

Description

The MK2704 is a low cost, low jitter, high-performance PLL clock synthesizer designed to replace oscillators and PLL circuits in set-top box and multimedia systems. Using IDT's patented analog Phase Locked Loop (PLL) techniques, the device uses a 27 MHz crystal or clock input to produce a buffered reference clock and a selectable audio clock.

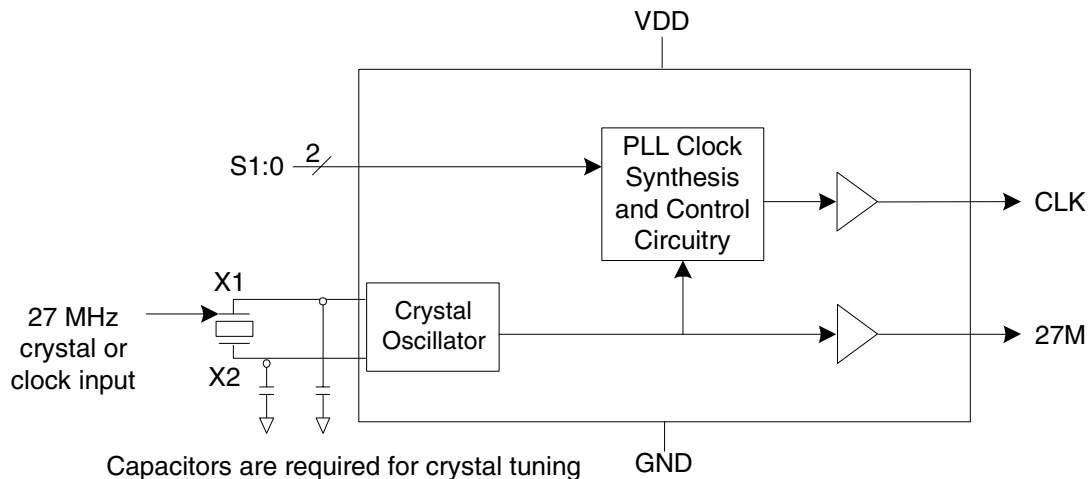

The audio clock is frequency locked to the 27 MHz clock, assuring that the audio with zero ppm error and video will track perfectly.

IDT manufactures the largest variety of Set-Top Box and multimedia clock synthesizers for all applications. Consult IDT to eliminate VCXOs, crystals and oscillators from your board.

Features

- Packaged in 8-pin SOIC
- Pb-free packaging
- Uses an inexpensive, fundamental crystal or clock
- Selectable audio output clock of 16.9344 MHz, 18.432 MHz, or 36.864 MHz
- Supports MPEG sampling rates of 384x, 44.1 kHz, 48 kHz, and 96 kHz
- Patented zero ppm synthesis error in all clocks
- All frequencies are frequency locked
- 25 mA output drive capability at TTL levels
- Advanced, low power, sub-micron CMOS process
- Operating voltage of 3.3 V or 5 V

Pin Descriptions

Pin Number	Pin Name	Pin Type	Pin Description
1	X1	XI	Crystal Connection. Connect to a 27 MHz fundamental crystal or clock.
2	VDD	Power	Connect to +3.3 V or +5 V.
3	GND	Power	Connect to ground.
4	27M	Output	27.00 MHz buffered reference clock output.
5	CLK	Output	Audio clock output per table above.
6	S1	Input	Audio clock frequency select input #1. Determines CLK output per table above. Internal pull-up resistor.
7	S0	Input	Audio clock frequency select input #0. Determines CLK output per table above. Internal pull-up resistor.
8	X2	XO	Crystal connection to a 27 MHz crystal, or leave unconnected for clock output.

External Components

Decoupling Capacitor

As with any high performance mixed-signal IC, the MK2704 must be isolated from system power supply noise to perform optimally.

A decoupling capacitor of 0.01 μ F must be connected between VDD and GND on pins 2 and 3. It must be connected close to the MK2704 to minimize lead inductance. No external power supply filtering is required for the MK2704.

Series Termination Resistor

A 33 Ω terminating resistor can be used next to the clock outputs for trace lengths over one inch.

Crystal Load Capacitors

The total on-chip capacitance is approximately 16 pF. A parallel resonant, fundamental mode, AT cut 27 MHz crystal should be used. The device crystal connections should include pads for small capacitors from X1 to ground and from X2 to ground. These capacitors are used to adjust the

stray capacitance of the board to match the nominally required crystal load capacitance. Because load capacitance can only be increased in this trimming process, it is important to keep stray capacitance to a minimum by using very short PCB traces (and no vias) between the crystal and device. Crystal capacitors, if needed, must be

connected from each of the pins X1 and X2 to ground.

The value (in pF) of these crystal caps should equal $(C_L - 16 \text{ pF}) \times 2$. In this equation, C_L = crystal load capacitance in pF. Example: For a crystal with an 18 pF load capacitance, each crystal capacitor would be 4 pF $[(18-16) \times 2] = 4$.

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the MK2704. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.
