.2.1 Functional Overview

The Data CRC Function B can be used to verify or generate CRC protected data streams of arbitrary length and different bit widths.

- Supported CRC polynomials
  - 32-bit Ethernet CRC
    $04C11DB7_H : X^{32}+X^{26}+X^{23}+X^{22}+X^{16}+X^{12}+X^{11}+X^{10}+X^8+X^7+X^5+X^4+X^2+X^1+1$
  - 16-bit CCITT CRC
    $1021_H : X^{16}+X^{12}+X^5+1$
  - 8-bit SAE J1850 CRC
    $1D_H : X^8+X^4+X^3+X^2+1$
  - 8-bit 0x2F CRC
    $2F_H : X^8+X^5+X^3+X^2+X+1$
- CRC generation to an arbitrary data block length
- After initialization of the DCRB data register, every write access to the DCRB input register generates a new CRC according to the chosen polynomial and the result is stored in the DCRB data register.

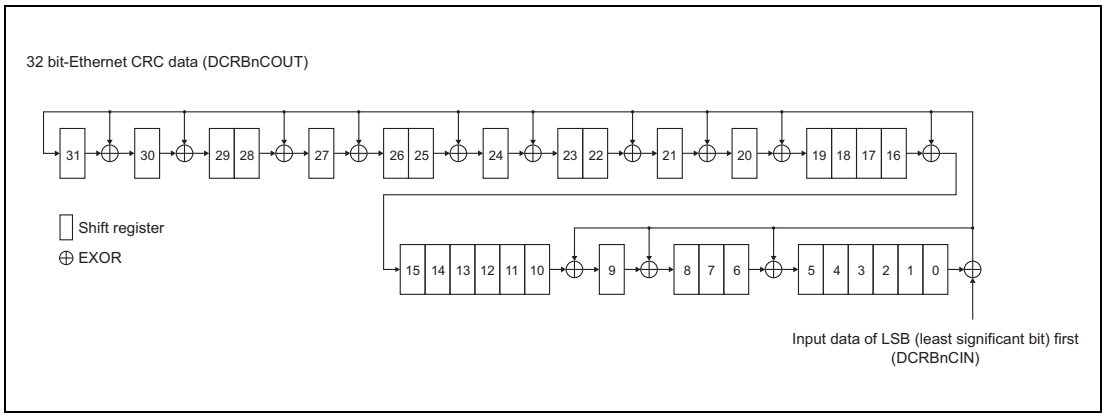

Figure 30.1 HW implementation of 32-bit Ethernet CRC calculation

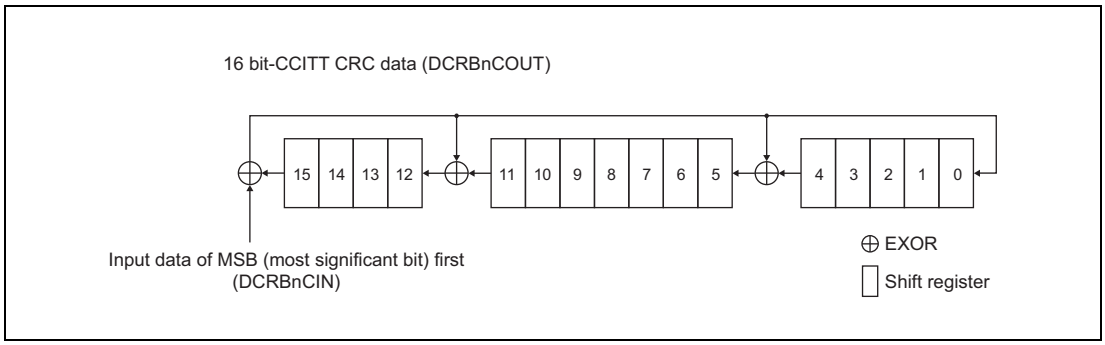

Figure 30.2 HW implementation of 16-bit CCITT CRC calculation

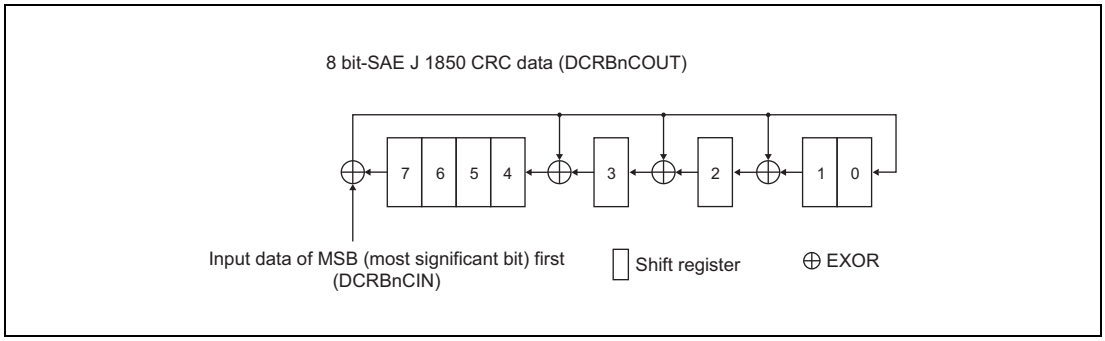

Figure 30.3 HW implementation of 8-bit SAE J1850 CRC calculation

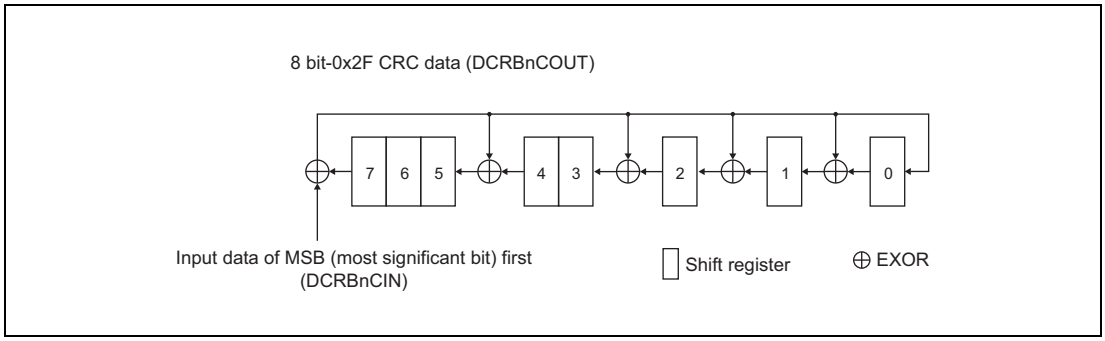

Figure 30.4 HW implementation of 8-bit 0x2F polynomial CRC calculation

30.2.2 Block Diagram

The following figure shows the block diagram of the Data CRC Function B.

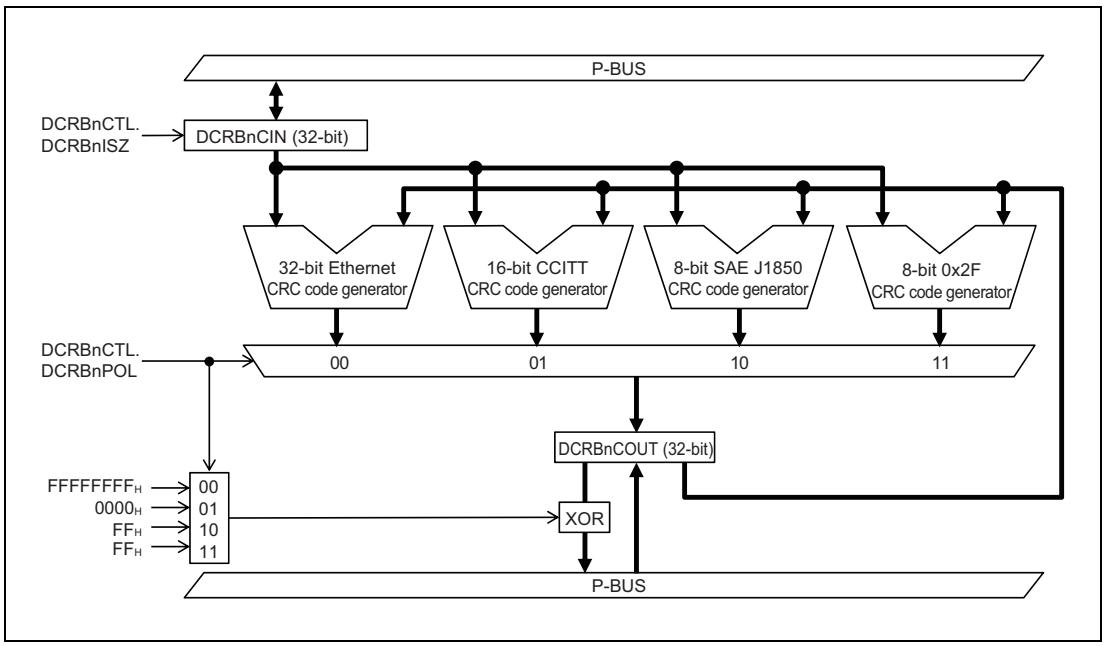

Figure 30.5 Block diagram of Data CRC Function B

Note: When reading from register DCRBnCOUT, the value is XORed by hardware with the value specified in the AUTOSAR standard for the chosen polynomial.

30.3 Registers

30.3.1 List of Registers

Table 30.4 List of Registers

Address Offset*1	Register Name	Description	Access Width	Value after reset	Access Protection	
					PBG	Other
00_H	DCRBnCIN	DCRB input register	32	0000 0000_H	—	—
04_H	DCRBnCOUT	DCRB data register	32	FFFF $FFFF_H$*2	—	—
20_H	DCRBnCTL	DCRB control register	8	00_H	—	—

Note 1. Each base address is described in **Table 30.2**.

Note 2. The read value after reset is 0000 0000_H, since the value is XORed by hardware and the 32-bit Ethernet CRC polynomial is selected as the CRC generating function after reset.

Table 30.5 Register Reset Condition

Register Name	Reset Condition				
	Power On Reset	System Reset 1	System Reset 2	Application Reset 1	Limited Reset
All registers	√	√	√	√	—

30.3.2 DCRBnCIN — DCRB input register

This register holds the input data for the CRC calculation. The effective bit width used for CRC calculation must be set by DCRBnCTL.DCRBnISZ[1:0].

When data is written to this register, the CRC code is generated.

The CRC calculation is immediately started after the DCRBnCIN register is written. The DCRBnCOUT register must be initialized, with the initial starting value, before the first data of the data block is written to DCRBnCIN register.

The byte order in DCRBnCIN depends on the selected CRC generating function:

- 32-bit Ethernet CRC polynomial generation (DCRBnCTL.DCRBnPOL[1:0] = 00)
  The byte order is LSB (least significant byte) first, this means that if the CRC input bit width is 8 bits (DCRBnISZ[1:0] = 10B), the input values are in bits 7 to 0 of the DCRBnCIN register and bit 0 (the LSB) is the first bit of the input data.
- 16-bit CCITT CRC polynomial generation (DCRBnCTL.DCRBnPOL[1:0] = 01)
  The byte order is MSB (most significant byte) first, this means that if the CRC input bit width is 8 bits (DCRBnISZ[1:0] = 10B), the input values are in bits 7 to 0 of the DCRBnCIN register and bit 7 (the MSB) is the first bit of the input data.
- 8-bit SAE J1850 CRC polynomial generation (DCRBnCTL.DCRBnPOL[1:0] = 10)
  The byte order is MSB (most significant byte) first, this means that if the CRC input bit width is 8 bits (DCRBnISZ[1:0] = 10B), the input values are in bits 7 to 0 of the DCRBnCIN register and bit 7 (the MSB) is the first bit of the input data.
- 8-bit 0x2F CRC polynomial generation (DCRBnCTL.DCRBnPOL[1:0] = 11)
  The byte order is MSB (most significant byte) first, this means that if the CRC input bit width is 8 bits (DCRBnISZ[1:0] = 10B), the input values are in bits 7 to 0 of the DCRBnCIN register and bit 7 (the MSB) is the first bit of the input data.

Access: DCRBnCIN register can be read/written in 32-bit units.

Address: <DCRBn_base>

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 30.6 DCRBnCIN register contents

Bit Position	Bit Name	Function
31 to 0	DCRBnCIN	Input data for CRC calculation. The valid bits are: • For 32 bit effective bit width: DCRBnCIN[31:0] • For 16 bit effective bit width: DCRBnCIN[15:0] • For 8 bit effective bit width: DCRBnCIN[7:0]

30.3.3 DCRBnCOUT — DCRB data register

This register stores the result of the CRC code generated by the 32 bit Ethernet, 16-bit CCITT, 8-bit SAE J1850 or 8-bit 0x2F polynomial.

Access: DCRBnCOUT register can be read/written in 32-bit units.

Address: <DCRBn_base> +4_H

Value after reset: FFFF $FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DCRBnCOUT															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCRBnCOUT															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 30.7 DCRBnCOUT register contents

Bit Position	Bit Name	Function
31 to 0	DCRBnCOUT [31:0]	Result of the CRC code generation. When the 16-bit CCITT polynomial is enabled, the bits 15 to 0 show the CRC result. The bits 31 to 16 are undefined. When 8-bit SAE J1850 or 8-bit 0x2F polynomial is enabled, bits 7 to 0 show the CRC result. The bits 31 to 8 are undefined. On reading these bits, the value read out is the XOR of the value described below and the DCRBnCOUT.DCRBnCOUT bits (this does not affect the DCRBnCOUT.DCRBnCOUT bits). • 32-bit Ethernet polynomial: FFFF $FFFF_H$ • 16-bit CCITT CRC polynomial: 0000_H • 8-bit SAE J1850 polynomial: FF_H • 8-bit 0x2F polynomial: FF_H Therefore, for the 32-bit Ethernet polynomial, 0000 0000_H is read from this register even in the initial state (FFFF $FFFF_H$).

CAUTION

This register must be initialized with the start value before the first data of the data block is written to DCRBnCIN register.

30.3.4 DCRBnCTL — DCRB control register

This register controls the CRC generation process.

Access: DCRBnCTL register can be read/written in 8-bit units.

Address: <DCRBn_base> +20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	DCRBnISZ		—	—	DCRBnPOL

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5, 4	DCRBnISZ	Specifies the CRC input bit width: 00: 32 bit (DCRBnCIN[31:0]) 01: 16 bit (DCRBnCIN[15:0]) 10: 8 bit (DCRBnCIN[7:0]) 11: Setting prohibited
3, 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	DCRBnPOL	Specifies the CRC generating function: 00: 32-bit Ethernet CRC polynomial generation. The byte order of the DCRBnCIN register is LSB (Least Significant Byte) first, this means that if the CRC input bit width is 8 bits (DCRBnISZ[1:0] = 10B), the input values are in bits 7 to 0 of the DCRBnCIN register and bit 0 (the LSB) is the first bit of the input data. 01: 16-bit CCITT CRC polynomial generation. The byte order of the DCRBnCIN register is MSB (Most Significant Byte) first, this means that if the CRC input bit width is 8 bits (DCRBnISZ[1:0] = 10B), the input values are in bits 7 to 0 of the DCRBnCIN register and bit 7 (the MSB) is the first bit of the input data. 10: 8-bit SAE J1850 CRC polynomial generation The byte order of the DCRBnCIN register is MSB (Most Significant Byte) first, this means that if the CRC input bit width is 8 bits (DCRBnISZ[1:0] = 10B), the input values are in bits 7 to 0 of the DCRBnCIN register and bit 7 (the MSB) is the first bit of the input data. 11: 8-bit 0x2F CRC polynomial generation The byte order of the DCRBnCIN register is MSB (Most Significant Byte) first, this means that if the CRC input bit width is 8 bits (DCRBnISZ[1:0] = 10B), the input values are in bits 7 to 0 of the DCRBnCIN register and bit 7 (the MSB) is the first bit of the input data.

NOTE

After changing the CRC generating function (DCRBnCTL.DCRBnPOL[1:0]) the DCRBnCOUT register must be initialized.

CAUTIONS

1. The CRC bit width (DCRBnCTL.DCRBnISZ[1:0]) must be set according to the data block bit width. Switching the CRC bit width is not allowed during processing of a data block (a data block consists of N bytes, half words or words). After the final CRC result is read from DCRBnCOUT register, the bit width can be changed and the DCRBnCOUT register must be initialized with the initial value afterwards.
2. Switching the CRC polynomial (DCRBnCTL.DCRBnPOL[1:0]) is also not allowed during processing of a data block.

30.4 Operation

The Data CRC Function B generates a CRC (cyclic redundancy check) of an arbitrary data block length. The data is forwarded to the Data CRC Function in 8-, 16- or 32-bit units. The CRC polynomial can either be selected for 32-bit Ethernet, 16-bit CCITT, 8-bit SAE J1850 or 8-bit 0x2F polynomial CRC, the initial starting value must be set at the DCRBnCOUT register before the first write access to the DCRB input register (DCRBnCIN) is performed.

After the last write access to the DCRBnCIN register is performed, the result can be read-out from the DCRBnCOUT register after one clock period.

The flow chart below shows the CRC generating procedure.

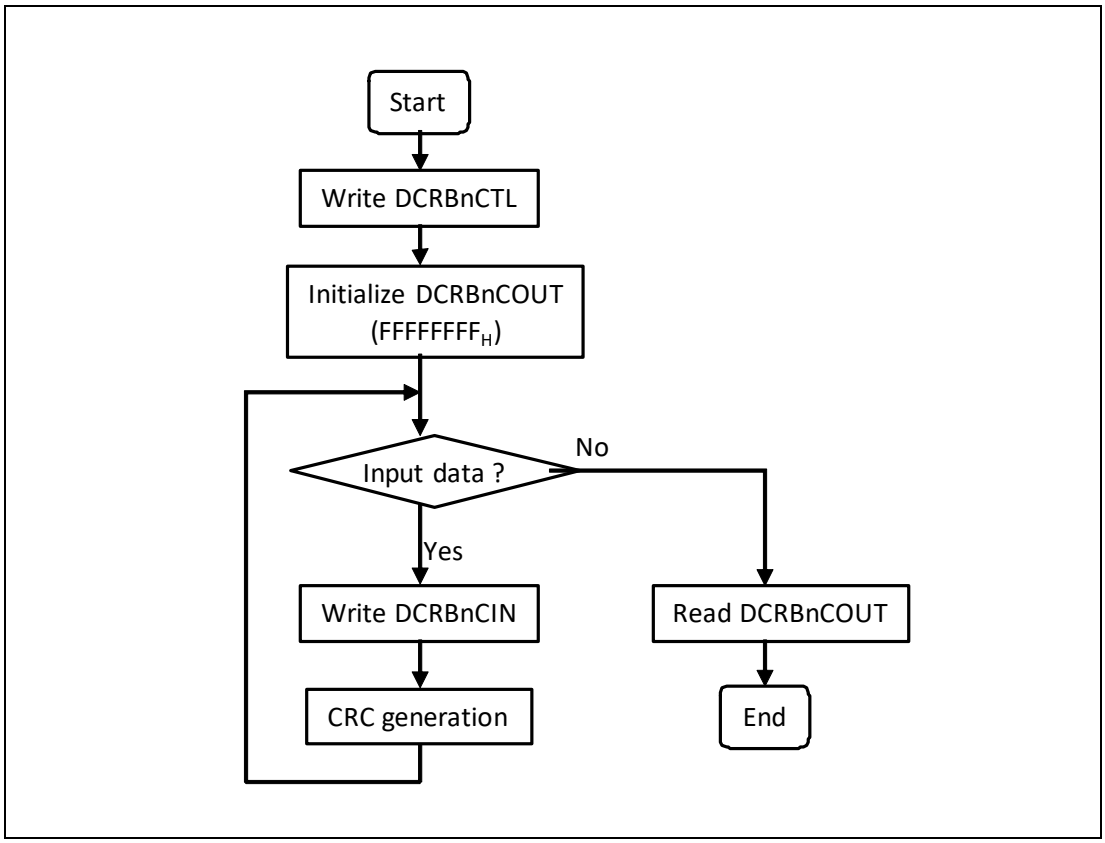

Figure 30.6 Data CRC Function B flow diagram

NOTE

- The initial value that has to be written into DCRBnCOUT can be chosen by the user. To be compliant to the AUTOSAR standard the initial value has to be chosen according to the value specified for the chosen polynomial.
- When reading from register DCRBnCOUT, the value is XORed by hardware with the value specified in the AUTOSAR standard for the chosen polynomial.
- Generation of CRC code and storage to DCRBnCOUT are done by hardware.
- All registers are accessible by CPU or by CPU-independent read/write access via DMA/DTS. Independent from access of the DCRB via CPU or DMA/DTS the verification of the CRC signature (CRC-check result in DCRBnCOUT) has to be performed by SW.

30.5 Difference among P1M-C, P1H-C and P1H-CE

The difference among devices is only the number of units. For details, see **Table 30.1** and **Table 30.2**.

Section 31 On-Chip Debugging Unit (OCD)

31.1 Debug Function

This product has an on-chip debug function. Using an on-chip debug emulator, the micro controller included in the target system debugs programs.

CAUTION

The debug function described in this section is supported by the microcontroller, but whether it can be used or not depends on the debugger. For details of the debugger, see the debugger's user's manual.

(1) Debug Interface

This product supports the NEXUS JTAG and Low Pin Debug Interface (4 pins) (hereinafter referred to as LPD (4 pins)) as the debug interfaces.

(2) Bypass Interface (P1H-CE only)

Emulation device incorporates the AUD-RAM monitor and supports the AUD-RAM monitor interfaces to monitor and tune on-chip RAM data, the peripheral registers, and the like.

(3) Debug Monitor Function

In debug mode, the monitor program proceeds in the debug-specific area.

Execution of the monitor program enables the following basic debug functions:

- Download of user programs
- Reading and writing of user resources including memory and registers while a user program is suspended.
- Execution of user programs starting from any addresses

(4) On-chip Break Function

Twelve break points are included in the CPU. Four of them can be designated for any accesses (access address and access data).

(5) Software Break Function

A software break point can be designated for any addresses on the user programs stored in the RAM.

(6) Forced Break Function

Execution of a user program can be forcibly suspended.

(7) Debug Interrupt Interface Function (P1H-CE only)

Execution of a user program can be forcibly suspended by asserting an input to the EVTIZ pin from the outside.

(8) Forced Reset Function

The micro controller (this product) can be forcibly reset.

(9) Real-time RAM Monitor (RRM)

A memory can be read during execution of a program. This read access can minimize the impact on program execution because it uses the debug-specific DMA.

(10) Dynamic Memory Modify (DMM)

A memory can be written during execution of a program. This write access can minimize the impact on program execution because it uses the debug-specific DMA.

(11) Timer Function

When a 32-bit counter is used, the time period during execution of a user program can be measured on the basis of a debug-specific clock.

(12) Mask Function

A reset factor (pin reset, software reset, or ECM reset) can be masked.

(13) Event Detection Function

Events can be detected by the following: execution address, access address, access data, range (comparison in size), and sequential execution.

(14) Trigger Input Interface (P1H-CE only)

This product incorporates an event trigger input interface to accept external events. It can accept an external event in response to an input from the EVTIZ pin.

(15) Trigger Output Interface (P1H-CE only)

An event trigger output interface is included in this product to notify the external debug device of event detection and the like. Output from the EVTOZ pin can output a trigger of event detection to the outside.

(16) Hot Plug-in Function

Debugging can be started in normal operating mode without an input of an external reset.

(17) Security Function

To prevent the contents of the flash memory from being read by an unauthorized person, a 256-bit ID code (OCD_ID) can be written to the microcontroller. If the code the user inputs when starting a debugger does not match the ID code, the flash memory cannot be accessed.

In addition, the devices supporting hardware security module provides higher security system. Debug functions are under controlled by security module and unauthorized person must communicate with security module for connecting any tools.

See *RH850/P1x-C User's Manual: Hardware (Security)* ***Section 1 Basic Security*** and ***Section 3 ICUMC***.

(18) Calibration Function (P1H-CE only)

Emulation of the flash memory and tuning of ROM data can be executed by using the ERAM, the memory for emulation. For details, **Section 31.2, Calibration Function (P1H-CE only)**.

(19) Tracing Function

User program execution history, data variation, and the like can be obtained. For details, see **Section 31.3, Trace Control Function**.

31.2 Calibration Function (P1H-CE only)

P1H-CE includes the Emulation RAM as an emulation memory for the on-chip flash memory.

(1) Emulation RAM

This product includes 2-Mbyte emulation RAM.

(2) Flash Emulation Function

The Emulation RAM can be mapped to any areas in the flash area (up to 32 blocks for each bank).

- Block 0-31 for bank A: 32 Kbytes each
- Block 0-31 for bank B: 32 Kbytes each

(3) Tuning Function

The ROM data can be dynamically tuned during execution of a user program via the Emulation RAM that been mapped to the flash area.

(4) Flash Cache Clear Function

The flash cache is cleared when the Emulation RAM mapping is set. This preserves coherency of the contents between the on-chip flash memory or the Emulation RAM and the flash cache memory.

31.3 Trace Control Function

This product provides several trace functions including branch PC trace of the CPU, data trace, and DMA data trace.

(1) Trace Interface: Aurora (P1H-CE only)

To achieve the necessary data throughput and to transfer the trace packages of a Multi-core system without data lost, a differential high-speed serial interface will be supported by the emulation device. This interface is compliant to the IEEE-ISTO 5001-2012 high-speed auxiliary port standard and the Aurora protocol.

(2) Software Trace

This function enables the obtaining of histories of user program execution, data variation, and the like.

The software trace information can be output via the debug interfaces, LPD (4 pin).

31.4 Peripheral Break Control

Peripheral break is a function for stopping the peripheral modules when a user program is halted (at a break point, etc.).

The on-chip modules can be classified into two by its operation at the time of peripheral break as follows:

1. Modules that are unconditionally stopped: WDTA0, WDTA1 and SWDT
2. Modules that can select abeyance or continuation: STM, GTM, CSIH0 to CSIH3 and RLIN30 to RLIN33.

31.5 Usage Notes for On-chip Debugging

(1) Caution of Devices Used for Debugging

Do not mount a device used for debugging on mass-produced products. The number of times data can be written to the flash memory cannot be guaranteed because the memory has already been rewritten.

Section 32 Flash Memory

32.1 Features

- Code flash memory capacity: Up to 10 Mbytes of user area. The devices with multi core (P1H-C and P1H-CE) will follow a banked memory approach.
- Data flash memory capacity: Up to 192 + 32 Kbytes for data area exclusively for ICUMC (P1M-C, P1H-C and P1H-CE)*1.
- Methods of programming :
  - Programming by communicating with the dedicated flash memory programmer via the serial interface (Serial programming).
  - Flash memory programming by a user program (Self-programming).
- Support for security functions to protect against illicit tampering with or reading out of data in flash memory.
- Support for protection functions to protect against erroneous overwriting of the flash memory.
- Support for OTP (one time programming) on Code Flash.
- Support for the detection and correction of errors in the flash memory.
- Support for the BGO (Back Ground Operation) function.
  - Code flash memory can be read while data flash memory is being programmed.
  - While flash memory in one bank is being erased/programmed/read, flash memory in the other bank can be erased/programed/read.
- The Option Bytes register value (some settings of the device) can be configured in the extended area of flash memory.
- Smallest writable unit on Code Flash is 256 bytes, on Data Flash is 4 bytes.
- Smallest erasable unit is a block. On Code Flash 8 Kbytes or 32 Kbytes and on data Flash 64 bytes.

Note 1. Can be used as normal data flash in case of non-secure applications.

32.1.1 Clock Supply

Clock supply to Flash Control Logic (FACI) is listed in the following table.

Table 32.1 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
FACI	Operation clock	CLK_LSB

32.2 Block Diagram

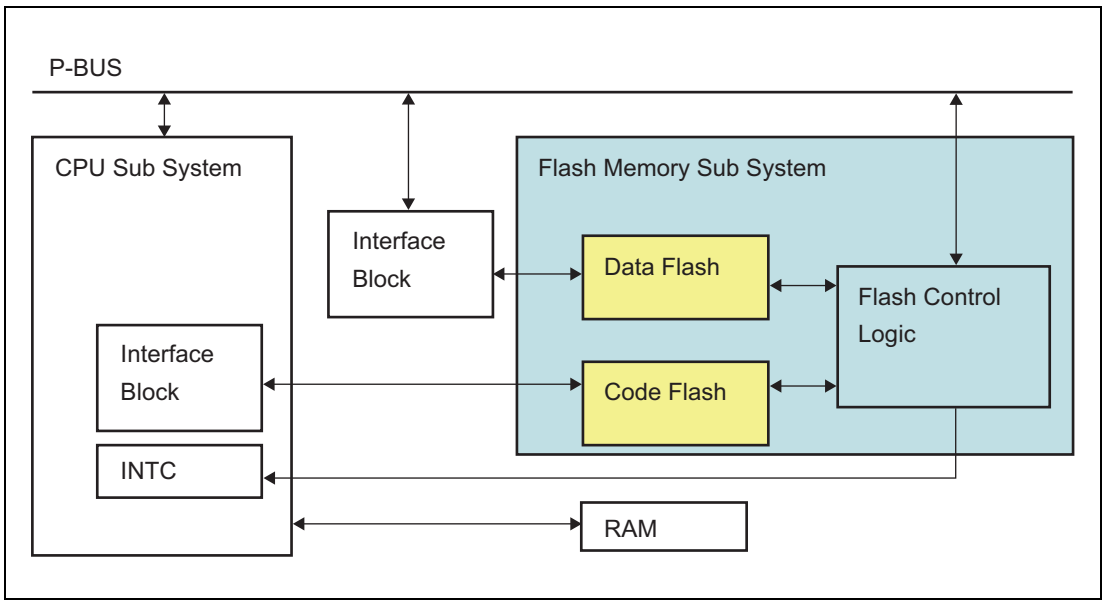

Figure 32.1 Block Diagram

32.3 Flash Size

Table 32.2 Flash size

Unit : [Kbytes]

Name	P1M-C	P1H-C (4MB)	P1H-C (8MB)	P1H-CE
Code Flash	2048	4096	8192	10240
Data Flash*1	64 + 32 (ICUMC exclusive)*2	128 + 32 (ICUMC exclusive)*2	192 + 32 (ICUMC exclusive)*2	192 + 32 (ICUMC exclusive)*2

Note 1. Data Flash sizes including for all devices the erase counter.

Note 2. Can be used as normal data flash in case of non-secure applications.

32.4 Memory Configuration

User area in code flash memory of RH850/P1x-C is divided into 8 Kbytes or 32 Kbytes blocks, which can be erased individually.

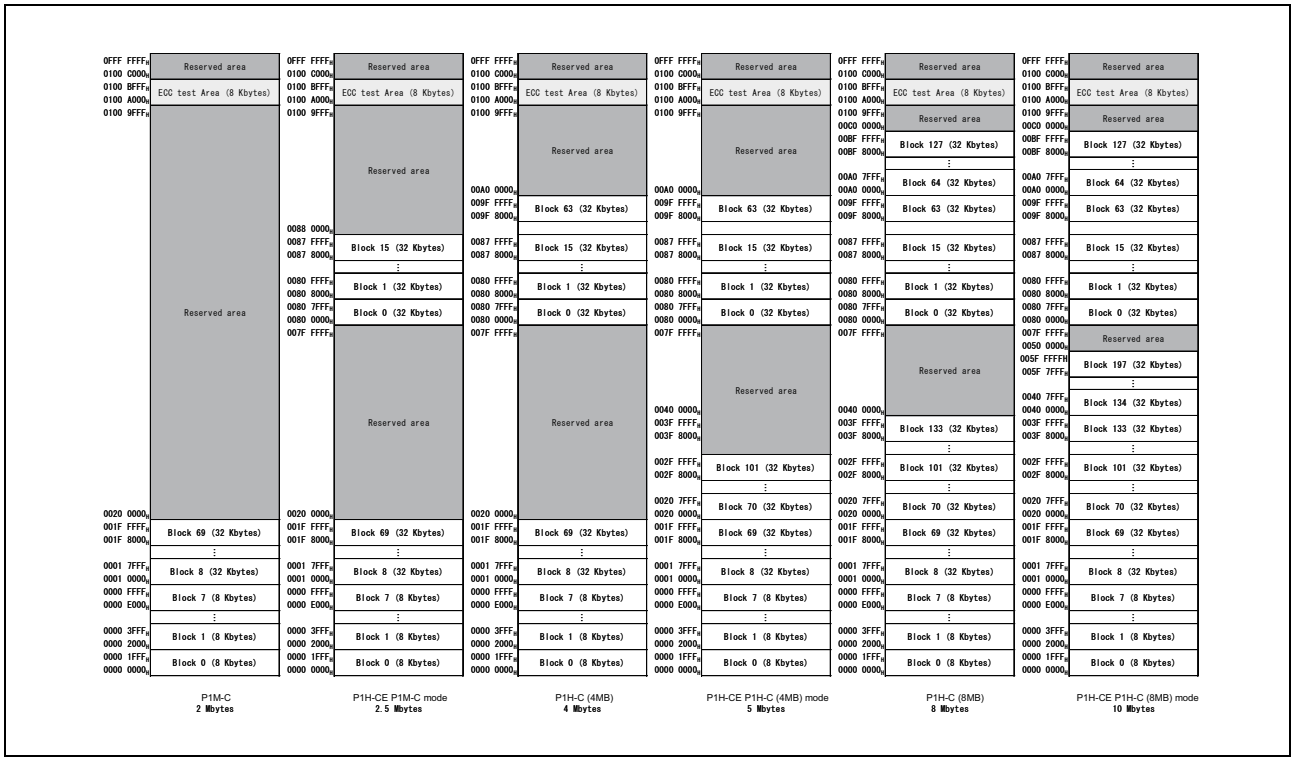

Figure 32.2 Code Flash Memory Mapping

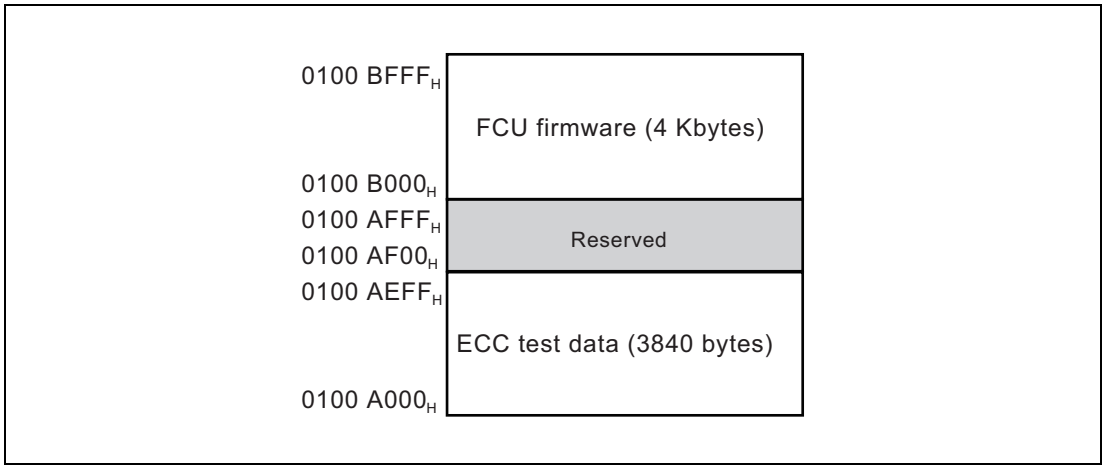

Figure 32.3 Detail of ECC test Area

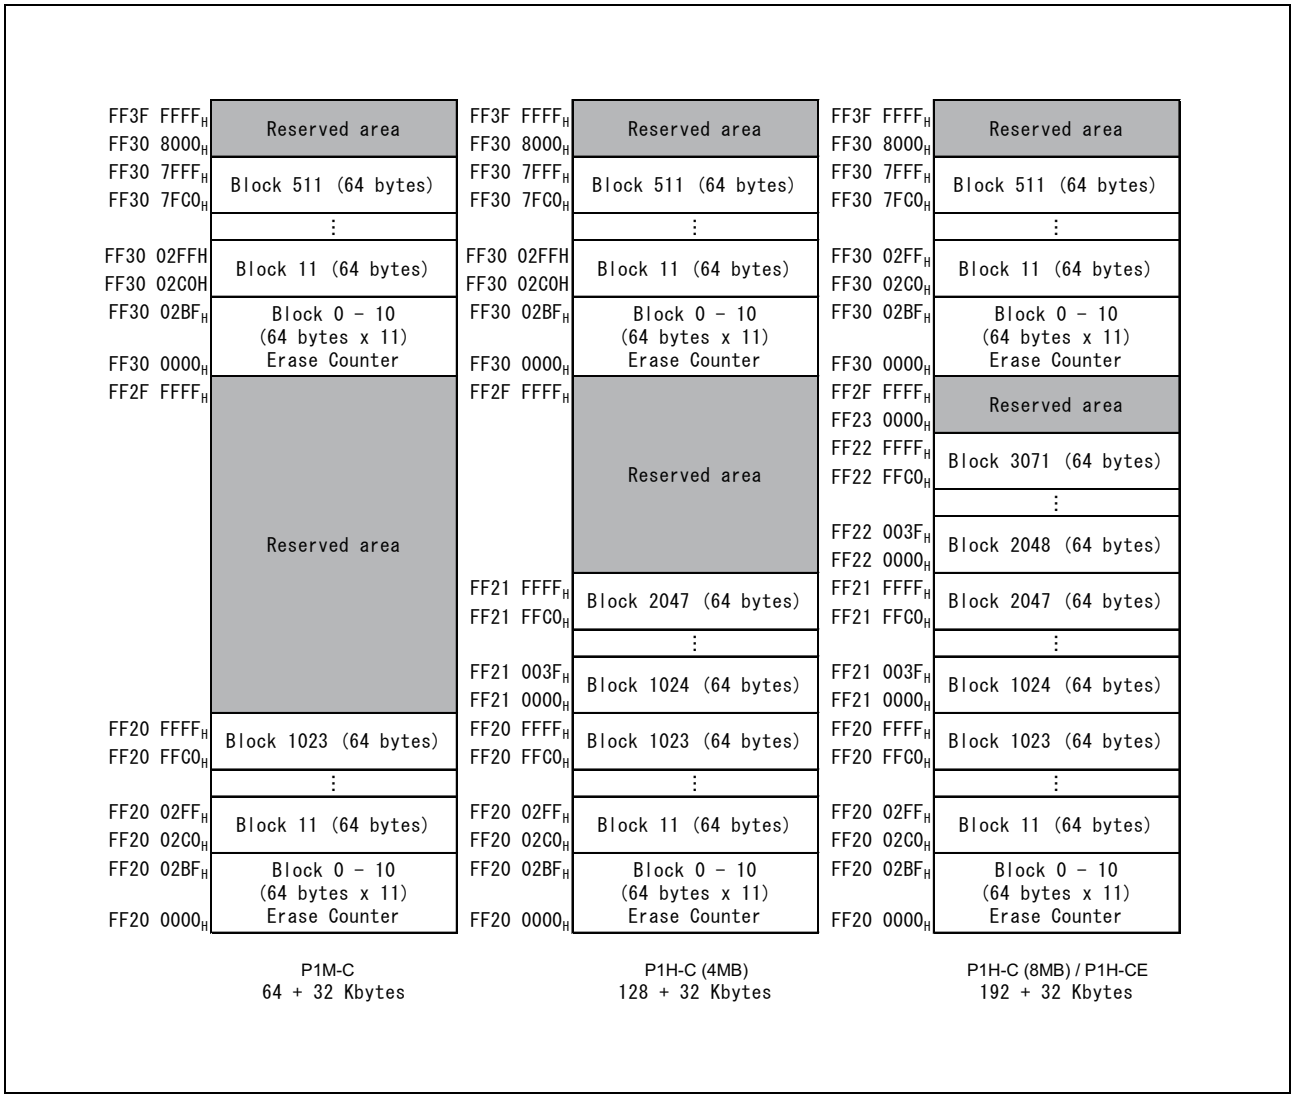
Data area in data flash memory of RH850/P1x-C is divided into 64 bytes blocks, which can be erased individually.



32.5 Registers

32.5.1 Register Base Address

Table 32.3 Register Base Address

Instance Name	Base Address
DCIB0	DCIB0_base = FFC5 9800$_H$
DCIB1	DCIB1_base = FFC5 9900$_H$
SCDS	SCDS_base = FFCD 0000$_H$
SYSCTL	SYSCTL_base = FFF8 0000$_H$

32.5.2 List of Registers

Table 32.4 List of Registers

Register Name	Abbreviation	R/W	Value after reset	Address	Access Size	Access Protection
Data Flash Memory Read Cycle Setting Register0	EEPRDCYCL0	R/W	0F$_H$	DCIB0_base + 0010$_H$	8	PBG5#0. PG5-DCIB0[*1]
Data Flash Memory Read Cycle Setting Register1	EEPRDCYCL1	R/W	0F$_H$	DCIB1_base + 0010$_H$	8	PBG5#0. PG5-DCIB1[*1]
Reset Vector for PE1/PE2 register	GREG8	R	XXXX XXXX$_H$	SCDS_base + 0020$_H$	32	PBG4#1. PG4-FLASH
Option Byte 0	OPBT0	R	XXXX XXXX$_H$	SCDS_base + 0030$_H$	32	PBG4#1. PG4-FLASH
Option Byte 1	OPBT1	R	XXXX XXXX$_H$	SCDS_base + 0034$_H$	32	PBG4#1. PG4-FLASH
Option Byte 2	OPBT2	R	XXXX XXXX$_H$	SCDS_base + 0038$_H$	32	PBG4#1. PG4-FLASH

Other Registers	√	√	√		

32.6 Operating Modes Associated with Flash Memory

Figure 32.5 is a diagram of the mode transitions associated with the flash memory. For the procedures for setting the modes, see **Section 5, Operating Modes**

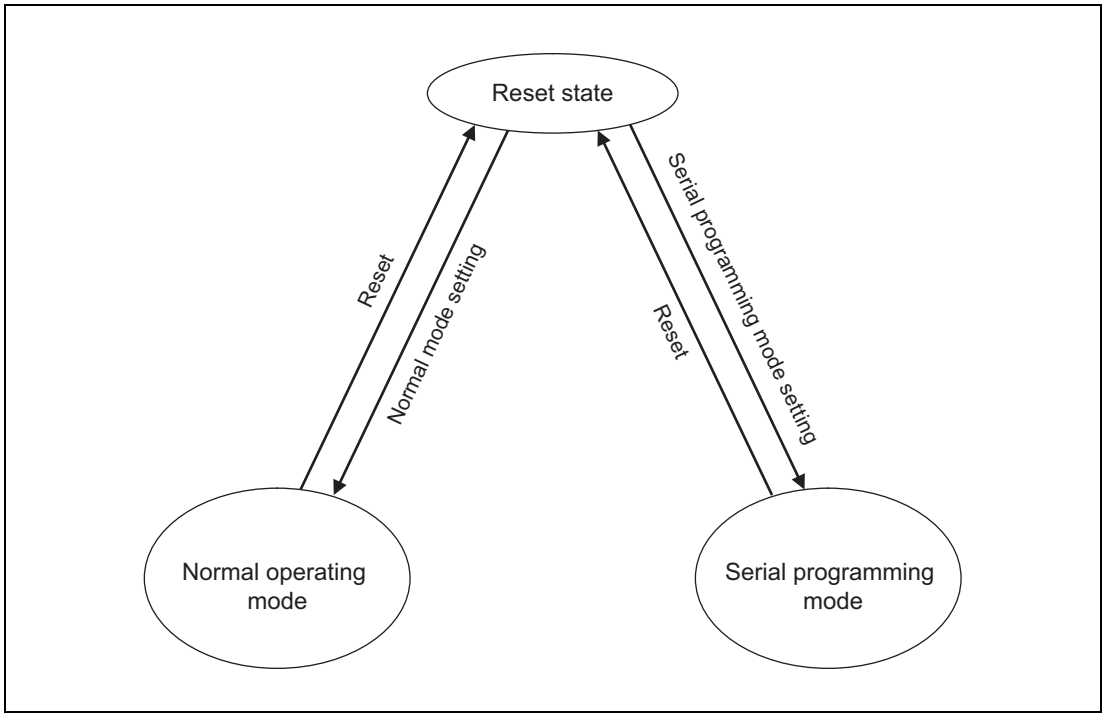

Figure 32.5 Mode Transition Associated with Flash Memory

The flash memory areas which are programmable and erasable and the boot program after a reset depend on the selected mode. The differences between modes are indicated in **Table 32.6**.

Table 32.6 Differences between Modes

Item	Normal Operating Mode	Serial Programming Mode
Programmable and erasable area	User area Data area	User area Data area
Boot program at a reset	Program in user area	Firmware program for serial programming

32.7 Functional Overview

On-chip flash memory of RH850/P1x-C can be programmed regardless of before and after the mounting to the target system with the programming function that employs the dedicated flash memory programmer (serial programming).

In addition, a security function that prohibits the programming of a user program written in on-chip flash memory is supported to address the protection against falsification of programs by outsiders.

The programming function using a user program (self-programming) is the method suitable for applications where modifying the program after the production or shipment of the target system is expected. A protection function for secure programming to flash memory area is also supported. Furthermore, programming can be conducted under various conditions, such as in parallel with communicating with outside, by utilizing the support for interrupt processing during self-programming. **Table 32.7** gives an overview of the methods of programming and the corresponding operating modes.

Table 32.7 Programming Methods

Programming Method	Functional Overview	Operating mode
Serial programming	A dedicated flash-memory programmer is capable of on-board programming the flash memory after the device is mounted on the target system.	Serial programming mode
	A dedicated flash memory programmer and dedicated programming adapter board allow off-board programming of the flash memory, i.e. programming of the device before it is mounted on the target system.	
Self-programming	Flash memory can be programmed by executing a user program preprogrammed in code flash memory with serial programming. When data flash memory is being programmed with self-programming, the BGO function enables instruction fetch and data read from code flash memory. Thus, data flash memory can be programmed by executing a program on code flash memory prepared for flash programming. When code flash memory is being programmed with self-programming,instruction fetch and data read from code flash memory for a bank during the programing are prohibited. This programming needs to be carried out by executing a program prepared for flash programming that has been transferred to Local RAM in advance or a program on a different bank.	Normal operating mode

Table 32.8 lists the functions of the on-chip flash memory. Serial programmer commands realize serial programming, while reading of the on-chip flash memory by a library function or the user program realizes self-programming.

Table 32.8 Basic Functions at a Glance

Function	Description in Overview	Level of Support (√: Supported, △: Conditionally Supported, ×: Not Supported)	
		Serial programming	Self-programming
Blank checking*1	This is used to check a specified block to ensure that writing to it has not already proceeded. Results of reading from code flash memory and data flash memory to which nothing has been written after erasure are not guaranteed, so use blank checking to confirm that writing to memory has not proceeded after erasure.	√	√
Block erasure	This is for erasing the contents of a specified block of memory.	√	√
Programming*1	This is for writing to a specified address.	√	√
Verification and checksum	Data that are read out from flash memory are compared with data transferred from the flash memory programmer.	√	× (reading of data by the user program is possible)
Reading	Data that have been written to the flash memory are read out.	√	√
Setting for OTP (one-time programming)	A specified block of code flash memory is set for OTP (OTP can only be set, that is, it is not possible to release a block's OTP setting).	√	√
Setting an ID	An ID setting is made for use in programming of the code flash memory by self-programming.	×	√
Security settings	Security settings are for use in serial programming.	√	△ (only when setting is prohibited after being permitted)
Protection settings	Lock bits for all blocks of code flash memory and overall of data flash memory are provided.	√	√
Setting of option bytes	Option bytes are set to change them from the value after reset for the RH850/P1x-C.	√	√
Clearing the configuration	ID setting, security settings, protection settings, and option byte settings are cleared.	√	×

Note 1. Data Flash Bank A consists of each 64K-byte area. "Program", "Blank Check" command processing in the case of Data Flash cannot cross over address boundary between different 64K Byte area.

For details on serial programming, see "*PG-FP5 Flash Memory Programmer User's Manual*" and "*Renesas Flash Programmer Flash Programming Software User's Manual*".

For details on self-programming, see the user's manuals for the code flash library and data flash library which this device targets.

The OTP setting is security functions for use with serial programming and self-programming and authentication of the ID code is security functions for use with self-programming.

In serial programming, prohibiting connection of a serial programmer and prohibition of commands (for block erasure, programming, and reading) are available for use as security functions.

Table 32.9 Summary of Security Functions

Function	Description
OTP	OTP can be individually set for each block of the user area of code flash memory. When the OTP setting is made for an area, programming by serial programming and by self programming is prohibited. Once set, the OTP setting cannot be released. Furthermore, since execution of the configuration clearing command is prohibited for any area for which OTP has been set, changing a security setting from “prohibited” to “permitted” is not possible.
ID authentication	The result of ID authentication can be used to control enabling of self-programming. The code flash memory cannot be programmed by self-programming without ID authentication.
Prohibition of connection of a serial programmer	The connection of a serial programmer for serial programming is prohibited. Since execution of the configuration clearing command is also prohibited when the connection of a serial programmer is prohibited, changing a security setting from “prohibited” to “permitted” is not possible.
Prohibition of block erasure commands	Block erasure commands at the time of serial programming are prohibited. Since execution of the configuration clearing command is also prohibited when block erasure commands are prohibited, changing a security setting from “prohibited” to “permitted” is not possible.
Prohibition of programming commands	Block erasure commands and programming commands at the time of serial programming are prohibited. Only through execution of the configuration clearing command can the prohibition be lifted.
Prohibition of read commands	Read commands at the time of serial programming are prohibited. Only through execution of the configuration clearing command can the prohibition be lifted.

Table 32.10 Available Operations and Security Settings (1/2)

Function	All Security Settings and Erasure, Programming, and Read Operations (√: Executable, ×: Not Executable, —: Not Supported)		Point for Caution Regarding the Security Setting	
	Serial programming	Self programming	Serial programming	Self programming
OTP	• Areas for which OTP is set – Block erasure commands: × – Programming commands: × – Read commands: √ • Areas for which OTP is not set – Block erasure commands: √ – Programming commands: √ – Read commands: √	• Areas for which OTP is set – Block erasure: × – Programming: × – Reading: √ • Areas for which OTP is not set – Block erasure: √ – Programming: √ – Reading: √	• The OTP setting cannot be released. • Execution of the configuration clearing command is not possible.	The OTP setting cannot be released.
ID authentication	ID authentication is not supported	• When the ID codes do not match [Code flash memory] – Block erasure: × – Programming: × – Reading: √ [Data flash memory] – Block erasure: √ – Programming: √ – Reading: √ • When the ID codes match – Block erasure: √ – Programming: √ – Reading: √		ID authentication is always in effect.
Prohibition of the connection of a serial programmer	• Block erasure commands: × • Programming commands: × • Read commands: ×	• Block erasure: √ • Programming: √ • Reading: √	Since execution of the configuration clearing command is prohibited, initialization of the setting for prohibition is not possible.	Initialization of the settings prohibited is impossible because the configuration clearing command is not supported.
Prohibition of block erasure commands	• Block erasure commands: × • Programming commands: √ • Read commands: √	• Block erasure: √ • Programming: √ • Reading: √	• Since execution of the configuration clearing command is prohibited, initialization of the setting for prohibition is not possible. • The setting for prohibition of serial programmer connection is not available.	Initialization of the settings prohibited is impossible because the configuration clearing command is not supported.
Prohibition of programming commands	• Block erasure commands: × • Programming commands: × • Read commands: √	• Block erasure: √ • Programming: √ • Reading: √	• Executing the configuration clearing command only can initialize the settings prohibited.	Initialization of the settings prohibited is impossible because the configuration clearing command is not supported.
Prohibition of read commands	• Block erasure commands: √ • Programming commands: √ • Read commands: ×	• Block erasure: √ • Programming: √ • Reading: √		

Table 32.10 Available Operations and Security Settings (2/2)

Function	All Security Settings and Erasure, Programming, and Read Operations (√: Executable, ×: Not Executable, —: Not Supported)		Point for Caution Regarding the Security Setting	
	Serial programming	Self programming	Serial programming	Self programming
Lock bit	• Areas for which lock bit is set – Block erasure commands: × – Programming commands: × – Read commands: √ • Areas for which lock bit is canceled or not set – Block erasure commands: √ – Programming commands: √ – Read commands: √	• Areas for which lock bit is set – Block erasure: × – Programming: × – Reading: √ • Areas for which lock bit is canceled or not set – Block erasure: √ – Programming: √ – Reading: √	The cancelation of lock bit is protected by basic hardware protection. regarding of basic hardware protection, see relating chapter.	The cancelation of lock bit is protected by basic hardware protection. regarding of basic hardware protection, see relating chapter.

Table 32.11 Summary of Protection Functions

Function	Description
Hardware protection	The level on the FLMD pin can be set to prohibit programming and erasure of the code flash memory. FLMD0 = 0: Programming prohibited FLMD0 = 1: Programming permitted
Variable reset vector	The protection settings include control of the reset vector. As shown in **Figure 32.6**, after programming of a new boot program while leaving the existing boot program in place, changing the reset vector is a safe way to change to the area holding the new boot program.

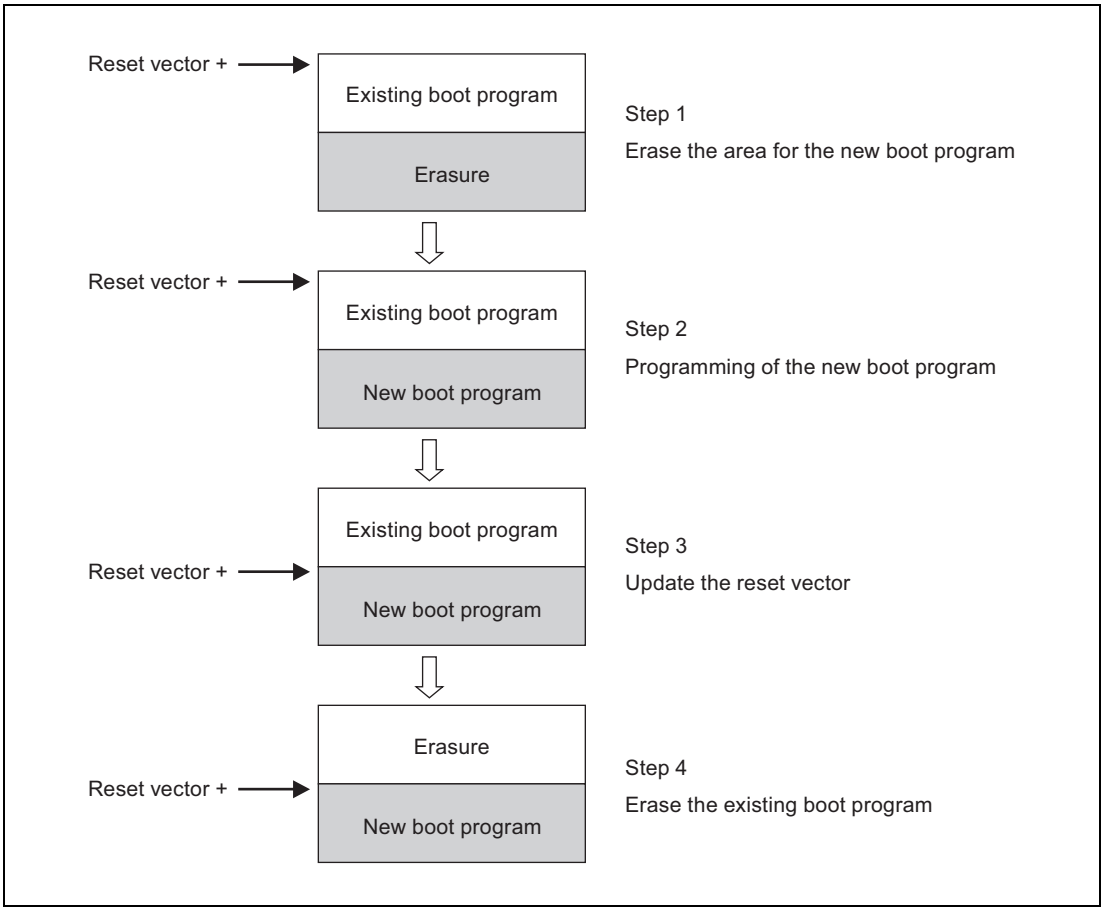

Figure 32.6 Utilizing the variable reset vector function to update the boot program

32.8 Communications Mode

32.8.1 One-wire UART as an Asynchronous Flash Programming Interface

To use a 1-wire UART as a single-wire asynchronous serial programming interface, connect the following pins and the flash memory programmer.

- FLSCI3RXD, FLSCI3TXD (FPDR)/JP0_0: Receive data input/transmit data output

32.8.2 Two-wire UART as an Asynchronous Flash Programming Interface

To use a 2-wire UART as a double-wire asynchronous serial programming interface, connect the following pins and the flash memory programmer.

- FLSCI3RXD (FPDR)/JP0_0: Receive data input
- FLSCI3TXD (FPDT)/JP0_1: Transmit data output

32.8.3 CSI as a Synchronous Flash Programming Interface

To use a CSI as a synchronous serial programming interface, connect the following pins and the flash memory programmer.

- FLSCI3RXD (FPDR)/JP0_0: Receive data input
- FLSCI3TXD (FPDT)/JP0_1: Transmit data output
- FLSCI3SCKI (FPCK)/JP0_2: Serial clock input

The flash memory programmer outputs the serial data clock signal (SCK) and the microcontroller operates as a slave.

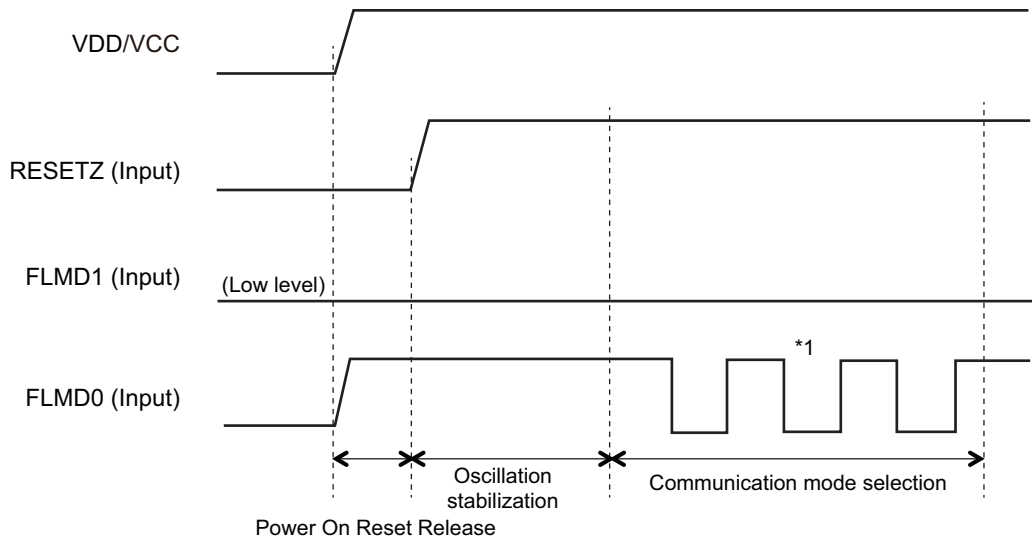
NOTE

For details on the flash programming software (Renesas Flash Programmer), see the *Renesas Flash Programmer Flash Programming Software User's Manual*.

32.8.4 Selecting the Communications System

In the RH850/P1x-C, the communications system is selected by the input of pulses (up to 7) to the FLMD0 pin after the chip shifts to the flash memory programming mode. These pulses are generated by the dedicated flash memory programmer.

The relationship between the communications system and the number of pulses is shown below.



Note 1. The number of input clocks depends on the communications system as shown below.

Pulses on FLMD0	Communications System	Notes
0	2 wire UART	
7	1 wire UART	
3	CSI	
	Others	Setting prohibited

Figure 32.7 Selecting the Communications Mode

32.9 Programming with Serial Programmer

Flash memory can be programmed in serial programming mode with the dedicated flash memory programmer.

Serial Programming

In serial programming, the microcontroller is mounted on the board. Mounting the connecter on the board allows the flash memory programmer to program the target microcontroller.

32.9.1 Programming Environment

The figure below shows the environment recommended for programming data to flash memory in the microcontroller.

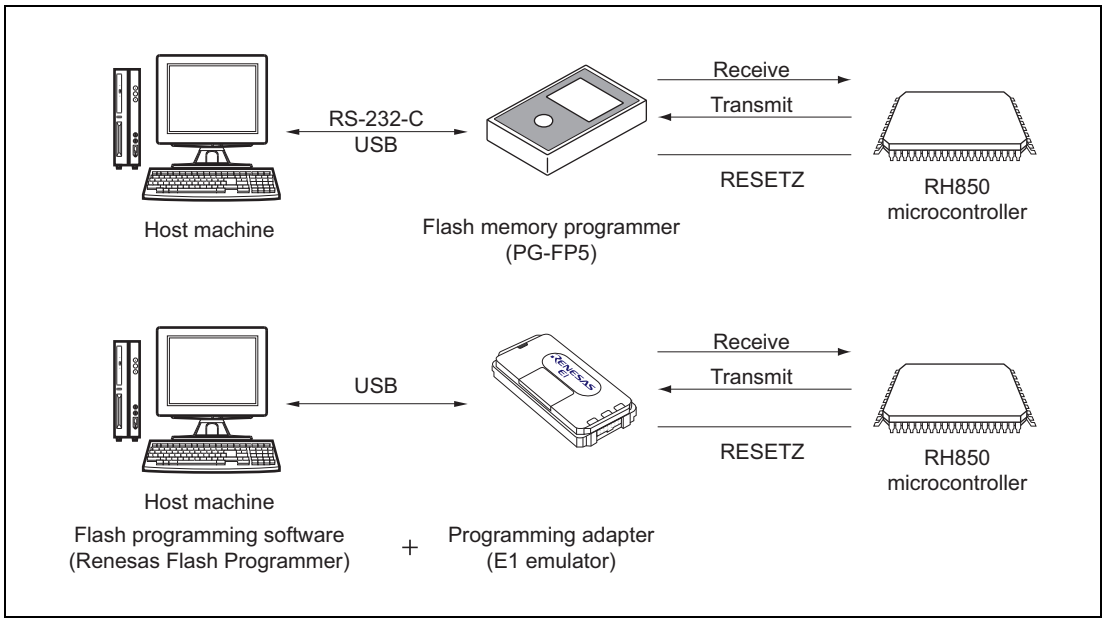


Figure 32.8 Environment for Programming Flash Memory

Using PG-FP5 flash memory programmer or Renesas Flash Programmer flash programming software (running on the host machine) in combination with E1 emulator used as the programming adaptor, you can easily conduct programming operations, such as erasure, programming, and verification, to Renesas Electronics' microcontroller with on-chip flash memory mounted on the user's board without the need for unmounting it.

PG-FP5 flash memory programmer supports programming from the host machine or programming in the standalone mode. The flash programming software (Renesas Flash Programmer) supports programming from the host machine.

NOTE

See *PG-FP5 flash memory programmer user's manual* for the details of PG-FP5, and *Renesas Flash Programmer flash programming software user's manual* for the details of Renesas Flash Programmer flash programming software.

32.10 Programming with Self-programming

32.10.1 Overview

RH850/P1x-C supports the flash memory programming of user program itself.

When programming data flash memory, you can execute a program on code flash memory prepared for flash programming using the BGO function to program data flash memory. Instead, you can also execute a program prepared for flash programming that has been transferred to Local RAM in advance to program data flash memory.

In addition, you can execute a program prepared for flash programming that has been transferred to Local RAM in advance to program code flash memory.

You can also execute a program from the different bank to program code flash memory.

32.10.2 BGO Function

When the combination of the flash memory to be erased/programmed and the flash memory to be read meets the conditions in the following list, the BGO function can be used.

Table 32.12 Conditions Required to Use BGO Function for read

Area to Be Erased/Programmed	Area to Be Read
Data flash memory	Code flash memory
Flash memory for a bank	Flash memory for the another bank

In addition, it is possible to operate programming or erasure in other bank during the programming or erasure in a bank for between different banks.

Table 32.13 Conditions Required to Use BGO Function for programming/erasure

Area to Be Programmed/erasure	Area to Be Programmed/erasure
Flash memory for a bank	Flash memory for the another bank

32.10.3 Enabling of Self-Programming

The self-programming function can be activated in normal operating mode.

Erasure and programming of the flash memory by the self-programming function is enabled by making the FLMD0 pin high level.

This prevents unnecessary overwriting of the program if the device operates incorrectly.

The FLMD0 pin is made high level by using one of the following methods.

- The FLMD0 pin is externally pulled up.
- The FLMD0 pin is pulled up by the FLMD control register.

The outline of the FLMD control register is described in **Section 32.10.3.1, FLMDCNT — FLMD control register**

Table 32.14 List of Enabling of Self-Programming Register

Module Name	Register Name	Abbreviation	R/W	Value after Reset	Address	Access Size	Access Protection
FLMD	FLMD control register	FLMDCNT	R/W	0000 0000_H	FFA0 0000_H	32	PBG4#1. PG4-FLMD1 (PBG4#2. PG4-FLMD2*[1])

FLMD	FLMD Protection Error Status Register	FLMDPS	R	0000 0000_H	FFA0 0008_H	32	PBG4#1. PG4-FLMD1 (PBG4#2. PG4-FLMD2*[1])

Note 1. See *RH850/P1x-C User's Manual: Hardware (Security)* ***Section 3 ICUMC***.

32.10.3.1 FLMDCNT — FLMD control register

This register specifies the internal pull-up or pull-down of the FLMD0 pin.

Access: This register can be read/written in 32-bit units.
Writing to this register is protected by a special sequence of instructions by using the protection command register FLMDPCMD.

Address: FFA0 0000$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 1	Reserved	When writing, write the value after reset.
0	FLMDPUP	FLMD0 Pin Software Control 0: Pull-down selected 1: Pull-up selected

32.10.3.2 FLMDPCMD — FLMD Protection Command Register

FLMDPCMD is a protection command register for the FLMDCNT register.

Access: This register is a write-only register that can be written in 32-bit units.

Address: FFA0 0004$_H$

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

31 to 8	Reserved	When writing, write the prescribed value.
7 to 0	FLMDPC[7:0]	Protection command register bits that enable writing to self-programming protection cluster registers

32.10.3.3 FLMDPS — FLMD Protection Error Status Register

This register is used to verify whether the write-protected register (FLMDCNT) has been successfully written or not.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FFA0 0008$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FLMDPRERR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 32.17 FLMDPS Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	FLMDPRERR	Indicates whether the write-protected register (FLMDCNT) has been successfully written. 0: Write operation successful 1: Write operation failed

32.10.4 Procedure for Writing to a Write-Protected Register

FLMDCNT register is Write-Protected Register.

The write protection procedure is based on the following state machine.

Step 1:

When write access to the protection command register is completed, the error flag is cleared to move on to step 2.

Unless the write value is 0000 $00A5_H$, an error flag is set in the protection status register and the state of step 1 is held.

Step 2:

Write access to the protected register should be completed (write data should be the expected value) to move on to step 3. If an unprotected register is accessed, an error flag is set to return to step 1.

Step 3:

Write access to the protected register should be completed (write data should be the reversed value of the expected one) to move on to step 4.

If the write data is not the reversed value or if an unprotected register is accessed, an error flag is set to return to step 1.

Step 4:

When write access to the protected register is completed (write data is the expected value), the write signal of the protected register is activated and writing is completed.

If write data is not the expected one or if an unprotected register is written, an error flag is set to return to step 1.

32.11 Flash Memory Read

32.11.1 Code Flash Memory Read

Special settings are not required to read code flash memory in normal mode. Data can simply be read out through access to addresses in the code flash memory.

Reading from an area of code flash memory that has been erased but not yet been programmed again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception. Furthermore, since the values of data cannot be guaranteed when an ECC error has been generated, use blank checking when you need to confirm that an area is in the non-programmed state.

32.11.2 Data Flash Memory Read

Configure the number of read cycles in the EEPRDCYCL0, 1 registers prior to reading data from data flash memory in normal mode.
Once the setting for the number of cycles is made, data can simply be read out through access to addresses in the data flash memory.
Values read from data flash memory that has been erased but not yet been programming again are undefined. Use blank checking when you need to confirm that an area is in the non-programmed state.

EEPRDCYCL0 set the read cycles for data flash Bank A and EEPRDCYCL1 is for Bank B

32.11.2.1 EEPRDCYCL0, 1 — Data Flash Memory Read Cycle Setting Register

This register sets the read cycle of data flash memory.

Access: This register can be read/written in 8-bit units.

Address: EEPRDCYCL0: FFC5 9810_H
EEPRDCYCL1: FFC5 9910_H

Value after reset: $0F_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	FRDCYCLD[3:0]			
Value after reset	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 32.18 EEPRDCYCL register contents

Bit Position	Bit Name	Function
7 to 4	Reserved	(The write value must be 1.)
3 to 0	FRDCYCLD[3:0]	Number of Data Flash Memory Read Cycles Data flash memory is read in setting value + 1 cycles. 0000: Read cycle 1 0001: Read cycle 2 0010: Read cycle 3 0011: Read cycle 4 0100: Read cycle 5 0101: Read cycle 6 0110: Read cycle 7 0111: Read cycle 8 1000: Read cycle 9 Other the above: Read cycle 10 The read cycle must be configured to satisfy the below condition Read cycle ≥ (CLK_LSB[MHz]/10)

32.11.3 Registers Related to Write and Erase Protect of Flash Memory

32.11.3.1 FHVE15 — FHVE15 Control Register

FHVE15 is a readable/writable register for software protection of flash memory against programming, erasure and blank checking. Set both the FHVE15 and FHVE3 registers in the programmable, erasable and blank-checkable state ($0000\ 0001_H$) to program, erase or blank check flash memory.

Access: This register can be read/written in 32-bit units.

Address: FFF8 $A430_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit Position	Bit Name	Function
31 to 1	Reserved	(The write value must be 1.)
0	FHVE15CNT	0: Programming, erasure and blank checking are disabled. 1: Programming, erasure and blank checking are enabled.

32.11.3.2 FHVE3 — FHVE3 Control Register

FHVE3 is a readable/writable register for software protection of flash memory against programming, erasure and blank checking. Set both the FHVE15 and FHVE3 registers in the programmable, erasable and blank-checkable state ($0000\ 0001_H$) to program, erase or blank check flash memory.

Access: This register can be read/written in 32-bit units.

Address: $FFF8\ 2410_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit Position	Bit Name	Function
31 to 0	Reset Vector 0	Reset vector for PE1/PE2

32.11.5 Registers Related to Product Information

32.11.5.1 PRDNAMEn — Product Name Storage Register (n = 1 to 4)

This register stores the product name. The product model name is stored in 16-byte ASCII code, and PRDNAME1, PRDNAME2, PRDNAME3, and PRDNAME4 correspond to the fourth to first bytes, eighth to fifth bytes, twelfth to ninth bytes, and sixteenth to thirteenth bytes of the product model name respectively.

Access: This register can be read in 32-bit units.

Address: PRDNAME1: FFCD 00D0$_H$
PRDNAME2: FFCD 00D4$_H$
PRDNAME3: FFCD 00D8$_H$
PRDNAME4: FFCD 00DC$_H$

Value after reset:

	P1H-CE (10MB)	P1H-C (8MB, CAN-FD)	P1H-C (4MB, BGA292)	P1M-C (BGA292-DPS)	P1M-C (LQFP144-DPS)

Table 32.28 OPBT15 register contents

Bit Position	Bit Name	Function
31 to 7	Reserved	(The write value must be 1.)
6 to 4	CAP_SEL	Main OSC Capacitance Configure X1, 2 capacitance (Cg0, Cd0) [pF] 000: 0 001: 1 010: 3 011: 4 100: 5 101: 6 110: 8 111: 9 (This value is internal device capacitance. The effective capacitance has 1 to 4pF parasitic capacitance in addition to this value.)
3 to 2	Reserved	(The write value must be 1.)
1, 0	AMP_SEL	Main OSC AMP Configure 00: 24MHz target 01: 20MHz target 10: 16MHz target 11: Setting prohibited

32.13 Erase Counter

For code flash, each sector of user area has 16-bit erase counter. Maximum count of erase counter is $03E9_H$ (1001), and counter is not increased if an “Erase” command is issued when erase counter is $03E9_H$.

Erase counter is located in first 704 bytes of data area. When an “Erase” command is issued to user area Flash System update erase counter (data area) first, after that code flash is erased.

Table 32.29 and **Table 32.30** show mapping of erase counter. UNUMBER indicates block number of user area, for example, U0 indicates block 0 in **Figure 32.2**.

Erase counter is supported for code flash area of mass-produced product, and is not supported for U134 to U197 which are used only in P1H-CE (emulation device).

When valid flag equal to $5AA5\ A55A_H$, Area 1 is valid. when valid flag is other values, Area 0 is valid.

Table 32.29 Mapping of Erase Counter (Bank A)

	Address (offset*1)	Bit 31	Bit16	Bit 15	Bit0
Area0	$0000\ 0000_H$ to $0000\ 0003_H$	Valid Flag			
	$0000\ 0004_H$ to $0000\ 003F_H$	Reserved			
	$0000\ 0040_H$ to $0000\ 0043_H$	Counter for U1		Counter for U0	
	$0000\ 0044_H$ to $0000\ 0047_H$	Counter for U3		Counter for U2	
	$0000\ 0048_H$ to $0000\ 004B_H$	Counter for U5		Counter for U4	
	$0000\ 004C_H$ to $0000\ 004F_H$	Counter for U7		Counter for U6	
	$0000\ 0050_H$ to $0000\ 0053_H$	Counter for U9		Counter for U8	
	$0000\ 0054_H$ to $0000\ 0057_H$	Counter for U11		Counter for U10	
	$0000\ 0148_H$ to $0000\ 014B_H$	Counter for U133		Counter for U132	
	$0000\ 014C_H$ to $0000\ 014F_H$	Reserved		Reserved	
	$0000\ 0150_H$ to $0000\ 017F_H$	Reserved			
Area1	$0000\ 0180_H$ to $0000\ 02BF_H$	Same as $0000\ 0040_H$ to $0000\ 017F_H$ (Valid area is decided by valid flag)			

Note 1. Base Address of EraseCounter(Bank A) is $FF200000_H$

Table 32.30 Mapping of Erase Counter (Bank B)

	Address (offset*1)	Bit 31	Bit16	Bit 15	Bit0
Area0	$0000\ 0000_H$ to $0000\ 0003_H$	Valid Flag			
	$0000\ 0004_H$ to $0000\ 003F_H$	Reserved			
	$0000\ 0040_H$ to $0000\ 0043_H$	Reserved		Counter for U0	
	$0000\ 0044_H$ to $0000\ 0047_H$	Reserved		Reserved	
	$0000\ 0048_H$ to $0000\ 004B_H$	Reserved		Counter for U1	
	$0000\ 004C_H$ to $0000\ 004F_H$	Reserved		Reserved	
	$0000\ 0050_H$ to $0000\ 0053_H$	Counter for U3		Counter for U2	
	$0000\ 0054_H$ to $0000\ 0057_H$	Counter for U5		Counter for U4	
	$0000\ 0148_H$ to $0000\ 014B_H$	Counter for U127		Counter for U126	
	$0000\ 014C_H$ to $0000\ 017F_H$	Reserved			
Area1	$0000\ 0180_H$ to $0000\ 02BF_H$	Same as $0000\ 0040_H$ to $0000\ 017F_H$ (Valid area is decided by valid flag)			

Note 1. Base Address of EraseCounter(Bank B) is $FF300000_H$

32.14 ECC Test Area

In ECC test Area (**Figure 32.3**), the data to test ECC decoder of code flash is stored (**Table 32.31**). User can attempt intentional error injection to ECC decoder by reading data from this area.

Table 32.31 ECC test data

		Flash content																										
		ECC (bit)									Data (bit)

Note: yellow marked cells represent the Injected Error.

32.15 Usage Notes

1. Reading areas where programming or erasure was interrupted
   When programming or erasure of an area of flash memory is interrupted, the data stored in the area become undefined. To avoid undefined data that are read out becoming the source of faulty operation, take care not to fetch instructions or read data from areas where programming or erasure was interrupted.
2. Reading the code flash memory that has been erased but not yet been programming again
   Note that reading from an area of code flash memory that has been erased but not yet been programming again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception. Use blank checking when you need to confirm that an area is in the non-programmed state.
3. Prohibition of additional writing
   Writing to a given area twice is not possible. If you want to overwrite data in an area of flash memory after writing to the area has been completed, erase the area first.
4. Resets during programming and erasure
   In the case of a reset due to the signal on the RESETZ pin during programming and erasure, wait for at least the minimum value of RESETZ input low level width (See **Section 35.6.3, RESETZ Timing**) once the operating voltage is within the range stipulated in the electrical characteristics (See **Section 35.3.1, Supply Voltage Characteristics**) after assertion of the reset signal before releasing the device from the reset state (See **Section 35.6.2, Power Up/ Down Timing**).
5. Allocation of vectors for interrupts and other exceptions during programming and erasure
   Generation of an interrupt or other exception during programming or erasure may lead to fetching of the vector from the code flash memory. If this does not satisfy the conditions for using background operation, set the address for vector fetching to an address that is not in the code flash memory.
6. Abnormal termination of programming and erasure (1)
   Even if programming/erasure ends abnormally due to reset input or power off, the programming/ erasure state of the flash memory with undefined data cannot be verified or checked. Therefore, before using the area where programming/erasure has ended abnormally, erase the area again to prove that the corresponding area is completely erased.
7. Abnormal termination of programming and erasure (2)
   If programming and erasure of code flash memory are not completed normally, the lock bit for the target area may be enabled. In such cases, erase the block to erase the lock bit while the lock bit is in the disabled state.
8. Items prohibited during programming, erasure and blank checking
   Do not perform the following operations during programming, erasure and blank checking.
   - Have the operating voltage from the power supply go beyond the allowed range.
   - Update the values of FHVE15 and FHVE3.
   - Change the operating frequency of CLK_LSB.

9. Items prohibited during clock gear change
   Clock gear change can be done by setting control registers of clock controller. (CKSC0C,CLKD0DIV) .
   See **Section 12, Clock Controller** for details.
   Clock gear change is possible under the following conditions:

   – Bus Master do not operate EEP read access to Flash.
     To change clock ratio, it is recommended to follow the guides shown below (1) - (6) to prevent from violating the conditions above.

     (1) Inform to other CPUs that CPUx starts clock gear change.
     Wait for the operation-end of all Bus Masters(which access to EEP).
     Until (6), all Bus Masters must follow the conditions shown above.

     (2) CPUx: Execute DI instruction for interrupt disable.
     Until (5), CPUx must follow the conditions shown above.

     (3) CPUx: Write to CLKD0DIV / CKSC0C register by the target value for new clock setting.

     (4) CPUx: Read the following CLKD0STAT / CKSC0S to confirm that clock output now corresponds to the actual divider setting in CLKD0DIV / CKSC0C.

     (5) CPUx: Execute EI instruction for interrupt enable.

     (6) Inform to other CPUs that CPUx completes clock gear change.
     All Bus Masters can operate EEP read access to Flash.

     CPUx : CPU which executes clock gear change operation. PE1, PE2 or ICUMC (if enabled)

32.17 Difference among P1M-C, P1H-C and P1H-CE

- The size of code flash and data flash is different between P1M-C, P1H-C and P1H-CE shown in **Figure 32.2 Code Flash Memory Mapping** and **Figure 32.4 Data Flash Memory Mapping**.
- Product Name Storage Register 1 to 4 (PRDNAME1 to 4) are different between P1M-C, P1H-C and P1H-CE.
- Emulation Mode Select Flag (EMF) in Option Byte 9 register and Select AUD RAM monitor Enable/Disable (OPAUDR) in Option Byte 0 register are in P1H-CE only.
- Automatic start of the WDTA1 (OPWDRUN1) in Option Byte 0 register does not exist in P1M-C (**Table 32.23**).
- "PLL0FREQ = 00" setting is only available in P1M-C, P1H-CE (**Table 32.24**).
- Parity Bit for PE2DIS (PE2PB) in Option Byte 14 register does not exist in P1M-C (**Table 32.27**).
- PE2 Disable Mode Control (PE2DIS) is Option Byte 14 register does not exist in P1M-C (**Table 32.27**).

Section 33 RAM Modules

33.1 Features

33.1.1 List of On-chip RAM

Table 33.1 shows the list of on-chip RAMs for RH850/P1x-C Group (P1M-C/P1H-C/P1H-CE).

Table 33.1 List of On-chip RAM

RAM List	P1M-C	P1H-C (4MB)	P1H-C (8MB)	P1H-CE
Instruction cache RAM (tag)	256words × 4	256words × 4/core	256words × 4/core	256words × 4/core
Instruction cache RAM (data)	4KB × 4	4KB × 4/core	4KB × 4/core	4KB × 4/core
Local RAM (PE1/PE2)	PE1: 128KB PE2: —*3	PE1: 64KB PE2: 64KB	PE1: 64KB PE2: 64KB	PE1: 128KB*1 PE2: 64KB
Global RAM (Bank A/B)	320KB	960KB	960KB	1344KB*2
Emulation RAM	—	—	—	2MB
FCU RAM	4KB × 2	4KB × 2	4KB × 2	4KB × 2
DTS RAM	4KB	4KB	4KB	4KB
CSIH RAM	512B/channel	512B/channel	512B/channel	512B/channel
FlexRay RAM	8KB/module 512B × 2/module	8KB/module 512B × 2/module	8KB/module 512B × 2/module	8KB/module 512B × 2/module
Ethernet RAM	2KB × 2/channel 1KB × 1/channel	2KB × 2/channel 1KB × 1/channel	2KB × 2/channel 1KB × 1/channel	2KB × 2/channel 1KB × 1/channel
GTM RAM	1KB × 2	1KB × 4	1KB × 4	1KB × 4
MCAN RAM	8KB/channel	8KB/channel	8KB/channel	8KB/channel
ICUMC Instruction cache RAM (tag)	128words × 2	128words × 2	128words × 2	128words × 2
ICUMC Instruction cache RAM (data)	2KB × 2	2KB × 2	2KB × 2	2KB × 2
Local RAM (ICUMC)	40KB	40KB	40KB	40KB

Note 1. Local RAM size 128KB can be used only when EMF in OPBT14 is configured P1M-C or P1H-CE P1M-C mode. Local RAM size is 64KB in Other mode. For details of EMF in OPBT14, see **Section 32, Flash Memory**.

Note 2. Available RAM size depends on EMF in OPBT14.

Note 3. P1M-C does not support PE2.

33.2 Overview

33.2.1 Function overview

Access:

The CPU, DMAC/DTS, and H-Bus masters can access Local RAM (PE1/PE2) and Global RAM (Bank A/B). For details, see **Section 3, CPU System**.

Emulation RAM:

The specific area of the code flash can be replaced with this RAM per page. The access latency from the CPU after replacement is the same as that of the Code Flash.

ECC:

From functional safety point of view, all RAM, except for Instruction cache RAM and Emulation RAM, are protected by Error-Correcting Code (ECC) mechanism. Instruction cache RAM provides only Error-Detecting Code (EDC). For details, see **Section 28, Functional Safety**.

RAM Initialization:

To avoid long initialization phases by software, a hardware mechanism is implemented to initialize the following RAMs. This initialization includes correct setting of the related ECC bits.

- Local RAM (PE1/PE2)
- Global RAM (Bank A/B)
- DTS RAM
- CSIH RAM
- FlexRay RAM
- GTM RAM
- MCAN RAM
- Local RAM (ICUMC)

RAM initialization to 0 is executed by all reset. In Application Reset 1 and Limited Reset, RAM initialization can be disabled according to the setting in RAM Initialization Mode Control Registers. For details, see **Section 8 Reset Controller.** In Application Reset 1, a backup RAM can be kept by STAC_LM0 register setting. For the address of backup RAM, see **Section 4, Address Map**.

All of above RAM are checked by the MBIST. After that, the RAM is initialized. For details about MBIST, see **28.5, BIST**.

33.3 Emulation RAM (P1H-CE only)

RH850/P1x-C includes the emulation RAM to emulate the Code Flash. The Emulation RAM is placed for each bank of Code Flash. RH850/P1x-C has the 2-bank Code Flash and the 2-Mbyte Emulation RAM (32 k byte × 32 blocks per one-bank Code Flash). The Emulation RAM is available in the Code Flash Emulation Function described below.

33.3.1 Code Flash Emulation Function Using the Emulation RAM

Mapping to a Code Flash area enables a Code Flash to move to the Emulation RAM and it enables the Emulation RAM to emulate the Code Flash. The ROM data can be dynamically modified during execution of a user program via the Emulation RAM which has mapped to the Code Flash area. **Figure 33.1** shows the circuit around the Emulation RAM.

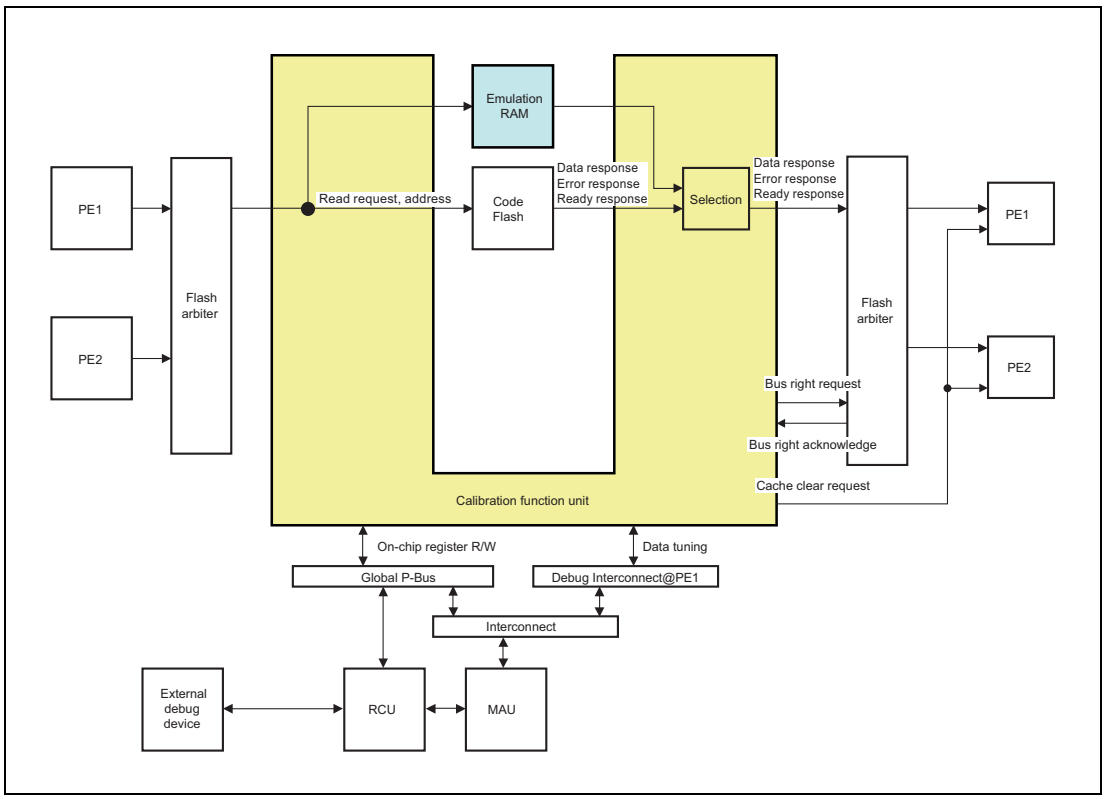

Figure 33.1 Circuit around the Emulation RAM

33.4 Usage Notes

When the ECC error detection/correction function is enabled for a RAM, it must be initialized with the maximum bit length of its access size before using the RAM.

If the RAM is accessed before its initialization, an ECC error may be detected. Also if initialization with the maximum bit length is not performed (e.g. if a 32-bit RAM is initialized by an 8-bit or 16-bit access), an ECC error may be detected.

On path between Local RAM and CPU, buffers are implemented to realize fast Local RAM access. Therefore when a load instruction is executed for the same address after a store instruction to Local RAM, the load instruction may read out data from buffers instead of data on Local RAM. Either of following procedures can be used to surely read data on Local RAM.

1. Read out the first written data, only after more than 32 bytes of data are written into Local RAM.
2. Execute a SYNCM instruction before a load instruction is executed on the same address after a store instruction to the Local RAM.

33.5 Difference among P1M-C, P1H-C and P1H-CE

See **Table 33.1** List of On-chip RAM for difference in RAM size.

The function of Emulation RAM (Section) supported only by P1H-CE.

Section 34 Boundary Scan

34.1 Functional Overview

RH850/P1x-C products has JTAG Interface function conforming to IEEE 1149.1.

34.1.1 Features

- Five test pins (TCK, TDI, TDO, TMS and TRSTZ)
- TAP controller
- Instruction Register
- Bypass Register
- Boundary Scan Register
- BYPASS mode
- EXTEST mode
- SAMPLE/PRELOAD mode
- IDCODE mode

34.1.2 Block diagram

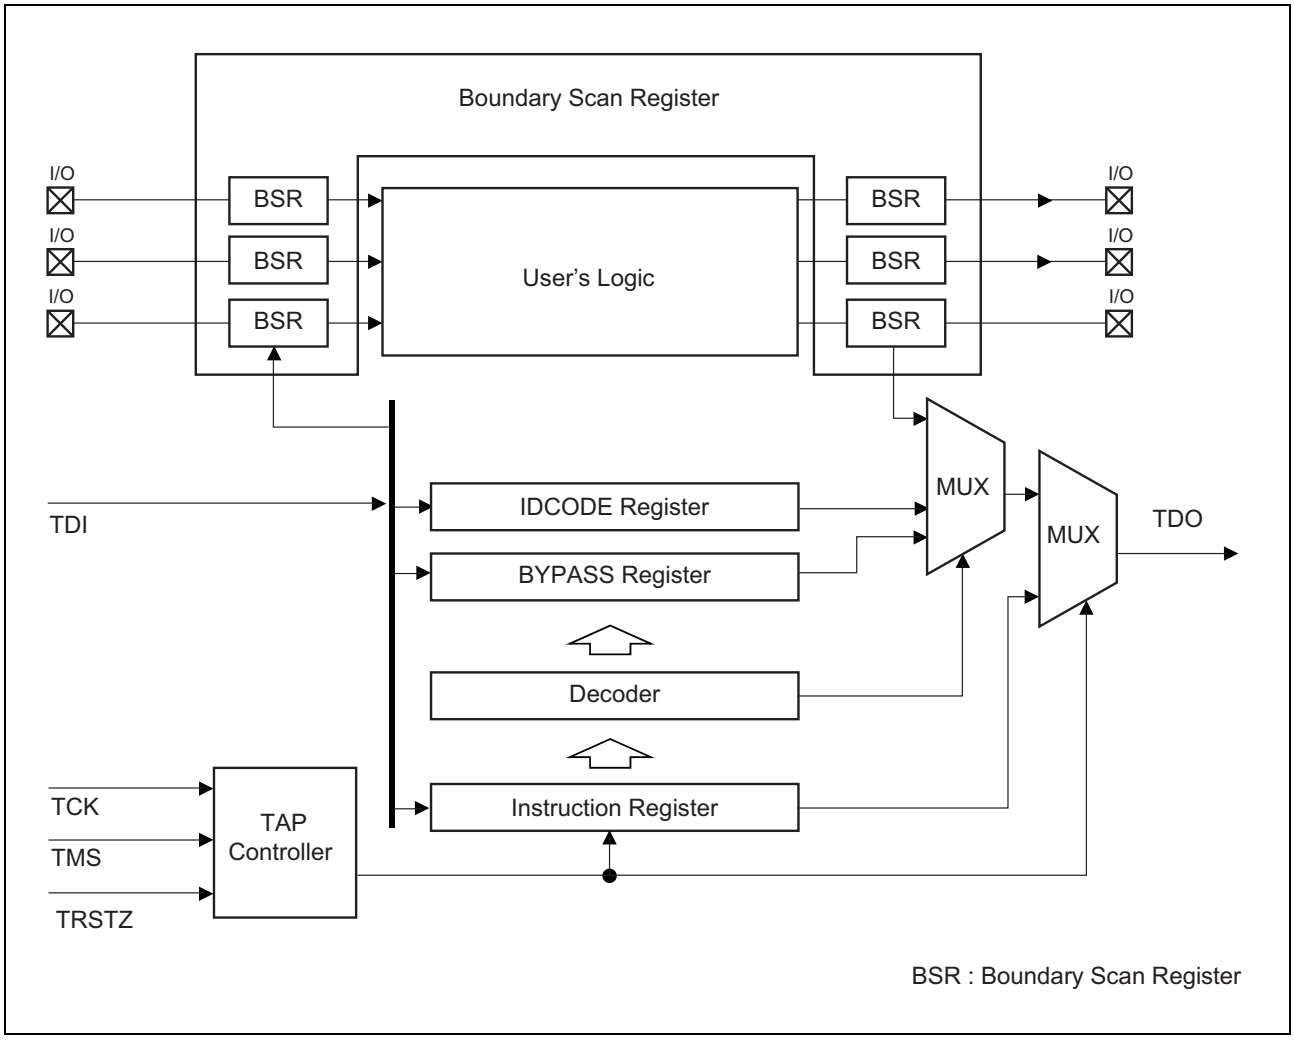

Figure 34.1 JTAG Interface Block Diagram

34.1.3 External input/output ports

Use the following pins for boundary scan I/O.

Table 34.1 Port interface pin

Pin Name	I/O	Description
TCK	I	Test clock input pin. All input signals are captured at the rising edge of TCK, and output starts at the falling edge of TCK.
TDI	I	Test data input pin. It functions as the input for the serial registers placed between TDI and TDO.
TDO	O	Test data output pin. It functions as the output for the serial registers lined up between TDI and TDO.
TMS	I	Test mode selection input pin. It inputs commands to the TAP controller.
TRSTZ	I	Test reset input pin. This pin acknowledges asynchronous input and resets the boundary scan circuit when low-level input is received. The TRSTZ pin is pulled down on the chip by using a resistor.

34.1.4 Boundary Scan Mode

When performing a boundary scan, set the system to the boundary scan mode.

To switch to this mode, set up the FLMD0, FLMD1, MODE0, and MODE1 pins, and then cancel the reset.

Table 34.2 Boundary Scan Mode Settings

FLMD0	FLMD1	MODE0	MODE1	Operation Mode
H	H	L	H	Boundary scan mode

Note: For details of mode settings, refer to **Table 5.1 Mode List** of 5 Section(Operating Modes).

34.2 TAP Controller

34.2.1 Target pins

All pins are subject to boundary scan except those in **Table 34.3, Pins Not Subject to Boundary Scan**.

Table 34.3 Pins Not Subject to Boundary Scan

Type	Pin Name
JTAG pins	JP0_2/TCK, JP0_0/TDI, JP0_1/TDO, JP0_3/TMS, JP0_4/TRSTZ, JP0_5/RDYZ
MODE pins	FLMD0, P4_5/FLMD1, P4_2/MODE0, P4_3/MODE1
Analog input pins	ADC0I0 to ADC0I19, ADC1I0 to ADC1I19, A0VREFH, A1VREFH
Clock pins	X1, X2
System pins	RESETZ, CVMOUTZ, ERROROUTZ
Debug pins	MSYNZ, AURORES1Z, AURORES2Z, AURORESPDZ, TODP0, TODN0, TODP1, TODN1, EVTIZ, EVTOZ, AUDRSTZ, AUDCK, AUDSYNCZ, AUDATA0 to AUDATA3, CICREFP, CICREFN, ERAMRES2Z, ERAMRESPDZ
Power supply pins	VDD, VCC, SYSVCC, A0VCC, A1VCC, E0VCC, E1VCC, EMUVDD, DVDD, DVCC, EMUVCC, ERAMVDD, ERAM0VCC, ERAM1VCC
GND pins	VSS, A0VSS, A1VSS, E0VSS, E1VSS, OSCVSS, EMUVSS, DVSS, ERAM0VSS, ERAM1VSS

34.2.2 Instructions

The RH850/P1x-C product supports the BYPASS, EXTEST, SAMPLE, PRELOAD and IDCODE instructions.

Table 34.4 Instruction Codes

Instructions	Instruction Codes	Remark
BYPASS	1111 1111	
EXTEST	0000 0000	
SAMPLE	0100 0000	Same code as PRELOAD
PRELOAD	0100 0000	Same code as SAMPLE
IDCODE	0101 0101	
	Other than the above	Setting prohibited

(1) BYPASS

When the BYPASS instruction is captured by the instruction register, the TAP controller enters the Shift-DR status and places the bypass register between TDI and TDO. The board-level scan path for the BYPASS instruction makes it easy to test the scan paths of other devices by using the shortest possible route.

(2) EXTEST

The EXTEST instruction makes it possible to test an external circuit from a JTAG circuit. The test vector is specified for the boundary scan register cell on the output pin side, and the test results are captured on the input pin side. Normally, the PRELOAD instruction is executed before the EXTEST instruction to specify the first test vector for the boundary scan register cell. The result of this is that, if the TAP controller enters the Update-IR status during EXTEST instruction execution, the output driver is enabled, and the PRELOAD data is output from the output pin.

(3) SAMPLE/PRELOAD

SAMPLE/PRELOAD is a general instruction for which the execution details are specified by IEEE 1149.1.

When the SAMPLE/PRELOAD instruction is captured by the instruction register, the TAP controller enters the Capture-DR status, and the data input to the I/O pin is captured by the boundary scan register.

(4) IDCODE

When the IDCODE instruction is selected, IDCODE register value is output to the TDO in Shift-DR state of TAP controller. In this case, IDCODE register value is output from the LSB. During this instruction execution, test circuit does not affect the system circuit. Instruction Register is initialized by the IDCODE instruction in Test-Logic-Reset state of TAP controller.

34.2.3 Scan registers

(1) Instruction register

The instruction register is used to store instructions to be issued by the TAP controller. When the instruction register is placed between TDI and TDO, instructions are captured by the register. When the power supply is turned on, the instruction register captures an IDCODE instruction. At this time, the TAP controller is reset to the Test-Logic-Reset status.

(2) Bypass register

The bypass register is a 1-bit register placed between TDI and TDO. The bypass register transfers sequential test data to other devices along the shortest possible route by way of the TAP controller.

(3) ID register

The ID register is a 32-bit register. When the TAP controller enters the capture-DR status after the instruction register captures an IDCODE instruction, the ID register captures a 32-bit device code and manufacturer code. When the TAP controller enters the Shift-DR status, the ID register is placed between TDI and TDO.

Table 34.5 ID Register Codes

		ID Register Codes			
Products	**Package Name**	**31 to 28**	**27 to 12**	**11 to 1**	**0**
P1M-C (BGA-292)	R7F701373EABG	0001	1000 0010 1100 0001	0100 0100 011	1
P1M-C (BGA-292, CAN-FD)	R7F701373AEABG	0001	1000 0011 0101 0100	0100 0100 011	1
P1M-C (LQFP-144)	R7F701374EAFP	0001	1000 0010 1100 0011	0100 0100 011	1
P1M-C (LQFP-144, CAN-FD)	R7F701374AEAFP	0001	1000 0011 0111 1000	0100 0100 011	1
P1M-C (BGA-156, CAN-FD)	R7F701397AEABG	0001	1000 0011 1100 0010	0100 0100 011	1
P1H-C 4MB	R7F701372EABG	0001	1000 0010 0011 1010	0100 0100 011	1
P1H-C 4MB (BGA-292, CAN-FD)	R7F701372AEABG	0001	1000 0011 0100 1010	0100 0100 011	1
P1H-C 4MB (BGA-156, CAN-FD)	R7F701396AEABG	0001	1000 0011 1100 0000	0100 0100 011	1
P1H-C 8MB (CAN-FD)	R7F701371EABG	0001	1000 0011 0001 0100	0100 0100 011	1
P1H-CE	R7F701370AEEBG	0001	1000 0010 1100 0000	0100 0100 011	1
P1H-CE (CAN-FD)	R7F701370BEEBG	0001	1000 0011 0100 0000	0100 0100 011	1

Note: Bit[31:28] : Revision Number. These bits indicate the revision of the product.
Bit[27:12] : Product Number. These bits indicate the product number.
Bit[11:1] : ManufactureID. These bits indicate the manufacturer number (manufacturer ID). 223_H: Renesas Electronics.

(4) Boundary Scan register

The Boundary Scan register is controlled by the TAP controller. When the TAP controller enters the Capture-DR status, the boundary scan register captures the contents of the RAM I/O ring. When the TAP controller enters the Shift-DR status, the boundary scan register is placed between TDI and TDO. Several TAP instructions use the boundary scan register.

34.2.4 Status transitions

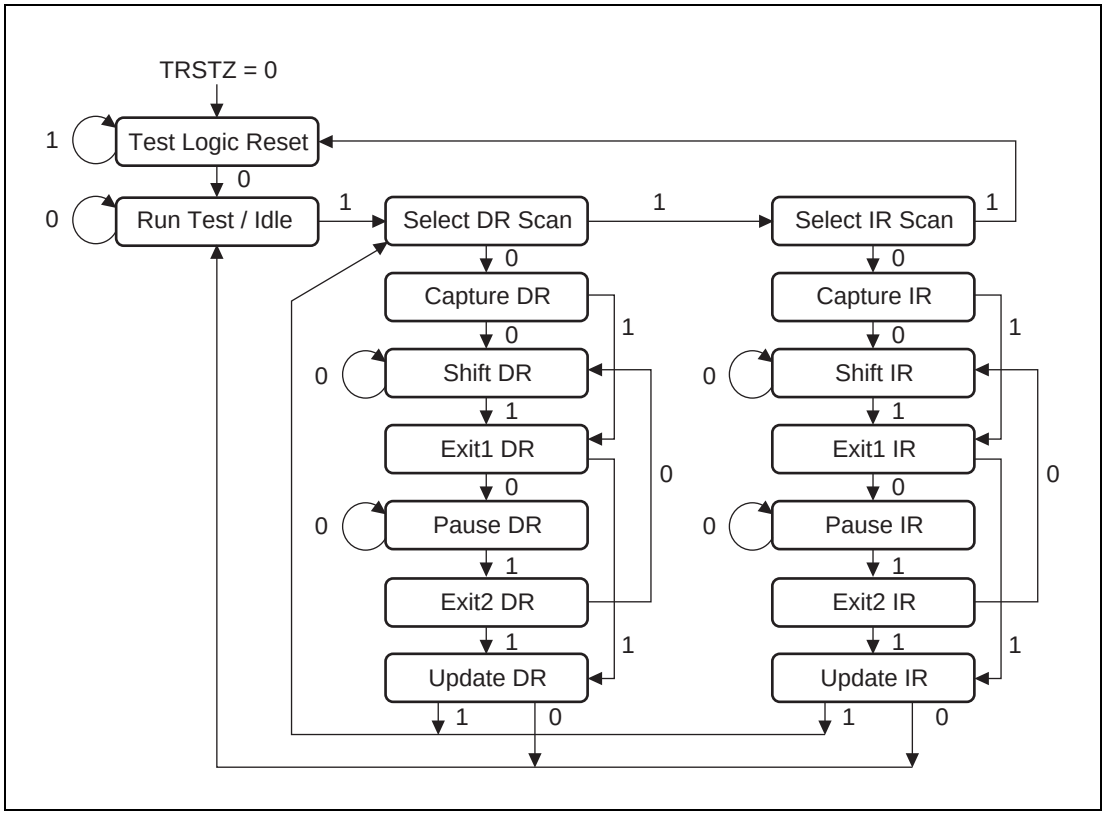

Figure 34.2 TAP Controller Status Transitions

34.3 Difference among P1M-C, P1H-C and P1H-CE

The difference among devices are Pin assignments and IDCODE.

For details, please refer to following.

Table 34.6 Related Differences

Differences	Describing Section
Pin assignments	**Section 2, Pin Functions**
IDCODE	**Table 34.5** (ID Register Codes)

Section 35 Electrical Specifications

35.1 Overview

The specifications in this section are for devices operating under the following conditions. Where a special condition is required for a given specification, the condition will be indicated. Furthermore, the specifications in this section are not guaranteed unless the conditions listed below are met.

35.2 Absolute Maximum Ratings

Absolute maximum ratings are shown in the table below.

Conditions:

- EnVSS = AnVSS = OSCVSS = VSS.
- Reference ground potential: VSS = 0 V.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Power Voltage	VDD		–0.3		1.8	V
	VCC		–0.3		6.5	V
	SYSVCC		–0.3		6.5	V
	E0VCC		–0.3		6.5	V
	E1VCC		–0.3		6.5	V
	A0VCC		–0.3		6.5	V
	A1VCC		–0.3		6.5	V
	DVCC	Emulation Device Only	–0.3		4.5	V*1
	DVDD		–0.3		1.8	V*1
	EMUVCC		–0.3		4.5	V*1
	EMUVDD		–0.3		1.8	V*1
	ERAM0VCC		–0.3		4.5	V*1
	ERAM1VCC		–0.3		4.5	V*1
	ERAMVDD		–0.3		1.8	V*1
Input Voltage	VI	E0VCC pin*4	–0.3		E0VCC+0.3	V*2
		E1VCC pin*5	–0.3		E1VCC+0.3	V*2
		RESETZ X1 pins	–0.3		SYSVCC+0.3	V*2
		ERAMRES2Z pin	–0.3		ERAM1VCC+0.3	V*1,*2
		AURORES1Z AURORES2Z pins	–0.3		EMUVCC+0.3	V*1,*2
		CICREFN CICREFP pins	–0.3		DVDD+0.3	V*1,*2
		AUDR I/F, EVTIZ pins	–0.3		E1VCC+0.3	V*1,*2
		ERAMRESPDZ pin	–0.3		E1VCC+0.3	V*1,*2
		AURORESPDZ, MSYNZ pins	–0.3		E0VCC+0.3	V*1,*2
Analogue reference voltage	A0VREFH		–0.3		A0VCC +0.3	V*2
	A1VREFH		–0.3		A1VCC +0.3	V*2

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Analogue input voltage	VIAN	A0VCC pins	–0.3		A0VCC +0.3	V*2
		A1VCC pins	–0.3		A1VCC +0.3	V*2
Output low current *3	I_{OL1p}	per pin			10	mA
	I_{OLall}	Sum of all output low currents of all EnVCC/AnVCC pins			200	mA
Output high current *3	I_{OH1p}	per pin			–10	mA
	I_{OHall}	Sum of all output high currents of all EnVCC/AnVCC pins			–200	mA
JunctionTemperature	Tj	BGA Package	–40		150	°C
		QFP Package	–40		160	
Storage Temperature	Tstg	BGA Package	–55		150	°C
		QFP Package	–55		160	

Note 1. Emulation Device only

Note 2. Input voltage of CICREFN and CICREFP must not exceed 1.8V, and Input voltage of other pins must not exceed 6.5V (4.5V in case of P1H-CE device).

Note 3. Given specification includes injected currents. For injected current refer to **Section 35.4.6**.

Note 4. P0, P3_11, P5, P6_2-15, P9, JP0*6, FLMD0, CVMOUTZ

Note 5. P1, P2, P3_0-10, P3_12-14, P4, P6_0-1, P7, P8, ERROROUTZ

Note 6. For P1H-CE device the JP0 is connected to E1VCC

CAUTION

- **Even momentarily exceeding the absolute maximum rating for just one item creates a threat of failure in the reliability of the products. That is, the absolute maximum ratings are the levels that raise a threat of physical damage to the products. Be sure to use the products only under conditions that do not exceed the ratings. The quality and normal operation of the product are guaranteed under the standards and conditions given as DC and AC characteristics.**
- **Input voltage, analog reference voltage and analog input voltage must not exceed 6.5 V**
- **Even in case when input voltage does not meet the specified characteristics, it is accepted if the injected current characteristics specified in Section 35.4.6 are met.**
- **The device's function is not guaranteed outside of the condition Section 35.3 General Characteristics.**

35.3 General Characteristics

35.3.1 Supply Voltage Characteristics

Conditions:

- Temperature range: Tjmin to Tjmax.
- EnVSS = AnVSS = OSCVSS = VSS.
- Reference ground potential: VSS = 0 V.

Table 35.1 Supply Voltage Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Core supply voltage (DPS)	VDD	DPS = dual power supply (VDD from external)	1.20	1.25	1.35	V*4
Regulator supply voltage	VCC		V_{POC}*3		3.6	V
System control supply voltage	SYSVCC	*1, *2	V_{POC}*3		3.6	V
IO supply voltage	EnVCC		V_{POC}*3		3.6	V
ADC supply voltage	AnVCC		V_{POC}*3		3.6	V
ADC reference voltage supply	AnVREFH		V_{POC}*3		3.6	V
Aurora I/F supply voltage (Analog)	DVCC	Emulation devices only	V_{POC}*3		3.6	V
Aurora I/F supply voltage (Digital)	DVDD		1.175	1.25	1.325	V
ERAM IO supply voltage	ERAM1VCC		V_{POC}*3		3.6	V
ERAM core supply voltage	ERAMVDD		1.20	1.25	1.35	V
Aurora control IO supply voltage	EMUVCC		V_{POC}*3		3.6	V
Aurora control core supply voltage	EMUVDD		1.175	1.25	1.325	V
VDD slew rate @power-up	VDDsru				500	V/ms
VCC slew rate @power-up	VCCsru				500	V/ms
SYSVCC slew rate @power-up	SYSVCCsru				500	V/ms
EnVCC slew rate @power-up	EnVCCsru				500	V/ms
AnVCC slew rate @power-up	AnVCCsru				500	V/ms
AnVREFH slew rate @power-up	AnVRFHsru				500	V/ms

Note 1. The device will operate as normal above the transistor threshold voltage level. Above this threshold level the device will operate or it is controlled by RESET/POC — depending on CVM.

Note 2. SYSVCC is monitored by POC, see chapter POC Characteristics.

Note 3. Specification value "V_{POC}" means: supply voltage higher than POC threshold value V_{POC} or higher or equal to 3.0V. For V_{POC} specification please refer to **Section 35.7.1, POC Characteristics**.

Note 4. During RESET condition an enlarged VDD up to 1.55V is accepted for a maximum time of 150s over lifetime.

35.3.2 Main Oscillator Characteristics

Conditions:

- Temperature range: Tjmin to Tjmax.
- Supply voltage range: Refer to **Section 35.3.1, Supply Voltage Characteristics**.
- EnVSS = AnVSS = OSCVSS = VSS.
- Reference ground potential: VSS = 0 V.

Table 35.2 Main Oscillator Characteristics

Item	Symbol	Comment	Condition	MIN.	TYP.	MAX.	Unit
Frequency	f_{MOSC} *1*2	Crystal		16 –1%		24 + 1%	MHz
Stabilization time	t_{MOST}			3*5			ms
Internal Capacitor size selectable by CAP_SEL setting (OPBT setting)*4	Ccapsel	CAP_SEL [2:0]	=000b		0		pF
			=001b		1		pF
			=010b		3		pF
			=011b		4		pF
			=100b		5		pF
			=101b (default)		6		pF
			=110b		8		pF
			=111b		9		pF
Internal damping register size selectable by RDSEL setting (OPBT setting)	Rrdsel	RDSEL [2:0]	=000b		846		Ω
			=100b		632		Ω
			=x10b		265		Ω
			=xx1b		18		Ω

Note 1. To reach internal usable clocks only following 3 fMOSC frequencies are supported: 16MHz, 20MHz and 24MHz. Tolerance of external quartz crystal is assumed as +/–1%.

Note 2. The StartUp is supported without external components under following conditions:
- Default values for drivability and capacitance are defined as follows
  - — Maximum drivability (AMPSEL = 00b)
  - — Default damping resistor configuration (RDSEL = 100b)
  - — Default internal capacitance of 6pF (CAPSEL = 011b)
- Specification covers a maximum external stray capacitance of up to 6pF to each pin X1 and X2.
- After StartUp drivability and capacitance will be configured by OPBT
- A possible exceeding of the recommended maximum drive level for a crystal for all start-up phases has to be agreed with the crystal manufacturers separately.

Note 3. Depends on characteristics of selected crystal

Note 4. The CAP_SEL capacity values refer to the selectable internal device capacitances. The effective capacitance will be 1-4pF higher due to parasitic capacitances.

Note 5. Depends on characteristics of selected crystal. External reset must not be released, before oscillation becomes stable.

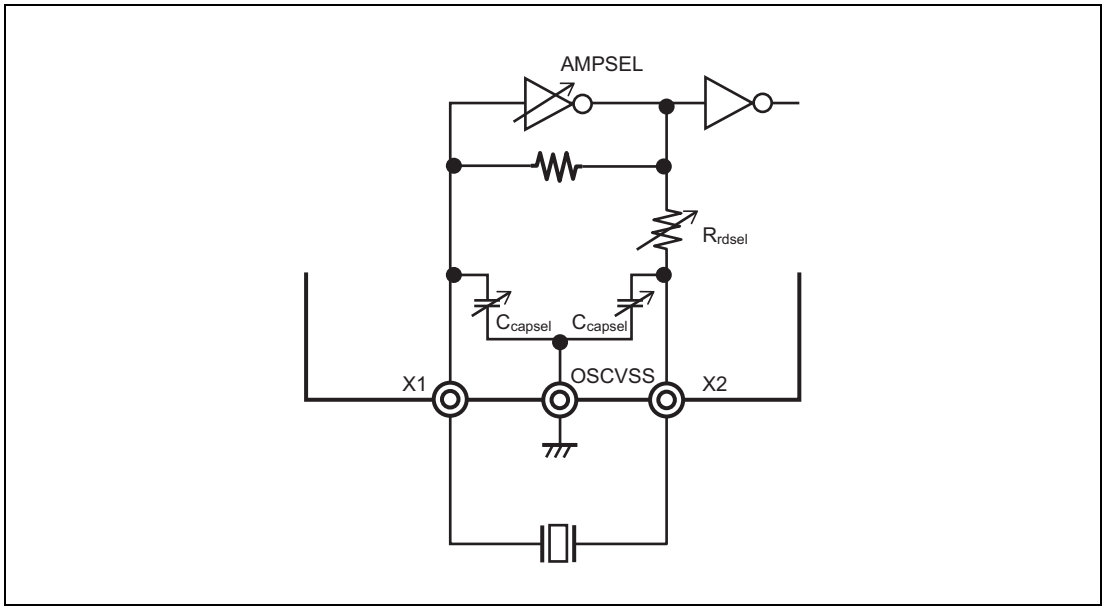

Figure 35.1 Oscillator Circuit Diagram and Connection Example of Crystal Resonator

NOTE

Figure 35.1 shows how to connect a crystal oscillator. For crystal oscillator that are tested and recommended by Renesas (inquire separately) any external components such as a load capacitor and a dumping resistor are not necessarily required for oscillation in general. However, proper operation should be verified under actual conditions prior to use including internal setting of AMPSEL, Ccapsel and Rrdsel.

35.3.3 PLL0 Characteristics

CAUTIONS

1. **PLL0 uses output of main (crystal) oscillator as input clock.**
2. **Below specification is based on the condition of an ideal clock input.**

Conditions:

- Temperature range: Tjmin to Tjmax.
- Supply voltage range: Refer to **Section 35.3.1, Supply Voltage Characteristics**.
- EnVSS = AnVSS = OSCVSS = VSS.
- Reference ground potential: VSS = 0 V.

Table 35.3 PLL0 Characteristics*1

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
PLL output period jitter	t_{PJ}		–200		+200	ps
PLL output long term jitter	t_{LTJ}	term = 1 µs	–500		+500	ps

Note 1. Input clock: main oscillator. Condition: Ideal clock input.

35.3.4 Internal Oscillator Characteristics

Conditions:

- Temperature range: Tjmin to Tjmax.
- Supply voltage range: Refer to **Section 35.3.1, Supply Voltage Characteristics**.
- EnVSS = AnVSS = OSCVSS = VSS.
- Reference ground potential: VSS = 0 V.

Table 35.4 Internal Oscillator Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Frequency	f_{RH1}	accuracy after trimming: +/–10%	14.4	16.0	17.6	MHz

35.3.5 Operational Condition

Conditions:

- Temperature range: Tjmin to Tjmax.
- EnVSS = AnVSS = OSCVSS = VSS.
- Reference ground potential: VSS = 0 V.

Table 35.5 Operational Condition

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
CPU operating clock frequency*1	f_{CPUCLK}				240	MHz
Junction temperature*2	T_j	For devices P1M-C (LQFP)	–40		160*4	°C
		For devices P1M-C (BGA-292)	–40		150*4	°C
		For devices P1M-C (BGA-156)	–40		150*4	°C
		For devices P1H-C (4MB)	–40		150*4	°C
		For devices P1H-C (8MB)	–40		150*4	°C
		For devices P1H-CE	–40		150*4	°C
Absolute DC output current per power supply pin	I_{O1s}	*3			70	mA
Ext. pull-down resistor for FLMD0	RPDMD0	*5	95			kΩ
		*6	0		750	Ω

Note 1. Please refer also to **Section 3, CPU System** and **Section 12, Clock Controller**.

Note 2. Details of thermal characteristics are described in **Section 35.8, Thermal Characteristics**.

Note 3. 1. Absolute value of the sum of DC output high and low currents of one EnVCC/AnVCC pin.
2. Regarding AC output currents, simultaneous switching of [max.] 8 output pins is allowed under the condition that the average current over lifetime does not exceed the limit given above for Item.

Note 4. In case of hotspots local Tj might exceeded. The function of the device is still ensured by test margin and library spec.

Note 5. An ext. pull-down resistor connected to FLMD0 pin is recommended in case flash programming will be used.

Note 6. A low resistance connection of FLMD0 pin to EnVSS prohibits any flash programming.

NOTES

1. If not otherwise stated, defines the valid condition for the specification values within this document.
2. The maximum frequency of a peripheral function is depending on the setting of the according clock domain in which the peripheral function resides. Please refer to **Section 12, Clock Controller**.

35.3.6 IO Capacitances

Conditions:

- Temperature range: Tjmin to Tjmax.

Table 35.6 I/O Capacitances*1*2

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input capacitance	C_I*3	f = 1 MHz 0 V for non measurement pins			10	pF
Input/output capacitance	C_{IO}*4				10	pF
Output capacitance	C_O*5				10	pF
Input capacitance X1	C_{X1}	Main OSC. EXCLK mode, CAP_SEL = 010			10	pF

Note 1. Please note that for pins of the main oscillator the capacitance value given above are exceeded

Note 2. For analog input pins (ADCnIm) please refer to the **Section 35.7.3, A/D Converter Characteristics**

Note 3. C_I: capacitance of between the input pin and ground

Note 4. C_{IO}: capacitance of between the input/output pin and ground

Note 5. C_O: capacitance of between the output pin and ground

35.4 DC Characteristics

35.4.1 Input Leakage Current

Conditions:

- Temperature range: Tjmin to Tjmax.
- Supply voltage range: Refer to **Section 35.3.1, Supply Voltage Characteristics**.
- EnVSS = AnVSS = OSCVSS = VSS.
- Reference ground potential: VSS = 0 V.

Table 35.7 Input Leakage Current

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input leakage current, high	I_{LIH1} *1	Digital I/O pins, VI = 0 to EnVCC			1.0	µA
Input leakage current, low	I_{LIL1} *1	Digital I/O pins, VI = 0 to EnVCC			–1.0	µA
Input leakage current, high	I_{LIH2}	RESETZ, VI = 0 to SYSVCC			1.0	µA
Input leakage current, low	I_{LIL2}	RESETZ, VI = 0 to SYSVCC			–1.0	µA
Input leakage current, high	I_{LIH3} *2	Analog input pins (ADCnlm), VIAN = 0 to AnVCC			0.15	µA
					1.0	µA
Input leakage current, low	I_{LIL3} *2	Analog input pins (ADCnlm), VIAN = 0 to AnVCC			–0.15	µA
					–1.0	µA
Input leakage current, high	I_{LIH4} *3	AUDR I/F, VIAU = 0 to EnVCC			5.0	µA
Input leakage current, low	I_{LIL4} *3	AUDR I/F, VIAU = 0 to EnVCC			–25.0	µA
Input leakage current, high	I_{LIH5} *1	ERAMRES2Z, VI = 0 to ERAM1VCC			1.0	µA
Input leakage current, low	I_{LIL5} *1	ERAMRES2Z, VI = 0 to ERAM1VCC			–1.0	µA
Input leakage current, high	I_{LIH6} *1	AURORESnZ, VI = 0 to EMUVCC			1.0	µA
Input leakage current, low	I_{LIL6} *1	AURORESnZ, VI = 0 to EMUVCC			–1.0	µA

Note 1. Pull-up/pull-down current sources/sinks are switched off.

Note 2. Leakage current under the condition that ADC conversion of the according analog input pin is switched off. When switched on, 1.0µA for high and -1.0µA for low. Both do not include charging current of the conversion sample circuits. Charging current can be judged with the equivalent input circuit and sampling time specified in **Section 35.7.3, A/D Converter Characteristics**.

Note 3. Emulation devices only

NOTE

For Aurora I/F there is no leakage current specification, because it is based on AC coupling only.

35.4.2 Digital IO Pins Input and Output Characteristics

Conditions:

- Temperature range: Tjmin to Tjmax.
- Supply voltage range: Refer to **Section 35.3.1, Supply Voltage Characteristics**.
- EnVSS = AnVSS = OSCVSS = VSS.
- Reference ground potential: VSS = 0 V.

Table 35.8 Digital IO Pins: Input and Output Characteristics (1/4)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
High level input voltage	V_{IH11}	CMOS, EnVCC = 3.0 to 3.6 V (Emulation devices only)	0.65 × EnVCC		EnVCC + 0.3	V
	V_{IH12}	SHMT1, EnVCC = 3.0 to 3.6 V	0.65 × EnVCC		EnVCC + 0.3	V
	V_{IH13}	SHMT2, EnVCC = 3.0 to 3.6 V	0.75 × EnVCC		EnVCC + 0.3	V
	V_{IH14}	SHMT4, EnVCC = 3.0 to 3.6 V	0.80 × EnVCC		EnVCC + 0.3	V
Low level input voltage	V_{IL11}	CMOS, EnVCC = 3.0 to 3.6 V (Emulation devices only)	–0.3		0.35 × EnVCC	V
	V_{IL12}	SHMT1, EnVCC = 3.0 to 3.6 V	–0.3		0.35 × EnVCC	V
	V_{IL13}	SHMT2, EnVCC = 3.0 to 3.6 V	–0.3		0.25 × EnVCC	V
	V_{IL14}	SHMT4, EnVCC = 3.0 to 3.6 V	–0.3		0.50 × EnVCC	V
Input hysteresis for Schmitt	V_{H11}	SHMT1, EnVCC = 3.0 to 3.6 V	0.3			V
	V_{H12}	SHMT2, EnVCC = 3.0 to 3.6 V	0.2 × EnVCC			V
	V_{H13}	SHMT4, EnVCC = 3.0 to 3.6 V	0.1			V
Input pull-up current source *2	I_{PU11}	EnVCC = 3.0 to 3.6 V, VI = EVSS*7	–150		–30	µA
		EnVCC = 3.3V, VI = EVSS*7, T_J = –40°C		–100		µA
		EnVCC = 3.3V, VI = EVSS*7, T_J = 25°C		–80		µA
		EnVCC = 3.3V, VI = EVSS*7, T_J = 150°C		–60		µA
Input pull-down current source*3	I_{PD11}	EnVCC = 3.0 to 3.6 V, VI = EnVCC*7	30		150	µA
		EnVCC = 3.3V, VI = EnVCC*7, T_J = –40°C		100		µA
		EnVCC = 3.3V, VI = EnVCC*7, T_J = 25°C		80		µA
		EnVCC = 3.3V, VI = EnVCC*7, T_J = 150°C		60		µA
Output resistance of GPIO buffer*6*8	R_{O11}	Drive strength 1, EnVCC = 3.0 to 3.6 V Forcing 0.4 V to 4 pins simultaneously or Forcing EnVCC – 0.4 V to 4 pins simultaneously	15	50	110	Ω
	R_{O12}	Drive strength 2, EnVCC = 3.0 to 3.6 V Forcing 0.4 V to 8pins simultaneously or Forcing EnVCC – 0.4 V to 8 pins simultaneously	30	100	220	Ω
	R_{O13}	Drive strength 3, EnVCC = 3.0 to 3.6 V Forcing 0.4 V to 16 pins simultaneously or Forcing EnVCC – 0.4 V to 16 pins simultaneously	60	200	440	Ω
	R_{O14}	Drive strength 4, EnVCC = 3.0 to 3.6 V Forcing 0.4 V to 16 pins simultaneously or Forcing EnVCC – 0.4 V to 16 pins simultaneously	120	400	880	Ω

Table 35.8 Digital IO Pins: Input and Output Characteristics (2/4)

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Output resistance of HSIO buffer*5*8	R_{O21}		Drive strength 1, E1VCC = 3.0 to 3.6 V Forcing 0.4 V to 4 pins simultaneously or Forcing E1VCC – 0.4 V to 4 pins simultaneously	6	20	44	Ω

	t_{OR242}/ t_{OF242}		Cload = 30 pF, 20% to 80%	9.3		55.0	ns

Note 1. Specification of parameters for IO supply voltage range EnVCC = VPOC to 3.0V is not guaranteed, but no malfunction of digital IO pins will occur.

Note 2. Pn_m, JP0_0-3, JP0_5, MSYNZ, EVTIZ
Regarding to treatment for FLMD0, please refer to **Section 35.3.5, Operational Condition** for the specification of an ext. pull-down resistor required to be connected to the FLMD0 pin, see **Table 35.5, Operational Condition**.

Note 3. Pn_m, JP0_0-5, RESETZ, ERAMRESPDZ, ERAMRES2Z, AURORES2Z, AURORES1Z, AURORESPDZ
Regarding to treatment for FLMD0, please refer to **Section 35.3.5, Operational Condition** for the specification of an ext. pull-down resistor required to be connected to the FLMD0 pin, see **Table 35.5, Operational Condition**.

Note 4. The number of pin indicates simultaneous ON. In addition, total current per 1 power supply pin of I_{OL}/I_{OH} is max. ±32mA (right side or left side to 1 power supply pin is max. +16/–16mA).

Note 5. P3_9, P3_10, P3_14, P8_9, P8_10, and P8_11

Note 6. JPn_m and Pn_m excluding P3_9, P3_10, P3_14, P8_9, P8_10, and P8_11

Note 7. VI is input voltage at related input pin.

Note 8. The resistance can increase above max data in case VOH11 to VOH24 or VOL11a to VOL24 exceed the condition.

35.4.3 Analog Input Pins (ADCnIm) Characteristics

Conditions:

- Temperature range: Tjmin to Tjmax.
- Supply voltage range: Refer to **Section 35.3.1, Supply Voltage Characteristics**.
- EnVSS = AnVSS = OSCVSS = VSS.
- Reference ground potential: VSS = 0 V.

Table 35.9 Analog Input Pins (ADCnIm) Characteristics*3

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Internal pull-up resistance*1	R_{PU21}	Analog input pins (ADCnIm), VIAN = AnVSS		10	20	40	kΩ
		AnVCC = 3.0V*2	VIAN = AnVSS			40	kΩ
			VIAN = AnVCC/2			25	
			VIAN = AnVCC			16	
		AnVCC = 3.6V*2	VIAN = AnVSS	10			kΩ
			VIAN = AnVCC/2	6.8			
			VIAN = AnVCC	3.6			
Internal pull-down resistance*1	R_{PD21}	Analog input pins (ADCnIm), VIAN = AnVCC		10	20	40	kΩ
		AnVCC = 3.0V*2	VIAN = AnVSS			10	kΩ
			VIAN = AnVCC/2			21	
			VIAN = AnVCC			40	
		AnVCC = 3.6V*2	VIAN = AnVSS	2			kΩ
			VIAN = AnVCC/2	6			
			VIAN = AnVCC	10			

Note 1. Pull-up/down resistors are only used for diagnostic test.
PU and PD resistor data includes TDE switch resistance.
For TDE switch resistance data see **Table 35.55, ADC Characteristics**.
Note 2. A linear extrapolation between the 3 specified points is allowed.
Note 3. Specification is valid for ADCnIm pins.

35.4.4 Main Oscillator Input Pin (X1) Characteristics

Conditions:

- Temperature range: Tjmin to Tjmax.
- Supply voltage range: Refer to **Section 35.3.1, Supply Voltage Characteristics**.
- EnVSS = AnVSS = OSCVSS = VSS.
- Reference ground potential: VSS = 0 V.

Table 35.10 Main Oscillator Input Pin (X1) Characteristics*1

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input voltage high level	V_{IH21}	SYSVCC = V_{POC} to 3.6V	0.7 × SYSVCC		SYSVCC	V
Input voltage low level	V_{IL21}		0		0.30 × SYSVCC	V

Note 1. Only valid for EXCLK mode, (selected by flash option byte).

35.4.5 Aurora Interface Clock Characteristics

Conditions:

- Temperature range: Tjmin to Tjmax.
- Supply voltage range: Refer to **Section 35.3.1, Supply Voltage Characteristics**.
- EnVSS = AnVSS = OSCVSS = VSS.
- Reference ground potential: VSS = 0 V.

Table 35.11 Aurora Interface Clock Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Differential input voltage external AC coupled	V_{CLK} *1		200		1600	mV
Recommended external AC coupling capacitor	TRF		75	100	200	nF
Differential input resistance	ZID		70	100	130	Ω

Note 1. Peak to peak differential input voltage.

35.4.6 Injected Current Characteristics

Conditions:

- Temperature range: Tjmin to Tjmax.
- Supply voltage range: Refer to **Section 35.3.1, Supply Voltage Characteristics**.
- EnVSS = AnVSS = OSCVSS = VSS.
- Reference ground potential: VSS = 0 V.

Table 35.12 Injected Current Operating Conditions*2

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Injection current per digital input	I_{INJ_DIN}	V_{IN} > EnVCC, VIN < EnVSS	–2.0		3.0	mA
Injection current per analog input	I_{INJ_AIN}	V_{IAN} > AnVCC, VIAN < AnVSS	–2.0		3.0	mA
Injection current ERAMRES2Z	I_{INJ_DINER}	V_{IN} > ERAM1VCC, V_{IN} < ERAM1VSS	–2.0		3.0	mA
Injection current AURORESnZ	I_{INJ_DINAU}	V_I > EMUVCC, V_I < EMUVSS	–2.0		3.0	mA
Total injection current of the device	I_{INJ_TOT}	*1	—		50.0	mA

Note 1. To be considered not only at supply pin but at every point of the supply part of an IO pin.
Sum of all injected currents into all pins of the device.

Note 2. The injected current operating condition for a pin will not degrade the specified performance and functionality of other ports pins which are not affected by injected current.

35.5 Supply Current Characteristics

35.5.1 General Definition

Total current consumption is defined as follows:

$I_{TOTn} = I_{VCC} + I_{VDD} (+ I_{VCC\_ED} + I_{VDD\_ED}) + I_{EnVCC} = I_{INT} + I_{EnVCC}$

with

- I_{TOTn}: total current consumption of the device.
- I_{VCC}: Current consumption of high-voltage (HV) domain (e.g. POC, RVG, OSC, CVM, ADC, PLL, temperature sensor, flash charge pump and regulator, ect.)
- I_{VDD}: Current consumption of core domain (depending on CPU frequency)
- I_{VCC_ED}: Current consumption of IO buffer of emulation domain
- I_{VDD_ED}: Current consumption of emulation core domain
- I_{INT}: Current consumption of IVCC and IVDD and IVCC_ED and IVDD_ED.
- I_{EnVCC}: Current consumption of IO buffer

CAUTION

The parameter I_{EnVCC} depends on customer's application and thus need to be defined by customer in order to determine the total power dissipation of a device.

35.5.2 Power Supply Currents (P1M-C)

Conditions:

- Temperature range: Tjmin to Tjmax.
- Supply voltage range: Refer to **Section 35.3.1, Supply Voltage Characteristics**.
- EnVSS = AnVSS = OSCVSS = VSS.
- Reference ground potential: VSS = 0 V.

Table 35.13 Supply Current Consumption: Device P1M-C

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Current consumption of HV domain	I_{VCC31}	VCC = SYSVCC = 3.6V			28	mA
Current consumption of core*1	I_{VDD32}	fCPUCLK = 240 MHz, VDD = 1.35V, TJ =150 °C			282	mA
	I_{VDD33}	fCPUCLK = 240 MHz, VDD =1.35V,TJ =160 °C			305	mA

Note 1. Include all cores and peripherals

Note 2. Delta current is based on the max use case as reflected in IVCC31.

35.5.3 Power Supply Currents (P1H-C (4MB))

Conditions:

- Temperature range: Tjmin to Tjmax.
- Supply voltage range: Refer to **Section 35.3.1, Supply Voltage Characteristics**.
- EnVSS = AnVSS = OSCVSS = VSS.
- Reference ground potential: VSS = 0 V.

Table 35.14 Supply Current Consumption: Device P1H-C (4MB)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Current consumption of HV domain	I_{VCC41}	VCC = SYSVCC = 3.6V			26	mA
Current consumption of core*1	I_{VDD42}	f_{CPUCLK} = 240 MHz, VDD = 1.35V, T_{JMAX}			536	mA

Note 1. Include all cores and peripherals

Note 2. Delta current is based on the max use case as reflected in IVCC41.

35.5.4 Power Supply Currents (P1H-C (8MB))

Conditions:

- Temperature range: Tjmin to Tjmax.
- Supply voltage range: Refer to **Section 35.3.1, Supply Voltage Characteristics**.
- EnVSS = AnVSS = OSCVSS = VSS.
- Reference ground potential: VSS = 0 V.

Table 35.15 Supply Current Consumption: Device P1H-C (8MB)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Current consumption of HV domain	I_{VCC51}	VCC = SYSVCC = 3.6V			30	mA
Current consumption of core*1	I_{VDD52}	f_{CPUCLK} = 240 MHz, VDD =1.35V,T_{JMAX}			546	mA

Note 1. Include all cores and peripherals.

Note 2. Delta current is based on the max use case as reflected in IVCC51.

35.5.5 Power Supply Currents (P1H-CE)

Conditions:

- Temperature range: Tjmin to Tjmax.
- Supply voltage range: Refer to **Section 35.3.1, Supply Voltage Characteristics**.
- EnVSS = AnVSS = OSCVSS = VSS.
- Reference ground potential: VSS = 0 V.

Table 35.16 Supply Current Consumption: Device P1H-CE

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Current consumption of HV domain	I_{VCC71}	VCC = SYSVCC = 3.4V, MP domain			30	mA
	I_{VCC_ED71}	VCC = SYSVCC = 3.4V, ED domain			35	mA
Current consumption of core (MP domain)*1	I_{VDD72}	Dual core f_{CPUCLK} = 240 MHz, VDD = 1.32V, T_{JMAX}			868	mA
	I_{VDD73}	Single core f_{CPUCLK} = 240 MHz, VDD =1.32V,T_{JMAX}			750	mA
	I_{VDD74}	Single core fCPUCLK = 160 MHz, VDD =1.32V,T_{JMAX}			690	mA
Current consumption of core (ED domain)	$I_{VDD\_ED71,eram}$	f_{CPUCLK} = 240 MHz, VDD = 1.32V, ERAM domain			138	mA
	$I_{VDD\_ED71,aur}$	f_{CPUCLK} = 240 MHz, VDD = 1.32V, Aurora domain			87	mA
Total internal current consumption	I_{INT71}	f_{CPUCLK} = 240 MHz, VDD = 1.32V, VCC = SYSVCC = 3.4 V, T_{JMAX}			1158	mA

Note 1. Include all cores and peripherals

Note 2. Delta current is based on the max use case as reflected in IVCC71.

35.6 AC Characteristics

35.6.1 AC Test Conditions

35.6.1.1 General Conditions

Below conditions are valid for all subsequent timing specifications if not noted otherwise:

- Temperature range: Tjmin to Tjmax.
- Supply voltage range: Refer to **Section 35.3.1, Supply Voltage Characteristics**.
- IO supply voltage range: EnVCC = 3.0 to 3.6 V
- EnVSS = AnVSS = OSCVSS = VSS.
- Reference ground potential: VSS = 0 V.

If there is no specification in particular, the specified spec is the following conditions.

- Output buffer is selected 100 Ω
- Capacitive load (Cload) connected to output pins is 30pF

NOTE

Even though AC characteristics correspond to the nominal frequency, a main oscillator tolerance of up to 1000ppm is considered with regard to timing characteristics for communication modules.

35.6.1.2 Input Measurement Points

If not stated otherwise, the below given AC timing specification is based on the measurements points as follows:

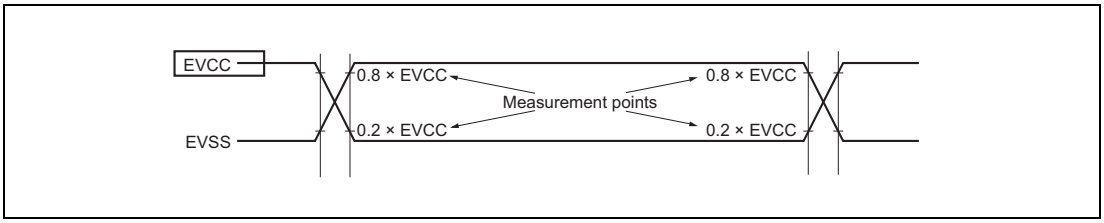

Figure 35.2 AC Input Measurement Points Definition

35.6.1.3 Output Measurement Points

If not stated otherwise, the below given AC timing specification is based on the measurements points as follows:

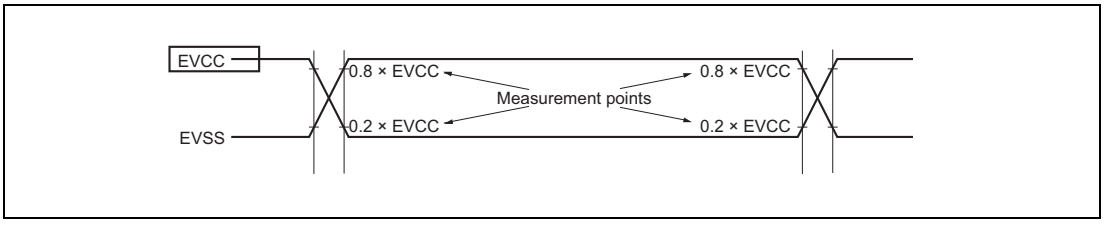

Figure 35.3 AC Output Measurement Points Definition

35.6.1.4 Load conditions

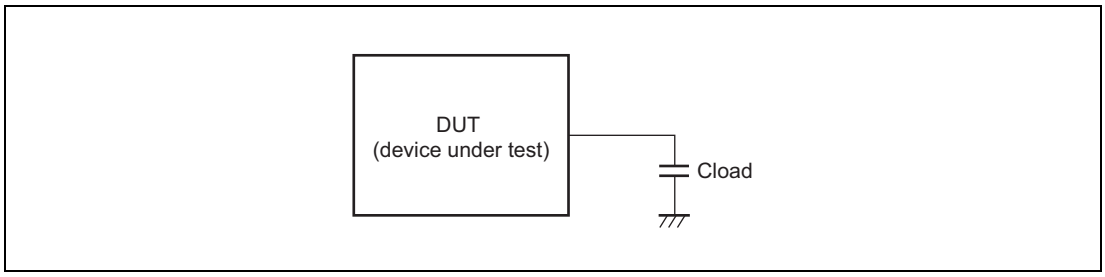

Figure 35.4 AC Load Conditions Definition

CAUTION

If not otherwise stated in conditions preceding to below AC timing specifications the following capacitive load condition is valid : Cload = 30 pF.

- **For GPIO pins with/ output drive strength 1 to 4: see the load conditions given for parameters “Output rise and fall times of GPIO buffer” in 35.4.2 Digital IO Pins Input and Output Characteristics.**
- **For HSIO pins with output drive strength 1 to 4: see the load conditions given for parameters “Output rise and fall times of HSIO buffer” in 35.4.2 Digital IO Pins Input and Output Characteristics.**

35.6.2 Power Up/Down Timing

Conditions:

- See **Section 35.6.1.1, General Conditions**
- VCC = SYSVCC = IOVCC, with IOVCC = EnVCC, AnVCC

Table 35.17 Power-Up/Down Timing: Using RESETZ Pin*1

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Delay time VCC ↑ & SYSVCC ↑ & IOVCC ↑ to RESETZ ↑	$t_{DVCCPUR}$	Power-up	t_{MOST} *2			ms
Delay time VDD ↑ to RESETZ ↑	$t_{DVDDPUR}$	Power-up Only in case of DPS	0			ms
FLMD0/1 setup time time (vs RESETZ ↑)	t_{SMDR}		1			ms
FLMD1 hold time time (vs RESETZ ↑)	t_{HMDR}		1 *3			ms
MODE0/1 setup time time (vs RESETZ ↑)	t_{SMODR}		1			ms
MODE0/1 hold time time (vs RESETZ ↑)	t_{HMODR}		1			ms
Delay time RESETZ ↓ to VCC ↓ & SYSVCC↓ & IOVCC ↓ *2*4	$t_{DRVCCPD}$	Power-down*5	10.5			µs
Delay time RESETZ↓ to VDD↓*4	$t_{DRVDDPD}$	Power-down*5	10.5			µs

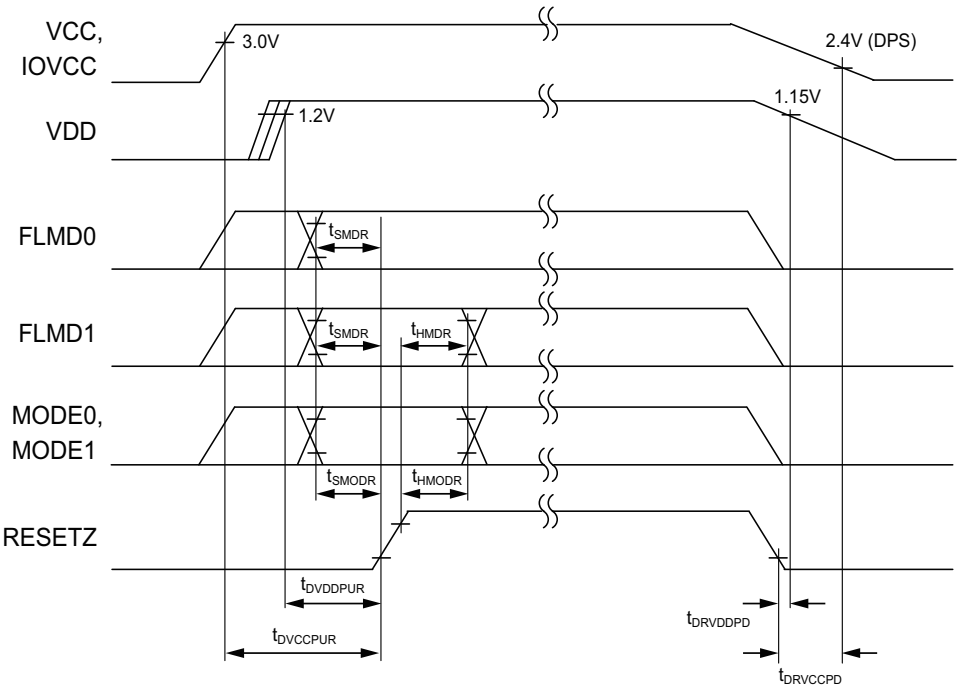
Note 1. In case power-up, power-down, RESETZ should be low. RESETZ must be asserted until CVMOUTZ is asserted and main osc. is stabilized.

Note 2. For t_{MOST} refer to **Section 35.3.2, Main Oscillator Characteristics**.

Note 3. Switching of FLMD0 after RESETZ ↑ is prohibited.

Note 4. The device can withstand up to 1000 uncontrolled power down cycles without impact on lifetime. Uncontrolled means not according to power down timing requirements.

Note 5. On reset assertion the IDD and ICC will drop significantly. Consequently the dynamic behavior to VCC and VDD has to be taken in account for the delay time.



Note: VCC = SYSVCC = IOVCC, with IOVCC = EnVCC, AnVCC.

Figure 35.5 Power-Up/Down Timing: Using RESETZ Pin

35.6.2.1 Power Up sequencing

Conditions:

- See **Section 35.6.1.1, General Conditions**

Table 35.18 Power Up sequencing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Runtime from RESETZ ↑ to start of instruction fetch*1		P1H-CE (CLK_CPU = 240MHz), P1H-C (8MB), P1H-C (4MB) and P1M-C			22	ms
		P1H-CE (CLK_CPU = 120MHz and CLK_CPU = 160MHz)			23	ms

Note 1. Including HW BIST (see **Section 8.4.5, HW BIST**), RAM initialization (see **Section 8.4.6, RAM initialization**), Read Configuration Data from FLASH (see **Section 8.4.4, Read Configuration Data from FLASH**) and PLL lock-up time (see **Section 35.3.3, PLL0 Characteristics**).

35.6.3 RESETZ Timing

Conditions:

- See **Section 35.6.1.1, General Conditions**

Table 35.19 RESETZ Timing*1

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
RESETZ input low level width*1	t_{WRSL}	*2	2400			ns
RESETZ pulse rejection width*2	t_{WRRJ}	*3	400		2400	ns

Note 1. The RESETZ input incorporates an analog noise filter.

Note 2. To activate the RESETZ, the low pulse width at the RESETZ input must be greater than the specified value.

Note 3. Input pulses shorter than the given min. value will be filtered out (resulting in no Reset). Input pulses between min. and max. value result in an undefined Reset condition (i.e. pulses might be filtered out or not).

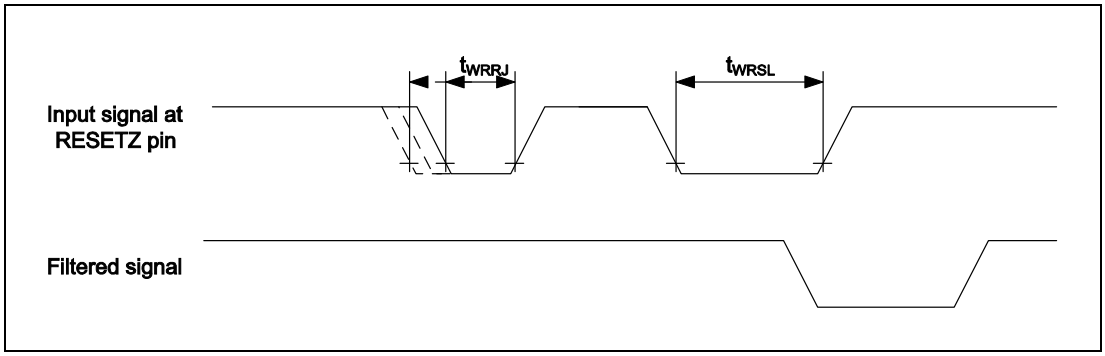


Figure 35.6 RESETZ Timing

35.6.4 Interrupt Timing

Conditions:

- See **Section 35.6.1.1, General Conditions**

Table 35.20 Interrupt Timing*1

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
NMI input high level width	t_{WNIH}	*2	600			ns
NMI input low level width	t_{WNIL}	*2	600			ns
NMI pulse rejection width	t_{WNIRJ}	*3	100		600	ns
INTPn input high level width	t_{WITH}	*2	600			ns
INTPn input low level width	t_{WITL}	*2	600			ns
INTPn pulse rejection width	t_{WIRJ}	*3	100		600	ns

Note 1. Each NMI and INTPn input incorporates an analog noise filter.

Note 2. Pulses must be longer than the [min.] spec value in order to pass the filter.

Note 3. Input pulses shorter than the given min. value will be filtered out (resulting in no interrupt detected). Input pulses between min. and max. value result in an undefined interrupt signal condition (i.e. pulses might be filtered out or not).

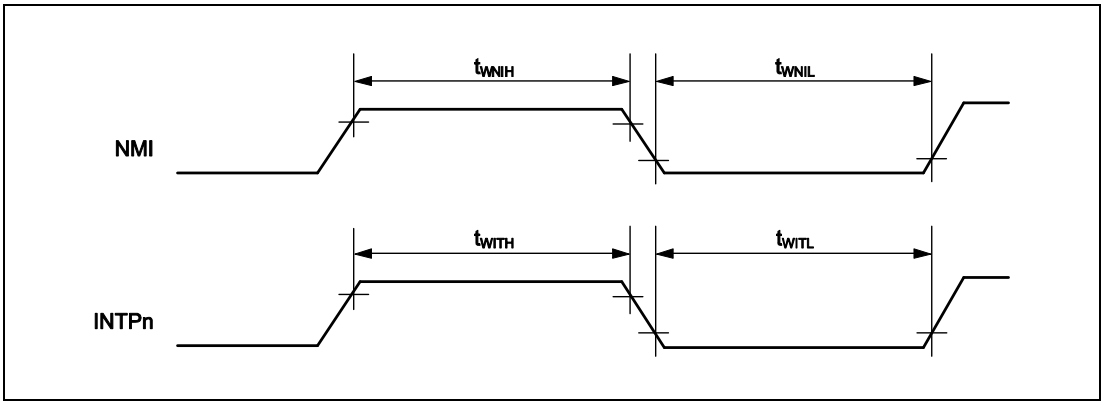

Figure 35.7 Interrupt Timing

35.6.5 Mode Timing

Conditions:

- See **Section 35.6.1.1, General Conditions**

Table 35.21 Mode Timing*1

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
FLMD0/1 input high level width	t_{WFDH}	*2	600			ns
FLMD0/1 input low level width	t_{WFDL}	*2	600			ns
FLMD0/1 pulse rejection width	t_{WFDRJ}	*3	100		600	ns

Note 1. Each FLMD0/1 input incorporates an analog noise filter.

Note 2. Pulses must be longer than the [min.] spec value in order to pass the filter.

Note 3. Input pulses between min. and max. value result in an undefined mode signal condition (i.e. pulses might be filtered out or not).This characteristic is not tested in production.

NOTE

Switching of FLMD0 after RESETZ ↑ is prohibited.

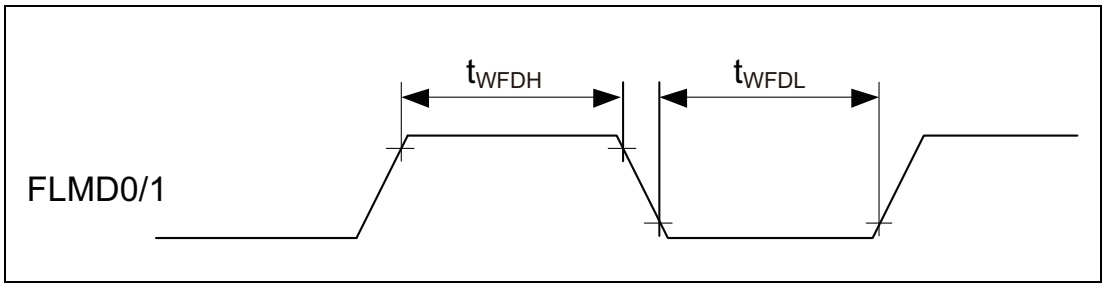

Figure 35.8 FLMD0/1 Timing

35.6.6 ADCnTRG Timing

Conditions:

- See **Section 35.6.1.1, General Conditions**

Table 35.22 ADCnTRG Timing*1

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
ADCnTRG input high-level width	t_{WADH}	*2	$t_{DDNF, max}$ *3			ns
ADCnTRG input low-level width	t_{WADL}	*2	$t_{DDNF, max}$ *3			ns
ADCnTRG pulse rejection width	t_{WADRJ}	*4	$t_{DDNFmin}$ *3		$t_{DDNFmax}$ *3	ns

Note 1. The ADC trigger (ADCnTRG) input incorporates a digital noise filter (DNF).

Note 2. Pulses must be longer than the [min.] spec value in order to pass the digital filter.

Note 3. The minimum and maximum delay time of a DNF (t_{DDNF}) is calculate as follows:

$$t_{DDNF,min} = (S-1) \times \frac{1}{fs}$$

$$t_{DDNF,max} = S \times \frac{1}{fs}$$

with s: number of sampling times (S = 2.5); fs: sampling clock; f_{DNFCK}: DNF macro clock.
Please note the fs is calculated as follows:

$$fs = \frac{f_{DNFCK}}{PRS}$$; with PRS: prescaler (PRS = 1, 2, 4, 8, ..., 128)

Note 4. Input pulse shorter than the given min. value will be filtered out (resulting in no ADCnTRG). Input pulses between min. and max. value result in an undefined ADCnTRG signal condition (i.e. pulses might be filtered out or not).
This characteristic is not tested in production.

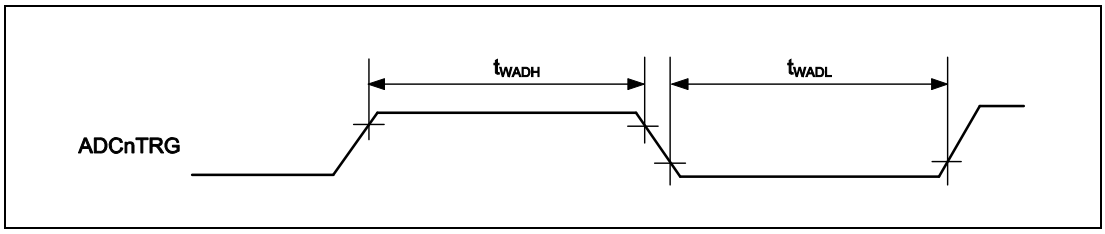

Figure 35.9 ADCnTRG Timing

35.6.7 Clock Output Timing

Conditions:

- See **Section 35.6.1.1, General Conditions**

Table 35.23 Clock Output Timing*1

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Clock output period time	t_{CLKOUT}		50			ns
Clock output high level width	t_{WCOH}		t_{CLKOUT} / 2 –15			ns
Clock output low level width	t_{WCOL}		t_{CLKOUT} / 2 –15			ns

Note 1. There is a function to output the internal clock via EXTCLKnO pin.
Note 2. For base clock refer to related Section 12, Clock Controller.

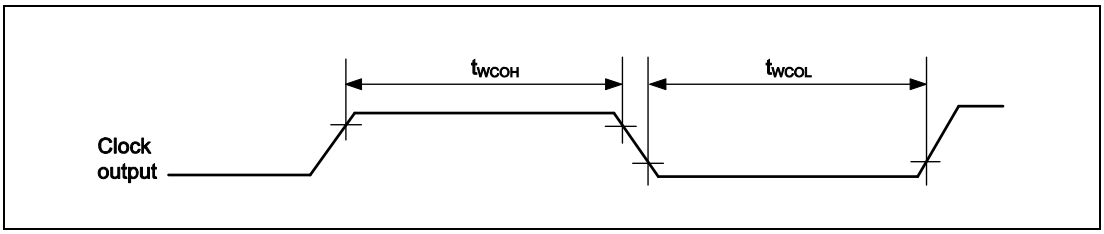

Figure 35.10 Clock Output Timing

35.6.8 High-Speed USRT Timing

Conditions:

- See **Section 35.6.1.1, General Conditions**

Table 35.24 HS-USRT timing (1/2)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
HSURTnCSIO to HSURTnSCKIO delay time	t_{DCSSCI}	input mode (RX)	t_{WHSCI}			ns
HSURTnSDIOm setup time	t_{SSDI}	input mode (RX)	7			ns
HSURTnSDIOm hold time	t_{SSDH}	input mode (RX)	7			ns
HSURTnSCKIO high level width	t_{WHSCI}	input mode (RX)	0.5 × t_{KCYS} – 4			ns
HSURTnSCKIO low level width	t_{WLSCI}	input mode (RX)	0.5 × t_{KCYS} – 4			ns
HSURTnSCKIO cycle time	t_{KCYS}	input mode (RX)	25			ns
HSURTnSCKIO to HSURTnCSIO delay time	t_{DSCICS}	input mode (RX)	10			ns
HSURTnCSIO high level width	t_{WHCS}	input mode (RX)	t_{KCYS}			ns
HSURTnSDIR to HSURTnCSIO delay time	t_{DSDCSI}	input mode (RX)	0			ns
HSURTnCSIO to HSURTnSDIR delay time	t_{DCSSDI}	input mode (RX)	0			ns
HSURTnCSIO to HSURTnSCKIO delay time	t_{DCSSCO}	output mode (TX)	0.5 × t_{KCYM}			ns
HSURTnSCKIO to SDO delay time	t_{DSCSDO}	output mode (TX)	0		25	ns
HSURTnSDIOm hold time	t_{HSDO}	output mode (TX)	25			ns

Table 35.24 HS-USRT timing (2/2)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
HSURTnSCKIO to HSURTnCSIO inactive time	t_{ISCCSO}	output mode (TX)	0.5 × t_{KCYM}			ns
HSURTnSCKIO high level width	t_{WHSCO}	output mode (TX)	0.5 × t_{KCYM} – 15			ns
HSURTnSCKIO low level width	t_{WLSCO}	output mode (TX)	0.5 × t_{KCYM} – 15			ns
HSURTnSCKIO cycle time	t_{KCYM}	output mode (TX)	100			ns
Interframe delay	t_{KIFM}	output mode (TX)	2 × t_{KCYM}			ns
Input mode (RX)	RHSUrx				160	Mbit/s
Output mode (TX)	RUSHtx				40	Mbit/s

	SO2	—	—	—	10MHz	—	10MHz	P8_0
	SI2	—	—	—	10MHz	—	10MHz	P8_1

Note: Description for CSIH communication is based on CSIH-pin group. A CSIH-pin group is defined by naming having same suffix n=> e.g. CSIH1SCn/CSIH1SOn/CSIH1SIn).

35.6.9.2 Master mode (10 MHz Communication Speed)

Conditions:

- See **Section 35.6.1.1, General Conditions**
- If not other mentioned the following conditions are different from the general ones given above:
  - Capacitive load (Cload) connected to output pins: CSIHnSC = 100pF, CSIHnSO = 100pF, CSIHnCSS = 100pF.
    It is necessary to select 50 Ω output buffer.
  - Capacitive load (Cload) connected to output pins: Up to 30pF.
    Output buffer can be selected 50/100/200 Ω.
  - EnVCC = 3.0 to 3.6V
- Usable pin for 10 MHz mode is random for all CSIH-pin group within one CSIHn (same suffix n). For CSIH-pin group see **Table 35.25, CSIH Communication Speed Overview**.
- Below terminals have no “100 Ω” output buffer.
  P3_9 (CSIH1CSS4), P3_10 (CSIH1CSS5)
  So using pin Group3 of CSIH1, please select “50 Ω” or “200 Ω” output buffer about all pin Group3 of CSIH1. About Group3 of CSIH1, see “**Section 2, Pin Functions**”.

Table 35.26 CSIH Timing (Master Mode, 10 MHz Communication Speed) (1/2)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
CSIH Operation clock cycle time	t_{KCYn}		6.25			ns
CSIHnSC cycle time	t_{KCYMn}		100			ns
CSIHnSC high level width	t_{KWHMn}	Cload = 20pF@50Ω output buffer select	0.5 × t_{KCYMn} – 7			ns
		Cload = 30pF@50Ω output buffer select	0.5 × t_{KCYMn} – 9			ns
		Cload = 100pF@50Ω output buffer select	0.5 × t_{KCYMn} – 23			ns
		Cload = 15pF@100Ω output buffer select	0.5 × t_{KCYMn} – 9			ns
		Cload = 30pF@100Ω output buffer select	0.5 × t_{KCYMn} – 15.5			ns
		Cload = 20pF@200Ω output buffer select	0.5 × t_{KCYMn} – 20			ns
		Cload = 30pF@200Ω output buffer select	0.5 × t_{KCYMn} – 28			ns

Table 35.26 CSIH Timing (Master Mode, 10 MHz Communication Speed) (2/2)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit

		Cload = 30pF@50Ω output buffer select	0.5 × t_{KCYMn} – 9			ns
		Cload = 100pF@50Ω output buffer select	0.5 × t_{KCYMn} – 23			ns
		Cload = 15pF@100Ω output buffer select	0.5 × t_{KCYMn} – 9			ns
		Cload = 30pF@100Ω output buffer select	0.5 × t_{KCYMn} – 15.5			ns
		Cload = 20pF@200Ω output buffer select	0.5 × t_{KCYMn} – 20			ns
		Cload = 30pF@200Ω output buffer select	0.5 × t_{KCYMn} – 28			ns
CSIHnSI setup time (vs. CSIHnSC)*1	t_{SSIMn}	*4	28			ns
CSIHnSI hold time (vs. CSIHnSC)*1	t_{HSIMn}	*4	0			ns
CSIHnSO output delay	t_{DSOMn}*5				7	ns
CSIHnCSS[7:0] inactive width	t_{WSCSBn}		CSIDLE × t_{KCYMn} – 28 *1			ns
CSIHnCSS[7:0] setup time (vs. CSIHnSC)	$t_{SSCSBn0}$	CSIHnCTL1.CSIHnDAP = 0	CSSETUP × t_{KCYMn} – 10 *2			ns
	$t_{SSCSBn1}$	CSIHnCTL1.CSIHnDAP = 1	(CSSETUP + 0.5) × t_{KCYMn} – 10*2			ns
CSIHnCSS[7:0] hold time (vs. CSIHnSC)	$t_{HSCSBn0}$	CSIHnCTL1.CSIHnSIT = 0	CSSHOLD × t_{KCYMn} – 5*3			ns
	$t_{HSCSBn1}$	CSIHnCTL1.CSIHnSIT = 1	(CSSHOLD + 0.5) × t_{KCYMn} – 5*3			ns
CSIHnRYI setup time (vs. CSIHnSC)	t_{SRYI}		2 × t_{KCYn} + 54			ns
CSIHnRYI high level width	t_{WRYI}		t_{KCYn} + 5			ns

Note 1. CSIDLE: Setting value of CSIHnCFGx.CSIHnIDx[2:0]

Note 2. CSSETUP: Setting value of CSIHnCFGx.CSIHnSPx[3:0]

Note 3. CSSHOLD: Setting value of CSIHnCFGx.CSIHnHDx[3:0]

Note 4. Please set SLRS = 1 if this specification can not be achieved by setting SLRS = 0 (See **Figure 35.13** and **Figure 35.14**). SLRS: Setting value of CSIHnCTL1.CSIHnSLRS

Note 5. tDSOMn timing is only valid for CSIHnSC and CSIHnSO have same output rise and fall times. If not identical the timing changes according the differences of Output rise and fall times. For tOR/tOF refer to “Output rise and fall times of GPIO buffer” in **Section 35.4.2, Digital IO Pins Input and Output Characteristics**.

35.6.9.3 Master mode (20 MHz Communication Speed)

Conditions:

- See **Section 35.6.1.1, General Conditions**
- If not other mentioned the following conditions are different from the general ones given above:
  - Capacitive load (Cload) connected to output pins: CSIHnSC = 15pF, CSIHnSO = 15pF, CSIHnCSS = 15pF.
    It is necessary to select 50 Ω output buffer.
  - EnVCC = 3.0 to 3.6V
- Usable pin for 20 MHz mode belong to same CSIH-pin group. For 20 MHz CSIH-pin group refer to **Table 35.25, CSIH Communication Speed Overview**.

Table 35.27 CSIH Timing (Master Mode, SLRS = 1, 20 MHz Communication Speed)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
CSIH Operation clock cycle time	t_{KCYn}		6.25			ns
CSIHnSC cycle time	t_{KCYMn}		50			ns
CSIHnSC high level width	t_{KWHMn}		$0.5 \times t_{KCYMn} - 6$			ns
CSIHnSC low level width	t_{KWLMn}		$0.5 \times t_{KCYMn} - 6$			ns
CSIHnSI setup time (vs. CSIHnSC)	t_{SSIMn}	SLRS = 1*4	20			ns
CSIHnSI hold time (vs. CSIHnSC)	t_{HSIMn}	SLRS = 1*4	0			ns
CSIHnSO output delay (vs. CSIHnSC)	t_{DSOMn}				7	ns
CSIHnCSS[7:0] inactive width	t_{WSCSBn}		CSIDLE × t_{KCYMn} – 23*1			ns
CSIHnCSS[7:0] setup time (vs. CSIHnSC)	$t_{SSCSBn0}$	CSIHnCTL1.CSIHnDAP = 0	CSSETUP × t_{KCYMn} – 10*2			ns
	$t_{SSCSBn1}$	CSIHnCTL1.CSIHnDAP = 1	(CSSETUP + 0.5) × t_{KCYMn} – 10*2			ns
CSIHnCSS[7:0] hold time (vs. CSIHnSC)	$t_{HSCSBn0}$	CSIHnCTL1.CSIHnSIT = 0	CSSHOLD × t_{KCYMn} – 5*3			ns
	$t_{HSCSBn1}$	CSIHnCTL1.CSIHnSIT = 1	(CSSHOLD + 0.5) × t_{KCYMn} – 5*3			ns
CSIHnRYI setup time (vs. CSIHnSC)	t_{SRYI}		$2 \times t_{KCYn} + 48$			ns
CSIHnRYI high level width	t_{WRYI}		$t_{KCYn} + 5$			ns

Note 1. CSIDLE: Setting value of CSIHnCFGx.CSIHnIDx[2:0]
Note 2. CSSETUP: Setting value of CSIHnCFGx.CSIHnSPx[3:0]
Note 3. CSSHOLD: Setting value of CSIHnCFGx.CSIHnHDx[3:0]
Note 4. SLRS: Setting value of CSIHnCTL1.CSIHnSLRS

35.6.9.4 Slave mode (10 MHz Communication Speed)

Conditions:

- See **Section 35.6.1.1, General Conditions**
- If not other mentioned the following conditions are different from the general ones given above:
  - Capacitive load (Cload) connected to output pins: Up to 100pF
    It is necessary to select 50 Ω output buffer.
  - Capacitive load (Cload) connected to output pins: Up to 30pF.
    Output buffer can be selected 50/100/200 Ω.
  - EnVCC = 3.0 to 3.6V
- Usable pin for 10 MHz mode is random for all CSIH-pin group within one CSIHn (same suffix n).
  For CSIH-pin group see **Table 35.25, CSIH Communication Speed Overview**.

Table 35.28 CSIH Timing (Slave Mode, 10 MHz Communication Speed)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
CSIH Operation clock cycle time	t_{KCYn}		6.25			ns
CSIHnSC cycle time	t_{KCYSn}		100			ns
CSIHnSC high level width	t_{KWHSn}		0.5 × t_{KCYSn} – 28			ns
CSIHnSC low level width	t_{KWLSn}		0.5 × t_{KCYSn} – 28			ns
CSIHnSI setup time (vs. CSIHnSC)	t_{SSISn}		10			ns
CSIHnSI hold time (vs. CSIHnSC)	t_{HSISn}		t_{KCYn} + 5			ns
CSIHnSO output delay (vs. CSIHnSC)	t_{DSOSn}				54	ns
CSIHnRYO output delay	t_{SRYOn}	t_{KCYSn} / t_{KCYn} is 8 and over			54	ns
		t_{KCYSn} / t_{KCYn} is less than 8			54 + tKCYSn	ns
CSIHnSSIZ setup time (vs. CSIHnSC)	t_{SSSIn}		0.5 × t_{KCYSn} – 10			ns
CSIHnSSIZ hold time (vs. CSIHnSC)	t_{HSSIn}		t_{KCYn} + 5			ns

35.6.9.5 Slave mode (20 MHz Communication Speed)

Conditions:

- See **Section 35.6.1.1, General Conditions**
- If not other mentioned the following conditions are different from the general ones given above:
  - Capacitive load (Cload) connected to output pins: Up to 15pF
    It is necessary to select 50 Ω output buffer.
  - EnVCC = 3.0 to 3.6V
- Usable pin for 20 MHz mode belong to same CSIH-pin group. For 20 MHz CSIH-pin group refer to **Table 35.25, CSIH Communication Speed Overview**.

Table 35.29 CSIH Timing (Slave Mode, 20 MHz Communication Speed)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
CSIH Operation clock cycle time	t_{KCYn}		6.25			ns
CSIHnSC cycle time	t_{KCYSn}		50			ns
CSIHnSC high level width	t_{KWHSn}		$0.5 \times t_{KCYSn} - 6$			ns
CSIHnSC low level width	t_{KWLSn}		$0.5 \times t_{KCYSn} - 6$			ns
CSIHnSI setup time (vs. CSIHnSC)	t_{SSISn}		10			ns
CSIHnSI hold time (vs. CSIHnSC)	t_{HSISn}		$t_{KCYn} + 5$			ns
CSIHnSO output delay (vs. CSIHnSC)	t_{DSOSn}				24	ns
CSIHnRYO output delay	t_{SRYOn}				24	ns
CSIHnSSIZ setup time (vs. CSIHnSC)	t_{SSSIn}		$0.5 \times t_{KCYSn} - 10$			ns
CSIHnSSIZ hold time (vs. CSIHnSC)	t_{HSSIn}		$t_{KCYn} + 5$			ns

35.6.10 FlexRay Timing

Conditions:

- See **Section 35.6.1.1, General Conditions**
- The following conditions are different from the general ones given above:
  - Capacitive load (Cload) connected to output pins: Up to 25pF
    It is necessary to select 50 Ω output buffer.
  - EnVCC = 3.0 to 3.6V.

Table 35.30 FlexRay Timing*1

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Transfer rate	RFLX	FLXnRXDA, FLXnRXDB, 10Mbps			10	Mbps

Note 1. Base of this specification is “FlexRay Electrical Physical Layer Specification V3.0.1, Oct-2010”

NOTE

“n” means unit number of Flexray. n = 0 or 1

35.6.11 RLIN3 Timing

Conditions:

- See **Section 35.6.1.1, General Conditions**

Table 35.31 RLIN3 Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
RLIN3 transfer rate	RRLlin	LIN mode			20	kbps
	RLurt	UART mode			6.6	Mbps

35.6.12 Ethernet Timing

35.6.12.1 MII Characteristics

Conditions:

- See **Section 35.6.1.1, General Conditions**
- Capacitive load (Cload) connected to output pins: Up to 15pF
  It is necessary to select 50 Ω output buffer.

Table 35.32 Ethernet Timing – 100 Mbit/s MII Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
ETHmTXCLK width	t_{MTC}		40 – 100 ppm	40	40 + 100 ppm	ns
ETHmTXCLK high width	t_{MTCH}	*1	14	20	26	ns
ETHmTXCLK low width	t_{MTCL}	*1	14	20	26	ns
ETHmTXD [3:0] delay time	t_{MTXD}		0		25	ns
ETHmTXEN delay time	t_{MTXE}		0		25	ns
ETHmRXCLK width	t_{MRC}		40 – 100 ppm	40	40 + 100 ppm	ns
ETHmRXCLK high width	t_{MRCH}	*1	14	20	26	ns
ETHmRXCLK low width	t_{MRCL}	*1	14	20	26	ns
ETHmRXD [3:0] setup time	t_{MRXDS}		10			ns
ETHmRXD [3:0] hold time	t_{MRXDH}		10			ns
ETHmRXDV, ETHmRXER setup time	t_{MRDES}		10			ns
ETHmRXDV, ETHmRXER hold time	t_{MRDEH}		10			ns

Note 1. The duty cycle of ETHmTXCLK and ETHmRXCLK shall be between 35 to 60% inclusive. (IEEE802.3)

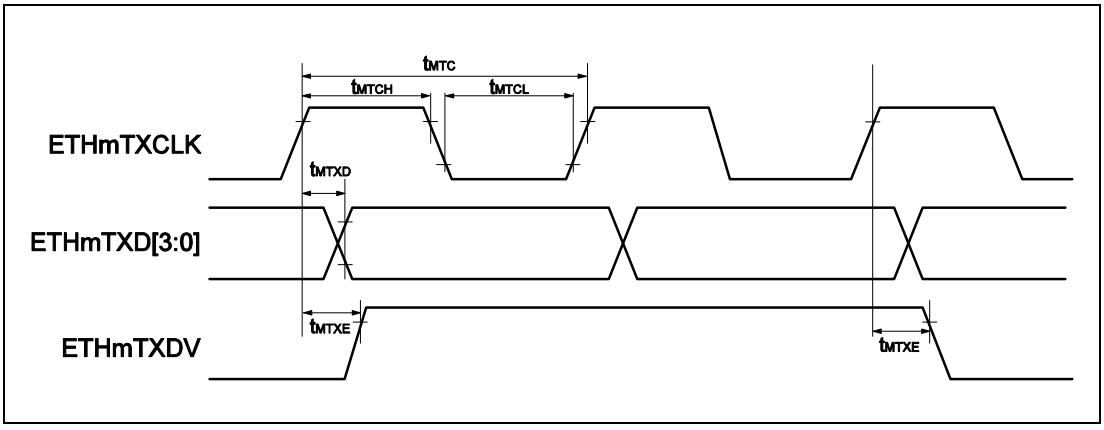

Figure 35.31 Ether net Timing – MII Transmitter

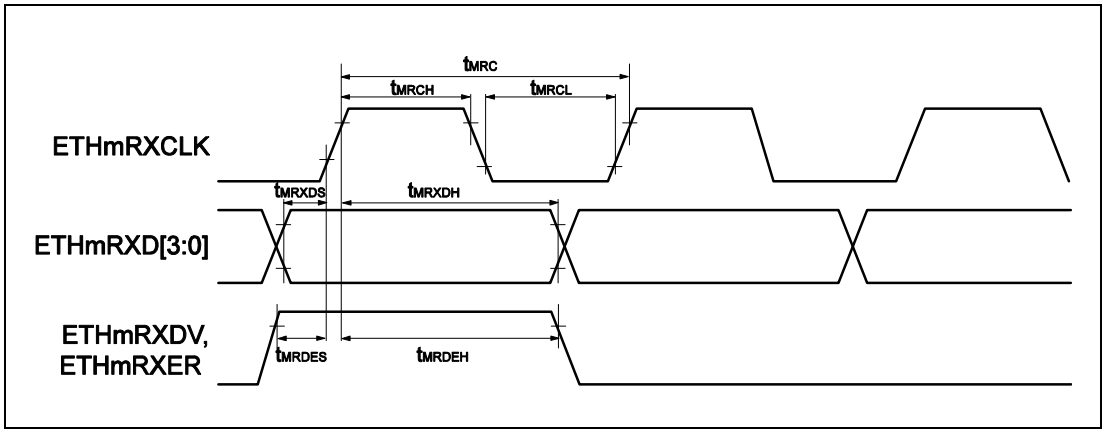

Figure 35.32 Ethernet Timing – MII Receiver

35.6.12.2 RMII Characteristics

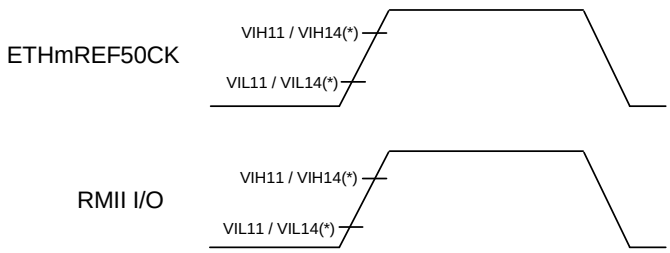
Conditions:

- See **Section 35.6.1.1, General Conditions**
- Capacitive load (Cload) connected to output pins: Up to 15pF
  It is necessary to select 20 Ω output buffer.

Table 35.33 Ethernet Timing – RMII Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
ETHmREF50CK width	t_{RMC}		20 – 50 ppm	20	20 + 50 ppm	ns
ETHmREF50CK high width	t_{RMCH}	*1	7		13	ns
ETHmREF50CK low width	t_{RMCL}	*1	7		13	ns
ETHmRXD [1:0], ETHmCRS and ETHmRXER setup time	t_{RMS}		4			ns
ETHmRXD [1:0], ETHmCRS and ETHmRXER hold time	t_{RMH}		2			ns
ETHmTXD [1:0], ETHmTXEN output delay time	t_{RMD}	Cload < 15 pF	2		16	ns

Note 1. The dutry cycle of ETHmREF50CK shall be between 35% to 65% inclusive. (RMII™ specification)



Note 1. VIH and VIL specification depend on PISn/JPIS0 register setting. Refer to **Section 2 Pin Functions**

Figure 35.33 Ethernet Timing – RMII AC Measurements (Valid I/O Levels)

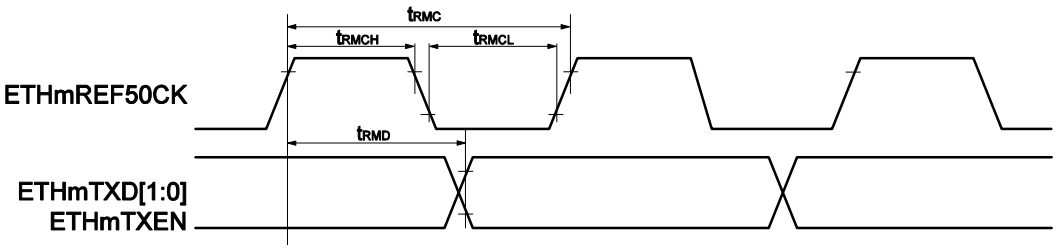


Figure 35.34 Ethernet Timing – RMII Transmitter

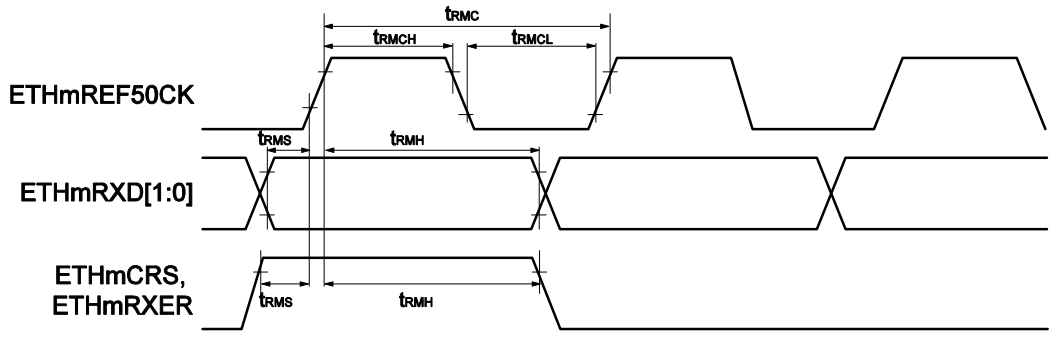

Figure 35.35 Ethernet Timing – RMII Receiver

35.6.13 GTM Timing

Conditions:

- See **Section 35.6.1.1, General Conditions**
- Below terminals have no “100 Ω” output buffer.
  P3_9 (GTMAT1O0), P3_10 (GTMAT0O1), P3_14 (GTMAT0O1),
  P8_9 (GTMAT2O0), P8_10 (GTMAT20N), P8_11 (GTMAT2O1)
  So please select “50 Ω” or “200 Ω” output buffer about these terminals.

Table 35.34 GTM Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
GTM input high-level width	t_{WGTH}		$2 \times T_{samp}$ *1			ns
GTM input low-level width	t_{WGTL}		$2 \times T_{samp}$ *1			ns
GTM output cycle time	t_{CYGT}		$4 \times T_{samp}$ *1			ns

Note 1. $T_{samp} = 1 / f_{CLK\_HSB}$

35.6.14 MCAN Timing

Conditions:

- See **Section 35.6.1.1, General Conditions**
- Below terminals have no “100 Ω” output buffer.
  P8_10 (MTTCAN0SOC), P8_11 (MTTCAN0TMP)
  So please select “50 Ω” or “200 Ω” output buffer about these terminals.

Table 35.35 MCAN Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Transfer rate*1	RMCN1	CAN-FD arbitration and CAN 2.0B			1	Mbps
	RMCN2*2	CAN-FD data phase			8	Mbps
Internal delay time (input plus output)	tDMCIN	tDIN + tDOUT (Cload = 15pF, with 50 Ω output buffer)			30	ns

Note 1. Protocol layer clock needs to be configured appropriately.

Note 2. It is necessary to select 50 Ω output buffer.

35.6.15 External Memory Controller (MEMC0) Timing

Conditions:

- See **Section 35.6.1.1, General Conditions**
- The following conditions are different from the general ones given above:
  - Please use internal pull-up for external memory interface data signal MEMC0D[7:0]I / MEMC0D[7:0]O
  - Below terminals have no “100 Ω” output buffer.
    P8_9 (MEMC0D1O), P8_10 (MEMC0D2O), P8_11 (MEMC0D3O)
    So please select “50 Ω” output buffer about these terminals.

35.6.15.1 MEMC0 — Read Access Timing (50 Ω output buffer / 30pF).

Conditions:

- See **Section 35.6.1.1, General Conditions**
- Capacitive load (Cload) connected to output pins: Up to 30pF
  It is necessary to select 50 Ω output buffer.

Table 35.36 MEMC0 – Read Access Timing (50 Ω output buffer / 30pF)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Bus operational period	T	Max. 20 MHz	50			ns
MEMC0D[7:0] data input setup time (from _MEMC0RDZ↓)	t_{SRDID}				T(*1) – 29	ns
MEMC0RDZ low level width	t_{WRDL}		T(*1) – 19			ns
MEMC0A[8:0] address, MEMC0CS[3:0]Z →MEMC0RDZ↓ delay time	t_{DARD}		T – 19			ns
MEMC0RDZ↑→from MEMC0A[8:0] address, MEMC0CS[3:0]Z delay time	t_{DRDA}		–15			ns
MEMC0D[7:0] data input hold time (from MEMC0RDZ↑)	t_{HRDID}		0			ns
MEMC0RDZ↑→MEMC0D[7:0] data output delay time	t_{DRDOD}		T(*2) – 9			ns

Note 1. Adjustment by WD is possible. W_D: wait cycle determined by DWC0 register.
Note 2. Adjustment by IWR is possible. I_{WR}: number of idle state after read cycle.

35.6.15.2 MEMC0 — Read Access Timing (100 Ω output buffer / 30pF).

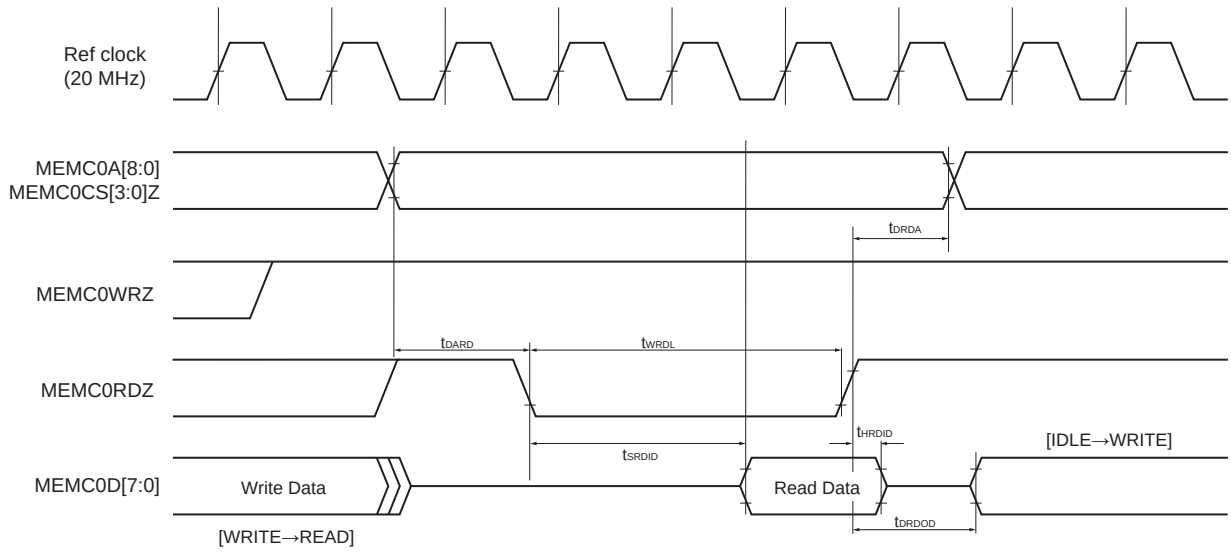
Conditions:

- See **Section 35.6.1.1, General Conditions**
- Capacitive load (Cload) connected to output pins: Up to 30pF
  Output buffer can be selected 50/100 Ω output buffer.

Table 35.37 MEMEC0 – Read Access Timing (100 Ω output buffer / 30pF)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Bus operational period	T	Max. 20 MHz	50			ns
MEMC0D[7:0] data input setup time (from _MEMC0RDZ↓)	t_{SRDID}				T(*1) – 38	ns
MEMC0RDZ low level width	t_{WRDL}		T(*1) – 19			ns
MEMC0A[8:0] address, MEMC0CS[3:0]Z →MEMC0RDZ↓ delay time	t_{DARD}		T – 25.5			ns
MEMC0RDZ↑→from MEMC0A[8:0] address, MEMC0CS[3:0]Z delay time	t_{DRDA}		–15			ns
MEMC0D[7:0] data input hold time (from MEMC0RDZ↑)	t_{HRDID}		0			ns
MEMC0RDZ↑→MEMC0D[7:0] data output delay time	t_{DRDOD}		T(*2) – 9			ns

Note 1. Adjustment by WD is possible. W_D: wait cycle determined by DWC0 register.
Note 2. Adjustment by IWR is possible. I_{WR}: number of idle state after read cycle.



Note: The dashed lines indicates high impedance.

Figure 35.36 MEMC0 – READ Access Timing

35.6.15.3 MEMC0 — Write Access Timing (50 Ω output buffer / 30pF)

Conditions:

- See **Section 35.6.1.1, General Conditions**
- Capacitive load (Cload) connected to output pins: Up to 30pF
  It is necessary to select 50 Ω output buffer.

Table 35.38 MEMC0 – Write Access Timing (50 Ω output buffer / 30pF)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Bus operational period	T	Max. 20 MHz	50			ns
MEMC0A[8:0] address, MEMC0CS[3:0]Z delay time (from _MEMC0WRZ↓)	t_{DAWR}		T – 19			ns
MEMC0WRZ↑→MEMC0A[8:0] address, MEMC0CS[3:0]Z delay time	t_{DWRA}		T(*2) – 25			ns
MEMC0WRZ low level width	t_{WWRL}		T(*1) – 19			ns
MEMC0D[7:0] data output setup time (from MEMC0WRZ↑)	t_{SODWR1}	WRITE2	2T(*1) – 19			ns
MEMC0D[7:0] data output setup time (from MEMC0WRZ↑)	t_{SODWR2}	WRITE1	2T(*1) – 19			ns
MEMC0D[7:0] data output hold time (from MEMC0WRZ↑)	t_{HWROD1}	WRITE2	T(*2) – 9			ns
MEMC0D[7:0] data output hold time (from MEMC0WRZ↑)	t_{HWROD2}	WRITE1	T(*2) – 9			ns

Note 1. Adjustment by WD is possible. W_D: Wait cycle determined by DWC0 register.
Note 2. Adjustment by WDH is possible. W_{DH}: wait cycle determined by DHC register.

35.6.15.4 MEMC0 — Write Access Timing (100 Ω output buffer / 30pF)

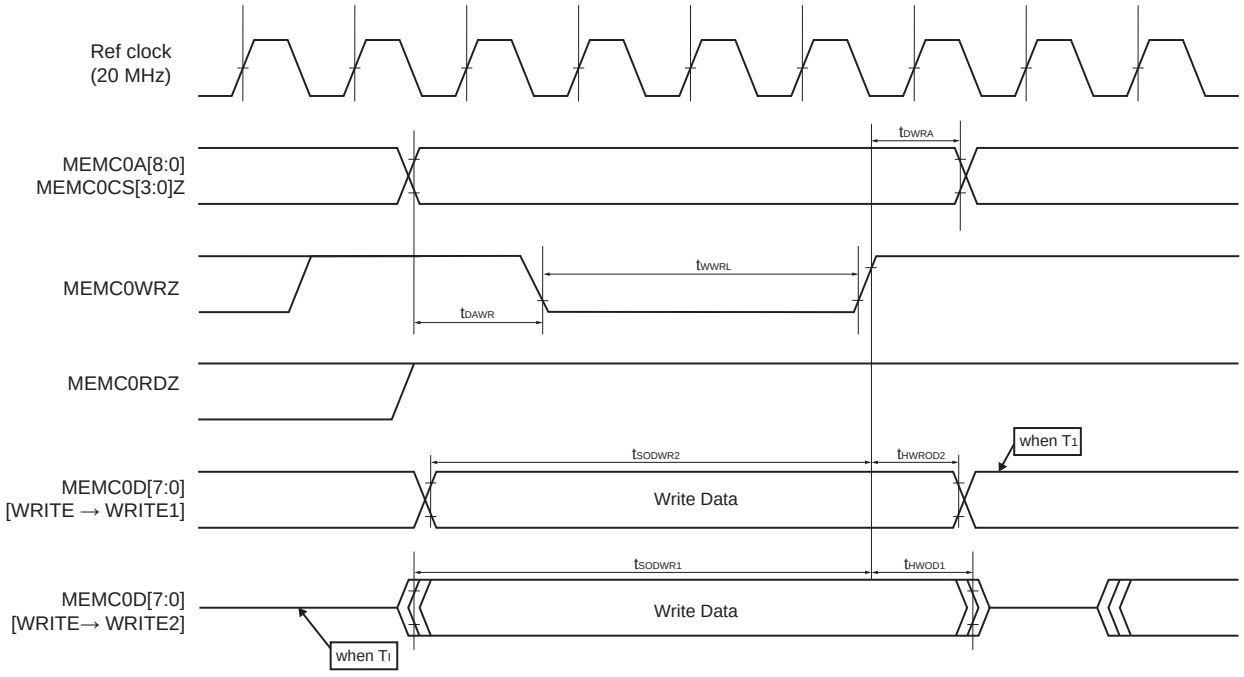
Conditions:

- See **Section 35.6.1.1, General Conditions**
- Capacitive load (Cload) connected to output pins: Up to 30pF
  Output buffer can be selected 50/100 Ω output buffer.

Table 35.39 MEMC0 – Write Access Timing (100 Ω output buffer / 30pF)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Bus operational period	T	Max. 20 MHz	50			ns
MEMC0A[8:0] address, MEMC0CS[3:0]Z delay time (from _MEMC0WRZ↓)	t_{DAWR}		T – 25.5			ns
MEMC0WRZ↑→MEMC0A[8:0] address, MEMC0CS[3:0]Z delay time	t_{DWRA}		T(*2) – 25			ns
MEMC0WRZ low level width	t_{WWRL}		T(*1) – 19			ns
MEMC0D[7:0] data output setup time (from MEMC0WRZ↑)	t_{SODWR1}	WRITE2	2T(*1) – 25.5			ns
MEMC0D[7:0] data output setup time (from MEMC0WRZ↑)	t_{SODWR2}	WRITE1	2T(*1) – 25.5			ns
MEMC0D[7:0] data output hold time (from MEMC0WRZ↑)	t_{HWROD1}	WRITE2	T(*2) – 9			ns
MEMC0D[7:0] data output hold time (from MEMC0WRZ↑)	t_{HWROD2}	WRITE1	T(*2) – 9			ns

Note 1. Adjustment by WD is possible. W_D: Wait cycle determined by DWC0 register.
Note 2. Adjustment by WDH is possible. W_{DH}: wait cycle determined by DHC register.



Note 1. In case of WRITE → WRITE operation
If TI cycle is not inserted, MEMC0 operates as [WRITE → WRITE1]
If TI cycle is inserted, MEMC0 operates as [WRITE → WRITE2]

Note 2. The dashed lines indicates high impedance.

Figure 35.37 MEMC0 – Write Access Timing

35.6.16 Emergency Shut-Off (ESO) Timing

Conditions:

- See **Section 35.6.1.1, General Conditions**

Table 35.40 ESO Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Delay time ESOnZ ↓ to GTMATnOx HiZ	t_{DESO}				50	ns

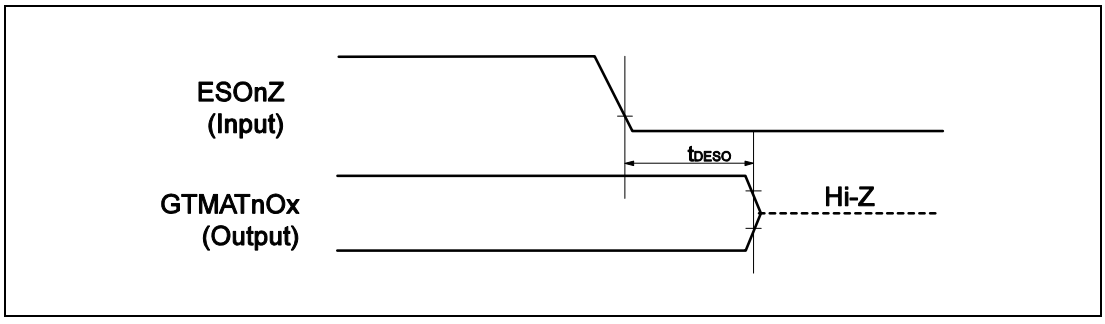


Figure 35.38 ESO Timing

35.6.17 TRSTZ Timing

Conditions:

- See **Section 35.6.1.1, General Conditions**

Table 35.41 TRSTZ Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
TRSTZ input low level width	t_{WTRL}		600			ns
TRSTZ release timing delay	t_{DTRT2R}		30			ms

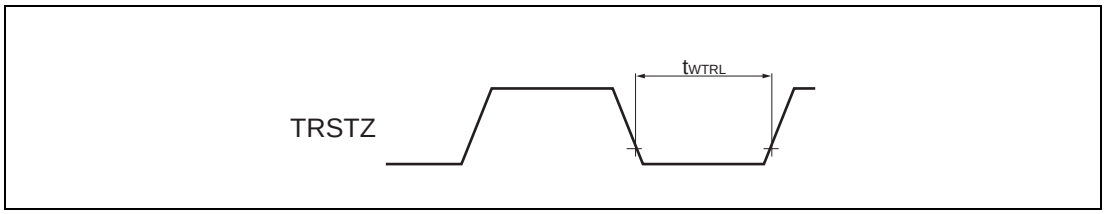

Figure 35.39 TRSTZ low level timing

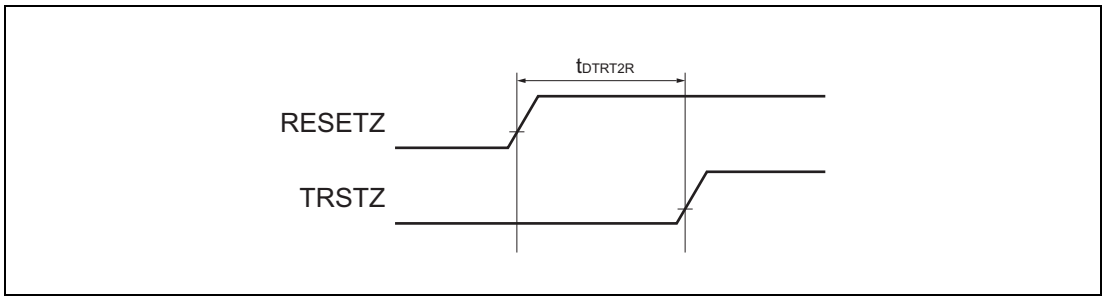

Figure 35.40 TRSTZ release timing

35.6.18 Nexus Interface Timing

Conditions:

- See **Section 35.6.1.1, General Conditions** except output buffer. Output buffer is selected 50Ω.

Table 35.42 Nexus Interface Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
TCK Cycle width	t_{DCKW}		50		666	ns
TCK high level width	t_{CKWH}		21			ns
TCK low level width	t_{CKWL}		21			ns
TDI setup time (vs. TCK ↑)	t_{SDI}		40			ns
TDI hold time (vs. TCK ↑)	t_{HDI}		3			ns
TMS setup time (vs. TCK ↑)	t_{SMS}		40			ns
TNS hold time (vs. TCK ↑)	t_{HMS}		3			ns
TDO delay time (vs. TCK ↓)	t_{DDO}		0		20	ns
RDYZ delay time (vs. TCK ↓)	t_{RDYZ}		0		20	ns

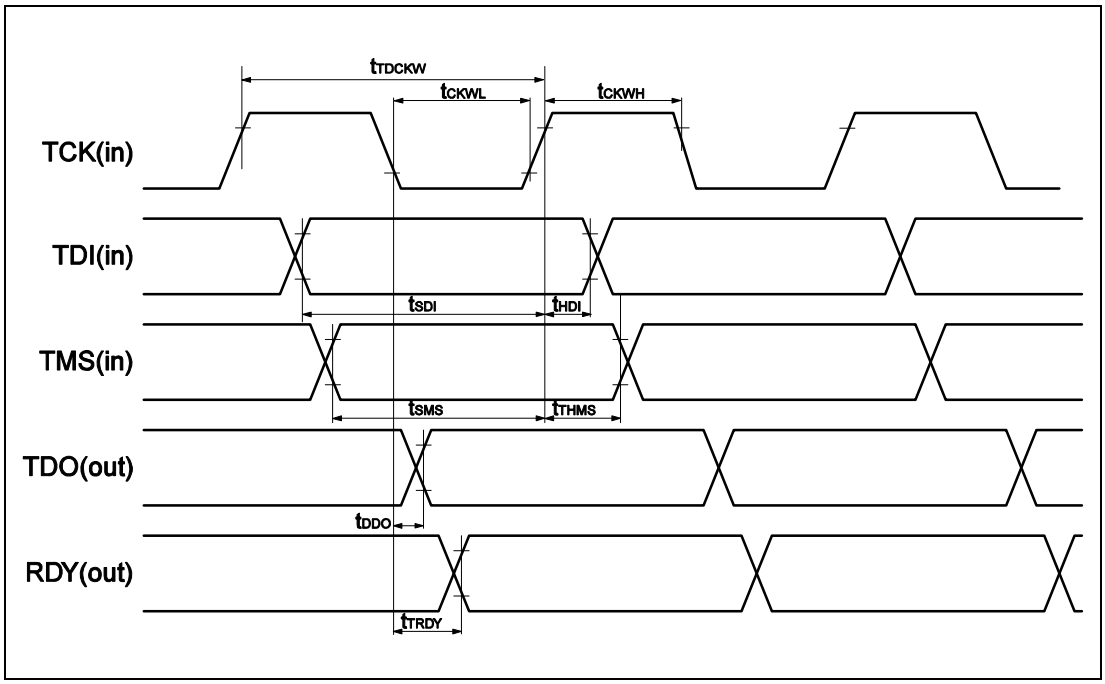

Figure 35.41 NEXUS Interface Timing

35.6.19 LPD (4pin) Interface Timing

Conditions:

- See **Section 35.6.1.1, General Conditions** except output buffer. Output buffer is selected 50Ω.

Table 35.43 LPD (4pin) Interface Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
LPDCLK cycle time / LPDCLKOUT cycle time	$t_{LPDCLKCY}$		83.3 (max. 12MHz)		666	ns
LPDCLK high level width / LPDCLK low level width	t_{LPDCKW}		0.5 × $t_{LPDCLKCY}$ – 10			ns
LPDCLKOUT high level width / LPDCLKOUT low level width	$t_{LPDCKOW}$		t_{LPDCKW} – 10			ns
LPDI setup time (vs. LPDCLK ↑)	t_{LPDIS}		41			ns
LPDI hold time (vs. LPDCLK ↑)	t_{LPDIH}		3			ns
LPDCLK to LPDCLKOUT delay time	$t_{LPDCKOD}$				44	ns
LPDO delay time (vs. LPDCLKOUT ↑)	t_{LPDOD}		0		15	ns

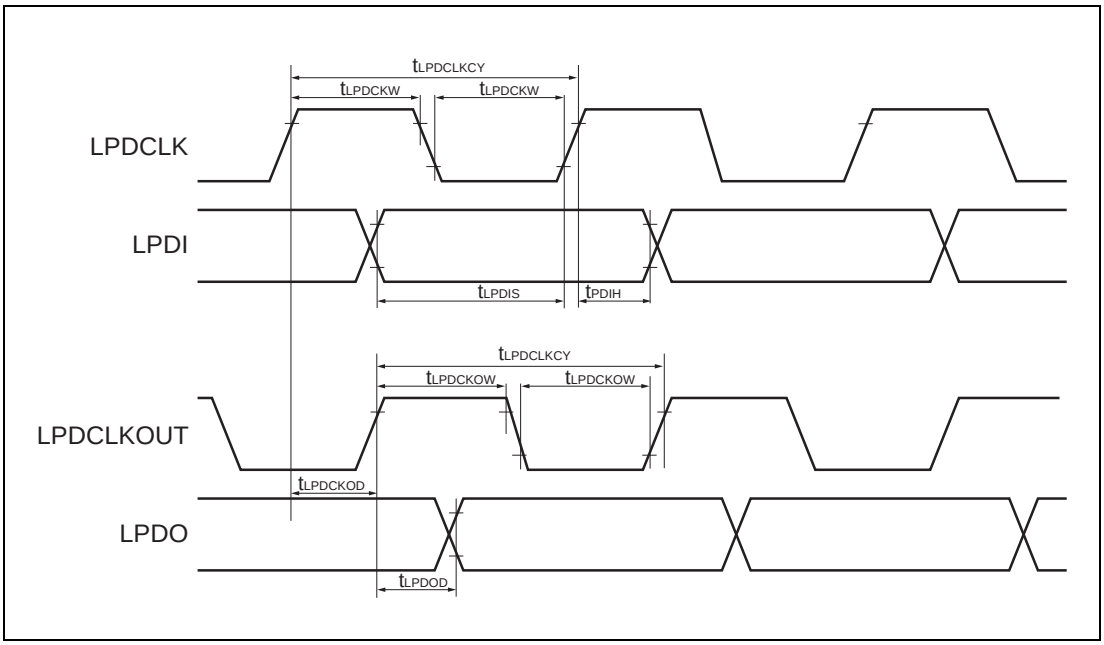

Figure 35.42 LPD (4pin) Interface Timing

35.6.20 AUDR Interface Timing

Conditions:

- See **Section 35.6.1.1, General Conditions**
- Capacitive load (Cload) connected to output pins: 10pF

Table 35.44 AUDR Interface Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
AUDCK cycle time	$t_{AUCKcyc}$		20			ns
AUDCK high level width	t_{AUCKH}		0.4			$t_{AUCKcyc}$
AUDCK low level width	t_{AUCKL}		0.4			$t_{AUCKcyc}$
AUDRSTZ setup time	t_{AURSTS}		12			ns
AUDRSTZ pulse width	t_{AURSTW}		5			$t_{AUCKcyc}$
AUDSYNCZ setup time	t_{AUSYS}		10			ns
AUDSYNCZ hold time	t_{AUSYH}		5			ns
AUDATA input setup time	t_{AUDTS}		8			ns
AUDATA input hold time	t_{AUDTH}		5			ns
AUDATA output delay	t_{AUDTD}				$t_{AUCKcyc}$ – 3.4	ns

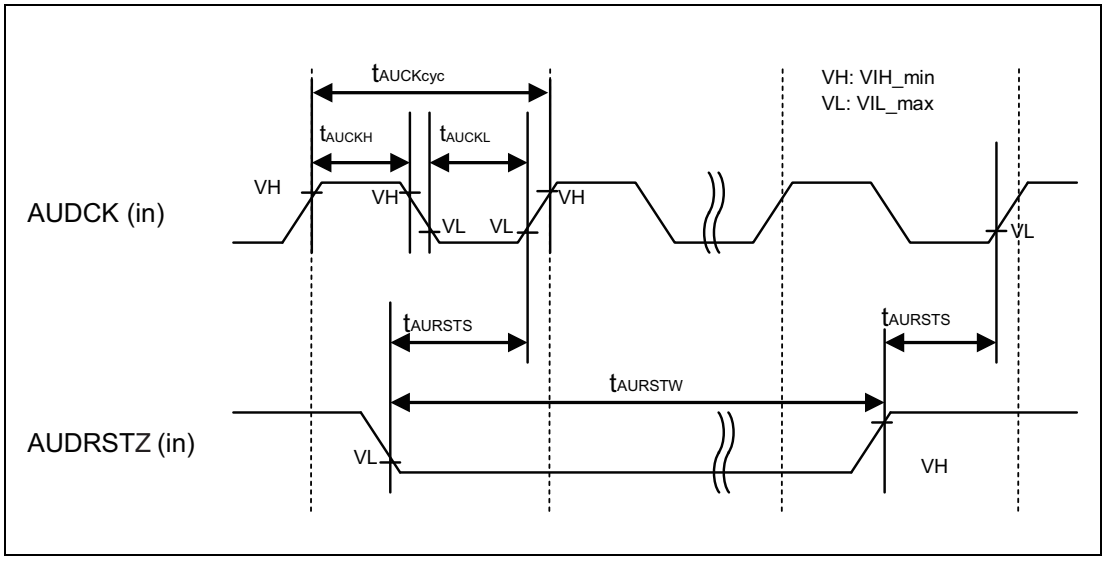

Figure 35.43 AUDRSTZ Timing

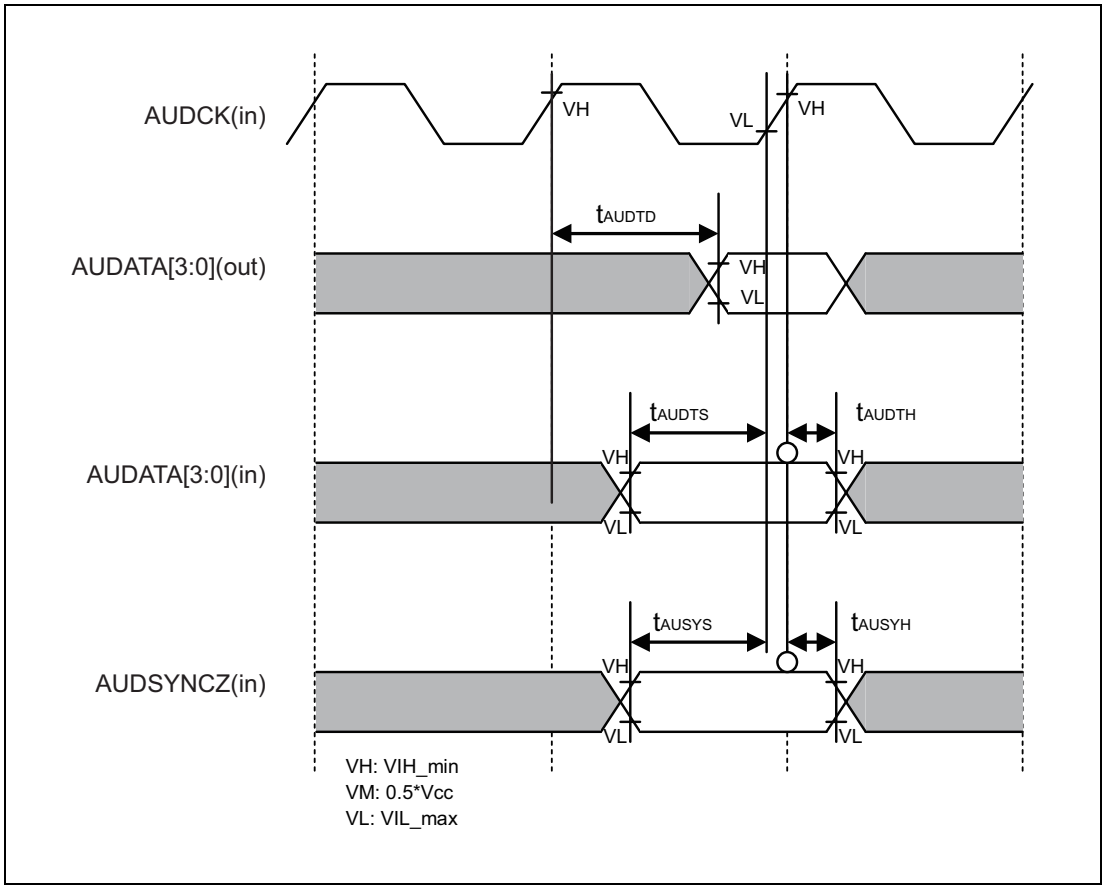

Figure 35.44 AUDR AC Timing

35.6.21 Aurora Interface Timing

Conditions:

- See **Section 35.6.1.1, General Conditions**

35.6.21.1 Aurora Interface — 1.25 Gbps baud rate

Table 35.45 Aurora Interface Operating Condition – 1.25Gbps baud rate

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Differential Voltage	VDIFF	*1	800		1600	mV
Rise / Fall Time	TRF	*2	60			ps
Deterministic jitter	JD				0.17	UI
Total jitter	JT				0.35	UI
Output skew	SO	*3			25	ps
Multiple output skew	SMO	*4			1000	ps
Unit interval	UI	± 100 ppm	800		800	ps
Differential output resistance	ZOD		70		130	Ω

Note 1. Peak to peak differential.
Note 2. At driver output.
Note 3. Skew at transmitter output between the differential pair.
Note 4. Skew at transmitter output between lanes of a multi-lane channel.

35.6.21.2 Aurora Interface — 2.5 Gbps baud rate

Table 35.46 Aurora Interface Operating Condition – 2.5Gbps baud rate

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Differential Voltage	VDIFF	*1	800		1600	mV
Rise / Fall Time	TRF	*2	40			ps
Deterministic jitter	JD				0.17	UI
Total jitter	JT				0.35	UI
Output skew	SO	*3			20	ps
Multiple output skew	SMO	*4			1000	ps
Unit interval	UI	± 100 ppm	400		400	ps
Differential output resistance	ZOD		70		130	Ω

Note 1. Peak to peak differential.
Note 2. At driver output.
Note 3. Skew at transmitter output between the differential pair.
Note 4. Skew at transmitter output between lanes of a multi-lane channel.

35.6.21.3 Aurora Interface – 3.125 Gbps baud rate

Table 35.47 Aurora Interface Operating Condition – 3.125Gps baud rate

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Differential Voltage	VDIFF	*1	800		1600	mV
Rise / Fall Time	TRF	*2	30			ps
Deterministic jitter	JD				0.17	UI
Total jitter	JT				0.35	UI
Output skew	SO	*3			15	ps
Multiple output skew	SMO	*4			1000	ps
Unit interval	UI	± 100 ppm	320		320	ps
Differential output resistance	ZOD		70		130	Ω

Note 1. Peak to peak differential.
Note 2. At driver output.
Note 3. Skew at transmitter output between the differential pair.
Note 4. Skew at transmitter output between lanes of a multi-lane channel.

35.6.21.4 Aurora Interface – Transmitter clock Timing

Table 35.48 Aurora Interface Transmitter clock timing

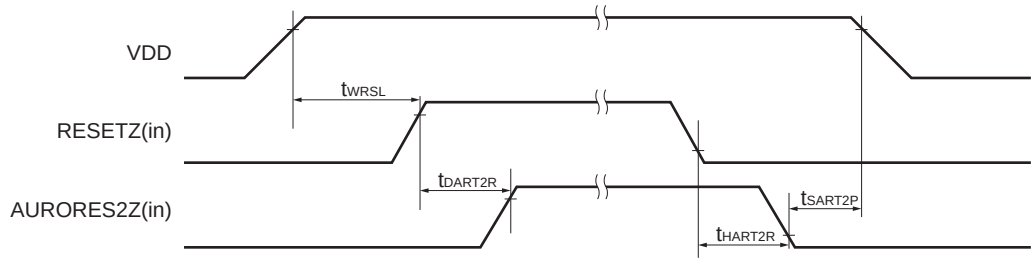
Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Reference clock frequency	CLKP	1.25 Gbps baud rate			62.5	MHz
		2.5 Gbps baud rate			125	MHz
		3.125 Gbps baud rate			156.25	MHz
Reference clock rise time					400	ps
Reference clock fall time					400	ps
Reference clock duty cycle			45		55	%
Reference clock total jitter		*1			40	ps
Stability			50			ppm

Note 1. Peak to peak.

35.6.22 Debug Resource (Aurora, ERAM) Specific Reset Timing

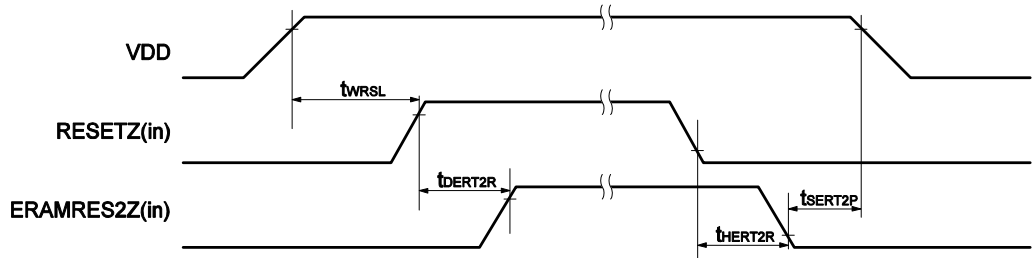
Table 35.49 Debug Resource (Aurora, ERAM) Specific Reset Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
AURORES2Z release timing delay	t_{DART2R}		0		400	ns
AURORES2Z inactive hold time	t_{HART2R}		2.4			µs
AURORES2Z setup time	t_{SART2P}		0			ns
ERAMRES2Z release timing delay	t_{DERT2R}		0		400	ns
ERAMRES2Z inactive hold time	t_{HERT2R}		2.4			µs
ERAMRES2Z assert setup time	t_{SERT2P}		0			ns
AURORES1Z release timing delay	$t_{DART2AVD}$		2.4			µs
AURORES1Z inactive hold time	$t_{SART2AVD}$		2.4			µs
ERAMRESPDZ release timing delay	$t_{DERT2EVD}$		2.4			µs
ERAMRESPDZ inactive hold time	$t_{SERT2EVD}$		2.4			µs



Note: About the parameter t_{WRSL}, please refer to “RESETZ low pulse width” in **Section 35.6.3**

Figure 35.45 AURORES2Z AC Timing



Note: About the parameter t_{WRSL}, please refer to “RESETZ low pulse width” in **Section 35.6.3**

Figure 35.46 ERAMRES2Z AC Timing

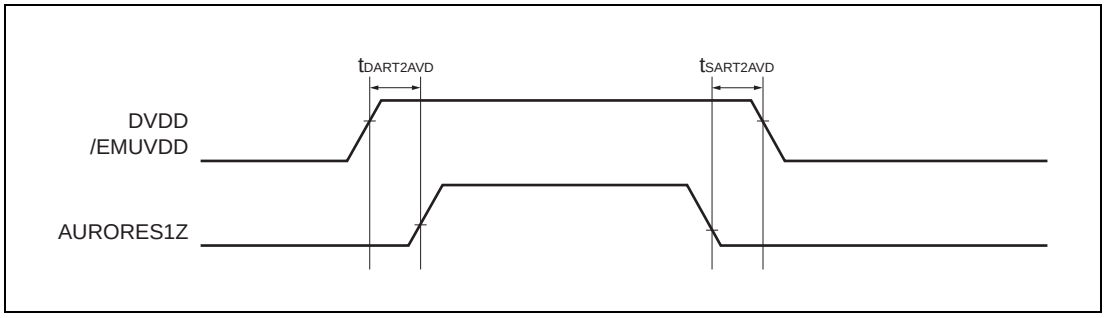


Figure 35.47 AURORES1Z AC Timing

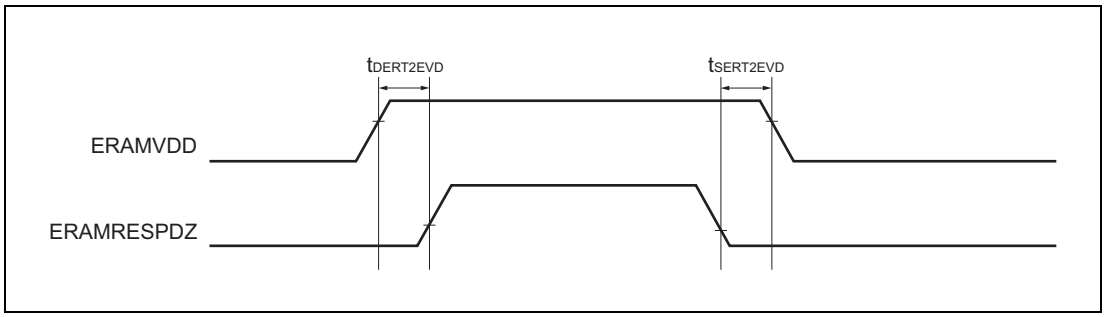

Figure 35.48 ERAMRESPDZ AC Timing

35.6.23 Debug Event Interface Timing

Table 35.50 Debug Event Interface Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
EVTIZ input high level width	t_{WEVIH}		t_{CPUCLK} *2			ns
EVTIZ input low level width	t_{WEVIL}		t_{CPUCLK} *2			ns
EVTOZ output high level width	t_{WEVOH}	*1	$16 \times t_{CPUCLK6} - 10$	60		ns
EVTOZ output low level width	t_{WEVOL}	*1	$16 \times t_{CPUCLK6} - 10$	60		ns
MSYNZ input high level width	t_{WMSNH}		40			ns
MSYNZ input low level width	t_{WMSNL}		40			ns

Note 1. Base clock frequency is CPU operating clock frequency (f_{CPUCLK}). Typical value corresponds to the case f_{CPUCLK} = 240 MHz.

Note 2. t_{CPUCLK} indicates a period of the lowest CPU clock in the device.

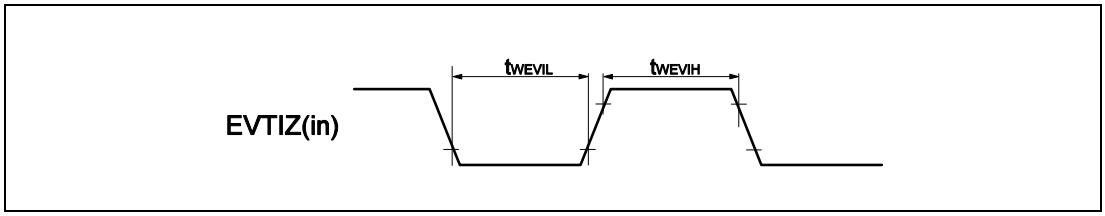

Figure 35.49 EVITZ AC Timing

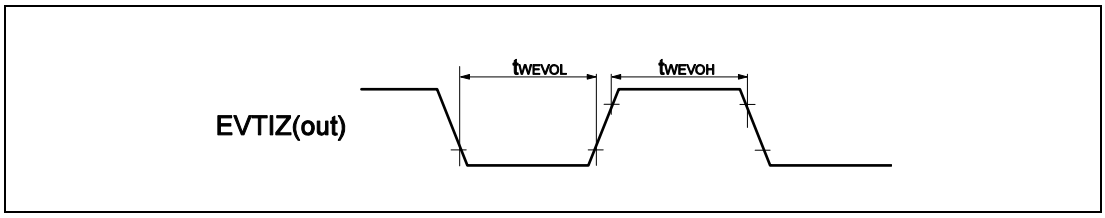

Figure 35.50 EVOTZ AC Timing

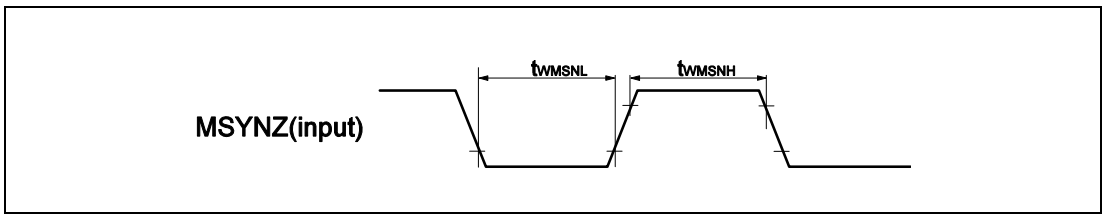

Figure 35.51 MSYNZ AC Timing

35.6.24 Flash Programming Characteristics

Conditions:

- See **Section 35.6.1.1, General Conditions** except output buffer. Output buffer is selected 50Ω.

Table 35.51 Flash FLSCI programming characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
FLSCI3 transfer rate		1-wired UART mode (f_{CLK_LSB} = 40MHz)			1	Mbps
		2-wired UART mode (f_{CLK_LSB} = 40MHz)			2	Mbps
FLSCI3SCKI cycle time	t_{KCYSF}	3-wired Clock Sync mode (f_{CLK_LSB} = 40MHz)	200*1			ns
FLSCI3SCKI high level width	t_{KWHSF}	3-wired Clock Sync mode	t_{KCYSF} / 2 – 15			ns
FLSCI3SCKI low level width	t_{KWLSF}	3-wired Clock Sync mode	t_{KCYSF} / 2 – 15			ns
FLSCI3RXD setup time (vs. FLSCI3SCKI)	t_{SSISF}	3-wired Clock Sync mode	2 × t_{Pcyc}*2			ns
FLSCI3RXD hold time (vs. FLSCI3SCKI)	t_{HSISF}	3-wired Clock Sync mode	2 × t_{Pcyc}*2			ns
FLSCI3TXD output delay (vs. FLSCI3SCKI)	t_{DSOSF}	3-wired Clock Sync mode	2 × t_{Pcyc}*2		3 × t_{Pcyc}*2 + 36	ns

Note 1. Input the external clock data is more than 6 clocks of CLK_LSB.

Note 2. t_{Pcyc} is a period of CLK_LSB

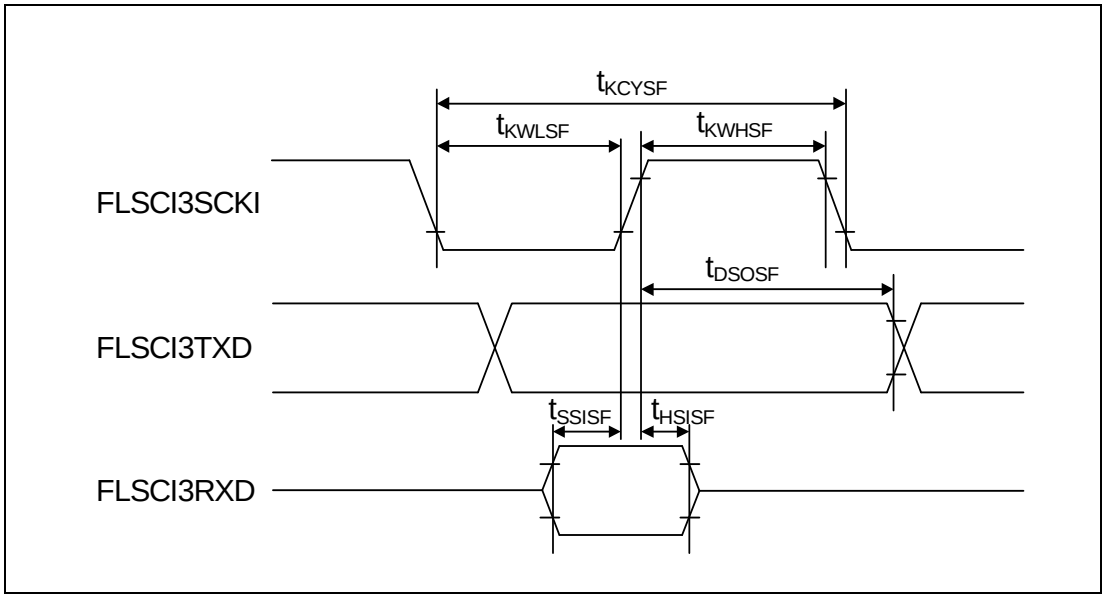

Figure 35.52 FLSCI Timing

Table 35.52 Serial Programmer Setup Timing

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Delay time VCC ↑ & SYSVCC ↑ & IOVCC ↑ to RESETZ ↑	t_{DPOR}		t_{MOST} *1			ms
FLMD0, 1 setup time (vs RESETZ ↑)	t_{SMDR} *3		1			ms
FLMD0, 1 hold time (vs RESETZ ↑)	t_{HMDR} *3		1			ms
FLMD0 pulse input start time	t_{RP}		900			µs
FLMD0 pulse input end time	t_{RPE}				11.5	ms
FLMD0 high level width	t_{PWH}		t_{WFDH} *2			ns
FLMD0 low level width	t_{PWL}		t_{WFDL} *2			ns
FLMD0 rise time	t_R				1	µs
FLMD0 fall time	t_F				1	µs

Note 1. For t_{MOST} refer to **Section 35.3.2, Main Oscillator Characteristics**.
Note 2. For t_{PWH}/t_{PWL} refer to **Section 35.6.5, Mode Timing**
Note 3. Refer to **Section 35.6.2, Power Up/Down Timing**

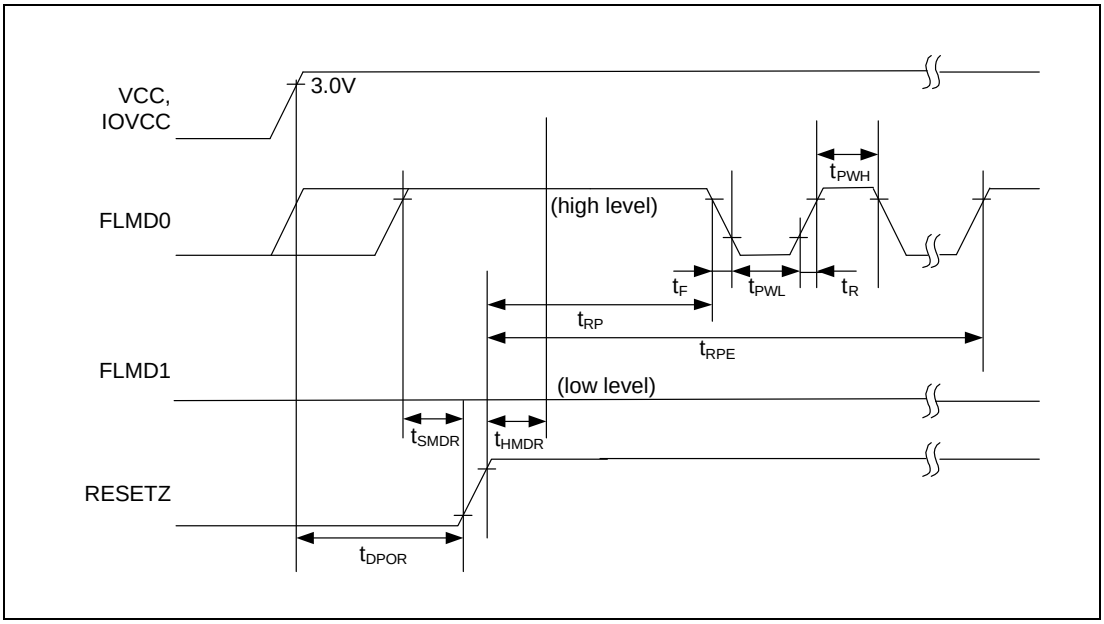

Figure 35.53 Serial Programmer Setup Timing

35.7 Analog Functions Characteristics

35.7.1 POC Characteristics

Conditions:

- Temperature range: Tjmin to Tjmax.
- Supply voltage range: Refer to **Section 35.3.1, Supply Voltage Characteristics**.
- EnVSS = AnVSS = OSCVSS = VSS.
- Reference ground potential: VSS = 0 V.

Table 35.53 POC Characteristics*1

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Detection threshold voltage	V_{POC}	Rise	2.70	2.85	3.00	V
		Fall	2.70	2.80	2.90	V
POC delay time	t_{DPOC}				2	ms
POC minimum pulse width	t_{WPOC}		0.2			ms

Note 1. POC monitors SYSVCC supply voltage.

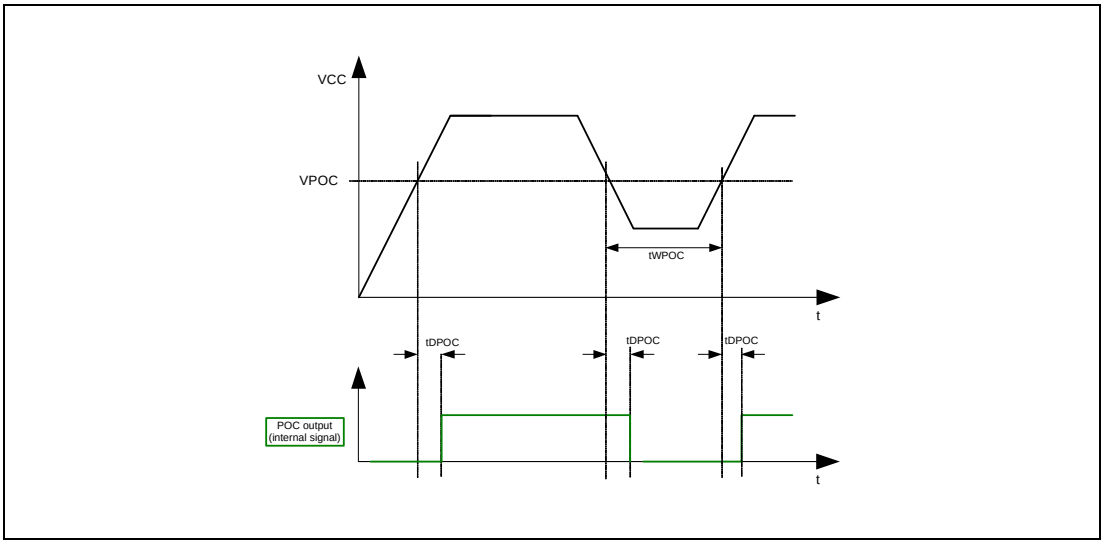

Figure 35.54 POC Characteristics

35.7.2 Core Voltage Monitor (CVM) Characteristics

Conditions:

- Temperature range: Tjmin to Tjmax.
- Supply voltage range: Refer to **Section 35.3.1, Supply Voltage Characteristics**.
- EnVSS = AnVSS = OSCVSS = VSS.
- Reference ground potential: VSS = 0 V.

Table 35.54 CVM Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
CVM high detection level	V_{CVMH}		1.35	1.39	1.43	V
CVM low detection level	V_{CVML}		1.10	1.15	1.20	V
CVM delay time	t_{DCVM}		0.2		10	µs
CVM filter time	t_{FCVM}		2	4	6	µs

35.7.3 A/D Converter Characteristics

Conditions:

- Temperature range: Tjmin to Tjmax.
- Supply voltage range: Refer to **Section 35.3.1, Supply Voltage Characteristics**.
- EnVSS = AnVSS = OSCVSS = VSS.
- Reference ground potential: VSS = 0 V.

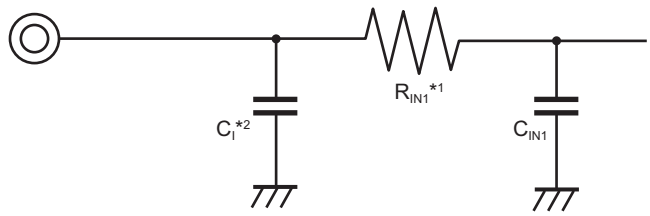
Table 35.55 ADC Characteristics

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Resolution					12		Bit
Analog supply voltages	AnVCC			3.0		3.6	V
		No guarantee of accuracy required, guarantee of operation is mandatory.		V_{POC}		3.0	V
Reference voltages	AnVREFH			3.0		AnVCC	V
		No guarantee of accuracy required, guarantee of operation is mandatory.		V_{POC}		3.0	V
Analog input voltage	V_{IAN}			AnVSS		AnVREFH	V
Operation frequency	f_{ADCLK}			8		40	MHz
A0VCC current	I_{A0VCC}					4	mA
A1VCC current	I_{A1VCC}					4	mA
A0VREFH current	$I_{A0VREFH}$					0.5	mA
A1VREFH current	$I_{A1VREFH}$					0.5	mA
Power up time w/o T&H	t_{PU}					1.0	µs
Conversion time (standard)	t_{CONV1}	t_{CONV} includes t_{SAMP}		1.0			µs
Sample time	t_{SAMP}			t_{CONV1} × (18/40)			ns
Total overall error	TOE	Include quantization error		–6.0		+6.0	LSB
Integral non-linearity error	INL			–3.0		+3.0	LSB
Differential non-linearity error	DNL	No missing code		–1.0		+2.0	LSB
Offset error	OSE			–5.5		+5.5	LSB
Full-scale error	FSE			–5.5		+5.5	LSB
Self-diagnosis accuracy	TOEdiag	A/D Conversion Circuit Diagnosis on single ADC*2	Include quantization error	–8.0		+8.0	LSB
		Pin Level Diagnosis from I/O*1		–40.0		+40.0	LSB
Equivalent input resistance w/o T&H	RIN1*3	PIN – RRanp: 96.7% PIN – 12 bit SAR – ADC: 3.3%				3.1	kΩ
Equivalent input sampling capacitance w/o T&H	CIN1					5.8	pF
TDE switch resistance	RTDE*3	ADCFnTDCR.TDE = 0		100		600	Ω

Note 1. The accuracy of the conversion result for the applied diagnostic voltage could be out of specification in case injected current is injected to the pin of this channel

Note 2. For details to operate “A/D Conversion Circuit Diagnostic Function” refer to CAUTION on **Section 27.4.7.2, A/D Conversion Circuit Diagnostic Function**

Note 3. RIN1 includes RTDE. For detail of TDE switch, see **Figure 27.11, diagnosis circuits**.



Note 1. RIN1 includes RTDE. For detail of TDE switch, see **Figure 27.11, diagnosis circuits**.
Note 2. For CI data, see **Section 35.3.6, IO Capacitances**.

Figure 35.55 Equivalent Circuit

35.7.4 Temperature Sensor Characteristics

Conditions:

- Supply voltage range: Refer to **Section 35.3.1, Supply Voltage Characteristics**.
- System control supply voltage range: SYSVCC = 3.0V to 3.6V.
- EnVSS = AnVSS = OSCVSS = VSS.
- Reference ground potential: VSS = 0 V.

Table 35.56 Temperature Sensor (TS) Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Temperature range	TTS1	*2	Tjmin		Tjmax*1	°C
Temperature accuracy*3	ACCTS1		–3		+3	°C
Temperature update period	t_{TSUP}				10	ms
Stand-by return time	t_{TSSB1}				200	µs
Operation frequency	f_{OTSCLK}*4		36		40	MHz

Note 1. Value of Tjmax is device dependent, see par. **Table 35.5 Operational Condition**.

Note 2. The operation of Temperature Sensor itself and ICUMC reaction for thermal attack between Tjmax and Tj=165degC is guaranteed, but by design only and will not be tested.

Note 3. For an absolute temperature within the given accuracy an offset has to be considered. The offset is given by trimming data in the register OTS0COEFFRA to OTS0COEFFRC.

Note 4. For f_{OTSCLK}, refer to **Section 11.1.3, Clock Supply**.

35.7.5 Flash Characteristics

(1) Code Flash

The code flash memory is shipped in the erased state. If the code flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception.

Table 35.57 Basic Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Operation frequency	f_{CLK_LSB}		2		40	MHz
Operation voltage	VDD		1.20		1.35	V
	VCC		3.0		3.6	V
Number of rewrites*1	CWRT	Data retention of 20 years*2	1000			times
Programming temperature (Tj)	TPRG		Tjmin*3		Tjmax*3	°C

Note 1. The number of rewrites is the number of erasures for each block. When the number of rewrites is “n” (n = 1000), the device can be erased “n” times for each block. For example, when a block of 32 KB is erased after 256 bytes of writing have been performed for different addresses 128 times, the number of rewrites is counted as 1. However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).

Note 2. This is the case when the average Ta is 85°C. This is the period starting on completion of a successful erasure of the code flash memory.

Note 3. Refer to **Table 35.5 Operational Condition**

Table 35.58 Programming Characteristics

Item	Symbol	Condition	Block size	MIN.	TYP.	MAX.	Unit
Programming time*1		f_{CLK_LSB} ≥ 20 MHz CWRT < 100 times	256 B		2	6	ms
		f_{CLK_LSB} ≥ 20 MHz CWRT ≥ 100 times	256 B		2.4	7.2	ms
		f_{CLK_LSB} ≥ 20 MHz	8 KB		16	96	ms
		f_{CLK_LSB} ≥ 20 MHz	32 KB		64	384	ms
		f_{CLK_LSB} ≥ 20 MHz CWRT < 10 times Tj = 10 – 80 °C	512 KB		0.8	3.6	s
		f_{CLK_LSB} ≥ 20 MHz CWRT ≥ 100 times	512 KB		1.03	6.15	s
Erasure time		f_{CLK_LSB} ≥ 20 MHz	8 KB		47	235	ms
		f_{CLK_LSB} ≥ 20 MHz	32 KB		169	576	ms
		f_{CLK_LSB} ≥ 20 MHz CWRT < 10 times Tj = 10 – 80 °C	512 KB		2.3	4.5	s
		f_{CLK_LSB} ≥ 20 MHz CWRT ≥ 100 times	512 KB		2.71	8.4	s

Note 1. Timings are based on availability of write buffer according to programmed block size of either 256 B, 8 KB or 32 KB.

Table 35.59 Program/Erase suspend latency Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Program Suspend Latency*1		f_{CLK_LSB} ≥ 20 MHz			120	µs
Erase Suspend Latency*1*2		Suspension-Priority (1st suspension for a pulse application) f_{CLK_LSB} ≥ 20 MHz			120	µs
		Suspension-Priority (2nd suspension for a pulse application) f_{CLK_LSB} ≥ 20 MHz			1.7	ms
		Erasure-Priority f_{CLK_LSB} ≥ 20 MHz			1.7	ms
Program Resume Latency*1		f_{CLK_LSB} ≥ 20 MHz			50	µs
Erase Resume Latency*1		Suspension-Priority (after 1st suspension) f_{CLK_LSB} ≥ 20 MHz			1.7	ms
		Suspension-Priority (after 2nd suspension) f_{CLK_LSB} ≥ 20 MHz			80	µs
		Erasure-Priority f_{CLK_LSB} ≥ 20 MHz			80	µs

Note 1. The target value is the hardware suspend time. A possible software overhead is not considered.

Note 2. FACI command (Code Flash Erase) with erase counter update cannot be suspended until erase counter update has finished.

(2) Data Flash

The data flash memory is shipped in the erased state. If the data flash memory is read where it has not been written after erasure (no write condition), an ECC error is generated, resulting in the occurrence of an exception

Table 35.60 Basic Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Operation frequency	f_{CLK_LSB}		2		40	MHz
Operation voltage	VDD		1.20		1.35	V
	VCC		3.0		3.6	V
Number of rewrites*1	CWRT	Data retention 20 years*2	125 k			times
		Data retention 3 years*2	250 k			times
Programming temperature (Tj)	TPRG		Tjmin*3		Tjmax*3	°C

Note 1. The number of rewrites is the number of erasures for each block. When the number of rewrites is “n” (n = 125000), the device can be erased “n” times for each block. For example, when a block of 64 bytes is erased after 4 bytes of writing have been performed for different addresses 168 times, the number of rewrites is counted as 1. However, multiple writing to the same address is not possible with 1 erasure (overwriting prohibited).

Note 2. This is the case when the average Ta is 85°C. This is the period starting on completion of a successful erasure of the data flash memory.

Note 3. Refer to **Table 35.5 Operational Condition**.

Table 35.61 Programming Characteristics

Item	Symbol	Condition	Block size	MIN.	TYP.	MAX.	Unit
Programming time		f_{CLK_LSB} ≥ 20 MHz	4 B		0.16	1.7	ms
Erasure time		f_{CLK_LSB} ≥ 20 MHz CWRT < 10 times Tj = 10 – 80 °C	8 KB		216	640	ms
		f_{CLK_LSB} ≥ 20 MHz	64 B		1.7	10	ms
Blank check time		f_{CLK_LSB} ≥ 20 MHz	4 B			30	µs

Table 35.62 Program/Erase suspend latency Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Program Suspend Latency*1		f_{CLK_LSB} ≥ 20 MHz			120	µs
Erase Suspend Latency*1		Suspension-Priority (1st suspension for a pulse application) f_{CLK_LSB} ≥ 20 MHz			120	µs
		Suspension-Priority (2nd suspension for a pulse application) f_{CLK_LSB} ≥ 20 MHz			300	µs
		Erasure-Priority f_{CLK_LSB} ≥ 20 MHz			300	µs
Program Resume Latency*1		f_{CLK_LSB} ≥ 20 MHz			50	µs
Erase Resume Latency*1		Suspension-Priority (after 1st suspension) f_{CLK_LSB} ≥ 20 MHz			300	µs
		Suspension-Priority (after 2nd suspension) f_{CLK_LSB} ≥ 20 MHz			70	µs
		Erasure-Priority f_{CLK_LSB} ≥ 20 MHz			70	µs

Note 1. The target value is the hardware suspend time. A possible software overhead is not considered.

35.8 Thermal Characteristics

The chip junction temperature TJ, max must never be exceeded. Please refer to the device and package dependent specification of TJ, max below.

It is the responsibility of the user to make sure the maximum junction temperature is not exceeded.

The actual TJ depends on the power dissipation and the thermal characteristics of the application. Please refer to chapter **Section 35.5, Supply Current Characteristics**, how to calculate the power dissipation. Power dissipation can be influenced by choosing several parameters. The thermal characteristic of the application environment need to be considered throughout the design process. The following sub-chapters describe metrics to consider this.

35.8.1 Junction-to-Board Resistance (Ψjb)

The simplest method to determine the actual chip temperature is to use the single resistance metric of Ψjb.

The following equation may be used:

$$T_j = T_b + (P_{TOTn} \times Y_{jb})$$

with:

- T_J: chip junction temperature in [°C]
- T_b: board temperature (according to JEDEC standard JESD51-2A) in [°C]
- P_{tot}: total power consumption (refer to **Section 35.5, Supply Current Characteristics**) in [W]
- Ψjb: thermal resistance between junction and board in [°C/W]

This simple metric considers the test board properties in a natural convection environment. The thermal resistance is derived from a defined test fixture (JEDEC) or simulation of such test fixture using a 3D simulation with a detailed model.

Table 35.63 Thermal Characteristics - Junction to Board Resistance (Ψjb)

Device	Symbol*1	Package	Condition*2*3	MAX Value	Unit
P1M-C	Ψjb32	BGA292	JEDEC, JESD51-9, TJ, max = 150°C	13.2*5	°C/W
	Ψjb34	BGA156	JEDEC, JESD51-9, TJ, max = 150°C	13.3	°C/W
	Ψjb33	LQFP144	JEDEC, JESD51-7, TJ, max = 160°C	26.7*4	°C/W
P1H-C (4MB)	Ψjb41	BGA292	JEDEC, JESD51-9, TJ, max = 150 °C	10.0*5	°C/W
	Ψjb42	BGA156	JEDEC, JESD51-9, TJ, max = 150 °C	10.2	°C/W
P1H-C (8MB)	Ψjb51	BGA292	JEDEC, JESD51-9, TJ, max = 150 °C	8.2*5	°C/W
P1H-CE	Ψjb71	BGA404	JEDEC, JESD51-9, TJ, max = 150 °C	5.1*5	°C/W

Note 1. In case of LQFP, Ψjb is a thermal resistance between junction and board surface at tip of LQFP pin. In case of BGA, Ψjb is a thermal resistance between junction and board surface beneath center of package

Note 2. Thermal resistance is based on a solder saturation (solder wetting) >= 50 %.

Note 3. Total power of Digital IO Pins and Analog Input Pins is calculated by assuming 60mW for P1M-C and P1H-C.
Note 4. Rth Tolerance: +2degC/W, L/F: standard L/F
Note 5. Data includes max Rth Tolerance

Section 36 Package

36.1 Package Line Up

36.3 Differences among products

Refer **Section 36.1, Package Line Up**

Section 37 CAN Controller (MCAN)

The Features described in this chapter are valid for all P1x-C devices except:

- R7F701370B
- R7F701371
- R7F701372A
- R7F701396A
- R7F701373A
- R7F701397A
- R7F701374A

For the MCAN description of these devices, please refer to **Section 19, CAN Controller (MCAN) According to ISO 11898-1:2015**

37.1 Features

The CAN controller (M(TT)CAN) is used to communicate via the CAN bus, as define in ISO11898-1. It can also support CAN FD (CAN with Flexible Data-rate) as specified in the Bosch CAN FD Specification V1.0. It covers the functionality of the Data Link Layer (DLL) and Medium Access Control (MAC). To enable the hardware to communicate, the physical layer must be provided externally, i.e., by connecting a CAN transceiver.

Table 37.1 M_CAN Specifications (1/2)

Item	Specification
Communication	CAN functionality conform to ISO 11898-1
Data transfer rate	Up to 1 Mbps, individually for each CAN channel for CAN FD, up to 8 Mbps
CAN channels	MTTCAN0, MCAN0, MCAN1, MCAN2
Selectable ID type	11-bit Standard ID
	11-bit Standard ID + 18-bit Extended ID
Message Buffer	Up to 64 dedicated Receive Buffers
	Up to 32 dedicated Transmit Buffers
FIFO number	Two configurable Receive FIFOs Configurable Transmit FIFO Configurable Transmit Queue Configurable Transmit Event FIFO
RX System	Scalable RX FIFO structures, with up to 64 CAN Buffers per FIFO RX timestamp RX FIFO Timeout Interrupt FIFO filling level Interrupt
TX System	FIFO filling level supervision (interrupt) Support for transmit cancellation to avoid “Inner priority inversion” Combined Message Buffer & TX FIFO and TX Queue Concept Dedicated TX message buffers for high-priority messages ID prioritization between TX buffers, TX Queue buffers and oldest TX FIFO element Transmit pause to separate two consecutive TX messages

Table 37.1 M_CAN Specifications (2/2)

Item	Specification
Enhanced reception filtering	Support of 11bit and 29bit CAN identifier, each filter element is configurable for acceptance/ rejection
	Programmable 29 bit CAN identifier acceptance filter mask for each entry
	Each acceptance filter element targets FIFO 0 or 1 or a dedicated RX Buffer
	Every FIFO or RX Buffer filter element can be used as a from-to range filter, as a filter for one or two dedicated IDs or as a classic bit mask filter
	Each filter element can be enabled/disabled individually
TT-CAN support	MTTCAN0 supports TT-CAN level 2 according to ISO11898-4
CAN-FD support	Variable Data Phase Speed up to 8 Mbit/s, variable Data Buffer size up to 64 Bytes/Frame
Timer	Time Stamp function
Power down function	Local Power Down modes
AUTOSAR requirements	Supports all AUTOSAR requirements Like Transmit Abort Interrupt, non-waiting processing Functionality and more than 2 TX Buffers with prioritization Supports *Pretended Networking* of AUTOSAR
Self-testing	External and internal loop back

37.1.1 Number of Units and Channels

Table 37.2 Number of MTTCAN/MCAN channel

	Device				
Macro	P1M-C	P1H-C (4MB)	P1H-C (8MB)	P1H-CE	Description
MTTCAN0	1*[1]	1	1	1	MTTCAN0 supports TT-CAN level 2 according to ISO11898-4
MCAN0	1	1	1	1	—
MCAN1	1	1	1	1	—
MCAN2	0	0	1	1	—

Note 1. P1M-C does not support MTTCAN0EVT, MTTCAN0RTP, MTTCAN0SOC, MTTCAN0SWT, and MTTCAN0TMP.

37.1.2 Register Base Address

MTTCAN/MCAN base addresses are listed in the following table. MTTCAN/MCAN register addresses are given as offsets from the base addresses in general.

Table 37.3 Register Base Address

Base Address Name	Base Address
<MTTCAN0_base>	FFD3 0000_H
<MCAN0_base>	FFEF 0000_H
<MCAN1_base>	FFD3 1000_H
<MCAN2_base>	FFEF 1000_H

37.1.3 Clock Supply

Clock supply by and to MTTCAN/MCAN is listed in the following table.

Table 37.4 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
MTTCAN0/ MCANn	H-Bus interface clock*1 (Host clock)	CLK_HSB
	CAN protocol layer clock*2 (CAN clock / m_can_cclk/ m_ttcan_cclk)	CLKP_H2

Note: The following condition must be fulfilled: CLK_HSB >= CLKP_H2

Note 1. H-bus interface clock:
The minimum frequency is **Table 37.5, Minimune MCAN / MTTCAN clock speed**.

Note 2. CAN protocol layer clock
- For maximum data rate, CLKP_H2 must be n x 1 MHz with n >= 8.
- For CAN-FD operation with bit rates above 1Mbit/s CLKP_H2 must be 2^n x 20MHz, with n = 0, 1, 2.
- For low power mode with limited throughput it can be reduce to CLK_HSB/3. This limits the throughput to 333Kbps.

Table 37.5 Minimune MCAN / MTTCAN clock speed

	P1M-C	P1H-C (4MB)	P1H-C (8MB)
Number of channels	3	3	4
Non CANFD	17.5 MHz		
CANFD			

37.1.4 RAM areas for MCAN

Table 37.6 RAM areas for MCAN

RAM Name	RAM Area
MTTCAN RAM area	FFD3 8000_H to FFD3 $9FFF_H$
MCAN0 RAM area	FFEF 8000_H to FFEF $9FFF_H$
MCAN1 RAM area	FFD3 $A000_H$ to FFD3 $BFFF_H$
MCAN2 RAM area	FFEF $A000_H$ to FFEF $BFFF_H$

37.1.5 Interrupt Requests

MTTCAN/MCAN interrupt requests are listed in the following table.

Table 37.7 Interrupt list

Unit Name	Interrupt Name	Interrupt Number	DMA Number	Description
MTTCAN0	INTMTTCANI0	172	—	MTTCAN0 interrupt 0
MTTCAN0	INTMTTCANI1	173	—	MTTCAN0 interrupt 1
MTTCAN0	INTMTTCANFE	174	—	MTTCAN0 filter event 1
MCAN0	INTMCAN0I0	175	—	MCAN0 interrupt 0
MCAN0	INTMCAN0I1	176	—	MCAN0 interrupt 1
MCAN0	INTMCAN0FE	177	—	MCAN0 filter event 1
MCAN1	INTMCAN1I0	178	—	MCAN1 interrupt 0
MCAN1	INTMCAN1I1	179	—	MCAN1 interrupt 1
MCAN1	INTMCAN1FE	180	—	MCAN1 filter event 1
MCAN2	INTMCAN2I0	181	—	MCAN2 interrupt 0
MCAN2	INTMCAN2I1	182	—	MCAN2 interrupt 1
MCAN2	INTMCAN2FE	183	—	MCAN2 filter event 1

Table 37.8 Internal Error Signal

Unit Name	Interrupt for Unit	Description	Connected to
MTTCAN0	mttcan0_ecc_err	MTTCAN0 error signal	ECM
MCAN0	mcan0_ecc_err	MCAN0 error signal	ECM
MCAN1	mcan1_ecc_err	MCAN1 error signal	ECM
MCAN2	mcan2_ecc_err	MCAN2 error signal	ECM

37.1.6 External Input / Output Pins

MTTCAN/MCAN has following external pins for each channel.

Table 37.9 External Input/Output Pins

Channel	I/O	Pin name of RH850/P1x-C	Function
MTTCAN0	I	MTTCAN0RX	MTTCAN0 receive data input
	O	MTTCAN0TX	MTTCAN0 transmit data output
	I	MTTCAN0SWT	MTTCAN0 stop watch trigger
	I	MTTCAN0EVT	MTTCAN0 event trigger
	O	MTTCAN0RTP	MTTCAN0 register time mark interrupt pulse
	O	MTTCAN0TMP	MTTCAN0 trigger time mark interrupt pulse
	O	MTTCAN0SOC	MTTCAN0 start of cycle
MCAN0	I	MCAN0RX	MCAN0 receive data input
	O	MCAN0TX	MCAN0 transmit data output
MCAN1	I	MCAN1RX	MCAN1 receive data input
	O	MCAN1TX	MCAN1 transmit data output
MCAN2	I	MCAN2RX	MCAN2 receive data input
	O	MCAN2TX	MCAN2 transmit data output
MCKDV	O	BHPDGRCLK0	Degrading clock output for MCAN

37.2 Overview

37.2.1 Functional overview

M(TT)CAN has following features

- M(TT)CAN functionality conform to ISO 11898-1
- M(TT)CAN supports local Power Down modes
- M(TT)CAN supports all AUTOSAR requirements
  - Transmit Abort Interrupt
  - Non-waiting processing functionality
  - Include more than 2 TX Buffers prioritization
- M(TT)CAN supports several measures for self-testing:external and internal loop back
  - For this reason, the port structure does not have additional functionality for self-testing
  - The usage of loop back functionality for safety requirements is described in **Section 28, Functional Safety**
- M(TT)CAN contains an improved RX System
  - Scalable RX FIFO structures, with up to 64 CAN Buffers per FIFO
  - RX timestamp
  - RX FIFO Timeout Interrupt
  - FIFO filling level Interrupt
- M(TT)CAN contains an improved TX System
  - Variable amount of 0 to 32 “classical” TX Buffers
  - Additional, size configurable TX FIFO
  - Additional, size configurable TX Queue
  - FIFO filling level supervision (interrupt)
  - Support for transmit cancellation to avoid “inner priority inversion”
  - Configurable TX Event history: For each transmitted message both ID and timestamp are written into a history
  - TX-Event FIFO (readable by CPU using polling or interrupts) containing 0 to 32 events
  - Combined Message Buffer & TX FIFO and TX Queue Concept
  - Dedicated TX message buffers for high-priority messages
  - ID prioritization between TX buffers, TX Queue buffers and oldest TX FIFO element
  - Transmit pause to separate two consecutive TX messages
- M(TT)CAN contains an enhanced reception filtering
  - Support of 11bit and 29bit CAN identifier, each filter element is configurable for acceptance/ rejection
  - Each acceptance filter element targets FIFO 0 or 1 or a dedicated RX Buffer
  - Every FIFO or RX Buffer filter element can be used as a from-to range filter, as a filter for one or two dedicated
  - IDs or as a classic bit mask filter

  - Each filter element can be enabled/disabled individually
  - Programmable 29 bit CAN identifier acceptance filter mask for each entry
- MTTCAN supports TT_CAN level 2 according to ISO11898-4
- MTTCAN supports additional synchronization input signals
  - MTTCAN supports additional status output signals
- Data transfer rate is up to 1Mbps, individually for each CAN channel. For CAN FD, up to 8Mbps
- M(TT)CAN supports Pretended Networking of AUTOSAR
  - This can be achieved by using the dedicated additional interrupt assigned to messages of filter group 1
- Selectable ID type
  - 11-bit Standard ID
  - 11-bit Standard ID + 18-bit Extended ID
- M(TT)CAN are supported by the debug system by means of a debug stop signal, which suppresses the register content modification by reading of accesses of the debugger
- M(TT)CAN supports Time Stamp function
- M(TT)CAN are supporting CAN-FD with 64 data bytes and flexible data rate

37.2.2 Block Diagram

Following block diagram shows MTTCAN/MCAN block diagram. P1H-C (8MB) and P1H-CE support MCAN2. P1M-C and P1H-C (4MB) does not support MCAN2.

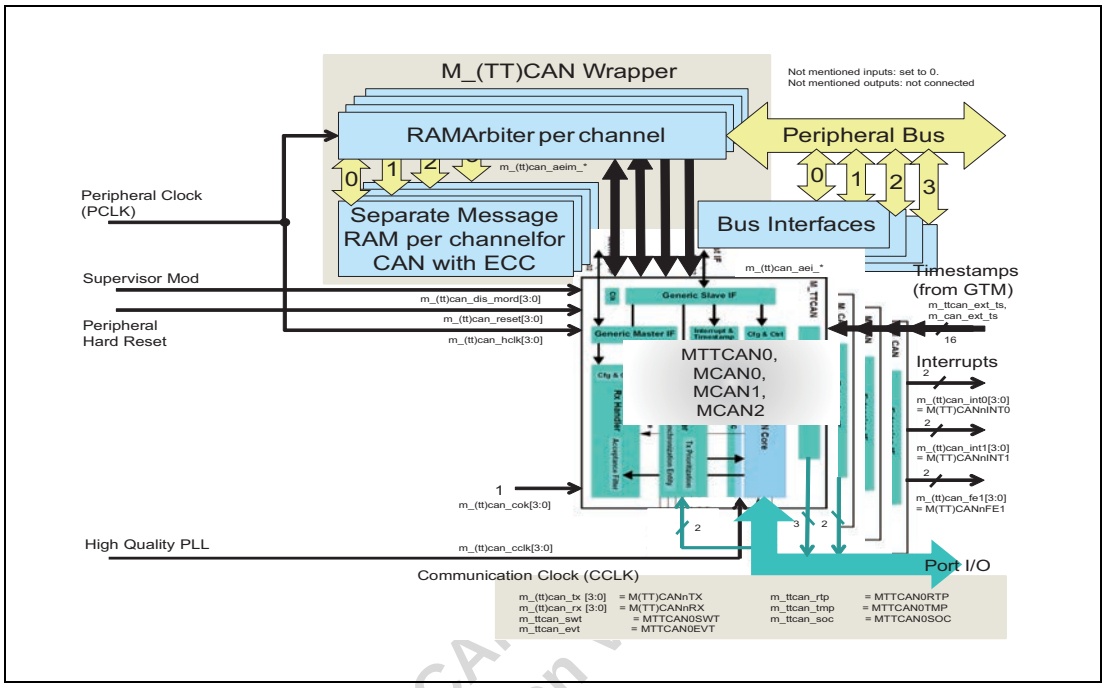

Figure 37.1 MCAN/MTTCAN block diagram

- M_TTCAN (MTTCAN0)
  8K RAM for messages, events and filters; no CCU implemented
  additional input signals MTTCAN0SWT, MTTCAN0EVT;
  additional output signals MTTCAN0RTP, MTTCAN0TMP, MTTCAN0SOC;
  timestamps from GTM IP
- M_CAN (MCAN0)
  8K RAM for messages, events and filters; common clocking with MTTCAN0
  timestamps from GTM IP
- M_CAN (MCAN1)
  8K RAM for messages, events and filters; common clocking with MTTCAN0
  timestamps from GTM IP
- M_CAN (MCAN2)
  8K RAM for messages, events and filters; common clocking with MTTCAN0
  timestamps from GTM IP
  P1M-C and P1H-C (4MB) don't support MCAN2.

  m_(tt) can_cok fixed "1"[1]

Note 1. This signal of M_(TT) CAN indicates that a proper clock supply is available. In devices P1M-C and P1H-C (incl. P1H-CE), clock is provided permanently so that M_(TT) CAN is enabled for transmission by this signal without precondition.

37.3 Registers

37.3.1 List of Registers

MTTCAN/MCAN registers are listed in the following table.

Table 37.10 Register list

Address	Register name	Description	Access Size[bit]	Initial Value	Access Protection	
					PBG	Other
*1	*1	MTTCAN0	32	*1	PBG3#1.PG3-MCANT	—
*1	*1	MCAN0	32	*1	PBG1#1.PG1-MCAN0	—
*1	*1	MCAN1	32	*1	PBG3#1.PG3-MCAN1	—
*1	*1	MCAN2	32	*1	PBG1#1.PG1-MCAN2	—

Note 1. For details of MTTCAN/MCAN-IP registers, please see **Table 37.68, M_TTCAN Register Map** and **Table 37.12, M_CAN Register Map**.

Table 37.11 Register Reset Condition

Register Name	Reset condition				
	Power On Reset	System Reset1	System Reset2	Application Reset1	Limited Reset
All registers	√	√	√	√	√

37.4 Operation

37.4.1 Procedure of Module Standby and Limited Reset

This module supports module standby and limited reset functions. Before these functions are enabled, all of the followings must be ensured:

- Module standby
  The M(TT)CAN can be set into power down mode controlled by CC Control Register M(TT)CANnCCCR.CSR. As long as the clock stop request is active, bit M(TT)CANnCCCR.CSR is read as one. When all pending transmission requests have completed, the M(TT)CAN waits until bus idle state is detected. Then the M(TT)CAN sets M(TT)CANnCCCR.INIT to one to prevent any further CAN transfers. Now the M(TT)CAN acknowledges that it is ready for power down by setting M(TT)CANnCCCR.CSA to one. In this state, before the clocks are switched off, further register accesses can be made. A write access to M(TT)CANnCCCR.INIT will have no effect. Now the module clock may be switched off. To leave power down mode, the application has to turn on the module clocks before resetting the CC Control Register flag M(TT)CANnCCCR.CSR. The M_CAN will acknowledge this by resetting M(TT)CANnCCCR.CSA. Afterwards, the application can restart CAN communication by resetting bit M(TT)CANnCCCR.INIT. Refer to the following flow chart.
- Limited Reset
  The M(TT)CAN can be reset by limited reset from SYSCTRL. The Limited Reset is functionally equivalent to a hardware reset. After limited reset, the registers of the M(TT)CAN hold the reset values. Additionally the Bus_Off state is reset and the output “m_(tt)can_tx” is set to recessive (HIGH). The value 0001_H (M(TT)CANnCCCR.INIT = ‘1’) in the CC Control Register enables software initialization. The M(TT)CAN does not influence the CAN bus until the CPU resets M(TT)CANnCCCR.INIT to ‘0’. Refer to the following flow chart.

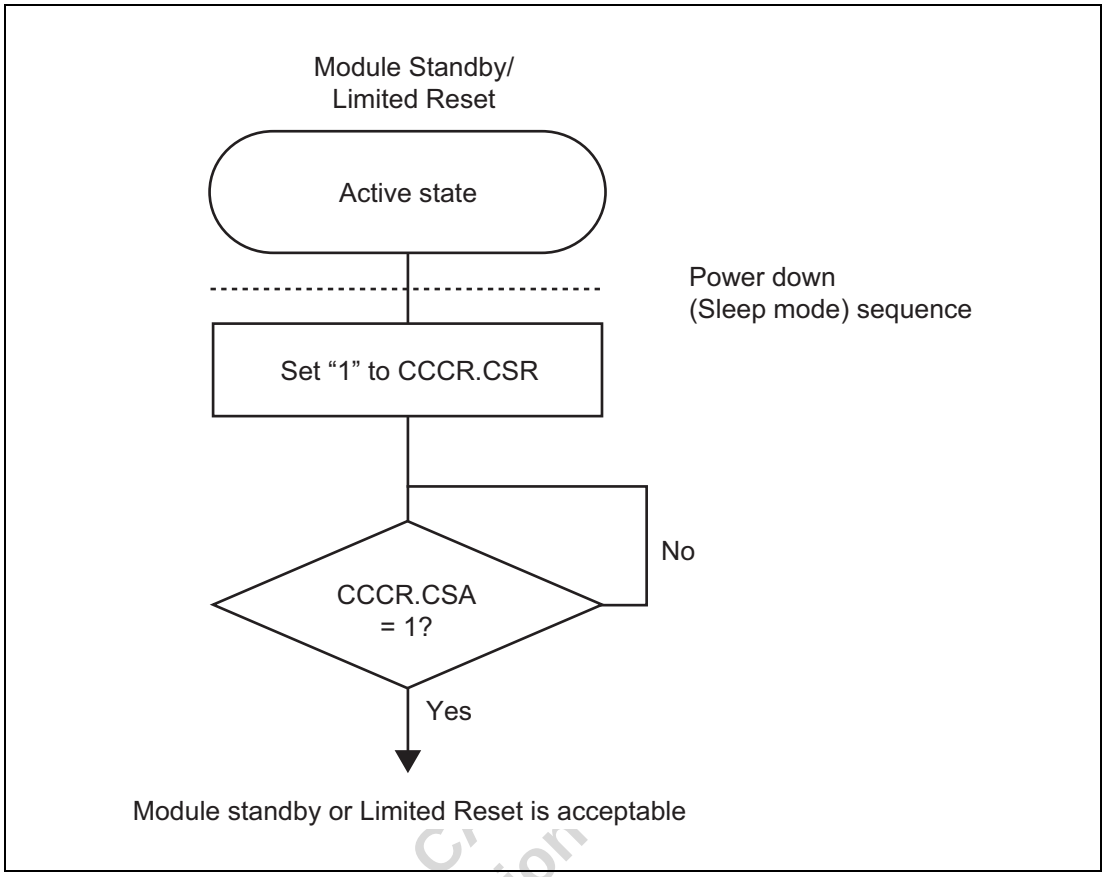

Figure 37.2 Module Standby/Limited Reset procedure

37.5 MCAN

37.5.1 Overview

The M_CAN performs communication according to ISO11898-1 (Bosch CAN specification 2.0 part A, B) and to Bosch CAN FD specification V1.0. Additional transceiver hardware is required for connection to the physical layer.

The message storage is intended to be a single-ported Message RAM outside of the module. It is connected to the M_CAN via the Generic Master Interface.

All functions concerning the handling of messages are implemented by the Rx Handler and the Tx Handler. The Rx Handler manages message acceptance filtering, the transfer of received messages from the CAN Core to the Message RAM as well as providing receive message status information. The Tx Handler is responsible for the transfer of transmit messages from the Message RAM to the CAN Core as well as providing transmit status information.

Acceptance filtering is implemented by a combination of up to 128 filter elements where each one can be configured as a range, as a bit mask, or as a dedicated ID filter.

37.5.1.1 Features

- Conform with CAN protocol version 2.0 part A, B and ISO 11898-1
- CAN FD with up to 64 data bytes supported
- CAN Error Logging
- AUTOSAR optimized
- SAE J1939 optimized
- Improved acceptance filtering
- Two configurable Receive FIFOs
- Separate signalling on reception of High Priority Messages
- Up to 64 dedicated Receive Buffers
- Up to 32 dedicated Transmit Buffers
- Configurable Transmit FIFO
- Configurable Transmit Queue
- Configurable Transmit Event FIFO
- Direct Message RAM access for Host CPU
- Programmable loop-back test mode
- Maskable module interrupts
- Two clock domains (CAN clock and Host clock)
- Power-down support

37.5.1.2 Block Diagram

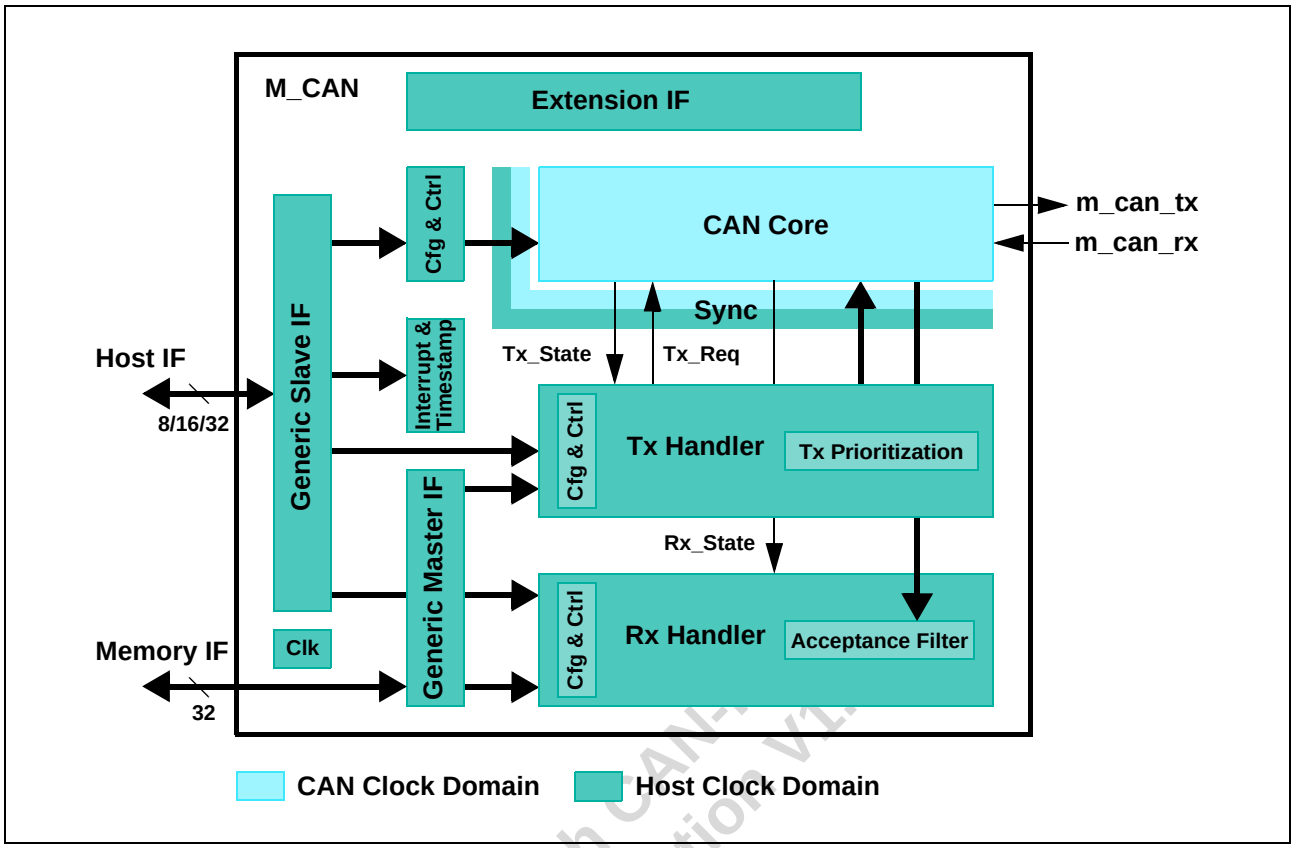

Figure 37.3 M_TTCAN Block Diagram

CAN Core:

CAN Protocol Controller and Rx/Tx Shift Register. Handles all ISO 11898-1 protocol functions. Supports 11-bit and 29-bit identifiers.

Sync:

Synchronizes signals from the Host clock domain to the CAN clock domain and vice versa.

Clk:

Synchronizes reset signal to the Host clock domain and to the CAN clock domain.

Cfg & Ctrl:

CAN Core related configuration and control bits.

Interrupt & Timestamp:

Interrupt control and 16-bit CAN bit time counter for receive and transmit timestamp generation. An externally generated 16-bit vector may substitute the integrated 16-bit CAN bit time counter for receive and transmit timestamp generation.

Tx Handler:

Controls the message transfer from the external Message RAM to the CAN Core. A maximum of 32 Tx Buffers can be configured for transmission. Tx buffers can be used as dedicated Tx Buffers, as Tx FIFO, part of a Tx Queue, or as a combination of them. A Tx Event FIFO stores Tx timestamps together with the corresponding Message ID. Transmit cancellation is also supported.

Rx Handler:

Controls the transfer of received messages from the CAN Core to the external Message RAM. The Rx Handler supports two Receive FIFOs, each of configurable size, and up to 64 dedicated Rx Buffers for storage of all messages that have passed acceptance filtering. A dedicated Rx Buffer, in contrast to a Receive FIFO, is used to store only messages with a specific identifier. An Rx timestamp is stored together with each message. Up to 128 filters can be defined for 11-bit IDs and up to 64 filters for 29-bit IDs.

Generic Slave Interface:

Connects the M_CAN to a customer specific Host CPU. The Generic Slave Interface is capable to connect to an 8/16/32-bit bus to support a wide range of interconnection structures.

Generic Master Interface:

Connects the M_CAN to a local 32-bit Message RAM. The implemented Message RAM size is 2K • 32 bit.

Extension Interface:

All flags from the Interrupt Register MCANnIR as well as selected internal status and control signals are routed to this interface. The interface is intended for connection of the M_CAN to a module-external interrupt unit or to other module-external components. The connection of these signals is optional.

37.5.1.3 Dual Clock Sources

To improve the EMC behavior, a spread spectrum clock can be used for the Host clock domain m_can_hclk (CLK_HSB). Due to the high precision clocking requirements of the CAN Core, a separate clock without any modulation has to be provided as m_can_cclk (CLKP_H2).

Within the M_TTCAN module there is a synchronization mechanism implemented to ensure save data transfer between the two clock domains.

NOTE

In order to achieve a stable function of the M_TTCAN, the Host clock must always be faster than or equal to the CAN clock. Also the modulation depth of the spread spectrum clock has to be regarded.

37.5.1.4 Dual Interrupt Lines

The module provides two interrupt lines. Interrupts can be routed either to m_can_int0 (INTMCANnI0) or to m_can_int1 (INTMCANnI1). By default all interrupts are routed to interrupt line m_can_int0 (INTMCANnI0). By programming MCANnILE.EINT0 and MCANnILE.EINT1 the interrupt lines can be enabled or disabled separately.

37.5.2 Programmer's Model

37.5.2.1 Hardware Reset Description

After hardware reset, the registers of the M_TTCAN hold the reset values listed in **Table 37.12**. Additionally the Bus_Off state is reset and the output m_can_tx is set to recessive (HIGH). The value 0001_H (MCANnCCCR.INIT = '1') in the CC Control Register enables software initialization. The M_TTCAN does not influence the CAN bus until the CPU resets MCANnCCCR.INIT to '0'.

37.5.2.2 Register Map

The M_TTCAN module allocates an address space of 256 bytes. All registers are organized as 32-bit registers. The M_CAN is accessible by the Host CPU via the Generic Slave Interface using a data width of 8 bit (byte access), 16 bit (half-word access), or 32 bit (word access). Write access by the Host CPU to registers/bits marked with "P = Protected Write" is possible only with MCANnCCCR.CCE = '1' AND MCANnCCCR.INIT = '1'. There is a delay from writing to a command register until the update of the related status register bits due to clock domain crossing.

Table 37.12 M_CAN Register Map (1/2)

37.5.2.3 Registers

(1) MCANnCREL — Core Release Register

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + 000_H

Value after reset: $3013\ 0506_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	REL[3:0]				STEP[3:0]				SUBSTEP[3:0]				YEAR[3:0]			
Value after reset	0	0	1	1	0	0	0	0	0	0	0	1	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	MON[7:0]								DAY[7:0]							
Value after reset	0	0	0	0	0	1	0	1	0	0	0	0	0	1	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.13 MCANnCREL Register Contents

Bit Position	Bit Name	Function
31 to 28	REL[3:0]	Core Release One digit, BCD-coded.
27 to 24	STEP[3:0]	Step of Core Release One digit, BCD-coded.
23 to 20	SUBSTEP[3:0]	Sub-step of Core Release One digit, BCD-coded.
19 to 16	YEAR[3:0]	Time Stamp Year One digit, BCD-coded. This field is set by generic parameter on M_CAN synthesis.
15 to 8	MON[7:0]	Time Stamp Month Two digits, BCD-coded. This field is set by generic parameter on M_CAN synthesis.
7 to 0	DAY[7:0]	Time Stamp Day Two digits, BCD-coded. This field is set by generic parameter on M_CAN synthesis.

Table 37.14 Coding of Revisions

Release	Step	SubStep	Year	Month	Day	Name
3	0	1	3	05	06	Revision 3.0.1, Date 2013/05/06

(2) MCANnENDN — Endian Register

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + 004_H

Value after reset: $8765\ 4321_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 37.15 MCANnENDN Register Contents

Bit Position	Bit Name	Function
31 to 0	ETV[31:0]	Endianness Test Value The endianness test value is 87654321_H.

(3) MCANnFBTP — Fast Bit Timing & Prescaler Register

This register is only writable if bits MCANnCCCR.CCE and MCANnCCCR.INIT are set. The CAN bit time may be programed in the range of 4 to 25 time quanta. The CAN time quantum may be programmed in the range of 1 to 32 m_can_cclk (CLKP_H2) periods. tq = (FBRP + 1) m_can_cclk (CLKP_H2) period.

FTSEG1 is the sum of Prop_Seg and Phase_Seg1. FTSEG2 is Phase_Seg2.

Therefore the length of the bit time is (programmed values) [FTSEG1 + FTSEG2 + 3] tq
or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] tq.

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + $00C_H$

Value after reset: 0000 $0A33_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	TDCO[4:0]					TDC	—	—	FBRP[4:0]

Table 37.16 MCANnFBTP Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 29	Reserved	These bits are always read as 0.
28 to 24	TDCO[4:0]	Transmitter Delay Compensation Offset 00_H to $1F_H$ Offset value defining the distance between the measured delay from m_can_tx to m_can_rx and the secondary sample point. Valid values are 0 to 31 m_can_cclk (CLKP_H2) periods.
23	TDC	Transmitter Delay Compensation 0: Transmitter Delay Compensation disabled 1: Transmitter Delay Compensation enabled
22, 21	Reserved	These bits are always read as 0.
20 to 16	FBRP[4:0]	Fast Baud Rate Prescaler 00_H to $1F_H$ The value by which the oscillator frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Baud Rate Prescaler are 0 to 31. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.
15 to 12	Reserved	These bits are always read as 0.
11 to 8	FTSEG1[3:0]	Fast time segment before sample point 1_H to F_H Valid values are 1 to 15. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.
7	Reserved	This bit is always read as 0.

Table 37.16 MCANnFBTP Register Contents (2/2)

Bit Position	Bit Name	Function
6 to 4	FTSEG2[2:0]	Fast time segment after sample point 0_H to 7_H Valid values are 0 to 7. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.
3, 2	Reserved	These bits are always read as 0.
1, 0	FSJW[1:0]	Fast (Re) Synchronization Jump Width 0_H to 3_H Valid values are 0 to 3. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

NOTES

1. With a CAN clock (m_can_cclk: CLKP_H2) of 8 MHz, the reset value of 0000 $0A33_H$ configures the M_CAN for a fast bit rate of 500 kBit/s.
2. The bit rate configured for the CAN FD data phase via MCANnFBTP must be higher or equal to the bit rate configured for the arbitration phase via MCANnBTP.

(4) MCANnTEST — Test Register

Write access to the Test Register has to be enabled by setting bit MCANnCCCR.TEST to '1'. All Test Register functions are set to their reset values when bit MCANnCCCR.TEST is reset.

Loop Back Mode and software control of pin m_can_tx are hardware test modes. Programming of TX ≠ "00" may disturb the message transfer on the CAN bus.

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + 010_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	TDCV[5:0]						RX	TX[1:0]		LBCK	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	—	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	RP	RP	RP	R	R	R	R

Table 37.17 MCANnTEST Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	These bits are always read as 0.
13 to 8	TDCV[5:0]	Transmitter Delay Compensation Value 00_H to $3F_H$ Position of the secondary sample point, defined by the sum of the measured delay from m_can_tx to m_can_rx and MCANnFBTP.TDCO. Valid values are 0 to 63 m_can_cclk (CLKP_H2) periods.
7	RX	Receive Pin Monitors the actual value of pin m_can_rx 0: The CAN bus is dominant (m_can_rx = '0'). 1: The CAN bus is recessive (m_can_rx = '1').
6, 5	TX[1:0]	Control of Transmit Pin 00: Reset value, m_can_tx controlled by the CAN Core, updated at the end of the CAN bit time. 01: Sample Point can be monitored at pin m_can_tx. 10: Dominant ('0') level at pin m_can_tx 11: Recessive ('1') at pin m_can_tx
4	LBCK	Loop Back Mode 0: Reset value, Loop Back Mode is disabled. 1: Loop Back Mode is enabled (see **(9) Test Modes**).
3 to 0	Reserved	These bits are always read as 0.

(5) MCANnRWD — RAM Watchdog

The RAM Watchdog monitors the readiness of the Message RAM. A Message RAM access via the M_CAN's Generic Master Interface starts the Message RAM Watchdog Counter with the value configured by MCANnRWD.WDC. The counter is reloaded with MCANnRWD.WDC when the Message RAM signals successful completion by activating its READY output. In case there is no response from the Message RAM until the counter has counted down to zero, the counter stops and interrupt flag MCANnIR.WDI is set. The RAM Watchdog Counter is clocked by the Host clock (m_can_hclk: CLK_HSB).

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 014_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 37.18 MCANnRWD Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are always read as 0. When written, write the initial value.
15 to 8	WDV[7:0]	Watchdog Value Actual Message RAM Watchdog Counter Value.
7 to 0	WDC[7:0]	Watchdog Configuration Start value of the Message RAM Watchdog Counter. With the reset value of "00" the counter is disabled.

(6) MCANnCCCR — CC Control Register

For details about setting and resetting of single bits see **(1) Software Initialization**.

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 018_H

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	RP	R	R	R/W	R/W	RP	RP	Rp	RP	Rp	R/W	R	Rp	RP	R/W

Table 37.19 MCANnCCCR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 15	Reserved	These bits are always read as 0. When written, write the initial value.
14	TXP	Transmit Pause If this bit is set, the M_CAN pauses for two CAN bit times before starting the next transmission after itself has successfully transmitted a frame (see **Section 37.6.3.5, Tx Handling**). 0: Transmit pause disabled 1: Transmit pause enabled
13	FDBS	CAN FD Bit Rate Switching 0: This node transmits no frames with bit rate switching. 1: This node transmits all frames (excl. remote frames) with bit rate switching.
12	FDO	CAN FD Operation 0: This node transmits all frames in CAN format according to ISO11898-1. 1: This node transmits all frames (excl. remote frames) in CAN FD format.
11, 10	CMR[1:0]	CAN Mode Request A change of the CAN operation mode is requested by writing to this bit field. After change to the requested operation mode the bit field is reset to “00” and the status flags FDBS and FDO are set accordingly. In case the requested CAN operation mode is not enabled, the value written to CMR is retained until it is overwritten by the next mode change request. In case CME = “01”/”10”/”11” a change to CAN operation according to ISO 11898-1 is always possible. Default is CAN operation according to ISO11898-1. 00: Unchanged 01: Request CAN FD operation 10: Request CAN FD operation with bit rate switching 11: Request CAN operation according ISO11898-1
9, 8	CME[1:0]	CAN Mode Enable 00: CAN operation according to ISO11898-1 enabled 01: CAN FD operation enabled 10: CAN FD operation with bit rate switching enabled 11: CAN FD operation with bit rate switching enabled **NOTE** When CME = “00”, received frames are strictly interpreted according to ISO11898-1, which leads to the transmission of an error frame when receiving a CAN FD frame. In case CME = “01”, transmission of long CAN FD frames and reception of long and fast CAN FD frames is enabled. With CME = “10”/“11”, transmission and reception of long and fast CAN FD frames is enabled.

Table 37.19 MCANnCCCR Register Contents (2/2)

Bit Position	Bit Name	Function
7	TEST	Test Mode Enable 0: Normal operation, register MCANnTEST holds reset values. 1: Test Mode, write access to register MCANnTEST enabled.
6	DAR	Disable Automatic Retransmission 0: Automatic retransmission of messages not transmitted successfully enabled. 1: Automatic retransmission disabled
5	MON	Bus Monitoring Mode Bit MON can only be set by the Host when both CCE and INIT are set to '1'. The bit can be reset by the Host at any time. 0: Bus Monitoring Mode is disabled 1: Bus Monitoring Mode is enabled
4	CSR	Clock Stop Request 0: No clock stop is requested. 1: Clock stop requested. When clock stop is requested, first INIT and then CSA will be set after all pending transfer requests have been completed and the CAN bus reached idle.
3	CSA	Clock Stop Acknowledge 0: No clock stop acknowledged. 1: M_TTCAN may be set in power down by stopping m_can_hclk (CLK_HSB) and m_can_cclk (CLKP_H2).
2	ASM	Restricted Operation Mode Bit ASM can only be set by the Host when both CCE and INIT are set to '1'. The bit can be reset by the Host at any time. For a description of the Restricted Operation Mode see **(5) Restricted Operation Mode**. 0: Normal CAN operation 1: Restricted Operation Mode active
1	CCE	Configuration Change Enable 0: The CPU has no write access to the protected configuration registers. 1: The CPU has write access to the protected configuration registers (while MCANnCCCR.INIT = '1').
0	INIT	Initialization 0: Normal Operation 1: Initialization is started.

NOTE

Due to the synchronization mechanism between the two clock domains, there may be a delay until the value written to INIT can be read back. Therefore the programmer has to assure that the previous value written to INIT has been accepted by reading INIT before setting INIT to a new value.

(7) MCANnBTP — Bit Timing & Prescaler Register

This register is only writable if bits MCANnCCCR.CCE and MCANnCCCR.INIT are set. The CAN bit time may be programed in the range of 4 to 81 time quanta. The CAN time quantum may be programmed in the range of 1 to 1024 m_can_cclk (CLKP_H2) periods. tq = (BRP + 1) m_can_cclk (CLKP_H2) period.

TSEG1 is the sum of Prop_Seg and Phase_Seg1. TSEG2 is Phase_Seg2.

Therefore the length of the bit time is (programmed values) [TSEG1 + TSEG2 + 3] tq
or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] tq.

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $01C_H$

Value after reset: 0000 $0A33_H$

Table 37.20 MCANnBTP Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	These bits are always read as 0. When written, write the initial value.
25 to 16	BRP[9:0]	Baud Rate Prescaler 000_H to $3FF_H$ The value by which the oscillator frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Baud Rate Prescaler are 0 to 1023. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.
15, 14	Reserved	These bits are always read as 0.
13 to 8	TSEG1[5:0]	Time segment before sample point 01_H to $3F_H$ Valid values are 1 to 63. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.
7 to 4	TSEG2[3:0]	Time segment after sample point 0_H to F_H Valid values are 0 to 15. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.
3 to 0	SJW[3:0]	(Re) Synchronization Jump Width 0_H to F_H Valid values are 0 to 15. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

NOTE

With a CAN clock (m_can_cclk: CLKP_H2) of 8 MHz, the reset value of 0000 $0A33_H$ configures the M_CAN for a bit rate of 500 kBit/s.

(8) MCANnTSCC — Timestamp Counter Configuration

For a description of the Timestamp Counter see **Section 37.5.3.2, Timestamp Generation**.

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 020_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	TCP[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 37.21 MCANnTSCC Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	These bits are always read as 0. When written, write the initial value.
19 to 16	TCP[3:0]	Timestamp Counter Prescaler 0_H to F_H Configures the timestamp and timeout counters time unit in multiples of CAN bit times [1 to 16]. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used. **NOTE** With CAN FD an external counter is required for timestamp generation (TSS = “10”)
15 to 2	Reserved	These bits are always read as 0.
1, 0	TSS[1:0]	Timestamp Select 00: Timestamp counter value always 0000_H 01: Timestamp counter value incremented according to TCP 10: External timestamp counter value used 11: Same as “00”

(9) MCANnTSCV — Timestamp Counter Value

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 024_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	TSC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC

Table 37.22 MCANnTSCV Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are always read as 0. When written, write the initial value.
15 to 0	TSC[15:0]	Timestamp Counter The internal/external Timestamp Counter value is captured on start of frame (both Rx and Tx). When MCANnTSCC.TSS = “01”, the Timestamp Counter is incremented in multiples of CAN bit times [1 to 16] depending on the configuration of MCANnTSCC.TCP. A wrap around sets interrupt flag MCANnIR.TSW. Write access resets the counter to zero. When MCANnTSCC.TSS = “10”, TSC reflects the external Timestamp Counter value. A write access has no impact.

NOTE

A “wrap around” is a change of the Timestamp Counter value from non-zero to zero not caused by write access to MCANnTSCV.

(10) MCANnTOCC — Timeout Counter Configuration

For a description of the Timeout Counter see **Section 37.5.3.3, Timeout Counter**.

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 028_H

Value after reset: FFFF 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TOP[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TOS[1:0]		ETOC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RP	RP	RP

Table 37.23 MCANnTOCC Register Contents

Bit Position	Bit Name	Function
31 to 16	TOP[15:0]	Timeout Period Start value of the Timeout Counter (down-counter). Configures the Timeout Period.
15 to 3	Reserved	These bits are always read as 0. When written, write the initial value.
2, 1	TOS[1:0]	Timeout Select When operating in Continuous mode, a write to MCANnTOCV presets the counter to the value configured by MCANnTOCC.TOP and continues down-counting. When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MCANnTOCC.TOP. Down-counting is started when the first FIFO element is stored. 00: Continuous operation 01: Timeout controlled by Tx Event FIFO 10: Timeout controlled by Rx FIFO 0 11: Timeout controlled by Rx FIFO 1
0	ETOC	Enable Timeout Counter 0: Timeout Counter disabled 1: Timeout Counter enabled

NOTE

For use of timeout function with CAN FD see **Section 37.6.3.3, Timeout Counter**.

(11) MCANnTOCV — Timeout Counter Value

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $02C_H$

Value after reset: $0000\ FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TOC[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC

Table 37.24 MCANnTOCV Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are always read as 0. When written, write the initial value.
15 to 0	TOC[15:0]	Timeout Counter The Timeout Counter is decremented in multiples of CAN bit times [1 to 16] depending on the configuration of MCANnTSCC.TCP. When decremented to zero, interrupt flag MCANnIR.TOO is set and the Timeout Counter is stopped. Start and reset/restart conditions are configured via MCANnTOCC.TOS.

(12) MCANnECR — Error Counter Register

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + 040_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CEL[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	X	X	X	X	X	X	X	X

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RP	REC[6:0]							TEC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.25 MCANnECR Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	These bits are always read as 0.
23 to 16	CEL[7:0]	CAN Error Logging The counter is incremented each time when a CAN protocol error causes the Transmit Error Counter or the Receive Error Counter to be incremented. It is reset by read access to CEL. The counter stops at FF_H; the next increment of TEC or REC sets interrupt flag MCANnIR.ELO.
15	RP	Receive Error Passive 0: The Receive Error Counter is below the error passive level of 128 1: The Receive Error Counter has reached the error passive level of 128
14 to 8	REC[6:0]	Receive Error Counter Actual state of the Receive Error Counter, values between 0 and 127
7 to 0	TEC[7:0]	Transmit Error Counter Actual state of the Transmit Error Counter, values between 0 and 255

NOTE

When MCANnCCCR.ASM is set, the CAN protocol controller does not increment TEC and REC when a CAN protocol error is detected, but CEL is still incremented.

(13) MCANnPSR — Protocol Status Register

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + 044_H

Value after reset: 0000 0707_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	REDL	RBRS	RESI	FLEC[2:0]			BO	EW	EP	ACT[1:0]		LEC[2:0]		
Value after reset	0	0	0	0	0	1	1	1	0	0	0	0	0	1	1	1
R/W	R	R	X	X	X	S	S	S	R	R	R	R	R	S	S	S

Table 37.26 MCANnPSR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 14	Reserved	These bits are always read as 0.
13	REDL	Received a CAN FD Message This bit is set independent of acceptance filtering. 0: Since this bit was reset by the CPU, no CAN FD message has been received 1: Message in CAN FD format with EDL flag set has been received
12	RBRS	BRS flag of last received CAN FD Message This bit is set together with REDL, independent of acceptance filtering. 0: Last received CAN FD message did not have its BRS flag set 1: Last received CAN FD message had its BRS flag set
11	RESI	ESI flag of last received CAN FD Message This bit is set together with REDL, independent of acceptance filtering. 0: Last received CAN FD message did not have its ESI flag set 1: Last received CAN FD message had its ESI flag set
10 to 8	FLEC[2:0]	Fast Last Error Code Type of last error that occurred in the data phase of a CAN FD format frame with its BRS flag set. Coding is the same as for LEC. This field will be cleared to zero when a CAN FD format frame with its BRS flag set has been transferred (reception or transmission) without error.
7	BO	Bus_Off Status 0: The M_CAN is not Bus_Off 1: The M_CAN is in Bus_Off state
6	EW	Warning Status 0: Both error counters are below the Error_Warning limit of 96 1: At least one of error counter has reached the Error_Warning limit of 96
5	EP	Error Passive 0: The M_CAN is in the Error_Active state. It normally takes part in bus communication and sends an active error flag when an error has been detected 1: The M_CAN is in the Error_Passive state
4, 3	ACT[1:0]	Activity Monitors the module's CAN communication state. 00: Synchronizing - node is synchronizing on CAN communication 01: Idle - node is neither receiver nor transmitter 10: Receiver - node is operating as receiver 11: Transmitter - node is operating as transmitter

Table 37.26 MCANnPSR Register Contents (2/2)

Bit Position	Bit Name	Function
2 to 0	LEC[2:0]	Last Error Code The LEC indicates the type of the last error to occur on the CAN bus. This field will be cleared to '0' when a message has been transferred (reception or transmission) without error. 0: No Error: No error occurred since LEC has been reset by successful reception or transmission. 1: Stuff Error: More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed. 2: Form Error: A fixed format part of a received frame has the wrong format. 3: AckError: The message transmitted by the M_TTCAN was not acknowledged by another node. 4: Bit1Error: During the transmission of a message (with the exception of the arbitration field), the device wanted to send a recessive level (bit of logical value '1'), but the monitored bus value was dominant. 5: Bit0Error: During the transmission of a message (or acknowledge bit, or active error flag, or overload flag), the device wanted to send a dominant level (data or identifier bit logical value '0'), but the monitored bus value was recessive. During Bus_Off recovery this status is set each time a sequence of 11 recessive bits has been monitored. This enables the CPU to monitor the proceeding of the Bus_Off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed). 6: CRCError: The CRC check sum of a received message was incorrect. The CRC of an incoming message does not match with the CRC calculated from the received data. 7: NoChange: Any read access to the Protocol Status Register re-initializes the LEC to '7'. When the LEC shows the value '7', no CAN bus event was detected since the last CPU read access to the Protocol Status Register.

NOTES

1. When a frame in CAN FD format has reached the data phase with BRS flag set, the next CAN event (error or valid frame) will be shown in FLEC instead of LEC. An error in a fixed stuff bit of a CAN FD CRC sequence will be shown as a Form Error, not Stuff Error.
2. The Bus_Off recovery sequence (see CAN Specification Rev. 2.0 or ISO11898-1) cannot be shortened by setting or resetting MCANnCCCR.INIT. If the device goes Bus_Off, it will set MCANnCCCR.INIT of its own accord, stopping all bus activities. Once MCANnCCCR.INIT has been cleared by the CPU, the device will then wait for 129 occurrences of Bus Idle (129 * 11 consecutive recessive bits) before resuming normal operation. At the end of the Bus_Off recovery sequence, the Error Management Counters will be reset. During the waiting time after the resetting of MCANnCCCR.INIT, each time a sequence of 11 recessive bits has been monitored, a Bit0Error code is written to MCANnPSR.LEC, enabling the CPU to readily check up whether the CAN bus is stuck at dominant or continuously disturbed and to monitor the Bus_Off recovery sequence. MCANnECR.REC is used to count these sequences.

(14) MCANnIR — Interrupt Register

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the Host clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register. The configuration of MCANnIE controls whether an interrupt is generated. The configuration of MCANnILS controls on which interrupt line an interrupt is signalled.

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 050_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 37.27 MCANnIR Register Contents (1/3)

Bit Position	Bit Name	Function
31	STE	Stuff Error 0: No Stuff Error detected 1: More than 5 equal bits in a sequence occurred
30	FOE	Format Error 0: No Format Error detected 1: A fixed format part of a received frame has the wrong format
29	ACKE	Acknowledge Error 0: No Acknowledge Error detected 1: A transmitted message was not acknowledged by another node
28	BE	Bit Error 0: No Bit Error detected 1: Device wanted to send a recessive / dominant level, but monitored bus level was dominant / recessive
27	CRCE	CRC Error 0: No CRC Error detected 1: Received CRC did not match the calculated CRC
26	WDI	Watchdog Interrupt 0: No Message RAM Watchdog event occurred 1: Message RAM Watchdog event due to missing READY
25	BO	Bus_Off Status 0: Bus_Off status unchanged 1: Bus_Off status changed
24	EW	Warning Status 0: Error_Warning status unchanged 1: Error_Warning status changed
23	EP	Error Passive 0: Error_Passive status unchanged 1: Error_Passive status changed
22	ELO	Error Logging Overflow 0: CAN Error Logging Counter did not overflow 1: Overflow of CAN Error Logging Counter occurred

Table 37.27 MCANnIR Register Contents (2/3)

Bit Position	Bit Name	Function
21	BEU	Bit Error Uncorrected Message RAM bit error detected, uncorrected. Controlled by input signal m_can_aeim_berr[1] generated by an optional external parity / ECC logic attached to the Message RAM. An uncorrected Message RAM bit error sets MCANnCCCR.INIT to '1'. This is done to avoid transmission of corrupted data. 0: No bit error detected when reading from Message RAM 1: Bit error detected, uncorrected (e.g. parity logic)
20	BEC	Bit Error Corrected Message RAM bit error detected and corrected. Controlled by input signal m_can_aeim_berr[0] generated by an optional external parity / ECC logic attached to the Message RAM. 0: No bit error detected when reading from Message RAM 1: Bit error detected and corrected (e.g. ECC)
19	DRX	Message stored to Dedicated Rx Buffer The flag is set whenever a received message has been stored into a dedicated Rx Buffer. 0: No Rx Buffer updated 1: At least one received message stored into an Rx Buffer
18	TOO	Timeout Occurred 0: No timeout 1: Timeout reached
17	MRAF	Message RAM Access Failure The flag is set, when the Rx Handler • has not completed acceptance filtering or storage of an accepted message until the arbitration field of the following message has been received. In this case acceptance filtering or message storage is aborted and the Rx Handler starts processing of the following message. • was not able to write a message to the Message RAM. In this case message storage is aborted. In both cases the FIFO put index is not updated resp. the New Data flag for a dedicated Rx Buffer is not set, a partly stored message is overwritten when the next message is stored to this location. The flag is also set when the Tx Handler was not able to read a message from the Message RAM in time. In this case message transmission is aborted. In case of a Tx Handler access failure the M_CAN is switched into Restricted Operation Mode (see **(5) Restricted Operation Mode**). To leave Restricted Operation Mode, the Host CPU has to reset MCANnCCCR.ASM. 0: No Message RAM access failure occurred 1: Message RAM access failure occurred
16	TSW	Timestamp Wraparound 0: No timestamp counter wrap-around 1: Timestamp counter wrapped around
15	TEFL	Tx Event FIFO Element Lost 0: No Tx Event FIFO element lost 1: Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero
14	TEFF	Tx Event FIFO Full 0: Tx Event FIFO not full 1: Tx Event FIFO full
13	TEFW	Tx Event FIFO Watermark Reached 0: Tx Event FIFO fill level below watermark 1: Tx Event FIFO fill level reached watermark
12	TEFN	Tx Event FIFO New Entry 0: Tx Event FIFO unchanged 1: Tx Handler wrote Tx Event FIFO element
11	TFE	Tx FIFO Empty 0: Tx FIFO non-empty 1: Tx FIFO empty

Table 37.27 MCANnIR Register Contents (3/3)

Bit Position	Bit Name	Function
10	TCF	Transmission Cancellation Finished 0: No transmission cancellation finished 1: Transmission cancellation finished
9	TC	Transmission Completed 0: No transmission completed 1: Transmission completed
8	HPM	High Priority Message 0: No high priority message received 1: High priority message received
7	RF1L	Rx FIFO 1 Message Lost 0: No Rx FIFO 1 message lost 1: Rx FIFO 1 message lost, also set after write attempt to Rx FIFO 1 of size zero
6	RF1F	Rx FIFO 1 Full 0: Rx FIFO 1 not full 1: Rx FIFO 1 full
5	RF1W	Rx FIFO 1 Watermark Reached 0: Rx FIFO 1 fill level below watermark 1: Rx FIFO 1 fill level reached watermark
4	RF1N	Rx FIFO 1 New Message 0: No new message written to Rx FIFO 1 1: New message written to Rx FIFO 1
3	RF0L	Rx FIFO 0 Message Lost 0: No Rx FIFO 0 message lost 1: Rx FIFO 0 message lost, also set after write attempt to Rx FIFO 0 of size zero
2	RF0F	Rx FIFO 0 Full 0: Rx FIFO 0 not full 1: Rx FIFO 0 full
1	RF0W	Rx FIFO 0 Watermark Reached 0: Rx FIFO 0 fill level below watermark 1: Rx FIFO 0 fill level reached watermark
0	RF0N	Rx FIFO 0 New Message 0: No new message written to Rx FIFO 0 1: New message written to Rx FIFO 0

(15) MCANnIE — Interrupt Enable

The settings in the Interrupt Enable register determine which status changes in the Interrupt Register will be signalled on an interrupt line.

0: Interrupt disabled
1: Interrupt enabled

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 054_H

Value after reset: $0000\ 0000_H$

0	RF0NE	Rx FIFO 0 New Message Interrupt Enable

(16) MCANnILS — Interrupt Line Select

The Interrupt Line Select register assigns an interrupt generated by a specific interrupt flag from the Interrupt Register to one of the two module interrupt lines.

0: Interrupt assigned to interrupt line m_can_int0 (INTMCANnI0)
1: Interrupt assigned to interrupt line m_can_int1 (INTMCANnI1)

Access: This register can be read/written in 32-bit units.
Address: <MCANn_base> + 058_H
Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

9	TCL	Transmission Completed Interrupt Line
8	HPML	High Priority Message Interrupt Line

Table 37.29 MCANnILS Register Contents (2/2)

Bit Position	Bit Name	Function
7	RF1LL	Rx FIFO 1 Message Lost Interrupt Line
6	RF1FL	Rx FIFO 1 Full Interrupt Line
5	RF1WL	Rx FIFO 1 Watermark Reached Interrupt Line
4	RF1NL	Rx FIFO 1 New Message Interrupt Line
3	RF0LL	Rx FIFO 0 Message Lost Interrupt Line
2	RF0FL	Rx FIFO 0 Full Interrupt Line
1	RF0WL	Rx FIFO 0 Watermark Reached Interrupt Line
0	RF0NL	Rx FIFO 0 New Message Interrupt Line

(17) MCANnILE — Interrupt Line Enable

Each of the two interrupt lines to the CPU can be enabled / disabled separately by programming bits EINT0 and EINT1.

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $05C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 37.30 MCANnILE Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	These bits are always read as 0. When written, write the initial value.
1	EINT1	Enable Interrupt Line 1 0: Interrupt line m_can_int1 (INTMCANnI1) disabled 1: Interrupt line m_can_int1 (INTMCANnI1) enabled
0	EINT0	Enable Interrupt Line 0 0: Interrupt line m_can_int0 (INTMCANnI0) disabled 1: Interrupt line m_can_int0 (INTMCANnI0) enabled

(18) MCANnGFC — Global Filter Configuration

Global settings for Message ID filtering. The Global Filter Configuration controls the filter path for standard and extended messages as described in **Figure 37.8, Standard Message ID Filter Path** and **Figure 37.9, Extended Message ID Filter Path**.

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 080_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.31 MCANnGFC Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	These bits are always read as 0. When written, write the initial value.
5, 4	ANFS[1:0]	Accept Non-matching Frames Standard Defines how received messages with 11-bit IDs that do not match any element of the filter list are treated. 00: Accept in Rx FIFO 0 01: Accept in Rx FIFO 1 10: Reject 11: Reject
3, 2	ANFE[1:0]	Accept Non-matching Frames Extended Defines how received messages with 29-bit IDs that do not match any element of the filter list are treated. 00: Accept in Rx FIFO 0 01: Accept in Rx FIFO 1 10: Reject 11: Reject
1	RRFS	Reject Remote Frames Standard 0: Filter remote frames with 11-bit standard IDs 1: Reject all remote frames with 11-bit standard IDs
0	RRFE	Reject Remote Frames Extended 0: Filter remote frames with 29-bit extended IDs 1: Reject all remote frames with 29-bit extended IDs

(19) MCANnSIDFC — Standard ID Filter Configuration

Settings for 11-bit standard Message ID filtering. The Standard ID Filter Configuration controls the filter path for standard messages as described in **Figure 37.8, Standard Message ID Filter Path**.

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 084_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	LSS[7:0]

	FLSSA[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	R	R

Table 37.32 MCANnSIDFC Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	These bits are always read as 0. When written, write the initial value.
23 to 16	LSS[7:0]	List Size Standard 0: No standard Message ID filter 1 to 128: Number of standard Message ID filter elements >128: Values greater than 128 are interpreted as 128
15 to 2	FLSSA[15:2]	Filter List Standard Start Address Start address of standard Message ID filter list (32-bit word address, see **Figure 37.4, Message RAM Configuration**).
1, 0	Reserved	These bits are always read as 0. When written, write the initial value.

(20) MCANnXIDFC — Extended ID Filter Configuration

Settings for 29-bit extended Message ID filtering. The Extended ID Filter Configuration controls the filter path for standard messages as described in **Figure 37.9, Extended Message ID Filter Path**.

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 088_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	LSE[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	RP	RP	RP	RP	RP	RP	RP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	R	R

Table 37.33 MCANnXIDFC Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	These bits are always read as 0. When written, write the initial value.
22 to 16	LSE[6:0]	List Size Extended 0: No extended Message ID filter 1 to 64: Number of extended Message ID filter elements >64: Values greater than 64 are interpreted as 64
15 to 2	FLESA[15:2]	Filter List Extended Start Address Start address of extended Message ID filter list (32-bit word address, see **Figure 37.4, Message RAM Configuration**).
1, 0	Reserved	These bits are always read as 0. When written, write the initial value.

(21) MCANnXIDAM — Extended ID AND Mask

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 090_H

Value after reset: $1FFF\ FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	EIDM[28:16]												
Value after reset	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EIDM[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP

Table 37.34 MCANnXIDAM Register Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	These bits are always read as 0. When written, write the initial value.
28 to 0	EIDM[28:0]	Extended ID Mask For acceptance filtering of extended frames the Extended ID AND Mask is ANDed with the Message ID of a received frame. Intended for masking of 29-bit IDs in SAE J1939. With the reset value of all bits set to one the mask is not active.

(22) MCANnHPMS — High Priority Message Status

This register is updated every time a Message ID filter element configured to generate a priority event matches. This can be used to monitor the status of incoming high priority messages and to enable fast access to these messages.

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + 094_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FLST	FIDX[6:0]							MSI[1:0]		BIDX[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.35 MCANnHPMS Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are always read as 0.
15	FLST	Filter List Indicates the filter list of the matching filter element. 0: Standard Filter List 1: Extended Filter List
14 to 8	FIDX[6:0]	Filter Index Index of matching filter element. Range is 0 to MCANnSIDFC.LSS – 1 resp. MCANnXIDFC.LSE – 1.
7, 6	MSI[1:0]	Message Storage Indicator 00: No FIFO selected 01: FIFO message lost 10: Message stored in FIFO 0 11: Message stored in FIFO 1
5 to 0	BIDX[5:0]	Buffer Index Index of Rx FIFO element to which the message was stored. Only valid when MSI[1] = ‘1’.

(23) MCANnNDAT1 — New Data 1

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 098_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ND31	ND30	ND29	ND28	ND27	ND26	ND25	ND24	ND23	ND22	ND21	ND20	ND19	ND18	ND17	ND16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 37.36 MCANnNDAT1 Register Contents

Bit Position	Bit Name	Function
31 to 0	ND[31:0]	New Data The register holds the New Data flags of Rx Buffers 0 to 31. The flags are set when the respective Rx Buffer has been updated from a received frame. The flags remain set until the Host clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register. 0: Rx Buffer not updated 1: Rx Buffer updated from new message

(24) MCANnNDAT2 — New Data 2

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $09C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ND63	ND62	ND61	ND60	ND59	ND58	ND57	ND56	ND55	ND54	ND53	ND52	ND51	ND50	ND49	ND48
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	ND47	ND46	ND45	ND44	ND43	ND42	ND41	ND40	ND39	ND38	ND37	ND36	ND35	ND34	ND33	ND32
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 37.37 MCANnNDAT2 Register Contents

Bit Position	Bit Name	Function
31 to 0	ND[63:32]	New Data The register holds the New Data flags of Rx Buffers 32 to 63. The flags are set when the respective Rx Buffer has been updated from a received frame. The flags remain set until the Host clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register. 0: Rx Buffer not updated 1: Rx Buffer updated from new message

(25) MCANnRXF0C — Rx FIFO 0 Configuration

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + $0A0_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	F0SA[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	R	R

Table 37.38 MCANnRXF0C Register Contents

Bit Position	Bit Name	Function
31	F0OM	FIFO 0 Operation Mode FIFO 0 can be operated in blocking or in overwrite mode (see **(2) Rx FIFOs**). 0: FIFO 0 blocking mode 1: FIFO 0 overwrite mode
30 to 24	F0WM[6:0]	Rx FIFO 0 Watermark 0: Watermark interrupt disabled 1 to 64: Level for Rx FIFO 0 watermark interrupt (MCANnIR.RF0W) >64: Watermark interrupt disabled
23	Reserved	This bit is always read as 0.
22 to 16	F0S[6:0]	Rx FIFO 0 Size 0: No Rx FIFO 0 1 to 64: Number of Rx FIFO 0 elements >64: Values greater than 64 are interpreted as 64 The Rx FIFO 0 elements are indexed from 0 to F0S-1
15 to 2	F0SA[15:2]	Rx FIFO 0 Start Address Start address of Rx FIFO 0 in Message RAM (32-bit word address, see **Figure 37.4, Message RAM Configuration**).
1, 0	Reserved	These bits are always read as 0.

(26) MCANnRXF0S — Rx FIFO 0 Status

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + $0A4_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	RF0L	F0F	—	—	F0PI[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	F0GI[5:0]						—	F0FL[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.39 MCANnRXF0S Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	These bits are always read as 0.
25	RF0L	Rx FIFO 0 Message Lost This bit is a copy of interrupt flag MCANnIR.RF0L. When MCANnIR.RF0L is reset, this bit is also reset. 0: No Rx FIFO 0 message lost 1: Rx FIFO 0 message lost, also set after write attempt to Rx FIFO 0 of size zero **NOTE** Overwriting the oldest message when MCANnRXF0C.F0OM = '1' will not set this flag.
24	F0F	Rx FIFO 0 Full 0: Rx FIFO 0 not full 1: Rx FIFO 0 full
23, 22	Reserved	These bits are always read as 0.
21 to 16	F0PI[5:0]	Rx FIFO 0 Put Index Rx FIFO 0 write index pointer, range 0 to 63.
15, 14	Reserved	These bits are always read as 0.
13 to 8	F0GI[5:0]	Rx FIFO 0 Get Index Rx FIFO 0 read index pointer, range 0 to 63.
7	Reserved	This bit is always read as 0.
6 to 0	F0FL[6:0]	Rx FIFO 0 Fill Level Number of elements stored in Rx FIFO 0, range 0 to 64.

(27) MCANnRXF0A — Rx FIFO 0 Acknowledge

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $0A8_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	F0AI[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 37.40 MCANnRXF0A Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	These bits are always read as 0. When written, write the initial value.
5 to 0	F0AI[5:0]	Rx FIFO 0 Acknowledge Index After the Host has read a message or a sequence of messages from Rx FIFO 0 it has to write the buffer index of the last element read from Rx FIFO 0 to F0AI. This will set the Rx FIFO 0 Get Index MCANnRXF0S.F0GI to F0AI + 1 and update the FIFO 0 Fill Level MCANnRXF0S.F0FL.

(28) MCANnRXBC — Rx Buffer Configuration

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $0AC_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 37.43 MCANnRXF1S Register Contents

Bit Position	Bit Name	Function
31, 30	DMS[1:0]	Debug Message Status 00: Idle state, wait for reception of debug messages, DMA request is cleared 01: Debug message A received 10: Debug messages A, B received 11: Debug messages A, B, C received, DMA request is set
29 to 26	Reserved	These bits are always read as 0.
25	RF1L	Rx FIFO 1 Message Lost This bit is a copy of interrupt flag MCANnIR.RF1L. When MCANnIR.RF1L is reset, this bit is also reset. 0: No Rx FIFO 1 message lost 1: Rx FIFO 1 message lost, also set after write attempt to Rx FIFO 1 of size zero **NOTE** Overwriting the oldest message when MCANnRXF0C.F0OM = '1' will not set this flag.
24	F1F	Rx FIFO 1 Full 0: Rx FIFO 1 not full 1: Rx FIFO 1 full
23, 22	Reserved	These bits are always read as 0.
21 to 16	F1PI[5:0]	Rx FIFO 1 Put Index Rx FIFO 1 write index pointer, range 0 to 63.
15, 14	Reserved	These bits are always read as 0.
13 to 8	F1GI[5:0]	Rx FIFO 1 Get Index Rx FIFO 1 read index pointer, range 0 to 63.
7	Reserved	This bit is always read as 0.
6 to 0	F1FL[6:0]	Rx FIFO 1 Fill Level Number of elements stored in Rx FIFO 1, range 0 to 64.

(31) MCANnRXF1A — Rx FIFO 1 Acknowledge

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $0B8_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 37.44 MCANnRXF1A Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	These bits are always read as 0. When written, write the initial value.
5 to 0	F1AI[5:0]	Rx FIFO 1 Acknowledge Index After the Host has read a message or a sequence of messages from Rx FIFO 1 it has to write the buffer index of the last element read from Rx FIFO 1 to F1AI. This will set the Rx FIFO 1 Get Index MCANnRXF1S.F1GI to F1AI + 1 and update the FIFO 1 Fill Level MCANnRXF1S.F1FL.

(32) MCANnRXESC — Rx Buffer / FIFO Element Size Configuration

Configures the number of data bytes belonging to an Rx Buffer / Rx FIFO element. Data field sizes >8 bytes are intended for CAN FD operation only.

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + $0BC_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	RBDS[2:0]			—	F1DS[2:0]			—	F0DS[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	RP	RP	RP	R	RP	RP	RP	R	RP	RP	RP

Table 37.45 MCANnRXESC Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	These bits are always read as 0.
10 to 8	RBDS[2:0]	Rx Buffer Data Field Size 000: 8 byte data field 001: 12 byte data field 010: 16 byte data field 011: 20 byte data field 100: 24 byte data field 101: 32 byte data field 110: 48 byte data field 111: 64 byte data field
7	Reserved	This bit is always read as 0.
6 to 4	F1DS[2:0]	Rx FIFO 1 Data Field Size 000: 8 byte data field 001: 12 byte data field 010: 16 byte data field 011: 20 byte data field 100: 24 byte data field 101: 32 byte data field 110: 48 byte data field 111: 64 byte data field
3	Reserved	This bit is always read as 0.
2 to 0	F0DS[2:0]	Rx FIFO 0 Data Field Size 000: 8 byte data field 001: 12 byte data field 010: 16 byte data field 011: 20 byte data field 100: 24 byte data field 101: 32 byte data field 110: 48 byte data field 111: 64 byte data field

NOTE

In case the data field size of an accepted CAN frame exceeds the data field size configured for the matching Rx Buffer or Rx FIFO, only the number of bytes as configured by MCANnRXESC are stored to the Rx Buffer resp. Rx FIFO element. The rest of the frame's data field is ignored.

(33) MCANnTXBC — Tx Buffer Configuration

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $0C0_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	TFQM	TFQS[5:0]						—	—	NDTB[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RP	RP	RP	RP	RP	RP	RP	R	R	RP	RP	RP	RP	RP	RP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TBSA[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	R	R

Table 37.46 MCANnTXBC Register Contents

Bit Position	Bit Name	Function
31	Reserved	This bit is always read as 0. When written, write the initial value.
30	TFQM	Tx FIFO/Queue Mode 0: Tx FIFO operation 1: Tx Queue operation
29 to 24	TFQS[5:0]	Transmit FIFO/Queue Size 0: No Tx FIFO/Queue 1 to 32: Number of Tx Buffers used for Tx FIFO/Queue >32: Values greater than 32 are interpreted as 32
23, 22	Reserved	These bits are always read as 0. When written, write the initial value.
21 to 16	NDTB[5:0]	Number of Dedicated Transmit Buffers 0: No Dedicated Tx Buffers 1 to 32: Number of Dedicated Tx Buffers >32: Values greater than 32 are interpreted as 32
15 to 2	TBSA[15:2]	Tx Buffers Start Address Start address of Tx Buffers section in Message RAM (32-bit word address, see **Figure 37.4, Message RAM Configuration**).
1, 0	Reserved	These bits are always read as 0. When written, write the initial value.

NOTE

Be aware that the sum of TFQS and NDTB may be not greater than 32. There is no check for erroneous configurations. The Tx Buffers section in the Message RAM starts with the dedicated Tx Buffers.

(34) MCANnTXFQS — Tx FIFO/Queue Status

The Tx FIFO/Queue status is related to the pending Tx requests listed in register MCANnTXBRP. Therefore the effect of Add/Cancellation requests may be delayed due to a running Tx scan (MCANnTXBRP not yet updated).

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + $0C4_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	TFQF	TFQPI[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	TFGI[4:0]					—	—	TFFL[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.47 MCANnTXFQS Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	These bits are always read as 0.
21	TFQF	Tx FIFO/Queue Full 0: Tx FIFO/Queue not full 1: Tx FIFO/Queue full
20 to 16	TFQPI[4:0]	Tx FIFO/Queue Put Index Tx FIFO/Queue write index pointer, range 0 to 31.
15 to 13	Reserved	These bits are always read as 0.
12 to 8	TFGI[4:0]	Tx FIFO Get Index Tx FIFO read index pointer, range 0 to 31. Read as zero when Tx Queue operation is configured (MCANnTXBC.TFQM = '1').
7, 6	Reserved	These bits are always read as 0.
5 to 0	TFFL[5:0]	Tx FIFO Free Level Number of consecutive free Tx FIFO elements starting from TFGI, range 0 to 32. Read as zero when Tx Queue operation is configured (MCANnTXBC.TFQM = '1')

NOTE

In case of mixed configurations where dedicated Tx Buffers are combined with a Tx FIFO or a Tx Queue, the Put and Get Indices indicate the number of the Tx Buffer starting with the first dedicated Tx Buffers.
Example: For a configuration of 12 dedicated Tx Buffers and a Tx FIFO of 20 Buffers a Put Index of 15 points to the fourth buffer of the Tx FIFO.

(35) MCANnTXESC — Tx Buffer Element Size Configuration

Configures the number of data bytes belonging to a Tx Buffer element. Data field sizes > 8 bytes are intended for CAN FD operation only.

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $0C8_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TBDS[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RP	RP	RP

Table 37.48 MCANnTXESC Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	These bits are always read as 0. When written, write the initial value.
2 to 0	TBDS[2:0]	Tx Buffer Data Field Size 000: 8 byte data field 001: 12 byte data field 010: 16 byte data field 011: 20 byte data field 100: 24 byte data field 101: 32 byte data field 110: 48 byte data field 111: 64 byte data field

NOTE

In case the data length code DLC of a Tx Buffer element is configured to a value higher than the Tx Buffer data field size MCANnTXESC.TBDS, the bytes not defined by the Tx Buffer are transmitted as "CC_H" (padding bytes).

(36) MCANnTXBRP — Tx Buffer Request Pending

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + $0CC_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TRP31	TRP30	TRP29	TRP28	TRP27	TRP26	TRP25	TRP24	TRP23	TRP22	TRP21	TRP20	TRP19	TRP18	TRP17	TRP16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.49 MCANnTXBRP Register Contents

Bit Position	Bit Name	Function
31 to 0	TRP[31:0]	Transmission Request Pending Each Tx Buffer has its own Transmission Request Pending bit. The bits are set via register MCANnTXBAR. The bits are reset after a requested transmission has completed or has been cancelled via register MCANnTXBCR. MCANnTXBRP bits are set only for those Tx Buffers configured via MCANnTXBC. After a MCANnTXBRP bit has been set, a Tx scan (see **Section 37.5.3.5, Tx Handling**) is started to check for the pending Tx request with the highest priority (Tx Buffer with lowest Message ID). A cancellation request resets the corresponding transmission request pending bit of register MCANnTXBRP. In case a transmission has already been started when a cancellation is requested, this is done at the end of the transmission, regardless whether the transmission was successful or not. The cancellation request bits are reset directly after the corresponding MCANnTXBRP bit has been reset. After a cancellation has been requested, a finished cancellation is signalled via MCANnTXBCF • after successful transmission together with the corresponding MCANnTXBTO bit • when the transmission has not yet been started at the point of cancellation • when the transmission has been aborted due to lost arbitration • when an error occurred during frame transmission In DAR mode all transmissions are automatically cancelled if they are not successful. The corresponding MCANnTXBCF bit is set for all unsuccessful transmissions. 0: No transmission request pending 1: Transmission request pending **NOTE** MCANnTXBRP bits which are set while a Tx scan is in progress are not considered during this particular Tx scan. In case a cancellation is requested for such a Tx Buffer, this Add Request is cancelled immediately, the corresponding MCANnTXBRP bit is reset.

(37) MCANnTXBAR — Tx Buffer Add Request

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $0D0_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AR31	AR30	AR29	AR28	AR27	AR26	AR25	AR24	AR23	AR22	AR21	AR20	AR19	AR18	AR17	AR16

Table 37.50 MCANnTXBAR Register Contents

Bit Position	Bit Name	Function
31 to 0	AR[31:0]	Add Request Each Tx Buffer has its own Add Request bit. Writing a '1' will set the corresponding Add Request bit; writing a '0' has no impact. This enables the Host to set transmission requests for multiple Tx Buffers with one write to MCANnTXBAR. MCANnTXBAR bits are set only for those Tx Buffers configured via MCANnTXBC. When no Tx scan is running, the bits are reset immediately, else the bits remain set until the Tx scan process has completed. 0: No transmission request added 1: Transmission requested added

NOTE

If an add request is applied for a Tx Buffer with pending transmission request (corresponding MCANnTXBRP bit already set), this add request is ignored.

(38) MCANnTXBCR — Tx Buffer Cancellation Request

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $0D4_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 37.52 MCANnTXBTO Register Contents

Bit Position	Bit Name	Function
31 to 0	TO[31:0]	Transmission Occurred Each Tx Buffer has its own Transmission Occurred bit. The bits are set when the corresponding MCANnTXBRP bit is cleared after a successful transmission. The bits are reset when a new transmission is requested by writing a ‘1’ to the corresponding bit of register MCANnTXBAR. 0: No transmission occurred 1: Transmission occurred

(40) MCANnTXBCF — Tx Buffer Cancellation Finished

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + $0DC_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CF31	CF30	CF29	CF28	CF27	CF26	CF25	CF24	CF23	CF22	CF21	CF20	CF19	CF18	CF17	CF16

	—	—	—	EFGI[4:0]					—	—	EFFL[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.57 MCANnTXEFS Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	These bits are always read as 0.
25	TEFL	Tx Event FIFO Element Lost This bit is a copy of interrupt flag MCANnIR.TEFL. When MCANnIR.TEFL is reset, this bit is also reset. 0: No Tx Event FIFO element lost 1: Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero.
24	EFF	Event FIFO Full 0: Tx Event FIFO not full 1: Tx Event FIFO full
23 to 21	Reserved	These bits are always read as 0.
20 to 16	EFPI[4:0]	Event FIFO Put Index Tx Event FIFO write index pointer, range 0 to 31.
15 to 13	Reserved	These bits are always read as 0.
12 to 8	EFGI[4:0]	Event FIFO Get Index Tx Event FIFO read index pointer, range 0 to 31.
7, 6	Reserved	These bits are always read as 0.
5 to 0	EFFL[5:0]	Event FIFO Fill Level Number of elements stored in Tx Event FIFO, range 0 to 32.

(45) MCANnTXEFA — Tx Event FIFO Acknowledge

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $0F8_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	EFAI[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 37.58 MCANnTXEFA Register Contents

Bit Position	Bit Name	Function
31 to 5	Reserved	These bits are always read as 0. When written, write the initial value.
4 to 0	EFAI[4:0]	Event FIFO Acknowledge Index After the Host has read an element or a sequence of elements from the Tx Event FIFO it has to write the index of the last element read from Tx Event FIFO to EFAI. This will set the Tx Event FIFO Get Index MCANnTXEFS.EFGI to EFAI + 1 and update the FIFO 0 Fill Level MCANnTXEFS.EFFL.

37.5.2.4 Message RAM

For storage of Rx/Tx messages and for storage of the filter configuration a single- or dual-ported Message RAM has to be connected to the M_CAN module.

(1) Message RAM Configuration

The Message RAM has a width of 32 bits. In case parity checking or ECC is used a respective number of bits has to be added to each word. The M_CAN module can be configured to allocate up to 4352 words in the Message RAM. It is not necessary to configure each of the sections listed in **Figure 37.4, Message RAM Configuration**, nor is there any restriction with respect to the sequence of the sections.

When operated in CAN FD mode the required Message RAM size strongly depends on the element size configured for Rx FIFO0, Rx FIFO1, Rx Buffers, and Tx Buffers via MCANnRXESC.F0DS, MCANnRXESC.F1DS, MCANnRXESC.RBDS, and MCANnTXESC.TBDS.

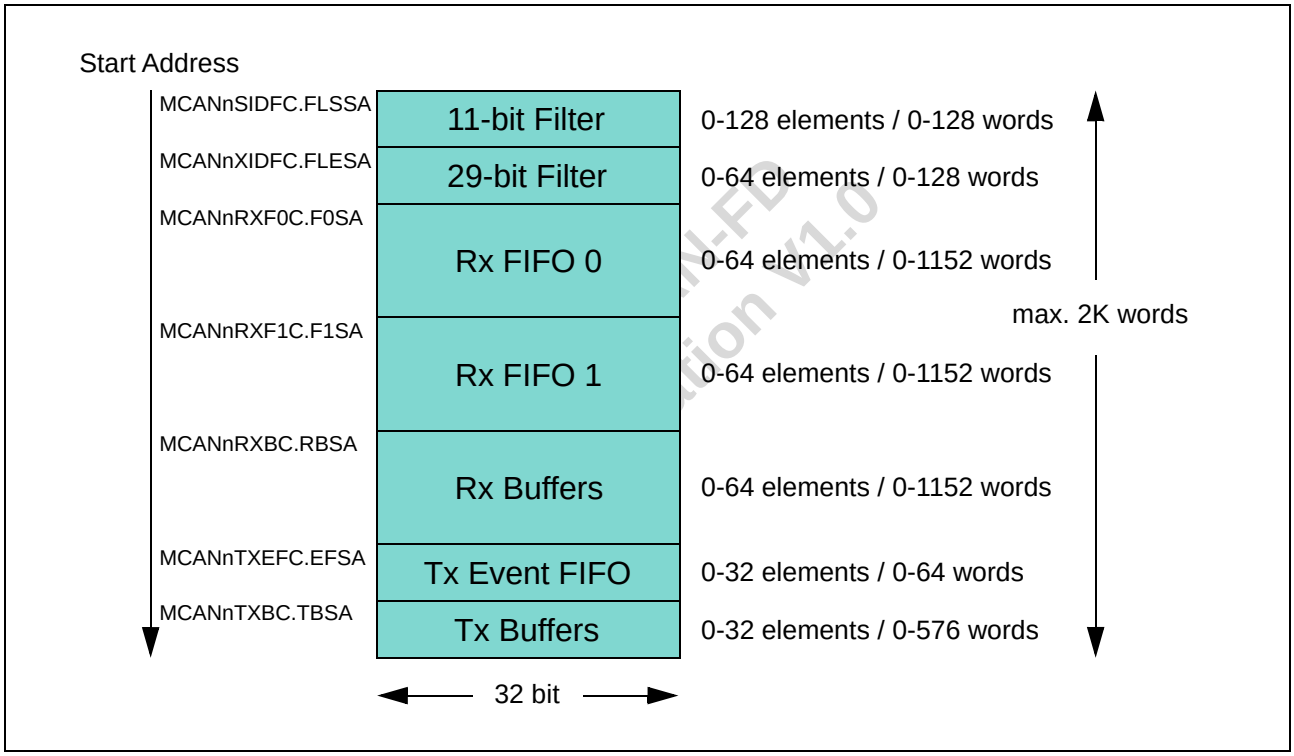

Figure 37.4 Message RAM Configuration

When the M_CAN addresses the Message RAM it addresses 32-bit words, not single bytes. The configurable start addresses are 32-bit word addresses i.e. only bits 15 to 2 are evaluated, the two least significant bits are ignored.

NOTE

The M_CAN does not check for erroneous configuration of the Message RAM. Especially the configuration of the start addresses of the different sections and the number of elements of each section has to be done carefully to avoid falsification or loss of data.

(2) Rx Buffer and FIFO Element

Up to 64 Rx Buffers and two Rx FIFOs can be configured in the Message RAM. Each Rx FIFO section can be configured to store up to 64 received messages. The structure of a Rx Buffer / FIFO element is shown in **Table 37.59** below. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register MCANnRXESC.

Table 37.59 Rx Buffer and FIFO Element

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R0	ESI	XTD	RTR	ID[28:0]																												
R1	ANMF	FIDX[6:0]							res	EDL	BRS	DLC[3:0]					RXTS[15:0]															
R2	DB3[7:0]								DB2[7:0]								DB1[7:0]								DB0[7:0]							
R3	DB7[7:0]								DB6[7:0]								DB5[7:0]								DB4[7:0]							
...	...								...								...								...							
Rn	DBm[7:0]								DBm-1[7:0]								DBm-2[7:0]								DBm-3[7:0]							

R0 Bit 31 ESI: Error State Indicator

0: Transmitting node is error active
1: Transmitting node is error passive

R0 Bit 30 XTD: Extended Identifier

Signals to the Host whether the received frame has a standard or extended identifier.

0: 11-bit standard identifier
1: 29-bit extended identifier

R0 Bit 29 RTR: Remote Transmission Request

Signals to the Host whether the received frame is a data frame or a remote frame.

0:Received frame is a data frame

1:Received frame is a remote frame

NOTE

There are no remote frames in CAN FD format. In case a CAN FD frame was received (EDL = 1'), bit RTR reflects the state of the reserved bit r1.

R0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].

R1 Bit 31 ANMF: Accepted Non-matching Frame

Acceptance of non-matching frames may be enabled via MCANnGFC.ANFS and MCANnGFC.ANFE.

0:Received frame matching filter index FIDX

1:Received frame did not match any Rx filter element

R1 Bits 30:24 FIDX[6:0]:Filter Index

0 to 127:Index of matching Rx acceptance filter element (invalid if ANMF = '1').
Range is 0 to MCANnSIDFC.LSS - 1 resp. MCANnXIDFC.LSE - 1.

R1 Bit 21 EDL: Extended Data Length

0:Standard frame format

1:CAN FD frame format (new DLC-coding and CRC)

R1 Bit 20 BRS: Bit Rate Switch

0:Frame received without bit rate switching

1:Frame received with bit rate switching

R1 Bits 19:16 DLC[3:0]: Data Length Code

0 to 8: CAN + CAN FD: received frame has 0 to 8 data bytes

9 to 15: CAN: received frame has 8 data bytes

9 to 15: CAN FD: received frame has 12/16/20/24/32/48/64 data bytes

R1 Bits 15:0 RXTS[15:0]:Rx Timestamp

Timestamp Counter value captured on start of frame reception. Resolution depending on configuration of the Timestamp Counter Prescaler MCANnTSCC.TCP.

R2 Bits 31:24 DB3[7:0]: Data Byte 3

R2 Bits 23:16 DB2[7:0]: Data Byte 2

R2 Bits 15:8 DB1[7:0]: Data Byte 1

R2 Bits 7:0 DB0[7:0]: Data Byte 0

R3 Bits 31:24 DB7[7:0]: Data Byte 7

R3 Bits 23:16 DB6[7:0]: Data Byte 6

R3 Bits 15:8 DB5[7:0]: Data Byte 5

R3 Bits 7:0 DB4[7:0]: Data Byte 4

...

Rn Bits 31:24 DBm[7:0]: Data Byte m

Rn Bits 23:16 DBm-1[7:0]:Data Byte m-1

Rn Bits 15:8 DBm-2[7:0]:Data Byte m-2

Rn Bits 7:0 DBm-3[7:0]:Data Byte m-3

NOTE

Depending on the configuration of the element size (MCANnRXESC), between two and sixteen 32-bit words (Rn = 3 to 17) are used for storage of a CAN message's data field.

(3) Tx Buffer Element

The Tx Buffers section can be configured to hold dedicated Tx Buffers as well as a Tx FIFO / Tx Queue. In case that the Tx Buffers section is shared by dedicated Tx buffers and a Tx FIFO / Tx Queue, the dedicated Tx Buffers start at the beginning of the Tx Buffers section followed by the buffers assigned to the Tx FIFO or Tx Queue. The Tx Handler distinguishes between dedicated Tx Buffers and Tx FIFO / Tx Queue by evaluating the Tx Buffer configuration MCANnTXBC.TFQS and MCANnTXBC.NDTB. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register MCANnTXESC.

Table 37.60 Tx Buffer Element

	31 24	23 16	15 8	7 0
T0	res, XTD, RTR	ID[28:0]		
T1	MM[7:0]	EFC, res, DLC[3:0]	res	
T2	DB3[7:0]	DB2[7:0]	DB1[7:0]	DB0[7:0]
T3	DB7[7:0]	DB6[7:0]	DB5[7:0]	DB4[7:0]
...	...	...	...	...
Tn	DBm[7:0]	DBm-1[7:0]	DBm-2[7:0]	DBm-3[7:0]

T0 Bit 30 XTD: Extended Identifier

0: 11-bit standard identifier

1: 29-bit extended identifier

T0 Bit 29 RTR: Remote Transmission Request

0: Transmit data frame

1: Transmit remote frame

NOTE

When RTR = 1, the M_CAN transmits a remote frame according to ISO11898-1, even if MCANnCCCR.CME enables the transmission in CAN FD format.

T0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier has to be written to ID[28:18].

T1 Bits 31:24 MM[7:0]: Message Marker

Written by CPU during Tx Buffer configuration. Copied into Tx Event FIFO element for identification of Tx message status.

T1 Bit 23 EFC: Event FIFO Control

0: Don’t store Tx events

1: Store Tx events

T1 Bits 19:16 DLC[3:0]: Data Length Code

0 to 8: CAN + CAN FD: transmit frame has 0-8 data bytes

9 to 15: CAN: transmit frame has 8 data bytes

9 to 15: CAN FD: transmit frame has 12/16/20/24/32/48/64 data bytes

T2 Bits 31:24DB3[7:0]:Data Byte 3

T2 Bits 23:16 DB2[7:0]: Data Byte 2

T2 Bits 15:8 DB1[7:0]: Data Byte 1

T2 Bits 7:0 DB0[7:0]: Data Byte 0

T3 Bits 31:24 DB7[7:0]: Data Byte 7

T3 Bits 23:16 DB6[7:0]: Data Byte 6

T3 Bits 15:8 DB5[7:0]: Data Byte 5

T3 Bits 7:0 DB4[7:0]: Data Byte 4

...

Tn Bits 31:24 DBm[7:0]: Data Byte m

Tn Bits 23:16 DBm-1[7:0]:Data Byte m-1

Tn Bits 15:8 DBm-2[7:0]:Data Byte m-2

Tn Bits 7:0 DBm-3[7:0]:Data Byte m-3

NOTE

Depending on the configuration of the element size (MCANnTXESC), between two and sixteen 32-bit words (Tn = 3 to 17) are used for storage of a CAN message’s data field.

(4) Tx Event FIFO Element

Each element stores information about transmitted messages. By reading the Tx Event FIFO the Host CPU gets this information in the order the messages were transmitted. Status information about the Tx Event FIFO can be obtained from register MCANnTXEFS

Table 37.61 Tx Event FIFO Element

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
E0	ESI	XTD	RTR	ID[28:0]																												
E1	MM[7:0]								ET[1:0]		EDL	BRS	DLC[3:0]				TXTS[15:0]															

E0 Bit 31 ESI: Error State Indicator

0: Transmitting node is error active

1: Transmitting node is error passive

E0 Bit 30 XTD: Extended Identifier

0: 11-bit standard identifier

1: 29-bit extended identifier

E0 Bit 29 RTR: Remote Transmission Request

0: Data frame transmitted

1: Remote frame transmitted

E0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].

E1 Bits 31:24 MM[7:0]: Message Marker

Copied from Tx Buffer into Tx Event FIFO element for identification of Tx message status.

E1 Bit 23:22 ET[1:0]: Event Type

00: Reserved

01: Tx event

10: Transmission in spite of cancellation (always set for transmissions in DAR mode)

11: Reserved

E1 Bit 21 EDL: Extended Data Length

0: Standard frame format

1: CAN FD frame format (new DLC-coding and CRC)

E1 Bit 20 BRS: Bit Rate Switch

0: Frame transmitted without bit rate switching

1: Frame transmitted with bit rate switching

E1 Bits 19:16 DLC[3:0]: Data Length Code

0 to 8: CAN + CAN FD: frame with 0-8 data bytes transmitted

9 to 15: CAN: frame with 8 data bytes transmitted

9 to 15: CAN FD: frame with 12/16/20/24/32/48/64 data bytes transmitted

E1 Bits 15:0 TXTS[15:0]:Tx Timestamp

Timestamp Counter value captured on start of frame transmission. Resolution depending on configuration of the Timestamp Counter Prescaler MCANnTSCC.TCP.

(5) Standard Message ID Filter Element

Up to 128 filter elements can be configured for 11-bit standard IDs. When accessing a Standard Message ID Filter element, its address is the Filter List Standard Start Address MCANnSIDFC.FLSSA plus the index of the filter element (0 to 127).

Table 37.62 Standard Message ID Filter Element

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
S0	SFT[1:0]		SFEC[2:0]		SFID1[10:0]											res								SFID2[10:0]							

Bits 31:30 SFT[1:0]: Standard Filter Type

00: Range filter from SF1ID to SF2ID (SF2ID ≥ SF1ID)

01: Dual ID filter for SF1ID or SF2ID

10: Classic filter: SF1ID = filter, SF2ID = mask

11: Reserved

Bit 29:27 SFEC[2:0]:Standard Filter Element Configuration

All enabled filter elements are used for acceptance filtering of standard frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If SFEC = “100”, “101”, or “110” a match sets interrupt flag MCANnIR.HPM and, if enabled, an interrupt is generated. In this case register MCANnHPMS is updated with the status of the priority match.

000: Disable filter element

001: Store in Rx FIFO 0 if filter matches

010: Store in Rx FIFO 1 if filter matches

011: Reject ID if filter matches

100: Set priority if filter matches

101: Set priority and store in FIFO 0 if filter matches

110: Set priority and store in FIFO 1 if filter matches

111: Store into Rx Buffer or as debug message, configuration of SFT[1:0] ignored

Bits 26:16 SFID1[10:0]:Standard Filter ID 1

First ID of standard ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of a standard message to be stored. The received identifiers must match exactly, no masking mechanism is used.

Bits 10:0 SFID2[10:0]:Standard Filter ID 2

This bit field has a different meaning depending on the configuration of SFEC:

1) SFEC = “001” to “110”Second ID of standard ID filter element

2) SFEC = “111”Filter for Rx Buffers or for debug messages

SFID2[10:9]: These bits decide whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.
00: Store message into an Rx Buffer
01: Debug Message A
10: Debug Message B
11: Debug Message C

SFID2[8:6]: These bits are used to control the filter event pins m_can_fe[2:0] at the Extension Interface. A one at the respective bit position enables generation of a pulse at the related filter event pin with the duration of one m_can_hclk (CLK_HSB) period in case the filter matches.

SFID2[5:0]: These bits define the offset to the Rx Buffer Start Address MCANnRXBC.RBSA for storage of a matching message.

(6) Extended Message ID Filter Element

Up to 64 filter elements can be configured for 29-bit extended IDs. When accessing an Extended Message ID Filter element, its address is the Filter List Extended Start Address MCANnXIDFC.FLESA plus two times the index of the filter element (0 to 63).

Table 37.63 Extended Message ID Filter Element

	31	24	23	16	15	8	7	0
F0	EFEC[2:0]		EFID1[28:0]					
F1	EFT[1:0]	res	EFID2[28:0]					

F0 Bit 31:29 EFEC[2:0]:Extended Filter Element Configuration

All enabled filter elements are used for acceptance filtering of extended frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If EFEC = “100”, “101”, or “110” a match sets interrupt flag MCANnIR.HPM and, if enabled, an interrupt is generated. In this case register MCANnHPMS is updated with the status of the priority match.

000: Disable filter element

001: Store in Rx FIFO 0 if filter matches

010: Store in Rx FIFO 1 if filter matches

011: Reject ID if filter matches

100: Set priority if filter matches

101: Set priority and store in FIFO 0 if filter matches

110: Set priority and store in FIFO 1 if filter matches

111: Store into Rx Buffer or as debug message, configuration of EFT[1:0] ignored

F0 Bits 28:0 EFID1[28:0]:Extended Filter ID 1

First ID of extended ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of an extended message to be stored. The received identifiers must match exactly, only MCANnXIDAM masking mechanism (see **Section (e), Extended Message ID Filtering**) is used.

F1 Bits 31:30 EFT[1:0]: Extended Filter Type

00: Range filter from EF1ID to EF2ID (EF2ID ≥ EF1ID)

01: Dual ID filter for EF1ID or EF2ID

10: Classic filter: EF1ID = filter, EF2ID = mask

11: Range filter from EF1ID to EF2ID (EF2ID ≥ EF1ID), MCANnXIDAM mask not applied

F1 Bits 28:0 EFID2[28:0]:Extended Filter ID 2

This bit field has a different meaning depending on the configuration of EFEC:

1) EFEC: “001” to ”110”Second ID of extended ID filter element

2) EFEC: “111”Filter for Rx Buffers or for debug messages

EFID2[10:9]: These bits decide whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.
00: Store message into an Rx Buffer
01: Debug Message A
10: Debug Message B
11: Debug Message C

EFID2[8:6]: These bits are used to control the filter event pins m_can_fe[2:0] at the Extension Interface. A one at the respective bit position enables generation of a pulse at the related filter event pin with the duration of one m_can_hclk (CLK_HSB) period in case the filter matches.

EFID2[5:0]: These bits define the offset to the Rx Buffer Start Address MCANnRXBC.RBSA for storage of a matching message.

37.5.3 Functional Description

37.5.3.1 Operating Modes

(1) Software Initialization

Software initialization is started by setting bit MCANnCCCR.INIT, either by software or by a hardware reset, when an uncorrected bit error was detected in the Message RAM, or by going Bus_Off. While MCANnCCCR.INIT is set, message transfer from and to the CAN bus is stopped, the status of the CAN bus output m_can_tx is recessive (HIGH). The counters of the Error Management Logic EML are unchanged. Setting MCANnCCCR.INIT does not change any configuration register. Resetting MCANnCCCR.INIT finishes the software initialization. Afterwards the Bit Stream Processor BSP synchronizes itself to the data transfer on the CAN bus by waiting for the occurrence of a sequence of 11 consecutive recessive bits (≡ Bus_Idle) before it can take part in bus activities and start the message transfer.

Access to the M_CAN configuration registers is only enabled when both bits MCANnCCCR.INIT and MCANnCCCR.CCE are set (protected write).

MCANnCCCR.CCE can only be set/reset while MCANnCCCR.INIT = ‘1’. MCANnCCCR.CCE is automatically reset when MCANnCCCR.INIT is reset.

The following registers are reset when MCANnCCCR.CCE is set

- MCANnHPMS - High Priority Message Status
- MCANnRXF0S - Rx FIFO 0 Status
- MCANnRXF1S - Rx FIFO 1 Status
- MCANnTXFQS - Tx FIFO/Queue Status
- MCANnTXBRP - Tx Buffer Request Pending
- MCANnTXBTO - Tx Buffer Transmission Occurred
- MCANnTXBCF - Tx Buffer Cancellation Finished
- MCANnTXEFS - Tx Event FIFO Status

The Timeout Counter value MCANnTOCV.TOC is preset to the value configured by MCANnTOCC.TOP when MCANnCCCR.CCE is set.

In addition the state machines of the Tx Handler and Rx Handler are held in idle state while MCANnCCCR.CCE = ‘1’.

The following registers are only writable while MCANnCCCR.CCE = ‘0’

- MCANnTXBAR - Tx Buffer Add Request
- MCANnTXBCR - Tx Buffer Cancellation Request

MCANnCCCR.TEST and MCANnCCCR.MON can only be set by the Host while MCANnCCCR.INIT = ‘1’ and MCANnCCCR.CCE = ‘1’. Both bits may be reset at any time. MCANnCCCR.DAR can only be set/reset while MCANnCCCR.INIT = ‘1’ and MCANnCCCR.CCE = ‘1’.

(2) Normal Operation

Once the M_TTCAN is initialized and MCANnCCCR.INIT is reset to *zero*, the M_CAN synchronizes itself to the CAN bus and is ready for communication.

After passing the acceptance filtering, received messages including Message ID and DLC are stored into a dedicated Rx Buffer or into Rx FIFO 0 or Rx FIFO 1.

For messages to be transmitted dedicated Tx Buffers and/or a Tx FIFO or a Tx Queue can be initialized or updated. Automated transmission on reception of remote frames is not implemented.

(3) CAN FD Operation

There are two variants in the CAN FD frame format, first the CAN FD frame without bit rate switching where the data field of a CAN frame may be longer than 8 bytes. The second variant is the CAN FD frame where control field, data field, and CRC field of a CAN frame are transmitted with a higher bit rate than the beginning and the end of the frame.

The CAN operation mode is enabled by programming MCANnCCCR.CME. In case MCANnCCCR.CME = “01” transmission of long CAN FD frames and reception of long and fast CAN FD frames is enabled. With MCANnCCCR.CME = “10”/“11” transmission and reception of long and fast CAN FD frames is enabled. MCANnCCCR.CME can only be changed while MCANnCCCR.INIT and MCANnCCCR.CCE are both set.

When initialization is left (MCANnCCCR.INIT set to ‘0’), the CAN FD protocol option is inactive, it has to be requested by writing to MCANnCCCR.CMR.

A mode change requested by writing to MCANnCCCR.CMR will be executed next time the CAN protocol controller FSM reaches idle phase between CAN frames. Upon this event MCANnCCCR.CMR is reset to “00” and the status flags MCANnCCCR.FDBS and MCANnCCCR.FDO are set accordingly. In case the requested CAN operation mode is not enabled, the value written to MCANnCCCR.CMR is retained until it is overwritten by the next mode change request. Default is CAN operation according to ISO11898-1.

It is not necessary to change the CAN operation mode after system startup. A mode change during CAN operation is only recommended under the following conditions:

- The failure rate in the CAN FD data phase is significant higher than in the CAN FD arbitration phase. In this case disable the CAN FD bit rate switching option for transmissions.
- During system startup all nodes are transmitting according to ISO11898-1 until it is verified that they are able to communicate in CAN FD format. If this is true, all nodes switch to CAN FD operation.
- End-of-line programming in case not all nodes are CAN FD capable. Non CAN FD nodes are held in silent mode until programming has completed. Then all nodes switch back to CAN communication according ISO11898-1.

When MCANnCCCR.CME [1] “00”, received CAN FD frames are interpreted according to the CAN FD Protocol Specification. The reserved bit in CAN frames with 11-bit identifiers and the first reserved bit in CAN frames with 29-bit identifiers will be decoded as EDL bit. EDL = recessive signifies a CAN FD frame, EDL = dominant signifies a standard CAN frame. In a CAN FD frame, the two bits following EDL, r0 and BRS, decide whether the bit rate inside of this CAN FD frame is switched. A CAN FD bit rate switch is signified by r0 = dominant and BRS = recessive. The coding of r0 = recessive is reserved for future expansion of the protocol.

Reception of CAN frames according to ISO 11898-1 is possible in all CAN operation modes.

The status bits MCANnCCCR.FDO and MCANnCCCR.FDBS indicate the format of transmitted frames. When MCANnCCCR.FDO is set, frames will be transmitted in CAN FD format with EDL = recessive. When both MCANnCCCR.FDO and MCANnCCCR.FDBS are set, frames will be transmitted in CAN FD format with bit rate switching and both bits EDL and BRS = recessive.

In the CAN FD format, the coding of the DLC differs from the standard CAN format. The DLC codes 0 to 8 have the same coding as in standard CAN, the codes 9 to 15, which in standard CAN all code a data field of 8 bytes, are coded according to **Table 37.64, Coding of DLC in CAN FD** below.

Table 37.64 Coding of DLC in CAN FD

DLC	9	10	11	12	13	14	15
Number of Data Bytes	12	16	20	24	32	48	64

In CAN FD frames, the bit timing will be switched inside the frame, after the BRS (Bit Rate Switch) bit, if this bit is recessive. Before the BRS bit, in the CAN FD arbitration phase, the standard CAN bit timing is used as defined by the Bit Timing & Prescaler Register MCANnBTP. In the following CAN FD data phase, the fast CAN bit timing is used as defined by the Fast Bit Timing & Prescaler Register MCANnFBTP. The bit timing is switched back from the fast timing at the CRC delimiter or when an error is detected, whichever occurs first.

The maximum configurable bit rate in the CAN FD data phase depends on the CAN clock frequency (m_can_cclk: CLKP_H2). Example: with a CAN clock frequency of 20MHz and the shortest configurable bit time of 4 tq, the bit rate in the data phase is 5 Mbit/s.

In both data frame formats, CAN FD long and CAN FD fast, the value of the bit ESI (Error Status Indicator) is determined by the transmitter's error state at the start of the transmission. If the transmitter is error passive, ESI is transmitted recessive, else it is transmitted dominant.

(4) Transmitter Delay Compensation

During the data phase of a CAN FD transmission only one node is transmitting, all others are receivers. The length of the bus line has no impact. When transmitting via pin m_can_tx the protocol controller receives the transmitted data from its local CAN transceiver via pin m_can_rx. The received data is delayed by the CAN transceiver's loop delay. In case this delay is greater than TSEG1 (time segment before sample point), a bit error is detected. In order to enable a data phase bit time that is even shorter than the transceiver loop delay, the delay compensation is introduced. Without transmitter delay compensation, the bit rate in the data phase of a CAN FD frame is limited by the transceivers loop delay.

(a) Description

The CAN FD protocol unit has implemented a delay compensation mechanism to compensate the CAN transceiver's loop delay, thereby enabling transmission with higher bit rates during the CAN FD data phase independent of the delay of a specific CAN transceiver. **Figure 37.5, Transmitter delay measurement** below describes how the transceiver loop delay is measured.

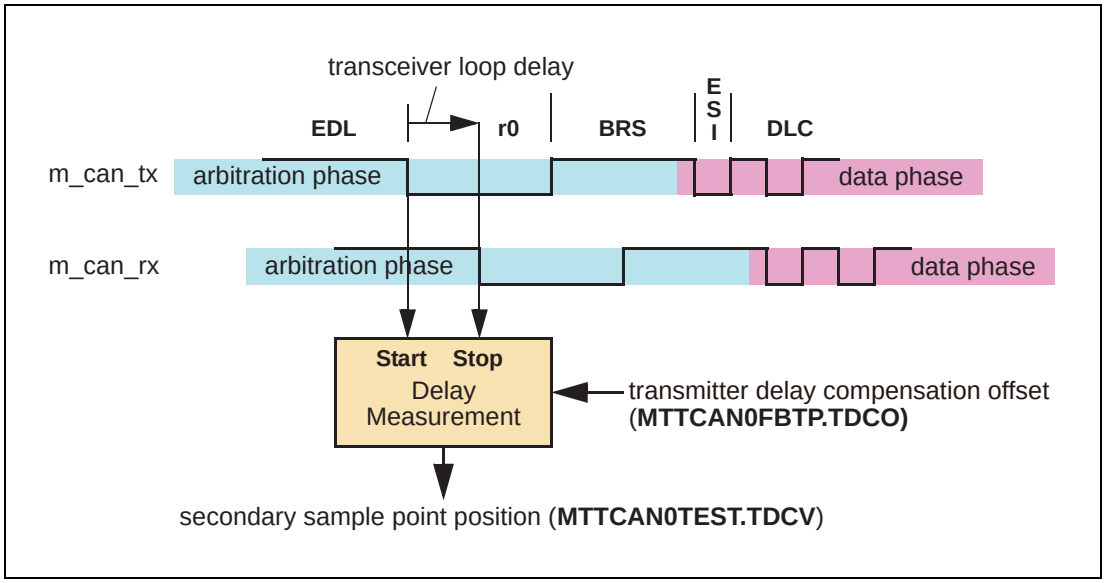

Figure 37.5 Transmitter delay measurement

Within each CAN FD frame, the transmitter measures the delay between the data transmitted at pin m_can_tx and the data received at pin m_can_rx. The measurement is done once, at the falling edge of bit EDL to bit r0. The delay is measured in m_can_cclk (CLKP_H2) periods.

A secondary sample point position is calculated by adding a configurable transmitter delay compensation offset MCANnFBTP.TDCO to the measured transceiver delay. This transmitter delay compensation value MCANnTEST.TDCV is the sum of the measured transceiver delay and the transmitter delay compensation offset. The transmitter delay compensation offset is chosen to adjust the secondary sample point inside the bit time (e.g. half of the bit time in the data phase). The position of the secondary sample point is rounded down to the next integer number of time quanta tq.

To check for bit errors during the data phase, the delayed transmit data is compared against the received data at the secondary sample point. If a bit error is detected at the secondary sample point, the transmitter will react to this bit error at the next following regular sample point. During arbitration phase the delay compensation is always disabled.

For the transmitter delay compensation the following boundary conditions have to be considered:

- The sum of the measured delay from m_can_tx to m_can_rx and the configured transmitter delay compensation offset MCANnFBTP.TDCO has to be less than 3 bit times in the data phase.
- The sum of the measured delay from m_can_tx to m_can_rx and the configured transmitter delay compensation offset MCANnFBTP.TDCO has to be less or equal 63 m_can_cclk (CLKP_H2) periods. In case this sum exceeds 63 m_can_cclk (CLKP_H2) periods, the maximum value of 63 m_can_cclk (CLKP_H2) periods is used for transmitter delay compensation.

The actual delay compensation value is monitored by reading MCANnTEST.TDCV.

(b) Configuration and Status

Compensation for the transceiver loop delay by the M_CAN is enabled via MCANnFBTP.TDC. The transmitter delay compensation offset is configured via MCANnFBTP.TDCO. The actual delay compensation value applied by the M_CAN's protocol engine can be read from MCANnTEST.TDCV.

(5) Restricted Operation Mode

In Restricted Operation Mode the node is able to receive data and remote frames and to give acknowledge to valid frames, but it does not send data frames, remote frames, active error frames, or overload frames. In case of an error condition or overload condition, it does not send dominant bits, instead it waits for the occurrence of bus idle condition to resynchronize itself to the CAN communication. The error counters are not incremented. The Host can set the M_CAN into Restricted Operation mode by setting bit MCANnCCCR.ASM. The bit can only be set by the Host when both MCANnCCCR.CCE and MCANnCCCR.INIT are set to '1'. The bit can be reset by the Host at any time.

Restricted Operation Mode is automatically entered when the Tx Handler was not able to read data from the Message RAM in time. To leave Restricted Operation Mode, the Host CPU has to reset MCANnCCCR.ASM.

The Restricted Operation Mode can be used in applications that adapt themselves to different CAN bit rates. In this case the application tests different bit rates and leaves the Restricted Operation Mode after it has received a valid frame.

If the M_CAN is connected to a Clock Calibration on CAN unit, MCANnCCCR.ASM is controlled by input m_can_cok. In case m_can_cok switches to '0', bit MCANnCCCR.ASM is set. When m_can_cok switches back to '1', bit MCANnCCCR.ASM returns to the previously written value. The state of MCANnCCCR.ASM is the written value while input m_can_cok is at '1'. The input is hardwired to '1' when there is no Clock Calibration on CAN unit connected.

(6) Bus Monitoring Mode

The M_CAN is set in Bus Monitoring Mode by programming MCANnCCCR.MON to one. In Bus Monitoring Mode (see ISO11898-1, 10.12 Bus monitoring), the M_TTCAN is able to receive valid data frames and valid remote frames, but cannot start a transmission. In this mode, it sends only recessive bits on the CAN bus. If the M_TTCAN is required to send a dominant bit (ACK bit, overload flag, active error flag), the bit is rerouted internally so that the M_TTCAN monitors this dominant bit, although the CAN bus may remain in recessive state. In Bus Monitoring Mode register MCANnTXBRP is held in reset state.

The Bus Monitoring Mode can be used to analyze the traffic on a CAN bus without affecting it by the transmission of dominant bits. **Figure 37.6** shows the connection of signals m_can_tx and m_can_rx to the M_CAN in Bus Monitoring Mode.

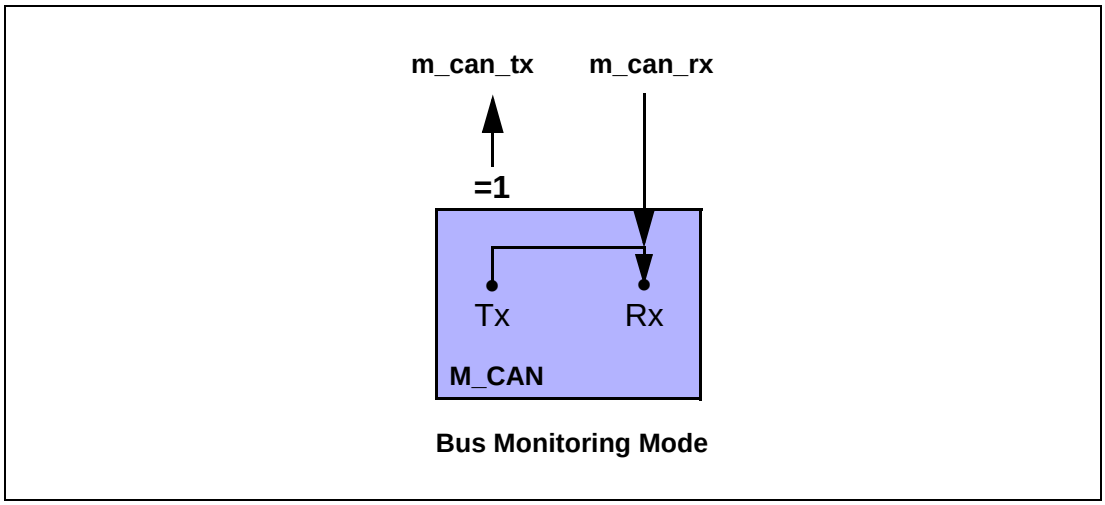

Figure 37.6 Pin Control in Bus Monitoring Mode

(7) Disabled Automatic Retransmission

According to the CAN Specification (see ISO11898-1, 6.3.3 Recovery Management), the M_TTCAN provides means for automatic retransmission of frames that have lost arbitration or that have been disturbed by errors during transmission. By default automatic retransmission is enabled. To support time-triggered communication as described in ISO 11898-1, chapter 9.2, the automatic retransmission may be disabled via MCANnCCCR.DAR.

(a) Frame Transmission in DAR Mode

In DAR mode all transmissions are automatically cancelled after they started on the CAN bus. A Tx Buffer's Tx Request Pending bit MCANnTXBRP.TRPx is reset after successful transmission, when a transmission has not yet been started at the point of cancellation, has been aborted due to lost arbitration, or when an error occurred during frame transmission.

- Successful transmission:
  Corresponding Tx Buffer Transmission Occurred bit MCANnTXBTO.TOx set
  Corresponding Tx Buffer Cancellation Finished bit MCANnTXBCF.CFx not set
- Successful transmission in spite of cancellation:
  Corresponding Tx Buffer Transmission Occurred bit MCANnTXBTO.TOx set
  Corresponding Tx Buffer Cancellation Finished bit MCANnTXBCF.CFx set
- Arbitration lost or frame transmission disturbed:
  Corresponding Tx Buffer Transmission Occurred bit MCANnTXBTO.TOx not set
  Corresponding Tx Buffer Cancellation Finished bit MCANnTXBCF.CFx set

In case of a successful frame transmission, and if storage of Tx events is enabled, a Tx Event FIFO element is written with Event Type ET = "10" (transmission in spite of cancellation).

(8) Power Down (Sleep Mode)

The M_TTCAN can be set into power down mode by using CC Control Register MCANnCCCR.CSR. When all pending transmission requests have completed, the M_TTCAN waits until bus idle state is detected. Then the M_TTCAN sets then MCANnCCCR.INIT to one to prevent any further CAN transfers. Now the M_TTCAN acknowledges that it is ready for power down by setting MCANnCCCR.CSA to one. In this state, before the clocks are switched off, further register accesses can be made. A write access to MCANnCCCR.INIT will have no effect. Now the module clock inputs m_can_hclk (CLK_HSB) and m_can_cclk (CLKP_H2) may be switched off.

To leave power down mode, the application has to turn on the module clocks before resetting CC Control Register flag MCANnCCCR.CSR. The M_CAN will acknowledge this by resetting MCANnCCCR.CSA. Afterwards, the application can restart CAN communication by resetting bit MCANnCCCR.INIT.

(9) Test Modes

To enable write access to register MCANnTEST (see **(4) MCANnTEST — Test Register**), bit MCANnCCCR.TEST has to be set to one. This allows the configuration of the test modes and test functions.

Four output functions are available for the CAN transmit pin m_can_tx by programming MCANnTEST.TX. Additionally to its default function – the serial data output – it can drive the CAN Sample Point signal to monitor the M_CAN's bit timing and it can drive constant dominant or recessive values. The actual value at pin m_can_rx can be read from MCANnTEST.RX. Both functions can be used to check the CAN bus' physical layer.

Due to the synchronization mechanism between CAN clock and Host clock domain, there may be a delay of several Host clock periods between writing to MCANnTEST.TX until the new configuration is visible at output pin m_can_tx. This applies also when reading input pin m_can_rx via MCANnTEST.RX.

NOTE

Test modes should be used for production tests or self test only. The software control for pin m_can_tx interferes with all CAN protocol functions. It is not recommended to use test modes for application.

(a) External Loop Back Mode

The M_CAN can be set in External Loop Back Mode by programming MCANnTEST.LBCK to one. In Loop Back Mode, the M_CAN treats its own transmitted messages as received messages and stores them (if they pass acceptance filtering) into an Rx Buffer or an Rx FIFO. **Figure 37.7, Pin Control in Loop Back Modes** shows the connection of signals m_can_tx and m_can_rx to the M_CAN in External Loop Back Mode.

This mode is provided for hardware self-test. To be independent from external stimulation, the M_CAN ignores acknowledge errors (recessive bit sampled in the acknowledge slot of a data/remote frame) in Loop Back Mode. In this mode the M_CAN performs an internal feedback from its Tx output to its Rx input. The actual value of the m_can_rx input pin is disregarded by the M_CAN. The transmitted messages can be monitored at the m_can_tx pin.

(b) Internal Loop Back Mode

Internal Loop Back Mode is entered by programming bits MCANnTEST.LBCK and MCANnCCCR.MON to one. This mode can be used for a “Hot Selftest”, meaning the M_TTCAN can be tested without affecting a running CAN system connected to the pins m_can_tx and m_can_rx. In this mode pin m_can_rx is disconnected from the M_CAN and pin m_can_tx is held recessive. **Figure 37.7, Pin Control in Loop Back Modes** shows the connection of m_can_tx and m_can_rx to the M_CAN in case of Internal Loop Back Mode.

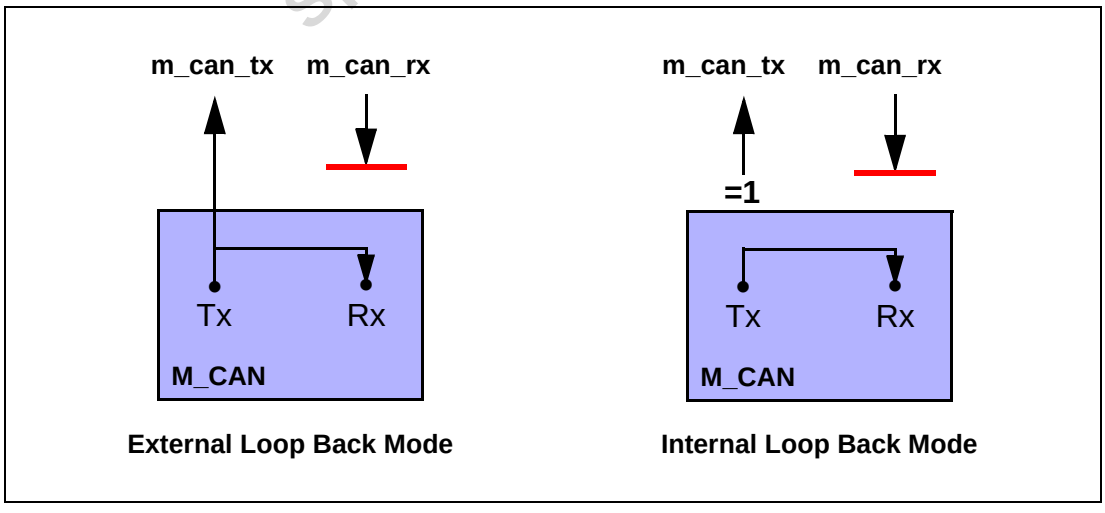

Figure 37.7 Pin Control in Loop Back Modes

37.5.3.2 Timestamp Generation

For timestamp generation the M_CAN supplies a 16-bit wrap-around counter. A prescaler MCANnTSCC.TCP can be configured to clock the counter in multiples of CAN bit times (1 to 16). The counter is readable via MCANnTSCV.TSC. A write access to register MCANnTSCV resets the counter to zero. When the timestamp counter wraps around interrupt flag MCANnIR.TSW is set.

On start of frame reception / transmission the counter value is captured and stored into the timestamp section of an Rx Buffer / Rx FIFO (RXTS[15:0]) or Tx Event FIFO (TXTS[15:0]) element.

By programming bit MCANnTSCC.TSS an external 16-bit timestamp can be used.

37.5.3.3 Timeout Counter

To signal timeout conditions for Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO the M_CAN supplies a 16-bit Timeout Counter. It operates as down-counter and uses the same prescaler controlled by MCANnTSCC.TCP as the Timestamp Counter. The Timeout Counter is configured via register MCANnTOCC. The actual counter value can be read from MCANnTOCV.TOC. The Timeout Counter can only be started while MCANnCCCR.INIT = '0'. It is stopped when MCANnCCCR.INIT = '1', e.g. when the M_CAN enters Bus_Off state.

The operation mode is selected by MCANnTOCC.TOS. When operating in Continuous Mode, the counter starts when MCANnCCCR.INIT is reset. A write to MCANnTOCV presets the counter to the value configured by MCANnTOCC.TOP and continues down-counting.

When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MCANnTOCC.TOP. Down-counting is started when the first FIFO element is stored. Writing to MCANnTOCV has no effect.

When the counter reaches zero, interrupt flag MCANnIR.TOO is set. In Continuous Mode, the counter is immediately restarted at MCANnTOCC.TOP.

NOTE

The clock signal for the Timeout Counter is derived from the CAN Core's sample point signal. Therefore the point in time where the Timeout Counter is decremented may vary due to the synchronization / re-synchronization mechanism of the CAN Core. If the baud rate switch feature in CAN FD is used, the timeout counter is clocked differently in arbitration and data field.

37.5.3.4 Rx Handling

The Rx Handler controls the acceptance filtering, the transfer of received messages to the Rx Buffers or to one of the two Rx FIFOs, as well as the Rx FIFO's Put and Get Indices.

(1) Acceptance Filtering

The M_CAN offers the possibility to configure two sets of acceptance filters, one for standard identifiers and one for extended identifiers. These filters can be assigned to an Rx Buffer or to Rx FIFO 0,1. For acceptance filtering each list of filters is executed from element #0 until the first matching element. Acceptance filtering stops at the first matching element. The following filter elements are not evaluated for this message.

The main features are:

- Each filter element can be configured as
  - range filter (from - to)
  - filter for one or two dedicated IDs
  - classic bit mask filter
- Each filter element is configurable for acceptance or rejection filtering
- Each filter element can be enabled / disabled individually
- Filters are checked sequentially, execution stops with the first matching filter element

Related configuration registers are:

- Global Filter Configuration MCANnGFC
- Standard ID Filter Configuration MCANnSIDFC
- Extended ID Filter Configuration MCANnXIDFC
- Extended ID AND Mask MCANnXIDAM

Depending on the configuration of the filter element (SFEC/EFEC) a match triggers one of the following actions:

- Store received frame in FIFO 0 or FIFO 1
- Store received frame in Rx Buffer
- Store received frame in Rx Buffer and generate pulse at filter event pin
- Reject received frame
- Set High Priority Message interrupt flag MCANnIR.HPM
- Set High Priority Message interrupt flag MCANnIR.HPM and store received frame in FIFO 0 or FIFO 1

Acceptance filtering is started after the complete identifier has been received. After acceptance filtering has completed, and if a matching Rx Buffer or Rx FIFO has been found, the Message Handler starts writing the received message data in portions of 32 bit to the matching Rx Buffer or Rx FIFO. If the CAN protocol controller has detected an error condition (e.g. CRC error), this message is discarded with the following impact on the affected Rx Buffer or Rx FIFO:

Rx Buffer

New Data flag of matching Rx Buffer is not set, but Rx Buffer (partly) overwritten with received data. For error type see MCANnPSR.LEC respectively MCANnPSR.FLEC.

Rx FIFO

Put index of matching Rx FIFO is not updated, but related Rx FIFO element (partly) overwritten with received data. For error type see MCANnPSR.LEC respectively MCANnPSR.FLEC. In case the matching Rx FIFO is operated in overwrite mode, the boundary conditions described in **(b) Rx FIFO Overwrite Mode** have to be considered.

NOTE

When an accepted message is written to one of the two Rx FIFOs, or into an Rx Buffer, the unmodified received identifier is stored independent of the filter(s) used. The result of the acceptance filter process is strongly depending on the sequence of configured filter elements.

(a) Range Filter

The filter matches for all received frames with Message IDs in the range defined by SF1ID/SF2ID resp. EF1ID/EF2ID.

There are two possibilities when range filtering is used together with extended frames:

EFT: “00”: The Message ID of received frames is ANDed with the Extended ID AND Mask (MCANnXIDAM) before the range filter is applied

EFT: “11”: The Extended ID AND Mask (MCANnXIDAM) is not used for range filtering

(b) Filter for specific IDs

A filter element can be configured to filter for one or two specific Message IDs. To filter for one specific Message ID, the filter element has to be configured with SF1ID = SF2ID resp. EF1ID = EF2ID.

(c) Classic Bit Mask Filter

Classic bit mask filtering is intended to filter groups of Message IDs by masking single bits of a received Message ID. With classic bit mask filtering SF1ID/EF1ID is used as Message ID filter, while SF2ID/EF2ID is used as filter mask.

A zero bit at the filter mask will mask out the corresponding bit position of the configured ID filter, e.g. the value of the received Message ID at that bit position is not relevant for acceptance filtering. Only those bits of the received Message ID where the corresponding mask bits are one are relevant for acceptance filtering.

In case all mask bits are one, a match occurs only when the received Message ID and the Message ID filter are identical. If all mask bits are zero, all Message IDs match.

(d) Standard Message ID Filtering

Figure 37.8, Standard Message ID Filter Path below shows the flow for standard Message ID (11-bit Identifier) filtering. The Standard Message ID Filter element is described in **(5) Standard Message ID Filter Element**.

Controlled by the Global Filter Configuration MCANnGFC and the Standard ID Filter Configuration MCANnSIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

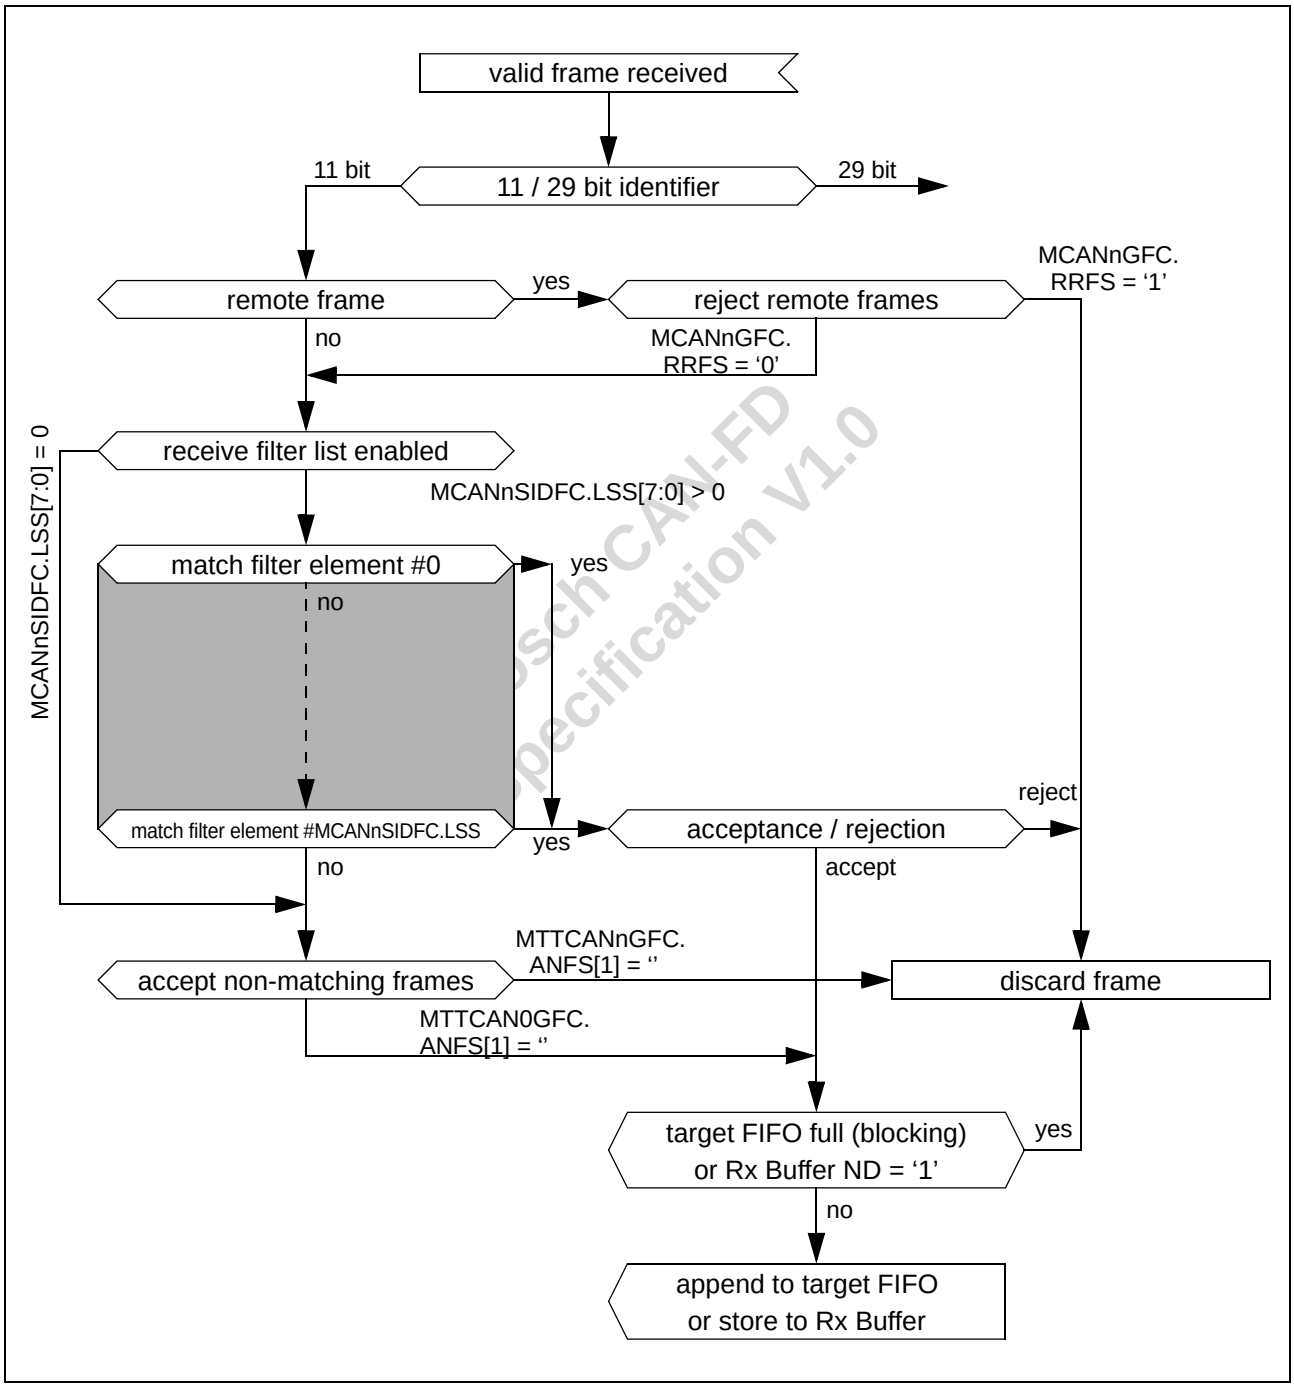

Figure 37.8 Standard Message ID Filter Path

(e) Extended Message ID Filtering

Figure 37.9, Extended Message ID Filter Path below shows the flow for extended Message ID (29-bit Identifier) filtering. The Extended Message ID Filter element is described in **(6) Extended Message ID Filter Element**.

Controlled by the Global Filter Configuration MCANnGFC and the Extended ID Filter Configuration MCANnXIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

The Extended ID AND Mask MCANnXIDAM is ANDed with the received identifier before the filter list is executed.

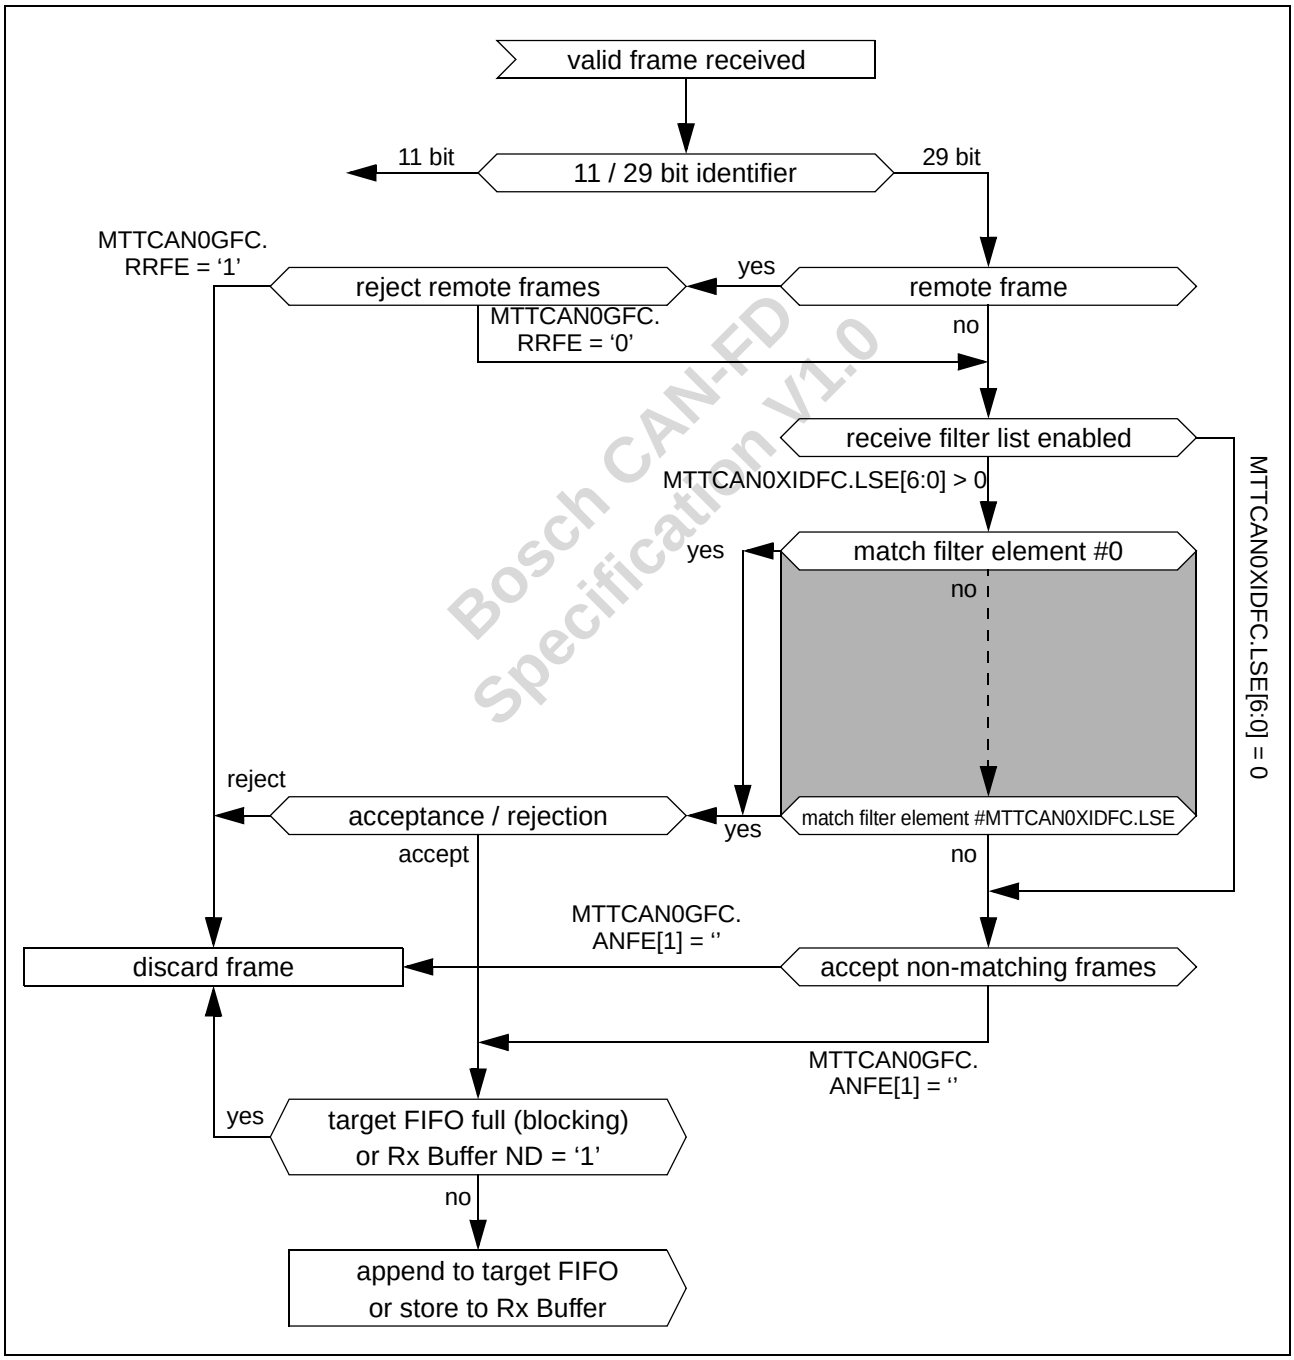

Figure 37.9 Extended Message ID Filter Path

(2) Rx FIFOs

Rx FIFO 0 and Rx FIFO 1 can be configured to hold up to 64 elements each. Configuration of the two Rx FIFOs is done via registers MCANnRXF0C and MCANnRXF1C.

Received messages that passed acceptance filtering are transferred to the Rx FIFO as configured by the matching filter element. For a description of the filter mechanisms available for Rx FIFO 0 and Rx FIFO 1 see **(1) Acceptance Filtering**. The Rx FIFO element is described in **(2) Rx Buffer and FIFO Element**.

To avoid an Rx FIFO overflow, the Rx FIFO watermark can be used. When the Rx FIFO fill level reaches the Rx FIFO watermark configured by RXFnC.FnWM, interrupt flag MCANnIR.RFnW is set. When the Rx FIFO Put Index reaches the Rx FIFO Get Index an Rx FIFO Full condition is signalled by RXFnS.FnF. In addition interrupt flag MCANnIR.RFnF is set.

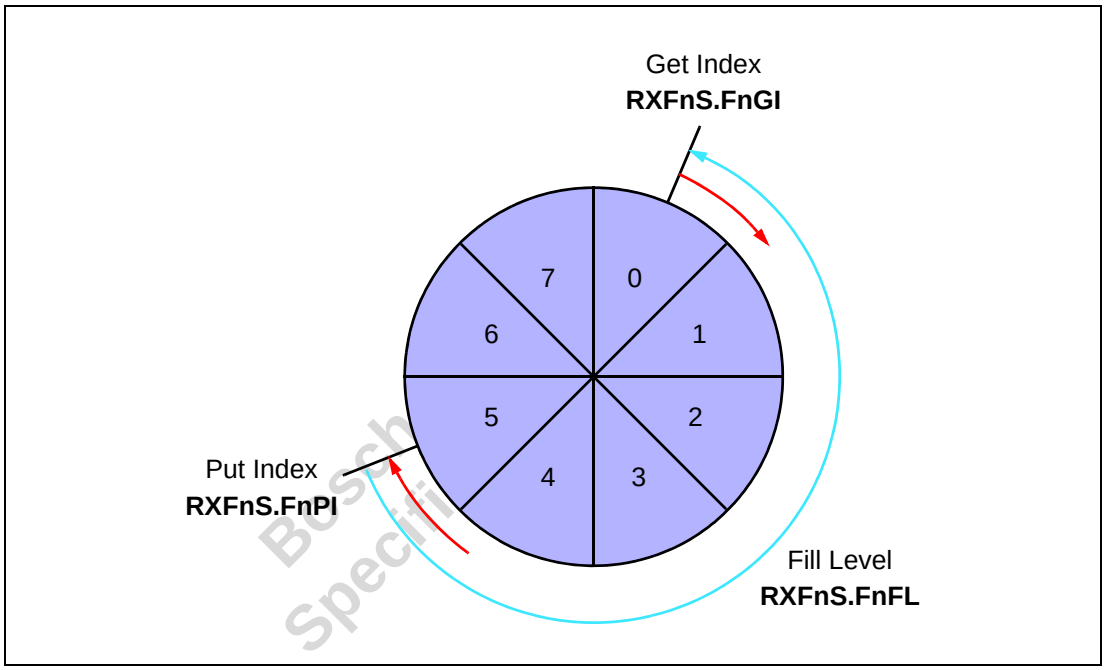

Figure 37.10 Rx FIFO Status

When reading from an Rx FIFO, Rx FIFO Get Index RXFnS.FnGI • FIFO Element Size has to be added to the corresponding Rx FIFO start address RXFnC.FnSA.

Table 37.65 Rx Buffer / FIFO Element Size

MCANnRXESC.RBDS[2:0] MCANnRXESC.FnDS[2:0]	Data Field [bytes]	FIFO Element Size [RAM words]
000	8	4
001	12	5
010	16	6
011	20	7
100	24	8
101	32	10
110	48	14
111	64	18

(a) Rx FIFO Blocking Mode

The Rx FIFO blocking mode is configured by RXFnC.FnOM = '0'. This is the default operation mode for the Rx FIFOs.

When an Rx FIFO full condition is reached (RXFnS.FnPI = RXFnS.FnGI), no further messages are written to the corresponding Rx FIFO until at least one message has been read out and the Rx FIFO Get Index has been incremented. An Rx FIFO full condition is signalled by RXFnS.FnF = '1'. In addition interrupt flag MCANnIR.RFnF is set.

In case a message is received while the corresponding Rx FIFO is full, this message is discarded and the message lost condition is signalled by RXFnS.RFnL = '1'. In addition interrupt flag MCANnIR.RFnL is set.

(b) Rx FIFO Overwrite Mode

The Rx FIFO overwrite mode is configured by RXFnC.FnOM = '1'.

When an Rx FIFO full condition (RXFnS.FnPI = RXFnS.FnGI) is signalled by RXFnS.FnF = '1', the next message accepted for the FIFO will overwrite the oldest FIFO message. Put and get index are both incremented by one.

When an Rx FIFO is operated in overwrite mode and an Rx FIFO full condition is signalled, reading of the Rx FIFO elements should start at least at get index + 1. The reason for that is, that it might happen, that a received message is written to the Message RAM (put index) while the CPU is reading from the Message RAM (get index). In this case inconsistent data may be read from the respective Rx FIFO element. Adding an offset to the get index when reading from the Rx FIFO avoids this problem. The offset depends on how fast the CPU accesses the Rx FIFO. **Figure 37.11, Rx FIFO Overflow Handling** shows an offset of two with respect to the get index when reading the Rx FIFO. In this case the two messages stored in element 1 and 2 are lost.

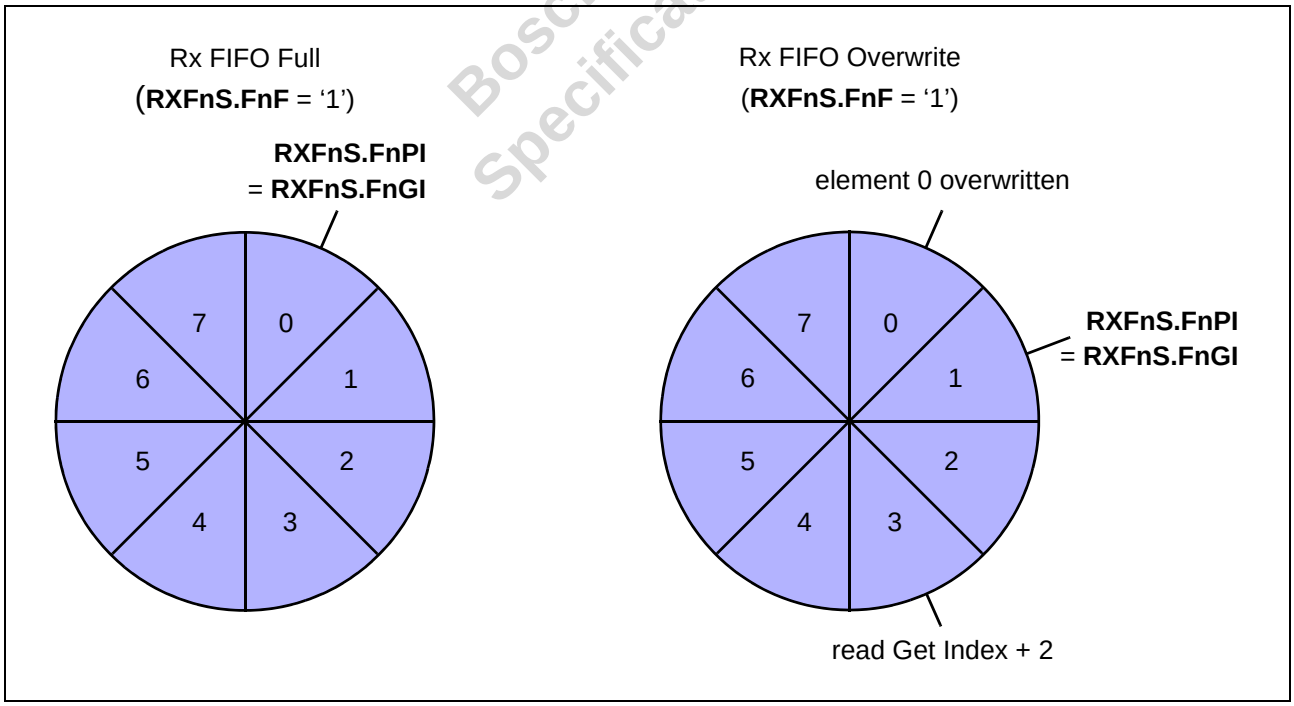

Figure 37.11 Rx FIFO Overflow Handling

After reading from the Rx FIFO, the number of the last element read has to be written to the Rx FIFO Acknowledge Index RXFnA.FnA. This increments the get index to that element number. In case the put index has not been incremented to this Rx FIFO element, the Rx FIFO full condition is reset (RXFnS.FnF = '0').

(3) Dedicated Rx Buffers

The M_CAN supports up to 64 dedicated Rx Buffers. The start address of the dedicated Rx Buffer section is configured via MCANnRXBC.RBSA.

For each Rx Buffer a Standard or Extended Message ID Filter Element with SFEC / EFEC = “111” and SFID2 / EFID2[10:9] = “00” has to be configured (see **(5) Standard Message ID Filter Element** and **(6) Extended Message ID Filter Element**).

After a received message has been accepted by a filter element, the message is stored into the Rx Buffer in the Message RAM referenced by the filter element. The format is the same as for an Rx FIFO element. In addition the flag MCANnIR.DRX (Message stored in Dedicated Rx Buffer) in the interrupt register is set.

Table 37.66 Example Filter Configuration for Rx Buffers

Filter Element	SFID1[10:0] EFID1[28:0]	SFID2[10:9] EFID2[10:9]	SFID2[5:0] EFID2[5:0]
0	ID message 1	00	00 0000
1	ID message 2	00	00 0001
2	ID message 3	00	00 0010

After the last word of a matching received message has been written to the Message RAM, the respective New Data flag in register MCANnNDAT1, 2 is set. As long as the New Data flag is set, the respective Rx Buffer is locked against updates from received matching frames. The New Data flags have to be reset by the Host by writing a ‘1’ to the respective bit position.

While an Rx Buffer’s New Data flag is set, a Message ID Filter Element referencing this specific Rx Buffer will not match, causing the acceptance filtering to continue. Following Message ID Filter Elements may cause the received message to be stored into another Rx Buffer, or into an Rx FIFO, or the message may be rejected, depending on filter configuration.

(a) Rx Buffer Handling

- Reset interrupt flag MCANnIR.DRX
- Read New Data registers
- Read messages from Message RAM
- Reset New Data flags of processed messages

37.5.3.5 Tx Handling

The Tx Handler handles transmission requests for the dedicated Tx Buffers, the Tx FIFO, and the Tx Queue. It controls the transfer of transmit messages to the CAN Core, the Put and Get Indices, and the Tx Event FIFO. Up to 32 Tx Buffers can be set up for message transmission. The Tx Buffer element is described in **(3) Tx Buffer Element**.

NOTE

AUTOSAR requires at least three Tx Queue Buffers and support of transmit cancellation

The Tx Handler starts a Tx scan to check for the highest priority pending Tx request (Tx Buffer with lowest Message ID) when the Tx Buffer Request Pending register MCANnTXBRP is updated, or when a transmission has been started.

(1) Transmit Pause

The transmit pause feature is intended for use in CAN systems where the CAN message identifiers are (permanently) specified to specific values and cannot easily be changed. These message identifiers may have a higher CAN arbitration priority than other defined messages, while in a specific application their relative arbitration priority should be inverse. This may lead to a case where one ECU sends a burst of CAN messages that cause another ECU's CAN messages to be delayed because that other messages have a lower CAN arbitration priority.

If e.g. CAN ECU-1 has the transmit pause feature enabled and is requested by its application software to transmit four messages, it will, after the first successful message transmission, wait for two CAN bit times of bus idle before it is allowed to start the next requested message. If there are other ECUs with pending messages, those messages are started in the idle time, they would not need to arbitrate with the next message of ECU-1. After having received a message, ECU-1 is allowed to start its next transmission as soon as the received message releases the CAN bus.

The transmit pause feature is controlled by bit MCANnCCCR.TXP. If the bit is set, the M_CAN will, each time it has successfully transmitted a message, pause for two CAN bit times before starting the next transmission. This enables other CAN nodes in the network to transmit messages even if their messages have lower prior identifiers. Default is transmit pause disabled (MCANnCCCR.TXP = '0').

This feature looses up burst transmissions coming from a single node and it protects against "babbling idiot" scenarios where the application program erroneously requests too many transmissions.

(2) Dedicated Tx Buffers

Dedicated Tx Buffers are intended for message transmission under complete control of the Host CPU. Each Dedicated Tx Buffer is configured with a specific Message ID. In case that multiple Tx Buffers are configured with the same Message ID, the Tx Buffer with the lowest buffer number is transmitted first.

If the data section has been updated, a transmission is requested by an Add Request via MCANnTXBAR.ARn. The requested messages arbitrate internally with messages from an optional Tx FIFO or Tx Queue and externally with messages on the CAN bus, and are sent out according to their Message ID.

A Dedicated Tx Buffer allocates Element Size 32-bit words in the Message RAM (see **Table 37.67, Tx Buffer / FIFO / Queue Element Size**). Therefore the start address of a dedicated Tx Buffer in the Message RAM is calculated by adding transmit buffer index (0 to 31) • Element Size to the Tx Buffer Start Address MCANnTXBC.TBSA.

Table 37.67 Tx Buffer / FIFO / Queue Element Size

MCANnTXESC.TBDS[2:0]	Data Field [bytes]	Element Size [RAM words]
000	8	4
001	12	5
010	16	6
011	20	7
100	24	8
101	32	10
110	48	14
111	64	18

(3) Tx FIFO

Tx FIFO operation is configured by programming MCANnTXBC.TFQM to '0'. Messages stored in the Tx FIFO are transmitted starting with the message referenced by the Get Index MCANnTXFQS.TFGI. After each transmission the Get Index is incremented cyclically until the Tx FIFO is empty. The Tx FIFO enables transmission of messages with the same Message ID from different Tx Buffers in the order these messages have been written to the Tx FIFO. The M_CAN calculates the Tx FIFO Free Level MCANnTXFQS.TFFL as difference between Get and Put Index. It indicates the number of available (free) Tx FIFO elements.

New transmit messages have to be written to the Tx FIFO starting with the Tx Buffer referenced by the Put Index MCANnTXFQS.TFQPI. An Add Request increments the Put Index to the next free Tx FIFO element. When the Put Index reaches the Get Index, Tx FIFO Full (MCANnTXFQS.TFQF = '1') is signalled. In this case no further messages should be written to the Tx FIFO until the next message has been transmitted and the Get Index has been incremented.

When a single message is added to the Tx FIFO, the transmission is requested by writing a '1' to the MCANnTXBAR bit related to the Tx Buffer referenced by the Tx FIFO's Put Index.

When multiple (n) messages are added to the Tx FIFO, they are written to n consecutive Tx Buffers starting with the Put Index. The transmissions are then requested via MCANnTXBAR. The Put Index is then cyclically incremented by n. The number of requested Tx buffers should not exceed the number of free Tx Buffers as indicated by the Tx FIFO Free Level.

When a transmission request for the Tx Buffer referenced by the Get Index is cancelled, the Get Index is incremented to the next Tx Buffer with pending transmission request and the Tx FIFO Free Level is recalculated. When transmission cancellation is applied to any other Tx Buffer, the Get Index and the FIFO Free Level remain unchanged.

A Tx FIFO element allocates Element Size 32-bit words in the Message RAM (see **Table 37.67, Tx Buffer / FIFO / Queue Element Size**). Therefore the start address of the next available (free) Tx FIFO Buffer is calculated by adding Tx FIFO/Queue Put Index MCANnTXFQS.TFQPI (0 to 31) • Element Size to the Tx Buffer Start Address MCANnTXBC.TBSA.

(4) Tx Queue

Tx Queue operation is configured by programming MCANnTXBC.TFQM to '1'. Messages stored in the Tx Queue are transmitted starting with the message with the lowest Message ID (highest priority). In case that multiple Queue Buffers are configured with the same Message ID, the Queue Buffer with the lowest buffer number is transmitted first.

New messages have to be written to the Tx Buffer referenced by the Put Index MCANnTXFQS.TFQPI. An Add Request cyclically increments the Put Index to the next free Tx Buffer. In case that the Tx Queue is full (MCANnTXFQS.TFQF = '1'), the Put Index is not valid and no further message should be written to the Tx Queue until at least one of the requested messages has been sent out or a pending transmission request has been cancelled.

The application may use register MCANnTXBRP instead of the Put Index and may place messages to any Tx Buffer without pending transmission request.

A Tx Queue Buffer allocates Element Size 32-bit words in the Message RAM (see **Table 37.67, Tx Buffer / FIFO / Queue Element Size**). Therefore the start address of the next available (free) Tx Queue Buffer is calculated by adding Tx FIFO/Queue Put Index MCANnTXFQS.TFQPI (0 to 31) • Element Size to the Tx Buffer Start Address MCANnTXBC.TBSA.

(5) Mixed Dedicated Tx Buffers / Tx FIFO

In this case the Tx Buffers section in the Message RAM is subdivided into a set of Dedicated Tx Buffers and a Tx FIFO. The number of Dedicated Tx Buffers is configured by MCANnTXBC.NDTB. The number of Tx Buffers assigned to the Tx FIFO is configured by MCANnTXBC.TFQS. In case MCANnTXBC.TFQS is programmed to zero, only Dedicated Tx Buffers are used.

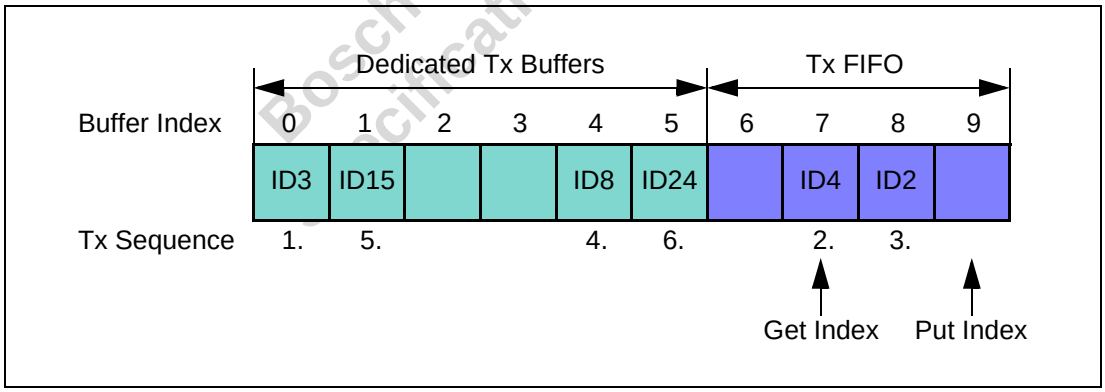

Figure 37.12 Example of mixed Configuration Dedicated Tx Buffers / Tx FIFO

Tx prioritization:

- Scan Dedicated Tx Buffers and oldest pending Tx FIFO Buffer (referenced by TXFS.TFGI)
- Buffer with lowest Message ID gets highest priority and is transmitted next

(6) Mixed Dedicated Tx Buffers / Tx Queue

In this case the Tx Buffers section in the Message RAM is subdivided into a set of Dedicated Tx Buffers and a Tx Queue. The number of Dedicated Tx Buffers is configured by MCANnTXBC.NDTB. The number of Tx Queue Buffers is configured by MCANnTXBC.TFQS. In case MCANnTXBC.TFQS is programmed to zero, only Dedicated Tx Buffers are used.

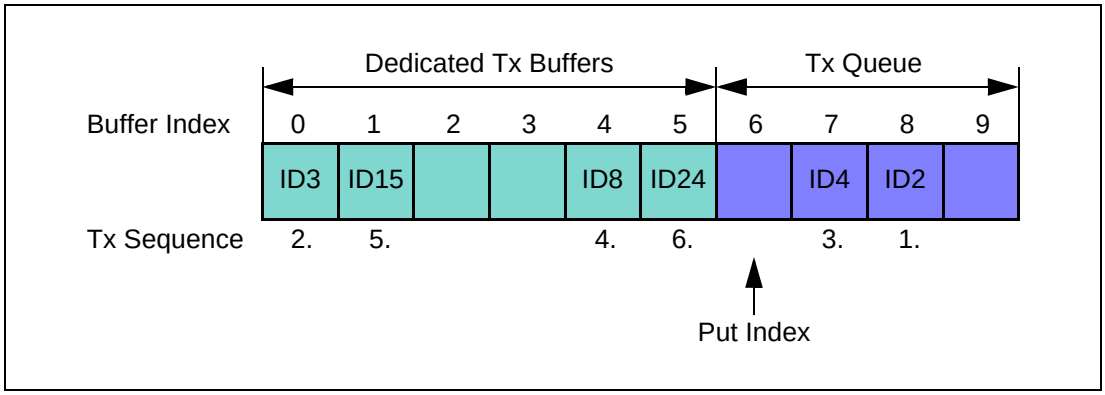

Figure 37.13 Example of mixed Configuration Dedicated Tx Buffers / Tx Queue

Tx prioritization:

- Scan all Tx Buffers with activated transmission request
- Tx Buffer with lowest Message ID gets highest priority and is transmitted next

(7) Transmit Cancellation

The M_CAN supports transmit cancellation. This feature is especially intended for gateway applications and AUTOSAR based applications. To cancel a requested transmission from a dedicated Tx Buffer or a Tx Queue Buffer the Host has to write a '1' to the corresponding bit position (= number of Tx Buffer) of register MCANnTXBCR. Transmit cancellation is not intended for Tx FIFO operation.

Successful cancellation is signalled by setting the corresponding bit of register MCANnTXBCF to '1'.

In case a transmit cancellation is requested while a transmission from a Tx Buffer is already ongoing, the corresponding MCANnTXBRP bit remains set as long as the transmission is in progress. If the transmission was successful, the corresponding MCANnTXBTO and MCANnTXBCF bits are set. If the transmission was not successful, it is not repeated and only the corresponding MCANnTXBCF bit is set.

NOTE

In case a pending transmission is cancelled immediately before this transmission could have been started, there follows a short time window where no transmission is started even if another message is also pending in this node. This may enable another node to transmit a message which may have a lower priority than the second message in this node.

(8) Tx Event Handling

To support Tx event handling the M_CAN has implemented a Tx Event FIFO. After the M_CAN has transmitted a message on the CAN bus, Message ID and timestamp are stored in a Tx Event FIFO element. To link a Tx event to a Tx Event FIFO element, the Message Marker from the transmitted Tx Buffer is copied into the Tx Event FIFO element.

The Tx Event FIFO can be configured to a maximum of 32 elements. The Tx Event FIFO element is described in **(4) Tx Event FIFO Element**.

When a Tx Event FIFO full condition is signalled by MCANnIR.TEFF, no further elements are written to the Tx Event FIFO until at least one element has been read out and the Tx Event FIFO Get Index has been incremented. In case a Tx event occurs while the Tx Event FIFO is full, this event is discarded and interrupt flag MCANnIR.TEFL is set.

To avoid a Tx Event FIFO overflow, the Tx Event FIFO watermark can be used. When the Tx Event FIFO fill level reaches the Tx Event FIFO watermark configured by MCANnTXEFC.EFWM, interrupt flag MCANnIR.TEFW is set.

When reading from the Tx Event FIFO, two times the Tx Event FIFO Get Index MCANnTXEFS.EFGI has to be added to the Tx Event FIFO start address MCANnTXEFC.EFSA.

37.5.3.6 FIFO Acknowledge Handling

The Get Indices of Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO are controlled by writing to the corresponding FIFO Acknowledge Index (see **(27) MCANnRXF0A — Rx FIFO 0 Acknowledge**, **(31) MCANnRXF1A — Rx FIFO 1 Acknowledge**, and **(45) MCANnTXEFA — Tx Event FIFO Acknowledge**). Writing to the FIFO Acknowledge Index will set the FIFO Get Index to the FIFO Acknowledge Index plus *one* and thereby updates the FIFO Fill Level. There are two use cases:

When only a single element has been read from the FIFO (the one being pointed to by the Get Index), this Get Index value is written to the FIFO Acknowledge Index.

When a sequence of elements has been read from the FIFO, it is sufficient to write the FIFO Acknowledge Index only once at the end of that read sequence (value: Index of the last element read), to update the FIFO's Get Index.

Due to the fact that the CPU has free access to the M_CAN's Message RAM, special care has to be taken when reading FIFO elements in an arbitrary order (Get Index not considered). This might be useful when reading a High Priority Message from one of the two Rx FIFOs. In this case the FIFO's Acknowledge Index should not be written because this would set the Get Index to a wrong position and also alters the FIFO's Fill Level. In this case some of the older FIFO elements would be lost.

NOTE

The application has to ensure that a valid value is written to the FIFO Acknowledge Index. The M_CAN does not check for erroneous values.

37.6 M_TTCAN

37.6.1 Overview

The M_TTCAN module is the new TTCAN Communication Controller IP-module. The M_TTCAN performs communication according to ISO 11898-1 (identical to Bosch CAN protocol specification 2.0 part A,B) and according to ISO 11898-4 (Time-triggered communication on CAN). The M_TTCAN provides all features of time-triggered communication specified in ISO 11898-4, including event synchronized time-triggered communication, global system time, and clock drift compensation. In addition the M_TTCAN supports communication according to CAN FD protocol specification 1.0. The CAN FD option can be used together with event-triggered and time-triggered CAN communication.

The message storage is intended to be a single--ported Message RAM outside of the module. It is connected to the M_TTCAN via the Generic Master Interface.

All functions concerning the handling of messages are implemented by the Rx Handler and the Tx Handler. The Rx Handler manages message acceptance filtering, the transfer of received messages from the CAN Core to the Message RAM as well as providing receive message status information. The Tx Handler is responsible for the transfer of transmit messages from the Message RAM to the CAN Core as well as providing transmit status information. It implements all functions concerning the time schedule and the global system time.

Acceptance filtering is implemented by a combination of up to 128 filter elements where each one can be configured as a range, as a bit mask, or as a dedicated ID filter.

The M_TTCAN’s clock domain concept allows the separation between the high precision CAN clock and the Host clock, which may be generated by an FM-PLL.

37.6.1.1 Features

- Conform with CAN protocol version 2.0 part A, B and ISO 11898-1, -4
- CAN FD with up to 64 data bytes supported
- TTCAN protocol level 1 and level 2 completely in hardware
- Event synchronized time-triggered communication supported
- CAN Error Logging
- AUTOSAR optimized
- SAE J1939 optimized
- Improved acceptance filtering
- Two configurable Receive FIFOs
- Separate signalling on reception of High Priority Messages
- Up to 64 dedicated Receive Buffers
- Up to 32 dedicated Transmit Buffers
- Configurable Transmit FIFO
- Configurable Transmit Queue
- Configurable Transmit Event FIFO
- Direct Message RAM access for Host CPU
- Programmable loop-back test mode
- Maskable module interrupts
- 8/16/32 bit Generic Slave Interface for connection customer-specific Host CPUs
- Two clock domains (CAN clock and Host clock)
- Power-down support

37.6.1.2 Block Diagram

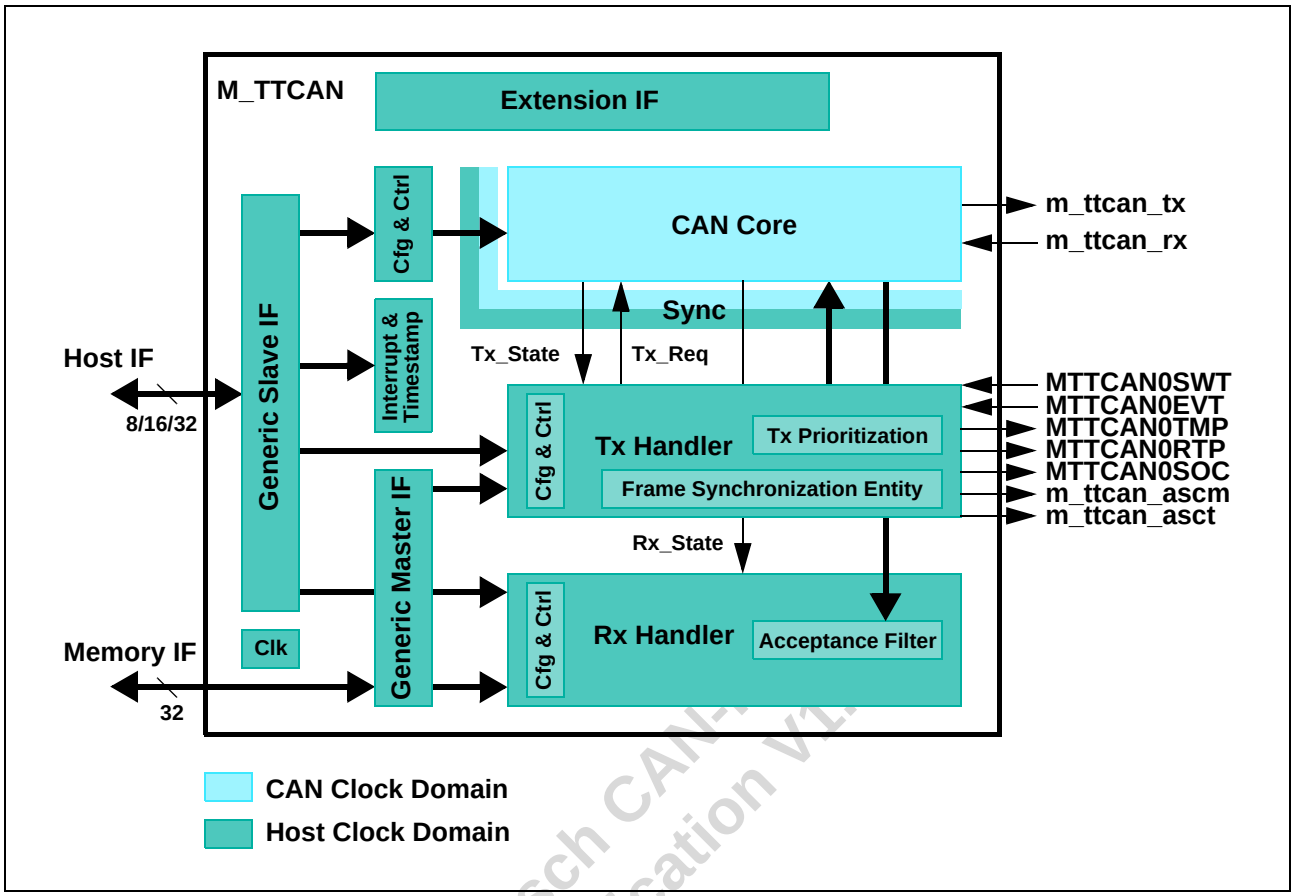

Figure 37.14 M_TTCAN Block Diagram

CAN Core

CAN Protocol Controller and Rx/Tx Shift Register. Handles all ISO 11898-1 protocol functions. Supports 11-bit and 29-bit identifiers.

Sync

Synchronizes signals from the Host clock domain to the CAN clock domain and vice versa.

Clk

Synchronizes reset signal to the Host clock domain and to the CAN clock domain.

Cfg & Ctrl

CAN Core related configuration and control bits.

Interrupt & Timestamp

Interrupt control and 16-bit CAN bit time counter for receive and transmit timestamp generation. An externally generated 16-bit vector may substitute the integrated 16-bit CAN bit time counter for receive and transmit timestamp generation.

Tx Handler

Controls the message transfer from the external Message RAM to the CAN Core. A maximum of 32 Tx Buffers can be configured for transmission. Tx buffers can be used as dedicated Tx Buffers, as Tx FIFO, part of a Tx Queue, or as a combination of them. A Tx Event FIFO stores Tx timestamps together with the corresponding Message ID. Transmit cancellation is also supported.

The Tx Handler also implements the Frame Synchronization Entity FSE which controls time-triggered communication according to ISO11898-4. It synchronizes itself to the reference messages on the CAN bus, controls cycle time and global time, and handles transmissions according to the predefined message schedule, the system matrix. It also handles the time marks of the system matrix that are linked to the messages in the Message RAM. Stop Watch Trigger, Event Trigger, and Time Mark Interrupt are synchronization interfaces.

Rx Handler

Controls the transfer of received messages from the CAN Core to the external Message RAM. The Rx Handler supports two Receive FIFOs, each of configurable size, and up to 64 dedicated Rx Buffers for storage of all messages that have passed acceptance filtering. A dedicated Rx Buffer, in contrast to a Receive FIFO, is used to store only messages with a specific identifier. An Rx timestamp is stored together with each message. Up to 128 filters can be defined for 11-bit IDs and up to 64 filters for 29-bit IDs.

Generic Slave Interface

Connects the M_TTCAN to a customer specific Host CPU. The Generic Slave Interface is capable to connect to an 8/16/32-bit bus to support a wide range of interconnection structures.

Generic Master Interface

Connects the M_TTCAN to a local 32-bit Message RAM. The implemented Message RAM size is 2K • 32 bit.

Extension Interface

All flags from the Interrupt Register MTTCAN0IR and TT Interrupt Register MTTCAN0TTIR as well as selected internal status and control signals are routed to this interface. The interface is intended for connection of the M_TTCAN to a module-external interrupt unit or to other module-external components. The connection of these signals is optional.

37.6.1.3 Dual Clock Sources

To improve the EMC behavior, a spread spectrum clock can be used for the Host clock domain m_ttcan_hclk (CLK_HSB). Due to the high precision clocking requirements of the CAN Core, a separate clock without any modulation has to be provided as m_ttcan_cclk (CLKP_H2). The CAN Core should be programmed to have at least 8 clocks per bittime, this is e.g. 1 Mbaud @ m_ttcan_cclk (CLKP_H2) >= 8 MHz. Even in case of a very high Host clock frequency, the clock frequency of the CAN Core needs not to be higher than 8 MHz.

Within the M_TTCAN module there is a synchronization mechanism implemented to ensure save data transfer between the two clock domains.

NOTE

In order to achieve a stable function of the M_TTCAN, the Host clock must always be faster than or equal to the CAN clock. Also the modulation depth of the spread spectrum clock has to be regarded.

37.6.1.4 Dual Interrupt Lines

The module provides two interrupt lines. Interrupts can be routed either to m_ttcan_int0 (INTMTTCANI0) or to m_ttcan_int1(INTMTTCANI1). By default all interrupts are routed to interrupt line m_ttcan_int0 (INTMTTCANI0). By programming MTTCAN0ILE.EINT0 and MTTCAN0ILE.EINT1 the interrupt lines can be enabled or disabled separately.

37.6.2 Programmer's Model

37.6.2.1 Hardware Reset Description

After hardware reset, the registers of the M_TTCAN hold the reset values listed in **Table 37.68**. Additionally the Bus_Off state is reset and the output m_ttcan_tx is set to *recessive* (HIGH). The value 0001_H (MTTCAN0CCCR.INIT = '1') in the CC Control Register enables software initialization. The M_TTCAN does not influence the CAN bus until the CPU resets MTTCAN0CCCR.INIT to '0'.

37.6.2.2 Register Map

The M_TTCAN module allocates an address space of 512 bytes. All registers are organized as 32-bit registers. The M_TTCAN is accessible by the Host CPU via the Generic Slave Interface using a data width of 8 bit (byte access), 16 bit (half-word access), or 32 bit (word access). Write access by the Host CPU to registers/bits marked with "P = Protected Write" is possible only with MTTCAN0CCCR.CCE = '1' AND MTTCAN0CCCR.INIT = '1'. There is a delay from writing to a command register until the update of the related status register bits due to clock domain crossing.

37.6.2.3 Registers

(1) MTTCAN0CREL — Core Release Register

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + 000_H

Value after reset: $3013\ 0508_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	REL[3:0]				STEP[3:0]				SUBSTEP[3:0]				YEAR[3:0]			
Value after reset	0	0	1	1	0	0	0	0	0	0	0	1	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MON[7:0]								DAY[7:0]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.69 MTTCAN0CREL Register Contents

Bit Position	Bit Name	Function
31 to 28	REL[3:0]	Core Release One digit, BCD-coded.
27 to 24	STEP[3:0]	Step of Core Release One digit, BCD-coded.
23 to 20	SUBSTEP[3:0]	Sub-step of Core Release One digit, BCD-coded.
19 to 16	YEAR[3:0]	Time Stamp Year One digit, BCD-coded. This field is set by generic parameter on M_TTCAN synthesis.
15 to 8	MON[7:0]	Time Stamp Month Two digits, BCD-coded. This field is set by generic parameter on M_TTCAN synthesis.
7 to 0	DAY[7:0]	Time Stamp Day Two digits, BCD-coded. This field is set by generic parameter on M_TTCAN synthesis.

Table 37.70 Coding of Revisions

Release	Step	SubStep	Year	Month	Day	Name
3	0	1	3	05	08	Revision 3.0.1, Date 2013/05/08

(2) MTTCAN0ENDN — Endian Register

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + 004_H

Value after reset: $8765\ 4321_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 37.71 MTTCAN0ENDN Register Contents

Bit Position	Bit Name	Function
31 to 0	ETV[31:0]	Endianness Test Value The endianness test value is $8765\ 4321_H$.

(3) MTTCAN0FBTP — Fast Bit Timing & Prescaler Register

This register is only writable if bits MTTCAN0CCCR.CCE and MTTCAN0CCCR.INIT are set. The CAN bit time may be programed in the range of 4 to 25 time quanta. The CAN time quantum may be programmed in the range of 1 to 32 m_ttcan_cclk (CLKP_H2) periods. tq = (FBRP + 1) m_ttcan_cclk (CLKP_H2) period.

FTSEG1 is the sum of Prop_Seg and Phase_Seg1. FTSEG2 is Phase_Seg2.

Therefore the length of the bit time is (programmed values) [FTSEG1 + FTSEG2 + 3] tq
or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] tq.

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $00C_H$

Value after reset: 0000 $0A33_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 37.72 MTTCAN0FBTP Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 29	Reserved	These bits are always read as 0. When written, write the initial value.
28 to 24	TDCO[4:0]	Transmitter Delay Compensation Offset 00_H to $1F_H$ Offset value defining the distance between the measured delay from m_ttcan_tx to m_ttcan_rx and the secondary sample point. Valid values are 0 to 31 m_ttcan_cclk (CLKP_H2) periods.
23	TDC	Transmitter Delay Compensation 0: Transmitter Delay Compensation disabled 1: Transmitter Delay Compensation enabled
22, 21	Reserved	These bits are always read as 0. When written, write the initial value.
20 to 16	FBRP[4:0]	Fast Baud Rate Prescaler 00_H to $1F_H$ The value by which the oscillator frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Baud Rate Prescaler are 0 to 31. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.
15 to 12	Reserved	These bits are always read as 0. When written, write the initial value.
11 to 8	FTSEG1[3:0]	Fast time segment before sample point 1_H to F_H Valid values are 1 to 15. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.
7	Reserved	These bits are always read as 0. When written, write the initial value.

Table 37.72 MTTCAN0FBTP Register Contents (2/2)

Bit Position	Bit Name	Function
6 to 4	FTSEG2[2:0]	Fast time segment after sample point 0_H to 7_H Valid values are 0 to 7. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.
3, 2	Reserved	These bits are always read as 0. When written, write the initial value.
1, 0	FSJW[1:0]	Fast (Re) Synchronization Jump Width 0_H to 3_H Valid values are 0 to 3. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

NOTES

1. With a CAN clock (m_ttcan_cclk: CLKP_H2) of 8 MHz, the reset value of 0000 $0A33_H$ configures the M_TTCAN for a fast bit rate of 500 kBit/s.
2. The bit rate configured for the CAN FD data phase via MTTCAN0FBTP must be higher or equal to the bit rate configured for the arbitration phase via MTTCAN0BTP.

(4) MTTCAN0TEST — Test Register

Write access to the Test Register has to be enabled by setting bit MTTCAN0CCCR.TEST to ‘1’. All Test Register functions are set to their reset values when bit MTTCAN0CCCR.TEST is reset.

Loop Back Mode and software control of pin m_ttcan_tx are hardware test modes. Programming of TX [1] “00” may disturb the message transfer on the CAN bus.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 010_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	RP	RP	RP	R	R	RP	RP

Table 37.73 MTTCAN0TEST Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 14	Reserved	These bits are always read as 0. When written, write the initial value.
13 to 8	TDCV[5:0]	Transmitter Delay Compensation Value 00_H to $3F_H$ Position of the secondary sample point, defined by the sum of the measured delay from m_ttcan_tx to m_ttcan_rx and MTTCAN0FBTP.TDCO. Valid values are 0 to 63 m_ttcan_cclk (CLKP_H2) periods.
7	RX	Receive Pin Monitors the actual value of pin m_ttcan_rx 0: The CAN bus is dominant (m_ttcan_rx = ‘0’). 1: The CAN bus is recessive (m_ttcan_rx = ‘1’).
6, 5	TX[1:0]	Control of Transmit Pin 00: Reset value, m_ttcan_tx controlled by the CAN Core, updated at the end of the CAN bit time. 01: Sample Point can be monitored at pin m_ttcan_tx. 10: Dominant (‘0’) level at pin m_ttcan_tx 11: Recessive (‘1’) at pin m_ttcan_tx
4	LBCK	Loop Back Mode 0: Reset value, Loop Back Mode is disabled. 1: Loop Back Mode is enabled (see **(9) Test Modes**).
3	CAT	Check ASC Transmit Control Monitors level at output pin m_ttcan_asct. 0: Output pin m_ttcan_asct = ‘0’ 1: Output pin m_ttcan_asct = ‘1’

Table 37.73 MTTCAN0TEST Register Contents (2/2)

Bit Position	Bit Name	Function
2	CAM	Check ASC Multiplexer Control Monitors level at output pin m_ttcan_ascm. 0: Output pin m_ttcan_ascm = '0' 1: Output pin m_ttcan_ascm = '1'
1	TAT	Test ASC Transmit Control Controls output pin m_ttcan_asct in test mode, ORed with the signal from the FSE 0: Level at pin m_ttcan_asct controlled by FSE 1: Level at pin m_ttcan_asct = '1'
0	TAM	Test ASC Multiplexer Control Controls output pin m_ttcan_ascm in test mode, ORed with the signal from the FSE 0: Level at pin m_ttcan_ascm controlled by FSE 1: Level at pin m_ttcan_ascm = '1'

(5) MTTCAN0RWD — RAM Watchdog

The RAM Watchdog monitors the READY output of the Message RAM (m_ttcan_aeim_ready). A Message RAM access via the M_TTCAN's Generic Master Interface (m_ttcan_aeim_sel active) starts the Message RAM Watchdog Counter with the value configured by MTTCAN0RWD.WDC. The counter is reloaded with MTTCAN0RWD.WDC when the Message RAM signals successful completion by activating its READY output. In case there is no response from the Message RAM until the counter has counted down to zero, the counter stops and interrupt flag MTTCAN0IR.WDI is set. The RAM Watchdog Counter is clocked by the Host clock (m_ttcan_hclk: CLK_HSB).

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 014_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	RP	RP	RP	RP	RP	RP	RP	RP

Table 37.74 MTTCAN0RWD Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are always read as 0. When written, write the initial value.
15 to 8	WDV[7:0]	Watchdog Value Actual Message RAM Watchdog Counter Value.
7 to 0	WDC[7:0]	Watchdog Configuration Start value of the Message RAM Watchdog Counter. With the reset value of "00" the counter is disabled.

(6) MTTCAN0CCCR — CC Control Register

For details about setting and resetting of single bits see **(1) Software Initialization**.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 018_H

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	TXP	FDBS	FDO	CMR[1:0]		CME[1:0]		TEST	DAR	MON	CSR	CSA	ASM	CCE	INIT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	RP	R	R	R/W	R/W	RP	RP	Rp	RP	Rp	R/W	R	Rp	RP	R/W

Table 37.75 MTTCAN0CCCR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 15	Reserved	These bits are always read as 0. When written, write the initial value.
14	TXP	Transmit Pause If this bit is set, the M_TTCAN pauses for two CAN bit times before starting the next transmission after itself has successfully transmitted a frame (see **(1) Transmit Pause**). 0: Transmit pause disabled 1: Transmit pause enabled
13	FDBS	CAN FD Bit Rate Switching 0: This node transmits no frames with bit rate switching. 1: This node transmits all frames (excl. remote frames) with bit rate switching.
12	FDO	CAN FD Operation 0: This node transmits all frames in CAN format according to ISO11898-1. 1: This node transmits all frames (excl. remote frames) in CAN FD format.
11, 10	CMR[1:0]	CAN Mode Request A change of the CAN operation mode is requested by writing to this bit field. After change to the requested operation mode the bit field is reset to “00” and the status flags FDBS and FDO are set accordingly. In case the requested CAN operation mode is not enabled, the value written to CMR is retained until it is overwritten by the next mode change request. In case CME = “01”/”10”/”11” a change to CAN operation according to ISO 11898-1 is always possible. Default is CAN operation according to ISO11898-1. 00: Unchanged 01: Request CAN FD operation 10: Request CAN FD operation with bit rate switching 11: Request CAN operation according ISO11898-1
9, 8	CME[1:0]	CAN Mode Enable 00: CAN operation according to ISO11898-1 enabled 01: CAN FD operation enabled 10: CAN FD operation with bit rate switching enabled 11: CAN FD operation with bit rate switching enabled **NOTE** When CME = “00”, received frames are strictly interpreted according to ISO11898-1, which leads to the transmission of an error frame when receiving a CAN FD frame. In case CME = “01”, transmission of long CAN FD frames and reception of long and fast CAN FD frames is enabled. With CME = “10”/“11”, transmission and reception of long and fast CAN FD frames is enabled.

Table 37.75 MTTCAN0CCCR Register Contents (2/2)

Bit Position	Bit Name	Function
7	TEST	Test Mode Enable 0: Normal operation, register MTTCAN0TEST holds reset values. 1: Test Mode, write access to register MTTCAN0TEST enabled.
6	DAR	Disable Automatic Retransmission 0: Automatic retransmission of messages not transmitted successfully enabled. 1: Automatic retransmission disabled
5	MON	Bus Monitoring Mode Bit MON can only be set by the Host when both CCE and INIT are set to '1'. The bit can be reset by the Host at any time. 0: Bus Monitoring Mode is disabled 1: Bus Monitoring Mode is enabled
4	CSR	Clock Stop Request 0: No clock stop is requested. 1: Clock stop requested. When clock stop is requested, first INIT and then CSA will be set after all pending transfer requests have been completed and the CAN bus reached idle.
3	CSA	Clock Stop Acknowledge 0: No clock stop acknowledged. 1: M_TTCAN may be set in power down by stopping m_ttcan_hclk (CLK_HSB) and m_ttcan_cclk (CLKP_H2).
2	ASM	Restricted Operation Mode Bit ASM can only be set by the Host when both CCE and INIT are set to '1'. The bit can be reset by the Host at any time. For a description of the Restricted Operation Mode see **(5) Restricted Operation Mode**. 0: Normal CAN operation 1: Restricted Operation Mode active
1	CCE	Configuration Change Enable 0: The CPU has no write access to the protected configuration registers. 1: The CPU has write access to the protected configuration registers (while MTTCAN0CCCR.INIT = '1').
0	INIT	Initialization 0: Normal Operation 1: Initialization is started.

NOTE

Due to the synchronization mechanism between the two clock domains, there may be a delay until the value written to INIT can be read back. Therefore the programmer has to assure that the previous value written to INIT has been accepted by reading INIT before setting INIT to a new value.

(7) MTTCAN0BTP — Bit Timing & Prescaler Register

This register is only writable if bits MTTCAN0CCCR.CCE and MTTCAN0CCCR.INIT are set. The CAN bit time may be programed in the range of 4 to 81 time quanta. The CAN time quantum may be programmed in the range of 1 to 1024 m_ttcan_cclk (CLKP_H2) periods. tq = (BRP + 1) m_ttcan_cclk (CLKP_H2) period.

TSEG1 is the sum of Prop_Seg and Phase_Seg1. TSEG2 is Phase_Seg2.

Therefore the length of the bit time is (programmed values) [TSEG1 + TSEG2 + 3] tq
or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] tq.

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $01C_H$

Value after reset: 0000 $0A33_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	BRP[9:0]

R/W	R	R	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP

Table 37.76 MTTCAN0BTP Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	These bits are always read as 0. When written, write the initial value.
25 to 16	BRP[9:0]	Baud Rate Prescaler 000_H to $3FF_H$ The value by which the oscillator frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Baud Rate Prescaler are 0 to 1023. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.
15, 14	Reserved	These bits are always read as 0.
13 to 8	TSEG1[5:0]	Time segment before sample point 01_H to $3F_H$ Valid values are 1 to 63. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.
7 to 4	TSEG2[3:0]	Time segment after sample point 0_H to F_H Valid values are 0 to 15. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.
3 to 0	SJW[3:0]	(Re) Synchronization Jump Width 0_H to F_H Valid values are 0 to 15. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

NOTE

With a CAN clock (m_ttcan_cclk: CLKP_H2) of 8 MHz, the reset value of 0000 $0A33_H$ configures the M_TTCAN for a bit rate of 500 kBit/s.

(8) MTTCAN0TSCC — Timestamp Counter Configuration

For a description of the Timestamp Counter see **Section 37.6.3.2, Timestamp Generation**.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 020_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 37.77 MTTCAN0TSCC Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	These bits are always read as 0. When written, write the initial value.
19 to 16	TCP[3:0]	Timestamp Counter Prescaler 0_H to F_H Configures the timestamp and timeout counters time unit in multiples of CAN bit times [1 to 16]. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used. **NOTE** With CAN FD an external counter is required for timestamp generation (TSS = “10”)
15 to 2	Reserved	These bits are always read as 0.
1, 0	TSS[1:0]	Timestamp Select 00: Timestamp counter value always 0000_H 01: Timestamp counter value incremented according to TCP 10: External timestamp counter value used 11: Same as “00”

(9) MTTCAN0TSCV — Timestamp Counter Value

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 024_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC

Table 37.78 MTTCAN0TSCV Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are always read as 0. When written, write the initial value.
15 to 0	TSC[15:0]	Timestamp Counter The internal/external Timestamp Counter value is captured on start of frame (both Rx and Tx). When MTTCAN0TSCC.TSS = “01”, the Timestamp Counter is incremented in multiples of CAN bit times [1 to 16] depending on the configuration of MTTCAN0TSCC.TCP. A wrap around sets interrupt flag MTTCAN0IR.TSW. Write access resets the counter to zero. When MTTCAN0TSCC.TSS = “10”, TSC reflects the external Timestamp Counter value. A write access has no impact.

NOTE

A “wrap around” is a change of the Timestamp Counter value from non-zero to zero not caused by write access to MTTCAN0TSCV.

(10) MTTCAN0TOCC — Timeout Counter Configuration

For a description of the Timeout Counter see **Section 37.6.3.3, Timeout Counter**.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 028_H

Value after reset: FFFF 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TOP[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP

	—	—	—	—	—	—	—	—	—	—	—	—	—	TOS[1:0]		ETOC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RP	RP	RP

Table 37.79 MTTCAN0TOCC Register Contents

Bit Position	Bit Name	Function
31 to 16	TOP[15:0]	Timeout Period Start value of the Timeout Counter (down-counter). Configures the Timeout Period.
15 to 3	Reserved	These bits are always read as 0. When written, write the initial value.
2, 1	TOS[1:0]	Timeout Select When operating in Continuous mode, a write to MTTCAN0TOCV presets the counter to the value configured by MTTCAN0TOCC.TOP and continues down-counting. When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MTTCAN0TOCC.TOP. Down-counting is started when the first FIFO element is stored. 00: Continuous operation 01: Timeout controlled by Tx Event FIFO 10: Timeout controlled by Rx FIFO 0 11: Timeout controlled by Rx FIFO 1
0	ETOC	Enable Timeout Counter 0: Timeout Counter disabled 1: Timeout Counter enabled

NOTE

For use of timeout function with CAN FD see **Section 37.5.3.3, Timeout Counter**.

(11) MTTCAN0TOCV — Timeout Counter Value

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $02C_H$

Value after reset: $0000\ FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	TOC[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC

Table 37.80 MTTCAN0TOCV Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are always read as 0. When written, write the initial value.
15 to 0	TOC[15:0]	Timeout Counter The Timeout Counter is decremented in multiples of CAN bit times [1 to 16] depending on the configuration of MTTCAN0TSCC.TCP. When decremented to zero, interrupt flag MTTCAN0IR.TOO is set and the Timeout Counter is stopped. Start and reset/restart conditions are configured via MTTCAN0TOCC.TOS.

(12) MTTCAN0ECR — Error Counter Register

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + 040_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CEL[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	X	X	X	X	X	X	X	X

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RP	REC[6:0]							TEC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.81 MTTCAN0ECR Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	These bits are always read as 0.
23 to 16	CEL[7:0]	CAN Error Logging The counter is incremented each time when a CAN protocol error causes the Transmit Error Counter or the Receive Error Counter to be incremented. It is reset by read access to CEL. The counter stops at FF_H; the next increment of TEC or REC sets interrupt flag MTTCAN0IR.ELO.
15	RP	Receive Error Passive 0: The Receive Error Counter is below the error passive level of 128 1: The Receive Error Counter has reached the error passive level of 128
14 to 8	REC[6:0]	Receive Error Counter Actual state of the Receive Error Counter, values between 0 and 127
7 to 0	TEC[7:0]	Transmit Error Counter Actual state of the Transmit Error Counter, values between 0 and 255

NOTE

When MTTCAN0CCCR.ASM is set, the CAN protocol controller does not increment TEC and REC when a CAN protocol error is detected, but CEL is still incremented. This enables monitoring of collisions between CAN frames and ASC frames.

(13) MTTCAN0PSR — Protocol Status Register

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + 044_H

Value after reset: 0000 0707_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	REDL	RBRS	RESI	FLEC[2:0]			BO	EW	EP	ACT[1:0]		LEC[2:0]		
Value after reset	0	0	0	0	0	1	1	1	0	0	0	0	0	1	1	1
R/W	R	R	X	X	X	S	S	S	R	R	R	R	R	S	S	S

Table 37.82 MTTCAN0PSR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 14	Reserved	These bits are always read as 0.
13	REDL	Received a CAN FD Message This bit is set independent of acceptance filtering. 0: Since this bit was reset by the CPU, no CAN FD message has been received 1: Message in CAN FD format with EDL flag set has been received
12	RBRS	BRS flag of last received CAN FD Message This bit is set together with REDL, independent of acceptance filtering. 0: Last received CAN FD message did not have its BRS flag set 1: Last received CAN FD message had its BRS flag set
11	RESI	ESI flag of last received CAN FD Message This bit is set together with REDL, independent of acceptance filtering. 0: Last received CAN FD message did not have its ESI flag set 1: Last received CAN FD message had its ESI flag set
10 to 8	FLEC[2:0]	Fast Last Error Code Type of last error that occurred in the data phase of a CAN FD format frame with its BRS flag set. Coding is the same as for LEC. This field will be cleared to zero when a CAN FD format frame with its BRS flag set has been transferred (reception or transmission) without error.
7	BO	Bus_Off Status 0: The M_TTCAN is not Bus_Off 1: The M_TTCAN is in Bus_Off state
6	EW	Warning Status 0: Both error counters are below the Error_Warning limit of 96 1: At least one of error counter has reached the Error_Warning limit of 96

Table 37.82 MTTCAN0PSR Register Contents (2/2)

Bit Position	Bit Name	Function
5	EP	Error Passive 0: The M_TTCAN is in the Error_Active state. It normally takes part in bus communication and sends an active error flag when an error has been detected 1: The M_TTCAN is in the Error_Passive state
4, 3	ACT[1:0]	Activity Monitors the module's CAN communication state. 00: Synchronizing - node is synchronizing on CAN communication 01: Idle - node is neither receiver nor transmitter 10: Receiver - node is operating as receiver 11: Transmitter - node is operating as transmitter
2 to 0	LEC[2:0]	Last Error Code The LEC indicates the type of the last error to occur on the CAN bus. This field will be cleared to '0' when a message has been transferred (reception or transmission) without error. 0: No Error: No error occurred since LEC has been reset by successful reception or transmission. 1: Stuff Error: More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed. 2: Form Error: A fixed format part of a received frame has the wrong format. 3: AckError: The message transmitted by the M_TTCAN was not acknowledged by another node. 4: Bit1Error: During the transmission of a message (with the exception of the arbitration field), the device wanted to send a recessive level (bit of logical value '1'), but the monitored bus value was dominant. 5: Bit0Error: During the transmission of a message (or acknowledge bit, or active error flag, or overload flag), the device wanted to send a dominant level (data or identifier bit logical value '0'), but the monitored bus value was recessive. During Bus_Off recovery this status is set each time a sequence of 11 recessive bits has been monitored. This enables the CPU to monitor the proceeding of the Bus_Off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed). 6: CRCError: The CRC check sum of a received message was incorrect. The CRC of an incoming message does not match with the CRC calculated from the received data. 7: NoChange: Any read access to the Protocol Status Register re-initializes the LEC to '7'. When the LEC shows the value '7', no CAN bus event was detected since the last CPU read access to the Protocol Status Register.

NOTES

1. When a frame in CAN FD format has reached the data phase with BRS flag set, the next CAN event (error or valid frame) will be shown in FLEC instead of LEC. An error in a fixed stuff bit of a CAN FD CRC sequence will be shown as a Form Error, not Stuff Error.
2. The Bus_Off recovery sequence (see CAN Specification Rev. 2.0 or ISO11898-1) cannot be shortened by setting or resetting MTTCAN0CCCR.INIT. If the device goes Bus_Off, it will set MTTCAN0CCCR.INIT of its own accord, stopping all bus activities. Once MTTCAN0CCCR.INIT has been cleared by the CPU, the device will then wait for 129 occurrences of Bus Idle (129 * 11 consecutive recessive bits) before resuming normal operation. At the end of the Bus_Off recovery sequence, the Error Management Counters will be reset. During the waiting time after the resetting of MTTCAN0CCCR.INIT, each time a sequence of 11 recessive bits has been monitored, a Bit0Error code is written to MTTCAN0PSR.LEC, enabling the CPU to readily check up whether the CAN bus is stuck at dominant or continuously disturbed and to monitor the Bus_Off recovery sequence. MTTCAN0ECR.REC is used to count these sequences.

(14) MTTCAN0IR — Interrupt Register

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the Host clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register. The configuration of MTTCAN0IE controls whether an interrupt is generated. The configuration of MTTCAN0ILS controls on which interrupt line an interrupt is signalled.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 050_H

Value after reset: $0000\ 0000_H$

Table 37.83 MTTCAN0IR Register Contents (1/3)

Bit Position	Bit Name	Function
31	STE	Stuff Error 0: No Stuff Error detected 1: More than 5 equal bits in a sequence occurred
30	FOE	Format Error 0: No Format Error detected 1: A fixed format part of a received frame has the wrong format
29	ACKE	Acknowledge Error 0: No Acknowledge Error detected 1: A transmitted message was not acknowledged by another node
28	BE	Bit Error 0: No Bit Error detected 1: Device wanted to send a rec / dom level, but monitored bus level was dom / rec
27	CRCE	CRC Error 0: No CRC Error detected 1: Received CRC did not match the calculated CRC
26	WDI	Watchdog Interrupt 0: No Message RAM Watchdog event occurred 1: Message RAM Watchdog event due to missing READY
25	BO	Bus_Off Status 0: Bus_Off status unchanged 1: Bus_Off status changed
24	EW	Warning Status 0: Error_Warning status unchanged 1: Error_Warning status changed
23	EP	Error Passive 0: Error_Passive status unchanged 1: Error_Passive status changed
22	ELO	Error Logging Overflow 0: CAN Error Logging Counter did not overflow 1: Overflow of CAN Error Logging Counter occurred

Table 37.83 MTTCAN0IR Register Contents (2/3)

Bit Position	Bit Name	Function
21	BEU	Bit Error Uncorrected Message RAM bit error detected, uncorrected. Controlled by input signal m_ttcan_aeim_berr[1] generated by an optional external parity / ECC logic attached to the Message RAM. An uncorrected Message RAM bit error sets MTTCAN0CCCR.INIT to '1'. This is done to avoid transmission of corrupted data. 0: No bit error detected when reading from Message RAM 1: Bit error detected, uncorrected (e.g. parity logic)
20	BEC	Bit Error Corrected Message RAM bit error detected and corrected. Controlled by input signal m_ttcan_aeim_berr[0] generated by an optional external parity / ECC logic attached to the Message RAM. 0: No bit error detected when reading from Message RAM 1: Bit error detected and corrected (e.g. ECC)
19	DRX	Message stored to Dedicated Rx Buffer The flag is set whenever a received message has been stored into a dedicated Rx Buffer. 0: No Rx Buffer updated 1: At least one received message stored into an Rx Buffer
18	TOO	Timeout Occurred 0: No timeout 1: Timeout reached
17	MRAF	Message RAM Access Failure The flag is set, when the Rx Handler • has not completed acceptance filtering or storage of an accepted message until the arbitration field of the following message has been received. In this case acceptance filtering or message storage is aborted and the Rx Handler starts processing of the following message. • was not able to write a message to the Message RAM. In this case message storage is aborted. In both cases the FIFO put index is not updated resp. the New Data flag for a dedicated Rx Buffer is not set, a partly stored message is overwritten when the next message is stored to this location. The flag is also set when the Tx Handler was not able to read a message from the Message RAM in time. In this case message transmission is aborted. In case of a Tx Handler access failure the M_TTCAN is switched into Restricted Operation Mode (see **(5) Restricted Operation Mode**). To leave Restricted Operation Mode, the Host CPU has to reset MTTCAN0CCCR.ASM. 0: No Message RAM access failure occurred 1: Message RAM access failure occurred
16	TSW	Timestamp Wraparound 0: No timestamp counter wrap-around 1: Timestamp counter wrapped around
15	TEFL	Tx Event FIFO Element Lost 0: No Tx Event FIFO element lost 1: Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero
14	TEFF	Tx Event FIFO Full 0: Tx Event FIFO not full 1: Tx Event FIFO full
13	TEFW	Tx Event FIFO Watermark Reached 0: Tx Event FIFO fill level below watermark 1: Tx Event FIFO fill level reached watermark
12	TEFN	Tx Event FIFO New Entry 0: Tx Event FIFO unchanged 1: Tx Handler wrote Tx Event FIFO element
11	TFE	Tx FIFO Empty 0: Tx FIFO non-empty 1: Tx FIFO empty

Table 37.83 MTTCAN0IR Register Contents (3/3)

Bit Position	Bit Name	Function
10	TCF	Transmission Cancellation Finished 0: No transmission cancellation finished 1: Transmission cancellation finished
9	TC	Transmission Completed 0: No transmission completed 1: Transmission completed
8	HPM	High Priority Message 0: No high priority message received 1: High priority message received
7	RF1L	Rx FIFO 1 Message Lost 0: No Rx FIFO 1 message lost 1: Rx FIFO 1 message lost, also set after write attempt to Rx FIFO 1 of size zero
6	RF1F	Rx FIFO 1 Full 0: Rx FIFO 1 not full 1: Rx FIFO 1 full
5	RF1W	Rx FIFO 1 Watermark Reached 0: Rx FIFO 1 fill level below watermark 1: Rx FIFO 1 fill level reached watermark
4	RF1N	Rx FIFO 1 New Message 0: No new message written to Rx FIFO 1 1: New message written to Rx FIFO 1
3	RF0L	Rx FIFO 0 Message Lost 0: No Rx FIFO 0 message lost 1: Rx FIFO 0 message lost, also set after write attempt to Rx FIFO 0 of size zero
2	RF0F	Rx FIFO 0 Full 0: Rx FIFO 0 not full 1: Rx FIFO 0 full
1	RF0W	Rx FIFO 0 Watermark Reached 0: Rx FIFO 0 fill level below watermark 1: Rx FIFO 0 fill level reached watermark
0	RF0N	Rx FIFO 0 New Message 0: No new message written to Rx FIFO 0 1: New message written to Rx FIFO 0

(15) MTTCAN0IE — Interrupt Enable

The settings in the Interrupt Enable register determine which status changes in the Interrupt Register will be signalled on an interrupt line.

0: Interrupt disabled

1: Interrupt enabled

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 054_H

Value after reset: $0000\ 0000_H$

0	RF0NE	Rx FIFO 0 New Message Interrupt Enable

(16) MTTCAN0ILS — Interrupt Line Select

The Interrupt Line Select register assigns an interrupt generated by a specific interrupt flag from the Interrupt Register to one of the two module interrupt lines. For interrupt generation the respective interrupt line has to be enabled via MTTCAN0ILE.EINT0 and MTTCAN0ILE.EINT1.

0: Interrupt assigned to interrupt line m_ttcan_int0 (INTMTTCANI0)

1: Interrupt assigned to interrupt line m_ttcan_int1 (INTMTTCANI1)

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 058_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 37.85 MTTCAN0ILS Register Contents (1/2)

Bit Position	Bit Name	Function
31	STEL	Stuff Error Interrupt Line
30	FOEL	Format Error Interrupt Line
29	ACKEL	Acknowledge Error Interrupt Line
28	BEL	Bit Error Interrupt Line
27	CRCEL	CRC Error Interrupt Line
26	WDIL	Watchdog Interrupt Line
25	BOL	Bus_Off Status Interrupt Line
24	EWL	Warning Status Interrupt Line
23	EPL	Error Passive Interrupt Line
22	ELOL	Error Logging Overflow Interrupt Line
21	BEUL	Bit Error Uncorrected Interrupt Line
20	BECL	Bit Error Corrected Interrupt Line
19	DRXL	Message stored to Dedicated Rx Buffer Interrupt Line
18	TOOL	Timeout Occurred Interrupt Line
17	MRAFL	Message RAM Access Failure Interrupt Line
16	TSWL	Timestamp Wraparound Interrupt Line
15	TEFLL	Tx Event FIFO Event Lost Interrupt Line
14	TEFFL	Tx Event FIFO Full Interrupt Line
13	TEFWL	Tx Event FIFO Watermark Reached Interrupt Line
12	TEFNL	Tx Event FIFO New Entry Interrupt Line
11	TFEL	Tx FIFO Empty Interrupt Line
10	TCFL	Transmission Cancellation Finished Interrupt Line
9	TCL	Transmission Completed Interrupt Line

Table 37.85 MTTCAN0ILS Register Contents (2/2)

Bit Position	Bit Name	Function
8	HPML	High Priority Message Interrupt Line
7	RF1LL	Rx FIFO 1 Message Lost Interrupt Line
6	RF1FL	Rx FIFO 1 Full Interrupt Line
5	RF1WL	Rx FIFO 1 Watermark Reached Interrupt Line
4	RF1NL	Rx FIFO 1 New Message Interrupt Line
3	RF0LL	Rx FIFO 0 Message Lost Interrupt Line
2	RF0FL	Rx FIFO 0 Full Interrupt Line
1	RF0WL	Rx FIFO 0 Watermark Reached Interrupt Line
0	RF0NL	Rx FIFO 0 New Message Interrupt Line

(17) MTTCAN0ILE — Interrupt Line Enable

Each of the two interrupt lines to the CPU can be enabled / disabled separately by programming bits EINT0 and EINT1.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $05C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 37.86 MTTCAN0ILE Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	These bits are always read as 0. When written, write the initial value.
1	EINT1	Enable Interrupt Line 1 0: Interrupt line m_ttcan_int1 (INTMTTCANI1) disabled 1: Interrupt line m_ttcan_int1 (INTMTTCANI1) enabled
0	EINT0	Enable Interrupt Line 0 0: Interrupt line m_ttcan_int0 (INTMTTCANI0) disabled 1: Interrupt line m_ttcan_int0 (INTMTTCANI0) enabled

(18) MTTCAN0GFC — Global Filter Configuration

Global settings for Message ID filtering. The Global Filter Configuration controls the filter path for standard and extended messages as described in **Figure 37.19, Standard Message ID Filter Path** and **Figure 37.20, Extended Message ID Filter Path**.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 080_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	RP	RP	RP	RP	RP	RP

Table 37.87 MTTCAN0GFC Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	These bits are always read as 0. When written, write the initial value.
5, 4	ANFS[1:0]	Accept Non-matching Frames Standard Defines how received messages with 11-bit IDs that do not match any element of the filter list are treated. 00: Accept in Rx FIFO 0 01: Accept in Rx FIFO 1 10: Reject 11: Reject
3, 2	ANFE[1:0]	Accept Non-matching Frames Extended Defines how received messages with 29-bit IDs that do not match any element of the filter list are treated. 00: Accept in Rx FIFO 0 01: Accept in Rx FIFO 1 10: Reject 11: Reject
1	RRFS	Reject Remote Frames Standard 0: Filter remote frames with 11-bit standard IDs 1: Reject all remote frames with 11-bit standard IDs
0	RRFE	Reject Remote Frames Extended 0: Filter remote frames with 29-bit extended IDs 1: Reject all remote frames with 29-bit extended IDs

(19) MTTCAN0SIDFC — Standard ID Filter Configuration

Settings for 11-bit standard Message ID filtering. The Standard ID Filter Configuration controls the filter path for standard messages as described in **Figure 37.19, Standard Message ID Filter Path**.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 084_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	LSS[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	R	R

Table 37.88 MTTCAN0SIDFC Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	These bits are always read as 0. When written, write the initial value.
23 to 16	LSS[7:0]	List Size Standard 0: No standard Message ID filter 1 to 128: Number of standard Message ID filter elements >128: Values greater than 128 are interpreted as 128
15 to 2	FLSSA[15:2]	Filter List Standard Start Address Start address of standard Message ID filter list (32-bit word address, see **Figure 37.4, Message RAM Configuration**).
1, 0	Reserved	These bits are always read as 0. When written, write the initial value.

(20) MTTCAN0XIDFC — Extended ID Filter Configuration

Settings for 29-bit extended Message ID filtering. The Extended ID Filter Configuration controls the filter path for standard messages as described in **Figure 37.20, Extended Message ID Filter Path**.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 088_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	LSE[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	RP	RP	RP	RP	RP	RP	RP

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	R	R

Table 37.89 MTTCAN0XIDFC Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	These bits are always read as 0. When written, write the initial value.
22 to 16	LSE[6:0]	List Size Extended 0: No extended Message ID filter 1 to 64: Number of extended Message ID filter elements >64: Values greater than 64 are interpreted as 64
15 to 2	FLESA[15:2]	Filter List Extended Start Address Start address of extended Message ID filter list (32-bit word address, see **Figure 37.4, Message RAM Configuration**).
1, 0	Reserved	These bits are always read as 0. When written, write the initial value.

(21) MTTCAN0XIDAM — Extended ID AND Mask

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 090_H

Value after reset: $1FFF\ FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	EIDM[28:16]												
Value after reset	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EIDM[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP

Table 37.90 MTTCAN0XIDAM Register Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	These bits are always read as 0. When written, write the initial value.
28 to 0	EIDM[28:0]	Extended ID Mask For acceptance filtering of extended frames the Extended ID AND Mask is ANDed with the Message ID of a received frame. Intended for masking of 29-bit IDs in SAE J1939. With the reset value of all bits set to one the mask is not active.

(22) MTTCAN0HPMS — High Priority Message Status

This register is updated every time a Message ID filter element configured to generate a priority event matches. This can be used to monitor the status of incoming high priority messages and to enable fast access to these messages.

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + 094_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FLST	FIDX[6:0]							MSI[1:0]		BIDX[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.91 MTTCAN0HPMS Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are always read as 0.
15	FLST	Filter List Indicates the filter list of the matching filter element. 0: Standard Filter List 1: Extended Filter List
14 to 8	FIDX[6:0]	Filter Index Index of matching filter element. Range is 0 to MTTCAN0SIDFC.LSS – 1 resp. MTTCAN0XIDFC.LSE – 1.
7, 6	MSI[1:0]	Message Storage Indicator 00: No FIFO selected 01: FIFO message lost 10: Message stored in FIFO 0 11: Message stored in FIFO 1
5 to 0	BIDX[5:0]	Buffer Index Index of Rx FIFO element to which the message was stored. Only valid when MSI[1] = ‘1’.

(23) MTTCAN0NDAT1 — New Data 1

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 098_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ND31	ND30	ND29	ND28	ND27	ND26	ND25	ND24	ND23	ND22	ND21	ND20	ND19	ND18	ND17	ND16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ND15	ND14	ND13	ND12	ND11	ND10	ND9	ND8	ND7	ND6	ND5	ND4	ND3	ND2	ND1	ND0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 37.92 MTTCAN0NDAT1 Register Contents

Bit Position	Bit Name	Function
31 to 0	ND[31:0]	New Data The register holds the New Data flags of Rx Buffers 0 to 31. The flags are set when the respective Rx Buffer has been updated from a received frame. The flags remain set until the Host clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register. 0: Rx Buffer not updated 1: Rx Buffer updated from new message

(24) MTTCAN0NDAT2 — New Data 2

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $09C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ND63	ND62	ND61	ND60	ND59	ND58	ND57	ND56	ND55	ND54	ND53	ND52	ND51	ND50	ND49	ND48
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ND47	ND46	ND45	ND44	ND43	ND42	ND41	ND40	ND39	ND38	ND37	ND36	ND35	ND34	ND33	ND32
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 37.93 MTTCAN0NDAT2 Register Contents

Bit Position	Bit Name	Function
31 to 0	ND[63:32]	New Data The register holds the New Data flags of Rx Buffers 32 to 63. The flags are set when the respective Rx Buffer has been updated from a received frame. The flags remain set until the Host clears them. A flag is cleared by writing a ‘1’ to the corresponding bit position. Writing a ‘0’ has no effect. A hard reset will clear the register. 0: Rx Buffer not updated 1: Rx Buffer updated from new message

(25) MTTCAN0RXF0C — Rx FIFO 0 Configuration

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + $0A0_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	F0OM	F0WM[6:0]							—	F0S[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	F0SA[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	R	R

Table 37.94 MTTCAN0RXF0C Register Contents

Bit Position	Bit Name	Function
31	F0OM	FIFO 0 Operation Mode FIFO 0 can be operated in blocking or in overwrite mode (see **(2) Rx FIFOs**). 0: FIFO 0 blocking mode 1: FIFO 0 overwrite mode
30 to 24	F0WM[6:0]	Rx FIFO 0 Watermark 0: Watermark interrupt disabled 1 to 64: Level for Rx FIFO 0 watermark interrupt (MTTCAN0IR.RF0W) >64: Watermark interrupt disabled
23	Reserved	This bit is always read as 0.
22 to 16	F0S[6:0]	Rx FIFO 0 Size 0: No Rx FIFO 0 1 to 64: Number of Rx FIFO 0 elements >64: Values greater than 64 are interpreted as 64 The Rx FIFO 0 elements are indexed from 0 to F0S-1
15 to 2	F0SA[15:2]	Rx FIFO 0 Start Address Start address of Rx FIFO 0 in Message RAM (32-bit word address, see **Figure 37.4, Message RAM Configuration**).
1, 0	Reserved	These bits are always read as 0.

(26) MTTCAN0RXF0S — Rx FIFO 0 Status

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + $0A4_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	RF0L	F0F	—	—	F0PI[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	F0GI[5:0]						—	F0FL[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.95 MTTCAN0RXF0S Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	These bits are always read as 0.
25	RF0L	Rx FIFO 0 Message Lost This bit is a copy of interrupt flag MTTCAN0IR.RF0L. When MTTCAN0IR.RF0L is reset, this bit is also reset. 0: No Rx FIFO 0 message lost 1: Rx FIFO 0 message lost, also set after write attempt to Rx FIFO 0 of size zero **NOTE** Overwriting the oldest message when MTTCAN0RXF0C.F0OM = '1' will not set this flag.
24	F0F	Rx FIFO 0 Full 0: Rx FIFO 0 not full 1: Rx FIFO 0 full
23, 22	Reserved	These bits are always read as 0.
21 to 16	F0PI[5:0]	Rx FIFO 0 Put Index Rx FIFO 0 write index pointer, range 0 to 63.
15, 14	Reserved	These bits are always read as 0.
13 to 8	F0GI[5:0]	Rx FIFO 0 Get Index Rx FIFO 0 read index pointer, range 0 to 63.
7	Reserved	This bit is always read as 0.
6 to 0	F0FL[6:0]	Rx FIFO 0 Fill Level Number of elements stored in Rx FIFO 0, range 0 to 64.

(27) MTTCAN0RXF0A — Rx FIFO 0 Acknowledge

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $0A8_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	F0AI[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 37.96 MTTCAN0RXF0A Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	These bits are always read as 0. When written, write the initial value.
5 to 0	F0AI[5:0]	Rx FIFO 0 Acknowledge Index After the Host has read a message or a sequence of messages from Rx FIFO 0 it has to write the buffer index of the last element read from Rx FIFO 0 to F0AI. This will set the Rx FIFO 0 Get Index MTTCAN0RXF0S.F0GI to F0AI + 1 and update the FIFO 0 Fill Level MTTCAN0RXF0S.F0FL.

(28) MTTCAN0RXBC — Rx Buffer Configuration

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $0AC_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 37.99 MTTCAN0RXF1S Register Contents

Bit Position	Bit Name	Function
31, 30	DMS[1:0]	Debug Message Status 00: Idle state, wait for reception of debug messages, DMA request is cleared 01: Debug message A received 10: Debug messages A, B received 11: Debug messages A, B, C received, DMA request is set
29 to 26	Reserved	These bits are always read as 0.
25	RF1L	Rx FIFO 1 Message Lost This bit is a copy of interrupt flag MTTCAN0IR.RF1L. When MTTCAN0IR.RF1L is reset, this bit is also reset. 0: No Rx FIFO 1 message lost 1: Rx FIFO 1 message lost, also set after write attempt to Rx FIFO 1 of size zero **NOTE** Overwriting the oldest message when MTTCAN0RXF0C.F0OM = '1' will not set this flag.
24	F1F	Rx FIFO 1 Full 0: Rx FIFO 1 not full 1: Rx FIFO 1 full
23, 22	Reserved	These bits are always read as 0.
21 to 16	F1PI[5:0]	Rx FIFO 1 Put Index Rx FIFO 1 write index pointer, range 0 to 63.
15, 14	Reserved	These bits are always read as 0.
13 to 8	F1GI[5:0]	Rx FIFO 1 Get Index Rx FIFO 1 read index pointer, range 0 to 63.
7	Reserved	This bit is always read as 0.
6 to 0	F1FL[6:0]	Rx FIFO 1 Fill Level Number of elements stored in Rx FIFO 1, range 0 to 64.

(31) MTTCAN0RXF1A — Rx FIFO 1 Acknowledge

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $0B8_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 37.100 MTTCAN0RXF1A Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	These bits are always read as 0. When written, write the initial value.
5 to 0	F1AI[5:0]	Rx FIFO 1 Acknowledge Index After the Host has read a message or a sequence of messages from Rx FIFO 1 it has to write the buffer index of the last element read from Rx FIFO 1 to F1AI. This will set the Rx FIFO 1 Get Index MTTCAN0RXF1S.F1GI to F1AI + 1 and update the FIFO 1 Fill Level MTTCAN0RXF1S.F1FL.

(32) MTTCAN0RXESC — Rx Buffer / FIFO Element Size Configuration

Configures the number of data bytes belonging to an Rx Buffer / Rx FIFO element. Data field sizes >8 bytes are intended for CAN FD operation only.

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + $0BC_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	RBDS[2:0]			—	F1DS[2:0]			—	F0DS[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	RP	RP	RP	R	RP	RP	RP	R	RP	RP	RP

Table 37.101 MTTCAN0RXESC Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	These bits are always read as 0.
10 to 8	RBDS[2:0]	Rx Buffer Data Field Size 000: 8 byte data field 001: 12 byte data field 010: 16 byte data field 011: 20 byte data field 100: 24 byte data field 101: 32 byte data field 110: 48 byte data field 111: 64 byte data field
7	Reserved	This bit is always read as 0.
6 to 4	F1DS[2:0]	Rx FIFO 1 Data Field Size 000: 8 byte data field 001: 12 byte data field 010: 16 byte data field 011: 20 byte data field 100: 24 byte data field 101: 32 byte data field 110: 48 byte data field 111: 64 byte data field
3	Reserved	This bit is always read as 0.
2 to 0	F0DS[2:0]	Rx FIFO 0 Data Field Size 000: 8 byte data field 001: 12 byte data field 010: 16 byte data field 011: 20 byte data field 100: 24 byte data field 101: 32 byte data field 110: 48 byte data field 111: 64 byte data field

NOTE

In case the data field size of an accepted CAN frame exceeds the data field size configured for the matching Rx Buffer or Rx FIFO, only the number of bytes as configured by MTTCAN0RXESC are stored to the Rx Buffer resp. Rx FIFO element. The rest of the frame's data field is ignored.

(33) MTTCAN0TXBC — Tx Buffer Configuration

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $0C0_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	TFQM	TFQS[5:0]						—	—	NDTB[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RP	RP	RP	RP	RP	RP	RP	R	R	RP	RP	RP	RP	RP	RP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TBSA[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	R	R

Table 37.102 MTTCAN0TXBC Register Contents

Bit Position	Bit Name	Function
31	Reserved	This bit is always read as 0. When written, write the initial value.
30	TFQM	Tx FIFO/Queue Mode 0: Tx FIFO operation 1: Tx Queue operation
29 to 24	TFQS[5:0]	Transmit FIFO/Queue Size 0: No Tx FIFO/Queue 1 to 32: Number of Tx Buffers used for Tx FIFO/Queue >32: Values greater than 32 are interpreted as 32
23, 22	Reserved	These bits are always read as 0. When written, write the initial value.
21 to 16	NDTB[5:0]	Number of Dedicated Transmit Buffers 0: No Dedicated Tx Buffers 1 to 32: Number of Dedicated Tx Buffers >32: Values greater than 32 are interpreted as 32
15 to 2	TBSA[15:2]	Tx Buffers Start Address Start address of Tx Buffers section in Message RAM (32-bit word address, see **Figure 37.4, Message RAM Configuration**).
1, 0	Reserved	These bits are always read as 0. When written, write the initial value.

NOTE

Be aware that the sum of TFQS and NDTB may be not greater than 32. There is no check for erroneous configurations. The Tx Buffers section in the Message RAM starts with the dedicated Tx Buffers.

(34) MTTCAN0TXFQS — Tx FIFO/Queue Status

The Tx FIFO/Queue status is related to the pending Tx requests listed in register MTTCAN0TXBRP. Therefore the effect of Add/Cancellation requests may be delayed due to a running Tx scan (MTTCAN0TXBRP not yet updated).

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + $0C4_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	TFQF	TFQPI[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	TFGI[4:0]					—	—	TFFL[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.103 MTTCAN0TXFQS Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	These bits are always read as 0.
21	TFQF	Tx FIFO/Queue Full 0: Tx FIFO/Queue not full 1: Tx FIFO/Queue full
20 to 16	TFQPI[4:0]	Tx FIFO/Queue Put Index Tx FIFO/Queue write index pointer, range 0 to 31.
15 to 13	Reserved	These bits are always read as 0.
12 to 8	TFGI[4:0]	Tx FIFO Get Index Tx FIFO read index pointer, range 0 to 31. Read as zero when Tx Queue operation is configured (MTTCAN0TXBC.TFQM = '1').
7, 6	Reserved	These bits are always read as 0.
5 to 0	TFFL[5:0]	Tx FIFO Free Level Number of consecutive free Tx FIFO elements starting from TFGI, range 0 to 32. Read as zero when Tx Queue operation is configured (MTTCAN0TXBC.TFQM = '1')

NOTE

In case of mixed configurations where dedicated Tx Buffers are combined with a Tx FIFO or a Tx Queue, the Put and Get Indices indicate the number of the Tx Buffer starting with the first dedicated Tx Buffers.
Example: For a configuration of 12 dedicated Tx Buffers and a Tx FIFO of 20 Buffers a Put Index of 15 points to the fourth buffer of the Tx FIFO.

(35) MTTCAN0TXESC — Tx Buffer Element Size Configuration

Configures the number of data bytes belonging to a Tx Buffer element. Data field sizes > 8 bytes are intended for CAN FD operation only.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $0C8_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TBDS[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RP	RP	RP

Table 37.104 MTTCAN0TXESC Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	These bits are always read as 0. When written, write the initial value.
2 to 0	TBDS[2:0]	Tx Buffer Data Field Size 000: 8 byte data field 001: 12 byte data field 010: 16 byte data field 011: 20 byte data field 100: 24 byte data field 101: 32 byte data field 110: 48 byte data field 111: 64 byte data field

NOTE

In case the data length code DLC of a Tx Buffer element is configured to a value higher than the Tx Buffer data field size MTTCAN0TXESC.TBDS, the bytes not defined by the Tx Buffer are transmitted as "CC_H" (padding bytes).

(36) MTTCAN0TXBRP — Tx Buffer Request Pending

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + $0CC_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.105 MTTCAN0TXBRP Register Contents

Bit Position	Bit Name	Function
31 to 0	TRP[31:0]	Transmission Request Pending Each Tx Buffer has its own Transmission Request Pending bit. The bits are set via register MTTCAN0TXBAR. The bits are reset after a requested transmission has completed or has been cancelled via register MTTCAN0TXBCR. MTTCAN0TXBRP bits are set only for those Tx Buffers configured via MTTCAN0TXBC. After a MTTCAN0TXBRP bit has been set, a Tx scan (see **Section 37.5.3.5, Tx Handling**) is started to check for the pending Tx request with the highest priority (Tx Buffer with lowest Message ID). A cancellation request resets the corresponding transmission request pending bit of register MTTCAN0TXBRP. In case a transmission has already been started when a cancellation is requested, this is done at the end of the transmission, regardless whether the transmission was successful or not. The cancellation request bits are reset directly after the corresponding MTTCAN0TXBRP bit has been reset. After a cancellation has been requested, a finished cancellation is signalled via MTTCAN0TXBCF • after successful transmission together with the corresponding MTTCAN0TXBTO bit • when the transmission has not yet been started at the point of cancellation • when the transmission has been aborted due to lost arbitration • when an error occurred during frame transmission In DAR mode all transmissions are automatically cancelled if they are not successful. The corresponding MTTCAN0TXBCF bit is set for all unsuccessful transmissions. 0: No transmission request pending 1: Transmission request pending **NOTE** MTTCAN0TXBRP bits which are set while a Tx scan is in progress are not considered during this particular Tx scan. In case a cancellation is requested for such a Tx Buffer, this Add Request is cancelled immediately, the corresponding MTTCAN0TXBRP bit is reset.

(37) MTTCAN0TXBAR — Tx Buffer Add Request

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $0D0_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AR31	AR30	AR29	AR28	AR27	AR26	AR25	AR24	AR23	AR22	AR21	AR20	AR19	AR18	AR17	AR16

Table 37.106 MTTCAN0TXBAR Register Contents

Bit Position	Bit Name	Function
31 to 0	AR[31:0]	Add Request Each Tx Buffer has its own Add Request bit. Writing a '1' will set the corresponding Add Request bit; writing a '0' has no impact. This enables the Host to set transmission requests for multiple Tx Buffers with one write to MTTCAN0TXBAR. MTTCAN0TXBAR bits are set only for those Tx Buffers configured via MTTCAN0TXBC. When no Tx scan is running, the bits are reset immediately, else the bits remain set until the Tx scan process has completed. 0: No transmission request added 1: Transmission requested added

NOTE

If an add request is applied for a Tx Buffer with pending transmission request (corresponding MTTCAN0TXBRP bit already set), this add request is ignored.

(38) MTTCAN0TXBCR — Tx Buffer Cancellation Request

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $0D4_H$

Value after reset: $0000\ 0000_H$

Table 37.108 MTTCAN0TXBTO Register Contents

Bit Position	Bit Name	Function
31 to 0	TO[31:0]	Transmission Occurred Each Tx Buffer has its own Transmission Occurred bit. The bits are set when the corresponding MTTCAN0TXBRP bit is cleared after a successful transmission. The bits are reset when a new transmission is requested by writing a ‘1’ to the corresponding bit of register MTTCAN0TXBAR. 0: No transmission occurred 1: Transmission occurred

(40) MTTCAN0TXBCF — Tx Buffer Cancellation Finished

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + $0DC_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CF31	CF30	CF29	CF28	CF27	CF26	CF25	CF24	CF23	CF22	CF21	CF20	CF19	CF18	CF17	CF16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 37.109 MTTCAN0TXBCF Register Contents

Bit Position	Bit Name	Function
31 to 0	CF[31:0]	Cancellation Finished Each Tx Buffer has its own Cancellation Finished bit. The bits are set when the corresponding MTTCAN0TXBRP bit is cleared after a cancellation was requested via MTTCAN0TXBCR. In case the corresponding MTTCAN0TXBRP bit was not set at the point of cancellation, CF is set immediately. The bits are reset when a new transmission is requested by writing a '1' to the corresponding bit of register MTTCAN0TXBAR. 0: No transmit buffer cancellation 1: Transmit buffer cancellation finished

(41) MTTCAN0TXBTIE — Tx Buffer Transmission Interrupt Enable

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $0E0_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.113 MTTCAN0TXEFS Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	These bits are always read as 0.
25	TEFL	Tx Event FIFO Element Lost This bit is a copy of interrupt flag MTTCAN0IR.TEFL. When MTTCAN0IR.TEFL is reset, this bit is also reset. 0: No Tx Event FIFO element lost 1: Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero.
24	EFF	Event FIFO Full 0: Tx Event FIFO not full 1: Tx Event FIFO full
23 to 21	Reserved	These bits are always read as 0.
20 to 16	EFPI[4:0]	Event FIFO Put Index Tx Event FIFO write index pointer, range 0 to 31.
15 to 13	Reserved	These bits are always read as 0.
12 to 8	EFGI[4:0]	Event FIFO Get Index Tx Event FIFO read index pointer, range 0 to 31.
7, 6	Reserved	These bits are always read as 0.
5 to 0	EFFL[5:0]	Event FIFO Fill Level Number of elements stored in Tx Event FIFO, range 0 to 32.

(45) MTTCAN0TXEFA — Tx Event FIFO Acknowledge

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $0F8_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 37.115 MTTCAN0TTTMC Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	These bits are always read as 0. When written, write the initial value.
22 to 16	TME[6:0]	Trigger Memory Elements 0: No Trigger Memory 1 to 64: Number of Trigger Memory elements >64: Values greater than 64 are interpreted as 64
15 to 2	TMSA[15:2]	Trigger Memory Start Address Start address of Trigger Memory in Message RAM (32-bit word address, see **Figure 37.4, Message RAM Configuration**).
1, 0	Reserved	These bits are always read as 0. When written, write the initial value.

(47) MTTCAN0TTRMC — TT Reference Message Configuration

For details about handling of reference messages see **(1) Reference Message**

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 104_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RMPS	XTD	—	RID[28:16]												
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	EECS	IRTO[6:0]							LDSDL[2:0]			TM	GEN	—	OM[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	R	RP	RP

Table 37.117 MTTCAN0TTOCF Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 27	Reserved	These bits are always read as 0. When written, write the initial value.
26	EVTP	Event Trigger Polarity 0: Rising edge trigger 1: Falling edge trigger
25	ECC	Enable Clock Calibration 0: Automatic clock calibration in TTCAN Level 0, 2 is disabled 1: Automatic clock calibration in TTCAN Level 0, 2 is enabled
24	EGTF	Enable Global Time Filtering 0: Global time filtering in TTCAN Level 0, 2 is disabled 1: Global time filtering in TTCAN Level 0, 2 is enabled
23 to 16	AWL[7:0]	Application Watchdog Limit The application watchdog can be disabled by programming AWL to 00H. 00_H to FF_H: Maximum time after which the application has to serve the application watchdog. The application watchdog is incremented once each 256 NTUs.
15	EECS	Enable External Clock Synchronization If enabled, TUR configuration (MTTCAN0TURCF.NCL only) may be updated during TTCAN operation. 0: External clock synchronization in TTCAN Level 0, 2 disabled 1: External clock synchronization in TTCAN Level 0, 2 enabled
14 to 8	IRTO[6:0]	Initial Reference Trigger Offset 00_H to $7F_H$: Positive offset, range from 0 to 127
7 to 5	LDSDL[2:0]	LD of Synchronization Deviation Limit The Synchronization Deviation Limit SDL is configured by its dual logarithm LDSDL with SDL = $2^{(LDSDL + 5)}$. It should not exceed the clock tolerance given by the CAN bit timing configuration. 0_H to 7_H: LD of Synchronization Deviation Limit (SDL ≤ 32 to 4096)
4	TM	Time Master 0: Time Master function disabled 1: Potential Time Master

Table 37.117 MTTCAN0TTOCF Register Contents (2/2)

Bit Position	Bit Name	Function
3	GEN	Gap Enable 0: Strictly time-triggered operation 1: External event-synchronized time-triggered operation
2	Reserved	This bit is always read as 0. When written, write the initial value.
1, 0	OM[1:0]	Operation Mode 00: Event-driven CAN communication, default 01: TTCAN level 1 10: TTCAN level 2 11: TTCAN level 0

(49) MTTCAN0TTMLM — TT Matrix Limits

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $10C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	ENTT[11:0]

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP

Table 37.118 MTTCAN0TTMLM Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	These bits are always read as 0. When written, write the initial value.
27 to 16	ENTT[11:0]	Expected Number of Tx Triggers 000_H to FFF_H: Expected number of Tx Triggers in one Matrix Cycle
15 to 12	Reserved	These bits are always read as 0. When written, write the initial value.
11 to 8	TXEW[3:0]	Tx Enable Window 0_H to F_H: Length of Tx enable window, 1 to 16 NTU cycles
7, 6	CSS[1:0]	Cycle Start Synchronization Enables sync pulse output at pin m_ttcan_soc (MTTCAN0SOC). 00: No sync pulse 01: Sync pulse at start of basic cycle 10: Sync pulse at start of matrix cycle 11: Reserved
5 to 0	CCM[5:0]	Cycle Count Max 00_H: 1 Basic Cycle per Matrix Cycle 01_H: 2 Basic Cycles per Matrix Cycle 03_H: 4 Basic Cycles per Matrix Cycle 07_H: 8 Basic Cycles per Matrix Cycle $0F_H$: 16 Basic Cycles per Matrix Cycle $1F_H$: 32 Basic Cycles per Matrix Cycle $3F_H$: 64 Basic Cycles per Matrix Cycle others: Reserved

NOTE

ISO 11898-4, Section 5.2.1 requires, that only the listed cycle count values are configured. Other values are possible but may lead to inconsistent matrix cycles.

(50) MTTCAN0TURCF — TUR Configuration

The length of the NTU is given by: NTU = CAN Clock Period • NC/DC

NC is an 18-bit value. Its high part, NCH[17:16] is hard wired to 0b01. Therefore the range of NC is 10000_H to $1FFFF_H$. The value configured by NCL is the initial value for MTTCAN0TURNA.NAV[15:0]. DC is set to 1000_H by hardware reset and it may not be written to 0000_H.

Level 1: NC ≥ 4 • DC and NTU = CAN bit time
Level 0, 2: NC ≥ 8 • DC

The actual value of TUR may be changed by the clock drift compensation function of TTCAN Level 0 and Level 2 in order to adjust the node's local view of the NTU to the time master's view of the NTU. DC will not be changed by the automatic drift compensation, MTTCAN0TURNA.NAV may be adjusted around NC in the range of the Synchronization Deviation Limit given by MTTCAN0TTOCF.LDSDL. NC and DC should be programmed to the largest suitable values in order to allow the best computational accuracy for the drift compensation process.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 110_H

Value after reset: $1000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ELT	—	DC[13:0]													
Value after reset	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RP	R	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NCL[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP

Table 37.119 MTTCAN0TURCF Register Contents (1/2)

Bit Position	Bit Name	Function
31	ELT	Enable Local Time 0: Local time is stopped, default 1: Local time is enabled **NOTE** Local time is started by setting ELT. It remains active until ELT is reset or until the next hardware reset. MTTCAN0TURCF.DC is locked when MTTCAN0TURCF.ELT = '1'. If ELT is written to '0', the readable value will stay at '1' until the new value has been synchronized into the CAN clock domain. During this time write access to the other bits of the register remains locked.
30	Reserved	This bit is always read as 0. When written, write the initial value.
29 to 16	DC[13:0]	Denominator Configuration 0000_H: Illegal value 0001_H to $3FFF_H$: Denominator Configuration

Table 37.119 MTTCAN0TURCF Register Contents (2/2)

Bit Position	Bit Name	Function
15 to 0	NCL[15:0]	Numerator Configuration Low Write access to the TUR Numerator Configuration Low is only possible during configuration with MTTCAN0TURCF.ELT = '0' or if MTTCAN0TTOCF.EECS (external clock synchronization enabled) is set. When a new value for NCL is written outside TT Configuration Mode, the new value takes effect when MTTCAN0TTOST.WECS is cleared to '0'. NCL is locked MTTCAN0TTOST.WECS is '1'. 0000_H to $FFFF_H$: Numerator Configuration Low **NOTE** If NC < 7 • DC in TTCAN Level 1, then it is required that subsequent time marks in the Trigger Memory must differ by at least 2 NTU.

(51) MTTCAN0TTOCN — TT Operation Control

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 114_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 37.120 MTTCAN0TTOCN Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 26	Reserved	These bits are always read as 0. When written, write the initial value.
15	LCKC	TT Operation Control Register Locked Set by a write access to register MTTCAN0TTOCN. Reset when the updated configuration has been synchronized into the CAN clock domain. 0: Write access to MTTCAN0TTOCN enabled 1: Write access to MTTCAN0TTOCN locked
14	Reserved	This bit is always read as 0. When written, write the initial value.
13	ESCN	External Synchronization Control If enabled the M_TTCAN synchronizes its cycle time phase to an external event signalled by a rising edge at pin m_ttcan_evt (MTTCAN0EVT)(see **Section 37.6.4.10, Synchronization to external Time Schedule**). 0: External synchronization disabled 1: External synchronization enabled
12	NIG	Next is Gap This bit can only be set when the M_TTCAN is the actual Time Master and when it is configured for external event-synchronized time-triggered operation (MTTCAN0TTOCF.GEN = '1') 0: No action, reset by reception of any reference message 1: Transmit next reference message with Next_is_Gap = '1'
11	TMG	Time Mark Gap 0: Reset by each reference message 1: Next reference message started when Register Time Mark interrupt MTTCAN0TTIR.RTMI is activated
10	FGP	Finish Gap Set by the CPU, reset by each reference message 0: No reference message requested 1: Application requested start of reference message
9	GCS	Gap Control Select 0: Gap control independent from m_ttcan_evt (MTTCAN0EVT) 1: Gap control by input pin m_ttcan_evt (MTTCAN0EVT)
8	TTIE	Trigger Time Mark Interrupt Pulse Enable External time mark events are configured by trigger memory element TMEX (see **(7) Trigger Memory Element**). A trigger time mark interrupt pulse is generated when the trigger memory element becomes active, and the M_TTCAN is in synchronization state In_Schedule or In_Gap. 0: Trigger Time Mark Interrupt output m_ttcan_tmp (MTTCAN0TMP) disabled 1: Trigger Time Mark Interrupt output m_ttcan_tmp (MTTCAN0TMP) enabled

Table 37.120 MTTCAN0TTOCN Register Contents (2/2)

Bit Position	Bit Name	Function
7, 6	TMC[1:0]	Register Time Mark Compare 00: No Register Time Mark Interrupt generated 01: Register Time Mark Interrupt if Time Mark = cycle time 10: Register Time Mark Interrupt if Time Mark = local time 11: Register Time Mark Interrupt if Time Mark = global time **NOTE** When changing the time mark reference (cycle, local, global time), it is recommended to first write TMC = “00”, then reconfigure MTTCAN0TTTMK, and finally set TMC to the intended time reference.
5	RTIE	Register Time Mark Interrupt Pulse Enable Register time mark interrupts are configured by register MTTCAN0TTTMK. A register time mark interrupt pulse with the length of one m_ttcan_clk period is generated when the time referenced by MTTCAN0TTOCN.TMC (cycle, local, or global) equals MTTCAN0TTTMK.TM, independent of the synchronization state. 0: Register Time Mark Interrupt output m_ttcan_rtp (MTTCAN0RTP) disabled 1: Register Time Mark Interrupt output m_ttcan_rtp (MTTCAN0RTP) enabled
4, 3	SWS[1:0]	Stop Watch Source 00: Stop Watch disabled 01: Actual value of cycle time is copied to MTTCAN0TTCPT.SWV 10: Actual value of local time is copied to MTTCAN0TTCPT.SWV 11: Actual value of global time is copied to MTTCAN0TTCPT.SWV
2	SWP	Stop Watch Polarity 0: Rising edge trigger 1: Falling edge trigger
1	ECS	External Clock Synchronization Writing a ‘1’ to ECS sets MTTCAN0TTOST.WECS if the node is the actual Time Master. ECS is reset after one Host clock period. The external clock synchronization takes effect at the start of the next basic cycle.
0	SGT	Set Global time Writing a ‘1’ to SGT sets MTTCAN0TTOST.WGDT if the node is the actual Time Master. SGT is reset after one Host clock period. The global time preset takes effect when the node transmits the next reference message with the Master_Ref_Mark modified by the preset value written to MTTCAN0TTGTP.

(52) MTTCAN0TTGTP — TT Global Time Preset

If MTTCAN0TTOST.WGDT is set, the next reference message will be transmitted with the Master_Ref_Mark modified by the preset value and with Disc_Bit = '1', presetting the global time in all nodes simultaneously.

TP is reset to 0000_H each time a reference message with Disc_Bit = '1' becomes valid or if the node is not the current Time Master. TP is locked while MTTCAN0TTOST.WGTD = '1' after setting MTTCAN0TTOCN.SGT until the reference message with Disc_Bit = '1' becomes valid or until the node is no longer the current Time Master.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 118_H

Value after reset: $0000\ 0000_H$

Bit Position	Bit Name	Function
31 to 16	CTP[15:0]	Cycle Time Target Phase CTP is write-protected while MTTCAN0TTOCN.ESCN or MTTCAN0TTOST.SPL are set (see **Section 37.6.4.10, Synchronization to external Time Schedule**). 0000_H to $FFFF_H$: Defines target value of cycle time when a rising edge of m_ttcan_evt (MTTCAN0EVT) is expected
15 to 0	TP[15:0]	Time Preset TP is write-protected while MTTCAN0TTOST.WGTD is set. 0000_H to $7FFF_H$: Next Master Reference Mark = Master Reference Mark + TP 8000_H: reserved 8001_H to $FFFF_H$: Next Master Reference Mark = Master Reference Mark – (10000_H – TP)

(53) MTTCAN0TTTMK — TT Time Mark

A time mark interrupt (MTTCAN0TTIR.RTMI = ‘1’) is generated when the time base indicated by MTTCAN0TTOCN.TMC (cycle time, local time, or global time) has the same value as TM.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $11C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 37.122 MTTCAN0TTTMK Register Contents

Bit Position	Bit Name	Function
31	LCKM	TT Time Mark Register Locked Always set by a write access to registers MTTCAN0TTOCN. Set by write access to register MTTCAN0TTTMK when MTTCAN0TTOCN.TMC ≠ “00”. Reset when the registers have been synchronized into the CAN clock domain. 0: Write access to MTTCAN0TTTMK enabled 1: Write access to MTTCAN0TTTMK locked
30 to 23	Reserved	These bits are always read as 0. When written, write the initial value.
22 to 16	TICC[6:0]	Time Mark Cycle Code Cycle count for which the time mark is valid. 000000x: valid for all cycles 000001c: valid every second cycle at cycle count mod2 = c 00001cc: valid every fourth cycle at cycle count mod4 = cc 0001ccc: valid every eighth cycle at cycle count mod8 = ccc 001cccc: valid every sixteenth cycle at cycle count mod16 = cccc 01ccccc: valid every thirty-second cycle at cycle count mod32 = ccccc 1cccccc: valid every sixty-fourth cycle at cycle count mod64 = cccccc
15 to 0	TM[15:0]	Time Mark 0000_H to $FFFF_H$: Time Mark

NOTE

When using byte access to register MTTCAN0TTTMK it is recommended to first disable the time mark compare function (MTTCAN0TTOCN.TMC = “00”) to avoid compares on inconsistent register values.

(54) MTTCAN0TTIR — TT Interrupt Register

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the Host clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 120_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	RW	R/W	RW	R/W	RW	R/W	RW	R/W	RW	R/W	RW	R/W	RW	R/W	RW	R/W

Table 37.123 MTTCAN0TTIR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 19	Reserved	These bits are always read as 0. When written, write the initial value.
18	CER	Configuration Error Trigger out of order. 0: No error found in trigger list 1: Error found in trigger list
17	AW	Application Watchdog 0: Application watchdog served in time 1: Application watchdog not served in time
16	WT	Watch Trigger 0: No missing reference message 1: Missing reference message (Level 0: cycle time FF00H)
15	IWT	Initialization Watch Trigger The initialization is restarted by resetting IWT. 0: No missing reference message during system startup 1: No system startup due to missing reference message
14	ELC	Error Level Changed Not set when error level changed during initialization. 0: No change in error level 1: Error level changed
13	SE2	Scheduling Error 2 0: No scheduling error 2 1: Scheduling error 2 occurred
12	SE1	Scheduling Error 1 0: No scheduling error 1 1: Scheduling error 1 occurred
11	TXO	Tx Count Overflow 0: Number of Tx Trigger as expected 1: More Tx trigger than expected in one matrix cycle
10	TXU	Tx Count Underflow 0: Number of Tx Trigger as expected 1: Less Tx trigger than expected in one matrix cycle

Table 37.123 MTTCAN0TTIR Register Contents (2/2)

Bit Position	Bit Name	Function
9	GTE	Global Time Error Synchronization deviation SD exceeds limit specified by MTTCAN0TTOCF.LDSDL, TTCAN Level 0, 2 only. 0: Synchronization deviation within limit 1: Synchronization deviation exceeded limit
8	GTD	Global Time Discontinuity 0: No discontinuity of global time 1: Discontinuity of global time
7	GTW	Global Time Wrap 0: No global time wrap occurred 1: Global time wrap from $FFFF_H$ to 0000_H occurred
6	SWE	Stop Watch Event 0: No rising/falling edge at stop watch trigger pin m_ttcan_swt (MTTCAN0SWT) detected 1: Rising/falling edge at stop watch trigger pin m_ttcan_swt (MTTCAN0SWT) detected
5	TTMI	Trigger Time Mark Event Internal Internal time mark events are configured by trigger memory element TMIN (see **(7) Trigger Memory Element**). Set when the trigger memory element becomes active, and the M_TTCAN is in synchronization state In_Gap or In_Schedule. 0: Time mark not reached 1: Time mark reached (Level 0: cycle time MTTCAN0TTOCF.IRTO • 200_H)
4	RTMI	Register Time Mark Interrupt Set when time referenced by MTTCAN0TTOCN.TMC (cycle, local, or global) equals MTTCAN0TTTMK.TM, independent of the synchronization state. 0: Time mark not reached 1: Time mark reached
3	SOG	Start of Gap 0: No reference message seen with Next_is_Gap bit set 1: Reference message with Next_is_Gap bit set becomes valid
2	CSM	Change of Synchronization Mode 0: No change in master to slave relation or schedule synchronization 1: Master to slave relation or schedule synchronization changed, also set when MTTCAN0TTOST.SPL is reset
1	SMC	Start of Matrix Cycle 0: No Matrix Cycle started since bit has been reset 1: Matrix Cycle started
0	SBC	Start of Basic Cycle 0: No Basic Cycle started since bit has been reset 1: Basic Cycle started

(55) MTTCAN0TTIE — TT Interrupt Enable

The settings in the TT Interrupt Enable register determine which status changes in the TT Interrupt Register will result in an interrupt.

0: TT interrupt disabled

1: TT interrupt enabled

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 124_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

6	SWEE	Stop Watch Event Interrupt Enable
5	TTMIE	Trigger Time Mark Event Internal Enable
4	RTMIE	Register Time Mark Interrupt Enable
3	SOGE	Start of Gap Interrupt Enable
2	CSME	Change of Synchronization Mode Interrupt Enable
1	SMCE	Start of Matrix Cycle Interrupt Enable
0	SBCE	Start of Basic Cycle Interrupt Enable

(56) MTTCAN0TTILS — TT Interrupt Line Select

The TT Interrupt Line Select register assigns an interrupt generated by a specific interrupt flag from the TT Interrupt Register to one of the two module interrupt lines. For interrupt generation the respective interrupt line has to be enabled via MTTCAN0ILE.EINT0 and MTTCAN0ILE.EINT1.

0: TT interrupt assigned to interrupt line m_ttcan_int0 (INTMTTCANI0)

1: TT interrupt assigned to interrupt line m_ttcan_int1 (INTMTTCANI1)

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 128_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

(57) MTTCAN0TTOST — TT Operation Status

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + $12C_H$

Value after reset: $0000\ 0080_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SPL	WECS	AWE	WFE	GSI	TMP[2:0]			GFI	WGTD	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RTO[7:0]								QCS	QGTP	SYS[1:0]		MS[1:0]		EL[1:0]	
Value after reset	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.126 MTTCAN0TTOST Register Contents (1/2)

Bit Position	Bit Name	Function
31	SPL	Schedule Phase Lock The bit is valid only when external synchronization is enabled (MTTCAN0TTOCN.ESCN = '1'). In this case it signals that the difference between cycle time configured by MTTCAN0TTGTP.CTP and the cycle time at the rising edge at pin m_ttcan_evt (MTTCAN0EVT) is less or equal 9 NTU (see **Section 37.6.4.10, Synchronization to external Time Schedule**). 0: Phase outside range 1: Phase inside range
30	WECS	Wait for External Clock Synchronization 0: No external clock synchronization pending 1: Node waits for external clock synchronization to take effect. The bit is reset at the start of the next basic cycle.
29	AWE	Application Watchdog Event The application watchdog is served by reading MTTCAN0TTOST. When the watchdog is not served in time, bit AWE is set, all TTCAN communication is stopped, and the M_TTCAN is set into Bus Monitoring Mode. 0: Application Watchdog served in time 1: Failed to serve Application Watchdog in time
28	WFE	Wait for Event 0: No Gap announced, reset by a reference message with Next_is_Gap = '0' 1: Reference message with Next_is_Gap = '1' received
27	GSI	Gap Started Indicator 0: No Gap in schedule, reset by each reference message and for all time slaves 1: Gap time after Basic Cycle has started
26 to 24	TMP[2:0]	Time Master Priority 0_H to 7_H: Priority of actual Time Master
23	GFI	Gap Finished Indicator Set when the CPU writes MTTCAN0TTOCN.FGP, or by a time mark interrupt if TMG = '1', or via input pin m_ttcan_evt (MTTCAN0EVT) if MTTCAN0TTOCN.GCS = '1'. Not set by Ref_Trigger_Gap or when Gap is finished by another node sending a reference message. 0: Reset at the end of each reference message 1: Gap finished by M_TTCAN
22	WGTD	Wait for Global Time Discontinuity 0: No global time preset pending 1: Node waits for the global time preset to take effect. The bit is reset when the node has transmitted a reference message with Disc_Bit = '1' or after it received a reference message.

Table 37.126 MTTCAN0TTOST Register Contents (2/2)

Bit Position	Bit Name	Function
21 to 16	Reserved	These bits are always read as 0.
15 to 8	RTO[7:0]	Reference Trigger Offset The Reference Trigger Offset value is a signed integer with a range from -127 (81_H) to 127 ($7F_H$). There is no notification when the lower limit of -127 is reached. In case the M_TTCAN becomes Time Master (MS[1:0] = “11”), the reset of RTO is delayed due to synchronization between Host and CAN clock domain. For time slaves the value configured by MTTCAN0TTOCF.IRTO is read. 00_H to FF_H: Actual Reference Trigger offset value
7	QCS	Quality of Clock Speed Only relevant in TTCAN Level 0 and Level 2, otherwise fixed to ‘1’. 0: Local clock speed not synchronized to Time Master clock speed 1: Synchronization Deviation ≤ SDL
6	QGTP	Quality of Global Time Phase Only relevant in TTCAN Level 0 and Level 2, otherwise fixed to ‘0’. 0: Global time not valid 1: Global time in phase with Time Master
5, 4	SYS[1:0]	Synchronization State 00: Out of Synchronization 01: Synchronizing to TTCAN communication 10: Schedule suspended by Gap (In_Gap) 11: Synchronized to schedule (In_Schedule)
3, 2	MS[1:0]	Master State 00: Master_Off, no master properties relevant 01: Operating as Time Slave 10: Operating as Backup Time Master 11: Operating as current Time Master
1, 0	EL[1:0]	Error Level 00: Severity 0 - No Error 01: Severity 1 - Warning 10: Severity 2 - Error 11: Severity 3 - Severe Error

(58) MTTCAN0TURNA — TUR Numerator Actual

There is no drift compensation in TTCAN Level 1 (NAV = NC). In TTCAN Level 0 and Level 2, the drift between the node's local clock and the time master's local clock is calculated. The drift is compensated when the Synchronization Deviation (difference between NC and the calculated NAV) is not more than 2 (MTTCAN0TTOCF.LDSDL + 5). With MTTCAN0TTOCF.LDSDL ≤ 7, this results in a maximum range for NAV of $(NC - 1000_H) \leq NAV \leq (NC + 1000_H)$.

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + 130_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 37.130 MTTCAN0TTCPT Register Contents

Bit Position	Bit Name	Function
31 to 16	SWV[15:0]	Stop Watch Value On a rising/falling edge (as configured via MTTCAN0TTOCN.SWP) at the Stop Watch Trigger pin m_ttcan_swt (MTTCAN0SWT) , when MTTCAN0TTOCN.SWS is ≠ “00” and MTTCAN0TTIR.SWE is ‘0’, the actual time value as selected by MTTCAN0TTOCN.SWS (cycle, local, global) is copied to SWV and MTTCAN0TTIR.SWE will be set to ‘1’. Capturing of the next stop watch value is enabled by resetting MTTCAN0TTIR.SWE. 0000_H to $FFFF_H$: Captured Stop Watch value
15 to 6	Reserved	These bits are always read as 0.
5 to 0	CCV[5:0]	Cycle Count Value Cycle count value captured together with SWV. 00_H to $3F_H$: Captured cycle count value

(62) MTTCAN0TTCSM — TT Cycle Sync Mark

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + 140_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	CSM[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 37.131 MTTCAN0TTCSM Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are always read as 0.
15 to 0	CSM[15:0]	Cycle Sync Mark The Cycle Sync Mark is measured in cycle time. It is updated when the reference message becomes valid and retains its value until the next reference message becomes valid. 0000_H to $FFFF_H$: Captured cycle time

37.6.2.4 Message RAM

For storage of Rx/Tx messages and for storage of the filter configuration a single-ported Message RAM is connected to the M_TTCAN module.

(1) Message RAM Configuration

The Message RAM has a width of 32 bits. In case parity checking or ECC is used a respective number of bits has to be added to each word. The M_TTCAN module can be configured to allocate up to 4480 words in the Message RAM. It is not necessary to configure each of the sections listed in **Figure 37.15, Message RAM Configuration**, nor is there any restriction with respect to the sequence of the sections.

When operated in CAN FD mode the required Message RAM size strongly depends on the element size configured for Rx FIFO0, Rx FIFO1, Rx Buffers, and Tx Buffers via MTTCAN0RXESC.F0DS, MTTCAN0RXESC.F1DS, MTTCAN0RXESC.RBDS, and MTTCAN0TXESC.TBDS.

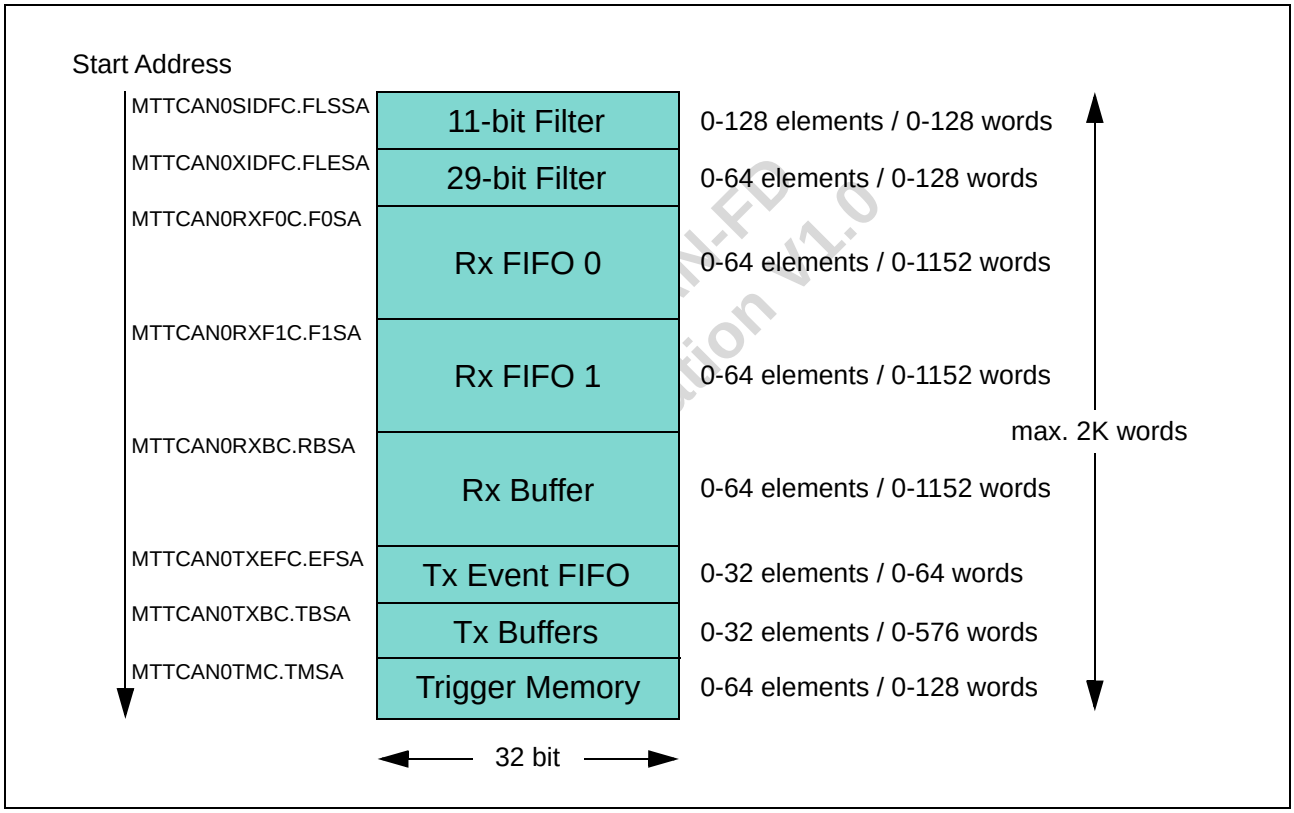

Figure 37.15 Message RAM Configuration

When the M_TTCAN addresses the Message RAM it addresses 32-bit words, not single bytes. The configurable start addresses are 32-bit word addresses i.e. only bits 15 to 2 are evaluated, the two least significant bits are ignored.

NOTE

The M_TTCAN does not check for erroneous configuration of the Message RAM. Especially the configuration of the start addresses of the different sections and the number of elements of each section has to be done carefully to avoid falsification or loss of data.

(2) Rx Buffer and FIFO Element

Up to 64 Rx Buffers and two Rx FIFOs can be configured in the Message RAM. Each Rx FIFO section can be configured to store up to 64 received messages. The structure of a Rx Buffer / FIFO element is shown in **Table 37.132** below. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register MTTCAN0RXESC.

Table 37.132 Rx Buffer and FIFO Element

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R0	ESI	XTD	RTR	ID[28:0]																												
R1	ANMF	FIDX[6:0]							res	EDL	BRS	DLC[3:0]					RXTS[15:0]															
R2	DB3[7:0]								DB2[7:0]								DB1[7:0]								DB0[7:0]							
R3	DB7[7:0]								DB6[7:0]								DB5[7:0]								DB4[7:0]							
...	...								...								...								...							
Rn	DBm[7:0]								DBm-1[7:0]								DBm-2[7:0]								DBm-3[7:0]							

R0 Bit 31 ESI: Error State Indicator

0: Transmitting node is error active
1: Transmitting node is error passive

R0 Bit 30 XTD: Extended Identifier

Signals to the Host whether the received frame has a standard or extended identifier.

0: 11-bit standard identifier
1: 29-bit extended identifier

R0 Bit 29 RTR: Remote Transmission Request

Signals to the Host whether the received frame is a data frame or a remote frame.

0:Received frame is a data frame

1:Received frame is a remote frame

NOTE

There are no remote frames in CAN FD format. In case a CAN FD frame was received (EDL = 1'), bit RTR reflects the state of the reserved bit r1.

R0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].

R1 Bit 31 ANMF: Accepted Non-matching Frame

Acceptance of non-matching frames may be enabled via MTTCAN0GFC.ANFS and MTTCAN0GFC.ANFE.

0:Received frame matching filter index FIDX

1:Received frame did not match any Rx filter element

R1 Bits 30:24 FIDX[6:0]:Filter Index

0 to 127:Index of matching Rx acceptance filter element (invalid if ANMF = '1').
Range is 0 to MTTCAN0SIDFC.LSS - 1 resp. MTTCAN0XIDFC.LSE - 1.

R1 Bit 21 EDL: Extended Data Length

0:Standard frame format

1:CAN FD frame format (new DLC-coding and CRC)

R1 Bit 20 BRS: Bit Rate Switch

0:Frame received without bit rate switching

1:Frame received with bit rate switching

R1 Bits 19:16 DLC[3:0]: Data Length Code

0 to 8: CAN + CAN FD: received frame has 0 to 8 data bytes

9 to 15: CAN: received frame has 8 data bytes

9 to 15: CAN FD: received frame has 12/16/20/24/32/48/64 data bytes

R1 Bits 15:0 RXTS[15:0]:Rx Timestamp

Timestamp Counter value captured on start of frame reception. Resolution depending on configuration of the Timestamp Counter Prescaler MTTCAN0TSCC.TCP.

R2 Bits 31:24 DB3[7:0]:Data Byte 3

R2 Bits 23:16 DB2[7:0]:Data Byte 2

R2 Bits 15:8 DB1[7:0]:Data Byte 1

R2 Bits 7:0 DB0[7:0]:Data Byte 0

R3 Bits 31:24 DB7[7:0]:Data Byte 7

R3 Bits 23:16 DB6[7:0]:Data Byte 6

R3 Bits 15:8 DB5[7:0]:Data Byte 5

R3 Bits 7:0 DB4[7:0]:Data Byte 4

...

Rn Bits 31:24 DBm[7:0]:Data Byte m

Rn Bits 23:16 DBm-1[7:0]:Data Byte m-1

Rn Bits 15:8 DBm-2[7:0]:Data Byte m-2

Rn Bits 7:0 DBm-3[7:0]:Data Byte m-3

NOTE

Depending on the configuration of the element size (MCTTAN0RXESC), between two and sixteen 32-bit words (Rn = 3 to 17) are used for storage of a CAN message's data field.

(3) Tx Buffer Element

The Tx Buffers section can be configured to hold dedicated Tx Buffers as well as a Tx FIFO / Tx Queue. In case that the Tx Buffers section is shared by dedicated Tx buffers and a Tx FIFO / Tx Queue, the dedicated Tx Buffers start at the beginning of the Tx Buffers section followed by the buffers assigned to the Tx FIFO or Tx Queue. The Tx Handler distinguishes between dedicated Tx Buffers and Tx FIFO / Tx Queue by evaluating the Tx Buffer configuration MTTCAN0TXBC.TFQS and MTTCAN0TXBC.NDTB. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register MTTCAN0TXESC.

Table 37.133 Tx Buffer Element

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
T0	res	XTD	RTR	ID[28:0]																												
T1	MM[7:0]								EFC	res			DLC[3:0]				res															
T2	DB3[7:0]								DB2[7:0]								DB1[7:0]								DB0[7:0]							
T3	DB7[7:0]								DB6[7:0]								DB5[7:0]								DB4[7:0]							
...	...								...								...								...							
Tn	DBm[7:0]								DBm-1[7:0]								DBm-2[7:0]								DBm-3[7:0]							

T0 Bit 30 XTD: Extended Identifier

0: 11-bit standard identifier

1: 29-bit extended identifier

T0 Bit 29 RTR: Remote Transmission Request

0: Transmit data frame

1: Transmit remote frame

NOTE

When RTR = 1, the M_TTCAN transmits a remote frame according to ISO11898-1, even if MTTCAN0CCCR.CME enables the transmission in CAN FD format.

T0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier has to be written to ID[28:18].

T1 Bits 31:24 MM[7:0]: Message Marker

Written by CPU during Tx Buffer configuration. Copied into Tx Event FIFO element for identification of Tx message status.

T1 Bit 23 EFC: Event FIFO Control

0: Don’t store Tx events

1: Store Tx events

T1 Bits 19:16 DLC[3:0]: Data Length Code

0 to 8: CAN + CAN FD: transmit frame has 0-8 data bytes

9 to 15: CAN: transmit frame has 8 data bytes

9 to 15: CAN FD: transmit frame has 12/16/20/24/32/48/64 data bytes

T2 Bits 31:24DB3[7:0]:Data Byte 3

T2 Bits 23:16 DB2[7:0]: Data Byte 2

T2 Bits 15:8 DB1[7:0]: Data Byte 1

T2 Bits 7:0 DB0[7:0]: Data Byte 0

T3 Bits 31:24 DB7[7:0]: Data Byte 7

T3 Bits 23:16 DB6[7:0]: Data Byte 6

T3 Bits 15:8 DB5[7:0]: Data Byte 5

T3 Bits 7:0 DB4[7:0]: Data Byte 4

...

Tn Bits 31:24 DBm[7:0]: Data Byte m

Tn Bits 23:16 DBm-1[7:0]:Data Byte m-1

Tn Bits 15:8 DBm-2[7:0]:Data Byte m-2

Tn Bits 7:0 DBm-3[7:0]:Data Byte m-3

NOTE

Depending on the configuration of the element size (MTTCAN0TXESC), between two and sixteen 32-bit words (Tn = 3 to 17) are used for storage of a CAN message’s data field.

(4) Tx Event FIFO Element

Each element stores information about transmitted messages. By reading the Tx Event FIFO the Host CPU gets this information in the order the messages were transmitted. Status information about the Tx Event FIFO can be obtained from register MTTCAN0TXEFS.

Table 37.134 Tx Event FIFO Element

	31				24	23				16	15				8	7				0
E0	ESI	XTD	RTR	ID[28:0]																
E1	MM[7:0]					ET[1:0]		EDL	BRS	DLC[3:0]						TXTS[15:0]				

E0 Bit 31 ESI: Error State Indicator

0: Transmitting node is error active

1: Transmitting node is error passive

E0 Bit 30 XTD: Extended Identifier

0: 11-bit standard identifier

1: 29-bit extended identifier

E0 Bit 29 RTR: Remote Transmission Request

0: Data frame transmitted

1: Remote frame transmitted

E0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].

E1 Bits 31:24 MM[7:0]: Message Marker

Copied from Tx Buffer into Tx Event FIFO element for identification of Tx message status.

E1 Bit 23:22 ET[1:0]: Event Type

00: Reserved

01: Tx event

10: Transmission in spite of cancellation (always set for transmissions in DAR mode)

11: Reserved

E1 Bit 21 EDL: Extended Data Length

0: Standard frame format

1: CAN FD frame format (new DLC-coding and CRC)

E1 Bit 20 BRS: Bit Rate Switch

0: Frame transmitted without bit rate switching

1: Frame transmitted with bit rate switching

E1 Bits 19:16 DLC[3:0]: Data Length Code

0 to 8: CAN + CAN FD: frame with 0-8 data bytes transmitted

9 to 15: CAN: frame with 8 data bytes transmitted

9 to 15: CAN FD: frame with 12/16/20/24/32/48/64 data bytes transmitted

E1 Bits 15:0 TXTS[15:0]:Tx Timestamp

Timestamp Counter value captured on start of frame transmission. Resolution depending on configuration of the Timestamp Counter Prescaler MTTCAN0TSCC.TCP.

(5) Standard Message ID Filter Element

Up to 128 filter elements can be configured for 11-bit standard IDs. When accessing a Standard Message ID Filter element, its address is the Filter List Standard Start Address MTTCAN0SIDFC.FLSSA plus the index of the filter element (0 to 127).

Table 37.135 Standard Message ID Filter Element

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
S0	SFT[1:0]		SFEC[2:0]		SFID1[10:0]											res								SFID2[10:0]							

Bits 31:30 SFT[1:0]: Standard Filter Type

00: Range filter from SF1ID to SF2ID (SF2ID ≥ SF1ID)

01: Dual ID filter for SF1ID or SF2ID

10: Classic filter: SF1ID = filter, SF2ID = mask

11: Reserved

Bit 29:27 SFEC[2:0]:Standard Filter Element Configuration

All enabled filter elements are used for acceptance filtering of standard frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If SFEC = “100”, “101”, or “110” a match sets interrupt flag MTTCAN0IR.HPM and, if enabled, an interrupt is generated. In this case register MTTCAN0HPMS is updated with the status of the priority match.

000: Disable filter element

001: Store in Rx FIFO 0 if filter matches

010: Store in Rx FIFO 1 if filter matches

011: Reject ID if filter matches

100: Set priority if filter matches

101: Set priority and store in FIFO 0 if filter matches

110: Set priority and store in FIFO 1 if filter matches

111: Store into Rx Buffer or as debug message, configuration of SFT[1:0] ignored

Bits 26:16 SFID1[10:0]:Standard Filter ID 1

First ID of standard ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of a standard message to be stored. The received identifiers must match exactly, no masking mechanism is used.

Bits 10:0 SFID2[10:0]:Standard Filter ID 2

This bit field has a different meaning depending on the configuration of SFEC:

1) SFEC = “001” to ”110” Second ID of standard ID filter element

2) SFEC = “111” Filter for Rx Buffers or for debug messages

SFID2[10:9]: These bits decide whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.
00: Store message into an Rx Buffer
01: Debug Message A
10: Debug Message B
11: Debug Message C

SFID2[8:6]: These bits are used to control the filter event pins m_ttcan_fe[2:0] at the Extension Interface. A one at the respective bit position enables generation of a pulse at the related filter event pin with the duration of one m_ttcan_hclk (CLK_HSB) period in case the filter matches.

SFID2[5:0]: These bits define the offset to the Rx Buffer Start Address MTTCAN0RXBC.RBSA for storage of a matching message.

(6) Extended Message ID Filter Element

Up to 64 filter elements can be configured for 29-bit extended IDs. When accessing an Extended Message ID Filter element, its address is the Filter List Extended Start Address MTTCAN0XIDFC.FLESA plus two times the index of the filter element (0 to 63).

Table 37.136 Extended Message ID Filter Element

	31	24	23	16	15	8	7	0
F0	EFEC[2:0]		EFID1[28:0]					
F1	EFT[1:0]	res	EFID2[28:0]					

F0 Bit 31:29 EFEC[2:0]:Extended Filter Element Configuration

All enabled filter elements are used for acceptance filtering of extended frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If EFEC = “100”, “101”, or “110” a match sets interrupt flag MCANnIR.HPM and, if enabled, an interrupt is generated. In this case register MCANnHPMS is updated with the status of the priority match.

000: Disable filter element

001: Store in Rx FIFO 0 if filter matches

010: Store in Rx FIFO 1 if filter matches

011: Reject ID if filter matches

100: Set priority if filter matches

101: Set priority and store in FIFO 0 if filter matches

110: Set priority and store in FIFO 1 if filter matches

111: Store into Rx Buffer or as debug message, configuration of EFT[1:0] ignored

F0 Bits 28:0 EFID1[28:0]:Extended Filter ID 1

First ID of extended ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of an extended message to be stored. The received identifiers must match exactly, only MTTCAN0XIDAM masking mechanism (see **Section (e), Extended Message ID Filtering**) is used.

F1 Bits 31:30 EFT[1:0]: Extended Filter Type

00: Range filter from EF1ID to EF2ID (EF2ID ≥ EF1ID)

01: Dual ID filter for EF1ID or EF2ID

10: Classic filter: EF1ID = filter, EF2ID = mask

11: Range filter from EF1ID to EF2ID (EF2ID ≥ EF1ID), MTTCAN0XIDAM mask not applied

F1 Bits 28:0 EFID2[28:0]:Extended Filter ID 2

This bit field has a different meaning depending on the configuration of EFEC:

1) EFEC: “001” to ”110”Second ID of extended ID filter element

2) EFEC: “111”Filter for Rx Buffers or for debug messages

EFID2[10:9]: These bits decide whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.
00: Store message into an Rx Buffer
01: Debug Message A
10: Debug Message B
11: Debug Message C

EFID2[8:6]: These bits are used to control the filter event pins m_ttcan_fe[2:0] at the Extension Interface. A one at the respective bit position enables generation of a pulse at the related filter event pin with the duration of one m_ttcan_hclk (CLK_HSB) period in case the filter matches.

EFID2[5:0]: These bits define the offset to the Rx Buffer Start Address MCANnRXBC.RBSA for storage of a matching message.

(7) Trigger Memory Element

Up to 64 trigger memory elements can be configured. When accessing a Trigger Memory element, its address is the Trigger Memory Start Address MTTCAN0TTTMC.TMSA plus the index of the trigger memory element (0 to 63).

Table 37.137 Trigger Memory Element

	31 24	23 16	15 8	7 0
T0	TM[15:0]		res CC[6:0]	ASC[1:0] TMIN TMEX TYPE[3:0]
T1	res	FTYPE MNR[6:0]	res	MSC[2:0]

T0 Bit 31:16 TM[15:0]:Time Mark

Cycle time for which the trigger becomes active.

T0 Bit 14:8 CC[6:0]:Cycle Code

Cycle count for which the trigger is valid. Ignored for trigger types Tx_Ref_Trigger, Tx_Ref_Trigger_Gap, Watch_Trigger, Watch_Trigger_Gap, End_of_List.

$000000x_B$ valid for all cycles

$000001c_B$ valid every 2nd cycle at cycle count mod2 = c

$00001cc_B$ valid every 4th cycle at cycle count mod4 = cc

$0001ccc_B$ valid every 8th cycle at cycle count mod8 = ccc

$001cccc_B$ valid every 16th cycle at cycle count mod16 = cccc

$01ccccc_B$ valid every 32nd cycle at cycle count mod32 = ccccc

$1cccccc_B$ valid every 64th cycle at cycle count mod64 = cccccc

T0 Bit 7:6 ASC[1:0]:Asynchronous Serial Communication

00: No ASC operation

01: Reserved, do not use

10: Node is ASC receiver

11: Node is ASC transmitter

T0 Bit 5 TMIN:Time Mark Event Internal

0: No action

1: MTTCAN0TTIR.TTMI is set when trigger memory element becomes active

T0 Bit 4 TMEX:Time Mark Event External

0: No action

1: Pulse at output m_ttcan_tmp (MTTCAN0TMP) with the length of one m_ttcan_cclk (CLKP_H2) period is generated when the time mark of the trigger memory element becomes active and MTTCAN0TTOCN.TTMIE = ‘1’

T0 Bit 3:0 TYPE[3:0]:Trigger Type

0000	Tx_Ref_Trigger - valid when not in Gap
0001	Tx_Ref_Trigger_Gap - valid when in Gap
0010	Tx_Trigger_Single - starts a single transmission in an exclusive time window
0011	Tx_Trigger_Continuous - starts continuous transmission in an exclusive time window
0100	Tx_Trigger_Arbitration - starts a transmission in an arbitrating time window
0101	Tx_Trigger_Merged - starts a merged arbitration window
0110	Watch_Trigger - valid when not in Gap
0111	Watch_Trigger_Gap - valid when in Gap
1000	Rx_Trigger - check for reception
1001	Time_Base_Trigger - only control TMIN, TMEX, and ASC
1010 to 1111	End_of_List - illegal type, causes config error

NOTE

For ASC operation (ASC = “10”, “11”) only trigger types Rx_Trigger and Time_Base_Trigger should be used.

T1 Bit 23 FTYPE:Filter Type

0= 11-bit standard message ID
1= 29-bit extended message ID

T1 Bit 22:16 FTYPE:Filter Type

Transmission: Trigger is valid for configured Tx Buffer number. Valid values are 0 to 31.
Reception: Trigger is valid for standard / extended message ID filter element number. Valid values are 0 to 63 resp. 0 to 127.

T1 Bits 2:0 MSC[2:0]:

Message Status Count

Counts scheduling errors for periodic messages in exclusive time windows. It has no function for arbitrating messages and in event-driven CAN communication (ISO11898-1).

0-7: Actual status

NOTES

1. The trigger memory elements have to be written when the M_TTCAN is in INIT state. Write access to the trigger memory elements outside INIT state is not allowed.
2. There is an exception for TMIN and TMEX when they are defined as part of a trigger memory element of TYPE Tx_Ref_Trigger. In this case they become active at the time mark modified by the actual Reference Trigger Offset (MTTCAN0TTOST.RTO).

37.6.3 Functional Description

37.6.3.1 Operating Modes

(1) Software Initialization

Software initialization is started by setting bit MTTCAN0CCCR.INIT, either by software or by a hardware reset, when an uncorrected bit error was detected in the Message RAM, or by going Bus_Off. While MTTCAN0CCCR.INIT is set, message transfer from and to the CAN bus is stopped, the status of the CAN bus output m_ttcan_tx is recessive (HIGH). The counters of the Error Management Logic EML are unchanged. Setting MTTCAN0CCCR.INIT does not change any configuration register. Resetting MTTCAN0CCCR.INIT finishes the software initialization. Afterwards the Bit Stream Processor BSP synchronizes itself to the data transfer on the CAN bus by waiting for the occurrence of a sequence of 11 consecutive recessive bits (≡ Bus_Idle) before it can take part in bus activities and start the message transfer.

Access to the M_TTCAN configuration registers is only enabled when both bits MTTCAN0CCCR.INIT and MTTCAN0CCCR.CCE are set (protected write).

MTTCAN0CCCR.CCE can only be set/reset while MTTCAN0CCCR.INIT = ‘1’. MTTCAN0CCCR.CCE is automatically reset when MTTCAN0CCCR.INIT is reset.

The following registers are reset when MTTCAN0CCCR.CCE is set

- MTTCAN0HPMS - High Priority Message Status
- MTTCAN0RXF0S - Rx FIFO 0 Status
- MTTCAN0RXF1S - Rx FIFO 1 Status
- MTTCAN0TXFQS - Tx FIFO/Queue Status
- MTTCAN0TXBRP - Tx Buffer Request Pending
- MTTCAN0TXBTO - Tx Buffer Transmission Occurred
- MTTCAN0TXBCF - Tx Buffer Cancellation Finished
- MTTCAN0TXEFS - Tx Event FIFO Status
- MTTCAN0TTOST - TT Operation Status
- MTTCAN0TTLGT - TT Local & Global Time, only Global Time MTTCAN0TTLGT.GT is reset
- MTTCAN0TTCTC - TT Cycle Time & Count
- MTTCAN0TTCSM - TT Cycle Sync Mark

The Timeout Counter value MTTCAN0TOCV.TOC is preset to the value configured by MTTCAN0TOCC.TOP when MTTCAN0CCCR.CCE is set.

In addition the state machines of the Tx Handler and Rx Handler are held in idle state while MTTCAN0CCCR.CCE = ‘1’.

The following registers are only writable while MTTCAN0CCCR.CCE = ‘0’

- MTTCAN0TXBAR - Tx Buffer Add Request
- MTTCAN0TXBCR - Tx Buffer Cancellation Request

MTTCAN0CCCR.TEST and MTTCAN0CCCR.MON can only be set by the Host while MTTCAN0CCCR.INIT = ‘1’ and MTTCAN0CCCR.CCE = ‘1’. Both bits may be reset at any time. MTTCAN0CCCR.DAR can only be set/reset while MTTCAN0CCCR.INIT = ‘1’ and MTTCAN0CCCR.CCE = ‘1’.

(2) Normal Operation

The M_TTCAN's default operating mode after hardware reset is event-driven CAN communication without time triggers (MTTCAN0TTOCF.OM = "00"). It is required that both MTTCAN0CCCR.INIT and MTTCAN0CCCR.CCE are set before the TT Operation Mode can be changed.

Once the M_TTCAN is initialized and MTTCAN0CCCR.INIT is reset to zero, the M_TTCAN synchronizes itself to the CAN bus and is ready for communication.

After passing the acceptance filtering, received messages including Message ID and DLC are stored into a dedicated Rx Buffer or into Rx FIFO 0 or Rx FIFO 1.

For messages to be transmitted dedicated Tx Buffers and/or a Tx FIFO or a Tx Queue can be initialized or updated. Automated transmission on reception of remote frames is not implemented.

(3) CAN FD Operation

There are two variants in the CAN FD frame format, first the CAN FD frame without bit rate switching where the data field of a CAN frame may be longer than 8 bytes. The second variant is the CAN FD frame where control field, data field, and CRC field of a CAN frame are transmitted with a higher bit rate than the beginning and the end of the frame.

The CAN operation mode is enabled by programming MTTCAN0CCCR.CME. In case MTTCAN0CCCR.CME = "01" transmission of long CAN FD frames and reception of long and fast CAN FD frames is enabled. With MTTCAN0CCCR.CME = "10"/"11" transmission and reception of long and fast CAN FD frames is enabled. MTTCAN0CCCR.CME can only be changed while MTTCAN0CCCR.INIT and MTTCAN0CCCR.CCE are both set.

When initialization is left (MTTCAN0CCCR.INIT set to '0'), the CAN FD protocol option is inactive, it has to be requested by writing to MTTCAN0CCCR.CMR.

A mode change requested by writing to MTTCAN0CCCR.CMR will be executed next time the CAN protocol controller FSM reaches idle phase between CAN frames. Upon this event MTTCAN0CCCR.CMR is reset to "00" and the status flags MTTCAN0CCCR.FDBS and MTTCAN0CCCR.FDO are set accordingly. In case the requested CAN operation mode is not enabled, the value written to MTTCAN0CCCR.CMR is retained until it is overwritten by the next mode change request. Default is CAN operation according to ISO11898-1.

It is not necessary to change the CAN operation mode after system startup. A mode change during CAN operation is only recommended under the following conditions:

- The failure rate in the CAN FD data phase is significant higher than in the CAN FD arbitration phase. In this case disable the CAN FD bit rate switching option for transmissions.
- During system startup all nodes are transmitting according to ISO11898-1 until it is verified that they are able to communicate in CAN FD format. If this is true, all nodes switch to CAN FD operation.
- End-of-line programming in case not all nodes are CAN FD capable. Non CAN FD nodes are held in silent mode until programming has completed. Then all nodes switch back to CAN communication according ISO11898-1.

When MTTCAN0CCCR.CME ≠ "00", received CAN FD frames are interpreted according to the CAN FD Protocol Specification. The reserved bit in CAN frames with 11-bit identifiers and the first reserved bit in CAN frames with 29-bit identifiers will be decoded as EDL bit. EDL = recessive signifies a CAN FD frame, EDL = dominant signifies a standard CAN frame. In a CAN FD frame, the two bits following EDL, r0 and BRS, decide whether the bit rate inside of this CAN FD frame is

switched. A CAN FD bit rate switch is signified by r0 = dominant and BRS = recessive. The coding of r0 = recessive is reserved for future expansion of the protocol.

Reception of CAN frames according to ISO 11898-1 is possible in all CAN operation modes.

The status bits MTTCAN0CCCR.FDO and MTTCAN0CCCR.FDBS indicate the format of transmitted frames. When MTTCAN0CCCR.FDO is set, frames will be transmitted in CAN FD format with EDL = recessive. When both MTTCAN0CCCR.FDO and MTTCAN0CCCR.FDBS are set, frames will be transmitted in CAN FD format with bit rate switching and both bits EDL and BRS = recessive.

In the CAN FD format, the coding of the DLC differs from the standard CAN format. The DLC codes 0 to 8 have the same coding as in standard CAN, the codes 9 to 15, which in standard CAN all code a data field of 8 bytes, are coded according to **Table 37.138** below.

Table 37.138 Coding of DLC in CAN FD

DLC	9	10	11	12	13	14	15
Number of Data Bytes	12	16	20	24	32	48	64

In CAN FD frames, the bit timing will be switched inside the frame, after the BRS (Bit Rate Switch) bit, if this bit is recessive. Before the BRS bit, in the CAN FD arbitration phase, the standard CAN bit timing is used as defined by the Bit Timing & Prescaler Register MTTCAN0BTP. In the following CAN FD data phase, the fast CAN bit timing is used as defined by the Fast Bit Timing & Prescaler Register MTTCAN0FBTP. The bit timing is switched back from the fast timing at the CRC delimiter or when an error is detected, whichever occurs first.

The maximum configurable bit rate in the CAN FD data phase depends on the CAN clock frequency (m_ttcan_cclk: CLKP_H2). Example: with a CAN clock frequency of 20MHz and the shortest configurable bit time of 4 tq, the bit rate in the data phase is 5 Mbit/s.

In both data frame formats, CAN FD long and CAN FD fast, the value of the bit ESI (Error Status Indicator) is determined by the transmitter's error state at the start of the transmission. If the transmitter is error passive, ESI is transmitted recessive, else it is transmitted dominant.

(4) Transmitter Delay Compensation

During the data phase of a CAN FD transmission only one node is transmitting, all others are receivers. The length of the bus line has no impact. When transmitting via pin m_ttcan_tx the protocol controller receives the transmitted data from its local CAN transceiver via pin m_ttcan_rx. The received data is delayed by the CAN transceiver's loop delay. In case this delay is greater than TSEG1 (time segment before sample point), a bit error is detected. In order to enable a data phase bit time that is even shorter than the transceiver loop delay, the delay compensation is introduced. Without transmitter delay compensation, the bit rate in the data phase of a CAN FD frame is limited by the transceivers loop delay.

(a) Description

The CAN FD protocol unit has implemented a delay compensation mechanism to compensate the CAN transceiver's loop delay, thereby enabling transmission with higher bit rates during the CAN FD data phase independent of the delay of a specific CAN transceiver. **Figure 37.16** below describes how the transceiver loop delay is measured.

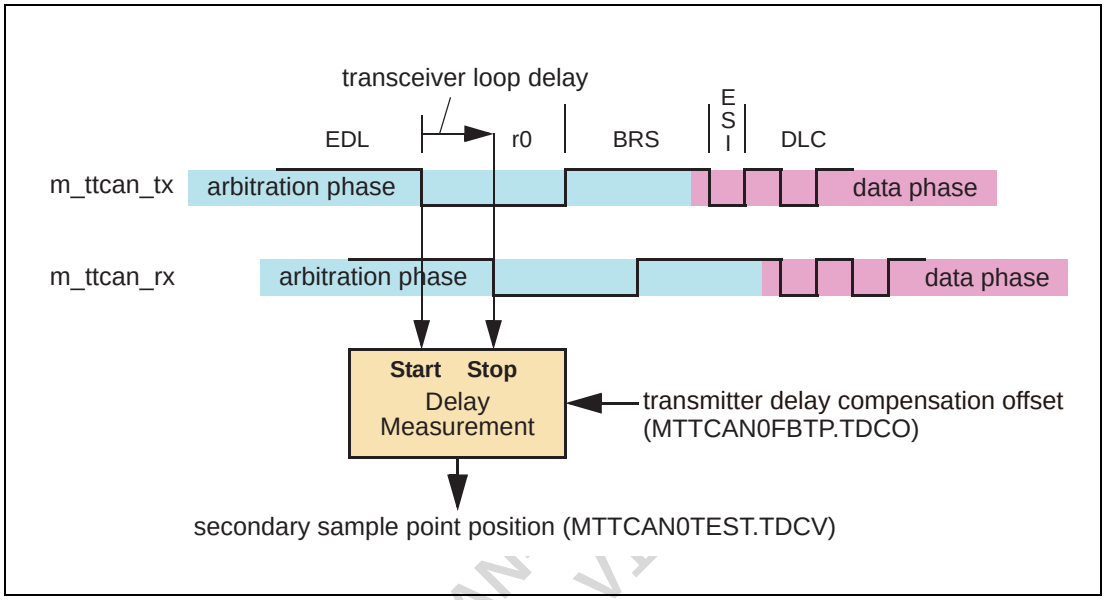

Figure 37.16 Transmitter delay measurement

Within each CAN FD frame, the transmitter measures the delay between the data transmitted at pin m_ttcan_tx and the data received at pin m_ttcan_rx. The measurement is done once, at the falling edge of bit EDL to bit r0. The delay is measured in m_ttcan_cclk (CLKP_H2) periods.

A secondary sample point position is calculated by adding a configurable transmitter delay compensation offset MTTCAN0FBTP.TDCO to the measured transceiver delay. This transmitter delay compensation value MTTCAN0TEST.TDCV is the sum of the measured transceiver delay and the transmitter delay compensation offset. The transmitter delay compensation offset is chosen to adjust the secondary sample point inside the bit time (e.g. half of the bit time in the data phase). The position of the secondary sample point is rounded down to the next integer number of time quanta t_q.

To check for bit errors during the data phase, the delayed transmit data is compared against the received data at the secondary sample point. If a bit error is detected at the secondary sample point, the transmitter will react to this bit error at the next following regular sample point. During arbitration phase the delay compensation is always disabled.

For the transmitter delay compensation the following boundary conditions have to be considered:

- The sum of the measured delay from m_ttcan_tx to m_ttcan_rx and the configured transmitter delay compensation offset MTTCAN0FBTP.TDCO has to be less than 3 bit times in the data phase.
- The sum of the measured delay from m_ttcan_tx to m_ttcan_rx and the configured transmitter delay compensation offset MTTCAN0FBTP.TDCO has to be less or equal 63 m_ttcan_cclk (CLKP_H2) periods. In case this sum exceeds 63 m_ttcan_cclk (CLKP_H2) periods, the maximum value of 63 m_ttcan_cclk (CLKP_H2) periods is used for transmitter delay compensation.

The actual delay compensation value is monitored by reading MTTCAN0TEST.TDCV.

(b) Configuration and Status

Compensation for the transceiver loop delay by the M_TTCAN is enabled via MTTCAN0FBTP.TDC. The transmitter delay compensation offset is configured via MTTCAN0FBTP.TDCO. The actual delay compensation value applied by the M_TTCAN's protocol engine can be read from MTTCAN0TEST.TDCV.

(5) Restricted Operation Mode

In Restricted Operation Mode the node is able to receive data and remote frames and to give acknowledge to valid frames, but it does not send data frames, remote frames, active error frames, or overload frames. In case of an error condition or overload condition, it does not send dominant bits, instead it waits for the occurrence of bus idle condition to resynchronize itself to the CAN communication. The error counters are not incremented. The Host can set the M_TTCAN into Restricted Operation mode by setting bit MTTCAN0CCCR.ASM. The bit can only be set by the Host when both MTTCAN0CCCR.CCE and MTTCAN0CCCR.INIT are set to '1'. The bit can be reset by the Host at any time.

Restricted Operation Mode is automatically entered when the Tx Handler was not able to read data from the Message RAM in time. To leave Restricted Operation Mode, the Host CPU has to reset MTTCAN0CCCR.ASM.

The Restricted Operation Mode can be used in applications that adapt themselves to different CAN bit rates. In this case the application tests different bit rates and leaves the Restricted Operation Mode after it has received a valid frame.

When the M_TTCAN is configured for Asynchronous Serial Communication, the Host has to set MTTCAN0CCCR.ASM during initialization to start with an ASC window. The bit is reset at the end of the first ASC window after the M_TTCAN has finished initializing. During time-triggered operation MTTCAN0CCCR.ASM is set by the M_TTCAN at the beginning of an ASC window (trigger memory element with T0.ASC = "10", "11"). It is reset by each trigger memory element with T0.ASC = "00".

If the M_TTCAN is connected to a Clock Calibration on CAN unit, MTTCAN0CCCR.ASM is controlled by input m_ttcan_cok. In case m_ttcan_cok switches to '0', bit MTTCAN0CCCR.ASM is set. When m_ttcan_cok switches back to '1', bit MTTCAN0CCCR.ASM returns to the previously written value. The state of MTTCAN0CCCR.ASM is the written value while input m_ttcan_cok is at '1'. The input is hardwired to '1' when there is no Clock Calibration on CAN unit connected.

(6) Bus Monitoring Mode

The M_TTCAN is set in Bus Monitoring Mode by programming MTTCAN0CCCR.MON to one or when error level S3 (MTTCAN0TTOST.EL = “11”) is entered. In Bus Monitoring Mode (see ISO11898-1, 10.12 Bus monitoring), the M_TTCAN is able to receive valid data frames and valid remote frames, but cannot start a transmission. In this mode, it sends only recessive bits on the CAN bus, if the M_TTCAN is required to send a dominant bit (ACK bit, overload flag, active error flag), the bit is rerouted internally so that the M_TTCAN monitors this dominant bit, although the CAN bus may remain in recessive state. In Bus Monitoring Mode register MTTCAN0TXBRP is held in reset state.

The Bus Monitoring Mode can be used to analyze the traffic on a CAN bus without affecting it by the transmission of dominant bits. **Figure 37.17** shows the connection of signals m_ttcan_tx and m_ttcan_rx to the M_TTCAN in Bus Monitoring Mode.

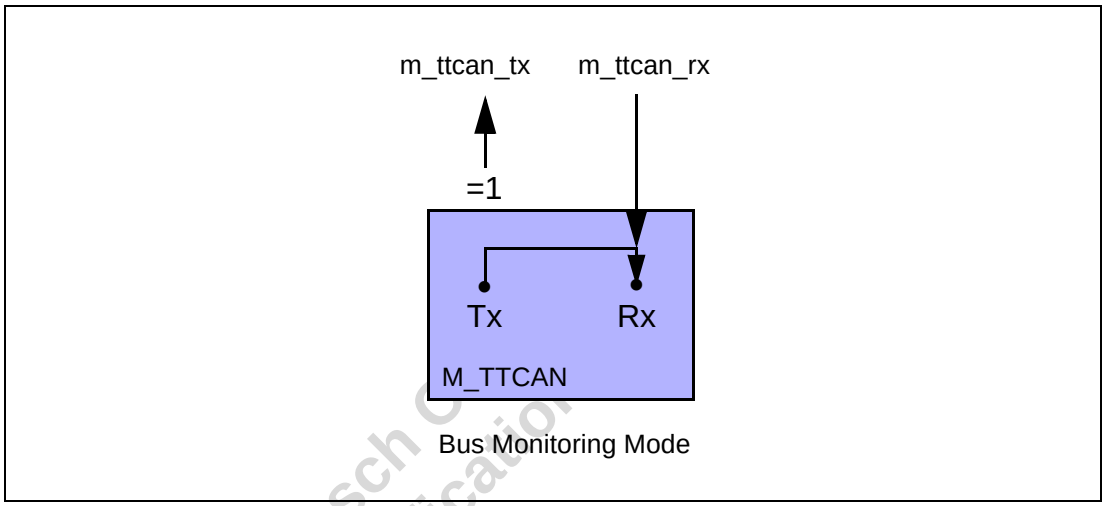

Figure 37.17 Pin Control in Bus Monitoring Mode

(7) Disabled Automatic Retransmission

According to the CAN Specification (see ISO11898-1, 6.3.3 Recovery Management), the M_TTCAN provides means for automatic retransmission of frames that have lost arbitration or that have been disturbed by errors during transmission. By default automatic retransmission is enabled. To support time-triggered communication as described in ISO 11898-1, chapter 9.2, the automatic retransmission may be disabled via MTTCAN0CCCR.DAR.

(a) Frame Transmission in DAR Mode

In DAR mode all transmissions are automatically cancelled after they started on the CAN bus. A Tx Buffer’s Tx Request Pending bit MTTCAN0TXBRP.TRPx is reset after successful transmission, when a transmission has not yet been started at the point of cancellation, has been aborted due to lost arbitration, or when an error occurred during frame transmission.

- Successful transmission:
  Corresponding Tx Buffer Transmission Occurred bit MTTCAN0TXBTO.TOx set
  Corresponding Tx Buffer Cancellation Finished bit MTTCAN0TXBCF.CFx not set
- Successful transmission in spite of cancellation:
  Corresponding Tx Buffer Transmission Occurred bit MTTCAN0TXBTO.TOx set
  Corresponding Tx Buffer Cancellation Finished bit MTTCAN0TXBCF.CFx set
- Arbitration lost or frame transmission disturbed:
  Corresponding Tx Buffer Transmission Occurred bit MTTCAN0TXBTO.TOx not set

Corresponding Tx Buffer Cancellation Finished bit MTTCAN0TXBCF.CFx set

In case of a successful frame transmission, and if storage of Tx events is enabled, a Tx Event FIFO element is written with Event Type ET = “10” (transmission in spite of cancellation).

(8) Power Down (Sleep Mode)

The M_TTCAN can be set into power down mode by using CC Control Register MTTCAN0CCCR.CSR. When all pending transmission requests have completed, the M_TTCAN waits until bus idle state is detected. Then the M_TTCAN sets then MTTCAN0CCCR.INIT to one to prevent any further CAN transfers. Now the M_TTCAN acknowledges that it is ready for power down by MTTCAN0CCCR.CSA to one. In this state, before the clocks are switched off, further register accesses can be made. A write access to MTTCAN0CCCR.INIT will have no effect. Now the module clock inputs m_ttcan_hclk (CLK_HSB) and m_ttcan_cclk (CLKP_H2) may be switched off.

To leave power down mode, the application has to turn on the module clocks before resetting CC Control Register flag MTTCAN0CCCR.CSR. The M_TTCAN will acknowledge this by resetting MTTCAN0CCCR.CSA. Afterwards, the application can restart CAN communication by resetting bit MTTCAN0CCCR.INIT.

(9) Test Modes

To enable write access to register MTTCAN0TEST (see **(4) MCANnTEST — Test Register**), bit MTTCAN0CCCR.TEST has to be set to one. This allows the configuration of the test modes and test functions.

Four output functions are available for the CAN transmit pin m_ttcan_tx by programming MTTCAN0TEST.TX. Additionally to its default function – the serial data output – it can drive the CAN Sample Point signal to monitor the M_TTCAN’s bit timing and it can drive constant dominant or recessive values. The actual value at pin m_ttcan_rx can be read from MTTCAN0TEST.RX. Both functions can be used to check the CAN bus’ physical layer.

Due to the synchronization mechanism between CAN clock and Host clock domain, there may be a delay of several Host clock periods between writing to MTTCAN0TEST.TX until the new configuration is visible at output pin m_ttcan_tx. This applies also when reading input pin m_ttcan_rx via MTTCAN0TEST.RX.

NOTE

Test modes should be used for production tests or self test only. The software control for pin m_ttcan_tx interferes with all CAN protocol functions. It is not recommended to use test modes for application.

(a) External Loop Back Mode

The M_TTCAN can be set in External Loop Back Mode by programming MTTCAN0TEST.LBCK to one. In Loop Back Mode, the M_TTCAN treats its own transmitted messages as received messages and stores them (if they pass acceptance filtering) into an Rx Buffer or an Rx FIFO. **Figure 37.18** shows the connection of signals m_ttcan_tx and m_ttcan_rx to the M_TTCAN in External Loop Back Mode.

This mode is provided for hardware self-test. To be independent from external stimulation, the M_TTCAN ignores acknowledge errors (recessive bit sampled in the acknowledge slot of a data/remote frame) in Loop Back Mode. In this mode the M_TTCAN performs an internal feedback from its Tx output to its Rx input. The actual value of the m_ttcan_rx input pin is disregarded by the M_TTCAN. The transmitted messages can be monitored at the m_ttcan_tx pin.

(b) Internal Loop Back Mode

Internal Loop Back Mode is entered by programming bits MTTCAN0TEST.LBCK and MTTCAN0CCCR.MON to one. This mode can be used for a “Hot Selftest”, meaning the M_TTCAN can be tested without affecting a running CAN system connected to the pins m_ttcan_tx and m_ttcan_rx. In this mode pin m_ttcan_rx is disconnected from the M_TTCAN and pin m_ttcan_tx is held recessive. **Figure 37.18** shows the connection of m_ttcan_tx and m_ttcan_rx to the M_TTCAN in case of Internal Loop Back Mode.

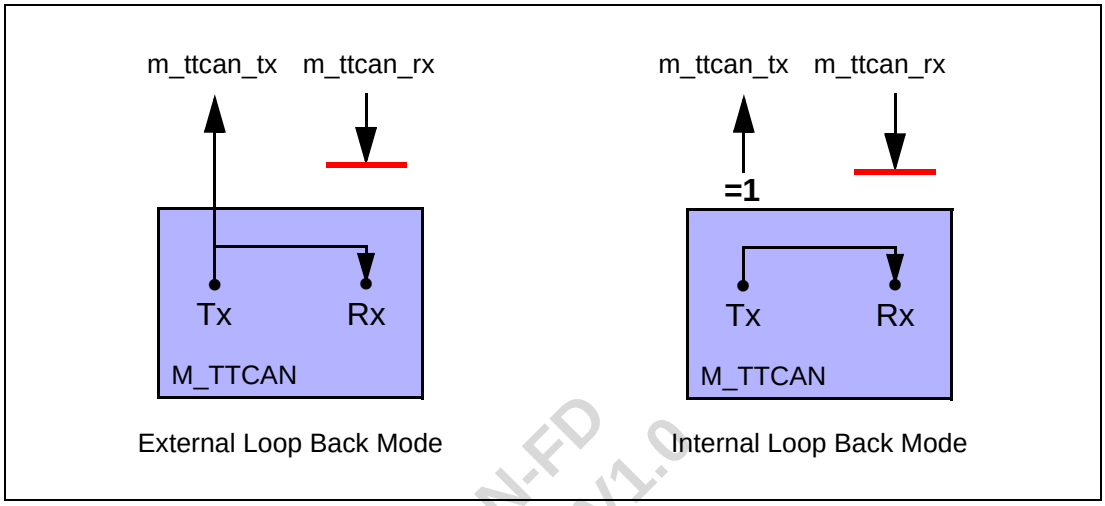

Figure 37.18 Pin Control in Loop Back Modes

(10) Application Watchdog

The application watchdog is served by reading register MTTCAN0TTOST. When the application watchdog is not served in time, bit MTTCAN0TTOST.AWE is set, all TTCAN communication is stopped, and the M_TTCAN is set into Bus Monitoring Mode.

The TT Application Watchdog can be disabled by programming the Application Watchdog Limit MTTCAN0TTOCF.AWL to 00_H. The TT Application Watchdog should not be disabled in a TTCAN application program.

37.6.3.2 Timestamp Generation

For timestamp generation the M_TTCAN supplies a 16-bit wrap-around counter. A prescaler MTTCAN0TSCC.TCP can be configured to clock the counter in multiples of CAN bit times (1 to 16). The counter is readable via MTTCAN0TSCV.TCV. A write access to register MTTCAN0TSCV resets the counter to zero. When the timestamp counter wraps around interrupt flag MTTCAN0IR.TSW is set.

On start of frame reception / transmission the counter value is captured and stored into the timestamp section of an Rx Buffer / Rx FIFO (RXTS[15:0]) or Tx Event FIFO (TXTS[15:0]) element.

By programming bit MTTCAN0TSCC.TSS an external 16-bit timestamp can be used.

37.6.3.3 Timeout Counter

To signal timeout conditions for Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO the M_TTCAN supplies a 16-bit Timeout Counter. It operates as down-counter and uses the same prescaler controlled by MTTCAN0TSCC.TCP as the Timestamp Counter. The Timeout Counter is configured via register MTTCAN0TOCC. The actual counter value can be read from MTTCAN0TOCV.TOC.

The Timeout Counter can only be started while MTTCAN0CCCR.INIT = ‘0’. It is stopped when MTTCAN0CCCR.INIT = ‘1’, e.g. when the M_TTCAN enters Bus_Off state.

The operation mode is selected by MTTCAN0TOCC.TOS. When operating in Continuous Mode, the counter starts when MTTCAN0CCCR.INIT is reset. A write to MTTCAN0TOCV presets the counter to the value configured by MTTCAN0TOCC.TOP and continues down-counting.

When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MTTCAN0TOCC.TOP. Down-counting is started when the first FIFO element is stored. Writing to MTTCAN0TOCV has no effect.

When the counter reaches zero, interrupt flag MTTCAN0IR.TOO is set. In Continuous Mode, the counter is immediately restarted at MTTCAN0TOCC.TOP.

NOTE

The clock signal for the Timeout Counter is derived from the CAN Core’s sample point signal. Therefore the point in time where the Timeout Counter is decremented may vary due to the synchronization / re-synchronization mechanism of the CAN Core. If the baud rate switch feature in CAN FD is used, the timeout counter is clocked differently in arbitration and data field.

37.6.3.4 Rx Handling

The Rx Handler controls the acceptance filtering, the transfer of received messages to the Rx Buffers or to one of the two Rx FIFOs, as well as the Rx FIFO's Put and Get Indices.

(1) Acceptance Filtering

The M_TTCAN offers the possibility to configure two sets of acceptance filters, one for standard identifiers and one for extended identifiers. These filters can be assigned to an Rx Buffer or to Rx FIFO 0,1. For acceptance filtering each list of filters is executed from element #0 until the first matching element. Acceptance filtering stops at the first matching element. The following filter elements are not evaluated for this message.

The main features are:

- Each filter element can be configured as
  - range filter (from - to)
  - filter for one or two dedicated IDs
  - classic bit mask filter
- Each filter element is configurable for acceptance or rejection filtering
- Each filter element can be enabled / disabled individually
- Filters are checked sequentially, execution stops with the first matching filter element

Related configuration registers are:

- Global Filter Configuration MTTCAN0GFC
- Standard ID Filter Configuration MTTCAN0SIDFC
- Extended ID Filter Configuration MTTCAN0XIDFC
- Extended ID AND Mask MTTCAN0XIDAM

Depending on the configuration of the filter element (SFEC/EFEC) a match triggers one of the following actions:

- Store received frame in FIFO 0 or FIFO 1
- Store received frame in Rx Buffer
- Store received frame in Rx Buffer and generate pulse at filter event pin
- Reject received frame
- Set High Priority Message interrupt flag MTTCAN0IR.HPM
- Set High Priority Message interrupt flag MTTCAN0IR.HPM and store received frame in FIFO 0 or FIFO 1

Acceptance filtering is started after the complete identifier has been received. After acceptance filtering has completed, and if a matching Rx Buffer or Rx FIFO has been found, the Message Handler starts writing the received message data in portions of 32 bit to the matching Rx Buffer or Rx FIFO. If the CAN protocol controller has detected an error condition (e.g. CRC error), this message is discarded with the following impact on the affected Rx Buffer or Rx FIFO:

Rx Buffer

New Data flag of matching Rx Buffer is not set, but Rx Buffer (partly) overwritten with received data. For error type see MTTCAN0PSR.LEC respectively MTTCAN0PSR.FLEC.

Rx FIFO

Put index of matching Rx FIFO is not updated, but related Rx FIFO element (partly) overwritten with received data. For error type see MTTCAN0PSR.LEC respectively MTTCAN0PSR.FLEC. In case the matching Rx FIFO is operated in overwrite mode, the boundary conditions described in **(b) Rx FIFO Overwrite Mode** have to be considered.

NOTE

When an accepted message is written to one of the two Rx FIFOs, or into an Rx Buffer, the unmodified received identifier is stored independent of the filter(s) used. The result of the acceptance filter process is strongly depending on the sequence of configured filter elements.

(a) Range Filter

The filter matches for all received frames with Message IDs in the range defined by SF1ID/SF2ID resp. EF1ID/EF2ID.

There are two possibilities when range filtering is used together with extended frames:

EFT: “00”: The Message ID of received frames is ANDed with the Extended ID AND Mask (MTTCAN0XIDAM) before the range filter is applied

EFT: “11”: The Extended ID AND Mask (MTTCAN0XIDAM) is not used for range filtering

(b) Filter for specific IDs

A filter element can be configured to filter for one or two specific Message IDs. To filter for one specific Message ID, the filter element has to be configured with SF1ID = SF2ID resp. EF1ID = EF2ID.

(c) Classic Bit Mask Filter

Classic bit mask filtering is intended to filter groups of Message IDs by masking single bits of a received Message ID. With classic bit mask filtering SF1ID/EF1ID is used as Message ID filter, while SF2ID/EF2ID is used as filter mask.

A zero bit at the filter mask will mask out the corresponding bit position of the configured ID filter, e.g. the value of the received Message ID at that bit position is not relevant for acceptance filtering. Only those bits of the received Message ID where the corresponding mask bits are one are relevant for acceptance filtering.

In case all mask bits are one, a match occurs only when the received Message ID and the Message ID filter are identical. If all mask bits are zero, all Message IDs match.

(d) Standard Message ID Filtering

Figure 37.19 below shows the flow for standard Message ID (11-bit Identifier) filtering. The Standard Message ID Filter element is described in **(5) Standard Message ID Filter Element**.

Controlled by the Global Filter Configuration MTTCAN0GFC and the Standard ID Filter Configuration MTTCAN0SIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

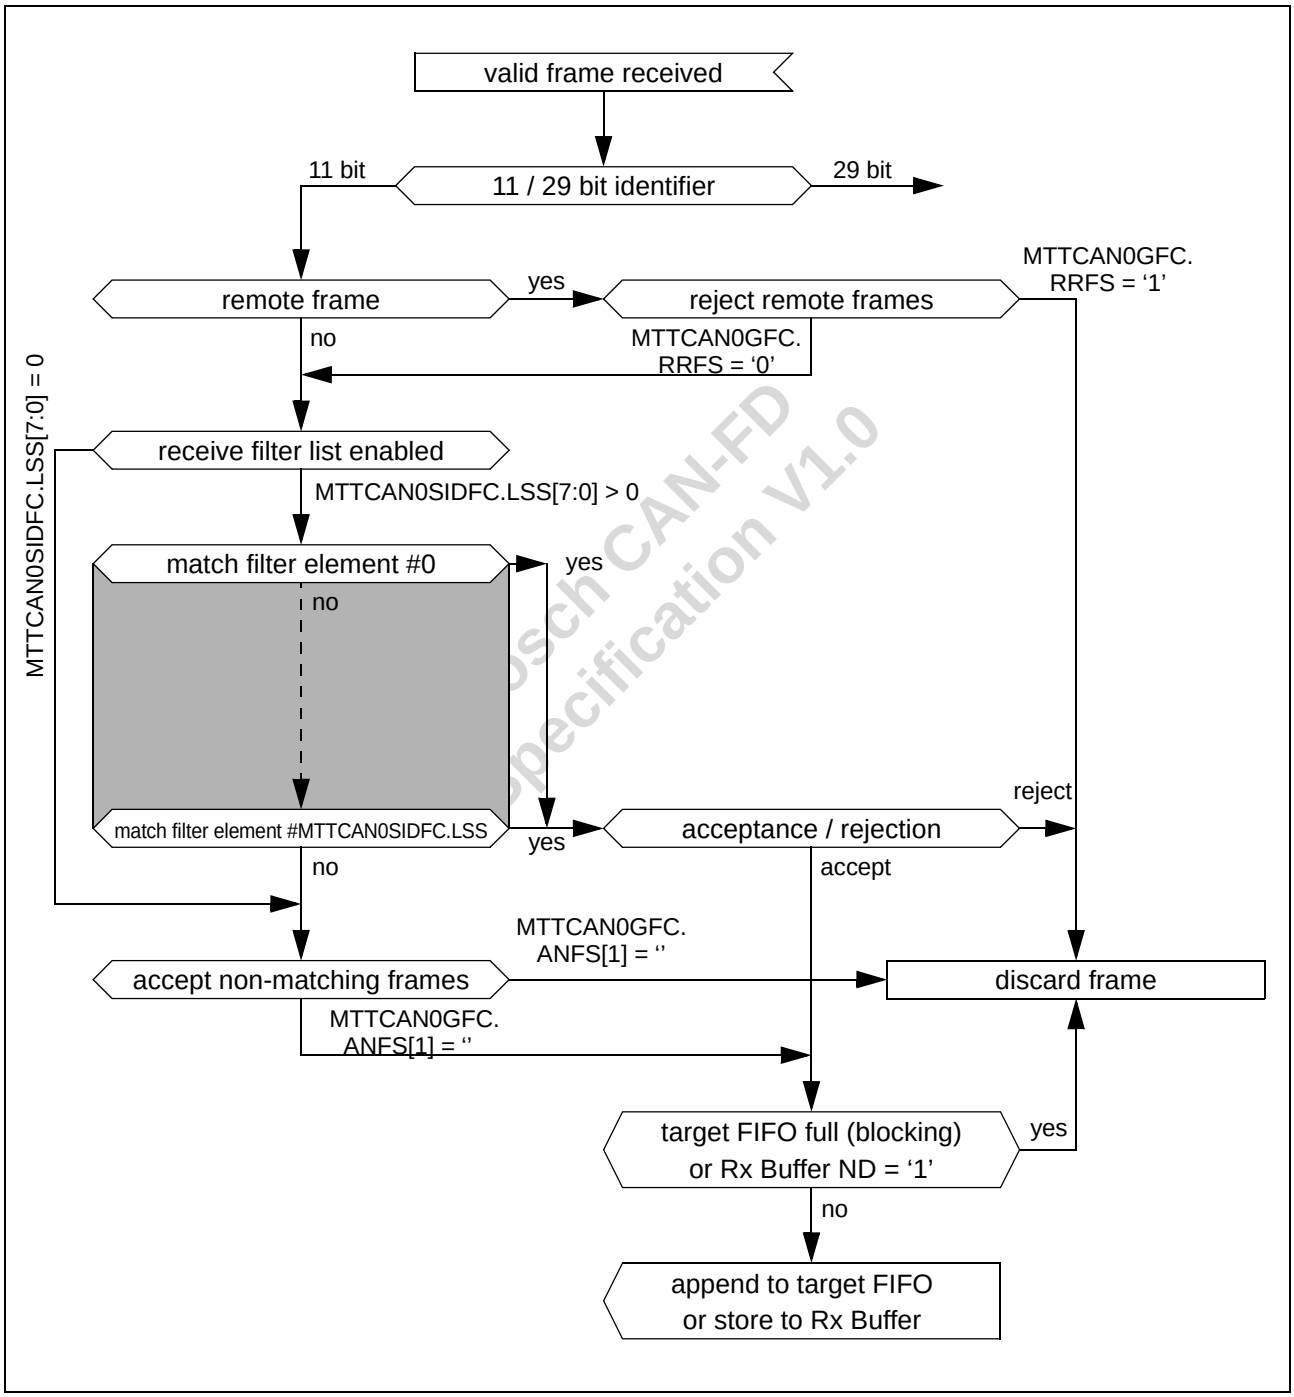

Figure 37.19 Standard Message ID Filter Path

(e) Extended Message ID Filtering

Figure 37.20 below shows the flow for extended Message ID (29-bit Identifier) filtering. The Extended Message ID Filter element is described in **(6) Extended Message ID Filter Element**.

Controlled by the Global Filter Configuration MTTCAN0GFC and the Extended ID Filter Configuration MTTCAN0XIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

The Extended ID AND Mask MTTCAN0XIDAM is ANDed with the received identifier before the filter list is executed.

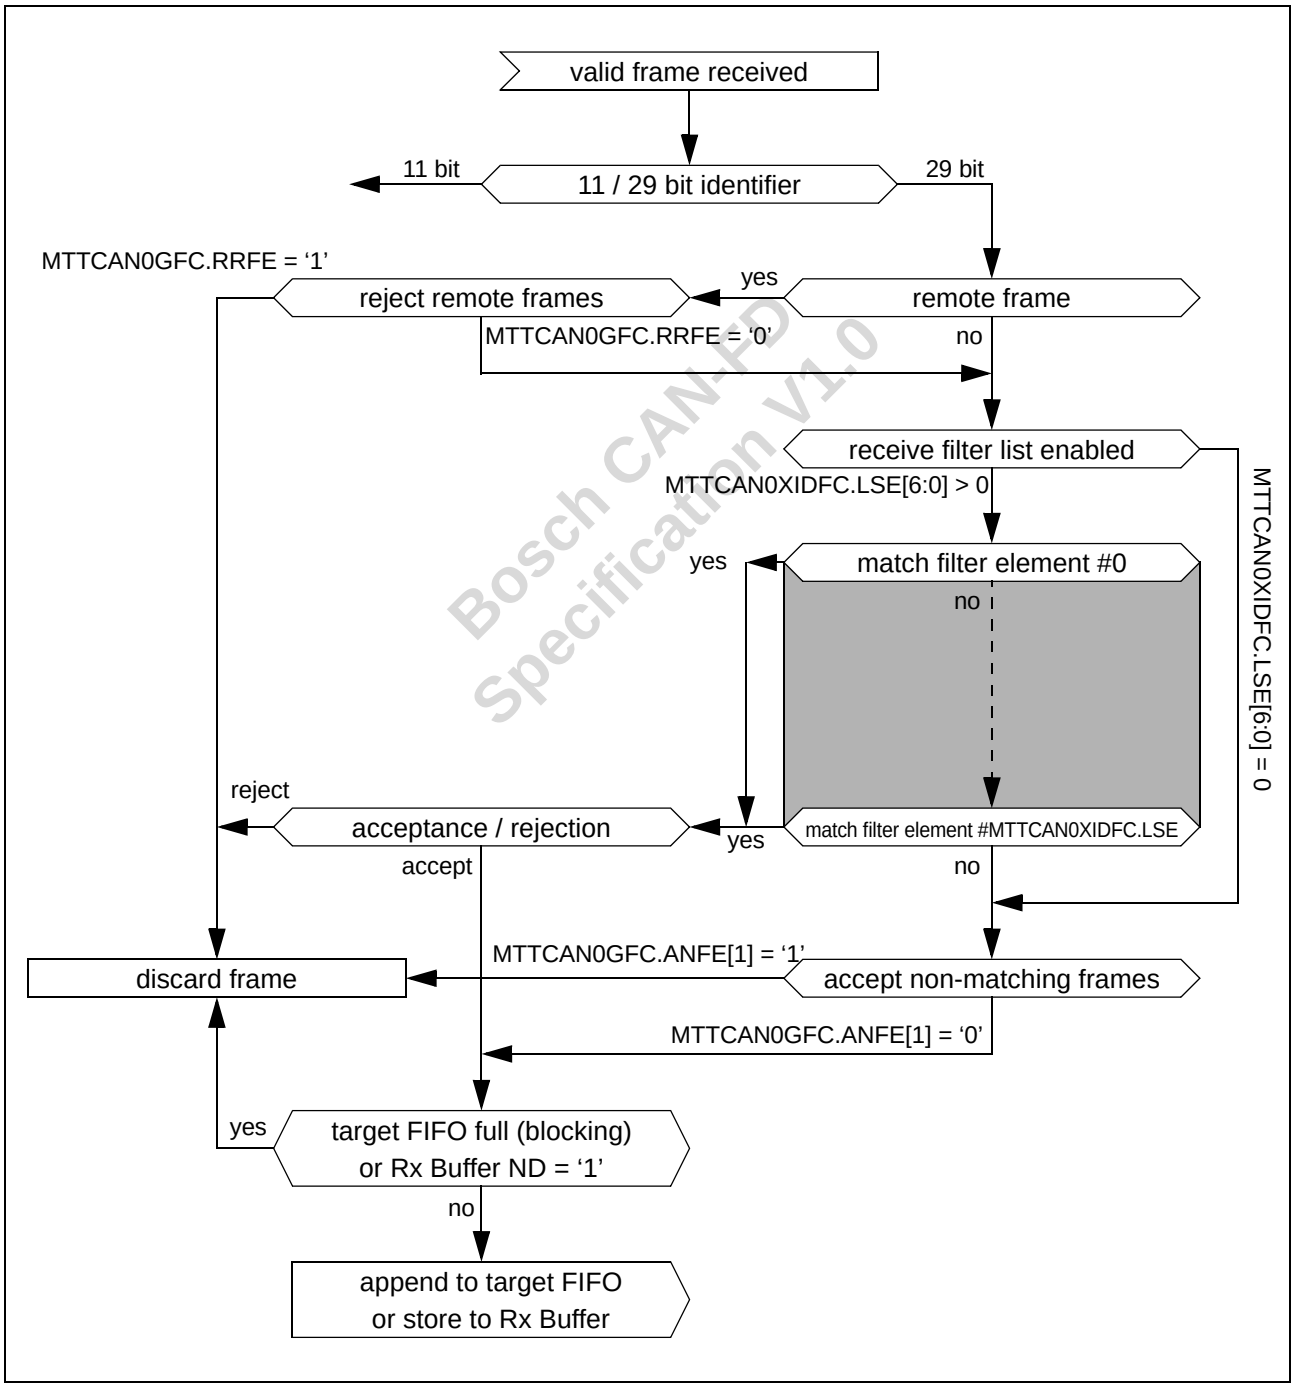

Figure 37.20 Extended Message ID Filter Path

(2) Rx FIFOs

Rx FIFO 0 and Rx FIFO 1 can be configured to hold up to 64 elements each. Configuration of the two Rx FIFOs is done via registers MTTCAN0RXF0C and MTTCAN0RXF1C.

Received messages that passed acceptance filtering are transferred to the Rx FIFO as configured by the matching filter element. For a description of the filter mechanisms available for Rx FIFO 0 and Rx FIFO 1 see **(1) Acceptance Filtering**. The Rx FIFO element is described in **(2) Rx Buffer and FIFO Element**.

To avoid an Rx FIFO overflow, the Rx FIFO watermark can be used. When the Rx FIFO fill level reaches the Rx FIFO watermark configured by RXFnC.FnWM, interrupt flag MTTCAN0IR.RFnW is set. When the Rx FIFO Put Index reaches the Rx FIFO Get Index an Rx FIFO Full condition is signalled by RXFnS.FnF. In addition interrupt flag MTTCAN0IR.RFnF is set.

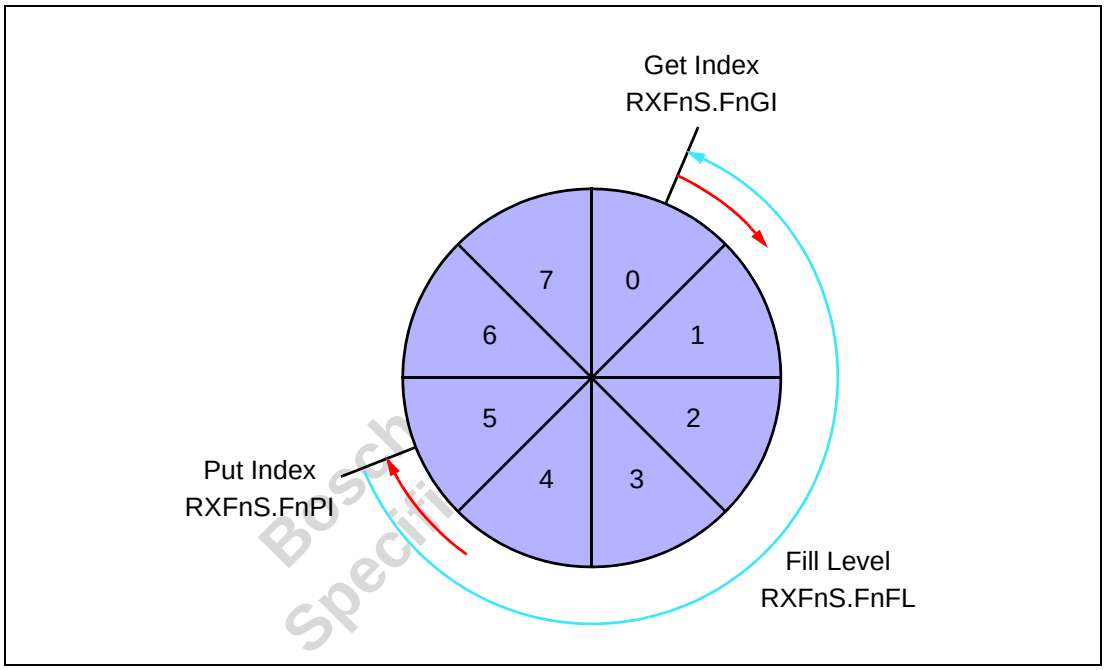

Figure 37.21 Rx FIFO Status

When reading from an Rx FIFO, Rx FIFO Get Index RXFnS.FnGI • FIFO Element Size has to be added to the corresponding Rx FIFO start address RXFnC.FnSA.

Table 37.139 Rx Buffer / FIFO Element Size

MTTCAN0RXESC.RBDS[2:0] MTTCAN0RXESC.FnDS[2:0]	Data Field [bytes]	FIFO Element Size [RAM words]
000	8	4
001	12	5
010	16	6
011	20	7
100	24	8
101	32	10
110	48	14
111	64	18

(a) Rx FIFO Blocking Mode

The Rx FIFO blocking mode is configured by RXFnC.FnOM = '0'. This is the default operation mode for the Rx FIFOs.

When an Rx FIFO full condition is reached (RXFnS.FnPI = RXFnS.FnGI), no further messages are written to the corresponding Rx FIFO until at least one message has been read out and the Rx FIFO Get Index has been incremented. An Rx FIFO full condition is signalled by RXFnS.FnF = '1'. In addition interrupt flag MTTCAN0IR.RFnF is set.

In case a message is received while the corresponding Rx FIFO is full, this message is discarded and the message lost condition is signalled by RXFnS.RFnL = '1'. In addition interrupt flag MTTCAN0IR.RFnL is set.

(b) Rx FIFO Overwrite Mode

The Rx FIFO overwrite mode is configured by RXFnC.FnOM = '1'.

When an Rx FIFO full condition (RXFnS.FnPI = RXFnS.FnGI) is signalled by RXFnS.FnF = '1', the next message accepted for the FIFO will overwrite the oldest FIFO message. Put and get index are both incremented by one.

When an Rx FIFO is operated in overwrite mode and an Rx FIFO full condition is signalled, reading of the Rx FIFO elements should start at least at get index + 1. The reason for that is, that it might happen, that a received message is written to the Message RAM (put index) while the CPU is reading from the Message RAM (get index). In this case inconsistent data may be read from the respective Rx FIFO element. Adding an offset to the get index when reading from the Rx FIFO avoids this problem. The offset depends on how fast the CPU accesses the Rx FIFO. **Figure 37.22** shows an offset of two with respect to the get index when reading the Rx FIFO. In this case the two messages stored in element 1 and 2 are lost.

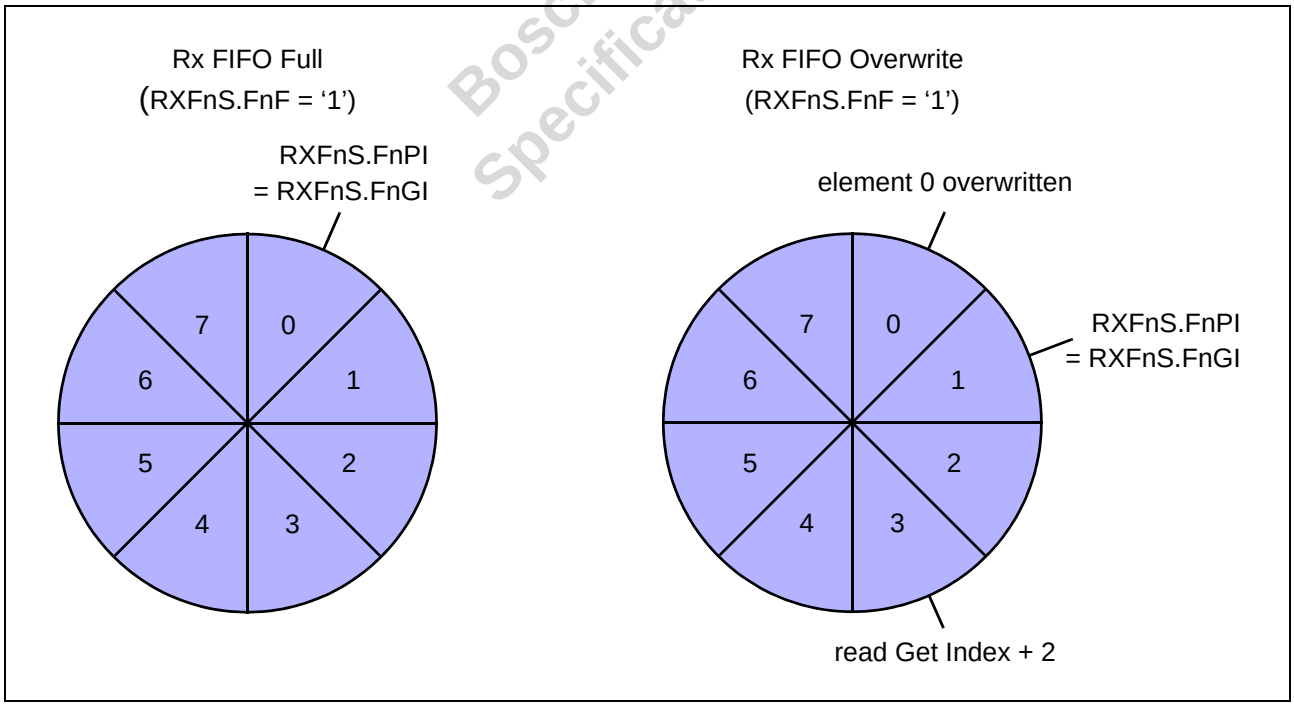

Figure 37.22 Rx FIFO Overflow Handling

After reading from the Rx FIFO, the number of the last element read has to be written to the Rx FIFO Acknowledge Index RXFnA.FnA. This increments the get index to that element number. In case the put index has not been incremented to this Rx FIFO element, the Rx FIFO full condition is reset (RXFnS.FnF = '0').

(3) Dedicated Rx Buffers

The M_TTCAN supports up to 64 dedicated Rx Buffers. The start address of the dedicated Rx Buffer section is configured via MTTCAN0RXBC.RBSA.

For each Rx Buffer a Standard or Extended Message ID Filter Element with SFEC / EFEC = “111” and SFID2 / EFID2[10:9] = “00” has to be configured (see **(5) Standard Message ID Filter Element** and **(6) Extended Message ID Filter Element**).

After a received message has been accepted by a filter element, the message is stored into the Rx Buffer in the Message RAM referenced by the filter element. The format is the same as for an Rx FIFO element. In addition the flag MTTCAN0IR.DRX (Message stored in Dedicated Rx Buffer) in the interrupt register is set.

Table 37.140 Example Filter Configuration for Rx Buffers

Filter Element	SFID1[10:0] EFID1[28:0]	SFID2[10:9] EFID2[10:9]	SFID2[5:0] EFID2[5:0]
0	ID message 1	00	00 0000
1	ID message 2	00	00 0001
2	ID message 3	00	00 0010

After the last word of a matching received message has been written to the Message RAM, the respective New Data flag in register MTTCAN0NDAT1,2 is set. As long as the New Data flag is set, the respective Rx Buffer is locked against updates from received matching frames. The New Data flags have to be reset by the Host by writing a ‘1’ to the respective bit position.

While an Rx Buffer’s New Data flag is set, a Message ID Filter Element referencing this specific Rx Buffer will not match, causing the acceptance filtering to continue. Following Message ID Filter Elements may cause the received message to be stored into another Rx Buffer, or into an Rx FIFO, or the message may be rejected, depending on filter configuration.

(a) Rx Buffer Handling

- Reset interrupt flag MTTCAN0IR.DRX
- Read New Data registers
- Read messages from Message RAM
- Reset New Data flags of processed messages

37.6.3.5 Tx Handling

The Tx Handler handles transmission requests for the dedicated Tx Buffers, the Tx FIFO, and the Tx Queue. It controls the transfer of transmit messages to the CAN Core, the Put and Get Indices, and the Tx Event FIFO. Up to 32 Tx Buffers can be set up for message transmission. The Tx Buffer element is described in **(3) Tx Buffer Element**.

NOTE

AUTOSAR requires at least three Tx Queue Buffers and support of transmit cancellation

The Tx Handler starts a Tx scan to check for the highest priority pending Tx request (Tx Buffer with lowest Message ID) when the Tx Buffer Request Pending register MTTCAN0TXBRP is updated, or when a transmission has been started.

(1) Transmit Pause

The transmit pause feature is intended for use in CAN systems where the CAN message identifiers are (permanently) specified to specific values and cannot easily be changed. These message identifiers may have a higher CAN arbitration priority than other defined messages, while in a specific application their relative arbitration priority should be inverse. This may lead to a case where one ECU sends a burst of CAN messages that cause another ECU's CAN messages to be delayed because that other messages have a lower CAN arbitration priority.

If e.g. CAN ECU-1 has the transmit pause feature enabled and is requested by its application software to transmit four messages, it will, after the first successful message transmission, wait for two CAN bit times of bus idle before it is allowed to start the next requested message. If there are other ECUs with pending messages, those messages are started in the idle time, they would not need to arbitrate with the next message of ECU-1. After having received a message, ECU-1 is allowed to start its next transmission as soon as the received message releases the CAN bus.

The transmit pause feature is controlled by bit MTTCAN0CCCR.TXP. If the bit is set, the M_TTCAN will, each time it has successfully transmitted a message, pause for two CAN bit times before starting the next transmission. This enables other CAN nodes in the network to transmit messages even if their messages have lower prior identifiers. Default is transmit pause disabled (MTTCAN0CCCR.TXP = '0').

This feature looses up burst transmissions coming from a single node and it protects against "babbling idiot" scenarios where the application program erroneously requests too many transmissions.

(2) Dedicated Tx Buffers

Dedicated Tx Buffers are intended for message transmission under complete control of the Host CPU. Each Dedicated Tx Buffer is configured with a specific Message ID. In case that multiple Tx Buffers are configured with the same Message ID, the Tx Buffer with the lowest buffer number is transmitted first.

If the data section has been updated, a transmission is requested by an Add Request via MTTCAN0TXBAR.ARn. The requested messages arbitrate internally with messages from an optional Tx FIFO or Tx Queue and externally with messages on the CAN bus, and are sent out according to their Message ID.

A Dedicated Tx Buffer allocates Element Size 32-bit words in the Message RAM (see **Table 37.141**). Therefore the start address of a dedicated Tx Buffer in the Message RAM is calculated by adding transmit buffer index (0 to 31) • Element Size to the Tx Buffer Start Address MTTCAN0TXBC.TBSA.

Table 37.141 Tx Buffer / FIFO / Queue Element Size

MTTCAN0TXESC.TBDS[2:0]	Data Field [bytes]	Element Size [RAM words]
000	8	4
001	12	5
010	16	6
011	20	7
100	24	8
101	32	10
110	48	14
111	64	18

(3) Tx FIFO

Tx FIFO operation is configured by programming MTTCAN0TXBC.TFQM to '0'. Messages stored in the Tx FIFO are transmitted starting with the message referenced by the Get Index MTTCAN0TXFQS.TFGI. After each transmission the Get Index is incremented cyclically until the Tx FIFO is empty. The Tx FIFO enables transmission of messages with the same Message ID from different Tx Buffers in the order these messages have been written to the Tx FIFO. The M_TTCAN calculates the Tx FIFO Free Level MTTCAN0TXFQS.TFFL as difference between Get and Put Index. It indicates the number of available (free) Tx FIFO elements.

New transmit messages have to be written to the Tx FIFO starting with the Tx Buffer referenced by the Put Index MTTCAN0TXFQS.TFQPI. An Add Request increments the Put Index to the next free Tx FIFO element. When the Put Index reaches the Get Index, Tx FIFO Full (MTTCAN0TXFQS.TFQF = '1') is signalled. In this case no further messages should be written to the Tx FIFO until the next message has been transmitted and the Get Index has been incremented.

When a single message is added to the Tx FIFO, the transmission is requested by writing a '1' to the MTTCAN0TXBAR bit related to the Tx Buffer referenced by the Tx FIFO's Put Index.

When multiple (n) messages are added to the Tx FIFO, they are written to n consecutive Tx Buffers starting with the Put Index. The transmissions are then requested via MTTCAN0TXBAR. The Put Index is then cyclically incremented by n. The number of requested Tx buffers should not exceed the number of free Tx Buffers as indicated by the Tx FIFO Free Level.

When a transmission request for the Tx Buffer referenced by the Get Index is cancelled, the Get Index is incremented to the next Tx Buffer with pending transmission request and the Tx FIFO Free Level is recalculated. When transmission cancellation is applied to any other Tx Buffer, the Get Index and the FIFO Free Level remain unchanged.

A Tx FIFO element allocates Element Size 32-bit words in the Message RAM (see **Table 37.141**). Therefore the start address of the next available (free) Tx FIFO Buffer is calculated by adding Tx FIFO/Queue Put Index MTTCAN0TXFQS.TFQPI (0 to 31) • Element Size to the Tx Buffer Start Address MTTCAN0TXBC.TBSA.

(4) Tx Queue

Tx Queue operation is configured by programming MTTCAN0TXBC.TFQM to ‘1’. Messages stored in the Tx Queue are transmitted starting with the message with the lowest Message ID (highest priority). In case that multiple Queue Buffers are configured with the same Message ID, the Queue Buffer with the lowest buffer number is transmitted first.

New messages have to be written to the Tx Buffer referenced by the Put Index MTTCAN0TXFQS.TFQPI. An Add Request cyclically increments the Put Index to the next free Tx Buffer. In case that the Tx Queue is full (MTTCAN0TXFQS.TFQF = ’1’), the Put Index is not valid and no further message should be written to the Tx Queue until at least one of the requested messages has been sent out or a pending transmission request has been cancelled.

The application may use register MTTCAN0TXBRP instead of the Put Index and may place messages to any Tx Buffer without pending transmission request.

A Tx Queue Buffer allocates Element Size 32-bit words in the Message RAM (see **Table 37.141**). Therefore the start address of the next available (free) Tx Queue Buffer is calculated by adding Tx FIFO/Queue Put Index MTTCAN0TXFQS.TFQPI (0 to 31) • Element Size to the Tx Buffer Start Address MTTCAN0TXBC.TBSA.

(5) Mixed Dedicated Tx Buffers / Tx FIFO

In this case the Tx Buffers section in the Message RAM is subdivided into a set of Dedicated Tx Buffers and a Tx FIFO. The number of Dedicated Tx Buffers is configured by MTTCAN0TXBC.NDTB. The number of Tx Buffers assigned to the Tx FIFO is configured by MTTCAN0TXBC.TFQS. In case MTTCAN0TXBC.TFQS is programmed to zero, only Dedicated Tx Buffers are used.

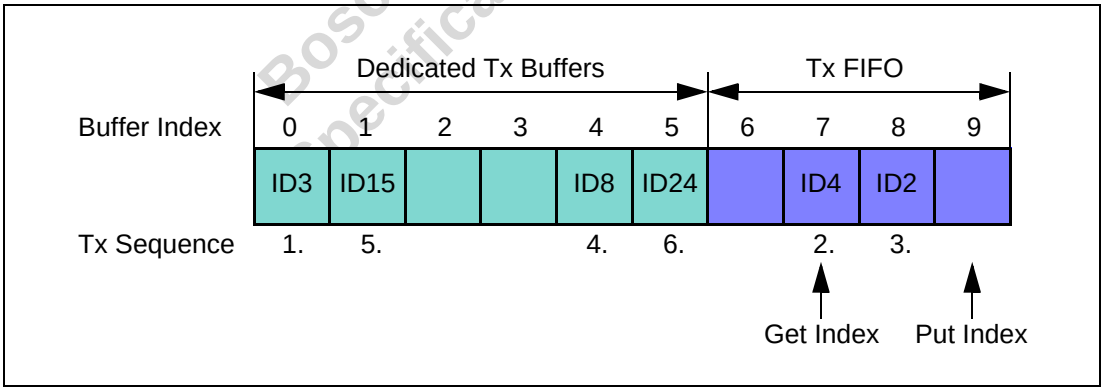

Figure 37.23 Example of mixed Configuration Dedicated Tx Buffers / Tx FIFO

Tx prioritization:

- Scan Dedicated Tx Buffers and oldest pending Tx FIFO Buffer (referenced by TXFS.TFGI)
- Buffer with lowest Message ID gets highest priority and is transmitted next

(6) Mixed Dedicated Tx Buffers / Tx Queue

In this case the Tx Buffers section in the Message RAM is subdivided into a set of Dedicated Tx Buffers and a Tx Queue. The number of Dedicated Tx Buffers is configured by MTTCAN0TXBC.NDTB. The number of Tx Queue Buffers is configured by MTTCAN0TXBC.TFQS. In case MTTCAN0TXBC.TFQS is programmed to zero, only Dedicated Tx Buffers are used.

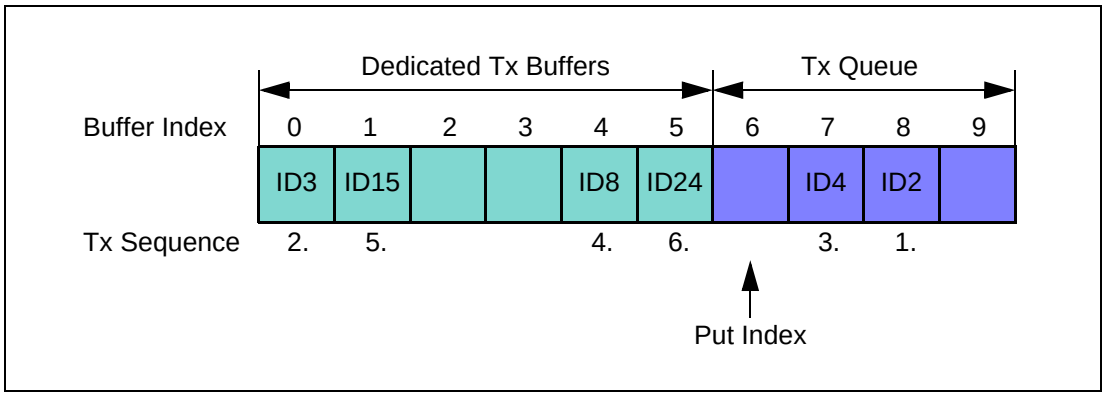

Figure 37.24 Example of mixed Configuration Dedicated Tx Buffers / Tx Queue

Tx prioritization:

- Scan all Tx Buffers with activated transmission request
- Tx Buffer with lowest Message ID gets highest priority and is transmitted next

(7) Transmit Cancellation

The M_TTCAN supports transmit cancellation. This feature is especially intended for gateway applications and AUTOSAR based applications. To cancel a requested transmission from a Dedicated Tx Buffer or a Tx Queue Buffer the Host has to write a '1' to the corresponding bit position (=number of Tx Buffer) of register MTTCAN0TXBCR. Transmit cancellation is not intended for Tx FIFO operation.

Successful cancellation is signalled by setting the corresponding bit of register MTTCAN0TXBCF to '1'.

In case a transmit cancellation is requested while a transmission from a Tx Buffer is already ongoing, the corresponding MTTCAN0TXBRP bit remains set as long as the transmission is in progress. If the transmission was successful, the corresponding MTTCAN0TXBTO and MTTCAN0TXBCF bits are set. If the transmission was not successful, it is not repeated and only the corresponding MTTCAN0TXBCF bit is set.

NOTE

In case a pending transmission is cancelled immediately before this transmission could have been started, there follows a short time window where no transmission is started even if another message is also pending in this node. This may enable another node to transmit a message which may have a lower priority than the second message in this node.

(8) Tx Event Handling

To support Tx event handling the M_TTCAN has implemented a Tx Event FIFO. After the M_TTCAN has transmitted a message on the CAN bus, Message ID and timestamp are stored in a Tx Event FIFO element. To link a Tx event to a Tx Event FIFO element, the Message Marker from the transmitted Tx Buffer is copied into the Tx Event FIFO element.

The Tx Event FIFO can be configured to a maximum of 32 elements. The Tx Event FIFO element is described in **(4) Tx Event FIFO Element**.

When a Tx Event FIFO full condition is signalled by MTTCAN0IR.TEFF, no further elements are written to the Tx Event FIFO until at least one element has been read out and the Tx Event FIFO Get Index has been incremented. In case a Tx event occurs while the Tx Event FIFO is full, this event is discarded and interrupt flag MTTCAN0IR.TEFL is set.

To avoid a Tx Event FIFO overflow, the Tx Event FIFO watermark can be used. When the Tx Event FIFO fill level reaches the Tx Event FIFO watermark configured by MTTCAN0TXEFC.EFWM, interrupt flag MTTCAN0IR.TEFW is set.

When reading from the Tx Event FIFO, two times the Tx Event FIFO Get Index MTTCAN0TXEFS.EFGI has to be added to the Tx Event FIFO start address MTTCAN0TXEFC.EFSA.

37.6.3.6 FIFO Acknowledge Handling

The Get Indices of Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO are controlled by writing to the corresponding FIFO Acknowledge Index (see **(27) MTTCAN0RXF0A — Rx FIFO 0 Acknowledge**, **(31) MTTCAN0RXF1A — Rx FIFO 1 Acknowledge**, and **(45) MTTCAN0TXEFA — Tx Event FIFO Acknowledge**). Writing to the FIFO Acknowledge Index will set the FIFO Get Index to the FIFO Acknowledge Index plus one and thereby updates the FIFO Fill Level. There are two use cases:

When only a single element has been read from the FIFO (the one being pointed to by the Get Index), this Get Index value is written to the FIFO Acknowledge Index.

When a sequence of elements has been read from the FIFO, it is sufficient to write the FIFO Acknowledge Index only once at the end of that read sequence (value: Index of the last element read), to update the FIFO's Get Index.

Due to the fact that the CPU has free access to the M_TTCAN's Message RAM, special care has to be taken when reading FIFO elements in an arbitrary order (Get Index not considered). This might be useful when reading a High Priority Message from one of the two Rx FIFOs. In this case the FIFO's Acknowledge Index should not be written because this would set the Get Index to a wrong position and also alters the FIFO's Fill Level. In this case some of the older FIFO elements would be lost.

NOTE

The application has to ensure that a valid value is written to the FIFO Acknowledge Index. The M_TTCAN does not check for erroneous values.

37.6.4 TTCAN Operation

37.6.4.1 Reference Message

A reference message is a data frame characterized by a specific CAN identifier. It is received and accepted by all nodes except the Time Master (sender of the reference message).

For Level 1 the data length must be at least one; for Level 0,2 the data length must be at least four; otherwise, the message is not accepted as reference message. The reference message may be extended by other data up to the sum of eight CAN data bytes. All bits of the identifier except the three LSBs characterize the message as a reference message. The last three bits specify the priorities of up to 8 potential time masters. Reserved bits are transmitted as logical 0 and are ignored by the receivers. The reference message is configured via register MTTCAN0TTRMC.

The time master transmits the reference message. If the reference message is disturbed by an error, it is retransmitted immediately. In case of a retransmission, the transmitted Master_Ref_Mark is updated. The reference message is sent periodically, but is allowed to stop the periodic transmission (Next_is_Gap bit) and to initiate transmission event-synchronized at the start of the next basic cycle by the current time master or by one of the other potential time masters.

The node transmitting the reference message is the current time master. The time master is allowed to transmit other messages. If the current time master fails, its function is replicated by the potential time master with the highest priority. Nodes that are neither time master nor potential time master are time-receiving nodes.

(1) Level 1

Level 1 operation is configured via MTTCAN0TTOCF.OM = “01” and MTTCAN0TTOCF.GEN. External clock synchronization is not available in Level 1.

The information related to the reference message is stored in the first data byte as shown in **Table 37.142** below. Cycle_Count is optional.

Table 37.142 First byte of Level 1 reference message

Bits	7	6	5	4	3	2	1	0
First Byte	Next_is_Gap	res	Cycle_Count[5:0]					

(2) Level 2

Level 2 operation is configured via MTTCAN0TTOCF.OM = “10” and MTTCAN0TTOCF.GEN.

The information related to the reference message is stored in the first four data bytes as shown in **Table 37.143** below. Cycle_Count and the lower four bits of NTU_Res are optional. The M_TTCAN does not evaluate NTU_Res[3:0] from received reference messages, it always transmits these bits as zero.

Table 37.143 First four bytes of Level 2 reference message

Bits	7	6	5	4	3	2	1	0
First Byte	Next_is_Gap	res	Cycle_Count[5:0]					
Second Byte	NTU_Res[6:4]				NTU_Res[3:0]			Disc_Bit
Third Byte	Master_Ref_Mark[7:0]							
Fourth Byte	Master_Ref_Mark[15:8]							

(3) Level 0

Level 0 operation is configured via MTTCAN0TTOCF.OM = “11”. External event-synchronized time-triggered operation is not available in Level 0.

The information related to the reference message is stored in the first four data bytes as shown in **Table 37.144** below. In Level 0 Next_is_Gap is always zero. Cycle_Count and the lower four bits of NTU_Res are optional. The M_TTCAN does not evaluate NTU_Res[3:0] from received reference messages, it always transmits these bits as zero.

Table 37.144 First four bytes of Level 0 reference message

Bits	7	6	5	4	3	2	1	0
First Byte	Next_is_Gap	res	Cycle_Count[5:0]					
Second Byte	NTU_Res[6:4]				NTU_Res[3:0]			Disc_Bit
Third Byte	Master_Ref_Mark[7:0]							
Fourth Byte	Master_Ref_Mark[15:8]							

37.6.4.2 TTCAN Configuration

(1) TTCAN Timing

The Network Time Unit NTU is the unit in which all times are measured. The NTU is a constant of the whole network and is defined a priori by the network system designer. In TTCAN Level 1 the NTU is the nominal CAN bit time. In TTCAN Level 0 and Level 2 the NTU is a fraction of the physical second.

The NTU is the time base for the local time. The integer part of the local time (16-bit value) is incremented once each NTU. Cycle time and global time are both derived from local time. The fractional part (3-bit value) of local time, cycle time, and global time is not readable.

In TTCAN Level 0 and Level 2 the length of the NTU is defined by the Time Unit Ratio TUR. The TUR is in principle a non-integer number and given by the formula TUR = MTTCAN0TURNA.NAV/ MTTCAN0TURCF.DC. The length of the NTU is given by the formula NTU = CAN Clock Period • TUR.

The TUR Numerator Configuration NC is an 18-bit number, MTTCAN0TURCF.NCL[15:0] can be programmed in the range 0000_H to $FFFF_H$. MTTCAN0TURCF.NCH[17:16] is hard wired to 0b01. When the number $nnnn_H$ is written to MTTCAN0TURCF.NCL[15:0], MTTCAN0TURNA.NAV starts with the value $10000_H + 0nnnn_H = 1nnnn_H$. The TUR Denominator Configuration MTTCAN0TURCF.DC is a 14-bit number. MTTCAN0TURCF.DC may be programmed in the range 0001_H to $3FFF_H$, 0000_H is an illegal value.

In Level 1, NC must be ≥ 4 • MTTCAN0TURCF.DC. In Level 0,2 NC must be ≥ 8 • MTTCAN0TURCF.DC to allow the 3-bit resolution for the internal fractional part of the NTU.

A hardware reset presets MTTCAN0TURCF.DC to 1000_H and MTTCAN0TURCF.NCL to 10000_H, resulting in an NTU consisting of 16 CAN clock periods. Local time and application watchdog are not started before either the MTTCAN0CCCR.INIT is reset, or MTTCAN0TURCF.ELT is set. MTTCAN0TURCF.ELT may not be set before the NTU is configured. Setting MTTCAN0TURCF.ELT to '1' also locks the write access to register MTTCAN0TURCF.

At startup MTTCAN0TURNA.NAV is updated from NC (= MTTCAN0TURCF.NCL + 10000_H) when MTTCAN0TURCF.ELT is set. In TTCAN Level 1 there is no drift compensation. MTTCAN0TURNA.NAV does not change during operation, it always equals NC.

In TTCAN Level 0 and Level 2 there are two possibilities for MTTCAN0TURNA.NAV to change. When operating as time slave or backup time master, and when MTTCAN0TTOCF.ECC is set, MTTCAN0TURNA.NAV is updated automatically to the value calculated from the monitored global time speed, as long as the M_TTCAN is in synchronization state In_Schedule or In_Gap. When it loses synchronization it returns to NC. When operating as the actual time master, and when MTTCAN0TTOCF.EECS is set, the Host may update MTTCAN0TURCF.NCL. When the Host sets MTTCAN0TTOCN.ECS, MTTCAN0TURNA.NAV will be updated from the new value of NC at the next reference message. The status flag MTTCAN0TTOST.WECS as is set when MTTCAN0TTOCN.ECS is set and is cleared when MTTCAN0TURNA.NAV is updated. MTTCAN0TURCF.NCL is write locked while MTTCAN0TTOST.WECS is set.

In TTCAN Level 0 and Level 2 the clock calibration process adapts MTTCAN0TURNA.NAV in the range of the Synchronization Deviation Limit SDL of NC ± $2^{(MTTCAN0TTOCF.LDSDL+5)}$. MTTCAN0TURCF.NCL should be programmed to the largest applicable numerical value in order to achieve the best accuracy in the calculation of MTTCAN0TURNA.NAV.

The synchronization deviation SD is the difference between NC and MTTCAN0TURNA.NAV (SD = |NC - MTTCAN0TURNA.NAV|). It is limited by the Synchronization Deviation Limit SDL,

which is configured by its dual logarithm MTTCAN0TTOCF.LDSDL (SDL = $2^{(MTTCAN0TTOCF.LDSDL+5)}$) and should not exceed the clock tolerance given by the CAN bit timing configuration. SD is calculated at each new Basic Cycle. When the calculated MTTCAN0TURNA.NAV deviates by more than SDL from NC, or if the Disc_Bit in the reference message is set, the drift compensation is suspended and MTTCAN0TTIR.GTE is set and TTOSC.QCS is reset, or in case of the Disc_Bit = '1', MTTCAN0TTIR.GTD is set.

TUR configuration examples are shown in **Table 37.145** below.

Table 37.145 TUR Configuration Examples

TUR	8	10	24	50	510	125000	32.5	100/12	529/17
NC	$1FFF8_H$	$1FFFE_H$	$1FFF8_H$	$1FFEA_H$	$1FFFE_H$	$1E848_H$	$1FFE0_H$	19000_H	10880_H
MTTCAN0TURCF.DC	$3FFF_H$	3333_H	1555_H	$0A3D_H$	0101_H	0001_H	$0FC0_H$	3000_H	0880_H

MTTCAN0TTOCN.ECS schedules NC for activation by the next reference message. MTTCAN0TTOCN.SGT schedules MTTCAN0TTGTP.TP for activation by the next reference message. Setting of MTTCAN0TTOCN.ECS and MTTCAN0TTOCN.SGT requires MTTCAN0TTOCF.EECS to be set (external clock synchronization enabled) while the M_TTCAN is actual time master.

The M_TTCAN module provides an application watchdog to verity the function of the application program. The Host has to serve this watchdog regularly, else all CAN bus activity is stopped. The Application Watchdog Limit MTTCAN0TTOCF.AWL specifies the number of NTUs between two times the watchdog has to be served. The maximum number of NTUs is 256. The Application Watchdog is served by reading register MTTCAN0TTOST. MTTCAN0TTOST.AWE indicates whether the watchdog has been served in time. In case the application failed to serve the application watchdog, interrupt flag MTTCAN0TTIR.AW is set. For software development, the application watchdog may be disabled by programming MTTCAN0TTOCF.AWL to 00_H (see also **(10) Application Watchdog**).

(a) Timing of Interface Signals

The timing events which cause a pulse at output m_ttcan_tmp (MTTCAN0TMP) and m_ttcan_rtp (MTTCAN0RTP) are generated in the CAN clock domain. There is a clock domain crossing delay to be considered before the same event is visible in the Host clock domain (MTTCAN0TTIR.TTMI resp. MTTCAN0TTIR.RTMI set). The signals can be connected e.g. to the timing input(s) of another TTCAN node (m_ttcan_swt:MTTCAN0SWT / m_ttcan_evt: MTTCAN0EVT), in order to automatically synchronize two TTCAN networks.

Output m_ttcan_soc (MTTCAN0SOC) gets active whenever a reference message is completed (either transmitted or received). The output is controlled in the Host clock domain.

(2) Message Scheduling

MTTCAN0TTOCF.TM controls whether the M_TTCAN operates as a potential time master or as a time slave. If it is a potential time master, the three LSBs of the reference message's identifier MTTCAN0TTRMC.RID define the master priority, 0 giving the highest and 7 giving the lowest priority. There may not be two nodes in the network using the same master priority. MTTCAN0TTRMC.RID is used for recognition of reference messages. MTTCAN0TTRMC.RMPS is not relevant for time slaves.

The Initial Reference Trigger Offset MTTCAN0TTOCF.IRTO is a 7-bit-value that defines (in NTUs) how long a backup time master waits before it starts the transmission of a reference message when a reference message is expected but the bus remains idle. The recommended value for

MTTCAN0TTOCF.IRTO is the master priority multiplied with a factor depending on the expected clock drift between the potential time masters in the network. The sequential order of the backup time masters, when one of them starts the reference message in case the current time master fails, should correspond to their master priority, even with maximum clock drift.

MTTCAN0TTOCF.OM decides whether the node operates in TTCAN Level 0, Level 1, or Level 2. In one network, all potential time masters have to operate on the same level. Time slaves may operate on Level 1 in a Level 2 network, but not vice versa. The configuration of the TTCAN operation mode via MTTCAN0TTOCF.OM is the last step in the setup. With MTTCAN0TTOCF.OM = “00” (event-driven CAN communication), the M_TTCAN operates according to ISO 11898-1, without time triggers. With MTTCAN0TTOCF.OM = “01” (Level 1), the M_TTCAN operates according to ISO 11898-4, but without the possibility to synchronize the basic cycles to external events, the Next_is_Gap bit in the reference message is ignored. With MTTCAN0TTOCF.OM = “10” (Level 2), the M_TTCAN operates according to ISO 11898-4, including the event-synchronized start of a basic cycle. With MTTCAN0TTOCF.OM = “11” (Level 0), the M_TTCAN operates as event-driven CAN but maintains a calibrated global time base as in Level 2.

MTTCAN0TTOCF.EECS enables the external clock synchronization, allowing the application program of the current time master to update the TUR configuration during time-triggered operation, to adapt the clock speed and (in Level 0,2 only) the global clock phase to an external reference.

MTTCAN0TTMLM.ENTT in the TT Matrix Limits register specifies the number of expected Tx_Triggers in the system matrix. This is the sum of Tx_Triggers for exclusive, single arbitrating and merged arbitrating windows, excluding the Tx_Ref_Triggers. Note that this is usually not the number of Tx_Trigger memory elements; the number of basic cycles in the system matrix and the trigger’s repeat factors have to be taken into account. An inaccurate configuration of MTTCAN0TTMLM.ENTT will result in either a Tx Count Underflow (MTTCAN0TTIR.TXU = ‘1’ and MTTCAN0TTOST.EL = “01”, severity 1) or in a Tx Count Overflow (MTTCAN0TTIR.TXO = ‘1’ and MTTCAN0TTOST.EL = “10”, severity 2).

NOTE

In case the first reference message seen by a node does not have Cycle_Count zero, this node may finish its first matrix cycle with its Tx count resulting in a Tx Count Underflow condition. As long as a node is in state Synchronizing its Tx_Triggers will not lead to transmissions.

MTTCAN0TTMLM.CCM specifies the number of the last basic cycle in the system matrix. The counting of basic cycles starts at 0. In a system matrix consisting of 8 basic cycles MTTCAN0TTMLM.CCM would be 7. MTTCAN0TTMLM.CCM is ignored by time slaves, a receiver of a reference message considers the received cycle count as the valid cycle count for the actual basic cycle.

MTTCAN0TTMLM.TXEW specifies the length of the Tx enable window in NTUs. The Tx enable window is that period of time at the beginning of a time window where a transmission may be started. If the sample point of the first bit of a transmit message is not inside the Tx enable window because of e.g. a slight overlap from the previous time window’s message, the transmission cannot be started in that time window at all. MTTCAN0TTMLM.TXEW has to be chosen with respect to the network’s synchronization quality and with respect to the relation between the length of the time windows and the length of the messages.

(3) Trigger Memory

The trigger memory is part of the external Message RAM to which the M_TTCAN is connected via its Generic Master Interface (see **Figure 37.15, Message RAM Configuration**). It stores up to 64 trigger elements. A trigger memory element consists of Time Mark TM, Cycle Code CC, Trigger Type TYPE, Filter Type FTYPE, Message Number MNR, Message Status Count MSC, Time Mark Event Internal TMIN, Time Mark Event External TMEX, and Asynchronous Serial Communication ASC (see **(7) Trigger Memory Element**).

The time mark defines at which cycle time a trigger becomes active. The triggers in the trigger memory have to be sorted by their time marks. The trigger element with the lowest time mark is written to the first trigger memory word. Message number and cycle code are ignored for triggers of type Tx_Ref_Trigger, Tx_Ref_Trigger_Gap, Watch_Trigger, Watch_Trigger_Gap, and End_of_List.

When the cycle time reaches the time mark of the actual trigger, the FSE switches to the next trigger and starts to read the following trigger from the trigger memory. In case of a transmit trigger, the Tx Handler starts to read the message from the Message RAM as soon as the FSE switches to its trigger. The RAM access speed defines the minimum time step between a transmit trigger and its preceding trigger, the Tx Handler has to be able to prepare the transmission before the transmit trigger's time mark is reached. The RAM access speed also limits the number of non-matching (with regard to their cycle code) triggers between two matching triggers, the next matching trigger must be read before its time mark is reached. If the reference message is n NTU long, a trigger with a time mark < n will never become active and will be treated as a configuration error.

Starting point of the cycle time is the sample point of the reference message's start of frame bit. The next reference message is requested when cycle time reaches the Tx_Ref_Trigger's time mark. The M_TTCAN reacts on the transmission request at the next sample point. A new Sync_Mark is captured at the start of frame bit, but the cycle time is incremented until the reference message is successfully transmitted (or received) and the Sync_Mark is taken as the new Ref_Mark. At that point in time, cycle time is restarted. As a consequence, cycle time can never (with the exception of initialisation) be seen at a value < n, with n being the length of the reference message measured in NTU.

Length of a basic cycle: Tx_Ref_Trigger's time mark + 1 NTU + 1 CAN bit time

The trigger list will be different for all nodes in the TTCAN network. Each node knows only the Tx_Triggers for its own transmit messages, the Rx_Triggers for those receive messages that are processed by this node, and the triggers concerning the reference messages.

(a) Trigger Types

Tx_Ref_Trigger (TYPE = "0000") and Tx_Ref_Trigger_Gap (TYPE = "0001") cause the transmission of a reference message by a time master. A configuration error (MTTCAN0TTOST.EL = "11", severity 3) is detected when a time slave encounters a Tx_Ref_Trigger(_Gap) in its trigger memory. Tx_Ref_Trigger_Gap is only used in external event-synchronized time-triggered operation mode. In that mode, Tx_Ref_Trigger is ignored when the M_TTCAN synchronization state is In_Gap (MTTCAN0TTOST.SYS = "10").

Tx_Trigger_Single (TYPE = "0010"), Tx_Trigger_Continuous (TYPE = "0011"), Tx_Trigger_Arbitration (TYPE = "0100"), and Tx_Trigger_Merged (TYPE = "0101") cause the start of a transmission. They define the start of a time window.

Tx_Trigger_Single starts a single transmission in an exclusive time window when the message buffer's Transmission Request Pending bit is set. After successful transmission the Transmission Request Pending bit is reset.

Tx_Trigger_Continuous starts a transmission in an exclusive time window when the message buffer's Transmission Request Pending bit is set. After successful transmission the Transmission Request Pending bit remains set, and the message buffer is transmitted again in the next matching time window.

Tx_Trigger_Arbitration starts an arbitrating time window, Tx_Trigger_Merged a merged arbitrating time window. The last Tx_Trigger of a merged arbitrating time window must be of type Tx_Trigger_Arbitration. A Configuration Error (MTTCAN0TTOST.EL = "11", severity 3) is detected when a trigger of type Tx_Trigger_Merged is followed by any other Tx_Trigger than one of type Tx_Trigger_Merged or Tx_Trigger_Arbitration. Several Tx_Triggers may be defined for the same Tx message buffer. Depending on their cycle code, they may be ignored in some basic cycles. The cycle code has to be considered when the expected number of Tx_Triggers (MTTCAN0TTMLM.ENTT) is calculated.

Watch_Trigger (TYPE = "0110") and Watch_Trigger_Gap (TYPE = "0111") check for missing reference messages. They are used by both time masters and time slaves. Watch_Trigger_Gap is only used in external event-synchronized time-triggered operation mode. In that mode, a Watch_Trigger is ignored when the M_TTCAN synchronization state is In_Gap (MTTCAN0TTOST.SYS = "10").

Rx_Trigger (TYPE = "1000") is used to check for the reception of periodic messages in exclusive time windows. Rx_Triggers are not active until state In_Schedule or In_Gap is reached. The time mark of an Rx_Trigger shall be placed after the end of that message's transmission, independent of time window boundaries. Depending on their cycle code, Rx_Triggers may be ignored in some basic cycles. At the time mark of the Rx_Trigger, it is checked whether the last received message before this time mark and after start of cycle or previous Rx_Trigger had matched the acceptance filter element referenced by MNR. Accepted messages are stored in one of the two receive FIFOs, according to the acceptance filtering, independent of the Rx_Trigger. Acceptance filter elements which are referenced by Rx_Triggers should be placed at the beginning of the filter list to ensure that the filtering is finished before the Rx_Trigger's time mark is reached.

Time_Base_Trigger (TYPE = "1001") are used to generate internal/external events depending on the configuration of ASC, TMIN, and TMEX.

End_of_List (TYPE = "1010 to 1111") is an illegal trigger type, a configuration error (MTTCAN0TTOST.EL = "11", severity 3) is detected when an End_of_List trigger is encountered in the trigger memory before the Watch_Trigger or Watch_Trigger_Gap.

(b) Restrictions for the Node's Trigger List

There may not be two triggers that are active at the same cycle time and cycle count, but triggers that are active in different basic cycles (different cycle code) may share the same time mark.

Rx_Triggers and Time_Base_Triggers may not be placed inside the Tx enable windows of Tx_Trigger_Single/Continuous/Arbitration, but they may be placed after Tx_Trigger_Merged.

Triggers that are placed after the Watch_Trigger (or the Watch_Trigger_Gap when MTTCAN0TTOST.SYS = "10") will never become active. The watch triggers themselves will not become active when the reference messages are transmitted on time.

All unused trigger memory words (after the Watch_Trigger or after the Watch_Trigger_Gap when MTTCAN0TTOST.SYS = "10") must be set to trigger type End_of_List.

A typical trigger list for a potential time master will begin with a number of Tx_Triggers and Rx_Triggers followed by the Tx_Ref_Trigger and the Watch_Trigger. For networks with external event- synchronized time-triggered communication, this is followed by the Tx_Ref_Trigger_Gap and the Watch_Trigger_Gap. The trigger list for a time slave will be the same but without the Tx_Ref_Trigger and the Tx_Ref_Trigger_Gap.

At the beginning of each basic cycle, that is at each reception or transmission of a reference message, the trigger list is processed starting with the first trigger memory element. The FSE looks for the first trigger with a cycle code that matches the current cycle count. The FSE waits until cycle time reaches the trigger's time mark and activates the trigger. Afterwards the FSE looks for the next trigger in the list with a cycle code that matches the current cycle count.

Special consideration is needed for the time around Tx_Ref_Trigger and Tx_Ref_Trigger_Gap. In a time master competing for master ship, the effective time mark of a Tx_Ref_Trigger may be decremented in order to be the first node to start a reference message. In backup time masters the effective time mark of a Tx_Ref_Trigger or Tx_Ref_Trigger_Gap is the sum of its configured time mark and the Reference Trigger Offset MTTCAN0TTOCF.IRTO. In case error level 2 is reached (MTTCAN0TTOST.EL = "10"), the effective time mark is the sum of its time mark and 127_H. No other trigger elements should be placed in this range otherwise it may happen, that the time marks appear out of order and are flagged as a configuration error. Trigger elements which are coming after Tx_Ref_Trigger may never become active as long as the reference messages come in time.

There are interdependencies between the following parameters:

- Host clock frequency
- Speed and waiting time for Trigger RAM accesses
- Length of the acceptance filter list
- Number of trigger elements
- Complexity of cycle code filtering in the trigger elements
- Offset between time marks of the trigger elements

(c) Example for Trigger Handling

The example below shows how the trigger list is derived from a node's system matrix. Assumed node A is first time master and has knowledge of the section of the system matrix shown in **Table 37.146** below.

Table 37.146 System Matrix Node A

Cycle Count	Time Mark1	Time Mark2	Time Mark3	Time Mark4	Time Mark5	Time Mark6	Time Mark7
0	Tx7					TxRef	Error
1	Rx3			Tx2, Tx4		TxRef	Error
2						TxRef	Error
3	Tx7		Rx5			TxRef	Error
4	Tx7			Rx6		TxRef	Error

The cycle count starts with 0 and runs until 0, 1, 3, 7, 15, 31, 63 (the number of basic cycles in the system matrix is 1, 2, 4, 8, 16, 32, 64). The maximum cycle count is configured by MTTCAN0TTMLM.CCM. The Cycle Code CC is composed of repeat factor (= value of most significant '1') and the number of the first basic cycle in the system matrix (= bit field after most significant '1').

Example:with a cycle code of 0b0010011 (repeat factor: 16, first basic cycle: 3) and a maximum cycle count of MTTCAN0TTMLM.CCM = "$3F_H$"matches occur at cycle counts 3, 19, 35, 51

A trigger element consists of Time Mark TM, Cycle Code CC, Trigger Type TYPE, and Message Number MNR. For transmission MNR references the Tx Buffer number (0 to 31). For reception MNR references the number of the filter element (0 to 127) that matched during acceptance filtering.

Depending on the configuration of the Filter Type FTYPE, the 11-bit or 29-bit message ID filter list is referenced.

In addition a trigger element can be configured for Asynchronous Serial Communication ASC, generation of Time Mark Event Internal TMIN, and Time Mark Event External TMEX. The Message Status Count MSC holds the counter value (0 to 7) for scheduling errors for periodic messages in exclusive time windows at the point in time when the time mark of the trigger element became active.

Table 37.147 Trigger List Node A

Trigger	Time Mark TM[15:0]	Cycle Code CC[6:0]	Trigger Type TYPE[3:0]	Mess. No. MNR[6:0]
0	Mark1	0000100_B	Tx_Trigger_Single	7
1	Mark1	1000000_B	Rx_Trigger	3
2	Mark1	1000011_B	Tx_Trigger_Single	7
3	Mark3	1000001_B	Tx_Trigger_Merged	2
4	Mark3	1000011_B	Rx_Trigger	5
5	Mark4	1000001_B	Tx_Trigger_Arbitration	4
6	Mark4	1000100_B	Rx_Trigger	6
7	Mark6	n.a.	Tx_Ref_Trigger	0 (Ref)
8	Mark7	n.a.	Watch_Trigger	n.a.
9	n.a.	n.a.	End_of_List	n.a.

Tx_Trigger_Single, Tx_Trigger_Continuous, Tx_Trigger_Merged, Tx_Trigger_Arbitration, Rx_Trigger, and Time_Base_Trigger are only valid for the specified cycle code. For all other trigger types the cycle code is ignored.

The FSE starts the basic cycle with scanning the trigger list starting from zero until a trigger with time mark > cycle time and with its Cycle Code CC matching the actual cycle count is reached, or a trigger of type Tx_Ref_Trigger, Tx_Ref_Trigger_Gap, Watch_Trigger, or Watch_Trigger_Gap is encountered.

When the cycle time reached the Time Mark TM, the action defined by Trigger Type TYPE and Message Number MNR is started. There is an error in the configuration when End_of_List is reached.

At Mark6 the reference message (always TxRef) is transmitted. After transmission of the reference message the FSE returns to the beginning of the trigger list. When the Watch Trigger at Mark7 is reached, the node was not able to transmit the reference message; error treatment is started.

(d) Detection of Configuration Errors

A configuration error is signalled via MTTCAN0TTOST.EL = “11” (severity 3) when:

The FSE comes to a trigger in the list with a cycle code that matches the current cycle count but with a time mark that is less than the cycle time.

The previous active trigger was a Tx_Trigger_Merged and the FSE comes to a trigger in the list with a cycle code that matches the current cycle count but that is neither a Tx_Trigger_Merged nor a Tx_Trigger_Arbitration nor a Time_Base_Trigger nor an Rx_Trigger.

The FSE of a node with MTTCAN0TTOCF.TM = ‘0’ (time slave) encounters a Tx_Ref_Trigger or a Tx_Ref_Trigger_Gap.

Any time mark placed inside the Tx enable window (defined by MTTCAN0TTMLM.TXEW) of a Tx_Trigger with a matching cycle code.

A time mark is placed near the time mark of a Tx_Ref_Trigger and the Reference Trigger Offset MTTCAN0TTOST.RTO causes a reversal of their sequential order measured in cycle time.

(4) TTCAN Schedule Initialization

The synchronization to the M_TTCAN's message schedule starts when MTTCAN0CCCR.INIT is reset. The M_TTCAN can operate strictly time-triggered (MTTCAN0TTOCF.GEN = '0') or external event-synchronized time-triggered (MTTCAN0TTOCF.GEN = '1'). All nodes start with cycle time zero at the beginning of their trigger list with MTTCAN0TTOST.SYS = "00" (out of synchronization), no transmission is enabled with the exception of the reference message. Nodes in external event-synchronized time-triggered operation mode will ignore Tx_Ref_Trigger and Watch_Trigger and will use instead Tx_Ref_Trigger_Gap and Watch_Trigger_Gap until the first reference message decides whether a Gap is active.

(a) Time Slaves

After configuration, a time slave will ignore its Watch_Trigger and Watch_Trigger_Gap when it did not receive any message before reaching the Watch_Triggers. When it reaches Init_Watch_Trigger, interrupt flag MTTCAN0TTIR.IWT is set, the FSE is frozen, and the cycle time will become invalid, but the node will still be able to take part in CAN bus communication (to give acknowledge or to send error flags). The first received reference message will restart the FSE and the cycle time.

NOTE

Init_Watch_Trigger is not part of the trigger list. It is implemented as an internal counter which counts up to $FFFF_H$ = maximum cycle time.

When a time slave has received any message but the reference message before reaching the Watch_Triggers, it will assume a fatal error (MTTCAN0TTOST.EL = "11", severity 3), set interrupt flag MTTCAN0TTIR.WT, switch off its CAN bus output, and enter the bus monitoring mode (MTTCAN0CCCR.MON set to '1'). In the bus monitoring mode it is still able to receive messages, but it cannot send any dominant bits and therefore cannot give acknowledge.

NOTE

To leave the fatal error state, the Host has to set MTTCAN0CCCR.INIT = '1'. After reset of MTTCAN0CCCR.INIT, the node restarts TTCAN communication.

When no error is encountered during synchronization, the first reference message sets MTTCAN0TTOST.SYS = "01" (Synchronizing), the second sets the TTCAN synchronization state (depending on its Next_is_Gap bit) to MTTCAN0TTOST.SYS = "11" (In_Schedule) or MTTCAN0TTOST.SYS = "10" (In_Gap), enabling all Tx_Triggers and Rx_Triggers.

(b) Potential Time Masters

After configuration, a potential time master will start the transmission of a reference message when it reaches its Tx_Ref_Trigger (or its Tx_Ref_Trigger_Gap when in external event-synchronized time-triggered operation). It will ignore its Watch_Trigger and Watch_Trigger_Gap when it did not receive any message or transmit the reference message successfully before reaching the Watch_Triggers (assumed reason: all other nodes still in reset or configuration, giving no acknowledge). When it reaches Init_Watch_Trigger, the attempted transmission is aborted, interrupt flag MTTCAN0TTIR.IWT is set, the FSE is frozen, and the cycle time will become invalid, but the node will still be able to take part in CAN bus communication (to give acknowledge or to send error flags). Resetting MTTCAN0TTIR.IWT will re-enable the transmission of reference messages until next time the Init_Watch_Trigger condition is met, or another CAN message is received. The FSE will be restarted by the reception of a reference message.

When a potential time master reaches the Watch_Triggers after it has received any message but the reference message, it will assume a fatal error (MTTCAN0TTOST.EL = “11”, severity 3), set interrupt flag MTTCAN0TTIR.WT, switch off its CAN bus output, and enter the bus monitoring mode (MTTCAN0CCCR.MON set to ‘1’). In bus monitoring mode, it is still able to receive messages, but it cannot send any dominant bits and therefore cannot give acknowledge.

When no error is detected during initialization, the first reference message sets MTTCAN0TTOST.SYS = “01” (synchronizing), the second sets the TTCAN synchronization state (depending on its Next_is_Gap bit) to MTTCAN0TTOST.SYS = “11” (In_Schedule) or MTTCAN0TTOST.SYS = “10” (In_Gap), enabling all Tx_Triggers and Rx_Triggers.

A potential time master is current time master (MTTCAN0TTOST.MS = “11”) when it was the transmitter of the last reference message, else it is backup time master (MTTCAN0TTOST.MS = “10”).

When all potential time masters have finished configuration, the node with the highest time master priority in the network will become the current time master.

37.6.4.3 TTCAN Gap Control

All functions related to Gap control apply only when the M_TTCAN is operated in external event-synchronized time-triggered mode (MTTCAN0TTOCF.GEN = ‘1’). In this operation mode the TTCAN message schedule may be interrupted by inserting Gaps between the basic cycles of the system matrix. All nodes connected to the CAN network have to be configured for external event-synchronized time-triggered operation.

During a Gap, all transmissions are stopped and the CAN bus remains idle. A Gap is finished when the next reference message starts a new basic cycle. A Gap starts at the end of a basic cycle that itself was started by a reference message with bit Next_is_Gap = ‘1’ e.g. Gaps are initiated by the current time master.

The current time master has two options to initiate a Gap. A Gap can be initiated under software control when the application program writes MTTCAN0TTOCN.NIG = ‘1’. The Next_is_Gap bit will be transmitted as ‘1’ with the next reference message. A Gap can also be initiated under hardware control when the application program enables the event trigger input pin m_ttcan_evt (MTTCAN0EVT) by writing MTTCAN0TTOCN.GCS = ‘1’. When a reference message is started and MTTCAN0TTOCN.GCS is set, a HIGH level at pin m_ttcan_evt (MTTCAN0EVT) will set Next_is_Gap = ‘1’.

As soon as that reference message is completed, the MTTCAN0TTOST.WFE bit will announce the Gap to the time master as well as to the time slaves. The current basic cycle will continue until its last time window. The time after the last time window is the Gap time.

For the actual time master and the potential time masters, MTTCAN0TTOST.GSI will be set when the last basic cycle has finished and the Gap time starts. In nodes that are time slaves, bit MTTCAN0TTOST.GSI will remain at ‘0’.

When a potential time master is in synchronization state In_Gap (MTTCAN0TTOST.SYS = “10”), it has four options to intentionally finish a Gap:

Under software control by writing MTTCAN0TTOCN.FGP = ‘1’.

Under hardware control (MTTCAN0TTOCN.GCS = ‘1’) an edge from HIGH to LOW at the event-trigger input pin m_ttcan_evt (MTTCAN0EVT) sets MTTCAN0TTOCN.FGP and restarts the schedule.

The third option is a time-triggered restart. When MTTCAN0TTOCN.TMG = ‘1’, the next register time mark interrupt (MTTCAN0TTIR.RTMI = ‘1’) will set MTTCAN0TTOCN.FGP and start the reference message.

Finally any potential time master will finish a Gap when it reaches its Tx_Ref_Trigger_Gap, assuming that the event to synchronize on did not occur in time.

Neither of these options can cause a basic cycle to be interrupted with a reference message.

Setting of MTTCAN0TTOCN.FGP after the Gap time has started will start the transmission of a reference message immediately and will thereby synchronize the message schedule. When MTTCAN0TTOCN.FGP is set before the Gap time has started (while the basic cycle is still in progress), the next reference message is started at the end of the basic cycle, at the Tx_Ref_Trigger – there will be no Gap time in the message schedule.

In strictly time-triggered operation, bit Next_is_Gap = ‘1’ in the reference message will be ignored, as well as the event-trigger input pin m_ttcan_evt (MTTCAN0EVT) and the bits MTTCAN0TTOCN.NIG, MTTCAN0TTOCN.FGP, and MTTCAN0TTOCN.TMG.

37.6.4.4 Stop Watch

The stop watch function enables capturing of M_TTCAN internal time values (local time, cycle time, or global time) triggered by an external event.

To enable the stop watch function, the application program first has to define local time, cycle time, or global time as stop watch source via MTTCAN0TTOCN.SWS. When MTTCAN0TTOCN.SWS is ≠ “00” and TT Interrupt Register flag MTTCAN0TTIR.SWE is ‘0’, the actual value of the time selected by MTTCAN0TTOCN.SWS will be copied into MTTCAN0TTCPT.SWV on the next rising/falling edge (as configured via MTTCAN0TTOCN.SWP) on pin m_ttcan_swt (MTTCAN0SWT). This will set interrupt flag MTTCAN0TTIR.SWE. After the application program has read MTTCAN0TTCPT.SWV, it may enable the next stop watch event by resetting MTTCAN0TTIR.SWE to ‘0’.

37.6.4.5 Local Time, Cycle Time, Global Time, and External Clock Synchronization

There are two possible levels in time-triggered CAN: Level 1 and Level 2. Level 1 only provides time-triggered operation using cycle time. Level 2 additionally provides increased synchronization quality, global time and external clock synchronization. In both levels, all timing features are based on a local time base - the local time.

The local time is a 16-bit cyclic counter, it is incremented once each NTU. Internally the NTU is represented by a 3-bit counter which can be regarded as a fractional part (three binary digits) of the local time. Generally, the 3-bit NTU counter is incremented 8 times each NTU. If the length of the NTU is shorter than 8 CAN clock periods (as may be configured in Level 1, or as a result of clock calibration in Level 2), the length of the NTU fraction is adapted, and the NTU counter is incremented only 4 times each NTU.

Figure 37.25 describes the synchronization of the cycle time and global time, performed in the same manner by all TTCAN nodes, including the time master. Any message received or transmitted invokes a capture of the local time taken at the message’s frame synchronization event. This frame synchronization event occurs at the sample point of each Start of Frame (SoF) bit and causes the local time to be stored as Sync_Mark. Sync_Marks and Ref_Marks are captured including the 3-bit fractional part.

Whenever a valid reference message is transmitted or received, the internal Ref_Mark is updated from the Sync_Mark. The difference between Ref_Mark and Sync_Mark is the Cycle Sync Mark

(Cycle Sync Mark = Sync_Mark - Ref_Mark) stored in register MTTCAN0TTCSM. The most significant 16 bits of the difference between Ref_Mark and the actual value of the local time is the cycle time (Cycle Time = Local Time - Ref_Mark).

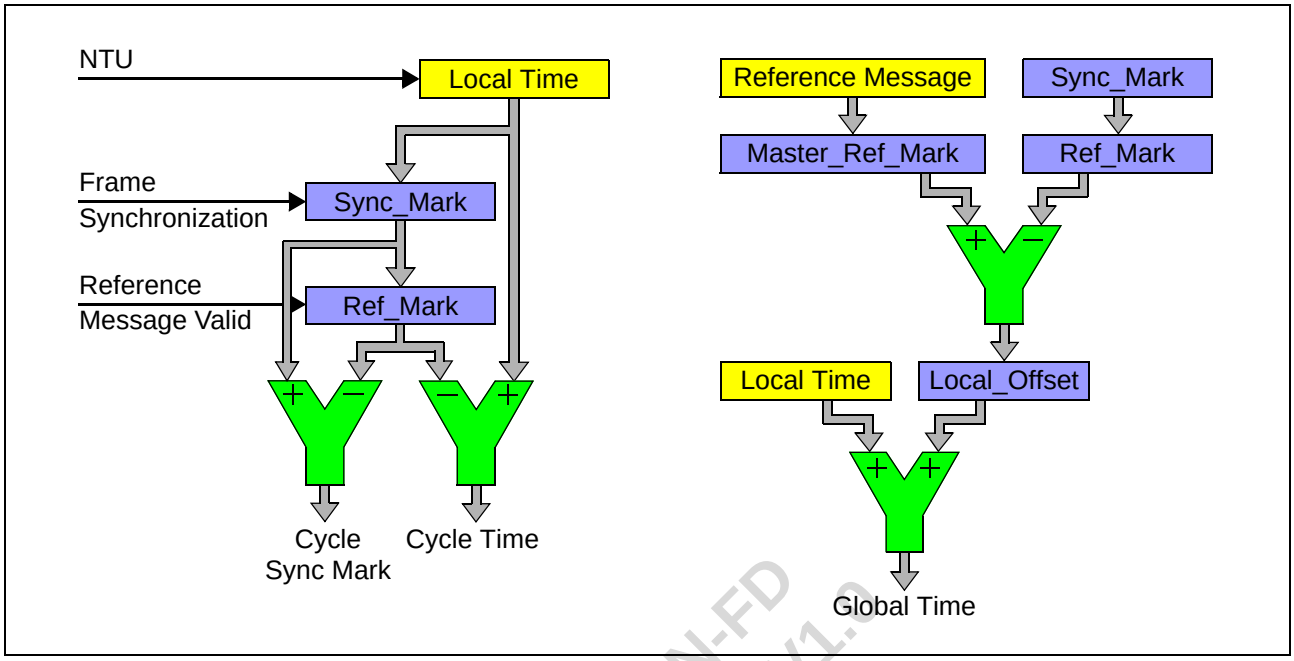

Figure 37.25 Cycle Time and Global Time Synchronization

The cycle time that can be read from MTTCAN0TTCTC.CT is the difference of the node's local time and Ref_Mark, both synchronized into the Host clock domain and truncated to 16 bit.

The global time exists for TTCAN Level 0 and Level 2 only, in Level 1 it is invalid. The node's view of the global time is the local image of the global time in (local) NTUs. After configuration, a potential time master will use its own local time as global time. The time master establishes its own local time as global time by transmitting its own Ref_Marks as Master_Ref_Marks in the reference message (bytes 3,4). The global time that can be read from MTTCAN0TTLGT.GT is the sum of the node's local time and its local offset, both synchronized into the Host clock domain and truncated to 16 bit. The fractional part is used for clock synchronization only.

A node that receives a reference message calculates its local offset to the global time by comparing its local Ref_Mark with the received Master_Ref_Mark (see **Figure 37.25**). The node's view of the global time is local time + local offset. In a potential time master that has never received another time master's reference message, Local_Offset will be zero. When a node becomes the current time master after first having received other reference messages, Local_Offset will be frozen at its last value. In the time receiving nodes, Local_Offset may be subject to small adjustments, due to clock drift, when another node becomes time master, or when there is a global time discontinuity, signalled by Disc_Bit in the reference message. With the exception of global time discontinuity, the global time provided to the application program by register MTTCAN0TTLGT is smoothed by a low-pass filtering to have a continuous monotonic value.

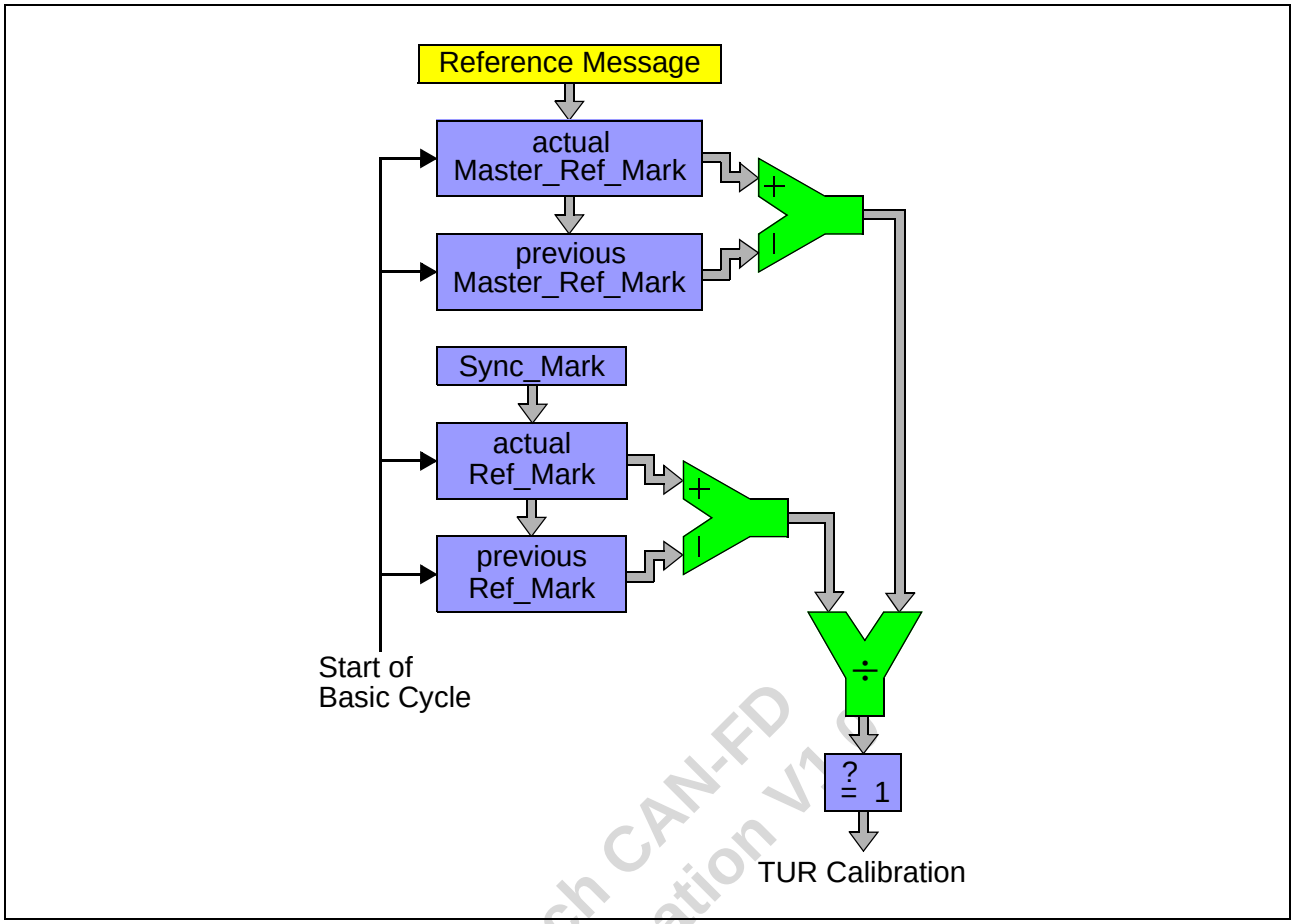

Figure 37.26 TTCAN Level 0 and Level 2 Drift Compensation

Figure 37.26 describes how in TTCAN Level 0,2 each time receiving node compensates the drift between its own local clock and the time master's clock by comparing the length of a basic cycle in local time and in global time. If there is a difference between the two values and the Disc_Bit in the reference message is not set, a new value for MTTCAN0TURNA.NAV is calculated. If the Synchronization Deviation SD = |NC - MTTCAN0TURNA.NAV| ≤ SDL (Synchronization Deviation Limit), the new value for MTTCAN0TURNA.NAV takes effect. Else the automatic drift compensation is suspended.

In TTCAN Level 0 and Level 2, MTTCAN0TTOST.QCS indicates whether the automatic drift compensation is active or suspended. In TTCAN Level 1, MTTCAN0TTOST.QCS is always '1'.

The current time master may synchronize its local clock speed and the global time phase to an external clock source. This is enabled by bit MTTCAN0TTOCF.EECS.

The stop watch function (see **Section 37.6.4.4, Stop Watch**) may be used to measure the difference in clock speed between the local clock and the external clock. The local clock speed is adjusted by first writing the newly calculated Numerator Configuration Low to MTTCAN0TURCF.NCL (MTTCAN0TURCF.DC cannot be updated during operation). The new value takes effect by writing MTTCAN0TTOCN.ECS to '1'.

The global time phase is adjusted by first writing the phase offset into the TT Global Time Preset register MTTCAN0TTGTP. The new value takes effect by writing MTTCAN0TTOCN.SGT to '1'. The first reference message transmitted after the global time phase adjustment will have the Disc_Bit set to '1'.

MTTCAN0TTOST.QGTP shows whether the node's global time is in phase with the time master's global time. MTTCAN0TTOST.QGTP is permanently '0' in TTCAN Level 1 and when the Synchronization Deviation Limit is exceeded in TTCAN Level 0,2 (MTTCAN0TTOST.QCS = '0'). It is temporarily '0' while the global time is low-pass filtered to supply the application with a continuous monotonic value. There is no low-pass filtering when the last reference message contained a Disc_Bit = '1' or when MTTCAN0TTOST.QCS = '0'.

37.6.4.6 TTCAN Error Level

The ISO 11898-4 specifies four levels of error severity:

S0 - No Error

S1 - Warning

Only notification of application, reaction application-specific.

S2 Error

Notification of application. All transmissions in exclusive or arbitrating time windows are disabled (i.e. no data or remote frames may be started). Potential time masters still transmit reference messages with the Reference Trigger Offset MTTCAN0TTOST.RTO set to the maximum value of 127.

S3 - Severe Error

Notification of application. All CAN bus operations are stopped, i.e. transmission of dominant bits is not allowed, and MTTCAN0CCCR.MON is set. The S3 error condition remains active until the application updates the configuration (set MTTCAN0CCCR.CCE).

If several errors are detected at the same time, the highest severity prevails. When an error is detected, the application is notified by MTTCAN0TTIR.ELC. The error level is monitored by MTTCAN0TTOST.EL.

The M_TTCAN signals the following error conditions as required by ISO 11898-4:

Config_Error (S3)

Sets Error Level MTTCAN0TTOST.EL to "11" when a merged arbitrating time window is not properly closed or when there is a Tx_Trigger with a time mark beyond the Tx_Ref_Trigger.

Watch_Trigger_Reached (S3)

Sets Error Level MTTCAN0TTOST.EL to "11" when a watch trigger was reached because the reference message is missing.

Application_Watchdog (S3)

Sets Error Level MTTCAN0TTOST.EL to "11" when the application failed to serve the application watchdog. The application watchdog is configured via MTTCAN0TTOCF.AWL. It is served by reading register MTTCAN0TTOST. When the watchdog is not served in time, bit MTTCAN0TTOST.AWE and interrupt flag MTTCAN0TTIR.AW are set, all TTCAN communication is stopped, and the M_TTCAN is set into bus monitoring mode (MTTCAN0CCCR.MON set to '1').

CAN_Bus_Off (S3)

Entering CAN_Bus_Off state sets error level MTTCAN0TTOST.EL to “11”. CAN_Bus_Off state is signalled by MTTCAN0PSR.BO = ‘1’ and MTTCAN0CCCR.INIT = ‘1’.

Scheduling_Error_2 (S2)

Sets Error Level MTTCAN0TTOST.EL to “10” if the MSC of one Tx_Trigger has reached 7. In addition interrupt flag MTTCAN0TTIR.SE2 is set. The Error Level MTTCAN0TTOST.EL is reset to “00” at the beginning of a matrix cycle when no Tx_Trigger has an MSC of 7 in the preceding matrix cycle.

Tx_Overflow (S2)

Sets Error Level MTTCAN0TTOST.EL to “10” when the Tx count is equal or higher than the expected number of Tx_Triggers MTTCAN0TTMLM.ENTT and a Tx_Trigger event occurs. In addition interrupt flag MTTCAN0TTIR.TXO is set. The Error Level MTTCAN0TTOST.EL is reset to “00” when the Tx count is no more than MTTCAN0TTMLM.ENTT at the start of a new matrix cycle.

Scheduling_Error_1 (S1)

Sets Error Level MTTCAN0TTOST.EL to “01” if within one matrix cycle the difference between the maximum MSC and the minimum MSC for all trigger memory elements (of exclusive time windows) is larger than 2, or if one of the MSCs of an exclusive Rx_Trigger has reached 7. In addition interrupt flag MTTCAN0TTIR.SE1 is set. If within one matrix cycle none of these conditions is valid, the Error Level MTTCAN0TTOST.EL is reset to “00”.

Tx_Underflow (S1)

Sets Error Level MTTCAN0TTOST.EL to “01” when the Tx count is less than the expected number of Tx_Triggers MTTCAN0TTMLM.ENTT at the start of a new matrix cycle. In addition interrupt flag MTTCAN0TTIR.TXU is set. The Error Level MTTCAN0TTOST.EL is reset to “00” when the Tx count is at least MTTCAN0TTMLM.ENTT at the start of a new matrix cycle.

37.6.4.7 TTCAN Message Handling

(1) Reference Message

For potential time masters the identifier of the reference message is configured via MTTCAN0TTRMC.RID. No dedicated Tx Buffer is required for transmission of the reference message. When a reference message is transmitted, the first data byte (TTCAN Level 1) resp. the first four data bytes (TTCAN Level 0 and Level 2) will be provided by the FSE.

In case the reference message Payload Select MTTCAN0TTRMC.RMPS is set, the rest of the reference message's payload (Level 1: bytes 2-8, Level 0,2: bytes 5-6) is taken from Tx Buffer 0. In this case the data length DLC code from message buffer 0 is used.

Table 37.148 Number of Data Bytes transmitted with a reference messages

MTTCAN0TTRMC.RMPS	MTTCAN0TXBRP.TRP0	Level 0	Level 1	Level 2
0	0	4	1	4
0	1	4	1	4
1	0	4	1	4
1	1	4 + MB0	1 + MB0	4 + MB0

To send additional payload with the reference message in Level 1 a DLC > 1 has to be configured, for Level 0,2 a DLC > 4 is required. In addition the transmission request pending bit MTTCAN0TXBRP.TRP0 of message buffer 0 must be set (see **Table 37.148**). In case bit MTTCAN0TXBRP.TRP0 is not set when a reference message is started, the reference message is transmitted with the data bytes supplied by the FSE only.

For acceptance filtering of reference messages the Reference Identifier MTTCAN0TTRMC.RID is used.

(2) Message Reception

Message reception is done via the two Rx FIFOs in the same way as for event-driven CAN communication (see **Section 37.6.3.4, Rx Handling**).

The Message Status Count MSC is part of the corresponding trigger memory element and has to be initialized to zero during configuration. It is updated while the M_TTCAN is in synchronization states In_Gap or In_Schedule. The update happens at the message's Rx_Trigger. At this point in time it is checked at which acceptance filter element the latest message received in this basic cycle had matched. The matching filter number is stored as the acceptance filter result. If this is the same the filter number as defined in this trigger memory element, the MSC is decremented by one. If the acceptance filter result is not the same filter number as defined for this filter element, or if the acceptance filter result is cleared, the MSC is incremented by one. At each Rx_Trigger and at each start of cycle, the last acceptance filter result is cleared.

The time mark of an Rx_Trigger should be set to a value where it is ensured that reception and acceptance filtering for the targeted message has completed. This has to take into consideration the RAM access time and the order of the filter list. It is recommended, that filters which are used for Rx_Triggers are placed at the beginning of the filter list. It is not recommended to use an Rx_Trigger for the reference message.

(3) Message Transmission

For time-triggered message transmission the M_TTCAN supplies 32 dedicated Tx buffers (see **Section (2), Dedicated Tx Buffers**). A Tx FIFO or Tx queue is not available when the M_TTCAN is configured for time-triggered operation (MTTCAN0TTOCF.OM = “01” or “10”).

Each Tx_Trigger in the trigger memory points to a particular Tx buffer containing a specific message. There may be more than one Tx_Trigger for a given Tx buffer if that Tx buffer contains a message that is to be transmitted more than once in a basic cycle or matrix cycle.

The application program has to update the data regularly and on time, synchronized to the cycle time. The Host CPU is responsible that no partially updated messages are transmitted. To assure this the Host has to proceed in the following way:

Tx_Trigger_Single / Tx_Trigger_Merged / Tx_Trigger_Arbitration

- Check whether the previous transmission has completed by reading MTTCAN0TXBTO
- Update the Tx buffer’s configuration and/or payload
- Issue an Add Request to set the Tx Buffer Request Pending bit

Tx_Trigger_Continuous

- Issue a Cancellation Request to reset the Tx Buffer Request Pending bit
- Check whether the cancellation has finished by reading MTTCAN0TXBCF
- Update Tx buffer’s configuration and/or payload
- Issue an Add Request to set the Tx Buffer Request Pending bit

The message’s MSC stored with the corresponding Tx_Trigger provides information on the success of the transmission.

The MSC is incremented by one when the transmission could not be started because the CAN bus was not idle within the corresponding transmit enable window or when the message was started and could not be completed successfully. The MSC is decremented by one when the message was transmitted successfully or when the message could have been started within its transmit enable window but was not started because transmission was disabled (M_TTCAN in Error Level S2 or Host has disabled this particular message).

The Tx buffers may be managed dynamically, i.e. several messages with different identifiers may share the same Tx buffer element. In this case the Host has to assure that no transmission request is pending for the Tx buffer element to be reconfigured by checking MTTCAN0TXBRP.

If a Tx buffer with pending transmission request should be updated, the Host first has to issue a cancellation request and check whether the cancellation has completed by reading MTTCAN0TXBCF before it starts updating.

The Tx Handler will transfer a message from the Message RAM to its intermediate output buffer at the trigger element which becomes active immediately before the Tx_Trigger element which defines the beginning of the transmit window. During and after the transfer time the transmit message may not be updated and its MTTCAN0TXBRP bit may not be changed. To control this transfer time, an additional trigger element may be placed before the Tx_Trigger. This may be e.g. a Time_Base_Trigger which need not cause any other action. The difference in time marks between the Tx_Trigger and the preceding trigger has to be large enough to guarantee that the Tx Handler can read four words from the Message RAM even at high RAM access load from other modules.

(a) Transmission in Exclusive Time Windows

A transmission is started time-triggered when the cycle time reaches the time mark of a Tx_Trigger_Single or Tx_Trigger_Continuous. There is no arbitration on the bus with messages from other nodes. The MSC is updated according the result of the transmission attempt. After successful transmission started by a Tx_Trigger_Single the respective Tx Buffer Request Pending bit is reset. After successful transmission started by a Tx_Trigger_Continuous the respective Tx Buffer Request Pending remains set. When the transmission was not successful due to disturbances, it will be repeated next time (one of) its Tx_Trigger(s) become(s) active.

(b) Transmission in Arbitrating Time Windows

A transmission is started time-triggered when the cycle time reaches the time mark of a Tx_Trigger_Arbitration. Several nodes may start to transmit at the same time. In this case the message has to arbitrate with the messages from other nodes. The MSC is not updated. When the transmission was not successful (lost arbitration or disturbance), it will be repeated next time (one of) its Tx_Trigger(s) become(s) active.

(c) Transmission in Merged Arbitrating Time Windows

The purpose of a merged arbitrating time window is to enable multiple nodes to send a limited number of frames which are transmitted in immediate sequence, the order given by CAN arbitration. It is not intended for burst transmission by a single node. Since the node does not have exclusive access within this time window, it may happen that not all requested transmissions are successful.

Messages which have lost arbitration or were disturbed by an error, may be re-transmitted inside the same merged arbitrating time window. The re-transmission will not be started if the corresponding Transmission Request Pending flag was reset by a successful Tx cancellation.

In single transmit windows, the Tx Handler transmits the message indicated by the message number of the trigger element. In merged arbitrating time windows, it can handle up to three message numbers from the trigger list. Their transmissions will be attempted in the sequence defined by the trigger list. If the time mark of a fourth message is read before the first is transmitted (or cancelled by the Host), the fourth request will be ignored.

The transmission inside a merged arbitrating time window is not time-triggered. The transmission of a message may start before its time mark, or after the time mark if the bus was not idle.

The messages transmitted by a specific node inside a merged arbitrating time window will be started in the order of their Tx_Triggers, so a message with low CAN priority may prevent the successful transmission of a following message with higher priority, if there is competing bus traffic. This has to be considered for the configuration of the trigger list. Time_Base_Triggers may be placed between consecutive Tx_Triggers to define the time until the data of the corresponding Tx Buffer needs to be updated.

37.6.4.8 TTCAN Interrupt and Error Handling

The TT Interrupt Register MTTCAN0TTIR consists of four segments. Each interrupt can be enabled separately by the corresponding bit in the TT Interrupt Enable register MTTCAN0TTIE. The flags remain set until the Host clears them. A flag is cleared by writing a '1' to the corresponding bit position.

The first segment consists of flags CER, AW, WT, and IWT. Each flag indicates a fatal error condition where the CAN communication is stopped. With the exception of IWT, these error conditions require a re-configuration of the M_TTCAN module before the communication can be restarted.

The second segment consists of flags ELC, SE1, SE2, TXO, TXU, and GTE. Each flag indicates an error condition where the CAN communication is disturbed. If they are caused by a transient failure, e.g. by disturbances on the CAN bus, they will be handled by the TTCAN protocol's failure handling and do not require intervention by the application program.

The third segment consists of flags GTD, GTW, SWE, TTMI, and RTMI. The first two flags are controlled by global time events (Level 0, 2 only) that require a reaction by the application program. With a Stop Watch Event triggered by a rising/falling edge on pin m_ttcan_swt (MTTCAN0SWT) internal time values are captured. The Trigger Time Mark Interrupt notifies the application that a specific Time_Base_Trigger is reached. The Register Time Mark Interrupt signals that the time referenced by MTTCAN0TTOCN.TMC (Cycle, Local, or Global) equals time mark MTTCAN0TTTMK.TM. It can also be used to finish a Gap.

The fourth segment consists of flags SOG, CSM, SMC, and SBC. These flags provide a means to synchronize the application program to the communication schedule.

37.6.4.9 Level 0

TTCAN Level 0 is not part of ISO11898-4. This operation mode makes the hardware, that in TTCAN Level 2 maintains the calibrated global time base, also available for event-driven CAN according to ISO11898-1.

Level 0 operation is configured via MTTCAN0TTOCF.OM = “11”. In this mode the M_TTCAN operates in event-driven CAN communication, there is no fixed schedule, the configuration of MTTCAN0TTOCF.GEN is ignored. External event-synchronized operation is not available in Level 0. A synchronized time base is maintained by transmission of reference messages.

In Level 0 the trigger memory is not active and therefore needs not to be configured. The time mark interrupt flag (MTTCAN0TTIR.TTMI) is set when the cycle time has reached MTTCAN0TTOCF.IRTO • 200_H, it reminds the Host to set a transmission request for message buffer 0. The Watch_Trigger interrupt flag (MTTCAN0TTIR.WT) is set when the cycle time has reached $FF00_H$. These values were chosen to have enough margin for a stable clock calibration. There are no further TT-error-checks.

Register time mark interrupts (MTTCAN0TTIR.RTMI) are also possible.

The reference message is configured as for Level 2 operation. Received reference messages are recognized by the identifier configured in register MTTCAN0TTRMC. For the transmission of reference messages only message buffer 0 may be used. The node transmits reference messages any time the Host sets a transmission request for message buffer 0, there is no reference trigger offset.

Level 0 operation is configured via:

- MTTCAN0TTRMC
- MTTCAN0TTOCF except EVTP, AWL, GEN
- MTTCAN0TTMLM except ENTT, TXEW
- MTTCAN0TURCF

Level 0 operation is controlled via:

- MTTCAN0TTOCN except NIG, TMG, FGP, GCS, TTMIE
- MTTCAN0TTGTP
- MTTCAN0TTTMK
- MTTCAN0TTIR excluding bits CER, AW, IWT SE2, SE1, TXO, TXU, SOG (no function)
- MTTCAN0TTIR the following bits have changed function
  - TTMI not defined by trigger memory - activated at cycle time MTTCAN0TTOCF.IRTO • 200_H
  - WT not defined by trigger memory - activated at cycle time $FF00_H$

Level 0 operation is signalled via:

- MTTCAN0TTOST excluding bits AWE, WFE, GSI, GFI, RTO (no function)

(1) Synchronizing

Figure 37.27 below describes the states and state transitions in TTCAN Level 0 operation. Level 0 has no In_Gap state.

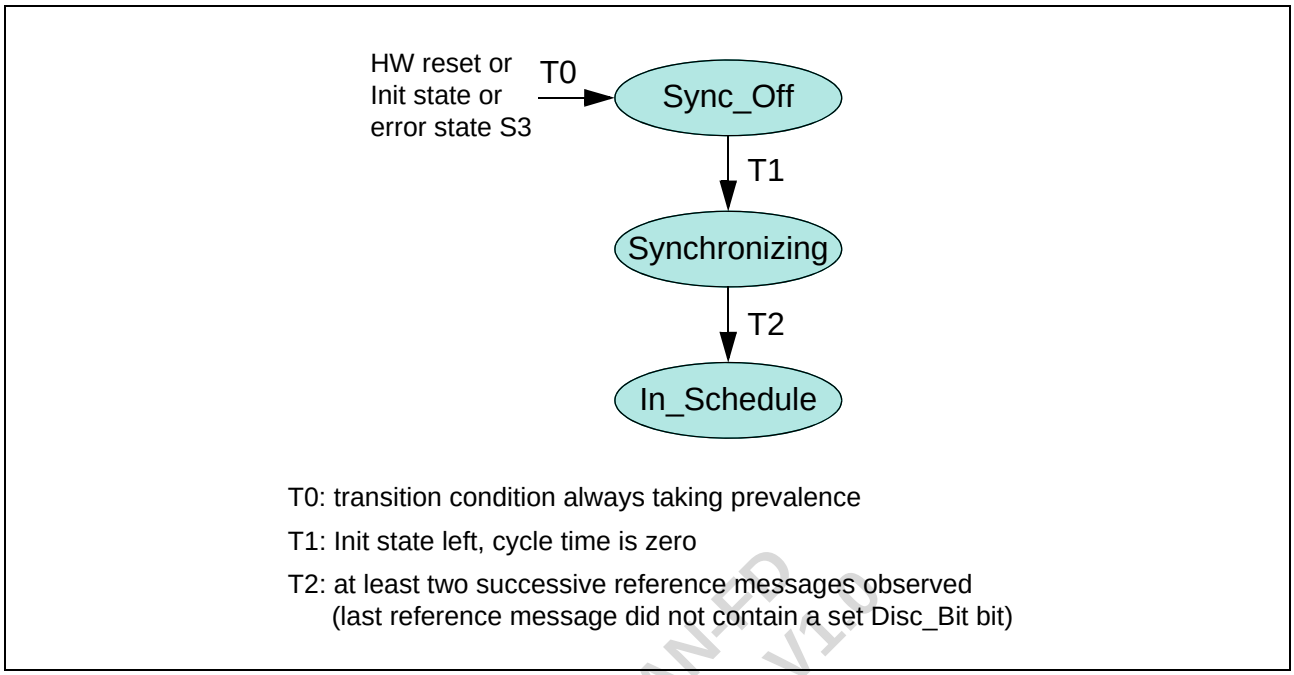

Figure 37.27 Level 0 schedule synchronization state machine

(2) Handling of Error Levels

During Level 0 operation only the following error conditions may occur:

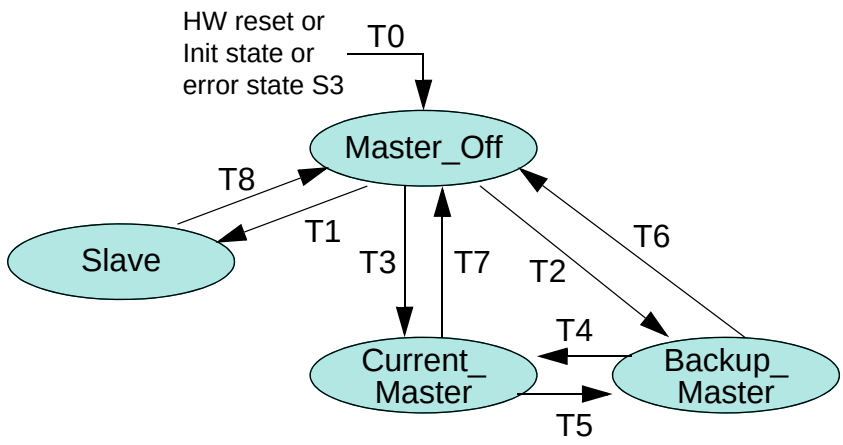
- Watch_Trigger_Reached (S3), reached cycle time $FF00_H$
- CAN_Bus_Off (S3)

Since no S1 and S2 error are possible, the error level can only switch between S0 (No Error) and S3 (Severe Error). In TTCAN Level 0 an S3 error is handled differently. When error level S3 is reached, both MTTCAN0TTOST.SYS and MTTCAN0TTOST.MS are reset, and interrupt flags MTTCAN0TTIR.GTE and MTTCAN0TTIR.GTD are set.

When error level S3 (MTTCAN0TTOST.EL = “11”) is entered, bus monitoring mode is, contrary to TTCAN Level 1 and Level 2, not entered. S3 error level is left automatically after transmission (time master) or reception (time slave) of the next reference message.

(3) Master Slave Relation

Figure 37.28 below describes the master slave relation in TTCAN Level 0. In case of an S3 error the M_TTCAN returns to state Master_Off.



T0: transition condition always taking prevalence

T1: reference message observed when not potential time master

T2: reference message observed with master priority ≠ own master priority, error state ≠ S3

T3: reference message observed with master priority = own master priority, error state ≠ S3

T4: reference message observed with own master priority

T5: reference message observed with master priority higher than own master priority

T6: error state S3

T7: error state S3

T8: error state S3

Figure 37.28 Level 0 master to slave relation

37.6.4.10 Synchronization to external Time Schedule

This feature can be used to synchronize the phase of the M_TTCAN's schedule to an external schedule (e.g. that of a second TTCAN network or FlexRay network). It is applicable only when the M_TTCAN is current time master (MTTCAN0TTOST.MS = "11").

External synchronization is controlled by event trigger input pin m_ttcan_evt (MTTCAN0EVT) . If bit MTTCAN0TTOCN.ESCN is set, a rising edge at pin m_ttcan_evt (MTTCAN0EVT) the M_TTCAN compares its actual cycle time with the target phase value configured by MTTCAN0TTGTP.CTP.

Before setting MTTCAN0TTOCN.ESCN the Host has to adapt the phases of the two time schedules e.g. by using the TTCAN gap control (see **Section 37.6.4.3, TTCAN Gap Control**). When the Host sets MTTCAN0TTOCN.ESCN, MTTCAN0TTOST.SPL is set.

If the difference between the cycle time and the target phase value MTTCAN0TTGTP.CTP at the rising edge at pin m_ttcan_evt (MTTCAN0EVT) is greater than 9 NTU, the phase lock bit MTTCAN0TTOST.SPL is reset, and interrupt flag MTTCAN0TTIR.CSM is set. MTTCAN0TTOST.SPL is also reset (and MTTCAN0TTIR.CSM is set), when another node becomes time master.

If both MTTCAN0TTOST.SPL and MTTCAN0TTOCN.ESCN are set, and if the difference between the cycle time and the target phase value MTTCAN0TTGTP.CTP at the rising edge at pin m_ttcan_evt (MTTCAN0EVT) is less or equal 9 NTU, the phase lock bit MTTCAN0TTOST.SPL remains set, and the measured difference is used as reference trigger offset value to adjust the phase at the next transmitted reference message.

NOTE

The rising edge detection at pin m_ttcan_evt (MTTCAN0EVT) is enabled with the start of each basic cycle. The first rising edge triggers the compare of the actual cycle time with MTTCAN0TTGTP.CTP. All further edges until the beginning of the next basic cycle are ignored.

37.7 Usage Notes

37.7.1 Port sharing between M_CAN IP and RLIN

By port sharing, ASC@CAN functionality can be achieved by sharing the M_TTCAN/M_CAN with the RLIN3.

All MTTCAN channel 0 pins will be shared with RLIN30.

One pair of MCAN channel 0 pins will be shared with RLIN30.

See the **Section 2, Pin Functions** and the **Section 18, LIN/UART Interface (RLIN3)** for details.

37.8 CAUTION

No.	Outline
ID1	M(TT)CAN - Transmitted bit in control field is falsified when using extreme bit time configurations. (Direction of use)

ID10	M(TT)CAN - Data loss in case storage of a received frame has not completed until end of EOF eld is reached (Specification change notice)
ID11	MTTCAN - Evaluation of event trigger input MTTCAN0EVT (Direction of use)
ID12	MTTCAN - Tx Enable Window of minimum length (Direction of use)
ID13	M(TT)CAN - Retransmission in DAR mode due to lost arbitration at the first two identifier bits. (Direction of use)
ID14	M(TT)CAN - Message RAM / RAM Arbiter not responding in time (Direction of use)

ID1		M(TT)CAN - Transmitted bit in control field is falsified when using extreme bit time configurations.
	Description	When M(TT)CANnBTP.TSEG2 and M(TT)CANnBTP.BRP are both zero and the M(TT)CAN transmits a frame, the FDF bit in CAN FD format (reserved bit in Classic CAN format) in the control eld may be falsied. The effect is different for frames to be transmitted in Classic CAN format and for frames to be transmitted in CAN FD format. Transmission of Classic CAN Frame: When M(TT)CANnBTP.TSEG2 and M(TT)CANnBTP.BRP are both zero and the M(TT)CAN transmits a Classic CAN frame (M(TT)CANnCCCR.CME = "00") with a 29-bit identier where the MSB (ID28) is '1', the reserved bit following the RTR bit will be transmitted recessive instead of dominant while the rest of the frame is transmitted in Classic CAN format. Transmission of CAN FD Frame: When M(TT)CANnBTP.TSEG2 and M(TT)CANnBTP.BRP are both zero and the M(TT)CAN transmits a CAN FD frame with a 29-bit identifier where the MSB (ID28) is '0' or a CAN FD frame with 11-bit identifier, the FDF bit of the frame is transmitted dominant instead of recessive, the rest of the frame is transmitted in Classic CAN format with a falsified DLC. Scope: The erratum is limited to the case when in the bit time configuration for Classic CAN operation and the Arbitration Phase in CAN FD operation M(TT)CANnBTP.TSEG2 and M(TT)CANnBTP.BRP are both zero. This configures the time segment after the sample point to the length of one time quantum and the length of the time quantum to one clock period. This is an unusual configuration. Effects: • Transmission of Classic CAN Frame When a Classic CAN frame is received by a CAN FD enabled receiving node it will interpret the falsified reserved bit as FDF bit. If this bit is recessive instead of dominant, the frame will be interpreted as CAN FD frame. In this case the receiving node will respond with an error frame when it detects that the rest of the frame is not in CAN FD format. A strictly Classic CAN receiving node will interpret the recessive FDF bit as reserved bit, ignore its actual value and will receive this frame correctly without detecting an error. • Transmission of CAN FD Frame When the M(TT)CAN wants to transmit a CAN FD frame, it transmits the FDF bit dominant instead of recessive and the rest of the frame in Classic CAN format with a falsified DLC.
	Workaround	Do not use bit timing configurations where M(TT)CANnBTP.TSEG2 and M(TT)CANnBTP.BRP are both zero for CAN FD communication.

ID2		M(TT)CAN - Message reception and transmission directly after detection of Protocol Exception Event.
	Description	When a CAN frame is received with bit FDF and the following res bit both recessive, the protocol controller correctly detects a Protocol Exception Event. Reception of the disturbed message is not finished, the message is discarded. If this happened, two cases have to be distinguished: 1. Message reception directly after Protocol Exception Event when the next frame is received interrupt flag M(TT)CANnIR.MRAF is set to '1' although the frame has been received correctly 2. Message transmission directly after Protocol Exception Event When a frame is transmitted directly after a Protocol Exception Event, that frame is transmitted with faulty frame format. In this case interrupt flag M(TT)CANnIR.MRAF is not set. The frame will cause an error frame. Only the first message after a Protocol Exception Event is affected, all following messages (received or transmitted) have no problem. Scope: The erratum is limited to the case when the reserved bit res after the FDF bit in CAN FD frames is received recessive. Effect: Reception directly after Protocol Exception Event: Interrupt flag IR.MRAF is set although there was no problem in accessing the Message RAM. The Message is received correctly. Transmission directly after Protocol Exception Event: Transmission of a frame with faulty frame format.
	Workaround	None
ID3		M(TT)CAN - Change of CAN operation mode during start of transmission.
	Description	When M(TT)CANnCCCR.CMR is changed during start of transmission, the following may happen: 1. Classic CAN -> CAN FD with bit rate switching: When the Tx Event FIFO is used, bits EDL and BRS of the related Tx Event FIFO element do not match with the transmitted frame type. They signal a CAN FD frame with bit rate switching (both set to one) while a Classic CAN frame was transmitted. 2. Classic CAN -> CAN FD without bit rate switching: When the Tx Event FIFO is used, bit EDL of the related Tx Event FIFO element does not match with the transmitted frame type. It signals a CAN FD frame while a Classic CAN frame was transmitted. 3. CAN FD with bit rate switching -> CAN FD without bit rate switching: When the Tx Event FIFO is used, bit BRS of the related Tx Event FIFO element does not match with the transmitted frame type. It signals a CAN FD frame without bit rate switching while a CAN FD frame with bit rate switching was transmitted. 4. CAN FD without bit rate switching -> CAN FD with bit rate switching: When the Tx Event FIFO is used, bit BRS of the related Tx Event FIFO element does not match with the transmitted frame type. It signals a CAN FD frame with bit rate switching while a CAN FD frame without bit rate switching was transmitted. 5. CAN FD with/without bit rate switching -> Classic CAN: M(TT)CANnIR.MRAF is set, the M(TT)CAN switches to Restricted Operation Mode, and the transmission is aborted. Scope: The erratum is limited to the case when the CAN operation mode is changed during start of transmission. Effects: Tx Event FIFO element faulty (cases 1,2,3,4) or interrupt flag M(TT)CANnIR.MRAF set, Restricted Operation Mode entered, and transmission aborted (case 5).
	Workaround	Do not change the CAN operation mode by writing to M(TT)CANnCCCR.CMR aslong as there are pending transmission requests (M(TT)CANnTXBRP.TRPnn ='1').

ID4		M(TT)CAN - Problem with frame transmission after recovery from Restricted Operation Mode.
	Description	After detecting a Message RAM Access Failure during frame transmission, interrupt flag M(TT)CANnIR.MRAF is set and the M(TT)CAN enters Restricted Operation Mode (M(TT)CANnCCCR.ASM = '1'). When the Restricted Operation Mode is left by writing M(TT)CANnCCCR.ASM = '0', it may happen, that the first frame transmitted is send out with unexpected identifier and control field. If this is a valid frame, it may happen that it is accepted and acknowledged by a receiver. Scope: The erratum is limited to the case when the M(TT)CAN has entered Restricted Operation Mode due to a Message RAM Access Failure, signalled by interrupt flag M(TT)CANnIR.MRAF. Effects: With the next transmission after leaving Restricted Operation Mode by resetting M(TT)CANnCCCR.ASM, a frame with unexpected identifier and control field is transmitted which accidentally might be accepted and acknowledged by a receiver.
	Workaround	To recover from Restricted Operation Mode proceed as follows: • Initialize M(TT)CAN and clear all pending transmission requests by writing M(TT)CANnCCCR.INIT = '1', M(TT)CANnCCCR.CCE = '1', M(TT)CANnCCCR.ASM = '0 • Restart M(TT)CAN by writing M(TT)CANnCCCR.INIT = '0 • Configure the CAN operation mode by writing to M(TT)CANnCCCR.CM • Request the transmissions cancelled by step one
ID5		M(TT)CAN - Setting / resetting M(TT)CANnCCCR.INIT during frame reception.
	Description	When M(TT)CANnCCCR.INIT is set while the M(TT)CAN is receiving a frame, the next received frame after resetting M(TT)CANnCCCR.INIT will cause M(TT)CANnIR.MRAF to be set. Scope: The erratum is limited to the case when M(TT)CANnCCCR.INIT is set / reset while the M(TT)CAN is receiving a frame. Effects: M(TT)CANnIR.MRAF is set when the first frame after resetting M(TT)CANnCCCR.INIT is received although that frame is received correctly.
	Workaround	Set M(TT)CANnCCCR.CCE before resetting M(TT)CANnCCCR.INIT.
ID6		M(TT)CAN - Frame transmission in DAR mode.
	Description	1.When a message is transmitted while M(TT)CANnCCCR.DAR = '1' (automatic retransmission disabled for messages not transmitted successfully), the Event Type of the corresponding Tx Event FIFO element is ET = "01" instead of ET = "10" 2.When multiple messages are transmitted sequentially using the same Tx Buffer while M(TT)CANnCCCR.DAR = '1', it may happen that a newly requested transmission is not started when it is requested in the time window starting at the successful completion of the previous message and ending at the end of the intermission phase before the bus is idle again. This message is then treated as if it had lost arbitration. Scope: The erratum is limited to message transmission when DAR mode is configured. Normal CAN / CAN FD operation is not affected Effects: 1. The Event Type of the associated Tx Event FIFO element is not correct 2. When a message was transmitted successfully from a specific Tx Buffer, a following transmission using the same Tx Buffer and requested in the described time window will not be started.
	Workaround	Do not use the same Tx Buffer for consecutive DAR transmissions or wait at least for 4 CAN bit times after successful transmission before requesting the next transmission from the same Tx Buffer.

ID7		M(TT)CAN - Setting M(TT)CANnCCCR.CCE while a Tx scan is ongoing.
	Description	When M(TT)CANnCCCR.CCE is set while a Tx scan is in progress, the Tx Handler FSM stops. After M(TT)CANnCCCR.INIT and M(TT)CANnCCCR.CCE are reset, the Tx Handler FSM does not execute transmission requests.
	Workaround	1) Cancel all pending transmission requests by writing 0hFFFF FFFF to register M(TT)CANnTXBCR 2) Issue a clock stop request by setting bit M(TT)CANnCCCR.CSR 3) Wait until the M(TT)CAN sets CCCR.INIT and M(TT)CANnCCCR.CSA to one 4) First reset M(TT)CANnCCCR.CSR 5) Then reset M(TT)CANnCCCR.INIT 6) Wait until M(TT)CANnCCCR.INIT is read as zero 7) Issue a second clock stop request by setting bit M(TT)CANnCCCR.CSR 8) Wait until the M(TT)CAN sets M(TT)CANnCCCR.INIT and M(TT)CANnCCCR.CSA to one 9) Set M(TT)CANnCCCR.CCE and reset M(TT)CANnCCCR.CSR
ID8		M(TT)CAN - Needless activation of interrupt IR.MRAF
	Description	During frame reception while the M(TT)CAN is in Error Passive state and the Receive Error Counter has the value M(TT)CANnECR.REC = 127, it may happen, that M(TT)CANnIR.MRAF is set although there was no Message RAM access failure. In case of MTTCAN: If enabled, the interrupt INTMTTCANI0 or INTMTTCANI1 is generated. In case of MCAN: If enabled, the interrupt INTMCANnI0 or INTMCANnI1 is generated.
	Workaround	The Message RAM Access Failure interrupt routine needs to check whether M(TT)CANnECR.RP = '1' and M(TT)CANnECR.REC = 127. In this case reset M(TT)CANnIR.MRAF, no further action required.
ID9		M(TT)CAN - Return of receiver from Bus Integration state after Protocol Exception Event.
	Description	In case a started transmission is aborted shortly before the transmission of the FDF bit, a receiver will detect a recessive FDF bit followed by recessive res bit. In this case receiving M(TT)CANs with Protocol Exception Event Handling enabled will detect a protocol exception event and will enter Bus Integration state. These receivers are expected to leave Bus Integration state after 11 consecutive recessive bits. Instead to start counting of 11 recessive bits directly after entering Bus Integration state, the M(TT)CAN needs to see at least one dominant bit before starting to count the sequence of 11 recessive bits.
	Workaround	Set and release M(TT)CANnCCCR.INIT.

ID10		M(TT)CAN - Data loss in case storage of a received frame has not completed until end of EOF eld is reached
	Description	Acceptance filtering and storage of a received frame must be finished until the end of EOF field is reached. In case storage of a received message has not completed until end of the received frame is reached, the following faulty behaviour can be observed: • The last write to the Message RAM to complete storage of the received message is omitted, this data is lost. Applies for data frames with DLC > 0, worst case is DLC = 1. • Rx FIFO: FIFO put index M(TT)CANnRXFnS.FnPI is updated although the last FIFO element holds corrupted data. • Rx Buffer: New Data flag NDATn.NDxx is set although the Rx Buffer holds corrupted data. • Interrupt flag IR.MRAF is not set.
	Workaround	To ensure that the acceptance filtering and storage of the received message has finished until the end of EOF field, the CLK_HSB must be set accordingly. For classic CAN communication:

Arbitration Phase [Mbps]	1	0.5
Data Phase [Mbps]	1	0.5
min. CLK_HSB frequency [MHz]	23.7	11.9

For CAN-FD communication:

Arbitration Phase [Mbps]	1	1	0.5	0.5
Data Phase [Mbps]	8	4	8	4
min. CLK_HSB frequency [MHz]	55.9	44.0	32.4	28.0

ID11		MTTCAN - Evaluation of event trigger input MTTCAN0EVT
	Description	When the event trigger input MTTCAN0EVT is activated (rising edge) in a narrow time window shortly after the MTTCAN has started the transmission of a reference message, the reference message is transmitted with the Next_is_Gap flag not set, but MTTCANnTTOST.WFE is set, signalling that a reference message with Next_is_Gap = '1' has been received. Due to this, the MTTCAN transmits a reference message with Next_is_Gap flag not set, but assumes that a gap starts at the end of the basic cycle. The backup time master in the system, not having seen a reference message with Next_is_Gap set, sends the next reference message and the M_TTCAN becomes backup time master. It will resume time mastership when it wins arbitration at the transmission of the following reference message.
	Workaround	The synchronization of the cycle time phase to an external event has to be repeated.
ID12		MTTCAN - Tx Enable Window of minimum length
	Description	When the Tx Enable Window is congured to its minimum length of one NTU (MTTCAN0TTMLM.TXEW = "0000"), it may happen, that the requested transmission is not started.
	Workaround	Congure the Tx Enable Window to a length of more than one NTU (MTTCAN0TTMLM.TXEW > "0000").

ID13		M(TT)CAN - Retransmission in DAR mode due to lost arbitration at the first two identifier bits.
	Description	When the M(TT)CAN is configured in DAR mode (M(TT)CANnCCCR.DAR = '1') the Automatic Retransmission for transmitted messages that have been disturbed by an error or have lost arbitration is disabled. When the transmission attempt is not successful, the Tx Buffer's transmission request bit (M(TT)CANnTXBRP.TRPxx) shall be cleared and its cancellation finished bit (M(TT)CANnTXBCF.CFxx) shall be set. When the transmitted message looses arbitration at one of the first two identifier bits, it may happen, that instead of the bits of the actually transmitted Tx Buffer, the M(TT)CANnTXBRP.TRPxx and M(TT)CANnTXBCF.CFxx bits of the previously started Tx Buffer (or Tx Buffer 0 if there is no previous transmission attempt) are written (M(TT)CANnTXBRP.TRPxx = '0', M(TT)CANnTXBCF.CFxx = '1'). If in this case the M(TT)CANnTXBRP.TRPxx bit of the Tx Buffer that lost arbitration at the first two identifier bits has not been cleared, retransmission is attempted. When the M(TT)CAN looses arbitration again at the immediately following retransmission, then actually and previously transmitted Tx Buffer are the same and this Tx Buffer's M(TT)CANnTXBRP.TRPxx bit is cleared and its M(TT)CANnTXBCF.CFxx bit is set. Scope: The erratum is limited to the case when the M(TT)CAN looses arbitration at one of the first two transmitted identifier bits while in DAR mode. The problem does not occur when the transmitted message has been disturbed by an error. Effects: In this case it may happen, that the M(TT)CANnTXBRP.TRPxx bit is cleared after the second transmision attempt instead of the first. Additionally it may happen that the M(TT)CANnTXBRP.TRPxx bit of the previously started Tx Buffer is cleared, if it has been set again. As in this case the previously started Tx Buffer has lost M(TT)CAN internal arbitration against the active Tx Buffer, its message has a lower identifier priority. It would also have lost arbitration on the CAN bus at the same position.
	Workaround	None
ID14		M(TT)CAN - Message RAM / RAM Arbiter not responding in time
	Description	When the M(TT)CAN wants to store a received frame, and the Message RAM / RAM Arbiter does not respond in time (no or delayed m_(tt)can_aeim_ready), this message cannot be stored completely and it is discarded with the reception of the next message. Interrupt flag M(TT)CANnIR.MRAF is set. It may happen that the next received message is stored incomplete. In this case, the respective Rx Buffer or Rx FIFO element holds inconsistent data.
	Workaround	Configure the RAM Watcdog to the maximum expected Message RAM access deley. In case the Message RAM / RAM Arbiter does not respond within this time, the Watchdog Interrupt M(TT)CANnIR.WDI is set. In this case discard the frame received after M(TT)CANnIR.MRAF has been activated.

37.9 Difference among P1M-C, P1H-C and P1H-CE

There are differences in channels, interrupts, and external pins. For details, please refer to **Table 37.2**, **Table 37.8**, and **Table 37.9**.

REVISION HISTORY	RH850/P1x-C User's Manual: Hardware

1.10	Jul 15, 2016	Section 16 Clocked Serial Interface H (CSIH)	
		650	16.2.1 Functional Overview: Description corrected
		652	Figure 16.1 CSIH block diagram: Corrected
		656	16.3.3 CSIHnCTL1 — CSIH control register 1: Register name of bits 15 to 8 in the bit chart, corrected
		656	Table 16.14 CSIHnCTL1 register contents: Functional description on bit 19, corrected
		656	Table 16.14 CSIHnCTL1 register contents: Functional description on bit 18, added
		657	Table 16.14 CSIHnCTL1 register contents: Functional description on bit 16, corrected
		657	Table 16.14 CSIHnCTL1 register contents: Functional description on bits 15 to 8, corrected
		657	Table 16.14 CSIHnCTL1 register contents, Description changed, Bit Position: 6
		657	Table 16.14 CSIHnCTL1 register contents: Functional description on bit 6, corrected
		659	Table 16.17 CSIHnCTL2 register contents: Functional description on bits 15 to 3, corrected
		660	16.3.4 CSIHnCTL2 — CSIH control register 2: Description corrected
		660	16.3.4 CSIHnCTL2 — CSIH control register 2: Description corrected
		678	Table 16.29 CSIHnCFGx register contents: Functional description on bits 31 and 30, corrected
		680	Table 16.29 CSIHnCFGx register contents (3/5): Functional description on bits 17 and 16, corrected
		681	Table 16.29 CSIHnCFGx register contents (4/5): Functional description on bits 17 and 16, corrected
		681	Table 16.29 CSIHnCFGx register contents (4/5): Functional description of bits 17 and 16, corrected
		681	Table 16.29 CSIHnCFGx register contents: Functional description on bit 15, corrected
		681	Table 16.29 CSIHnCFGx register contents: Register name corrected
		682	Table 16.29 CSIHnCFGx register contents (4/5): Functional description on bits 14 to 12, corrected
		683	Table 16.30 CSIHnBRSx register contents: Functional description on bits 11 to 0
		686	16.3.18 PMMAnTCTLx — PMM TG control register (x = 0 to 7): Description corrected
		688	16.3.20 PMMAnRX — PMMA TG receive buffer: Register name corrected
		692	16.3.24 PMMAnSTC — PMMA TG status clear register: R/W of bits 31 to 16 (Reserved) in the bit chart, corrected
		693	Table 16.39 Notes on Setting Registers: Corrected
		693	Table 16.39 Notes on Setting Registers: Corrected
		693	Table 16.39 Notes on Setting Registers: Corrected
		693	Table 16.39 Notes on Setting Registers: Corrected
		695	Table 16.39 Notes on Setting Registers: Corrected
		698	16.4.3.1 CSIHTIC in direct access mode: Description corrected
		709	16.5.3.1 Configuration registers: Description corrected
		710	Figure 16.14 Chip select and RCB example: Corrected
		712	Figure 16.16 to Figure 16.18: Title corrected
		713	Figure 16.16 to Figure 16.18: Title corrected
		716	Figure 16.22 Baud rate generator block diagram: Corrected
		716	16.5.5 Transmission clock selection: Description corrected
		717	16.5.5 Transmission clock selection: Corrected
		723	16.5.8.2 Data length greater than 16 bits: NOTES corrected
		726	16.5.10.2 CSIHTSSO operation, Changed, Figure
		733	16.5.12.3 Time-out error: Register name corrected
		740	Figure 16.45 Enforced Chip Select Idle Example, Changed
		744	16.5.17 Limited Reset and Module stand-by: Description corrected
		745	16.5.18 Chip select Return to Inactive: Corrected
		745	16.5.18 Chip select Return to Inactive: Note1 corrected
		745	16.5.18 Chip select Return to Inactive, Changed, Figure
		747	16.5.19 Select the timing of outputting INT_CSIHTIC: Added

		2277	Table 27.13 ADCFnDIRj register contents, Changed, Bit Name
		2281	Table 27.17 ADCFnMPXCURR register contents, Description changed, Bit Position: 3 to 0, Function
		2282	Table 27.18 ADCFnMPXOWR register contents, Description changed
		2284	27.3.13 ADCFnADENDP0 — A/D Conversion Monitor Virtual Channel Pointer: Description corrected
		2284	Table 27.20 ADCFnADENDP0 register contents: Functional description on bits 5 to 0, corrected
		2302	27.3.29 ADCFnSGSRx — Scan Group x Status Register, Added. CAUTION
		2314	Figure 27.11 diagnosis circuits, Added, Note
		2314	Figure 27.11 diagnosis circuits, Changed
		2315	27.4.7.2 A/D Conversion Circuit Diagnostic Function, Change the form, CAUTION
		2317	27.4.7.3 Wiring-Break Detection Diagnostic Function, Description changed, NOTE
		2319	27.4.11 Starting a Scan Group by Using a Hardware Trigger, Description Added, NOTE
		2319	Figure 27.15 A/D Conversion Monitor Timing, Changed

Rev.	Date	Description	
		Page	Summary
1.10	Jul 15, 2016	Section 28 Functional Safety	
		2333	Table 28.3 Code Flash ECC: Corrected
		2334	Table 28.4 List of Register: Corrected
		2335	(1) UCFERRINT — FLI (Code-Flash) Data and Address Error Information Control Register: Title and description corrected
		2341	(7) UCFnSEDADR — FLI (Code-Flash) n ECC SED Address Register (n = 1 to 4): Description corrected
		2346	(4) Self-diagnosis of address parity check function: NOTE added
		2354	(6) DFERRINTn — Data flash error notification control register (n = 0, 1): Description corrected
		2355	(7) DFEADRn — Data flash 1st error address register (n = 0, 1): Description corrected
		2355	Table 28.24 DFEADRn register contents: Functional description on bits 20 and 19, corrected
		2355	Table 28.24 DFEADRn register contents: Functional description on bits 20 and 19, corrected
		2364	(2) LRERRINT_PE1/PE2 — Local-RAM Error Information Control Register: Description corrected
		2377	28.2.5.1 Overview, Description corrected
		2377	28.2.5.1 Overview, Description changed
		2377	28.2.5.1 Overview, Description deleted
		2378	Table 28.40 Global RAM ECC, Description changed: "EDC" → "ECC"
		2378	Table 28.40 Global RAM ECC, Changed, Item: Address ECC
		2381	Table 28.41 List of Registers, Added, Note 1
		2386	Table 28.46 UGRSERSTR register contents, Description corrected
		2391	(9) GRECCCTL_GRAMC — Global-RAM ECC Control Register, Description changed
		2394	(11) GRTDATBF[0/1][L/H] — Global-RAM Test Data Read Buffer (Lower/Upper 32 bit of Bank0/1): NOTE added
		2397	(14) GRECCCTL_VCI2GRAM/PE1/PE2/AXI2GRAM — Global-RAM ECC Control Register, Description deleted and Note 1 added
		2417	(14) ITOVFSTR_PE1/PE2 — Instruction Cache Tag RAM Error Count Overflow Status Register, Description corrected
		2422	28.2.8.1 Overview, (1) FlexRay, CSIHn (n = 0 to 3), MCAN, GTM: Titile corrected
		2423	28.2.8.1 Overview: (3) FlexRay added
		2426	Table 28.77 List of Register: Note 3 added
		2426	Table 28.78 Register Map: Corrected
		2430	(2) TMC — ECC test mode control register: Name of bit 7 in the bit chart, corrected
		2440	Table 28.89 List of Registers, Description corrected
		2440	Table 28.89 List of Registers, Description corrected

		41	Table 1.2 Features in each product, Description changed, P1H-C (4MB)
		41	Table 1.2 Features in each product, Description changed, P1M-C
		Section 2 Pin Functions	
		61	2.1.6 P1M-C/P1H-C (BGA-156) (TOP View), Section added
		61	2.1.7 Term Definition, Column for P1M-C/P1H-C (156) added
		61	2.1.7 Term Definition, Description in Table added, Table header
		63	Table 2.1 Pin List, Column added
		75	Table 2.3 Pin Function assignments, Columns added
		75	Table 2.3 Pin Function assignments, Description in the table header added
		Section 4 Address Map	
		257	Table 4.1 List of P-bus area access, Description added, Table header
		257	Table 4.1 List of P-bus area access, Columns added
		267	Table 4.1 List of P-bus area access, Note 3 added
		268	Table 4.2 List of H-Bus area access, Description added, Table header
		268	Table 4.2 List of H-Bus area access, Columns added
		268	Table 4.2 List of H-Bus area access, Note 1 added
		Section 6 Interrupt Controller (INTC)	
		327	Table 6.26 Difference among P1M-C, P1H-C and P1H-CE, *3 added
		330	Table 6.26 Difference among P1M-C, P1H-C and P1H-CE, Note 3 added
		Section 7 DMA	
		374	Table 7.12 List of DMA Trigger Sources, Description added, DMA Trigger Source: DMACTRG[8] and DMACTRG[9]
		376	Table 7.12 List of DMA Trigger Sources, Description added, DMA Trigger Source: DMACTRG[94] to DMACTRG[97]
		376	Table 7.12 List of DMA Trigger Sources, Description added, DMA Trigger Source: DMACTRG[102] to DMACTRG[105]
		378	Table 7.13 List of DTS Trigger Sources, Description added, Primary DTS Trigger Source: DTSTRG[8] and DTSTRG[9]
		381	Table 7.13 List of DTS Trigger Sources, Description added, Primary DTS Trigger Source: DTSTRG[104] to DTSTRG[107]
		381	Table 7.13 List of DTS Trigger Sources, Description added, Primary DTS Trigger Source: DTSTRG[112] to DTSTRG[115]
		Section 15 External Memory Controller (MEMC)	
		645	Table 15.12 Difference of number of macro, Description added, Table header
		645	Table 15.12 Difference of number of macro, Columns for BGA-156 added, P1M-C/P1H-C
		Section 16 Clocked Serial Interface H (CSIH)	
		650	Table 16.10 Data Consistency Checking and Port Pins, Description added, Data Consistency Checking: CSIH0 and CSIH1
		650	Table 16.10 Data Consistency Checking and Port Pins, Description changed, Data Consistency Checking: CSIH3
		790	16.8 Difference among P1M-C, P1H-C and P1H-CE, Description added
		Section 17 High Speed USRT (HS-USRT)	
		791	Table 17.1 HS-USRT Channels, Description added, Product Name
		839	17.5 Difference among P1M-C, P1H-C and P1H-CE, Description added

Rev.	Date	Description	
		Page	Summary
1.21	Mar 10, 2017	Section 18 LIN/UART Interface (RLIN3)	
		840	Table 18.1 Units, Description changed, Table header
		840	Table 18.1 Units, Columns added
		840	Table 18.2 Unit Configurations and Channels, Description added, Table header
		840	Table 18.2 Unit Configurations and Channels, Columns added
		983	Table 18.95 Different specification of RLIN3n, Description added, Table header
		Section 19 CAN Controller (MCAN)	
		984	Section 19 CAN Controller (MCAN), Description added
		985	Table 19.2 Number of MTTCAN/MCAN channel, *1 added, P1H-C (4MB): MTTCAN0
		985	Table 19.2 Number of MTTCAN/MCAN channel, Description changed, Note 1
		990	19.2.2 Block Diagram, Note number changed
		990	19.2.2 Block Diagram, Note 1 added
		Section 20 FlexRay (FLX)	
		1239	Table 20.1 Number of FlexRay Modules, Description added, Table header
		1531	20.5 Difference among P1M-C, P1H-C and P1H-CE, Description added, Table header
		Section 21 Ethernet Controller (ETNA)	
		1532	Table 21.1 Ethernet Channels, Description added, Table header
		1534	Table 21.5 Difference of number of macro, Column added
		1534	Table 21.5 Difference of number of macro, Description added, Table header
		1534	Table 21.6 Ethernet External Input / Output Signals, Note 3 added
		1553	Table 21.15 ETNAnECSRm register contents, Note added
		1556	Table 21.18 ETNAnPLSRm register contents, Description added, Function: Bit 0
		1556	Table 21.18 ETNAnPLSRm register contents, Note added
		Section 22 Single Edge Nibble Transmission (SENT)	
		1678	Table 22.2 The number of channels in each product, Description added, Table header
		1678	Table 22.2 The number of channels in each product, Columns added
		1678	Table 22.3 Register Base Address <RSENTn_base>, Columns added
		1678	Table 22.3 Register Base Address <RSENTn_base>, Description deleted, <RSENTn_base> Address: RSENT6 to RSENT9
		1684	Table 22.8 Overview of RSENTn Registers, Description deleted, Register Name: RSENT6TSSEL to RSENT9TSSEL
		1752	Table 22.43 Different specification of RSENT, Description added, Table header
		1752	Table 22.43 Different specification of RSENT, Columns added
		Section 25 Generic Timer Module (GTM)	
		1801	Table 25.2 Sub-Units and Channels, *2 and *3 added, Instance name (P1H-C, P1H-CE): ATOM
		1801	Table 25.2 Sub-Units and Channels, Notes 2 and 3 added
		1805	Table 25.6 Pin Function Information, Description added, Table header
		Section 26 Peripheral Interconnect (PIC)	
		2239	Table 26.4 Pin Function Information, Description added, Table header
		2256	Table 26.15 Connections between RLIN3 and GTM, Description added, Table header
		2258	Table 26.16 Each device different specification, Note 1 and *1 added
		Section 27 A/D Converter (ADCF)	
		2327	Table 27.44 Different specifications of ADCF, Description added, Table header
		2327	Table 27.44 Different specifications of ADCF, Columns added
		Section 28 Functional Safety	
		2542	Table 28.169 PBG Group, Description added, Note: PBG channel numbers 8 and 9 (PBG1 #1)
		2544	Table 28.169 PBG Group, Description added, Note: PBG channel numbers 8 and 9 (PBG3 #1)
		2550	Table 28.170 List of Registers, Description added, Note: FFEE0240H to FFEE024CH
		2554	Table 28.170 List of Registers, Description added, Note: FFF94240H to FFF9424CH
		2571	Table 28.184 List of Registers, Description added, Note: FFFA0020H to FFFA003CH
		2572	Table 28.184 List of Registers, Description added, Note: FFFA0060H to FFFA00DCH

		2763	Table 35.25 CSIH Communication Speed Overview, Columns added
		2806	Table 35.63 Thermal Characteristics - Junction to Board Resistance (Ψjb), Row added, P1M-C
		2806	Table 35.63 Thermal Characteristics - Junction to Board Resistance (Ψjb), Row added, P1H-C (4MB)
		Section 36 Package	
		2808	36.1 Package Line Up, Column added
		2808	36.1 Package Line Up, Description added, Table header
		2810	36.2.2 FBGA (156pin) Package Drawing, Section added
1.30	Dec 25, 2017	3	Notes for CMOS Devices, Corrected, Title header
		3	Notes for CMOS Devices, Description changed, (2) Handling of unused input pins
		5	Description of Registers, Description changed
		7	Table of Contents, Corrected, Title header
		Section 2 Pin Functions	
		76	Table 2.3 Pin Function assignments, Description added, P1M-C/P1H-C(BGA-156) (2nd Alternative): FLXNTUOUT
		76	Table 2.3 Pin Function assignments, Description deleted, P1M-C/P1H-C (BGA-156) (Special Function): ICUMGPIO0 and ICUMGPIO1
		99	2.3 Port Overview, Corrected, Section title
		103	Figure 2.8 Port Control Logic Block Diagram, Description in the figure changed
		Section 3 CPU System	
		214	Table 3.68 Register Contents of IPGECRUM, Description changed, Function: Bit 0
		251	3.4.9 Restrictions to use DMAC0/1, DTS ICUM, Section added
		251	3.4.10 Restrictions to use HBU Master (Ethernet, HS-USRT, FlexRay), Section added
		Section 4 Address Map	
		256	4.2 Address space viewed from each bus master, Corrected, Section title
		268	Table 4.1 List of P-bus area access, Description changed, FFFF 5000_H to FFFF $7AFF_H$
		Section 6 Interrupt Controller (INTC)	
		293	6.4.1 EICn — EI level interrupt control registers, CAUTION added
		294	6.4.2 IMRm — EI level interrupt mask registers, CAUTION 2 added
		322	6.10 Broadcast notification function processor elements, Description deleted
		322	6.10 Broadcast notification function processor elements, Description deleted
		323	Table 6.23 Corresponding register setting (INTC2), Description changed, Content/Description: IMK
		Section 12 Clock Controller	
		571	Figure 12.1 Clock diagram (user's perspective), Description in the figure deleted
		Section 18 LIN/UART Interface (RLIN3)	
		876	18.3.2.19 RLN3nLDBRb — LIN Data Buffer b Register, Description changed, For response reception

Rev.	Date	Description	
		Page	Summary
1.30	Dec 25, 2017	901	18.3.3.18 RLN3nLDBRb — LIN Data Buffer b Register, Description changed, For response reception
		955	Figure 18.20 Target Time Area for LIN Error Detection (LIN Slave Mode), Description in the figure changed
		Section 19 CAN Controller (MCAN)	
		1002	Table 19.16 MCANnDBTP Register Contents, Description added, Bits 20 to 16
		1099	Table 19.75 MTTCAN0DBTP Register Contents, Description added, Bits 20 to 16
		1166	19.6.2.3 (59) MTTCAN0TURNA — TUR Numerator Actual, Description changed, Value after reset
		1166	19.6.2.3 (59) MTTCAN0TURNA — TUR Numerator Actual, Description changed, Value after reset: Bit 16
		1237	19.8 CAUTION, Description in the table header deleted, "R7F701327"
		1237	19.8 CAUTION, ID2 added
		1238	19.8 CAUTION, Description changed, "CCCR.EFBI" to "M(TT)CANnCCCR.EFBI"
		1238	19.8 CAUTION, Description changed, "M_CAN" to "M(TT)CAN"
		1238	19.8 CAUTION, Description changed, "m_can_rx" to "m(tt)can_rx"
		1238	19.8 CAUTION, Description changed, "CCCR.INIT" to "M(TT)CANnCCCR.INIT"
		1238	19.8 CAUTION, Description changed, "CCCR.PXHD" to "M(TT)CANnCCCR.PXHD"
		1239	19.8 CAUTION, ID2 added
		Section 25 Generic Timer Module (GTM)	
		1807	Table 25.6 Pin Function Information, Description in the table header added, Supporting Device
		Section 27 A/D Converter (ADCF)	
		2318	27.4.7.3 Wiring-Break Detection Diagnostic Function, Description added, NOTE
		2321	Figure 27.16 Scan Conversion End Interrupt Occurrence Timing, Timing cycles changed
		2322	Figure 27.17 Example of an MPX Interrupt Occurrence, Timing cycles changed
		2323	Figure 27.18 Example of an Occurrence of A/D Error Interrupt and A/D Parity Error Notification, Timing cycles changed
		Section 28 Functional Safety	
		2518	28.2.10.4 (1) Generating an Error Detecting Code, Description deleted
		Section 35 Electrical Specifications	
		2741	Table 35.5 Operational Condition, Description changed, Max.: For devices P1M-C (BGA-292)
		2808	Table 35.63 Thermal Characteristics - Junction to Board Resistance (Ψjb), Description changed, Condition: P1M-C (BGA292)
		Section 36 Package	
		2810	36.1 Package Line Up, Description added, P1M-C 156,P1H-C 156: Mass (g)[TYP]
		2812	Figure 36.3 FBGA (156pin) outline, Figure added
		Section 37 CAN Controller (MCAN)	
		2816	Section 37 CAN Controller (MCAN), Description added
		3057	37.8 CAUTION, Description in the table header deleted, "R7F701327"
		3057	37.8 CAUTION, ID13 and ID14 added
		3059	37.8 CAUTION, Corrected, ID2: Description
		3060	37.8 CAUTION, Description added, ID5
		3060	37.8 CAUTION, Description changed, ID5: Description
		3062	37.8 CAUTION, Description added, ID10: Description
		3062	37.8 CAUTION, Corrected, ID10: Description
		3062	37.8 CAUTION, Corrected, ID11: Description
		3063	37.8 CAUTION, ID13 and ID14 added
