

### FEATURES:

- 1.8V Operation
- SSTL\_18 style clock and data inputs
- Differential CLK input
- Configurable as 25-bit 1:1 or 14-bit 1:2 registered buffer
- Control inputs compatible with LVCMOS levels
- Flow-through architecture for optimum PCB design
- Latch-up performance exceeds 100mA
- ESD >2000V per MIL-STD-883, Method 3015; >200V using machine model (C = 200pF, R = 0)
- Checks parity on data inputs
- Available in 96-pin LFBGA package

### APPLICATIONS:

- Along with C8SPU877/A/D DDR2-400 PLL, provides complete solution for DDR2-400/533 DIMMs
- Optimized for DDR2-400/533 (PC2-3200/4300) JEDEC Raw Cards E, F, and G

### DESCRIPTION:

This 25-bit 1:1/14-bit 1:2 configurable registered buffer is designed for 1.7V to 1.9V  $V_{DD}$  operation. In the 1:1 pinout configuration, only one device per DIMM is required to drive nine SDRAM loads. In the 1:2 pinout configuration, two devices per DIMM are required to drive eighteen SDRAM loads. All inputs are SSTL\_18, except reset ( $\overline{RESET}$ ) and control (Cn) inputs, which are LVCMOS. All outputs are edge-controlled circuits optimized for unterminated DIMM loads, and meet SSTL\_18 specifications, except the open-drain error ( $\overline{QERR}$ ) output.

The SSTU32866B operates from a differential clock ( $\overline{CLK}$  and  $\overline{CLK}$ ). Data are registered at the crossing of  $\overline{CLK}$  going high and  $\overline{CLK}$  going low. Parity is checked on the parity bit (PAR\_IN) input which arrives one cycle after the input data to which it applies. The  $\overline{QERR}$  output is open drain.

When used as a single device, the C0 and C1 inputs are tied low. In this configuration, the partial-parity-out (PPO) and  $\overline{QERR}$  signals are produced two clock cycles after the corresponding data output.

When used in pairs, the C0 input of the first register is tied low and the C0 input of the second register is tied high. The C1 input of both registers are tied high. The  $\overline{QERR}$  output of the first SSTU32866B is left floating and the valid error information is latched on the  $\overline{QERR}$  output of the second SSTU32866B.

If an error occurs and the  $\overline{QERR}$  output is driven low, it stays latched low for two clock cycles or until  $\overline{RESET}$  is driven low. The DIMM-dependent signals (DODT, DCKE,  $\overline{DCS}$ , and  $\overline{CSR}$ ) are not included in the parity check.

The C0 input controls the pinout configuration of the 1:2 pinout from register A configuration (when low) to register B configuration (when high). The C1 input controls the pinout configuration from 25-bit 1:1 (when low) to 14-bit 1:2 (when high). C0 and C1 should not be switched during normal operation. They should be hard-wired to a valid low or high level to configure the register in the desired mode. In the 25-bit 1:1 pinout configuration, the A6, D6, and H6 terminals are driven low and should not be used.

The device supports low-power standby operation. When  $\overline{RESET}$  is low, the differential input receivers are disabled, and undriven (floating) data, clock, and reference voltage ( $V_{REF}$ ) inputs are allowed. In addition, when  $\overline{RESET}$  is low, all registers are reset and all outputs except  $\overline{QERR}$  are forced low. The LVCMOS  $\overline{RESET}$  and Cn inputs always must be held at a valid logic high or low level.

There are two  $V_{REF}$  pins (A3 and T3). However, it is necessary to only connect one of the two  $V_{REF}$  pins to the external  $V_{REF}$  power supply. An unused  $V_{REF}$  pin should be terminated with a  $V_{REF}$  coupling capacitor.

The device also supports low-power active operation by monitoring both system chip select ( $\overline{DCS}$  and  $\overline{CSR}$ ) inputs and will gate the Qn and PPO outputs from changing states when both  $\overline{DCS}$  and  $\overline{CSR}$  inputs are high. If either  $\overline{DCS}$  or  $\overline{CSR}$  input is low, the Qn and PPO outputs will function normally. Also, if the internal low power signal ( $\overline{LPS1}$ ) is high, the device will gate the  $\overline{QERR}$  output from changing states. If  $\overline{LPS1}$  is low, the  $\overline{QERR}$  output will function normally. The  $\overline{RESET}$  input has priority over the  $\overline{DCS}$  and  $\overline{CSR}$  control and when driven low will force the Qn and PPO outputs low, and the  $\overline{QERR}$  output high. If the  $\overline{DCS}$  control functionality is not desired, then the  $\overline{CSR}$  input can be hard-wired to ground, in which case the setup-time requirement for  $\overline{DCS}$  would be the same as for the other D data inputs. To control the low-power mode with  $\overline{DCS}$  only, then the  $\overline{CSR}$  input should be pulled up to  $V_{DD}$  through a pullup resistor.

To ensure defined outputs from the register before a stable clock has been supplied,  $\overline{RESET}$  must be held in the low state during power up.

### NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- The input and output negative voltage ratings may be exceeded if the ratings of the I/P and O/P clamp current are observed.
- This value is limited to 2.5V maximum.

RENESAS ELECTRONICS CORPORATION AND ITS SUBSIDIARIES (“RENESAS”) PROVIDES TECHNICAL SPECIFICATIONS AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES “AS IS” AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT OF THIRD-PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for developers who are designing with Renesas products. You are solely responsible for (1) selecting the appropriate products for your application, (2) designing, validating, and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, or other requirements. These resources are subject to change without notice. Renesas grants you permission to use these resources only to develop an application that uses Renesas products. Other reproduction or use of these resources is strictly prohibited. No license is granted to any other Renesas intellectual property or to any third-party intellectual property. Renesas disclaims responsibility for, and you will fully indemnify Renesas and its representatives against, any claims, damages, costs, losses, or liabilities arising from your use of these resources. Renesas' products are provided only subject to Renesas' Terms and Conditions of Sale or other applicable terms agreed to in writing. No use of any Renesas resources expands or otherwise alters any applicable warranties or warranty disclaimers for these products.
