

PROGRAMMABLE TIMING CONTROL HUB FOR INTEL BASED SYSTEMS

ICS9LRS3187B

Recommended Application:

CK505 version 1.1 clock, with fully integrated voltage regulators and series resistors

Output Features:

- 2 CPU differential low power push-pull pairs
- 1 SRC differential low power push-pull pair
- 1 SATA differential low power push-pull pair
- 1 DOT differential low power push-pull pair
- 1 REF, able to drive 3 loads, 14.318MHz
- 1 27MHz_SS/non_SS single-ended output pair

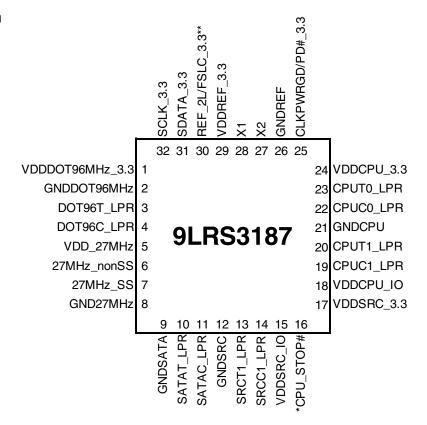

Features/Benefits:

- Supports spread spectrum modulation, 0 to -0.5% down spread for CPU and SRC clocks
- Uses external 14.318MHz crystal, external crystal load caps are required for frequency tuning
- Available in commercial (0 to +70°C) and industrial (-40 to +85°C) temperature ranges
- Meets PCIe Gen2 specifications

Key Specifications:

- CPU outputs cycle-cycle jitter <85ps
- SRC outputs cycle-cycle jitter <125ps
- +/- 100ppm frequency accuracy on all clocks

General Description

The ICS9LRS3187B is a CK505 clock synthesizer. The ICS9LRS3187B provides a single-chip solution for Intel based systems. The ICS9LRS3187B is driven with a 14.318MHz crystal.

How to Write:

- · Controller (host) sends a start bit.
- Controller (host) sends the write address D2 (H)
- IDT clock will acknowledge
- Controller (host) sends the beginning byte location = N
- IDT clock will acknowledge
- Controller (host) sends the data byte count = X
- IDT clock will acknowledge
- Controller (host) starts sending Byte N through Byte N + X -1
- IDT clock will acknowledge each byte one at a time
- · Controller (host) sends a Stop bit

How to Read:

- · Controller (host) will send start bit.
- Controller (host) sends the write address D2 (H)
- IDT clock will acknowledge
- Controller (host) sends the begining byte location = N
- IDT clock will acknowledge
- Controller (host) will send a separate start bit.
- Controller (host) sends the read address D3 (H)
- IDT clock will acknowledge
- IDT clock will send the data byte count = X

¹Measurement taken for single ended waveform on a component test board (not in system)

 $^{^{\}rm 2}\,\text{Measurement}$ taken from differential waveform on a component test board. (not in system)

³ Slew rate emastured through V_swing voltage range centered about differential zero

⁴ Vcross is defined at the voltage where Clock = Clock#, measured on a component test board (not in system)

⁵ Only applies to the differential rising edge (Clock rising, Clock# falling)

⁶ Matching applies to rising edge rate for Clock and falling edge rate for Clock#. It is measured using a +/-75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage

⁷ The max voltage including overshoot.

⁸ The min voltage including undershoot.

⁹ The total variation of all Vcross measurements in any particular system. Note this is a subset of V_cross min/mas (V_Cross absolute) allowed. The intent is to limit Vcross induced modulation by setting C_cross_delta to be smaller than V_Cross absolute

¹JItter specs are specified as measured on a clock characterization board. System designers need to take special care not to use these numbers, as the in-system performance will be somewhat degraded. The receiver EMTS (chispet or CPU) will have the receiver jitter specs as measured in a real system.

² Phase jitter requirement: The designated Gen2 outputs will meet the reference clock jitter requirements from the PCI Express Gen2 Base Spec. The test is performed on a component test board under quiet conditions with all outputs on.

³See http://www.pcisig.com for complete specs

¹Edge rate in system is measured from 0.8V to 2.0V.

² Duty cycle, Peroid and Jitter are measured with respect to 1.5V

³ The average period over any 1us period of time

⁴ Using frequency counter with the measurment interval equal or greater that 0.15s, target frequency is 14.318180 MHz

¹Edge rate in system is measured from 0.8V to 2.0V at default slew rate control setting.

² All Long Term Accuracy and Clock Period specifications are guaranteed assuming that REF out is at 14.31818MHz

³ At nominal temperature and voltage.

⁴ Long term and peak to peak jitter do not apply to the 27MHz spreading output. The spread modulation directly impacts these values.

 $^{^{\}rm 2}\,{\rm Input}$ leakage current does not include inputs with pull-up or pull-down resistors

³ 3.3V referenced inputs are: SCLK, SDATA, and CKPWRGD

⁴ Frequency Select pins which have tri-level input

⁵ If present, not all parts have this feature.

¹Measurement taken for single ended waveform on a component test board (not in system)

 $^{^{2}}$ Measurement taken from differential waveform on a component test board. (not in system)

 $^{^3}$ Slew rate measured through mimimum V_swing voltage range centered about differential zero

⁴ Vcross is defined at the voltage where Clock = Clock#, measured on a component test board (not in system)

⁵ Only applies to the differential rising edge (Clock rising, Clock# falling)

⁶ Matching applies to rising edge rate for Clock and falling edge rate for Clock#. It is measured using a +/-75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage

⁷ The max voltage including overshoot.

⁸ The min voltage including undershoot.

⁹ The total variation of all Vcross measurements in any particular system. Note this is a subset of V_cross min/max (V_Cross absolute) allowed. The intent is to limit Vcross induced modulation by setting C_cross_delta to be smaller than V_Cross absolute

¹JItter specs are specified as measured on a clock characterization board. System designers need to take special care not to use these numbers, as the in-system performance will be somewhat degraded. The receiver EMTS (chispet or CPU) will have the receiver jitter specs as measured in a real system.

² Phase jitter requirement: The designated Gen2 outputs will meet the reference clock jitter requirements from the PCI Express Gen2 Base Spec. The test is performed on a component test board under quiet conditions with all outputs on.

³See http://www.pcisig.com for complete specs

¹Edge rate in system is measured from 0.8V to 2.0V at default slew rate control setting.

 $^{^{\}rm 2}\,{\rm Duty}$ cycle, Peroid and Jitter are measured with respect to 1.5V

³ The average period over any 1us period of time

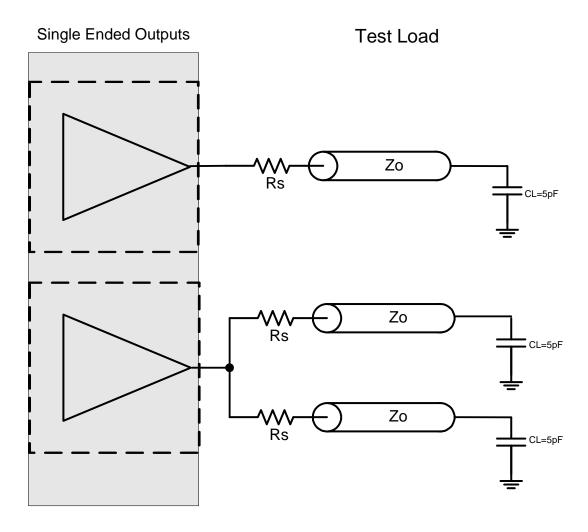

⁴ Using frequency counter with the measurment interval equal or greater that 0.15s, target frequency is 14.318180 MHz

¹ Edge rate in system is measured from 0.8V to 2.0V at default slew rate control setting.

² All Long Term Accuracy and Clock Period specifications are guaranteed assuming that REF out is at 14.31818MHz

³ At nominal temperature and voltage.

⁴ Long term and peak to peak jitter do not apply to the 27MHz spreading output. The spread modulation directly impacts these values.

Suggested Suggested termination resistors for various driving conditions are as follows for transmission lines with Zo = 50 ohms:

REF Output	Driving 1 load, Rs = 39 ohms
REF Output	Driving 2 loads, Rs = 22 ohms
27M SS and Non-SS outputs	Driving 1 load, Rs = 39 ohms
27 W 33 and Non-33 outputs	Driving 2 loads, Rs = 22 ohms
