19 Output Differential Buffer for PCIe Gen2 and QPI

9DB1904B

Description

The **9DB1904** is electrically compatible to the Intel DB1900GS Differential Buffer Specification. This buffer provides 19 output clocks for PCI-Express Gen2 or Intel QPI 6.4GT/s applications. A differential clock from a CK410B+ main clock generator, such as the ICS932S421 drives the **9DB1904**. The **9DB1904** can provide outputs up to 400MHz in Bypass Mode.

Recommended Application

19 Output Differential Buffer for PCIe Gen2 and QPI

Key Specifications

- DIF output cycle-to-cycle jitter < 50ps
- DIF output-to-output skew < 150ps across all outputs

Features/Benefits

- Power up default is all outputs in 1:1 mode/No SMBus programming
- Spread spectrum compatible/EMI reductions
- Supports output frequencies up to 400 MHz in bypass mode/flexible fanout buffer
- 8 Selectable SMBus addresses/no SMBus segmentation required
- SMBus address determines PLL or Bypass mode/pin savings
- Dedicated VDDA and CKPWRGD_PD# pins/easy board design

[1]Guaranteed by design and characterization, not 100% tested in production. IREF = VDD/(3xR_R). For R_R = 475Ω (1%), I_{REF} = 2.32mA. I_{OH} = 6 x I_{REF} and V_{OH} = 0.7V @ Z_O=50Ω (100Ω differential impedance).

[2] Measured from differential waveform

[3] Slew rate is measured through the Vswing voltage range centered around differential 0V. This results in a +/-150mV window around differential 0V.

[4] Matching applies to rising edge rate of Clock / falling edge rate of Clock#. It is measured in a +/-75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage thresholds the oscilloscope uses for the edge rate calculations.

[5] Vcross is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e. Clock rising and Clock# falling).

[6] The total variation of all Vcross measurements in any particular system. Note that this is a subset of V_cross_min/max (V_cross absolute) allowed. The intent is to limit Vcross induced modulation by setting V_cross_delta to be smaller than V_cross absolute.

[2] Measured from differential cross-point to differential cross-point

[3] PLL mode Input-to-Output skew is measured at the first output edge following the corresponding input.

[4] All Bypass Mode Input-to-Output specs refer to the timing between an input edge and the specific output edge created by it.

[5] Duty cycle distortion is the difference in duty cycle between the output and the input clock when the device is operated in bypass mode.

[6] VT = 50% of Vout

[7] This parameter is deterministic for a given device

[8] Measured with scope averaging on to find mean value.

[9] Long-term variation from nominal of input-to-output skew over temperature and voltage for a single device.

[10] This parameter is measured at the outputs of two separate 9DB1904 devices driven by a single main clock. The 9DB1904's must be set to high bandwidth. Differential phase jitter is the accumulation of the phase jitter not shared by the outputs (eg. not including the affects of spread spectrum). Target ranges of consideration are agents with BW of 1-22MHz and 11-33MHz.

[11] t is the period of the input clock

[12] Differential spread spectrum tracking error is the difference in spread spectrum tracking between two 9DB1904 devices This parameter is measured at the outputs of two separate 9DB1904 devices driven by a single main clock in Spread Spectrum mode. The 9DB1904's must be set to high bandwidth. The spread spectrum characteristics are: maximum of 0.5%, 30-33KHz modulation frequency, linear profile.

[13] This parameter is an absolute value. It is not a double-sided figure.

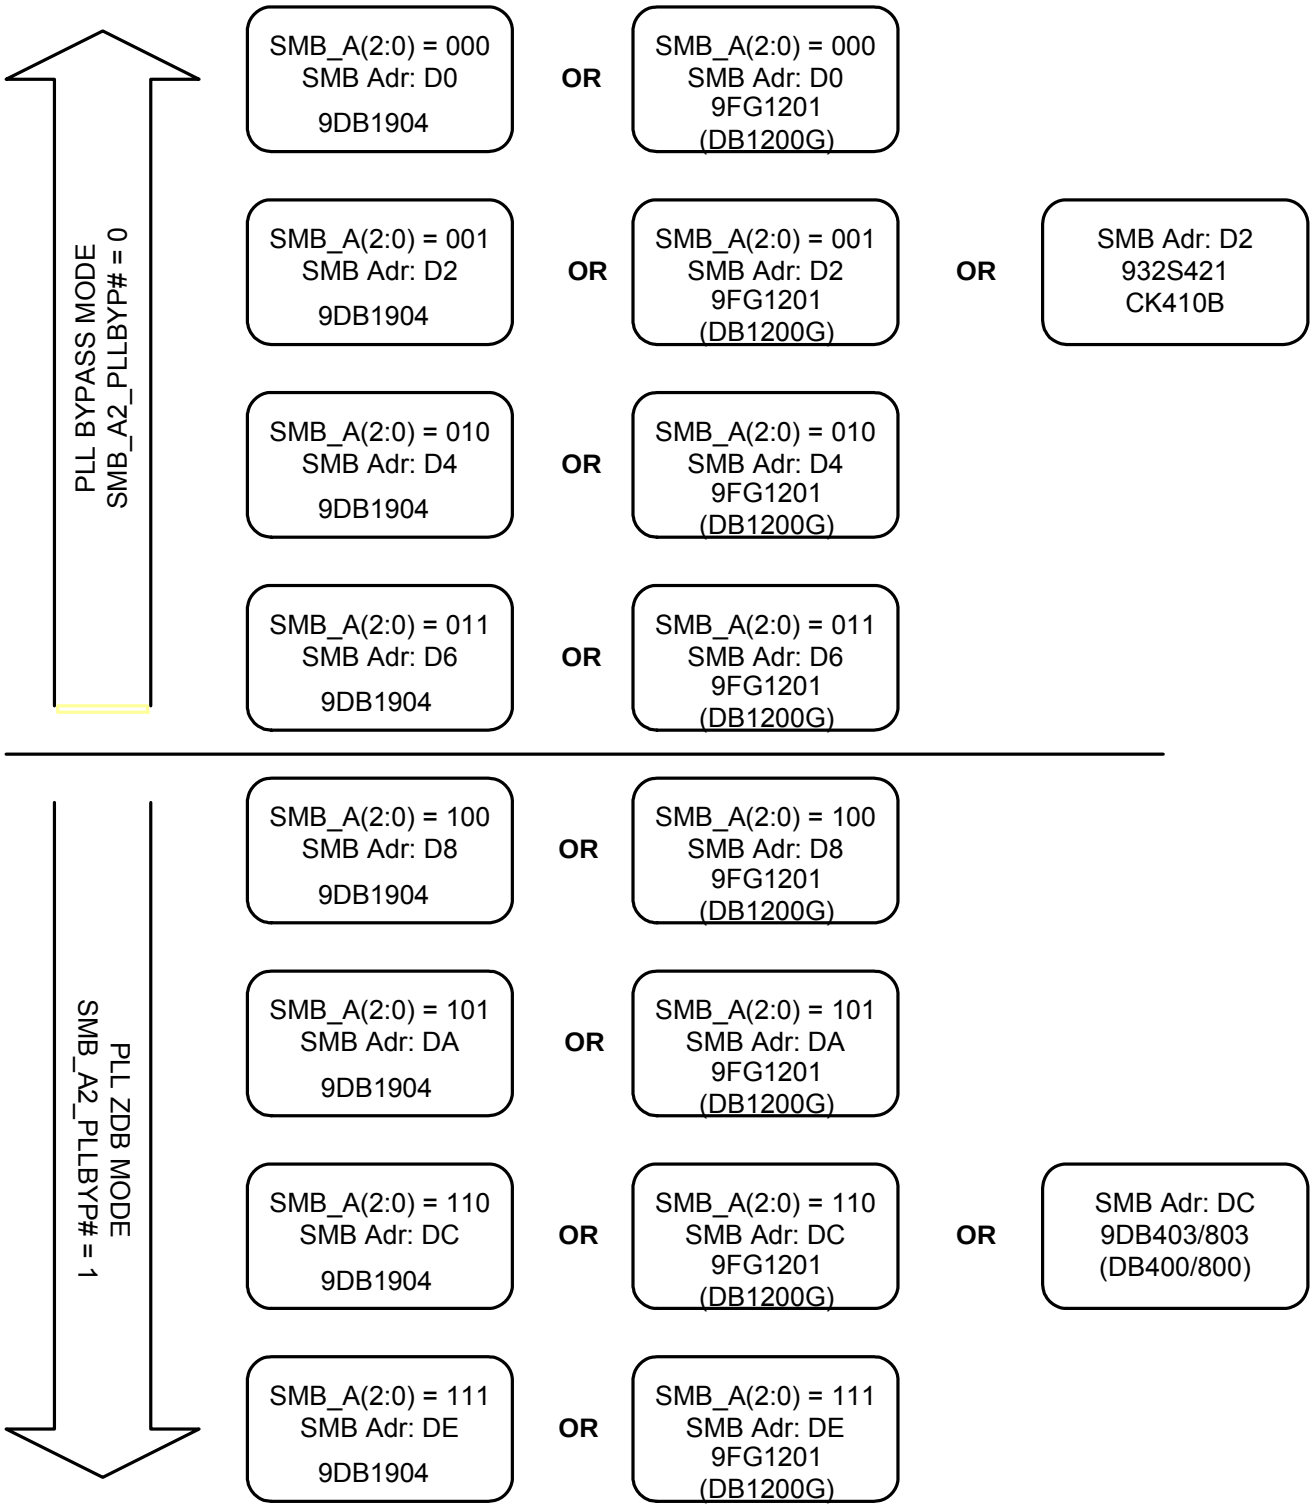
9DB1904 SMBus Address Mapping when using CK410/CK410B, 9FG1200, and 9DB403/803



General SMBus serial interface information for the 9DB1904B

How to Write:

- Controller (host) sends a start bit.
- Controller (host) sends the write address $D4_{(h)}$
- IDT clock will ***acknowledge***
- Controller (host) sends the begining byte location = N
- IDT clock will ***acknowledge***
- Controller (host) sends the data byte count = X
- IDT clock will ***acknowledge***
- Controller (host) starts sending ***Byte N through Byte N + X -1***
- IDT clock will ***acknowledge*** each byte ***one at a time***
- Controller (host) sends a Stop bit

How to Read:

- Controller (host) will send start bit.
- Controller (host) sends the write address $D4_{(h)}$
- IDT clock will ***acknowledge***
- Controller (host) sends the begining byte location = N
- IDT clock will ***acknowledge***
- Controller (host) will send a separate start bit.
- Controller (host) sends the read address $D5_{(h)}$
- IDT clock will ***acknowledge***
- IDT clock will send the data byte count = X
- IDT clock sends ***Byte N + X -1***
- IDT clock sends ***Byte 0 through byte X (if $X_{(h)}$ was written to byte 8)***.
- Controller (host) will need to acknowledge each byte
- Controllor (host) will send a not acknowledge bit
- Controller (host) will send a stop bit

Ordering Information

Part / Order Number	Shipping Packaging	Package	Temperature
9DB1904BKLF	Tubes	72-pin MLF	0 to +70° C
9DB1904BKLFT	Tape and Reel	72-pin MLF	0 to +70° C

"LF" suffix to the part number are the Pb-Free configuration, RoHS compliant.
"B" is the device revision designator (will not correlate with the datasheet revision).

Revision History

Rev.	Issue Date	Description	Page #
0.1	7/1/2009	Initial release	-
0.2	7/8/2009	Updated revision ID in Byte 5	13
A	9/21/2010	Updated electrical characteristics tables. Added Test loads and terminations Corrected minor typo's, move to release.	Various
B	9/23/2010	1. Updated electrical char tables 2. Updated test loads and termination figures 3. Added Period PPM tables	Various
C	4/19/2011	1. Updated electrical tabels with Typ. Values 2. Updated Differential Clock Period PPM tables	Various
