

To our customers,

---

## Old Company Name in Catalogs and Other Documents

---

On April 1<sup>st</sup>, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: <http://www.renesas.com>

April 1<sup>st</sup>, 2010  
Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (<http://www.renesas.com>)

Send any inquiries to <http://www.renesas.com/inquiry>.

Not recommended  
for new design

## Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: “Standard”, “High Quality”, and “Specific”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as “Specific” without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as “Specific” or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
  - “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
  - “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
  - “Specific”: Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

To all our customers

---

## **Regarding the change of names mentioned in the document, such as Mitsubishi Electric and Mitsubishi XX, to Renesas Technology Corp.**

---

The semiconductor operations of Hitachi and Mitsubishi Electric were transferred to Renesas Technology Corporation on April 1st 2003. These operations include microcomputer, logic, analog and discrete devices, and memory chips other than DRAMs (flash memory, SRAMs etc.) Accordingly, although Mitsubishi Electric, Mitsubishi Electric Corporation, Mitsubishi Semiconductors, and other Mitsubishi brand names are mentioned in the document, these names have in fact all been changed to Renesas Technology Corp. Thank you for your understanding. Except for our corporate trademark, logo and corporate statement, no changes whatsoever have been made to the contents of the document, and these changes do not constitute any alteration to the contents of the document itself.

Note : Mitsubishi Electric will continue the business operations of high frequency & optical devices and power devices.

# M66009FP

8-BIT I/O EXPANDER WITH 5-BIT ADDRESS

## DESCRIPTION

M66009 silicon gate CMOS (complementary metal oxide semiconductor) integrated circuit converts 8-bit data from serial to parallel and vice versa.

This IC has 5 address setting bits, which enable users to set a distinctive address.

This IC offers a wide range of applications, such as for micro-computer input/output port extension.

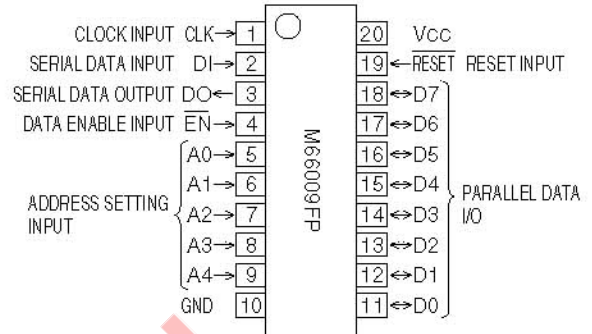

## FEATURES

- Has 5 bits for address setting
- Connected to microcomputer via 4 pins ( $\overline{EN}$ , CLK, DI and DO)
- Input/output setting possible by the bit
- Schmitt input (RESET,  $\overline{EN}$  and CLK)
- Wide operating temperature range ( $T_a = -20^\circ\text{C}$  to  $75^\circ\text{C}$ )

## APPLICATION

Microcomputer I/O port extension, etc.

## PIN CONFIGURATION (TOP VIEW)

Outline 20P2N-A

## BLOCK DIAGRAM

**FUNCTION**

M66009 semiconductor circuit converts data from serial to parallel and vice versa. Address can be set freely at users' option.

It communicates with microcomputer via 4 signals lines:  $\overline{EN}$ , CLK, DI and DO.

It has 5-bit address setting input. Connect each address input pin to Vcc or GND, then the address can be determined from among 32 patterns. When serial data arrives from microcomputer, this IC compares the address in the data to the address

set with these pins. If the two addresses are the same, the given command is executed.

To output serial input data in parallel, this IC converts the lower 8 bits of the 16-bit serial data into parallel, and outputs each to pins D0 to D7. The upper 8 bits are processed as address bits and command bits.

To output parallel input data in series, this IC prefixes one acknowledgement bit to the 8 parallel bits which respectively refer to the status of pins D0 to D7, and then outputs 9 bits in series.

**PIN DESCRIPTIONS**

Pin	Name	Input/Output	Functions
$\overline{RESET}$	Reset input	Input	"L" level: M66009 is reset to initial state.
$\overline{EN}$	Data enable input	Input	"L" level: M66009 becomes accessible.
CLK	Serial clock input	Input	Serial data that arrives at pin DI from microcomputer is taken into M66009 shift register at CLK rise edge, serial data is output from pin DO synchronously with CLK fall edge. Pin DO status stays at "H" level except during serial data output.
DI	Serial data input	Input	
DO	Serial data output	Output	
A0~A4	Address setting input	Input	Connect each to Vcc or GND to set distinctive address. Command is executed only when serial data from microcomputer includes the same address as that set by these pins. When connected to Vcc, pin status is "1". When connected to GND, pin status is "0".
D0~D7	Parallel data input/output	Input/Output	Used to input/output parallel data. Because pull-down resistor is built in and output transistor is P-ch open drain, pins in "L" output status (equals to P-ch transistor OFF) function as input pins.
Vcc	Positive supply pin	—	Connected positive supply (5V).
GND	Grounding pin	—	Used for grounding (0V).

**INPUT/OUTPUT DATA LOGIC**

Serial data input from pin DI is output in parallel from pins D0 thru D7, being inverted in logic. Parallel data input from pins D0 thru D7 is output in series from pin DO in the same logic. Therefore, to set I/O pins to input, DI input data should be set to "H".

**DATA SENDING/RECEIVING PROTOCOL AND OPERATION PROCEDURE**

The timing at which microcomputer communicates with M66009 is as shown in the diagram below. When microcomputer accesses to M66009, it declares the start of access by lowering pin  $\overline{EN}$  status from "H" to "L". It then sends data to pins CLK and DI at the timing shown below. The access stops as pin  $\overline{EN}$  status rises from "L" to "H". Given below is more detailed explanation of data sending/receiving procedure:

- (1) At  $\overline{EN}$  fall edge, 8-bit parallel data that arrives at input/output pins D0 thru D7 is loaded into shift register for serial output.
- (2) At CLK rise edge, data at pin DI is taken into serial input shift register, and internal clock counter starts counting up.
- (3) When 5-bit address is taken in, it is compared to address set by pins A0 thru A4. If they are the same, acknowledge bit "0" is output to pin DO synchronously with CLK 8T fall edge. (When the addresses are not the same, pin DO output status stays at the "H" level.)
- (4) When command bits C2, C1 and C0 are all "1", operation proceeds to (5) and (6) described below. If any of these command bits are not "1" while the addresses are the same, pin DO output is fixed to "H" synchronously with CLK 9T rise, and operation is halted until  $\overline{EN}$  rises. When  $\overline{EN}$  rises, clock counter is reset, and M66009 becomes ready to accept a next access.

- (5) When the addresses are the same and the command bits are all "1", serial output operation starts. Eight-bit data latched at step (1) as described above is output in series, starting from the bit at pin D7, through pin D0 synchronously with the fall edges of CLK 9T thru 16T. No operation is performed for CLK inputs after 16T, except the count up of CLK.
  - (6) When  $\overline{EN}$  rises: Output pin DO status is fixed to "H", and only when clock counter has counted 16 CLK rise edges (counter output = 10H), the lower 8 bits of the 16-bit serial data is sent to output latch synchronously with the  $\overline{EN}$  rise edge. The latched data is inverted in logic, and output to pins D0 thru D7 in parallel. Clock counter is then reset, completing one sequence.
- (Note) If the clock counter output is not 10 H when  $\overline{EN}$  rises, data is not sent to output latch. Output pin DO is fixed to "H", clock counter is reset, and M66009 becomes ready to accept a next access.

( ) Command bits (C2, C1, C0) = (1, 1, 1)

**Data Communication protocol**

**ACKNOWLEDGE BIT ACK0**

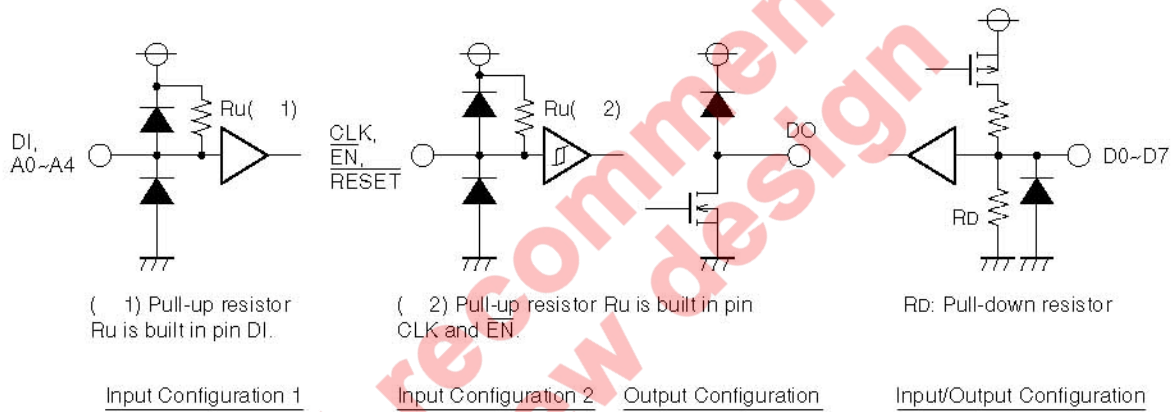

Acknowledge bit ACK0 is output only when address in serial input data is the same as that set by pins A0 thru A4. It is output from pin DO as ACK0 = "0" ("L") synchronously with CLK 8T fall.

**INITIAL STATUS AFTER RESET**

If "L" is input to RESET, M66009 is put in the conditions specified below:

I/O pins D0 thru D7	Input state ("L" output state) (Output p-channel transistor off)
DO output	"H" output state (Output n-channel transistor off)

**INPUT AND OUTPUT EQUIVALENT CIRCUITS**

**ABSOLUTE MAXIMUM RATINGS**

Symbol	Parameter	conditions	Ratings	Unit
V <sub>CC</sub>	Supply voltage		-0.5 ~ +7.0	V
V <sub>I</sub>	Input voltage		-0.5 ~ V <sub>CC</sub> + 0.5	V
