Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.
   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.
7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION (“Vulnerability Issues”). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.
(Note2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)
   A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.
2. Processing at power-on
   The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.
3. Input of signal during power-off state
   Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.
4. Handling of unused pins
   Unconnected CMOS device inputs can be cause of malfunction. If an input pin is unconnected, it is possible that an internal input level may be generated due to noise, etc., causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using pull-up or pull-down circuitry. Each unused pin should be connected to power supply or GND via a resistor if there is a possibility that it will be an output pin. All handling related to unused pins must be judged separately for each device and according to related specifications governing the device.
5. Voltage application waveform at input pin
   Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).
6. Prohibition of access to reserved addresses
   Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.
7. Power ON/OFF sequence
   In the case of a device that uses different power supplies for the internal operation and external interface, as a rule, switch on the external power supply after switching on the internal power supply. When switching the power supply off, as a rule, switch off the external power supply and then the internal power supply. Use of the reverse power on/off sequences may result in the application of an overvoltage to the internal elements of the device, causing malfunction and degradation of internal elements due to the passage of an abnormal current. The correct power on/off sequence must be judged separately for each device and according to related specifications governing the device.

How to Use This Manual

Readers This manual is intended for users who wish to understand the functions of the RH850/P1x-C and design application systems using the following RH850/P1x-C microcontrollers:

Purpose This manual is intended to give users an understanding of the hardware functions of the RH850/P1x-C shown in the *Organization* below.

Organization This manual is divided into four parts: Hardware (this manual), Flash Hardware interface (RH850/P1x-C Flash Memory User's Manual: Hardware Interface), Architecture (RH850G3M User's Manual: Software) and Security (RH850/P1x-C User's Manual: Hardware (Security)).

Hardware	Flash Memory I/F	Software	Security
Pin functions	Module Configuration	Overview	Basic Security
CPU function	Address Map	Processor Model	Secure Watchdog Timer
On-chip peripheral functions	Registers	Register Reference	ICUMC
Flash memory programming	Flash Sequencer Modes	Exceptions and Interrupts	
	FACI Command	Memory Management	
	Security Functions	Instruction Reference	
	Protection Function	Reset	
		Appendix	

How to read this manual It is assumed that the readers of this manual have general knowledge in the fields of electrical engineering, logic circuits, and microcontrollers.

To understand the overall functions of the RH850/P1x-C.

→ Read this manual according to the Contents.

To understand the details of programming of Flash

→ See RH850/P1x-C Flash Memory User's Manual: Hardware Interface available separately.

To understand the details of an instruction function

→ See RH850G3M User's Manual: Software available separately.

To understand the details of a security function

→ See RH850/P1x-C User's Manual: Hardware (Security) available separately.

Conventions Data significance: Higher digits on the left and lower digits on the right

Active low representation: xxxZ

Memory map address: Higher addresses on the top and lower addresses on the bottom

Note: Footnote for item marked with Note in the text

Caution: Information requiring particular attention

Remark: Supplementary information

Numeric representation: Binary ... xxxx or $xxxx_B$

Decimal ... xxxx

Hexadecimal ... $xxxx_H$

Prefix indicating power of 2 (address space, memory capacity):

K (kilo): $2^{10} = 1,024$

M (mega): $2^{20} = 1,024^2$

G (giga): $2^{30} = 1,024^3$

Description of Registers

Each register description includes register access, register address, and register value after a reset, a bit chart, illustrating the arrangement of bits, and a table of bits, describing the meaning of the bit settings.

The standard format for bit charts and tables are described below.

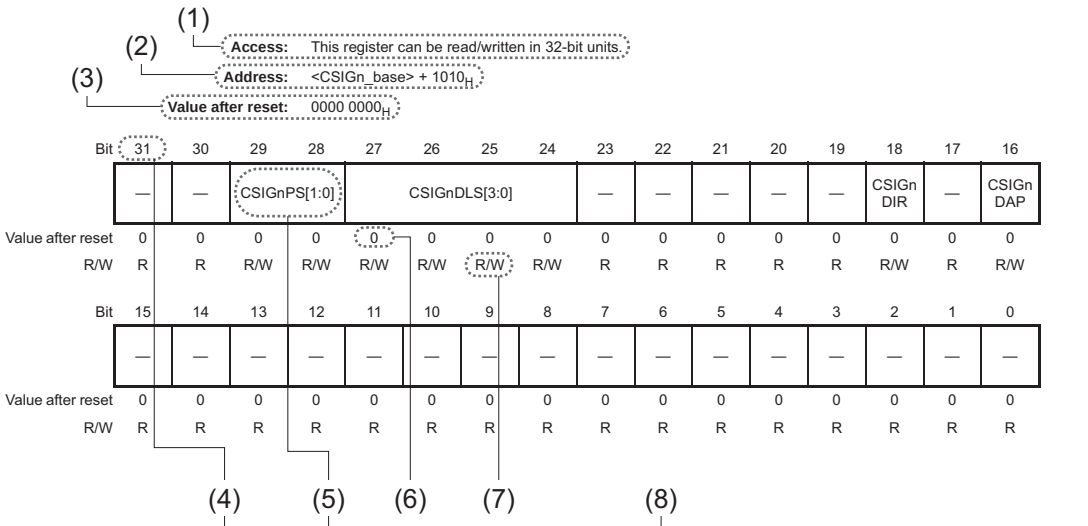

Table 14.19 CSIGnCFG0 register contents (1/2)

Bit Position	Bit Name	Function
31, 30	Reserved	The write value should always be the value after reset.
29, 28	CSIGnPS[1:0]	Specifies parity.

CSIGn PS1	CSIGn PS0	Transmission	Reception
0	0	No parity transmitted	No parity is waited for.
0	1	Add parity bit fixed at 0	Parity bit is waited for but not judged.
1	0	Add odd parity	Odd parity bit is waited for.
1	1	Add even parity	Even parity bit is waited for.

27 to 24	CSIGnDLS [3:0]	Specifies data length. 0: Data length is 16 bits 1: Data length is 1 bit 2: Data length is 2 bits ... 15: Data length is 15 bits **CAUTION** For a data length of less than 7 bits, do not set bits CSIGnCFG0.CSIGnDLS[3:0] for a value 1 to 6 when the extended data length function is disabled with bit CSIGnCTL1.CSIGnEDLE set to 0. It is forbidden to transmit two consecutive data with a data length of less than 7 bits.
23 to 19	Reserved	The write value should always be the value after reset.

(1) Access

The register can be accessed in the bit unit indicated here.

(2) Address

This is the register address.
For base address, see description of base address in each section.

(3) Value after a reset (in hexadecimal notation)

This is the value of all bits of the register after a reset. Values for bytes are given as numbers in the range from 0 to 9 and letters from A to F or as X where they are undefined.

(4) Bit position

This is the bit number.
The bits are numbered from 31 to 0 for 32-bit registers, 15 to 0 for 16-bit registers, and 7 to 0 for 8-bit registers.

(5) Bit name

Bit name or field name is indicated.
When clearly identifying the digits of a bit field is required, do so by using a form such as CSIGnDLS[3:0] above.
Indicate reserved bits by using a dash (—).

(6) Value after a reset (in binary notation)

This is the bit values after a reset.

0	:	The value after a reset is 0.
1	:	The value after a reset is 1.
—	:	The value after a reset is undefined.

(7) R/W

This is the bit attribute of all bits of the register.

R/W	:	The bit or field is readable and writable.
R	:	The bit or field is readable. Note that all reserved bits are indicated as R. When written, the value specified in the bit chart or the value after a reset should be written. In case of writing to writable registers that also include non-reserved bits with the R-attribute, writing to the R-attribute bits will be ignored unless otherwise specified.
W	:	This bit or field is writable.When read, the value is undefined. If a value is indicated in the bit chart, the value is returned.

(8) Function

This is function of the bit.

Table of Contents

Section 1 Overview

RH850/P1x-C is a product series of Renesas Electronics' single-chip microcomputer RH850 family. This section describes the overview of RH850/P1x-C.

1.1 Outline

RH850/P1x-C is a 32-bit single-chip microcomputer with multiple CPUs, Code Flash, Data Flash, RAM modules, DMA controllers, many communication interfaces that are used in the automotive applications, A/D converters, timer units, etc. This chip is oriented to the automotive applications which comply with functional safety standard (ISO26262).

The main features are as below.

(1) RH850 multi-core CPU
This chip equips one or two RH850 G3M unit(s) as main CPU(s) depending on the product type, and each CPU unit has Lock-Step Dual Core feature for the functional safety. In addition to that, the chip equips one RH850 G3K unit as a sub CPU which controls security functionality (depending on product type).
The architecture of these CPUs realizes the compact footprint of the programs by 2-byte basic instructions and high-level language compiler oriented instruction sets. These CPUs have very quick interrupt response time so that they can support hard real-time applications.

(2) On-Chip Code Flash and Data Flash
This chip has high-speed Code Flash from which the CPU can fetch the instructions and the constant data. Its capacity is up to 8MB for the Production Device and 10MB for the Emulation Device. This Code Flash can be reprogrammed in the situation that the chip is mounted in the application systems.
This chip also has Data Flash with EEPROM emulation capability. Its capacity is up to 224KB.

(3) Rich peripheral functionality
This chip equips not only common communication interfaces such as SPI and HS-USRT but also automotive oriented ones such as MCAN, FlexRay, RLIN, SENT. In addition, it also supports Ethernet (depending on product type). As internal peripheral modules, the chip has A/D Converter, System Timer, Generic Timer Module, and dedicated Peripheral Interconnect module which connects the functionalities of these peripherals.

(4) Functional Safety support
This chip equips several dedicated functionalities including the Lock-Step Dual Core configuration for the CPU, the memory protection with ECC, the bus protection with ECC, the peripheral module protection, and voltage / clock monitors to support the functional safety standard (ISO26262) required in the automotive applications.

(5) Security support
This chip supports various security features (depending on product type). The Intelligent Cryptographic Unit – Master (ICUMC) has a dedicated secure CPU (RH850G3K) and some secure peripherals such as AES engine and Random Number Generator (RNG). The chip also realizes the HW-level domain separation between non-secure and secure domains. The internal resources such as Code- and Data-Flash can be assigned to either domain and the secure domain is protected against non-secure accesses by the HW mechanism. The chip also has the protection scheme for a malicious access from external.

1.2 Product List

Table 1.1 Product list and package

Product Name	Product type	Package	Package Name	Note
R7F701370A	P1H-CE	BGA404	R7F701370AEEBG	
R7F701370B	P1H-CE	BGA404	R7F701370BEEBG	CAN-FD
R7F701371	P1H-C (8MB)	BGA292	R7F701371EABG	CAN-FD
R7F701372	P1H-C (4MB)	BGA292	R7F701372EABG	
R7F701372A	P1H-C (4MB)	BGA292	R7F701372AEABG	CAN-FD
R7F701396A	P1H-C (4MB)	BGA156	R7F701396AEABG	CAN-FD
R7F701373	P1M-C	BGA292	R7F701373EABG	
R7F701373A	P1M-C	BGA292	R7F701373AEABG	CAN-FD
R7F701374	P1M-C	LQFP144	R7F701374EAFP	
R7F701374A	P1M-C	LQFP144	R7F701374AEAFP	CAN-FD
R7F701397A	P1M-C	BGA156	R7F701397AEABG	CAN-FD

For better readability common Product Short Names will be used in this manual.

Wherever a more detailed distinction of the device is required either the specific Product Name (R7Fxxxx) or the nickname followed by further information in brackets (e.g. “P1M-C (BGA-292)”) will be used.

Product		RH850/P1x-C						
Product Short Name		P1M-C			P1H-C (4MB)		P1H-C (8MB)	P1H-CE
Package		QFP-144	BGA		BGA		BGA-292	BGA-404
			BGA-156	BGA-292	BGA-156	BGA-292		
	Package Extension to Product Name	EAFP	EABG					EEBG
Product name	Non-CANFD	R7F701374	—	R7F701373	—	R7F701372	—	R7F701370A
	CANFD	R7F701374A	R7F701397A	R7F701373A	R7F701396A	R7F701372A	R7F701371	R7F701370B

- “P1x-C” refers to all products covered in this document.
- “P1M-C” refers to all P1M-C variants regardless of package (QFP, BGA).
- “P1M-C(BGA-292)” refers to a subset of P1M-C devices, i.e. all “P1M-C” in the BGA package with 292 balls

1.3 Block Diagram

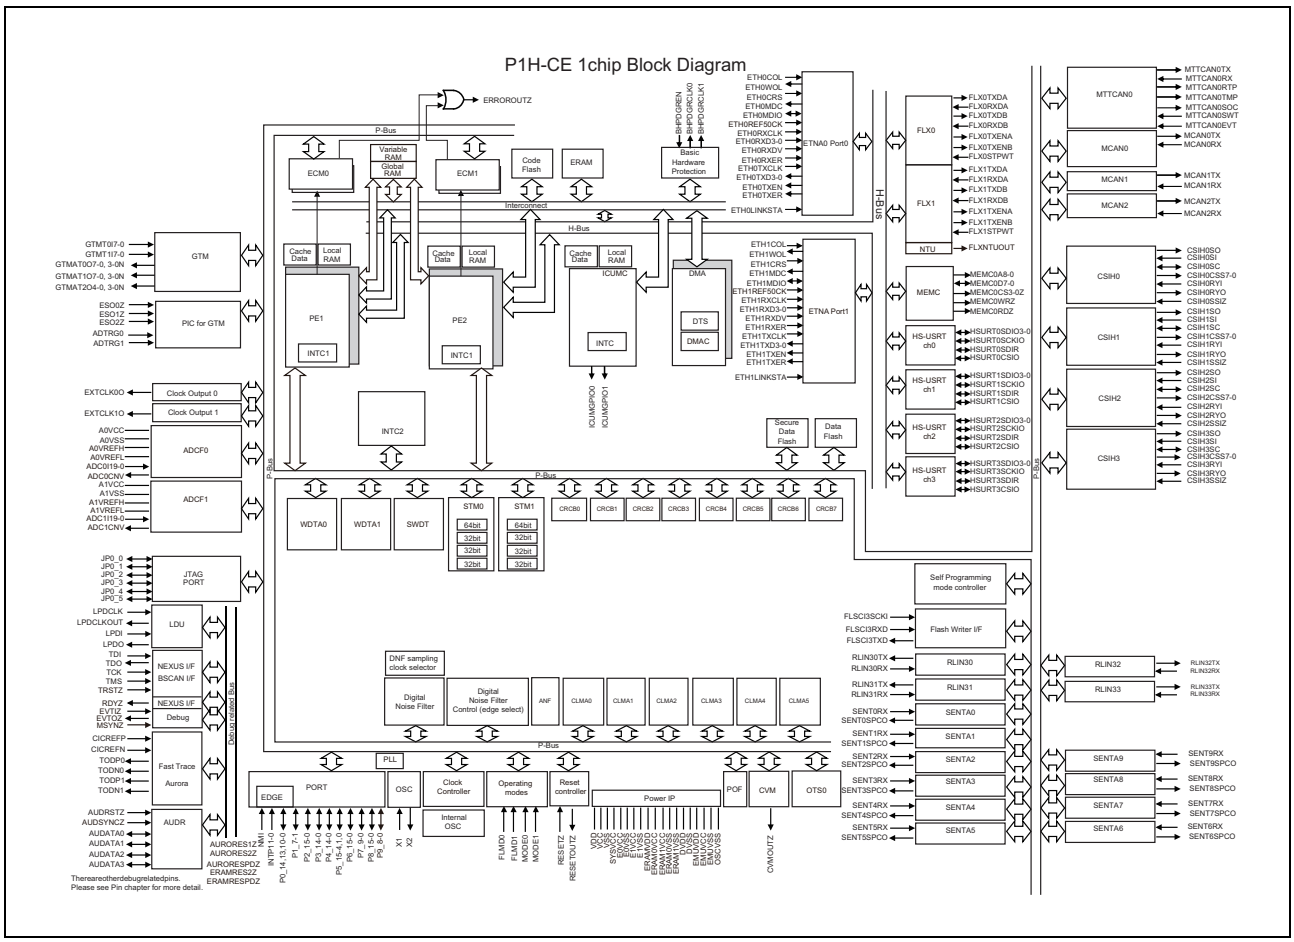

Figure 1.1 RH850/P1x-C chip block diagram (P1H-CE)

1.4 Features

(1/12)

Item	Features
Pin and Port Functions	• Most of the digital pins have selectable functionalities from up to nine dedicated functions (up to four alternative functions with each In and Out and a special function) and a general purpose I/O port. • Selectable drivability for output pins • Selectable pull-up/pull-down/off for input pins • General purpose I/O port can be accessed per-pin basis by multi-CPU without mutual exclusion
CPU Subsystem	• CPU – High performance 32-bit architecture for embedded controllers – 32-bit internal data busses – Thirty-two 32-bit general purpose registers – RISC type instructions set • Load / Store instructions with long / short format • Three operand instructions • Based on C language – Operating modes: User mode / Supervisor mode – Address space: 4GB linear address space for data and instruction • Floating Point Unit (FPU) – Supports single-precision (32-bit) and double-precision (64-bit) – Supports IEEE754 compliant data types and exceptions – Rounding modes: To nearest / Toward 0 / Toward +∞ / Toward -∞ – Handling of denormalized numbers: Truncation to zero / IEEE754 compliant exception • Interrupt Handling – 16 interrupt priority levels can be specified for each interrupt channel – Two methods of interrupt handler address calculation • Direct vector method • Table reference method – PUSHSP and POPSP instructions for fast context switch • Protection Mechanisms – Memory Protection Unit (MPU) protects memory regions against illegal accesses by software. – Internal Peripheral Guard (IPG) protects registers of internal peripherals against illegal accesses by software. – PE Guard (PEG) protects Local RAM and internal peripheral registers against illegal accesses by external bus masters. – Global RAM (GRAM) Guard protects GRAM regions against illegal accesses by all bus masters. • Instruction Cache – Each CPU has its own instruction cache for the Code Flash. • Local RAM – Each CPU has its own Local RAM. • Global RAM – Each CPU can access Global RAM. • Interprocessor Communication and Mutual Exclusion Mechanisms – Interprocessor interrupt registers (IPIR) – Semaphore registers – CAXI (compare and exchange for interlock), LDL.W (load linked word) and STC.W (store conditional word) instructions

(2/12)

Item	Features
Operating Modes	• Operating modes – Normal Operating Mode – Serial Flash Programming Mode – Boundary SCAN Mode • Mode Setting – Set by the mode selecting pins: FLMD0, FLMD1, MODE0, MODE1 (FLMD1, MODE0, MODE1 can be used as GPIO as well.) – Latched at Power-On Reset or System Reset 1
External Memory Controller	• Supports external memory access (Devices with conventional SRAM interface directly connectable) • Four Chip Select pins (CS0, CS1, CS2, CS3) Up to 512 bytes linear address space for each CS • 8-bit data bus • Programmable data setup wait cycle independently for – Each CS – Read / Write • Programmable write data hold wait cycle (deassertion edge of write strobe) • Programmable Idle cycle independently for after read and after write bus cycle
Interrupt Functions	• Three types of interrupt – FENMI: FE-level non maskable interrupt – FEINT: FE-level maskable interrupt – EIINT: EI-level maskable interrupt • 16 priority levels for each interrupt independently • Maskable for each interrupt independently • Interrupt Controller – Primary interrupt controller (INTC1) • Each CPU (PE1 and PE2) has its own INTC1. • Direct handling up to 2 FE-level interrupts and up to 32 EI-level interrupts – Secondary interrupt controller (INTC2) • Shared by both CPUs • Up to 224 interrupts notified to CPU via INTC1 • Each interrupt can be independently mapped to only one CPU or both CPUs in parallel.
Direct Memory Access	• Two types of DMA engine: DMAC and DTS – DMAC • Transfer information is stored in the DMAC control registers. • Up to 16 channels (1 register set for each channel) • Up to 128 DMA trigger source – DTS • Transfer information is stored in the dedicated SRAM (DTSRAM). • Up to 128 channels can be active at the same time. • Up to 128 DTS requests • Address space: 4GB • Transfer mode: Single transfer, Block transfer 1, Block transfer 2 • Transfer data size: 1/2/4/8/16 bytes • Interrupt: Transfer Completion Interrupt, Transfer Count Match Interrupt • Reload function support • Chain function support
Power Supply	• Dual Power Supply (DPS) • Internal POC (Power On Clear) for safe startup • Core Voltage Monitor (CVM) for the internal supply voltage (VDD) monitoring

(3/12)

Item	Features
Reset Controller	• 6 reset functions – Power-On Reset – System Reset 1 – System Reset 2 – Application Reset 1 – Limited Reset – Debug Reset • External output pin: RESETOUTZ • Automatic RAM initialization after some reset • Automatic HW BIST execution after some reset
Clock Controller	• On-chip crystal resonant circuit (Main OSC) • On-chip internal oscillator which is used as a Backup clock during the clock start up and used for safety purpose • On-chip PLL to generate the high speed internal clocks from Main OSC • Clock frequency – Main OSC: 16/20/24MHz – Internal oscillator: 16MHz – Internal clocks generated by the PLL: up to 240MHz • Two software configurable external clock outputs • Software configurable clock dividers to enable flexible clock gear function
Power Down Modes	• HALT mode support in Main CPUs (PE1 and PE2) and ICUMC (ICUP) • Module Standby mode support in ICUMC and some peripheral module
Clocked Serial Interface H	• Three-wire serial synchronous data transfer well known as SPI • Full duplex operation (simultaneous transfer and receive), receive only mode, or transmit only mode • Master mode and slave mode selectable • Phase of clock and data selectable for each chip select • Data transfer with MSB or LSB first selectable for each chip select • Transfer data length selectable from 2 to 16 bits in 1-bit units for each chip select • EDL (Extended Data Length) function for transferring data with more than 16 bits • Maximum transmission speed – in master mode: up to 20Mbit/s – in slave mode: up to 20Mbit/s • Bit rate selectable by BRG output (at Master mode) or by slave clock • Transmit mode, Receive mode and Transmit/Receive mode selectable • Buffer size is 128 words (1 word is data 32 bits + ECC 7 bits) • Memory mode selectable (FIFO, dual buffer, Tx-only buffer, direct access) • Built-in handshake function • Error detection (data consistency check, parity, time-out, overrun) • JOB enable control bit for AUTOSAR • RCB (Recessive Configuration for Broadcasting) bit for Broadcasting • LBM (Loop Back Mode) function for self test • Four different interrupt request signals (INTCSIHnTIC, INTCSIHnTIR, INTCSIHnTIRE, INTCSIHnTIJC) • IDLE State Control function • Silent mode communication for extended idle time • Automatically generation of chip select output signal with configurable active level • Data transfer without activated chip select • Transmission speed for each chip select is selectable out of four predefined baud rates (in master mode) or by clock input signal from master (in slave mode) • Full DMA support for all CSIH registers

(4/12)

Item	Features
High-Speed Universal Synchronous Receiver / Transmitter	• Communication and framing – Half-duplex synchronous serial communication – Selectable : Master (transmission) and Slave (reception) The status (master or slave) is shown by SDIR pin. – MSB first – Communication frame length • Data of 16 bits w/o parity bit • Data of 15 bits with even parity bit • Data of 15 bits with odd parity bit • Number of the communication lane – Selectable from 1, 2, and 4 lanes • Communication rate – Tx: 10 Mbps / lane (40 Mbps in 4 lanes) [TXCLK@80MHz] – Rx: 40 Mbps / lane (160 Mbps in 4 lanes) • Clock divider of TXCLK for the master communication clock – Selectable from 8, 10, 12, 14, 16, 24, and 32 • Communication buffer size – Transmission: 8 frames (4 frames x2) – Reception: 64frames (32frames x2) • Interrupt factor – TX Completion Interrupt – RX of First Frame Interrupt – RX of Group Frames Interrupt – RX Completion Interrupt – Parity Error Interrupt – RX Buffer Overflow Error Interrupt – Error detection – Parity Error (none/odd/even) – RX Buffer Overflow Error • Other function – Integrated DMAC for communication data transfer – Protect function against register write
RLIN	• Compliant with LIN protocol spec versions 1.3, 2.0, 2.1, 2.2 and SAE J2602 • Three operating modes – LIN Master – LIN Slave – UART (half-duplex, full-duplex) • LIN Self-test mode with internal data loop back

(5/12)

Item	Features
MCAN	• Conforming to the ISO 11898-1 • Data transfer rate is up to 1Mbps, individually for each CAN channel. For CAN FD, up to 8Mbps • Selectable ID type – 11-bit Standard ID – 11-bit Standard ID + 18-bit Extended ID • Message Buffer – Up to 64 dedicated Receive Buffers – Up to 32 dedicated Transmit Buffers • Supports all AUTOSAR requirements – Transmit Abort Interrupt – Non-waiting processing functionality – Including more than 2 TX Buffers prioritization • Supports several measures for self-testing:external and internal loop back • Improved RX System – Scalable RX FIFO structures, with up to 64 CAN Buffers per FIFO – RX timestamp – RX FIFO Timeout Interrupt – FIFO filling level Interrupt • Improved TX System – FIFO filling level supervision (interrupt) – Support for transmit cancellation to avoid “inner priority inversion” – Combined Message Buffer & TX FIFO and TX Queue Concept – Dedicated TX message buffers for high-priority messages – ID prioritization between TX buffers, TX Queue buffers and oldest TX FIFO element – Transmit pause to separate two consecutive TX messages • FIFOs – Two configurable Receive FIFOs – Configurable Transmit FIFO – Configurable Transmit Queue – Configurable Transmit Event FIFO • Enhanced reception filtering – Support of 11bit and 29bit CAN identifier, each filter element is configurable for acceptance/rejection – Programmable 29 bit CAN identifier acceptance filter mask for each entry – Each acceptance filter element targets FIFO 0 or 1 or a dedicated RX Buffer – Every FIFO or RX Buffer filter element can be used as a from-to range filter, as a filter for one or two dedicated IDs or as a classic bit mask filter – Each filter element can be enabled/disabled individually • Supports TT_CAN level 2 according to ISO11898-4 • Supports Pretended Networking of AUTOSAR • Supports Time Stamp function

(6/12)

Item	Features
FlexRay	• Conforming to the FlexRay protocol specification v2.1 • Data transfer rate: up to 10 Mbit/s on each channel • Data link layer clock frequency: 80MHz • FlexRay channels: 2 (channel A and B) • Message buffer – Up to 128 message buffers configurable – Configuration of message buffers with different payload lengths possible – Each message buffer can be configured as receive buffer, as transmit buffer or as part of the receive FIFO – Filtering for slot counter, cycle counter, and channel • Message RAM – 8 Kbyte of Message RAM for storage of e.g. • 128 message buffers with max. 48 byte data section • up to 30 message buffers with 254 byte data section • FIFO: One configurable receive FIFO • Message buffer access – by Host CPU via Input and Output Buffer • Input Buffer: Holds message to be transferred to the Message RAM • Output Buffer: Holds message read from the Message RAM – by data transfer function • Input transfer: Message buffer content is transferred from LRAM/GRAM to Message RAM on CPU request • Output transfer: Message buffer content is transferred from Message RAM to LRAM/GRAM automatically • Network management: Automatic HW support • Interrupts: Maskable module interrupts • Timer – 2 absolute timers – 1 relative timer • NTU generation – Generation of FlexRay macrotick – Generation of FlexRay cycle

(7/12)

Item	Features
Ethernet	• MAC (Media Access Controller) – Conforming to the IEEE 802.3 MAC layer standard – 100Mbps or 10Mbps data transfer. – full or half-duplex mode. – PHY interface: MII (Media Independent Interface), RMII (Reduce Media Independent Interface) • MAC port number: 2 ports • DMA transfer function – Each channel implements the H-Bus master function and transfers the received/transmitted data from/to the RAM memory area. – Supports the 8 times of the 32-bit burst transfer. – Descriptor management system used by EDMAC (Data transfer without CPU intervention). – Single-frame/single-descriptor and single-frame/multi-descriptor oparation. – Transmission/reception status indication in descriptor. • Address filter function – Performs address filtering based on the destination address. – Up to 32 different addresses can be configured individually. – Supports the storm filter for broadcast frames. – Supports the mode enable/disable function for broadcast frames by using CAM entry table. • Others – Magic packet detection and Wake-On-LAN signal output. – PAUSE control frame format. – CRC calculation for RX/TX frames. – Interrupts for configurable error and status conditions. – Internal loopback function (external loopback function can be realized with PHY interface). – MAC management counters

(8/12)

Item	Features
SENT	• Support of SENT standard protocol – SAE J2716 JAN2010 • Supported features: – SENT master function (= sensor data reception) – Decoding the sensor data – CRC for received data – Falling-edge detection and timing measurement capabilities to receive the encoded signal – Triple speed SENT – Clock period rates in range of 1us to 90us – Variable data transfer rates in range of • 24.5 to 65.8kbps (based on 6 nibble data at 3us clock rate) • 73.5 to 197.4kbps (based on 6 nibble data at 1us clock rate) – Unidirectional communication between sensor and MCU by standard – Bidirectional communication between sensor and MCU supported by SPC enhancement of the standard – Single edge data transmission, coded by the temporal distance of two consecutive detected falling edges on the data line – Transmission of frames with up to 6 data nibbles and additional status/communication nibble – CRC protected data transmission – CRC data is readable by SW – Calibration phase at each data frame – Multi-slave bus topology – One optional pause pulse • Each SENT macro consists of one SENT channel. If more than one SENT channel is required several SENT macros can be implemented. See **Table 22.2** for the number of implemented SENT channels. • Each time stamp counter of the macros can run independently, or in order to synchronize the timestamp across multiple channels, one instance can be set as master and reset the configured consecutive time stamp counters. Depending on the total number of instances, more than one master-slave(s) pairs can be configured. • Each SENT macro supports below requirements in addition to SAE J2716 specification of JAN2010: – R1: 32-Bit-Register for serial sensor data (24Bit+CRC6+READ-Bit) – R2: Includes comparator for sensor data evaluation – R3: CRC check of received sensor data implemented but CRC code transparent – R4: 32-Bit counter for time stamp (resolution: 1us) – R5: clock ticks down to 1us – R6: SPC (Short PWM Code) extension • Enables bidirectional communication channel • Master can pull down the signal to initiate SENT message transmission.
Watchdog Timer	• One channel for one CPU • Fixed activation code and variable activation code (VAC) selectable • Two counter start modes available – Automatic (default) start mode – Software trigger start mode • Generate an error signal to ECM on error detection • Interrupt request generation at 75% of the counter overflow value • Window function for refresh
System Timer	• One 64-bit counter, which can be used as a long period timestamp • Three 32-bit counters • Four compare registers for each counter
Generic Timer Module	GTM is a modular timer unit used to support chassis control applications by unloading the CPU from a high interrupt load. Most of the task of GTM can run independently from the CPU. Two different GTM configurations are implemented depending on product type.

(9/12)

Item	Features
Peripheral Interconnect	Peripheral interconnect (PIC) connects some peripherals with each other in order to achieve enhanced functionality of a stand-alone function. • ADCF trigger select function • Signal routing function for: – ADCF conversion interrupt routed to GTM input – GTM output monitor for PWM diagnostic – Hi-Z control function over external pin for GTM output – Baud rate measurement for an UART (RLIN3)
A/D Converter	• A/D conversion based on successive approximation (SAR-ADC) method • 12-bit resolution • Minimum conversion time: 1 us. • Virtual channel concept • Scan groups support • Two scan modes: Multi-cycle scan mode and Continuous scan mode • Asynchronous / synchronous suspend and resume function • Interrupts and DMA transfers are supported. • A/D converted value adding function • Analog conversion voltage range can be set. • Abundant safety functions are provided.
Functional Safety	• Development compliant with ISO26262 functional safety standard. • Major safety mechanisms – Error Correction Code (ECC) and Error Detection Code (EDC) – Lockstep function of Redundant Data Processing Units (CPU, DMA) with compare units – Memory Protection Unit (MPU) and Slave Guards for Processor Element (PEG), Internal Peripheral Modules (IPG), Global RAM (GRG) and Peripheral Bus (PBG) – Field BIST at start-up test – Error Control Module (ECM), for signaling error pin at failure detection by safety mechanisms – Core Voltage Monitor (CVM) – Clock Monitor (CLMA) – Watch Dog Timer (WDTA) – Data CRC (DCRB) – Triple Modular Redundant (TMR) registers, for application independent parts to ensure robustness against transient faults caused by Single Event Effects (SEE) – Safety Oriented Chip Layout
Error Control Module	Error Control Module (ECM) generates error signal to outside MCU, interrupts, and reset requests by the error input signals from various error sources and monitor logics. • Interrupt request generation as against each error cause • Internal Reset (System Reset 2) request generation as against each error cause • Error signal generation as against error cause, which is connected to a dedicated digital output terminal • Current error status is confirmable. • Self-diagnosis function is implemented. • Time-out function of interrupt processing • ERROROUTZ release timer Wait time is configurable by SW. After the configured time is passed, ERROROUTZ can be set to high by SW. • Hi-Z control of GTM timer output terminals with PIC • When ECM catches the safety-related error, GTM timer output terminals will be Hi-Z by Low level of ECM output.

(10/12)

Item	Features
Data CRC Function	• Supports the following four CRC generator polynomials in compliance with the AUTOSAR standard – 32-bit Ethernet CRC – 16-bit CCITT CRC – 8-bit SAE J1850 CRC – 8-bit 0x2F polynomial CRC
Core Voltage Monitor	• CVM monitors over and under voltage of the core voltage. • Violating the operating range of the core voltage is informed by: – Single output pin (CVMOUTZ). – Core voltage over and under-voltage flags – CVM Reset • With the exception of diagnostic function, the CVM function is independent from internal or external RESET, except for Power-On Reset. • Diagnostic function: – CVM function is testable. – Over and under-voltage error can be generated without influencing core voltage itself. – CVM error test is done by changing reference voltage. – For diagnostic the signal path to the CVMOUTZ pin can be masked. – CVMOUTZ pin provides read back function to check pin level.
Clock Monitor	• Up to six clock monitors depending on the device configuration. • Detects clock disturbance that results in lower or higher frequency than target frequency, and sends an error notification to the ECM and INTC of ICUMC • Supports self-diagnosis function
Temperature Sensor	• Out of range detection of temperature for security • Operating modes – Single measurement mode – Continuous measurement mode • Interrupt generation – Temperature Measurement End Interrupt (OTI) – Temperature Rise/Drop Interrupt (OTULI) – Temperature Alarm Error (OTABE) (This is routed to ICUMC and ECM) – Temperature Sensor Error (OTE) • Self-diagnosis function support
On-Chip Debug	• Debug control interface: NEXUS (JTAG) and Low-Pin-count Debug interface • Single- and Multi-core debug support via single interface for debugging and calibration • Synchronized multi-core debugging, triggering and controlling • Trigger/Event conditions configurable for hardware break function, tracing and timing measurement • Support of timing and performance measurement functions • High-level security protection feature – Separate authentication mechanisms for non-secure resources and secure resources – Flash contents protection in debug mode
Emulation Device	• Extended debug interfaces – JTAG / Low-Pin-count Debug interface – Trace interface (Aurora): ED only – Bypass interface (AUD): ED only • ERAM for Code Flash calibration • Extra capacity for Code Flash and GRAM • Comprehensive trace information for each CPU core, DMA and System bus including timestamp information • Separate power domains for ERAM and Trace interface (Aurora) • Emulation mode support for each Production Device (P1M-C and P1H-C)

(11/12)

Item	Features
FLASH Memory	• Code Flash – Capacity: up to 8MB in Production Devices, up to 10MB in Emulation Device – Dual banked configuration in Dual CPU devices (P1H-C and P1H-CE) – Program unit: 256 bytes, Erase unit: 8KB or 32KB (depending on the block) – Per-block OTP (One Time Programmable) support – Per-block Write Protection support – Security features • Configurable region separation between non-secure and secure areas • Password protection in the debug mode • Data Flash – Capacity: up to 192KB for non-secure region, 32KB for secure region*1 – Program unit: 4 bytes, Erase unit: 64 bytes • ECC support for error detection and correction • Programming method – Serial programming mode from an external flash writer – Self programming mode from the internal CPU • BGO (BackGround Operation) support – Code Flash read is possible during Data Flash P/E – While the flash memory is erased / programmed / read in the bank, a flash memory in another bank, can be erased / programmed / read. • Extra areas to store the system configuration parameters Note 1. Can be used as normal data flash in case of non-secure applications.
RAM Modules	• Main CPU (PE1 and PE2) – Local RAM (LRAM) – Instruction Cache (Tag and Data) • ICUMC – Local RAM (LRAM) – Instruction Cache (Tag and Data) • Global RAM (GRAM) • Emulation RAM (ERAM) (P1H-CE only) • FCU RAM • Peripheral modules – DTS RAM – CSIH RAM – MCAN RAM – FlexRay RAM – Ethernet RAM – GTM RAM • Error detection and correction for functional safety • Automatic RAM initialization after reset for LRAM, GRAM and peripheral RAMs (exceptions: the head 1KB of LRAM in PE1, FCU RAM, ERAM and Ethernet RAM)
Boundary Scan	• Conforming to the IEEE 1149.1 • Support instructions: BYPASS, EXTEST, SAMPLE/PELOAD, IDCODE

(12/12)

Item	Features
Basic Security	• HW level domain separation between secure and non-secure domains • Flash protection • Mode entry protection • Debugger authentication • Device degradation controlled by Flash configuration options • Secure watchdog timer • Cache protection • RAM initialization after reset
ICUMC	• Dedicated CPU (RH850 G3K) for secure applications (depending on product type) • Secure interrupts handling • Dedicated secure peripherals – AES Engine – Random Number Generator (RNG) – Timers • Watchdog Timer • Additional authentication for tool connection such as a debugger

Table 1.3 Abbreviation table

Full name	Abbreviation
External Memory Controller	MEMC
Interrupt Controller	INTC
Direct Memory Access Controller	DMAC
Data Transfer System	DTS
Clocked Serial Interface H	CSIH
High-Speed Universal Synchronous Receiver / Transmitter	HS-USRT
FlexRay	FLX
Ethernet Controller	ETNA
Window Watchdog Timer	WDTA
System Timer	STM
Generic Timer Module	GTM
Peripheral Interconnect	PIC
AD Converter	ADCF
Error Control Module	ECM
Data CRC Function	DCRB
Core Voltage Monitor	CVM
Clock Monitor	CLMA
Temperature Sensor	OTS
On-Chip Debug	OCD
Emulation Device	ED
Intelligent Cryptographic Unit – Master	ICUMC

1.5 Difference among P1M-C, P1H-C and P1H-CE

See **Table 1.2**.

Section 2 Pin Functions

This section describes the pin and port functions.

Section 2.1, **2.2** describes the pin connection and respective pins.

Section 2.3 to **2.6** describes the general port functions.

Section 2.7 describe Noise filter & Edge detection.

2.1.7 Term Definition

The following terms are used in this section:

Pin

Denotes the physical pin. Every pin is denoted by a unique pin number.
A pin can be used in several modes. Each pin is assigned a name that reflects its function, which is determined by the selected mode.

Port group

Denotes a group of pins. All the pins of a specific port group are controlled by the same port control register.
The RH850/P1x-C provides the following port groups, indicated by the numbers in the table below.

	P1M-C/P1H-C (156)	P1M-C (144)	P1M-C (292)	P1H-C (4MB) (292)	P1H-C (8MB) (292)	P1H-C (8MB) ED (404)
Number of Group	7	8	10	11	11	11
Name of Group	P0 to P5, JP0	P0 to P6, JP0	P0 to P7, P9, JP0	P0 to P9, JP0	P0 to P9, JP0	P0 to P9, JP0

Port group index n

Each port group is identified by its own index “n” throughout this section; e.g.
PMCn for the port mode control register of the Pn port.

Port mode and ports

A pin in port mode works as a general purpose input/output pin. It is then called “port”.
The corresponding name is Pn_m. For example, P0_7 denotes port 7 of port group 0. It is referenced as “port P0_7”.

Alternative mode

In alternative mode, a pin can be used for various non-general-purpose input/output functions. It is such as CSI and INTP.

SHMT1/SHMT2/SHMT4

Denotes input buffer types. Each types have a different DC characteristics. For detail, refer to the **Section 35, Electrical Specifications**.

GPIO/HSIO.

GPIO indicates General purpose I/O and HSIO indicates High speed I/O. For detai, refer to the **Section 35, Electrical Specifications**.

2.2 Pin List

2.2.1 Pin List and Function assignment

CAUTION

To prevent malfunction, secure reset value to registers that are not available for the individual product. For port availability of each product see Table 2.1.

	AuroraReset2	—	I (Pull-down)	I (Pull-down)	I (Pull-down)	I (Pull-down)	I (Pull-down)	I (Pull-down)	I (Pull-down)
ERAM (*12, only for P1H-CE)	ERAMReset1 PD	—	I (Pull-down)	I (Pull-down)	I (Pull-down)	I (Pull-down)	I (Pull-down)	I (Pull-down)	I (Pull-down)
	ERAMReset2	—	I (Pull-down)	I (Pull-down)	I (Pull-down)	I (Pull-down)	I (Pull-down)	I (Pull-down)	I (Pull-down)
Other Debug (*12, only for P1H-CE)	EVTIZ	—	I (Pull-up)	I (Pull-up)	I (Pull-up)	I (Pull-up)	I (Pull-up)	I (Pull-up)	I (Pull-up)
	EVTOZ	—	O	O	O	O	O	O	O
	MSYNZ	—	I (Pull-up)	I (Pull-up)	I (Pull-up)	I (Pull-up)	I (Pull-up)	I (Pull-up)	I (Pull-up)

Note 1. RESETOUTZ pin drive out low level during and after reset. Until being disabled by port register settings, this pin keeps driveing out low level.

Note 2. CVMOUTZ pin level depends on core voltage status. And this pin has read back function to check pin level.

Note 3. ERROROUTZ pin is reseted to TriState level while CVM Reset. This pin has read back function to check pin level.

Note 4. FLMD0, FLMD1, MODE0, MODE1 signals are latched at RESETZ rising timing.

Note 5. During Field BIST execution, CVMOUTZ pin status is depends on CVMFBISTME bit in CVMDE register. For details, see **Section 10.3.5, CVMDE — CVM detection enable register** in **Section 10, Core Voltage Monitor (CVM)**.

Note 6. ERROROUTZ pin is Low-clamp until Field BIST execution is done.

Note 7. FLMD1, MODE0, MODE1 inputs are masked by FLMD0 value.

Note 8. Hi-Z when AUDR is disabled. Regarding of a setting to enable AUDR, see *Section 33.12.1 OPBT0 and RH850/P1x-C User's Manual: Hardware (Security)*.

Note 9. JP0_4 can be used only as input pin and its pin level can only be read by JPPR0 register in Port mode.

Note 10. "EVA_MODE0.OCD_MD = 1" cannot be given during Boundary Scan mode.

Note 11. SCDS is initialized when EVA_MODE0.OCD_MD = 0 (not reset mask) & RESETZ = L. Therefore, JTAG pins are also initialized like "RESETZ pin = L" status.

Note 12. Debug pins run only on the emulation device.

Note 13. Field BIST status will be skipped if it set TRSTZ = H.

Note 14. ERROROUTZ = Low during "RESETZ = L & TRSTZ = H & EVA_MODE0.OCD_MD = 1" at "Application Reset 1" and "System Reset 2".

Note 15. RDYZ = OUT status during TRSTZ = H.

Note 16. "EVA_MODE0.OCD_MD = 1" cannot be given during bootmode mode (Serial Programming Mode).

2.2.3 Pin Function assignments

159	FLX0TXDB	O		FLX0 channel B transmit data output
160	FLX0TXENA	O		FLX0 channel A transmit enable
161	FLX0TXENB	O		FLX0 channel B transmit enable
164	FLX1RXDA	I	FLX1	FLX1 channel A receive data input
165	FLX1RXDB	I		FLX1 channel B receive data input
166	FLX1STPWT	I		FLX1 stop watch trigger input
167	FLX1TXDA	O		FLX1 channel A transmit data output
168	FLX1TXDB	O		FLX1 channel B transmit data output
169	FLX1TXENA	O		FLX1 channel A transmit enable
170	FLX1TXENB	O		FLX1 channel B transmit enable
173	SENT0RX	I	SENT0	SENT ch0 sensor data input
174	SENT0SPCO	O		SENT ch0 SPC extension output

Table 2.4 Pin Function Name Definition (5/14)

Line	Function name	I/O	Category	Explanation
175	SENT1RX	I	SENT1	SENT ch1 sensor data input
176	SENT1SPCO	O		SENT ch1 SPC extension output
177	SENT2RX	I	SENT2	SENT ch2 sensor data input
178	SENT2SPCO	O		SENT ch2 SPC extension output
179	SENT3RX	I	SENT3	SENT ch3 sensor data input
180	SENT3SPCO	O		SENT ch3 SPC extension output
181	SENT4RX	I	SENT4	SENT ch4 sensor data input
182	SENT4SPCO	O		SENT ch4 SPC extension output
183	SENT5RX	I	SENT5	SENT ch5 sensor data input
184	SENT5SPCO	O		SENT ch5 SPC extension output
185	SENT6RX	I	SENT6	SENT ch6 sensor data input
186	SENT6SPCO	O		SENT ch6 SPC extension output
187	SENT7RX	I	SENT7	SENT ch7 sensor data input
188	SENT7SPCO	O		SENT ch7 SPC extension output
189	SENT8RX	I	SENT8	SENT ch8 sensor data input
190	SENT8SPCO	O		SENT ch8 SPC extension output
191	SENT9RX	I	SENT9	SENT ch9 sensor data input
192	SENT9SPCO	O		SENT ch9 SPC extension output
193	ETH0COL	I	ETH0	ETH0 Collision detection signal
194	ETH0WOL	O		ETH0 Wake on Lan signal (magic packet detection)
195	ETH0CRS	I		ETH0 Carrier detection signal
196	ETH0MDC	O		ETH0 Serial management interface transfer clock
197	ETH0MDI	I		ETH0 Serial management interface data Input
198	ETH0MDO	O		ETH0 Serial management interface data Output
199	ETH0REF50CK	I		ETH0 RMII reference clock
200	ETH0RXCLK	I		ETH0 Reception clock
201	ETH0RXD0	I		ETH0 Reception data 0
202	ETH0RXD1	I		ETH0 Reception data 1
203	ETH0RXD2	I		ETH0 Reception data 2
204	ETH0RXD3	I		ETH0 Reception data 3
205	ETH0RXDV	I		ETH0 Reception data valid
206	ETH0RXER	I		ETH0 Reception data error
207	ETH0TXCLK	I		ETH0 Transmission clock
208	ETH0TXD0	O	ETH0	ETH0 Transmission data 0
209	ETH0TXD1	O		ETH0 Transmission data 1
210	ETH0TXD2	O		ETH0 Transmission data 2
211	ETH0TXD3	O		ETH0 Transmission data 3
212	ETH0TXEN	O		ETH0 Transmission data enable
213	ETH0TXER	O		ETH0 Transmission data error
214	ETH0LINKSTA	I		ETH0 Link status from PHY

Table 2.4 Pin Function Name Definition (6/14)

Line	Function name	I/O	Category	Explanation
215	ETH1COL	I	ETH1	ETH1 Collision detection signal
216	ETH1WOL	O		ETH1 Wake on Lan signal (magic packet detection)
217	ETH1CRS	I		ETH1 Carrier detection signal
218	ETH1MDC	O		ETH1 Serial management interface transfer clock
219	ETH1MDI	I		ETH1 Serial management interface data Input
220	ETH1MDO	O		ETH1 Serial management interface data Output
221	ETH1REF50CK	I		ETH1 RMII reference clock
222	ETH1RXCLK	I		ETH1 Reception clock
223	ETH1RXD0	I		ETH1 Reception data 0
224	ETH1RXD1	I		ETH1 Reception data 1
225	ETH1RXD2	I		ETH1 Reception data 2
226	ETH1RXD3	I		ETH1 Reception data 3
227	ETH1RXDV	I		ETH1 Reception data valid
228	ETH1RXER	I		ETH1 Reception data error
229	ETH1TXCLK	I		ETH1 Transmission clock
230	ETH1TXD0	O		ETH1 Transmission data 0
231	ETH1TXD1	O		ETH1 Transmission data 1
232	ETH1TXD2	O		ETH1 Transmission data 2
233	ETH1TXD3	O		ETH1 Transmission data 3
234	ETH1TXEN	O		ETH1 Transmission data enable
235	ETH1TXER	O		ETH1 Transmission data error
236	ETH1LINKSTA	I		ETH1 Link status from PHY
237	MEMC0A0	O	External bus	External memory interface address bus bit0
238	MEMC0A1	O		External memory interface address bus bit1
239	MEMC0A2	O		External memory interface address bus bit2
240	MEMC0A3	O		External memory interface address bus bit3
241	MEMC0A4	O		External memory interface address bus bit4
242	MEMC0A5	O		External memory interface address bus bit5
243	MEMC0A6	O		External memory interface address bus bit6
244	MEMC0A7	O		External memory interface address bus bit7
245	MEMC0A8	O		External memory interface address bus bit8
246	MEMC0D0I	I		External memory interface data bus bit0 input
247	MEMC0D1I	I		External memory interface data bus bit1 input
248	MEMC0D2I	I		External memory interface data bus bit2 input
249	MEMC0D3I	I		External memory interface data bus bit3 input
250	MEMC0D4I	I		External memory interface data bus bit4 input
251	MEMC0D5I	I		External memory interface data bus bit5 input

Table 2.4 Pin Function Name Definition (7/14)

Line	Function name	I/O	Category	Explanation
252	MEMC0D6I	I	External bus	External memory interface data bus bit6 input
253	MEMC0D7I	I		External memory interface data bus bit7 input
254	MEMC0D0O	O		External memory interface data bus bit0 output
255	MEMC0D1O	O		External memory interface data bus bit1 output
256	MEMC0D2O	O		External memory interface data bus bit2 output
257	MEMC0D3O	O		External memory interface data bus bit3 output
258	MEMC0D4O	O		External memory interface data bus bit4 output
259	MEMC0D5O	O		External memory interface data bus bit5 output
260	MEMC0D6O	O		External memory interface data bus bit6 output
261	MEMC0D7O	O		External memory interface data bus bit7 output
262	MEMC0CS0Z	O		External memory interface chip select signals CS0
263	MEMC0CS1Z	O		External memory interface chip select signals CS1
264	MEMC0CS2Z	O		External memory interface chip select signals CS2
265	MEMC0CS3Z	O		External memory interface chip select signals CS3
266	MEMC0RDZ	O		External memory interface read strobe
267	MEMC0WRZ	O		External memory interface write strobe
268	ADC0CNV	O	ADC0	ADC0 AD conversion signal
269	ADC0TRG	I		ADC0 AD trigger input
270	ADC0I0	I		ADC0 input channel
271	ADC0I1	I		ADC0 input channel
272	ADC0I2	I		ADC0 input channel
273	ADC0I3	I		ADC0 input channel
274	ADC0I4	I		ADC0 input channel
275	ADC0I5	I		ADC0 input channel
276	ADC0I6	I		ADC0 input channel
277	ADC0I7	I		ADC0 input channel
278	ADC0I8	I		ADC0 input channel
279	ADC0I9	I		ADC0 input channel
280	ADC0I10	I		ADC0 input channel
281	ADC0I11	I		ADC0 input channel
282	ADC0I12	I		ADC0 input channel
283	ADC0I13	I		ADC0 input channel
284	ADC0I14	I		ADC0 input channel
285	ADC0I15	I		ADC0 input channel
286	ADC0I16	I		ADC0 input channel
287	ADC0I17	I		ADC0 input channel
288	ADC0I18	I		ADC0 input channel
289	ADC0I19	I		ADC0 input channel
290	ADC1CNV	O	ADC1	ADC1 AD conversion signal
291	ADC1TRG	I		ADC1 AD trigger input
292	ADC1I0	I		ADC1 input channel
293	ADC1I1	I		ADC1 input channel
294	ADC1I2	I		ADC1 input channel

Table 2.4 Pin Function Name Definition (8/14)

Line	Function name	I/O	Category	Explanation
295	ADC1I3	I	ADC1	ADC1 input channel
296	ADC1I4	I		ADC1 input channel
297	ADC1I5	I		ADC1 input channel
298	ADC1I6	I		ADC1 input channel
299	ADC1I7	I		ADC1 input channel
300	ADC1I8	I		ADC1 input channel
301	ADC1I9	I		ADC1 input channel
302	ADC1I10	I		ADC1 input channel
303	ADC1I11	I		ADC1 input channel
304	ADC1I12	I		ADC1 input channel
305	ADC1I13	I		ADC1 input channel
306	ADC1I14	I		ADC1 input channel
307	ADC1I15	I		ADC1 input channel
308	ADC1I16	I		ADC1 input channel
309	ADC1I17	I		ADC1 input channel
310	ADC1I18	I		ADC1 input channel
311	ADC1I19	I		ADC1 input channel
312	TCK	I	Debug	Debug clock
313	TDI	I		Debug data input
314	TDO	O		Debug data output
315	TMS	I		Debug mode select
316	RDYZ	O		Debug ready
317	TRSTZ	I		Debug reset
318	LPDCLK	I	Debug (LPD-4pin)	Debug clock for Low-pin count debug
319	LPDI	I		Debug data input for Low-pin count debug
320	LPDO	O		Debug data output for Low-pin count debug
321	LPDCLKOUT	O		Debug clock output for Low-pin count debug
322	LPDRSTZ	I		Debug reset for Low-pin count debug
323	EVTOZ	O	Nexus	Debug I/F event output signal
324	EVTIZ	I		Debug I/F event input signal
325	FLSCI3TXD	O	Flash Writer I/F	Flash Writer I/F TxD
326	FLSCI3RXD	I		Flash Writer I/F RxD
327	FLSCI3SCKI	I		Flash Writer I/F SCK
328	AUDRSTZ	I	AUDR	AUDR reset signal
329	AUDCK	I		AUDR clock signal
330	AUDSYNCZ	I		AUDR synchronous signal
331	AUDATA0	I/O		AUDR data signal
332	AUDATA1	I/O		AUDR data signal
333	AUDATA2	I/O		AUDR data signal
334	AUDATA3	I/O		AUDR data signal

Table 2.4 Pin Function Name Definition (9/14)

Line	Function name	I/O	Category	Explanation
335	CICREFP	I	Trace I/F	Trace I/F clock pos
336	CICREFN	I		Trace I/F clock neg
337	TODP0	O		Trace I/F data pos 0
338	TODN0	O		Trace I/F data neg 0
339	TODP1	O		Trace I/F data pos 1
340	TODN1	O		Trace I/F data neg 1
341	MSYNZ	I		Trace I/F Synchronization request
342	AURORES1Z	I		Aurora Domain Reset signal
343	AURORES2Z	I		Aurora domain signal Isolation
344	AURORESPDZ	I		Core domain Aurora signal Isolation
345	ERAMRESPDZ	I		Core domain ERAM signal Isolation
346	ERAMRES2Z	I		ERAM domain core signal Isolation
347	GTM0I0	I	GTM TIM	GTM TIM 0 input 0
348	GTM0I1	I		GTM TIM 0 input 1
349	GTM0I2	I		GTM TIM 0 input 2
350	GTM0I3	I		GTM TIM 0 input 3
351	GTM0I4	I		GTM TIM 0 input 4
352	GTM0I5	I		GTM TIM 0 input 5
353	GTM0I6	I		GTM TIM 0 input 6
354	GTM0I7	I		GTM TIM 0 input 7
355	GTM1I0	I		GTM TIM 1 input 0
356	GTM1I1	I		GTM TIM 1 input 1
357	GTM1I2	I		GTM TIM 1 input 2
358	GTM1I3	I		GTM TIM 1 input 3
359	GTM1I4	I		GTM TIM 1 input 4
360	GTM1I5	I		GTM TIM 1 input 5
361	GTM1I6	I		GTM TIM 1 input 6
362	GTM1I7	I		GTM TIM 1 input 7
363	GTMAT0O0	O	ATOM	GTM ATOM 0 output 0
364	GTMAT0O1	O		GTM ATOM 0 output 1
365	GTMAT0O2	O		GTM ATOM 0 output 2
366	GTMAT0O3	O		GTM ATOM 0 output 3
367	GTMAT0O4	O		GTM ATOM 0 output 4
368	GTMAT0O5	O		GTM ATOM 0 output 5
369	GTMAT0O6	O		GTM ATOM 0 output 6
370	GTMAT0O7	O		GTM ATOM 0 output 7
371	GTMAT1O0	O		GTM ATOM 1 output 0
372	GTMAT1O1	O		GTM ATOM 1 output 1
373	GTMAT1O2	O		GTM ATOM 1 output 2
374	GTMAT1O3	O		GTM ATOM 1 output 3
375	GTMAT1O4	O		GTM ATOM 1 output 4
376	GTMAT1O5	O		GTM ATOM 1 output 5
377	GTMAT1O6	O		GTM ATOM 1 output 6
378	GTMAT1O7	O		GTM ATOM 1 output 7

Table 2.4 Pin Function Name Definition (10/14)

Line	Function name	I/O	Category	Explanation
379	GTMAT2O0	O	ATOM	GTM ATOM 2 output 0

Table 2.4 Pin Function Name Definition (14/14)

Line	Function name	I/O	Category	Explanation
551	EnVCC	power	IO_Power	IO supply voltage n = 0, 1
552	EnVSS	power		IO ground n = 0, 1
553	VCC	power	Internal Regulator	Regulator supply voltage
554	VDD	power	Core_Power	Core supply voltage
555	VSS	power	Core_Ground	Core ground
556	DVCC	power	Trace_IF_Power	Aurora I/F supply voltage (Analog)
557	DVDD	power		Aurora I/F supply voltage (Digital)
558	DVSS	power		Aurora I/F ground
559	AnVCC	power	ADC	ADC supply voltage n = 0, 1
560	AnVSS	power		ADC ground n = 0, 1
561	AnVREFH	power		ADC reference voltage plus n = 0, 1
562	EMUVCC	power	EMU	Aurora control IO supply voltage
563	EMUVDD	power		Aurora control core supply voltage
564	EMUVSS	power		Aurora control ground
565	SYSVCC	power	System	System control supply voltage
566	OSCVSS	power	OSC	OSC ground
567	ERAMVDD	power	ERAM Control	ERAM core supply voltage
568	ERAMnVCC	power		ERAM IO supply voltage n = 0, 1
569	ERAMnVSS	power		ERAM ground n = 0, 1

2.2.5 Recommended Connection of Unused Pins

Table 2.5 Recommended Connection of Unused Pins

Table 2.5 Recommended Connection of Unused Pins (1/3)

Category	Pin Name	Recommended Connection of Unused Pins
CLOCK	X1	(Must be used.)
	X2	Leave open-circuit in case of external clock supply.
SYSTEM	RESETZ	(Must be used.)
	FLMD0	(Must be used.)
	P4_2, P4_3	• When FLMD0 is H level and P4_5(FLMD1) is H level Connected to E1VSS via a resistor. • When FLMD0 is L level or P4_5(FLMD1) is L level [Buffer disabled] Leave open-circuit. [Input] Leave open-circuit and the settings are to enable on-chip pullup/pull-down resistors.(use PUn_m, PDn_m) Connected to E1VCC or E1VSS via a resistor. [Output] Leave open-circuit.
SYSTEM	P4_5	• When FLMD0 is H level Connected to E1VSS via a resistor. • When FLMD0 is L level [Buffer disabled] Leave open-circuit. [Input] Leave open-circuit and the settings are to enable on-chip pullup/pull-down resistors.(use PUn_m, PDn_m) Connected to E1VCC or E1VSS via a resistor. [Output] Leave open-circuit.
Pn_m	P0 P1 P2 P3 P4(excluding P4_2, P4_3, and P4_5) P5 P6 P7 P8 P9	[Buffer disabled] Leave open-circuit. [Input] Leave open-circuit and the settings are to enable on-chip pullup/pull-down resistors.(use PUn_m, PDn_m) Connected to EnVCC or EVSS via a resistor. [Output] Leave open-circuit.

Table 2.5 Recommended Connection of Unused Pins (2/3)

Category	Pin Name	Recommended Connection of Unused Pins
JP0_m	JP0_0 : TDI/LPDI	Connected to E0VCC via a resistor*1
	JP0_0 : JP0_0	[Buffer disabled] Leave open-circuit. [Input] Leave open-circuit and the settings are to enable on-chip pullup/pull-down resistors.(use PUn_m, PDn_m) Connected to E0VCC or E0VSS via a resistor.*3 [Output] Leave open-circuit.
	JP0_1 : TDO/ LPDO	Leave open-circuit.
	JP0_1 : JP0_1	[Buffer disabled] Leave open-circuit. [Input] Leave open-circuit and the settings are to enable on-chip pullup/pull-down resistors.(use PUn_m, PDn_m) Connected to E0VCC or E0VSS via a resistor.*3 [Output] Leave open-circuit.
	JP0_2 : TCK/ LPDCLK	Connected to E0VCC via a resistor*1, or Leave open-circuit.
	JP0_2 : JP0_2	[Buffer disabled] Leave open-circuit. [Input] Leave open-circuit and the settings are to enable on-chip pullup/pull-down resistors.(use PUn_m, PDn_m) Connected to E0VCC or E0VSS via a resistor.*3 [Output] Leave open-circuit.
	JP0_3 : TMS	Connected to E0VCC via a resistor*1
	JP0_3 : JP0_3	[Buffer disabled] Leave open-circuit. [Input] Leave open-circuit and the settings are to enable on-chip pullup/pull-down resistors.(use PUn_m, PDn_m) Connected to E0VCC or E0VSS via a resistor.*3 [Output] Leave open-circuit.
	JP0_4 : TRSTZ/ LPDRSTZ/JP0_4	Connected to E0VSS via a resistor*2
	JP0_5 : RDYZ/ LPDCLKOUT	Leave open-circuit.
	JP0_5 : JP0_5	[Buffer disabled] Leave open-circuit. [Input] Leave open-circuit and the settings are to enable on-chip pullup/pull-down resistors.(use PUn_m, PDn_m) Connected to E0VCC or E0VSS via a resistor. [Output] Leave open-circuit.
ADC	ADC0In	Leave open-circuit Or connected to A0VCC or A0VSS .
	ADC1In	Leave open-circuit Or connected to A1VCC or A1VSS .
Other Func	ERROROUTZ	Leave open-circuit
	CVMOUTZ	Leave open-circuit

Table 2.5 Recommended Connection of Unused Pins (3/3)

Category	Pin Name	Recommended Connection of Unused Pins
Trace I/F	AURORES1Z	Connected to EMUVSS via a resistor.
	AURORES2Z	
	AURORESPDZ	Connected to E0VSS via a resistor.
	CICREFN, CLCREFP	Leave open-circuit
	TODN0, TODN1	Leave open-circuit
	TODP0, TODP1	
	MSYNZ	Connected to E0VCC via a resistor.
ERAM	ERAMRESPDZ	Connected to E1VSS via a resistor.
	ERAMRES2Z	Connected to ERAM1VSS via a resistor.
EMU	EVTOZ	Leave open-circuit
	EVTIZ	Connected to E1VCC via a resistor.
	AUDATA0 to AUDATA3	Connected to E1VCC via a resistor.
	AUDSYNCZ	Connected to E1VCC via a resistor.
	AUDCK	Connected to E1VCC via a resistor.
	AUDRSTZ	Connected to E1VSS via a resistor.
Power	EnVCC, EnVSS	(Must be used.)
	OSCVSS	(Must be used.)
	SYSVCC	(Must be used.)
	VDD, VSS	(Must be used.)
	VCC	(Must be used.)
	A0VREFH, A1VREFH	Connected to EnVCC.
	A0VCC, A1VCC	Connected to EnVCC.
	A0VSS, A1VSS	Connected to EnVSS.
	DVCC, DVDD, DVSS	(Must be used.) for Emulation devices
	EMUVCC, EMUVDD, EMUVSS	(Must be used.) for Emulation devices
	ERAMnVCC, ERAMVDD, ERAMnVSS	(Must be used.) for Emulation devices

Note 1. Except for P1H-CE. P1H-CE is “Connected to E1VCC via a resistor.”

Note 2. Except for P1H-CE. P1H-CE is “Connected to E1VSS via a resistor.”

Note 3. Except for P1H-CE. P1H-CE is “Connected to E1VCC or E1VSS via a resistor.”

2.3 Port Overview

This document defines the standard “port control logic” including the interface between IO buffers. Each parameters as Port Number are optimized for RH850/P1x-C products.

2.3.1 Introduction

The port of microcontroller is an interface between external devices and the internal resources (IPs) of the microcomputer. From design point of view, a port usually consists of IO buffer and the control logic as it is shown below.

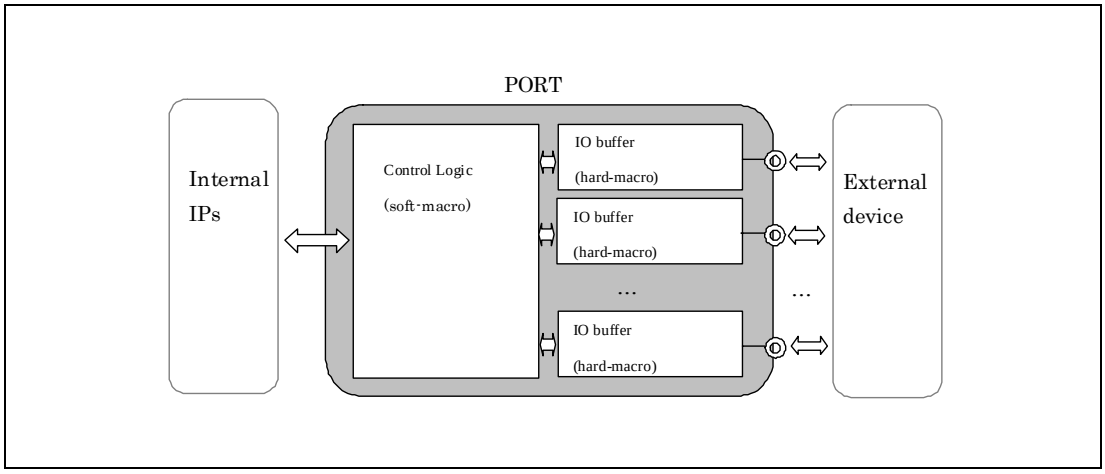

Figure 2.7 Port structure overview

2.3.2 Functional Overview

Active microcontroller reset result in a Hi-Z state for nearly all port pins. For exceptions refer to **Table 2.2, Pin Status**. After RESETZ release SW can define different state. All state changes by SW become active immediately after bus cycle of the associated write access is finished (<1us).

When a port pin is configured as digital input it is possible to configure it with pull-up or pull-down or without pull up. Internal pull-up on an input pin is enabled by setting pull-up register (PUn.PUn_m = 1) and pull-down is enabled by setting pull-down register (PDn.PDn_m = 1). If a pin is configured such that both an internal pull-up resistor (PUn.PUn_m = 1) and pull-down resistor (PDn.PDn_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected. If no pull-up or pull-down is required on an input port pin deselect pull-up and pull-down register (PUn.PUn_m = 0, PDn.PDn_m = 0).

External Interrupts Pins:

The maskable external interrupt pins (INTP0 to INTPn) and one non maskable interrupt pin (NMI) are available in the device. For external interrupts, falling edge, rising edge or both edges is selectable for each pin by the setting of the External Interrupt Detecting Method Select bits in the external interrupt control register. Furthermore, interrupt priority levels 0 to 15 can be set for each pin in interrupt control registers (IC0 to ICn). When edge detection is selected as an interrupt detecting method, an interrupt request is detected by a change in INTPn pins, and an interrupt request signal is sent to the INTC. Four external interrupts can generate DMA request and for more details see **Section 6, Interrupt Controller (INTC)**.

2.3.2.1 Port Category

(1) Numeric Port

The numeric port provides functions including Digital IO and alternative functions.

For example, functions like timer outputs, serials communications can be assigned on this port. External bus interface can also be assigned.

(2) JTAG Port

Several special functionalities are provided by JTAG port. This port is standardized to be used as a test interface, a debug interface, and port interface including flash programming interface.

The switch between debug interface and port mode is controlled by OPBT2. (See **Section 32.12.1, OPBT0 — Option Byte 0**)

Although any port functionalities can be realized with this pin, they cannot be emulated when the pin is used as a debug interface. Therefore it is recommended not to assign important user functions to this pin.

2.3.3 Operation Mode

Pins can operate in three operation modes.

- Port mode(PMCn.PMCn_m bit = 0)

  A pin in port mode operates as a general purpose input/output pin. The input / output mode is selected by setting the PMn.PMn_m bit.

- Alternative mode software I/O control(PMCn.PMCn_m bit = 1, PIPCn.PIPCn_m bit = 0)

  In this mode, the pins operate as alternative functions. The input / output mode is selected by setting the PMn.PMn_m bit.

- Alternative mode direct I/O control(PMCn.PMCn_m bit = 1, PIPCn.PIPCn_m bit = 1)

  In this mode, the pins operate as alternative funtions. Unlike the alternative mode software I/O control, however, the input / output direction is selected by the alternative function.

The following is register effect related to operation modes and pin I/O direction.

- PMCn.PMCn_m bit

  This bit selects port mode(PMCn_m = 0) or alternative mode(PMCn_m = 1).

- PMn.PMn_m bit

  This bit selects input(PMn_m = 1) or output(PMn_m = 0) when the port mode(PMCn_m = 0) and alternative mode software I/O control(PMCn_m = 1, PIPCn_m = 0) have been selected.

- PIBCn.PIBCn_m bit

  This bit disables(PIBCn_m = 0) or enables(PIBCn_m = 1) the input buffer in input port mode(PMCn_m = 0, PMn_m = 1). If alternative mode, this bit must always set to 0.

- PIPCn.PIPCn_m bit

  This bit selects alternative mode software I/O control or alternative mode direct I/O control.

- PBDCn.PBDCn_m bit

  In output mode or output enabled by alternative function, when this bit is set to 1, the pin enters the bidirectional mode.

The input / output direction and each modes by register setting is shown below **Table 2.6, Pin register setting**.

Table 2.6 Pin register setting

PMCn_m	PMn_m	PIBCn_m	PIPCn_m	PBDCn_m	Modes	I/O Direction
0	0	X	X	0	Port mode Output mode	Output
				1	Port mode Bi-directional mode	Input / Output
	1	0		X	Port mode Input mode (input disabled)	-
		1			Port mode Input mode (input enabled)	Input
1	0	0*1	0	0	Alternative mode Software I/O control Output mode	Output
				1	Alternative mode Software I/O control Bi-directional mode	Input / Output
	1			X	Alternative mode Software I/O control Input mode	Input
	X		1	0	Alternative mode Direct I/O control Input or output	Controlled by the alternative function
				1	Alternative mode Direct I/O control Input or bi-direction	Controlled by the alternative function

Note 1. Setting PIBC 1 in alternative mode is prohibited.

Table 2.7 Alternative mode selection table

PFCEn_[15:0]	PFCn_[15:0]	PMn_[15:0]	Function
0	0	1	Alternative peripheral function 1 (Alternative Mode 1) Input
		0	Alternative peripheral function 1 (Alternative Mode 1) Output
	1	1	Alternative peripheral function 2 (Alternative Mode 2) Input
		0	Alternative peripheral function 2 (Alternative Mode 2) Output
1	0	1	Alternative peripheral function 3 (Alternative Mode 3) Input
		0	Alternative peripheral function 3 (Alternative Mode 3) Output
	1	1	Alternative peripheral function 4 (Alternative Mode 4) Input
		0	Alternative peripheral function 4 (Alternative Mode 4) Output

Remark:
Some input or output functions is assigned to more than one pin. For using functions on multiple pins refer to the related register description in **Section 2.5.6, PFCEn/JPFCE0 — Port Function Control Expansion Register**.

CAUTION

To prevent malfunction, secure reset value to registers that are not available for the individual product. For port availability of each product see Table 2.1.

2.3.4 Pin data input/output

The registers used for data input/output are described below.

The location that is read via the PPRn register differs depending on the pin mode.

(1) Output data

In the port mode (PMCn.PMCn_m = 0), the value of the Pn.Pn_m bit is output to the Pn_m pin.

(2) Input data

When the PPRn register is read, either the value of the Pn_m pin, the value of the corresponding bit of the port register Pn.Pn_m, or the value output by the alternative function is returned.

Which value is returned depends on the pin mode and setting of several control bits. The different PPRn read modes are shown in the **Table 2.8, PPRn_m Read Values**.

Table 2.8 PPRn_m Read Values

PMC n_m	PMn_m	PIBC n_m	PIPC n_m	PBDC n_m	Mode	PPRn_m Read Value
0	0	X	X	0	Port Mode Output Mode	Pn.Pn_m bit
				1	Port Mode Bi-directional Mode	Pn_m pin
	1	0		X	Port Mode Input Mode, (Input disabled)	Pn.Pn_m bit
		1			Port Mode Input Mode (Input enabled)	Pn_m pin
1	0	0*1	0	0	Alternative Mode Software I/O control Output Mode	Alternative-function internal output signal
				1	Alternative Mode Software I/O control Bi-directional Mode	Pn_m pin
	1			X	Alternative Mode Software I/O control Input Mode	Pn_m pin
	X		1	0	Alternative Mode Direct I/O control Input or output	I/O port in alternative mode: * Input: Pn_m pin * Output: Alternative-function internal output signal
				1	Alternative Mode Direct I/O control Input or bi-direction	I/O port in alternative mode: * Input: Pn_m pin * Bi-direction: Pn_m pin

Note 1. Setting PIBC 1 in alternative mode is prohibited.

2.4 Port Functions

This section explains port control logic functions.

2.4.1 Port Control Logic Block Diagram

This section describes the superset of port structure and functionality. A port in this device is a subset of the logic structure shown below.

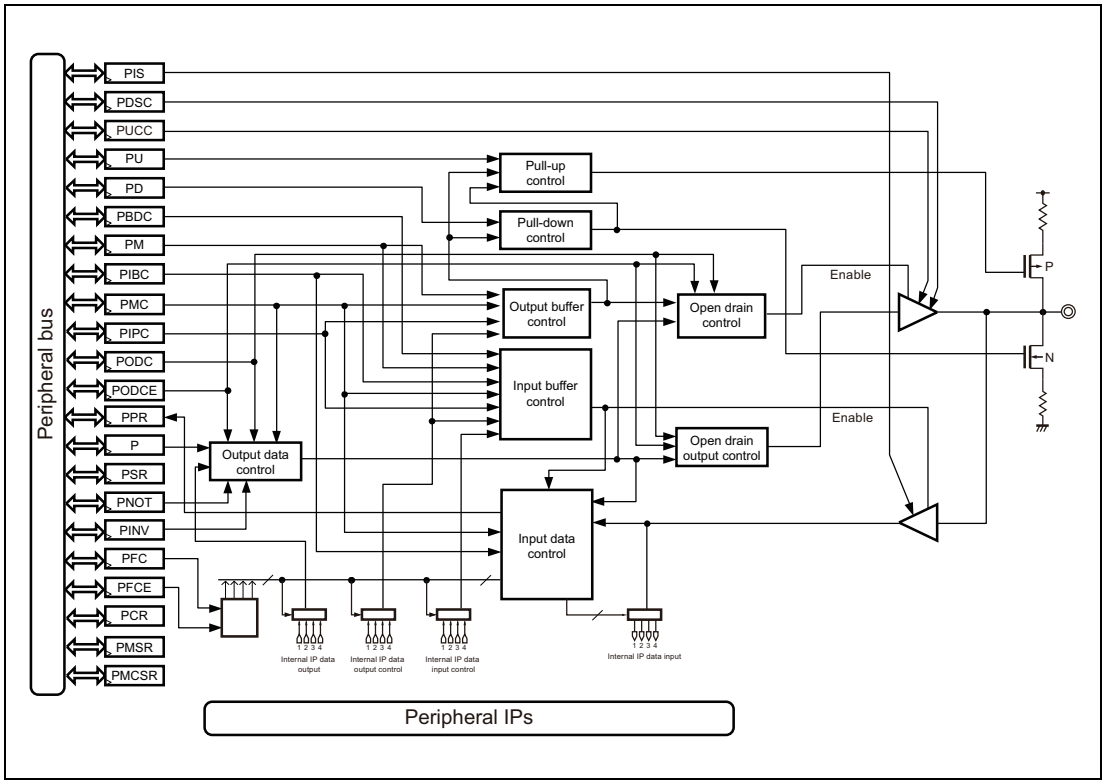

Figure 2.8 Port Control Logic Block Diagram

2.4.2 JTAG port 0 (JP0)

2.4.2.1 Control Register

Port	Register	Function	Access Size	Base Address	Offset Address	Reset Value	Existent Bit	
							R/W	Position
JP0	JP0	JTAG Port register 0	8	FFC2 0000_H	0000_H	00_H	R/W	5, 3-0
	JPSR0	JTAG Set Reset register 0	32		0004_H	0000 0000_H	R/W	21, 19-16, 5, 3-0
	JPNOT0	JTAG Port NOT register 0	8		0008_H	00_H	W	5, 3-0
	JPPR0	JTAG Port Pin Read register 0	8		$000C_H$	00_H	R	5-0
	JPM0	JTAG Port Mode register 0	8		0010_H	FF_H	R/W	5, 3-0
	JPMC0	JTAG Port Mode Control register 0	8		0014_H	00_H	R/W	2-0
	JPFCE0	JTAG Port Function Control Expansion register 0	8		$001C_H$	00_H	R/W	2-0
	JPMSR0	JTAG Port Mode Set Reset register 0	32		0020_H	0000 $00FF_H$	R/W	21, 19-16, 5, 3-0
	JPMCSR0	JTAG Port Mode Control Set Reset register 0	32		0024_H	0000 0000_H	R/W	18-16, 2-0
	JPINV0	JTAG Port output value Inversion register 0	8		0030_H	00_H	R/W	5, 3-0
	JPIBC0	JTAG Port Port Input Buffer Control register 0	8		4000_H	00_H	R/W	5-0
	JPBDC0	JTAG Port Bi-Direction Control register 0	8		4004_H	00_H	R/W	5, 3-0
	JPU0	JTAG Pull-up option register 0	8		$400C_H$	00_H	R/W	5, 3-0
	JPD0	JTAG Pull-down option register 0	8		4010_H	00_H	R/W	5, 3-0
	JPODC0	JTAG Port Open Drain Control register 0	32		4014_H	0000 0000_H	R/W	5, 3-0
	JPDSC0	JTAG Port Drive Strength Control register 0	32		4018_H	0000 0000_H	R/W	5, 3-0
	JPIS0	JTAG Port Input Selection register 0	8		$401C_H$	00_H	R/W	5, 3-0
	JPUCC0	JTAG Port Universal Characteristics Control register 0	32		4028_H	0000 0000_H	R/W	5, 3-0
	JPODCE0	JTAG Port Open Drain Control Expansion register 0	32		4038_H	0000 0000_H	R/W	5, 3-0

Note: Not all bit exist for all products. For details to the available port pins refer to **Table 2.1**

Note 1. When the JP0_m pin are used as NEXUS or LPD-4pin, set Reset Value to the register of JPM0, JPMC0 and JPIBC0.

The change between debug interface and Port mode of the JTAG port is controlled by the OPBT2. (See **Section 32.12.3, OPBT2 — Option Byte 2**) The following table describes the functionality of each JP0_m pin in the different modes.

OPJTAG1	OPJTAG0	Mode	JP0_0	JP0_1	JP0_2	JP0_3	JP0_4	JP0_5
1	1	Nexus (JTAG)	TDI input	TDO output	TCK input	TMS input	TRSTZ input	RDYZ output
0	1	LPD (4-pin)	LPDI input	LPDO output	LPDCLK input	Port	LPDRSTZ input	LPDCLKOUT output
0	0	GPIO	Port	Port	Port	Port	TRSTZ Input*1	Port

Note 1. JP0_4 pin level can only be read by JPPR0 register in Port mode.

2.4.3 Port 0 (P0)

2.4.3.1 Control Register

Port	Register	Function	Access Size	Base Address	Offset Address	Reset Value	Existent Bit	
							R/W	Position
P0	P0	Port register 0	16	FFC1 0000_H	0000_H	0000_H	R/W	14, 13, 10-0
	PSR0	Port Set Reset register 0	32		0004_H	$0000\ 0000_H$	R/W	30, 29, 26-16, 14, 13, 10-0
	PNOT0	Port NOT register 0	16		0008_H	0000_H	W	14, 13, 10-0
	PPR0	Port Pin Read register 0	16		$000C_H$	$0000\ 0000_H$	R	14, 13, 10-0
	PM0	Port Mode register 0	16		0010_H	$FBFF_H$	R/W	14, 13, 10-0
	PMC0	Port Mode Control register 0	16		0014_H	0000_H	R/W	14, 13, 9-0
	PFC0	Port Function Control register 0	16		0018_H	0000_H	R/W	14, 13, 9-0
	PFCE0	Port Function Control Expansion register 0	16		$001C_H$	0000_H	R/W	14, 13, 9-0
	PMSR0	Port Mode Set Reset register 0	32		0020_H	$0000\ FBFF_H$	R/W	30, 29, 26-16, 14, 13, 10-0
	PMCSR0	Port Mode Control Set Reset register 0	32		0024_H	$0000\ 0000_H$	R/W	30, 29, 26-16, 14, 13, 9-0
	PINV0	Port output value Inversion register 0	16		0030_H	0000_H	R/W	14, 13, 10-0
	PIBC0	Port Port Input Buffer Control register 0	16		4000_H	0000_H	R/W	14, 13, 10-0
	PBDC0	Port Bi-Direction Control register 0	16		4004_H	0000_H	R/W	14, 13, 10-0
	PIPC0	Port IP Control register 0	16		4008_H	0000_H	R/W	13, 9-7, 5-0
	PU0	Pull-up option register 0	16		$400C_H$	0000_H	R/W	14, 13, 10-0
	PD0	Pull-down option register 0	16		4010_H	0000_H	R/W	14, 13, 10-0
	PODC0	Port Open Drain Control register 0	32		4014_H	$0000\ 0400_H$	R/W	14, 13, 10-0
	PDSC0	Port Drive Strength Control register 0	32		4018_H	$0000\ 0000_H$	R/W	14, 13, 10-0
	PIS0	Port Input Selection register 0	16		$401C_H$	0000_H	R/W	14, 13, 10-0
	PUCC0	Port Universal Characteristics Control register 0	32		4028_H	$0000\ 0000_H$	R/W	14, 13, 10-0
	PODCE0	Port Open Drain Control Expansion register 0	32		4038_H	$0000\ 0000_H$	R/W	14, 13, 10-0

Note: Not all bit exist for all products. For details to the available port pins refer to **Table 2.1**

Note: RESET-OUT function.
The pin P0_10 has RESETOUTZ function emulated by port logic and special IO buffer. By this function, this pin can drive out low level during and after reset to reset external ASIC. This function is realized by having a special reset value of this pin being output mode by PM0_10 = 0 and being open-drain output buffer by PODC0_10 = 1, with the output value being low by P0_10 = 0. This function is effective for any kind of resets either it is external or internal.
Until being disabled by register settings, pin P0_10 keeps driving out low level after any kind of reset. To avoid data collision, the outside circuit connected to this pin must not drive in high level at any case.

2.4.4 Port 1 (P1)

2.4.4.1 Control Register

Port	Register	Function	Access Size	Base Address	Offset Address	Reset Value	Existent Bit	
							R/W	Position
P1	P1	Port register 1	16	FFC1 0000_H	0040_H	0000_H	R/W	7-1
	PSR1	Port Set Reset register 1	32		0044_H	$0000\ 0000_H$	R/W	23-17, 7-1
	PNOT1	Port NOT register 1	16		0048_H	0000_H	W	7-1
	PPR1	Port Pin Read register 1	16		$004C_H$	$0000\ 0000_H$	R	7-1
	PM1	Port Mode register 1	16		0050_H	$FFFF_H$	R/W	7-1

Note: Not all bit exist for all products. For details to the available port pins refer to **Table 2.1**

2.4.12 Port 9 (P9)

2.4.12.1 Control Register

Port	Register	Function	Access Size	Base Address	Offset Address	Reset Value	Existent Bit	
							R/W	Position
P9	P9	Port register 9	16	$FFC10000_H$	0240_H	0000_H	R/W	8-0
	PSR9	Port Set Reset register 9	32		0244_H	0000 0000_H	R/W	24-16, 8-0
	PNOT9	Port NOT register 9	16		0248_H	0000_H	W	8-0
	PPR9	Port Pin Read register 9	16		$024C_H$	0000 0000_H	R	8-0
	PM9	Port Mode register 9	16		0250_H	$FFFF_H$	R/W	8-0
	PMC9	Port Mode Control register 9	16		0254_H	0000_H	R/W	8-0
	PFC9	Port Function Control register 9	16		0258_H	0000_H	R/W	8-5, 3-0
	PFCE9	Port Function Control Expansion register 9	16		$025C_H$	0000_H	R/W	6, 5, 3-0
	PMSR9	Port Mode Set Reset register 9	32		0260_H	0000 $FFFF_H$	R/W	24-16, 8-0
	PMCSR9	Port Mode Control Set Reset register 9	32		0264_H	0000 0000_H	R/W	24-16, 8-0
	PINV9	Port output value Inversion register 9	16		0270_H	0000_H	R/W	8-0
	PIBC9	Port Port Input Buffer Control register 9	16		4240_H	0000_H	R/W	8-0
	PBDC9	Port Bi-Direction Control register 9	16		4244_H	0000_H	R/W	8-0
	PIPC9	Port IP Control register 9	16		4248_H	0000_H	R/W	8-1
	PU9	Pull-up option register 9	16		$424C_H$	0000_H	R/W	8-0
	PD9	Pull-down option register 9	16		4250_H	0000_H	R/W	8-0
	PODC9	Port Open Drain Control register 9	32		4254_H	0000 0000_H	R/W	8-0
	PDSC9	Port Drive Strength Control register 9	32		4258_H	0000 0000_H	R/W	8-0
	PIS9	Port Input Selection register 9	16		$425C_H$	0000_H	R/W	8-0
	PUCC9	Port Universal Characteristics Control register 9	32		4268_H	0000 0000_H	R/W	8-0
	PODCE9	Port Open Drain Control Expansion register 9	32		4278_H	0000 0000_H	R/W	8-0

Note: Not all bit exist for all products. For details to the available port pins refer to **Table 2.1**

2.4.13 Register Address Mapping

2.4.13.1 Offset Address

To make a port macro reusable over different products, the offset address decoder in port macro is also standardized as the following tables.

Table 2.9 Offset Address of Numeric Port Register

		Numeric Port Category (64 ports available)							
		User Register Type (16 registers available. 16KB)					OS Register Type (16 registers available. 16KB)		
		P	PSR	PNOT	…	.....	PIBC	…	…
64 ports	Port 0	0000	0004	0008	…	003C	4000	…	403C
	Port 1	0040	0044	0048	…	007C	4040	…	407C
	…	…	…	…..	…	…	…	…	…
	Port 63	0FC0	0FC4	0FC8	…	0FFC	4FC0	…	4FFC
RFU (LowerByte)	Port 0	1000	…	…	…	103C	5000	…	503C
	…	…	…	…	…	…	…	…	…
	Port 63	1FC0	…	…	…	1FFC	5FC0	…	5FFC
RFU (UpperByte)	Port 0	2000	…	…	…	203C	6000	…	603C
	…	…	…	…	…	…	…	…	…
	Port 63	2FC0	…	…	…	2FFC	6FC0	…	6FFC
RFU	Port 0	3000	…	…	…	303C	7000	…	703C
	…	…	…	…	…	…	…	…	…
	Port 64	3FC0	…	…	…	3FFC	7FC0	…	7FFC

Port registers were grouped into two types, User register type and OS register type.

For protection both types are considered as one port instance for the P-Bus Guard.

For more details about P-Bus guard, see **Section 3, CPU System**.

Table 2.10 Offset Address of JTAG Port Register

		JTAG Port Category (4 ports available though only 1 is defined as JTAG port)							
		User Register Type (16 registers available. 1KB)					OS Register Type (16 registers available. 1KB)		
		JP	JPSR	JPNOT	...	...	JPIBC	...	...
	JPort0	0000	0004	0008		003C	4000		403C
RFU	JPort1	0040	0044	0048	...	007C	4040	...	407C
	JPort2	0080	0084	0088	...	00BC	4080	...	408C
	JPort3	00C0	00C4	00C8		00FC	40C0		40FC
	JPort0	1000				103C	5000		503C
RFU (LowerByte)	...	...	...		...	...	...	...	...
	JPort3	10C0				10FC	50C0		50FC
	JPort0	2000				203C	6000		603C
RFU (UpperByte)	...	...	...		...	...	...	...	...
	JPort3	20C0				20FC	60C0		60FC
	JPort0	3000				303C	7000		703C
RFU	...	...	...		...	...	...	...	...
	JPort3	30C0				30FC	70C0		70FC

2.5 Port Register Description

The list of port control register types are described below.

Table 2.11 Port Register Overview

Port Register Name	Port Symbol	Offset Address	
		Numeric Port	JTAG Port
Port register	P	0x0000 + 0x40*n	0x0000 + 0x40*n
Port Set Reset register	PSR	0x0004 + 0x40*n	0x0004 + 0x40*n
Port NOT register	PNOT	0x0008 + 0x40*n	0x0008 + 0x40*n
Port Pin Read register	PPR	0x000C + 0x40*n	0x000C + 0x40*n
Port Mode register	PM	0x0010 + 0x40*n	0x0010 + 0x40*n
Port Mode Control register	PMC	0x0014 + 0x40*n	0x0014 + 0x40*n
Port Function Control register	PFC	0x0018 + 0x40*n	0x0018 + 0x40*n
Port Function Control Expansion register	PFCE	0x001C + 0x40*n	0x001C + 0x40*n
Port Mode Set Reset register	PMSR	0x0020 + 0x40*n	0x0020 + 0x40*n
Port Mode Control Set Reset register	PMCSR	0x0024 + 0x40*n	0x0024 + 0x40*n
Port output value Inversion register	PINV	0x0030 + 0x40*n	0x0030 + 0x40*n
Port Input Buffer Control register	PIBC	0x4000 + 0x40*n	0x4000 + 0x40*n
Port Bi-Direction Control register	PBDC	0x4004 + 0x40*n	0x4004 + 0x40*n
Port IP Control register	PIPC	0x4008 + 0x40*n	0x4008 + 0x40*n
Pull-Up option register	PU	0x400C + 0x40*n	0x400C + 0x40*n
Pull-Down option register	PD	0x4010 + 0x40*n	0x4010 + 0x40*n
Port Open Drain Control register	PODC	0x4014 + 0x40*n	0x4014 + 0x40*n
Port Drive Strength Control register	PDSC	0x4018 + 0x40*n	0x4018 + 0x40*n
Port Input buffer Selection register	PIS	0x401C + 0x40*n	0x401C + 0x40*n
Port Universal Characteristic Control register	PUCC	0x4028 + 0x40*n	0x4028 + 0x40*n
Port Open Drain Control Expansion register	PODCE	0x4038 + 0x40*n	0x4038 + 0x40*n
Port Control register	PCR	0x2000 + 0x40*n + 0x4*m	0x2000 + 0x4*m

Note: n = Port group numbers, m = Bit numbers of Port

CAUTION

To prevent malfunction, secure reset value to registers that are not available for the individual product. For port availability of each product see Table 2.1.

2.5.1 Pn/JP0 — Port Register

This register defines port pins output levels for port output mode.

Access: Pn: This register can be read / written in 16-bit units.
JP0: This register can be read / written in 8-bit units.

Address: Pn: <PORTn_base> + 0000_H + n × 40_H
JP0: < JPORT0_base> + 0000_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Pn_15	Pn_14	Pn_13	Pn_12	Pn_11	Pn_10	Pn_9	Pn_8	Pn_7	Pn_6	Pn_5	Pn_4	Pn_3	Pn_2	Pn_1	Pn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 2.12 Pn/JP0 register contents

Bit	Bit Name	Function
15 to 0	Pn_[15:0]	Sets the output level of pin Pn_m (m = 0 to 15). 0: Port pin drives low level 1: Port pin drives high level

NOTES

1. Reading Pn returns the register value independent from other register settings.
2. The value on this register bit is reflected to a pin level in the following conditions.
   Case : Port Mode (PMCn_m = 0) & Output Mode (PMn_m = 0)

2.5.2 PPRn/JPPR0 — Port Pin Read Register

This register reflects the actual pin level when the input buffer is active.

Access: PPRn: This register can be read only in 16-bit units.
JPPR0: This register can be read only in 8-bit units.
This register is read only. Writing this register is ignored and the written data is discarded

Address: PPRn: <PORTn_base> + $000C_H$ + n × 40_H
JPPR0: < JPORT0_base> + $000C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PPRn_15	PPRn_14	PPRn_13	PPRn_12	PPRn_11	PPRn_10	PPRn_9	PPRn_8	PPRn_7	PPRn_6	PPRn_5	PPRn_4	PPRn_3	PPRn_2	PPRn_1	PPRn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 2.13 PPRn/JPPR0 register contents

Bit	Bit Name	Function
15 to 0	PPRn_[15:0]	This register reflects the actual pin level when the input buffer is active 0: Port pin is at low level 1: Port pin is at high level

2.5.3 PMn/JPM0 — Port Mode Register

This register selects the pin direction as input or output.

Access: PMn: This register can be read/written in 16-bit units.
JPM0: This register can be read/written in 8-bit units.

Address: PMn: <PORTn_base> + 0010_H + n × 40_H
JPM0: < JPORT0_base> + 0010_H

Value after reset: $FFFF_H$*1

Note 1. The PM0 register is $FBFF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMn_15	PMn_14	PMn_13	PMn_12	PMn_11	PMn_10	PMn_9	PMn_8	PMn_7	PMn_6	PMn_5	PMn_4	PMn_3	PMn_2	PMn_1	PMn_0
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 2.14 PMn/JPM0 register contents

Bit	Bit Name	Function
15 to 0	PMn_[15:0]	Specifies input/output mode of the corresponding pin. 0: Output mode (output enabled) 1: Input mode (output disabled)

2.5.4 PMCn/JPMC0 — Port Mode Control Register

This register specifies whether the individual pins of port group n are in port mode or in alternative mode.

Access: PMCn: This register can be read/written in 16-bit units.
JPMC0: This register can be read/written in 8-bit units.

Address: PMCn: <PORTn_base> + 0014_H + n × 40_H
JPMC0: <JPORT0_base> + 0014_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMCn_15	PMCn_14	PMCn_13	PMCn_12	PMCn_11	PMCn_10	PMCn_9	PMCn_8	PMCn_7	PMCn_6	PMCn_5	PMCn_4	PMCn_3	PMCn_2	PMCn_1	PMCn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 2.15 PMCn/JPMC0 register contents

Bit	Bit Name	Function
15 to 0	PMCn_[15:0]	Specifies the operation mode of the corresponding pin. 0: Port mode 1: Alternative mode

2.5.5 PFCn — Port Function Control Register

This register selects the alternative peripheral functions together with PMn in Control Mode (PMCn = 1)

Access: PFCn: This register can be read/written in 16-bit units.

Address: PFCn: <PORTn_base> + 0018_H + n × 40_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCn_15	PFCn_14	PFCn_13	PFCn_12	PFCn_11	PFCn_10	PFCn_9	PFCn_8	PFCn_7	PFCn_6	PFCn_5	PFCn_4	PFCn_3	PFCn_2	PFCn_1	PFCn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 2.16 PFCn register contents

Bit	Bit Name	Function
15 to 0	PFCn_[15:0]	Specifies the alternative function of a pin. See **Table 2.17, Setting alternative functions**

Table 2.17 Setting alternative functions

PFCn_[15:0]	PMn_[15:0]	Function
0	1	Alternative peripheral function 1 (Control Mode 1) Input
	0	Alternative peripheral function 1 (Control Mode 1) Output
1	1	Alternative peripheral function 2 (Control Mode 2) Input
	0	Alternative peripheral function 2 (Control Mode 2) Output

Note: Do not set the control mode at the same time in the share function pins.

2.5.6 PFCEn/JPFCE0 — Port Function Control Expansion Register

This register selects the alternative peripheral functions together with PFCn and PMn in Control Mode (PMCn = 1).

Access: PFCEn: This register can be read/written in 16-bit units.
JPFCE0: This register can be read/written in 8-bit units.

Address: PFCEn: <PORTn_base> + $001C_H$ + n × 40_H
JPFCE0 : <JPORT0_base> + $001C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCEn_15	PFCEn_14	PFCEn_13	PFCEn_12	PFCEn_11	PFCEn_10	PFCEn_9	PFCEn_8	PFCEn_7	PFCEn_6	PFCEn_5	PFCEn_4	PFCEn_3	PFCEn_2	PFCEn_1	PFCEn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 2.18 PFCEn/JPFCE0 register contents

Bit	Bit Name	Function
15 to 0	PFCEn_[15:0]	Specifies the alternative function of a pin. See **Table 2.19, Setting alternative functions.**

Table 2.19 Setting alternative functions

PFCEn_m	PFCn_m	PMn_m	Function
0	0	1	Alternative peripheral function 1 (Control Mode 1) Input
		0	Alternative peripheral function 1 (Control Mode 1) Output
	1	1	Alternative peripheral function 2 (Control Mode 2) Input
		0	Alternative peripheral function 2 (Control Mode 2) Output
1	0	1	Alternative peripheral function 3 (Control Mode 3) Input
		0	Alternative peripheral function 3 (Control Mode 3) Output
	1	1	Alternative peripheral function 4 (Control Mode 4) Input
		0	Alternative peripheral function 4 (Control Mode 4) Output

Note 1. Output functions can possibly be assigned to more than one port for parallel usage. The output timing can differ between the ports because it depends on buffer selection and pin connection.

Note 2. Only activate one single pin to one given alternative input function. Do not activate a input function on multiple pins at the same time.
[e.g.]
MTTCAN0RX is assigned to the following pins on this device. When the 2nd input alternative function of P5_15 is selected, using the 3rd input alternative function of P2_6 and the 3rd input alternative function of P4_5 are prohibited.
- P2_6(3rd input alternative function)
- P4_5(3rd input alternative function)
- P5_15(2nd input alternative function)

2.5.7 PNOTn/JPNOT0 — Port Not Register

This register provided a method to flip the bit values of Pn register. The bits of Pn register are flipped if the PNOTn register is written with the corresponding bit values being 1.

Access: PNOTn: This register can be read / written in 16-bit units. The value is always read as 0000_H.
JPNOTn: This register can be read / written in 8-bit units. The value is always read as 00_H.

Address: PNOTn: <PORTn_base> + 0008_H + n × 40_H
JPNOT0: <JPORT0_base> + 0008_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PNOTn_15	PNOTn_14	PNOTn_13	PNOTn_12	PNOTn_11	PNOTn_10	PNOTn_9	PNOTn_8	PNOTn_7	PNOTn_6	PNOTn_5	PNOTn_4	PNOTn_3	PNOTn_2	PNOTn_1	PNOTn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 2.20 PNOTn/JPNOT0 register contents

Bit	Bit Name	Function
15 to 0	PNOTn_[15:0]	0: No effect on the value of Pn_m bit. 1: The value of Pn_m bit is flipped

NOTE

Only write operation on this register is relevant.

Reading PNOTn register always returns 0.

2.5.8 PSRn/JPSR0 — Port Set Reset Register

This register provides an alternative method to write/read data on Pn register.

The upper 16 bits of PSRn act as a mask which specifies whether or not the value Pn.Pn_m is set by the corresponding bit in the lower 16 bits of PSRn.

Access: PSRn: This register can be read / written in 32-bit units.

Address: PSRn: <PORTn_base> + 0004_H + n × 40_H
JPSR0: <JPORT0_base> + 0004_H

Value after reset: $0000\ 0000_H$

A reset from any source initialize the bits

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PSRn_31	PSRn_30	PSRn_29	PSRn_28	PSRn_27	PSRn_26	PSRn_25	PSRn_24	PSRn_23	PSRn_22	PSRn_21	PSRn_20	PSRn_19	PSRn_18	PSRn_17	PSRn_16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PSRn_15	PSRn_14	PSRn_13	PSRn_12	PSRn_11	PSRn_10	PSRn_9	PSRn_8	PSRn_7	PSRn_6	PSRn_5	PSRn_4	PSRn_3	PSRn_2	PSRn_1	PSRn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 2.21 PSRn/JPSR0 register contents

Bit	Bit Name	Function
31 to 16	PSRn_[31:16]	Specifies whether the value of the corresponding lower bit PSRn_m value is written to Pn_m. 0: Pn_m is not affected by PSRn_m. 1: Pn_m is PSRn_m
15 to 0	PSRn_[15:0]	Sets the output level of pin Pn_m (m = 0 to 15). 0: Low level is written on Pn_m when it is enabled by PSRn_(m+16) 1: High level is written on Pn_m when it is enabled by PSRn_(m+16)

NOTE

Reading PSRn_[31:16] bits always returns 0.

Reading PSRn_[15:0] returns the value of Pn_[15:0].

2.5.9 PMSRn/JPMSR0 — Port Mode Set/Reset Register

This register provides an alternative method to write/read data on PMn register.

The upper 16 bits of PMSRn act as a mask which specifies whether or not the value PMn.PMn_m is set by the corresponding bit in the lower 16 bits of PMSRn.

Access: This register can be read/written in 32-bit units. Bits 31 to 16 are always read as 0000_H. Reading bits 15 to 0 returns the value of register PMn.

Address: PMSRn: <PORTn_base> + 0020_H + n × 40_H
JPMSR0: <JPORT0_base> + 0020_H

Value after reset: 0000 $FFFF_H$*1

Note 1. The PMSR0 register is 0000 $FBFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PMSRn_31	PMSRn_30	PMSRn_29	PMSRn_28	PMSRn_27	PMSRn_26	PMSRn_25	PMSRn_24	PMSRn_23	PMSRn_22	PMSRn_21	PMSRn_20	PMSRn_19	PMSRn_18	PMSRn_17	PMSRn_16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 2.22 PMSRn/JPMSR0 register contents

Bit	Bit Name	Function
31 to 16	PMSRn_[31:16]	Specifies whether the value of the corresponding lower bit PMSRn_m value is written to PMn_m. 0: PMn_m is not affected by PMSRn_m. 1: PMn_m is PMSRn_m Example: If PMSRn.PMSRn_31 = 1, the value of bit PMSRn.PMSRn_15 is written to bit PMn.PMn_15.
15 to 0	PMSRn_[15:0]	Data bits that specify the PMn_m value if the corresponding upper bit (PMSRn_[31:16]) PMSRn_m is 1. 0: PMn_m = 0 1: PMn_m = 1

NOTE

Reading PMSRn_[15:0] returns the value of PMn_[15:0].

2.5.10 PMCSRn/JPMCSR0 — Port Mode Control Set/Reset Register

This register provides an alternative method to write data to the PMCn register.

The upper 16 bits of PMCSRn act as a mask which specifies whether or not the value PMCn.PMCn_m is set by the corresponding bit in the lower 16 bits of PMCSRn.

Access: This register can be read/written in 32-bit units. Bits 31 to 16 are always read as 0000_H. Reading bits 15 to 0 returns the value of register PMCn.

Address: PMCSRn: <PORTn_base> + 0024_H + n × 40_H
JPMCSR0: <JPORT0_base> + 0024_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PMCSRn_31	PMCSRn_30	PMCSRn_29	PMCSRn_28	PMCSRn_27	PMCSRn_26	PMCSRn_25	PMCSRn_24	PMCSRn_23	PMCSRn_22	PMCSRn_21	PMCSRn_20	PMCSRn_19	PMCSRn_18	PMCSRn_17	PMCSRn_16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

	PMCSRn_15	PMCSRn_14	PMCSRn_13	PMCSRn_12	PMCSRn_11	PMCSRn_10	PMCSRn_9	PMCSRn_8	PMCSRn_7	PMCSRn_6	PMCSRn_5	PMCSRn_4	PMCSRn_3	PMCSRn_2	PMCSRn_1	PMCSRn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 2.23 PMCSRn/JPMCSR0 register contents

Bit	Bit Name	Function
31 to 16	PMCSRn_ [31:16]	Specifies whether the value of the corresponding lower bit PMCSRn_m value is written to PMCn_m. 0: PMCn_m is not affected by PMCSRn_m. 1: PMCn_m is PMCSRn_m Example: If PMCSRn.PMCSRn_31 = 1, the value of bit PMCSRn.PMCSRn15 is written to bit PMCn.PMCn15.
15 to 0	PMCSRn_[15:0]	Data bits that specify the PMCn_m value if the corresponding upper bit (PMCSRn_[31:16]) PMCSRn_m is 1. 0: PMCn_m = 0 1: PMCn_m = 1

2.5.11 PINVn/JPINV0 — Port output value Inversion Register

This register inverts the output value of the port.

Access: PINVn: This register can be read/written in 16-bit units.
JPINV0: This register can be read/written in 8-bit units.

Address: PINVn: <PORTn_base> + 0030_H + n × 40_H
JPINV0: <JPORT0_base> + 0030_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PINVn_15	PINVn_14	PINVn_13	PINVn_12	PINVn_11	PINVn_10	PINVn_9	PINVn_8	PINVn_7	PINVn_6	PINVn_5	PINVn_4	PINVn_3	PINVn_2	PINVn_1	PINVn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 2.24 PINVn/JPINV0 register contents

Bit	Bit Name	Function
15 to 0	PINVn_[15:0]	This register inverts the output value of the port. 0: No effect 1: Inverted value is output

2.5.12 PIBCn/JPIBC0 — Port Input Buffer Control Register

This register is used as one of the factors to enable/disable port pin's input buffer in Port Mode (PMC = 0).

Access: PIBCn: This register can be read/written in 16-bit units.
JPIBC0: This register can be read/written in 8-bit units.

Address: PIBCn: <PORTn_base> + 4000_H + n × 40_H
JPIBC0: <JPORT0_base> + 4000_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIBCn_15	PIBCn_14	PIBCn_13	PIBCn_12	PIBCn_11	PIBCn_10	PIBCn_9	PIBCn_8	PIBCn_7	PIBCn_6	PIBCn_5	PIBCn_4	PIBCn_3	PIBCn_2	PIBCn_1	PIBCn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 2.25 PIBCn/JPIBC0 register contents

Bit	Bit Name	Function
15 to 0	PIBCn_[15:0]	Enables/disables the input buffer. 0: Input buffer disabled 1: Input buffer enabled.

NOTES

1. To enable port pin's input buffer, the IO direction must be set as input mode by PM = 1 during Port Mode (PMC = 0).
2. By keeping this register at a reset value of 0, port pin's input buffer does not consumes current even when the pin level is at an intermediate voltage. When the input buffer is disabled, in port mode, through current does not flow even when the pin level is Hi-Z. Thus the pin does not need to be fixed to a high or low level externally.
3. During this register set 1 with Port Mode (PMC = 0), the values for peripheral macro are fixed.
4. During "Software I/O control altermative-function input" Mode (PMC = 1, PM = 1, PIPC = 0), this register bit must be set to 0.

2.5.13 PBDCn/JPBDC0 — Port Bi-Direction Control Register

This register enables the input buffer and sets the port to bi-directional mode. In bi-direction mode, PPRn.PPRn_m can read the level of the Pn_m pin.

Access: PBDCn: This register can be read/written in 16-bit units.
JPBDC0: This register can be read/written in 8-bit units.

Address: PBDCn: <PORTn_base> + 4004_H + n × 40_H
JPBDC0: <JPORT0_base> + 4004_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PBDCn_15	PBDCn_14	PBDCn_13	PBDCn_12	PBDCn_11	PBDCn_10	PBDCn_9	PBDCn_8	PBDCn_7	PBDCn_6	PBDCn_5	PBDCn_4	PBDCn_3	PBDCn_2	PBDCn_1	PBDCn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 2.26 PBDCn/JPBDC0 register contents

Bit	Bit Name	Function
15 to 0	PBDCn_[15:0]	Enables/disables bi-directional mode of the corresponding pin. 0: Bi-directional mode disabled 1: Bi-directional mode enabled

NOTE

Loopback is enabled after four cycles of CLK_LSB since this register is wrriten.

2.5.14 PIPCn — Port IP Control Register

This register specifies whether the I/O direction of pin Pn_m is controlled by the port mode register PMn.PMn_m or by an alternative function. If pin Pn_m is operated in alternative mode (PMCn.PMCn_m = 1) and the alternative function requires direct control of the I/O direction, then PIPCn.PIPCn_m must be set to 1 as well. This transfers I/O control to the alternative function and overrules the PMn.PMn_m setting. The list of alternative function that require direct control of the I/O direction is provided **Table 2.28**. PIPC must be set to 1 when these alternative function is selected.

Access: PIPCn: This register can be read/written in 16-bit units.

Address: PIPCn: <PORTn_base> + 4008_H + n × 40_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIPCn_15	PIPCn_14	PIPCn_13	PIPCn_12	PIPCn_11	PIPCn_10	PIPCn_9	PIPCn_8	PIPCn_7	PIPCn_6	PIPCn_5	PIPCn_4	PIPCn_3	PIPCn_2	PIPCn_1	PIPCn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 2.27 PIPCn register contents

Bit	Bit Name	Function
15 to 0	PIPCn_[15:0]	Specifies the I/O control mode. 0: I/O mode is selected by PMn.PMn_m (software I/O control). 1: I/O mode is selected by the peripheral function (direct I/O control).

Table 2.28 Direct Control of the I/O direction by Alternative Function

Function			Explanation	Note

	ETHnMDO	O	ETH Serial management interface data Output	

2.5.15 PUn/JPU0 — Pull-Up Option Register

This register specifies whether pull-up resistor is connected to an input pin.

Access: PUn: This register can be read/written in 16-bit units.
JPU0: This register can be read/written in 8-bit units.

Address: PUn: <PORTn_base> + $400C_H$ + n × 40_H
JPU0: <JPORT0_base> + $400C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PUn_15	PUn_14	PUn_13	PUn_12	PUn_11	PUn_10	PUn_9	PUn_8	PUn_7	PUn_6	PUn_5	PUn_4	PUn_3	PUn_2	PUn_1	PUn_0

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 2.29 PUn/JPU0 register contents

Bit	Bit Name	Function
15 to 0	PUn_[15:0]	Specifies whether a pull-up resistor is connected to the corresponding pin. 0: No pull-up resistor connected 1: Pull-up resistor connected

NOTES

1. If a pin is configured such that both an internal pull-up resistor (PUn.PUn_m = 1) and pull-down resistor (PDn.PDn_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
2. The pull-up resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG pull-up option register (JPU0) are JPU0_ [7:0].

2.5.16 PDn/JPD0 — Pull-down option Register

This register specifies whether to connect an internal pull-down resistor to an input pin.

Access: PDn: This register can be read/written in 16-bit units.
JPD0:This register can be read/written in 8-bit units.

Address: PDn: <PORTn_base> + 4010_H + n × 40_H
JPD0: <JPORT0_base> + 4010_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PDn_15	PDn_14	PDn_13	PDn_12	PDn_11	PDn_10	PDn_9	PDn_8	PDn_7	PDn_6	PDn_5	PDn_4	PDn_3	PDn_2	PDn_1	PDn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 2.30 PDn/JPD0 register contents

Bit	Bit Name	Function
15 to 0	PDn_[15:0]	Specifies whether to connect an internal pull-down resistor to the corresponding pin: 0: No internal pull-down resistor connected 1: An internal pull-down resistor connected

NOTES

1. If a pin is configured such that both an internal pull-up resistor (PUn.PUn_m = 1) and pull-down resistor (PDn.PDn_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
2. The internal pull-down resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG pull-down option register (JPD0) are JPD0_[7:0].

2.5.17 PODCn/JPODC0 — Port Open Drain Control Register

This register selects push-pull or open-drain as output buffer function.

Access: This register can be read/written in 32-bit units.

Address: PODCn: <PORTn_base> + 4014_H + n × 40_H
JPODC0: <JPORT0_base> + 4014_H

Value after reset: 0000 0000_H*1

Note 1. The PODC0 register is 0000 0400_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 2.31 PODCn/JPODC0 register contents

Bit	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15 to 0	PODCn_[15:0]	Specifies the output buffer function. 0: Push-pull 1: Open-drain

2.5.18 PODCEn/JPODCE0 — Port Open Drain Control Expansion Register

This register selects the emulated P-channel Open Drain together with PODCn.

Access: This register can be read/written in 32-bit units.

Address: PODCEn: <PORTn_base> + 4038_H + n × 40_H
JPODCE0: <JPORT0_base> + 4038_H

Value after reset: 0000 0000_H

Bit	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15 to 0	PODCEn_[15:0]	See **Table 2.33, Port Open Drain Control Expansion** for the detailed operation on PODCE.

Table 2.33 Port Open Drain Control Expansion

PODCEn_m	PODCn_m	Function
0	0	push-pull
0	1	emulated N-channel Open Drain
1	0	push-pull
1	1	emulated P-channel Open Drain

2.5.19 PDSCn/JPDSC0 — Port drive strength control register

This register specifies the output driver strength of the port pin. This function is also related to the fast mode (high drive strength) and slow mode (low drive strength) of the output buffer.

Access: This register can be read/written in 32-bit units.

Address: PDSCn: <PORTn_base> + 4018_H + n × 40_H
JPDSC0: <JPORT0_base> + 4018_H

Value after reset: 0000 0000_H

Table 2.34 PDSCn/JPDSC0 register contents

Bit	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15 to 0	PDSCn_[15:0]	Specifies the port drive strength of the output buffer of the port pin. 0: Lower drive strength 1: High drive strength

2.5.20 PUCCn/JPUCC0 — Port Universal Characteristic Control Register

This register expands the number of output buffer characteristics selection capability. If it is used with PDSC register, the maximum of 4 characteristics selection is possible.

Access: This register can be read/written in 32-bit units.

Address: PUCCn: <PORTn_base> + 4028_H + n × 40_H
JPUCC0: <JPORT0_base> + 4028_H

Value after reset: 0000 0000_H

2.5.21 PISn/JPIS0 — Port input buffer selection register

This register specifies the input buffer characteristics.

Access: PISn: This register can be read/written in 16-bit units.
JPIS0: This register can be read/written in 8-bit units.

Address: PISn: <PORTn_base> + $401C_H$ + n × 40_H
JPIS0: <JPORT0_base> + $401C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PISn_15	PISn_14	PISn_13	PISn_12	PISn_11	PISn_10	PISn_9	PISn_8	PISn_7	PISn_6	PISn_5	PISn_4	PISn_3	PISn_2	PISn_1	PISn_0

Table 2.38 PISn/JPIS0 register contents

Bit	Bit Name	Function
15 to 0	PISn_[15:0]	Specifies the input buffer characteristic: 0: Type 1 (SHMT1) 1: Type 2 (SHMT4)

2.5.22 PCRn_m/JPCR0_m — Port Control Register

By going through this register, it is possible to have access to the registers of each port group, and the individual pins is specified all functions by 1 PCR register setting.

Access: PCRn_m/JPCR0_m: This register can be read/written in 32-bit units

Address: PCRn_m: <PORTn_base>+2000H + n × 40_H + m × 4_H
JPCR0_m: <JPORT0_base>+2000H + m × 4_H

Value after reset: 0000 0010_H*1,*2

Note 1. The PCR0_10 register is 1000 0000_H

Note 2. The JPCR0_4 register is 00000000H, because do not support JPM0_4 bit.

Table 2.39 PCRn_m/JPCR0_m register contents (1/2)

Bit	Bit Name	Function
31	Reserved	When read, the value after reset is read. When writing, write the value after reset.
30	PINV	Same as the m bit of PINVn/JPINV0 register
29	Reserved	When read, the value after reset is read. When writing, write the value after reset.
28	PODC	Same as the m bit of PODCn/JPODC0 register
27	PODCE	Same as the m bit of PODCEn/JPODCE0 register
26	Reserved	When read, the value after reset is read. When writing, write the value after reset.
25	PUCC	Same as the m bit of PUCCn/JPUCC0 register
24	PDSC	Same as the m bit of PDSCn/JPDSC0 register
23 to 21	Reserved	When read, the value after reset is read. When writing, write the value after reset.
20	PIS	Same as the m bit of PISn/JPIS0 register
19	PU	Same as the m bit of PUn/JPU0 register
18	PD	Same as the m bit of PDn/JPD0 register
17	PBDC	Same as the m bit of PBDCn/JPBDC0 register
16	PIBC	Same as the m bit of PIBCn/JPIBC0 register
15 to 13	Reserved	When read, the value after reset is read. When writing, write the value after reset.
12	P	Same as the m bit of Pn/JP0 register
11 to 9	Reserved	When read, the value after reset is read. When writing, write the value after reset.
8	PPR	Same as the m bit of PPRn/JPPR0 register
7	Reserved	When read, the value after reset is read. When writing, write the value after reset.

Table 2.39 PCRn_m/JPCR0_m register contents (2/2)

Bit	Bit Name	Function
6	PMC	Same as the m bit of PMCn/JPMC0 register
5	PIPC	Same as the m bit of PIPCn register
4	PM	Same as the m bit of PMn/JPM0 register
3, 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	PFCE	Same as the m bit of PFCEn/JPFCE0 register
0	PFC	Same as the m bit of PFCn register

2.6 Port Setting Flow Example

Port setting flow examples are shown in this section.

The following figure indicates an example of setting a port group collectively.

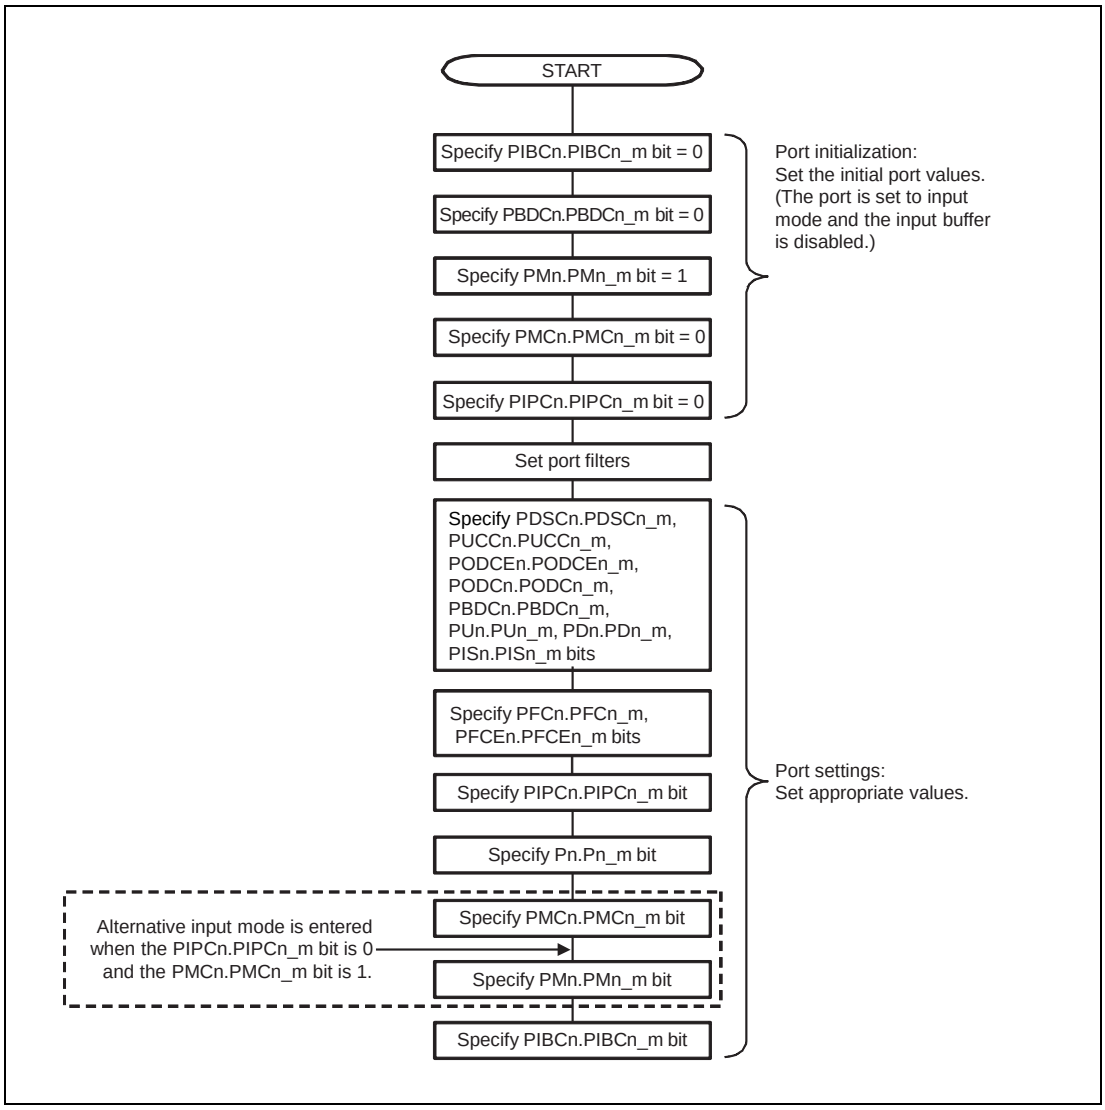

Figure 2.9 Port setting flow example (setting collectively)

Setting individually

The following figure indicates an example of setting an individual port.

By going through this register, it is possible to have access to the registers of each port group, and the individual pins is specified all functions by 1 PCR register setting.

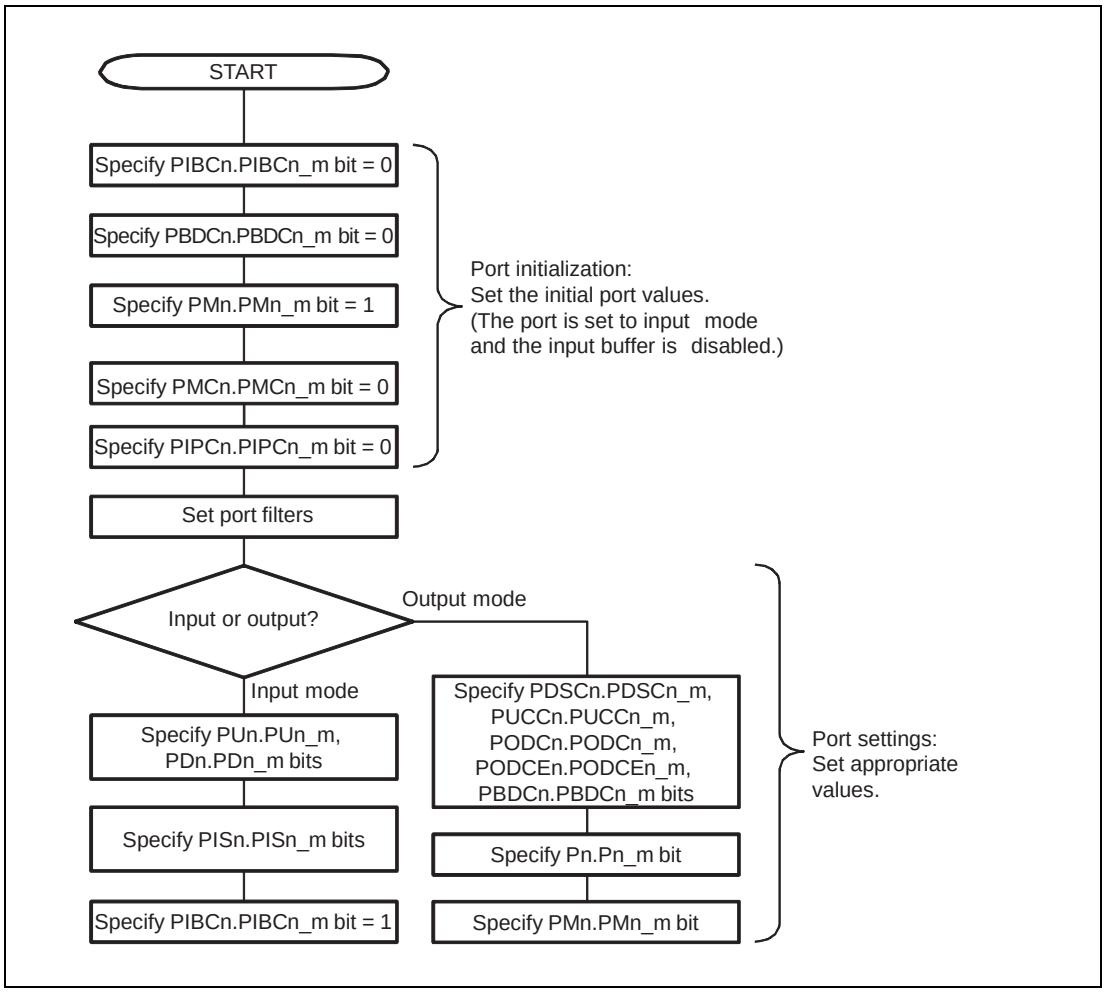

Figure 2.10 Port setting flow example (Port mode)

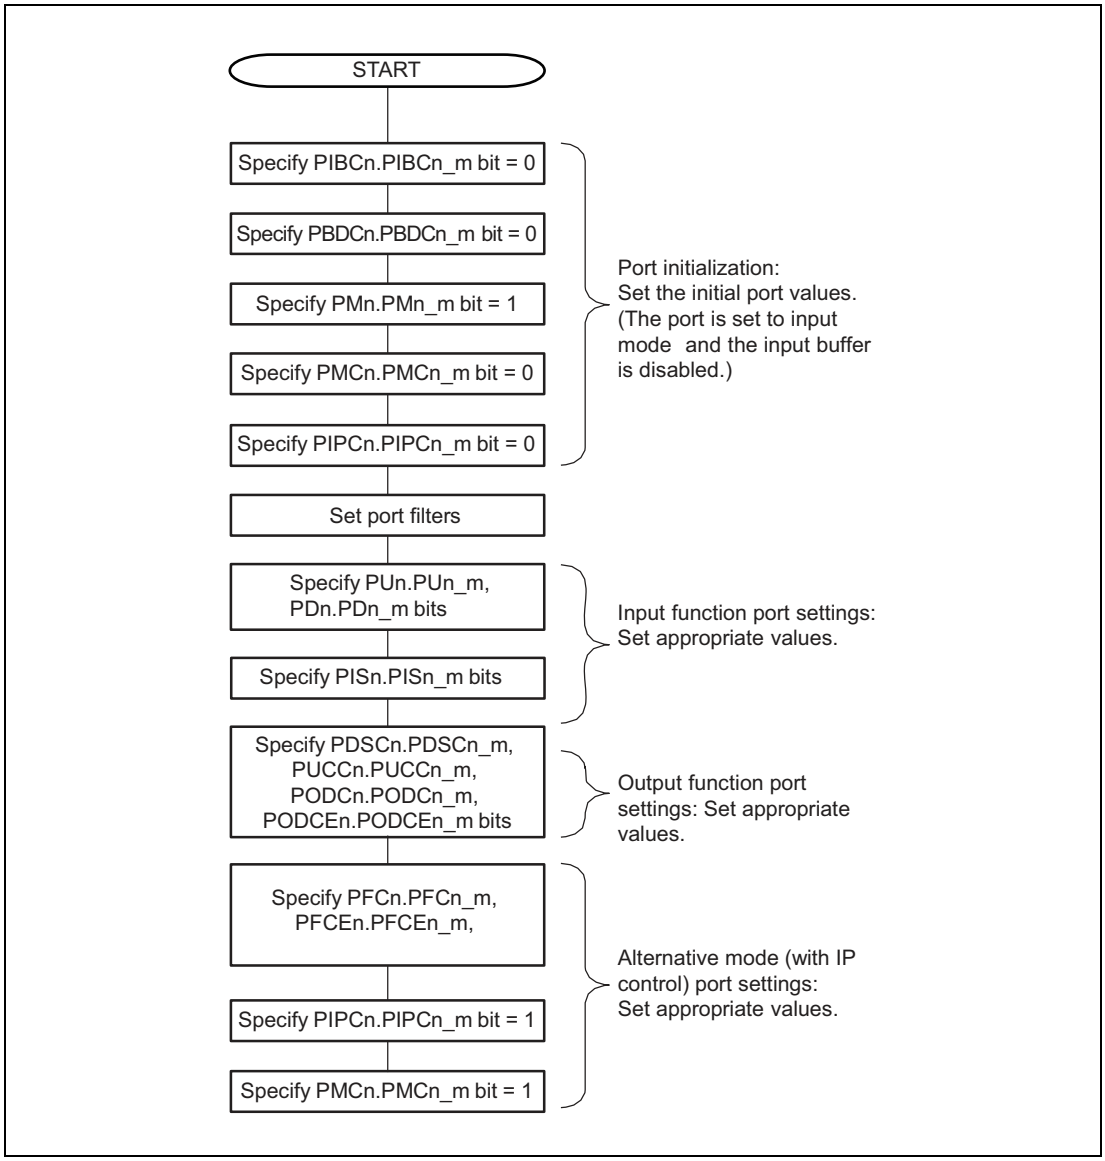

Figure 2.11 Port setting flow example (Alternative mode w/ IP control)

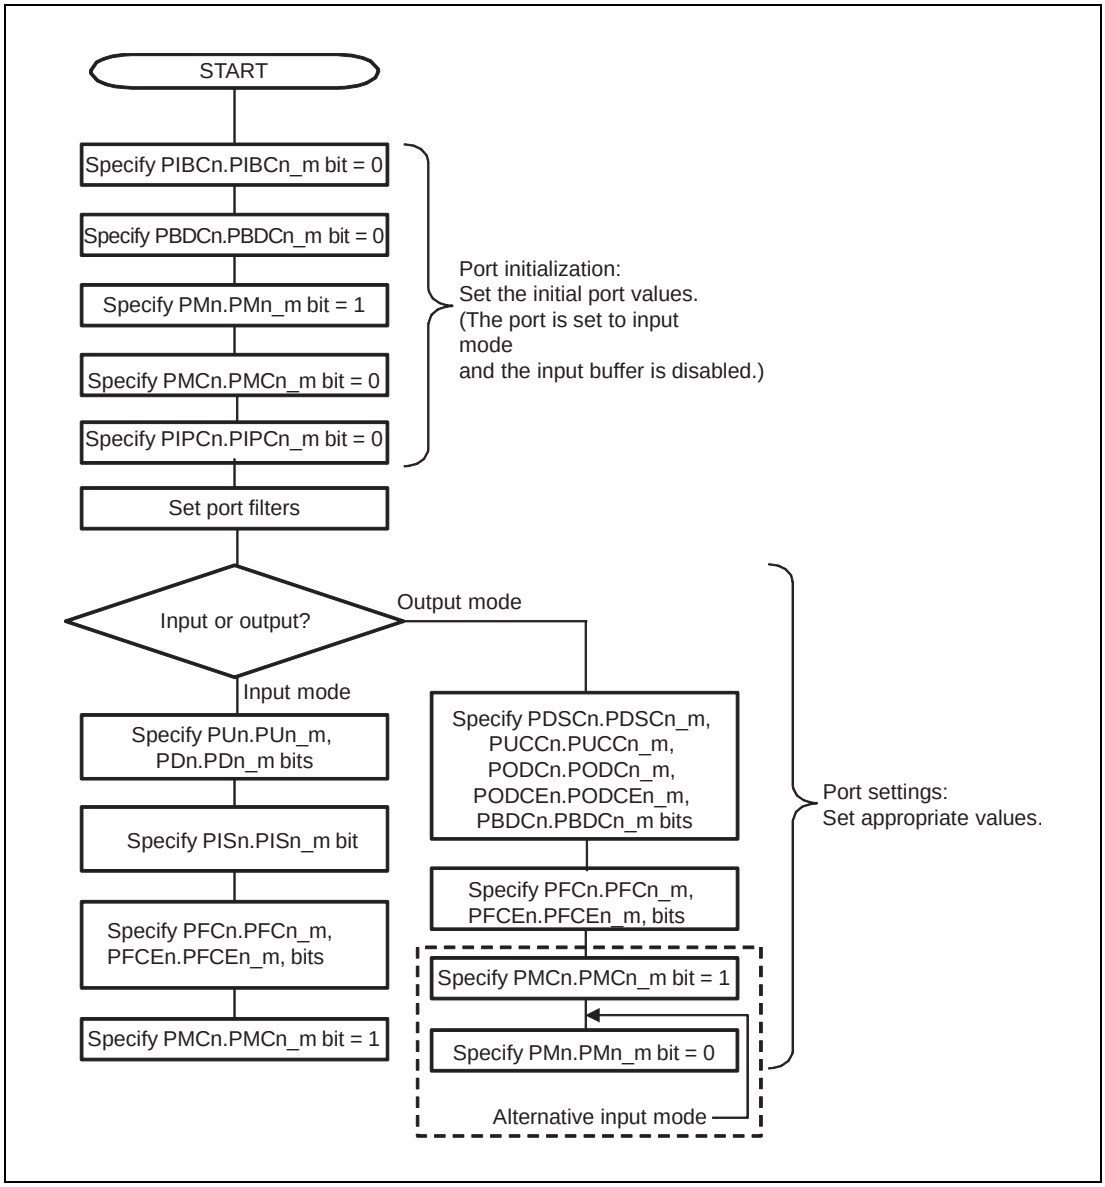

Figure 2.12 Port setting flow example (Alternative mode w/o IP control)

2.7 Noise Filter & Edge Detector

The input signals at some pins are passed through a filter to eliminate noise and glitches. This device supports both analog and digital filters. It also supports the function for edge and level detection after the signals have passed through a filter. The first part of this section provides an overview of port input signals that are equipped with a filter and the filter type, noise filter & edge detection control registers and bits, and register addresses.

Note: Level detection feature is not available in this device

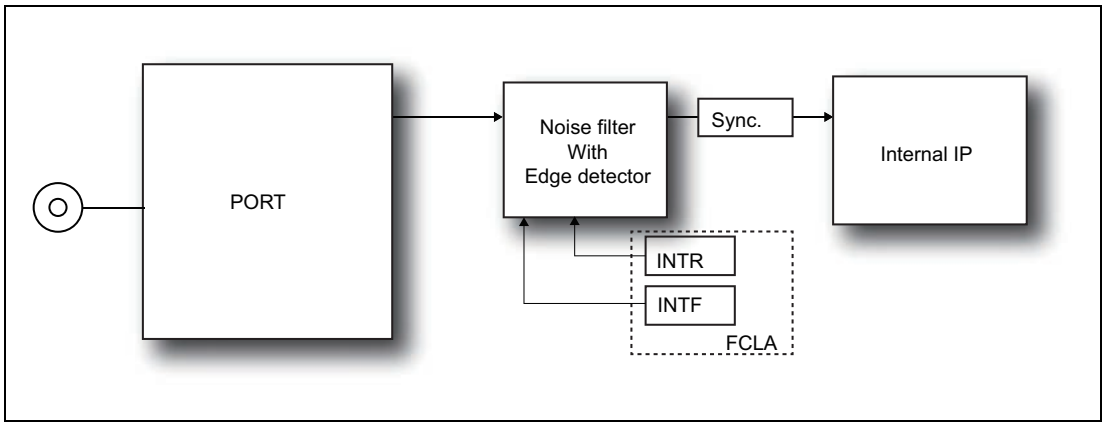

Figure 2.13 Noise Filter & Edge Detector Block Diagram

2.7.1 Port filter assignment

A list of the input pins that incorporate an analog or digital filter is provided below.

2.7.1.1 Input pins that incorporate analog filter type A

The input pins of analog filter type A incorporate an analog filter and edge/level detection function. Edge/level detection is controlled by the following registers.

- Filter control register FCLAnCTLm (n = 0 to 6, m = 0 to 7)
  A dedicated FCLAnCTLm register is provided for each pin in a port that incorporates an analog filter.

Table 2.41 Input pins that incorporate analog filter type A

	FCLAnCTLm Register Configuration	
Input signal	**Register**	**Address**
NMI	FCLAnCTLm	See **Table 2.44, Noise Filter Register List**
INTPn	FCLAnCTLm	See **Table 2.44, Noise Filter Register List**

Here n is the external interrupt number, m varies from 0 to 7 and x varies from L & H

2.7.1.2 Input pins that incorporate analog filter type B

The input pins of analog filter type B only incorporate the analog filter function.

Table 2.42 Input pins that incorporate analog filter type B

AURORES1Z
AURORESPDZ
AURORES2Z
ERAMRESPDZ
ERAMRES2Z

2.7.1.3 Input pins that incorporate digital filter type C

The input pins of digital filter type C incorporate a digital filter and edge detection function. The digital filter and edge detection are controlled by the following registers.

- Filter control register FCLAnCTLm (m = 0)
  Each port with a digital filter has a special FCLAnCTLm register.
- Digital noise elimination control register DNFAnCTL
  Each DNFAnCTL control register controls digital filter processing for three input signals per group.
- Digital noise elimination enable register DNFAnEN
  The setting of the DNFAnNFENL[2:0] bits in DNFAnEN enables or disables digital noise elimination for three input signals per group.

Input pins that incorporate digital filter type C are yet to be decided.

2.7.1.4 Input pins that incorporate digital filter type D

The input pins of digital filter type D incorporate a digital filter and without edge detection function. The digital filter is controlled by registers same as type C.

2.7.1.5 Input pins that incorporate combination of analog filter and digital filter type E

The input pins of filter type E incorporate a digital filter and analog filter without edge detection function. The analog filter and digital filter is controlled by registers same as type A and C.

2.7.2 Noise Filter Assignment

The noise filter type of each pin is shown below.

Table 2.43 Noise Filter Assignment Overview (1/3)

Note 1. RXD doesn't have noise filter. DNF and ED is inserted only path for wake up factor.

Note 2. GTM has DNF for each input within itself. For more details, see **Section 25.10, Timer Input Module (TIM)**.

About edge detect of each serial macro's received data for Wake up, additional circuit diagram is described as following. DNFAm/FICTLm block of each Figure is added for the edge detect function to wake up.

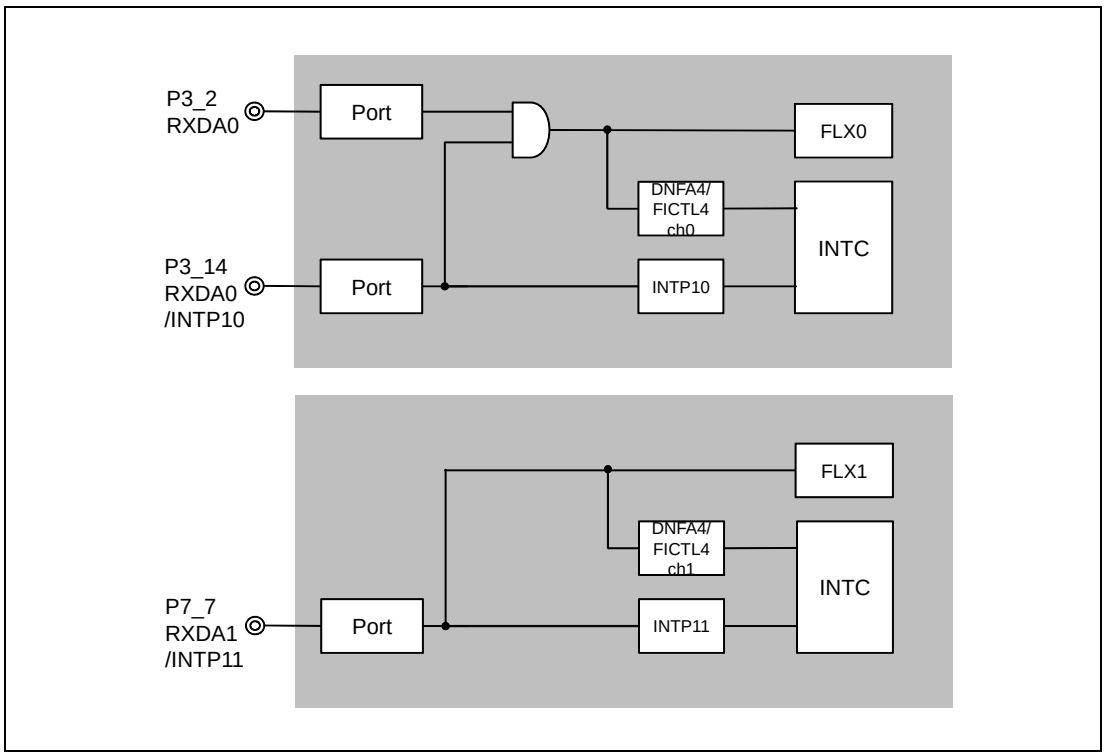

Figure 2.14 FlexRay RXDA and INTP connection diagram

NOTE

When RXDA0 of P3_2 is used for FLX0, P3_14 can not be used as INTP10 for Wake up.

When RXDA0 of P3_14 is used for FLX0, P3_14 can be used as INTP10 for Wake up.

2.7.3 Description of Port Noise Filter & Edge/Level Detection

External input signals pass through different types of filters according to the application of the signal to be filtered.

(1) Analog filters

Analog filters have fixed characteristics.

- Type A: An analog filter with edge detection or level detection.
  Used for external interrupt signals.
- Type B: An analog filter only.
  Used for the external RESETZ input and mode signals.

(2) Digital filters

The digital filter characteristics can be adjusted to suit the application.

- Type C: A digital filter with edge detection.
  Used for the wake up signal.
- Type D: A digital filter without edge detection.
  Used for the ADC trigger input signal.

(3) Digital and Analog filters

- Type E: An analog and digital filter with edge detection.
  Used for the SENT receive signal.

2.7.3.1 Analog filters

Analog filter characteristic

The characteristics of the analog filter as well as of the level and edge detectors are specified in the **Section 35, Electrical Specifications**.

Analog filters control registers

For each input signal, that is equipped with an analog filter, a dedicated control register FCLAnCTLm and a control register in each peripheral macro are provided.

(1) Analog filter type A

A block diagram of analog filter type A is shown below.

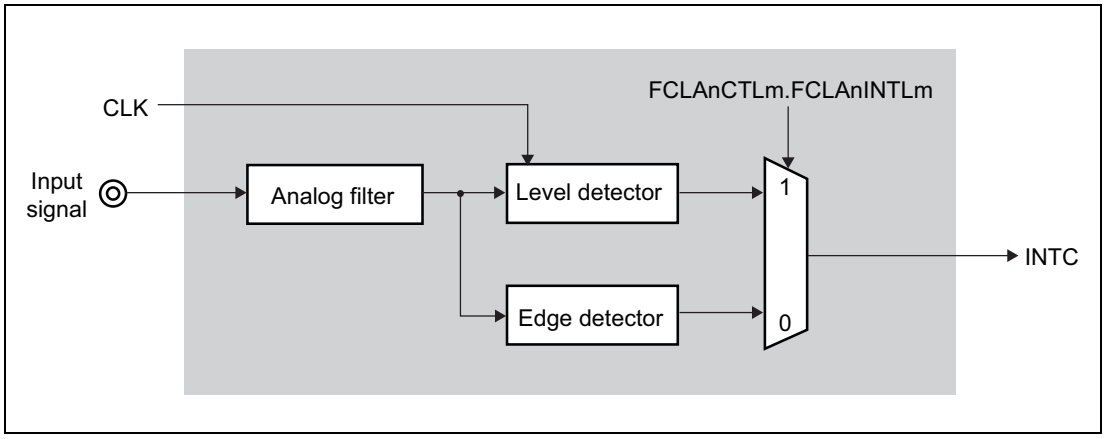

Figure 2.17 Block diagram of analog filter type A

After passing an external signal through the filter to eliminate noise and spikes, the filter generates an output signal according to whether an event is detected; that is whether a specified level is detected or whether a change in the level (an edge) occurs.

Whether a level or an edge is detected is selected by the control bit FCLAnCTLm.FCLAnINTLm.

- FCLAnCTLm = 0: Edge detection
  Whether a rising or falling edge is detected can be specified by setting the FCLAnCTLm.FCLAnINTRm and FCLAnCTLm.FCLAnINTFm bits.
- FCLAnINTLm = 1: Level detection
  The detection of a high level or low level can be specified by setting FCLAnCTLm.FCLAnINTRm.

The table below summarizes the detection conditions of the analog filter.

Table 2.46 Analog filter event detection conditions

FCLAnINTLm	FCLAnINTFm	FCLAnINTRm	Edge detection	Level detection
0	0	0	No edge detected	Disabled
	0	1	Rising edge	
	1	0	Falling edge	
	1	1	Rising and falling edges	
1	X	0	Disabled	Low Level
	X	1		High Level

(2) Analog filter type B

A block diagram of analog filter type B is shown below.

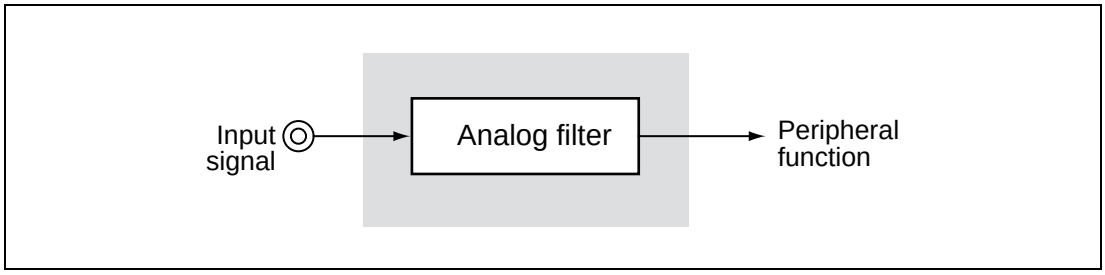

Figure 2.18 Block diagram of analog filter type B

The occurred signals are always signals that have passed through an analog filter.

2.7.3.2 Digital filters

Digital filter characteristic

The digital filters allow adjusting the filter characteristics to the needs of the application.

The input signal is sampled with the sampling frequency f_s.

If a specified number of successive samples yield the same (high or low) level, the signal level is judged as valid and the filter output signal is set accordingly.

If an external signal level change is detected within the specified number of samples (same level samples s), the signal level is judged as noise – or a spike – and the filter output signal does not change.

The length of an external signal pulse to be judged as noise depends on the sampling frequency and the specified number of same level samples.

Both parameters can be specified:

- DNFAnCTL.DNFAnPRS[2:0] allows to select the sampling frequency to
  $f_s = f_{DNFATCKI} / 2^{DNFAnPRS[2:0]}$
  where $f_{DNFATCKI}$ is the frequency of the DNFATCKI clock.
- DNFAnCTL.DNFAnNFSTS[1:0] determines the number s of same level samples (2 to 5):
  External signal pulses, shorter than
  DNFAnNFSTS[1:0] × 1/ f_s
  are always suppressed.
  External signal pulses, longer than
  (DNFAnNFSTS[1:0] + 1) × 1/ f_s
  are always judged as valid and are passed on to the filter output.
  Consequently, external signal pulses in the range
  DNFAnNFSTS[1:0] × 1/ f_s to (DNFAnNFSTS[1:0] + 1) × 1/ f_s
  may be suppressed or judged as valid.
  The filter operation is illustrated in the figure below with DNFAnNFSTS[1:0] = 01_B, i.e. s = 3 same level samples.

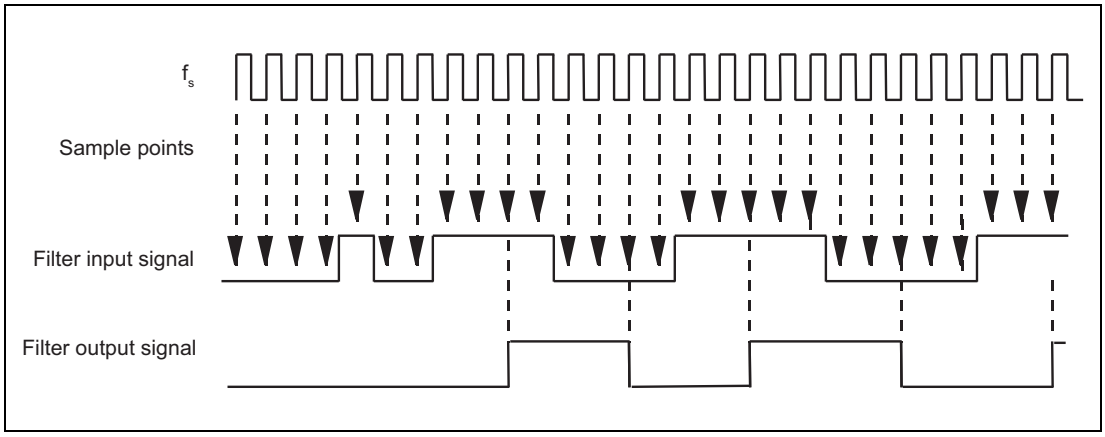

Figure 2.19 Digital Filter function

Digital filter groups

The input signals with digital filters are ordered in groups of up to 16 signals.

The digital filter characteristics, specified by DNFAnCTL.DNFAnPRS[2:0] and DNFAnNFSTS[1:0] apply to the filters of the entire group.

However the digital filter for each signal can be enabled or disabled separately by DNFAnEN.DNFAnNFENm.

CAUTIONS

1. **When the output signal from the digital filter is set to an input for an alternative function, allow at least the following interval to elapse after the digital filter is enabled (DNFAnEN.DNFAnNFENm = 1) for the port pin to switch to the alternative function.**
   DNFAnNFSTS[1:0] × $1/f_S$ + 4 × $1/f_{DNFATCKI}$
2. **When a digital filter is used with an interrupt acting as an event output signal, only enable the digital filter (by setting DNFAnEN.DNFAnNFENm = 1) while interrupts are disabled. Furthermore, only enable interrupts after enabling the digital filter, waiting for the time below to elapse, and then clearing the interrupt request flag.**
   DNFAnNFSTS[1:0] × $1/f_S$ + 5 × $1/f_{DNFATCKI}$

Digital filters control registers

For each group of up to 16 digital filters a common digital filter setup register DNFAnCTL and digital filter enable register DNFAnEN are provided with the same index n.

While the filter setup by DNFAnCTL affects the entire group, the control bits DNFAnNFENm in the filter enable register DNFAnEN allows to enable or disable each filter separately. The register index m is in the range from 0 to 15:

DNFAnCTL is the control register of group n for the digital filters m (m = 0 to 15), enabled/disabled by the DNFAnEN.DNFAnNFEN0 to DNFAnEN.DNFAnNFEN15 control bits.

The edge detection setup is done via the filter dedicated control register and the registers for individual peripheral functions.

The assignment of the input signals to the control registers and their addresses are given in **Table 2.44, Noise Filter Register List**.

CAUTION

Do not change any control register settings, while the concerned digital filter is enabled by DNFAnEN.DNFAnNFENm = 1. Otherwise an unintended filter output may be generated.

(1) Digital filter type C

A block diagram of digital filter type C is shown below.

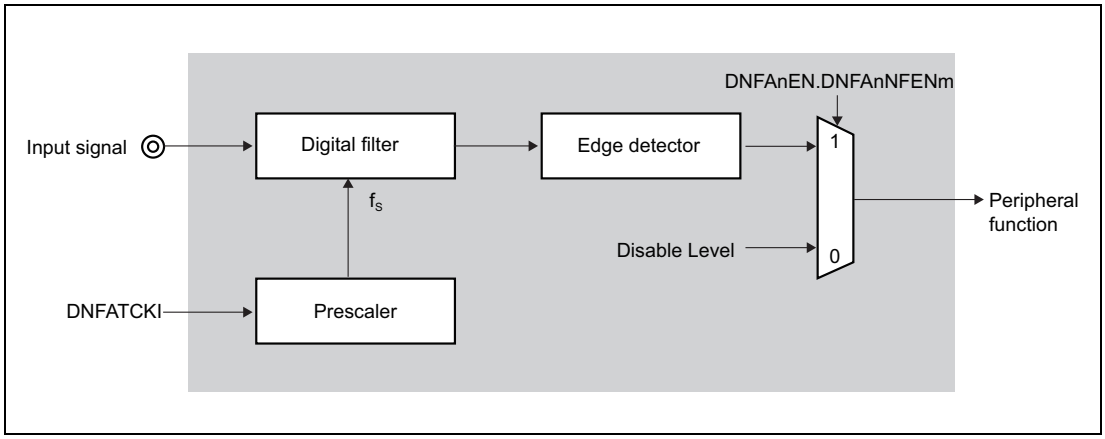

Figure 2.20 Block diagram of digital filter type C

The generated signal depends on the register setting, as shown in the following table.

Table 2.47 Output options for digital filter type C

DNFAnEN.DNFAnNFENm	Signals output to peripheral functions
0	Fixed to disable level
1	Input signal passed through filter

(2) Digital filter type D

A block diagram of digital filter type D is shown below.

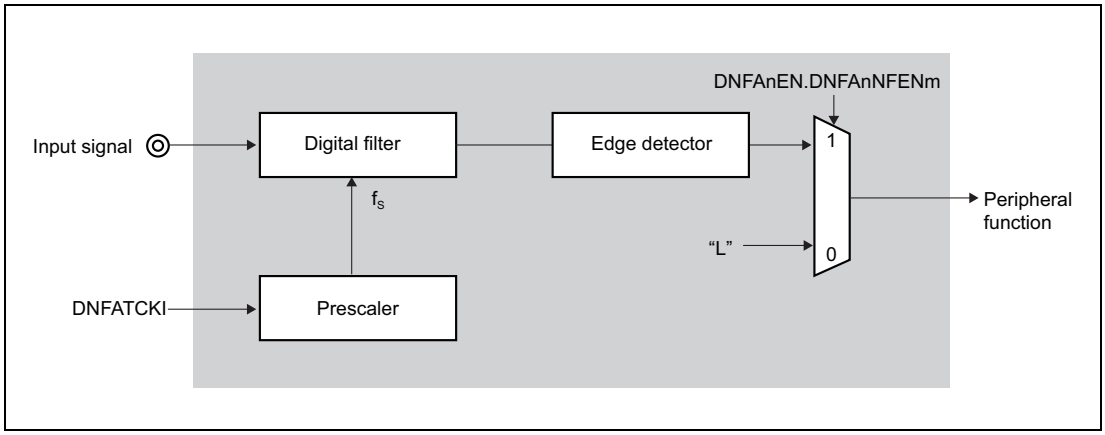

Figure 2.21 Block diagram of digital filter type D

The generated signal depends on the register setting, as shown in the following table.

Table 2.48 Output options for digital filter type D

DNFAnEN.DNFAnNFENm	Signals output to peripheral functions
0	Fixed to disable level
1	Input signal passed through filter

(3) Analog and Digital filter type E

A block diagram of filter type E is shown below.

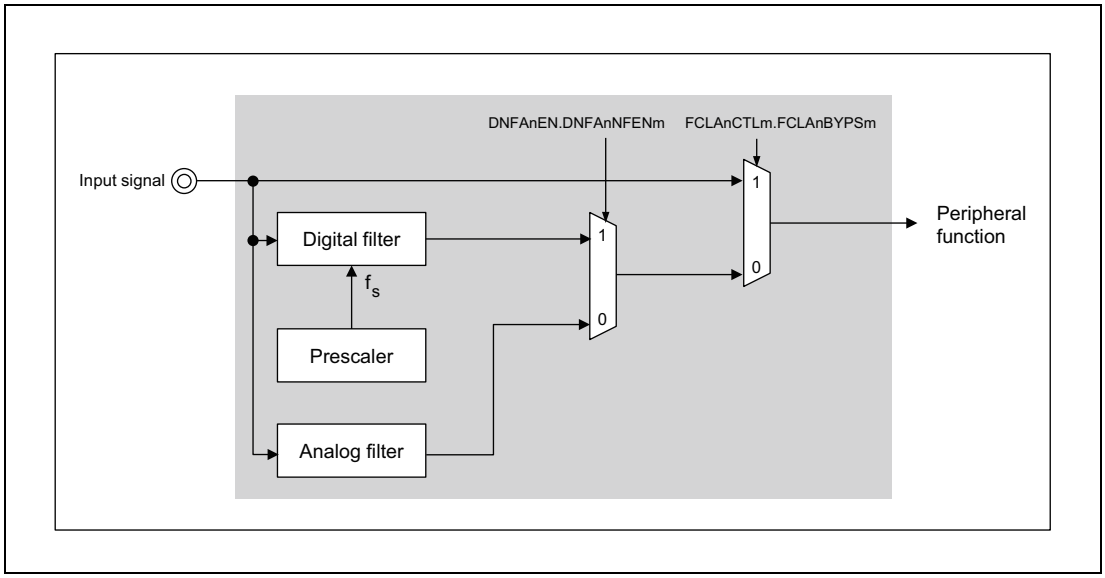

Figure 2.22 Block diagram of analog and digital filter type E

The generated signal depends on the register setting, as shown in the following table.

Table 2.49 Selection of filter type for filter type E

DNFAnEN.DNFAnNFENm	Signals output to peripheral functions
0	Input signal passed through Analog filter
1	Input signal passed through Digital filter

Table 2.50 Filter type E event detection conditions

FCLAnBYPSm	FCLAnINTFm	FCLAnINTRm	Edge detection	Bypass
0	0	0	No edge detected	Select filter signal
	0	1	Rising edge	
	1	0	Falling edge	
	1	1	Rising and falling edges	
1	X	X	disable	Select filter-bypass signal

2.7.3.3 Filter control registers

The analog and digital filters are controlled and operated by the following registers:

Register name	Symbol	Address
Filter control register m	FCLAnCTLm	See **Table 2.44, Noise Filter Register List**
Digital noise elimination control register	DNFAnCTL	
Digital noise elimination enable register	DNFAnEN	
Digital noise elimination enable L register	DNFAnENL	

(1) FCLAnCTLm — Filter Control Register

This register controls the analog and digital filter operation.

Because the control options for analog and digital filters partially differ, register descriptions are provided separately.

Access: This register can be read or written in 8-bit or 1-bit units.

Address: See **Table 2.44, Noise Filter Register List**

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	FCLAnBYPSm	—	—	—	—	FCLAnINTLm	FCLAnINTFm	FCLAnINTRm
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 2.51 FCLAnCTLm register contents

Bit	Bit Name	Function
7	FCLAnBYPSm	Bypass mode selection 0: Select filter signal 1: Select filter-bypass signal Note: This bit is only valid for filter type E.
2	FCLAnINTLm	Detection mode selection 0: Edge detection 1: Level detection Note: This bit is only valid for analog filter type A.
1	FCLAnINTFm	• In level detection mode (FCLAnINTLm = 1): This bit has no effect. • In edge detection mode (FCLAnINTLm = 0): Falling edge detection control 0: Falling edge detection disabled 1: Falling edge detection enabled Note: This bit is only valid for filter type A and filter type C. However, digital filter type C is placed in edge detection mode.
0	FCLAnINTRm	• In level detection mode (FCLAnINTLm = 1): Detected level selection 0: Low level detection 1: High level detection • In edge detection mode (FCLAnINTLm = 0): Rising edge detection control 0: Rising edge detection disabled 1: Rising edge detection enabled Note: This bit is only valid for filter type A and filter type C.

CAUTION

Analog filter type A: Be sure to set 0 to bit 7.
Digital filter type C: Be sure to set 0 to bits 7 and 2.

(2) DNFAnCTL — Digital noise elimination control register

This register is used to specify the filter characteristics of the digital noise elimination filter.

NOTES

1. This register is only valid for digital filter type.

Access: This register can be read or written in 8-bit or 1-bit units.
Address: See **Table 2.44, Noise Filter Register List**
Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	DNFAnNFSTS[1:0]		—	—	DNFAnPRS[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R	R	R/W	R/W	R/W

Table 2.52 DNFAnCTL register contents

Bit	Bit Name	Function
6, 5	DNFAnNFSTS [1:0]	The DNFAnNFSTS[1:0] bits specify the number of samples used to judge whether an external signal pulse is valid.

DNFAnNFSTS[1:0]	Number of samples
00_B	2
01_B	3
10_B	4
11_B	5

Bit	Bit Name	Function
2 to 0	DNFAnPRS[2:0]	Digital filter sampling clock selection

DNFAnPRS[2:0]	Sampling clock frequency
000_B	DNFATCKI/1
001_B	DNFATCKI/2
010_B	DNFATCKI/4
011_B	DNFATCKI/8
100_B	DNFATCKI/16
101_B	DNFATCKI/32
110_B	DNFATCKI/64
111_B	DNFATCKI/128

(3) DNFAnEN — Digital noise elimination enable register

This register enables and disables digital noise elimination for a specified input signal.

NOTE

This register is only valid for digital filter type.

Access: This register can be read or written in 16-bit or 1-bit units.
The lower-order bytes (DNFAnNFENL[7:0]) are accessible in 8- or 1-bit units respectively by setting DNFAnENL.DNFAnNFENL[7:0].

Address: See **Table 2.44, Noise Filter Register List**

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DNFAnNFENH7	DNFAnNFENH6	DNFAnNFENH5	DNFAnNFENH4	DNFAnNFENH3	DNFAnNFENH2	DNFAnNFENH1	DNFAnNFENH0	DNFAnNFENL7	DNFAnNFENL6	DNFAnNFENL5	DNFAnNFENL4	DNFAnNFENL3	DNFAnNFENL2	DNFAnNFENL1	DNFAnNFENL0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 2.53 DNFAnEN register contents

Bit	Bit Name	Function
15 to 0	DNFAnNFENH [7:0], DNFAnNFENL [7:0]	Digital noise elimination control 0: Digital noise elimination disabled 1: Digital noise elimination enabled

(4) DNFAnENL — Digital noise elimination enable L register

Setting in this register correspond to those of the 8 lower-order bits of the DNFAnEN register..

NOTE

This register is only valid for digital filter type.

Access: This register can be read or written in 8-bit or 1-bit units.

Address: See **Table 2.44, Noise Filter Register List**

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	DNFAnNFENL7	DNFAnNFENL6	DNFAnNFENL5	DNFAnNFENL4	DNFAnNFENL3	DNFAnNFENL2	DNFAnNFENL1	DNFAnNFENL0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

For details of the respective bit functions, see **2.7.3.3 (3), DNFAnEN — Digital noise elimination enable register**

2.8 Difference among P1M-C, P1H-C and P1H-CE

Table 2.54 Related Differences

Differences	Describing Section
Pin Connection Diagrams	**Section 2.1**
Pin Assignments	**Section 2.2 Table 2.1, Pin List**
Function Assignments	**Section 2.2 Table 2.3, Pin Function assignments**

Section 3 CPU System

3.1 Overview

3.1.1 Block Configuration

Figure 3.1 shows the block configuration diagram.

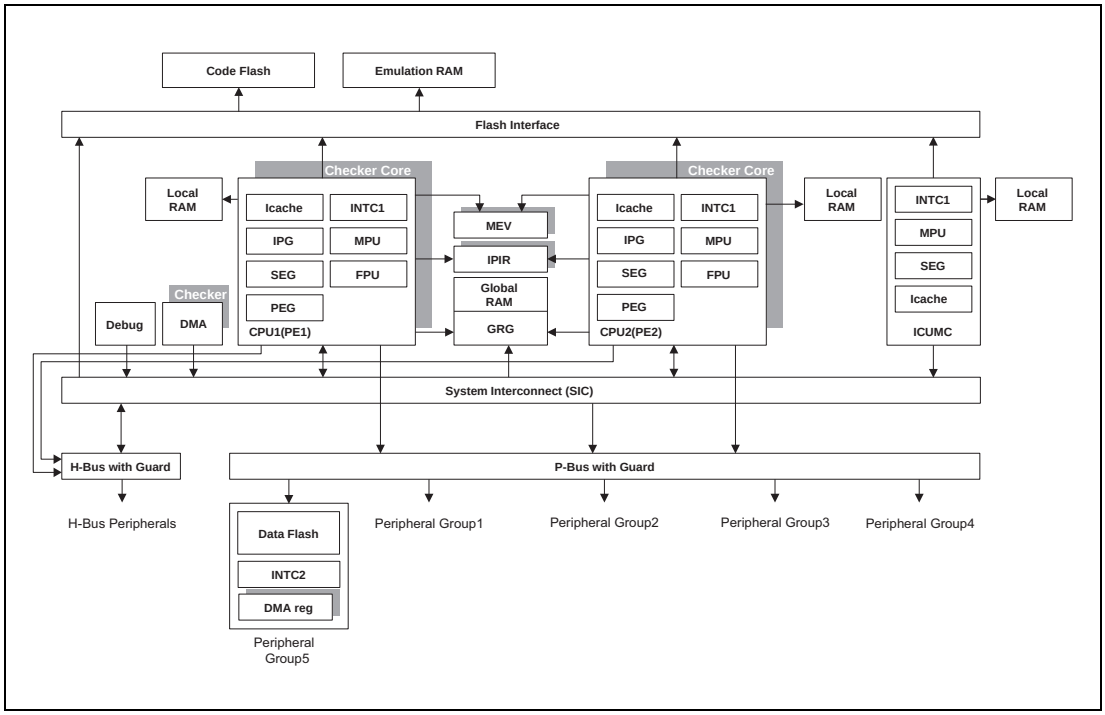

Figure 3.1 Block Configuration Diagram (maximum configuration of P1H-CE)

CPU1 (PE1), CPU2 (PE2)

The RH850 G3M Core is included as a main CPU. CPUs also include the Checker Core for safety assurance.

ICUMC

See *RH850/P1x-C User's Manual: Hardware (Security)* ***Section 3 ICUMC***.

Local RAM

Each PE has a high-speed accessible Local RAM.

Global RAM

The Global RAM is a mass on-chip RAM that all PEs can share.

Code Flash

A mass Code Flash is included for program storage. CPU1, CPU2 and ICUMC share the Code Flash and they are connected via the Code Flash Interface.

Emulation RAM

It is a RAM to emulate the Code Flash. The programs can be replaced by an external tool without rewriting the Code Flash.

Data Flash

It is a flash memory being rewritable by the CPU.

P-Bus and H-Bus

Peripherals are connected on P-Bus and H-Bus. The P-Bus consists of 5 groups, Peripheral Group 1 to 5.

INTC1, INTC2

INTC1 is an interrupt controller exclusive to each PE. INTC2 is a common interrupt controller that all PEs can share, being able to set the binding destination PE of an interrupt request by the registers.

DMA

Two DMA transfer modules, DMAC and DTS, are included. DMA includes the checker logic for safety assurance.

Slave Guard

The slave guard is a system to prevent unauthorized access from the specific bus master, consisting of the following guard structures:

(1) PE Guard (PEG)
The PE guard is a system to prevent unauthorized access to the resources (Local RAM) in the PE from the external master. Access from the PE itself is only enabled but all other accesses except ICUMC are disabled after release from the reset state. ICUMC can read Local RAM of PEs after release from the reset state but cannot write.

(2) Internal Peripheral Guard (IPG)
Each PE has an “Internal Peripheral Guard” (IPG) that protects the registers of peripherals inside the PE against invalid accesses.

(3) System Error Generation (SEG)
The registers controls how to response SYSERR.

(4) Global RAM Guard (GRG)
The global RAM guard is a system to prevent unauthorized access to the global RAM from the external master. The global RAM is unprotected (accessible from all bus masters) after release from the reset state.

IPIR

The IPIR handles inter PE interrupt, specific to multicore configuration.

This handles inter processor interrupt generation.

MEV

MEV is Mutual Exclusion Variable Register, specific to multicore configuration.

The CAXI instruction can be used on these registers to implement semaphores.

3.2 CPU

3.2.1 Core Functions

The Renesas 32-bit RISC architecture RH850 define hardware virtualization as architecture features, but these features by P1x-C Group is not supported, although RH850 documents including this document hereafter may describe hardware threading or virtual CPUs. “Software manual” mentioned in this document means “RH850G3M User's Manual: Software”.

3.2.1.1 Features

Table 3.1 lists features of the RH850G3M core.

Table 3.1 Features of the RH850G3M Core

Item	Feature
CPU	• Advanced 32-bit architecture for embedded control • 32 32-bit general registers • RISC-type instruction sets – Long-/short-format load/store instructions – Three-operand instructions • CPU operating modes – User mode, supervisor mode • Address space: 4-Gbyte linear address space for both data and instructions • Instructions: A snooze instruction (SNOOZE) is included for temporary suspension by switching the CPU clock signal off for 32 clock cycles.
Coprocessor	• A floating-point operation coprocessor (FPU) mounted – Supports single precision (32 bits) and double precision (64 bits). – Supports data types and exceptions conforming to IEEE754. – Rounding mode: Neighborhood, 0 direction, +∞ direction, and -∞ direction – Handling denormalized numbers: Rounding down to 0 or exception notification to conform to IEEE754
Exception/ Interrupt	• 16 interrupt priority levels settable for each channel • Vector selection method selectable according to performance request or memory usage – Direct branching exception vectors – Indirect branching exception vectors referring to the address table • Supports the high-speed save/restore processing of the context by the dedicated instructions (PUSHSP and POPSP) at the generation of an interrupt
Memory Management	• Memory protection function (MPU): 16 areas settable
Cache	• Instruction cache

3.2.1.2 Register Set

(1) Program Registers

Program registers include the general-purpose registers (r0 to r31) and program counter (PC).

Table 3.2 List of Program Registers

Program Register	Name	Function	Description
General-purpose registers	r0	Zero register	Always retains “0”
	r1	Assembler reserved register	Used as working register for generating addresses
	r2	Register for address and data variables (used when the real-time OS used does not use this register)	
	r3	Stack pointer (SP)	Used for generating a stack frame when a function is called
	r4	Global pointer (GP)	Used for accessing a global variable in the data area
	r5	Text pointer (TP)	Used as a register that indicates the start of the text area (area where program code is placed)
	r6 to r29	Register for addresses and data variables	
	r30	Element pointer (EP)	Used as a base pointer for generating addresses when accessing memory
	r31	Link pointer (LP)	Used when the compiler calls a function
Program counter	PC	Retains instruction addresses during execution of programs	

NOTE

For further descriptions of r1, r3 to r5, and r31 used for an assembler and/or C compiler, see the specification of each software development environment.

(a) General-Purpose Registers

A total of 32 general-purpose registers (r0 to r31) are provided. All of these registers can be used for either data variables or address variables.

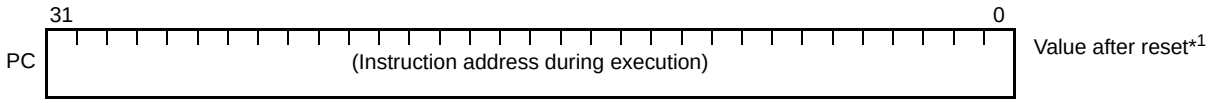
Of the general-purpose registers, r0 to r5, r30, and r31 are assumed to be used for special purposes in software development environments, so it is necessary to note the following when using them.

1. r0, r3, r30
   These registers are implicitly used by instructions.
   r0 is a register that always retains “0”. It is used for operations that use 0 and addressing with base address being 0.
   r3 is implicitly used by the PREPARE, DISPOSE, PUSHSP, and POPSP instructions.
   r30 is used as a base pointer when the SLD instruction or SST instruction accesses memory.
2. r1, r4, r5, r31
   These registers are implicitly used by the assembler and C compiler.
   When using these registers, register contents must first be saved so they are not lost and can be restored after the registers are used.

3. r2
   This register might be used by a real-time OS in some cases. If the real-time OS that is being used is not using r2, r2 can be used as a register for address variables or data variables.

(b) PC – Program Counter

The PC retains the address of the instruction being executed. Bit 0 is fixed to 0, and branching to an odd number address is disabled.



Note 1. depends on RBASE

(2) Basic System Registers

The basic system registers are used to control CPU status and to retain exception information.

System registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

Table 3.3 Basic System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR0, 0	EIPC	Status save registers when acknowledging EI level exception	SV
SR1, 0	EIPSW	Status save registers when acknowledging EI level exception	SV
SR2, 0	FEPC	Status save registers when acknowledging FE level exception	SV
SR3, 0	FEPSW	Status save registers when acknowledging FE level exception	SV
SR 5, 0	PSW	Program status word	*1
SR 6, 0	FPSR	Refer to FPU function registers.	CU0 and SV
SR 7, 0	FPEPC	Refer to FPU function registers.	CU0 and SV
SR8, 0	FPST	Refer to FPU function registers.	CU0
SR9, 0	FPCC	Refer to FPU function registers.	CU0
SR10, 0	FPCFG	Refer to FPU function registers.	CU0
SR 11, 0	FPEC	Refer to FPU function registers.	CU0 and SV
SR 13, 0	EIIC	EI level exception cause	SV
SR 14, 0	FEIC	FE level exception cause	SV
SR 16, 0	CTPC	CALLT execution status save register	UM
SR 17, 0	CTPSW	CALLT execution status save register	UM
SR 20, 0	CTBP	CALLT base pointer	UM
SR 28, 0	EIWR	EI level exception working register	SV
SR 29, 0	FEWR	FE level exception working register	SV
SR 31, 0	BSEL	Not implemented. A value of 0 is returned when read and writing is ignored.	SV
SR0, 1	MCFG0	Machine configuration	SV
SR2, 1	RBASE	Reset vector base address	SV
SR3, 1	EBASE	Exception handler vector address	SV
SR4, 1	INTBP	Base address of the interrupt handler table	SV
SR 5, 1	MCTL	CPU control	SV
SR 6, 1	PID	Processor ID	SV
SR 11, 1	SCCFG	SYSCALL operation setting	SV
SR 12, 1	SCBP	SYSCALL base pointer	SV
SR0, 2	HTCFG0	Thread configuration	SV
SR6, 2	MEA	Memory error address	SV
SR7, 2	ASID	Address space ID	SV
SR8, 2	MEI	Memory error information	SV

Note 1. The access permission differs depending on the bit.

(a) EIPC —Status save register when acknowledging EI level exception

When an EI level exception is acknowledged, the address of the instruction that was being executed when the EI level exception occurred, or of the next instruction, is saved to the EIPC register (see **5.1.2 Types of exceptions in Software Manual**).

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the EIPC register. An odd-numbered address must not be specified.

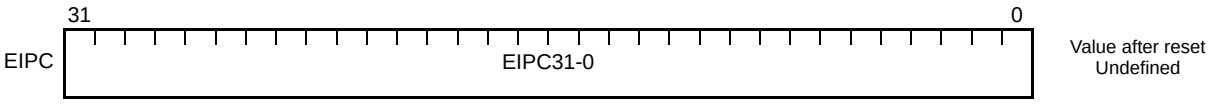


Table 3.4 EIPC Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 1	EIPC31-1	These bits indicate the PC saved when an EI level exception is acknowledged.	R/W	Undefined
0	EIPC0	This bit indicates the PC saved when an EI level exception is acknowledged. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the EIRET instruction is executed is 0.	R/W	Undefined

(b) EIPSW — Status save register when acknowledging EI level exception

When an EI level exception is acknowledged, the current PSW setting is saved to the EIPSW register.

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

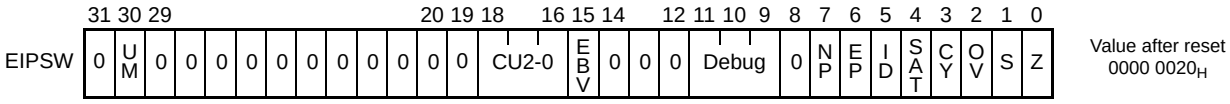

Table 3.5 EIPSW Register Contents (1/2)

Bit	Name	Description	R/W	Value after reset
31	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
30	UM	This bit stores the PSW.UM bit setting when an EI level exception is acknowledged.	R/W	0
29 to 19	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
18 to 16	CU2-0	These bits store the PSW.CU 2 to 0 field setting when an EI level exception is acknowledged.	R/W	0
15	EBV	This bit stores the PSW.EBV bit setting when an EI level exception is acknowledged.	R/W	0
14 to 12	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
11 to 9	Debug	These are bits for debugging.	R/W	0
8	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
7	NP	This bit stores the PSW.NP bit setting when an EI level exception is acknowledged.	R/W	0
6	EP	This bit stores the PSW.EP bit setting when an EI level exception is acknowledged.	R/W	0
5	ID	This bit stores the PSW.ID bit setting when an EI level exception is acknowledged.	R/W	1
4	SAT	This bit stores the PSW.SAT bit setting when an EI level exception is acknowledged.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when an EI level exception is acknowledged.	R/W	0

Table 3.5 EIPSW Register Contents (2/2)

Bit	Name	Description	R/W	Value after reset
2	OV	This bit stores the PSW.OV bit setting when an EI level exception is acknowledged.	R/W	0
1	S	This bit stores the PSW.S bit setting when an EI level exception is acknowledged.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when an EI level exception is acknowledged.	R/W	0

(c) FEPC —Status save register when acknowledging FE level exception

When an FE level exception is acknowledged, the address of the instruction that was being executed when the FE level exception occurred, or of the next instruction, is saved to the FEPC register (see **5.1.2 Types of exceptions in Software Manual**).

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the FEPC register. An odd-numbered address must not be specified.

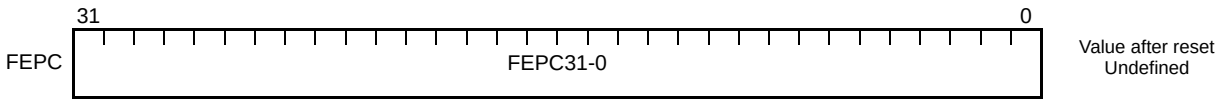

Table 3.6 FEPC Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 1	FEPC31-1	These bits indicate the PC saved when an FE level exception is acknowledged.	R/W	Undefined
0	FEPC0	This bit indicates the PC saved when an FE level exception is acknowledged. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the FERET instruction is executed is 0.	R/W	Undefined

(d) FEPSW — Status save register when acknowledging FE level exception

When an FE level exception is acknowledged, the current PSW setting is saved to the FEPSW register.

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

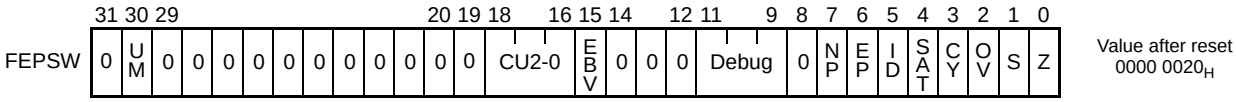

Table 3.7 FEPSW Register Contents

Bit	Name	Description	R/W	Value after reset
31	—	(Reserved for future expansion. Be sure to clear to 0.)	R/W	0
30	UM	This bit stores the PSW.UM bit setting when an FE level exception is acknowledged.	R/W	0
29 to 19	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
18 to 16	CU2-0	These bits store the PSW.CU 2 to 0 field setting when an FE level exception is acknowledged.	R/W	0
15	EBV	This bit stores the PSW.EBV bit setting when an FE level exception is acknowledged.	R/W	0
14 to 12	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
11 to 9	Debug	These are bits for debugging.	R/W	0
8	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
7	NP	This bit stores the PSW.NP bit setting when an FE level exception is acknowledged.	R/W	0
6	EP	This bit stores the PSW.EP bit setting when an FE level exception is acknowledged.	R/W	0
5	ID	This bit stores the PSW.ID bit setting when an FE level exception is acknowledged.	R/W	1
4	SAT	This bit stores the PSW.SAT bit setting when an FE level exception is acknowledged.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when an FE level exception is acknowledged.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when an FE level exception is acknowledged.	R/W	0
1	S	This bit stores the PSW.S bit setting when an FE level exception is acknowledged.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when an FE level exception is acknowledged.	R/W	0

(e) PSW — Program status word

PSW (program status word) is a set of flags that indicate the program status (instruction execution result) and bits that indicate the operation status of the CPU (flags are bits in the PSW that are referenced by a condition instruction (Bcond, CMOV, etc.)).

When the LDSR instruction is used to change the contents of each bit in this register, the changed contents become valid immediately after completion of an LDSR instruction execution.

The access permission for the PSW register differs depending on the bit. All bits can be read, but some bits can only be written under certain conditions. See **Table 3.8, Access Permission for PSW Register** for the access permission for each bit.

Table 3.8 Access Permission for PSW Register

Bit		Access Permission When Reading	Access Permission When Writing	Supplement
30	UM	UM	SV*1	
18 to 16	CU2-0		SV*1	
15	EBV		SV*1	
11 to 9	Debug		Special*1	
7	NP		SV*1	
6	EP		SV*1	
5	ID		SV*1	
4	SAT		UM	
3	CY		UM	
2	OV		UM	
1	S		UM	
0	Z		UM	

Note 1. The access permission for the whole PSW register is UM, so the PIE exception does not occur even if the register is written by using an LDSR instruction when PSW.UM is 1. In this case, writing is ignored.

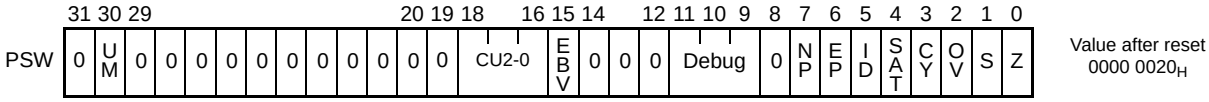

Table 3.9 PSW Register Contents (1/2)

Bit	Name	Description	R/W	Value after reset
31	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
30	UM	This bit indicates that the CPU is in user mode (UM mode) 0: Supervisor mode 1: User mode	R/W	0
29 to 19	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
18, 17	CU2-CU1	These bits indicate the coprocessor use permissions. (Reserved for future expansion. Be sure to clear to 0.)	R	00
16	CU0	This bit indicates the coprocessor use permissions. When the bit corresponding to the coprocessor is 0, a coprocessor use prohibition exception is generated in response to execution of a coprocessor instruction or access to coprocessor resources (system registers). CU0 bit 16: FPU	R/W	0
15	EBV	This bit indicates the reset vector and exception vector operation. See the descriptions of the RBASE register in **(q), RBASE — Reset vector base address register** and the EBASE register in **(r), EBASE — Exception handler vector address register**.	R/W	0
14 to 12	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
11 to 9	Debug	These bits are used in the debugging functions of development tools. In normal operation, clear these bits to 0.	R/W	0
8	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
7	NP	This bit indicates that an FE-level exception is being processed. When an FE level exception is acknowledged, this bit is set to 1, which prohibits occurrence of multiple exceptions. 0: FE level exception handling is not in progress. 1: FE level exception handling is in progress.	R/W	0
6	EP	This bit indicates that an exception other than an interrupt is being serviced. It is set to 1 when the corresponding exception occurs. This bit does not affect acknowledging an exception request even when it is set to 1. 0: An interrupt is being serviced. 1: An exception other than an interrupt is being serviced.	R/W	0
5	ID	This bit indicates that an EI-level exception can be acknowledged. It is used to disable EI level exceptions from being acknowledged during critical sections of an ordinary program or while a EI level interrupt is being serviced. It is set to 1 when the DI instruction is executed, and cleared to 0 when the EI instruction is executed. When an EI level exception is acknowledged, this bit is set to 1 by hardware to disable generation of multiple interrupts by default. 0: Acknowledgement of EI level exception is enabled (after execution of EI instruction). 1: Acknowledgement of EI level exception is disabled (after execution of DI instruction or after acknowledgement of an EI level exception).	R/W	1
4	SAT*[1]	This bit indicates that the operation result is saturated because the result of a saturated operation instruction operation has overflowed. This is a cumulative flag, so when the operation result of the saturated operation instruction becomes saturated, this bit is set to 1, but it is not cleared to 0 when the operation result for a subsequent instruction is not saturated. This bit is cleared to 0 by the LDSR instruction. This bit is neither set to 1 nor cleared to 0 when an arithmetic operation instruction is executed. 0: Not saturated 1: Saturated	R/W	0

Table 3.9 PSW Register Contents (2/2)

Bit	Name	Description	R/W	Value after reset
3	CY	This bit indicates whether a carry or borrow has occurred in the operation result. 0: Carry and borrow have not occurred. 1: Carry or borrow has occurred.	R/W	0
2	OV*1	This bit indicates whether or not an overflow has occurred during an operation. 0: Overflow has not occurred. 1: Overflow has occurred.	R/W	0
1	S*1	This bit indicates whether or not the result of an operation is negative. 0: Result of operation is positive or 0. 1: Result of operation is negative	R/W	0
0	Z	This bit indicates whether or not the result of an operation is 0. 0: Result of operation is not 0. 1: Result of operation is 0.	R/W	0

Note 1. The operation result of the saturation processing is determined in accordance with the contents of the OV flag and S flag during a saturated operation. When only the OV flag is set to 1 during a saturated operation, the SAT flag is set to 1.

Operation result status	Flag status			Operation result after saturation processing
	SAT	OV	S	
Exceeded positive maximum value	1	1	0	7FFF FFFF$_H$
Exceeded negative maximum value	1	1	1	8000 0000$_H$
Positive (maximum value not exceeded)	Value prior to operation is retained.	0	0	Operation result itself
Negative (maximum value not exceeded)			1	

(f) EIIC — EI level exception source register

The EIIC register retains the source of any EI level exception that occurs. The value retained in this register is an exception code corresponding to a specific exception source.

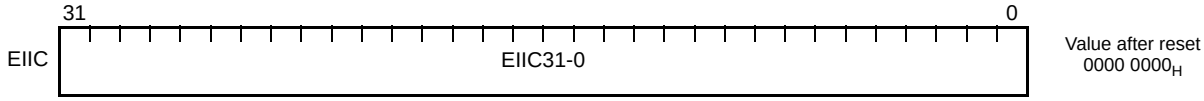

Table 3.10 EIIC Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 0	EIIC31-0	These bits store the exception source code when an EI level exception occurs. The EIIC 15 to 0 field stores the lower 16 bits of the exception source code. The EIIC31 to 16 field stores detailed exception source codes defined individually for each exception. If there is no particular definition, these bits are set to 0.	R/W	0

(g) FEIC — FE level exception source register

The FEIC register retains the source of any FE level exception that occurs. The value retained in this register is an exception code corresponding to a specific exception source.

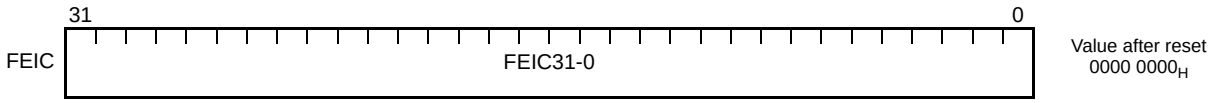

Table 3.11 FEIC Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 0	FEIC31-0	These bits store the exception source code when an FE level exception occurs. The FEIC 15 to 0 field stores the lower 16 bits of the exception source code. The FEIC31 to 16 field stores detailed exception source codes defined individually for each exception. If there is no particular definition, these bits are set to 0.	R/W	0

(h) CTPC — Status save register when executing CALLT register

When a CALLT instruction is executed, the address of the next instruction after the CALLT instruction is saved to CTPC. Be sure to set an even-numbered address to the CTPC register. An odd-numbered address must not be specified.

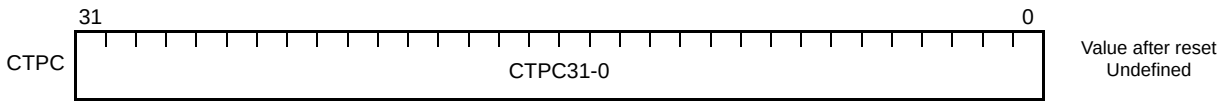

Table 3.12 CTPC Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 1	CTPC31-1	These bits indicate the PC of the instruction after the CALLT instruction.	R/W	Undefined
0	CTPC0	This bit indicates the PC of the instruction after the CALLT instruction. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the CTRET instruction is executed is 0.	R/W	Undefined

(i) CTPSW — Status save register when executing CALLT register

When a CALLT instruction is executed, some of the PSW (program status word) settings are saved to CTPSW.

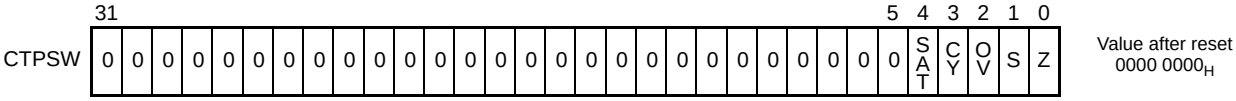

Table 3.13 CTPSW Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 5	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
4	SAT	This bit stores the PSW.SAT bit setting when the CALLT instruction is executed.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when the CALLT instruction is executed.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when the CALLT instruction is executed.	R/W	0
1	S	This bit stores the PSW.S bit setting when the CALLT instruction is executed.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when the CALLT instruction is executed.	R/W	0

(j) CTBP — CALLT base pointer register

The CTBP register is used to specify table addresses of the CALLT instruction and generate target addresses. Be sure to set the CTBP register to a halfword address.

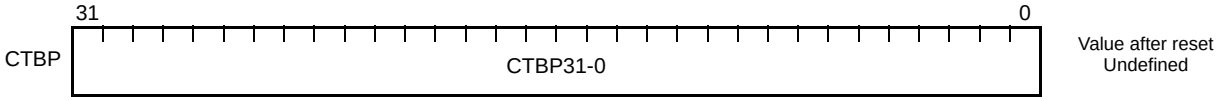

Table 3.14 CTBP Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 1	CTBP31-1	These bits indicate the base pointer address of the CALLT instruction. These bits indicate the first address in the table used by the CALLT instruction.	R/W	Undefined
0	CTBP0	These bits indicate the base pointer address of the CALLT instruction. These bits indicate the first address in the table used by the CALLT instruction. Always set this bit to 0.	R	0

(k) ASID — Address space ID register

This is the address space ID. This is used to identify the address space provided by the memory management function.

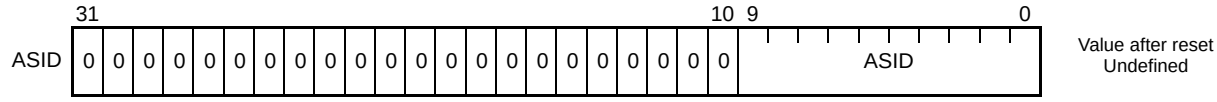

Table 3.15 ASID Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 10	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
9 to 0	ASID	This is the address space ID.	R/W	Undefined

(l) EIWR — EI level exception working register

The EIWR register is used as a working register when an EI level exception has occurred.

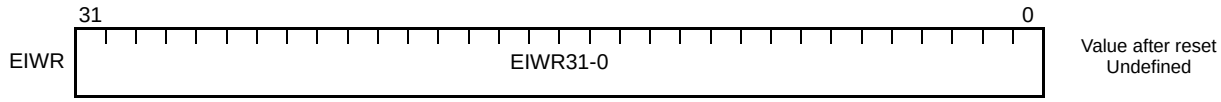

Table 3.16 EIWR Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 0	EIWR31-0	These bits constitute a working register that can be used for any purpose during the processing of an EI level exception. Use this register for purposes such as storing the values of general-purpose registers.	R/W	Undefined

(m) FEWR — FE level exception working register

The FEWR register is used as a working register when an FE level exception has occurred.

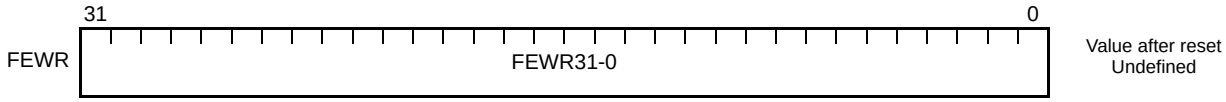

Table 3.17 FEWR Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 0	FEWR31-0	These bits constitute a working register that can be used for any purpose during the processing of an FE level exception. Use this register for purposes such as storing the values of general-purpose registers.	R/W	Undefined

(n) HTCFG0 — Thread configuration register

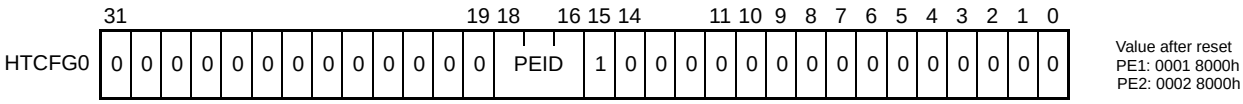

Table 3.18 HTCFG0 Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 19	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
18 to 16	PEID	These bits indicate the processor element number.	R	CPU1 (PE1): 001_B CPU2 (PE2): 010_B
15	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
14 to 0	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0

(o) MEA — Memory error address register

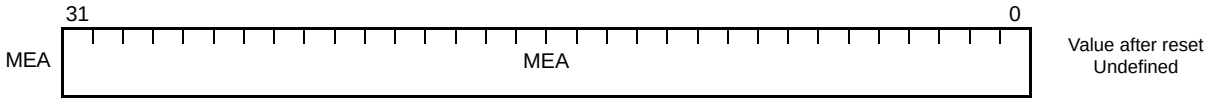

Table 3.19 MEA Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 0	MEA	These bits store a virtual address when a MAE (misaligning) or MPU violation occurs.	R/W	Undefined

(p) MEI — Memory error information register

This register is used to store information about the instruction that caused the exception when a misaligned (MAE) or memory protection (MDP) exception occurs. This information is used during emulation.

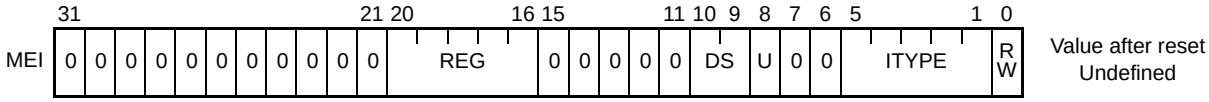

Table 3.20 MEI Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 21	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
20 to 16	REG4-0	These bits indicate the number of the source or destination register accessed by the instruction that caused the exception. For details, see **Table 3.21, Instructions Causing Exceptions and Values of MEI Register**.	R/W	Undefined
15 to 11	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
10, 9	DS	These bits indicate the type of data handled by the instruction that caused the exception.*1 0: Byte (8 bits) 1: Halfword (16 bits) 2: Word (32 bits) 3: Double-word (64 bits) For details, see **Table 3.21, Instructions Causing Exceptions and Values of MEI Register**.	R/W	Undefined
8	U	These bits indicate the sign extension method of the instruction that caused the exception. 0: Signed 1: Unsigned For details, see **Table 3.21, Instructions Causing Exceptions and Values of MEI Register**.	R/W	Undefined
7, 6	–	(Reserved for future expansion. Be sure to clear to 0.)	R	0
5 to 1	ITYPE4-0	These bits indicate the instruction that caused the exception. For details, see **Table 3.21, Instructions Causing Exceptions and Values of MEI Register**.	R/W	Undefined
0	RW	This bit indicates whether the operation of the instruction that caused the exception was read (Load-memory) or write (Store-memory) 0: Read (Load-memory) 1: Write (Store-memory) For details, see **Table 3.21, Instructions Causing Exceptions and Values of MEI Register**.	R/W	Undefined

Note 1. Even if the data is divided and access is made several times due to the specifications of the hardware, the original data type indicated by the instruction is stored.

Table 3.21 Instructions Causing Exceptions and Values of MEI Register

Instruction	REG	DS	U	RW	ITYPE
SLD.B	dst	0 (byte)	0 (signed)	0 (read)	00000b
SLD.BU	dst	0 (byte)	1 (unsigned)	0 (read)	00000b

PREPARE	—	2 (word)	1 (unsigned)	1 (write)	01100b
DISPOSE	—	2 (word)	1 (unsigned)	0 (read)	01100b
PUSHSP	—	2 (word)	1 (unsigned)	1 (write)	01101b
POPSP	—	2 (word)	1 (unsigned)	0 (read)	01101b
SWITCH	—	1 (halfword)	0 (signed)	0 (read)	10000b
CALLT	—	1 (halfword)	1 (unsigned)	0 (read)	10001b
SYSCALL	—	2 (word)	1 (unsigned)	0 (read)	10010b
CACHE	—	—	—	0/1*2	10100b
Interrupt (table reference)*3	—	2 (word)	1 (unsigned)	0 (read)	10101b

Note 1. This exception occurs when the instruction executes a read access.

Note 2. It depends on actual operation.

Note 3. An exception occurs when the table reference interrupt vector is read.

NOTE

dst: destination register number, src: source register number

(q) RBASE — Reset vector base address register

This register indicates the reset vector address when there is a reset. If the PSW.EBV bit is 0, this vector address is also used as the exception vector address.

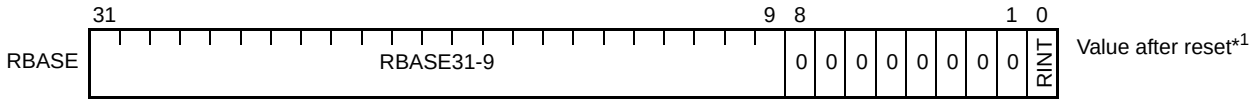

Table 3.22 RBASE Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 9	RBASE31-9	These bits indicate the reset vector when there is a reset. When PSW.EBV = 0, this address is also used as the exception vector. The RBASE8 to 1 bits are not assigned as names because these bits are always 0.	R	
8 to 1	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
0	RINT	When the RINT bit is set, all maskable interrupts are diverted to one single interrupt handler (Reduced Mode). This bit is valid when PSW.EBV = 0.	R	0

Note 1. Hardware reset will set RBASE31-9 to its predefined value PE1 and PE2 have the same value.

(r) EBASE — Exception handler vector address register

This register indicates the exception handler vector address. This register is valid when the PSW.EBV bit is 1.

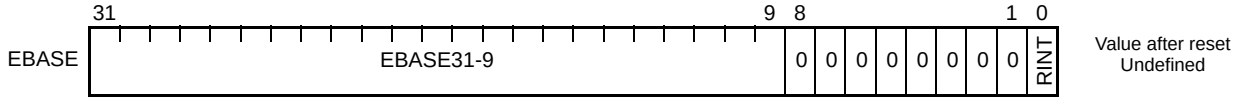

Table 3.23 EBASE Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 9	EBASE31-9	The exception handler routine address is changed to the address resulting from adding the offset address of each exception to the base address specified for this register. The EBASE8 to 1 bits are not assigned as names because these bits are always 0.	R/W	Undefined
8 to 1	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
0	RINT	When the RINT bit is set, all maskable interrupts are diverted to one single interrupt handler (Reduced Mode).	R/W	Undefined

(s) INTBP — Base address of the interrupt handler table register

This register indicates the base address of the address table when the table reference method is selected as the interrupt handler address selection method.

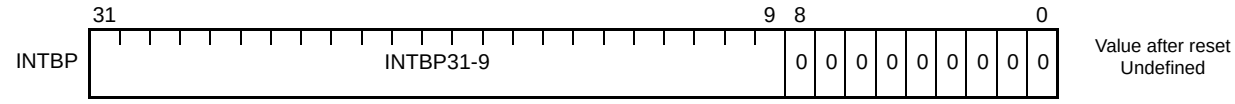

Table 3.24 INTBP Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 9	INTBP31-9	These bits indicate the base pointer address for an interrupt prescribed in the expanded specifications. The value indicated by these bits is the first address in the table used to determine the exception handler when the interrupt prescribed by the expanded specifications (EIINT0 to EIINT511) is acknowledged. The INTBP8 to 0 bits are not assigned as names because these bits are always 0.	R/W	Undefined
8 to 0	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0

(t) PID — Processor ID register

The PID register retains a processor identifier that is unique to the CPU. The PID register is a read-only register.

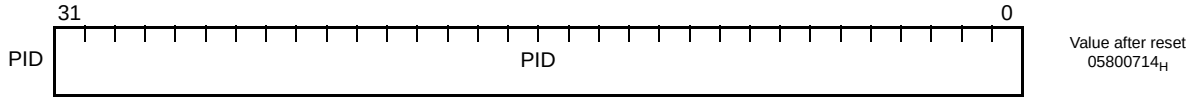

Table 3.25 PID Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 24	PID	Architecture identifier This identifier indicates the architecture of the processor.	R	05_H
23 to 8		Function identifier This identifier indicates the functions of the processor. These bits indicate whether or not functions defined per bit are implemented (1: implemented, 0: not implemented). Bit 23-11 Reserved Bit 10 Double-precision floating-point operation function Bit 9 Single-precision floating-point operation function Bit 8 Memory protection unit (MPU) function	R	8007_H
7 to 0		Version identifier This identifier indicates the version of the processor.	R	14_H

(u) SCCFG — SYSCALL operation setting register

This register is used to specify operations related to the SYSCALL instruction. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

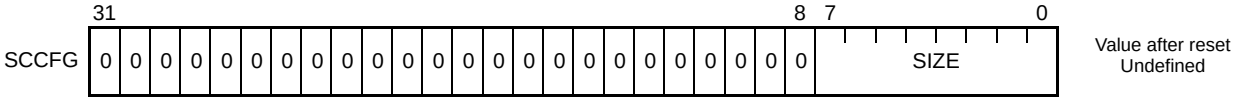

Table 3.26 SCCFG Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 8	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
7 to 0	SIZE	These bits specify the maximum number of entries of a table that the SYSCALL instruction references. The maximum number of entries the SYSCALL instruction references is 1 if SIZE is 0, and 256 if SIZE is 255. By setting the maximum number of entries appropriately in accordance with the number of functions branched by the SYSCALL instruction, the memory area can be effectively used. If a vector exceeding the maximum number of entries is specified for the SYSCALL instruction, the first entry is selected. Place an error processing routine at the first entry.	R/W	Undefined

(v) SCBP — SYSCALL base pointer register

The SCBP register is used to specify a table address of the SYSCALL instruction and generate a target address. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

Be sure to set a word address to the SCBP register.

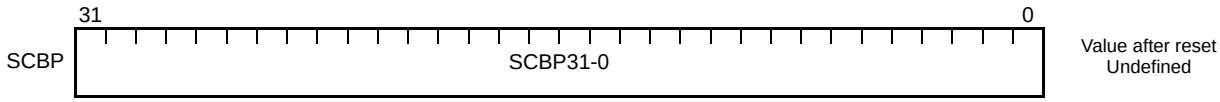

Table 3.27 SCBP Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 2	SCBP31-2	These bits indicate the base pointer address of the SYSCALL instruction. These bits indicate the first address in the table used by the SYSCALL instruction.	R/W	Undefined
1, 0	SCBP1-0	These bits indicate the base pointer address of the SYSCALL instruction. These bits indicate the first address in the table used by the SYSCALL instruction. Always set this bit to 0.	R	0

(w) MCFG0 — Machine configuration register

This register indicates the CPU configuration.

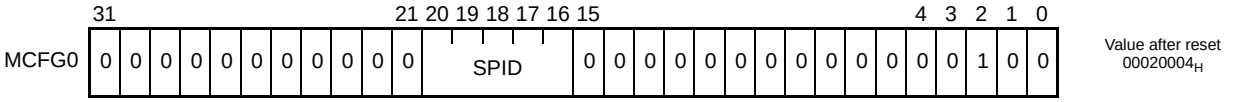

Table 3.28 MCFG0 Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 21	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
20 to 16	SPID	These bits indicate the system protection number. It is not possible to write “00000_B”/“00001_B” to SPID. If witten, these value is “00010_B”.	R/W	00010_B
15 to 3	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
2	—	(Reserved for future expansion. Be sure to clear to 1.)	R	1
1, 0	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0

(x) MCTL — Machine control register

This register is used to control the CPU.

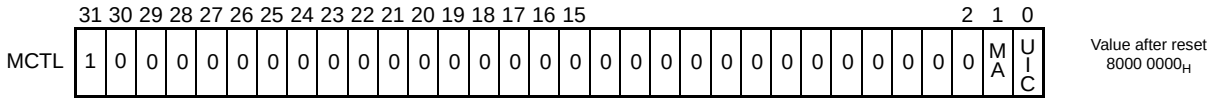

Table 3.29 MCTL Register Contents

Bit	Name	Description	R/W	Value after reset
31	—	(Reserved for future expansion. Be sure to clear to 1.)	R	1
30 to 2	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
1	MA	This bit specifies the operation when a misaligned access occurs. 0: An exception occurs. *1 1: Hardware operates normally.	R/W	0
0	UIC	This bit is used to control the interrupt enable/disable operation in user mode. When this bit is set to 1, executing the EI/DI instruction become possible in user mode.	R/W	0

Note 1. Excluding LD.DW and ST.DW instructions executed at an address at a word boundary.

When MA bit is “1”, CPU divides the transaction from misaligned data access to aligned data accesses for 16-bit and 32-bit accesses shown below. In case of this, atomic characteristics are not guaranteed.

In case of 64-bit access, an exception still occurs even when MA bit is “1” for a misaligned access except word boundary address.

Access Conditions		Cycles Divided by the CPU		
Data Width	Address	1st	2nd	3rd
16 bits	2n + 1	8-bit access to 2n + 1	8-bit access to 2n + 2	—
32 bits	4n + 1	8-bit access to 4n + 1	16-bit access to 4n + 2	8-bit access to 4n + 4
32 bits	4n + 2	16-bit access to 4n + 2	16-bit access to 4n + 4	—
32 bits	4n + 3	8-bit access to 4n + 3	16-bit access to 4n + 4	8-bit access to 4n + 6

(3) Interrupt Function Registers

Table 3.30 Interrupt Function System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR7, 1	FPIPR	FPI exception interrupt priority setting	—
SR10, 2	ISPR	Priority of interrupt being serviced	SV
SR11, 2	PMR	Interrupt priority masking	SV
SR12, 2	ICSR	Interrupt control status	SV
SR13, 2	INTCFG	Interrupt function setting	SV

(a) FPIPR — FPI exception interrupt priority setting register

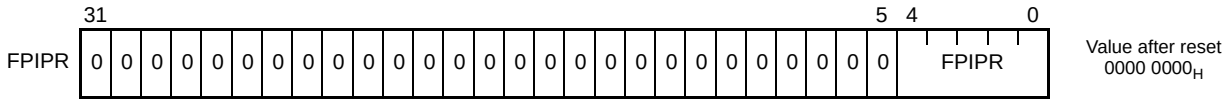

Table 3.31 FPIPR Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 5	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
5 to 0	FPIPR	These bits specify the priority of the floating-point operation exception interrupt (FPI, indicating imprecision). Values from 0 to 16 should be used; the settings 17 and higher are prohibited. FPI exceptions are handled according to this interrupt priority, which is specified in advance. When generated at the same time as another interrupt with the same priority level, the FPI takes priority. NOTE: If these bits are set to 17 or higher values, handling is as if the setting were 16.	R/W	0

(b) ISPR — Priority of interrupt being serviced register

This register holds the priority of the EIINTn interrupt being serviced. This priority value is then used to perform priority ceiling processing when multiple interrupts are generated.

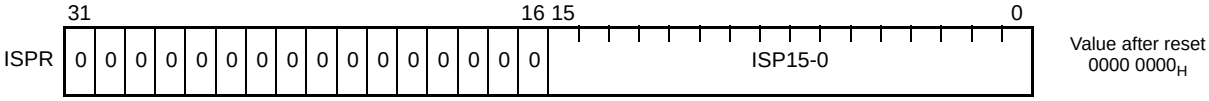

Table 3.32 ISPR Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 16	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
15 to 0	ISP15-0	These bits indicate the acknowledgment status of an EIINTn interrupt with a priority that corresponds to the relevant bit position. 0: An interrupt request for an interrupt whose priority corresponds to the relevant bit position has not been acknowledged. 1: An interrupt request for an interrupt whose priority corresponds to the relevant position is being serviced by the CPU core. The bit positions correspond to the following priority levels: **Bit** / **Priority** 0 / Priority 0 (highest) 1 / Priority 1 ... 14 / Priority 14 15 / Priority 15 When an interrupt request (EIINTn) is acknowledged, the bit corresponding to the acknowledged interrupt request is automatically set to 1. If PSW.EP is 0 when the EIRET instruction is executed, the bit with the highest priority among the ISP15 to 0 bits that are set (0 is the highest priority) is cleared to 0.*1 While a bit in this register is set to 1, same and lower priority interrupts (EIINTn) and FPI exception*2 are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged. When performing software-based priority control using the PMR register, be sure to clear this register by using the INTCFG.ISPC bit.	R*3	0

Note 1. Interrupt acknowledgment and auto-updating of values when the EIRET instruction is executed are disabled by setting (1) the INTCFG.ISPC bit. It is recommended to enable auto-updating of values, so in normal cases, the INTCFG.ISPC bit should be cleared to 0.

Note 2. Since FPI exceptions have the same level of priority as this interrupt (EIINTn), they are affected by interrupts in the same way as the ISPR. The priority of the FPI exception is set by the FPIPR register.

Note 3. This is R or R/W, depending on the setting of the INTCFG.ISPC bit. It is recommended to use this register as a read-only (R) register.

(c) PMR — Interrupt priority masking register

This register is used to mask the specified interrupt priority.

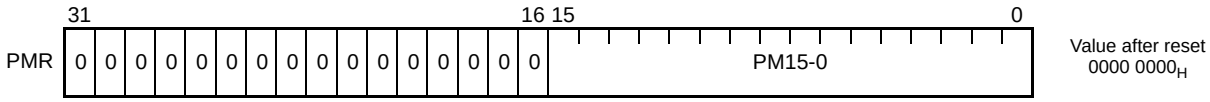

Table 3.33 PMR Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 16	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
15 to 0	PM15-0	These bits mask an interrupt request with a priority level that corresponds to the relevant bit position. 0: Servicing of an interrupt request with a priority that corresponds to the relevant bit position is enabled. 1: Servicing of an interrupt request with a priority that corresponds to the relevant bit position is disabled. The bit positions correspond to the following priority levels: **Bit** / **Priority** 0 / Priority 0 (highest) 1 / Priority 1 ... 14 / Priority 14 15 / Priority 15 and priority 16 (lowest) While a bit in this register is set to 1, interrupts (EIINTn) with the priority corresponding to that bit and FPI exception*1 are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged*2.	R/W	0

Note 1. Since a FPI exception is specified as the same level of priority as that of an interrupt (EIINTn), it is affected by the PMR like interrupts. The priority of FPI exception is set by the FPIPR register.

Note 2. Specify the masks by setting the bits to 1 in order from the lowest-priority bit. For example, $FF00_H$ can be set, but $F0F0_H$ or $00FF_H$ cannot.

(d) ICSR — Interrupt control status register

This register indicates the interrupt control status in the CPU.

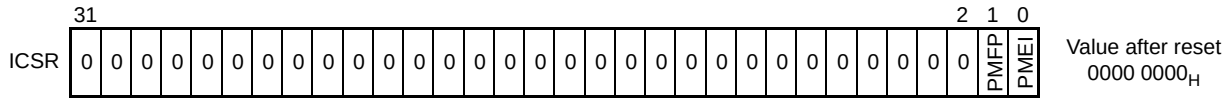

Table 3.34 ICSR Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 2	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
1	PMFP	This bit indicates that an FPI exception with the priority level masked by the PMR register exists. Be sure to clear this bit to 0.	R	0
0	PMEI	This bit indicates that an interrupt (EIINTn) with the priority level masked by the PMR register exists	R	0

(e) INTCFG — Interrupt function setting register

This register is used to specify settings related to the CPU's internal interrupt function.

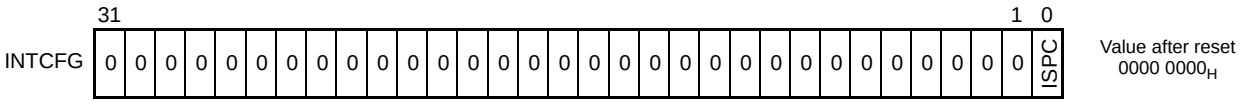

Table 3.35 INTCFG Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 1	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
0	ISPC	This bit changes how the ISPR register is written. 0: The ISPR register is automatically updated. Updates triggered by the program (via execution of LDSR instruction) are ignored. 1: The ISPR register is not automatically updated. Updates triggered by the program (via execution of LDSR instruction) are performed. If this bit is cleared to 0, the bits of the ISPR register are automatically set to 1 when an interrupt (EIINTn) is acknowledged, and cleared to 0 when the EIRET instruction is executed. In this case, the bits are not updated by an LDSR instruction executed by the program. If this bit is set to 1, the bits of the ISPR register are not updated by the acknowledgement of an interrupt (EIINTn) or by execution of the EIRET instruction. In this case, the bits can be updated by an LDSR instruction executed by the program. In normal cases, the ISPC bit should be cleared. When performing software-based priority control, however, set this bit to 1 and perform priority control by using the PMR register.	R/W	0

(4) FPU Function Registers

The FPU can use the following system registers to control floating-point operation. For details of the registers, see the Software Manual.

Table 3.36 FPU System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR6, 0	FPSR	Floating-point operation setting/status	CU0 and SV
SR7, 0	FPEPC	Floating-point operation exception program counter	CU0 and SV
SR8, 0	FPST	Floating-point status	CU0
SR9, 0	FPCC	Floating-point operation comparison result	CU0
SR10, 0	FPCFG	Floating-point operation configuration	CU0
SR11, 0	FPEC	Floating-point operation exception control	CU0 and SV

(5) MPU function resisters

Table 3.37 MPU Function System Registers (1/2)

Register No. (regID, selID)	Symbol	Function	Access Permission
SR0, 5	MPM	Memory protection operation mode setting	SV
SR1, 5	MPRC	MPU region control	SV
SR4, 5	MPBRGN	MPU base region number	SV
SR5, 5	MPTRGN	MPU end region number	SV
SR8, 5	MCA	Memory protection setting check address	SV
SR9, 5	MCS	Memory protection setting check size	SV
SR10, 5	MCC	Memory protection setting check command	SV
SR11, 5	MCR	Memory protection setting check result	SV
SR0, 6	MPLA0	Protection area minimum address	SV
SR1, 6	MPUA0	Protection area maximum address	SV
SR2, 6	MPAT0	Protection area attribute	SV
SR4, 6	MPLA1	Protection area minimum address	SV
SR5, 6	MPUA1	Protection area maximum address	SV
SR6, 6	MPAT1	Protection area attribute	SV
SR8, 6	MPLA2	Lower address of the protection area	SV
SR9, 6	MPUA2	Protection area maximum address	SV
SR10, 6	MPAT2	Protection area attribute	SV
SR12, 6	MPLA3	Protection area minimum address	SV
SR13, 6	MPUA3	Protection area maximum address	SV
SR14, 6	MPAT3	Protection area attribute	SV
SR16, 6	MPLA4	Protection area minimum address	SV
SR17, 6	MPUA4	Protection area maximum address	SV
SR18, 6	MPAT4	Protection area attribute	SV
SR20, 6	MPLA5	Protection area minimum address	SV
SR21, 6	MPUA5	Protection area maximum address	SV
SR22, 6	MPAT5	Protection area attribute	SV
SR24, 6	MPLA6	Protection area minimum address	SV

Table 3.37 MPU Function System Registers (2/2)

Register No. (regID, selID)	Symbol	Function	Access Permission
SR25, 6	MPUA6	Protection area maximum address	SV
SR26, 6	MPAT6	Protection area attribute	SV
SR28, 6	MPLA7	Protection area minimum address	SV
SR29, 6	MPUA7	Protection area maximum address	SV
SR30, 6	MPAT7	Protection area attribute	SV
SR0, 7	MPLA8	Protection area minimum address	SV
SR1, 7	MPUA8	Protection area maximum address	SV
SR2, 7	MPAT8	Protection area attribute	SV
SR4, 7	MPLA9	Protection area minimum address	SV
SR5, 7	MPUA9	Protection area maximum address	SV
SR6, 7	MPAT9	Protection area attribute	SV
SR8, 7	MPLA10	Protection area minimum address	SV
SR9, 7	MPUA10	Protection area maximum address	SV
SR10, 7	MPAT10	Protection area attribute	SV
SR12, 7	MPLA11	Protection area minimum address	SV
SR13, 7	MPUA11	Protection area maximum address	SV
SR14, 7	MPAT11	Protection area attribute	SV
SR16, 7	MPLA12	Protection area minimum address	SV
SR17, 7	MPUA12	Protection area maximum address	SV
SR18, 7	MPAT12	Protection area attribute	SV
SR20, 7	MPLA13	Protection area minimum address	SV
SR21, 7	MPUA13	Protection area maximum address	SV
SR22, 7	MPAT13	Protection area attribute	SV
SR24, 7	MPLA14	Protection area minimum address	SV
SR25, 7	MPUA14	Protection area maximum address	SV
SR26, 7	MPAT14	Protection area attribute	SV
SR28, 7	MPLA15	Protection area minimum address	SV
SR29, 7	MPUA15	Protection area maximum address	SV
SR30, 7	MPAT15	Protection area attribute	SV

(a) MPM — Memory protection operation mode register

The memory protection mode register is used to define the basic operating state of the memory protection function. The settings for this register are normally specified once on startup and are not changed during program operation.

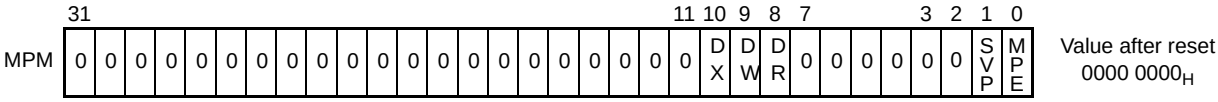

Table 3.38 MPM Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 11	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
10	DX	Not supported. It should be set to 0.	R	0
9	DW	Not supported. It should be set to 0.	R	0
8	DR	Not supported. It should be set to 0.	R	0
7 to 2	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
1	SVP	In SV mode. (when PSW.UM = 0), this bit is used to specify whether to restrict access according to the SX, SW, and SR bits of the MPAT register for each protection area.*1 0: As usual, implicitly enable all access in SV mode. 1: Restrict access according to the SX, SW, and SR bits even in SV mode.*2	R/W	0
0	MPE	This bit is used to specify whether to enable or disable MPU function. 0: Disable 1: Enable	R/W	0

Note 1. When the SVP bit is set to 1, access will become restricted after a certain number of clock cycles, even in SV mode. Therefore, specify the protection area before setting the SVP bit to prevent restriction of access by the program itself.

Note 2. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access to the memory area necessary for the exception handler and exception handling is permitted.

(b) MPRC — MPU region control register

Bits used to perform special memory protection function operations are located in this register.

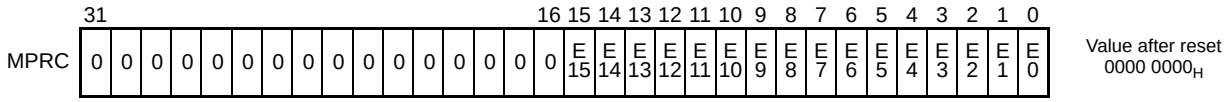

Table 3.39 MPRC Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 16	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
15 to 0	E15-E0	These are the enable bits for each protection area. Bit En is a copy of bit MPATn.E (where n = 15 to 0).	R/W	0

(c) MPBRGN — MPU base region register

This register indicates the minimum usable MPU area number.

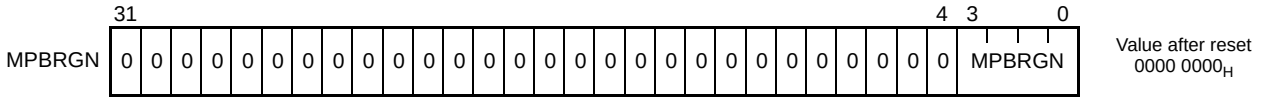

Table 3.40 MPBRGN Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 4	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
3 to 0	MPBRGN	These bits indicate the smallest number of an MPU area. These bits are always read as 0 .	R	0

(d) MPTRGN — MPU end region register

This register indicates the maximum usable MPU area number + 1.

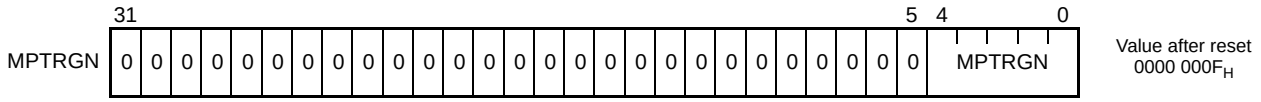

Table 3.41 MPTRGN Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 5	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
4 to 0	MPTRGN	These bits always indicate the maximum number of MPU areas that the hardware can support. For P1x-C, number of MPU area is 15.	R	F_H

(e) MCA — Memory protection setting check address register

This register is used to specify the base address of the area for which a memory protection setting check is to be performed.

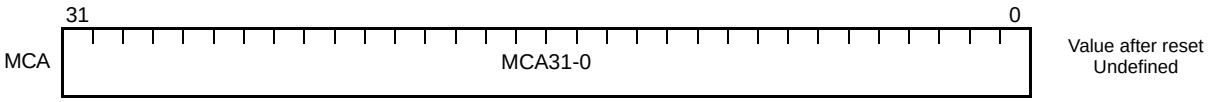

Table 3.42 MCA Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 0	MCA31-0	These bits are used to specify the start address of the memory area subject to a memory protection setting check in bytes.	R/W	Undefined

(f) MCS — Memory protection setting check size register

This register is used to specify the size of the area for which a memory protection setting check is to be performed.

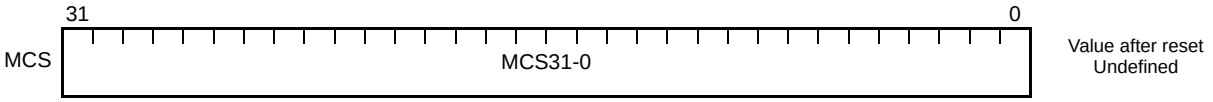

Table 3.43 MCS Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 0	MCS31-0	These bits specify the size of the target area to specify the size of the memory area subject to a memory protection setting check in bytes. These bits specify the size in bytes of a memory area that is subject to a memory protection setting. Checking in areas below the address value in the MCS register is not possible because the specified size is handled as an unsigned integer. Do not set 0000 0000_H in the MCS register.	R/W	0

(g) MCC — Memory protection setting check command register

This command register is used to start a memory protection setting check.

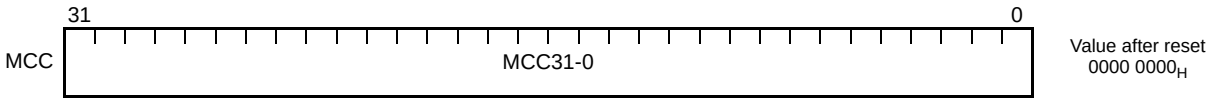

Table 3.44 MCC Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 0	MCC31-0	When any value is written to the MCC register, a memory protection setting check starts. Setting the MCA and MCS registers and then writing to this register leads to storage of the result of checking in the MCR register. Since writing any value to this register starts the check, doing so does not require any extra registers when r0 is used as a source register. The result of checking is reflected in MCR according to any area setting regardless of the setting of the PSW.UM bit. The value read from the MCC register is always 0000 0000_H.	R/W	0

(h) MCR — Memory protection setting check result register

This register is used to store the results of a memory protection setting check.

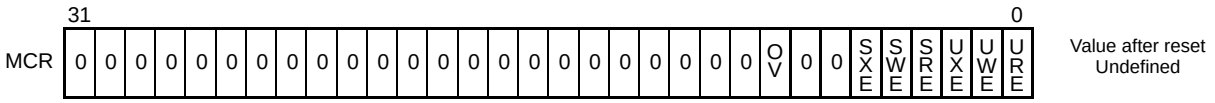

Table 3.45 MCR Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 9	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
8	OV	If the specified area includes 0000 0000_H or 7FFF $FFFF_H$, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
7, 6	—	(Reserved for future expansion. Be sure to clear to 0.)	R/W	0
5	SXE	If the specified area is contained within one protection area and execution is permitted for that area in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
4	SWE	If the specified area is contained within one protection area and writing to that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
3	SRE	If the specified area is contained within one protection area and reading from that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
2	UXE	If the specified area is contained within one protection area and execution is permitted for that area in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
1	UWE	If the specified area is contained within one protection area and writing to that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
0	URE	If the specified area is contained within one protection area and reading from that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined

(i) MPLAn — Protection area minimum address register

These registers indicate the minimum address of area n (where n = 0 to 15).

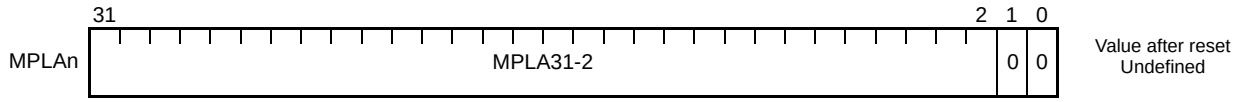

Table 3.46 MPLAn Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 2	MPLA31-2	These bits indicate the minimum address of area n. The MPLA1, 0 bits are used implicitly set to 0.	R/W	Undefined
1, 0	—	Reserved for future expansion. Be sure to clear these bits to 0.	R	0

(j) MPUAn — Protection area maximum address register

These registers indicate the maximum address of area n (where n = 0 to 15).

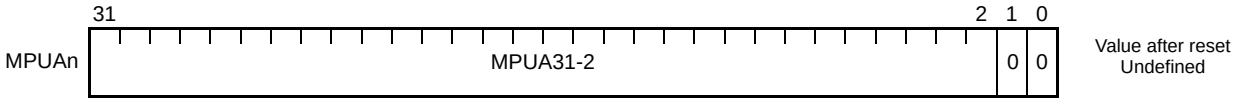

Table 3.47 MPUAn Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 2	MPUA31-2	These bits indicate the maximum address of area n. The MPUA1, 0 bits are used implicitly set to 1.	R/W	Undefined
1, 0	—	Reserved for future expansion. Be sure to clear these bits to 0.	R	0

(k) MPATn — Protection area attribute register

These registers indicate the attributes of area n (where n = 0 to 15).

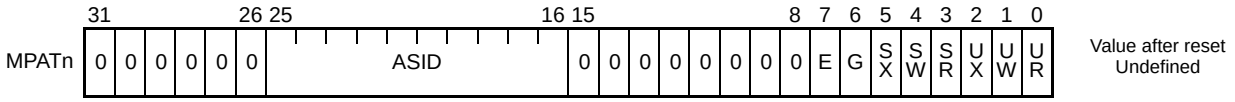

Table 3.48 MPATn Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 26	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
25 to 16	ASID	These bits indicate the ASID value to be used as the area match condition.	R/W	Undefined
15 to 8	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
7	E	This bit indicates whether area n is enabled or disabled.	R/W	0
6	G	This bit is used for the global specification of an MPU area. When this bit is set to 1, the ASID bit has no effect on the area-matching condition.	R/W	Undefined
5	SX	This bit indicates the execution privilege for supervisor mode.*1	R/W	Undefined
4	SW	This bit indicates the write permission for supervisor mode.*1	R/W	Undefined
3	SR	This bit indicates the write permission for supervisor mode*1	R/W	Undefined
2	UX	This bit indicates the execution privilege for user mode.	R/W	Undefined
1	UW	This bit indicates the write permission for user mode.	R/W	Undefined
0	UR	This bit indicates the read permission for user mode.	R/W	Undefined

Note 1. If access is restricted in SV mode., execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access to the memory area necessary for the exception handler and exception handling is permitted.

(6) Cache Operation Function registers

The cache control system registers are individually provided for both physical CPU.

Table 3.49 Cache Operation Function Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR16, 4	ICTAGL	Instruction cache tag Lo access	SV
SR17, 4	ICTAGH	Instruction cache tag Hi access	SV
SR18, 4	ICDATL	Instruction cache data Lo access	SV
SR19, 4	ICDATH	Instruction cache data Hi access	SV
SR24, 4	ICCTRL	Instruction cache control	SV
SR26, 4	ICCFG	Instruction cache configuration	SV
SR28, 4	ICERR	Instruction cache error	SV

(a) ICTAGL — Instruction cache tag Lo access register

This register is used for CIST and CILD instructions for the instruction cache. This register holds values to be stored in the tag RAM of the instruction cache by the execution of CIST instructions and values read from the tag RAM of the instruction cache by the execution of CILD instructions.

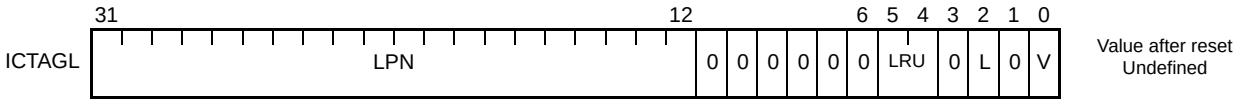

Table 3.50 ICTAGL Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 12	LPN	These bits hold the values of 31 to 12 bits of physical page numbers, i.e. the physical page numbers. When writing, always write 0 to bits 31 to 25.	R/W	Undefined
11 to 6	—	Reserved for future expansion. When writing, always write 0 to these bits.	R	0
5, 4	LRU	These bits indicate the LRU information of the specified cache line. The CIST instruction cannot be used to change the LRU information to desired values.	R/W	Undefined
3	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
2	L	This bit holds the lock information.	R/W	Undefined
1	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
0	V	This bit retains whether the specified cache line is enabled or disabled.	R/W	Undefined

(b) ICTAGH — Instruction cache tag Hi access register

This register is used for a CIST or CILD instruction for the instruction cache. This register stores the value to be stored in the instruction cache tag RAM on CIST execution and the value read from the instruction cache tag RAM on CILD execution.

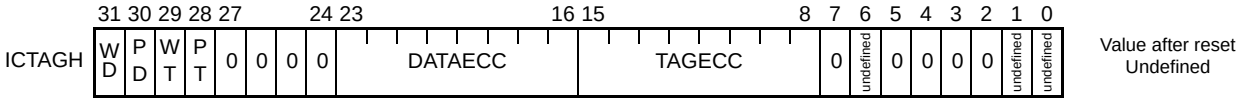

Table 3.51 ICTAGH Register Contents

Bit	Name	Description	R/W	Value after reset
31	WD	When this bit is set to 1, executing a CIST instruction updates the cache data RAM.	R/W	Undefined
30	PD	When this bit is set to 1, executing a CIST instruction writes the value in the DATAECC field of this register to the ECC/parity field of the data RAM.	R/W	Undefined
29	WT	This bit updates the cache tag RAM when this bit is set to 1 before CIST execution.	R/W	Undefined
28	PT	This bit writes the value in TAGECC field to ECC for tag RAM when this bit is set to 1 before CIST execution.	R/W	Undefined
27 to 24	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
23 to 16	DATAECC	These bits retain ECC/parity of the data RAM.	R/W	Undefined
15 to 8	TAGECC	These bits retain ECC of the tag RAM. Be sure to clear bit 15 to 0.	R/W	Undefined
7	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
6	—	(Reserved for future expansion. Be sure to set to 0.)	R	Undefined
5 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1, 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	Undefined

(c) ICDATL — Instruction cache data Lo access register

This register is used for a CIST or CILD instruction for the instruction cache. This register stores the value to be stored in the instruction cache tag RAM on CIST execution and the value read from the instruction cache tag RAM on CILD execution.

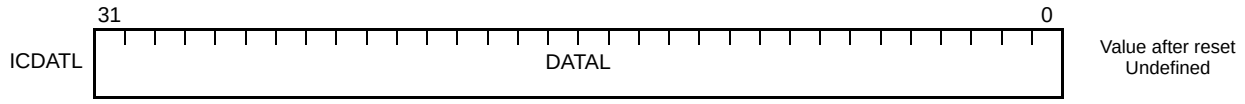

Table 3.52 ICDATL Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 0	DATAL	These bits retain the values of bits 31 to 0 or of bit 95 to 64 from the instruction data of the block within the specified cache line. The offset of the index specifies the target range of bit numbers. Index offset = 0000: bits 31 to 0 Index offset = 1000: bits 95 to 64	R/W	Undefined

(d) ICDATH — Instruction cache data Hi access register

This register is used for a CIST or CILD instruction for the instruction cache. This register stores the value to be stored in the instruction cache tag RAM on CIST execution and the value read from the instruction cache tag RAM on CILD execution

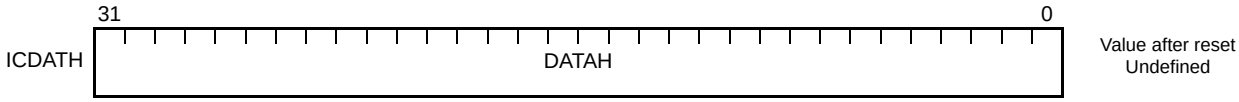

Table 3.53 ICDATH Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 0	DATAH	These bits retain the values of bit 63 to 32 or those of bit 127 to 96 from the instruction data of the block within the specified cache line. The index offset specifies the bit number to be retained. Index offset = 0000: bit 63 to 32 Index offset = 1000: bit 127 to 96	R/W	Undefined

(e) ICCTRL — Instruction cache control register

This register controls the instruction cache.

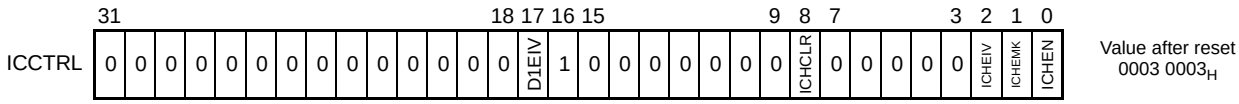

Table 3.54 ICCTRL Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 18	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
17	D1EIV	This bit selects the operation in response to 1-bit errors in the data RAM. 0: The error is corrected and then processing continues, but the address of the entry that had an error is retained. 1: The error is not corrected, the entry is cleared, and fetching is repeated. This bit is read as the previous value until the setting is actually reflected in the instruction cache.	R/W	1
16	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
15 to 9	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
8	ICHCLR	Setting this bit to 1 selects clearing of the whole instruction cache in a single operation. After this bit has been set to 1, it will be read as 1 until clearing is completed. The bit is cleared to 0 once clearing of the cache is completed.	R/W	0
7 to 3	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
2	ICHEIV	Setting this bit to 1 allows the instruction cache to be automatically disabled (ICHEN bit to be cleared to 0) when a cache error occurs.	R/W	0
1	ICHEMK	Setting this bit to 1 selects masking of cache error exception notifications for the CPU when cache errors are encountered.	R/W	1
0	ICHEN	This bit disables or enables the instruction cache. 0: Instruction cache is disabled. 1: Instruction cache is enabled. This bit is read as the previous value until the setting is actually reflected in the instruction cache.	R/W	1

(f) ICCFG — Instruction cache configuration register

This register shows the configuration of the instruction cache.

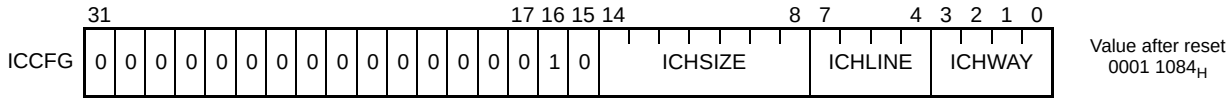

Table 3.55 ICCFG Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 17	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
16	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
15	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
14 to 8	ICHSIZE	These bits indicate the capacity (in K bytes) of the instruction cache. 001 0000: 16 K byte	R	10_H
7 to 4	ICHLINE	These bits indicate the number of lines per 1 way in the instruction cache. 1000: 256 lines	R	8_H
3 to 0	ICHWAY	These bits indicate the number of ways of the instruction cache. 0100: 4 ways	R	4_H

(g) ICERR — Instruction cache error register

This register stores cache error data of the instruction cache.

Once the ICHERR bit is set to 1, subsequent cache error data is not stored in this register until the ICHERR bit is cleared to 0.

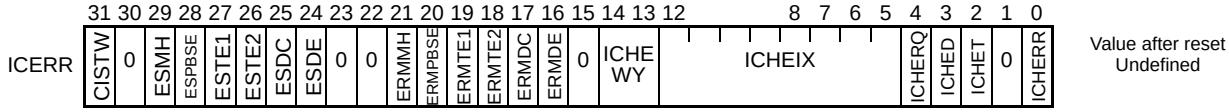

Table 3.56 ICERR Register Contents

Bit	Name	Description	R/W	Value after reset
31	CISTW	This bit is set to indicate that the destination way specified for a CISTI instruction was in error. Although the entry information is overwritten so that writing is completed, the V bit will be cleared the next time the cache line is read (i.e. reading will be judged to have missed the cache). However, setting of this bit is not accompanied by an exception for the CPU.	R/W	0
30	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
29	ESMH	Error status: multi-hit	R/W	Undefined
28	ESPBSE	Error status: way error	R/W	Undefined
27	ESTE1	Error status: 1-bit error in the tag RAM	R/W	Undefined
26	ESTE2	Error status: 2-bit error in the tag RAM	R/W	Undefined
25	ESDC	Error status: 1-bit correction in the data RAM	R/W	Undefined
24	ESDE	Error status: 2-bit correction in the data RAM	R/W	Undefined
23, 22	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
21	ERMMH	Error exception notification mask: multi-hit	R/W	0
20	ERMPBSE	Error exception notification mask: way error	R/W	0
19	ERMTE1	Error exception notification mask: 1-bit error in the tag RAM	R/W	0
18	ERMTE2	Error exception notification mask: 2-bit error in the tag RAM	R/W	0
17	ERMDC	Error exception notification mask: 1-bit correction in the data RAM	R/W	0
16	ERMDE	Error exception notification mask: 2-bit correction in the data RAM	R/W	0
15	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
14, 13	ICHEWY	These bits retain a way number where a cache error occurs.	R/W	Undefined
12 to 5	ICHEIX	These bits retain a cache index where a cache error occurs.	R/W	Undefined
4	ICHERQ	Setting of this bit to 1 indicates that the CPU is being notified of a cache error exception. If cache error exceptions are masked, however, the CPU is not notified of an exception even when this bit is set to 1.	R/W	0
3	ICHED	This bit indicates that an error occurs in the data RAM.	R/W	0
2	ICHET	This bit indicates that an error occurs in the tag RAM.	R/W	0
1	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
0	ICHERR	This bit is set to 1 when a cache error occurs.	R/W	0

(7) Data Buffer Operation Function Registers

The data buffer control system registers can be individually provided of the physical CPU.

Table 3.57 Data Buffer Operation Function Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR24, 13	CDBCR	Data buffer control register	SV

(a) CDBCR — Data Buffer Control Register

This register controls the data buffer.

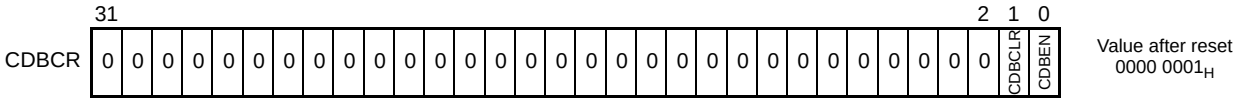

Table 3.58 CDBCR Register Contents

Bit	Name	Description	R/W	Value after reset
31 to 2	—	(Reserved for future expansion. Be sure to clear to 0.)	R	0
1	CDBCLR	When this bit is set to 1, the data buffer is cleared at a time. This bit is always read as 0.	W	0
0	CDBEN	This bit disables or enables the data buffer. 0: Data buffer is disabled. 1: Data buffer is enabled.	R/W	1

3.2.2 Instruction Cache and Data Buffer

3.2.2.1 Features

A 16-kbyte and 4-way set-associative Instruction Cache is mounted between the CPU1, 2 and the Code Flash. The Instruction Cache and the Code Flash are connected to each other via a 128-bit dedicated bus to minimize penalties caused by a cache miss-hit. Also a Data Buffer is mounted between the CPU1, 2 and the Code Flash to achieve high-speed data access. The 32-MB area from 0000 0000_H to 01FF $FFFF_H$ in the address space is intended for the Instruction Cache and Data Buffer.

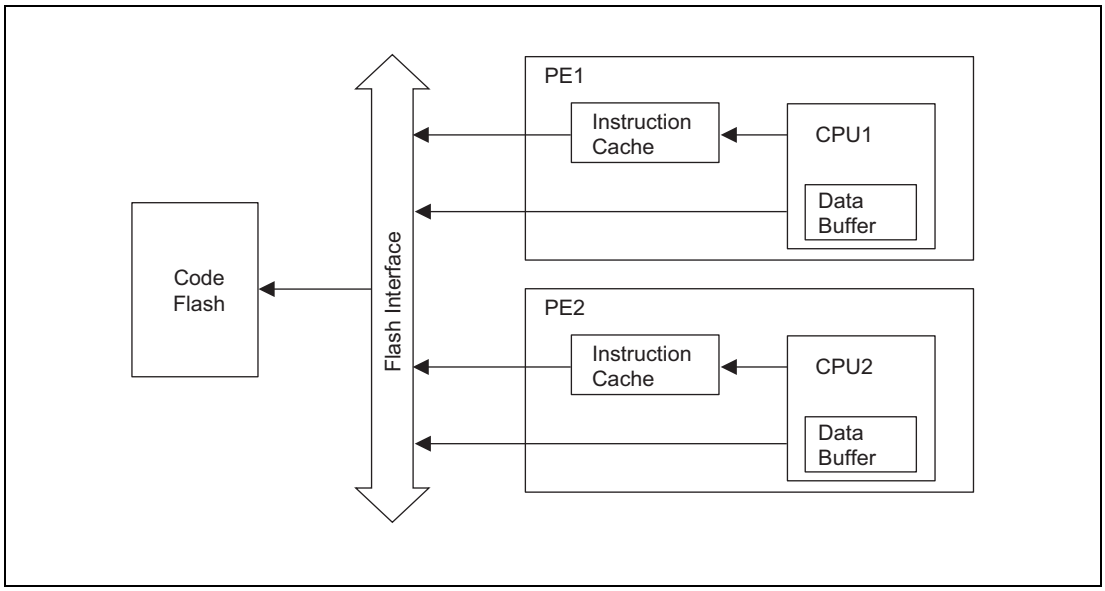

Figure 3.2 Instruction Cache and Data Buffer

3.2.2.2 Instruction Cache Function

The 16-kbyte and 4-way set-associative Cache includes four Ways consisting of 256-entry blocks of four words per line, amounting to 16 kbytes capacity in total. The Ways are divided into two groups, Way Group 0 consisting of Way0 and Way1 and Way Group 1 consisting of Way2 and Way3. The Way Group can be selected and used by decoding of the address information of the access destination. If a cache error occurs, each line is refilled by a replace algorithm using LRU. CPU instruction fetches from the Code Flash are performed via the instruction cache.

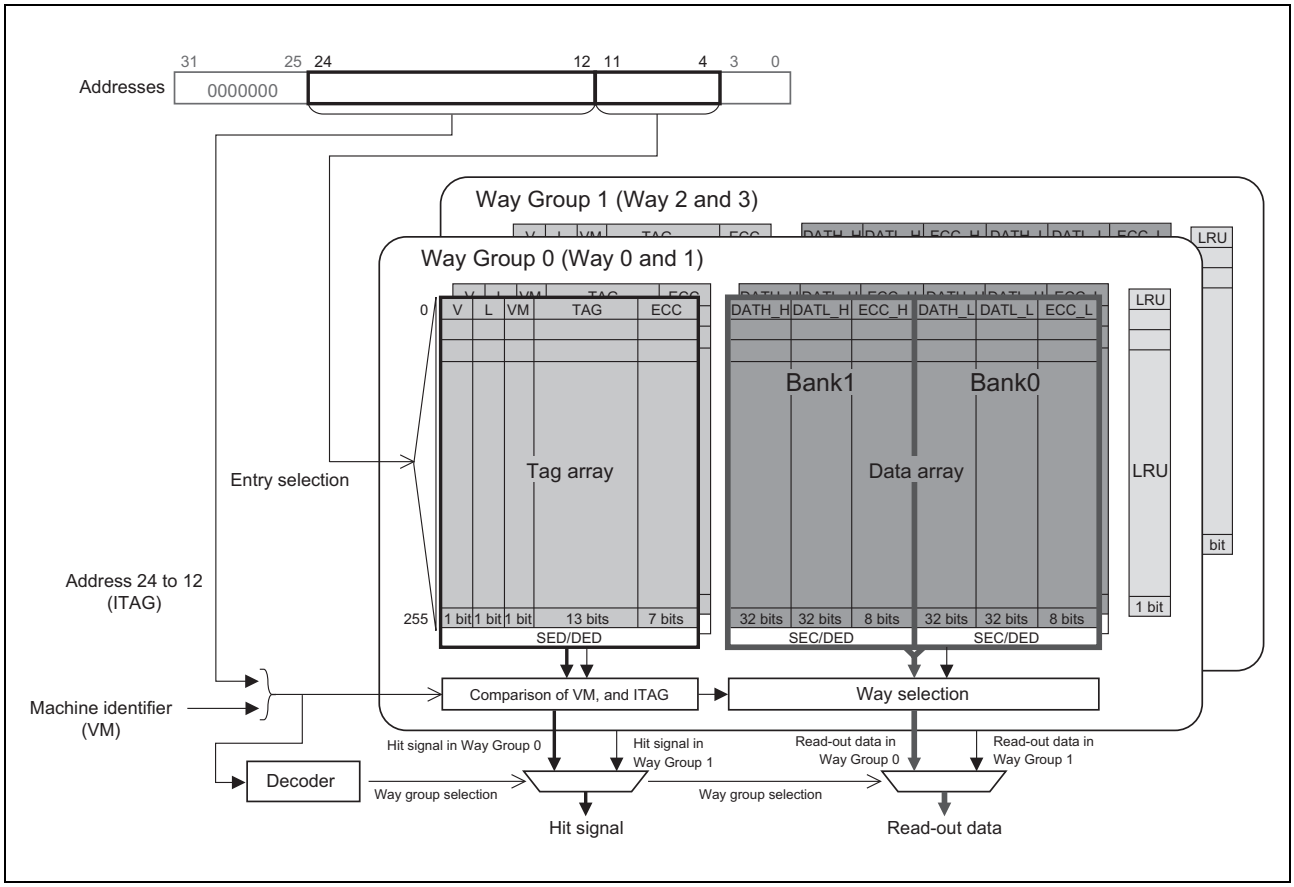

Figure 3.3 Instruction Cache Configuration

Tag Array

V bit	This bit indicates whether valid data is stored in the cache line. Setting of this bit to 1 makes the cache line data valid. The V bit is initialized to 0 by reset.
L bit	This bit indicates whether a cache line is locked or not. Setting of this bit to 1 locks the cache line and it can not be replaced with new data. The L bit is valid only when the V bit is 1, and it is not initialized by reset.
VM bit	VM bit is always set into 0 because virtual machine mode is not supported. The VM bit is not initialized by reset.
TAG	Among 32 bits in the operable addresses of the data line to be cached, bits 24 to 12 are stored in this bit. The TAG bit is not initialized by reset.
ECC	The ECC of the tag array is stored in this bit. The ECC bit is not initialized by reset.

Data Array

DATH_H, DATH_L, DATL_H, DATL_L	The 128-bit cache line data is stored per 32 bits as follows: the bits [127:96], [95:64], [63:32], [31:0] in the DATH_H, DATL_H, DATH_L, and DATL_L, respectively. In the CIST or CILD operation in response to a cache instruction, the ICDATH register is used for DATH_H and DATH_L and ICDATL is used for DATL_H and DATL_L.
ECC_H, ECC_L	The ECC of the data in bits [127:64] and [63:0] are stored in ECC_H and ECC_L, respectively.

LRU

LRU	The LRU information in the same Way Group is stored in this data array. The LRU is initialized by reset.

CAUTION

When writing test data to the tag array of the instruction cache in the CIST instruction and then fetching the relevant line by the instruction, write the tag information in units of WAY group. For example, when writing tag information to a line on the WAY0 side of WAY group 0, also write the tag information of the same line on the WAY1 side and then perform instruction fetch.

- **When writing data to WAY group 0 (WAY0, WAY1), write a value that makes the Exclusive OR of the ICTAGL.LPN bit bit 0.**
- **When writing data to WAY group 1 (WAY2, WAY3), write a value that makes the Exclusive OR of the ICTAGL.LPN bit bit 1.**

When a value other than those above is written to the tag array and instruction fetch is performed, a WAY error occurs and the ICERR.ESPBSE bit is set to 1. When the same tag information is written to the same line of two WAYs in a WAY group and instruction fetch is performed, a multi-hit error occurs and the ICERR.ESMH bit is set to 1.

3.2.2.3 Data Buffer Function

The four-line buffer with 128 bits per line is mounted as a data buffer. The data of 128 bits per line read from the Code Flash is stored in the data buffer. The data is read out from the data buffer after the next access to the same address, so the Code Flash is not accessed again.

3.2.3 Inter-Processor Interrupts

Registers (IPIR_CH#) for interrupt communication between PEs are provided for two channels.

IPIR_CH1 to IPIR_CH2 are assigned to CH1 to CH2 of user interrupt (EIINT). An interrupt for specific PEs (including own PE) can be requested by manipulating bits corresponding to respective PEs.

See **Section 6**, Exception/Interrupt Functions.

3.2.4 Reliability Functions

3.2.4.1 PE Guard Function (PEG)

(1) Overview of the PEG Function

The PEG is a constituent of the slave guard system to prevent unauthorized access to the resources in the PE from the external master. This function protects access to the local RAM in the PE. In the initial state after a reset, all access by masters other than the PE itself is disabled except read access from ICUMC. Setting the registers listed in (3), List of PEG Protection Setting Registers, enables access by masters other than the PE itself.

(1) Detecting PE guard violation

If the external master outside the PE makes an unauthorized access to the resource area in the PE for which PE guard is set, the access is detected as a PE guard violation. PE Guard informs it to ECM and reports the details about the access in registers.

(2) Blocking unauthorized accesses

When a PE guard violation is detected, unauthorized accesses to the internal resources of the PE are blocked to prevent the contents of PE resources from being modified illegally.

(3) Notifying occurrence of violation

An error response to an unauthorized access is sent to the request source of external master (except H-Bus master peripherals).

When the DMAC or DTS makes an unauthorized access, meanwhile, a DMA transfer error is detected.

(2) Protection Made by SPID

- Setting PEG Protection
  - Up to eight areas can be set depending on the Local RAM address of the own PE.
  - The area range is specified by the base address and the mask bit (4 kbytes to 4 Gbytes).
  - “Read enable” and “write enable” can be set for each area.
  - “Enable” or “disable” can be selected on each system protection identifier (SPID) for each area.
- Access permission by the system protection identifier (SPID) (see **Figure 3.4**)

1. When the Local RAM area is to be accessed, go to step 2.
   Otherwise, return an error response.
2. When any of enabled area 0 to area 7 is to be accessed, go to step 3.
   Otherwise, return an error response.
3. Are all the conditions below for the relevant area met?

– The system protection identifier (SPID) is enabled.
– Required operations (read/write) are enabled.
Otherwise, return an error response.

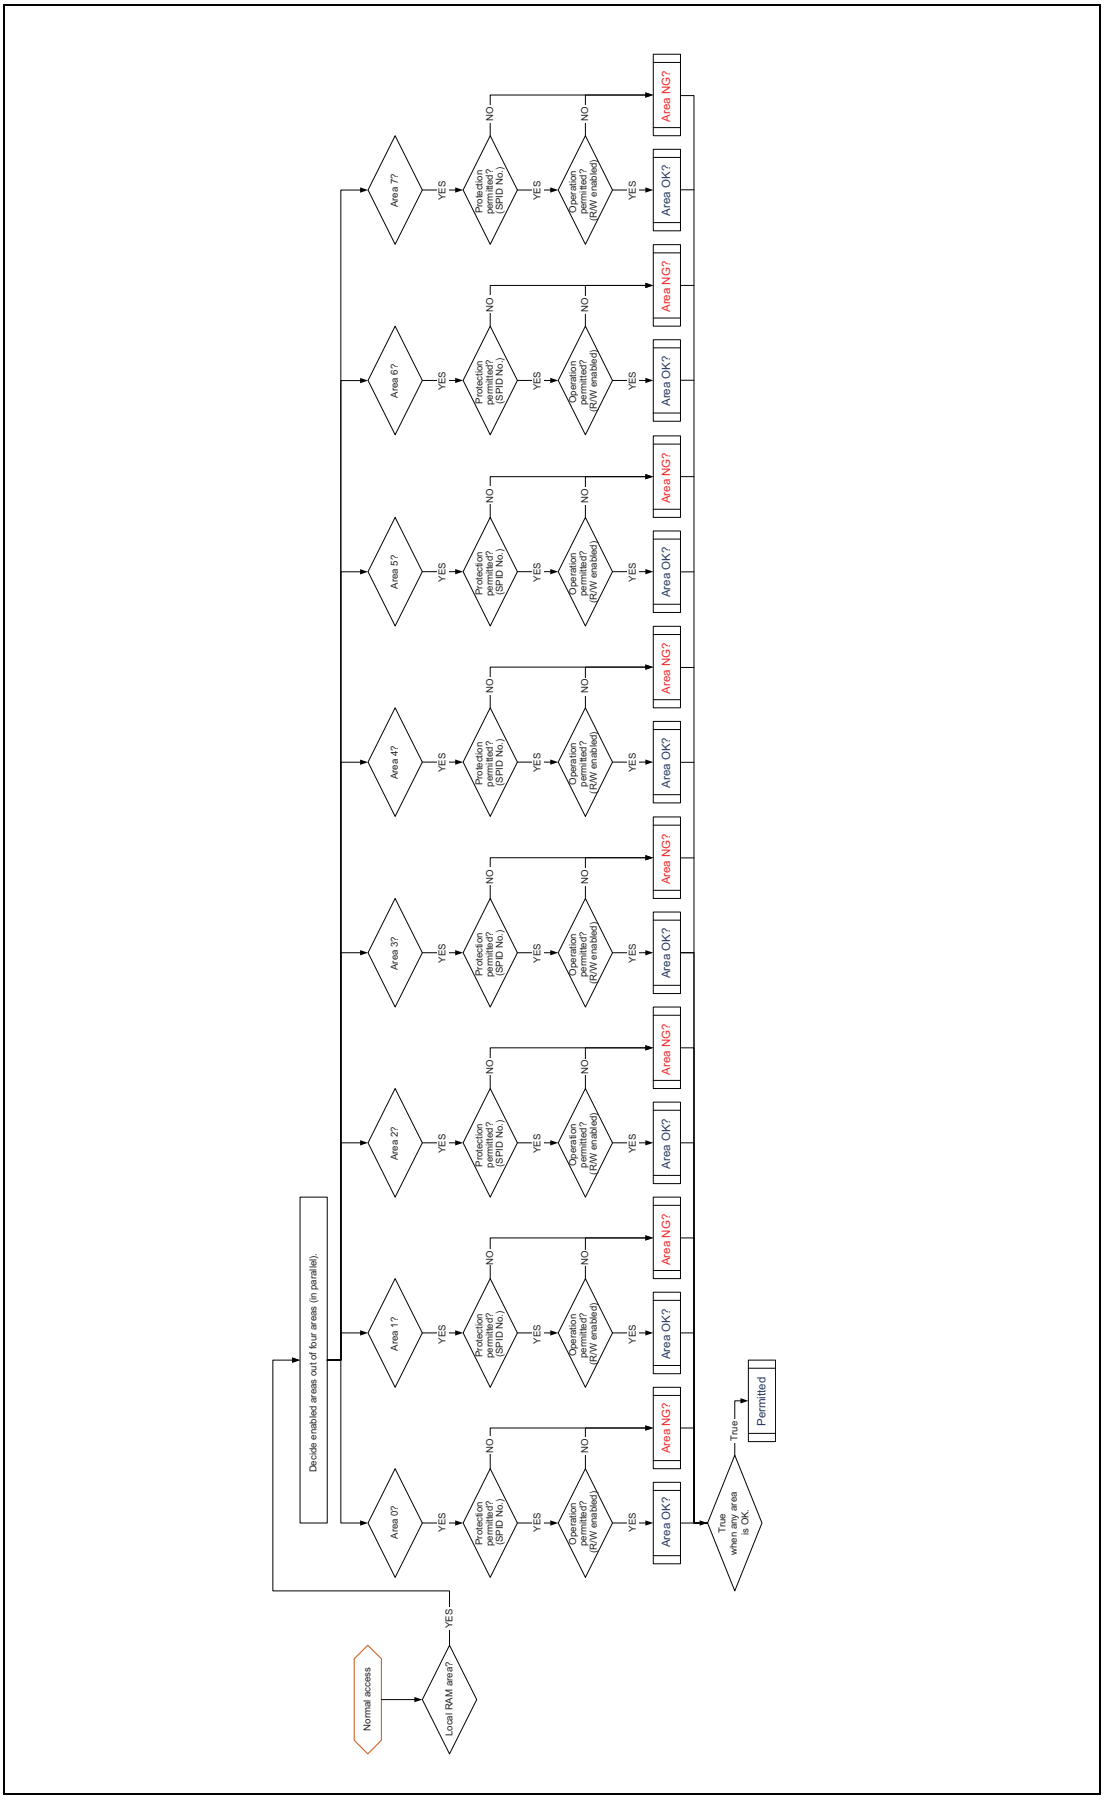

Figure 3.4 Access Permission by the System Protection Identifier (SPID)

(3) List of PEG Protection Setting Registers

Make necessary settings for the following registers to protect PE resources from unauthorized accesses by the external master.

- Accesses to the Local RAM in the PE are permitted as detection targets.

Table 3.59 PEG registers (Base Address: FFFE E600$_H$)

Address Offset	Size (Byte)	Register Name	Abbreviation	Right	R/W	Operable Bit 1	8	16	32	Value after reset

x=2 APBGRD_PFSS1.SP2

x = 1, 2

(4) Register Set

(a) PEGGnMK — PE Guard Area n Mask Setting Register (n = 0 to 7)

The PEGGnMK register defines which bits of PEGGnBA are compared with the access address. If bit MASKm is cleared, bit BASEm is compared with bit m of the access address.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GnMASK															
Value after reset *1																
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GnMASK				—	—	—	—	—	—	—	—	—	—	—	—
Value after reset *1																
	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. See **Table 3.59, PEG registers (Base Address: FFFE E600$_H$)**.

Table 3.61 GnMask register contents

Bit Position	Bit Name	Function
31 to 12	GnMASK	0: Target address bits are compared when determining the PE guard area. 1: Target address bits are not compared when determining the PE guard area.
11 to 0	Reserved	These bits are always read as 0. The write value should always be 0.

(b) PEGGnBA — PE Guard Area n Base Setting Register (n = 0 to 7)

In combination with the PEGGnMK register, this register specifies a range or ranges within PE guard protection area n. Setting the GnEN bit to 1 brings the address enable conditions specified by this register and the PEGGnMK register into effect.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GnBASE															
Value after reset *1

Table 3.66 PGERRINFO_PEx register contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset always is read.
7 to 5	PEID	PEID of the bus master that initiated the access
4 to 0	SPID	SPID of the bus master that initiated the access

3.2.4.2 PE's Internal Peripherals Protection Function (IPG)

(1) Overview of the IPG Function

The IPG is a system to prevent unauthorized accesses to peripherals from the CPU core equipped with the IPG. The IPG achieves the following functions. The IPG covers accesses to resources except the Code Flash and the local RAM.

(1) **Detecting violation of peripherals protection**
If the CPU makes an unauthorized access to an area (peripherals) for which peripherals protection is set, the access is detected as "violation of peripherals protection."

(2) **Storing unauthorized-access information**
When a violation of peripherals protection is detected, the unauthorized-access information is stored in the IPG's internal register.

(3) **Blocking unauthorized accesses**
When a violation of peripherals protection is detected, unauthorized accesses to peripherals are blocked to prevent contents of peripherals from being modified illegally.

(4) **Notifying violation**
When a violation of peripherals protection is detected, a request for generating an exception is made to ask the CPU to stop the processing.

NOTE

The G3M makes a request for generating a SYSERR (asynchronous) exception via SysErrGen.

(5) **Invalidating subsequent accesses**
When a violation of peripherals protection is detected, subsequent accesses (regardless of authorized or unauthorized accesses) are blocked until instructions from the CPU are received.

NOTE

Even if a request for generating an exception is immediately sent to the CPU in step (4) above, a subsequent access issued (before receiving a request from the IPG) by the CPU that does not know an occurrence of violation may illegally modify contents of peripherals. (Accesses after a violation has occurred result in unauthorized accesses.)

(2) IPG Function

(1) This function invalidates accesses according to their attributes (including address, transfer type, and access right).

(2) After an access right violation is detected until the error flag (described later) is cleared by writing by the software, subsequent accesses are invalidated. However, invalidation is applied only to accesses from the CPU and is not applied to accesses from outside the CPU core. Invalidation is performed independently of addresses.

(3) When a request for accessing different peripherals simultaneously is made due to misalignment or double-word access, the access is executed when all such accesses are enabled.

(3) IPG Protection Setting Registers for Illegal Users

To protect peripherals from unauthorized accesses by programs in user mode, necessary settings are required for the registers listed below.

- Accesses to respective machines in user mode are to be detected.
- This register set is intended for IPG settings related to user mode and reading the IPG settings in own machine.

Table 3.67 IPG registers (Base Address: FFFE E000$_H$)

Address Offset	Size (Byte)	Register Name	Abbreviation	Right*1	R/W	Operable Bit				Value after reset
						1	8	16	32	
+002$_H$	2	Peripherals protection violation access information register	IPGECRUM	SV	R/W	—	—	√	—	Undefined
+008$_H$	4	Peripherals protection violation access address register	IPGADRUM	SV	R/W	—	—	—	√	Undefined
+00D$_H$	1	Peripherals protection enable register	IPGENUM	SV	R/W	√	√	—	—	00$_H$
+020$_H$	1	Peripherals protection setting register 0	IPGPMTUM0	SV	R/W	√	√	—	—	00$_H$
+021$_H$	1	Peripherals protection setting register 1	IPGPMTUM1	SV	R/W	√	√	—	—	00$_H$
+022$_H$	1	Peripherals protection setting register 2	IPGPMTUM2	SV	R/W	√	√	—	—	00$_H$
+023$_H$	1	Peripherals protection setting register 3	IPGPMTUM3	SV	R/W	√	√	—	—	00$_H$
+024$_H$	1	Peripherals protection setting register 4	IPGPMTUM4	SV	R/W	√	√	—	—	00$_H$

Note 1. Registers for which “SV” is described are accessible by accesses with SV right (UM = 0).

(4) Register Set

(a) IPGECRUM — Peripherals Protection Violation Access Information Register

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	DS				EX	WR	RD	VD
Value after reset	0	0	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

×: Undefined

Table 3.68 Register Contents of IPGECRUM

Bit Position	Bit Name	Function
15, 14	Reserved	These bits are always read as 0. The write value should always be 0.
13 to 8	Reserved	The read value is undefined. The write value should always be 0.
7 to 4	DS	These bits store the data size of access that made a violation. 1000: Double-word (8 bytes) 0100: Word (4 bytes) 0010: Half-word (2 bytes) 0001: Byte Other than above: RFU
3	EX	This bit is set to 1 when a violation occurred in an instruction fetch read access. In other cases, this bit is cleared to 0.
2	WR	This bit is set to 1 when a violation occurred in a write access or bit operation or CAXI. In other cases, this bit is cleared to 0.
1	RD	This bit is set to 1 when a violation occurred in a read access or bit operation or CAXI. In other cases, this bit is cleared to 0.
0	VD	This bit is set to 1 when a violation of peripherals protection is detected by a program with the relevant right. If another violation of peripheral protection is detected, data of this IPGECRUM register and the IPGADRUM register is updated.

NOTE

When the IRE bit value of the IPGENUM register (described later) is 0 and violation of peripherals protection by a program operating in user mode is an instruction fetch read access, no bit of this register is updated.

(b) IPGADRUM — Peripherals Protection Violation Access Address Register

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EADR															
Value after reset	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EADR															
Value after reset	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

×: Undefined (retained)

Table 3.69 Register Contents of IPGADRUM

Bit Position	Bit Name	Function
31 to 0	EADR	These bits store the address of the access in which a violation occurred.

NOTE

When the IRE bit value of the IPGENUM register (described later) is 0 and violation of peripherals protection by a program operating in user mode is an instruction fetch read access, no bit of this register is updated.

(c) IPGENUM — Peripheral Device Protection Enable Register

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	IRE	E
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 3.70 Register Contents of IPGENUM

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset always is read. When writing, always write the value after reset.
1	IRE	This bit sets whether to store the access information in the peripheral device protection violation access address register and the peripherals protection violation access information register when a violation of peripherals protection occurred in an instruction fetch access. 0: Instruction fetch access information is not stored. (Value after reset) 1: Instruction fetch access information is stored. **CAUTION** If you do not want to detect speculative instruction fetches (no instruction is executed in some cases), clear this bit to 0.
0	E	This bit enables or disables the peripherals protection function against accesses by the relevant access right. 0: The peripherals protection function is disabled. (Value after reset) 1: The peripherals protection function is enabled.

(d) IPGPMTUM0 — Peripherals Protection Setting Register 0

Bit	7	6	5	4	3	2	1	0
	—	X1	W1	R1	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R	R	R	R

Table 3.71 Register Contents of IPGPMTUM0

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset always is read. When writing, always write the value after reset.
6	X1	This bit sets whether to enable instruction fetch read access to Peripheral Groups. 0: Instruction fetch read access to Peripheral Groups is treated as violation. (Value after reset) 1: Instruction fetch read access to Peripheral Groups is not restricted.
5	W1	This bit sets whether to enable write access to Peripheral Groups. 0: Write access to Peripheral Groups is treated as violation. (Value after reset) 1: Write access to Peripheral Groups is not restricted.
4	R1	This bit sets whether to enable read access to Peripheral Groups. 0: Read access to Peripheral Groups is treated as violation. (Value after reset) 1: Read access to Peripheral Groups is not restricted.
3 to 0	Reserved	Reserved. These bits are always read as 0. The write value should always be 0.

(e) IPGPMTUM1 — Peripherals Protection Setting Register 1

Bit	7	6	5	4	3	2	1	0
	—	X1	—	—	—	X0	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R	R	R	R/W	R	R

Table 3.72 Register Contents of IPGPMTUM1

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset always is read. When writing, always write the value after reset.
6	X1	This bit sets whether to enable instruction fetch read access to GRAM Bank#1. 0: Instruction fetch read access to GRAM Bank#1 is treated as violation. (Value after reset) 1: Instruction fetch read access to GRAM Bank#1 is not restricted.
5 to 3	Reserved	When read, the value after reset always is read. When writing, always write the value after reset.
2	X0	This bit sets whether to enable instruction fetch read access to GRAM Bank#0. 0: Instruction fetch read access to GRAM Bank#0 is treated as violation. (Value after reset) 1: Instruction fetch read access to GRAM Bank#0 is not restricted.
1, 0	Reserved	When read, the value after reset always is read. When writing, always write the value after reset.

(f) IPGPMTUM2 — Peripherals Protection Setting Register 2

Bit	7	6	5	4	3	2	1	0
	—	—	W1	R1	—	—	W0	R0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R/W	R/W

Table 3.73 Register Contents of IPGPMTUM2

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset always is read. When writing, always write the value after reset.
5	W1	This bit sets whether to enable write access to IPIR, MECNT, and COMPTEST. 0: Write access to IPIR MECNT, and COMPTEST is treated as violation. (Value after reset) 1: Write access to IPIR MECNT, and COMPTEST is not restricted.
4	R1	This bit sets whether to enable read access to IPIR, MECNT, and COMPTEST. 0: Read access to IPIR MECNT, and COMPTEST is treated as violation. (Value after reset) 1: Read access to IPIR MECNT, and COMPTEST is not restricted.
3, 2	Reserved	When read, the value after reset always is read. When writing, always write the value after reset.
1	W0	This bit sets whether to enable write access to INTC1. 0: Write access to INTC1 is treated as violation. (Value after reset) 1: Write access to INTC1 is not restricted.
0	R0	This bit sets whether to enable read access to INTC1. 0: Read access to INTC1 is treated as violation. (Value after reset) 1: Read access to INTC1 is not restricted.

(g) IPGPMTUM3 — Peripherals Protection Setting Register 3

Bit	7	6	5	4	3	2	1	0
	—	—	W1	R1	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R

Table 3.74 Register Contents of IPGPMTUM3

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset always is read. When writing, always write the value after reset.
5	W1	This bit sets whether to enable write access to SysErrGen. 0: Write access to SysErrGen is treated as violation. (Value after reset) 1: Write access to SysErrGen is not restricted.
4	R1	This bit sets whether to enable read access to SysErrGen. 0: Read access to SysErrGen is treated as violation. (Value after reset) 1: Read access to SysErrGen is not restricted
3 to 0	Reserved	When read, the value after reset always is read. When writing, always write the value after reset.

(h) IPGPMTUM4 — Peripherals Protection Setting Register 4

Bit	7	6	5	4	3	2	1	0
	—	X1	W1	R1	—	—	W0	R0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R	R	R/W	R/W

Table 3.75 Register Contents of IPGPMTUM4

Bit Position	Bit Name	Function
7	Reserved	Reserved. The bit is always read as 0. The write value should always be 0.
6	X1	This bit sets whether to enable instruction fetch read access to peripherals to be connected to the H-Bus. 0: Instruction fetch read access to peripherals to be connected to the H-Bus is treated as violation. (value after reset) 1: Instruction fetch read access to peripherals to be connected to the H-Bus is not restricted.
5	W1	This bit sets whether to enable write access to peripherals to be connected to the H-Bus. 0: Write access to peripherals to be connected to the H-Bus is treated as violation. (value after reset) 1: Write access to peripherals to be connected to the H-Bus is not restricted.
4	R1	This bit sets whether to enable read access to peripherals to be connected to the H-Bus. 0: Read access to peripherals to be connected to the H-Bus is treated as violation. (Valueafter reset) 1: Read access to peripherals to be connected to the H-Bus is not restricted
3 to 2	Reserved	Reserved. These bits are always read as 0. The write value should always be 0.
1	W0	This bit sets whether to enable write access to the PEG. 0: Write access to the PEG is treated as violation. (Value after reset) 1: Write access to the PEG is not restricted.
0	R0	This bit sets whether to enable read access the PEG. 0: Read access to the PEG is treated as violation. (Value after reset) 1: Read access to the PEG is not restricted

3.2.4.3 System Error Notification Control Function (SEG)

SEG (SysErrGen) controls interrupt notification and recording after a system error occurred by a data access.

Multiple error occurrence inputs are categorized according to error factors, and are processed sequentially from the highest-priority error factor, generating an FE-level asynchronous exception (SYSERR).

The bit position of the SEGFLAG register becomes the priority of error factors. Error factors of lower bits take precedence over error factors of upper bits.

Error information is recorded once regardless of error frequency.

The error with the highest priority of error factor (in case errors occurred simultaneously) is valid. Recorded error information is not overwritten by subsequent errors.

(1) List of SEG Function Control Registers

Table 3.76 SEG Register (Base Address: FFFE E980$_H$)

Address Offset	Size (Byte)	Register Name	Abbreviation	Right	R/W	Operable Bit				Value after reset
						1	8	16	32	
+00$_H$	2	Error notification control register	SEGCONT	—	R/W *1	—	—	√	—	0000$_H$
+02$_H$	2	Error occurrence retention register	SEGFLAG	—	R/W *1	—	—	√	—	0000$_H$
+04$_H$	2	Error factor retention register	SEGTYPE	—	R/W *1	—	—	√	—	Undefined
+06$_H$	2	Error factor retention register (Operation source)	SEGSIDE	—	R/W *1	—	—	√	—	Undefined
+08$_H$	4	Error factor retention register (address)	SEGADDR	—	R/W *1	—	—	√	√	Undefined

Note 1. Write accesses from user mode are ignored.

NOTE

- If an access is made with an address offset or operable bits other than those specified above, an error response is returned.
- Write access is only possible with the SV privilege. Attempting to write, if these conditions do not hold, leads to an error response being returned.
- No restriction is provided for read accesses.
  — Read accesses to ranges permitted by other protection systems are enabled at any time.

(2) Register Set

(a) SEGCONT — Error Notification Control Register

- This register is used to enable (= 1) or disable (= 0) notification of SysErr request in response to error flags that store error occurrence status according to factors.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	VPGE	VCRE	—	TCME	—	VCIE	—	ICCE	—	NEE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R/W	R	R/W	R	R/W	R	R/W

Table 3.77 SEGCONT register contents (1/2)

Bit Position	Bit Name	Function
15 to 10	Reserved	When read, the value after reset always is read. When writing, always write the value after reset.
9	VPGE	This bit notifies an error in writing access to P-Bus. The error includes the followings: • P-Bus guard error • Address EDC error • Data ECC error • Access to unimplemented area in the P-Bus • P-Bus slave peripherals error
8	VCRE	This bit notifies the IPG violation access detection and subsequent access blocking.*1
7	Reserved	When read, the value after reset always is read. When writing, always write the value after reset.
6	TCME	This bit notifies an error in accessing data to its own local RAM. The error includes the following cases: • ECC error • Access to the RAM-unimplemented area in the local RAM
5	Reserved	When read, the value after reset always is read. When writing, always write the value after reset.

Table 3.77 SEGCONT register contents (2/2)

Bit Position	Bit Name	Function
4	VCIE	This bit notifies an error The error includes the followings: • in reading access to P-Bus – P-Bus guard error – Address EDC error – Data ECC error – access to unimplemented area in the P-Bus – P-Bus slave peripheral error • in access to H-Bus – H-Bus guard error – access to unimplemented area in the H-Bus area – H-Bus slave peripheral error • in access to Code Flash – Code Flash guard error – Address Parity error – Data ECC error • in access to Global RAM – GRAM guard error – Address ECC error – Data ECC error • in access to foreign Local RAM – PE guard error – Address ECC error – Data ECC error • in access to system peripheral – access to the unimplemented area in the system peripheral area • This bit notifies the IPG violation access detection and subsequent access blocking.*1 • in access privilege violation – n reading or writing access to IPG Protection Setting Registers by user mode (PSW.UM = 1) – In writing access to the SEG Function Control Registers by user mode (PSW.UM = 1)
3	Reserved	When read, the value after reset always is read. When writing, always write the value after reset.
2	ICCE	Instruction cache error notification enable The error that occurred in the instruction cache is handled when the instruction cache system register, ICCTRL.ICHEMK, is set to 0 (whose value after reset is 1): For instruction cache errors, see **(g) ICERR — Instruction cache error register** in **Section 3.2.1.2, Register Set**, **(6) Cache Operation Function registers**.
1	Reserved	When read, the value after reset always is read. When writing, always write the value after reset.
0	NEE	This bit notifies the correctable ECC error Code Flash, Global RAM, Local RAM, Foreign Local RAM To enable this function, it is necessary to set VCIE or TCME bit at the same time.

Note 1. For error factor address, see **Section 3.2.4.2, PE's Internal Peripherals Protection Function (IPG)**, IPGADRUM register.

(b) SEGFLAG — Error Occurrence Retention Register

- The register SEGFLAG indicates from which slaves error responses have been received so far. SEGFLAG is not cleared automatically. Clearing can be performed by writing a zero into the register.
- Writing to the register enables both setting and clearing.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	VPGF	VCRF	—	TCMF	—	VCIF	—	ICCF	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R/W	R	R/W	R	R/W	R	R

Table 3.78 SEGFLAG register contents

Bit Position	Bit Name	Function
15 to 10	Reserved	When read, the value after reset always is read. When writing, always write the value after reset.
9	VPGF	Flag corresponding to bit 9 of the SEGCONT register
8	VCRF	Flag corresponding to bit 8 of the SEGCONT register
7	Reserved	When read, the value after reset always is read. When writing, always write the value after reset.
6	TCMF	Flag corresponding to bit 6 of the SEGCONT register
5	Reserved	When read, the value is undefined. When writing, always write the value after reset.
4	VCIF	Flag corresponding to bit 4 of the SEGCONT register
3	Reserved	When read, the value after reset always is read. When writing, always write the value after reset.
2	ICCF	Flag corresponding to bit 2 of the SEGCONT register
1, 0	Reserved	When read, the value after reset always is read. When writing, always write the value after reset.

Table 3.79 Relationship between System Error Exception Cause Code and SEGFLAG

FEIC	Error Cause
10_H	Reserved
11_H	Instruction fetch from code flash
12_H	SEGFLAG.ICCF
13_H	Instruction fetch from other than code flash
14_H	SEGFLAG.VCIF
15_H	Reserved
16_H	SEGFLAG.TCMF
17_H	Reserved
18_H	SEGFLAG.VCRF
19_H	SEGFLAG.VPGF
$1A_H$ to $1F_H$	Reserved

(c) Error Factor Retention Register (SEGTYPE)

This register records information of an error factor that notifies a SYSERR request (only one history is recorded). It records ETYPE[6:0] and CODE[3:0] where the error factors for the VPGF, VCIF and TCMF bits of the SEGFLAG register were found. The error factors except VPGF, VCIF and TCMF bits of the SEGFLAG register to be recorded as ETYPE[6:0] = 0000000_B and CODE[3:0] = 0000_B. This can not be modified when the error occurrence flag to enable notification is set.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ETYPE[6:0]							—	—	—	—	—	CODE[3:0]			
Value after reset	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 3.80 SEGTYPE register contents

Bit Position	Bit Name	Function
15 to 9	ETYPE[6:0]	Error Type 6: Address Error 5: Response Error 4: Uncorrected Error 3: Protect Error 2: Request Error 1: Un-support Error 0: Boundary Error
8 to 4	Reserved	The read value is undefined. The write value should always be 0.
3 to 0	CODE[3:0]	Error Cause Code These bits indicate bit position in SEGFLAG.

(d) SEG Error Information (Master) Register (SEGSIDE)

This register records information of an error factor that notifies a SYSERR request (only one history is recorded). It records PEID[2:0] where the error factors for the VPGF, VCIF, VCRF and TCMF bits of the SEGFLAG register were found. The error factors except VPGF, VCIF, VCRF and TCMF bits of the SEGFLAG register to be recorded as PEID[2:0] = 000_B. It records SPID[4:0] where the error factors for the VCIF and TCMF bits of the SEGFLAG register were found.

The error factors except VCIF and TCMF bits of the SEGFLAG register to be recorded as SPID[4:0] = 00000_B. It records UM where the error factors for the VCIF, VCRF and TCMF bits of the SEGFLAG register were found. The error factors except VCIF, VCRF and TCMF bits of the SEGFLAG register to be recorded as UM = 0_B. This can not be modified when the error occurrence flag to enable notification is set.

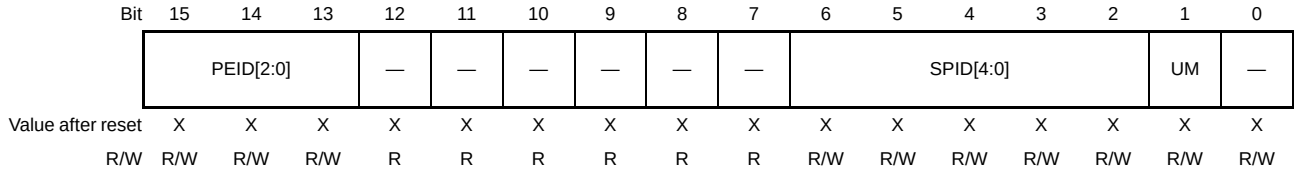

Table 3.81 SEGSIDE register contents

Bit Position	Bit Name	Function
15 to 13	PEID[2:0]	PEID of the access source from which the SYSERR is generated.
12 to 7	Reserved	The read value is undefined. The write value should always be 0.
6 to 2	SPID[4:0]	SPID of the access source from which the SYSERR is generated.
1	UM	UM of the access source from which the SYSERR is generated
0	Reserved	The read value is undefined. The write value should always be 0.

(e) SEGADDR — SEG Error Information (Address) Register

This register records information of an error factor that notifies a SysErr request (only one history is recorded). It records the addresses where the error factors for the VCIF and TCMF bits of the SEGFLAG register were found. The error factors except VCIF and TCMF bits of the SEGFLAG register to be recorded as $0000\ 0000_H$. This can not be modified when the error occurrence flag to enable notification is set.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Address[31:16]															
Value after reset	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Address[15:0]															
Value after reset	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

×: Undefined (retained)

Note 1. This can not be modified when the error occurrence flag to enable notification is set.

Table 3.82 SEGADDR Register Contents

Bit Position	Bit Name	Function
31 to 0	Address[31:0]	Request address of operation source

(3) SEG Function

(a) SEG function: Notifying a SysErr request due to an error flag

- Setting an error flag takes precedence over clearing the same flag.
  - Simultaneous clearing operation is ignored.
- Priority of error factors
  - The bit position of the notification-enabled SEGFLAG register becomes the priority of error factors. Error factors of lower bits take precedence over error factors of upper bits. Notification is made from the highest-priority error factor.
  - The bit position of error factors is notified as a “SysErr factor code.”
- Conditions for starting SysErr request notification
  - Even if a SEGFLAG register bit is set to 1, notification is not made.
  - Notification is made immediately after a SEGCONT register bit is set to 1.
  - After clearing SEGFLAG register bits of error notification subject, notification is made depending on priority of SEGFLAG register bits except for cleared bits (re-arbitration).
- Finishing notification at a SysErr request response
  - Even after notification is finished, the flag is not cleared automatically.
  - Notification is not made until re-arbitration is performed by setting or clearing the flag.
  - If an error flag that is prioritized higher than the error factor is set prior to a request response, the notification information may be replaced with an upper SysErr factor code.

(b) SEG function: Recording error factor information

- When notification-enabled error occurrence is input, the error address is retained in the above register.
  - No information is retained by setting or clearing an error flag described in "**(3) (a) SEG function: Notifying a SysErr request due to an error flag**" above.
  - When multiple error occurrence inputs are present simultaneously, information other than the prioritized error factor is not retained.
- While the notification-enabled error flag described in "**(3) (a) SEG function: Notifying a SysErr request due to an error flag**" above is set to 1, overwrite to the above register is inhibited
  - If error occurrence input continues, information of subsequent error factors is not retained.
  - To reset the inhibition of overwrite to the register, clear either SEGCONT or SEGFLAG register (or both of them).

(c) Additional information on SYSERR exception

- Even if an SYSERR exception occurs, the value of the PSW.EBV bit is kept and the base address of an exception handler does not change.
- Error detection in instruction cache
  Even if an error is detected in instruction cache, resumable SYSERR exception by instruction fetch factor does not occur. Instruction cache automatically invalidates the entry which includes an error and the CPU continues the instruction execution by refetching from the code flash. When the ICCTRL.ICHEMK bit in the system register is set to 0, an error occurred in instruction cache is notified to the SEG.

3.2.4.4 FLI (Code-Flash) Guard

The code flash has its own guard. If an illegal access occurs, the code flash guard uses three registers to report information about the violation. The register MGDCFSTAT indicates if an access violation has occurred. The register MGDCFTYPE describes the access type of the first access that triggered a violation. Finally, the register MGDCFCTL is used to reset the MGDCFSTAT register.

(1) List of FLI Guard Control Registers

Table 3.83 FLI Guard Register (Base Address: FFC4 8000_H)

Address Offset	Size (Byte)	Register Name	Abbreviation	PBG	R/W	Operable Bit 1	8	16	32	Value after reset

0	WRITE	PWRITE signal at P-Bus Guard error was occurred

3.2.4.6 Checker Core

The PE1, PE2 has the Checker Core for safety assurance, resulting in a highly reliable system. Monitoring the outputs from the PE1, PE2 and the Checker Core with the comparator all the time enables immediate detection of the PE1, PE2 abnormal operations. See **Section 28, Functional Safety** for detail.

3.3 Inter CPU Functions Overview

3.3.1 Processor Element Identifier

The PEID, each processor element ID number, can be read from the PEID field in the HTCFG0 register. Which CPU core performs a specific program can be understood by referring to the PEID. The following shows the PEID of this product.

CPUcore	PEID
CPU1 (PE1)	001B
CPU2 (PE2)	010B

3.3.2 Inter-Processor Interrupt Function

Both CPU1 and CPU2 individually have IPIR registers as their own peripheral functions. Setting of the IPIR register enables an EI-level interrupt request from a PE to another PE. For details, see INTC Chapter.

3.3.3 Exclusive Function

The Local RAM, Global RAM, and exclusive control register (MEV) are available as a resource for exclusive control. Atomic operation instructions of LDL/STC, CAXI, SET1, CLR1, and NOT1 can be performed for the Local RAM and the Global RAM. Such instructions cannot be performed to H-BUS area. For the exclusive control register (MEV), CAXI, SET1, CLR1, and NOT1 can be performed.

3.3.3.1 Exclusive Control Register (MEV)

This register supports exclusive control for variables shared between PEs (common resources).

(MEV = Mutual Exclusion Variable Register)

- 32-bit MEV register is included.
- 1-, 8-, 16-, and 32-bit accesses are available for each MEV.
- Accesses from CPU1 (PE1) and CPU2 (PE2) can be made.
- Atomic operation instructions of CAXI, SET1, CLR1, and NOT1 can be performed.

CPU1 and CPU2 each have an independent access path for the MEV registers. Therefore, when CPU1 and CPU2 each access different MEV registers, they do not need to wait for access. When they access the same MEV register, however, waiting for access is required.

Table 3.91 MEV Registers (Base Address: FFFE EC00$_H$) (1/2)

Address Offset	Size (Byte)	Register Name	Abbreviation	R/W	Operable Bit 1	8	16	32	Value after reset

3.3.3.2 Operation of the LDL.W and STC.W Instructions

The LDL.W and STC.W instructions can be used to obtain atomic read-modify-write operations for accurate processing in the updating of memory by multicore systems. The LDL.W and STC.W instructions operate as follows. The LDL.W and STC.W instructions are only in the instruction set for the PE1/PE2.

- Link generation: The CPU is capable of generating links to both the local RAM and global RAM. Executing the LDL.W instruction on the target RAM for the operation leads to the link flag being set and a link being generated in response to reading by the instruction. Two link flag systems are provided, one each for the following two areas of RAM.

(1) The local RAM for the given processor

(2) The global RAM

- Success in storing: After a link has been generated, storing will only proceed in response to executing an STC.W instruction corresponding to the generated link.
- Failure in storing: If a link is lost, storing does not proceed even when an STC.W instruction for the corresponding address is processed. Storing also does not proceed when an STC.W instruction that does not correspond to the link is processed.
- Condition for successful storing: If the following condition is met, the STC.W instruction is judged to be for the address corresponding to the link.
  - The address for the LDL.W instruction which generated the link matches that for the STC.W instruction.
- Loss of the link: If any of the following occurs, the link flag is cleared and the link is lost.
  - Any of the following processing by the CPU for which the link was generated:
    - CLL instruction being executed.
    - An STC.W instruction being executed. The corresponding link (for (1) or (2) above) will be lost irrespective of the success or failure of storing.
    - Occurrence of an exception or the CPU executing an instruction to return from an exception processing routine (FERET or EIRET). The link for the linked RAM area and the link flag are cleared.
    - A successive LDL.W instruction being executed for a location corresponding to the link flag for the linked RAM. The link generated in response to the preceding LDL.W instruction will be lost. Do not execute such processing.
    - Storing operations other than execution of a STC.W instruction for the address indicated by the link. Do not execute such processing.
  - Access as described below by another bus master:
    Any storing operation, including execution of an STC.W instruction for the address indicated by the link. The corresponding link will be lost.

Success of the STC.W instruction means that the LDL.W and STS.W instructions have realized an atomic Read-Modify-Write operation.

3.3.4 Write-Through Buffer for Global RAM

If global RAM is implemented, it is accessible by each CPU core through a 64-bit bus.

PE1 and PE2 share the common Write-Through Buffer (WT-Buffer or WT-Buf for short). The WT-Buf consists of 2 banks (one for each GRAM bank) and each bank consists of 8 entries x 64bits. The WT-Buf behavior is summarized below according to access type from PE:

Read hit: data are returned from the WT-Buf.

Read miss: data are read from GRAM and they are registered in WT-Buf

Write hit: Both WT-Buf and GRAM are updated

Write miss (no RmW): Both WT-Buf and GRAM are updated

Write miss (with RmW): Read from GRAM first and write the parts to both WT-Buf and GRAM

Since one WT-Buffer is shared for both PE1 and PE2, no coherency control is needed. The data coherency between GRAM and WT-Buffer is always kept because the same data is always written to GRAM and WT-Buffer at the same time. The data coherency between PE and DMA is also kept, as DMA writes to GRAM as well as WT-Buffer at the same time and DMA always reads from GRAM not from WT-Buffer.

The WT-Buffer equips invalidation timer to invalidate the entries automatically. Invalidation timer cycle count can be chosen from 16-cycles / 64-cycles / 256-cycles. Software invalidation is also possible and one register is provided for this purpose.

The WT-Buffer configuration itself can also be chosen either On or Off. After reset, WT-Buffer is set as On.

Table 3.92 Write-Through Buffer Control Register (Base Address: FFFF 7A00$_H$)

Address	Register Name	Description	PBG	Access Width	Value after reset
<GRAMC_QOSREG_base> + 4_H	GRAMC_ WTBCONFIG0	GRAMC WTBuf Configuration Register 0	APBGRD_ PFSS1.SP4	32bit	1_H
<GRAMC_QOSREG_base> + 8_H	GRAMC_ WTBCONFIG1	GRAMC WTBuf Configuration Register 1	APBGRD_ PFSS1.SP4	32bit	7_H
<GRAMC_QOSREG_base> + C_H	GRAMC_ WTBCONFIG2	GRAMC WTBuf Configuration Register 2	APBGRD_ PFSS1.SP4	32bit	0_H

Note 1. Configuration of above registers are common, i.e. effects both PEs and both GRAM banks

R/W	R	R	R	R	R	R	R	R

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	WTBufMode
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R/W

Table 3.93 GRAMC_WTBCONFIG0 register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset always is read. When writing, always write the value after reset.
0	WTBufMode	This bit sets whether to enable WT Buf 0: disable WT Buf 1: enable WT Buf

GRAMC_WTBCONFIG0.WTBufMode change is possible under the following conditions.

– All of GRAM masters (PE1/PE2/ICUM/H-Bus master/Debug) must not access to GRAM.

To change WTBufMode, it is recommended to follow the guides shown below from (1) to (5) to prevent from violating the conditions above.

(1) Inform to other masters that PE1 starts WTBufMode change. Until (5) other masters must not access to GRAM.

(2) PE1: Execute DI instruction for interrupt disabling.

(3) Operate (3a) and (3b), (3c) for the necessary WTBufMode settings.

(3a) PE1: Write to GRAMC_WTBCONFIG0 register by the target value for new WTBufMode.
(3b) PE1: Read the GRAMC_WTBCONFIG0 register to confirm that WTBufMode setting was changed.
(3c) PE1: Execute SYNCP instruction.

(4) PE1: Execute EI instruction for interrupt enabling.

(5) Inform to other masters that PE1 completes WTBufMode change.

If it is necessary to confirm data on RAM from PE1 or PE2 while a master accesses to GRAM, the flushing of WT buffer is avairable. Then PE can read data on RAM before flushing.

(b) GRAMC_WTBCONFIG1 — GRAMC WTBuf Configuration Register 1

Bit	31	30	29	28	27	26	25	24
	—	—	—	—	—	—	—	—

Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R*1

Note 1. The function of this bit is used by read access.

Table 3.95 GRAMC_WTBCONFIG2 register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset always is read.
0	WTBufTmcClr	When this register is read, All WT Buf entries are flushed. The read value of this bit is always 0.

3.4 Usage Notes

3.4.1 Synchronization of Store Instruction Completion and Subsequent Instruction Generation

When a control register is updated by a store instruction, there is a time lag between CPU implementation of the store instruction and actual updating of the control register. Therefore, adequate synchronization processing is needed to ensure the control register reflects updated contents before generation of a subsequent instruction. How to perform synchronization processing is shown below.

When updated results in the control registers are reflected in the implementation of a subsequent instruction:

This includes the following case: an interrupt is enabled by implementation of an EI instruction after an interrupt request is cleared by access from the control register in the INTC2 and the peripheral circuits. Proceed as follows in this case.

(1) Store instruction to update a control register (ST.W, etc.)

(2) Dummy read of the above-mentioned control register (LD.W etc.)

(3) SYNCP

(4) Subsequent instruction (EI)

Implement the same processing even when the access required after waiting to secure the updating of a given control register (register A) is to another control register (register B). This includes the following cases: the interlinked operation of different peripheral modules and when releasing the interrupt mask in INTC after making peripheral module settings.

However, this processing is unnecessary if control registers A and B are in the same peripheral group.

(1) Issue the instruction for storage to update control register A (ST.W, etc.)

(2) Dummy-read the above control register (LD.W, etc.)

(3) Issue SYNCP.

(4) Issue the instruction to access control register B (ST.W, LD.W, etc.)

The same processing is also required when access to control registers and memory within the scope of protection starts after waiting for the completion of settings for safety functions such as memory protection, ECC checking, and so on.

When the updated results in the control registers and memories are reflected in the instruction fetch of a subsequent instruction:

This includes the following case: after writing an instruction in a memory, the written instruction is implemented. Proceed as follows in this case.

(1) Store instruction to update a memory (ST.W, etc.)

(2) Dummy read of the above-mentioned memory (LD.W, etc.)

(3) SYNCP

(4) SYNCI

(5) Subsequent instruction (branch instruction, etc.)

When SYNCM-instruction is executed after a store instruction from PE1 or PE2:

SYNCM-instruction waits for the completion of any preceding memory access (excluding the access to HBUS area or instruction fetch) from the PE.

3.4.2 Error response handling

The interfaces used to access the different memory and I/O resources are generating error responses in case the access cannot be completed as expected. This includes access to an address where no memory or register is implemented . These error responses can lead to a SYSERR exception that is not resumeable.

3.4.3 Speculative accesses handling

The MPU only checks the addresses of the instruction and involved data for the currently executed instruction. Therefore, speculative access to instructions or data (e.g., during a cache prefetch) can only trigger an illegal access if the instruction or data is used during instruction execution. All addresses that are not used by the CPU pipeline are also not checked by the MPU.

3.4.4 Timing supervision

The system timer can be used to implement timing supervision. Timing supervision allows detecting special multi-core related problems like deadlocks and starvation of the system. For this purpose, one of the compare registers of the system timer is loaded with the timeout time before entering a critical section. The system timer can also be used to patrol interrupt request rates with little software overhead. The interrupt handler samples the current time by reading the system timer counter, compares it to the previous time and takes corrective action if necessary.

3.4.5 Clock Ratio Change

CPU1(PE1) and CPU2(PE2) are working at CLK_CPU while HSB module and peripheral modules are working at CLK_HSB and CLK_LSB, respectively.

Clock gear change can be done by setting control registers of clock controller. See **Section 12, Clock Controller** for details. Clock gear change is possible under the following conditions:

- PE1 and PE2 do not access to H-Bus.
- PE1 and PE2 do not access to Local RAM of other CPU.
- DMA, H-Bus master, ICUMC and Debug (on System Interconnect) do not access to resources inside PE (Local RAM and peripherals inside PE).
- DMA, H-Bus master, ICUMC and Debug (on System Interconnect) do not access to GRAM in case where clock ratio is changed from CLK_CPU = CLK_HSB to CLK_CPU > CLK_HSB.

To change clock ratio, it is recommended to follow the guides shown below (1. – 5.) to prevent from violating the conditions above.

1. Inform to PE2 that PE1 starts clock gear change. Until (5), PE2 must follow the conditions shown above.
2. PE1: Execute DI instruction for interrupt disable.
3. Repeat (3a) and (3b) for the necessary clock divider settings.
   3a. PE1: Write to CLKDxDIV* register by the target value for new clock ratio.
   3b. PE1: Read the following CLKDxSTAT* register to confirm that clock output now corresponds to the actual divider setting in CLKDxDIV*.
4. PE1: Execute EI instruction for interrupt enable.
5. Inform PE2 that PE1 completes clock gear change.

Note: x= 0 and 1

Note that GRAM and CodeFLASH are working at CLK_CPU and accesses to GRAM and CodeFLASH take multiple cycles of CLK_CPU. Therefore, if frequency of CLK_CPU is changed, access time of GRAM and CodeFLASH is also changed.

3.4.6 Register Initialization

Some CPU registers are undefined after a HW reset; therefore they may be different in each core. It must to initialize the register before usage to prevent false error indications from the PE if it is running in lockstep mode. The following assembler sequence can be used for this purpose:

```
#ifndef INIT_REGISTER_DISABLE
    -- Initialize CPU register to avoid Compare Unit Mismatch Error
    -- This code must be executed in supervisor mode (PSW.UM = 0)
       mov     r0,     r1
       mov     r0,     r2
       mov     r0,     r3
       mov     r0,     r4
       mov     r0,     r5
       mov     r0,     r6
       mov     r0,     r7
       mov     r0,     r8
       mov     r0,     r9
       mov     r0,     r10
       mov     r0,     r11
       mov     r0,     r12
       mov     r0,     r13
       mov     r0,     r14
       mov     r0,     r15
       mov     r0,     r16
       mov     r0,     r17
       mov     r0,     r18
       mov     r0,     r19
       mov     r0,     r20
       mov     r0,     r21
       mov     r0,     r22
       mov     r0,     r23
       mov     r0,     r24
       mov     r0,     r25
       mov     r0,     r26
       mov     r0,     r27
       mov     r0,     r28
       mov     r0,     r29
       mov     r0,     r30
       mov     r0,     r31

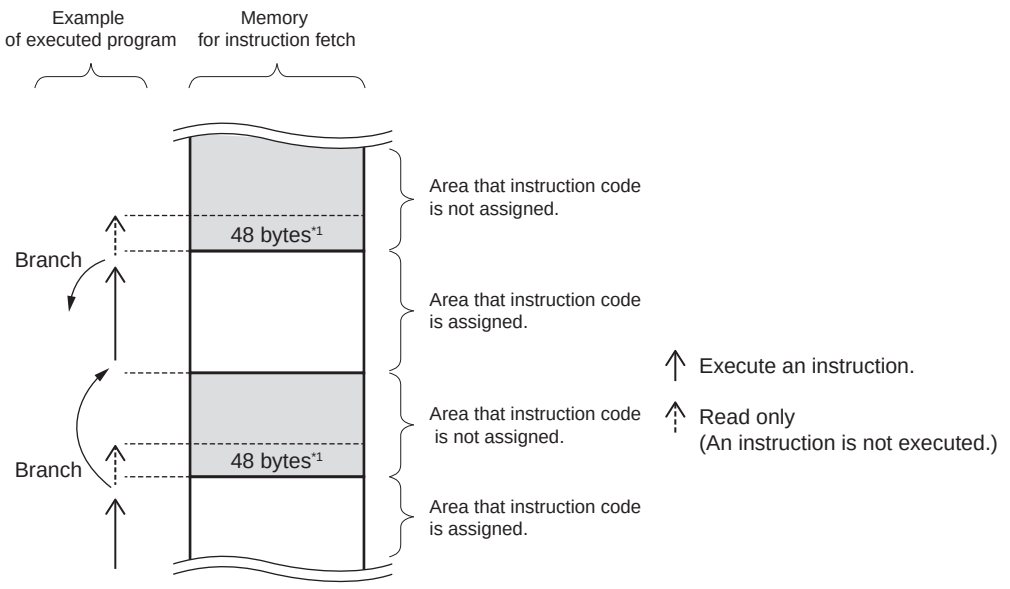
3.4.7 Notes on Prefetch

The CPU performs speculative instruction fetches to areas after the ongoing program area to maintain the instruction fetch throughput. This prefetch may generate a memory read access also from an area (* in **Figure 3.5**) that contains no instruction code. Therefore, note the following. Even if a memory read access from the area (* in **Figure 3.5**) is generated, the read value is not used in instructions. This note is applicable to all memories that allow instruction fetch.

- Occurrence of ECC error due to unstable memory data values
  This prefetch may cause an ECC error in the erased code flash or the uninitialized Local RAM/ Global RAM. When allocating instruction codes in the memory, initialize the relevant area (* in **Figure 3.5**) with desired data.
- Detecting illegal accesses by guard functions
  This prefetch may be detected as an illegal access by the guard functions. To prevent detection of illegal accesses, avoid overlap of the relevant area (* in **Figure 3.5**) with the access prohibited area by guard. Even if memory read access is made to an area protected by the MPU, no memory protection exception occurs.
- Access to access-prohibited area
  Allocate instruction codes in the memory so that the relevant area (* in **Figure 3.5**) does not overlap with access-prohibited areas.



Note 1. An area from instruction code final address to final address + 48 bytes. Even when no instruction code is allocated in this area, memory read may be generated at the time of branching upon a prefetch request.

Note 2. That in case of other memory like LRAM/GRAM the prefetch size is 32 bytes.

Figure 3.5 Area That Needs Attention for Prefetch

3.4.8 System Register Hazards

To resolve potential hazards when updating the register values of some system registers, implement the following procedures.

- Instruction fetch:

  When fetching instructions after updating the following registers, start to do so only after executing the EIRET instruction, FERET instruction, or a SYNCP instruction followed by SYNCI instruction after executing the register update instruction.

  – PSW.UM, MCFG0.SPID

  When fetching instructions after updating the following registers, start to do so only after executing a SYNCP instruction followed by the SYNCI instruction after executing the register update instruction.

  – ASID, MPU: All related registers (Register number: SR*, 5-7)

- SYSCALL instruction:

  When a SYSCALL instruction is to be executed after updating the register below, execute a SYNCP instruction after the instruction to update the register and before the SYSCALL instruction.

  – SCCFG

- Load/Store:

  When executing instructions that involve load/store operations after updating the following registers, execute the load/store instruction only after executing the SYNCP instruction after executing the register update instruction.

  – ASID, MPU protection area setting registers (Register number: SR*, 6-7)

  Do not execute instructions that involve load/store operations during the instruction preceding and the instruction following update of the following registers.

  – MCTL.MA (For ICUMC only)

- Interrupts:

  Update the following registers in the interrupt disabled state (PSW.ID = 1).

  – PSW.EBV, EBASE, INTBP, ISPR, PMR, ICSR, INTCFG

- Instruction cache clear operation:

  When the confirmation of instruction cache clear operation completed, check the read value of ICCTRL.ICHCLR bit.

- FPU register update:

  When the following register by executing the instruction is updated, execute the SYNCP instruction after executing the instruction.

  – FPU All related registers (Register number: SR6-11, 0)

- FPP/FPI exception mode change:

  When the exception FPP/FPI mode is changed, update the following register after executing the SYNCP and SYNCE instruction. For change the register, apply also the above “FPU register update”.

  – FPSR.PEM

3.4.9 Restrictions to use DMAC0/1, DTS ICUM

When DMAC0/1, DTS and ICUM access to the same GRAM Bank0 or Bank1 simultaneously, the number of the masters should be less than or equal to 3 masters and the transfer size of DMAC0/ DMAC1, DTS should be equal or less than 64bit.

3.4.10 Restrictions to use H-Bus Master (Ethernet, HS-USRT, FlexRay)

When H-Bus Master transmission/reception data is located to GRAM, the restrictions shown in (1) or (2) is required.

(1) H-Bus Master which can be used simultaneously is up to 2 and respective GRAM Bank have to be separated.
i.e.: Bank0: Ethernet ch0, Bank1: HS-USRT

(2) Either of GRAM Bank0 or Bank1 is only for transmission, and the other is only for reception.
i.e.: Bank0: Transmission data, Bank1: Reception data. However, Ethernet descriptor should be located in LRAM.

3.5 Difference among P1M-C, P1H-C and P1H-CE

	P1M-C	P1H-C (4MB)	P1H-C (8MB)	P1H-CE
Number of PEs	**1**	**2**	**2**	**2**
CPU clock freq. [MHz]	120, 160, 240	160, 240	160, 240	120, 160, 240
Local RAM [KB]	PE1: 128	PE1: 64 PE2: 64	PE1: 64 PE2: 64	PE1: 128 PE2: 64
GlobalRAM [KB]	320	960	960	1344
IPIR	—	Yes	Yes	Yes
Semaphore Registers	—	Yes	Yes	Yes
FLI Guard Registers	*1	Yes	Yes	Yes

Note 1. The registers for PE2 are disabled.

Section 4 Address Map

4.1 Address Map

Figure 4.1 shows the address map for each product.

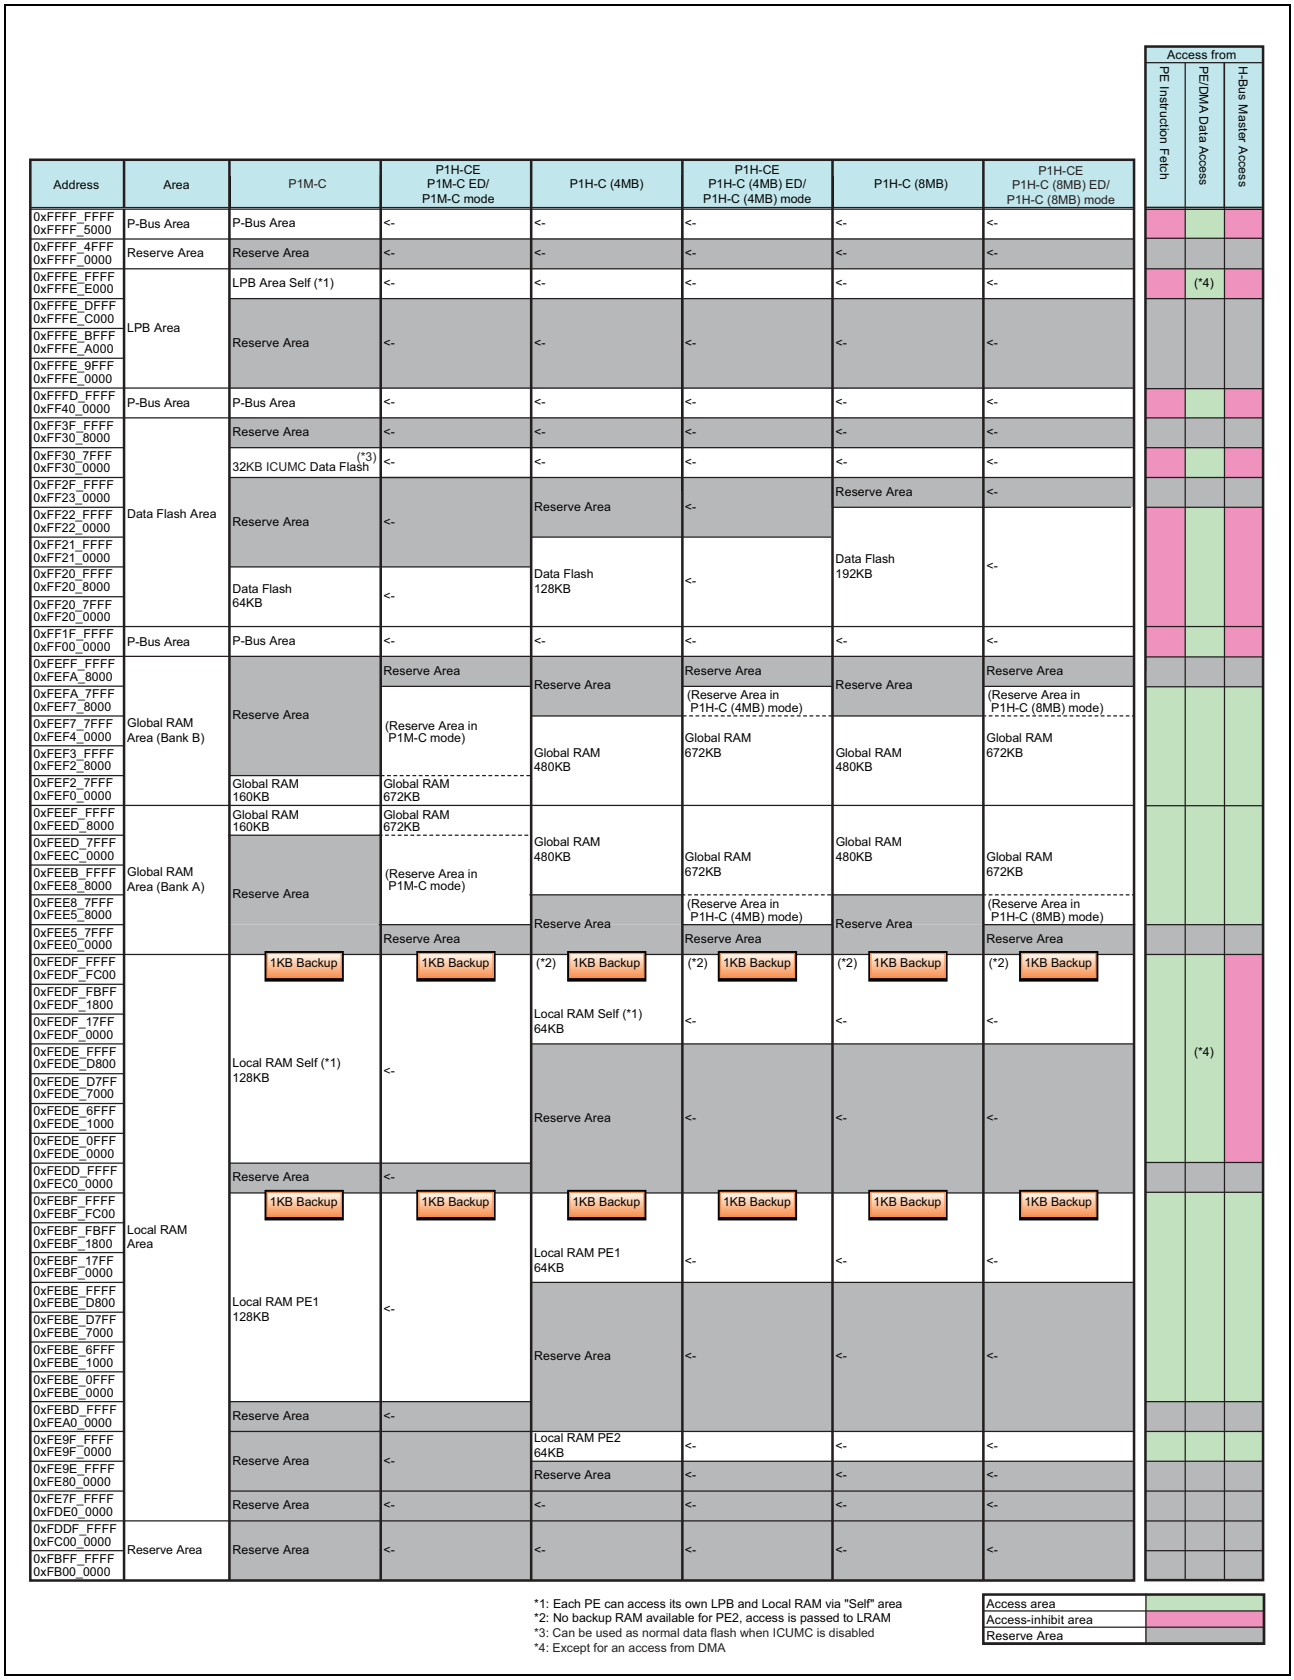


Figure 4.1 Address Map (P1M-C, P1H-C and P1H-CE) (1/2)

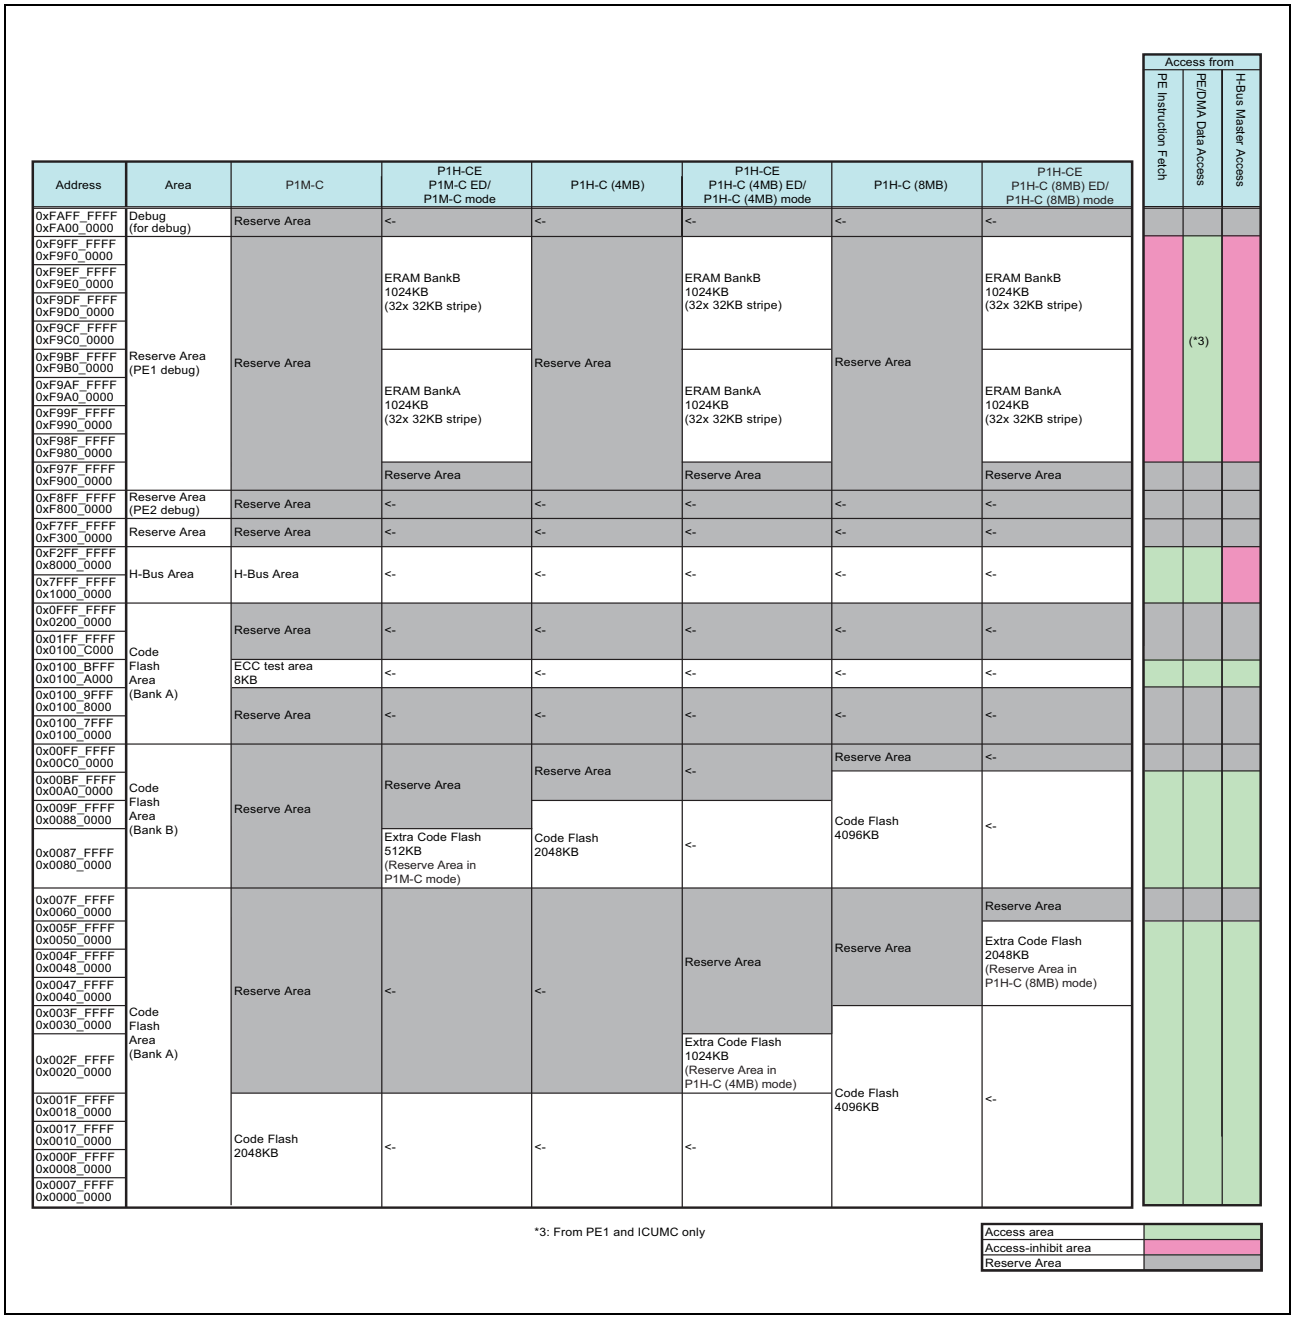

Address	Area	P1M-C	P1H-CE P1M-C ED/ P1M-C mode	P1H-C (4MB)	P1H-CE P1H-C (4MB) ED/ P1H-C (4MB) mode	P1H-C (8MB)	P1H-CE P1H-C (8MB) ED/ P1H-C (8MB) mode

Figure 4.1 Address Map (P1M-C, P1H-C and P1H-CE) (2/2)

4.2 Address space viewed from each bus master

Figure 4.1 shows address spaces viewed from each bus master.

4.2.1 Space in which instructions can be fetched

1. .Instructions of PE1/PE2 can be fetched from the code flash, its own local RAM and the global RAM.

4.3 Error notification for an access to unmapped area

When any master accesses to “unmapped area” in which the significant resource is not assigned, the error notification to ECM or error response via bus to the access master is signaled. Regarding of the reaction for an error response of each master, see **Section 4.3.1** to **Section 4.3.10**.

4.3.1 Unmapped Code Flash area access error

In the address region 0000 0000_H to 0FFF $FFFF_H$, when a master accesses to code flash unmapped area, error notification is signaled to ECM (No.72 and No.77) from code flash guard on each path.

4.3.2 Unmapped Global RAM area access error

In address region FEE0 0000_H to FEFF $FFFF_H$, when a master accesses to global RAM unmapped area, error notification is signaled to ECM (No.73 and No.78) from global RAM guard on each path.

4.3.3 Unmapped Local RAM area access error

For own Local RAM area including self-area, unmapped access error is signaled to the PE as the error response. For other PE’s Local RAM area, PE guard error is signaled to ECM (No.64) and error response is returned to the access master when PE guard is correctly configured. Local RAM area is the below

- Self: FEC0 0000_H to FEDF $FFFF_H$
- PE1: FEA0 0000_H to FEBF $FFFF_H$
- PE2: FE80 0000_H to FE9F $FFFF_H$
- Reserved: FDE0 0000_H to FE7F $FFFF_H$

4.3.4 Unmapped Local On-chip I/O area access error

For PE own on-chip I/O area including self-area, an access error to areas where no module is assigned is signaled to the PE as the error response and ECM (No.74). For other PE’s local on-chip I/O area, error response is returned to the access master. Local on-chip I/O area is the below

- Self: FFFE $E000_H$ to FFFE $FFFF_H$
- PE1: FFFE $C000_H$ to FFFE $DFFF_H$*1
- PE2: FFFE $A000_H$ to FFFE $BFFF_H$*2
- Reserved: FFFE 0000_H to FFFE $9FFF_H$

Note 1. For PE1 and debug master

Note 2. For PE2 and debug master

4.3.5 Details of P-Bus area

P-Bus on-chip I/O area consists of data flash area "FF20 0000_H to FF3F $FFFF_H$ (Data Flash Area)" and on-chip I/O area "FF00 0000_H to FF1F $FFFF_H$ (P-Bus Area)", "FF40 0000_H to FFFD $FFFF_H$ (P-Bus Area)" and "FFFF 5000_H to FFFF $FFFF_H$ (P-Bus Area)". For P-bus on-chip I/O area, an access error to areas where no module is assigned is signaled to the access master as the error response and also ECM (No.75).

Note 1. The size of data flash area depends on device and in case of P1H-CE on the device mode. The other data flash area is treated as Unmapped area.

Note 2. The access does not output an error response in P1H-CE P1MC mode.

Note 3. The access does not output an error response.

4.3.6 Details of H-Bus area

H-Bus on-chip I/O area is on-chip I/O area of 1000 0000_H to F2FF $FFFF_H$ in **Table 4.2**. For H-bus on-chip I/O area, an access error to areas where no module is assigned is signaled to the access master as the error response and also ECM (No.76).

Table 4.2 List of H-Bus area access

2C00 0000_H	F2FF $FFFF_H$	Unmapped area	—	—	—	—	—	—	—	—	ERRSLVHI

Note 1. The access does not output an error response.

4.3.7 Unmapped access error from H-bus master

The access from H-bus master is restricted to code flash, global RAM and local RAM area. Therefore when H-bus master accesses to other area, access error is signaled to ECM (No.79).

Table 4.3 List of H-Bus master access

Start Address	End Address	Module Name	Unmapped Area Access Error Information
0000 0000$_H$	0FFF FFFF$_H$	Code Flash Area	
1000 0000$_H$	FE7F FFFF$_H$	unmapped area	ERRSLVXI
FE80 0000$_H$	FE9F FFFF$_H$	PE2 Local RAM Area	
FEA0 0000$_H$	FEBF FFFF$_H$	PE1 Local RAM Area	
FEC0 0000$_H$	FEDF FFFF$_H$	unmapped area	ERRSLVXI
FEE0 0000$_H$	FEFF FFFF$_H$	Global RAM Area	
FE00 0000$_H$	FFFF FFFF$_H$	unmapped area	ERRSLVXI

4.3.8 Debug area

For PE own debug area including self-area, an unmapped access error is not generated. For other PE's debug area, error response is returned to the access master. Debug area is the below

- Self: FA00 0000$_H$ to FAFF FFFF$_H$
- PE1: F900 0000$_H$ to F9FF FFFF$_H$
- PE2: F800 0000$_H$ to F8FF FFFF$_H$

4.3.9 Other area

When PE1, PE2 and DMA access to areas except for the above region, an error response is returned to the access master.

4.3.10 Registers

When an unmapped access to code flash, global RAM, P-bus and H-bus on-chip I/O area occurs, an error status is stored into register. In case of global RAM unmapped access error, see **Section 28.4.2, GRG**.

Table 4.4 List of Registers (1/2)

Table 4.4 List of Registers (2/2)

Module Name	Register	Symbol	Address
ERRSLV4AI	P-bus Unmapped Area Error Control Register (PBG4)	ERRSLV4AICTL	FFF9 0800$_H$
ERRSLV4AI	P-bus Unmapped Area Error Status Register (PBG4)	ERRSLV4AISTAT	FFF9 0804$_H$
ERRSLV4AI	P-bus Unmapped Area Error Access Type Register (PBG4)	ERRSLV4AITYPE	FFF9 080C$_H$

NOTE

The registers with symbols "_VCI2CFB", "_PE1", and "_PE2" as suffixes are provided to the particular code flash guard registers: the registers with "_VCI2CFB" are provided for access from the system interconnect to code flash, the registers with "_PE1" are provided for access from the CPU1 to code flash, and the registers with "_PE2" are provided for access from the CPU2 to code flash.

4.3.10.1 MGDCFCTL_VCI2CFB/PE1/PE2 — Code Flash Guard Control Register (VCI2CFB/PE1/PE2)

See **(2) (a) FLI Guard Control Register (VCI2CFB, PE1, PE2) (MGDCFCTL_{VCI2CFB, PE1, PE2})** in FLI (Code-Flash) Guard in **Section 3.2.4.4**.

4.3.10.2 MGDCFSTAT_VCI2CFB/PE1/PE2 — Code Flash Guard Error Status Register (VCI2CFB/PE1/PE2)

See **(2) (b) FLI Guard Error Status Register (VCI2CFB, PE1, PE2) (MGDCFSTAT_{VCI2CFB, PE1, PE2})** in FLI (Code-Flash) Guard in **Section 3.2.4.4**.

4.3.10.3 MGDCFTYPE_VCI2CFB/PE1/PE2_ — Code Flash Guard Error Access Type Register (VCI2CFG/PE1/PE2)

See **(2) (c) FLI Guard Error Access Type Register (VCI2CFB, PE1, PE2) (MGDCFTYPE_{VCI2CFB, PE1, PE2})** in FLI (Code-Flash) Guard in **Section 3.2.4.4**.

4.3.10.4 H-bus Unmapped area access error registers

The functionality is the same as ERRSLV for H-bus guard. See (4), ERRSLVxxCTL, (5), ERRSLVxxSTAT and (6), ERRSLVxxTYPE in **Section 28.4.4.1**.

4.3.10.5 P-bus Unmapped area access error registers for PFSS

See (2) (a) ERRSLV Control Register for PFSS APB Area Error (ERRSLVCTL_PBAREA), (b) ERRSLV Status Register for PFSS APB Area Error (ERRSLVSTAT_PBAREA), (d) ERRSLV Error Transfer Type Register for PFSS APB Area Error (ERRSLVTYPE_PBAREA), in APB Un-implemented Area Error in **Section 3.2.4.5**.

4.3.10.6 P-bus Unmapped area access error registers

The functionality is the same as ERRSLV for P-bus guard. See (11), ERRSLVxCTL - ERRSLV Control Register for P-bus Guard, (12), ERRSLVxSTAT - ERRSLV Status Register for P-Bus Guard and (13), ERRSLVxTYPE - ERRSLV Error Transfer Type Register for P-Bus Guard in **Section 28.4.3.2**.

4.4 Guard function

The following table shows the guard function for each of memory area. In additional to these guard function, each of PE has MPU function in itself. In detail see **28.4.1**

Memory Area	Access from	Guard function
P-Bus Area	All bus masters	P-Bus Guard (PBG)
LPB Area	own PE	Internal Peripheral Guard (IPG)
	other bus masters	PE Guard (PEG)
Data Flash Area	All bus masters	Data Flash Guard (DFG)
Global RAM Area	All bus masters	GRAM Guard (GRG)
Local RAM Area	All bus masters (except own PE)	PE Guard (PEG)
H-Bus Area	All bus masters	H-Bus Guard (HBG)
Code Flash Area	All bus masters (except ICUMC)	Code Flash Guard (CFG)

4.5 Difference among P1M-C, P1H-C and P1H-CE

See **Figure 4.1**.

Section 5 Operating Modes

5.1 Features

The device supports 3 User modes. Operating modes are selected by the mode terminals FLMD0, FLMD1, MODE0 and MODE1. **Table 5.1** shows the list of the operating modes. Device Mode decoding is only executed after Terminal reset.

Table 5.1 Mode List

	mode pin				
	FLMD0	**FLMD1**	**MODE0**	**MODE1**	**mode**
User mode	0	x	x	x	Normal Operation Mode
	1	0	x	x	Serial Flash Programming Mode (Following serial I/F are supported 3-wire Clocked serial Interface, 2-wire UART, 1-wire UART)
	1	1	0	1	Boundary SCAN Mode

5.1.1 Normal Operation Mode

This mode is the default mode for execution of application software. Also self-tests and the On-chip Debug capabilities use this mode. Wake up condition for calibration is generated from external via debug interface. After reset release, instruction fetch is carried out from the user mat. For reset vector of each CPU, see **Section 32, Flash Memory**.

5.1.2 Serial Flash Programming Mode

This mode is initiated by an external programming device. Use it to store application code or application data into the flash memories of the device. After reset release, the MCU boots up from the on-chip boot program and starts connection in the specified transmission method. For details, see **Section 32, Flash Memory**.

5.1.3 Boundary SCAN Mode

This mode allows Boundary SCAN tests compliant with IEEE Standard 1149.1. In this mode, CPU is in reset status. For details, see **Section 34, Boundary Scan**.

5.2 Input Pins

Table 5.2 shows the pin information for mode setting. All mode terminals are taken in Mode Register. FLMD1 and MODE [1:0] can be used as GPIO. The level on the FLMD0 pin can be set to prohibit programming and erasure of the code flash memory. When the FLMD0 pin is at the high level, programming and erasure of the memory are permitted; when it is at the low level it is prohibited to program or erase the memory. For details, see **Section 32, Flash Memory**.

Table 5.2 Pin information for mode setting

Pin Name	I/O	Function
FLMD0	input	Operating mode select pin
FLMD1	input	Operating mode select pin
MODE0	input	Operating mode select pin
MODE1	input	Operating mode select pin

5.3 Register Description

5.3.1 List of Registers

Table 5.3 Register Configuration

Address	Register Name	Description	Access Width	Value after reset	Access Protection	
					PBG	other
FFF8 0104	MODE	Mode Register	32	0000 000X$_H$	PBG4#0. PG4-SC3	—

Table 5.4 Register Reset condition

Register Name	Reset condition				
	Power On Reset	System Reset 1	System Reset 2	Application Reset 1	Limited Reset
MODE	√	√*1			

Note 1. Terminal Reset only

The status of the mode pin is taken in this register when Terminal reset is released.

5.3.2 MODE — Mode Register

This register indicates the Operating Mode of the device.

The status of the mode pin is taken in this register when Terminal reset is released.

Access: This register can be read in 32-bit units.

Address: FFF8 0104$_H$

Value after reset: 0000 000X$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	MODE1	MODE0	FLMD1	FLMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	X	X	X	X
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 5.5 MODE Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is read.
3	MODE1	Mode 1 This bit indicates the Status of the Latch for Mode Pin MODE 1 0: Low-level detection 1: High-level detection
2	MODE0	Mode 0 This bit indicates the Status of the Latch for Mode Pin MODE 0 0: Low-level detection 1: High-level detection
1	FLMD1	FLMD 1 This bit indicates the Status of the Latch for Mode Pin FLMD 1 0: Low-level detection 1: High-level detection
0	FLMD0	FLMD 0 This bit indicates the Status of the Latch for Mode Pin FLMD 0 0: Low-level detection 1: High-level detection

Section 6 Interrupt Controller (INTC)

6.1 Features

The act of branching from a currently running program to a different program in response to an event is called an exception. This microcontroller supports the following types of exceptions.

The details on exceptions are described in *the RH850G3M User's Manual: Software*.

Table 6.1 List of Exception Sources

Name	Symbol	Source	Priority	Saved to
Reset	RESET	Reset input	High	—
Debug exception (asynchronous)	AsyncDB (NMI)	Asynchronous debug event		DB
FE level non-maskable interrupt*1	FENMI (NMI)	FENMI input		FE
System error exception	SYSERR (NMI)	SYSERR input		FE
FE level maskable interrupt*1	FEINT (NMI)	FEINT input		FE
FPU exception	FPU(NMI)	Execution of an FPU instruction		EI
EI level maskable interrupt*1	INT	Interrupt controller		EI
Debug exception (synchronous)	SyncDB	Synchronous debug event		DB
Memory protection violation (execution right)	MIP	Memory protection violation		FE
System error exception	SYSERR	Error input at instruction fetch		FE
Reserved instruction exception	RIE	Execution of reserved instruction		FE
Coprocessor unusable exception	UCPOP	Execution of coprocessor instruction		FE
Privileged instruction exception	PIE	Execution of reserved instruction		FE
Misalign exception	MAE	Generation of misalign access		FE
Memory protection exception (access right)	MDP	Memory protection violation		FE
Debug trap	DBTRAP	Execution of DBTRAP instruction		DB
FPU exception (precise)	FPP	Execution of an FPU instruction		EI
Runtime monitor trap	RMTRAP	Execution of RMTRAP instruction		DB
System call	SYSCALL	Execution of SYSCALL instruction		EI
FE level trap	FETRAP	Execution of FETRAP instruction		FE
EI level trap 0	EITRAP0	Execution of TRAP0n instruction		EI
EI level trap 1	EITRAP1	Execution of TRAP1n instruction	Low	EI

Note 1. The description of these exceptions and interrupts are subject to this section.

(1) Interrupts

The following three exceptions from **Table 6.1** are called interrupts, and are thus described in this section.

- FE level non-maskable interrupt (FENMI)
  An FENMI interrupt is acknowledged even if another FE level interrupt – FENMI or FEINT – is in service.
  - FENMI is acknowledged even if the CPU system register PSW.NP = 1.
  - Return from FENMI interrupt is not possible, recover is disabled
- FE level maskable interrupt (FEINT)
  An FEINT interrupt can be acknowledged if another FE level interrupt – FENMI or FEINT – is not in service.
  - FEINT can be acknowledged if the CPU system register PSW.NP = 0. It is masked if PSW.NP = 1.
  - Return enabled, recover enabled
  - Highest priority interrupt (except FENMI)
- EI level maskable interrupt (EIINT)
  An INT interrupt can be acknowledged if FE level interrupt – FENMI or FEINT – is not in service.
  - EIINT can be acknowledged if the CPU system register PSW.NP = 0.
    It is masked if PSW.NP = 1, EIINT with higher priority is being processed, or PSW.ID = 1.
  - Return enabled, recover enabled.
  - Interrupt masking can be specified per interrupt channel.
  - 16 interrupt priority levels can be specified for each interrupt channel
  - In this section, the EIINT that corresponds to interrupt channel n is indicated by “EIINTn”, whereas the EIINT that corresponds to interrupt source xxxis indicated by “INTxxx”.
  - Interrupts from peripheral Modules can be used for additional trigger events like DMA.

For the PSW register, see **Section 3.2.1.2(2)(e), PSW — Program status word** and *RH850G3M User's Manual: Software*.

RH850 core provide the DI (disable interrupts) instruction to disable all EI level maskable interrupts until an EI (enable interrupts) instruction is issued.

Exceptions, which are local to a core, are raised locally. Exceptions from a global source, e.g. ECC failures on common RAM areas or peripheral areas (e.g. CAN RAM, Flexray RAM and so on) are commonly reported to all cores. All CPUs of a multicore device have the means for each CPU core to issue maskable interrupts to each other core.

NOTE

Return: Indicates whether execution restart from the last position at which program execution was interrupted is possible.

Recover: Indicates whether recovery to the processor status (status of processor resources including general-purpose registers and system registers) at the time of program execution interruption is possible.

These interrupt sources are described in the following pages.

Table 6.2 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
INTC1	Operation clock	CLK_CPU
INTC2	Operation clock	CLK_HSB

6.2 RH850/P1x-C Interrupt sources

6.2.1 RH850/P1x-C Interrupt sources

(1) FE level non-maskable interrupts

(a) Priority group

See **Table 6.1, List of Exception Sources**.

(b) Return PC

An FE non-maskable interrupt does not allow to return or recover.

(c) Status register

See **Section 6.4.3, FNC — FE level NMI status register**.

(d) Return instruction

None

Table 6.3 FE level non-maskable interrupt requests

Interrupt			Interrupt request					
	Control register							
Symbol	Name	Address	Name	Cause	Unit	Priority group	Exception code	Handler address offset
FENMI	FNC	FFFE EA78$_H$	SWDTA0NMI	Secure WDT overflow interrupt	WDT	*1	E0$_H$	0E0$_H$

Note 1. See **Table 6.1, List of Exception Sources**.

(2) FE level maskable interrupts

There are three sources for the FEINT: ECM and STM interrupt and terminal NMI.

These three sources are mapped to the interrupt controller INTC1. There is a status flag register and an event clear register for each source. The event status flag has to be cleared by software.

The event status flag should be cleared by software in the beginning of the interrupt service routine. If there is a pending interrupt flag after leaving the interrupt service routine the interrupt will be asserted again until all flags in FEINTESTAT are cleared.

(a) Priority group

See **Table 6.1, List of Exception Sources**.

(b) Return PC

The PC return from an interrupt handling routine by the FERET instruction is the suspended PC (current PC).

(c) Status register

See **Section 6.4.4, FIC — FE level maskable interrupt status register**.

(d) Return instruction

FERET

Table 6.4 FE level maskable interrupt requests

Interrupt			Interrupt request					
	Control register							
Symbol	Name	Address	Name	Cause	Unit	Priority group	Exception code	Handler address offset
FEINT for PE1	FIC	FFFE EA7A$_H$	—	NMI pin	Port	*1	0F0$_H$ (PE1)	0F0$_H$ (PE1)
			—	non mask-able interrupt (STM interrupt 8 for STM0) ,	STM			
			—	non mask-able interrupt from ECM	ECM			
FEINT for PE2	FIC	FFFE EA7A$_H$	—	NMI pin	Port	*1	0F0$_H$ (PE2)	0F0$_H$ (PE2)
			—	non mask-able interrupt (STM interrupt 8 for STM1) ,	STM			
			—	non mask-able interrupt from ECM	ECM			

Note 1. See **Table 6.1, List of Exception Sources**.

The source of the FEINT interrupt can be evaluated by a dedicated flag register. See **Section 6.4.5, FEINTFn — FE level maskable interrupt event status register** and **Section 6.8.7, FEINT Source selection** for details.

(3) EI level maskable interrupts

(a) Priority group

See **Table 6.1, List of Exception Sources**.

(b) Return PC

The PC return from an interrupt handling routine by the EIRET instruction is the suspended PC (current PC).

(c) Control register

EI level maskable interrupt control register

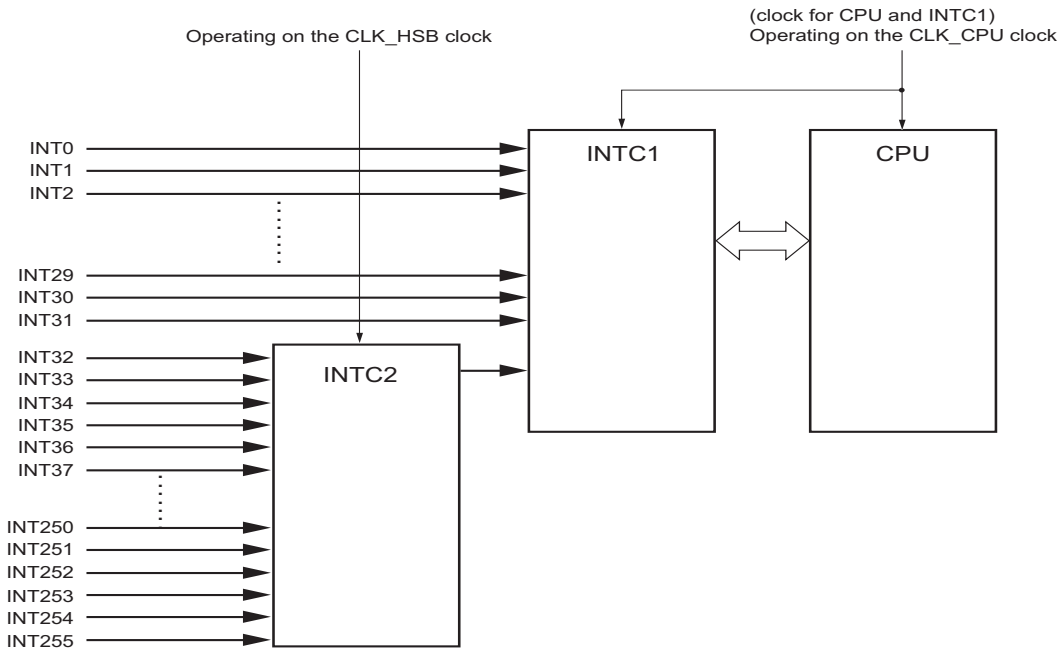
See **Section 6.4.1, EICn — EI level interrupt control registers**.

(d) Return instruction

EIRET

(e) Configuration

EI level maskable interrupt is supported total 256 channels with cascade connection of INTC1 and INTC2.



Note: In case of multicore configuration (P1H-C(4MB), P1H-C(8MB), and P1H-CE) an INTC1 is implmented in each PE. INTC2 is shared among the PEs.

Figure 6.1 Configuration Diagram of EI-level Maskable Interrupt

CAUTION

As CLK_HSB is the operating clock for INTC2, INT32 to INT255 interrupts, which are connected to INTC2, are delayed more than the interrupts directly connected to INTC1.

Table 6.5 lists EI-level maskable interrupts.

0 to 31: Connected to INTC1. 32 to 255: Connected to INTC2

Table 6.5 RH850/P1x-C EI level maskable interrupt sources (1/7)

Interrupt			Interrupt request			Detection type*2	Exception code	Handler address (offset)*6		
	Control register							Direct jumping to an address		
Channel*1	Name	Address	Name	Cause	Unit			RINT = 0*3	RINT = 1*4	Reference to a table*5
0	EIC0	FFFE EA00$_H$	INTECM0MI/ INTECM1MI	mask-able interrupt from ECM	ECM	Edge	1000$_H$	Offset address does not differ from channel to channel; it is determined according to the priority order, and is taken from an address between +100$_H$ to +1F0$_H$.	Offset address is uniformly +100$_H$ irrespective of the priority order.	+000$_H$
1	EIC1	FFFE EA02$_H$	INTIPIR0	IPIR_CH1 (between PE interrupt)	IPIR	Edge	1001$_H$			+004$_H$

252	Reserved						10FC$_H$			+3F0$_H$
253	Reserved						10FD$_H$			+3F4$_H$
254	Reserved						10FE$_H$			+3F8$_H$
255	Reserved						10FF$_H$			+3FC$_H$

Note 1. 0 to 31: Connected to INTC1. 32 to 255: Connected to INTC2

Note 2. This indicates whether an interrupt source is detected at the level or edge. This also affects the initial value of an EI level interrupt control register. For details, see **Section 6.4.1, EICn — EI level interrupt control registers**.

Note 3. Irrespective of interrupt channels, an offset address is determined according to the priority order (0 to 7), from the range between +100$_H$ to 1F0$_H$.

Note 4. Irrespective of the priority order, offset addresses are uniformly +100$_H$.

Note 5. The table reference method has a table that reads exception handler address for each interrupt channel, and it extracts handler address by referencing that table. Table reference position is determined by the following formula.
Exception handler address read position = INTBP register + channel number × 4 bytes

Note 6. For details, see **Section 6.9, Exception Handler Address**.

6.3 Edge Detection Configuration

The external interrupts INTPm and NMI can be configured to generate an interrupt request upon a rising or falling edge or upon both edges of the external pin.

The following registers are used to specify the edge and level of each interrupt:

Table 6.6 External interrupt edge detection registers

Interrupt	Register
INTP0	FCLA0CTL1
INTP1	FCLA0CTL2
INTP2	FCLA0CTL3
INTP3	FCLA0CTL4
INTP4	FCLA0CTL5
INTP5	FCLA0CTL6
INTP6	FCLA0CTL7
INTP7	FCLA1CTL0
INTP8	FCLA1CTL1
INTP9	FCLA1CTL2
INTP10	FCLA1CTL3
INTP11	FCLA1CTL4
NMI	FCLA0CTL0

See **Section 2, Pin Functions** for details of these registers.

6.4 Interrupt Controller Control Registers

Writing to the EICn and IMRm (m = 0 to 7) registers is enabled only in supervisor mode (PSW.UM = 0).

6.4.1 EICn — EI level interrupt control registers

These registers, each of which is for a channel of EI level maskable interrupt INT, are used to set the conditions to control each channel.

Access: EICn can be read/written in 16-bit units.
EICnH and EICnL can be read/written in 8- or 1-bit units.

Address: See **Table 6.5, RH850/P1x-C EI level maskable interrupt sources.**

Value after reset: $008F_H$ (edge detection), $808F_H$ (high level detection)
Note 1. This register is initialized by any reset.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CTn	—	—	RFn	—	—	—	—	MKn	TBn	—	—	P3n	P2n	P1n	P0n
Value after reset	0/1*1	0	0	0	0	0	0	0	1	0	0	0	1	1	1	1
R/W	R	R	R	R/W	R	R	R	R	R/W	R/W	R	R	R/W	R/W	R/W	R/W

Note 1. The value after reset differs depending on the detection type of an interrupt (edge detection: 0, level detection: 1). For details, see **Table 6.5, RH850/P1x-C EI level maskable interrupt sources**.

Table 6.7 EICn register contents (1/2)

Bit Position	Bit Name	Function
15	CTn	This bit indicates an interrupt channel type. This bit is read-only. 0: Detection in synchronization with an edge is currently selected. 1: Detection of the high level is currently selected.
14, 13	Reserved	When read, the value after reset is read. When writing, write the value after reset.
12	RFn	This is an interrupt request flag. The RFn bit can be written from a program. Setting the RFn bit to 1 generates an EI level maskable interrupt n (INTn), just as when an interrupt request is acknowledged. 0: No interrupt request is made (value after reset). 1: Interrupt request is made. **Input Interface** / **Operation** Detection in synchronization with an edge (CTn = 0) / This bit is automatically cleared when an interrupt request is acknowledged by the CPU core. It can be set and cleared by software. Detection of the high level (CTn = 1) / This bit cannot be set or cleared by software. It is readable only It is not cleared when an interrupt request is acknowledged by the CPU core.
11 to 8	Reserved	When read, the value after reset is read. When writing, write the value after reset.
7	MKn	This is the interrupt request mask bit. When the MKn bit is set, interrupt requests from the channel are masked and, therefore, not issued to the CPU core. The interrupt pending status is not reflected in the ICSR.PMEI bit for any channels that are masked. When the interrupt request from the channel is masked with MKn = 1, the RFn still reflects the interrupt request for the channel and can be polled in software. When the MKn bit is cleared, interrupt requests from the channel are issued to the CPU core for subsequent processing. The state of the MKn bit is also reflected in the corresponding IMRm register. 0: Enables interrupt processing 1: Disables interrupt processing (value after reset)

Table 6.7 EICn register contents (2/2)

Bit Position	Bit Name	Function
6	TBn	This bit is used to select the way to determine the interrupt vector. 0: Direct jumping to an address determined from the level of priority 1: Reference to a table For details on the way to determine the interrupt vector, see *the RH850 Family Users' Manual: Software*.
5, 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3 to 0	P3n to P0n	These bits specify the interrupt priority as one of 16 levels, with 0 as the highest and 15 as the lowest. When multiple EI level-interrupt requests are made simultaneously, the interrupt from the source with the highest priority setting in these bits is selected and conveyed to the CPU core for servicing first. When the P3n to P0n bits specify the same priority level for simultaneously occurring interrupt requests, the source with the lower channel number takes priority. This order is fixed.

CAUTION

When a channel n is defined as broadcast interrupt (EIBDn.CST = 1), MKn and RFn bits of the EICn register of the channel must be set to 0 after an initial configuration of the channel. In the period when the EIINTn interrupt is enabled, it is prohibited to mask (MKn = 1) an interrupt processing of the channel. When it is necessary to mask a broadcast interrupt, EIC4 to EIC7 registers in INTC1 of each PE can be used to mask the corresponding broadcast interrupt.

NOTE

In this product, all EICn registers can be accessed. Accessing these registers does not affect operation.

6.4.2 IMRm — EI level interrupt mask registers (m = 0 to 7)

These registers are a collection of the MKn bits of the EICn registers. Each bit of IMRm reflects the setting of the corresponding MKn bit. Setting IMRm is reflected in the corresponding MKn bit.

Access: IMRm can be read/written in 32-bit units.
IMRmH and IMRmL can be read/written in 16-bit units.
MRmHH, IMRmHL, IMRmLH, and IMRmLL can be read/written in 8- or 1-bit units.

Address: IMR0: FFFE EAF0$_H$, IMR1: FFFF B404$_H$, IMR2: FFFF B408$_H$, IMR3: FFFF B40C$_H$
IMR4: FFFF B410$_H$, IMR5: FFFF B414$_H$, IMR6: FFFF B418$_H$, IMR7: FFFF B41C$_H$

Value after reset: FFFF FFFF$_H$ This register is initialized by any reset.

Table 6.8 IMRm register contents

Bit Position	Bit Name	Function
31 to 0	IMRmEIMKm×32+31 to IMRmEIMKm×32	These are mask bits for EI level maskable interrupt (INT) 0 to 255. 0: Enables interrupt servicing 1: Disables interrupt servicing

CAUTIONS

1. MKn bits for interrupt channels, not listed in **Table 6.5, RH850/P1x-C EI level maskable interrupt sources** must be set to 1.
2. When a channel is used as broadcast interrupt (EIBDn.CST = 1), IMRmEIMKn bit corresponding to the channel must be set to 0.

6.4.3 FNC — FE level NMI status register

This register indicates the status of an FE level non-maskable interrupt (FENMI).

Access: FNC can be read in 16-bit units.
FNCH and FNCL can be read in 8- or 1-bit units.

Address: FFFE EA78 $_H$

Value after reset: 0000_H (synchronous edge detection), This register is initialized by any reset.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FNCT	—	—	FNRF	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 6.9 FNC register contents

Bit Position	Bit Name	Function
15	FNCT	This bit indicates an interrupt channel type. 0: Detection in synchronization with an edge is currently selected. 1: Detection of the high level is currently selected.
14, 13	Reserved	When read, the value after reset is read.
12	FNRF	Interrupt request flag 0: No interrupt request (value after reset) 1: Interrupt request occurred
11 to 0	Reserved	When read, the value after reset is read.

Input Interface	Operation
Detection in synchronization with an edge (FNCT = 0)	It is automatically cleared when an interrupt request for the FE level NMI is acknowledged by CPU core. This bit can be set and cleared by software in debug mode.
Detection of the high level (FNCT = 1)	This bit cannot be set or cleared by software. This bit is read-only.

6.4.4 FIC — FE level maskable interrupt status register

This register indicates the status of an FE level maskable interrupt (FEINT).

Access: FIC can be read in 16-bit units.
FICH and FICL can be read in 8- or 1-bit units.

Address: FFFE EA7A$_H$

Value after reset: 0000$_H$ (synchronous edge detection), This register is initialized by any reset.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FICT	—	—	FIRF	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 6.10 FIC register contents

Bit Position	Bit Name	Function
15	FICT	This bit indicates an interrupt channel type. This bit is read-only. 0: Detection in synchronization with an edge is currently selected. 1: Detection of the high level is currently selected.
14, 13	Reserved	When read, the value after reset is read.
12	FIRF	Interrupt request flag 0: No interrupt request (value after reset) 1: Interrupt request occurred
11 to 0	Reserved	When read, the value after reset is read.

Input Interface	Operation
Detection in synchronization with an edge (FICT = 0)	It is automatically cleared when an interrupt request for the FE level NMI is acknowledged by CPU core. This bit can be set and cleared by software in debug mode.
Detection of the high level (FICT = 1)	This bit cannot be set or cleared by software. This bit is read-only.

6.4.5 FEINTFn — FE level maskable interrupt event status register

Access: FEINTF can be read/written in 32-bit units.

Address: FEINTF0: FFD4 2000_H, FEINTF1: FFD4 3000_H

Value after reset: 0000 0000_H This register is initialized by any reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 6.11 FEINTF register contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is read.
2	FEINTESTAT2	Terminal NMI interrupt occurrence 0: No interrupt occurred 1: Interrupt has occurred
1	FEINTESTAT1	ECM interrupt (INTECMTnNMI) occurrence 0: No interrupt occurred 1: Interrupt has occurred
0	FEINTESTAT0	STM interrupt 8 occurrence 0: No interrupt occurred 1: Interrupt has occurred

6.4.6 FEINTFCn — FEINT event clear register

This register clears the bits of the FEINT event register (FEINT).

Access: This register can be written in 32-bit units.

Address: FEINTFC0: FFD4 2008_H, FEINTFC1: FFD4 3008_H

Value after reset: 0000 0000_H
This register is initialized by any reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

1	FEINTECLR1	FEINTESTAT1 flag clear 0: — 1: Cleared
0	FEINTECLR0	FEINTESTAT0 flag clear 0: — 1: Cleared

6.4.7 FEINTFMSKn — FE level maskable interrupt event mask register

Access: FEINTFMSKn can be read/written in 32-bit units.

Address: FEINTFMSK0: FFD4 2004_H, FEINTFMSK1: FFD4 3004_H

Value after reset: 0000 0000_H This register is initialized by any reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 6.13 FEINTFMSK register contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is read.
2	FEINTEMSK2	Terminal NMI interrupt mask 1: Interrupt is masked 0: Interrupt is not masked
1	FEINTEMSK1	ECM interrupt (INTECMTnNMI) mask 1: Interrupt is masked 0: Interrupt is not masked
0	FEINTEMSK0	STM interrupt 8 mask 1: Interrupt is masked 0: Interrupt is not masked

6.4.8 EIBD0 to EIBD255 — EI Level Interrupt Bind Registers 0 to 255

These registers are provided for each EI level interrupt source to make correspondence between each source and PE.

Access: This register can be Read/written in 32-bit units.

Address: See **Table 6.15, List of EIBDn register Address**.

Value after reset: $0000\ 0001_H$: EIBD0 to 31 (PE1/INTC1)
$0000\ 0002_H$: EIBD0 to 31 (PE2/INTC1)
$0000\ 0001_H$: EIBD32 to 255 (INTC2)
This register is initialized by any reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EIBDnH	CST	—	—	—	—	BCP2n	BCP1n	BCP0n	—	—	—	—	—	GPID 2n	GPID 1n	GPID 0n

Table 6.14 EIBD Register Contents

Bit Position	Bit Name	Function
31	CSTn	By setting CST bit to '1' the corresponding interrupt channel is handled as broadcast interrupt The CST bit can only be written in INTC2 (Interrupt channels EIINT[255:32]). 0: Interrupt is handled normally (value after reset) 1: Interrupt is defined as broadcast interrupt
30 to 27	Reserved	When read, the value after reset is read. When writing, write the value after reset.
26 to 24	BCP[2:0]n	Broadcast Channel selection register These bits are only be used if CST is set to "1" The BCP bits can only be changed in INTC2 (Interrupt channels EIINT[255:32]. If CST is set to 0: These bits are ignored If CST is set to 1: The bits BCP[2:0] define the number of the selected broadcast channel
18 to 16	GPID[2:0]n	These bits are provided only in EIBD32 to EIBD255. Set either of the following values for these bits according to the PEID setting. 000: When PE1 is selected by PEID as a bind destination 001: When PE2 is selected by PEID as a bind destination These bits are reserved for EIBD0 to EIBD31. The write value should always be 0. These bits are always read as 0.
15 to 3	Reserved	When read, the value after reset is read. When writing, write the value after reset.
2 to 0	PEID[2:0]n	These bits specify an interrupt bind (request) destination. However, these bits are fixed in EIBD0 to EIBD31 and cannot be modified. For the INTC2 Interrupt channels EIINT[255:32] the PE can be selected by writing the corresponding PEID to this EIBD register.

6.4.9 SINTRn — Software Interrupt Registers (n = 0 to 2)

SINTR0 to SINTR2 are 8-bit registers to control software interrupts 0 to 2 (INTSW0 to INTSW2). Writing 01_H to these registers generates software interrupts 0 to 2 (INTSW0 to INTSW2). Writing 00_H during the generated interrupt handler clears the interrupt source. When these registers are read, the current register value is read. SINTR0 to SINTR2 are initialized to 00_H by a power-on reset.

Access: This register can be Read/written in 8/1-bit units.

Address: SINTR0: FFCD $E000_H$, SINTR1: FFCD $E004_H$, SINTR2: FFCD $E008_H$

Value after reset: 00_H This register is initialized by any reset.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SINTCn
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 6.16 SINTRn Register Contents (n = 0 to 2)

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	SINTCn	Software Interrupt Request This bit generates a software interrupt. [Read operation] The current bit value is read. [Write operation] Writing 1: Generates an interrupt. Writing 1 while the SINTC bit is 1 is prohibited. Writing 0: Clears the interrupt source.

6.4.10 IPIR_CHn — Inter Processor Interrupt Register

Registers (IPIR_CH#) for interrupt communication between PEs are provided for two channels.

IPIR_CH1 and IPIR_CH2 are assigned to INTC1. An interrupt for specific PEs (including own PE) can be requested by manipulating bits corresponding to respective PEs.

This type of register is located in the CPU specific peripheral of each PE.

Access: This register can be Read/written in 32-, 16-, 8- or 1-bit units.

Address: IPIR_CH1: FFFE EC84$_H$, IPIR_CH2: FFFE EC88$_H$

Value after reset: 0000 0000$_H$
This register is initialized by any reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CHnPE2	CHnPE1
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 6.17 IPIR_CHn Register Contents

Bit Position	Bit Name	Function
30 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	CHnPE2	Inter-PE Interrupt Request to PE2 Writing 1 to this bit generates an interrupt request to PE2. This bit is automatically cleared to 0 when the interrupt request has been notified. 0: Inter-PE interrupt request output is not specified or an interrupt request is not being output. 1: Interrupt request output is specified or an interrupt request is being output.
0	CHnPE1	Inter-PE Interrupt Request to PE1 Writing 1 to this bit generates an interrupt request to PE1. This bit is automatically cleared to 0 when the interrupt request has been notified. 0: Inter-PE interrupt request output is not specified or an interrupt request is not being output. 1: Interrupt request output is specified or an interrupt request is being output.

6.5 Interrupt Function System Registers

See **Section 3.2.1.2(3), Interrupt Function Registers**.

6.5.1 ISPR — Priority of interrupt being serviced

See **Section 3.2.1.2(3)(b), ISPR — Priority of interrupt being serviced register**.

6.5.2 PMR — Interrupt priority masking

See **Section 3.2.1.2(3)(c), PMR — Interrupt priority masking register**.

6.5.3 ICSR — Interrupt control status

See **Section 3.2.1.2(3)(d), ICSR — Interrupt control status register**.

6.5.4 INTCFG — Interrupt function setting

See **Section 3.2.1.2(3)(e), INTCFG — Interrupt function setting register**.

6.6 Operation When Acknowledging an Interrupt Exception

Check whether each exception that is reported during instruction execution is acknowledged according to the priority. The procedure for acknowledgment operation of each interrupt is shown below.

(1) Check whether the acknowledgment conditions are satisfied and whether exceptions are acknowledged according to their priority.

(2) Calculate the exception handler address according to the current PSW value*1.

(3) For FE-level non-maskable/maskable interrupts, the following processing is performed:

- Save the PC to the FEPC.
- Save the PSW to the FEPSW.
- Store the exception code in the FEIC.
- Update the PSW and MCTL.
- Store the exception handler address calculated in (2) in the PC, and then pass its control to the exception handler.

(4) For EI level exceptions, the following processing is performed:

- Save the PC to the EIPC.
- Save the PSW to the EIPSW.
- Store the exception code in the EIC.
- Update the PSW and MCTL.
- Store the exception handler address calculated in (2) in the PC, and then pass its control to the exception handler.

Note 1. For details, see **Section 6.9, Exception Handler Address**.

The following figure shows steps (1) to (4).

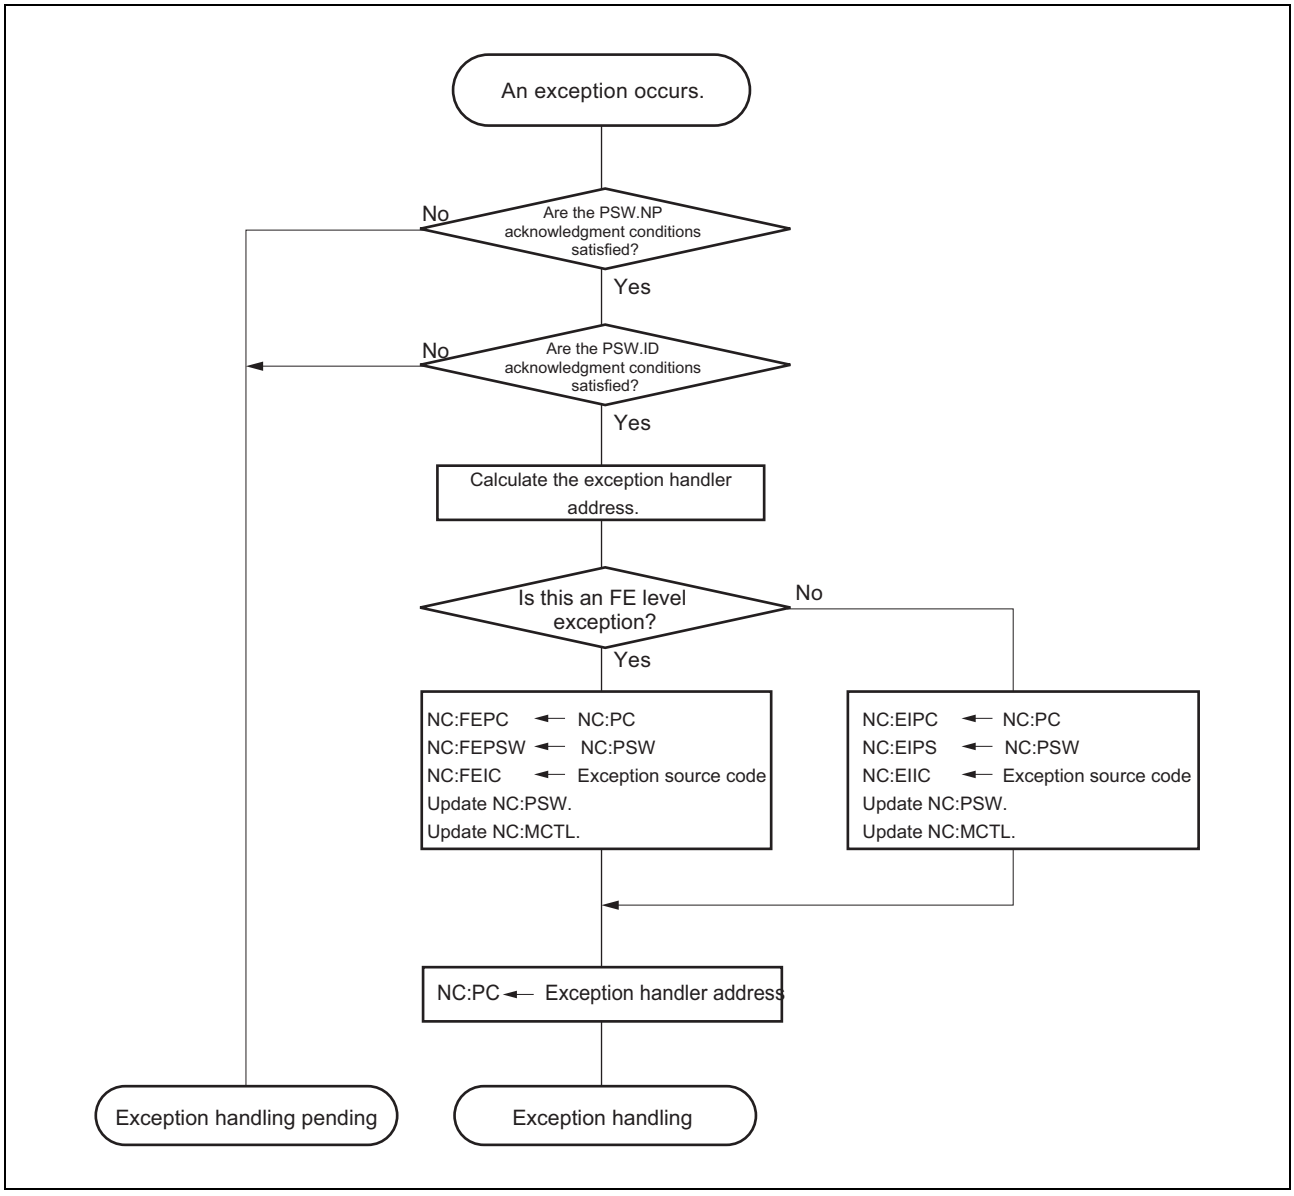

Figure 6.2 Processing upon occurrence of interrupt request

6.7 Return from Interrupts

To return from interrupt handling, execute the return instruction (EIRET or FERET) corresponding to each relevant interrupt level.

When a context has been saved in a stack and the like, the context must be restored before executing the return instruction.

When execution is returned from an irrecoverable interrupt or exception, the status before the exception occurs in the original program cannot be restored. Consequently, the execution result might differ from that when the interrupt does not occur.

The EIRET instruction is used to return from the EI-level maskable interrupt handling and the FERET instruction is used to return from FE-level maskable interrupt handling.

When the EIRET or FERET instruction is executed, the CPU performs the following processing and then passes its control to the return PC address:

(1) Return PC and PSW are loaded from the EIPC and EIPSW registers or the FEPC and FEPSW registers.

(2) Control is passed to the addresses indicated by the return PC and PSW that were loaded.

(3) When EIRET and EP = 0 and INTCFG.ISPC = 0, the CPU updates the ISPR register.

The flows for returning from exception handling using the EIRET and FERET instructions are shown below.

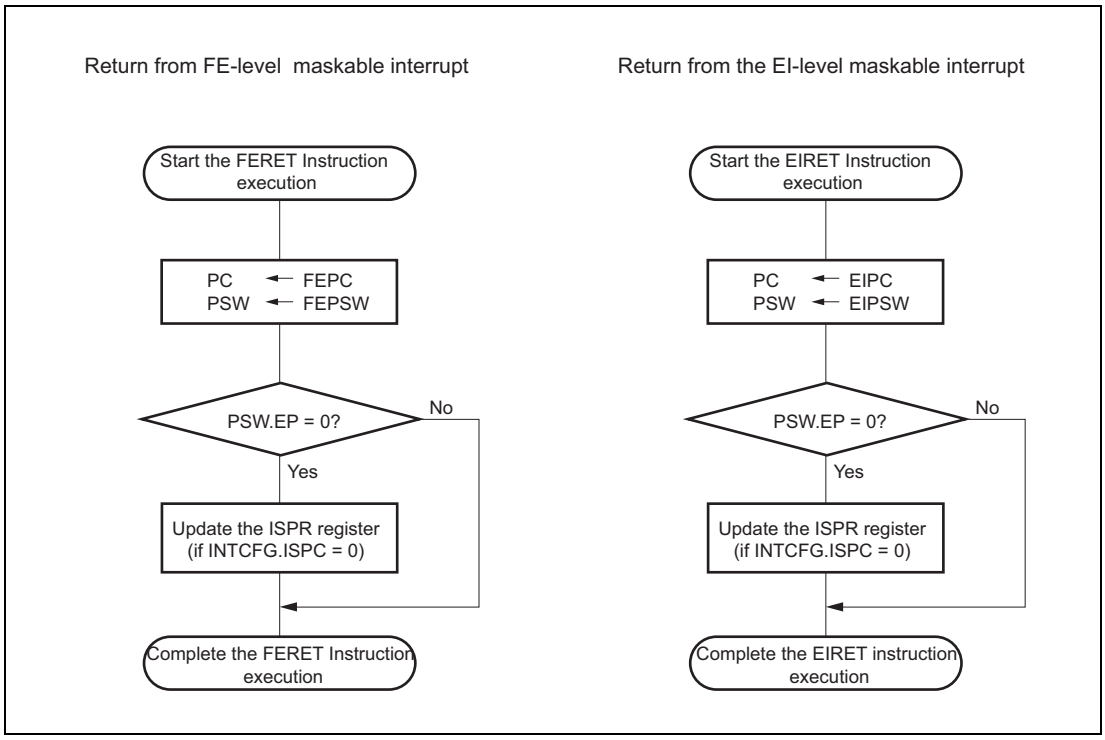

Figure 6.3 Flow of Return from Interrupts

6.8 Interrupt Operation

6.8.1 Mask function of EI level maskable interrupt INTn

Interrupt masking can be specified for each respective interrupt channel of INTn. Interrupt masking is performed by the following register settings.

Table 6.18 Operation of the MKn Bit

EICn.MKn	Operation
1	Masks interrupt
0	Enables interrupt

The EICn.MKn bits can also be read and written via the corresponding MKn bits of the IMRm registers. The interrupt mask state is reflected in both the EICn registers and the IMRm registers.

Operation example

(1) When a 1 is written to a IMRm.EIMKn bit, interrupts are prohibited for the corresponding channel.

(2) When the corresponding EICn.MKn bit is read, a 1 is returned.

CAUTION

If the MKn bit is set to 0 while an interrupt request is withheld (RFn = 1), the interrupt service routine will be executed at that time (subject to the rules of interrupt prioritization). Even if an interrupt request is issued in software by setting the RFn bit to 1, the interrupt will not occur as long as the interrupt is masked with MKn = 1.

To remove an interrupt request that is withheld, clear the corresponding RFn bit in software (as would be done when polling for interrupt requests).

In case of using the external pin interrupt, it is necessary to clear the corresponding MKn bit after switched to the external pin by setting pin function registers.

6.8.2 Interrupt priority level judgment

When FE level non-maskable interrupts (FENMI), FE level maskable interrupts (FEINT), and EI level maskable interrupts (INT) are input, priorities including other exceptions are determined, and the exception with the highest priority (including interrupts) is requested. Exceptions requested at the same time (including interrupts) are processed in a pre-allocated priority order (the default priority order). The priority orders of FENMI, FEINT, and INT interrupts are as follows.

FENMI > FEINT > EIINT

See **Table 6.5, RH850/P1x-C EI level maskable interrupt sources** and *the RH850G3M User's Manual: Software* for other exceptions.

For EIINTn interrupts, the priority level can be set independently for each interrupt source. Specify the priority level with the bits P3n to P0n. The interrupt priority levels can be set from 0 to 15: 0 is the

highest and 15 the lowest. Among multiple EIINTn interrupts with the same priority level, the interrupt with the lowest interrupt channel number has priority.

Table 6.19 Example of EIINTn interrupt priority level settings and priority levels

EIINTn	EICn.P[3:0]n setting	Priority level during operation
EIINT0	3	10
EIINT1	4	11
EIINT2	0	1
EIINT3	0	2
EIINT4	1	3
EIINT5	2	6
EIINT6	2	7
EIINT7	1	4
EIINT8	1	5
EIINT9	2	8
EIINT10	2	9

The interrupt controller executes multiple interrupt handling when another interrupt request is acknowledged while an interrupt processing has been executed. When multiple EIINTn interrupts are requested at the same time, the interrupt to be acknowledged is determined by the following procedure.

6.8.2.1 Comparison with the priority level as the interrupt currently being serviced

Interrupts with the same or lower priority level as the interrupt currently being serviced are held pending.

The priority level of the interrupt currently being serviced is shown in the ISPR register.

Interrupts with a higher priority level than the interrupt currently being serviced proceed to the next priority judgment stage.

6.8.2.2 Masking through priority mask register (PMR)

Only interrupts enabled by the PMR register proceed to the next priority judgment stage.

For the PMR register, see the **Section 3.2.1.2(3)(c), PMR — Interrupt priority masking register** or *the RH850G3M User's Manual: Software*.

6.8.2.3 The requested interrupt source with the highest priority level is selected

When interrupts are being simultaneously requested from multiple sources, the interrupt source from the highest priority level, with the smallest interrupt channel number is selected.

6.8.2.4 Interrupt hold by CPU

Interrupt acknowledgment is pending according to the state of the NP and ID bits of the PSW register.

At this time, priority judgment among EIINTn interrupts, and priority judgment among EIINTn, FEINT and FENMI interrupts is performed even while interrupt acknowledgment is pending, and the interrupt with the highest priority is selected upon realization of the acknowledgment condition.

Example

An EIINTn interrupt with the priority level 5 has already been requested and interrupt generation is pending because the value of the PSW.ID bit is 1. If a subsequent EIINTn interrupt with the priority

level 3 is requested and the PSW.ID bit is cleared to 0, the latter EIINT interrupt (with the priority level 3) will be generated.

Figure 6.4 shows an example of multiple interrupt handling when another interrupt request is acknowledged while an interrupt processing has been executed.

When an interrupt request signal is acknowledged, the PSW.ID flag is automatically set to 1. Therefore, the ID flag should be cleared to 0 to execute multiple interrupt handling. Specifically, execute the EI instruction and the like in an interrupt handling program to enable the interrupt.

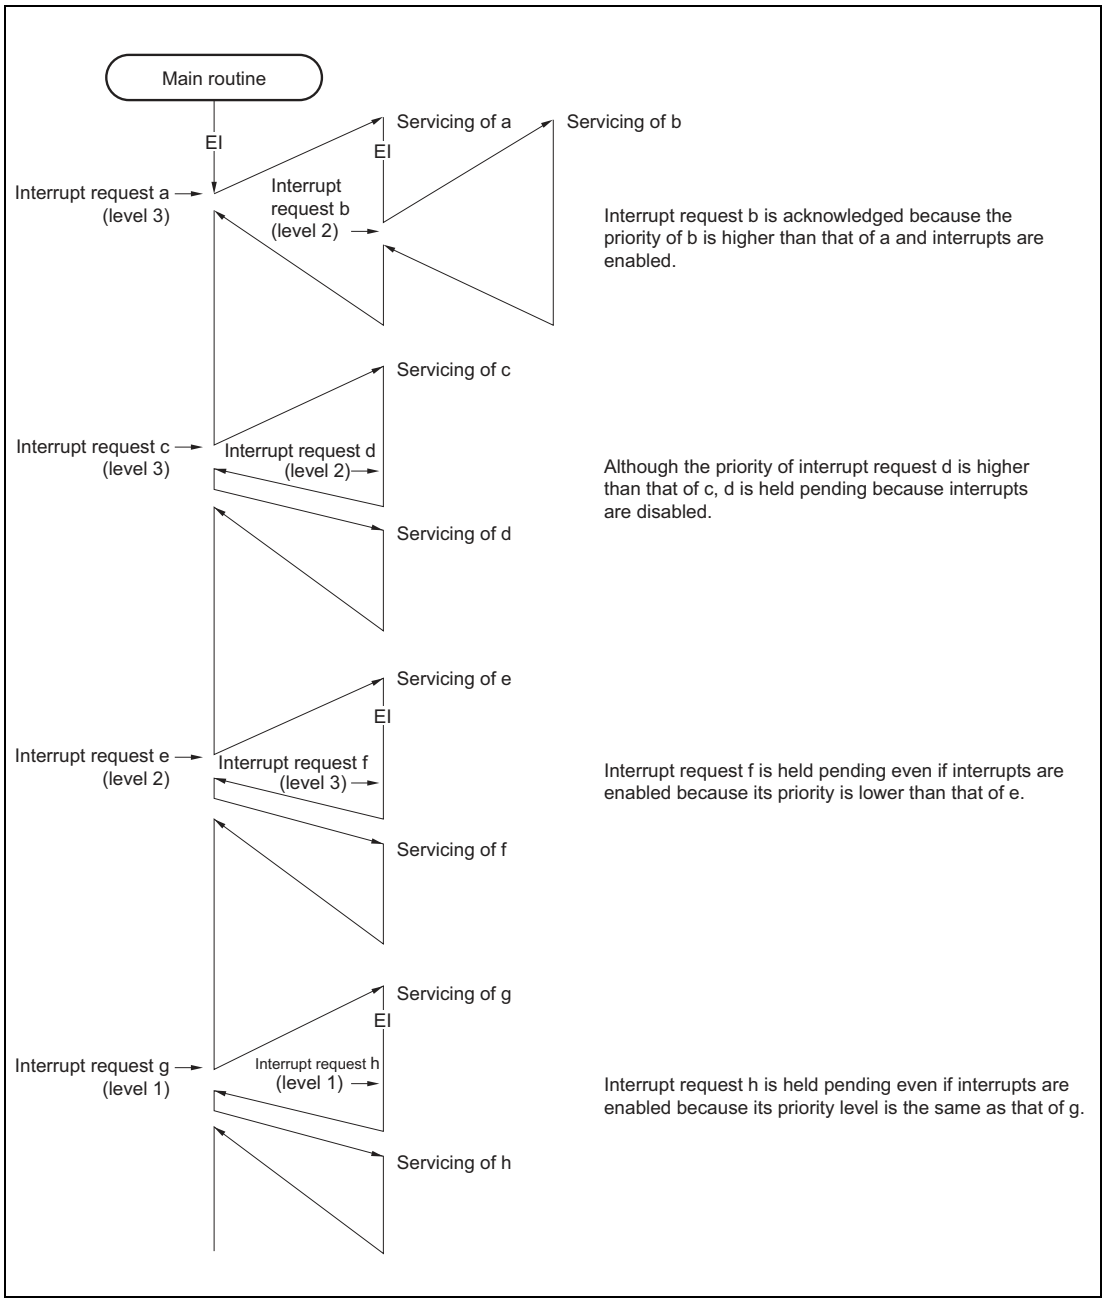

Figure 6.4 Example of processing in which an interrupt request is issued while another interrupt is being serviced (1)

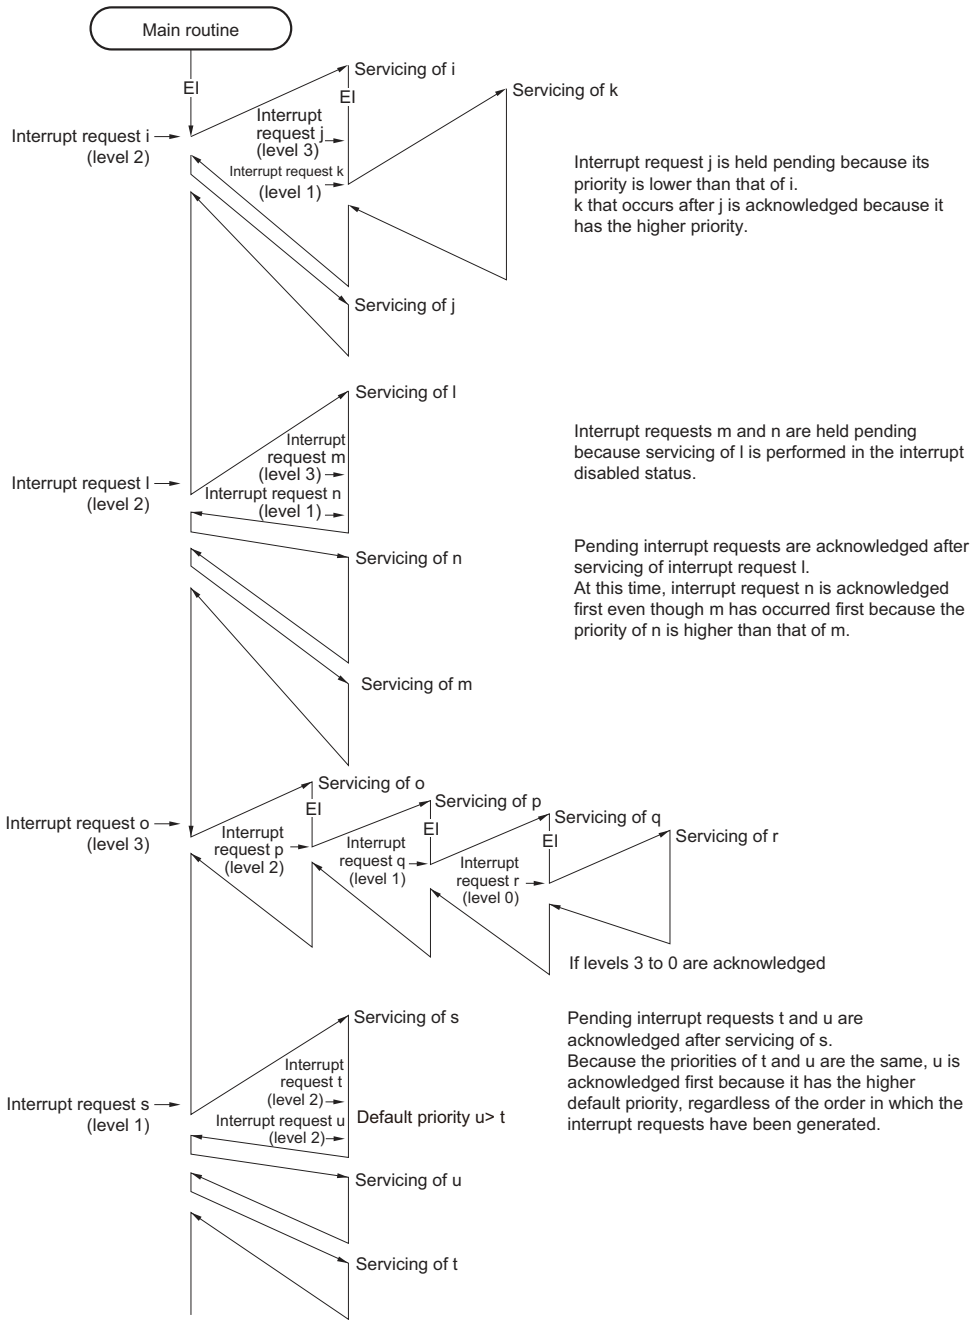


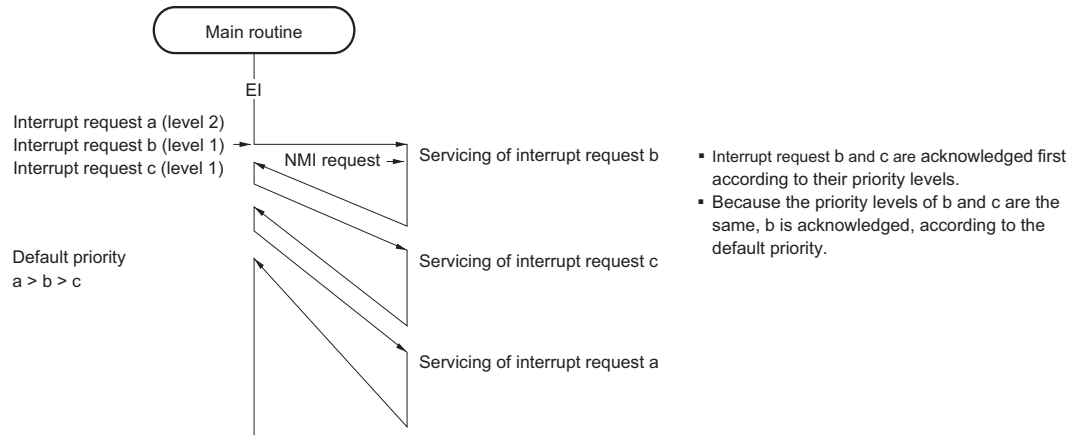
Note 1. “a” to “u” in the figure are the temporary names of interrupt request signals shown for the sake of explanation.

Note 2. The default priority in the figure indicates the relative priority between two interrupt request signals.

Figure 6.5 Example of processing in which an interrupt request signal is issued while another interrupt is being serviced (2)

CAUTION

To perform multiple interrupt servicing, the values of the EIPC and EIPSW registers must be saved before executing the EI instruction. When returning from multiple interrupt servicing, restore the values of EIPC and EIPSW after executing the DI instruction.



Note 1. “a” to “c” in the figure are the temporary names of interrupt request signals shown for the sake of explanation.

Note 2. The default priority in the figure indicates the relative priority between two interrupt request signals.

Figure 6.6 Example of servicing simultaneously generated interrupt requests

6.8.3 Interrupt request acceptance condition and the priority

See *RH850G3M User's Manual: Software*.

6.8.4 Exception priority of interrupts and the priority mask

See *RH850G3M User's Manual: Software*.

6.8.5 Interrupt priority mask

See *RH850G3M User's Manual: Software*.

6.8.6 Priority mask function

The priority mask function prohibits in batch EIINTn interrupts of the specified interrupt priority levels.

The interrupt priority levels to be masked are specified in the PMR register. Masking and acknowledgment can be set for each priority level.

The following operations are possible using this function:

- Temporary prohibition of interrupts that have a priority level that is lower than a given priority level
- Temporary prohibition of interrupts that have a given priority level

Table 6.20 Priority mask function

PMR.PMm	Operation
0	Acknowledges requests from priority level m interrupt source.
1	Masks requests from priority level m interrupt source.

Note: m = 0 to 15

The PMR register prohibits vectoring to the interrupt service when an interrupt request of the specified priority is generated.

The presence of EIINTn interrupts held pending with this function can be checked with **Section 6.8.8, Interrupt management**.

For details on the PMR register, see **Section 3.2.1.2(3)(c), PMR — Interrupt priority masking register**, or *the RH850G3M User's Manual: Software*.

6.8.7 FEINT Source selection

There are three sources for the FEINT: ECM and STM interrupt and terminal NMI.

These three sources are mapped to the interrupt controller INTC1. There is a status flag register (See **Section 6.4.5, FEINTFn — FE level maskable interrupt event status register**), an event mask register (See **Section 6.4.7, FEINTFMSKn — FE level maskable interrupt event mask register**) and an event clear register (See **Section 6.4.6, FEINTFCn — FEINT event clear register**) for each source. The event status flag has to be cleared by software. If an event is masked (FEINTEMSKn = 1) the corresponding bit FEINTESTATn is not set.

The event status flag should be cleared by software in the beginning of the interrupt service routine. If there is a pending interrupt flag after leaving the interrupt service routine the interrupt will be asserted again until all flags in FEINTESTAT are cleared.

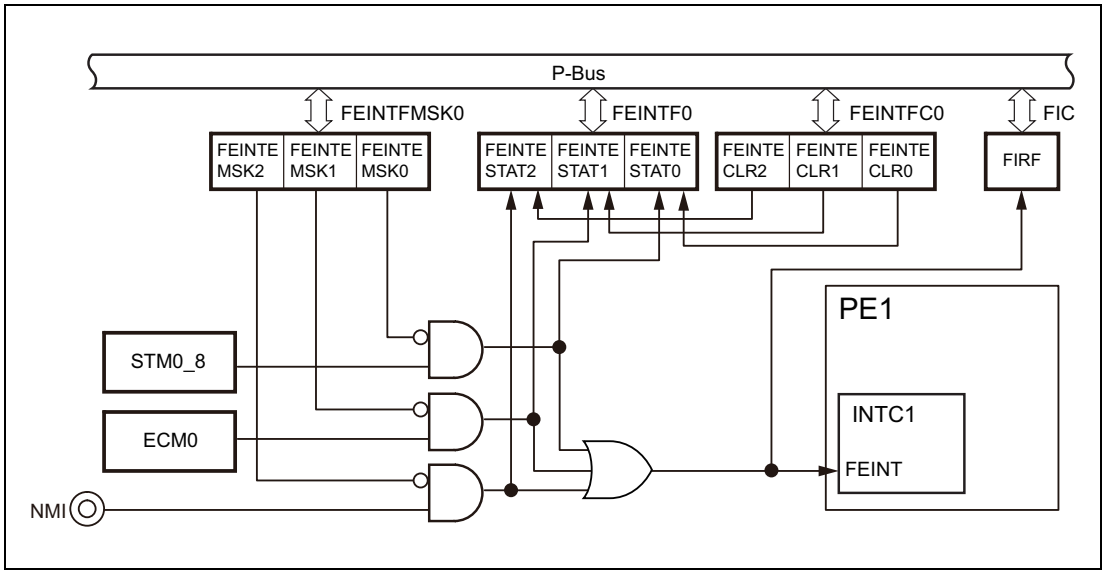


Figure 6.7 FEINT Source selection for PE1

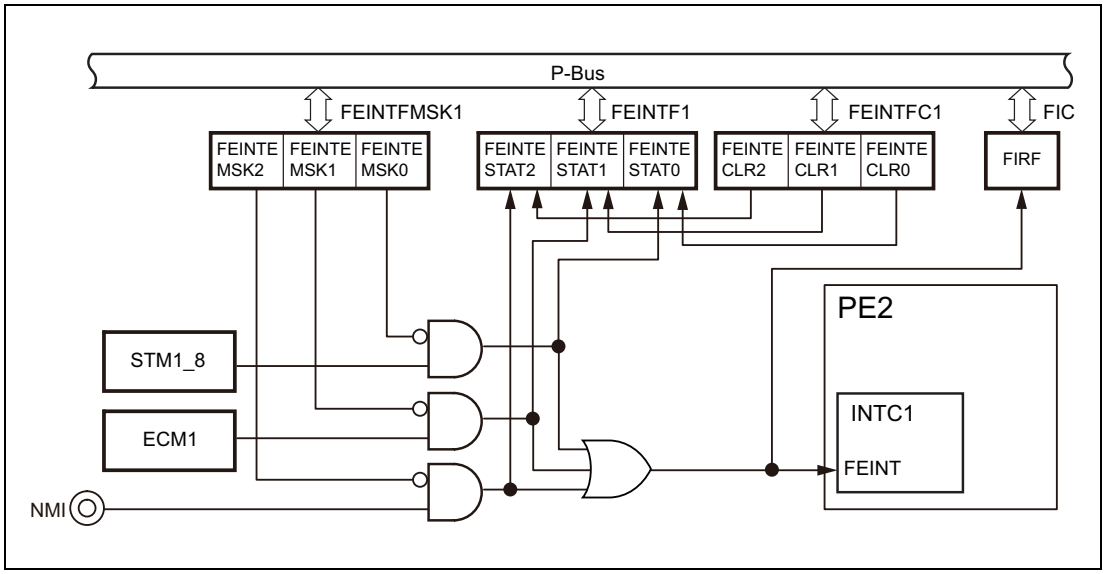

Figure 6.8 FEINT Source selection for PE2

6.8.8 Interrupt management

The suspended interrupt can be checked in the RH850/P1x-C. For details, see *the RH850G3M User's Manual: Software*.

6.9 Exception Handler Address

For the RH850/P1x-C, the exception handler address used for execution during reset input, exception acknowledgment, or interrupt acknowledgment can be changed according to the settings.

The exception handler address for reset and exception (including interrupt) is determined with the direct vector method, in which the reference point of the exception handler address can be changed by using the PSW.EBV bit, the RBASE register, and the EBASE register. For interrupts, the direct vector method and table reference method can be selected for each channel.

If the table reference method is selected, execution can branch to the address indicated by the exception handler table allocated in the memory.

CAUTION

The exception handler address of EINTn selected using the direct vector method differs from that of the V850E2 core products. In the V850E2 core products, a different exception handler address is individually assigned to each interrupt channel (EINTn). In the RH850/P1x-C, one exception handler address is assigned to each interrupt priority. Consequently, interrupts that have the same priority level branch to the same exception handler.

6.9.1 Direct Vector Method

The CPU uses the result of adding the offset shown in **Table 6.21, Selection of Base Register/ Offset Address** to the base address indicated by the RBASE or EBASE register as the exception handler address.

Select whether the RBASE or EBASE register is used as the base address in the PSW.EBV bit. When the PSW.EBV bit is set to 1, the value of the EBASE register is used as the base address. When the PSW.EBV bit is cleared to 0, the value of the RBASE register is used as the base address.

For reset input , however, the RBASE register is always used for reference.

In addition, user interrupts refer to the RINT bit of the corresponding base register, and reduce the offset address according to the bit status. If the RBASE.RINT bit or EBASE.RINT bit is set to 1, all user interrupts are handled using an offset of 100_H. If the bit is cleared to 0, the offset address is determined according to **Table 6.21, Selection of Base Register/Offset Address**.

Note 1. Exception acknowledgment itself may sometimes update the status of the PSW.EBV bit. In this case, the base register is selected based on the new bit value.

Note 2. The exceptions that always refer to the RBASE register are determined according to the hardware specifications.

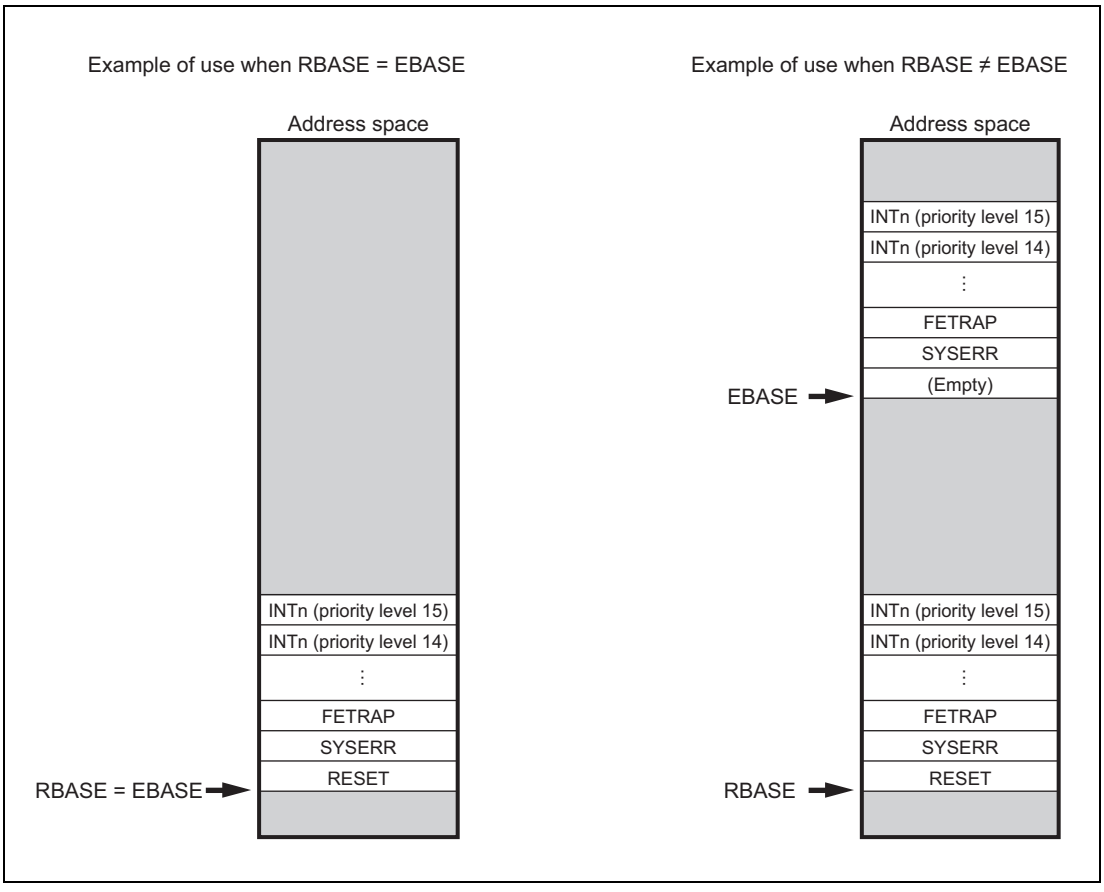

Figure 6.9 Direct Vector Method

The table below shows how base register selection and offset address reduction function for each exception to determine the exception handler address. The value of the PSW bit determines the exception handler on the basis of the value after updated by the acknowledgment of an exception.

Table 6.21 Selection of Base Register/Offset Address

	PSW.EBV = 0	PSW.EBV = 1	RINT = 0	RINT = 1
Exception/Interrupt	**Base register**		**Offset address**	
RESET	RBASE	N.A.	000_H	000_H
SYSERR		EBASE	010_H	010_H
FETRAP			030_H	030_H
TRAP0			040_H	040_H
TRAP1			050_H	050_H
RIE			060_H	060_H

UCPOP			080_H	080_H
MIP/MDP/ITLBE/DTLBE			090_H	090_H
PIE			$0A0_H$	$0A0_H$
Debug			$0B0_H$	$0B0_H$
MAE			$0C0_H$	$0C0_H$
Reserved			$0D0_H$	$0D0_H$
FENMI			$0E0_H$	$0E0_H$
FEINT			$0F0_H$	$0F0_H$
EIINTn (Priority level 0)			100_H	100_H
EIINTn (Priority level 1)			110_H	
EIINTn (Priority level 2)			120_H	
EIINTn (Priority level 3)			130_H	
EIINTn (Priority level 4)			140_H	
EIINTn (Priority level 5)			150_H	
EIINTn (Priority level 6)			160_H	
EIINTn (Priority level 7)			170_H	
EIINTn (Priority level 8)			180_H	
EIINTn (Priority level 9)			190_H	
EIINTn (Priority level 10)			$1A0_H$	
EIINTn (Priority level 11)			$1B0_H$	
EIINTn (Priority level 12)			$1C0_H$	
EIINTn (Priority level 13)			$1D0_H$	
EIINTn (Priority level 14)			$1E0_H$	
EIINTn (Priority level 15)			$1F0_H$	

Base register selection is used to execute the exception handling for reset and some hardware errors by using the programs in a relatively reliable area such as ROM instead of the areas that are easily affected by software errors such as RAM and cache area. The user interrupt offset address reduction function is used to reduce the memory occupation size required by the exception handler for specific system-internal operating modes. The main purpose of this is to minimize the amount of memory consumed in operating modes that use only the minimum functionality, for example, during system maintenance and diagnosis.

6.9.2 Table Reference Method

In the Direct Vector Method, there is one user-interrupt exception handler for each interrupt priority level, and interrupt channels that indicate multiple interrupts with the same priority branch to the same interrupt handler, but some users might want to use different code areas for each interrupt handler from the beginning.

The RH850/P1x-C defines the table reference method for interrupts that assume the above usage.

For the table reference method, if the table reference method is specified as the interrupt channel vector selection method in the interrupt controller and the like, the method for determining the exception handler address when an interrupt request corresponding to that interrupt channel is acknowledged differs as follows.

<1> In any of the following cases, the exception handler address is determined by using the direct vector method:

- When PSW.EBV = 0 and RBASE.RINT = 1
- When PSW.EBV = 1 and EBASE.RINT = 1
- When the interrupt channel setting is not the table reference method

<2> In cases other than <1>, calculate the table reference position.
Exception handler address read position = INTBP register + channel number × 4 bytes

<3> Read word data starting at the interrupt handler address read position calculated in <2>.

<4> Use the word data read in <3> as the exception handler address.

Table 6.22 shows the exception handler address read positions corresponding to each interrupt channel and **Figure 6.10** shows an overview of the placement in memory.

Table 6.22 Exception Handler Address Expansion

Type of Interrupt	Exception Handler Address Read Position
EI level maskable interrupt channel 0	INTBP register value + 0 × 4
EI level maskable interrupt channel 1	INTBP register value + 1 × 4
EI level maskable interrupt channel 2	INTBP register value + 2 × 4
:	:
EI level maskable interrupt channel 254	INTBP register value + 254 × 4
EI level maskable interrupt channel 255	INTBP register value + 255 × 4

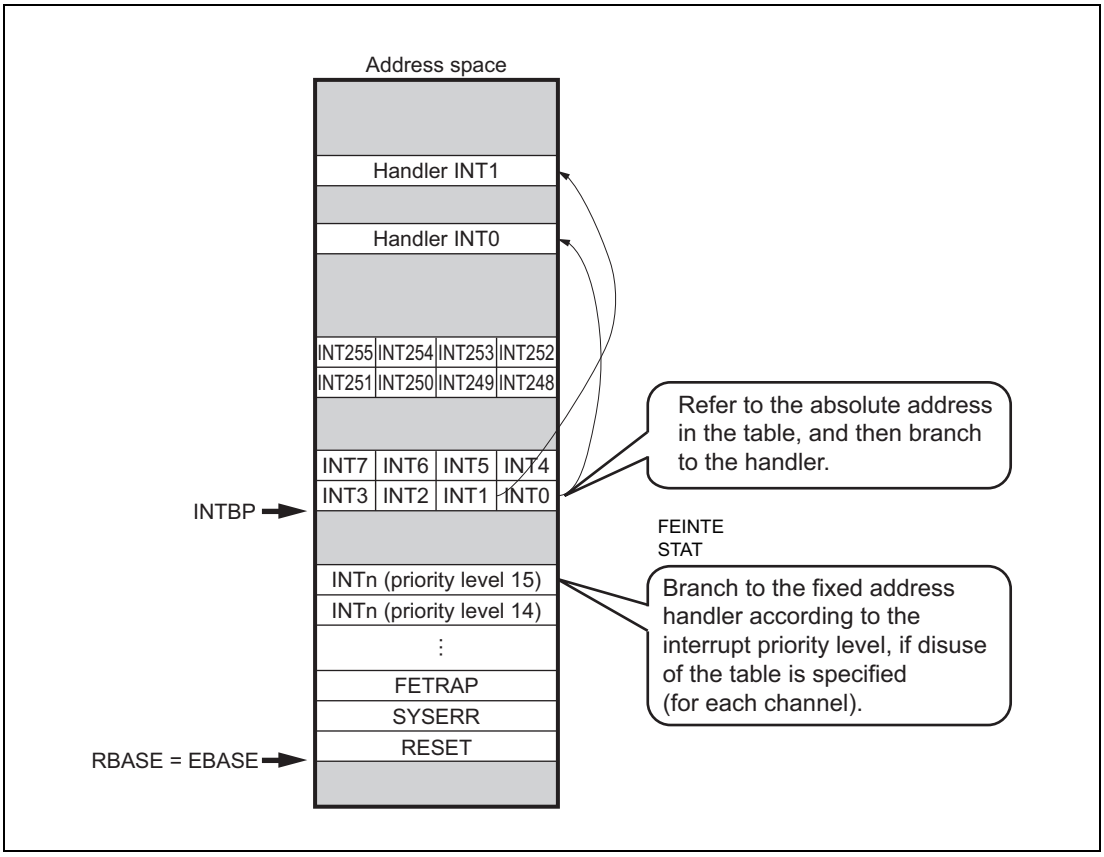

Figure 6.10 Overview of the Table Reference Method

6.10 Broadcast notification function processor elements

Each interrupt has its own interrupt control register and interrupt bind register. Each interrupt can be assigned to one dedicated PE by setting the corresponding EIBD.CST bit to ‘0’ (value after reset) and the EIBDn.PEID[2:0] to the number of the target PE. If an interrupt should be handled by all processor elements the broadcast function is used. In this case the bit EIBDn.CST has to be set to ‘1’.One of the 4 available broadcast channels can be selected by programming the EIBDn accordingly. There Interrupt inputs EIINT[7:4] of each INTC1 are used for the broadcast interrupt handling. These are no dedicated broadcast channels (this means the assignment to the interrupt inputs of the INTC1 has to done during specification phase and will be implemented in hardware. Thus the assignment of the broadcast channels (outputs of INTC2) to the INTC1 inputs cannot be changed by software).

- It is prohibited to allocate two or more interrupt channels to the same broadcast notification port of INTC1.
- If an interrupt EIINTn is assigned to a broadcast notification channel the interrupt priority information in EICn.EIPm is ignored. Thus the interrupt vector of the assigned broadcast notification interrupt is used.
- It is possible to mask a broadcast notification interrupt for a dedicated PEx by setting the mask bit EICx.IMK in the corresponding INTC1 macro.
- The interrupt vector for a broadcast notification interrupt is the vector of the corresponding EIINT interrupt input at the INTC1 macro (broadcast channel).

6.10.1 Example:

- Peripheral interrupt INTRXD is assigned to INTC2, channel 100,
- Broadcast channels 3 to 0 are used.
- The broadcast channels are connected to INTC1.eiint[7:4]
- EIBD100.CST is set to ‘1’ (broadcast notification enabled)
- EIBD100.BCP[2:0] I set to 0x2 (broadcast notification channel 2 is selected)
- Thus INTRXD interrupt is assigned to PE1 and PE2, interrupt channel 6
- The priority of this interrupt is now defined by EIC6.EIP[3:0] (for each PE separately)
- The corresponding mask bit is EIC6.IMK and the interrupt request flag is EIC6.IRF (thus the interrupt can be masked/enable for each PE separately in its own INTC1)

In case of an interrupt from the peripheral the INTRXD signal would be active. This interrupt request is provided from INTC2 to INTC1 via the broadcast notification interrupt INTBN2. Thus the EIC6.RF is set for both INTC1 macros. Both PE’s will execute the corresponding interrupt service routine and each EIC6.RF flags are cleared automatically.

Corresponding register setting:

Table 6.23 Corresponding register setting (INTC2)

Register	Bit	Content	Description
EIC100	ICT	1/0	User readable
	IRF	Don't care	No function if broadcast notification is set
	IMK	0	Set to 0 during broadcast interrupt service
	ITB	Don't care	No function if broadcast notification is set
	IP	Don't care	No function if broadcast notification is set (priority is defined by BN2)
EIBD100	CST	1	Broadcast notification is enabled
	BCP	010	Broadcast notification channel = 2
	PEID	Don't care	No function if broadcast notification is set

Table 6.24 Corresponding register setting (INTC1)

Register	Bit	Content	Description
EIC6	ICT	1/0	User readable
	IRF	1/0	Interrupt flag of the broadcast notification channel 2
	IMK	1/0	Interrupt mask bit of the broadcast notification channel 2
	ITB	1/0	User programmable
	IP	0 to15	User programmable
EIBD6	CST	0	Fixed (cannot be changed)
	BCP	000	Fixed (cannot be changed)
	INTC1.PEID	ID (PE1) ID (PE2)	Fixed (cannot be changed)

6.11 Interrupt latency

The interrupt latency is summarized in **Table 6.25, Interrupt latency**. The given values describe the response time from the assertion of the interrupt trigger at the INTC module and the execution of the first instruction inside the interrupt handling routine. The response time is the typical time for the given scenario. However, it is assumed that no other bus master accesses the code flash in case of an instruction cache miss. The unit of the response time is PE clock cycle.

Table 6.25 Interrupt latency

Device	Instruction cache	Interrupt detection	Exception handler addressing method	Address reference table location	Latency (PE1/2)		Latency (ICUMC)	
					INTC1	INTC2	INTC1	INTC2
P1M-C, P1H-C and P1H-CE 240 MHz	hit	edge	direct vector	NA	8	16	18	24
	miss	edge	direct vector	NA	13	21	26	32
	hit	level	direct vector	NA	7	13	15	21
	miss	level	direct vector	NA	12	18	23	29
	hit	edge	table reference	Local RAM	12	20	27	33
	miss	edge	table reference	Local RAM	17	25	35	41
	hit	level	table reference	Local RAM	11	17	24	30
	miss	level	table reference	Local RAM	16	22	32	38
	hit	edge	table reference	Code flash	17	25	39	45
	miss	edge	table reference	Code flash	22	30	47	53
	hit	level	table reference	Code flash	16	22	36	42
	miss	level	table reference	Code flash	21	27	44	50

Note 1. Not in P1M-C (QFP-144)

Note 2. The registers for FEINT.
FEINTF0, FEINTFC0,FEINTFMSK0 are available for all.
FEINTF1, FEINTFC1,FEINTFMSK1 are not available for P1M-C

Note 3. Not in P1M-C (BGA-156) / P1H-C (4MB, BGA-156)

Section 7 DMA

7.1 Overview

7.1.1 Overview

Direct memory access (DMA) is used to access data without going through the CPU.

DMA consists of two types of DMA transfer modules: DMAC and DTS. A DMAC includes registers for storing transfer information, and a DTS stores transfer information in the dedicated RAM (DTSRAM). DMA has two 8-channel DMAC modules and one 128-channel DTS module.

In this manual, DTFR denotes the function to select among hardware DMA transfer sources for a DMAC and retain the DMA transfer request, and DTSFSL denotes the function to retain a DMA transfer request for each DTS channel. The DTFR can handle 128 types of hardware DMA transfer sources, and the DTSFSL can handle 128 types of them.

The address space that can be used for DMA transfer is a 4 GB address space represented by a 32-bit address. For information about which resource is assigned to a particular area in the 4 GB address space and which area is accessible from DMA, see **Section 4, Address Map**.

7.1.2 Clock Supply

Clock supply by and to the DMA is listed in the following table.

Table 7.1 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
DMA/DTS	Operation clock (DMA clock)	CLK_HSB

7.1.3 Term Definition

Table 7.2 shows the terms used in this section.

Table 7.2 List of Term Definitions

Term	Meaning
DMA transfer	A general term for data transfer carried out by DMA.
DMA cycle	A series of actions that consist of reading an amount of data specified by the transfer size (8/16/32/64/128 bits) from the address specified by the source address and writing it to the address specified by the destination address. The first half of the DMA cycle (reading part) is called a read cycle, and the second half (writing part) is called a write cycle.
Hardware DMA transfer source	A trigger for a DMA transfer request given by an internal peripheral device.
Hardware DMA transfer request	A DMA transfer request generated by a hardware DMA transfer source
Software DMA transfer request	A DMA transfer request generated by software writing to a register.
DMA transfer request	A trigger to start DMA transfer with a DMAC or DTS.
Transfer information (TI)	The information required for DMA transfer, including the source address, destination address, transfer data size, and transfer count. The transfer information for a DTS is specifically termed as TI.
DTSRAM	RAM used by a DTS to store the transfer information.
Single transfer	DMA transfer consisting of one DMA cycle started by one DMA transfer request.
Block transfer 1	DMA transfer consisting of a number of DMA cycles specified by the transfer count in the transfer information, started by one DMA transfer request.
Block transfer 2	DMA transfer consisting of a number of DMA cycles specified by the address reload count in the transfer information, started by one DMA transfer request.
Block transfer	A general term for both block transfer 1 and block transfer 2.
Last transfer	The DMA cycle carried out when the transfer count in the transfer information is 1.
Address reload transfer	The DMA cycle carried out when the address reload count in the transfer information is 1 if the reload function 2 is used.
Suspension	An action of pausing DMA transfer during block transfer. You can resume DMA transfer after suspension.
Resume	An action of resuming suspended DMA transfer.
Transfer abort	An action of aborting DMA transfer in the middle. You cannot resume DMA transfer after that.

7.2 DMA Function

7.2.1 Basic Operation of DMA Transfer

7.2.1.1 Transfer Mode

DMA has three transfer modes.

Single Transfer

One DMA cycle is executed when a DMA transfer request is accepted.

Block Transfer 1

A number of DMA cycles specified in the transfer count register are executed when a DMA transfer request is accepted.

Block Transfer 2

A number of DMA cycles specified by the address reload count are executed when a DMA transfer request is accepted. If the address reload count is larger than the value in the transfer count register, a number of DMA cycles specified in the transfer count register are executed.

7.2.1.2 Executing a DMA Cycle

DMA always executes a write cycle after a read cycle is complete. For example, if the transfer data size is 128 bits, a write cycle is executed after a read cycle for the 128-bit data is finished. A write cycle never starts in the middle of a read cycle.
The bus is not locked. Consequently, a CPU cycle may interrupt between the read and write cycles, and between the four read cycles and four write cycles during multi-byte transfers. In other words, the DMA cycles are not atomic. Source and destination addresses must be aligned according to the transfer width

7.2.1.3 Updating Transfer Information

When a DMA cycle is executed, DMA updates transfer information as follows.

Source Address and Destination Address

Transfer information will be updated as described in **Table 7.3** according to the settings for the source address and destination address and the settings in the transfer control register such as the count directions of source address and destination address and transfer data size.

Table 7.3 Updating the Source Address and the Destination Address (1/2)

Direction of Count	Transfer Data Size	Address after Update
Increment	8 bit	(address before update) + 0000_0001_H
	16 bit	(address before update) + 0000_0002_H
	32 bit	(address before update) + 0000_0004_H
	64 bit	(address before update) + 0000_0008_H
	128 bit	(address before update) + 0000_0010_H

Table 7.3 Updating the Source Address and the Destination Address (2/2)

Direction of Count	Transfer Data Size	Address after Update
Decrement	8 bit	(address before update) – 0000_0001_H
	16 bit	(address before update) – 0000_0002_H
	32 bit	(address before update) – 0000_0004_H
	64 bit	(address before update) – 0000_0008_H
	128 bit	(address before update) – 0000_0010_H
Fixed	—	Same as the address before update.

When you use the reload function, a special update rule is applied other than the one described in **Table 7.3** for the last transfer and the address reload transfer. For details, see **Section 7.2.3, Reload Function**.

Transfer Count/Address Reload Count

The transfer count is decremented by one for every DMA cycle.

The address reload count is decremented by one for every DMA cycle when the reload function 2 or block transfer 2 is used. When the reload function 2 or block transfer 2 is not used, it is not updated.

When you use the reload function, a special update rule is applied for the last transfer and the address reload transfer. For details, see **Section 7.2.3, Reload Function**.

Other transfer information

Other transfer information is not updated during execution of a DMA cycle.

7.2.1.4 Last Transfer and Address Reload Transfer

The last transfer means a DMA cycle executed when the value in the transfer count register, which shows the remaining number of transfers, is one. The last transfer differs in operation compared to other DMA cycles as follows.

- The transfer completion flag (DCSTn.TC) is set when the last transfer is complete. (Only applicable for a DMAC)
- The channel operation enable (DCENn.DTE) bit is cleared when the last transfer is complete. (Only applicable for a DMAC. When the continuous transfer is disabled.)
- When the transfer completion interrupt output enable is set, a transfer completion interrupt is output when the last transfer is complete.
- When the reload function 1 is enabled, the reload function 1 is executed at the timing of the last transfer. For details, see **Section 7.2.3, Reload Function**.

The address reload transfer means a DMA cycle executed when the reload function 2 is enabled and the address reload count is one. The reload function 2 is executed during the address reload transfer. For details, see **Section 7.2.3, Reload Function**.

7.2.1.5 Transfer Completion Interrupt and Transfer Count Match Interrupt Outputs

DMA can output a transfer completion interrupt and a transfer count match interrupt.

Transfer Completion Interrupt Output

When the transfer completion interrupt output enable (DTCTn.TCE) is set in the transfer control register, a DMAC requests a DMAC transfer completion interrupt when the last transfer is complete.

When the transfer completion interrupt output enable (DTTCTn.TCE) is set in the transfer control register, a DTS requests a DTS transfer completion interrupt when the last transfer is complete.

Transfer Count Match Interrupt Output

When the transfer count match interrupt enable (DTCTn.CCE) is set in the transfer control register, a DMAC requests a DMAC transfer count match interrupt when the DMA cycle in which the transfer count compare register and the transfer count have the same value is complete.

When the transfer count match interrupt enable (DTTCTn.CCE) is set in the transfer control register, a DTS requests a DTS transfer count match interrupt at the completion of the DMA cycle in which the transfer count compare register and the transfer count have the same value.

Figure 7.1 shows the operation of the transfer completion interrupt and the transfer count match interrupt.

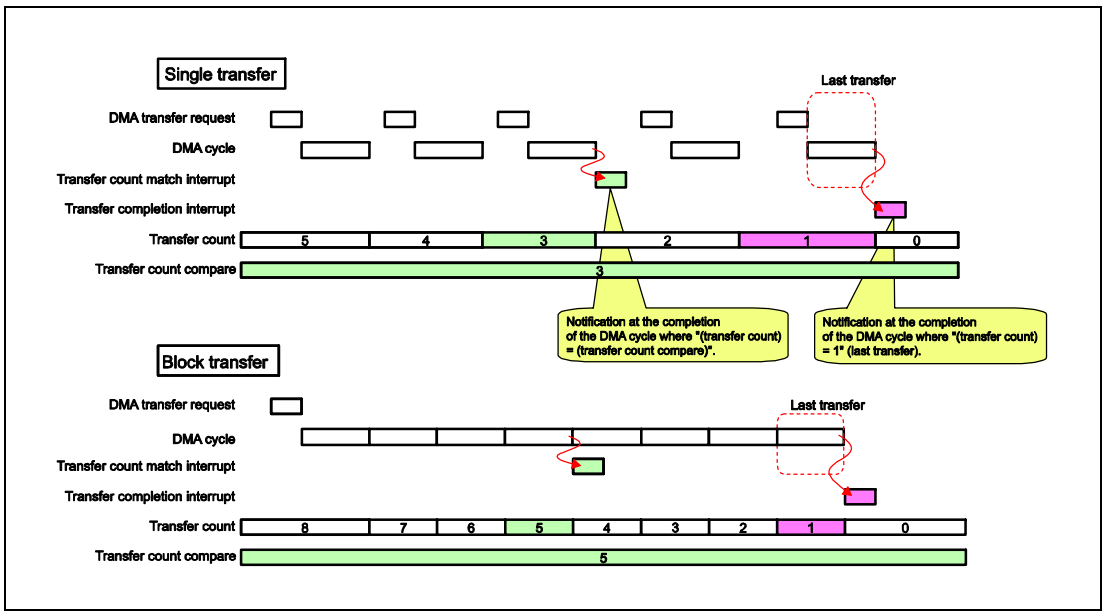

Figure 7.1 Transfer Completion Interrupt and Transfer Count Match Interrupt

7.2.1.6 Continuous Transfer

If the continuous transfer is not used, a DMAC sets the transfer completion flag (DCSTn.TC) and clears the channel operation enable (DCENn.DTE) bit when the last transfer is complete. In this case, a DMA transfer request is not accepted when the request is generated after the completion of the last transfer.

If the continuous transfer is used, the channel operation enable (DCENn.DTE) bit is not cleared when the last transfer is complete, and a DMA transfer request can be accepted even when the transfer completion flag is set. If DMA is used for a case where a specified number of DMA transfers are executed repetitively, software overhead associated with clearing the transfer completion flag and setting the channel operation enable bit after the completion of the last transfer can be reduced by using the continuous transfer.

The continuous transfer is enabled by setting the continuous transfer enable (DTCTn.MLE) in the DMAC transfer control register.

The continuous transfer is designed to work with the reload function 1. The continuous transfer function itself does not update the source address register, destination address register, and transfer count register. If, after the last transfer is complete, you want to restore the source address register, destination address register, and transfer count register to the state before the DMA transfer starts, use the reload function 1 and set the values of the source address register, destination address register, and the transfer count register before the DMA transfer starts to the reload source address register, reload destination address register, and reload transfer count register respectively.

A DTS does not have a setting corresponding to the continuous transfer enable (DTCTn.MLE) for a DMAC. This is because a DTS does not have bits like the transfer completion flag (DCSTn.TC) and the channel operation enable (DCENn.DTE) a DMAC has.

A DTS does not start DMA transfer when a DMA transfer request is generated while the transfer count is 0. (This corresponds to the case for a DMAC where the continuous transfer is not used.)

If the reload function 1 is used for a DTS and the value other than 0 is reloaded to the transfer count when the last transfer is complete, DMA transfer can start when the next DMA transfer request is accepted. (This corresponds to the case for a DMAC where the continuous transfer is used.)

Figure 7.2 shows an operation of continuous transfer by a DMAC.

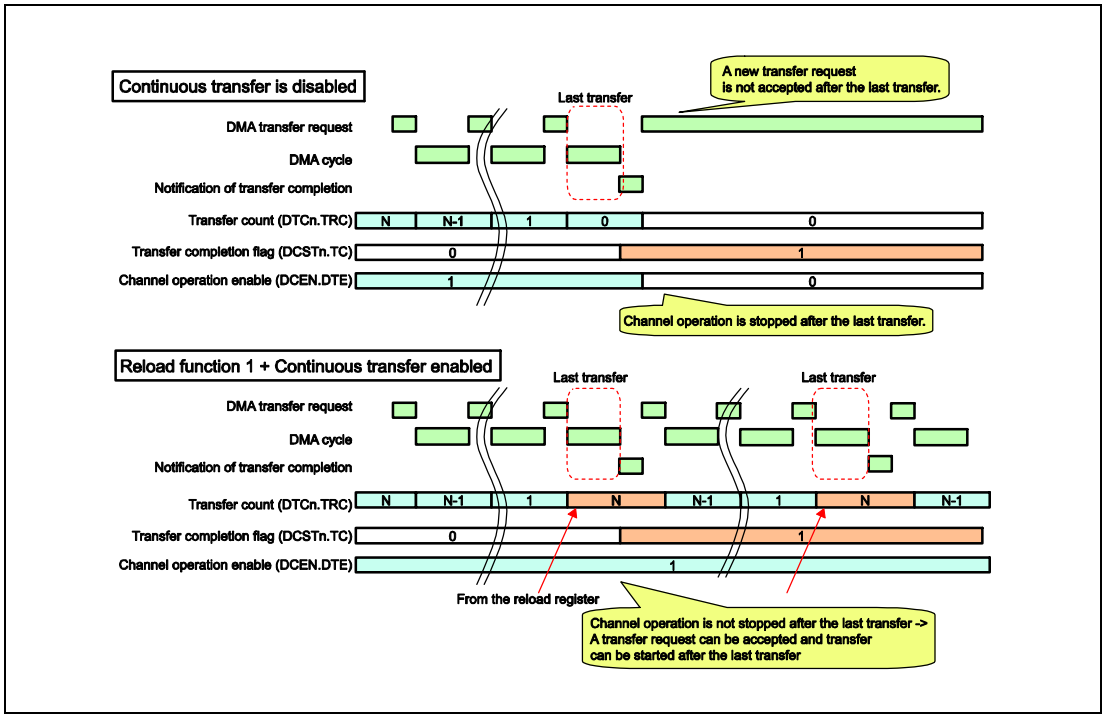

Figure 7.2 Operation of Continuous Transfer by a DMAC

7.2.2 Channel Priority Order

This subsection explains arbitration between multiple DMA channels.

7.2.2.1 DMAC Channel Arbitration

A DMAC select one channel out of eight channels with arbitration. Arbitration is done according to the fixed priority order. The priority order is “channel 0 > channel 1 > channel 2 > channel 3 > channel 4 > channel 5 > channel 6 > channel 7” for DMAC0, and “channel 8 > channel 9 > channel 10 > channel 11 > channel 12 > channel 13 > channel 14 > channel 15” for DMAC1.

Arbitration is done for every DMA cycle. No arbitration occurs between the read and write of a DMA cycle.

If, at the timing when one DMA cycle in the middle of a block transfer of a channel is complete, there is a DMA transfer request from a channel with a higher priority than the channel, a DMA cycle of the channel with the higher priority will be executed next as the result of arbitration.

If a DMAC executes the block transfer 1 or block transfer 2, DMAC channel arbitration is done for every DMA cycle, and possibly a DMA cycle of another DMAC channel with a higher priority can cut in.

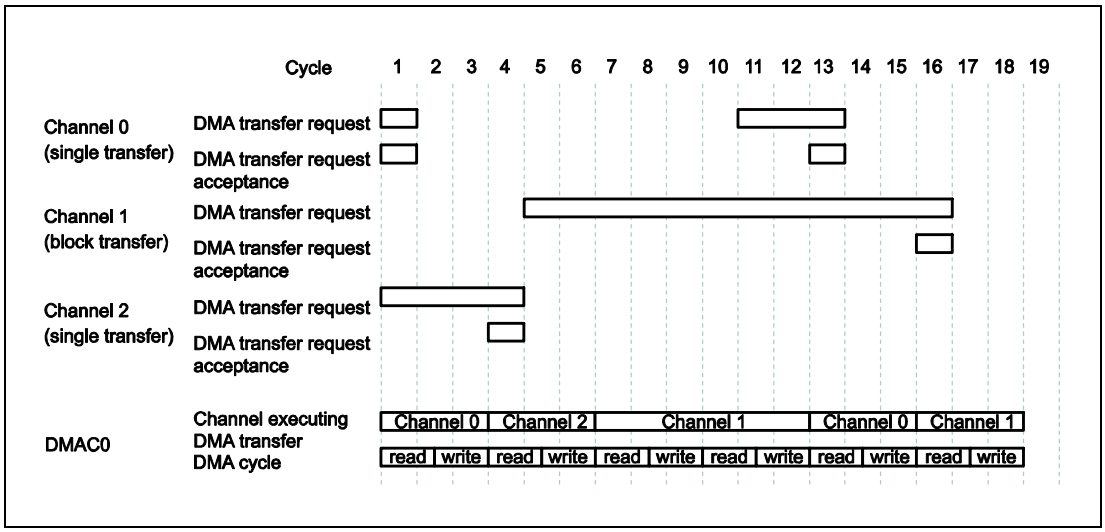

Figure 7.3 DMAC Channel Arbitration

Cycle numbers shown in **Figure 7.3** are for explanation purpose only. They do not indicate an actual number of cycles necessary for executing DMA transfer.

In **Figure 7.3**, DMA transfer requests for channels 0 and 2 are generated at Cycle 1. As a result of arbitration, a DMA cycle for channel 0 starts because its priority is higher. At Cycle 4, a DMA cycle for channel 2 starts. At Cycle 5, a DMA transfer request for channel 1 is generated. The DMA cycle for channel 2 is still ongoing and no arbitration is done at this point. At Cycle 7, a DMA cycle for channel 1 starts. Channel 1 uses block transfer. Another DMA cycle continues at Cycle 10 because there are no DMA transfer requests from other channels. At Cycle 11, a DMA transfer request for channel 0 is generated. The DMA cycle for channel 1 is still ongoing and no arbitration is done at this point. At Cycle 12, the DMA cycle for channel 1 is complete. At Cycle 13, a DMA cycle for channel 0 starts as a result of arbitration between DMA channels 0 and 1.

It should be noted that, even though a block transfer of channel 1 has been already started, a DMA cycle of not channel 1 but channel 0 is executed at Cycle 13 because the priority of the latter is higher.

At Cycle 15, the DMA cycle for channel 0 is complete. At Cycle 16, a DMA cycle for channel 1 starts again. At Cycle 18, the last DMA cycle of the block transfer of channel 1 is complete.

7.2.2.2 DTS Channel Arbitration

If there are DMA transfer requests from multiple DTS channels, the DTSFSL arbitrates those DTS channels. For each DTS channel, a priority can be selected from four levels using DTS channel priority setting registers.

If there are DMA transfer request from multiple DTS channels, the arbitration is done as follows.

1. A channel with a higher priority level in the setting of DTS channel priority setting registers has a priority.
2. If two channels have the same priority level in the setting of DTS channel priority setting registers, a channel with a lower channel number has a priority.

The DTSFSL sends the DTS a DMA transfer request for the channel selected by arbitration. The DTS executes DMA transfer when it accepts the DMA transfer request.

Unlike DMA transfer with a DMAC, DMA transfer with a DTS does not allow arbitration between DTS channels in the middle of a block transfer. That means, even if a DMA transfer request with a higher priority comes during a block transfer for a channel with a lower priority, the DMA transfer with a higher priority does not start until the current block transfer for the channel with a lower priority is complete*.

Note 1. Block transfer is complete when the last transfer for the block transfer 1 or the last transfer or address reload transfer for the block transfer 2 occurs.

When a DTS executes the block transfer 1 or block transfer 2, a DMA cycle of a DTS channel with a higher priority does not take over the ongoing block transfer until the last transfer.

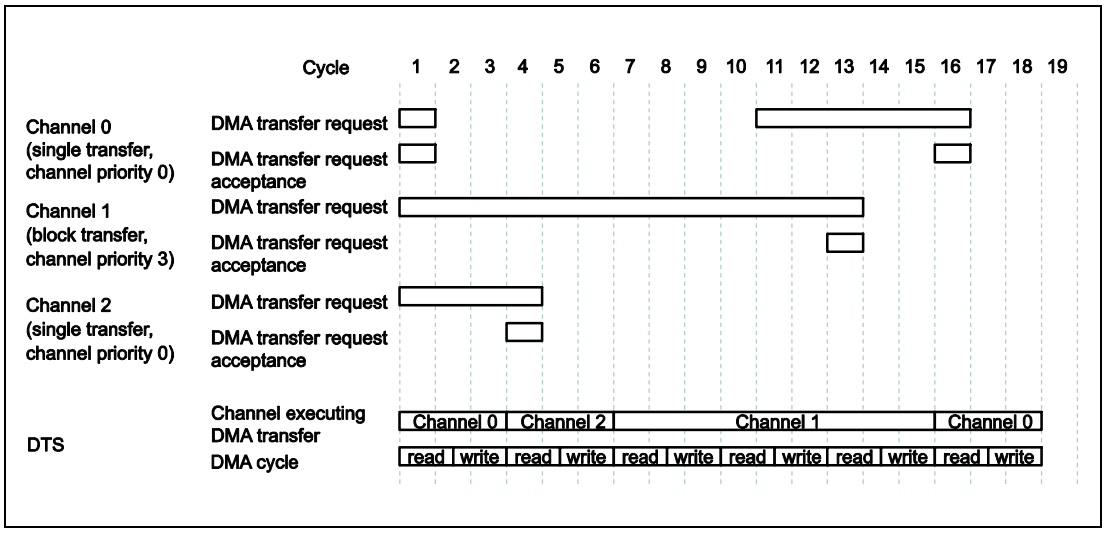

Figure 7.4 DTS Channel Arbitration

Cycle numbers shown in **Figure 7.4** are for explanation purpose only. They do not indicate an actual number of cycles necessary for executing DMA transfer.

In **Figure 7.4**, DMA transfer requests for channels 0, 1, and 2 are generated at Cycle 1. The channel priority for channels 0 and 2 is 0 and is higher than the channel priority for channel 1, which is 3. In addition, if two channels have the same priority, the channel with the smaller channel number has a higher priority. Consequently, the priority order for arbitration is “channel 0 > channel 2 > channel 1”,

and a DMA cycle for channel 0 starts because its priority is the highest At Cycle 4, as a result of arbitration between channels 1 and 2, a DMA cycle for channel 2 starts. At Cycle 7, a DMA cycle for channel 1 starts. Channel 1 uses block transfer. Another DMA cycle continues at Cycle 10 because there are no DMA transfer requests from other channels. At Cycle 11, a DMA transfer request for channel 0 is generated. The DMA cycle for channel 1 is still ongoing and no arbitration is done until the block transfer of channel 1 is complete.

At Cycle 15, the block transfer of channel 1 is complete. At Cycle 16, a DMA cycle for channel 0 starts.

7.2.2.3 Interface Arbitration

The interface between the DMASS and the System Interconnect is shown in **Figure 7.5**. DMAC0, DMAC1 and DTS operate independently and they can request bus transfers via the DMAT to the system interconnect. As the system interconnect performs non-blocking data transfers, multiple DMA transfers can be active coincidentally.

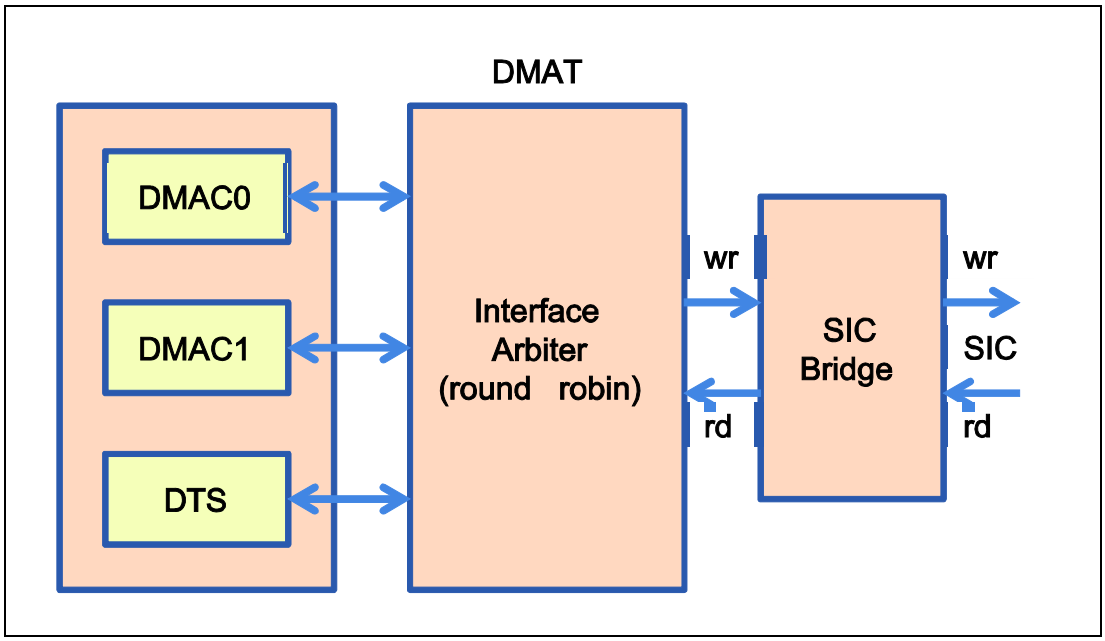

Figure 7.5 Interface Arbitration

Read and write busses are separated and they operate independently. In case of conflicts, the arbitration is done in round robin. Issuing a read or write request takes one DMA clock cycle. While the issuer waits for the response, another active unit may issue its request in the subsequent clock cycle.

7.2.3 Reload Function

7.2.3.1 Overview of the Reload Function

The reload function updates a portion of transfer information, more specifically, the source address, destination address, transfer count, and address reload count, to the predefined values during DMA transfer.

The reload function has two types of functions: reload function 1 and reload function 2.

7.2.3.2 Operation of Reload Function 1

When the reload function 1 is enabled, actions described in **Table 7.4** are executed at the timing of the last transfer according to the reload function 1 setting.

Table 7.4 Operation of Reload Function 1

Reload Function 1 Setting	Register	Action at the Last Transfer
00 (Reload function 1 disabled.)	Source address	Not reloaded.
	Destination address	Not reloaded.
	Transfer count	Not reloaded.
	Address reload count	Not reloaded.
01 (Reload function 1 enabled. Reloading source address and transfer count.)	Source address	The reload source address is copied to this.
	Destination address	Not reloaded.
	Transfer count	The reload transfer count is copied to this.
	Address reload count	• If the reload function 2 is disable: Not reloaded. • If the reload function 2 is enabled: The reload address reload count is copied to this.
10 (Reload function 1 enabled. Reloading destination address and transfer count.)	Source address	Not reloaded.
	Destination address	The reload destination address is copied to this.
	Transfer count	The reload transfer count is copied to this.
	Address reload count	• If the reload function 2 is disable: Not reloaded. • If the reload function 2 is enabled: The reload address reload count is copied to this.
11 (Reload function 1 enabled. Reloading source address, destination address, and transfer count.)	Source address	The reload source address is copied to this.
	Destination address	The reload destination address is copied to this.
	Transfer count	The reload transfer count is copied to this.
	Address reload count	• If the reload function 2 is disable: Not reloaded • If the reload function 2 is enabled: The reload address reload count is copied to this.

Figure 7.6 shows an operation of the reload function 1.

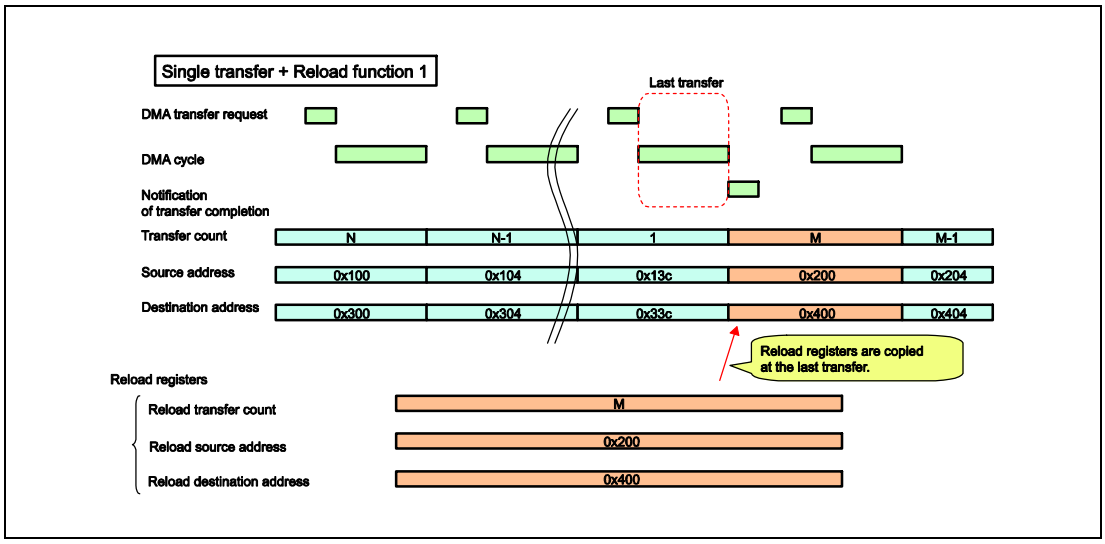

Figure 7.6 Operation of Reload Function 1

7.2.3.3 Reload Function 2

When the reload function 2 is enabled, actions described in **Table 7.5** are executed at the timing of the address reload transfer according to the reload function 2 setting.

Table 7.5 Operation of Reload Function 2

Reload Function 2 Setting	Register	Action at the Address Reload Transfer
00 (Reload function 2 disabled.)	Source address	Not reloaded.
	Destination address	Not reloaded.
	Address reload count	Not reloaded.
01 (Reload function 2 enabled. Reloading source address.)	Source address	The reload source address is copied to this.
	Destination address	Not reloaded.
	Address reload count	The reload address reload count is copied to this.
10 (Reload function 2 enabled. Reloading destination address.)	Source address	Not reloaded.
	Destination address	The reload destination address is copied to this.
	Address reload count	The reload address reload count is copied to this.
11 (Reload function 2 enabled. Reloading source address and destination address.)	Source address	The reload source address is copied to this.
	Destination address	The reload destination address is copied to this.
	Address reload count	The reload address reload count is copied to this.

Figure 7.7 shows an operation of the reload function 2.

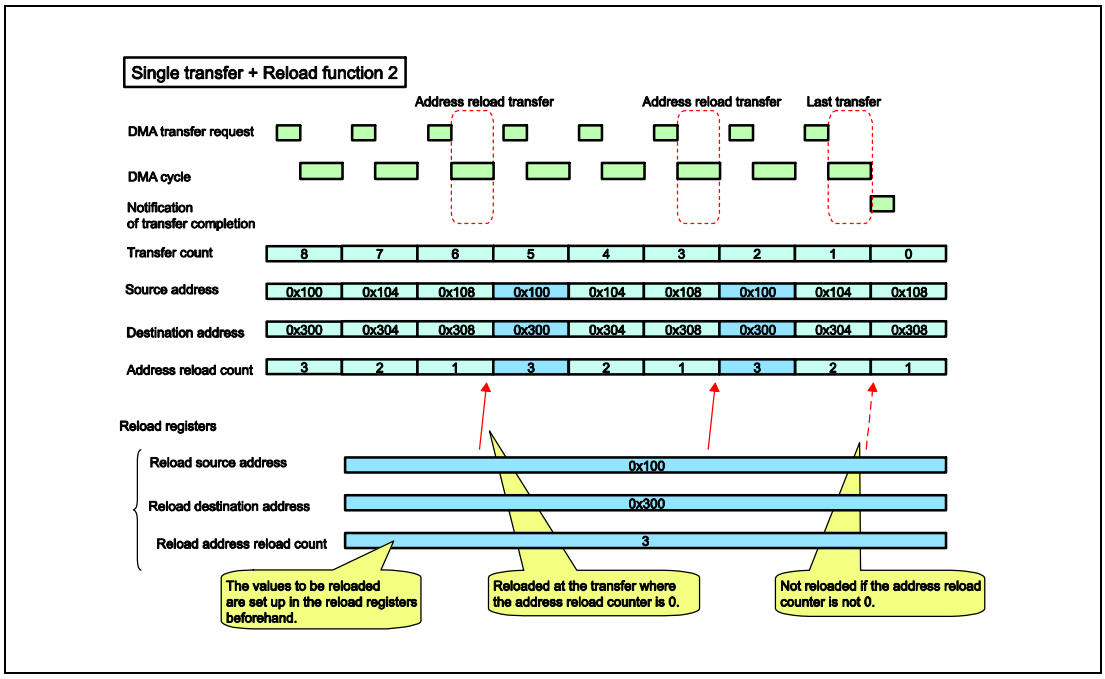

Figure 7.7 Operation of Reload Function 2

Figure 7.8 shows an operation when both the reload function 1 and the reload function 2 are used simultaneously.

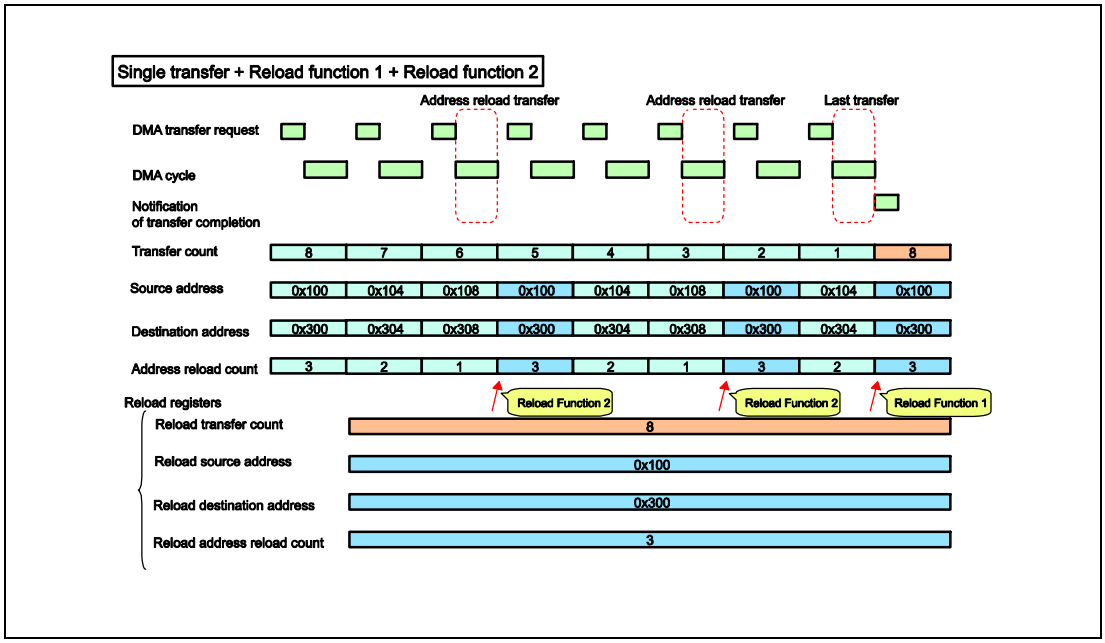

Figure 7.8 Operation when combining the reload function 1 and the reload function 2

7.2.3.4 Timing of Setting DMAC Reload Registers

You can set up the reload source address register, reload destination address register, and reload transfer count register any time (even during DMA transfer). As an exception, if you update the reload source address register, reload destination address register, and reload transfer count register during DMA transfer, there may be a conflict between reloading at the last transfer or address reload transfer and updating the reload register. In order to avoid this conflict, setting up reload registers must be completed before the last transfer or address reload transfer starts.

If you need to update the reload source address register, reload destination address register, and reload transfer count register during DMA transfer, one way to know the right timing of update is to use a DMA transfer count match interrupt. In this case, you must set up the DMA transfer count compare register (DTCCn) so that you can have enough margin for the time necessary to update the reload registers.

7.2.3.5 Timing of Setting DTS Reload Registers

It should be noted that the right timing of setting up the reload source address information, reload destination address information, and reload transfer count information differs depending on the transfer mode.

In the single transfer mode, the TI fetched at the beginning of the last transfer or address reload transfer is used for reload at the completion of the DMA cycle. Therefore, if you use the reload function for single transfer, the reload source address information, reload destination address information, and reload transfer count information in the TI must be set up before the beginning of the last transfer or address reload transfer.

During block transfer, TI is fetched only at the beginning of DMA transfer. The TI fetched at the beginning of the DMA transfer is used for reload at the last transfer or address reload transfer. Therefore, if you use the reload function for block transfer, the reload source address information, reload destination address information, and reload transfer count information in the TI must be set up before the beginning of the DMA transfer. If you update the reload source address information, reload destination address information, and reload transfer count information in the TI in the middle of a block transfer, those new settings will not be used for reload at the completion of the block transfer.

7.2.4 Chain Function

7.2.4.1 Overview

DMA offers a function called chain function. If you use the chain function, the completion of the DMA cycle or last transfer for one channel can trigger a DMA transfer request for another channel. A DMA transfer request for another channel initiated by the chain function is called a chain request.

You can select the condition for generating a chain request from the following two options.

- Always chain: A chain request is generated at the completion of every DMA cycle.
- Chain at the last transfer: A chain request is generated at the completion of the last transfer.

Figure 7.9 shows an operation of the case “always chain”.

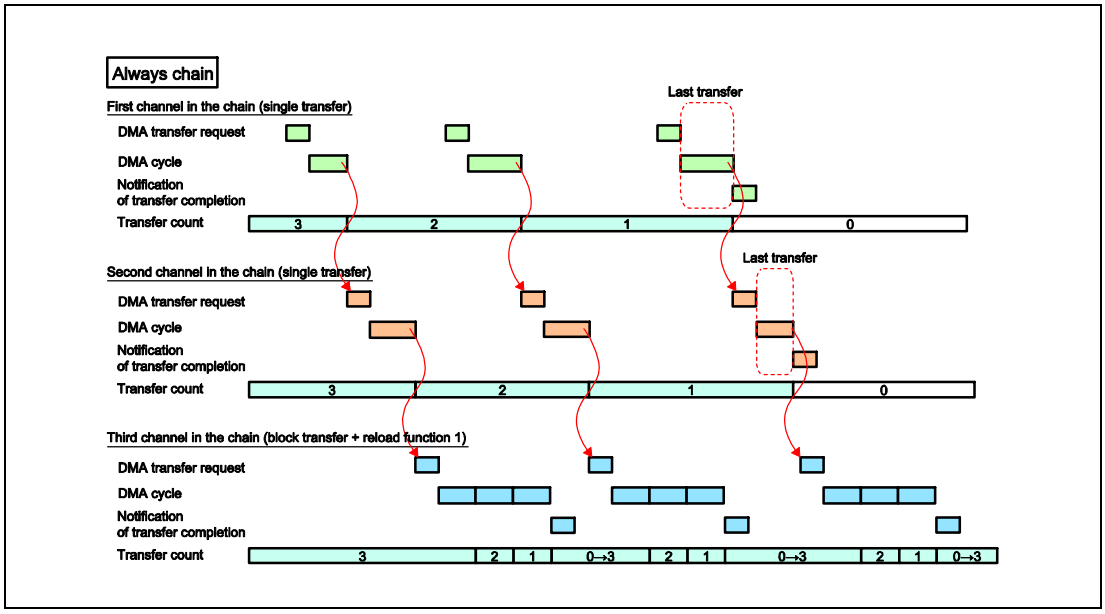

Figure 7.9 Operation of the Case “Always Chain”

shows an operation of the case “chain at the last transfer”.

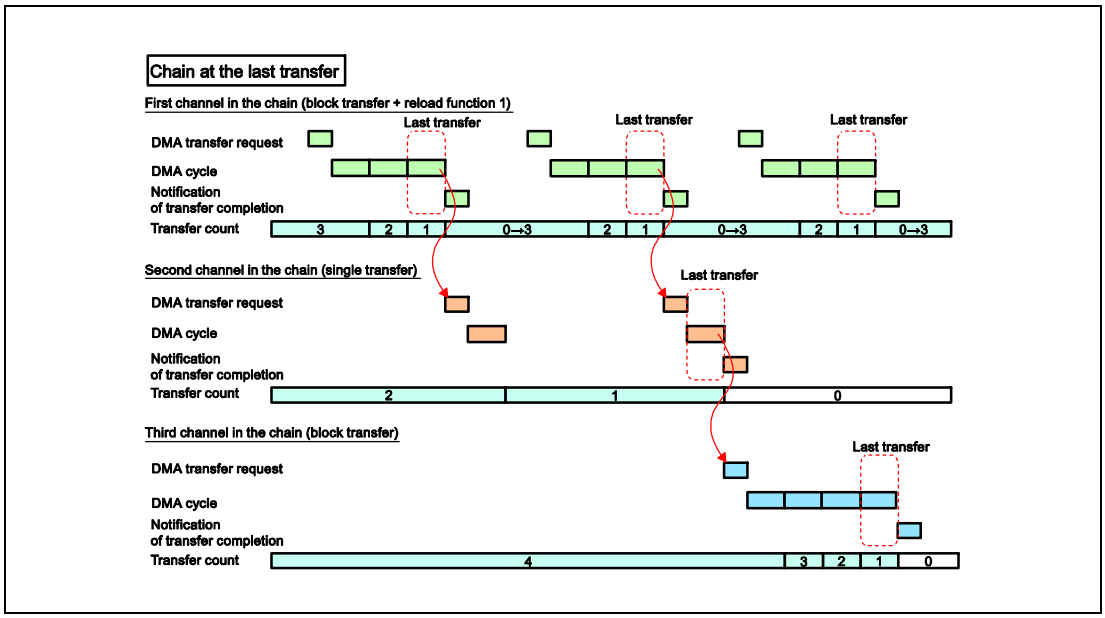

Figure 7.10 Operation of the Case “Chain at the Last Transfer”.

7.2.4.2 Setting Up the Chain Function

For a DMAC, you need to write to the chain enable (DTCTn.CHNE) and the next channel in the chain selection (DTCTn.CHNSEL) in the DMAC transfer control register in order to set up the type of chain function and the next channel number in the chain.

For a DTS, you need to write to the chain enable (DTTCTnnn.CHNE) and the next channel in the chain selection (DTTCTnnn.CHNSEL) in the DTS transfer control register in order to set up the type of chain function and the next channel number in the chain.

7.2.4.3 Caution for Using the Chain Function

The chain function sets the software DMA transfer request flag of the next channel in the chain as a part of its function. Therefore, you need to set up the channel settings of the next channel in the chain in the same way as when the software DMA transfer request is used. If you specify a channel using the hardware DMA transfer request for the next channel in the chain, the chain function does not work.

A channel and its next channel in the chain must belong to the same module (DMAC0, DMAC1, and DTS). You cannot specify a channel in another module for its next channel in the chain.

7.2.5 DMAC Operation

7.2.5.1 Types of DMA Transfer Requests and Assigning DMA Transfer Requests

A DMAC starts DMA transfer by accepting a hardware DMA transfer request or software DMA transfer request. The DMA transfer request selection assignment (DRS) bit in the DMAC transfer control register (DTCTn) determines whether a hardware DMA transfer request or a software DMA transfer request is used.

In the case of a hardware DMA transfer request for a DMAC, one out of 128 hardware DMA transfer sources is selected and assigned for each channel of the DMAC in the DTFR. This assignment is configured in the DTFR setting registers.

7.2.5.2 Generating and Accepting a Hardware DMA Transfer Request

DMAC can handle an edge-detection type of hardware DMA transfer source.

(1) Edge-detection type

In case of using edge-detection type, DTFR detects a rising edge of hardware DMA transfer source input and keeps it as a hardware DMA transfer request. DTFR also notifies DMAC of the existence of hardware DMA transfer request. When DTFR receives acknowledgement of hardware DMA transfer request from DMAC, DTFR clears hardware DMA transfer request.

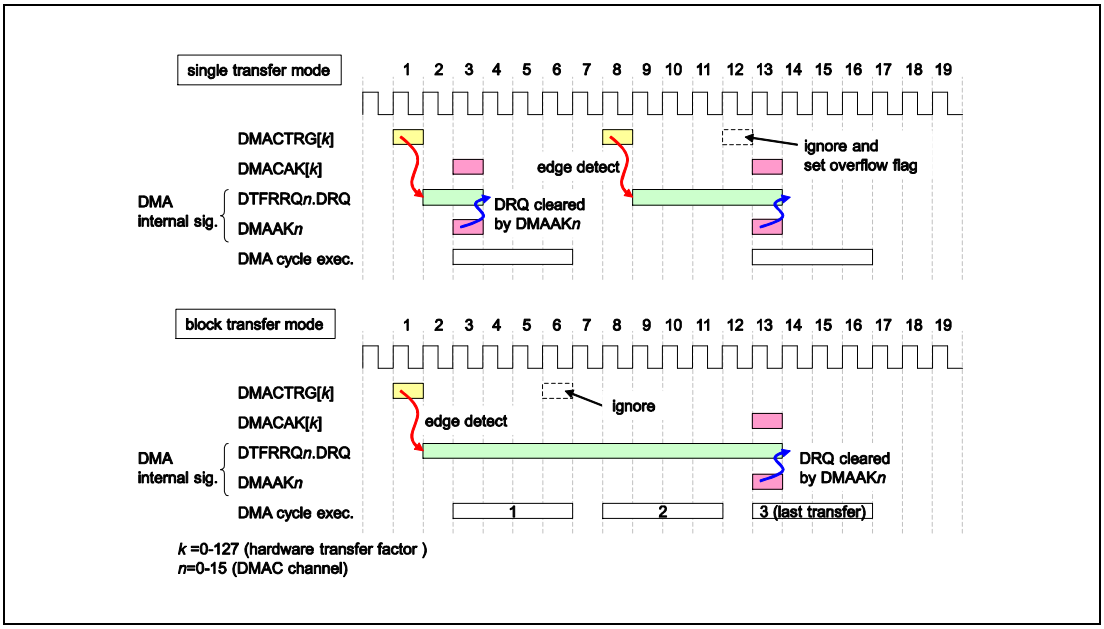

Figure 7.11 Operation of hardware DMA transfer request by DMAC (Edge-detection type)

In case of edge-detection type, DTFR can keep one hardware DMA transfer request per channel. If DTFR keeps a hardware DMA transfer request for a channel and additional rising edge of hardware DMA transfer source is inputted for the same channel, DTFR set the hardware DMA transfer request overflow flag of corresponding channel.

(2) The Timing of Hardware DMA Transfer Acknowledgement Notification

The timing that DMA asserts the acknowledgement of hardware DMA transfer request (DMACAK) is different between DMA transfer modes.

- In case of single transfer, DMACAK is asserted at each time when DMA acknowledges hardware DMA transfer request.
- In case of block transfer 1, DMACAK is asserted when DMA executes final transfer.
- In case of block transfer 2, DMACAK is asserted when DMA executes address reload transfer.

CAUTION

Caution about the operation of DTFR hardware DMA transfer source selection enable bit during block transfer.

Be careful about the following operation when DMAC is used both with hardware DMA transfer request and with block transfer (1 or 2) mode.

If DTFR hardware DMA transfer source selection enable bit is set to disable (DTFRn.REQEN = 0) by software while DMAC is executing block transfer, the ongoing block transfer is suspended.

When DMAC is used both with hardware DMA transfer request and with block transfer (1 or 2) mode, it is recommended not to modify DTFR hardware DMA transfer source selection enable bit (DTFRn.REQEN) by software while DMAC is executing block transfer. It is also recommended to use DTCT.MLE bit to control the acknowledgement of succeeding hardware DMA transfer requests.

DTFR hardware DMA transfer request bit (DTFRRQn.DRQ) is kept set during block transfer and is cleared at the start of last transfer. (see the bottom figure of **Figure 7.12**). If DTFR hardware DMA transfer source selection enable bit is set to disable (DTFRn.REQEN = 0) by software while DMAC is executing block transfer, the hardware DMA transfer request is going to be masked and as a result DMAC cannot recognize the existence of hardware DMA transfer request.

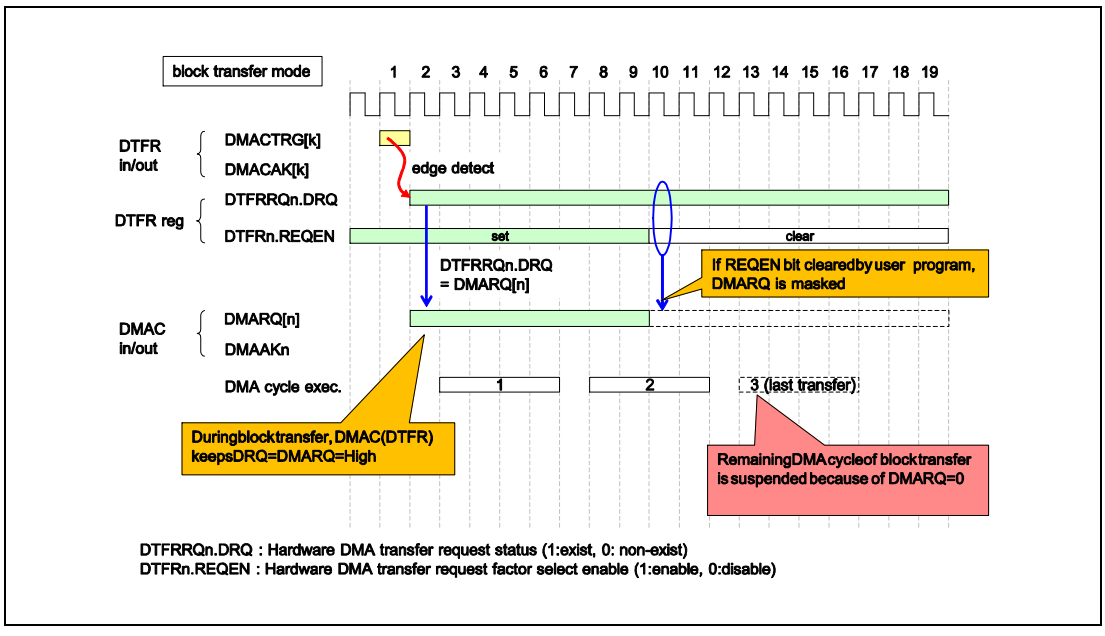

Figure 7.12 Caution about the operation of DTFR hardware DMA transfer source selection enable bit during block transfer

This caution does not apply to the following situations.

- The case that DMAC is used both with hardware DMA transfer request and with single transfer.
- The case that DMAC is used with software DMA transfer request.
- The case that DTS is used.

7.2.5.3 Generating and Accepting a Software DMA Transfer Request

By setting the software DMA transfer request flag (SR) in the DMAC transfer status register (DCSTn) using the DMAC transfer status set register (DCSTSn), a software DMA transfer request can be generated.

The software DMA transfer request flag is automatically cleared when the DMAC processes the DMA transfer request. The timing when the software DMA transfer request flag is automatically cleared differs depending on the transfer mode of the DMA transfer to be executed.

- In the single transfer mode, the software DMA transfer request flag is cleared whenever the software DMA transfer request is accepted.
- In the block transfer 1 mode, the software DMA transfer request flag is cleared when the last transfer starts.
- In the block transfer 2 mode, the software DMA transfer request flag is cleared when the last transfer or address reload transfer starts.

The software DMA transfer request flag can also be cleared by software using the DMAC transfer status clear register (DCSTCn). When you abort a DMA transfer of a DMAC channel, you must clear the software DMA transfer request flag.

7.2.5.4 Execution of DMA transfer

The DMAC block executes the DMA transfer of the accepted channel. DMAC arbitration is done, when two or more channels request transfers at the same time.

Figure 7.13 shows one example of the DMAC transfer timing in single transfer mode, starting with a transfer count of 2.

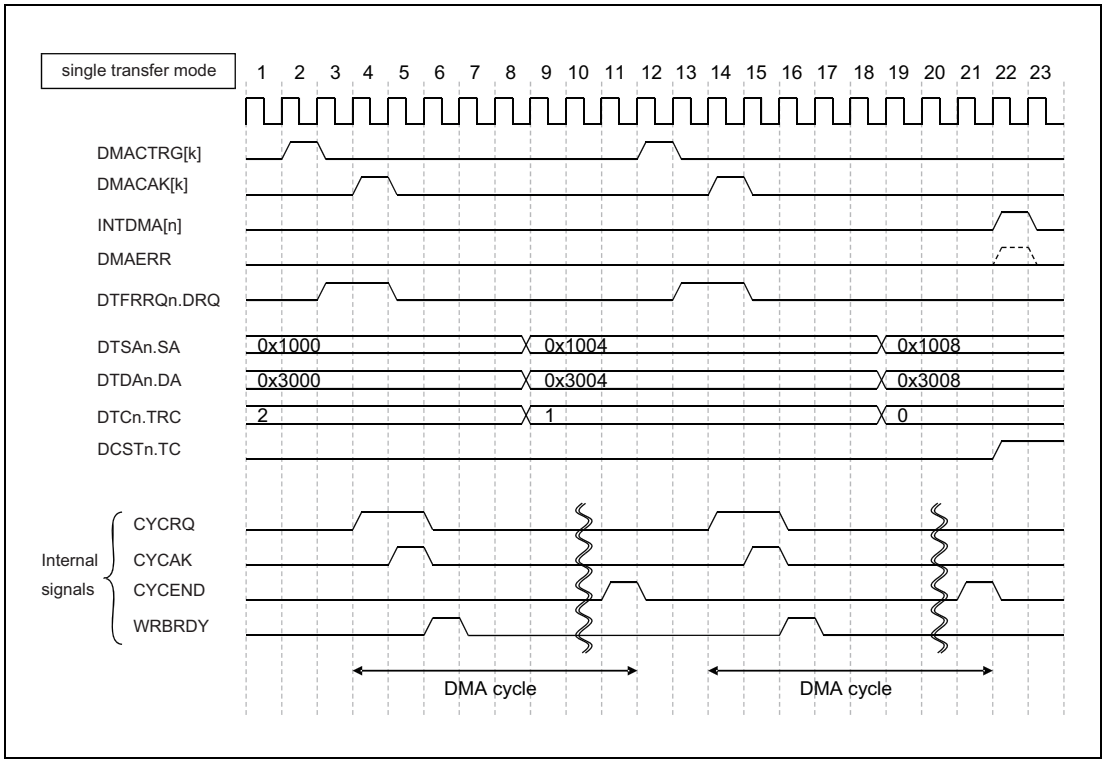

Figure 7.13 Example of DMA transfer timing in single transfer mode

Figure 7.14 shows an example of the DMAC transfer timing in block transfer mode, starting with a transfer count of 2.

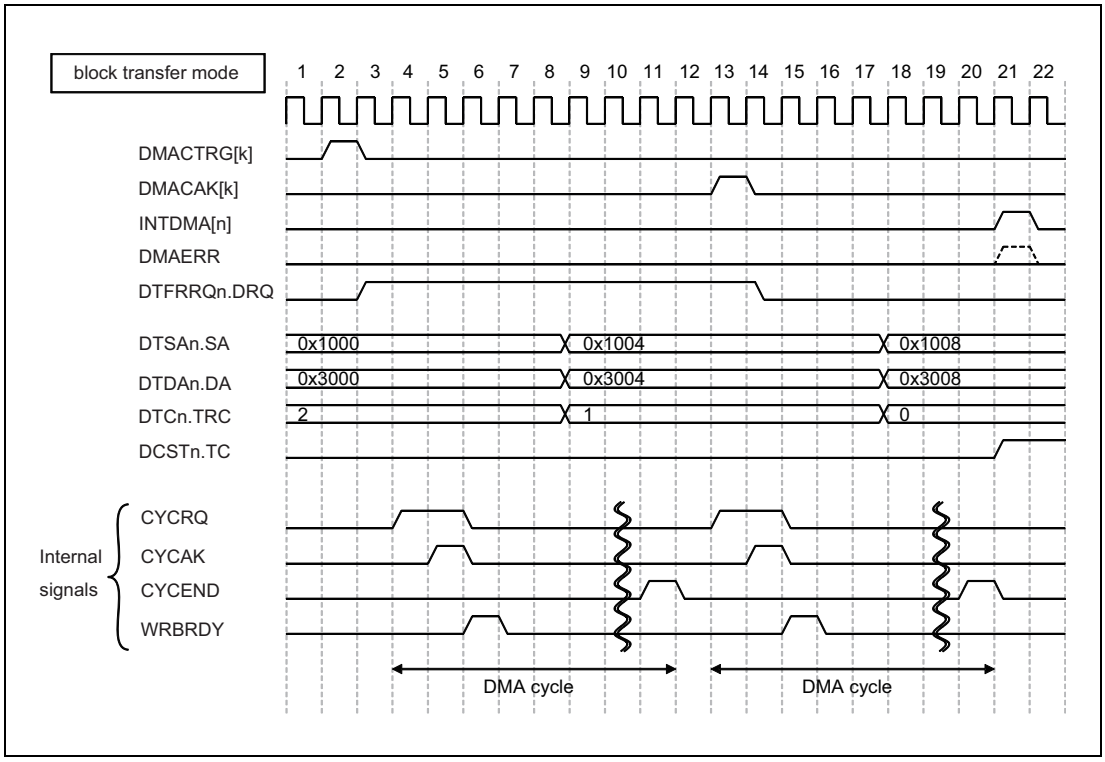

Figure 7.14 Example of DMA transfer timing in block transfer mode

Figure 7.15 shows the timing, in which the source address register, the destination address register, the transfer count register and the transfer completion flag are updated.

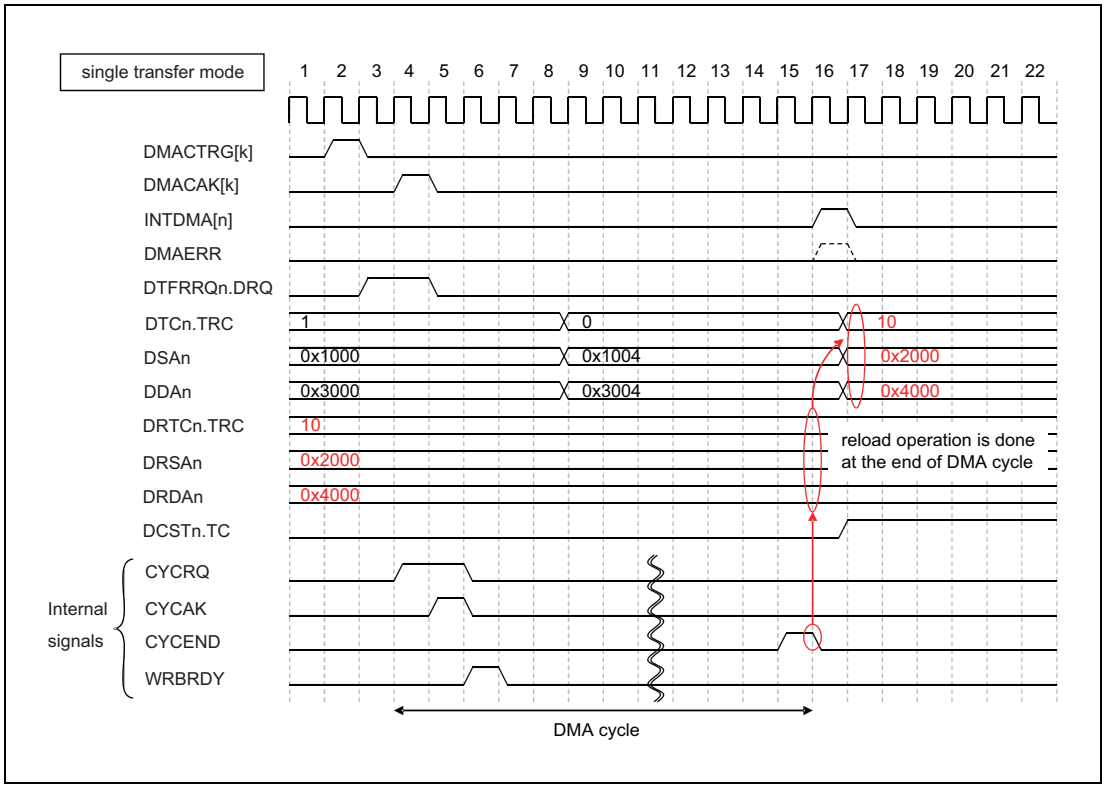

Figure 7.15 Example of DMA transfer timing with reload function 1

7.2.6 DTS Operation

7.2.6.1 Types of DMA Transfer Requests and Assigning DMA Transfer Requests

A DTS starts DMA transfer by accepting a hardware DMA transfer request or software DMA transfer request.

A transfer request for a DTS is retained in the transfer request pending bit of the DTSFSL for each channel.

As for the DTSFSL, both a hardware DMA transfer request and a software DMA transfer request are retained in the same transfer request pending bit. When executing DMA transfer, a DTS does not care whether a DMA transfer request is a hardware DMA transfer request or software DMA transfer request.

In the case of a hardware DMA transfer request for a DTS, each of 128 hardware DMA transfer sources is assigned to one of 128 channels in the DTSFSL in the fixed manner. You cannot change this assignment by, for example, register settings.

7.2.6.2 Generating and Accepting a DMA Transfer Request

When the DTSFSL detects a hardware DMA transfer source input, the DTSFSL sets the transfer request pending bit and retains the hardware DMA transfer source as a DMA transfer request. If the transfer request pending bit is set and the transfer request enable bit (DTFSLnnn.REQEN) in the DTSFSL operation setting register is set, the DTSFSL notifies the DTS of the DMA transfer request.

Software can also generate a DMA transfer request by setting the transfer request pending bit (DTFSTnnn.DRQ) using the DTSFSL transfer request set register (DTFSSnnn).

The DTSFSL can retain only one DMA transfer request per channel. If, while the transfer request pending bit for a channel is set, a new hardware DMA transfer source input for the same channel comes, DTSFSL sets request overflow flag of corresponding channel.

When the DTS accepts a DMA transfer request, it notifies of the acceptance of the DMA transfer request.

The transfer request pending bit is automatically cleared when the DTS accepts the DMA transfer request. The DTSFSL clears the transfer request pending bit automatically when the DTS accepts the DMA transfer request regardless of the type of the DMA transfer to be executed by the DTS.

The transfer request pending bit can also be cleared using the DTSFSL transfer request clear register (DTFSCnnn). If the transfer request pending bit of a channel is cleared before the DTS accepts the DMA transfer request, DMA transfer of the channel is not executed.

7.2.6.3 Executing DMA Transfer

When the DTS accepts a DMA transfer request for a channel, the DTS executes DMA transfer of the channel. If there are DMA transfer requests from multiple channels, the DTSFSL arbitrates the DTS channels and picks up one channel for a DMA transfer request.

While the DTS is executing DMA transfer, the DTS transfer status (DTSSTS.DTSACT) bit in the DTS status register is set. In addition, the channel number of the currently ongoing DMA transfer is set in the DTS transfer channel (DTSSTS.DTSACH).

When the DMA transfer is complete or aborted because of DMA transfer error or writing to registers and no channel is currently executing DMA transfer, the DTS transfer status (DTSSTS.DTSACT) bit is cleared.

Figure 7.16 shows an example of a single DTS transfer. Note that the drawing shows also internal states, which are not reflected in registers. The DTS transfer is accepted in cycle 5, which causes fetching the transfer information (TI) in cycles 6 to 14. The DMA cycle is executed in cycles 15 to 23 and the TI information is written back in cycles 24 to 28. The state changes to idle and the DTS waits for the next DMA request. This picture is an example and the clock cycles of each phase may differ from the depicted flow.

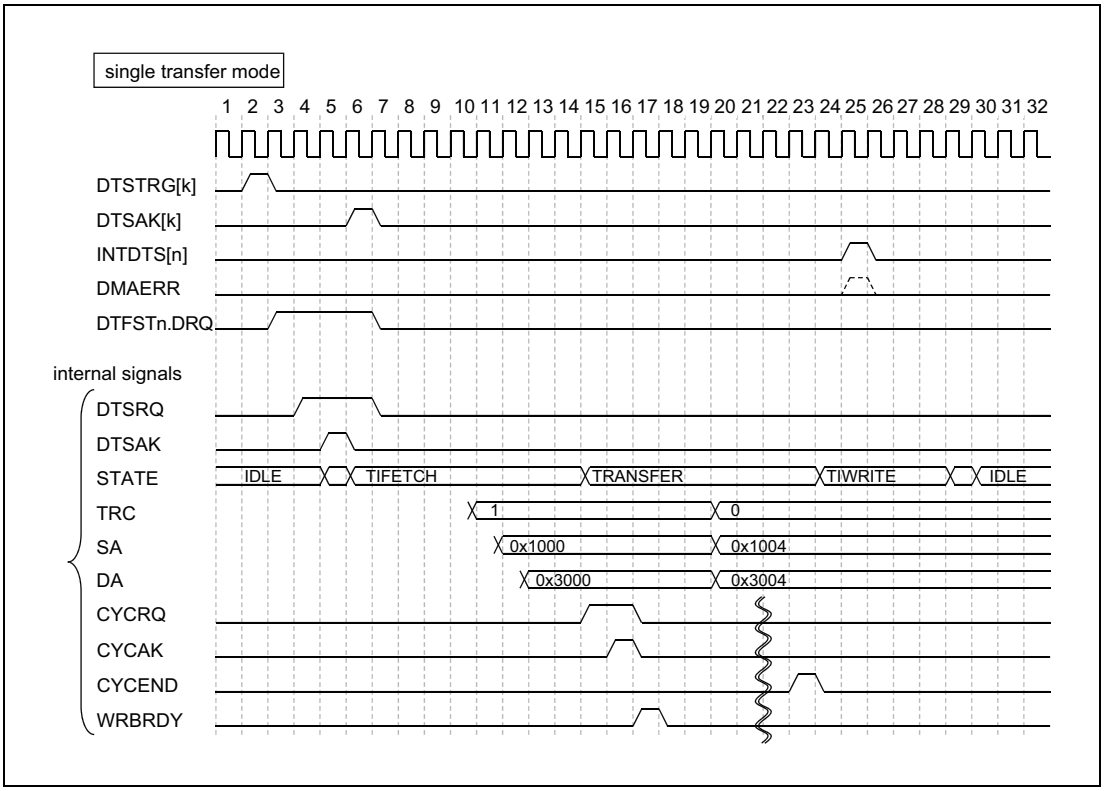

Figure 7.16 DTS single transfer timing

Figure 7.17 shows an example of a DTS block transfer. The DTS transfer is accepted in cycle 5, which causes fetching the transfer information (TI) in cycles 6 to 10. Three transfers are executed in cycles 11 to 25 and the TI information is written back in cycles 26 to 30. In cycle 32, the state changes to idle and the next DMA transfer can be executed.

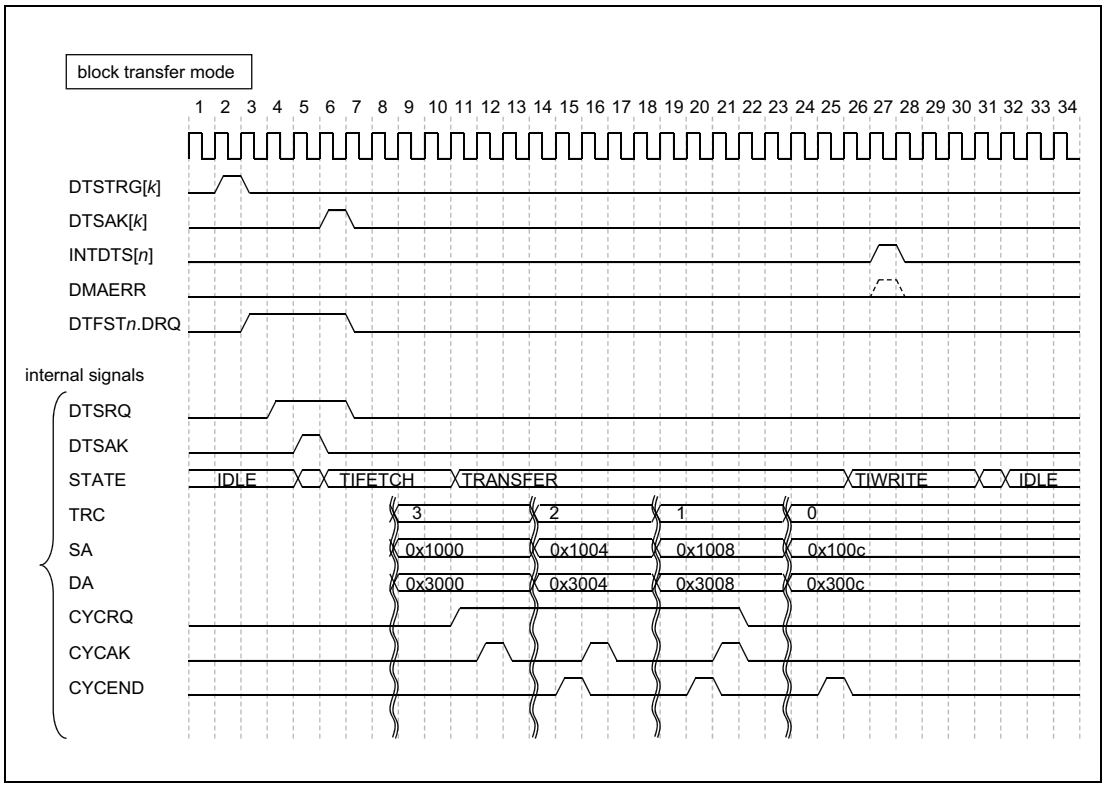

Figure 7.17 DTS block transfer timing

7.2.6.4 DTSRAM Access

A DTS accesses the DTSRAM when DMA transfer starts and finishes.

A DTS's action of reading transfer information from the DTSRAM when DMA transfer starts is called TI fetch.

A DTS's action of updating the transfer information on the DTSRAM when DMA transfer finishes is called TI write back.

A single transfer performs a TI fetch at the beginning of a DMA cycle and a TI write back at the end of a DMA cycle.

A block transfer performs a TI fetch at the beginning of the first DMA cycle and a TI write back at the end of the DMA cycle that satisfies the block transfer completion condition (the last transfer or address reload transfer).

Therefore, in the case of single transfer, the transfer information on the DTSRAM is updated for each DMA cycle. In the case of block transfer, the transfer information on the DTSRAM is updated after the completion of the block transfer. If software reads the transfer information on the DTSRAM during execution of a block transfer, the transfer information at the beginning of the block transfer is read.

Table 7.6 Number of TI fetch cycles when not using the chain function

Transfer mode	Reload Function 1	Reload Function 2	Transfer count	Address reload count	TI fetch cycles
Single transfer	disabled	enabled	—	1	12 cycles
	enabled	disabled	1	—	
		enabled	>1	1	
			1	—	
Block transfer 1	disabled	enabled	—	Not zero	
	enabled	—	—	—	
Block transfer 2	disabled	enabled	—	Not zero	
	enabled	—	—	—	
All other transfers					9 cycles

7.2.6.5 DTS Interrupt Merge function

A DTS interrupt merger maps 32 DTS interrupt request output signals into one interrupt request input signal of the interrupt controller. Four such mergers are implemented for the 128 DTS transfer completion interrupts and four others for the 128 DTS count match interrupts. The status of a DTS interrupt is available in the DTS interrupt status register (PINT0 to PINT7). Writing the DTS interrupt clear registers (PINTCLR0 to PINTCLR7) resets these flags.

Table 7.7 DTS Interrupt-Related Registers

Interrupt Source	DTS Channel	DTS Interrupt Status Register	DTS Interrupt Clear Register
DTS transfer completion interrupt	0 to 31	PINT0	PINTCLR0
	32 to 63	PINT1	PINTCLR1
	64 to 95	PINT2	PINTCLR2
	96 to 127	PINT3	PINTCLR3
DTS transfer count match interrupt	0 to 31	PINT4	PINTCLR4

	96 to 127	PINT7	PINTCLR7

(1) DTS Interrupt Processing Flow

Figure 7.18 shows the DTS interrupt request flow.

- When only one interrupt request is generated out of bundled 32 interrupt sources
  - The bit corresponding to the interrupt request in the PINTn register is set to 1 and an interrupt request is output.
  - When the interrupt processing has been completed, write 1 to the clear register (PINTCLRn) to clear the interrupt request. The INTC waits for another interrupt request.
- When multiplex interrupt requests are generated out of bundled 32 interrupt sources
  - The highest-priority bit (interrupts on the lower-bits side take precedence) out of bits with interrupt request is extracted and only the extracted bit in the PINTn register is set to 1, and an interrupt request is output.
  - When the interrupt processing has been completed, write 1 to the clear register (PINTCLRn) to clear the highest-priority interrupt request.
  - After the highest-priority interrupt request has been cleared, the second highest-priority interrupt request is accepted. The corresponding bit in the PINTn register is set to 1 in the same way as before, and an interrupt request is output.
  - These steps are repeated until all interrupt sources bundled into 32 bits are cleared.

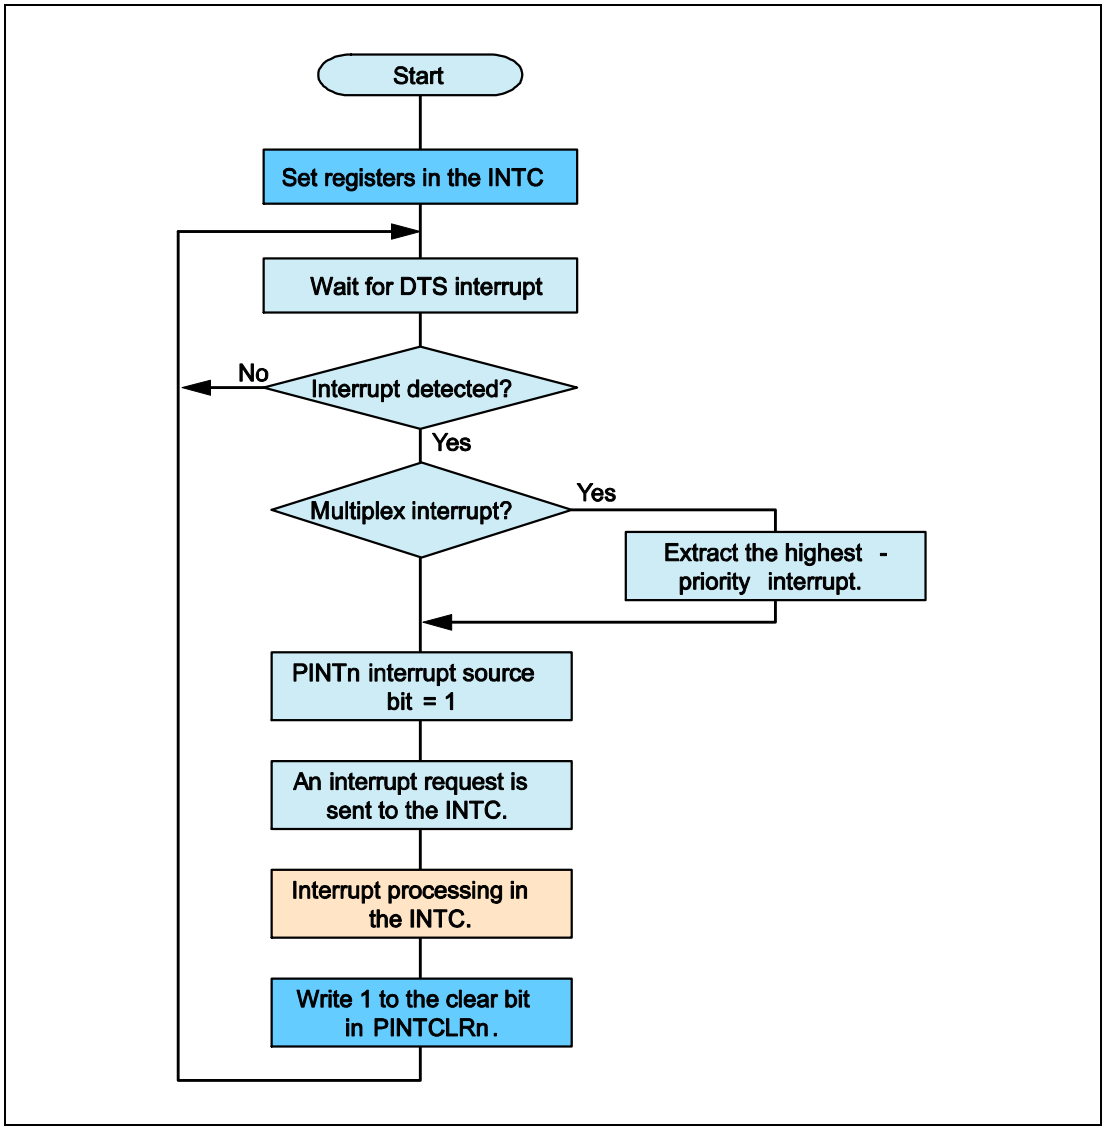

Figure 7.18 DTS Interrupt Processing Flow

7.2.6.6 DTS Trigger Select function

Many DTS channels can be triggered by one of two alternative trigger sources. See **Table 7.13** for the supported assignments. The DTS select function selects the primary or secondary trigger input for each DTS channel.

Table 7.8 DTS Trigger Select Registers

Register Name	Function	DTS Channels
DTSTRGSEL0 (See **Section 7.13.1.1**)	DTS primary/secondary select register 0	0 to 31
DTSTRGSEL1 (See **Section 7.13.1.2**)	DTS primary/secondary select register 1	32 to 63
DTSTRGSEL2 (See **Section 7.13.1.3**)	DTS primary/secondary select register 2	64 to 95
DTSTRGSEL3 (See **Section 7.13.1.4**)	DTS primary/secondary select register 3	96 to 127

7.3 Temporarily Suspending DMA transfers

DMA transfers can be temporarily suspended by disabling individual channels or the whole DMA controller. All DMA transfers are suspended, by setting the DMACTL.DMASPD bit. Setting the DTSCTL1.DTSUST bit suspends DTS transfers. Each DMAC and DTS channel can hold one DMA request during executing DMA cycle, even if transfers are suspended or if the respective channel is disabled. Any additional transfer request is lost if a channel has already held a DMA request. Lost transfers due to such overflows are reported by the DTFRRQn.OVF and DTFSTnnn.OVF flags, again also during suspend and disable states.

7.3.1 Suspension, restart and abortion a DMAC channel

DMA transfers for individual channels can be suspended by clearing the DCENn.DTE bit of that channel. A DMA cycle, which is ongoing while DTE is cleared, will be finished. DMA transfers resume, when DTE is set. As one DMA transfer request is stored during suspension, it is recommended to clear the hardware DMA transfer request in the DTFR in the case of a hardware DMA transfer request, the software DMA request flag DCSTn.SR by writing the register flag clear command into DCSTCn.SRC in the case of a software DMA transfer request, if the DMA transfer shall be entirely stopped.

In case that the continuous transfer enable bit (DTCTn.MLE) is set, the channel operation enable bit (DCENn.DTE) is kept to be set. Even though the channel operation enable bit (DCENn.DTE) is cleared by software during a DMA cycle in a last transfer, the function of the continuous transfer enable bit (DTCTn.MLE) is given high priority and the channel operation enable bit (DCENn.DTE) is set after completion of the last transfer. If you want to abort an ongoing DMA transfer of a DMAC channel when continuous transfer function is enabled, please clear the continuous transfer enable bit (DTCTn.MLE) first and then clear the channel operation enable bit (DCENn.DTE) to abort DMA transfer of the DMAC channel. Only for the operation, DMAC Transfer Control Register (DTCTn) can be written under the channel operation is enabled (DCENn.DTE = 1).

Figure 7.19 shows an example of suspending, restarting and aborting DMA transfers. Both channels 0 and 1 execute block transfers. Channel 1 begins its transfer at t1 and is interrupted by the higher priority channel 0 at t2. The channel 0 transfers end at t3 and channel 1 resumes its transfer, which ends at t4. At t5, channel 1 starts the next block transfer, which is again interrupted at t6 due to the higher priority of channel 0. At t7, channel 0 is suspended and therefore channel 1 can finish its block transfer at t8. At t9, channel 0 has been restarted and it resumes its block transfer until it is again suspended at t10. At t11, the DMA channel 0 is stopped and the ongoing block transfer is aborted. Therefore, no further transfer is started at t12.

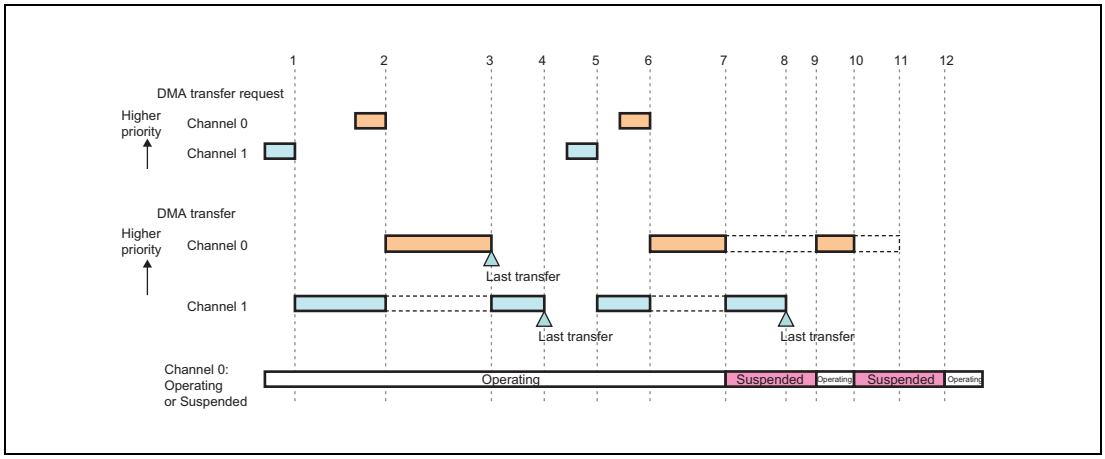

Figure 7.19 Example of Suspension, Resume, and Transfer Abort of a DMAC Channel

7.3.2 Suspension, Resume, and Transfer Abort of a DTS

You can suspend the DMA transfer executed by a DTS by setting the DTS suspend bit (DTSCTL1.DTSUST) in the DTS control register 1. If a DMA cycle is ongoing, the DMA transfer is suspended at the timing when the DMA cycle is finished. If the ongoing DMA cycle is a single transfer or a transfer that completes a block transfer (the last transfer or address reload transfer), the DMA transfer is suspended after a TI write back after the completion of the DMA cycle. If the ongoing DMA cycle is a type other than the above, the DMA transfer is suspended after the completion of the DMA cycle without a TI write back. If you resume the DMA transfer while the DMA transfer is suspended, clear the DTS suspend bit in the DTS control register 1.

If you want to abort the currently ongoing DMA transfer executed by a DTS, suspend the DTS as described above, and then set the DTS transfer abort request bit (DTSCTL2.DTSTIT) in the DTS control register 2 to abort the currently suspended DMA transfer. If transfer is aborted, no TI write back is executed. In addition, aborting the DMA transfer does not change the value of the DTS suspend bit (DTSCTL1.DTSUST). If you want the DTS to accept another DMA transfer request after the abort, clear the DTS suspend bit.

Figure 7.20 shows an example of suspension, resume, and transfer abort of a DTS.

In **Figure 7.20**, channels 0, 1, and 2 are executing block transfer. At time tick 1, a DMA transfer request for channel 1 is accepted and DMA transfer starts. At time tick 2, DMA transfer requests for channels 0 and 2 are generated. At time tick 3, the last transfer of channel 1 is complete, and as a result of DTS channel arbitration, a DMA transfer request for channel 0 is accepted, and DMA transfer of channel 0 starts because channel 0 has a higher priority than channel 2. At time tick 4, the last transfer of channel 0 is complete, and DMA transfer of channel 2 starts. At time tick 5, the DTS is put into the suspended state, and the DMA transfer of channel 2 is suspended. At time tick 6, DMA transfer requests for channels 0 and 1 are generated. At time tick 7, the suspended state for the DTS is cleared, and the DMA transfer of channel 2, which has been suspended in the middle of a block transfer, is resumed. If DMA transfer is suspended in the middle of a block transfer, no DTS channel arbitration is done when it is resumed. At time tick 8, the last transfer of channel 2 is complete, and as a result of DTS channel arbitration, a DMA transfer request for channel 0 is accepted and the DMA transfer starts because channel 0 has a higher priority than channel 2. At time tick 9, the DTS is put into the suspended state, and at time tick 10, the suspended DMA transfer of channel is aborted. When the suspended state of the DTS 0 is cleared at time tick 11, DMA transfer of channel 1 starts because there is no currently ongoing DMA transfer and channel 1 is the only channel with a DMA transfer request.

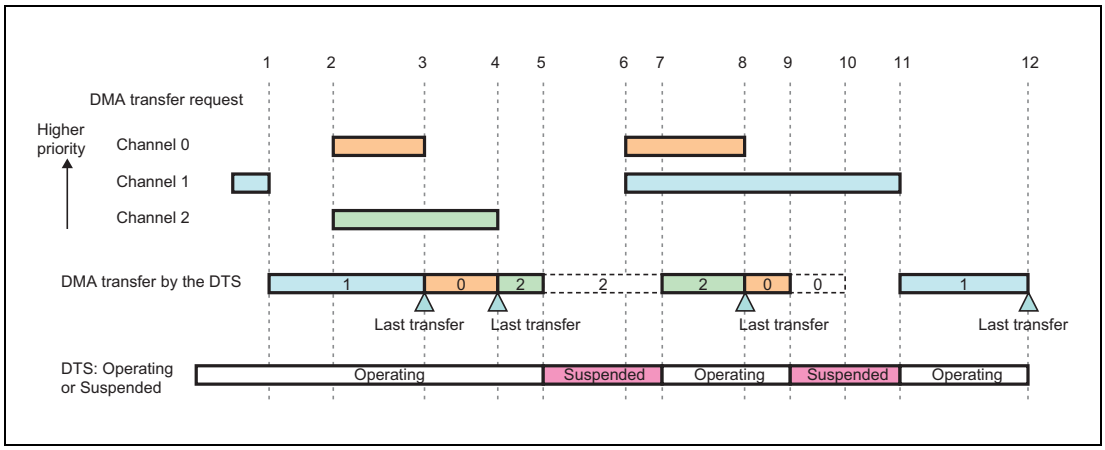

Figure 7.20 Example of Suspension, Resume, and Transfer Abort of a DTS

7.3.3 Masking and Clearing a Hardware DMA Transfer Request by the DTFR

If a DMAC uses a hardware DMA transfer request, you can temporarily disable (mask) the hardware DMA transfer request output from the DTFR to the DMAC by clearing the hardware DMA transfer source selection enable bit (DTFRn.REQEN) in the DTFR setting register.

Also, if a hardware DMA transfer source is used, you can clear a hardware DMA transfer request retained in the DTFR by using the hardware DMA transfer request clear (DTFRRQCn.DRQC) bit in the DTFR transfer request clear register.

Even if you suspend or abort DMA transfer of a DMAC channel, the hardware DMA transfer request selection/hold circuit of the DTFR is still running, and consequently, the DTFR may retain a hardware DMA transfer request that came to the DTFR during the suspension or transfer abort period of the DMAC channel. When you resume or start DMA transfer of a DMAC channel, clear the hardware DMA transfer request retained in the DTFR as required.

Be careful that if DTFR hardware DMA transfer source selection enable bit is set to disable (DTFRn.REQEN = 0) by software while DMAC is executing block transfer, the ongoing block transfer is suspended. (see **Section 7.2.5.2, Generating and Accepting a Hardware DMA Transfer Request**)

7.3.4 Masking and Clearing a Hardware DMA Transfer Request by the DTSFSL

As for a DTS, you can temporarily disable (mask) a DMA transfer request from a channel to the DTS by clearing the transfer request enable bit (DTFSLnnn.REQEN) in the DTSFSL operation setting register. (The masking is actually done by excluding the channel from the candidates in DTS channel arbitration in the DTSFSL.)

Also, you can clear a DMA transfer request retained in the DTSFSL by using the transfer request clear (DTFSCnnn.DRQC) bit in the DTSFSL transfer request clear register.

Regardless of the state of the DTS and the transfer request enable bit (DTFSLnnn.REQEN) of the DTSFSL, the DTSFSL always monitors the hardware transfer source input from outside, and a DMA transfer request for a channel is set when a hardware transfer source for the channel is input to the DTSFSL. When you resume or start DTS transfer, clear the hardware DMA transfer request retained in the DTSFSL as required.

7.3.5 List of Suspend, Resume, and Transfer Abort Functions

Table 7.9 List of Suspend, Resume, and Transfer Abort Functions

Function	How to execute the function	Operation	Possibility of DMA transfer abort	Master that can execute the function (See Section 7.5, Reliability Function.)
DMA suspension and resume by software control	Setting and clearing the DMACCTL.DMASPD.	All channels are in the suspended state.	Not possible *1	Special master
Suspension and resume of a DMAC channel	Clearing and setting the DCENn.DTE in each channel register.*2	DMA transfer of a channel is suspended.	Possible (by clearing the DMA transfer request flag during suspension)	Special master, and general master assigned to the channel.
Suspension and resume of a DTS	Setting and clearing the DTSCTL1.DTSUST.	DMA transfer of a DTS is suspended.	Possible (by setting the DTSCTL2.DTSTIT during suspension)	Special master

Note 1. In order to abort DMA transfer, you need to either abort transfer for the DMAC channel or abort transfer for the DTS.

Note 2. In case that the continuous transfer enable bit (DTCTn.MLE) is set, please clear (or set) the continuous transfer enable bit (DTCTn.MLE) first.

7.4 Error Control

7.4.1 Type of Error

DMA can generate the following two types of errors.

- DMA Transfer Error
  DMA transfer errors are generated by ECC errors or by guard violations.
  Guard errors in the read cycle or write cycle, ECC errors may occur in the read cycle. This error can be generated in all DMAC and DTS channels during execution of DMA transfer.
- DTSRAM Error
  A DTSRAM error is generated when an ECC error is detected by the DTSRAM read access, which is performed by the DTS when fetching the transfer information.

Both DMA Transfer Error types are propagated to the same input of the Error Control Module, DTSRAM Error types are propagated to other inputs. In detail please refer **29.3.1 Error Input** of **Section 29, Error Control Module (ECM)**.

7.4.2 DMA Transfer Error

7.4.2.1 Operation of a DMAC When DMA Transfer Error Occurs

When DMA transfer error occurs in a DMAC, the transfer error flag (DCSTn.ER) in the DMAC transfer status register of the channel with the DMA transfer error. The DMAC error register (DMACER) shows the transfer error flags of all 16 DMAC channels.

While the transfer error flag of a channel is set, a new DMA cycle is not executed if the transfer error case DMA transfer disable setting (DTCTn.ESE) bit is set. On the other hand, a DMA cycle is executed regardless of the value of the transfer error flag if the transfer error case DMA transfer disable setting (DTCTn.ESE) bit is cleared.

If you want to abort the DMA transfer of a channel with DMA transfer error, follow the procedure to abort DMA transfer of the DMAC channel.

If DMA transfer error occurs during the read cycle of a DMA cycle, the write cycle is not executed. If DMA transfer error occurs during the write cycle of a DMA cycle, the validity of the write is not guaranteed.

Regardless of whether DMA transfer error occurs in the read cycle or write cycle of a DMA cycle, the source address, destination address, transfer count, and address reload count registers are updated.

7.4.2.2 Operation of a DTS When DMA Transfer Error Occurs

When DMA transfer error occurs in a DTS, the DTS error flag (DTSER1.DTSER) in the DTS error register is set, and the DTS channel number with the DMA transfer error is stored in the DTS error channel (DTSER1.DTSERCH) in the same register.

If DMA transfer error occurs in a single transfer, a TI write back is executed to finish the DMA cycle.

If DMA transfer error occurs in the middle of a block transfer and the transfer error case DMA transfer abort setting (DTTCTnnn.ESE) is set, the remaining DMA cycles in the block transfer are not executed, but a TI write back is executed to finish the DMA cycle. At the same time, the DTS transfer status (DTSSTS.DTSACT) bit in the DTS status register is cleared. If DMA transfer error occurs in the middle of a block transfer and the transfer error case DMA transfer abort setting (DTTCTnnn.ESE) is cleared, the block transfer continues regardless of the DMA transfer error.

If DMA transfer error occurs during the read cycle of a DMA cycle, the write cycle is not executed. If DMA transfer error occurs during the write cycle of a DMA cycle, the validity of the write is not guaranteed.

Regardless of whether DMA transfer error occurs in the read cycle or write cycle of a DMA cycle, the source address, destination address, transfer count, and address reload count registers are updated, and the TI is updated by a TI write back.

If the DTS error flag in the DTS error register is set, a TI fetch is executed when the DTS accepts a DMA transfer request for the channel with the same channel number as the one stored in the DTS error channel. If, as a result of the TI fetch, the transfer error case DMA transfer abort setting (DTTCTnnn.ESE) is found to be set, a DMA cycle and a TI write back are not executed. If the transfer error case DMA transfer abort setting (DTTCTnnn.ESE) is cleared, DMA transfer is executed.

If the DTS error flag in the DTS error register is set, DMA transfer is executed when the DTS accepts a DMA transfer request for a channel with a channel number other than the one stored in the DTS error channel.

7.4.3 DTSRAM Error

There are two types of DTSRAM errors detected in the DTSRAM read access: ECC 1-bit error and ECC 2-bit error.

If an ECC 1-bit error is detected during a TI fetch, error corrected data is used, and DMA transfer continues. If an ECC 1-bit error is detected during DTS channel register access from software, error corrected data is returned as read data. In either case, the DTSRAM SEC error flag (DTSER2.RAMSED) in the DTS error register 2 is set, and the address of the error location in the DTSRAM is stored to the DTSRAM SEC error address (DTSER2.RAMSEDAD). In addition, the error is notified to the ECM according to DTSRAM error notification control register (DTRERINT.SEDIE).

If an ECC 2-bit error is detected during a TI fetch, handling of the DMA transfer request is terminated without executing a DMA cycle and TI write back. If an ECC 2-bit error is detected during DTS channel register access from software, peripheral bus error is notified. In either case, the DTSRAM DED error flag (DTSER2.RAMDED) in the DTS error register 2 is set, and the address of the error location in the DTSRAM is stored to the DTSRAM DED error address (DTSER2.RAMDEDAD). In addition, the error is notified to the ECM according to DTSRAM error notification control register (DTRERINT.DEDIE).

7.4.3.1 DTSRAM ECC Test

The proper generation of the error correction code of the DTS RAM can be tested with the following algorithm:

1. Make sure that the RAM location to be tested is not modified by any ongoing DTS transfer.
   It is recommended to disable DTS entirely.
2. Write 0x4000_0002 to DTSRAM Test Control Register (DTRTSCTL).
   Enable ECC Test Mode, encode ECC from write data.
3. Write data to any DTSRAM location.
4. Read data from the same DTSRAM location.
5. Check ECC data in DTSRAM Test Reading Data Register (DTRTRDAT).
6. Restore DTS activity as required.

7.4.3.2 Stimulation of DTSRAM ECC Error

DTSRAM ECC errors can be stimulated to test the proper operation of the error control module. The following algorithm can be used to stimulate such an ECC error:

1. Make sure that the RAM location to be tested is not modified by any ongoing DTS transfer.
   It is recommended to disable DTS entirely.
   The test is intended be done with ECC enabled and 1-bit error correction enabled (default setting of DTRECCTL).
2. Write 0x4000_0003 to DTSRAM Test Control Register (DTRTSCTL).
   Enable ECC Test Mode, write ECC from DTRTWDAT.TWDAT[6:0].
3. Write good or faulty ECC into DTRTWDAT.TWDAT[6:0].
4. Write data to any DTSRAM location.
5. Read data from the same DTSRAM location.
   good ECC should not generate an ECC error.
   faulty ECC should generate an ECC error.
6. Restore DTS activity as required.

7.5 Reliability Function

7.5.1 Overview

In this product, DMA is a resource used by multiple masters (PE). In order for DMA to support multi-core configuration, the following reliability functions are offered.

- Register access protection function
- Master information inherit function

7.5.2 Register Access Protection Function

This product is designed to assign each DMA channel to a PE.

The register access protection function allows access to the transfer information of each DMA channel from the master (PE) assigned to the channel but prohibits access from other masters.

The register access protection function prevents the channel settings from being updated by masters other than the one assigned to the channel. Please note that any master can always read all registers and that the DMAC/DTS controller cannot read or write its own registers.

7.5.2.1 Identifying the Accessing Master

DMA identifies a master based on the ID of the accessing CPU (PEID), the system protection ID configured by the accessing CPU (SPID), and the state of PSW.UM.

7.5.2.2 Special Master Access

The DMA subsystem handles accesses from a special master in UM = 0 as a special master access. In special master access, write access to all DMA registers is allowed. Both PE1 and PE2 can do special master accesses.

7.5.2.3 General Master Access

In master access, access to the following registers is allowed.

- Channel registers of the channels assigned by the channel assignment. (For details, see **Section 7.5.2.4, Channel Assignment**.)

In general master access, write access to registers other than the above is not allowed.

7.5.2.4 Channel Assignment

To each channel, DMA can assign a master (PE) so that the master is allowed to use the channel. Channel assignment is configured in the channel master setting register (DMnnCM in the case of a DMAC and DTSnnnCM in the case of a DTS) by the CPU in the supervisor mode.

In general master access, the master assigned to a channel by channel assignment is allowed to access the channel registers of the channel. If the channel registers of a channel is write accessed by a master other than the master assigned to the channel, the access is called illegal access. For information about illegal access, see **Section 7.5.2.5, Illegal Access**.

7.5.2.5 Illegal Access

DMA handles the following access as illegal access.

(a) General master write access to the global registers

(b) General master write access to the channel registers of a channel by a master other than the master assigned to the channel

DMA's actions against illegal access are as follows.

For both cases (a) and (b),

- Write access is ignored.

Only for the case (b),

- The information about the illegal access is stored in a register access protection violation register.
- The DMAC0, DMAC1, and DTS have their own register access protection violation registers (DM0CMV, DM1CMV, and DTSCMV respectively).
- DMA assert illegal access notification to ECM.

Only the special master can access the register access protection violation registers. The special master can check whether illegal access has occurred by checking the register access protection violation registers periodically or checking DMA illegal access error of ECM.

In addition, it is recommended that, when a master tries to use DMA and configures transfer information in the channel registers, the master should check whether the configuration has been successfully completed without illegal access by, for example, reading back the settings.

7.5.3 Master Information Inherit Function

In this product, DMA access inherits master information that is equivalent to the master information of the PE assigned to the DMA channel.

The master information that is output from DMA is as in **Table 7.10**.

Table 7.10 Master Information That Is Output from DMA

Meaning	Value that is output from DMA
SPID*[1]	Same as the SPID bit value in the channel master setting register as long as it is between 2 and 31.
PEID	Fixed to 4

Note 1. In case that register value is 0 or 1, DMA outputs 2 instead of register value

7.5.4 Other Reliability Functions

7.5.4.1 Restriction on the Next Channel in the Chain

The reliability function limits the channels you can select as the next channel in the chain. When you use the chain function, the channel master settings of a channel and its next channel in the chain must be the same.

The chain function is designed so that a channel and its next channel in the chain are managed by the same master.

When DMA detects that different masters are assigned to a channel and its next channel in the chain, it is deemed illegal and the chain function is suppressed. More specifically, when DMA tries to execute the chain function, DMA compares the chain master settings of the channel and its next channel in the chain, and if the settings are the same for both PEID and UM, the chain function is allowed and a chain request is sent to the next channel. If the settings are not the same for either PEID or UM, a chain request is not sent.

7.6 Setting Up DMA Transfer

7.6.1 Overview of Setting Up DMA

Table 7.11 Recommended DMA/DTS channel Configuration Sequence

No.	Master that configures the setting	Description		Register	Necessity of the setting
1	Special master (CPU in the supervisor mode)	Overall DMA operation setting	DTSPR0 to DTSPR7	DTS channel priority setting	Mandatory (if a DTS is used)
2			DM00CM to DM17CM	DMAC channel master setting	Mandatory (if a DMAC is used)
3			DTS000CM to DTS127CM	DTS channel master setting	Mandatory (if a DTS is used)
4		Status clear	DTSERC	DTS error clear register	Recommended
5			CMVC	Channel protection violation clear register	Recommended
6	Master assigned to the DMAC channel	Channel setting	DSAn	DMAC source address	Mandatory
7			DDAn	DMAC destination address	Mandatory
8			DTCn	DMAC transfer count	Mandatory
9			DTCTn	DMAC transfer control	Mandatory
10			DRSAn	DMAC reload source address	Mandatory (if the reload function is used)
11			DRDAn	DMAC reload destination address	Mandatory (if the reload function is used)
12			DRTCn	DMAC reload transfer count	Mandatory (if the reload function is used)
13			DTCCn	DMAC transfer count compare	Mandatory (if the transfer count match interrupt is used)
14			DTFRn	DTFR setting register	Mandatory
15		Status clear	DCSTCn	DMAC transfer status clear	Mandatory
16			DTFRRQCn	DTFR transfer request clear	Recommended
17		Channel operation enable	DCENn	DMAC channel operation enable setting	Mandatory
18	Master assigned to the DTS channel	Channel setting	DTSAnnn	DTS source address	Mandatory
19			DTDAnnn	DTS destination address	Mandatory
20			DTTCnnn	DTS transfer count	Mandatory
21			DTTCTnnn	DTS transfer control	Mandatory
22			DTRSAnnn	DTS reload source address	Mandatory (if the reload function is used)
23			DTRDAnnn	DTS reload destination address	Mandatory (if the reload function is used)
24			DTRTCnnn	DTS reload transfer count	Mandatory (if the reload function is used)
25			DTTCCnnn	DTS transfer count compare	Mandatory (if the transfer count match interrupt is used)
26		Status clear	DTFSCnnn	DTSFSL transfer request clear	Recommended
27		Transfer request enable	DTFSLnnn	DTSFSL operation setting	Mandatory

7.6.2 Setting Up the Overall DMA Operation

You need to set up the overall DMA operation before you start using DMA.

To configure the overall DMA operation, the special master (a CPU in the supervisor mode) needs to set up global registers. Global registers can be set up only by special master access. For details, see **Section 7.5, Reliability Function**.

The following registers must be set up to configure the overall DMA operation.

- DTS channel priority setting registers (DTSPRn, n = 0 to 7)
  Those registers configure the priority level of each DTS channel used for DTS channel arbitration.
- DMAC channel master setting registers (DMnnCM)
- DTS channel master setting registers (DTSnnnCM)

Those registers configure channel assignment. (For details, see **Section 7.5, Reliability Function**.)

If the DMAC channel master setting registers and the DTS channel master setting registers are not properly set, DMA channel setting and DMA transfer cannot be executed properly.

Also, if errors are detected in the following registers while the overall DMA operation is set up, clearing the errors is recommended.

- DTS error register 1 (DTSER1)
- DTS error register 2 (DTSER2)
- DMAC0 register access protection violation register (DM0CMV)
- DMAC1 register access protection violation register (DM1CMV)
- DTS register access protection violation register (DTSCMV)

7.6.3 Setting Up the DMA Channel Setting

The DMA channel setting defines the transfer information and transfer source for each DMAC and DTS channel.

To configure the DMA channel setting, the master assigned to each channel by the channel assignment needs to set up channel registers.

7.6.3.1 Setting Up the DMAC Channel Setting

Follow the procedure below to set up the DMAC channel setting and use the DMAC.

(1) Disabling the DMAC Channel Operation

If the channel operation enable (DTE) in the DMAC channel operation enable setting register (DCENn) is set, clear the DTE bit to disable the channel operation.

(2) Setting Up the Transfer Information

When you set up the transfer information of the DMAC, the following registers need to be set up.

- DMAC source address register (DSAn)
- DMAC destination address register (DDAn)
- DMAC transfer count register (DTCn)
- DMAC transfer control register (DTCTn)
- DMAC reload source address register (DRSAn)
- DMAC reload destination address register (DRDAn)
- DMAC reload transfer count register (DRTCn)
- DMAC transfer count compare register (DTCCn)

(3) Setting Up the DMA Transfer Request

While setting the transfer information, you need to set up the DMA transfer request selection assignment (DTCTn.DRS) bit in the DMAC transfer control register (DTCTn) to define whether the hardware or software DMA transfer request is used.

You cannot use both the hardware and software DMA transfer requests for the same channel at the same time.

If you use the hardware DMA transfer request, you need to select one source used as the hardware DMA transfer request out of 128 hardware DMA transfer sources using the hardware DMA transfer source selection (DTFRn.REQSEL) in the DTFR setting register. Also, you need to enable the hardware DMA transfer source selection (DTFRn.REQEN) in the same register.

The DTFR may retain a hardware DMA transfer request that came before the hardware DMA transfer source is selected. Clear the hardware DMA transfer request (DTFRRQn.DRQ) retained in the DTFR using the DTFR transfer request clear register (DTFRRQCn) if necessary.

If you use the software DMA transfer request, disable the hardware DMA transfer source selection (DTFRn.REQEN) in the DTFR setting register.

(4) Clearing the Transfer Status

The DMAC transfer status register (DCSTn) may retain the result of the previous DMA transfer. You need to clear the flags in the DMAC transfer status register using the DMAC transfer status clear register (DCSTCn).

(5) Enabling the DMAC Channel Operation

Set the channel operation enable (DCENn.DTE) bit in the DMAC channel operation enable setting register to enable the channel operation.

After the channel operation enable bit is set, the DMAC can accept a DMA transfer request and start DMA transfer.

7.6.3.2 Setting Up the DTS Channel Setting

Follow the procedure below to set up the DTS channel setting and use the DTS.

(1) Disabling the Transfer Request by the DTSFSL

Clear the transfer request enable (DTFSLnnn.REQEN) bit in the DTSFSL operation setting register of the DTS channel you want to set up the channel setting for. This procedure is not mandatory but recommended in order to prevent a DMA transfer request from being sent mistakenly to the DTS channel currently being configured.

It is also recommended to check the DTS status register (DTSSTS) and confirm that DMA transfer is not ongoing for the DTS channel currently being configured.

(2) Setting Up the Transfer Information

When you set up the transfer information of the DTS, the following registers need to be set up to configure the transfer information.

- DTS source address register (DTSAnnn)
- DTS destination address register (DTDAnnn)
- DTS transfer count register (DTTCnnn)
- DTS transfer control register (DTTCTnnn)
- DTS reload source address register (DTRSAnnn)
- DTS reload destination address register (DTRDAnnn)
- DTS reload transfer count register (DTRTCnnn)
- DTS transfer count compare register (DTTCCnnn)

(3) Setting Up the DMA Transfer Request

Unlike a DMAC, a DTS does not care whether a DMA transfer request is a hardware DMA transfer request or software DMA transfer request. A DTS has a transfer request pending bit for each channel in the DTSFSL, and both a hardware and software DMA transfer requests are retained in the same transfer request pending bit (DTFSTnnn.DRQ). Therefore, a DTS has no setting for selecting whether the hardware or software transfer request is used.

The DTSFSL may retain a DMA transfer request that came before the transfer information is set up. Clear the DMA transfer request (DTFSTnnn.DRQ) retained in the DTSFSL if necessary, using the DTFSL transfer request clear register (DTFSCnnn).

(4) Enabling the Transfer Request by the DTSFSL

Set the transfer request enable (DTFSLnnn.REQEN) bit in the DTSFSL operation setting register to enable the DMA transfer request for the DTS channel.

After the transfer request enable bit for the DTSFSL is set, the DTS can accept a DMA transfer request and start DMA transfer.

7.7 DMA Trigger Source

7.7.1 List of DMA Trigger Sources

The DMA trigger source assignment for DMA channel n is set in the DTFR setting register (DTFRn).

Table 7.12 List of DMA Trigger Sources (1/4)

	Function/Module	DMA Trigger Source
DMACTRG[0]	Pin	External Interrupt0
DMACTRG[1]		External Interrupt1

			Special Master	General Master
0124_H	DM11CM	DMAC1 channel 1 channel master setting	√	×
0128_H	DM12CM	DMAC1 channel 2 channel master setting	√	×
$012C_H$	DM13CM	DMAC1 channel 3 channel master setting	√	×
0130_H	DM14CM	DMAC1 channel 4 channel master setting	√	×
0134_H	DM15CM	DMAC1 channel 5 channel master setting	√	×
0138_H	DM16CM	DMAC1 channel 6 channel master setting	√	×
$013C_H$	DM17CM	DMAC1 channel 7 channel master setting	√	×
0200_H + 4 × [DTS channel number] *1 (0200_H to $03FC_H$)	DTSnnnCM *1	DTS channel nnn channel master setting *1	√	×

Note 1. [DTS channel number] and “nnn” in the register symbols and meanings are numbers in the range from 000 to 127.

Note: √: supported
x: not supported

7.9.2 Details of Global Registers

7.9.2.1 DMACTL — DMA Control Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8000_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMA SPD
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.15 DMACTL Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	DMASPD	DMA suspension This bit shows whether DMA transfer for all channels is suspended. If a user writes 1 to this bit, DMA transfer for all channels can be suspended. If a user writes 0 to this bit, suspension of DMA transfer for all channels can be cleared. The suspension controlled by this bit is independent from the suspension controlled by the transfer enable bit (DTE) of each DMAC channel and the suspension setting bit (DTSUST) for a DTS. That means, if this bit is 1, all DMA transfers are suspended regardless of the values of the DTE bit of each channel and the DTSUST bit of the DTS. Writing to this bit does not affect the DTE bit of each channel and the DTSUST bit of the DTS. 0: DMA suspension cleared 1: DMA suspension request/DMA suspension ongoing

7.9.2.2 DTSCTL1 — DTS Control Register 1

Access: This register can be read/written in 32-bit units.

Address: FFFF 8010_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DTSUST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.16 DTSCTL1 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	DTSUST	DTS suspension This bit shows whether DMA transfer of a DTS is suspended. If a user writes 1 to this bit, DMA transfer of a DTS can be suspended. 0: DTS suspension cleared 1: DTS suspension request/DTS suspension ongoing

7.9.2.3 DTSCTL2 — DTS Control Register 2

Access: This register can be read/written in 32-bit units.

Address: FFFF 8014_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DTSTIT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.17 DTSCTL2 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	DTSTIT	DTS transfer abort request While the DTS is suspended, a user can write 1 to this bit to abort the suspended DMA transfer. When the suspended DMA transfer of a DTS is aborted, the DTSSTS.DTSACT bit is cleared to 0. The read value of this bit is always zero.

7.9.2.4 DTSSTS — DTS Status Register

Access: This register can be read in 32-bit units.

Address: FFFF 8018$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DTS CYC	DTSA CH6	DTSA CH5	DTSA CH4	DTSA CH3	DTSA CH2	DTSA CH1	DTSA CH0	DTSA CT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.18 DTSSTS Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is read.
8	DTSCYC	DMA cycle execution state This bit shows whether a DMA cycle is ongoing in the DTS. 0: DMA cycle is not ongoing. 1: DMA cycle is ongoing. After suspending DTS transfers, DTSCYC may be polled to assure that any possibly ongoing DTS cycle has finished
7 to 1	DTSACH[6:0]	DTS transfer channel If there is a channel in the DTS executing DMA transfer, the channel number is shown. If there is no channel in the DTS executing DMA transfer, the channel number of the last DMA transfer is shown.
0	DTSACT	DTS transfer status This bit shows whether there is a channel in the DTS executing DMA transfer. 0: There is a channel in the DTS executing DMA transfer. 1: There is no channel in the DTS executing DMA transfer. DTSACT is asserted during TI fetch, all DMA cycles and TI write-back. It is cleared after the last cycle of the TI write back is completed. If the DTS is put into the suspended state while there is a channel executing DMA transfer, this bit remains 1. If a DTS transfer abort request is made using the DTSCTL2.DTSTIT bit, the suspended DTS transfer is aborted, and this bit is cleared to 0. When DMA transfer error occurs and the DMA transfer is aborted, this bit is cleared.

7.9.2.5 DMACER — DMAC Error Register

Access: This register can be read in 32-bit units.

Address: FFFF 8020$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DM1 ER7	DM1 ER6	DM1 ER5	DM1 ER4	DM1 ER3	DM1 ER2	DM1 ER1	DM1 ER0	DM0 ER7	DM0 ER6	DM0 ER5	DM0 ER4	DM0 ER3	DM0 ER2	DM0 ER1	DM0 ER0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.19 DMACER Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read.
15 to 8	DM1ER[7:0]	DMAC1 DMA transfer error status These bits show the DMA transfer error status of channels 0 through 7 of the DMAC1. Each bit is mapped from the DCSTn.ER bit of each channel of the DMAC1 and is read-only. 0: DMA transfer error is not generated 1: DMA transfer error is generated
7 to 0	DM0ER[7:0]	DMAC0 DMA transfer error status These bits show the DMA transfer error status of channels 0 through 7 of the DMAC0. Each bit is mapped from the DCSTn.ER bit of each channel of the DMAC0 and is read-only. 0: DMA transfer error is not generated 1: DMA transfer error is generated

7.9.2.6 DTSER1 — DTS Error Register 1

Access: This register can be read in 32-bit units.

Address: FFFF 8024_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	DTSERCH6	DTSERCH5	DTSERCH4	DTSERCH3	DTSERCH2	DTSERCH1	DTSERCH0	—	—	—	—	—	—	DTSERWR	DTSER
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.20 DTSER1 Register Contents

Bit Position	Bit Name	Function
31 to 15	Reserved	When read, the value after reset is read.
14 to 8	DTSERCH[6:0]	DTS error channel These bits show the DTS channel number of the first DMA transfer error after the DTSER bit is cleared to 0. These bits are read-only and cannot be cleared.
7 to 2	Reserved	When read, the value after reset is read.
1	DTSERWR	DTS DMA transfer error occurring cycle This bit is updated at the same time as setting of the DTS DMA transfer error flag (DTSER), indicating which cycle of read or write the DMA transfer error occurs in. This bit is not updated when a new DMA transfer error occurs after the DTSER bit has been set. If the DTSER bit is cleared, this bit is also cleared to 0. 0: DMA transfer error occurs in read cycle. 1: DMA transfer error occurs in write cycle.
0	DTSER	DTS DMA transfer error flag This bit shows whether DMA transfer error is generated in the DTS. 0: DMA transfer error is not generated 1: DMA transfer error is generated If DMA transfer error is generated in the DTS while this bit is 0, this bit is set, and DTSERCH6 to 0 retains the DTS channel number of the DMA transfer error. If DMA transfer error is generated in the DTS while this bit is 1, this bit remains 1, and DTSERCH6 to 0 does not change. This bit can be cleared by using the DTSERC register.

7.9.2.7 DTSER2 — DTS Error Register 2

Access: This register can be read in 32-bit units.

Address: FFFF 8028$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RAMDED	RAMDEDOV	—	—	RAMDEDAD11	RAMDEDAD10	RAMDEDAD9	RAMDEDAD8	RAMDEDAD7	RAMDEDAD6	RAMDEDAD5	RAMDEDAD4	RAMDEDAD3	RAMDEDAD2	RAMDEDAD1	RAMDEDAD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RAMSED	RAMSEDOV	—	—	RAMSEDAD11	RAMSEDAD10	RAMSEDAD9	RAMSEDAD8	RAMSEDAD7	RAMSEDAD6	RAMSEDAD5	RAMSEDAD4	RAMSEDAD3	RAMSEDAD2	RAMSEDAD1	RAMSEDAD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.21 DTSER2 Register Contents (1/2)

Bit Position	Bit Name	Function
31	RAMDED	DTSRAM DED error flag This bit shows whether the DED error is generated in the read access to the DTSRAM. 0: DED error is not generated in the DTSRAM 1: DED error is generated in the DTSRAM If DED error is generated in the DTSRAM while this bit is 0, this bit is set, and RAMDEDAD11 to 0 retains the DTSRAM address of the error. If DED error is generated in the DTSRAM while this bit is 1, this bit remains 1, and RAMDEDAD11-0 does not change. This bit can be cleared by using the DTSERC register.
30	RAMDEDOV	DTSRAM DED error overflow flag This bit is set when the RAMDED bit is 1 and the DED error occurs in DTSRAM read access whose address is different from that specified by the RAMDEDAD11 to 0 bit. This bit can be cleared by operation of the DTSERC register.
29, 28	Reserved	When read, the value after reset is read.
27 to 16	RAMDEDAD [11:0]	DTSRAM DED error address These bits show the DTSRAM address of the first DTSRAM DED error after the RAMDED bit is cleared to 0. These bits are read-only and cannot be cleared.
15	RAMSED	DTSRAM SEC error flag This bit shows whether the SEC error is generated in the read access to the DTSRAM. 0: SEC error is not generated in the DTSRAM 1: SEC error is generated in the DTSRAM If SEC error is generated in the DTSRAM while this bit is 0, this bit is set, and RAMSEDAD11 to 0 retains the DTSRAM address of the error. If SEC error is generated in the DTSRAM while this bit is 1, this bit remains 1, and RAMSEDAD11 to 0 does not change. This bit can be cleared by using the DTSERC register.
14	RAMSEDOV	DTSRAM SEC error overflow flag This bit is set when the RAMSED bit is 1 and the SEC error occurs in DTSRAM read access whose address is different from that specified by the RAMSEDAD11 to 0 bit. This bit can be cleared by operation of the DTSERC register.
13, 12	Reserved	When read, the value after reset is read.

Table 7.21 DTSER2 Register Contents (2/2)

Bit Position	Bit Name	Function
11 to 0	RAMSEDAD [11:0]	DTSRAM SEC error address These bits show the DTSRAM address of the first DTSRAM SEC error after the RAMSED bit is cleared to 0. These bits are read-only and cannot be cleared.

7.9.2.8 DTSERC — DTS Error Clear Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 802C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RAMDEDC	RAMDEDOVC	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	RAMSEDC	RAMSEDOVC	—	—	—	—	—	—	—	—	—	—	—	—	—	DTSERC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.22 DTSERC Register Contents

Bit Position	Bit Name	Function
31	RAMDEDC	DTSRAM DED error flag clear If a user writes 1 to this bit, the DTSRAM DED error flag (DTSER2.RAMDED) is cleared. 0 is always read from this bit.
30	RAMDEDOVC	DTSRAM DED error overflow flag clear When the user writes 1 to this bit, the DTSRAM DED error overflow flag (DTSER2.RAMDEDOV) is cleared. The read value of this bit is always 0.
29 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15	RAMSEDC	DTSRAM SEC error flag clear If a user writes 1 to this bit, the DTSRAM SEC error flag (DTSER2.RAMSED) is cleared. 0 is always read from this bit.
14	RAMSEDOVC	DTSRAM DED error overflow flag clear When the user writes 1 to this bit, the DTSRAM DED error overflow flag (DTSER2.RAMSEDOV) is cleared. The read value of this bit is always 0.
13 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	DTSERC	DTS error flag clear If a user writes 1 to this bit, the DTS DMA error flag (DTSER1.DTSER) is cleared. 0 is always read from this bit.

7.9.2.9 DM0CMV — DMAC0 Register Access Protection Violation Register

Access: This register can be read in 32-bit units.

Address: FFFF 8030$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PEID2	PEID1	PEID0	—	—	—	—	—	—	SPID4	SPID3	SPID2	SPID1	SPID0	UM	—

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.23 DM0CMV Register Contents

Bit Position	Bit Name	Function
31 to 29 22 to 18 17	PEID[2:0] SPID[4:0] UM	Illegal access master information These bits show the accessing master information of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
28 to 23 16 to 7	Reserved	When read, the value after reset is read.
6 to 4	VCH[2:0]	Illegal access channel These bits show the channel number (0 to 7) of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
3 to 1	Reserved	When read, the value after reset is read.
0	VF	Illegal access flag This bit shows whether illegal access occurs in the DMAC0. 0: No illegal access has occurred in the DMAC0 1: Illegal access has occurred in the DMAC0 If illegal access occurs in the DMAC0 while this bit is 0, this bit is set, and PEID, SPID, UM and VCH store their respective information. If illegal access occurs in the DMAC0 while this bit is 1, this bit remains 1, and PEID, SPID, UM and VCH do not change. This bit can be cleared by using the CMVC register.

7.9.2.10 DM1CMV — DMAC1 Register Access Protection Violation Register

Access: This register can be read in 32-bit units.

Address: FFFF 8034_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PEID2	PEID1	PEID0	—	—	—	—	—	—	SPID4	SPID3	SPID2	SPID1	SPID0	UM	—

Table 7.25 DTSCMV Register Contents

Bit Position	Bit Name	Function
31 to 29 22 to 18 17	PEID[2:0] SPID[4:0] UM	Illegal access master information These bits show the accessing master information of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
28 to 23 16 to 11	Reserved	When read, the value after reset is read.
10 to 4	VCH[6:0]	Illegal access channel These bits show the channel number (0 to 127) of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
3 to 1	Reserved	When read, the value after reset is read.
0	VF	Illegal access flag This bit shows whether illegal access occurs in the DTS. 0: No illegal access has occurred in the DTS 1: Illegal access has occurred in the DTS If illegal access occurs in the DTS while this bit is 0, this bit is set, and PEID, SPID, UM and VCH store their respective information. If illegal access occurs in the DTS while this bit is 1, this bit remains 1, and PEID, SPID, UM and VCH do not change. This bit can be cleared by using the CMVC register.

7.9.2.12 CMVC — Register Access Protection Violation Clear Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 803C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 7.26 CMVC Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is read. When writing, write the value after reset.
2	DTSVC	DTS illegal access flag clear The DTS illegal access flag (DTSCMV.VF) can be cleared by writing 1 to this bit. 0 is always read from this bit.
1	DM1VC	DMAC1 illegal access flag clear The DMAC1 illegal access flag (DM1CMV.VF) can be cleared by writing 1 to this bit. 0 is always read from this bit.
0	DM0VC	DMAC0 illegal access flag clear The DMAC0 illegal access flag (DM0CMV.VF) can be cleared by writing 1 to this bit. 0 is always read from this bit.

7.9.2.13 TFRSTS — Transfer Status Register

Access: This register can be read in 32-bit units.

Address: FFFF 804C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.27 TFRSTS Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is read.
16	DTSCYC	DMA cycle state of DTS IP block: 0: No DTS-DMA cycle executing 1: DTS-DMA cycle is executing After suspending DTS transfers, DTSCYC may be polled to assure that any possibly ongoing DTS cycle has finished. This flag is a copy of DTSSTS.DTSCYC
15 to 8 7 to 0	DMACY[17:10] DMACY[07:00]	DMA cycle execution state This bit shows whether a DMA cycle is ongoing in this channel. 0: DMA cycle is not ongoing. 1: DMA cycle is ongoing. After suspending a DMA channel, CY may be polled to assure that any possibly ongoing DMA cycle has finished. These flags are copies from DCSTn.CY.

7.9.2.14 DTSPRn — DTS Channel Priority Setting (n = 0 to 7)

- DTSPR0

Access: This register can be read/written in 32-bit units.

Address: FFFF 8060$_H$

Value after reset: 0000 0000$_H$

Table 7.35 DTSPR7 Register Contents

Bit Position	Bit Name	Function
31 to 0	DTS[127:112] PR[1:0]	DTS channel [127:112] priority setting These bits configure the priority level of each DTS channel used for DTS channel arbitration. 00 is the highest priority, and 11 is the lowest.

7.9.2.15 DTRECCTL — DTSRAM ECC Control Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8080_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 7.36 DTRECCTL register contents

Bit Position	Bit Name	Function
31, 30	PROT[1:0]	This bits enable or disable writing to the ECCDIS and SECDIS bits. The written data is not retained. The read value is always 0. This bit should be written when (PROT1, PROT0) = (0, 1)
29 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	SECDIS	DTSRAM 1-bit error correction disable This bit enables or disables 1-bit error correction when the ECCDIS bit is 0. Set (PROT1, PROT0) = (0, 1) at the same time as writing to this bit. 0: Error correction is enabled when the 1-bit error is detected. 1: Error correction is disabled when the 1-bit error is detected.
0	ECCDIS	DTSRAM ECC disable This bit enables or disables DTSRAM ECC error detection and correction. Set (PROT1, PROT0) = (0, 1) at the same time as writing to this bit. 0: Error detection and correction are enabled. 1: Error detection and correction are disabled. The encoding function is effective when error detection and correction are disabled

7.9.2.16 DTRERINT — DTSRAM Error Notification Control Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8084_H

Value after reset: 0000 0002_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDIE	SEDIE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 7.37 DTRERINT register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	DEDIE	DTSRAM DED error external notification enable This bit enables or disables notification of DED error detection to the ECM when the ECCDIS bit in DTRECCTL is 0. 0: Notification of DED error to ECM is disabled. 1: Notification of DED error to ECM is enabled.
0	SEDIE	DTSRAM 1-bit error external notification enable This bit enables or disables notification of 1-bit error detection to the ECM when the ECCDIS bit in DTRECCTL is 0. 0: Notification of 1-bit error to ECM is disabled. 1: Notification of 1-bit error to ECM is enabled.

7.9.2.17 DTRTSCTL — DTSRAM Test Control Register

This register is used for ECC test (self-diagnosis). It enables setting of ECC test mode and selection of ECC data to be written to the DTSRAM.

Access: This register can be read/written in 32-bit units.

Address: FFFF 8094_H

Value after reset: $0000\ 0000_H$

Table 7.38 DTRTSCTL register contents

Bit Position	Bit Name	Function
31, 30	PROT[1:0]	This bits enable or disable writing to the ECCTST and DATSEL bits. The written data is not retained. The read value is always 0. This bit should be written when (PROT1, PROT0) = (0, 1)
29 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	ECCTST	DTSRAM ECC Test Mode This bit enables or disables DTSRAM ECC test mode. Set (PROT1, PROT0) = (0, 1) at the same time as writing to this bit. 0: ECC test mode is disabled. 1: ECC test mode is enabled.
0	DATSEL	ECC Test Data Selection This bit is valid when ECCTST is 1 and selects ECC data to be written to the DTSRAM. Set (PROT1, PROT0) = (0, 1) at the same time as writing to this bit. 0: ECC encoded from the written data is used. 1: The value specified by the DTSRAM test data writing register (DTRTWDAT) is used.

7.9.2.18 DTRTWDAT — DTSRAM Test Write Data Register

This register is used for ECC test (self-diagnosis). It specifies ECC data to be written to the DTSRAM after ECC test mode is enabled (ECCTST = 1).

Access: This register can be read/written in 32-bit units.

Address: FFFF 8098$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 7.39 DTRTWDAT register contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6 to 0	TWDAT[6:0]	ECC Test Write Data This bits specifies ECC data to be written to the DTSRAM when DTRTSCTL.ECCTST = 1 and DTRTSCTL.DATSEL = 1. Writing to this bit is enabled when DTRTSCTL.ECCTST = 1 When DTRTSCTL.ECCTST = 0, this bit cannot be written and its read value is 0.

7.9.2.19 DTRTRDAT — DTSRAM Test Read Data Register

This register is used for ECC test (self-diagnosis). It reads out ECC data of the DTSRAM after ECC test mode is enabled (ECCTST = 1).

Access: This register can be read in 32-bit units.

Address: FFFF 809C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.40 DTRTRDAT register contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is read.
6 to 0	TRDAT[6:0]	ECC Test Read Data This bits retains the last ECC data read out from the DTSRAM when DTRTSCTL.ECCTST = 1. When DTRTSCTL.ECCTST = 0, the read value of this bit is 0.

7.9.2.20 ADECCTCL — ECC on BUS Address ECC Test Control Register

See **Section 28.2.9.6**.

Access: This register can be read/written in 32-bit units.

Address: FFFF 80A0$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ECCTST	RWSEL
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 7.41 ADECCTCL register contents

Bit Position	Bit Name	Function
31, 30	PROT[1:0]	Write control bits of ECCTST bit and RWSEL bit. Write data to these bit are not kept internally. 0 is always read from these bits.
29 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	ECCTST	Address ECC Test Mode Configures ECConBUS address ECC test mode. To update this bit, (PROT1, PROT0) = (0, 1) must be written at the same time. 0: Address ECC test mode is disabled. 1: Address ECC test mode is enabled. Address ECC output is replaced with the value of ADECCTDT register.
0	RWSEL	Address ECC Test Cycle Selection Selects either read cycle or write cycle to test address ECC. This bit is valid only at ECCTST=1. To update this bit, (PROT1, PROT0) = (0, 1) must be written at the same time. 0: Address ECC output is replaced with test data at DMA read cycle. 1: Address ECC output is replaced with test data at DMA write cycle.

7.9.2.21 ADECCTDT — ECC on BUS Address ECC Test Data Register

See **Section 28.2.9.6**.

Access: This register can be read/written in 32-bit units.

Address: FFFF 80A4$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.42 ADECCTDT register contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6 to 0	ECCDAT[6:0]	ECC test data Specifies ECC test data used at ADECCTCL.ECCTST = 1.

7.9.2.22 DMnnCM — DMAC Channel Master Setting (nn = 00 to 07, 10 to 17)

Access: This register can be read/written in 32-bit units.

Address: FFFF 8100_H + 4 × Ch. No. n (n = 0 to 7)
FFFF 8120_H + 4 × Ch. No. n - 10 (n = 10 to 17)

Value after reset: 0000 2008_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PEID2	PEID1	PEID0	—	—	—	—	—	—	SPID4	SPID3	SPID2	SPID1	SPID0	UM	—
Value after reset	0	0	1	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.43 DMnnCM Register Contents

Bit Position	Bit Name	Function ion
31 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15 to 13	PEID[2:0]	Channel master PEID setting Specifies the PEID information of the master assigned to the channel.
12 to 7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6 to 2	SPID[4:0]	Channel master SPID setting Specifies the SPID information used by the master assigned to the channel. SPID = 0 and 1 are reserved and must not be used. If SPID = 0 or 1 is set, DMA will use SPID = 2.
1	UM	Channel master UM setting Specifies the UM information of the master assigned to the channel.
0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

CAUTION

DM00CM to DM07CM configure the channel master information of the DMAC0 channel 0 to 7 respectively.

DM10CM to DM17CM configure the channel master information of the DMAC1 channel 0 to 7 respectively.

For information about the functions this register offers, see **Section 7.5, Reliability Function**.

7.9.2.23 DTSnnnCM — DTS Channel Master Setting Register (nnn = 000 to 127)

Access: This register can be read/written in 32-bit units.

Address: FFFF 8200_H + 4_H × Ch. No. n (n = 0 to 127)

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PEID2	PEID1	PEID0	—	—	—	—	—	—	SPID4	SPID3	SPID2	SPID1	SPID0	UM	—
Value after reset	Unfixed	Unfixed	Unfixed	Unfixed	Unfixed	Unfixed	Unfixed	Unfixed	Unfixed	Unfixed	Unfixed	Unfixed	Unfixed	Unfixed	Unfixed	Unfixed

	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.44 DTS Channel Master Setting Register Contents

Bit Position	Bit Name	Function
31 to 29	PEID[2:0]	Channel master PEID setting Specifies the PEID information of the master assigned to the channel.
28 to 23	Reserved	When writing, write the value “0”. When read, the unfixed value after reset and “0” after write.
22 to18	SPID[4:0]	Channel master SPID setting Specifies the SPID information used by the master assigned to the channel. SPID = 0 and 1 are reserved and must not be used. If SPID = 0 or 1 is set, DMA will use SPID = 2.
17	UM	Channel master UM setting Specifies the UM information of the master assigned to the channel.
16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15 to 0	CMC[15:0]	Transfer count compare In terms of contents, this field is the same as the bit [15:0] of the **Section 7.11.3.8, DTTCCnnn — DTS Transfer Count Compare Register**.

CAUTION

DTS000CM to DTS127CM configure the channel master information of the DTS channel 0 to 127 respectively.

For information about the functions this register offers, see **Section 7.5, Reliability Function**.

CAUTION

The lowest 16 bits of this register are shared with the DTS transfer count compare register, one of the DTS channel registers.
If you write to this register, the DTS transfer count compare register is updated as well.

Recommended setup procedure of the DTS channel master setting register

When the special master configures the overall DTS operation, the channel master setting must be configured in the bits 31 to 29, 22 to 17 in this register, and 0 must be specified in the bits 28 to 23,16 to 0.

The bits 28 to 23 of this register are reserved, but you can read and write those bits.

7.10 DMAC Channel Register

7.10.1 DMAC Channel Register Address

Address = Base address "FFFF 8000_H" + Offset address

Table 7.45 DMAC Channel Register Address

Offset Address	Register Symbol	Meaning	Accessed Permission*2	
			Special Master	General Master
$0400_H + 40_H \times$ [channel number]*1	DSAn*1	DMAC source address	√	√
$0404_H + 40_H \times$ [channel number]*1	DDAn*1	DMAC destination address	√	√
$0408_H + 40_H \times$ [channel number]*1	DTCn*1	DMAC transfer count	√	√
$040C_H + 40_H \times$ [channel number]*1	DTCTn*1	DMAC transfer control	√	√
$0410_H + 40_H \times$ [channel number]*1	DRSAn*1	DMAC reload source address	√	√
$0414_H + 40_H \times$ [channel number]*1	DRDAn*1	DMAC reload destination address	√	√
$0418_H + 40_H \times$ [channel number]*1	DRTCn*1	DMAC reload transfer count	√	√
$041C_H + 40_H \times$ [channel number]*1	DTCCn*1	DMAC transfer count compare	√	√
$0420_H + 40_H \times$ [channel number]*1	DCENn*1	DMAC channel operation enable setting	√	√
$0424_H + 40_H \times$ [channel number]*1	DCSTn*1	DMAC transfer status	√	√
$0428_H + 40_H \times$ [channel number]*1	DCSTSn*1	DMAC transfer status set	√	√
$042C_H + 40_H \times$ [channel number]*1	DCSTCn*1	DMAC transfer status clear	√	√
$0430_H + 40_H \times$ [channel number]*1	DTFRn*1	DTFR setting	√	√
$0434_H + 40_H \times$ [channel number]*1	DTFRRQn*1	DTFR transfer request status	√	√
$0438_H + 40_H \times$ [channel number]*1	DTFRRQCn*1	DTFR transfer request clear	√	√

Note 1. The [channel number] in the offset addresses and "n" in the register symbols are numbers in the range from 0 to 15, and the correspondence between the channel number n and the channel is as follows.

Note 2. √: supported
x: not supported

Channel number n	Channel
0	DMAC0 channel 0
1	DMAC0 channel 1
2	DMAC0 channel 2
3	DMAC0 channel 3
4	DMAC0 channel 4
5	DMAC0 channel 5
6	DMAC0 channel 6
7	DMAC0 channel 7
8	DMAC1 channel 0
9	DMAC1 channel 1
10	DMAC1 channel 2
11	DMAC1 channel 3
12	DMAC1 channel 4
13	DMAC1 channel 5
14	DMAC1 channel 6
15	DMAC1 channel 7

7.10.2 Details of DMAC Channel Registers

The “n” in the register symbols indicates the DMA channel number (n = 0 to 15).

7.10.2.1 DSAn — DMAC Source Address Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8400_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SA31	SA30	SA29	SA28	SA27	SA26	SA25	SA24	SA23	SA22	SA21	SA20	SA19	SA18	SA17	SA16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SA15	SA14	SA13	SA12	SA11	SA10	SA9	SA8	SA7	SA6	SA5	SA4	SA3	SA2	SA1	SA0

Table 7.46 DSAn Register Contents

Bit Position	Bit Name	Function
31 to 0	SA[31:0]	Source address Specifies the DMA transfer source address. Those bits are updated whenever a DMA cycle is executed. If you read from those bits, the transfer source address for the next DMA cycle is read.

CAUTIONS

1. **It is forbidden to write to those bits when the channel operation is enabled (DTE bit = 1). If you do, the correct operation is not guaranteed.**
2. **The address must be set up while the DTE bit is 0.**
3. **DMA transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size is as follows. (× denotes an arbitrary one bit.)**
   The correct operation is not guaranteed if you select other setting.

Data Size	SA3	SA2	SA1	SA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

7.10.2.2 DDAn — DMAC Destination Address Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8404_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DA31	DA30	DA29	DA28	DA27	DA26	DA25	DA24	DA23	DA22	DA21	DA20	DA19	DA18	DA17	DA16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DA15	DA14	DA13	DA12	DA11	DA10	DA9	DA8	DA7	DA6	DA5	DA4	DA3	DA2	DA1	DA0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.47 DDAn Register Contents

Bit Position	Bit Name	Function
31 to 0	DA[31:0]	Destination address Specifies the DMA transfer destination address. Those bits are updated whenever a DMA cycle is executed. If you read from those bits, the transfer destination address for the next DMA cycle is read.

CAUTIONS

1. **It is forbidden to write to those bits when the channel operation is enabled (DTE bit = 1). If you do, the correct operation is not guaranteed.**
2. **The address must be set up while the DTE bit is 0.**
3. **If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the destination address is updated.**
4. **DMA transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size is as follows. (× denotes an arbitrary one bit.)**
   The correct operation is not guaranteed if you select other setting.

Data Size	DA3	DA2	DA1	DA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

7.10.2.3 DTCn — DMAC Transfer Count Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8408_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ARC15	ARC14	ARC13	ARC12	ARC11	ARC10	ARC9	ARC8	ARC7	ARC6	ARC5	ARC4	ARC3	ARC2	ARC1	ARC0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TRC15	TRC14	TRC13	TRC12	TRC11	TRC10	TRC9	TRC8	TRC7	TRC6	TRC5	TRC4	TRC3	TRC2	TRC1	TRC0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.48 DTCn Register Contents

Bit Position	Bit Name	Function
31 to 16	ARC[15:0]	Address reload count Specifies the number of transfers until the address reload when the reload function 2 is used, and also specifies the number of transfers when the block transfer 2 is used. If you read from those bits during DMA transfer, the address reload count for the next DMA cycle is read. When the reload function 2 or block transfer 2 is used, ARC[15:0] is decremented by one for every DMA cycle. When the reload function 2 or block transfer 2 is not used, ARC[15:0] is not updated. If the value is 0000_H, it means that the number of transfers until the address reload when the reload function 2 is used and the number of transfers when the block transfer 2 is used are 65536.
15 to 0	TRC[15:0]	Transfer count Configures the number of transfers. TRC[15:0] is decremented by one whenever a DMA cycle is executed. If you read from those bits, the remaining number of transfers for the next DMA cycle is read. If the reload function is not used, after the last transfer is complete, the value at the completion (0000_H) is retained.

TRC15 to 0	Operation
0000_H	The number of transfers is 65536, or the transfer is complete.
0001_H	The number of transfers or remaining transfers is 1.
:	:
$FFFF_H$	The number of transfers or remaining transfers is 65535.

CAUTIONS

1. **It is forbidden to write to those bits when the channel operation is enabled (DTE bit = 1). If you do, the correct operation is not guaranteed.**
2. **If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the transfer count and the address reload count are updated.**

7.10.2.4 DTCTn — DMAC Transfer Control Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 840C$_H$ + 40$_H$ × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	ESE	DRS	—	—	—	—	—	CHNSEL2	CHNSEL1	SHNSEL0	CHNE1	CHNE0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 7.49 DTCTn Register Contents (1/3)

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is read. When writing, write the value after reset.
27	ESE	Transfer error case DMA transfer disable setting Configures whether a DMA cycle is executed when the DCSTn.ER bit is set due to DMA transfer error. If this bit is cleared to 0, even when the DCSTn.ER bit is set due to DMA transfer error, the following DMA cycles can be executed. If this bit is set to 1, the following DMA cycles are not executed when the DCSTn.ER bit is set due to DMA transfer error. 0: DMA cycles are executed while the DCSTn.ER bit is set. 1: DMA cycles are not executed while the DCSTn.ER bit is set.
26	DRS	DMA transfer request selection assignment Selects the type of DMA transfer requests to be accepted. 0: Software DMA transfer request 1: Hardware DMA transfer request
25 to 21	Reserved	When read, the value after reset is read. When writing, write the value after reset.
20 to 18	CHNSEL[2:0]	Next channel in the chain Specifies the next channel in the chain. The next channel must be another channel in the same DMAC. You cannot specify a channel in the different DMAC or in the DTS. You cannot specify the same channel for the next channel. (If you do, the correct operation is not guaranteed.)
17, 16	CHNE1, 0	Chain enable Selects the chain function. 00: Disabled 01: Chain at the last transfer A chain request is generated at the completion of the DMA cycle in which the remaining transfer count is one. 10: (Forbidden. No guarantee of operation) 11: Always chain A chain request is generated at the completion of every DMA cycle.
15	CCE	Transfer count match interrupt enable If this bit is set, a transfer count match interrupt is generated at the completion of the DMA cycle in which the transfer count compare register and the remaining transfer count have the same value.
14	TCE	Transfer completion interrupt enable If this bit is set, a transfer completion interrupt is generated at the completion of the last transfer.

Table 7.49 DTCTn Register Contents (2/3)

Bit Position	Bit Name	Function
13	MLE	Continuous transfer enable If this bit is set, the DTE bit is not cleared at the completion of DMA transfer. In addition, even if the TC bit is not cleared, DMA transfer starts when there is a DMA transfer request. 0: The DTE bit is cleared at the completion of DMA transfer. In addition, the next DMA transfer can start only after the TC bit is cleared. 1: The DTE bit is not cleared at the completion of DMA transfer. In addition, even if the TC bit is not cleared, DMA transfer starts when there is a DMA transfer request.
12, 11	RLD2M1, 0	Reload function 2 setting Configures the reload function 2. 00: Reload function 2 is disabled. 01: Reload function 2 is enabled. The source address and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1. 10: Reload function 2 is enabled. The destination address and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1. 11: Reload function 2 is enabled. The source address, destination address, and address reload count are reloaded at the completion of the DMA cycle in which the address reload count is 1.
10, 9	RLD1M1, 0	Reload function 1 setting Configures the reload function 1. 00: Reload function 1 is disabled. 01: Reload function 1 is enabled. The source address and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1. (If the reload function 2 is enabled, the address reload count is also reloaded.) 10: Reload function 1 is enabled. The destination address and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1. (If the reload function 2 is enabled, the address reload count is also reloaded.) 11: Reload function 1 is enabled. The source address, destination address, and transfer count are reloaded at the completion of the DMA cycle in which the remaining transfer count is 1. (If the reload function 2 is enabled, the address reload count is also reloaded.)
8, 7	DACM1, 0	Destination address count direction Specifies the count direction of the destination address.

DACM1	DACM0	Direction of Count
0	0	Increment
0	1	Decrement
1	0	Fixed
1	1	Forbidden (No guarantee of operation)

6, 5	SACM1, 0	Source address count direction Specifies the count direction of the source address.

SACM1	SACM0	Direction of Count
0	0	Increment
0	1	Decrement
1	0	Fixed
0	1	Forbidden (No guarantee of operation)

Table 7.49 DTCTn Register Contents (3/3)

<table>
<tr><th>Bit Position</th><th>Bit Name</th><th>Function</th></tr>
<tr><td>4 to 2</td><td>DS[2:0]</td><td>Transfer data size
Specifies the transfer data size.
<table>
<tr><th>DS2</th><th>DS1</th><th>DS0</th><th>Transfer Data Size</th></tr>
<tr><td>0</td><td>0</td><td>0</td><td>8 bits</td></tr>
<tr><td>0</td><td>0</td><td>1</td><td>16 bits</td></tr>
<tr><td>0</td><td>1</td><td>0</td><td>32 bits</td></tr>
<tr><td>0</td><td>1</td><td>1</td><td>64 bits</td></tr>

<tr><td colspan="3">Other than the above</td><td>Forbidden (No guarantee of operation)</td></tr>
</table></td></tr>
<tr><td>1, 0</td><td>TRM1, 0</td><td>Transfer mode
Specifies the DMA transfer mode.
00: Single transfer
01: Block transfer 1 (The number of transfers is specified by the transfer count.)
10: Block transfer 2 (The number of transfers is specified by the address reload count.)
11: Forbidden (No guarantee of operation)</td></tr>
</table>

CAUTIONS

1. **Except for the case to clear MLE bit, it is forbidden to write to those bits when the channel operation is enabled (DTE bit = 1). If you do, the correct operation is not guaranteed.**
2. **If forbidden settings are used for some of the bits, the correct operation is not guaranteed.**

7.10.2.5 DRSAn — DMAC Reload Source Address Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8410_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 7.50 DRSAn Register Contents

Bit Position	Bit Name	Function
31 to 0	RSA[31:0]	Reload source address Specifies the source address to be reloaded to the DMA source address register when the reload function 1 or reload function 2 is used.

CAUTION

DMA transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size is as follows. (× denotes an arbitrary one bit.) The correct operation is not guaranteed if you select other setting.

Data Size	RSA3	RSA2	RSA1	RSA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

7.10.2.6 DRDAn — DMAC Reload Destination Address Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8414_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 7.51 DRDAn Register Contents

Bit Position	Bit Name	Function
31 to 0	RDA[31:0]	Reload destination address Specifies the destination address to be reloaded to the DMA destination address register when the reload function 1 or reload function 2 is used.

CAUTION

DMA transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size is as follows. (× denotes an arbitrary one bit.) The correct operation is not guaranteed if you select other setting.

Data Size	RDA3	RDA2	RDA1	RDA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

7.10.2.7 DRTCn — DMAC Reload Transfer Count Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8418_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RARC15	RARC14	RARC13	RARC12	RARC11	RARC10	RARC9	RARC8	RARC7	RARC6	RARC5	RARC4	RARC3	RARC2	RARC1	RARC0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.52 DRTCn Register Contents

Bit Position	Bit Name	Function
31 to 16	RARC[15:0]	Reload address reload count Specifies the value to be loaded to the address reload count in the transfer count register at the timing of reload when the reload function 2 is used.
15 to 0	RTRC[15:0]	Reload transfer count Specifies the value to be loaded to the transfer count in the transfer count register at the timing of reload when the reload function 1 (including a combination of reload function 1 and 2) is used.

7.10.2.8 DTCCn — DMAC Transfer Count Compare Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 841C$_H$ + 40$_H$ × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMC15	CMC14	CMC13	CMC12	CMC11	CMC10	CMC9	CMC8	CMC7	CMC6	CMC5	CMC4	CMC3	CMC2	CMC1	CMC0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.53 DTCCn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15 to 0	CMC[15:0]	Transfer count compare Configures the transfer count to be compared to the transfer count register. At the completion of the DMA cycle in which the remaining transfer count is the same as the value in this register, the transfer count match flag (DCSTn.CC) in the DMAC transfer status register is set. Furthermore, if the transfer count match interrupt enable (DTCTn.CCE) bit is 1, a transfer count match interrupt is generated. If 0000$_H$ is set, comparison with the transfer count is disabled. In this case, the transfer count match flag in the DMAC transfer status register is never set, and a transfer count match interrupt is never generated.

CAUTION

It is forbidden to write to those bits when the channel operation is enabled (DTE bit = 1). If you do, the correct operation is not guaranteed.

7.10.2.9 DCENn — DMAC Channel Operation Enable Setting Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8420_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DTE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.54 DCENn Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	DTE	Channel operation enable Specifies whether to enable or disable the transfer operation of the channel. If the DTE bit is 1, DMA transfer starts when there is a DMA transfer request. If the MLE bit is 0, the DTE bit is cleared automatically at the completion of the DMA transfer. In addition, if 0 is written to the DTE bit during DMA transfer, the DMA transfer is suspended. If 1 is written to the DTE bit during suspension, the suspension is cleared and the DMA transfer resumes. 0: Channel operation is disabled/Channel suspended 1: Channel operation is enabled/Channel suspension cleared

7.10.2.10 DCSTn — DMAC Transfer Status Register

Access: This register can be read in 32-bit units.

Address: FFFF 8424_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	ERWR	—	—	CY	ER	—	CC	TC	—	—	DR	SR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.55 DCSTn Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after reset is read.
11	ERWR	DMA Transfer Error occurring cycle This bit is updated at the same time as setting of the DMA transfer error flag (ER), indicating which cycle of read or write the DMA transfer error occurs in. This bit is not updated when a new DMA transfer error occurs after the ER bit has been set. If the ER bit is cleared, this bit is also cleared to 0. 0: DMA transfer error occurs in read cycle. 1: DMA transfer error occurs in write cycle.
10, 9	Reserved	When read, the value after reset is read.
8	CY	DMA cycle execution state This bit shows whether a DMA cycle is ongoing in this channel. 0: DMA cycle is not ongoing. 1: DMA cycle is ongoing. After suspending a DMA channel, CY may be polled to assure that any possibly ongoing DMA cycle has finished.
7	ER	Transfer error flag This bit is set when DMA transfer error is generated. If this bit is 1 and the DTCTn.ESE bit is set, a DMA cycle is not executed when a DMA transfer request is generated. 0: No DMA transfer error is generated 1: DMA transfer error is generated
6	Reserved	When read, the value after reset is read.
5	CC	Transfer count match flag This bit is set at the completion of the DMA cycle in which the remaining transfer count is the same as the value set in the transfer compare register. 0: No compare match has occurred with the transfer count compare register. 1: Compare match has occurred with the transfer count compare register.
4	TC	Transfer completion flag This bit is set at the completion of the last transfer and shows whether the DMA transfer is complete. If the MLE bit is 0 and this bit is 1, a DMA cycle is not executed when a DMA transfer request is generated. 0: DMA transfer incomplete 1: DMA transfer complete
3, 2	Reserved	When read, the value after reset is read.

Table 7.55 DCSTn Register Contents (2/2)

Bit Position	Bit Name	Function
1	DR	Hardware DMA transfer request status This bit shows whether there is a hardware DMA transfer request (DMARQ) from the DTFR. This bit changes regardless of the value of the DTE bit when a hardware DMA transfer request from the DTFR is generated. If the software DMA transfer request is selected by the transfer request selection bit (DRS) in the DMAC transfer control register, this bit is not set even when a hardware DMA transfer request is input from the DTFR. 0: There is no hardware DMA transfer request 1: There is a hardware DMA transfer request
0	SR	Software DMA transfer request flag This bit shows whether there is a software DMA transfer request (DMARQ). This bit is automatically cleared at the completion of the last transfer. A user can set this bit by writing 1 to the SRS bit in the DMAC transfer status set register. In addition, a user can clear this bit by writing 1 to the SRC bit in the DMAC transfer status clear register, but if this is done, the ongoing DMA transfer is aborted and cannot be resumed. 0: There is no software DMA transfer request 1: There is a software DMA transfer request

7.10.2.11 DCSTSn — DMAC Transfer Status Set Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8428_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SRS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.56 DCSTSn Set Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	SRS	Software DMA transfer request flag A user can set the software DMA transfer request flag (SR) by writing 1 to this bit. 0 is always read from this bit.

7.10.2.12 DCSTCn — DMAC Transfer Status Clear Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 842C$_H$ + 40$_H$ × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ERC	—	CCC	TCC	—	—	—	SRC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R	R	R	R/W

Table 7.57 DCSTCn Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is read. When writing, write the value after reset.
7	ERC	Transfer error flag clear The DMA transfer error flag (ER) can be cleared by writing 1 to this bit. 0 is always read from this bit.
6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5	CCC	Transfer count match flag clear The transfer count match flag (CC) can be cleared by writing 1 to this bit. 0 is always read from this bit.
4	TCC	Transfer completion flag clear The transfer completion flag (TC) can be cleared by writing 1 to this bit. 0 is always read from this bit.
3 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	SRC	Software DMA transfer request flag clear The software DMA transfer request flag (SR) can be cleared by writing 1 to this bit. 0 is always read from this bit.

7.10.2.13 DTFRn — DTFR Setting Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8430_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	REQSEL6	REQSEL5	REQSEL4	REQSEL3	REQSEL2	REQSEL1	REQSEL0	REQEN
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.58 DTFRn Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is read. When writing, write the value after reset.
7 to 1	REQSEL[6:0]	Hardware DMA transfer source selection Selects one out of 128 hardware DMA transfer sources as the hardware DMA transfer request. 000_0000: Selecting the DMACTRG[0] input : 111_1111: Selecting the DMACTRG[127] input
0	REQEN	Hardware DMA transfer source selection enable This bit enables/disables the hardware DMA transfer source selection. 0: Hardware DMA transfer source selection is disabled. 1: Hardware DMA transfer source selection is enabled. If this bit is 0, even when the hardware DMA transfer source selected by the REQSEL6 to 0 bits is activated, it is not recognized as a hardware DMA transfer request, and a hardware DMA transfer request is not generated.

7.10.2.14 DTFRRQn — DTFR Transfer Request Status Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8434_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVF	DRQ
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.59 DTFRRQn Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read.
1	OVF	DMA overflow flag If this bit is set, the DMA channel has received at least one more DMA requests than it can store or handle. One or more DMA requests are lost. OVF can only be read, not written. Write 1 to DTFRRQCn.OVFC to clear OVF.
0	DRQ	Hardware DMA transfer request status If this bit is set, it means that a hardware DMA transfer request exists or is retained. • If the hardware DMA transfer request is an edge detection type*1 This bit shows whether a hardware DMA transfer request generated by edge detection is retained. When the DMA transfer request acceptance signal (DMAAKn) from the DMAC is asserted, this bit is automatically cleared. A user can clear this bit by writing 1 to the DRQCn.DRQC bit. • If the hardware DMA transfer request is a level input type*1 This bit shows whether there is a hardware DMA transfer request input from the outside. Even when the DMA transfer request acceptance signal (DMAAKn) from the DMAC is asserted, this bit is not automatically cleared. In addition, this bit is not cleared even when a user writes to the DRQCn.DRQC bit. This bit changes regardless of the value of the DTFRn.REQEN bit when a hardware DMA transfer request from the outside is generated. 0: There is no hardware DMA transfer request 1: There is a hardware DMA transfer request

Note 1. Whether the hardware DMA transfer request is an edge detection type or level input type depends on the hardware DMA transfer source selected by DTFRn.REQSEL. The hardware DMA transfer request is only an edge detection type in this device.

7.10.2.15 DTFRRQCn — DTFR Transfer Request Clear Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 8438_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVFC	DRQC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 7.60 DTFRRQCn Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	OVFC	DMA overflow flag clear Write 1 to OVFC to clear DTFRRQn.OVF. 0 is always read from this bit.
0	DRQC	Hardware DMA transfer request clear If the hardware DMA transfer request is an edge detection type*[1], a user can clear the DRQS.DRQ bit by writing 1 to this bit. If the hardware DMA transfer request is a level input type*, the DRQS.DRQ bit cannot be cleared by writing to this bit. 0 is always read from this bit.

Note 1. Whether the hardware DMA transfer request is an edge detection type or level input type depends on the hardware DMA transfer source selected by DTFRn.REQSEL. The hardware DMA transfer request is only an edge detection type in this device.

7.11 DTS Channel Register

7.11.1 Transfer information of the DTS (TI)

7.11.1.1 Structure of the TI

The transfer information of the DTS is called TI. One set of TI consists of 32 bits. 8 sets of TI are assigned for each channel. The 8 sets of TI is called TI-A, TI-B, TI-C, TI-D, TI- E, TI-F, TI-G, and TI-H.

Figure 7.21 shows the structure of the TI.

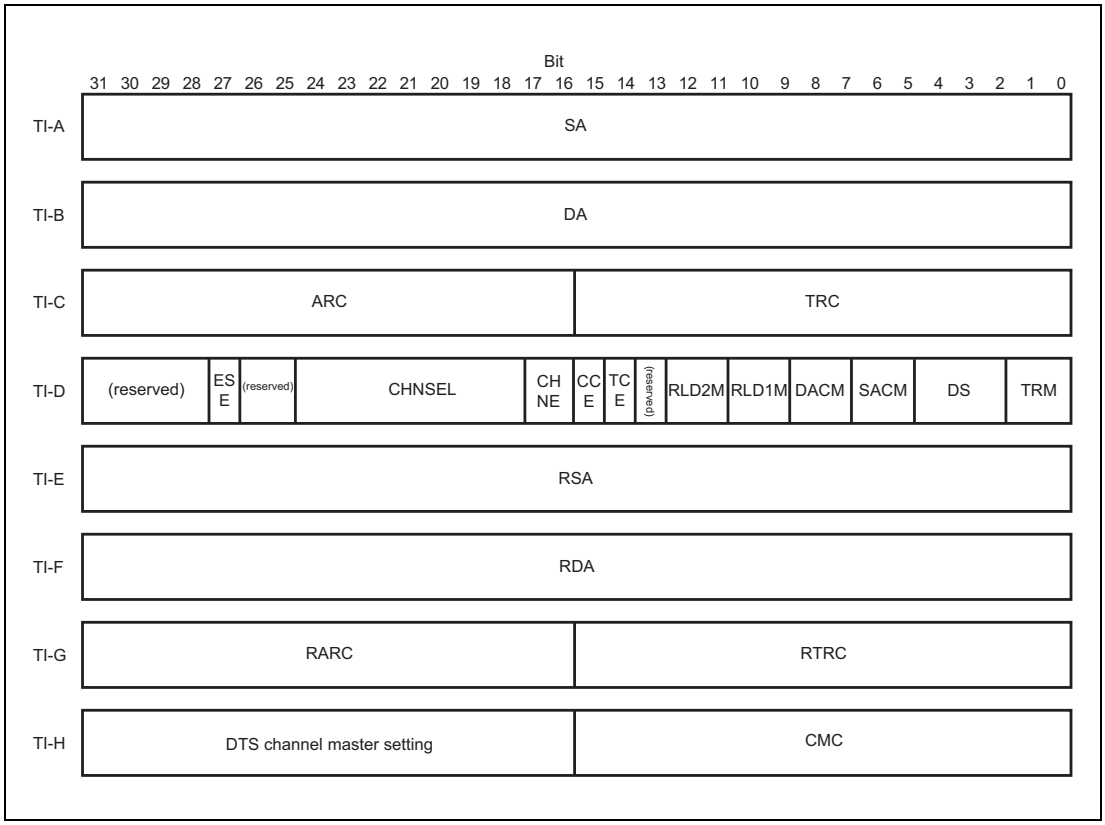

Figure 7.21 Structure of the TI

7.11.1.2 Organization of the TI in the DTSRAM

A user indirectly accesses the DTSRAM by way of the DTS channel registers for each channel and the DTS channel master setting registers.

Therefore, usually, a user does not have to think about the address organization of the TI in the DTSRAM. As an exception, when ECC error occurs while the DTSRAM is read, the address of the ECC error in the DTSRAM is stored to the DTSRAM error register 2 (DTSER2), one of the global registers. In order to know which channel and TI have generated the error, you need to understand the address organization of the TI in the DTSRAM.

Figure 7.22 shows the address organization of the TI in the DTSRAM.

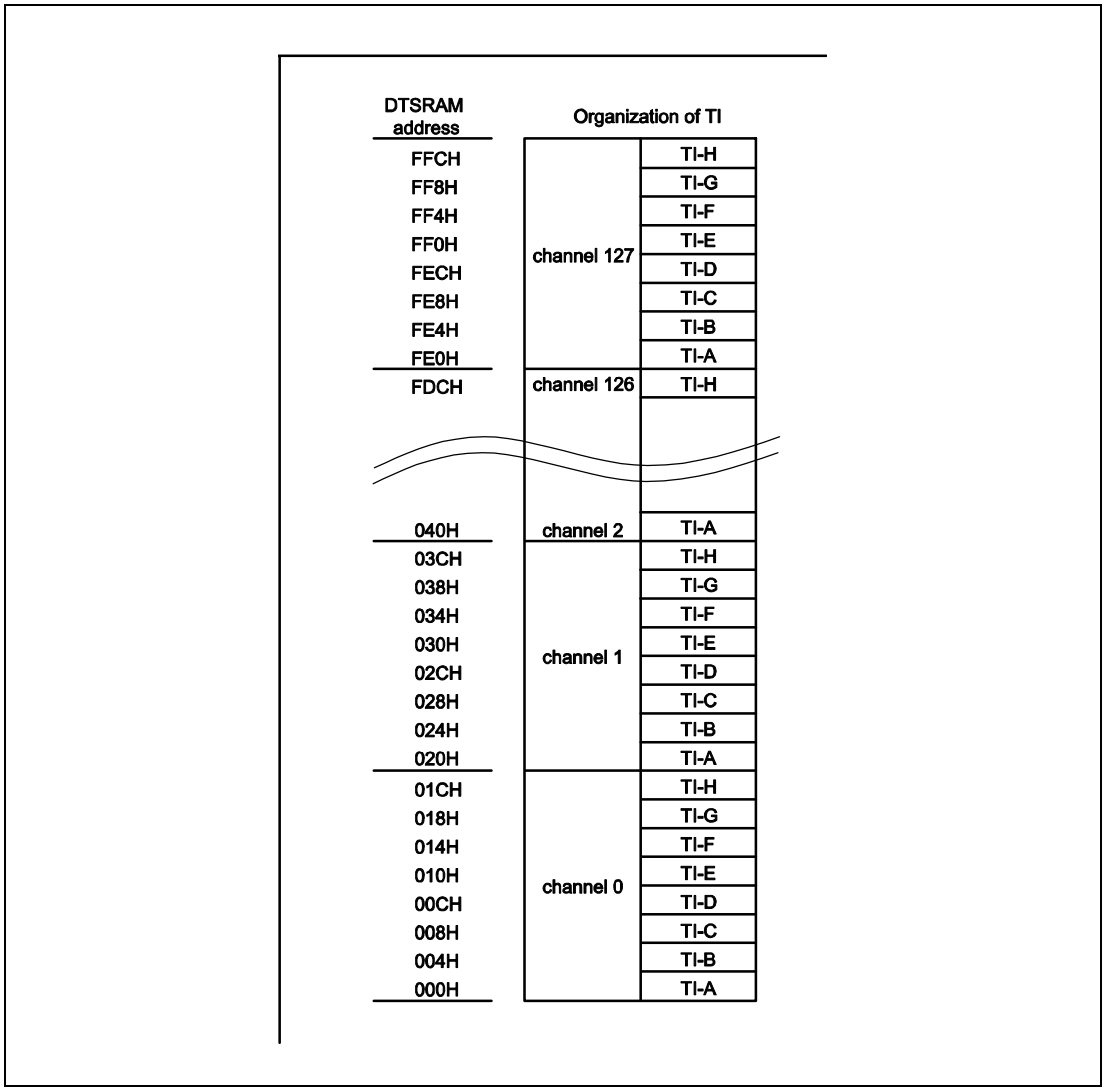

Figure 7.22 Organization of the TI in the DTSRAM

7.11.1.3 Accessing the TI

TI-A can be accessed by way of the DTS source address register (DTSAnnn) for each channel.

TI-B can be accessed by way of the DTS destination address register (DTDAnnn) for each channel.

TI-C can be accessed by way of the DTS transfer count register (DTTCnnn) for each channel.

TI-D can be accessed by way of the DTS transfer control register (DTTCTnnn) for each channel.

TI-E can be accessed by way of the DTS reload source address register (DTRSAnnn) for each channel.

TI-F can be accessed by way of the DTS reload destination address register (DTRDAnnn) for each channel.

TI-G can be accessed by way of the DTS reload transfer count register (DTRTCnnn) for each channel.

TI-H can be accessed by way of the channel master setting register (DTSnnnCM), which is a global register, and the transfer count compare register (DTTCCnnn) for each channel.

7.11.1.4 Caution about accessing the TI

The data of the DTS channel master setting register and the data of the DTS transfer count compare register are stored to the same TI-H.

Access to the DTS channel master setting register (DTSnnnCM) is actually 32-bit access to the whole TI-H. Therefore, when you write to the DTS channel master setting register, the lower 16-bit data, which is the data for the DTS transfer count compare (CMC), is updated at the same time. When you read from the DTS channel master setting register, the value of the DTS transfer count compare (CMC) is read as the lower 16-bit data.

When you read from the DTS transfer count compare register (DTTCTnnn), 32-bit data is read from the TI-H, but only the lower 16-bit data is actually seen in the result of the register read. When you write to the DTS transfer count compare register (DTTCTnnn), lower 16-bit read/modify/write access to the 32-bit TI-H is used. Data in the TI immediately after the reset is undefined. It should be noted that, if you try to write to the DTS transfer count compare register (DTTCTnnn) before setting up the DTS channel master setting register, ECC error may be detected during the read of the read/modify/write access.

The bits 28 to 23 of the TI-H are not used, but you can read and write those bits by accessing the DTS channel master setting register. Our recommendation is as follows. When you write to those bits, write 0. When you read from those bits, discard the read value by software.

You can access the TI from a CPU while the DTS is executing DMA transfer. But if you do so, the following should be noted.

- While a channel is executing DMA transfer, the TI of the channel should not be updated by TI access from a CPU. If this situation happens, the result of the DMA transfer and the contents of the TI may mismatch.
- If TI access is requested from CPU while TI fetch or TI write back is executed, the TI access is executed after the completion of TI fetch or TI write back. If TI fetch or TI write back is requested while TI access request from CPU is processed, the TI fetch or TI write back is executed after the completion of TI access.

After the reset, the values of TI in DTSRAM are undefined. After the reset, if you read TI before you write to the TI, ECC error will occur.

Therefore, the first access to the following registers after the reset must be write access. The first access after the reset should never be read access.

- DTS source address register (DTSAnnn)
- DTS destination address register (DTDAnnn)
- DTS transfer count register (DTTCnnn)
- DTS transfer control register (DTTCTnnn)
- DTS reload source address register (DTRSAnnn)
- DTS reload destination address register (DTRDAnnn)
- DTS reload transfer count register (DTRTCnnn)
- Channel master setting registers (DTSnnnCM)

In addition, the first access to DTS transfer count compare register (DTTCTnnn) after the reset must be done after write access to channel master setting register (DTSnnnCM).

You can access the TI from a CPU while the DTS is complete.executing DMA transfer. But if you do so, the following should be noted.

- While a channel is executing DMA transfer, the TI of the channel should not be updated by TI access from CPU. If this situation happens, the result of the DMA transfer and the contents of the TI may mismatch.
- If TI access is requested from CPU while TI fetch or TI write back is executed, the TI access is executed after the completion of TI fetch or TI write back. If TI fetch or TI write back is requested while TI access request from CPU is processed, the TI fetch or TI write back is executed after the completion of TI access.

7.11.2 DTS Channel Register Address

Address = Base address "FFFF 9000_H" + Offset address

Offset Address	Register Symbol	Meaning	Accessed Permission	
			Special Master	General Master
$0000_H + 40_H \times$ [channel number]	DTSAnnn	DTS source address	√	√
$0004_H + 40_H \times$ [channel number]	DTDAnnn	DTS destination address	√	√
$0008_H + 40_H \times$ [channel number]	DTTCnnn	DTS transfer count	√	√
$000C_H + 40_H \times$ [channel number]	DTTCTnnn	DTS transfer control	√	√
$0010_H + 40_H \times$ [channel number]	DTRSAnnn	DTS reload source address	√	√
$0014_H + 40_H \times$ [channel number]	DTRDAnnn	DTS reload destination address	√	√
$0018_H + 40_H \times$ [channel number]	DTRTCnnn	DTS reload transfer count	√	√
$001C_H + 40_H \times$ [channel number]	DTTCCnnn	DTS transfer count compare	√	√
$0020_H + 40_H \times$ [channel number]	DTFSLnnn	DTSFSL operation setting	√	√
$0024_H + 40_H \times$ [channel number]	DTFSTnnn	DTSFSL transfer request status	√	√
$0028_H + 40_H \times$ [channel number]	DTFSSnnn	DTSFSL transfer request set	√	√
$002C_H + 40_H \times$ [channel number]	DTFSCnnn	DTSFSL transfer request clear	√	√

Note: The [channel number] in the offset addresses is a number in the range from 0 to 127.
The "nnn" in the register symbols is a 3-digit number in the range from 000 to 127.

Note: √: supported
x: not supported

7.11.3 Details of DTS Channel Registers

The “nnn” in the register symbols indicates the DTS channel number (nnn = 000 to 127).

7.11.3.1 DTSAnnn — DTS Source Address Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 9000_H + 40_H × Ch. No. n (n = 0 to 127)

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SA31	SA30	SA29	SA28	SA27	SA26	SA25	SA24	SA23	SA22	SA21	SA20	SA19	SA18	SA17	SA16
Value after reset	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SA15	SA14	SA13	SA12	SA11	SA10	SA9	SA8	SA7	SA6	SA5	SA4	SA3	SA2	SA1	SA0

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.61 DTSAnnn Register Contents

Bit Position	Bit Name	Function
31 to 0	SA[31:0]	Source address Specifies the DMA transfer source address. SA[31:0] is updated at the timing of the TI write back and retains the DMA transfer source address for the next DMA transfer.

CAUTION

DMA transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size is as follows. (× denotes an arbitrary one bit.) The correct operation is not guaranteed if you select other setting.

Data Size	SA3	SA2	SA1	SA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

7.11.3.2 DTDAnnn — DTS Destination Address Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 9004_H + 40_H × Ch. No. n (n = 0 to 127)

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DA31	DA30	DA29	DA28	DA27	DA26	DA25	DA24	DA23	DA22	DA21	DA20	DA19	DA18	DA17	DA16
Value after reset	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DA15	DA14	DA13	DA12	DA11	DA10	DA9	DA8	DA7	DA6	DA5	DA4	DA3	DA2	DA1	DA0
Value after reset	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.62 DTDAnnn Register Contents

Bit Position	Bit Name	Function
31 to 0	DA[31:0]	Destination address Specifies the DMA transfer destination address. DA[31:0] is updated at the timing of the TI write back and retains the DMA transfer destination address for the next DMA transfer.

CAUTIONS

1. **If DMA transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the destination address is updated.**
2. **DMA transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size is as follows. (× denotes an arbitrary one bit.) The correct operation is not guaranteed if you select other setting.**

Data Size	DA3	DA2	DA1	DA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

7.11.3.3 DTTCnnn — DTS Transfer Count Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 9008_H + 40_H × Ch. No. n (n = 0 to 127)

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ARC15	ARC14	ARC13	ARC12	ARC11	ARC10	ARC9	ARC8	ARC7	ARC6	ARC5	ARC4	ARC3	ARC2	ARC1	ARC0
Value after reset	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TRC15	TRC14	TRC13	TRC12	TRC11	TRC10	TRC9	TRC8	TRC7	TRC6	TRC5	TRC4	TRC3	TRC2	TRC1	TRC0
Value after reset	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.63 DTTCnnn Register Contents

Bit Position	Bit Name	Function
31 to 16	ARC[15:0]	Address reload count Specifies the number of transfers until the address reload when the reload function 2 is used, and also specifies the number of transfers when the block transfer 2 is used. When the reload function 2 or block transfer 2 is used, ARC[15:0] is decremented by one for every DMA cycle and updated at the timing of the TI write back. When the reload function 2 or block transfer 2 is not used, ARC[15:0] is not updated. If 0000_H is set, address reload is disabled.
15 to 0	TRC[15:0]	Transfer count Configures the number of transfers. TRC[15:0] is decremented by one whenever a DMA cycle is executed. It is updated at the timing of the TI write back. If the reload function is not used, after the last transfer is complete, the value at the completion (0000_H) is retained. If 0000_H is set, DMA transfer is not executed even when a DMA transfer request is accepted.

TRC15 to 0	Operation
0000_H	Transfer is disabled or complete.
0001_H	The number of transfers or remaining transfers is 1.
:	:
$FFFF_H$	The number of transfers or remaining transfers is 65535.

CAUTIONS

1. **If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the transfer count and the address reload count are updated.**
2. **Unlike a DMAC, "0000_H" in the transfer count of the DTS does not mean "65536 transfers" but means that transfer is disabled or complete.**

7.11.3.4 DTTCTnnn — DTS Transfer Control Register

Access: This register can be read/written in 32-bit units.

Address: FFFF $900C_H$ + 40_H × Ch. No. n (n = 0 to 127)

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 7.64 DTTCTnnn Register Contents (1/3)

Bit Position	Bit Name	Function
31 to 28	Reserved	When writing, write the value “0”. When read, the unfixed value after reset and “0” after write.
27	ESE	Transfer error case DMA transfer abort setting Specifies whether to abort DMA transfer when DMA transfer error is generated. If this bit is cleared to 0, DMA transfer continues when DMA transfer error is generated. If this bit is set to 1, DMA transfer is aborted when DMA transfer error is generated. 0: DMA transfer continues when DMA transfer error is generated. 1: DMA transfer is aborted when DMA transfer error is generated.
26, 25	Reserved	When writing, write the value “0”. When read, the unfixed value after reset and “0” after write.
24 to 18	CHNSEL[6:0]	Next channel in the chain Specifies the next channel in the chain. The next channel must be another channel in the DTS. You cannot specify a channel in a DMAC. You cannot specify the same channel for the next channel. (If you do, the correct operation is not guaranteed.)
17, 16	CHNE1, 0	Chain enable Selects the chain function. 00: Disabled 01: Chain at the last transfer A chain request is generated at the completion of the DMA cycle in which the remaining transfer count is one. 10: (Forbidden. No guarantee of operation) 11: Always chain A chain request is generated at the completion of every DMA cycle.
15	CCE	Transfer count match interrupt enable If this bit is set, a transfer count match interrupt is generated at the completion of the DMA cycle in which the transfer count compare register and the remaining transfer count have the same value.
14	TCE	Transfer completion interrupt enable If this bit is set, a transfer completion interrupt is generated at the completion of the last transfer.
13	Reserved	When writing, write the value “0”. When read, the unfixed value after reset and “0” after write.

Table 7.64 DTTCTnnn Register Contents (3/3)

Bit Position	Bit Name	Function
1, 0	TRM1, 0	Transfer mode Specifies the DMA transfer mode. 00: Single transfer 01: Block transfer 1 (The number of transfers is specified by the transfer count.) 10: Block transfer 2 (The number of transfers is specified by the address reload count.) 11: Forbidden (No guarantee of operation)

CAUTIONS

1. **If forbidden settings are used for some of the bits, the correct operation is not guaranteed.**
2. **The 31 to 28, 26, 25, and bit 13 are unused, but you can read and write those bits. Our recommendation is as follows. When you write to those bits, write 0. When you read from those bits, discard the read value.**

7.11.3.5 DTRSAnnn — DTS Reload Source Address Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 9010_H + 40_H × Ch. No. n (n = 0 to 127)

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSA31	RSA30	RSA29	RSA28	RSA27	RSA26	RSA25	RSA24	RSA23	RSA22	RSA21	RSA20	RSA19	RSA18	RSA17	RSA16

Table 7.68 DTTCCnnn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15 to 0	CMC[15:0]	Transfer count compare Configures the transfer count to be compared to the transfer count register. If the transfer count match interrupt enable (DTTCTnnn.CCE) bit in the DTS transfer control register is 1, a transfer count match interrupt is generated at the completion of the DMA cycle in which the remaining transfer count is the same as the value in this register. If 0000_H is set, comparison with the transfer count is disabled. In this case, a transfer count match interrupt is not generated.

CAUTION

This register must be accessed after the DTS channel master setting register is set up.

If you access this register without setting up the DTS channel master setting register after the reset, ECC error may be generated during access to this register.

7.11.3.9 DTFSLnnn — DTSFSL Operation Setting Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 9020_H + 40_H × Ch. No. n (n = 0 to 127)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	REQEN
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.69 DTFSLnnn Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	REQEN	DMA transfer request enable This bit selects whether a DMA transfer request from this channel retained in the DTSFSL is used as a candidate in DTS channel arbitration. 0: A DMA transfer request from this channel is not used as a candidate in DTS channel arbitration. 1: A DMA transfer request from this channel is used as a candidate in DTS channel arbitration. If this bit is 0, even if the DTSFSL retains a DMA transfer request, this channel is not a candidate in DTS channel arbitration inside the DTSFSL, and consequently a DMA transfer request from this channel is not generated.

7.11.3.10 DTFSTnnn — DTSFSL Transfer Request Status Register

Access: This register can be read in 32-bit units.

Address: FFFF 9024_H + 40_H × Ch. No. n (n = 0 to 127)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVF	DRQ
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.70 DTFSTnnn Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read.
1	OVF	DTS overflow flag If this bit is set, the DTS channel has received at least one more DMA requests than it can store or handle. One or more DMA requests are lost. OVF can only be read, not written. Write 1 to DTFSCnnn.OVFC to clear OVF.
0	DRQ	DMA transfer request pending This bit shows whether a DMA transfer request of this channel is pending. This bit is set when a rising edge is detected in the hardware transfer source input from the DTSTRG pin, or when software writes “1” to the DTFSSnnn.DRQ bit. This bit is automatically cleared when the DMA transfer request acceptance signal (DTSAK) from the DTS is asserted while the DTSFSL is requesting DMA transfer of this channel. Alternatively, software can clear this bit by writing 1 to the DTFSCnnn.DRQC bit. 0: A DMA transfer request is not pending. 1: A DMA transfer request is pending.

7.11.3.11 DTFSSnnn — DTSFSL Transfer Request Set Register

Access: This register can be read/written in 32-bit units.

Address: FFFF 9028_H + 40_H × Ch. No. n (n = 0 to 127)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

7.12.1 DTS Merge Function Register Descriptions

7.12.1.1 PINT0 — DTS Interrupt Status Register 0

The DTS transfer completion interrupt and transfer count match interrupt are merged in 32-channel units. PINT0 contain the interrupt status flags to indicate the originating channels for these interrupts.

Writing the interrupt read register value to the interrupt clear register (PINTCLR0) of the same channel in the interrupt handler clears interrupts. Interrupts on the lower-bits side take precedence to support multiplex interrupts.

Access: This register can be read in 32-bit units.

Address: FFD4 0000_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INTDTS31	INTDTS30	INTDTS29	INTDTS28	INTDTS27	INTDTS26	INTDTS25	INTDTS24	INTDTS23	INTDTS22	INTDTS21	INTDTS20	INTDTS19	INTDTS18	INTDTS17	INTDTS16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.73 PINT0 Register Contents

Bit Position	Bit Name	Function
31 to 0	INTDTS[31:0]	Data transfer completion interrupt generated INTDTSn indicates the status of a data transfer completion interrupt for DTS channel n. INTDTSn = 0: No interrupt generated INTDTSn = 1: Transfer completion interrupt for channel n generated **NOTE** If multiple transfer completion interrupts are pending at the same time, only the INTDTSn bit for the channel with the highest priority (lowest channel number) is set. The PINTn registers are read only registers. INTDTSn is cleared by writing 1 to the corresponding INTCLRn bit of the PINTCLR0 register. There is some delay between writing the INTCLRn bit and clearing the INTDTSn flag. It is recommended to read PINT0 twice after clearing one of its bits. The second read operation will read the correct status.

7.12.1.2 PINT1 — DTS Interrupt Status Register 1

The DTS transfer completion interrupt and transfer count match interrupt are merged in 32-channel units. PINT1 contain the interrupt status flags to indicate the originating channels for these interrupts.

Writing the interrupt read register value to the interrupt clear register (PINTCLR1) of the same channel in the interrupt handler clears interrupts. Interrupts on the lower-bits side take precedence to support multiplex interrupts.

Access: This register can be read in 32-bit units.

Address: FFD4 0004_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.74 PINT1 Register Contents

Bit Position	Bit Name	Function
31 to 0	INTDTS[63:32]	Data transfer completion interrupt generated INTDTSn indicates the status of a data transfer completion interrupt for DTS channel n. INTDTSn = 0: No interrupt generated INTDTSn = 1: Transfer completion interrupt for channel n generated **NOTE** If multiple transfer completion interrupts are pending at the same time, only the INTDTSn bit for the channel with the highest priority (lowest channel number) is set. The PINTn registers are read only registers. INTDTSn is cleared by writing 1 to the corresponding INTCLRn bit of the PINTCLR1 register. There is some delay between writing the INTCLRn bit and clearing the INTDTSn flag. It is recommended to read PINT1 twice after clearing one of its bits. The second read operation will read the correct status.

7.12.1.3 PINT2 — DTS Interrupt Status Register 2

The DTS transfer completion interrupt and transfer count match interrupt are merged in 32-channel units. PINT2 contain the interrupt status flags to indicate the originating channels for these interrupts.

Writing the interrupt read register value to the interrupt clear register (PINTCLR2) of the same channel in the interrupt handler clears interrupts. Interrupts on the lower-bits side take precedence to support multiplex interrupts.

Access: This register can be read in 32-bit units.

Address: FFD4 0008$_H$

Value after reset: 0000 0000$_H$

Table 7.75 PINT2 Register Contents

Bit Position	Bit Name	Function
31 to 0	INTDTS[95:64]	Data transfer completion interrupt generated INTDTSn indicates the status of a data transfer completion interrupt for DTS channel n. INTDTSn = 0: No interrupt generated INTDTSn = 1: Transfer completion interrupt for channel n generated **NOTE** If multiple transfer completion interrupts are pending at the same time, only the INTDTSn bit for the channel with the highest priority (lowest channel number) is set. The PINTn registers are read only registers. INTDTSn is cleared by writing 1 to the corresponding INTCLRn bit of the PINTCLR2 register. There is some delay between writing the INTCLRn bit and clearing the INTDTSn flag. It is recommended to read PINT2 twice after clearing one of its bits. The second read operation will read the correct status.

7.12.1.4 PINT3 — DTS Interrupt Status Register 3

The DTS transfer completion interrupt and transfer count match interrupt are merged in 32-channel units. PINT3 contain the interrupt status flags to indicate the originating channels for these interrupts.

Writing the interrupt read register value to the interrupt clear register (PINTCLR3) of the same channel in the interrupt handler clears interrupts. Interrupts on the lower-bits side take precedence to support multiplex interrupts.

Access: This register can be read in 32-bit units.

Address: FFD4 000C$_H$

Value after reset: 0000 0000$_H$

Table 7.85 PINTCLR4 Register Contents

Bit Position	Bit Name	Function
31 to 0	INTCLR [31:0]	DTS count match interrupt clear Writing 1 to the INTCLRn bit clears the corresponding INTCTDTSn flag of the PINT4 register. INTCLRn = 0: Don't clear INTCTDTSn flag INTCLRn = 1: Clear INTCTDTSn flag **NOTE** 1. These bits are always read as 0. 2. There is some delay between writing the INTCLRn bit and clearing the INTDTSn flag. It is recommended to read PINT4 twice after clearing one of its bits. The second read operation will read the correct status.

7.12.1.14 PINTCLR5 — DTS interrupt clear Register 5

Access: This register can be read/written in 32-bit units.

Address: FFD4 0034_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INTCLR 63	INTCLR 62	INTCLR 61	INTCLR 60	INTCLR 59	INTCLR 58	INTCLR 57	INTCLR 56	INTCLR 55	INTCLR 54	INTCLR 53	INTCLR 52	INTCLR 51	INTCLR 50	INTCLR 49	INTCLR 48
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.92 DTSTRGSEL3 Register Contents

Bit Position	Bit Name	Function
31 to 0	DTSSEL[127:96]	Trigger selector DTSSELn specifies the DTS trigger input for DTS channel n. DTSSELn = 0: Primary channel selected DTSSELn = 1: Secondary channel selected. If a secondary channel is not available, the DTS trigger is kept at low level (inactive).

7.14 H-Bus DMA Halt Function

H-Bus Peripheral Master has DMA function. H-Bus DMA Halt function can halt transfer to/from memories (Global RAM, PE1/2 Local RAM, Code Flash) of H-Bus Peripheral Master.

A halt can be requested via the HTHDMACTL register. Transfer to Global RAM and to the other memories (PE1/2 Local RAM, Code Flash) can be halted individually. To check if all transfers have been halted, HTHDMASTAT register can be used.

7.14.1 H-Bus DMA Halt register Address

Address	Register Symbol	Meaning
FFFA 2000_H	HTHDMACTL	H-Bus DMA Halt control register
FFFA 2004_H	HTHDMASTAT	H-Bus DMA Halt status register

7.14.2 Detail of H-Bus DMA Halt register

7.14.2.1 HTHDMACTL — H-Bus DMA Halt Control register

Access: This register can be read/written in 8/16/32-bit units.

Address: FFFA 2000_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 7.93 HTHDMACTL Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	SICSRQ	Halt request for H-Bus DMA transfer to/from LRAM and Code Flash 0: System interconnect target is in normal operation mode 1: System interconnect target is in halt mode
0	GRISRQ	Halt request for H-Bus DMA transfer to/from GRAM 0: GRAM target is in normal operation mode 1: GRAM target is in halt mode

7.14.2.2 HTHDMASTAT — H-Bus DMA Halt status register

Access: This register can be read/written in 8/16/32-bit units.

Address: FFFA 2004_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SICSAK	GRISAK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.94 HTHDMASTAT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	SICSAK	Halt status for H-Bus DMA transfer to/from LRAM and Code Flash 0: System interconnect target has continued operation 1: System interconnect target has stopped operation
0	GRISAK	Halt status for H-Bus DMA transfer to/from GRAM 0: GRAM target has continued operation 1: GRAM target has stopped operation

CAUTION

Please do not clear HTHDMACTL halt request bit until HTHDMASTAT halt status bit will be set, once you sets HTHDMACTL halt request bit. Also, please do not set HTHDMACTL halt request bit until HTHDMASTAT halt status bit will be clear, once you clears HTHDMACTL halt request bit.

Please note that all H-Bus Peripheral Master have built-in memories to buffer received messages while the bus is stopped. The user is responsible that these buffers do not overflow while the H-Bus is halted.

7.15 Difference among P1M-C, P1H-C and P1H-CE

There are some differences of available DMA/DTS trigger sources listed in **Section 7.7.1** and **Section 7.8.1**.

Section 8 Reset Controller

8.1 Features

The Reset Controller controls all factors that have an influence on the reset behavior of the device.

The device has several kinds of reset categories depending on the areas that are reset. Each of reset categories is triggered by one or multiple reset sources.

The relation between reset categories and their sources are shown in **Table 8.1**. The relation between reset categories and initialized area is shown in **Table 8.2**.

Table 8.1 Reset Categories and Reset Sources

Reset Category	Source
Power On Reset	• Power On Reset*1
System Reset 1	• Terminal Reset • CVM Reset • Debugger Disconnect Reset
System Reset 2	• Software Reset (by SWSRESA0, SWSRESA1) • ECM Reset (if RESC0 = 0)
Application Reset 1	• Software Reset (by SWARESA0, SWARESA1) • ECM Reset (if RESC0 = 1)
Limited Reset	• Software Reset (by SWLRESAn) • ICUMC WDTA Reset
Debug Reset	• Debug Reset (by TRSTZ)*2

Note 1. Power On Reset is asserted when SYSVCC supply voltage is under VPOC level and is released when SYSVCC supply is over VPOC level.

Note 2. For details, See **Section 31, On-Chip Debugging Unit (OCD)**.

Table 8.2 Reset categories and initialized area (√ : reset (initialized) — : without reset (kept))

Initialized Area(module)		Reset category				
		Power On Reset	System Reset 1	System Reset 2	Application Reset 1	Limited Reset
PE1	PE1	√	√	√	√	—
	PE1 Local RAM (backup section)	√	√	√	√*1	—
	PE1 Local RAM (excluding backup section)	√	√	√	√*1	—
	Window Watchdog Timer 0	√	√	√	√	—

	RESETOUTZ Pin	√	√	√	√	—
	CVMOUTZ Pin	√	—	—	—	—
Peripheral	ECM master/checker error source status register 0/1/2	√	—	—	—	—
	ECM Error Output Clear Invalidation Configuration Register	√	√	√	—	—
	ECM	√	√	√	√	—
	MCAN/M-TTCAN/FlexRay/GTM/ Ethernet/CSIH	√	√	√	√*1	√*1
	SENT/HS-USRT/RLIN3/ADCF	√	√	√	√	√
	Secure WDT (SWDT)	√	√	√	√	—
	System Timer (counter)	√	√	√	√*2	—
	System Timer (excluding counter)	√	√	√	—	—
	Other Peripherals	√	√	√	√	—

Note 1. The execution of RAM initialization is configurable by a register setting.
Note 2. It can be masked by a System Timer register.
Note 3. For details, see the “**Section 29, Error Control Module (ECM)**”.
Note 4. Only the associated module is reset by the individual limited reset.

Note 5. Terminal Reset only

Note 6. For details, see the “**Section 10, Core Voltage Monitor (CVM)**”.

8.2 Input/Output Pins

I/O pins related to reset are shown in **Table 8.3**.

Table 8.3 I/O pins

Pin function name	Direction	Description
RESETZ	Input	Reset Input
RESETOUTZ	Output	Reset Output

8.3 Register Description

The register list related to reset is shown in **Table 8.4**.

Registers can be protected from inadvertent write access due to erroneouts program execution, etc. by configuration of the P-Bus Guards. For details, see **Section 28, Functional Safety**.

Table 8.4 List of Registers (1/2)

Address	Register Name	Description	Access Width	Value after reset	PBG
FFF8 1000h	RESF	Reset Factor Register	32	0000 0403h*1 0000 0406h or 0000 0404h*2	PBG4#0.PG4-SC3

Note 1. CVM Reset only

Note 2. CVM Reset only: Please note the different reset value options for CVM Reset condition as described in **Table 8.4**.

8.3.1 RESF — Reset Factor Register

This register indicates whether a Reset occurred since it was cleared last time.

All bits will be cleared by a Power On Reset, CVM Reset or by software, except it is described differently in **Table 8.6**.

Access: This register can be read in 32-bit units.

Address: FFF8 1000_H

Value after reset: $0000\ 0403_H$: Power On Reset
$0000\ 0406_H$ or $0000\ 0404_H$: CVM Reset*2

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset *1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 8.6 Reset Factor Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is read.
10	ARESF3	HW BIST Execution Flag This flag will always be asserted after a preceding Power-On or System Reset if the HW BIST is enabled. In this case the corresponding Power-On or System Reset Flag indication is asserted as well. This flag is only cleared by software. 0: HW BIST was not executed 1: HW BIST was executed
9	ARESF2	ECM Application Reset Flag 0: No reset occurred 1: Reset has occurred
8	ARESF1	Software Application Reset 1 Flag 0: No reset occurred 1: Reset has occurred
7	ARESF0	Software Application Reset 0 Flag 0: No reset occurred 1: Reset has occurred
6	Reserved	When read, the value is undefined.
5	SRESF4	ECM System Reset Flag 0: No reset occurred 1: Reset has occurred
4	SRESF3	Software System Reset 1 Flag 0: No reset occurred 1: Reset has occurred
3	SRESF2	Software System Reset 0 Flag 0: No reset occurred 1: Reset has occurred
2	SRESF1	CVM Reset Flag This flag is only cleared by a Power On Reset or by software. 0: No reset occurred 1: Reset has occurred

Table 8.6 Reset Factor Register Contents (2/2)

Bit Position	Bit Name	Function
1	SRESF0*2	Terminal Reset Flag The value of this flag after CVM Reset is undefined. This flag is only cleared by software. 0: No reset occurred 1: Reset has occurred
0	PRESF0	Power On Reset Flag This flag is set by a Power On Reset. This flag is also set, if it is triggered by the debugger. This flag can only be cleared by a CVM Reset or by software. 0: No reset occurred 1: Reset has occurred

Note 1. Value after Power On Reset

Note 2. Value of SRESF0 after CVM Reset is undefined

8.3.2 RESFC — Reset Factor Clear Register

This register clears the reset flags of the RESF register.

Access: This register can be writtern in 32-bit units.

Address: FFF8 1008_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ARESFC3	ARESFC2	ARESFC1	ARESFC0	—	SRESFC4	SRESFC3	SRESFC2	SRESFC1	SRESFC0	PRESFC0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 8.7 Reset Factor Clear Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is read. When writing, write the value after reset.
10	ARESFC3	HW BIST Execution Flag Clear 0: — 1: Clear flag This bit is read as 0
9	ARESFC2	ECM Application Reset Flag Clear 0: — 1: Clear reset flag This bit is read as 0
8	ARESFC1	Software Application Reset 1 Flag Clear 0: — 1: Clear reset flag This bit is read as 0
7	ARESFC0	Software Application Reset 0 Flag Clear 0: — 1: Clear reset flag This bit is read as 0
6	Reserved	When read, the value after reset is read. when writing, write the “1”.
5	SRESFC4	ECM System Reset Flag Clear 0: — 1: Clear reset flag This bit is read as 0
4	SRESFC3	Software System Reset 1 Flag Clear 0: — 1: Clear reset flag This bit is read as 0
3	SRESFC2	Software System Reset 0 Flag Clear 0: — 1: Clear reset flag This bit is read as 0
2	SRESFC1	CVM Reset Flag Clear 0: — 1: Clear reset flag This bit is read as 0

Table 8.7 Reset Factor Clear Register Contents (2/2)

Bit Position	Bit Name	Function
1	SRESFC0	Terminal Reset Flag Clear 0: — 1: Clear reset flag This bit is read as 0
0	PRESFC0	Power On Reset Flag Clear 0: — 1: Clear reset flag This bit is read as 0

8.3.3 ICUMRESF — ICUMC Reset Factor Register

This register indicates whether a reset occurred since it was cleared last time.

All bits will be cleared by a Power On Reset, CVM Reset or by software.

Access: This register can be read in 32-bit units.

Address: FFF8 6300$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ICUMLRESF1	ICUMLRESF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 8.8 ICUMC Reset Factor Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read.
1	ICUMLRESF1	ICUMC Software Reset Flag 0: No reset occurred 1: Reset has occurred
0	ICUMLRESF0	ICUMC WDTA Reset Flag 0: No reset occurred 1: Reset has occurred

8.3.4 ICUMRESFC — ICUMC Reset Factor Clear Register

This register clears the reset flags of the ICUMRESF register.

Access: This register can be writtern in 32-bit units.

Address: FFF8 6308$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ICUMLRESFC1	ICUMLRESFC0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 8.9 ICUMC Reset Factor Clear Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	ICUMLRESFC1	ICUMC Software Reset Flag Clear 0: — 1: Clear reset flag This bit is read as 0.
0	ICUMLRESFC0	ICUMC WDTA Reset Flag Clear 0: — 1: Clear reset flag This bit is read as 0.

8.3.5 SWSRESA0 — Software System Reset Assertion Register 0

This register is used to generate a System Reset 2.

Access: This register can be writtern in 32-bit units.

Address: FFF8 1100_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 8.10 Software System Reset Assertion Register 0 Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	SWSRESA0_0	Software System Reset Trigger 0 This bit is read as 0. 0: no function 1: generate software system reset 2

8.3.6 SWSRESA1 — Software System Reset Assertion Register 1

This register is used to generate a System Reset 2 by ICUMC.

Access: This register can be writtern in 32-bit units.

Address: FFF8 6000_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SWSRESA1_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	SWARESA1_0	Software Application Reset Trigger 1 This bit is read as 0. 0: no function 1: generate software application reset by ICUMC

8.3.9 SWLRESA2 — Software Limited Reset Assertion Register for ICUMC

This register is used to generate a Limited Reset for ICUMC.

Access: This register can be writtern in 32-bit units.

Address: FFF8 6208$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SWLRESA2_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 8.14 Software Limited Reset Assertion Register for ICUMC Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	SWLRESA2_0	Software Limited Reset Trigger for ICUMC This bit is read as 0. 0: no function 1: generate limited reset

8.3.10 SWLRESA3 — Software Limited Reset Assertion Register for MCAN

This register is used to generate a Limited Reset for MCAN.

Access: This register can be writtern in 32-bit units.

Address: FFF8 1708$_H$

Value after reset: 0000 0000$_H$

8.3.30 BOOTCTRL — Boot Control Register

This register controls the Start-Up of each PE (including ICUMC). At the time of reset (Power On Reset, System Reset 1/2, Application Reset 1) release, the PEs are started according to the initial setting of this register, which is defined by a FLASH option byte. After reset release, PE can be started selectively by asserting the corresponding bit of this register. Only 1-write is possible for these bits. 0-write is ignored. See **Table 8.45** for details.
In P1M-C, BOOTCTRL.BC2 can be accessed, but the function is disabled. Initial value of BOOTCTRL.BC2 is defined by a FLASH option byte.

Access: This register can be read/write in 32-, 16- or 8-bit units.

Address: FFC5 8000_H

Value after reset: 0000 $000X_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

1	BC1	Boot Control 1 This bit triggers the start-up of the PE1 0: Inactive 1: Active
0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

8.3.31 STAC_DTSRAM — RAM Initialization Mode Control Register for DTS_RAM

This register is used to control the RAM initialization execution of the DTSRAM. In Application Reset 1, initialization of DTS_RAM is executed depending on this register.

Access: This register can be read/write in 32-bit units.

Address: FFF8 1320_H

Value after reset: 0000 0003_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

8.4 Operation

8.4.1 Reset Categories

Power On Reset

The Power On Reset represents a Start-Up of the device during power up. This reset occurs when SYSVCC supply voltage is under a definite level and is released when SYSVCC supply voltage is over the definite level. In this case entire microcontroller is initialized.

System Reset 1

System Reset 1 is identical to the Power On Reset with the following exceptions. The Reset Factor Register of the Reset Controller and the Error Source Status Register of the Error Control Module and a part of Core Voltage Monitor registers are excluded from this reset. System Reset 1 sources are as follows.

- Terminal Reset
- Core Voltage Monitor Reset
- Debugger Disconnect Reset

System Reset 2

System Reset 2 is identical to the System Reset 1 with the following exceptions. A part of the Clock Controller registers is preserved (Divider0/1, Selector0). System Reset 2 sources are as follows.

- Software Reset by writing the associated register
- Error Control Module Reset (The Reset Category is configured by the Reset Configuration Register)

Application Reset 1

Application Reset 1 is used for fast re-initialization of the application. This reset is basically identical to the System Reset 2 with the following exceptions. The configuration data stored in the FLASH is not reloaded. HW BIST is not executed too. Therefore, fast re-initialization is realized. In addition, reset to the system timer is masked depending on a register setting. Application Reset 1 sources are as follows.

- Software Reset by writing the associated register
- Error Control Module Reset (The Reset Category is configured by the Reset Configuration Register)

Limited Reset

Limited Reset is used for re-initialization of dedicated device function like certain peripherals and the ICUMC. PE1 and PE2 does’t have Limited Reset function.

8.4.2 Reset Sources

Power On Reset

The Power On Reset identifies a Start-Up of the device during power up. The power up condition is detected by a Power-On-Clear circuit (POC). It permanently compares the power supply voltage SYSVCC with an internal reference voltage (Vpoc). If SYSVCC lowers below the internal reference voltate (SYSVCC < Vpoc), Power On Reset is generated.

Terminal Reset (by RESETZ)

A dedicated Reset Input pin (RESETZ) is available for initialization.

The associated buffer has input hysteresis. Therefore, there is no restriction for the slew rate of the reset signal as defined in the Electrical Characteristics.

The Terminal Reset is active low. Its status will propagate independently from clock activity.

In case of an open reset input, the device will be initialized via the internal pull-down of the Reset Input Buffer. This ensures that the device is always in a safe state.

A Reset glitch filter is provided.

In case Power-up, RESETZ must be asserted until VDD exceeds the threshold and main oscillator is stabilized. Until SYSVCC and VDD exceed the threshold, Internal reset is generated. After Internal reset and RESETZ are released, HW BIST and RAM initialization are executed. For details on the required RESETZ low period (tDVDDPUR, tDVCCPUR) and the threshold of SYSVCC and VDD, see the "**Section 35, Electrical Specifications**".

In case of Terminal Reset excluding power-up/down, the low pulse width of the RESETZ input must be greater than the value of noise-filter characteristic (tWRSL) to activate the reset.

Core Voltage Monitor Reset

The Core Voltage Monitor reset can be asserted as soon as one of the core supply voltages is outside the operating range. The execution of the CVM reset can be masked as well. For details , see the **Section 10, Core Voltage Monitor (CVM)**.

The CVM operation is independent from the Terminal Reset.

Debugger Disconnect Reset

System reset 1 is generated when the input level of debug reset pin (TRSTZ pin) is changed from high to low. (e.g. disconnecting of debug tool)

ECM Reset

No device failure (e.g. illegal access) shall result in a reset. All failures which are detectable by the Error Control Module (ECM) generate dedicated internal reset or interrupts (FENMI or EINT)instead. The failure signals and system behavior can be configured in the ECM (see **Section 29, Error Control Module (ECM)**). Optionally the device failures can be configured to be used as a Reset Source.

The ECM Reset can generate a System Reset 2 or an Application Reset 1. The behavior can be configured by the Reset Configuration Register.

Software Reset

The device supports multiple software resets that can trigger the reset of dedicated Reset Domains:

- Software System Reset Assertion Register 0 (SWSRESA0) triggers a System Reset 2
- Software Application Reset Assertion Register 0 (SWARESA0) triggers an Application Reset 1
- Software Limited Reset Assertion Register n triggers each of the peripheral Reset Domains (Limited Reset).
- Software System Reset Assertion Register 1 (SWSRESA1) for ICUMC(if present) triggers a System Reset 2.
- Software Application Reset Assertion Register 1 (SWARESA1) for ICUMC(if present) triggers an Application Reset 1.

Each software reset can be triggered when software writes to the associated Reset Assertion Register.

These registers are implemented as TMR to avoid reset reaction on single bit fail.

Each Reset Assertion Register is protected against unintended access by configuration of the P-Bus Guards. For details, see **Section 28, Functional Safety**. In addition, the P-Bus Guard allows restricting the register access to certain CPUs.

For example, this feature can be used to:

- prevent the ICUMC from writing to the SWSRESA0/SWARESA0 assigned to the other PEs.
- prevent any PE except of the ICUMC from writing the SWSRESA1/SWARESA1 assigned to the ICUMC

Before writing to limited reset assertion register, please verify that the corresponding peripheral module is in the idle state and other Limited Reset is not being executed. The procedure of Limited reset execution is shown in **Figure 8.1**. For the procedure of checking idle state, see the section of corresponding peripheral module. After limited reset, the reset module excluding ICUMC moves to the module standby state.

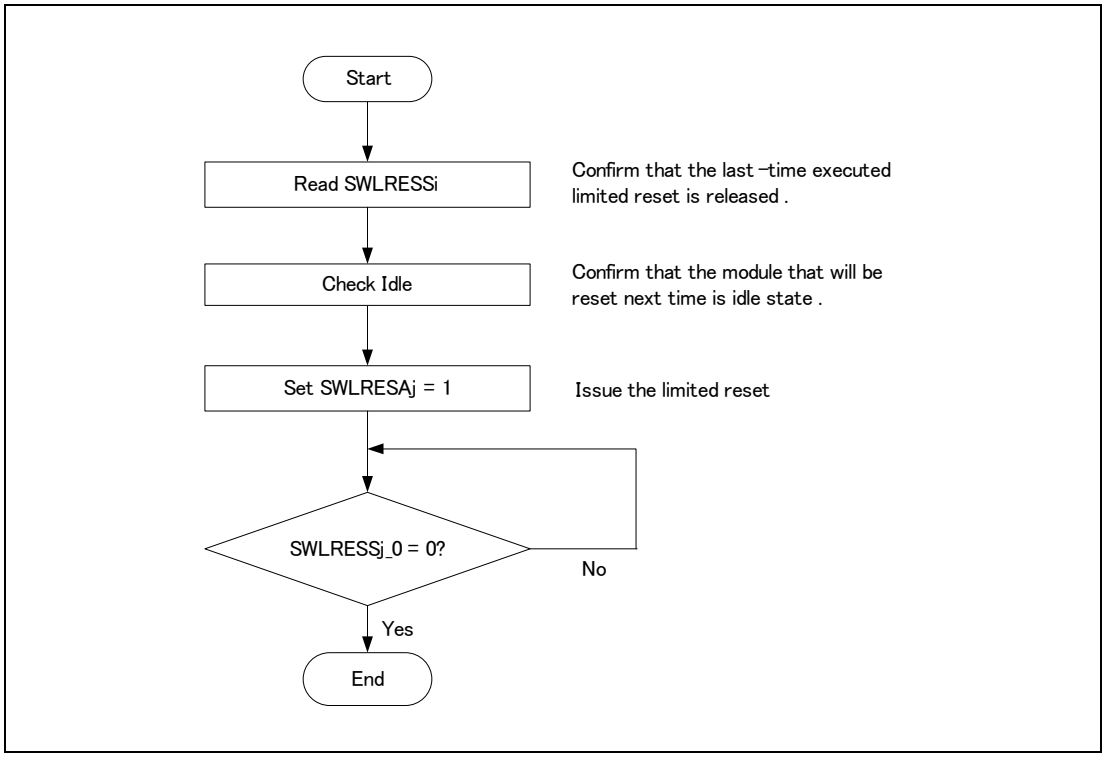

Figure 8.1 Flowchart of limited reset

ICUMC WDTA Reset

The ICUP Window Watchdog Timer allows interrupting or resetting the ICUMC sub-system in the event of system deadlocks.

8.4.3 Reset Flags

Any reset root cause can be identified by SW in the Reset Factor Register(RESF) and the ICUMC Reset Factor Regester (ICUMRESF). Each reset source will be indicated by one bit when it occurs. The status can be read out after the reset has been executed.

8.4.4 Read Configuration Data from FLASH

Reading configuration data from FLASH memory is executed by Power On Reset, System Reset 1 and System Reset2. If an ECC Error is detected during reading the configulation data from Flash in Normal Operation Mode, the device will be kept in reset state and will not start up.

8.4.5 HW BIST

HW BIST is executed by Power-On-Reset, System Reset 1 and System Reset 2. In System Reset 2, HW BIST execution can be disabled depending on Field BIST control register (BSEQ0CTL). HW BIST isn't executed except in Normal Operation Mode.

8.4.6 RAM initialization

RAM initialization to 0 is basically executed by all reset categories. In Application Reset 1 and Limited Reset, RAM initialization can be disabled depending on RAM Initialization Mode Control Register.

8.4.7 Start Up of Cores

After reset (Power On Reset , System Reset 1/2,Application Reset 1), start-up cores can be selected by FLASH option byte(STARTUPPE).

The relation of the start-up cores and the FLASH option byte is shown in **Table 8.45**.

In RH850/P1x-C, only PE1 and ICUMC can be selected to start first. ICUMC always must be started first and it is also possible to start PE1 and ICUMC in parallel either .In this case, it is ensured by hardware, that these cores start executing their code simultaneously. About the start-condition of ICUMC, see *the RH850/P1x-C User's Manual: Hardware (Security)* ***Section 3 ICUMC***.

Table 8.45 Start Up of Cores

	The setting of Flash option bytes		The CPUs to be started first		
Operating Mode	STARTUPPE	ICUMC Start Enable	PE1	PE2	ICUMC
Normal Operating Mode	1	0	√	—	—
	0	1	—	—	√
	1	1	√	—	√

Another setting except for the above is prohibited.

The CPUs that are started first can trigger the start-up of the others by writing the Boot Control Register (BOOTCTRL). But ICUMC can't be started by SW because ICUMC always starts-up first.

8.4.8 Reset Mask function

In debug mode System Reset 1/2 and Application Reset 1 can be masked by debugger setting. For details , see the “Section 31, On-chip Debug Unit (OCD)”.

Masked reset sources are shown in **Table 8.46**.

Table 8.46 Masked reset sources

Reset Categories	Reset Sources
System Reset 1	Terminal Reset
System Reset 2	ECM Reset (RESC0 = 0)
	Software Reset by SWSRESA0
	Software Reset by SWSRESA1
Application Reset 1	ECM Reset (RESC0 = 1)
	Software Reset by SWARESA0
	Software Reset by SWARESA1

8.4.9 Reset Output (RESETOUTZ)

A dedicated Reset Output pin RESETOUTZ is available for controlling the reset of external devices. It will be asserted by Power On Reset, System Reset 1, System Reset 2 and Application Reset. After the reset release, its status will be kept and it operates as an Open-Drain (Low) GPIO. It can be released or asserted by writing to the corresponding GPIO control registers.

Section 9 Power Supply

9.1 Features

This section describes the external voltage connection and internal voltage distribution required to operate the microcontroller. The power supply circuit has a POC (Power On Clear) circuit for safe startup.

The power supply of this microcontroller family is dual power supply.

9.2 External Pin List

Table 9.1 The list of external pins and **Table 9.2 The list of external pins (P1H-CE only)** show the list of external pins.

Table 9.1 The list of external pins

Pin name	I/O	Range	Function
E0VCC	Power	3.0 to 3.6 V	I/O power supply
E1VCC			
E0VSS	Ground	0V	
E1VSS			
SYSVCC	Power	3.0 to 3.6 V	Power supply for IPs (CVM and OSC)
VCC	Power	3.0 to 3.6 V	Internal voltage regulator power
VDD	Power	1.20 V to 1.35 V	Power supply for Internal
VSS	Ground	0 V	
OSCVSS	Ground	0 V	Power supply for Oscillator
A0VCC	Power	3.0 V to 3.6 V	Power supply for ADCF
A1VCC			
A0VSS	Ground	0 V	
A1VSS			
A0VREFH	Input	3.0 V to 3.6 V	Reference voltage for ADCF
A1VREFH			

Table 9.2 The list of external pins (P1H-CE only)

Pin name	I/O	Range	Function
DVCC	Power	3.0 V to 3.6 V	Power supply for fast trace I/F
DVDD	Power	1.175 V to 1.325 V	
DVSS	Ground	0 V	
EMUVCC	Power	3.0 V to 3.6 V	Power supply for EMU
EMUVDD	Power	1.175 V to 1.325 V	
EMUVSS	Ground	0 V	
ERAM0VCC	Power	3.0 V to 3.6 V	Power supply for ERAM
ERAM1VCC			
ERAMVDD	Power	1.20 V to 1.35 V	
ERAM0VSS	Ground	0 V	
ERAM1VSS

Section 10 Core Voltage Monitor (CVM)

10.1 Overview of RH850/P1x-C CVM

10.1.1 Units

The P1x-C has the following number of units of the CVM.

Table 10.1 Units

Products	P1M-C, P1H-C, P1H-CE
Number of units	1
Name	CVM

10.1.2 Register Addresses

CVM register addresses are represented by an offset from the base address <CVMn_base>.

The following table shows the base address <CVMn_base> of CVM module

Table 10.2 Register Base Address

CVMn	<CVMn_base> Address
CVM0	FFF8 2000_H

10.1.3 Clock Supply

Clock supply by and to a CVM is listed in the following table.

Table 10.3 Clock Supply

Unit Name	Specification	Description
CVM	Low speed system clock (CLK_LSB)	P-BUS clock for module register

Note: A VDD independent internal OSC is used for the noise filtering.
Refer to **Section 10.4.1**, **(5) Digital noise filter**.

10.1.4 Input/Output Pins

I/O pin related to CVM is shown in **Table 10.4**.

Table 10.4 I/O pins

Pin function name	Direction	Description
CVMOUTZ	Output	CVM detection output

10.2 Overview

The Core voltage monitor (CVM) monitors over and under voltage of the core voltage (VDD).

Violating the operating range of the core voltage is informed by:

- Single output pin (CVMOUTZ).
- Over and under voltage flags
- CVM Reset.

The CVM function is independent of internal or external RESET, except

  – Power On Reset
  – System Reset 1 while diagnostic function.

All writable CVM control registers are protected by a P-Bus guard.

The CVM has a diagnostic function:

- CVM function is testable.
- Over and under-voltage error can be generated without influencing core voltage itself.
- CVM error test is done by changing reference voltage.
- For diagnostic the signal path to the CVMOUTZ pin can be masked.
- CVMOUTZ pin provides read back function to check pin level.

10.2.1 Block Diagram

The block diagram of CVM for P1M-C, P1H-C and P1H-CE is shown in **Figure 10.1**.

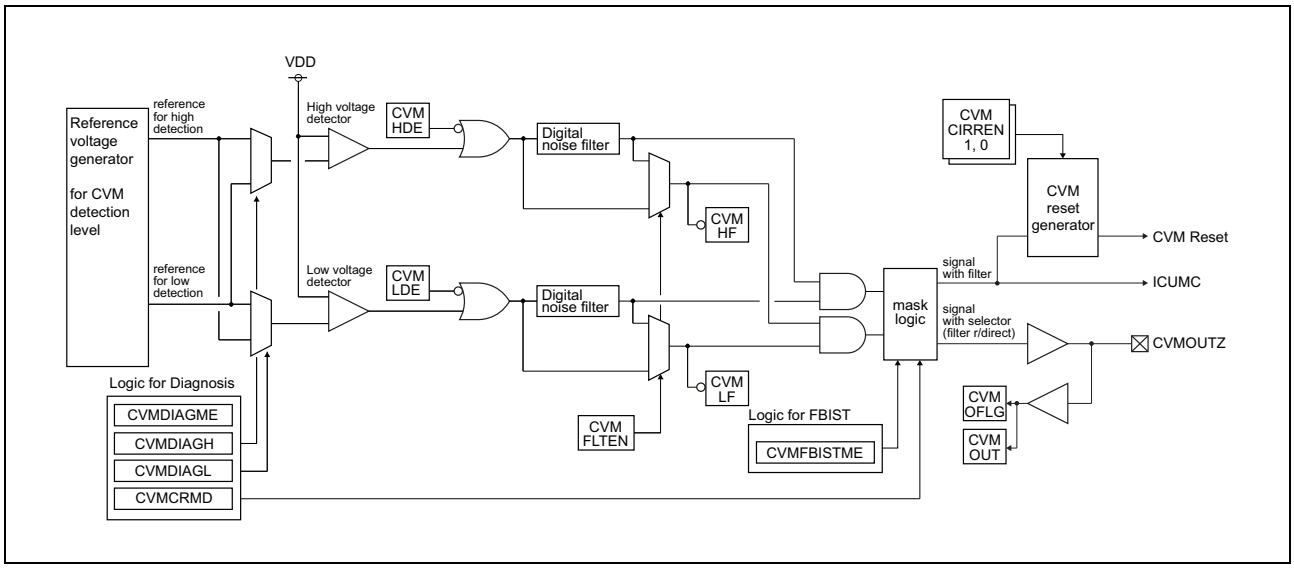

Figure 10.1 CVM Block diagram for P1M-C, P1H-C and P1H-CE

10.3 Registers

10.3.1 List of Registers

A register list related to CVM is shown in **Table 10.5**.

Table 10.5 List of Registers

Address	Register Name	Description	Access Width	Value after reset	Access Protection	
					PBG	other
<CVM0_base>+C00$_H$	CVMF	CVM Factor register	8	00$_H$	PBG4#0. PG4-SC3	—
<CVM0_base>+C04$_H$	CVMDE	CVM Detection Enable register	8	0x$_H$	PBG4#0. PG4-SC3	—
<CVM0_base>+C0C$_H$	CVMDMASK	CVM Detection output diagnosis MASK register	8	00$_H$	PBG4#0. PG4-SC3	—
<CVM0_base>+C10$_H$	CVMDIAG	CVM DIAG mode setting register	8	00$_H$	PBG4#0. PG4-SC3	—
<CVM0_base>+C14$_H$	CVMMON	CVM Monitor register	8	0x$_H$ *2	PBG4#0. PG4-SC3	—
<CVM0_base>+C18$_H$	CVMFC	CVMF clear register	8	00$_H$	PBG4#0. PG4-SC3	—
<CVM0_base>+C1C$_H$	CVMDEW	CVMDE write register	8	00$_H$	PBG4#0. PG4-SC3	*1

Note 1. Writing is permitted only once after power on reset.

Note 2. This value after reset depends on the status of CVMOUTZ pin.

10.3.2 Reset of Registers

Register reset conditions are shown in **Table 10.6**.

When VDD error occurs (over or under-voltage detection of CVM), all registers operate normally when the terminal reset is performed after the core voltage has recovered.

In case VDD error occurs and CVM reset is performed, all registers operate normal except for CVMDMASK and CVMDIAG.

A VDD error occurrence is indicated by the CVM factor register (CVMF) and is detectable after VDD has recovered and a system reset 1 has performed. The CVMF keeps the status of a VDD error unaffected of the CVM reset, terminal reset or over or under-voltage of VDD.

Table 10.6 Register reset conditions

Register Name	Reset condition				
	Power On Reset	**System Reset 1** (*1)	**System Reset 2**	**Application Reset 1**	**Limited Reset**
CVMF	√				
CVMDE	√	(*2)			
CVMDMASK	√	√			
CVMDIAG	√	√			
CVMMON					
CVMFC					
CVMDEW					

Note 1. CVM Reset is excluded.

Note 2. CVMDE[1:0] (CVMHDE and CVMLDE) are set by Flash option when Power On Reset or Terminal Reset (RESETZ) is released.

10.3.3 CVMF — CVM factor register

CVMF register indicates that an error is detected by CVM. Each flag of CVMF can be cleared individually by writing '1' to the corresponding bit in CVMFC.

This register is initialized only by Power On Reset.

Access: This register can be read in 8-bit units.

Address: <CVM0_base> +$C00_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CVMOFLG	—	—	—	—	—	CVMHVF	CVMLVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 10.7 CVM Factor register

Bit Position	Bit Name	Function
7	CVMOFLG	CVMOUTZ flag When CVMOUTZ pin has changed to low level, this flag is set to 1. 0: CVMOUTZ doesn't have changed to low level. 1: CVMOUTZ has changed to low level.
6 to 2	Reserved	These bits are read as 0.
1	CVMHVF	High voltage detection flag 0: No high core voltage violation detected 1: High core voltage violation occurred
0	CVMLVF	Low voltage detection flag 0: No low core voltage violation detected 1: low core voltage violation occurred

10.3.4 CVMFC — CVMF clear register

CVMFC is a register to clear the CVMF register. The read value of this register is always 00_H.

Access: This register can be written in 8-bit units.

Address: <CVM0_base> +$C18_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CVMOFLGC	—	—	—	—	—	CVMHVFC	CVMLVFC
Value after reset	0	0	0	0	0	0	0	0
R/W	W	R	R	R	R	R	W	W

Table 10.8 CVMF clear register

Bit Position	Bit Name	Function
7	CVMOFLGC	Clear CVMOUTZ flag 0: writing 0 has no effect 1: writing 1 will clear CVMOFLG
6 to 2	Reserved	These bits are read as 0. The write value should be 0.
1	CVMHVFC	Clear high voltage detection flag 0: writing 0 has no effect 1: writing 1 will clear CVMHVF
0	CVMLVFC	Clear low voltage detection flag 0: writing 0 has no effect 1: writing 1 will clear CVMLVF

10.3.5 CVMDE — CVM detection enable register

CVMDE is a read only register to inform about status of CVM control. It is a read back path from the CVM configuration about CVM reset, mask of CVM signal and filter of CVM signal.

Bit1,0 is set by flash option byte when Power On Reset or Terminal Reset (RESETZ) is released.

Bit7, 5, 4 to 2 are initialized by Power On Reset and reflect the settings written to the corresponding bits of CVMDEW.

Access: This register can be read in 8-bit units.

Address: <CVM0_base> +$C04_H$

Value after reset: $0X_H$

Bit	7	6	5	4	3	2	1	0
	CVMCIRREN1	—	CVMCIRREN0	CVMFBISTME	CVMFLTEN	CVMDIAGME	CVMHDE	CVMLDE
Value after reset	0	0	0	0	0	0	X (Flash-opt)	X (Flash-opt)
R/W	R	R	R	R	R	R	R	R

Table 10.9 CVM detection enable register

Bit Position	Bit Name	Function
7	CVMCIRREN1	Permit CVM reset. CVMCIRREN1, 0 00_B: CVM internal reset is not permitted 11_B: CVM internal reset is permitted
6	Reserved	This bit is read as 0.
5	CVMCIRREN0	refer to bit7 (CVMCIRREN1)
4	CVMFBISTME	Permit CVMOUTZ output mask for FBIST operation 0: During FBIST the CVMOUTZ and CVM reset can be masked 1: During FBIST the CVMOUTZ and CVM reset cannot be masked
3	CVMFLTEN	Enable output filter for CVMOUTZ 0: Enable output filter for CVMOUTZ 1: Disable output filter for CVMOUTZ
2	CVMDIAGME	Permit DIAG function 0: DIAG function of the CVM can be enabled 1: DIAG function of the CVM cannot be enabled
1	CVMHDE	High voltage detection enable 0: Disable high voltage detection 1: Enable high voltage detection The value after reset of this register can be set by flash option byte (CVMHDETEN)
0	CVMLDE	Low voltage detection enable 0: Disable low voltage detection 1: Enable low voltage detection The value after reset of this register can be set by flash option byte (CVMLDETEN)

NOTE

CVM internal reset function and DIAG function should not be enabled simultaneously.

10.3.6 CVMDEW — CVMDE write register

CVMDEW is a register to set values of CVMDE. Writing is permitted only once after Power On Reset was released. Subsequent write operation is ignored. The read value of this register is always $00_{H.}$

Access: This register can be write in 8-bit units.

Address: <CVM0_base> +$C1C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CVM CIRREN1W	—	CVM CIRREN0W	CVM FBISTMEW	CVMFLTENW	CVMDIAGMEW	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	W	R	W	W	W	W	R	R

Table 10.10 CVMDE write register

Bit Position	Bit Name	Function
7	CVMCIRREN1W	The data written in this bit is set to CVMDE.CVMCIRREN1.
6	Reserved	This bit is read as 0. The write value should be 0.
5	CVMCIRREN0W	The data written in this bit is set to CVMDE.CVMCIRREN0.
4	CVMFBISTMEW	The data written in this bit is set to CVMDE.CVMFBISTME.
3	CVMFLTENW	The data written in this bit is set to CVMDE.CVMFLTEN.
2	CVMDIAGMEW	The data written in this bit is set to CVMDE.CVMDIAGME.
1, 0	Reserved	This bit is read as 0. The write value should be 0.

NOTE

CVMDIAGMEW is needed to be set “1” whenever both CVMCIRREN1W and CVMCIRREN0W are set “1”.

10.3.7 CVMDMASK — CVM detection output diagnosis mask register

CVMDMASK is a register to mask CVMOUTZ and the interrupt to ICUMC when CVMDE.CVMDIAGME = 0. CVMDMASK's setting is ignored if CVMDE.CVMDIAGME = 1.

Writing is possible without depending on CVMDIAGME's setting.

This register is initialized by Power On Reset or Terminal Reset (RESETZ) .

Access: This register can be read/write in 8-bit units.

Address: <CVM0_base> +$C0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CVMCRMD
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 10.11 CVM detection output diagnosis mask register

Bit Position	Bit Name	Function
7 to 1	Reserved	These bits are read as 0. The write value should be 0.
0	CVMCRMD	This bit masks CVMOUTZ and the interrupt to ICUMC when CVMDIAGME = 0. 0: CVM control signals are not masked. 1: CVM control signals are masked. As a result CVMOUTZ is high. And the interrupt and the reset don't occur. Note: The value of CVMDE.CVMCIRREN1,0 is '00_B' while the CVM diagnosis application is carried out after Power On Reset. Therefore CVM reset has been already masked by CVMCIRREN1,0 even if CVMCRMD isn't set to '1'.

10.3.8 CVMDIAG — CVM DIAG mode setting register

CVMDIAG forces CVM comparators to output error. This register is valid only in DIAG mode when CVMDE.CVMDIAGME = 0. CVMDIAG's setting is ignored if CVMDE.CVMDIAGME = 1.

Writing is possible without depending on CVMDIAGME's setting.

This register is initialized by Power On Reset or Terminal Reset (RESETZ) .

Access: This register can be read/write in 8-bit units.

Address: <CVM0_base> +$C10_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	CVMDIAGH	CVMDIAGL	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R	R

Table 10.12 CVM diag mode setting register

Bit Position	Bit Name	Function
7 to 4	Reserved	These bits are read as 0. The write value should be 0.
3	CVMDIAGH	This bit can change the detection level of high voltage detector to low level intentionally when CVMDIAGME = 0. 0: CVM for high voltage monitors normally. 1: CVM for high voltage will detect violation condition because detection level changes.
2	CVMDIAGL	This bit can change the detection level of low voltage detector to high level intentionally when CVMDIAGME = 0. 0: CVM for low voltage monitors normally. 1: CVM for low voltage will detect violation condition because detection level changes.
1, 0	Reserved	These bits are read as 0. The write value should be 0.

10.3.9 CVMMON — CVM Monitor register

CVMMON register reflects the status of CVMOUTZ pin.

Access: This register can be read in 8-bit units.

Address: <CVM0_base> +$C14_H$

Value after reset: $0X_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CVMOUT
Value after reset	0	0	0	0	0	0	0	X
R/W	R	R	R	R	R	R	R	R

Table 10.13 CVM monitor register

Bit Position	Bit Name	Function
7 to 1	Reserved	These bits are read as 0.
0	CVMOUT	CVMOUTZ pin level 0: CVMOUTZ Output level is at low level. 1: CVMOUTZ Output level is at high level.

10.4 Operation

10.4.1 CVM basic function

CVM watches VDD voltage all the time except when VCC or EVCC is not stable and Power On Reset occurs. CVM has high and low voltage detection circuit. If it detects a voltage error, it records the error to CVMF register, report the error internally to the ICUMC and notifies the error to the outside via CVMOUTZ pin. Configurable, the CVM can also generate an internal reset (CVM reset) in case of a voltage error.

(1) CVM detection flag

CVM sets '1' to CVMF.CVMHF when VDD becomes higher than high voltage detection level of CVM. Similarly, CVM sets '1' to CVMF.CVMLF when VDD becomes lower than low voltage detection level of CVM. These flags can be cleared to '0' by writing in the corresponding bit of CVMFC (CVMHFC for CVMHF, CVMLFC for CVMLF). These flags are also cleared by power on reset (not cleared by other resets). **Figure 10.2** shows the operation example of CVMHF and CVMLF.

NOTE

For voltage detection level, see **Section 35.7.2, Core Voltage Monitor (CVM) Characteristics**.

(2) CVMOUTZ pin

While VDD voltage is higher than high voltage detection level or lower than low voltage detection level of CVM, CVMOUTZ pin outputs low. If CVM doesn't detect voltage error, CVMOUTZ pin outputs high.

To avoid unwanted operation of CVM circuit caused by instable power supply at power up, CVMOUTZ is fixed to low during power on reset period. CVMOUTZ outputs error detection result during other reset period.

The status of CVMOUTZ is readable from CVMF.CVMOFLG or CVMMON.CVMOUT. CVMOFLG is set to '1' when CVMOUTZ pin becomes low. It is cleared to '0' when '1' is written to CVMFC.CVMOFLGC. It is also cleared by Power On Reset (not cleared by other resets). **Figure 10.2** shows the operation example of CVMOUTZ and CVMOFLG.

CVMMON.CVMOUT is used for self-diagnosis function. See **Section 10.4.3, CVM diagnosis function** for further information.

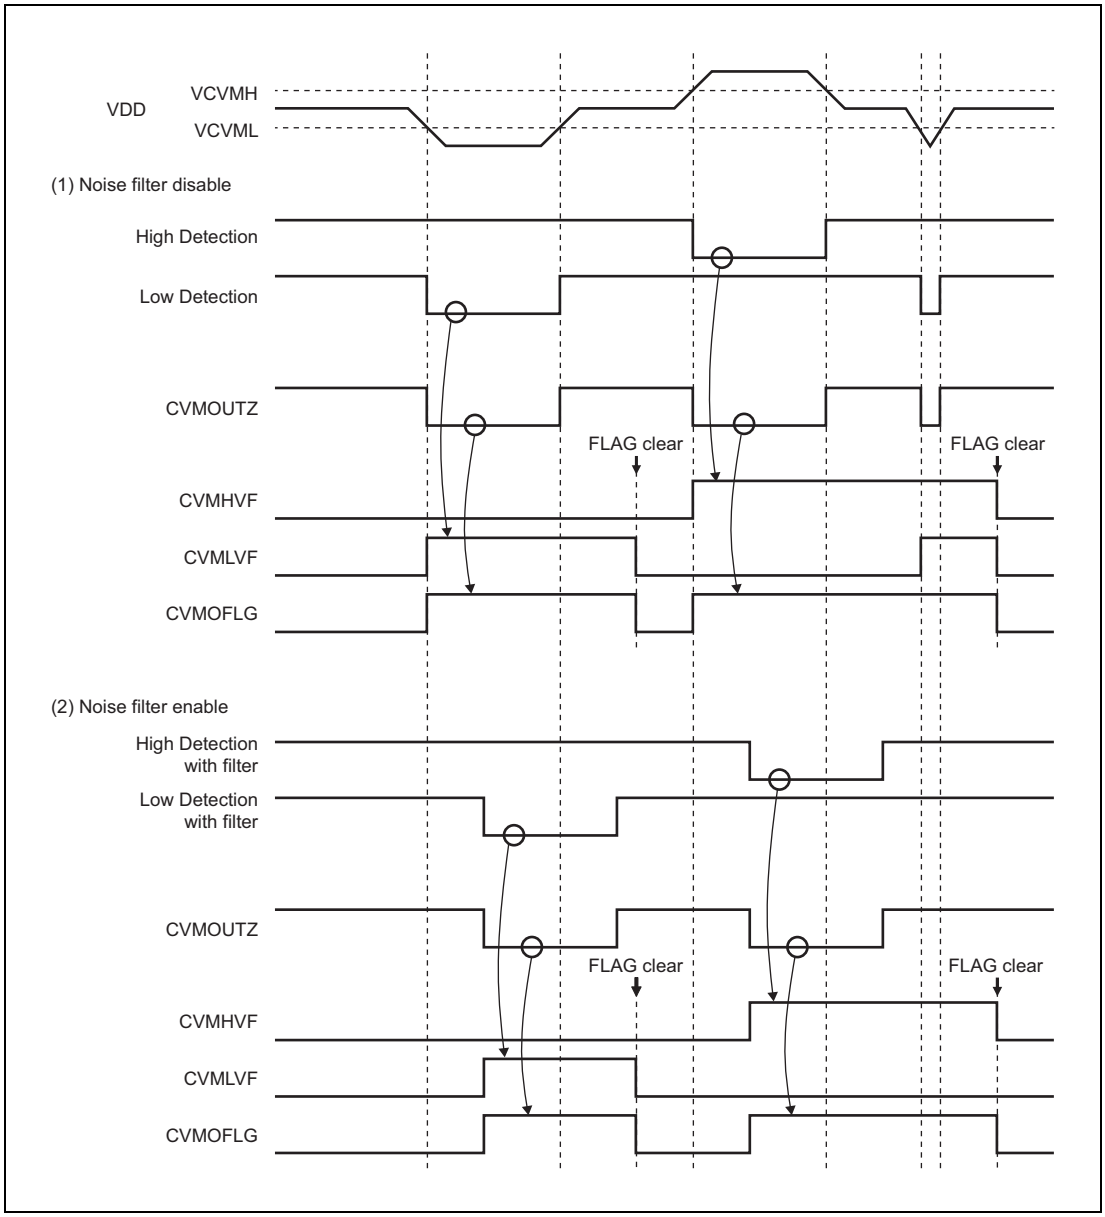

Figure 10.2 CVM basic operation

(3) CVM reset

If VDD voltage becomes higher than high voltage detection level or lower than low voltage detection level of CVM when "11_H" was set to CVMMDE.CVMCIRREN1, 0 in advance, CVM reset occurs and the MCU is initialized. After CVM detects the normal voltage, CVM reset is released when the time is needed to initialize internal circuits has elapsed. **Figure 10.3** shows the operation example of CVM reset.

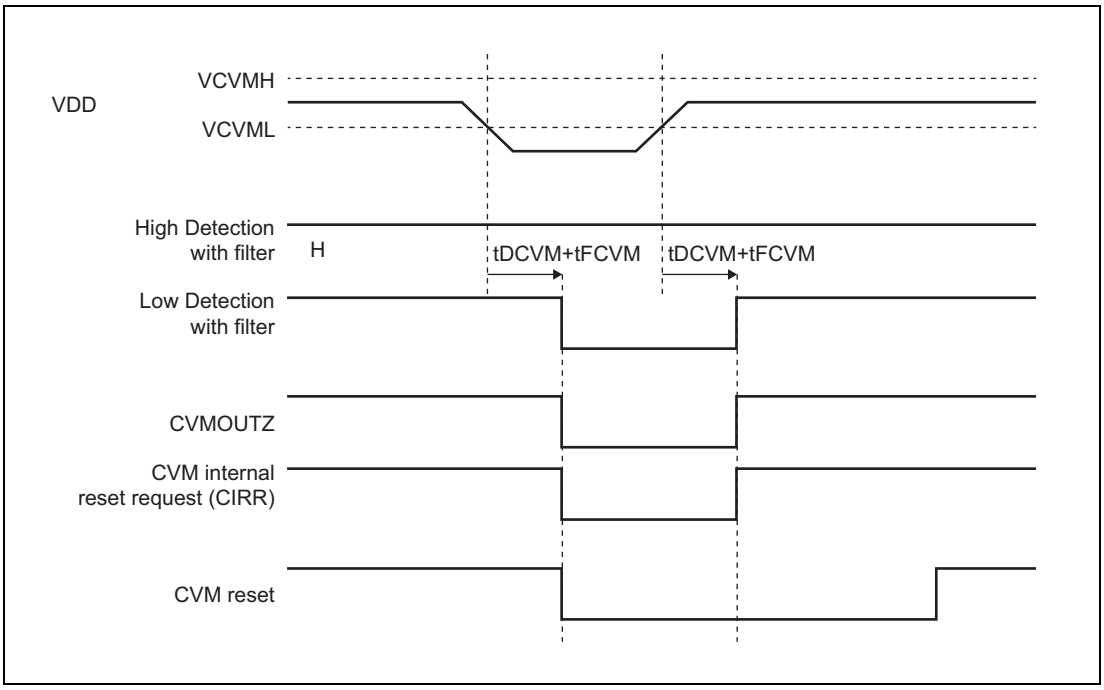

Figure 10.3 CVM reset operation

(4) Relation with ICUMC

VDD voltage error detected by CVM is notified to ICUMC. ICUMC can treat this notification as the interrupt if CVM reset is inactivated and VDD is in the operating range

(5) Digital noise filter

The output signal of the CVM comparators passes through a digital noise filter to remove an unintended glitch. Whether to use filtered output or to bypass the filter is selectable by CVMDE.CVMFLTEN. This setting is applied to CVMOUTZ, CVMHF and CVMLF. On the other hand, the filtered signal is always used for CVM reset or the interrupt to ICUMC.

A VDD independent internal OSC is used for the noise filtering.

NOTE

For filter timing, see **Section 35.7.2, Core Voltage Monitor (CVM) Characteristics**.

10.4.2 CVM function in FBIST and Serial programing mode (Mask of CVMOUTZ pin and CVM reset)

It is possible to mask CVMOUTZ output and the interrupt to ICUMC and CVM reset by CVMDE.CVMFBISTME when field-BIST is carried out after Power On Reset and System Reset1. In this case, CVMOUTZ is fixed to high level. And the request of the interrupt to ICUMC and CVM reset don't occur.

Field-BIST can be executed after system reset2 by setting of BSEQ0CTL.HWBISTEXE bit. However, CVMOUTZ output and the interrupt to ICU-M and CVM reset are not masked when field-BIST is carried out after System Reset2. Therefore, as long as it is known that VDD is stabled within the range when the field-BIST is being executed, field-BIST can be executed after System reset2.

CVMOUTZ output is fixed to high level in Serial programing mode.

10.4.3 CVM diagnosis function

(1) Change of CVM detection level for the error injection

When CVMDE.CVMDIAGME is set to '0', CVM detection level can be changed by CVMDIAG.CVMDIAGH or CVMDIAG.CVMDIAGL. CVM error detection signal can be intentionally generated by setting these registers even when VDD voltage is in the operating range.

(2) Mask of CVMOUTZ pin, the interrupt to ICUMC and CVM reset

When CVMDE.CVMDIAGME is set to '0' and CVMDMASK.CVMCRMD is set to '1', CVMOUTZ output and the interrupt to ICUMC can be masked. This setting fixes CVMOUTZ to high level and can avoid the occurrence of the interrupt to ICUMC even if CVM error is occurred by CVMDIAGH or CVMDIAGL.

The value of CVMDE.CVMCIRREN1,0 is '00_B' while the CVM diagnosis application is carried out after Power On Reset. Therefore CVM reset has been already masked by CVMCIRREN1,0 even if CVMCRMD isn't set to '1'.

(3) CVMMON register

The status of CVMOUTZ can be monitored by CVMMON.CVMOUT. By reading this register, it can be checked that CVMOUTZ is at low level when CVM error is occurred by CVMDIAGH or CVMDIAGL.

(4) The flow of CVM diagnosis application

CVMDE.CVMDIAGME is initialized to '0' by Power On Reset. So CVM diagnosis function is enabled at start-up after these resets. The user's application controls the diagnostic function by CVMDMASK and CVMDIAG. **Figure 10.4** shows the example of the diagnosis application.

After diagnosis application was over, write '1' to CVMDEW.CVMDIAGMEW*1 and disable CVM diagnosis function immediately. This function protects each flag against erroneous operation when VDD is out of the operating range.

Note 1. Set the other bits of CVMDEW too at the same time, because writing in CVMDEW is permitted only once.

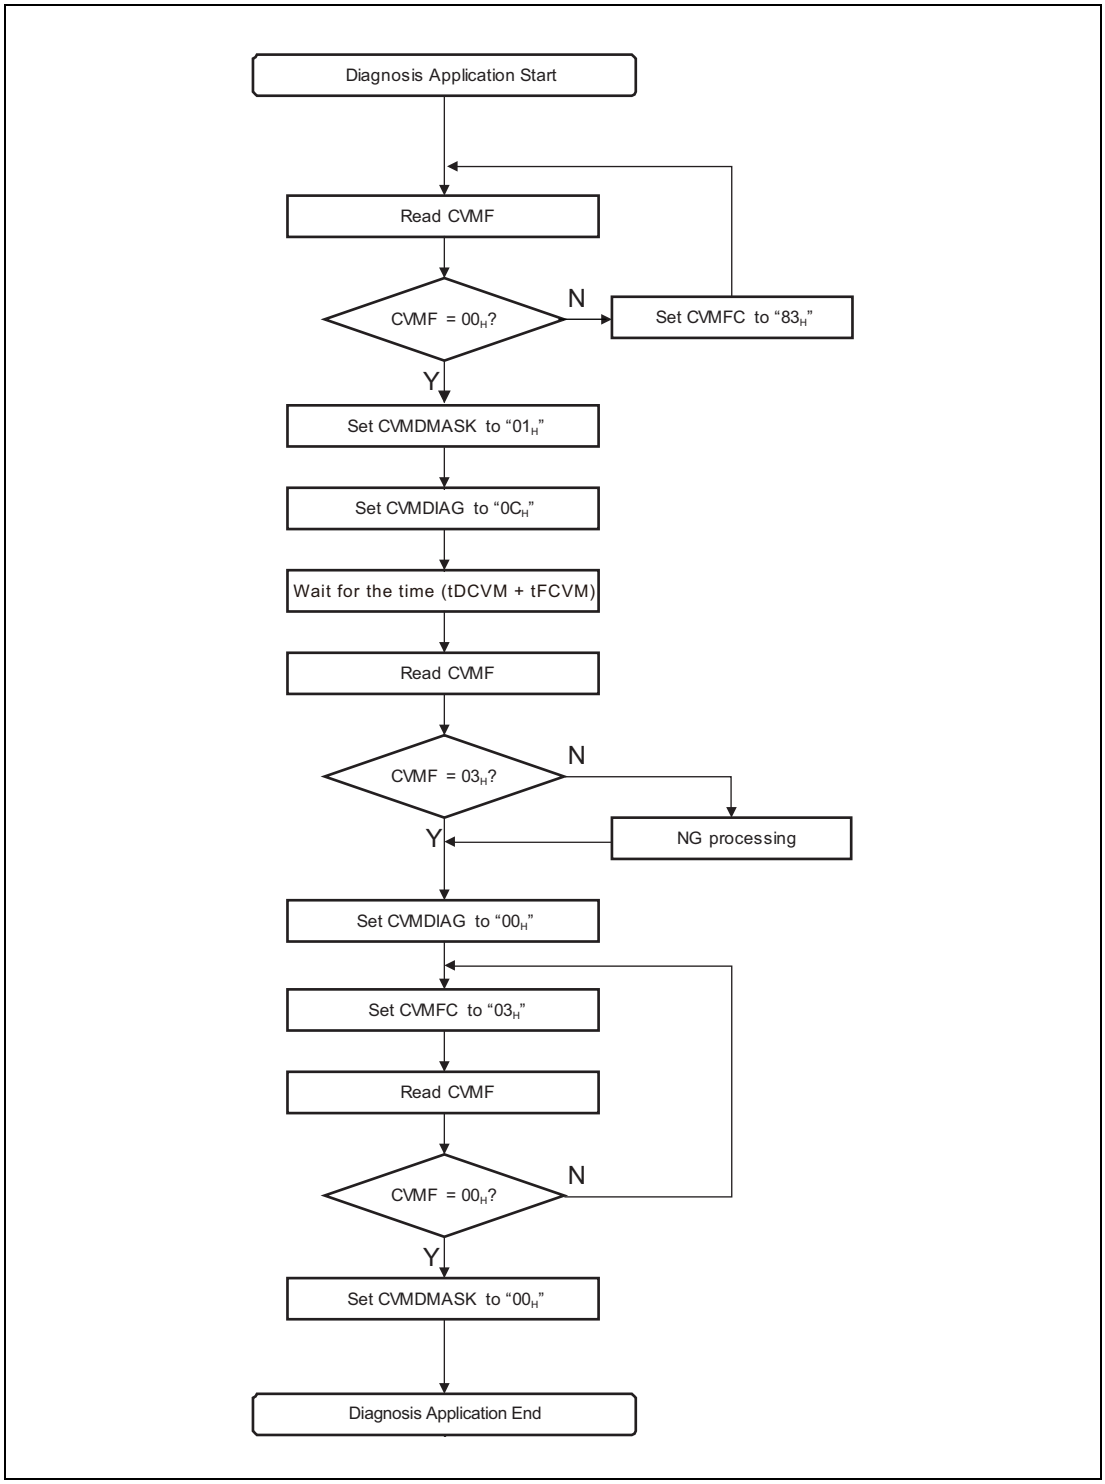

Figure 10.4 The example of the flowchart of CVM diagnosis application

10.5 Usage Notes

(1) Flag bit (CVMHF, CVMLF, CVMOFLG)

Setting 1 to CVMHF by error detection is prior to clearing CVMHF by CVMHFC. Similarly, setting 1 to CVMLF by error detection is prior to clearing CVMLF by CVMLFC. Setting 1 to CVMOFLG by pin status is prior to clearing CVMOFLG by CVMOFLGC. These functions protect each flag against erroneous operation when VDD is out of the operating range. When VDD is recovered to the operating range, the MCU need to be initialized by RESETZ pin or CVM reset, or the MCU may still continue erroneous operation and then unintended clear of flag may occur.

(2) ERROROUTZ pin

Enable CVM reset if you want to notify CVM error detection signal to outside of the MCU via ERROROUTZ. When CVM reset is occurred, ERROROUTZ is set to Hi-Z (high impedance) regardless of whether VDD is in the operating range or not.

Section 11 Temperature Sensor

RH850/P1x-C provided with a temperature sensor that outputs digital internal temperature data consists of a sensor section and an separate Delta-Sigma-A/D converter.

11.1 Overview of RH850/P1x-C Temperature Sensor

11.1.1 Channels

RH850/P1x-C has the following number of channels of temperature sensor.

Table 11.1 Channels

	Temperature Sensor
Number of channels	1
Name	OTS0

11.1.2 Register Address

The temperature sensor addresses are given as offsets from individual base addresses <OTSn_base>.

OTSn register addresses are listed in the following table.

Table 11.2 Register Base Address

OTSn	<OTSn_base> Address
OTS0	FFF9 3000_H

11.1.3 Clock Supply

Clock supply by and to a temperature sensor is listed in the following table.

Table 11.3 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
OTS0	P-Bus interface clock (PCLK)	CLK_LSB
	Operation clock (OTSCLK)	CLKP_L

Note: The following condition must be fulfilled: 0.6 × CLKP_L ≤ CLK_LSB ≤ CLKP_L
Only when CLKP_L = 36 MHz – 40 MHz, the electrical characteristics can be guaranteed.

11.1.4 Interrupt Request

The temperature sensor interrupt requests are listed in the following table.

Table 11.4 Interrupt Requests

Unit Interrupt Name	Outline	Interrupt Number
OTE	Temperature sensor error interrupt	37
OTI	Temperature measurement end interrupt	38
OTULI	Triggered if state machine change the stage by the temperature rising or falling in the guaranteed temperature range	39

Table 11.5 Alarm Notification

Unit Interrupt Name	Outline	Connected to
OTABE	Abnormal temperature error signal	ECM

11.1.5 Hardware Reset

The registers that constitute the temperature sensor are initialized by the reset sources listed below.

Table 11.6 Register Reset Condition

		Reset Condition				
Unit Name	Register Name	Power On Reset	System Reset 1	System Reset 2	Application Reset 1	Limited Reset
OTS0	All registers	√	√	√	√	—

11.1.6 External Input/Output Signals

No external Input and Output pins.

11.2 Overview

The following describes features of the temperature sensor.

- Temperature measurement range
  For this manipulation detection the operating temperature borders (TJ, MIN and TJ, MAX) must be precise reachable. Due to delay timing and the limited reachable accuracy the operation of Temperature Sensor itself and ICUMC reaction for thermal attack must exceed the specified range of TJ, MAX. This extended temperature range above TJ, MAX is agreed to be guaranteed by design only and will not be tested.
- Temperature measurement time
  Internal OTS clock (approx. 51.28 kHz) × 512 states
- Temperature data register
  A temperature data register stores a temperature measurement value.
- Temperature measurement mode
  Single measurement mode: Used to measure temperature only once.
  Continuous measurement mode: Used to measure temperature continuously.
- Supporting temperature measurement end interrupt
  Each time temperature measurement ends, the temperature sensor can generate an interrupt request (OTI) to be sent to the INTC.
- Supporting temperature alarm error and temperature rise/drop interrupt
  The temperature sensor sets six temperature threshold values (high-temperature border AH > high-temperature border AL > high-temperature border BH > high-temperature border BL > low-temperature border AH > low-temperature border AL) in advance. Furthermore, the temperature sensor has four temperature states (high temperature A, high temperature B, ordinary temperature, and low temperature A). These temperature states are updated at each temperature measurement according to six temperature threshold values. The following describes conditions for generating a temperature alarm error and a temperature rise/drop interrupt.
  - A temperature alarm error (OTABE) is output at a transition from a state other than high temperature A to high temperature A or at a transition from a state other than low temperature A to low temperature A.
  - A temperature rise/drop interrupt (OTULI) is output at a transition from high temperature A to high temperature B or ordinary temperature or at a transition from high temperature B to ordinary temperature, that is, when temperature drops.
  - A temperature rise/drop interrupt (OTULI) is output at a transition from low temperature A to high temperature B or ordinary temperature or at a transition from ordinary temperature to high temperature B, that is, when temperature rises.

Temperature status can be monitored by reading the temperature status register.

- Diagnosis function
  When temperature is measured in continuous measurement mode, if the difference between the measured value and the immediately previous measured value is larger than the prespecified difference (temperature difference limit value), a temperature sensor error (OTE) is output.
- Reducing errors by temperature correction
  Three temperature correction coefficients are stored beforehand in coefficient registers A to C.

11.3 Configuration

Figure 11.1 shows a block diagram of the temperature sensor.

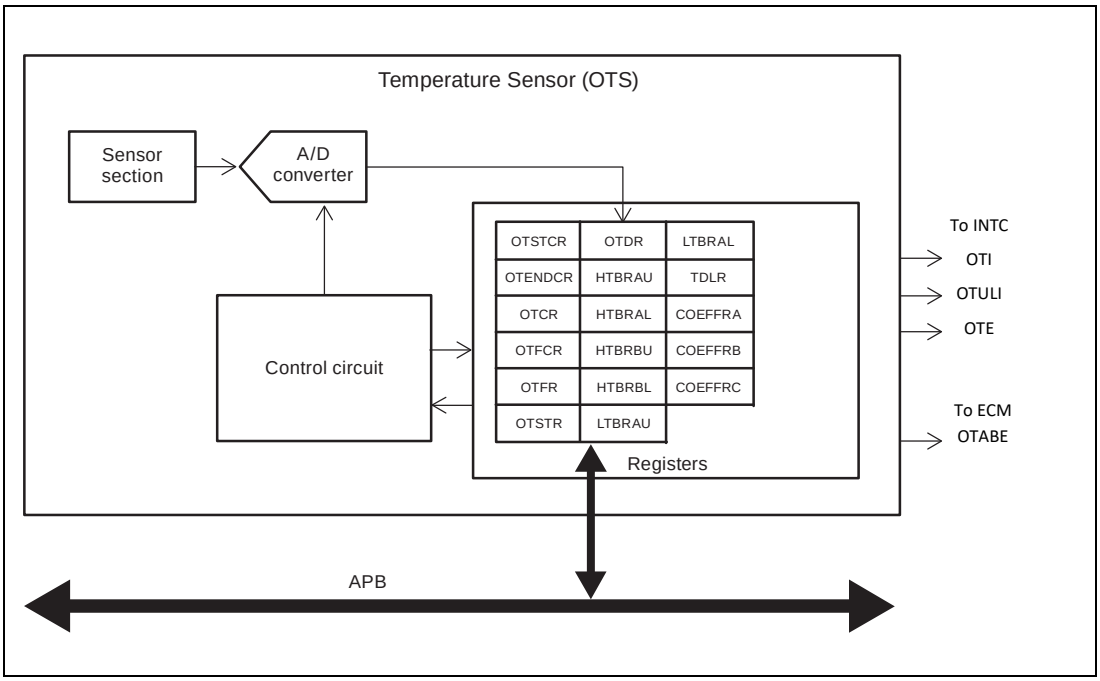

Figure 11.1 Temperature Sensor Block Diagram

11.3.1 List of Registers

The following table lists registers of the temperature sensor.

Address Offset	Register Name	Description	Access Width (bits)	Value after reset	Access Protection	
					PBG	Other
000_H	OTS0OTSTCR	Temperature measurement start control register	8	00_H	PBG4#1. PG4-OTS	—
004_H	OTS0OTENDCR	Temperature measurement end control register	8	00_H	PBG4#1. PG4-OTS	—
008_H	OTS0OTCR	Temperature sensor control register	8	00_H	PBG4#1. PG4-OTS	—
$00C_H$	OTS0OTFCR	Temperature sensor flag clear register	8	00_H	PBG4#1. PG4-OTS	—
010_H	OTS0OTFR	Temperature sensor flag register	8	00_H	PBG4#1. PG4-OTS	—
014_H	OTS0OTSTR	Temperature status register	8	00_H	PBG4#1. PG4-OTS	—
018_H	OTS0OTDR	Temperature data register	16	0000_H	PBG4#1. PG4-OTS	—
$01C_H$	OTS0HTBRAU	High-temperature border AU register	16	0000_H	PBG4#1. PG4-OTS	—
020_H	OTS0HTBRAL	High-temperature border AL register	16	0000_H	PBG4#1. PG4-OTS	—
024_H	OTS0HTBRBU	High-temperature border BU register	16	0000_H	PBG4#1. PG4-OTS	—
028_H	OTS0HTBRBL	High-temperature border BL register	16	0000_H	PBG4#1. PG4-OTS	—
$02C_H$	OTS0LTBRAU	Low-temperature border AU register	16	0000_H	PBG4#1. PG4-OTS	—
030_H	OTS0LTBRAL	Low-temperature border AL register	16	0000_H	PBG4#1. PG4-OTS	—
034_H	OTS0TDLR	Temperature difference limiting register	16	$7FFF_H$	PBG4#1. PG4-OTS	—
038_H	OTS0COEFFRA	Coefficient A register	16	N/A	PBG4#1. PG4-OTS	—
$03C_H$	OTS0COEFFRB	Coefficient B register	16	N/A	PBG4#1. PG4-OTS	—
040_H	OTS0COEFFRC	Coefficient C register	16	N/A	PBG4#1. PG4-OTS	—

11.4 Details of Registers

This section describes registers of the temperature sensor.

11.4.1 OTS0OTSTCR — Temperature Measurement Start Control Register

OTS0OTSTCR is an 8-bit write-only register to control starting the temperature sensor. This register is always read as 0.

Access: This register can be written in 8-bit units.

Address: <OTSn_base> + 000_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OTST
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 11.7 Contents of OTS0OTSTCR Register

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	OTST	Temperature Measurement Start Condition for starting temperature measurement by OTST Write 1 to OTST when OTACT = 0

11.4.2 OTS0OTENDCR — Temperature Measurement End Control Register

OTS0OTENDCR is an 8-bit write-only register to control terminating the temperature sensor. This register is always read as 0.

Access: This register can be written in 8-bit units.

Address: <OTSn_base> + 004_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OTEND
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 11.8 Contents of OTS0OTENDCR Register

Bit Position	Bit Name	Function
7 to1	Reserved	When writing, write the value after reset.
0	OTEND*[1]	Temperature Measurement End Condition for terminating temperature measurement by OTEND Write 1 to OTEND and then wait for 2-cycle OTS clock.

Note 1. When doing stop processing by OTEND bit, the measuring data is broken. When OTEND bit is set to 1 before once of temperature measurement was completed in a once measurement mode, do not output a measurement result, measurement operating is ended.

11.4.3 OTS0OTCR — Temperature Sensor Control Register

OTS0OTCR is an 8-bit readable/writable register to control the temperature sensor. OTS0OTCR is initialized to 00_H by any reset.

Access: This register can be read/written in 8-bit units.

Address: <OTSn_base> + 008_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	OTEE	OTULIE	OTABEE	SDE	OTMD
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 11.9 Contents of OTS0OTCR Register

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4	OTEE	Temperature Sensor Error Enable 0: Disabled 1: Enabled When OTMD = 0 (single measurement mode) or SDE = 0 (diagnosis disabled), no temperature sensor error is generated regardless of the OTEE setting.
3	OTULIE	Temperature Rise /Drop Interrupt Enable 0: Disabled 1: Enabled
2	OTABEE	Temperature Alarm Error Enable 0: Disabled 1: Enabled
1	SDE	Diagnosis Enable 0: Disabled 1: Enabled When OTMD = 0 (single measurement mode), diagnosis is not performed regardless of the SDE setting.
0	OTMD	Temperature Measurement Mode 0: Single temperature measurement mode 1: Continuous temperature measurement mode

CAUTION

To prevent malfunction, set OTS0OTCR while the OTACT bit in OTS0OTFR is 0.

11.4.4 OTS0OTFCR — Temperature Sensor Flag Clear Register

OTS0OTFCR is an 8-bit write-only register to control starting and terminating the temperature sensor. This register is always read as 0.

Access: This register can be written in 8-bit units.

Address: <OTSn_base> + $00C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	SDERC	—	OTFC
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	W	R	W

Table 11.10 Contents of OTS0OTFCR Register

Bit Position	Bit Name	Function
7 to 3	Reserved	When writing, write the value after reset.
2	SDERC	Diagnosis Error Clear Writing 0: Does not clear the diagnosis error. Writing 1: Clears the diagnosis error.
1	Reserved	When writing, write the value after reset.
0	OTFC	Temperature Measurement End Flag Clear Writing 0: Does not clear the temperature measurement end flag. Writing 1: Clears the temperature measurement end flag.

11.4.5 OTS0OTFR — Temperature Sensor Flag Register

OTS0OTFR is an 8-bit read-only register to indicate temperature sensor flags. OTS0OTFR is initialized to 00_H by any reset.

Access: This register can be read in 8-bit units.

Address: <OTSn_base> + 010_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	SDER	OTACT	OTF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 11.11 Contents of OTS0OTFR Register

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is read.
2	SDER	Diagnosis Error Setting condition A diagnosis error occurred. Clearing condition SDERC = 1
1	OTACT	Temperature Sensor Status 0: The temperature sensor is in the idle state. 1: The temperature sensor is operating.
0	OTF	Temperature Measurement End Flag Setting condition A temperature measurement value is written to OTS0OTDR. Clearing condition OTS0OTDR is read when OTFC = 1.

CAUTION

SDER is updated when a temperature measurement value is written to OTS0OTDR.

When SDER asserting condition and clear condition are conflicted, flag clear operation is given priority to.

11.4.6 OTS0OTSTR — Temperature Status Register

OTS0OTSTR is an 8-bit read-only register to indicate temperature sensor status. OTS0OTSTR is initialized to 00_H by any reset.

Access: This register can be read in 8-bit units.

Address: <OTSn_base> + 014_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TSTAT[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 11.12 Contents of OTS0OTSTR Register

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read.
1, 0	TSTAT[1:0]	Temperature Status 0 0: Ordinary temperature (value after reset) 0 1: High temperature B 1 0: High temperature A 1 1: Low temperature A When temperature is measured, temperature status is determined by the temperature measurement value and the status is reflected in TSTAT[1:0]. **Table 11.13** shows status transitions of TSTAT. **Table 11.14** shows temperature alarm error and temperature rise/drop interrupt generating conditions.

CAUTION

The TSTAT[1:0] bits are updated when a temperature measurement value is written to OTS0OTDR.

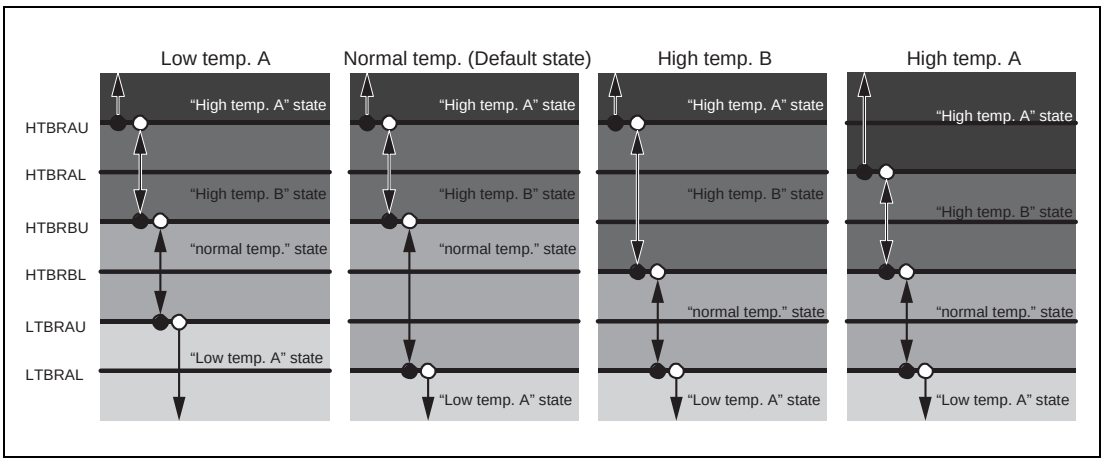

Figure 11.2 Temperature status and transition states

Table 11.13 Temperature Status Transitions

		After Status Transition			
		High temp. A	**High temp. B**	**Ordinary temp.**	**Low temp. A**
Before status transition	**High temp. A**	# High A↓	High A↓ and # High B↓	High B↓ and # Low A↓	Low A↓
	High temp. B	High A↑	# High A↑ and # High B↓	High B↓ and # Low A↓	Low A↓
	Ordinary temp.	High A↑	# High A↑ and High B↑	# High B↑ and # Low A↓	Low A↓
	Low temp. A	High A↑	# High A↑ and High B↑	# High B↑ and Low A↑	# Low A↑

This table shows TSTAT[1:0] status transitions before and after temperature measurement according to conditions of temperature measurement values.

[Legend]

High A ↑: High-temperature border AU register (OTS0HTBRAU) or more

High A ↓: Less than high-temperature border AL register (OTS0HTBRAL)

High B ↑: High-temperature border BU register (OTS0HTBRBU) or more

High B ↓: Less than high-temperature border BL register (OTS0HTBRBL)

Low A ↑: Low-temperature border AU register (OTS0LTBRAU) or more

Low A ↓: Less than low-temperature border AL register (OTS0LTBRAL)

#: Negation

Table 11.14 Conditions for Generating Temperature Alarm Error and Temperature Rise/Drop Interrupts

		After Status Transition			
		High temp. A	**High temp. B**	**Ordinary temp.**	**Low temp. A**
Before status transition	**High temp. A**	**N/A**	**OTULI**	**OTULI**	**OTABE**
	High temp. B	**OTABE**	**N/A**	**OTULI**	**OTABE**
	Ordinary temp.	**OTABE**	**OTULI**	**N/A**	**OTABE**
	Low temp. A	**OTABE**	**OTULI**	**OTULI**	**N/A**

[Legend]

OTABE: Occurrence of temperature alarm error

OTULI: Occurrence of temperature rise or drop interrupt

N/A: Neither OTABE nor OTULI occurs.

11.4.7 OTS0OTDR — Temperature Data Register

OTS0OTDR is a 16-bit read-only register that stores a temperature measurement value. OTS0OTDR is initialized to 0000_H by any reset.

Access: This register can be read in 16-bit units.

Address: <OTSn_base> + 018_H

Value after reset: 0000_H

Signed fixed-point format

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	S*1															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

↑

Decimal point position

Note 1. S: Sign bit (always 0)

As temperature guideline following table can be used.

Table 11.15 temperature guideline

Register value	Temperature [°C]	Register value	Temperature [°C]
$1D95_H$	–40	$2B8C_H$	70
$1ED9_H$	–30	$2CD1_H$	80
$201E_H$	–20	$2E15_H$	90
2164_H	–10	$2F59_H$	100
$22A7_H$	0	$309F_H$	110
$23ED_H$	10	$31E4_H$	120
2532_H	20	3328_H	130
2677_H	30	$346D_H$	140
$27BA_H$	40	$35B3_H$	150
2900_H	50	$36F9_H$	160
$2A47_H$	60	$383D_H$	170

The temperature formula is:

- Temperature [°C] = P × OTS0OTDR – Tm
  - P = 1008.3°C
  - Tm = 273.15°C
  - OTS0OTDR = sum of data times bit value

  Example Bit 14 => value of 1/2, bit 13 => value of 1/4,
  OTS0OTDR = 2800_H => value of 0.25 + 0.0625 => 1008.3 × 0.3125 – 273.15 = +42°C

NOTE

For an absolute temperature within the given accuracy (refer to **Section 35.7.4, Temperature Sensor Characteristics**), an offset has to be considered. The offset is given by trimming data in the register OTS0COEFFRA to OTS0COEFFRC. For correction calculation formula with coefficients, refer to **Section 11.4.11, OTS0COEFFRn — Coefficient n Register**.

11.4.8 OTS0HTBRmn — High-Temperature Border mn Register

OTS0HTBRmnis a 16-bit readable/writable register to specify the temperature border of high temperature m. OTS0HTBRmn is initialized to 0000_H by any reset.

Access: This register can be read/written in 16-bit units.

Address: OTS0HTBRAU: <OTSn_base> + $01C_H$, OTS0HTBRAL: <OTSn_base> + 020_H
OTS0HTBRBU: <OTSn_base> + 024_H, OTS0HTBRBL: <OTSn_base> + 028_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HTBmn															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 11.16 Contents of OTS0HTBRmn Register

Bit Position	Bit Name	Function
15 to 0	HTBmn	high-Temperature Border mn These bits specify high-temperature border mn. Specify it so that the following condition is met. OTS0HTBRAU > OTS0HTBRAL > OTS0HTBRBU > OTS0HTBRBL > OTS0LTBRAU > OTS0LTBRAL The HTBmn format is the same as the OTS0OTDR format. HTBmn[15] is always 0. For details, see **Section 11.4.6, OTS0OTSTR — Temperature Status Register**

CAUTION

To prevent malfunction, set OTS0HTBRmn while the OTACT bit in OTS0OTFR is 0.

NOTE

m = A, B n = U, L

11.4.9 OTS0LTBRAn — Low-Temperature Border An Register

OTS0LTBRAn is a 16-bit readable/writable register to specify the temperature border of low temperature A. OTS0LTBRAn is initialized to 0000_H by any reset.

Access: This register can be read/written in 16-bit units.

Address: OTS0LTBRAU: <OTSn_base> + $02C_H$, OTS0LTBRAL: <OTSn_base> + 030_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LTBAn															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 11.17 Contents of OTS0LTBRAn Register

Bit Position	Bit Name	Function
15 to 0	LTBAn	Low-Temperature Border An These bits specify low-temperature border An. Specify it so that the following condition is met. OTS0HTBRAU > OTS0HTBRAL > OTS0HTBRBU > OTS0HTBRBL > OTS0LTBRAU > OTS0LTBRAL The LTBAn format is the same as the OTS0OTDR format. LTBAn[15] is always 0. For details, see **Section 11.4.6, OTS0OTSTR — Temperature Status Register**

CAUTION

To prevent malfunction, set OTS0LTBRAn while the OTACT bit in OTS0OTFR is 0.

NOTE

n = U, L

11.4.10 OTS0TDLR — Temperature Difference Limiting Register

OTS0TDLR is a 16-bit readable/writable register to specify the temperature difference limit value for self-diagnosis. OTS0TDLR is initialized to $7FFF_H$ by any reset.

Access: This register can be read/written in 16-bit units.

Address: <OTSn_base> + 034_H

Value after reset: $7FFF_H$

Signed fixed-point format

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TDL															
Value after reset	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Decimal point position

Table 11.18 Contents of OTS0TDLR Register

Bit Position	Bit Name	Function
15 to 0	TDL	Temperature Difference Limit Value These bits specify a value for limiting temperature difference between present temperature measurement value and previous temperature measurement value in continuous measurement mode. When the following condition is met, SDER (diagnosis error) is set to 1. OTS0TDLR < | present temperature measurement value – previous temperature measurement value | TDL[15] is always 0.

NOTE

To prevent malfunction, set OTS0TDLR while the OTACT bit in OTS0OTFR is 0.

11.4.11 OTS0COEFFRn — Coefficient n Register

OTS0COEFFRn is a 16-bit read-only register to store coefficients for correction calculation.

Coefficients are stored in OTS0COEFFRn during shipping inspection. This data is expressed in two's complement form with sign.

Access: This register can be read in 16-bit units.

Address: OTS0COEFFRA: <OTSn_base> + 038_H, OTS0COEFFRB: <OTSn_base> + $03C_H$, OTS0COEFFRC: <OTSn_base> + 040_H

Value after reset: The value after reset will be stored at delivery inspection for each devices

Signed fixed-point format

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	S*1															
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

↑
Decimal point position

Note 1. S: Sign bit

- Reducing errors by temperature correction
  Three temperature correction coefficients are stored beforehand in coefficient registers A to C. Errors of temperature measurement values can be reduced by making a correction by a temperature correction calculation formula that uses temperature correction coefficients. However, temperature correction must be made by the CPU. By this the Temperature Border setting can be improved.

- Correction calculation formula: $T = AX^2 + BX + C$
  - T [K]: Temperature value after correction
  - X: OTS0OTDR
  - A to C: Coefficients A to C

NOTE

n = A to C

11.5 Operation

11.5.1 Functional description

- The temperature sensor sets six temperature threshold values in advance
- High-temperature border AU (OTS0HTBRAU) > High-temperature border AL (OTS0HTBRAL) > High-temperature border BU (OTS0HTBRBU) > High-temperature border BL (OTS0HTBRBL) > Low-temperature border AU (OTS0LTBRAU) > Low-temperature border AL (OTS0LTBRAL).
  Furthermore, the temperature sensor has four temperature states
  high temperature A, high temperature B, ordinary temperature, and low temperature A
  These temperature states are updated at each temperature measurement according to six temperature threshold values. The following describes conditions for generating a temperature alarm error and a temperature rise/drop interrupt.
- A temperature alarm error (OTABE) is output at a transition from a state other than high temperature A to high temperature A or at a transition from a state other than low temperature A to low temperature A.
- A temperature rise/drop interrupt (OTULI) is output at a transition from high temperature A to high temperature B or ordinary temperature or at a transition from high temperature B to ordinary temperature, that is, when temperature drops.
- A temperature rise/drop interrupt (OTULI) is output at a transition from low temperature A to high temperature B or ordinary temperature or at a transition from ordinary temperature to high temperature B, that is, when temperature rises.

11.5.2 Examples of Temperature Measurement Operation

The following figure shows temperature measurement operation in continuous measurement mode. There is no internal stabilization time in the second and subsequent temperature measurements.

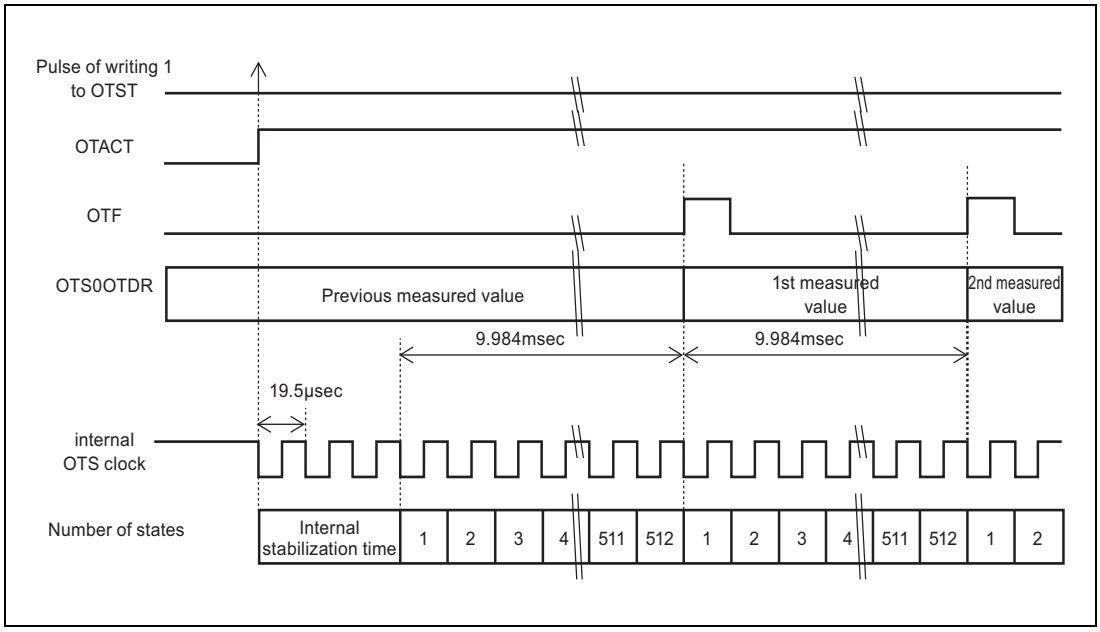

Figure 11.3 Example of Temperature Measurement Operation (Continuous Measurement Mode)

11.5.3 Temperature Measurement End Interrupt Request

The temperature sensor can generate a temperature measurement end interrupt request (OTI) to be sent to the INTC. At this time, the OTF bit in OTS0OTFR is set.

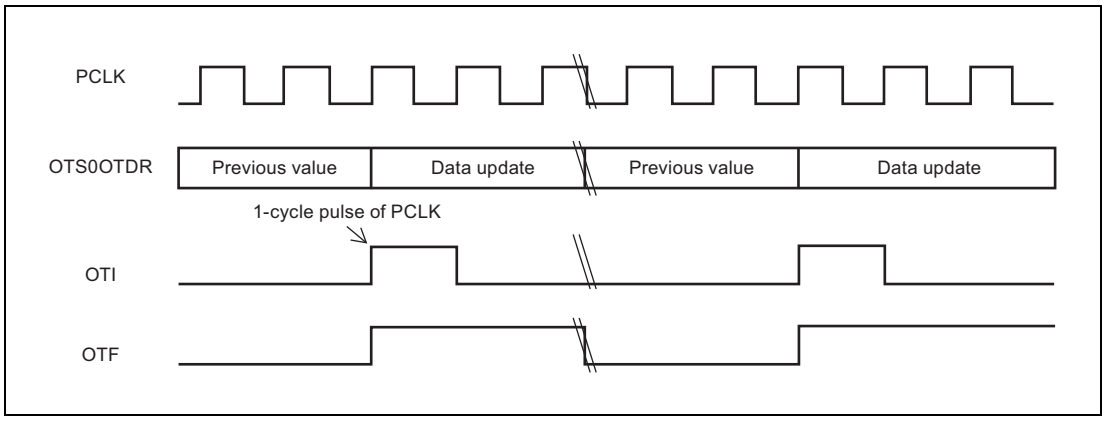

Figure 11.4 Example of Occurrence of a Temperature Measurement End Interrupt

When OTF asserting condition and clear condition are conflicted, flag clear operation is given priority to. But, when a result of measurement was renewed in the period until processing is suspended (within OTS 2 clock cycle) after the OTEND bit is set to 1, Temperature Sensor make OTI and OTF occur at the result of measurement renewal timing.

11.5.4 Temperature Alarm Error and Temperature Rise /Drop Interrupt and Temperature Sensor Error Interrupt Requests

The temperature sensor can generate a temperature rise or drop interrupt request(OTULI) and a temperature sensor error interrupt request (OTE) to be sent to the INTC. The temperature sensor can also generate a temperature alarm error (OTABE) to be sent to the error control module (ECM). Setting OTULIE in OTS0OTCR to 1 enables OTULI. Setting OTULIE to 0 disables OTULI. Setting OTEE in OTS0OTCR to 1 enables INTOTS0OTE. Setting OTEE to 0 disables INTOTS0OTE. Furthermore, setting OTABEE in OTS0OTCR to 1 enables OTABE. Setting OTABEE to 0 disables OTABE.

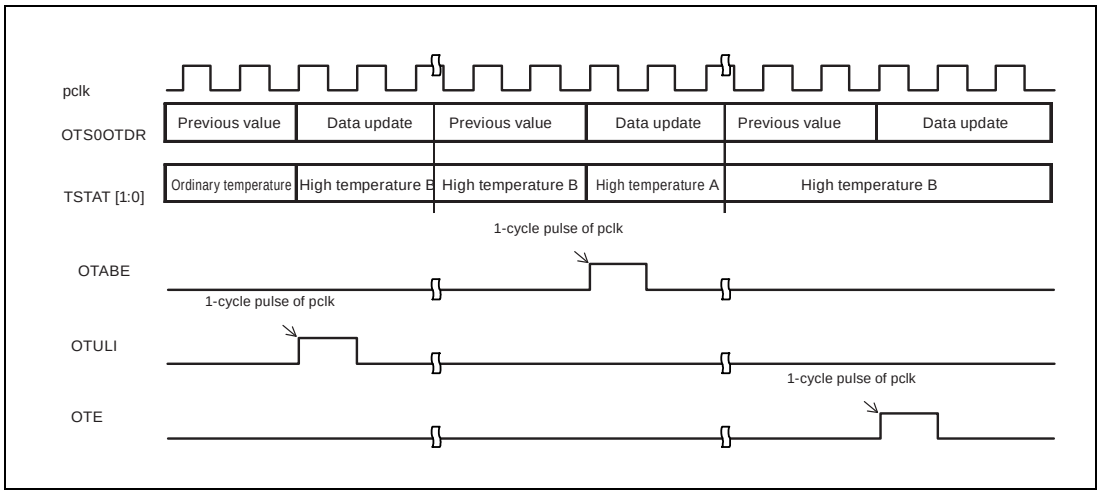

Figure 11.5 Example of Occurrence of a Temperature Alarm Error and a Temperature Rise/Drop Interrupt and a Temperature Sensor Error Interrupt

When Temperature Sensor do not measure temperature (OTFR.OTACT = 0), the initial value of temperature condition is "room temperature". After the OTSTCR.OTST bit is set to 1, and detecting the state except the room temperature, OTULI or OTABE are occurred (Detecting high-temperature B : OTULI, Detecting high-temperature A or low-temperature A : OTABE)

Section 12 Clock Controller

The clock controller supplies clock pulses inside the chip and external devices. The clock controller consists of a main oscillator circuit (Main OSC), an internal oscillator, a Phase Locked Loop circuit (PLL), clock dividers and clock selectors. In RH850/P1x-C, the PLL uses the Main OSC as a reference clock and the Main OSC is mandatory for these devices.

12.1 Features

- Incorporates crystal resonation circuit (Main OSC), which is used as a reference clock of the PLL
- Incorporates internal oscillator, which is used until the PLL becomes stable, used as a backup clock during clock start up, and used for safety purpose.
- Incorporates PLL circuit to generate high speed internal clocks by multiplying the Main OSC input.
- Generates clock pulses used inside the chip from internal oscillator, main oscillator and PLL.
- Software configurable dividers for system clock tree (divider 0), peripheral clock tree (divider 1), which enable flexible clock gear function.
- Software configurable external clock output (divider 2 and 3).
- Adjustable PLL frequency by stored parameters in user accessible FLASH area.
- Halts clock supply to each module in Module standby mode.

12.1.1 External Input / Output pins

Table 12.1 shows the pins related to the clock controller.

Table 12.1 Pins Related to the Clock Controller

Pin function name	Direction	Function
X1	Input	Main OSC crystal resonator/external clock input
X2	Output	Main OSC crystal resonator
EXTCLK0O	Output	Clock controller output (divider 2)
EXTCLK1O	Output	Clock controller output (divider 3)

12.2 Overview

12.2.1 Type of clocks

Table 12.2 shows the list of clocks, **Table 12.3** shows the operation clocks of each functional module

Table 12.2 List of clocks

Clock name	Symbol	Clock frequency (MHz)				Remarks
CPU clock	CLK_CPU	(CPU)	240	160	120	Divider 0 (maximum frequencies configured by FLASH option) Clock source: PLL output or CLK_IOSC
		(GRAM)	120 (1wait)	80 (1wait)	60 (1wait)	
High speed system clock	CLK_HSB		80	80	60	
Low speed system clock	CLK_LSB		40	40	30	
CSIH peripheral clock	CLKP_C		160	160	160	Divider 1 Clock source: PLL output or CLK_IOSC
High speed peripheral clock1	CLKP_H1		80	80	80	
High speed peripheral clock2	CLKP_H2		80	80	40	
Low speed peripheral clock	CLKP_L		40	40	40	
Backup clock	CLK_IOSC		8	8	8	Internal oscillator clock *1/2
SWDTA counter clock	SWDTACLKI		640kHz / 2kHz	640kHz / 2kHz	640kHz / 2kHz	1/250 or (1/250 * 1/320) of 160MHz clock generated by the PLL (Configured by FLASH option)
WDTA counter clock	WDTACLKI		8 / 0.25	8 / 0.25	8 / 0.25	1/1 or 1/32 of CLK_IOSC (Configured by FLASH option)
External clock out 0	EXTCLK0O		1/1 to 1/1023 of CLK_CPU, CLK_LSB, CLK_IOSC or Main OSC			Divider 2 Maximum output frequency: 20MHz
External clock out 1	EXTCLK1O		1/1 to 1/1023 of CLK_CPU, CLK_LSB, CLK_IOSC or Main OSC			Divider 3 Maximum output frequency: 20MHz

Table 12.3 Clocks and functional modules

Clock name	Functional module name
CPU clock	PE1, PE2 (Master, Checker, LRAM, etc.), GRAM (1wait), Flash (1 or 2 wait)
High speed system clock	ICUMC, GTM, INTC, DMAC, DTS, ECM, DCRB, PIC, STM, MEMC, ETNA
Low speed system clock	SENT, ADCA, Clock controller
CSIH peripheral clock	CSIH
High speed peripheral clock1	FLX, SENT
High speed peripheral clock2	HS-USRT, MCAN/ M_TTCAN
Low speed peripheral clock	RLIN, OTS
Backup clock	CLMA
SWDT counter clock	SWDT
WDTA counter clock	WDTA

Note: Backup clock is supplied until the PLL oscillation becomes stable.

12.2.2 Block Diagram

Figure 12.1 shows the block diagram of clocks.

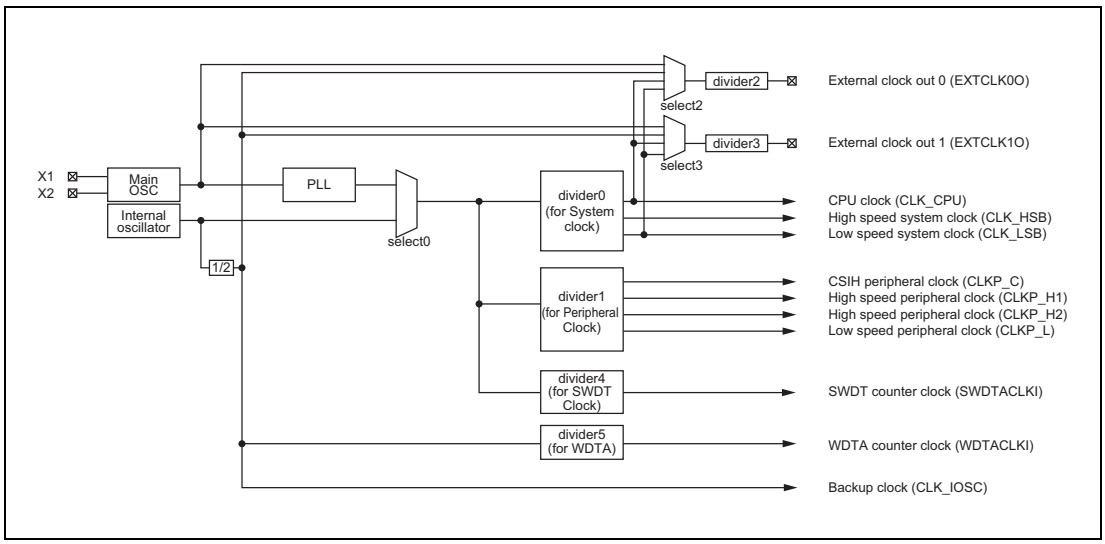

Figure 12.1 Clock diagram (user's perspective)

12.2.3 Clock sources

- Internal oscillator: 16MHz
- Main oscillator (Main OSC, crystal resonator or external clock): 16/20/24 MHz
- Phase Locked Loop (PLL)

12.2.4 PLL for the System Clock

The device may provide one dedicated PLL for the System Clock that is supplied to the CPU and related macros.

The Main Oscillator is used as a reference clock.

This PLL allows to select the operating frequencies of 120, 160, 240 MHz for the CPU and 80 MHz for the peripherals based on the preferred crystal input frequency of 16, 20, or 24MHz.

12.2.5 PLL Configuration

In RH850/P1x-C, the PLL macro is used. It provides various options for selecting the output frequency depending on flexible input clock requirements.

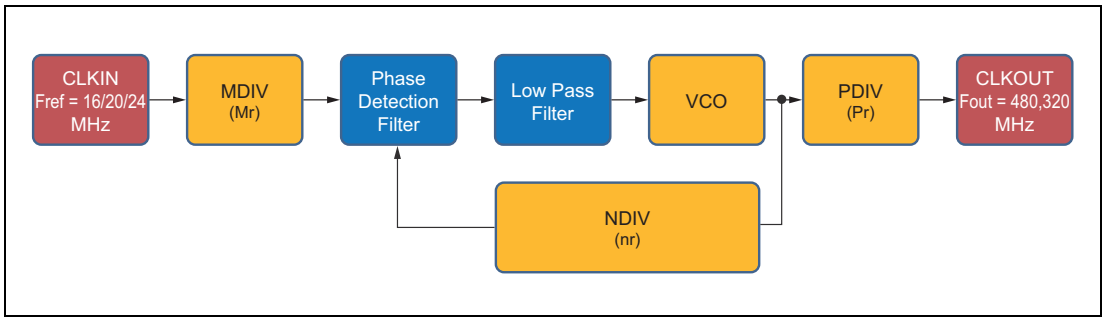

Figure 12.2 PLL diagram

The supported configurations are given in **Table 12.4, PLL and Clock divider setting.** Other input and output frequencies are not supported.

Table 12.4 PLL and Clock divider setting

No	CLKIN [MHz]	MDIV (OPBT1. PLL0MDIV)	NDIV (OPBT1. PLL0NDIV)	PDIV (OPBT1. PLL0PDIV)	CLKOUT [MHz]	OPBT1. PLL0FREQ	CLK_CPU [MHz]	Normal operation mode	Serial Flash Programing mode

12*2	24	2 (001)*1	40 (0x27) *1	1 (000)*1	480	2_H*1	240 (480/2)	—	√

Note 1. Initial setting of Option Byte 1 (OPBT1).

Note 2. No.10,11 and 12 are available only in the Serial programming mode. Set configuration No 1-9 before using the chip in normal operation mode.

12.2.6 Main Oscillator

The Main Oscillator clock is used as the reference clock for the PLLs.

- There are two ways of supplying the clock signal to the main oscillator. One is to connecting a crystal resonator, the another is to inputting an external clock signal. It can be selected by EXCLKIN FLASH options in **Section 32, Flash Memory**.
- A crystal resonator can be connected to X1 and X2. In this case, it is adjusted to the frequency of the crystal resonator by AMPSEL FLASH options in **Section 32, Flash Memory**. External Reset must not be released, before it is stabilized.

12.2.7 Internal Oscillator

The Internal Oscillator is used as Backup Clock during clock start up.

- It generates a clock, which runs at a frequency of 16 MHz It starts operation during power up and can not be stopped.

12.3 Register Description

12.3.1 Writing to protected registers

Registers can be protected from inadvertent write access due to erroneous program execution, etc. by configuration of the Slave Guards. For details, see **Section 28, Functional Safety**.

12.3.2 Register Overview

The Clock Controller is controlled and operated by the following registers:

Table 12.5 List of registers

Address	Register Name	Description	Access Width	Access Protection		
				Value after reset	PBG	other
FFF8 8800$_H$	CLKD0DIV	Clock divider 0 divisor register	32	0000 0001$_H$	PBG4#2.SC5	—

12.3.3 CLKD0DIV — Clock divider 0 divisor register

This register defines the divider factor of the clock divider0 used for the system clock generation. This register must not be written with a new value while the CLKD0SYNC is de-asserted. This register should be protected by a slave guard.

This register is initialized by the Power-on reset and the System reset 1.

Access: This register can be read/write in 32-bit units.

Address: FFF8 8800$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 12.12 CLKD0STAT register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	These bits are always read as 0.
1	CLKD0SYNC	Divider clock synchronized 0: Clock output does not correspond to the actual divisor setting in CLKD0DIV. 1: Clock output corresponds to the actual divisor setting in CLKD0DIV.
0	CLKD0CLKACT	Divider clock active 0: Clock inactive 1: Clock active

12.3.5 CLKD1DIV — Clock divider 1 divisor register

This register defines the divider factor of the clock divider1 used for the peripheral clock generation. This register must not be written with a new value while the CLKD1SYNC is de-asserted. This register should be protected by a slave guard.

This register is initialized by the Power-on reset and the System reset 1.

Access: This register can be read/write in 32-bit units.

Address: FFF8 8808$_H$

Value after reset: 0000 0001$_H$

12.3.6 CLKD1STAT — Clock divider 1 status register

This register indicates the status of the clock divider1 used for the peripheral clock generation.

This register is initialized by the Power-on reset and the System reset 1.

Access: This register can be read in 32-bit units.

Address: FFF8 880C$_H$

Value after reset: 0000 0003$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12.18 CLKD1STAT register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	These bits are always read as 0.
1	CLKD1SYNC	Divider clock synchronized 0: Clock output does not correspond to the actual divisor setting in CLKD1DIV 1: Clock output corresponds to the actual divisor setting in CLKD1DIV
0	CLKD1CLKACT	Divider clock active 0: Clock inactive 1: Clock active

12.3.7 CLKD2DIV — Clock divider 2 divisor register

This register defines the divider factor of the clock divider2 used for the external clock 0. This register must not be written with a new value while the CLKD2SYNC is de-asserted. This register should be protected by a slave guard.

This register is initialized by the Power-on reset, the System reset 1/2 and the Application reset.

Access: This register can be read/write in 32-bit units.

Address: FFF8 8810_H

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 12.22 CLKD3STAT register contents

Bit Position	Bit Name	Function
31 to 2	Reserved	These bits are always read as 0.
1	CLKD3SYNC	Divider clock synchronized 0: Clock output does not correspond to the actual divisor setting in CLKD3DIV 1: Clock output corresponds to the actual divisor setting in CLKD3DIV
0	CLKD3CLKACT	Divider clock active 0: Clock inactive 1: Clock active

12.3.11 CKSC0C — Clock selector 0 control register

This register selects the clock which drives the system and peripheral clock trees. This register must not be written with a new value while the CKSC0S shows different ID. This register is protected by a slave guard.

This register is initialized by the Power-on reset and the System reset 1.

Access: This register can be read/write in 32-bit units.

Address: FFF8 9000_H

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 12.23 CKSC0C register contents

Bit Position	Bit Name	Function
31 to 3	Reserved	These bits are always read as 0. The write value should always be 0.
2 to 0	CKSC0	Clock source control Defines the ID of the clock source to be selected next. ID = 1_H: PLL ID = 2_H: Internal oscillator Other than above: setting prohibited.

Note: See "**Section 3.4.5, Clock Ratio Change**" of **Section 3 CPU System** and "**Section 32.15, Usage Notes**" of **Section 32 Flash Memory**.

12.3.12 CKSC0S — Clock selector 0 status register

This register indicates the status of the clock selector 0.

This register is initialized by the Power-on reset and the System reset 1.

Access: This register can be read in 32-bit units.

Address: FFF8 9008$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

NOTE

CKSC3 should not be modified when CLKD3DIV is set to 0H. Please refer **12.4.2** which shows the procedure to modify this register.

12.3.16 CKSC3S — Clock selector 3 status register

This register indicates the status of the clock selector 3.

This register is initialized by the Power-on reset, the System reset 1/2, and the Application reset.

Access: This register can be read in 32-bit units.

Address: FFF8 90C8$_H$

Value after reset: 0000 0004$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 12.28 CKSC3S register contents

Bit Position	Bit Name	Function
31 to 3	Reserved	These bits are always read as 0.
2 to 0	CKSC3	Clock source status Indicates the ID of the selected clock source of clock selector 3. This bit field means the clock source with the ID is selected or its de-selection is pending. ID = 3$_H$: Main OSC ID = 4$_H$: CLK_LSB ID = 5$_H$: CLK_CPU ID = 6$_H$: Backup clock

12.3.17 CKSC4C — Clock selector 4 control register

This register selects the clock source of the SWDTACLKI.

This register is initialized by the Power-on reset, the System reset 1/2, and the Application reset.

Access: This register can be read/write in 32-bit units.

Address: FFF8 4000$_H$

Value after reset: 0000 0008$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R/W*1

Note 1. Update available only one time if the SWDOPRUN is 1. If update is needed, it should have been done before the SWDTA start running.

Table 12.29 CKSC4C register contents

Bit Position	Bit Name	Function
31 to 4	Reserved	These bits are always read as 0. The write value should always be 0.
3 to 0	CKSC4	Clock source control Defines the ID of the clock source to be selected next. Writing CKSC4 with 0 and writing CKSC4 with values not defined below are ignored. <SWDOPSCKS = 1> ID = 8_H: 1/250 <= Default ID = 9_H: 1/250 * 1/320 <SWDOPSCKS = 0> ID = 8_H: 1/250 * 1/320 <= Default ID = 9_H: 1/250 <SWDOPRUN = 0> This register cannot be updated. <SWDOPRUN = 1> This register can be updated only once. (The CKSC4C register can be written only once, i.e. writing CKSC4C register will disable any subsequent write to the CKSC4C register.)

12.3.18 CKSC4S — Clock selector 4 status register

This register indicates the status of the clock selector 4 (SWDTACLKI).

This register is initialized by the Power-on reset, the System reset 1/2, and the Application reset.

Access: This register can be read in 32-bit units.

Address: FFF8 4008$_H$

Value after reset: 0000 0008$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	CLKACT4			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12.30 CKSC4S register contents

Bit Position	Bit Name	Function
31 to 4	Reserved	These bits are always read as 0.
3 to 0	CLKACT4	Clock source control Indicates the ID of the selected clock source of clock selector 4. This bit field means the clock source with the ID is selected or its de-selection is pending. <SWDOPSCKS = 1> ID = 8$_H$: 1/250 <= Default ID = 9$_H$: 1/250 * 1/320 <SWDOPSCKS = 0> ID = 8$_H$: 1/250 * 1/320 <= Default ID = 9$_H$: 1/250

12.4 Operation

12.4.1 Clock Selection for Operating Frequency

The device provides software configurable dividers for the System and Peripheral Clock Trees (see **Figure 12.1, Clock Tree Overview**). Depending on the setting of these dividers, the operating of those trees can be limited to 1/n of the respective target frequency. These dividers are prepared to realize a clock gear function to decrease the current consumption. In the initial state, the dividers are set to the target frequency. Each clock frequency can be reduced by using CLKD0DIV and CLKD1DIV registers. For a register description, see **Section 12.3.3, CLKD0DIV — Clock divider 0 divisor register, Section 12.3.4, CLKD0STAT — Clock divider 0 status register, Section 12.3.5, CLKD1DIV — Clock divider 1 divisor register, Section 12.3.6, CLKD1STAT — Clock divider 1 status register.**

Clock gear function could be used in the following case only. Please continue to use the clock gear with the initial setting usually.

1. If there is a need to change the system clock source to the backup clock.
2. If there is a requirement to decrease the power consumption when the microcontroller operation is not needed temporally.

Notes on writing to CLKD0DIV and CLKD1DIV registers are following.

1. To prevent the voltage drop and voltage rise caused by sudden change of current consumption, clock frequency should be changed step by step with any time intervals.
2. Peripherals should be set to the module standby mode beforehand if clock frequency will be changed (It is necessary to keep the module standby mode while the clock gear setting is changed from the initial setting).
3. Follow the procedure for changing these register:

   a. Read CLKDxSTAT.CLKDxSYNC and verify that the value of CLKDxSTAT.CLKDxSYNC is 1.

   b. Write new division ratio of the divider to the CLKDxDIV.CLKDxDIV.

   c. Read CLKDxSTAT.CLKDxSYNC and repeat until the value of CLKDxSTAT.CLKDxSYNC becomes 1.

   (x = 0; 1)
4. There are some notes other than above which are described in other chapter. Please refer **Section 3.4.5, Clock Ratio Change** of **Section 3** and **Section 32.15, Usage Notes** of **Section 32**.

Follow the procedure for changing CKSC0C and CKSC4C:

1. Write new ID to CKSCiC
2. Read CKSCiC repeatedly until new ID is read from CKSCiC.CLKACTi.

   (i = 0, 4)

When the internal oscillator has been selected as a clock source by CKSC0C, divide factor of system clock dividers and peripheral clock dividers becomes divide by 2 regardless of the setting of CLKD0DIV and CLKD1DIV(refer to **Table 12.11** and **Table 12.17**). In this case, please note CSIH cannot be used because the frequency relation between CLK_HSB and CLKP_C is not suitable for CSIH.

12.4.2 External Clock Output Pins (ECLK0/1)

The device provides 2 continuous external clock outputs that can be used as clock supply for external circuits. The clock selection can be configured by software. For details see **Section 12.3.7, CLKD2DIV — Clock divider 2 divisor register, Section 12.3.8, CLKD2STAT — Clock divider 2 status register, Section 12.3.9, CLKD3DIV — Clock divider 3 divisor register, Section 12.3.10, CLKD3STAT — Clock divider 3 status register, Section 12.3.13, CKSC2C — Clock selector 2 control register, Section 12.3.14, CKSC2S — Clock selector 2 status register, and Section 12.3.15, CKSC3C — Clock selector 3 control register, Section 12.3.16, CKSC3S — Clock selector 3 status register**.

- Clock signals can be output from the EXTCLKnO (n = 0, 1) pins by the clock output function.
- Output clock frequencies can be divided by the division circuit with register settings.
- Main OSC, CLK_LSB, CLK_CPU and Backup clock can be selected with register settings.

CLKD2DIV and CLKD3DIV and CKSC2C and CKSC3C are registers that should be changed according to the next procedure.

Procedure to change CLKD2DIV and CLKD3DIV:

1. Write new value to CLKDiDIV
2. Read CLKDiDIV (confirming of register write)
3. Wait until CLKDiSTAT.CLKDiSYNC becomes 1
4. Insert min. 4 times dummy reads of CLKDiSTAT
5. Write the same value as used at procedure 1 to CLKDiDIV again
6. Read CLKDiDIV (confirming of register write)
7. Wait until CLKDiSTAT.CLKDiSYNC becomes 1

   (i = 2; 3)

Procedure to change CKSC2C and CKSC3C:

1. Write $0x00_H$ to CLKDiDIV
2. Read CLKDiDIV (confirming of register write)
3. Wait until CLKDiSTAT.CLKDiSYNC becomes 1
4. Insert min. 4 times dummy reads of CLKDiSTAT
5. Write $0x00_H$ to CLKDiDIV again
6. Read CLKDiDIV (confirming of register write)
7. Wait until CLKDiSTAT.CLKDiSYNC becomes 1
8. Write new ID to CKSCiC
9. Read CKSCiC repeatedly until new ID is read from CKSCiC.CLKACTi.

   (i = 2; 3)

12.5 Usage Notes

12.5.1 How to Connect a Crystal Resonator

Figure 12.3 shows how to connect a crystal resonator. When the resonator recommended by the company is used (the detail information is separately provided), any external component such as a load capacitor and a dumping resistor is not necessarily required for oscillation.

As shown in **Figure 12.3**, do not cross any other signal lines over the signal lines to the X1 and X2 pins.

Induction may inhibit proper oscillation.

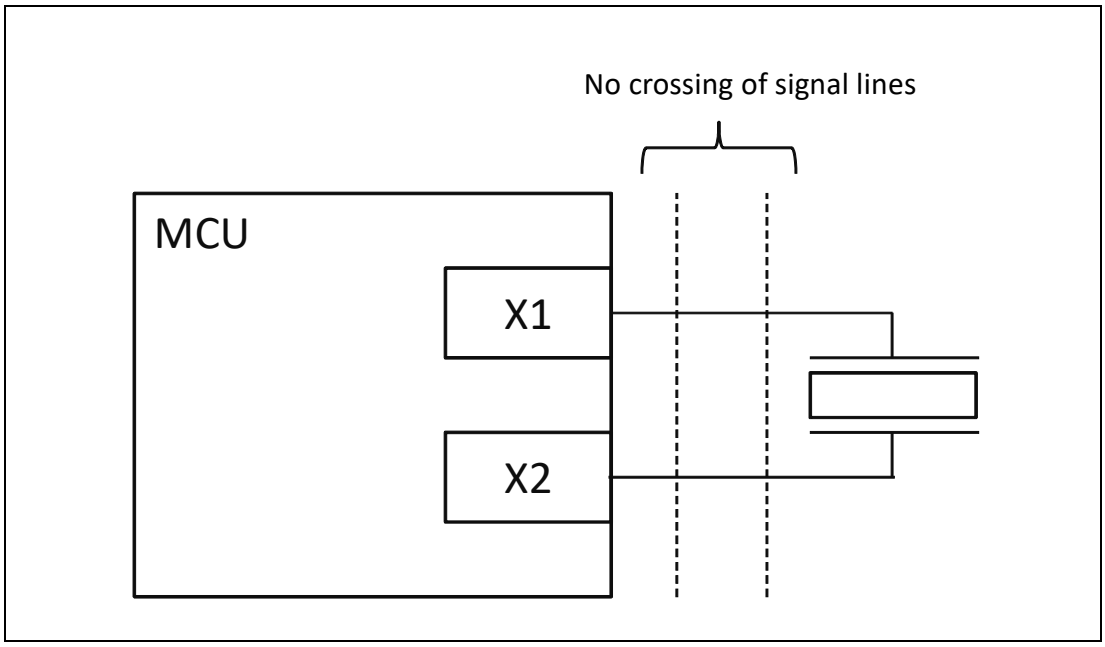

Figure 12.3 Connection Example of Crystal Resonator 1

12.6 Difference among P1M-C, P1H-C and P1H-CE

No differences in Clock controller but the targeted operating frequencies of P1H-C devices are 240 and 160MHz only.

Section 13 Clock Monitor (CLMA)

The following sections describe clock monitor A (CLMA).

The first section describes the attributes specific to the RH850/P1x-C microcontrollers, including the number of channels, register base addresses, and input/output signal names.

The ensuing sections describe the functions relevant to all operations.

13.1 Features of RH850/P1x-C CLMA

13.1.1 Number of Channels

The RH850/P1x-C microcontrollers incorporate CLMA with the following number of channels.

Table 13.1 Number of Channels

Product Name	P1M-C	P1H-C, P1H-CE
Number of channels	5	6
Name	CLMA0, CLMA1, CLMA2, CLMA3, CLMA5	CLMA0, CLMA1, CLMA2, CLMA3, CLMA4, CLMA5

13.1.2 Register Base Addresses

The CLMA base addresses are listed in the following table.

The CLMA register addresses are expressed as offsets from the base addresses.

Table 13.2 Register Base Addresses

Base Address Name	Base Address
<CLMA0_base>	FFF8 3100_H
<CLMA1_base>	FFF8 3200_H
<CLMA2_base>	FFF8 3300_H
<CLMA3_base>	FFF8 3400_H
<CLMA4_base>	FFF8 3500_H
<CLMA5_base>	FFF8 6800_H
<CLMAT_base>	FFF8 3000_H

13.1.3 Clock Supply

The clocks monitored by CLMA and the CLMA sampling clocks are indicated below.

Table 13.3 Clock Supply

Channel Name	Unit Clock Name	Clock Name
CLMA0	CLMATMON (monitored clock)	Main OSC
	CLMATSMP (sampling clock)	CLK_IOSC / 2
	PCLK (register access clock)	CLK_LSB
CLMA1	CLMATMON (monitored clock)	CLKP_L (to OTS0)
	CLMATSMP (sampling clock)	Main OSC / 4
	PCLK (register access clock)	CLK_LSB
CLMA2	CLMATMON (monitored clock)	WDTACLKI
	CLMATSMP (sampling clock)	Main OSC / 256
	PCLK (register access clock)	CLK_LSB
CLMA3	CLMATMON (monitored clock)	CLK_CPU (@PE1 checker core) / 2
	CLMATSMP (sampling clock)	Main OSC / 4
	PCLK (register access clock)	CLK_LSB
CLMA4	CLMATMON (monitored clock)	CLK_CPU (@PE2 checker core) / 2
	CLMATSMP (sampling clock)	Main OSC / 4
	PCLK (register access clock)	CLK_LSB
CLMA5	CLMATMON (monitored clock)	CLK_HSB (to ICUMC)
	CLMATSMP (sampling clock)	Main OSC / 4
	PCLK (register access clock)	CLK_LSB

Note: The PLL lock loss error status can be detected by CLMA1, CLMA3-5, because the PLL clock is monitored by theses clock monitors.

13.1.4 Reset Sources

CLMAn is initialized by the Power-on reset, the System reset 1/2, the Application reset, and register. CLMATEST.RESCLM can reset each CLMAn by special procedure. See **Section 13.5.3** and **Section 13.6.2** about CLMATEST.RESCLM.

Table 13.4 CLMAn reset conditions

CLMA	Reset condition										
						CLMATEST.RESCLM					
	Power On Reset	System Reset 1	System Reset 2	Application Reset 1	Limited Reset	CLMA0TESEN = 1	CLMA1TESEN = 1	CLMA2TESEN = 1	CLMA3TESEN = 1	CLMA4TESEN = 1	CLMA5TESEN = 1
CLMA0	√	√	√	√		√					
CLMA1	√	√	√	√			√				
CLMA2	√	√	√	√				√			
CLMA3	√	√	√	√					√		
CLMA4	√	√	√	√						√	
CLMA5	√	√	√	√							√

13.1.5 Internal Input/Output Signals

Table 13.5 Internal Input/Output Signals

Clock Monitor	Output to
CLMA0	ECM for PE1/PE2, Error factor #8
CLMA1	ECM for PE1/PE2, Error factor #12
CLMA2	ECM for PE1/PE2, Error factor #9
CLMA3	ECM for PE1, Error factor #10
CLMA4	ECM for PE2, Error factor #10
CLMA5	ECM for PE1/PE2, Error factor #11 ICUMC interrupt input INTCLMATI5

13.2 Overview

13.2.1 Functional Overview

Clock monitor CLMA detects frequency abnormalities in the monitored clock. It uses sampling clock CLMATSMP to monitor whether the frequency of input clock CLMATMON is within a specific range. Upon detection of an abnormal clock, it outputs an error notification to the ECM. In case of CLMA5 additionally an interrupt to the ICUMC.

The main components of the clock monitor are shown in **Figure 13.1**.

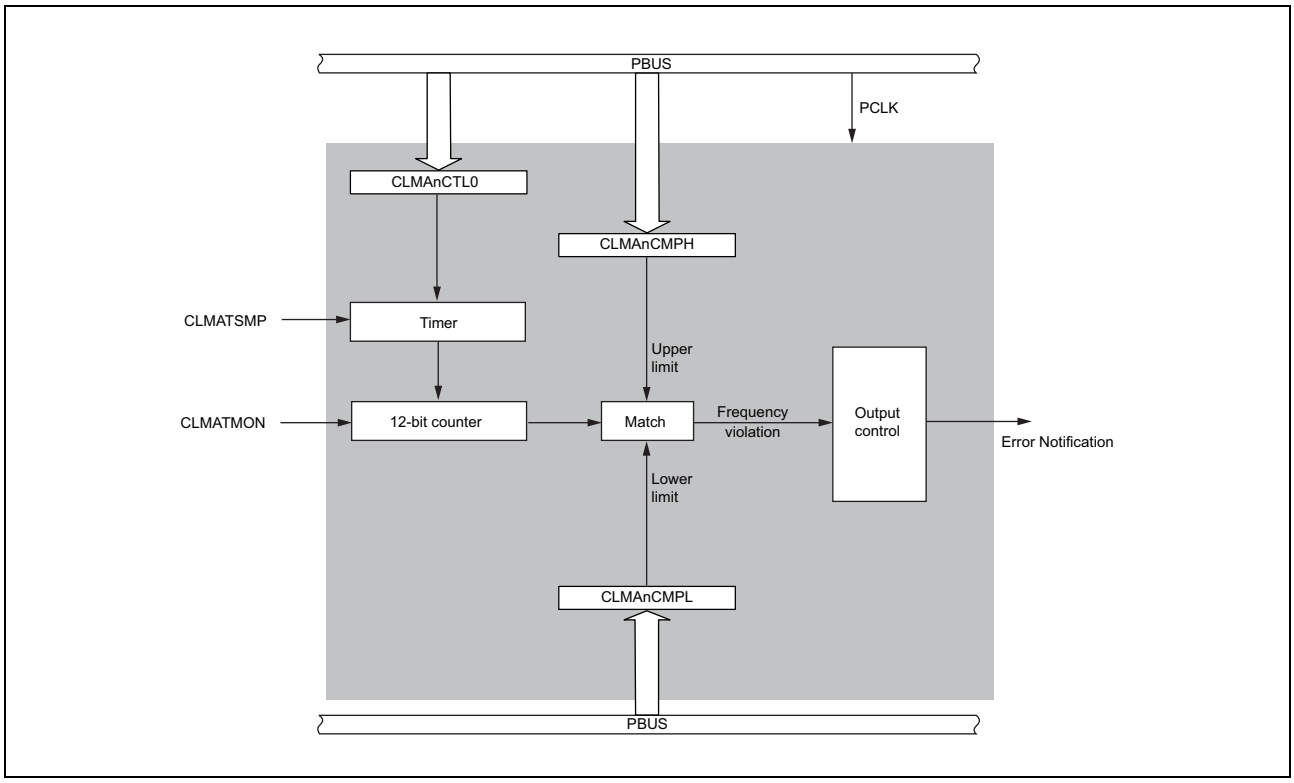

Figure 13.1 Block Diagram of the Clock Monitor A

13.3 Enabling CLMA

To enable CLMAn, CLMAnCTL0 which is a register to control CLMAn should be set 01_H. The control register CLMAnCTL0 is a write protection register to enable CLMAn. See **Section 13.6.1** about procedure to enable CLMAn.

NOTE

- CLMAn can be only disabled by reset. Writing 0 to CLMAnCTL0 cannot disable CLMAn.
- The value after reset of CLMAnCTL0 is 00_H. (00_H means CLMAn is disabled)

13.4 Functions

The Clock Monitor CLMAn is used to verify whether the frequency of a clock (CLMATMON) is within the specified range.

13.4.1 Detection of Abnormal Clock Frequencies

NOTE

The clock monitor is not intended to detect a stopped clock (CLMATMON). There is a case that abnormal state is not detected when the monitor clock completely stops.

Detection Method

(1) CLMAn counts the rising edges of the monitored clock CLMATMON within 16 cycles of the sampling clock CLMATSMP and then compares the counter with the configured thresholds:
- CLMAnCMPL.CLMAnCMPL[11:0] defines the lower threshold.
- CLMAnCMPH.CLMAnCMPH[11:0] defines the upper threshold.

(2) When the monitored clock (CLMATMON) frequency is too low, the counter falls below CLMAnCMPL.CLMAnCMPL (Counter < CLMAnCMPL.CLMAnCMPL[11:0]).

(3) When the frequency of CLMATMON is too high, the counter exceeds CLMAnCMPH.CLMAnCMPH (CLMAnCMPH.CLMAnCMPH[11:0] ≤ Counter).

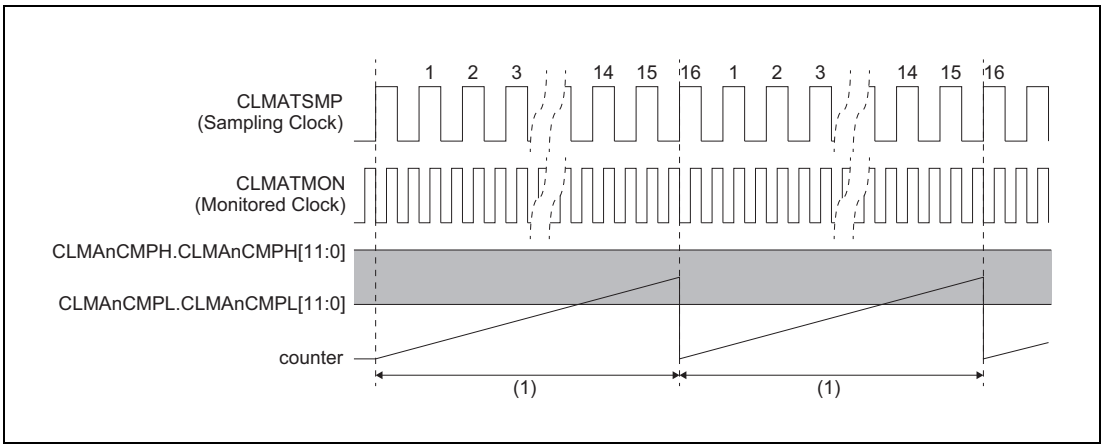

Figure 13.2 Example: fCLMATMON is within the specified limit.

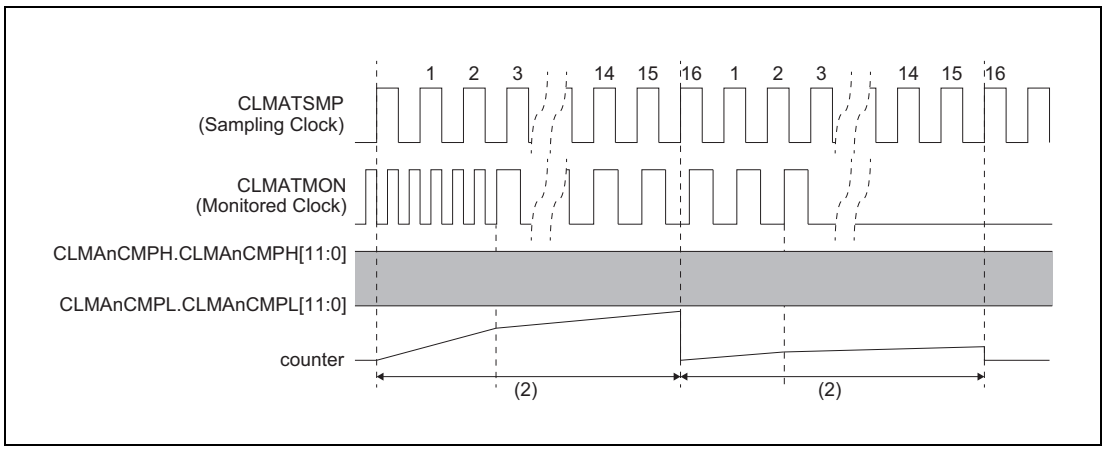

Figure 13.3 Example: fCLMATMON is lower than the specified limit.

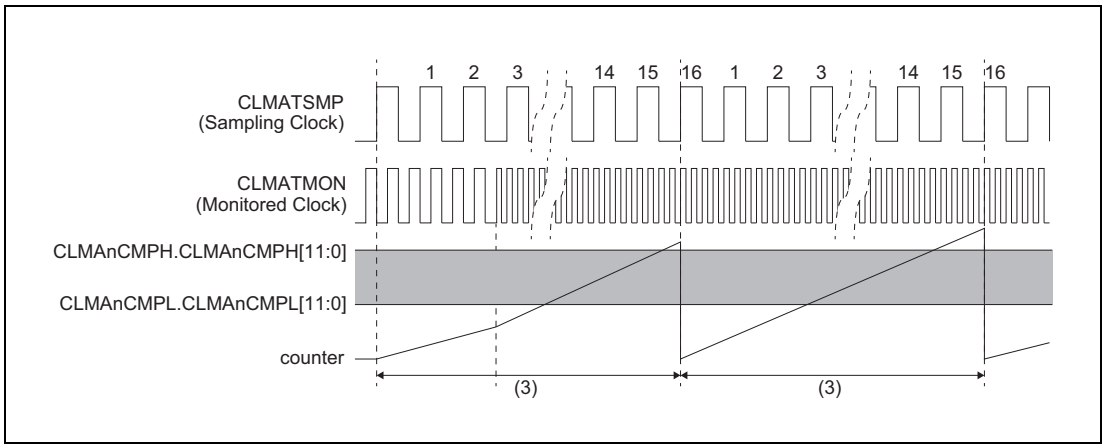

Figure 13.4 Example: fCLMATMON is higher than the specified limit.

NOTE

Even if the fCLMATMON exceeds or falls below the specified limits during a sample period, the counter might be within the valid range.

Abnormal fCLMATMON is detected after one sampling interval later.

Calculation of thresholds

The compare registers CLMAnCMPL and CLMAnCMPH are configured with the minimum and maximum number of clock cycles of CLMATMON that are assumed to be valid within 16 cycles of the sampling clock CLMATSMP.

The expected number of clock cycles is denoted by N.

$$\frac{16}{f_{CLMATSMP}} = \frac{N}{f_{CLMATMON}}$$

$$N = \frac{f_{CLMATMON}}{f_{CLMATSMP}} \times 16$$

Considering the allowed frequency deviations of CLMATMON and CLMATSMP, the threshold values can be calculated by the following formulas:

$$\text{Lower threshold} = N_{min} = \frac{f_{CLMATMON(min)}}{f_{CLMATSMP(max)}} \times 16 - 1$$

$$\text{Upper threshold} = N_{max} = \frac{f_{CLMATMON(max)}}{f_{CLMATSMP(min)}} \times 16 + 1$$

Example

For fCLMATSMP = 240 kHz (±8%) and fCLMATMON = 16 MHz (±5%) the recommended threshold values are the following:

$N_{min} = 15{,}200 / 259.2 \times 16 - 1$

$= 937.27$

$\text{CLMAnCMPL} = 937 = 03A9_H$

$N_{max} = 16{,}800 / 220.8 \times 16 + 1$

$= 1218.39$

$\text{CLMAnCMPH} = 1219 = 04C3_H$

Minimum thresholds

The following restrictions must be taken into account:

- $\text{CLMAnCMPL} \geq 0001_H$
- $\text{CLMAnCMPH} \geq \text{CLMAnCMPL} + 0003_H$

13.4.2 Notification of Abnormal Clock Frequency

If $f_{CLMATMON}$ exceeds the upper threshold or falls below the lower threshold, this is indicated as follows:

- CLMAn sends an error notification to the ECM
- in case of CLMA5 additionally an interrupt to the ICUMC.

NOTE

The error notification is not negated until CLMAn is reset.

13.4.3 Self-Test

RH850/P1x-C implements a self-test function for the clock monitors.

It allows isolating the clock monitor from the system and executing functional test patterns via software. Each clock monitor can be tested individually. For performing these tests, the clock monitor inputs can be controlled by dedicated control registers, while its outputs can be observed in status registers.

Two registers are implemented for the self-test of the Clock Monitor, the Clock Monitor Test Register (CLMATEST) and the Clock Monitor Test Status Register (CLMATESTS). See the corresponding register descriptions for details.

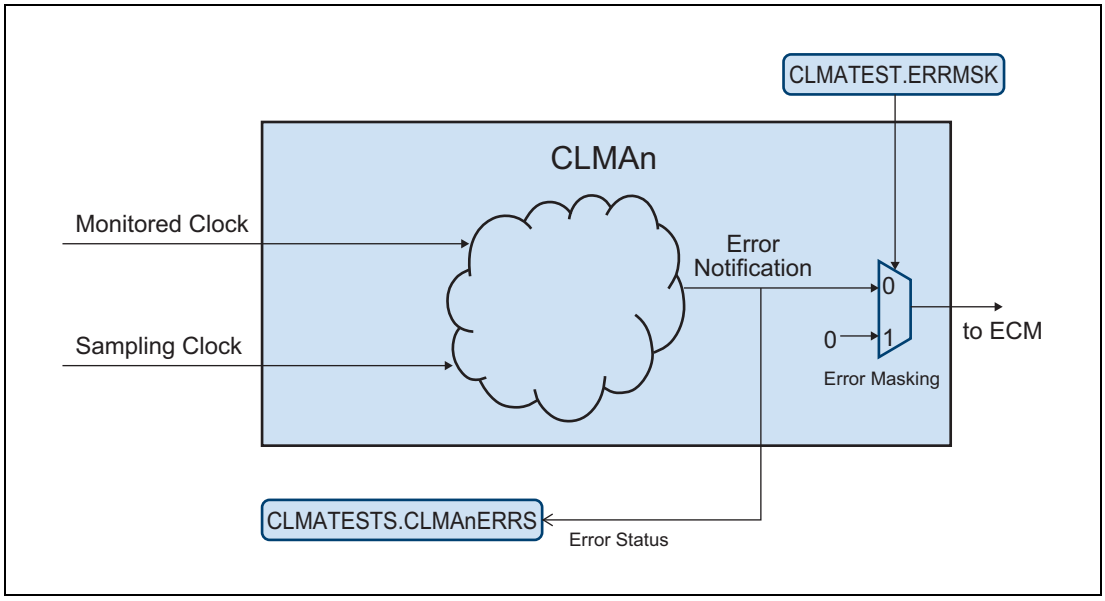

Figure 13.5 Self-Test of the clock monitor

13.5 Registers

13.5.1 Register Protection

Write protected registers are protected from inadvertent write access due to erroneous program execution, etc. Following Clock Monitor registers feature this special write protection:

- CLMAn control register 0 CLMAnCTL0

Other registers can be protected from inadvertent write access due to erroneous program execution, etc. by configuration of the P-Bus Guards. For details, see **Section 28, Functional Safety**.

And, CLMATEST.CLMA5TESEN is also protected from inadvertent write access by CLMA5CTL1.

13.5.2 List of Registers

The following table lists the CLMA registers.

<CLMAn_base> is defined in **Section 13.1.2, Register Base Addresses**.

Table 13.6 List of Registers

Module name	Address	Register Name	Description	Access Width	Value after reset	Access Protection	
						PBG	other
CLMAn	<CLMAn_base> + 00_H	CLMAnCTL0	CLMAn control register 0	8	00_H	PBG4#2.SC1 (n = 5) PBG4#0. PG4-SC3 (other)	CLMAnPCMD
CLMAn	<CLMAn_base> + 08_H	CLMAnCMPL	CLMAn comparison register L	16	0001_H	PBG4#2.SC1 (n = 5) PBG4#0. PG4-SC3 (other)	accessible only when CLMAnCTL0.CLMAnCLME = 0
CLMAn	<CLMAn_base> + $0C_H$	CLMAnCMPH	CLMAn comparison register H	16	$03FF_H$	PBG4#2.SC1 (n = 5) PBG4#0. PG4-SC3 (other)	accessible only when CLMAnCTL0.CLMAnCLME = 0

CLMAC	<CLMAT_base> + 04_H	CLMATESTS	Clock monitor test status regsiter	32	$0000\ 0000_H$	PBG4#0.PG4-SC3	
CLMA5	<CLMA5_base> + 04_H	CLMA5CTL1	CLMA5 control register 1	8	00_H	PBG4#2SC1	

NOTE

CLMA4* registers cannot be written and is read as 0 in P1M-C.

13.5.3 Reset of Registers

Table 13.7 Register Reset Conditions

Register Name	Reset condition				
	Power On Reset	System Reset 1	System Reset 2	Application Reset 1	Limited Reset
All registgers	√	√	√	√	N/A

CLMATEST.RESCLM can also reset each clock monitor (CLMA0/1/2/3/4/5). Then, before clock frequency is changed by register for clock during operations, it is necessary to go through special procedure and to retry setting parameters for CLMAn.

About special procedure, see **Section 13.6.2**.

13.5.4 CLMAnCTL0 — CLMAn Control Register 0

This register enables the clock monitor CLMAn.

This register is initialized by the Power-on reset, the System reset 1/2 and the Application reset.

CLMA4CTL0 (n = 4) cannot be written and is read as 0 in P1M-C.

Protection

Writing to this register is protected by a special sequence of instructions by using the protection command register CLMAnPCMD. See **Section 13.3, Enabling CLMA**.

Access: This register can be read/written in 8-bit units

Address: <CLMAn_base> + 00_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CLMAn CLME
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 13.9 CLMAnCTL0 Register contents

Bit Position	Bit Name	Function
7 to 1	Reserved	These bits are always read as 0. Write value should always be 0.
0	CLMAnCLME	Enables or disables the clock monitor: 0: Disables CLMAn. 1: Enables CLMAn. This bit can only be cleared by a reset

13.5.5 CLMAnCMPL — CLMAn comparison register L

This register specifies the lower limit of monitored clock frequency.

Write access is permitted only when the CLMAn is disabled (CLMAnCTL0.CLMAnCLME = 0).

This register is initialized by the Power-on reset, the System reset 1/2 and the Application reset.

CLMA4CMPL (n = 4) cannot be written and is read as 0 in P1M-C.

Access: This register can be read/written in 16-bit units

Address: <CLMAn_base> + 08_H

Value after reset: 0001_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CLMAnCMPL[11:0]

Table 13.10 CLMAnCMPL Register contents

Bit Position	Bit Name	Function
15 to 12	Reserved	These bits are always read as 0. Write value should always be 0.
11 to 0	CLMAnCMPL [11:0]	Specifies the lower threshold The recommended value is (fCLMATMON(min) × 16) / fCLMATSMP(max) -1 The minimum value is 0001_H

13.5.6 CLMAnCMPH — CLMAn comparison register H

This register specifies the upper limit of monitored clock frequency.

Write access is permitted only when the CLMAn is disabled (CLMAnCTL0.CLMAnCLME = 0).

This register is initialized by the Power-on reset, the System reset 1/2 and the Application reset.

CLMA4CMPH (n = 4) cannot be written and is read as 0 in P1M-C.

Access: This register can be read/written in 16-bit units

Address: <CLMAn_base> + $0C_H$

Value after reset: $03FF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CLMAnCMPH[11:0]											
Value after reset	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.11 CLMAnCMPH Register contents

Bit Position	Bit Name	Function
15 to 12	Reserved	These bits are always read as 0. Write value should always be 0
11 to 0	CLMAnCMPH [11:0]	Specifies the upper threshold The recommended value is (fCLMATMON(max) × 16) / fCLMATSMP(min) +1 The minimum value is CLMAnCMPL + 0003_H.

13.5.7 CLMAnPCMD — CLMAn Protection command register

This register is a protection command register for the CLMAnCTL0 register against unintended writing. This register is initialized by the Power-on reset, the System reset 1/2 and the Application reset.

CLMA4PCMD (n = 4) cannot be written in P1M-C.

NOTE

See **Section 13.6.1** for the procedure.

Access: This register can be written in 8-bit units

Address: <CLMAn_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CLMAnREG[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W

Table 13.12 CLMAnPCMD Register contents

Bit Position	Bit Name	Function
7 to 0	CLMAnREG [7:0]	Protection command that enables to write to clock monitor control protection cluster registers

13.5.8 CLMAnPS — CLMAn Protection status register

This register is used to verify whether the write-protected register (CLMAnCTL0) has been successfully written or not.

This register is initialized by the Power-on reset, the System reset 1/2 and the Application reset.

CLMA4PS (n = 4) is read as 0 in P1M-C.

Access: This register can be read in 8-bit units

Address: <CLMAn_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CLMAn PRERR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 13.13 CLMAnPS Register contents

Bit Position	Bit Name	Function
7 to 1	Reserved	These bits are always read as 0.
0	CLMAnPRERR	Indicates whether the write-protected register (CLMAnCTL0) has been successfully written. 0: Write operation successful 1: Write operation failed

13.5.9 CLMAnEMU0 — CLMAn Emulation Register 0

This register provides bits to emulate a frequency deviation error while the microcontroller is set in break mode during debugging. About break mode, See Section 31, On-chip Debug Unit (OCD).

This register is initialized by the Power-on reset, the System reset 1/2 and the Application reset.

CLMA4EMU0 (n = 4) cannot be written and is read as 0 in P1M-C.

Access: This register can be read/written in 8-bit units

Address: <CLMAn_base> + 18H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CLMAn SLFST	CLMAn SLSLW
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 13.14 CLMAnEMU0 Register contents

Bit Position	Bit Name	Function
7 to 2	Reserved	These bits are always read as 0. Write value should always be 0.
1	CLMAnSLFST	Specifies the higher value of fCLMATMON during emulation: 0: CLMATMON is assumed to be within the normal frequency range 1: CLMATMON is assumed to exceed the upper threshold.
0	CLMAnSLSLW	Specifies the lower value of fCLMATMON during emulation: 0: CLMATMON is assumed to be within the normal frequency range 1: CLMATMON is assumed to fall below the lower threshold.

CAUTION

It is prohibited to emulate a status of too low and too high frequency of CLMATMON at the same time. Thus CLMAnEMU0 must not be set to 03_H.

13.5.10 CLMATEST — Clock Monitor Test register

This register is used for the self-test of the clock monitors. Each Clock Monitor can be tested individually.

This register is initialized by the Power-on reset, the System reset 1/2 and the Application reset.

Access: This register can be read/written in 32-bit units

Address: <CLMAT_base> + 00_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 13.15 CLMATEST Register contents (1/2)

Bit Position	Bit Name	Function
31 to 9	Reserved	These bits are always read as 0. Write value should always be 0.
8	CLMA5TESEN	CLMA5 self-test enable/disable 0: Test disabled. 1: Test enabled. When CLMA5CTL1 is 0x1, this bit cannot be written.
7	CLMA4TESEN	CLMA4 self-test enable/disable 0: Test disabled. 1: Test enabled. This bit can be read and written but the function is disabled in P1M-C.
6	CLMA3TESEN	CLMA3 self-test enable/disable 0: Test disabled. 1: Test enabled.
5	CLMA2TESEN	CLMA2 self-test enable/disable 0: Test disabled. 1: Test enabled.
4	CLMA1TESEN	CLMA1 self-test enable/disable 0: Test disabled. 1: Test enabled.
3	CLMA0TESEN	CLMA0 self-test enable/disable 0: Test disabled. 1: Test enabled.
2	ERRMSK*[1]	CLMA test error mask setting Asserting this bit prevents the detected error from being forwarded into the device. CLMA test reset signal mask setting 0: Error signal generation enabled 1: Error signal generation disabled (masked)

Table 13.15 CLMATEST Register contents (2/2)

Bit Position	Bit Name	Function
1	MONCLKMSK *1	Monitor clock mask setting Asserting this bit disables the input of monitored clock to the associated Clock Monitor. 0: Monitored clock enabled 1: Monitored clock disabled (masked) **CAUTION** Do not use monitor clock masking function for self-test purpose
0	RESCLM*1	CLMAn test reset signal control Asserting this bit re-initializes the Clock Monitor in order to continue normal operation. 0: Reset signal for CLMAn is released. 1: Reset signal for CLMAn is asserted.

Note 1. These bits are valid for CLMAn which is in self-test mode by setting “1” to CLMAnTESTEN.

NOTE

See **Section 13.6.2** for the procedure of the individual reset for CLMAn.

13.5.11 CLMATESTS — Clock Monitor Test Status register

This register is used for the self-test of the clock monitors. It monitors the error detection flags which are otherwise forwarded to the ECM module. Once error is detected, this register keeps the status until CLMAn is reset.

This register is initialized by the Power-on reset, the System reset 1/2 and the Application reset.

Access: This register can be read in 32-bit units

Address: <CLMAT_base> + 04_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 13.16 CLMATESTS Register contents

Bit Position	Bit Name	Function
31 to 6	Reserved	These bits are always read as 0
5	CLMA5ERRS	CLMA5 error status 0: No error detected 1: Error detected
4	CLMA4ERRS	CLMA4 error status 0: No error detected 1: Error detected This bit is read as 0 in P1M-C.
3	CLMA3ERRS	CLMA3 error status 0: No error detected 1: Error detected
2	CLMA2ERRS	CLMA2 error status 0: No error detected 1: Error detected
1	CLMA1ERRS	CLMA1 error status 0: No error detected 1: Error detected
0	CLMA0ERRS	CLMA0 error status 0: No error detected 1: Error detected

13.5.12 CLMA5CTL1 — CLMA5 control register 1

This register is a write protection register for the CLMATEST.CLMA5TESEN.

This register is initialized by the Power-on reset, the System reset 1/2 and the Application reset.

Access: This register can be read/written in 8-bit units

Address: <CLMA5_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TESENWPRT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 13.17 CLMA5CTL1 Register contents

Bit Position	Bit Name	Function
7 to 1	Reserved	These bits are always read as 0. Write value should always be 0.
0	TESENWPRT	Asserting the bit prevents the write access to the CLMATEST.CLMA5TESEN 0: enable to write CLMA5TESEN 1: disable to write CLMA5TESEN

13.6 Operation

13.6.1 Procedures to enable CLMAn

To enable CLMAn, CLMAnCTL0 which is a register to control CLMAn should be set 01_H.

Set 01_H to CLMAnCTL0 under the following instruction sequence.

[Procedure]

1. Write $A5_H$ in CLMAnPCMD.
2. Writing CLMAnCTL0 should be proceeded under the following sequence to enable CLMAn:
   - Write 01_H first.
   - Write the reversed value FE_H.
   - Write the target value 01_H again.
3. Read out the value of CLMAnCTL0.
   If the value of CLMAnCTL0 is 01_H, CLMAn has been enabled.
   In other cases as shown below, the value of the CLMAnCTL0 write operation status register, CLMAnPS should be checked.
   - When CLMAnPS = 01_H, the instruction sequence does not proceed correctly. Execute the sequence from step 1 again to enable CLMAn.
   - When CLMAnPS = 00_H, write 00_H in CLMAnPCMD and then execute the sequence from step 1 again.

13.6.2 Procedures to Reset by CLMATEST.RESCLM

CLMATEST.RESCLM can also reset each clock monitor (CLMA0/1/2/3/4/5). Then, before clock frequency is changed by register for clock during operations, it is necessary to go through the procedure as below and to retry setting parameters for CLMAn.

[Procedure]

Example Case: Reset CLMA0

1. CLMATEST.CLMA0TESEN = 1 (write data : 0000_0008_H)
2. CLMATEST.ERRMSK = 1 (write data : 0000_000C_H)
3. CLMATEST.MONCLKMSK = 1 (write data : 0000_000E_H)
4. CLMATEST.RESCLM = 1 (write data : 0000_000F_H)
5. CLMATEST.RESCLM = 0 (write data : 0000_000E_H)
6. CLMATEST.MONCLKMSK = 0 (write data : 0000_000C_H)
7. CLMATEST.ERRMSK = 0 (write data : 0000_0008_H)
8. CLMATEST.CLMA0TESEN = 0 (write data : 0000_0000_H)

NOTE

The CLMA5CTL1.TESENWPRT should be set to 0 while setting the CLMATEST.CLMA5TESEN bit for CLMA5.

13.7 Difference among P1M-C, P1H-C and P1H-CE

P1M-C device doesn’t have the CLMA4. Other clock monitors are same in these devices.

Section 14 Power Down Modes

14.1 Features

In order to reduce the current consumption, HALT mode and module standby are supported.

14.2 Power down Modes

14.2.1 HALT Mode

When the HALT instruction is executed, the CPU transits to HALT mode and stops instruction execution.

Each CPU (PE1, PE2 and ICUMC) can be controlled individually. **Table 14.1** shows the modules that participate in HALT Mode.

The CPU returns from this state by the occurrence of a reset input, interrupt, or exception.

Table 14.1 Modules that participate in HALT mode

Module	Status during HALT Mode
PE1	HALT/Run
PE2	HALT/Run
ICUMC	HALT/Run

14.2.2 Module standby

This function stops the clocks for peripheral macros to reduce the power consumption in accordance with register settings. **Table 14.2** shows the modules that participate in the module standby modes.

After reset is released, all peripherals except ICUMC enter module standby modes.

Example of the procedure of module standby mode is shown below.

Transition to Module standby mode

(1) Check the modules that participate in the module standby mode have completed the operation and are in idle state and no other module or external pin may activate the module.
For the details of the way to confirm the idle state of the modules, see the section related to each module.

(2) Check the Software Limited Reset Status Register of modules that participate in the module standby mode is 0. (SWLRESSx.SWLRESx_0 = 0)

(3) Stop all target clock domains that participate in the module standby mode.
(MSR_LMxx.MS_LMxx = 1)

(4) Read the value of MSRxxxx.MS_LMxx register and check the value is 1.

Canceling Module standby mode

(1) Check the Software Limited Reset Status Register of modules that participate in the module standby mode is 0. (SWLRESSx.SWLRESx_0 = 0)

(2) Start all target clock domains that cancels module standby mode. (MSR_LMxx.MS_LMxx = 0)

(3) Read the value of MSR_xxxx.MS_LMxx register and check the value is 0.

(4) Execute the activating procedures of the modules which participate in the module standby mode. For the details, see the section related to each module.

Table 14.2 Modules that participate in Module standby mode

Module standby register	Module

14.3.2 MSR_LM2 — Module Standby Register for ICUMC

This register is used to control the Stop Modes of the ICUMC.

This register is initialized by Power on reset, System reset 1, System Reset 2, Application reset 1 and Limited reset for ICUMC.

Access: This register can be read/written in 32-bit units.

Address: FFF8 6210$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

It is forbidden to set MS_LM2 during SWLRESS2.SWLRESS2_0 = 1.

14.3.3 MSR_LM3 — Module Standby Register for MCAN

This register is used to control the Stop Modes of the MCAN.

This register is initialized by Power on reset, System reset 1, System Reset 2, Application reset 1 and Limited reset for MCAN.

Access: This register can be read/written in 32-bit units.

Address: FFF8 1710_H

Value after reset: $0000\ 0001_H$

It is forbidden to set MS_LM3 during SWLRESS3.SWLRESS3_0 = 1

14.3.4 MSR_LM4 — Module Standby Register for FlexRay

This register is used to control the Stop Modes of the FlexRay.

This register is initialized by Power on reset, System reset 1, System Reset 2, Application reset 1 and Limited reset for FlexRay.

Access: This register can be read/written in 32-bit units.

Address: FFF8 1810_H

Value after reset: $0000\ 0001_H$

It is forbidden to set MS_LM4 during SWLRESS4.SWLRESS4_0 = 1

14.3.5 MSR_LM5 — Module Standby Register for GTM

This register is used to control the Stop Modes of the GTM.

This register is initialized by Power on reset, System reset 1, System Reset 2, Application reset 1 and Limited reset for GTM.

Access: This register can be read/written in 32-bit units.

Address: FFF8 1910_H

Value after reset: 0000 0001_H

It is forbidden to set MS_LM6 during SWLRESS6.SWLRESS6_0 = 1

14.3.7 MSR_LM7 — Module Standby Register for SENT

This register is used to control the Stop Modes of the SENT.

This register is initialized by Power on reset, System reset 1, System Reset 2, Application reset 1 and Limited reset for SENT.

Access: This register can be read/written in 32-bit units.

Address: FFF8 $1B10_H$

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

It is forbidden to set MS_LM7 during SWLRESS7.SWLRESS7_0 = 1

14.3.8 MSR_LM8 — Module Standby Register for HS-USRT

This register is used to control the Stop Modes of the HS-USRT.

This register is initialized by Power on reset, System reset 1, System Reset 2, Application reset 1 and Limited reset for US-USRT.

Access: This register can be read/written in 32-bit units.

Address: FFF8 $1C10_H$

Value after reset: 0000 0001_H

Section 15 External Memory Controller (MEMC)

This section describes the External Memory Controller (MEMC) module.

The first subsection describes all the characteristics specific to the RH850/P1x-C such as channels, register base addresses, and input/output signal names.
The second and subsequent subsections describe characteristics of External Memory Controller.

15.1 External Memory Controller (MEMC) Overview

15.1.1 Number of Channels

The RH850/P1x-C includes one physical channel.

Table 15.1 MEMC Channels

	External Memory Controller
Number of Channels	1
Name	MEMC

15.1.2 Register Addresses

External Memory Controller register addresses are represented by an offset from the base address <MEMC_base>.

Table 15.2 Register Base Address <MEMC_base>

Module	<MEMC_base> Address
MEMC	$1003\ 0000_H$

15.1.3 Clock Supply

The following clock input is supplied for the External Memory Controller module.

Table 15.3 Clock Supply

Unit Name	Specification	Description
MEMC	CLK_HSB (High speed system clock)	H-BUS clock

Note: The input frequency must be 80MHz

15.1.4 External Input/Output Signals

The following table shows the External Memory Controller input/output signals.

Table 15.4 MEMC External Input / Output Signals

Pin Name	I/O	Function
MEMC0A[8:0]	Output	External memory address output
MEMC0CS[3:0]Z	Output	External memory chip select output
MEMC0WRZ	Output	Write strobe output for external
MEMC0RDZ	Output	Read strobe output for external
MEMC0D[7:0]	Input/Output	Data input/output Input pin MEMC0D*n*I (n = 0 to 7) Output pin MEMC0D*n*O (n = 0 to 7)

15.2 Overview

15.2.1 Functional Overview

The external memory controller (= MEMC) provides an interface to connect external memories, such as SRAM, ASICs, etc. to the microcontroller. This controller includes four chip select areas whose wait time can be set independently for each chip select area. This external memory controller has various programmable wait functions that can be set for each chip select area.

MEMC has following features.

- External address space.
  - Supports CS0 to CS3 address space.
  - Possible to access with max 512B linear address for each CS address space.
- Data bus width
  - Fixed 8bits
- Wait state
  - Programmable wait cycle for
  - Each CS address space (CS0 to CS3)
  - Each read access and write access
- Data hold wait
  - Possible to insert a wait for the state following the rising edge of the write strobe signal in order to secure the hold time for the data write strobe.
- Idle cycle
  - Possible to be set independently after a read cycle or after a write cycle for each chip select area.
- Supported clock frequency
  - Only 20MHz

15.2.2 Block Diagram

Figure 15.1 shows MEMC block diagram.

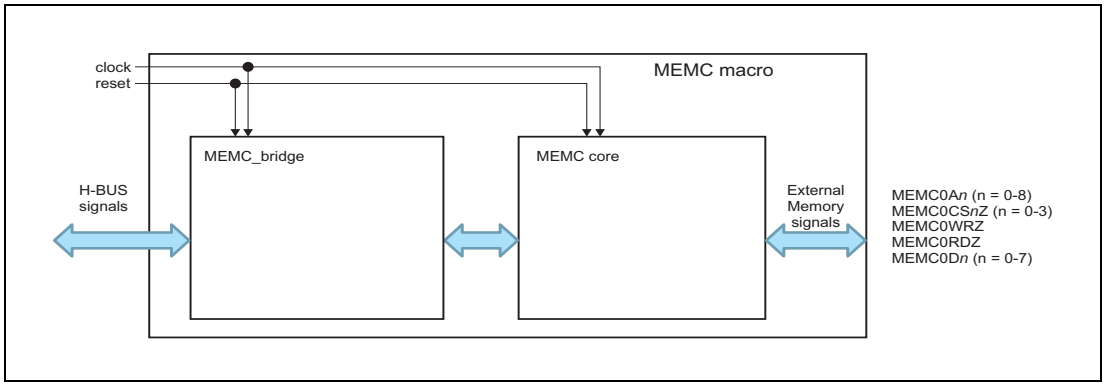

Figure 15.1 MEMC block diagram

15.3 Registers

These registers are used to control the setting of the external memory controller.

Remark: The clock counts shown this section indicate the clock count when operating on the external bus clock unless otherwise specified.

Table 15.5 Overview of External Memory Controller Registers

Address Offset *1	Register Name	Description	Access Width	Value after reset	Access Protection	
					PBG	Other
04_H	MEMCBCT0	Bus cycle type configuration register 0	16	0000_H	HB	—
08_H	MEMCDWC0	Data wait configuration register 0	16	$FFFF_H$	HB	—
$0C_H$	MEMCDHC	Data hold wait configuration register	16	0000_H	HB	—
14_H	MEMCICC0	Idle cycle configuration register 0	16	3333_H	HB	—

Note 1. Base address is described in **Table 15.2**

Table 15.6 Register Reset Condition

Register Name	Reset Condition				
	Power On Reset	System Reset 1	System Reset 2	Application Reset 1	Limited Reset*1
All registers	x	x	x	x	—

Note 1. MEMC does not support Limited Reset.

15.3.1 MEMCBCT0 — Bus cycle type configuration register

The MEMCBCT0 enables/disables the generation of bus cycles for each chip select area. This register can be read or written in 16-bit units.

CAUTION

Set the MEMCBCT0 register immediately after reset release, and do not change their values after they have been set. Otherwise, the operation will not be guaranteed.

Access:

Address: Base + 04_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ME3	—	BCT31	BCT30	ME2	—	BCT21	BCT20	ME1	—	BCT11	BCT10	ME0	—	BCT01	BCT00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 15.7 MEMCBCT0 register contents

Bit Position	Bit Name	Function
13, 12, 9, 8, 5, 4, 1, 0	BCTn1, BCTn0	Bus cycle setting bits These bits set a memory (bus cycle type) to be connected to each chip select area in the separate bus mode.
15, 11, 7, 3	MEn	Memory controller operation enable bits These bits enable or disable the operation of the internal memory controller for each chip select area.
14, 10, 6, 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.

BCTn1	BCTn0	Memory type
0	0	SRAM
0	1	Setting prohibited
1	0	Setting prohibited
1	1	Setting prohibited

MEn	Memory controller operation
0	Operation stopped (External bus cycle is not generated.)
1	Operation enabled

If the operation is disabled by the MEn bit, the generation of external bus cycles is stopped and the ongoing reading/writing is completed.

Note: n = 0 to 3

15.3.2 MEMCDWC0 — Data wait configuration register

The MEMCDWC0 register is used to set the number of data wait states of the external bus. These registers can be read or written in 16-bit units.

Access:

Address: Base + 08_H

Value after reset: $FFFF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DW33	DW32	DW31	DW30	DW23	DW22	DW21	DW20	DW13	DW12	DW11	DW10	DW03	DW02	DW01	DW00
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.8 MEMCDWC0 register contents

Bit position	Bit name	Function
15 to 12, 11 to 8, 7 to 4, 3 to 0	DWm3, DWm2, DWm1, DWm0	Data wait setting bits These bits set the number of data wait states for each chip select area.

DWm3	DWm2	DWm1	DWm0	Number of data wait states
0	0	0	0	No data wait
0	0	0	1	1 clock
0	0	1	0	2 clocks
0	0	1	1	3 clocks
0	1	0	0	4 clocks
0	1	0	1	5 clocks
0	1	1	0	6 clocks
0	1	1	1	7 clocks
1	0	0	0	8 clocks
1	0	0	1	9 clocks
1	0	1	0	10 clocks
1	0	1	1	11 clocks
1	1	0	0	12 clocks
1	1	0	1	13 clocks
1	1	1	0	14 clocks
1	1	1	1	15 clocks

Note: m = 0 to 3

15.3.3 MEMCDHC — Data hold wait configuration register

The MEMCDHC register is used to set the number of extended data hold wait states for each chip select area in the write cycle of the external bus. The number of data hold wait states determined by the set value of the MEMCDHC register + 1 cycle is inserted in a write cycle. This register can be read or written in 16-bit units.

Access: This register can be read or written in 16-bit units.

Address: Base + $0C_H$

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	DH31	DH30	DH21	DH20	DH11	DH10	DH01	DH00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.9 MEMCDHC register contents

Bit position	Bit name	Function
15 to 8	Reserved	When read, the value after reset is read. When writing, write the value after reset.
7, 6, 5, 4, 3, 2, 1, 0	DHn1, DHn0	Data hold wait setting bits These bits set the number of data hold wait states for each chip select area.

DHn1	DHn0	Number of data hold wait states
0	0	No data hold wait
0	1	1 clock
1	0	2 clocks
1	1	3 clocks

Note: n = 0 to 3

15.3.4 MEMCICC0 — Idle cycle configuration register

The MEMCICC0 register is used to set the number of idle cycles of the external bus. The number of idle cycles can be set for each chip select area and in the read cycle or write cycle. These registers can be read or written in 16-bit units.

Access:

Address: Base + 14_H

Value after reset: 3333_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WIC31	WIC30	RIC31	RIC30	WIC21	WIC20	RIC21	RIC20	WIC11	WIC10	RIC11	RIC10	WIC01	WIC00	RIC01	RIC00
Value after reset	0	0	1	1	0	0	1	1	0	0	1	1	0	0	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.10 MEMCICC0 register contents

Bit Position	Bit Name	Function
13, 12, 9, 8, 5, 4, 1, 0	RICn1, RICn0	Idle cycle setting bits after read cycle These bits set the number of idle cycles for each chip select area after a read cycle.

RICn1	RICn0	Number of idle cycles
0	0	No idle cycle*1
0	1	1 clock
1	0	2 clocks
1	1	3 clocks

Bit Position	Bit Name	Function
15, 14, 11, 10, 7, 6, 3, 2,	WICn1, WICn0	Idle cycle setting bits after write cycle These bits set the number of idle cycles for each chip select area after a write cycle.

WICn1	WICn0	Number of idle cycles
0	0	No idle cycle*1
0	1	1 clock
1	0	2 clocks
1	1	3 clocks

Note 1. When the response cycle to CPU (or DMA) is inserted after it ends at the bus cycle, the interval that is few clocks spend on the response is caused regardless of the idle setting. Therefore, the interval of few clocks is caused when setting it to “No idle cycle” to the generation of the next bus cycle after it ends at the bus cycle. The additional idle cycles depends on an internal response & request latency.

Note: n = 0 to 3

15.4 Operation

15.4.1 Chip Select Output Function

The connected external memory area is managed divided into 4 chip select areas up to CSn (n = 0 to 3), as shown in **Figure 15.2**. The allocation of these chip select areas is fixed by the system and cannot be changed through programming. When a bus cycle is generated for the external bus, the external memory controller makes the MEMC0CS[3:0]Z output pins corresponding to the access target address active (low level), along with outputting the access target address from the MEMC0A[8:0] pins. The settings for the external bus, such as the number of wait/idle states, can be made for each chip select area.

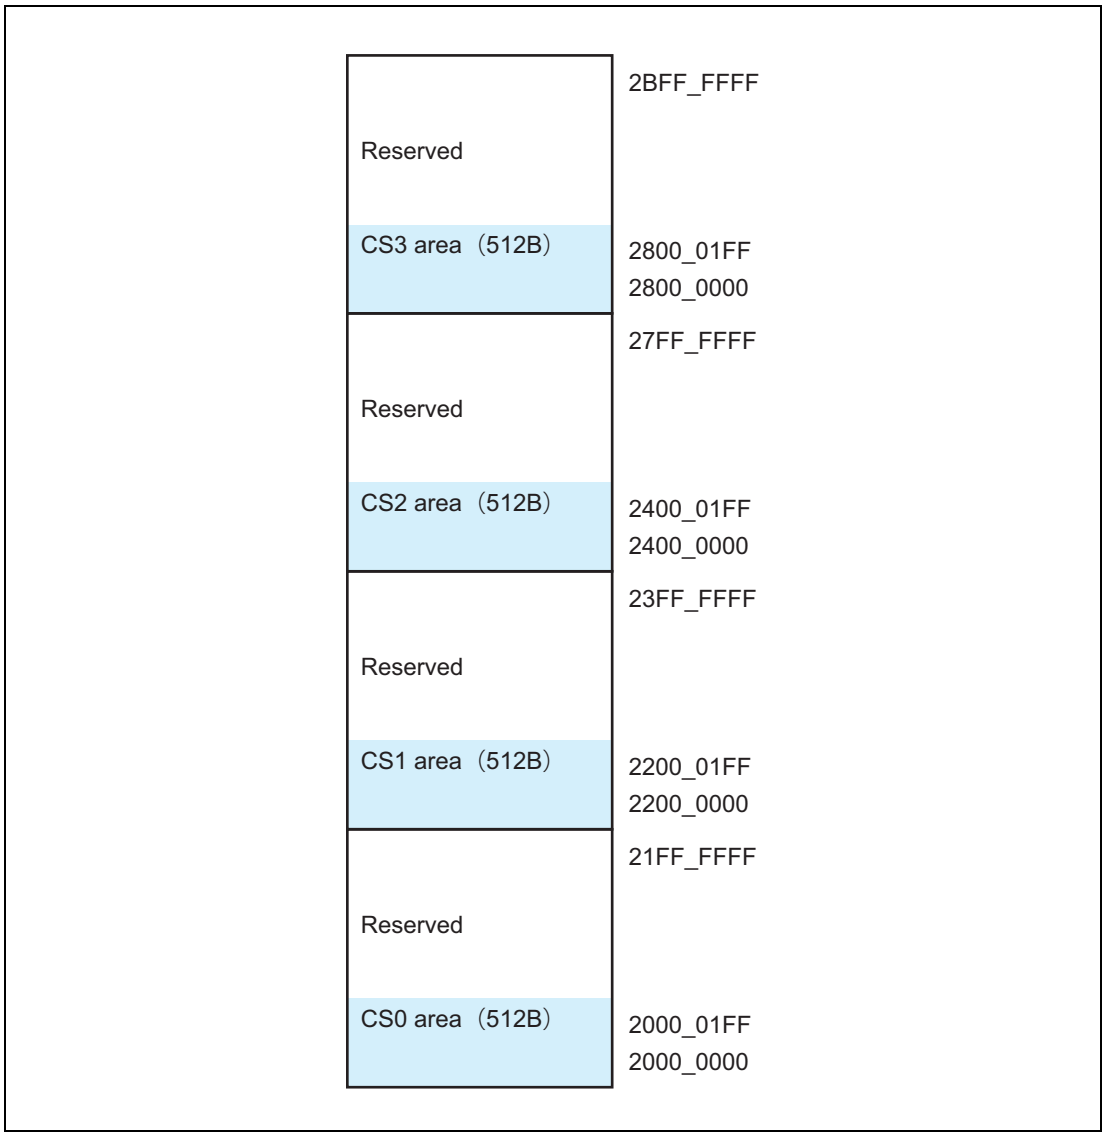

Figure 15.2 External Memory Map

15.4.2 Operation Enable/Operation Disable Setting Function

In this memory controller the operation can be enabled/disabled for each of the above-mentioned chip select areas shown in **Section 15.3.1** through the setting of the MEn (n = 0 to 3) bits of the MEMCBCT0 register.

If an access request is issued from the CPU (or DMA controller) to a chip select area for which operation has been disabled with this function, no external bus cycle is generated, the write value is ignored, and the read value becomes 0000 0000_H.

15.4.3 Wait functions

This external memory controller supports the wait functions listed below.

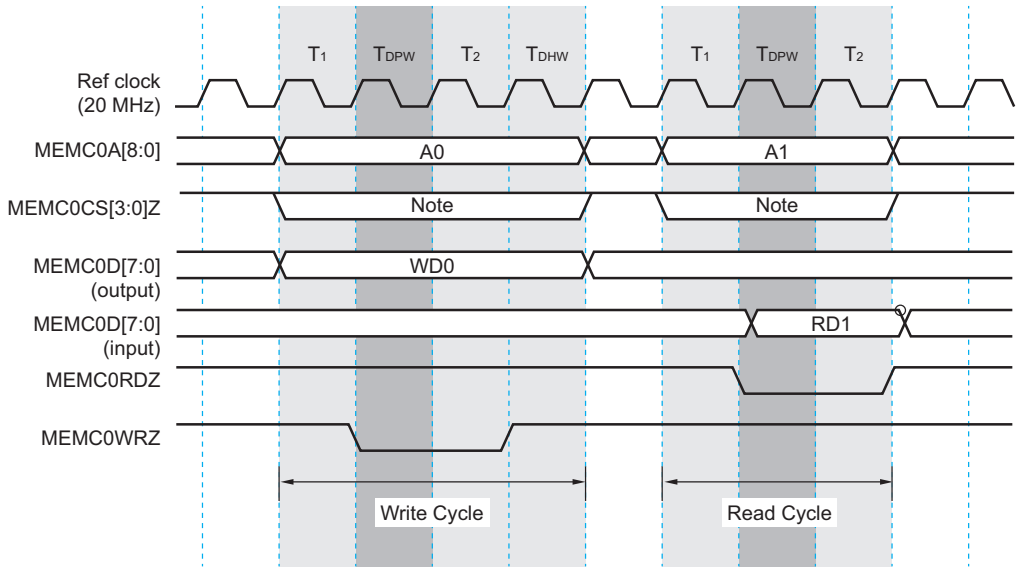
Table 15.11 Wait Functions

Wait Function		Programmable Data Wait	Data Hold Wait	Idle
SRAM bus cycle	Read	√	—	√
	Write	√	√	√
Setting registers		MEMCDWC0	MEMCDHC0	MEMCICC0
Max. number of waits		15	3	3

15.4.4 Programmable Data Wait Function

This wait function is for delaying the data latch timing by extending the read strobe and write strobe periods. This function is enabled during the write accesses and at the first data transfer timing.

Up to 15 cycles can be inserted. Moreover, setting individual chip select areas with the MEMCDWC register is also possible.



Note: Indicates the chip select area to be accessed.

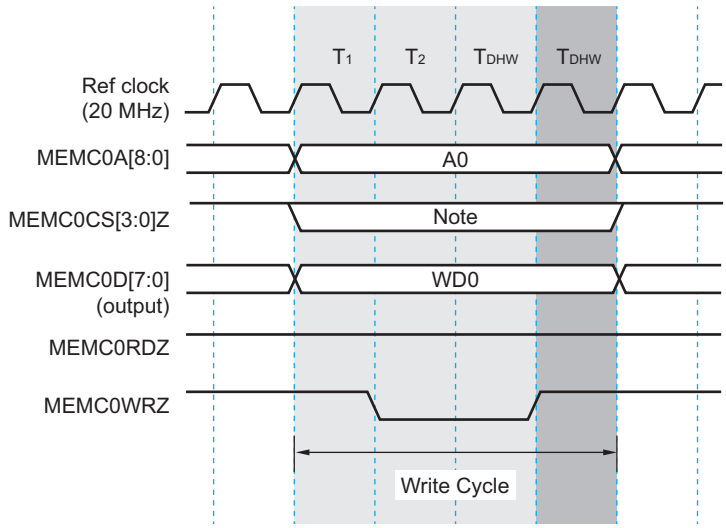
Figure 15.3 Programmable Data Wait

15.4.5 Data Hold Wait Function

This function inserts a wait for the state following the rising edge of the write strobe signal in order to secure the hold time for the data write strobe. This function is enabled only during the write cycle

This external memory controller always inserts 1 data hold wait state upon occurrence of a write cycle. This data hold wait extends the MEMCDHC register setting by up to 3 cycles, allowing insertion of 4 cycles.

The number of data hold wait extensions can be set for each chip select area with the MEMCDHC register. The initial status is no wait extension for any of the chip select areas (1 data hold wait cycle).



Note: Indicates the chip select area to be accessed.

Figure 15.4 Data Hold Wait

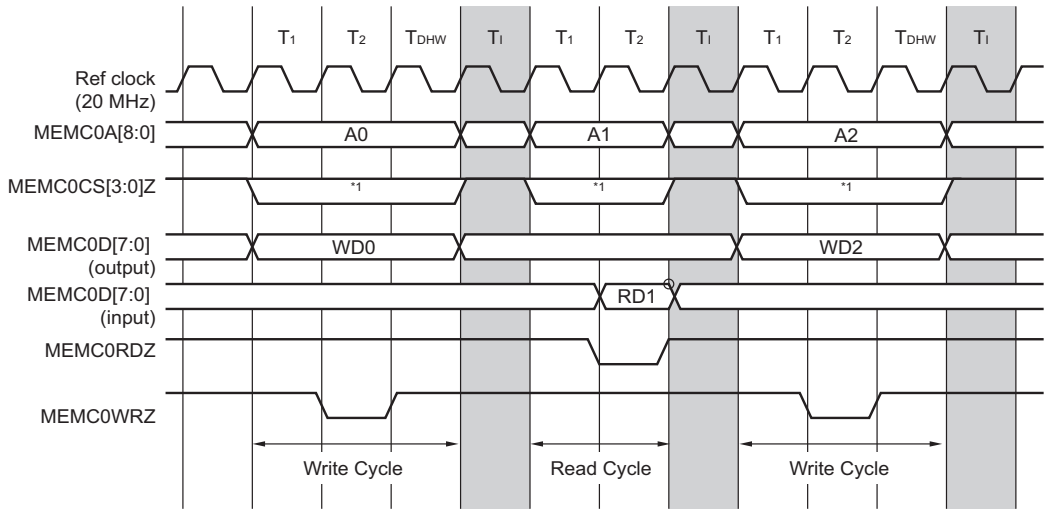
15.4.6 Idle Insertion Function

This function inserts an idle state after the last state of each cycle in order to prevent bus fights between cycles. For example, if a 32-bit write access occurs when an external memory that has an 8-bit bus width is connected, four write cycles are executed, and then an idle state is inserted.

This function can be set independently after a read cycle or after a write cycle for each chip select area by setting the ICC register. Up to 3 cycles can be inserted.

CAUTION

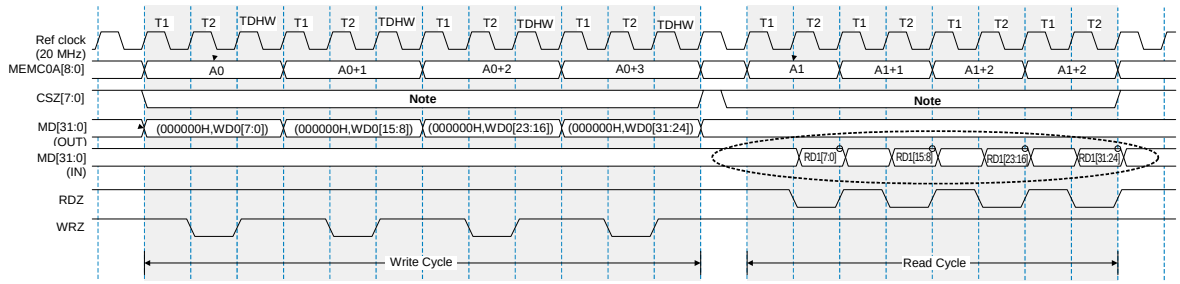
When the response cycle to CPU (or DMA) is inserted after it ends at the bus cycle, the interval that is few clocks spend on the response is caused regardless of the idle setting. Therefore, the interval of few clocks is caused when setting it to "No idle cycle" to the generation of the next bus cycle after it ends at the bus cycle. The additional idle cycles depends on an internal response & request latency.



Note: Indicates the chip select area to be accessed

Figure 15.5 Idle Cycle

15.4.7 Memory access timing examples



Note: Indicates the chip select area to be accessed.

Note 1. If the data is wider than 32 bits, separate 32 bit unit and transfer little endian manner

Figure 15.6 Memory access timing example, 32-bit Read/Write, 8-bit External Bus (see *1)

15.5 Difference among P1M-C, P1H-C and P1H-CE

Table 15.12 Difference of number of macro

Macro	Device					
	P1M-C (QFP, BGA-292)	P1M-C (BGA-156)	P1H-C (4MB, BGA-292)	P1H-C (4MB, BGA-156)	P1H-C (8MB)	P1H-CE
MEMC	—	—	1	—	1	1

Section 16 Clocked Serial Interface H (CSIH)

This section contains a generic description of the Clocked Serial Interface H (CSIH).

The first part of this section describes all RH850/P1x-C specific properties, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of CSIH.

16.1 Features of RH850/P1x-C CSIH

This module is the clock serial interface (CSIH) with the following additional functions.

- Flexible idle state control mode
- Silent mode
- Sample point modification function
- Priority management module (PMM) function

As the priority management module function is a relatively large additional function within the above functions, it will be described individually following the description on the basic functions of CSIH.

16.1.1 Units

This microcontroller has the following number of CSIH units.

Each CSIH unit has one channel interface.

Table 16.1 Units

	CSIH
Product Name	P1M-C, P1H-C and P1H-CE
Number of Units	4
Name	CSIHn (n = 0 to 3)

Table 16.2 Unit Configurations and Channels

Unit Name (Channel Name) CSIHn	Channels per Unit	RH850/P1x-C (4 ch)
CSIH0	1	√
CSIH1	1	√
CSIH2	1	√
CSIH3	1	√

Note: The channel names are same as those of the corresponding units.

Table 16.3 Index (1/2)

Index	Meaning
n	Throughout this section, the individual CSIH units are identified by the index “n” (n = 0 to 3): for example, CSIHnCTL0 is the CSIHn control register0.
x	CSIHn has up to 8 chip select signals. Throughout this section, the individual chip select signals are identified by the index “x” (x = 0 to 7): that is, CSx denotes a non-specified chip select signal.

Table 16.3 Index (2/2)

Index	Meaning
y	A variable used for explanation is identified by the index “y” (y = 0 to 3): for example, CSIHnBRSy is a non-specified baud rate setting register of CSIHn.
z	The clock division ratio used in calculating the bit rate is indicated by the letter “z”.
k	The value of the bit rate setting is indicated by the letter “k”.

Table 16.4 Number of Chip Select Signals

Unit Name	Chip Select Index
CSIH0	CSIH0CSSx (x = 0 to 7)
CSIH1	CSIH1CSSx (x = 0 to 7)
CSIH2	CSIH2CSSx (x = 0 to 7)
CSIH3	CSIH3CSSx (x = 0 to 7)

16.1.2 Register Base Address

CSIH base addresses are listed in the following table.

CSIH register addresses are given as offsets from the base addresses in general.

Table 16.5 Register Base Address

Base Address Name	Base Address
<CSIH0_base>	FFD8 0000_H
<CSIH1_base>	FFCA 0000_H
<CSIH2_base>	FFD8 3000_H
<CSIH3_base>	FFCA 3000_H

16.1.3 Clock Supply

Clock supply by and to CSIH is listed in the following table.

Table 16.6 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
CSIHn	P-Bus interface clock (PCLK)	CLK_HSB
	CSIHn communication clock (clkc)	CLKP_C

Note: In case of P1M-C, P1H-C following clock condition must be fulfilled
CLK_HSB < CLKP_C < (3 x CLK_HSB)
In case of P1H-CE following clock condition must be fulfilled
CLK_HSB <= CLKP_C < (3 x CLK_HSB)

For detail of clock supply, see **Section 12, Clock Controller**.

16.1.4 Interrupt Requests

CSIH interrupt requests are listed in the following table.

Table 16.7 Interrupt Requests

Unit Interrupt Name	Outline	Interrupt Number	DMA Trigger Number
CSIH0			
CSIHTIC	Communication status interrupt	88	79
CSIHTIR	Receive status interrupt	87	78
CSIHTIRE	Communication error interrupt	86	—
CSIHTIJC	Job completion interrupt	89	80
CSIH1			
CSIHTIC	Communication status interrupt	92	82
CSIHTIR	Receive status interrupt	91	81
CSIHTIRE	Communication error interrupt	90	—
CSIHTIJC	Job completion interrupt	93	83
CSIH2			
CSIHTIC	Communication status interrupt	96	85
CSIHTIR	Receive status interrupt	95	84
CSIHTIRE	Communication error interrupt	94	—
CSIHTIJC	Job completion interrupt	97	86
CSIH3			
CSIHTIC	Communication status interrupt	100	88
CSIHTIR	Receive status interrupt	99	87
CSIHTIRE	Communication error interrupt	98	—
CSIHTIJC	Job completion interrupt	101	89

16.1.5 Hardware Reset

CSIH reset sources are listed in the following table. CSIH is initialized by these reset sources.

Table 16.8 Reset Sources

	Reset condition				
Reset Name	Power On Reset	System Reset 1	System Reset 2	Application Reset 1	Limited Reset
All Registers	√	√	√	√	√

16.1.6 External Input/Output Signals

External input/output signals of CSIH are listed below.

Table 16.9 External Input/Output Signals

Unit Signal Name	Outline	Alternative port pin signal
CSIH0		
CSIHTSCK(in)	Serial clock input signal	CSIH0SCI
CSIHTSCK(out)	Serial clock output signal	CSIH0SCO
CSIHTSI	Serial data input signal	CSIH0SI
CSIHTSSIZ	SS function control input signal	CSIH0SSIZ
CSIHTRYI	Ready(1)/busy(0) input signal	CSIH0RYI
CSIHTSO	Serial data output signal	CSIH0SO
CSIHTRYO	Ready(1)/busy(0) output signal	CSIH0RYO
CSIHTCSS[7:0]	Serial peripheral chip select signal	CSIH0CSS[7:0]
CSIHTDCS	Data consistency check signal	CSIH0DCS
CSIH1		
CSIHTSCK(in)	Serial clock input signal	CSIH1SCI
CSIHTSCK(out)	Serial clock output signal	CSIH1SCO
CSIHTSI	Serial data input signal	CSIH1SI
CSIHTSSIZ	SS function control input signal	CSIH1SSIZ

CSIHTSO	Serial data output signal	CSIH1SO
CSIHTRYO	Ready(1)/busy(0) output signal	CSIH1RYO
CSIHTCSS[7:0]	Serial peripheral chip select signal	CSIH1CSS[7:0]
CSIHTDCS	Data consistency check signal	CSIH1DCS
CSIH2		
CSIHTSCK(in)	Serial clock input signal	CSIH2SCI
CSIHTSCK(out)	Serial clock output signal	CSIH2SCO
CSIHTSI	Serial data input signal	CSIH2SI
CSIHTSSIZ	SS function control input signal	CSIH2SSIZ
CSIHTRYI	Ready(1)/busy(0) input signal	CSIH2RYI
CSIHTSO	Serial data output signal	CSIH2SO
CSIHTRYO	Ready(1)/busy(0) output signal	CSIH2RYO
CSIHTCSS[7:0]	Serial peripheral chip select signal	CSIH2CSS[7:0]
CSIHTDCS	Data consistency check signal	CSIH3DCS
CSIH3		
CSIHTSCK(in)	Serial clock input signal	CSIH3SCI
CSIHTSCK(out)	Serial clock output signal	CSIH3SCO
CSIHTSI	Serial data input signal	CSIH3SI
CSIHTSSIZ	SS function control input signal	CSIH3SSIZ
CSIHTRYI	Ready(1)/busy(0) input signal	CSIH3RYI
CSIHTSO	Serial data output signal	CSIH3SO
CSIHTRYO	Ready(1)/busy(0) output signal	CSIH3RYO
CSIHTCSS[7:0]	Serial peripheral chip select signal	CSIH3CSS[7:0]
CSIHTDCS	Data consistency check signal	CSIH3DCS

16.1.7 Data Consistency Check

The following table lists the port pins on which CSIHnSO pin functions are multiplexed and whether or not the CSIHnSO pin functions support data consistency checking. See **Section 16.5.12, Error detection** for details on data consistency checking.

Table 16.10 Data Consistency Checking and Port Pins

Unit Signal Name	Port Pin Name	Alternative Function	Data Consistency Checking
CSIH0			
CSIHTSO	P2_13	ALT_OUT3	Supported (except P1M-C (BGA-156)/P1H-C (4MB, BGA-156))
	P0_9	ALT_OUT3	Supported (except P1M-C (BGA-156)/P1H-C (4MB, BGA-156))
	P5_5	ALT_OUT2	Supported
CSIH1			
CSIHTSO	P4_2	ALT_OUT3	Supported
	P0_7	ALT_OUT4	Supported (except P1M-C (BGA-156)/P1H-C (4MB, BGA-156))
	P1_2	ALT_OUT3	Supported
CSIH2			
CSIHTSO	P2_1	ALT_OUT3	Supported
	P4_10	ALT_OUT3	Supported
	P5_6	ALT_OUT4	Supported
CSIH3			
CSIHTSO	P8_0	ALT_OUT4	Supported (except P1M-C/P1H-C (4MB, BGA-156))
	P1_4	ALT_OUT2	Supported
	P6_13	ALT_OUT2	Supported (except P1M-C (QFP-144)/P1M-C (BGA-156)/ P1H-C (4MB, BGA-156))

CAUTION

PUCCn_m bit in PUCCn register and PDSCn_m bit in PDSCn register used for CSIH data pins should be set as written below depending on the communication speed and load capacitance (C load). For detail, See the Pin function.

Communication speed	C load	Register setting
Faster than 10 Mbps	Up to 15pF	PUCCn_m = 1, and PDSCn_m = 1
Slower than 10Mbps	Up to 100pF	PUCCn_m = 1, and PDSCn_m = 1
	up to 30pF	PUCCn_m = 1, and PDSCn_m = 0/1
	Up to 20pF	PUCCn_m = 1 and PDSCn_m = 0/1
		PUCCn_m = 0 and PDSCn_m = 1

16.2 Overview

16.2.1 Functional Overview

- Three-wire serial synchronous data transfer
- Full duplex operation (simultaneous transfer and receive), receive only mode, or transmit only mode
- Master mode and slave mode selectable
- Phase of clock and data selectable for each chip select
- Data transfer with MSB or LSB first selectable for each chip select
- Transfer data length selectable from 2 to 16 bits in 1-bit units for each chip select
- EDL (Extended Data Length) function for transferring data with more than 16 bits
- Maximum transmission speed:
  - in master mode: 20 MHz
  - in slave mode: 20 MHz
- Bit rate selectable by BRG (baud rate generator) output (at Master mode) or by slave clock
- Transmit mode, Receive mode and Transmit/Receive mode selectable
- Buffer size is 128 words (1 word is data 32 bits + ECC 7 bits)
- Memory mode selectable (FIFO, dual buffer, transmit-only buffer, and direct access)
- Built-in handshake function
- Error detection (data consistency check, parity, time-out, overflow, and overrun)
- JOB enable control bit for AUTOSAR
- RCB (Recessive Configuration for Broadcasting) bit for Broadcasting
- LBM (Loop Back Mode) function for self-test
- Four different interrupt request signals. (INTCSIHnTIC, INTCSIHnTIR, INTCSIHnTIRE, INTCSIHnTIJC)
- IDLE State Control function.
- Silent mode communication for extended idle time
- Automatically generation of chip select output signal with configurable active level
- Data transfer without activated chip select
- Transmission speed for each chip select is selectable out of four predefined baud rates (in master mode) or by clock input signal from master (in slave mode)
- Full DMA support for all CSIH registers (The SPI interface should be accessible by more than one bus-master without explicit SW-synchronization)

16.2.2 Functional Overview Description

The Clocked Serial Interface uses three signals for communication:

- Transmission clock CSIHTSCK (output in master mode, input in slave mode)
- Data output signal CSIHTSO
- Data input signal CSIHTSI

Additional signals are available for external control and monitoring.

- CSIHTSSIZ: Slave select input signal
- CSIHTRYO: Ready/busy output signal (handshake signal)
- CSIHTRYI: Ready/busy input signal (handshake signal)
- CSIHTCSS[7:0]: Chip select signals
- CSIHTDCS: Data consistency check signal

Data transmission is bit-wise and serial, and synchronous to the transmission clock.

The following table shows the most important registers for setting up the CSIH.

Table 16.11 Most important registers for setting up the CSIH

Register	Function
CSIHnCTL0	Enables/disables transmission clock, and permits/ prohibits data transmission and data reception. Defines end-of-job behavior and enables/disables buffering (bypass of the buffer).
CSIHnCTL1	Controls options like interrupt timing, extended data length, job feature, data consistency check, loop-back mode, handshake, etc.
CSIHnCTL2	Selects master/slave mode, and the baud rate of the internal generator (BRG) in master mode
CSIHnMCTL0	Selects memory mode and specifies the time-out value
CSIHnMCTL1	Controls the memory in FIFO mode
CSIHnMCTL2	Controls the memory in dual buffer mode
CSIHnCFGx	Registers to configure the communication protocol for each chip select signal

16.2.3 Block Diagram

The block diagram shows the main components of the CSIH.

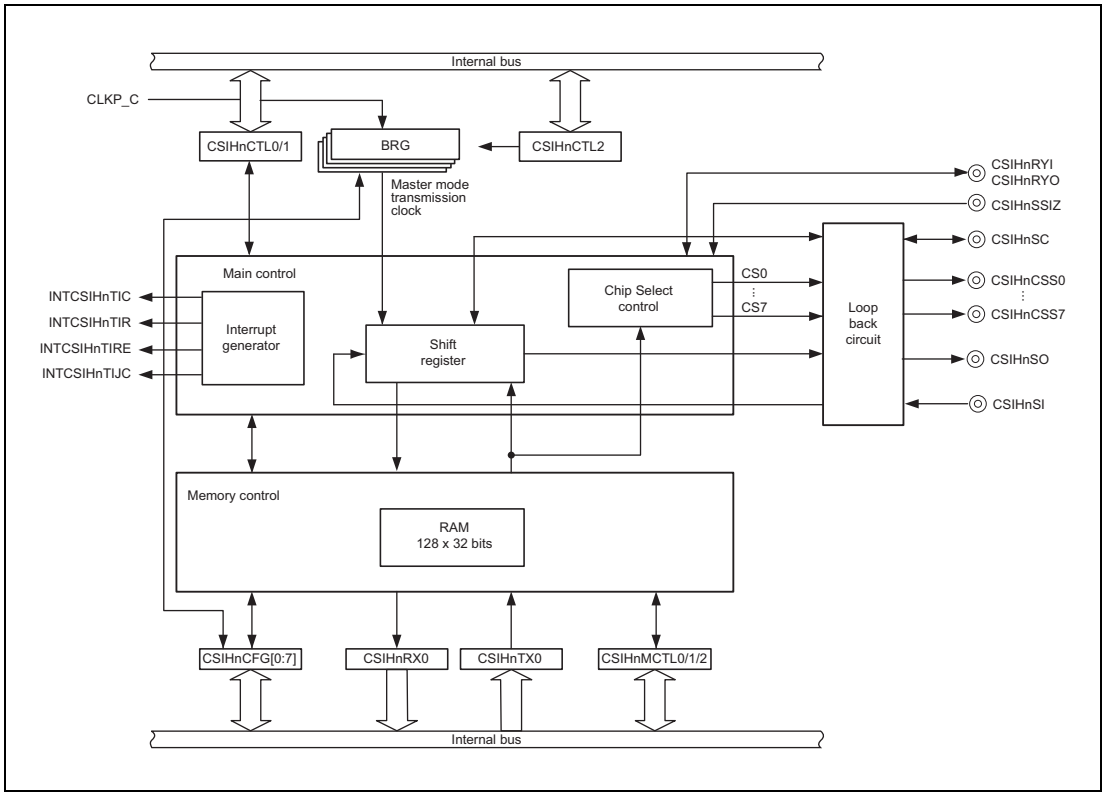

Figure 16.1 CSIH block diagram

In master mode, the transmission clock CSIHTSCK is generated by the built-in baud rate generator (BRG). In slave mode, the transmission clock is provided from an external source.

The built-in memory can be configured as FIFO, dual buffer (separate transmit and receive buffers), or transmit-only buffer. It can also be bypassed for data transmission and reception without buffering.

The loop back circuit disconnects the CSIH completely from the ports and supports internal self-test.

It is possible to pre-configure 4 different baud rates, which can be individually selected for each CS.

NOTE

This chapter describes the following modes:

- The “operating mode” separates between master and slave mode. In this context, only a master can control and communicate with several slaves (for details see **Section 16.5.1, Operating modes (master/slave)**).
- The “job mode” is related to the AUTOSAR job concept (for details see **Section 16.5.3.3, Job concept**).
- The “memory mode” takes the various configurations of the associated buffer memory into account (for details see **Section 16.5.6, CSIH buffer memory**).
- The “data transfer mode” specifies the kind of the communication — transmit-only, receive only, or transmit/receive (for details see **Section 16.5.7, Data transfer modes**).

16.3 Registers

16.3.1 List of Registers

CSIH registers are listed in the following table.

Table 16.12 Registers (1/2)

Address <CSIHn_base> +	Register Name	Description	Access Width	Value after reset	Access Protection	
					PBG	other
0000_H	CSIHnCTL0	CSIH control register 0	8	00_H	*1	—
0010_H	CSIHnCTL1	CSIH control register 1	32	$0000\ 0000_H$	*1	—
0014_H	CSIHnCTL2	CSIH control register 2	16	$E000_H$	*1	—
1000_H	CSIHnMCTL1	CSIH memory control register 1	32	$0000\ 0000_H$	*1	—
1004_H	CSIHnMCTL2	CSIH memory control register 2	32	$0000\ 0000_H$	*1	—
1008_H	CSIHnTX0W	CSIH transmit data register 0	32	—	*1	—
$100C_H$	CSIHnTX0H	CSIH transmit data register 0	16	—	*1	—
1010_H	CSIHnRX0W	CSIH receive data register 0	32	—	*1	—

2070_H	PMMAnSTC	PMM TG status clear register	32	$0000\ 0000_H$	*1	—

Note 1. In the case of
n = 0 PBG3#1.PG3-CSIH0,
n = 1 PBG1#1.PG1-CSIH1,
n = 2 PBG3#1.PG3-CSIH2,
n = 3 PBG1#1.PG1-CSIH3

<CSIHn_base>

The base address <CSIHn_base> of the CSIHn is defined in **Section 16.1.2, Register Base Address**.

16.3.2 CSIHnCTL0 — CSIH control register 0

This register controls the operation clock and enables/disables transmission/reception and the memory part for transmission and/or reception. It forces the stop of communication at the end of the current job.

Access: This register can be read/write in 8-bit or 1-bit units.

Address: <CSIHn_base> + 0000_H

Value after reset: 00_H This register is initialized by reset operation.

Bit	7	6	5	4	3	2	1	0
	CSIHnPWR	CSIHnTXE	CSIHnRXE	—	—	—	CSIHnJOBE	CSIHnMBS
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R/W	R/W

Table 16.13 CSIHnCTL0 register contents

Bit Position	Bit Name	Function
7	CSIHnPWR	Controls the operation clock. 0: Stops operation clock0. 1: Provides operation clock. Clearing CSIHnPWR to 0 resets the internal circuits, stops operation, and sets CSIH to standby state. No clock is provided to internal circuits. If CSIHnPWR is cleared during communication, ongoing communication is immediately aborted. In this case, communication must be started over.
6	CSIHnTXE	Enables/disables transmission. 0: Transmission disabled 1: Transmission enabled
5	CSIHnRXE	Enables/disables reception. 0: Reception disabled 1: Reception enabled.
4 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	CSIHnJOBE	Stops communication at the end of the current job (Communication ends after data with CSIHnEOJ = 1 was sent.): 0: Communication stop is not requested. 1: Stops communication. This bit can be used to abort an ongoing job. This bit is cleared to 0 automatically. If this bit is set to 1, the read value is always 0. In FIFO mode, the pointer must be cleared by setting CSIHnSTCR0.CSIHnPCT = 1 before the next communication is started This bit is disabled when CSIHnCTL1.CSIHnJE = 0.
0	CSIHnMBS	Bypasses the memory for transmission and/or reception data. 0: Memory mode CSIH memory is used for transmission and/or reception data. 1: Direct access mode CSIH memory is bypassed.

CAUTION

For the setting of this register, see Table 16.39, Notes on Setting Registers.

16.3.3 CSIHnCTL1 — CSIH control register 1

This register specifies the interrupt timing and the interrupt delay mode. It enables/disables extended data length control, data consistency check, loop-back mode, handshake functionality, and job mode. It selects the active output level of each chip select signal and the behavior of the chip select signals after the transfer of the final data.

Access: This register can be read/write in 32-bit units.

Address: <CSIHn_base> + 0010_H

Value after reset: $0000\ 0000_H$ This register is initialized by reset operation.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	CSIHn SLRS	—	—	—	CSIHn ISCE	CSIHn SME	—	CSIHn CKR	CSIHn SLIT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 16.14 CSIHnCTL1 register contents (1/2)

Bit Position	Bit Name	Function
31 to 25	Reserved	When read, the value after reset is read. When writing, write the value after reset.
24	CSIHnSLRS	Sets the internal sampling time for receive data input. 0: Standard sampling point 1: Shifted sampling point In master mode, this bit relaxes the setup time of received data by half clock period of communication clock. In slave mode, this bit is invalid. When The communication speed is faster than 5Mbps (excluding 5Mbps), CSIHnSLRS bit should be set to 1. For detail about sampling point, see **Table 16.29, CSIHnCFGx register contents (3/5 and 4/5)**.
23 to 21	Reserved	When read, the value after reset is read. When writing, write the value after reset.
20	CSIHnISCE	Idle state control mode enable/disable bit 0: ISC mode disabled The behavior between two transfers will be controlled by the setting in CSIHnCFGx.CSIHnIDLx bit. 1: ISC mode enabled The behavior between two transfers will be controlled by the setting in CSIHnTX0W.CSIHnISC bit. The CSIHnCFGx.CSIHnIDLx bit must be set to 0 if idle state control mode is enabled. This bit can only be written if CSIHnCTL0.CSIHnPWR = 0
19	CSIHnSME	Enable/disable silent mode. 0: Disables silent mode 1: enables silent mode
18	Reserved	When read, the value after reset is read. When writing, write the value after reset.
17	CSIHnCKR	CSIHSCK clock inversion function 0: The default level of CSIHSC is high 1: The default level of CSIHSC is low For details, see **16.3.15, CSIHnCFGx — CSIH Configuration register (x = 0 to 7)**.

Table 16.14 CSIHnCTL1 register contents (2/2)

Bit Position	Bit Name	Function
16	CSIHnSLIT	Selects the timing of interrupt INTCSIHnTIC. 0: Normal interrupt timing (interrupt is generated after the transfer) 1: As soon as the contents of the CSIHnTX0 register are transferred to the shift register, an interrupt is generated (this function is activated only in direct access mode). For details, see **Section 16.4.3, CSIHTIC (communication interrupt)**. **CAUTION** SLIT setting is invalid in the TX Only Buffer mode.
15 to 8	CSIHnCSLx (x = 0 to 7)	Selects the active output level of chip select signal x (CSIHnCSSx). 0: Chip select is active low. 1: Chip select is active high. For details, see **Section 16.5.3, Chip selection (CS) features**.
7	CSIHnEDLE	Enables/disables extended data length (EDL) mode. 0: Disables extended data length mode. 1: Enables extended data length mode. For details, see **Section 16.5.8.2, Data length greater than 16 bits**.
6	CSIHnJE	Enables/disables job mode. 0: Disables job mode. 1: Enables job mode. For details, see **Section 16.5.3.3, Job concept**. The CSIHnCTL0.CSIHnJOBE, CSIHnTX0W.CSIHnEOJ, and CSIHnTX0W.CSIHnCIRE bits are enabled only when CSIHnJE = 1. Setting this bit in slave mode is prohibited.
5	CSIHnDCS	Enables/disables data consistency check. 0: Disables data consistency check. 1: Enables data consistency check. For details, see **Section 16.5.12.1, Data consistency check**.
4	CSIHnCSRI	Defines chip select signal behavior after last data transfer. 0: Chip select signal holds the active level. 1: Chip select signal returns to the inactive level. Judgement of final data is interrupt output timing in Direct Access mode and FIFO mode. In Direct Access mode, CSIHnCTL1.CSIHnSLIT=1.
3	CSIHnLBM	Controls loop-back mode (LBM). 0: Deactivates loop-back mode. 1: Activates loop-back mode. For details, see **Section 16.5.13, Loop-back mode**. When LBM = 1: - CSIHTSI is internally connected to CSIHTSO - All CS are inactive (no influence of external world) - Physical CSIHTSO pin is set to a fixed level (no influence of external world) - External clock is not sent out
2	CSIHnSIT	Selects interrupt delay mode. 0: No delay is generated. 1: Half clock delay is generated for all interrupts. This bit is only valid in master mode. In slave mode, no delay is generated. For details, see **Section 16.4.2, General interrupt delay**. Interrupts mean INT_CSIHTIC, INT_CSIHTIR, INT_CSIHTIRE and INT_CSIHTIJC.
1	CSIHnHSE	Enables/disables handshake mode. 0: Disables the handshake function. 1: Enables the handshake function. For details see **Section 16.5.11, Handshake function**.
0	CSIHnSSE	Enables/disables the slave select function. 0: Input signal CSIHnSSIZ is ignored. 1: Input signal CSIHnSSIZ is recognized. If the slave select function is not used, this bit must be set to 0 (see also **Section 16.5.2, Master/slave connections**).

Details about CSIHnCTL1.CSIHnSSE are shown in the following tables.

Table 16.15 Operation of the slave select function during reception

CSIHnCTL0.CSIHnRXE	CSIHnCTL1.CSIHnSSE	CSIHTSSIZ	Receive operation
0	—	—	Reception is disabled
1	0	—	Possible
1	1	0	Possible
1	1	1	Disabled

Table 16.16 Operation of the slave select function during transmission

CSIHnCTL0.CSIHnTXE	CSIHnCTL1.CSIHnSSE	CSIHTSSI	Transmit operation
0	—	—	Transmission is disabled
1	0	—	Possible
1	1	0	Possible
1	1	1	Disabled

CAUTION

For the setting of this register, see **Table 16.39, Notes on Setting Registers**.

16.3.4 CSIHnCTL2 — CSIH control register 2

This register selects operating mode and the input clock for the four baud rate generators.

For details see **Section 16.5.5, Transmission clock selection**.

Access: This register can be read/write in 16-bit units.

Address: <CSIHn_base> + 0014_H

Value after reset: $E000_H$ This register is initialized by reset operation.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHnPRS[2:0]			—	—	—	—	—	—	—	—	—	—	—	—	—

Table 16.17 CSIHnCTL2 register contents

Bit Position	Bit Name	Function
15 to 13	CSIHnPRS[2:0]	These bits select the operation mode and the reference clock value.
12 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

CSIHnPRS2	CSIHnPRS1	CSIHnPRS0	Selection of Reference Clock (PRSOUT)
0	0	0	CLKP_C (Master mode)
0	0	1	CLKP_C/2 (Master mode)
0	1	0	CLKP_C/4 (Master mode)
0	1	1	CLKP_C/8 (Master mode)
1	0	0	CLKP_C/16 (Master mode)
1	0	1	CLKP_C/32 (Master mode)
1	1	0	CLKP_C/64 (Master mode)
1	1	1	External clock via CSIHnSC(in) (Slave mode)

In master mode, the following bits are used to set the transmission baud rate:

- CSIHnCTL2.CSIHnPRS[2:0]
- CSIHnCFGx.CSIHnBRSSx[1:0] (x = 0 to 7)
- CSIHnBRSy.CSIHnBRSy[11:0] (y = 0 to 3)

Four different baud rates can be pre-configured by the CSIHnBRSy registers (y = 0 to 3).

In CSIHnCFGx.CSIHnBRSSx[1:0] (x = 0 to 7) one of these baud rates can be selected for each chip select.

The following table shows the relationship between CSIHnCFGx.CSIHnBRSSx[1:0] and CSIHnBRSy.CSIHnBRSy[11:0] (y = 0 to 3) (x = 0 to 7).

CSIHnCFGx.CSIHnBRSSx [1:0] (x = 0 to 7)	Baud rate setting bit to be selected
00	CSIHnBRS0.CSIHnBRS[11:0]
01	CSIHnBRS1.CSIHnBRS[11:0]
10	CSIHnBRS2.CSIHnBRS[11:0]
11	CSIHnBRS3.CSIHnBRS[11:0]

The following table shows the relationship between the baud rate setting CSIHnBRSy [11:0] and the baud rate selected by the CSIHnBRSSx[1:0] bit when the bit value of the CSIHnPRS[2:0] bit is α.

CSIHnBRSy[11:0](k)	Baud Rate
0	BRG stopped
1	CLKP_C / (2^{α} × 1 × 2)
2	CLKP_C / (2^{α} × 2 × 2)
3	CLKP_C / (2^{α} × 3 × 2)
4	CLKP_C / (2^{α} × 4 × 2)
...	…
4095	CLKP_C / (2^{α} × 4095 × 2)

When CLKP_C = 80MHz, Fast baud rate is 20.0Mbps (CLKP_C/4) in Master mode and 13.3Mbps (CLKP_C/6) in Slave mode.

The slowest baud rate is 152.6bps (CLKP_C/524160)

CAUTION

For the setting of this register, see **Table 16.39, Notes on Setting Registers**.

16.3.5 CSIHnMCTL1 — CSIH Memory control register 1

This register selects the conditions to generate the interrupt requests, CSIHTIC and CSIHTIR in FIFO mode.

Access: This register can be read/write in 32-bit units.

Address: <CSIHn_base> + 1000_H

Value after reset: $0000\ 0000_H$ This register is initialized by reset operation.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	CSIHnFES[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CSIHnFFS[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.18 CSIHnMCTL1 register contents

Bit position	Bit name	Function
31 to 23	Reserved	When read, the value after reset is read. When writing, write the value after reset.
22 to 16	CSIHnFES[6:0]	Selects the conditions to generate the CSIHTIC interrupt (transmit data empty) in FIFO mode. When the number of unsent data to be transmitted in FIFO (CSIHnSTR0. CSIHnSPF[7:0]) equals CSIHnMCTL1.CSIHnFES[6:0], and the CSIHTIC interrupt request is generated.
15 to 7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6 to 0	CSIHnFFS[6:0]	Selects the conditions to generate the CSIHTIR interrupt (receive data full) in FIFO mode. When the number of received data in the FIFO (CSIHnSTR0.CSIHnSRP[7:0]) equals (128-CSIHnMCTL1.CSIHnFFS[6:0]), the CSIHTIR interrupt request is generated.

CAUTION

For the setting of this register, see **Table 16.39, Notes on Setting Registers**.

16.3.6 CSIHnMCTL2 — CSIH Memory control register 2

This register controls the operation of the memory in dual buffer or transmit-only buffer mode and triggers to start communication in buffer mode.

Access: This register can be read/write in 32-bit units.

Address: <CSIHn_base> + 1004_H

Value after reset: $0000\ 0000_H$ This register is initialized by reset operation.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CSIHn BTST	—	—	—	—	—	—	—	CSIHnND[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CSIHnSOP[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.19 CSIHnMCTL2 register contents (1/2)

Bit Position	Bit Name	Function
31	CSIHnBTST	Provides a start trigger for buffer transfer. 0: No operation. 1: Issues the start transfer command. The read value is always 0. **CAUTION** This bit can only be used in dual buffer mode and transmit-only buffer mode.
30 to 24	Reserved	When read, the value after reset is read. When writing, write the value after reset.
23 to 16	CSIHnND[7:0]	Specifies the number of data for each memory mode. The read value indicates the number of remaining communication data.

CSIHn ND[7:0]	Dual buffer mode	Transmit-only buffer mode	FIFO mode	Direct access mode
00_H	Send 0 data	Send 0 data	No influence	No influence
01_H	Send 1 data	Send 1 data	No influence	No influence
...	...	...	No influence	No influence
$3F_H$	Send 63 data	Send 63 data	No influence	No influence
40_H	Send 64 data	Send 64 data	No influence	No influence
...	Prohibited	...	No influence	No influence
$7F_H$	Prohibited	Send 127 data	No influence	No influence
80_H	Prohibited	Send 128 data	No influence	No influence
Other than the above	Setting is prohibited.			

The values are automatically decremented after data transfer (Not decremented in direct access mode).

15 to 7	Reserved	When read, the value after reset is read. When writing, write the value after reset.

Table 16.19 CSIHnMCTL2 register contents (2/2)

Bit Position	Bit Name	Function
6 to 0	CSIHnSOP[6:0]	Selects the pointer of the data to be sent.

CSIHn SOP[6:0]	Dual buffer mode	Transmit-only buffer mode	FIFO mode	Direct access mode
00_H	0000_H	0000_H	0000_H	No influence
01_H	0004_H	0004_H	0004_H	No influence
...	...	...	...	No influence
$3F_H$	$00FC_H$	$00FC_H$	$00FC_H$	No influence
40_H	Prohibited	0100_H	0100_H	No influence
...	Prohibited	...	...	No influence
$7F_H$	Prohibited	$01FC_H$	$01FC_H$	No influence

CAUTION

If communication is forced to stop by setting CSIHnCTL0.PWR to 0 or CSIHnSTR0.CSIHnPCT to 1, these bits are cleared by hardware.
In FIFO mode, these bits indicate the send address.
In direct access mode, these bits are not incremented.

CAUTION

For the setting of this register, see **Table 16.39, Notes on Setting Registers**.

16.3.7 CSIHnTX0W — CSIH transmit data register 0 for word access

This register stores transmission data. In addition, it specifies the communication interrupt request, the end-of-job, the extended data length, and the chip select activation.

Access: This register can be read/write in 32-bit units.

Address: <CSIHn_base> + 1008_H

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CSIHnCIRE	CSIHnEOJ	CSIHnEDL	CSIHnSFN1	CSIHnSFN0	CSIHnISC	—	—	CSIHnCS7	CSIHnCS6	CSIHnCS5	CSIHnCS4	CSIHnCS3	CSIHnCS2	CSIHnCS1	CSIHnCS0
Value after reset				0	0	0	0	0

	CSIHnTX[15:0]															
Value after reset																
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.20 CSIHnTX0W register contents (1/2)

Bit Position	Bit Name	Function
31	CSIHnCIRE	Enables the communication interrupt request CSIHTIC in dual buffer or transmit-only buffer mode, or the job completion interrupt CSIHTIJC request in FIFO mode. 0: No interrupt is requested. 1: An interrupt is requested. Generates interrupt CSIHTIC or CSIHTIJC after transmission. For details, see **Section 16.4.3, CSIHTIC (communication interrupt)** and **Section 16.4.3.8, CSIHTIJC (job completion interrupt)**. **CAUTION** This bit is only valid when job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
30	CSIHnEOJ	Specifies the end of a job. 0: Indicates that the job does not end. The job continues. 1: Indicates end-of-job data. **CAUTION** This bit is only valid when job mode is enabled (CSIHnCTL1.CSIHnJE = 1). This bit must be set to 0 in slave mode.
29	CSIHnEDL	Specifies whether the associated data requires the extended data length (EDL) option. 0: Normal operation 1: Enables the extended data length. The associated data is transmitted as a 16-bit packet. No inter-data time or idle time will be inserted after the data is transmitted. If CSIHnCTL1.CSIHnEDLE = 1 and CSIHnTX0W.CSIHnEDL = 1, the subsequent data must have the same CS selection. If CS is modified for the subsequent data, the correct operation is not assured. **CAUTION** This bit is only available if CSIHnCTL1.CSIHnEDLE = 1. This bit is cleared when CSIHnCTL1.CSIHnEDLE is cleared.

Table 16.20 CSIHnTX0W register contents (2/2)

Bit Position	Bit Name	Function
28, 27	CSIHnSFN[1:0]	CSIHnSFN[1:0] will decide the number of the inserted dummy frames to extend idle time after the transmitted data. 00: No dummy frame will be inserted after the transmission. 01: Two dummy frames (32 bits) will be inserted after the transmission. 10: Four dummy frames (64 bits) will be inserted after the transmission. 11: Eight dummy frames (128 bits) will be inserted after the transmission. **CAUTION** This bit is only valid when silent mode is enabled (CSIHnCTL1.CSIHnSME = 1). If the CSIHnEDL bit and one or both of the CSIHnSFN[1:0] bits are set, no silent communication will be added.
26	CSIHnISC	The idle state control bit decides whether the chip select signal change to inactive state after end of the transfer or not. 0: No change of the output level of CS signals after end of the transfer. 1: Change to inactive state of CS signals after end of the transfer. **CAUTION** This bit is only valid when flexible idle state mode is enabled (CSIHnCTL1.CSIHnISCE = 1).
25, 24	Reserved	When read, the value after reset is read. When writing, write the value after reset.
23 to 16	CSIHnCSx (x = 0 to 7)	Activates one or several chip select signals. 0: Activates chip select x for the associated transmission. 1: Deactivates chip select x for the associated transmission. Setting CSIHnTX0W.CSIHnCSx = FF_H is prohibited. **CAUTION** If several chip select signals are enabled for broadcasting, the configuration of one with CSIHnCFGx.CSIHnRCBx = 0 (dominant) is used. In this case, all dominant chip select signals must be set to precisely the same value. In slave mode, set the CSIHnCSx bit to FE_H.
15 to 0	CSIHnTX[15:0]	Stores the transmission data.

CAUTION

For the setting of this register, see **Table 16.39, Notes on Setting Registers**.

16.3.8 CSIHnTX0H — CSIH transmit data register 0 for half word access

This register stores the transmission data. This register is the same as bits 15 to 0 of register CSIHnTX0W.

The upper 16 bits of CSIHnTX0W are applied for transfer. Set transmit data to CSIHnTX0W before using this register because the value of CSIHnTX0W is undefined after the reset.

Access: This register can be read/write in 16-bit units.

Address: <CSIHn_base> + $100C_H$

Value after reset: Undefined

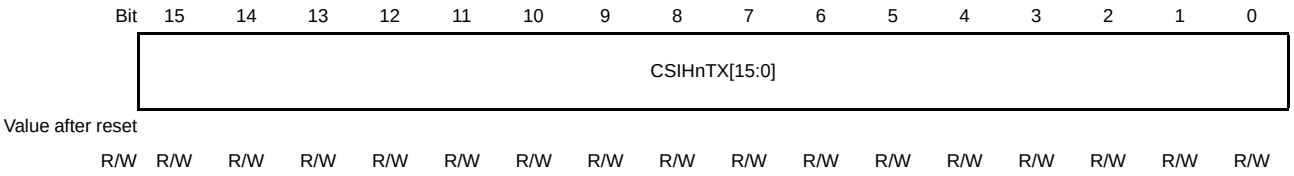

Table 16.21 CSIHnTX0H register contents

Bit Position	Bit Name	Function
15 to 0	CSIHnTX[15:0]	Stores the transmission data.

CAUTION

For the setting of this register, see **Table 16.39, Notes on Setting Registers**.

16.3.9 CSIHnRX0W — CSIH receive data register 0 for word access

This register stores the received data.

Access: This register can be read in 32-bit units.

Address: <CSIHn_base> + 1010_H

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	CSIHnRPE	CSIHnTDCE	CSIHnCS7	CSIHnCS6	CSIHnCS5	CSIHnCS4	CSIHnCS3	CSIHnCS2	CSIHnCS1	CSIHnCS0
Value after reset	0	0	0	0	0	0

Table 16.22 CSIHnRX0W register contents

Bit position	Bit name	Function
31 to 26	Reserved	When read, the value after reset is read.
25	CSIHnRPE	Indicates whether a reception data parity error was detected. 0: No parity error was detected on the associated reception data. 1: A parity error was detected on the associated reception data.
24	CSIHnTDCE	Indicates whether a transmission data consistency error was detected. 0: No consistency error was detected on the associated transmission data. 1: A consistency error was detected on the associated transmission data.
23 to 16	CSIHnCSx (x = 7 to 0)	Indicates which chip select signal was activated. 0: Chip select x was activated for the associated reception. 1: Chip select x was deactivated for the associated reception.
15 to 0	CSIHnRX[15:0]	Stores the received data.

CAUTION

For the setting of this register, see **Table 16.39, Notes on Setting Registers**.

16.3.10 CSIHnRX0H — CSIH receive data register 0 for half word access

This register stores the received data. This register is the same as bits 15 to 0 of register CSIHnRX0W.

Access: This register can be read in 16-bit units.
This register is lower 16-bit same as CSIHnRX0W register.

Address: <CSIHn_base> + 1014_H

Value after reset: Undefined

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHnRX[15:0]															
Value after reset																
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 16.23 CSIHnRX0H register contents

Bit position	Bit name	Function
15 to 0	CSIHnRX[15:0]	Stores the received data.

CAUTION

For the setting of this register, see **Table 16.39, Notes on Setting Registers**.

16.3.11 CSIHnMRWP0 — CSIH memory read/write pointer register 0

This register sets the pointers for reading from and writing to the dual or transmit-only buffer.

Access: This register can be read/written in 32-bit units.

Address: <CSIHn_base> + 1018_H

Value after reset: $0000\ 0000_H$ This register is initialized by reset operation.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	CSIHnRRA[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CSIHnTRWA[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.24 CSIHnMRWP0 register contents (1/2)

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is read. When writing, write the value after reset.
22 to 16	CSIHnRRA[6:0]	Selects the read pointer of the buffer.

CSIHn RRA[6:0]	Dual buffer mode	Transmit-only buffer mode	FIFO mode	Direct access mode
00_H	0000_H	No influence	0000_H	No influence
01_H	0004_H	No influence	0004_H	No influence
...	...	No influence	...	No influence
$3F_H$	$00FC_H$	No influence	$00FC_H$	No influence
40_H	Prohibited	No influence	0100_H	No influence
...	Prohibited	No influence	...	No influence
$7F_H$	Prohibited	No influence	$01FC_H$	No influence

These bits are automatically incremented when received data is read.
If an overrun error is generated while reading the CSIHnRX0W or CSIHnRX0H register, the read pointer is not incremented.
These bits are cleared when CSIHnSTCR0.CSIHnPCT is set to 1.
In direct access mode and transmit-only buffer mode, these bits are not incremented.
To perform write access in transmit-only mode, set 0000_H to these bits.
In FIFO mode, these bits indicate the read address of the received data.

15 to 7	Reserved	When read, the value after reset is read. When writing, write the value after reset.

Table 16.24 CSIHnMRWP0 register contents (2/2)

Bit Position	Bit Name	Function
6 to 0	CSIHnTRWA [6:0]	Selects the read/write pointer of the transmit buffer.

CSIHn TRWA[6:0]	Dual buffer mode	Transmit-only buffer mode	FIFO mode	Direct access mode
00_H	0000_H	0000_H	0000_H	No influence
01_H	0004_H	0004_H	0004_H	No influence
...	...	...	...	No influence
$3F_H$	$00FC_H$	$00FC_H$	$00FC_H$	No influence
40_H	Prohibited	0100_H	0100_H	No influence
...	Prohibited	...	...	No influence
$7F_H$	Prohibited	$01FC_H$	$01FC_H$	No influence

These bits are automatically incremented when the transmission data is written or read.
These bits are cleared when CSIHnSTCR0.CSIHnPCT is set to 1.
In direct access mode, these bits are not incremented.
In FIFO mode, these bits indicate the read/write address of transmission data.

CAUTION

For the setting of this register, see **Table 16.39, Notes on Setting Registers**.

16.3.12 CSIHnSTR0 — CSIH status register 0

This register indicates the status of CSIH.

Access: This register can be read in 32-bit units.

Address: <CSIHn_base> + $101C_H$

Value after reset: $0000\ 0010_H$ This register is initialized by reset operation.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CSIHnSRP[7:0]								CSIHnSPF[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHn TMOE	CSIHn OFE	—	—	—	—	—	—	CSIHn TSF	—	CSIHn FLF	CSIHn EMF	CSIHn DCE	—	CSIHn PE	CSIHn OVE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 16.25 CSIHnSTR0 register contents (1/4)

Bit Position	Bit Name	Function
31 to 24	CSIHnSRP[7:0]	Indicates the number of received data packets in FIFO mode. **CSIHnSRP[7:0] / Description** 00_H — Number of received data packets (0 to 128) … 80_H Other than the above — Reserve These bits are cleared by CSIHnSTCR0.CSIHnPCT. In direct access mode, dual buffer mode, or transmit-only buffer memory mode, this value is fixed to 00_H. In direct access mode, this bit is fixed to 0 because there is no pointer. In buffer mode, this bit is fixed to 0 because the number of data packets is managed by CSIHnMCTL2.CSIHnND[6:0].
23 to 16	CSIHnSPF[7:0]	Indicates the number of unsent data in FIFO mode. (The number of data written by the CPU/DMA to the CSIH is the number of data to be transmitted.) **CSIHnSPF[7:0] / Description** 00_H — Number of unsent data packets (0 to 128_D) … 80_H Other than the above — Reserve These bits are cleared by CSIHnSTCR0.CSIHnPCT. In direct access mode, dual buffer mode, or transmit-only buffer memory mode, this value is fixed to 00_H. In direct access mode, this bit is fixed to 0 because there is no pointer. In buffer mode, this bit is fixed to 0 because the number of data packets is managed by CSIHnMCTL2.CSIHnND[6:0].

Table 16.25 CSIHnSTR0 register contents (2/4)

Bit Position	Bit Name	Function
15	CSIHnTMOE	Time-out error flag in FIFO mode. Indicates whether a time-out error was detected in FIFO mode. 0: No time out error is detected. 1: A time out error is detected. For details, see **Section 16.5.12.3, Time-out error**. This bit is cleared by CSIHnSTCR0.CSIHnTMOEC. If this bit is set to 1 and cleared by CSIHnSTCR0.CSIHnTMOEC at the same time, setting to 1 is prioritized. This bit is initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0.
14	CSIHnOFE	Overflow error flag in FIFO mode. Indicates whether an overflow error was detected in FIFO mode. 0: No overflow error is detected. 1: An overflow error is detected. For details, see **Section 16.5.12.4, Overflow error**. This bit is cleared by CSIHnSTCR0.CSIHnOFEC. If this bit is set to 1 and cleared by CSIHnSTCR0.CSIHnOFEC at the same time, setting to 1 is prioritized. This bit is initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0. When CSIHnCTL0.CSIHnPWR = 0, if transmission data (129) is written to CSIHnTX0W or CSIHnTX0H, an overflow error occurs.
13 to 8	Reserved	When read, the value after reset is read.

Table 16.25 CSIHnSTR0 register contents (3/4)

Bit Position	Bit Name	Function
7	CSIHnTSF	Transfer status flag. 0: Idle state 1: Transmission is in progress or being prepared. Conditions for setting and clearing this bit are shown in the following tables.

Master mode	Set by: Direct access mode, FIFO mode	Set by: Double Buffer mode, transmit-only mode	Cleared by
Transmit-only mode	Data is written to a transmit register (CSIHnTX0W/ CSIHnTX0H)	Bit CSIHnMCTL2. CSIHnBTST is set	Within a half clock of the last serial clock edge*1
Transmit/receive mode			
Receive-only mode			

Note 1. TSF flag will only be cleared if data can be transferred from shift register to empty RX register. If RX register is not empty, TSF flag will remain high until RX register has been read.

Slave mode	Set by: Direct access mode, FIFO mode	Set by: Double Buffer mode, transmit-only mode	Cleared by
Transmit-only mode	Data is written to a transmit register (CSIHnTX0W/ CSIHnTX0H)	Bit CSIHnMCTL2. CSIHnBTST is set	Within a half clock of the last serial clock edge*2
Transmit/receive mode			
Receive-only mode	Input timing of CSIHnSC		

Note 2. TSF flag will only be cleared if data can be transferred from shift register to empty RX register. If RX register is not empty, TSF flag will remain high until RX register has been read.

This bit is cleared by CSIHnSTCR0.CSIHnPCT.

CAUTION

The TSF flag will be set with a certain delay after the set event described in the tables above has occured (e.g. “Data is written to a transmit register”). Consider this behaviour when reading the status of this bit. Alternatively use the corresponding interrupt / interrupt status flag to monitor the transfer status.

6	Reserved	When read, the value after reset is read.
5	CSIHnFLF	A flag indicating that the buffer is full in FIFO mode. 0: FIFO buffer is not full. 1: FIFO buffer is full. This bit is cleared by CSIHnSTCR0.CSIHnPCT. The FIFO buffer might be filled with unsent data or received data.

Table 16.25 CSIHnSTR0 register contents (4/4)

Bit Position	Bit Name	Function
4	CSIHnEMF	A flag indicating that the buffer is empty in FIFO mode. 0: FIFO buffer is not empty. 1: FIFO buffer is empty. This bit is set to 1 by CSIHnSTCR0.CSIHnPCT. This bit is set to 1 when the setting value of CSIHnMCTL1.CSIHnFES[6:0] and the value for the CSIHnSTR0.CSIHnSPF[7:0] bit match. The FIFO buffer might be filled with unsent data or received data. Set condition: – If CSIHnSTR0.CSIHnSRP[7:0] plus CSIHnSTR0.CSIHnSPF[7:0] equals 00H, This bit is set by CSIHnSTCR0.CSIHnPCT bit. Clear condition: – If CSIHnSTR0.CSIHnSRP[7:0] plus CSIHnSTR0.CSIHnSPF[7:0] not equals 00H.
3	CSIHnDCE	Data consistency checks error flag. 0: No data consistency error is detected. 1: Data consistency error is detected. This bit is cleared by writing 1 to CSIHnSTCR0.CSIHnDCEC. If this bit is set to 1 and cleared by CSIHnSTCR0.CSIHnDCEC at the same time, setting to 1 is prioritized. This bit is initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0.
2	Reserved	When read, the value after reset is read.
1	CSIHnPE	Parity error flag 0: No parity error is detected. 1: Parity error is detected. This bit is cleared by writing 1 to CSIHnSTCR0.CSIHnPEC. Write access to this bit is enabled when CSIHnCTL0.CSIHnPWR = 0. This bit is initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0. When this bit is set to 1 by the detection of parity error and cleared to 0 by CSIHnSTCR0.CSIHnPEC simultaneously, setting to 1 is prioritized.
0	CSIHnOVE	Overrun error flag (Fixed to 0 in dual buffer mode). 0: No overrun error is detected. 1: Overrun error is detected. This bit is cleared by writing 1 to CSIHnSTCR0.CSIHnOVEC. When this bit is set to 1 by the detection of overrun error and cleared to 0 by CSIHnSTCR0.CSIHnOVEC simultaneously, setting to 1 is prioritized. This bit is Initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0.

Table 16.26 Behavior in memory mode

		Mode			
Bit name	**Bit position**	**Direct access**	**FIFO**	**Transmit-only**	**Dual buffer**
CSIHnSRP[7:0]	31 to 24	Fixed to 0	Number of received words	Fixed to 0	Fixed to 0
CSIHnSPF[7:0]	23 to 16	Fixed to 0	Number of unsent data	Fixed to 0	Fixed to 0
CSIHnTMOE	15	Fixed to 0	Time-out error flag	Fixed to 0	Fixed to 0
CSIHnOFE	14	Fixed to 0	Overflow error flag	Fixed to 0	Fixed to 0
CSIHnTSF	7	0: Idle state 1: Transmission is in progress or being prepared*1			
CSIHnFLF	5	Fixed to 0	FIFO full flag	Fixed to 0	Fixed to 0
CSIHnEMF	4	Fixed to 1	FIFO empty flag	Fixed to 1	Fixed to 1

Table 16.26 Behavior in memory mode

Bit name	Bit position	Mode			
		Direct access	FIFO	Transmit-only	Dual buffer
CSIHnDCE	3	0: No error is detected. 1: An error is detected.			
CSIHnPE	1	0: No error is detected. 1: An error is detected.			
CSIHnOVE	0	0: No error is detected. 1: An error is detected.	0: No error is detected. 1: An error is detected.	0: No error is detected. 1: An error is detected.	Fixed to 0

Note 1. TSF flag will only be cleared if data can be transferred from shift register to empty RX register. If RX register is not empty, TSF flag will remain high until RX register has been read.

CAUTIONS

1. For the setting of this register, see **Table 16.39, Notes on Setting Registers**.
2. The TSF flag will be set with a certain delay after the set event (e.g. "Data is written to a transmit register"). Consider this behaviour when reading the status of this bit. Alternatively use the corresponding interrupt / interrupt status flag to monitor the transfer status.

16.3.13 CSIHnSTCR0 — CSIH status clear register 0

This register clears the status flags of the CSIHnSTR0 status register.

Access: This register can be read/written in 16-bit units.
When read, the value 0000_H is always returned.

Address: <CSIHn_base> + 1020_H

Value after reset: 0000_H This register is initialized by reset operation.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHn TMOEC	CSIHn OFEC	—	—	—	—	—	CSIHn PCT	—	—	—	—	CSIHn DCEC	—	CSIHn PEC	CSIHn OVEC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R/W	R	R	R	R	R/W	R	R/W	R/W

Table 16.27 CSIHnSTCR0 register contents

Bit Position	Bit Name	Function
15	CSIHnTMOEC	Controls the time-out error flag clear command. 0: No operation. The read value is always 0. 1: Clears the time out error flag (CSIHnSTR0.CSIHnTMOE).
14	CSIHnOFEC	Controls the overflow error flag clear command. 0: No operation. The read value is always 0. 1: Clears the overflow error flag (CSIHnSTR0.CSIHnOFE).
13 to 9	Reserved	When read, the value after reset is read. When writing, write the value after reset.
8	CSIHnPCT	Controls the FIFO pointer clear command. 0: No operation. The read value is always 0. 1: Clears the FIFO buffer pointers below (in FIFO mode and dual buffer mode only) and the status bits.

FIFO buffer pointer	Status bit
CSIHnMRWPO.CSIHnTRWA[6:0] CSIHnMRWPO.CSIHnRRA[6:0] CSIHnMCTL2.CSIHnSOP[6:0]	CSIHnSTR0.CSIHnSPF[7:0] CSIHnSTR0.CSIHnSRP[7:0] CSIHnSTR0.CSIHnFLF CSIHnSTR0.CSIHnTSF

Additionally, the CSIHnSTR0.CSIHnEMF bit is set to 1 (FIFO empty) (in FIFO mode only).

7 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	CSIHnDCEC	Controls the data consistency error flag clear command. 0: No operation. The read value is always 0. 1: Clears the data consistency error flag (CSIHnSTR0.CSIHnDCE).
2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	CSIHnPEC	Controls the parity error flag clear command. 0: No operation. The read value is always 0. 1: Clears the parity error flag (CSIHnSTR0.CSIHnPE).
0	CSIHnOVEC	Controls the overrun error flag clear command. 0: No operation. The read value is always 0. 1: Clears the overrun error flag (CSIHnSTR0.CSIHnOVE).

CAUTION

For the setting of this register, see **Table 16.39, Notes on Setting Registers**.

16.3.14 CSIHnMCTL0 — CSIH Memory control register 0

This register selects the memory mode and the time-out setting.

Access: This register can be read/written in 16-bit units.

Address: <CSIHn_base> + 1040_H

Value after reset: $001F_H$ This register is initialized by reset operation.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CSIHn MMS[1:0]		—	—	—	CSIHnTO[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 16.28 CSIHnMCTL0 register contents

Bit Position	Bit Name	Function
15 to 10	Reserved	When read, the value after reset is read. When writing, write the value after reset.
9 to 8	CSIHnMMS [1:0]	Selects the memory mode. **CSIHn MMS1 / CSIHn MMS0 / Description** 0 / 0 / FIFO mode 0 / 1 / Dual buffer mode 1 / 0 / Transmit-only buffer mode 1 / 1 / Prohibited After a change of the memory mode, the respective buffer pointers must be cleared by setting the CSIHnSTCR0.CSIHnPCT bit to 1. In direct access mode, the setting of these bits is ignored.
7 to 5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 0	CSIHnTO[4:0]	Selects the time-out setting in FIFO mode. **CSIHnTO[4:0] / Description** 00000_B / No time-out is detected 00001_B / Time-out is (1 × 8 × BRG output clocks) 00010_B / Time-out is (2 × 8 × BRG output clocks) ... 11111_B / Time-out is (31 × 8 × BRG output clocks) **CAUTION** Changing the time-out setting is only permitted when CSIHnCTL0.CSIHnPWR = 0. Set the CSIHnTO[4:0] bit to 00000_B in direct access mode, dual buffer mode, or transmit-only mode (except FIFO mode). For details about time-out detection, see also **Section 16.5.12.3, Time-out error**.

CAUTION

For the setting of this register, see **Table 16.39, Notes on Setting Registers**.

16.3.15 CSIHnCFGx — CSIH Configuration register (x = 0 to 7)

These eight registers specify for each chip select signal CSIHTCSSx used baud rate generator, parity, data length, recessive configuration for broadcasting, serial data direction, clock and data phase, idle enforcement configuration, idle time, hold time, inter-data time and setup time.

Slave mode

In slave mode, the transmission protocol setting of the CSIHnCFG0 register is effective.

- CSIHnPS0[1:0]: parity usage
- CSIHnDLS0[3:0]: data length selection
- CSIHnDIR0: data direction
- CSIHnCKP0, CSIHnDAP0: clock and data phase

In slave mode, set 0 to all the bits other than above in the CSIHnCFG0 register, and the CSIHnCFG1 to CSIHnCFG7 registers.

Access: This register can be read/written in 32-bit units.

Address: CSIHnCFG0: <CSIHn_base> + 1044_H
CSIHnCFG1: <CSIHn_base> + 1048_H
CSIHnCFG2: <CSIHn_base> + $104C_H$
CSIHnCFG3: <CSIHn_base> + 1050_H
CSIHnCFG4: <CSIHn_base> + 1054_H
CSIHnCFG5: <CSIHn_base> + 1058_H
CSIHnCFG6: <CSIHn_base> + $105C_H$
CSIHnCFG7: <CSIHn_base> + 1060_H

Value after reset: $0000\ 0000_H$ This register is initialized by reset operation.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 16.29 CSIHnCFGx register contents (1/5)

Bit Position	Bit Name	Function
31, 30	CSIHnBRSSx [1:0]	A register used to set the baud rate.

CSIHn BRSSx1	CSIHn BRSSx0	Baud rate setting register selection
0	0	The baud rate is set according to the CSIHnBRS0 setting
0	1	The baud rate is set according to the CSIHnBRS1 setting
1	0	The baud rate is set according to the CSIHnBRS2 setting
1	1	The baud rate is set according to the CSIHnBRS3 setting

The maximum value for setting the baud rate, combining the CSIHnCTL2.CSIHnPRS to 0 setting, must be as follows:
Master mode: CLKP_C/4 (Up to 20 MHz bit/s)
Slave mode: CLKP_C/6 (Up to 20 MHz bit/s)

Table 16.29 CSIHnCFGx register contents (2/5)

<table>
<tr><th>Bit Position</th><th>Bit Name</th><th>Function</th></tr>

</table>

CAUTION

For the setting of this register, see **Table 16.39, Notes on Setting Registers**.

16.3.16 CSIHnBRSx — CSIH baud rate setting register (x = 0 to 3)

This register sets the baud rate for each chip select signal.

With CSIHnCFGx.CSIHnBRSSx[1:0] bits, one of the four types of baud rate settings can be selected for each chip select signal. (x = 0 to 7)

For details of baud rate setting, see **Section 16.5.5, Transmission clock selection**.

Access: This register can be read/write in 16-bit units.

Address: CSIHnBRS0: <CSIHn_base> + 1068_H
CSIHnBRS1: <CSIHn_base> + $106C_H$
CSIHnBRS2: <CSIHn_base> + 1070_H
CSIHnBRS3: <CSIHn_base> + 1074_H

Value after reset: 0000_H This register is initialized by reset operation.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CSIHnBRSx[11:0]

Table 16.30 CSIHnBRSx register contents

Bit position	Bit name	Function
15 to 12	Reserved	When read, the value after reset is read. When writing, write the value after reset.
11 to 0	CSIHnBRSx [11:0]	0: BRG stopped 1: CLKP_C / (2^{α} × 1 × 2) 2: CLKP_C / (2^{α} × 2 × 2) 3: CLKP_C / (2^{α} × 3 × 2) 4: CLKP_C / (2^{α} × 4 × 2) . . . 4095: CLKP_C / (2^{α} × 4095 × 2) α is the value of CSIHnCTL2.CSIHnPRS (bit 2 to 0).

CAUTION

For the setting of this register, see **Table 16.39, Notes on Setting Registers**.

16.3.17 PMMAnCTL — PMM control register

This register controls the operation clock.

Access: This register can be read/write in 32-bit units.

Address: <CSIHn_base> + 2000_H

Value after reset: $0000\ 0000_H$ This register is initialized by reset operation.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PMMAnPWR	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 16.31 PMMAnCTL register contents

Bit position	Bit name	Function
31	PMMAnPWR	Controls the operation clock: 0: Stops operation clock 1: Provides operation clock Clearing PMMAnPWR to 0 resets the internal circuits (internal registers will have reset value after enabling), stops operation. No clock is provided to internal circuits. **NOTE** PMMAnTCNT, PMMAnSTR0/1, and PMMAnRX registers are cleared.Others aren't cleared. If PMMAnPWR is cleared during TG handling all TG's are immediately aborted.
30 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

16.3.18 PMMAnTCTLx — PMM TG control register (x = 0 to 7)

This register controls the operation of priority management module.

Access: This register can be read/write in 32-bit units.

Address: PMMAnTCTL0: <CSIHn_base> + 2004_H
PMMAnTCTL1: <CSIHn_base> + 2008_H
PMMAnTCTL2: <CSIHn_base> + $200C_H$
PMMAnTCTL3: <CSIHn_base> + 2010_H
PMMAnTCTL4: <CSIHn_base> + 2014_H
PMMAnTCTL5: <CSIHn_base> + 2018_H
PMMAnTCTL6: <CSIHn_base> + $201C_H$
PMMAnTCTL7: <CSIHn_base> + 2020_H

Value after reset: $0000\ 0000_H$ This register is initialized by reset operation.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 16.32 PMMAnTCTLx register contents (1/2)

Bit position	Bit name	Function
31	PMMAnSTx	Start trigger to enable the TG 0: No effect 1: Start trigger to enable the TG By setting the PMMAnSTx bit the PMMAnTTXm register will be cleared to avoid the use of old data. This bit is always read as 0
30	PMMAnSPx	Stop trigger to disable the TG 0: No effect 1: Stop trigger to disable the TG At the time of Enable and Pending mode, by setting this bit TGx will be set to Disabled mode immediately. Only if the TGx is currently in Active or Wait mode, the current Job will be finished before changing the mode. After disabling a TG it is not possible to resume it automatically. For details on each state, see **Section 16.7.1.2, TG status.** This bit is always read as 0 Writing to the PMMAnSPx bit is enabled in the mode other than the Disable mode When the PMMAnSPx bit is set to 1 in Disable mode, status flags are not updated and the operation remains in Disabled mode. This bit is disabled after the read data reception finish at the time of active wait.
29 to 24	Reserved	When read, the value after reset is read. When writing, write the value after reset.
23 to 16	PMMAnTGLGx [7:0]	Specify the number of data packages (32bit (data + control bits)) for TGx. If the frame length is 256, "00_H" should be set. Max. TG length: 256
15, 14	Reserved	When read, the value after reset is read. When writing, write the value after reset.
13 to 11	PMMAnPRIOx [2:0]	Specify the priority of the TG 000_B: Highest priority : 101_B: lowest priority Other than above: Setting prohibited

Table 16.32 PMMAnTCTLx register contents (2/2)

Bit position	Bit name	Function
10	PMMAnMD	Specifies the transfer mode 0: Transmit only mode (Tx) 1: Transmit and receive mode (Tx/Rx)
9, 8	PMMAnTOx [1:0]	Specify the trigger option 00_B: Trigger disable 01_B: Software trigger 10_B: Hardware trigger 11_B: Hardware and Software trigger When the PMMAnTOx[1:0] bits are set to 00, even if the bit for the software or hardware trigger is set to 1, it is ignored.
7	PMMAnSWTx	Software Trigger to set TGx to pending mode This bit is valid in Enable mode. When 1 is written to the PMMAnST bit and this bit simultaneously in Disable mode, this bit is also valid. This bit is always read as 0 Writing to the PMMAnSWTx bit is enabled when the TG is in Disable or Enable mode If the PMMAnSWTx bit is only set to 1, this setting is ignored and the operation remains in Disable mode.
6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5 to 0	PMMAnHWTx [5:0]	Select the hardware trigger source Setting 100011 or more number to PMMAnTCTL.PMMAnHWTm[5:0] is prohibited. Details about hardware trigger sources, see **Table 16.53**.

NOTES

1. Writing to other than the PMMAnSPx and PMMAnSWTx bits in the PMMAnTCTLx register is only allowed when the TG is in Disable mode.
2. When the PMMAnSTx and PMMAnSWTx bits are set to 1 simultaneously while the TG is in Disable mode, transition to the Pending mode is made.
3. If the PMMAnSTx and PMMAnSPx bits are input simultaneously, the PMMAnSPx bit is ignored because the PMMAnSPx bit has priority

16.3.19 PMMAnTTXm — PMM TG transmit buffer (x = 0 to 7)

This register is transmitting buffer.

Access: This register can be read/write in 32-bit units. (Writing in from CPU to this register is prohibited.)

Address:
PMMAnTTX0: <CSIHn_base> + 2024_H
PMMAnTTX1: <CSIHn_base> + 2028_H
PMMAnTTX2: <CSIHn_base> + $202C_H$
PMMAnTTX3: <CSIHn_base> + 2030_H
PMMAnTTX4: <CSIHn_base> + 2034_H
PMMAnTTX5: <CSIHn_base> + 2038_H
PMMAnTTX6: <CSIHn_base> + $203C_H$
PMMAnTTX7: <CSIHn_base> + 2040_H

Value after reset: $0000\ 0000_H$ This register is initialized by reset operation.

Table 16.33 PMMAnTTXm register contents

Bit position	Bit name	Function
31 to 0	PMMAnTTXm	Data buffer of TGx for the transmit path.

16.3.20 PMMAnRX — PMM TG receive buffer

This register is receiving buffer.

Access: This register can be read in 32-bit units.

Address: PMMAnRX: <CSIHn_base> + 2044_H

Value after reset: $0000\ 0000_H$ This register is initialized by reset operation.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 16.34 PMMAnRX register contents

Bit position	Bit name	Function
31 to 0	PMMAnRX	Data buffer for the receive path In transmit-only mode, data is not stored in the PMMAnRX register.

16.3.21 PMMAnTCNTx — PMM TGx counter (x = 0 to 7)

This register is counter which indicated the remaining data transfers to PMMA for TGx.

Access: This register can be read in 32-bit units.

Address: PMMAnTCNT0: <CSIHn_base> + 2048_H
PMMAnTCNT1: <CSIHn_base> + $204C_H$
PMMAnTCNT2: <CSIHn_base> + 2050_H
PMMAnTCNT3: <CSIHn_base> + 2054_H
PMMAnTCNT4: <CSIHn_base> + 2058_H
PMMAnTCNT5: <CSIHn_base> + $205C_H$
PMMAnTCNT6: <CSIHn_base> + 2060_H
PMMAnTCNT7: <CSIHn_base> + 2064_H

Value after reset: $0000\ 0000_H$ This register is initialized by reset operation.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 16.35 PMMAnTCNTx register contents

Bit position	Bit name	Function
31 to 8	Reserved	When read, the value after reset is read.
7 to 0	PMMAn TCNTx[7:0]	Counter which indicated the remaining data transfers to PMMA for TGx Will be loaded with value of PMMAnTGLGx[7:0] when PMMAnCTLx.PMMAnSTx bit is set. Every time data is forwarded to CSIHnTX0W register, this register value does -1.

16.3.22 PMMAnSTR0 — PMM TG status register 0

This register indicates the status of TG.

Access: This register can be read in 32-bit units.

Address: <CSIHn_base> + 2068_H

Value after reset: $0000\ 0000_H$ This register is initialized by reset operation.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 16.36 PMMAnSTR0 register contents

Bit position	Bit name	Function
31 to 24	PMMAnENx	Indicates the mode disabled enabled 0: TGx is disabled 1: TGx is enabled For detail, see **Section 16.7.1.2, TG status**.
23 to 16	Reserved	When read, the value after reset is read.
15 to 8	PMMAnAFx	Indicates if TGx is set to status active 0: TGx is not in status active. 1: TGx is set to status active. For detail, see **Section 16.7.1.2, TG status**.
7 to 0	PMMAnPFx	Indicates if TGm is set to status pending 0: TGx is not in pending status 1: TGx is set to status pending. For detail, see **Section 16.7.1.2, TG status**.

16.3.23 PMMAnSTR1 — PMM TG status register 1

This register indicates the transmit/receive status of TG.

Access: This register can be read in 32-bit units.

Address: <CSIHn_base> + $206C_H$

Value after reset: $0000\ 0000_H$ This register is initialized by reset operation.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 16.37 PMMAnSTR1 register contents

Bit position	Bit name	Function
15 to 8	PMMAnRFx	Indicates the status of the reception path of TGx 0: Not all data are received for TGx. 1: PMM receive handling has finished for TGx. **NOTES** 1. PMMAnRFx is set to 1 after the completion of TG reception. 2. When 1 is written to PMMAnTCTLx.PMMAnSPx while PMMAnTCNTx ≠ 0, PMMAnRFx remains set to 0 after the completion of last job data reception. 3. This bit does not indicate the status of the received data in RAM. If this bit is set it is only ensured that the last receive data was read by the DTS. 4. This bit is cleared when PMMAnSTC.PMMAnCLRFx is set to 1. In Disable mode, be sure to clear this bit by PMMAnSTC.PMMAnCLRFx.
7 to 0	PMMAnTFx	Indicates the status of the transmit path of TGx 0: Not all data are transferred for TGx. 1: PMM transmit handling has finished for TGx. **NOTES** 1. PMMAnTFx is set to 1 after the completion of TG transmission. 2. When 1 is written to PMMAnTCTLx.PMMAnSPx while PMMAnTCNTx ≠ 0, PMMAnTFx remains set to 0 after the completion of last job data transmission. 3. This bit does not indicate the status of the communication inside PMMA. If this bit is set it is only ensured that all pending data are transferred to PMMA. 4. This bit is cleared when PMMAnSTC.PMMAnCLTFx is set to 1. In Disable mode, be sure to clear this bit by PMMAnSTC.PMMAnCLTFx.

16.3.24 PMMAnSTC — PMM TG status clear register

This register clears the transmit/receive status of TG.

Access: This register can be write in 32-bit units.

Address: <CSIHn_base> + 2070_H

Value after reset: $0000\ 0000_H$ This register is initialized by reset operation.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMMAn CLRF7	PMMAn CLRF6	PMMAn CLRF5	PMMAn CLRF4	PMMAn CLRF3	PMMAn CLRF2	PMMAn CLRF1	PMMAn CLRF0	PMMAn CLTF7	PMMAn CLTF6	PMMAn CLTF5	PMMAn CLTF4	PMMAn CLTF3	PMMAn CLTF2	PMMAn CLTF1	PMMAn CLTF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 16.38 PMMAnSTC register contents

Bit position	Bit name	Function
31 to 16	Reserved	When writing, write the value after reset.
15 to 8	PMMAnCLRFx	Clear the reception path status flag of TGx 0: no function. 1: Reset reception path status flag (PMMAnRFx = 0).
7 to 0	PMMAnCLTFx	Clear the transmit path status flag of TGx 0: no function. 1: Reset transmit path status flag (PMMAnTFx = 0).

16.3.25 List of Caution

Table 16.39 Notes on Setting Registers (1/3)

Register	Bit	Content
CSIHnCTL0	CSIHnPWR	If this bit is cleared during communication, ongoing communication is aborted. A restart of the communication is then required. After cancelling the suspension, it is necessary to restart the communication. Just after setting the PWR bit to 1 from 0, it is necessary to read CSIHnCTL0 register.
CSIHnCTL0	CSIHnTXE CSIHnRXE	Do not modify any of these bits while CSIHnCTL0.CSIHnPWR = 0. (These bits can be modified at the same time with the CSIHnCTL0.CSIHnPWR bit.) Do not modify these bits while CSIHnSTR0.CSIHnTSF = 1, because ongoing communication is aborted and operation of this setting is not assured.
CSIHnCTL0	CSIHnJOBE	Do not modify this bit while CSIHnCTL0.CSIHnPWR = 0. This bit is only valid when CSIHnCTL1.CSIHnJE = 1. Setting this bit is prohibited in slave mode.
CSIHnCTL0	CSIHnMBS	This bit should be modified at the same time as the CSIHnCTL0.CSIHnPWR bit is set to 1. Modification of this bit is only allowed while CSIHnSTR0.CSIHnTSF=0. Do not modify of “FIFO mode <-> Direct Access mode” while CSIHnCTL0.CSIHnPWR=1.
CSIHnCTL1	CSIHnSLRS	When the communication speed is faster than 5Mbps (excluding 5Mbps), CSIHnSLRS bit should be set to 1.
CSIHnCTL1	CSIHnISCE	The CSIHnCFGx.CSIHnIDLx bit must be set to 0 if idle state control mode is enabled. This bit can only be written if CSIHnCTL0.CSIHnPWR = 0
CSIHnCTL1	CSIHnCKR	Modification of this bit is only allowed while CSIHnCTL0.CSIHnPWR = 0. This bit is only valid when the chip-select signal is not in use. Fix it to 0 when the chip-select signal is in use. Use this bit instead of CSIHnCFG0-7.CSIHnCKPn and CSIHnCFG0-7.CSIHnCKP must be set to “0”. This bit must be set correctly in slave mode.
CSIHnCTL1	CSIHnSLIT CSIHnCSL[7:0] CSIHnEDLE CSIHnDCS CSIHnCSRI CSIHnHSE	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0.
CSIHnCTL1	CSIHnSME CSIHnJE CSIHnLBM	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting of this bit is prohibited in slave mode.
CSIHnCTL1	CSIHnSSE	Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting of this bit is prohibited in master mode.
CSIHnCTL1	CSIHnSIT	Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. This bit is only valid in master mode. In slave mode, no delay is generated.
CSIHnCTL2	CSIHnPRS[2:0]	Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting of the max baud rate is as follows. • Master mode: CLKP_C/4 • Slave mode: CLKP_C/6
CSIHnSTR0	CSIHnSRP[7:0] CSIHnSPF[7:0] CSIHnFLF CSIHnEMF CSIHnTSF	Writing these bits is prohibited, and only reading is permitted.
CSIHnSTR0	CSIHnTMOE CSIHnOFE CSIHnDCE CSIHnPE CSIHnOVE	Writing is invalid when CSIHnCTL0.CSIHnPWR=1. Only read is effective. Writing is effective when CSIHnCTL0.CSIHnPWR=0.These bits are initialized when CSIHnCTL0.CSIHnPWR=0-> 1 or CSIHnCTL0.CSIHnPWR=1-> 0.
CSIHnSTCR0	CSIHnPCT	If this bit is set to1 during communication, ongoing communication is aborted.

Table 16.39 Notes on Setting Registers (2/3)

Register	Bit	Content
CSIHnMCTL0	CSIHnMMS[1:0]	Modification of these bits is only allowed while CSIHnCTL0.CSIHnPWR = 0 and CSIHnCTL0.CSIHnMBS = 0.
CSIHnMCTL0	CSIHnTO[4:0]	Modification of these bits is only allowed while CSIHnCTL0.CSIHnPWR = 0. Set these bits to 0 in master mode. Set these bits to 0 in direct access, dual buffer, and transmit-only buffer mode.
CSIHnMCTL1	CSIHnFES[6:0] CSIHnFFS[6:0]	Write to these bits during communication is permitted.
CSIHnMCTL2	CSIHnBTST CSIHnND[7:0] CSIHnSOP[6:0]	Writing these bits is prohibited when CSIHnCTL0.CSIHnPWR = 0. Writing these bits is prohibited when CSIHnCTL0.CSIHnTXE = CSIHnCTL0.CSIHnRXE = 0. Writing these bits is prohibited when CSIHnSTR0.CSIHnTSF = 1. Writing these bits is prohibited in direct access or FIFO mode.
CSIHnMRWP0	CSIHnRRA[6:0]	Write to these bits during communication is permitted. Writing these bits is prohibited in direct access or FIFO mode. When writing is required, set “0000_H” to these bits in transmit only buffer mode.
CSIHnMRWP0	CSIHnTRWA [6:0]	Write to these bits during communication is permitted. Writing these bits is prohibited in direct access or FIFO mode.
CSIHnCFGx x = 0 to 7	CSIHnBRSSx [1:0] CSIHnRCBx CSIHnIDLx CSIHnIDx[2:0] CSIHnHDx[3:0] CSIHnINx[3:0] CSIHnSPx[3:0]	Modification of these bits is only allowed while CSIHnCTL0.CSIHnPWR = 0. These bits must be set to 0 in slave mode.
CSIHnCFGx x = 0 to 7	CSIHnPSx[1:0] CSIHnDLSx[3:0] CSIHnDIRx CSIHnDAPx	Modification of these bits is only allowed while CSIHnCTL0.CSIHnPWR = 0. In slave mode, the CSIHnCFG0 setting is used for the configuration. Therefore, all the bits in CSIHnCFG1 to CSIHnCFG7 must be set to 0.
CSIHnCFGx x = 0 to 7	CSIHnCKPx	Modification of this bit is only allowed while CSIHnCTL0.CSIHnPWR = 0. As CSIHnCTL1.CSIHnCKR must be used, set this bit to 0 in slave mode. If CS is not used, use CSIHnCTL1.CSIHnCKR bit instead of this bit, and clear this bit to 0.
CSIHnTX0W	CSIHnEOJ CSIHnCIRE	This bit is only valid when CSIHnCTL1.CSIHnJE = 1. While CSIHnCTL1.CSIHnJE = 0, the value of this bit is ignored even if 1 is read. Set these bits to 0 in slave mode.
CSIHnTX0W	CSIHnEDL	This bit is only valid when CSIHnCTL1.CSIHnEDLE = 1. While CSIHnCTL1.CSIHnEDLE = 0, the value of this bit is ignored even if 1 is read.
CSIHnTX0W	CSIHnSFNx	This bit is available in only CSIHnCTL1.CSIHnSME=1. The IDLE period is set more than a period of CSIHnCFGx.CSIHnIDLx.
CSIHnTX0W	CSIHnISC	This bit is available in only CSIHnCTL1.CSIHnISCME=1. Inactive period of CSIHTCSSn can set flexibly. If using the idle state control function (CSIHnCTL1.CSIHnISCME), CSIHnCFGx.CSIHnIDLx must be 0.
CSIHnTX0W	CSIHnCSx	In master mode, setting these bits to “FF_H” is prohibited. In slave mode, setting these bits to “FE_H” is needed.
CSIHnTX0W CSIHnTX0H		Reading to these bits during communication is prohibited in FIFO mode. While CSIHnCTL0.CSIHnPWR = 0, read/write access these bits is prohibited in FIFO mode. While CSIHnCTL0.CSIHnTXE = CSIHnCTL0.CSIHnRXE = 0, writing to these bits are prohibited in direct access mode.

Table 16.39 Notes on Setting Registers (3/3)

Register	Bit	Content
CSIHnRX0W CSIHnRX0H		Read access is permitted while CSIHnCTL0.CSIHnPWR=1. While CSIHnCTL0.CSIHnPWR = 0, read access to these bits is prohibited in FIFO mode. These bits are initialized when CSIHnCTL0.CSIHnPWR = 0 ->1 or CSIHnCTL0.CSIHnPWR = 1-> 0.
CSIHnBRSy y = 0 to 3		Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting of the max baud rate is as follows with the CSIHnCTL2.CSIHnPRS[2:0] setting. • Master mode: CLKP_C/4 (Up to 20 MHz bit/s) • Slave mode: CLKP_C/6 (Up to 20 MHz bit/s)

16.4 Interrupt Sources

CSIH can generate the following interrupt requests:

- CSIHTIC (communication interrupt)
- CSIHTIR (communication interrupt)
- CSIHTIRE (error interrupt)
- CSIHTIJC (job completion interrupt)

16.4.1 Overview

The error interrupt CSIHTIRE is generated when an error is detected. The generation of the other interrupts depends on the memory mode, the job mode, and – in case of the job completion interrupt CSIHTIJC –also the operating mode.

The job completion interrupt CSIHTIJC is only generated when job mode is enabled (CSIHnCTL1.CSIHnJE = 1). It is not available in slave mode.

The following table gives an overview.

Table 16.40 Interrupt generation

		Cause of interrupt	
Memory mode	**Interrupt**	**Job mode disabled CSIHnCTL1.CSIHnJE = 0**	**Job mode enabled CSIHnCTL1.CSIHnJE = 1**
FIFO	INTCSIHnTIC	Tx data empty*1	Tx data empty*1
	INTCSIHnTIR	Rx data full*2*5	Rx data full*2*5
	INTCSIHnTIRE	Error detected	Error detected
	INTCSIHnTIJC*3	Not applicable	CSIHnTX0W.CSIHnCIRE = 1, or job abortion*4
Transmit-only buffer, dual buffer	INTCSIHnTIC	End of communication	CSIHnTX0W.CSIHnCIRE = 1 and (CSIHnCTL0.CSIHnJOBE = 0 or CSIHnTX0W.CSIHnEOJ = 0)
	INTCSIHnTIR	Data received*5	Data received*5
	INTCSIHnTIRE	Error detected	Error detected
	INTCSIHnTIJC*3	Not applicable	Job abortion*2
Direct access	INTCSIHnTIC	One data transferred	One data transferred, if not aborted by job abortion*4
	INTCSIHnTIR	Data received*5	Data received*5
	INTCSIHnTIRE	Error detected	Error detected
	INTCSIHnTIJC*3	Not applicable	Job abortion*4

Note 1. “Tx data empty” refers to the FIFO fill level, defined by CSIHnMCTL1.CSIHnFES[6:0].
Note 2. “Rx data full” refers to the FIFO fill level, defined by CSIHnMCTL1.CSIHnFFS[6:0].
Note 3. INTCSIHnTIJC is not available in slave mode.
Note 4. Job abortion condition: CSIHnTX0W.CSIHnEOJ = 1 *and* CSIHnCTL0.CSIHnJOBE = 1
Note 5. Only if data reception is enabled (CSIHnCTL0.CSIHnRXE = 1).

16.4.2 General interrupt delay

In master mode, all interrupts generated by the master can be delayed by one half period of the transmission clock, CSIHTSCK. This is not possible in slave mode.

The delay is specified by setting bit CSIHnCTL1.CSIHnSIT = 1.

The following example illustrates the interrupt delay function, assuming a setting of CSIHnCTL1.CSIHnSIT = 1 (interrupt delay enabled), CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0 (normal clock and data phase), and CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B (data length 8 bits).

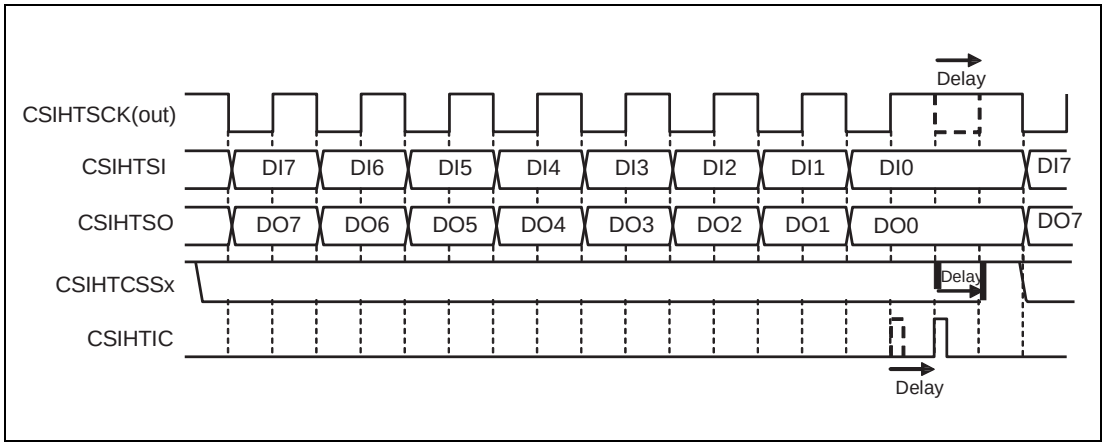

Figure 16.2 Interrupt delay function (CSIHnCTL1.CSIHnSIT = 1)

Setting CSIHnCTL1.CSIHnSIT = 1 adds half period delay to the transmission clock. This delays also the end of the present chip select signal (CSIHTCSSx).

16.4.3 CSIHTIC (communication interrupt)

Depending on the memory mode and the job mode, this interrupt is generated according to the conditions shown in the following table.

Table 16.41 CSIHTIC interrupt generation

	Cause of interrupt	
Memory mode	**Job mode disabled CSIHnCTL1.CSIHnJE = 0**	**Job mode enabled CSIHnCTL1.CSIHnJE = 1**
FIFO	This interrupt is generated when transmission data is about to be missing in the FIFO, indicating to the application that new data should be added. CSIHTIC is generated, if the number of data to be sent remaining in the FIFO (CSIHnSTR0.CSIHnSPF[7:0]) equals CSIHnMTCL1.CSIHnFES[6:0].CSIHnTX0W. CSIHnCIRE = 1 and job abortion*1 are sent, the CSIHTIJC interrupt is generated instead of CSIHTIC	In the same way as when JE = 0, this interrupt is generated when the number of transmission data CSIHnSTR0.CSIHnSPF[7:0] remaining in the FIFO equals the CSIHnMCTL1.CSIHnFES[6:0] value, but this interrupt is not generated when job is aborted.
Transmit-only buffer, dual buffer	Generated at the End of communication. (Specified by the CSIHnMTLC2.CSIHnND[7:0] bit)	Generated when data with CSIHnTX0W.CSIHnCIRE = 1 is sent. Note that if data with CSIHnTX0W.CSIHnCIRE = 1 and job abortion*1 are sent, the CSIHTIJC interrupt is generated instead of CSIHTIC.
Direct access	Generated after every data transfer.	Generated after every data transfer, except when the communication was aborted.

Note 1. Job abortion condition: CSIHnTX0W.CSIHnEOJ = 1 and CSIHnCTL0.CSIHnJOBE = 1.

16.4.3.1 CSIHTIC in direct access mode

The examples below show the CSIHTIC behavior in direct access mode.

The examples assume:

- Master mode
- Direct access mode
- No general interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock and data phase
  (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)
- Normal CSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)

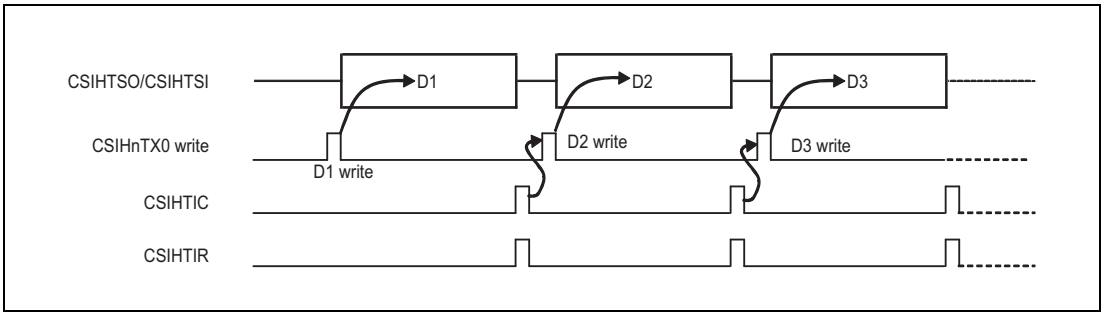

Figure 16.3 Generation of CSIHTIC after transfer (CSIHnCTL1.CSIHnSLIT = 0)

If job mode is enabled (CSIHnCTL1.CSIHnJE = 1) and a job ends because data is sent with CSIHnT0W.CSIHnEOJ = 1 and communication stop is requested (CSIHnCTL0.CSIHnJOBE = 1), then CSIHTIC is replaced by the job completion interrupt CSIHTIJC.

CSIHTIC can also be set up to occur as soon as the CSIHnTX0 register is free for the next data. This is specified by setting CSIHnCTL1.CSIHnSLIT = 1.

NOTE

This mode allows faster data transfer but is only available in direct access mode.

The effect is illustrated in the figure below.

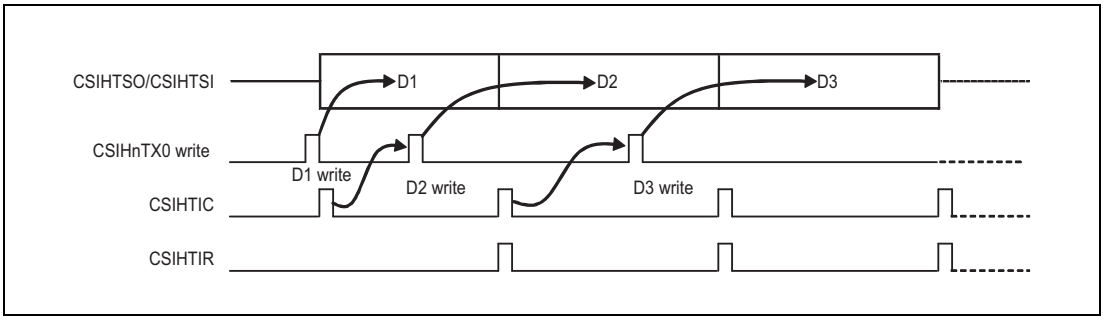

Figure 16.4 Immediate generation of CSIHTIC (CSIHnCTL1.CSIHnSLIT = 1)

Thus, the new data can be written in advance.

16.4.3.2 CSIHTIC in FIFO mode

The example below shows the CSIHTIC behavior in FIFO mode.

The example assumes:

- Master mode
- FIFO mode
- No general interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock and data phase
  (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)

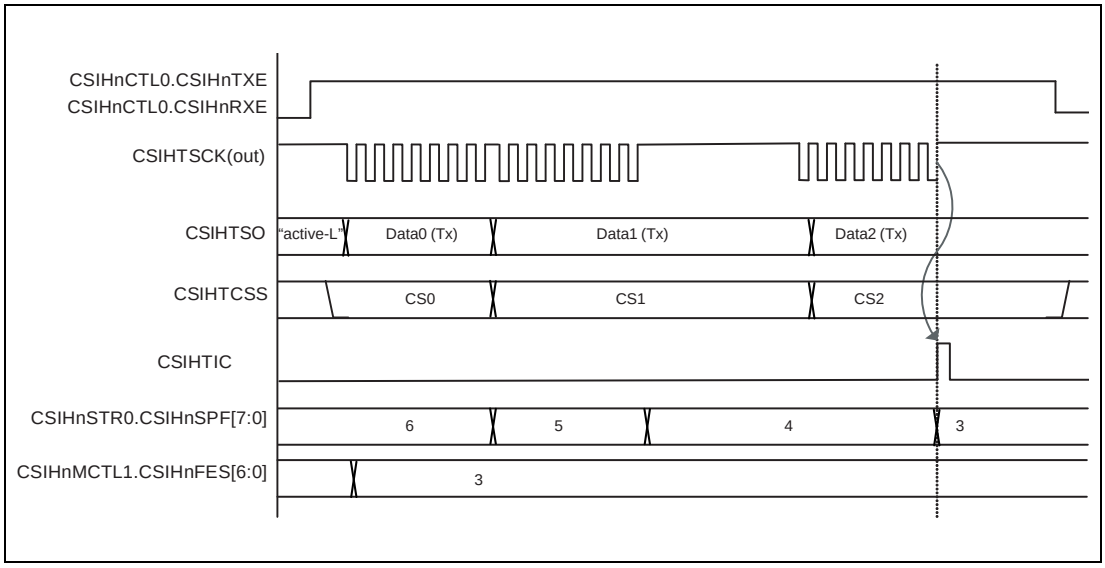

Figure 16.5 Generation of CSIHTIC in FIFO memory mode

The condition for “FIFO empty” is specified in CSIHnMCTL1.CSIHnFES[6:0]. In the example of the diagram above, the number of unsent data in FIFO is set to 3. CSIHnSTR0.CSIHnSPF[7:0] indicates the number of unsent data. When both match, the interrupt CSIHTIC occurs.

16.4.3.3 CSIHTIC in job mode

The example below shows the CSIHTIC behavior in job mode.

The example assumes:

- Master mode
- Job mode enabled (CSIHnCTL1.CSIHnJE = 1)
- No general interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock and data phase
  (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)
- Normal CSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)

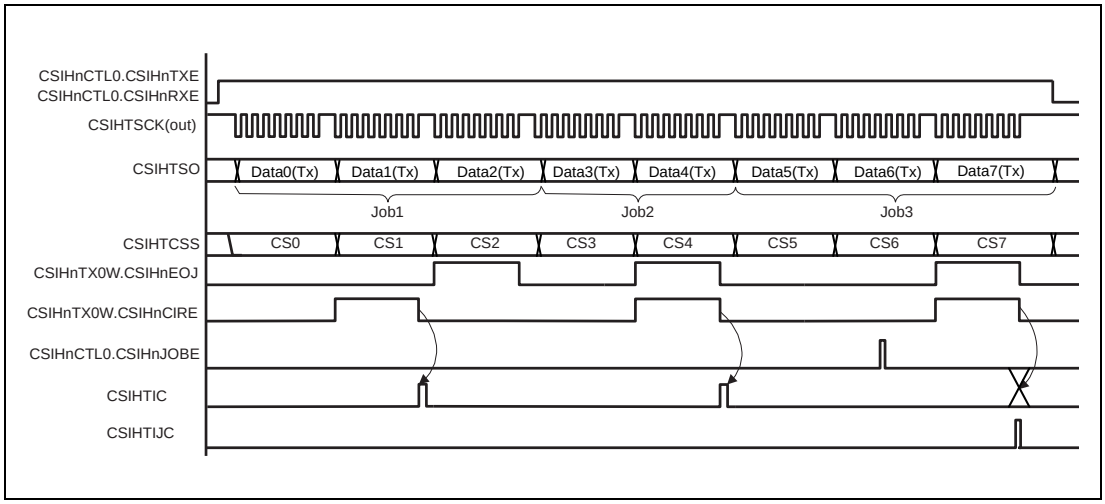

Figure 16.6 Generation of CSIHTIC in job mode

The rules for generating CSIHTIC in job mode are shown in the following table.

Table 16.42 Generation of CSIHTIC in job mode

CSIHnTX0W. CSIHnEOJ	CSIHnTX0W. CSIHnCIRE	CSIHTIC
0	0	Not generated
0	1	Generated
1	0	Not generated
1	1	CSIHnCTL0.CSIHnJOBE = 0: Generated
		CSIHnCTL0.CSIHnJOBE = 1: Not generated, replaced by interrupt CSIHTIJC

16.4.3.4 CSIHTIR (reception interrupt)

Depending on the memory mode and the job mode, this interrupt is generated according to the conditions below.

Table 16.43 CSIHTIR interrupt generation

	Cause of interrupt	
Memory mode	**Job mode disabled CSIHnCTL1.CSIHnJE = 0**	**Job mode enabled CSIHnCTL1.CSIHnJE = 1**
FIFO	This interrupt occurs when CSIHnCTL0.CSIHnRXE is 1 and the FIFO buffer is almost full with received data, notifying the application that the FIFO must be emptied.INTCSIHTIR is generated, if the number of received data in the FIFO(CSIHnSTR0.CSIHnSRP[7:0]) equals (128 - CSIHnMCTL1.CSIHnFFS[6:0]).	
Dual buffer	Generated when the communication has finished (as specified by the CSIHnMCTL2.ND[7:0] bit)	Generated after every data transfer.
Transmit-only buffer, Direct access	Generated after every data transfer.	

16.4.3.5 CSIHTIR in direct access mode

The example below shows the CSIHTIR behavior in direct access mode.

The example below assumes:

- Master mode
- Direct access mode
- No general interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock and data phase
  (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)

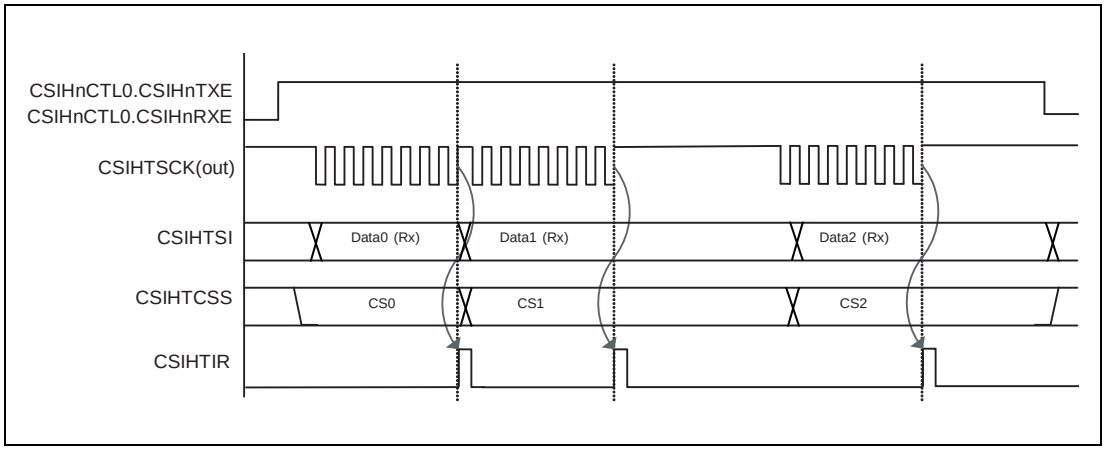

Figure 16.7 Generation of CSIHTIR in direct access memory mode

16.4.3.6 CSIHTIR in dual buffer mode

The example below shows the CSIHTIR behavior in dual buffer mode.

The example assumes:

- Master mode
- Dual buffer mode
- No general interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Default clock and data phase
  (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)

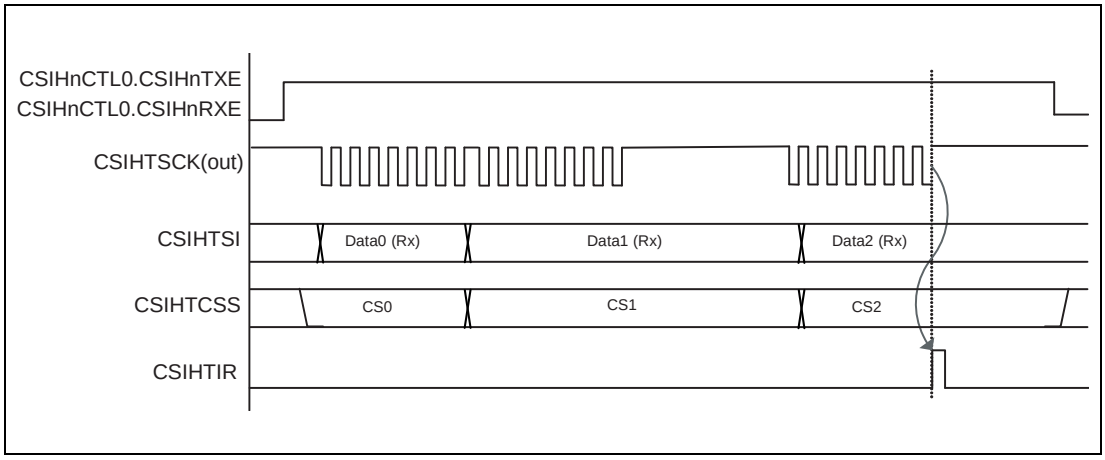

Figure 16.8 Generation of CSIHTIR in dual buffer mode

16.4.3.7 CSIHTIRE (reception error interrupt)

This interrupt is generated whenever an error is detected.

For details about generation interruption timing, see **Section 16.5.12, Error detection**.

Table 16.44 Data error types

Error type	Communication status after error interrupt	Comment
FIFO overflow error	Interrupt is generated and communication continues	The data written to the FIFO is lost, but communication continues even if the error occurs
Parity error	Interrupt is generated and communication continues	—
Data consistency error	Interrupt is generated and communication continues	—
Time-out error	Interrupt is generated and communication continues	—
Overrun error	Interrupt is generated and communication continues In slave mode interrupt is generated, but error can be avoided by hand-shake function.	This error is generated when the number of received data items is 0 and the CPU attempts to read reception data and data was received, but FIFO is full. (This is only valid in FIFO mode) In transmit-only buffer mode or direct access mode: Received data is left in the CSIHnRX0 register.

The type of error that caused the generation of CSIHTIRE is flagged in register CSIHnSTR0.

Additionally a parity error flag and a data consistency error flag are attached to the received data in CSIHnRX0W.

For details about the various error types, see **Section 16.5.12, Error detection**.

16.4.3.8 CSIHTIJC (job completion interrupt)

This interrupt supports the handling of jobs, see **Section 16.5.3.3, Job concept**. This interrupt is only available in master mode.

Job mode is enabled by setting CSIHnCTL1.CSIHnJE = 1. When CSIHnCTL1.CSIHnJE = 0, CSIHTIJC is not generated.

Depending on the memory mode, this interrupt is generated according to the condition shown in the following table.

Table 16.45 CSIHTIJC interrupt generation

Memory mode	Job mode disabled CSIHnCTL1.CSIHnJE = 0	Job mode enabled CSIHnCTL1.CSIHnJE = 1
FIFO	Not applicable	Indicates that the communication has stopped at the end of a job after a job abortion*1 was triggered
Transmit-only buffer		
Dual buffer		
Direct access		

Note 1. Job abortion condition: CSIHnTX0W.CSIHnEOJ = 1 and CSIHnCTL0.CSIHnJOBE = 1

16.5 Operation

16.5.1 Operating modes (master/slave)

16.5.1.1 Master mode

In master mode, the BRG frequency can be set by combining the CSIHnCTL2.CSIHnPRS[2:0] bit and the CSIHnBRSy.CSIHnBRSy[11:0] bit.

Master mode is enabled by setting CSIHnCTL2.CSIHnPRS[2:0] to anything but 111_B. In master mode, the BRG frequency can be set by combining the CSIHnCTL2.CSIHnPRS[2:0] bit and the CSIHnBRSy.CSIHnBRSy[11:0] bit.

(1) Chip select signals

In master mode, one or several chip select signals can be used. If several slaves are connected to the master, the chip select signals can be used to address one or several of the slaves. Only a selected slave is then enabled for communication.

The communication protocol as well as additional parameters is stored separately for each chip select signal. This makes it possible to adapt the data transfer individually to the requirements of each slave. For details see **Section 16.5.3, Chip selection (CS) features**.

(2) Clock defaults

The default level of CSIHTSCK depends on the clock phase selection bit: It is high when CSIHnCTL1.CSIHnCKR = 0, and is low when CSIHnCTL1.CSIHnCKR = 1.

The example below shows the communication in master mode for 8 data bits, CSIHnCTL1.CSIHnCKR = 0, CSIHnCFGx.CSHBAnDAPx = 0, and MSB first:

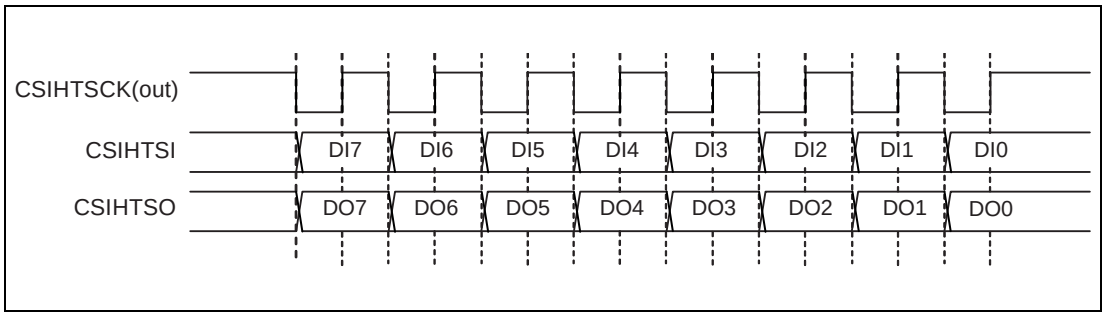

Figure 16.9 Transmit/receive in master mode

16.5.1.2 Slave mode

In slave mode, another device is the communication master and provides the transmission clock. Send/receive operation normally starts as soon as a clock signal is detected.

Slave mode is selected by setting the CSIHnCTL2.CSIHnPRS[2:0] bit to 111_B.

In slave mode, the transmission protocol setting of the CSIHnCFG0 register is enabled (setting of the CSIHnCFG1-CSIHnCFG7 register is disabled).

- CSIHnPS0[1:0]: parity usage
- CSIHnDLS0[3:0]: data length selection
- CSIHnDIR0: data direction
- CSIHnCKP0,CSIHnDAP0: clock and data phase

NOTE

When using slave mode, disable the baud rate generator (BRG) by clearing bit CSIHnBRSy.CSIHnBRSy[11:0].

But only when time-out error detection is used, set some value these bits as the master does. Because these bits are used as time-out clock.

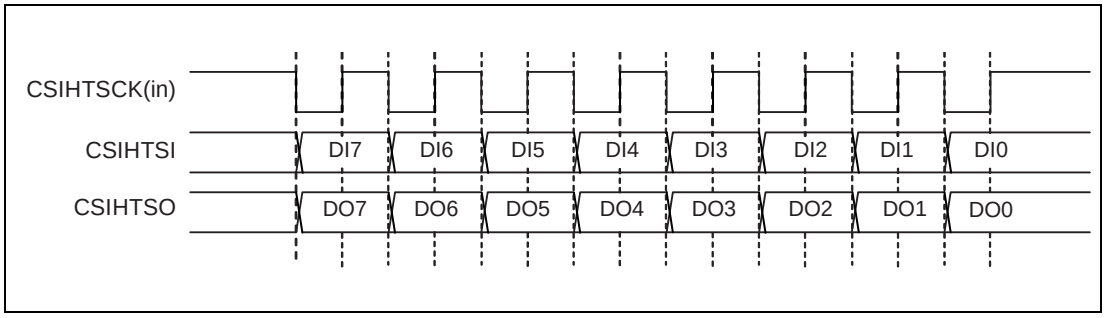

Figure 16.10 Transmit/receive in slave mode

16.5.2 Master/slave connections

16.5.2.1 One master and one slave

The following figure illustrates the connections between one master and one slave.

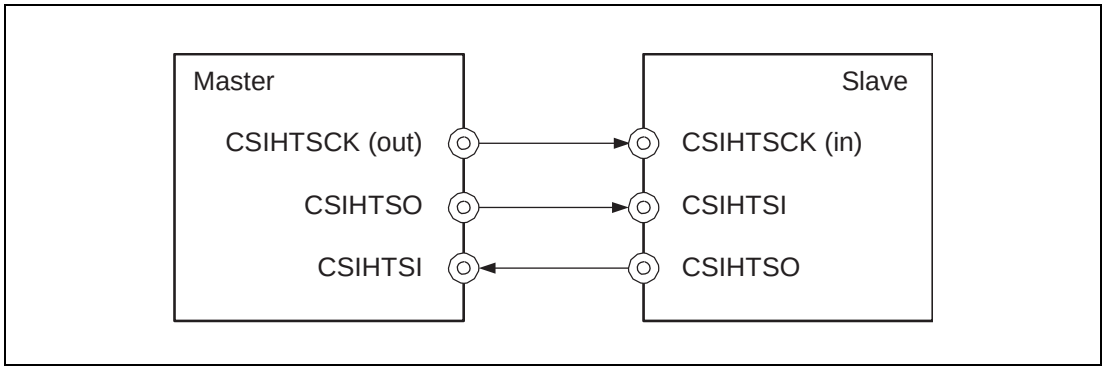

Figure 16.11 Direct master/slave connection

16.5.2.2 One master and multiple slaves

The following figure illustrates the connections between one master and multiple slaves. In this example, the master provides one chip select (CS) signal to each of the slaves. This signal is connected to the slave select input CSIHTSSIZ of the slave.
The recognition function of the CSIHTSSIZ signal can be enabled/disabled by bit CSIHnCTL1.CSIHnSSE.

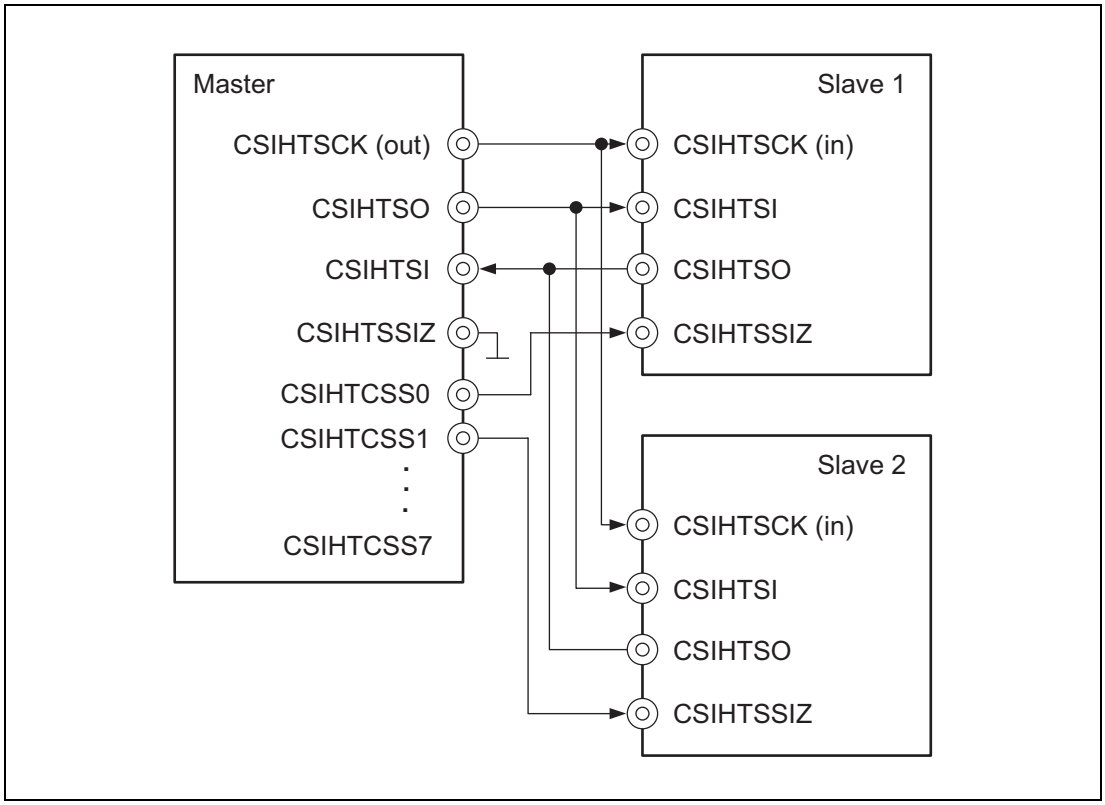

Figure 16.12 Master to multiple slaves connection

By default, the chip select level is active low. That means, a slave is selected (enabled) as a CSIH slave when its CSIHTSSIZ signal has low level. However, to adapt the CS to other devices, the output level of each chip select signal can also be programmed to be active high.

If a slave is not selected, it will neither receive nor transmit data. In addition, its output CSIHTSO of a slave that is not selected is set to input mode in order to avoid interference with the output of another slave that was selected.

CAUTION

I/O function of chip SCKO pin must be controlled by not only CSIHTSCO but also control signal of each product. Because reset (system reset) value of CSIHTSCO is active level. I/O function of chip SO pin must be controlled by not only CSIHTSCO but also control signal of each product. Because reset (system reset) value of CSIHTSCO is active level.

16.5.3 Chip selection (CS) features

The chip select signal, CSIHTCSSx can be used by the master to select one or several slaves for communication.

16.5.3.1 Configuration registers

The parameters for each chip select signal CSIHTCSSx are defined in the corresponding configuration register CSIHnCFGx. The parameters include the communication protocol and additional CS parameters.

The communication protocol specifies:

- Data length: The number of bits to be sent or received.
- Transfer direction: MSB or LSB first.
- Parity usage: Odd, even, 0 parity or none.
- Clock phase and data phase.

Additional parameters for each chip select signal that is only available in master mode are:

- One out of four baud rates can be selected for each chip select.
- Chip select priority: Separates between “dominant” and “recessive” chip select signals. The priority applies if two or more chip selects signals with different configurations are simultaneously activated for message broadcasting. In this case, the configuration that is set as dominant is used.

The principle is also called “Recessive Configuration for Broadcasting” (RCB).

CAUTION

It is forbidden to specify several chip select signals as dominant with different configurations unless all dominant chip selects have the same configuration.

- Chip select timing:
  - Setup time T_{setup}: The time from setting the CS signal active to starting data output.
  - Inter-data time T_{inter}: The time between data packets while the same CS signal is active.
  - Hold time T_{hold}: Hold time of CS active level before changing the CS.
  - Idle time T_{idle}: Inactive time after terminating a CS signal or after every data transfer to the same CSx.

The CS timings of the setup time, the inter-data time, the hold time, and the idle time are illustrated in the figure below. If the CSIHnTX0W.CSIHnCSx setting of two consecutive transfers is different, an idle state is inserted between two transfers.

Figure 16.13 provides an example when the default CS1 and CS2 signals are active low (CSIHnCTL1.CSIHnCSL1 bit = 0, CSIHnCTL1.CSIHnCSL2 bit = 0). The active level can be specified individually for each CS.

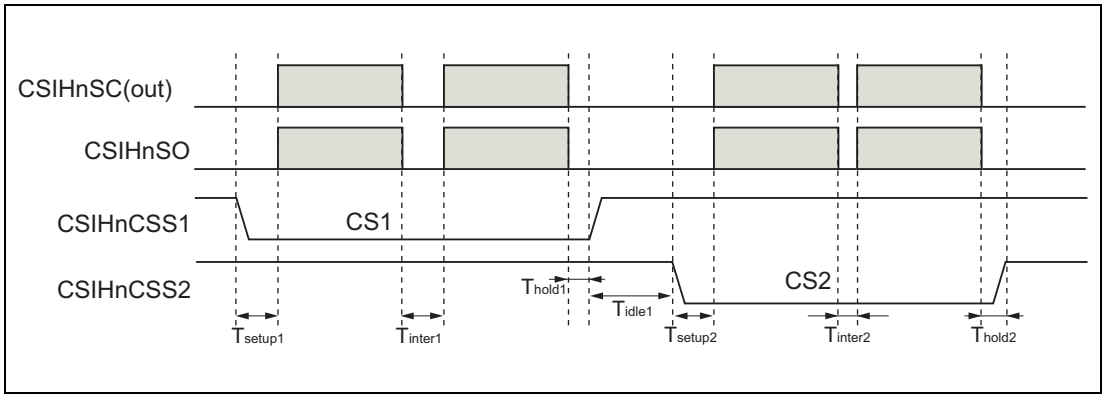

Figure 16.13 Chip select timings

16.5.3.2 CS example

The following figure shows an example of two consecutive data transmissions.

The first communication uses CS0 to communicate with one single slave. The second enables CS0 and CS1 to broadcast a message to two slaves. The priority of CS0 is set to “recessive: low priority”, the priority of CS1 to “dominant: high priority”.

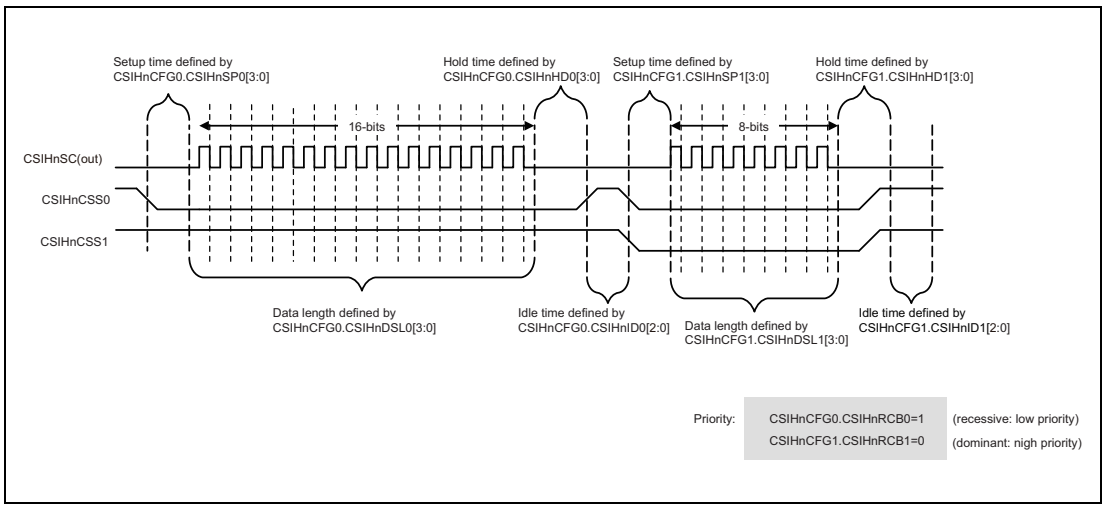

Figure 16.14 Chip select and RCB example

Note that each CS signal can have a different value for setup, inter-data time, hold time, and idle time.

A particular chip select signal is activated by writing ‘0’ to the appropriate bit in the transmission register CSIHnTX0W.CSIHnCSx.

CSIHnRX0W.CSIHnCSx in the reception register indicates the chip select signal associated with the received data.

During broadcasting, chip selects which are simultaneously active with the same RCB value must have the same configuration.

16.5.3.3 Job concept

In terms of CSIH, a job consists of a number of data pockets that are transferred.

Job mode enable

The job mode can only be enabled in master mode. The job mode is enabled and disabled by CSIHnCTL1.CSIHnJE.

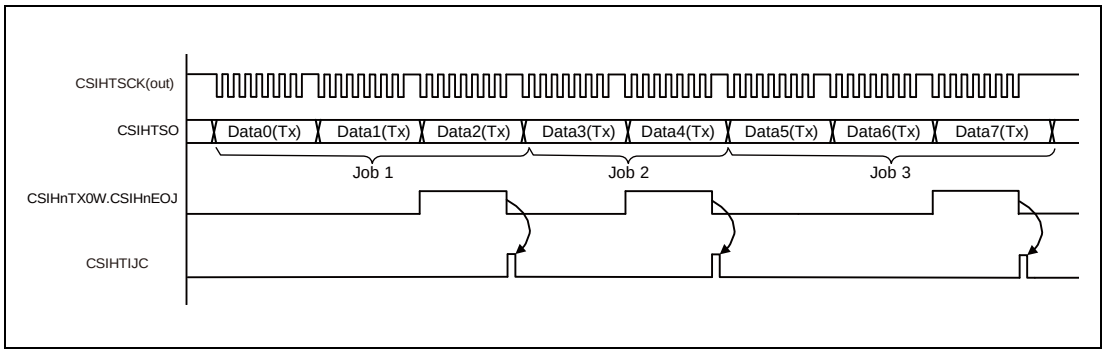

Figure 16.15 Job examples

A job ends when a data packet with the end-of-job bit set, i.e. by transmitting a data packet with CSIHnTX0W.CSIHnEOJ = 1.

A communication stop can be specified to occur after a job has finished. This is done by setting CSIHnCTL0.CSIHnJOBE. When CSIHnJOBE is set, the communication continues until data is sent, for which the CSIHnEOJ bit was set. After this data is sent, the communication is stopped and the - interrupt CSIHTIJC is generated.

16.5.4 Chip select timing details

16.5.4.1 Changing the clock phase

The serial clock level specified by CSIHnCFGx.CSIHnCKPx may be changed when communication is disabled. The minimum value of an idle time is one period of transmission clock (CSIHTSCO).

If the idle time is set to 0.5 transmission clock periods (in CSIHnCFGx.CSIHnIDx[2:0]) and two consecutive data packets are sent with different CSIHnCFGx.CSIHnCKPx configuration, the idle time is automatically extended to one period of CSIHTSCO.

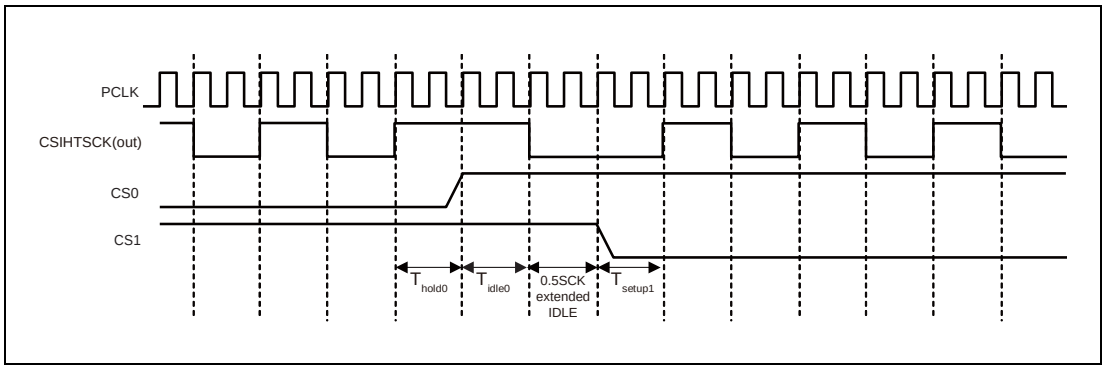

Figure 16.16 Clock phase timing
CLKP_C/4, $T_{hold}0 = T_{setup1}$ = 0.5SCK, T_{idle0} = 0.5SCK, CKP0 = 0 (CS0) -> CKP1 = 1 (CS1)

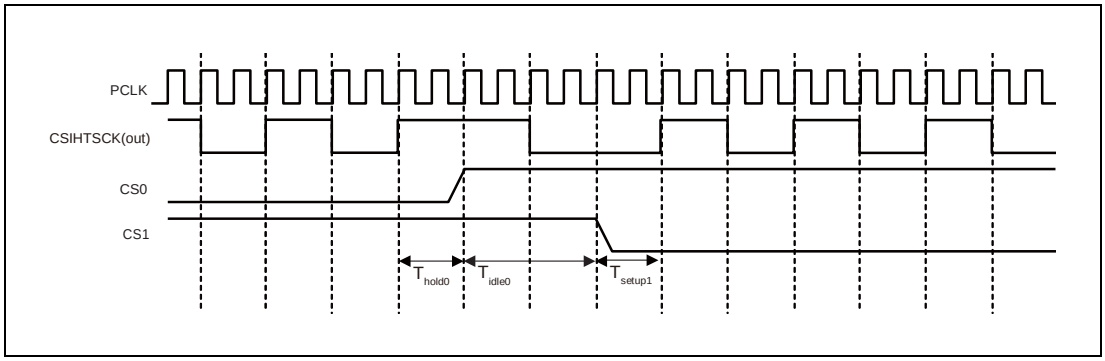

Figure 16.17 Clock phase timing
CLKP_C/4, $T_{hold}0 = T_{setup1}$ = 0.5SCK, T_{idle0} = 1SCK, CKP0 = 0 (CS0) -> CKP1 = 1 (CS1)

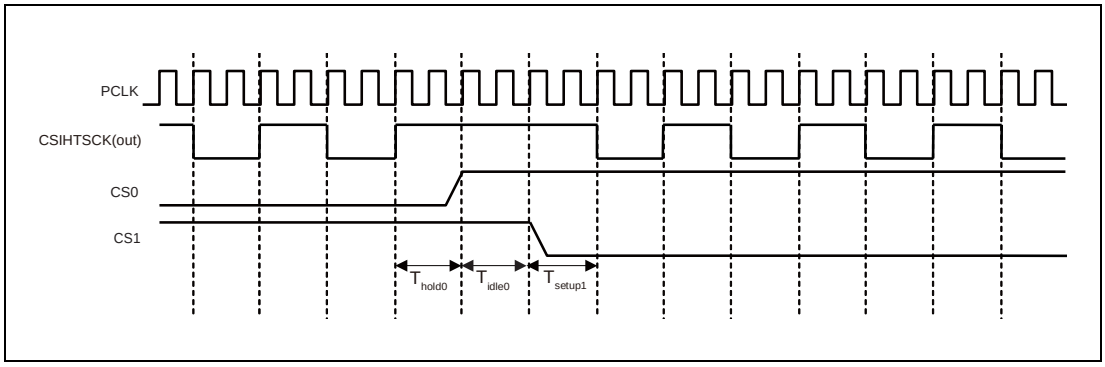

Figure 16.18 Clock phase timing
CLKP_C/4, $T_{hold}0 = T_{setup1} = 0.5SCK$, $T_{idle0} = 0.5SCK$, CKP0 = 0 (CS0) -> CKP2 = 0 (CS2)

16.5.4.2 Changing the data phase

The CSIHnCFGx.CSIHnDAPx bit defines the phase of the data bits relative to the clock.

SCK level changes whether the value of CSIHnCKPx bit for the next frame.

There is a difference of 0.5SCK until the edge of the serial clock is output by setting of CSIHnCFGx.CSIHnDAPx

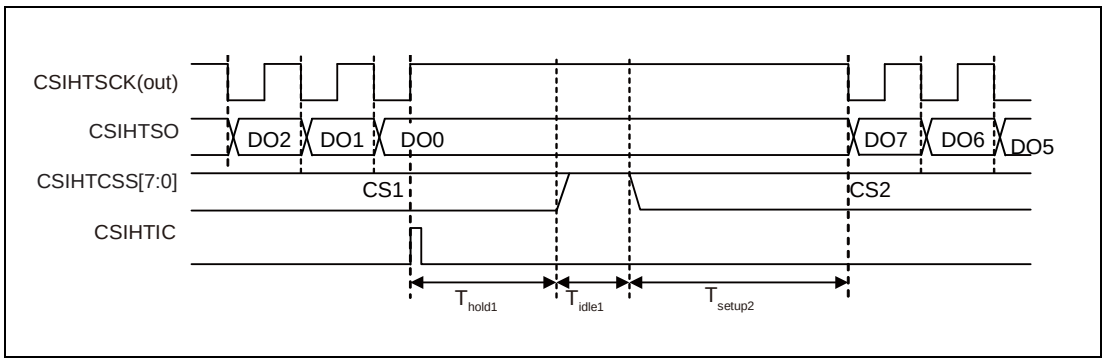

Figure 16.19 Data phase timing with CSIHnCFG1.CSIHnCKP1 = 0, CSIHnCFG1.CSIHnDAP1 = 0 and CSIHnCFG2.CSIHnCKP2 = 0, CSIHnCFG2.CSIHnDAP2 = 0

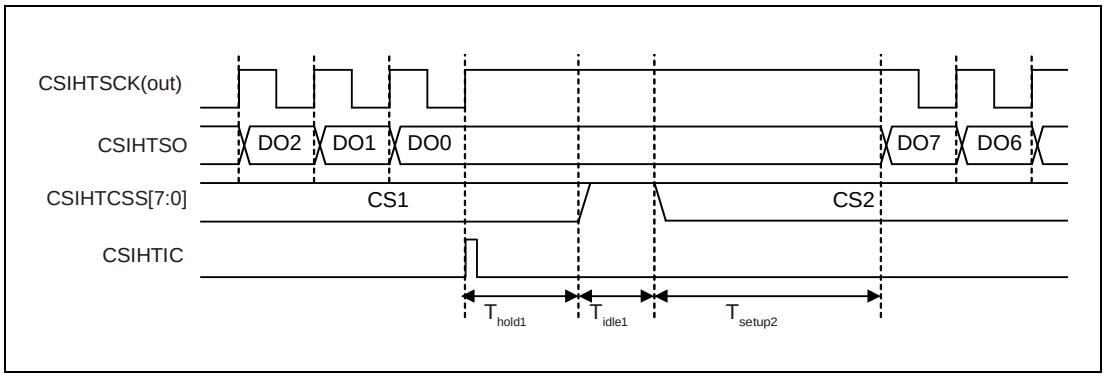

Figure 16.20 Data phase timing with CSIHnCFG1.CSIHnCKP1 = 0, CSIHnCFG1.CSIHnDAP1 = 1 and CSIHnCFG2.CSIHnCKP2 = 0, CSIHnCFG2.CSIHnDAP2 = 1

If the CSIHnCFGx.CSIHnDAPx bit changes between two consecutive chip select signals, the data phase of CSIHnSO changes during the idle period after the last bit of the first data is transferred:

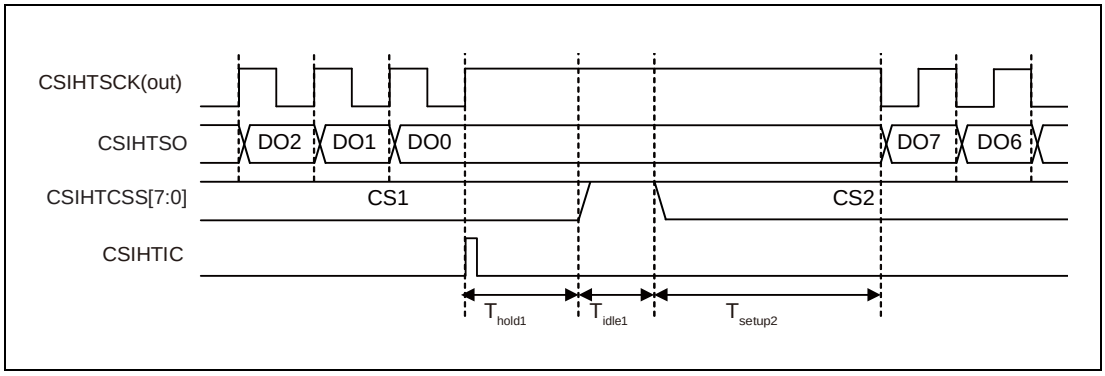

Figure 16.21 Data phase timing with CSIHnCFG1.CSIHnCKP1 = 0, CSIHnCFG1.CSIHnDAP1 = 1 and CSIHnCFG2.CSIHnCKP2 = 0, CSIHnCFG2.CSIHnDAP2 = 0

Note that the minimum idle time of one CSIHnSC period is automatically inserted, if CSIHnCFGx.CSIHnIDx[2:0] = 0 (T_{idle1} = 0.5 transmission clock periods).

16.5.5 Transmission clock selection

In master mode, the transmission baudrate is selectable using the following bits:

- CSIHnCTL2.CSIHnPRS[2:0]
- CSIHnBRSy.CSIHnBRSy[11:0] (y = 0 to 3)
- CSIHnCFGx.CSIHnBRSSx[1:0] (x = 0 to 7)

While the settings in the CSIHnCTL2 register determine the transmission clock CSIHTCLK, a chip select dedicated prescaler, controlled by CSIHnCFGx.CSIHnPSCLx[1:0], allows to generate different baudrates for different chip selects.

The following figure shows a block diagram of the baudrate generator.

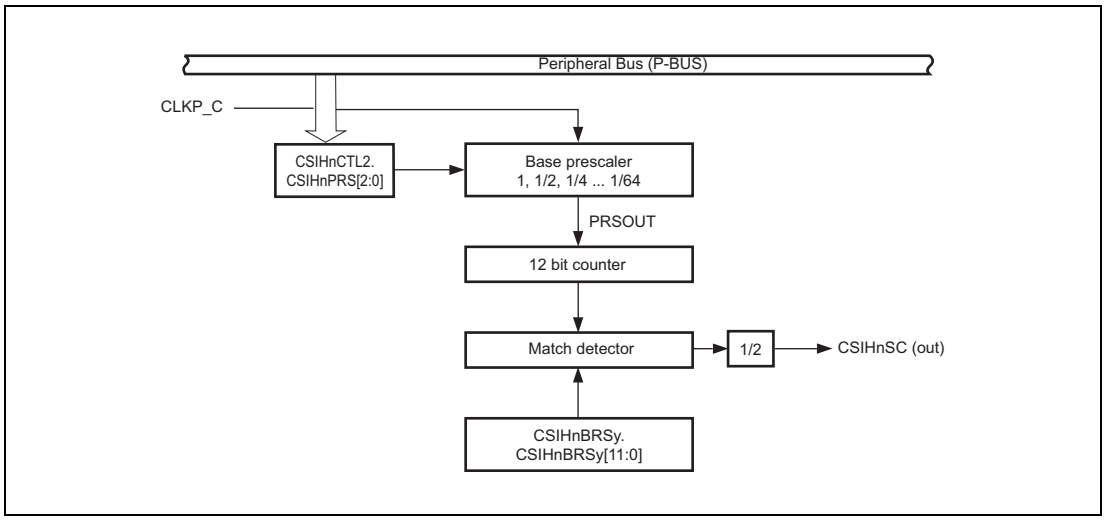

Figure 16.22 Baud rate generator block diagram

Clearing CSIHnBRSy.CSIHnBRSy[11:0] disables the baudrate generator, and thus all CSIHTSCK are stopped.

Baud rate calculation

The baudrate is calculated as:

$$CSIHTSCK = CLKP\_C / (2^{\alpha} \times k \times 2)$$

where

α = CSIHnCTL2.CSIHnPRS[2:0] = 0 to 6

k = CSIHnBRS0.CSIHnBRS0[11:0] = 1 to 4095
(when CSIHnBRSSx[1:0] = 0)

k = CSIHnBRS1.CSIHnBRS1[11:0] = 1 to 4095
(when CSIHnBRSSx[1:0] = 1)

k = CSIHnBRS2.CSIHnBRS2[11:0] = 1 to 4095
(when CSIHnBRSSx[1:0] = 2)

k = CSIHnBRS3.CSIHnBRS3[11:0] = 1 to 4095
(when CSIHnBRSSx[1:0] = 3)

Baud rate limits

When setting the baud rate, please note:

- Maximum acceptable baud rate in master mode is CLKP_C/4.
- Maximum acceptable baud rate in slave mode is CLKP_C/6 (must be ensured by the external master).
- Minimum baud rate in both modes is CLKP_C/524160.

CLKP_C for CSIH is 160 MHz and the maximum baud rate is as follows:

- 20.0 Mbps in master mode
- 20.0 Mbps in slave mode

The minimum baud rate is 305.25 bps (CLKP_C/524160).

16.5.6 CSIH buffer memory

The CSIH has a configurable RAM that can be used for buffered I/O. The size is 128 words. One word is comprised of 32 bits data plus 7 bits ECC.

The following configurations are available:

Mode	CSIHnCTL0. CSIHnMBS	CSIHnMCTL0. CSIHnMMS[1:0]
FIFO mode	0	00_B
Dual buffer mode		01_B
Transmit-only buffer mode		10_B
Direct access mode	1	X

16.5.6.1 FIFO mode

In FIFO mode, data can be written to the CSIHnTX0W register without waiting for completion of the transmission, and data can be received without reading the CSIHnRX0W register immediately, provided the FIFO is not full.

Data to be transmitted is stored to the FIFO memory. Transmission and reception occur simultaneously – one data is sent, one data is received. That means, received data overwrites the transmitted data in the FIFO.

The CSIH automatically updates the respective FIFO memory pointers when a data packet is committed, sent or received:

Table 16.46 FIFO mode

Pointer description	Control bit[*1]	Range
Number of unsent words	CCSIHnSTR0.CSIHnSPF[7:0]	0 to 128
Number of words received and stored in the FIFO	CSIHnSTR0.CSIHnSRP[7:0]	0 to 128
Address of data to be sent	CSIHnMRWP0.CSIHnTRWA[6:0]	0000_H to $01FC_H$
Address of received data	CSIHnMRWP0.CSIHnRRA[6:0]	0000_H to $01FC_H$
Address of currently transferred/ received data	CSIHnMCTL2.CSIHnSOP[6:0]	0000_H to $01FC_H$

Note 1. Pointers are automatically incremented after each read/write.

The CSIH status register contains also two FIFO status flags:

- CSIHnSTR0.CSIHnFLF: FIFO full
- CSIHnSTR0.CSIHnEMF: FIFO empty

When this mode is started, bit CSIHnSTCR0.CSIHnPCT must be set. This resets all FIFO pointers and flags.

16.5.6.2 Dual buffer mode

In this mode, the memory is divided into two parts of equal size – this means 64 words for transmit data and 64 words for received data. In dual buffer mode, the respective buffer pointers indicate the values shown in the following table.

Table 16.47 Dual buffer mode

Pointer description	Pointer*1	Range
Destination address for data written to or read from CSIHnTX0W/H	CSIHnMRWP0.CSIHnTRWA[6:0]	0 to 63
Address of data read from CSIHnRX0W/H	CSIHnMRWP0.CSIHnRRA[6:0]	0 to 63

Note 1. Pointers are automatically incremented after each read/write.

16.5.6.3 Transmit-only buffer mode

In this mode, the entire memory is used to save transmission data.

Received data must be read directly from CSIHnRX0W/H.

In transmit-only buffer mode, the respective buffer pointer indicates the values shown in the following table.

Table 16.48 Transmit-only buffer mode

Pointer description	Pointer*1	Range
Destination address for data written to or read from CSIHnTX0W/H	CSIHnMRWP0.CSIHnTRWA[6:0]	0 to 127

Note 1. Pointers are automatically incremented after each read/write.

16.5.6.4 Direct access mode

In direct access mode, the CSIH memory is completely bypassed:

- Transmission data provided by the CPU to the transmission register CSIHnTX0W or CSIHnTX0H is directly copied to the shift register.
- Reception data is directly copied from the shift register to the reception register CSIHnRX0W or CSIHnRX0H.

16.5.7 Data transfer modes

16.5.7.1 Transmit-only mode

Setting CSIHnCTL0.CSIHnTXE = 1 and CSIHnCTL0.CSIHnRXE = 0 puts the CSIH in transmit-only mode. Start of transmission depends on the memory mode:

- In case of FIFO or direct access mode, transmission starts when transmit data is written to the CSIHnTX0W or CSIHnTX0H register.
- In case of dual buffer or transmit-only buffer mode, transmission starts when bit CSIHnMCTL2.CSIHnBTST is set.

16.5.7.2 Receive-only mode

Setting CSIHnCTL0.CSIHnTXE = 0 and CSIHnCTL0.CSIHnRXE = 1 puts the CSIH in receive-only mode.

In master mode, start of reception depends on the memory mode:

- In case of FIFO or direct access mode, reception starts when dummy data is written in the CSIHnTX0W or CSIHnTX0H register.
- In case of dual buffer mode or transmit-only buffer mode, reception starts when bit CSIHnMCTL2.CSIHnBTST is set.

In slave mode, reception starts as soon as the CSIHTSCK transmission clock from the master is received. It is not necessary to write data to the CSIHnTX0W or CSIHnTX0H register of the slave.

16.5.7.3 Transmit/receive mode

Setting CSIHnCTL0.CSIHnTXE = 1 and CSIHnCTL0.CSIHnRXE = 1 puts the CSIH in transmit/receive mode.

Start of communication (transmission and reception) depends on the memory mode:

- In case of FIFO or direct access mode, communication starts when transmit data is written to the CSIHnTX0W or CSIHnTX0H register.
- In case of dual buffer or transmit-only buffer mode, communication starts when bit CSIHnMCTL2.CSIHnBTST is set.

16.5.7.4 Summary

The following table summarizes this section. It shows how data transfer is started in the various memory, operating, and transfer modes.

Table 16.49 Start of data transfer

Memory and operating mode		Transfer mode	
		Transmit-only Transmit / receive	Receive-only
FIFO, direct access	Master	Writing to the CSIHnTX0W register or the CSIHnTX0H register	Writing to the CSIHnTX0W register on the CSIHnTX0H register
	Slave		Incoming clock from the master
Transmit-only buffer, dual buffer	Master	CSIHnMCTL2.CSIHnBTST = 1	CSIHnMCTL2.CSIHnBTST = 1
	Slave		Incoming clock from the master

16.5.8 Data length selection

16.5.8.1 Data length between 2 and 16 bits

The length of a data packet is selectable for each chip select signal from 2 to 16 bits using CSIHnCFGx.CSIHnDLSx[3:0]. The examples below show the communication with MSB first (CSIHnCFGx.CSIHnDIRx = 0).

Data length = 16 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 0000_B)

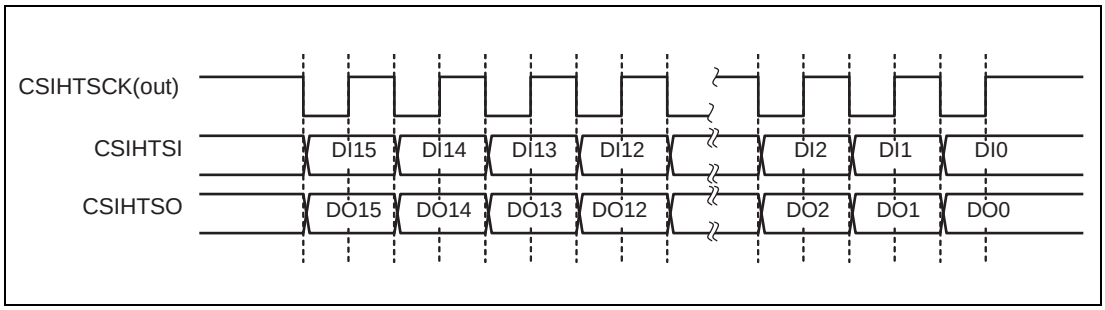

Figure 16.23 16 bit data length, MSB first

Data length = 14 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1110_B):

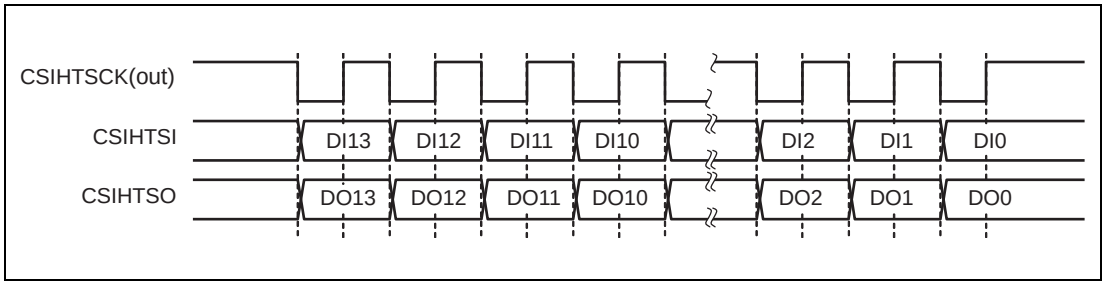

Figure 16.24 14 bit data length, MSB first

CAUTION

When the data length is set to 2, the handshake function might be restricted. For details, see Section 16.5.11, Handshake function.

16.5.8.2 Data length greater than 16 bits

If the length of the data to be sent/received exceeds 16 bits, the extended data length (EDL) feature can be used.

EDL is enabled by setting bit CSIHnCTL1.CSIHnEDLE to 1.

EDL works as follows:

- The data has to be broken into 16-bit blocks plus remainder. For example, a string of 42 bits would be broken into two 16-bit blocks plus 10 bits.
- The remainder defines the “data length” that has to be specified in CSIHnCFGx.CSIHnDLSx[3:0].
- For transmitting the 16-bit blocks, CSIHnTX0W.CSIHnEDL must be set to 1. In this case, the data written to CSIHnTX0W is sent as a 16-bit data length regardless of the CSIHnCFG0.CSIHnDLS[3:0] bit setting.
- The transfer is complete after a block with the specified data length (the remainder of data specified with CSIHnTX0W.CSIHnEDL = 0) has been sent.

Example

Example for sending 40-bit data ($123456789A_H$) to CS0:

40 bits are split 2 × 16 bits plus 8 bits.

- Initialize CSIHnCFG0.CSIHnDLS0[3:0] = 8.
- To send $123456789A_H$ with MSB first, write the following sequence to CSIHnTX0W:
  - $20FE\ 1234_H$ (CSIHnTX0W.CSIHnEDL = 1)
  - $20FE\ 5678_H$ (CSIHnTX0W.CSIHnEDL = 1)
  - $00FE\ 009A_H$ (CSIHnTX0W.CSIHnEDL = 0)

The following figure illustrates the timing.

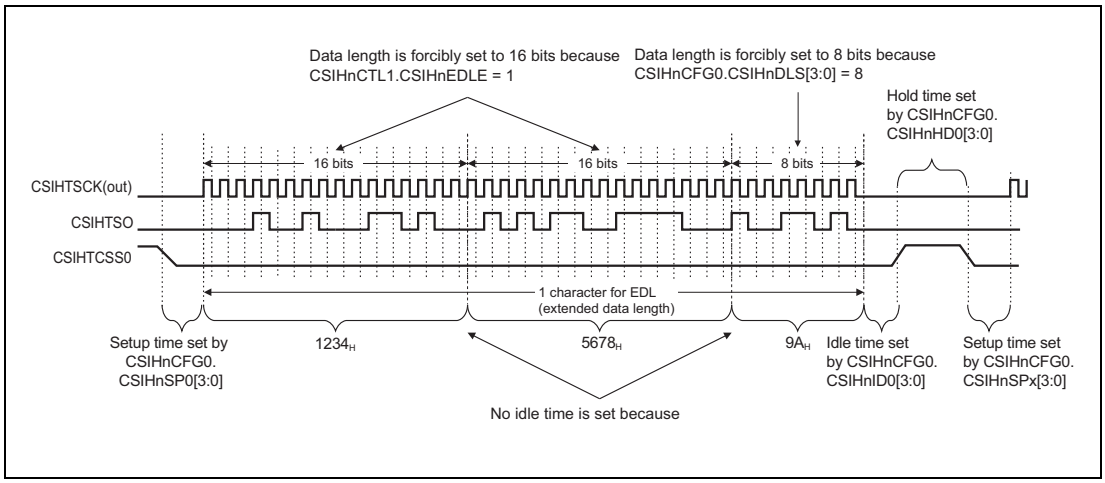

Figure 16.25 EDL timing diagram

NOTES

1. Data lengths setting of 1 bit is only permitted in combination with EDL mode.
2. It is not possible to transmit two consecutive data with a data length of 1 bit.
3. If parity is enabled, the parity bit is added after the last bit.
4. To consider the data direction, pay attention to the following example:
   - Data to be sent: 123456_H
   - MSB first:
     Set CSIHnCFGx.CSIHnDIR = 0
     Write CSIHnTX0W = 2000 1234_H (EDL bit = 1)
     Write CSIHnTX0W = 0000 0056_H (EDL bit = 0)
   - LSB first:
     Set CSIHnCFGx.CSIHnDIR = 1
     Write CSIHnTX0W = 2000 3456_H (EDL bit = 1)
     Write CSIHnTX0W = 0000 0012_H (EDL bit = 0)
5. EDL mode cannot be used in receive-only mode of slave mode.
   ($CSIHnCTL1.CSIHnPRS[2:0] = 111_B$, CSIHnCTL0.CSIHnTXE = 0, CSIHnCTL0.CSIHnRXE = 1)
6. When setting less than 5bit of communication by DLS[3:0], Communication clock doesn't become active continuously,and communication wait sometimes occurs. When using by a slave mode, set the handshake function effective (CSIHnHSE = 1). Details are below

		CSIHnDLS[3:0] settng		
		0001_B 1 bit setting	**0010_B ~ 0101_B 2 bit ~ 5 bit setting**	**0000_B, 0110_B~1111_B 6 bit ~ 16 bit setting**
Communication bits <= 16 bit	Master	Setting prohibit	Communication wait sometimes occur	No limitation
	Slave		CSIHnHSE=1 setting is needed	
Communication bits >= 17 bit	Master	Communication wait sometimes occur	Communication wait sometimes occur r	
	Slave	CSIHnHSE=1 setting is needed	CSIHnHSE=1 setting is needed	

16.5.9 Serial data direction selection

The serial data direction is selectable for each chip select signal using the CSIHnDIRx bit in the CSIHnCFGx register.

The examples below show communication for a data length of 8 bit (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).

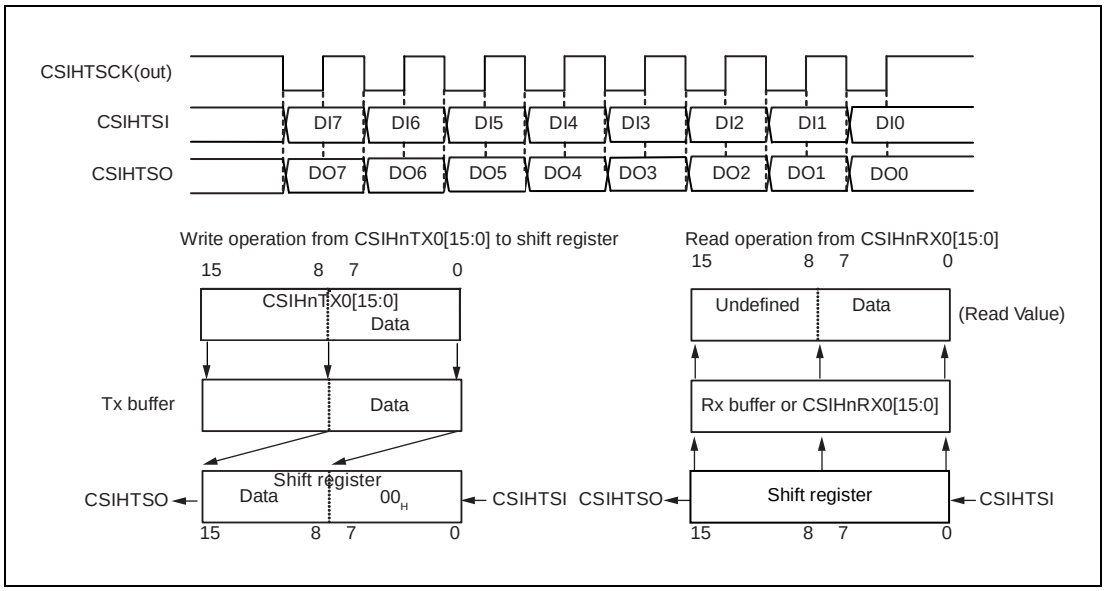

Figure 16.26 Serial data direction select function - MSB first (CSIHnDIR = 0)

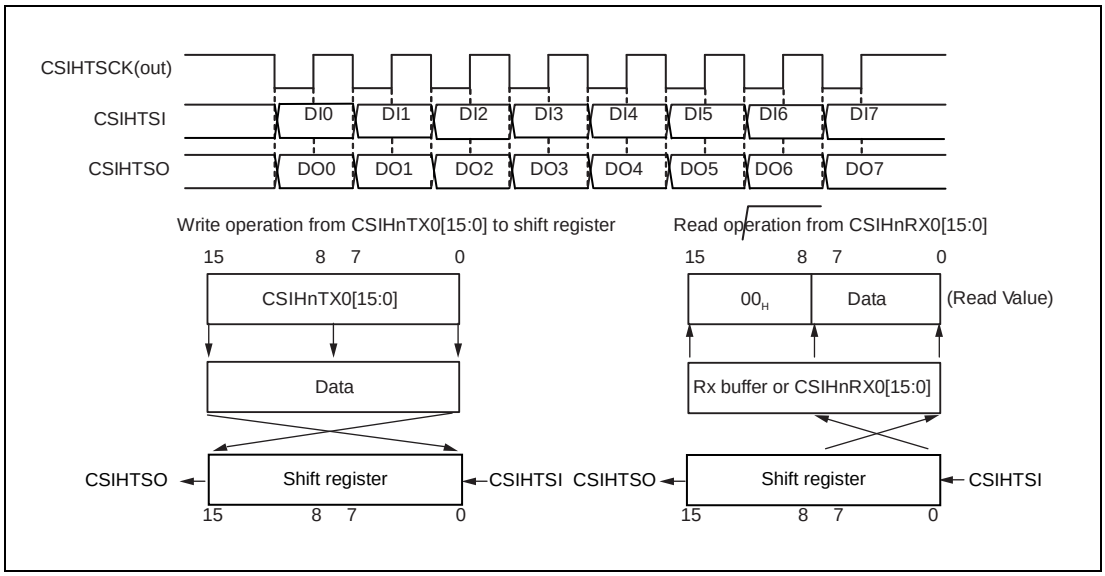

Figure 16.27 Serial data direction select function - LSB first (CSIHnDIR = 1)

16.5.10 SS Function

The SS function realizes communication between one master and multiple slaves (SPI communications).

In master mode, the master device outputs the salve select signal (CSIHTCSSx) to select a single slave. Communication by a device in slave mode is enabled when the slave input select signal (CSIHTSSI) is at the low level.

See the **Section 16.5.2, Master/slave connections**, for an example of a connection using the SS function.

16.5.10.1 SPI Communication Timing Using SS Function

The following figure illustrates the SPI communication signal using the SS function and timings.

In slave mode, the data transfer configuration is determined by the CSIHnCFG0 register.

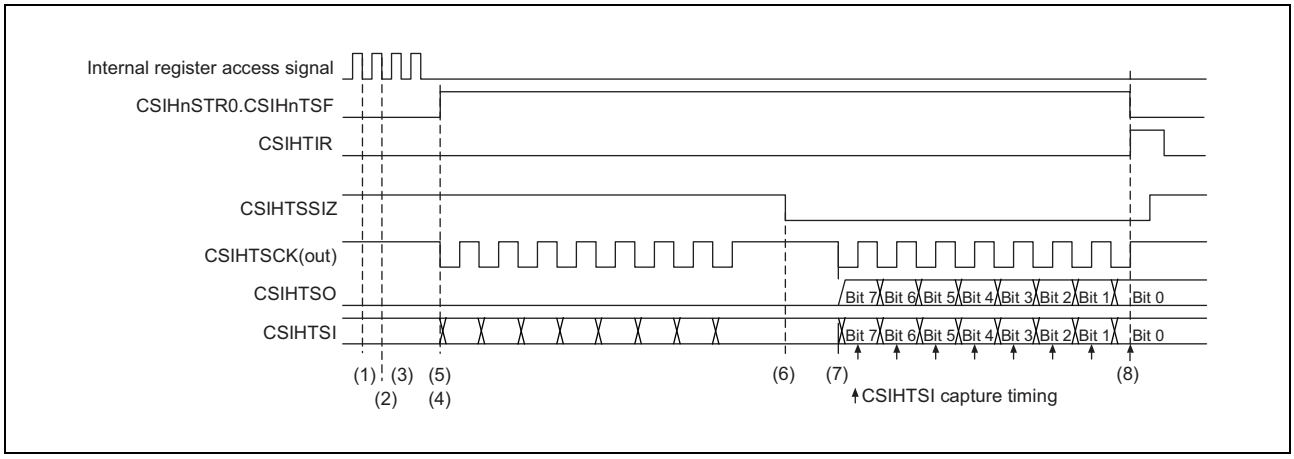

Figure 16.28 Tx/Rx Timing of SPI Communication Using SS Function

(1) CSIH is put into slave mode by setting CSIHnCTL2.CSIHnPRS[2:0] = 111_B. CSIHnCFG0.CSIHnCKP0 and CSIHnCFG0.CSIHnDAP0 are 0.

(2) The data length is 8 bits (CSIHnCFG0.CSIHnDLS0[3:0] = 1000_B). The data direction is MSB first (CSIHnCFG0.CSIHnDIR0 = 0).

(3) CSIH is set to transmit/receive operation mode (CSIHnCTL0.CSIHnTXE = 1, CSIHnCTL0.CSIHnRXE = 1). Communication start is permitted.

(4) The “transmission in progress” flag CSIHnSTR0.CSIHnTSF is automatically set when transfer data is written to the CSIHnTX0W or CSIHnTX0H transmission register.

CAUTION

The TSF flag will be set with a certain delay after the set event (e.g. "Data is written to a transmit register"). Consider this behaviour when reading the status of this bit. Alternatively use the corresponding interrupt / interrupt status flag to monitor the transfer status.

(5) As long as signal CSIHTSSIZ is high, transmission/reception is not started, even if an external transmission clock CSIHTSCK is applied. Input at CSIHTSI is ignored.

(6) As soon as CSIHTSSIZ falls to low level, CSIHTSO is enabled and ready for transmission.

(7) Now, as soon as the external clock signal CSIHTSCK appears, the slave transmits data to CSIHTSO and simultaneously captures data from CSIHTSI.

(8) Interrupt CSIHTIR indicates when the reception is complete. The CSIHnRX0W/H register can be read.The TSF flag will be cleared if data could be transferred from shift register to empty RX register. If RX register was not empty, TSF flag will remain high until RX register has been read.

16.5.10.2 CSIHTSSO operation

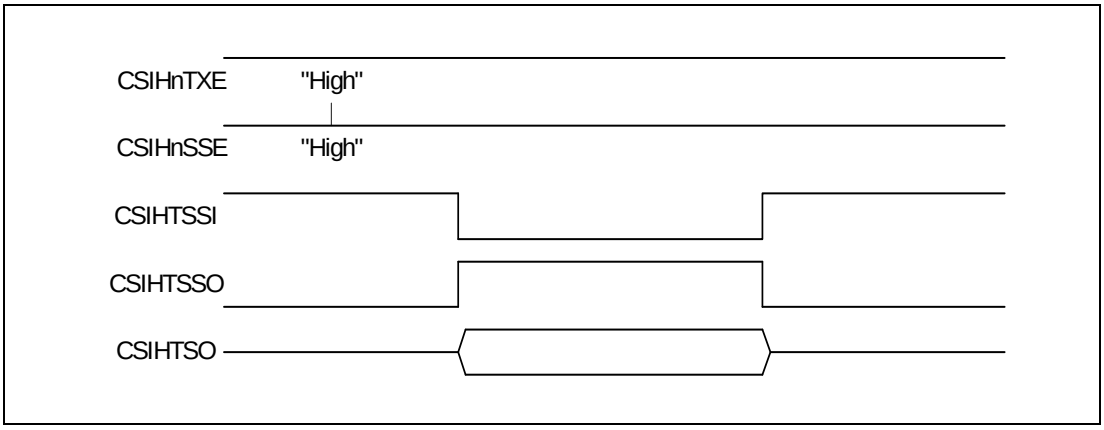
CSIHnPWR	CSIHnTXE	CSIHnRXE	CSIHnSSE	CSIHTSSO
0	-	-	-	H
1	-	-	0	H
	0		1	H
	1		1	Reversed value of CSIHTSSI level

CSIHTSSO pin is a signal to control I/O function of chip SO pin in case of using SS function.

CSIHTSO pin is enabled when CSIHTSSO pin is “High”. (Chip SO pin is drive.)

CSIHTSO pin is disabled when CSIHTSSO pin is “Low”. (Chip SO pin is not drive.)

(Operation of CSIHTSSO)



CAUTION

If CSIHTSSI pin is changed during communication (CSIHnSTR0.CSIHnTSF = 1), current communication is not assured.

16.5.11 Handshake function

CSIH features a handshake function to synchronize the master and the slave devices. This function can be enabled/disabled by bit CSIHnCTL1.CSIHnHSE. For handshake, the signals CSIHTRYI and CSIHTRYO are used.

The timing depends on the data phase selection bit, CSIHnCFGx.CSIHnDAPx setting.

16.5.11.1 Slave mode

When CSIHnCTL1.CSIHnHSE = 1 and the slave is busy, the CSIHTRYO signal outputs low level (0). This can happen in two cases:

1. When memory mode is FIFO mode:
   The slave is in transmit-only or transmit/receive mode but has no transmission data in its buffer. This status is indicated by the flag, CSIHnSTR0.CSIHnEMF.

The example below is on the assumption of an eight-bit data length.

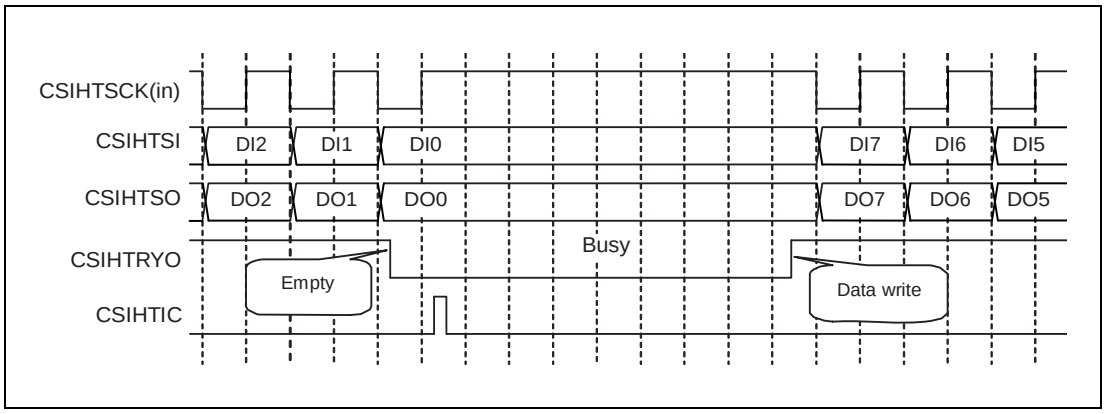


Figure 16.29 Busy signal from the slave (FIFO mode; CSIHnCFGx.CSIHnDAPx = 0)

The slave sets CSIHTRYO to high (“ready”) as soon as new transmission data is written to the FIFO.

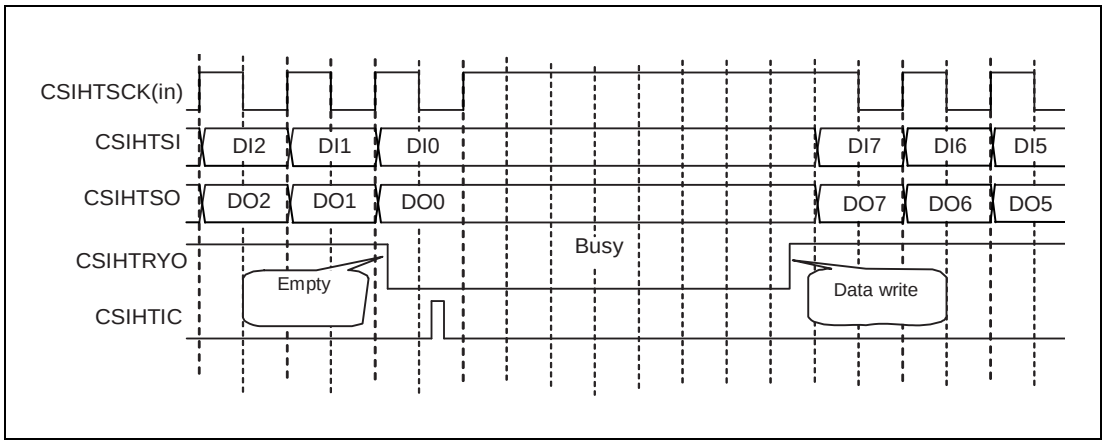

Figure 16.30 Busy signal from the slave (FIFO mode; CSIHnCFGx.CSIHnDAPx = 1)

2. When memory mode is direct access mode:
   Because the slave is in receive-only or transmit/receive mode but previously received data is still in the CSIHnRX0 register, new data cannot be copied from the shift register to CSIHnRX0 (CSIHnRX0 full condition).

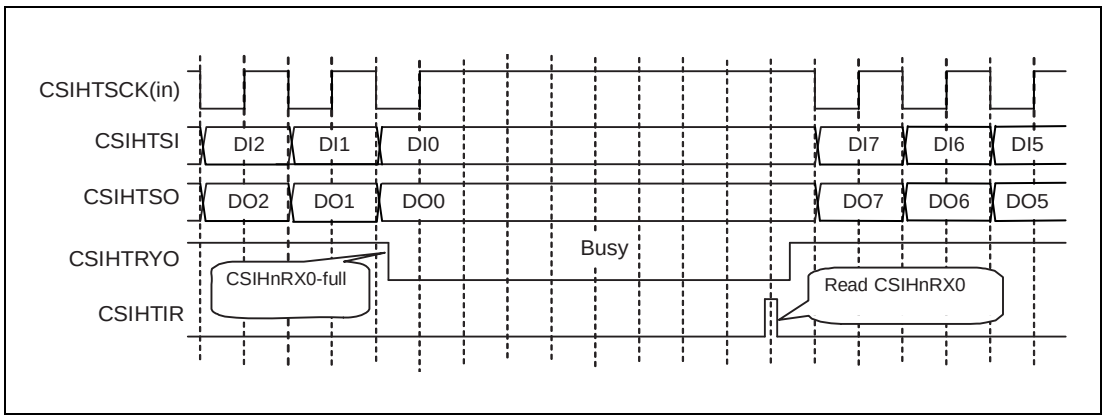

Figure 16.31 Busy signal from the slave (Direct access mode; CSIHnCFGx.CSIHnDAPx = 0)

The slave sets CSIHTRYO to high (“ready”) as soon as the reception register CSIHnRX0 has been read.

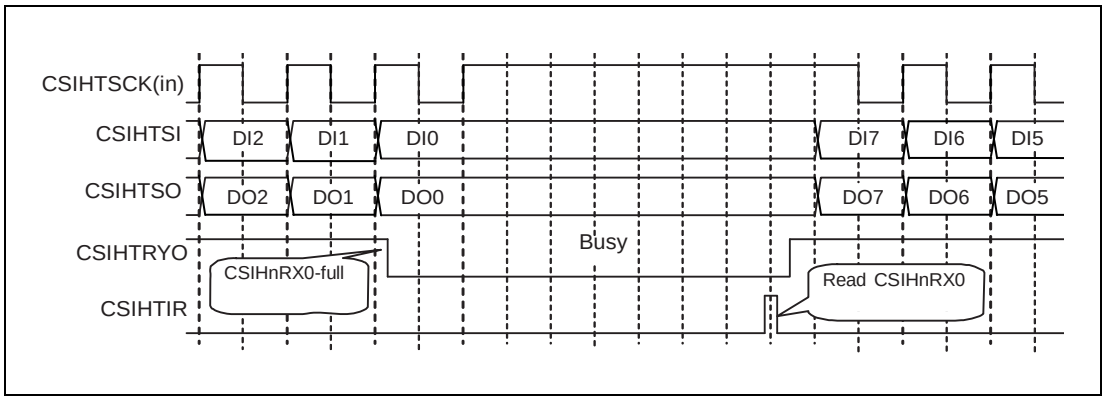

Figure 16.32 Busy signal from the slave (CSIHnCFGx.CSIHnDAPx = 1)

16.5.11.2 Master mode

When the master detects CSIHTRYI = 0, the following transfer is put on hold, and the master goes into wait status. It suspends the CSIHTSCK clock.

The CSIHTRYI level is checked at each half clock cycle of CSIHTSCK.

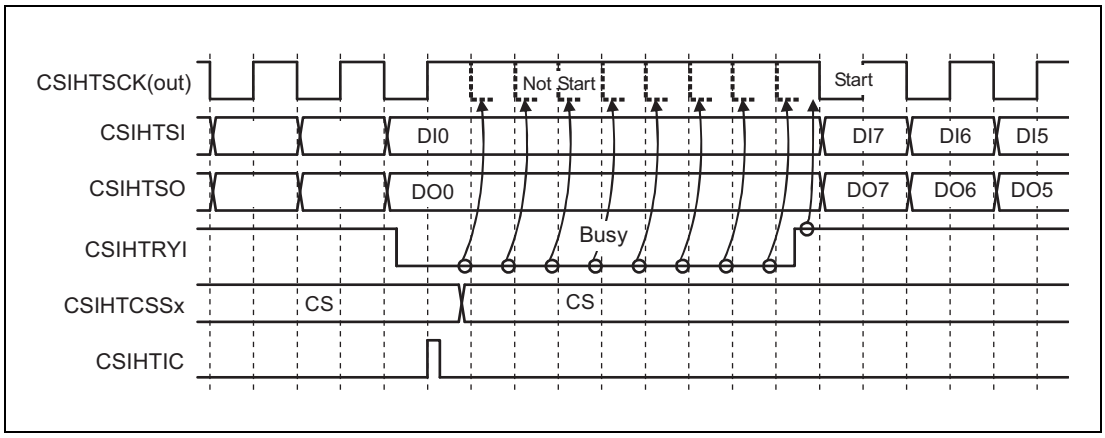

Figure 16.33 Master's reaction on CSIHTRYI (CSIHnCFGx.CSIHnDAPx = 0)

CSIHTRYO must be pulled down by the slave before the next transfer starts.

The master resumes the communication as soon as CSIHTRYO becomes high (the slave is "ready").

NOTE

CSIHTRYO output level is fixed to "Low" in master mode.

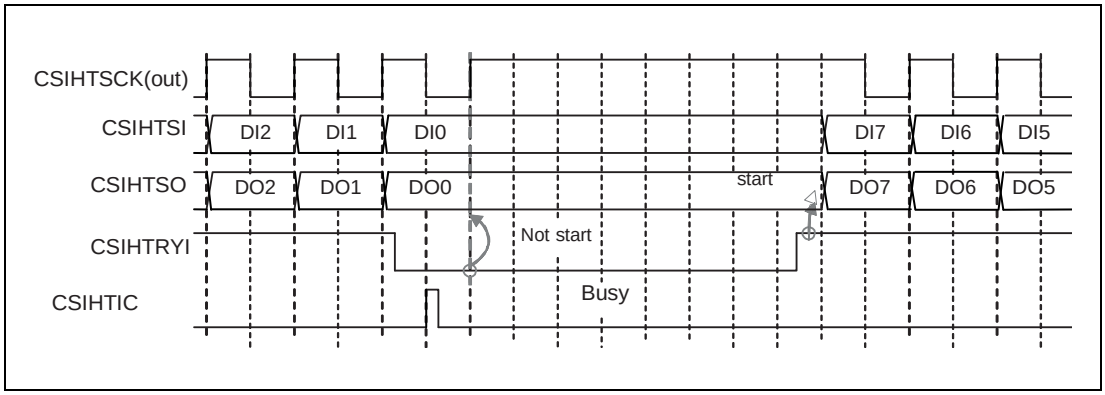

Figure 16.34 Master's reaction on CSIHTRYI (CSIHnCFGx.CSIHnDAPx = 1)

CAUTION

If multiple slaves are connected, the master must only detect the CSIHTRYI signal of the slave it has selected for communication.

Even if CSIHTRYO signal comes from slave to master CSIHTRYI during transfer, communication doesn't wait until completion of data transfer.

16.5.12 Error detection

- CSIH can detect five error types:
- Data consistency error (transmission data)
- Parity error (received data)
- Overrun error (received data)
- Time-out error (in FIFO mode)
- Overflow error (in FIFO mode)

Check for parity, data consistency and time-out errors can be enabled/disabled individually.

If one of these errors is detected, the interrupt request, CSIHTIRE is generated and the corresponding flags are set.

16.5.12.1 Data consistency check

The purpose of the data consistency check is to ensure that the data physically sent as output signal is identical to the original data that was copied to the shift register.

The data consistency check can be enabled/disabled by bit CSIHnCTL1.CSIHnDCS. It is not active if data transmission is disabled (CSIHnCTL0.CSIHnTXE = 0).

When the data consistency check is active, the data transferred from CSIHnTX0W or CSIHnTX0H to the shift register is copied to a separate register. In addition, the physical levels at CSIHTSO are read back via the CSIHTDCS signal into an own shift register.

After completion of the transmission, the sent data is compared with the original transmission data.

Mismatch is considered as a data consistency error:

- Interrupt CSIHTIRE is generated.
- Bit CSIHnSTR0.CSIHnDCE is set.

Additionally, CSIHnRX0W.CSIHnTDCE of data that contains the error is set.

The data consistency check function is illustrated in the following block diagram.

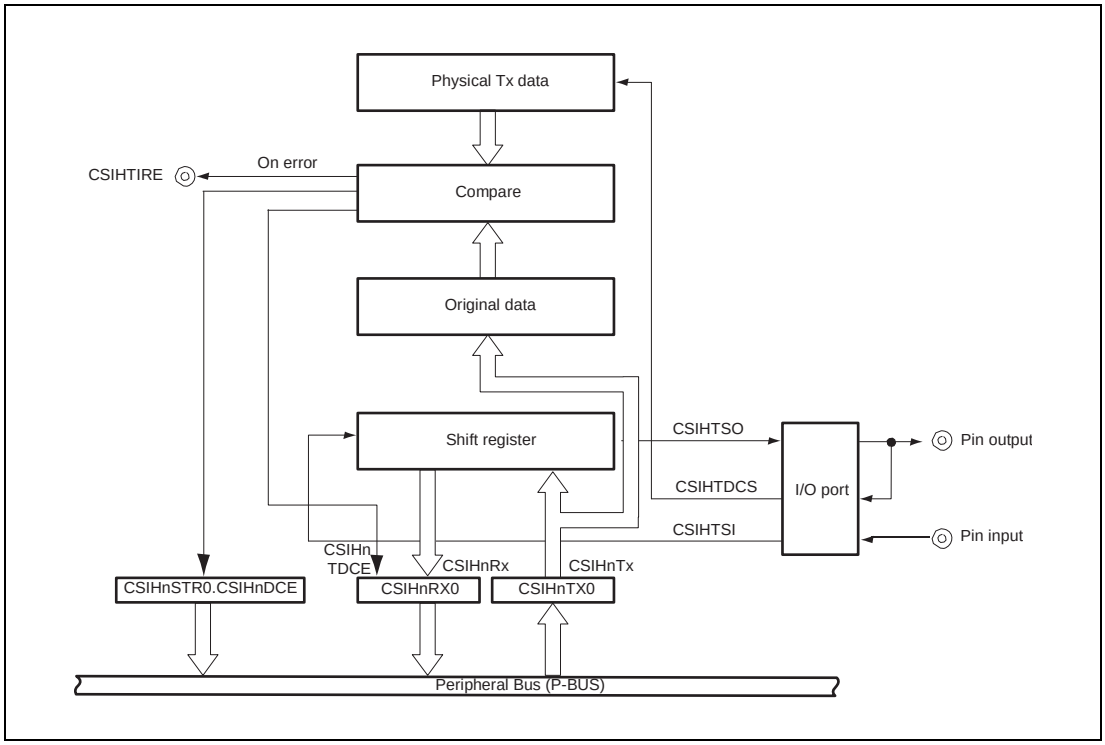

Figure 16.35 Data consistency check functional block diagram

16.5.12.2 Parity check

CSIH can append a parity bit to the last data bit (even if extended data length is used).

The use and type of parity is specified in CSIHnCFGx.CSIHnPSx[1:0].

Parity check is enabled if CSIHnCFGx.CSIHnPSx[1] = 1.

The parity bit is checked after a reception is complete. In case of parity error:

- Interrupt CSIHTIRE is generated.
- Bit CSIHnSTR0.CSIHnPE is set.

Additionally, CSIHnRX0W.CSIHnRPE of data that contains the error is set.

The figure below shows an example.

- Data length is 8 bits.
- The data to be transmitted is 05_H and 35_H.
- Data direction is LSB first.
- Parity type is odd.

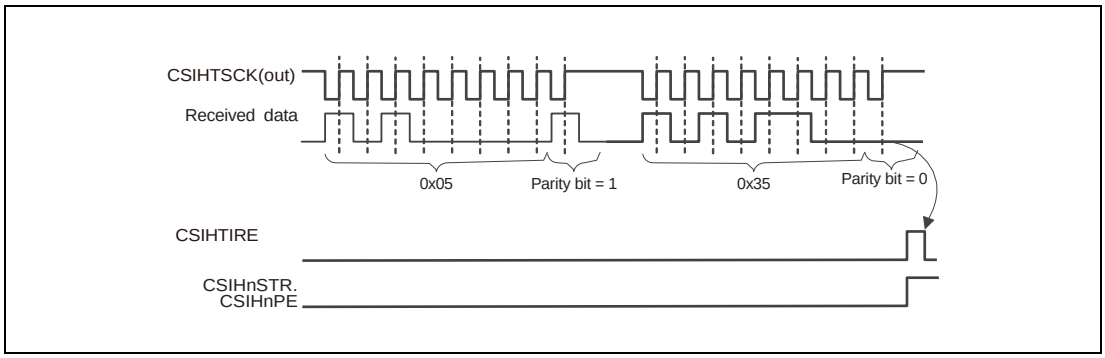

Figure 16.36 Parity check example

The parity bit of the first data is 1. There is no parity error, because the total number of ones (including the parity bit) is odd.

The parity bit of the second data is 0. This is detected as a parity error, because the total number of ones (including the parity bit) is even.

If the EDL (extended data length) function is used, the parity bit is added after the last bit of the data.

16.5.12.3 Time-out error

Time-out errors can be checked only in slave FIFO mode.

This error occurs if neither of the following occurred within a certain period of time:

- Received data in FIFO is read
- FIFO receives data from CSIHTSI

The time is defined in CSIHnMCTL0.CSIHnTO[4:0] in multiples of 8 times the transmission clock, CSIHSCK. A time-out error occurs when the specified time is exceeded (The time-out time is not detected when CSIHnMCTL0.CSIHnTO[4:0] = 00000_B).

A dedicated time-out counter measures the time between the last and the next read operation.

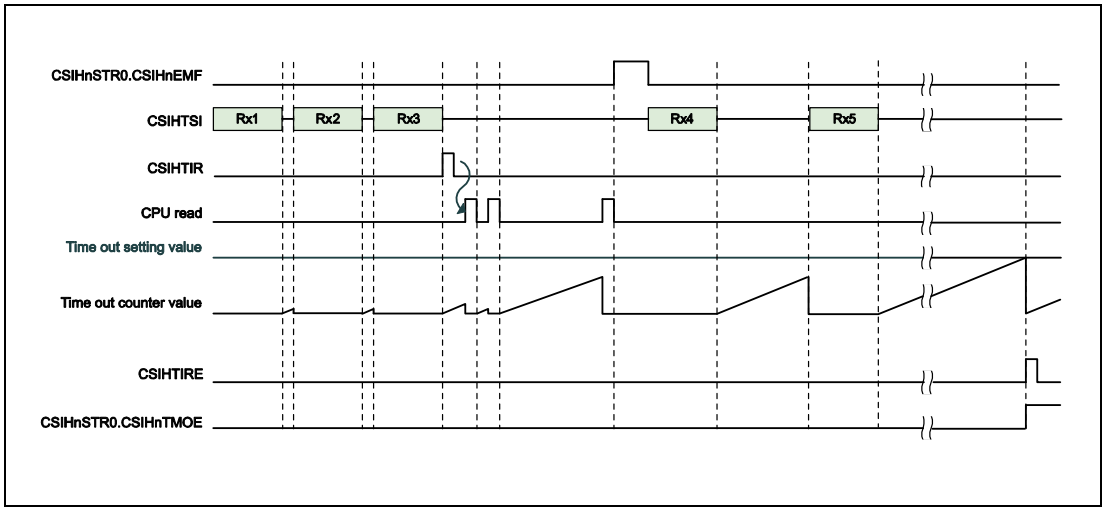

Figure 16.37 Time-out check functional timing diagram

The start timing of the time-out counter is as follows:

- When reception is completed
- When data read from the CPU completes
  (The counter does not start if the buffer is empty.)
- When a time-out error is detected

After a time-out error is detected, if data is still available in FIFO, the time-out counter restarts.

If the value set by bit CSIHnMCTL0.CSIHnTO[4:0] is reached again, the CSIHTIRE interrupt is output again.

The timeout counter continues to count until received data is read. To stop the counter, read all received data or set CSIHnSTCR0.CSIHnPCT to 1. Note that the pointer is cleared if you perform the latter.

The counter is reset at the following timing:

- Data is read once.
- New data is received.
- A timeout error is detected.
- The CSIHnSTCR0.CSIHnPCT bit is set to 1.

If a timeout error occurs, the following occurs:

- Interrupt CSIHTIRE is generated.
- Bit CSIHnSTR0.CSIHnTMOE is set.

16.5.12.4 Overflow error

An overflow error can happen in FIFO mode. It occurs when transmission data is written to the CSIHnTX0W register while the FIFO buffer is filled with received data.

Example

100 data packets have been transmitted. That means, the FIFO contains 100 received packets. The application starts to read the received data.

While the read operation is in progress, the application begins to write another set of 50 transmission data packets to the FIFO. However, only 10 received packets have been read up to now, 90 are still in the FIFO.

In this case, only 38 cells are available for new transmission data packets. When the CPU tries to write the 39th data packets, an overflow error happens.

This is illustrated in the following figure.

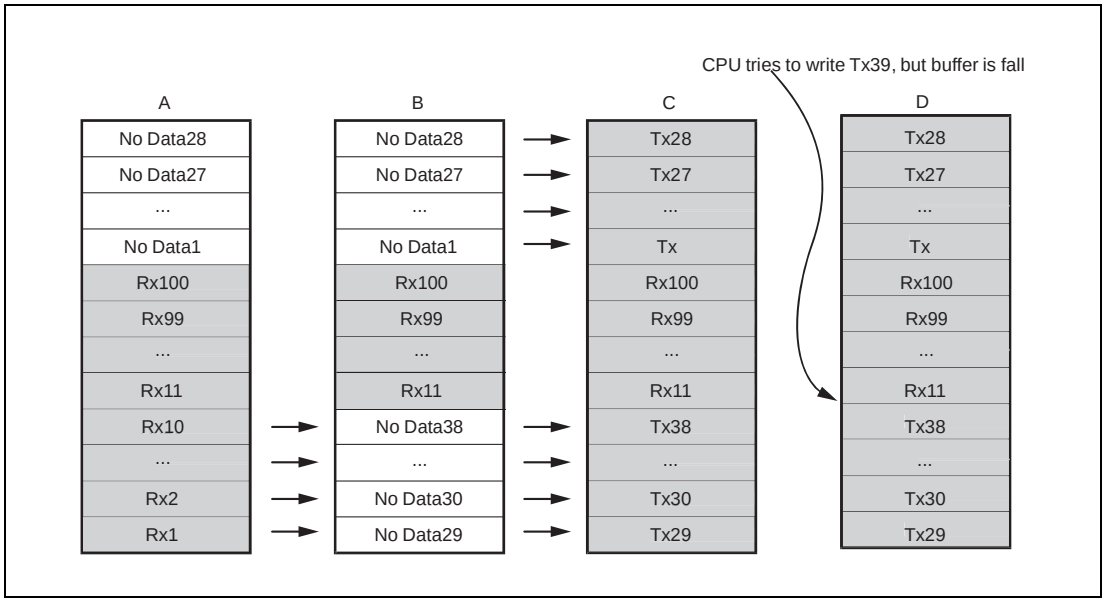

Figure 16.38 FIFO overview

The data packets after 39 are discarded. The figure below shows the overflow timing.

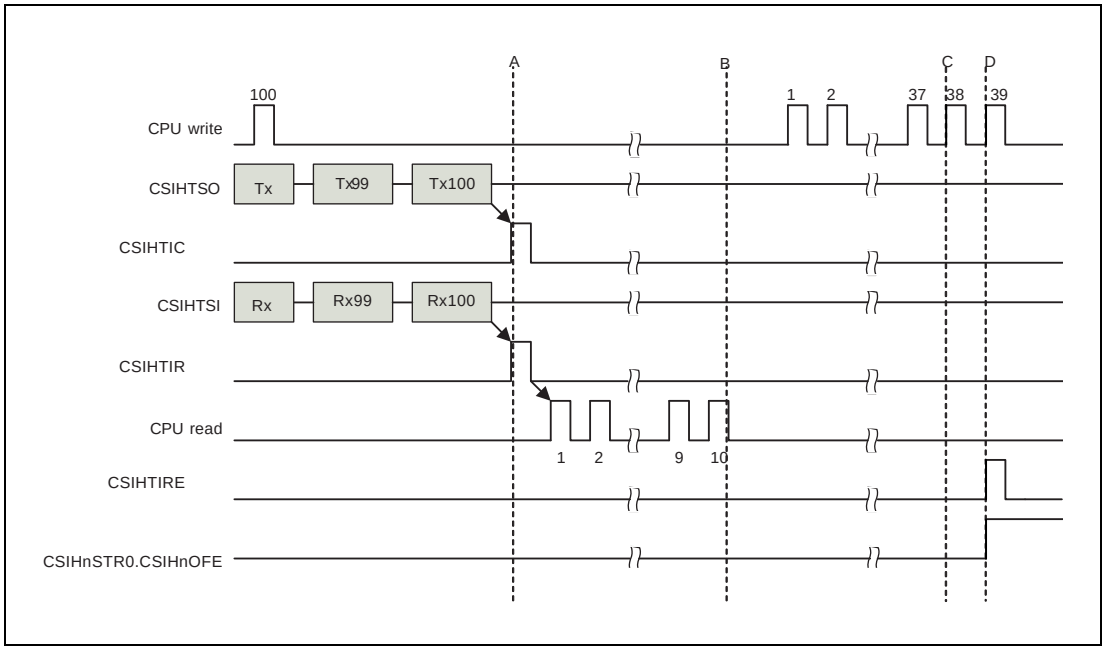

Figure 16.39 FIFO overflow timing

In case of overflow error:

- Interrupt CSIHTIRE is generated.
- Bit CSIHnSTR0.CSIHnOFE is set.

CAUTION

If transmission data is written to CSIHnTX0W when buffer is full by reception data, overflow error is generated.

16.5.12.5 Overrun error

An overrun error can happen in direct access, transmit-only buffer, and FIFO modes. It cannot happen in dual buffer mode. The overrun error is not generated if data reception is disabled (CSIHnCTL0.CSIHnRXE = 0).

(1) Direct access/transmit-only buffer

In direct access and transmit-only buffer mode, this error occurs when newly received data cannot be transferred from the shift register to the reception register CSIHnRX0. This happens when CSIHnRX0 was not read and therefore contains previous reception data.

The following figure illustrates the function.

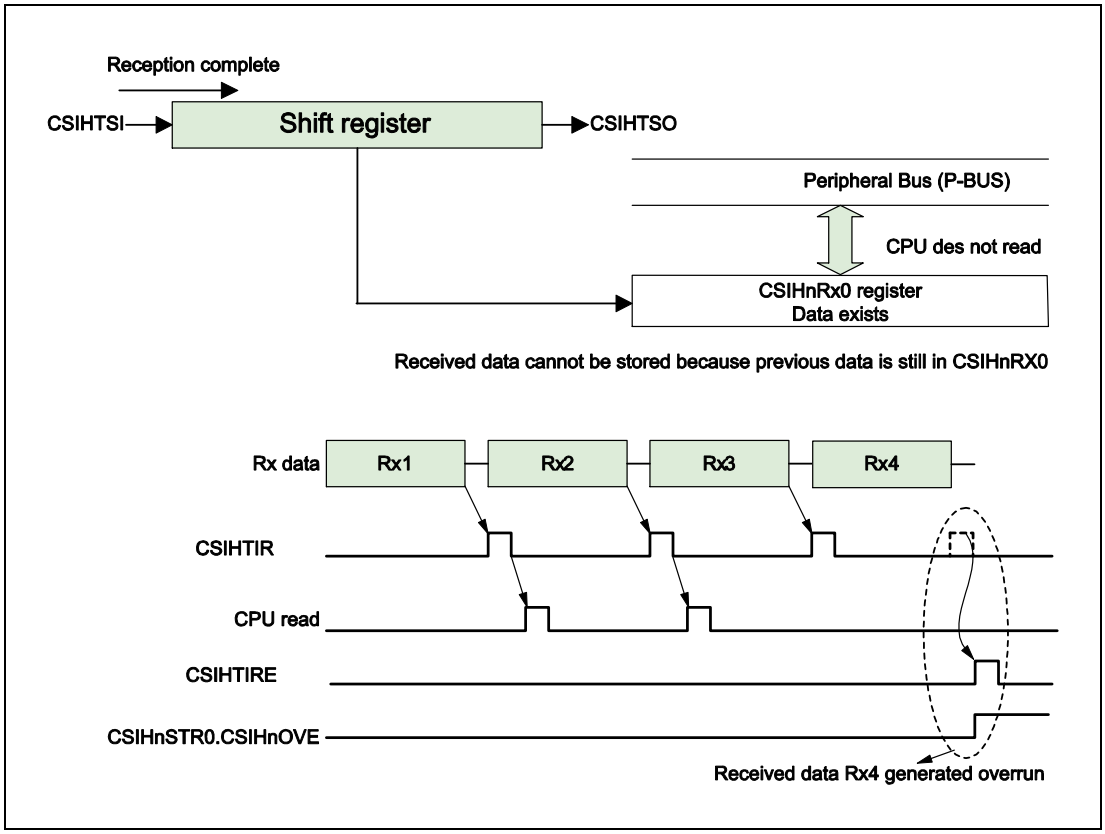

Figure 16.40 Overrun error detection in direct access and transmit-only buffer mode

NOTE

If overrun error is detected, INT_CSIHTIRE is generated instead of INT_CSIHTIR. CSIHnOVE bit of CSIHnSTR0 register is set to “1”. And reception data is overwritten to CSIHnRX0W.

(2) FIFO mode

In FIFO mode, this error occurs if:

1. Newly received data cannot be transferred from the shift register to the FIFO because the FIFO is full.

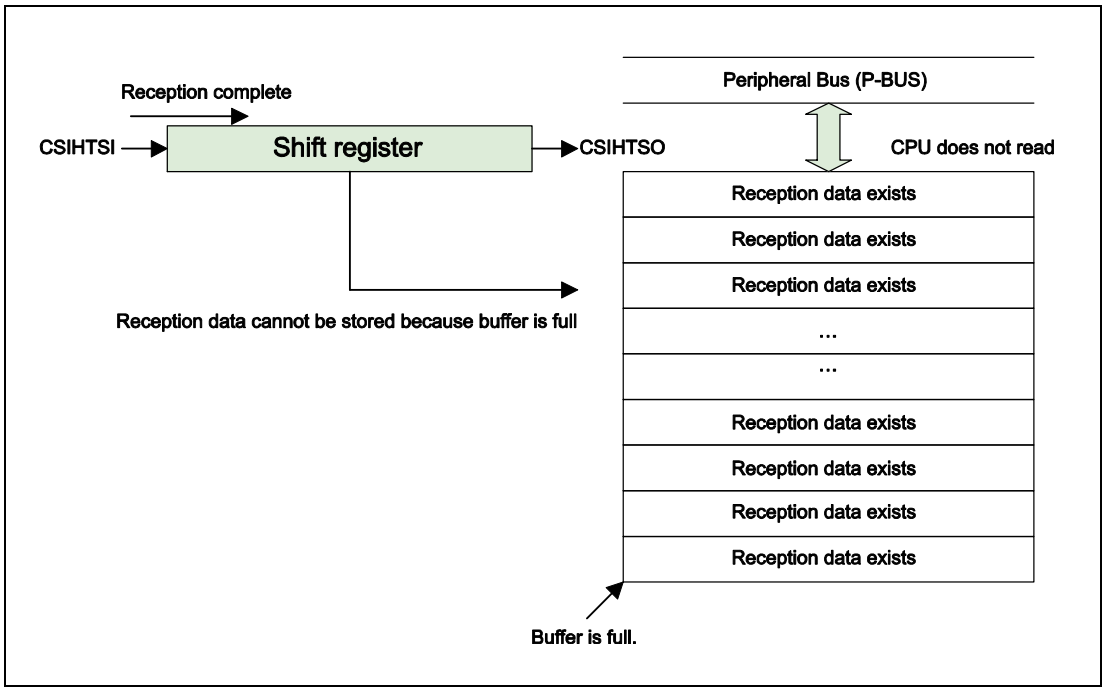

Figure 16.41 Overrun error detection in FIFO mode (FIFO full)

This error is detected only in FIFO and Receive mode. Reason is as follows.

- In FIFO and Transmit/Receive mode, transmission start is written to FIFO buffer.
- If Tx data is written in condition that FIFO buffer is full, overflow error is occurred.
- And that Tx data is not written to FIFO buffer, because buffer is full.
- Because transmission is not started. Therefore, overrun error is not occurred.

NOTE

If overrun error is detected, INT_CSIHTIRE is generated instead of INT_CSIHTIR. CSIHnOVE bit of CSIHnSTR0 register is set to “1”. And reception data is overwritten to CSIHnRX0W.

2. The CPU attempts to read non existing reception data.

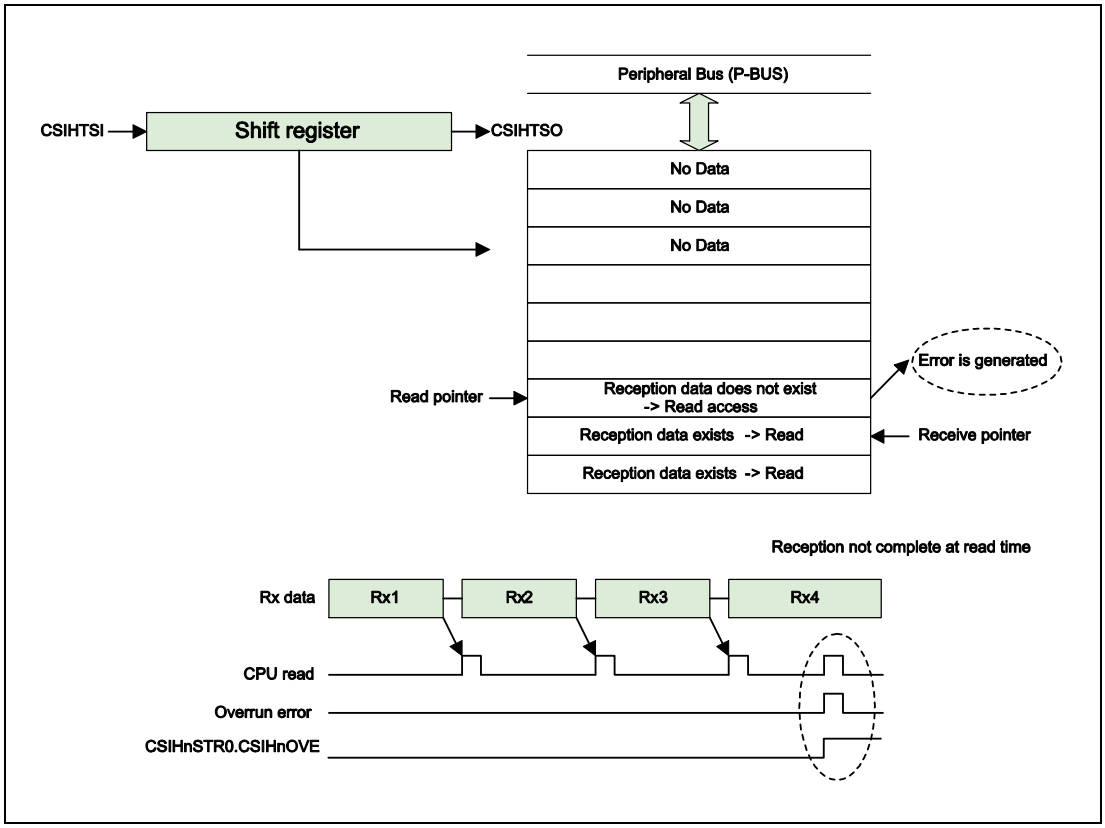

Figure 16.42 Overrun error detection in FIFO mode (no data)

3. In case of overrun error:
   - Interrupt CSIHTIRE is generated.
   - Bit CSIHnSTR0.CSIHnOVE is set.
   - Communication is stopped (except if the CPU tried to read non existing data).

NOTE

An overrun error can be avoided in slave mode by using the handshake function. When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver has read its reception register and is ready again.

For details see **Section 16.5.11, Handshake function**.

16.5.13 Loop-back mode

Loop-back mode is a special mode for self-test. This feature is only available in master mode.

When this mode is active, the transmit and receive signals are internally connected, as shown in the figures below. The signals CSIHTSCK, CSIHTSO, and CSIHTSI are disconnected from the ports. In addition, the CSIHTSO output level is fixed to low, and CSIHTSCK is set to the inactive level as defined by CSIHnCFGx.CSIHnCKPx. The rest of CSIH works as in normal operation.

In order to test CSIH, put it in loop-back mode and carry out normal transfer operations. Then check that the received data is the same as the transmitted data.

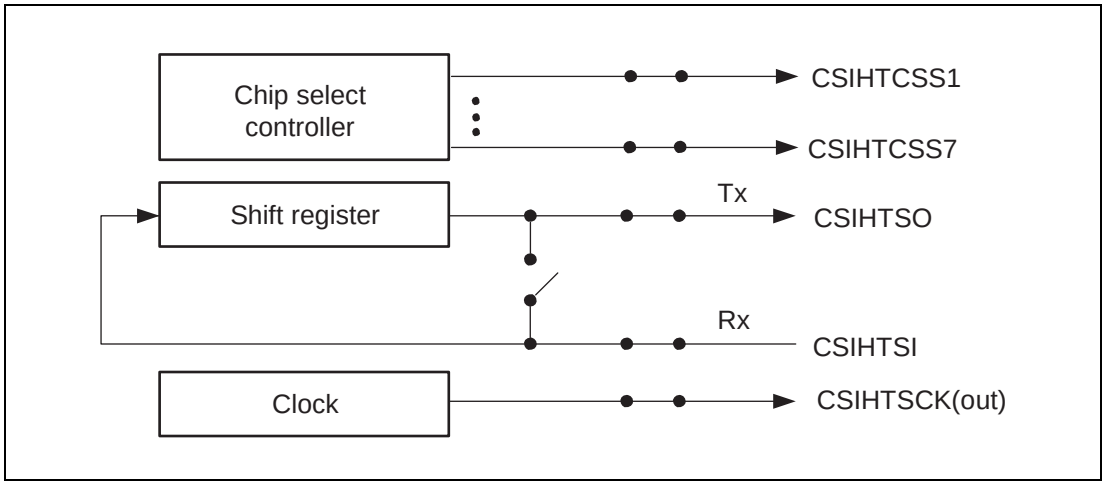

Figure 16.43 Normal operation

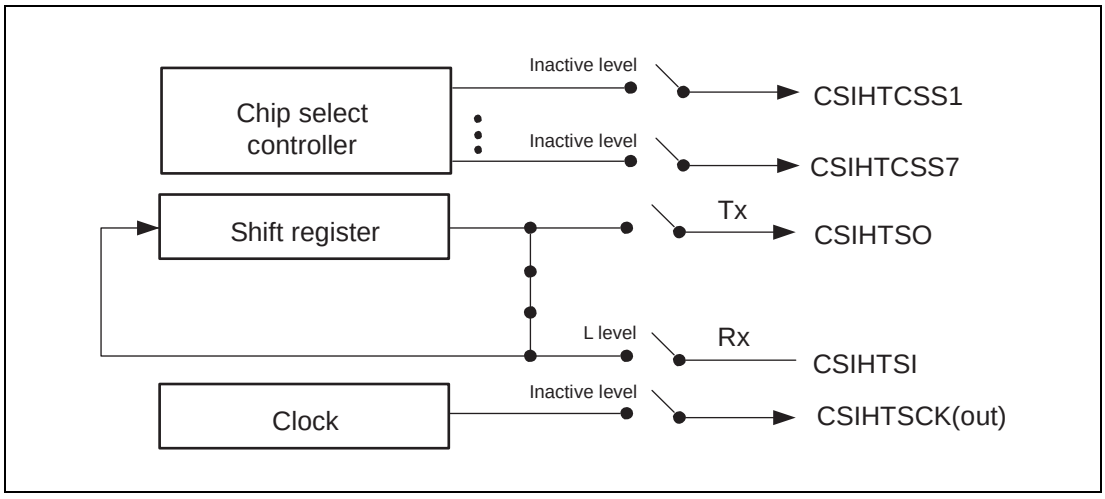

Figure 16.44 Loop-back operation

CAUTION

When CSIHnCTL1.CSIHnLBM =1, macro operates as usual even if macro has received CSIHTRYI signal from slave.

16.5.14 Enforced chip select idle setting

This macro is able to insert an idle state between the two consecutive transfer data by the setting of CSIHnCFGx.CSIHnIDLx. Detail is as follows.

1. When CSIHnCFGx.CSIHnIDLx = 0
   If a next CSIHTCSSx is the same as the previous one, an idle state is not inserted and an inter-data time is inserted.
   If a next CSIHTCSSx is different from the previous one, an idle state is inserted.
2. When CSIHnCFGx.CSIHnIDLx = 1
   An idle state is always inserted even if a next CSIHT is not different from the previous one.

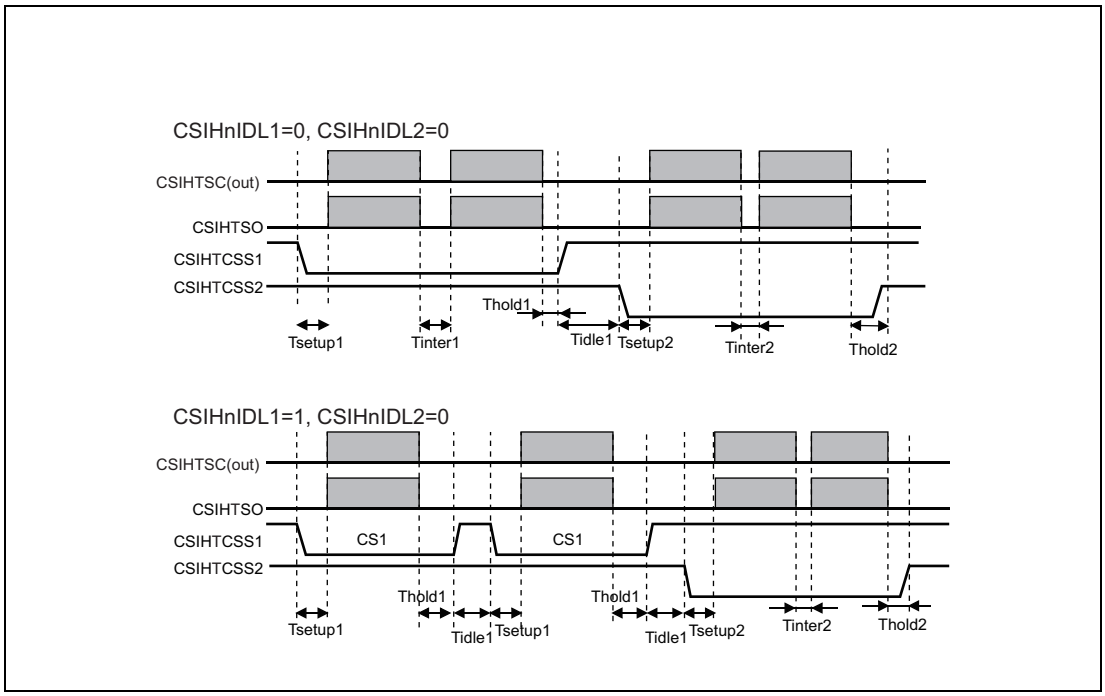

Figure 16.45 Enforced Chip Select Idle Example

16.5.15 Idle state control mode

CSIH is extended by a flexible idle state control mode.

In this mode the insertion of the idle state during the idle time can be controlled individually for each physical frame by the “idle state control bit” CSIHnISC in the upper 16 control bits of the transmit data.

In this mode, a couple of CSIHCSSn is used as chip select signal and control signal of communication direction. The configuration is defined as follows.

Table 16.50 ISC mode CS-coupling

	Used as chip select	Used as transmit direction
Group0	CSIHTCSS0	CSIHTCSS1
Group1	CSIHTCSS2	CSIHTCSS3
Group2	CSIHTCSS4	CSIHTCSS5
Group3	CSIHTCSS6	CSIHTCSS7

By setting the CSIHnISC bit, the behavior of the chip select signal (CS0, 2, 4 and 6) can be controlled.

If CSIHnISC is set, the CSIHTCSSn which is used as chip select will change to high after the end of the transmission.

If CHIHnISC is low, the CSIHTCSSn which used as chip select will not change to high state after the end of the transfer. Detailed timing is explained in **Table 16.51, Idle state control mode communication**.

NOTES

1. In the flexible idle state control mode the CSIHnIDLx bit has no function. Thereby, the mechanism of an automatically inserted idle state, if the chip select setting changes, is not available in this mode (CSIHnIDLx = 0).
2. In the flexible idle state control mode an active period of chip selection after the last data communication completion is maintained in CSIHnCTL1.CSIHnCSRI=0.
3. The change of the idle state control mode has no impact on the EDL mode.
4. In case of the idle state control enable (CSIHnISCE=1), when changing the configuration information (CSIHnCFG0-7) during each communication, CSIHnISC bit must be set to 1 (idle state insertion enable).
5. When CSIHnISC is set to 0, there is a possibility that slave device malfunctions because idle state is not inserted during communication.

Table 16.51 Idle state control mode communication (1/3)

CSIHn ISCE	CSIHn CSRI	CSIHn IDLx	Chip select output operation
0	0	0	
Table 16.51 Idle state control mode communication (2/3)

CSIHn ISCE	CSIHn CSRI	CSIHn IDLx	Chip select output operation
0	0	1	0	1	0	0	1	1	1	0	0	1	0	1	
Table 16.51 Idle state control mode communication (3/3)

CSIHn ISCE	CSIHn CSRI	CSIHn IDLx	Chip select output operation
1	1	0	1	1	1	
16.5.16 Silent mode

In silent mode, a “silent” communication can be inserted automatically after each physical frame. This silent communication will not generate a clock, data or chip select signal (CSIHTCSS[7:0] and CSIHSCK will become inactive; the data line will hold the end level of the former communication). This silent communication enables time slots with no communication. By using this, the customer can configure an extended idle time between two communications which cannot be interrupted by software. In each physical frame, the user can configure if 0-bit, 32-bit, 64-bit or 128-bit silent communication will be inserted afterwards.

The following table shows the possible silent communication time.

Table 16.52 Silent time

Baud Rate (Mbps)	$T_{silent1}$ (µs)			
	0-bit	32-bit	64-bit	128-bit
20	0	1.60	3.20	6.40
10	0	3.20	6.40	12.80
8	0	4.00	8.00	16.00
5	0	6.40	12.80	25.60
3.3	0	9.70	19.39	38.79

Figure 16.44 shows a sample communication with extended idle time between two data transfers by silent mode.

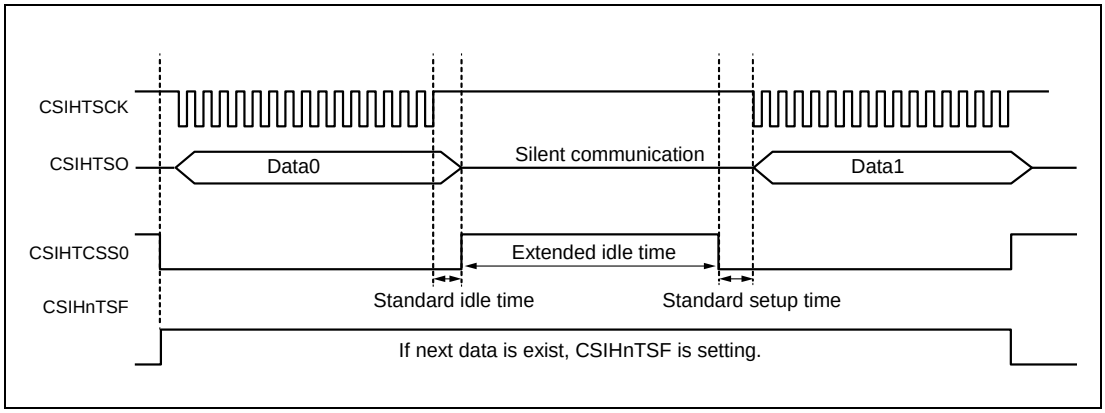

Figure 16.46 Silent mode communication

16.5.17 Limited Reset and Module stand-by

The CSIH can be reset by limited reset from SYSCTRL. The Limited Reset is functionally equivalent to a hardware reset. Software must ensure that CSIH is halted (CSIHnCTL0.CSIHnPWR bit = 0 and CSIHnCTL0.CSIHnTXE bit = 0 and CSIHnCTL0.CSIHnRXE bit =0 and PMMAnCTL.PMMAnPWR bit = 0)

The CSIH clock can be disabled by the SYSCTRL module stand-by function. Software must ensure that CSIH is halted if module stand-by enable.

16.5.18 Chip select Return to Inactive

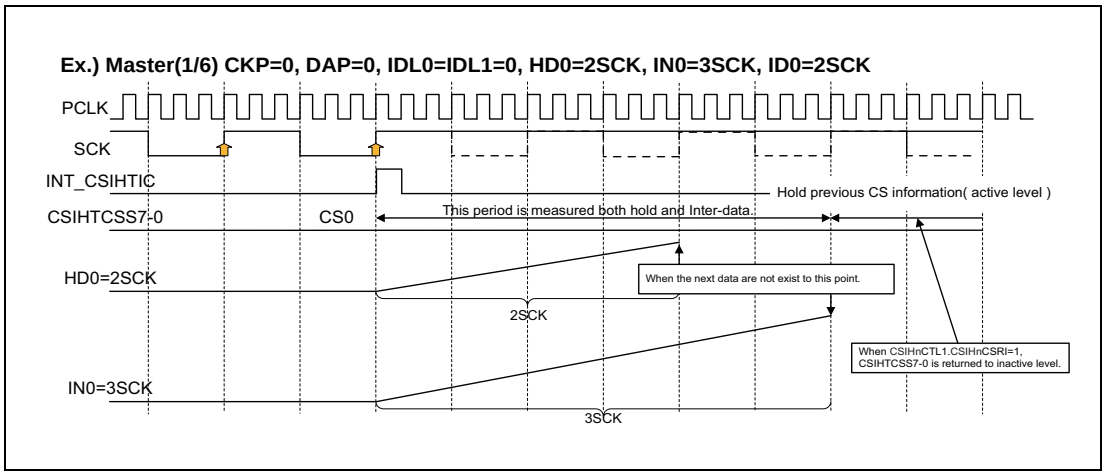
The CSIHnCTL1.CSIHnCSRI bit controls the level of CSIHTCSSn whether CS level is held active level or CS level is returned to inactive level after last transmission.**Note 1.**

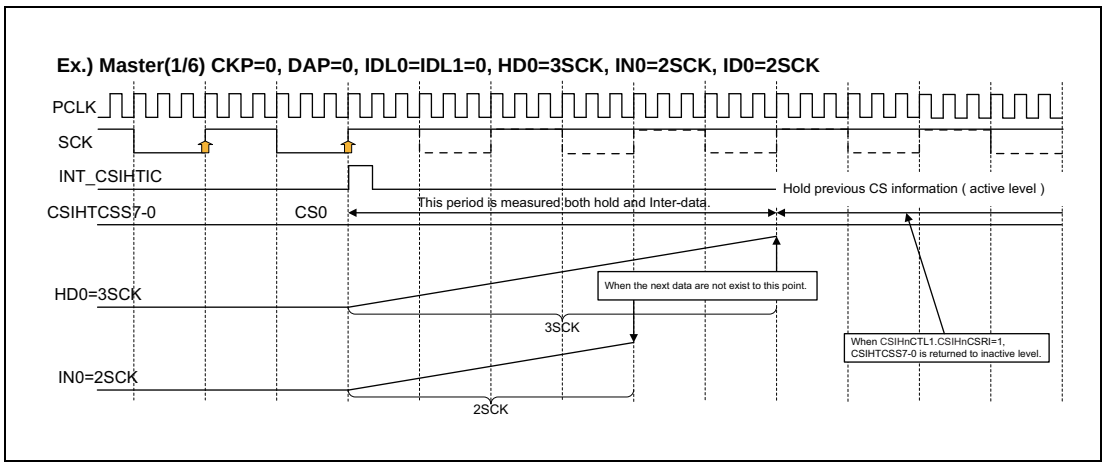
When CSIHnCTL1.CSIHnCSRI=0, CS level is held to active level after last transmission is completed.

When CSIHnCTL1.CSIHnCSRI=1, CS level is returned to inactive level after last transmission is completed.

When CSIHnCFG0-7.CSIHnIDLn=1, CS level during transfer is returned to inactive level.

Note 1. Chip select operation is as follows after last data is transmitted.
When CSIHnCFG0-7.CSIHnIDLn=0, CSIHnCTL1.CSIHnCSRI=0 and there is no next transmission data, macro operation is as follows.
Firstly, both inter-data and hold time are measured. If next transmission data is not prepared even macro has been waited for inter-data or hold time, CSIHTCSSn level is held to active level.





And, when the next transmission data is prepared during inter-data or hold time,

1. If previous CSIHnTX0W.CSIHnCS7-0 is as same as next CSIHnTX0W.CSIHnCS7-0,

   => 1) when the next transmission data is prepared before inter-data time, the next data willbetransferred after waiting for inter-data-time.

=> 2) when the next transmission data is prepared after inter-data time, the next data will be transferred by next operated clock.

2. If previous CSIHnTX0W.CSIHnCS7-0 is not same as next CSIHnTX0W.CSIHnCS7-0,

   => 1) when the next transmission data is prepared before hold-time, Idle-period is inserted after waiting for hold-time.

   => 2) when the next transmission data is prepared after hold-time, it's moving to Idle-period by next operated clock.

16.5.19 Select the Timing of Outputting INT_CSIHTIC

This function is used to select the timing of outputting CSIHTIC.

If CSIHnCTL1.CSIHnSLIT bit is set to 0, INT_CSIHTIC is generated after transfer.

If CSIHnCTL1.CSIHnSLIT bit is set to 1, INT_CSIHTIC is generated at start of transfer.

When CSIHnCTL1.CSIHnSLIT=0 and CSIHnCTL1.CSIHnSLIT=1, INT_CSIHTIC output timings are as follows. (Direct Access mode of CSIH-System.)

- In Master mode, INT_CSIHTIC is generated at point of 2PCLK from final edge of CSIHTSCO0-2 (regardless of DAP).

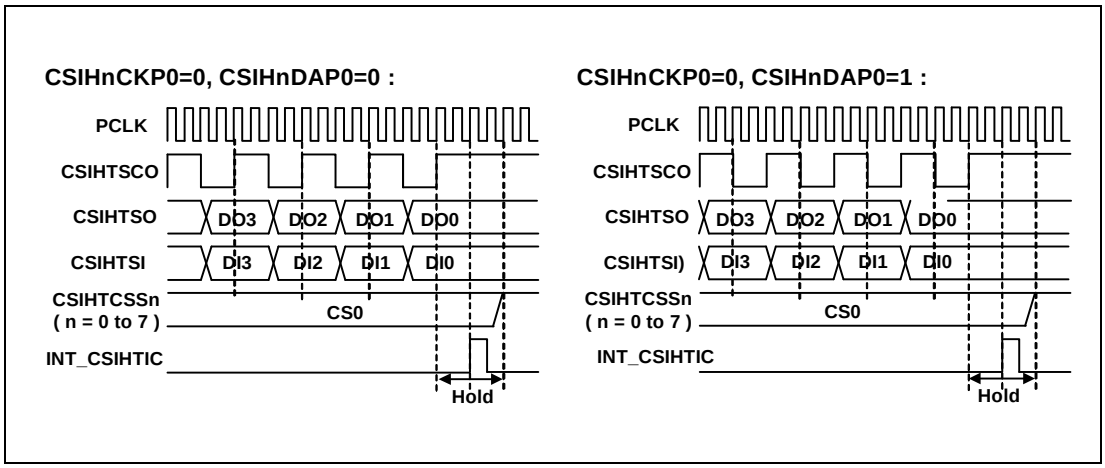


Figure 16.47 INT_CSIHTIC Output Timing in Master Mode (CSIHnCTL1.CSIHnSLIT = 0)

- In Slave mode, INT_CSIHTIC is generated at point of 2PCLK +α from final edge of CSIHTSCI (regardless of DAP).

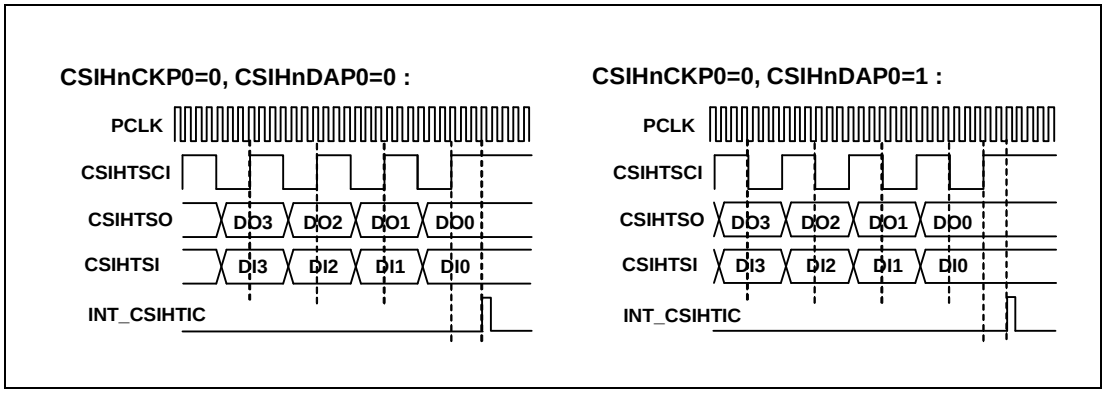

Figure 16.48 INT_CSIHTIC Output Timing in Slave Mode (CSIHnCTL1.CSIHnSLIT = 0)

- In Master mode, INT_CSIHTIC is generated at start edge of CSIHTSCO (regardless of DAP).

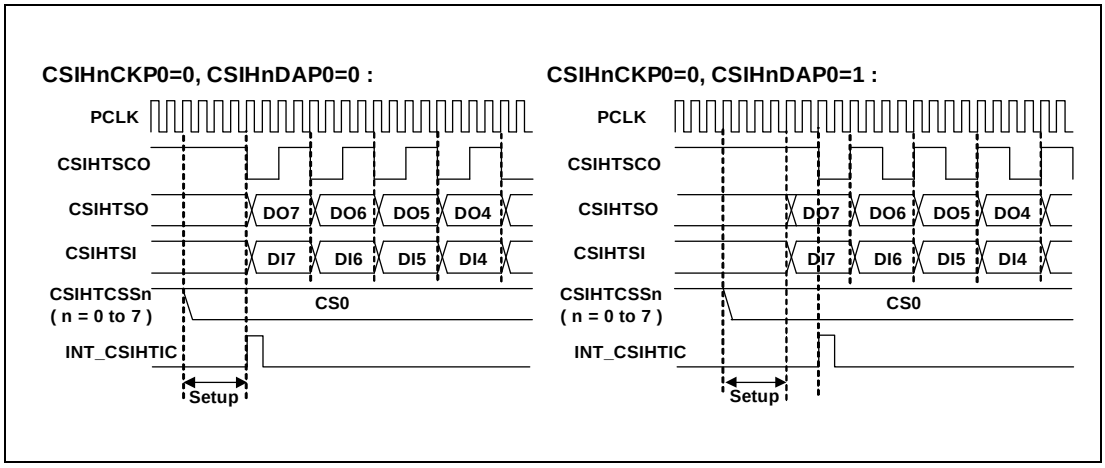

Figure 16.49 INT_CSIHTIC Output Timing in Master Mode (CSIHnCTL1.CSIHnSLIT = 1)

- In Slave mode, INT_CSIHTIC is generated at point of 2PCLK +α from start edge of CSIHTSCI (regardless of DAP).

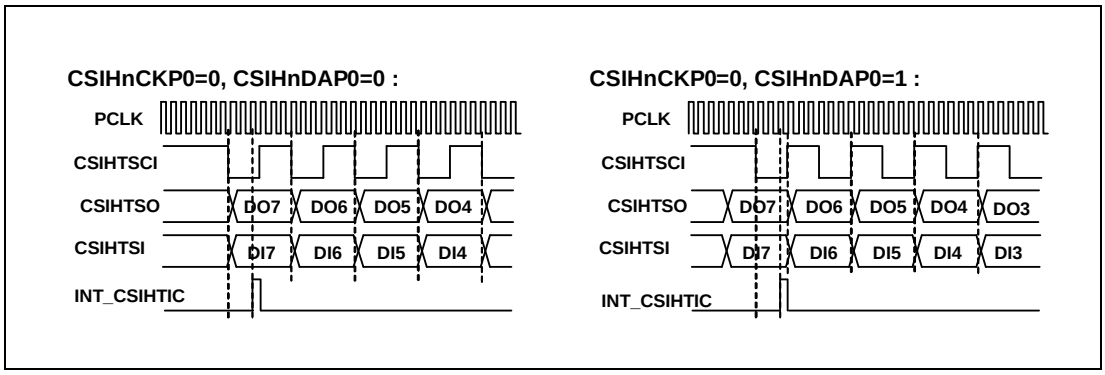

Figure 16.50 INT_CSIHTIC Output Timing in Slave Mode (CSIHnCTL1.CSIHnSLIT = 1)

This feature is only available in Direct Access mode of CSIH-System.

Interrupt Name / Memory Mode	INT_CSIHTIC	INT_ CSIHTIR	INT_CSIHTIRE	INT_CSIHTIJC
Direct Access • Tx Only Buffer	Enabled	Disabled	Disabled	Disabled
FIFO • Tx Only Buffer • Dual Buffer	Disabled	Disabled	Disabled	Disabled

16.6 Operating Procedures

The examples and procedures below are described according to the memory mode in the following order:

- Direct access mode
- Transmit-only buffer mode
- Dual buffer mode
- FIFO mode

16.6.1 Procedures in direct access mode

Two examples for a master are provided, one with job mode disabled, and the other one with job mode enabled.

16.6.1.1 Transmit/receive in master mode when job mode is disabled

The procedures below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = $1000_{B)}$.
- Transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No general interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- Normal CSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Direct access mode (CSIHnCTL0.CSIHnMBS = 1)

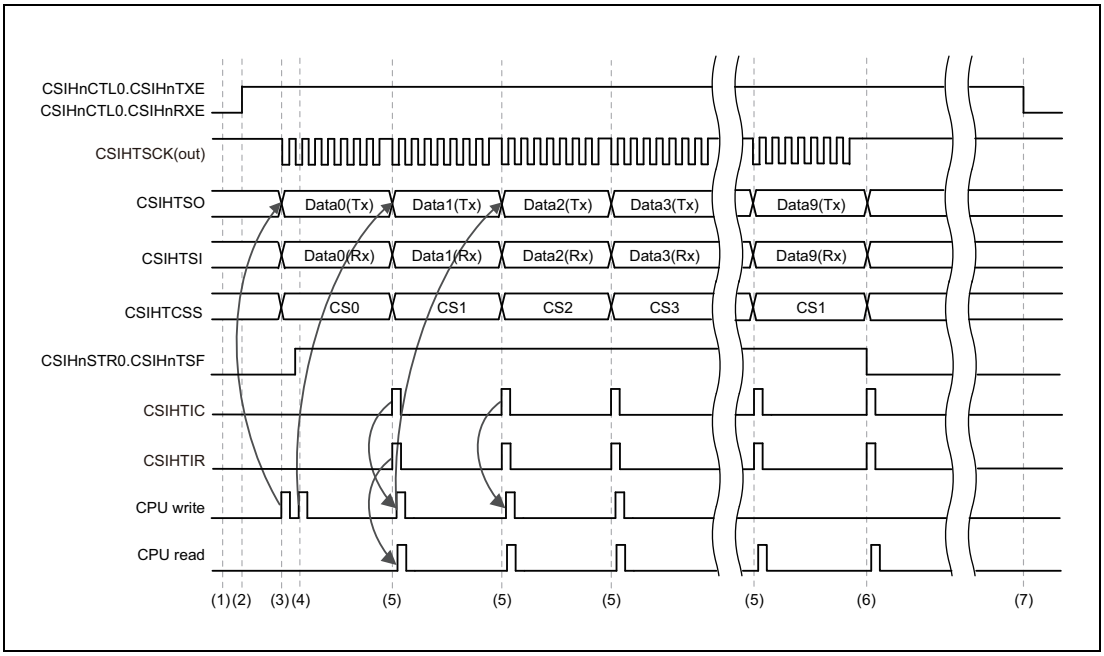

Figure 16.51 Master in direct access mode, CSIHnCTL1.CSIHnJE = 0

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS0 to CS3.
   Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
2. In the CSIHnCTL0 register, set bits CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), CSIHnRXE = 1 (permits reception).
   The output signal, CSIHTSO is enabled.
3. Write the first data packet to be sent to the transmission register, CSIHnTX0W. Within the same write operation, activate CS0. Transmission starts automatically when the first data becomes available.
4. Write the second data to CSIHnTX0W. If required, you can change the CS to address a different device. Writing the second data immediately after the first one avoids unnecessary delays between the packets.
5. After every transmission of a data packet the interrupts CSIHTIC and CSIHTIR are generated:
   – CSIHTIC indicates that the next data can be written to CSIHnTX0W.
   – CSIHTIR indicates that the reception register, CSIHnRX0 must be read.
6. No more write action is required after completion of packet 8. Packet 9 (the last packet) has been written in advance.
   However, reception register CSIHnRX0 must be read after completion of writing packets 8 and 9.
7. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation.

16.6.1.2 Transmit/receive in master mode when job mode is enabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = $1000_{B)}$.
- Transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No general interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- Normal CSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Direct access mode (CSIHnCTL0.CSIHnMBS = 1)
- Two jobs, each of them sends three data packets.

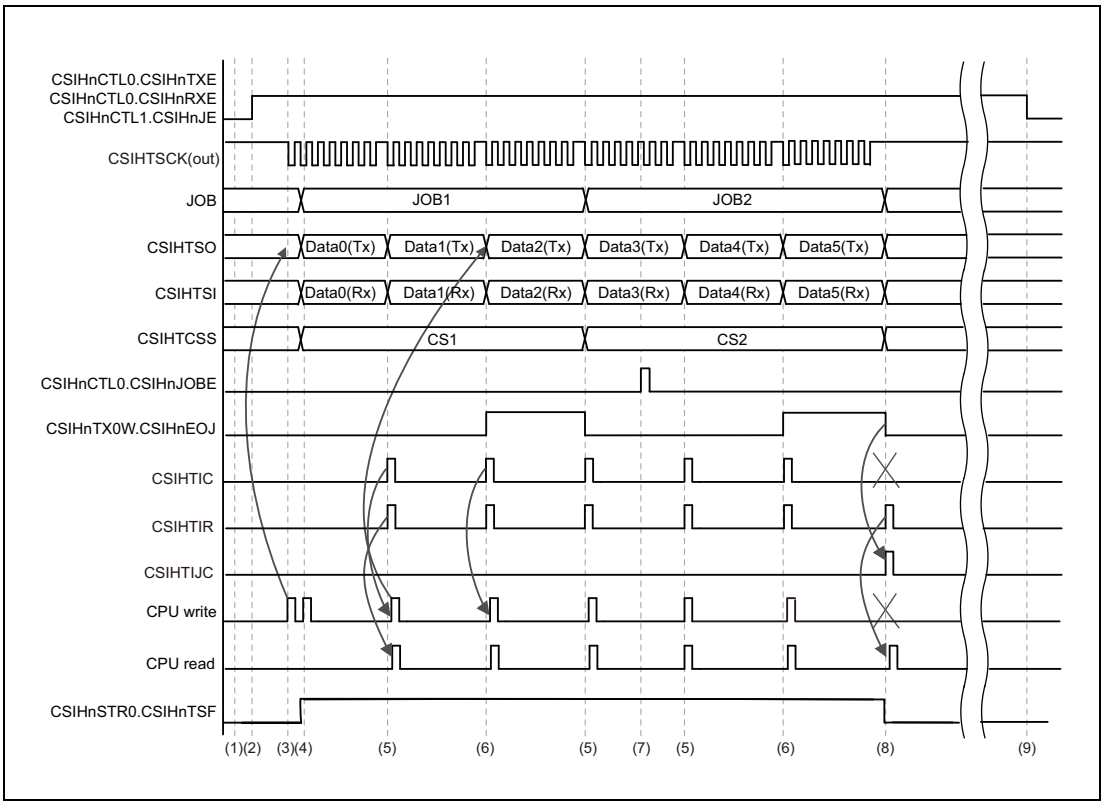

Figure 16.52 Master in direct access mode, CSIHnCTL1.CSIHnJE = 1

CAUTION

"int_JOBE" in the above figure is internal signal of CSIHnCTL0.CSIHnJOBE bit.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS1 and CS2.
   Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
2. In the CSIHnCTL0 register, set the bits CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), CSIHnRXE = 1 (permits the reception), and CSIHnMBS = 1 (selects direct access mode).
   The output signal, CSHITSO is enabled.
3. Write the first data packet to be sent to the transmission register CSIHnTX0W. Transmission starts automatically when the first data becomes available.
   The CSIHnSTR0.CSIHnTSF flag indicates that communication is in progress.
4. Write the second data to CSIHnTX0H. Writing the second data immediately after the first one avoids unnecessary delays between the packets.
5. After every packet transmission, the interrupt requests, CSIHTIC and CSIHTIR are generated.
   – CSIHTIC indicates that the next packet can be written to CSIHnTX0.
   – CSIHTIR indicates that the reception register, CSIHnRX0 must be read.
6. Setting CSIHnTX0W.CSIHnEOJ = 1 indicates that the last data packet of the current job is sent. After that, the next job may begin.
7. By setting CSIHnCTL0.CSIHnJOBE = 1, communication is forced to stop at the end of the current job (JOB2).
8. After the forced stop of communication, the interrupt request, CSIHTIC is replaced by CSIHTIJC. CSIHTIR is generated as usual.
   The interrupt request, CSIHTIJC indicates a forced stop of communication at the end of the current job.
   The interrupt request, CSIHTIC is not generated. Additionally, the transmission data available in the CSIHnTX0 register is not sent.
9. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation.
   To start another transmission without stopping communication, perform steps 3 and later.

16.6.2 Procedures in transmit-only buffer mode

Two examples for a master is provided, one with job mode disabled, and the other one with job mode enabled.

16.6.2.1 Transmit/receive in master mode when job mode is disabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = $1000_{B)}$.
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No general interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- The number of data packets is 9 (CSIHnMCTL2.CSIHnND[7:0] = 09_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).

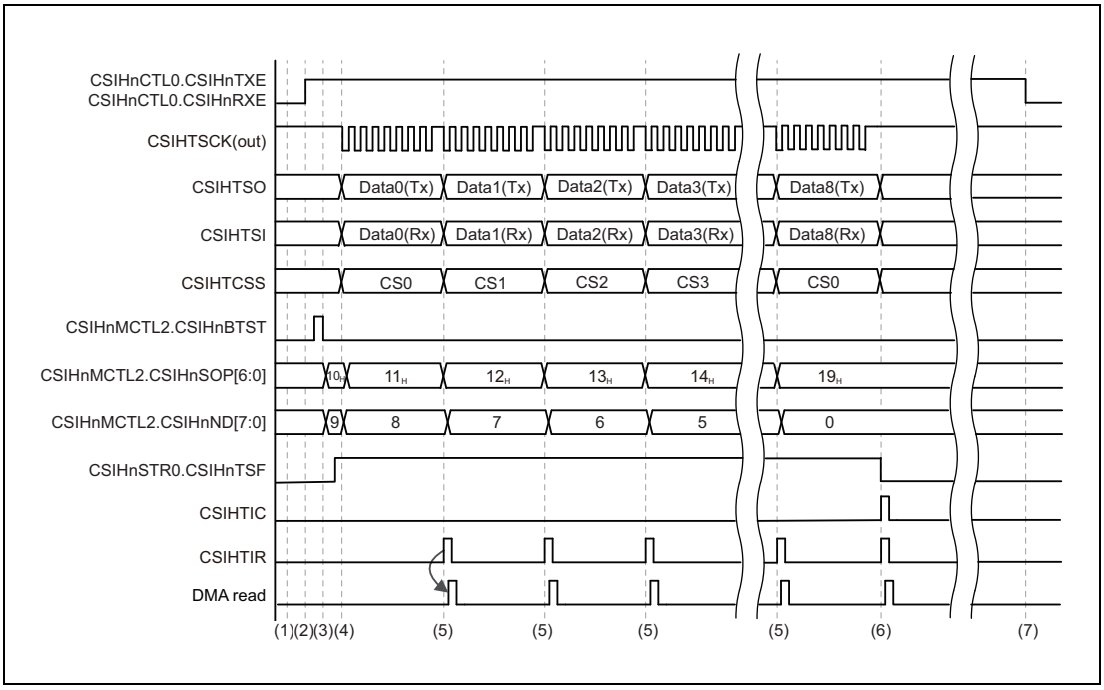

Figure 16.53 Master in transmit-only buffer mode, CSIHnCTL1.CSIHnJE = 0

NOTE

The procedure of writing the data into the buffer is not described.

Set CSIHnMRWP0.CSIHnTRWA6-0 to the first data address and write the transmit data to CSIHnTX0W. The CSIHnMRWP0.CSIHnTRWA6-0 is automatically incremented after each write.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS0 to CS3.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
2. Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0]. Set CSIHnMCTL0.CSIHnMMS[1:0] = 10_B.
3. In the CSIHnCTL0 register, set the bits CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission) and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
4. Configure the send pointer and the number of data packets by setting bits CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0]. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
   Bit CSIHnMCTL2.CSIHnSOP[6:0] is automatically incremented and bit CSIHnMCTL2.CSIHnND[7:0] is decremented after each data packet transmission. Transmission/reception is started.
5. After every data packet transmission, the interrupt request, CSIHTIR is generated. CSIHTIR indicates that the reception register, CSIHnRX0 must be read.
6. When all transmissions are complete, the interrupt request, CSIHTIC is generated.
7. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation.

16.6.2.2 Transmit/receive in master mode when job mode is enabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No general interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- The number of data packets is 8 (CSIHnMCTL2.CSIHnND[7:0] = 08_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).

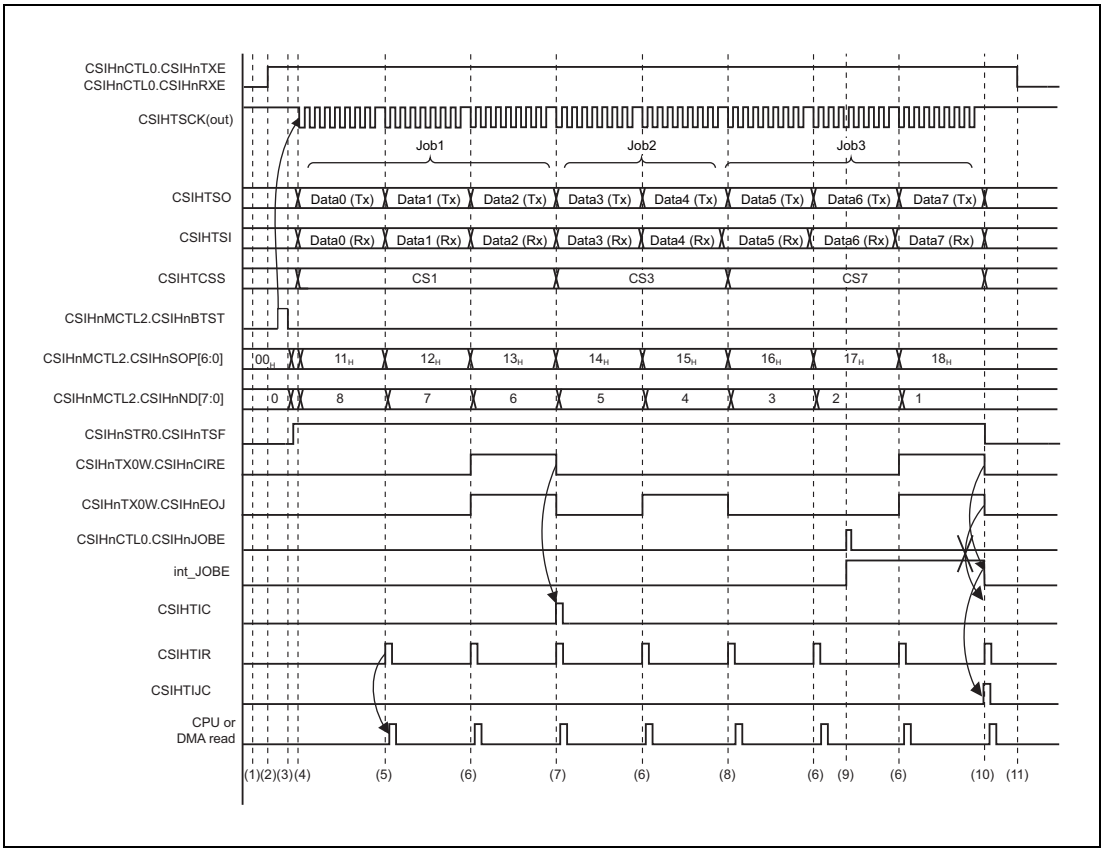

Figure 16.54 Master in transmit-only buffer mode, CSIHnCTL1.CSIHnJE = 1

CAUTION

The process of writing the data into the buffer is not described.

Set CSIHnMRWP0.CSIHnTRWA6-0 to the first data address and write the transmit data to CSIHnTX0W. The CSIHnMRWP0.CSIHnTRWA6-0 is automatically incremented after each write.

The int_JOBE signal in the timing chart above is an internal signal for the CSIHnJOBE bit.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register.This example uses chip select signals CS1, CS3, and CS7.
   Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
2. Configure the memory mode in CSIHnMCTL0.CSIHnMMS[1:0]. Set CSIHnMCTL0.CSIHnMMS[1:0] = 10_B.
3. In the CSIHnCTL0 register, set bits CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
4. Configure the send pointer and the number of data packets by setting bits CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0]. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
   Transmission is started. Bit CSIHnMCTL2.CSIHnSOP[6:0] is automatically incremented and bit CSIHnMCTL2.CSIHnND[7:0] is decremented after each data packet transmission.
5. After every data packet transmission, the interrupt request, CSIHTIR is generated. CSIHTIR indicates that the reception register, CSIHnRX0 must be read.
6. The CSIHnTX0W.CSIHnEOJ = 1 setting indicates that the last data of the current job is sent.
7. The interrupt request CSIHTIC is generated. CSIHTIC indicates that the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 1.
8. The CSIHTIC interrupt request is not generated because the last data of the current job (CSIHnTX0W.CHABnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 0.
9. By setting CSIHnCTL0.CSIHnJOBE = 1, communication is forced to stop at the end of JOB3.
10. After the forced stop of communication, interrupt requests CSIHTIJC and CSIHTIR are generated at the end of job3.
    The CSIHTIJC interrupt request indicates a forced stop of communication at the end of the current job.
    The CSIHTIC interrupt request is not generated because the CSIHTIJC interrupt request is generated instead of the CSIHTIC interrupt request. Additionally, the transmission data available in the CSIHnTX0 register is not sent.
11. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/ receive operation.

16.6.3 Procedures in dual buffer mode

Four examples are provided, two for a master and the other two for a slave with job mode disabled and enabled.

16.6.3.1 Transmit/receive in master mode when job mode is disabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CHABnCFGx.CSIHnDIRx = 0).
- Default clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No general interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- The number of data packets is 9 (CSIHnMCTL2.CSIHnND[7:0] = 09_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).

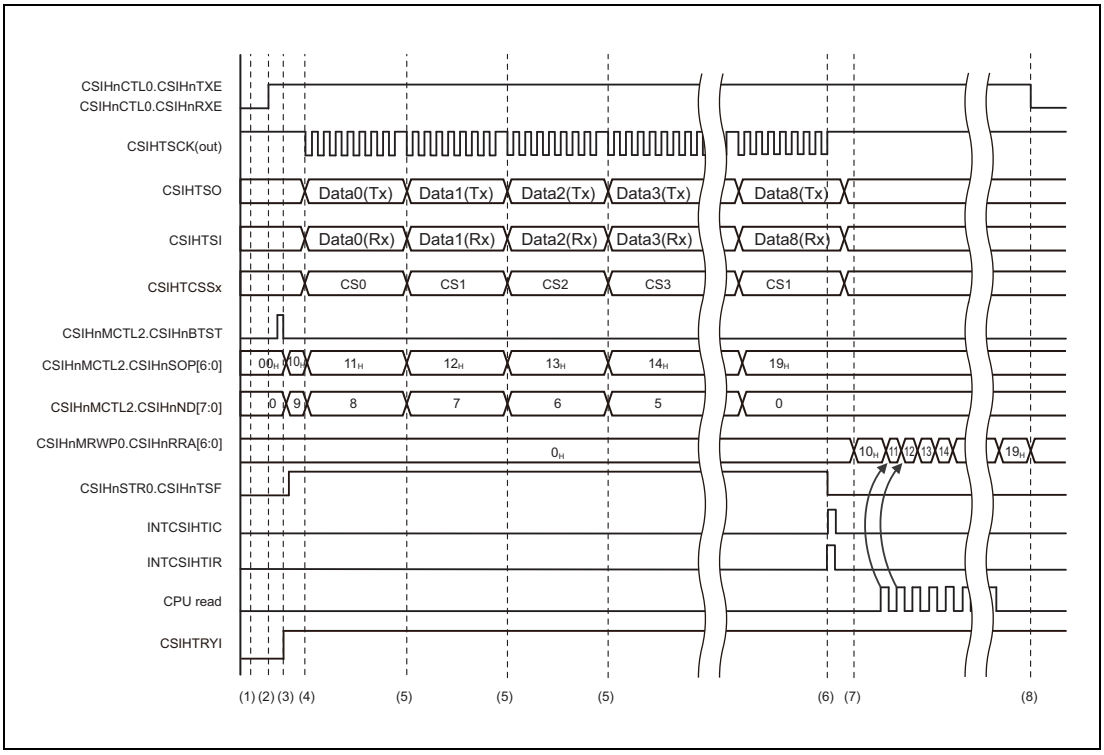

Figure 16.55 Master in dual buffer mode, CSIHnCTL1.CSIHnJE = 0

NOTE

The process of writing the data into the buffer is not described.

Set CSIHnMRWP0.CSIHnTRWA6-0 to the first data address and write the transmit data to CSIHnTX0W. The CSIHnMRWP0.CSIHnTRWA6-0 is automatically incremented after each write.

Procedure:

1. Before setting CSIHnCTL0.CSIHnPWR = 1, configure the required bits of following registers at first. CSIHnCTL1, CSIHnCTL2, CSIHnMCTL0, CSIHnCFG0 to 7.
2. Set bits of CSIHnCTL0.CSIHnPWR = 1 (enable the clock), CSIHnCTL0.CSIHnTXE = 1 (enable transmission), CSIHnCTL0.CSIHnRXE = 1 (enable reception), CSIHnCTL0.CSIHnMBS = 0 (Memory mode).
3. Configure the send pointer and the number of data by setting bits CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0].
   Start communication by setting CSIHnMCTL2.CSIHnBTST.
4. Communication is started. Bits CSIHnMCTL2.CSIHnSOP[6:0] are automatically incremented and bits CSIHnMCTL2.CSIHnND[7:0] decremented after each data.
5. This is repeated until the last data is transmitted/received. The INTCSIHTIC and INTCSIHTIR are not generated.
6. When all communications are completed, the INTCSIHTIC and INTCSIHTIR are generated. The CPU starts to read the received data from the Rx buffer.
7. The start address of the read access is specified in CSIHnMRWP0.CSIHnRRA[6:0] (CSIHnRRA[6:0] is set to 10_H by the software in this figuer). These bits are incremented after the reading of every data.
8. To finalize, disable the transmit/receive operation, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE. In order to minimize the power consumption of CSIH while it is not used, set also CSIHnCTL0.CSIHnPWR = 0.

16.6.3.2 Transmit/receive in master mode when job mode is enabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No general interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- The number of data packets is 8 (CSIHnMCTL2.CSIHnND[7:0] = 08_H).
- The transfer start address is 00_H (CSIHnMCTL2.CSIHnSOP[6:0] = 00_H).

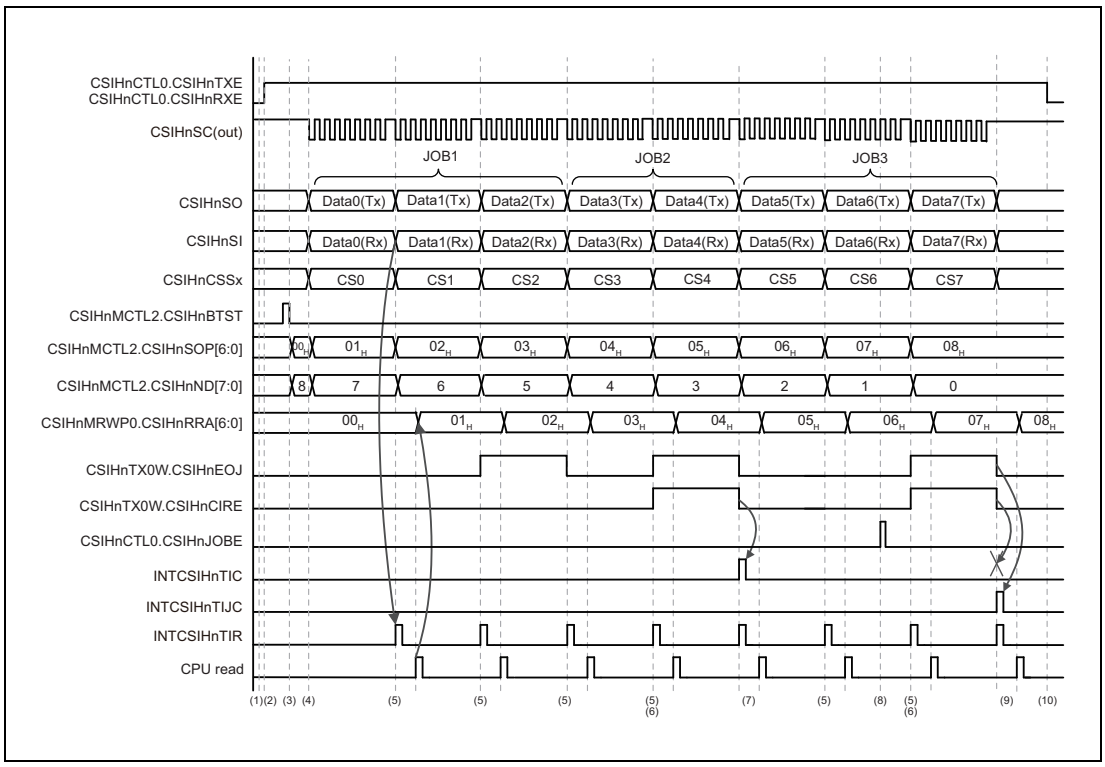

Figure 16.56 Master in dual buffer mode, CSIHnCTL1.CSIHnJE = 1

NOTES

1. The process of writing the data into the buffer is not described.
   Set CSIHnMRWP0.CSIHnTRWA6-0 to the first data address and write the transmit data to CSIHnTX0W. The CSIHnMRWP0.CSIHnTRWA6-0 is automatically incremented after each write.
2. The int_JOBE signal in the timing chart above is an internal signal for the CSIHnJOBE bit.

Procedure:

1. Before setting CSIHnCTL0.CSIHnPWR = 1, configure the required bits of following registers at first. CSIHnCTL1, CSIHnCTL2, CSIHnMCTL0, CSIHnCFG0 to 7.
2. 2. Set bits of CSIHnCTL0.CSIHnPWR = 1 (enable the clock), CSIH0CTL0.CSIH0TXE = 1 (enable transmission), CSIHnCTL0.CSIHnRXE = 1 (enable reception), CSIHnCTL0.CSIHnMBS = 0 (Memory mode).
3. Configure the send pointer and the number of data by setting bits CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0].
   Start communication by setting CSIHnMCTL2.CSIHnBTST.
4. Communication is started. Bits CSIHnMCTL2.CSIHnSOP[6:0] are automatically incremented and bits CSIHnMCTL2.CSIHnND[7:0] decremented after each data.
5. After every data has been received, the INTCSIHTIR is generated. INTCSIHTIR indicates that the reception register CSIHnRX0W must be read.
6. The INTCSIHTIC is generated. INTCSIHTIC indicates that the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 1.
7. By setting CSIHnCTL0.CSIHnJOBE = 1 the communication is forced to stop at the end of JOB3.
8. After the forced stop of communication, the INTCSIHTIJC and INTCSIHTIR are generated at the end of JOB3. The INTCSIHTIJC indicates a forced stop of communication at the end of the current job. The INTCSIHTIC is not generated because the INTCSIHTIJC is generated instead. Additionally, the transmission data available in register CSIHnTX0W is not sent.
9. To finalize, disable the transmit/receive operation, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE. In order to minimize the power consumption of CSIH while it is not used, set also CSIHnCTL0.CSIHnPWR = 0.

16.6.3.3 Transmit/receive in slave mode when job mode is disabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCFG0.CSIHnCKP0 = 0, CSIHnCFG0.CSIHnDAP0 = 0)
- No general interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- The number of data packets is 9 (CSIHnMCTL2.CSIHnND[7:0] = 09_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).

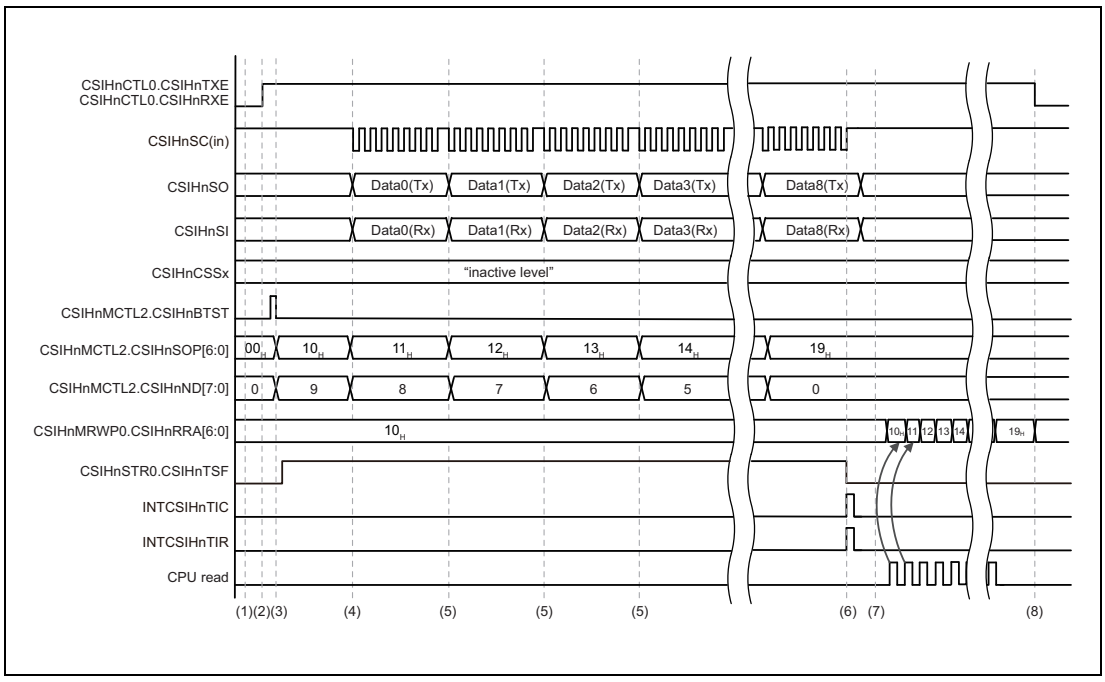

Figure 16.57 Slave in dual buffer mode, CSIHnCTL1.CSIHnJE = 0

NOTE

The process of writing the data into the buffer is not described.
Set CSIHnMRWP0.CSIHnTRWA6-0 to the first data address and write the transmit data to CSIHnTX0W. The CSIHnMRWP0.CSIHnTRWA6-0 is automatically incremented after each write.

Procedure:

1. Before setting CSIHnCTL0.CSIHnPWR = 1, configure the required bits of following registers at first. CSIHnCTL1, CSIHnCTL2, CSIHnMCTL0, CSIHnCFG0 to 7.
2. Set bits of CSIHnCTL0.CSIHnPWR = 1 (enable the clock), CSIHnCTL0.CSIHnTXE = 1 (enable transmission), CSIHnCTL0.CSIHnRXE = 1 (enable reception), CSIHnCTL0.CSIHnMBS = 0 (Memory mode).
3. Configure the send pointer and the number of data by setting bits CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0].
   Start communication by setting CSIHnMCTL2.CSIHnBTST.
4. Communication is started when serial clock comes from master. Bits CSIHnMCTL2.CSIHnSOP[6:0] are automatically incremented and bits CSIHnMCTL2.CSIHnND[7:0] decremented after each data.
5. This is repeated until the last data is transmitted/received. The INTCSIHTIC and INTCSIHTIR are not generated.
6. When all communications are completed, the INTCSIHTIC and INTCSIHTIR are generated. The CPU starts to read the received data from the Rx buffer.
7. The CPU starts to read the received data from the Rx buffer (CSIHnRRA[6:0] is set to 10_H by the software in this figure). The start address of the read access is specified in CSIHnMRWP0.CSIHnRRA[6:0]. These bits are incremented after the reading of every data.
8. To finalize, disable the transmit/receive operation, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE. In order to minimize the power consumption of CSIH while it is not used, set also CSIHnCTL0.CSIHnPWR = 0.

16.6.4 Procedures in FIFO mode

Two examples for a master is provided, one with job mode disabled, the other one with job mode enabled.

16.6.4.1 Transmit/receive in master mode when job mode is disabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No general interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).

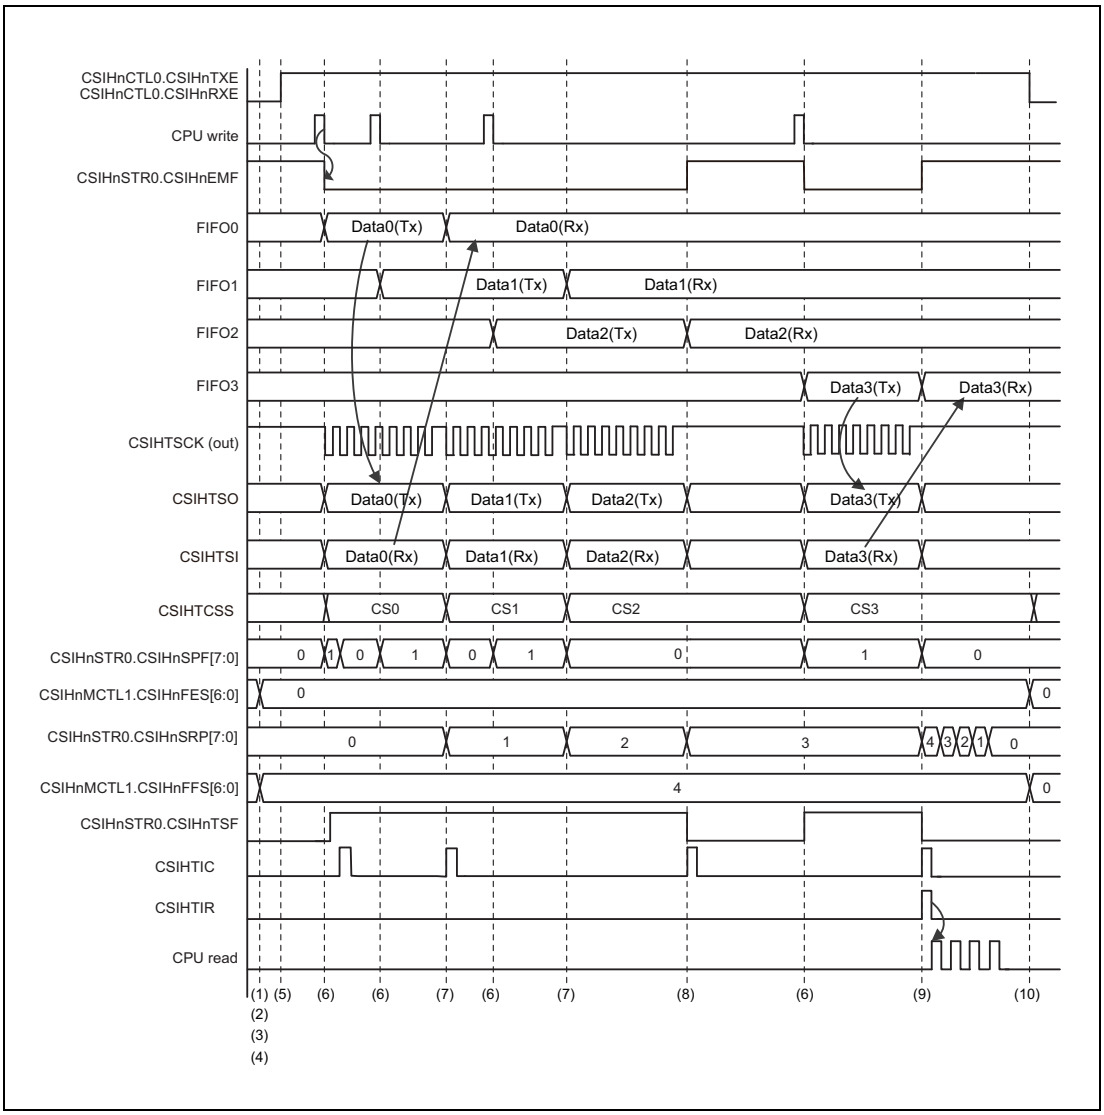

Figure 16.58 Master in FIFO mode, CSIHnCTL1.CSIHnJE = 0

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS0 to CS3.
2. Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
3. Set CSIHnMCTL0.CSIHnMMS[1:0] = 00_B (FIFO mode).
   Set bit CSIHnSTCR0.CSIHnPCT to 1 to clear all buffer pointers.
   Make sure CSIHnSTR0.CSIHnFLF is set to 0, CSIHnSTR0.CSIHnEMF is set to 1, and CSIHnSTR0.CSIHnSPF[7:0] is set to 00_H.
   With CSIHnMCTL1.CSIHnFES[6:0], specify the conditions for the CSIHTIC interrupt and the FIFO empty flag (CSIHnSTR0.CSIHnEMF[6:0]).
   With CSIHnFFS[6:0] in the same register, specify the condition for the CSIHTIR interrupt and the FIFO full flag (CSIHnSTR0.CSIHnFLF).
4. In the CSIHnCTL0 register, set bits CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
5. Write the first data to be sent to the transmission register, CSIHnTX0. Transmission starts automatically when the first data becomes available.
   Make sure CSIHnSTR0.CSIHnEMF is set to 0.
6. The current transmission is complete.
7. Bit CSIHnSTCR0.CSIHnEMF is set to 1 when there is no further data to be transferred into the buffer.
   The interrupt request, CSIHTIC is generated because CSIHnFES[6:0] = CSIHnSPF[7:0].
8. The CSIHTIR is generated because values of CSIHnMCTL1.CSIHFFS[6:0] and (128 - CSIHnSTR0.CSIHnSRP[7:0]) are equal at this timing. The CSIHTIC is generated because values of CSIHnSTR0.CSIHnSPF[7:0] and CSIHnMCTL1.CSIHnFES[6:0] are equal at this timing.
   The CPU starts to read the received data that are stored in the buffer.
9. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation.

16.6.4.2 Master in transmit/receive mode when job mode is enabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0)
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No general interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- JOB1 consists of four data packets, JOB2 consists of three data packets, and JOB3 consists of five data packets.

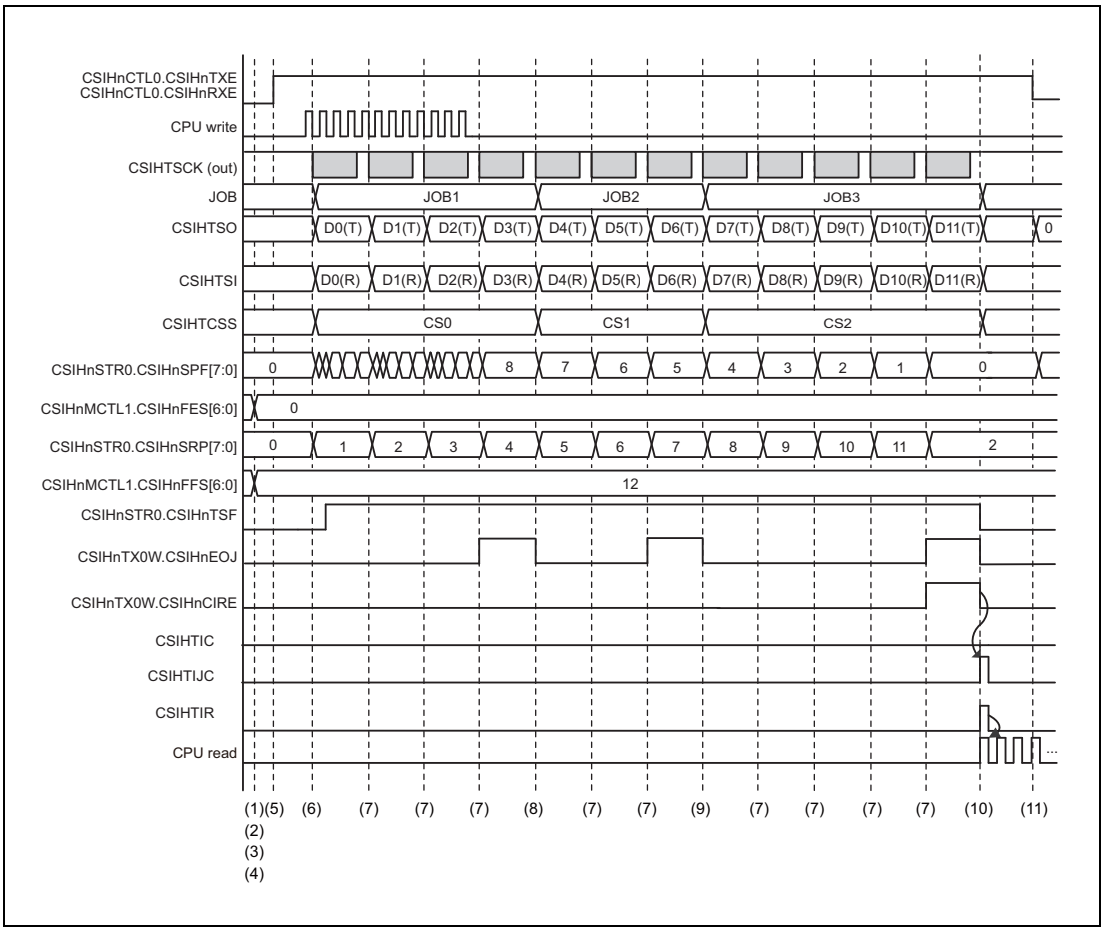

Figure 16.59 Master in FIFO mode, CSIHnCTL1.CSIHnJE = 1

NOTE

"int_JOBE" in the above figure is internal signal of CSIHnCTL0.CSIHnJOBE bit.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. The example uses chip select signals CS0 to CS2.
2. Select the memory mode by setting CSIHnMCTL0.CSIHnMMS[1:0] = 00_B.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
3. Set bit CSIHnSTCR0.CSIHnPCT to 1 to clear all buffer pointers.
4. Make sure CSIHnSTR0.CSIHnFLF is set to 0, CSIHnSTR0.CSIHnEMF is set to 1, and CSIHnSTR0.CSIHnSPF[7:0] is set to 00_H.
   With CSIHnMCTL1.CSIHnFES[6:0], specify the conditions for generating the CSIHTIC interrupt request. With CSIHnMCTL1.CSIHnFFS[6:0], specify the conditions for generating the CSIHTIR interrupt request.
5. In the CSIHnCTL0 register, set bits CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
6. Write the first data packet to be sent to the CSIHnTX0 transmission register. Transmission starts automatically when the first data becomes available.
   Make sure CSIHnSTR0.CSIHnEMF is set to 0.
7. The current transmission is completed.
8. Setting CSIHnTX0W.CSIHnEOJ = 1 specifies that the last data of the current job is sent.
   The CSIHTIC interrupt request is not generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was sent with CSIHnTX0W.CSIHnCIRE = 0.
9. Setting CSIHnCTL0.CSIHnJOBE to 1 forcibly stops communication when JOB3 ends.
10. After communication was stopped forcibly, interrupt requests CSIHTIJC and CSIHTIR are generated at the end of JOB3.
    The CSIHTIJC interrupt request indicates that communication is forcibly terminated when the current job ends.
    Interrupt request CSIHTIC is not generated because interrupt request CSIHTIJC is generated instead. Additionally, the transmission data available in the CSIHnTX0H register is not sent.
11. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation.

16.7 Priority Management Module (PMM)

CSIH Priority Management Module (PMM) is an add-on module of CSIH module with transfer groups & priority handling capability. The PMM will handle up to 8 TG's with six configurable priorities. Each TG will be able to generate two DTS trigger which can be used to load transmit data from local or global RAM and store receive data into local or global RAM. (DTS configuration must be done in software). PMM will enable software to use the same CSIH by different applications simultaneously, without any software synchronization.

16.7.1 Transfer groups

The CSIH communication will be handled by transfer groups (TG).

Each TG has the following properties:

- Configured with one or more jobs
- Six priority levels can be set
- DTS triggers dedicated for receive path and transmit path are used.
  - Can be changed even when another transfer group (TG) is under transferring
  - Can be changed without affecting another transfer group (TG)
  - Can be halted between jobs by the transfer group (TG) with a higher priority
  - Three types of triggers
    Hardware trigger
    Software trigger
    Hardware and software trigger

16.7.1.1 TG structure

The general message format within a TG is shown in **Figure 16.60, TG message format**.

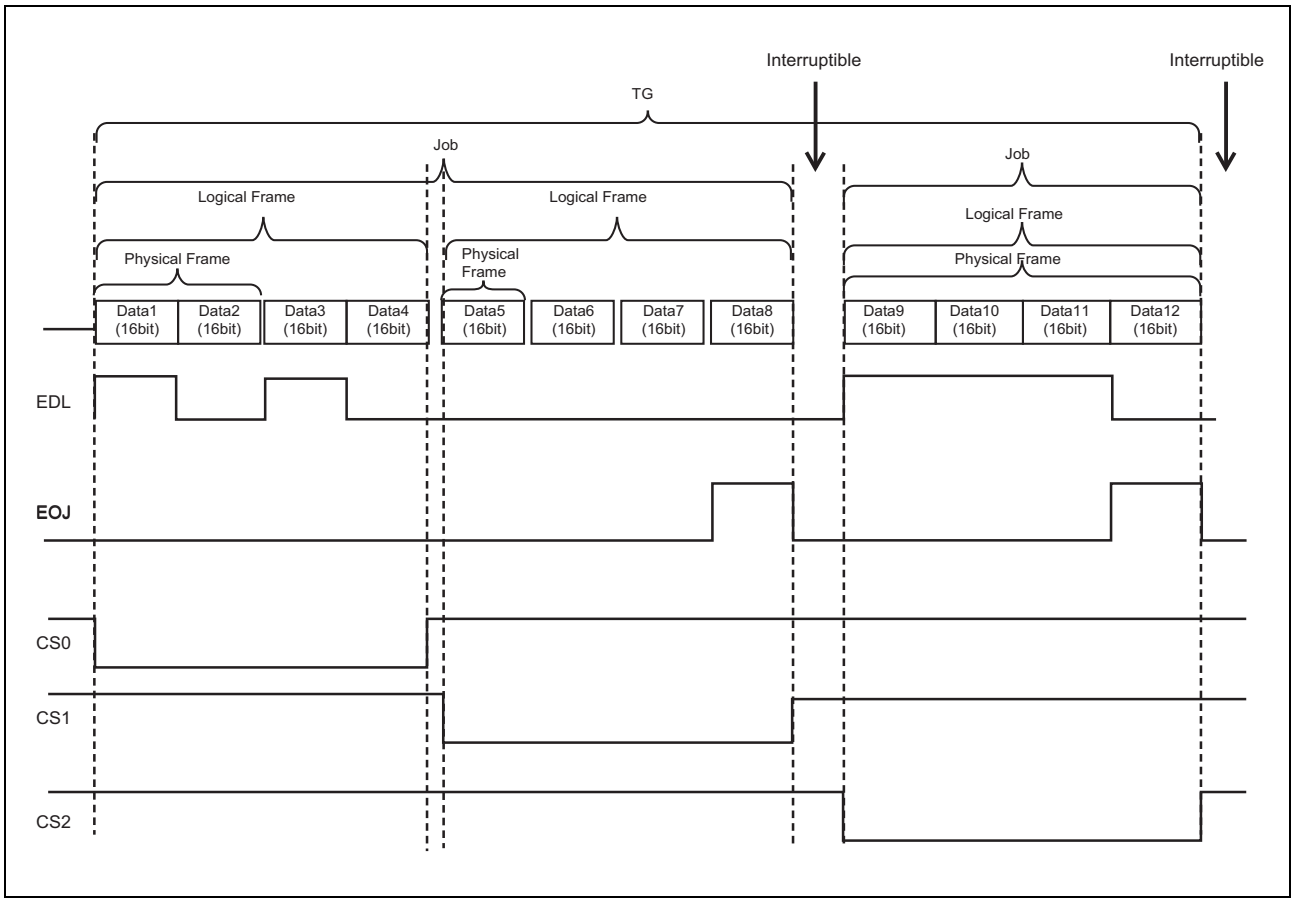

Figure 16.60 TG message format

The TG can be separate in the following units (beginning with the smallest unit):

- Physical frame
- Logical frame
- Job

(1) Physical frame

A physical frame is the smallest atomic transfer of data. The length of the physical frame is flexible (2 bits up to n bit). A physical frame with more than 16 bits will be transferred by means of the EDL feature of the CSIH. For details, see the CSIH description. Within one physical frame the “CS setting” (active CS signal, transfer direction, parity usage, clock/data phase,… see CSIH documentation for details) will not be changed.

The physical frame cannot be interrupted by a higher priority transfer.

(2) Logical frame

A logical frame is a composition of multiple physical frames. The “CS settings” may change between the included physical frames. The logical frame cannot be interrupted by a higher prior transfer.

(3) Job

A Job is a composition of multiple logical frames. The end of a Job must be indicated by setting the EOJ bit in the upper 16 bit of the last Tx data.

After each job the communication is interruptible by a higher priority communication request.

16.7.1.2 TG status

The following different statuses are used to indicate the current status of a TG. See **Section 16.7.4, PMM operation** details.

- **Disabled [PMMAnENm = 0; PMMAnPFm = 0; PMMAnAFm = 0; PMMAnTFm = X; PMMAnRFm = X]**
  TG is not used and is not considered for priority handling and data transfer.
  In this mode the configuration settings in PMMAnTCTLm register can be modified.
  This mode will be entered after a reset occurs and it is the final state after TG transfer.
- **In case of Tx/Rx mode:** The PMMAnTFm and PMMAnRFm flag will be set.
  This indicates that all Tx data was sent to CSIH and all Rx data was read by DTS. TG can be reconfigured and enabled for next transfer.
  See **Section 16.7.5.2** for details.
- **In case of Tx only mode:** only the PMMAnTFm will be set.
  This indicates that all Tx data was sent to CSIH.

NOTE

In case of transition to Disabled mode by set of PMMAnSPm (SW abortion) PMMAnTFm and PMMAnRFm will be set to 0 and PMMTIJC will be generated.

In case of Tx/Rx mode user must wait until data was transferred to the RAM, before reconfiguration for next transfer.

Transition to disabled mode is possible from each mode, except Active mode and wait mode, by setting the STOP trigger bit (PMMAnSPm) in TG control register (PMMAnTCTLm).

If the STOP bit is set for a TG which is currently in the Active mode the TG will be set to disable mode after finishing the current Job.

All needed preconfigurations in RAM, DTS and PMM are done by software and PMM waits for initial trigger.

- **Enabled [PMMAnENm = 1; PMMAnPFm = 0; PMMAnAFm = 0; PMMAnTFm = 0; PMMAnRFm = 0]**
  All needed preconfigurations in RAM, DTS and PMM are done by SW and PMM waits for initial trigger.
- **Pending [PMMAnENm = 1; PMMAnPFm = 1; PMMAnAFm = 0; PMMAnTFm = 0; PMMAnRFm = 0]**
  TG was triggered by SW or HW and Job transfer is pending.
- **Active [PMMAnENm = 1; PMMAnPFm = 1; PMMAnAFm = 1; PMMAnTFm = 0; PMMAnRFm = 0]**
  A Job of TG is currently processed in CSIH and PMM.

NOTE

Only one TG can be active at the same time.

- **Wait [PMMAnENm = 1; PMMAnPFm = 0; PMMAnAFm = 0/1; PMMAnTFm = X; PMMAnRFm = 0]**
  In case of transition to wait mode during normal communication, the PMMAnTFm will be 1.
  In case of transition due to set of PMMAnSPm (SW abortion) PMMAnTFm will be 0.

In case of Tx/Rx mode:

Data transmission of last TG Job to the CSIH has completed.
As long as the last Rx data was not received in PMMAnRX PMMAnAFm = 1.
When Rx data was received in PMMAnRX, but data was not read by DTS, PMMAnAFm will change to 0.

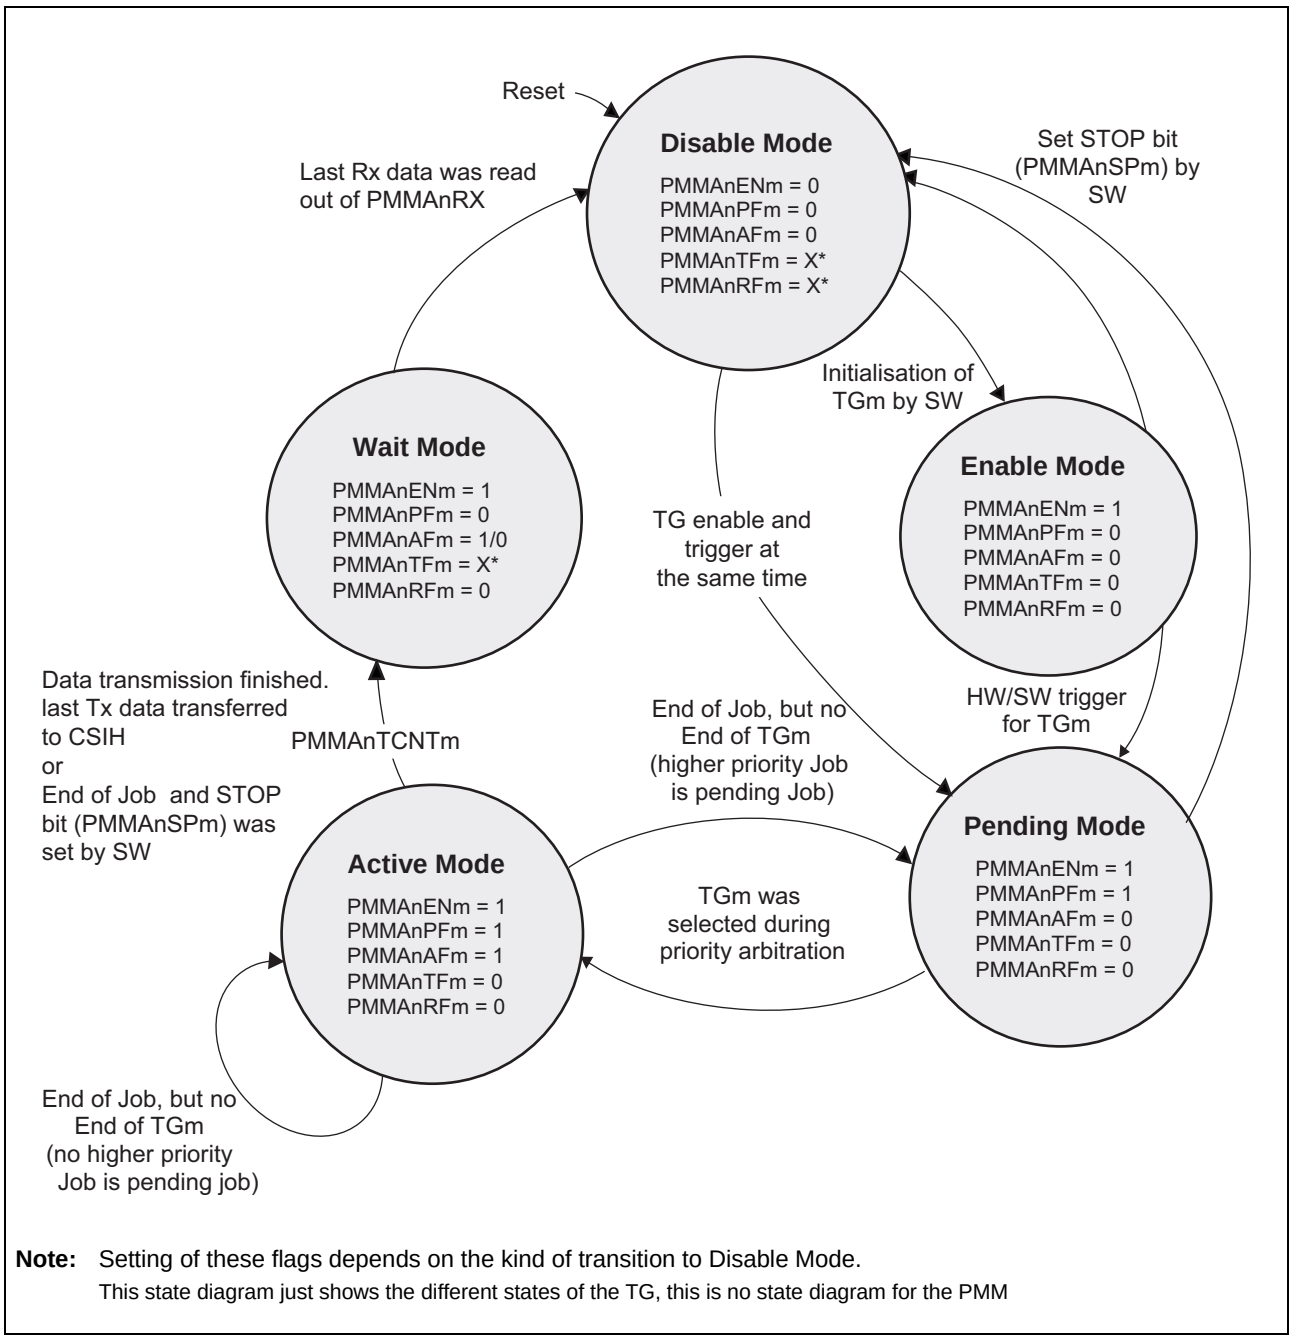
In case of Tx only mode:

Data transmission of last TG Job to the CSIH has completed.
As long as the last “dummy” Rx data was not received in PMMAnRX PMMAnAFm = 1.
When Rx data was received in PMMAnRX, PMMAnAFm will change to 0 and TG will enter disable mode.

NOTE

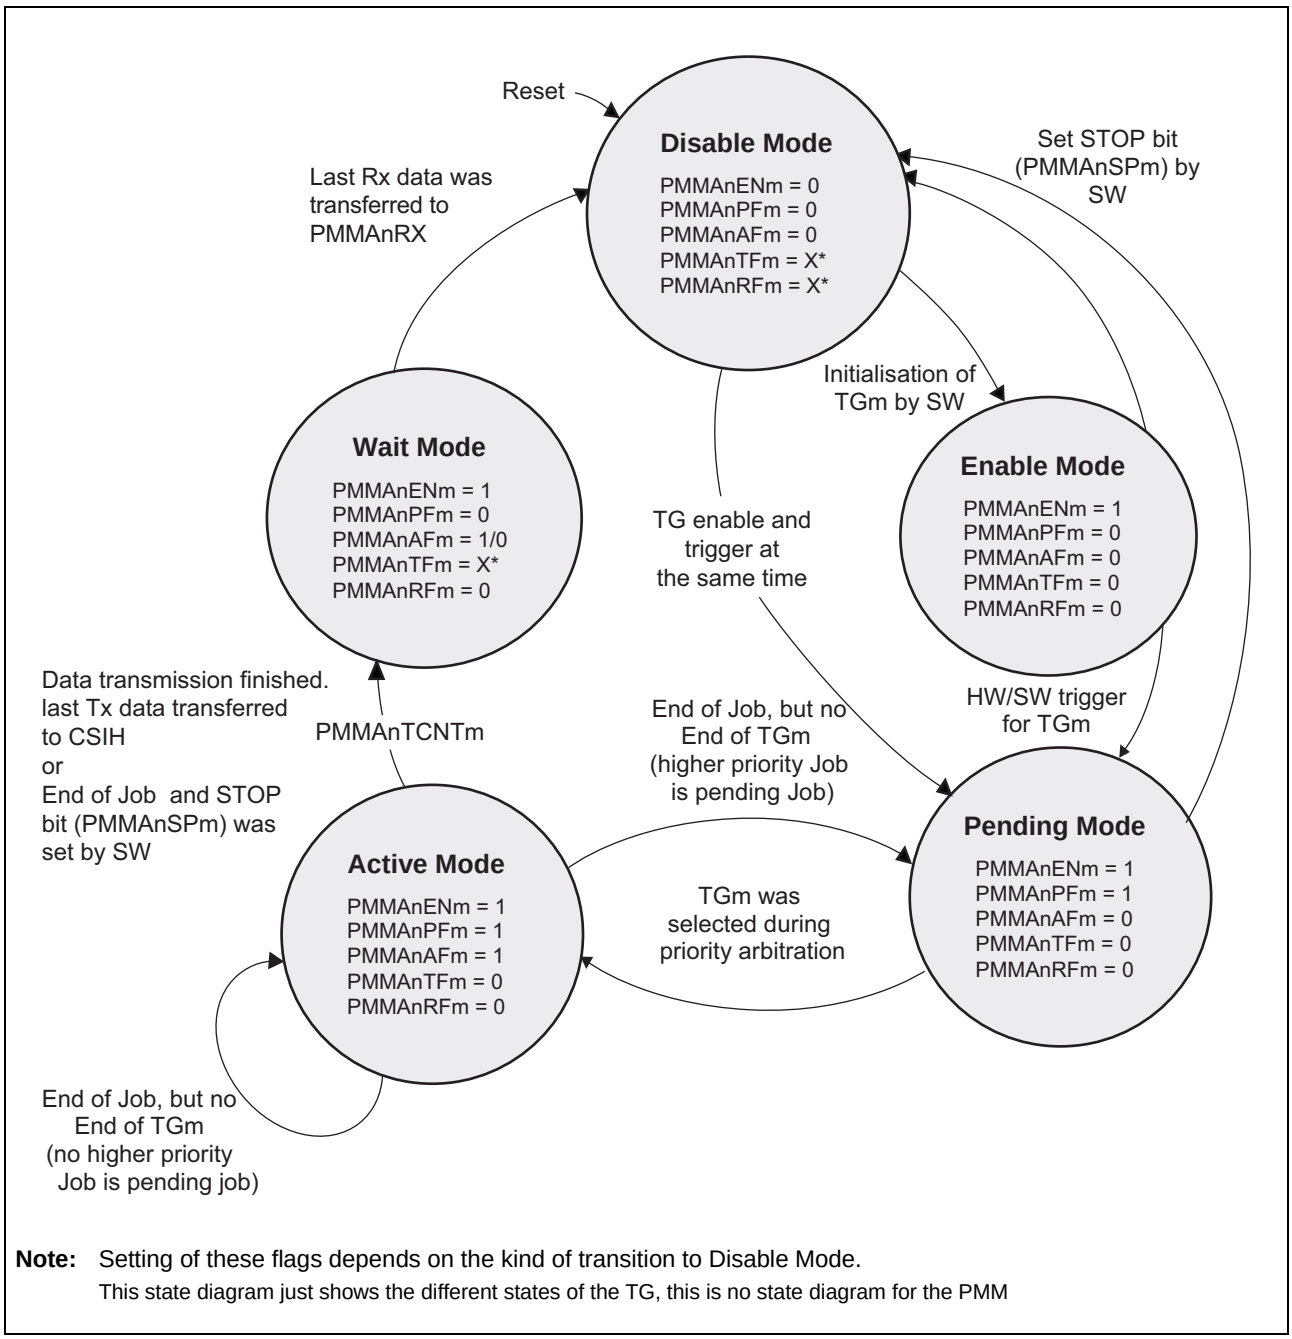
To improve the data throughput the next pending TG will be started when PMMAnAFm changes from 1 to 0.

“dummy” Rx data will be send to PMMAnRX, because CSIH operates always in Tx/Rx mode.



Note: Setting of these flags depends on the kind of transition to Disable Mode.
This state diagram just shows the different states of the TG, this is no state diagram for the PMM

Figure 16.61 TG state diagram (Tx/Rx mode)



Note: Setting of these flags depends on the kind of transition to Disable Mode.
This state diagram just shows the different states of the TG, this is no state diagram for the PMM

Figure 16.62 TG state diagram (Tx only mode)

16.7.1.3 TG Flexible Priority

Priority assignment of each TG's will be done by setting PMMAnPRIOm[2:0] bits of PMMAnTCTLm register. Setting a value of 0 gives the TG the highest priority and setting a value of 5 gives the TG the lowest priority. If two or more TG has same PMMAnPRIOm[2:0] bit setting, then the natural priority will be considered. That is, TG0 has the highest priority and TG7 has the lowest priority.

Writing to PMMAnPRIOm[2:0] bits of PMMAnTCTLm register is only allowed when the TGm is in the disable mode.

16.7.2 Block Diagram

The block diagram shows the main components of the PMM.

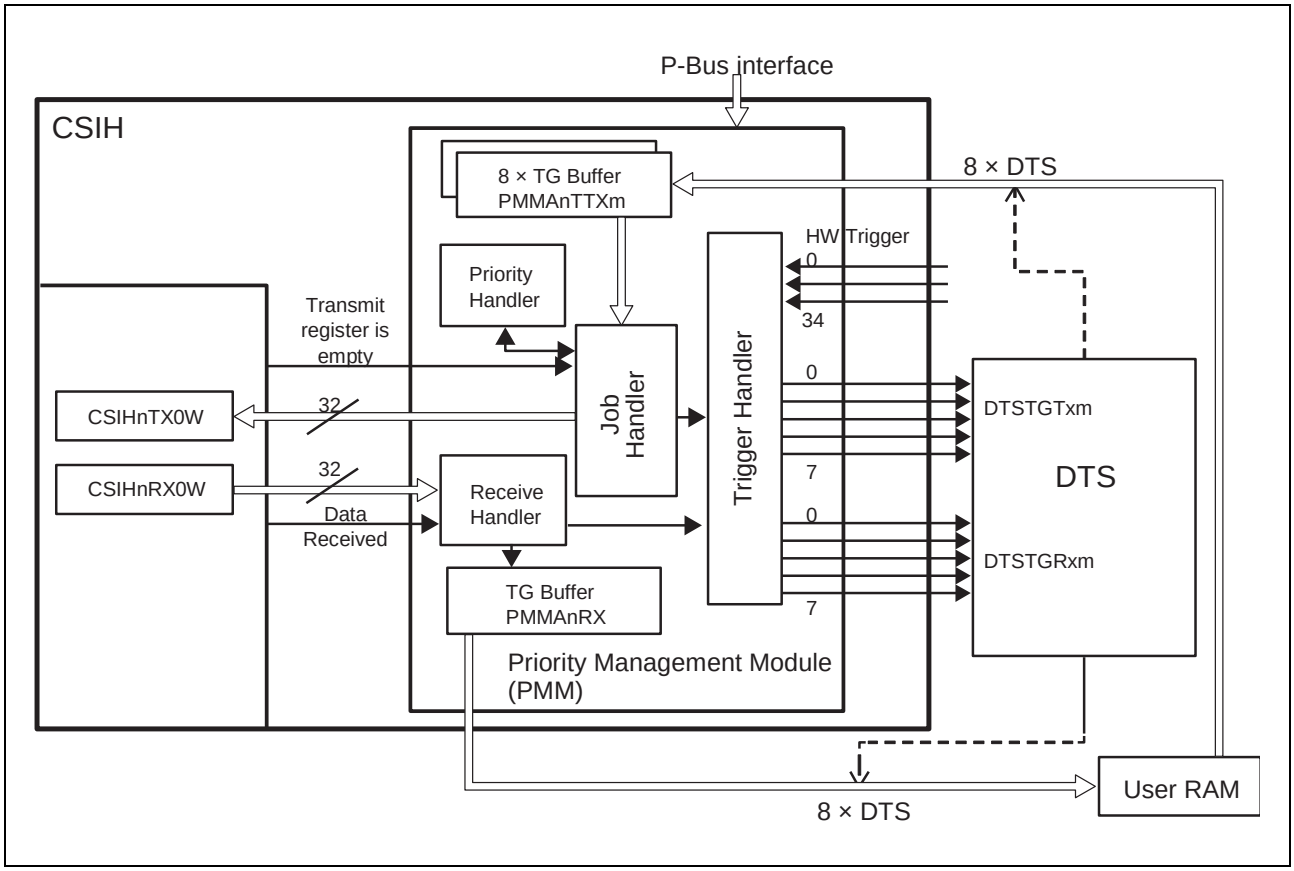


Figure 16.63 Block diagram of PMM

16.7.3 Functional Overview

- One PMM per CSIH instance
- Support of up to 8 transfer groups, each with six configurable priority levels
- Three interrupt request signals
  - PMMTIC: Data transfer to CSIH of TG finished
  - PMMRIC: Data reception in CSIH and PMM finished (Tx/Rx mode). Data transfer finished (Tx only mode).
  - PMMTIJC: TG was aborted by PMMAnSPm bit.

Each TG has the following capability

- Generation of DTS trigger signals for receive and transmit path
- Software and hardware triggered start of TG transfer
- Selectable hardware trigger source from multiple input signals
- Enable/Disable TG
- Support TG length of up to 256 × 32bit (data + control bits)
- Support of EDL functionality of CSIH
- Configurable job length by EOJ bit in control bits of the Tx data

NOTE

PMMTIC is shared with CSIHTIC

PMMRIC is shared with CSIHTIR

PMMTIJC is shared with CSIHTIJC

16.7.3.1 Function description

The PMM can manage the communication of up to 8 different TG's. The user only has to set up the TG structure in RAM and configure the DTS and PMM accordingly. As soon as the TG was triggered by hardware or software, the PMM handles the complete communication between local RAM and CSIH for transmit and receive communication. Data transfer between local RAM and PMM is done by DTS and peripheral bus. Therefore the PMM can trigger up to 16 different DTS channels, 8 for transmit and 8 for receive path. The transfer from PMM to CSIH is done directly, without bus usage.

The start of a TG communication can be triggered by software and/or hardware. The PMM has up to 35 hardware trigger inputs which can be assigned to the different TG's. (Each TG can be assigned to only one hardware or software trigger)

As soon as a TG was triggered, the PMM will process the first Job of the TG. To handle also more than one pending TG, the PMM process priority arbitration after each Job end to serve always the highest prioritized TG next.

16.7.3.2 TG buffer

To minimise delay time, due to peripheral bus load, and to handle DTS lock phase the PMM is equipped with 9 data buffers, one transmit buffer (PMMAnTTXm) for each TG and one common receive buffer (PMMAnRX). In PMMAnTTXm the data from local RAM to CSIH are buffered. In PMMAnRX the received data from CSIH are buffered before sending them to local RAM via DTS. Each buffer contains 32bits to store the complete CSIHTx0W and CSIHRx0W content.

NOTE

To avoid any loss of data, due to a delay in reading the received data from PMMAnRX.

The PMM is equipped with a flow control, which stops loading data to CSIH in case of receive path is fully loaded.

16.7.3.3 Trigger Handler

The DTS trigger logic handles the incoming hardware trigger signals, the software trigger and it generates the DTS trigger signals for each TG.

(1) Trigger inputs

The user application can trigger the communication of a TG by following trigger options

- Software trigger
- Hardware trigger
- Hardware trigger and software trigger

Following external hardware trigger sources will be supported. The used hardware trigger can be set in PMMAnTCTLm register separately for each TG.

NOTE

One Trigger can be assigned to several TG. In this case each TG will be triggered by this trigger. If a hardware or software trigger will occur for an already started TG the trigger will be ignored by the PMM.

Table 16.53 PMM External trigger sources (1/2)

PMMAnHWTm[5:0]	Unit	Trigger source
000000	Pin	External Interrupt 0 (INTP0)
000001	Pin	External Interrupt 1 (INTP1)
000010	Pin	External Interrupt 2 (INTP2)
000011	Pin	External Interrupt 3 (INTP3)
000100	STM0	STM0_interrupt 0
000101	STM0	STM0_interrupt 1
000110	GTM	Interrupt 0 from sub module MCS0
000111	GTM	Interrupt 1 from sub module MCS0
001000	GTM	Interrupt 2 from sub module MCS0
001001	GTM	Interrupt 3 from sub module MCS0
001010	GTM	Interrupt 4 from sub module MCS0
001011	GTM	Interrupt 5 from sub module MCS0
001100	GTM	Interrupt 0 from sub module MCS1
001101	GTM	Interrupt 1 from sub module MCS1
001110	GTM	Interrupt 0 from sub module ATOM0
001111	GTM	Interrupt 1 from sub module ATOM0
010000	GTM	Interrupt 2 from sub module ATOM0
010001	GTM	Interrupt 3 from sub module ATOM0
010010	GTM	Interrupt 4 from sub module ATOM0
010011	GTM	Interrupt 5 from sub module ATOM0
010100	GTM	Interrupt 6 from sub module ATOM0
010101	GTM	Interrupt 7 from sub module ATOM0
010110	GTM	Interrupt 0 from sub module ATOM1
010111	GTM	Interrupt 1 from sub module ATOM1
011000	GTM	Interrupt 2 from sub module ATOM1
011001	GTM	Interrupt 3 from sub module ATOM1

Table 16.53 PMM External trigger sources (2/2)

PMMAnHWTm[5:0]	Unit	Trigger source
011010	GTM	Interrupt 4 from sub module ATOM1
011011	GTM	Interrupt 5 from sub module ATOM1
011100	GTM	Interrupt 6 from sub module ATOM1
011101	GTM	Interrupt 7 from sub module ATOM1
011110	GTM	Interrupt 0 from sub module ATOM2
011111	GTM	Interrupt 1 from sub module ATOM2
100000	GTM	Interrupt 2 from sub module ATOM2
100001	GTM	Interrupt 3 from sub module ATOM2
100010	GTM	Interrupt 4 from sub module ATOM2
Other than above	—	Setting prohibited

NOTE

When setting all except for 000000-100010 as PMMAnHWTm[5:0], a trigger becomes invalid.

16.7.4 PMM operation

16.7.4.1 Input trigger handling

After enabling the TG (see **Section 16.7.5.1, TG Preconfiguration:**) the Trigger Handler will observe the corresponding trigger source.

(1) When a hardware or software trigger occurs for an enabled TG, the PMM will set the TG to status pending by setting the bit PMMAnPFm. This indicates that this TG must be processed.

(2) In addition the DTSTGTXm trigger will be generated to trigger the transfer of the first data from RAM into PMMAnTTXm register.

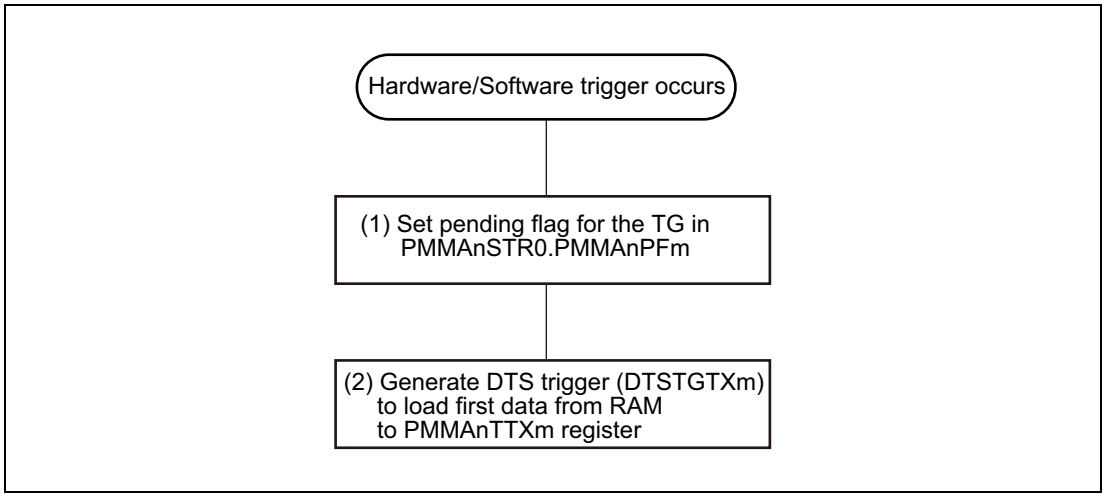

Figure 16.64 Initial TG trigger (Input)

NOTE

At the time of pending, if HW trigger and SW trigger are input, DTSTGTXm is not output.

16.7.4.2 Output trigger handling

The DTS trigger transmit path (DTSTGTXm) will be generated direct after initial software or hardware trigger (see **Section 16.7.4.1, Input trigger handling**) and by Job Handler (see **Section 16.7.4.4, job Handler**). Each time the Job Handler triggers the DTS the following flow will be processed. At first the Trigger Handler will check for the current active TG, then the corresponding DTS trigger will be generated.

The DTS trigger for the receive path (DTSTGRXm) will be generated only by the Receive Handler when PMM is operation in Tx/Rx mode.

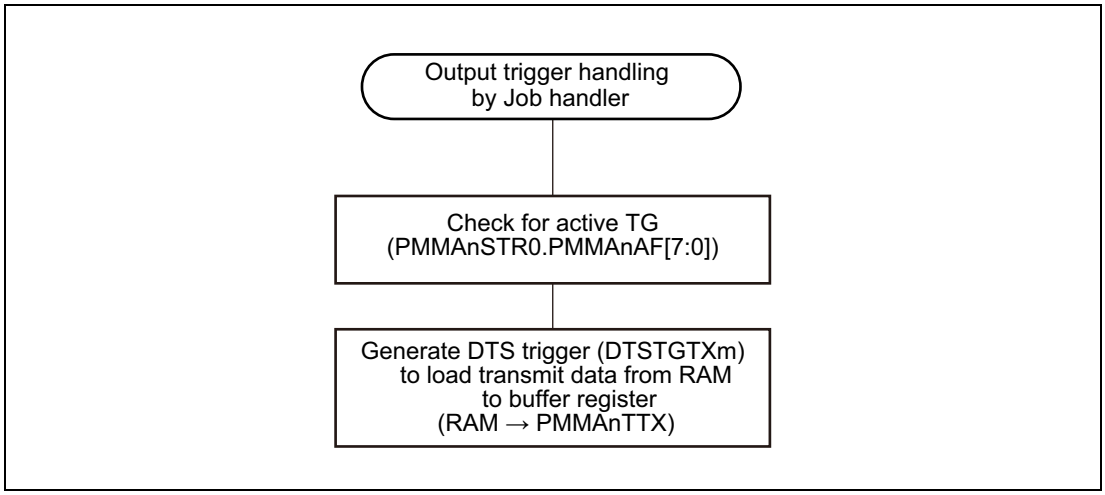

Figure 16.65 Initial TG trigger (output)

16.7.4.3 Priority Handler

The priority handler module inside the PMM detects the pending TG with the highest priority after every job end and services this TG number next.

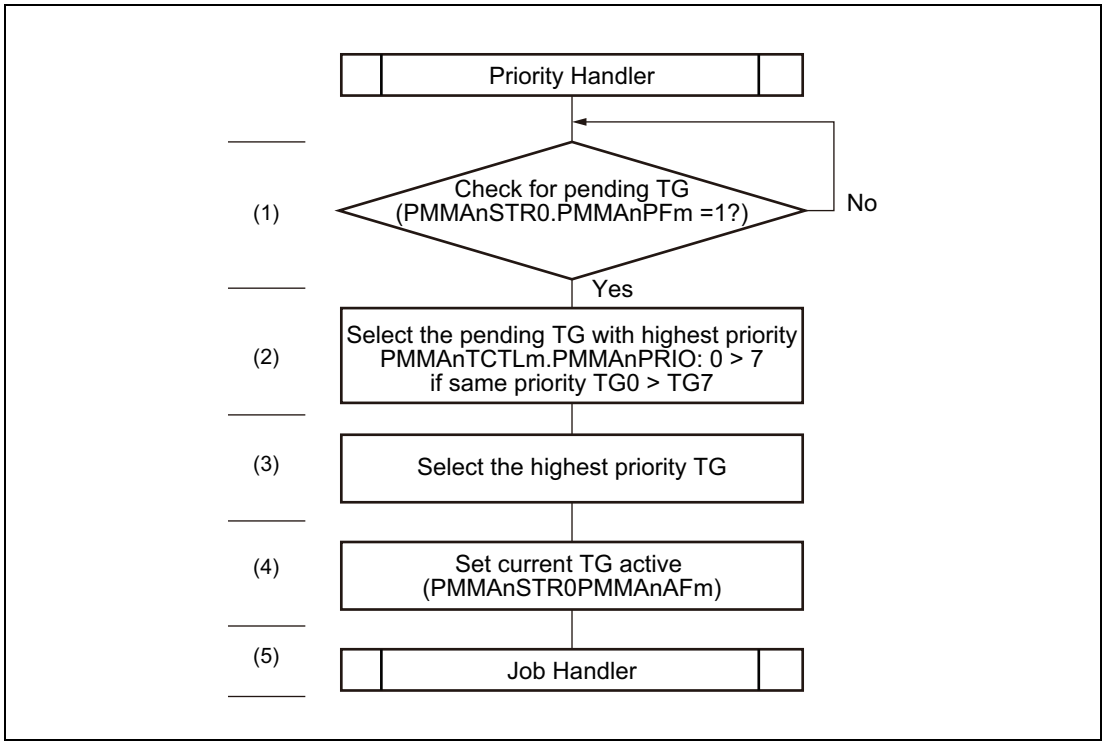

Figure 16.66 Priority Handler flow

(1) If no TG is pending the Priority handler will stay in idle/wait state.

(2) If there is a pending TG the Priority handler will select the pending TG with the highest set priority in the PMMAnTCTLm register, if two or more TG's have the same priority the natural priority (TG number) will be considered (TG0 has the highest priority).

(3) As the result the pending TG with the highest priority will be set active.

(4) Before starting the Job handler the selected TG will be set as active in PMMAnSTR0.PMMAnAFm.
Note: Only one TG can be active at the same time. All other PMMAnAFm bits must be cleared.

(5) Finally, the next Job of the highest prior TG will be processed in the Job handler.

Finally, the next Job of the highest prior TG will be processed in the Job handler.

After finishing the Job in the Job handler and in the Receive Handler, the Priority Handler will start from the beginning, to consider also new triggered TG's. Thereby, it is ensured that after each Job, always the next Job of the highest pending TG will be executed.

NOTE

When selecting the highest priority TG, even if write data isn't loaded from RAM the highest priority pending TG at the time is selected. The waiting time forms until data is loaded in TG from RAM in this case.

16.7.4.4 job Handler

The Job Handler is handling the transfer of data from PMM to CSIH and it will generate the DTS trigger signals via the DTS trigger module.

NOTE

The Job Handler will be active for the complete Job transfer. The Priority Handler will not operate during this time.

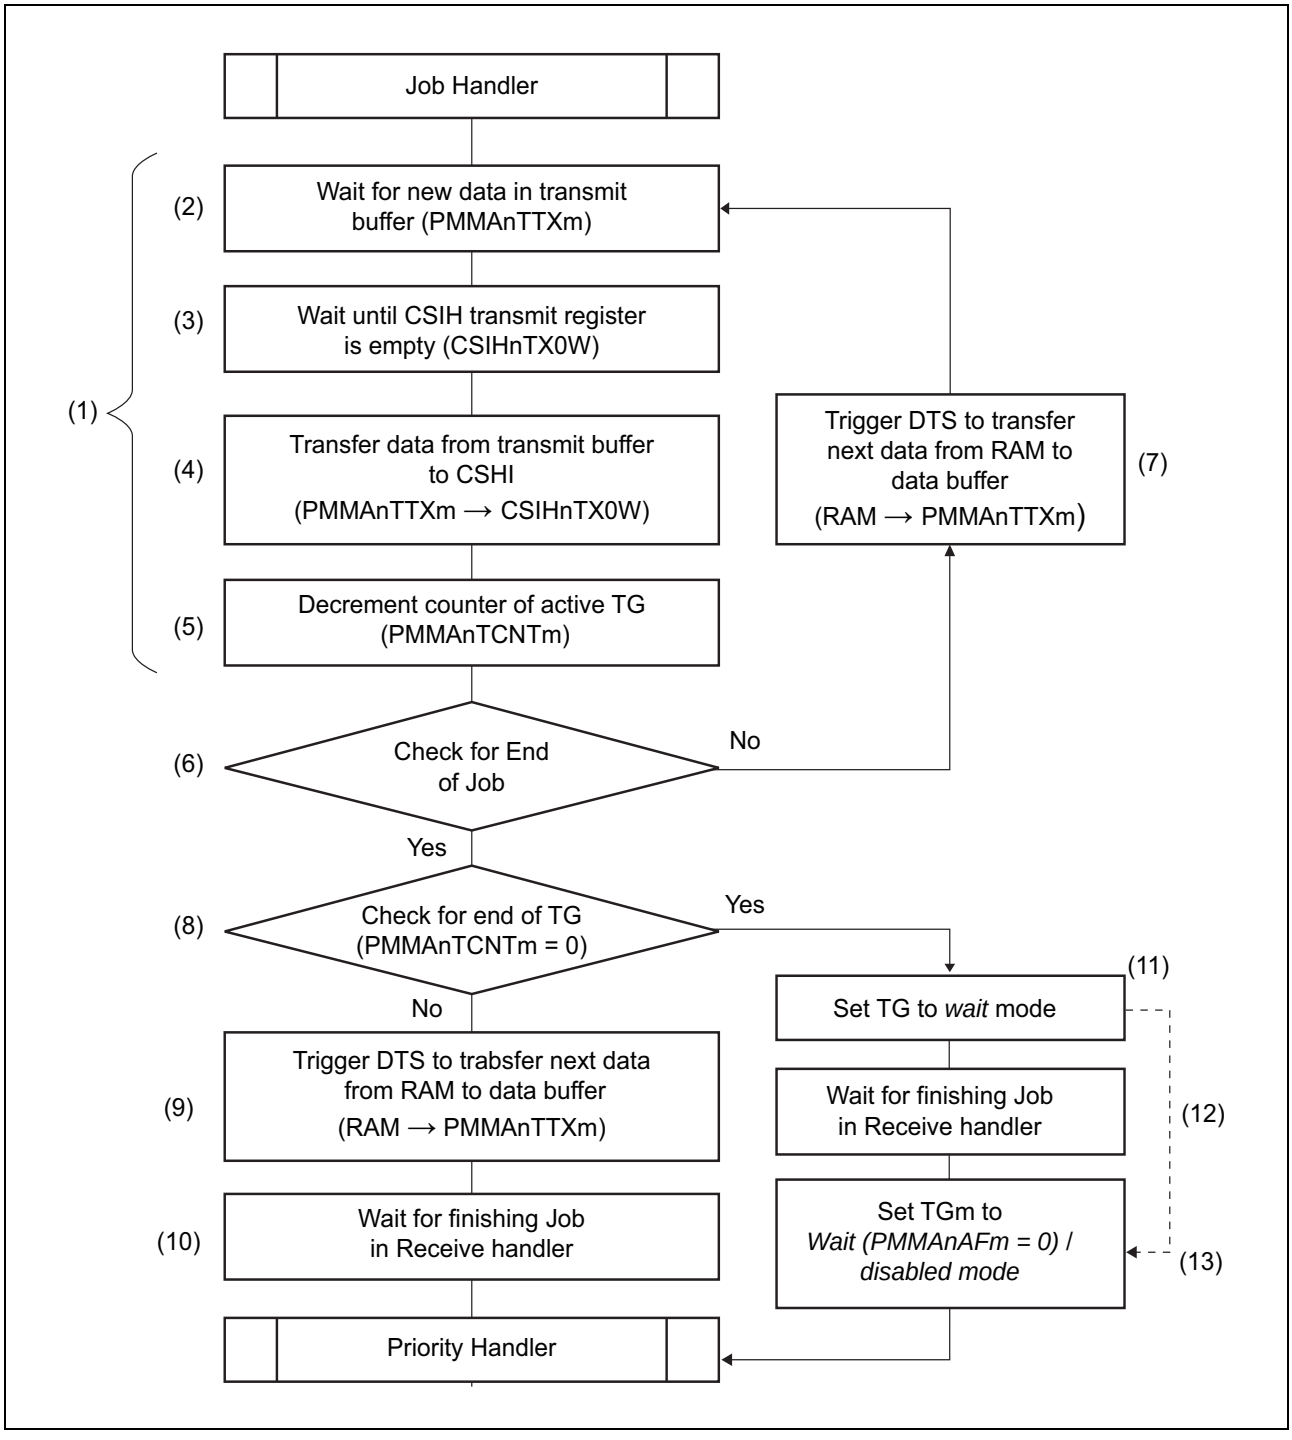

Figure 16.67 Job Handler flow

(1) In the main loop of the Job Handler the communication to the CSIH will be done.

(2) In each case the loop starts with a check if new data in PMMAnTTXm register are available. This check will be done to handle a possible delay between the DTS trigger and data reception in PMMAnTTXm, due to bus load or DTS lock phase.

(3) In the next step the TG Handler has to check if CSIH is ready to receive new Tx data.

(4) If both checks are done (new data are available and CSIH is ready), the Job handler will transfer the data from PMMAnTTXm to CSIH.

NOTE

The data of PMMAnTTXm will be treated as empty register automatically after data shift to transmit buffer register from PMMAnTTXm.

(5) After this the corresponding TG counter (PMMAnTCNTm) will be decremented to detect the end of the TG in further check.

(6) To decide if the loop (1) can be exit or not, the EOJ bit of the transferred data in step (4) will be checked.

(7) If the EOJ bit was not set, the DTSTGTXm signal of the active TG will be triggered to load the next data to PMMAnTTXm register and the loop (1) will start from the beginning.

(8) If the EOJ bit was set (Job has finished) the loop (1) will be exit and the Job Handler will check if this is also the end of the TG (TG counter = 0).

(9) If TG has not finished (TG counter ≠ 0), the DTSTGTXm trigger will be generated to pre-load the next data to PMMAnTTXm register.

(10) After this the Job Handler will wait until the last data of the active Job was processed in Receive Handler, before entering the Priority Handler.

In case of Tx/Rx mode:

(11) If EOJ bit was set and the TG has finished (TG counter = 0), Job Handler will set current TG to wait mode (PMMAnPFm = 0 and PMMAnTFm = 1) .

(12) The Job handler will wait until the DTS trigger for the last data of the active TG was triggered in Receive Handler.

(13) Before clearing the PMMAnAFm flag (TG still remains in wait mode).

NOTE

As soon as the data in PMMAnRX was read by DTS the TG will be set to disabled mode.

In case of Tx only mode:

(14) If EOJ bit was set and the TG has finished (TG counter = 0).

(15) Job Handler will set the PMMAnTFm in PMMAnSTR1 (9) and set the TG directly to Disabled mode.

The synchronisation (10) and (12) with the receive path has the following function:

- It ensures that always the correct DTS channel will be triggered in Receive Handler, because no other TG will be set to active before the trigger for the last DTS transfer was generated.
- It ensures that priority arbitration will not start before the Job has completely finished. Therefore, all triggers which occurred during the complete previous Job transfer will be considered in Priority Handler.
- It ensures that the PMMAnRFm flag will be set when PMM has completely processed the corresponding TG. (Including reading data from PMMAnRX register)

NOTE

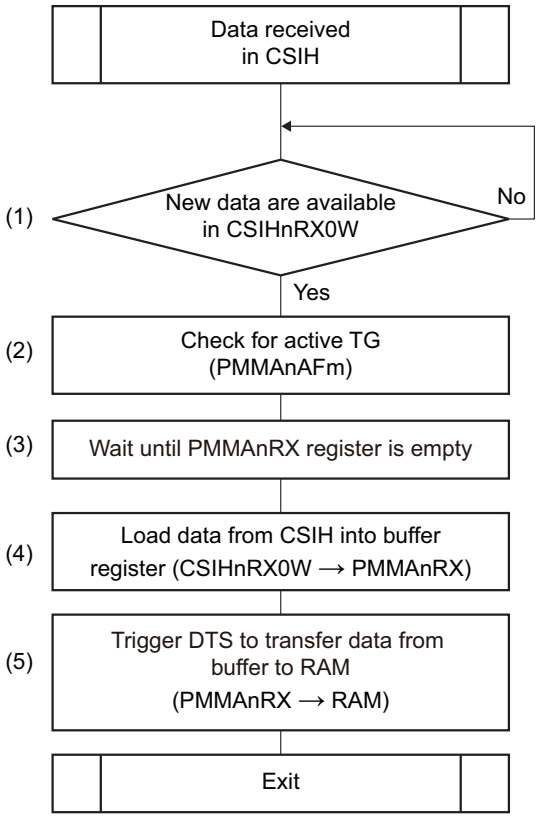
As soon as the TF flag will be set the PMMTIC interrupt will be generated.
(PMMTIC will be shared with CSIH interrupt signal)

As soon as the RF flag will be set the PMMRIC interrupt will be generated.
(PMMRIC will be shared with CSIH interrupt signal)

When the Job Handler has finished, the Priority handler starts operation from the beginning.

16.7.4.5 Receive Handler

When data reception in CSIH has completed and new received data are available, the Receive Handler will be automatically started.



Note: The DTS trigger will only be generated if the TG was set to Transmit and Receive mode in PMMAnTCTLm.

Figure 16.68 Receive Handler flow

(1) On the arrival of a new data in CSIHnRX0W that will be notified to PMM (1).

(2) PMM will check for the active TG.This check will avoid overwriting of data inside receive buffer.

(3) Wait until receive buffer (PMMAnRX) is empty.

(4) If the buffer is empty the Receive Handler will shift the data from CSIHnRX0W to PMMAnRX.

(5) As last action the DTS receive trigger DTSTGRXm will be generated for the active TG to load the data from PMMAnRX to local RAM and the Receive Handler will exit.

NOTE

The data of PMMAnRX will be treated as empty register automatically after DTS read access. Loss of Read data is stopped by making them wait for SPI communication because PMM can't stock data of CSIHnRX0W in PMMAnRX an APB bus is locked by CPU access, and when being not forwarded data to RAM from PMMAnRX.

16.7.5 PMM operation description

16.7.5.1 TG Preconfiguration:

Before using the TG and priority handling of the PMM, the following initialization must be done by application:

- Store the complete TG transmit data in RAM.
  - Including control bits for each 16 bit entry
  - Data must be stored in a consecutive order
- Set up DTS channel for transmit path
  - Source address: first transmit data of TGm in RAM (decrementing or incrementing)
  - Destination address: corresponding PMMAnTTXm register in PMM (fixed)
  - Transfer length: 32 bit
  - Count: total number of buffer entries (32 bit entry: 16 control bits + 16 data bits)
  - Trigger: DTSTGTXm from PMM
- Set up DTS channel for receive path
  - Source address: corresponding PMMAnRX register in PMM (fixed)
  - Destination address: first receive data of TGm in RAM (decrementing or incrementing)
  - Count: total number of buffer entries (32 bit entry: 16 control bits + 16 data bits)
  - Trigger: DTSTGRXm from PMM
- Configure CSIH
  - Master mode
  - Tx/Rx mode
  - Direct access mode
  - EDL in case of communication >16 bit
- Configure PMM PMMAnTCTLm
  - Select trigger option (Software and/or hardware)
  - Select hardware trigger source, in case of hardware triggering
  - Set the transfer mode (Transmit only or Transmit and Receive)

NOTE

If the parity check function of the CSIH will be used, it is recommended to use the PMM in Tx/Rx mode for all TG's.

Background:

CSIH will perform parity check for all TG's also for TG which will not receive data.

This will generate erroneous parity errors which will be flagged in the Rx data of the CSIH.

To detect erroneous parity errors correctly, all Rx data must be available for the user.

– Set length of TG
– Set the priority
– Clear transmit and receive status flags by PMMAnCLTFm and PMMAnCLRFm.

If all these configurations are done, the TG can be enabled in PMM PMMAnTCTLm register.

By enabling the TG the following operation will/should be executed:

- Software should ensure not to write in the control register bits (except the PMMAnSPm bit and PMMAnSWTm bit), to avoid reconfiguration of the TG during active transfer.
- PMM will load TG length in PMM counter (PMMAnTCNTm)
- PMM will clear the PMMAnTTXm register to avoid use of old data in the job handler sequence.

NOTE

The other TG control registers must kept unlocked to enable configuration of a new/disabled TG during PMM operation.

The data of PMMAnTTXm will be treated as empty register automatically after data shift to transmit buffer register from PMMAnTTXm.

The setting flow of Power ON/OFF of CSIH, PMM is below. Be sure to follow this flow

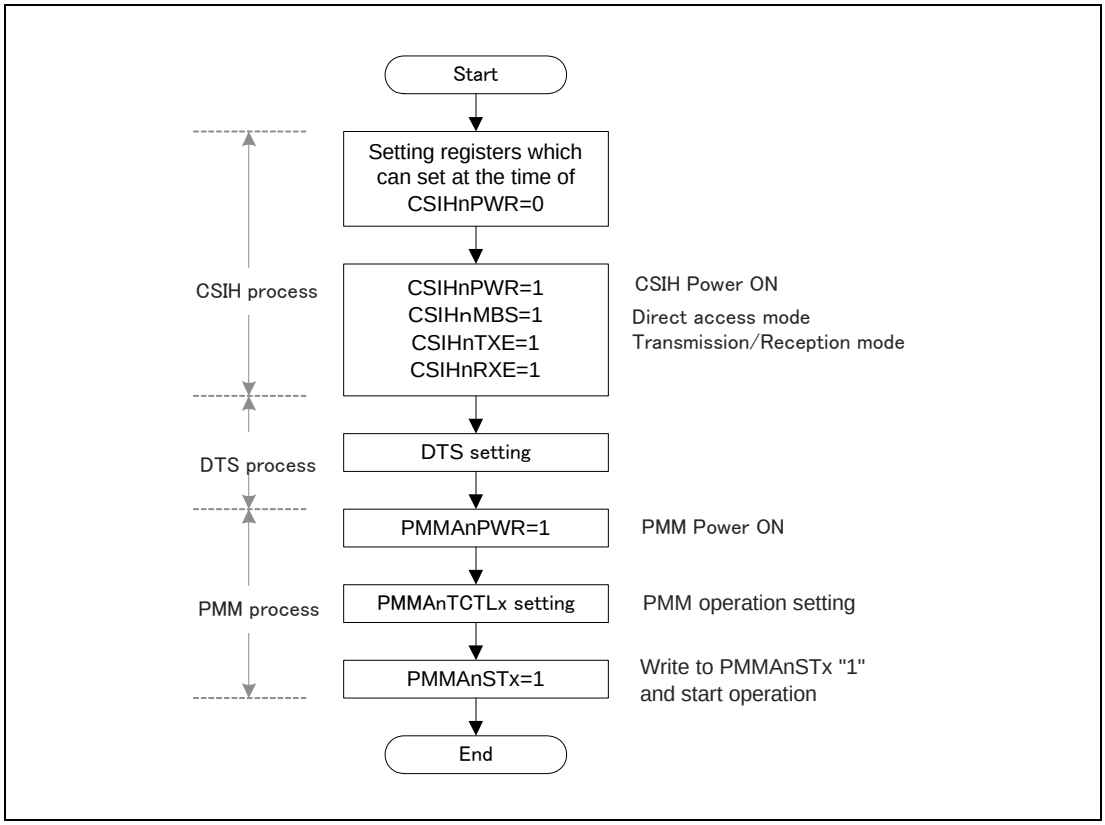


Figure 16.69 Power on flow

The setting of PMMAnPWR=1 and PMMAnTCTLx is inconsecutive. The setting of PMMAnTCTLx is also possible at PMMAnPWR=0.

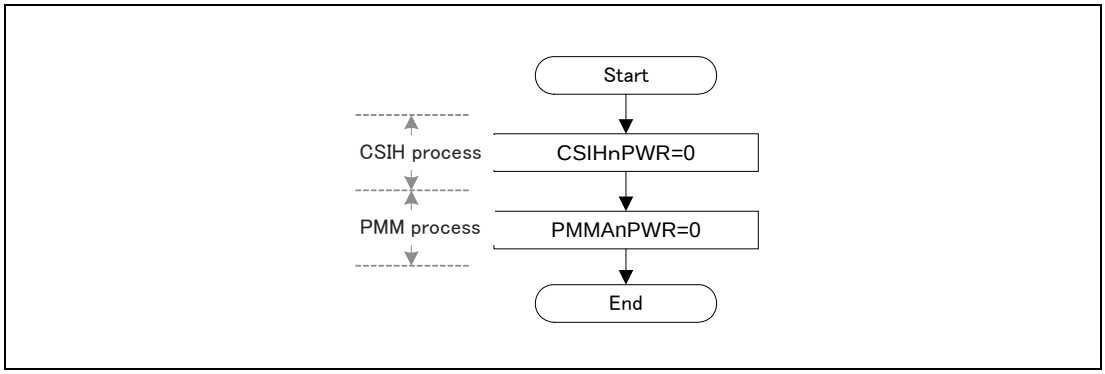

Figure 16.70 Power off flow

Be sure to turn off power by the order of CSIHnPWR->PMMAnPWR.

16.7.5.2 TG Reconfiguration:

After a TG was transferred completely and entered the disable mode, software has to do the following reconfigurations to set-up the next TG transmission:

- Set up DTS channel for transmit path
  Count: total number of buffer entries (32 bit entry: 16 control bits + 16 data bits)
- Set up DTS channel for receive path
  Count: total number of buffer entries (32 bit entry: 16 control bits + 16 data bits)
- Set up PMM
  - Select trigger option (Software and/or hardware)
  - Select hardware trigger source, in case of hardware triggering
  - Set the transfer mode (Transmit only or Transmit and Receive)
  - Set length of TG
  - Set the priority
  - Clear transmit and receive status flags by PMMAnCLTFm and PMMAnCLRFm.
  - Enable the TG by the start bit (PMMAnSTm) bit in the PMMAnTCTLm register.

16.8 Difference among P1M-C, P1H-C and P1H-CE

- CSIH3CSS4, CSIH3CSS5, CSIH3CSS6, CSIH3CSS7, CSIH3DCS1, CSIH3DCS2, CSIH3RYI, CSIH3RYO, CSIH3SCI1, CSIH3SCI2, CSIH3SCO1, CSIH3SCO2, CSIH3SI1, CSIH3SI2, CSIH3SO1, CSIH3SO2, CSIH3SSIZ are not available in P1M-C (QFP-144)
- CSIH3CSS4, CSIH3CSS5, CSIH3DCS2, CSIH3SCI2, CSIH3SCO2, CSIH3SI2, CSIH3SO2, CSIH3SSIZ are not available in P1M-C (BGA-292)
- CSIH0DCS1, CSIH0DCS2, CSIH0SCI1, CSIH0SCI2, CSIH0SCO1, CSIH0SCO2, CSIH0SI1, CSIH0SI2, CSIH0SO1, CSIH0SO2, CSIH1DCS2, CSIH1RYI, CSIH1RYO, CSIH1SCI2, CSIH1SCO2, CSIH1SI2, CSIH1SO2, CSIH2CSS4, CSIH2CSS5, CSIH2RYI, CSIH2RYO, CSIH3CSS1, CSIH3CSS3, CSIH3CSS4, CSIH3CSS5, CSIH3CSS6, CSIH3CSS7, CSIH3DCS1, CSIH3DCS2, CSIH3RYI, CSIH3RYO, CSIH3SCI1, CSIH3SCI2, CSIH3SCO1, CSIH3SCO2, CSIH3SI1, CSIH3SI2, CSIH3SO1, CSIH3SO2, CSIH3SSIZ are not available in P1M-C (BGA-156), P1H-C (4MB, BGA-156)
- See **Table 16.10** for difference in Data Consistency Check

Section 17 High Speed USRT (HS-USRT)

This section describes the High-speed USRT (HS-USRT) module.

The first subsection describes all the characteristics specific to the RH850/P1x-C such as channels, register base addresses, and input/output signal names.
The second and subsequent subsections describe characteristics common to all the versions.

17.1 RH850/P1x-C HS-USRT Overview

17.1.1 Number of Channels

The RH850/P1x-C includes up to four HS-USRT channels.

Table 17.1 HS-USRT Channels

	HS-USRT	
Product Name	P1M-C, P1H-C (4MB, BGA-156)	P1H-C (4MB, BGA-292), P1H-C (8MB), P1H-CE
Number of Channels	2	4
Name	HSUSn (n = 0 , 1)	HSUSn (n = 0 to 3)

Index n

This section identifies each HS-USRT channel by “n”. For example, the HS-USRT clock enable register is described as HSUSnCKEN.

17.1.2 Register Addresses

HS-USRT register addresses are represented by an offset from the base address <HSUSn_base>.

The following table shows the base address <HSUSn_base> of each HS-USRT module.

Table 17.2 Register Base Address <HSUSn_base>

HS-USRTn Channel	<HSUSn_base> Address
HSUS0	FFD8 8000_H
HSUS1	FFCA 8000_H
HSUS2	FFD8 9000_H
HSUS3	FFCA 9000_H

17.1.3 Clock Supply

The following clock input is supplied for the HS-USRT module.

Table 17.3 HS-USRT Clock Source

Module	Clock Name	Clock symbol	Description
HSUSn	High Speed system clock	CLK_HSB	High speed Bus clock (HCLK)
HSUSn	High Speed system clock	CLK_HSB	Peripheral Bus clock (PCLK)
HSUSn	High Speed Peripheral clock 2	CLKP_H2	Internal clock for transmission (TXCLK)

Note 1. The max. input clock for HCKL and PCLK is 80MHz.

Note 2. The following condition must be fulfilled:
- CLK_HSB >= CLKP_H2
- CLK_HSB > SCKIO (only in case of data reception)

For detail of clock supply, see **Section 12, Clock Controller**.

17.1.4 Interrupts and DMA/DTS

The HS-USRT module can generate the following interrupt requests.

Table 17.4 Interrupt Requests

Unit Interrupt Name	Outline	Interrupt Number	DMA Trigger Number	DTS Trigger Number
HS-USRT0				
INTHSUS0ERR	Bundled error interrupt for HS-USRT0	116	—	—
INTHSUS0RE	Bundled reception interrupt for HS-USRT0	117	—	—
INTHSUS0TR	Bundled transmission interrupt for HSUSRT0	118	—	—
HS-USRT1				
INTHSUS1ERR	Bundled error interrupt for HS-USRT1	119	—	—
INTHSUS1RE	Bundled reception interrupt for HS-USRT1	120	—	—
INTHSUS1TR	Bundled transmission interrupt for HS-USRT1	121	—	—
HS-USRT2				
INTHSUS2ERR	Bundled error interrupt for HS-USRT2	122	—	—
INTHSUS2RE	Bundled reception interrupt for HS-USRT2	123	—	—
INTHSUS2TR	Bundled transmission interrupt for HS-USRT2	124	—	—
HS-USRT3				
INTHSUS3ERR	Bundled error interrupt for HS-USRT3	125	—	—
INTHSUS3RE	Bundled reception interrupt for HS-USRT3	126	—	—
INTHSUS3TR	Bundled transmission interrupt for HS-USRT3	127	—	—

17.1.5 HS-USRT Hardware Reset

The HS-USRT module and its registers are initialized by the following reset condition.

Table 17.5 HS-USRT Reset Condition

Reset Name	Reset condition				
	Power On Reset	System Reset 1	System Reset 2	Application Reset 1	Limited Reset
All Registers	√	√	√	√	√

17.1.6 Input/Output Signals

The following table shows the HS-USRT input/output signals.

Table 17.6 HS-USRTn Input/Output Signals (1/2)

Pin name	Function
HS-USRT0	
HSURT0SDIO0	HSURT0 data I/O 0
HSURT0SDIO1	HSURT0 data I/O 1
HSURT0SDIO2	HSURT0 data I/O 2
HSURT0SDIO3	HSURT0 data I/O 3
HSURT0SCKIO	HSURT0 serial clock I/O
HSURT0SDIR	HSURT0 direction indication output
HSURT0CSIO	HSURT0 chip select IO
HS-USRT1	
HSURT1SDIO0	HSURT1 data I/O 0
HSURT1SDIO1	HSURT1 data I/O 1
HSURT1SDIO2	HSURT1 data I/O 2
HSURT1SDIO3	HSURT1 data I/O 3
HSURT1SCKIO	HSURT1 serial clock I/O
HSURT1SDIR	HSURT1 direction indication output
HSURT1CSIO	HSURT1 chip select IO
HS-USRT2	
HSURT2SDIO0	HSURT2 data I/O 0
HSURT2SDIO1	HSURT2 data I/O 1
HSURT2SDIO2	HSURT2 data I/O 2
HSURT2SDIO3	HSURT2 data I/O 3
HSURT2SCKIO	HSURT2 serial clock I/O
HSURT2SDIR	HSURT2 direction indication output
HSURT2CSIO	HSURT2 chip select IO
HS-USRT3	
HSURT3SDIO0	HSURT3 data I/O 0
HSURT3SDIO1	HSURT3 data I/O 1
HSURT3SDIO2	HSURT3 data I/O 2
HSURT3SDIO3	HSURT3 data I/O 3

Table 17.6 HS-USRTn Input/Output Signals (2/2)

Pin name	Function
HSURT3SCKIO	HSURT3 serial clock I/O
HSURT3SDIR	HSURT3 direction indication output
HSURT3CSIO	HSURT3 chip select IO

17.2 Overview

Table 17.7 Specifications of HS-USRT

Item	Description
Communications mode	• Half-duplex clock-synchronous serial transfer • Master (transmission) or slave (reception) selectable (the SDIR pin indicates the master or slave state) • MSB first • Lengths of frames for transfer 16-bit data without parity 15-bit data + even parity bit 15-bit data + odd parity bit
Number of lines	1, 2 and 4 lines selectable
Transfer rates	When TXCLK is running at 80 MHz: • Transmission: 10 Mbps/line (40 Mbps when 4 lines are in use) Reception: 40 Mbps/line (160 Mbps when 4 lines are in use)
Master communications clock division settings	Ratios for frequency division of TXCLK are selectable from among 1/8, 1/10, 1/12, 1/14, 1/16, 1/24, and 1/32.
Transfer buffer capacities	• Transmission: 8 frames (2 × 4-frame buffers) • Reception: 64 frames (2 × 32-frame buffers)
• Interrupt sources	• Packet transmission complete interrupt • First frame reception interrupt • Group frame reception interrupt • Packet reception complete interrupt • Packet error interrupt • Receive overflow error interrupt
Error detection	• Parity error (none, odd, even) • Receive overflow error
Other functions	• Internal DMAC to handle transfer of data in communications • Register write protection
Clock signals	• Internal clock for transmission: 60/80 MHz • Peripheral bus clock : 60/80 MHz • High-speed bus clock : 40/80 MHz • Rx clock (SCKIO): 40 MHz

17.2.1 Block Diagram

The following figure shows a block diagram of the HS-USRT module.

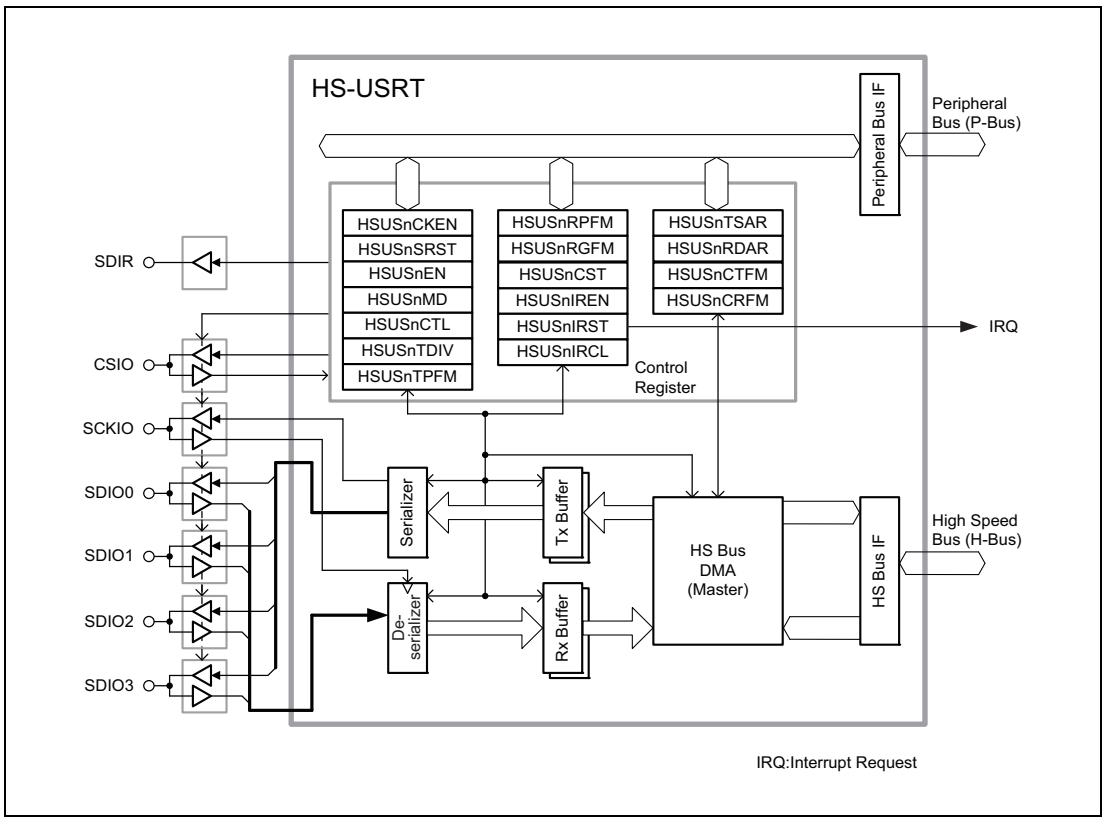

Figure 17.1 Block Diagram of HS-USRT

The LSI pin name have prefix for identification (see **Section 17.1.6, Input/Output Signals**).

17.3 Registers

HS-USRTn is controlled and operated by the following registers.

Table 17.8 Overview of HS-USRTn Registers

Register Name	Abbreviation	Address	Access Protection	
			PBG	Others
HS-USRT Clock Enable Register	HSUSnCKEN	<HSUSn_base> + 0000_H	*1	—
HS-USRT Software Reset Register	HSUSnSRST	<HSUSn_base> + 0004_H	*1	—
HS-USRT Communication Enable Register	HSUSnEN	<HSUSn_base> + 0008_H	*1	—
HS-USRT Mode Register	HSUSnMD	<HSUSn_base> + $000C_H$	*1	—
HS-USRT Communication Control Register	HSUSnCTL	<HSUSn_base> + 0010_H	*1	—
HS-USRT Transmit Clock Division Select Register	HSUSnTDIV	<HSUSn_base> + 0014_H	*1	—
HS-USRT Transmit Data Source Address Register	HSUSnTSAR	<HSUSn_base> + 0018_H	*1	—
HS-USRT Transmit Frame Number Register	HSUSnTPFM	<HSUSn_base> + $001C_H$	*1	—
HS-USRT Data Destination Address Register	HSUSnRDAR	<HSUSn_base> + 0020_H	*1	—
HS-USRT Receive Frame number Register	HSUSnRPFM	<HSUSn_base> + 0024_H	*1	—
HS-USRT Receive Group Frame Number Register	HSUSnRGFM	<HSUSn_base> + 0028_H	*1	—
HS-USRT Interrupt Enable Register	HSUSnIREN	<HSUSn_base> + $002C_H$	*1	—
HS-USRT Interrupt Status Register	HSUSnIRST	<HSUSn_base> + 0030_H	*1	—
HS-USRT Interrupt Status Clear Register	HSUSnIRCL	<HSUSn_base> + 0034_H	*1	—
HS-USRT Communication Status Register	HSUSnCST	<HSUSn_base> + 0038_H	*1	—
HS-USRT Current Transmit Frame Number Register	HSUSnCTFM	<HSUSn_base> + $003C_H$	*1	—
HS-USRT Current Receive Frame Number Register	HSUSnCRFM	<HSUSn_base> + 0040_H	*1	—

Note 1. In the case of
n = 0 PBG3#1.PG3-HSUSRT0,
n = 1 PBG1#1.PG1-HSUSRT1,
n = 2 PBG3#1.PG3-HSUSRT2,
n = 3 PBG1#1.PG1-HSUSRT3

<HSUSn_base>

The base address <HSUSn_base> of HS-USRTn is defined by the keywords in **Table 17.2, Register Base Address <HSUSn_base>**.

17.3.1 HSUSnCKEN — HS-USRT Clock Enable Register

This register is used to control HS-USRT clock operations.

Access: This register can be read/written in 32-bit units.

Address: <HSUSn_base> + 0000_H

Value after reset: $0000\ 0000_H$ This register is initialized by various types of reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HSUSn CKEN
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 17.9 HSUSnCKEN register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	HSUSnCKEN	Clock Operation Enable Bit Control the operation of HCLK and of TXCLK. 0: Stop the clock supply (Except peripheral clock and SCKIO). 1: Enable the clock operation.

The value of this register can be changed while communication is halted (HSUSnEN.HSUSnEN bits = 0 and HSUSnCST.HSUSnACTF bits = 0).

HSUSnCKEN Bit (Clock Operation Enable)

This bit runs and stops clock signals.

The clock signals to be controlled are HCLK and TXCLK.

17.3.2 HSUSnSRST — HS-USRT Software Reset Register

This register is used to initiate a software reset.

Access: This register can be written only in 32-bit units.

Address: <HSUSn_base> + 0004_H

Value after reset: $0000\ 0000_H$ This register is initialized by various types of reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HSUSn SRST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 17.10 HSUSnSRST register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	HSUSnSRST	Software Reset Bit All registers other than the HSUSnSRST register are initialized by writing '1' to the bit. This bit always reads as 0. 0: No function 1: Cause reset of HS-USRT by Software.

A software reset can be initiated while communication is halted (HSUSnEN.HSUSnEN bit = 0 and HSUSnCST.HSUSnACTF bit = 0).

NOTE

After software reset generation, Read this register at once before any register access.

HSUSnSRST Bit (Software Reset)

When a software reset is initiated, all registers of HS-USRT except this register are initialized.

Reading this bit always returns 0.

17.3.3 HSUSnEN — HS-USRT Communication Enable Register

This register enables or disables communication.

Access: This register can be read/written in 32-bit units.

Address: <HSUSn_base> + 0008_H

Value after reset: $0000\ 0000_H$ This register is initialized by various types of reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HSUSnEN
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 17.11 HSUSnEN register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	HSUSnEN	Communication Enable Bit Enable or disable the communication. 0: Disable the communication 1: Enable the communication.

HSUSnEN Bit (Communication Enable)

This bit enables or disables communication.

In combination with a setting in the communication mode register (HSUSnMD), this bit controls the state of the SDIR pin for specifying the direction of transfer and of the bidirectional (I/O) pins that handle transfer. For details on the states of the SDIR pin and bidirectional pins, see **Table 17.27, Settings for Mode and Enable Bits and Pin Control**.

If 0 is written to this bit during communication, ongoing communication is aborted. If 0 is written during communication, follow the procedure in **Section 17.4.9.5, Aborting Transfer**.

Write access to the protected registers is not allowed while communication is enabled.

17.3.4 HSUSnMD — HS-USRT Mode Register

This register selects the communication direction (transmission or reception).

Access: This register can be read/written in 32-bit units.

Address: <HSUSn_base> + $000C_H$

Value after reset: $0000\ 0000_H$ This register is initialized by various types of reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HSUSnMD
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 17.12 HSUSnMD register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	HSUSnMD	Communication Mode Bit Control the operation direction of the HS-USRT. 0: Transmission 1: Reception

The value of this register can be changed while communication is halted (HSUSnEN.HSUSnEN bits = 0 and HSUSnCST.HSUSnACTF bits = 0).

HSUSnMD Bit (Communication Mode)

This bit controls the direction of transfer (transmission or reception) by the HS-USRT.

In combination with a setting in the communication enable register (HSUSnEN), this bit controls the state of the SDIR pin for specifying the direction of transfer and of the bidirectional (I/O) pins that handle transfer. For details on the states of the SDIR pin and bidirectional pins, see **Table 17.27, Settings for Mode and Enable Bits and Pin Control.**

17.3.5 HSUSnCTL — HS-USRT Communication Control Register

This register controls the handling of parity and selects the number of lines (SDIO lines) used in transfer.

Access: This register can be read/written in 32-bit units.

Address: <HSUSn_base> + 0010_H

Value after reset: $0000\ 0000_H$ This register is initialized by various types of reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	PRSL[1:0]		—	—	LANE[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W

Table 17.13 HSUSnCTL register contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5, 4	HSUSn PRSL[1:0]	Parity Select Bit Select the usage of parity (no parity/even parity/odd parity) for the communication data. 00_B: No parity (transmission) / Parity is not checked (reception) 01_B: Even parity 10_B: Setting prohibited 11_B: Odd parity
3, 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	HSUSn LANE[1:0]	Number of SDIO Lines Select Bit Select the number of SDIO lanes for communication. 00_B: SDIO0, SDIO1, SDIO2, SDIO3 01_B: SDIO0, SDIO1 10_B: SDIO0 11_B: Setting prohibited

The value of this register can be changed while communication is halted (HSUSnEN.HSUSnEN bits = 0 and HSUSnCST.HSUSnACTF bits = 0).

HSUSnLANE[1:0] Bits (number of SDIO Lines Select)

This bit selects the number of lines used in transfer.

For the lines to be used and data arrangement in memory, see **Section 17.4.3.1, Relationship between the Format of Data Storage and the Lines**.

HSUSnPRSL[1:0] Bits (Parity Select)

This bit selects the handling of parity (no parity, even parity, or odd parity) for data in transfer.

17.3.6 HSUSnTDIV — HS-USRT Transmit Clock Division Select Register

This register selects the frequency division ratio for transmission.

Access: This register can be read/written in 32-bit units.

Address: <HSUSn_base> + 0014_H

Value after reset: $0000\ 0003_H$ This register is initialized by various types of reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	HSUSnTDIV[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 17.14 HSUSnTDIV register contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3 to 0	HSUSn TDIV[3:0]	Transmission Clock Division Selection Bit Select the division factor for the transmission operation. 0011_B: TXCLK / 8 0100_B: TXCLK / 10 0101_B: TXCLK / 12 0110_B: TXCLK / 14 0111_B: TXCLK / 16 1011_B: TXCLK / 24 1111_B: TXCLK / 32 Other than above: Setting prohibited

The value of this register can be changed while communication is halted (HSUSnEN.HSUSnEN bits = 0 and HSUSnCST.HSUSnACTF bits = 0).

HSUSnTDIV[3:0] Bits (Transmission Clock Division Select)

This bit selects the division factor for transmission.

17.3.7 HSUSnTSAR — HS-USRT Transmit Data Source Address Register

This register sets the source address of data for transmission.

Access: This register can be read/written in 32-bit units.

Address: <HSUSn_base> + 0018_H

Value after reset: $0000\ 0000_H$ This register is initialized by various types of reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	HSUSnTSAR[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HSUSnTSAR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.15 HSUSnTSAR register contents

Bit Position	Bit Name	Function
31 to 0	HSUSn TSAR[31:0]	Transmit data Source Address Bit Define the read pointer base address of the transmit data packet. Source Address of the transmit data packet.

The value of this register can be changed while communication is halted (HSUSnEN.HSUSnEN bits = 0 and HSUSnCST.HSUSnACTF bits = 0).

HSUSnTSAR[31:0] Bit (Transmit Data Source Address)

These bits set the source address of data for transmission.

Since data from the memory is read in 4-frame units, the write value to the 3 lower-order bits is ignored, and reading these bits always returns 0.

17.3.8 HSUSnTPFM — HS-USRT Transmit Frame Number Register

This register specifies the number of frames for transmission.

Access: This register can be read/written in 32-bit units.

Address: <HSUSn_base> + $001C_H$

Value after reset: $0000\ 0000_H$ This register is initialized by various types of reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	HSUSnTPFM[12:0]												
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.16 HSUSnTPFM register contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is read. When writing, write the value after reset.
12 to 0	HSUSn TPFM[12:0]	Transmit Frame Number Bits Specify the number of transmit frames. Up to 4 K frames can be specified (0001_H to 1000_H). Setting the value beyond above range is not allowed. 4 lines are used: The multiple number of 4 can be specified. 2 lines are used: The multiple number of 2 can be specified. 1 line is used: Any value can be specified.

The value of this register can be changed while communication is halted (HSUSnEN.HSUSnEN bits = 0 and HSUSnCST.HSUSnACTF bits = 0).

HSUSnTPFM[12:0] Bits (Transmit Frame number)

These bits specify the number of frames for transmission.

Range of allowable settings: Up to 4 Kframes (0001_H to 1000_H)

Do not make settings outside the range of allowable settings.

17.3.9 HSUSnRDAR — HS-USRT Data Destination Address Register

This register specifies the destination address of received data.

Access: This register can be read/written in 32-bit units.

Address: <HSUSn_base> + 0020_H

Value after reset: $0000\ 0000_H$ This register is initialized by various types of reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	HSUSnRDAR[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HSUSnRDAR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.17 HSUSnRDAR register contents

Bit Position	Bit Name	Function
31 to 0	HSUSn RDAR[31:0]	Receive Data Destination Address Bit Destination Address of the receive data packet Define the write pointer base address of the receive data packet.

The value of this register can be changed while communication is halted (HSUSnEN.HSUSnEN bits = 0 and HSUSnCST.HSUSnACTF bits = 0).

HSUSnRDAR[31:0] Bits (Receive Data Destination Address)

These bits specify the destination address of receive data.

Since the received data write to the Global RAM (or Local RAM (PE)) is read in 32-frame units, the write value to the 6 lower-order bits is ignored, and reading these bits always returns 0.

17.3.10 HSUSnRPFM — HS-USRT Receive Frame number Register

This register specifies the number of receive frames.

Access: This register can be read/written in 32-bit units.

Address: <HSUSn_base> + 0024_H

Value after reset: $0000\ 0000_H$ This register is initialized by various types of reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 17.18 HSUSnRPFM register contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is read. When writing, write the value after reset.
18 to 0	HSUSn RPFM[18:0]	Receive Frame Number Bits Specify the number of receive frames. Up to 256 K frames can be specified (00001_H to 40000_H). Setting the value beyond above range is not allowed. 4 lines are used: The multiple number of 4 can be specified. 2 lines are used: The multiple number of 2 can be specified. 1 line is used: Any value can be specified.

The value of this register can be changed while communication is halted (HSUSnEN.HSUSnEN bits = 0 and HSUSnCST.HSUSnACTF bits = 0).

HSUSnRPFM[18:0] Bits (Receive Frame number)

These bits specify the number of receive frames.

Range of allowable settings: Up to 256 Kframes (00001_H to 40000_H)

Do not make settings outside the range of allowable settings.

17.3.11 HSUSnRGFM — HS-USRT Receive Group Frame Number Register

This register specifies the number of receive frames in a group.

Access: This register can be read/written in 32-bit units.

Address: <HSUSn_base> + 0028_H

Value after reset: $0000\ 0000_H$ This register is initialized by various types of reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HSUSn RGFM[17:16]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HSUSnRGFM[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.19 HSUSnRGFM register contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is read. When writing, write the value after reset.
17 to 0	HSUSnRGFM [18:0]	Receive Group Frame Number Bits Specify the number of receive frames in a group. Up to 192 K frames can be specified (00000_H to 30000_H). Additional condition: HSUSnRGFM ≤ HSUSnRPFM Setting the value beyond above range is not allowed. 4 lines are used: The multiple number of 4 can be specified. 2 lines are used: The multiple number of 2 can be specified. 1 line is used: Any value can be specified.

The value of this register can be changed while communication is halted (HSUSnEN.HSUSnEN bits = 0 and HSUSnCST.HSUSnACTF bits = 0).

HSUSnRGFM[17:0] Bits (Receive Group Frame number)

These bits specify the number of receive frames in a group.

If detection of receive frames in a group is not required, set 00000_H to this register.

Range of allowable settings: Up to 192 Kframes (00000_H to 30000_H); HSUSnRGFM ≤ HSUSnRPFM

Do not make settings outside the range of allowable settings.

17.3.12 HSUSnIREN — HS-USRT Interrupt Enable Register

This register enables or disables interrupt requests.

Access: This register is read/written in 32-bit units.

Address: <HSUSn_base> + $002C_H$

Value after reset: $0000\ 0000_H$ This register is initialized by various types of reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.20 HSUSnIREN register contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5	HSUSnOVEE	Overflow Error Interrupt Enable Bit 0: Disable Overflow Error interrupt 1: Enable Overflow Error interrupt
4	HSUSnPEE	Parity Error Interrupt Enable Bit 0: Disable Parity Error interrupt 1: Enable Parity Error interrupt
3	HSUSnRPCE	RX Completion Interrupt Enable Bit 0: Disable RX Completion interrupt 1: Enable RX Completion interrupt
2	HSUSnRGFE	RX of Group Frame Interrupt Enable Bit 0: Disable RX of Group Frame interrupt 1: Enable RX of Group Frame interrupt
1	HSUSnRFFE	RX of First Frame Interrupt Enable Bit 0: Disable RX of First Frame interrupt 1: Enable RX of First Frame interrupt
0	HSUSnTPCE	TX Completion Interrupt Enable Bit 0: Disable TX Completion interrupt 1: Enable TX Completion interrupt

The value of this register can be changed while communication is halted (HSUSnEN.HSUSnEN bits = 0 and HSUSnCST.HSUSnACTF bits = 0).

HSUSnTPCE Bit (Packet Transmission Complete Interrupt Enable)

This bit enables or disables output of the packet transmission complete interrupt request.

HSUSnRFFE Bit (First Frame Reception Interrupt Enable)

This bit enables or disables output of the first frame reception interrupt request.

HSUSnRGFE Bit (Group Frame Reception Interrupt Enable)

This bit enables or disables output of the group frame reception interrupt request.

HSUSnRPCE Bit (Packet Reception Complete Interrupt Enable)

This bit enables or disables output of the packet reception complete interrupt request.

HSUSnPEE Bit (Parity Error Interrupt Enable)

This bit enables or disables output of the parity error interrupt request.

HSUSnOVEE Bit (Overflow Error Interrupt Enable)

This bit enables or disables output of the overflow error interrupt request.

17.3.13 HSUSnIRST — HS-USRT Interrupt Status Register

This register indicates the interrupt status.

Access: This register is read-only in 32-bit units.

Address: <HSUSn_base> + 0030_H

Value after reset: $0000\ 0000_H$ This register is initialized by various types of reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	HSUSn OVEF	HSUSn PEF	HSUSn RPCF	HSUSn RGFF	HSUSn RFFF	HSUSn TPCF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.21 HSUSnIRST register contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is read.
5	HSUSnOVEF	Overflow Error Interrupt Flag 0: No Overflow Error detected 1: Overflow Error detected
4	HSUSnPEF	Parity Error Interrupt Flag 0: No Parity Error detected 1: Parity Error detected
3	HSUSnRPCF	RX Completion Interrupt Flag 0: Receiving of frames is not complete 1: Receiving of frames is complete
2	HSUSnRGFF	RX of Group Frame Interrupt Flag 0: Receiving of group of frames is not complete 1: Receiving of group of frames is complete
1	HSUSnRFFF	RX of First Frame Interrupt Flag 0: Receiving of first frame not started 1: Receiving of first frame has started
0	HSUSnTPCF	TX Completion Interrupt Flag 0: Transmission of frames is not complete 1: Transmission of frames is complete

If writing of 1 to the corresponding bit in the interrupt status clear register (HSUSnIRCL) to clear a flag is in contention with the condition for the flag becoming zero, one of the operations below will proceed.

- If the value of the flag is 0, the flag will be set.
- If the value of the flag is 1, the flag will be cleared.

HSUSnTPCF Flag (Packet Transmission Complete Flag)

This flag indicates that the transmission has been completed.

The packet transmission complete interrupt request (INT_TPC) is not output while this flag is 1.

When transfer is to be started, clear all interrupt status flags to 0 before enabling communications (setting the HSUSnEN bit to 1).

[Setting conditions]

- Transmission of the number of frames specified in the transmit frame number register (HSUSnTPFM) ing completed

[Clearing conditions]

- 1 being written to the packet transmission complete flag clear bit (HSUSnIRCL.HSUSnTPCC)
- Software reset being applied through the software reset register (HSUSnSRST)

HSUSnRFFF Flag (First Frame Reception Flag)

This bit indicates that transmission from the Radar-ASIC has started.

The first frame reception interrupt request (INT_RFF) is not output while this flag is 1. When transfer is to be started, clear this flag to 0 before enabling communications (setting the HSUSnEN bit to 1).

[Setting condition]

- The first detection of the low level on the CSIO after reception has started

[Clearing conditions]

- 1 being written to the first frame reception flag clear bit (HSUSnIRCL.HSUSnRFFC)
- Software reset being applied through the software reset register (HSUSnSRST)

HSUSnRGFF Flag (Group Frame Reception Flag)

This flag indicates that the first frame of a group has been detected.

The group frame reception interrupt request (INT_RGF) is not output while , overflow error flag (HSUSnOVEF) or this flag is 1. When transfer is to be started, clear all interrupt status flags to 0 before enabling communications (setting the HSUSnEN bit to 1).

[Setting conditions]

When the following two conditions are met:

- DMA transfer of the number of frames specified in the Rx group frame number register (HSUSnRGFM) being completed
- The HSUSnOVEF flag being 0

[Clearing conditions]

- 1 being written to the group frame reception flag clear bit (HSUSnIRCL.HSUSnRGFC)
- Software reset being applied through the software reset register (HSUSnSRST)

HSUSnRPCF Flag (Packet Reception Complete Flag)

This flag indicates that the reception has been completed.

The packet reception complete interrupt request (INT_RPC) is not output while overflow error flag (HSUSnOVEF) or this flag is 1. When transfer is to started, clear all interrupt status flags to 0 before enabling communications (setting the HSUSnEN bit to 1).

[Setting conditions]

When the following two conditions are met:

- DMA transfer of the number of frames of received data specified in the Rx frame number register (HSUSnRPFM) being completed
- The HSUSnOVEF flag being 0

[Clearing conditions]

- 1 being written to the packet reception complete flag clear bit (HSUSnIRCL.HSUSnRPCC)
- Software reset being applied through the software reset register (HSUSnSRST)

HSUSnPEF Flag (Parity Error Flag)

This flag indicates that a parity error has been detected during reception.

While this flag is 1, the subsequent parity error interrupt request (INT_PE) is not output. When transfer is to be started, clear this flag to 0 before enabling communications (setting the HSUSnEN bit to 1).

[Setting conditions]

- A parity error being detected in the received data

[Clearing conditions]

- 1 being written to the parity error flag clear bit (HSUSnIRCL.HSUSnPEC)
- Software reset being applied through the software reset register (HSUSnSRST)

HSUSnOVEF Flag (Overflow Error Flag)

This flag indicates that the buffer has overflowed during reception.

While this flag is 1, the subsequent receive overflow error interrupt request (INT_OVE) is not output. When transfer is to be started, clear this flag to 0 before enabling transfer (setting the HSUSnEN bit to 1).

[Setting condition]

- The Rx buffer being overflowed

[Clearing conditions]

- 1 being written to the overflow error flag clear bit (HSUSnIRCL.HSUSnOVEC)
- Software reset being applied through the software reset register (HSUSnSRST)

17.3.14 HSUSnIRCL — HS-USRT Interrupt Status Clear Register

This register is used to clear the corresponding interrupt status flag.

Access: This register is written only in 32-, 16- or 8-bit units.

Address: <HSUSn_base> + 0034_H

Value after reset: $0000\ 0000_H$ The read value of this register is always $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	HSUSnOVEC	HSUSnPEC	HSUSnRPCC	HSUSnRGFC	HSUSnRFFC	HSUSnTPCC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	W	W	W	W	W	W

Table 17.22 HSUSnIRCL register contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5	HSUSnOVEC	Overflow Error Interrupt Flag Clear Bit 0: No function 1: Clear the Overflow Error Flag (HSUSnIRST.HSUSnOVEF = 0)
4	HSUSnPEC	Parity Error Interrupt Flag Clear Bit 0: No function 1: Clear the Parity Error Flag (HSUSnIRST.HSUSnPEF = 0)
3	HSUSnRPCC	RX Completion Interrupt Flag Clear Bit 0: No function 1: Clear the RX Complete Flag (HSUSnIRST.HSUSnRPCF = 0)
2	HSUSnRGFC	RX of Group Frame Interrupt Flag Clear Bit 0: No function 1: Clear the RX of Group Frame Flag (HSUSnIRST.HSUSnRGFF = 0)
1	HSUSnRFFC	RX of First Frame Interrupt Flag Clear Bit 0: No function HSUSn 1: Clear the RX of First Frame Flag (HSUSnIRST.RFFF = 0)
0	HSUSnTPCC	TX Completion Interrupt Flag Clear Bit 0: No function 1: Clear the TX Complete Flag (HSUSnIRST.HSUSnTPCF = 0)

When read, this register always returns $0000\ 0000_H$.

HSUSnTPCC Bit (Packet Transmission Complete Flag Clear)

This bit clears the packet transmission complete flag (HSUSnIRST.HSUSnTPCF) to 0.

HSUSnRFFC Bit (First Frame Reception Flag Clear)

This bit clears the first frame reception flag (HSUSnIRST.HSUSnRFFF) to 0.

HSUSnRGFC Bit (Group Frame Reception Flag Clear)

This bit clears the group frame reception flag (HSUSnIRST.HSUSnRGFF) to 0.

HSUSnRPCC Bit (Packet Reception Complete Flag Clear)

This bit clears the packet reception complete flag (HSUSnIRST.HSUSnRPCF) to 0.

HSUSnPEC Bit (Parity Error Flag Clear)

This bit clears the parity error flag (HSUSnIRST.HSUSnPEF) to 0.

HSUSnOVEC Bit (Overflow Error Flag Clear)

This bit clears the overflow error flag (HSUSnIRST.HSUSnPEF) to 0.

17.3.15 HSUSnCST — HS-USRT Communication Status Register

This register indicates the communications status.

Access: This register can be read/ only in 32-bit units.

Address: <HSUSn_base> + 0038_H

Value after reset: $0000\ 0000_H$ This register is initialized by various types of reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HSUSn ACTF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.23 HSUSnCST register contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read.
0	HSUSnACTF	Active Flag Indicate the communication status of HS-USRT. 0: The communication is stopped 1: The communication is in operation

HSUSnACTF Flag (Active Flag)

This bit indicates the communications status of the HS-USRT.

[Clearing condition]

- Transfer is completed and the HS-USRT is stopped.

[Setting condition]

- Transfer is started by setting the HSUSnEN bit to 1

17.3.16 HSUSnCTFM — HS-USRT Current Transmit Frame Number Register

This register indicates the number of the current Tx frames.

Access: This register can be read only in 32-bit units.

Address: <HSUSn_base> + $003C_H$

Value after reset: $0000\ 0000_H$ This register is initialized by various types of reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	HSUSnCTFM[12:0]												
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.24 HSUSnCTFM register contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is read.
12 to 0	HSUSn CTFM[12:0]	Current Transmit Frame Number Bit Transmit Frame Counter Value Indicates the number of the frames that were fetched from memory by DMA operation for transmission. The data is always handled in blocks of 4 frames by DMA operation, and the value in the register may exceed that in the Transmit Frame Number Register (HSUSnTPFM), if HSUSnTPFM is not specifying a multiple of 4.

HSUSnCTFM[12:0] Bits (Current Tx Frame number)

These bits indicate the number of the current Tx frames.

This register indicates the number of frames that have been fetched from the Global RAM (or Local RAM) by DMA transfer.

The data is always read from the Global RAM (or Local RAM) in 4-frame units; accordingly the value of this register may exceed the value set in the HSUSnTPFMn register if the value of the Tx frame number register (HSUSnTPFM) is not a multiple of 4.

This register is cleared to $0000\ 0000_H$ after one cycle of PCLK has elapsed following the disabling of communications (by clearing the HSUSnEN bit to 0).

17.3.17 HSUSnCRFM — HS-USRT Current Receive Frame Number Register

This register indicates the number of the current Rx frames.

Access: This register can be read only in 32-bit units.

Address: <HSUSn_base> + 0040_H

Value after reset: $0000\ 0000_H$ This register is initialized by various types of reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	HSUSnCRFM[18:16]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HSUSnCRFM[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.25 HSUSnCRFM register contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is read.
18 to 0	HSUSn CRFM[18:0]	Current Receive Frame Number Bit Receive Frame Counter Value Indicate the number of the frames that were sent to memory by DMA operation from reception. The data is always handled in blocks of 32 frames by DMA operation, and the value in the register may exceed that in the Receive Frame Number Register (HSUSnRPFM), if HSUSnRPFM is not specifying a multiple of 32.

HSUSnCRFM[18:0] Bits (Current Rx Frame number)

These bits indicate the number of the current Rx frames.

This register indicates the number of frames that have been written to the Global RAM (or Local RAM) by DMA transfer.

The data is always written to the Global RAM (or Local RAM) in 32-frame units; accordingly the value of this register may exceed the value set in the HSUSnRPFM register if the value of the Rx frame number register (HSUSnRPFM) is not a multiple of 32.

This register is cleared to $0000\ 0000_H$ after one cycle of PCLK has elapsed following the disabling of communications (by clearing the HSUSnEN bit to 0).

17.4 Operation

17.4.1 Overview of HS-USRT Operation

The HS-USRT is used for half-duplex clock synchronous serial transfer to and from the on-board radar system (radar ASIC). The HS-USRT supports communication in two modes, transmission and reception.

17.4.1.1 Operation of Transmit Mode

Transmit mode operates in the following order. For the setting procedure, see **Section 17.4.9, Setting Procedure**.

1. Set the communication enable bit (HSUSnEN) to 1.
2. Use the internal DMAC of the HS-USRT to read data for transmission from the address specified in the transmit data source address register (HSUSnTSAR) and store the data in the Tx buffer.
3. Transmission starts when the data for transmission is stored in the Tx block (serializer) from the Tx buffer.
4. In the transmission, the low level is output from the CSIO pin and a clock signal is output from the SCKIO pin. Data is output from the SDIOn pin in synchronization with the rising edge of the SCKIO clock signal (n = 0 to 3).
5. Upon completion of the transmission of the number of frames specified in the Tx frame number register (HSUSnTPFM), the high level is output from the CSIO pin, and this leads to output of the packet transmission complete interrupt request (INT_TPC).

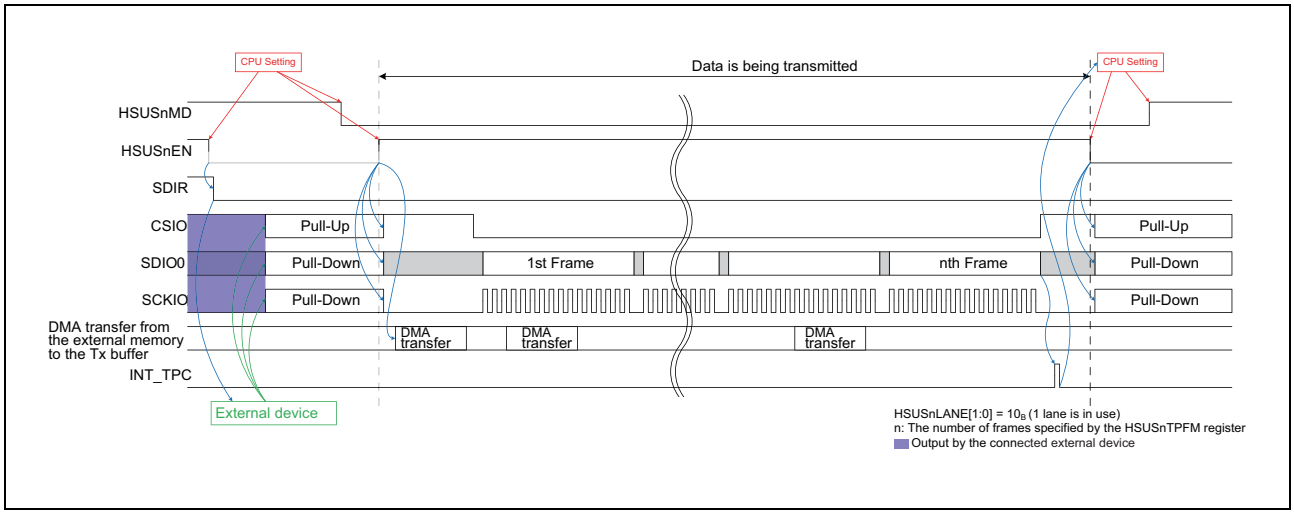

Figure 17.2 Timing chart of transmission operation example

17.4.1.2 Operation of Receive Mode

Receive mode operates in the following order. For the setting procedure, see **Section 17.4.9, Setting Procedure**.

1. Set the communication enable bit (HSUSnEN) to 1.
2. The high level is output from the CSIO pin.
3. The interface is ready for reception, which proceeds in synchronization with the Rx clock (SCKIO) while the CSIO pin is at the low level.
4. The Rx block (De-serializer) stores the received frame data in the Rx buffer.
5. DMA transfer to the address specified in the Rx data destination address register (HSUSnRDAR) starts when the received data is stored in the internal DMAC of the HS-USRT from the Rx buffer.
6. Upon completion of the DMA transfer of the number of frames of the received data specified in the Rx frame number register (HSUSnTPFM), the packet transmission complete interrupt request (INT_TPC) is output.
7. Setting the communication enable bit (HSUSnEN) to 0 leads to output of the low level from the SDIR pin.

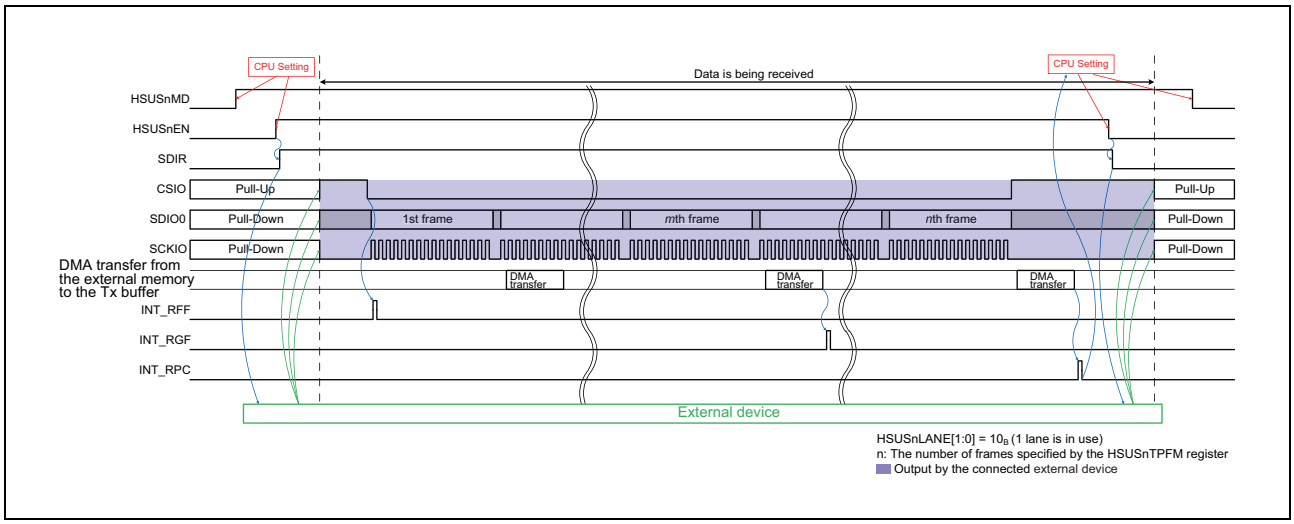

Figure 17.3 Example of Reception Operation

17.4.2 Control of the HS-USRT Pins

This table shows control of the HS-USRT pins.

Table 17.26 Settings for Mode and Number of Lanes and Pin States and Operations

Mode	Pin	Pin State		
Tx	Lines / Pin	Settings of HSUSnCTL.HSUSnLANE[1:0]		
		4 lines (00_B)	2 lines (01_B)	1 lines (10_B)
	SDIO0	Data output	Data output	Data output
	SDIO1	Data output	Data output	Not used (low output)
	SDIO2	Data output	Not used (low output)	Not used (low output)
	SDIO3	Data output	Not used (low output)	Not used (low output)
	SDIR	Low level output		
	CSIO	Output		
	SCKIO	TX clock output		
Rx	Lines / Pin	Settings of HSUSnCTL.HSUSnLANE[1:0]		
		4 lines (00_B)	2 lines (01_B)	1 lines (10_B)
	SDIO0	Data input	Data input	Data input
	SDIO1	Data input	Data input	Not used (input disabled)
	SDIO2	Data input	Not used (input disabled)	Not used (input disabled)
	SDIO3	Data input	Not used (input disabled)	Not used (input disabled)
	SDIR	High level output		
	CSIO	Input		
	SCKIO	RX clock input		

Table 17.27 Settings for Mode and Enable Bits and Pin Control

	Communication Mode Register (HSUSnMD)	Communication Enable Register (HSUSnEN)	Communication Direction Specification Pin	I/O Pin*1
Mode	MD	EN	SDIR	CSIO, SCKIO, SDIOn
Tx	0	0	Low	Hi-Z*2
		1	Low	Output
Rx	1	0	Low	Hi-Z
		1	High	Hi-Z (input)

Note 1. Pull up the CSIO pin and pull down the SCKIO and SDIOn pins while the communication enable bit is 0, since this places the pins in the Hi-Z state.

Note 2. If the transmission is aborted by writing 0 to the HSUSnEN bit during transmission, the output state continues until transmission of the frame currently being transmitted is completed.

17.4.3 Data Format

17.4.3.1 Relationship between the Format of Data Storage and the Lines

This figure shows the format of data storage in memory and transfer of the data through the lanes.

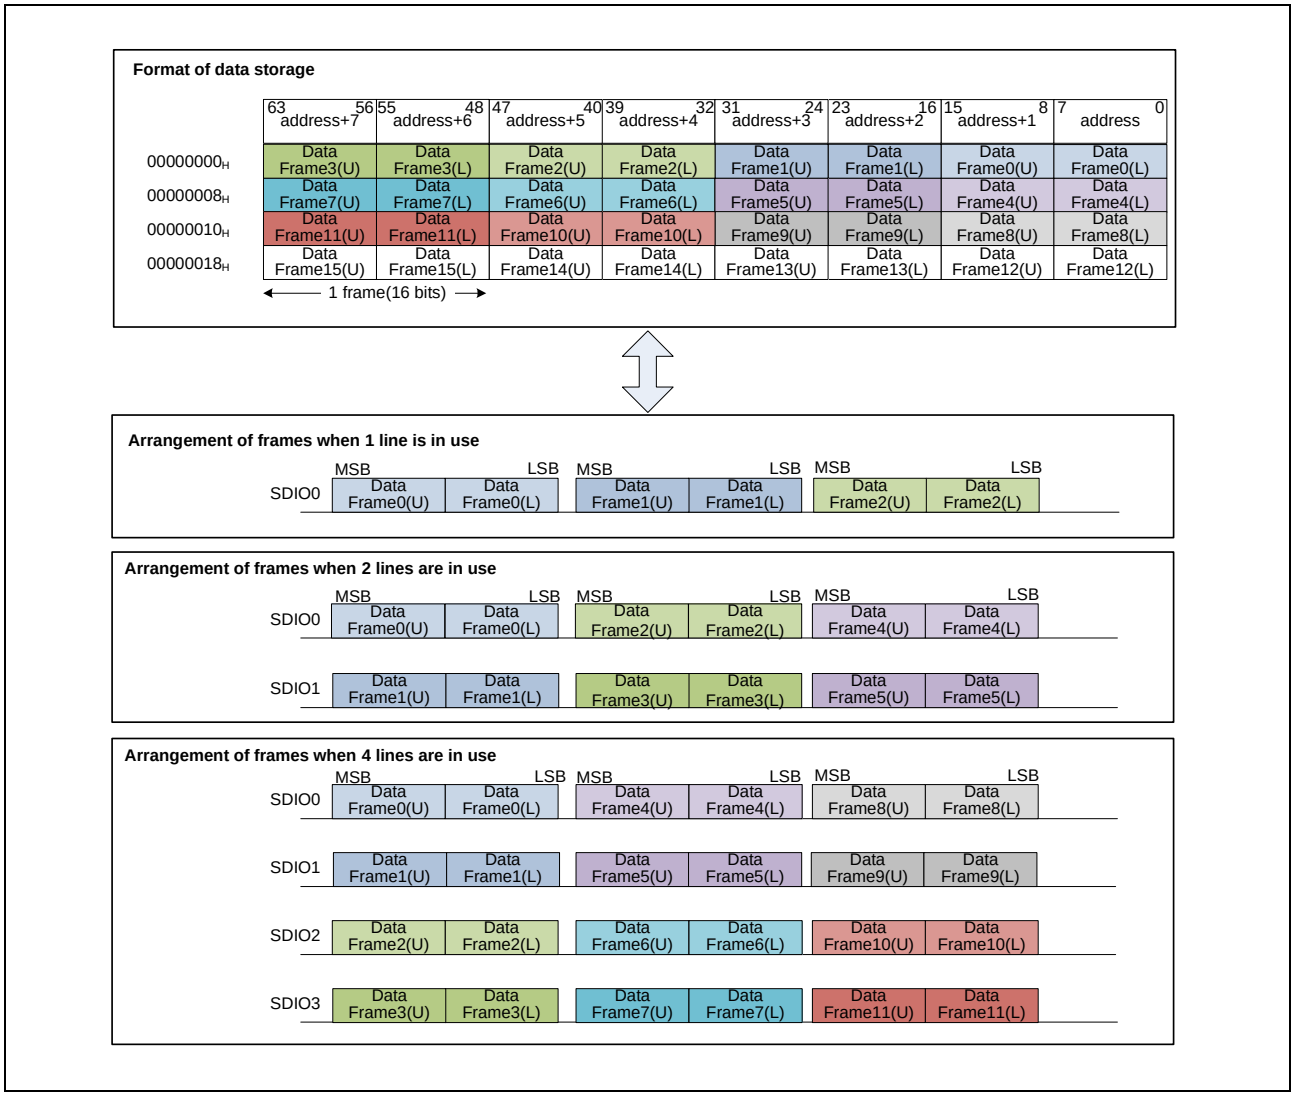

Figure 17.4 Format of Data Storage in Memory and Transfer of the Data through the Lines

17.4.3.2 Frame Data Format

This figure shows the format of frames. For details of parity, see **Section 17.4.3.3, Parity Control**.

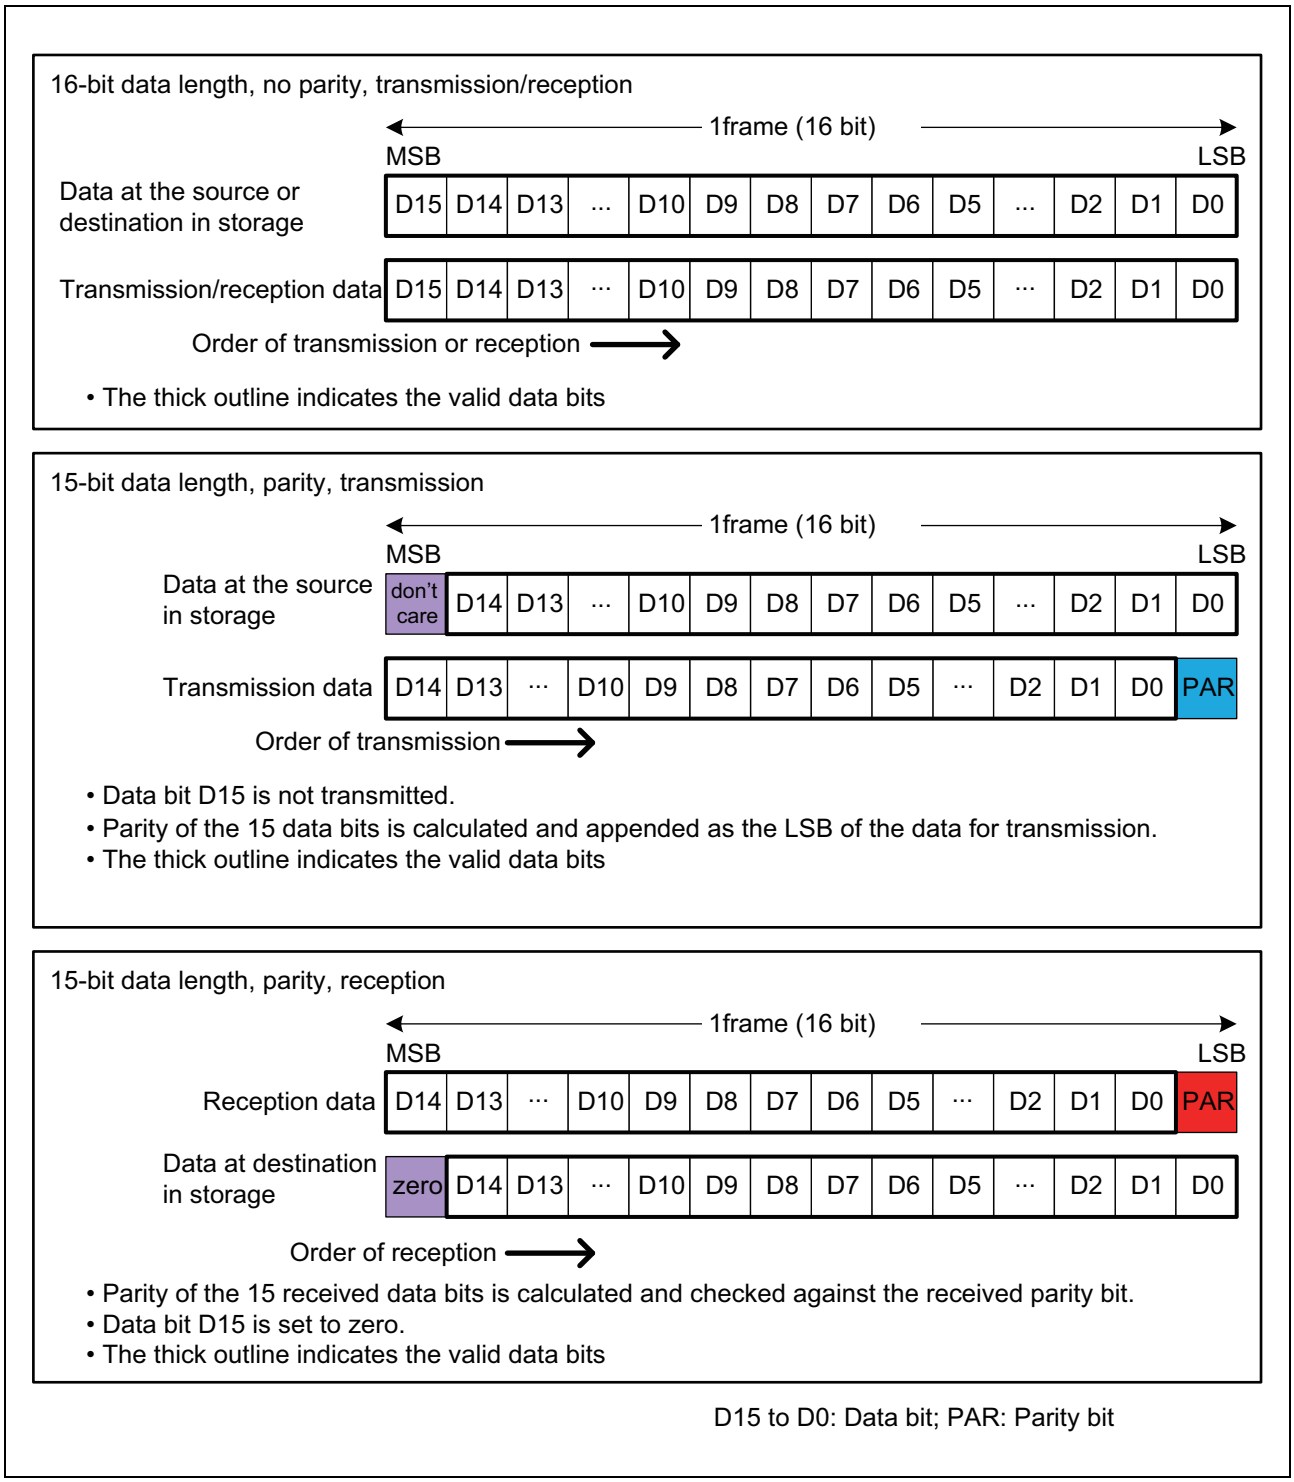

Figure 17.5 Frame Format

17.4.3.3 Parity Control

A parity bit is used to detect bit errors in transferred data. Usually, the same type of parity will be used in transmission and reception.

Even parity and odd parity can be used to detect errors in 1 bit (and in other odd numbers of bits).

(1) Even parity

- For transmission
  The parity bit is controlled so that the number of 0-valued bits in the data for transmission, including the parity bit itself, is even. The value of the parity bit is as follows:
  Number of 1-valued bits in the data for transmission is odd: 1
  Number of 1-valued bits in the data for transmission is even: 0
- For reception
  The number of 1-valued bits in the received data, including the parity bit itself, is counted. If the result is an odd number, a parity error has occurred.

(2) Odd parity

- For transmission
  The parity bit is controlled so that the number of 0-valued bits in the data for transmission, including the parity bit itself, is odd. The value of the parity bit is as follows:
  Number of 1-valued bits in the data for transmission is odd: 0
  Number of 1-valued bits in the data for transmission is even: 1
- For reception
  The number of 1-valued bits in the received data, including the parity bit itself, is counted. If the result is an even number, a parity error has occurred.

(3) No parity

A parity bit is not appended to data for transmission.
Reception proceeds with no parity bit. Since received data do not include parity bits, parity errors will not occur.

17.4.3.4 Relationship between the Clock Pin and Data

This figure shows the relationship between the level on the SCKIO pin and the timing of data output, and the timing of data output and sampling of data through the SDIO pins.

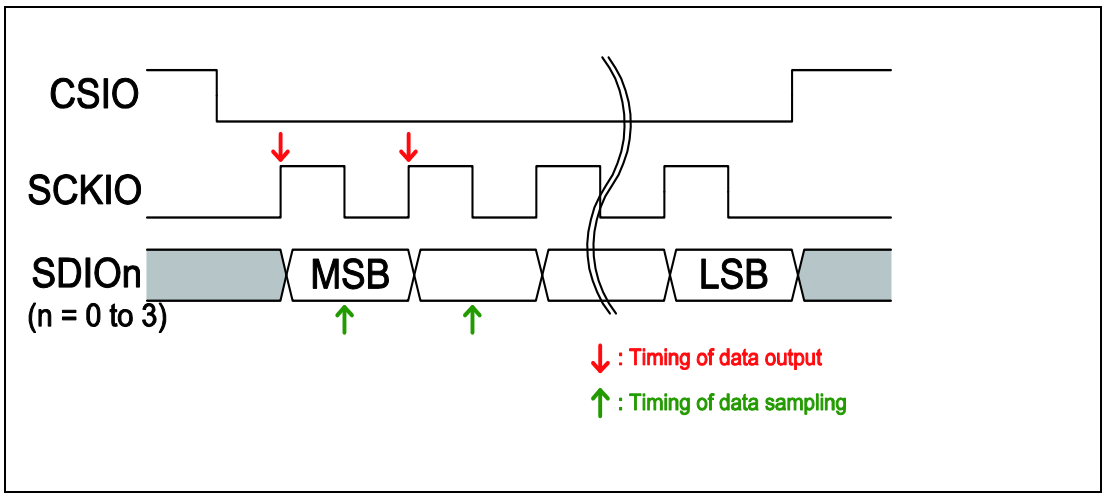

Figure 17.6 Relationship between the SCKIO Pin and Data

17.4.4 Buffer Configuration

17.4.4.1 Configuration of Tx Buffers

Double buffering is used in transmission, so two buffers are provided. Each buffer can hold 4 frames of data for transmission.

When a buffer becomes empty, a request for the transfer of 4 frames of data for transmission is issued to the on-chip DMAC regardless of the settings of the bits for selecting the number of lanes (HSUSnLANE[1:0]) and the Tx frame number register (HSUSnTPFM).

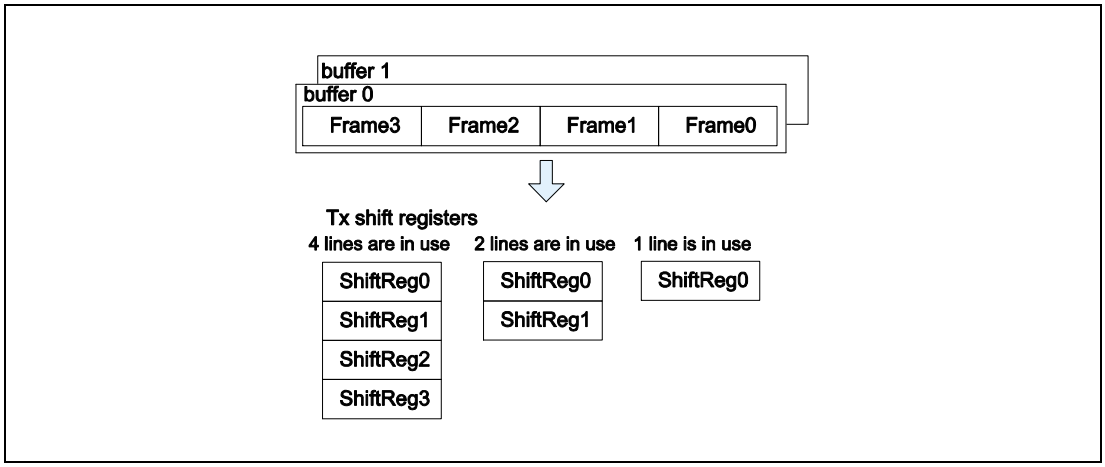

Figure 17.7 Configuration of Tx Buffers

17.4.4.2 Configuration of Rx Buffers

Double buffering is used in reception, so two buffers are provided. Each buffer can hold 32 frames (4 frames × 8) of received data.

When a buffer (buffer 0 or buffer 1) becomes full of received data, a request for transfer of the data is issued to the on-chip DMAC. The other buffer (buffer 1 or buffer 0) can continue reception during that time.

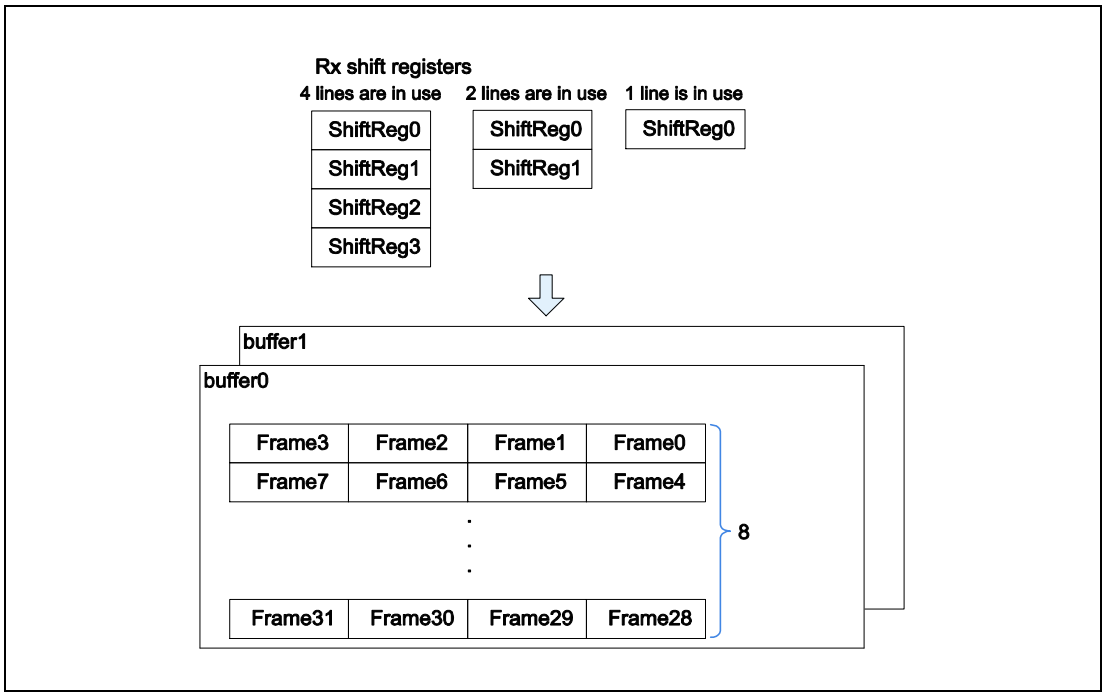

Figure 17.8 Configuration of Rx Buffers

17.4.5 Interrupt Requests

17.4.5.1 Interrupt Sources

The HS-USRT generates six types of interrupt request. Each interrupt source has its own interrupt request signal, and each interrupt request source has an enable bit, flag bit and flag clearing bit.

A flag is cleared by writing to the flag clearing bit. Writing 1 to the flag clearing bit for a flag bit that is indicating generation of the corresponding interrupt clears the flag bit.

The interrupt request signal is driven to the high level with a pulse width of one cycle of PCLK.

Each of the interrupt request signals is generated with the timing shown in **Figure 17.9, Timing of Interrupt Request Output**.

Table 17.28 HS-USRT Interrupt Sources

Interrupt Name	Interrupt Sources	Symbol	Enable bit	Flag bit	Flag clear bit
INTHSUSnERR	Receive overflow error	INT_OVE	HSUSnOVEE	HSUSnOVEF	HSUSnOVEC
	Parity error	INT_PE	HSUSnPEE	HSUSnPEF	HSUSnPEC
INTHSUSnRE	First frame reception	INT_RFF	HSUSnRFFE	HSUSnRFFF	HSUSnRFFC
	Packet reception complete	INT_RPC	HSUSnRPCE	HSUSnRPCF	HSUSnRPCC
	Group frame reception	INT_RGF	HSUSnRGFE	HSUSnRGFF	HSUSnRGFC
INTHSUSnTR	Packet transmission complete	INT_TPC	HSUSnTPCE	HSUSnTPCF	HSUSnTPCC

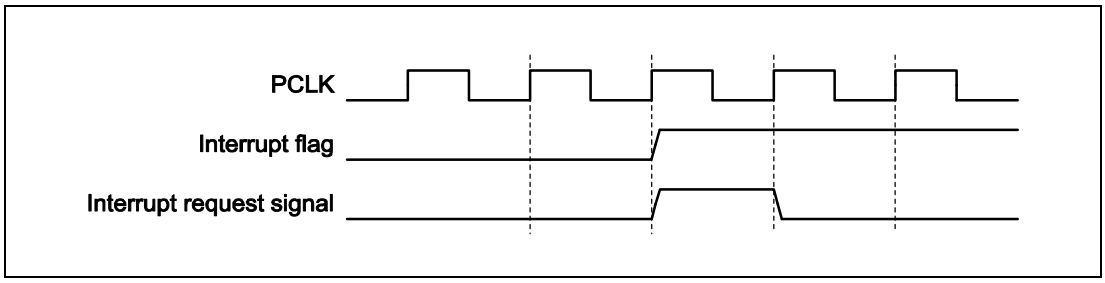

Figure 17.9 Timing of Interrupt Request Output

17.4.5.2 Packet Transmission Complete Interrupt Request

Upon completion of the transmission of the frames specified in the Tx frame number register (HSUSnTPFM), a packet transmission complete interrupt request (INT_TPC) is generated.

A packet transmission complete interrupt request (INT_TPC) is not generated while the packet transmission complete flag (HSUSnTPCF) is 1. When transfer is to be started, clear all interrupt status flags to 0 before enabling communications (setting the HSUSnEN bit to 1).

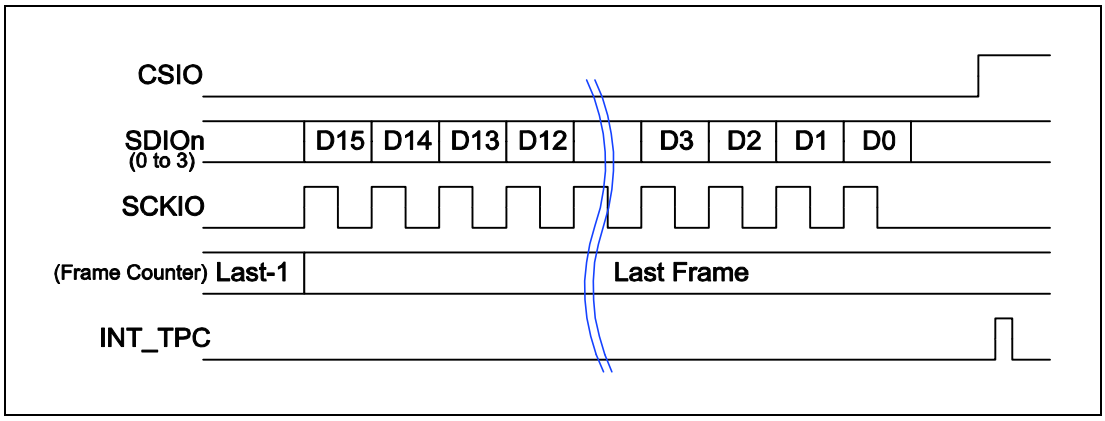

Figure 17.10 Packet Transmission Complete Interrupt Request

17.4.5.3 First Frame Reception Interrupt Request

When the low level on the CSIO pin is first detected after reception has started, a first frame reception interrupt request (INT_RFF) is generated.

The first frame reception interrupt request (INT_RFF) is not generated while the first frame reception flag (HSUSnRFFF) is 1. When transfer is to be started, clear the first frame reception flag (HSUSnRFFF) to 0 before enabling communications (setting the HSUSnEN bit to 1).

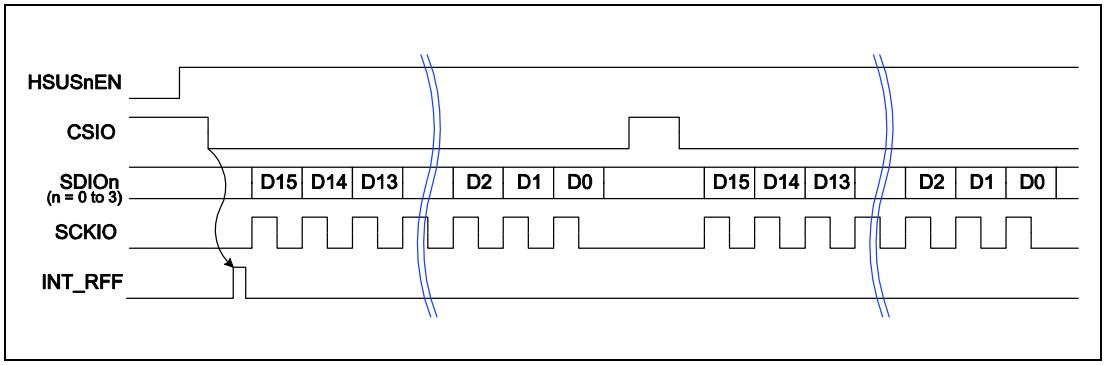

Figure 17.11 First Frame Reception Interrupt Request

17.4.5.4 Group Frame Reception Interrupt Request

If the value of the current Rx frame number register (HSUSnCRFM) has exceeded (or equal to) the value set in the Rx group frame number register (HSUSnRGFM) during reception, a group frame reception interrupt request (INT_RGF) is generated.

The group frame reception interrupt request (NT_RGF) is not generated while the Rx group frame number register (HSUSnRGFM) value is 0000 0000_H.

While the overflow error flag (HSUSnOVEF), or the group frame reception flag (HSUSnRGFF) is 1, the group frame reception interrupt request (INT_RGF) is not generated. When transfer is to be started, clear all interrupt status flags to 0 before enabling communications (setting the HSUSnEN bit to 1).

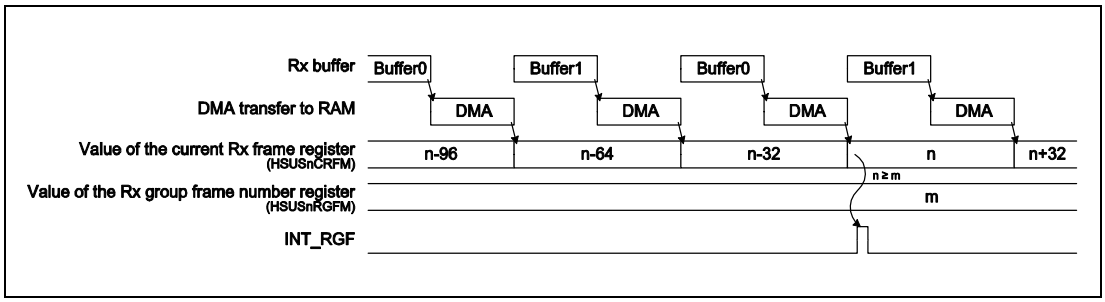

Figure 17.12 Group Frame Reception Interrupt Request

17.4.5.5 Packet Reception Complete Interrupt Request

If the value of the current Rx frame number register (HSUSnCRFM) has exceeded (or equal to) the value set in the Rx frame number register (HSUSnRPFM) during reception, a packet reception complete interrupt request (INT_RPC) is generated.

While the overflow error flag (HSUSnOVEF), or the packet reception complete flag (HSUSnRPCF) is 1, the packet reception complete interrupt request (INT_RPC) is not generated. When transfer is to be started, clear all interrupt status flags to 0 before enabling communications (setting the HSUSnEN bit to 1).

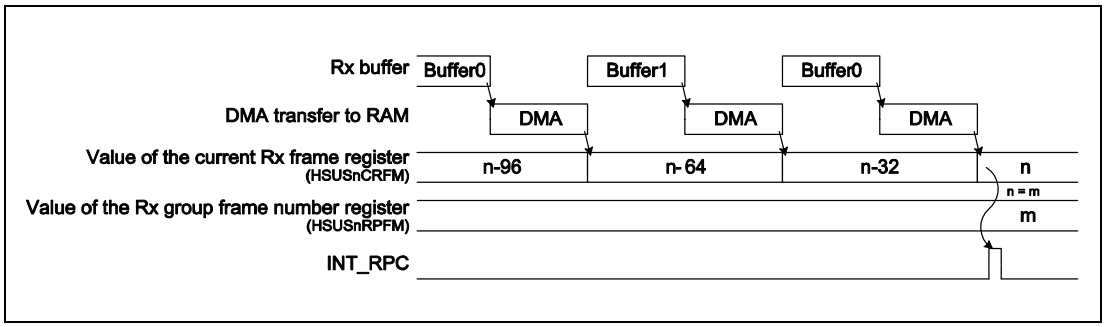

Figure 17.13 Packet Reception Complete Interrupt Request

17.4.5.6 Parity Error Interrupt Request

If the parity value calculated from the received frame data and the value of the parity bit in the received data are not identical, a parity error interrupt request (INT_PE) is generated. The parity error interrupt request (INT_PE) is not generated while the parity error flag (HSUSnPEF) is 1 following the occurrence of a parity error interrupt. When transfer is to be started, clear the parity error flag (HSUSnPEF) to 0 before enabling communications (setting the HSUSnEN bit to 1).

The interrupt request is generated upon detection of a parity error in the Rx block (De-serializer).

Reception continues after a parity error.

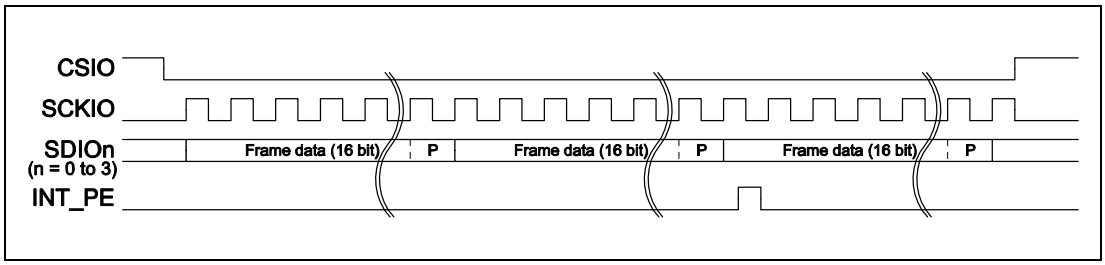

Figure 17.14 Parity Error Interrupt Request

17.4.5.7 Receive Overflow Error Interrupt Request

Double buffering is also used in reception, so two buffers are provided. This allows the continuous reception of data by the interface while the DMA transfer of data that have already been received is proceeding.

If the received data is stored in the Rx buffer while the two buffers are full, a receive overflow error interrupt (INT_OVE) is generated. A group frame reception interrupt request (INT_RGF) or packet reception complete interrupt request (INT_RPC) is not generated while the overflow error flag (HSUSnOVEF) is 1 following the occurrence of a receive overflow error interrupt. Also, a receive overflow error interrupt (INT_OVE) is not generated. When transfer is to be started, clear the overflow error flag (HSUSnOVEF) to 0 before enabling communications (setting the HSUSnEN bit to 1).

If a receive overflow occurs, data in the buffer is overwritten.

17.4.6 Discarding Received Data

If the CSIO pin is driven to the high level while a frame is being received (before sampling of the 16th bit), the received data having fewer than 16 bits are judged to be invalid and the HS-USRT proceeds with the next operation. Note that generation of an interrupt request and indication by a status flag due to discarding of the received data do not proceed.

- Received data are discarded and not counted in the number of received frames.
- If a frame of received data judged to have been invalid is retransmitted and received normally, the retransmitted frame data is stored in the Rx buffer and counted as the number of received frames.
- If a frame of received data judged to have been invalid is not retransmitted, the value will not reach the number of received frames specified in the Rx frame number register (HSUSnRPFM), and the packet reception complete interrupt request will not be output. If a timeout is managed by a timer external to the HS-USRT, this will lead to a reception timeout.

17.4.7 Operation for Reception of Overrun Frames

If the radar ASIC transmits more frames than the number specified in the Rx frame number register (HSUSnRPFM), i.e. there is an overrun of frames, data in frames following the generation of the packet reception complete interrupt request (INT_RPC) are discarded.

If an overrun frame which has a parity error is received, the parity error interrupt request (INT_PE) is output.

In addition, if an overrun frame is received while the two Rx buffers are full, a receive overflow error interrupt (INT_OVE) is output.

17.4.8 Timeout

Following the start of reception after the CSIO pin is initially switched to the low level, a first frame reception interrupt request is generated to indicate the start of reception. This interrupt signal and a timer external to the HS-USRT can be used to detect a reception timeout error by monitoring whether packet reception is completed within a predetermined period.

Figure 17.15 is an example where the external timer detects incomplete packet reception due to the discarding of received data while the second frame was being received.

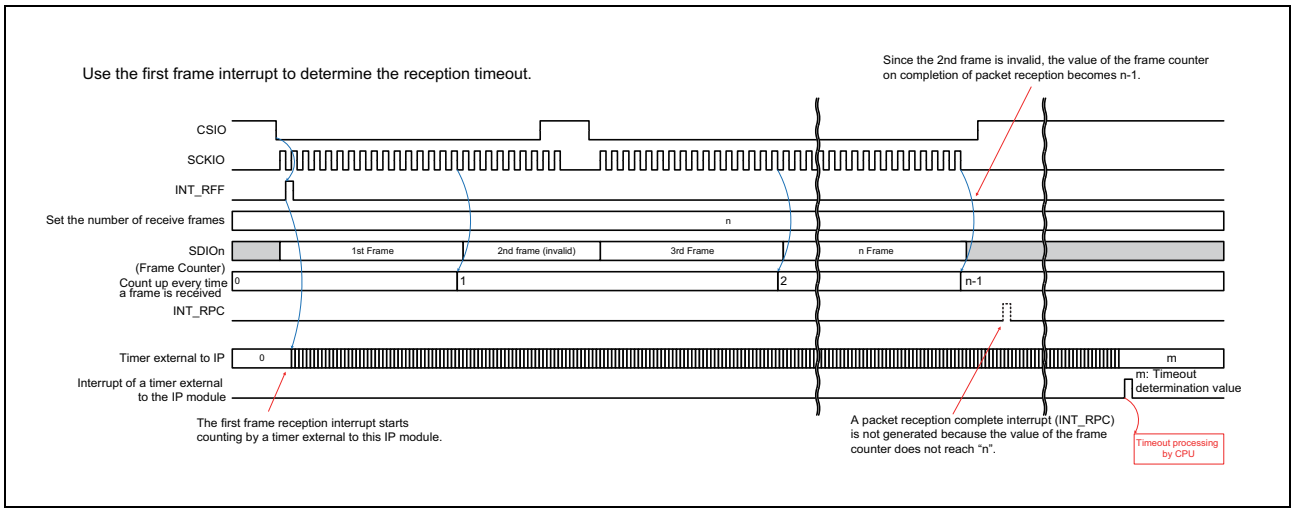

Figure 17.15 Example of Timeout Error Detection

17.4.9 Setting Procedure

17.4.9.1 Flows of Initialization and Stopping Operations

Figure 17.16 shows the flow of initialization and **Figure 17.17** shows the flow of processing to stop operations after transfer is completed.

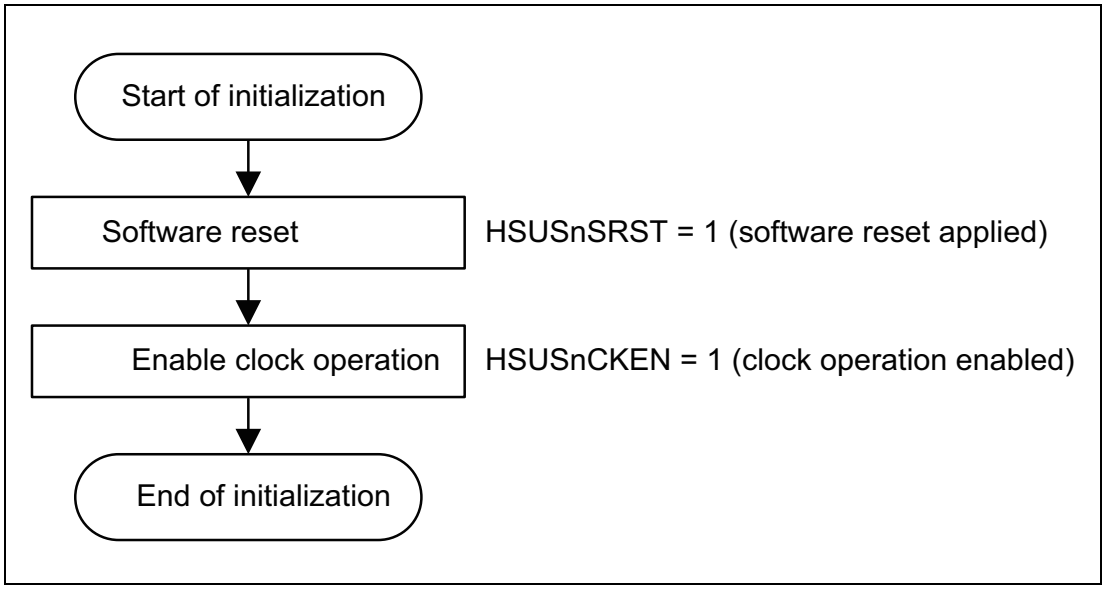

Figure 17.16 Initialization Flow

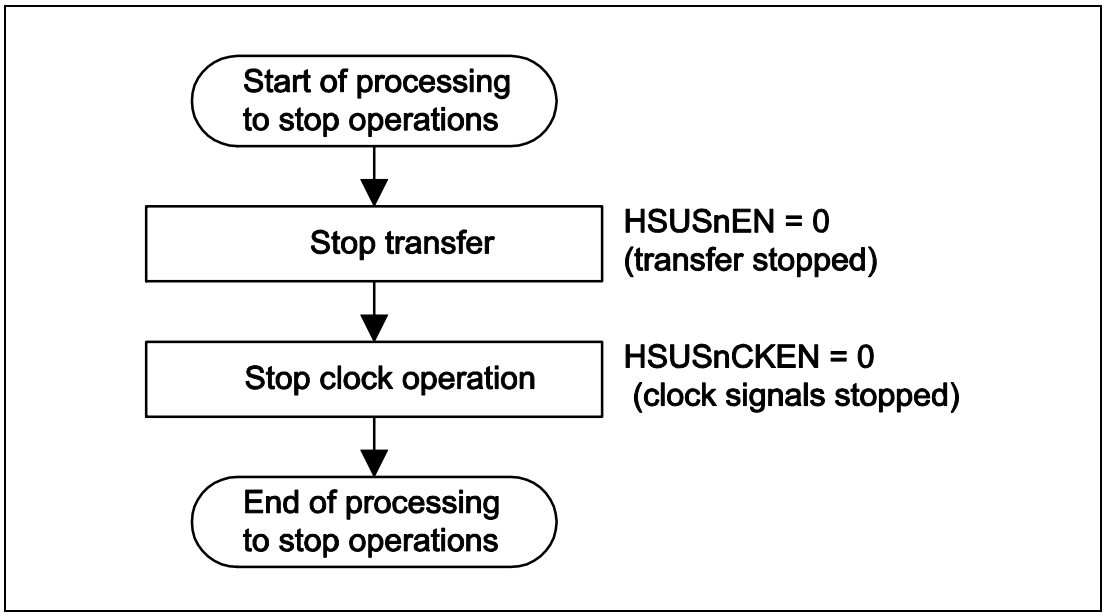

Figure 17.17 Flow of Processing to Stop Operations

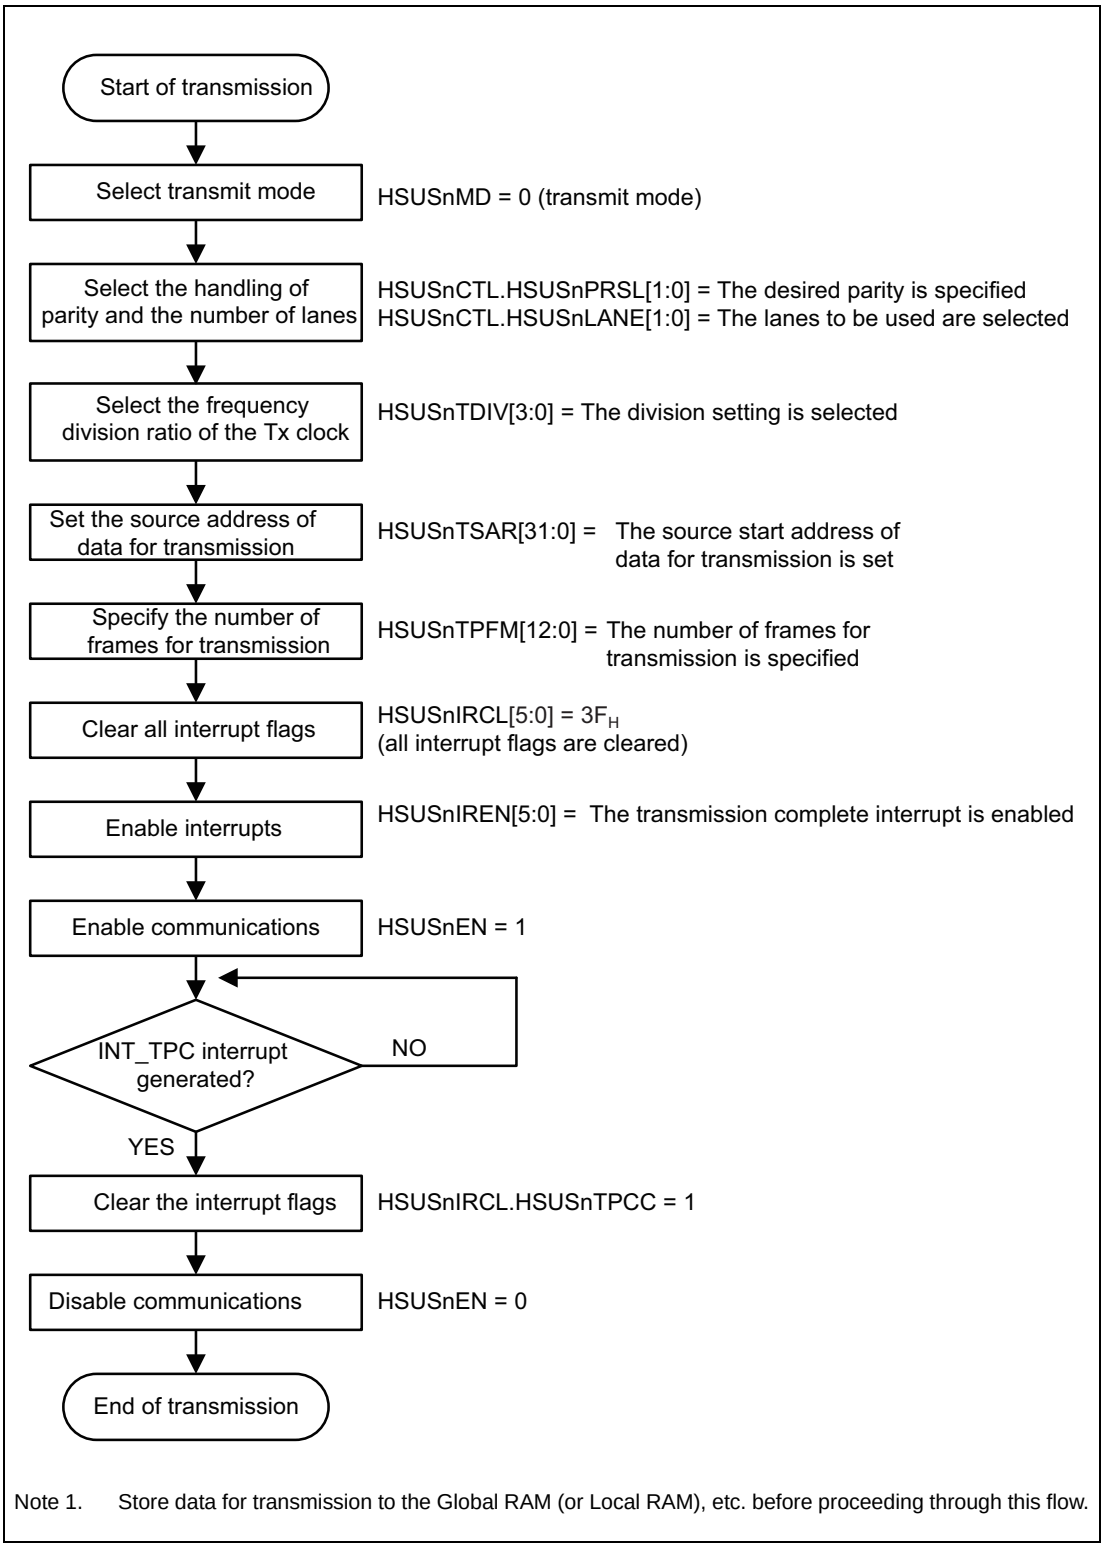
17.4.9.2 Flow of Settings for Transmission

Figure 17.18 shows an example of the flow of settings for transmission.



Note 1. Store data for transmission to the Global RAM (or Local RAM), etc. before proceeding through this flow.

Figure 17.18 Example of Transmission Setting Flow

17.4.9.3 Flow of Settings for Reception

Figure 17.19 shows an example of the flow of settings for reception.

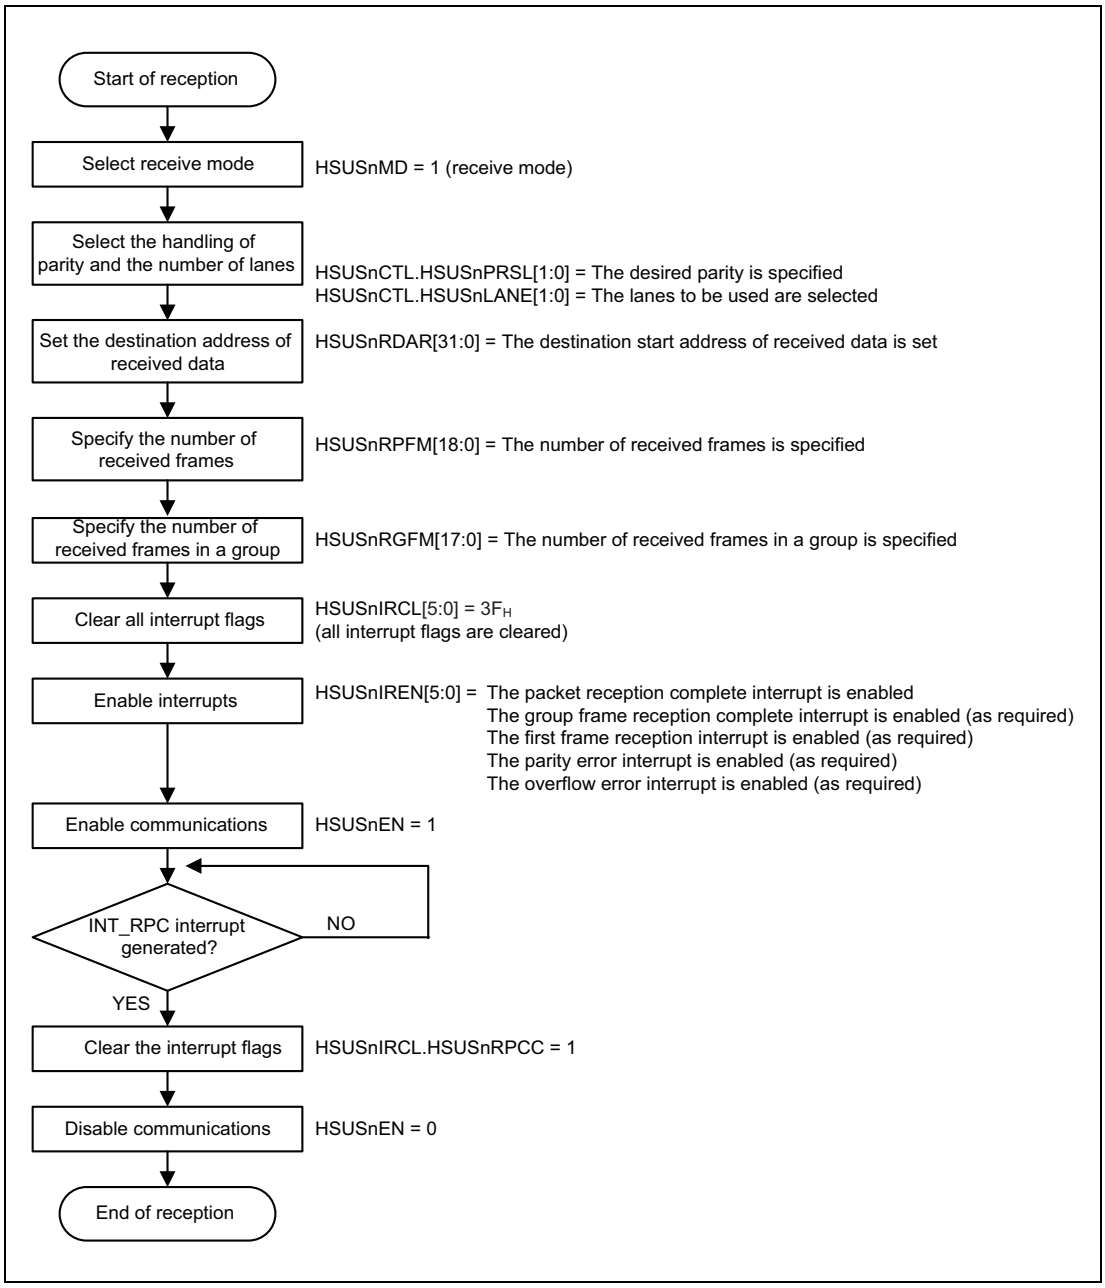


Figure 17.19 Example of Reception Setting Flow

17.4.9.4 Flow of Error Processing

Figure 17.20 shows an example of the flow of error processing.

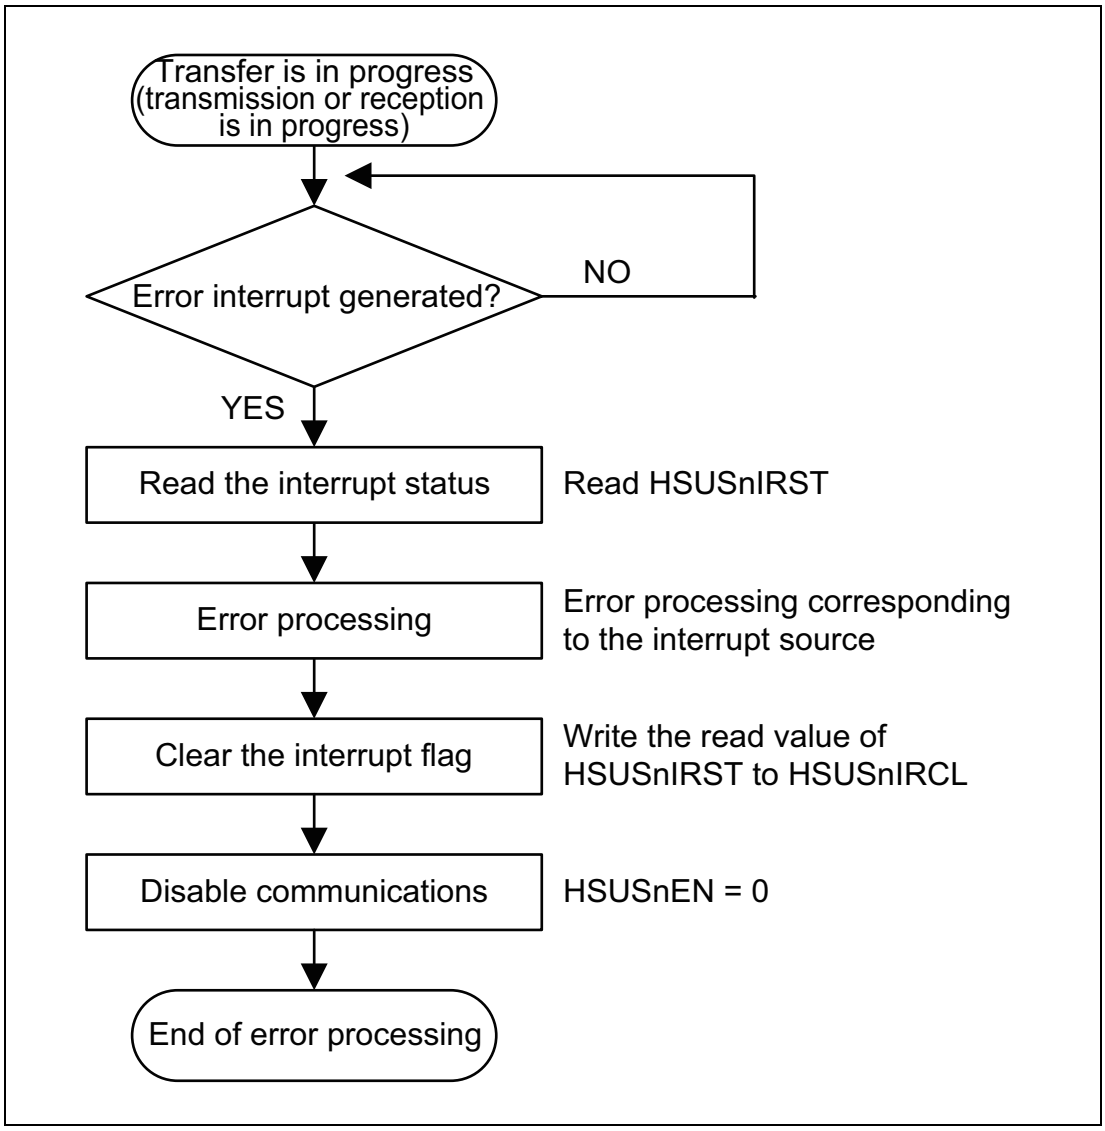

Figure 17.20 Example of Error Processing Flow

17.4.9.5 Aborting Transfer

Transfer is stopped by writing 0 to the HSUSnEN.HSUSnEN bit. Writing 0 to the HSUSnEN bit to stop transfer leads to the HSUSnCST.HSUSnACTF flag being cleared to 0, so read the latter register to confirm that transfer has actually been stopped, then apply a software reset.

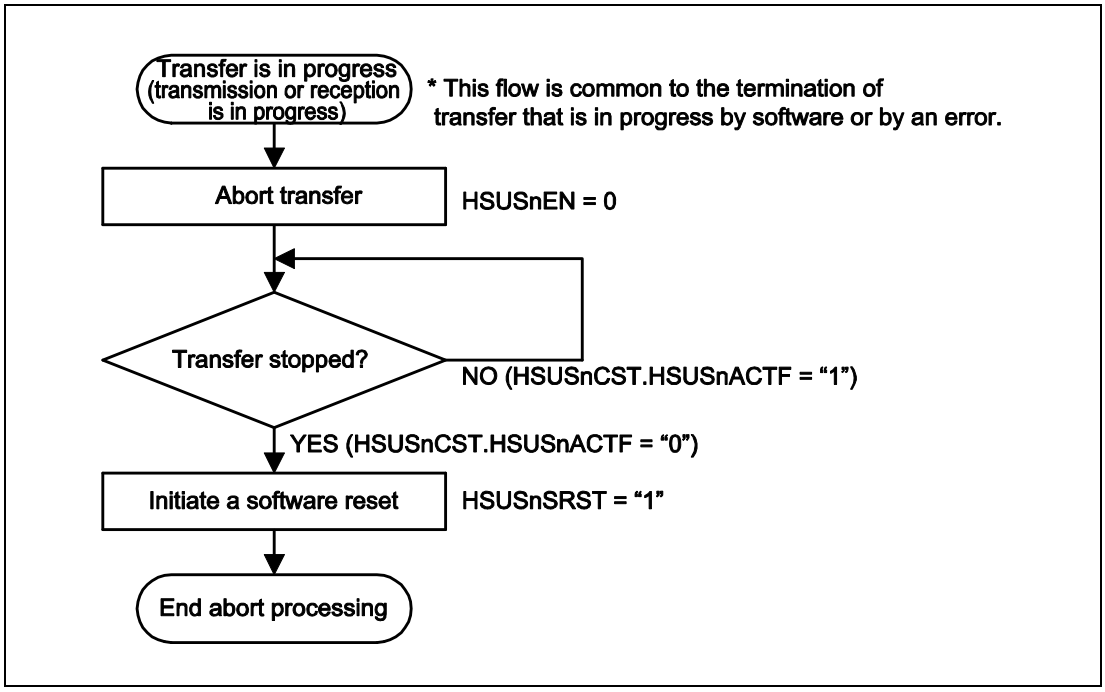

Figure 17.21 Flow for Aborting Transfer

Table 17.29 Operations when Stopping Transfer in Progress

Communications mode	Operations when Stopping Transfer (by Writing 0 to HSUSnEN)
Transmission	On completion of transmission of the frame currently being transmitted, the CSIO pin is driven to the high level and transfer is stopped.
Reception	The frame being received is discarded and transfer is stopped.

17.4.10 Notes

17.4.10.1 When Aborting Transfer

If transfer in progress is stopped, be sure to initiate a software reset. For details, see **Section 17.4.9.5, Aborting Transfer**

17.4.10.2 Write Protection for Setting Registers

Write protection for the setting registers is only applied while the communication enable bit (HSUSnEN) is 1 and the setting registers cannot be written to during this period. Write protection does not depend on the state of the active flag (HSUSnACTF), but if a software reset is applied while the active flag (HSUSnACTF) is 1, if transmission is in progress, it will immediately be aborted. Also, the H-bus transaction will be aborted.

Accordingly, when writing to the software reset register or the setting registers, do so while the communication enable bit (HSUSnEN) is 0 and the active flag (HSUSnACTF) is 0.

17.4.10.3 Clock Frequency

When the HS-USRT is to be used, make settings so that PCLK and HCLK have the same frequency and the relationship between TXCLK and HCLK is HCLK ≥ TXCLK. For reception, the relationship between SCKIO and HCLK must also satisfy the condition HCLK > SCKIO.

17.4.11 Limited Reset and Module stand-by

The HS-USRT can be reset by limited reset from SYSCTRL. The Limited Reset is functionally equivalent to a hardware reset. Software must ensure that HS-USRT is halted (HSUSnEN.HSUSnEN bit = 0 and HSUSnCST.HSUSnACTF bit = 0)

The HS-USRT clock can be disabled by the SYSCTRL module stand-by function. Software must ensure that HS-USRT is halted if module stand-by enable.

17.4.12 Data Storage and Address Space

The Transmission data in the Global RAM (or Local RAM) must set with the LSB end.

The internal DMAC of the HS-USRT store the receiving data in the Global RAM (or Local RAM) in 32-frame units as shown in **Figure 17.22**. Accordingly, if the number of received frames is not a multiple of 32, invalid data are written to the area that does not correspond to valid received frames, i.e. after the last frame of actual data is stored. Ensure that the storage area for received data has enough space so that such invalid data is not written over actual data.

	MSB			LSB	
+00H	Frame3	Frame2	Frame1	Frame0	
+08H	Frame7	Frame6	Frame5	Frame4

Figure 17.22 Received Frame Data Storage Area

17.5 Difference among P1M-C, P1H-C and P1H-CE

The difference among devices is only the number of units. For details, See **Table 17.1, HS-USRT Channels**.

Device P1M-C, P1H-C (4MB, BGA-156):

2 instances of HS_USRT (total receive bit rate is 320 Mbits/s)

Device P1H-C (4MB, BGA-292), P1H-C (8MB), P1H-CE:

4 instances of HS_USRT (total receive bit rate is 640 Mbits/s)

Section 18 LIN/UART Interface (RLIN3)

This section contains a generic description of the LIN/UART interface (RLIN3).

The first part of this section describes all RH850/P1x-C specific properties, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of RLIN3.

18.1 Features of RH850/P1x-C RLIN3

18.1.1 Units and Channels

This microcontroller has the following number of RLIN3 units.

RLIN3 unit has one channel interface. “Number of channels” is used with the same meaning as “number of units” in this section

Table 18.1 Units

Product	P1M-C (QFP, BGA-292)	P1M-C (BGA-156)	P1H-C (4MB, BGA-292)	P1H-C (4MB, BGA-156)	P1H-C (8MB)	P1H-CE
Channel number(n)	2	2	4	2	4	4
Name	RLIN3n (n = 0 to 3)					

Table 18.2 Unit Configurations and Channels

Unit Name (Channel Name) RLIN3n	Channels per Unit	P1M-C (QFP, BGA-292)	P1M-C (BGA-156)	P1H-C (4MB, BGA-292)	P1H-C (4MB, BGA-156)	P1H-C (8MB)	P1H-CE
RLIN30	1	√	√	√	√	√	√
RLIN31	1	√	√	√	√	√	√
RLIN32	1	—	—	√	—	√	√
RLIN33	1	—	—	√	—	√	√

Note: The channel names are same as those of the corresponding units.

The following lists the index corresponding to each product.

Table 18.3 Index

Index	Meaning
n	Throughout this section, the individual RLN3 units are identified by the index “n” (n = 0 to 3): for example, RLN3nLCUC is the RLN3n control register.
b	Throughout this section, the individual transmit/receive buffers of RLN3n are identified by the index “b” (b = 1 to 8): for example, RLN3nLDBR1 is the first stage data buffer register.

18.1.2 Register Base Address

RLIN3 base addresses are listed in the following table.

RLIN3 register addresses are given as offsets from the base addresses in general.

Table 18.4 Register Base Address

Base Address Name	Base Address
<RLIN30_base>	FFD8 C000$_H$
<RLIN31_base>	FFCA C000$_H$
<RLIN32_base>	FFD8 D000$_H$
<RLIN33_base>	FFCA D000$_H$

18.1.3 Clock Supply

Clock supply by and to RLIN3 is listed in the following table.

Table 18.5 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
RLIN3n	P-Bus interface clock (PCLK)	CLK_HSB
	RLIN3 communication clock (clkc)	CLKP_L

Note: To use the RLIN3, following condition must be fulfilled: CLK_HSB ≥ CLKP_L

For detail of clock supply, see **Section 12, Clock Controller**.

18.1.4 Interrupt Request

RLIN3 interrupt requests are listed in the following table.

Table 18.6 Interrupt Requests

Unit Interrupt Name	Outline	Interrupt Number	DMA Trigger Number	DTS Trigger Number (Primary)
RLIN30				
INTRLIN3nUR0 (n = 0)	RLIN30 transmit interrupt	104	91	101
INTRLIN3nUR1 (n = 0)	RLIN30 receive completion interrupt	103	90	100
INTRLIN3nUR2 (n = 0)	RLIN30 status interrupt	102	—	—
RLIN31				
INTRLIN3nUR0 (n = 1)	RLIN31 transmit interrupt	107	93	103
INTRLIN3nUR1 (n = 1)	RLIN31 receive completion interrupt	106	92	102
INTRLIN3nUR2 (n = 1)	RLIN31 status interrupt	105	—	—
RLIN32				
INTRLIN3nUR0 (n = 2)	RLIN32 transmit interrupt	110	95	105
INTRLIN3nUR1 (n = 2)	RLIN32 receive completion interrupt	109	94	104
INTRLIN3nUR2 (n = 2)	RLIN32 status interrupt	108	—	—
RLIN33				
INTRLIN3nUR0 (n = 3)	RLIN33 transmit interrupt	113	97	107
INTRLIN3nUR1 (n = 3)	RLIN33 receive completion interrupt	112	96	106
INTRLIN3nUR2 (n = 3)	RLIN33 status interrupt	111	—	—

18.1.5 Reset sources

RLIN3 reset sources are listed in the following table. RLIN3 is initialized by these reset sources.

Table 18.7 Register Reset Condition

		Reset Condition				
Unit name	Register Name	Power On Reset	System Reset 1	System Reset 2	Application Reset 1	Limited Reset
RLIN3n	All registers	√	√	√	√	√

NOTE

After reset, clear register value of error and status (RLN3nLMST, RLN3nLST and RLN3nLEST) and ignore UART reception data (RLIN3nLIDB, RLN3nLURDR, RLN3nLURDRL and RLN3nLURDRH).

18.1.6 External Input/Output Signals

External input/output signals of RLIN3 are listed below.

Table 18.8 External Input/Output Signals

Unit Signal Name	Outline	Alternative port pin signal
RLIN30		
RLIN3nRX (n = 0)	RLIN30 receive data input	RLIN30RX
RLIN3nTX (n = 0)	RLIN30 transmit data output	RLIN30TX
RLIN31		
RLIN3nRX (n = 1)	RLIN31 receive data input	RLIN31RX
RLIN3nTX (n = 1)	RLIN31 transmit data output	RLIN31TX
RLIN32		
RLIN3nRX (n = 2)	RLIN32 receive data input	RLIN32RX
RLIN3nTX (n = 2)	RLIN32 transmit data output	RLIN32TX
RLIN33		
RLIN3nRX (n = 3)	RLIN33 receive data input	RLIN33RX
RLIN3nTX (n = 3)	RLIN33 transmit data output	RLIN33TX

Note: RLIN30RX/TX is sharing terminal to three port pairs (MTTCAN0RX/MTTCAN0TX) of MTTCAN0 and one port pair of MCAN0.

18.2 Overview

18.2.1 Functional Overview

The LIN/UART interface is a hardware LIN communication controller that supports LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2 and SAE J2602, and automatically performs frame communication and error determination.

The LIN/UART interface is provided with UART mode and can also be used as a UART.

The appropriate mode should be used for the LIN/UART interface according to the application: LIN master, LIN slave, or UART.

LIN master

- LIN reset mode
- LIN mode (LIN master mode)
  - LIN wake-up mode
  - LIN operation mode
- LIN self-test mode

LIN slave

- LIN reset mode
- LIN mode (LIN slave mode [auto baud rate] or LIN slave mode [fixed baud rate])
  - LIN wake-up mode
  - LIN operation mode
- LIN self-test mode

UART

- LIN reset mode
- UART mode

Table 18.9 gives the LIN/UART interface specifications.

Table 18.9 LIN/UART Interface Specifications (1/3)

Item		Specifications	
	Channel count	6 channels	
LIN communication function	Protocol	LIN Specification Package Revision 1.3, 2.0, and 2.1	
	Variable frame structure	Master	• Break transmission width: 13 to 28 Tbits • Break delimiter transmission width: 1 to 4 Tbits • Inter-byte space (header): 0 to 7 Tbits (space between Sync field and ID field)*1 • Response space: 0 to 7 Tbits*1 • Inter-byte space: 0 to 3 Tbits (space between data bytes in response area) • Wake-up: 1 to 16 Tbits
		Slave	• Break reception width: 9.5 or 10.5 Tbits [for fixed baud rate] : 10 or 11 Tbits [for auto baud rate] • Response space: 0 to 7 Tbits • Inter-byte space: 0 to 3 Tbits (space between data bytes in response area) • Wake-up: 1 to 16 Tbits
	Checksum	• Automatic operation for both transmission and reception • Classic or enhanced selectable (for each frame)	
	Response field data byte count	Variable from 0 to 8 bytes Multi-byte (9 or more bytes) response transmission and reception also possible	
	Frame communication modes	Master	• Mode in which header transmission and response transmission/reception is started with a single transmission start request • Mode in which header transmission and response transmission are started with separate transmission start requests (frame combined mode)
		Slave	• Mode in which header is automatically received with fixed baud rate • Mode in which header is automatically received with the baud rate set according to the sync field measurement result of the sync field and break field detected
	Wake-up transmission and reception	LIN wake-up mode provided • Wake-up transmission (1 to 16 Tbits) • Wake-up reception Low-level width of input signals measured	

Table 18.9 LIN/UART Interface Specifications (2/3)

Item		Specifications	
LIN communication function	Status	Master	• Successful frame/wake-up transmission • Successful header transmission • Successful frame/wake-up reception*2 • Successful 1st data byte reception • Error detection • Operation mode (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode)
		Slave	• Successful frame/wake-up transmission • Successful frame/wake-up reception*2 • Successful header reception • Successful 1st data byte reception • Error detection • Operation mode (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode)
	Error status	Master	• Bit error • Checksum error • Frame timeout error/response timeout error • Physical bus error • Framing error • Response preparation error
		Slave	• Bit error • Checksum error • Frame timeout error/response timeout error • Sync field error • ID parity error • Framing error • Response preparation error
	Baud rate selection	Baud rate conforming to the LIN specifications generated using baud rate generator	
	Test mode	Self-test mode for user evaluation	
	Interrupt function	Master	• Successful header/frame/wake-up transmission • Successful frame/wake-up reception*2 • Error detection
		Slave	• Successful frame/wake-up transmission • Header/frame/wake-up reception*2 • Error detection

Table 18.9 LIN/UART Interface Specifications (3/3)

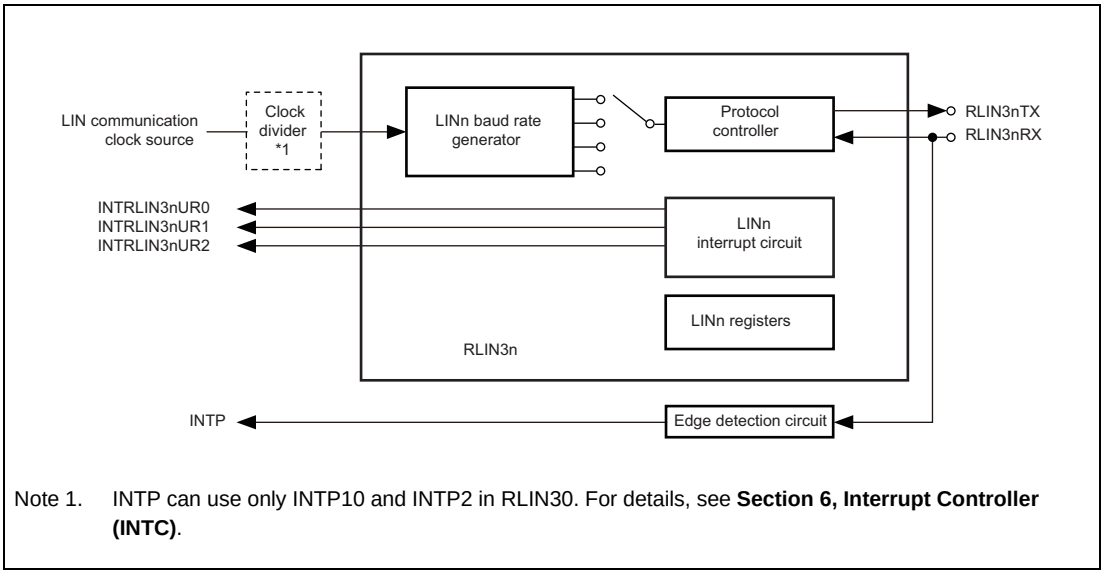
Item		Specifications
UART communication function	Data buffer	• Transmission data buffer/transmission data buffer for wait (exclusively for transmission; data length of 1. Character length of 7, 8, and 9 bits supported) • UART multi-byte data (exclusively for transmission; variable data length from 1 to 9 bits; character length of 7 and 8 bits supported) • Reception data buffer (exclusively for reception; data length of 1. Character length of 7, 8, and 9 bits supported)
	Data format	Character length: 7 or 8 bits 9 bits including the expansion bit supported.
		Transmission stop bit: 1 or 2 bits
		Parity function: odd, even, 0, or none
		LSB- or MSB-first transfer selectable
		Reverse input/output of transmission/reception data
	Status	• Transmission status • Reception status • Successful UART multi-byte data transmission • Error SUM • Expansion bit detection • ID match • Reset mode status
	Error status	• Bit error • Framing error • Parity error • Overrun error
	Baud rate selection	With the baud rate generator incorporated, any baud rate can be set.
	When a certain expansion bit is at the expected level, the data received can be compared to the 8-bit data preset in the register.	
	The stop bit received is guaranteed (start of transmission can be delayed when start of transmission is attempted during reception of the stop bit).	
	Interrupt function	• Transmission start/complete • Reception complete • Status detection

Note 1. Since the same register is used for setting, the inter-byte space (header) = response space.

Note 2. For wake-up reception, the low level width of the input signal is indicated.

18.2.2 Block Diagram

Figure 18.1 shows a block diagram of the LIN/UART interface.



Note 1. INTP can use only INTP10 and INTP2 in RLIN30. For details, see **Section 6, Interrupt Controller (INTC)**.

Figure 18.1 LIN/UART Interface Block Diagram

18.2.3 Description of Blocks

- RLIN3nTX, RLIN3nRX: LIN/UART interface I/O pins
- LINn baud rate generator: Generates the LIN/UART interface communication clock signal.
- LINn registers: LIN/UART interface registers
- LINn interrupt controller: Controls interrupt requests generated by the LIN/UART interface

18.3 Registers

18.3.1 List of Registers

RLIN3 registers are listed in the following table.

For <RLIN3n_base>, see **Section 18.1.2, Register Base Address**.

Table 18.10 Registers (1/2)

Module	Register	Symbol	Address	LIN Master	LIN Slave	UART	Access Protection	
							PBG	Other
RLN3n	LIN wake-up baud rate selector register	RLN3nLWBR	<RLIN3n_base> + 01_H	√	√	√	*1	—
RLN3n	LIN / UART baud rate prescaler 01 register	RLN3n LBRP01	<RLIN3n_base> + 02_H	—	√	√	*1	—
RLN3n	LIN / UART baud rate prescaler 0 register	RLN3n LBRP0	<RLIN3n_base> + 02_H	√	√	√	*1	—
RLN3n	LIN / UART baud rate prescaler 1 register	RLN3n LBRP1	<RLIN3n_base> + 03_H	√	√	√	*1	—
RLN3n	LIN self-test control register	RLN3nLSTC	<RLIN3n_base> + 04_H	√	√	—	*1	—
RLN3n	LIN mode register	RLN3nLMD	<RLIN3n_base> + 08_H	√	√	√	*1	—
RLN3n	LIN break field configuration register/ UART configuration register	RLN3nLBFC	<RLIN3n_base> + 09_H	√	√	√	*1	—
RLN3n	LIN / UART space configuration register	RLN3nLSC	<RLIN3n_base> + $0A_H$	√	√	√	*1	—
RLN3n	LIN wake-up configuration register	RLN3nLWUP	<RLIN3n_base> + $0B_H$	√	√	—	*1	—
RLN3n	LIN interrupt enable register	RLN3nLIE	<RLIN3n_base> + $0C_H$	√	√	—	*1	—
RLN3n	LIN / UART error detection enable register	RLN3nLEDE	<RLIN3n_base> + $0D_H$	√	√	√	*1	—
RLN3n	LIN / UART control register	RLN3nLCUC	<RLIN3n_base> + $0E_H$	√	√	√	*1	—
RLN3n	LIN / UART transmission control register	RLN3nLTRC	<RLIN3n_base> + 10_H	√	√	√	*1	—
RLN3n	LIN / UART mode status register	RLN3nLMST	<RLIN3n_base> + 11_H	√	√	√	*1	—
RLN3n	LIN / UART status register	RLN3nLST	<RLIN3n_base> + 12_H	√	√	√	*1	—
RLN3n	LIN / UART error status register	RLN3nLEST	<RLIN3n_base> + 13_H	√	√	√	*1	—
RLN3n	LIN data field configuration register	RLN3nLDFC	<RLIN3n_base> + 14_H	√	√	√	*1	—
RLN3n	LIN / UART ID buffer register	RLN3nLIDB	<RLIN3n_base> + 15_H	√	√	√	*1	—
RLN3n	LIN checksum buffer register	RLN3nLCBR	<RLIN3n_base> + 16_H	√	√	—	*1	—
RLN3n	UART data 0 buffer register	RLN3n LUDB0	<RLIN3n_base> + 17_H	—	—	√	*1	—
RLN3n	LIN / UART data buffer 1 register	RLN3n LDBR1	<RLIN3n_base> + 18_H	√	√	√	*1	—
RLN3n	LIN / UART data buffer 2 register	RLN3n LDBR2	<RLIN3n_base> + 19_H	√	√	√	*1	—
RLN3n	LIN / UART data buffer 3 register	RLN3n LDBR3	<RLIN3n_base> + $1A_H$	√	√	√	*1	—
RLN3n	LIN / UART data buffer 4 register	RLN3n LDBR4	<RLIN3n_base> + $1B_H$	√	√	√	*1	—
RLN3n	LIN / UART data buffer 5 register	RLN3n LDBR5	<RLIN3n_base> + $1C_H$	√	√	√	*1	—
RLN3n	LIN / UART data buffer 6 register	RLN3n LDBR6	<RLIN3n_base> + $1D_H$	√	√	√	*1	—
RLN3n	LIN / UART data buffer 7 register	RLN3n LDBR7	<RLIN3n_base> + $1E_H$	√	√	√	*1	—
RLN3n	LIN / UART data buffer 8 register	RLN3n LDBR8	<RLIN3n_base> + $1F_H$	√	√	√	*1	—
RLN3n	UART operation enable register	RLN3n LUOER	<RLIN3n_base> + 20_H	—	—	√	*1	—
RLN3n	UART option register 1	RLN3n LUOR1	<RLIN3n_base> + 21_H	—	—	√	*1	—

Table 18.10 Registers (2/2)

Module	Register	Symbol	Address	LIN Master	LIN Slave	UART	Access Protection	
							PBG	Other
RLN3n	UART transmission data register	RLN3n LUTDR	<RLIN3n_base> + 24_H	—	—	√	*1	—
RLN3n	UART transmission data register L	RLN3n LUTDRL	<RLIN3n_base> + 24_H	—	—	√	*1	—
RLN3n	UART transmission data register H	RLN3n LUTDRH	<RLIN3n_base> + 25_H	—	—	√	*1	—
RLN3n	UART reception data register	RLN3n LURDR	<RLIN3n_base> + 26_H	—	—	√	*1	—
RLN3n	UART reception data register L	RLN3n LURDRL	<RLIN3n_base> + 26_H	—	—	√	*1	—
RLN3n	UART reception data register H	RLN3n LURDRH	<RLIN3n_base> + 27_H	—	—	√	*1	—
RLN3n	UART wait transmission data register	RLN3n LUWTDR	<RLIN3n_base> + 28_H	—	—	√	*1	—
RLN3n	UART wait transmission data register L	RLN3n LUWTDRL	<RLIN3n_base> + 28_H	—	—	√	*1	—
RLN3n	UART wait transmission data register H	RLN3n LUWTDRH	<RLIN3n_base> + 29_H	—	—	√	*1	—

Note: √: Used
—: Not used
When writing to a register not used, write 00_H.

Note 1. In the case of
n = 0 and 2 PBG3#0.PG3-RLIN3,
n = 1 and 3 PBG1#0.PG1-RLIN3

18.3.2 LIN Master Related Registers

18.3.2.1 RLN3nLWBR — LIN Wake-up Baud Rate Select Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 01_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	NSPB[3:0]				LPRS[2:0]			LWBR0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.11 RLN3nLWBR register contents

Bit Position	Bit Name	Function
7 to 4	NSPB[3:0]	Bit Sampling Count Select b7 b4 0 0 0 0: 16 sampling Settings other than the above are prohibited.
3 to 1	LPRS[2:0]	Prescaler Clock Select b3 b1 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128
0	LWBR0	Wake-up Baud Rate Select 0: When LIN1.3 is used. 1: When LIN2.x is used.

Set the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

NSPB[3:0] Bits (Bit Sampling Count Select)

These bits select the number of sampling in one Tbit (reciprocal of the baud rate).
In LIN master mode (LIN/UART mode select bits in LIN mode register = 00_B), set these bits to 0000_B (16 sampling).

LPRS[2:0] Bits (Prescaler Clock Select)

These bits select the frequency division ratio for the prescaler.
The LIN communication clock source is divided by this prescaler.

LWBR0 Bit (Wake-up Baud Rate Select)

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. This allows the 2.5-Tbit or longer low-level width of the input signal to be measured.

When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. Setting the LWBR0 bit to 1 selects the LIN system clock (fLIN) as fa regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed). This allows the 2.5-Tbit or longer low-level width of the input signal to be measured.

Setting the baud rate to 19200 bps while fa is selected allows the 130 µs or longer low-level width of the input signal to be detected during LIN wake-up mode regardless of the setting of the RLN3nLMD.LCKS bit.

18.3.2.2 RLN3nLBRP0 — LIN Baud Rate Prescaler 0 Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 02_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LBRP0[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.12 RLN3nLBRP0 register contents

Bit Position	Bit Name	Function
7 to 0	LBRP0[7:0]	Assuming that the value set in this register is N (0 to 255), the baud rate prescaler divides the frequency of the prescaler clock by N + 1. Setting Range: 00_H to FF_H

Set the RLN3nLBRP0 register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock sources fa, fb, and fc.

Assuming that the value set in this register is N, baud rate prescaler 0 divides the frequency of the clock that is selected by the LPRS bits by N + 1.

Registers RLN3nLBRP0 and RLN3nLBRP1 can be accessed as RLN3nLBRP01 in 16-bit units.

18.3.2.3 RLN3nLBRP1 — LIN Baud Rate Prescaler 1 Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 03_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LBRP1[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.13 RLN3nLBRP1 register contents

Bit Position	Bit Name	Function
7 to 0	LBRP1[7:0]	Assuming that the value set in this register is M (0 to 255), the baud rate prescaler divides the frequency of the prescaler clock by M + 1. Setting Range: 00_H to FF_H

Set the RLN3nLBRP1 register when the OMM0 bit in the RLN3LMST register is 0_B (in LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock source fd.

Assuming that the value set in this register is M, baud rate prescaler 1 divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) by M + 1.

Registers RLN3nLBRP0 and RLN3nLBRP1 can be accessed as RLN3nLBRP01 in 16-bit units.

18.3.2.4 RLN3nLSTC — LIN Self-Test Control Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	LSTME[5:0]						LSTM
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 18.14 RLN3nLSTC register contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value is undefined. In writing to this bit, write value is meaningful only when $A7_H$, 58_H, and 01_H are written successively to this register in LIN Self-Test mode. In other cases, write value is ignored.
6 to 1	LSTME[5:0]	LIN Self-Test Mode Entry The test mode key values for configuring the RLIN3 module in Self-Test mode.
0	LSTM	LIN Self-Test Mode 0: The module is not in LIN self-test mode. 1: The module is in LIN self-test mode.

The RLN3nLSTC register cancels protection of LIN self-test mode.

Set the RLN3nLSTC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

Writing $A7_H$, 58_H, and 01_H successively to the RLN3nLSTC register places the module into LIN self-test mode.

When successive writing is completed thus placing LIN self-test mode to be entered, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For making transition to LIN self-test mode, see **Section 18.5.5, LIN Self-Test Mode**.

When read, bits 6 to 1 return "$000\ 000_B$", and bit 7 returns an undefined value.

LSTM Bit (LIN Self-Test Mode)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.
For leaving LIN self-test mode, see **Section 18.5.5, LIN Self-Test Mode**.
Writing 1 to this bit does not affect the value of the RLN3nLSTC register if it is not a part of successive writing of $A7_H$, 58_H, and 01_H.

18.3.2.5 RLN3nLMD — LIN Mode Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base>+ 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	LRDNFS	LIOS	LCKS[1:0]		LMD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.15 RLN3nLMD register contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	LRDNFS	LIN Reception Data Noise Filtering Disable 0: The noise filter is enabled. 1: The noise filter is disabled.
4	LIOS	LIN Interrupt Output Select 0: Not supported, setting is prohibited. 1: RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n status interrupt are used.
3, 2	LCKS[1:0]	LIN System Clock Select b3 b2 0 0: fa (Clock generated by baud rate prescaler 0) 0 1: fb (1/2 clock generated by baud rate prescaler 0) 1 0: fc (1/8 clock generated by baud rate prescaler 0) 1 1: fd (1/2 clock generated by baud rate prescaler 1)
1, 0	LMD[1:0]	LIN/UART Mode Select b1 b0 0 0: LIN master mode

Set the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode)

LRDNFS Bit (LIN Reception Data Noise Filtering Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.
With 0 set, the noise filter is enabled when receiving data.
With 1 set, the noise filter is disabled when receiving data.

LIOS Bit (LIN Interrupt Output Select)

The LIOS bit selects the number of interrupt outputs from the LIN/UART interface.
With 0 set, the RLIN3 interrupt n is generated from the LIN/UART interface.
With 1 set, the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n status interrupt are generated from the LIN/UART interface.
For each interrupt source, see **Section 18.4, Interrupt Sources**.
The LIOS bit must always be set when using LIN mode operation, in order to enable the interrupt generation by the RLIN3 module. For UART mode, this bit is not relevant.

LCKS[1:0] Bits (LIN System Clock Select)

The LCKS bits select the clock to be input to the protocol controller.
With 00_B set, the protocol controller is provided with fa (clock generated by baud rate prescaler 0).
With 01_B set, the protocol controller is provided with fb (1/2 clock generated by baud rate prescaler 0).
With 10_B set, the protocol controller is provided with fc (1/8 clock generated by baud rate prescaler 0).
With 11_B set, the protocol controller is provided with fd (1/2 clock generated by baud rate prescaler 1).

With 1 is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x is used), and the RLN3nLMST register is 01 (LIN wake-up mode), the protocol controller is provided with fa regardless of the setting of the bit (the LCKS bit is not changed)

LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.
To use the LIN/UART interface as an LIN master, set these bits to 00_B.

18.3.2.6 RLN3nLBFC — LIN Break Field Configuration Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 09_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	BDT[1:0]		BLT[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.16 RLN3nLBFC register contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5, 4	BDT[1:0]	Transmission Break Delimiter (High Level) Width Select b5 b4 0 0: 1 Tbit 0 1: 2 Tbits 1 0: 3 Tbits 1 1: 4 Tbits
3 to 0	BLT[3:0]	Transmission Break (Low Level) Width Select b3 b0 0 0 0 0: 13 Tbits 0 0 0 1: 14 Tbits 0 0 1 0: 15 Tbits : 1 1 1 0: 27 Tbits 1 1 1 1: 28 Tbits

Set the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

Some combinations of the set values result in the length of a frame exceeding the timeout time. Set the appropriate values in this register.

BDT[1:0] Bits (Transmission Break Delimiter (High Level) Width Select)

This bit is used to set the break high level width of transmission frame header.
1 Tbit to 4 Tbits can be set.

BLT[3:0] Bits (Transmission Break (Low Level) Width Select)

This BLT bits set the break low level width of transmission frame header.
13 Tbits to 28 Tbits can be set.

18.3.2.7 RLN3nLSC — LIN Space Configuration Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base>+ $0A_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	IBHS[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Table 18.17 RLN3nLSC register contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5, 4	IBS[1:0]	Inter-Byte Space Select b5 b4 0 0: 0 Tbit 0 1: 1 Tbit 1 0: 2 Tbits 1 1: 3 Tbits
3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2 to 0	IBHS[2:0]	Inter-Byte Space (Header)/Response Space Select b2 b0 0 0 0: 0 Tbit 0 0 1: 1 Tbit 0 1 0: 2 Tbits 0 1 1: 3 Tbits 1 0 0: 4 Tbits 1 0 1: 5 Tbits 1 1 0: 6 Tbits 1 1 1: 7 Tbits

Set the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

Some combinations of the set values result in the length of a frame or a response exceeding the timeout time. Set the appropriate values in this register.

IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the inter-byte space of the transmission frame response field.
0 Tbit to 3 Tbits can be set.
These bits are enabled only during response transmission; these are disabled during response reception.

When data is transferred from the UART transmit data register (RLN3nLUTDR) and the UART wait transmit data register (RLN3nLUWTDR), the setting of these bits is ignored. Set these bits to "00_B"

IBHS[2:0] Bits (Inter-Byte Space (Header)/Response Space Select)

The IBHS bits set the width of the response space before response transmission.
0 Tbit to 7 Tbits can be set.
The response space setting is enabled only during response transmission; setting is disabled during response reception.
The inter-byte space (header) is equal to the response space.

18.3.2.8 RLN3nLWUP — LIN Wake-up Configuration Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base>+ $0B_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	WUTL[3:0]				—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 18.18 RLN3nLWUP register contents

Bit Position	Bit Name	Function
7 to 4	WUTL[3:0]	Wake-up Transmission Low Level Width Select b7 b4 0 0 0 0: 1 Tbit 0 0 0 1: 2 Tbits 0 0 1 0: 3 Tbits 0 0 1 1: 4 Tbits : 1 1 0 0: 13 Tbits 1 1 0 1: 14 Tbits 1 1 1 0: 15 Tbits 1 1 1 1: 16 Tbits
3 to 0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

Set the RLN3nLWUP register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

WUTL[3:0] Bits (Wake-up Transmission Low Level Width Select)

The WUTL bits set the low level width of the wake-up signal transmission.
1 Tbit to 16 Tbits can be set.

With 1 is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x is used), fa is selected as the LIN system clock (fLIN) regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed).

18.3.2.9 RLN3nLIE — LIN Interrupt Enable Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + $0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SHIE	ERRIE	FRCIE	FTCIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 18.19 RLN3nLIE register contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	SHIE	Successful Header Transmission Interrupt Enable 0: Disables successful header transmission interrupt. 1: Enables successful header transmission interrupt.
2	ERRIE	Error Detection Interrupt Enable 0: Disables error detection interrupt. 1: Enables error detection interrupt.
1	FRCIE	Successful Frame/Wake-up Reception Interrupt Enable 0: Disables successful frame/wake-up reception interrupt. 1: Enables successful frame/wake-up reception interrupt.
0	FTCIE	Successful Frame/Wake-up Transmission Interrupt Enable 0: Disables successful frame/wake-up transmission interrupt. 1: Enables successful frame/wake-up transmission interrupt.

Set the RLN3nLIE register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

SHIE Bit (Successful Header Transmission Interrupt Enable)

The SHIE bit enables or disables interrupt generation upon successful transmission of a header.
With 0 set, the interrupt is not generated when the HTRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt is generated when the HTRC flag in the RLN3nLST register is set to 1.

ERRIE Bit (Error Detection Interrupt Enable)

The ERRIE bit enables or disables interrupt generation upon detection of an error.
With 0 set, the interrupt is not generated when the ERR flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt is generated when the ERR flag in the RLN3nLST register is set to 1.
Error types that are interrupt sources are the bit error, physical bus error, frame/response timeout error, framing error, checksum error, and response preparation error.
Detection of the bit error, physical bus error, frame/response timeout error, and framing error can be enabled or disabled using the RLN3nLEDE register.

FRCIE Bit (Successful Frame/Wake-up Reception Interrupt Enable)

The FRCIE bit enables or disables interrupt generation upon successful reception of a frame or a wake-up signal (counting of low level width of the input signal).
With 0 set, the interrupt is not generated when the FRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt is generated when the FRC flag in the RLN3nLST register is set to 1.

FTCIE Bit (Successful Frame/Wake-up Transmission Interrupt Enable)

The FTCIE bit enables or disables interrupt generation upon successful transmission of a frame or a wake-up signal.
With 0 set, the interrupt is not generated when the FTC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt is generated when the FTC flag in the RLN3nLST register is set to 1.

18.3.2.10 RLN3nLEDE — LIN Error Detection Enable Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + $0D_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LTES	—	—	—	FERE	FTERE	PBERE	BERE
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R/W	R/W	R/W	R/W

Table 18.20 RLN3nLEDE register contents

Bit Position	Bit Name	Function
7	LTES	Timeout Error Select 0: Frame timeout error 1: Response timeout error
6 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	FERE	Framing Error Detection Enable 0: Disables framing error detection. 1: Enables framing error detection.
2	FTERE	Timeout Error Detection Enable 0: Disables frame/response timeout error detection. 1: Enables frame/response timeout error detection.
1	PBERE	Physical Bus Error Detection Enable 0: Disables physical bus error detection. 1: Enables physical bus error detection.
0	BERE	Bit Error Detection Enable 0: Disables bit error detection. 1: Enables bit error detection.

Set the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode)

LTES Bit (Timeout Error Select)

The LTES bit selects the timeout function to be used.
With 0 set, the timeout function applies to frame timeout.
With 1 set, the timeout function applies to response timeout.
For details on the timeout error, see **Section 18.5.3.7, Error Status**.

FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
When this bit is set to 1, the detection result is indicated in the FER flag in the RLN3nLEST register.
For details on the framing error, see **Section 18.5.3.7, Error Status**.

FTERE Bit (Timeout Error Detection Enable)

The FTERE bit enables or disables detection of the frame timeout error or the response timeout error.
With 0 set, the frame timeout error or response timeout error is not detected.
With 1 set, the frame timeout error or response timeout error is detected.
When this bit is set to 1, the detection result is indicated in the FTER flag in the RLN3nLEST register.
With the LTES bit, either the frame timeout error or response timeout error can be selected.
Do not use the timeout error if response data of 9 bytes or more is to be transmitted or received.
For details on the timeout error, see **Section 18.5.3.7, Error Status**.
Timeout error should be disabled for data group communication.

PBERE Bit (Physical Bus Error Detection Enable)

The PBERE bit enables or disables detection of the physical bus error.
With 0 set, the physical bus error is not detected.
With 1 set, the physical bus error is detected.
When this bit is set to 1, the detection result is indicated in the PBER flag in the RLN3nLEST register.
For details on the physical bus error, see **Section 18.5.3.7, Error Status**.

BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
When this bit is set to 1, the detection result is indicated in the BER flag in the RLN3nLEST register.
For details on the bit error, see **Section 18.5.3.7, Error Status**.

18.3.2.11 RLN3nLCUC — LIN Control Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + $0E_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OM1	OM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.21 RLN3nLCUC register contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1	OM1	LIN Mode Select 0: LIN wake-up mode is caused. 1: LIN operation mode is caused.
0	OM0	LIN Reset 0: LIN reset mode is caused. 1: LIN reset mode is canceled.

Set the RLN3nLCUC register to 01_H to cause a transition to LIN wake-up mode after canceling LIN reset mode, and set the register to 03_H to cause a transition to LIN operation mode.

In LIN self-test mode, set the RLN3nLCUC register to 03h after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

OM1 Bit (LIN Mode Select)

The OM1 bit selects the specific operation mode (either LIN wake-up mode or LIN operation mode) after canceling LIN reset mode.
With 0 set, LIN wake-up mode is caused.
With 1 set, LIN operation mode is caused.
This bit is valid only when the OMM0 bit in the RLN3nLMST register is 1.
Writing a value to this bit is disabled while the FTS bit in the RLN3nLTRC register is 1.

OM0 Bit (LIN Reset)

The OM0 bit selects either causing a transition to LIN reset mode or canceling LIN reset mode.
With 0 set, LIN reset mode is caused.
With 1 set, LIN reset mode is canceled.

18.3.2.12 RLN3nLTRC — LIN Transmission Control Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RTS	FTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.22 RLN3nLTRC register contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1	RTS	Response Transmission/Reception Start 0: Response transmission/reception is stopped in frame separate mode. 1: Response transmission/reception is started in frame separate mode.
0	FTS	Frame Transmission/Wake-up Transmission /Reception Start 0: Frame Transmission/wake-up transmission/reception is stopped. 1: Frame Transmission/wake-up transmission reception is started.

RTS Bit (Response Transmission/Reception Start)

Set the RTS bit to 1 in frame separate mode after header transmission is started (FTS bit is 1) and response transmission data is ready. Once set, this bit is automatically cleared to 0 upon completion of frame communication or transition to LIN reset mode.
Only 1 can be written to this bit; 0 cannot be written.
To write 1 to this bit, write 02_H to the RLN3nLTRC register using the single memory storing instruction.
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (in LIN reset mode).
Writing a value to this bit is disabled when the FTS bit is 0 (frame transmission or wake-up transmission/reception is halted).
When response data of 9 bytes or more is to be transmitted or received, set this bit to 1 each time a data group (variable from 0 to 8 bytes) is transmitted or received. Once set, this bit is automatically cleared to 0 at the end of communication or transition to LIN reset mode.

FTS Bit (Frame Transmission/Wake-up Transmission/Reception Start)

Set the FTS bit to 1 to start frame/wake-up transmission.
Also set this bit to 1 to allow wake-up reception (counting of the low level width of the input signal).
Only 1 can be written to this bit; 0 cannot be written.
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (in LIN reset mode).

This bit is set to 0 upon completion of frame or wake-up communication and transition to LIN reset mode.

18.3.2.13 RLN3nLMST — LIN Mode Status Register (n = 0 to 3)

Access: This register can be read only in 8-bit units

Address: <RLIN3n_base> + 11_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OMM1	OMM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 18.23 RLN3nLMST register contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. Writing is ignored.
1	OMM1	LIN Mode Status Monitor 0: The module is in LIN wake-up mode. 1: The module is in LIN operation mode.
0	OMM0	LIN Reset Status Monitor 0: The module is in LIN reset mode. 1: The module is not in LIN reset mode.

OMM1 Bit (LIN Mode Status Monitor)

The OMM1 bit indicates the current operating mode.

OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

It takes 3 peripheral clock cycles + 4 communication clock cycles, until the OMM0 bit in the RLN3nLMST register reflects the OM0 bit setting in the RLN3nLCUC register.

18.3.2.14 RLN3nLST — LIN Status Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 12_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	HTRC	D1RC	—	—	ERR	—	FRC	FTC
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W

Table 18.24 RLN3nLST register contents

Bit Position	Bit Name	Function
7	HTRC	Successful Header Transmission Flag 0: Header transmission has not been completed. 1: Header transmission has been completed.
6	D1RC	Successful 1st data byte Reception Flag These bits are always read as 0. The write value should always be 0.
5, 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
1	FRC	Successful Frame/Wake-up Reception Flag 0: Frame or wake-up reception has not been completed. 1: Frame or wake-up reception has been completed.
0	FTC	Successful Frame/Wake-up Transmission Flag 0: Frame or wake-up transmission has not been completed. 1: Frame or wake-up transmission has been completed.

The RLN3nLST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the single memory storing instruction.

HTRC Flag (Successful Header Transmission Flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The HTRC flag is set to 1 upon completion of header transmission. Here, an interrupt is generated if the SHIE bit in the RLN3nLIE register is 1 (interrupt is enabled). This bit is cleared automatically when LTRC.FTS is set.

D1RC Flag (Successful 1st data byte Reception Flag)

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The D1RC flag is set to 1 upon completion of 1st data byte reception. Here, an interrupt request is not generated. Here, an interrupt is not generated. This bit is cleared automatically when LTRC.FTS is set.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time 1st data byte of a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

ERR Flag (Error Detection Flag)

The ERR flag is set to 1 upon detection of an error (when the value of at least one of the flags of the RLN3nLEST register is set to 1). Here, an interrupt is generated if the ERRIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the RPER, CSER, FER, FTER, PBER, and BER flags in the RLN3nLEST register in LIN operation mode or LIN wake-up mode. This clears the ERR flag to 0.

FRC Flag (Successful Frame/Wake-up Reception Flag)

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The FRC flag is set to 1 upon completion of frame or wake-up reception. Here, an interrupt is generated if the FRCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). This bit is cleared automatically when LTRC.FTS is set.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

FTC Flag (Successful Frame/Wake-up Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The FTC flag is set to 1 upon completion of frame or wake-up transmission. Here, an interrupt is generated if the FTCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). This bit is cleared automatically when LTRC.FTS is set.
When response data of 9 bytes or more is to be transmitted, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is transmitted. Write 0 before starting transmission of the next data group.

18.3.2.15 RLN3nLEST — LIN Error Status Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 13_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RPER	—	CSER	—	FER	FTER	PBER	BER
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R	R/W	R/W	R/W	R/W

Table 18.25 RLN3nLEST register contents

Bit Position	Bit Name	Function
7	RPER	Response Preparation Error Flag 0: Response preparation error has not been detected. 1: Response preparation error has been detected.
6	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
5	CSER	Checksum Error Flag 0: Checksum error has not been detected. 1: checksum error has been detected.
4	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	FTER	Timeout Error Flag 0: Frame/response timeout error has not been detected. 1: Frame/response timeout error has been detected.
1	PBER	Physical Bus Error Flag 0: Physical bus error has not been detected. 1: Physical bus error has been detected.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

When the FTS bit in the RLN3nLTRC register is 1 (frame transmission or wake-up transmission/ reception is started), do not write a value to this register.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the single memory storing instruction.

RPER Flag (Response Preparation Error Flag)

Only 0 can be written to the RPER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The RPER flag is set to 1 upon response preparation error detection. This happens, if response preparation was not completed before the first byte of a response has been received. This bit is cleared automatically when LTRC.FTS is set.

CSER Flag (Checksum Error Flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The CSER flag is set to 1 upon checksum error detection. This bit is cleared automatically when LTRC.FTS is set.

FER Flag (Framing Error Flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
When the value of the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled), the FER flag is set to 1 upon framing error detection. This bit is cleared automatically when LTRC.FTS is set.

FTER Flag (Timeout Error Flag)

Only 0 can be written to the FTER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
When the FTERE bit of the RLN3nLEDE register is 1 (frame/response timeout error detection enabled), the FTER flag is set to 1 upon frame timeout error or response timeout error detection. This bit is cleared automatically when LTRC.FTS is set.

PBER Flag (Physical Bus Error Flag)

Only 0 can be written to the PBER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
When the PBERE bit of the RLN3nLEDE register is 1 (physical bus error detection enabled), the PBER flag is set to 1 upon physical bus error detection. This bit is cleared automatically when LTRC.FTS is set.

BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
When the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled), the BER flag is set to 1 upon bit error detection. This bit is cleared automatically when LTRC.FTS is set.

18.3.2.16 RLN3nLDFC — LIN Data Field Configuration Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LSS	FSM	CSM	RFT	RFDL[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.26 RLN3nLDFC register contents

Bit Position	Bit Name	Function
7	LSS	Transmission/Reception Continuation Select 0: The data group to be transmitted/received next is the last one. 1: The data group to be transmitted/received next is not the last one. (Checksum is not included.)
6	FSM	Frame Separate Mode Select 0: Frame combined mode is set. 1: Frame separate mode is set.
5	CSM	Checksum Select 0: Classic checksum mode 1: Enhanced checksum mode
4	RFT	Response Field Communication Direction Select 0: Reception 1: Transmission
3 to 0	RFDL[3:0]	Response Field Length Select b3 b0 0 0 0 0: 0 byte (+ checksum) 0 0 0 1: 1 byte (+ checksum) 0 0 1 0: 2 bytes (+ checksum) : 0 1 1 1: 7 bytes (+ checksum) 1 0 0 0: 8 bytes (+ checksum) 1 0 0 1: 8 bytes (+ checksum) 1 0 1 0: 8 bytes (+ checksum) : 1 1 1 1: 8 bytes (+ checksum)

LSS Bit (Transmission/Reception Continuation Select)

The LSS bit indicates that the data group to be transmitted or received next is not the last data group when response data of 9 bytes or more is to be transmitted or received.
With 0 set, data and checksum are transmitted or received because the next data group to be transmitted or received is the last one.
With 1 set, only data is transmitted or received, and the checksum is not included because the next data group to be transmitted or received is not the last one.
Set the LSS bit only when the FSM bit is 1 (frame separate mode) and response data of 9 bytes or more is to be transmitted or received.

Set the LSS bit only when the RTS bit in the RLN3nLTRC is 0 (response transmit/receive is stopped).

FSM Bit (Frame Separate Mode Select)

The FSM bit sets the response communication mode.
With 0 set, frame separate mode is not selected. In this case, after header transmission is started (the FTS bit in the RLN3nLTRC register is 1), response is transmitted/received without the RTS bit in the RLN3nLTRC register being set.
With 1 set, frame separate mode is selected. If the RTS bit of the RLN3nLTRC register is set to 1 during header transmission, response transmission is executed after header transmission is completed.

For response reception or transmission following the header transmission automatically (frame combined mode), set the FSM bit to 0.
When causing a transition to LIN self-test mode, set this bit to 0 before transition.
For details on frame separate mode, see **Section 18.5.3.4 (2), Frame Separate Mode**.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).
When response data of 9 bytes or more is to be transmitted or received, set the FSM bit to 1.

CSM Bit (Checksum Select)

The CSM bit sets the checksum mode.
With 0 set, classic checksum mode is selected.
With 1 set, enhanced checksum mode is selected.
When the timeout error is used (the FTERE bit in the RLN3nLEDE register is 1), the specific timeout time depends on the setting of this bit. For details on the bit error, see **Section 18.5.3.7, Error Status**.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).
When response data of 9 bytes or more is to be transmitted or received, do not change the CSM bit setting after the first data group through the last data group.
During communication of response data of 9 bytes or more, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

RFT Bit (Response Field Communication Direction Select)

The RFT bits set the direction of the response field/wake-up signal communication.
With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (low level width of the input signal is counted).
With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).
When response data of 9 bytes or more is to be transmitted or received, do not change the RFT bit setting after the first data group through the last data group.

RFDL[3:0] Bits (Response Field Length Select)

The RFDL bits set the length of the response field data.
The data length can be 0 to 8 bytes excluding the checksum size.
To transmit response data with the FSM bit set to 0 (frame combined mode), set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).
To transmit response data with the FSM bit set to 1 (frame separate mode), set the RFDL bits before response transmission (the RTS bit in the RLN3nLTRC register is 0).
To receive response data, set the RFDL bits before header transmission (the FTS bit in the

RLN3nLTRC register is 0).
When response data of 9 bytes or more is to be transmitted or received, set the RFDL bits before data group transmission/reception (RTS bit in the RLN3nLTRC register is 0).
Only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

18.3.2.17 RLN3nLIDB — LIN ID Buffer Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 15_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	IDP1	IDP0	ID[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.27 RLN3nLIDB register contents

Bit Position	Bit Name	Function
7	IDP1	Parity Setting (P1) Sets the parity bits (P1) to be transmitted in the ID field.
6	IDP0	Parity Setting (P0) Sets the parity bits (P0) to be transmitted in the ID field.
5 to 0	ID[5:0]	ID Setting Sets the 6-bit ID value to be transmitted in the ID field.

Set the RLN3nLIDB register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

In LIN self-test mode, this register operates as described below.

Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 18.5.5, LIN Self-Test Mode**.

IDP[1:0] Bits (Parity Setting)

The IDP bits set the parity bits (P0 and P1) to be transmitted in the ID field of the LIN frame. IDP0 for P0 and IDP1 for P1.

Since parity is not automatically calculated, set the calculation result. Note that if the erroneous result is set, it is transmitted as is.

ID[5:0] Bits (ID Setting)

The ID bit sets the 6-bit ID value to be transmitted in the ID field of the LIN frame.

18.3.2.18 RLN3nLCBR — LIN Checksum Buffer Register (n = 0 to 3)

Access: This register can be read only in 8-bit units. In LIN self-test mode, this register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 16_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CKSM[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.28 RLN3nLCBR register contents

Bit Position	Bit Name	Function
7 to 0	CKSM[7:0]	Holds the checksum value transmitted or received.

In LIN mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
  The value transmitted can be read from the register. Read the value after transmission is completed.
  Writing to this register is invalid.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
  The value received can be read from the register. Read the value after reception is completed.
  Writing to this register is invalid.

In LIN self-test mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
  After completion of the frame transmission (after loopback), the reversed value of the received value can be read.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
  Write the value to be received before communication. After completion of frame reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 18.5.5, LIN Self-Test Mode**.

Set the RLN3nLCBR register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, the checksum is appended only to the last data group; this register is not updated for the other data groups.

18.3.2.19 RLN3nLDBRb — LIN Data Buffer b Register (n = 0 to 3, b = 1 to 8)

Access: This register can be read/written in 8-bit units.

Address: RLN3nLDBR1: <RLIN3n_base> + 18_H
RLN3nLDBR2: <RLIN3n_base> + 19_H
RLN3nLDBR3: <RLIN3n_base> + $1A_H$
RLN3nLDBR4: <RLIN3n_base> + $1B_H$
RLN3nLDBR5: <RLIN3n_base> + $1C_H$
RLN3nLDBR6: <RLIN3n_base> + $1D_H$
RLN3nLDBR7: <RLIN3n_base> + $1E_H$
RLN3nLDBR8: <RLIN3n_base> + $1F_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LDB[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.29 RLN3nLDBRb register contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Sets the data to be transmitted or allows the received data to be read. Setting Range: 00_H to FF_H

- For response transmission:
  The LDBRb registers set the data to be transmitted in the response field.
  Use these registers with the following settings.
  - RFT in RLN3nLDFC register is 1 (transmission)
  - FSM in RLN3nLDFC register is 0 (frame combined mode)
  - FTS bit in RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted)

  or
  - RFT in RLN3nLDFC register is 1 (transmission)
  - FSM in RLN3nLDFC register is 1 (frame separate mode)
  - RTS in RLN3nLTRC register is 0 (response transmission/reception is halted)
- For response reception:
  The LDBRb registers hold the data received in the response field.
  The received data is overwritten. If an error is detected, the data up to the byte in which the error was detected are stored in the register.
  Do not read these registers when the FTS bit is 1 (frame transmission or wake-up transmission/reception is started)
- For transmission of response data of 9 bytes or more:
  Use the LDBRb registers with the following settings.
  - RFT in RLN3nLDFC register is 1 (transmission)
  - FSM in RLN3nLDFC register is 1 (frame separate mode)
  - RTS in RLN3nLTRC register is 0 (response transmission/reception is halted)
- For reception of response data of 9 bytes or more:
  Do not read these registers when the RTS bit is 1 (response transmission/reception is started).

- In LIN self-test mode, these registers operate as described below.

Write the value to be transmitted before communication. After completion of frame transmission/ reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 18.5.5, LIN Self-Test Mode**.

18.3.3 LIN Slave Related Registers

18.3.3.1 RLN3nLWBR — LIN Wake-up Baud Rate Select Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 01_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	NSPB[3:0]				LPRS[2:0]			—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 18.30 RLN3nLWBR register contents

Bit Position	Bit Name	Function
7 to 4	NSPB[3:0]	Bit Sampling Count Select b7 b4 0 0 0 0: 16 sampling 0 0 1 1: 4 sampling 0 1 1 1: 8 sampling Settings other than the above are prohibited.
3 to 1	LPRS[2:0]	Prescaler Clock Select b3 b1 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128
0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

Set the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

NSPB[3:0] Bits (Bit Sampling Count Select)

The NSPB bits select the number of sampling in one Tbit (reciprocal of the baud rate).
When the frame communication is performed in LIN slave mode (fixed baud rate) (LMD[1:0] bits in the RLN3nLMD register = 11_B), set these bits to "0000_B" (16 sampling).
When the frame communication is performed in LIN slave mode (auto baud rate) (LMD[1:0] bits in the RLN3nLMD register = 10_B), set these bits to "0011_B" (4 sampling) or "0111_B" (8 sampling).

LPRS[2:0] Bits (Prescaler Clock Select)

The LPRS bits select the frequency division ratio for the prescaler. The LIN communication clock source is divided by this prescaler.

The LIN communication clock source is divided by this prescaler.

In LIN slave mode (auto baud rate) (LMD[1:0] bits in the RLN3nLMD register = 10_B), set these bits so that the prescaler clock becomes as follows according to the target baud rate.

[Target baud rate]	[Prescaler clock]
1 to 20 kbps	: 4 MHz*1
1 to 2.4 kbps (excluding 2.4 kbps)	: 4 MHz
2.4 to 20 kbps	: 8 to 12 MHz

Note 1. Use the clock with NSPB bits set to "0011_B" (four samplings).

18.3.3.2 RLN3nLBRP01 — LIN Baud Rate Prescaler 01 Register (n = 0 to 3)

Access: RLN3nLBRP01 can be read/written in 16-bit units.
RLN3nLBRP0 can be read/written in 8-bit units.
RLN3nLBRP1 can be read/written in 8-bit units.

Address: RLN3nLBRP01: <RLIN3n_base> + 02_H
RLN3nLBRP0: <RLIN3n_base> + 02_H
RLN3nLBRP1: <RLIN3n_base> + 03_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BRP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.31 RLN3nLBRP01 register contents

Bit Position	Bit Name	Function
15 to 0	BRP[15:0]	Assuming that the value set in this register is L (0 to 65535), the baud rate prescaler divides the frequency of the prescaler clock by L + 1. Setting Range: 0000_H to $FFFF_H$

Set the RLN3nLBRP01 register when the OMM0 bit in the RLN3nLMST register is 0B (in LIN reset mode).
Assuming that the value set in this register is L, the baud rate prescaler divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) in the RLN3nLWBR register by L + 1.
The RLN3nLBRP01 register can be accessed in 8-bit units by registers RLN3nLBRP0 and RLN3nLBRP1.

18.3.3.3 RLN3nLSTC — LIN Self-Test Control Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LSTM
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 18.32 RLN3nLSTC register contents

Bit Position	Bit Name	Function
7 to 1	Reserved	LIN Self-Test Mode Entry The test mode key values for configuring the RLIN3 module in Self-Test mode.
0	LSTM	LIN Self-Test Mode 0: LIN self test mode is not set. 1: LIN self test mode is set.

The RLN3nLSTC register cancels protection of LIN self-test mode.

Set the RLN3nLSTC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

Writing $A7_H$, 58_H, and 01_H successively to the RLN3nLSTC register places the module into LIN self-test mode.

When successive writing is completed thus placing LIN self-test mode to be entered, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For making transition to LIN self-test mode, see **Section 18.5.5, LIN Self-Test Mode**.

When read, bits 6 to 1 return "000000_B", and bit 7 returns an undefined value.

LSTM Bit (LIN Self-Test Mode)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.
For leaving LIN self-test mode, see **Section 18.5.5, LIN Self-Test Mode**.
Writing 1 to this bit does not affect the value of the RLN3nLSTC register if it is not a part of successive writing of $A7_H$, 58_H, and 01_H.

18.3.3.4 RLN3nLMD — LIN Mode Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	LRDNFS	LIOS	—	—	LMD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R/W	R/W

Table 18.33 RLN3nLMD register contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	LRDNFS	LIN Reception Data Noise Filtering Disable 0: The noise filter is enabled. 1: The noise filter is disabled.
4	LIOS	LIN Interrupt Output Select 0: Not supported, setting is prohibited. 1: RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n reception status interrupt are used.
3, 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	LMD[1:0]	LIN/UART Mode Select b1 b0 1 0: LIN Slave mode with Auto Baud rate 1 1: LIN Slave mode with fixed Baud rate

Set the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

LRDNFS Bit (LIN Reception Data Noise Filtering Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.
With 0 set, the noise filter is enabled when receiving data.
With 1 set, the noise filter is disabled when receiving data.

LIOS Bit (LIN Interrupt Output Select)

The LIOS bit selects the number of interrupt outputs from the LIN/UART interface.
With 0 set, the RLIN3n interrupt n is generated from the LIN/UART interface.
With 1 set, the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n reception status interrupt are generated from the LIN/UART interface.
For each interrupt source, see **Section 18.4, Interrupt Sources**.
The LIOS bit must always be set when using LIN mode operation, in order to enable the interrupt generation by the RLIN3n module. For UART mode, this bit is not relevant.

LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.
To use this module as an LIN slave, set these bits to "10_B" (auto baud rate) or "11_B" (fixed baud rate).

18.3.3.5 RLN3nLBFC — LIN Break Field Configuration Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 09_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LBLT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 18.34 RLN3nLBFC register contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	LBLT	Reception Break (Low-Level) Detection Width Setting 0: A break (low-level) is detected in 9.5 or 10 Tbits 1: A break (low-level) is detected in 10.5 or 11 Tbits

Set the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

LBLT Bit (Reception Break (Low-Level) Detection Width Setting)

- When RLN3nLMD.LMD is "10_B" (in LIN slave mode (auto baud rate))
  - 0: Low-level width of 10 Tbits or longer is detected.
  - 1: Low-level width of 11 Tbits or longer is detected.
- When RLN3nLMD.LMD is "11_B" (in LIN slave mode (fixed baud rate))
  - 0: Low-level width of 9.5 Tbits or longer is detected.
  - 1: Low-level width of 10.5 Tbits or longer is detected.

18.3.3.6 RLN3nLSC — LIN Space Configuration Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + $0A_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	IBHS[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Table 18.35 RLN3nLSC register contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5, 4	IBS[1:0]	Inter-Byte Space Select b5 b4 0 0: 0 Tbit 0 1: 1 Tbit 1 0: 2 Tbits 1 1: 3 Tbits
3	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
2 to 0	IBHS[2:0]	Inter-Byte Space (Header)/Response Space Select b2 b0 0 0 0: 0 Tbit 0 0 1: 1 Tbit 0 1 0: 2 Tbits 0 1 1: 3 Tbits 1 0 0: 4 Tbits 1 0 1: 5 Tbits 1 1 0: 6 Tbits 1 1 1: 7 Tbits

Set the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

This register is enabled only during response transmission, and disabled during response reception.

Some combinations of the set values result in the length of a frame or a response exceeding the timeout time. Set the appropriate values in this register.

IBS[1:0] Bits (Inter-Byte Space Select)

These bits set the width of the inter-byte space of the response transmission.
0 Tbit to 3 Tbits can be set.

IBHS[2:0] Bits (Inter-Byte Space (Header)/Response Space Select)

The IBHS bits set the width of the response space before response transmission.
0 Tbit to 7 Tbits can be set.

18.3.3.7 RLN3nLWUP — LIN Wake-up Configuration Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + $0B_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	WUTL[3:0]				—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 18.36 RLN3nLWUP register contents

Bit Position	Bit Name	Function
7 to 4	WUTL[3:0]	Wake-up Transmission Low level Width Select b7 b4 0 0 0 0: 1 Tbit 0 0 0 1: 2 Tbits 0 0 1 0: 3 Tbits 0 0 1 1: 4 Tbits : 1 1 0 0: 13 Tbits 1 1 0 1: 14 Tbits 1 1 1 0: 15 Tbits 1 1 1 1: 16 Tbits
3 to 0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

Set the RLN3nLWUP register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

WUTL[3:0] Bits (Wake-up Transmission Low Level Width Select)

These bits set the low-level width of the wake-up frame transmission.
1 Tbit to 16 Tbits can be set.

18.3.3.8 RLN3nLIE — LIN Interrupt Enable Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + $0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SHIE	ERRIE	FRCIE	FTCIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 18.37 RLN3nLIE register contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	SHIE	Successful Header Transmission Interrupt Enable 0: Disables successful header transmission interrupt. 1: Enables successful header transmission interrupt.
2	ERRIE	Error Detection Interrupt Enable 0: Disables error detection interrupt. 1: Enables error detection interrupt.
1	FRCIE	Successful Response/Wake-up Reception Interrupt Enable 0: Disables successful Response/wake-up reception interrupt. 1: Enables successful Response/wake-up reception interrupt.
0	FTCIE	Successful Response/Wake-up Transmission Interrupt Enable 0: Disables successful Response/wake-up transmission interrupt. 1: Enables successful Response/wake-up transmission interrupt.

Set the RLN3nLIE register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

SHIE Bit (Successful Header Reception Interrupt Enable)

The SHIE bit enables or disables interrupt generation upon successful reception of a header.
With 0 set, the interrupt is not generated when the HTRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt is generated when the HTRC flag in the RLN3nLST register is set to 1.

ERRIE Bit (Error Detection Interrupt Enable)

The ERRIE bit enables or disables interrupt generation upon detection of an error.
With 0 set, the interrupt is not generated when the ERR flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt is generated when the ERR flag in the RLN3nLST register is set to 1.
Interrupt sources can be the bit error, frame/response timeout error, framing error, sync filed error, ID parity error, checksum error, and response preparation error.
Detection of the bit error, frame/response timeout error, sync filed error, ID parity error, and framing error can be enabled or disabled using the RLN3nLEDE register.

FRCIE Bit (Successful Response/Wake-up Reception Interrupt Enable)

The FRCIE bit enables or disables interrupt generation upon successful reception of a response or a wake-up frame (counting of low level width of the input signal).
With 0 set, the interrupt is not generated when the FRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt is generated when the FRC flag in the RLN3nLST register is set to 1.

FTCIE Bit (Successful Response/Wake-up Transmission Interrupt Enable)

The FTCIE bit enables or disables interrupt generation upon successful transmission of a response or a wake-up frame.
With 0 set, the interrupt is not generated when the FTC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt is generated when the FTC flag in the RLN3nLST register is set to 1.

18.3.3.9 RLN3nLEDE — LIN Error Detection Enable Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + $0D_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LTES	IPERE	—	SFERE	FERE	TERE	—	BERE
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W

Table 18.38 RLN3nLEDE register contents

Bit Position	Bit Name	Function
7	LTES	Timeout Error Select 0: Frame timeout error 1: Response timeout error
6	IPERE	ID Parity Error Detection Enable 0: Disables ID Parity error detection. 1: Enables ID Parity error detection.
5	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
4	SFERE	Sync Field Error Detection Enable 0: Disables Sync Field error detection. 1: Enables Sync Field error detection.
3	FERE	Framing Error Detection Enable 0: Disables framing error detection. 1: Enables framing error detection.
2	TERE	Timeout Error Detection Enable 0: Disables frame/response timeout error detection. 1: Enables frame/response timeout error detection.
1	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
0	BERE	Bit Error Detection Enable 0: Disables bit error detection. 1: Enables bit error detection.

Set the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

LTES Bit (Timeout Error Select)

The LTES bit selects the timeout function to be used.
With 0 set, the timeout function applies to frame timeout.
With 1 set, the timeout function applies to response timeout.
For details on the timeout error, see **Section 18.5.3.7, Error Status**.

IPERE Bit (ID Parity Error Detection Enable)

This bit enables or disables detection of the ID parity error.
With 0 set, the ID parity error is not detected.
With 1 set, the ID parity error is detected.
When this bit is set to 1, the detection result is reflected in the IPER flag in the RLN3nLEST register.
For details on the ID parity error, see **Section 18.5.3.7, Error Status**.

SFERE Bit (Sync Field Error Detection Enable)

This bit enables or disables detection of the sync field error.
With 0 set, the sync field error is not detected.
With 1 set, the sync field error is detected.
Regardless of the setting of this bit, when a sync field error is detected, this module waits for the next header.
When this bit is set to 1, the detection result is reflected in the SFER flag in the RLN3nLEST register.
For details on the sync filed error, see **Section 18.5.3.7, Error Status**.

FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
When this bit is set to 1, the detection result is indicated in the FER flag in the RLN3nLEST register.
For details on the framing error, see **Section 18.5.3.7, Error Status**.

TERE Bit (Timeout Error Detection Enable)

The TERE bit enables or disables detection of the frame timeout error or the response timeout error.
With 0 set, the frame timeout error or response timeout error is not detected.
With 1 set, the frame timeout error or response timeout error is detected.
When this bit is set to 1, the detection result is indicated in the TER flag in the RLN3nLEST register.
With the LTES bit, either the frame timeout error or response timeout error can be selected.
The timeout error should not be used in LIN slave mode [auto baud rate] (when the LMD[1:0] bits in the RLN3nLMD register are "10_B").
Do not use the timeout error if response data of 9 bytes or more is to be transmitted or received.
For details on the timeout error, see **Section 18.5.3.7, Error Status**.

BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
When this bit is set to 1, the detection result is indicated in the BER flag in the RLN3nLEST register.
For details on the bit error, see **Section 18.5.3.7, Error Status**.

18.3.3.10 RLN3nLCUC — LIN Control Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + $0E_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OM1	OM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.39 RLN3nLCUC register contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1	OM1	LIN Mode Select 0: LIN wake-up mode is caused. 1: LIN operation mode is caused.
0	OM0	LIN Reset 0: LIN reset mode is caused. 1: LIN reset mode is canceled.

Set the RLN3nLCUC register to 01_H to cause a transition to LIN wake-up mode after canceling LIN reset mode, or set the register to 03_H to cause a transition to LIN operation mode.

In LIN self-test mode, set the RLN3nLCUC register to 03_H after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

OM1 Bit (LIN Mode Select)

The OM1 bit selects the specific LIN operation mode (either LIN wake-up mode or LIN operation mode) after canceling LIN reset mode.
With 0 set, LIN wake-up mode is caused.
With 1 set, LIN operation mode is caused.
This bit is valid only when the OMM0 bit in the RLN3nLMST register is 1.
Writing a value to this bit is disabled while the FTS bit in the RLN3nLTRC register is 1.

OM0 Bit (LIN Reset)

The OM0 bit selects either causing a transition to LIN reset mode or canceling LIN reset mode.
With 0 set, LIN reset mode is caused.
With 1 set, LIN reset mode is canceled.

It takes 3 peripheral clock cycles + 4 communication clock cycles, until the OMM0 bit in the RLN3nLMST register reflects the OM0 bit setting in the RLN3nLCUC register.

18.3.3.11 RLN3nLTRC — LIN Transmission Control Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	LNRR	RTS	FTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 18.40 RLN3nLTRC register contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	LNRR	No LIN Response Request 0: Response for the reception ID 1: No response for the reception ID
1	RTS	Response Transmission/Reception Start 0: Response transmission/reception is stopped. 1: Response transmission/reception is started.
0	FTS	LIN Communication Start 0: Header reception/wake-up transmission/reception is stopped. 1: Header reception/wake-up transmission reception is started.

LNRR Bit (No LIN Response Request)

After receiving the header and checking the received ID, set this bit to 1 if no response is transmitted/received.
Once set, this bit is automatically cleared to 0 upon detection of new sync field or transition to LIN reset mode.
Only 1 can be written to this bit; 0 cannot be written.

To write 1 to this bit, write 04_H using the single memory storing instruction.
Do not set this bit and the RTS bit to 1 simultaneously.

Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).

Writing a value to this bit is disabled when the FTS bit is 0 (header reception or wake-up transmission/reception is halted).

RTS Bit (Response Transmission/Reception Start)

After receiving the header and checking the received ID, set this bit to 1 at the response transmission or at the start of response reception.
After receiving the header and checking the received ID, set this bit to 1 at the start of response transmission/reception.
Once set, this bit is automatically cleared to 0 upon completion of response or transition to LIN reset mode.
Only 1 can be written to this bit; 0 cannot be written.
To write 1 to this bit, write 02_H to the RLN3nLTRC register using the single memory storing instruction.

Do not set this bit and the LNRR bit to 1 simultaneously
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).

Writing a value to this bit is disabled when the FTS bit is 0 (header reception or wake-up transmission/reception is halted).
When response data of 9 bytes or more is to be transmitted or received, set this bit to 1 each time a data group (variable from 0 to 8 bytes) is transmitted or received. Once set, this bit is automatically cleared to 0 upon completion of data group transmission/reception or transition to LIN reset mode.

FTS Bit (LIN Communication Start)

Set this bit to 1 to start header reception or wake-up transmission/reception.
Also set this bit to 1 to allow wake-up reception (counting of the low level width of the input signal).
Only 1 can be written to this bit; 0 cannot be written.
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).

This bit is set to 0 upon completion of frame or wake-up communication and transition to LIN reset mode.

18.3.3.12 RLN3nLMST — LIN Mode Status Register (n = 0 to 3)

Access: This register can be read only in 8-bit units

Address: <RLIN3n_base> $+11_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OMM1	OMM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 18.41 RLN3nLMST register contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. Writing is ignored.
1	OMM1	LIN Mode Status Monitor 0: The module is in LIN wake-up mode. 1: The module is in LIN operation mode.
0	OMM0	LIN Reset Status Monitor 0: The module is in LIN reset mode. 1: The module is not in LIN reset mode.

OMM1 Bit (LIN Mode Status Monitor)

The OMM1 bit indicates the current operating mode.

OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

It takes 3 peripheral clock cycles + 4 communication clock cycles, until the OMM0 bit in the RLN3nLMST register reflects the OM0 bit setting in the RLN3nLCUC register.

18.3.3.13 RLN3nLST — LIN Status Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 12_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	HTRC	D1RC	—	—	ERR	—	FRC	FTC
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W

Table 18.42 RLN3nLST register contents

Bit Position	Bit Name	Function
7	HTRC	Successful Header Reception Flag 0: Header transmission has not been completed. 1: Header transmission has been completed.
6	D1RC	Successful 1st data byte Reception Flag These bits are always read as 0. The write value should always be 0.
5, 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
1	FRC	Successful Response/Wake-up Reception Flag 0: Response or wake-up reception has not been completed. 1: Response or wake-up reception has been completed.
0	FTC	Successful Response/Wake-up Transmission Flag 0: Response or wake-up transmission has not been completed. 1: Response or wake-up transmission has been completed.

The RLN3nLST register is automatically cleared to 00_H upon transition to LIN reset mode.

In LIN reset mode, writing a value to this register is disabled. In LIN reset mode, the register retains 00_H.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the single memory storing instruction.

HTRC Flag (Successful Header Reception Flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value before 1 is written. The HTRC flag is set to 1 upon completion of header reception. Here, an interrupt request is generated if the SHIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if header reception is completed while this bit is 1, an interrupt is not generated. To clear this bit to 0, write 0 to the bit.
To detect a new header in the response field upon completion of header reception, clear this bit after it is set to 1.

D1RC Flag (Successful 1st data byte Reception Flag)

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The D1RC flag is set to 1 upon completion of 1st data byte reception. Here, an interrupt request is not generated. Write 0 to clear this bit.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time 1st data byte of a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

ERR Flag (Error Detection Flag)

The ERR flag is set to 1 upon detection of an error (when the value of at least one of the flags of the RLN3nLEST register is set to 1). Here, an interrupt is generated if the ERRIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if an error is detected while this bit is 1, an interrupt is not generated. To clear the bit to 0, write 0 to the RPER, IPER, CSER, SFER, FER, TER, and BER flags in the RLN3nLEST register.

FRC Flag (Successful Response/Wake-up Reception Flag)

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The FRC flag is set to 1 upon completion of response or wake-up reception. Here, an interrupt is generated if the FRCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if response reception or wake-up reception is completed while this bit is 1, an interrupt is not generated. Write 0 to clear this bit.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

FTC Flag (Successful Response/Wake-up Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The FTC flag is set to 1 upon completion of response or wake-up transmission. Here, an interrupt is generated if the FTCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if response reception or wake-up reception is completed while this bit is 1, an interrupt is not generated. Write 0 to clear this bit.
When response data of 9 bytes or more is to be transmitted, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is transmitted. Write 0 before starting transmission of the next data group.

18.3.3.14 RLN3nLEST — LIN Error Status Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 13_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RPER	IPER	CSER	SFER	FER	TER	—	BER
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W

Table 18.43 RLN3nLEST register contents

Bit Position	Bit Name	Function
7	RPER	Response Preparation Error Flag 0: Response preparation error has not been detected. 1: Response preparation error has been detected.
6	IPER	ID Parity Error Flag 0: ID parity error has not been detected. 1: ID parity error has been detected.
5	CSER	Checksum Error Flag 0: Checksum error has not been detected. 1: Checksum error has been detected.
4	SFER	Sync Field Error Flag 0: Sync field error has not been detected. 1: Sync field error has been detected.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	TER	Timeout Error Flag 0: Frame/response timeout error has not been detected. 1: Frame/response timeout error has been detected.
1	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00_H upon transition to LIN reset mode.

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the single memory storing instruction.

RPER Flag (Response Preparation Error Flag)

Only 0 can be written to the RPER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The RPER flag is set to 1 when response preparation is not completed before reception of the first byte of response is completed. Write 0 to clear this bit.

IPER Flag (ID Parity Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

This bit is set to 1 when the received identifier parity bits do not match the calculated identifier parity bit values and the corresponding error detection is enabled. Write 0 to clear this bit.

CSER Flag (Checksum Error Flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The CSER flag is set to 1 when the received checksum value during response reception does not match the internally calculated checksum value. Write 0 to clear this bit.

SFER Flag (Sync Field Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
This bit is set to 1 if the sync field is not detected as "55_H" and the break low width is more than or equal to the configured break low width. Write 0 to clear this bit.

FER Flag (Framing Error Flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The FER flag is set to 1 when a '0' value is sampled as STOP bit during reception and the corresponding error detection is enabled. Write 0 to clear this bit.

TER Flag (Timeout Error Flag)

Only 0 can be written to the TER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
This flag is set to 1 when the internal timeout counter (frame or response timeout) reaches the error threshold value (calculated automatically) and the corresponding error detection is enabled. Write 0 to clear this bit.

BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The BER flag is set to 1 when the sampled bit value does not match the transmitted bit value during transmission and the corresponding error detection is enabled. Write 0 to clear this bit.

18.3.3.15 RLN3nLDFC — LIN Data Field Configuration Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LSS	—	LCS	RCDS	RFDL[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.44 RLN3nLDFC register contents

Bit Position	Bit Name	Function
7	LSS	Transmission/Reception Continuation Select 0: The data group to be transmitted/received next is the last one. 1: The data group to be transmitted/received next is not the last one. (Checksum is not included.)
6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	LCS	Checksum Select 0: Classic checksum mode 1: Enhanced checksum mode
4	RCDS	Response Field Communication Direction Select 0: Reception 1: Transmission
3 to 0	RFDL[3:0]	Response Field Length Select b3 b0 0 0 0 0: 0 byte (+ checksum) 0 0 0 1: 1 byte (+ checksum) 0 0 1 0: 2 bytes (+ checksum) : 0 1 1 1: 7 bytes (+ checksum) 1 0 0 0: 8 bytes (+ checksum) 1 0 0 1: 8 bytes (+ checksum) 1 0 1 0: 8 bytes (+ checksum) : 1 1 1 1: 8 bytes (+ checksum)

LSS Bit (Transmission/Reception Continuation Select)

The LSS bit indicates that the data group to be transmitted or received next is not the last data group when response data of 9 bytes or more is to be transmitted or received. With 0 set, data and checksum are transmitted or received because the next data group to be transmitted or received is the last one. With 1 set, only data is transmitted or received, and the checksum is not included because the next data group to be transmitted or received is not the last one.
During LIN communication, do not set “1” to this bit.
This should be set when the RTS bit is 0 (response transmission/reception stopped).

LCS Bit (Checksum Select)

The LCS bit sets the checksum mode.
With 0 set, classic checksum mode is selected.
With 1 set, enhanced checksum mode is selected.
When the timeout error is used (the TERE bit in the RLN3nLEDE register is 1), the specific timeout

time depends on the setting of this bit. For details on the bit error, see **Section 18.5.3.7, Error Status**.
When the length of the response field data is 0 byte (the RFDL bit is 0), do not set this bit to “1” (enhanced).
When response data of 9 bytes or more is to be transmitted or received, do not change the LCS bit setting after the first data group through the last data group.
During transmission or reception of response data of 9 bytes or more, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.
When response data of 9 bytes or more is to be transmitted or received, set the FSM bit to 1.
This should be set when the RTS bit is 0 (response transmission/reception stopped).

RCDS Bit (Response Field Communication Direction Select)

This bit selects the direction of the response field/wake-up signal communication.
With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (low-level width of the input signal is counted).
With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.
This bit should be set when the RTS bit in the RLN3nLTRC register is 0 in LIN operation mode (response transmission/reception stopped) or when the FTS bit is 0 in LIN wake-up mode (header reception or wake-up transmission/reception stopped).
When response data of 9 bytes or more is to be transmitted or received, do not change this bit setting after the first data group through the last data group.

RFDL[3:0] Bits (Response Field Length Select)

The RFDL bits set the length of the response field data.
The data length can be 0 to 8 bytes excluding the checksum size.
These bits should be set when the RTS bit in the RLN3nLTRC register is 0 (response transmission/reception stopped).
When response data of 9 bytes or more is to be transmitted, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit in the RLN3nLDFC register is 1) include the checksum.

18.3.3.16 RLN3nLIDB — LIN/UART ID Buffer Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 15_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	IDP1	IDP0	ID[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.45 RLN3nLIDB register contents

Bit Position	Bit Name	Function
7, 6	IDP[1:0]	Parity Setting Stores the parity bits (P0 and P1) to be received in the ID field.
5 to 0	ID[5:0]	ID Setting Stores the 6-bit ID value to be received in the ID field.

The value in the RLN3nLIDB register is enabled after the completion of header reception. In LIN mode (LIN operation mode, LIN wake-up mode), writing to this register is disabled.

In LIN self-test mode, the operation is as follows.

Write the value to be transmitted before communication. After completion of frame transmission/ reception (after loopback), the reversed value of the received value can be read. For details about the LIN self-test mode, see **Section 18.5.5, LIN Self-Test Mode**.

IDP[1:0] Bits (Parity Setting)

The IDP bits store the parity bits (P0 and P1) to be received in the ID field of the LIN frame. IDP0 is for P0 and IDP1 is for P1.

When the IPERE bit in the RLN3nLEDE register is 1 (ID parity detection enable), the received value and the value calculated internally are checked. If they do not match, IPER (ID parity error flag) is set.

ID[5:0] Bits (ID Setting)

The ID bits store the 6-bit ID value to be received in the ID field of the LIN frame.

18.3.3.17 RLN3nLCBR — LIN Checksum Buffer Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units. However, in LIN self-test mode, this register can be read and written in 8-bit units.

Address: <RLIN3n_base> + 16_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CKSM[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.46 RLN3nLCBR register contents

Bit Position	Bit Name	Function
7 to 0	CKSM[7:0]	Holds the checksum value transmitted or received.

In LIN mode, this register operates as follows:

- When the RCDS bit in the RLN3nLDFC register is 1 (transmission):
  The value transmitted can be read from the register. Read the value after transmission is completed.
  Writing to this register is invalid.
- When the RCDS bit in the RLN3nLDFC register is 0 (reception):
  The value received can be read from the register. Read the value after reception is completed.
  Writing to this register is invalid.

When response data of 9 bytes or more is to be transmitted or received, the checksum is appended only to the last data group; this register is not updated for the other data groups.

In LIN self-test mode, this register operates as follows:

- When the RCDS bit in the RLN3nLDFC register is 1 (transmission):
  After completion of the frame transmission (after loopback), the reversed value of the received value can be read.
- When the RCDS bit in the RLN3nLDFC register is 0 (reception):
  Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 18.5.5, LIN Self-Test Mode**.

Set the RLN3nLCBR register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

18.3.3.18 RLN3nLDBRb — LIN Data Buffer b Register (n = 0 to 3, b = 1 to 8)

Access: This register can be read/written in 8-bit units.

Address: RLN3nLDBR1: <RLIN3n_base> + 18_H
RLN3nLDBR2: <RLIN3n_base> + 19_H
RLN3nLDBR3: <RLIN3n_base> + $1A_H$
RLN3nLDBR4: <RLIN3n_base> + $1B_H$
RLN3nLDBR5: <RLIN3n_base> + $1C_H$
RLN3nLDBR6: <RLIN3n_base> + $1D_H$
RLN3nLDBR7: <RLIN3n_base> + $1E_H$
RLN3nLDBR8: <RLIN3n_base> + $1F_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LDB[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.47 RLN3nLDBRb register contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Sets the data to be transmitted or allows the received data to be read. Setting Range: 00_H to FF_H

- For response transmission:
  The RLN3nLDBRb registers set the data to be transmitted in the response field.
  These registers should be set when the RTS bit in the RLN3nLTRC register is 0 (response transmission/reception is halted).
- For response reception:
  The RLN3nLDBRb registers hold the data received in the response field.
  The received data is overwritten. If an error is detected, the data up to the byte in which the error was detected are stored in the register.
  Do not read these registers when the RTS bit is 1 (response transmission/reception is started)

In LIN self-test mode, the operation is as follows.

Write the value to be transmitted before communication. After completion of frame transmission/ reception (after loopback), the reversed value of the received value can be read. For details about the LIN self-test mode, see **Section 18.5.5, LIN Self-Test Mode**.

18.3.4 UART Related Registers

18.3.4.1 RLN3nLWBR — LIN Wake-up Baud Rate Select Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 01_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	NSPB[3:0]				LPRS[2:0]			—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 18.48 RLN3nLWBR register contents

Bit Position	Bit Name	Function
7 to 4	NSPB[3:0]	Bit Sampling Count Select b7 b4 0 1 0 1: 6 sampling 0 1 1 0: 7 sampling 0 1 1 1: 8 sampling 1 0 0 0: 9 sampling 1 0 0 1: 10 sampling 1 0 1 0: 11 sampling 1 0 1 1: 12 sampling 1 1 0 0: 13 sampling 1 1 0 1: 14 sampling 1 1 1 0: 15 sampling 1 1 1 1: 16 sampling Settings other than the above are prohibited.

0	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.

Set the LN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

NSPB[3:0] Bits (Bit Sampling Count Select)

The NSPB bits select the number of sampling in one Tbit (reciprocal of the bit rate).
In UART mode, it is possible to set the NSPB bits from 6 sampling to 16 sampling.

LPRS[2:0] Bits (Prescaler Clock Select)

The LPRS bits select the frequency division ratio for the prescaler.

The LIN communication clock source is divided by this prescaler.

18.3.4.2 RLN3nLBRP01 — UART Baud Rate Prescaler 01 Register (n = 0 to 3)

Access: RLN3nLBRP01 register can be read/written in 16-bit units.
RLN3nLBRP0 register can be read/written in 8-bit units.
RLN3nLBRP1 register can be read/written in 8-bit units.

Address: RLN3nLBRP01: <RLIN3n_base> + 02_H
RLN3nLBRP0: <RLIN3n_base> + 02_H
RLN3nLBRP1: <RLIN3n_base> + 03_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BRP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.49 RLN3nLBRP01 register contents

Bit Position	Bit Name	Function
15 to 0	LBRP0[15:0]	Assuming that the value set in this register is L (0 to 65535), the baud rate prescaler divides the frequency of the prescaler clock by L + 1. Setting Range: 0000_H to $FFFF_H$

Assuming that the value set in this register is L, the baud rate prescaler divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) in the RLN3nLWBR register by L + 1.

The RLN3nLBRP01 register can be accessed in 8-bit units by the registers RLN3nLBRP0 and RLN3nLBRP1

18.3.4.3 RLN3nLMD — UART Mode Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	LRDNFS	—	—	—	LMD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R	R	R/W	R/W

Table 18.50 RLN3nLMD register contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	LRDNFS	LIN Reception Data Noise Filtering Disable 0: The noise filter is enabled. 1: The noise filter is disabled.
4 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1, 0	LMD[1:0]	LIN/UART Mode Select b1 b0 0 1: UART mode

Set the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

LRDNFS Bit (UART Reception Data Noise Filtering Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.
With 0 set, the noise filter is enabled when receiving data.
With 1 set, the noise filter is disabled when receiving data.

LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.
To use the LIN/UART interface as an LIN master, set these bits to 01_B.

18.3.4.4 RLN3nLBFC — UART Configuration Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 09_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	UTPS	URPS	UPS[1:0]		USBLS	UBOS	UBLS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.51 RLN3nLBFC register contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
6	UTPS	UART Output Polarity Switch 0: Transmit data normal output 1: Transmit data with inversion output
5	URPS	UART Input Polarity Switch 0: Reception data normal output 1: Reception data with inversion output
4, 3	UPS[1:0]	UART Parity Select 00: Parity prohibited 01: Even Parity 10: 0 Parity 11: Odd parity
2	USBLS	UART Stop Bit length Select 0: Stop bit:1 bit 1: Stop bit: 2 bits
1	UBOS	UART Transfer Format Order Select 0: LSB First 1: MSB First
0	UBLS	UART Character Length Select 0: UART 8 bits communication 1: UART 7 bits communication

Set the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

UTPS Bit (UART Output Polarity Switch)

Sets the output polarity for UART communication.
With 0 set, transmit data is output without inversion.
With 1 set, receive data is output with inversion.
The setting of this bit is valid in all the bits of the UART frame.
In half-duplex communication using a single data line, this setting should match with the setting of URPS bit.

URPS Bit (UART Input Polarity Switch)

Sets the input polarity for UART communication.
With 0 set, receive data is input without inversion.
With 1 set, receive data is input with inversion.

The setting of this bit is valid in all the bits of the UART frame.
In half-duplex communication using a single data line, this setting should match with the setting of UTPS bit.

UPS[1:0] Bits (UART Parity Select)

Sets the UART parity.

- When these bits are set to “00_B”, data is communicated without the parity.

  [Transmission]

  A parity bit is not added to transmit data.

  [Reception]

  Data is received without parity processing. A parity error does not occur, because the parity bit must not exist in the UART frame.

- When these bits are set to “01”, data is communicated with the even parity.

  [Transmission]

  If the number of 1s in transmit data is odd, “1” is added to the parity bit. If the number of 1s in transmit data is even, “0” is added to the parity bit.

  [Reception]

  If the number of 1s in receive data including the parity bit is odd, a parity error occurs.

- When these bits are set to “10”, data is communicated with 0 parity.

  [Transmission]

  Regardless of the number 1s in transmit data, “0” is added to the parity bit.

  [Reception]

  The value of the parity bit is not judged. Therefore, no parity error occurs.

- When these bits are set to “11”, data is communicated with the odd parity.

  [Transmission]

  If the number of 1s in transmit data is odd, “0” is added to the parity bit. If the number of 1s in transmit data is even, “1” is added to the parity bit.

  [Reception]

  If the number of 1s in receive data including the parity bit is even, a parity error occurs.

USBLS Bit (UART Stop Bit Length Select)

Sets the stop bit length of data for UART communication.
With 0 set, stop bit length of 1 bit is selected.
With 1 set, stop bit length of 2 bits is selected.

UBOS Bit (UART Transfer Format Select)

Sets the bit order of data for UART communication.
With 0 set, LSB first is selected.
With 1 set, MSB first is selected.

UBLS Bit (UART Character Length Select)

Sets the character length of one frame for UART communication.
With 0 set, the character length is 8 bits.
With 1 set, the character length is 7 bits.
When the character length of one frame is 9 bits (the UEBE bit in the RLN3nLUOR1 register is 1), the setting of this bit is ignored.

18.3.4.5 RLN3nLSC — UART Space Configuration Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + $0A_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R

Table 18.52 RLN3nLSC register contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5, 4	IBS[1:0]	Inter-Byte Space Select b5 b4 0 0: 0 Tbit 0 1: 1 Tbit 1 0: 2 Tbits 1 1: 3 Tbits
3 to 0	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

Set the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the inter-byte space during multi-byte UART transmission.

0 Tbit to 3 Tbits can be set.

18.3.4.6 RLN3nLEDE — UART Error Detection Enable Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + $0D_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	FERE	OERE	—	BERE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R	R/W

Table 18.53 RLN3nLEDE register contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3	FERE	Framing Error Detection Enable 0: Disables framing error detection. 1: Enables framing error detection.
2	OERE	Overrun Error Detection Enable 0: Disables overrun error detection. 1: Enables overrun error detection.
1	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
0	BERE	Bit Error Detection Enable 0: Disables bit error detection. 1: Enables bit error detection.

Set the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0_B (in Software reset mode).

FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
When this bit is set to 1, the detection result is indicated in the FER flag in the RLN3nLEST register.
For details on the framing error, see **Section 18.5.4.5, Error Status**.

OERE Bit (Overrun Error Detection Enable)

This bit enables or disables detection of the overrun error.
With 0 set, the overrun error is not detected.
With 1 set, the overrun error is detected.
When this bit is set to 1, the detection result is reflected in the OER flag in the RLN3nLEST register.
For details on the overrun error, see **Section 18.5.4.5, Error Status**.

BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
When this bit is set to 1, the detection result is indicated in the BER flag in the RLN3nLEST register.

In full-duplex communication, do not set this bit to “1”.
Do not set this register when the NSPB bits in the RLN3nLWBR register is 0101_B (6 sampling) and the LRDNFS bit in the RLN3nLMD register is 0 (noise filter is enabled).

For details on the bit error, see **Section 18.5.4.5, Error Status**.

18.3.4.7 RLN3nLCUC — UART Control Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + $0E_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 18.54 RLN3nLCUC register contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	OM0	Software Reset 0: Software reset mode is caused. 1: Software reset mode is canceled.

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

OM0 Bit (Software Reset)

The OM0 bit selects either causing a transition to reset mode or canceling reset mode.
With 0 set, reset mode is caused.
With 1 set, reset mode is canceled.

It takes 3 peripheral clock cycles + 4 communication clock cycles, until the OMM0 bit in the RLN3nLMST register reflects the OM0 bit setting in the RLN3nLCUC register.

18.3.4.8 RLN3nLTRC — UART Transmission Control Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RTS	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R

Table 18.55 RLN3nLTRC register contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1	RTS	UART Buffer Transmission Start 0: UART Buffer transmission is stopped. 1: UART Buffer transmission is started.
0	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.

RTS Bit (UART Buffer Transmission Start)

When transmitting data from the UART multi-byte data, set this bit to “1”.
Only 1 can be written to this bit; 0 cannot be written.
Write to this bit when the UTOE bit in the RLN3nLUOER register is 1 (transmission enable) and the UTS bit in the RLN3nLST register is 0 (transmission is not in progress).
Once set, regardless of errors, this bit is automatically cleared to 0 upon completion of the number of data transmission specified by the MDL bit in the RLN3nLDFC register. Moreover, this bit is automatically cleared to 0 upon transition to reset mode.
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (in LIN reset mode).
When writing 1 to this bit while the UTSW bit in the RLN3nLDFC register is 1: start of transmission of multi-byte UART buffers is delayed until the stop bit of reception data is completed.

18.3.4.9 RLN3nLMST — UART Mode Status Register (n = 0 to 3)

Access: This register can be read only in 8-bit units

Address: <RLIN3n_base> + 11_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OMM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 18.56 RLN3nLMST register contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. Writing is ignored.
0	OMM0	LIN Reset Status Monitor 0: The module is in LIN reset mode. 1: The module is not in LIN reset mode.

OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

It takes 3 peripheral clock cycles + 4 communication clock cycles, until the OMM0 bit in the RLN3nLMST register reflects the OM0 bit setting in the RLN3nLCUC register.

18.3.4.10 RLN3nLST — UART Status Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 12_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	URS	UTS	ERR	—	—	FTC
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R/W

Table 18.57 RLN3nLST register contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	URS	Data Reception Status 0: Reception is not in progress. 1: Reception is in progress.
4	UTS	Transmission Status 0: Transmission is not in progress. 1: Transmission is in progress.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2, 1	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	FTC	Successful UART Multi-byte Transmission Flag 0: UART multi-byte transmission has not been completed. 1: UART multi-byte transmission has been completed.

The RLN3nLST register is automatically cleared to "00_H" upon transition to LIN reset mode. In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains "00_H". To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the single memory storing instruction.

URS Bit (Data Reception Status)

At the start of the reception, this flag is set to 1.
The reception is started under the following condition.

- When the start bit is detected

At the end of reception, this flag is cleared to 0. While reception is stopped, this flag retains 0.
The reception is ended under the following conditions.

- Sampling point of the first bit of the stop bits

UTS Bit (Transmission Status Flag)

At the start of the transmission, this flag is set to 1. During the transmission, this flag retains 1.

The transmission is started under the following conditions.

- When transmission data is set to the RLN3nLUTDR or RLN3nLUWTDR register

- When the RTS bit in the RLN3nLTRC register is set to 1

This flag is cleared to 0 at the end of transmission.
The transmission is ended under the following conditions.

- When transmission of data set in the RLN3nLUTDR or RLN3nLUWTDR register is completed and next data is not set
- When the UART multi-byte transmission is completed (when the RTS bit in the RLN3nLTRC register is cleared to 0)
- When transmission operation enable bit UTOE in register LUOER is cleared.

ERR Flag (Error Detection Flag)

This flag is set to 1 upon detection of an error, detection of an expansion bit, or upon ID matching (when the value of at least one of the flags of the RLN3nLEST register is 1). At this time, an interrupt is generated. However, when this bit is 1, an interrupt is not generated upon detection of an error, detection of an expansion bit, or upon ID matching. To clear the bit to 0, write 0 to the UPER, EXBT, OER, and ER flags in the RLN3nLEST register.

FTC Flag (Successful Frame/Wake-up Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
Regardless of errors, this bit is set to 1 upon completion of the number of data transmission specified by the MDL bit in the RLN3nLDFC register, when the UART multi-byte mode is used. At this time, an interrupt is generated.

18.3.4.11 RLN3nLEST — UART Error Status Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 13_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	UPER	IDMT	EXBT	FER	OER	—	BER
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R	R/W

Table 18.58 RLN3nLEST register contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
6	UPER	Parity Error Flag 0: Parity error has not been detected. 1: Parity error has been detected.
5	IDMT	ID Matching Flag 0: The receive data does not match with the ID value. 1: The receive data matches with the ID value.
4	EXBT	Expanded Bit Detection Flag 0: Expanded bit has not been detected. 1: Expanded bit has been detected.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	OER	Overrun Error Flag 0: Overrun error has not been detected. 1: Overrun error has been detected.
1	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00_H when the module transitions to LIN reset mode. In LIN reset mode, this register cannot be written to, and the value of 00_H is held. To clear certain bits in this register, write 0 to those bits, and write 1 to the bits not to be cleared by using the single memory storing instruction.

UPER Flag (Parity Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
This flag is set to 1 upon parity error detection. To clear the bit, write 0 to the bit.

IDMT Flag (ID Matching Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The IDMT flag becomes 1 when all the following conditions are met:

- The UEBE bit in the RLN3nLUOR1 register is 1 (expansion bit enabled)
- The UECD bit in the RLN3nLUOR1 register is 0 (expansion bit comparison enabled)
- The UEBDCE bit in the RLN3nLUOR1 register is 1 (expansion bit/data comparison enabled)
  - The received expansion bit and the value of the UEBDL bit of the RLN3nLUOR1 register are matched.
  - The 8-bit receive data excluding the expansion bit and the value of the RLN3nLIDB register are matched.

To clear the bit, write 0 to the bit.

EXBT Flag (Expanded Bit Detection Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
When the UEBE bit in the RLN3nLUOR1 register is 1 (expansion bit enable), if the received expansion bit matches with the UEBDL bit in the RLN3nLUOR1 register, this flag is set to 1.
To clear the bit, write 0 to the bit.

FER Flag (Framing Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The FER flag is set to 1 upon framing error detection while the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled). To clear the bit, write 0 to the bit.
Framing error is detected always on the first stop bit, regardless of the stop bit amount setting.

OER Flag (Overrun Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
This flag is set to 1 upon overrun error detection. This is, when receive data has been stored into the UART receive data register and the next receive operation is completed before that receive data has been read.

BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The BER flag is set to 1 when the transmitted data and the data monitored at the sampling point position at the receive input do not match while the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled).
To clear the bit, write 0 to the bit.

18.3.4.12 RLN3nLDFC — UART Data Field Configuration Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	UTSW	—	MDL[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R/W	R/W	R/W	R/W

Table 18.59 RLN3nLDFC register contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	UTSW	Multi-byte Transmission Start Wait 0: When UART multi-byte transmission is requested, transmission is started immediately. 1: When UART multi-byte transmission is requested, transmission is not started until reception of the stop bit is completed.
4	Reserved	When read, the value after reset is returned. When writing to this bit, write the value after reset.
3 to 0	MDL[3:0]	UART multi-byte Data Length Select b3 b0 0 0 0 0: 9 bytes 0 0 0 1: 1 bytes 0 0 1 0: 2 bytes 0 0 1 1: 3 bytes 0 1 0 0: 4 bytes 0 1 0 1: 5 bytes 0 1 1 0: 6 bytes 0 1 1 1: 7 bytes 1 0 0 0: 8 bytes 1 0 0 1: 9 bytes 1 0 1 0: 9 bytes : 1 1 1 1: 9 bytes

UTSW Bit (Transmission Start Wait)

This bit controls the transmission start timing of UART multi-byte data.
With 0 set, transmission is started as soon as the start of UART multi-byte data transmit is requested.
With 1 set, transmission is started after the completion of the stop bit reception.
Note that the wait time is only 1 bit even if the stop bit length is set to 2 bits with the USBLS bit in the RLN3nLBFC register.
This bit is enabled when the RTS bit in the RLN3nLTRC register is set to 1. In addition, writing a value to this bit is disabled when the RTS bit is 1 (UART multi-byte data transmission started).
Set this bit to 1 only to switch from reception to transmission in half-duplex communication.

MDL[3:0] Bits (UART Buffer Data Length Select)

This bit specifies the data length of the UART multi-byte data.
Writing a value to these bits is disabled when the RTS bit in the RLN3nLTRC register is 1 (UART multi-byte data transmission started).

18.3.4.13 RLN3nLIDB — UART ID Buffer Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 15_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	ID[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.60 RLN3nLIDB register contents

Bit Position	Bit Name	Function
7 to 0	ID[7:0]	ID value that is referred for the expansion bit data comparison is set

ID Bit (ID Bit)

When the UEBE bit in the RLN3nLUOR1 register is set to 1 (expansion bit enabled), the UECD bit is set to 0 (expansion bit comparison enabled), and the UEBDCE bit is set to 1 (expansion bit/data comparison enabled), write the reference ID value for comparison into this register. Write to the RLN3nLIDB register when the URS bit in the RLN3nLST register is 0 (receive operation is not in progress).

18.3.4.14 RLN3nLUDB0 — UART Data 0 Buffer Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 17_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	UDB[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.61 RLN3nLUDB0 register contents

Bit Position	Bit Name	Function
7 to 0	UDB[7:0]	Value of UART data

If the data length selection corresponds to 9 data bytes (RLN3nLDFC.MDL bit is "0_H" or "9_H") for multi-byte UART transmission, then the first data value for UART communication is present in this buffer.

Write to the RLN3nLUDB0 register when the RTS bit of the RLN3nLTRC register is 0 (UART multi-byte data transmission stopped).

For details about the UART multi-byte data, see **Section 18.5.4.1 (2), UART Buffer Transmission**.

18.3.4.15 RLN3nLDBRb — UART Data Buffer b Register (n = 0 to 3, b = 1 to 8)

Access: This register can be read/written in 8-bit units.

Address: RLN3nLDBR1: <RLIN3n_base> +18_H
RLN3nLDBR2: <RLIN3n_base> + 19_H
RLN3nLDBR3: <RLIN3n_base> + $1A_H$
RLN3nLDBR4: <RLIN3n_base> + $1B_H$
RLN3nLDBR5: <RLIN3n_base> + $1C_H$
RLN3nLDBR6: <RLIN3n_base> + $1D_H$
RLN3nLDBR7: <RLIN3n_base> + $1E_H$
RLN3nLDBR8: <RLIN3n_base> + $1F_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LDB[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.62 RLN3nLDBRb register contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Sets the data to be transmitted.

This register specifies the data transmitted in UART multi-byte mode.

Write to these registers when the RTS bit of the RLN3nLTRC register is 0 (UART multi-byte data transmission stopped).

For details about the UART multi-byte data, see **Section 18.5.4.1(2), UART Buffer Transmission**.

18.3.4.16 RLN3nLUOER — UART Operation Enable Register (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	UROE	UTOE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 18.63 RLN3nLUOER register contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
1	UROE	Reception Enable 0: Disables reception. 1: Enables reception.
0	UTOE	Transmission Enable 0: Disables transmission. 1: Enables transmission.

The RLN3nLUOER register is automatically cleared to 00_H upon transition to LIN reset mode.
In LIN reset mode, this register cannot be written to.
In LIN reset mode, the register retains 00_H.

UROE Bit (Reception Enable)

The UROE bit enables or disables reception.
With 0 set, reception is disabled.
With 1 set, reception is enabled.
Do not clear this bit during reception and not set this bit during multi-byte transmission. If the communication is suspended during reception, set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) to shift to the LIN reset mode. However, the transmit operation is also suspended at this time.

UTOE Bit (Transmission Enable)

The UTOE bit enables or disables transmission.
With 0 set, transmission is disabled.
With 1 set, transmission is enabled.
Do not clear this bit during transmission. If the communication is suspended during transmission, set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) to shift to the LIN reset mode. However, the receive operation is also suspended at this time.

18.3.4.17 RLN3nLUOR1 — UART Option Register 1 (n = 0 to 3)

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 21_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	UECD	UTIGTS	UEBDCE	UEBDL	UEBE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 18.64 RLN3nLUOR1 register contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
4	UECD	Expansion Bit Comparison Disable 0: Enables comparison between the received expansion bit and the UEBDL bit value. 1: Disables comparison between the received expansion bit and the UEBDL bit value.
3	UTIGTS	Transmission Interrupt Generation Timing Select 0: Transmission interrupt is generated at the start of transmission. 1: Transmission interrupt is generated at the completion of transmission.
2	UEBDCE	Expansion Bit Data Comparison Enable 0: Disables data comparison after an expansion bit is detected. 1: Enables data comparison after an expansion bit is detected.
1	UEBDL	Expansion Bit Detection Level Select 0: Selects expansion bit value 0 as the expansion bit detection level. 1: Selects expansion bit value 1 as the expansion bit detection level.
0	UEBE	Expansion Bit Enable 0: Disables expansion bit operation. 1: Enables expansion bit operation.

UECD Bit (Expansion Bit Comparison Disable)

The UECD bit enables or disables comparison between the received expansion bit and the UEBDL bit value when the UEBE bit is 1 (expansion bit operation is enabled).
With 0 set, comparison between the received expansion bit and the UEBDL bit value is enabled when the expansion bit is received.
With 1 set, comparison between the received expansion bit and the UEBDL bit value is disabled when the expansion bit is received.
Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (in LIN reset mode).
Do not set this bit to 1 when the UART multi-byte mode is used.
Do not set this bit to 1 when the UEBDCE bit is 1 (expansion bit/data comparison enable).

UTIGTS Bit (Transmission Interrupt Generation Timing Select)

The UTIGTS bit sets the generation timing of the transmission interrupt.
With 0 set, the transmission interrupt is generated at the start of transmission.
With 1 set, the transmission interrupt is generated at the completion of transmission.
When transmission from the UART multi-byte mode is performed with 0 set, the transmission interrupt is generated only at the start of the transmission of the last data of the data length set with the MDL bits

in the RLN3nLDFC register.
When transmission from the UART multi-byte mode is performed with 1 set, the transmission interrupt is generated only at the completion of the transmission of the last data of the data length set with the MDL bits in the RLN3nLDFC register.

UEBDCE Bit (Expansion Bit Data Comparison Enable)

After an expansion bit is detected, this bit enables or disables the comparison between the 8-bit receive data excluding the expansion bit and the value of the RLN3nLIDB register.
With 0 set, when the level selected by the UEBDL bit is detected as an expansion bit, the comparison between the receive value in the RLN3nLURDR register and the value of the RLN3nLIDB register is disabled.
With 1 set, when the level selected by the UEBDL bit is detected as an expansion bit, the comparison between the receive value in the RLN3nLURDR register and the value of the RLN3nLIDB register is enabled.
Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (in LIN reset mode).
Do not set this bit to 1 when the UEBE bit is 0 (expansion bit operation disabled).
Do not set this bit to 1 when the UECD bit is 1 (expansion bit comparison disabled).
Do not set this bit to 1 when the UART multi-byte mode is used.

UEBDL Bit (Expansion Bit Detection Level Select)

The UEBDL bit sets the level to be detected as the expansion bit when the UEBE bit is 1 (expansion bit operation is enabled) and the UECD bit is 0 (comparison of the expansion bit is enabled).
With 0 set, expansion bit value 0 is the level to be detected as the expansion bit.
With 1 set, expansion bit value 1 is the level to be detected as the expansion bit.
Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (in LIN reset mode).
Do not set this bit to 1 when the UART multi-byte mode is used.

UEBE Bit (Expansion Bit Enable Bit)

The UEBE bit enables or disables expansion bit operation.
With 0 set, expansion bit operation is disabled.
With 1 set, expansion bit operation is enabled.
Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (in LIN reset mode).
Do not set this bit to 1 when the UART multi-byte mode is used.

18.3.4.18 RLN3nLUTDR — UART Transmission Data Register (n = 0 to 3)

Access: RLN3nLUTDR register can be read/written in 16-bit units.
RLN3nLUTDRL register can be read/written in 8-bit units.
RLN3nLUTDRH register can be read/written in 8-bit units.

Address: RLN3nLUTDR: <RLIN3n_base> + 24_H (n = 0 to 3)
RLN3nLUTDRL: <RLIN3n_base> + 24_H (n = 0 to 3)
RLN3nLUTDRH: <RLIN3n_base> + 25_H (n = 0 to 3)

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	UTD[8:0]								
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 18.65 RLN3nLUTDR register contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
8 to 0	UTD[8:0]	Sets the data to be transmitted from the transmission buffer. Setting Range: 000_H to $1FF_H$

The RLN3nLUTDR register sets the data to be transmitted from the transmit data register.

Writing data to this register with the UTOE bit in the RLN3nLUOER register set to 1 starts transmission.

This register can be accessed in 8 bits.

In 9-bit communication mode, do not attempt 8-bit access.

Do not write data to this register when data transmission from the UART multi-byte data is in progress.

Also, do not write data to this register when a transmission request is being generated due to write access to the RLN3nLUWTDR register.

When transmitting data continuously, do not set another piece of transmission data in this register before the generation of transmission interrupt.

The table below shows the bit arrangement according to the set communication format.

Table 18.66 Bit Arrangement of the RLN3nLUTDR Register According to Each Communication Format

	RLN3nLUTDR								
	b8	b7	b6	b5	b4	b3	b2	b1	b0

18.3.4.19 RLN3nLURDR — UART Reception Data Register (n = 0 to 3)

Access: RLN3nLURDR register can be read only in 16-bit units.
RLN3nLURDRL register can be read only in 8-bit units.
RLN3nLURDRH register can be read only in 8-bit units.

Address: RLN3nLURDR: <RLIN3n_base> + 26_H (n = 0 to 3)
RLN3nLURDRL: <RLIN3n_base> + 26_H (n = 0 to 3)
RLN3nLURDRH: <RLIN3n_base> + 27_H (n = 0 to 3)

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	URD [8:0]								
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.67 RLN3nLURDR register contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is returned. Writing is ignored.
8 to 0	URD [8:0]	Value of received data Setting Range: 000_H to $1FF_H$

The RLN3nLURDR allows the reception data to be read from the receive data register.

When the UROE bit in the RLN3nLUOER register is 1, the reception data is stored in this register and can be read out.

This register is updated at the stop bit of the reception data.

This register is also updated when an error is caused by the parity or stop bit.

However, the value of this register is not updated upon occurrence of an overrun error when the OERE bit of the RLN3nLEDE register is 1 (overrun detection enabled). The value of this register is updated upon occurrence of an overrun error when the OERE bit is 0 (overrun detection disabled).

Read this register upon occurrence of a receive error (overrun error, framing error, parity error) when the OERE bit of the RLN3nLEDE register is 1 (overrun error detection enabled). If the next data is received without reading this register, an overrun error occurs.

This register can be accessed in 8 bits.

However, during expansion bit use (UEBE bit of the RLN3nLUOR1 register is 1 (expansion bit operation enabled), do not attempt 8-bit access.

The table below shows the bit arrangement according to the set communication format.

Table 18.68 Bit Arrangement of the RLN3nLURDR Register According to Each Communication Format

	RLN3nLURDR								
	b8	**b7**	**b6**	**b5**	**b4**	**b3**	**b2**	**b1**	**b0**

Table 18.69 RLN3nLUWTDR register contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
8 to 0	UWTD[8:0]	Sets the data to be transmitted from the wait transmit data register after waiting for the stop bit reception to be completed. Setting Range: 000_H to $1FF_H$

The RLN3nLUWTDR register sets the data to be transmitted from the UART wait transmit data register.

Writing data to this register with the UTOE bit in the RLN3nLUOER register set to 1 starts transmission.

Use this register only to switch from reception to transmission in half-duplex communication.

The user should use this register only if data reception is expected or in progress..

Note that the wait time is only 1 bit even if the stop bit length is set to 2 bits with the USBLS bit in the RLN3nLBFC register.

When this register is read, the RLN3nLUTDR register value is actually read.

In 9-bit communication mode, do not attempt 8-bit access.

Do not write data to this register when data transmission from the UART multi-byte data is in progress.

The table below shows the bit arrangement according to the set communication format.

Table 18.70 Bit Arrangement of the RLN3nLUWTDR Register According to Each Communication Format

	RLN3nLUWTDR								
	b8	b7	b6	b5	b4	b3	b2	b1	b0
7-bit; LSB first	—	—	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
7-bit; MSB first	—	—	Bit0	Bit1	Bit2	Bit3	Bit4	Bit5	Bit6
8-bit; LSB first	—	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
8-bit; MSB first	—	Bit0	Bit1	Bit2	Bit3	Bit4	Bit5	Bit6	Bit7
9-bit; LSB first	Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
9-bit; MSB first	Bit0	Bit1	Bit2	Bit3	Bit4	Bit5	Bit6	Bit7	Bit8

18.4 Interrupt Sources

The LIN/UART interface generates four types of interrupt requests.

- RLIN3n successful transmission interrupt
- RLIN3n successful reception interrupt
- RLIN3n status interrupt

It is required to set the LIOS bit in the RLN3nLMD register to 1 in order to output the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, or RLIN3n status interrupt depending on the interrupt request.

Table 18.71 lists the sources for each interrupt.

Table 18.71 Interrupt Sources

		LIOS bit in RLN3nLMD register is 1 *1			
		RLIN3n Interrupt	**RLIN3n Transmission Interrupt**	**RLIN3n Successful Reception Interrupt**	**RLIN3n Status Interrupt**
LIN mode	LIN master mode	• Successful frame transmission • Successful frame reception • Successful wake-up transmission • Successful wake-up reception • Successful header transmission • Bit error • Physical bus error • Frame/response timeout error • Framing error • Checksum error • Response preparation error	• Successful frame transmission • Successful wake-up transmission • Successful header transmission	• Successful frame reception • Successful wake-up reception	• Bit error • Physical bus error • Frame/response timeout error • Framing error • Checksum error • Response preparation error
	LIN slave mode	• Successful response transmission • Successful response reception • Successful wake-up transmission • Successful wake-up reception • Successful header reception • Bit error • Frame/response timeout error • Framing error • Sync field error • Checksum error • ID parity error • Response preparation error	• Successful response transmission • Successful wake-up transmission	• Successful response reception • Successful wake-up reception • Successful header reception	• Bit error • Frame/response timeout error • Framing error • Sync field error • Checksum error • ID parity error • Response preparation error
UART mode		—	• Transmission start/successful transmission	• Successful reception • Expansion bit mismatch	• Bit error • Overrun error • Framing error • Expansion bit detection • ID match • Parity error

Note 1. The LIOS bit setting is valid in LIN Mode. In UART mode, setting the LIOS bit is not required.

Each interrupt request is output when the corresponding bit in the RLN3nLIE register is 1 (interrupt is enabled) and the corresponding flag in the RLN3nLST register is 1.

18.5 Operation

18.5.1 Modes

The LIN/UART interface provides the following four modes, depending upon the specific function to be performed:

- LIN reset mode
- LIN mode
  (LIN master mode/LIN slave mode [auto baud rate]/LIN slave mode [fixed baud rate])
- UART mode
- LIN self-test mode

The supply of clocks to the LIN/UART interface is stopped in LIN reset mode, which reduces power consumption.

Figure 18.2 shows mode transitions. **Table 18.72** describes mode transition conditions. **Table 18.73** lists operations available in each mode.

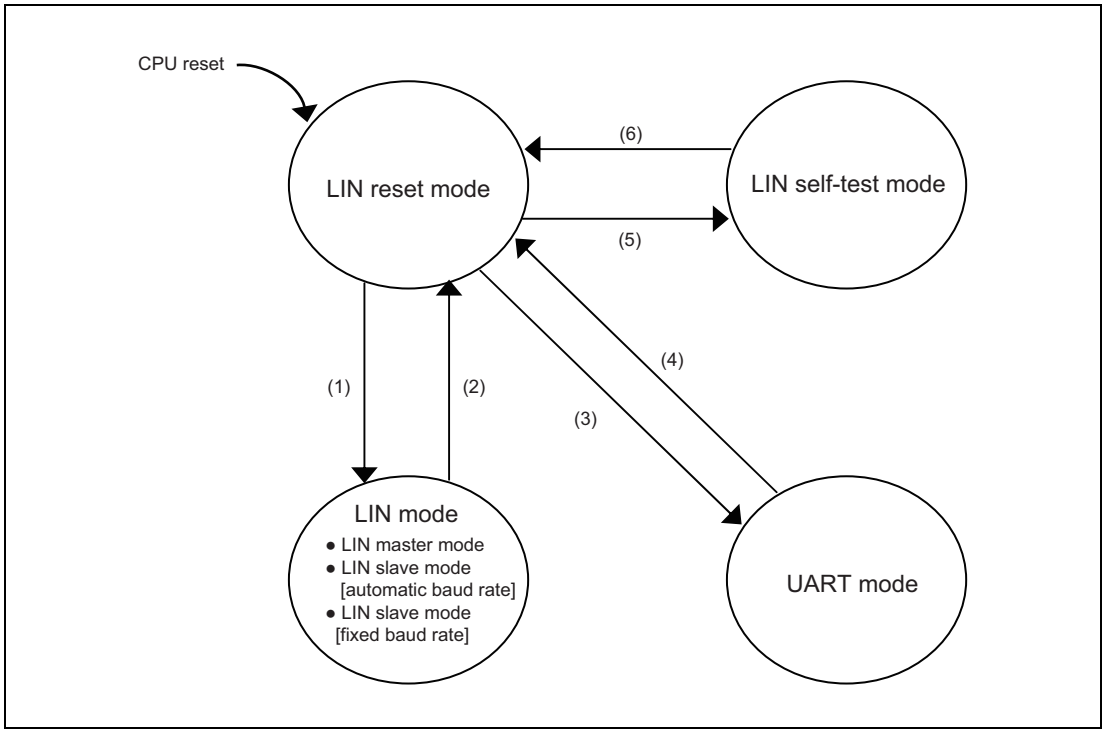

Figure 18.2 Mode Transitions

Table 18.72 Transition Condition of Each Mode

	Mode Transition			Transition Condition
1	LIN reset mode	→	LIN mode (LIN master mode)	LMD bit in RLN3nLMD register = 00_B and OM1 and OM0 bits in RLN3nLCUC register = 01_B or 11_B
	LIN reset mode	→	LIN mode (LIN slave mode [auto baud rate])	LMD bit in RLN3nLMD register = 10_B and OM1 and OM0 bits in RLN3nLCUC register = 01_B or 11_B
	LIN reset mode	→	LIN mode (LIN slave mode [fixed baud rate])	LMD bit in RLN3nLMD register = 11_B and OM1 and OM0 bits of RLN3nLCUC register = 01_B or 11_B
2	LIN mode	→	LIN reset mode	OM0 bit in RLN3nLCUC register = 0_B
3	LIN reset mode	→	UART mode	LMD bit in RLN3nLMD register = 01_B and OM0 bit in RLN3nLCUC register = 1_B
4	UART mode	→	LIN reset mode	OM0 bit in RLN3nLCUC register = 0_B
5	LIN reset mode	→	LIN self-test mode	See **Section 18.5.5, LIN Self-Test Mode**.
6	LIN self-test mode	→	LIN reset mode	See **Section 18.5.5, LIN Self-Test Mode**.

Table 18.73 Operations Available in Each Mode

LIN mode			
LIN master mode	**LIN slave mode [auto baud rate] LIN slave mode [fixed baud rate]**	**UART mode**	**LIN self-test mode**
Header transmission Response transmission Response reception Wake-up transmission Wake-up reception Error detection	Header reception Response transmission Response reception Wake-up transmission Wake-up reception Error detection	UART transmission UART reception Error detection	Self test

Whether a transition has been caused to LIN reset mode, the LIN mode, or the UART mode can be verified by reading the LMD bits in the RLN3nLMD register or the OMM0 bit in the RLN3nLMST register.

For a description of the LIN self-test mode, see **Section 18.5.5, LIN Self-Test Mode**.

18.5.2 LIN Reset Mode

Setting the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) causes a transition to LIN reset mode. The change to LIN reset mode can be verified by determining that the OMM0 bit in the RLN3nLMST register has been set to 0 (LIN reset mode). In this mode, the LIN communication and the UART communication functions are halted.

From LIN reset mode, transitions to LIN mode, UART mode, and LIN self-test mode can be made.

When the mode changes to LIN reset mode, the following registers are initialized to their reset values, and as long as LIN reset mode is in effect, they retain their initial values.

- RLN3nLTRC register
- RLN3nLST register
- RLN3nLEST register
- RLN3nLUOER register

The following registers retain their previous values even when a transition to LIN reset mode is made:

- RLN3nLWBR register
- RLN3nLBRP0 register
- RLN3nLBRP1 register
- RLN3nLMD register
- RLN3nLBFC register
- RLN3nLSC register
- RLN3nLWUP register
- RLN3nLIE register
- RLN3nLEDE register
- RLN3nLDFC register
- RLN3nLIDB register
- RLN3nLCBR register
- RLN3nLUDB0 register
- RLN3nLDBRb register (b = 1 to 8)
- RLN3nLUOR1 register
- RLN3nLUTDR register
- RLN3nLURDR register
- RLN3nLUWTDR register

18.5.3 LIN Mode

The LIN mode provides the following three operation modes:

- LIN operation mode
- LIN wake-up mode
- LIN self-test mode

LIN mode can operate in the following submodes: LIN master mode, LIN slave mode [auto baud rate], and LIN slave mode [fixed baud rate].

In LIN master mode, the following operations can be performed: header transmission, response transmission, response reception, wake-up transmission, wake-up reception, and error detection. In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 00_B (LIN master mode) and the OM1 and OM0 bits in the RLN3nLCUC register to either 01_B or 11_B sets LIN master mode, turning the OMM1 and OMM0 bits in the RLN3nLMST register to either 01_B to 11_B.

In LIN slave mode [auto baud rate] and LIN slave mode [fixed baud rate], header reception, response transmission, response reception, wake-up transmission, wake-up reception, and error detection can be performed.

The LIN slave mode [auto baud rate] allows automatic detection of the break field and the sync field, and sets a baud rate based on the results of measurement of a sync field. The baud rate can be set to the range from 1kbps to 20kbps.

Set the LPRS[2:0] bits in the RLN3nLWBR register so that the prescaler clock (with the frequency of the LIN communication clock source divided by the prescaler) becomes as follows according to the target baud rate.

[Target baud rate]	[Prescaler clock]
1 to 20 kbps	: 4 MHz*1
1 to 2.4 kbps (excluding 2.4 kbps)	: 4 MHz
2.4 to 20 kbps	: 8 to 12 MHz

Note 1. Use the clock with NSPB[3:0] bits in the RLN3nLWBR register set to "0011_B" (four samplings).

In LIN slave mode [fixed baud rate] allows automatic detection of the break field, the sync field, and the ID filed at a baud rate that is set in advance by the baud rate generator.

In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 10_B (LIN slave mode [auto baud rate] and setting the OM1 and OM0 bit in the RLN3nLCUC register to 01_B or 11_B sets LIN slave mode [auto baud rate]; and setting the LMD bits in the RLN3nLMD register to 11_B (LIN slave mode [fixed baud rate]), and setting the OM1 and OM0 bits in the RLN3nLCUC register to 01_B or 11_B sets LIN slave mode [fixed baud rate], turning the OMM1 and OMM0 bits in the RLN3nLMST register to 01_B or 11_B.

When changing a submode to another submode within LIN mode, a transition to LIN reset mode should first be made and change the LMD bits in the RLN3nLMD register.

The LIN mode provides the following two operation modes:

- LIN operation mode
- LIN wake-up mode

Figure 18.3 shows the transition of operation modes. **Table 18.74** describes the transition conditions of operation modes.

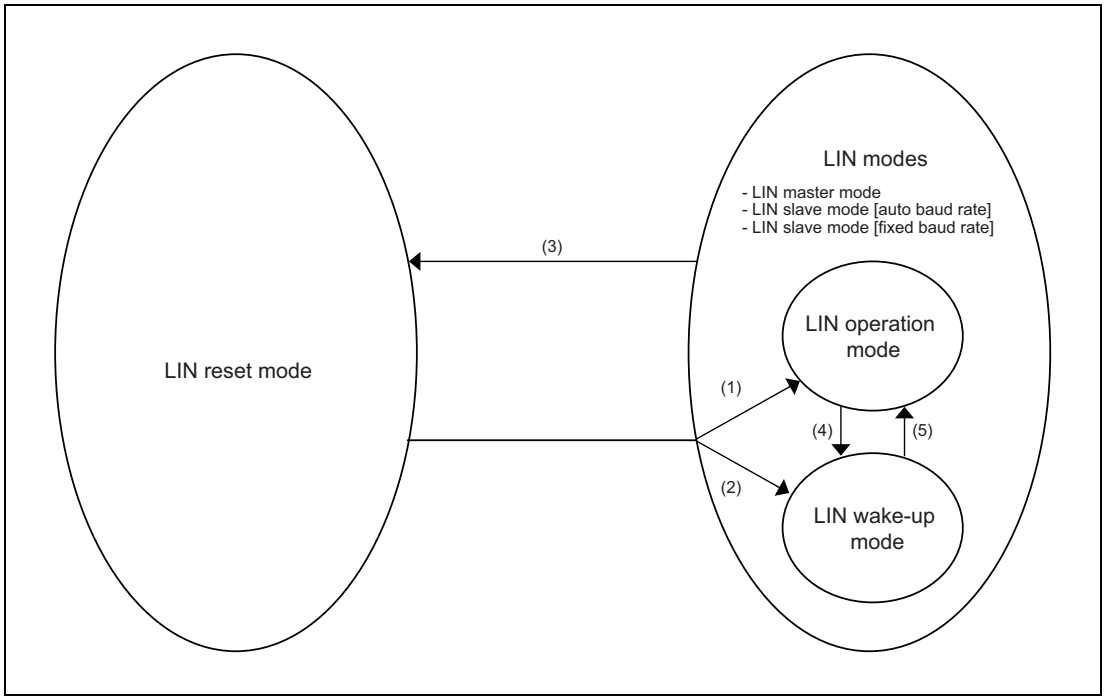

Figure 18.3 Transition of Operation Modes

Table 18.74 Transition condition for Operation Mode

	Operation mode transition			Transition condition
(1)	LIN reset mode	→	LIN mode - LIN operation mode	LMD bit in RLN3nLMD register = 00_B or 10_B or 11_B and OM1 and OM0 bits in RLN3nLCUC register = 11_B
(2)	LIN reset mode	→	LIN mode - LIN wake-up mode	LMD bit in RLN3nLMD register = 00_B or 10_B or 11_B and OM1 and OM0 bits in RLN3nLCUC register = 01_B
(3)	LIN mode - LIN operation mode - LIN wake-up mode	→	LIN reset mode	OM0 bit in LCUC register = 0_B
(4) *1	LIN mode - LIN operation mode	→	LIN mode - LIN wake-up mode	OM1 and OM0 bits in RLN3nLCUC register = 01_B
(5) *1	LIN mode - LIN wake-up mode	→	LIN mode - LIN operation mode	OM1 and OM0 bits in RLN3nLCUC register = 11_B

Note 1. Transition between LIN operation mode and LIN wake-up mode cannot be made when communication is going on (when the FTS bit in the RLN3nLTRC register is 1).

(1) LIN Operation Mode

In LIN operation mode, frame processing (header transmission, header reception, response transmission, response reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 11_B changes the mode to LIN operation mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 11_B. Communication settings should be performed after the OMM1 and OMM0 bits have become 11_B.

(2) LIN Wake-up Mode

In LIN wake-up mode, wake-up signal processing (wake-up transmission, wake-up reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 01_B changes the mode to LIN wake-up mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 01_B. Communication settings should be performed after the OMM1 and OMM0 bits have become 01_B.

18.5.3.1 LIN Master Mode

(1) Header Transmission

Figure 18.4 shows the operation of the LIN/UART interface (LIN master mode) in header transmission. **Table 18.75** provides processing in header transmission.

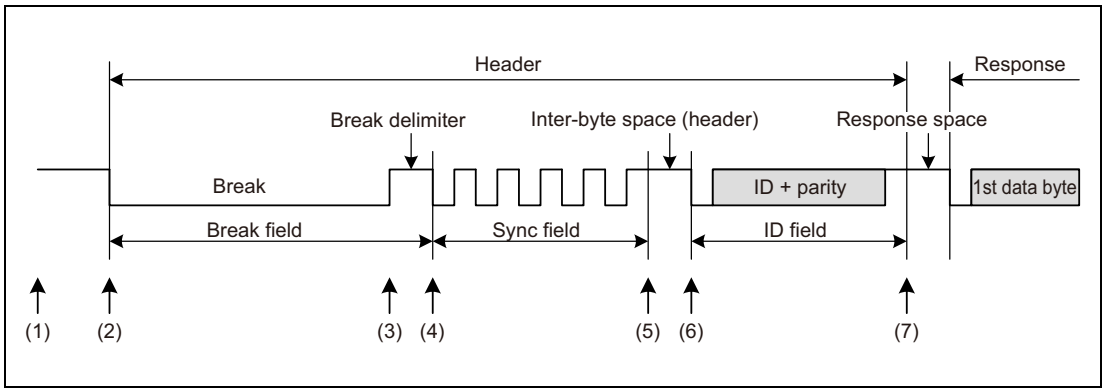

Figure 18.4 Operation in Header Transmission

Table 18.75 Processing in Header Transmission (1/2)

	Software processing	LIN/UART interface processing
(1)	• Sets a baud rate • Sets noise filter ON/OFF • Enables interrupt • Enables error detection • Sets frame configuration parameters • Changes the LIN/UART interface to the LIN master mode: LIN operation mode • Sets information on the frame to be transmitted (ID, parity, data length, response direction, Checksum method, and transmission data)	Waits for the setting of the FTS bit in the RLN3nLTRC register by software (idle)
(2)	Sets the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started)	Transmits a break.

Table 18.75 Processing in Header Transmission (2/2)

	Software processing	LIN/UART interface processing
(3)	Waits for an interrupt request	Transmits a break delimiter.
(4)		Transmits a sync field (55_H).
(5)		Transmits an inter-byte space (header).
(6)		Transmits an ID field.
(7)		Sets a successful header transmission flag.

NOTE

For information about error detection, see **Section 18.5.3.7, Error Status**.

(2) Response Transmission

Figure 18.5 shows the operation of the LIN/UART interface (LIN master mode) in response transmission. **Table 18.76** provides processing in response transmission.

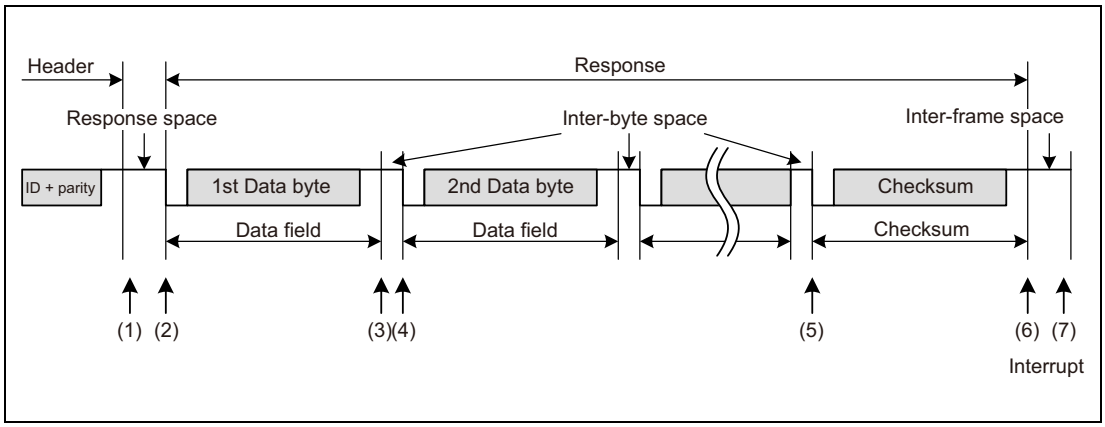

Figure 18.5 Operation in Response Transmission

Table 18.76 Processing in Response Transmission (1/2)

	Software processing	LIN/UART interface processing
(1)	(When in frame separate mode) • Sets the RTS bit in the RLN3nLTRC register to 1 (response transmission/ reception started) (When in frame (combined mode)) • Waits for an interrupt request	(When in frame separate mode) • Waits for the setting of the RTS bit in the RLN3nLTRC register to 1 by software. • When the bit is set to 1, sends a response space. (When in frame (combined mode)) • Sends a response space.

Table 18.76 Processing in Response Transmission (2/2)

	Software processing	LIN/UART interface processing
(2)	Waits for an interrupt request	Transmits 1st data byte.
(3)		Transmits an inter-byte space.
(4)		• Transmits 2nd data byte. • Transmits an inter-byte space • Transmits 3rd data byte. • Transmits an inter-byte space (Repeats the transmission of inter-byte spaces as many times as the data length specified in bits RFDL[3:0] in the RFC register, and stops the transmission when the BER flag in the RLN3nLEST register is 1 (bit error detected). If an error occurs, does not perform the Checksum transmission in item (5)). : :
(5)		Transmits the checksum.
(6)		• Sets a successful frame/wake-up transmission flag. • Sets the FTS bit in the RLN3nLTRC register to 0 (frame transmission or wake-up transmission/reception stopped). • Sets the RTS bit in the RLN3nLTRC register to 0 (when in frame separate mode, response transmission/reception stopped).
(7)	• Processing after communication Checks the RLN3nLST register, and clears flags.	Idle

NOTE

For information about error detection, see **Section 18.5.3.7, Error Status**.

(3) Response Reception

Figure 18.6 shows the operation of the LIN/UART interface (LIN master mode) on response reception. **Table 18.77** provides processing in response reception.

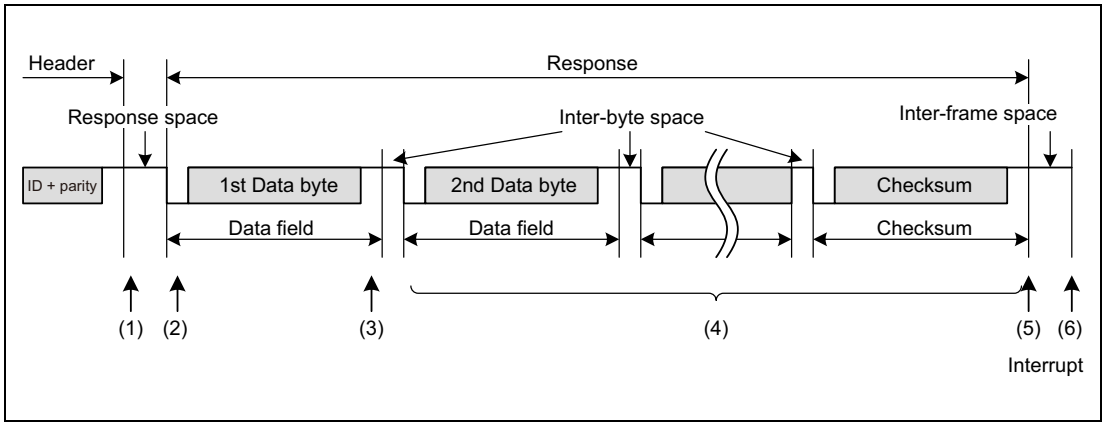

Figure 18.6 Operation in Response Reception

Table 18.77 Processing in Response Reception

	Software processing	LIN/UART interface processing
(1)	• When in frame separate mode Sets the RTS bit in the RLN3nLTRC register to 1 (response transmission/ reception started) • When in frame combined mode Waits for an interrupt request (no processing)	• When in frame separate mode Waits for the setting of the RTS bit in the RLN3nLTRC register to 1 by software. When the bit is set to 1, waits for detection of a start bit. • When in frame combined mode Waits for detection of a start bit.
(2)		Receives 1st data byte when the start bit is detected.
(3)		Sets the successful 1st data byte reception flag.
(4)		• Receives 2nd data byte when the start bit is detected. • Receives 3rd data byte when the start bit is detected. Repeats the reception of data bytes as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register, and stops the reception when any bit in the RLN3nLEST register is 1 (bit error detected). If an error occurs, the checksum determination in item (5) is not performed). : : • Receives the checksum when the start bit is detected.
(5)		• Determines the checksum. • Sets the successful frame/wake-up reception flag. • Sets the RTS and FTS bits in the RLN3nLTRC register to 0 (response transmission/reception stopped).
(6)	• Processing after communication Reads the received data. Checks the RLN3nLST register, and clears flags.	Idle

NOTE

For information about error detection, see **Section 18.5.3.7, Error Status**.

18.5.3.2 LIN Slave Mode

(1) Header Reception

Figure 18.7 shows the operation of the LIN/UART interface (LIN slave mode) in header reception.
Table 18.78 provides processing in header reception.

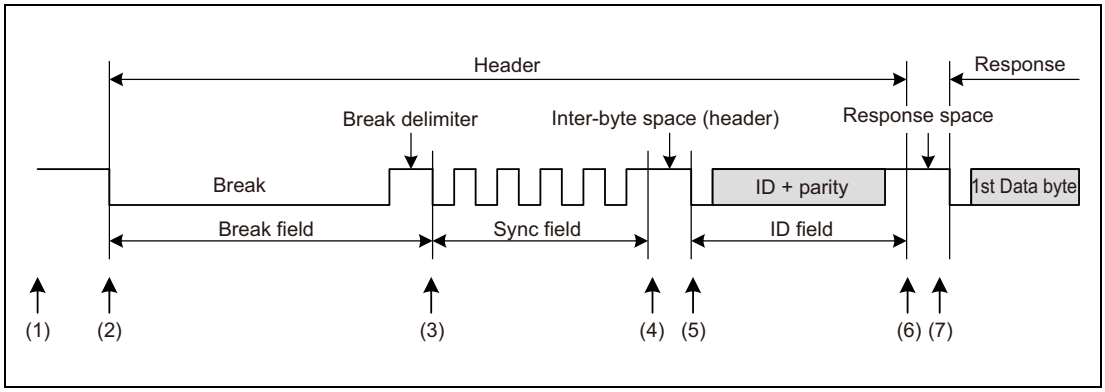

Figure 18.7 Operation in Header Reception

Table 18.78 Processing in Header Reception

	Software processing	LIN/UART interface processing
(1)	• Sets a baud rate • Sets noise filter ON/OFF • Enables interrupt • Enables error detection • Sets frame configuration parameters • Changes the LIN/UART interface to the LIN slave mode: LIN operation mode • Sets the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/ reception started)	Waits for the setting of the FTS bit in the RLN3nLTRC register by software.
(2)	Waits for an interrupt request.	Waits for detection of break field
(3)		Detects a break field. In the case of break field detection (LIN slave mode [fixed baud rate]). For details about the break field detection timing in the case of LIN slave mode [auto baud rate], see [Auto Baud Rate Correction Function])
(4)		• Detects a sync field (55_H) • Baud rate generator setting (in the case of LIN slave mode [auto baud rate]) • Clears the no-response request bit (LNRR bit).
(5)		• Receives an ID field. • Checks an ID parity bit
(6)		Sets a header reception complete flag.
(7)	• Checks the RLN3nLST register, and clears flags. • Checks the RLN3nLIDB register, and prepares a response.	• Completes a header reception process. • Waits for a response request.

NOTE

The LIN/UART interface allows reception of break fields during frame transmission/reception. In that case, a framing error, bit error or other error may be detected at the stop bit position of the frame before the break field is received, and a status interrupt may occur as a result. For information about error detection, see **Section 18.5.3.7, Error Status**.

[Auto Baud Rate Correction Function]

In LIN slave mode [auto baud rate], the system always measures the low-level widths that are received. If the first “Low level” width is 10 times (if the BLT bit of the RLN3nLBFC register is “0”) or 11 times (if the BLT bit of the RLN3nLBFC register is “1”) or greater calculated from the average of the starting 2 bits (the period of the consecutive fall edges from the beginning of the sync field) of the sync field, the system concludes that the detection of break field was successful, the system verifies that the data in the sync field is 55_H. If the data in the sync field is indeed 55_H and the system judges that sync field reception was successful, the system automatically sets the baud rate correction result to the RLN3nLBRP01 register.

If data is received up to the ID field without error, a successful header reception interrupt is generated at the stop bit position.

On the other hand, if the data in the sync field is not 55_H and the system judges that sync field reception failed, the system sets the sync field error flag and an error interrupt is generated. In that case, baud rate correction is not performed and the LIN/UART interface waits for the detection of the next break field (low level).

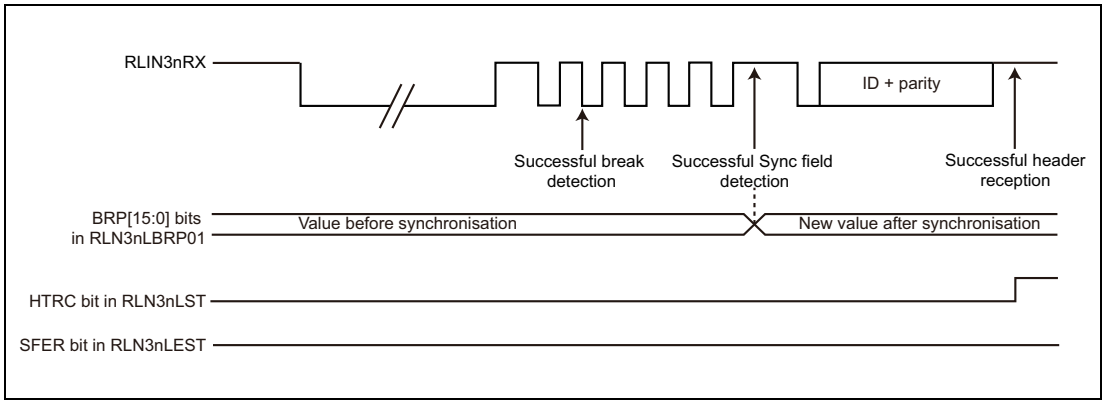

Figure 18.8 Header Reception in LIN Slave Mode [Auto Baud Rate] (in Normal Operation)

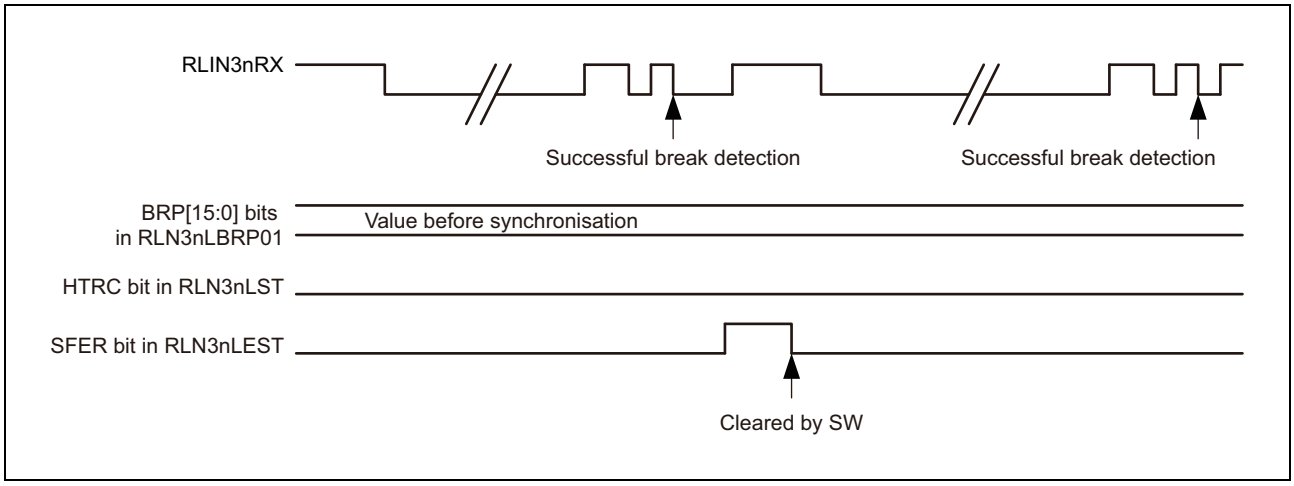

Figure 18.9 Header Reception in LIN Slave Mode [Auto Baud Rate] (Sync Field Error)

(2) Response Transmission

Figure 18.10 shows the operation of the LIN/UART interface (in LIN slave mode) in response transmission. **Table 18.79** provides processing in response transmission.

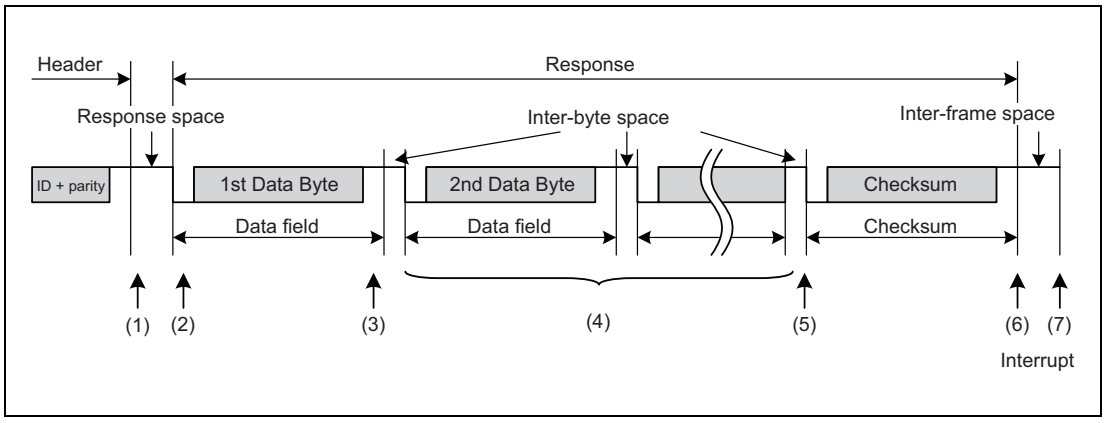

Figure 18.10 Operation in Response Transmission

Table 18.79 Processing in Response Transmission (1/2)

	Software processing	LIN/UART interface processing
(1)	• Sets the RLN3nLDFC register. • Sets the RLN3nLDBRb registers. (b = 1 to 8) • Sets the RTS bit in the RLN3nLTRC register to 1 (response transmission/ reception started)	• Waits for the setting of the RTS or LNRR bit of the RLN3nLTRC register by software • Transmits the response space after the RTS bit of the RLN3nLTRC register is set to 1

Table 18.79 Processing in Response Transmission (2/2)

	Software processing	LIN/UART interface processing
(2)	Waits for an interrupt request.	Transmits 1st data byte.
(3)		Transmits the inter-byte space.
(4)		• Transmits 2nd data byte. • Transmits an inter-byte space • Transmits 3rd data byte. • Transmits an inter-byte space (Repeats the transmission of inter-byte spaces as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register, and stops the transmission when the BER bit in the RLN3nLEST register is 1 (bit error detected). If an error occurs, the checksum transmission in item (5) is not performed). : :
(5)		Transmits the checksum.
(6)		• Sets a successful frame/wake-up transmission flag. • Sets the FTS bit in the RLN3nLTRC register to 0 (frame transmission or wake-up transmission/reception stopped) [In frame separate mode] • Sets the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception stopped)
(7)	• Processing after communication Checks the RLN3nLST register, and clears flags.	• Completes the response transmission process. • Waits for a new break.

NOTE

- For information about error detection, see **Section 18.5.3.7, Error Status**.
- The LIN/UART interface allows reception of break fields during frame transmission/reception. In that case, a framing error, bit error or other error may be detected at the stop bit position of the frame before the break field is received, and a status interrupt may occur as a result.

(3) Response Reception

Figure 18.11 shows the operation of the LIN/UART interface (LIN slave mode) in response reception. **Table 18.80** provides processing in response reception.

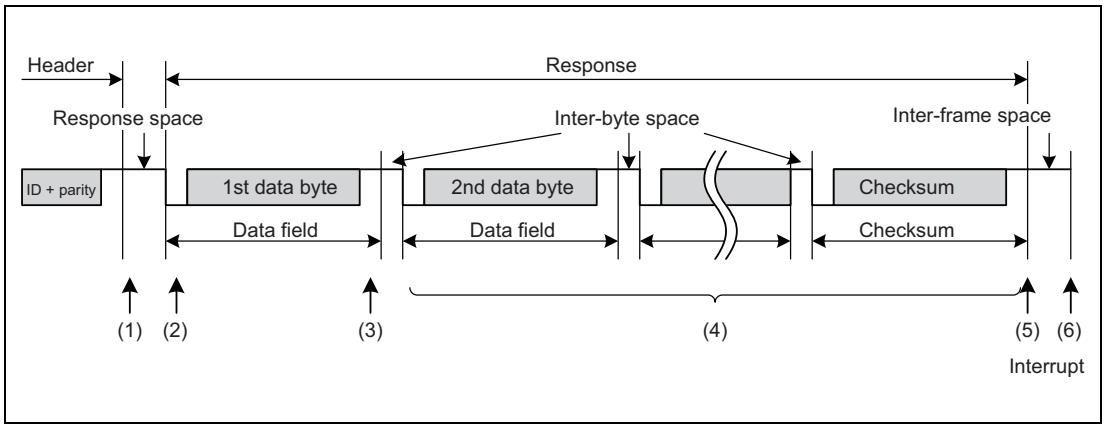

Figure 18.11 Operation in Response Reception

Table 18.80 Processing in Response Reception

	Software processing	LIN/UART interface processing
(1)	• Sets the RLN3nLDFC register. • Sets the response transmission/ reception start bit (RTS bit) to 1.	• Waits for the setting by software of the response transmission/ reception start bit (RTS bit) or the no-response request bit (LNRR bit). • Waits for detection of the start bit.
(2)	Waits for an interrupt request.	Receives 1st data byte when the start bit is detected.
(3)		Sets the successful 1st data byte reception flag.
(4)		• Receives 2nd data byte when the start bit is detected. • Receives 3rd data byte when the start bit is detected. Repeats the transmission of inter-byte spaces as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register, and stops the transmission when any bit in the RLN3nLEST register is 1 (bit error detected). If an error occurs, the checksum determination in item (5) is not performed). : : • Receives the checksum when the start bit is detected.
(5)		• Determines the checksum. • Sets a successful frame/wake-up reception flag or an error flag. • Sets the FTS bit in the RLN3nLTRC register to 0 (response transmission/reception stopped).
(6)	• Processing after communication Reads the received data. Checks the RLN3nLST register, and clears flags.	• Completes the response process. • Waits for a new break.

NOTE

- For information about error detection, see **Section 18.5.3.7, Error Status**.
- The LIN/UART interface allows reception of break fields during frame transmission/reception. In that case, a framing error, bit error or other error may be detected at the stop bit position of the frame before the break field is received, and a status interrupt may occur as a result.

(4) No-Response Request

Figure 18.12 shows the operation of the LIN/UART interface (LIN slave mode) when no response is requested. **Table 18.81** shows the processing that occurs when no response is requested.

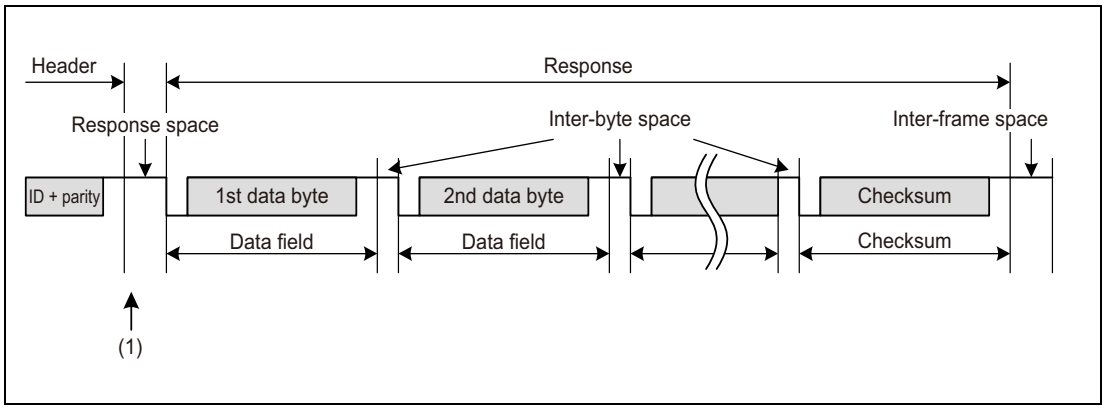

Figure 18.12 Operation when No Response is Requested

Table 18.81 Processing when No Response is Requested

	Software processing	LIN/UART interface processing
(1)	• Sets the no-response request bit (LNRR bit) to 1.	• Waits for setting of the no-response request bit (LNRR bit) by software • Completes the frame reception process • Waits for a new break

18.5.3.3 Data Transmission/Reception

(1) Data Transmission

One bit of data is transmitted per 1 Tbit.

The data that is transmitted returns to the reception data input pin via the LIN transceiver. The received data and the transmitted data is compared bit by bit, and the results are stored in the BER flag in the RLN3nLEST register (see **Section 18.5.3.7, Error Status**).

In LIN master mode and LIN slave mode [fixed baud rate], 1 Tbit is generated to be 16fLIN, and thus the sampling point for received data is at the 13th clock cycle (81.25% position).

In LIN slave mode [auto baud rate], if 1 Tbit is generated to be 4fLIN, the sampling point for received data is at the third clock cycle (75% position). If 1 Tbit is generated to be 8fLIN, the sampling point for received data is at the 7th clock cycle (87.5% position).

Figure 18.13 shows an example of data transmission timing.

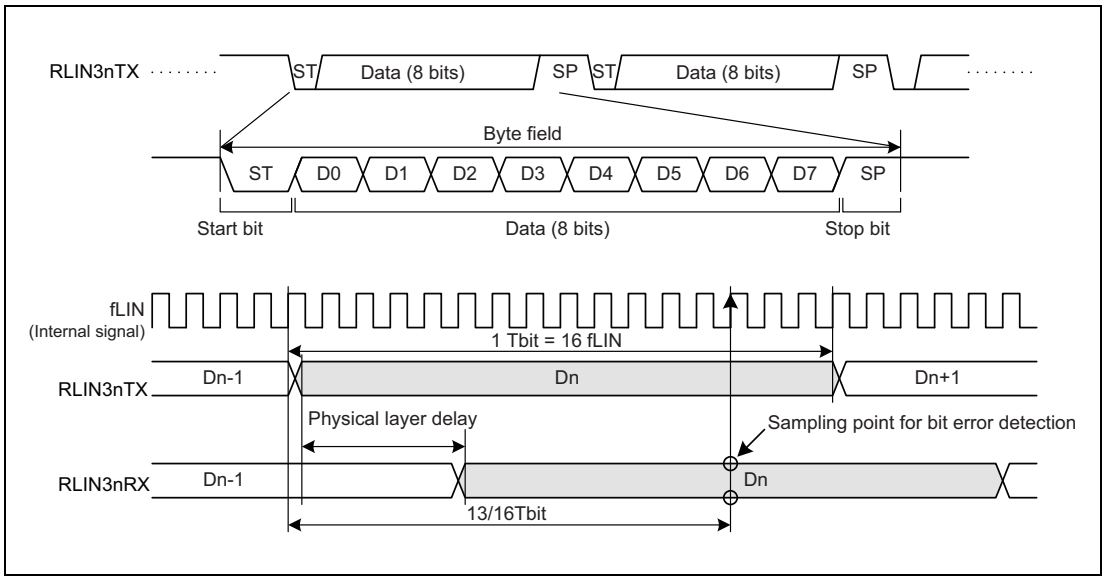

Figure 18.13 Example of Data Transmission Timing (LIN Master Mode, LIN Slave Mode [Fixed Baud Rate])

(2) Data Reception

Data reception is performed by using the synchronized RLIN3nRX signal (an internal signal) that is the input from the RLIN3nRX pin synchronized with prescaler clock.

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal. After the falling edge is detected, sampling is performed again 0.5 Tbit later, and the falling edge is recognized as a start bit if the synchronized RLIN3nRX signal is low level. The falling edge is not recognized as a start bit if the RLIN3nRX signal after the clearing of the resetting is low-level-fixed or if a high level is detected on re-sampling.

After the start bit is detected, the system samples 1 bit per Tbit.

The LIN/UART interface has a noise filter function with respect to reception data. If the LRDNFS bit in the RLN3nLMD register is 0, the LIN/UART interface uses a noise filter, and for a sampling value the value determined by a 3-sampling majority rule on prescaler clocks is used. If the LRDNFS bit in the RLN3nLMD register is 1, the LIN/UART interface does not use a noise filter, and for a sampling value the value of the synchronized RLIN3nRX value at the sampling position is used as is.

Figure 18.14 shows an example of data reception timing.

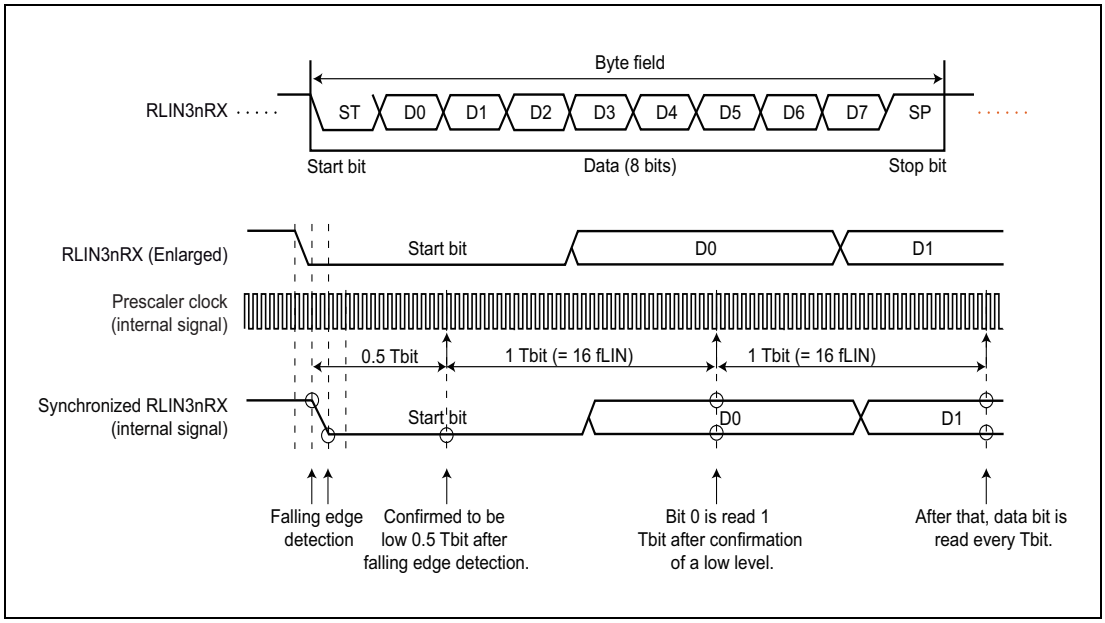

Figure 18.14 Example of Data Reception Timing (LIN Master Mode, LIN Slave Mode [Fixed Baud Rate])

18.5.3.4 Transmission/Reception Data Buffering

This section explains the buffer processing that takes place when the LIN/UART interface sends or receives data continuously.

(1) LIN Frame Transmission

For an 8-byte transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR8 are sequentially transmitted to data areas 1 to 8 of the LIN frame. In the case of a 4-bytes transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR4 are transmitted to data areas 1 to 4 of the LIN frame, but the contents of registers RLN3nLDBR5 to RLN3nLDBR8 are not transmitted. The transmitted checksum data is stored in the RLN3nLCBR register.

Figure 18.15 depicts the LIN transmission processing and the required buffer.

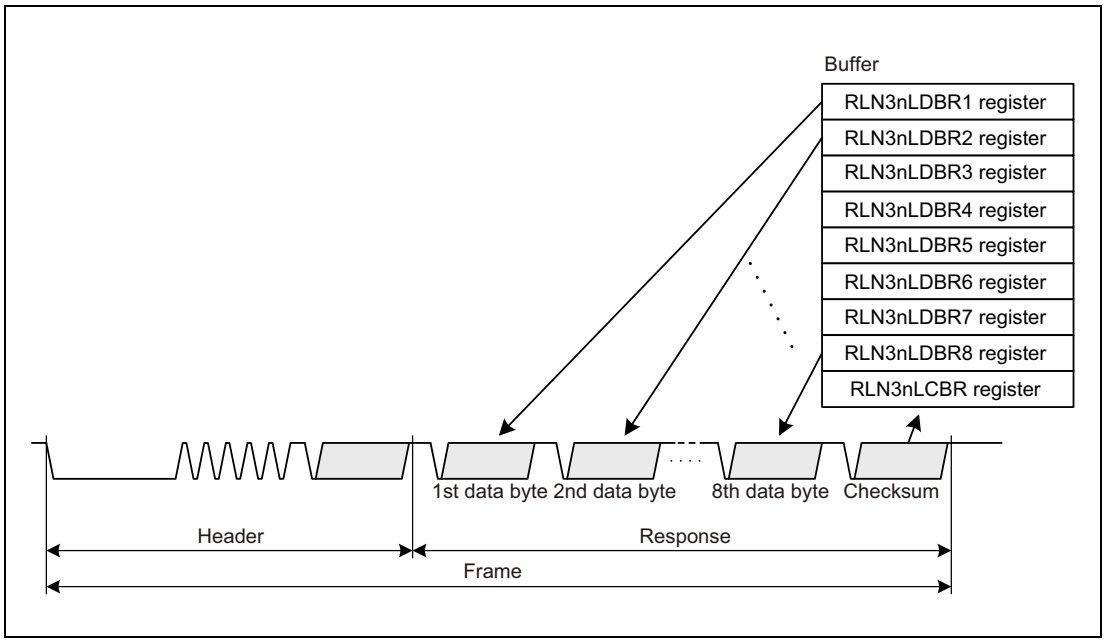

Figure 18.15 LIN Transmission Processing and Required Buffer

(2) Frame Separate Mode

Setting the FSM bit in the RLN3nLDFC register to 1 turns on the frame separate mode.

In frame separate mode, a header and a response are transmitted when prompted by separate transmission start requests.

When the transmission of a header is finished, the HTRC flag in the RLN3nLST register turns 1 (successful header transmission).

Use frame separate mode when sending or receiving response data of 9 bytes or greater in LIN master mode.

(3) Reception of LIN Frames

For an 8-byte reception, the contents of data areas 1 to 8 of the LIN frame is stored in registers RLN3nLDBR1 to RLN3nLDBR8, respectively, upon receipt of a stop bit. In the case of a 4-byte reception, the contents of data areas 1 to 4 of the LIN frame are stored in registers RLN3nLDBR1 to RLN3nLDBR4, respectively; however, no data is stored in registers RLN3nLDBR5 to RLN3nLDBR8. Also, the received checksum data is stored in the RLN3nLCBR register.

Figure 18.16 depicts the LIN reception processing and the required buffer.

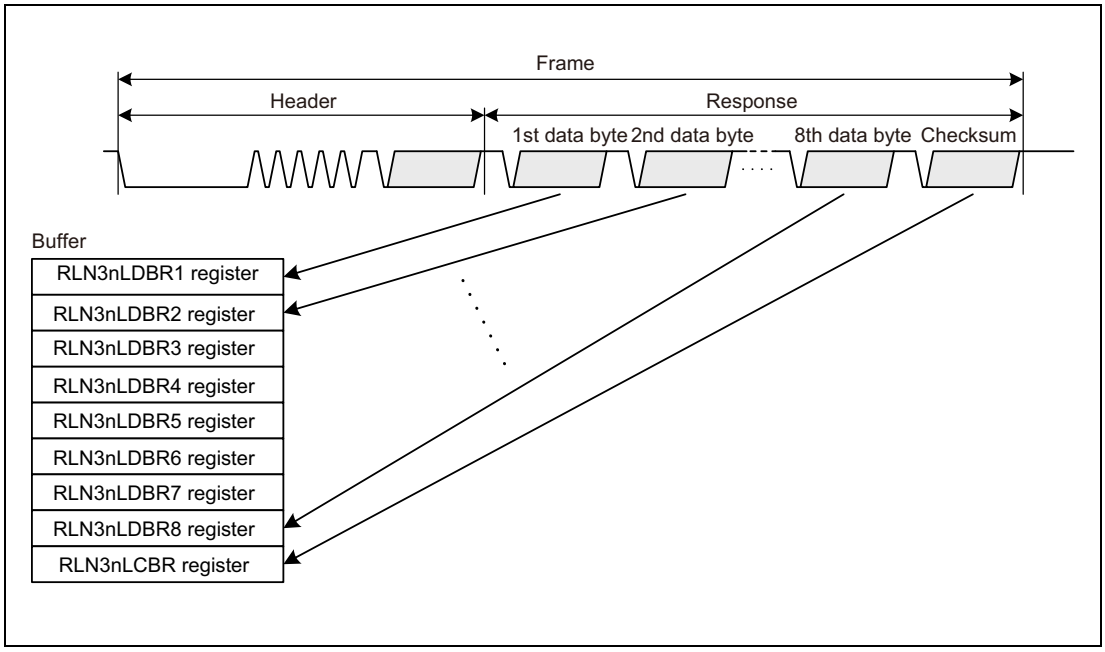

Figure 18.16 LIN Reception Processing and Required Buffer

(4) Reception of 1st data byte

When the reception of the first byte of data is finished, the D1RC flag in the RLN3nLST register turns 1 (successful 1st data byte reception).

(5) Multi-Byte Response Transmission/Reception Function

In normal LIN communication, a response is no more than or equal to 9 bytes (including the checksum field).In case responses are more than or equal to 9 bytes (plus checksum field) users can use response communication.

In such a case, the bit error, framing error, response preparation error detection, and auto checksum functions are enabled.

If the data length is greater than 8 bytes, the LSS bit in RLN3nLDFC register should be set to 1 (indicating that the next data group to be sent or received is not the final data group) in the first data group (variable in 0 to 8 bytes) before sending or receiving the data group. After the transmission or reception, the user should determine whether the next data group is the final data group. If it is the final data group, the LSS bit should be set to 0 (indicating that the next data group to be sent or received is the final data group), and a checksum should be appended to the final data group.

By changing the RFDL bit in RLN3nLDFC register settings when the RTS bit in RLN3nLTRC register is 0, the user can change the data length for each data group.

When performing multi-byte response transmission/reception in LIN master mode, set the FSM bit in RLN3nLDFC register in the RLN3nLDFC register to 1 (frame separate mode).

NOTE

In LIN slave mode, the LIN/UART interface can detect a new break field during the transmission or reception of a response.

18.5.3.5 Wake-up Transmission/Reception

The wake-up transmission/reception can be used in LIN wake-up mode.

(1) Wake-up Transmission

In LIN wake-up mode, setting the RCDS bit in the RLN3nLDFC register to 1 (transmission) and the RFT bit in the RLN3nLDFC register to 1 (LIN master mode: response transmission), or setting the RCDS bit in the RLN3nLDFC register to 1 (LIN slave mode: response transmission) and the FTS bit in the RLN3nLTRC register to 1 (frame transmission, header reception or wake-up transmission/ reception started) causes a wake-up signal to be output from the output pin. The low width of the wake-up signal should be set using the WUTL[3:0] bits in the RLN3nLWUP register.

However, if the LWBR0 bit of the RLN3nLWBR register in LIN master mode is 1 (LIN2.x use), the LIN system clock (fLIN) becomes low level width at fa regardless of the setting of the LCKS bit of the RLN3nLMD register. By setting the WUTL[3:0] bit of the RLN3nLWUP register to 0100_B (5 Tbits), 260 µs low width can be output in LIN wake-up mode regardless of the setting of the LCKS bit of the RLN3nLMD register.

If a wake-up low is output without any bit error, the FTC flag in the RLN3nLST register turns 1 (successful frame response or wake-up transmission); when the FTCIE bit in the RLN3nLIE register is 1 (successful frame response/wakeup transmission interrupt enabled), an interrupt request is generated.

If a bit error is detected, wake-up transmission is canceled and the BER flag in the RLN3nLEST register is set to 1 (bit error detection).

Figure 18.17 shows the wake-up transmission timing.

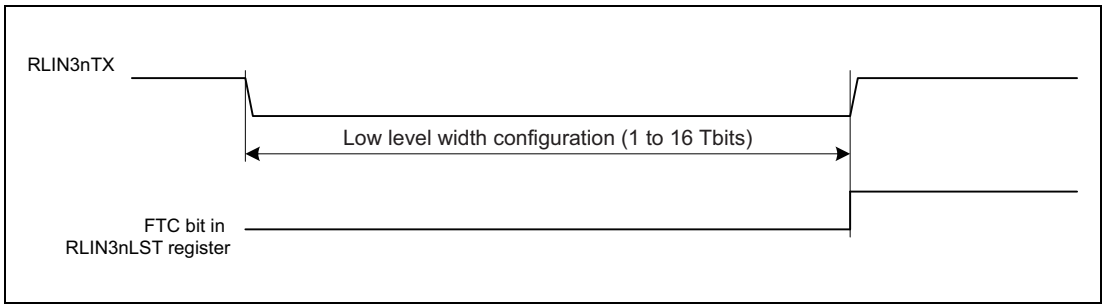

Figure 18.17 Wake-up Transmission Timing

(2) Wake-up Reception

The detection of a wake-up involves the use of an input signal low level width count function.

The input signal low level width count function measures the low level width of the input signal to the RLIN3nRX pin, using the same sampling point as data reception. This allows the 2.5-Tbit or longer low-level width of the input signal of fLIN to be measured.

In LIN master mode, by setting the LWBR0 bit in the RLN3nLWBR register, operation is executed without changing the baud rate generator setting at a transition between LIN operation mode and LIN wake-up mode.

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1.

Setting the LWBR0 bit to 1 selects the LIN system clock (fLIN) to fa regardless of the setting of the LCKS bit in the RLN3nLMD register. (The LCKS bit is not changed). By setting the baud rate to 19200bps while fa is selected, the 130 µs or longer low-level width of the input signal to be measured regardless of the setting of the LCKS bit in the RLN3nLMD register.

When using this function, in LIN wake-up mode set the RFT bit in the RLN3nLDFC register to 0 (LIN master mode: response reception), the RCDS bit in the RLN3nLDFC register to 0 (LIN slave mode: response reception), or the FTS bit in the RLN3nLTRC register to 1 (frame transmission (header reception) or wake-up transmission/reception started).

When the low level width to be measured is reached, the FRC flag in the RLN3nLST register turns 1 (successful frame response/wake-up reception). If the FRCIE bit in the RLN3nLIE register is 1 (successful frame response or wake-up reception interrupt enabled), an interrupt request is generated.

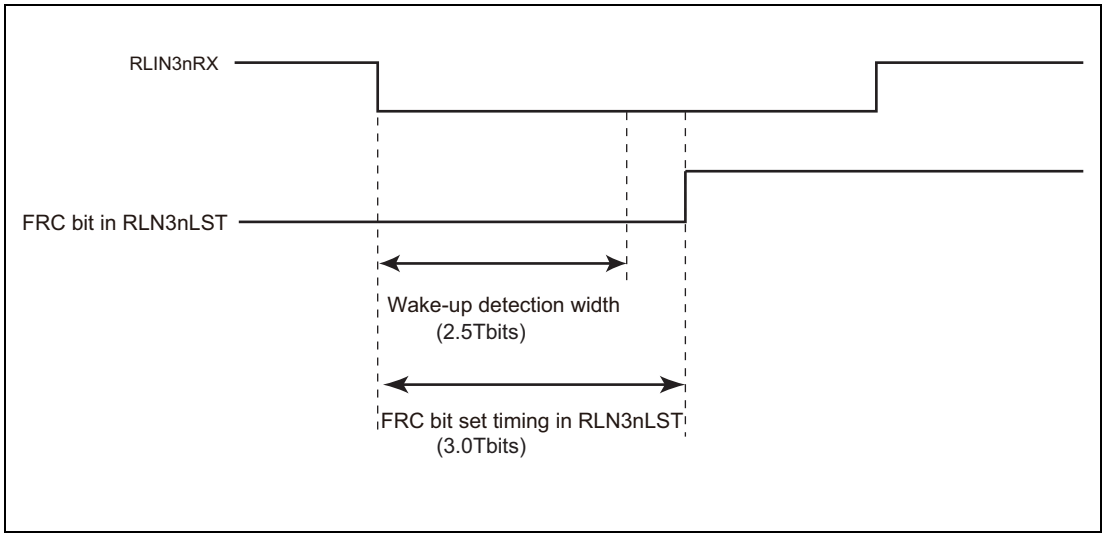

Figure 18.18 Input Signal Low level Count Function

(3) Wakeup Collision

If the master node and the slave node transmit wakeup signals simultaneously, a collision will occur on the LIN bus, though a collision of wakeup signals is not detected in the LIN/UART interface.

18.5.3.6 Status

During LIN mode operation, the LIN/UART interface can detect seven types of statuses.

The four statuses, successful frame/wake-up transmission, successful frame/wake-up reception, error detection, successful header transmission/reception, can generate interrupt requests.

Table 18.82 shows the types of statuses available in LIN master mode. **Table 18.83** lists the types of statuses available in LIN slave mode [auto baud rate] and in LIN slave mode [fixed baud rate].

Table 18.82 Types of Statuses in LIN Master Mode

Status	Status set condition	Status clear condition	Operation mode capable of status detection	Corresponding bit	Interrupt
Reset	After the OM0 bit in the RLN3nLCUC register is set to not-LIN–reset-mode, if actually the LIN/UART interface is cleared from LIN reset mode.	After the OM0 bit in the RLN3nLCUC register is set to LIN reset mode, if actually the LIN/UART interface enters LIN reset mode.	All modes	OMM0 bit in RLN3nLMST register	—
Operation mode	After the OM1 bit in the RLN3nLCUC register is set to LIN operation mode, if actually the LIN/UART interface enters LIN operation mode.	After the OM1 bit in the RLN3nLCUC register is set to LIN wake-up mode, if actually the LIN/UART interface enters LIN wake-up mode.	• LIN operation mode • LIN wake-up mode	OMM1 bit in RLN3nLMST register	—
Frame/wake-up transmission end	When a frame (header transmission + response transmission), a wake-up signal, or a data group is transmitted successfully.	• When another communication is started • When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FTC flag in RLN3nLST register	√
Frame/wake-up reception end	When a frame (header transmission + response reception), a wake-up signal, or a data group is received successfully.	• When another communication is started • When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FRC flag in RLN3nLST register	√
Error detection	If any of the PRER flag, CSER flag, FER flag, FTER flag, PBER flag, and BER flags in the RLN3nLEST register turns 1 (error detected).	• When another communication is started • When cleared by software*1 • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	ERR flag in RLN3nLST register	√
1st data byte reception end	The RFT bit in the RLN3nLDFC register is 0 (reception) and the first byte of the response field is received.*2	• When another communication is started • When cleared by software • After transition to LIN reset mode	LIN operation mode	D1RC flag in RLN3nLST register	—
Header transmission end	When a header field is transmitted successfully.	• When another communication is started • When cleared by software • After transition to LIN reset mode	LIN operation mode	HTRC flag in RLN3nLST register	√

Note 1. In LIN operation mode, the ERR flag in the RLN3nLST register is cleared to 0 by writing 0 to the PRER flag, CSER flag, FER flag, FTER flag, PBER flag, or BER flags in the RLN3nLEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN3nLDFC register are 0000_B (0-byte + checksum).

Table 18.83 Types of Statuses in LIN Slave Mode

Status	Status set condition	Status clear condition	Operation mode capable of status detection	Corresponding bit	Interrupt
Reset	After the OM0 bit in the RLN3nLCUC register is set to not-LIN–reset-mode, if actually the LIN/UART interface is cleared from LIN reset mode.	After the OM0 bit of the RLN3nLCUC register is set to LIN reset mode, if actually the LIN/UART interface enters LIN reset mode.	All modes	OMM0 bit in RLN3nLMST register	—
Operation mode	After the OM1 bit in the RLN3nLCUC register is set to LIN operation mode, if actually the LIN/UART interface enters LIN operation mode.	• After the OM1 bit in the RLN3nLCUC register is set to LIN wake-up mode, if actually the LIN/UART interface enters LIN wake-up mode.	• LIN operation mode • LIN wake-up mode	OMM1 bit in RLN3nLMST register	—
Frame/wake-up transmission end	When a response field, a wake-up signal, or a data group is transmitted successfully.	• When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FTC flag in RLN3nLST register	√
Frame/wake-up reception end	When a response field, a wake-up signal, or a data group is received successfully.	• When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FRC flag in RLN3nLST register	√
Error detection	If any of the PRER flag, IPER flag, CSER flag, SFER flag, FER flag, TER flag, and BER flag in the RLN3nLEST register turns 1 (error detected).	• When cleared by software*1 • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	ERR flag in RLN3nLST register	√
1st data byte reception end	The RCDS bit in the RLN3nLDFC register is 0 (reception) and the first byte of the response field is received.*2	• When cleared by software • After transition to LIN reset mode	LIN operation mode	D1RC flag in RLN3nLST register	—
Header reception end	When a header field is received successfully.	• When cleared by software • After transition to LIN reset mode	LIN operation mode	HTRC flag in RLN3nLST register	√

Note 1. In LIN operation mode, the ERR flag in the RLN3nLST register is cleared to 0 by writing 0 to the PRER flag, IPER flag, CSER flag, SFER flag, FER flag, TER flag, or BER flag in the RLN3nLEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN3nLDFC register are 0000_B (0-byte + checksum).

18.5.3.7 Error Status

(1) LIN Master Mode

(a) Types of Error Statuses

The LIN/UART interface can detect six types of error statuses in LIN master mode. The condition of these error statuses can be checked by means of the corresponding bits in the RLN3nLEST register.

All error statuses represent interrupt events.

Table 18.84 shows the types of error statuses.

Table 18.84 Types of Error Statuses in LIN Master Mode

Status	Error detection condition	Operation mode capable of error detection	Communication	Enable/ disable detection	Corresponding bit
Bit error	The transmitted data and the data on the LIN bus monitored by the receive pin do not match *1*2	• LIN operation mode • LIN wake-up mode	Cancel	Enabled	BER flag in RLN3nLEST register
Physical bus error	• LIN bus is detected to be high level when sending a break • LIN bus is detected to be low level when sending a break delimiter • LIN bus is detected to be high level when sending a wake-up	• LIN operation mode • LIN wake-up mode	Cancel	Enabled	PBER flag in RLN3nLEST register
Timeout error	A frame or response transmission/reception does not terminate within a given time*3	LIN operation mode	Cancel	Enabled	FTER flag in RLN3nLEST register
Framing error	In response field reception, a stop bit of each data byte is low level	LIN operation mode	Cancel	Enabled	FER flag in RLN3nLEST register
Checksum error	In response field reception, the result of checksum test gives an error	LIN operation mode	—	Disabled	CSER flag in RLN3nLEST register
Response preparation error	One of the following conditions occurs in frame combined mode during a multi-byte response reception: • The first reception data byte is received after completion of header transmission but before a response transmission/reception request is set • The first reception data byte is received after the completion of previous data group reception before a transmission/reception request for another data group is set.	LIN operation mode	Cancel	Disabled	RPER flag in RLN3nLEST register

Note 1. If a bit error is detected, the process is canceled after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is canceled immediately after that area. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is canceled after the error-causing bit is sent.

Note 2. In a multi-byte response transmission, bit errors are detected also between data groups.

Note 3. The timeout time depends on the response field data length (the RFDL [3:0] bits in the RLN3nLDFC register) and the checksum selection (the CSM bit in the RLN3nLDFC register), and this can be calculated according to the following formula:
[Frame timeout]
On classic selection (when the CSM bit in RLN3nLDFC is 0): Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]
On enhanced selection (when the CSM bit in RLN3nLDFC is 1): Timeout time = 48 + (number of data bytes + 1) × 14 [Tbit]

The aforementioned timeout time is a time greater than the TFRAME_MAX of LIN Specification Package

Revision 1.3 on classic selection, or the TFRAME_MAX of LIN Specification Package Revision 2.x on enhanced selection.

[Response timeout]
Timeout time = (number of data bytes + 1) × 14 [Tbit]

The error status is cleared when the next communication is started, by software, or at a transition to LIN reset mode.

(b) Target Time Area for LIN Error Detection

Figure 18.19 shows the time domain in which the LIN/UART interface in LIN master mode performs monitoring for error detection.

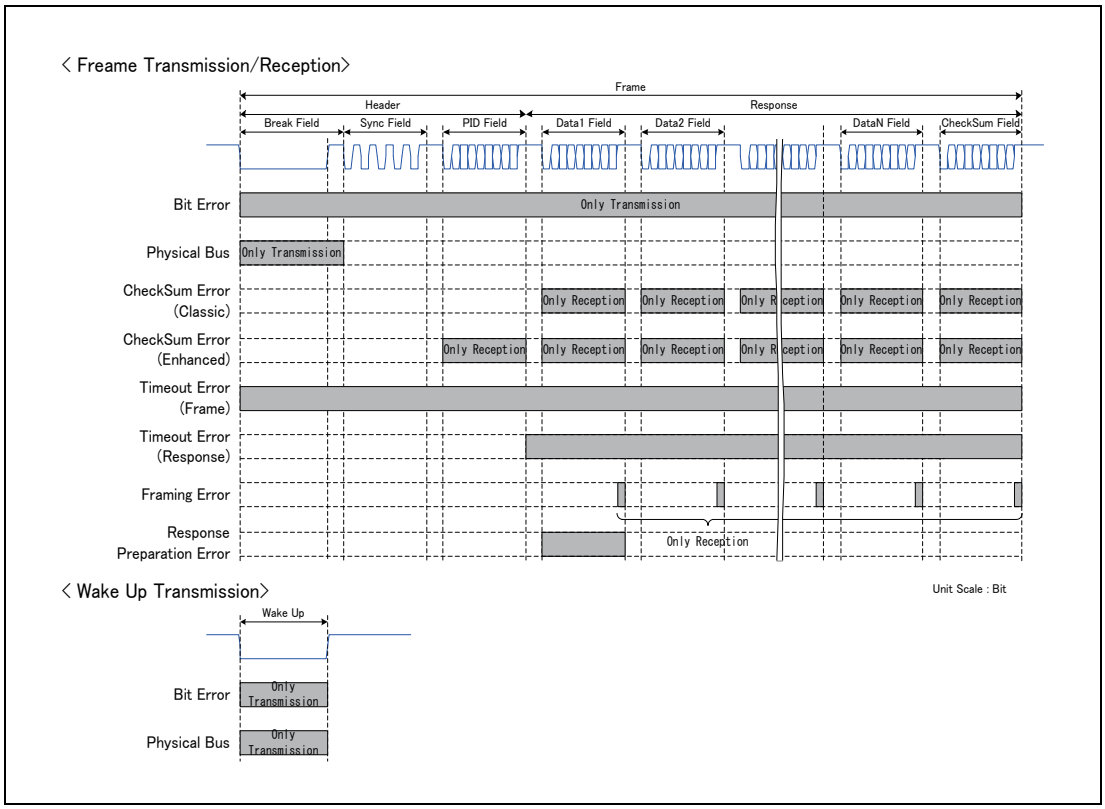

Figure 18.19 Target Time Area for LIN Error Detection (LIN Master Mode)

(2) LIN Slave Mode

(a) Types of Error Statuses

The LIN/UART interface can detect seven types of error statuses in LIN slave mode [auto baud rate] or in LIN slave mode [fixed baud rate]. These error statuses can be verified by checking the corresponding bits in the RLN3nLEST register.

Table 18.85 shows the types of error statuses.

Table 18.85 Types of Error Statuses in LIN Slave Mode

Status	Error detection condition	Operation mode capable of error detection	Communication	Enable/ disable detection	Corresponding bit
Bit error	The transmitted data and the data on the LIN bus monitored by the receive pin do not match[*1] [*2]	• LIN operation mode • LIN wake-up mode	Cancel	Enabled	BER flag in RLN3nLEST register
Timeout error	A frame or response transmission/reception does not terminate within a given time[*3*6]	LIN operation mode	Cancel	Enabled	TER flag in RLN3nLEST register
Framing error	In response field reception, a stop bit of each data byte is low level	LIN operation mode	Cancel	Enabled	FER flag in RLN3nLEST register
Sync field error	If the width of the break low level is greater than the width set by the LBLT bit in the RLN3nLBFC register and the sync field is not 55_H	LIN operation mode	Cancel	Enabled[*4]	SFER flag in RLN3nLEST register
Checksum error	In response field reception, the result of checksum test gives an error	LIN operation mode	—[*5]	Disabled	CSER flag in RLN3nLEST register
ID parity error	If the received ID parity bit does not match the value that is automatically calculated by the LIN/ UART interface	LIN operation mode	Cancel	Enabled	IPER flag in RLN3nLEST register
Response preparation error	• After the reception of a header, before the first reception data byte is received, response preparation is not made in time. • Before the completion of receiving the first reception data byte for the next data group in a multi-byte response reception, response preparation for the next group is not made in time	LIN operation mode	Cancel	Disabled	RPER flag in RLN3nLEST register

Note 1. If a bit error is detected, the process is canceled after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is canceled immediately after that area. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is canceled after the error-causing bit is sent.

Note 2. In a multi-byte response transmission, bit error can be detected between data groups.

Note 3. The timeout time depends on the response field data length (the RFDL [3:0] bits in the RLN3nLDFC register) and the checksum selection (the LCS bit in the RLN3nLDFC register), and this can be calculated according to the following formula. The time-out period until the RTS or LNRR bit of the RLN3nLTRC register is set is 8 data bytes. When the RTS bit is set, the timeout time is reset to the time based on the response field data length (RFDL[3:0] bit of the RLN3nLDFC register). When the LNRR bit is set, the timeout function stops.

[Frame timeout]
On classic selection (when the CSM bit in RLN3nLDFC is 0): Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]
On enhanced selection (when the CSM bit in RLN3nLDFC is 1): Timeout time = 48 + (number of data bytes + 1) × 14 [Tbit]

The aforementioned timeout time is a time greater than the TFRAME_MAX of LIN Specification Package Revision 1.3 on classic selection, or the TFRAME_MAX of LIN Specification Package Revision 2.x on enhanced selection.

[Response timeout]
Timeout time = (number of data bytes + 1) × 14 [Tbit]

Note 4. Only reflection of the result to the SFER flag can be enabled/disabled. Error detection cannot be enabled/ disabled.

Note 5. Checksum judgment is performed upon completion of response frame reception. In case of an error, the receive complete flag is not set to 1.

Note 6. If RLIN3 transitions to LIN reset mode by clearing RLN3nLCUC.OM0 to 0 when the timeout function is used (RLN3nLEDE.TERE = 1), users should take the procedure shown in **Figure 18.4**.

The error status is cleared by software or at a transition to LIN reset mode.

(3) Target Time Area for LIN Error Detection

Figure 18.20 shows the time domain in which the LIN/UART interface in slave mode performs monitoring for error detection.

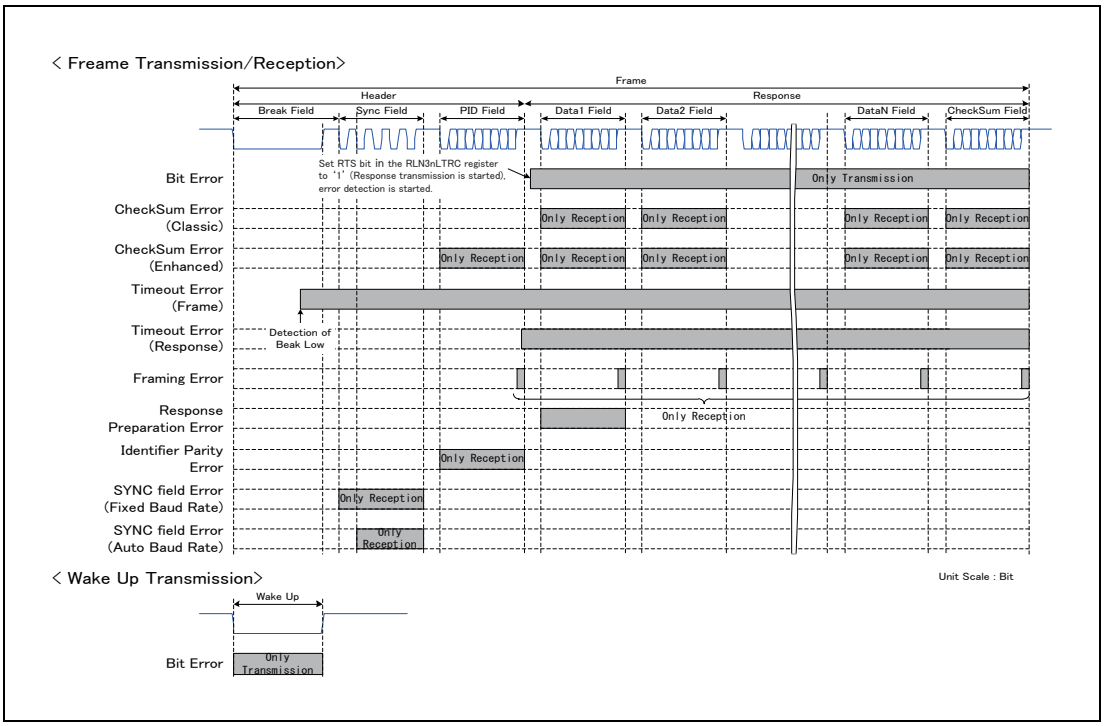

Figure 18.20 Target Time Area for LIN Error Detection (LIN Slave Mode)

18.5.4 UART Mode

In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 01_B (UART mode) and the OM0 bit in the RLN3nLCUC register to 1 changes the mode to UART mode, turning the OMM0 bit in the RLN3nLMST register to 1.

18.5.4.1 Transmission

Figure 18.21 shows LIN/UART interface (in UART mode) transmission operations; **Table 18.86** shows LIN/UART interface (in UART mode) transmission processing.

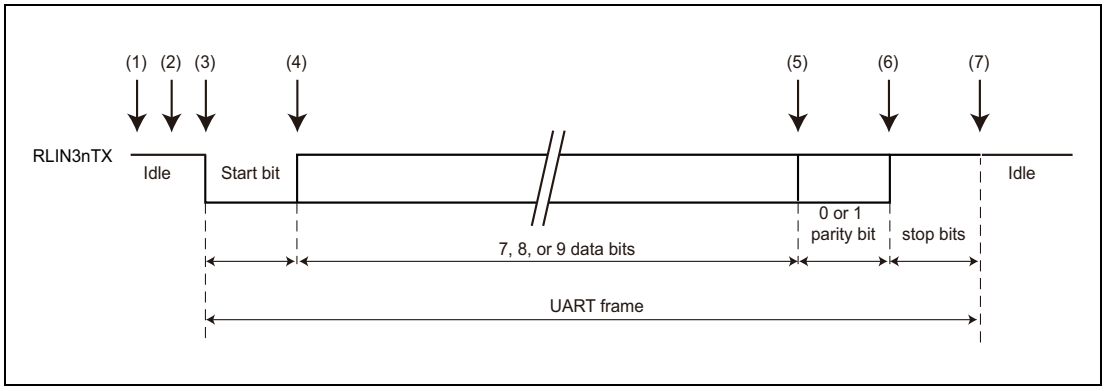

Figure 18.21 LIN/UART Interface (in UART mode) Transmission Operation

Table 18.86 LIN/UART Interface (UART Mode) Transmission Processing (1/2)

	Software processing	LIN/UART interface processing
(1)	• Sets a baud rate. • Sets noise filter ON/OFF. • Sets error detection enable. • Sets data format. • Sets an interrupt generation timing. • Clears the LIN/UART interface from LIN reset mode. • Sets the transmit enable bit (UTOE bit) to 1.	• Waits for a transmission trigger (RLN3nLUTDR register) by software.
(2)	• Sets the transmit data to the UART transmit data register (RLN3nLUTDR) or UART wait transmit data register (RLN3nLUWTDR).	• Sets the transmit status flag.
(3)	• Waits an interrupt request. [When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)]	• Transmits a start bit (for switching between transmission and reception in half duplex communication, transmits a start bit after receiving 1 stop bit. For details about this function, see **(3) Transmission Start Wait Function**. [When the UTIGTS bit is 0 (a transmission interrupt is generated)] • Outputs a transmission interrupt.
(4)	• When transmitting data continuously, sets another piece of transmission data in the UART transmit data register (RLN3nLUTDR register), waits for the generation of an interrupt request.	Transmits the data set in the UART (for wait) transmit data register.
(5)		Transmits a parity bit when parity is used.
(6)		Transmits 1 or 2 stop bits.

Table 18.86 LIN/UART Interface (UART Mode) Transmission Processing (2/2)

	Software processing	LIN/UART interface processing
(7)	[When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] • If another piece of transmission data is set, goes to step (3). [When the UTIGTS bit is 1 (a transmission interrupt is output upon end of transmission)] • When transmitting data continuously, goes to step (2).	[When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] • If another piece of transmission data is set, goes to step (3). • If another piece of transmission data is not set, clears the transmit status flag. [When the UTIGTS bit is 1 (a transmission interrupt is output upon end of transmission)] • Outputs a transmission interrupt • Clears the transmission status flag

(1) Continuous Transmission

The LIN/UART interface (in UART mode) can transmit multiple sets of data continuously by using the RLN3nLUTDR register. **Figure 18.22** shows an operation example where the transmission interrupt generation timing is the start of transmission and an operation example where the transmission interrupt generation timing is the end of transmission.

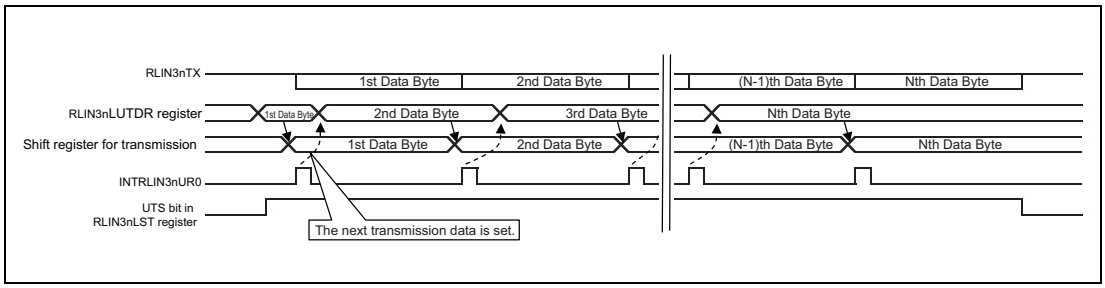

Figure 18.22 Operation Example of LIN/UART Interface (UART Mode) Continuous Transmission

An interrupt can be generated at the end of a transmission by changing the UTIGTS bit in the RLN3nLUOR1 register from 0 to 1 after the start of transmission of final data, provided only that the transmission interrupt generation timing is the start of transmission and the end of transmission of final data needs to be known.

(2) UART Buffer Transmission

The LIN/UART interface (in UART mode) has a maximum of nine bytes of UART multi-byte data, and thus it is capable of performing continuous transmissions through the use of UART multi-byte data.

Figure 18.23 shows the UART multi-byte data transmission operation in the LIN/UART interface (in UART mode). **Table 18.87** shows the UART multi-byte data transmission processing.

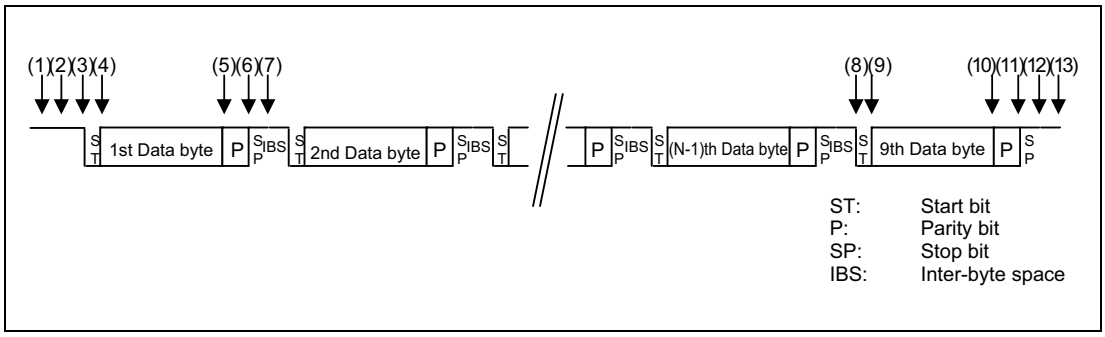

Figure 18.23 UART Buffer Transmission in LIN/UART Interface (in UART mode for 9-byte transmission)

Table 18.87 UART Buffer Transmission Processing in LIN/UART Interface (in UART mode) (1/2)

	Software processing	LIN/UART interface processing
(1)	• Sets a baud rate • Sets noise filter ON/OFF • Sets error detection enable • Sets data format • Sets an interrupt generation timing to the end of transmission. • Clears the LIN/UART interface from LIN reset mode. • Sets the transmit enable bit (UTOE bit) to 1	• Waits for a transmission trigger (RTS bit) by software
(2)	• Sets the UART multi-byte data length and whether the system must wait for the start of transmission. • Sets the transmission data in the UART data 0 buffer register (RLN3nLUDB0) and the LIN data buffer m register (RLN3nLDBRb). (b = 1 to 8) • Sets the UART multi-byte data transmission start bit (RTS).	• Sets the transmit status flag.
(3)	Waits for an interrupt request.	Transmits a start bit. (When switching from reception to transmission during half-duplex communication, transmits the start bit upon completion of the stop bit for reception. For details about this function, see **(3) Transmission Start Wait Function**.)
(4)		Transmits the data set in the UART data buffer 0 register (RLN3nLUDB0) and the LIN/UART data buffer b register (RLN3nLDBRb).
(5)		Transmits a parity bit when parity is used.
(6)		Transmits 1 or 2 stop bits
(7)		Transmits an inter-byte space (idle).
		Repeats steps (3) to (7) until frame count -1 that was set in the UART multi-byte data length select bits is reached.

Table 18.87 UART Buffer Transmission Processing in LIN/UART Interface (in UART mode) (2/2)

	Software processing	LIN/UART interface processing
(8)		Transmits a start bit.
(9)		Transmits the data set in the LIN/UART data buffer b register (RLN3nLDBRb).
(10)		Transmits a parity bit when parity is used.
(11)		Transmits 1 or 2 stop bits.
(12)		• Sets the buffer transmission end flag. • Clears the UART multi-byte data transmit start bit (RTS). • A transmission interrupt request signal. • Clears the transmission status flag.
(13)	• Checks the RLN3nLST register, and clears flags • In the case of continuous data transmission, goes to step (2).	

(1) UART Buffer Transmission

For a 9-byte transmission, the contents stored in the RLN3nLUDB0 and RLN3nLDBR1 to RLN3nLDBR8 registers are transmitted to data areas 1 to 9. The RLN3nLUDB0 register is used only if 9-byte transmission is set. In other cases, the RLN3nLDBR1 to RLN3nLDBR8 registers are selected depending upon the length of data involved. For a 4-byte transmission, the contents stored in the RLN3nLDBR1 to RLN3nLDBR4 registers are transmitted to data areas 1 to 4, but the contents of the RLN3nLDBR5 to RLN3nLDBR8 registers are not transmitted. An RLIN3n transmission interrupt is generated after the transmission of the data that is set in the MDL [3:0] bits of the RLN3nLDFC register. The spaces between transmission data items can be set in the IBS bit in the RLN3nLSC register.

Figure 18.24 shows a UART multi-byte data and the transmission processing.

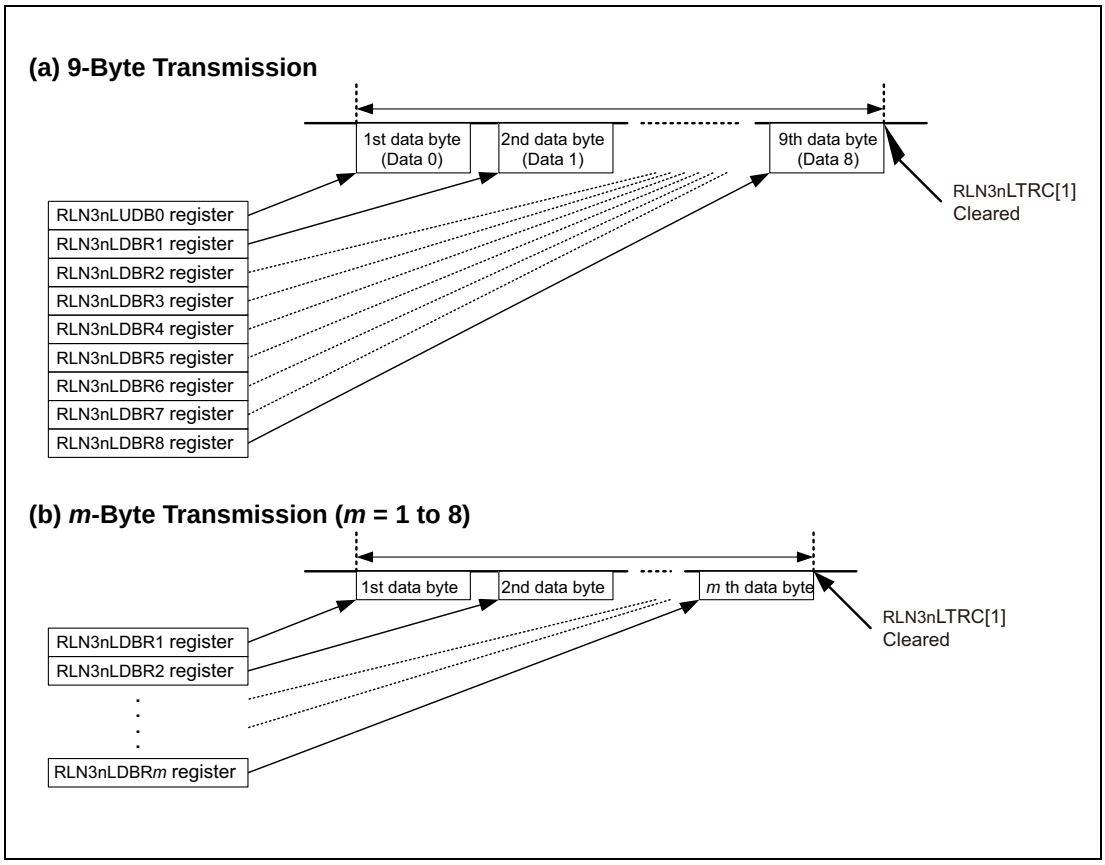

Figure 18.24 UART Buffer and Transmission Processing

(2) Data Transmission

One bit of data is transmitted per Tbit.

In single-wire (half-duplex) communication, if the BERE bit in the RLN3nLEDE register is 1 (bit error detection enabled), the transmission data and the input pin level are compared bit by bit during data transmission, and the results are stored in the BER flag in the RLN3nLEST register (see **Section 18.5.3.7, Error Status**). The timing at which the input pin is sampled during data transmission can vary depending upon the settings of the LPRS[2:0] and NSPB[3:0] bits in the RLN3nLWBR register.

The bit error detection timing in UART mode is shown in **Table 18.88**.

Table 18.88 Error Detection Timing in UART Mode

Sampling count per bit	Bit error detection timing
6 samples	3rd clock cycle + 1 prescaler clock
7 samples	4th clock cycle + 1 prescaler clock
8 samples	4th clock cycle + 1 prescaler clock
9 samples	5th clock cycle + 1 prescaler clock
10 samples	5th clock cycle + 1 prescaler clock
11 samples	6th clock cycle + 1 prescaler clock
12 samples	6th clock cycle + 1 prescaler clock
13 samples	7th clock cycle + 1 prescaler clock
14 samples	7th clock cycle + 1 prescaler clock
15 samples	8th clock cycle + 1 prescaler clock
16 samples	8th clock cycle + 1 prescaler clock

Example of Data Transmission Timing (when 1 Tbit = 16 Sampling) is shown in **Figure 18.25**

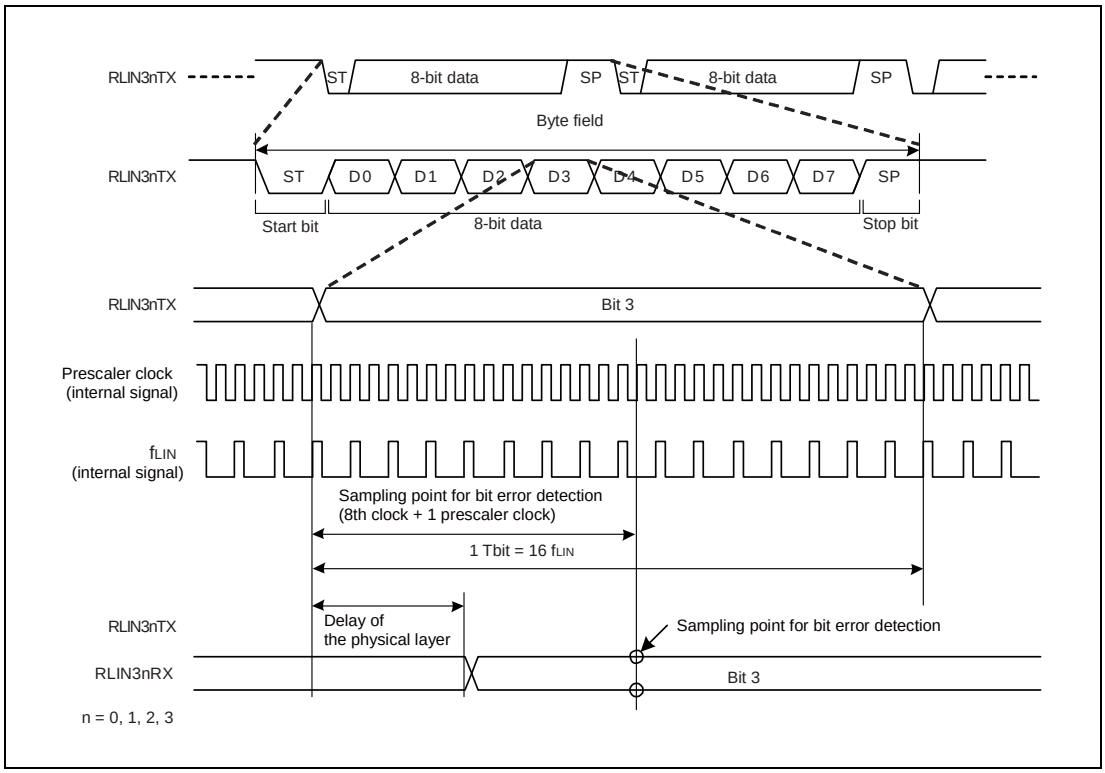

Figure 18.25 Example of Data Transmission Timing (When 1 Tbit = 16 Sampling)

(3) Transmission Start Wait Function

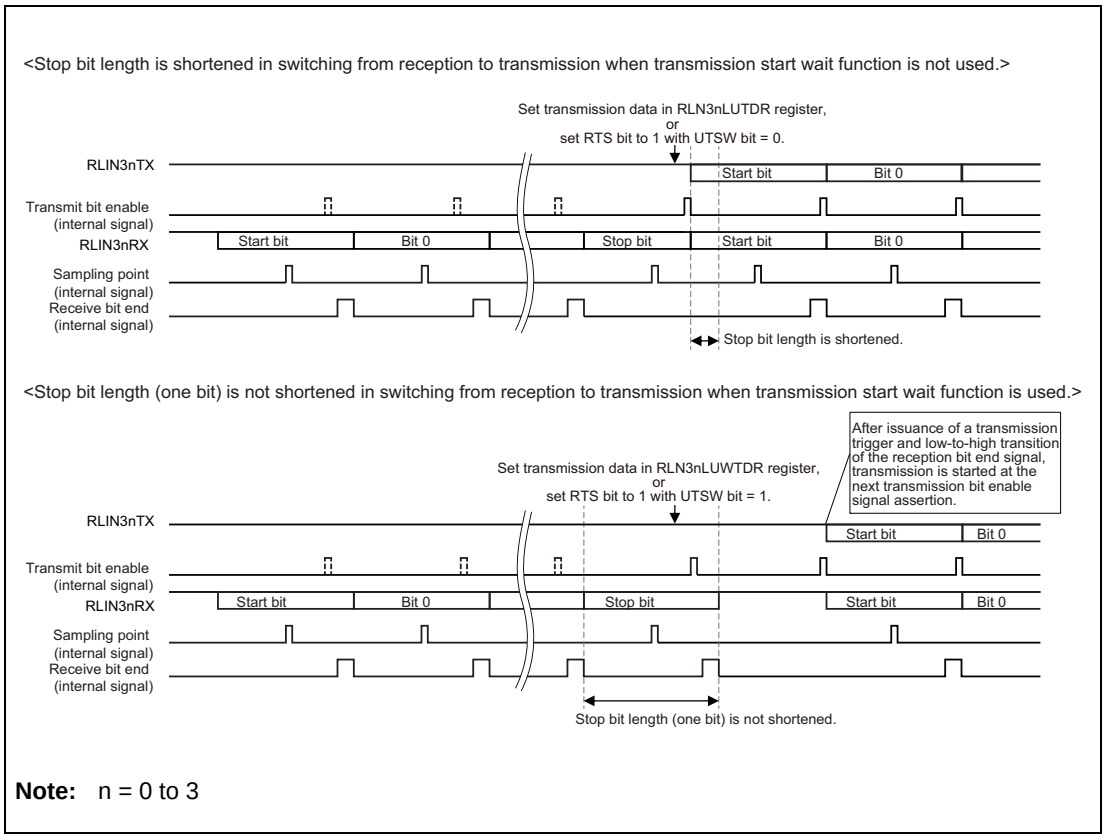
For performing half-duplex communication, the LIN/UART interface (in UART mode) has the function of securing the reception stop bit length when switching from reception to transmission.

If it is desired to delay the start of transmission until the stop bits for the reception are completed, set data in the RLN3nLUWTDR register, which is used only for the wait function, instead of setting transmission data in the RLN3nLUTDR register as a start-of-transmission request. When transmitting from the UART multi-byte data, set 1 (UART multi-byte data transmission started) in the RTS bit in the RLN3nLTRC register with 1 set in the UTSW bit in the RLN3nLDFC register.

In such a case, the LIN/UART interface delays the start of transmission until the stop bits of reception data are completed.

It should be noted that even if the UART stop bit length select bit (USBLS) in RLN3nBLFC register is 1 (stop bits = 2 bits), delay is made only for 1 bits.

Figure 18.26 shows the operation of transmission wait function.



Note: n = 0 to 3

Figure 18.26 Transmission Wait Function (If Transmission Data is Set during the Stop Bits in the Received Data)

18.5.4.2 Reception

Figure 18.23 shows the LIN/UART interface (in UART mode) reception operation**Table 18.89**. shows the LIN/UART interface (in UART mode) reception processing.

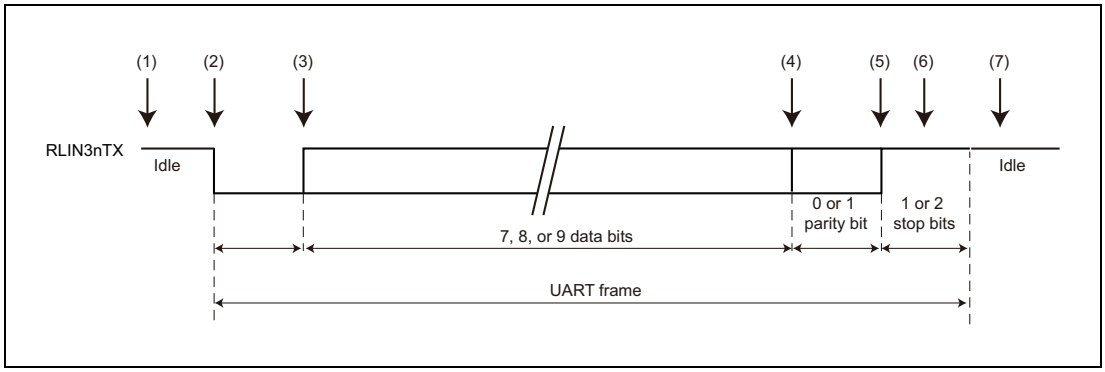


Figure 18.27 LIN/UART Interface (in UART Mode) Reception Operation

Table 18.89 LIN/UART Interface (in UART Mode) Reception Processing

	Software processing	LIN/UART interface processing
(1)	• Sets a baud rate. • Sets noise filter ON/OFF. • Sets error detection enable. • Sets data format. • Clears the LIN/UART interface from LIN reset mode. • Sets the receive enable bit (UROE bit) to 1.	• Waits for reception enable state switching by software. • Waits for detection of a start bit.
(2)	Waits for an interrupt request.	• Waits for a falling edge from the reception pin, and detects a start bit. • Sets the reception status flag.
(3)		Receives data.
(4)		Receives a parity bit when parity is used.
(5)		Receives only 1 stop bit.
(6)		• A successful reception interrupt request signal • Clears the reception status flag.
(7)	Checks the RLN3nLST register, and clears flags	Waits for a falling edge from the reception pin.

(1) Data Reception

Data reception is performed by using the synchronized RLIN3nRX (an internal signal) that is the input from the RLIN3nRX pin synchronized with the prescaler clock.

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal.

After the falling edge is detected, resampling is performed 0.5 Tbits later when the number of the sampling per 1 Tbit is even and {(the number of the sampling + 1) / 2} / (the number of sampling) Tbits later when the number is odd. If the synchronized RLIN3nRX signal is low level, the bit is recognized as a start bit.

The bit is not recognized as a start bit if the RLIN3nRX signal is fixed at low level after the reset is cleared or if a high level is detected during the resampling.

After the start bit is detected, 1 bit is sampled per Tbit.

However, when the BERE bit in the RLN3nLEDE register is 1, the sampling point is the same as the bit error detection timing.

The LIN/UART interface has a noise filter function with respect to received data. If the LRDNFS bit in the RLN3nLMD register is 0, the noise filter is used. For a sampling value, the value determined by a 3-sampling majority rule by the prescaler clock is used. If the LRDNFS bit in the RLN3nLMD register is 1, the noise filter is not used. In this case, for a sampling value, the synchronized RLIN3nRX value at the sampling position is used as is.

Figure 18.28 shows an example of data reception timing.

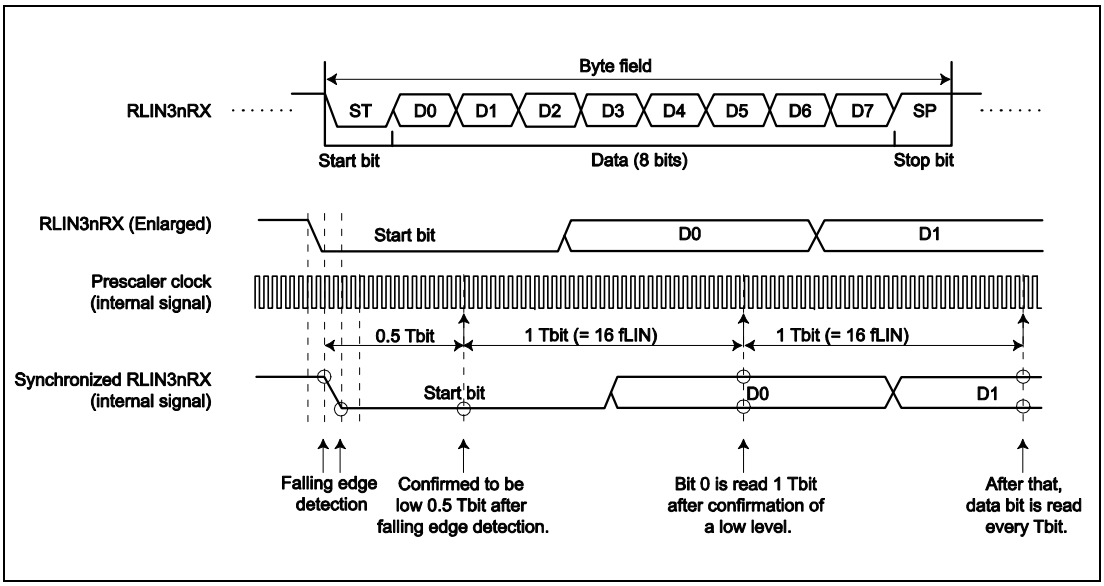

Figure 18.28 Example of Data Reception Timing (When Sampling Count is 16 in 1 Tbit)

18.5.4.3 Expansion Bits

The LIN/UART interface (in UART mode) can transmit and receive 9-bit long data by setting the UEBE bit in the RLN3nLUOR1 register to 1.

(1) Expansion Bit Transmission

The LIN/UART interface (in UART mode) can transmit 9-bit long data when the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1 and by writing the 9-bit data to either the UART transmission data register (RLN3nLUTDR) or the UART wait transmission data register (RLN3nLUWTDR).

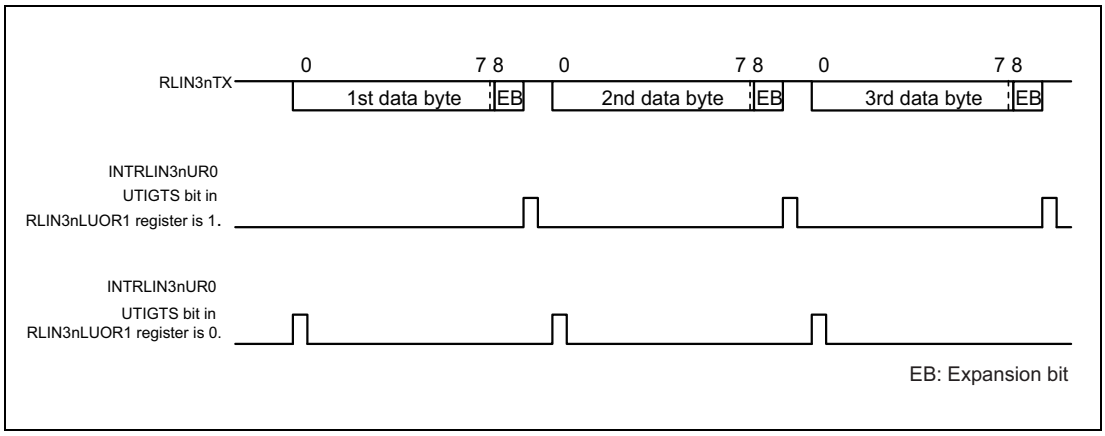

Figure 18.29 Transmission Example When Expansion Bit is Enabled (LSB First)

(2) Expansion Bit Reception

With the LIN/UART interface (in UART mode), 9-bit data can always be received without requiring a comparison of expansion bits, provided that the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1, the expansion bit comparison disable bit (UECD) is 1, and the expansion bit data comparison enable bit (UEBDCE) is 0. Irrespective of the particular setting of the expansion bit detection level select bit (UEBDL) in the UART option register 1 (RLN3nLUOR1), a successful RLIN3n reception interrupt is generated (n = 0 to 3) when 9-bit data is received.

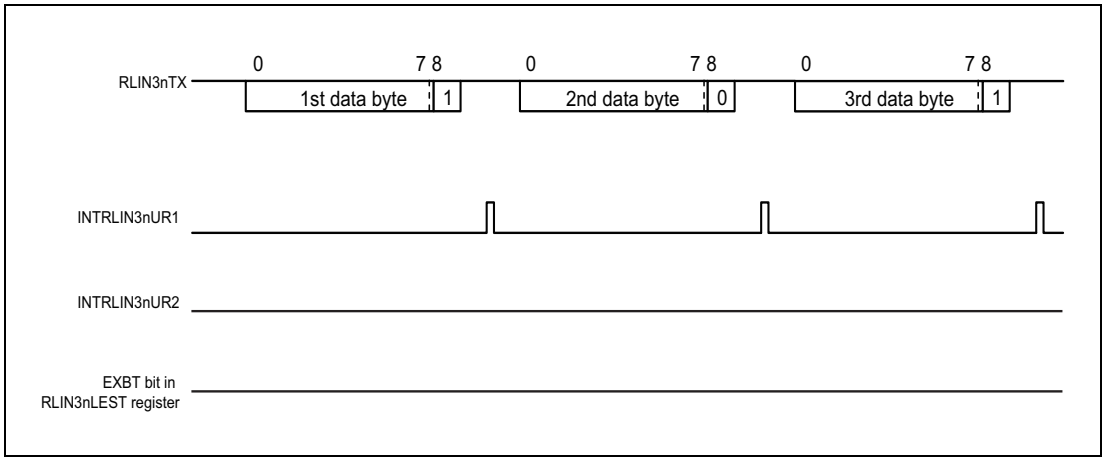

Figure 18.30 Expansion Bit Reception Example (LSB First)

(3) Expansion Bit Reception (with Expansion Bit Comparison)

The LIN/UART interface (in UART mode) can compare received expansion bits and the UEBDL bits when the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1 and the expansion bit comparison disable bit (UECD) is 0 and the expansion bit/data comparison enable bit (UEBDCE) is 0.

If the level that was set in the expansion bit detection level select bit (UEBDL) is detected, an RLIN3n status interrupt is generated upon completion of data reception, and the expansion bit detection flag (EXBT) in the LIN error status register (RLN3nLEST) is set. If the reversed value of an expansion bit detection level is detected, a successful RLIN3n reception interrupt is generated. In either case, the received data is stored in the UART reception data register (RLN3nLURDR), unless there was an overrun error.

RLIN3n Module does not judge the expansion bit comparison, if the reception error (parity error, framing error) occurs. RLIN3n Module judge the expansion bit comparison, if the reception error (overrun error) occurs.

Figure 18.31 shows an example when the expansion bit detection level select bit (UEBDL) is set to 0.

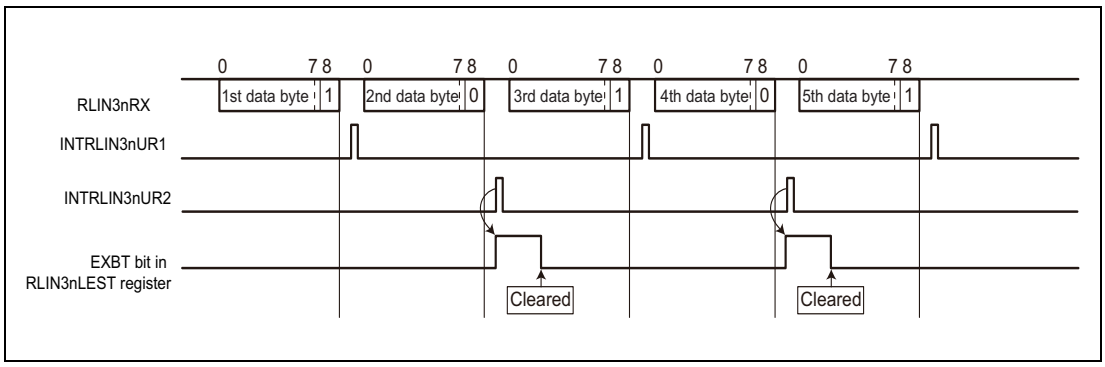

Figure 18.31 Expansion Bit Reception Example (with Expansion Bit Comparison) (LSB First, UEBDL = 0)

NOTE

- If a reception error (parity error, framing error, or overrun error) occurs in received data 0, 2, or 4 (if a reversed value of an expansion bit detection level is detected), an RLIN3n status interrupt is generated, and the error flag is updated. In this case, a successful RLIN3n reception interrupt is not generated.
- If a reception error (parity error, framing error, or overrun error) occurs in received 1st data byte or 3 (if an expansion bit detection level is detected), an RLIN3n status interrupt is generated, and the error flag is updated. If the overrun error occurs, the expansion bit detection flag (EXBT) is also set.

(4) Expansion Bit Reception (with Data Comparison)

If the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1 and the expansion bit comparison disable bit (UECD) is 0 and the expansion bit/data comparison enable bit (UEBDCE) is 1, and if the level that was set by the expansion bit detection level select bit (RLN3nUEBDL) is detected, the LIN/UART interface compares the 8 bits, exclusive of the expansion bit in the received data, with the a pre-set RLN3nLIDB register value.

If the result of the comparison is a match, the LIN/UART interface performs the following operations:

- Generates an RLIN3n reception status interrupt
- Sets an expansion bit detection flag (EXBT)
- Sets an ID match flag (IDMT)
- Stores the received data in the UART reception data register (RLN3nLURDR)

Even when the result of the comparison is a match, a successful RLIN3n reception interrupt is not generated.

If the result of the comparison is not a match, no successful RLIN3n reception interrupt or RLIN3n status interrupt is generated, and the EXBT and IDMT flags are not set to 1. The received data is stored in the UART reception data register (RLN3nLURDR).

When changing the UEBDCE bit to 0, make the change before the reception of another set of data is finished.

Figure 18.32 shows an example when the expansion bit detection level select bit (UEBDL) is set to 0.

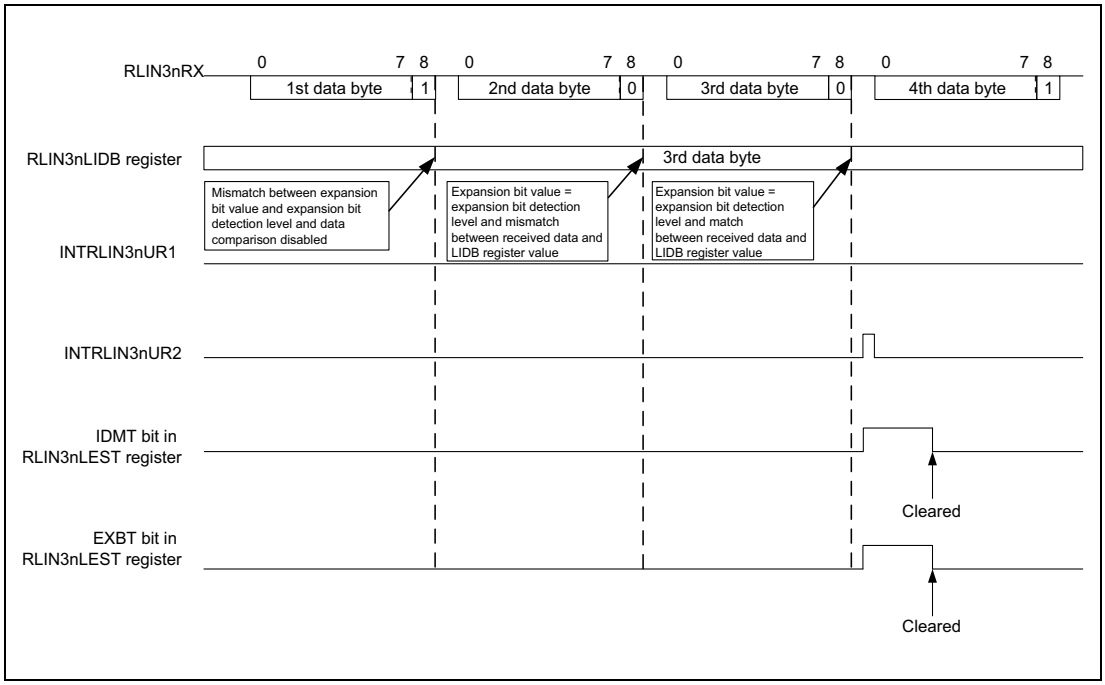

Figure 18.32 Expansion Bit Reception Example (with Data Comparison) (LSB First, UEBDL = 0)

18.5.4.4 Status

In UART mode, the LIN/UART interface can detect five types of statuses.

Two statuses, successful UART multi-byte data transmission and error detection, can generate interrupt requests.

Table 18.90 shows the types of statuses available in UART mode.

Table 18.90 Types of Statuses in UART Mode

Status	Status set condition	Status clear condition	Corresponding bit	Interrupt
Reset	After the OM0 bit in the RLN3nLCUC register is set to not-LIN–reset-mode, if actually the LIN/UART interface is cleared from LIN reset mode.	After the OM0 bit in the RLN3nLCUC register is set to LIN reset mode, if actually the LIN/UART interface enters LIN reset mode.	OMM0 bit in RLN3nLMST register	—
Successful UART multi-byte data transmission	When the transmission is finished of data equal to the length set in the MDL bits in the RLN3nLDFC register • When the UTIGTS bit in the RLN3nLUOR1 register is 0 (transmission interrupt request is generated upon start of transmission), the transmission of the last data of the data length set by the MDL bit in the RLN3nLDFC register is started. • When the UTIGTS bit in the RLN3nLUOR1 register is 1 (transmission interrupt request is generated upon end of transmission), the transmission of the data length set by the MDL bit in the RLN3nLDFC register is ended.	• When cleared by software • After transition to LIN reset mode	FTC flag in RLN3nLST register	√
Error detection	If any of the UPER flag, IDMT flag, EXBT flag, FER flag, OER flag, and BER flags in the RLN3nLEST register turns 1 (error detected).	• When cleared by software*1 • After transition to LIN reset mode	ERR flag in RLN3nLST register	√
Transmission status	• When data is written to the RLN3nLUTDR or RLN3nLUWTDR register. • When a 1 is written to the RTS bit in the RLN3nLTRC register.	• The transmission of the data set in the RLN3nLUTDR or RLN3nLUWTDR register is complete, but another transmission data item is not set • The transmission of the data in the UART multi-byte data is complete, and the RTS bit in the RLN3nLTRC register is cleared • After transition to LIN reset mode	UTS flag in RLN3nLST register	—
Reception status	• When a start bit is detected.	• When a sampling point for stop bits is detected • After transition to LIN reset mode	URS flag in RLN3nLST register	—

Note 1. Writing a 0 to the UPER, IDMT, EXBT, FER, OER, and BER flags in the RLN3nLEST register when the LIN reset mode is being canceled turns the ERR flag in the RLN3nLST register to 0.

18.5.4.5 Error Status

Types of Error Statuses

In UART mode, the LIN/UART interface can detect four types of errors and two types of statuses. The condition of these statuses can be checked by means of the corresponding bits in the RLN3nLEST register.

Table 18.91 lists applicable status types.

Table 18.91 Types of Statuses in UART Mode

Status	Error detection condition	Communication	Enable/ disable detection	Corresponding bit
Bit error	The transmitted data and the data monitored on the receive pin do not match*1	Continues until the transmission of the set transmission data is finished.	Enabled	BER flag in RLN3nLEST register
Overrun error	After received data is stored in the RLN3nLURDR register, another data item is received before the data is read. (In this case, no data is stored in the RLN3nLURDR register).	— (Reception is finished by the time this error is detected)	Enabled	OER flag in RLN3nLEST register
Framing error	When the first stop bit is low level in the reception processing.	— (Reception is finished by the time this error is detected)	Enabled	FER flag in RLN3nLEST register
Parity error	The received parity value fails to match the parity value calculated from the received data	Continues until the data reception is finished.	Disabled *2	UPER flag in RLN3nLEST register
Expansion bit detection	The value of the received expansion bit matches the value of the UEBDL bit in the RLN3nLUOR1 register.	—	Enabled	EXBT flag in RLN3nLEST register
ID match detection	The value of the received expansion bit matches the value of the UEBDL bit in the RLN3nLUOR1 register and the 8-bit receive data excluding the expansion bit matches the value of the RLN3nLIDB register.	—	Enabled	IDMT flag in RLN3nLEST register

Note 1. In the case of transmission from the UART multi-byte data, bit errors are detected even in the space between UART frames (interval space).

Note 2. Setting the UPS[1:0] bits in the RLN3nLBFC register to 10_B (0 parity) disables the checking of parity bit values. In this case, no parity error is generated.

The error status is cleared by software or at a transition to LIN reset mode.

18.5.5 LIN Self-Test Mode

When the LIN/UART interface enters the LIN self-test mode, RLIN3nTX and RLIN3nRX are disconnected from external pins and RLIN3nTX and RLIN3nRX are connected in the LIN/UART interface. Therefore, the frame transmitted from RLIN3nTX is looped back to RLIN3nRX.

The LIN self-test mode can perform tests exclusively in LIN mode.

The self-test can be performed in the following four types.

- LIN master self-test mode (transmission): Header transmission and response transmission
- LIN master self-test mode (reception): Header transmission and response reception
- LIN slave self-test mode (transmission): Header reception and response transmission
- LIN slave self-test mode (reception): Header reception and response reception

In LIN self-test mode, the operate is at the fastest baud rate, regardless of the setting of the baud rate generator.

Regardless of the setting of the baud rate related registers, the baud rate operates at the LIN communication clock source/16 [bps]. (The NSPB bits in the RLN3nLWBR register should be set to 0000_B or 1111_B.)

In addition, in LIN self-test mode, the following functions are not supported.

- LIN wake-up mode
- Frame separate mode
- Multi-byte response transmission/reception
- LIN slave mode (Auto baud rate)
- Frame/response timeout error

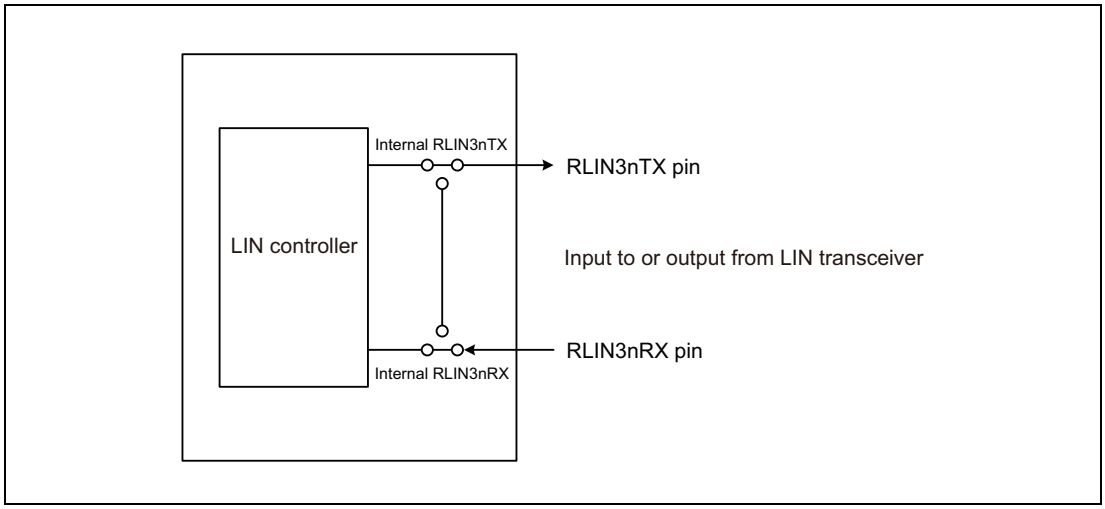

Figure 18.33 Connection in LIN Reset Mode, LIN Mode, and UART Mode

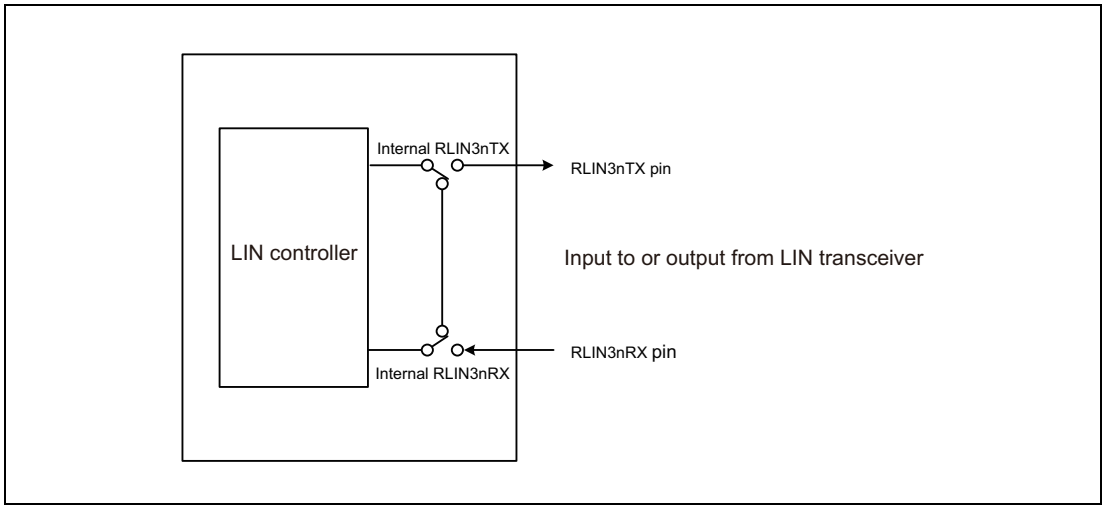

Figure 18.34 Connection in LIN Self-Test Mode

18.5.5.1 Change to LIN Self-Test Mode

Writing to the RLN3nLSTC register makes a transition to the LIN self-test mode.
When the LSTM bit in the RLN3nLSTC register is set to 1, the shift to the LIN self-test mode is checked.

When changing to LIN self-test mode, be sure to execute a specific sequence. In that sequence, information must be written three times consecutively to the LIN self-test control register, as follows:

- Change to LIN reset mode
  Set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode).
  Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).
- Select a LIN mode
  LMD bits in RLN3nLMD = 00_B (LIN master mode) or 11_B (LIN slave mode [fixed baud rate])
- 1st write: RLN3nLSTC register = 1010 0111 ($A7_H$)
- 2nd write: RLN3nLSTC register = 0101 1000 (58_H)
- 3rd write: RLN3nLSTC register = 0000 0001_B (01_H)
- Verify the transition to LIN self-test mode
  Read the LSTM bit in the RLN3nLSTC register; verify that it is 1 (LIN self-test mode).

If the key of the first write ($A7_H$) is written twice by mistake, the transition to LIN self-test mode is canceled. The above sequence should be retried from the step of first write. In addition, if a write to another LIN-related register is performed during transition to LIN self-test mode (three consecutive write operations to the RLN3nLSTC register), the transition is also canceled.

18.5.5.2 Transmission in LIN Master Self-Test Mode

To execute a self-test on LIN master transmission, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = $0000xxxx_B$ *1
  RLN3nLBRP0 register = $xxxxxxxx_B$ *1
  RLN3nLBRP1 register = $xxxxxxxx_B$ *1
  RLN3nLMD register = $00xxxx00_B$ *1
- Set the interrupt enable and error enable related registers.
  RLN3nLIE register = $0000xxxx_B$ *2
  RLN3nLEDE register = x000x0xx
- Set the break field and space related registers.
  RLN3nLBFC register = $00xxxxxx_B$
  RLN3nLSC register = $00xx0xxx_B$
- Cancel the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are 11_B.
- Set the transmit frame related registers.
  RLN3nLDFC register = $00x1xxxx_B$
  RLN3nLIDB register = $xxxxxxxx_B$
  RLN3nLDRB1 to RLN3nLDRB8 registers = $xxxxxxxx_B$
- Header transmission → response transmission started
  Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/ reception started).
  The LIN master self-test mode (transmission) is executed. In this mode, interrupt are generated, and status and error status are also updated. The checksum is automatically calculated by the LIN/ UART interface.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the transmission fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Don't care

Note 1. The following register settings are not reflected to the operation of the LIN self-test mode. The LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register and the LCKS bit in the RLN3nLMD register. Therefore, those settings are not necessary.

Note 2. If necessary, set the related registers described in **Section 6, Interrupt Controller (INTC)**.

Note 3. When the successful header transmission interrupt and the successful frame transmission interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame transmission interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled). The time required from the set of the successful header transmission flag to the set of the successful frame/wake-up transmission flag is calculated by the following formula.

10 × (number of data bytes + 1) [Tbit]
1 Tbit = frequency of LIN communication clock source × 16

18.5.5.3 Reception in LIN Master Self-Test Mode

To execute a self-test on LIN master reception, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = $0000xxxx_B$ *1
  RLN3nLBRP0 register = $xxxxxxxx_B$ *1
  RLN3nLBRP1 register = $xxxxxxxx_B$ *1
  RLN3nLMD register = $00xxxx00_B$ *1
- Set the interrupt enable and error enable related registers.
  RLN3nLIE register = $0000xxxx_B$ *2
  RLN3nLEDE register = $x000x0xx_B$
- Set the break field and space related registers.
  RLN3nLBFC register = $00xxxxxx_B$
  RLN3nLSC register = $00xx0xxx_B$ *1
- Cancel the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are 11_B.
- Set the reception frame related registers.
  RLN3nLDFC register = $00x0xxxx_B$
  RLN3nLIDB register = $xxxxxxxx_B$
  RLN3nLDRB1 to RLN3nLDRB8 registers = $xxxxxxxx_B$
  RLN3nCBR register = $xxxxxxxx_B$
  Since the checksum value to be transmitted is not automatically calculated, set the calculation value to the RLN3nLCBR register.
- Header transmission → response reception started
  Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/ reception started).
  The LIN master self-test mode (reception) is executed. In this mode, interrupt are generated, and status and error status are also updated.
- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the set value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the reception fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Don't care

Note 1. The following register settings are not reflected to the operation of the LIN self-test mode. The LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register, the LCKS bit in the RLN3nLMD register, and the IBS bit in the RLN3nLSC register. Therefore, those settings are not necessary.

Note 2. If necessary, set the related registers described in **Section 6, Interrupt Controller (INTC)**.

Note 3. When the successful header transmission interrupt and the successful frame reception interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame reception interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled).
The time required from the set of the successful header transmission flag to the set of the successful frame/wake-up reception flag is calculated by the following formula.

10 × (number of data bytes + 1) [Tbit]

1 Tbit = 1/LIN communication clock source × 16

18.5.5.4 Transmission in LIN Slave Self-Test Mode

To execute a self-test on LIN slave transmission, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = $0000xxx0_B$ *1
  RLN3nLBRP0 register = $xxxxxxxx_B$ *1
  RLN3nLBRP1 register = $xxxxxxxx_B$ *1
  RLN3nLMD register = $00xx0011_B$
- Set the interrupt enable and error enable related registers.
  RLN3nLIE register = $0000xxxx_B$ *2
  RLN3nLEDE register = $xx0xx00x_B$
- Set the break field and space related registers.
  RLN3nLBFC register = $0000000x_B$ *3
  RLN3nLSC register = $00xx0001_B$
- Cancel the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are 11_B.
- Set the transmit frame related registers.
  RLN3nLDFC register = $00x1xxxx_B$
  RLN3nLIDB register = $xxxxxxxx_B$
  RLN3nLDBR1 to RLN3nLDBR8 registers = $xxxxxxxx_B$
- Header reception → response transmission started
  Set the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/ reception started).
  (Without any setting of the RTS bit in the RLN3nLTRC register, the header reception and the response transmission are executed in this order.)
  The LIN slave self mode (transmission) is executed. In this mode, interrupt are generated, and status and error status are also updated.
  The checksum is automatically calculated by the LIN/UART interface.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the transmission fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Don't care

Note 1. The following register settings are not reflected to the operation of the LIN self-test mode. The LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, and the RLN3nLBRP1 register. Therefore, those settings are not necessary.

Note 2. If necessary, set the related registers described in **Section 6, Interrupt Controller (INTC)**

Note 3. According to the setting of this register, 9.5-Tbit or 10.5-Tbit width break is output from the internal RLIN3nTX.

Note 4. When the successful header reception interrupt and the successful response transmission interrupt are used in the same interrupt processing, if the software processing of the successful header reception interrupt is not completed before the generation of the successful response transmission interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header reception interrupt enabled). The time required from the set of the successful header reception flag to the set of the successful response/wake-up reception flag is calculated by the following formula.

10 × (number of data bytes + 1) [Tbit]

1 Tbit = frequency of 1/LIN communication clock source × 16

18.5.5.5 Reception in LIN Slave Self-Test Mode

To execute a self-test on LIN slave reception, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = $0000xxx0_B$ *1
  RLN3nLBRP0 register = $xxxxxxxx_B$ *1
  RLN3nLBRP1 register = $xxxxxxxx_B$ *1
  RLN3nLMD register = $00xx0011_B$
- Set the interrupt enable and error enable related registers.
  RLN3nLIE register = $0000xxxx_B$ *2
  RLN3nLEDE register = $xx0xx00x_B$
- Set the break field and space related registers.
  RLN3nLBFC register = $0000000x_B$ *3
  RLN3nLSC register = $00xx0001_B$ *1
- Cancel the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are 11_B.
- Set the reception frame related registers.
  RLN3nLDFC register = $00x0xxxx_B$
  RLN3nLIDB register = $xxxxxxxx_B$
  RLN3nLDBR1 to RLN3nLDBR8 registers = $xxxxxxxx_B$
  RLN3nCBR register = $xxxxxxxx_B$
  Since the checksum value to be transmitted is not automatically calculated, set the calculation value to the RLN3nLCBR register.
- Header reception → response reception started
  Set the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/ reception started).
  (Without any setting of the RTS bit in the RLN3nLTRC register, the header reception and the response reception are executed in this order.)
  The LIN slave self-test mode (reception) is executed. In this mode, interrupt are generated, and status and error status are also updated.

- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the set value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the reception fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Don't care

Note 1. The following register settings are not reflected to the operation of the LIN self-test mode. The LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register, and the IBS bit in the RLN3nLSC register. Therefore, those settings are not necessary.

Note 2. If necessary, set the related registers described in **Section 6, Interrupt Controller (INTC)**.

Note 3. According to the setting of this register, 9.5-Tbit or 10.5-Tbit width break is output from the internal RLIN3nTX.

Note 4. When the successful header reception interrupt and the successful response reception interrupt are used in the same interrupt processing, if the software processing of the successful header reception interrupt is not completed before the generation of the successful response reception interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header reception interrupt enabled).
The time required from the set of the successful header reception flag to the set of the successful response/wake-up reception flag is calculated by the following formula.

10 × (number of data bytes + 1) [Tbit]

1 Tbit = frequency of 1/LIN communication clock source × 16

18.5.5.6 Terminating LIN Self-Test Mode

To terminate LIN self-test mode, perform the procedure below:

- Write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register.
  If the OMM1 and OMM0 bits in the RLN3nLMST register are not 11_B, write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register. After confirming that the OMM1 and OMM0 bits in the RLN3nLMST register have turned 11_B, change to LIN reset mode.
- Verify the cancelation of LIN self-test mode.
  Read the LSTM bit in the RLN3nLSTC register; confirm that it is not 0 (not in LIN self-test)
- Verify the transition to LIN reset mode.
  Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).

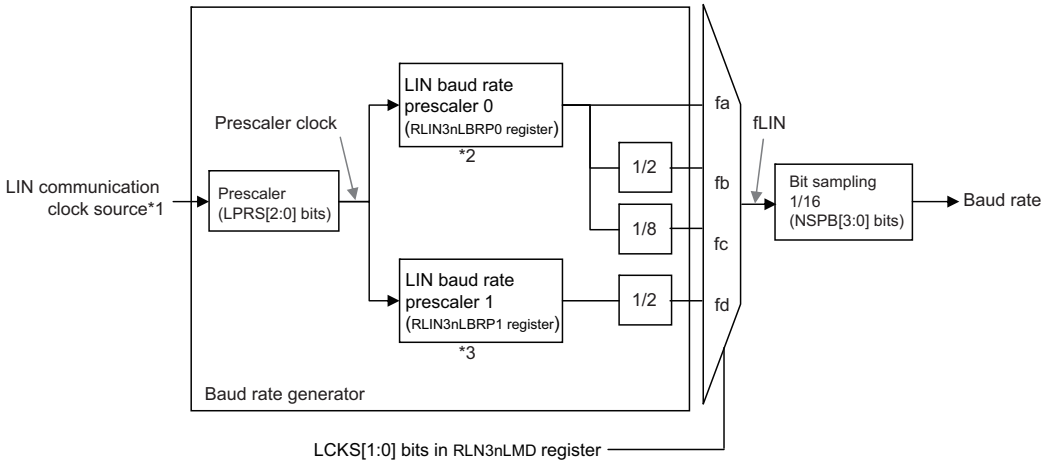
18.5.6 Baud Rate Generator

The prescaler clock is obtained by frequency-dividing the LIN communication clock source by the prescaler, and the LIN system clock (fLIN) is obtained by frequency-dividing the prescaler clock by the baud rate generator. The clock obtained by frequency-dividing the LIN system clock (fLIN) by the number of samples is the baud rate. The reciprocal of this baud rate is called the bit time (Tbit).

The LIN/UART interface has two kinds of baud rate generators. The baud rate generators switch over according to the mode used.

18.5.6.1 LIN Master Mode

Figure 18.35 shows a block diagram of baud rate generation in LIN master mode.



Note 1. For the LIN communication clock source, see **Section 12, Clock Controller**.
Note 2. When the value in RLN3nLBRP0 register is N (N = 0 to 255), the clock frequency is divided by N + 1.
Note 3. When the value in RLN3nLBRP1 register is M (M = 0 to 255), the clock frequency is divided by N + 1.

Figure 18.35 Block Diagram of Baud Rate Generation in LIN Master Mode

By setting the RLN3nLBRP0 register so that fa is 307200 Hz (= 19200 × 16), the resulting bit rates are fa = 19200 × 16, fb = 9600 × 16, and fc = 2400 × 16. These bit rates are frequency-divided by 16 in the bit timing generator, enabling bit rates of 19200 bps, 9600 bps and 2400 bps, to be generated. Also, by setting the RLN3nLBRP1 register so that fd is 166672 Hz (= 10417 × 16), the resulting bit rate is fd = 10417 × 16. This bit rate is frequency-divided by 16 in the bit timing generator, enabling 10417 bps to be generated.

Table 18.92 shows examples of baud rate (19200, 9600, 2400, and 10417 bps) generation for each LIN communication clock source frequency, and also the corresponding errors.

Table 18.92 Examples of Baud Rate (19200, 10417, 9600, and 2400 bps) Generation in LIN Master Mode

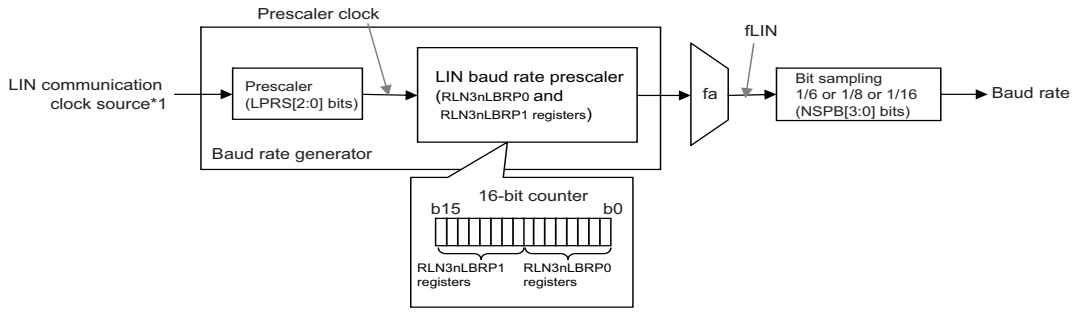
LIN communication clock source	Prescaler	Baud rate generator 0 (N + 1) frequency-divided	Baud rate generator 1 (M + 1) frequency-divided	System Clock	Baud rate	Error
40 MHz	1/1	130	—	fa	19230.77	+0.16%
		—	120	fd	10416.67	–0.003%
		130	—	fb	9615.38	+0.16%
		130	—	fc	2403.85	+0.16%

NOTE

Bit sampling count is 16 sampling (RLN3nLWBR.NSPB[3:0] = 0000_B).

18.5.6.2 LIN Slave Mode

Figure 18.36 shows a block diagram of baud rate generation in LIN slave mode.



Note 1. For the LIN communication clock source, see **Section 12, Clock Controller**.

Figure 18.36 Block Diagram of Baud Rate Generation in LIN Slave Mode

Table 18.93 shows examples of baud rate (19200, 10417, 9600, and 2400 bps) generation for each peripheral function clock frequency, and also the corresponding errors.

Table 18.93 Examples of Baud Rate Generation (19200 bps, 10417 bps, 9600 bps, and 2400 bps) in LIN Slave Mode [Fixed Baud Rate]

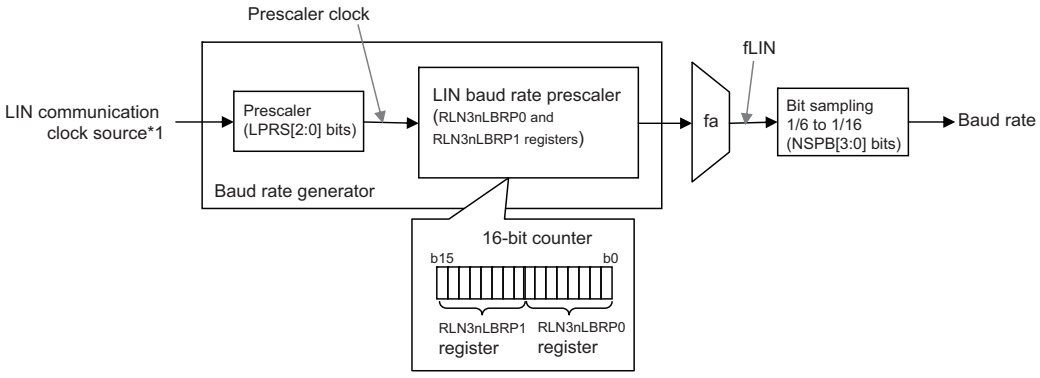
LIN communication clock	Prescaler	Baud rate generator 01 (MN+1) frequency-divided	Baud rate	Error
40MHz	1/1	130	19230.77	+0.16%
		240	10416.67	–0.003%
		260	9615.38	+0.16%
		1040	2403.85	+0.16%

NOTE

The bit sampling count in **Table 18.93** is 16 sampling (RLN3nLWBR.NSPB[3:0] = 0000_B).

18.5.6.3 UART Mode

Figure 18.37 shows a block diagram of baud rate generation in UART mode.



Note 1. For the LIN communication clock source, see **Section 12, Clock Controller**.

Figure 18.37 Block Diagram of Baud Rate Generation in UART Mode

UART baud rate is calculated with the following formula:

UART baud rate
= {LIN communication clock source frequency} × (RLN3nLWBR.LPRS[2:0] select clock) ÷ (RLN3nLBRP01 + 1) ÷ {RLN3nLWBR.NSPB[3:0] select count} [bps]

Table 18.94 lists the examples of baud rate (6600000, 38400, 31250, 19200, 9600, 4800, 2400 and 1200 bps) generation for each LIN communication clock source frequency, and also the corresponding errors.

Table 18.94 UART Baud Rate Setting Examples (when LIN communication clock source = 40 MHz)

UART Baud Rate (Target Baud Rate)	Prescaler	Baud rate generator 01 (MN + 1) frequency-divided	Baud rate	Error
1200 bps	1/2	1042	1199.62	–0.03%
2400 bps	1/2	512	2399.23	–0.03%
4800 bps	1/2	260	4807.69	+0.16%
9600 bps	1/2	130	9615.38	+0.16%
19200 bps	1/2	65	19230.77	+0.16%
31250 bps	1/2	40	31250.00	0.00%
38400 bps	1/2	33	37878.79	–1.36%
6600000 bps	1/1	1	6666666.67	–1.36%

NOTE

The bit sampling count for each baud rate is written below.

6.6Mbps: 6 sampling (RLN3nLWBR.NSPB[3:0] = 0101_B)

other than 6.6Mbps: 16 sampling (RLN3nLWBR.NSPB[3:0] = 1111_B)

18.5.7 Noise Filter

The LIN/UART interface has a noise filter for reducing erroneous receiving of data due to noise. By setting the LRDNFS bit in the RLN3nLMD register to 0 (to use the noise filter), the noise filter is activated. The noise filter samples the level of the synchronized RLIN3nRX with the prescaler clock, and outputs the sampling value determined by a 3-sampling majority rule. The value of each bit of the receive data is determined based on the noise filter output.

Figure 18.38 shows the configuration of the noise filter, **Figure 18.39** shows an example of a noise filter circuit, and **Figure 18.40** shows the determination of the received data when the noise filter is used.

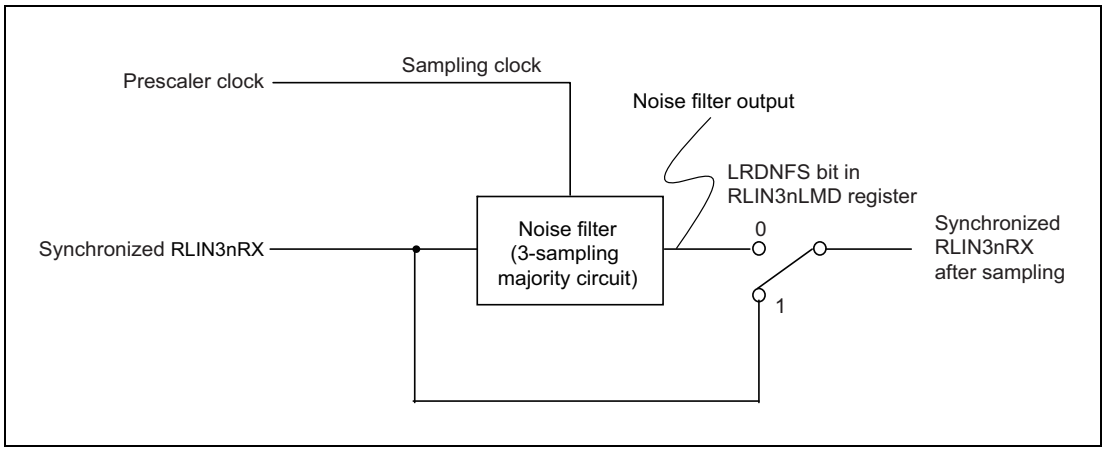


Figure 18.38 Configuration of Noise Filter

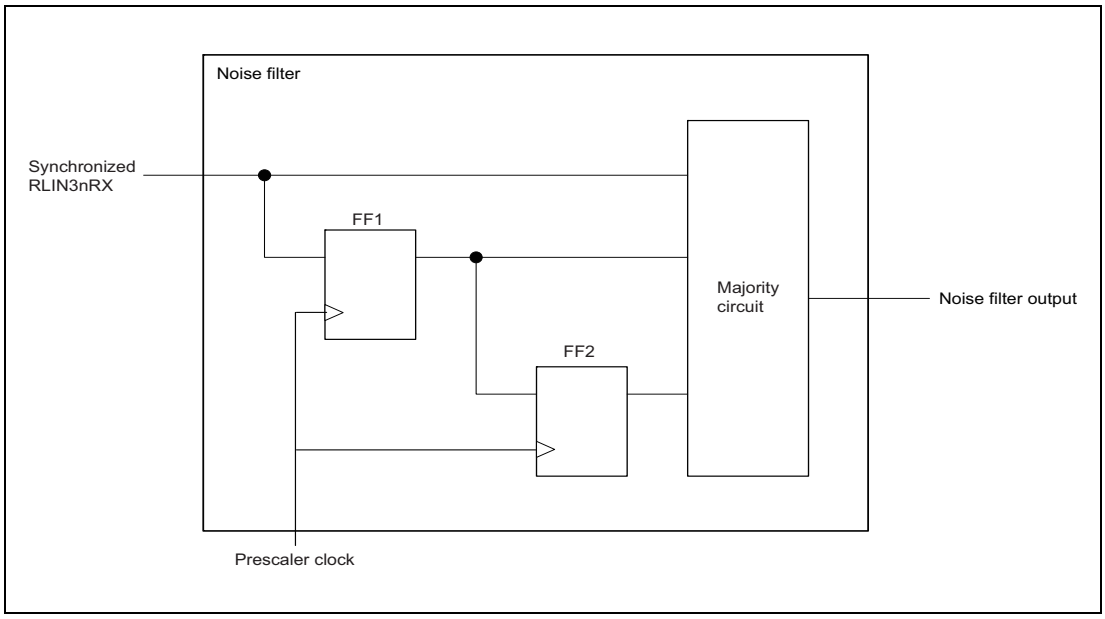

Figure 18.39 Example of Noise Filter Circuit

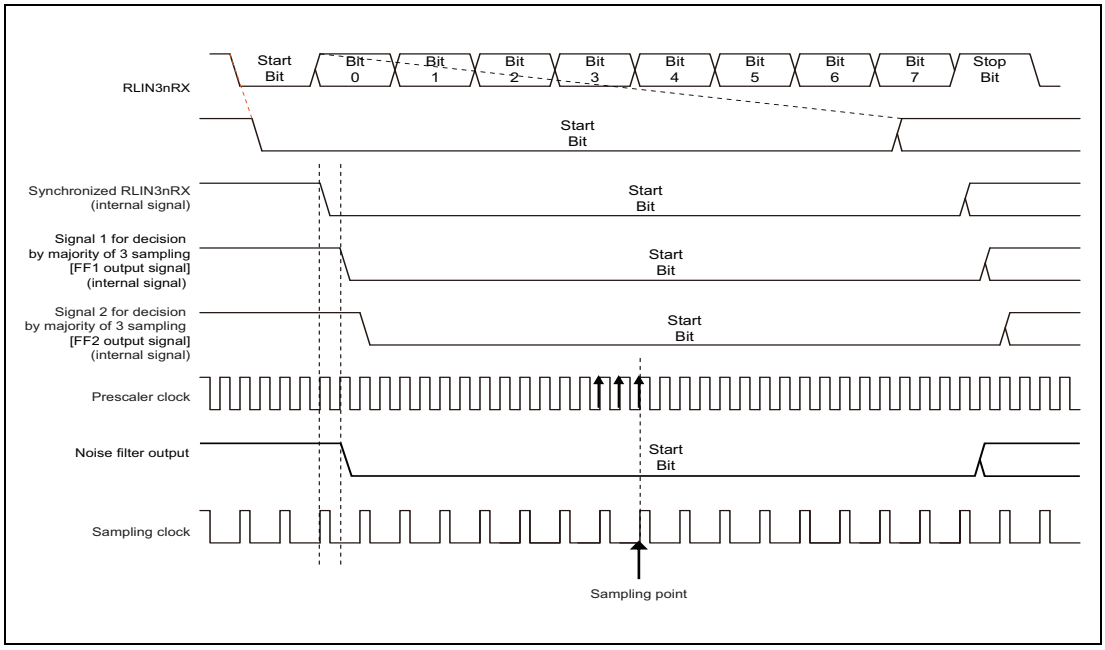

Figure 18.40 Determination of Received Data when Noise Filter is Used

18.5.8 Limited Reset and Module stand-by

The RLIN3n can be reset by limited reset from SYSCTRL. The Limited Reset is functionally equivalent to a hardware reset. Software must ensure that RLIN3n is halted (LIN reset mode or idle mode). (See **Section 18.5.2, LIN Reset Mode** or **Section 18.5.3, LIN Mode)**

The RLIN3n clock can be disabled by the SYSCTRL module stand-by function. Software must ensure that RLIN3n is LIN reset mode or idle mode if module stand-by enable.

18.6 Difference among P1M-C, P1H-C and P1H-CE

Table 18.95 Different specification of RLIN3n

Device	P1M-C and P1H-C (4MB, BGA-156)	P1H-C (4MB, BGA-292) and P1H-C (8MB)	P1H-CE
RLIN3n channel	RLIN3n: 2	RLIN3n: 4	RLIN3n: 4

Section 19 CAN Controller (MCAN)

The Features described in this chapter are only valid for the following devices:

- R7F701370B
- R7F701371
- R7F701372A
- R7F701396A
- R7F701373A
- R7F701397A
- R7F701374A

For the MCAN description of other devices, please refer to **Section 37, CAN Controller (MCAN)**
According to Bosch CAN-FD Specification V1.0

19.1 Features

The CAN controller (M(TT)CAN) is used to communicate via the CAN bus, as define in ISO11898-1:2015. It can also support CAN FD (CAN with Flexible Data-rate). It covers the functionality of the Data Link Layer (DLL) and Medium Access Control (MAC). To enable the hardware to communicate, the physical layer must be provided externally, i.e., by connecting a CAN transceiver.

Table 19.1 M_CAN Specifications (1/2)

Item	Specification
Communication	CAN functionality conform to ISO 11898-1:2015
Data transfer rate	Up to 1 Mbps, individually for each CAN channel for CAN FD, up to 8 Mbps
CAN channels	MTTCAN0, MCAN0, MCAN1, MCAN2
Selectable ID type	11-bit Standard ID
	11-bit Standard ID + 18-bit Extended ID
Message Buffer	Up to 64 dedicated Receive Buffers
	Up to 32 dedicated Transmit Buffers
FIFO number	Two configurable Receive FIFOs Configurable Transmit FIFO Configurable Transmit Queue Configurable Transmit Event FIFO
RX System	Scalable RX FIFO structures, with up to 64 CAN Buffers per FIFO RX timestamp RX FIFO Timeout Interrupt FIFO filling level Interrupt
TX System	FIFO filling level supervision (interrupt) Support for transmit cancellation to avoid “Inner priority inversion” Combined Message Buffer & TX FIFO and TX Queue Concept Dedicated TX message buffers for high-priority messages ID prioritization between TX buffers, TX Queue buffers and oldest TX FIFO element Transmit pause to separate two consecutive TX messages

Table 19.1 M_CAN Specifications (2/2)

Item	Specification
Enhanced reception filtering	Support of 11bit and 29bit CAN identifier, each filter element is configurable for acceptance/ rejection
	Programmable 29 bit CAN identifier acceptance filter mask for each entry
	Each acceptance filter element targets FIFO 0 or 1 or a dedicated RX Buffer
	Every FIFO or RX Buffer filter element can be used as a from-to range filter, as a filter for one or two dedicated IDs or as a classic bit mask filter
	Each filter element can be enabled/disabled individually
TT-CAN support	MTTCAN0 supports TT-CAN level 2 according to ISO11898-4
CAN-FD support	Variable Data Phase Speed up to 8 Mbit/s, variable Data Buffer size up to 64 Bytes/Frame
Timer	Time Stamp function
Power down function	Local Power Down modes
AUTOSAR requirements	Supports all AUTOSAR requirements Like Transmit Abort Interrupt, non-waiting processing Functionality and more than 2 TX Buffers with prioritization Supports *Pretended Networking* of AUTOSAR
Self-testing	External and internal loop back

19.1.1 Number of Units and Channels

Table 19.2 Number of MTTCAN/MCAN channel

	Device				
Macro	P1M-C	P1H-C (4MB)	P1H-C (8MB)	P1H-CE	Description
MTTCAN0	1*1	1*1	1	1	MTTCAN0 supports TT-CAN level 2 according to ISO11898-4
MCAN0	1	1	1	1	—
MCAN1	1	1	1	1	—
MCAN2	0	0	1	1	—

Note 1. P1M-C, P1H-C (4MB, BGA-156) do not support MTTCAN0EVT, MTTCAN0RTP, MTTCAN0SOC, MTTCAN0SWT, and MTTCAN0TMP.

19.1.2 Register Base Address

MTTCAN/MCAN base addresses are listed in the following table. MTTCAN/MCAN register addresses are given as offsets from the base addresses in general.

Table 19.3 Register Base Address

Base Address Name	Base Address
<MTTCAN0_base>	FFD3 0000_H
<MCAN0_base>	FFEF 0000_H
<MCAN1_base>	FFD3 1000_H
<MCAN2_base>	FFEF 1000_H

19.1.3 Clock Supply

Clock supply by and to MTTCAN/MCAN is listed in the following table.

Table 19.4 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
MTTCAN0/ MCANn	H-Bus interface clock*1 (Host clock)	CLK_HSB
	CAN protocol layer clock*2 (CAN clock / m_can_cclk/ m_ttcan_cclk)	CLKP_H2

Note: The following condition must be fulfilled: CLK_HSB >= CLKP_H2

Note 1. H-bus interface clock:
The minimum frequency is **Table 19.5, Minimum MCAN / MTTCAN clock speed**.

Note 2. CAN protocol layer clock
- For maximum data rate, CLKP_H2 must be n x 1 MHz with n >= 8.
- For CAN-FD operation with bit rates above 1Mbit/s CLKP_H2 must be 2^n x 20MHz, with n = 0, 1, 2.
- For low power mode with limited throughput it can be reduce to CLK_HSB/3. This limits the throughput to 333Kbps.

Table 19.5 Minimum MCAN / MTTCAN clock speed

	P1M-C	P1H-C (4MB)	P1H-C (8MB)
Number of channels	3	3	4
Non CANFD	17.5 MHz		
CANFD			

19.1.4 RAM areas for MCAN

Table 19.6 RAM areas for MCAN

RAM Name	RAM Area
MTTCAN RAM area	FFD3 8000_H to FFD3 $9FFF_H$
MCAN0 RAM area	FFEF 8000_H to FFEF $9FFF_H$
MCAN1 RAM area	FFD3 $A000_H$ to FFD3 $BFFF_H$
MCAN2 RAM area	FFEF $A000_H$ to FFEF $BFFF_H$

19.1.5 Interrupt Requests

MTTCAN/MCAN interrupt requests are listed in the following table.

Table 19.7 Interrupt list

Unit Name	Interrupt Name	Interrupt Number	DMA Number	Description
MTTCAN0	INTMTTCANI0	172	—	MTTCAN0 interrupt 0
MTTCAN0	INTMTTCANI1	173	—	MTTCAN0 interrupt 1
MTTCAN0	INTMTTCANFE	174	—	MTTCAN0 filter event 1
MCAN0	INTMCAN0I0	175	—	MCAN0 interrupt 0
MCAN0	INTMCAN0I1	176	—	MCAN0 interrupt 1
MCAN0	INTMCAN0FE	177	—	MCAN0 filter event 1
MCAN1	INTMCAN1I0	178	—	MCAN1 interrupt 0
MCAN1	INTMCAN1I1	179	—	MCAN1 interrupt 1
MCAN1	INTMCAN1FE	180	—	MCAN1 filter event 1
MCAN2	INTMCAN2I0	181	—	MCAN2 interrupt 0
MCAN2	INTMCAN2I1	182	—	MCAN2 interrupt 1
MCAN2	INTMCAN2FE	183	—	MCAN2 filter event 1

Table 19.8 Internal Error Signal

Unit Name	Interrupt for Unit	Description	Connected to
MTTCAN0	mttcan0_ecc_err	MTTCAN0 error signal	ECM
MCAN0	mcan0_ecc_err	MCAN0 error signal	ECM
MCAN1	mcan1_ecc_err	MCAN1 error signal	ECM
MCAN2	mcan2_ecc_err	MCAN2 error signal	ECM

19.1.6 External Input / Output Pins

MTTCAN/MCAN has following external pins for each channel.

Table 19.9 External Input/Output Pins

Channel	I/O	Pin name of RH850/P1x-C	Function
MTTCAN0	I	MTTCAN0RX	MTTCAN0 receive data input
	O	MTTCAN0TX	MTTCAN0 transmit data output

19.2 Overview

19.2.1 Functional overview

M(TT)CAN has following features

- M(TT)CAN functionality conform to ISO 11898-1:2015
- M(TT)CAN supports local Power Down modes
- M(TT)CAN supports all AUTOSAR requirements
  - Transmit Abort Interrupt
  - Non-waiting processing functionality
  - Include more than 2 TX Buffers prioritization
- M(TT)CAN supports several measures for self-testing:external and internal loop back
  - For this reason, the port structure does not have additional functionality for self-testing
  - The usage of loop back functionality for safety requirements is described in **Section 28, Functional Safety**
- M(TT)CAN contains an improved RX System
  - Scalable RX FIFO structures, with up to 64 CAN Buffers per FIFO
  - RX timestamp
  - RX FIFO Timeout Interrupt
  - FIFO filling level Interrupt
- M(TT)CAN contains an improved TX System
  - Variable amount of 0 to 32 “classical” TX Buffers
  - Additional, size configurable TX FIFO
  - Additional, size configurable TX Queue
  - FIFO filling level supervision (interrupt)
  - Support for transmit cancellation to avoid “inner priority inversion”
  - Configurable TX Event history: For each transmitted message both ID and timestamp are written into a history
  - TX-Event FIFO (readable by CPU using polling or interrupts) containing 0 to 32 events
  - Combined Message Buffer & TX FIFO and TX Queue Concept
  - Dedicated TX message buffers for high-priority messages
  - ID prioritization between TX buffers, TX Queue buffers and oldest TX FIFO element
  - Transmit pause to separate two consecutive TX messages
- M(TT)CAN contains an enhanced reception filtering
  - Support of 11bit and 29bit CAN identifier, each filter element is configurable for acceptance/ rejection
  - Each acceptance filter element targets FIFO 0 or 1 or a dedicated RX Buffer
  - Every FIFO or RX Buffer filter element can be used as a from-to range filter, as a filter for one or two dedicated
  - IDs or as a classic bit mask filter

  - Each filter element can be enabled/disabled individually
  - Programmable 29 bit CAN identifier acceptance filter mask for each entry
- MTTCAN supports TT_CAN level 2 according to ISO11898-4
- MTTCAN supports additional synchronization input signals
  - MTTCAN supports additional status output signals
- Data transfer rate is up to 1Mbps, individually for each CAN channel. For CAN FD, up to 8Mbps
- M(TT)CAN supports Pretended Networking of AUTOSAR
  - This can be achieved by using the dedicated additional interrupt assigned to messages of filter group 1
- Selectable ID type
  - 11-bit Standard ID
  - 11-bit Standard ID + 18-bit Extended ID
- M(TT)CAN are supported by the debug system by means of a debug stop signal, which suppresses the register content modification by reading of accesses of the debugger
- M(TT)CAN supports Time Stamp function
- M(TT)CAN are supporting CAN-FD with 64 data bytes and flexible data rate

19.2.2 Block Diagram

Following block diagram shows MTTCAN/MCAN block diagram. P1H-C (8MB) and P1H-CE support MCAN2. P1M-C and P1H-C (4MB) does not support MCAN2.

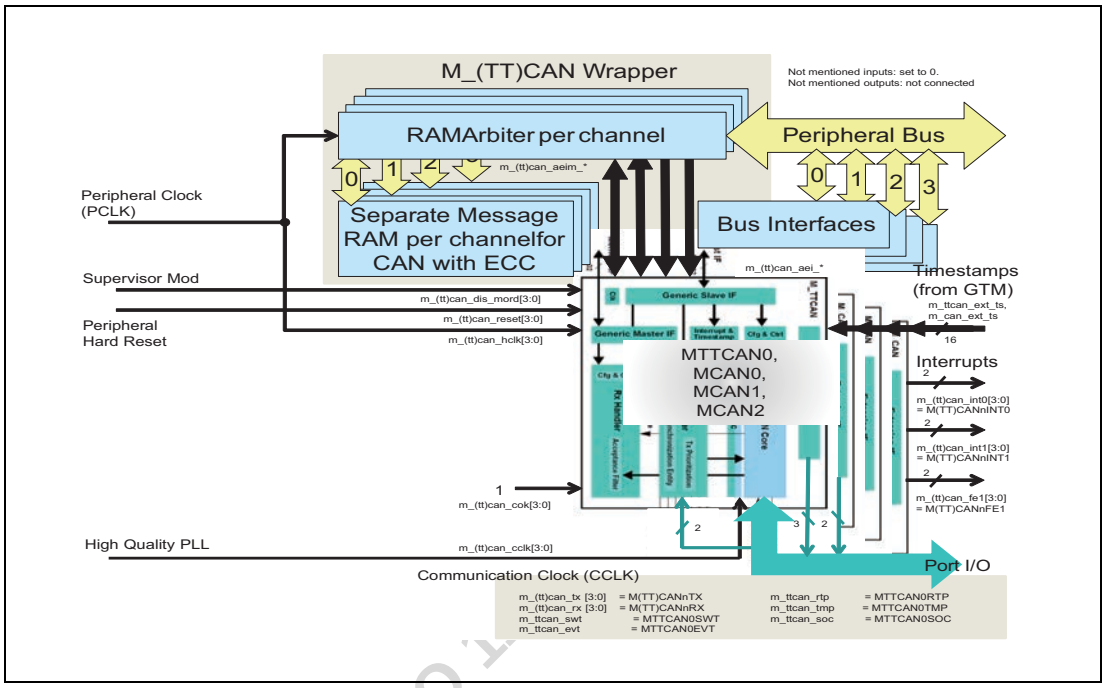

Figure 19.1 MCAN/MTTCAN block diagram

- M_TTCAN (MTTCAN0)
  8K RAM for messages, events and filters; no CCU implemented
  additional input signals MTTCAN0SWT, MTTCAN0EVT;*1
  additional output signals MTTCAN0RTP, MTTCAN0TMP, MTTCAN0SOC;*1
  timestamps from GTM IP
- M_CAN (MCAN0)
  8K RAM for messages, events and filters; common clocking with MTTCAN0
  timestamps from GTM IP
- M_CAN (MCAN1)
  8K RAM for messages, events and filters; common clocking with MTTCAN0
  timestamps from GTM IP
- M_CAN (MCAN2)
  8K RAM for messages, events and filters; common clocking with MTTCAN0
  timestamps from GTM IP
  P1M-C and P1H-C (4MB) don't support MCAN2.

  *m_(tt) can_cok fixed "1"*2

Note 1. These signals are not supported in P1M-C, P1H-C (4MB, BGA-156).

Note 2. This signal of M_(TT) CAN indicates that a proper clock supply is available. In devices P1M-C and P1H-C (incl. P1H-CE), clock is provided permanently so that M_(TT) CAN is enabled for transmission by this signal without precondition.

19.3 Registers

19.3.1 List of Registers

MTTCAN/MCAN registers are listed in the following table.

Table 19.10 Register list

Address	Register name	Description	Access Size[bit]	Initial Value	Access Protection	
					PBG	Other
*1	*1	MTTCAN0	32	*1	PBG3#1.PG3-MCANT	—
*1	*1	MCAN0	32	*1	PBG1#1.PG1-MCAN0	—
*1	*1	MCAN1	32	*1	PBG3#1.PG3-MCAN1	—
*1	*1	MCAN2	32	*1	PBG1#1.PG1-MCAN2	—

Note 1. For details of MTTCAN/MCAN-IP registers, please see **Table 19.71, M_TTCAN Register Map** and **Table 19.12, M_CAN Register Map**.

Table 19.11 Register Reset Condition

Register Name	Reset condition				
	Power On Reset	System Reset1	System Reset2	Application Reset1	Limited Reset
All registers	√	√	√	√	√

19.4 Operation

19.4.1 Procedure of Module Standby and Limited Reset

This module supports module standby and limited reset functions. Before these functions are enabled, all of the followings must be ensured:

- Module standby
  The M(TT)CAN can be set into power down mode controlled by CC Control Register M(TT)CANnCCCR.CSR. As long as the clock stop request is active, bit M(TT)CANnCCCR.CSR is read as one. When all pending transmission requests have completed, the M(TT)CAN waits until bus idle state is detected. Then the M(TT)CAN sets M(TT)CANnCCCR.INIT to one to prevent any further CAN transfers. Now the M(TT)CAN acknowledges that it is ready for power down by setting M(TT)CANnCCCR.CSA to one. In this state, before the clocks are switched off, further register accesses can be made. A write access to M(TT)CANnCCCR.INIT will have no effect. Now the module clock may be switched off. To leave power down mode, the application has to turn on the module clocks before resetting the CC Control Register flag M(TT)CANnCCCR.CSR. The M_CAN will acknowledge this by resetting M(TT)CANnCCCR.CSA. Afterwards, the application can restart CAN communication by resetting bit M(TT)CANnCCCR.INIT. Refer to the following flow chart.
- Limited Reset
  The M(TT)CAN can be reset by limited reset from SYSCTRL. The Limited Reset is functionally equivalent to a hardware reset. After limited reset, the registers of the M(TT)CAN hold the reset values. Additionally the Bus_Off state is reset and the output “m_(tt)can_tx” is set to recessive (HIGH). The value 0001_H (M(TT)CANnCCCR.INIT = ‘1’) in the CC Control Register enables software initialization. The M(TT)CAN does not influence the CAN bus until the CPU resets M(TT)CANnCCCR.INIT to ‘0’. Refer to the following flow chart.

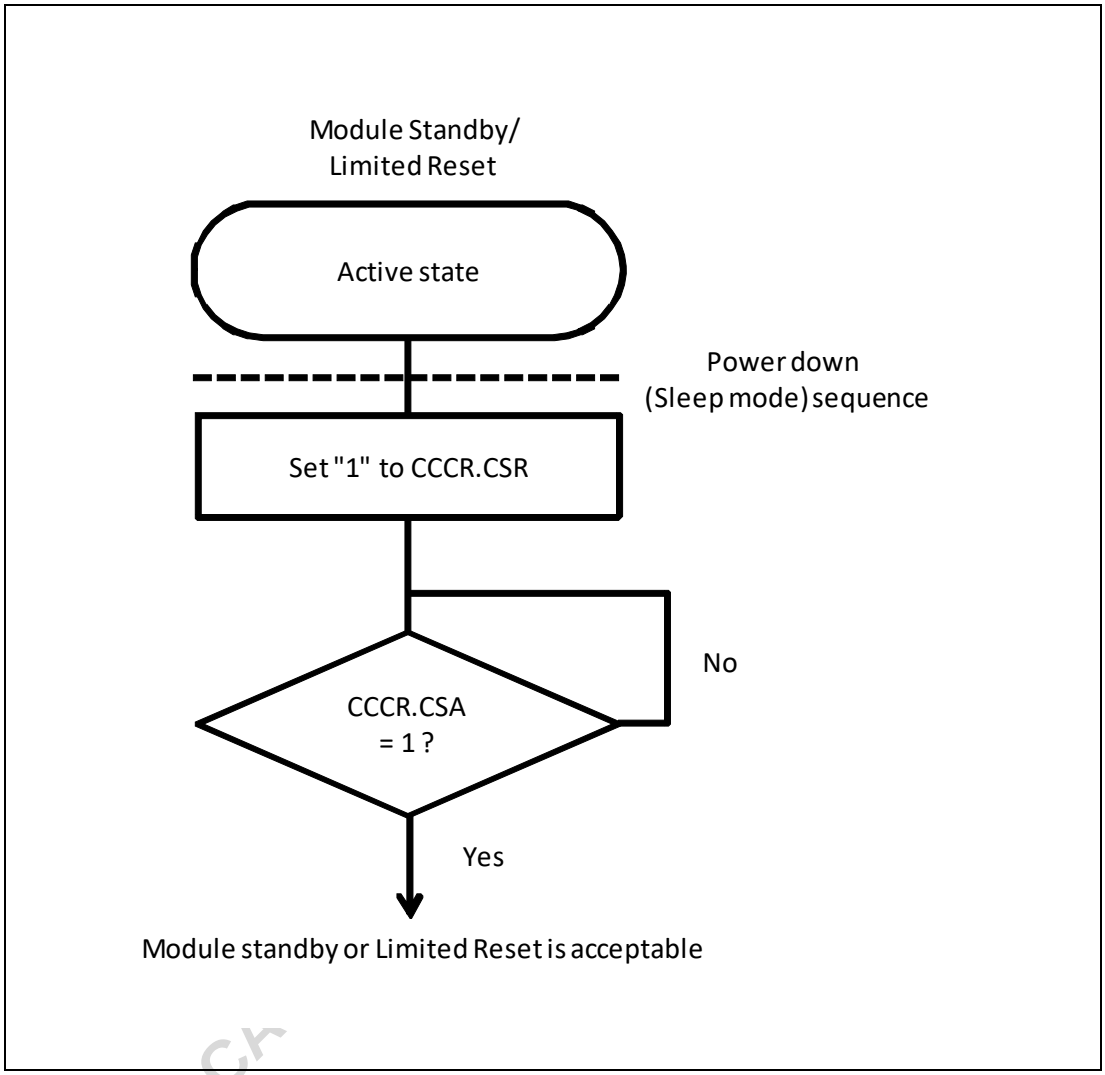

Figure 19.2 Module Standby/Limited Reset procedure

19.5 MCAN

19.5.1 Overview

The M_CAN performs communication according to ISO11898-1:2015. Additional transceiver hardware is required for connection to the physical layer.

The message storage is intended to be a single-ported Message RAM outside of the module. It is connected to the M_CAN via the Generic Master Interface.

All functions concerning the handling of messages are implemented by the Rx Handler and the Tx Handler. The Rx Handler manages message acceptance filtering, the transfer of received messages from the CAN Core to the Message RAM as well as providing receive message status information. The Tx Handler is responsible for the transfer of transmit messages from the Message RAM to the CAN Core as well as providing transmit status information.

Acceptance filtering is implemented by a combination of up to 128 filter elements where each one can be configured as a range, as a bit mask, or as a dedicated ID filter.

19.5.1.1 Features

- Conform with ISO 11898-1:2015
- CAN FD with up to 64 data bytes supported
- CAN Error Logging
- AUTOSAR optimized
- SAE J1939 optimized
- Improved acceptance filtering
- Two configurable Receive FIFOs
- Separate signalling on reception of High Priority Messages
- Up to 64 dedicated Receive Buffers
- Up to 32 dedicated Transmit Buffers
- Configurable Transmit FIFO
- Configurable Transmit Queue
- Configurable Transmit Event FIFO
- Direct Message RAM access for Host CPU
- Programmable loop-back test mode
- Maskable module interrupts
- Two clock domains (CAN clock and Host clock)
- Power-down support

19.5.1.2 Block Diagram

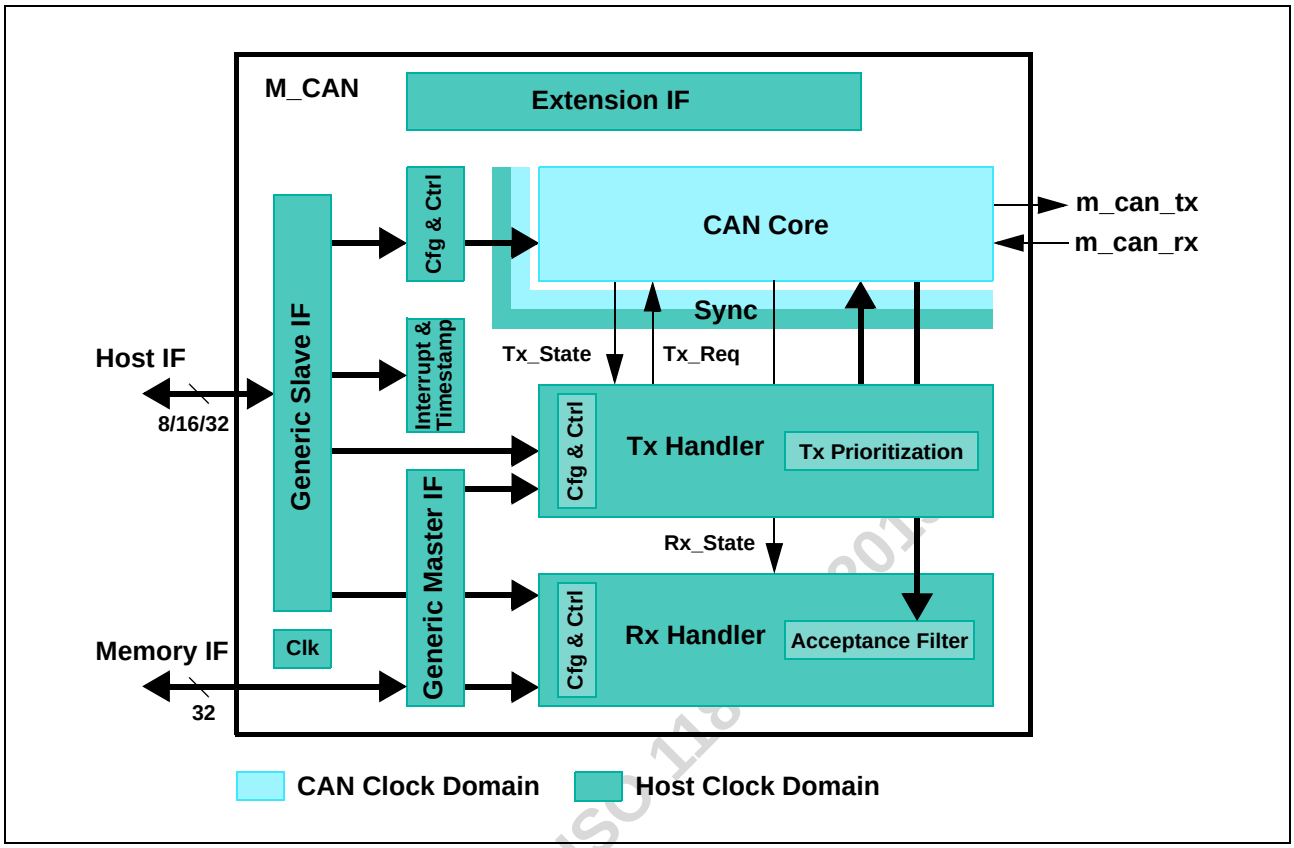

Figure 19.3 M_TTCAN Block Diagram

CAN Core:

CAN Protocol Controller and Rx/Tx Shift Register. Handles all ISO 11898-1 protocol functions. Supports 11-bit and 29-bit identifiers.

Sync:

Synchronizes signals from the Host clock domain to the CAN clock domain and vice versa.

Clk:

Synchronizes reset signal to the Host clock domain and to the CAN clock domain.

Cfg & Ctrl:

CAN Core related configuration and control bits.

Interrupt & Timestamp:

Interrupt control and 16-bit CAN bit time counter for receive and transmit timestamp generation. An externally generated 16-bit vector may substitute the integrated 16-bit CAN bit time counter for receive and transmit timestamp generation.

Tx Handler:

Controls the message transfer from the external Message RAM to the CAN Core. A maximum of 32 Tx Buffers can be configured for transmission. Tx buffers can be used as dedicated Tx Buffers, as Tx FIFO, part of a Tx Queue, or as a combination of them. A Tx Event FIFO stores Tx timestamps together with the corresponding Message ID. Transmit cancellation is also supported.

Rx Handler:

Controls the transfer of received messages from the CAN Core to the external Message RAM. The Rx Handler supports two Receive FIFOs, each of configurable size, and up to 64 dedicated Rx Buffers for storage of all messages that have passed acceptance filtering. A dedicated Rx Buffer, in contrast to a Receive FIFO, is used to store only messages with a specific identifier. An Rx timestamp is stored together with each message. Up to 128 filters can be defined for 11-bit IDs and up to 64 filters for 29-bit IDs.

Generic Slave Interface:

Connects the M_CAN to a customer specific Host CPU. The Generic Slave Interface is capable to connect to an 8/16/32-bit bus to support a wide range of interconnection structures.

Generic Master Interface:

Connects the M_CAN to a local 32-bit Message RAM. The implemented Message RAM size is 2K • 32 bit.

Extension Interface:

All flags from the Interrupt Register MCANnIR as well as selected internal status and control signals are routed to this interface. The interface is intended for connection of the M_CAN to a module-external interrupt unit or to other module-external components. The connection of these signals is optional.

19.5.1.3 Dual Clock Sources

To improve the EMC behavior, a spread spectrum clock can be used for the Host clock domain m_can_hclk (CLK_HSB). Due to the high precision clocking requirements of the CAN Core, a separate clock without any modulation has to be provided as m_can_cclk (CLKP_H2).

Within the M_TTCAN module there is a synchronization mechanism implemented to ensure save data transfer between the two clock domains.

NOTE

In order to achieve a stable function of the M_TTCAN, the Host clock must always be faster than or equal to the CAN clock. Also the modulation depth of the spread spectrum clock has to be regarded.

19.5.1.4 Dual Interrupt Lines

The module provides two interrupt lines. Interrupts can be routed either to m_can_int0 (INTMCANnI0) or to m_can_int1 (INTMCANnI1). By default all interrupts are routed to interrupt line m_can_int0 (INTMCANnI0). By programming MCANnILE.EINT0 and MCANnILE.EINT1 the interrupt lines can be enabled or disabled separately.

19.5.2 Programmer's Model

19.5.2.1 Hardware Reset Description

After hardware reset, the registers of the M_TTCAN hold the reset values listed in **Table 19.12**. Additionally the Bus_Off state is reset and the output m_can_tx is set to recessive (HIGH). The value 0001_H (MCANnCCCR.INIT = '1') in the CC Control Register enables software initialization. The M_TTCAN does not influence the CAN bus until the CPU resets MCANnCCCR.INIT to '0'.

19.5.2.2 Register Map

The M_TTCAN module allocates an address space of 256 bytes. All registers are organized as 32-bit registers. The M_CAN is accessible by the Host CPU via the Generic Slave Interface using a data width of 8 bit (byte access), 16 bit (half-word access), or 32 bit (word access). Write access by the Host CPU to registers/bits marked with "P = Protected Write" is possible only with MCANnCCCR.CCE = '1' AND MCANnCCCR.INIT = '1'. There is a delay from writing to a command register until the update of the related status register bits due to clock domain crossing.

23 to 20	SUBSTEP[3:0]	Sub-step of Core Release One digit, BCD-coded.
19 to 16	YEAR[3:0]	Time Stamp Year One digit, BCD-coded. This field is set by generic parameter on M_CAN synthesis.
15 to 8	MON[7:0]	Time Stamp Month Two digits, BCD-coded. This field is set by generic parameter on M_CAN synthesis.
7 to 0	DAY[7:0]	Time Stamp Day Two digits, BCD-coded. This field is set by generic parameter on M_CAN synthesis.

Table 19.14 Coding of Revisions

Release	Step	SubStep	Year	Month	Day	Name
3	2	1	5	03	20	Revision 3.2.1, Date 2015/03/20

(2) MCANnENDN — Endian Register

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + 004_H

Value after reset: $8765\ 4321_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 19.15 MCANnENDN Register Contents

Bit Position	Bit Name	Function
31 to 0	ETV[31:0]	Endianness Test Value The endianness test value is 87654321_H.

(3) MCANnDBTP — Data Bit Timing & Prescaler Register

This register is only writable if bits MCANnCCCR.CCE and MCANnCCCR.INIT are set. The CAN bit time may be programed in the range of 4 to 49 time quanta. The CAN time quantum may be programmed in the range of 1 to 32 m_can_cclk (CLKP_H2) periods. tq = (DBRP + 1) mtq.

DTSEG1 is the sum of Prop_Seg and Phase_Seg1. DTSEG2 is Phase_Seg2.

Therefore the length of the bit time is (programmed values) [DTSEG1 + DTSEG2 + 3] tq
or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] tq.

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + $00C_H$

Value after reset: 0000 $0A33_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 19.16 MCANnDBTP Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	These bits are always read as 0.
23	TDC	Transmitter Delay Compensation 0: Transmitter Delay Compensation disabled 1: Transmitter Delay Compensation enabled
22, 21	Reserved	These bits are always read as 0.
20 to 16	DBRP[4:0]	Data Bit Rate Prescaler 00_H to $1F_H$ The value by which the oscillator frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Bit Rate Prescaler are 0 to 31. When TDC = 1, the range is limited to 0, 1. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.
15 to 13	Reserved	These bits are always read as 0.
12 to 8	DTSEG1[4:0]	Data time segment before sample point 00_H to $1F_H$ Valid values are 0 to 31. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.
7 to 4	DTSEG2[3:0]	Data time segment after sample point 0_H to F_H Valid values are 0 to 15. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.
3 to 0	DSJW[3:0]	Data (Re) Synchronization Jump Width 0_H to F_H Valid values are 0 to 15. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

NOTES

1. With a CAN clock (m_can_cclk: CLKP_H2) of 8 MHz, the reset value of 0000 $0A33_H$ configures the M_CAN for a fast bit rate of 500 kBit/s.
2. The bit rate configured for the CAN FD data phase via MCANnDBTP must be higher or equal to the bit rate configured for the arbitration phase via MCANnNBTP.

(4) MCANnTEST — Test Register

Write access to the Test Register has to be enabled by setting bit MCANnCCCR.TEST to ‘1’. All Test Register functions are set to their reset values when bit MCANnCCCR.TEST is reset.

Loop Back Mode and software control of pin m_can_tx are hardware test modes. Programming of TX ≠ “00” may disturb the message transfer on the CAN bus.

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + 010_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	RX	TX[1:0]		LBCK	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	—	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	RP	RP	RP	R	R	R	R

Table 19.17 MCANnTEST Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	These bits are always read as 0.
7	RX	Receive Pin Monitors the actual value of pin m_can_rx 0: The CAN bus is dominant (m_can_rx = ‘0’). 1: The CAN bus is recessive (m_can_rx = ‘1’).
6, 5	TX[1:0]	Control of Transmit Pin 00: Reset value, m_can_tx controlled by the CAN Core, updated at the end of the CAN bit time. 01: Sample Point can be monitored at pin m_can_tx. 10: Dominant (‘0’) level at pin m_can_tx 11: Recessive (‘1’) at pin m_can_tx
4	LBCK	Loop Back Mode 0: Reset value, Loop Back Mode is disabled. 1: Loop Back Mode is enabled (see **(9) Test Modes**).
3 to 0	Reserved	These bits are always read as 0.

(5) MCANnRWD — RAM Watchdog

The RAM Watchdog monitors the readiness of the Message RAM. A Message RAM access via the M_CAN's Generic Master Interface starts the Message RAM Watchdog Counter with the value configured by MCANnRWD.WDC. The counter is reloaded with MCANnRWD.WDC when the Message RAM signals successful completion by activating its READY output. In case there is no response from the Message RAM until the counter has counted down to zero, the counter stops and interrupt flag MCANnIR.WDI is set. The RAM Watchdog Counter is clocked by the Host clock (m_can_hclk: CLK_HSB).

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 014_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 19.18 MCANnRWD Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are always read as 0. When written, write the initial value.
15 to 8	WDV[7:0]	Watchdog Value Actual Message RAM Watchdog Counter Value.
7 to 0	WDC[7:0]	Watchdog Configuration Start value of the Message RAM Watchdog Counter. With the reset value of "00" the counter is disabled.

(6) MCANnCCCR — CC Control Register

For details about setting and resetting of single bits see **(1) Software Initialization**.

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 018_H

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NISO	TXP	EFBI	PXHD	—	—	BRSE	FDOE	TEST	DAR	MON	CSR	CSA	ASM	CCE	INIT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	RP	RP	RP	RP	R	R	RP	RP	Rp	RP	Rp	R/W	R	Rp	RP	R/W

Table 19.19 MCANnCCCR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are always read as 0. When written, write the initial value.
15	NISO	Non ISO Operation If this bit is set, the M_CAN uses the CAN FD frame format as specified by the Bosch CAN FD Specification V1.0. 0: CAN FD frame format according to ISO11898-1:2015 1: CAN FD frame format according to Bosch CAN FD Specification V1.0
14	TXP	Transmit Pause If this bit is set, the M_CAN pauses for two CAN bit times before starting the next transmission after itself has successfully transmitted a frame (see **Section 19.6.3.5, Tx Handling**). 0: Transmit pause disabled 1: Transmit pause enabled
13	EFBI	Edge Filtering during Bus Integration 0: Edge filtering disabled 1: Two consecutive dominant tq required to detect an edge for hard synchronization.
12	PXHD	Protocol Exception Handling Disable 0: Protocol exception handling enabled 1: Protocol exception handling disabled **NOTE** When protocol exception handling is disabled, the M_CAN will transmit an error frame when it detects a protocol exception condition.
11, 10	Reserved	These bits are always read as 0. When written, write the initial value.
9	BRSE	Bit Rate Switch Enable 0: Bit rate switching for transmissions disabled. 1: Bit rate switching for transmissions enabled. **NOTE** When CAN FD operation is disabled FDOE = ‘0’, BRSE is not evaluated.
8	FDOE	FD Operation Enable 0: FD operation disabled 1: FD operation enabled

Table 19.19 MCANnCCCR Register Contents (2/2)

Bit Position	Bit Name	Function
7	TEST	Test Mode Enable 0: Normal operation, register MCANnTEST holds reset values. 1: Test Mode, write access to register MCANnTEST enabled.
6	DAR	Disable Automatic Retransmission 0: Automatic retransmission of messages not transmitted successfully enabled. 1: Automatic retransmission disabled
5	MON	Bus Monitoring Mode Bit MON can only be set by the Host when both CCE and INIT are set to '1'. The bit can be reset by the Host at any time. 0: Bus Monitoring Mode is disabled 1: Bus Monitoring Mode is enabled
4	CSR	Clock Stop Request 0: No clock stop is requested. 1: Clock stop requested. When clock stop is requested, first INIT and then CSA will be set after all pending transfer requests have been completed and the CAN bus reached idle.
3	CSA	Clock Stop Acknowledge 0: No clock stop acknowledged. 1: M_TTCAN may be set in power down by stopping m_can_hclk (CLK_HSB) and m_can_cclk (CLKP_H2).
2	ASM	Restricted Operation Mode Bit ASM can only be set by the Host when both CCE and INIT are set to '1'. The bit can be reset by the Host at any time. For a description of the Restricted Operation Mode see **(5) Restricted Operation Mode**. 0: Normal CAN operation 1: Restricted Operation Mode active
1	CCE	Configuration Change Enable 0: The CPU has no write access to the protected configuration registers. 1: The CPU has write access to the protected configuration registers (while MCANnCCCR.INIT = '1').
0	INIT	Initialization 0: Normal Operation 1: Initialization is started.

NOTE

Due to the synchronization mechanism between the two clock domains, there may be a delay until the value written to INIT can be read back. Therefore the programmer has to assure that the previous value written to INIT has been accepted by reading INIT before setting INIT to a new value.

(7) MCANnNBTP — Nominal Bit Timing & Prescaler Register

This register is only writable if bits MCANnCCCR.CCE and MCANnCCCR.INIT are set. The CAN bit time may be programed in the range of 4 to 385 time quanta. The CAN time quantum may be programmed in the range of 1 to 512 m_can_cclk (CLKP_H2) periods. tq = (NBRP + 1) mtq.

NTSEG1 is the sum of Prop_Seg and Phase_Seg1. NTSEG2 is Phase_Seg2.

Therefore the length of the bit time is (programmed values) [NTSEG1 + NTSEG2 + 3] tq
or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] tq.

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $01C_H$

Value after reset: 0600 $0A03_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	NSJW[6:0]							NBRP[8:0]								
Value after reset	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0
R/W	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NTSEG1[7:0]								—	NTSEG2[6:0]						
Value after reset	0	0	0	0	1	0	1	0	0	0	0	0	0	0	1	1
R/W	RP	RP	RP	RP	RP	RP	RP	RP	R	RP	RP	RP	RP	RP	RP	RP

Table 19.20 MCANnNBTP Register Contents

Bit Position	Bit Name	Function
31 to 25	NSJW[6:0]	Nominal (Re)Synchronization Jump Width. 00_H to $7F_H$ Valid values are 0 to 127. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.
24 to 16	NBRP[8:0]	Nominal Bit Rate Prescaler 000_H to $1FF_H$ The value by which the oscillator frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Bit Rate Prescaler are 0 to 511. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.
15 to 8	NTSEG1[7:0]	Nominal Time segment before sample point 01_H to FF_H Valid values are 1 to 255. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.
7	Reserved	These bits are always read as 0. When written, write the initial value.
6 to 0	NTSEG2[6:0]	Nominal Time segment after sample point 00_H to $7F_H$ Valid values are 1 to 127. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.

NOTE

With a CAN clock (m_can_cclk: CLKP_H2) of 8 MHz, the reset value of 0600 $0A03_H$ configures the M_CAN for a bit rate of 500 kBit/s.

(8) MCANnTSCC — Timestamp Counter Configuration

For a description of the Timestamp Counter see **Section 19.5.3.2, Timestamp Generation**.

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 020_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	TCP[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RP	RP	RP	RP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TSS[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RP	RP

Table 19.21 MCANnTSCC Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	These bits are always read as 0. When written, write the initial value.
19 to 16	TCP[3:0]	Timestamp Counter Prescaler 0_H to F_H Configures the timestamp and timeout counters time unit in multiples of CAN bit times [1 to 16]. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used. **NOTE** With CAN FD an external counter is required for timestamp generation (TSS = “10”)
15 to 2	Reserved	These bits are always read as 0.
1, 0	TSS[1:0]	Timestamp Select 00: Timestamp counter value always 0000_H 01: Timestamp counter value incremented according to TCP 10: External timestamp counter value used 11: Same as “00”

(9) MCANnTSCV — Timestamp Counter Value

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 024_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC

Table 19.22 MCANnTSCV Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are always read as 0. When written, write the initial value.
15 to 0	TSC[15:0]	Timestamp Counter The internal/external Timestamp Counter value is captured on start of frame (both Rx and Tx). When MCANnTSCC.TSS = “01”, the Timestamp Counter is incremented in multiples of CAN bit times [1 to 16] depending on the configuration of MCANnTSCC.TCP. A wrap around sets interrupt flag MCANnIR.TSW. Write access resets the counter to zero. When MCANnTSCC.TSS = “10”, TSC reflects the external Timestamp Counter value. A write access has no impact.

NOTE

A “wrap around” is a change of the Timestamp Counter value from non-zero to zero not caused by write access to MCANnTSCV.

(10) MCANnTOCC — Timeout Counter Configuration

For a description of the Timeout Counter see **Section 19.5.3.3, Timeout Counter**.

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 028_H

Value after reset: FFFF 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TOP[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TOS[1:0]		ETOC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RP	RP	RP

Table 19.23 MCANnTOCC Register Contents

Bit Position	Bit Name	Function
31 to 16	TOP[15:0]	Timeout Period Start value of the Timeout Counter (down-counter). Configures the Timeout Period.
15 to 3	Reserved	These bits are always read as 0. When written, write the initial value.
2, 1	TOS[1:0]	Timeout Select When operating in Continuous mode, a write to MCANnTOCV presets the counter to the value configured by MCANnTOCC.TOP and continues down-counting. When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MCANnTOCC.TOP. Down-counting is started when the first FIFO element is stored. 00: Continuous operation 01: Timeout controlled by Tx Event FIFO 10: Timeout controlled by Rx FIFO 0 11: Timeout controlled by Rx FIFO 1
0	ETOC	Enable Timeout Counter 0: Timeout Counter disabled 1: Timeout Counter enabled

NOTE

For use of timeout function with CAN FD see **Section 19.6.3.3, Timeout Counter**.

(11) MCANnTOCV — Timeout Counter Value

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $02C_H$

Value after reset: $0000\ FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TOC[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC

Table 19.24 MCANnTOCV Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are always read as 0. When written, write the initial value.
15 to 0	TOC[15:0]	Timeout Counter The Timeout Counter is decremented in multiples of CAN bit times [1 to 16] depending on the configuration of MCANnTSCC.TCP. When decremented to zero, interrupt flag MCANnIR.TOO is set and the Timeout Counter is stopped. Start and reset/restart conditions are configured via MCANnTOCC.TOS.

(12) MCANnECR — Error Counter Register

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + 040_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CEL[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	X	X	X	X	X	X	X	X

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RP	REC[6:0]							TEC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 19.25 MCANnECR Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	These bits are always read as 0.
23 to 16	CEL[7:0]	CAN Error Logging The counter is incremented each time when a CAN protocol error causes the Transmit Error Counter or the Receive Error Counter to be incremented. It is reset by read access to CEL. The counter stops at FF_H; the next increment of TEC or REC sets interrupt flag MCANnIR.ELO.
15	RP	Receive Error Passive 0: The Receive Error Counter is below the error passive level of 128 1: The Receive Error Counter has reached the error passive level of 128
14 to 8	REC[6:0]	Receive Error Counter Actual state of the Receive Error Counter, values between 0 and 127
7 to 0	TEC[7:0]	Transmit Error Counter Actual state of the Transmit Error Counter, values between 0 and 255

NOTE

When MCANnCCCR.ASM is set, the CAN protocol controller does not increment TEC and REC when a CAN protocol error is detected, but CEL is still incremented.

(13) MCANnPSR — Protocol Status Register

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + 044_H

Value after reset: $0000\ 0707_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	TDCV[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	PXE	RFDF	RBRS	RESI	DLEC[2:0]			BO	EW	EP	ACT[1:0]		LEC[2:0]		
Value after reset	0	0	0	0	0	1	1	1	0	0	0	0	0	1	1	1
R/W	R	X	X	X	X	S	S	S	R	R	R	R	R	S	S	S

Table 19.26 MCANnPSR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 23	Reserved	These bits are always read as 0.
22 to 16	TDCV[6:0]	Transmitter Delay Compensation Value 00_H to $7F_H$ Position of the secondary sample point, defined by the sum of the measured delay from m_can_tx to m_can_rx and MCANnTDCR.TDCO. The SSP position is, in the data phase, the number of mtq between the start of the transmitted bit and the secondary sample point. Valid values are 0 to 127 mtq.
15	Reserved	These bits are always read as 0.
14	PXE	Protocol Exception Event 0: No protocol exception event occurred since last read access 1: Protocol exception event occurred
13	RFDF	Received a CAN FD Message This bit is set independent of acceptance filtering. 0: Since this bit was reset by the CPU, no CAN FD message has been received 1: Message in CAN FD format with FDF flag set has been received
12	RBRS	BRS flag of last received CAN FD Message This bit is set together with RFDF, independent of acceptance filtering. 0: Last received CAN FD message did not have its BRS flag set 1: Last received CAN FD message had its BRS flag set
11	RESI	ESI flag of last received CAN FD Message This bit is set together with RFDF, independent of acceptance filtering. 0: Last received CAN FD message did not have its ESI flag set 1: Last received CAN FD message had its ESI flag set
10 to 8	DLEC[2:0]	Data Phase Last Error Code Type of last error that occurred in the data phase of a CAN FD format frame with its BRS flag set. Coding is the same as for LEC. This field will be cleared to zero when a CAN FD format frame with its BRS flag set has been transferred (reception or transmission) without error.
7	BO	Bus_Off Status 0: The M_CAN is not Bus_Off 1: The M_CAN is in Bus_Off state
6	EW	Warning Status 0: Both error counters are below the Error_Warning limit of 96 1: At least one of error counter has reached the Error_Warning limit of 96

Table 19.26 MCANnPSR Register Contents (2/2)

Bit Position	Bit Name	Function
5	EP	Error Passive 0: The M_CAN is in the Error_Active state. It normally takes part in bus communication and sends an active error flag when an error has been detected 1: The M_CAN is in the Error_Passive state
4, 3	ACT[1:0]	Activity Monitors the module's CAN communication state. 00: Synchronizing - node is synchronizing on CAN communication 01: Idle - node is neither receiver nor transmitter 10: Receiver - node is operating as receiver 11: Transmitter - node is operating as transmitter **NOTE** ACT is set to "00" by a Protocol Exception Event.
2 to 0	LEC[2:0]	Last Error Code The LEC indicates the type of the last error to occur on the CAN bus. This field will be cleared to '0' when a message has been transferred (reception or transmission) without error. 0: No Error: No error occurred since LEC has been reset by successful reception or transmission. 1: Stuff Error: More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed. 2: Form Error: A fixed format part of a received frame has the wrong format. 3: AckError: The message transmitted by the M_TTCAN was not acknowledged by another node. 4: Bit1Error: During the transmission of a message (with the exception of the arbitration field), the device wanted to send a recessive level (bit of logical value '1'), but the monitored bus value was dominant. 5: Bit0Error: During the transmission of a message (or acknowledge bit, or active error flag, or overload flag), the device wanted to send a dominant level (data or identifier bit logical value '0'), but the monitored bus value was recessive. During Bus_Off recovery this status is set each time a sequence of 11 recessive bits has been monitored. This enables the CPU to monitor the proceeding of the Bus_Off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed). 6: CRCError: The CRC check sum of a received message was incorrect. The CRC of an incoming message does not match with the CRC calculated from the received data. 7: NoChange: Any read access to the Protocol Status Register re-initializes the LEC to '7'. When the LEC shows the value '7', no CAN bus event was detected since the last CPU read access to the Protocol Status Register.

NOTES

1. When a frame in CAN FD format has reached the data phase with BRS flag set, the next CAN event (error or valid frame) will be shown in DLEC instead of LEC. An error in a fixed stuff bit of a CAN FD CRC sequence will be shown as a Form Error, not Stuff Error.
2. The Bus_Off recovery sequence (see CAN Specification Rev. 2.0 or ISO11898-1:2015) cannot be shortened by setting or resetting MCANnCCCR.INIT. If the device goes Bus_Off, it will set MCANnCCCR.INIT of its own accord, stopping all bus activities. Once MCANnCCCR.INIT has been cleared by the CPU, the device will then wait for 129 occurrences of Bus Idle (129 * 11 consecutive recessive bits) before resuming normal operation. At the end of the Bus_Off recovery sequence, the Error Management Counters will be reset. During the waiting time after the resetting of MCANnCCCR.INIT, each time a sequence of 11 recessive bits has been monitored, a Bit0Error code is written to MCANnPSR.LEC, enabling the CPU to readily check up whether the CAN bus is stuck at dominant or continuously disturbed and to monitor the Bus_Off recovery sequence. MCANnECR.REC is used to count these sequences.

(14) MCANnTDCR — Transmitter Delay Compensation Register

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + 048_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 19.27 MCANnTDCR Register Contents

Bit Position	Bit Name	Function
31 to 15	Reserved	These bits are always read as 0. When written, write the initial value.
14 to 8	TDCO[6:0]	Transmitter Delay Compensation Offset 00_H to $7F_H$ Offset value defining the distance between the measured delay from m_can_tx to m_can_rx and the secondary sample point. Valid values are 0 to 127 mtq.
7	Reserved	These bits are always read as 0. When written, write the initial value.
10 to 8	TDCF[6:0]	Transmitter Delay Compensation Filter Window Length 00_H to $7F_H$ Defines the minimum value for the SSP position, dominant edges on m_can_rx that would result in an earlier SSP position are ignored for transmitter delay measurement. The feature is enabled when TDCF is configured to a value greater than TDCO. Valid values are 0 to 127 mtq.

(15) MCANnIR — Interrupt Register

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the Host clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register. The configuration of MCANnIE controls whether an interrupt is generated. The configuration of MCANnILS controls on which interrupt line an interrupt is signalled.

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 050_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 19.28 MCANnIR Register Contents (1/3)

Bit Position	Bit Name	Function
31, 30	Reserved	These bits are always read as 0. When written, write the initial value.
29	ARA	Access to Reserved Address 0: No access to reserved address occurred 1: Access to reserved address occurred
28	PED	Protocol Error in Data Phase (Data Bit Time is used) 0: No protocol error in data phase 1: Protocol error in data phase detected (MCANnPSR.DLEC ≠ 0,7)
27	PEA	Protocol Error in Arbitration Phase (Nominal Bit Time is used) 0: No protocol error in arbitration phase 1: Protocol error in arbitration phase detected (MCANnPSR.LEC ≠ 0,7)
26	WDI	Watchdog Interrupt 0: No Message RAM Watchdog event occurred 1: Message RAM Watchdog event due to missing READY
25	BO	Bus_Off Status 0: Bus_Off status unchanged 1: Bus_Off status changed
24	EW	Warning Status 0: Error_Warning status unchanged 1: Error_Warning status changed
23	EP	Error Passive 0: Error_Passive status unchanged 1: Error_Passive status changed
22	ELO	Error Logging Overflow 0: CAN Error Logging Counter did not overflow 1: Overflow of CAN Error Logging Counter occurred

Table 19.28 MCANnIR Register Contents (2/3)

Bit Position	Bit Name	Function
21	BEU	Bit Error Uncorrected Message RAM bit error detected, uncorrected. Controlled by input signal m_can_aeim_berr[1] generated by an optional external parity / ECC logic attached to the Message RAM. An uncorrected Message RAM bit error sets MCANnCCCR.INIT to '1'. This is done to avoid transmission of corrupted data. 0: No bit error detected when reading from Message RAM 1: Bit error detected, uncorrected (e.g. parity logic)
20	BEC	Bit Error Corrected Message RAM bit error detected and corrected. Controlled by input signal m_can_aeim_berr[0] generated by an optional external parity / ECC logic attached to the Message RAM. 0: No bit error detected when reading from Message RAM 1: Bit error detected and corrected (e.g. ECC)
19	DRX	Message stored to Dedicated Rx Buffer The flag is set whenever a received message has been stored into a dedicated Rx Buffer. 0: No Rx Buffer updated 1: At least one received message stored into an Rx Buffer
18	TOO	Timeout Occurred 0: No timeout 1: Timeout reached
17	MRAF	Message RAM Access Failure The flag is set, when the Rx Handler • has not completed acceptance filtering or storage of an accepted message until the arbitration field of the following message has been received. In this case acceptance filtering or message storage is aborted and the Rx Handler starts processing of the following message. • was not able to write a message to the Message RAM. In this case message storage is aborted. In both cases the FIFO put index is not updated resp. the New Data flag for a dedicated Rx Buffer is not set, a partly stored message is overwritten when the next message is stored to this location. The flag is also set when the Tx Handler was not able to read a message from the Message RAM in time. In this case message transmission is aborted. In case of a Tx Handler access failure the M_CAN is switched into Restricted Operation Mode (see **(5) Restricted Operation Mode**). To leave Restricted Operation Mode, the Host CPU has to reset MCANnCCCR.ASM. 0: No Message RAM access failure occurred 1: Message RAM access failure occurred
16	TSW	Timestamp Wraparound 0: No timestamp counter wrap-around 1: Timestamp counter wrapped around
15	TEFL	Tx Event FIFO Element Lost 0: No Tx Event FIFO element lost 1: Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero
14	TEFF	Tx Event FIFO Full 0: Tx Event FIFO not full 1: Tx Event FIFO full
13	TEFW	Tx Event FIFO Watermark Reached 0: Tx Event FIFO fill level below watermark 1: Tx Event FIFO fill level reached watermark
12	TEFN	Tx Event FIFO New Entry 0: Tx Event FIFO unchanged 1: Tx Handler wrote Tx Event FIFO element
11	TFE	Tx FIFO Empty 0: Tx FIFO non-empty 1: Tx FIFO empty

Table 19.28 MCANnIR Register Contents (3/3)

Bit Position	Bit Name	Function
10	TCF	Transmission Cancellation Finished 0: No transmission cancellation finished 1: Transmission cancellation finished
9	TC	Transmission Completed 0: No transmission completed 1: Transmission completed
8	HPM	High Priority Message 0: No high priority message received 1: High priority message received
7	RF1L	Rx FIFO 1 Message Lost 0: No Rx FIFO 1 message lost 1: Rx FIFO 1 message lost, also set after write attempt to Rx FIFO 1 of size zero
6	RF1F	Rx FIFO 1 Full 0: Rx FIFO 1 not full 1: Rx FIFO 1 full
5	RF1W	Rx FIFO 1 Watermark Reached 0: Rx FIFO 1 fill level below watermark 1: Rx FIFO 1 fill level reached watermark
4	RF1N	Rx FIFO 1 New Message 0: No new message written to Rx FIFO 1 1: New message written to Rx FIFO 1
3	RF0L	Rx FIFO 0 Message Lost 0: No Rx FIFO 0 message lost 1: Rx FIFO 0 message lost, also set after write attempt to Rx FIFO 0 of size zero
2	RF0F	Rx FIFO 0 Full 0: Rx FIFO 0 not full 1: Rx FIFO 0 full
1	RF0W	Rx FIFO 0 Watermark Reached 0: Rx FIFO 0 fill level below watermark 1: Rx FIFO 0 fill level reached watermark
0	RF0N	Rx FIFO 0 New Message 0: No new message written to Rx FIFO 0 1: New message written to Rx FIFO 0

(16) MCANnIE — Interrupt Enable

The settings in the Interrupt Enable register determine which status changes in the Interrupt Register will be signalled on an interrupt line.

0: Interrupt disabled
1: Interrupt enabled

Access: This register can be read/written in 32-bit units.
Address: <MCANn_base> + 054_H
Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

1	RF0WE	Rx FIFO 0 Watermark Reached Interrupt Enable
0	RF0NE	Rx FIFO 0 New Message Interrupt Enable

(17) MCANnILS — Interrupt Line Select

The Interrupt Line Select register assigns an interrupt generated by a specific interrupt flag from the Interrupt Register to one of the two module interrupt lines. For interrupt generation the respective interrupt line has to be enabled via MCANnILE.EINT0 and MCANnILE.EINT1.

0: Interrupt assigned to interrupt line m_can_int0 (INTMCANnI0)
1: Interrupt assigned to interrupt line m_can_int1 (INTMCANnI1)

Access: This register can be read/written in 32-bit units.
Address: <MCANn_base> + 058_H
Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 19.32 MCANnGFC Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	These bits are always read as 0. When written, write the initial value.
5, 4	ANFS[1:0]	Accept Non-matching Frames Standard Defines how received messages with 11-bit IDs that do not match any element of the filter list are treated. 00: Accept in Rx FIFO 0 01: Accept in Rx FIFO 1 10: Reject 11: Reject
3, 2	ANFE[1:0]	Accept Non-matching Frames Extended Defines how received messages with 29-bit IDs that do not match any element of the filter list are treated. 00: Accept in Rx FIFO 0 01: Accept in Rx FIFO 1 10: Reject 11: Reject
1	RRFS	Reject Remote Frames Standard 0: Filter remote frames with 11-bit standard IDs 1: Reject all remote frames with 11-bit standard IDs
0	RRFE	Reject Remote Frames Extended 0: Filter remote frames with 29-bit extended IDs 1: Reject all remote frames with 29-bit extended IDs

(20) MCANnSIDFC — Standard ID Filter Configuration

Settings for 11-bit standard Message ID filtering. The Standard ID Filter Configuration controls the filter path for standard messages as described in **Figure 19.8, Standard Message ID Filter Path**.

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 084_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 19.33 MCANnSIDFC Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	These bits are always read as 0. When written, write the initial value.
23 to 16	LSS[7:0]	List Size Standard 0: No standard Message ID filter 1 to 128: Number of standard Message ID filter elements >128: Values greater than 128 are interpreted as 128
15 to 2	FLSSA[15:2]	Filter List Standard Start Address Start address of standard Message ID filter list (32-bit word address, see **Figure 19.4, Message RAM Configuration**).
1, 0	Reserved	These bits are always read as 0. When written, write the initial value.

(21) MCANnXIDFC — Extended ID Filter Configuration

Settings for 29-bit extended Message ID filtering. The Extended ID Filter Configuration controls the filter path for standard messages as described in **Figure 19.9, Extended Message ID Filter Path**.

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 088_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 19.34 MCANnXIDFC Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	These bits are always read as 0. When written, write the initial value.
22 to 16	LSE[6:0]	List Size Extended 0: No extended Message ID filter 1 to 64: Number of extended Message ID filter elements >64: Values greater than 64 are interpreted as 64
15 to 2	FLESA[15:2]	Filter List Extended Start Address Start address of extended Message ID filter list (32-bit word address, see **Figure 19.4, Message RAM Configuration**).
1, 0	Reserved	These bits are always read as 0. When written, write the initial value.

(22) MCANnXIDAM — Extended ID AND Mask

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 090_H

Value after reset: $1FFF\ FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	EIDM[28:16]												
Value after reset	0	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EIDM[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP

Table 19.35 MCANnXIDAM Register Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	These bits are always read as 0. When written, write the initial value.
28 to 0	EIDM[28:0]	Extended ID Mask For acceptance filtering of extended frames the Extended ID AND Mask is ANDed with the Message ID of a received frame. Intended for masking of 29-bit IDs in SAE J1939. With the reset value of all bits set to one the mask is not active.

(23) MCANnHPMS — High Priority Message Status

This register is updated every time a Message ID filter element configured to generate a priority event matches. This can be used to monitor the status of incoming high priority messages and to enable fast access to these messages.

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + 094_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FLST	FIDX[6:0]							MSI[1:0]		BIDX[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 19.36 MCANnHPMS Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are always read as 0.
15	FLST	Filter List Indicates the filter list of the matching filter element. 0: Standard Filter List 1: Extended Filter List
14 to 8	FIDX[6:0]	Filter Index Index of matching filter element. Range is 0 to MCANnSIDFC.LSS – 1 resp. MCANnXIDFC.LSE – 1.
7, 6	MSI[1:0]	Message Storage Indicator 00: No FIFO selected 01: FIFO message lost 10: Message stored in FIFO 0 11: Message stored in FIFO 1
5 to 0	BIDX[5:0]	Buffer Index Index of Rx FIFO element to which the message was stored. Only valid when MSI[1] = ‘1’.

(24) MCANnNDAT1 — New Data 1

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + 098_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ND31	ND30	ND29	ND28	ND27	ND26	ND25	ND24	ND23	ND22	ND21	ND20	ND19	ND18	ND17	ND16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.37 MCANnNDAT1 Register Contents

Bit Position	Bit Name	Function
31 to 0	ND[31:0]	New Data The register holds the New Data flags of Rx Buffers 0 to 31. The flags are set when the respective Rx Buffer has been updated from a received frame. The flags remain set until the Host clears them. A flag is cleared by writing a ‘1’ to the corresponding bit position. Writing a ‘0’ has no effect. A hard reset will clear the register. 0: Rx Buffer not updated 1: Rx Buffer updated from new message

(25) MCANnNDAT2 — New Data 2

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $09C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ND63	ND62	ND61	ND60	ND59	ND58	ND57	ND56	ND55	ND54	ND53	ND52	ND51	ND50	ND49	ND48

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	R	R

Table 19.39 MCANnRXF0C Register Contents

Bit Position	Bit Name	Function
31	F0OM	FIFO 0 Operation Mode FIFO 0 can be operated in blocking or in overwrite mode (see **(2) Rx FIFOs**). 0: FIFO 0 blocking mode 1: FIFO 0 overwrite mode
30 to 24	F0WM[6:0]	Rx FIFO 0 Watermark 0: Watermark interrupt disabled 1 to 64: Level for Rx FIFO 0 watermark interrupt (MCANnIR.RF0W) >64: Watermark interrupt disabled
23	Reserved	This bit is always read as 0.
22 to 16	F0S[6:0]	Rx FIFO 0 Size 0: No Rx FIFO 0 1 to 64: Number of Rx FIFO 0 elements >64: Values greater than 64 are interpreted as 64 The Rx FIFO 0 elements are indexed from 0 to F0S-1
15 to 2	F0SA[15:2]	Rx FIFO 0 Start Address Start address of Rx FIFO 0 in Message RAM (32-bit word address, see **Figure 19.4, Message RAM Configuration**).
1, 0	Reserved	These bits are always read as 0.

(27) MCANnRXF0S — Rx FIFO 0 Status

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + $0A4_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	RF0L	F0F	—	—	F0PI[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 19.40 MCANnRXF0S Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	These bits are always read as 0.
25	RF0L	Rx FIFO 0 Message Lost This bit is a copy of interrupt flag MCANnIR.RF0L. When MCANnIR.RF0L is reset, this bit is also reset. 0: No Rx FIFO 0 message lost 1: Rx FIFO 0 message lost, also set after write attempt to Rx FIFO 0 of size zero **NOTE** Overwriting the oldest message when MCANnRXF0C.F0OM = '1' will not set this flag.
24	F0F	Rx FIFO 0 Full 0: Rx FIFO 0 not full 1: Rx FIFO 0 full
23, 22	Reserved	These bits are always read as 0.
21 to 16	F0PI[5:0]	Rx FIFO 0 Put Index Rx FIFO 0 write index pointer, range 0 to 63.
15, 14	Reserved	These bits are always read as 0.
13 to 8	F0GI[5:0]	Rx FIFO 0 Get Index Rx FIFO 0 read index pointer, range 0 to 63.
7	Reserved	This bit is always read as 0.
6 to 0	F0FL[6:0]	Rx FIFO 0 Fill Level Number of elements stored in Rx FIFO 0, range 0 to 64.

(28) MCANnRXF0A — Rx FIFO 0 Acknowledge

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $0A8_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 19.44 MCANnRXF1S Register Contents

Bit Position	Bit Name	Function
31, 30	DMS[1:0]	Debug Message Status 00: Idle state, wait for reception of debug messages, DMA request is cleared 01: Debug message A received 10: Debug messages A, B received 11: Debug messages A, B, C received, DMA request is set
29 to 26	Reserved	These bits are always read as 0.
25	RF1L	Rx FIFO 1 Message Lost This bit is a copy of interrupt flag MCANnIR.RF1L. When MCANnIR.RF1L is reset, this bit is also reset. 0: No Rx FIFO 1 message lost 1: Rx FIFO 1 message lost, also set after write attempt to Rx FIFO 1 of size zero **NOTE** Overwriting the oldest message when MCANnRXF1C.F1OM = '1' will not set this flag.
24	F1F	Rx FIFO 1 Full 0: Rx FIFO 1 not full 1: Rx FIFO 1 full
23, 22	Reserved	These bits are always read as 0.
21 to 16	F1PI[5:0]	Rx FIFO 1 Put Index Rx FIFO 1 write index pointer, range 0 to 63.
15, 14	Reserved	These bits are always read as 0.
13 to 8	F1GI[5:0]	Rx FIFO 1 Get Index Rx FIFO 1 read index pointer, range 0 to 63.
7	Reserved	This bit is always read as 0.
6 to 0	F1FL[6:0]	Rx FIFO 1 Fill Level Number of elements stored in Rx FIFO 1, range 0 to 64.

(32) MCANnRXF1A — Rx FIFO 1 Acknowledge

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $0B8_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	—	—	F1AI[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.45 MCANnRXF1A Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	These bits are always read as 0. When written, write the initial value.
5 to 0	F1AI[5:0]	Rx FIFO 1 Acknowledge Index After the Host has read a message or a sequence of messages from Rx FIFO 1 it has to write the buffer index of the last element read from Rx FIFO 1 to F1AI. This will set the Rx FIFO 1 Get Index MCANnRXF1S.F1GI to F1AI + 1 and update the FIFO 1 Fill Level MCANnRXF1S.F1FL.

(33) MCANnRXESC — Rx Buffer / FIFO Element Size Configuration

Configures the number of data bytes belonging to an Rx Buffer / Rx FIFO element. Data field sizes >8 bytes are intended for CAN FD operation only.

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + $0BC_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	RBDS[2:0]			—	F1DS[2:0]			—	F0DS[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	RP	RP	RP	R	RP	RP	RP	R	RP	RP	RP

Table 19.46 MCANnRXESC Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	These bits are always read as 0.
10 to 8	RBDS[2:0]	Rx Buffer Data Field Size 000: 8 byte data field 001: 12 byte data field 010: 16 byte data field 011: 20 byte data field 100: 24 byte data field 101: 32 byte data field 110: 48 byte data field 111: 64 byte data field
7	Reserved	This bit is always read as 0.
6 to 4	F1DS[2:0]	Rx FIFO 1 Data Field Size 000: 8 byte data field 001: 12 byte data field 010: 16 byte data field 011: 20 byte data field 100: 24 byte data field 101: 32 byte data field 110: 48 byte data field 111: 64 byte data field
3	Reserved	This bit is always read as 0.
2 to 0	F0DS[2:0]	Rx FIFO 0 Data Field Size 000: 8 byte data field 001: 12 byte data field 010: 16 byte data field 011: 20 byte data field 100: 24 byte data field 101: 32 byte data field 110: 48 byte data field 111: 64 byte data field

NOTE

In case the data field size of an accepted CAN frame exceeds the data field size configured for the matching Rx Buffer or Rx FIFO, only the number of bytes as configured by MCANnRXESC are stored to the Rx Buffer resp. Rx FIFO element. The rest of the frame's data field is ignored.

(34) MCANnTXBC — Tx Buffer Configuration

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $0C0_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 19.47 MCANnTXBC Register Contents

Bit Position	Bit Name	Function
31	Reserved	This bit is always read as 0. When written, write the initial value.
30	TFQM	Tx FIFO/Queue Mode 0: Tx FIFO operation 1: Tx Queue operation
29 to 24	TFQS[5:0]	Transmit FIFO/Queue Size 0: No Tx FIFO/Queue 1 to 32: Number of Tx Buffers used for Tx FIFO/Queue >32: Values greater than 32 are interpreted as 32
23, 22	Reserved	These bits are always read as 0. When written, write the initial value.
21 to 16	NDTB[5:0]	Number of Dedicated Transmit Buffers 0: No Dedicated Tx Buffers 1 to 32: Number of Dedicated Tx Buffers >32: Values greater than 32 are interpreted as 32
15 to 2	TBSA[15:2]	Tx Buffers Start Address Start address of Tx Buffers section in Message RAM (32-bit word address, see **Figure 19.4, Message RAM Configuration**).
1, 0	Reserved	These bits are always read as 0. When written, write the initial value.

NOTE

Be aware that the sum of TFQS and NDTB may be not greater than 32. There is no check for erroneous configurations. The Tx Buffers section in the Message RAM starts with the dedicated Tx Buffers.

(35) MCANnTXFQS — Tx FIFO/Queue Status

The Tx FIFO/Queue status is related to the pending Tx requests listed in register MCANnTXBRP. Therefore the effect of Add/Cancellation requests may be delayed due to a running Tx scan (MCANnTXBRP not yet updated).

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + $0C4_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	TFQF	TFQPI[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	TFGI[4:0]					—	—	TFFL[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 19.48 MCANnTXFQS Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	These bits are always read as 0.
21	TFQF	Tx FIFO/Queue Full 0: Tx FIFO/Queue not full 1: Tx FIFO/Queue full
20 to 16	TFQPI[4:0]	Tx FIFO/Queue Put Index Tx FIFO/Queue write index pointer, range 0 to 31.
15 to 13	Reserved	These bits are always read as 0.
12 to 8	TFGI[4:0]	Tx FIFO Get Index Tx FIFO read index pointer, range 0 to 31. Read as zero when Tx Queue operation is configured (MCANnTXBC.TFQM = ‘1’).
7, 6	Reserved	These bits are always read as 0.
5 to 0	TFFL[5:0]	Tx FIFO Free Level Number of consecutive free Tx FIFO elements starting from TFGI, range 0 to 32. Read as zero when Tx Queue operation is configured (MCANnTXBC.TFQM = ‘1’)

NOTE

In case of mixed configurations where dedicated Tx Buffers are combined with a Tx FIFO or a Tx Queue, the Put and Get Indices indicate the number of the Tx Buffer starting with the first dedicated Tx Buffers.
Example: For a configuration of 12 dedicated Tx Buffers and a Tx FIFO of 20 Buffers a Put Index of 15 points to the fourth buffer of the Tx FIFO.

(36) MCANnTXESC — Tx Buffer Element Size Configuration

Configures the number of data bytes belonging to a Tx Buffer element. Data field sizes > 8 bytes are intended for CAN FD operation only.

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $0C8_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 19.49 MCANnTXESC Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	These bits are always read as 0. When written, write the initial value.
2 to 0	TBDS[2:0]	Tx Buffer Data Field Size 000: 8 byte data field 001: 12 byte data field 010: 16 byte data field 011: 20 byte data field 100: 24 byte data field 101: 32 byte data field 110: 48 byte data field 111: 64 byte data field

NOTE

In case the data length code DLC of a Tx Buffer element is configured to a value higher than the Tx Buffer data field size MCANnTXESC.TBDS, the bytes not defined by the Tx Buffer are transmitted as "CC_H" (padding bytes).

(37) MCANnTXBRP — Tx Buffer Request Pending

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + $0CC_H$

Value after reset: $0000\ 0000_H$

Table 19.50 MCANnTXBRP Register Contents

Bit Position	Bit Name	Function
31 to 0	TRP[31:0]	Transmission Request Pending Each Tx Buffer has its own Transmission Request Pending bit. The bits are set via register MCANnTXBAR. The bits are reset after a requested transmission has completed or has been cancelled via register MCANnTXBCR. MCANnTXBRP bits are set only for those Tx Buffers configured via MCANnTXBC. After a MCANnTXBRP bit has been set, a Tx scan (see **Section 19.5.3.5, Tx Handling**) is started to check for the pending Tx request with the highest priority (Tx Buffer with lowest Message ID). A cancellation request resets the corresponding transmission request pending bit of register MCANnTXBRP. In case a transmission has already been started when a cancellation is requested, this is done at the end of the transmission, regardless whether the transmission was successful or not. The cancellation request bits are reset directly after the corresponding MCANnTXBRP bit has been reset. After a cancellation has been requested, a finished cancellation is signalled via MCANnTXBCF • after successful transmission together with the corresponding MCANnTXBTO bit • when the transmission has not yet been started at the point of cancellation • when the transmission has been aborted due to lost arbitration • when an error occurred during frame transmission In DAR mode all transmissions are automatically cancelled if they are not successful. The corresponding MCANnTXBCF bit is set for all unsuccessful transmissions. 0: No transmission request pending 1: Transmission request pending **NOTE** MCANnTXBRP bits which are set while a Tx scan is in progress are not considered during this particular Tx scan. In case a cancellation is requested for such a Tx Buffer, this Add Request is cancelled immediately, the corresponding MCANnTXBRP bit is reset.

(38) MCANnTXBAR — Tx Buffer Add Request

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $0D0_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 19.51 MCANnTXBAR Register Contents

Bit Position	Bit Name	Function
31 to 0	AR[31:0]	Add Request Each Tx Buffer has its own Add Request bit. Writing a '1' will set the corresponding Add Request bit; writing a '0' has no impact. This enables the Host to set transmission requests for multiple Tx Buffers with one write to MCANnTXBAR. MCANnTXBAR bits are set only for those Tx Buffers configured via MCANnTXBC. When no Tx scan is running, the bits are reset immediately, else the bits remain set until the Tx scan process has completed. 0: No transmission request added 1: Transmission requested added

NOTE

If an add request is applied for a Tx Buffer with pending transmission request (corresponding MCANnTXBRP bit already set), this add request is ignored.

(39) MCANnTXBCR — Tx Buffer Cancellation Request

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $0D4_H$

Value after reset: $0000\ 0000_H$

Table 19.58 MCANnTXEFS Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	These bits are always read as 0.
25	TEFL	Tx Event FIFO Element Lost This bit is a copy of interrupt flag MCANnIR.TEFL. When MCANnIR.TEFL is reset, this bit is also reset. 0: No Tx Event FIFO element lost 1: Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero.
24	EFF	Event FIFO Full 0: Tx Event FIFO not full 1: Tx Event FIFO full
23 to 21	Reserved	These bits are always read as 0.
20 to 16	EFPI[4:0]	Event FIFO Put Index Tx Event FIFO write index pointer, range 0 to 31.
15 to 13	Reserved	These bits are always read as 0.
12 to 8	EFGI[4:0]	Event FIFO Get Index Tx Event FIFO read index pointer, range 0 to 31.
7, 6	Reserved	These bits are always read as 0.
5 to 0	EFFL[5:0]	Event FIFO Fill Level Number of elements stored in Tx Event FIFO, range 0 to 32.

(46) MCANnTXEFA — Tx Event FIFO Acknowledge

Access: This register can be read/written in 32-bit units.

Address: <MCANn_base> + $0F8_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 19.59 MCANnTXEFA Register Contents

Bit Position	Bit Name	Function
31 to 5	Reserved	These bits are always read as 0. When written, write the initial value.
4 to 0	EFAI[4:0]	Event FIFO Acknowledge Index After the Host has read an element or a sequence of elements from the Tx Event FIFO it has to write the index of the last element read from Tx Event FIFO to EFAI. This will set the Tx Event FIFO Get Index MCANnTXEFS.EFGI to EFAI + 1 and update the FIFO Fill Level MCANnTXEFS.EFFL.

19.5.2.4 Message RAM

For storage of Rx/Tx messages and for storage of the filter configuration a single- or dual-ported Message RAM has to be connected to the M_CAN module.

(1) Message RAM Configuration

The Message RAM has a width of 32 bits. In case parity checking or ECC is used a respective number of bits has to be added to each word. The M_CAN module can be configured to allocate up to 4352 words in the Message RAM. It is not necessary to configure each of the sections listed in **Figure 19.4, Message RAM Configuration**, nor is there any restriction with respect to the sequence of the sections.

When operated in CAN FD mode the required Message RAM size strongly depends on the element size configured for Rx FIFO0, Rx FIFO1, Rx Buffers, and Tx Buffers via MCANnRXESC.F0DS, MCANnRXESC.F1DS, MCANnRXESC.RBDS, and MCANnTXESC.TBDS.

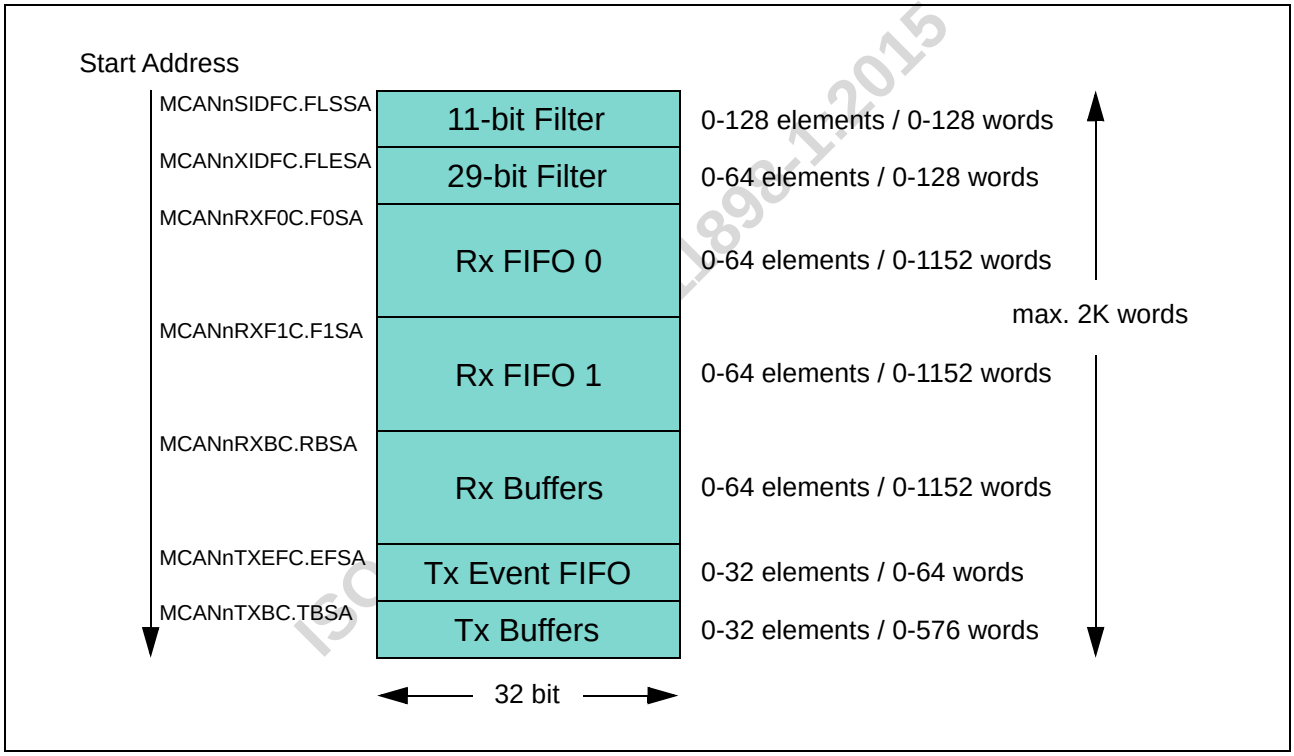

Figure 19.4 Message RAM Configuration

When the M_CAN addresses the Message RAM it addresses 32-bit words, not single bytes. The configurable start addresses are 32-bit word addresses i.e. only bits 15 to 2 are evaluated, the two least significant bits are ignored.

NOTE

The M_CAN does not check for erroneous configuration of the Message RAM. Especially the configuration of the start addresses of the different sections and the number of elements of each section has to be done carefully to avoid falsification or loss of data.

(2) Rx Buffer and FIFO Element

Up to 64 Rx Buffers and two Rx FIFOs can be configured in the Message RAM. Each Rx FIFO section can be configured to store up to 64 received messages. The structure of a Rx Buffer / FIFO element is shown in **Table 19.60** below. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register MCANnRXESC.

Table 19.60 Rx Buffer and FIFO Element

	31 24	23 16	15 8	7 0
R0	ESI, XTD, RTR, ID[28:0]			
R1	ANMF, FIDX[6:0]	res, FDF, BRS, DLC[3:0]	RXTS[15:0]	
R2	DB3[7:0]	DB2[7:0]	DB1[7:0]	DB0[7:0]
R3	DB7[7:0]	DB6[7:0]	DB5[7:0]	DB4[7:0]
...	...	...	...	...
Rn	DBm[7:0]	DBm-1[7:0]	DBm-2[7:0]	DBm-3[7:0]

R0 Bit 31 ESI: Error State Indicator

0: Transmitting node is error active
1: Transmitting node is error passive

R0 Bit 30 XTD: Extended Identifier

Signals to the Host whether the received frame has a standard or extended identifier.

0: 11-bit standard identifier
1: 29-bit extended identifier

R0 Bit 29 RTR: Remote Transmission Request

Signals to the Host whether the received frame is a data frame or a remote frame.

0:Received frame is a data frame

1:Received frame is a remote frame

NOTE

There are no remote frames in CAN FD format. In case a CAN FD frame (FDF = '1'), the dominant RRS (Remote Request Substitution) bit replaces bit RTR (Remote Transmission Request).

R0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].

R1 Bit 31 ANMF: Accepted Non-matching Frame

Acceptance of non-matching frames may be enabled via MCANnGFC.ANFS and MCANnGFC.ANFE.

0:Received frame matching filter index FIDX

1:Received frame did not match any Rx filter element

R1 Bits 30:24 FIDX[6:0]:Filter Index

0 to 127:Index of matching Rx acceptance filter element (invalid if ANMF = '1').
Range is 0 to MCANnSIDFC.LSS - 1 resp. MCANnXIDFC.LSE - 1.

R1 Bit 21 FDF: FD Format

0:Standard frame format

1:CAN FD frame format (new DLC-coding and CRC)

R1 Bit 20 BRS: Bit Rate Switch

0:Frame received without bit rate switching

1:Frame received with bit rate switching

R1 Bits 19:16 DLC[3:0]: Data Length Code

0 to 8: CAN + CAN FD: received frame has 0 to 8 data bytes

9 to 15: CAN: received frame has 8 data bytes

9 to 15: CAN FD: received frame has 12/16/20/24/32/48/64 data bytes

R1 Bits 15:0 RXTS[15:0]:Rx Timestamp

Timestamp Counter value captured on start of frame reception. Resolution depending on configuration of the Timestamp Counter Prescaler MCANnTSCC.TCP.

R2 Bits 31:24 DB3[7:0]: Data Byte 3

R2 Bits 23:16 DB2[7:0]: Data Byte 2

R2 Bits 15:8 DB1[7:0]: Data Byte 1

R2 Bits 7:0 DB0[7:0]: Data Byte 0

R3 Bits 31:24 DB7[7:0]: Data Byte 7

R3 Bits 23:16 DB6[7:0]: Data Byte 6

R3 Bits 15:8 DB5[7:0]: Data Byte 5

R3 Bits 7:0 DB4[7:0]: Data Byte 4

...

Rn Bits 31:24 DBm[7:0]: Data Byte m

Rn Bits 23:16 DBm-1[7:0]:Data Byte m-1

Rn Bits 15:8 DBm-2[7:0]:Data Byte m-2

Rn Bits 7:0 DBm-3[7:0]:Data Byte m-3

NOTE

Depending on the configuration of the element size (MCANnRXESC), between two and sixteen 32-bit words (Rn = 3 to 17) are used for storage of a CAN message's data field.

(3) Tx Buffer Element

The Tx Buffers section can be configured to hold dedicated Tx Buffers as well as a Tx FIFO / Tx Queue. In case that the Tx Buffers section is shared by dedicated Tx buffers and a Tx FIFO / Tx Queue, the dedicated Tx Buffers start at the beginning of the Tx Buffers section followed by the buffers assigned to the Tx FIFO or Tx Queue. The Tx Handler distinguishes between dedicated Tx Buffers and Tx FIFO / Tx Queue by evaluating the Tx Buffer configuration MCANnTXBC.TFQS and MCANnTXBC.NDTB. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register MCANnTXESC.

Table 19.61 Tx Buffer Element

	31 24	23 16	15 8	7 0
T0	ESI, XTD, RTR	ID[28:0]		
T1	MM[7:0]	EFC, res, FDF, BRS, DLC[3:0]	res	
T2	DB3[7:0]	DB2[7:0]	DB1[7:0]	DB0[7:0]
T3	DB7[7:0]	DB6[7:0]	DB5[7:0]	DB4[7:0]
...	...	...	...	...
Tn	DBm[7:0]	DBm-1[7:0]	DBm-2[7:0]	DBm-3[7:0]

T0 Bit 31 ESI: Error State Indicator

0: ESI bit in CAN FD format depends only on error passive flag

1: ESI bit in CAN FD format transmitted recessive

NOTE

The ESI bit of the transmit buffer is or'ed with the error passive flag to decide the value of the ESI bit in the transmitted FD frame. As required by the CAN FD protocol specification, an error active node may optionally transmit the ESI bit recessive, but an error passive node will always transmit the ESI bit recessive

T0 Bit 30 XTD: Extended Identifier

0: 11-bit standard identifier

1: 29-bit extended identifier

T0 Bit 29 RTR: Remote Transmission Request

0: Transmit data frame

1: Transmit remote frame

NOTE

When RTR = 1, the M_CAN transmits a remote frame according to ISO11898-1:2015, even if MCANnCCCR.FDOE enables the transmission in CAN FD format.

T0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier has to be written to ID[28:18].

T1 Bits 31:24 MM[7:0]: Message Marker

Written by CPU during Tx Buffer configuration. Copied into Tx Event FIFO element for identification of Tx message status.

T1 Bit 23 EFC: Event FIFO Control

0: Don’t store Tx events

1: Store Tx events

T1 Bit 21 FDF: FD Format

0: Frame transmitted in Classic CAN format

1: Frame transmitted in CAN FD format

T1 Bit 20 BRS: Bit Rat Switching

0: CAN FD frames transmitted without bit rate switching

1: CAN FD frames transmitted with bit rate switching

NOTE

Bits ESI, FDF, and BRS are only evaluated when CAN FD operation is enabled MCANnCCCR.FDOE = ‘1’. Bit BRS is only evaluated when in addition CCCR.BRSE = ‘1’

T1 Bits 19:16 DLC[3:0]: Data Length Code

0 to 8: CAN + CAN FD: transmit frame has 0-8 data bytes

9 to 15: CAN: transmit frame has 8 data bytes

9 to 15: CAN FD: transmit frame has 12/16/20/24/32/48/64 data bytes

T2 Bits 31:24DB3[7:0]:Data Byte 3

T2 Bits 23:16 DB2[7:0]: Data Byte 2

T2 Bits 15:8 DB1[7:0]: Data Byte 1

T2 Bits 7:0 DB0[7:0]: Data Byte 0

T3 Bits 31:24 DB7[7:0]: Data Byte 7

T3 Bits 23:16 DB6[7:0]: Data Byte 6

T3 Bits 15:8 DB5[7:0]: Data Byte 5

T3 Bits 7:0 DB4[7:0]: Data Byte 4

...

Tn Bits 31:24 DBm[7:0]: Data Byte m

Tn Bits 23:16 DBm-1[7:0]:Data Byte m-1

Tn Bits 15:8 DBm-2[7:0]:Data Byte m-2

Tn Bits 7:0 DBm-3[7:0]:Data Byte m-3

NOTE

Depending on the configuration of the element size (MCANnTXESC), between two and sixteen 32-bit words (Tn = 3 to 17) are used for storage of a CAN message's data field.

(4) Tx Event FIFO Element

Each element stores information about transmitted messages. By reading the Tx Event FIFO the Host CPU gets this information in the order the messages were transmitted. Status information about the Tx Event FIFO can be obtained from register MCANnTXEFS

Table 19.62 Tx Event FIFO Element

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
E0	ESI	XTD	RTR	ID[28:0]																												
E1	MM[7:0]								ET[1:0]		FDF	BRS	DLC[3:0]				TXTS[15:0]															

E0 Bit 31 ESI: Error State Indicator

0: Transmitting node is error active

1: Transmitting node is error passive

E0 Bit 30 XTD: Extended Identifier

0: 11-bit standard identifier

1: 29-bit extended identifier

E0 Bit 29 RTR: Remote Transmission Request

0: Data frame transmitted

1: Remote frame transmitted

E0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].

E1 Bits 31:24 MM[7:0]: Message Marker

Copied from Tx Buffer into Tx Event FIFO element for identification of Tx message status.

E1 Bit 23:22 ET[1:0]: Event Type

00: Reserved

01: Tx event

10: Transmission in spite of cancellation (always set for transmissions in DAR mode)

11: Reserved

E1 Bit 21 FDF: FD Format

0: Standard frame format

1: CAN FD frame format (new DLC-coding and CRC)

E1 Bit 20 BRS: Bit Rate Switch

0: Frame transmitted without bit rate switching

1: Frame transmitted with bit rate switching

E1 Bits 19:16 DLC[3:0]: Data Length Code

0 to 8: CAN + CAN FD: frame with 0-8 data bytes transmitted

9 to 15: CAN: frame with 8 data bytes transmitted

9 to 15: CAN FD: frame with 12/16/20/24/32/48/64 data bytes transmitted

E1 Bits 15:0 TXTS[15:0]:Tx Timestamp

Timestamp Counter value captured on start of frame transmission. Resolution depending on configuration of the Timestamp Counter Prescaler MCANnTSCC.TCP.

(5) Standard Message ID Filter Element

Up to 128 filter elements can be configured for 11-bit standard IDs. When accessing a Standard Message ID Filter element, its address is the Filter List Standard Start Address MCANnSIDFC.FLSSA plus the index of the filter element (0 to 127).

Table 19.63 Standard Message ID Filter Element

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
S0	SFT[1:0]		SFEC[2:0]		SFID1[10:0]											res								SFID2[10:0]							

Bits 31:30 SFT[1:0]: Standard Filter Type

00: Range filter from SFID1 to SFID2 (SFID2 ≥ SFID1)

01: Dual ID filter for SFID1 or SFID2

10: Classic filter: SFID1 = filter, SFID2 = mask

11: Filter element disabled

NOTE

With SFT = “11” the filter element is disabled and the acceptance filtering continues (same behaviour as with SFEC = “000”)

Bit 29:27 SFEC[2:0]:Standard Filter Element Configuration

All enabled filter elements are used for acceptance filtering of standard frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If SFEC = “100”, “101”, or “110” a match sets interrupt flag MCANnIR.HPM and, if enabled, an interrupt is generated. In this case register MCANnHPMS is updated with the status of the priority match.

000: Disable filter element

001: Store in Rx FIFO 0 if filter matches

010: Store in Rx FIFO 1 if filter matches

011: Reject ID if filter matches

100: Set priority if filter matches

101: Set priority and store in FIFO 0 if filter matches

110: Set priority and store in FIFO 1 if filter matches

111: Store into Rx Buffer or as debug message, configuration of SFT[1:0] ignored

Bits 26:16 SFID1[10:0]:Standard Filter ID 1

First ID of standard ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of a standard message to be stored. The received identifiers must match exactly, no masking mechanism is used.

Bits 10:0 SFID2[10:0]:Standard Filter ID 2

This bit field has a different meaning depending on the configuration of SFEC:

1) SFEC = “001” to “110”Second ID of standard ID filter element

2) SFEC = “111”Filter for Rx Buffers or for debug messages

SFID2[10:9]: These bits decide whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.
00: Store message into an Rx Buffer
01: Debug Message A
10: Debug Message B
11: Debug Message C

SFID2[8:6]: These bits are used to control the filter event pins m_can_fe[2:0] at the Extension Interface. A one at the respective bit position enables generation of a pulse at the related filter event pin with the duration of one m_can_hclk (CLK_HSB) period in case the filter matches.

SFID2[5:0]: These bits define the offset to the Rx Buffer Start Address MCANnRXBC.RBSA for storage of a matching message.

(6) Extended Message ID Filter Element

Up to 64 filter elements can be configured for 29-bit extended IDs. When accessing an Extended Message ID Filter element, its address is the Filter List Extended Start Address MCANnXIDFC.FLESA plus two times the index of the filter element (0 to 63).

Table 19.64 Extended Message ID Filter Element

	31 24	23 16	15 8	7 0
F0	EFEC[2:0]	EFID1[28:0]		
F1	EFT[1:0] / res	EFID2[28:0]		

F0 Bit 31:29 EFEC[2:0]:Extended Filter Element Configuration

All enabled filter elements are used for acceptance filtering of extended frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If EFEC = “100”, “101”, or “110” a match sets interrupt flag MCANnIR.HPM and, if enabled, an interrupt is generated. In this case register MCANnHPMS is updated with the status of the priority match.

000: Disable filter element

001: Store in Rx FIFO 0 if filter matches

010: Store in Rx FIFO 1 if filter matches

011: Reject ID if filter matches

100: Set priority if filter matches

101: Set priority and store in FIFO 0 if filter matches

110: Set priority and store in FIFO 1 if filter matches

111: Store into Rx Buffer or as debug message, configuration of EFT[1:0] ignored

F0 Bits 28:0 EFID1[28:0]:Extended Filter ID 1

First ID of extended ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of an extended message to be stored. The received identifiers must match exactly, only MCANnXIDAM masking mechanism (see **Section (e), Extended Message ID Filtering**) is used.

F1 Bits 31:30 EFT[1:0]: Extended Filter Type

00: Range filter from EFID1 to EFID2 (EFID2 ≥ EFID1)

01: Dual ID filter for EFID1 or EFID2

10: Classic filter: EFID1 = filter, EFID2 = mask

11: Range filter from EFID1 to EFID2 (EFID2 ≥ EFID1), MCANnXIDAM mask not applied

F1 Bits 28:0 EFID2[28:0]:Extended Filter ID 2

This bit field has a different meaning depending on the configuration of EFEC:

1) EFEC: “001” to ”110”Second ID of extended ID filter element

2) EFEC: “111”Filter for Rx Buffers or for debug messages

EFID2[10:9]: These bits decide whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.
00: Store message into an Rx Buffer
01: Debug Message A
10: Debug Message B
11: Debug Message C

EFID2[8:6]: These bits are used to control the filter event pins m_can_fe[2:0] at the Extension Interface. A one at the respective bit position enables generation of a pulse at the related filter event pin with the duration of one m_can_hclk (CLK_HSB) period in case the filter matches.

EFID2[5:0]: These bits define the offset to the Rx Buffer Start Address MCANnRXBC.RBSA for storage of a matching message.

19.5.3 Functional Description

19.5.3.1 Operating Modes

(1) Software Initialization

Software initialization is started by setting bit MCANnCCCR.INIT, either by software or by a hardware reset, when an uncorrected bit error was detected in the Message RAM, or by going Bus_Off. While MCANnCCCR.INIT is set, message transfer from and to the CAN bus is stopped, the status of the CAN bus output m_can_tx is recessive (HIGH). The counters of the Error Management Logic EML are unchanged. Setting MCANnCCCR.INIT does not change any configuration register. Resetting MCANnCCCR.INIT finishes the software initialization. Afterwards the Bit Stream Processor BSP synchronizes itself to the data transfer on the CAN bus by waiting for the occurrence of a sequence of 11 consecutive recessive bits (≡ Bus_Idle) before it can take part in bus activities and start the message transfer.

Access to the M_CAN configuration registers is only enabled when both bits MCANnCCCR.INIT and MCANnCCCR.CCE are set (protected write).

MCANnCCCR.CCE can only be set/reset while MCANnCCCR.INIT = ‘1’. MCANnCCCR.CCE is automatically reset when MCANnCCCR.INIT is reset.

The following registers are reset when MCANnCCCR.CCE is set

- MCANnHPMS - High Priority Message Status
- MCANnRXF0S - Rx FIFO 0 Status
- MCANnRXF1S - Rx FIFO 1 Status
- MCANnTXFQS - Tx FIFO/Queue Status
- MCANnTXBRP - Tx Buffer Request Pending
- MCANnTXBTO - Tx Buffer Transmission Occurred
- MCANnTXBCF - Tx Buffer Cancellation Finished
- MCANnTXEFS - Tx Event FIFO Status

The Timeout Counter value MCANnTOCV.TOC is preset to the value configured by MCANnTOCC.TOP when MCANnCCCR.CCE is set.

In addition the state machines of the Tx Handler and Rx Handler are held in idle state while MCANnCCCR.CCE = ‘1’.

The following registers are only writable while MCANnCCCR.CCE = ‘0’

- MCANnTXBAR - Tx Buffer Add Request
- MCANnTXBCR - Tx Buffer Cancellation Request

MCANnCCCR.TEST and MCANnCCCR.MON can only be set by the Host while MCANnCCCR.INIT = ‘1’ and MCANnCCCR.CCE = ‘1’. Both bits may be reset at any time. MCANnCCCR.DAR can only be set/reset while MCANnCCCR.INIT = ‘1’ and MCANnCCCR.CCE = ‘1’.

(2) Normal Operation

Once the M_TTCAN is initialized and MCANnCCCR.INIT is reset to *zero*, the M_CAN synchronizes itself to the CAN bus and is ready for communication.

After passing the acceptance filtering, received messages including Message ID and DLC are stored into a dedicated Rx Buffer or into Rx FIFO 0 or Rx FIFO 1.

For messages to be transmitted dedicated Tx Buffers and/or a Tx FIFO or a Tx Queue can be initialized or updated. Automated transmission on reception of remote frames is not implemented.

(3) CAN FD Operation

There are two variants in the CAN FD frame transmission, first the CAN FD frame without bit rate switching. The second variant is the CAN FD frame where control field, data field, and CRC field of a CAN frame are transmitted with a higher bit rate than the beginning and the end of the frame.

The previously reserved bit in CAN frames with 11-bit identifiers and the first previously reserved bit in CAN frames with 29-bit identifiers will now be decoded as FDF bit. FDF = recessive signifies a CAN FD frame, FDF = dominant signifies a Classic CAN frame. In a CAN FD frame, the two bits following FDF, res and BRS, decide whether the bit rate inside of this CAN FD frame is switched. A CAN FD bit rate switch is signified by res = dominant and BRS = recessive. The coding of res = recessive is reserved for future expansion of the protocol. In case the M_CAN receives a frame with FDF = recessive and res = recessive, it will signal a Protocol Exception Event by setting bit PSR.PXE. When Protocol Exception Handling is enabled (MCANnCCCR.PXHD = ‘0’), this causes the operation state to change from Receiver (MCANnPSR.ACT = “10”) to Integrating (MCANnPSR.ACT = “00”) at the next sample point. In case Protocol Exception Handling is disabled (MCANnCCCR.PXHD = ‘1’), the M_CAN will treat a recessive res bit as an form error and will respond with an error frame.

CAN FD operation is enabled by programming MCANnCCCR.FDOE. In case MCANnCCCR.FDOE = ‘1’, transmission and reception of CAN FD frames is enabled. Transmission and reception of Classic CAN frames is always possible. Whether a CAN FD frame or a Classic CAN frame is transmitted can be configured via bit FDF in the respective Tx Buffer element. With MCANnCCCR.FDOE = ‘0’, received frames are interpreted as Classic CAN frames, which leads to the transmission of an error frame when receiving a CAN FD frame. When CAN FD operation is disabled, no CAN FD frames are transmitted even if bit FDF of a Tx Buffer element is set. MCANnCCCR.FDOE and MCANnCCCR.BRSE can only be changed while MCANnCCCR.INIT and MCANnCCCR.CCE are both set.

With MCANnCCCR.FDOE = ‘0’, the setting of bits FDF and BRS is ignored and frames are transmitted in Classic CAN format. With MCANnCCCR.FDOE = ‘1’ and MCANnCCCR.BRSE = ‘0’, only bit FDF of a Tx Buffer element is evaluated. With MCANnCCCR.FDOE = ‘1’ and MCANnCCCR.BRSE = ‘1’, transmission of CAN FD frames with bit rate switching is enabled. All Tx Buffer elements with bits FDF and BRS set are transmitted in CAN FD format with bit rate switching

A mode change during CAN operation is only recommended under the following conditions:

- The failure rate in the CAN FD data phase is significant higher than in the CAN FD arbitration phase. In this case disable the CAN FD bit rate switching option for transmissions.
- During system startup all nodes are transmitting Classic CAN messages until it is verified that they are able to communicate in CAN FD format. If this is true, all nodes switch to CAN FD

operation.

- Wake-up messages in CAN Partial Networking have to be transmitted in Classic CAN format.
- End-of-line programming in case not all nodes are CAN FD capable. Non CAN FD nodes are held in Silent mode until programming has completed. Then all nodes switch back to Classic CAN communication.

In the CAN FD format, the coding of the DLC differs from the standard CAN format. The DLC codes 0 to 8 have the same coding as in standard CAN, the codes 9 to 15, which in standard CAN all code a data field of 8 bytes, are coded according to **Table 19.65, Coding of DLC in CAN FD** below.

Table 19.65 Coding of DLC in CAN FD

DLC	9	10	11	12	13	14	15
Number of Data Bytes	12	16	20	24	32	48	64

In CAN FD frames, the bit timing will be switched inside the frame, after the BRS (Bit Rate Switch) bit, if this bit is recessive. Before the BRS bit, in the CAN FD arbitration phase, the standard CAN bit timing is used as defined by the Nominal Bit Timing & Prescaler Register MCANnNBTP. In the following CAN FD data phase, the data phase bit timing is used as defined by the Data Bit Timing & Prescaler Register MCANnDBTP. The bit timing is switched back from the fast timing at the CRC delimiter or when an error is detected, whichever occurs first.

The maximum configurable bit rate in the CAN FD data phase depends on the CAN clock frequency (m_can_cclk: CLKP_H2). Example: with a CAN clock frequency of 20MHz and the shortest configurable bit time of 4 tq, the bit rate in the data phase is 5 Mbit/s.

In both data frame formats, CAN FD long and CAN FD with bit rate switching , the value of the bit ESI (Error Status Indicator) is determined by the transmitter's error state at the start of the transmission. If the transmitter is error passive, ESI is transmitted recessive, else it is transmitted dominant.

(4) Transmitter Delay Compensation

During the data phase of a CAN FD transmission only one node is transmitting, all others are receivers. The length of the bus line has no impact. When transmitting via pin m_can_tx the protocol controller receives the transmitted data from its local CAN transceiver via pin m_can_rx. The received data is delayed by the CAN transceiver's loop delay. In case this delay is greater than TSEG1 (time segment before sample point), a bit error is detected. In order to enable a data phase bit time that is even shorter than the transceiver loop delay, the delay compensation is introduced. Without transmitter delay compensation, the bit rate in the data phase of a CAN FD frame is limited by the transceivers loop delay.

(a) Description

The CAN FD protocol unit has implemented a delay compensation mechanism to compensate the CAN transceiver's loop delay, thereby enabling transmission with higher bit rates during the CAN FD data phase independent of the delay of a specific CAN transceiver.

To check for bit errors during the data phase of transmitting nodes, the delayed transmit data is compared against the received data at the Secondary Sample Point SSP. If a bit error is detected, the transmitter will react on this bit error at the next following regular sample point. During arbitration phase the delay compensation is always disabled.

The transmitter delay compensation enables configurations where the data bit time is shorter than the transmitter delay, it is described in detail in the ISO11898-1:2015. It is enabled by setting bit MCANnDBTP.TDC.

The received bit is compared against the transmitted bit at the SSP. The SSP position is defined as the sum of the measured delay from the CAN FD transmit output m_can_tx through the transceiver to the receive input m_can_rx plus the transmitter delay compensation offset as configured by MCANnTDCR.TDCO. The transmitter delay compensation offset is used to adjust the position of the SSP inside the received bit (e.g. half of the bit time in the data phase). The position of the secondary sample point is rounded down to the next integer number of mtq.

MCANnPSR.TDCV shows the actual transmitter delay compensation value. MCANnPSR.TDCV is cleared when MCANnCCCR.INIT is set and is updated at each transmission of an FD frame while MCANnDBTP.TDC is set.

The following boundary conditions have to be considered for the transmitter delay compensation implemented in the M_CAN:

- The sum of the measured delay from m_can_tx to m_can_rx and the configured transmitter delay compensation offset MCANnTDCR.TDCO has to be less than 6 bit times in the data phase.
- The sum of the measured delay from m_can_tx to m_can_rx and the configured transmitter delay compensation offset MCANnTDCR.TDCO has to be less or equal 127 mtq. In case this sum exceeds 127 mtq, the maximum value of 127 mtq is used for transmitter delay compensation.
- The data phase ends at the sample point of the CRC delimiter, that stops checking of receive bits at the SSPs

(b) Transmitter Delay Compensation Measurement

If transmitter delay compensation is enabled by programming MCANnDBTP.TDC = ‘1’, the measurement is started within each transmitted CAN FD frame at the falling edge of bit FDF to bit res. The measurement is stopped when this edge is seen at the receive input m_can_rx of the transmitter. The resolution of this measurement is one mtq

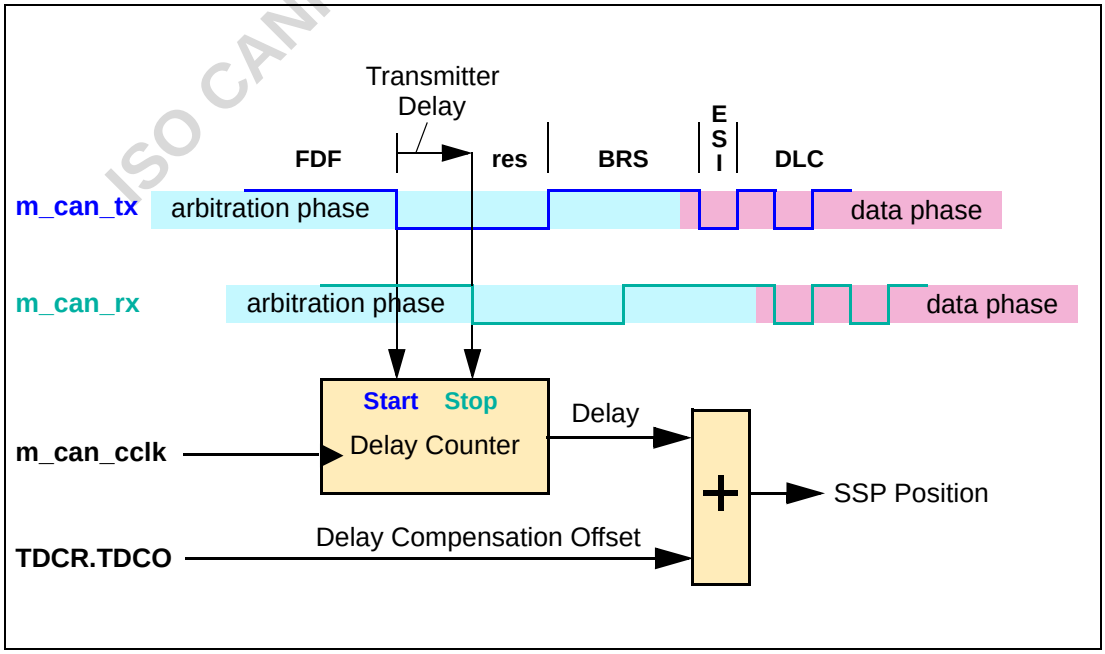

Figure 19.5 Transmitter delay measurement

To avoid that a dominant glitch inside the received FDF bit ends the delay compensation measurement before the falling edge of the received res bit, resulting in a to early SSP position, the use of a transmitter delay compensation filter window can be enabled by programming MCANnTDCR.TDCF.

This defines a minimum value for the SSP position. Dominant edges on m_can_rx, that would result in an earlier SSP position are ignored for transmitter delay measurement. The measurement is stopped when the SSP position is at least MCANnTDCR.TDCF AND m_can_rx is low.

(5) Restricted Operation Mode

In Restricted Operation Mode the node is able to receive data and remote frames and to give acknowledge to valid frames, but it does not send data frames, remote frames, active error frames, or overload frames. In case of an error condition or overload condition, it does not send dominant bits, instead it waits for the occurrence of bus idle condition to resynchronize itself to the CAN communication. The error counters(MCANnECR.REC, MCANnECR.TEC) are frozen while Error Logging (MCANnECR.CEL) is active. The Host can set the M_CAN into Restricted Operation mode by setting bit MCANnCCCR.ASM. The bit can only be set by the Host when both MCANnCCCR.CCE and MCANnCCCR.INIT are set to '1'. The bit can be reset by the Host at any time.

Restricted Operation Mode is automatically entered when the Tx Handler was not able to read data from the Message RAM in time. To leave Restricted Operation Mode, the Host CPU has to reset MCANnCCCR.ASM.

The Restricted Operation Mode can be used in applications that adapt themselves to different CAN bit rates. In this case the application tests different bit rates and leaves the Restricted Operation Mode after it has received a valid frame.

If the M_CAN is connected to a Clock Calibration on CAN unit, MCANnCCCR.ASM is controlled by input m_can_cok. In case m_can_cok switches to '0', bit MCANnCCCR.ASM is set. When m_can_cok switches back to '1', bit MCANnCCCR.ASM returns to the previously written value. When there is no Clock Calibration on CAN unit connected input m_can_cok is hardwired to '1'.

NOTE

The Restricted Operation Mode must not be combined with the Loop Back Mode (internal or external).

(6) Bus Monitoring Mode

The M_CAN is set in Bus Monitoring Mode by programming MCANnCCCR.MON to one. In Bus Monitoring Mode (see ISO11898-1:2015, 10.12 Bus monitoring), the M_TTCAN is able to receive valid data frames and valid remote frames, but cannot start a transmission. In this mode, it sends only recessive bits on the CAN bus. If the M_TTCAN is required to send a dominant bit (ACK bit, overload flag, active error flag), the bit is rerouted internally so that the M_TTCAN monitors this dominant bit, although the CAN bus may remain in recessive state. In Bus Monitoring Mode register MCANnTXBRP is held in reset state.

The Bus Monitoring Mode can be used to analyze the traffic on a CAN bus without affecting it by the transmission of dominant bits. **Figure 19.6** shows the connection of signals m_can_tx and m_can_rx to the M_CAN in Bus Monitoring Mode.

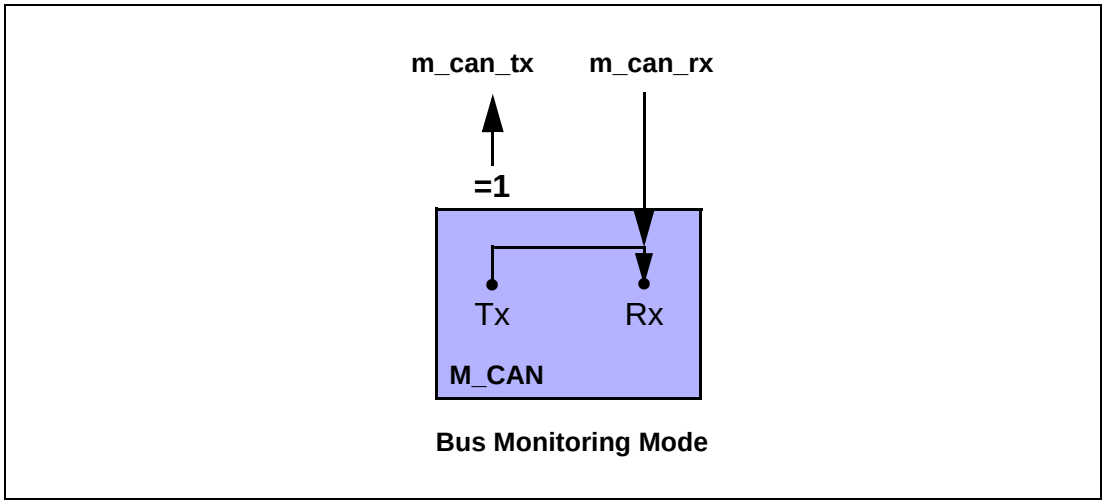

Figure 19.6 Pin Control in Bus Monitoring Mode

(7) Disabled Automatic Retransmission

According to the CAN Specification (see ISO11898-1:2015, 6.3.3 Recovery Management), the M_TTCAN provides means for automatic retransmission of frames that have lost arbitration or that have been disturbed by errors during transmission. By default automatic retransmission is enabled. To support time-triggered communication as described in ISO 11898-1, chapter 9.2, the automatic retransmission may be disabled via MCANnCCCR.DAR.

(a) Frame Transmission in DAR Mode

In DAR mode all transmissions are automatically cancelled after they started on the CAN bus. A Tx Buffer's Tx Request Pending bit MCANnTXBRP.TRPx is reset after successful transmission, when a transmission has not yet been started at the point of cancellation, has been aborted due to lost arbitration, or when an error occurred during frame transmission.

- Successful transmission:
  Corresponding Tx Buffer Transmission Occurred bit MCANnTXBTO.TOx set
  Corresponding Tx Buffer Cancellation Finished bit MCANnTXBCF.CFx not set
- Successful transmission in spite of cancellation:
  Corresponding Tx Buffer Transmission Occurred bit MCANnTXBTO.TOx set
  Corresponding Tx Buffer Cancellation Finished bit MCANnTXBCF.CFx set
- Arbitration lost or frame transmission disturbed:
  Corresponding Tx Buffer Transmission Occurred bit MCANnTXBTO.TOx not set
  Corresponding Tx Buffer Cancellation Finished bit MCANnTXBCF.CFx set

In case of a successful frame transmission, and if storage of Tx events is enabled, a Tx Event FIFO element is written with Event Type ET = "10" (transmission in spite of cancellation).

(8) Power Down (Sleep Mode)

The M_TTCAN can be set into power down mode by using CC Control Register MCANnCCCR.CSR. When all pending transmission requests have completed, the M_TTCAN waits until bus idle state is detected. Then the M_TTCAN sets then MCANnCCCR.INIT to one to prevent any further CAN transfers. Now the M_TTCAN acknowledges that it is ready for power down by setting MCANnCCCR.CSA to one. In this state, before the clocks are switched off, further register accesses can be made. A write access to MCANnCCCR.INIT will have no effect. Now the module clock inputs m_can_hclk (CLK_HSB) and m_can_cclk (CLKP_H2) may be switched off.

To leave power down mode, the application has to turn on the module clocks before resetting CC Control Register flag MCANnCCCR.CSR. The M_CAN will acknowledge this by resetting MCANnCCCR.CSA. Afterwards, the application can restart CAN communication by resetting bit MCANnCCCR.INIT.

(9) Test Modes

To enable write access to register MCANnTEST (see **(4) MCANnTEST — Test Register**), bit MCANnCCCR.TEST has to be set to one. This allows the configuration of the test modes and test functions.

Four output functions are available for the CAN transmit pin m_can_tx by programming MCANnTEST.TX. Additionally to its default function – the serial data output – it can drive the CAN Sample Point signal to monitor the M_CAN's bit timing and it can drive constant dominant or recessive values. The actual value at pin m_can_rx can be read from MCANnTEST.RX. Both functions can be used to check the CAN bus' physical layer.

Due to the synchronization mechanism between CAN clock and Host clock domain, there may be a delay of several Host clock periods between writing to MCANnTEST.TX until the new configuration is visible at output pin m_can_tx. This applies also when reading input pin m_can_rx via MCANnTEST.RX.

NOTE

Test modes should be used for production tests or self test only. The software control for pin m_can_tx interferes with all CAN protocol functions. It is not recommended to use test modes for application.

(a) External Loop Back Mode

The M_CAN can be set in External Loop Back Mode by programming MCANnTEST.LBCK to one. In Loop Back Mode, the M_CAN treats its own transmitted messages as received messages and stores them (if they pass acceptance filtering) into an Rx Buffer or an Rx FIFO. **Figure 19.7, Pin Control in Loop Back Modes** shows the connection of signals m_can_tx and m_can_rx to the M_CAN in External Loop Back Mode.

This mode is provided for hardware self-test. To be independent from external stimulation, the M_CAN ignores acknowledge errors (recessive bit sampled in the acknowledge slot of a data/remote frame) in Loop Back Mode. In this mode the M_CAN performs an internal feedback from its Tx output to its Rx input. The actual value of the m_can_rx input pin is disregarded by the M_CAN. The transmitted messages can be monitored at the m_can_tx pin.

(b) Internal Loop Back Mode

Internal Loop Back Mode is entered by programming bits MCANnTEST.LBCK and MCANnCCCR.MON to one. This mode can be used for a “Hot Selftest”, meaning the M_TTCAN can be tested without affecting a running CAN system connected to the pins m_can_tx and m_can_rx. In this mode pin m_can_rx is disconnected from the M_CAN and pin m_can_tx is held recessive. **Figure 19.7, Pin Control in Loop Back Modes** shows the connection of m_can_tx and m_can_rx to the M_CAN in case of Internal Loop Back Mode.

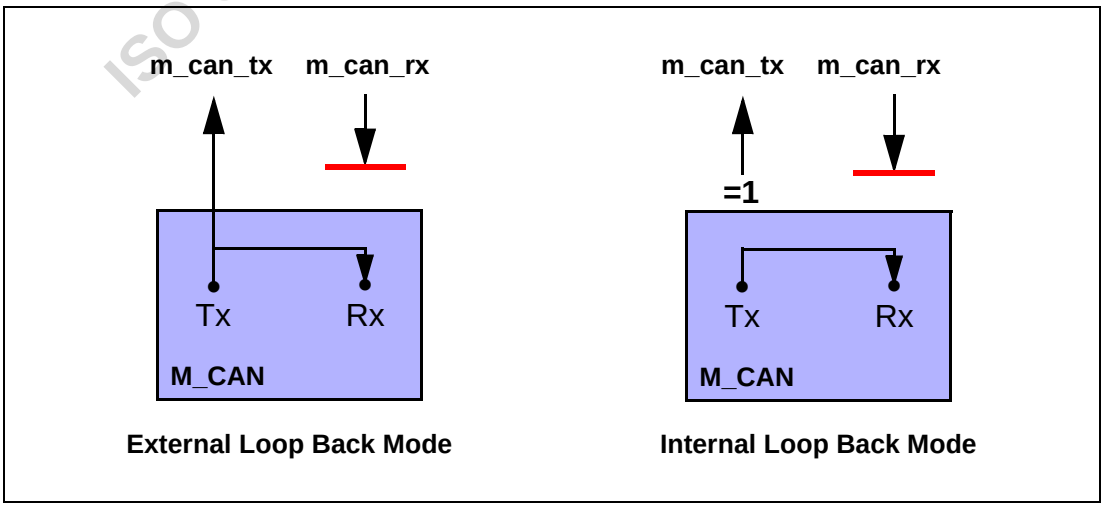

Figure 19.7 Pin Control in Loop Back Modes

19.5.3.2 Timestamp Generation

For timestamp generation the M_CAN supplies a 16-bit wrap-around counter. A prescaler MCANnTSCC.TCP can be configured to clock the counter in multiples of CAN bit times (1 to 16). The counter is readable via MCANnTSCV.TSC. A write access to register MCANnTSCV resets the counter to zero. When the timestamp counter wraps around interrupt flag MCANnIR.TSW is set.

On start of frame reception / transmission the counter value is captured and stored into the timestamp section of an Rx Buffer / Rx FIFO (RXTS[15:0]) or Tx Event FIFO (TXTS[15:0]) element.

By programming bit MCANnTSCC.TSS an external 16-bit timestamp can be used.

19.5.3.3 Timeout Counter

To signal timeout conditions for Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO the M_CAN supplies a 16-bit Timeout Counter. It operates as down-counter and uses the same prescaler controlled by MCANnTSCC.TCP as the Timestamp Counter. The Timeout Counter is configured via register MCANnTOCC. The actual counter value can be read from MCANnTOCV.TOC. The Timeout Counter can only be started while MCANnCCCR.INIT = '0'. It is stopped when MCANnCCCR.INIT = '1', e.g. when the M_CAN enters Bus_Off state.

The operation mode is selected by MCANnTOCC.TOS. When operating in Continuous Mode, the counter starts when MCANnCCCR.INIT is reset. A write to MCANnTOCV presets the counter to the value configured by MCANnTOCC.TOP and continues down-counting.

When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MCANnTOCC.TOP. Down-counting is started when the first FIFO element is stored. Writing to MCANnTOCV has no effect.

When the counter reaches zero, interrupt flag MCANnIR.TOO is set. In Continuous Mode, the counter is immediately restarted at MCANnTOCC.TOP.

NOTE

The clock signal for the Timeout Counter is derived from the CAN Core's sample point signal. Therefore the point in time where the Timeout Counter is decremented may vary due to the synchronization / re-synchronization mechanism of the CAN Core. If the bit rate switch feature in CAN FD is used, the timeout counter is clocked differently in arbitration and data field.

19.5.3.4 Rx Handling

The Rx Handler controls the acceptance filtering, the transfer of received messages to the Rx Buffers or to one of the two Rx FIFOs, as well as the Rx FIFO's Put and Get Indices.

(1) Acceptance Filtering

The M_CAN offers the possibility to configure two sets of acceptance filters, one for standard identifiers and one for extended identifiers. These filters can be assigned to an Rx Buffer or to Rx FIFO 0,1. For acceptance filtering each list of filters is executed from element #0 until the first matching element. Acceptance filtering stops at the first matching element. The following filter elements are not evaluated for this message.

The main features are:

- Each filter element can be configured as
  - range filter (from - to)
  - filter for one or two dedicated IDs
  - classic bit mask filter
- Each filter element is configurable for acceptance or rejection filtering
- Each filter element can be enabled / disabled individually
- Filters are checked sequentially, execution stops with the first matching filter element

Related configuration registers are:

- Global Filter Configuration MCANnGFC
- Standard ID Filter Configuration MCANnSIDFC
- Extended ID Filter Configuration MCANnXIDFC
- Extended ID AND Mask MCANnXIDAM

Depending on the configuration of the filter element (SFEC/EFEC) a match triggers one of the following actions:

- Store received frame in FIFO 0 or FIFO 1
- Store received frame in Rx Buffer
- Store received frame in Rx Buffer and generate pulse at filter event pin
- Reject received frame
- Set High Priority Message interrupt flag MCANnIR.HPM
- Set High Priority Message interrupt flag MCANnIR.HPM and store received frame in FIFO 0 or FIFO 1

Acceptance filtering is started after the complete identifier has been received. After acceptance filtering has completed, and if a matching Rx Buffer or Rx FIFO has been found, the Message Handler starts writing the received message data in portions of 32 bit to the matching Rx Buffer or Rx FIFO. If the CAN protocol controller has detected an error condition (e.g. CRC error), this message is discarded with the following impact on the affected Rx Buffer or Rx FIFO:

Rx Buffer

New Data flag of matching Rx Buffer is not set, but Rx Buffer (partly) overwritten with received data. For error type see MCANnPSR.LEC respectively MCANnPSR.DLEC.

Rx FIFO

Put index of matching Rx FIFO is not updated, but related Rx FIFO element (partly) overwritten with received data. For error type see MCANnPSR.LEC respectively MCANnPSR.DLEC. In case the matching Rx FIFO is operated in overwrite mode, the boundary conditions described in **(b) Rx FIFO Overwrite Mode** have to be considered.

NOTE

When an accepted message is written to one of the two Rx FIFOs, or into an Rx Buffer, the unmodified received identifier is stored independent of the filter(s) used. The result of the acceptance filter process is strongly depending on the sequence of configured filter elements.

(a) Range Filter

The filter matches for all received frames with Message IDs in the range defined by SF1ID/SF2ID resp. EF1ID/EF2ID.

There are two possibilities when range filtering is used together with extended frames:

EFT: “00”: The Message ID of received frames is ANDed with the Extended ID AND Mask (MCANnXIDAM) before the range filter is applied

EFT: “11”: The Extended ID AND Mask (MCANnXIDAM) is not used for range filtering

(b) Filter for specific IDs

A filter element can be configured to filter for one or two specific Message IDs. To filter for one specific Message ID, the filter element has to be configured with SF1ID = SF2ID resp. EF1ID = EF2ID.

(c) Classic Bit Mask Filter

Classic bit mask filtering is intended to filter groups of Message IDs by masking single bits of a received Message ID. With classic bit mask filtering SF1ID/EF1ID is used as Message ID filter, while SF2ID/EF2ID is used as filter mask.

A zero bit at the filter mask will mask out the corresponding bit position of the configured ID filter, e.g. the value of the received Message ID at that bit position is not relevant for acceptance filtering. Only those bits of the received Message ID where the corresponding mask bits are one are relevant for acceptance filtering.

In case all mask bits are one, a match occurs only when the received Message ID and the Message ID filter are identical. If all mask bits are zero, all Message IDs match.

(d) Standard Message ID Filtering

Figure 19.8, Standard Message ID Filter Path below shows the flow for standard Message ID (11-bit Identifier) filtering. The Standard Message ID Filter element is described in **(5) Standard Message ID Filter Element**.

Controlled by the Global Filter Configuration MCANnGFC and the Standard ID Filter Configuration MCANnSIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

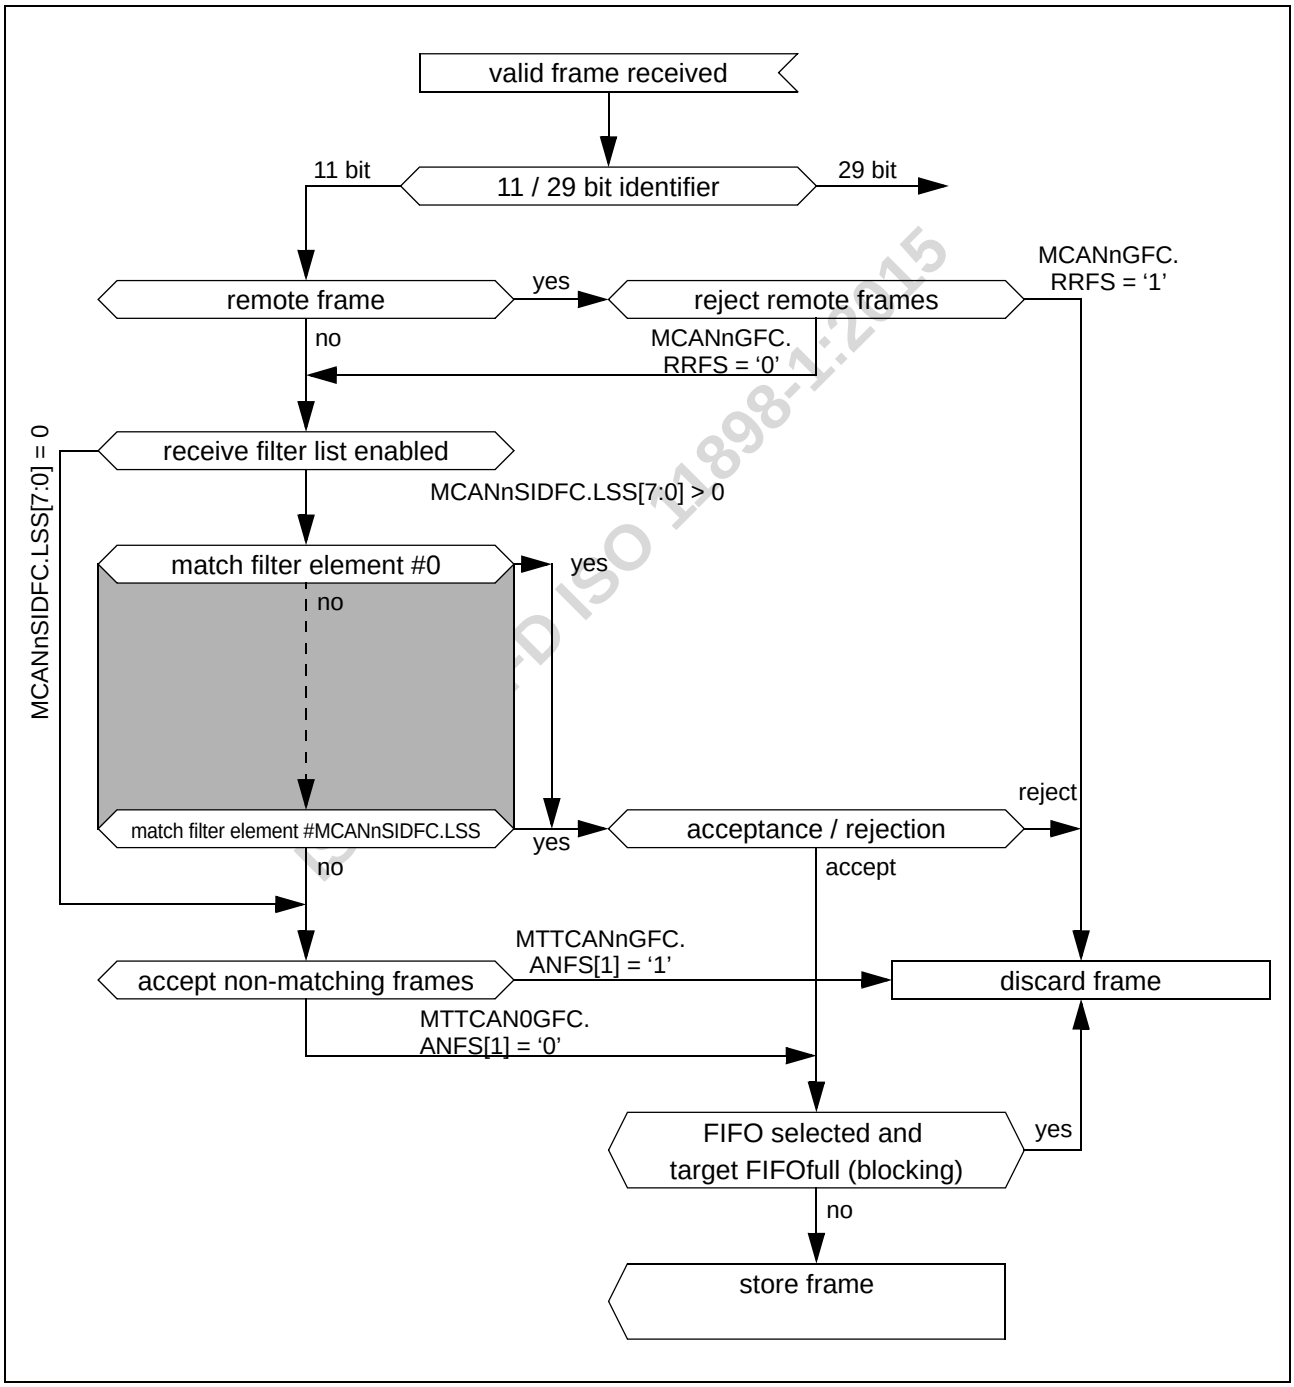

Figure 19.8 Standard Message ID Filter Path

(e) Extended Message ID Filtering

Figure 19.9, Extended Message ID Filter Path below shows the flow for extended Message ID (29-bit Identifier) filtering. The Extended Message ID Filter element is described in **(6) Extended Message ID Filter Element**.

Controlled by the Global Filter Configuration MCANnGFC and the Extended ID Filter Configuration MCANnXIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

The Extended ID AND Mask MCANnXIDAM is ANDed with the received identifier before the filter list is executed.

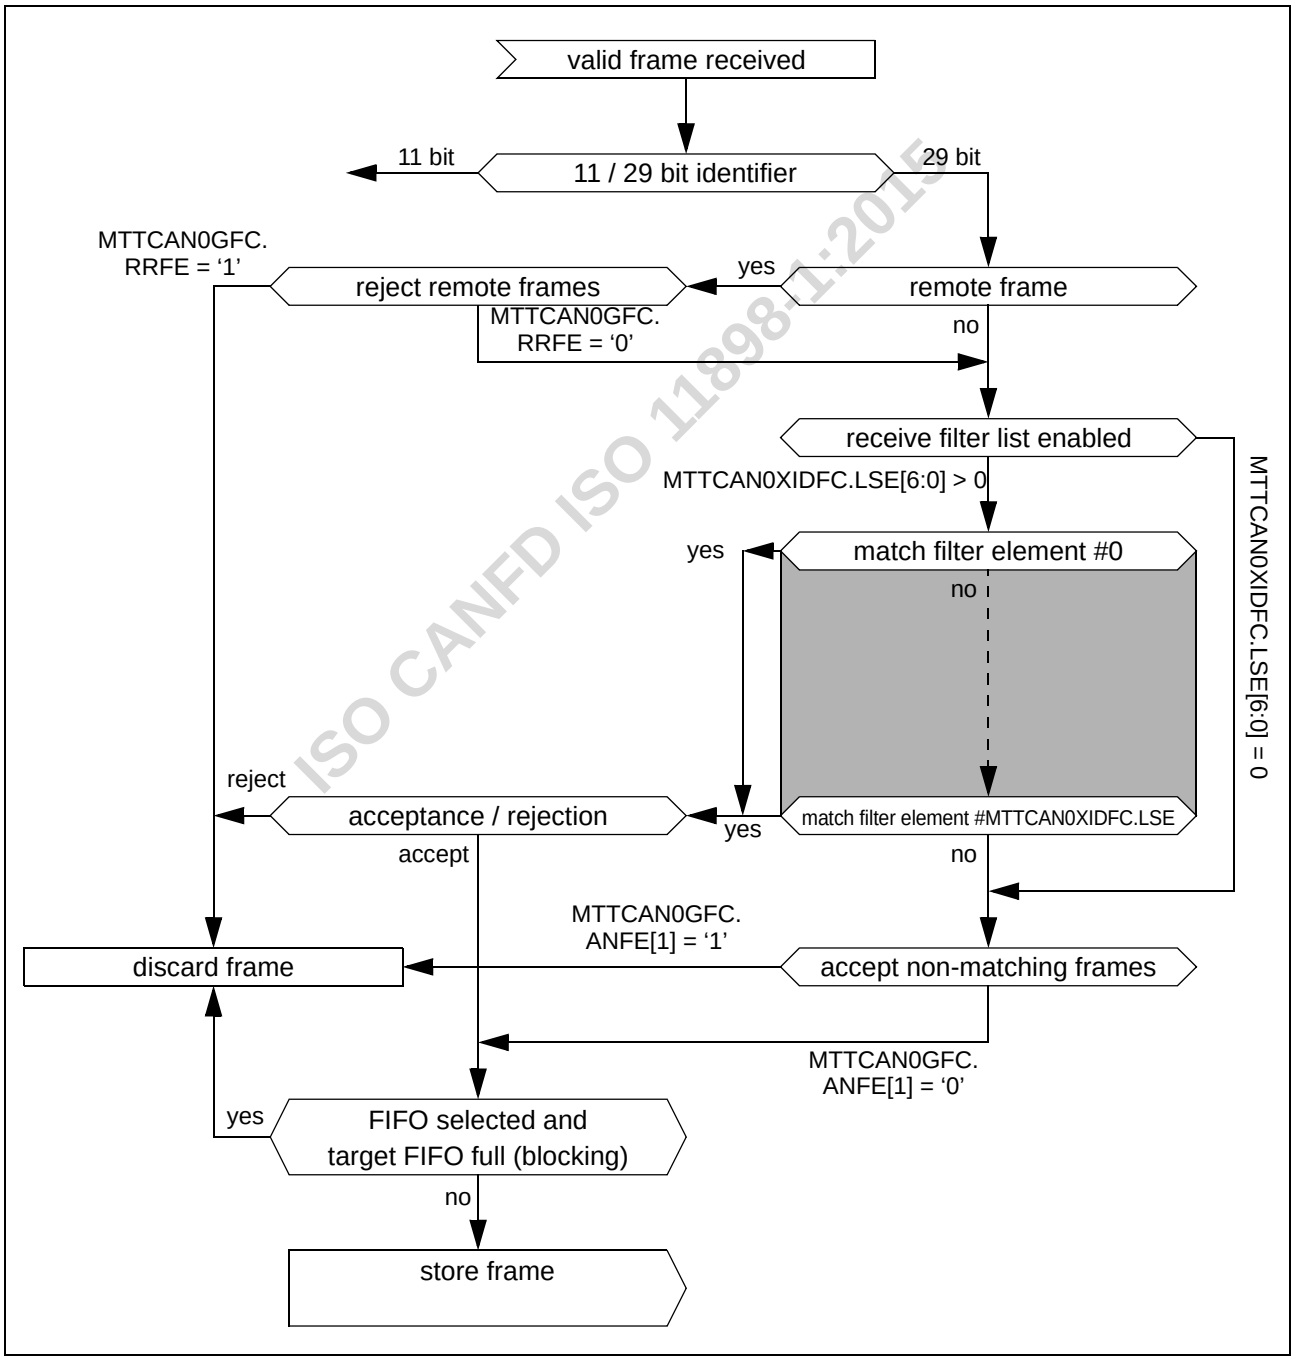

Figure 19.9 Extended Message ID Filter Path

(2) Rx FIFOs

Rx FIFO 0 and Rx FIFO 1 can be configured to hold up to 64 elements each. Configuration of the two Rx FIFOs is done via registers MCANnRXF0C and MCANnRXF1C.

Received messages that passed acceptance filtering are transferred to the Rx FIFO as configured by the matching filter element. For a description of the filter mechanisms available for Rx FIFO 0 and Rx FIFO 1 see **(1) Acceptance Filtering**. The Rx FIFO element is described in **(2) Rx Buffer and FIFO Element**.

To avoid an Rx FIFO overflow, the Rx FIFO watermark can be used. When the Rx FIFO fill level reaches the Rx FIFO watermark configured by RXFnC.FnWM, interrupt flag MCANnIR.RFnW is set. When the Rx FIFO Put Index reaches the Rx FIFO Get Index an Rx FIFO Full condition is signalled by RXFnS.FnF. In addition interrupt flag MCANnIR.RFnF is set.

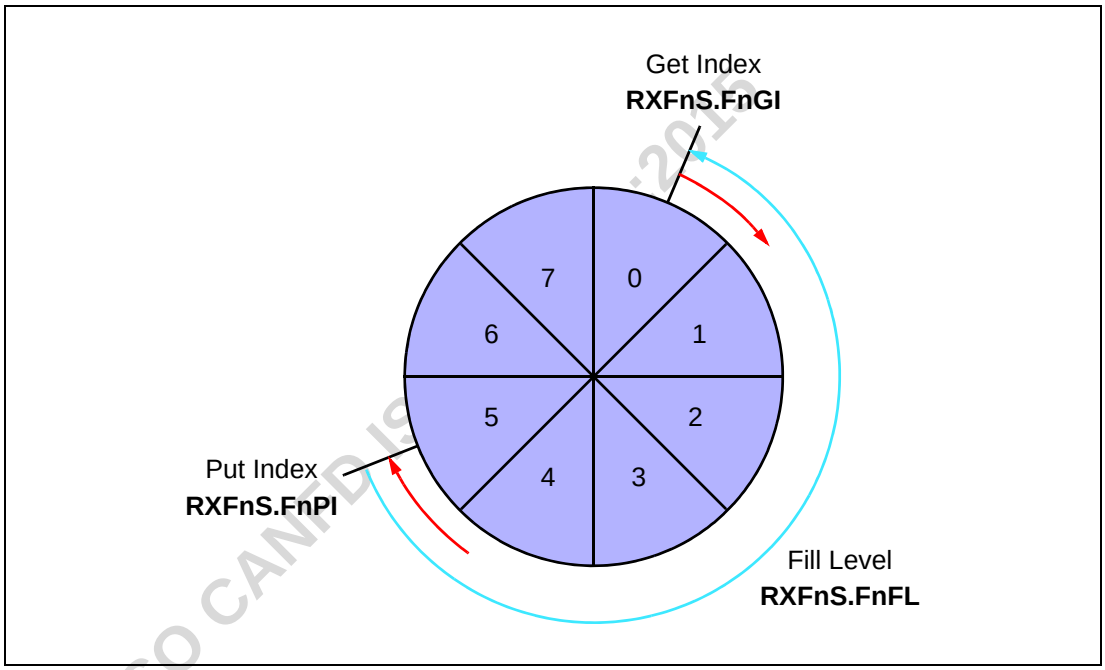

Figure 19.10 Rx FIFO Status

When reading from an Rx FIFO, Rx FIFO Get Index RXFnS.FnGI • FIFO Element Size has to be added to the corresponding Rx FIFO start address RXFnC.FnSA.

Table 19.66 Rx Buffer / FIFO Element Size

MCANnRXESC.RBDS[2:0] MCANnRXESC.FnDS[2:0]	Data Field [bytes]	FIFO Element Size [RAM words]
000	8	4
001	12	5
010	16	6
011	20	7
100	24	8
101	32	10
110	48	14
111	64	18

(a) Rx FIFO Blocking Mode

The Rx FIFO blocking mode is configured by RXFnC.FnOM = '0'. This is the default operation mode for the Rx FIFOs.

When an Rx FIFO full condition is reached (RXFnS.FnPI = RXFnS.FnGI), no further messages are written to the corresponding Rx FIFO until at least one message has been read out and the Rx FIFO Get Index has been incremented. An Rx FIFO full condition is signalled by RXFnS.FnF = '1'. In addition interrupt flag MCANnIR.RFnF is set.

In case a message is received while the corresponding Rx FIFO is full, this message is discarded and the message lost condition is signalled by RXFnS.RFnL = '1'. In addition interrupt flag MCANnIR.RFnL is set.

(b) Rx FIFO Overwrite Mode

The Rx FIFO overwrite mode is configured by RXFnC.FnOM = '1'.

When an Rx FIFO full condition (RXFnS.FnPI = RXFnS.FnGI) is signalled by RXFnS.FnF = '1', the next message accepted for the FIFO will overwrite the oldest FIFO message. Put and get index are both incremented by one.

When an Rx FIFO is operated in overwrite mode and an Rx FIFO full condition is signalled, reading of the Rx FIFO elements should start at least at get index + 1. The reason for that is, that it might happen, that a received message is written to the Message RAM (put index) while the CPU is reading from the Message RAM (get index). In this case inconsistent data may be read from the respective Rx FIFO element. Adding an offset to the get index when reading from the Rx FIFO avoids this problem. The offset depends on how fast the CPU accesses the Rx FIFO. **Figure 19.11, Rx FIFO Overflow Handling** shows an offset of two with respect to the get index when reading the Rx FIFO. In this case the two messages stored in element 1 and 2 are lost.

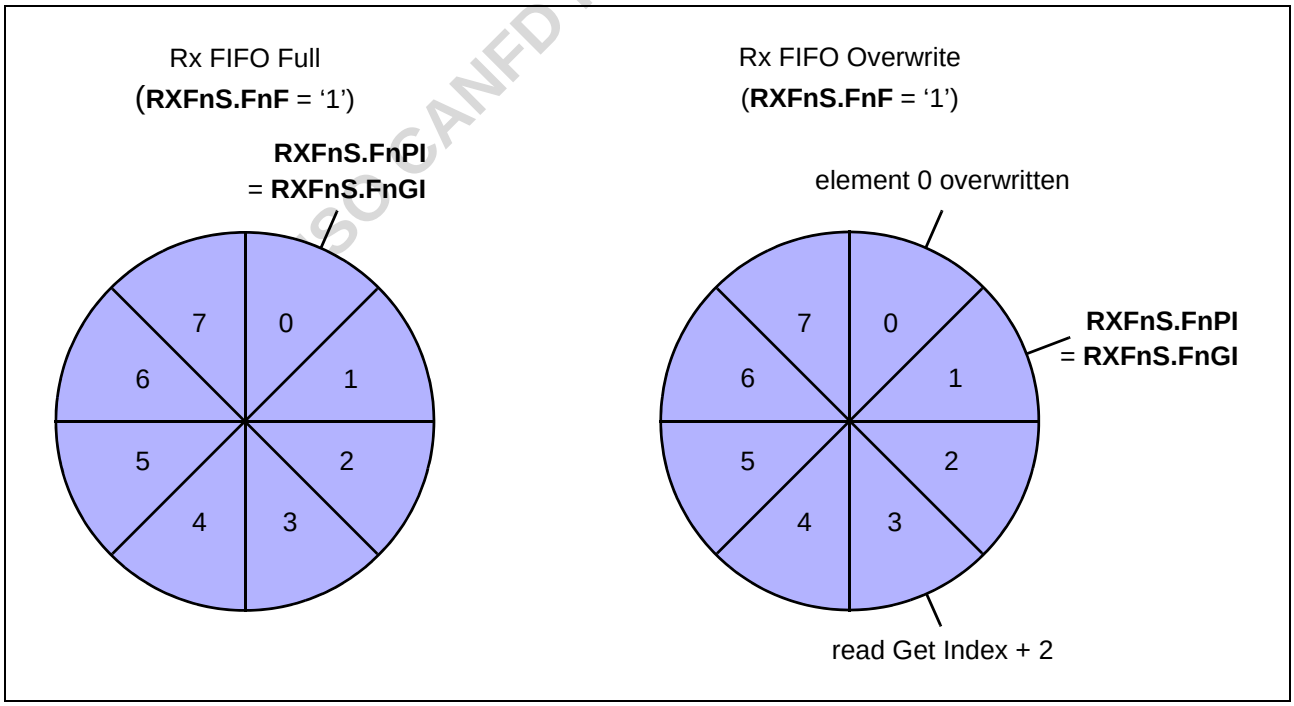

Figure 19.11 Rx FIFO Overflow Handling

After reading from the Rx FIFO, the number of the last element read has to be written to the Rx FIFO Acknowledge Index RXFnA.FnA. This increments the get index to that element number. In case the put index has not been incremented to this Rx FIFO element, the Rx FIFO full condition is reset (RXFnS.FnF = '0').

(3) Dedicated Rx Buffers

The M_CAN supports up to 64 dedicated Rx Buffers. The start address of the dedicated Rx Buffer section is configured via MCANnRXBC.RBSA.

For each Rx Buffer a Standard or Extended Message ID Filter Element with SFEC / EFEC = “111” and SFID2 / EFID2[10:9] = “00” has to be configured (see **(5) Standard Message ID Filter Element** and **(6) Extended Message ID Filter Element**).

After a received message has been accepted by a filter element, the message is stored into the Rx Buffer in the Message RAM referenced by the filter element. The format is the same as for an Rx FIFO element. In addition the flag MCANnIR.DRX (Message stored in Dedicated Rx Buffer) in the interrupt register is set.

Table 19.67 Example Filter Configuration for Rx Buffers

Filter Element	SFID1[10:0] EFID1[28:0]	SFID2[10:9] EFID2[10:9]	SFID2[5:0] EFID2[5:0]
0	ID message 1	00	00 0000
1	ID message 2	00	00 0001
2	ID message 3	00	00 0010

After the last word of a matching received message has been written to the Message RAM, the respective New Data flag in register MCANnNDAT1, 2 is set. As long as the New Data flag is set, the respective Rx Buffer is locked against updates from received matching frames. The New Data flags have to be reset by the Host by writing a ‘1’ to the respective bit position.

While an Rx Buffer’s New Data flag is set, a Message ID Filter Element referencing this specific Rx Buffer will not match, causing the acceptance filtering to continue. Following Message ID Filter Elements may cause the received message to be stored into another Rx Buffer, or into an Rx FIFO, or the message may be rejected, depending on filter configuration.

(a) Rx Buffer Handling

- Reset interrupt flag MCANnIR.DRX
- Read New Data registers
- Read messages from Message RAM
- Reset New Data flags of processed messages

(4) Debug on CAN Support

Debug messages are stored into Rx Buffers. For debug handling three consecutive Rx buffers (e.g. #61, #62, #63) have to be used for storage of debug messages A, B, and C. The format is the same as for an Rx Buffer or an Rx FIFO element (see M_CAN User’s Manual section 2.4.2).

Advantage: Fixed start address for the DMA transfers (relative to MCANnRXBC.RBSA), no additional configuration required.

For filtering of debug messages Standard / Extended Filter Elements with SFEC / EFEC = “111” have to be set up. Messages matching these filter elements are stored into the Rx Buffers addressed by SFID2 / EFID2[5:0].

After message C has been stored, the DMA request output m_can_dma_req is activated and the three messages can be read from the Message RAM under DMA control. The RAM words holding the debug messages will not be changed by the M_CAN while m_can_dma_req is activated. The behaviour is similar to that of an Rx Buffers with its New Data flag set.

After the DMA has completed the DMA unit sets m_ttcan_dma_ack. This resets m_can_dma_req. Now the M_TTCAN is prepared to receive the next set of debug messages.

(a) Filtering for Debug Messages

Filtering for debug messages is done by configuring one Standard / Extended Message ID Filter Element for each of the three debug messages. To enable a filter element to filter for debug messages SFEC / EFEC has to be programmed to “111”. In this case fields SFID1 / SFID2 and EFID1 / EFID2 have a different meaning (see Section 2.4.5 and Section 2.4.6). While SFID2 / EFID2[10:9] controls the debug message handling state machine, SFID2 / EFID2[5:0] controls the location for storage of a received debug message.

When a debug message is stored, neither the respective New Data flag nor MCANnIR.DRX are set. The reception of debug messages can be monitored via MCANnRXF1S.DMS

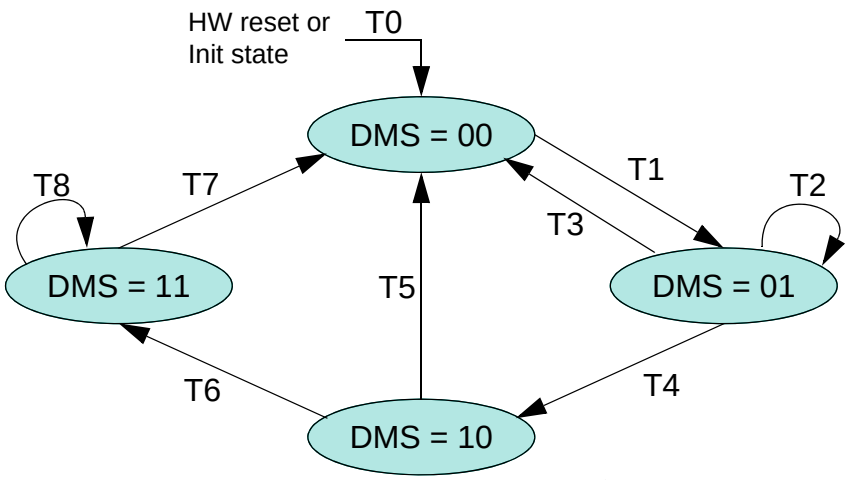
Table 19.68 Example Filter Configuration for Debug Message

Filter Element	SFID1[10:0] EFID1[28:0]	SFID2[10:9] EFID2[10:9]	SFID2[5:0] EFID2[5:0]
0	ID debug message A	01	11 1101
1	ID debug message B	10	11 1110
2	ID debug message C	11	11 1111

(b) Debug Message Handling

The debug message handling state machine assures that debug messages are stored to three consecutive Rx Buffers in correct order. In case of missing messages the process is restarted. The DMA request is activated only when all three debug messages A, B, C have been received in correct order.

The status of the debug message handling state machine is signalled via RXF1S.DMS



T0: reset m_can_dma_req output, enable reception of debug messages A, B, and C
T1: reception of debug message A
T2: reception of debug message A
T3: reception of debug message C
T4: reception of debug message B
T5: reception of debug messages A, B
T6: reception of debug message C
T7: DMA transfer completed
T8: reception of debug message A,B,C (message rejected)

Figure 19.12 Debug Message Handling State Machine

19.5.3.5 Tx Handling

The Tx Handler handles transmission requests for the dedicated Tx Buffers, the Tx FIFO, and the Tx Queue. It controls the transfer of transmit messages to the CAN Core, the Put and Get Indices, and the Tx Event FIFO. Up to 32 Tx Buffers can be set up for message transmission. The CAN mode for transmission (Classic CAN or CAN FD) can be configured separately for each Tx Buffer element. The Tx Buffer element is described in **(3) Tx Buffer Element**. **Table 19.69** below describes the possible configurations for frame transmission

Table 19.69 Possible Configurations for Frame Transmission

CCCR		Tx Buffer Element		
BRSE	FDOE	FDF	BRS	Frame Transmission
ignored	0	ignored	ignored	Classic CAN
0	1	0	ignored	Classic CAN
0	1	1	ignored	FD without bit rate switching
1	1	0	ignored	Classic CAN
1	1	1	0	FD without bit rate switching
1	1	1	1	FD with bit rate switching

NOTE

AUTOSAR requires at least three Tx Queue Buffers and support of transmit cancellation

The Tx Handler starts a Tx scan to check for the highest priority pending Tx request (Tx Buffer with lowest Message ID) when the Tx Buffer Request Pending register MCANnTXBRP is updated, or when a transmission has been started.

(1) Transmit Pause

The transmit pause feature is intended for use in CAN systems where the CAN message identifiers are (permanently) specified to specific values and cannot easily be changed. These message identifiers may have a higher CAN arbitration priority than other defined messages, while in a specific application their relative arbitration priority should be inverse. This may lead to a case where one ECU sends a burst of CAN messages that cause another ECU's CAN messages to be delayed because that other messages have a lower CAN arbitration priority.

If e.g. CAN ECU-1 has the transmit pause feature enabled and is requested by its application software to transmit four messages, it will, after the first successful message transmission, wait for two CAN bit times of bus idle before it is allowed to start the next requested message. If there are other ECUs with pending messages, those messages are started in the idle time, they would not need to arbitrate with the next message of ECU-1. After having received a message, ECU-1 is allowed to start its next transmission as soon as the received message releases the CAN bus.

The transmit pause feature is controlled by bit MCANnCCCR.TXP. If the bit is set, the M_CAN will, each time it has successfully transmitted a message, pause for two CAN bit times before starting the next transmission. This enables other CAN nodes in the network to transmit messages even if their messages have lower prior identifiers. Default is transmit pause disabled (MCANnCCCR.TXP = '0').

This feature looses up burst transmissions coming from a single node and it protects against "babbling idiot" scenarios where the application program erroneously requests too many transmissions.

(2) Dedicated Tx Buffers

Dedicated Tx Buffers are intended for message transmission under complete control of the Host CPU. Each Dedicated Tx Buffer is configured with a specific Message ID. In case that multiple Tx Buffers are configured with the same Message ID, the Tx Buffer with the lowest buffer number is transmitted first.

If the data section has been updated, a transmission is requested by an Add Request via MCANnTXBAR.ARn. The requested messages arbitrate internally with messages from an optional Tx FIFO or Tx Queue and externally with messages on the CAN bus, and are sent out according to their Message ID.

A Dedicated Tx Buffer allocates Element Size 32-bit words in the Message RAM (see **Table 19.70, Tx Buffer / FIFO / Queue Element Size**). Therefore the start address of a dedicated Tx Buffer in the Message RAM is calculated by adding transmit buffer index (0 to 31) • Element Size to the Tx Buffer Start Address MCANnTXBC.TBSA.

Table 19.70 Tx Buffer / FIFO / Queue Element Size

MCANnTXESC.TBDS[2:0]	Data Field [bytes]	Element Size [RAM words]
000	8	4
001	12	5
010	16	6
011	20	7
100	24	8
101	32	10
110	48	14
111	64	18

(3) Tx FIFO

Tx FIFO operation is configured by programming MCANnTXBC.TFQM to ‘0’. Messages stored in the Tx FIFO are transmitted starting with the message referenced by the Get Index MCANnTXFQS.TFGI. After each transmission the Get Index is incremented cyclically until the Tx FIFO is empty. The Tx FIFO enables transmission of messages with the same Message ID from different Tx Buffers in the order these messages have been written to the Tx FIFO. The M_CAN calculates the Tx FIFO Free Level MCANnTXFQS.TFFL as difference between Get and Put Index. It indicates the number of available (free) Tx FIFO elements.

New transmit messages have to be written to the Tx FIFO starting with the Tx Buffer referenced by the Put Index MCANnTXFQS.TFQPI. An Add Request increments the Put Index to the next free Tx FIFO element. When the Put Index reaches the Get Index, Tx FIFO Full (MCANnTXFQS.TFQF = ‘1’) is signalled. In this case no further messages should be written to the Tx FIFO until the next message has been transmitted and the Get Index has been incremented.

When a single message is added to the Tx FIFO, the transmission is requested by writing a ‘1’ to the MCANnTXBAR bit related to the Tx Buffer referenced by the Tx FIFO’s Put Index.

When multiple (n) messages are added to the Tx FIFO, they are written to n consecutive Tx Buffers starting with the Put Index. The transmissions are then requested via MCANnTXBAR. The Put Index is then cyclically incremented by n. The number of requested Tx buffers should not exceed the number of free Tx Buffers as indicated by the Tx FIFO Free Level.

When a transmission request for the Tx Buffer referenced by the Get Index is cancelled, the Get Index is incremented to the next Tx Buffer with pending transmission request and the Tx FIFO Free Level is recalculated. When transmission cancellation is applied to any other Tx Buffer, the Get Index and the FIFO Free Level remain unchanged.

A Tx FIFO element allocates Element Size 32-bit words in the Message RAM (see **Table 19.70, Tx Buffer / FIFO / Queue Element Size**). Therefore the start address of the next available (free) Tx FIFO Buffer is calculated by adding Tx FIFO/Queue Put Index MCANnTXFQS.TFQPI (0 to 31) • Element Size to the Tx Buffer Start Address MCANnTXBC.TBSA.

(4) Tx Queue

Tx Queue operation is configured by programming MCANnTXBC.TFQM to ‘1’. Messages stored in the Tx Queue are transmitted starting with the message with the lowest Message ID (highest priority). In case that multiple Queue Buffers are configured with the same Message ID, the Queue Buffer with the lowest buffer number is transmitted first.

New messages have to be written to the Tx Buffer referenced by the Put Index MCANnTXFQS.TFQPI. An Add Request cyclically increments the Put Index to the next free Tx Buffer. In case that the Tx Queue is full (MCANnTXFQS.TFQF = ’1’), the Put Index is not valid and no further message should be written to the Tx Queue until at least one of the requested messages has been sent out or a pending transmission request has been cancelled.

The application may use register MCANnTXBRP instead of the Put Index and may place messages to any Tx Buffer without pending transmission request.

A Tx Queue Buffer allocates Element Size 32-bit words in the Message RAM (see **Table 19.70, Tx Buffer / FIFO / Queue Element Size**). Therefore the start address of the next available (free) Tx Queue Buffer is calculated by adding Tx FIFO/Queue Put Index MCANnTXFQS.TFQPI (0 to 31) • Element Size to the Tx Buffer Start Address MCANnTXBC.TBSA.

(5) Mixed Dedicated Tx Buffers / Tx FIFO

In this case the Tx Buffers section in the Message RAM is subdivided into a set of Dedicated Tx Buffers and a Tx FIFO. The number of Dedicated Tx Buffers is configured by MCANnTXBC.NDTB. The number of Tx Buffers assigned to the Tx FIFO is configured by MCANnTXBC.TFQS. In case MCANnTXBC.TFQS is programmed to zero, only Dedicated Tx Buffers are used.

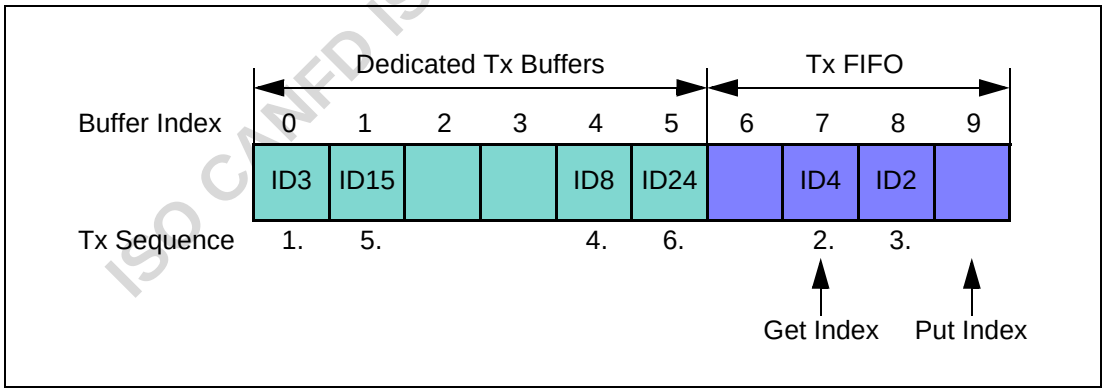


Figure 19.13 Example of mixed Configuration Dedicated Tx Buffers / Tx FIFO

Tx prioritization:

- Scan Dedicated Tx Buffers and oldest pending Tx FIFO Buffer (referenced by TXFS.TFGI)
- Buffer with lowest Message ID gets highest priority and is transmitted next

(6) Mixed Dedicated Tx Buffers / Tx Queue

In this case the Tx Buffers section in the Message RAM is subdivided into a set of Dedicated Tx Buffers and a Tx Queue. The number of Dedicated Tx Buffers is configured by MCANnTXBC.NDTB. The number of Tx Queue Buffers is configured by MCANnTXBC.TFQS. In case MCANnTXBC.TFQS is programmed to zero, only Dedicated Tx Buffers are used.

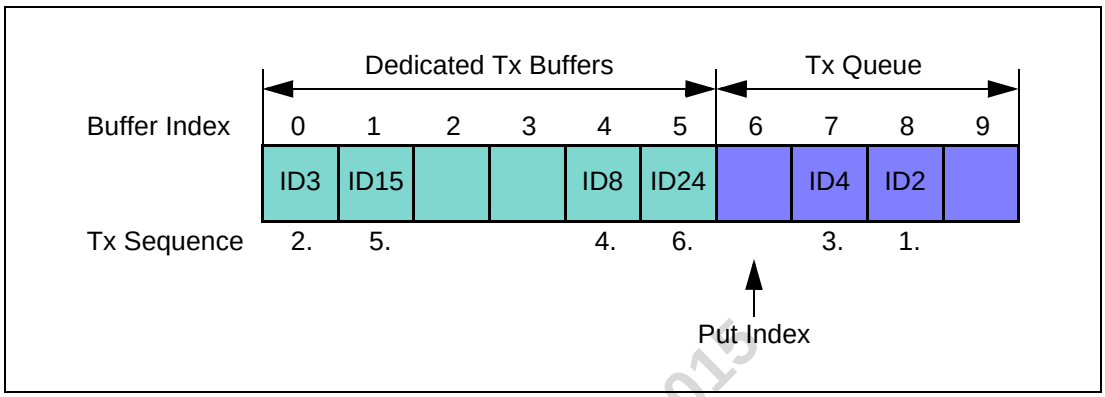

Figure 19.14 Example of mixed Configuration Dedicated Tx Buffers / Tx Queue

Tx prioritization:

- Scan all Tx Buffers with activated transmission request
- Tx Buffer with lowest Message ID gets highest priority and is transmitted next

(7) Transmit Cancellation

The M_CAN supports transmit cancellation. This feature is especially intended for gateway applications and AUTOSAR based applications. To cancel a requested transmission from a dedicated Tx Buffer or a Tx Queue Buffer the Host has to write a '1' to the corresponding bit position (= number of Tx Buffer) of register MCANnTXBCR. Transmit cancellation is not intended for Tx FIFO operation.

Successful cancellation is signalled by setting the corresponding bit of register MCANnTXBCF to '1'.

In case a transmit cancellation is requested while a transmission from a Tx Buffer is already ongoing, the corresponding MCANnTXBRP bit remains set as long as the transmission is in progress. If the transmission was successful, the corresponding MCANnTXBTO and MCANnTXBCF bits are set. If the transmission was not successful, it is not repeated and only the corresponding MCANnTXBCF bit is set.

NOTE

In case a pending transmission is cancelled immediately before this transmission could have been started, there follows a short time window where no transmission is started even if another message is also pending in this node. This may enable another node to transmit a message which may have a lower priority than the second message in this node.

(8) Tx Event Handling

To support Tx event handling the M_CAN has implemented a Tx Event FIFO. After the M_CAN has transmitted a message on the CAN bus, Message ID and timestamp are stored in a Tx Event FIFO element. To link a Tx event to a Tx Event FIFO element, the Message Marker from the transmitted Tx Buffer is copied into the Tx Event FIFO element.

The Tx Event FIFO can be configured to a maximum of 32 elements. The Tx Event FIFO element is described in **(4) Tx Event FIFO Element**.

The purpose of the Tx Event FIFO is to decouple handling transmit status information from transmit message handling i.e. a Tx Buffer holds only the message to be transmitted, while the transmit status is stored separately in the Tx Event FIFO. This has the advantage, especially when operating a dynamically managed transmit queue, that a Tx Buffer can be used for a new message immediately after successful transmission. There is no need to save transmit status information from a Tx Buffer before overwriting that Tx Buffer.

When a Tx Event FIFO full condition is signalled by MCANnIR.TEFF, no further elements are written to the Tx Event FIFO until at least one element has been read out and the Tx Event FIFO Get Index has been incremented. In case a Tx event occurs while the Tx Event FIFO is full, this event is discarded and interrupt flag MCANnIR.TEFL is set.

To avoid a Tx Event FIFO overflow, the Tx Event FIFO watermark can be used. When the Tx Event FIFO fill level reaches the Tx Event FIFO watermark configured by MCANnTXEFC.EFWM, interrupt flag MCANnIR.TEFW is set.

When reading from the Tx Event FIFO, two times the Tx Event FIFO Get Index MCANnTXEFS.EFGI has to be added to the Tx Event FIFO start address MCANnTXEFC.EFSA.

19.5.3.6 FIFO Acknowledge Handling

The Get Indices of Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO are controlled by writing to the corresponding FIFO Acknowledge Index (see **(28) MCANnRXF0A — Rx FIFO 0 Acknowledge**, **(32) MCANnRXF1A — Rx FIFO 1 Acknowledge**, and **(46) MCANnTXEFA — Tx Event FIFO Acknowledge**). Writing to the FIFO Acknowledge Index will set the FIFO Get Index to the FIFO Acknowledge Index plus *one* and thereby updates the FIFO Fill Level. There are two use cases:

When only a single element has been read from the FIFO (the one being pointed to by the Get Index), this Get Index value is written to the FIFO Acknowledge Index.

When a sequence of elements has been read from the FIFO, it is sufficient to write the FIFO Acknowledge Index only once at the end of that read sequence (value: Index of the last element read), to update the FIFO's Get Index.

Due to the fact that the CPU has free access to the M_CAN's Message RAM, special care has to be taken when reading FIFO elements in an arbitrary order (Get Index not considered). This might be useful when reading a High Priority Message from one of the two Rx FIFOs. In this case the FIFO's Acknowledge Index should not be written because this would set the Get Index to a wrong position and also alters the FIFO's Fill Level. In this case some of the older FIFO elements would be lost.

NOTE

The application has to ensure that a valid value is written to the FIFO Acknowledge Index. The M_CAN does not check for erroneous values.

19.6 M_TTCAN

19.6.1 Overview

The M_TTCAN module is the new TTCAN Communication Controller IP-module. The M_TTCAN performs communication according to ISO 11898-1:2015 and according to ISO 11898-4 (Time-triggered communication on CAN). The M_TTCAN provides all features of time-triggered communication specified in ISO 11898-4, including event synchronized time-triggered communication, global system time, and clock drift compensation. The CAN FD option can be used together with event-triggered and time-triggered CAN communication.

The message storage is intended to be a single-ported Message RAM outside of the module. It is connected to the M_TTCAN via the Generic Master Interface.

All functions concerning the handling of messages are implemented by the Rx Handler and the Tx Handler. The Rx Handler manages message acceptance filtering, the transfer of received messages from the CAN Core to the Message RAM as well as providing receive message status information. The Tx Handler is responsible for the transfer of transmit messages from the Message RAM to the CAN Core as well as providing transmit status information. It implements all functions concerning the time schedule and the global system time.

Acceptance filtering is implemented by a combination of up to 128 filter elements where each one can be configured as a range, as a bit mask, or as a dedicated ID filter.

The M_TTCAN's clock domain concept allows the separation between the high precision CAN clock and the Host clock, which may be generated by an FM-PLL.

19.6.1.1 Features

- Conform with ISO11898-1:2015 and ISO 11898-4
- CAN FD with up to 64 data bytes supported
- TTCAN protocol level 1 and level 2 completely in hardware
- Event synchronized time-triggered communication supported
- CAN Error Logging
- AUTOSAR optimized
- SAE J1939 optimized
- Improved acceptance filtering
- Two configurable Receive FIFOs
- Separate signalling on reception of High Priority Messages
- Up to 64 dedicated Receive Buffers
- Up to 32 dedicated Transmit Buffers
- Configurable Transmit FIFO
- Configurable Transmit Queue
- Configurable Transmit Event FIFO
- Direct Message RAM access for Host CPU
- Programmable loop-back test mode
- Maskable module interrupts
- 8/16/32 bit Generic Slave Interface for connection customer-specific Host CPUs
- Two clock domains (CAN clock and Host clock)
- Power-down support
- Debug on CAN support

19.6.1.2 Block Diagram

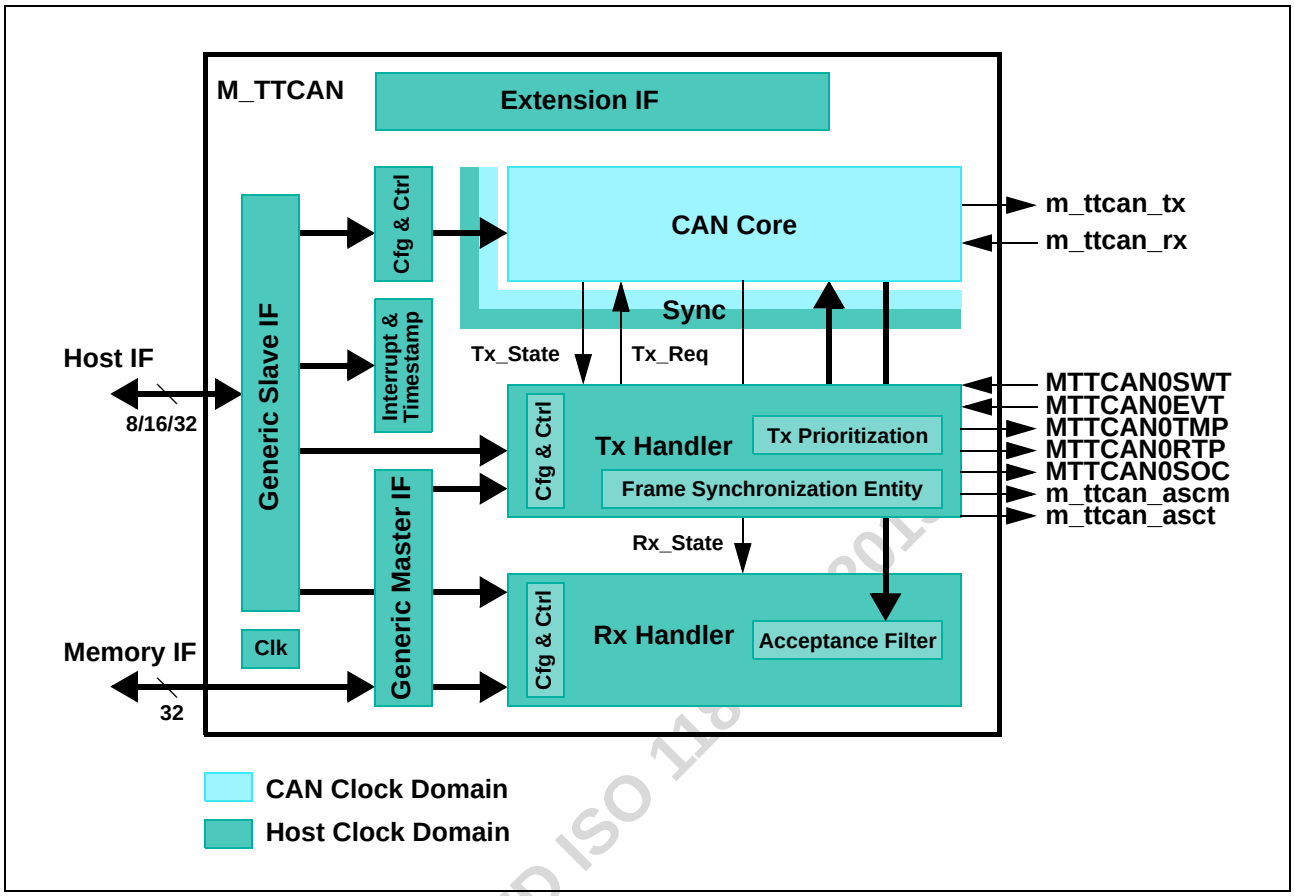

Figure 19.15 M_TTCAN Block Diagram

CAN Core

CAN Protocol Controller and Rx/Tx Shift Register. Handles all ISO 11898-1 protocol functions. Supports 11-bit and 29-bit identifiers.

Sync

Synchronizes signals from the Host clock domain to the CAN clock domain and vice versa.

Clk

Synchronizes reset signal to the Host clock domain and to the CAN clock domain.

Cfg & Ctrl

CAN Core related configuration and control bits.

Interrupt & Timestamp

Interrupt control and 16-bit CAN bit time counter for receive and transmit timestamp generation. An externally generated 16-bit vector may substitute the integrated 16-bit CAN bit time counter for receive and transmit timestamp generation.

Tx Handler

Controls the message transfer from the external Message RAM to the CAN Core. A maximum of 32 Tx Buffers can be configured for transmission. Tx buffers can be used as dedicated Tx Buffers, as Tx FIFO, part of a Tx Queue, or as a combination of them. A Tx Event FIFO stores Tx timestamps together with the corresponding Message ID. Transmit cancellation is also supported.

The Tx Handler also implements the Frame Synchronization Entity FSE which controls time-triggered communication according to ISO11898-4. It synchronizes itself to the reference messages on the CAN bus, controls cycle time and global time, and handles transmissions according to the predefined message schedule, the system matrix. It also handles the time marks of the system matrix that are linked to the messages in the Message RAM. Stop Watch Trigger, Event Trigger, and Time Mark Interrupt are synchronization interfaces.

Rx Handler

Controls the transfer of received messages from the CAN Core to the external Message RAM. The Rx Handler supports two Receive FIFOs, each of configurable size, and up to 64 dedicated Rx Buffers for storage of all messages that have passed acceptance filtering. A dedicated Rx Buffer, in contrast to a Receive FIFO, is used to store only messages with a specific identifier. An Rx timestamp is stored together with each message. Up to 128 filters can be defined for 11-bit IDs and up to 64 filters for 29-bit IDs.

Generic Slave Interface

Connects the M_TTCAN to a customer specific Host CPU. The Generic Slave Interface is capable to connect to an 8/16/32-bit bus to support a wide range of interconnection structures.

Generic Master Interface

Connects the M_TTCAN to a local 32-bit Message RAM. The implemented Message RAM size is 2K • 32 bit.

Extension Interface

All flags from the Interrupt Register MTTCAN0IR and TT Interrupt Register MTTCAN0TTIR as well as selected internal status and control signals are routed to this interface. The interface is intended for connection of the M_TTCAN to a module-external interrupt unit or to other module-external components. The connection of these signals is optional.

19.6.1.3 Dual Clock Sources

To improve the EMC behavior, a spread spectrum clock can be used for the Host clock domain m_ttcan_hclk (CLK_HSB). Due to the high precision clocking requirements of the CAN Core, a separate clock without any modulation has to be provided as m_ttcan_cclk (CLKP_H2).

Within the M_TTCAN module there is a synchronization mechanism implemented to ensure save data transfer between the two clock domains.

NOTE

In order to achieve a stable function of the M_TTCAN, the Host clock must always be faster than or equal to the CAN clock. Also the modulation depth of the spread spectrum clock has to be regarded.

19.6.1.4 Dual Interrupt Lines

The module provides two interrupt lines. Interrupts can be routed either to m_ttcan_int0 (INTMTTCANI0) or to m_ttcan_int1(INTMTTCANI1). By default all interrupts are routed to interrupt line m_ttcan_int0 (INTMTTCANI0). By programming MTTCAN0ILE.EINT0 and MTTCAN0ILE.EINT1 the interrupt lines can be enabled or disabled separately.

19.6.2 Programmer's Model

19.6.2.1 Hardware Reset Description

After hardware reset, the registers of the M_TTCAN hold the reset values listed in **Table 19.71**. Additionally the Bus_Off state is reset and the output m_ttcan_tx is set to *recessive* (HIGH). The value 0001_H (MTTCAN0CCCR.INIT = '1') in the CC Control Register enables software initialization. The M_TTCAN does not influence the CAN bus until the CPU resets MTTCAN0CCCR.INIT to '0'.

19.6.2.2 Register Map

The M_TTCAN module allocates an address space of 512 bytes. All registers are organized as 32-bit registers. The M_TTCAN is accessible by the Host CPU via the Generic Slave Interface using a data width of 8 bit (byte access), 16 bit (half-word access), or 32 bit (word access). Write access by the Host CPU to registers/bits marked with "P = Protected Write" is possible only with MTTCAN0CCCR.CCE = '1' AND MTTCAN0CCCR.INIT = '1'. There is a delay from writing to a command register until the update of the related status register bits due to clock domain crossing.

(1) Access to reserved Register Addresses

In case the application software wants to access one of the reserved addresses in the M_TTCAN register map (read or write access), interrupt flag MTTCAN0IR.ARA is set, and if enable the interrupt is signalled via the assigned interrupt line (m_ttcan_int0 or m_ttcan_int1).

19.6.2.3 Registers

(1) MTTCAN0CREL — Core Release Register

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + 000_H

Value after reset: $3215\ 0323_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 19.72 MTTCAN0CREL Register Contents

Bit Position	Bit Name	Function
31 to 28	REL[3:0]	Core Release One digit, BCD-coded.
27 to 24	STEP[3:0]	Step of Core Release One digit, BCD-coded.
23 to 20	SUBSTEP[3:0]	Sub-step of Core Release One digit, BCD-coded.
19 to 16	YEAR[3:0]	Time Stamp Year One digit, BCD-coded. This field is set by generic parameter on M_TTCAN synthesis.
15 to 8	MON[7:0]	Time Stamp Month Two digits, BCD-coded. This field is set by generic parameter on M_TTCAN synthesis.
7 to 0	DAY[7:0]	Time Stamp Day Two digits, BCD-coded. This field is set by generic parameter on M_TTCAN synthesis.

Table 19.73 Coding of Revisions

Release	Step	SubStep	Year	Month	Day	Name
3	2	1	5	03	23	Revision 3.2.1, Date 2015/03/23

(2) MTTCAN0ENDN — Endian Register

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + 004_H

Value after reset: $8765\ 4321_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ETV[31:16]															
Value after reset	1	0	0	0	0	1	1	1	0	1	1	0	0	1	0	1

	ETV[15:0]															
Value after reset	0	1	0	0	0	0	1	1	0	0	1	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 19.74 MTTCAN0ENDN Register Contents

Bit Position	Bit Name	Function
31 to 0	ETV[31:0]	Endianness Test Value The endianness test value is $8765\ 4321_H$.

(3) MTTCAN0DBTP — Data Bit Timing & Prescaler Register

This register is only writable if bits MTTCAN0CCCR.CCE and MTTCAN0CCCR.INIT are set. The CAN bit time may be programed in the range of 4 to 49 time quanta. The CAN time quantum may be programmed in the range of 1 to 32 m_ttcan_cclk (CLKP_H2) periods. tq = (DBRP + 1) mtq.

DTSEG1 is the sum of Prop_Seg and Phase_Seg1. DTSEG2 is Phase_Seg2.

Therefore the length of the bit time is (programmed values) [DTSEG1 + DTSEG2 + 3] tq
or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] tq.

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $00C_H$

Value after reset: $0000\ 0A33_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	TDC	—	—	DBRP[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP

Table 19.75 MTTCAN0DBTP Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	These bits are always read as 0. When written, write the initial value.
23	TDC	Transmitter Delay Compensation 0: Transmitter Delay Compensation disabled 1: Transmitter Delay Compensation enabled
22, 21	Reserved	These bits are always read as 0. When written, write the initial value.
20 to 16	DBRP[4:0]	Data Bit Rate Prescaler 00_H to $1F_H$ The value by which the oscillator frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Bit Rate Prescaler are 0 to 31. When TDC = 1, the range is limited to 0, 1. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.
15 to 13	Reserved	These bits are always read as 0. When written, write the initial value.
12 to 8	DTSEG1[4:0]	Data time segment before sample point 00_H to $1F_H$ Valid values are 0 to 31. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.
7 to 4	DTSEG2[3:0]	Data time segment after sample point 0_H to F_H Valid values are 0 to 15. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.
3 to 0	DSJW[3:0]	Data (Re) Synchronization Jump Width 0_H to F_H Valid values are 0 to 15. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

NOTES

1. With a CAN clock (m_ttcan_cclk: CLKP_H2) of 8 MHz, the reset value of 0000 0A33H configures the M_TTCAN for a data phase bit rate of 500 kBit/s.
2. The bit rate configured for the CAN FD data phase via MTTCAN0DBTP must be higher or equal to the bit rate configured for the arbitration phase via MTTCAN0NBTP.

(4) MTTCAN0TEST — Test Register

Write access to the Test Register has to be enabled by setting bit MTTCAN0CCCR.TEST to ‘1’. All Test Register functions are set to their reset values when bit MTTCAN0CCCR.TEST is reset.

Loop Back Mode and software control of pin m_ttcan_tx are hardware test modes. Programming of TX ≠ “00” may disturb the message transfer on the CAN bus.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 010_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	—	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	RP	RP	RP	R	R	RP	RP

Table 19.76 MTTCAN0TEST Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	These bits are always read as 0. When written, write the initial value.
7	RX	Receive Pin Monitors the actual value of pin m_ttcan_rx 0: The CAN bus is dominant (m_ttcan_rx = ‘0’). 1: The CAN bus is recessive (m_ttcan_rx = ‘1’).
6, 5	TX[1:0]	Control of Transmit Pin 00: Reset value, m_ttcan_tx controlled by the CAN Core, updated at the end of the CAN bit time. 01: Sample Point can be monitored at pin m_ttcan_tx. 10: Dominant (‘0’) level at pin m_ttcan_tx 11: Recessive (‘1’) at pin m_ttcan_tx
4	LBCK	Loop Back Mode 0: Reset value, Loop Back Mode is disabled. 1: Loop Back Mode is enabled (see **(9) Test Modes**).
3	CAT	Check ASC Transmit Control Monitors level at output pin m_ttcan_asct. 0: Output pin m_ttcan_asct = ‘0’ 1: Output pin m_ttcan_asct = ‘1’
2	CAM	Check ASC Multiplexer Control Monitors level at output pin m_ttcan_ascm. 0: Output pin m_ttcan_ascm = ‘0’ 1: Output pin m_ttcan_ascm = ‘1’
1	TAT	Test ASC Transmit Control Controls output pin m_ttcan_asct in test mode, ORed with the signal from the FSE 0: Level at pin m_ttcan_asct controlled by FSE 1: Level at pin m_ttcan_asct = ‘1’
0	TAM	Test ASC Multiplexer Control Controls output pin m_ttcan_ascm in test mode, ORed with the signal from the FSE 0: Level at pin m_ttcan_ascm controlled by FSE 1: Level at pin m_ttcan_ascm = ‘1’

(5) MTTCAN0RWD — RAM Watchdog

The RAM Watchdog monitors the READY output of the Message RAM (m_ttcan_aeim_ready). A Message RAM access via the M_TTCAN's Generic Master Interface (m_ttcan_aeim_sel active) starts the Message RAM Watchdog Counter with the value configured by MTTCAN0RWD.WDC. The counter is reloaded with MTTCAN0RWD.WDC when the Message RAM signals successful completion by activating its READY output. In case there is no response from the Message RAM until the counter has counted down to zero, the counter stops and interrupt flag MTTCAN0IR.WDI is set. The RAM Watchdog Counter is clocked by the Host clock (m_ttcan_hclk: CLK_HSB).

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 014_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 19.77 MTTCAN0RWD Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are always read as 0. When written, write the initial value.
15 to 8	WDV[7:0]	Watchdog Value Actual Message RAM Watchdog Counter Value.
7 to 0	WDC[7:0]	Watchdog Configuration Start value of the Message RAM Watchdog Counter. With the reset value of "00" the counter is disabled.

(6) MTTCAN0CCCR — CC Control Register

For details about setting and resetting of single bits see **(1) Software Initialization**.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 018_H

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NISO	TXP	EFBI	PXHD	—	—	BRSE	FDOE	TEST	DAR	MON	CSR	CSA	ASM	CCE	INIT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	RP	RP	RP	RP	R	R	RP	RP	Rp	RP	Rp	R/W	R	Rp	RP	R/W

Table 19.78 MTTCAN0CCCR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are always read as 0. When written, write the initial value.
15	NISO	Non ISO Operation If this bit is set, the M_TTCAN uses the CAN FD frame format as specified by the Bosch CAN FD Specification V1.0. 0: CAN FD frame format according to ISO11898-1:2015 1: CAN FD frame format according to Bosch CAN FD Specification V1.0
14	TXP	Transmit Pause If this bit is set, the M_TTCAN pauses for two CAN bit times before starting the next transmission after itself has successfully transmitted a frame (see **(1) Transmit Pause**). 0: Transmit pause disabled 1: Transmit pause enabled
13	EFBI	Edge Filtering during Bus Integration 0: Edge filtering disabled. 1: Two consecutive dominant tq required to detect an edge for hard synchronization.
12	PXHD	Protocol Exception Handling Disable 0: Protocol exception handling enabled. 1: Protocol exception handling disabled. **NOTE** When protocol exception handling is disabled, the M_TTCAN will transmit an error frame when it detects a protocol exception condition.
11, 10	Reserved	These bits are always read as 0. When written, write the initial value.
9	BRSE	Bit Rate Switch Enable 0: Bit rate switching for transmissions disabled. 1: Bit rate switching for transmissions enabled. **NOTE** When CAN FD operation is disabled FDOE = ‘0’, BRSE is not evaluated.
8	FDOE	FD Operation Enable 0: FD operation disabled. 1: FD operation enabled.

Table 19.78 MTTCAN0CCCR Register Contents (2/2)

Bit Position	Bit Name	Function
7	TEST	Test Mode Enable 0: Normal operation, register MTTCAN0TEST holds reset values. 1: Test Mode, write access to register MTTCAN0TEST enabled.
6	DAR	Disable Automatic Retransmission 0: Automatic retransmission of messages not transmitted successfully enabled. 1: Automatic retransmission disabled
5	MON	Bus Monitoring Mode Bit MON can only be set by the Host when both CCE and INIT are set to '1'. The bit can be reset by the Host at any time. 0: Bus Monitoring Mode is disabled 1: Bus Monitoring Mode is enabled
4	CSR	Clock Stop Request 0: No clock stop is requested. 1: Clock stop requested. When clock stop is requested, first INIT and then CSA will be set after all pending transfer requests have been completed and the CAN bus reached idle.
3	CSA	Clock Stop Acknowledge 0: No clock stop acknowledged. 1: M_TTCAN may be set in power down by stopping m_ttcan_hclk (CLK_HSB) and m_ttcan_cclk (CLKP_H2).
2	ASM	Restricted Operation Mode Bit ASM can only be set by the Host when both CCE and INIT are set to '1'. The bit can be reset by the Host at any time. For a description of the Restricted Operation Mode see **(5) Restricted Operation Mode**. 0: Normal CAN operation 1: Restricted Operation Mode active
1	CCE	Configuration Change Enable 0: The CPU has no write access to the protected configuration registers. 1: The CPU has write access to the protected configuration registers (while MTTCAN0CCCR.INIT = '1').
0	INIT	Initialization 0: Normal Operation 1: Initialization is started.

NOTE

Due to the synchronization mechanism between the two clock domains, there may be a delay until the value written to INIT can be read back. Therefore the programmer has to assure that the previous value written to INIT has been accepted by reading INIT before setting INIT to a new value.

(7) MTTCAN0NBTP — Nominal Bit Timing & Prescaler Register

This register is only writable if bits MTTCAN0CCCR.CCE and MTTCAN0CCCR.INIT are set. The CAN bit time may be programed in the range of 4 to 385 time quanta. The CAN time quantum may be programmed in the range of 1 to 512 m_ttcan_cclk (CLKP_H2) periods. tq = (NBRP + 1) mtq.

NTSEG1 is the sum of Prop_Seg and Phase_Seg1. NTSEG2 is Phase_Seg2.

Therefore the length of the bit time is (programmed values) [NTSEG1 + NTSEG2 + 3] tq
or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] tq.

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $01C_H$

Value after reset: $0600\ 0A03_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	NSJW[6:0]							NBRP[8:0]								
Value after reset	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0
R/W	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NTSEG1[7:0]								—	NTSEG2[6:0]						
Value after reset	0	0	0	0	1	0	1	0	0	0	0	0	0	0	1	1
R/W	RP	RP	RP	RP	RP	RP	RP	RP	R	RP	RP	RP	RP	RP	RP	RP

Table 19.79 MTTCAN0NBTP Register Contents

Bit Position	Bit Name	Function
31 to 25	NSJW[6:0]	Nominal (Re)Synchronization Jump Width. 00_H to $7F_H$ Valid values are 0 to 127. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.
24 to 16	NBRP[8:0]	Nominal Bit Rate Prescaler 000_H to $1FF_H$ The value by which the oscillator frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Bit Rate Prescaler are 0 to 511. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.
15 to 8	NTSEG1[7:0]	Nominal Time segment before sample point 01_H to FF_H Valid values are 1 to 255. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.
7	Reserved	These bits are always read as 0.
6 to 0	NTSEG2[6:0]	Nominal Time segment after sample point 00_H to $7F_H$ Valid values are 1 to 127. The actual interpretation by the hardware of this value is such that one more than the programmed value is used.

NOTE

With a CAN clock (m_ttcan_cclk: CLKP_H2) of 8 MHz, the reset value of $0600\ 0A03_H$ configures the M_TTCAN for a bit rate of 500 kBit/s.

(8) MTTCAN0TSCC — Timestamp Counter Configuration

For a description of the Timestamp Counter see **Section 19.6.3.2, Timestamp Generation**.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 020_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	TCP[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TSS[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RP	RP

Table 19.80 MTTCAN0TSCC Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	These bits are always read as 0. When written, write the initial value.
19 to 16	TCP[3:0]	Timestamp Counter Prescaler 0_H to F_H Configures the timestamp and timeout counters time unit in multiples of CAN bit times [1 to 16]. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used. **NOTE** With CAN FD an external counter is required for timestamp generation (TSS = “10”)
15 to 2	Reserved	These bits are always read as 0.
1, 0	TSS[1:0]	Timestamp Select 00: Timestamp counter value always 0000_H 01: Timestamp counter value incremented according to TCP 10: External timestamp counter value used 11: Same as “00”

(9) MTTCAN0TSCV — Timestamp Counter Value

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 024_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSC[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC	RC

Table 19.81 MTTCAN0TSCV Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are always read as 0. When written, write the initial value.
15 to 0	TSC[15:0]	Timestamp Counter The internal/external Timestamp Counter value is captured on start of frame (both Rx and Tx). When MTTCAN0TSCC.TSS = “01”, the Timestamp Counter is incremented in multiples of CAN bit times [1 to 16] depending on the configuration of MTTCAN0TSCC.TCP. A wrap around sets interrupt flag MTTCAN0IR.TSW. Write access resets the counter to zero. When MTTCAN0TSCC.TSS = “10”, TSC reflects the external Timestamp Counter value. A write access has no impact.

NOTE

A “wrap around” is a change of the Timestamp Counter value from non-zero to zero not caused by write access to MTTCAN0TSCV.

(10) MTTCAN0TOCC — Timeout Counter Configuration

For a description of the Timeout Counter see **Section 19.6.3.3, Timeout Counter**.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 028_H

Value after reset: FFFF 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TOP[15:0]															
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TOS[1:0]		ETOC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RP	RP	RP

Table 19.82 MTTCAN0TOCC Register Contents

Bit Position	Bit Name	Function
31 to 16	TOP[15:0]	Timeout Period Start value of the Timeout Counter (down-counter). Configures the Timeout Period.
15 to 3	Reserved	These bits are always read as 0. When written, write the initial value.
2, 1	TOS[1:0]	Timeout Select When operating in Continuous mode, a write to MTTCAN0TOCV presets the counter to the value configured by MTTCAN0TOCC.TOP and continues down-counting. When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MTTCAN0TOCC.TOP. Down-counting is started when the first FIFO element is stored. 00: Continuous operation 01: Timeout controlled by Tx Event FIFO 10: Timeout controlled by Rx FIFO 0 11: Timeout controlled by Rx FIFO 1
0	ETOC	Enable Timeout Counter 0: Timeout Counter disabled 1: Timeout Counter enabled

NOTE

For use of timeout function with CAN FD see **Section 19.5.3.3, Timeout Counter**.

(11) MTTCAN0TOCV — Timeout Counter Value

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $02C_H$

Value after reset: $0000\ FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 19.84 MTTCAN0ECR Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	These bits are always read as 0.
23 to 16	CEL[7:0]	CAN Error Logging The counter is incremented each time when a CAN protocol error causes the Transmit Error Counter or the Receive Error Counter to be incremented. It is reset by read access to CEL. The counter stops at FF_H; the next increment of TEC or REC sets interrupt flag MTTCAN0IR.ELO.
15	RP	Receive Error Passive 0: The Receive Error Counter is below the error passive level of 128 1: The Receive Error Counter has reached the error passive level of 128
14 to 8	REC[6:0]	Receive Error Counter Actual state of the Receive Error Counter, values between 0 and 127
7 to 0	TEC[7:0]	Transmit Error Counter Actual state of the Transmit Error Counter, values between 0 and 255

NOTE

When MTTCAN0CCCR.ASM is set, the CAN protocol controller does not increment TEC and REC when a CAN protocol error is detected, but CEL is still incremented. This enables monitoring of collisions between CAN frames and ASC frames.

(13) MTTCAN0PSR — Protocol Status Register

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + 044_H

Value after reset: 0000 0707_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	TDCV[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	X	X	X	X	S	S	S	R	R	R	R	R	S	S	S

Table 19.85 MTTCAN0PSR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 23	Reserved	These bits are always read as 0.
22 to 16	TDCV[6:0]	Transmitter Delay Compensation Value 00_H to $7F_H$ Position of the secondary sample point, defined by the sum of the measured delay from m_ttcan_tx to m_ttcan_rx and MTTCAN0TDCR.TDCO. The SSP position is, in the data phase, the number of mtq between the start of the transmitted bit and the secondary sample point Valid values are 0 to 127 mtq.
14	PXE	Protocol Exception Event 0: No protocol exception event occurred since last read access. 1: Protocol exception event occurred.
13	RFDF	Received a CAN FD Message This bit is set independent of acceptance filtering. 0: Since this bit was reset by the CPU, no CAN FD message has been received 1: Message in CAN FD format with FDF flag set has been received
12	RBRS	BRS flag of last received CAN FD Message This bit is set together with RFDF, independent of acceptance filtering. 0: Last received CAN FD message did not have its BRS flag set 1: Last received CAN FD message had its BRS flag set
11	RESI	ESI flag of last received CAN FD Message This bit is set together with RFDF, independent of acceptance filtering. 0: Last received CAN FD message did not have its ESI flag set 1: Last received CAN FD message had its ESI flag set
10 to 8	DLEC[2:0]	Data Phase Last Error Code Type of last error that occurred in the data phase of a CAN FD format frame with its BRS flag set. Coding is the same as for LEC. This field will be cleared to zero when a CAN FD format frame with its BRS flag set has been transferred (reception or transmission) without error.
7	BO	Bus_Off Status 0: The M_TTCAN is not Bus_Off 1: The M_TTCAN is in Bus_Off state
6	EW	Warning Status 0: Both error counters are below the Error_Warning limit of 96 1: At least one of error counter has reached the Error_Warning limit of 96

Table 19.85 MTTCAN0PSR Register Contents (2/2)

Bit Position	Bit Name	Function
5	EP	Error Passive 0: The M_TTCAN is in the Error_Active state. It normally takes part in bus communication and sends an active error flag when an error has been detected 1: The M_TTCAN is in the Error_Passive state
4, 3	ACT[1:0]	Activity Monitors the module's CAN communication state. 00: Synchronizing - node is synchronizing on CAN communication 01: Idle - node is neither receiver nor transmitter 10: Receiver - node is operating as receiver 11: Transmitter - node is operating as transmitter **NOTE** ACT is set to "00" by a Protocol Exception Event.
2 to 0	LEC[2:0]	Last Error Code The LEC indicates the type of the last error to occur on the CAN bus. This field will be cleared to '0' when a message has been transferred (reception or transmission) without error. 0: No Error: No error occurred since LEC has been reset by successful reception or transmission. 1: Stuff Error: More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed. 2: Form Error: A fixed format part of a received frame has the wrong format. 3: AckError: The message transmitted by the M_TTCAN was not acknowledged by another node. 4: Bit1Error: During the transmission of a message (with the exception of the arbitration field), the device wanted to send a recessive level (bit of logical value '1'), but the monitored bus value was dominant. 5: Bit0Error: During the transmission of a message (or acknowledge bit, or active error flag, or overload flag), the device wanted to send a dominant level (data or identifier bit logical value '0'), but the monitored bus value was recessive. During Bus_Off recovery this status is set each time a sequence of 11 recessive bits has been monitored. This enables the CPU to monitor the proceeding of the Bus_Off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed). 6: CRCError: The CRC check sum of a received message was incorrect. The CRC of an incoming message does not match with the CRC calculated from the received data. 7: NoChange: Any read access to the Protocol Status Register re-initializes the LEC to '7'. When the LEC shows the value '7', no CAN bus event was detected since the last CPU read access to the Protocol Status Register.

NOTES

1. When a frame in CAN FD format has reached the data phase with BRS flag set, the next CAN event (error or valid frame) will be shown in DLEC instead of LEC. An error in a fixed stuff bit of a CAN FD CRC sequence will be shown as a Form Error, not Stuff Error.
2. The Bus_Off recovery sequence (see CAN Specification Rev. 2.0 or ISO11898-1:2015) cannot be shortened by setting or resetting MTTCAN0CCCR.INIT. If the device goes Bus_Off, it will set MTTCAN0CCCR.INIT of its own accord, stopping all bus activities. Once MTTCAN0CCCR.INIT has been cleared by the CPU, the device will then wait for 129 occurrences of Bus Idle (129 * 11 consecutive recessive bits) before resuming normal operation. At the end of the Bus_Off recovery sequence, the Error Management Counters will be reset. During the waiting time after the resetting of MTTCAN0CCCR.INIT, each time a sequence of 11 recessive bits has been monitored, a Bit0Error code is written to MTTCAN0PSR.LEC, enabling the CPU to readily check up whether the CAN bus is stuck at dominant or continuously disturbed and to monitor the Bus_Off recovery sequence. MTTCAN0ECR.REC is used to count these sequences.

(14) MTTCAN0TDCR — Transmitter Delay Compensation Register

Access: This register can be read in 32-bit units.

Address: <MCANn_base> + 048_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 19.86 MTTCAN0TDCR Register Contents

Bit Position	Bit Name	Function
31 to 15	Reserved	These bits are always read as 0. When written, write the initial value.
14 to 8	TDCO[6:0]	Transmitter Delay Compensation Offset 00_H to $7F_H$ Offset value defining the distance between the measured delay from m_ttcan_tx to m_ttcan_rx and the secondary sample point. Valid values are 0 to 127 mtq.
7	Reserved	These bits are always read as 0. When written, write the initial value.
6 to 0	TDCF[6:0]	Transmitter Delay Compensation Filter Window Length 00_H to $7F_H$ Defines the minimum value for the SSP position, dominant edges on m_ttcan_rx that would result in an earlier SSP position are ignored for transmitter delay measurement. The feature is enabled when TDCF is configured to a value greater than TDCO. Valid values are 0 to 127 mtq.

(15) MTTCAN0IR — Interrupt Register

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the Host clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register. The configuration of MTTCAN0IE controls whether an interrupt is generated. The configuration of MTTCAN0ILS controls on which interrupt line an interrupt is signalled.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 050_H

Value after reset: $0000\ 0000_H$

Table 19.87 MTTCAN0IR Register Contents (1/3)

Bit Position	Bit Name	Function
31, 30	Reserved	These bits are always read as 0. When written, write the initial value.
29	ARA	Access to Reserved Address 0: No access to reserved address occurred 1: Access to reserved address occurred
28	PED	Protocol Error in Data Phase (Data Bit Time is used) 0: No protocol error in data phase 1: Protocol error in data phase detected (MTTCAN0PSR.DLEC ≠ 0,7)
27	PEA	Protocol Error in Arbitration Phase (Nominal Bit Time is used) 0: No protocol error in arbitration phase 1: Protocol error in arbitration phase detected(MTTCAN0PSR.LEC ≠ 0,7)
26	WDI	Watchdog Interrupt 0: No Message RAM Watchdog event occurred 1: Message RAM Watchdog event due to missing READY
25	BO	Bus_Off Status 0: Bus_Off status unchanged 1: Bus_Off status changed
24	EW	Warning Status 0: Error_Warning status unchanged 1: Error_Warning status changed
23	EP	Error Passive 0: Error_Passive status unchanged 1: Error_Passive status changed
22	ELO	Error Logging Overflow 0: CAN Error Logging Counter did not overflow 1: Overflow of CAN Error Logging Counter occurred

Table 19.87 MTTCAN0IR Register Contents (2/3)

Bit Position	Bit Name	Function
21	BEU	Bit Error Uncorrected Message RAM bit error detected, uncorrected. Controlled by input signal m_ttcan_aeim_berr[1] generated by an optional external parity / ECC logic attached to the Message RAM. An uncorrected Message RAM bit error sets MTTCAN0CCCR.INIT to '1'. This is done to avoid transmission of corrupted data. 0: No bit error detected when reading from Message RAM 1: Bit error detected, uncorrected (e.g. parity logic)
20	BEC	Bit Error Corrected Message RAM bit error detected and corrected. Controlled by input signal m_ttcan_aeim_berr[0] generated by an optional external parity / ECC logic attached to the Message RAM. 0: No bit error detected when reading from Message RAM 1: Bit error detected and corrected (e.g. ECC)
19	DRX	Message stored to Dedicated Rx Buffer The flag is set whenever a received message has been stored into a dedicated Rx Buffer. 0: No Rx Buffer updated 1: At least one received message stored into an Rx Buffer
18	TOO	Timeout Occurred 0: No timeout 1: Timeout reached
17	MRAF	Message RAM Access Failure The flag is set, when the Rx Handler • has not completed acceptance filtering or storage of an accepted message until the arbitration field of the following message has been received. In this case acceptance filtering or message storage is aborted and the Rx Handler starts processing of the following message. • was not able to write a message to the Message RAM. In this case message storage is aborted. In both cases the FIFO put index is not updated resp. the New Data flag for a dedicated Rx Buffer is not set, a partly stored message is overwritten when the next message is stored to this location. The flag is also set when the Tx Handler was not able to read a message from the Message RAM in time. In this case message transmission is aborted. In case of a Tx Handler access failure the M_TTCAN is switched into Restricted Operation Mode (see **(5) Restricted Operation Mode**). To leave Restricted Operation Mode, the Host CPU has to reset MTTCAN0CCCR.ASM. 0: No Message RAM access failure occurred 1: Message RAM access failure occurred
16	TSW	Timestamp Wraparound 0: No timestamp counter wrap-around 1: Timestamp counter wrapped around
15	TEFL	Tx Event FIFO Element Lost 0: No Tx Event FIFO element lost 1: Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero
14	TEFF	Tx Event FIFO Full 0: Tx Event FIFO not full 1: Tx Event FIFO full
13	TEFW	Tx Event FIFO Watermark Reached 0: Tx Event FIFO fill level below watermark 1: Tx Event FIFO fill level reached watermark
12	TEFN	Tx Event FIFO New Entry 0: Tx Event FIFO unchanged 1: Tx Handler wrote Tx Event FIFO element
11	TFE	Tx FIFO Empty 0: Tx FIFO non-empty 1: Tx FIFO empty

Table 19.87 MTTCAN0IR Register Contents (3/3)

Bit Position	Bit Name	Function
10	TCF	Transmission Cancellation Finished 0: No transmission cancellation finished 1: Transmission cancellation finished
9	TC	Transmission Completed 0: No transmission completed 1: Transmission completed
8	HPM	High Priority Message 0: No high priority message received 1: High priority message received
7	RF1L	Rx FIFO 1 Message Lost 0: No Rx FIFO 1 message lost 1: Rx FIFO 1 message lost, also set after write attempt to Rx FIFO 1 of size zero
6	RF1F	Rx FIFO 1 Full 0: Rx FIFO 1 not full 1: Rx FIFO 1 full
5	RF1W	Rx FIFO 1 Watermark Reached 0: Rx FIFO 1 fill level below watermark 1: Rx FIFO 1 fill level reached watermark
4	RF1N	Rx FIFO 1 New Message 0: No new message written to Rx FIFO 1 1: New message written to Rx FIFO 1
3	RF0L	Rx FIFO 0 Message Lost 0: No Rx FIFO 0 message lost 1: Rx FIFO 0 message lost, also set after write attempt to Rx FIFO 0 of size zero
2	RF0F	Rx FIFO 0 Full 0: Rx FIFO 0 not full 1: Rx FIFO 0 full
1	RF0W	Rx FIFO 0 Watermark Reached 0: Rx FIFO 0 fill level below watermark 1: Rx FIFO 0 fill level reached watermark
0	RF0N	Rx FIFO 0 New Message 0: No new message written to Rx FIFO 0 1: New message written to Rx FIFO 0

(16) MTTCAN0IE — Interrupt Enable

The settings in the Interrupt Enable register determine which status changes in the Interrupt Register will be signalled on an interrupt line.

0: Interrupt disabled

1: Interrupt enabled

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 054_H

Value after reset: $0000\ 0000_H$

(17) MTTCAN0ILS — Interrupt Line Select

The Interrupt Line Select register assigns an interrupt generated by a specific interrupt flag from the Interrupt Register to one of the two module interrupt lines. For interrupt generation the respective interrupt line has to be enabled via MTTCAN0ILE.EINT0 and MTTCAN0ILE.EINT1.

0: Interrupt assigned to interrupt line m_ttcan_int0 (INTMTTCANI0)

1: Interrupt assigned to interrupt line m_ttcan_int1 (INTMTTCANI1)

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 058_H

Value after reset: $0000\ 0000_H$

Table 19.91 MTTCAN0GFC Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	These bits are always read as 0. When written, write the initial value.
5, 4	ANFS[1:0]	Accept Non-matching Frames Standard Defines how received messages with 11-bit IDs that do not match any element of the filter list are treated. 00: Accept in Rx FIFO 0 01: Accept in Rx FIFO 1 10: Reject 11: Reject
3, 2	ANFE[1:0]	Accept Non-matching Frames Extended Defines how received messages with 29-bit IDs that do not match any element of the filter list are treated. 00: Accept in Rx FIFO 0 01: Accept in Rx FIFO 1 10: Reject 11: Reject
1	RRFS	Reject Remote Frames Standard 0: Filter remote frames with 11-bit standard IDs 1: Reject all remote frames with 11-bit standard IDs
0	RRFE	Reject Remote Frames Extended 0: Filter remote frames with 29-bit extended IDs 1: Reject all remote frames with 29-bit extended IDs

(20) MTTCAN0SIDFC — Standard ID Filter Configuration

Settings for 11-bit standard Message ID filtering. The Standard ID Filter Configuration controls the filter path for standard messages as described in **Figure 19.20, Standard Message ID Filter Path**.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 084_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 19.92 MTTCAN0SIDFC Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	These bits are always read as 0. When written, write the initial value.
23 to 16	LSS[7:0]	List Size Standard 0: No standard Message ID filter 1 to 128: Number of standard Message ID filter elements >128: Values greater than 128 are interpreted as 128
15 to 2	FLSSA[15:2]	Filter List Standard Start Address Start address of standard Message ID filter list (32-bit word address, see **Figure 19.4, Message RAM Configuration**).
1, 0	Reserved	These bits are always read as 0. When written, write the initial value.

(21) MTTCAN0XIDFC — Extended ID Filter Configuration

Settings for 29-bit extended Message ID filtering. The Extended ID Filter Configuration controls the filter path for standard messages as described in **Figure 19.21, Extended Message ID Filter Path**.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 088_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 19.93 MTTCAN0XIDFC Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	These bits are always read as 0. When written, write the initial value.
22 to 16	LSE[6:0]	List Size Extended 0: No extended Message ID filter 1 to 64: Number of extended Message ID filter elements >64: Values greater than 64 are interpreted as 64
15 to 2	FLESA[15:2]	Filter List Extended Start Address Start address of extended Message ID filter list (32-bit word address, see **Figure 19.4, Message RAM Configuration**).
1, 0	Reserved	These bits are always read as 0. When written, write the initial value.

(22) MTTCAN0XIDAM — Extended ID AND Mask

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 090_H

Value after reset: $1FFF\ FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	EIDM[28:16]

Table 19.94 MTTCAN0XIDAM Register Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	These bits are always read as 0. When written, write the initial value.
28 to 0	EIDM[28:0]	Extended ID Mask For acceptance filtering of extended frames the Extended ID AND Mask is ANDed with the Message ID of a received frame. Intended for masking of 29-bit IDs in SAE J1939. With the reset value of all bits set to one the mask is not active.

(23) MTTCAN0HPMS — High Priority Message Status

This register is updated every time a Message ID filter element configured to generate a priority event matches. This can be used to monitor the status of incoming high priority messages and to enable fast access to these messages.

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + 094_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 19.95 MTTCAN0HPMS Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are always read as 0.
15	FLST	Filter List Indicates the filter list of the matching filter element. 0: Standard Filter List 1: Extended Filter List
14 to 8	FIDX[6:0]	Filter Index Index of matching filter element. Range is 0 to MTTCAN0SIDFC.LSS – 1 resp. MTTCAN0XIDFC.LSE – 1.
7, 6	MSI[1:0]	Message Storage Indicator 00: No FIFO selected 01: FIFO message lost 10: Message stored in FIFO 0 11: Message stored in FIFO 1
5 to 0	BIDX[5:0]	Buffer Index Index of Rx FIFO element to which the message was stored. Only valid when MSI[1] = ‘1’.

(24) MTTCAN0NDAT1 — New Data 1

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 098_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ND31	ND30	ND29	ND28	ND27	ND26	ND25	ND24	ND23	ND22	ND21	ND20	ND19	ND18	ND17	ND16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.96 MTTCAN0NDAT1 Register Contents

Bit Position	Bit Name	Function
31 to 0	ND[31:0]	New Data The register holds the New Data flags of Rx Buffers 0 to 31. The flags are set when the respective Rx Buffer has been updated from a received frame. The flags remain set until the Host clears them. A flag is cleared by writing a ‘1’ to the corresponding bit position. Writing a ‘0’ has no effect. A hard reset will clear the register. 0: Rx Buffer not updated 1: Rx Buffer updated from new message

(25) MTTCAN0NDAT2 — New Data 2

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $09C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ND63	ND62	ND61	ND60	ND59	ND58	ND57	ND56	ND55	ND54	ND53	ND52	ND51	ND50	ND49	ND48

Table 19.98 MTTCAN0RXF0C Register Contents

Bit Position	Bit Name	Function
31	F0OM	FIFO 0 Operation Mode FIFO 0 can be operated in blocking or in overwrite mode (see **(2) Rx FIFOs**). 0: FIFO 0 blocking mode 1: FIFO 0 overwrite mode
30 to 24	F0WM[6:0]	Rx FIFO 0 Watermark 0: Watermark interrupt disabled 1 to 64: Level for Rx FIFO 0 watermark interrupt (MTTCAN0IR.RF0W) >64: Watermark interrupt disabled
23	Reserved	This bit is always read as 0.
22 to 16	F0S[6:0]	Rx FIFO 0 Size 0: No Rx FIFO 0 1 to 64: Number of Rx FIFO 0 elements >64: Values greater than 64 are interpreted as 64 The Rx FIFO 0 elements are indexed from 0 to F0S-1
15 to 2	F0SA[15:2]	Rx FIFO 0 Start Address Start address of Rx FIFO 0 in Message RAM (32-bit word address, see **Figure 19.4, Message RAM Configuration**).
1, 0	Reserved	These bits are always read as 0.

(27) MTTCAN0RXF0S — Rx FIFO 0 Status

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + $0A4_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	RF0L	F0F	—	—	F0PI[5:0]

	—	—	F0GI[5:0]						—	F0FL[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 19.99 MTTCAN0RXF0S Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	These bits are always read as 0.
25	RF0L	Rx FIFO 0 Message Lost This bit is a copy of interrupt flag MTTCAN0IR.RF0L. When MTTCAN0IR.RF0L is reset, this bit is also reset. 0: No Rx FIFO 0 message lost 1: Rx FIFO 0 message lost, also set after write attempt to Rx FIFO 0 of size zero **NOTE** Overwriting the oldest message when MTTCAN0RXF0C.F0OM = '1' will not set this flag.
24	F0F	Rx FIFO 0 Full 0: Rx FIFO 0 not full 1: Rx FIFO 0 full
23, 22	Reserved	These bits are always read as 0.
21 to 16	F0PI[5:0]	Rx FIFO 0 Put Index Rx FIFO 0 write index pointer, range 0 to 63.
15, 14	Reserved	These bits are always read as 0.
13 to 8	F0GI[5:0]	Rx FIFO 0 Get Index Rx FIFO 0 read index pointer, range 0 to 63.
7	Reserved	This bit is always read as 0.
6 to 0	F0FL[6:0]	Rx FIFO 0 Fill Level Number of elements stored in Rx FIFO 0, range 0 to 64.

(28) MTTCAN0RXF0A — Rx FIFO 0 Acknowledge

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $0A8_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 19.103 MTTCAN0RXF1S Register Contents

Bit Position	Bit Name	Function
31, 30	DMS[1:0]	Debug Message Status 00: Idle state, wait for reception of debug messages, DMA request is cleared 01: Debug message A received 10: Debug messages A, B received 11: Debug messages A, B, C received, DMA request is set
29 to 26	Reserved	These bits are always read as 0.
25	RF1L	Rx FIFO 1 Message Lost This bit is a copy of interrupt flag MTTCAN0IR.RF1L. When MTTCAN0IR.RF1L is reset, this bit is also reset. 0: No Rx FIFO 1 message lost 1: Rx FIFO 1 message lost, also set after write attempt to Rx FIFO 1 of size zero **NOTE** Overwriting the oldest message when MTTCAN0RXF0C.F0OM = '1' will not set this flag.
24	F1F	Rx FIFO 1 Full 0: Rx FIFO 1 not full 1: Rx FIFO 1 full
23, 22	Reserved	These bits are always read as 0.
21 to 16	F1PI[5:0]	Rx FIFO 1 Put Index Rx FIFO 1 write index pointer, range 0 to 63.
15, 14	Reserved	These bits are always read as 0.
13 to 8	F1GI[5:0]	Rx FIFO 1 Get Index Rx FIFO 1 read index pointer, range 0 to 63.
7	Reserved	This bit is always read as 0.
6 to 0	F1FL[6:0]	Rx FIFO 1 Fill Level Number of elements stored in Rx FIFO 1, range 0 to 64.

(32) MTTCAN0RXF1A — Rx FIFO 1 Acknowledge

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $0B8_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 19.104 MTTCAN0RXF1A Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	These bits are always read as 0. When written, write the initial value.
5 to 0	F1AI[5:0]	Rx FIFO 1 Acknowledge Index After the Host has read a message or a sequence of messages from Rx FIFO 1 it has to write the buffer index of the last element read from Rx FIFO 1 to F1AI. This will set the Rx FIFO 1 Get Index MTTCAN0RXF1S.F1GI to F1AI + 1 and update the FIFO 1 Fill Level MTTCAN0RXF1S.F1FL.

(33) MTTCAN0RXESC — Rx Buffer / FIFO Element Size Configuration

Configures the number of data bytes belonging to an Rx Buffer / Rx FIFO element. Data field sizes >8 bytes are intended for CAN FD operation only.

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + $0BC_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	RBDS[2:0]			—	F1DS[2:0]			—	F0DS[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	RP	RP	RP	R	RP	RP	RP	R	RP	RP	RP

Table 19.105 MTTCAN0RXESC Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	These bits are always read as 0.
10 to 8	RBDS[2:0]	Rx Buffer Data Field Size 000: 8 byte data field 001: 12 byte data field 010: 16 byte data field 011: 20 byte data field 100: 24 byte data field 101: 32 byte data field 110: 48 byte data field 111: 64 byte data field
7	Reserved	This bit is always read as 0.
6 to 4	F1DS[2:0]	Rx FIFO 1 Data Field Size 000: 8 byte data field 001: 12 byte data field 010: 16 byte data field 011: 20 byte data field 100: 24 byte data field 101: 32 byte data field 110: 48 byte data field 111: 64 byte data field
3	Reserved	This bit is always read as 0.
2 to 0	F0DS[2:0]	Rx FIFO 0 Data Field Size 000: 8 byte data field 001: 12 byte data field 010: 16 byte data field 011: 20 byte data field 100: 24 byte data field 101: 32 byte data field 110: 48 byte data field 111: 64 byte data field

NOTE

In case the data field size of an accepted CAN frame exceeds the data field size configured for the matching Rx Buffer or Rx FIFO, only the number of bytes as configured by MTTCAN0RXESC are stored to the Rx Buffer resp. Rx FIFO element. The rest of the frame's data field is ignored.

(34) MTTCAN0TXBC — Tx Buffer Configuration

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $0C0_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	TFQM	TFQS[5:0]						—	—	NDTB[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	RP	RP	RP	RP	RP	RP	RP	R	R	RP	RP	RP	RP	RP	RP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TBSA[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	R	R

Table 19.106 MTTCAN0TXBC Register Contents

Bit Position	Bit Name	Function
31	Reserved	This bit is always read as 0. When written, write the initial value.
30	TFQM	Tx FIFO/Queue Mode 0: Tx FIFO operation 1: Tx Queue operation
29 to 24	TFQS[5:0]	Transmit FIFO/Queue Size 0: No Tx FIFO/Queue 1 to 32: Number of Tx Buffers used for Tx FIFO/Queue >32: Values greater than 32 are interpreted as 32
23, 22	Reserved	These bits are always read as 0. When written, write the initial value.
21 to 16	NDTB[5:0]	Number of Dedicated Transmit Buffers 0: No Dedicated Tx Buffers 1 to 32: Number of Dedicated Tx Buffers >32: Values greater than 32 are interpreted as 32
15 to 2	TBSA[15:2]	Tx Buffers Start Address Start address of Tx Buffers section in Message RAM (32-bit word address, see **Figure 19.4, Message RAM Configuration**).
1, 0	Reserved	These bits are always read as 0. When written, write the initial value.

NOTE

Be aware that the sum of TFQS and NDTB may be not greater than 32. There is no check for erroneous configurations. The Tx Buffers section in the Message RAM starts with the dedicated Tx Buffers.

(35) MTTCAN0TXFQS — Tx FIFO/Queue Status

The Tx FIFO/Queue status is related to the pending Tx requests listed in register MTTCAN0TXBRP. Therefore the effect of Add/Cancellation requests may be delayed due to a running Tx scan (MTTCAN0TXBRP not yet updated).

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + $0C4_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	TFQF	TFQPI[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	TFGI[4:0]					—	—	TFFL[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 19.107 MTTCAN0TXFQS Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	These bits are always read as 0.
21	TFQF	Tx FIFO/Queue Full 0: Tx FIFO/Queue not full 1: Tx FIFO/Queue full
20 to 16	TFQPI[4:0]	Tx FIFO/Queue Put Index Tx FIFO/Queue write index pointer, range 0 to 31.
15 to 13	Reserved	These bits are always read as 0.
12 to 8	TFGI[4:0]	Tx FIFO Get Index Tx FIFO read index pointer, range 0 to 31. Read as zero when Tx Queue operation is configured (MTTCAN0TXBC.TFQM = '1').
7, 6	Reserved	These bits are always read as 0.
5 to 0	TFFL[5:0]	Tx FIFO Free Level Number of consecutive free Tx FIFO elements starting from TFGI, range 0 to 32. Read as zero when Tx Queue operation is configured (MTTCAN0TXBC.TFQM = '1')

NOTE

In case of mixed configurations where dedicated Tx Buffers are combined with a Tx FIFO or a Tx Queue, the Put and Get Indices indicate the number of the Tx Buffer starting with the first dedicated Tx Buffers.
Example: For a configuration of 12 dedicated Tx Buffers and a Tx FIFO of 20 Buffers a Put Index of 15 points to the fourth buffer of the Tx FIFO.

(36) MTTCAN0TXESC — Tx Buffer Element Size Configuration

Configures the number of data bytes belonging to a Tx Buffer element. Data field sizes > 8 bytes are intended for CAN FD operation only.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $0C8_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	TBDS[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RP	RP	RP

Table 19.108 MTTCAN0TXESC Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	These bits are always read as 0. When written, write the initial value.
2 to 0	TBDS[2:0]	Tx Buffer Data Field Size 000: 8 byte data field 001: 12 byte data field 010: 16 byte data field 011: 20 byte data field 100: 24 byte data field 101: 32 byte data field 110: 48 byte data field 111: 64 byte data field

NOTE

In case the data length code DLC of a Tx Buffer element is configured to a value higher than the Tx Buffer data field size MTTCAN0TXESC.TBDS, the bytes not defined by the Tx Buffer are transmitted as "CC_H" (padding bytes).

(37) MTTCAN0TXBRP — Tx Buffer Request Pending

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + $0CC_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 19.109 MTTCAN0TXBRP Register Contents

Bit Position	Bit Name	Function
31 to 0	TRP[31:0]	Transmission Request Pending Each Tx Buffer has its own Transmission Request Pending bit. The bits are set via register MTTCAN0TXBAR. The bits are reset after a requested transmission has completed or has been cancelled via register MTTCAN0TXBCR. MTTCAN0TXBRP bits are set only for those Tx Buffers configured via MTTCAN0TXBC. After a MTTCAN0TXBRP bit has been set, a Tx scan (see **Section 19.5.3.5, Tx Handling**) is started to check for the pending Tx request with the highest priority (Tx Buffer with lowest Message ID). A cancellation request resets the corresponding transmission request pending bit of register MTTCAN0TXBRP. In case a transmission has already been started when a cancellation is requested, this is done at the end of the transmission, regardless whether the transmission was successful or not. The cancellation request bits are reset directly after the corresponding MTTCAN0TXBRP bit has been reset. After a cancellation has been requested, a finished cancellation is signalled via MTTCAN0TXBCF • after successful transmission together with the corresponding MTTCAN0TXBTO bit • when the transmission has not yet been started at the point of cancellation • when the transmission has been aborted due to lost arbitration • when an error occurred during frame transmission In DAR mode all transmissions are automatically cancelled if they are not successful. The corresponding MTTCAN0TXBCF bit is set for all unsuccessful transmissions. 0: No transmission request pending 1: Transmission request pending **NOTE** MTTCAN0TXBRP bits which are set while a Tx scan is in progress are not considered during this particular Tx scan. In case a cancellation is requested for such a Tx Buffer, this Add Request is cancelled immediately, the corresponding MTTCAN0TXBRP bit is reset.

(38) MTTCAN0TXBAR — Tx Buffer Add Request

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $0D0_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AR31	AR30	AR29	AR28	AR27	AR26	AR25	AR24	AR23	AR22	AR21	AR20	AR19	AR18	AR17	AR16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 19.110 MTTCAN0TXBAR Register Contents

Bit Position	Bit Name	Function
31 to 0	AR[31:0]	Add Request Each Tx Buffer has its own Add Request bit. Writing a '1' will set the corresponding Add Request bit; writing a '0' has no impact. This enables the Host to set transmission requests for multiple Tx Buffers with one write to MTTCAN0TXBAR. MTTCAN0TXBAR bits are set only for those Tx Buffers configured via MTTCAN0TXBC. When no Tx scan is running, the bits are reset immediately, else the bits remain set until the Tx scan process has completed. 0: No transmission request added 1: Transmission requested added

NOTE

If an add request is applied for a Tx Buffer with pending transmission request (corresponding MTTCAN0TXBRP bit already set), this add request is ignored.

(39) MTTCAN0TXBCR — Tx Buffer Cancellation Request

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $0D4_H$

Value after reset: $0000\ 0000_H$

Table 19.121 MTTCAN0TTOCF Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 27	Reserved	These bits are always read as 0. When written, write the initial value.
26	EVTP	Event Trigger Polarity 0: Rising edge trigger 1: Falling edge trigger
25	ECC	Enable Clock Calibration 0: Automatic clock calibration in TTCAN Level 0, 2 is disabled 1: Automatic clock calibration in TTCAN Level 0, 2 is enabled
24	EGTF	Enable Global Time Filtering 0: Global time filtering in TTCAN Level 0, 2 is disabled 1: Global time filtering in TTCAN Level 0, 2 is enabled
23 to 16	AWL[7:0]	Application Watchdog Limit The application watchdog can be disabled by programming AWL to 00H. 00_H to FF_H: Maximum time after which the application has to serve the application watchdog. The application watchdog is incremented once each 256 NTUs.
15	EECS	Enable External Clock Synchronization If enabled, TUR configuration (MTTCAN0TURCF.NCL only) may be updated during TTCAN operation. 0: External clock synchronization in TTCAN Level 0, 2 disabled 1: External clock synchronization in TTCAN Level 0, 2 enabled
14 to 8	IRTO[6:0]	Initial Reference Trigger Offset 00_H to $7F_H$: Positive offset, range from 0 to 127
7 to 5	LDSDL[2:0]	LD of Synchronization Deviation Limit The Synchronization Deviation Limit SDL is configured by its dual logarithm LDSDL with SDL = $2^{(LDSDL + 5)}$. It should not exceed the clock tolerance given by the CAN bit timing configuration. 0_H to 7_H: LD of Synchronization Deviation Limit (SDL ≤ 32 to 4096)
4	TM	Time Master 0: Time Master function disabled 1: Potential Time Master

Table 19.121 MTTCAN0TTOCF Register Contents (2/2)

Bit Position	Bit Name	Function
3	GEN	Gap Enable 0: Strictly time-triggered operation 1: External event-synchronized time-triggered operation
2	Reserved	This bit is always read as 0. When written, write the initial value.
1, 0	OM[1:0]	Operation Mode 00: Event-driven CAN communication, default 01: TTCAN level 1 10: TTCAN level 2 11: TTCAN level 0

(50) MTTCAN0TTMLM — TT Matrix Limits

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $10C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	ENTT[11:0]

R/W	R	R	R	R	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	TXEW[3:0]				CSS[1:0]		CCM[5:0]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP

Table 19.122 MTTCAN0TTMLM Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	These bits are always read as 0. When written, write the initial value.
27 to 16	ENTT[11:0]	Expected Number of Tx Triggers 000_H to FFF_H: Expected number of Tx Triggers in one Matrix Cycle
15 to 12	Reserved	These bits are always read as 0. When written, write the initial value.
11 to 8	TXEW[3:0]	Tx Enable Window 0_H to F_H: Length of Tx enable window, 1 to 16 NTU cycles
7, 6	CSS[1:0]	Cycle Start Synchronization Enables sync pulse output at pin m_ttcan_soc (MTTCAN0SOC). 00: No sync pulse 01: Sync pulse at start of basic cycle 10: Sync pulse at start of matrix cycle 11: Reserved
5 to 0	CCM[5:0]	Cycle Count Max 00_H: 1 Basic Cycle per Matrix Cycle 01_H: 2 Basic Cycles per Matrix Cycle 03_H: 4 Basic Cycles per Matrix Cycle 07_H: 8 Basic Cycles per Matrix Cycle $0F_H$: 16 Basic Cycles per Matrix Cycle $1F_H$: 32 Basic Cycles per Matrix Cycle $3F_H$: 64 Basic Cycles per Matrix Cycle others: Reserved

NOTE

ISO 11898-4, Section 5.2.1 requires, that only the listed cycle count values are configured. Other values are possible but may lead to inconsistent matrix cycles.

(51) MTTCAN0TURCF — TUR Configuration

The length of the NTU is given by: NTU = CAN Clock Period • NC/DC

NC is an 18-bit value. Its high part, NCH[17:16] is hard wired to 0b01. Therefore the range of NC is 10000_H to $1FFFF_H$. The value configured by NCL is the initial value for MTTCAN0TURNA.NAV[15:0]. DC is set to 1000_H by hardware reset and it may not be written to 0000_H.

Level 1: NC ≥ 4 • DC and NTU = CAN bit time
Level 0, 2: NC ≥ 8 • DC

The actual value of TUR may be changed by the clock drift compensation function of TTCAN Level 0 and Level 2 in order to adjust the node's local view of the NTU to the time master's view of the NTU. DC will not be changed by the automatic drift compensation, MTTCAN0TURNA.NAV may be adjusted around NC in the range of the Synchronization Deviation Limit given by MTTCAN0TTOCF.LDSDL. NC and DC should be programmed to the largest suitable values in order to allow the best computational accuracy for the drift compensation process.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 110_H

Value after reset: 1000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ELT	—	DC[13:0]													
Value after reset	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RP	R	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NCL[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP	RP

Table 19.123 MTTCAN0TURCF Register Contents (1/2)

Bit Position	Bit Name	Function
31	ELT	Enable Local Time 0: Local time is stopped, default 1: Local time is enabled **NOTE** Local time is started by setting ELT. It remains active until ELT is reset or until the next hardware reset. MTTCAN0TURCF.DC is locked when MTTCAN0TURCF.ELT = '1'. If ELT is written to '0', the readable value will stay at '1' until the new value has been synchronized into the CAN clock domain. During this time write access to the other bits of the register remains locked.
30	Reserved	This bit is always read as 0. When written, write the initial value.
29 to 16	DC[13:0]	Denominator Configuration 0000_H: Illegal value 0001_H to $3FFF_H$: Denominator Configuration

Table 19.123 MTTCAN0TURCF Register Contents (2/2)

Bit Position	Bit Name	Function
15 to 0	NCL[15:0]	Numerator Configuration Low Write access to the TUR Numerator Configuration Low is only possible during configuration with MTTCAN0TURCF.ELT = '0' or if MTTCAN0TTOCF.EECS (external clock synchronization enabled) is set. When a new value for NCL is written outside TT Configuration Mode, the new value takes effect when MTTCAN0TTOST.WECS is cleared to '0'. NCL is locked MTTCAN0TTOST.WECS is '1'. 0000_H to $FFFF_H$: Numerator Configuration Low **NOTE** If NC < 7 • DC in TTCAN Level 1, then it is required that subsequent time marks in the Trigger Memory must differ by at least 2 NTU.

(52) MTTCAN0TTOCN — TT Operation Control

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 114_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 19.124 MTTCAN0TTOCN Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 26	Reserved	These bits are always read as 0. When written, write the initial value.
15	LCKC	TT Operation Control Register Locked Set by a write access to register MTTCAN0TTOCN. Reset when the updated configuration has been synchronized into the CAN clock domain. 0: Write access to MTTCAN0TTOCN enabled 1: Write access to MTTCAN0TTOCN locked
14	Reserved	This bit is always read as 0. When written, write the initial value.
13	ESCN	External Synchronization Control If enabled the M_TTCAN synchronizes its cycle time phase to an external event signalled by a rising edge at pin m_ttcan_evt (MTTCAN0EVT)(see **Section 19.6.4.11, Synchronization to external Time Schedule**). 0: External synchronization disabled 1: External synchronization enabled
12	NIG	Next is Gap This bit can only be set when the M_TTCAN is the actual Time Master and when it is configured for external event-synchronized time-triggered operation (MTTCAN0TTOCF.GEN = '1') 0: No action, reset by reception of any reference message 1: Transmit next reference message with Next_is_Gap = '1'
11	TMG	Time Mark Gap 0: Reset by each reference message 1: Next reference message started when Register Time Mark interrupt MTTCAN0TTIR.RTMI is activated
10	FGP	Finish Gap Set by the CPU, reset by each reference message 0: No reference message requested 1: Application requested start of reference message
9	GCS	Gap Control Select 0: Gap control independent from m_ttcan_evt (MTTCAN0EVT) 1: Gap control by input pin m_ttcan_evt (MTTCAN0EVT)
8	TTIE	Trigger Time Mark Interrupt Pulse Enable External time mark events are configured by trigger memory element TMEX (see **(7) Trigger Memory Element**). A trigger time mark interrupt pulse is generated when the trigger memory element becomes active, and the M_TTCAN is in synchronization state In_Schedule or In_Gap. 0: Trigger Time Mark Interrupt output m_ttcan_tmp (MTTCAN0TMP) disabled 1: Trigger Time Mark Interrupt output m_ttcan_tmp (MTTCAN0TMP) enabled

Table 19.124 MTTCAN0TTOCN Register Contents (2/2)

Bit Position	Bit Name	Function
7, 6	TMC[1:0]	Register Time Mark Compare 00: No Register Time Mark Interrupt generated 01: Register Time Mark Interrupt if Time Mark = cycle time 10: Register Time Mark Interrupt if Time Mark = local time 11: Register Time Mark Interrupt if Time Mark = global time **NOTE** When changing the time mark reference (cycle, local, global time), it is recommended to first write TMC = “00”, then reconfigure MTTCAN0TTTMK, and finally set TMC to the intended time reference.
5	RTIE	Register Time Mark Interrupt Pulse Enable Register time mark interrupts are configured by register MTTCAN0TTTMK. A register time mark interrupt pulse with the length of one m_ttcan_clk period is generated when the time referenced by MTTCAN0TTOCN.TMC (cycle, local, or global) equals MTTCAN0TTTMK.TM, independent of the synchronization state. 0: Register Time Mark Interrupt output m_ttcan_rtp (MTTCAN0RTP) disabled 1: Register Time Mark Interrupt output m_ttcan_rtp (MTTCAN0RTP) enabled
4, 3	SWS[1:0]	Stop Watch Source 00: Stop Watch disabled 01: Actual value of cycle time is copied to MTTCAN0TTCPT.SWV 10: Actual value of local time is copied to MTTCAN0TTCPT.SWV 11: Actual value of global time is copied to MTTCAN0TTCPT.SWV
2	SWP	Stop Watch Polarity 0: Rising edge trigger 1: Falling edge trigger
1	ECS	External Clock Synchronization Writing a ‘1’ to ECS sets MTTCAN0TTOST.WECS if the node is the actual Time Master. ECS is reset after one Host clock period. The external clock synchronization takes effect at the start of the next basic cycle.
0	SGT	Set Global time Writing a ‘1’ to SGT sets MTTCAN0TTOST.WGDT if the node is the actual Time Master. SGT is reset after one Host clock period. The global time preset takes effect when the node transmits the next reference message with the Master_Ref_Mark modified by the preset value written to MTTCAN0TTGTP.

(53) MTTCAN0TTGTP — TT Global Time Preset

If MTTCAN0TTOST.WGDT is set, the next reference message will be transmitted with the Master_Ref_Mark modified by the preset value and with Disc_Bit = '1', presetting the global time in all nodes simultaneously.

TP is reset to 0000_H each time a reference message with Disc_Bit = '1' becomes valid or if the node is not the current Time Master. TP is locked while MTTCAN0TTOST.WGTD = '1' after setting MTTCAN0TTOCN.SGT until the reference message with Disc_Bit = '1' becomes valid or until the node is no longer the current Time Master.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 118_H

Value after reset: $0000\ 0000_H$

Table 19.125 MTTCAN0TTGTP Register Contents

Bit Position	Bit Name	Function
31 to 16	CTP[15:0]	Cycle Time Target Phase CTP is write-protected while MTTCAN0TTOCN.ESCN or MTTCAN0TTOST.SPL are set (see **Section 19.6.4.11, Synchronization to external Time Schedule**). 0000_H to $FFFF_H$: Defines target value of cycle time when a rising edge of m_ttcan_evt (MTTCAN0EVT) is expected
15 to 0	TP[15:0]	Time Preset TP is write-protected while MTTCAN0TTOST.WGTD is set. 0000_H to $7FFF_H$: Next Master Reference Mark = Master Reference Mark + TP 8000_H: reserved 8001_H to $FFFF_H$: Next Master Reference Mark = Master Reference Mark – (10000_H – TP)

(54) MTTCAN0TTTMK — TT Time Mark

A time mark interrupt (MTTCAN0TTIR.RTMI = ‘1’) is generated when the time base indicated by MTTCAN0TTOCN.TMC (cycle time, local time, or global time) has the same value as TM.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + $11C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LCKM	—	—	—	—	—	—	—	—	TICC[6:0]

Table 19.126 MTTCAN0TTTMK Register Contents

Bit Position	Bit Name	Function
31	LCKM	TT Time Mark Register Locked Always set by a write access to registers MTTCAN0TTOCN. Set by write access to register MTTCAN0TTTMK when MTTCAN0TTOCN.TMC ≠ “00”. Reset when the registers have been synchronized into the CAN clock domain. 0: Write access to MTTCAN0TTTMK enabled 1: Write access to MTTCAN0TTTMK locked
30 to 23	Reserved	These bits are always read as 0. When written, write the initial value.
22 to 16	TICC[6:0]	Time Mark Cycle Code Cycle count for which the time mark is valid. 000000x: valid for all cycles 000001c: valid every second cycle at cycle count mod2 = c 00001cc: valid every fourth cycle at cycle count mod4 = cc 0001ccc: valid every eighth cycle at cycle count mod8 = ccc 001cccc: valid every sixteenth cycle at cycle count mod16 = cccc 01ccccc: valid every thirty-second cycle at cycle count mod32 = ccccc 1cccccc: valid every sixty-fourth cycle at cycle count mod64 = cccccc
15 to 0	TM[15:0]	Time Mark 0000_H to $FFFF_H$: Time Mark

NOTE

When using byte access to register MTTCAN0TTTMK it is recommended to first disable the time mark compare function (MTTCAN0TTOCN.TMC = “00”) to avoid compares on inconsistent register values.

(55) MTTCAN0TTIR — TT Interrupt Register

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the Host clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register.

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 120_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 19.127 MTTCAN0TTIR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 19	Reserved	These bits are always read as 0. When written, write the initial value.
18	CER	Configuration Error Trigger out of order. 0: No error found in trigger list 1: Error found in trigger list
17	AW	Application Watchdog 0: Application watchdog served in time 1: Application watchdog not served in time
16	WT	Watch Trigger 0: No missing reference message 1: Missing reference message (Level 0: cycle time FF00H)
15	IWT	Initialization Watch Trigger The initialization is restarted by resetting IWT. 0: No missing reference message during system startup 1: No system startup due to missing reference message
14	ELC	Error Level Changed Not set when error level changed during initialization. 0: No change in error level 1: Error level changed
13	SE2	Scheduling Error 2 0: No scheduling error 2 1: Scheduling error 2 occurred
12	SE1	Scheduling Error 1 0: No scheduling error 1 1: Scheduling error 1 occurred
11	TXO	Tx Count Overflow 0: Number of Tx Trigger as expected 1: More Tx trigger than expected in one matrix cycle
10	TXU	Tx Count Underflow 0: Number of Tx Trigger as expected 1: Less Tx trigger than expected in one matrix cycle

Table 19.127 MTTCAN0TTIR Register Contents (2/2)

Bit Position	Bit Name	Function
9	GTE	Global Time Error Synchronization deviation SD exceeds limit specified by MTTCAN0TTOCF.LDSDL, TTCAN Level 0, 2 only. 0: Synchronization deviation within limit 1: Synchronization deviation exceeded limit
8	GTD	Global Time Discontinuity 0: No discontinuity of global time 1: Discontinuity of global time
7	GTW	Global Time Wrap 0: No global time wrap occurred 1: Global time wrap from $FFFF_H$ to 0000_H occurred
6	SWE	Stop Watch Event 0: No rising/falling edge at stop watch trigger pin m_ttcan_swt (MTTCAN0SWT) detected 1: Rising/falling edge at stop watch trigger pin m_ttcan_swt (MTTCAN0SWT) detected
5	TTMI	Trigger Time Mark Event Internal Internal time mark events are configured by trigger memory element TMIN (see **(7) Trigger Memory Element**). Set when the trigger memory element becomes active, and the M_TTCAN is in synchronization state In_Gap or In_Schedule. 0: Time mark not reached 1: Time mark reached (Level 0: cycle time MTTCAN0TTOCF.IRTO • 200_H)
4	RTMI	Register Time Mark Interrupt Set when time referenced by MTTCAN0TTOCN.TMC (cycle, local, or global) equals MTTCAN0TTTMK.TM, independent of the synchronization state. 0: Time mark not reached 1: Time mark reached
3	SOG	Start of Gap 0: No reference message seen with Next_is_Gap bit set 1: Reference message with Next_is_Gap bit set becomes valid
2	CSM	Change of Synchronization Mode 0: No change in master to slave relation or schedule synchronization 1: Master to slave relation or schedule synchronization changed, also set when MTTCAN0TTOST.SPL is reset
1	SMC	Start of Matrix Cycle 0: No Matrix Cycle started since bit has been reset 1: Matrix Cycle started
0	SBC	Start of Basic Cycle 0: No Basic Cycle started since bit has been reset 1: Basic Cycle started

(56) MTTCAN0TTIE — TT Interrupt Enable

The settings in the TT Interrupt Enable register determine which status changes in the TT Interrupt Register will result in an interrupt.

0: TT interrupt disabled

1: TT interrupt enabled

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 124_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 19.128 MTTCAN0TTIE Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	These bits are always read as 0. When written, write the initial value.
18	CERE	Configuration Error Interrupt Enable
17	AWE	Application Watchdog Interrupt Enable
16	WTE	Watch Trigger Interrupt Enable
15	IWTE	Initialization Watch Trigger Interrupt Enable
14	ELCE	Change Error Level Interrupt Enable
13	SE2E	Scheduling Error 2 Interrupt Enable
12	SE1E	Scheduling Error 1 Interrupt Enable
11	TXOE	Tx Count Overflow Interrupt Enable
10	TXUE	Tx Count Underflow Interrupt Enable
9	GTEE	Global Time Error Interrupt Enable
8	GTDE	Global Time Discontinuity Interrupt Enable
7	GTWE	Global Time Wrap Interrupt Enable
6	SWEE	Stop Watch Event Interrupt Enable
5	TTMIE	Trigger Time Mark Event Internal Enable
4	RTMIE	Register Time Mark Interrupt Enable
3	SOGE	Start of Gap Interrupt Enable
2	CSME	Change of Synchronization Mode Interrupt Enable
1	SMCE	Start of Matrix Cycle Interrupt Enable
0	SBCE	Start of Basic Cycle Interrupt Enable

(57) MTTCAN0TTILS — TT Interrupt Line Select

The TT Interrupt Line Select register assigns an interrupt generated by a specific interrupt flag from the TT Interrupt Register to one of the two module interrupt lines. For interrupt generation the respective interrupt line has to be enabled via MTTCAN0ILE.EINT0 and MTTCAN0ILE.EINT1.

0: TT interrupt assigned to interrupt line m_ttcan_int0 (INTMTTCANI0)

1: TT interrupt assigned to interrupt line m_ttcan_int1 (INTMTTCANI1)

Access: This register can be read/written in 32-bit units.

Address: <MTTCAN0_base> + 128_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 19.129 MTTCAN0TTILS Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	These bits are always read as 0. When written, write the initial value.
18	CERL	Configuration Error Interrupt Line
17	AWL	Application Watchdog Interrupt Line
16	WTL	Watch Trigger Interrupt Line
15	IWTL	Initialization Watch Trigger Interrupt Line
14	ELCL	Change Error Level Interrupt Line
13	SE2L	Scheduling Error 2 Interrupt Line
12	SE1L	Scheduling Error 1 Interrupt Line
11	TXOL	Tx Count Overflow Interrupt Line
10	TXUL	Tx Count Underflow Interrupt Line
9	GTEL	Global Time Error Interrupt Line
8	GTDL	Global Time Discontinuity Interrupt Line
7	GTWL	Global Time Wrap Interrupt Line
6	SWEL	Stop Watch Event Interrupt Line
5	TTMIL	Trigger Time Mark Event Internal Line
4	RTMIL	Register Time Mark Interrupt Line
3	SOGL	Start of Gap Interrupt Line
2	CSML	Change of Synchronization Mode Interrupt Line
1	SMCL	Start of Matrix Cycle Interrupt Line
0	SBCL	Start of Basic Cycle Interrupt Line

(58) MTTCAN0TTOST — TT Operation Status

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + $12C_H$

Value after reset: $0000\ 0080_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SPL	WECS	AWE	WFE	GSI	TMP[2:0]			GFI	WGTD	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RTO[7:0]								QCS	QGTP	SYS[1:0]		MS[1:0]		EL[1:0]	
Value after reset	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 19.130 MTTCAN0TTOST Register Contents (1/2)

Bit Position	Bit Name	Function
31	SPL	Schedule Phase Lock The bit is valid only when external synchronization is enabled (MTTCAN0TTOCN.ESCN = '1'). In this case it signals that the difference between cycle time configured by MTTCAN0TTGTP.CTP and the cycle time at the rising edge at pin m_ttcan_evt (MTTCAN0EVT) is less or equal 9 NTU (see **Section 19.6.4.11, Synchronization to external Time Schedule**). 0: Phase outside range 1: Phase inside range
30	WECS	Wait for External Clock Synchronization 0: No external clock synchronization pending 1: Node waits for external clock synchronization to take effect. The bit is reset at the start of the next basic cycle.
29	AWE	Application Watchdog Event The application watchdog is served by reading MTTCAN0TTOST. When the watchdog is not served in time, bit AWE is set, all TTCAN communication is stopped, and the M_TTCAN is set into Bus Monitoring Mode. 0: Application Watchdog served in time 1: Failed to serve Application Watchdog in time
28	WFE	Wait for Event 0: No Gap announced, reset by a reference message with Next_is_Gap = '0' 1: Reference message with Next_is_Gap = '1' received
27	GSI	Gap Started Indicator 0: No Gap in schedule, reset by each reference message and for all time slaves 1: Gap time after Basic Cycle has started
26 to 24	TMP[2:0]	Time Master Priority 0_H to 7_H: Priority of actual Time Master
23	GFI	Gap Finished Indicator Set when the CPU writes MTTCAN0TTOCN.FGP, or by a time mark interrupt if TMG = '1', or via input pin m_ttcan_evt (MTTCAN0EVT) if MTTCAN0TTOCN.GCS = '1'. Not set by Ref_Trigger_Gap or when Gap is finished by another node sending a reference message. 0: Reset at the end of each reference message 1: Gap finished by M_TTCAN
22	WGTD	Wait for Global Time Discontinuity 0: No global time preset pending 1: Node waits for the global time preset to take effect. The bit is reset when the node has transmitted a reference message with Disc_Bit = '1' or after it received a reference message.

Table 19.130 MTTCAN0TTOST Register Contents (2/2)

Bit Position	Bit Name	Function
21 to 16	Reserved	These bits are always read as 0.
15 to 8	RTO[7:0]	Reference Trigger Offset The Reference Trigger Offset value is a signed integer with a range from -127 (81_H) to 127 ($7F_H$). There is no notification when the lower limit of -127 is reached. In case the M_TTCAN becomes Time Master (MS[1:0] = “11”), the reset of RTO is delayed due to synchronization between Host and CAN clock domain. For time slaves the value configured by MTTCAN0TTOCF.IRTO is read. 00_H to FF_H: Actual Reference Trigger offset value
7	QCS	Quality of Clock Speed Only relevant in TTCAN Level 0 and Level 2, otherwise fixed to ‘1’. 0: Local clock speed not synchronized to Time Master clock speed 1: Synchronization Deviation ≤ SDL
6	QGTP	Quality of Global Time Phase Only relevant in TTCAN Level 0 and Level 2, otherwise fixed to ‘0’. 0: Global time not valid 1: Global time in phase with Time Master
5, 4	SYS[1:0]	Synchronization State 00: Out of Synchronization 01: Synchronizing to TTCAN communication 10: Schedule suspended by Gap (In_Gap) 11: Synchronized to schedule (In_Schedule)
3, 2	MS[1:0]	Master State 00: Master_Off, no master properties relevant 01: Operating as Time Slave 10: Operating as Backup Time Master 11: Operating as current Time Master
1, 0	EL[1:0]	Error Level 00: Severity 0 - No Error 01: Severity 1 - Warning 10: Severity 2 - Error 11: Severity 3 - Severe Error

(59) MTTCAN0TURNA — TUR Numerator Actual

There is no drift compensation in TTCAN Level 1 (NAV = NC). In TTCAN Level 0 and Level 2, the drift between the node's local clock and the time master's local clock is calculated. The drift is compensated when the Synchronization Deviation (difference between NC and the calculated NAV) is not more than 2 (MTTCAN0TTOCF.LDSDL + 5). With MTTCAN0TTOCF.LDSDL ≤ 7, this results in a maximum range for NAV of $(NC - 1000_H) \leq NAV \leq (NC + 1000_H)$.

Access: This register can be read in 32-bit units.

Address: <MTTCAN0_base> + 130_H

Value after reset: 0001 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 19.135 MTTCAN0TTCSM Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are always read as 0.
15 to 0	CSM[15:0]	Cycle Sync Mark The Cycle Sync Mark is measured in cycle time. It is updated when the reference message becomes valid and retains its value until the next reference message becomes valid. 0000_H to $FFFF_H$: Captured cycle time

19.6.2.4 Message RAM

For storage of Rx/Tx messages and for storage of the filter configuration a single-ported Message RAM is connected to the M_TTCAN module.

(1) Message RAM Configuration

The Message RAM has a width of 32 bits. In case parity checking or ECC is used a respective number of bits has to be added to each word. The M_TTCAN module can be configured to allocate up to 4480 words in the Message RAM. It is not necessary to configure each of the sections listed in **Figure 19.16, Message RAM Configuration**, nor is there any restriction with respect to the sequence of the sections.

When operated in CAN FD mode the required Message RAM size strongly depends on the element size configured for Rx FIFO0, Rx FIFO1, Rx Buffers, and Tx Buffers via MTTCAN0RXESC.F0DS, MTTCAN0RXESC.F1DS, MTTCAN0RXESC.RBDS, and MTTCAN0TXESC.TBDS.

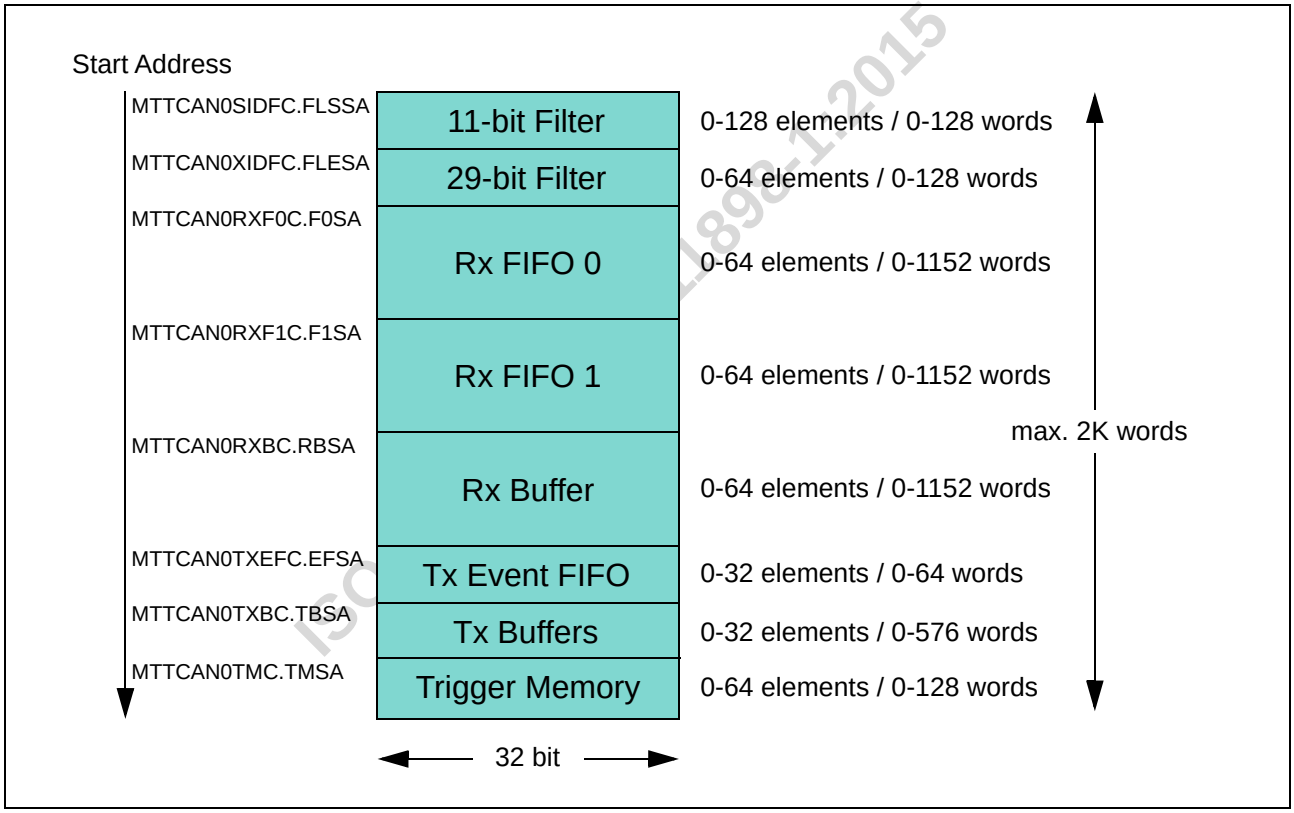

Figure 19.16 Message RAM Configuration

When the M_TTCAN addresses the Message RAM it addresses 32-bit words, not single bytes. The configurable start addresses are 32-bit word addresses i.e. only bits 15 to 2 are evaluated, the two least significant bits are ignored.

NOTE

The M_TTCAN does not check for erroneous configuration of the Message RAM. Especially the configuration of the start addresses of the different sections and the number of elements of each section has to be done carefully to avoid falsification or loss of data.

(2) Rx Buffer and FIFO Element

Up to 64 Rx Buffers and two Rx FIFOs can be configured in the Message RAM. Each Rx FIFO section can be configured to store up to 64 received messages. The structure of a Rx Buffer / FIFO element is shown in **Table 19.136** below. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register MTTCAN0RXESC.

Table 19.136 Rx Buffer and FIFO Element

	31 24	23 16	15 8	7 0
R0	ESI, XTD, RTR, ID[28:0]			
R1	ANMF, FIDX[6:0]	res, FDF, BRS, DLC[3:0]	RXTS[15:0]	
R2	DB3[7:0]	DB2[7:0]	DB1[7:0]	DB0[7:0]
R3	DB7[7:0]	DB6[7:0]	DB5[7:0]	DB4[7:0]
...	...	...	...	...
Rn	DBm[7:0]	DBm-1[7:0]	DBm-2[7:0]	DBm-3[7:0]

R0 Bit 31 ESI: Error State Indicator

0: Transmitting node is error active
1: Transmitting node is error passive

R0 Bit 30 XTD: Extended Identifier

Signals to the Host whether the received frame has a standard or extended identifier.

0: 11-bit standard identifier
1: 29-bit extended identifier

R0 Bit 29 RTR: Remote Transmission Request

Signals to the Host whether the received frame is a data frame or a remote frame.

0:Received frame is a data frame

1:Received frame is a remote frame

NOTE

There are no remote frames in CAN FD format. In case a CAN FD frame (FDF = '1'), the dominant RRS (Remote Request Substitution) bit replaces bit RTR (Remote Transmission Request).

R0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].

R1 Bit 31 ANMF: Accepted Non-matching Frame

Acceptance of non-matching frames may be enabled via MTTCAN0GFC.ANFS and MTTCAN0GFC.ANFE.

0:Received frame matching filter index FIDX

1:Received frame did not match any Rx filter element

R1 Bits 30:24 FIDX[6:0]:Filter Index

0 to 127:Index of matching Rx acceptance filter element (invalid if ANMF = '1').
Range is 0 to MTTCAN0SIDFC.LSS - 1 resp. MTTCAN0XIDFC.LSE - 1.

R1 Bit 21 FDF: FD Format

0:Standard frame format

1:CAN FD frame format (new DLC-coding and CRC)

R1 Bit 20 BRS: Bit Rate Switch

0:Frame received without bit rate switching

1:Frame received with bit rate switching

R1 Bits 19:16 DLC[3:0]: Data Length Code

0 to 8: CAN + CAN FD: received frame has 0 to 8 data bytes

9 to 15: CAN: received frame has 8 data bytes

9 to 15: CAN FD: received frame has 12/16/20/24/32/48/64 data bytes

R1 Bits 15:0 RXTS[15:0]:Rx Timestamp

Timestamp Counter value captured on start of frame reception. Resolution depending on configuration of the Timestamp Counter Prescaler MTTCAN0TSCC.TCP.

R2 Bits 31:24 DB3[7:0]:Data Byte 3

R2 Bits 23:16 DB2[7:0]:Data Byte 2

R2 Bits 15:8 DB1[7:0]:Data Byte 1

R2 Bits 7:0 DB0[7:0]:Data Byte 0

R3 Bits 31:24 DB7[7:0]:Data Byte 7

R3 Bits 23:16 DB6[7:0]:Data Byte 6

R3 Bits 15:8 DB5[7:0]:Data Byte 5

R3 Bits 7:0 DB4[7:0]:Data Byte 4

...

Rn Bits 31:24 DBm[7:0]:Data Byte m

Rn Bits 23:16 DBm-1[7:0]:Data Byte m-1

Rn Bits 15:8 DBm-2[7:0]:Data Byte m-2

Rn Bits 7:0 DBm-3[7:0]:Data Byte m-3

NOTE

Depending on the configuration of the element size (MCTTAN0RXESC), between two and sixteen 32-bit words (Rn = 3 to 17) are used for storage of a CAN message's data field.

(3) Tx Buffer Element

The Tx Buffers section can be configured to hold dedicated Tx Buffers as well as a Tx FIFO / Tx Queue. In case that the Tx Buffers section is shared by dedicated Tx buffers and a Tx FIFO / Tx Queue, the dedicated Tx Buffers start at the beginning of the Tx Buffers section followed by the buffers assigned to the Tx FIFO or Tx Queue. The Tx Handler distinguishes between dedicated Tx Buffers and Tx FIFO / Tx Queue by evaluating the Tx Buffer configuration MTTCAN0TXBC.TFQS and MTTCAN0TXBC.NDTB. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register MTTCAN0TXESC.

Table 19.137 Tx Buffer Element

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
T0	ESI	XTD	RTR	ID[28:0]																												
T1	MM[7:0]								EFC	res	FDF	BRS	DLC[3:0]				res															
T2	DB3[7:0]								DB2[7:0]								DB1[7:0]								DB0[7:0]							
T3	DB7[7:0]								DB6[7:0]								DB5[7:0]								DB4[7:0]							
...	...								...								...								...							
Tn	DBm[7:0]								DBm-1[7:0]								DBm-2[7:0]								DBm-3[7:0]							

T0 Bit 31 ESI: Error State Indicator

0: ESI bit in CAN FD format depends only on error passive flag

1: ESI bit in CAN FD format transmitted recessive

NOTE

The ESI bit of the transmit buffer is or'ed with the error passive flag to decide the value of the ESI bit in the transmitted FD frame. As required by the CAN FD protocol specification, an error active node may optionally transmit the ESI bit recessive, but an error passive node will always transmit the ESI bit recessive

T0 Bit 30 XTD: Extended Identifier

0: 11-bit standard identifier

1: 29-bit extended identifier

T0 Bit 29 RTR: Remote Transmission Request

0: Transmit data frame

1: Transmit remote frame

NOTE

When RTR = 1, the M_TTCAN transmits a remote frame according to ISO11898-1:2015, even if MTTCAN0CCCR.FDOE enables the transmission in CAN FD format.

T0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier has to be written to ID[28:18].

T1 Bits 31:24 MM[7:0]: Message Marker

Written by CPU during Tx Buffer configuration. Copied into Tx Event FIFO element for identification of Tx message status.

T1 Bit 23 EFC: Event FIFO Control

0: Don’t store Tx events

1: Store Tx events

T1 Bit 21 FDF: FD Format

0: Frame transmitted in Classic CAN format

1: Frame transmitted in CAN FD format

T1 Bit 20 BRS: Bit Rat Switching

0: CAN FD frames transmitted without bit rate switching

1: CAN FD frames transmitted with bit rate switching

NOTE

Bits ESI, FDF, and BRS are only evaluated when CAN FD operation is enabled MTTCAN0CCCR.FDOE = ‘1’. Bit BRS is only evaluated when in addition CCCR.BRSE = ‘1’.

T1 Bits 19:16 DLC[3:0]: Data Length Code

0 to 8: CAN + CAN FD: transmit frame has 0-8 data bytes

9 to 15: CAN: transmit frame has 8 data bytes

9 to 15: CAN FD: transmit frame has 12/16/20/24/32/48/64 data bytes

T2 Bits 31:24DB3[7:0]:Data Byte 3

T2 Bits 23:16 DB2[7:0]: Data Byte 2

T2 Bits 15:8 DB1[7:0]: Data Byte 1

T2 Bits 7:0 DB0[7:0]: Data Byte 0

T3 Bits 31:24 DB7[7:0]: Data Byte 7

T3 Bits 23:16 DB6[7:0]: Data Byte 6

T3 Bits 15:8 DB5[7:0]: Data Byte 5

T3 Bits 7:0 DB4[7:0]: Data Byte 4

...

Tn Bits 31:24 DBm[7:0]: Data Byte m

Tn Bits 23:16 DBm-1[7:0]:Data Byte m-1

Tn Bits 15:8 DBm-2[7:0]:Data Byte m-2

Tn Bits 7:0 DBm-3[7:0]:Data Byte m-3

NOTE

Depending on the configuration of the element size (MTTCAN0TXESC), between two and sixteen 32-bit words (Tn = 3 to 17) are used for storage of a CAN message's data field.

(4) Tx Event FIFO Element

Each element stores information about transmitted messages. By reading the Tx Event FIFO the Host CPU gets this information in the order the messages were transmitted. Status information about the Tx Event FIFO can be obtained from register MTTCAN0TXEFS.

Table 19.138 Tx Event FIFO Element

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
E0	ESI	XTD	RTR	ID[28:0]																												
E1	MM[7:0]								ET[1:0]		FDF	BRS	DLC[3:0]				TXTS[15:0]															

E0 Bit 31 ESI: Error State Indicator

0: Transmitting node is error active

1: Transmitting node is error passive

E0 Bit 30 XTD: Extended Identifier

0: 11-bit standard identifier

1: 29-bit extended identifier

E0 Bit 29 RTR: Remote Transmission Request

0: Data frame transmitted

1: Remote frame transmitted

E0 Bits 28:0 ID[28:0]: Identifier

Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].

E1 Bits 31:24 MM[7:0]: Message Marker

Copied from Tx Buffer into Tx Event FIFO element for identification of Tx message status.

E1 Bit 23:22 ET[1:0]: Event Type

00: Reserved

01: Tx event

10: Transmission in spite of cancellation (always set for transmissions in DAR mode)

11: Reserved

E1 Bit 21 FDF: FD Format

0: Standard frame format

1: CAN FD frame format (new DLC-coding and CRC)

E1 Bit 20 BRS: Bit Rate Switch

0: Frame transmitted without bit rate switching

1: Frame transmitted with bit rate switching

E1 Bits 19:16 DLC[3:0]: Data Length Code

0 to 8: CAN + CAN FD: frame with 0-8 data bytes transmitted

9 to 15: CAN: frame with 8 data bytes transmitted

9 to 15: CAN FD: frame with 12/16/20/24/32/48/64 data bytes transmitted

E1 Bits 15:0 TXTS[15:0]:Tx Timestamp

Timestamp Counter value captured on start of frame transmission. Resolution depending on configuration of the Timestamp Counter Prescaler MTTCAN0TSCC.TCP.

(5) Standard Message ID Filter Element

Up to 128 filter elements can be configured for 11-bit standard IDs. When accessing a Standard Message ID Filter element, its address is the Filter List Standard Start Address MTTCAN0SIDFC.FLSSA plus the index of the filter element (0 to 127).

Table 19.139 Standard Message ID Filter Element

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
S0	SFT[1:0]		SFEC[2:0]		SFID1[10:0]											res								SFID2[10:0]							

Bits 31:30 SFT[1:0]: Standard Filter Type

00: Range filter from SFID1 to SFID2 (SFID2 ≥ SFID1)

01: Dual ID filter for SFID1 or SFID2

10: Classic filter: SFID1 = filter, SFID2 = mask

11: Filter element disabled

NOTE

With SFT = “11” the filter element is disabled and the acceptance filtering continues (same behaviour as with SFEC = “000”).

Bit 29:27 SFEC[2:0]:Standard Filter Element Configuration

All enabled filter elements are used for acceptance filtering of standard frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If SFEC = “100”, “101”, or “110” a match sets interrupt flag MTTCAN0IR.HPM and, if enabled, an interrupt is generated. In this case register MTTCAN0HPMS is updated with the status of the priority match.

000: Disable filter element

001: Store in Rx FIFO 0 if filter matches

010: Store in Rx FIFO 1 if filter matches

011: Reject ID if filter matches

100: Set priority if filter matches

101: Set priority and store in FIFO 0 if filter matches

110: Set priority and store in FIFO 1 if filter matches

111: Store into Rx Buffer or as debug message, configuration of SFT[1:0] ignored

Bits 26:16 SFID1[10:0]:Standard Filter ID 1

First ID of standard ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of a standard message to be stored. The received identifiers must match exactly, no masking mechanism is used.

Bits 10:0 SFID2[10:0]:Standard Filter ID 2

This bit field has a different meaning depending on the configuration of SFEC:

1) SFEC = “001” to ”110” Second ID of standard ID filter element

2) SFEC = “111” Filter for Rx Buffers or for debug messages

SFID2[10:9]: These bits decide whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.
00: Store message into an Rx Buffer
01: Debug Message A
10: Debug Message B
11: Debug Message C

SFID2[8:6]: These bits are used to control the filter event pins m_ttcan_fe[2:0] at the Extension Interface. A one at the respective bit position enables generation of a pulse at the related filter event pin with the duration of one m_ttcan_hclk (CLK_HSB) period in case the filter matches.

SFID2[5:0]: These bits define the offset to the Rx Buffer Start Address MTTCAN0RXBC.RBSA for storage of a matching message.

(6) Extended Message ID Filter Element

Up to 64 filter elements can be configured for 29-bit extended IDs. When accessing an Extended Message ID Filter element, its address is the Filter List Extended Start Address MTTCAN0XIDFC.FLESA plus two times the index of the filter element (0 to 63).

Table 19.140 Extended Message ID Filter Element

	31	24	23	16	15	8	7	0
F0	EFEC[2:0]		EFID1[28:0]					
F1	EFT[1:0]	res	EFID2[28:0]					

F0 Bit 31:29 EFEC[2:0]:Extended Filter Element Configuration

All enabled filter elements are used for acceptance filtering of extended frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If EFEC = “100”, “101”, or “110” a match sets interrupt flag MCANnIR.HPM and, if enabled, an interrupt is generated. In this case register MCANnHPMS is updated with the status of the priority match.

000: Disable filter element

001: Store in Rx FIFO 0 if filter matches

010: Store in Rx FIFO 1 if filter matches

011: Reject ID if filter matches

100: Set priority if filter matches

101: Set priority and store in FIFO 0 if filter matches

110: Set priority and store in FIFO 1 if filter matches

111: Store into Rx Buffer or as debug message, configuration of EFT[1:0] ignored

F0 Bits 28:0 EFID1[28:0]:Extended Filter ID 1

First ID of extended ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of an extended message to be stored. The received identifiers must match exactly, only MTTCAN0XIDAM masking mechanism (see **Section (e), Extended Message ID Filtering**) is used.

F1 Bits 31:30 EFT[1:0]: Extended Filter Type

00: Range filter from EFID1 to EFID2 (EFID2 ≥ EFID1)

01: Dual ID filter for EFID1 or EFID2

10: Classic filter: EFID1 = filter, EFID2 = mask

11: Range filter from EFID1 to EFID2 (EFID2 ≥ EFID1), MTTCAN0XIDAM mask not applied

F1 Bits 28:0 EFID2[28:0]:Extended Filter ID 2

This bit field has a different meaning depending on the configuration of EFEC:

1) EFEC: “001” to ”110”Second ID of extended ID filter element

2) EFEC: “111”Filter for Rx Buffers or for debug messages

EFID2[10:9]: These bits decide whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.
00: Store message into an Rx Buffer
01: Debug Message A
10: Debug Message B
11: Debug Message C

EFID2[8:6]: These bits are used to control the filter event pins m_ttcan_fe[2:0] at the Extension Interface. A one at the respective bit position enables generation of a pulse at the related filter event pin with the duration of one m_ttcan_hclk (CLK_HSB) period in case the filter matches.

EFID2[5:0]: These bits define the offset to the Rx Buffer Start Address MCANnRXBC.RBSA for storage of a matching message.

(7) Trigger Memory Element

Up to 64 trigger memory elements can be configured. When accessing a Trigger Memory element, its address is the Trigger Memory Start Address MTTCAN0TTTMC.TMSA plus the index of the trigger memory element (0 to 63).

Table 19.141 Trigger Memory Element

	31 24	23 16	15 8	7 0
T0	TM[15:0]		res CC[6:0]	ASC[1:0] TMIN TMEX TYPE[3:0]
T1	res	FTYPE MNR[6:0]	res	MSC[2:0]

T0 Bit 31:16 TM[15:0]:Time Mark

Cycle time for which the trigger becomes active.

T0 Bit 14:8 CC[6:0]:Cycle Code

Cycle count for which the trigger is valid. Ignored for trigger types Tx_Ref_Trigger, Tx_Ref_Trigger_Gap, Watch_Trigger, Watch_Trigger_Gap, End_of_List.

$000000x_B$ valid for all cycles

$000001c_B$ valid every 2nd cycle at cycle count mod2 = c

$00001cc_B$ valid every 4th cycle at cycle count mod4 = cc

$0001ccc_B$ valid every 8th cycle at cycle count mod8 = ccc

$001cccc_B$ valid every 16th cycle at cycle count mod16 = cccc

$01ccccc_B$ valid every 32nd cycle at cycle count mod32 = ccccc

$1cccccc_B$ valid every 64th cycle at cycle count mod64 = cccccc

T0 Bit 7:6 ASC[1:0]:Asynchronous Serial Communication

00: No ASC operation

01: Reserved, do not use

10: Node is ASC receiver

11: Node is ASC transmitter

T0 Bit 5 TMIN:Time Mark Event Internal

0: No action

1: MTTCAN0TTIR.TTMI is set when trigger memory element becomes active

T0 Bit 4 TMEX:Time Mark Event External

0: No action

1: Pulse at output m_ttcan_tmp (MTTCAN0TMP) with the length of one m_ttcan_cclk (CLKP_H2) period is generated when the time mark of the trigger memory element becomes active and MTTCAN0TTOCN.TTMIE = ‘1’

T0 Bit 3:0 TYPE[3:0]:Trigger Type

0000	Tx_Ref_Trigger - valid when not in Gap
0001	Tx_Ref_Trigger_Gap - valid when in Gap
0010	Tx_Trigger_Single - starts a single transmission in an exclusive time window
0011	Tx_Trigger_Continuous - starts continuous transmission in an exclusive time window
0100	Tx_Trigger_Arbitration - starts a transmission in an arbitrating time window
0101	Tx_Trigger_Merged - starts a merged arbitration window
0110	Watch_Trigger - valid when not in Gap
0111	Watch_Trigger_Gap - valid when in Gap
1000	Rx_Trigger - check for reception
1001	Time_Base_Trigger - only control TMIN, TMEX, and ASC
1010 to 1111	End_of_List - illegal type, causes config error

NOTE

For ASC operation (ASC = “10”, “11”) only trigger types Rx_Trigger and Time_Base_Trigger should be used.

T1 Bit 23 FTYPE:Filter Type

0= 11-bit standard message ID
1= 29-bit extended message ID

T1 Bit 22:16 MNR[6:0]:Message Number

Transmission: Trigger is valid for configured Tx Buffer number. Valid values are 0 to 31.
Reception: Trigger is valid for standard / extended message ID filter element number. Valid values are 0 to 63 resp. 0 to 127.

T1 Bits 2:0 MSC[2:0]:Message Status Count

Counts scheduling errors for periodic messages in exclusive time windows. It has no function for arbitrating messages and in event-driven CAN communication (ISO11898-1:2015).

0-7: Actual status

NOTES

1. The trigger memory elements have to be written when the M_TTCAN is in INIT state. Write access to the trigger memory elements outside INIT state is not allowed.
2. There is an exception for TMIN and TMEX when they are defined as part of a trigger memory element of TYPE Tx_Ref_Trigger. In this case they become active at the time mark modified by the actual Reference Trigger Offset (MTTCAN0TTOST.RTO).

19.6.3 Functional Description

19.6.3.1 Operating Modes

(1) Software Initialization

Software initialization is started by setting bit MTTCAN0CCCR.INIT, either by software or by a hardware reset, when an uncorrected bit error was detected in the Message RAM, or by going Bus_Off. While MTTCAN0CCCR.INIT is set, message transfer from and to the CAN bus is stopped, the status of the CAN bus output m_ttcan_tx is recessive (HIGH). The counters of the Error Management Logic EML are unchanged. Setting MTTCAN0CCCR.INIT does not change any configuration register. Resetting MTTCAN0CCCR.INIT finishes the software initialization. Afterwards the Bit Stream Processor BSP synchronizes itself to the data transfer on the CAN bus by waiting for the occurrence of a sequence of 11 consecutive recessive bits (≡ Bus_Idle) before it can take part in bus activities and start the message transfer.

Access to the M_TTCAN configuration registers is only enabled when both bits MTTCAN0CCCR.INIT and MTTCAN0CCCR.CCE are set (protected write).

MTTCAN0CCCR.CCE can only be set/reset while MTTCAN0CCCR.INIT = ‘1’. MTTCAN0CCCR.CCE is automatically reset when MTTCAN0CCCR.INIT is reset.

The following registers are reset when MTTCAN0CCCR.CCE is set

- MTTCAN0HPMS - High Priority Message Status
- MTTCAN0RXF0S - Rx FIFO 0 Status
- MTTCAN0RXF1S - Rx FIFO 1 Status
- MTTCAN0TXFQS - Tx FIFO/Queue Status
- MTTCAN0TXBRP - Tx Buffer Request Pending
- MTTCAN0TXBTO - Tx Buffer Transmission Occurred
- MTTCAN0TXBCF - Tx Buffer Cancellation Finished
- MTTCAN0TXEFS - Tx Event FIFO Status
- MTTCAN0TTOST - TT Operation Status
- MTTCAN0TTLGT - TT Local & Global Time, only Global Time MTTCAN0TTLGT.GT is reset
- MTTCAN0TTCTC - TT Cycle Time & Count
- MTTCAN0TTCSM - TT Cycle Sync Mark

The Timeout Counter value MTTCAN0TOCV.TOC is preset to the value configured by MTTCAN0TOCC.TOP when MTTCAN0CCCR.CCE is set.

In addition the state machines of the Tx Handler and Rx Handler are held in idle state while MTTCAN0CCCR.CCE = ‘1’.

The following registers are only writable while MTTCAN0CCCR.CCE = ‘0’

- MTTCAN0TXBAR - Tx Buffer Add Request
- MTTCAN0TXBCR - Tx Buffer Cancellation Request

MTTCAN0CCCR.TEST and MTTCAN0CCCR.MON can only be set by the Host while MTTCAN0CCCR.INIT = ‘1’ and MTTCAN0CCCR.CCE = ‘1’. Both bits may be reset at any time. MTTCAN0CCCR.DAR can only be set/reset while MTTCAN0CCCR.INIT = ‘1’ and MTTCAN0CCCR.CCE = ‘1’.

(2) Normal Operation

The M_TTCAN's default operating mode after hardware reset is event-driven CAN communication without time triggers (MTTCAN0TTOCF.OM = "00"). It is required that both MTTCAN0CCCR.INIT and MTTCAN0CCCR.CCE are set before the TT Operation Mode can be changed.

Once the M_TTCAN is initialized and MTTCAN0CCCR.INIT is reset to zero, the M_TTCAN synchronizes itself to the CAN bus and is ready for communication.

After passing the acceptance filtering, received messages including Message ID and DLC are stored into a dedicated Rx Buffer or into Rx FIFO 0 or Rx FIFO 1.

For messages to be transmitted dedicated Tx Buffers and/or a Tx FIFO or a Tx Queue can be initialized or updated. Automated transmission on reception of remote frames is not implemented.

(3) CAN FD Operation

There are two variants in the CAN FD frame transmission, first the CAN FD frame without bit rate switching . The second variant is the CAN FD frame where control field, data field, and CRC field are transmitted with a higher bit rate than the beginning and the end of the frame.

The previously reserved bit in CAN frames with 11-bit identifiers and the first previously reserved bit in CAN frames with 29-bit identifiers will now be decoded as FDF bit. FDF = recessive signifies a CAN FD frame, FDF = dominant signifies a Classic CAN frame. In a CAN FD frame, the two bits following FDF, res and BRS, decide whether the bit rate inside of this CAN FD frame is switched. A CAN FD bit rate switch is signified by res = dominant and BRS = recessive. The coding of res = recessive is reserved for future expansion of the protocol. In case the M_TTCAN receives a frame with FDF = recessive and res = recessive, it will signal a Protocol Exception Event by setting bit PSR.PXE. When Protocol Exception Handling is enabled (MTTCAN0CCCR.PXHD = '0'), this causes the operation state to change from Receiver (MTTCAN0PSR.ACT = "10") to Integrating (MTTCAN0PSR.ACT = "00") at the next sample point. In case Protocol Exception Handling is disabled (MTTCAN0CCCR.PXHD = '1'), the M_TTCAN will treat a recessive res bit as an form error and will respond with an error frame.

CAN FD operation is enabled by programming MTTCAN0CCCR.FDOE. In case MTTCAN0CCCR.FDOE = '1', transmission and reception of CAN FD frames is enabled. Transmission and reception of Classic CAN frames is always possible. Whether a CAN FD frame or a Classic CAN frame is transmitted can be configured via bit FDF in the respective Tx Buffer element. With MTTCAN0CCCR.FDOE = '0', received frames are interpreted as Classic CAN frames, which leads to the transmission of an error frame when receiving a CAN FD frame. When CAN FD operation is disabled, no CAN FD frames are transmitted even if bit FDF of a Tx Buffer element is set. MTTCAN0CCCR.FDOE and MTTCAN0CCCR.BRSE can only be changed while MTTCAN0CCCR.INIT and CCCR.CCE are both set.

With MTTCAN0CCCR.FDOE = '0', the setting of bits FDF and BRS is ignored and frames are transmitted in Classic CAN format. With MTTCAN0CCCR.FDOE = '1' and MTTCAN0CCCR.BRSE = '0', only bit FDF of a Tx Buffer element is evaluated. With MTTCAN0CCCR.FDOE = '1' and MTTCAN0CCCR.BRSE = '1', transmission of CAN FD frames with bit rate switching is enabled. All Tx Buffer elements with bits FDF and BRS set are transmitted in CAN FD format with bit rate switching.

A mode change during CAN operation is only recommended under the following conditions:

- The failure rate in the CAN FD data phase is significant higher than in the CAN FD arbitration phase. In this case disable the CAN FD bit rate switching option for transmissions.
- During system startup all nodes are transmitting Classic CAN messages until it is verified that

they are able to communicate in CAN FD format. If this is true, all nodes switch to CAN FD operation.

- Wake-up messages in CAN Partial Networking have to be transmitted in Classic CAN format.
- End-of-line programming in case not all nodes are CAN FD capable. Non CAN FD nodes are held in Silent mode until programming has completed. Then all nodes switch back to Classic CAN communication.

In the CAN FD format, the coding of the DLC differs from the standard CAN format. The DLC codes 0 to 8 have the same coding as in standard CAN, the codes 9 to 15, which in standard CAN all code a data field of 8 bytes, are coded according to **Table 19.142** below.

Table 19.142 Coding of DLC in CAN FD

DLC	9	10	11	12	13	14	15
Number of Data Bytes	12	16	20	24	32	48	64

In CAN FD frames, the bit timing will be switched inside the frame, after the BRS (Bit Rate Switch) bit, if this bit is recessive. Before the BRS bit, in the CAN FD arbitration phase, the nominal CAN bit timing is used as defined by the Nominal Bit Timing & Prescaler Register MTTCAN0NBTP. In the following CAN FD data phase, the data phase bit timing is used as defined by the Data Bit Timing & Prescaler Register MTTCAN0DBTP. The bit timing is switched back from the data phase timing at the CRC delimiter or when an error is detected, whichever occurs first.

The maximum configurable bit rate in the CAN FD data phase depends on the CAN clock frequency (m_ttcan_cclk: CLKP_H2). Example: with a CAN clock frequency of 20MHz and the shortest configurable bit time of 4 tq, the bit rate in the data phase is 5 Mbit/s.

In both data frame formats, CAN FD and CAN FD with bit rate switching, the value of the bit ESI (Error Status Indicator) is determined by the transmitter's error state at the start of the transmission. If the transmitter is error passive, ESI is transmitted recessive, else it is transmitted dominant.

(4) Transmitter Delay Compensation

During the data phase of a CAN FD transmission only one node is transmitting, all others are receivers. The length of the bus line has no impact. When transmitting via pin m_ttcan_tx the protocol controller receives the transmitted data from its local CAN transceiver via pin m_ttcan_rx. The received data is delayed by the CAN transceiver's loop delay. In case this delay is greater than TSEG1 (time segment before sample point), a bit error is detected. In order to enable a data phase bit time that is even shorter than the transceiver loop delay, the delay compensation is introduced. Without transmitter delay compensation, the bit rate in the data phase of a CAN FD frame is limited by the transceivers loop delay.

(a) Description

The CAN FD protocol unit has implemented a delay compensation mechanism to compensate the CAN transceiver's loop delay, thereby enabling transmission with higher bit rates during the CAN FD data phase independent of the delay of a specific CAN transceiver.

To check for bit errors during the data phase of transmitting nodes, the delayed transmit data is compared against the received data at the Secondary Sample Point SSP. If a bit error is detected, the transmitter will react on this bit error at the next following regular sample point. During arbitration phase the delay compensation is always disabled.

The transmitter delay compensation enables configurations where the data bit time is shorter than the transmitter delay, it is described in detail in the ISO11898-1:2015. It is enabled by setting bit MTTCAN0DBTP.TDC.

The received bit is compared against the transmitted bit at the SSP. The SSP position is defined as the sum of the measured delay from the M_TTCAN's transmit output m_ttcan_tx through the transceiver to the receive input m_ttcan_rx plus the transmitter delay compensation offset as configured by MTTCAN0TDCR.TDCO. The transmitter delay compensation offset is used to adjust the position of the SSP inside the received bit (e.g. half of the bit time in the data phase). The position of the secondary sample point is rounded down to the next integer number of mtq.

MTTCAN0PSR.TDCV shows the actual transmitter delay compensation value. MTTCAN0PSR.TDCV is cleared when MTTCAN0CCCR.INIT is set and is updated at each transmission of an FD frame while MTTCAN0DBTP.TDC is set.

The following boundary conditions have to be considered for the transmitter delay compensation implemented in the M_TTCAN:

- The sum of the measured delay from m_ttcan_tx to m_ttcan_rx and the configured transmitter delay compensation offset MTTCAN0TDCR.TDCO has to be less than 6 bit times in the data phase.
- The sum of the measured delay from m_ttcan_tx to m_ttcan_rx and the configured transmitter delay compensation offset MTTCAN0TDCR.TDCO has to be less or equal 127 mtq. In case this sum exceeds 127 mtq, the maximum value of 127 mtq is used for transmitter delay compensation.
- The data phase ends at the sample point of the CRC delimiter, that stops checking of receive bits at the SSPs

(b) Transmitter Delay Compensation Measurement

If transmitter delay compensation is enabled by programming MTTCAN0DBTP.TDC = ‘1’, the measurement is started within each transmitted CAN FD frame at the falling edge of bit FDF to bit res. The measurement is stopped when this edge is seen at the receive input m_ttcan_rx of the transmitter. The resolution of this measurement is one mtq.

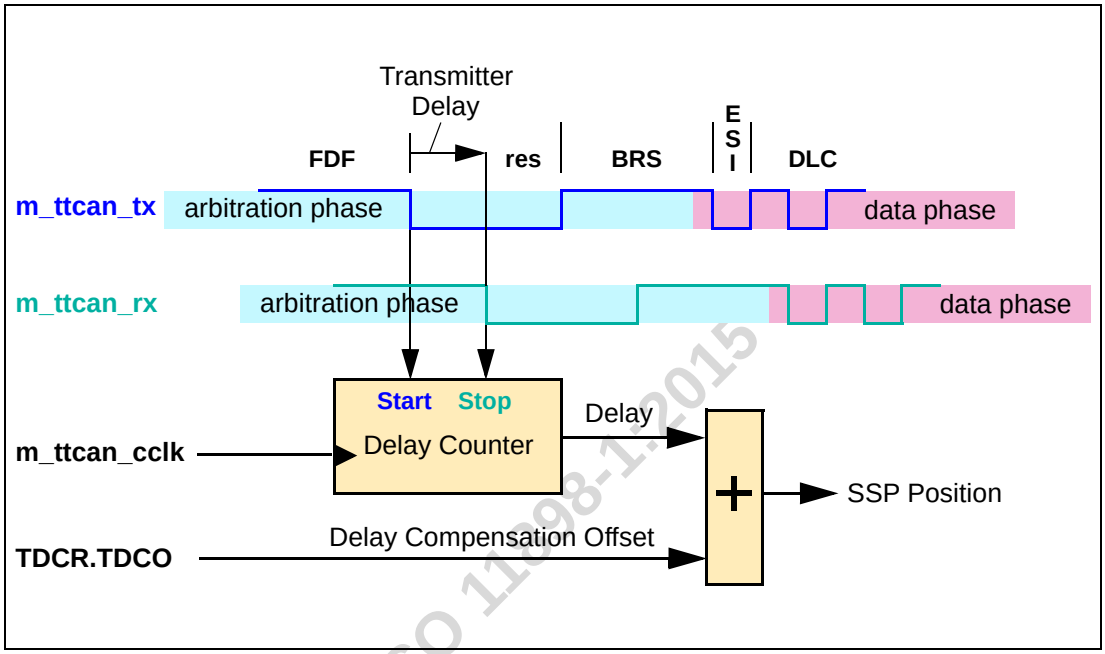

Figure 19.17 Transmitter delay measurement

To avoid that a dominant glitch inside the received FDF bit ends the delay compensation measurement before the falling edge of the received res bit, resulting in a to early SSP position, the use of a transmitter delay compensation filter window can be enabled by programming MTTCAN0TDCR.TDCF. This defines a minimum value for the SSP position. Dominant edges on m_ttcan_rx, that would result in an earlier SSP position are ignored for transmitter delay measurement. The measurement is stopped when the SSP position is at least MTTCAN0TDCR.TDCF AND m_ttcan_rx is low.

(5) Restricted Operation Mode

In Restricted Operation Mode the node is able to receive data and remote frames and to give acknowledge to valid frames, but it does not send data frames, remote frames, active error frames, or overload frames. In case of an error condition or overload condition, it does not send dominant bits, instead it waits for the occurrence of bus idle condition to resynchronize itself to the CAN communication. The error counters (ECR.REC, ECR.TEC) are frozen while Error Logging (ECR.CEL) is active. The Host can set the M_TTCAN into Restricted Operation mode by setting bit MTTCAN0CCCR.ASM. The bit can only be set by the Host when both MTTCAN0CCCR.CCE and MTTCAN0CCCR.INIT are set to '1'. The bit can be reset by the Host at any time.

Restricted Operation Mode is automatically entered when the Tx Handler was not able to read data from the Message RAM in time. To leave Restricted Operation Mode, the Host CPU has to reset MTTCAN0CCCR.ASM.

The Restricted Operation Mode can be used in applications that adapt themselves to different CAN bit rates. In this case the application tests different bit rates and leaves the Restricted Operation Mode after it has received a valid frame.

When the M_TTCAN is configured for Asynchronous Serial Communication, the Host has to set MTTCAN0CCCR.ASM during initialization to start with an ASC window. The bit is reset at the end of the first ASC window after the M_TTCAN has finished initializing. During time-triggered operation MTTCAN0CCCR.ASM is set by the M_TTCAN at the beginning of an ASC window (trigger memory element with T0.ASC = "10", "11"). It is reset by each trigger memory element with T0.ASC = "00".

If the M_TTCAN is connected to a Clock Calibration on CAN unit, MTTCAN0CCCR.ASM is controlled by input m_ttcan_cok. In case m_ttcan_cok switches to '0', bit MTTCAN0CCCR.ASM is set. When m_ttcan_cok switches back to '1', bit MTTCAN0CCCR.ASM returns to the previously written value. When there is no Clock Calibration on CAN unit connected input m_ttcan_cok is hardwired to '1'.

NOTE

The Restricted Operation Mode must not be combined with the Loop Back Mode (internal or external).

(6) Bus Monitoring Mode

The M_TTCAN is set in Bus Monitoring Mode by programming MTTCAN0CCCR.MON to one or when error level S3 (MTTCAN0TTOST.EL = “11”) is entered. In Bus Monitoring Mode (see ISO11898-1:2015, 10.12 Bus monitoring), the M_TTCAN is able to receive valid data frames and valid remote frames, but cannot start a transmission. In this mode, it sends only recessive bits on the CAN bus, if the M_TTCAN is required to send a dominant bit (ACK bit, overload flag, active error flag), the bit is rerouted internally so that the M_TTCAN monitors this dominant bit, although the CAN bus may remain in recessive state. In Bus Monitoring Mode register MTTCAN0TXBRP is held in reset state.

The Bus Monitoring Mode can be used to analyze the traffic on a CAN bus without affecting it by the transmission of dominant bits. **Figure 19.18** shows the connection of signals m_ttcan_tx and m_ttcan_rx to the M_TTCAN in Bus Monitoring Mode.

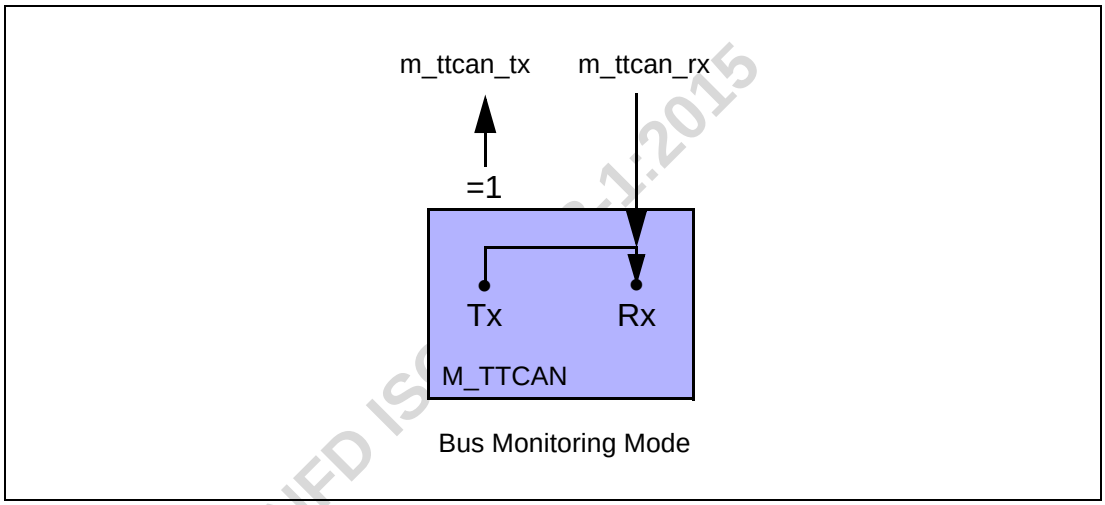

Figure 19.18 Pin Control in Bus Monitoring Mode

(7) Disabled Automatic Retransmission

According to the CAN Specification (see ISO11898-1:2015, 6.3.3 Recovery Management), the M_TTCAN provides means for automatic retransmission of frames that have lost arbitration or that have been disturbed by errors during transmission. By default automatic retransmission is enabled. To support time-triggered communication as described in ISO 11898-1, chapter 9.2, the automatic retransmission may be disabled via MTTCAN0CCCR.DAR.

(a) Frame Transmission in DAR Mode

In DAR mode all transmissions are automatically cancelled after they started on the CAN bus. A Tx Buffer’s Tx Request Pending bit MTTCAN0TXBRP.TRPx is reset after successful transmission, when a transmission has not yet been started at the point of cancellation, has been aborted due to lost arbitration, or when an error occurred during frame transmission.

- Successful transmission:
  Corresponding Tx Buffer Transmission Occurred bit MTTCAN0TXBTO.TOx set
  Corresponding Tx Buffer Cancellation Finished bit MTTCAN0TXBCF.CFx not set
- Successful transmission in spite of cancellation:
  Corresponding Tx Buffer Transmission Occurred bit MTTCAN0TXBTO.TOx set
  Corresponding Tx Buffer Cancellation Finished bit MTTCAN0TXBCF.CFx set
- Arbitration lost or frame transmission disturbed:

Corresponding Tx Buffer Transmission Occurred bit MTTCAN0TXBTO.TOx not set
Corresponding Tx Buffer Cancellation Finished bit MTTCAN0TXBCF.CFx set

In case of a successful frame transmission, and if storage of Tx events is enabled, a Tx Event FIFO element is written with Event Type ET = “10” (transmission in spite of cancellation).

(8) Power Down (Sleep Mode)

The M_TTCAN can be set into power down mode by using CC Control Register MTTCAN0CCCR.CSR. When all pending transmission requests have completed, the M_TTCAN waits until bus idle state is detected. Then the M_TTCAN sets then MTTCAN0CCCR.INIT to one to prevent any further CAN transfers. Now the M_TTCAN acknowledges that it is ready for power down by MTTCAN0CCCR.CSA to one. In this state, before the clocks are switched off, further register accesses can be made. A write access to MTTCAN0CCCR.INIT will have no effect. Now the module clock inputs m_ttcan_hclk (CLK_HSB) and m_ttcan_cclk (CLKP_H2) may be switched off.

To leave power down mode, the application has to turn on the module clocks before resetting CC Control Register flag MTTCAN0CCCR.CSR. The M_TTCAN will acknowledge this by resetting MTTCAN0CCCR.CSA. Afterwards, the application can restart CAN communication by resetting bit MTTCAN0CCCR.INIT.

(9) Test Modes

To enable write access to register MTTCAN0TEST (see **(4) MCANnTEST — Test Register**), bit MTTCAN0CCCR.TEST has to be set to one. This allows the configuration of the test modes and test functions.

Four output functions are available for the CAN transmit pin m_ttcan_tx by programming MTTCAN0TEST.TX. Additionally to its default function – the serial data output – it can drive the CAN Sample Point signal to monitor the M_TTCAN’s bit timing and it can drive constant dominant or recessive values. The actual value at pin m_ttcan_rx can be read from MTTCAN0TEST.RX. Both functions can be used to check the CAN bus’ physical layer.

Due to the synchronization mechanism between CAN clock and Host clock domain, there may be a delay of several Host clock periods between writing to MTTCAN0TEST.TX until the new configuration is visible at output pin m_ttcan_tx. This applies also when reading input pin m_ttcan_rx via MTTCAN0TEST.RX.

NOTE

Test modes should be used for production tests or self test only. The software control for pin m_ttcan_tx interferes with all CAN protocol functions. It is not recommended to use test modes for application.

(a) External Loop Back Mode

The M_TTCAN can be set in External Loop Back Mode by programming MTTCAN0TEST.LBCK to one. In Loop Back Mode, the M_TTCAN treats its own transmitted messages as received messages and stores them (if they pass acceptance filtering) into an Rx Buffer or an Rx FIFO. **Figure 19.19** shows the connection of signals m_ttcan_tx and m_ttcan_rx to the M_TTCAN in External Loop Back Mode.

This mode is provided for hardware self-test. To be independent from external stimulation, the M_TTCAN ignores acknowledge errors (recessive bit sampled in the acknowledge slot of a data/remote frame) in Loop Back Mode. In this mode the M_TTCAN performs an internal feedback from its Tx output to its Rx input. The actual value of the m_ttcan_rx input pin is disregarded by the M_TTCAN. The transmitted messages can be monitored at the m_ttcan_tx pin.

(b) Internal Loop Back Mode

Internal Loop Back Mode is entered by programming bits MTTCAN0TEST.LBCK and MTTCAN0CCCR.MON to one. This mode can be used for a “Hot Selftest”, meaning the M_TTCAN can be tested without affecting a running CAN system connected to the pins m_ttcan_tx and m_ttcan_rx. In this mode pin m_ttcan_rx is disconnected from the M_TTCAN and pin m_ttcan_tx is held recessive. **Figure 19.19** shows the connection of m_ttcan_tx and m_ttcan_rx to the M_TTCAN in case of Internal Loop Back Mode.

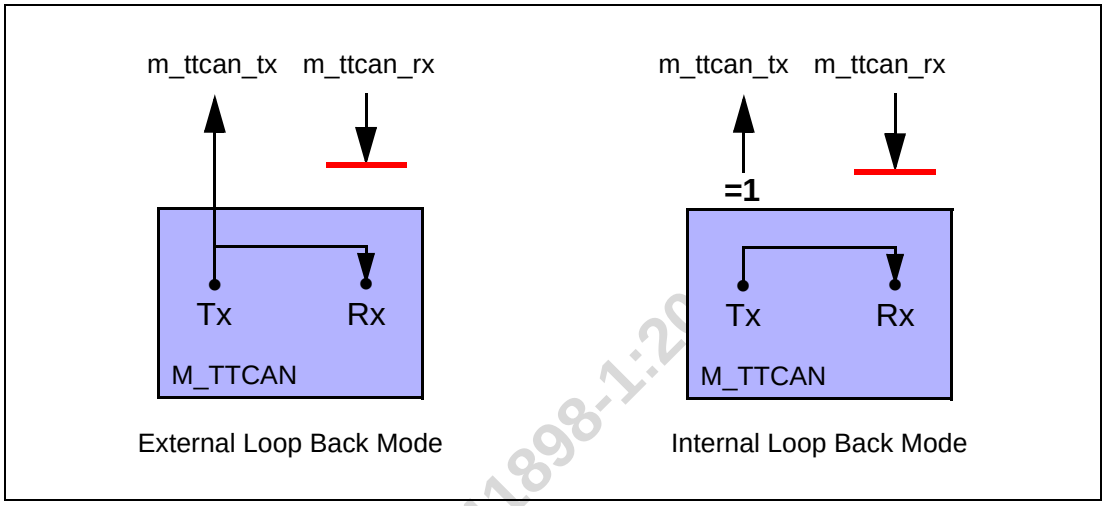

Figure 19.19 Pin Control in Loop Back Modes

(10) Application Watchdog

The application watchdog is served by reading register MTTCAN0TTOST. When the application watchdog is not served in time, bit MTTCAN0TTOST.AWE is set, all TTCAN communication is stopped, and the M_TTCAN is set into Bus Monitoring Mode.

The TT Application Watchdog can be disabled by programming the Application Watchdog Limit MTTCAN0TTOCF.AWL to 00_H. The TT Application Watchdog should not be disabled in a TTCAN application program.

19.6.3.2 Timestamp Generation

For timestamp generation the M_TTCAN supplies a 16-bit wrap-around counter. A prescaler MTTCAN0TSCC.TCP can be configured to clock the counter in multiples of CAN bit times (1 to 16). The counter is readable via MTTCAN0TSCV.TCV. A write access to register MTTCAN0TSCV resets the counter to zero. When the timestamp counter wraps around interrupt flag MTTCAN0IR.TSW is set.

On start of frame reception / transmission the counter value is captured and stored into the timestamp section of an Rx Buffer / Rx FIFO (RXTS[15:0]) or Tx Event FIFO (TXTS[15:0]) element.

By programming bit MTTCAN0TSCC.TSS an external 16-bit timestamp can be used.

19.6.3.3 Timeout Counter

To signal timeout conditions for Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO the M_TTCAN supplies a 16-bit Timeout Counter. It operates as down-counter and uses the same prescaler controlled by MTTCAN0TSCC.TCP as the Timestamp Counter. The Timeout Counter is configured via register MTTCAN0TOCC. The actual counter value can be read from MTTCAN0TOCV.TOC.

The Timeout Counter can only be started while MTTCAN0CCCR.INIT = ‘0’. It is stopped when MTTCAN0CCCR.INIT = ‘1’, e.g. when the M_TTCAN enters Bus_Off state.

The operation mode is selected by MTTCAN0TOCC.TOS. When operating in Continuous Mode, the counter starts when MTTCAN0CCCR.INIT is reset. A write to MTTCAN0TOCV presets the counter to the value configured by MTTCAN0TOCC.TOP and continues down-counting.

When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MTTCAN0TOCC.TOP. Down-counting is started when the first FIFO element is stored. Writing to MTTCAN0TOCV has no effect.

When the counter reaches zero, interrupt flag MTTCAN0IR.TOO is set. In Continuous Mode, the counter is immediately restarted at MTTCAN0TOCC.TOP.

NOTE

The clock signal for the Timeout Counter is derived from the CAN Core’s sample point signal. Therefore the point in time where the Timeout Counter is decremented may vary due to the synchronization / re-synchronization mechanism of the CAN Core. If the baud rate switch feature in CAN FD is used, the timeout counter is clocked differently in arbitration and data field.

19.6.3.4 Rx Handling

The Rx Handler controls the acceptance filtering, the transfer of received messages to the Rx Buffers or to one of the two Rx FIFOs, as well as the Rx FIFO's Put and Get Indices.

(1) Acceptance Filtering

The M_TTCAN offers the possibility to configure two sets of acceptance filters, one for standard identifiers and one for extended identifiers. These filters can be assigned to an Rx Buffer or to Rx FIFO 0,1. For acceptance filtering each list of filters is executed from element #0 until the first matching element. Acceptance filtering stops at the first matching element. The following filter elements are not evaluated for this message.

The main features are:

- Each filter element can be configured as
  - range filter (from - to)
  - filter for one or two dedicated IDs
  - classic bit mask filter
- Each filter element is configurable for acceptance or rejection filtering
- Each filter element can be enabled / disabled individually
- Filters are checked sequentially, execution stops with the first matching filter element

Related configuration registers are:

- Global Filter Configuration MTTCAN0GFC
- Standard ID Filter Configuration MTTCAN0SIDFC
- Extended ID Filter Configuration MTTCAN0XIDFC
- Extended ID AND Mask MTTCAN0XIDAM

Depending on the configuration of the filter element (SFEC/EFEC) a match triggers one of the following actions:

- Store received frame in FIFO 0 or FIFO 1
- Store received frame in Rx Buffer
- Store received frame in Rx Buffer and generate pulse at filter event pin
- Reject received frame
- Set High Priority Message interrupt flag MTTCAN0IR.HPM
- Set High Priority Message interrupt flag MTTCAN0IR.HPM and store received frame in FIFO 0 or FIFO 1

Acceptance filtering is started after the complete identifier has been received. After acceptance filtering has completed, and if a matching Rx Buffer or Rx FIFO has been found, the Message Handler starts writing the received message data in portions of 32 bit to the matching Rx Buffer or Rx FIFO. If the CAN protocol controller has detected an error condition (e.g. CRC error), this message is discarded with the following impact on the affected Rx Buffer or Rx FIFO:

Rx Buffer

New Data flag of matching Rx Buffer is not set, but Rx Buffer (partly) overwritten with received data. For error type see MTTCAN0PSR.LEC respectively MTTCAN0PSR.DLEC.

Rx FIFO

Put index of matching Rx FIFO is not updated, but related Rx FIFO element (partly) overwritten with received data. For error type see MTTCAN0PSR.LEC respectively MTTCAN0PSR.DLEC. In case the matching Rx FIFO is operated in overwrite mode, the boundary conditions described in **(b) Rx FIFO Overwrite Mode** have to be considered.

NOTE

When an accepted message is written to one of the two Rx FIFOs, or into an Rx Buffer, the unmodified received identifier is stored independent of the filter(s) used. The result of the acceptance filter process is strongly depending on the sequence of configured filter elements.

(a) Range Filter

The filter matches for all received frames with Message IDs in the range defined by SF1ID/SF2ID resp. EF1ID/EF2ID.

There are two possibilities when range filtering is used together with extended frames:

EFT: “00”: The Message ID of received frames is ANDed with the Extended ID AND Mask (MTTCAN0XIDAM) before the range filter is applied

EFT: “11”: The Extended ID AND Mask (MTTCAN0XIDAM) is not used for range filtering

(b) Filter for specific IDs

A filter element can be configured to filter for one or two specific Message IDs. To filter for one specific Message ID, the filter element has to be configured with SF1ID = SF2ID resp. EF1ID = EF2ID.

(c) Classic Bit Mask Filter

Classic bit mask filtering is intended to filter groups of Message IDs by masking single bits of a received Message ID. With classic bit mask filtering SF1ID/EF1ID is used as Message ID filter, while SF2ID/EF2ID is used as filter mask.

A zero bit at the filter mask will mask out the corresponding bit position of the configured ID filter, e.g. the value of the received Message ID at that bit position is not relevant for acceptance filtering. Only those bits of the received Message ID where the corresponding mask bits are one are relevant for acceptance filtering.

In case all mask bits are one, a match occurs only when the received Message ID and the Message ID filter are identical. If all mask bits are zero, all Message IDs match.

(d) Standard Message ID Filtering

Figure 19.20 below shows the flow for standard Message ID (11-bit Identifier) filtering. The Standard Message ID Filter element is described in **(5) Standard Message ID Filter Element**.

Controlled by the Global Filter Configuration MTTCAN0GFC and the Standard ID Filter Configuration MTTCAN0SIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

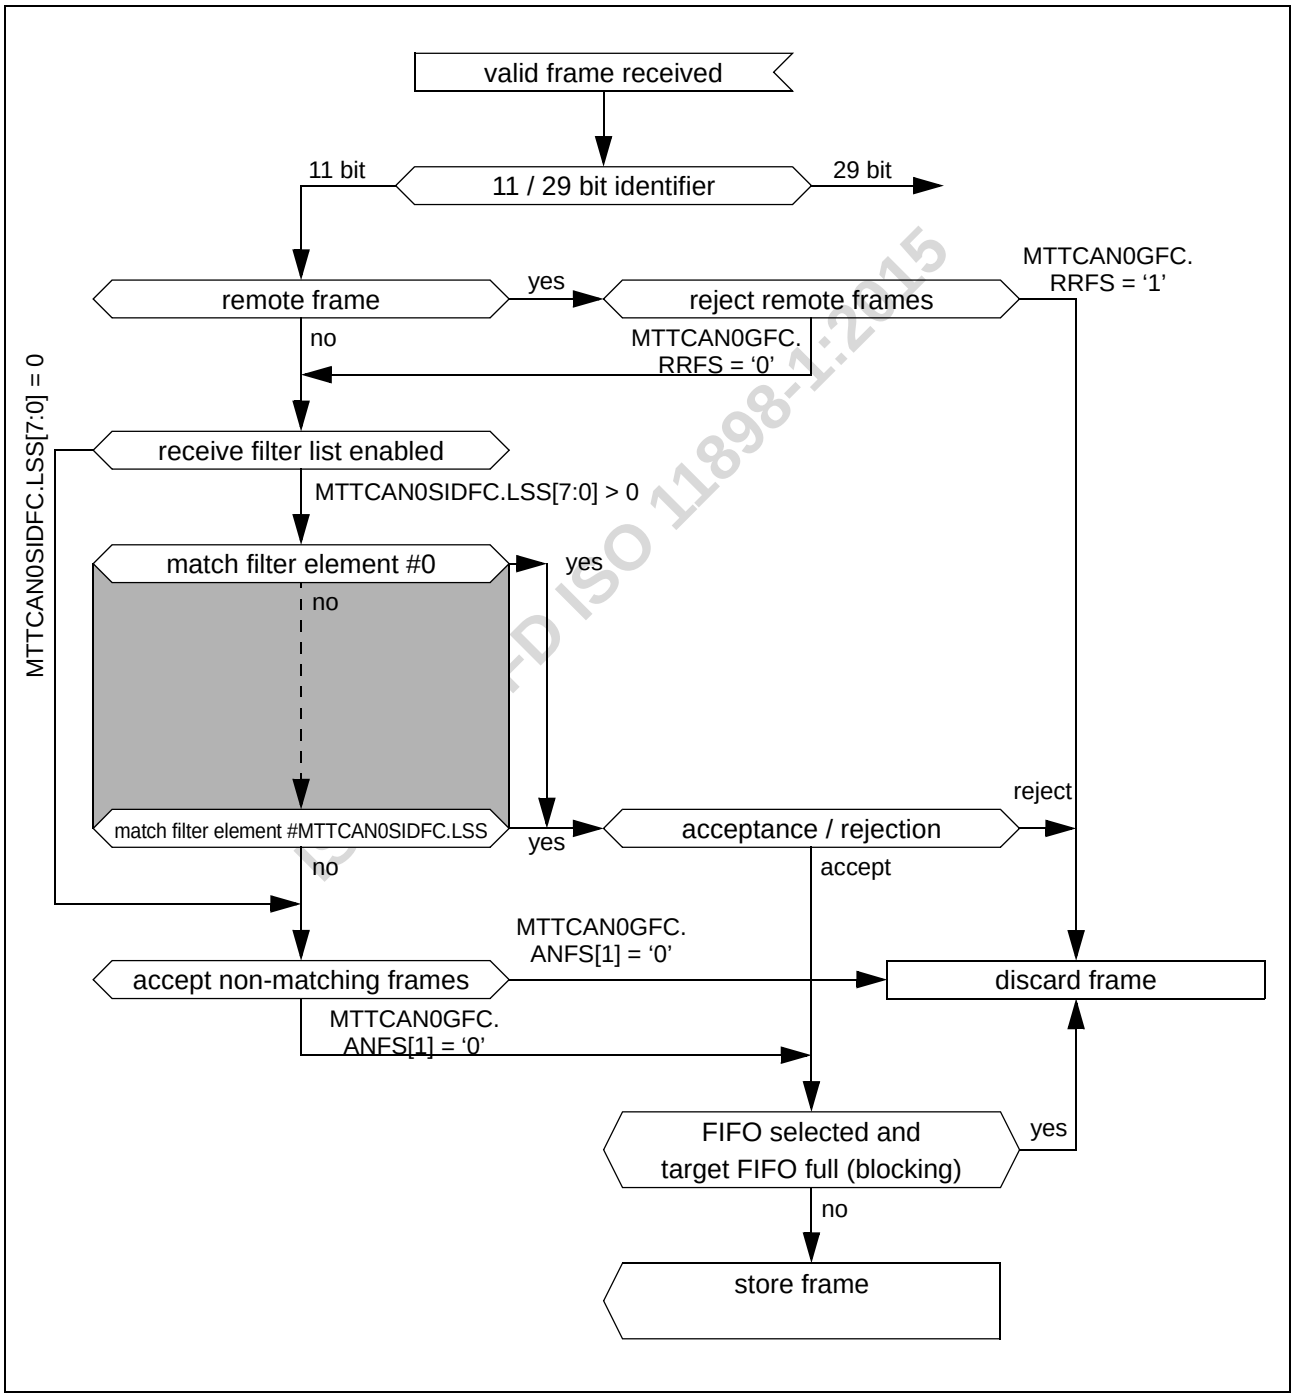

Figure 19.20 Standard Message ID Filter Path

(e) Extended Message ID Filtering

Figure 19.21 below shows the flow for extended Message ID (29-bit Identifier) filtering. The Extended Message ID Filter element is described in **(6) Extended Message ID Filter Element**.

Controlled by the Global Filter Configuration MTTCAN0GFC and the Extended ID Filter Configuration MTTCAN0XIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

The Extended ID AND Mask MTTCAN0XIDAM is ANDed with the received identifier before the filter list is executed.

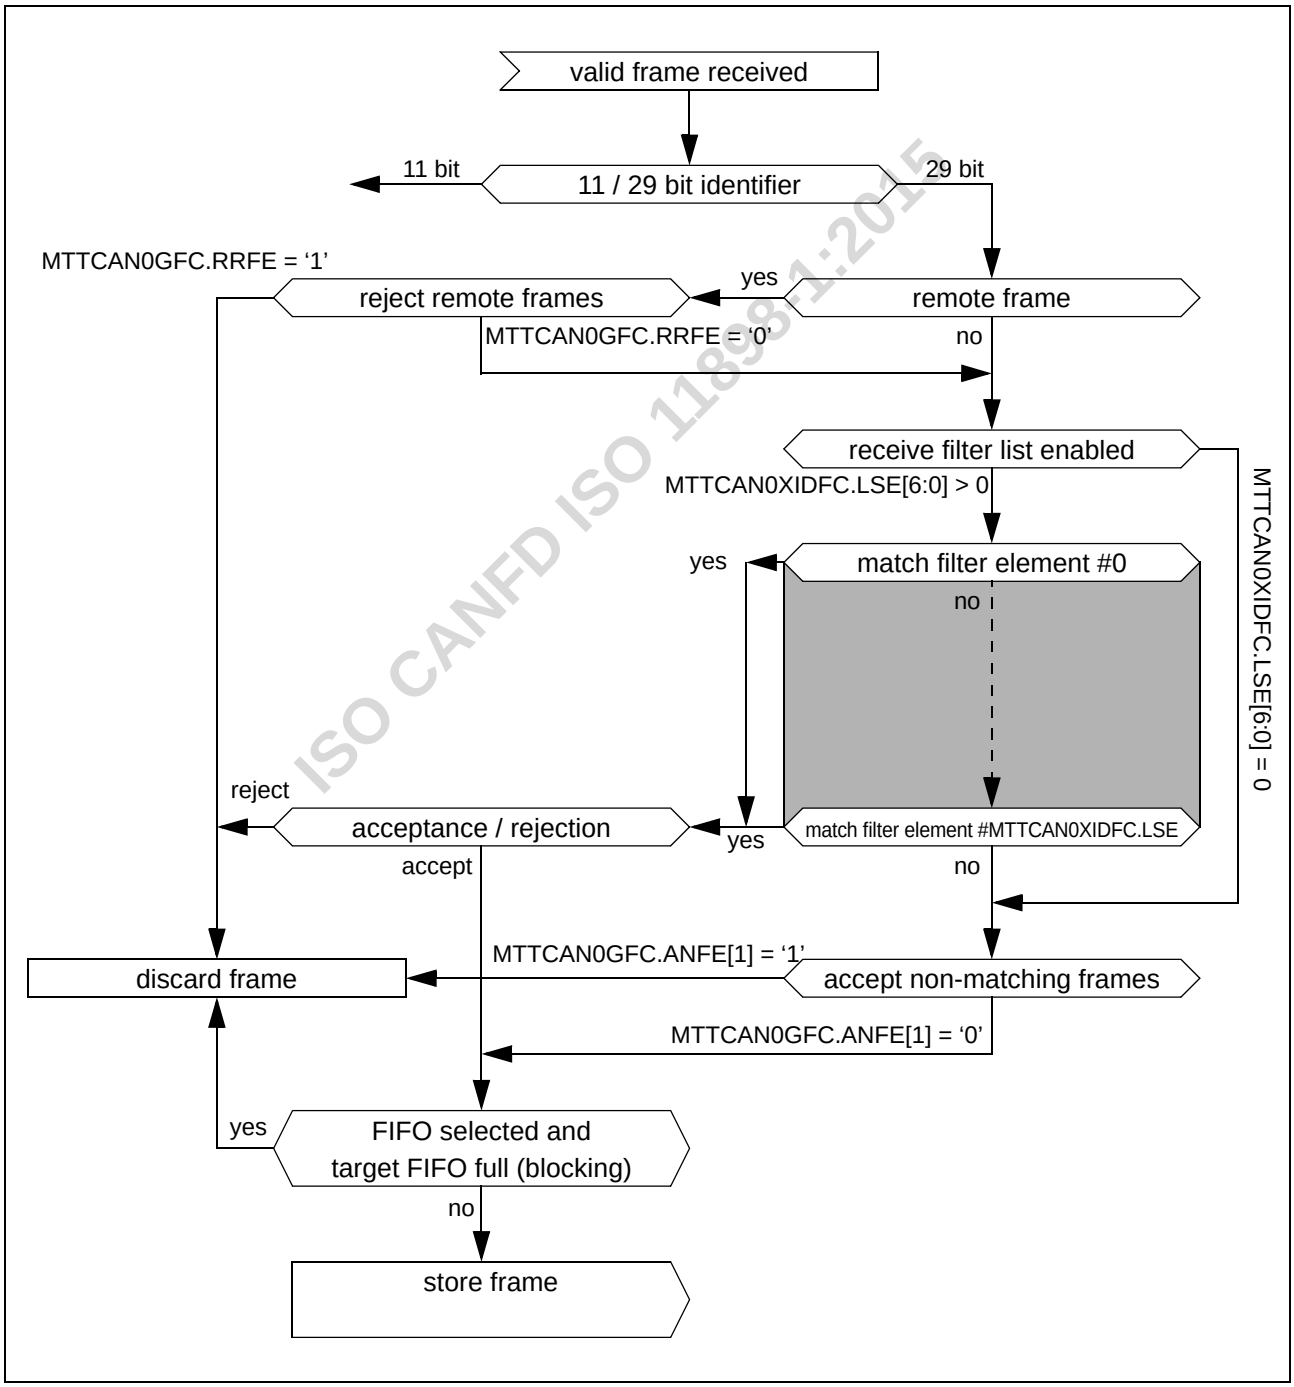

Figure 19.21 Extended Message ID Filter Path

(2) Rx FIFOs

Rx FIFO 0 and Rx FIFO 1 can be configured to hold up to 64 elements each. Configuration of the two Rx FIFOs is done via registers MTTCAN0RXF0C and MTTCAN0RXF1C.

Received messages that passed acceptance filtering are transferred to the Rx FIFO as configured by the matching filter element. For a description of the filter mechanisms available for Rx FIFO 0 and Rx FIFO 1 see **(1) Acceptance Filtering**. The Rx FIFO element is described in **(2) Rx Buffer and FIFO Element**.

To avoid an Rx FIFO overflow, the Rx FIFO watermark can be used. When the Rx FIFO fill level reaches the Rx FIFO watermark configured by RXFnC.FnWM, interrupt flag MTTCAN0IR.RFnW is set. When the Rx FIFO Put Index reaches the Rx FIFO Get Index an Rx FIFO Full condition is signalled by RXFnS.FnF. In addition interrupt flag MTTCAN0IR.RFnF is set.

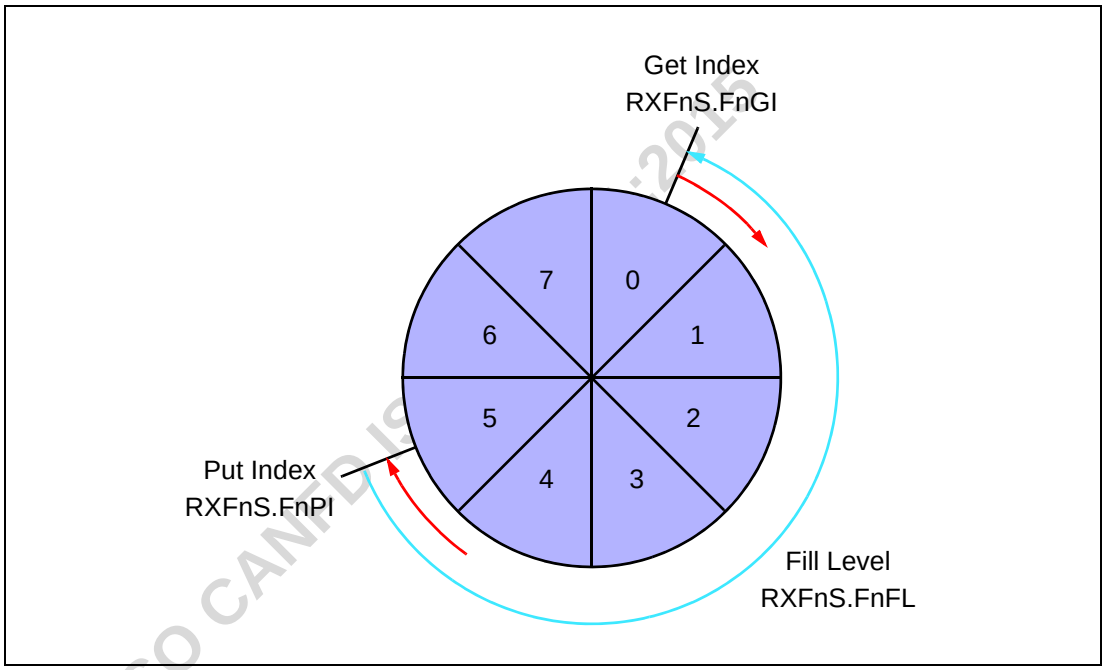

Figure 19.22 Rx FIFO Status

When reading from an Rx FIFO, Rx FIFO Get Index RXFnS.FnGI • FIFO Element Size has to be added to the corresponding Rx FIFO start address RXFnC.FnSA.

Table 19.143 Rx Buffer / FIFO Element Size

MTTCAN0RXESC.RBDS[2:0] MTTCAN0RXESC.FnDS[2:0]	Data Field [bytes]	FIFO Element Size [RAM words]
000	8	4
001	12	5
010	16	6
011	20	7
100	24	8
101	32	10
110	48	14
111	64	18

(a) Rx FIFO Blocking Mode

The Rx FIFO blocking mode is configured by RXFnC.FnOM = '0'. This is the default operation mode for the Rx FIFOs.

When an Rx FIFO full condition is reached (RXFnS.FnPI = RXFnS.FnGI), no further messages are written to the corresponding Rx FIFO until at least one message has been read out and the Rx FIFO Get Index has been incremented. An Rx FIFO full condition is signalled by RXFnS.FnF = '1'. In addition interrupt flag MTTCAN0IR.RFnF is set.

In case a message is received while the corresponding Rx FIFO is full, this message is discarded and the message lost condition is signalled by RXFnS.RFnL = '1'. In addition interrupt flag MTTCAN0IR.RFnL is set.

(b) Rx FIFO Overwrite Mode

The Rx FIFO overwrite mode is configured by RXFnC.FnOM = '1'.

When an Rx FIFO full condition (RXFnS.FnPI = RXFnS.FnGI) is signalled by RXFnS.FnF = '1', the next message accepted for the FIFO will overwrite the oldest FIFO message. Put and get index are both incremented by one.

When an Rx FIFO is operated in overwrite mode and an Rx FIFO full condition is signalled, reading of the Rx FIFO elements should start at least at get index + 1. The reason for that is, that it might happen, that a received message is written to the Message RAM (put index) while the CPU is reading from the Message RAM (get index). In this case inconsistent data may be read from the respective Rx FIFO element. Adding an offset to the get index when reading from the Rx FIFO avoids this problem. The offset depends on how fast the CPU accesses the Rx FIFO. **Figure 19.23** shows an offset of two with respect to the get index when reading the Rx FIFO. In this case the two messages stored in element 1 and 2 are lost.

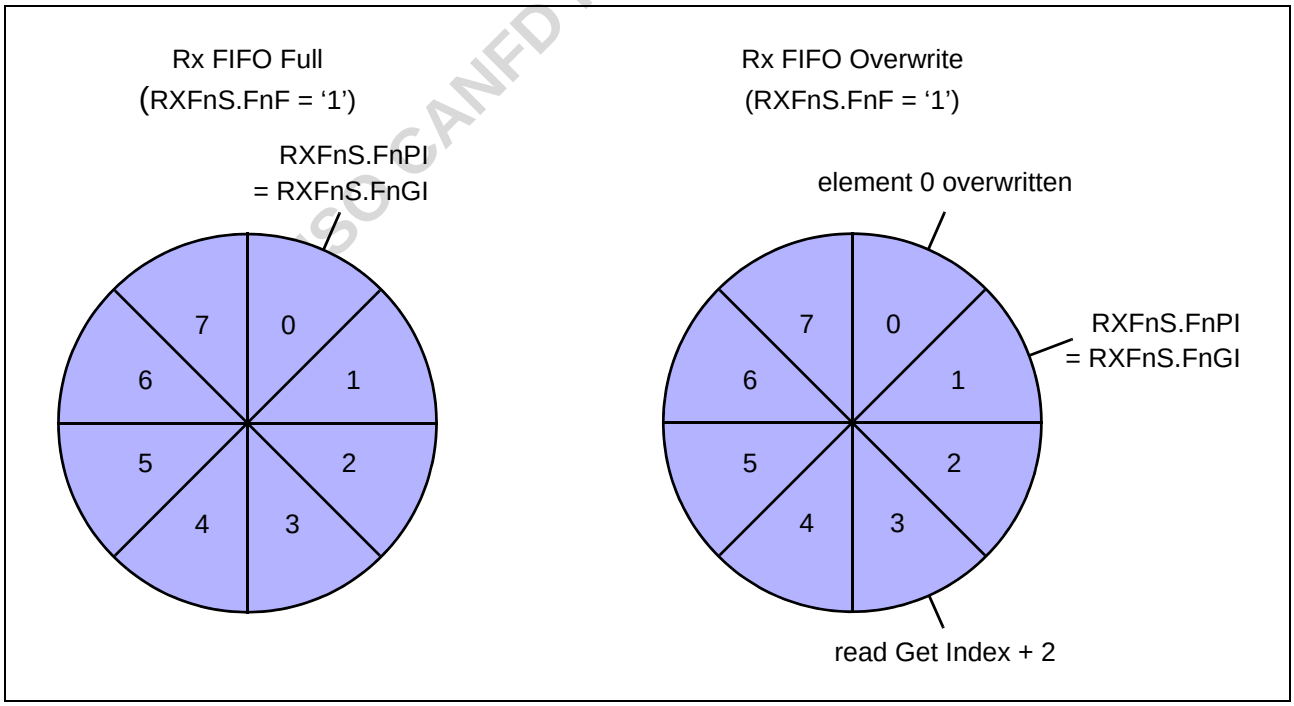

Figure 19.23 Rx FIFO Overflow Handling

After reading from the Rx FIFO, the number of the last element read has to be written to the Rx FIFO Acknowledge Index RXFnA.FnA. This increments the get index to that element number. In case the put index has not been incremented to this Rx FIFO element, the Rx FIFO full condition is reset (RXFnS.FnF = '0').

(3) Dedicated Rx Buffers

The M_TTCAN supports up to 64 dedicated Rx Buffers. The start address of the dedicated Rx Buffer section is configured via MTTCAN0RXBC.RBSA.

For each Rx Buffer a Standard or Extended Message ID Filter Element with SFEC / EFEC = “111” and SFID2 / EFID2[10:9] = “00” has to be configured (see **(5) Standard Message ID Filter Element** and **(6) Extended Message ID Filter Element**).

After a received message has been accepted by a filter element, the message is stored into the Rx Buffer in the Message RAM referenced by the filter element. The format is the same as for an Rx FIFO element. In addition the flag MTTCAN0IR.DRX (Message stored in Dedicated Rx Buffer) in the interrupt register is set.

Table 19.144 Example Filter Configuration for Rx Buffers

Filter Element	SFID1[10:0] EFID1[28:0]	SFID2[10:9] EFID2[10:9]	SFID2[5:0] EFID2[5:0]
0	ID message 1	00	00 0000
1	ID message 2	00	00 0001
2	ID message 3	00	00 0010

After the last word of a matching received message has been written to the Message RAM, the respective New Data flag in register MTTCAN0NDAT1,2 is set. As long as the New Data flag is set, the respective Rx Buffer is locked against updates from received matching frames. The New Data flags have to be reset by the Host by writing a ‘1’ to the respective bit position.

While an Rx Buffer’s New Data flag is set, a Message ID Filter Element referencing this specific Rx Buffer will not match, causing the acceptance filtering to continue. Following Message ID Filter Elements may cause the received message to be stored into another Rx Buffer, or into an Rx FIFO, or the message may be rejected, depending on filter configuration.

(a) Rx Buffer Handling

- Reset interrupt flag MTTCAN0IR.DRX
- Read New Data registers
- Read messages from Message RAM
- Reset New Data flags of processed messages

(4) Debug on CAN Support

Debug messages are stored into Rx Buffers. For debug handling three consecutive Rx buffers (e.g. #61, #62, #63) have to be used for storage of debug messages A, B, and C. The format is the same as for an Rx Buffer or an Rx FIFO element (see M_TTCAN User’s Manual section 2.4.2).

Advantage: Fixed start address for the DMA transfers (relative to MTTCAN0RXBC.RBSA), no additional configuration required.

For filtering of debug messages Standard / Extended Filter Elements with SFEC / EFEC = “111” have to be set up. Messages matching these filter elements are stored into the Rx Buffers addressed by SFID2 / EFID2[5:0].

After message C has been stored, the DMA request output m_ttcan_dma_req is activated and the three messages can be read from the Message RAM under DMA control. The RAM words holding the debug messages will not be changed by the M_TTCAN while m_ttcan_dma_req is activated. The behaviour is similar to that of an Rx Buffers with its New Data flag set.

After the DMA has completed the DMA unit sets m_ttcan_dma_ack. This resets m_ttcan_dma_req. Now the M_TTCAN is prepared to receive the next set of debug messages.

(a) Filtering for Debug Messages

Filtering for debug messages is done by configuring one Standard / Extended Message ID Filter Element for each of the three debug messages. To enable a filter element to filter for debug messages SFEC / EFEC has to be programmed to “111”. In this case fields SFID1 / SFID2 and EFID1 / EFID2 have a different meaning (see Section 2.4.5 and Section 2.4.6). While SFID2 / EFID2[10:9] controls the debug message handling state machine, SFID2 / EFID2[5:0] controls the location for storage of a received debug message.

When a debug message is stored, neither the respective New Data flag nor MTTCAN0IR.DRX are set. The reception of debug messages can be monitored via MTTCAN0RXF1S.DMS

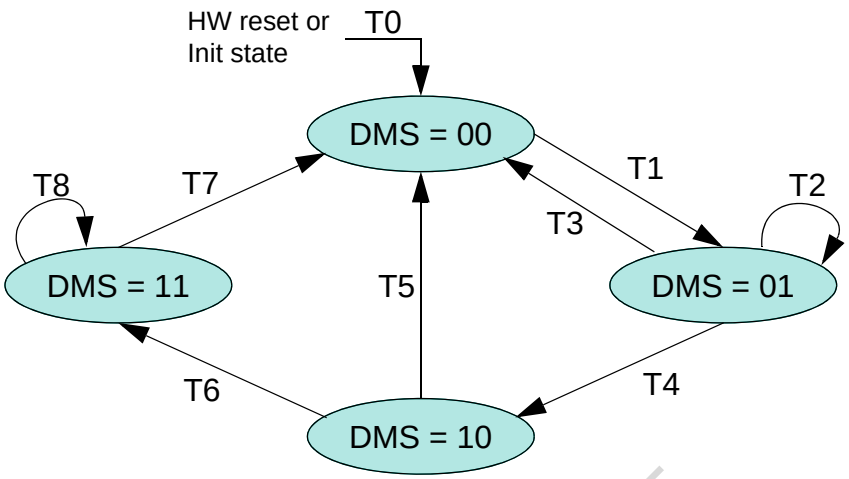
Table 19.145 Example Filter Configuration for Debug Message

Filter Element	SFID1[10:0] EFID1[28:0]	SFID2[10:9] EFID2[10:9]	SFID2[5:0] EFID2[5:0]
0	ID debug message A	01	11 1101
1	ID debug message B	10	11 1110
2	ID debug message C	11	11 1111

(b) Debug Message Handling

The debug message handling state machine assures that debug messages are stored to three consecutive Rx Buffers in correct order. In case of missing messages the process is restarted. The DMA request is activated only when all three debug messages A, B, C have been received in correct order.

The status of the debug message handling state machine is signalled via RXF1S.DMS



T0: reset m_ttcan_dma_req output, enable reception of debug messages A, B, and C
T1: reception of debug message A
T2: reception of debug message A
T3: reception of debug message C
T4: reception of debug message B
T5: reception of debug messages A, B
T6: reception of debug message C
T7: DMA transfer completed
T8: reception of debug message A,B,C (message rejected)

Figure 19.24 Debug Message Handling State Machine

19.6.3.5 Tx Handling

The Tx Handler handles transmission requests for the dedicated Tx Buffers, the Tx FIFO, and the Tx Queue. It controls the transfer of transmit messages to the CAN Core, the Put and Get Indices,and the Tx Event FIFO. Up to 32 Tx Buffers can be set up for message transmission. The CAN mode for transmission (Classic CAN or CAN FD) can be configured separately for each Tx Buffer element. The Tx Buffer element is described in **(3) Tx Buffer Element**. **Table 19.146** below describes the possible configurations for frame transmission

Table 19.146 Possible Configurations for Frame Transmission

CCCR		Tx Buffer Element		
BRSE	FDOE	FDF	BRS	Frame Transmission
ignored	0	ignored	ignored	Classic CAN
0	1	0	ignored	Classic CAN
0	1	1	ignored	FD without bit rate switching
1	1	0	ignored	Classic CAN
1	1	1	0	FD without bit rate switching
1	1	1	1	FD with bit rate switching

NOTE

AUTOSAR requires at least three Tx Queue Buffers and support of transmit cancellation

The Tx Handler starts a Tx scan to check for the highest priority pending Tx request (Tx Buffer with lowest Message ID) when the Tx Buffer Request Pending register MTTCAN0TXBRP is updated, or when a transmission has been started.

(1) Transmit Pause

The transmit pause feature is intended for use in CAN systems where the CAN message identifiers are (permanently) specified to specific values and cannot easily be changed. These message identifiers may have a higher CAN arbitration priority than other defined messages, while in a specific application their relative arbitration priority should be inverse. This may lead to a case where one ECU sends a burst of CAN messages that cause another ECU’s CAN messages to be delayed because that other messages have a lower CAN arbitration priority.

If e.g. CAN ECU-1 has the transmit pause feature enabled and is requested by its application software to transmit four messages, it will, after the first successful message transmission, wait for two CAN bit times of bus idle before it is allowed to start the next requested message. If there are other ECUs with pending messages, those messages are started in the idle time, they would not need to arbitrate with the next message of ECU-1. After having received a message, ECU-1 is allowed to start its next transmission as soon as the received message releases the CAN bus.

The transmit pause feature is controlled by bit MTTCAN0CCCR.TXP. If the bit is set, the M_TTCAN will, each time it has successfully transmitted a message, pause for two CAN bit times before starting the next transmission. This enables other CAN nodes in the network to transmit messages even if their messages have lower prior identifiers. Default is transmit pause disabled (MTTCAN0CCCR.TXP = ‘0’).

This feature looses up burst transmissions coming from a single node and it protects against "babbling idiot" scenarios where the application program erroneously requests too many transmissions.

(2) Dedicated Tx Buffers

Dedicated Tx Buffers are intended for message transmission under complete control of the Host CPU. Each Dedicated Tx Buffer is configured with a specific Message ID. In case that multiple Tx Buffers are configured with the same Message ID, the Tx Buffer with the lowest buffer number is transmitted first.

If the data section has been updated, a transmission is requested by an Add Request via MTTCAN0TXBAR.ARn. The requested messages arbitrate internally with messages from an optional Tx FIFO or Tx Queue and externally with messages on the CAN bus, and are sent out according to their Message ID.

A Dedicated Tx Buffer allocates Element Size 32-bit words in the Message RAM (see **Table 19.147**). Therefore the start address of a dedicated Tx Buffer in the Message RAM is calculated by adding transmit buffer index (0 to 31) • Element Size to the Tx Buffer Start Address MTTCAN0TXBC.TBSA.

Table 19.147 Tx Buffer / FIFO / Queue Element Size

MTTCAN0TXESC.TBDS[2:0]	Data Field [bytes]	Element Size [RAM words]
000	8	4
001	12	5
010	16	6
011	20	7
100	24	8
101	32	10
110	48	14
111	64	18

(3) Tx FIFO

Tx FIFO operation is configured by programming MTTCAN0TXBC.TFQM to ‘0’. Messages stored in the Tx FIFO are transmitted starting with the message referenced by the Get Index MTTCAN0TXFQS.TFGI. After each transmission the Get Index is incremented cyclically until the Tx FIFO is empty. The Tx FIFO enables transmission of messages with the same Message ID from different Tx Buffers in the order these messages have been written to the Tx FIFO. The M_TTCAN calculates the Tx FIFO Free Level MTTCAN0TXFQS.TFFL as difference between Get and Put Index. It indicates the number of available (free) Tx FIFO elements.

New transmit messages have to be written to the Tx FIFO starting with the Tx Buffer referenced by the Put Index MTTCAN0TXFQS.TFQPI. An Add Request increments the Put Index to the next free Tx FIFO element. When the Put Index reaches the Get Index, Tx FIFO Full (MTTCAN0TXFQS.TFQF = ‘1’) is signalled. In this case no further messages should be written to the Tx FIFO until the next message has been transmitted and the Get Index has been incremented.

When a single message is added to the Tx FIFO, the transmission is requested by writing a ‘1’ to the MTTCAN0TXBAR bit related to the Tx Buffer referenced by the Tx FIFO’s Put Index.

When multiple (n) messages are added to the Tx FIFO, they are written to n consecutive Tx Buffers starting with the Put Index. The transmissions are then requested via MTTCAN0TXBAR. The Put Index is then cyclically incremented by n. The number of requested Tx buffers should not exceed the number of free Tx Buffers as indicated by the Tx FIFO Free Level.

When a transmission request for the Tx Buffer referenced by the Get Index is cancelled, the Get Index is incremented to the next Tx Buffer with pending transmission request and the Tx FIFO Free Level is recalculated. When transmission cancellation is applied to any other Tx Buffer, the Get Index and the FIFO Free Level remain unchanged.

A Tx FIFO element allocates Element Size 32-bit words in the Message RAM (see **Table 19.147**). Therefore the start address of the next available (free) Tx FIFO Buffer is calculated by adding Tx FIFO/Queue Put Index MTTCAN0TXFQS.TFQPI (0 to 31) • Element Size to the Tx Buffer Start Address MTTCAN0TXBC.TBSA.

(4) Tx Queue

Tx Queue operation is configured by programming MTTCAN0TXBC.TFQM to ‘1’. Messages stored in the Tx Queue are transmitted starting with the message with the lowest Message ID (highest priority). In case that multiple Queue Buffers are configured with the same Message ID, the Queue Buffer with the lowest buffer number is transmitted first.

New messages have to be written to the Tx Buffer referenced by the Put Index MTTCAN0TXFQS.TFQPI. An Add Request cyclically increments the Put Index to the next free Tx Buffer. In case that the Tx Queue is full (MTTCAN0TXFQS.TFQF = ’1’), the Put Index is not valid and no further message should be written to the Tx Queue until at least one of the requested messages has been sent out or a pending transmission request has been cancelled.

The application may use register MTTCAN0TXBRP instead of the Put Index and may place messages to any Tx Buffer without pending transmission request.

A Tx Queue Buffer allocates Element Size 32-bit words in the Message RAM (see **Table 19.147**). Therefore the start address of the next available (free) Tx Queue Buffer is calculated by adding Tx FIFO/Queue Put Index MTTCAN0TXFQS.TFQPI (0 to 31) • Element Size to the Tx Buffer Start Address MTTCAN0TXBC.TBSA.

(5) Mixed Dedicated Tx Buffers / Tx FIFO

In this case the Tx Buffers section in the Message RAM is subdivided into a set of Dedicated Tx Buffers and a Tx FIFO. The number of Dedicated Tx Buffers is configured by MTTCAN0TXBC.NDTB. The number of Tx Buffers assigned to the Tx FIFO is configured by MTTCAN0TXBC.TFQS. In case MTTCAN0TXBC.TFQS is programmed to zero, only Dedicated Tx Buffers are used.

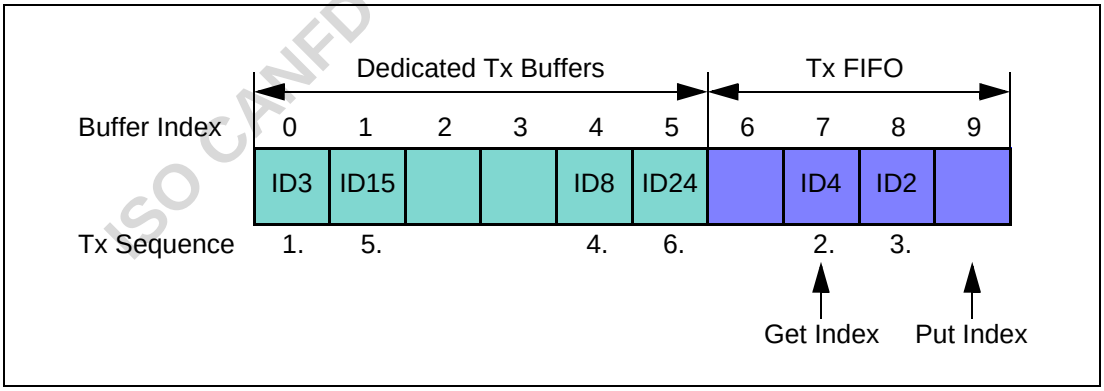


Figure 19.25 Example of mixed Configuration Dedicated Tx Buffers / Tx FIFO

Tx prioritization:

- Scan Dedicated Tx Buffers and oldest pending Tx FIFO Buffer (referenced by TXFS.TFGI)
- Buffer with lowest Message ID gets highest priority and is transmitted next

(6) Mixed Dedicated Tx Buffers / Tx Queue

In this case the Tx Buffers section in the Message RAM is subdivided into a set of Dedicated Tx Buffers and a Tx Queue. The number of Dedicated Tx Buffers is configured by MTTCAN0TXBC.NDTB. The number of Tx Queue Buffers is configured by MTTCAN0TXBC.TFQS. In case MTTCAN0TXBC.TFQS is programmed to zero, only Dedicated Tx Buffers are used.

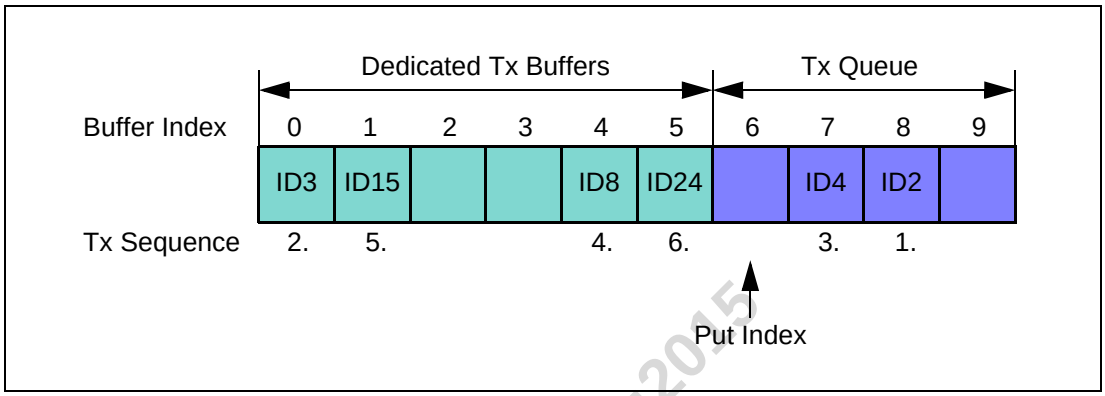

Figure 19.26 Example of mixed Configuration Dedicated Tx Buffers / Tx Queue

Tx prioritization:

- Scan all Tx Buffers with activated transmission request
- Tx Buffer with lowest Message ID gets highest priority and is transmitted next

(7) Transmit Cancellation

The M_TTCAN supports transmit cancellation. This feature is especially intended for gateway applications and AUTOSAR based applications. To cancel a requested transmission from a Dedicated Tx Buffer or a Tx Queue Buffer the Host has to write a '1' to the corresponding bit position (=number of Tx Buffer) of register MTTCAN0TXBCR. Transmit cancellation is not intended for Tx FIFO operation.

Successful cancellation is signalled by setting the corresponding bit of register MTTCAN0TXBCF to '1'.

In case a transmit cancellation is requested while a transmission from a Tx Buffer is already ongoing, the corresponding MTTCAN0TXBRP bit remains set as long as the transmission is in progress. If the transmission was successful, the corresponding MTTCAN0TXBTO and MTTCAN0TXBCF bits are set. If the transmission was not successful, it is not repeated and only the corresponding MTTCAN0TXBCF bit is set.

NOTE

In case a pending transmission is cancelled immediately before this transmission could have been started, there follows a short time window where no transmission is started even if another message is also pending in this node. This may enable another node to transmit a message which may have a lower priority than the second message in this node.

(8) Tx Event Handling

To support Tx event handling the M_TTCAN has implemented a Tx Event FIFO. After the M_TTCAN has transmitted a message on the CAN bus, Message ID and timestamp are stored in a Tx Event FIFO element. To link a Tx event to a Tx Event FIFO element, the Message Marker from the transmitted Tx Buffer is copied into the Tx Event FIFO element.

The Tx Event FIFO can be configured to a maximum of 32 elements. The Tx Event FIFO element is described in **(4) Tx Event FIFO Element**.

The purpose of the Tx Event FIFO is to decouple handling transmit status information from transmit message handling i.e. a Tx Buffer holds only the message to be transmitted, while the transmit status is stored separately in the Tx Event FIFO. This has the advantage, especially when operating a dynamically managed transmit queue, that a Tx Buffer can be used for a new message immediately after successful transmission. There is no need to save transmit status information from a Tx Buffer before overwriting that Tx Buffer.

When a Tx Event FIFO full condition is signalled by MTTCAN0IR.TEFF, no further elements are written to the Tx Event FIFO until at least one element has been read out and the Tx Event FIFO Get Index has been incremented. In case a Tx event occurs while the Tx Event FIFO is full, this event is discarded and interrupt flag MTTCAN0IR.TEFL is set.

To avoid a Tx Event FIFO overflow, the Tx Event FIFO watermark can be used. When the Tx Event FIFO fill level reaches the Tx Event FIFO watermark configured by MTTCAN0TXEFC.EFWM, interrupt flag MTTCAN0IR.TEFW is set.

When reading from the Tx Event FIFO, two times the Tx Event FIFO Get Index MTTCAN0TXEFS.EFGI has to be added to the Tx Event FIFO start address MTTCAN0TXEFC.EFSA.

19.6.3.6 FIFO Acknowledge Handling

The Get Indices of Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO are controlled by writing to the corresponding FIFO Acknowledge Index (see **(28) MTTCAN0RXF0A — Rx FIFO 0 Acknowledge**, **(32) MTTCAN0RXF1A — Rx FIFO 1 Acknowledge**, and **(46) MTTCAN0TXEFA — Tx Event FIFO Acknowledge**). Writing to the FIFO Acknowledge Index will set the FIFO Get Index to the FIFO Acknowledge Index plus one and thereby updates the FIFO Fill Level. There are two use cases:

When only a single element has been read from the FIFO (the one being pointed to by the Get Index), this Get Index value is written to the FIFO Acknowledge Index.

When a sequence of elements has been read from the FIFO, it is sufficient to write the FIFO Acknowledge Index only once at the end of that read sequence (value: Index of the last element read), to update the FIFO's Get Index.

Due to the fact that the CPU has free access to the M_TTCAN's Message RAM, special care has to be taken when reading FIFO elements in an arbitrary order (Get Index not considered). This might be useful when reading a High Priority Message from one of the two Rx FIFOs. In this case the FIFO's Acknowledge Index should not be written because this would set the Get Index to a wrong position and also alters the FIFO's Fill Level. In this case some of the older FIFO elements would be lost.

NOTE

The application has to ensure that a valid value is written to the FIFO Acknowledge Index. The M_TTCAN does not check for erroneous values.

19.6.4 TTCAN Operation

19.6.4.1 Reference Message

A reference message is a data frame characterized by a specific CAN identifier. It is received and accepted by all nodes except the Time Master (sender of the reference message).

For Level 1 the data length must be at least one; for Level 0,2 the data length must be at least four; otherwise, the message is not accepted as reference message. The reference message may be extended by other data up to the sum of eight CAN data bytes. All bits of the identifier except the three LSBs characterize the message as a reference message. The last three bits specify the priorities of up to 8 potential time masters. Reserved bits are transmitted as logical 0 and are ignored by the receivers. The reference message is configured via register MTTCAN0TTRMC.

The time master transmits the reference message. If the reference message is disturbed by an error, it is retransmitted immediately. In case of a retransmission, the transmitted Master_Ref_Mark is updated. The reference message is sent periodically, but is allowed to stop the periodic transmission (Next_is_Gap bit) and to initiate transmission event-synchronized at the start of the next basic cycle by the current time master or by one of the other potential time masters.

The node transmitting the reference message is the current time master. The time master is allowed to transmit other messages. If the current time master fails, its function is replicated by the potential time master with the highest priority. Nodes that are neither time master nor potential time master are time-receiving nodes.

(1) Level 1

Level 1 operation is configured via MTTCAN0TTOCF.OM = “01” and MTTCAN0TTOCF.GEN. External clock synchronization is not available in Level 1.

The information related to the reference message is stored in the first data byte as shown in **Table 19.148** below. Cycle_Count is optional.

Table 19.148 First byte of Level 1 reference message

Bits	7	6	5	4	3	2	1	0
First Byte	Next_is_Gap	res	Cycle_Count[5:0]					

(2) Level 2

Level 2 operation is configured via MTTCAN0TTOCF.OM = “10” and MTTCAN0TTOCF.GEN.

The information related to the reference message is stored in the first four data bytes as shown in **Table 19.149** below. Cycle_Count and the lower four bits of NTU_Res are optional. The M_TTCAN does not evaluate NTU_Res[3:0] from received reference messages, it always transmits these bits as zero.

Table 19.149 First four bytes of Level 2 reference message

Bits	7	6	5	4	3	2	1	0
First Byte	Next_is_Gap	res	Cycle_Count[5:0]					
Second Byte	NTU_Res[6:4]			NTU_Res[3:0]				Disc_Bit
Third Byte	Master_Ref_Mark[7:0]							
Fourth Byte	Master_Ref_Mark[15:8]							

(3) Level 0

Level 0 operation is configured via MTTCAN0TTOCF.OM = “11”. External event-synchronized time-triggered operation is not available in Level 0.

The information related to the reference message is stored in the first four data bytes as shown in **Table 19.150** below. In Level 0 Next_is_Gap is always zero. Cycle_Count and the lower four bits of NTU_Res are optional. The M_TTCAN does not evaluate NTU_Res[3:0] from received reference messages, it always transmits these bits as zero.

Table 19.150 First four bytes of Level 0 reference message

Bits	7	6	5	4	3	2	1	0
First Byte	Next_is_Gap	res	Cycle_Count[5:0]					
Second Byte	NTU_Res[6:4]			NTU_Res[3:0]				Disc_Bit
Third Byte	Master_Ref_Mark[7:0]							
Fourth Byte	Master_Ref_Mark[15:8]							

19.6.4.2 TTCAN Configuration

(1) TTCAN Timing

The Network Time Unit NTU is the unit in which all times are measured. The NTU is a constant of the whole network and is defined a priori by the network system designer. In TTCAN Level 1 the NTU is the nominal CAN bit time. In TTCAN Level 0 and Level 2 the NTU is a fraction of the physical second.

The NTU is the time base for the local time. The integer part of the local time (16-bit value) is incremented once each NTU. Cycle time and global time are both derived from local time. The fractional part (3-bit value) of local time, cycle time, and global time is not readable.

In TTCAN Level 0 and Level 2 the length of the NTU is defined by the Time Unit Ratio TUR. The TUR is in principle a non-integer number and given by the formula TUR = MTTCAN0TURNA.NAV/ MTTCAN0TURCF.DC. The length of the NTU is given by the formula NTU = CAN Clock Period • TUR.

The TUR Numerator Configuration NC is an 18-bit number, MTTCAN0TURCF.NCL[15:0] can be programmed in the range 0000_H to $FFFF_H$. MTTCAN0TURCF.NCH[17:16] is hard wired to 0b01. When the number $nnnn_H$ is written to MTTCAN0TURCF.NCL[15:0], MTTCAN0TURNA.NAV starts with the value $10000_H + 0nnnn_H = 1nnnn_H$. The TUR Denominator Configuration MTTCAN0TURCF.DC is a 14-bit number. MTTCAN0TURCF.DC may be programmed in the range 0001_H to $3FFF_H$, 0000_H is an illegal value.

In Level 1, NC must be ≥ 4 • MTTCAN0TURCF.DC. In Level 0,2 NC must be ≥ 8 • MTTCAN0TURCF.DC to allow the 3-bit resolution for the internal fractional part of the NTU.

A hardware reset presets MTTCAN0TURCF.DC to 1000_H and MTTCAN0TURCF.NCL to 10000_H, resulting in an NTU consisting of 16 CAN clock periods. Local time and application watchdog are not started before either the MTTCAN0CCCR.INIT is reset, or MTTCAN0TURCF.ELT is set. MTTCAN0TURCF.ELT may not be set before the NTU is configured. Setting MTTCAN0TURCF.ELT to '1' also locks the write access to register MTTCAN0TURCF.

At startup MTTCAN0TURNA.NAV is updated from NC (= MTTCAN0TURCF.NCL + 10000_H) when MTTCAN0TURCF.ELT is set. In TTCAN Level 1 there is no drift compensation. MTTCAN0TURNA.NAV does not change during operation, it always equals NC.

In TTCAN Level 0 and Level 2 there are two possibilities for MTTCAN0TURNA.NAV to change. When operating as time slave or backup time master, and when MTTCAN0TTOCF.ECC is set, MTTCAN0TURNA.NAV is updated automatically to the value calculated from the monitored global time speed, as long as the M_TTCAN is in synchronization state In_Schedule or In_Gap. When it loses synchronization it returns to NC. When operating as the actual time master, and when MTTCAN0TTOCF.EECS is set, the Host may update MTTCAN0TURCF.NCL. When the Host sets MTTCAN0TTOCN.ECS, MTTCAN0TURNA.NAV will be updated from the new value of NC at the next reference message. The status flag MTTCAN0TTOST.WECS as is set when MTTCAN0TTOCN.ECS is set and is cleared when MTTCAN0TURNA.NAV is updated. MTTCAN0TURCF.NCL is write locked while MTTCAN0TTOST.WECS is set.

In TTCAN Level 0 and Level 2 the clock calibration process adapts MTTCAN0TURNA.NAV in the range of the Synchronization Deviation Limit SDL of $NC \pm 2^{(MTTCAN0TTOCF.LDSDL+5)}$. MTTCAN0TURCF.NCL should be programmed to the largest applicable numerical value in order to achieve the best accuracy in the calculation of MTTCAN0TURNA.NAV.

The synchronization deviation SD is the difference between NC and MTTCAN0TURNA.NAV (SD = |NC - MTTCAN0TURNA.NAV|). It is limited by the Synchronization Deviation Limit SDL,

which is configured by its dual logarithm MTTCAN0TTOCF.LDSDL (SDL = $2^{(MTTCAN0TTOCF.LDSDL+5)}$) and should not exceed the clock tolerance given by the CAN bit timing configuration. SD is calculated at each new Basic Cycle. When the calculated MTTCAN0TURNA.NAV deviates by more than SDL from NC, or if the Disc_Bit in the reference message is set, the drift compensation is suspended and MTTCAN0TTIR.GTE is set and TTOSC.QCS is reset, or in case of the Disc_Bit = '1', MTTCAN0TTIR.GTD is set.

TUR configuration examples are shown in **Table 19.151** below.

Table 19.151 TUR Configuration Examples

TUR	8	10	24	50	510	125000	32.5	100/12	529/17
NC	$1FFF8_H$	$1FFFE_H$	$1FFF8_H$	$1FFEA_H$	$1FFFE_H$	$1E848_H$	$1FFE0_H$	19000_H	10880_H
MTTCAN0TURCF.DC	$3FFF_H$	3333_H	1555_H	$0A3D_H$	0101_H	0001_H	$0FC0_H$	3000_H	0880_H

MTTCAN0TTOCN.ECS schedules NC for activation by the next reference message. MTTCAN0TTOCN.SGT schedules MTTCAN0TTGTP.TP for activation by the next reference message. Setting of MTTCAN0TTOCN.ECS and MTTCAN0TTOCN.SGT requires MTTCAN0TTOCF.EECS to be set (external clock synchronization enabled) while the M_TTCAN is actual time master.

The M_TTCAN module provides an application watchdog to verity the function of the application program. The Host has to serve this watchdog regularly, else all CAN bus activity is stopped. The Application Watchdog Limit MTTCAN0TTOCF.AWL specifies the number of NTUs between two times the watchdog has to be served. The maximum number of NTUs is 256. The Application Watchdog is served by reading register MTTCAN0TTOST. MTTCAN0TTOST.AWE indicates whether the watchdog has been served in time. In case the application failed to serve the application watchdog, interrupt flag MTTCAN0TTIR.AW is set. For software development, the application watchdog may be disabled by programming MTTCAN0TTOCF.AWL to 00_H (see also **(10) Application Watchdog**).

(a) Timing of Interface Signals

The timing events which cause a pulse at output m_ttcan_tmp (MTTCAN0TMP) and m_ttcan_rtp (MTTCAN0RTP) are generated in the CAN clock domain. There is a clock domain crossing delay to be considered before the same event is visible in the Host clock domain (MTTCAN0TTIR.TTMI resp. MTTCAN0TTIR.RTMI set). The signals can be connected e.g. to the timing input(s) of another TTCAN node (m_ttcan_swt:MTTCAN0SWT / m_ttcan_evt: MTTCAN0EVT), in order to automatically synchronize two TTCAN networks.

Output m_ttcan_soc (MTTCAN0SOC) gets active whenever a reference message is completed (either transmitted or received). The output is controlled in the Host clock domain.

(2) Message Scheduling

MTTCAN0TTOCF.TM controls whether the M_TTCAN operates as a potential time master or as a time slave. If it is a potential time master, the three LSBs of the reference message's identifier MTTCAN0TTRMC.RID define the master priority, 0 giving the highest and 7 giving the lowest priority. There may not be two nodes in the network using the same master priority. MTTCAN0TTRMC.RID is used for recognition of reference messages. MTTCAN0TTRMC.RMPS is not relevant for time slaves.

The Initial Reference Trigger Offset MTTCAN0TTOCF.IRTO is a 7-bit-value that defines (in NTUs) how long a backup time master waits before it starts the transmission of a reference message when a reference message is expected but the bus remains idle. The recommended value for

MTTCAN0TTOCF.IRTO is the master priority multiplied with a factor depending on the expected clock drift between the potential time masters in the network. The sequential order of the backup time masters, when one of them starts the reference message in case the current time master fails, should correspond to their master priority, even with maximum clock drift.

MTTCAN0TTOCF.OM decides whether the node operates in TTCAN Level 0, Level 1, or Level 2. In one network, all potential time masters have to operate on the same level. Time slaves may operate on Level 1 in a Level 2 network, but not vice versa. The configuration of the TTCAN operation mode via MTTCAN0TTOCF.OM is the last step in the setup. With MTTCAN0TTOCF.OM = “00” (event-driven CAN communication), the M_TTCAN operates according to ISO 11898-1, without time triggers. With MTTCAN0TTOCF.OM = “01” (Level 1), the M_TTCAN operates according to ISO 11898-4, but without the possibility to synchronize the basic cycles to external events, the Next_is_Gap bit in the reference message is ignored. With MTTCAN0TTOCF.OM = “10” (Level 2), the M_TTCAN operates according to ISO 11898-4, including the event-synchronized start of a basic cycle. With MTTCAN0TTOCF.OM = “11” (Level 0), the M_TTCAN operates as event-driven CAN but maintains a calibrated global time base as in Level 2.

MTTCAN0TTOCF.EECS enables the external clock synchronization, allowing the application program of the current time master to update the TUR configuration during time-triggered operation, to adapt the clock speed and (in Level 0,2 only) the global clock phase to an external reference.

MTTCAN0TTMLM.ENTT in the TT Matrix Limits register specifies the number of expected Tx_Triggers in the system matrix. This is the sum of Tx_Triggers for exclusive, single arbitrating and merged arbitrating windows, excluding the Tx_Ref_Triggers. Note that this is usually not the number of Tx_Trigger memory elements; the number of basic cycles in the system matrix and the trigger’s repeat factors have to be taken into account. An inaccurate configuration of MTTCAN0TTMLM.ENTT will result in either a Tx Count Underflow (MTTCAN0TTIR.TXU = ‘1’ and MTTCAN0TTOST.EL = “01”, severity 1) or in a Tx Count Overflow (MTTCAN0TTIR.TXO = ‘1’ and MTTCAN0TTOST.EL = “10”, severity 2).

NOTE

In case the first reference message seen by a node does not have Cycle_Count zero, this node may finish its first matrix cycle with its Tx count resulting in a Tx Count Underflow condition. As long as a node is in state Synchronizing its Tx_Triggers will not lead to transmissions.

MTTCAN0TTMLM.CCM specifies the number of the last basic cycle in the system matrix. The counting of basic cycles starts at 0. In a system matrix consisting of 8 basic cycles MTTCAN0TTMLM.CCM would be 7. MTTCAN0TTMLM.CCM is ignored by time slaves, a receiver of a reference message considers the received cycle count as the valid cycle count for the actual basic cycle.

MTTCAN0TTMLM.TXEW specifies the length of the Tx enable window in NTUs. The Tx enable window is that period of time at the beginning of a time window where a transmission may be started. If the sample point of the first bit of a transmit message is not inside the Tx enable window because of e.g. a slight overlap from the previous time window’s message, the transmission cannot be started in that time window at all. MTTCAN0TTMLM.TXEW has to be chosen with respect to the network’s synchronization quality and with respect to the relation between the length of the time windows and the length of the messages.

(3) Trigger Memory

The trigger memory is part of the external Message RAM to which the M_TTCAN is connected via its Generic Master Interface (see **Figure 19.16, Message RAM Configuration**). It stores up to 64 trigger elements. A trigger memory element consists of Time Mark TM, Cycle Code CC, Trigger Type TYPE, Filter Type FTYPE, Message Number MNR, Message Status Count MSC, Time Mark Event Internal TMIN, Time Mark Event External TMEX, and Asynchronous Serial Communication ASC (see **(7) Trigger Memory Element**).

The time mark defines at which cycle time a trigger becomes active. The triggers in the trigger memory have to be sorted by their time marks. The trigger element with the lowest time mark is written to the first trigger memory word. Message number and cycle code are ignored for triggers of type Tx_Ref_Trigger, Tx_Ref_Trigger_Gap, Watch_Trigger, Watch_Trigger_Gap, and End_of_List.

When the cycle time reaches the time mark of the actual trigger, the FSE switches to the next trigger and starts to read the following trigger from the trigger memory. In case of a transmit trigger, the Tx Handler starts to read the message from the Message RAM as soon as the FSE switches to its trigger. The RAM access speed defines the minimum time step between a transmit trigger and its preceding trigger, the Tx Handler has to be able to prepare the transmission before the transmit trigger's time mark is reached. The RAM access speed also limits the number of non-matching (with regard to their cycle code) triggers between two matching triggers, the next matching trigger must be read before its time mark is reached. If the reference message is n NTU long, a trigger with a time mark < n will never become active and will be treated as a configuration error.

Starting point of the cycle time is the sample point of the reference message's start of frame bit. The next reference message is requested when cycle time reaches the Tx_Ref_Trigger's time mark. The M_TTCAN reacts on the transmission request at the next sample point. A new Sync_Mark is captured at the start of frame bit, but the cycle time is incremented until the reference message is successfully transmitted (or received) and the Sync_Mark is taken as the new Ref_Mark. At that point in time, cycle time is restarted. As a consequence, cycle time can never (with the exception of initialisation) be seen at a value < n, with n being the length of the reference message measured in NTU.

Length of a basic cycle: Tx_Ref_Trigger's time mark + 1 NTU + 1 CAN bit time

The trigger list will be different for all nodes in the TTCAN network. Each node knows only the Tx_Triggers for its own transmit messages, the Rx_Triggers for those receive messages that are processed by this node, and the triggers concerning the reference messages.

(a) Trigger Types

Tx_Ref_Trigger (TYPE = "0000") and Tx_Ref_Trigger_Gap (TYPE = "0001") cause the transmission of a reference message by a time master. A configuration error (MTTCAN0TTOST.EL = "11", severity 3) is detected when a time slave encounters a Tx_Ref_Trigger(_Gap) in its trigger memory. Tx_Ref_Trigger_Gap is only used in external event-synchronized time-triggered operation mode. In that mode, Tx_Ref_Trigger is ignored when the M_TTCAN synchronization state is In_Gap (MTTCAN0TTOST.SYS = "10").

Tx_Trigger_Single (TYPE = "0010"), Tx_Trigger_Continuous (TYPE = "0011"), Tx_Trigger_Arbitration (TYPE = "0100"), and Tx_Trigger_Merged (TYPE = "0101") cause the start of a transmission. They define the start of a time window.

Tx_Trigger_Single starts a single transmission in an exclusive time window when the message buffer's Transmission Request Pending bit is set. After successful transmission the Transmission Request Pending bit is reset.

Tx_Trigger_Continuous starts a transmission in an exclusive time window when the message buffer's Transmission Request Pending bit is set. After successful transmission the Transmission Request Pending bit remains set, and the message buffer is transmitted again in the next matching time window.

Tx_Trigger_Arbitration starts an arbitrating time window, Tx_Trigger_Merged a merged arbitrating time window. The last Tx_Trigger of a merged arbitrating time window must be of type Tx_Trigger_Arbitration. A Configuration Error (MTTCAN0TTOST.EL = "11", severity 3) is detected when a trigger of type Tx_Trigger_Merged is followed by any other Tx_Trigger than one of type Tx_Trigger_Merged or Tx_Trigger_Arbitration. Several Tx_Triggers may be defined for the same Tx message buffer. Depending on their cycle code, they may be ignored in some basic cycles. The cycle code has to be considered when the expected number of Tx_Triggers (MTTCAN0TTMLM.ENTT) is calculated.

Watch_Trigger (TYPE = "0110") and Watch_Trigger_Gap (TYPE = "0111") check for missing reference messages. They are used by both time masters and time slaves. Watch_Trigger_Gap is only used in external event-synchronized time-triggered operation mode. In that mode, a Watch_Trigger is ignored when the M_TTCAN synchronization state is In_Gap (MTTCAN0TTOST.SYS = "10").

Rx_Trigger (TYPE = "1000") is used to check for the reception of periodic messages in exclusive time windows. Rx_Triggers are not active until state In_Schedule or In_Gap is reached. The time mark of an Rx_Trigger shall be placed after the end of that message's transmission, independent of time window boundaries. Depending on their cycle code, Rx_Triggers may be ignored in some basic cycles. At the time mark of the Rx_Trigger, it is checked whether the last received message before this time mark and after start of cycle or previous Rx_Trigger had matched the acceptance filter element referenced by MNR. Accepted messages are stored in one of the two receive FIFOs, according to the acceptance filtering, independent of the Rx_Trigger. Acceptance filter elements which are referenced by Rx_Triggers should be placed at the beginning of the filter list to ensure that the filtering is finished before the Rx_Trigger's time mark is reached.

Time_Base_Trigger (TYPE = "1001") are used to generate internal/external events depending on the configuration of ASC, TMIN, and TMEX.

End_of_List (TYPE = "1010 to 1111") is an illegal trigger type, a configuration error (MTTCAN0TTOST.EL = "11", severity 3) is detected when an End_of_List trigger is encountered in the trigger memory before the Watch_Trigger or Watch_Trigger_Gap.

(b) Restrictions for the Node's Trigger List

There may not be two triggers that are active at the same cycle time and cycle count, but triggers that are active in different basic cycles (different cycle code) may share the same time mark.

Rx_Triggers and Time_Base_Triggers may not be placed inside the Tx enable windows of Tx_Trigger_Single/Continuous/Arbitration, but they may be placed after Tx_Trigger_Merged.

Triggers that are placed after the Watch_Trigger (or the Watch_Trigger_Gap when MTTCAN0TTOST.SYS = "10") will never become active. The watch triggers themselves will not become active when the reference messages are transmitted on time.

All unused trigger memory words (after the Watch_Trigger or after the Watch_Trigger_Gap when MTTCAN0TTOST.SYS = "10") must be set to trigger type End_of_List.

A typical trigger list for a potential time master will begin with a number of Tx_Triggers and Rx_Triggers followed by the Tx_Ref_Trigger and the Watch_Trigger. For networks with external event- synchronized time-triggered communication, this is followed by the Tx_Ref_Trigger_Gap and the Watch_Trigger_Gap. The trigger list for a time slave will be the same but without the Tx_Ref_Trigger and the Tx_Ref_Trigger_Gap.

At the beginning of each basic cycle, that is at each reception or transmission of a reference message, the trigger list is processed starting with the first trigger memory element. The FSE looks for the first trigger with a cycle code that matches the current cycle count. The FSE waits until cycle time reaches the trigger's time mark and activates the trigger. Afterwards the FSE looks for the next trigger in the list with a cycle code that matches the current cycle count.

Special consideration is needed for the time around Tx_Ref_Trigger and Tx_Ref_Trigger_Gap. In a time master competing for master ship, the effective time mark of a Tx_Ref_Trigger may be decremented in order to be the first node to start a reference message. In backup time masters the effective time mark of a Tx_Ref_Trigger or Tx_Ref_Trigger_Gap is the sum of its configured time mark and the Reference Trigger Offset MTTCAN0TTOCF.IRTO. In case error level 2 is reached (MTTCAN0TTOST.EL = "10"), the effective time mark is the sum of its time mark and 127_H. No other trigger elements should be placed in this range otherwise it may happen, that the time marks appear out of order and are flagged as a configuration error. Trigger elements which are coming after Tx_Ref_Trigger may never become active as long as the reference messages come in time.

There are interdependencies between the following parameters:

- Host clock frequency
- Speed and waiting time for Trigger RAM accesses
- Length of the acceptance filter list
- Number of trigger elements
- Complexity of cycle code filtering in the trigger elements
- Offset between time marks of the trigger elements

(c) Example for Trigger Handling

The example below shows how the trigger list is derived from a node's system matrix. Assumed node A is first time master and has knowledge of the section of the system matrix shown in **Table 19.152** below.

Table 19.152 System Matrix Node A

Cycle Count	Time Mark1	Time Mark2	Time Mark3	Time Mark4	Time Mark5	Time Mark6	Time Mark7
0	Tx7					TxRef	Error
1	Rx3			Tx2, Tx4		TxRef	Error
2						TxRef	Error
3	Tx7		Rx5			TxRef	Error
4	Tx7			Rx6		TxRef	Error

The cycle count starts with 0 and runs until 0, 1, 3, 7, 15, 31, 63 (the number of basic cycles in the system matrix is 1, 2, 4, 8, 16, 32, 64). The maximum cycle count is configured by MTTCAN0TTMLM.CCM. The Cycle Code CC is composed of repeat factor (= value of most significant '1') and the number of the first basic cycle in the system matrix (= bit field after most significant '1').

Example:with a cycle code of 0b0010011 (repeat factor: 16, first basic cycle: 3) and a maximum cycle count of MTTCAN0TTMLM.CCM = "$3F_H$"matches occur at cycle counts 3, 19, 35, 51

A trigger element consists of Time Mark TM, Cycle Code CC, Trigger Type TYPE, and Message Number MNR. For transmission MNR references the Tx Buffer number (0 to 31). For reception MNR references the number of the filter element (0 to 127) that matched during acceptance filtering.

Depending on the configuration of the Filter Type FTYPE, the 11-bit or 29-bit message ID filter list is referenced.

In addition a trigger element can be configured for Asynchronous Serial Communication ASC, generation of Time Mark Event Internal TMIN, and Time Mark Event External TMEX. The Message Status Count MSC holds the counter value (0 to 7) for scheduling errors for periodic messages in exclusive time windows at the point in time when the time mark of the trigger element became active.

Table 19.153 Trigger List Node A

Trigger	Time Mark TM[15:0]	Cycle Code CC[6:0]	Trigger Type TYPE[3:0]	Mess. No. MNR[6:0]
0	Mark1	0000100_B	Tx_Trigger_Single	7
1	Mark1	1000000_B	Rx_Trigger	3
2	Mark1	1000011_B	Tx_Trigger_Single	7
3	Mark3	1000001_B	Tx_Trigger_Merged	2
4	Mark3	1000011_B	Rx_Trigger	5
5	Mark4	1000001_B	Tx_Trigger_Arbitration	4
6	Mark4	1000100_B	Rx_Trigger	6
7	Mark6	n.a.	Tx_Ref_Trigger	0 (Ref)
8	Mark7	n.a.	Watch_Trigger	n.a.
9	n.a.	n.a.	End_of_List	n.a.

Tx_Trigger_Single, Tx_Trigger_Continuous, Tx_Trigger_Merged, Tx_Trigger_Arbitration, Rx_Trigger, and Time_Base_Trigger are only valid for the specified cycle code. For all other trigger types the cycle code is ignored.

The FSE starts the basic cycle with scanning the trigger list starting from zero until a trigger with time mark > cycle time and with its Cycle Code CC matching the actual cycle count is reached, or a trigger of type Tx_Ref_Trigger, Tx_Ref_Trigger_Gap, Watch_Trigger, or Watch_Trigger_Gap is encountered.

When the cycle time reached the Time Mark TM, the action defined by Trigger Type TYPE and Message Number MNR is started. There is an error in the configuration when End_of_List is reached.

At Mark6 the reference message (always TxRef) is transmitted. After transmission of the reference message the FSE returns to the beginning of the trigger list. When the Watch Trigger at Mark7 is reached, the node was not able to transmit the reference message; error treatment is started.

(d) Detection of Configuration Errors

A configuration error is signalled via MTTCAN0TTOST.EL = “11” (severity 3) when:

The FSE comes to a trigger in the list with a cycle code that matches the current cycle count but with a time mark that is less than the cycle time.

The previous active trigger was a Tx_Trigger_Merged and the FSE comes to a trigger in the list with a cycle code that matches the current cycle count but that is neither a Tx_Trigger_Merged nor a Tx_Trigger_Arbitration nor a Time_Base_Trigger nor an Rx_Trigger.

The FSE of a node with MTTCAN0TTOCF.TM = ‘0’ (time slave) encounters a Tx_Ref_Trigger or a Tx_Ref_Trigger_Gap.

Any time mark placed inside the Tx enable window (defined by MTTCAN0TTMLM.TXEW) of a Tx_Trigger with a matching cycle code.

A time mark is placed near the time mark of a Tx_Ref_Trigger and the Reference Trigger Offset MTTCAN0TTOST.RTO causes a reversal of their sequential order measured in cycle time.

(4) TTCAN Schedule Initialization

The synchronization to the M_TTCAN's message schedule starts when MTTCAN0CCCR.INIT is reset. The M_TTCAN can operate strictly time-triggered (MTTCAN0TTOCF.GEN = '0') or external event-synchronized time-triggered (MTTCAN0TTOCF.GEN = '1'). All nodes start with cycle time zero at the beginning of their trigger list with MTTCAN0TTOST.SYS = "00" (out of synchronization), no transmission is enabled with the exception of the reference message. Nodes in external event-synchronized time-triggered operation mode will ignore Tx_Ref_Trigger and Watch_Trigger and will use instead Tx_Ref_Trigger_Gap and Watch_Trigger_Gap until the first reference message decides whether a Gap is active.

(a) Time Slaves

After configuration, a time slave will ignore its Watch_Trigger and Watch_Trigger_Gap when it did not receive any message before reaching the Watch_Triggers. When it reaches Init_Watch_Trigger, interrupt flag MTTCAN0TTIR.IWT is set, the FSE is frozen, and the cycle time will become invalid, but the node will still be able to take part in CAN bus communication (to give acknowledge or to send error flags). The first received reference message will restart the FSE and the cycle time.

NOTE

Init_Watch_Trigger is not part of the trigger list. It is implemented as an internal counter which counts up to $FFFF_H$ = maximum cycle time.

When a time slave has received any message but the reference message before reaching the Watch_Triggers, it will assume a fatal error (MTTCAN0TTOST.EL = "11", severity 3), set interrupt flag MTTCAN0TTIR.WT, switch off its CAN bus output, and enter the bus monitoring mode (MTTCAN0CCCR.MON set to '1'). In the bus monitoring mode it is still able to receive messages, but it cannot send any dominant bits and therefore cannot give acknowledge.

NOTE

To leave the fatal error state, the Host has to set MTTCAN0CCCR.INIT = '1'. After reset of MTTCAN0CCCR.INIT, the node restarts TTCAN communication.

When no error is encountered during synchronization, the first reference message sets MTTCAN0TTOST.SYS = "01" (Synchronizing), the second sets the TTCAN synchronization state (depending on its Next_is_Gap bit) to MTTCAN0TTOST.SYS = "11" (In_Schedule) or MTTCAN0TTOST.SYS = "10" (In_Gap), enabling all Tx_Triggers and Rx_Triggers.

(b) Potential Time Masters

After configuration, a potential time master will start the transmission of a reference message when it reaches its Tx_Ref_Trigger (or its Tx_Ref_Trigger_Gap when in external event-synchronized time-triggered operation). It will ignore its Watch_Trigger and Watch_Trigger_Gap when it did not receive any message or transmit the reference message successfully before reaching the Watch_Triggers (assumed reason: all other nodes still in reset or configuration, giving no acknowledge). When it reaches Init_Watch_Trigger, the attempted transmission is aborted, interrupt flag MTTCAN0TTIR.IWT is set, the FSE is frozen, and the cycle time will become invalid, but the node will still be able to take part in CAN bus communication (to give acknowledge or to send error flags). Resetting MTTCAN0TTIR.IWT will re-enable the transmission of reference messages until next time the Init_Watch_Trigger condition is met, or another CAN message is received. The FSE will be restarted by the reception of a reference message.

When a potential time master reaches the Watch_Triggers after it has received any message but the reference message, it will assume a fatal error (MTTCAN0TTOST.EL = “11”, severity 3), set interrupt flag MTTCAN0TTIR.WT, switch off its CAN bus output, and enter the bus monitoring mode (MTTCAN0CCCR.MON set to ‘1’). In bus monitoring mode, it is still able to receive messages, but it cannot send any dominant bits and therefore cannot give acknowledge.

When no error is detected during initialization, the first reference message sets MTTCAN0TTOST.SYS = “01” (synchronizing), the second sets the TTCAN synchronization state (depending on its Next_is_Gap bit) to MTTCAN0TTOST.SYS = “11” (In_Schedule) or MTTCAN0TTOST.SYS = “10” (In_Gap), enabling all Tx_Triggers and Rx_Triggers.

A potential time master is current time master (MTTCAN0TTOST.MS = “11”) when it was the transmitter of the last reference message, else it is backup time master (MTTCAN0TTOST.MS = “10”).

When all potential time masters have finished configuration, the node with the highest time master priority in the network will become the current time master.

19.6.4.3 TTCAN Gap Control

All functions related to Gap control apply only when the M_TTCAN is operated in external event-synchronized time-triggered mode (MTTCAN0TTOCF.GEN = ‘1’). In this operation mode the TTCAN message schedule may be interrupted by inserting Gaps between the basic cycles of the system matrix. All nodes connected to the CAN network have to be configured for external event-synchronized time-triggered operation.

During a Gap, all transmissions are stopped and the CAN bus remains idle. A Gap is finished when the next reference message starts a new basic cycle. A Gap starts at the end of a basic cycle that itself was started by a reference message with bit Next_is_Gap = ‘1’ e.g. Gaps are initiated by the current time master.

The current time master has two options to initiate a Gap. A Gap can be initiated under software control when the application program writes MTTCAN0TTOCN.NIG = ‘1’. The Next_is_Gap bit will be transmitted as ‘1’ with the next reference message. A Gap can also be initiated under hardware control when the application program enables the event trigger input pin m_ttcan_evt (MTTCAN0EVT) by writing MTTCAN0TTOCN.GCS = ‘1’. When a reference message is started and MTTCAN0TTOCN.GCS is set, a HIGH level at pin m_ttcan_evt (MTTCAN0EVT) will set Next_is_Gap = ‘1’.

As soon as that reference message is completed, the MTTCAN0TTOST.WFE bit will announce the Gap to the time master as well as to the time slaves. The current basic cycle will continue until its last time window. The time after the last time window is the Gap time.

For the actual time master and the potential time masters, MTTCAN0TTOST.GSI will be set when the last basic cycle has finished and the Gap time starts. In nodes that are time slaves, bit MTTCAN0TTOST.GSI will remain at ‘0’.

When a potential time master is in synchronization state In_Gap (MTTCAN0TTOST.SYS = “10”), it has four options to intentionally finish a Gap:

Under software control by writing MTTCAN0TTOCN.FGP = ‘1’.

Under hardware control (MTTCAN0TTOCN.GCS = ‘1’) an edge from HIGH to LOW at the event-trigger input pin m_ttcan_evt (MTTCAN0EVT) sets MTTCAN0TTOCN.FGP and restarts the schedule.

The third option is a time-triggered restart. When MTTCAN0TTOCN.TMG = ‘1’, the next register time mark interrupt (MTTCAN0TTIR.RTMI = ‘1’) will set MTTCAN0TTOCN.FGP and start the reference message.

Finally any potential time master will finish a Gap when it reaches its Tx_Ref_Trigger_Gap, assuming that the event to synchronize on did not occur in time.

Neither of these options can cause a basic cycle to be interrupted with a reference message.

Setting of MTTCAN0TTOCN.FGP after the Gap time has started will start the transmission of a reference message immediately and will thereby synchronize the message schedule. When MTTCAN0TTOCN.FGP is set before the Gap time has started (while the basic cycle is still in progress), the next reference message is started at the end of the basic cycle, at the Tx_Ref_Trigger – there will be no Gap time in the message schedule.

In strictly time-triggered operation, bit Next_is_Gap = ‘1’ in the reference message will be ignored, as well as the event-trigger input pin m_ttcan_evt (MTTCAN0EVT) and the bits MTTCAN0TTOCN.NIG, MTTCAN0TTOCN.FGP, and MTTCAN0TTOCN.TMG.

19.6.4.4 Stop Watch

The stop watch function enables capturing of M_TTCAN internal time values (local time, cycle time, or global time) triggered by an external event.

To enable the stop watch function, the application program first has to define local time, cycle time, or global time as stop watch source via MTTCAN0TTOCN.SWS. When MTTCAN0TTOCN.SWS is ≠ “00” and TT Interrupt Register flag MTTCAN0TTIR.SWE is ‘0’, the actual value of the time selected by MTTCAN0TTOCN.SWS will be copied into MTTCAN0TTCPT.SWV on the next rising/falling edge (as configured via MTTCAN0TTOCN.SWP) on pin m_ttcan_swt (MTTCAN0SWT). This will set interrupt flag MTTCAN0TTIR.SWE. After the application program has read MTTCAN0TTCPT.SWV, it may enable the next stop watch event by resetting MTTCAN0TTIR.SWE to ‘0’.

19.6.4.5 Local Time, Cycle Time, Global Time, and External Clock Synchronization

There are two possible levels in time-triggered CAN: Level 1 and Level 2. Level 1 only provides time-triggered operation using cycle time. Level 2 additionally provides increased synchronization quality, global time and external clock synchronization. In both levels, all timing features are based on a local time base - the local time.

The local time is a 16-bit cyclic counter, it is incremented once each NTU. Internally the NTU is represented by a 3-bit counter which can be regarded as a fractional part (three binary digits) of the local time. Generally, the 3-bit NTU counter is incremented 8 times each NTU. If the length of the NTU is shorter than 8 CAN clock periods (as may be configured in Level 1, or as a result of clock calibration in Level 2), the length of the NTU fraction is adapted, and the NTU counter is incremented only 4 times each NTU.

Figure 19.27 describes the synchronization of the cycle time and global time, performed in the same manner by all TTCAN nodes, including the time master. Any message received or transmitted invokes a capture of the local time taken at the message’s frame synchronization event. This frame synchronization event occurs at the sample point of each Start of Frame (SoF) bit and causes the local time to be stored as Sync_Mark. Sync_Marks and Ref_Marks are captured including the 3-bit fractional part.

Whenever a valid reference message is transmitted or received, the internal Ref_Mark is updated from the Sync_Mark. The difference between Ref_Mark and Sync_Mark is the Cycle Sync Mark

(Cycle Sync Mark = Sync_Mark - Ref_Mark) stored in register MTTCAN0TTCSM. The most significant 16 bits of the difference between Ref_Mark and the actual value of the local time is the cycle time (Cycle Time = Local Time - Ref_Mark).

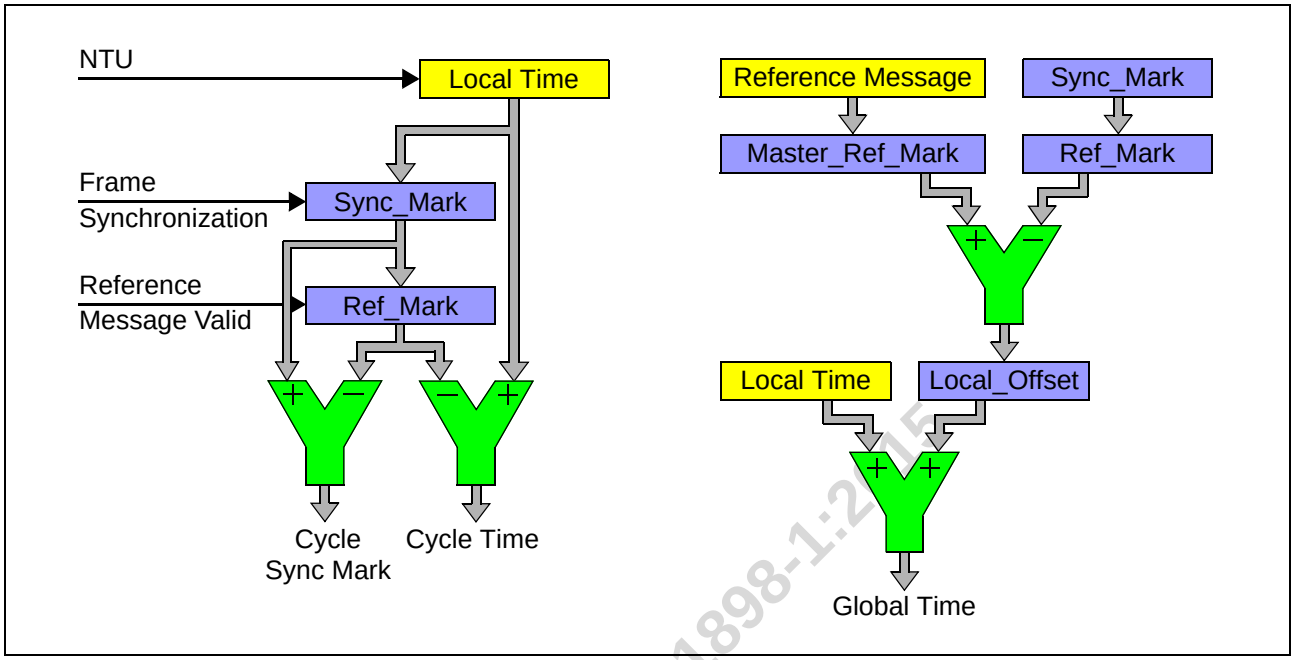

Figure 19.27 Cycle Time and Global Time Synchronization

The cycle time that can be read from MTTCAN0TTCTC.CT is the difference of the node's local time and Ref_Mark, both synchronized into the Host clock domain and truncated to 16 bit.

The global time exists for TTCAN Level 0 and Level 2 only, in Level 1 it is invalid. The node's view of the global time is the local image of the global time in (local) NTUs. After configuration, a potential time master will use its own local time as global time. The time master establishes its own local time as global time by transmitting its own Ref_Marks as Master_Ref_Marks in the reference message (bytes 3,4). The global time that can be read from MTTCAN0TTLGT.GT is the sum of the node's local time and its local offset, both synchronized into the Host clock domain and truncated to 16 bit. The fractional part is used for clock synchronization only.

A node that receives a reference message calculates its local offset to the global time by comparing its local Ref_Mark with the received Master_Ref_Mark (see **Figure 19.27**). The node's view of the global time is local time + local offset. In a potential time master that has never received another time master's reference message, Local_Offset will be zero. When a node becomes the current time master after first having received other reference messages, Local_Offset will be frozen at its last value. In the time receiving nodes, Local_Offset may be subject to small adjustments, due to clock drift, when another node becomes time master, or when there is a global time discontinuity, signalled by Disc_Bit in the reference message. With the exception of global time discontinuity, the global time provided to the application program by register MTTCAN0TTLGT is smoothed by a low-pass filtering to have a continuous monotonic value.

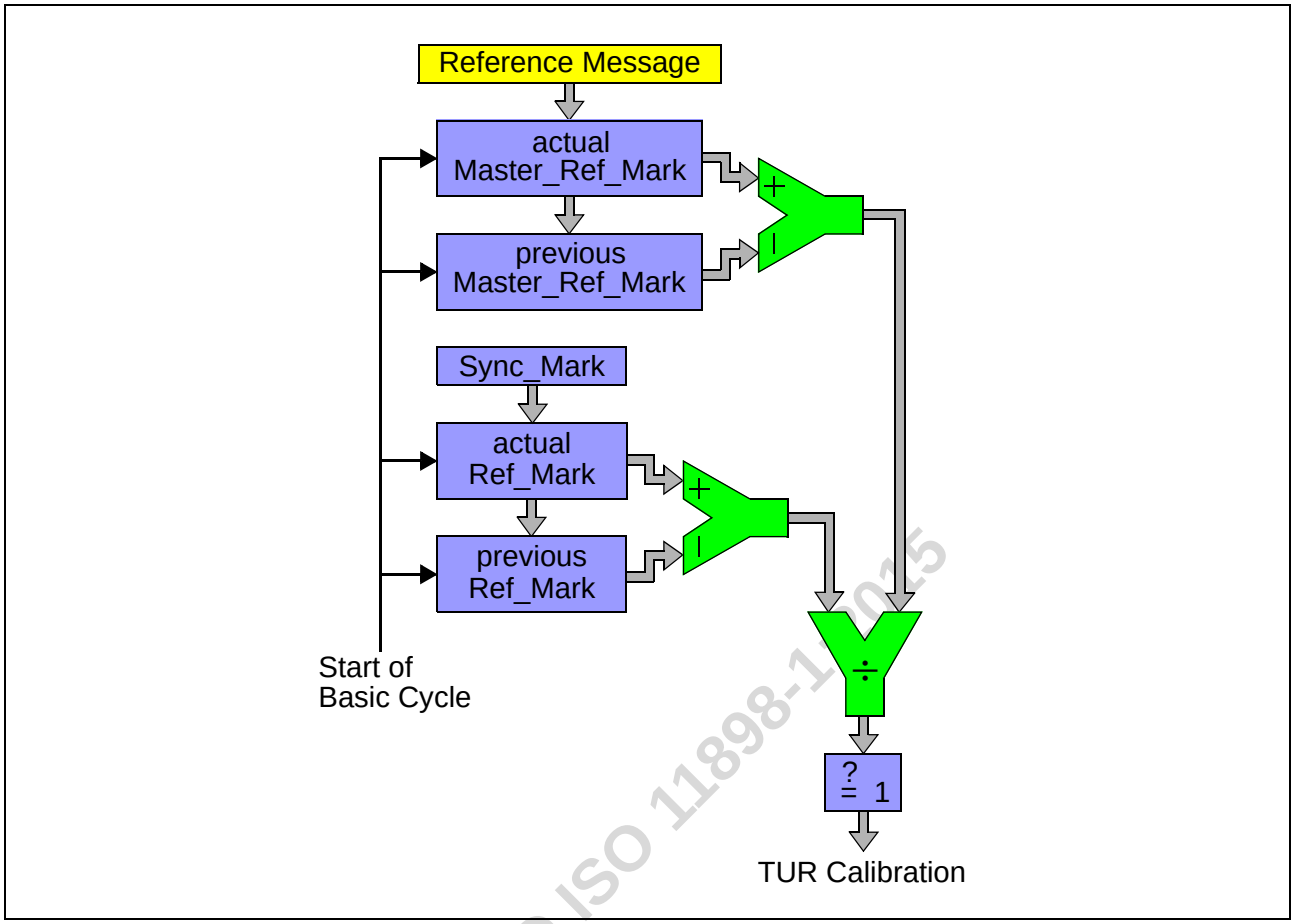

Figure 19.28 TTCAN Level 0 and Level 2 Drift Compensation

Figure 19.28 describes how in TTCAN Level 0,2 each time receiving node compensates the drift between its own local clock and the time master's clock by comparing the length of a basic cycle in local time and in global time. If there is a difference between the two values and the Disc_Bit in the reference message is not set, a new value for MTTCAN0TURNA.NAV is calculated. If the Synchronization Deviation SD = |NC - MTTCAN0TURNA.NAV| ≤ SDL (Synchronization Deviation Limit), the new value for MTTCAN0TURNA.NAV takes effect. Else the automatic drift compensation is suspended.

In TTCAN Level 0 and Level 2, MTTCAN0TTOST.QCS indicates whether the automatic drift compensation is active or suspended. In TTCAN Level 1, MTTCAN0TTOST.QCS is always '1'.

The current time master may synchronize its local clock speed and the global time phase to an external clock source. This is enabled by bit MTTCAN0TTOCF.EECS.

The stop watch function (see **Section 19.6.4.4, Stop Watch**) may be used to measure the difference in clock speed between the local clock and the external clock. The local clock speed is adjusted by first writing the newly calculated Numerator Configuration Low to MTTCAN0TURCF.NCL (MTTCAN0TURCF.DC cannot be updated during operation). The new value takes effect by writing MTTCAN0TTOCN.ECS to '1'.

The global time phase is adjusted by first writing the phase offset into the TT Global Time Preset register MTTCAN0TTGTP. The new value takes effect by writing MTTCAN0TTOCN.SGT to '1'. The first reference message transmitted after the global time phase adjustment will have the Disc_Bit set to '1'.

MTTCAN0TTOST.QGTP shows whether the node's global time is in phase with the time master's global time. MTTCAN0TTOST.QGTP is permanently '0' in TTCAN Level 1 and when the Synchronization Deviation Limit is exceeded in TTCAN Level 0,2 (MTTCAN0TTOST.QCS = '0'). It is temporarily '0' while the global time is low-pass filtered to supply the application with a continuous monotonic value. There is no low-pass filtering when the last reference message contained a Disc_Bit = '1' or when MTTCAN0TTOST.QCS = '0'.

19.6.4.6 TTCAN Error Level

The ISO 11898-4 specifies four levels of error severity:

S0 - No Error

S1 - Warning

Only notification of application, reaction application-specific.

S2 Error

Notification of application. All transmissions in exclusive or arbitrating time windows are disabled (i.e. no data or remote frames may be started). Potential time masters still transmit reference messages with the Reference Trigger Offset MTTCAN0TTOST.RTO set to the maximum value of 127.

S3 - Severe Error

Notification of application. All CAN bus operations are stopped, i.e. transmission of dominant bits is not allowed, and MTTCAN0CCCR.MON is set. The S3 error condition remains active until the application updates the configuration (set MTTCAN0CCCR.CCE).

If several errors are detected at the same time, the highest severity prevails. When an error is detected, the application is notified by MTTCAN0TTIR.ELC. The error level is monitored by MTTCAN0TTOST.EL.

The M_TTCAN signals the following error conditions as required by ISO 11898-4:

Config_Error (S3)

Sets Error Level MTTCAN0TTOST.EL to "11" when a merged arbitrating time window is not properly closed or when there is a Tx_Trigger with a time mark beyond the Tx_Ref_Trigger.

Watch_Trigger_Reached (S3)

Sets Error Level MTTCAN0TTOST.EL to "11" when a watch trigger was reached because the reference message is missing.

Application_Watchdog (S3)

Sets Error Level MTTCAN0TTOST.EL to "11" when the application failed to serve the application watchdog. The application watchdog is configured via MTTCAN0TTOCF.AWL. It is served by reading register MTTCAN0TTOST. When the watchdog is not served in time, bit MTTCAN0TTOST.AWE and interrupt flag MTTCAN0TTIR.AW are set, all TTCAN communication is stopped, and the M_TTCAN is set into bus monitoring mode (MTTCAN0CCCR.MON set to '1').

CAN_Bus_Off (S3)

Entering CAN_Bus_Off state sets error level MTTCAN0TTOST.EL to “11”. CAN_Bus_Off state is signalled by MTTCAN0PSR.BO = ‘1’ and MTTCAN0CCCR.INIT = ‘1’.

Scheduling_Error_2 (S2)

Sets Error Level MTTCAN0TTOST.EL to “10” if the MSC of one Tx_Trigger has reached 7. In addition interrupt flag MTTCAN0TTIR.SE2 is set. The Error Level MTTCAN0TTOST.EL is reset to “00” at the beginning of a matrix cycle when no Tx_Trigger has an MSC of 7 in the preceding matrix cycle.

Tx_Overflow (S2)

Sets Error Level MTTCAN0TTOST.EL to “10” when the Tx count is equal or higher than the expected number of Tx_Triggers MTTCAN0TTMLM.ENTT and a Tx_Trigger event occurs. In addition interrupt flag MTTCAN0TTIR.TXO is set. The Error Level MTTCAN0TTOST.EL is reset to “00” when the Tx count is no more than MTTCAN0TTMLM.ENTT at the start of a new matrix cycle.

Scheduling_Error_1 (S1)

Sets Error Level MTTCAN0TTOST.EL to “01” if within one matrix cycle the difference between the maximum MSC and the minimum MSC for all trigger memory elements (of exclusive time windows) is larger than 2, or if one of the MSCs of an exclusive Rx_Trigger has reached 7. In addition interrupt flag MTTCAN0TTIR.SE1 is set. If within one matrix cycle none of these conditions is valid, the Error Level MTTCAN0TTOST.EL is reset to “00”.

Tx_Underflow (S1)

Sets Error Level MTTCAN0TTOST.EL to “01” when the Tx count is less than the expected number of Tx_Triggers MTTCAN0TTMLM.ENTT at the start of a new matrix cycle. In addition interrupt flag MTTCAN0TTIR.TXU is set. The Error Level MTTCAN0TTOST.EL is reset to “00” when the Tx count is at least MTTCAN0TTMLM.ENTT at the start of a new matrix cycle.

19.6.4.7 TTCAN Message Handling

(1) Reference Message

For potential time masters the identifier of the reference message is configured via MTTCAN0TTRMC.RID. No dedicated Tx Buffer is required for transmission of the reference message. When a reference message is transmitted, the first data byte (TTCAN Level 1) resp. the first four data bytes (TTCAN Level 0 and Level 2) will be provided by the FSE.

In case the reference message Payload Select MTTCAN0TTRMC.RMPS is set, the rest of the reference message's payload (Level 1: bytes 2-8, Level 0,2: bytes 5-6) is taken from Tx Buffer 0. In this case the data length DLC code from message buffer 0 is used.

Table 19.154 Number of Data Bytes transmitted with a reference messages

MTTCAN0TTRMC.RMPS	MTTCAN0TXBRP.TRP0	Level 0	Level 1	Level 2
0	0	4	1	4
0	1	4	1	4
1	0	4	1	4
1	1	4 + MB0	1 + MB0	4 + MB0

To send additional payload with the reference message in Level 1 a DLC > 1 has to be configured, for Level 0,2 a DLC > 4 is required. In addition the transmission request pending bit MTTCAN0TXBRP.TRP0 of message buffer 0 must be set (see **Table 19.154**). In case bit MTTCAN0TXBRP.TRP0 is not set when a reference message is started, the reference message is transmitted with the data bytes supplied by the FSE only.

For acceptance filtering of reference messages the Reference Identifier MTTCAN0TTRMC.RID is used.

(2) Message Reception

Message reception is done via the two Rx FIFOs in the same way as for event-driven CAN communication (see **Section 19.6.3.4, Rx Handling**).

The Message Status Count MSC is part of the corresponding trigger memory element and has to be initialized to zero during configuration. It is updated while the M_TTCAN is in synchronization states In_Gap or In_Schedule. The update happens at the message's Rx_Trigger. At this point in time it is checked at which acceptance filter element the latest message received in this basic cycle had matched. The matching filter number is stored as the acceptance filter result. If this is the same the filter number as defined in this trigger memory element, the MSC is decremented by one. If the acceptance filter result is not the same filter number as defined for this filter element, or if the acceptance filter result is cleared, the MSC is incremented by one. At each Rx_Trigger and at each start of cycle, the last acceptance filter result is cleared.

The time mark of an Rx_Trigger should be set to a value where it is ensured that reception and acceptance filtering for the targeted message has completed. This has to take into consideration the RAM access time and the order of the filter list. It is recommended, that filters which are used for Rx_Triggers are placed at the beginning of the filter list. It is not recommended to use an Rx_Trigger for the reference message.

(3) Message Transmission

For time-triggered message transmission the M_TTCAN supplies 32 dedicated Tx buffers (see **Section (2), Dedicated Tx Buffers**). A Tx FIFO or Tx queue is not available when the M_TTCAN is configured for time-triggered operation (MTTCAN0TTOCF.OM = “01” or “10”).

Each Tx_Trigger in the trigger memory points to a particular Tx buffer containing a specific message. There may be more than one Tx_Trigger for a given Tx buffer if that Tx buffer contains a message that is to be transmitted more than once in a basic cycle or matrix cycle.

The application program has to update the data regularly and on time, synchronized to the cycle time. The Host CPU is responsible that no partially updated messages are transmitted. To assure this the Host has to proceed in the following way:

Tx_Trigger_Single / Tx_Trigger_Merged / Tx_Trigger_Arbitration

- Check whether the previous transmission has completed by reading MTTCAN0TXBTO
- Update the Tx buffer’s configuration and/or payload
- Issue an Add Request to set the Tx Buffer Request Pending bit

Tx_Trigger_Continuous

- Issue a Cancellation Request to reset the Tx Buffer Request Pending bit
- Check whether the cancellation has finished by reading MTTCAN0TXBCF
- Update Tx buffer’s configuration and/or payload
- Issue an Add Request to set the Tx Buffer Request Pending bit

The message’s MSC stored with the corresponding Tx_Trigger provides information on the success of the transmission.

The MSC is incremented by one when the transmission could not be started because the CAN bus was not idle within the corresponding transmit enable window or when the message was started and could not be completed successfully. The MSC is decremented by one when the message was transmitted successfully or when the message could have been started within its transmit enable window but was not started because transmission was disabled (M_TTCAN in Error Level S2 or Host has disabled this particular message).

The Tx buffers may be managed dynamically, i.e. several messages with different identifiers may share the same Tx buffer element. In this case the Host has to assure that no transmission request is pending for the Tx buffer element to be reconfigured by checking MTTCAN0TXBRP.

If a Tx buffer with pending transmission request should be updated, the Host first has to issue a cancellation request and check whether the cancellation has completed by reading MTTCAN0TXBCF before it starts updating.

The Tx Handler will transfer a message from the Message RAM to its intermediate output buffer at the trigger element which becomes active immediately before the Tx_Trigger element which defines the beginning of the transmit window. During and after the transfer time the transmit message may not be updated and its MTTCAN0TXBRP bit may not be changed. To control this transfer time, an additional trigger element may be placed before the Tx_Trigger. This may be e.g. a Time_Base_Trigger which need not cause any other action. The difference in time marks between the Tx_Trigger and the preceding trigger has to be large enough to guarantee that the Tx Handler can read four words from the Message RAM even at high RAM access load from other modules.

(a) Transmission in Exclusive Time Windows

A transmission is started time-triggered when the cycle time reaches the time mark of a Tx_Trigger_Single or Tx_Trigger_Continuous. There is no arbitration on the bus with messages from other nodes. The MSC is updated according the result of the transmission attempt. After successful transmission started by a Tx_Trigger_Single the respective Tx Buffer Request Pending bit is reset. After successful transmission started by a Tx_Trigger_Continuous the respective Tx Buffer Request Pending remains set. When the transmission was not successful due to disturbances, it will be repeated next time (one of) its Tx_Trigger(s) become(s) active.

(b) Transmission in Arbitrating Time Windows

A transmission is started time-triggered when the cycle time reaches the time mark of a Tx_Trigger_Arbitration. Several nodes may start to transmit at the same time. In this case the message has to arbitrate with the messages from other nodes. The MSC is not updated. When the transmission was not successful (lost arbitration or disturbance), it will be repeated next time (one of) its Tx_Trigger(s) become(s) active.

(c) Transmission in Merged Arbitrating Time Windows

The purpose of a merged arbitrating time window is to enable multiple nodes to send a limited number of frames which are transmitted in immediate sequence, the order given by CAN arbitration. It is not intended for burst transmission by a single node. Since the node does not have exclusive access within this time window, it may happen that not all requested transmissions are successful.

Messages which have lost arbitration or were disturbed by an error, may be re-transmitted inside the same merged arbitrating time window. The re-transmission will not be started if the corresponding Transmission Request Pending flag was reset by a successful Tx cancellation.

In single transmit windows, the Tx Handler transmits the message indicated by the message number of the trigger element. In merged arbitrating time windows, it can handle up to three message numbers from the trigger list. Their transmissions will be attempted in the sequence defined by the trigger list. If the time mark of a fourth message is read before the first is transmitted (or cancelled by the Host), the fourth request will be ignored.

The transmission inside a merged arbitrating time window is not time-triggered. The transmission of a message may start before its time mark, or after the time mark if the bus was not idle.

The messages transmitted by a specific node inside a merged arbitrating time window will be started in the order of their Tx_Triggers, so a message with low CAN priority may prevent the successful transmission of a following message with higher priority, if there is competing bus traffic. This has to be considered for the configuration of the trigger list. Time_Base_Triggers may be placed between consecutive Tx_Triggers to define the time until the data of the corresponding Tx Buffer needs to be updated.

19.6.4.8 TTCAN Interrupt and Error Handling

The TT Interrupt Register MTTCAN0TTIR consists of four segments. Each interrupt can be enabled separately by the corresponding bit in the TT Interrupt Enable register MTTCAN0TTIE. The flags remain set until the Host clears them. A flag is cleared by writing a '1' to the corresponding bit position.

The first segment consists of flags CER, AW, WT, and IWT. Each flag indicates a fatal error condition where the CAN communication is stopped. With the exception of IWT, these error conditions require a re-configuration of the M_TTCAN module before the communication can be restarted.

The second segment consists of flags ELC, SE1, SE2, TXO, TXU, and GTE. Each flag indicates an error condition where the CAN communication is disturbed. If they are caused by a transient failure, e.g. by disturbances on the CAN bus, they will be handled by the TTCAN protocol's failure handling and do not require intervention by the application program.

The third segment consists of flags GTD, GTW, SWE, TTMI, and RTMI. The first two flags are controlled by global time events (Level 0, 2 only) that require a reaction by the application program. With a Stop Watch Event triggered by a rising/falling edge on pin m_ttcan_swt (MTTCAN0SWT) internal time values are captured. The Trigger Time Mark Interrupt notifies the application that a specific Time_Base_Trigger is reached. The Register Time Mark Interrupt signals that the time referenced by MTTCAN0TTOCN.TMC (Cycle, Local, or Global) equals time mark MTTCAN0TTTMK.TM. It can also be used to finish a Gap.

The fourth segment consists of flags SOG, CSM, SMC, and SBC. These flags provide a means to synchronize the application program to the communication schedule.

19.6.4.9 Level 0

TTCAN Level 0 is not part of ISO11898-4. This operation mode makes the hardware, that in TTCAN Level 2 maintains the calibrated global time base, also available for event-driven CAN according to ISO11898-1:2015.

Level 0 operation is configured via MTTCAN0TTOCF.OM = “11”. In this mode the M_TTCAN operates in event-driven CAN communication, there is no fixed schedule, the configuration of MTTCAN0TTOCF.GEN is ignored. External event-synchronized operation is not available in Level 0. A synchronized time base is maintained by transmission of reference messages.

In Level 0 the trigger memory is not active and therefore needs not to be configured. The time mark interrupt flag (MTTCAN0TTIR.TTMI) is set when the cycle time has reached MTTCAN0TTOCF.IRTO • 200_H, it reminds the Host to set a transmission request for message buffer 0. The Watch_Trigger interrupt flag (MTTCAN0TTIR.WT) is set when the cycle time has reached $FF00_H$. These values were chosen to have enough margin for a stable clock calibration. There are no further TT-error-checks.

Register time mark interrupts (MTTCAN0TTIR.RTMI) are also possible.

The reference message is configured as for Level 2 operation. Received reference messages are recognized by the identifier configured in register MTTCAN0TTRMC. For the transmission of reference messages only message buffer 0 may be used. The node transmits reference messages any time the Host sets a transmission request for message buffer 0, there is no reference trigger offset.

Level 0 operation is configured via:

- MTTCAN0TTRMC
- MTTCAN0TTOCF except EVTP, AWL, GEN
- MTTCAN0TTMLM except ENTT, TXEW
- MTTCAN0TURCF

Level 0 operation is controlled via:

- MTTCAN0TTOCN except NIG, TMG, FGP, GCS, TTMIE
- MTTCAN0TTGTP
- MTTCAN0TTTMK
- MTTCAN0TTIR excluding bits CER, AW, IWT SE2, SE1, TXO, TXU, SOG (no function)
- MTTCAN0TTIR the following bits have changed function
  - TTMI not defined by trigger memory - activated at cycle time MTTCAN0TTOCF.IRTO • 200_H
  - WT not defined by trigger memory - activated at cycle time $FF00_H$

Level 0 operation is signalled via:

- MTTCAN0TTOST excluding bits AWE, WFE, GSI, GFI, RTO (no function)

(1) Synchronizing

Figure 19.29 below describes the states and state transitions in TTCAN Level 0 operation. Level 0 has no In_Gap state.

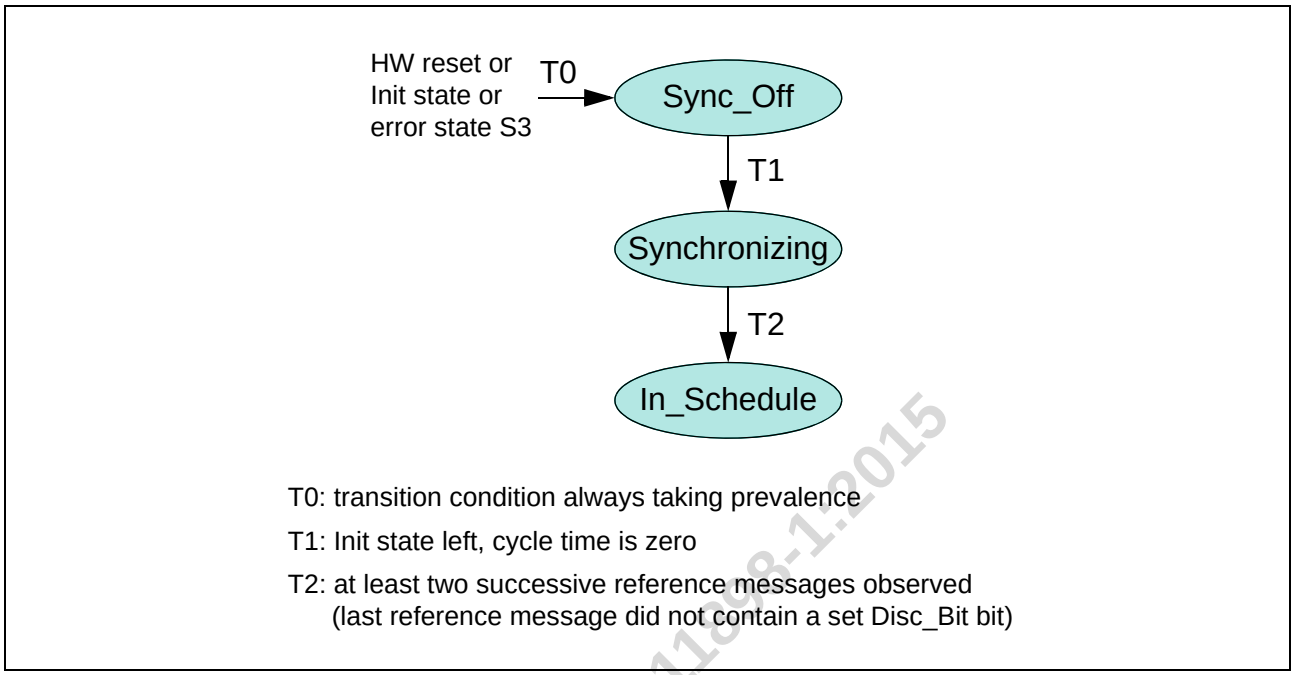

Figure 19.29 Level 0 schedule synchronization state machine

(2) Handling of Error Levels

During Level 0 operation only the following error conditions may occur:

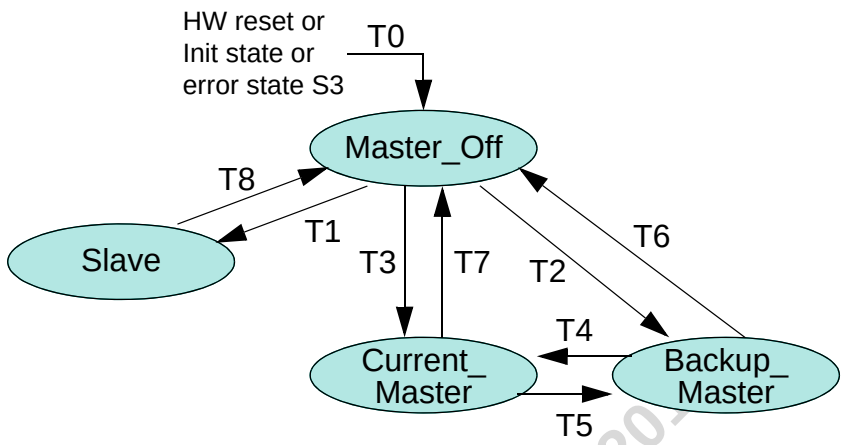
- Watch_Trigger_Reached (S3), reached cycle time $FF00_H$
- CAN_Bus_Off (S3)

Since no S1 and S2 error are possible, the error level can only switch between S0 (No Error) and S3 (Severe Error). In TTCAN Level 0 an S3 error is handled differently. When error level S3 is reached, both MTTCAN0TTOST.SYS and MTTCAN0TTOST.MS are reset, and interrupt flags MTTCAN0TTIR.GTE and MTTCAN0TTIR.GTD are set.

When error level S3 (MTTCAN0TTOST.EL = “11”) is entered, bus monitoring mode is, contrary to TTCAN Level 1 and Level 2, not entered. S3 error level is left automatically after transmission (time master) or reception (time slave) of the next reference message.

(3) Master Slave Relation

Figure 19.30 below describes the master slave relation in TTCAN Level 0. In case of an S3 error the M_TTCAN returns to state Master_Off.



T0: transition condition always taking prevalence

T1: reference message observed when not potential time master

T2: reference message observed with master priority ≠ own master priority, error state ≠ S3

T3: reference message observed with master priority = own master priority, error state ≠ S3

T4: reference message observed with own master priority

T5: reference message observed with master priority higher than own master priority

T6: error state S3

T7: error state S3

T8: error state S3

Figure 19.30 Level 0 master to slave relation

19.6.4.10 Asynchronous Serial Communication

When configured for TTCAN Level 1 or Level 2 operation, the M_TTCAN time base can be used to switch access to the CAN bus for predefined time windows between M_TTCAN and an ASC module (see **Figure 19.31**).

When an exclusive time window is assigned to the ASC module, the multiplexer connects the ASC module to the CAN transceiver. ASC transmission is free of CAN requirements for arbitration and fault confinement and therefore higher bit rates and effective payloads are possible

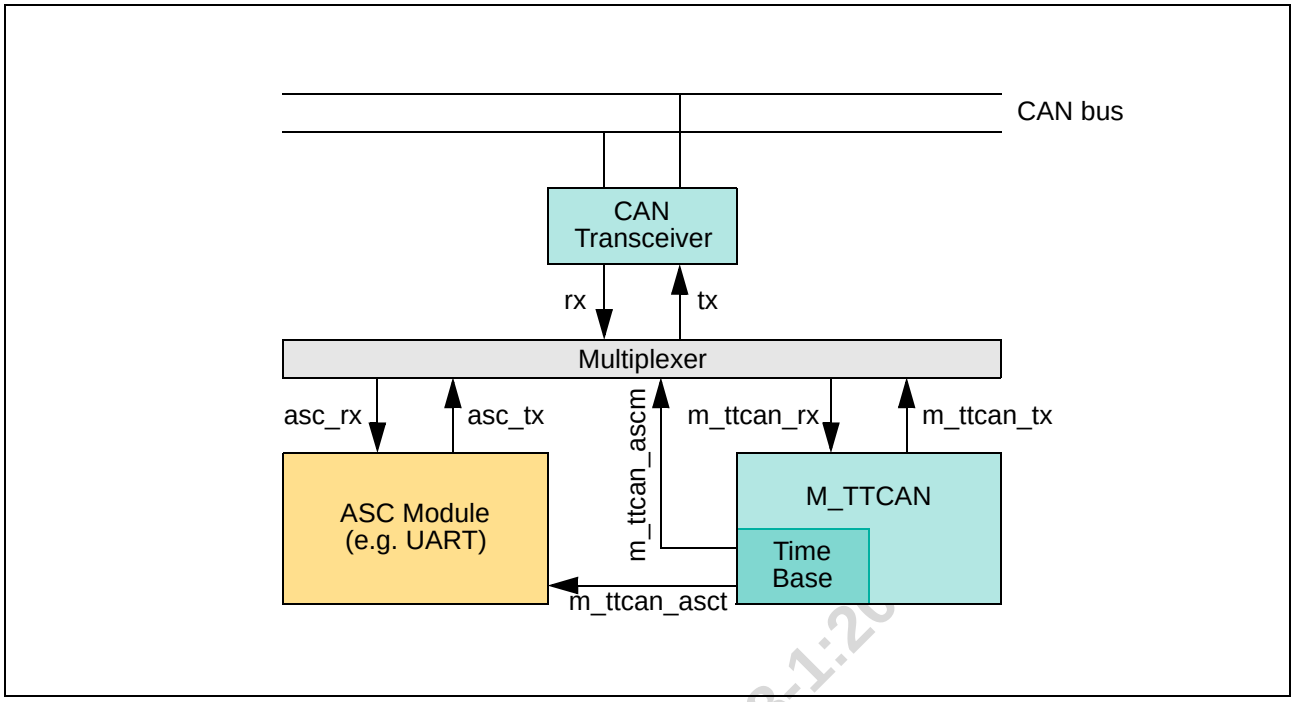


Figure 19.31 Asynchronous Serial Communication at CAN

Asynchronous serial operation is configured for each trigger element separately via T0.ASC. The M_TTCAN's time base controls access to the CAN transceiver for M_TTCAN or ASC module via output signal m_ttcan_ascm. Output signal m_ttcan_asct controls whether the ASC module is transmitter or receiver. For ASC transmission only one node in the network must be configured as transmitter while all other nodes are receivers.

With T0.ASC = "00" the ASC module is disconnected from the CAN bus (m_ttcan_ascm = '0', m_ttcan_asct = '0'). When T0.ASC = "01" the ASC module is receiver (m_ttcan_ascm = '1', m_ttcan_asct = '0'). When T0.ASC = "10" the ASC module is transmitter (m_ttcan_ascm = '1', m_ttcan_asct = '1')

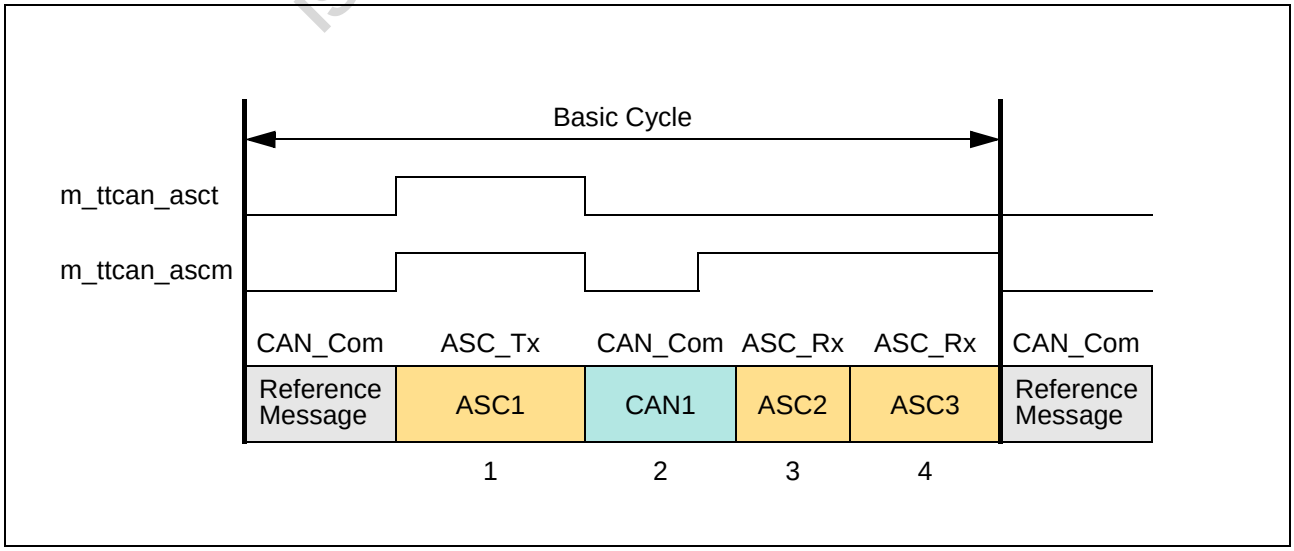

Figure 19.32 ASC@CAN operation

There are separate time windows for ASC transmission and reception. For each ASC time window there is one predefined transmitter, all other nodes are configured as receivers.

To start with an ASC window, the Host has to set CCCR.ASM during initialization. The bit is reset at the end of the first ASC window after the M_TTCAN has finished initializing. During time-triggered operation CCCR.ASM is set by the M_TTCAN at the beginning of an ASC window (trigger memory element with T0.ASC = “10”, “11”). It is reset by each trigger memory element with T0.ASC = “00”.

When CCCR.ASM is set, the CAN protocol controller

- sends no error/overload frames
- does not increment ECR.REC and ECR.TEC
- waits for Bus_Idle (11 recessive bits) after it has detected an error or overload condition
- acknowledges valid frames
- may start the transmission of a frame after it has detected Bus_Idle (11 recessive bits)

ASC mode operation is only entered when the M_TTCAN is synchronization state In_Schedule or In_Gap (m_ttcan_ascm = ’0’ and m_ttcan_asct = ’0’ when not synchronized).

19.6.4.11 Synchronization to external Time Schedule

This feature can be used to synchronize the phase of the M_TTCAN’s schedule to an external schedule (e.g. that of a second TTCAN network or FlexRay network). It is applicable only when the M_TTCAN is current time master (MTTCAN0TTOST.MS = “11”).

External synchronization is controlled by event trigger input pin m_ttcan_evt (MTTCAN0EVT) . If bit MTTCAN0TTOCN.ESCN is set, a rising edge at pin m_ttcan_evt (MTTCAN0EVT) the M_TTCAN compares its actual cycle time with the target phase value configured by MTTCAN0TTGTP.CTP.

Before setting MTTCAN0TTOCN.ESCN the Host has to adapt the phases of the two time schedules e.g. by using the TTCAN gap control (see **Section 19.6.4.3, TTCAN Gap Control**). When the Host sets MTTCAN0TTOCN.ESCN, MTTCAN0TTOST.SPL is set.

If the difference between the cycle time and the target phase value MTTCAN0TTGTP.CTP at the rising edge at pin m_ttcan_evt (MTTCAN0EVT) is greater than 9 NTU, the phase lock bit MTTCAN0TTOST.SPL is reset, and interrupt flag MTTCAN0TTIR.CSM is set. MTTCAN0TTOST.SPL is also reset (and MTTCAN0TTIR.CSM is set), when another node becomes time master.

If both MTTCAN0TTOST.SPL and MTTCAN0TTOCN.ESCN are set, and if the difference between the cycle time and the target phase value MTTCAN0TTGTP.CTP at the rising edge at pin m_ttcan_evt (MTTCAN0EVT) is less or equal 9 NTU, the phase lock bit MTTCAN0TTOST.SPL remains set, and the measured difference is used as reference trigger offset value to adjust the phase at the next transmitted reference message.

NOTE

The rising edge detection at pin m_ttcan_evt (MTTCAN0EVT) is enabled with the start of each basic cycle. The first rising edge triggers the compare of the actual cycle time with MTTCAN0TTGTP.CTP. All further edges until the beginning of the next basic cycle are ignored.

19.7 Usage Notes

19.7.1 Port sharing between M_CAN IP and RLIN

By port sharing, ASC@CAN functionality can be achieved by sharing the M_TTCAN/M_CAN with the RLIN3.

All MTTCAN channel 0 pins will be shared with RLIN30.

One pair of MCAN channel 0 pins will be shared with RLIN30.

See the **Section 2, Pin Functions** and the **Section 18, LIN/UART Interface (RLIN3)** for details.

19.8 CAUTION

No.	Outline
ID1	M(TT)CAN - Edge filtering causes mis-synchronization when falling edge at Rx input pin coincides with end of integration phase. (Direction of use)
ID2	M(TT)CAN - Retransmission in DAR mode due to lost arbitration at the first two identifier bits. (Direction of use)
ID3	M(TT)CAN - Message transmitted with wrong arbitration and control fields.

ID1		M(TT)CAN - Edge filtering causes mis-synchronization when falling edge at Rx input pin coincides with end of integration phase.
	Description	When edge filtering is enabled (M(TT)CANnCCCR.EFBI = '1') and when the end of the integration phase coincides with a falling edge at the Rx input pin it may happen, that the M(TT)CAN synchronizes itself wrongly and does not correctly receive the first bit of the frame. In this case the CRC will detect that the first bit was received incorrectly, it will rate the received FD frame as faulty and an error frame will be send. The issue only occurs, when there is a falling edge at the Rx input pin (m(tt)can_rx) within the last time quantum (tq) before the end of the integration phase. The last time quantum of the integration phase is at the sample point of the 11th recessive bit of the integration phase. When the edge filtering is enabled, the bit timing logic of the M(TT)CAN sees the Rx input signal delayed by the edge filtering. When the integration phase ends, the edge filtering is automatically disabled. This affects the reset of the FD CRC registers at the beginning of the frame. The Classical CRC register are not affected, so this issue does not affect the reception of Classical frames. In CAN communication, the M(TT)CAN may enter integrating state (either by resetting M(TT)CANnCCCR.INIT or by protocol exception event) while a frame is active on the bus. In this case the 11 recessive bits are counted between the acknowledge bit and the following start of frame. All nodes have synchronized at the beginning of the dominant acknowledge bit. This means that the edge of the following start of frame bit cannot fall on the sample point, so the issue does not occur. The issue occurs only when the M(TT)CAN is, by local errors, mis-synchronized with regard to the other nodes. Glitch filtering as specified in ISO 11898-1:2015 is fully functional. Edge filtering was introduced for applications where the data bit time is at least two tq (of the nominal bit time) long. In that case, edge filtering requires at least two consecutive dominant time quanta before the counter counting the 11 recessive bits for idle detection is restarted. This means edge filtering covers the theoretical case of occasional 1-tq-long dominant spikes on the CAN bus that would delay idle detection. Repeated dominant spikes on the CAN bus would disturb all CAN communication, so the filtering to speed up idle detection would not help network performance. When this rare event occurs, the M(TT)CAN sends an error frame and the sender of the affected frame retransmits the frame. When the retransmitted frame is received, the M(TT)CAN has left integration phase and the frame will be received correctly. Edge filtering is only applied during integration phase, it is never used during normal operation. As integration phase is very short with respect to "active communication time", the impact on total error frame rate is negligible. The issue has no impact on data integrity. The M(TT)CAN enters integration phase under the following conditions: • when M(TT)CANnCCCR.INIT is set to '0' after start-up • after a protocol exception event (only when M(TT)CANnCCCR.PXHD = '0') Scope: The erratum is limited to FD frame reception when edge filtering is active (M(TT)CANnCCCR.EFBI = '1') and when the end of the integration phase coincides with a falling edgeat the Rx input pin. Effect: The calculated CRC value does not match the CRC value of the received FD frame and the M(TT)CAN sends an error frame. After retransmission the frame is received correctly.
	Workaround	Disable edge filtering or wait on retransmission in case this rare event happens.

ID2		M(TT)CAN - Retransmission in DAR mode due to lost arbitration at the first two identifier bits.
	Description	When the M(TT)CAN is configured in DAR mode (M(TT)CANnCCCR.DAR = '1') the Automatic Retransmission for transmitted messages that have been disturbed by an error or have lost arbitration is disabled. When the transmission attempt is not successful, the Tx Buffer's transmission request bit (M(TT)CANnTXBRP.TRPxx) shall be cleared and its cancellation finished bit (M(TT)CANnTXBCF.CFxx) shall be set. When the transmitted message looses arbitration at one of the first two identifier bits, it may happen, that instead of the bits of the actually transmitted Tx Buffer, the M(TT)CANnTXBRP.TRPxx and M(TT)CANnTXBCF.CFxx bits of the previously started Tx Buffer (or Tx Buffer 0 if there is no previous transmission attempt) are written (M(TT)CANnTXBRP.TRPxx = '0', M(TT)CANnTXBCF.CFxx = '1'). If in this case the M(TT)CANnTXBRP.TRPxx bit of the Tx Buffer that lost arbitration at the first two identifier bits has not been cleared, retransmission is attempted. When the M(TT)CAN looses arbitration again at the immediately following retransmission, then actually and previously transmitted Tx Buffer are the same and this Tx Buffer's M(TT)CANnTXBRP.TRPxx bit is cleared and its M(TT)CANnTXBCF.CFxx bit is set. Scope: The erratum is limited to the case when the M(TT)CAN looses arbitration at one of the first two transmitted identifier bits while in DAR mode. The problem does not occur when the transmitted message has been disturbed by an error. Effects: In this case it may happen, that the M(TT)CANnTXBRP.TRPxx bit is cleared after the second transmision attempt instead of the first. Additionally it may happen that the M(TT)CANnTXBRP.TRPxx bit of the previously started Tx Buffer is cleared, if it has been set again. As in this case the previously started Tx Buffer has lost M(TT)CAN internal arbitration against the active Tx Buffer, its message has a lower identifier priority. It would also have lost arbitration on the CAN bus at the same position.
	Workaround	None

ID3		M(TT)CAN - Message transmitted with wrong arbitration and control fields.
	Description	Under the following conditions a message with wrong ID, format, and DLC is transmitted: • M(TT)CAN is in state "Receiver" (M(TT)CANnPSR.ACT = "10"), no pending transmission • A new transmission is requested before the 3rd bit of Intermission is reached • The CAN bus is sampled dominant at the third bit of Intermission which is treated as SoF (see ISO11898ISO11898-1:2015 Section 10.4.2.2) Under the conditions listed above it may happen, that: • The shift register is not loaded with ID, format, and DLC of the requested message • The M(TT)CAN will start arbitration with wrong ID, format, and DLC on the next bit • In case the ID wins arbitration, a CAN message with valid CRC is transmitted • In case this message is acknowledged, the ID stored in the Tx Event FIFO is the ID of the requested Tx message and not the ID of the message transmitted on the CAN bus, no error is detected by the transmitting M(TT)CAN. Under the conditions listed above it may happen, that: Scope: The erratum is limited to the case when M(TT)CAN is in state "Receiver" (M(TT)CANnPSR.ACT = "10") with no pending transmission (no M(TT)CANnTXBRP bit set) and a new transmission is requested before the 3rd bit of Intermission is reached and this 3rd bit of intermission is seen dominant. When a transmission is requested by the CPU by writing to M(TT)CANnTXBAR, the Tx Message Handler performs an internal arbitration and loads the pending transmit message with the highest priority into its output buffer and then sets th the transmission request for the CAN Protocol Controller. The problem occurs only when the transmission request for the CAN Protocol Controller is activated in the critical time window between the sample points of the 2nd and 3rd bit of Intermission and if that 3rd bit of intermission is seen dominant. This dominant level at the 3rd bit of Intermission may result from an external disturbance or may be transmitted by another node with a significantly faster clock. Effects: In the described case it may happen that the shift register is not loaded with arbitration and control field of the message to be transmitted. The frame is transmitted with wrong ID, format, and DLC but with the data field of the requested message. The message is transmitted in correct CAN (FD) frame format with a valid CRC. If the message loses arbitration or is disturbed by an error, it is retransmitted with correct arbitration and control fields.

ID3	Workaround	1. Request a new transmission only if another transmission is already pending or when the M(TT)CAN is not in state "Receiver" (when M(TT)CANnPSR.ACT ACT ≠ "10"). To avoid activating the transmission request in the critical time window between the sample points of the 2nd and 3rd bit of Intermission, the application software can evaluate the Rx Interrupt flags M(TT)CANnIR.DRX,M(TT)CANnIR.RF0N, M(TT)CANnIR.RF1N which are set at the last bit of EoF when a received and accepted message gets valid. The last bit of EoF is followed by three bits of Intermission. Therefore the critical time window has safely terminated three bit times after the Rx interrupt. Now a transmission may be requested by writing to M(TT)CANnTXBAR. After the interrupt, the application has to take care that the transmission request for the CAN Protocol Controller is activated before the critical window of the following reception is reached. 2. A checksum covering arbitration and control fields can be added to the data field of the message to be transmitted, to detect frames transmitted with wrong arbitration and control fields. 3. If a transmission is to be requested while no other transmission request is already pending and the CAN bus is not idle, set the M(TT)CANnCCCR.INIT bit (which stops the CAN protocol controller), set the transmission request and finally clear the M(TT)CANnCCCR.INIT bit. The message currently being received when M(TT)CANnCCCR.INIT is set will be lost, but no errors (or error frames) will be generated and the CAN protocol controller will re-integrate into the CAN communication immediately at the 11 recessive bits of the next End-of-Frame & Intermission (or Idle) and will receive (or transmit) the following message. 4. It is also possible to keep the number of pending transmissions always at > 0 by frequently requesting a message, then the condition "no pending transmission" is never met. The frequently requested message may be given a low priority, losing arbitration to all other messages.

19.9 Difference among P1M-C, P1H-C and P1H-CE

There are differences in channels, interrupts, and external pins. For details, please refer to **Table 19.2**, **Table 19.8**, and **Table 19.9**.

Section 20 FlexRay (FLX)

The FlexRay IP-module performs communication according to the FlexRay protocol specification v2.1. With maximum specified sample clock the bitrate is 10 MBit/s. Additional bus driver (BD) hardware is required for connection to the physical layer.

This section contains a generic description of the FlexRay.

The first part of this section describes all RH850/P1x-C specific properties, such as the number of channels, register base addresses, internal input/output signals, etc.

The remainder of this section describes the properties common to all versions of the RH850/P1x-C FlexRay.

NOTE

If not other mentioned the meaning of POC in **Section 20** is Protocol Operation Control.

20.1 Overview of RH850/P1x-C FlexRay

20.1.1 Channels

This microcontroller has the following number of FlexRay modules.

Table 20.1 Number of FlexRay Modules

FlexRay	P1M-C, P1H-C (4MB, BGA-156)	P1H-C (4MB, BGA-292) and P1H-CE
Number of modules	1	2
Name	FLXn (n = 0)	FLXn (n = 0, 1)

Index n

Throughout this section, the individual modules of the FlexRay is identified by the index “n” , for example, FLXAnFROC for the FlexRay control register.

20.1.2 Register Base Addresses

All FlexRay register addresses are given as address offsets to the individual base address<FLXn_base>.

The base address <FLXn_base> of each FlexRay is listed in the following table:

Table 20.2 Register Base Addresses <FLXn_base>

FlexRay Channel	<FLXAn_base> Address
FLXA0	$1002\ 0000_H$
FLXA1	$1002\ 1000_H$

20.1.3 Clock Supply

FlexRay provide one clock input.

Table 20.3 Clock Supply

Module	Clock Name	Clock Symbol	Description
FLXAn	High Speed Peripheral clock 1	CLKP_H1	FlexRay sample clock
	Speed Peripheral clock 1	CLKP_H1	NTU clock Source
	High speed system clock	CLK_HSB	Bus clock

Note 1. CLK_HSB must be set to min.44.8125MHz
Note 2. CLKP_H1 must be 80MHz

20.1.4 Interrupts

FlexRay can generate the following interrupt requests:

Table 20.4 Interrupt Requests

Unit Interrupt Name	Outline	Interrupt Number	DMA Trigger Number	DTS Trigger Number
FlexRay0				
INTFLX0LINE0	Universal interrupt chA for FLX0	186	—	—
INTFLX0LINE1	Universal interrupt chB for FLX0	187	—	—
INTFLX0TIM0	Timer 0 interrupt for FLX0	188	—	—
INTFLX0TIM1	Timer 1 interrupt for FLX0	189	—	—
INTFLX0TIM2	Timer 2 interrupt for FLX0	190	—	—
INTFLX0FDA	FIFO data available (FIFO not empty) interrupt for FLX0	191	—	—
INTFLX0FW	FIFO warning interrupt for FLX0	192	—	—
INTFLX0OW	Output transfer warning interrupt for FLX0	193	—	—
INTFLX0OT	Output transfer done interrupt for FLX0	194	—	—
INTFLX0IQF	Input queue full interrupt for FLX0	195	—	—
INTFLX0IQE	Input queue empty interrupt for FLX0	196	—	—
FlexRay1				
INTFLX1LINE0	Universal interrupt chA for FLX1	197	—	—
INTFLX1LINE1	Universal interrupt chB for FLX1	198	—	—
INTFLX1TIM0	Timer 0 interrupt for FLX1	199	—	—
INTFLX1TIM1	Timer 1 interrupt for FLX1	200	—	—
INTFLX1TIM2	Timer 2 interrupt for FLX1	201	—	—
INTFLX1FDA	FIFO data available (FIFO not empty) interrupt for FLX1	202	—	—
INTFLX1FW	FIFO warning interrupt for FLX1	203	—	—
INTFLX1OW	Output transfer warning interrupt for FLX1	204	—	—
INTFLX1OT	Output transfer done interrupt for FLX1	205	—	—
INTFLX1IQF	Input queue full interrupt for FLX1	206	—	—
INTFLX1IQE	Input queue empty interrupt for FLX1	207	—	—
NTU				
INTFLXNTU	NTU loss interrupt	40	—	—

20.1.5 FlexRay Hardware Reset

FlexRay and registers of FlexRay are initialized by the following reset condition:

Table 20.5 Reset Condition

Reset Name	Reset condition				
	Power On Reset	System Reset 1	System Reset 2	Application Reset 1	Limited Reset
All Registers	√	√	√	√	√

20.1.6 I/O Signals

The I/O signals of the FlexRay are listed in the following table.

Table 20.6 FlexRay I/O Signals

Pin name	I/O	Function
FLXnRXDA	Input	Flex Ray n channel A receive data input
FLXnTXDA	Output	Flex Ray n channel A transmit data output
FLXnTXENA	Output	Flex Ray n channel A transmit data enable
FLXnRXDB	Input	Flex Ray n channel B receive data input
FLXnTXDB	Output	Flex Ray n channel B transmit data output
FLXnTXENB	Output	Flex Ray n channel B transmit data enable
FLXnSTPWT	Input	Flexray n stop watch trigger input
FLXNTUOUT	Output	NTU clock output
BHPDGRCLK1	Output	Degraded clock

20.1.7 Functions

For communication on a FlexRay network, individual message buffers with up to 254 data bytes are configurable. The message storage is a Message RAM that is configurable to hold up to 128 message buffers. All functions concerning the handling of messages are implemented in the Message Handler. Those functions are the acceptance filtering, the transfer of messages between the two FlexRay Channel Protocol Controllers and the Message RAM, maintaining the transmission schedule as well as providing message status information.

The register set of the FlexRay IP-module can be accessed directly by an external Host via the module's Host interface. These registers are used to control/configure/monitor the FlexRay Channel Protocol Controllers, Message Handler, Global Time Unit, System Universal Control, Frame and Symbol Processing, Network Management, Interrupt Control, to access the Message RAM via Input / Output Buffer; and to control the data transfer between the Message RAM and the Local RAM/Global RAM.

The FlexRay IP-module supports the following features:

Item	Specification
Communication	Conformance with FlexRay protocol specification v2.1
Data transfer rate	Up to 10 Mbit/s on each channel
Data link layer clock frequency	80 MHz
FlexRay channels	2 (channels A and B)
Message buffer	Up to 128 message buffers configurable
	Configuration of message buffers with different payload lengths possible
	Each message buffer can be configured as receive buffer, as transmit buffer or as part of the receive FIFO
	Filtering for slot counter, cycle counter, and channel
Message RAM	8 Kbyte of Message RAM for storage of e.g.
	128 message buffers with max. 48 byte data section
	Up to 30 message buffers with 254 byte data section
FIFO	One configurable receive FIFO
Message buffer access	By Host CPU via Input and Output Buffer Input Buffer: Holds message to be transferred to the Message RAM Output Buffer: Holds message read from the Message RAM
	By data transfer function Input transfer: Message buffer content is transferred from Local RAM/Global RAM to Message RAM on CPU request Output transfer: Message buffer content is transferred from Message RAM to Local RAM/Global RAM automatically
Network management	Automatic hardware support
Interrupts	Maskable module interrupts
Timer	2 absolute timer 1 relative timer
NTU generation	Generation of FlexRay macrotick Generation of FlexRay cycle

20.1.8 Block Diagram

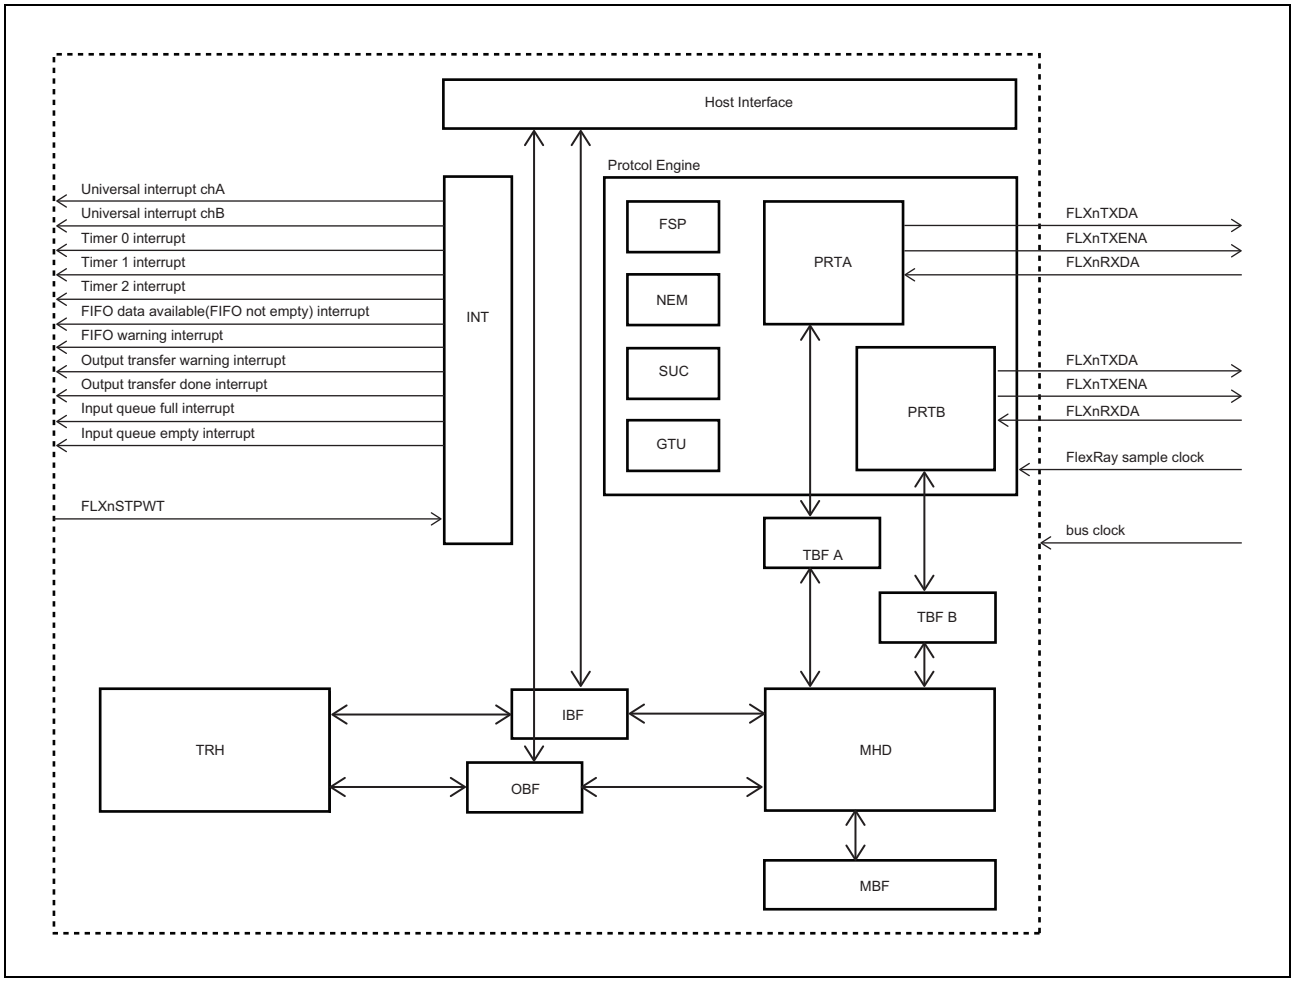

Figure 20.1 FlexRay IP Block Diagram

Input Buffer (IBF)

For write access to the message buffers configured in the Message RAM, the Host can write the header and data section for a specific message buffer to the Input Buffer. The Message Handler then transfers the data from the Input Buffer to the selected message buffer in the Message RAM.

Output Buffer (OBF)

For read access to a message buffer configured in the Message RAM the Message Handler transfers the selected message buffer to the Output Buffer. After the transfer has completed, the Host can read the header and data section of the transferred message buffer from the Output Buffer.

Message Handler (MHD)

The FlexRay Message Handler controls data transfers between the following components:

- Input / Output Buffer and Message RAM
- Temporary buffer RAMs of the two FlexRay Protocol Controllers and Message RAM

Message RAM (MRAM)

The Message RAM consists of a single-ported RAM that store up to 128 FlexRay message buffers together with the related configuration data (header and data partition).

Temporary buffer RAM (TBF A/B)

Stores the data section of two complete messages.

FlexRay Channel Protocol Controller (PRT A/B)

The FlexRay Channel Protocol Controllers consist of shift register and FlexRay protocol FSM. They are connected to the Temporary buffer RAMs for intermediate message storage and to the physical layer via bus driver BD.

They perform the following functionality:

- Control and check of bit timing
- Reception / transmission of FlexRay frames and symbols
- Check of header CRC
- Generation / check of frame CRC
- Interfacing to bus driver

Global Time Unit (GTU)

The Global Time Unit performs the following functions:

- Generation of microtick (µT)
- Generation of macrotick (MT)
- Fault tolerant clock synchronization by FTM algorithm
  - rate correction
  - offset correction
- Cycle counter
- Timing control of static segment
- Timing control of dynamic segment (minislotting)
- Support of external clock correction

System Universal Control (SUC)

The System Universal Control controls the following functions:

- Configuration
- Wakeup
- Startup
- Normal Operation
- Passive Operation

Frame and Symbol Processing (FSP)

The Frame and Symbol Processing controls the following functions:

- Checks the correct timing of frames and symbols
- Tests the syntactical and semantical correctness of received frames
- Sets the slot status flags

Network Management (NEM)

Handles the network management vector.

Interrupt Control (INT)

The Interrupt Controller performs the following functions:

- Provides error and status interrupt flags
- Enable / disable interrupt sources
- Assignment of interrupt sources to one of the two general module interrupt lines
- Enable / disable module interrupt lines

Timer (TIM)

The Timer module includes the following macrotick timer:

- two absolute timers
- one relative timer
- one stop watch timer

Transfer Handler (TRH)

Handles the data transfer between Local RAM/Global RAM and FlexRay module.

The Transfer Handler supports the following transfer types:

- Transfer of buffer configuration data from the Local RAM/Global RAM to the Message RAM
- Transfer of payload data for temporary buffers from the Local RAM/Global RAM to the Message RAM
- Transfer of buffer configuration data and payload data for temporary buffer from the Local RAM/Global RAM to the Message RAM
- Automatic transfer of payload data from receive buffer to the Local RAM/Global RAM upon frame reception
- Automatic transfer of payload data, buffer configuration data and message buffer status data from receive buffer to the Local RAM/Global RAM upon frame reception
- Automatic transfer of buffer configuration data and message buffer status data from the dedicated transmit/receive buffer to the Local RAM/Global RAM in response to slot status update
- Manual transfer of payload data, buffer configuration data and message buffer status data from the dedicated transmit/receive buffer to the Local RAM/Global RAM

20.2 Register

20.2.1 Register Map

The FlexRay module allocates an address space as shown in **Table 20.7, FlexRay Register Map**.

Within this specification the “Values after reset” refers to the microcontroller’s HW reset. For registers in the address range 0010_H to $0FFF_H$ the “Value after reset” are also applicable when the SW reset (using FLXAnFROC.OE) is applied.

The addresses in this specification are listed as offsets from a base address. The base address <FLXn_base> must thus be added to the addresses.

For <FLXn_base>, see **Section 20.1.2, Register Base Addresses**.

Table 20.7 FlexRay Register Map (1/5)

Register Name	Symbol	Value after Reset	Address	Access Size	Access Protection	
					HBG/PBG	Other
FlexRay Operation Control Register	FLXAnFRPV	2A10 2300_H	<FLXn_base> + 0000_H	32	HBG. FlexRayn*[1]	—
