

## Description

The 9DBL02x2/9DBL04x2/ 9DBL06x1/9DBL08x1 buffers are low-power, high-performance members of Renesas' full featured PCIe family. The buffers support PCIe Gen1 through Gen5.

## PCIe Clocking Architectures

- Common Clocked (CC)
- Independent Reference (IR) with and without spread spectrum (SRIS, SRNS)

## Typical Applications

- PCIe Riser Cards
- nVME Storage
- Networking
- Accelerators
- Industrial Control/Embedded

## Key Specifications

- Additive PCIe Gen5 CC jitter < 60fs RMS (fan-out mode)
- PCIe Gen5 CC jitter < 150fs RMS (High-BW ZDB Mode)

## Features

- 2 to 8 Low-Power HCSSL (LP-HCSSL) outputs eliminate 4 resistors per output pair
- 9DBLxx4x devices provide integrated 100Ω terminations
- 9DBLxx5x devices provide integrated 85Ω terminations
- See [AN-891](#) for easy coupling to other logic families
- Spread-spectrum compatible
- Dedicated OE# pin for each output
- 1MHz to 200MHz operation in fan-out mode
- 3 selectable SMBus addresses
- Extensive SMBus-selectable features allow optimization to customer requirements
- SMBus interface not required for device operation
- -40°C to +85°C operating temperature range
- Space-saving 4 × 4 mm 24-VFQFPN to 6 × 6 mm 48-VFQFPN packages (see [Ordering Information](#) table for details)

vOE7#	Input	Active low input for enabling output 7. This pin has an internal 120kΩ pull-down. 1 =disable outputs, 0 = enable outputs	46	–	–	–
vSADR_tri	Latched In	Tri-level latch to select SMBus Address. It has an internal pull-down resistor. See the <a href="#">SMBus Address Selection</a> table.	1	1	32	23

[a] A ‘^’ prefix indicates internal 120kΩ pull-up resistor.

[b] A ‘^v’ prefix indicates internal 120kΩ pull-up and pull-down resistor (biased to VDD/2).

[c] A ‘v’ prefix indicates internal 120kΩ pull-down resistor.

## Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the 9DBL02x2/9DBL04x2/ 9DBL06x1/9DBL08x1. These ratings, which are standard values for Renesas commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

**Table 2. Absolute Maximum Ratings<sup>[a]</sup>**

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
V <sub>DDx</sub>	Supply Voltage <sup>[b]</sup>	Applies to V <sub>DD</sub> , V <sub>DDA</sub> and V <sub>DDIO</sub> .	-0.5		3.9	V
V <sub>IN</sub>	Input Voltage <sup>[c]</sup>		-0.5		V <sub>DD</sub> + 0.5	V
V <sub>IHSMB</sub>	Input High Voltage, SMBus	SMBus clock and data pins.			3.9	V
T <sub>s</sub>	Storage Temperature		-65		150	°C
T <sub>j</sub>	Junction Temperature				125	°C
ESD prot	Input ESD Protection	Human Body Model.	2000			V

[a] Guaranteed by design and characterization, not 100% tested in production.

[b] Operation under these conditions is neither implied nor guaranteed.

[c] Not to exceed 3.9V.

[a] The Refclk jitter is measured after applying the filter functions found in PCI Express Base Specification 5.0, Revision 1.0. See the [Test Loads](#) section of the data sheet for the exact measurement setup. The total Ref Clk jitter limits for each data rate are listed for convenience. Jitter may be subtracted from the limit using RSS subtraction to determine remaining margin. Guaranteed by design and characterization, not 100% tested in production.

[b] Jitter measurements shall be made with a capture of at least 100,000 clock cycles captured by a real-time oscilloscope (RTO) with a sample rate of 20GS/s or greater. Broadband oscilloscope noise must be minimized in the measurement. The measured PP jitter is used (no extrapolation) for RTO measurements. Alternately, jitter measurements may be used with a Phase Noise Analyzer (PNA) extending (flat) and integrating and folding the frequency content up to an offset from the carrier frequency of at least 200MHz (at 300MHz absolute frequency) below the Nyquist frequency. For PNA measurements for the 2.5GT/s data rate, the RMS jitter is converted to peak to peak jitter using a multiplication factor of 8.83. In the case where real-time oscilloscope and PNA measurements have both been done and produce different results the RTO result must be used.

[c] SSC spurs from the fundamental and harmonics are removed up to a cutoff frequency of 2MHz taking care to minimize removal of any non-SSC content.

[d] Note that 0.7ps RMS is to be used in channel simulations to account for additional noise in a real system.

[e] Note that 0.25ps RMS is to be used in channel simulations to account for additional noise in a real system.

[f] While the PCI Express Base Specification 5.0, Revision 1.0 provides the filters necessary to calculate SRIS jitter values, it does not provide specification limits, hence the N/A in the Limit column. SRIS values are informative only. In general, a clock operating in an SRIS system must be twice as good as a clock operating in a Common Clock system. For RMS values, twice as good is equivalent to dividing the CC value by  $\sqrt{2}$ . It is up to the user to divide the clock output budget or the clock input budget by  $\sqrt{2}$  to arrive at a target limit.

**Table 5. 12kHz to 20MHz Phase Jitter [a] [b]**

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
$t_{jph156M12k-20}$	Additive Phase Jitter, Fanout Mode	156.25MHz, 12kHz to 20MHz.	–	363	–	fs (rms)

[a] Guaranteed by design and characterization, not 100% tested in production.

[b] Additive jitter is calculated using Root-Sum-Square (RSS) subtraction.

**Table 6. Clock Input Parameters**

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
$V_{CROSS}$	Input Crossover Voltage [a]	Crossover voltage.	150	–	900	mV

$t_{jycyc-cyc}$	Jitter, Cycle to Cycle	PLL Mode.		15	50	ps

[a] Guaranteed by design and characterization, not 100% tested in production.

[b] The Minimum/Typical/Maximum values of each BW setting track each other, i.e., maximum low BW will never occur with minimum high BW.

[c] Measured from differential waveform.

[d] Duty cycle distortion is the difference in duty cycle between the output and the input clock when the device is operated in bypass mode.

[e] All outputs at default slew rate.

**Table 8. LP-HCSL (DIF) Output Characteristics**

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
dV/dt	Slew Rate <sup>[a]</sup> <sup>[b]</sup> <sup>[c]</sup>	Scope averaging on, fast setting.	2	2.8	4	V/ns
		Scope averaging on, slow setting.	1.2	1.9	3.1	
$\Delta tR/tF$	Rise/Fall Matching <sup>[a]</sup> <sup>[d]</sup>	Single-ended measurement.		7	20	%
V <sub>HIGH</sub>	Voltage High <sup>[e]</sup>	Statistical measurement on single-ended signal using oscilloscope math function (scope averaging on).	660	768	850	mV
V <sub>LOW</sub>	Voltage Low <sup>[e]</sup>		-150	-11	150	
V <sub>max</sub>	Max Voltage <sup>[e]</sup>	Measurement on single ended signal using absolute value (scope averaging off).		811	1150	
V <sub>min</sub>	Min Voltage <sup>[e]</sup>		-300	-49		
V <sub>cross_abs</sub>	Crossing Voltage (abs) <sup>[a]</sup> <sup>[f]</sup>	Scope averaging off.	250	357	550	
$\Delta$ -V <sub>cross</sub>	Crossing Voltage (var) <sup>[a]</sup> <sup>[g]</sup>	Scope averaging off.		14	140	

[a] Guaranteed by design and characterization, not 100% tested in production.

[b] Measured from differential waveform.

[c] Slew rate is measured through the V<sub>swing</sub> voltage range centered around differential 0V. This results in a ±150mV window around differential 0V.

[d] Matching applies to rising edge rate for Clock and falling edge rate for Clock#. It is measured using a ±75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations.

[e] At default SMBus settings.

[f] V<sub>cross</sub> is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e. Clock rising and Clock# falling).

[g] The total variation of all V<sub>cross</sub> measurements in any particular system. Note that this is a subset of V<sub>cross\_min/max</sub> (V<sub>cross</sub> absolute) allowed. The intent is to limit V<sub>cross</sub> induced modulation by setting  $\Delta$ -V<sub>cross</sub> to be smaller than V<sub>cross</sub> absolute.

### How to Write

- Controller (host) sends a start bit
- Controller (host) sends the write address
- Renesas clock will **acknowledge**
- Controller (host) sends the beginning byte location = N
- Renesas clock will **acknowledge**
- Controller (host) sends the byte count = X
- Renesas clock will **acknowledge**
- Controller (host) starts sending Byte N through Byte N+X-1
- Renesas clock will **acknowledge** each byte **one at a time**
- Controller (host) sends a stop bit

			9DBL0442BKILFT	"T" = Tape and Reel
	6	40-VFQFPN - 5 × 5 × 0.9 mm, 0.40mm Pitch	9DBL0641BKILF	Trays
			9DBL0641BKILFT	"T" = Tape and Reel
	8	48-VFQFPN - 6 × 6 × 0.9 mm, 0.40mm Pitch	9DBL0841BKILF	Trays
			9DBL0841BKILFT	"T" = Tape and Reel

[a] "B" is the device revision designator (will not correlate with the datasheet revision).

[b] "LF" denotes Pb-free configuration, RoHS compliant.

[c] "I" indicates that all devices are specified over the -40°C to +85°C (industrial) temperature range.

[d] "T" = Tape and Reel, Pin 1 Orientation: EIA-481C (see Table 38 for more details)

T	Quadrant 1 (EIA-481-C)	

## Revision History

**Table 39. Revision History**

Revision Date	Description of Change
November 30, 2022	Updated POD links in <a href="#">Ordering Information</a> table.
March 18, 2022	<ul style="list-style-type: none"> <li>▪ Updated <a href="#">Pin Descriptions</a>.</li> <li>▪ Updated <a href="#">Package Outline Drawings</a> section and <a href="#">Ordering Information</a> table.</li> </ul>
January 24, 2022	<ul style="list-style-type: none"> <li>▪ Added missing <a href="#">Table 16</a> ZDB (PLL) Operating Mode.</li> <li>▪ Added cross references to <a href="#">Table 16</a> in <a href="#">Table 21</a>.</li> </ul>
April 1, 2021	Corrected pin numbers on vSADR_tri pin for 04x2 and 02x2 in pin descriptions table.
August 13, 2020	<ul style="list-style-type: none"> <li>▪ Changed the shipment packing for the 9DBL0242B and 0252B from “Cut Tape” to “Trays” in the <a href="#">Ordering Information</a> table.</li> </ul>
July 8, 2020	<ul style="list-style-type: none"> <li>▪ Merged 9DBL02x2, 9DBL04x2, 9DBL06x1 and 9DBL08x1 into single document.</li> <li>▪ Updated PCIe jitter tables to show PCIe Gen5.</li> <li>▪ Updated Test Loads figures to indicate PCIe Jitter Test setup.</li> <li>▪ Updated package outline drawings link for the 9DBL08x1 devices to NDG48P2.</li> </ul>
February 8, 2017	Last update of 9DBL0242/0252 data sheet.
February 9, 2017	Last update of 9DBL0442/0452 data sheet.
February 8, 2017	Last update of 9DBL0641/0651 data sheet.
February 9, 2017	Last update of 9DBL0841/0851 data sheet.
