NOTES on DIF Output AC Specs: (unless otherwise noted, guaranteed by design and characterization, not 100% tested in production).

[1] Measurement taken for single ended waveform on a component test board (not in system)

[2] Measurement taken from differential waveform on a component test board. (not in system)

[3] Slew rate emastured through V_swing voltage range centered about differential zero

[4] Vcross is defined at the voltage where Clock = Clock#, measured on a component test board (not in system)

[5] Only applies to the differential rising edge (Clock rising, Clock# falling)

[6] Total distributed intentional SRC to SRC skew. PCIE Gen2 outputs (SRC3, 4, 6 and 7) will have 0 nominal skew. Maximum allowable interpair skew is 150 ps.

[7] The max voltage including overshoot.

[8] The min voltage including undershoot.

[9] The total variation of all Vcross measurements in any particular system. Note this is a subset of V_cross min/mas (V_Cross absolute) allowed. The intent is to limit Vcross induced modulation by setting C_cross_delta to be smaller than V_Cross absolute.

[10] Matching applies to rising edge rate for Clock and falling edge rate for Clock#. It is measured using a +/-75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations.

[11] For PCIe Gen2 compliant devices, SRC 3, 4, 6, and 7 will have 0 ps nominal skew.

Clock Jitter Specs - Low Power Differential Outputs

SRC Jitter - Cycle to Cycle	SRCJC2C	Differential Measurement		125	ps	1,2
DOT Jitter - Cycle to Cycle	DOTJC2C	Differential Measurement		250	ps	1

NOTES on DIF Output Jitter: (unless otherwise noted, guaranteed by design and characterization, not 100% tested in production).

[1] JItter specs are specified as measured on a clock characterization board. System designers need to take special care not to use these numbers, as the in-system performance will be somewhat degraded. The receiver EMTS (chispet or CPU) will have the receiver jitter specs as measured ina real system.

[2] Phase jitter requirement: The deisgnated Ge2 outputs will meet the reference clock jitter requiremernts from the PCI Express Gen2 Base Spec. The test is performed on a componnet test board under quiet condittions with all outputs on. Jitter analysis is performed using the standardized tool provided by the PCI SIG.

FSLC./TEST_SEL -->3-level latched input	>2.0V	1	X	0	REF/N
If power-up w/ V>2.0V then use TEST_SEL If power-up w/ V<2.0V then use FSLC FSLB/TEST_MODE -->low Vth input TEST_MODE is a real time input	>2.0V	1	X	1	REF/N
	<2.0V	X	1	0	HI-Z
If TEST_SEL HW pin is 0 during power-up, test mode can be invoked through B9b3. If test mode is invoked by B9b3, only B9b4 is used to select HI-Z or REF/N FSLB/TEST_Mode pin is not used. Cycle power to disable test mode, one shot control	<2.0V	X	1	1	REF/N

B9b3: 1= ENTER TEST MODE, Default = 0 (NORMAL OPERATION)
B9b4: 1= REF/N, Default = 0 (HI-Z)
