

## GENERAL DESCRIPTION

This document describes the specification for the IDTF1370 **D**igital **P**re-**D**istortion Demodulator for PA linearization. This series of devices is offered in 2 variants to cover common UTRA bands. See part number matrix below for additional detail.

## COMPETITIVE ADVANTAGE

In typical basestation transmitters digital pre-distortion is employed to improve the Transmitter performance. The signal coming out of the PA is sampled and the incoming Tx chain I&Q data is pre-distorted to counteract the distortion inherent in the PA. The PA signal is adjusted via a digital step attenuator to a lower level and then sub-sampled at an IF frequency of ~200 MHz which necessitates the need for a highly linear demodulator to downmix to quadrature IF from the Transmit frequency. By sampling IF\_I and IF\_Q independently and then digitally combining these signals, an effective doubling of the sample rate can be achieved. Any distortion in this path will degrade the performance of the DPD algorithm. By utilizing an ultra-linear demodulator w/integrated DSA such as the IDTF1370, the ACLR and/or power consumption of the full Tx system can be improved significantly.

- ✓ DPD full path ACLR: ↓ **1 dB**
- ✓ I<sub>cc</sub>: DPD function Power Consumption ↓ **40%**
- ✓ **Zero-Distortion™ Demod** eliminates **2 IF amps**
- ✓ **Integrates 2 BPFs, 2 Baluns, SPDT RF switch**
- ✓ Glitch-Free™ gain control

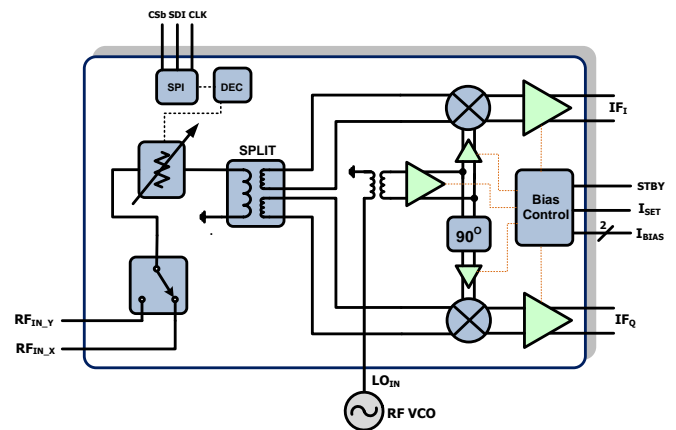

## PART# MATRIX

Part#	RF range	UTRA bands	IF freq range	Typ. Gain	Injection
F1320	550 - 1150	5,6,8,12,13,14,17	20 - 350	12.5	High Side or Low Side
F1370	1300 - 2900	1,2,3,4,9,10,7,21, 24, 38	20 - 500	12.5	High Side or Low Side

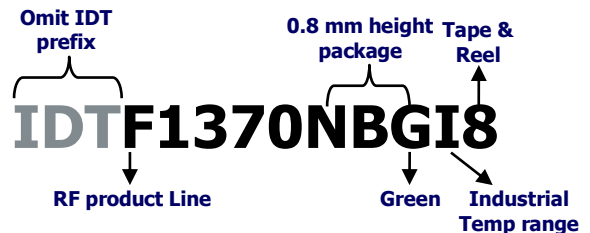

## FEATURES (I OR Q PATH)

- Wide flat performance IF BW
- Wide RF and LO BWs (~ 1.6 GHz)
- Ideal for Multi-Carrier Systems
- **Drives ADC directly**
- Ultra linear **+41 dBm IP<sub>3o</sub>**
- Low Noise Figure
- Excellent ACLR performance
- **200 Ω** output impedance
- Fully integrated DPD demodulator
- **6x6 36 pin package**
- Standby Mode w/Fast Recovery
- I<sub>cc</sub>: **275 mA**

## DEVICE BLOCK DIAGRAM

## ORDERING INFORMATION

## ABSOLUTE MAXIMUM RATINGS

V <sub>CC</sub> to GND	-0.3V to +5.5V
SW_Latch, DATA, CSb, CLK	0V to 3.6V
STBY	0V to V <sub>CC</sub>
IF_I+, IF_I-, IF_Q+, IF_Q-	1V to (V <sub>CC</sub> + 0.3V)
LO_IN	-0.3V to +0.3V
RF_INX, RF_INY	-0.3V to +0.3V
IF_BiasI, IF_BiasQ to GND	-0.3V to +1.2V
LO_ADJ to GND	2.1V to 4.0V
RF Input Power (Into RFIN_X or RFIN_Y)	<b>+27 dBm</b>
Continuous Power Dissipation	2.5W
θ <sub>JA</sub> (Junction – Ambient)	+40°C/W
θ <sub>JC</sub> (Junction – Case) The Case is defined as the exposed paddle	+3°C/W
Operating Temperature Range (Case Temperature)	T <sub>C</sub> = -40°C to +105°C
Maximum Junction Temperature	150°C
Storage Temperature Range	-65°C to +150°C
Moisture Sensitivity Level	<b>1</b>
Lead Temperature (soldering, 10s)	+260°C

*Stresses above those listed above may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.*

### ESD Caution

*This product features proprietary protection circuitry. However, it may be damaged if subjected to high energy ESD. Please use proper ESD precautions when handling to avoid damage or loss of performance.*

## IDTF1370 SPECIFICATION

Specifications apply at  $V_{CC} = +5.0V$ ,  $T_C = 25C$ ,  $F_{RF} = 2100 \text{ MHz}$ ,  $F_{LO} = 2300 \text{ MHz}$ , Gain =  $G_{MAX}$ ,  $P_{LO} = 0 \text{ dBm}$ ,  $T_C = +25^\circ C$ , STBY = GND unless otherwise noted. Full Lineup measured through to I or Q path. IF Transformers and RF input trace losses de-embedded.

Parameter	Comment	Symbol	min	typ	max	units
Logic Input High	FOR STBY, DATA, CSb, CLK, SW_Latch	$V_{IH}$	<b>2.3</b>			V
Logic Input Low	FOR STBY, DATA, CSb, CLK, SW_Latch	$V_{IL}$			<b>0.5</b>	V

Attenuator switched 16dB to 15.5dB					250		

#### SPECIFICATION NOTES:

- 1 – Items in min/max columns in **bold italics** are Guaranteed by Test
- 2 – All other Items in min/max columns are Guaranteed by Design Characterization
- 3 – Excludes SPI write time

## POWER-ON SEQUENCE

The power-on sequence ensures F1370 works in default mode once powered on. If the F1370 is programmed after applying DC power, the following power-on sequence is not needed. Note: To use power on sequence, SW\_LATCH cannot be grounded permanently.

The power-on sequence should be:

1. CSb & SW\_LATCH must be set low at power-on
2. Once powered on, first set SW\_LATCH high, then set CSb high
3. Proceed with normal programming.

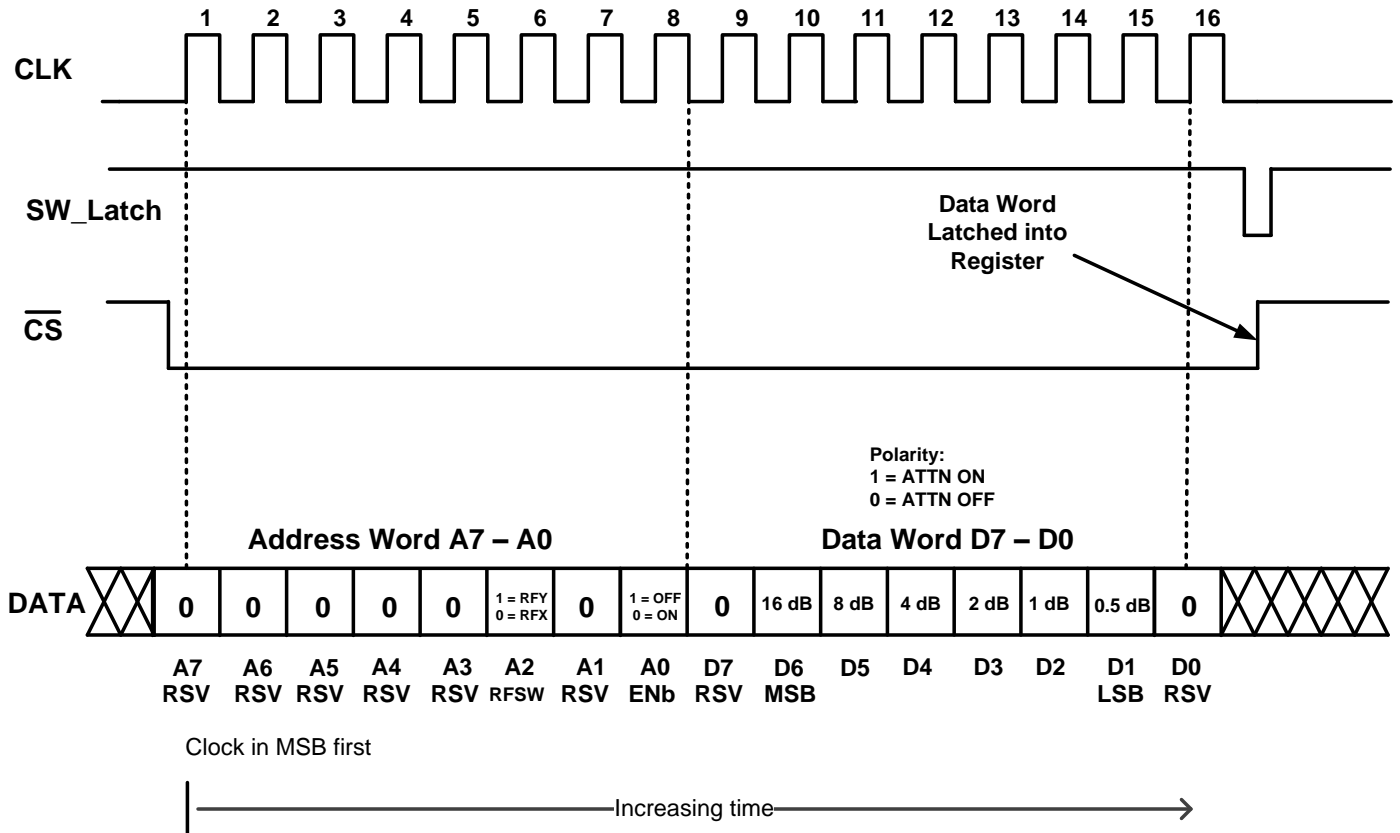

The default state after using power-on sequence:

- Maximum attenuation
- RF\_INX selected
- Normal operation (not Standby Mode)

## SERIAL PROGRAMMING

The device is programmed via the serial port by asserting Chip Select (CSb). Note: Most-Significant-Bit first, where the Address Word is the Most-Significant-Byte.

### Serial mode timing diagram high level:

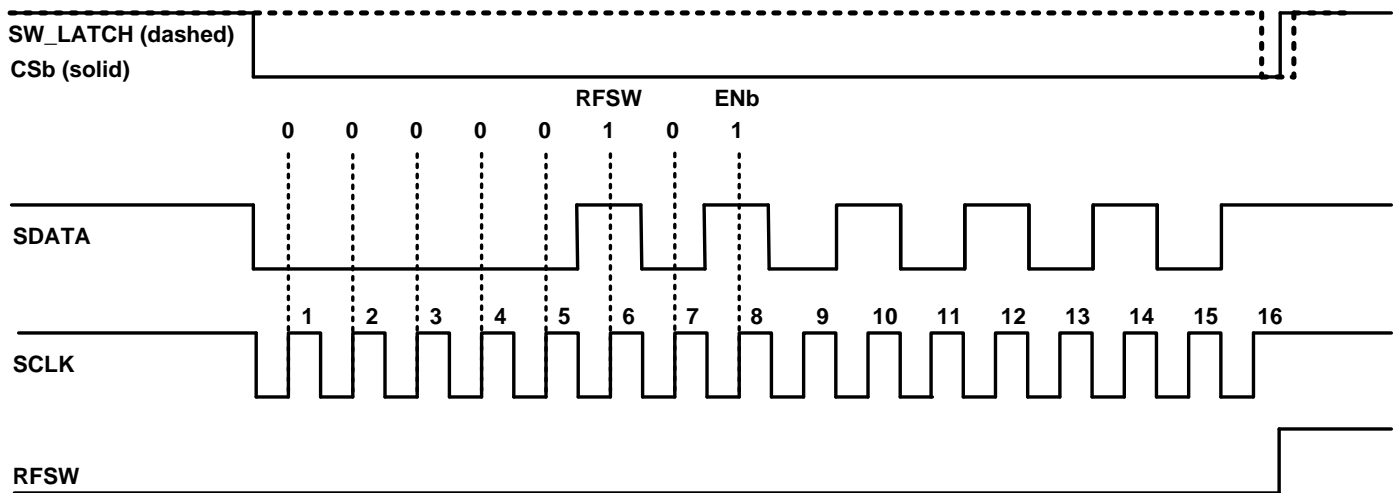

## TO PROGRAM THE SERIAL INTERFACE:

If CSb is de-asserted (set to high), the serial interface will ignore the CLK line. Once CSb is asserted (set to low), the serial interface will recognize the CLK and any data present on DATA will be clocked into the registers with each rising CLK edge. After the 16<sup>th</sup> CLK cycle, and before the 17<sup>th</sup> CLK cycle, CSb must be de-asserted to successfully program the part with the desired bytes. If CSb is de-asserted before the 16<sup>th</sup> CLK cycle, or after the 17<sup>th</sup> CLK cycle, there is no guarantee that the correct bytes will be programmed and the user will have to re-program the interface in accordance with the aforementioned procedure.

## SW\_LATCH PROGRAMMING SEQUENCE

- When SW\_LATCH is pinned high during the programming sequence, “RFSW” and “ENb” registers cannot be programmed and therefore will not toggle.
- If SW\_LATCH is pinned low during the programming sequence, the “RFSW” and “ENb” register will toggle. This can be prevented with the “Programming Sequence” below.

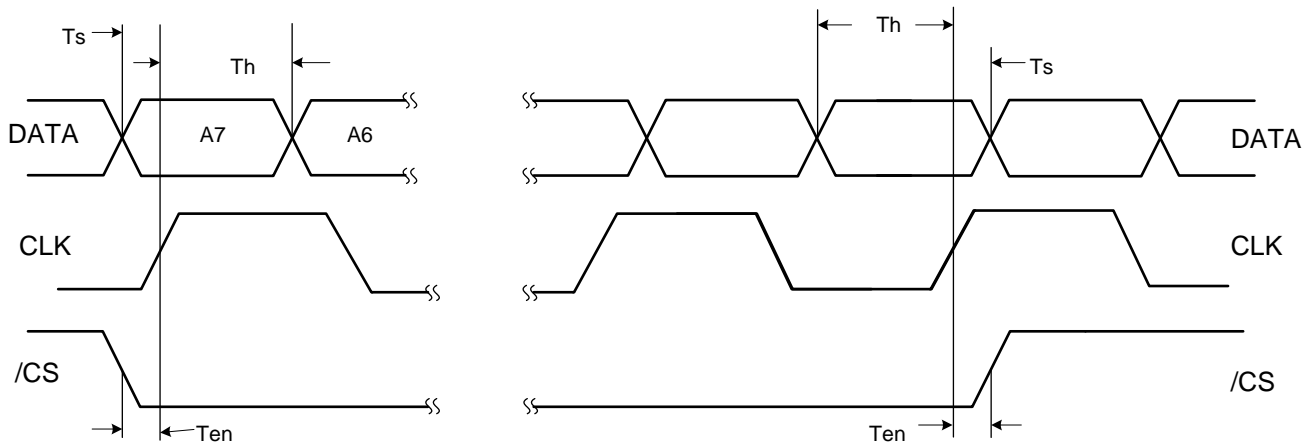

## SEQUENCE FOR PROGRAMMING REGISTERS A<2>:A<0>

- 1) SW\_Latch = 1; CSb = 0
- 2) CLK in 8- or 16-bit word, *do not de-assert (pull high) CSb*
- 3) Set SW\_LATCH = 0 while CSb = 0 remains)
- 4) With SW\_Latch = 0, set CSb = 1
- 5) Set SW\_Latch = 1
- 6) Program complete

## SPECIAL NOTE REGARDING PHASE OF I & Q:

- When LO is high-side injected, IF\_I leads IF\_Q by 90 degrees
- When LO is low-side injected, IF\_Q leads IF\_I by 90 degrees

## SERIAL MODE TIMING DIAGRAM ZOOM:

- Data is shifted with the rising edge of CLK when /CS is low
- The rising edge of /CS latches data into the device

## LOGIC TRUTH TABLE:

STBY	SW_LATCH	MODE	WRITE ACCESS
0	0	Operating Mode	A2:A0 Enabled, D7:D0 Enabled
0	1	Operating Mode	A2:A0 Disabled, D7:D0 Enabled
1	0	Off	A2:A0 Enabled, D7:D0 Enabled
1	1	Off	A2:A0 Disabled, D7:D0 Enabled

### F1370 ATTENUATION TABLE

The F1370 gain/attenuation setting is controlled by 6 bits in the data word. The device provides an added attenuation range from 0 dB to 25.5 dB in 0.5 dB steps. A “high” or “1” bit corresponds to attenuation stepped IN, while a “low” or “0” bit corresponds to attenuation stepped OUT.

F1370 DPD Demodulator - Attenuation Table (Data Word D7-D0)						
BINARY	HEX	Added Atten (dB)		BINARY	HEX	Added Atten (dB)
00000000	00	0		00110100	34	13
00000010	02	0.5		00110110	36	13.5
00000100	04	1		00111000	38	14
00000110	06	1.5		00111010	3A	14.5
00001000	08	2		00111100	3C	15
00001010	0A	2.5		00111110	3E	15.5
00001100	0C	3		01000000	40	16
00001110	0E	3.5		01000010	42	16.5
00010000	10	4		01000100	44	17
00010010	12	4.5		01000110	46	17.5
00010100	14	5		01001000	48	18
00010110	16	5.5		01001010	4A	18.5
00011000	18	6		01001100	4C	19
00011010	1A	6.5		01001110	4E	19.5
00011100	1C	7		01010000	50	20
00011110	1E	7.5		01010010	52	20.5
00100000	20	8		01010100	54	21
00100010	22	8.5		01010110	56	21.5
00100100	24	9		01011000	58	22
00100110	26	9.5		01011010	5A	22.5
00101000	28	10		01011100	5C	23
00101010	2A	10.5		01011110	5E	23.5
00101100	2C	11		01100000	60	24
00101110	2E	11.5		01100010	62	24.5
00110000	30	12		01100100	64	25
00110010	32	12.5		01100110	66	25.5

Because the first and last bits of the Data Word are not presently used by the F1370, two additional hex character pairs exists for each of those in this table. For example, data words of either H00, H80, or H01 (binary “00000000,” “10000000,” or 00000001) will place the F1370 in its minimum attenuation state. Likewise, data words of either H66, HE6, or H67 (binary “01100110” or “11100110” or “01100111”) will place the F1370 in its maximum attenuation state of 25.5 added attenuation.

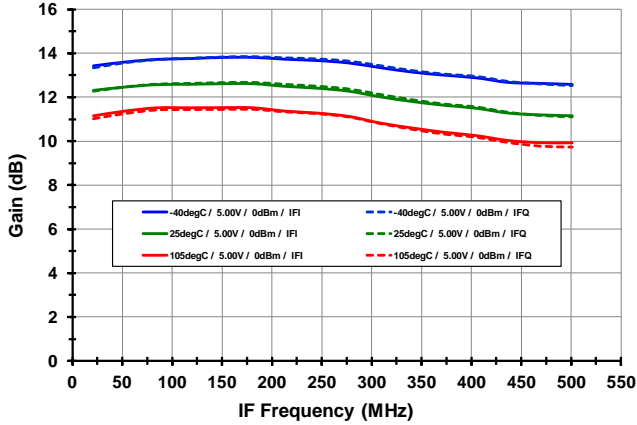

## TYPICAL OPERATING CONDITIONS

Unless otherwise noted for the TOC graphs, the following conditions apply

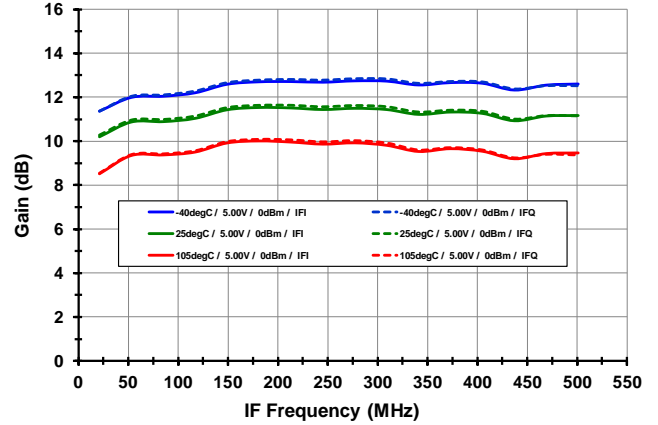

- **IF = 200 MHz**
- **Tone spacing = 5 MHz**
- **Pin = - 11 dBm / Tone**
- **Pout ~ 1 dBm / Tone**
- **RF\_X, IF\_Q selected**
- **Minimum Attenuation selected (0 dB ATTN)**
- **V<sub>CC</sub> = 5.00 V**
- **LO level = 0 dBm**
- **Case Temperature = 25C**
- **All Temperatures are Case Temperature (T<sub>CASE</sub>)**
- **Output Transformers are de-embedded**
- **Input RF trace losses are de-embedded**

## PACKAGE DRAWING (NBG36 6x6 QFN)

## PIN DIAGRAM

Signal Path Inputs & Outputs in **BLUE**

Internal Connections in **[RED]**

## PIN DESCRIPTIONS

Pins	Name	Function
1	SW_LATCH	Stand-by latch. Pull Low or Ground for Normal Operation. If left floating, this input will be internally pulled high, disabling SPI writes to ENb (Standby) and RF SW bits (A0, A2).
2, 4, 5, 6, 8, 11, 15, 21, 22, 30, 31, 32, 33, 34, 36	GND	Ground these Pins.
3	RF_INY	Alternate RF Input. Separated from RF_INX by internal SP2T. AC couple to this pin. Internally matched to 50 ohms
9, 16, 25	VCC	Power Supply. Bypass to GND with capacitors shown in the Typical Application Circuit as close as possible to pin.
10	LO_ADJ	Connect the specified resistor from this pin to ground to set the LO path I <sub>CC</sub> . This IS a current setting resistor
12	LO_IN	LO Input. AC couple to this pin. Internally matched to 50 ohms
7, 13, 29	N.C.	No Connection. Not internally connected. OK to connect to V <sub>CC</sub> . Recommended Connection is Ground
14	STBY	STBY Mode. Pull this pin high for Standby mode (30mA). Pull low or Ground for normal Operation
17, 18	IF_BIAS_I IF_BIAS_Q	Connect the specified resistor from this pin to ground to set the IF amplifier bias reference. This is NOT a current setting resistor
19, 20	IF_I+, IF_I-	<i>In-Phase</i> Mixer Differential IF Output. Connect pullup inductors from each of these pins to V <sub>CC</sub> (see the Typical Application Circuit).
23, 24	IF_Q-, IF_Q+	<i>Quadrature</i> Mixer Differential IF Output. Connect pullup inductors from each of these pins to V <sub>CC</sub> (see the Typical Application Circuit).
26	CSb	Chip Select Bar. The falling edge initiates a programming cycle and the rising edge latches the programmed shift register data into the active register.
27	DATA	Serial Data Input
28	CLK	Serial Clock Input
35	RF_INX	Main RF Input. Separated from RF_INY by internal SP2T. AC couple to this pin. Internally matched to 50 ohms
	— EP	Exposed Pad. Internally connected to GND. Solder this exposed pad to a PCB pad that uses multiple ground vias to provide heat transfer out of the device into the PCB ground planes. These multiple via grounds are also required to achieve the noted RF performance.

### CONTROL PIN VOLTAGE & RESISTANCE VALUES

The following table provides open-circuit DC voltage and resistance values referenced to ground for each of the control pins listed.

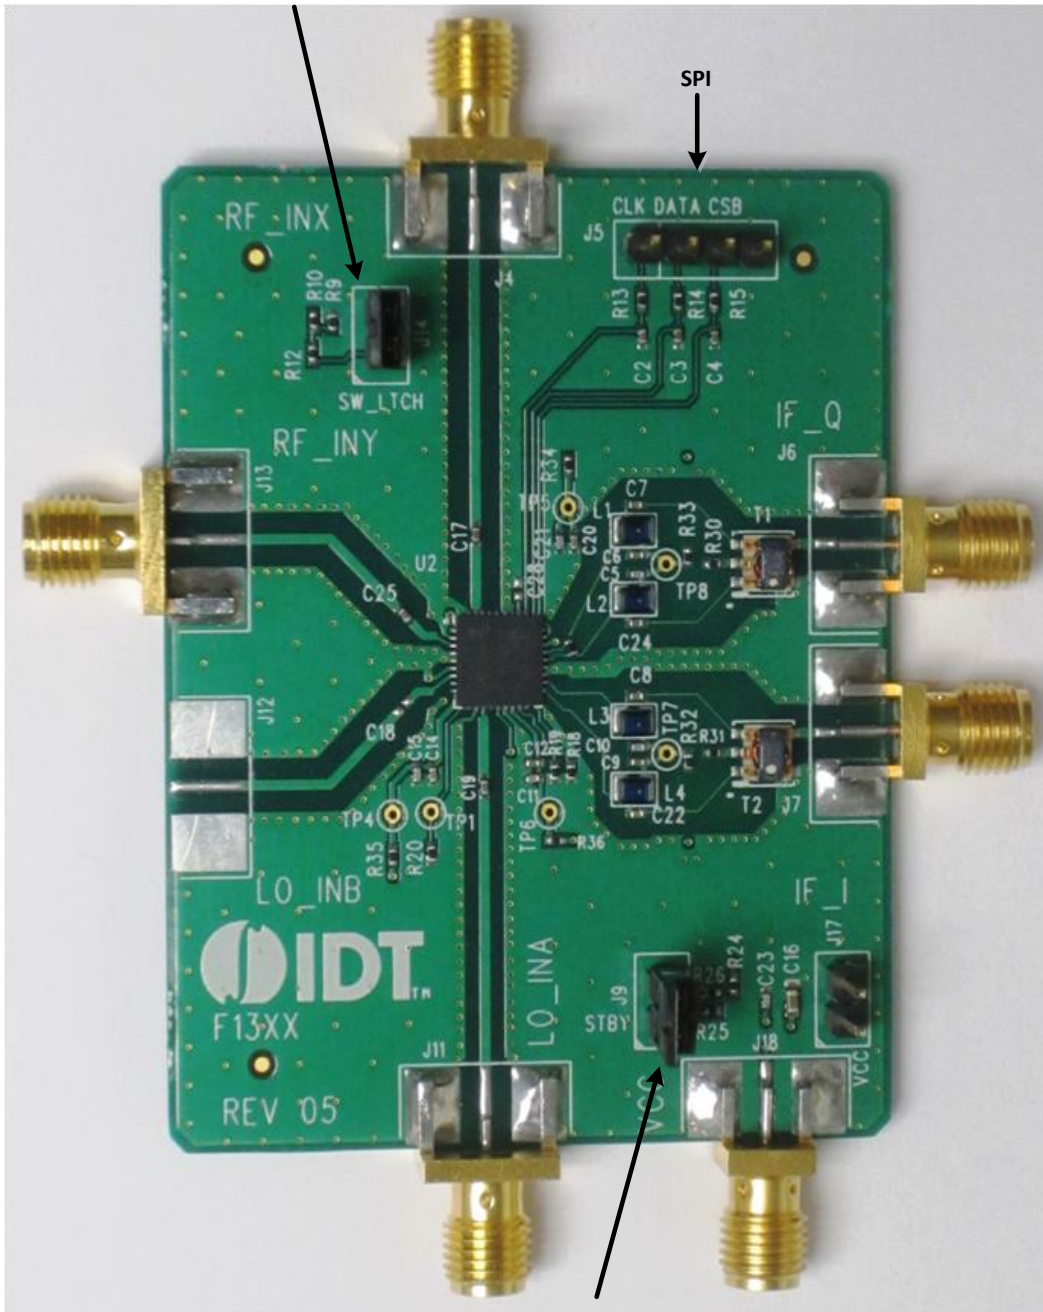

Pin	Name	DC voltage (volts)	Resistance (ohms)
1	SW_LATCH	1.75	1.6M
14	STBY	5	50k
26	CSb	1.75	1.6M
27	DATA	1.75	1.6M
28	CLK	1.75	1.6M

### POWER SUPPLIES

All supply pins should be bypassed with external capacitors to minimize noise and fast transients. Supply noise can degrade noise figure and fast transients can trigger ESD clamps and cause them to fail. Supply voltage change or transients should have a slew rate smaller than  $1V/20\mu S$ . In addition, all control pins should remain at 0V (+/-0.3V) while the supply voltage ramps or while it returns to zero.

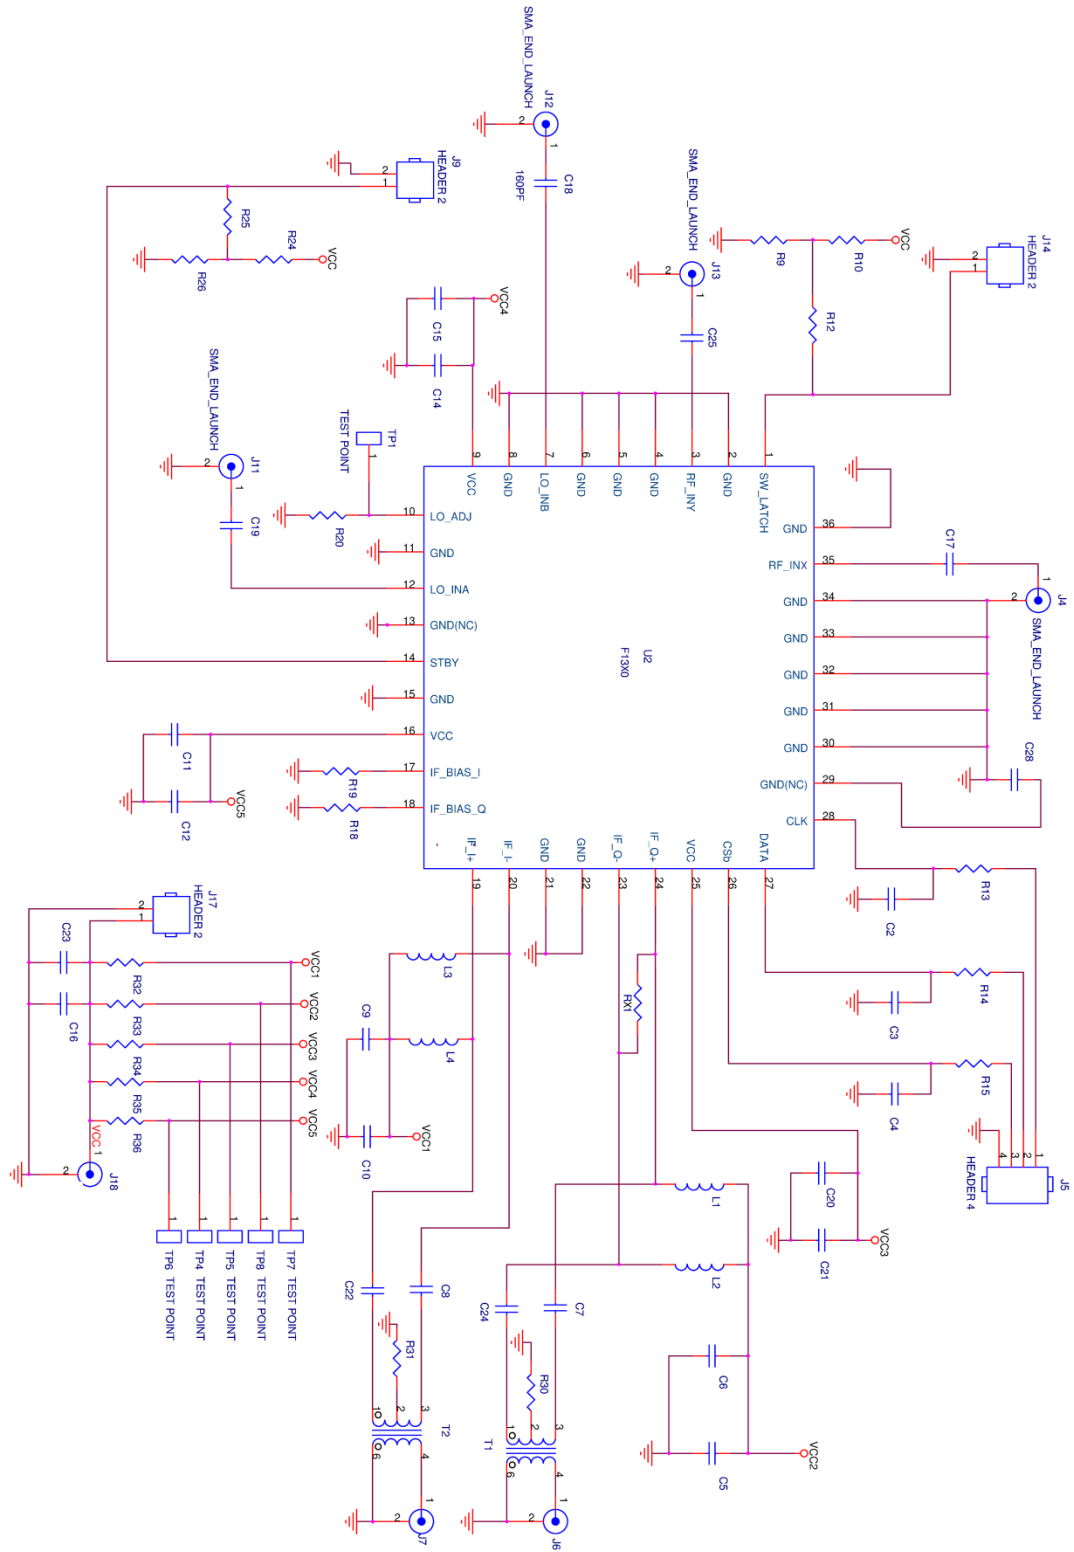

## EVKIT PICTURE / LAYOUT / OPERATION

Close to program  
 Open to disable SPI Address Word (A7-A0) writes

Close to turn device ON  
 Open to turn device OFF

## EVKIT / APPLICATIONS CIRCUIT

## EVKIT BOM
