Application Information

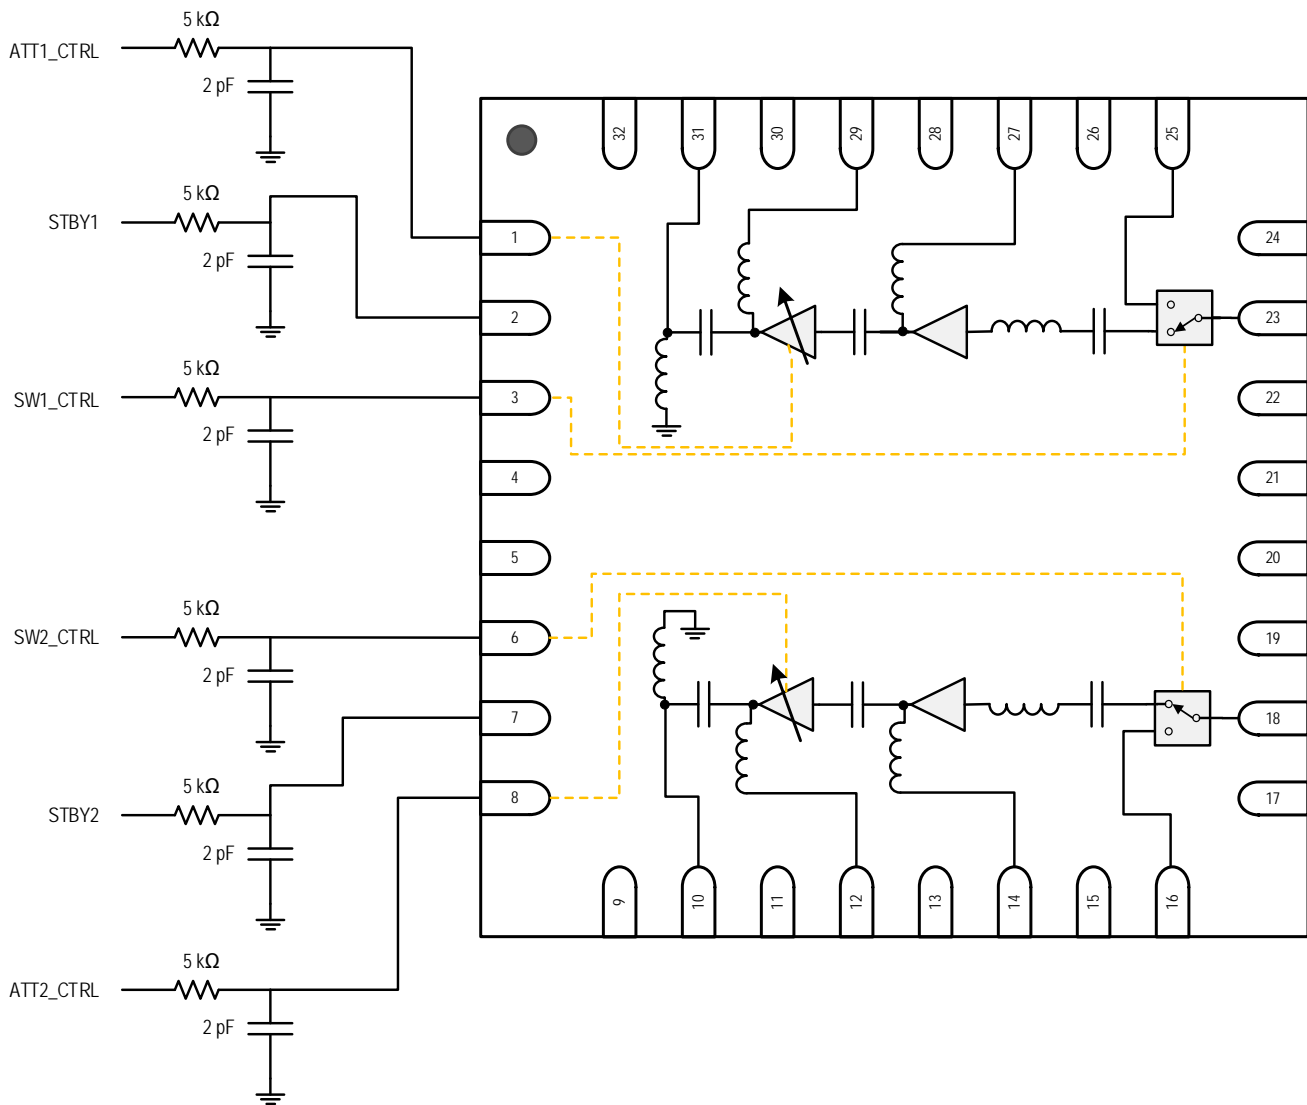

Power Supplies

A common V_{DD} power supply should be used for all pins requiring DC power. All supply pins should be bypassed with external capacitors to minimize noise and fast transients. Supply noise can degrade the noise figure, and fast transients can trigger ESD clamps and cause them to fail. Supply voltage change or transients should have a slew rate smaller than $1V / 20\mu s$. In addition, all control pins should remain at $0V (\pm 0.3V)$ while the supply voltage ramps up or while it returns to zero.

Control Pin Interface

If control signal integrity is a concern and clean signals cannot be guaranteed due to overshoot, undershoot, ringing, etc., the following circuit at the input of each control pin is recommended. This applies to control pins 1, 2, 3, 6, 7, and 8 displayed in Figure 28.

Marking Diagram

- Lines 1 and 2 indicate the part number
- Line 3 indicates the following:
 - “#” denotes stepping
 - “YY” is the last two digits of the year; “WW” is the work week number when the part was assembled.
 - “\$” denotes the mark code.
- Line 4 is the lot number
