

RTKA211605DR0010BU

The RTKA211605DR0010BU board is designed to demonstrate and quickly evaluate the [RAA211605](#), a DC/DC step-down regulator with 450 kHz switching frequency.

The RAA211605 supports a wide input voltage range (from 4.5V to 60V) and adjustable output voltage. It can deliver up to 0.5A continuous output current with premium load regulation and line regulation performance.

The demonstration board implements a complete buck regulator using the RAA211605. The output voltage is set to 3.3V but can be adjusted by changing the resistor values in the feedback network.

**Features**

- Simple and flexible design
- Wide input voltage range: 4.5V to 60V
- Adjustable output voltage
- Convenient power conversion

**Specifications**

The following are the design specifications for the RTKA211605DR0010BU:

- Input voltage ( $V_{IN}$ ): 4.5V to 60V
- Output voltage ( $V_{OUT}$ ): 3.3V
- Maximum output current: 0.5A

# 1. Functional Description

The RAA211605 is an easy-to-use Buck switching regulator with an integrated 600mΩ high-side MOSFET. The RTKA211605DR0010BU board demonstrates the operations of RAA211605. It allows you to evaluate the performance of the part with different application circuits. It also provides you a reference for board layout.

## 1.1 Setting the Output Voltage

The output voltage is set to 3.3V by default and can be changed by changing the values of R<sub>3</sub> and R<sub>4</sub> in the feedback resistor network based on Equation 1:

$$(EQ. 1) \quad R_3 = R_4 \cdot \frac{V_{out} - 0.8}{0.8}$$

For applications where the V<sub>IN</sub> - V<sub>OUT</sub> is larger than 3V, Renesas recommends using a 20kΩ resistor for R<sub>4</sub> and choose R<sub>3</sub> based on Equation 1. For applications where V<sub>IN</sub> - V<sub>OUT</sub> is less than 3V, Renesas recommends using smaller R<sub>3</sub> and R<sub>4</sub> such that there is larger than 50mA load at V<sub>OUT</sub>.

## 1.2 Quick Test Setup

1. EN is tied to VIN by default through a 0Ω resistor on R<sub>1</sub>, but R<sub>1</sub> and R<sub>2</sub> can also be used to set the input undervoltage lockout level.
2. Connect the power supply to the input terminals VIN(T1) and GND(T2). Connect the load to the output terminals VOUT(T3) and GND(T4). **Important:** Ensure the setup is correctly connected before applying any power or load to the board.
3. Turn on the power supply and the part should start operating.
4. Verify that the output voltage is 3.3V and phase node waveforms can be monitored at J2.
