

Description

The MK2772-01 is a low cost, low jitter, high performance VCXO and clock synthesizer for set-top boxes. The on-chip Voltage Controlled Crystal Oscillator accepts a 0 to 3V input voltage to cause the output clocks to vary by ± 100 ppm. Using ICS' patented VCXO and analog Phase-Locked Loop (PLL) techniques, the device uses an inexpensive 13.5 MHz crystal input to produce multiple output clocks. All clocks are frequency locked to the 27.00MHz output (and to each other) with zero ppm error. The MK2772 includes a glitch-free multiplexer to switch input sources during operation.

ICS manufactures the largest variety of Set-Top Box and multimedia clock synthesizers for all applications. Consult ICS to eliminate VCXOs, crystals and oscillators from your board.

Notes: 1. Stresses beyond those listed under Absolute Maximum Ratings could cause permanent damage to the device. Prolonged exposure to levels above the operating limits but below the Absolute Maximums may affect device reliability.

2. With ACLK at 12.288 MHz.

3. With a recommended crystal.

External Components/Crystal Selection

The MK2772-01 requires a minimum number of external components for proper operation. Decoupling capacitors of 0.1µF should be connected between VDD (pin 15) and GND (14), and between VDD (4) and GND (7), as close to the MK2772-01 as possible. A series termination resistor of 33 Ω may be used for each clock output. The input crystal must be connected as close to the chip as possible.

For the VCXO to operate correctly, a crystal properly specified and matched to the MK2772-01 must be used. For more information, including a list of recommended crystals, refer to application note MAN05.
