

RTKA211450DE0010BU

The RTKA211450DE0010BU board evaluates the [RAA211450](#) (HTSSOP version), a DC/DC synchronous step-down regulator with programmable switching frequency.

The RAA211450 supports a wide input voltage range (from 4.5V to 42V) and adjustable output voltage. It delivers up to a continuous 3A output current with a premium load regulation and line regulation performance.

Features

- Simple and flexible design
- 4.5V to 42V V_{IN} range
- Convenient power conversion

Specifications

The following are the design specifications for the RTKA211450DE0010BU:

- Input voltage (V_{IN}): 4.5V to 42V
- Output voltage (V_{OUT}): 3.3V
- Maximum output current: 5A

1. Functional Description

The RAA211450 (HTSSOP version) is an easy-to-use synchronous Buck switching regulator with integrated 90mΩ (high-side) and 45mΩ (low-side) MOSFETs. The RTKA211450DE0010BU board evaluates the operations of RAA211450 (HTSSOP version). The board allows you to evaluate the performance of the part with a different application circuit, and it provides a reference for a board layout.

The manual includes a schematic (Figure 4), PCB layers (Figure 5 to Figure 8), performance data and waveforms taken from the evaluation board (Figure 9 to Figure 16), and a full list of materials (Bill of Materials).

1.1 Operational Characteristics

The board input voltage range is from 4.5V to 42V. The output voltage is set to 3.3V by default and can be changed by R_9 and R_{10} , as shown in Equation 1:

$$(EQ. 1) \quad R_9 = R_{10} \cdot \frac{V_{OUT} - 0.8}{0.8}$$

Renesas recommends using a 20kΩ resistor for R_{10} and choose R_9 based on Equation 1.

1.2 Setup and Configuration

1. Populate a jumper on JP1(VIN shorted to EN).
2. Connect the power supply to the input terminals VIN(T1) and GND(T2). Connect the load to the output terminals VOUT(T3) and GND(T4). Verify the setup is correctly connected before applying any power or load to the board.
3. Turn on the power supply, and the part should start operating.
4. Verify that the output voltage is 3.3V and the phase node waveforms can be monitored at J1.
