

## Description

The ICS1894-33 is a low-power, physical-layer device (PHY) that supports the ISO/IEC 10Base-T and 100Base-TX Carrier-Sense Multiple Access/Collision Detection (CSMA/CD) Ethernet standards, ISO/IEC 8802.3. It is intended for RMII Node applications and includes the Auto-MDIX feature that automatically corrects crossover errors in plant wiring.

The ICS1894-33 incorporates Digital-Signal Processing (DSP) control in its Physical-Medium Dependent (PMD) sub-layer. As a result, it can transmit and receive data on unshielded twisted-pair (UTP) category 5 cables with attenuation in excess of 24 dB at 100MHz.

The ICS1894-33 provides a Serial-Management Interface for exchanging command and status information with a Station-Management (STA) entity. The ICS1894-33 Media-Dependent Interface (MDI) can be configured to provide half/full-duplex operation at data rates of 10 Mb/s or 100Mb/s.

In addition, the ICS1894-33 includes a programmable LED and interrupt output function. The LED outputs can be configured through registers to indicate the occurrence of certain events such as LINK, ACTIVITY, etc. The purpose of the programmable interrupt output is to notify the PHY controller device immediately when a certain event happens instead of having the PHY controller continuously poll the PHY. The events that could be used to generate interrupts are: receiver error, Jabber, page received, parallel detect fault, link partner acknowledge, link status change, auto-negotiation complete, remote fault, etc.

The ICS1894-33 has deep power modes that can result in significant power savings when the link is broken.

**Applications:** NIC cards, PC motherboards, switches, routers, DSL and cable modems, game machines, printers, network connected appliances, and industrial equipment.

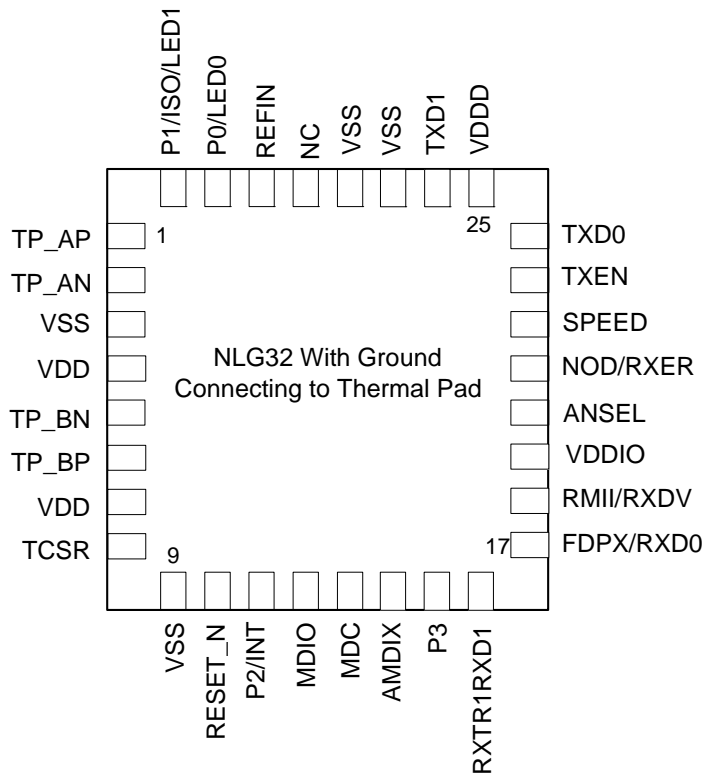

## Features

- Supports category 5 cables and above with attenuation in excess of 24dB at 100 MHz.
- Single-chip, fully integrated PHY provides PCS, PMA, PMD, and AUTONEG sub layers functions of IEEE standard.
- 10Base-T and 100Base-TX ISO/IEC 8802.3 compliant
- MIIM (MDC/MDIO) management bus for PHY register configuration
- RMII interface support with external 50 MHz system clock
- Single 3.3V power supply
- Highly configurable, supports:
  - Auto-Negotiation with Parallel detection
  - Node applications, managed or unmanaged
  - 10M or 100M half/full duplex modes
- Auto-MDI/MDIX crossover correction
- Low-power CMOS (typically 300 mW)
- Power-Down mode (typically 21mW)
- Programmable LEDs
- Interrupt output pin
- Fully integrated, DSP-based PMD includes:
  - Adaptive equalization and baseline-wander correction
  - Transmit wave shaping and stream cipher scrambler
  - MLT-3 encoder and NRZ/NRZI encoder
- Core power supply (3.3 V)
- 3.3 V/1.8 V VDDIO operation supported
- Smart power control with deep power down feature
- Available in 32-pin (5mm x 5mm) QFN package, Pb-free
- Available in Industrial Temp and Lead Free

### Pin Assignment

## Pin Descriptions

| Pin Number | Pin Name       | Pin Type <sup>1</sup> | Pin Description   |
|------------|----------------|-----------------------|---|
| 1          | TP_AP          | AIO                   | Twisted pair port A (for either transmit or receive) positive signal  |
| 2          | TP_AN          | AIO                   | Twisted pair port A (for either transmit or receive) negative signal  |
| 3          | VSS            | Ground                | Connect to ground.  |
| 4          | VDD            | Power                 | 3.3V Power Supply   |
| 5          | TP_BN          | AIO                   | Twisted pair port B (for either transmit or receive) negative signal  |
| 6          | TP_BP          | AIO                   | Twisted pair port B (for either transmit or receive) positive signal  |
| 7          | VDD            | Power                 | 3.3V Power Supply   |
| 8          | TCSR           | AIO                   | Transmit Current bias pin, connected to Vdd and ground via resistors (see “Recommended Component Values” table and the “ICS1894-33 TCSR” figure).                                   |
| 9          | VSS            | Ground                | Connect to ground.  |
| 10         | RESET_N        | Input                 | Hardware reset for the entire chip (active low)   |
| 11         | P2/INT         | IO/lpd                | PHY address Bit 2 as input (during power on reset/hardware reset)<br>Interrupt output as output (default active low, can be programmed to active high)                              |
| 12         | MDIO           | IO                    | Management Data Input/Output  |
| 13         | MDC            | Input                 | Management Data Clock   |
| 14         | AMDIX          | IO/lpu                | AMDIX enable as input (during power on reset/hardware reset)  |
| 15         | P3             | IO/lpd                | PHY address Bit 3 as input (during power on reset/hardware reset)   |
| 16         | RXTRI/<br>RXD1 | IO/lpd                | RX tri-state enable as input (during power on reset/hardware reset)<br>Receive data Bit 1 in RMII mode as output.   |
| 17         | FDPX/<br>RXD0  | IO/lpu                | Half/Full duplex enable as input (during power on reset/hardware reset)<br>Receive data Bit 0 in RMII mode as output  |
| 18         | RMII/RXDV      | IO/lpd                | RMII select as input (during power on reset/hardware reset). Connect this pin to VDDIO using a 1k resistor. CRS_DV in RMII mode as output.  |
| 19         | VDDIO          | Power                 | 3.3 V/1.8 V IO Power Supply.  |
| 20         | ANSEL          | IO/lpu                | Auto-negotiation enable as input (during power on reset/hardware reset)   |
| 21         | NOD/<br>RXER   | IO/lpd                | Node select as input (during power on reset/hardware reset)<br>Receive error in RMII mode as output<br>It is recommended to always pull this pin low on power-up or hardware reset. |
| 22         | SPEED          | IO/lpu                | 10M/100M select as input (during power on reset/hardware reset)   |
| 23         | TXEN           | Input                 | Transmit enable in RMII mode  |
| 24         | TXD0           | Input                 | Transmit data Bit 0 in RMII mode  |
| 25         | VDDD           | Power                 | 3.3 V Power Supply  |
| 26         | TXD1           | Input                 | Transmit data Bit 1 in RMII mode  |
| 27         | VSS            | Ground                | Connect this pin to GND   |
| 28         | VSS            | Ground                | Connect this pin to GND   |
| 29         | NC             | —                     | No connect.   |
| 30         | REFIN          | Input                 | 50 MHz clock input in RMII mode.  |

| Pin Number | Pin Name    | Pin Type <sup>1</sup> | Pin Description   |
|------------|-------------|-----------------------|---|
| 31         | P0/LED0     | IO                    | PHY address Bit 0 as input (during power on reset/hardware reset) and LED # 0 (function configurable, default is "activity/no activity") as output  |
| 32         | P1/ISO/LED1 | IO                    | PHY address Bit 1 as input (during power on reset/hardware reset) and LED # 1 (function configurable, default is "10/100 mode") as output; After latch, alternates as a real time receiver isolation input. |
| PADDLE     | VSS         | Ground                | Connect to ground.  |

**Notes:**

1. AIO: Analog input/output PAD.

IO: Digital input/output.

IN/Ipu: Digital input with internal 20k pull-up.

IN/Ipd: Digital input with internal 20k pull-down.

IO/Ipu: Digital input/output with internal 20k pull-up.

IO/Ipd: Digital input/output with internal 20k pull-down.

2. RMII Rx Mode: The RXD[1:0] bits are synchronous with REFIN. For each clock period in which CRS\_DV is asserted, two bits of recovered data are sent from the PHY to the MAC.

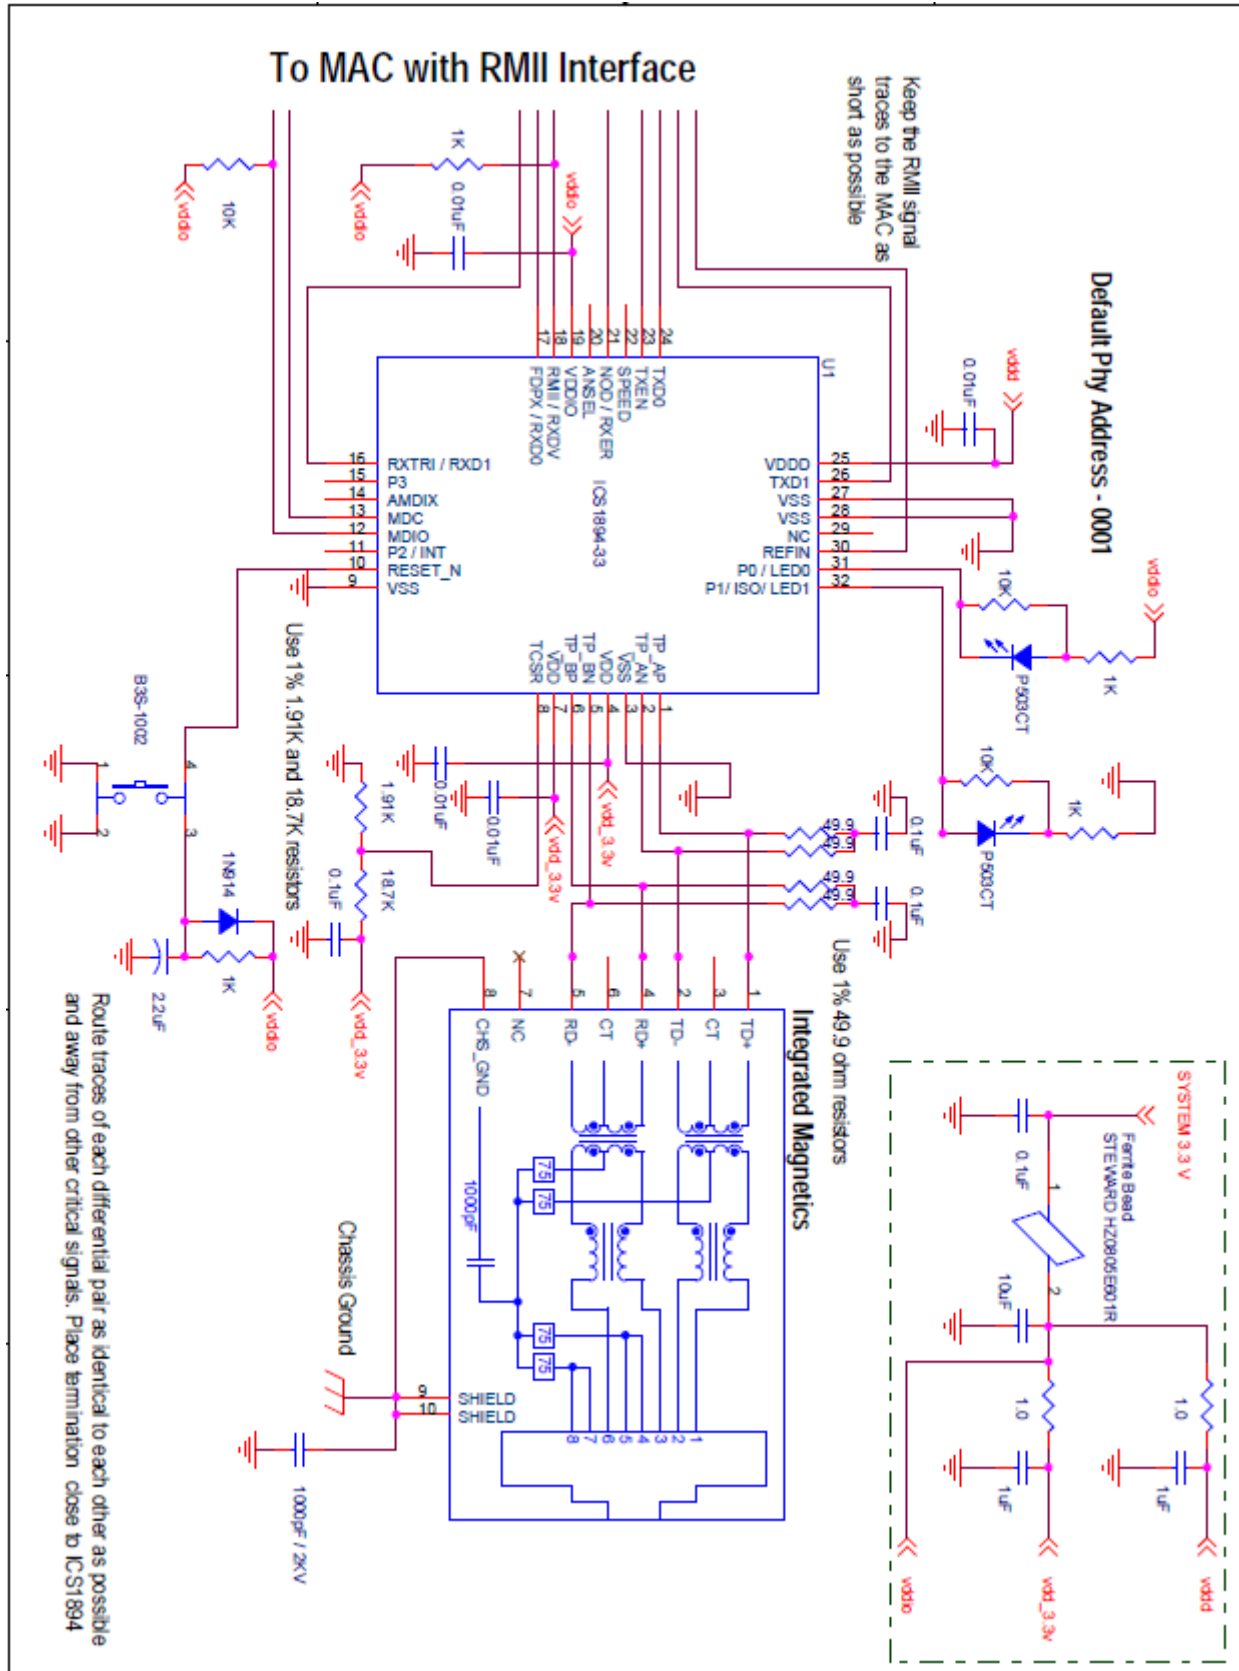

3. RMII Tx Mode: The TXD[1:0] bits are synchronous with REFIN. For each clock period in which TX\_EN is asserted, two bits of data are received by the PHY from the MAC.

## Strapping Options

| Pin Number | Pin Name           | Pin Type <sup>1</sup> | Pin Function  |
|------------|--------------------|-----------------------|---|
| 14         | <b>AMDIX</b>       | IO/lpu                | 1 = AMDIX enable<br>0 = AMDIX disable   |
| 15         | <b>P3</b>          | IO/lpd                | The PHY address is set by P[3:0] at power-on reset. P0 and P1 must have external pull-up or pull-down to set address at start up. |
| 11         | <b>P2/INT</b>      | IO/lpd                |   |
| 31         | <b>P0/LED0</b>     | IO                    |   |
| 32         | <b>P1/ISO/LED1</b> | IO                    |   |
| 16         | <b>RXTRI/RXD1</b>  | IO/lpd                | 1 = Real time receiver isolation function enable <sup>3</sup> ; 0 = Receiver Tristate Disable                                     |
| 17         | <b>FDPX/RXD0</b>   | IO/lpu                | 1=Full duplex<br>0=Half duplex<br>Ignored if Auto negotiation is enabled  |
| 18         | <b>RMII/RXDV</b>   | IO/lpd                | 1 = RMII mode<br>0 = Not supported  |
| 20         | <b>ANSEL</b>       | IO/lpu                | 1=Enable auto negotiation<br>0=Disable auto negotiation   |
| 21         | <b>NOD/RXER</b>    | IO/lpd                | 0=Node mode<br>1=repeater mode (mode not supported)   |
| 22         | <b>SPEED</b>       | IO/lpu                | 1=100M mode<br>0=10M mode<br>Ignored if Auto negotiation is enabled   |

1. IO/lpu = Digital Input with internal 20k pull-up during power on reset/hardware reset; output pin otherwise.
2. IO/lpd = Digital Input with internal 20k pull-down during power on reset/hardware reset; output pin otherwise.
3. If RXTRI/RXD1 pin is latched high during power on reset/hardware reset, P1/ISO/LED1 functions as RX real time isolation control input after latch and LED1 function will be disabled.

Application Schematic

## Functional Description

The ICS1894-33 is an ethernet PHYceiver. During data transmission, it accepts sequential nibbles/di-bits from the MAC (Media Access Control), converts them into a serial bit stream, encodes them, and transmits them over the medium through an external isolation transformer. When receiving data, the ICS1894-33 converts and decodes a serial bit stream (acquired from an isolation transformer that interfaces with the medium) into sequential nibbles/di-bits. It subsequently presents these nibbles/di-bits to the MAC Interface.

The ICS1894-33 implements the OSI model's physical layer, consisting of the following, as defined by the ISO/IEC 8802-3 standard:

- Physical Coding sublayer (PCS)
- Physical Medium Attachment sublayer (PMA)
- Physical Medium Dependent sublayer (PMD)
- Auto-Negotiation sublayer

The ICS1894-33 is transparent to the next layer of the OSI model, the link layer. The link layer has two sublayers: the Logical Link Control sublayer and the MAC sublayer. The ICS1894-33 can interface directly with the MAC via RMII interface signals.

The ICS1894-33 transmits framed packets acquired from its MAC Interface and receives encapsulated packets from another PHY, which it translates and presents to its MAC Interface.

**Note:** As per the ISO/IEC standard, the ICS1894-33 does not affect, nor is it affected by, the underlying structure of the MAC frame it is conveying.

## 100Base-TX Operation

During 100Base-TX data transmission, the ICS1894-33 accepts packets from the MAC and inserts Start-of-Stream Delimiters (SSDs) and End-of-Stream Delimiters (ESDs) into the data stream. The ICS1894-33 encapsulates each MAC frame, including the preamble, with an SSD and an ESD. As per the ISO/IEC Standard, the ICS1894-33 replaces the first octet of each MAC preamble with an SSD and appends an ESD to the end of each MAC frame.

When receiving data from the medium, the ICS1894-33 removes each SSD and replaces it with the pre-defined preamble pattern before presenting the data on the MAC Interface. When the ICS1894-33 encounters an ESD in the received data stream, signifying the end of the frame, it ends

the presentation of data on the MAC Interface. Therefore, the local MAC receives an unaltered copy of the transmitted frame sent by the remote MAC.

During periods when MAC frames are being neither transmitted nor received, the ICS1894-33 signals and detects the IDLE condition on the Link Segment. In the 100Base-TX mode, the ICS1894-33 transmit channel sends a continuous stream of scrambled ones to signify the IDLE condition. Similarly, the ICS1894-33 receive channel continually monitors its data stream and looks for a pattern of scrambled ones. The results of this signaling and monitoring provide the ICS1894-33 with the means to establish the integrity of the Link Segment between itself and its remote link partner and inform its Station Management Entity (SME) of the link status.

## 10Base-T Operation

During 10Base-T data transmission, the ICS1894-33 inserts only the IDL delimiter into the data stream. The ICS1894-33 appends the IDL delimiter to the end of each MAC frame. However, since the 10Base-T preamble already has a Start-of-Frame delimiter (SFD), it is not required that the ICS1894-33 insert an SSD-like delimiter.

When receiving data from the medium (such as a twisted-pair cable), the ICS1894-33 uses the preamble to synchronize its receive clock. When the ICS1894-33 receive clock establishes lock, it presents the preamble nibbles to the MAC Interface.

In 10M operations, during periods when MAC frames are being neither transmitted nor received, the ICS1894-33 signals and detects Normal Link Pulses. This action allows the integrity of the Link Segment with the remote link partner to be established and then reported to the ICS1894-33's SME.

## Auto-Negotiation

The ICS1894-33 conforms to the auto-negotiation protocol, defined in Clause 28 of the IEEE 802.3u specification. Autonegotiation is enabled by either hardware pin strapping (pin 20) or software (register 0h bit 12).

Auto-negotiation allows link partners to select the highest common mode of operation. Link partners advertise their capabilities to each other, and then compare their own capabilities with those they received from their link partners. The highest speed and duplex setting that is common to the two link partners is selected as the mode of operation.

The following list shows the speed and duplex operation mode from highest to lowest.

- Priority 1: 100Base-TX, full-duplex
- Priority 2: 100Base-TX, half-duplex
- Priority 3: 10Base-T, full-duplex
- Priority 4: 10Base-T, half-duplex

If auto-negotiation is not supported or the ICS1894-33 link partner is forced to bypass auto-negotiation, the ICS1894-33 sets its operating mode by observing the signal at its receiver. This is known as parallel detection, and allows the ICS1894-33 to establish link by listening for a fixed signal protocol in the absence of auto-negotiation advertisement protocol.

### MII Management (MIIM) Interface

The ICS1894-33 supports the IEEE 802.3 MII Management Interface, also known as the Management Data Input / Output (MDIO) Interface. This interface allows upper-layer devices to monitor and control the state of the ICS1894-33. An external device with MIIM capability is used to read the PHY status and/or configure the PHY settings. Additional details on the MIIM interface can be found in Clause

22.2.4.5 of the IEEE 802.3u Specification.

The MIIM interface consists of the following:

- A physical connection that incorporates the clock line (MDC) and the data line (MDIO).
- A specific protocol that operates across the aforementioned physical connection that allows an external controller to communicate with one or more ICS1894-33 devices. Each ICS1894-33 device is assigned a PHY address between 1 and 7 by the P[4:0] strapping pins. P3 and P4 address bits are hardcoded to '0' in design.
- An internal addressable set of thirty-one 8-bit MDIO registers. Register [0:6] are required, and their functions are defined by the IEEE 802.3u Specification. The additional registers are provided for expanded functionality.

The following table shows the MII Management frame format for the ICS1894-33.

### MII Management Frame Format

|       | Preamble | Start of Frame | Read/Write OP Code | PHY Address Bits [4:0] | REG Address Bits [4:0] | TA | Data Bits [15:0]  | Idle |
|-------|----------|----------------|--------------------|------------------------|------------------------|----|-------------------|------|
| Read  | 32 1's   | 01             | 10                 | 00AAA                  | RRRRR                  | Z0 | DDDDDDDD_DDDDDDDD | Z    |
| Write | 32 1's   | 01             | 01                 | 00AAA                  | RRRRR                  | 10 | DDDDDDDD_DDDDDDDD | Z    |

### Interrupt (INT)

P2/INT (pin 11) is an optional interrupt signal that is used to inform the external controller that there has been a status update in the ICS1894-33 PHY register. Register 23 shows the status of the various interrupts while register 22 controls the enabling/disabling of the interrupts.

### MII Data Interface

The Media Independent Interface (MII) is specified in Clause 22 of the IEEE 802.3u Specification. It provides a common interface between physical layer and MAC layer devices, and has the following key characteristics:

- Supports 10Mbps and 100Mbps data rates.
- Uses a 25MHz reference clock, sourced by the PHY.
- Provides independent 4-bit wide (nibble) transmit and receive data paths.
- Contains two distinct groups of signals: one for transmission and the other for reception.

The ICS1894-33 is configured for MII mode upon power-up or hardware reset with the following:

- A 25MHz crystal connected to REFIN, REFOUT (pins 30, 29), or an external 25MHz clock source (oscillator) connected to REFIN

### Reduced MII (RMII) Data Interface

The Reduced Media Independent Interface (RMII) specifies a low pin count Media Independent Interface (MII). It provides a common interface between physical layer and MAC layer devices, and has the following key characteristics:

- Supports 10Mbps and 100Mbps data rates.
- Uses a single 50MHz reference clock provided by the MAC or the system board.
- Provides independent 2-bit wide (di-bit) transmit and receive data paths.
- Contains two distinct groups of signals: one for transmission and the other for reception.

In RMII mode, a 50 MHz reference clock is connected to REFIN(pin 30).

## RMII Signal Definition

The following table describes the RMII signals. Refer to RMII Specification for detailed information.

| RMII Signal Name | Direction<br>(with respect to PHY,<br>ICS1894-33 signal) | Direction<br>(with respect to MAC) | Description  |
|------------------|--|------------------------------------|--|
| REFIN            | Input  | Input or Output                    | Synchronous 50 MHz clock reference for receive, transmit and control interface |
| TXEN             | Input  | Output                             | Transmit Enable  |
| TXD[1:0]         | Input  | Output                             | Transmit Data [1:0]  |
| RXD[1:0]         | Output   | Input                              | Receive Data [1:0]   |
| RXER             | Output   | Input, or (not required)           | Receive Error  |
| CRS_DV[RXDV]     | Output   | Input                              | Carrier Sense/Data Valid   |

### Reference Clock (REFIN)

REFIN is sourced by the MAC or system board. It is a continuous 50MHz clock that provides the timing reference for TX\_EN, TXD[1:0], CRS\_DV, RXD[1:0], and RX\_ER.

### Transmit Enable (TX\_EN)

TX\_EN indicates that the MAC is presenting di-bits on TXD[1:0] for transmission. It is asserted synchronously with the first nibble of the preamble and remains asserted while all di-bits to be transmitted are presented on the RMII, and is negated prior to the first REFIN following the final di-bit of a frame. TX\_EN transitions synchronously with respect to REFIN.

### Transmit Data [1:0] (TXD[1:0])

TXD[1:0] transitions synchronously with respect to REFIN. When TX\_EN is asserted, TXD[1:0] are accepted for transmission by the PHY. TXD[1:0] is "00" to indicate idle when TX\_EN is de-asserted. Values other than "00" on TXD[1:0] while TX\_EN is de-asserted are ignored by the PHY.

### Carrier Sense/Data Valid (CRS\_DV[RXDV])

CRS\_DV, identified as RXDV (pin 18), shall be asserted by the PHY when the receive medium is non-idle. The specifics of the definition of idle for 10BASE-T and 100BASE-X are contained in IEEE 802.3 [1] and IEEE 802.3u [2]. CRS\_DV is asserted asynchronously on detection of carrier due to the criteria relevant to the operating mode. That is, in 10BASE-T mode, when squelch is passed or in 100BASE-X mode when 2 non-contiguous zeroes in 10 bits are detected carrier is said to be detected.

Loss of carrier shall result in the deassertion of CRS\_DV synchronous to the cycle of REFIN which presents the first di-bit of a nibble onto RXD[1:0] (i.e. CRS\_DV is deasserted

only on nibble boundaries). If the PHY has additional bits to be presented on RXD[1:0] following the initial deassertion of CRS\_DV, then the PHY shall assert CRS\_DV on cycles of REFIN which present the second di-bit of each nibble and deassert CRS\_DV on cycles of REFIN which present the first di-bit of a nibble. The result is: Starting on nibble boundaries CRS\_DV toggles at 25 MHz in 100Mb/s mode and 2.5 MHz in 10Mb/s mode when the Carrier event ends before the RX\_DV signal internal to the PHY is deasserted (i.e. the FIFO still has bits to transfer when the carrier event ends.) Therefore, the MAC can accurately recover RX\_DV and the Carrier event end time. During a false carrier event, CRS\_DV shall remain asserted for the duration of carrier activity.

The data on RXD[1:0] is considered valid once CRS\_DV is asserted. However, since the assertion of CRS\_DV is asynchronous relative to REFIN, the data on RXD[1:0] shall be "00" until proper receive signal decoding takes place (see definition of RXD[1:0] behavior).

**\*Note:** CRS\_DV is asserted asynchronously in order to minimize latency of control signals through the PHY.

### Receive Data [1:0] (RXD[1:0])

RXD[1:0] transitions synchronously to REFIN. For each clock period in which CRS\_DV is asserted, RXD[1:0] transfers two bits of recovered data from the PHY. RXD[1:0] is "00" to indicate idle when CRS\_DV is de-asserted. Values other than "00" on RXD[1:0] while CRS\_DV is de-asserted are ignored by the MAC.

## Receive Error (RX\_ER)

RX\_ER is asserted for one or more REFIN periods to indicate that an error (e.g. a coding error or any error that a PHY is capable of detecting, and that may otherwise be undetectable by the MAC sub-layer) was detected somewhere in the frame presently being transferred from the PHY. RX\_ER transitions synchronously with respect to REFIN. While CRS\_DV is de-asserted, RX\_ER has no effect on the MAC.

## Auto-MDI/MDIX Crossover

The ICS1894-33 includes the auto-MDI/MDIX crossover feature. In a typical CAT 5 Ethernet installation the transmit twisted pair signal pins of the RJ45 connector are crossed over in the CAT 5 wiring to the partners receive twisted pair signal pins and receive twisted pair to the partners transmit twisted pair. This is usually accomplished in the wiring plant. Hubs generally wire the RJ45 connector crossed to accomplish the crossover. Two types of CAT 5 cables (straight and crossed) are available to achieve the correct connection. The Auto-MDI/MDIX feature automatically corrects for miss-wired installations by automatically swapping transmit and receive signal pairs at the PHY when no link results. Auto-MDI/MDIX is automatic, but may be disabled for test purposes by writing MDIO register 19 Bits 9:8 in the MDIO register. The Auto-MDI/MDIX function is independent of Auto-Negotiation and precedes Auto-Negotiation when enabled.

## Auto MDI/MDIX Table

| AMDIX_EN<br>(pin 14) | AMDIX_EN<br>[Reg 19:9] | MDI_MODE<br>[Reg 19:8] | Tx/Rx MDI<br>Configuration   |
|----------------------|------------------------|------------------------|------------------------------|
| x                    | 0                      | 0                      | straight                     |
| x                    | 0                      | 1                      | cross                        |
| 0                    | 1                      | x                      | straight                     |
| 1                    | 1                      | x                      | straight/cross (auto select) |

| 1                    | 1                      | 0                      | straight/cross (auto select) |

### Definitions:

**straight** transmit = TP\_AP & TP\_AN

receive = TP\_BP & TP\_BN

**cross** transmit = TP\_BP & TP\_BN

receive = TP\_AP & TP\_AN

AMDIX\_EN (Pin 14) AMDIX enable pin with 20 kOhm pull-up resistor

AMDIX\_EN [19:9] MDIO register 19h bit 9

MDI\_MODE [19:8] MDIO register 19h bit 8

## Power Management

The ICS1894-33 supports a Deep Power Mode (DPD) that is enabled under the following conditions:

1. The Phy is not Receiving any signal from the partner (Link Down)
2. The MAC is not transmitting data to the Phy (TXEN Low)

Once the above conditions are met, the Phy goes into DPD mode after 32s (typical).

The logic internal to the device can be selectively shut down in DPD mode depending on Register 24 Bits 8-4.

## Block Diagram of the Different Sections of the PHY as Affected by Register 24 bits

## Clock Reference Interface

The REFIN pin provides the ICS1894-33 Clock Reference Interface. The ICS1894-33 requires a single clock reference with a frequency of 25 MHz  $\pm$ 50 parts per million. This accuracy is necessary to meet the interface requirements of the ISO/IEEE 8802-3 standard, specifically clauses 22.2.2.1 and 24.2.3.4. The ICS1894-33 supports two clock source configurations: a CMOS oscillator or a CMOS driver. The input to REFIN is CMOS (10% to 90% VDD), not TTL. Alternately, a 25MHz crystal may be used.

## Crystal or Oscillator Connection

## 50 MHz Oscillator Specification table

| Specifications                     | Symbol       | Minimum | Typical  | Maximum  | Unit  |
|------------------------------------|--------------|---------|----------|----------|-------|
| Output Frequency                   | F0           | 49.9975 | 50.00000 | 50.0025  | MHz   |
| Freq. Stability (including aging)  | $\Delta F/f$ |         |          | $\pm 50$ | ppm   |
| Duty cycle CMOS level one-half VDD | $T_w/T$      | 35      |          | 65       | %     |
| VIH                                |              | 2.79    |          |          | Volts |
| VIL                                |              |         |          | 0.33     | Volts |

## Status Interface

The ICS1894-33 has two multi-function configuration pins that report the PHY status by providing signals that are intended for driving LEDs. Configuration is set by Bank0 Register 20.

### Pins for Monitoring the Data Link table

| Pin         | Status Events that drive the LEDs  |
|-------------|------------------------------------|
| P0/LED0     | Link, Activity, Tx, Rx, Mode, Dplx |
| P1/ISO/LED1 | Link, Activity, Tx, Rx, Mode, Dplx |

#### Note:

1. During either power-on reset or hardware reset, each multi-function configuration pin is an input that is sampled when the ICS1894-33 exits the reset state. After sampling is complete, these pins are output pins that can drive status LEDs.
2. A software reset does not affect the state of a multi-function configuration pin. During a software reset, all multi-function configuration pins are outputs.
3. Each multi-function configuration pin must be pulled either up or down with a resistor to establish the address of the ICS1894-33. LEDs may be placed in series with these resistors to provide a designated status indicator as

described in the *Pins for Monitoring the Data Link* table. Use 1K $\Omega$  resistors.

**Caution:** Pins listed in the *Pins for Monitoring the Data Link* table must not float.

4. As outputs, the asserted state of a multi-function configuration pin is the inverse of the sense sampled during reset. This inversion provides a signal that can illuminate an LED during an asserted state. For example, if a multi-function configuration pin is pulled down to ground through an LED and a current-limiting resistor, then the sampled sense of the input is low. To illuminate this LED for the asserted state, the output is driven high.

5. Adding 10K $\Omega$  resistors across the LEDs ensures the PHY address is fully defined during slow VDD power-ramp conditions.

6. PHY address 00 tri-states the RMII interface. (Do not select PHY address 00 unless you want the RMII interface tri-stated.)

The following figure shows typical biasing and LED connections for the ICS1894-33.

The above circuit decodes the PHY address = 1

## Register Map

| Register Address | Register Name                                   | Basic / Extended |
|------------------|---|------------------|
| 0                | Control   | Basic            |
| 1                | Status  | Basic            |
| 2,3              | PHY Identifier                                  | Extended         |
| 4                | Auto-Negotiation Advertisement                  | Extended         |
| 5                | Auto-Negotiation Link Partner Ability           | Extended         |
| 6                | Auto-Negotiation Expansion                      | Extended         |
| 7                | Auto-Negotiation Next Page Transmit             | Extended         |
| 8                | Auto-Negotiation Next Page Link Partner Ability | Extended         |
| 9 through 15     | Reserved by IEEE                                | Extended         |
| 16 through 31    | Vendor-Specific (IDT) Registers                 | Extended         |

## Register Description

Note 1: Ignored if Auto negotiation is enabled.

Note 2: CW = Command Override Write

LH = Latching High

LL = Latching Low

LMX = Latching Maximum

RO = Read Only

RW = Read/Write

RW/0 = Read/Write Zero

RW/1 = Read/Write One

SC = Self-clearing

SF = Special Functions

Note 3: L = Latched on power-up/hardware reset

‡ Whenever the PHY address is equal to 00000 (binary), the Isolate bit 0.10 is logic one, whenever the PHY address is not equal to 00000, the Isolate bit 0.10 is logic zero.

† As per the IEEE Std 802.3u, during any write operation to any bit in this register, the STA must write the default value to all Reserved bits.

## DC and AC Operating Conditions

### Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the ICS1894-33. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

| Parameter                | Rating   |
|--------------------------|--|
| VDD (measured to VSS)    | -0.3 V to 3.6V   |
| Digital Inputs / Outputs | -0.3 V to VDD +0.3 V                                     |
| Storage Temperature      | -55° C to +150° C  |
| Junction Temperature     | 125° C   |
| Soldering Temperature    | 260° C   |
| Power Dissipation        | See section "DC Operating Conditions for Supply Current" |

### Recommended Operating Conditions

| Parameter                                  | Symbol | Min.  | Max.  | Units |
|--|--------|-------|-------|-------|
| Ambient Operating Temperature - Commercial | $T_A$  | 0     | +70   | °C    |
| Ambient Operating Temperature - Industrial | $T_A$  | -40   | +85   | °C    |
| Power Supply Voltage (measured to VSS)     | VDD    | +3.14 | +3.47 | V     |

## Recommended Component Values

| Parameter           | Minimum | Typical  | Maximum | Tolerance | Units    |
|---------------------|---------|--|---------|-----------|----------|
| TCSR Resistor Value | –       | 1.91k $\Omega$ to GND<br>18.7k $\Omega$ to VDD | –       | 1%        | $\Omega$ |
| LED Resistor Value  |         | 1k   |         | –         | $\Omega$ |

### ICS1894-33 TCSR

#### Note:

1. The bias resistor network sets the 10baseT and 100baseTX output amplitude levels.
2. Amplitude is directly related to current sourced out of the TCSR pin.
3. Resistor values shown above are typical. User should check amplitudes and adjust for transformer effects.
4. The 18.7K resistor provides negative feedback to compensate for VDD changes. Reducing the value of this resistor will lower the 100baseT amplitude. Reducing the value of the resistor to ground on the other hand will increase the output signal amplitude.

## DC Operating Characteristics for Supply Current

The table below lists the DC operating characteristics for the supply current to the ICS1894-33 under various conditions.

| Condition                | VDDIO (V) | VDD and VDDD (V) | Current (mA) (typical) |
|--------------------------|-----------|------------------|------------------------|
| Autonegotiation          | 3.3       | 3.3              | 68                     |
|                          | 1.8       | 3.3              | 66                     |
| 100BaseTX FD and Linked  | 3.3       | 3.3              | 102                    |
| 10BaseTX FD and Linked   | 3.3       | 3.3              | 97                     |
| Power Down (Reg0:11 = 1) | 3.3       | 3.3              | 16                     |

## Deep Power Down Current Consumption Table

|                               |                       | Case 1 | Case 2 | Case 3 | Case 4 | Case 5 |

| Register 24:7                 | TPLL_100 DPD Enable   |        | √      | √      | √      | √      |
| Register 24:6                 | RX_100 DPD Enable     |        |        | √      | √      | √      |
| Register 24:5                 | Admix_TX DPD Enable   |        |        |        | √      | √      |
| Register 24:4                 | CDR100_cdr DPD Enable |        |        |        |        | √      |
| <b>Current (mA) (typical)</b> |                       | 68     | 39     | 26     | 24     | 16     |

## DC Operating Characteristics for Inputs and Outputs

Unless otherwise specified, the table below lists the 3.3V/1.8 V DC operating characteristics of the ICS1894-33 inputs and outputs.

### For 3.3 V Signals

| Parameter           | Symbol   | Conditions       | Min. | Max. | Units |
|---------------------|----------|------------------|------|------|-------|
| Input High Voltage  | $V_{IH}$ |                  | 2.0  | –    | V     |
| Input Low Voltage   | $V_{IL}$ |                  | –    | 0.8  | V     |
| Output High Voltage | $V_{OH}$ | $I_{OH} = -4$ mA | 2.4  | –    | V     |
| Output Low Voltage  | $V_{OL}$ | $I_{OL} = +4$ mA | –    | 0.4  | V     |

### For 1.8 V Signals

| Parameter           | Symbol   | Conditions       | Min. | Max. | Units |
|---------------------|----------|------------------|------|------|-------|
| Input High Voltage  | $V_{IH}$ |                  | 0.8  | –    | V     |
| Input Low Voltage   | $V_{IL}$ |                  | –    | 0.7  | V     |
| Output High Voltage | $V_{OH}$ | $I_{OH} = -4$ mA | 1.6  | –    | V     |
| Output Low Voltage  | $V_{OL}$ | $I_{OL} = +4$ mA | –    | 0.1  | V     |

## DC Operating Characteristics for REFIN

The table below lists the 3.3V DC characteristics for the REFIN pin.

| Parameter          | Symbol   | Min. | Max. | Units |
|--------------------|----------|------|------|-------|
| Input High Voltage | $V_{IH}$ | 2.97 | –    | V     |
| Input Low Voltage  | $V_{IL}$ | –    | 0.33 | V     |

## DC Operating Characteristics for RMII Interface Pins

The table below lists DC operating characteristics for the Reduced Media Independent Interface (RMII) for the ICS1894-33.

| Parameter                   | Conditions   | Min. | Typ. | Max. | Units    |
|-----------------------------|--------------|------|------|------|----------|
| RMII Input Pin Capacitance  | –            | –    | –    | 8    | pF       |
| RMII Output Pin Capacitance | –            | –    | –    | 14   | pF       |
| RMII Output Drive Impedance | VDDIO = 3.3V | –    | 20   | –    | $\Omega$ |

## Timing Diagrams

### Timing for Clock Reference (REFIN) Pin

The table below lists the significant time periods for signals on the clock reference (REFIN) pin. The *REFIN Timing Diagram* figure shows the timing diagram for the time periods.

| Time Period | Parameter               | Conditions | Min. | Typ. | Max. | Units |
|-------------|-------------------------|------------|------|------|------|-------|
| t1          | REFIN Duty Cycle (RMII) | –          | 45   | 50   | 55   | %     |
| t2          | REFIN Period (RMII)     | –          | –    | 20   | –    | ns    |

### REFIN Timing Diagram

## MII Management Interface Timing

The table below lists the significant time periods for the MII Management Interface timing (which consists of timings of signals on the MDC and MDIO pins). The *MII Management Interface Timing Diagram* figure shows the timing diagram for the time periods.

| Time Period | Parameter                   | Conditions | Min. | Typ. | Max. | Units |
|-------------|-----------------------------|------------|------|------|------|-------|
| t1          | MDC Minimum High Time       | –          | 160  | –    | –    | ns    |
| t2          | MDC Minimum Low Time        | –          | 160  | –    | –    | ns    |
| t3          | MDC Period                  | –          | 400  | –    | –    | ns    |

## MII Management Interface Timing Diagram

## 10Base-T: Normal Link Pulse Timing

The table below lists the significant time periods for the 10Base-T Normal Link Pulse (which consists of timings of signals on the TP\_TXP pins). The *10Base-T Normal Link Pulse Timing Diagram* shows the timing diagram for the time periods.

| Time Period | Parameter                                     | Conditions | Min. | Typ. | Max. | Units |
|-------------|---|------------|------|------|------|-------|
| t1          | Normal Link Pulse Width                       | 10Base-T   | –    | 100  | –    | ns    |
| t2          | Normal Link Pulse to Normal Link Pulse Period | 10Base-T   | 8    | 20   | 25   | ms    |

## 10Base-T Normal Link Pulse Timing Diagram

## Auto-Negotiation Fast Link Pulse Timing

The table below lists the significant time periods for the ICS1894-33 Auto-Negotiation Fast Link Pulse. The time periods consist of timings of signals on the following pins:

- TP\_TXP
- TP\_TXN

The *Auto-Negotiation Fast Link Pulse Timing Diagram* shows the timing diagram for one pair of these differential signals, for example TP\_TXP minus TP\_TXN.

| Time Period | Parameter                                      | Conditions | Min. | Typ. | Max. | Units  |
|-------------|--|------------|------|------|------|--------|
| t1          | Clock/Data Pulse Width                         | –          | –    | 90   | –    | ns     |
| t2          | Clock Pulse-to-Data Pulse Timing               | –          | 55   | 60   | 70   | μs     |
| t3          | Clock Pulse-to-Clock Pulse Timing              | –          | 110  | 125  | 140  | μs     |
| t4          | Fast Link Pulse Burst Width                    | –          | –    | 5    | –    | ms     |
| t5          | Fast Link Pulse Burst to Fast Link Pulse Burst | –          | 10   | 15   | 25   | ms     |
| t6          | Number of Clock/Data Pulses in a Burst         | –          | 15   | 20   | 30   | pulses |

## Auto-Negotiation Fast Link Pulse Timing Diagram

## RMII Timing

| Time Param       | Description | Min. | Typ. | Max. | Units |
|------------------|-------------|------|------|------|-------|
| t <sub>cyc</sub> | Clock Cycle | –    | 20   |      | ns    |
| t <sub>1</sub>   | Setup time  | 4    |      |      | ns    |
| t <sub>2</sub>   | Hold time   | 2    |      |      | ns    |

## Marking Diagrams

### Notes:

1. 'L' designates Pb (lead) free, RoHS compliant.
2. "I" designates industrial temperature.
3. 'YYWW' designates date code.
4. 'ORIGIN' designates country of origin.
5. '#####' designates the lot number.

## Package Outline and Package Dimensions (32-pin 5mm x 5mm QFN)

Package dimensions are kept current with JEDEC Publication No. 95

| Symbol         | Millimeters    |      |
|----------------|----------------|------|
|                | Min            | Max  |
| A              | 0.80           | 1.00 |
| A1             | 0              | 0.05 |
| A3             | 0.20 Reference |      |
| b              | 0.18           | 0.30 |
| e              | 0.50 BASIC     |      |
| N              | 32             |      |
| N <sub>D</sub> | 8              |      |
| N <sub>E</sub> | 8              |      |
| D x E BASIC    | 5.00 x 5.00    |      |
| D2             | 3.00           | 3.3  |
| E2             | 3.00           | 3.3  |
| L              | 0.3            | 0.5  |

## Ordering Information

| Part / Order Number | Marking     | Shipping Packaging | Package    | Temperature  |
|---------------------|-------------|--------------------|------------|--------------|
| 1894K-33LF          | see page 35 | Tray               | 32-pin QFN | 0 to +70°C   |
| 1894K-33LFT         |             | Tape and Reel      | 32-pin QFN | 0 to +70°C   |
| 1894KI-33LF         |             | Tray               | 32-pin QFN | -40 to +85°C |
| 1894KI-33LFT        |             | Tape and Reel      | 32-pin QFN | -40 to +85°C |

"LF" suffix to the part number are the Pb-Free configuration and are RoHS compliant.

While the information presented herein has been checked for both accuracy and reliability, Integrated Device Technology (IDT) assumes no responsibility for either its use or for the infringement of any patents or other rights of third parties, which would result from its use. No other circuits, patents, or licenses are implied. This product is intended for use in normal commercial applications. Any other applications such as those requiring extended temperature range, high reliability, or other extraordinary environmental requirements are not recommended without additional processing by IDT. IDT reserves the right to change any circuitry or specifications without notice. IDT does not authorize or warrant any IDT product for use in life support devices or critical medical instruments.

## Revision History

| Rev. | Originator  | Date     | Description of Change  |
|------|-------------|----------|--|
| A    | K.Beckmeyer | 02/16/12 | <ol style="list-style-type: none"><li>1. Removed all references, diagrams, sections for MII.</li><li>2. Updated pinout and pin descriptions (pins 14,15,20,22,27,28,29).</li><li>3. Added Applications Schematic</li><li>4. Updated device top-side marking diagrams and ordering information.</li></ol> |
|      |             |          |  |
|      |             |          |  |
