Table 30.26 DFTSTCTL Register Contents

Bit Position	Bit Name	Function
15, 14	PROT[1:0]	These bits enable to write to this register. The read value is 0.
13 to 1	—	Reserved These bits are always read as 0. The write value should also be 0.
0	ECCTST	ECC Test Sets ECC test mode.

30.2.3.4 Test Function

Data in the ROM and the ECC bits can be read through the setting of the data flash test control register (DFTSTCTL).

(1) Reading the ROM Data

- (a) Set the ECCDIS bit in the DFECCTL register to 1 to disable ECC error detection and correction.
- (b) When ECCDIS = 1, neither error detection nor correction proceeds when the data flash is read; the data output from the data flash is read unchanged.

How to exit this test mode:

- (a) Set the ECCDIS bit in the DFECCTL register to 0 to enable ECC error detection and correction.

(2) Reading the ECC Data

- (a) Set the ECCDIS bit in the DFECCTL register to 1 to disable ECC error detection and correction.
- (b) Set the ECCTST bit in the DFTSTCTL register to 1 to set test mode.
- (c) When the data flash is read, the 7 lower-order bits of read data are read as ECC data.

How to exit this test mode:

- (a) Set the ECCDIS bit in the DFECCTL register to 0 to enable ECC error detection and correction.
- (b) Set the ECCTST bit in the DFTSTCTL register to 0 to set normal mode.

(3) Self-Diagnosis

Self-diagnosis of the ECC decoder is possible by writing incorrect data to the data flash memory beforehand (fault injection) and then reading this data. A 1- or 2-bit ECC error fault can be injected by generating correct ECC bits once and inverting only the appropriate bits.

For details on programming of the data flash, refer to *RH850/E1x-FCC2 Flash Memory User's Manual: Hardware Interface*.

30.2.4 Local RAM (CPU1) ECC and Address Parity

30.2.4.1 Overview

The local RAM ECC of CPU1 is summarized in the table below.

Table 30.27 Overview of Local RAM ECC of CPU1

Item	Description
ECC error detection and correction	<p>ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected.</p> <ul style="list-style-type: none"> ECC error detection and correction are carried out (2-bit error detection and 1-bit error detection and correction are carried out). ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). <p>When disabled, neither error detection nor correction is carried out. In the state after reset, the ECC function is enabled; 1-bit error detection and correction and 2-bit error detection and notification are carried out.</p>
Address parity	<p>Address parity check can be either enabled or disabled. During data write, a parity bit generated based on the written address is written simultaneously with the write data. At this time, the same parity bit is written to two locations in the RAM. During read, comparison is performed between a parity bit generated based on the read address and a parity bit read from the RAM. The error decoding specifications are shown in Table 30.28 Address Parity Definitions. In the state after reset, this function is enabled.</p>
Error notification	<p>Upon occurrence of an ECC error or address parity error, the ECM is notified of the error.</p> <p>ECC Error:</p> <ul style="list-style-type: none"> Error notification can be either enabled or disabled upon detection of a 2-bit ECC error. Error notification can be either enabled or disabled upon detection of a 1-bit ECC error. <p>In the state after reset, notification of the 2-bit error is enabled and notification of the 1-bit error is disabled.</p> <p>Parity Error:</p> <ul style="list-style-type: none"> Error notification can be either enabled or disabled upon detection of an address parity error. Error notification can be either enabled or disabled upon detection of a parity bit error. <p>In the state after reset, notification of the address parity error is enabled and notification of the parity bit error is disabled. The error notification signal is output, where a 2-bit ECC error and an address parity error are handled as one source, and a 1-bit ECC error and a parity bit error are handled as one source.</p>
Error status	<p>A status register is provided, which indicates the statuses of 2-bit ECC error detection, 1-bit ECC error detection, and address parity error detection. If an error occurs while no error status flag is set, the corresponding status is set. The error status can be cleared using the clear register.</p>
Address capture	<p>If an ECC error or a parity error occurs while no error status flag is set, the address at which the associated error has occurred is captured. The address is captured when a 2-bit ECC error, a 1-bit ECC error, or an address parity error is detected. The error status serves as the enable bit of the capture address.</p>
Self-diagnosis	<p>Desired values can be written as RAM data and to the ECC and address parity bits. The RAM data and the ECC and address parity bits can be read directly.</p>

The definitions of the address parity error during read accesses are shown in the table below.

Table 30.28 Address Parity Definitions

Address Parity Bit		Read Address Parity	Error Determination and Error Name
0	0	0	No error
0	0	1	Address parity error
0	1	0	Parity bit error
0	1	1	Parity bit error
1	0	0	Parity bit error
1	0	1	Parity bit error
1	1	0	Address parity error
1	1	1	No error

CPU1 is capable of simultaneously writing or reading up to 128 bits of data at a time to or from the local RAM. Meanwhile, ECC and address parity bits are provided for each 32 bits of data and each 32-bit data is called Word 0 to 3. The relationship between addresses and Word numbers are as follows.

Table 30.29 Relationship between Addresses and Bank Numbers

4 Lower-Order Bits of Address (Hexadecimal Notation)	F _H to C _H	B _H to 8 _H	7 _H to 4 _H	3 _H to 0 _H
Bank number	Word3	Word2	Word1	Word0

The error data of the CPU1 is retained for each instruction and data.

30.2.4.2 List of Registers

Table 30.30 List of Registers

Address	Symbol	Register Name	R/W	Value after Reset	Access Size
FFC6 5000 _H	LRAPCTL_PE1	Local RAM address parity control register (PE1)	R/W	0000 0000 _H	16/32
FFC6 5004 _H	LRTSTCTL_PE1	Local RAM test control register (PE1)	R/W	0000 0000 _H	16/32
FFC6 5008 _H	LRTDATBF0_PE1	Local RAM test data read buffer 0 (PE1)	R	0000 0000 _H	8/16/32
FFC6 500C _H	LRTDATBF1_PE1	Local RAM test data read buffer 1 (PE1)	R	0000 0000 _H	8/16/32
FFC6 5400 _H	LRECCCTL_PE1	Local RAM ECC control register (PE1)	R/W	0000 0000 _H	16/32
FFC6 5404 _H	LRERRINT_PE1	Local RAM error information control register (PE1)	R/W	0000 0006 _H	8/16/32
FFC6 5408 _H	LRSTCLR_PE1	Local RAM status clear register (PE1)	W	0000 0000 _H	8/16/32
FFC6 540C _H	LROVFSTR_PE1	Local RAM error count overflow status register (PE1)	R	0000 0000 _H	8/16/32
FFC6 5410 _H	LR1STERSTR_PE1	Local RAM 1st error status register (PE1)	R	0000 0000 _H	8/16/32
FFC6 5450 _H	LR1STEADR0_PE1	Local RAM 1st error address register 0 (PE1)	R	0000 0000 _H	8/16/32
FFC6 5454 _H	LR1STEADR1_PE1	Local RAM 1st error address register 1 (PE1)	R	0000 0000 _H	8/16/32

30.2.4.3 Details of Registers

(1) LRAPCTL_PE1 — Local RAM Address Parity Control Register

LRAPCTL enables or disables address parity check. Set PROT[1:0] bits to 01_B when writing to this register.

This register is initialized by an internal reset or an external reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT[1:0]	—	—	—	—	—	—	—	—	—	—	—	—	—	—	APARIDIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 30.31 LRAPCTL_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved These bits are always read as 0. The write value should also be 0.
15, 14	PROT[1:0]	These bits enable to write to this register. The read value is 0.
13 to 1	—	Reserved These bits are always read as 0. The write value should also be 0.
0	APARIDIS	Address Parity Check Disable Enables or disables address parity check by all the address parity circuits (Word0 to Word3). 0: Enables address parity check. 1: Disables address parity check.

(2) LRTSTCTL_PE1 — Local RAM Test Control Register

This register is used for the ECC test (self-diagnosis) and address parity checker test (self-diagnosis). After ECC test mode is enabled by setting ECCTST = 1, desired values can be written to the ECC and address parity bits. The DATSEL bit is used to select RAM data or the ECC and address parity bits.

By setting address parity test mode (APTEST_i = 1; i = 0, 1, 2, 3), the parity to be input to the address parity checker is inverted. Set PROT[1:0] bits to 01_B when writing to this register.

This register is initialized by an internal reset or an external reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT[1:0]	—	—	—	—	—	—	—	—	—	APTES T3	APTES T2	APTES T1	APTES T0	ECCTS T	DATSE L
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 30.32 LRTSTCTL_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved These bits are always read as 0. The write value should also be 0.
15, 14	PROT[1:0]	These bits enable to write to this register. The read value is 0.
13 to 6	—	Reserved These bits are always read as 0. The write value should also be 0.
5	APTEST3	Address Parity Checker (Word3) Test Sets the address parity checker to test mode. When APTEST3 = 1, the parity generated through the address parity generator is inverted.
4	APTEST2	Address Parity Checker (Word2) Test Sets the address parity checker to test mode. When APTEST2 = 1, the parity generated through the address parity generator is inverted.
3	APTEST1	Address Parity Checker (Word1) Test Sets the address parity checker to test mode. When APTEST1 = 1, the parity generated through the address parity generator is inverted.
2	APTEST0	Address Parity Checker (Word0) Test Sets the address parity checker to test mode. When APTEST0 = 1, the parity generated through the address parity generator is inverted.
1	ECCTST	ECC Test After ECC test mode is enabled by setting ECCTST = 1, the ECC and address parity bits can be read directly.
0	DATSEL	Data Select This bit is valid when ECCTST = 1. This bit selects the RAM bit which can be accessed when writing. 0: RAM data is selected. 1: The ECC bits and address parity bit are selected.

Note 1. When ECC test mode for the local RAM is enabled (ECCTST = 1), access to the local RAM should be accessed in 4-byte units.

(3) LRTDATBF_n_PE1 — Local RAM Test Data Read Buffer n (n = 0, 1)

In ECC test mode (self-diagnosis), the ECC and address parity bits can be read. If the local RAM is read while ECCTST = 1 in the local RAM test control register LRTSTCTL, reading from the local RAM reads out the ECC and address parity bits, and these bits are stored in this buffer.

This register is initialized by an internal reset or an external reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—							LRTDATBF(2n+1)								
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—							LRTDATBF(2n)								
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.33 LRTDATBF_n_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 25	—	Reserved These bits are always read as 0. The write value should also be 0.
24 to 16	LRTDATBF(2n+1)	These bits are valid when ECCTST = 1 (selecting test mode) in the local RAM test control register. When reading from the corresponding Word in the local RAM, the ECC bits for the local RAM (Word (2n + 1)) and the address parity bit are respectively stored in LRTDATBF[22:16] and LRTDATBF[24:23].
15 to 9	—	Reserved These bits are always read as 0. The write value should also be 0.
8 to 0	LRTDATBF(2n)	These bits are valid when ECCTST = 1 (selecting test mode) in the local RAM test control register. When reading from the corresponding Word in the local RAM, the ECC bits for the local RAM (Word (2n)) and the address parity bit are respectively stored in LRTDATBF[6:0] and LRTDATBF[8:7].

(4) LRECCCTL_PE1 — Local RAM ECC Control Register

LRECCCTL enables or disables ECC error detection and correction and 1-bit error correction. Set PROT[1:0] bits to 01_B when writing to this register.

This register is initialized by an internal reset or an external reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT[1:0]	—	—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 30.34 LRECCCTL_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved These bits are always read as 0. The write value should also be 0.
15, 14	PROT[1:0]	These bits enable to write to this register. The read value is 0.
13 to 2	—	Reserved These bits are always read as 0. The write value should also be 0.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. 0: Enables correction of the 1-bit error detected. 1: Disables correction of the 1-bit error detected.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(5) LRERRINT_PE1 — Local RAM Error Information Control

LRERRINT enables or disables generation of the error notification signal to the ECM upon detection of a 2-bit ECC error, a 1-bit ECC error, an address parity error, or a parity bit error.

LRERRINT is initialized by an internal reset or an external reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 30.35 LRERRINT_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 4	—	Reserved These bits are always read as 0. The write value should also be 0.
3	PBEIE	Parity Bit Error Notification Enable Enables or disables generation of the error notification signal upon detection of a parity bit error when address parity check is enabled. 0: Disables notification of the parity bit error. 1: Enables notification of the parity bit error.
2	APEIE	Address Parity Error Notification Enable Enables or disables generation of the error notification signal upon detection of an address parity error when address parity check is enabled. 0: Disables notification of the address parity error. 1: Enables notification of the address parity error.
1	DEDIE	2-Bit ECC Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the 2-bit ECC error. 1: Enables notification of the 2-bit ECC error.
0	SEDIE	1-Bit ECC Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the 1-bit ECC error. 1: Enables notification of the 1-bit ECC error.

(6) LRSTCLR_PE1 — Local RAM Status Clear Register

LRSTCLR clears the error flags in the error status register (LR1STERSTR), the overflow flag in the error count overflow status register (LROVFSTR), and the error address register (LR1STEADR).

LRSTCLR is a write-only register and is always read as 0.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STCLR 1	STCLR 0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 30.36 LRSTCLR_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 2	—	Reserved These bits are always read as 0. The write value should also be 0.
1	STCLR1	Error Overflow Flag Clear (for data) Writing 1 to this bit clears the PBEF1, APEF1, DEDF1, and SEDF1 flags in LR1STERSTR; ERROVF1 flag in LROVFSTR; and LR1STEADR1.
0	STCLR0	Error Overflow Flag Clear (for instructions) Writing 1 to this bit clears the PBEF0, APEF0, DEDF0, and SEDF0 flags in LR1STERSTR; ERROVF0 flag in LROVFSTR; and LR1STEADR0.

(7) LROVFSTR_PE1 — Local RAM Error Count Overflow Status Register

LROVFSTR monitors occurrence of error overflow. If the second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set. ERROVF is cleared by an internal reset, an external reset, or setting the STCLR bit to 1 in LRSTCLR.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERROVF1	ERROVF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.37 LROVFSTR_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 2	—	Reserved These bits are always read as 0. The write value should also be 0.
1	ERROVF1	Error Overflow Flag (for data) This flag is set if the second error occurs while any of the error flags (PBEF1, APEF1, DEDF1, and SEDF1) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error.
0	ERROVF0	Error Overflow Flag (for instructions) This flag is set if the second error occurs while any of the error flags (PBEF0, APEF0, DEDF0, and SEDF0) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error.

(8) LR1STERSTR_PE1 — Local RAM 1st Error Status Register

LR1STERSTR monitors occurrence of the first error. Errors are detected and the states are updated independently for each bank. An error status flag is set if an error occurs while all error flags for the given bank are 0. Note, however, that the corresponding error flag is also set if a 2-bit ECC error or an address parity error occurs in subsequent access as long as only the 1-bit ECC error flag or parity bit error flag is set at the time.

If more than one error is detected for a given memory access, all the corresponding error flags are set. LR1STERSTR is cleared by an internal reset, an external reset, or setting 1 to the STCLR bit in LRSTCLR.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	PBEF1	APEF1	DEDF1	SEDF1	—	—	—	—	PBEF0	APEF0	DEDF0	SEDF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.38 LR1STERSTR_PE1 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 12, 7 to 4	—	Reserved These bits are always read as 0. The write value should also be 0.
3+8n	PBEFn	Parity Bit Error Monitor Flag Clearing conditions: A reset is generated. The LRSTCLR.STCLRn bit is set to 1. Setting condition: An parity bit error has occurs while the error flags PBEFn, APEFn, DEDFn, and SEDFn are all 0.
2+8n	APEFn	Address Parity Error Monitor Flag Clearing conditions: A reset is generated. The LRSTCLR.STCLRn bit is set to 1. Setting condition: An address parity error has occurs while the error flags DEDFn and APEFn are 0.
NOTE		
This flag is set regardless of the generation source, read or write operation.		
1+8n	DEDFn	2-Bit ECC Error Monitor Flag Clearing conditions: A reset is generated. The LRSTCLR.STCLRn bit is set to 1. Setting condition: A 2-bit ECC error has occurs while the error flags DEDFn and APEFn are 0.

Table 30.38 LR1STERSTR_PE1 Register Contents (2/2)

Bit Position	Bit Name	Function
0+8n	SEDFn	1-Bit ECC Error Monitor Flag Clearing conditions: A reset is generated. The LRSTCLR.STCLRn bit is set to 1. Setting condition: A 1-bit ECC error has occurs while the error flags PBEFn, APEFn, DEDFn, and SEDFn are all 0.

Note: n = 0 (for instructions), n = 1 (for data)

(9) LR1STEADR_n_PE1 — Local RAM 1st Error Address Register n (n = 0, 1)

LR1STEADR_n holds the address at which an error has occurred.

The error address is set if an error occurs while all the error flags are 0 in LR1STERSTR. The address is updated if a 2-bit ECC error or an address parity error occurs while the 1-bit ECC error flag or parity bit error flag is set in LR1STERSTR. Once a 2-bit ECC error or an address parity error occurs, the address is not updated.

EADR[22:2] of this register correspond to bits [22:2] of the real address. The real address can be calculated by appending the higher-order address bits [31:23] as a base address. LR1STEADR_n is cleared by an internal reset, an external reset, or setting the STCLR bit to 1 in LRSTCLR.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—									EADR[22:16]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EADR[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.39 LR1STEADR_n_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 23	—	Reserved These bits are always read as 0. The write value should also be 0.
22 to 2	EADR[22:2]	1st Error Address (for Word) These bits monitor the address of the first error. The error address is set if an error occurs while all the error flags for word are 0 in LR1STERSTR. The address is updated if a 2-bit ECC error or an address parity error occurs while the 1-bit ECC error flag or parity bit error flag is set as the first error. Once a 2-bit ECC error or an address parity error occurs, the address is not updated.
1, 0	—	Reserved When read, 0 is always read. When writing, always write 0.

Note: n = 0 (for instructions), n = 1 (for data)

The second bit is always 0 for the register:

LR1STEADR₀_PE1

For example, FEF0 0000_H is stored in the register above as an error address, it indicates that a failure has occurred in the address of FEF0 0000_H or FEF0 0004_H.

30.2.4.4 Test Function

Through appropriate register setting, desired values can be written as RAM data and to the ECC and address parity bits. Also, data in the RAM and the ECC and address parity bits can all be read.

(1) Writing RAM Data

- (a) Set the ECCTST bit in the LRTSTCTL register to 1 to set test mode.
- (b) Set the corresponding DATSEL bit in the LRTSTCTL register to 0 to select RAM data for access when writing.
- (c) When data is written to the local RAM, only the RAM data can be modified without updating the ECC bits.

How to exit this test mode:

- (a) Set the ECCTST bit in the LRTSTCTL register to 0 to disable test mode (normal mode).

(2) Reading RAM Data

- (a) Set the ECCDIS bit in the LRECCCTL register to 1 to disable ECC error detection and correction.
- (b) Read the local RAM. Since neither error detection nor correction proceeds when the local RAM is read, the RAM data is read unchanged.

How to exit this test mode:

- (a) Set the ECCDIS bit in the LRECCCTL register to 0 to enable ECC error detection and correction.

(3) Writing to the ECC and Address Parity Bits

- (a) Set the ECCTST bit in the LRTSTCTL register to 1 to set test mode.
- (b) Set the corresponding DATSEL bit in the LRTSTCTL register to 1 to select the ECC bits and the address parity bit for access when writing.
- (c) When data is written to the local RAM, only the ECC and address parity bits can be modified without updating the RAM data. At that time, bit[6:0] and bit[8:7] are respectively written to the ECC bits and to the address parity bit.

How to exit this test mode:

- (a) Set the ECCTST bit in the LRTSTCTL register to 0 to disable test mode (normal mode).

(4) Reading the ECC and Address Parity Bits

- (a) Set the ECCTST bit in the LRTSTCTL register to 1 to set test mode.
- (b) When the local RAM is read, the ECC and address parity bits are stored in the Word corresponding to local RAM test data read buffer 0 or local RAM test data read buffer 1.

How to exit this test mode:

- (a) Set the ECCTST bit in the local RAM test control register to 0 to disable test mode (normal mode).

(5) Self-Diagnosis of the ECC Check Function

Desired values can be written to the RAM data and/or ECC bits by following the procedure described in (1) or (3) above. Therefore, a fault can be injected by, for example, inverting appropriate bits of the RAM data and/or ECC bits. After that, self-diagnosis of the ECC decoder is possible by reading the local RAM in normal mode and checking the result of error correction or detection.

(6) Self-Diagnosis of the Address Parity Check Function

Self-diagnosis is enabled by following either of the two procedures below.

- (a) Setting $APTSTCTL_i$ ($i = 0, 1, 2, 3$) in the LRTSTCTL register to 1 inverts the result of address parity generation for the corresponding Word. That is, a fault can be injected to the address parity generator. Writing to the corresponding Word in the local RAM in this state and checking the result of parity error detection allows self-diagnosis of the address parity check function in writing.
- (b) Desired data can be written to the address parity bit through the procedure described in (3) above. This enables injection of a 1-bit or 2-bit fault to the address parity bit by inverting the address parity bit. After that, self-diagnosis of the address parity bit checking function for reading is possible by reading the local RAM in normal mode and checking the result of parity error detection.

30.2.5 Local RAM (PCU) ECC

30.2.5.1 Overview

The local RAM ECC of PCU is summarized in the table below.

Table 30.40 Overview of Local RAM ECC of PCU

Item	Description
ECC error detection and correction	<p>ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected.</p> <ul style="list-style-type: none"> • ECC error detection and correction are carried out (2-bit error detection and 1-bit error detection and correction are carried out). • ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). <p>When disabled, neither error detection nor correction is carried out. In the state after reset, the ECC function is enabled; 1-bit error detection and correction and 2-bit error detection and notification are carried out.</p>
Address parity	None
Error notification	<p>Upon occurrence of an ECC error, the ECM is notified of the error.</p> <p>ECC Error:</p> <ul style="list-style-type: none"> • Error notification can be either enabled or disabled upon detection of a 2-bit ECC error. • Error notification can be either enabled or disabled upon detection of a 1-bit ECC error. <p>In the state after reset, notification of 2-bit error is enabled and notification of 1-bit error is disabled. The error notification signal is output, where a 2-bit ECC error is handled as one source and a 1-bit ECC error is handled as one source.</p>
Error status	<p>A status register is provided, which indicates the statuses of 2-bit ECC error detection and 1-bit ECC error detection. If an error occurs while no error status flag is set, the corresponding status is set. The error status can be cleared using the clear register.</p>
Address capture	<p>If an ECC error occurs while no error status flag is set, the address at which the associated error has occurred is captured. The address is captured when a 2-bit ECC error or a 1-bit ECC error is detected. The error status serves as the enable bit of the capture address.</p>
Self-diagnosis	<p>Desired values can be written as RAM data and to the ECC bits. Data in the RAM and the ECC bits can be read directly.</p>

30.2.5.2 List of Registers

Table 30.41 List of Registers

Address	Symbol	Register Name	R/W	Value after Reset	Access Size
FFC6 5800 _H	LRECCCTL_PCU	Local RAM ECC control register (PCU)	R/W	0000 0000 _H	16/32
FFC6 5804 _H	LRFSTERSTR_PCU	Local RAM 1st error status register (PCU)	R	0000 0000 _H	32
FFC6 5824 _H	LRSTCLR_PCU	Local RAM error status clear register (PCU)	W	0000 0000 _H	8/16/32
FFC6 5828 _H	LROVFSTR_PCU	Local RAM overflow status register (PCU)	R	0000 0000 _H	32

FFC6 5830 _H	LRFSTEADR0_PCU	Local RAM 1st error address register 0 (PCU)	R	0000 0000 _H	32
FFC6 58B0 _H	LRERRINT_PCU	Local RAM error information control register (PCU)	R/W	0000 0002 _H	8/16/32
FFC6 58B4 _H	LRTSTCTL_PCU	Local RAM test control register (PCU)	R/W	0000 0000 _H	16/32
FFC6 58B8 _H	LRTDATBF0_PCU	Local RAM test data read buffer (PCU)	R	0000 0000 _H	32

30.2.5.3 Details of Registers

(1) LRECCCTL_PCU — Local RAM ECC Control Register

LRECCCTL enables or disables ECC error detection and correction and 1-bit error correction. Set PROT[1:0] bits to 01B when writing to this register.

This register is initialized by an internal reset or an external reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT[1:0]	—	—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 30.42 LRECCCTL_PCU Register Contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved These bits are always read as 0. The write value should also be 0.
15, 14	PROT[1:0]	These bits enable to write to this register. The read value is 0.
13 to 2	—	Reserved These bits are always read as 0. The write value should also be 0.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. 0: Enables correction of the 1-bit error detected. 1: Disables correction of the 1-bit error detected.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(2) LRFSTERSTR_PCU — Local RAM 1st Error Status Register

LRFSTERSTR monitors occurrence of the first error.

An error status bit is set if an error occurs while the error flag is 0. Note, however, that the corresponding error flag is also set if a 2-bit ECC error occurs in subsequent access as long as only the 1-bit ECC error flag is set at the time.

LRFSTERSTR is cleared by an internal reset or an external reset, or by setting the FSTERRCLR0 bit in LRSTCLR to 1.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDF0	SEDF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.43 LRFSTERSTR_PCU Register Contents

Bit Position	Bit Name	Function
31 to 2	—	Reserved These bits are always read as 0. The write value should also be 0.
1	DEDF0	2-Bit ECC Error Monitor Flag Clearing conditions: A reset is generated. The LRSTCLR.FSTERRCLR0 bit is set to 1. Setting condition: A 2-bit ECC error has occurred while the error flags DEDF0 is 0.
0	SEDF0	1-Bit RAM ECC Error Monitor Flag Clearing conditions: A reset is generated. The LRSTCLR.FSTERRCLR0 bit is set to 1. Setting condition: A 1-bit ECC error has occurs while the error flags DEDF0 and SEDF0 are all 0.

(3) LRSTCLR_PCU — Local RAM Error Status Clear Register

LRSTCLR clears the error flags in the local RAM 1st error status register (LRFSTERSTR). LRSTCLR is a write-only register and is always read as 0.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FSTER RCLR0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 30.44 LRSTCLR_PCU Register Contents

Bit Position	Bit Name	Function
31 to 1	—	Reserved These bits are always read as 0. The write value should also be 0.
0	FSTERRCLR0	1st Error Status Register Clear Writing 1 to this bit clears the error flags in the 1st error status register.

(4) LROVFSTR_PCU — Local RAM Overflow Status Register

LROVFSTR monitors occurrence of local RAM error overflow. ERROVF0 is cleared by an internal reset, an external reset, or setting the ERROVFCLR0 bit to 1 in LROVFSTC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERROVF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.45 LROVFSTR_PCU Register Contents

Bit Position	Bit Name	Function
31 to 1	—	Reserved These bits are always read as 0. The write value should also be 0.
0	ERROVF0	Error Overflow Flag This bit is set when an error which source is other than that of the same error address has occurred while one of the error flags (DEDF0, SEDF0) in the error status register.

(5) LROVFSTC_PCU — Local RAM Overflow Status Clear Register

LROVFSTC clears the local RAM error overflow flag. Setting the ERROVFCLR0 bit to 1 clears the flag.

LROVFSTC is initialized by an internal reset or an external reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERROVFCLR0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 30.46 LROVFSTC_PCU Register Contents

Bit Position	Bit Name	Function
31 to 1	—	Reserved These bits are always read as 0. The write value should also be 0.
0	ERROVFCLR0	Error Overflow Flag Clear Writing 1 to this bit clears the ERROVF0 flag. This bit is always read as 0.

(6) LRFSTEADR0_PCU — Local RAM 1st Error Address Register 0

LRFSTEADR0 holds the address at which an ECC error has occurred. LRFSTEADR0[21:2] of this register correspond to bits [21:2] of the real address. The real address can be calculated by appending the higher-order address bits [31:22] as a base address.

LRFSTEADR0 is initialized by an internal reset or an external reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—										LRFSTEADR0[21:16]					
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LRFSTEADR0[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.47 LRFSTEADR0_PCU Register Contents

Bit Position	Bit Name	Function
31 to 22	—	Reserved These bits are always read as 0. The write value should also be 0.
21 to 2	LRFSTEADR0 [21:2]	1st Error Address These bits are read-only and used to monitor the address of the first error. The address is updated under the following conditions: <ul style="list-style-type: none"> When error source for the retained address is SEDF <ul style="list-style-type: none"> A 1-bit error has occurred on the same address -> The address is not overwritten. A 1-bit error has occurred on a different address -> The address is not overwritten. A 2-bit error has occurred -> The address is overwritten. When error source for the retained address is DEDF <ul style="list-style-type: none"> A 1-bit error has occurred -> The address is not overwritten. A 2-bit error has occurred on the same address -> The address is not overwritten. A 2-bit error has occurred on a different address -> The address is not overwritten.
1, 0	—	Reserved These bits are always read as 0. The write value should also be 0.

(7) LRERRINT_PCU — Local RAM Error Information Control Register

LRERRINT enables or disables generation of the error notification signal to the ECM upon detection of a 2-bit ECC error or a 1-bit ECC error.

LRERRINT is initialized by an internal reset or an external reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDIE	SEDIE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 30.48 LRERRINT_PCU Register Contents

Bit Position	Bit Name	Function
31 to 2	—	Reserved These bits are always read as 0. The write value should also be 0.
1	DEDIE	2-Bit ECC Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the 2-bit ECC error. 1: Enables notification of the 2-bit ECC error.
0	SEDIE	1-Bit ECC Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the 1-bit ECC error. 1: Enables notification of the 1-bit ECC error

(8) LRTSTCTL_PCU — Local RAM Test Control Register

This register is used for the ECC test (self-diagnosis). After ECC test mode is enabled by setting ECCTST = 1, desired values can be written to the ECC bits. The DATSEL bit is used to select the RAM data or ECC bits. Set PROT[1:0] bits to 01_B when writing to this register.

This register is initialized by an internal reset or an external reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT[1:0]	—	—	—	—	—	—	—	—	—	—	—	—	—	ECCTST	DATSEL
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 30.49 LRTSTCTRL_PCU Register Contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved These bits are always read as 0. The write value should also be 0.
15, 14	PROT[1:0]	These bits enable to write to this register. The read value is 0.
13 to 2	—	Reserved These bits are always read as 0. The write value should also be 0.
1	ECCTST	ECC Test After ECC test mode is enabled by setting ECCTST = 1, the ECC and address parity bits can be read directly.
0	DATSEL	Data Select This bit is valid when ECCTST = 1. This bit selects the RAM bit which can be accessed when writing. 0: RAM data is selected. 1: The ECC bits and address parity bit are selected.

Note 1. When ECC test mode for the local RAM is enabled (ECCTST = 1), access to the local RAM should be accessed in 4-byte units.

(9) LRTDATBF0_PCU — Local RAM Test Data Read Buffer 0

In ECC test mode (self-diagnosis), the ECC bits can be read. If the local RAM is read while ECCTST = 1 in the local RAM test control register LRTSTCTL, reading from the local RAM reads out the ECC bits, and these bits are stored in this buffer.

This register is initialized by an internal reset or an external reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	LRTDATBF						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.50 LRTDATBF0_PCU Register Contents

Bit Position	Bit Name	Function
31 to 7	—	Reserved These bits are always read as 0. The write value should also be 0.
6 to 0	LRTDATBF	These bits are valid when ECCTST = 1 (selecting test mode) in the local RAM test control register. When reading from the local RAM, the ECC bits are stored in LRTDATBF[6:0].

30.2.5.4 Test Function

For the test function and procedures for self-diagnosis, see the section on the local RAM (for the CPU). However, since the local RAM for the PCU does not have an address parity facility, ignore the description of address parity.

30.2.6 Global RAM ECC and Address Parity

30.2.6.1 Overview

The global RAM ECC is summarized in the table below.

Table 30.51 Overview of Global RAM ECC

Item	Description
ECC error detection and correction	<p>ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected.</p> <ul style="list-style-type: none"> ECC error detection and correction are carried out (2-bit error detection and 1-bit error detection and correction are carried out). ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). <p>When disabled, neither error detection nor correction is carried out. In the state after reset, the ECC function is enabled, and 1-bit error detection and correction and 2-bit error detection and notification are carried out.</p>
Address parity	<p>Address parity check can be either enabled or disabled. During data write, a parity bit generated based on the written address is written simultaneously with the write data. At this time, the parity bit is written to only one location in the RAM. During data read, comparison is performed between a parity bit generated based on the read address and a parity bit2 read from the memory. In this case, the specification of the error decode is as shown in Table 30.50 Definition of Address Parity. In the state after reset, this function is enabled.</p>
Error notification	<p>Upon occurrence of an ECC error or address parity error, the ECM is notified of the error.</p> <p>ECC Error:</p> <ul style="list-style-type: none"> Error notification can be either enabled or disabled upon detection of a 2-bit ECC error. Error notification can be either enabled or disabled upon detection of a 1-bit ECC error. <p>In the state after reset, error notification is enabled upon detection of a 2-bit ECC error, and error notification is disabled upon detection of a 1-bit ECC error.</p> <p>Parity Error:</p> <ul style="list-style-type: none"> Error notification can be either enabled or disabled upon detection of an address parity error. Error notification can be either enabled or disabled upon detection of a parity bit error. <p>In the state after reset, notification of an address parity error is enabled and notification of a parity bit error is disabled.</p> <p>In the state after reset, error notification is enabled upon detection of an address parity error. The error notification signal is output, where a 2-bit ECC error and an address parity error are handled as one source, and a 1-bit ECC error is handled as one source.</p>
Error status	<p>A status register is provided, which indicates the statuses of 2-bit ECC error detection, 1-bit ECC error detection, and address parity error detection. If an error occurs while no error status flag is set, the corresponding status is set. The error status can be cleared using the clear register.</p>
Address capture	<p>If an ECC error or a parity error occurs while no error status flag is set, the address at which the associated error has occurred is captured. The address is captured when a 2-bit ECC error, a 1-bit ECC error, or an address parity error is detected. The error status serves as the enable bit of the capture address.</p>
Self-diagnosis	<p>Desired values can be written as RAM data and to the ECC and address parity bits. Data in the RAM and the ECC and address parity bits can be read directly.</p>

The definition of the address parity error for read-access is as shown below.

Table 30.52 Definition of Address Parity

Address Parity Bit		Read Address Parity	Error Judgement/Error Name
0	0	0	No error
0	0	1	Address parity error
0	1	0	Parity bit error
0	1	1	Parity bit error
1	0	0	Parity bit error
1	0	1	Parity bit error
1	1	0	Address parity error
1	1	1	No error

The ECC encoder and decoder and the address parity generator are provided for the access paths (CPU1 and interconnect) that are connected to the global RAM. Separate address checkers are provided for bank A and bank B of the global RAM. Also, the ECC decoder and ECC encoder for RMW processing are provided for each of bank A and bank B. See **Figure 30.3**.

- RMW processing

Bit manipulation instructions, 2-byte writing and 1-byte writing are executed in three steps: 1) reading of 32-bit data; 2) generation of write data by replacement of (modifying) the predetermined data; and 3) writing of 32-bit data. In this section, such operations are referred to as read-modify-write (RMW) processing. RMW processing for the global RAM proceeds in the controller for each bank.

In RMW processing, ECC decoding proceeds in step 1), reading, and ECC encoding proceeds in step 3), writing. Refer to **Figure 30.4** for the configuration of ECC for use in RMW processing. As for the ECC decoder for use with the new values corresponding to the data to be written in step 2), an erroneous result can be injected by switching to a register in which a desired value can be set. Regarding the method for injecting errors, see **30.2.6.4, Test Function**.

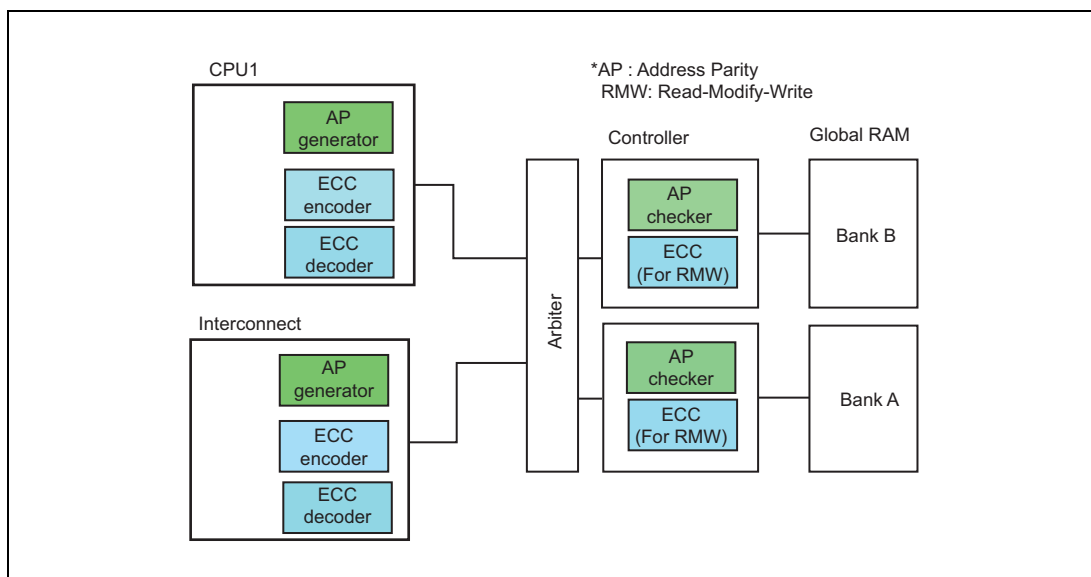

Figure 30.3 ECC of Global RAM and Address Parity

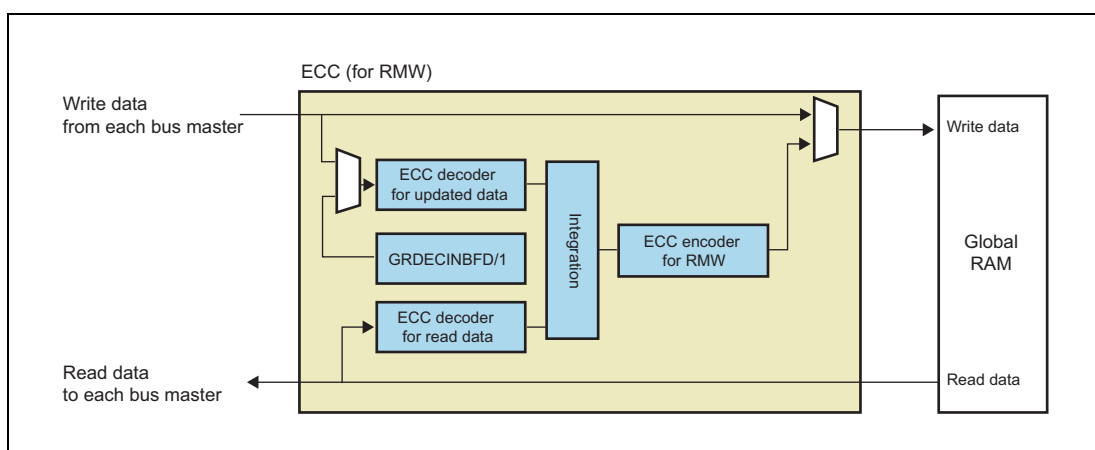

Figure 30.4 ECC Configuration of RWM for Global RAM

The structure of the global RAM allows the simultaneous reading or writing of up to 64 bits of data. Each bus master (CPU1 and the interconnect) has a 64-bit data bus. The configuration of the data bus on the controller side is of bank A and bank B, each having a width of 128-bits. On the other hand, calculation of the ECC and address parity is arranged to be per 32 bits of data.

That is to say, the ECC decoders and the ECC encoders, the ECC for use in RMW operations, and the address parity checkers in **Figure 30.3** are provided in pairs on the bus-master side, with one for the 32 higher-order bits and the other for the 32 higher-order bits, but they are provided in groups of four on the controller side, with each handling a word from word 0 to word 3 into which the 128 bits are divided. Both banks A and B are further divided into sets of four words.

Table 30.53 ECC Circuit Corresponding to Addresses

4 Lower-Order Bits of Address (Hexadecimal Notation)	F_H to C_H	B_H to 8_H	7_H to 4_H	3_H to 0_H
ECC circuit (Bus master side)	32 higher-order bits	32 lower-order bits	32 higher-order bits	32 lower-order bits
ECC circuit (Controller side)	Word3	Word2	Word1	Word0

CAUTION

The global RAM is divided into Bank A and Bank B at the boundary of the address, FEF 0000_H.

Error information of the CPU1 is retained for each instruction and data. Error information of the interconnect is stored per higher-order and lower-order section of the data. See **Figure 30.5**.

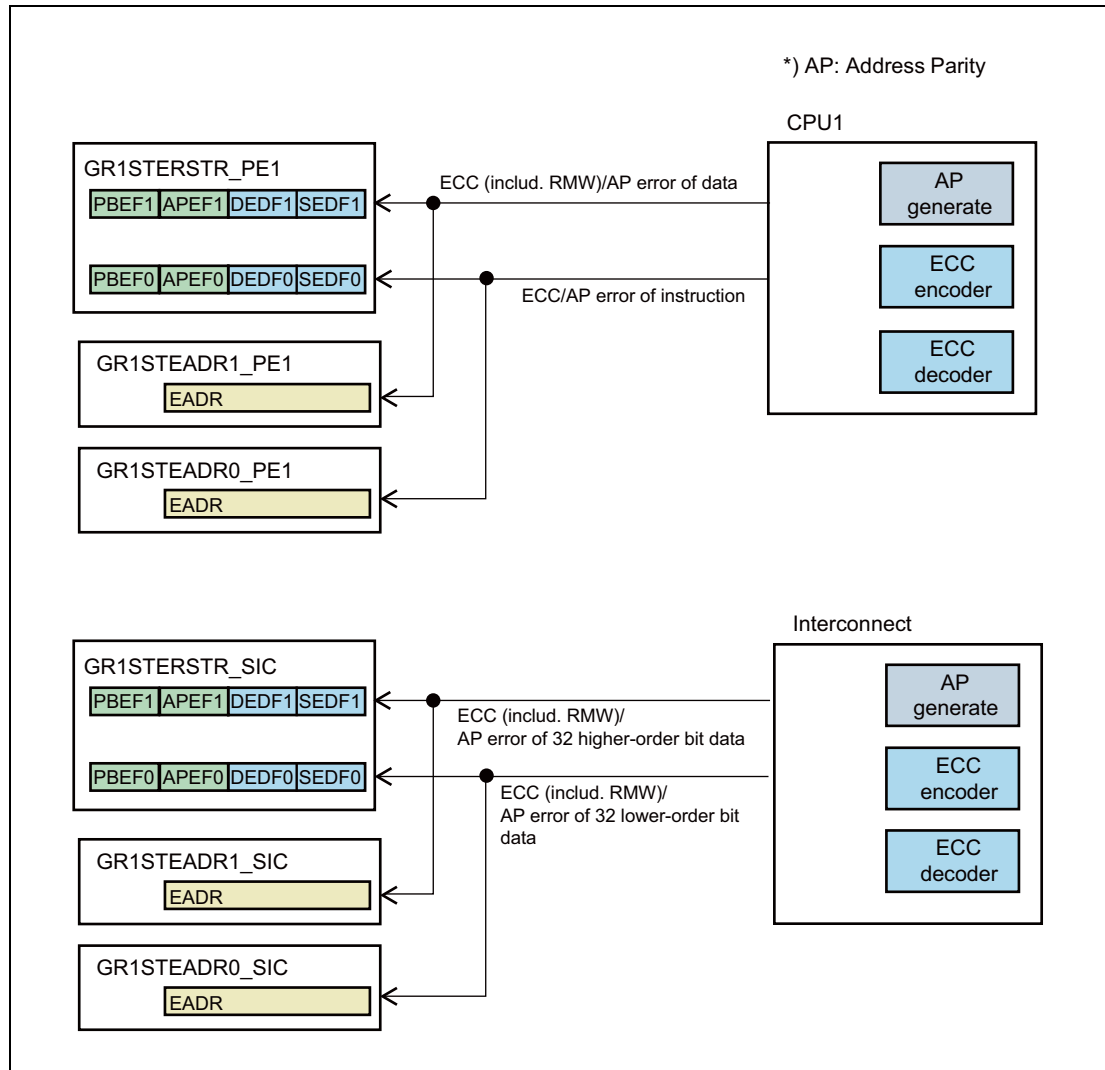

Figure 30.5 Configuration of Error Information Retention for Global RAM

30.2.6.2 List of Registers

Table 30.54 List of Registers

Address	Symbol*1	Register Name	R/W	Value after Reset	Access Size
FFC6 4000 _H	GRECCCTL_GRAMC	Global RAM ECC control register (GRAMC)	R/W	0000 0000 _H	16/32

FFC6 4204 _H	GRERRINT_SIC	Global RAM error information control register (SIC)	R/W	0000 0006 _H	8/16/32
FFC6 4208 _H	GRSTCLR_SIC	Global RAM status clear register (SIC)	W	0000 0000 _H	8/16/32
FFC6 420C _H	GROVFSTR_SIC	Global RAM error count overflow status register (SIC)	R	0000 0000 _H	8/16/32
FFC6 4210 _H	GR1STERSTR_SIC	Global RAM 1st error status register (SIC)	R	0000 0000 _H	8/16/32
FFC6 4250 _H	GR1STEADR0_SIC	Global RAM 1st error (lower 32-bit data) address register (SIC)	R	0000 0000 _H	8/16/32
FFC6 4254	GR1STEADR1_SIC	Global RAM 1st error (upper 32-bit data) address register (SIC)	R	0000 0000 _H	8/16/32
FFC6 4404 _H	GRERRINT_PE1	Global RAM error information control register (PE1)	R/W	0000 0006 _H	8/16/32
FFC6 4408 _H	GRSTCLR_PE1	Global RAM status clear register (PE1)	W	0000 0000 _H	8/16/32
FFC6 440C _H	GROVFSTR_PE1	Global RAM error count overflow status register (PE1)	R	0000 0000 _H	8/16/32
FFC6 4410 _H	GR1STERSTR_PE1	Global RAM 1st error status register (PE1)	R	0000 0000 _H	8/16/32
FFC6 4450 _H	GR1STEADR0_PE1	Global RAM 1st error (instruction) address register (PE1)	R	0000 0000 _H	8/16/32
FFC6 4454 _H	GR1STEADR1_PE1	Global RAM 1st error (data) address register (PE1)	R	0000 0000 _H	8/16/32

Note 1. In the register symbols, “_SIC” and “_PE1” indicate the registers provided for the ECC controllers for each of the access path. Specifically, “_SIC” and “_PE1” indicate the control registers for access to the Global RAM from system interconnect 1 and to the Global RAM from CPU1, respectively. “_GRAMC” is a common control register for all access paths.

30.2.6.3 Details of Registers

(1) GRECCCTL_GRAMC — Global RAM ECC Control Register

GRECCCTL is the ECC and address parity control register shared by Global RAMs. This register enables or disables address parity check and specifies ECC processing. Set PROT[1:0] bits to 01_B when writing to this register.

This register is initialized by an internal reset or an external reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT[1:0]	—	—	—	—	—	—	—	—	—	—	—	—	APARIDIS	SECDIS	ECCDIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 30.55 GRECCCTL_GRAMC Register Contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved These bits are always read as 0. The write value should also be 0.
15, 14	PROT[1:0]	These bits enable to write to this register. The read value is 0.
13 to 3	—	Reserved These bits are always read as 0. The write value should also be 0.
2	APARIDIS	Address Parity Check Disable Enables or disables address parity check. In the initial state, the parity check is enabled. 0: Enables address parity check. 1: Disables address parity check.
1	SECDIS	1-Bit Error Correction Disable for RMW Enables or disables 1-bit error correction when ECC error detection and correction are enabled. 0: Enables correction of the 1-bit error detected. 1: Disables correction of the 1-bit error detected.
0	ECCDIS	ECC Disable for RMW Enables or disables ECC error detection and correction. In the initial state, ECC error detection and correction are enabled. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.
NOTE		
The encoding function is enabled even though the error detection and correction are disabled.		

(2) GRTSTCTL — Global RAM Test Control Register

This register is used for the ECC test (self-diagnosis) and address parity checker test (self-diagnosis).

After the test function is enabled by setting TESTEN = 1, desired values can be written to the ECC and address parity bits. The DATSEL bit is used to select the RAM data or the ECC and address parity bits. Also, input and output by the ECC decoder in the Global RAM controller can be controlled for testing (self-diagnosis).

By setting address parity test mode (MAPTEST = 1, BAPTEST = 1), the parity to be input to the address parity checker is inverted. Set PROT[1:0] bits to 01_B when writing to this register.

This register is initialized by an internal reset or an external reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PROT[1:0]		—	—	—	—	MAPBIT[1:0]		MAPTEST[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BAPTEST[7:0]								—	RAMSEL		DATSEL		DECIN EN	TESTE N	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 30.56 GRTSTCTL Register Contents (1/2)

Bit Position	Bit Name	Function
31, 30	PROT[1:0]	This bit enables write-access to this register. When read, 0 is always read.
29 to 26	—	Reserved When read, 0 is always read. When writing, always write 0.
25, 24	MAPBIT[1:0]	These bits set the memory address parity bit. The memory address parity is used for an address parity check during read-access. This bit setting is effective except when TESTEN = 1 or MAPTEST[7:0] = 00 _H . When MAPBIT is 1, the target memory address parity bit is inverted. The relationship between MAPBIT[1:0] and the corresponding memory address parity bit is as shown below. MAPBIT[0]: Lower-order address parity bit MAPBIT[1]: Higher-order address parity bit This bit setting is applied to all Words and Banks.
23 to 16	MAPTEST[7:0]	These bits set the memory address parity checker in test mode. When MAPTEST is 1, setting of the MAPBIT[1:0] is enabled. The setting of this bit is effective only when TESTEN is 1. MAPTEST [0]: BankA Word0 MAPTEST [1]: BankA Word1 MAPTEST [2]: BankA Word2 MAPTEST [3]: BankA Word3 MAPTEST [4]: BankB Word0 MAPTEST [5]: BankB Word1 MAPTEST [6]: BankB Word2 MAPTEST [7]: BankB Word3

Table 30.56 GRTSTCTL Register Contents (2/2)

Bit Position	Bit Name	Function
15 to 8	BAPTEST[7:0]	<p>These bits set the bus address parity checker in test mode. The bus address parity is used for address parity checking during write-access. The parity generated in the bus address parity generation unit is inverted while BAPTEST = 1.</p> <p>This bit setting is effective when TESTEN = 1.</p> <p>BAPTEST [0]: BankA Word0 BAPTEST [1]: BankA Word1 BAPTEST [2]: BankA Word2 BAPTEST [3]: BankA Word3 BAPTEST [4]: BankB Word0 BAPTEST [5]: BankB Word1 BAPTEST [6]: BankB Word2 BAPTEST [7]: BankB Word3</p>
7	—	<p>Reserved</p> <p>When read, 0 is always read. When writing, always write 0.</p>
6 to 4	RAMSEL[2:0]	<p>These bits set the global RAM address for reading the GRTDATBF register.</p> <p>000_B: BankA Word0 001_B: BankA Word1 010_B: BankA Word2 011_B: BankA Word3 100_B: BankB Word0 101_B: BankB Word1 110_B: BankB Word2 111_B: BankB Word3</p> <p>This bit setting is effective only when TESTEN = 1.</p>
3, 2	DATSEL[1:0]	<p>These bits selects write data to the RAM and read data in GRTDATBF. This bit setting is effective only when TESTEN = 1.</p> <p>00_B :</p> <ul style="list-style-type: none"> – GRTDATBF: RAM data is stored during read-access. – Global RAM: Only RAM data area is updated during write-access ECC bits and parity bits are not updated. <p>01_B :</p> <ul style="list-style-type: none"> – GRTDATBF: ECC bits and address parity bits are stored during read-access to RAM. – Global RAM: Only ECC bits and address parity bits are updated during write-access to RAM. The data area of the RAM is not updated. <p>1x_B :</p> <p>Reserved (setting prohibited)</p>
1	DECINEN	<p>ECC Decoder Error Injection Enabling for DECINEN RMW</p> <p>This bit is effective when TESTEN = 1 and enables input of the data of the ECC decoder input buffer register to ECC decoder for updated data during RMW.</p> <p>0: Data of the ECC decoder input buffer is not input. 1: Data of the ECC decoder input buffer is input.</p>
0	TESTEN	<p>ECC Test</p> <p>When ECC test mode is set (TESTEN = 1), the data in the ECC bits and address parity bits can be read directly.</p>

(3) GRTDATBF — Global RAM Test Data Read Buffer

This register can read the RAM data and ECC bits and address parity bits. When the RAM is read, the value selected by the DATSEL1 or DATSEL0 bit of the GRTSTCTL register is stored in this buffer.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GRTDATBF															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	GRTDATBF															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.57 GRTDATBF Register Contents

Bit Position	Bit Name	Function
31 to 0	GRTDATBF	<p>These bits operate as a buffer for retaining data read from the global RAM. The address in global RAM from which the data are to be read is selected by the setting of the RAMSEL bits.</p> <p>When RAM is read while the setting of the DATSEL[1:0] bits is (0, 0), the data are stored in the GRTDATBF[31:0] bits. When RAM is read while the setting of the DATSEL[1:0] bits is (0, 1), the corresponding ECC bits are stored in the GRTDATBF[6:0] bits and the corresponding address parity bits are stored in the GRTDATBF[8:7] bits. The GRTDATBF[31:9] bits all have the value 0 in this case.</p>

(4) GRDECINBF0 — Global RAM ECC Decoder Input Data Buffer 0

This register is for setting 32-bit RAM data for input to the ECC decoder for updating data during RMW.

Using this register allows self-diagnosis of the ECC decoder for updating data during RMW.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GRDECINBF0															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 30.58 GRDECINBF0 Register Contents

Bit Position	Bit Name	Function
31 to 0	GRDECINBF0	These bits become effective when the value of the GRTSTCTL.TESTEN bit is 1 (test mode). When an instruction for an RMW operation is executed while the value of the DECINEN bit is 1, the bits in this register are input to the ECC decoder for use with the new values as if they were 32 bits of data from RAM. This register is for common use with words 0 to 3 of both the higher- and lower-order sections of data for both banks A and B.

(5) GRDECINBF1 — Global RAM ECC Decoder Input Data Buffer 1

This register is for setting a desired 7-bit ECC-encoded value for input to the ECC decoder for use with the new values in RMW operations. Using this register allows self-diagnosis of the ECC decoder for use with the new values in RMW operations.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 30.59 GRDECINBF1 Register Contents

Bit Position	Bit Name	Function
31 to 7	—	Reserved These bits are always read as 0. The write value should also be 0.
6 to 0	GRDECINBF1	These bits are valid when TESTEN = 1 (test mode) in the GRTSTCTL register. When DECINEN = 1, the value of this register is input to the ECC decoder as data for use in updating in response to the execution of an RMW instruction. This register is common to banks A and B and provides the values for both the higher-/lower-order bits and Word0 to Word3.

(6) GRERRINT_SIC/PE1 — Global RAM Error Information Control Register

GRERRINT enables or disables generation of the error notification signal to the ECM upon detection of a 2-bit ECC error, a 1-bit ECC error, or an address parity error.

The setting of this register is used for accesses through the respective access path.

GRERRINT is initialized by an internal reset or an external reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 4	—	Reserved These bits are always read as 0. The write value should also be 0.
3	PBEIE	Parity Bit Error Notification Enable Enables or disables of generation of the error notification signal upon detection of a parity bit error when address parity check is enabled. 0: Disables notification of the parity bit error. 1: Enables notification of the parity error.
2	APEIE	Address Parity Error Notification Enable Enables or disables generation of the error notification signal upon detection of an address parity error when address parity check is enabled. 0: Disables notification of the address parity error. 1: Enables notification of the address parity error.
1	DEDIE	2-Bit ECC Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the 2-bit ECC error. 1: Enables notification of the 2-bit ECC error.
0	SEDIE	1-Bit ECC Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the 1-bit ECC error. 1: Enables notification of the 1-bit ECC error.

(7) GRSTCLR_SIC/PE1 — Global RAM Status Clear Register

GRSTCLR clears the error flags in the error status register (GR1STERSTR), the overflow flag in the error count overflow status register (GROVFSTR), and the error address register (GR1STEADR). GRSTCLR is a write-only register and is always read as 0.

The setting of this register is used for accesses through the respective access path.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 30.61 GRSTCLR_SIC/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 2	—	Reserved These bits are always read as 0. The write value should also be 0.
1	STCLR1	Error Overflow Flag Clear (PE1: for data, SIC: for data of the 32 higher-order bits and RMW) Writing 1 to this bit clears the PBEF1 and APEF1 flags in GR1STERSTR; ERROVF1 flag in GROVFSTR; and GR1STEADR1.
0	STCLR0	Error Overflow Flag Clear (PE1: for instructions, SIC: for data of the 32 lower-order bits and RMW) Writing 1 to this bit clears the PBEF0, APEF0, DEDF0, and SEDF0 flags in GR1STERSTR; ERROVF0 flag in GROVFSTR; and GR1STEADR0.

(8) GROVFSTR_SIC/PE1 — Global RAM Error Count Overflow Status Register

GROVFSTR monitors occurrence of error overflow. If the second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set. ERROVF is cleared by an internal reset, an external reset, or setting the STCLR bit to 1 in GRSTCLR.

The setting of this register is used for accesses through the respective access path.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 30.62 GROVFSTR_SIC/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 2	—	Reserved These bits are always read as 0. The write value should also be 0.
1	ERROVF1	Error Overflow Flag (for data of the 32 higher-order bits) When writing 1 to this bit clears the PBEF1, APEF1, DEDF1, and SEDF1 flags in the GR1STERSTR register; the ERROVF1 flag in the GROVFSTR register; and the GR1STEADR1 register.
0	ERROVF0	Error Overflow Flag (for data of the 32 lower-order bits) Writing 1 to this bit clears the PBEF0, APEF0, DEDF0, and SEDF0 flags in the GR1STERSTR register; the ERROVF0 flag in the GROVFSTR register; and the GR1STEADR0 register.

(9) GR1STERSTR_SIC/PE1 — Global RAM 1st Error Status Register

GR1STERSTR monitors occurrence of the first error. Errors are detected and the states are updated independently for the higher- and lower-order 32 bits. An error status flag is set if an error occurs while all error flags for the higher-order or the lower-order bits are 0. Note, however, that the corresponding error flag is also set if a 2-bit ECC error or an address parity error occurs in subsequent access as long as only the 1-bit ECC error flag or parity bit error flag is set at the time.

If more than one error is detected for a given memory access, all the corresponding error flags are set. GR1STERSTR is cleared by an internal reset, an external reset, or setting the STCLR bit to 1 in GRSTCLR.

The setting of this register is used for accesses through the respective access port.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.63 GR1STERSTR_SIC/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 12, 7 to 4	—	Reserved These bits are always read as 0. The write value should also be 0.
3+8n	PBEFn	Parity Error Monitoring Flag Clearing conditions: A reset is generated. The GRSTCLR.STCLRn bit is set to 1. Setting condition: A parity bit error has occurred while the error flags PBEFn, APEFn, DEDFn, and SEDFn are all 0.
2+8×n	APEFn	Address Parity Error Monitor Flag Clearing conditions: A reset is generated. The GRSTCLR.STCLRn bit is set to 1. Setting condition: An address parity error has occurred while the error flags APEFn and DEDFn are 0.
NOTE		
This flag is set equally for read and write; the error generation source is not considered.		
1+8×n	DEDFn	2-Bit ECC Error Monitor Flag Clearing conditions: A reset is generated. The GRSTCLR.STCLRn bit is set to 1. Setting condition: A 2-bit ECC error has occurred while the error flags APEFn and DEDFn are 0.

Table 30.63 GR1STERSTR_SIC/PE1 Register Contents

Bit Position	Bit Name	Function
0+8×n	SEDFn	1-Bit ECC Error Monitor Flag Clearing conditions: A reset is generated. The GRSTCLR.STCLRn bit is set to 1. Setting condition: A parity bit error has occurred while the error flags PBEFn, APEFn, DEDFn, and SEDFn are all 0.

Note: SIC: n = 0 (the 32 lower-order bits and RMW), n = 1: (the 32 higher-order bits and RMW)
PE1: n = 0 (for instructions), n = 1: (for data and RMW)

(10) GR1STEADR_n_SIC/PE1 — Global RAM 1st Error Address Register n (n = 0, 1)

GR1STEADR_n holds the address at which an error has occurred.

The error address is set if an error occurs while all the error flags are 0 in GR1STERSTR. The address is updated if a 2-bit ECC error or an address parity error occurs while the 1-bit ECC error flag is set as the first error. Once a 2-bit ECC error or an address parity error occurs, the address is not updated.

EADR[20:2] of this register correspond to bits [20:2] of the real address. The real address can be calculated by appending the higher-order address bits [31:21] as a base address.

GR1STEADR is cleared by an internal reset, an external reset, or setting the STCLR bit to 1 in GRSTCLR. During accesses to the lower 32-bit data, the address is stored in GR1STEADR0. During accesses to the 32 higher-order bits data, the address is stored in GR1STEADR1.

The setting of this register is used for accesses through the respective access path.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—											EADR[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EADR[15:2]														—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.64 GR1STEADR_n_SIC/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 21	—	Reserved These bits are always read as 0. The write value should also be 0.
20 to 2	EADR[20:2]	1st Error Address These bits monitor the address of the first error. The error address is set if an error occurs while all the error flags are 0 in GR1STERSTR. The address is updated if a 2-bit ECC error or an address parity error occurs while the 1-bit ECC error flag is set as the first error. Once a 2-bit ECC error or an address parity error occurs, the address is not updated.
1, 0	—	Reserved When read, 0 is always read. When writing, always write 0.

Note: SIC: n = 0 (the 32 lower-order bits and RMW), n = 1: (the 32 higher-order bits and RMW)
PE1: n = 0 (for instructions), n = 1: (for data and RMW)

The second bit is always 0 for the register:

GR1STEADR0_PE1

When FEF0 0000_H is stored as an error address to the register above, it indicates that a failure has occurred in the address FEF0 0000_H or FEF0 0004_H.

30.2.6.4 Test Function

Through appropriate register setting, desired values can be written as RAM data and to the ECC and address parity bits. Also, data in the RAM and the ECC and address parity bits and the ECC decoder output data for RMW can all be read.

It is possible to input the desired data in the ECC decoder for RMW.

(1) Writing RAM Data

- (a) Set the TESTEN bit in the GRTSTCTL register to 1 to set test mode.
- (b) Set the corresponding DATSEL1 to 0 and DATSEL0 to 0 in the GRTSTCTL register to select RAM data for access when writing.
- (c) When data is written to the global RAM, only the RAM data can be modified without updating the ECC bits.

How to exit this test mode:

- (a) Set the TESTEN bit in the GRTSTCTL register to 0 to disable test mode (normal mode).

(2) Reading RAM Data

- (a) Set the ECCDIS bit in the GRECCCTL_GRAMC register to 1 to disable ECC error detection and correction.
- (b) Read the global RAM. Since neither error detection nor correction proceeds when the global RAM is read, the RAM data is read unchanged.

How to exit this test mode:

- (a) Set the ECCDIS bit in the GRECCCTL_GRAMC register to 0 to enable ECC error detection and correction.

(3) Writing to the ECC and Address Parity Bits

- (a) Set the TESTEN bit in the GRTSTCTL register to 1 to set test mode.
- (b) Set the corresponding DATSEL1 bit to 0 and DATSEL0 bit to 1 in the GRTSTCTL register to select the ECC bits and the address parity bit for access when writing.
- (c) When data is written to the global RAM, only the ECC and address parity bits can be modified without updating the RAM data. At that time, bits[6:0] and bits[8:7] are respectively written to the ECC bits and to the address parity bit.

How to exit this test mode:

- (a) Set the TESTEN bit in the GRTSTCTL register to 0 to disable test mode (normal mode).

(4) Reading the ECC and Address Parity Bits

- (a) Set the TESTEN bit in the GRTSTCTL register to 1 to set test mode.
- (b) Setting the DATSEL1 and DATSEL0 bits in the GRTSTCTL register to 0 and 1, respectively, to select the ECC and address parity bits for access when reading. The GRTSTCTL.RAMSEL bit is set in accordance with the address of the global RAM that reads the data.
- (c) When data in the global RAM is read, the ECC and address parity bits are stored in the GRTDATBF register.

How to exit this test mode:

- (a) Set the TESTEN bit in the GRTSTCTL register to 0 to disable test mode (normal mode).

(5) Self-Diagnosis of the ECC Check Function for the Access Ports

Desired values can be written to the RAM data and/or ECC bits by following the procedure described in (1) or (3) above. Therefore, a fault can be injected by, for example, inverting appropriate bits of the RAM data and/or ECC bits. After that, self-diagnosis of the ECC decoder is possible by reading the global RAM in normal mode and checking the result of error correction or detection.

(6) Self-Diagnosis of the Address Parity Check Function

Self-diagnosis by address parity check for write and read is enabled by following either of the two procedures below.

- (a) Setting BAPTEST[7:0] in the GRTSTCTL register to 1 inverts the result of address parity generation for the corresponding data area (Word0 to Word 3) of the corresponding bank (bank A or B). That is, a fault can be injected to the address parity generator. Writing to the corresponding data area of the corresponding bank in the global RAM in this state and checking the result of parity error detection allows self-diagnosis of the address parity check function in writing.
- (b) Setting the MAPTEST[7:0] bits in the GRTSTCTL register to 1 leads to inversion of the generated result for address parity of the selected span of data (word 0, 1, 2, or 3) in the selected bank (A or B). That is to say, it allows the injection of errors (faulty values) to the address parity generator. When the selected span of data in the selected bank is read in this state, an address parity error is conveyed in accord with the setting of the MAPBIT[1:0] bits. This allows self-diagnosis of address-parity checking by confirming the results for the detection of parity errors during reading. Furthermore, by following the procedures described in (3) and (4) above, the method of self-diagnosis with injection of a desired value to the address-parity bits is also possible.

Inverting the address bits in this way allows the injection of an error (faulty value) in one or both of the address-parity bits. Subsequently reading the global RAM in normal mode allows the self-diagnosis of address-parity checking during reading by confirming the results for the detection of parity errors.

(7) Self-Diagnosis of the ECC Decoder for the Data Read Out in an RMW Operation

Desired values can be written as the RAM data or ECC bits by following the procedures described in (1) and (3) above. Doing so by inverting suitable bits among, for example, the RAM data or ECC bits allows the injection of errors. Subsequently executing RMW processing then confirming the results for error correction or error detection allows self-diagnosis of the ECC decoder for the data read out in RMW operations.

(8) Self-Diagnosis of the ECC Decoder for the Data being Updated at the Time of RMW Access

Setting the DECINEN bit in the GRTSTCTL register to 1 selects switching of the values of the global RAM ECC decoder data input buffers 0 and 1 (GRDECINBF0, 1) to replace write data sent from all routes for access as the input to the ECC decoder for use with the new values in RMW operations. Accordingly, suitable errors can be injected by thus writing appropriate values to input buffer registers 0 and 1 for the ECC decoder for use with the new values in RMW operations. Subsequently executing RMW processing then confirming the results for error correction or error detection allows self-diagnosis of the ECC decoder for use with the new values in RMW operations.

30.2.7 Instruction Cache ECC and EDC

30.2.7.1 Overview

The instruction cache ECC is summarized in the table below.

Table 30.65 Overview of Instruction Cache ECC

Item	Description
ECC error detection and correction	<p>ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected.</p> <ul style="list-style-type: none"> ECC error detection and correction are carried out (2-bit error detection and 1-bit error detection and correction are carried out). ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). <p>When disabled, neither error detection nor correction is carried out. In the state after reset, the ECC function is enabled, and 1-bit error detection and correction and 2-bit error detection and notification are carried out.</p>
Address parity	None
Error notification	<p>Upon occurrence of an ECC error, the ECM is not notified of the error.</p> <p>ECC Error:</p> <ul style="list-style-type: none"> Error notification can be either enabled or disabled upon detection of a 2-bit ECC error. Error notification can be either enabled or disabled upon detection of a 1-bit ECC error. <p>In the state after reset, notification of the 2-bit ECC error is disabled, and notification of the 1-bit ECC error is disabled. The error notification signal is output, where a 2-bit ECC error is handled as one source, and a 1-bit ECC error is handled as one source.</p>
Error status	<p>A status register is provided, which indicates the statuses of 2-bit ECC error detection and 1-bit ECC error detection. If an error occurs while no error status flag is set, the corresponding status is set. The error status can be cleared using the clear register.</p>
Address capture	<p>If an ECC error occurs while no error status flag is set, the address at which the associated error has occurred is captured. The address is captured when a 2-bit ECC error or a 1-bit ECC error is detected. The error status serves as the enable bit of the capture address.</p>
Self-diagnosis	<p>A cache instruction is used to write the desired values as RAM data and to the ECC bits. Similarly, data in the RAM and the ECC bits can be read directly. Since instructions as described above go through the same encoding or decoding path as a normal cache fill or instruction fetch, only such instructions can be used in inserting and confirming errors.</p>

30.2.7.2 List of Registers

Table 30.66 List of Registers

Address	Symbol	Register Name	R/W	Value after Reset	Access Size
FFC6 0400 _H	IDECCTL_PE1	Instruction cache data RAM ECC control register (PE1)	R/W	0000 0000 _H	16/32

30.2.7.3 Details of Registers

(1) IDECCCTL_PE1 — Instruction Cache Data RAM ECC Control Register

IDECCCTL enables or disables ECC error detection and correction and 1-bit error correction for cache data RAM. Set PROT[1:0] bits to 01_B when writing to this register.

This register is initialized by an internal reset or an external reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PROT[1:0]	—	—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Table 30.67 IDECCCTL_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved These bits are always read as 0. The write value should also be 0.
15, 14	PROT[1:0]	These bits enable to write to this register. The read value is 0.
13 to 2	—	Reserved These bits are always read as 0. The write value should also be 0.
1	SECDIS	1-Bit Error Correction Disable Enables or disables 1-bit error correction when ECC error detection and correction are enabled. 0: Enables correction of the 1-bit error detected. 1: Disables correction of the 1-bit error detected.
0	ECCDIS	ECC Disable Enables or disables ECC error detection and correction. 0: Enables ECC error detection and correction. 1: Disables ECC error detection and correction.

(2) IDERRINT_PE1 — Instruction Cache Data RAM Error Information Control Register

IDERRINT enables or disables generation of the error notification signal to the ECM upon detection of a 2-bit ECC error or a 1-bit ECC error in cache data RAM.

IDERRINT is initialized by an internal reset or an external reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 30.68 IDERRINT_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 2	—	Reserved These bits are always read as 0. The write value should also be 0.
1	DEDIE	2-Bit ECC Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the 2-bit ECC error. 1: Enables notification of the 2-bit ECC error.
0	SEDIE	1-Bit ECC Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the 1-bit ECC error. 1: Enables notification of the 1-bit ECC error.

(3) IDSTCLR_PE1 — Instruction Cache Data RAM Error Status Clear Register

IDSTCLR clears the error flags in the error status register (ID1STERSTR), the overflow flag in the error count overflow status register (IDOVFSTR), and the error address register (ID1STEADR).

IDSTCLR is a write-only register and is always read as 0.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 30.69 IDSTCLR_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 1	—	Reserved These bits are always read as 0. The write value should also be 0.
0	STCLR0	Error Overflow Flag Clear Writing 1 to this bit clears the DEDF0 and SEDF0 flags in ID1STERSTR; ERROVF0 flag in IDOVFSTR; and ID1STEADR0.

(4) IDOVFSTR_PE1 — Instruction Cache Data RAM Error Count Overflow Status Register

IDOVFSTR monitors occurrence of error overflow in cache data RAM. If the second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set. ERROVF is cleared by an internal reset, an external reset, or setting the STCLR bit to 1 in IDSTCLR.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.70 IDOVFSTR_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 1	—	Reserved These bits are always read as 0. The write value should also be 0.
0	ERROVF0	Error Overflow Flag (for bank 0) This flag is set if the second error occurs while any of the error flags (DEDFO and SEDFO) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error.

(5) ID1STERSTR_PE1 — Instruction Cache Data RAM 1st Error Status Register

ID1STERSTR monitors occurrence of the first error in cache data RAM. The error status flag is set if an error occurs while all the error flags are 0. If a 2-bit ECC error occurs while the 1-bit ECC error flag is set, the corresponding error flag is set.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.71 ID1STERSTR_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 2	—	Reserved These bits are always read as 0. The write value should also be 0.
1	DEDFO	2-Bit ECC Error Monitor Flag Clearing conditions: A reset is generated. The STCLR0 bit in IDSTCLR is set to 1. Setting condition: A 2-bit ECC error has occurred while the error flag DEDFO is 0.
0	SEDF0	1-Bit ECC Error Monitor Flag Clearing conditions: A reset is generated. The STCLR0 bit in IDSTCLR is set to 1. Setting condition: A 1-bit ECC error has occurred while the error flags DEDFO and SEDFO are 0.

(6) ID1STEADR0_PE1 — Instruction Cache Data RAM 1st Error Address Register

ID1STEADR holds the address at which an error has occurred in cache data RAM.

The error address is set if an error occurs while all the error flags are 0 in ID1STERSTR. The address is updated if a 2-bit ECC error is found while the 1-bit ECC error flag is set for a first error. Once a 2-bit ECC error occurs, the address is not updated.

The data RAM and tag RAM destination addresses of the cached code are uniquely determined from the addresses in code flash memory. This register holds the source addresses of cached code from the code flash memory. For the relationship between the addresses in code flash memory and the data RAM and tag RAM of the instruction cache, see **Section 3.2.2, Instruction Cache and Data Buffer**.

ID1STEADR is cleared by an internal reset, an external reset, or setting the STCLR bit to 1 in IDSTCLR.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—							EADR0[24:16]

Table 30.72 ID1STEADR0_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 25	—	Reserved When read, 0 is always read. When writing, always write 0.
24 to 3	EADR0[24:3]	1st Error Address These bits monitor the address of the first error. The error address is set if an error occurs while all the error flags are 0 in ID1STERSTR. The address is updated if a 2-bit ECC error is found while the 1-bit ECC error flag is set as the first error. Once a 2-bit ECC error occurs, the address is not updated.
2 to 0	—	Reserved: When read, 0 is always read. When writing, always write 0.

(7) ITECCCTL_PE1 — Instruction Cache Tag RAM ECC Control Register

This register is used to enable or disable ECC error detection of the cache TAG RAM. Set PROT[1:0] bits to 01_B when writing to this register.

This register is initialized by an internal reset or an external reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 30.73 ITECCCTL_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved These bits are always read as 0. The write value should also be 0.
15, 14	PROT[1:0]	These bits enable to write to this register. The read value is 0.
13 to 1	—	Reserved These bits are always read as 0. The write value should also be 0.
0	ECCDIS	ECC Disable Enables or disables ECC error detection. 0: Enables ECC error detection. 1: Disables ECC error detection.

(8) ITERRINT_PE1 — Instruction Cache Tag RAM Error Information Control Register

ITERRINT enables or disables generation of the error notification signal to the ECM upon detection of a 2-bit ECC error or a 1-bit ECC error in cache tag RAM.

ITERRINT is initialized by an internal reset or an external reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 30.74 ITERRINT_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 2	—	Reserved These bits are always read as 0. The write value should also be 0.
1	DEDIE	2-Bit ECC Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection and correction are enabled. 0: Disables notification of the 2-bit ECC error. 1: Enables notification of the 2-bit ECC error.
0	SEDIE	1-Bit ECC Error Notification Enable Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection and correction are enabled. 0: Disables notification of the 1-bit ECC error. 1: Enables notification of the 1-bit ECC error.

(9) ITSTCLR_PE1 — Instruction Cache Tag RAM Error Status Clear Register

ITSTCLR clears the error flags in the error status register (IT1STERSTR), the overflow flag in the error count overflow status register (ITOVFSTR), and the error address register (IT1STEADR0).

ITSTCLR is a write-only register and is always read as 0.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 30.75 ITSTCLR_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 1	—	Reserved These bits are always read as 0. The write value should also be 0.
0	STCLR0	Error Overflow Flag Clear Writing 1 to this bit clears the DEDF0 and SEDF0 flags in IT1STERSTR; ERROVF0 flag in ITOVFSTR; and IT1STEADR0.

(10) ITOVFSTR_PE1 — Instruction Cache Tag RAM Error Count Overflow Status Register

ITOVFSTR monitors occurrence of error overflow in cache tag RAM. If the second error occurs after the first error (= while any of the error flags in the error status register is set), the flag in this register is set. However, if the second error is identical to the first error (both the source and address are same), this flag is not set. ERROVF is cleared by an internal reset, an external reset, or setting the STCLR bit to 1 in ITSTCLR.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.76 ITOVFSTR_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 1	—	Reserved These bits are always read as 0. The write value should also be 0.
0	ERROVF0	Error Overflow Flag This flag is set if the second error occurs while any of the error flags (DEDFO and SEDFO) in the error status register is set, except when both of the error address and source of the second error are the same as those of the first error.

(11) IT1STERSTR_PE1 — Instruction Cache Tag RAM 1st Error Status Register

IT1STERSTR monitors occurrence of the first error in cache tag RAM.

The error status flag is set if an error occurs while all the error flags are 0. If a 2-bit ECC error occurs while the 1-bit ECC error flag is set, the corresponding error flag is set.

IT1STERSTR is cleared by an internal reset, an external reset, or setting the STCLR bit to 1 in ITSTCLR.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.77 IT1STERSTR_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 2	—	Reserved These bits are always read as 0. The write value should also be 0.
1	DEDFO	2-Bit ECC Error Monitor Flag Clearing conditions: A reset is generated. The STCLR0 bit in ITSTCLR is set to 1. Setting condition: A 2-bit ECC error has occurred while the error flag DEDFO is 0.
0	SEDF0	1-Bit ECC Error Monitor Flag Clearing conditions: A reset is generated. The STCLR0 bit in ITSTCLR is set to 1. Setting condition: A 1-bit ECC error has occurred while the error flags DEDFO and SEDFO are 0.

(12) IT1STEADR0_PE1 — Instruction Cache Tag RAM 1st Error Address Register

IT1STEADR0 holds the address at which an error has occurred in cache tag RAM.

The error address is set if an error occurs while all the error flags are 0 in IT1STERSTR. The address is updated if a 2-bit ECC error is found while the 1-bit ECC error flag is set as the first error. Once a 2-bit ECC error occurs, the address is not updated.

The data RAM and tag RAM destination addresses of the cached code are uniquely determined from the addresses in code flash memory. This register holds the source addresses of cached code from the code flash memory. For the relationship between the addresses in code flash memory and the data RAM and tag RAM of the instruction cache, see **Section 3.2.2, Instruction Cache and Data Buffer**.

IT1STEADR0 is cleared by an internal reset, an external reset, or setting the STCLR bit to 1 in ITSTCLR.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	EADR[15:5]											—				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.78 IT1STEADR0_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 25	—	Reserved When read, 0 is always read. When writing, always write 0.
24 to 5	EADR[24:5]	1st Error Address Monitors the address of the first error. The error address is set if an error occurs while all the error flags are 0 in IT1STERSTR. The address is updated if a 2-bit ECC error is found while the 1-bit ECC error flag is set as the first error. Once a 2-bit ECC error or an address parity error occurs, the address is not updated.
4 to 0	—	Reserved When read, 0 is always read. When writing, always write 0.

30.2.7.4 Test Function

A cache instruction is used to write the desired values as RAM data and to the ECC bits, and read data in the RAM and the ECC bits directly.

Since instructions as described above go through the same encoding or decoding path as a normal cache fill or instruction fetch, only such instructions can be used in inserting and confirming errors.

For details, see *RH850G3MH User's Manual: Software*.

30.2.8 DTS RAM ECC

See **Section 7, DMA**.

30.2.9 ECC for Peripheral RAM (32 Bits)

30.2.9.1 Overview

This is an ECC module for the RAM of the following peripheral modules.

RS-CAN-FD, FlexRay, APA, and DFE

Error Detection and Correction

Seven-bit ECC data is appended to the 32-bit RAM data.

This ECC module provides 2-bit ECC error detection and 1-bit ECC error detection and correction.

CAUTION

This module is not capable of reliably detecting errors in three or more bits.

If errors occur in three or more bits, the module may detect the errors as 1- or 2-bit ECC errors or not detect any errors. Depending on the settings, this may lead to the correction of a bit that was not actually inverted.

Enabling or Disabling ECC Error Detection and Correction

- ECC error detection can be either enabled or disabled.
- One-bit ECC error correction can be either enabled or disabled.
- If all the bits of RAM output data are stuck to 0 or 1, it is detected as a 2-bit ECC error.

Error Notification

- The ECM is notified when 2-bit ECC errors are detected (this can be enabled or disabled).
- The ECM is notified when 1-bit ECC errors are detected (this can be enabled or disabled).

Once the ECM has been notified of an error, even if another ECC error is detected, the ECM is not notified until the error status bit corresponding to the initial error is cleared.

Error Status

- Detection of 2-bit and 1-bit ECC errors can be monitored.
- Special registers are provided to clear error status.

Address Capture

- Only one address at which an ECC error has occurred can be captured.
- When a 2-bit or 1-bit ECC error is detected, the error-causing address is captured. It is used to capture only when the first error is detected after the flag is cleared.

Testing Function (Error Insertion)

- By setting the test mode, register values can be used as the data to be output to the RAM. When a peripheral module writes to the RAM, the ECEDB[31:0] register value can be written to the RAM data section, and the ECERDB[6:0] register value can be written to the ECC redundant bit section.
- By setting the test mode, the ECC redundant bit section can be latched when RAM data is read, and the value can be confirmed.
- By setting the test mode, the ECC redundant bit (encoding circuit) and syndrome code (decoding circuit), which are generated from the input data, can be confirmed.

30.2.9.2 List of Registers

(1) List of ECC Modules

The RAMs of the multiple peripheral functions are provided with the ECC modules. The following table shows the peripheral functions provided with the ECC modules, the corresponding ECC module names, and base addresses of the ECC modules.

Table 30.79 List of ECC Modules

Peripheral Functions		ECC Module Names and Register Base Addresses			
		Master Side*1		Checker Side*1	
		Module Name	Base Address <base_addr>	Module Names	Base Address <base_addr>
RS-CAN-FD	Message buffer RAM (MB RAM)	E7RC1M	FFC7 1400 _H	E7RC1C	FFC7 1600 _H
	Acceptance filter list RAM (AFL RAM)	E7RC2M	FFC7 1800 _H	E7RC2C	FFC7 1A00 _H
FlexRay	Message RAM (MRAM)	E7FR0M	FFC7 2000 _H	E7FR0C	FFC7 2200 _H
	Temporary buffer (TBF A)	E7FR1M	FFC7 2400 _H	E7FR1C	FFC7 2600 _H
	Temporary buffer(TBF B)	E7FR2M	FFC7 2800 _H	E7FR2C	FFC7 2A00 _H
APA	Element RAM0 (ELRAM0)	E7AP0M	FFC7 6000 _H	E7AP0C	FFC7 6200 _H
	Element RAM1 (ELRAM1)	E7AP1M	FFC7 6400 _H	E7AP1C	FFC7 6600 _H
	Element RAM2 (ELRAM2)	E7AP2M	FFC7 6800 _H	E7AP2C	FFC7 6A00 _H
DFE	Coefficient memory (CMEM)	E7DF1M	FFC7 D000 _H	E7DF1C	FFC7 D200 _H

Note 1. Two ECC modules are provided to support BIST, one for the master and the other for the checker. For details, refer to **Section 30.7, BIST**.

(2) List of Registers

Each ECC module has the registers shown in the following table.

Table 30.80 List of Registers

Register Name	Symbol	R/W	Value after Reset	Address	Access Size
ECC control register*1	E710CTL	R/W	001X _H	<base_addr> + 00 _H	8/16
ECC test mode control register	E710TMC	R/W	0000 _H	<base_addr> + 04 _H	8/16
ECC redundant bit data control test register	E710TRC	R/W	0000 0000 _H	<base_addr> + 08 _H	32
ECC encoder and decoder data test register	E710TED	R/W	0000 0000 _H	<base_addr> + 0C _H	32
ECC error address register	E710EAD	R/W	0000 0000 _H	<base_addr> + 10 _H	32

Note 1. The reset value of the LSB in the ECC control register is undefined.

(3) Register Map**Table 30.81 List of Register Map**

Symbol	31	24	23	16	15	8	7	0	Address
E710CTL	— (00 _H)		— (00 _H)		ECCTL[15:8]		ECCTL[7:0]		00 _H
E710TMC	— (00 _H)		— (00 _H)		ECTMC[15:8]		ECTMC[7:0]		04 _H
E710TRC	ECSYND[7:0]		ECHORD[7:0]		ECECRD[7:0]		ECERDB[7:0]		08 _H
E710TED	ECEDB[31:24]		ECEDB[23:16]		ECEDB[15:8]		ECEDB[7:0]		0C _H
E710EAD	ECEAD[31:24]		ECEAD[23:16]		ECEAD[15:8]		ECEAD[7:0]		10 _H

30.2.9.3 Details of Registers

(1) E710CTL — ECC Control Register

E710CTL controls the status and modes of the ECC module.

E710CTL can be read and written to using the 16-bit or 8-bit manipulation instruction.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EMCA[1:0]		—	—	ECOVFF	ECER2C	ECER1C	—	ECTHM	—	EC1ECP	EC2EDIC	EC1EDIC	ECER2F	ECER1F	ECEMF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	Undefined
R/W	R/W*1	R/W*1	R	R	R	R/W*1	R/W*1	R	R/W	R	R/W	R/W	R/W	R	R	R

Note 1. This bit is always read as 0.

Table 30.82 E710CTL Register Contents (1/2)

Bit Position	Bit Name	Function
15, 14	EMCA[1:0]	Access Control 1 and 0 to ECC Mode Select Bit These bits reserve the write trigger to bit 7. The read value is always 0.
13, 12	—	Reserved When read, 0 is always read. When writing, always write 0.
11	ECOVFF	Error Overflow Detection Flag This flag is set when an error of any source other than the same error address occurs while the error flag (ECER2F or ECER1F) is set. One of the following clears this flag. - An internal or external reset - ECC detection and correction being disabled (ECTHM = 1) - Writing 1 to ECER2C and ECRE1C
10	ECER2C	2-Bit ECC Error Detection Flag Clear Clears the bit 2 (ECER2F) status flag. The read value is always 0, and writing 0 to ECER2C does not change the state. If writing 1 to ECER2C conflicts with the condition for setting bit 2, the former takes priority. Writing 1 to ECER2C while ECER2F is set clears ECER2F.
9	ECER1C	1-Bit ECC Error Detection Flag Clear Clears the bit 1 (ECER1F) status flag. The read value is always 0, and writing 0 to ECER1C does not change the internal state. If writing 1 to ECER1C conflicts with the condition for setting bit 1, the former takes priority. Writing 1 to ECER1C while ECER1F is set clears ECER1F.
8	—	Reserved When read, 0 is always read. When writing, always write 0.
7	ECTHM	ECC Function Disable Select Selects the ECC decoding operation. Write access to ECTHM is enabled when the value of bits 15 and 14 is 01 _B . Therefore, only the 16-bit manipulation instruction is valid. Setting ECTHM to 1 disables error detection and bit correction. Here, if the data to be output to the peripheral module contains an error, the data is output without bit correction. Setting ECTHM to 1 has no effect on the encoder side. 0: Enables ECC detection and correction. 1: Disables ECC detection and correction.
6	—	Reserved When read, 0 is always read. When writing, always write 0.
5	EC1ECP	1-Bit ECC Error Correction Enable 0: Enables 1-bit error correction upon error detection. 1: Disables 1-bit error correction upon error detection.
4	EC2EDIC	2-Bit ECC Error Detection Notification Enable 0: When a 2-bit error is detected, the ECM is not notified of the error. 1: When a 2-bit error is detected, the ECM is notified of the error.

Table 30.82 E710CTL Register Contents (2/2)

Bit Position	Bit Name	Function
3	EC1EDIC	<p>1-Bit ECC Error Detection Notification Enable</p> <p>0: When a 1-bit error is detected, the ECM is not notified of the error. 1: When a 1-bit error is detected, the ECM is notified of the error.</p>
2	ECER2F	<p>2-Bit ECC Error Detection Flag</p> <p>Indicates that errors have been detected at two bits in bits 0 to 38 of the data read from the RAM during RAM read access while error detection is enabled. This bit is a read only flag.</p> <p>0: 2-bit error has not been generated since this bit was cleared. 1: 2-bit error has been generated</p> <p>Clearing conditions</p> <p>(1) Reset is applied. (2) 1 is written to ECER2C. (3) ECC detection and correction being disabled (ECTHM = 1)</p>
1	ECER1F	<p>1-Bit ECC Error Detection And Correction Flag</p> <p>Indicates that an error has been detected at one bit in bits 0 to 38 of the data read from the RAM during RAM read access while error detection is enabled. This bit is a read only flag.</p> <p>0: 1-bit error is not generated 1: 1-bit error is generated</p> <p>Clearing conditions</p> <p>(1) Reset is applied. (2) 1 is written to ECER1C. (3) ECC detection and correction being disabled (ECTHM = 1)</p>
0	ECEMF	<p>ECC Error Message Flag</p> <p>Indicates that the current read data bus contains an error. ECEMF is updated every time RAM data is output. Since the RAM value after reset is undefined, the initial value of this module is determined to be an error, and thus ECEMF may be set. Therefore, the ECEMF value after reset is undefined.</p> <p>0: The current read data bus contains no bit errors. 1: The current RAM output data contains bit errors.</p> <p>Clearing conditions</p> <p>(1) ECC detection and correction being disabled (ECTHM = 1) (2) Decoding circuit input data contains no 1-bit errors.</p> <p>ECEMF remains set as long as RAM data containing a bit error is output with error detection being enabled.</p>

(2) E710TMC — ECC Test Mode Control Register

E710TMC is a 16-bit register to switch the mode to test mode and controls the mode.

E710TMC can be read and written to using the 16-bit or 8-bit manipulation instruction.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ETMA[1:0]		—	—	—	—	—	—	ECTMCE	—	—	ECTRRS	ECREOS	ECENS	ECDCS	ECREIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W*1	R/W*1	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Note 1. This bit is always read as 0.

Table 30.83 E710TMC Register Contents (1/2)

Bit Position	Bit Name	Function
15, 14	ETMA[1:0]	Access Control 1 and 0 to ECC Test Mode Control Enable Bit These bits reserve the write trigger to bit 7. The read value is always 0.
13 to 8	—	Reserved When read, 0 is always read. When writing, always write 0.
7	ECTMCE	ECC Test Mode Control Enable ECTMCE enables or disables access to the test registers and test control bits. Write access to ECTMCE is enabled when the value of bits 15 and 14 is 10 _B . 0: Disables access to the test registers and test control bits. 1: Enables access to the test registers and test control bits.
6, 5	—	Reserved When read, 0 is always read. When writing, always write 0.
4	ECTRRS	ECC RAM Read Test Mode Control Enable ECTRRS enables the read status of RAM to be generated by reading the E710TED register, and also allows the RAM output data to be read out when the E710TRC:ECERDB[7:0] bits and the E710TED register are read. Write access to ECTRRS is enabled only when ECTMCE is 1 (can be set simultaneously). ECTRRS is cleared by writing 0 to ECTMCE (can be cleared synchronously). 0: Disables generation of RAM read status for testing when E710TED is read. 1: Enables generation of RAM read status for testing when E710TED is read. When E710TRC:ECERDB[7:0] and E710TED are read, the values of the RAM output data pin are read out.
3	ECREOS	ECC Redundant Bit Output Data Select ECREOS selects either the ECC encoder output data or the ECERDB register value to be output as the ECC redundant bit output. Write access to ECREOS is enabled only when ECTMCE is 1 (can be set simultaneously). ECREOS is cleared by writing 0 to ECTMCE (can be cleared synchronously). 0: Allows encoding result to be output as the ECC redundant bit output. 1: Allows the E710TRC:ECERDB[6:0] value to be output as the ECC redundant bit output.
2	ECENS	ECC Encoder Input Select ECENS selects either the data value from the peripheral module or the internal test register value (E710TED:ECEDB[31:0]) as the input signal to be encoded. Write access to ECENS is enabled only when ECTMCE is 1 (can be set simultaneously). ECENS is cleared by writing 0 to ECTMCE (can be cleared synchronously). 0: Allows the RAM write data from the peripheral module to be input as the ECC encoder input data. 1: Allows the E710TED:ECEDB[31:0] value to be input as the ECC encoder input data.

Table 30.83 E710TMC Register Contents (2/2)

Bit Position	Bit Name	Function
1	ECDCS	<p>ECC Decoder Input Select</p> <p>ECDCS selects either the lower 32-bit data value from the RAM or the internal test register value (E710TED:ECEDB[31:0]) as the lower 32-bit data of the input signal to be decoded.</p> <p>Write access to ECDCS is enabled only when ECTMCE is 1 (can be set simultaneously).</p> <p>ECDCS is cleared by writing 0 to ECTMCE (can be cleared synchronously).</p> <p>0: Allows the lower 32-bit RAM output data to be input to the data area (32 lower-order bits) to the decoder.</p> <p>1: Allows the E710TED:ECEDB[31:0] value to be input to the data area to the decoder.</p>
0	ECREIS	<p>ECC Redundant Bit Input Data Select</p> <p>ECREIS selects either the upper 7-bit data value from the RAM (redundant bit area) or the internal test register value (E710TRC:ECERDB[6:0]) as the upper 7-bit data of the input signal to be decoded.</p> <p>Write access to ECREIS is enabled only when ECTMCE is 1 (can be set simultaneously).</p> <p>ECREIS is cleared by writing 0 to ECTMCE (can be cleared synchronously).</p> <p>0: Allows the upper 7-bit RAM output data to be input to the ECC redundant bit area to the decoder.</p> <p>1: Allows the E710TRC:ECERDB[6:0] value to be input to the ECC redundant bit area to the decoder.</p>

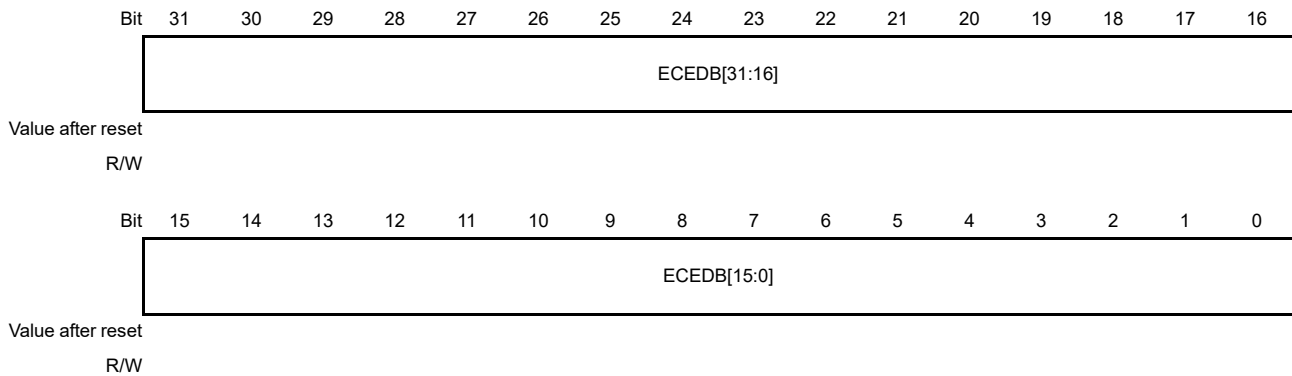

(3) E710TED — ECC Encoder and Decoder Data Test Register

E710TED is a 32-bit data test register for ECC encoding and decoding.

When ECTMCE = 1, E710TED can be read and written to using the 32-bit manipulation instruction.

When ECTMCE = 0, E710TED is always read as 0.

In test mode, the E710TED value can be used as the input data to the encoding circuit and decoding circuit.

**NOTE**

Changing ECTMCE from 1 to 0 resets E710TED synchronously.

When E710TMC:ECENS = 1, the ECEDB value is input to the encoding circuit and supplied to the RAM.

When E710TMC:ECDCS = 1, the ECEDB value is input as the 31th to 0th bits of the input data to the decoding circuit.

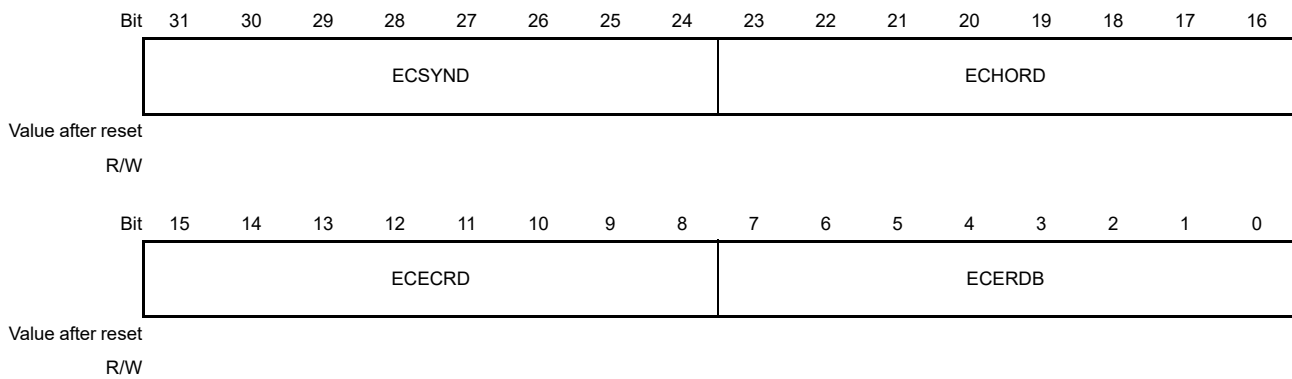

When E710TMC:ECTRRS = 1, reading ECEDB returns the RAM output data instead of the data written to ECEDB.

(4) E710TRC — ECC Redundant Bit Data Control Test Register

E710TRC is a 32-bit test register consisting of four fields (ECSYND, ECHORD, ECECRD, and ECRODM) corresponding to the ECC redundant bit area. Each field can be accessed as the 8-bit register with the same name. For details of each field, refer to the descriptions of these four registers.

When ECTMCE = 0, E710TRC is always read as 0.

When ECTMCE = 1, E710TRC can be read using the 32-bit manipulation instruction.

**NOTE**

Changing ECTMCE from 1 to 0 resets E710TRC synchronously.

(5) ECSYND — ECC Decoder Syndrome Data Register

ECSYND is a read-only register to confirm the syndrome code generated by the decoding circuit in test mode (ECTMCE = 1).

Write access to ECSYND is ignored.

When read, the ECSYND bits return the value of the syndrome code (synd[6:0]) generated based on the input data to the decoding circuit.

The ECSYND bits are not holding circuits; the register value changes as the input signal changes.

ECSYND is valid only when ECTMCE = 1, and is always read as 00_H when ECTMCE = 0.

Bit 31 is reserved. When reading this bit, 0 is always read. The write value should also be 0.

(6) ECHORD — ECC 7-Bit Redundant Data Holding Test Register

ECHORD holds the 7-bit ECC redundant area (upper 7-bit RAM data), which cannot be confirmed by the peripheral module, when the peripheral module accesses the RAM for reading in test mode (ECTMCE = 1).

Bit	7	6	5	4	3	2	1	0
	—	HORD[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

The ECHORD bits are loaded with the upper 7-bit RAM output data at the next rising edge of the operating clock signal after the peripheral module accesses the RAM for reading data in test mode (ECTMCE = 1).

The ECHORD bits are also loaded with the data on the input pins EC7TERI38 to EC7TERI32 at the next operating clock pulse when the ECEDB[15:0] register is read while E710TMC:ECTRRS = 1.

ECHORD is valid only when ECTMCE = 1, and is always read as 00_H when ECTMCE = 0.

Bit 23 is reserved. When reading this bit, 0 is always read. The write value should also be 0.

(7) ECECRD — ECC Encoder Test Register

ECECRD is a read-only register to read the 7-bit redundant section generated by the encoding circuit in test mode (ECTMCE = 1).

Bit	7	6	5	4	3	2	1	0
	—	ECRD[6:0]						
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

ECECRD is used to confirm the redundant bits generated by the input data from the peripheral module. Here, the read-out data is the result of encoding (ecc[6:0]), not the output value.

ECECRD is valid only when ECTMCE = 1, and is always read as 00_H when ECTMCE = 0.

Bit 15 is reserved. When reading this bit, 0 is always read. The write value should also be 0.

(8) ECERDB — ECC Redundant Bit Input and Output Substitution Buffer Register

ECERDB is a buffer register for the data that substitutes for the input and output data for the 7-bit ECC redundant data area in test mode (ECTMCE = 1).

ECERDB can be read and written to in ECC test mode (ECTMCE = 1).

Bit	7	6	5	4	3	2	1	0
	ERDB[6:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

When ECREOSS = 1, the ECERDB value, instead of the seven redundant bits generated by the encoding circuit, is output to the pin to be supplied to the RAM.

When ECREIESS = 1, the ECERDB value, instead of the upper seven data bits to be input to the decoding circuit, is handled by the decoding circuit.

When ECTRRS = 1, reading ECERDB returns the signal value supplied to RAM instead of the data written to ECERDB.

Bit 7 is reserved. When reading this bit, 0 is always read. The write value should also be 0.

(9) E710EAD — ECC Error Address Register

E710EAD is a read-only register to hold the address at which an ECC error has occurred.

If an ECC error is detected while ECC error detection is enabled, the RAM address is latched using the detection signal as a trigger, and the address is stored in E710EAD as the address at which the ECC error has occurred.

The address is stored upon detection of the first ECC error while no error status flag is set. However, if a 1-bit error is followed by a 2-bit error, the address of the latter is stored.

Only one address can be held in E710EAD.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECEAD[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECEAD[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

30.2.9.4 Notification to ECM

Detection of errors in two bits can be set for this module and the ECM is notified of detected errors.

- 1-bit Error Notification

While EC1EDIC is set to 1_B, when an error is detected in one bit from among bits 0 to 38 of data read from RAM, the ECM is notified of the 1-bit error. When ECER1F or ECER2F is already set, however, the ECM will not be notified of the error.

- 2-bit Error Notification

While EC2EDIC is set to 1_B, when an error is detected in two bits from among bits 0 to 38 of data read from RAM, the ECM is notified of the 2-bit error. When ECER2F is already set, however, the ECM will not be notified of the error.

30.2.9.5 Test Function

(1) Writing to RAM Data

Write data to the peripheral RAM. However, the ECC corresponding to the written data will be written to the ECC bits simultaneously. In order to write a specified value to the ECC bits, use the ECC test mode described in (3) below.

(2) Reading RAM Data

- (a) Set the ECTHM bit in the E710CTL register to 1 to disable ECC error detection and correction.
- (b) Read the peripheral RAM. Since neither error detection nor correction proceeds when the peripheral RAM is read, the RAM data is read unchanged.

How to exit this test mode:

- (a) Set the ECTHM bit in the E710CTL register to 0 to enable ECC error detection and correction.

(3) Writing to the ECC Bits

- (a) Set the ECTMCE bit in the E710TMC register to 1 to set ECC test mode.
- (b) Write the value for writing to the ECC bits to the E710TRC.ECERDB[6:0] bits.
- (c) Set the ECREOS bit in the E710TMC register to 1 to select writing of the value of the E710TRC.ECERDB[6:0] bits to the ECC bits.
- (d) When data are written to the peripheral RAM, the value in the E710TRC.ECERDB[6:0] bits will be written to the ECC bits.

How to exit this test mode:

- (a) Set the ECTMCE bit in the E710TMC register to 0 to set normal mode.

(4) Reading the ECC Bits

- (a) Set the ECTMCE bit in the E710TMC register to 1 to set ECC test mode.
- (b) When data in the peripheral RAM is read, the ECC bits are stored in the E710TRC.ECHORD[6:0] bits.

How to exit this test mode:

- (a) Set the ECTMCE bit in the E710TMC register to 0 to set normal mode.

30.2.10 ECC for Peripheral RAM (16 Bits)

30.2.10.1 Overview

This is an ECC module for the RAM of the following peripheral module.

DFE

Error Detection and Correction

Six-bit ECC data is appended to the 16-bit RAM data.

This ECC module provides 2-bit ECC error detection and 1-bit ECC error detection and correction.

CAUTION

If three or more bits of errors occur, they cannot be detected by this module. In this case, such errors may be detected as 1 or 2-bit errors; no errors may be detected; or a non-inverted bit may be corrected depending on the setting.

Enabling or Disabling ECC Error Detection and Correction

- ECC error detection can be either enabled or disabled.
- One-bit ECC error correction can be either enabled or disabled.
- If all the bits of RAM output data are stuck to 0 or 1, it is detected as a 2-bit ECC error.

Error Notification

- The ECM is notified when 2-bit ECC errors are detected (this can be enabled or disabled).
- The ECM is notified when 1-bit ECC errors are detected (this can be enabled or disabled).

Once the ECM has been notified of an error, even if another ECC error is detected, the ECM is not notified until the error status bit corresponding to the initial error is cleared.

Error Status

- Detection of 2- and 1-bit ECC errors can be monitored.
- Special registers are provided to clear error status.

Address Capture

- Only one address at which an ECC error has occurred can be captured.
- When a 2-bit or 1-bit ECC error is detected, the address where the error was found is captured (when the first (1-bit or 2-bit) error is detected after the flag is cleared).

Testing Function (Error Insertion)

- By setting the test mode, register values can be used as the data to be output to the RAM. When a peripheral module writes to the RAM, the ECEDB[15:0] register value can be written to the RAM data section, and the ECERDB[5:0] register value can be written to the ECC redundant bit section.
- By setting the test mode, the ECC redundant bit section can be latched when RAM data is read, and the value can be confirmed.
- By setting the test mode, the ECC redundant bit (encoding circuit) and syndrome code (decoding circuit), which are generated from the input data, can be confirmed.

30.2.10.2 List of Registers

(1) List of ECC Modules

The RAMs of the multiple peripheral functions are provided with the ECC modules. The following table shows the peripheral functions provided with the ECC modules, the corresponding ECC module names, and base addresses of the ECC modules.

Table 30.84 List of ECC Modules

Peripheral Functions		ECC Module Names and Register Base Addresses			
		Master Side* ¹		Checker Side* ¹	
		Module Name	Base Address <base_addr>	Module Names	Base Address <base_addr>
DFE	Data memory (DMEM0)	E6DF0M	FFC7 D400 _H	E6DF0C	FFC7 D600 _H
	Data memory (DMEM1)	E6DF1M	FFC7 D800 _H	E6DF1C	FFC7 DA00 _H

Note 1. Two ECC modules are provided to support BIST, one for the master and the other for the checker. For details, refer to **Section 30.7, BIST**.

(2) List of Registers

Each ECC module has the registers shown in the following table.

Table 30.85 List of Registers

Register Name	Symbol	R/W	Value after Reset	Address	Access Size
ECC control register* ¹	E610CTL	R/W	001X _H	<base_addr> + 00 _H	8/16
ECC test mode control register	E610TMC	R/W	0000 _H	<base_addr> + 04 _H	8/16
ECC redundant bit data control test register	E610TRC	R	0000 0000 _H	<base_addr> + 08 _H	32
ECC encoder and decoder data test register	E610TED	R/W	0000 0000 _H	<base_addr> + 0C _H	32
ECC error address register	E610EAD	R	0000 0000 _H	<base_addr> + 10 _H	32

Note 1. The reset value of the LSB in the ECC control register is undefined.

(3) Register Map

Table 30.86 Register Map

Abbreviation	31	24	23	16	15	8	7	0	Offset Address
E610CTL	— (00 _H)	— (00 _H)	— (00 _H)	— (00 _H)	ECCTL[15:8]	ECCTL[7:0]	— (00 _H)	— (00 _H)	00 _H
E610TMC	— (00 _H)	— (00 _H)	— (00 _H)	— (00 _H)	ECTMC[15:8]	ECTMC[7:0]	— (00 _H)	— (00 _H)	04 _H
E610TRC	ECSYND[7:0]	ECHORD[7:0]	ECHORD[7:0]	ECHORD[7:0]	ECECRD[7:0]	ECRODM[7:0]	— (00 _H)	— (00 _H)	08 _H
E610TED	ECEDB[31:24]	ECEDB[23:16]	ECEDB[23:16]	ECEDB[23:16]	ECRIDM[15:8]	ECERDB[7:0]	— (00 _H)	— (00 _H)	0C _H
E610EAD	ECEAD[31:24]	ECEAD[23:16]	ECEAD[23:16]	ECEAD[23:16]	ECEAD[15:8]	ECEAD[7:0]	— (00 _H)	— (00 _H)	10 _H

30.2.10.3 Details of Registers

(1) E610CTL — ECC Control Register

E610CTL controls the status and modes of the ECC module.

E610CTL can be read and written to using the 16-bit or 8-bit manipulation instruction.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EMCA[1:0]		—	—	ECOVFF	ECER2C	ECER1C	—	ECTHM	—	EC1ECP	EC2EDIC	EC1EDIC	ECER2F	ECER1F	ECEMF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	Undefined
R/W	R/W*1	R/W*1	R	R	R	R/W*1	R/W*1	R	R/W	R	R/W	R/W	R/W	R	R	R

Note 1. This bit is always read as 0.

Table 30.87 E610CTL Register Contents (1/2)

Bit Position	Bit Name	Function
15, 14	EMCA[1:0]	Access Control 1 and 0 to ECC Mode Select Bit These bits reserve the write trigger to bit 7. The read value is always 0.
13, 12	—	Reserved When read, 0 is always read. When writing, always write 0.
11	ECOVFF	Error Overflow Detection Flag This flag is set when an error of any source other than the same error address occurs while the error flag (ECER2F or ECER1F) is set. This flag is cleared by an internal or external reset, ECC detection and correction being disabled (ECTHM = 1), or writing 1 to ECER2C and ECRE1C.
10	ECER2C	2-Bit ECC Error Detection Flag Clear Clears the bit 2 (ECER2F) status flag. The read value is always 0, and writing 0 to ECER2C does not change the state. If writing 1 to ECER2C conflicts with the condition for setting bit 2, the former takes priority. Writing 1 to ECER2C while ECER2F is set clears ECER2F.
9	ECER1C	1-Bit ECC Error Detection And Correction Accumulated Flag Clear Clears the bit 1 (ECER1F) status flag. The read value is always 0, and writing 0 to ECER1C does not change the state. If writing 1 to ECER1C conflicts with the condition for setting bit 1, the former takes priority. Writing 1 to ECER1C while ECER1F is set clears ECER1F.
8	—	Reserved When read, 0 is always read. When writing, always write 0.
7	ECTHM	ECC Function Disable Selection Selects the ECC decoding operation. Write access to ECTHM is enabled when the value of bits 15 and 14 is 01 _B . Therefore, only the 16-bit manipulation instruction is valid. Setting ECTHM to 1 disables error detection and bit correction. Here, if the data to be output to the peripheral module contains an error, the data is output without bit correction. Setting ECTHM to 1 has no effect on the encoder side. 0: Enables ECC detection and correction 1: Disables ECC detection and correction. Has no effect on the encoder side.
6	—	Reserved When read, 0 is always read. When writing, always write 0.
5	EC1ECP	1-Bit ECC Error Correction Enable 0: Enables 1-bit error correction upon error detection. 1: Disables 1-bit error correction upon error detection.
4	EC2EDIC	2-Bit ECC Error Detection Notification Enable 0: When a 2-bit error is detected, the ECM is not notified of the error. 1: When a 2-bit error is detected, the ECM is notified of the error.

Table 30.87 E610CTL Register Contents (2/2)

Bit Position	Bit Name	Function
3	EC1EDIC	<p>1-Bit ECC Error Detection Notification Enable</p> <p>0: When a 1-bit error is detected, the ECM is not notified of the error. 1: When a 1-bit error is detected, the ECM is notified of the error.</p>
2	ECER2F	<p>2-Bit ECC Error Detection Flag</p> <p>Indicates that errors have been detected at two bits in bits 0 to 21 of the data read from the RAM during RAM read access while error detection is enabled. This bit is a read only flag.</p> <p>0: 2-bit error has not been generated after clearing of this bit. 1: 2-bit error has been generated</p> <p>Clearing conditions</p> <p>(1) Reset is applied. (2) 1 is written to ECER2C. (3) ECC detection and correction being disabled (ECTHM = 1).</p>
1	ECER1F	<p>1-Bit ECC Error Detection And Correction Flag</p> <p>Indicates that an error has been detected at one bit in bits 0 to 21 of the data read from the RAM during RAM read access while error detection is enabled. This bit is a read only flag.</p> <p>0: 1-bit error has not been generated after clearing of this bit. 1: 1-bit error has been generated</p> <p>Clearing conditions</p> <p>(1) Reset is applied. (2) 1 is written to ECER1C. (3) ECC detection and correction being disabled (ECTHM = 1)</p>
0	ECEMF	<p>ECC Error Message Flag</p> <p>Indicates that the current read data bus contains an error. This bit is updated for each RAM output data. Since the RAM value after reset is undefined, the initial value of this module is determined to be an error, and thus ECEMF may be set. Therefore, the ECEMF value after reset is undefined.</p> <p>0: The current read data bus contains no bit errors. 1: The current RAM output data contains bit errors.</p> <p>Clearing conditions</p> <p>(1) ECC detection and correction being disabled (ECTHM = 1) (2) Decoding circuit input data contains no 1-bit errors.</p> <p>ECEMF remains set as long as RAM data containing a bit error is output with error detection being enabled.</p>

(2) E610TMC — ECC Test Mode Control Register

E610TMC is a 16-bit register to switch the mode to test mode and controls the mode.

E610TMC can be read and written to using the 16-bit or 8-bit manipulation instruction.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ETMA[1:0]		—	—	—	—	—	—	ECTMCE	—	—	ECTRRS	ECREOS	ECENS	ECDCS	ECREIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W*1	R/W*1	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Note 1. This bit is always read as 0.

Table 30.88 E610TMC Register Contents (1/2)

Bit Position	Bit Name	Function
15, 14	ETMA[1:0]	Access Control 1 and 0 to ECC Test Mode Control Enable Bit These bits reserve the write trigger to bit 7. The read value is always 0.
13 to 8	—	Reserved When read, 0 is always read. When writing, always write 0.
7	ECTMCE	ECC Test Mode Control Enable ECTMCE enables or disables access to the test registers and test control bits. Write access to ECTMCE is enabled when the value of bits 15 and 14 is 10 _B . 0: Disables access to the test registers and test control bits. 1: Enables access to the test registers and test control bits.
6, 5	—	Reserved When read, 0 is always read. When writing, always write 0.
4	ECTRRS	ECC RAM Read Test Mode Control Enable ECTRRS enables the read status of RAM to be generated by reading the E610TED register, and also allows the RAM output data to be read out when the E610TED:ECEDB[15:0] and E610TED:ECRIDM[7:0] are read. Write access to ECTRRS is enabled only when ECTMCE is 1 (can be set simultaneously). ECTRRS is cleared by writing 0 to ECTMCE (can be cleared synchronously). 0: Disables generation of RAM read status for testing when E610TED is read. 1: Enables generation of RAM read status for testing when E610TED is read. When E610TED:ECEDB[15:0] and E610TED:ECRIDM[7:0] are read, the values of the RAM output data pin are read out.
3	ECREOS	ECC Redundant Bit Output Data Select ECREOS selects either the ECC encoder output data or the ECERDB register value to be output as the ECC redundant bit output. Write access to ECREOS is enabled only when ECTMCE is 1 (can be set simultaneously). ECREOS is cleared by writing 0 to ECTMCE (can be cleared synchronously). 0: Allows encoding result to be output as the ECC redundant bit output. 1: Allows the E610TED:ECERDB[5:0] value to be output as the ECC redundant bit output.
2	ECENS	ECC Encoder Input Select ECENS selects either the data value from the peripheral module or the internal test register value (E610TED:ECEDB[15:0]) as the input signal to be encoded. Write access to ECENS is enabled only when ECTMCE is 1 (can be set simultaneously). ECENS is cleared by writing 0 to ECTMCE (can be cleared synchronously). 0: Allows the RAM write data from the peripheral module to be input as the ECC encoder input data. 1: Allows the E610TED:ECEDB[15:0] value to be input as the ECC encoder input data.

Table 30.88 E610TMC Register Contents (2/2)

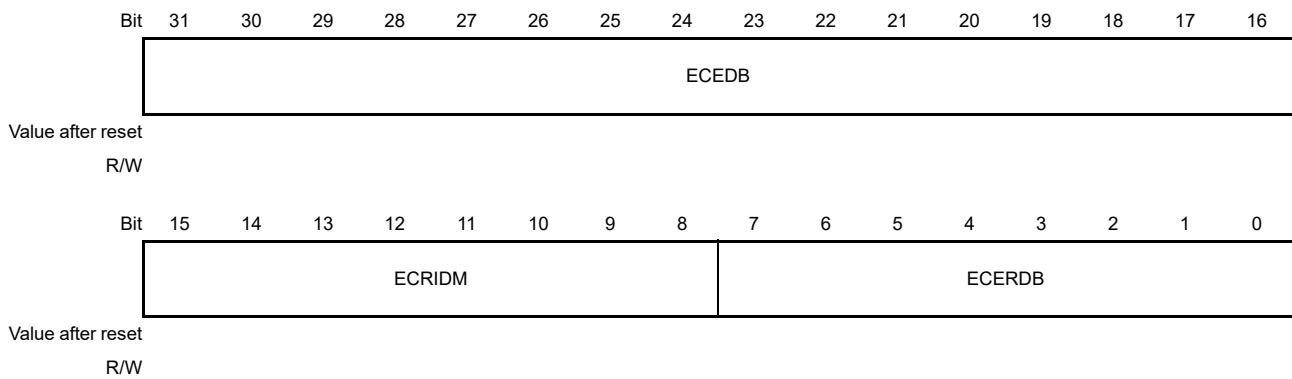

Bit Position	Bit Name	Function
1	ECDCS	<p>ECC Decoder Input Select</p> <p>ECDCS selects either the lower 16-bit data value from the RAM or the internal test register value (E610TED:ECEDB[15:0]) as the lower 32-bit data of the input signal to be decoded.</p> <p>Write access to ECDCS is enabled only when ECTMCE is 1 (can be set simultaneously).</p> <p>ECDCS is cleared by writing 0 to ECTMCE (can be cleared synchronously).</p> <p>0: Allows the lower 16-bit RAM output data to be input to the data area (lower 16 bits) to the decoder.</p> <p>1: Allows the E610TED:ECEDB[15:0] value to be input to the data area to the decoder.</p>
0	ECREIS	<p>ECC Redundant Bit Input Data Select</p> <p>ECREIS selects either the upper 6-bit data value from the RAM (redundant bit area) or the internal test register value (E610TED:ECERDB[5:0]) as the upper 6-bit data of the input signal to be decoded.</p> <p>Write access to ECREIS is enabled only when ECTMCE is 1 (can be set simultaneously).</p> <p>ECREIS is cleared by writing 0 to ECTMCE (can be cleared synchronously).</p> <p>0: Allows the upper 6-bit RAM output data to be input to the ECC redundant bit area to the decoder.</p> <p>1: Allows the E610TED:ECERDB[5:0] value to be input to the ECC redundant bit area to the decoder.</p>

(3) E610TED — ECC Encoder and Decoder Data Test Register

E610TED is a 32-bit test register consisting of three fields (ECEDB, ECRIDM, and ECERDB) corresponding to the ECC data area and redundant bit area. Each field can be accessed as the register with the same name. For details of each field, refer to the descriptions of these three registers.

When ECTMCE = 1, E610TED can be read and written to using the 32-bit manipulation instruction.

When ECTMCE = 0, E610TED is always read as 0.

**NOTE**

Changing ECTMCE from 1 to 0 resets E710TED synchronously.

(4) ECEDB — ECC Encoder and Decoder Data Input and Output Substitution Buffer Register

ECEDB is a 16-bit data buffer register for ECC encoding and decoding.

ECEDB can be read and written to in test mode (ECTMCE = 1).

When ECTMCE = 1, the ECEDB value can be used as the input data to the encoding circuit and decoding circuit.

When E610TMC:ECENS = 1, the ECEDB value is input to the encoding circuit and supplied to the RAM.

When E610TMC:ECDCS = 1, the ECEDB value is input as the 15th to 0th bits of the input data to the decoding circuit. When E610TMC:ECTRRS = 1, reading ECEDB returns the RAM output data instead of the data written to ECEDB.

(5) ECRIDM — ECC Redundant Bit Input Data Monitoring Register

ECRIDM is a read-only register to monitor the upper 6-bit data (redundant bit area) value from the RAM in test mode (ECTMCE = 1) when E610TMC:ECTRRS = 1. With ECRIDM, the RAM output data can be confirmed easily.

When ECTRRS = 0, ECRIDM is always read as 0.

Bit 15 and 14 are reserved. When reading these bits, 0 is always read. When writing, the write value should always be 0.

Bit	7	6	5	4	3	2	1	0
	—	—	RIDM[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

(6) ECERDB — ECC Redundant Bit Input and Output Substitution Buffer Register

ECERDB is a buffer register for the data that substitutes for the input and output data for the 6-bit ECC redundant data area in test mode (ECTMCE = 1).

ECERDB can be read and written to in test mode (ECTMCE = 1).

Bit	7	6	5	4	3	2	1	0
	—	—	ERDB[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

When ECREOS = 1, the ECERDB value, instead of the six redundant bits generated by the encoding circuit, is output to the ECC redundant bit output pin to be supplied to the RAM.

When ECREIS = 1, the ECERDB value, instead of the upper six data bits to be input to the decoding circuit, is handled by the decoding circuit.

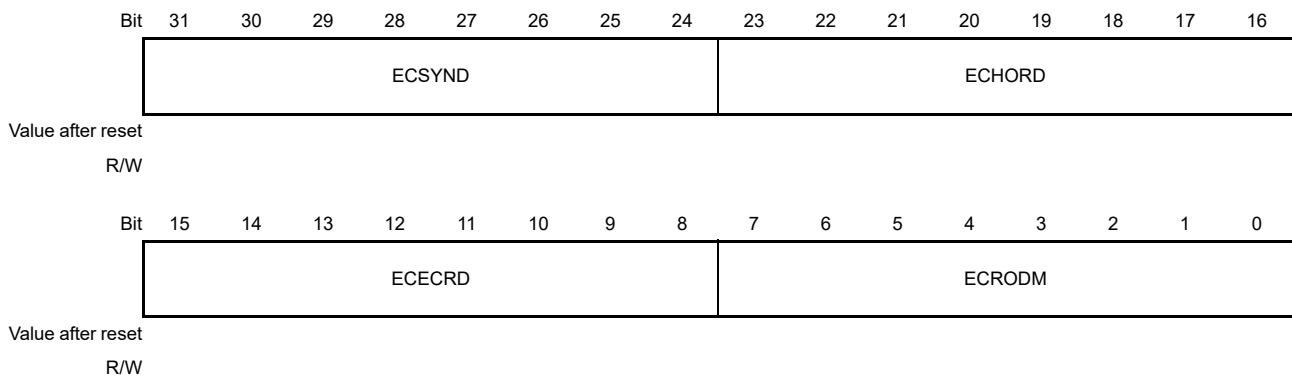

Bit 7 and 6 are reserved. When reading these bits, 0 is always read. When writing, the write value should always be 0.

(7) E610TRC — ECC Redundant Bit Data Control Test Register

E610TRC is a 32-bit test register consisting of four fields (ECSYND, ECHORD, ECECRD, and ECRODM) corresponding to the ECC redundant bit area. Each field can be accessed as the 8-bit register with the same name. For details of each field, refer to the descriptions of these four registers.

When ECTMCE = 0, E610TRC is always read as 0.

When ECTMCE = 1, E610TRC can be read using the 32-bit manipulation instruction.

**(8) ECSYND — ECC Decoder Syndrome Data Register**

ECSYND is a read-only register to confirm the syndrome code generated by the decoding circuit in test mode (ECTMCE = 1).

Write access to ECSYND is ignored.

When read, the ECSYND bits return the value of the syndrome code (synd[5:0]) generated based on the input data to the decoding circuit.

The ECSYND bits are not holding circuits; the register value changes as the input signal changes.

ECSYND is valid only when ECTMCE = 1, and is always read as 00_H when ECTMCE = 0.

Bit 31 and 30 are reserved. When reading these bits, 0 is always read. When writing, the write value should always be 0.

(9) ECHORD — ECC 6-Bit Redundant Data Holding Test Register

ECHORD holds the 6-bit ECC redundant area (upper 6-bit RAM data), which cannot be confirmed by the peripheral module, when the peripheral module accesses the RAM for reading in test mode (ECTMCE = 1).

Bit	7	6	5	4	3	2	1	0
	—	—	HORD[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

The ECHORD bits are loaded with the upper 6-bit RAM output data at the next rising edge of the operating clock signal after the peripheral module accesses the RAM for reading data in test mode (ECTMCE = 1).

The ECHORD bits are also loaded with the data on the input pins at the next operating clock pulse when the ECEDB[15:0] register is read while E610TMC:ECTRRS = 1.

ECHORD is valid only when ECTMCE = 1, and is always read as 00_H when ECTMCE = 0.

Bit 23 and 22 are reserved. When reading these bits, 0 is always read. When writing, the write value should always be 0.

(10) ECECRD — ECC Encoder Test Register

ECECRD is a read-only register to read the 6-bit redundant section generated by the encoding circuit in test mode (ECTMCE = 1).

Bit	7	6	5	4	3	2	1	0
	—	—	ECRD[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

ECECRD is used to confirm the redundant bits generated by the input data from the peripheral module. Here, the read-out data is the result of encoding (ecc[5:0]), not the value output from the ECC redundant bits.

ECECRD is valid only when ECTMCE = 1, and is always read as 00_H when ECTMCE = 0.

Bit 15 and 14 are reserved. When reading these bits, 0 is always read. When writing, the write value should always be 0.

(11) ECRODM — ECC Redundant Bit Output Data Monitoring Register

ECRODM is a read-only register to monitor the value of the ECC redundant bit output pin in test mode (ECTMCE = 1).

With ECRODM, the upper 6-bit output data to the RAM can be confirmed easily.

Bit	7	6	5	4	3	2	1	0
	—	—	RODM[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

ECRODM is valid only when ECTMCE = 1, and is always read as 00_H when ECTMCE = 0.

Bit 7 and 6 are reserved. When reading these bits, 0 is always read. When writing, the write value should always be 0.

(12) E610EAD — ECC Error Address Register

E610EAD is a read-only register to hold the address at which an ECC error has occurred.

If an ECC error is detected while ECC error detection is enabled, the RAM address is latched using the detection signal as a trigger, and the address is stored in E610EAD as the address at which the ECC error has occurred.

The address is stored upon detection of the first ECC error while no error status flag is set. However, if a 1-bit error is followed by a 2-bit error, the address of the latter is stored.

Only one address can be held in E610EAD.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECEAD[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECEAD[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

30.2.10.4 Notification to ECM

Detection of errors in two bits can be set for this module and the ECM is notified of detected errors.

- 1-bit Error Notification
While EC1EDIC is set to 1_B, when an error is detected in one bit from among bits 0 to 21 of data read from RAM, the ECM is notified of the 1-bit error. When ECER1F or ECER2F is already set, however, the ECM will not be notified of the error.
- 2-bit Error Notification
While EC2EDIC is set to 1_B, when an error is detected in two bits from among bits 0 to 21 of data read from RAM, the ECM is notified of the 2-bit error. When ECER2F is already set, however, the ECM will not be notified of the error.

30.2.10.5 Test Function

(1) Writing to RAM Data

Write data to the peripheral RAM. However, the ECC corresponding to the written data will be written to the ECC bits simultaneously. In order to write a specified value to the ECC bits, use the ECC test mode described in (3) below.

(2) Reading RAM Data

- (a) Set the ECTHM bit in the E610CTL register to 1 to disable ECC error detection and correction.
- (b) Read the peripheral RAM. Since neither error detection nor correction proceeds when the peripheral RAM is read, the RAM data is read unchanged.

How to exit this test mode:

- (a) Set the ECTHM bit in the E610CTL register to 0 to enable ECC error detection and correction.

(3) Writing to the ECC Bits

- (a) Set the ECTMCE bit in the E610TMC register to 1 to set ECC test mode.
- (b) Write the value for writing to the ECC bits to the E610TED.ECERDB[5:0] bits.
- (c) Set the ECREOS bit in the E610TMC register to 1 to select writing of the value of the E610TED.ECERDB[5:0] bits to the ECC bits.
- (d) When data are written to the peripheral RAM, the value in the E610TED.ECERDB[5:0] bits will be written to the ECC bits.

How to exit this test mode:

- (a) Set the ECTMCE bit in the E610TMC register to 0 to set normal mode.

(4) Reading the ECC Bits

- (a) Set the ECTMCE bit in the E610TMC register to 1 to set ECC test mode.
- (b) When data in the peripheral RAM is read, the ECC bits are stored in the E610TRC.ECHORD[5:0] bits.

How to exit this test mode:

- (a) Set the ECTMCE bit in the E610TMC register to 0 to set normal mode.

30.2.11 Data Parity for Data Transfer Paths

The following shows the transfer paths to which data parity is applied. Data parity errors can be detected during data transfer from the access sources to destinations shown below. If a parity error is detected in any of the paths, the ECM is notified of the error.

Table 30.89 Transfer Paths to which Data Parity is Applied

Access Source (Master)	Access Destination (Slave)
CPU1, PCU, DMAC, DTS	INTC2, DMA, DTS, APA, ATU-IV, CSIH, $\Delta\Sigma$ AD, ADC port group 0, DNF, edge detection DNF, SENT
DMAC, DTS	CPU1 local RAM, global RAM

When a data parity error occurs during read operation, 0 is returned to CPU1 and error data is returned to other masters.

When a data parity error occurs during write operation, the write operation is cancelled if the slave is INTC 2, APA, ATU-IV, $\Delta\Sigma$ AD, ADC (except IFC), DNF, edge detection DNF, or SENT.

Some of the parity-applied modules have the control registers in the parity controllers (encoder and decoder), which can enable or disable parity detection and hold status upon detection of an error. If a parity error is detected in these modules, it is possible to identify the access that caused the error.

On the other hand, parity controllers which do not have control registers always perform parity detection. Though the status upon detection of an error is not retained in these controllers, whether an error has been detected or not is retained in the ECM.

30.2.11.1 List of Registers

Table 30.90 List of Registers

Symbol	Register Name	R/W	Value after Reset	Address	Access Size
APDPERRST_xx	P-Bus data parity status register xx	R	0000 0000 _H	<Base_addr>+0 _H	8/16/32
APDPERRSTC_xx	P-Bus data parity status clear register xx	W	0000 0000 _H	<Base_addr>+4 _H	8/16/32
APDPTMC_xx	P-Bus data parity test mode control register xx	R/W	0000 0000 _H	<Base_addr>+8 _H	16/32
APDPERRADR_xx	P-Bus data parity error address register xx	R	0000 0000 _H	<Base_addr>+C _H	32

The symbol xx in the above table indicates a parity-applied module for which the control register is provided. **Table 30.91** shows the parity-applied modules and base addresses<base_addr>.

Table 30.91 List of Data Parity Control Modules (1/2)

Module to Which Parity is Applied	xx	<base_addr>
INTC2 (Group A) ^{*3}	INTC2A	FFC6 8800 _H
INTC2 (Group B) ^{*3}	INTC2B	FFC8 6000 _H
INTC2 (Group C) ^{*3}	INTC2C	FFF9 9000 _H
DMA_DTS	PDMA	FFC6 8900 _H
APA0 (Except APA input selection function)	APAA	FFDC 2000 _H
APA (APA input selection function)	APGA	FFDC 2020 _H
RSENT0	SNT0	FFDC_2100 _H
RSENT1	SNT1	FFDC_2120 _H

ADC1	ADC1	FFC8 8020 _H
ADC (IFC)	IFC	FFC8 8100 _H
ADC (ASF)	ASF	FFC8 8120 _H
Port group 0 (group A) ^{*2}	PT0A	FFC8 5000 _H
Port group 0 (group B) ^{*2}	PT0B	FFC8 5020 _H
Port group 1 to 17 (group A) ^{*2}	PT1A	FFC8 5040 _H
Port group 1 to 17 (group B) ^{*2}	PT1B	FFC8 5060 _H
DNF0	DNF0	FFC8 50C0 _H
DNF1	DNF1	FFC8 50E0 _H
Edge detection DNF2	DNF2	FFC8 5800 _H
Edge detection DNF3	DNF3	FFC8 5820 _H
Edge detection DNF4	DNF4	FFC8 5840 _H
Edge detection DNF5	DNF5	FFC8 5860 _H

Table 30.91 List of Data Parity Control Modules (2/2)

Module to Which Parity is Applied	xx	<base_addr>
Edge detection DNF6	DNF6	FFC8 5880 _H
Edge detection DNF7	DNF7	FFC8 58A0 _H
Edge detection	DNF8	FFC8 5100 _H

- Note 1. The CSIHx registers are divided into the following two groups and controlled separately.
 Group A: CSIHnCTL0 to CSIHnCTL2, CSIHnSTR0, and CSIHnSTCR0
 Group B: Other than above.
- Note 2. The port group registers are divided into the following two groups and controlled separately.
 Group A: Registers other than PCRn_m registers (see **Section 2.1.4.1 Table 2.6**)
 Group B: PCRn_m
 Here, n represents the port group number (n = 0 to 17), and m represents the bit numbers (m = 0 to 15) in each port group.
- Note 3. INTC2 registers are divided into 3 groups to be controlled.
 Group A: EICn, IMRn, and EIBDn
 Group B: NMICTL, EXINT registers, and SINTR0 to SINTR3
 Group C: PINT0 to PINT7, PINTCLR0 to PINTCLR7, and TIMER

30.2.11.2 Details of Registers

(1) APDPERRST_xx — P-Bus Data Parity Status Register

For the symbol xx, see **Table 30.91, List of Data Parity Control Modules.**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	APDPE RR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.92 APDPERRST Register Contents

Bit Position	Bit Name	Function
31 to 1	—	Reserved These bits are always read as 0. The write value should also be 0.
0	APDPERR	Data Parity Error Monitor Flag Indicates occurrence of the parity error. APDPERR is cleared by setting the Data Parity error monitor flag clear bit (APDPERRC) to 1. 0: Indicates that a parity error has not occurred. 1: Indicates that a parity error has occurred.

(2) APDPERRSTC_xx — P-Bus Data Parity Status Clear Register

For the symbol xx, see **Table 30.91, List of Data Parity Control Modules.**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	APDPE RRC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 30.93 APDPERRSTC Register Contents

Bit Position	Bit Name	Function
31 to 1	—	Reserved These bits are always read as 0. The write value should also be 0.
0	APDPERRC	Clears the Data Parity error monitor flag (APDPERR). Writing 1 to this bit with the APDPERR bit set clears APDPERR. This bit is always read as 0.

(3) APDPTMC_xx — P-Bus Data Parity Test Mode Control Register

APDPTMC[1:0] bits must be set to 01B before writing to this register.

For the symbol xx, see **Table 30.91, List of Data Parity Control Modules**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	APDPTMC[1:0]	—	—	—	—	—	—	—	—	—	—	—	APDPEIC3	APDPEIC2	APDPEIC1	APDPEIC0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 30.94 APDPTMC Register Contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved These bits are always read as 0. The write value should also be 0.
15, 14	APDPTMC[1:0]	Data Parity Mode Control These bits enables write-access to this register. When reading these bits, 0 is read.
13 to 4	—	Reserved These bits are always read as 0. The write value should also be 0.
3	APDPEIC3	Byte-Lane 3 Error Insertion Control Changes the type of the parity bit generation and check for byte-lane 3 (bits 31 to 24) to odd parity. 0: Parity bit generation and check is performed with even parity. 1: Parity bit generation and check is performed with odd parity. (Error insertion)
2	APDPEIC2	Byte-Lane 2 Error Insertion Control Changes the type of the parity bit generation and check for byte-lane 2 (bits 23 to 16) to odd parity. 0: Parity bit generation and check is performed with even parity. 1: Parity bit generation and check is performed with odd parity. (Error insertion)
1	APDPEIC1	Byte-Lane 1 Error Insertion Control Changes the type of the parity bit generation and check for byte-lane 1 (bits 15 to 8) to odd parity. 0: Parity bit generation and check is performed with even parity. 1: Parity bit generation and check is performed with odd parity. (Error insertion)
0	APDPEIC0	Byte-Lane 0 Error Insertion Control Changes the type of the parity bit generation and check for byte-lane 0 (bits 7 to 0) to odd parity. APDPEIC0 can be written to when APDPTMC[1:0] = 01 _B . 0: Parity bit generation and check is performed with even parity. 1: Parity bit generation and check is performed with odd parity. (Error insertion)

(4) APDPERRADR_XX — P-Bus Data Parity Error Address Register

For the symbol xx, see **Table 30.91, List of Data Parity Control Modules.**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	APDPERRADR[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	APDPERRADR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.95 APDPERRADR Register Contents

Bit Position	Bit Name	Function
31 to 0	APDPERRADR [31:0]	Data Parity Error Address Holds the address at which the first parity error has occurred while the Data Parity error monitor flag (APDPAERR) is not set. The retained information is not updated even though the next parity error occurs while DPAERR is set.

30.3 Lockstep

This product incorporates the CPU1 with the lockstep function to quickly detect CPU failures without special software. The CPU1 executes the program using two different cores, that is, master core and checker core, and constantly compares the execution results of the two cores. When the results do not agree, the CPU1 determines that an error has occurred in one of the cores, and notifies a lockstep compare error to the ECM.

Bus outputs to be compared are outputs to the local RAM of CPU1, global RAM, a CPU peripheral, interconnect, the P-bus, code flash memory, and the tag RAM and data RAM of the instruction cache.

The lockstep function of the CPU1 features failure insertion, with which errors can be intentionally caused and thus self-diagnosis of the lockstep operation is possible. When a lockstep compare error occurs, the address and data can be captured to a register.

30.3.1 List of Registers

Table 30.96 List of Registers

Address	Symbol	Register Name	R/W	Value after Reset	Access Size
FFFE ED00 _H	TESTCOMPREG0	Comparator test register 0	R/W	0000 0000 _H	8/16/32
FFFE ED04 _H	TESTCOMPREG1	Comparator test register 1	R/W	0000 0000 _H	8/16/32
FFFE EE00 _H	LS_ERR_CNT	Lockstep error control register	R/W	0000 0000 _H	32
FFFE EE04 _H	LS_ERR_ST	Lockstep error status register	R/W	0000 0000 _H	32

FFFE EE14 _H	LS_ERR_DATA	Lockstep error data register	R	Undefined (retained)	32

These registers are placed in the CPU Peripheral of the CPU1. These registers can only be accessed by the CPU1.

30.3.2 Details of Registers

30.3.2.1 TESTCOMPREG0 — Comparator Test Register 0

TESTCOMPREG0 is test register 0 used for the lockstep function of the CPU1.

Combining TESTCOMPREG0 with TESTCOMPREG1 enables self-diagnosis of the lockstep function. The following gives an example of self-diagnosis procedure.

- (1) Write arbitrary value to TESTCOMPREG0.
- (2) Write a different value to TESTCOMPREG1.
- (3) Read TESTCOMPREG0. The different values are read and sent to the master core and checker core.
- (4) Using the values read, run the comparator to be diagnosed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TESTCOMPREG0[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 30.97 TESTCOMPREG0 Register Contents

Bit Position	Bit Name	Function
31 to 0	TESTCOMPREG0[31:0]	Write: Data is written to each byte. Read: PE1: TESTCOMPREG0[31:0] value is read. PE1C: TESTCOMPREG1[31:0] value is read.

30.3.2.2 TESTCOMPREG1 — Comparator Test Register 1

TESTCOMPREG1 is test register 0 used for the lockstep function of the CPU1.

Combining TESTCOMPREG1 with TESTCOMPREG0 enables self-diagnosis of the lockstep function.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TESTCOMPREG1[31:16]

Table 30.98 TESTCOMPREG1 Register Contents

Bit Position	Bit Name	Function
31 to 0	TESTCOMPREG1[31:0]	Write: Data is written to each byte. Read: PE1: TESTCOMPREG1[31:0] value is read. PE1C: TESTCOMPREG0[31:0] value is read.

30.3.2.3 LS_ERR_CNT — Lockstep error control register

Register LS_ERR_CNT is used to enable or disable capturing of the address and data in the given destination area for access when a lock-step error occurs for an address and data. That is, setting an effective bit of this register to 1 selects capturing of addresses and data in the given destination area for access.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	L1RAM	L2RAM	GAPB	LAPB
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 30.99 LS_ERR_CNT Register Contents

Bit Position	Bit Name	Function
31 to 4	—	Reserved When read, 0 is always read. When writing, always write 0.
3	L1RAM	Enables or disables lockstep error address/data capture of the local RAM access 0: Capture is disabled 1: Capture is enabled
2	L2RAM	Enables or disables lockstep error address/data capture of the global RAM access 0: Capture is disabled 1: Capture is enabled
1	GAPB	Enables or disables lockstep error address/data capture of the P-bus access* ¹ 0: Capture is disabled 1: Capture is enabled
0	LAPB	Enables or disables lockstep error address/data capture of the IPIR and MEV access* ¹ 0: Capture is disabled 1: Capture is enabled

Note 1. For P-bus access and configuration for IPIR or MEV access, see **Section 3, CPU System**.

30.3.2.4 LS_ERR_ST — Lockstep Error Status Register

The LS_ERR_ST register is for monitoring the first occurrence of a lock-step error. After a flag is set to indicate the first occurrence of a lock-step error, the other flags are not set to 1 even in response to an error until the flag indicating the first error has been cleared. Also, in cases of contention between different source signals for setting of the error flags, the following order of priority determines which flag is set: L1RAM word 0 to L1RAM word 3 > L2RAM P0 to L2RAM P1 > GAPB > LAPB. Each of the flags when set is cleared by an internal or external reset or by writing 1 to the flag.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	L1RAM W0	L1RAM W1	L1RAM W2	L1RAM W3	L2RAM P0	L2RAM P1	GAPB	LAPB
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 30.100 LS_ERR_ST Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 8	—	Reserved When read, 0 is always read. When writing, always write 0.
7	L1RAMW0	Indicates state of the lockstep error address and data capture of Word0 in the local RAM Writing 1 clears this bit. 0: No input capture has occurred 1: Input capture has occurred
6	L1RAMW1	Indicates state of the lockstep error address and data capture of Word1 in the local RAM Writing 1 clears this bit. 0: No input capture has occurred 1: Input capture has occurred
5	L1RAMW2	Indicates state of the lockstep error address and data capture of Word2 in the local RAM Writing 1 clears this bit. 0: No input capture has occurred 1: Input capture has occurred
4	L1RAMW3	Indicates state of the lockstep error address and data capture of Word3 in the local RAM Writing 1 clears this bit. 0: No input capture has occurred 1: Input capture has occurred
3	L2RAMP0	Indicates state of the lockstep error address and data capture of the lower-order data in the global RAM. Writing 1 clears this bit. 0: No input capture has occurred 1: Input capture has occurred
2	L2RAMP1	Indicates state of the lockstep error address and data capture of the higher-order data in the global RAM. Writing 1 clears this bit. 0: No input capture has occurred 1: Input capture has occurred

Table 30.100 LS_ERR_ST Register Contents (2/2)

Bit Position	Bit Name	Function
1	GAPB	Indicates state of the lockstep error address and data capture of the P-bus access*1. Writing 1 clears this bit. 0: No input capture has occurred 1: Input capture has occurred
0	LAPB	Indicates state of the lockstep error address and data capture of the IPIR and MEV access*1. Writing 1 clears this bit. 0: No input capture has occurred 1: Input capture has occurred

Note 1. For P-bus access and configuration for IPIR or MEV access, see **Section 3, CPU System**.

30.3.2.5 LS_ERR_ADDRESS — Lockstep Error Address Register

This register stores data when an error occurs.

It stores the data of each error source of LS_ERR_ST.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Address[31:16]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Address[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.101 LS_ERR_ADDRESS Register Contents

Bit Position	Bit Name	Function
31 to 0	Address[31:0]	This register is to monitor the address when a lockstep error occurs. Effective bits when address is captured are as follows. 0 is stored to all invalid bits. See below to convert the address of each error flag in LS_ERR_ST to actual address. L1RAMW0: Local RAM base_address + (Address [14:0]<<4) L1RAMW1: Local RAM base_address + (Address [14:0]<<4) + 0 × 4 L1RAMW2: Local RAM base_address + (Address [14:0]<<4) + 0 × 8 L1RAMW3: Local RAM base_address + (Address [14:0]<<4) + 0 × C L2RAMP0: Global RAM_base_address + Address [20:0] L2RAMP1: Global RAM_base_address + Address [20:0] + 0×4 GAPB: Address [31:0] LAPB: 0xFF000000 + Address [23:0]

30.3.2.6 LS_ERR_DATA — Lockstep Error Data Register

This register stores data when an error occurs.

It stores the data of each error source of LS_ERR_ST.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DATA[31:16]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.102 LS_ERR_DATA Register Contents

Bit Position	Bit Name	Function
31 to 0	DATA[31:0]	This register is to monitor the data [31:0] when a lockstep error occurs.

30.4 Memory Protection

30.4.1 Overview

This product incorporates the memory protection function to prevent erroneous accesses to data in memories and control registers of the peripheral circuits.

- MPU

The CPU1 and PCU protect memories against illegal accesses from the CPU1 and PCU themselves. Accesses to addresses that are prohibited by the MPU are never issued by the CPU1 or PCU. For details, refer to *RH850G3MH User's Manual: Software* and *RH850G3K User's Manual: Software*.

- Slave Guard

A specific memory is protected against illegal accesses from any bus master. Slave guard includes the following guard types. The details of each type are given in the following sections.

- PEG

The local RAM is protected against illegal accesses. However, accesses from the CPU incorporating the local RAM itself are excluded. For example, accesses from the CPU1 to local RAM in the CPU1 are not rejected by the PEG.

For details, refer to **Section 3, CPU System**.

- GRG

The global RAM is protected against illegal accesses.

- PBG

The control registers in the peripheral circuits and memories are protected against illegal accesses. For details, refer to **Section 30.4.3**

30.4.1.1 Identifiers for Slave Guard

For the slave guard function, the type of illegal accesses to be rejected can be designated using the following identifiers.

Table 30.103 Identifiers for Slave Guard

Identifier	Function
UM	<p>When the CPU makes an access, the operating mode of the CPU is indicated.</p> <p>0: Supervisor mode 1: User mode</p> <p>When the DMAC or DTS makes an access, the value of this identifier is the value in the channel master setting register.</p> <p>When the other master makes an access, the value of this identifier is always 0.</p>
SPID	<p>When the CPU makes an access, the system protection identifier SPID that is assigned to the CPU is indicated.</p> <p>When the DMAC or DTS makes an access, the value of this identifier is the value in the channel master setting register.</p> <p>When the other master makes an access, the value of this identifier is always 00_B.</p>
PEID	<p>The access source bus master is indicated.</p> <p>3'b000: Reserved 3'b001: CPU1 3'b010: Reserved 3'b011: PCU 3'b100: Other bus master 3'b101: Reserved 3'b110: Reserved 3'b111: DMAC/DTS</p>

30.4.2 GRG (Global RAM Guard)

This product is provided with 4-channel GRG, which is described in detail in the following sections.

30.4.2.1 List of Registers

Table 30.104 List of Registers (1/2)

Address	Symbol	Register Name	R/W	Value after Reset	Access Size
FFC4 9100 _H	MGDGRSCTL_SIC	GRG control register (SIC)	R/W	0000 0000 _H	8/16/32

FFC4 9468 _H	MGDGRBAD6	GRG compare base address register 6	R/W	0000 0000 _H	8/16/32
FFC4 946C _H	MGDGRADV6	GRG valid compare address register 6	R/W	0000 0000 _H	8/16/32
FFC4 9470 _H	MGDGRPROT7	GRG protection setting register 7	R/W	07FF 0000 _H	8/16/32

Table 30.104 List of Registers (2/2)

Address	Symbol	Register Name	R/W	Value after Reset	Access Size
FFC4 9474 _H	MGDGRSPID7	GRG protection SPID setting register 7	R/W	FFFF FFFF _H	8/16/32
FFC4 9478 _H	MGDGRBAD7	GRG compare base address register 7	R/W	0000 0000 _H	8/16/32
FFC4 947C _H	MGDGRADV7	GRG valid compare address register 7	R/W	0000 0000 _H	8/16/32

- MGDGRPROT_n, MGDGRSPID_n, MGDGRBAD_n, and MGDGRADV_n set the protection specifications for each channel (n: 0 to 7).
- MGDGRSCTL_*, MGDGRSSTAT_*, MGDGRSAD_*, and MGDGRSTYPE_* indicate error information on each access path: “_SIC” represents access from the system interconnect to the global RAM, and “_PE1” represents access from the CPU1 to the global RAM.
- An error is detected if access is to the access-prohibited area of the address space FEE0_0000_H to FEEF_FFFF_H listed in **Table 4.1** in **Section 4.1, Address Space**.

30.4.2.2 Details of Registers

(1) MGDGRSCTL_SIC/PE1 — GRG Control Register n

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ERRCLO	ERRCLE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 30.105 MGDGRSCTL_SIC/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 2	—	Reserved These bits are always read as 0. The write value should also be 0.
1	ERRCLO	Clears the error entry overflow flag 0: No operation. 1: Clears the overflow flag.
0	ERRCLE	Clears the error detection flag 0: No operation. 1: Clears the error detection flag. Note that this bit must be set simultaneously with the ERRCLO bit as shown in the table below.

Table 30.106 Combination of ERRCLO and ERRCLE

ERRCLO	ERRCLE	Function
0	0	Clears neither of the bits.
0	1	Clears neither of the bits (setting ignored).
1	0	Clears the OVF bit.
1	1	Clears both of the bits.

(2) MGDGRSSTAT_SIC/PE1 — GRG Error Status Register

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVF	ERR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.107 MGDGRSSTAT_SIC/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 2	—	Reserved These bits are always read as 0. The write value should also be 0.
1	OVF	Error Entry Overflow Flag 0: No overflow. 1: Overflow occurred. Since the error entry depth of GRG is 1, when another guard violation occurs after the error detection flag was set due to the earlier guard violation, the error entry overflow occurs and this flag is set. Occurrence of overflow is not reported to ECM. Guard violation error information is not captured in case of an overflow.
0	ERR	Error Detection Flag 0: No error 1: An error occurred.

CAUTION

An error is detected also when access is to the access-prohibited area of the address space FEE0_0000_H to FEFF_FFFF_H listed in **Table 4.1** in **Section 4.1, Address Space**.

(3) MGDGRSAD_SIC/PE1 — GRG Error Address Register

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	GRIFA[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GRIFA[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.108 MGDGRSAD_SIC/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 21	—	Reserved These bits are always read as 0. The write value should also be 0.
20 to 0	GRIFA[20:0]	Address upon Error Occurrence

CAUTION

An error is detected and the address to which GRIFA is accessed is retained also when access is to the access-prohibited area of the address space FEE0_0000_H to FEF_F_FFF_F_H listed in **Table 4.1** in **Section 4.1, Address Space**.

(4) MGDGRSTYPE_SIC/PE1 — GRG Error Access Type Register

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PEID[2:0]			—	—	—	SPID[1:0]		—	UM	—	TYPE[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.109 MGDGRSTYPE_SIC/PE1 Register Contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved These bits are always read as 0. The write value should also be 0.
15 to 13	PEID[2:0]	PEID upon Error Occurrence
12 to 10	—	Reserved These bits are always read as 0. The write value should also be 0.
9, 8	SPID[1:0]	SPID upon Error Occurrence
7	—	Reserved This bit is always read as 0. The write value should also be 0.
6	UM	UM upon Error Occurrence
5	—	Reserved This bit is always read as 0. The write value should also be 0.
4 to 0	TYPE[4:0]	Transfer Type upon Error Occurrence (Internal bus and interconnect signals. Reference information.)

(5) MGDGRPROTn — GRG Protection Setting Register n (n = 0 to 7)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	EN	—	—	—	—	UM	DEB	PEID[7:0]							
Value after reset	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.110 MGDGRPROTn Register Contents

Bit Position	Bit Name	Function
31	—	Reserved This bit is always read as 0. The write value should also be 0.
30	EN	Protection Enable 0: Disables protection. 1: Enables protection. The access permitted by this register is enabled.
29 to 27	—	Reserved These bits are always read as 0. The write value should also be 0.
26	—	Reserved This bit is always read as 1. The write value should also be 1.
25	UM	User Mode Access 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
24	DEB	PEID Access 0: Disables access from the debug master. 1: Enables access from the debug master. Make sure to set this bit to 1. Setting this bit to 0 may lead to incorrect operation of the debugger or RAM monitoring tool.
23 to 16	PEID[7:0]	PEID Access The PEID field is a bit list, in which one bit corresponds to one PEID value. Setting multiple bits enables the ID values of the multiple virtual processors simultaneously. For example, setting the PEID field to 0101 _B enables access with PEID = 0 and PEID = 2. 0: Disables access with PEID = n. 1: Enables access with PEID = n.
15 to 0	—	Reserved These bits are always read as 0. The write value should also be 0.

(6) MGDGRSPIDn — GRG Protection SPID Setting Register n (n = 0 to 7)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	SPID[3:0]			
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 30.111 MGDGRSPIDn Register Contents

Bit Position	Bit Name	Function
31 to 4	—	Reserved These bits are always read as 1. The write value should also be 1.
3 to 0	SPID[3:0]	Access by SPID The SPID field is a bit list, in which one bit corresponds to one SPID value. Setting multiple bits enables the multiple SPID values simultaneously. For example, setting the SPID field to 0101B enables access with SPID = 0 and SPID = 2. 0: Disables access with SPID = n 1: Enables access with SPID = n

(7) MGDGRBADn — GRG Compare Base Address Register n (n = 0 to 7)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	AD[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AD[15:9]							—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Table 30.112 MGDGRBADn Register Contents

Bit Position	Bit Name	Function
31 to 21	—	Reserved These bits are always read as 1. The write value should also be 1.
20 to 9	AD[20:9]	Compare base address
8 to 0	—	Reserved These bits are always read as 0. The write value should also be 0.

(8) MGDGRADVn — GRG Valid Compare Address Register n (n = 0 to 7)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	ADV[20:16]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADV[15:9]							—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Table 30.113 MGDGRADVn Register Contents

Bit Position	Bit Name	Function
31 to 21	—	Reserved These bits are always read as 0. The write value should also be 0.
20 to 9	ADV[20:9]	Valid Compare Address Address comparison proceeds for addresses for which the corresponding bit in MGDGRADVn[20:9] is 1. When all MGDGRADVn[20:9] bits are set to 1, 512 bytes (the minimum unit) are targeted for protection based on the addresses specified by MGDGRBADn. When all MGDGRADVn[20:9] bits are set to 0, the scope of protection is the whole of the global RAM.
8 to 0	—	Reserved These bits are always read as 0. The write value should also be 0.

Setting example: When the setting of MGDGRBADn[20:9] is 800_H and that of MGDGRADVn[20:9] is FF7_H, for example, global RAM guard protection area n is FEF0 0000_H to FEF0 01FF_H and FEF0 1000_H to FEF0 11FF_H.

Concept: When the setting of MGDGRBADn[20:9] is 800_H, the base address becomes FEF0 0000_H and the settable range of bits is enclosed in [] below.

```
1111 1110 111 [1 0000 0000 000] 0 0000 0000
F      E      F      0      0      0      0      0
```

When MGDGRADVn[20:9] is FF7_H, bits with 0 in that range and the 9 lower-order bits are ignored, so we have

```
1111 1110 111[1 0000 000X 000] X XXXX XXXX
```

which means that the 512-byte ranges (a total of 1 Kbyte) from

```
F      E      F      0      0      0      0      0 to
F      E      F      0      0      1      F      F,
```

and

```
F      E      F      0      1      0      0      0 to
F      E      F      0      1      1      F      F
```

will be protected.

30.4.3 PBG

The PBG module is divided into several PBG groups, each of which is provided with a maximum of 16 protection channels. A single PBG channel can designate the access against which a single peripheral circuit should be protected. Each PBG group can hold the information of the access that has been rejected.

The following table lists the peripheral circuits to be protected, the corresponding PBG group names, and the PBG channel numbers.

Table 30.114 List of Peripheral Circuit Module To be Protected (1/2)

PBG Group	PBG Channel Number	Module to be Protected
PBG0A	0	INTC2 (Group A) ^{*3}
	1	DMA_DTS
PBG0B	4	GRG (control register)
	5	GRG status (VCI2GRAM)
	6	GRG status (PE1)
PBG1A	0	APA0 (except I/O selection function)
	1	APA (I/O selection function)
	3	RSENT0
	4	RSENT1
	5	RSENT2
	6	RSENT3
	7	RSENT4
	8	RSENT5
PBG1B	0	ATU-IV (shared control, prescaler, DMA/AD requests)
	1	ATU-IV (Timer A)
	2	ATU-IV (Timer B)
	3	ATU-IV (Timer C)
	4	ATU-IV (Timer D)
	5	ATU-IV (Timer E)
	6	ATU-IV (Timer F)
	7	ATU-IV (Timer G)
	8	ATU-IV (Timer H)
	9	ATU-IV (Timer J)
PBG2A	0	CSIH0 (group A) ^{*1}
	1	CSIH0 (group B) ^{*1}
	2	CSIH1 (group A) ^{*1}
	3	CSIH1 (group B) ^{*1}
	4	CSIH2 (group A) ^{*1}
	5	CSIH2 (group B) ^{*1}
	6	CSIH3 (group A) ^{*1}
	7	CSIH3 (group B) ^{*1}
	12	INTC2 (group C) ^{*3}

Table 30.114 List of Peripheral Circuit Module To be Protected (2/2)

PBG Group	PBG Channel Number	Module to be Protected
PBG3A	0	$\Delta\Sigma$ AD (shared register)
	1	$\Delta\Sigma$ AD (CH0 register)
	2	$\Delta\Sigma$ AD (CH1 register)
	3	$\Delta\Sigma$ AD (CH2 register)
	4	$\Delta\Sigma$ AD (CH3 register)
	5	$\Delta\Sigma$ AD (CH4 register)
	6	$\Delta\Sigma$ AD (CH5 register)
	7	$\Delta\Sigma$ AD (CH6 register)
	8	$\Delta\Sigma$ AD (CH7 register)
	9	ADC0
	10	ADC1
	11	ADC (IFC)
	12	ADC (ASF)
	13	ECM (M)
	14	ECM (C)
15	ECM (Common)	
PBG3B	0	Port group 0 (group A) ^{*2}
	1	Port group 0 (group B) ^{*2}
	2	INTC2 (Group B) ^{*3}

Note 1. The CSIHx registers are divided into the following two groups and controlled separately.

Group A: CSIHnCTL0 to CSIHnCTL2, CSIHnSTR0, and CSIHnSTCR0

Group B: Other than above.

Note 2. The port group registers are divided into the following two groups and controlled separately.

Group A: Registers other than PCR0_m registers (see **Section 2.1.4.1 Table 2.6**)

Group B: PCR0_m

Here, m represents the bit numbers (m = 0 to 14) in each port group.

Note 3. The INTC2 registers are divided into three groups and controlled.

Group A: EICn, IMRn, EIBDn

Group B: NMICTL, EXINT registers, SINTR0 to SINTR3

Group C: PINT0 to PINT7, PINTCLR0 to PINTCLR7, TIMER

30.4.3.1 List of Registers

The following table lists the register provided for each PBG channel.

Table 30.115 List of Registers (for PBG Channel)

Register Symbol	Register Name	R/W	Value after Reset	Address	Access Size
FSGDxxDPROTn	PBGxx protection register n	R/W	07FF FFFF _H	<base_addr0> + 4*n	8/16/32

The following table lists the registers provided for each PBG group.

Table 30.116 List of Registers (for PBG Group)

Register Symbol	Register Name	R/W	Value after Reset	Address	Access Size
ERRSLVxxCTL	PBGxx error control register	W	0000 0000 _H	<base_addr1> + 0 _H	8/16/32
ERRSLVxxSTAT	PBGxx error status register	R	0000 0000 _H	<base_addr1> + 4 _H	8/16/32
ERRSLVxxADDR	PBGxx error address register	R	0000 0000 _H	<base_addr1> + 8 _H	32
ERRSLVxxTYPE	PBGxx error type register	R	0000 0000 _H	<base_addr1> + C _H	16/32

In the above tables, “xx” and “n” in the register names and symbols represents the PBG group numbers and PBG channel numbers, respectively. The table below shows the base address values <base_addr0> and <base_addr1>, which correspond to each of the PBG group numbers and PBG channel numbers.

Table 30.117 List of Base Address

PBG Group	PBG Group Number xx	PBG Channel Number n	<base_addr0>	<base_addr1>
PBG0A	0A	0, 1	FFC4 C000 _H	FFC4 C800 _H
PBG0B	0B	4 to 7	FFC4 C100 _H	FFC4 C900 _H
PBG1A	1A	0, 1, 3 to 8	FFDC 0000 _H	FFDC 0200 _H
PBG1B	1B	0 to 9	FFDD D000 _H	FFDD D200 _H
PBG2A	2A	0 to 7, 12	FFF9 4000 _H	FFF9 4200 _H
PBG3A	3A	0 to 15	FFC4 0000 _H	FFC4 0200 _H
PBG3B	3B	0 to 2	FFC4 1000 _H	FFC4 1200 _H

30.4.3.2 Details of Registers

(1) FSGDxxDPROTn — PBGxx Protection Register n

FSGDxxDPROTn designates the access to be rejected against which the peripheral circuit control registers and RAM should be protected. Any access that is disabled using any of the identifiers is rejected as an illegal access.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	PROTUM	PROTPEID[7:0]							—	
Value after reset	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PROTSPID[3:0]				PROTDEB	PROTRDPDEF	PROTWRPDEF	PROTRD	PROTWR
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 30.118 FSGDxxDPROTn Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 27	—	Reserved These bits are always read as 0. The write value should also be 0.
26	—	Reserved This bit is always read as 1. The write value should also be 1.
25	PROTUM	User Mode Access 0: Enables access in supervisor mode. 1: Enables access in user mode and supervisor mode.
24 to 17	PROTPEID[7:0]	PEID Access The PROTNPEID field is a bit list, in which one bit corresponds to one PEID value. Setting multiple bits enables the ID values of the multiple virtual processors simultaneously. For example, setting the PROTNPEID field to 0101 _B enables access with PEID = 0 and PEID = 2. 0: Disables access with PEID = n. 1: Enables access with PEID = n.
16 to 9	—	Reserved These bits are always read as 1. The write value should also be 1.
8 to 5	PROTSPID[3:0]	SPID Access The PROTNSPID field is a bit list, in which one bit corresponds to one SPID value. Setting multiple bits enables the multiple SPID values simultaneously. For example, setting the PROTNSPID field to 0101 _B enables access with SPID = 0 and SPID = 2. 0: Disables access with SPID = n. 1: Enables access with SPID = n.
4	PROTDEB	Debug Access 0: Disables access from the debug master. 1: Enables access from the debug master. Make sure to set this bit to 1. Setting this bit to 0 may result in incorrect operation of the debugger or RAM monitoring tool.
3	PROTRDPDEF	Default Read Protection 0: Enables read access from any master. 1: Only enables read access from the master to which access is permitted.
2	PROTWRPDEF	Default Write Protection 0: Enables write access from any master. 1: Only enables write access from the master to which access is permitted.

Table 30.118 FSGDxxDPROTn Register Contents (2/2)

Bit Position	Bit Name	Function
1	PROTRD	PROTnRD Read Permission 0: Disables read access from any master. 1: Only enables read access from the master to which access is permitted. However, if both PROTRDPDEF and PROTRD are set to 0, the setting of PROTRDPDEF = 0 is given priority, enabling read access from any master.
0	PROTWR	PROTnWR Write Permission 0: Disables write access from any master 1: Only enables write access from the master to which access is permitted. However, if both PROTWRPDEF and PROTWR are set to 0, the setting of PROTWRPDEF = 0 is given priority, enabling write access from any master.

(2) ERRSLVxxCTL — PBGxx Error Control Register

ERRSLVxxCTL clears the status in the error status register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CLRO	CLRE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 30.119 ERRSLVxxCTL Register Contents

Bit Position	Bit Name	Function
31 to 2	—	Reserved These bits are always read as 0. The write value should also be 0.
1	CLRO	Clears the error entry overflow flag. 0: No operation. 1: Clears the overflow flag.
0	CLRE	Clears the error detection flag. 0: No operation. 1: Clears the error detection flag.

(3) ERRSLVxxSTAT — PBGxx Error Status Register

ERRSLVxxSTAT holds the status of the illegal access rejected with the PBGxx.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—														OVF	ERR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.120 ERRSLVxxSTAT Register Contents

Bit Position	Bit Name	Function
31 to 2	—	Reserved These bits are always read as 0. The write value should also be 0.
1	OVF	Error Entry Overflow Flag 0: No overflow. 1: Overflow occurred. Since the error entry depth of PBG is 1, when another guard violation occurs after the error detection flag was set due to the earlier guard violation, the error entry overflow occurs and this flag is set. Occurrence of overflow is not reported to ECM. Guard violation error information is not captured in case of an overflow.
0	ERR	Error Detection Flag 0: No error. 1: Error occurred.

(4) ERRSLVxxADDR — PBGxx Error Address Register

ERRSLVxxADDR holds the address of the illegal access rejected with the PBGxx.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADDR[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADDR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.121 ERRSLVxxADDR Register Contents

Bit Position	Bit Name	Function
31 to 0	ADDR[31:0]	Address upon Error Occurrence ADDR[1:0] are always fixed to 0.

(5) ERRSLVxxTYPE — PBGxx Error Type Register

ERRSLVxxTYPE holds the type of the illegal access rejected with the PBGxx.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.122 ERRSLVxxTYPE Register Contents

Bit Position	Bit Name	Function
31 to 16	—	Reserved These bits are always read as 0. The write value should also be 0.
15 to 13	PEID[2:0]	PEID when an error has occurred
12 to 10	—	Reserved These bits are always read as 0. The write value should also be 0.
9, 8	SPID[1:0]	SPID when an error has occurred
7	—	Reserved This bit is always read as 0. The write value should also be 0.
6	UM	UM when an error has occurred
5	—	Reserved This bit is always read as 0. The write value should also be 0.
4 to 1	STRB[3:0]	Strobe signal when an error has occurred (this is an internal bus and interconnect signal and provides information for reference)
0	WRITE	Write signal when an error has occurred (this is an internal bus and interconnect signal and provides information for reference)

30.5 Multi-Input Signature Generator (MISG)

30.5.1 Overview

This LSI incorporates multi-input signature generators (MISG) for self-diagnosis by the CPUs.

The table below shows the overview of the MISG specifications.

Table 30.123 Specification Overview

Item	Description
Generating polynomials	<p>Two polynomials are available for use in signature generation.</p> <ul style="list-style-type: none"> MISR1: $G(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$ MISR2: $G(x) = x^{32} + x^{22} + x^2 + x + 1$ <p>*To support signature generation for 64-bit data, each CPU is connected with an MISG that has two MISRs (MISR1 and MISR2).</p>
Signature generation	<p>Signature generation can be enabled or disabled.</p> <ul style="list-style-type: none"> Signature generation in MISR1 is enabled or disabled. Signature generation in MISR2 is enabled or disabled. <p>The following two conditions can be selected as conditions for signature generation</p> <ul style="list-style-type: none"> Writing to the register <p>A signature is generated by writing to the MISR1 calculation register (MISRCDR_*)</p> <ul style="list-style-type: none"> Monitoring write access <p>A signature is generated if writing to the address area specified for monitoring occurs when writing by the CPU is being monitored. The address area is specified by the monitoring area base address register and the monitoring area address mask register.</p>
Automatic signature comparison	<p>Two signature generation units are selected for comparison of signatures. Each signature generation unit has a data counter and comparison proceeds when the values of the data counters in the MISGs selected as the target for comparison match. The data counter counts the number of write accesses to the MISRCDRL register or the address area being monitored.</p>
Error notification	<p>When signatures are compared and do not match, the ECM is notified of an error. Enabling or disabling of error notification to the ECM can be selected. No interrupt request is not issued directly to the INTC.</p>

“*” in MISRCDR_*, MISR1_*, and MISR2_* indicates PE1 or PCU.

30.5.2 Block Diagram

30.5.2.1 MISG

The figure below is a block diagram of the MISG. The MISG consists of two signature generation units and a signature comparison unit.

Write monitoring mode for signature generation conditions (**Section 30.5.3.1 (2), Write Monitoring Mode**) can only be executed between the corresponding signature generation unit and the CPU. Therefore, each signature generation unit is given a name corresponding to the CPU number (MISG_PE1, MISG_PCU). MISG_PE1 can monitor write access by CPU1. MISG_PCU cannot monitor write access by PCU.

When register write mode is the signature generation condition, there is no correspondence between a CPU and the signature generation unit. Any CPU can generate a signature in any signature generation unit.

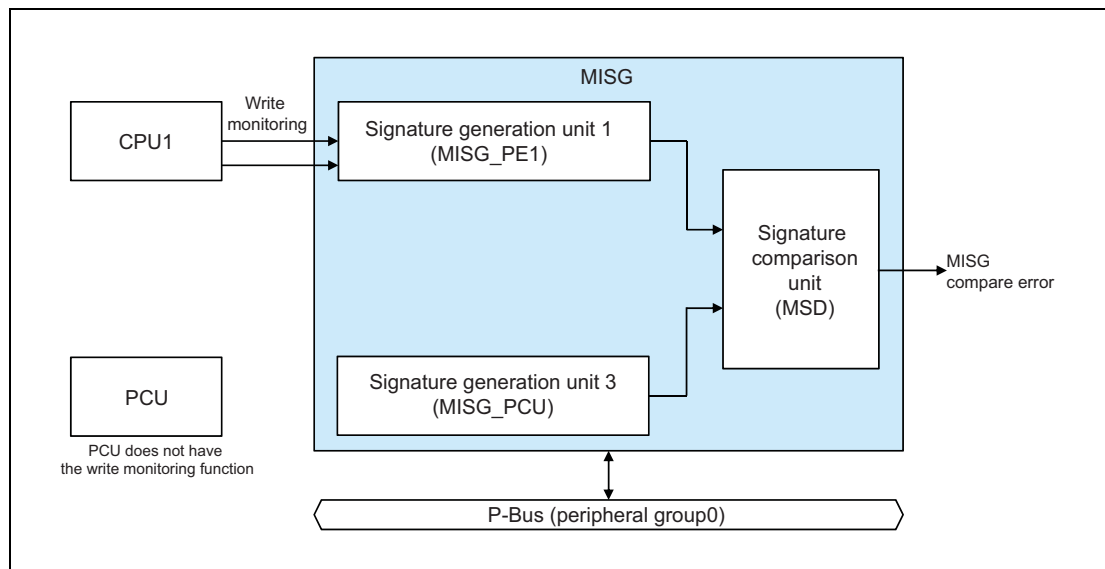

Figure 30.6 MISG Block Diagram (Multi Core)

30.5.2.2 Signature Generation

The figure below shows the flow of data in signature generation. MISR1 and MISR2 consist of two 32-bit signature generation units (MISR1_*, MISR2_*).

MISR2_* can generate a signature from 64-bits of data being written by the CPU being monitored, or from data being written to MISRCDR_*. The PCU does not have write monitoring, so in the case of the PCU, signatures are only generated from the data being written to MISRCDR_*.

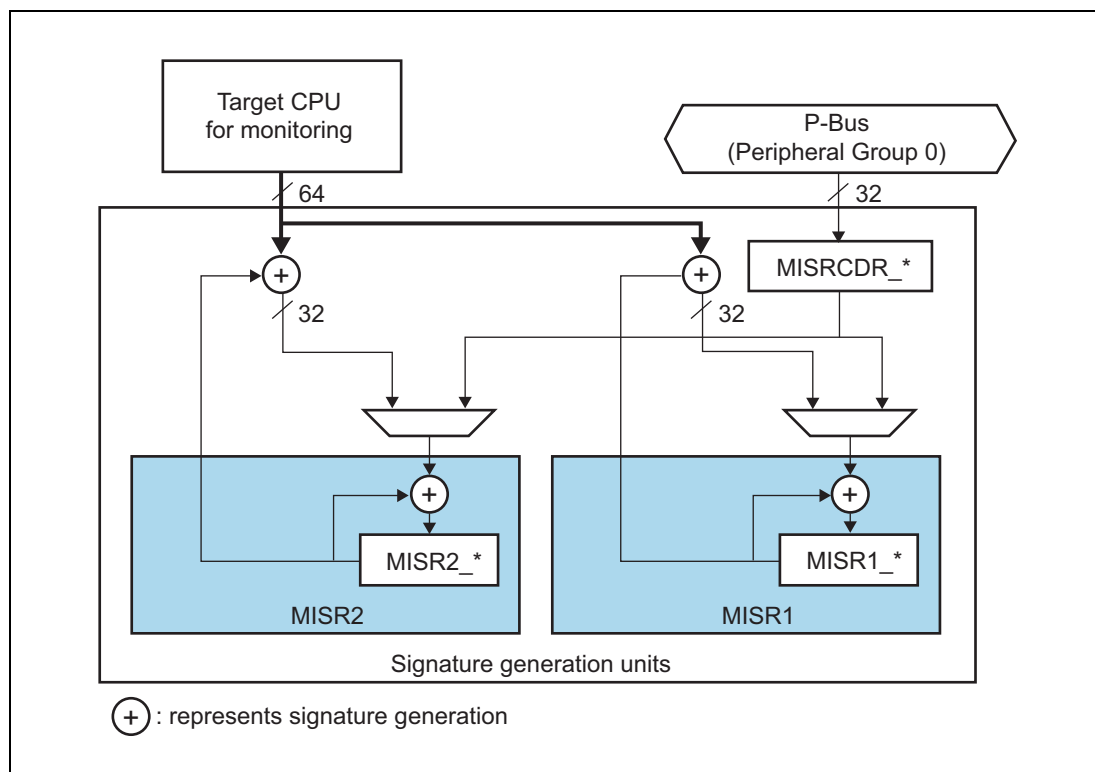

Figure 30.7 Signature Generation Units

Block diagrams of signature generation in MISR1_* and the polynomials used for this are shown below.

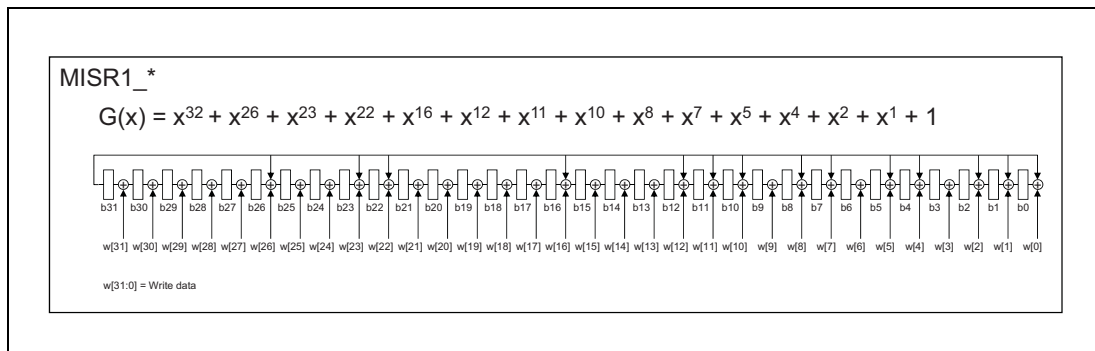

Figure 30.8 Block Diagram of Signature Generation in MISR1_*

Block diagrams of signature generation in MISR2_* and the polynomials used for this are shown below.

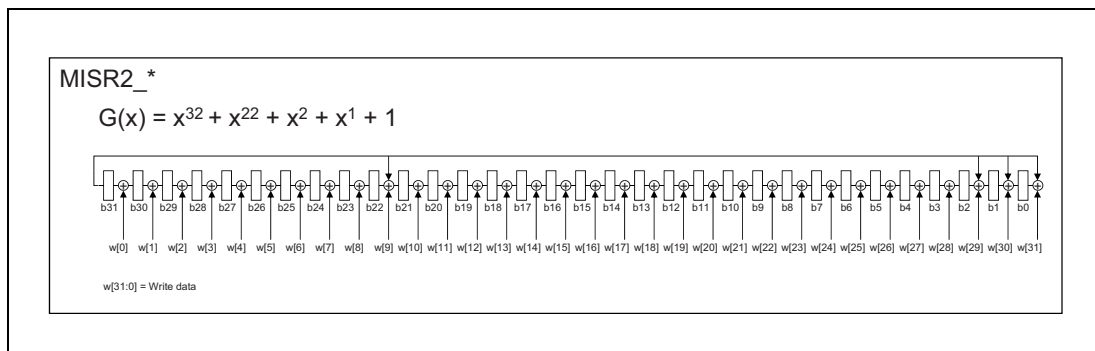

Figure 30.9 Block Diagram of Signature Generation in MISR2_*

30.5.3 Functional Specification

30.5.3.1 Conditions for Signature Generation

The conditions for signature generation in MISR1 and MISR2 can be selected by the setting of the MISR control register (MISRCR_*).

Signature generation conditions in MISR_i (i = 1, 2)

Table 30.124 Signature Generation Conditions of MISR_i

MISRCR. MISR1EN	MISRCR. MISR2EN	Signature Generation Conditions
0	—	MISR _i does not generate a signature.
1	0	Register write mode Writing to the MISRCDRL register leads to MISR _i generating a signature.
1	1	Write monitoring mode MISR _i generates a signature after the corresponding CPU writes to an address specified for monitoring.

(1) Register Write Mode

Writing to the MISR calculation register (MISRCDR_*) while MISR1 is in register write mode leads to the generation of a 32-bit signature in MISR1 from the value held in the multi-input signature register 1 (MISR1_*) and the data written to MISRCDR_*, and the result is retained in MISR1_*. Similarly, a 32-bit signature is generated in MISR2 from the value held in the multi-input signature register 2 (MISR2_*) and the data written to MISRCDR_*, and the result is retained in MISR2_*.

Writing to MISRCDR_* can proceed in 8-, 16-, or 32-bit units, and bits to which a value is not written are treated as 0. For example, writing to the 16 lower-order bits of MISRCDR_* leads to the generation of a signature with the 16 higher-order bits of write data treated as 0. Similarly, writing to the 16 higher-order bits of MISRCDR_* leads to the generation of a signature with the 16 lower-order bits of write data treated as 0. However, these cases will not arise if access is by using the IO header file.

MISR1 and MISR2 do not identify the bus master which writes to the MISRCDR_*. Writing by any bus master, whether a CPU, DMAC, or debugging master, produces a signature.

(2) Write Monitoring Mode

When the CPU writes to an address area specified for monitoring while MISR1 is in write-monitoring mode, MISR1 generates compressed 32-bit signatures from the value in MISR1_* and 64-bit data being written by the CPU, and generates signatures from the 32-bit compressed data and the value that is again held in MISR1_*. The generated signatures are stored in MISR1_*. Similarly, when the CPU writes to an address area specified for monitoring while MISR2 is in write-monitoring mode, MISR2 generates compressed 32-bit signatures from the value in MISR2_* and 64-bit data being written by the CPU, and generates signatures from the 32-bit compressed data and the value that is again held in MISR2_*. The generated signatures are stored in MISR2_*.

The address area specified for monitoring for signature generation is set by the MISR monitoring area base address register (MISRBASEADR) and the MISR monitoring area address mask register (MISRADRMSK). If the CPU write address is within the address area specified for monitoring, a signature is generated.

Write monitoring mode monitors write access by the corresponding CPU in 8-, 16-, 32-, or 64 units. When writing proceeds in 8-, or 16 units, remaining bits to which a value is not written are treated as

0, and compressed 32 bit data from 64-bit data is always input to MISR1 or MISR2. Write data are allocated to the lower-order side regardless of the destination address. For example, when 16 bits are written to an address of the form $4N + 2$, the 16 bits are allocated to the lower-order side and a signature is generated with the 16 higher-order bits treated as 0.

The CPU write access destinations that can be monitored by MISR1 and MISR2 are as follows:

Local RAM, global RAM, CPU peripheral (local APB), Peripheral circuit connected to the interconnect or to the P-Bus

The restrictions described below apply to the given store operations.

- (1) Instructions that core write data in slave responses: store operations such as BitOp, CAXI, and STC.W are not subject to monitoring.
- (2) Instructions for saving units of data larger than 64 bits on the stack (PREPARE and PUSHSP): signature values between the masters may not be matched when the instruction is suspended because of an interrupt. Therefore, the area to be used with the instructions must not be subject to monitoring or steps must be taken to make sure that the operation is not suspended due to an interrupt.

Write monitoring mode can only be executed between the specified signature generation unit and the corresponding CPU.

In this product, the following monitoring operations are possible. Writing by the PCU cannot be monitored.

- Monitoring of CPU1 write access by signature generation unit 1

A signature is not generated if write monitoring mode is set for a signature generation unit that does not support write monitoring mode. At this time, reference to the values of MISRBASEADR and MISRADRMSK is not possible from anywhere.

30.5.3.2 Automatic Signature Comparison

Of the signature generation units, two signature generation units are selected for the comparison of signatures by the MISR1CMPEN2 bit or MISR2CMPEN2 bit. Each signature generation unit has a data counter, and the signatures are compared if the values of the data counters generated in two signature generation units selected as targets for comparison match.

If two signatures are to be compared, use MISR1CMPEN2 or MISR2CMPEN2 in the MISRCMPCTL register to enable signature comparison by two signature generation units.

30.5.3.3 Data Counter

The MISR data counter register (MISRDCNT) counts how many times writing to MISRCDR_* or the address range specified by BASEADR and ADRMSK proceeds. When the CNTSTA bit = 1 and the CNTTRG bit = 0 in the data counter control register (MISRDCNTCTL), MISRDCNT counts the number of write accesses to MISRCDRL. When the CNTSTA bit = 1 and the CNTTRG bit = 1 in MISRDCNTCTL, MISRDCNT counts the number of write accesses by the corresponding CPU to the address range specified by MISRBASEADR and MISRADRMSK.

MISRDCNT can count the number of times either MISR1 or MISR2 or both MISR1 and MISR2 generate signatures by setting the trigger for counting up by MISRDCNT as the signature generation condition in MISR1 or MISR2. Note, however, that if the signature generation conditions for MISR1 and MISR2 and the trigger for counting up by the data counter are not consistent, the value of MISRDCNT and the signature generation count will not match.

CAUTIONS

1. When the MISR1EN and MISR2EN bits in the MISRCR register are both 0, counting by MISRDCNTCTL is not incremented even if writing to MISRCDRL and the address range specified by MISRBASEADR and MISRADRMSK proceeded.
2. In the signature generation unit that does not support write monitoring mode, the data counter is not incremented when the CPU write access to the monitoring address area is set as the trigger for counting up by the data counter.

30.5.3.4 Error Notification

When the CMPERREN bit in the error notification control register (MISRERRCTL) is set to 1, the ECM is notified of an error when signatures are compared and do not match. At the same time, the error flag in the compare error status register is set.

An interrupt request for the INTC is not generated.

30.5.4 Register Specifications

30.5.4.1 Register Map

The table below lists the registers of the signature generation units.

The registers with symbols ending in “_PE1” are those of signature generation unit 1 (MISG_PE1).

The registers with symbols ending in “_PCU” are those of signature generation unit 3 (MISG_PCU).

Note that the endings of the register symbols (“_PE1”, and “_PCU”) are omitted if signature generation units 1 and 3 do not require identification.

MISG_PE1_base = FFC5 1000_H

MISG_PCU_base = FFC5 3000_H

Table 30.125 List of Registers of the Signature Generation Units

Register Symbol	Register Name	R/W	Value after Reset	Address	Access Size
MISR1_PE1	Multi input signature register 1 (PE1)	R/W	0000 0000 _H	<MISG_PE1_base> + 000 _H	32
MISR2_PE1	Multi input signature register2 (PE1)	R/W	0000 0000 _H	<MISG_PE1_base> + 008 _H	32

MISRDCNT_PE1	MISR data count register (PE1)	R/W	0000 _H	<MISG_PE1_base> + 028 _H	16
MISR1_PCU	Multi input signature register 1 (PCU)	R/W	0000 0000 _H	<MISG_PCU_base> + 000 _H	32
MISR2_PCU	Multi input signature register 2 (PCU)	R/W	0000 0000 _H	<MISG_PCU_base> + 008 _H	32
MISRCDR_PCU	MISR calculation data register (PCU)	W	—	<MISG_PCU_base> + 010 _H	8/16/32
MISRRCR_PCU	MISR control register (PCU)	R/W	00 _H	<MISG_PCU_base> + 018 _H	8
MISRBASEADR_PCU	MISR monitoring area base address register (PCU)	R/W	0000 0000 _H	<MISG_PCU_base> + 01C _H	8/16/32
MISRADRMSK_PCU	MISR monitoring area mask address register (PCU)	R/W	0000 0000 _H	<MISG_PCU_base> + 020 _H	8/16/32
MISRDCNTCTL_PCU	MISR data count control register (PCU)	R/W	00 _H	<MISG_PCU_base> + 024 _H	8
MISRDCNT_PCU	MISR data count register (PCU)	R/W	0000 _H	<MISG_PCU_base> + 028 _H	16

The table below lists the registers of the signature comparison unit (MSD sub-block).

MSD_base = FFC5 0000_H

Table 30.126 List of Registers of the Signature Comparison Units

Register symbol	Register Name	R/W	Value after Reset	Address	Access Size
MISRCMPCTL	MISR comparator control register	R/W	0000 _H	<MSD_base> + 00 _H	8/16
MISRCMPERSTR	MISR compare error status register	R	00 _H	<MSD_base> + 04 _H	8
MISRCMPERRSTC	MISR compare error status clear register	W	00 _H	<MSD_base> + 08 _H	8
MISRERRCTL	MISR error notification control register	R/W	00 _H	<MSD_base> + 0C _H	8

Note 1. In case of access to a register in a unit smaller than 32 bits, the bits that are not specified are ignored when writing and read as 0.

The following describes the control registers of the signature comparison unit.

30.5.4.2 MISRCDR_PE1/PCU — MISR Calculation Data Register

The MISR calculation data register is a 32-bit write-only register.

When signature generation in register write mode is selected, a signature is generated in MISR1 or MISR2 by writing to this register. Data written to this register is the data input to the multi-input signature register 1 (MISR1_*) or the multi-input signature register 2 (MISR2_*). For the conditions for signature generation, see **Section 30.5.3.1, Conditions for Signature Generation**.

This register can be written in 8-, 16-, or 32-bit units. When writing proceeds in 8- or 16-bit units, remaining bits to which a value is not written are treated as 0, and 32-bit data is always input to MISR1_* or MISR2_*.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 30.127 MISRCDR_PE1/PCU Register Contents

Bit Position	Bit Name	Functions
31 to 0	MISRCDR31 to MISRCDR0	Calculation Data Input data to MISR1 or MISR2. When the MISR1EN bit = 1 and the MISR1CND bit = 0 in the MISRCR register, or the MISR2EN bit = 1 and the MISR2CND bit = 0, a new signature is generated each time the MISRCDR register is written, and the result is retained in MISR1 or MISR2.

30.5.4.3 MISR1_PE1/PCU — Multi-Input Signature Register 1

The multi-input signature register 1 is a 32-bit writable register.

Once the signature generation condition is met, this register generates a new signature each time the condition is met and retains the generated value. For the conditions for signature generation, see **Section 30.5.3.1, Conditions for Signature Generation**.

Signatures are generated by using the following polynomial:

$$G(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$$

Table 30.128 MISR1_PE1/PCU Register Contents

Bit Position	Bit Name	Functions
31 to 0	MISR131 to MISR10	Multi-Input Signature Register 1 When read, a new signature is always read.

30.5.4.4 MISR2_PE1/PCU — Multi-Input Signature Register 2

The multi-input signature register 2 is a 32-bit readable and writable register.

Once the signature generation condition is met, this register generates a new signature each time the condition is met and retains the generated value. For the conditions for signature generation, see **Section 30.5.3.1, Conditions for Signature Generation**.

Signatures are generated by using the following polynomial:

$$G(x) = x^{32} + x^{22} + x^2 + x + 1$$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 30.129 MISR2_PE1/PCU Register Contents

Bit Position	Bit Name	Function
31 to 0	MISR231 to MISR20	Multi-Input Signature Register 2 When read, a new signature is always read.

30.5.4.5 MISRCR_PE1/PCU — MISR Control Register

MISR is an 8-bit readable and writable register.

The MISR1EN and MISR2EN bits are used to enable signature generation in MISR1 and MISR2. When the MISR1EN or MISR2EN bit is 1, MISR1 or MISR2 generates a signature and retains the generated value. When the MISR1EN or MISR2EN bit is 0, MISR1 or MISR2 does not generate signatures and the values of these registers are not updated.

When the MISR1EN or MISR2EN bit is 1, the MISR1CND or MISR2CND bit selects the signal generation condition in MISR1 or MISR2. Setting the MISR1CND or MISR2CND bit to 0 selects signature generation in register write mode by MISR1 or MISR2, so writing to MISRCDR_* leads to signature generation. Setting the MISR1CND or MISR2CND bit to 1 selects signature generation in write monitoring mode by MISR1 or MISR2, writing by the CPU to the address range specified by the MISRBASEADR and MISRADRMSK registers leads to signature generation. For the conditions for signature generation, see **Section 30.5.3.1, Conditions for Signature Generation**.

Bit	7	6	5	4	3	2	1	0

Table 30.130 MISRCR_PE1/PCU Register Contents

Bit Position	Bit Name	Functions
7 to 4	—	Reserved
3	MISR2CND	MISR2 Signature Write Control This bit sets the signature generation condition in MISR2 when the MISR2EN bit = 1. 0: Register write mode 1: Write monitoring mode
2	MISR1CND	MISR1 Signature Write Control This bit sets the signature generation condition in MISR1 when the MISR1EN bit = 1. 0: Register write mode 1: Write monitoring mode
1	MISR2EN	MISR2 Enable 0: MISR2 does not generate a signature. 1: MISR2 generates a signature and the MISR2H and MISR2_* values are updated.
0	MISR1EN	MISR1 Enable 0: MISR1 does not generate a signature. 1: MISR1 generates a signature and the MISR1H and MISR1_* values are updated.

30.5.4.6 MISRBASEADR_PE1/PCU — MISR Monitoring Area Base Address Register

MISRBASEADR specifies the CPU write access area to be monitored by MISG when signature generation in write monitoring mode is selected. In combination with the setting of the monitoring area mask address register, this register specifies the address range of the monitoring area. For the conditions for signature generation, see **Section 30.5.3.1, Conditions for Signature Generation**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 0	BASEADR31 to BASEADR0	Monitoring Area Base Address Register

For the mechanism to judge access to the monitoring area, see **Section 30.5.4.7, MISRADRMSK_PE1/PCU — MISR Monitor Area Address Mask Register**.

30.5.4.7 MISRADRMSK_PE1/PCU — MISR Monitor Area Address Mask Register

MISRADRMSK specifies the CPU write access area to be monitored by MISG when signature generation in write monitoring mode is selected. In combination with the setting of the monitoring area base address register, this register specifies the address range of the monitoring area. For the conditions for signature generation, see **Section 30.5.3.1, Conditions for Signature Generation**.

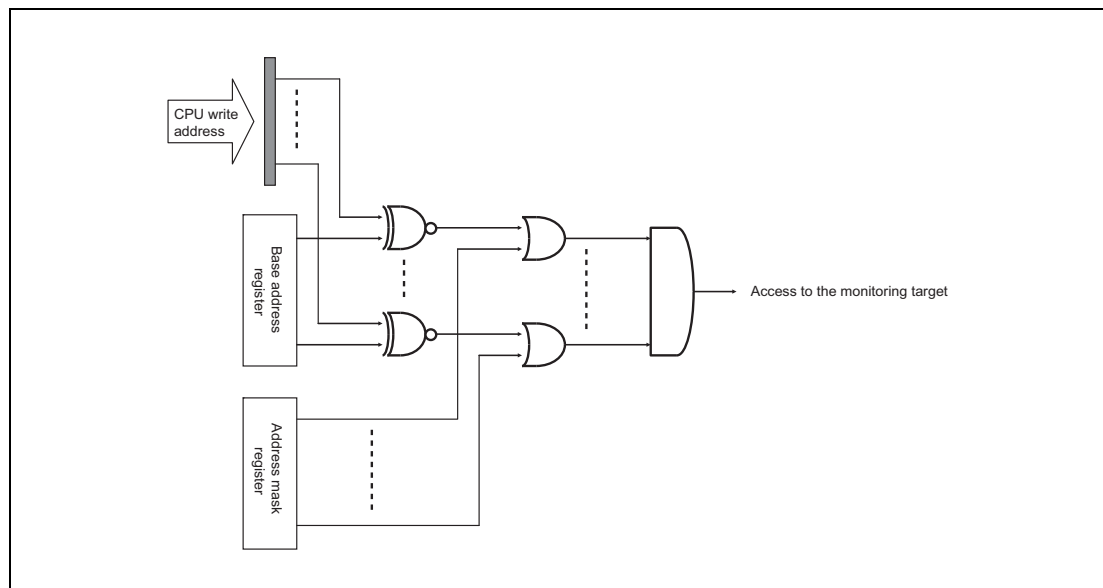

Figure 30.10 How to Detect Access to the Monitoring Area

30.5.4.8 MISRDCNTCTL_PE1/PCU — MISR Data Counter Control Register

This register controls operation of the MSIR data counter register. If the event selected by the CNTTRG bit occurs while the CNTSTA bit is 1, the data counter is incremented. For operation of the data counter, see **Section 30.5.3.3, Data Counter**.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CNTTRG	CNTSTA
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 30.133 MISRDCNTCTL_PE1/PCU Register Contents

Bit Position	Bit Name	Functions
7 to 2	—	Reserved
1	CNTTRG	Count-Up Trigger Select This bit selects the trigger for counting up by the data counter. 0: Write access to the MISRCDR_* register 1: Write access to the address area specified by the MISRBASEADR and MISRADRMSK registers
0	CNTSTA	Data Counter Start This bit is an enable bit for the data counter. If the event selected by the CNTTRG bit occurs while CNTSTA = 1, the data counter is incremented. 0: The data counter is stopped. 1: The data counter is operating.

30.5.4.9 MISRDCNT_PE1/PCU — MISR Data Counter Register

The data counter is a 16-bit readable and writable register.

If the data counter values of two signature generation units selected for comparison match, automatic comparison of the signatures proceeds.

When the CNTTRG bit in the data counter control register is 0, the data counter is incremented by write access to the MISR calculation data register. When the CNTTRG bit in the data control register is 1, the data counter is incremented by write access by the corresponding CPU to the address area specified by the MISRBASEADR and MISRADRMSK registers. For operation of the data counter, see **Section 30.5.3.3, Data Counter**.

Table 30.134 MISRDCNT_PE1/PCU Register Contents

Bit Position	Bit Name	Function
15 to 0	DCNT15 to DCNT0	Data Counter Register

The following describes the control registers of the MSD unit (signature comparison unit).

30.5.4.10 MISRCMPCTL — MISR Comparator Control Register

MISRCMPCTL is a 16-bit readable and writable register.

This register controls the comparator that compares signatures generated in the signature generation units. For automatic comparison of signatures, see **Section 30.5.3.2, Automatic Signature Comparison**.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	MISR2 CMPEN 2	—	—	MISR1 CMPEN 2	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R	R

Table 30.135 MISRCMPCTL Register Contents

Bit Position	Bit Name	Functions
15 to 6	—	Reserved When read, 0 is always read. When writing, always write 0.
5	MISR2CMPEN2	MISR2 Signature Compare Enable 2 This bit controls comparison of signatures retained in MISR2 of MISG_PCU and MISG_PE1. 0: Disables comparison 1: Enables comparison
4, 3	—	Reserved When read, 0 is always read. When writing, always write 0.
2	MISR1CMPEN2	MISR1 Signature Compare Enable 2 This bit controls comparison of signatures retained in MISR1 of MISG_PCU and MISG_PE1. 0: Disables comparison 1: Enables comparison
1, 0	—	Reserved When read, 0 is always read. When writing, always write 0.

30.5.4.11 MISRCMPERSTR — MISR Compare Error Status Register

The compare error status register is an 8-bit readable register.

If a mismatch occurs in signature comparison enabled by the comparator control register, the corresponding error flag is set.

The error flag is cleared by writing 1 to the corresponding clear bit in the compare error status clear register. The flag is also cleared by a reset.

Bit	7	6	5	4	3	2	1	0
	—	—	MISR2ERR2	—	—	MISR1ERR2	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 30.136 MISRCMPERSTR Register Contents

Bit Position	Bit Name	Functions
7, 6	—	Reserved When read, 0 is always read. When writing, always write 0.
5	MISR2ERR2	MISR2 Signature Compare Error Flag 2 This flag is set when signatures retained in MISR2 of MISG_PE1 and MISG_PCU are compared and do not match. 0: A mismatch has not occurred in signature comparison. 1: A mismatch has occurred in signature comparison.
4, 3	—	Reserved When read, 0 is always read. When writing, always write 0.
2	MISR1ERR2	MISR1 Signature Compare Error Flag 2 This flag is set when signatures retained in MISR1 of MISG_PE1 and MISG_PCU are compared and do not match. 0: A mismatch has not occurred in signature comparison. 1: A mismatch has occurred in signature comparison.
1, 0	—	Reserved When read, 0 is always read. When writing, always write 0.

30.5.4.12 MISRCMPERRSTC — MISR Compare Error Status Clear Register

The compare error status clear register is an 8-bit write-only register.

When an error flag in the compare error status register is 1, writing 1 to corresponding clear bit clears the error flag. Read the MISR compare error status register and write 1 to the clear bit for the flag being 1.

Bit	7	6	5	4	3	2	1	0
	—	—	MISR2CLR2	—	—	MISR1CLR2	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	W	R	R	W	R	R

Table 30.137 MISRCMPERRSTC Register Contents

Bit Position	Bit Name	Functions
7, 6	—	Reserved When read, 0 is always read. When writing, always write 0.
5	MISR2CLR2	MISR2 Signature Compare Error Clear 2 Writing 1 to this bit clears the MISR2ERR2 bit in the MISRCMPERSTR register.
4, 3	—	Reserved When read, 0 is always read. When writing, always write 0.
2	MISR1CLR2	MISR1 Signature Compare Error Clear 2 Writing 1 to this bit clears the MISR1ERR2 bit in the MISRCMPERSTR register.
1, 0	—	Reserved When read, 0 is always read. When writing, always write 0.

30.5.4.13 MISRERRCTL — MISR Error Notification Control Register

The error notification control register is an 8-bit readable and writable register.

This register enables or disables error notification when signatures are compared by the automatic signature comparison and do not mach. For the automatic signature comparison and error notification, see **Section 30.5.3.2, Automatic Signature Comparison**, and **Section 30.5.3.4, Error Notification**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CMPPERREN
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 30.138 MISRERRCTL Register Contents

Bit Position	Bit Name	Functions
7 to 1	—	Reserved When read, 0 is always read. When writing, always write 0.
0	CMPPERREN	Compare Error Notification Enable This bit enables or disables error notification when signatures are compared and do not mach. 0: Error notification does not proceed even if a mismatch has occurred in signature comparison. 1: Error notification proceeds if a mismatch has occurred in signature comparison.

30.5.5 Usage

30.5.5.1 Usage Example 1

The self-diagnostic program eases diagnosis. By using the MISG to compress intermediate transitions, the self-diagnostic program makes the saving and comparison of all intermediate results unnecessary. Results of self diagnosis including intermediate transitions can be judged by comparing the results of compression by the MISG with the expected results when the program ends.

This has the effect of reducing requirements for memory capacity and times for processing comparisons (substitution by CRCs is also possible).

Example of settings (when PE1 is running the self-diagnostic program)

The descriptions of registers of an MISG below applies to the registers of signature generation unit 1 (MISG_PE1), which is for PE1.

- (1) Initialize the multi-input signature register 1 (MISR1_*), multi-input signature register 2 (MISR2_*) and data counter register (MISRDCNT).
- (2) Set the MISR1CND or MISR2CND bit in the MISR control register (MISRCR) to 1 to select signature generation by MISR1 or MISR2 in write monitoring mode.
- (3) Use the MISR monitoring area base address register (MISRBASEADR) and MISR monitoring area address mask register (MISRADRMSK) to set the address area for monitoring.
- (4) Set the MISR1EN or MISR2EN bit in the MISR control register to 1 to enable signature generation in MISR1 or MISR2.
- (5) Run the self-diagnostic program on PE1.
- (6) Upon completion of execution of the self-diagnostic program, MISR1_* or MISR2_* data is compared with the expected value in flash memory.

30.5.5.2 Usage Example 2

Use multiple processors to run the same processing (including the self-diagnostic program) to confirm the correctness of results. Comparing results from different hardware raises reliability.

Example of settings (when PE1 and PCU are running the same task)

The descriptions of registers of an MISG below applies to the MISG registers of PE1 and PCU.

- (1) Initialize the multi-input signature register 1 (MISR1_*), multi-input signature register 2 (MISR2_*), and data counter register (MISRDCNT).
- (2) Set the MISR1CND or MISR2CND bit in the MISR control register (MISRCR) to 0 to select signature generation by MISR1 or MISR2 in register write mode.
- (3) Set MISR1CMPEN1 or MISR2CMPEN1 in the MISR comparator control register (MISRCMPCTL) to 1 to enable signature comparison by the comparator.
- (4) Set the CMPERREN bit in the MISR error notification control register to 1 to enable error notification to the ECM.

- (5) Set the CNTTRG bit in the MISR data counter control register (MISRDCNTCTL) to 0 to set writing to MISRCDR_* as the trigger for counting up by the data counter. Set the CNTSTA bit to 1 to enable operation of the data counter.
- (6) Set the MISR1EN or MISR2EN bit in the MISR control register to 1 to enable signature generation in MISR1 or MISR2.
- (7) Run the self-diagnostic program on all CPUs.
- (8) The self-diagnostic program stores intermediate results while the program is running in MISRCDR_* of the signature generation units. The signatures in the MISR1 and MISR2 registers of MISG_PE1 and MISG_PCU are compared whenever the values of the data counter registers (MISRDCNT) of MISG_PE1 and MISG_PCU match.
- (9) Check the comparison status register to see if there were errors in comparison.

30.6 Clock Monitors

30.6.1 Overview

This product incorporates the clock monitors to monitor the clock operation by detecting the abnormal frequency of the clock to be monitored. The clock monitors provide the following functions.

- Monitors to see if the frequency of the clock to be monitored is within the specified range based on the sampling clock.
- Issues an error notice to the ECM upon detection of the abnormal state of the clock.

Table 30.139 shows the clocks monitored by the clock monitors and the sampling clocks used.

Table 30.139 List of Clocks Monitored by Each Clock Monitor and Sampling Clocks Used

Clock Monitor Channel	Monitored Clock	Sampling Clock
CLMA0	Low-speed peripheral clock (40 MHz SSG)	Non-modulated low-speed peripheral clock (40 MHz clean)
CLMA1	Non-modulated low-speed peripheral clock (40 MHz clean)	10 MHz (1/2 main OSC)
CLMA2	WDTA counter clock (1/80 main OSC)	Low-speed ROSC clock (ROSC)

30.6.2 List of Registers

30.6.2.1 Clock Monitor Channel Registers

Table 30.140 List of Registers

Address	Symbol	Register Name	R/W	Value after Reset	Access Size
<Base_adr + 00 _H >	CLMA _n CTL0	CLMA _n control register 0	R/W	00 _H	8
<Base_adr + 08 _H >	CLMA _n CMPL	CLMA _n compare register L	R/W	0001 _H	16
<Base_adr + 0C _H >	CLMA _n CMPH	CLMA _n compare register H	R/W	03FF _H	16
<Base_adr + 10 _H >	CLMA _n PCMD	CLMA _n protection command register	W	00 _H	8
<Base_adr + 14 _H >	CLMA _n PS	CLMA _n protection command status register	R	00 _H	8

The base addresses of the registers are shown below.

Table 30.141 List of Base Address Registers

Clock Monitor Channel	<Base_adr>

Register Symbol	Register Name	R/W	Value after Reset	Address	Access Size	Protection
CLMATEST	CLMA self-test register	R/W	0000 0000 _H	FFF8 8204 _H	32	PROT1PHCMD ^{*1}
CLMATESTS	CLMA self-test status register	R/W	0000 0000 _H	FFF8 8208 _H	32	

Note 1. For this register, refer to **Section 11, Clock Controller**.

30.6.3 Details of Registers

30.6.3.1 CLMAnCTL0 — CLMAn Control Register 0

CLMAnCTL0 controls the operation of the clock monitors. CLMAnCTL0 is protected by the CLMAnPCMD register.

CLMAnCTL0 can be initialized by either an internal reset or an external reset.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CLMAnCLME
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W*1

Note 1. CLMAnCTL0 can be cleared by a reset. Writing 0 is ignored.

Table 30.143 CLMAnCTL0 Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved These bits are always read as 0. The write value should also be 0. When writing, follow the procedure of the protection release sequence, write the value after reset, or the bit inverse value of the value after reset to these bits.
0	CLMAnCLME	Clock Monitor Operation 0: Disables operation. 1: Enables operation.

30.6.3.2 CLMAnCMPL — CLMAn Compare Register L

CLMAnCMPL sets the lower limit of the normal frequency range used for comparison.

CLMAnCMPL can be initialized by either an internal reset or an external reset.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CLMAnCMPL[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 30.144 CLMAnCMPL Register Contents

Bit Position	Bit Name	Function
15 to 12	—	Reserved These bits are always read as 0. The write value should also be 0.
11 to 0	CLMAnCMPL [11:0]	Lower Limit of Normal Frequency Range CLMAnCMPL can be written to when CLMAnCTL0.CLMAnCLME is 0. Once CLMAnCTL0.CLMAnCLME is set to 1, writing to CLMAnCMPL is invalid.

30.6.3.3 CLMAnCMPH — CLMAn Compare Register H

CLMAnCMPH sets the upper limit of the normal frequency range used for comparison.

CLMAnCMPH can be initialized by either an internal reset or an external reset.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CLMAnCMPH[11:0]											
Value after reset	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 30.145 CLMAnCMPH Register Contents

Bit Position	Bit Name	Function
15 to 12	—	Reserved These bits are always read as 0. The write value should also be 0.
11 to 0	CLMAnCMPH [11:0]	Upper Limit of Normal Frequency Range CLMAnCMPH can be written to when CLMAnCTL0.CLMAnCLME is 0. Once CLMAnCTL0.CLMAnCLME is set to 1, writing to CLMAnCMPH is invalid.

30.6.3.4 CLMAnPCMD — CLMAn Protection Command Register

CLMAnPCMD is a special sequential register for CLMAnCTL0.

CLMAnPCMD can be initialized by either an internal reset or an external reset.

Bit	7	6	5	4	3	2	1	0
	CLMAnPCMD[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W

See **Section 30.6.6.1, Writing to Protected Registers**, regarding this protection method on details.

30.6.3.5 CLMAnPS — CLMAn Protection Command Status Register

CLMAnPS is a special sequential register for CLMAnCTL0.

CLMAnPS can be initialized by either an internal reset or an external reset

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CLMAnPRERR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 30.146 CLMAnPS Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved These bits are always read as 0.
0	CLMAnPRERR	Protection Error Detection 0: A protection error has not been generated. 1: A protection error has been generated.

Operating conditions of the CLMAnPRERR bit:

Setting condition: Access to CLMAnCTL0, which is the target for protection specified by CLMAnPCMD, without following the protection cancelling sequence.

Clearing condition: Writing of A5_H to the CLMAnPCMD register (step 1 in the protection cancelling sequence).

30.6.3.6 CLMATEST — CLMA Self-Test Register

CLMATEST is used for self-testing of CLMA2 to CLMA0.

CLMATEST can be protected by the PROT1PHCMD register.

CLMATEST is initialized by an internal reset or an external reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	CLMA2 TESTE N	CLMA1 TESTE N	CLMA0 TESTE N	ERRMS K	MONCL KMSK	RESCL M
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 30.147 CLMATEST Register Contents

Bit Position	Bit Name	Function
31 to 6	—	Reserved These bits are always read as 0. When writing, follow the procedure of the protection release sequence, write the value after reset, or the bit inverse value of the value after reset to these bits.
5 to 3	CLMA2TESTEN CLMA1TESTEN CLMA0TESTEN	These bits enable or disable self-testing of CLMA2 to CLMA0. 0: Disables self-testing of the corresponding CLMA. 1: Enables self-testing of the corresponding CLMA.
2	ERRMSK	Masks an error notification to the ECM when CLMA _n detects an error. When the ERRMSK is set for a certain CLMA _n , the associated CLMA _n does not issue an error notification to the ECM even if it detects an error. ERRMSK setting is valid only for the CLMA _n for which CLMA _n TESTEN (n = 0 to 2) is set to 1. 0: Does not mask an error notification to the ECM. 1: Masks an error notification to the ECM.
1	MONCLKMSK	Fixes the level of the clock input to the CLMA _n that should be monitored, to the low level. MONCLKMSK setting is valid only for the CLMA _n for which CLMA _n TESTEN (n = 0 to 2) is set to 1. 0: Does not fix the clock input to the CLMA _n that should be monitored to the low level. 1: Fixes the clock input to the CLMA _n that should be monitored to the low level.
0	RESCLM	Initializes CLMA _n forcibly. RESCLM setting is valid only for the CLMA _n for which CLMA _n TESTEN (n = 0 to 2) is set to 1. 0: Does not initialize CLMA _n . 1: Initializes CLMA _n .

30.6.3.7 CLMATESTS — CLMA Self-Test Status Register

CLMATESTS indicates the self-testing result of CLMA2 to CLMA0.

CLMATESTS is initialized by an internal reset or an external reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	CLMA2 ERRS	CLMA1 ERRS	CLMA0 ERRS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 30.148 CLMATESTS Register Contents

Bit Position	Bit Name	Function
31 to 3	—	Reserved These bits are always read as 0.
2 to 0	CLMA2ERRS CLMA1ERRS CLMA0ERRS	These bits indicate whether or not CLMA2 to CLMA0 have detected an error. These bits are not affected by CLMATEST.ERRMSK. 0: The corresponding CLMA _n has not yet detected an error. 1: The corresponding CLMA _n has detected an error.

30.6.4 Detection of Abnormal Clock Frequency

- CLMAN counts the number of rising edges of the monitored clock signal within 16 sampling clock cycles, and compares the count with the specified thresholds.
 - The lower threshold is specified using the CLMANCMPL[11:0] bits in CLMANCMPL register.
 - The upper threshold is specified using the CLMANCMPH[11:0] bits in CLMANCMPH register.
- When the frequency of the monitored clock is low^{*1} and the counter value falls below the value set in CLMANCMPL[11:0] in the CLMANCMPL register, CLMAN notifies the ECM of the abnormal clock. CLMAN also notifies the ECM of the abnormal clock when the clock frequency is high and the counter value exceeds the value set in CLMANCMPH[11:0] in the CLMANCMPH register.

Note 1. If the monitored clock stops completely, an error may not be detected.

Note that even if the frequency of the monitored clock fluctuates during the sampling period, an error is not notified as long as the number of detected edges falls within the specified range.

Figure 30.11 Operation When Clock Frequency is Within the Specified Range

Figure 30.12 Operation When Clock Frequency is Lower than the Specified Range

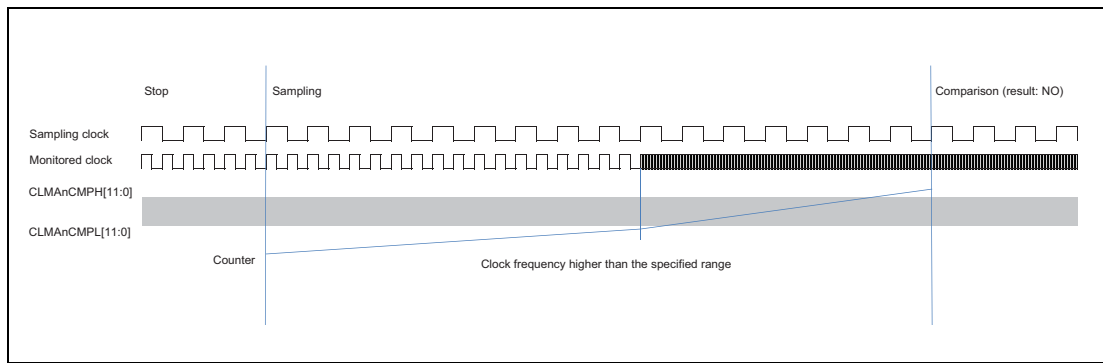

Figure 30.13 Operation When Clock Frequency is Higher than the Specified Range

(1) Calculating the thresholds set by CLMAncMPL.CLMAncMPL[11:0] and CLMAncMPH.CLMAncMPH[11:0]

The minimum and maximum values of the clock cycles of the monitored clock CLMATMON that are assumed to be valid within 16 cycles of the sampling clock CLMATMPL are set in the comparison registers CLMAncMPL and CLMAncMPH.

The expected clock cycle is indicated by “N”.

$$\frac{16}{f_{\text{CLMATMPL}}} = \frac{N}{f_{\text{CLMATMON}}}$$

$$N = \frac{f_{\text{CLMATMON}}}{f_{\text{CLMATMPL}}} \times 16$$

The thresholds are calculated considering allowable frequency deviation of CLMATMON and CLMATMPL.

$$\begin{aligned} \text{Lower threshold} &= N_{\text{min}} \\ &= \frac{f_{\text{CLMATMON}(\text{min})}}{f_{\text{CLMATMPL}(\text{max})}} \times 16 - 1 \end{aligned}$$

$$\begin{aligned} \text{Upper threshold} &= N_{\text{max}} \\ &= \frac{f_{\text{CLMATMON}(\text{max})}}{f_{\text{CLMATMPL}(\text{min})}} \times 16 + 1 \end{aligned}$$

NOTE

PLL jitter is covered by “+1” and “-1” as in the formulae.

Example

$f_{\text{CLMATSMPL}} = 240 \text{ kHz } (\pm 8\%)$ and $f_{\text{CLMATMON}} = 16 \text{ MHz } (\pm 5\%)$, the recommendable thresholds will be as follows:

$$\begin{aligned} N_{\min} &= 15,200 / 259.2 \times 16 - 1 \\ &= 937.27 \\ \text{CLMAAnCMPL} &= 937 = 03A9_{\text{H}} \end{aligned}$$

$$\begin{aligned} N_{\max} &= 16,800 / 220.8 \times 16 + 1 \\ &= 1218.39 \\ \text{CLMAAnCMPH} &= 1219 = 04C3_{\text{H}} \end{aligned}$$

Minimum Threshold:

The following restrictions must be taken into consideration.

- $\text{CLMAAnCMPL} \geq 0001_{\text{H}}$
- $\text{CLMAAnCMPH} \geq \text{CLMAAnCMPL} + 0003_{\text{H}}$

(2) Definition of initial values input to the threshold registers

The values of the threshold registers in the initial state and after a reset should permit the maximum frequency deviation of the monitor clock.

- $\text{CLMAAnCMPL}[11:0] = 0001_{\text{H}}$
- $\text{CLMAAnCMPH}[11:0] = 03FF_{\text{H}}$

30.6.5 Self-Diagnosis

Self-diagnosis of the clock monitor is available as described below. In the description, the clock monitor to be self-diagnosed is operating.

- (1) Set the threshold for the clock monitor to be self-diagnosed (set CLMAnCMPL and CLMAnCMPH).

At this time, set the threshold to a value which generates an error.

- (2) Specify the clock monitor to be self-diagnosed.

Setting the CLMATEST.CLMAnTESEN bit to 1 enables specifying the corresponding clock monitor to be self-diagnosed.

- (3) To prevent conveyance of the error signal to the ECM based on self-diagnosis, set CLMATEST.ERRMSKL simultaneously with step (2).

- (4) Set the CLMAnCTL0.CLMAnCLME bit to 1 to enable operation of the clock monitor.

- (5) Wait for the time long enough to allow error occurrence, read the CLMATESTS register to see if an error has been generated in the clock monitor to be self-diagnosed. The time from the start of self-diagnosis to the error occurrence depends on the CLMAnCMPL setting and the start point of self-diagnosis in the sampling period. A maximum of two sampling cycles are required.

- (6) Clear the error generated by self-diagnosis.

Setting CLMATEST.RESCLM to 1 enables initializing the clock monitor to be self-diagnosed.

- (7) Terminate self-diagnosis.

Setting all the bits in CLMATEST to 0 enables terminating self-diagnosis.

Before restarting the clock monitor that has been self-diagnosed, set the registers again as required.

30.6.6 Notes on Register Setting

30.6.6.1 Writing to Protected Registers

Writing to the CLMAnCTL0 register (n = 0 to 2) of each clock monitor is only possible with the protection release sequence described below.

Procedure

- 1) Write the fixed value (A5_H) to register CLMAnPCMD.
- 2) Write the new setting to register CLMAnCTL0. Write the value after a reset to the reserved bits.
- 3) Write the bitwise inverse of the setting value to register CLMAnCTL0. Write the inverse of the value after a reset to the reserved bits.
- 4) Write the new setting to register CLMAnCTL0. Write the value after a reset to the reserved bits.

A value can only be written to a write-protected register by following the procedure above.

Protection is not released if the procedure is not followed correctly, the setting is not written to the write-protected register, and the CLMAnPS.CLMAnPRERR bit is set to 1. (Although this is not a requirement, you can confirm if the values set in the targeted register was correctly written by checking that the setting of the CLMAnPS.CLMAnPRERR bit is 0 after step 4.)

In case of failure to follow the sequence, repeat the procedure from the beginning.

In case of writing to another register during steps 1) to 4) of the sequence, the protection function operates as follows. Operation is also as described when any interrupt is accepted during the sequence and the interrupt handling includes access to another register.

- When the writing is to another register in the same module*¹, writing to the protected register fails and the CLMAnPS.CLMAnPRERR bit is set to 1.
- When writing is to a register in another module, writing to the protected register will successfully proceed to completion, if the remainder of the procedure is followed correctly.

Reading of another register while the sequence is in progress does not lead to failure.

For writing to CLMATEST, see the description of the PROT1PHCMD register.

Note 1. “Another register in the same module” indicates a register under the same module name as that containing the write-protected register. For the module names of the registers, see **Appendix, List of Registers**.

30.6.6.2 Setting CLMAnCMPL/CLMAnCMPH Registers

The CLMAnCMPL/CLMAnCMPH registers should be set so that the following conditions are satisfied. If the clock monitor is otherwise used, operation cannot be guaranteed.

- $1 \leq \text{CLMAnCMPL}$
- $\text{CLMAnCMPL} + 3 \leq \text{CLMAnCMPH}$ (n = 0, 1, or 2)

30.7 BIST

This product incorporates the function to detect failures of the failure detection function itself, which is referred to as BIST. The functions shown in the table below have the dual hardware configuration, and a BIST error notice is issued to the ECM if a failure occurs in any function.

Table 30.149 List of Failure Detection Function

BIST-Applied Function	Remark
Lockstep comparator	Lockstep comparator for CPU1
ECC decoder	
Address parity decoder	

For the ECC decoder for the peripheral RAM and Data Flash, the hardware including the control registers has dual configuration. When using the BIST function, set the same values to the control registers of the master and checker.

The control register is not duplexed for other ECC decoder and address parity checker.

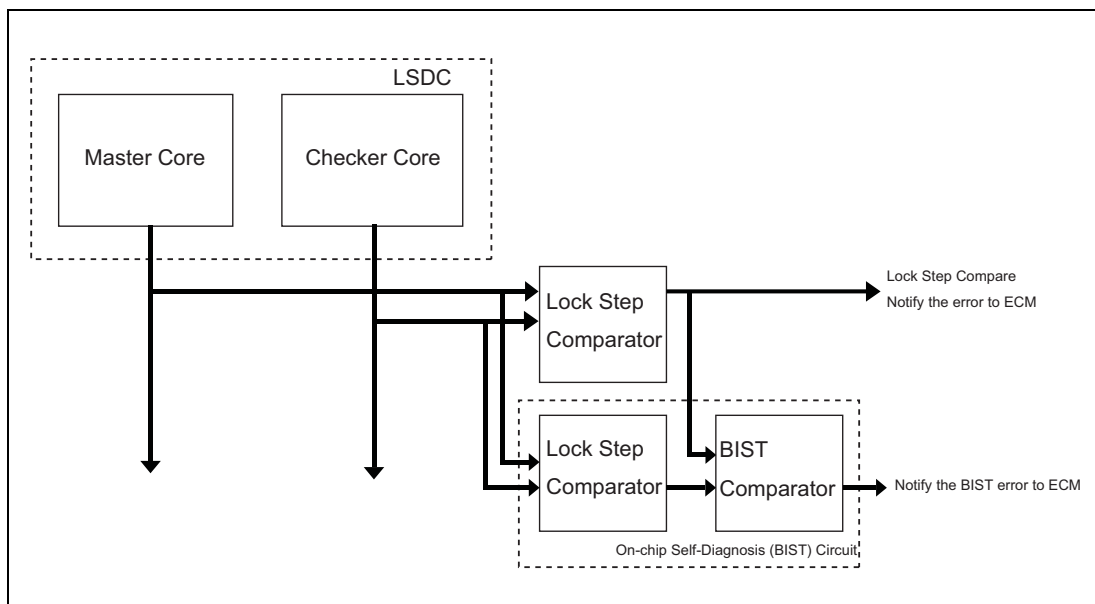

Figure 30.14 Lock Step Configuration

30.8 ECM

The ECM monitors various failure detection states in the LSI chip, and defines the operation to be carried out upon failure detection. For the details of the ECM, refer to **Section 31, Error Control Module (ECM)**.

Section 31 Error Control Module (ECM)

31.1 Overview

31.1.1 Specification Overview

The error control module (ECM) collects error signals coming from different error sources and monitoring circuits. It also outputs error signals (ERROROUT output) from the ERROROUT pin ($\overline{\text{ERROROUT_M}}$ and $\overline{\text{ERROROUT_C}}$) and generates interrupts and internal reset signals. **Table 31.1** shows the specification overview of the ECM.

Table 31.1 Specification Overview

Item	Description
Safety processing	<p>The ECM can handle the following processing in response to error signal inputs from individual modules.</p> <ul style="list-style-type: none"> • Error flag set • Maskable interrupt generation Maskable interrupt generation can be controlled (enabled/disabled) for individual errors. • FE level interrupt generation FE level interrupt generation can be controlled (enabled/disabled) for individual errors. • Internal reset generation Internal reset generation can be controlled (enabled/disabled) for individual errors. • ERROROUT output Pin output mask can be controlled (enabled/disabled) for individual errors. Output can be toggled in response to a timer input or made at a fixed level.
Error status	<p>The ECM incorporates the ECM master/checker error source status register, which can be used to confirm the error status from the error flag. The error flags are only cleared by setting the bit corresponding to the ECM error source status clear trigger register to 1 or an external reset. In case of an internal reset, the error flags are kept and the reset generation source can be confirmed by reading the ECM master/checker error source status after reset.</p>
Debug, self-diagnosis	<ul style="list-style-type: none"> • Pseudo errors can be generated for debug and self-diagnosis. The operation during injection of pseudo errors is identical to that for the occurrence of real errors. All configurations for the mask to the ERROROUT output, interrupt, or internal reset apply in the same way. • The ECM incorporates a loop-back function of the ERROROUT output that is used to diagnose the path to the ERROROUT pin. The status of the ERROROUT pin is reflected to the ECM master/checker error source status register and can be confirmed by reading the register.
Timeout function	<p>The ECM incorporates a function that generates an ERROROUT output or internal reset when the count value of the delay timer matches with the delay timer compare register because the delay timer was not stopped during the interrupt processing after being started simultaneously with the occurrence of an interrupt request. The value counted by the delay timer is in cycles of the low-speed peripheral clock.</p>
Register protection	<p>A write-protection with a special sequence is incorporated to protect registers from inadvertent write access.</p>
Others	<p>The ECM is duplexed. The ERROROUT pin is duplexed to the two pins of the master pin and the checker pin. ERROROUT output of the ECM master and ECM checker are constantly compared. Upon a mismatch, the ECM compare error (error source 26) occurs.</p>

31.1.2 Error Sources and Safety Processing

Table 31.2 shows the error sources and safety processing to the ECM.

Table 31.2 List of Error Sources and Safety Processing (1/2)

Note 1. Refer to **Section 20 Window Watchdog Timer (WDTA)** for the details of the errors.

Note 2. The internal reset generation is enabled in the initial state.

Note 3. Refer to **Section 30 Safety** for the details of the errors.

Note 4. Refer to **Section 3 CPU System** for the details of the errors.

Note 5. Refer to **Table 31.1 Specification Overview** for the details of the errors.

Note 6. Refer to **Section 28 Delta-Sigma AD Converter (DS-ADC)** for the details of the errors.

Note 7. Refer to **Section 27 A/D Converter (ADCB)** for the details of the errors.

Note 8. Refer to **RH850/E1x-FCC2 Flash Memory User's Manual: Hardware Interface** for the details of the errors.

Note 9. Refer to **Section 7 DMA** for the details of the errors.

Note 10. Refer to **Section 21 OS Timer (OSTM)** for the details of the errors.

Note 11. Refer to **Section 37, Secure Watchdog Timer (SWDT)** for the details of the errors.

Note 12. Operation of the device is not guaranteed if an FACI reset transfer error has occurred. When clearing the error signal output by the ERROROUT pin after release from the reset state, confirm that an FACI reset transfer error has not occurred by checking that an error state is not being indicated again.

Error sources are merged as described in **Table 31.3**.

Table 31.3 Merging of Error Sources

Error Source No	Module	Error Sources	Note
0	WDTA	WDTA error (WDTA0, WDTA1)	Overflows of WDTA0 and WDTA1 are merged. The internal reset generation is enabled in the initial state.
6	RAM	Local RAM (CPU1, PCU): 2-bit ECC error, Local RAM (CPU1): Address parity error	2-bit ECC errors (local RAM CPU1, PCU) and address parity errors (excluding PCU) are merged.
7		Local RAM (CPU1, PCU): 1-bit ECC error Local RAM (CPU1): Parity bit error	1-bit ECC errors (local RAM CPU1, PCU) and parity bit errors (excluding PCU) are merged.
8		Global RAM: 2-bit ECC error and address parity error	2-bit ECC errors and address parity errors when global RAM is accessed from each master are merged.
9		Global RAM: 1-bit ECC error and parity bit error	1-bit ECC errors and parity bit errors when global RAM is accessed from each master are merged.
10		Peripheral RAM (FlexRay, CAN, DFE, DTS, APA): 2-bit ECC error	2-bit ECC errors for RAM of peripheral circuits are merged.
11		Peripheral RAM (FlexRay, CAN, DFE, DTS, APA): 1-bit ECC error	1-bit ECC errors for RAM of peripheral circuits are merged.
12	Code flash	Code flash 2-bit ECC error Code flash address parity error	2-bit ECC errors and address parity errors when code flash is accessed from each master are merged.
13		Code flash 1-bit ECC error	1-bit ECC errors when code flash is accessed from each master are merged.
21	GRG (Global RAM Guard)	GRG error	GRG errors from each master in access to the global RAM are merged.
22	Peripheral guard	PBG error	Peripheral guard errors for each peripheral circuit are merged.
25	Data parity	Data parity error	Data parity errors for each access path are merged.
37	DSADC	AD parity error	AD parity errors for DSADC0-7 and ADC0-1 are merged.
	ADC	AD parity error	
41	DMA	DTS RAM Data ECC SEC-DED	2-bit ECC errors and 1-bit errors for DTS RAM are merged.
42	BIST	Error detection using on-chip self-diagnostic (BIST) circuit	Errors for each self-diagnostic circuit are merged.
43	DMA	DMAVIOL (DMA violation access notice)	DMA violation accesses for DMAC0, DMAC1, and DTS are merged.

Note: The error sources other than those listed in **Table 31.3** are not merged.

31.1.3 Operations for ERROROUT Output

The $\overline{\text{ERROROUT_M}}$ pin outputs the error level in the reset state or after release from the reset state. Clear the error output by following the procedure described in **Section 31.3.3, CAUTIONS** before use. As the $\overline{\text{ERROROUT_C}}$ pin is multiplexed with a general-purpose port and other functions, select the ERROROUT_C function before use. For settings, see **Section 2, Pins**.

ERROROUT output can be set in two operating modes: non-dynamic mode and dynamic mode. ERROROUT output is in synchronization with the occurrence of error source conditions and the error level is output as the pin state regardless of the dynamic mode pulse cycle.

Table 31.4 Operations for ERROROUT Output

Error Status ECMmSSE031 to ECMmSSE000 ECMmSSE115 to ECMmSSE100	Operating Mode ECMSL0 Bit	ERROROUT Output Operating Mode	ERROROUT Output Level	Error Status
0	0	Non-dynamic	High level	Normal
	1	Dynamic	Toggles (along with timer input) ^{*1}	Normal
1	0	Non-dynamic	Low level	Error
	1	Dynamic	Low level	Error

Note 1. See **Section 21 OS Timer (OSTM)** for the details.

31.1.3.1 Dynamic Mode Enable

1. Initialize OSTM0.
2. Set the ERROROUT output to normal output by setting the ECMmECT bit (m = M/C) in the ECM master/checker error clear trigger register to 1.
3. Set the ECMSL0 bit in the ECM error pulse configuration register to 1 to specify dynamic mode.
4. Start up OSTM0.

31.1.3.2 Dynamic Mode Disable

1. Set the ERROROUT output to error output by setting the ECMmEST bit (m = M/C) in the ECM master/checker error set trigger register to 1.
2. Stop OSTM0.
3. Clear the ECMSL0 bit in the ECM error pulse configuration register to 0 to specify non-dynamic mode.

31.1.4 Loop-Back Function

The ECM incorporates a loop-back function that is used to check the path to the ERROROUT pin. The output level of the ERROROUT pin can be checked with the ECMmSSE131 bit (m = M/C) in the ECM master/checker error source status register 1.

31.1.5 Pseudo Error Generation

The ECM incorporates a function that can generate pseudo errors for test or debug purposes. The operation of the ECM during injection of pseudo errors is identical to that for the occurrence of real errors. All configurations for error masks, interrupt, internal reset, or delay timer apply in the same way.

31.1.6 Error Status

The error status is indicated by ECM master/checker error source status register 0 and ECM master/checker error source status register 1. The error status is only cleared by setting the bit corresponding to the ECM error source status clear trigger register to 1 or an external reset. In case of an internal reset, the error status is kept and the error of the reset source can be confirmed by reading the ECM master/checker error source status register 0 and ECM master/checker error source status register 1 after release from the reset state.

31.1.7 Write-Protected Registers

Write protected registers are protected from inadvertent write access due to erroneous program execution, etc.

31.1.7.1 Sequence of Writing to the Write-Protected Registers

Writing to the write-protected registers is only possible with the protection unlock sequence described below.

1. Write the fixed value (0000 00A5_H) to the ECM protection command register ECMPCMD1 and ECM master/checker protection command register ECMmPCMD0.
2. Write the new setting to the write-protected registers in the ECM and ECMm. Write the value after a reset to the reserved bits.
3. Write the bitwise inverse of the setting value to the same registers as in step 2. Write the inverse of the value after a reset to the reserved bits.
4. Write the new setting to the same registers as in step 2. Write the value after a reset to the reserved bits.

A value can only be written to a write-protected register by following the procedure above.

Protection is not unlocked if the procedure is not followed correctly, the setting is not written to the write-protected register, and the ECMPRERR bit of the ECM protection status register ECMPS is set to 1. (Although this is not a requirement, you can confirm if the values set in the targeted register was correctly written by checking that the setting of the ECMPRERR bit of the ECM protection status register ECMPS is 0 after step 4.)

In case of failure to follow the sequence, repeat the procedure from the beginning.

In case of writing to another register during steps 1 to 4 of the sequence, the protection function operates as follows. Operation is also as described when any interrupt is accepted during the sequence and the interrupt handling includes access to another register.

- When the writing is to another register in the same module*¹, writing to the protected register fails and the protection status bit in the protection status register is set to 1.
- When writing is to a register in another module, writing to the protected register will successfully proceed to completion, if the remainder of the procedure is followed correctly.

Reading of another register while the sequence is in progress does not lead to failure.

Note 1. As to ECM, all registers under the module name of ECM, ECMM, or ECMC in **Appendix, List of Registers** are treated as “another register in the same module”.

31.1.8 Timeout Function for Interrupt Processing

The ECM incorporates a function that generates an ERROROUT output or internal reset when the count value of the delay timer incorporated in the ECM matches with the value of the ECM delay timer compare register because the delay timer was not stopped during the interrupt processing after being started simultaneously with the occurrence of an interrupt request. The timer counting is not stopped when a break occurs.

The counting of the delay timer always starts from 0. Configure the duration until an internal reset or ERROROUT output is generated with the settings of the ECM delay timer compare register.

In response to the occurrence of a new error source condition with the setting to start the delay timer while the delay timer is operating, the counter value of the delay timer which is currently operating is not reset. Instead, counting by the timer continues.

31.2 Block Diagram

Figure 31.1 shows the outline of the ECM, and **Figure 31.2** shows connection of the ECM.

The ERROROUT output, internal reset, and ERROROUTZ signals are active low, while the maskable and FE level interrupt signals are active high. Note that the ERROROUTZ signal for PIC1 is not toggled even if the ECM is in dynamic mode.

$\overline{\text{ERROROUT_M}}$ is ORed with the ERROROUT output of the voltage sensor.

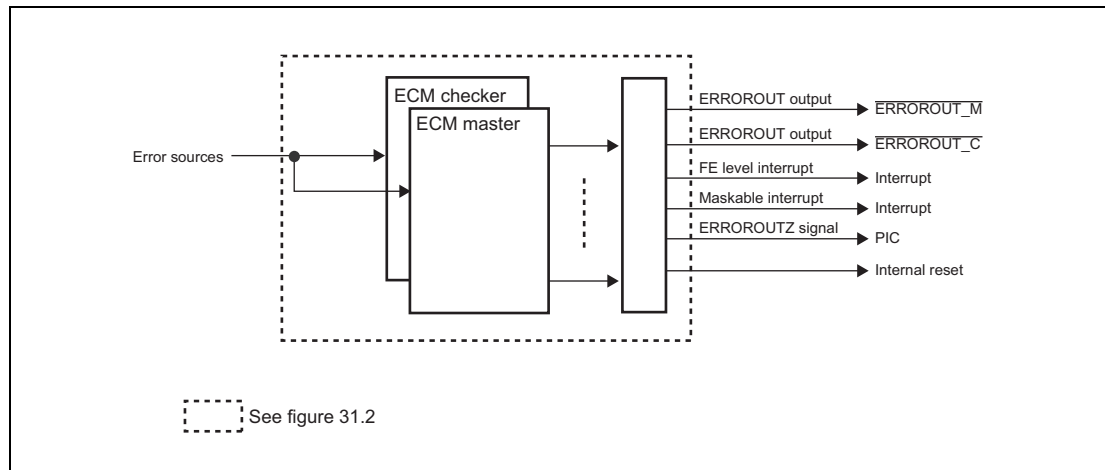

Figure 31.1 Outline of ECM

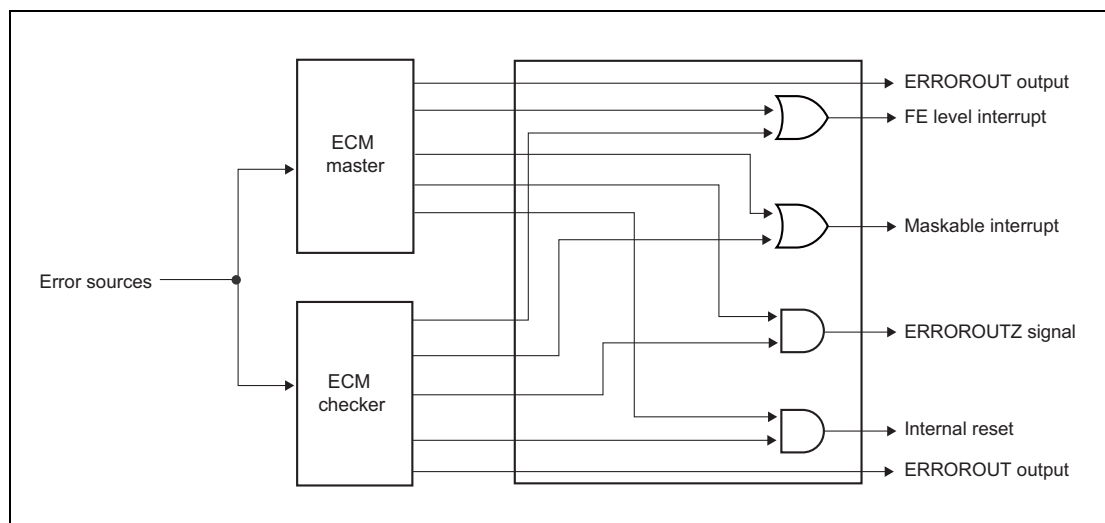

Figure 31.2 Connection of ECM

CAUTION

Pay attention to the difference in output voltage between the $\overline{\text{ERROROUT_M}}$ and $\overline{\text{ERROROUT_C}}$ pins because different power supply systems are used for those pins.

$\overline{\text{ERROROUT_M}}$ pin: VCC (3.3 V)

$\overline{\text{ERROROUT_C}}$ pin: EVCC (5 V) for P4_0 and P4_15; TTLVCC (5 V / 3.3 V) for P13_4

31.3 Register Specification

31.3.1 List of Registers

The ECM registers are divided into three address ranges. These are for the ECM master registers, the ECM checker registers, and the ECM registers common to both master and checker operation (ECM common registers). Writing to the common register area is effective simultaneously for both ECM master and checker. Reading from the common area returns the value for the ECM master. The ECM master registers and ECM checker registers allow separate writing.

The following shows the register map of the ECM master registers.

Table 31.5 List of Registers (ECM master)

<ECMM_base: FFCB 0000 _H >					
Register Symbol	Register Name	R/W	Value after Reset	Protection by Sequence	Address
ECMMESET	ECM master error set trigger register	W	00 _H	Protected	<ECMM_base>
ECMMECLR	ECM master error clear trigger register	W	00 _H	Protected	<ECMM_base> + 04 _H
ECMMESSTR0	ECM master error source status register 0	R	0000 0000 _H	Not protected	<ECMM_base> + 08 _H
ECMMESSTR1	ECM master error source status register 1	R	0000 0000 _H	Not protected	<ECMM_base> + 0C _H
ECMMPCMD0	ECM master protection command register	W	Undefined	Not protected	<ECMM_base> + 10 _H

The following shows the register map of the ECM checker registers.

Table 31.6 List of Registers (ECM checker)

<ECMC_base: FFCB 1000 _H >					
Register Symbol	Register Name	R/W	Value after Reset	Protection by Sequence	Address
ECMCESET	ECM checker error set trigger register	W	00 _H	Protected	<ECMC_base>
ECMCECLR	ECM checker error clear trigger register	W	00 _H	Protected	<ECMC_base> + 04 _H
ECMCESSTR0	ECM checker error source status register 0	R	0000 0000 _H	Not protected	<ECMC_base> + 08 _H
ECMCESSTR1	ECM checker error source status register 1	R	0000 0000 _H	Not protected	<ECMC_base> + 0C _H
ECMCPCMD0	ECM checker protection command register	W	Undefined	Not protected	<ECMC_base> + 10 _H

The following shows the register map of the ECM common registers.

Table 31.7 List of Registers (ECM common)

<ECM_base: FFCB 2000 _H >					
Register Symbol	Register Name	R/W	Value after reset	Protection by Sequence	Address
ECMEPCFG	ECM error pulse configuration register	R/W	00 _H	Protected	<ECM_base>
ECMMICFG0	ECM maskable interrupt configuration register 0	R/W	0000 0000 _H	Protected	<ECM_base> + 04 _H
ECMMICFG1	ECM maskable interrupt configuration register 1	R/W	0000 _H	Protected	<ECM_base> + 08 _H
ECNMICFG0	ECM FE level interrupt configuration register 0	R/W	0000 0000 _H	Protected	<ECM_base> + 0C _H
ECNMICFG1	ECM FE level interrupt configuration register 1	R/W	0000 _H	Protected	<ECM_base> + 10 _H

ECMPCMD1	ECM protection command register	W	Undefined	Not protected	<ECM_base> + 2C _H
ECMPS	ECM protection status register	R	00 _H	Not protected	<ECM_base> + 30 _H
ECMPE0	ECM pseudo error trigger register 0	W	0000 0000 _H	Protected	<ECM_base> + 34 _H
ECMPE1	ECM pseudo error trigger register 1	W	0000 0000 _H	Protected	<ECM_base> + 38 _H
ECMDTMCTL	ECM delay timer control register	W	00 _H	Protected	<ECM_base> + 3C _H
ECMDTMR	ECM delay timer register	R	0000 0000 _H	Not protected	<ECM_base> + 40 _H
ECMDTMCMP	ECM delay timer compare register	R/W	0000 0000 _H	Protected	<ECM_base> + 44 _H
ECMDTMCFG0	ECM delay timer configuration register 0	R/W	0000 0000 _H	Protected	<ECM_base> + 48 _H
ECMDTMCFG1	ECM delay timer configuration register 1	R/W	0000 0000 _H	Protected	<ECM_base> + 4C _H
ECMDTMCFG2	ECM delay timer configuration register 2	R/W	0000 0000 _H	Protected	<ECM_base> + 50 _H
ECMDTMCFG3	ECM delay timer configuration register 3	R/W	0000 0000 _H	Protected	<ECM_base> + 54 _H

31.3.2 ECMmESET (m = M/C) — ECM Master/Checker Error Set Trigger Register

The ECM master/checker error set trigger register is for selecting output of the error signal from the ERROROUT pin. When an ECMmEST bit is set to 1, the ERROROUT pin immediately outputs the error signal. The output cannot be masked. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 31.1.7, Write-Protected Registers**, for the details of the protection unlock sequence. This register is always read as 00_H.

Access: This register can be written in 8-bit units.

Address: <ECMM_base>
<ECMC_base>

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ECMmESET
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 31.8 ECMmESET Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
0	ECMmESET	Error Set Trigger 0: Writing 0 is invalid 1: Set the output level from the ERROROUT pin to the error output.

CAUTIONS

Setting the ERROROUT output from the ERROROUT pin via the ECMmESET will set the ECMmSSE026 bit of the ECMmESSTR0 register (ECM compare error). Therefore, the ECMmESET or ECMmECLR register has to be set following the sequence below.

1. Set the ECMEMK026 bit of the ECMEMK0 register to “masked”.
2. Prevent the generation of interrupts by setting the ECMMIE026 bit of the ECMMICFG0 register to “prohibited” and the ECMNMIE026 bit of the ECMNMICFG0 register to “prohibited”.
3. Prevent generation of an internal reset by setting the ECMIRE026 bit of the ECMIRCFG0 register to “prohibited”.
4. Set the ERROROUT output bit by the ECMmESET register.
5. Clear error flags by setting the ECMCLSSE026 bit of the ECMESSTC0 register.
6. Make the following settings in accord with the condition of usage for the ECM compare error.
If an ERROROUT is being output from the ERROROUT pin, set the ECMEMK026 bit of the ECMEMK0 register to “not masked”.
If an interrupt is being enabled, set the ECMMIE026 bit of the ECMMICFG0 register to “enabled” or the ECMNMIE026 bit of the ECMNMICFG0 register to “enabled”.
If an internal reset is being enabled, set the ECMIRE026 bit of the ECMIRCFG0 register to “enabled”.

31.3.3 ECMmECLR (m = M/C) — ECM Master/Checker Error Clear Trigger Register

The ECM master/checker error clear trigger register is for setting the error signal from the ERROROUT pin to the normal output. When an ECMmECT bit is set to 1, the ERROROUT pin outputs the normal signal level to indicate that an error has not been detected as long as there are no other sources that set the ERROROUT pin to the normal signal level, which indicates that an error has been detected. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 31.1.7, Write-Protected Registers**, for the details of the protection unlock sequence. This register is always read as 00_H.

Access: This register can be written in 8-bit units.

Address: <ECMM_base> + 04_H
<ECMC_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ECMmECT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 31.9 ECMmECLR Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
0	ECMmECT	Error Clear Trigger 0: Writing 0 is invalid 1: Set the output level from the ERROROUT pin to the normal output.

CAUTIONS

Clearing of the ERROROUT pin is only possible if all errors, not masked by ECMEMK0/1, are cleared beforehand.

Clearing the ERROROUT output by the ECMmECLR register will set the ECMmSSE026 bit (ECM compare error) in the ECMmESSTR0 register. Therefore, the ECMmECLR register has to be set by following the sequence below.

1. Set the ECMEMK026 (ECM compare error) bit of the ECMEMK0 register to “masked”.
2. Disable interrupts by setting the ECMMIE026 bit of the ECMMICFG0 register to “disabled” and the ECMNMIE026 bit of the ECMNMICFG0 register to “disabled”.
3. Disable an internal reset by setting the ECMIRE026 bit of the ECMIRCFG0 register to “disabled”.
4. Clear error flags by setting the ECMmECLR (m = M/C) register.
5. Clear error flags by setting the ECMCLSSE026 bit of the ECMESSTC0 register.
6. Make the following settings in accordance with the condition of usage for the ECM compare error.
 - If ERROROUT will be output from the ERROROUT pin, set the ECMEMK026 bit in the ECMEMK0 register to “not masked”.
 - If interrupts are to be enabled, set the ECMMIE026 bit in the ECMMICFG0 register to “enabled” or the ECMNMIE026 bit in the ECMNMICFG0 register to “enabled”.
 - If a reset exception is to be enabled, set the ECMIRE026 bit in the ECMIRCFG0 register to “enabled”.

31.3.4 ECMmESSTR0 (m = M/C) — ECM Master/Checker Error Source Status Register 0

The ECM master/checker error source status register represents the status of individual internal error sources, which is irrelevant to the setting of the error mask. The status can be cleared only by writing 1 to the corresponding bit in the ECM error source status clear trigger register 0 or by an external reset. An internal reset does not affect this register.

Access: This register can be read in 32-bit units.

Address: <ECMM_base> + 08_H
<ECMC_base> + 08_H

Value after reset: 0000 0000_H

Table 31.10 ECMmESSTR0 Register Contents

Bit Position	Bit Name	Function
31, 30	ECMmSSE031, ECMmSSE030	Error Source Status ECMmSSE031 and ECMmSSE030 correspond to error sources 31 and 30. 0: Error not occurred 1: Error occurred
29, 28	—	Reserved When read, the value after reset is returned.
27 to 25	ECMmSSE027 to ECMmSSE025	Error Source Status ECMmSSE027 to ECMmSSE025 correspond to error sources 27 to 25. 0: Error not occurred 1: Error occurred
24, 23	—	Reserved When read, the value after reset is returned.
22 to 3	ECMmSSE022 to ECMmSSE003	Error Source Status ECMmSSE022 to ECMmSSE003 correspond to error sources 22 to 3. 0: Error not occurred 1: Error occurred
2	—	Reserved When read, the value after reset is returned.
1, 0	ECMmSSE001, ECMmSSE000	Error Source Status ECMmSSE001 and ECMmSSE000 correspond to error sources 1 and 0. 0: Error not occurred 1: Error occurred

31.3.5 ECMmESSTR1 (m = M/C) — ECM Master/Checker Error Source Status Register 1

The ECM master/checker error source status register 1 represents the status of individual internal error sources, which is irrelevant to the setting of the error mask. The status can be cleared only by writing 1 to the corresponding bit in the ECM error source status clear trigger register 1 or by an external reset. An internal reset does not affect this register.

Access: This register can be read in 32-bit units.

Address: <ECMM_base> + 0C_H
<ECMC_base> + 0C_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 31.11 ECMmESSTR1 Register Contents

Bit Position	Bit Name	Function
31	ECMmSSE131	Indicates the ERROROUT output loopback status. 0: The ERROROUT_m pin outputs the low level. 1: The ERROROUT_m pin outputs the high level. Note: m = M/C
30	ECMmSSE130	Indicates the ECMmESET write status. 0: No error 1: Error is set by the ECMmEST bit of the ECMmESET register
29	ECMmSSE129	Indicates whether delay timer overflow has occurred. 0: Delay timer overflow not occurred 1: Delay timer overflow occurred
28 to 13	—	Reserved When read, the value after reset is returned.
12 to 9	ECMmSSE112 to ECMmSSE109	Error Source Status ECMmSSE109 to ECMmSSE112 correspond to error sources 44 to 41. 0: Error not occurred 1: Error occurred
8	—	Reserved When read, the value after reset is returned.
7 to 5	ECMmSSE107 to ECMmSSE105	Error Source Status ECMmSSE107 to ECMmSSE105 correspond to error sources 39 to 37. 0: Error not occurred 1: Error occurred
4 to 0	—	Reserved When read, the value after reset is returned.

31.3.6 ECMmPCMD0 (m = M/C) — ECM Master/Checker Protection Command Register

This register is used to protect targeted registers against unauthorized write access such as incorrect programming.

Refer to Section **Section 31.3.1, List of Registers**, for the protected registers by the ECM master/checker protection register.

Refer to **Section 31.1.7, Write-Protected Registers**, for the details of the protection unlock sequence.

Access: This register can be written in 32-bit units.

Address: <ECMM_base> + 10_H
<ECMC_base> + 10_H

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 13	—	Reserved When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
12 to 9	ECMNMIE112 to ECMNMIE109	ECM FE Level Interrupt Generation Control ECMNMIE112 to ECMNMIE109 correspond to error sources 44 to 41. 0: Interrupt generation disabled 1: Interrupt generation enabled
8, 7	—	Reserved When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
6, 5	ECMNMIE106, ECMNMIE105	ECM FE Level Interrupt Generation Control ECMNMIE106 and ECMNMIE105 correspond to error sources 38 and 37. 0: Interrupt generation disabled 1: Interrupt generation enabled
4 to 0	—	Reserved When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.

31.3.12 ECMIRCFG0 — ECM Internal Reset Configuration Register 0

The ECM internal reset configuration register 0 is used to set the generation of internal resets in response to internal errors. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 31.1.7, Write-Protected Registers**, for the details of the protection unlock sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 14_H

Value after reset: 0000 000F_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 31.18 ECMIRCFG0 Register Contents

Bit Position	Bit Name	Function
31, 30	ECMIRE031, ECMIRE030	ECM Internal Reset Generation Control ECMIRE031 and ECMIRE030 correspond to error sources 31 and 30. 0: Internal reset generation disabled 1: Internal reset generation enabled
29, 28	—	Reserved When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
27 to 25	ECMIRE027 to ECMIRE025	ECM Internal Reset Generation Control ECMIRE027 to ECMIRE025 correspond to error sources 27 to 25. 0: Internal reset generation disabled 1: Internal reset generation enabled
24, 23	—	Reserved When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
22 to 3	ECMIRE022 to ECMIRE003	ECM Internal Reset Generation Control ECMIRE022 to ECMIRE003 correspond to error sources 22 to 3. 0: Internal reset generation disabled 1: Internal reset generation enabled
2	—	Reserved When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
1, 0	ECMIRE001, ECMIRE000	ECM Internal Reset Generation Control ECMIRE001 and ECMIRE000 correspond to error sources 1 and 0. 0: Internal reset generation disabled 1: Internal reset generation enabled

31.3.13 ECMIRCFG1 — ECM Internal Reset Configuration Register 1

The ECM internal reset configuration register 1 is used to set the generation of internal resets in response to internal errors. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 31.1.7, Write-Protected Registers**, for the details of the protection unlock sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 18_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 31.19 ECMIRCFG1 Register Contents

Bit Position	Bit Name	Function
31, 30	—	Reserved When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
29	ECMIRE129	ECM Internal Reset Occurrence Control Corresponds to delay timer overflow. 0: Internal reset generation disabled 1: Internal reset generation enabled
28 to 13	—	Reserved When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
12 to 9	ECMIRE112 to ECMIRE109	ECM Internal Reset Control ECMIRE112 to ECMIRE109 correspond to error sources 44 to 41. 0: Internal reset generation disabled 1: Internal reset generation enabled
8, 7	—	Reserved When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
6, 5	ECMIRE106, ECMIRE105	ECM Internal Reset Control ECMIRE106 and ECMIRE105 correspond to error sources 38 and 37. 0: Internal reset generation disabled 1: Internal reset generation enabled
4 to 0	—	Reserved When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.

31.3.14 ECMEMK0 — ECM Error Mask Register 0

The ECM error mask register 0 is used to set masking of the individual error sources of the ERROROUT output. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 31.1.7, Write-Protected Registers**, for the details of the protection unlock sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 1C_H

Value after reset: 0000 0000_H

Bit Position	Bit Name	Function
31, 30	ECMEMK031, ECMEMK030	ECM ERROROUT Output Mask Control ECMEMK031 and ECMEMK030 correspond to error sources 31 and 30. 0: ERROROUT output not masked 1: ERROROUT output masked
29, 28	—	Reserved When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
27 to 25	ECMEMK027 to ECMEMK025	ECM ERROROUT Output Mask Control ECMEMK027 to ECMEMK025 correspond to error sources 27 to 25. 0: ERROROUT output not masked 1: ERROROUT output masked
24, 23	—	Reserved When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
22 to 3	ECMEMK022 to ECMEMK003	ECM ERROROUT Output Mask Control ECMEMK022 to ECMEMK003 correspond to error sources 22 to 3. 0: ERROROUT output not masked 1: ERROROUT output masked
2	—	Reserved When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
1, 0	ECMEMK001, ECMEMK000	ECM ERROROUT Output Mask Control ECMEMK001 and ECMEMK000 correspond to error sources 1 and 0. 0: ERROROUT output not masked 1: ERROROUT output masked

31.3.15 ECMEMK1 — ECM Error Mask Register 1

The ECM error mask register 1 is used to set masking of the individual error sources of the ERROROUT output. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 31.1.7, Write-Protected Registers**, for the details of the protection unlock sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 20_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 31.21 ECMEMK1 Register Contents

Bit Position	Bit Name	Function
31, 30	—	Reserved When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
29	ECMEMK129	ECM ERROROUT Output Mask Control ECMEMK129 corresponds to an overflow of the delay timer. 0: ERROROUT output not masked 1: ERROROUT output masked
28 to 13	—	Reserved When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
12 to 9	ECMEMK112 to ECMEMK109	ECM ERROROUT Output Mask Control ECMEMK112 to ECMEMK109 correspond to error sources 44 to 41. 0: ERROROUT output not masked 1: ERROROUT output masked
8	—	Reserved When read, the value after reset is returned. When writing to this bit, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
7 to 5	ECMEMK107 to ECMEMK105	ECM ERROROUT Output Mask Control ECMEMK107 to ECMEMK105 correspond to error sources 39 to 37. 0: ERROROUT output not masked 1: ERROROUT output masked
4 to 0	—	Reserved When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.

31.3.16 ECMESSTC0 — ECM Error Source Status Clear Trigger Register 0

The ECM error source status clear trigger register 0 is used to clear the individual error source status of the ECM master/checker error source status register 0. Both the error status of the ECM master and the ECM checker are cleared simultaneously. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 31.1.7, Write-Protected Registers**, for the details of the protection unlock sequence.

Access: This register can be written in 32-bit units.

Address: <ECM_base> + 24_H

Value after reset: 0000 0000_H

Table 31.22 ECMESSTC0 Register Contents

Bit Position	Bit Name	Function
31, 30	ECMCLSSE031, ECMCLSSE030	ECM Error Status Clear ECMCLSSE031 and ECMCLSSE030 correspond to error sources 31 and 30. 0: Corresponding error status unchanged 1: Corresponding error status cleared
29, 28	—	Reserved When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
27 to 25	ECMCLSSE027 to ECMCLSSE025	ECM Error Status Clear ECMCLSSE027 to ECMCLSSE025 correspond to error sources 27 to 25. 0: Corresponding error status unchanged 1: Corresponding error status cleared
24, 23	—	Reserved When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
22 to 3	ECMCLSSE022 to ECMCLSSE003	ECM Error Status Clear ECMCLSSE022 to ECMCLSSE003 correspond to error sources 22 to 3. 0: Corresponding error status unchanged 1: Corresponding error status cleared
2	—	Reserved When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
1, 0	ECMCLSSE001, ECMCLSSE000	ECM Error Status Clear ECMCLSSE001 and ECMCLSSE000 correspond to error sources 1 and 0. 0: Corresponding error status unchanged 1: Corresponding error status cleared

31.3.17 ECMESSTC1 — ECM Error Source Status Clear Trigger Register 1

The ECM error source status clear trigger register 1 is used to clear the individual error source status of the ECM master/checker error source status register 1. Both the error status of the ECM master and the ECM checker are cleared simultaneously. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 31.1.7, Write-Protected Registers**, for the details of the protection unlock sequence.

Access: This register can be written in 32-bit units.

Address: <ECM_base> + 28_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 31.23 ECMESSTC1 Register Contents

Bit Position	Bit Name	Function
31	—	Reserved When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
30, 29	ECMCLSSE130, ECMCLSSE129	ECM Error Status Clear ECMCLSSE130 and ECMCLSSE129 correspond to writing status and delay timer overflow in the ECMmESET register. 0: Corresponding error status unchanged 1: Corresponding error status cleared
28 to 13	—	Reserved When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
12 to 9	ECMCLSSE112 to ECMCLSSE109	ECM Error Status Clear ECMCLSSE112 to ECMCLSSE109 correspond to error source 44 to 41. 0: Corresponding error status unchanged 1: Corresponding error status cleared
8	—	Reserved When writing to this bit, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
7 to 5	ECMCLSSE107 to ECMCLSSE105	ECM Error Status Clear ECMCLSSE107 to ECMCLSSE105 correspond to error source 39 and 37. 0: Corresponding error status unchanged 1: Corresponding error status cleared
4 to 0	—	Reserved When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.

31.3.18 ECMPCMD1 — ECM Protection Command Register

Refer to **Section 31.3.1, List of Registers**, for the protected registers by the ECM protection command register. Refer to **Section 31.1.7, Write-Protected Registers**, for the details of the protection unlock sequence.

Access: This register can be written in 32-bit units.

Address: <ECM_base> + 2C_H

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 31.24 ECMPCMD1 Register Contents

Bit Position	Bit Name	Function
31 to 8	—	Reserved When writing to these bits, write the value after reset.
7 to 0	ECMREG1[7:0]	Protection command that enables writing to write protected ECM registers.

31.3.19 ECMP5 — ECM Protection Status Register

The ECM protection status register is used to verify the write protected register has been written successfully or not. Refer to **Section 31.1.7, Write-Protected Registers**.

Access: This register can be read in 8-bit units.

Address: <ECM_base> + 30_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ECMPRERR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 31.25 ECMP5 Register Contents

Bit Position	Bit Name	Function
7 to 1	—	Reserved When read, the value after reset is returned.
0	ECMPRERR	ECM Protection Status Indicates whether writing to a write protected register is failed or not. 0: Writing was successfully completed. 1: Writing failed

31.3.20 ECMPE0 — ECM Pseudo Error Trigger Register 0

The ECM pseudo error trigger register is used to generate a pseudo error for test purposes. The ECM operation in response to the generation of a pseudo error is identical to that in response to a real error source. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 31.1.7, Write-Protected Registers**, for the details of the protection unlock sequence.

Access: This register can be written in 32-bit units.

Address: <ECM_base> + 34_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	R	W	W

Table 31.26 ECMPE0 Register Contents

Bit Position	Bit Name	Function
31, 30	ECMPE031, ECMPE030	ECM Pseudo Error Trigger ECMPE031, ECMPE030 correspond to error sources 31 to 30. 0: Pseudo error not generated 1: Generates corresponding pseudo error
29, 28	—	Reserved When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
27 to 25	ECMPE027 to ECMPE025	ECM Pseudo Error Trigger ECMPE027 to ECMPE025 correspond to error sources 27 to 25. 0: Pseudo error not generated 1: Generates corresponding pseudo error
24, 23	—	Reserved When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
22 to 3	ECMPE022 to ECMPE003	ECM Pseudo Error Trigger ECMPE022 to ECMPE003 correspond to error sources 22 to 3. 0: Pseudo error not generated 1: Generates corresponding pseudo error
2	—	Reserved When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
1, 0	ECMPE001, ECMPE000	ECM Pseudo Error Trigger ECMPE001 and ECMPE000 correspond to error sources 1 and 0. 0: Pseudo error not generated 1: Generates corresponding pseudo error

31.3.21 ECMPE1 — ECM Pseudo Error Trigger Register 1

The ECM pseudo error trigger register 1 is used to generate a pseudo error for test purposes. The ECM operation in response to the generation of a pseudo error is identical to that in response to a real error source. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 31.1.7, Write-Protected Registers**, for the details of the protection unlock sequence.

Access: This register can be written in 32-bit units.

Address: <ECM_base> + 38_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 31.27 ECMPE1 Register Contents

Bit Position	Bit Name	Function
31, 30	—	Reserved When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
29	ECMPE129	ECM Pseudo Error Trigger Corresponds to delay timer overflow. 0: Pseudo error not generated 1: Generates corresponding pseudo error
28 to 13	—	Reserved When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
12 to 9	ECMPE112 to ECMPE109	ECM Pseudo Error Trigger ECMPE112 to ECMPE109 correspond to error sources 44 to 41. 0: Pseudo error not generated 1: Generates corresponding pseudo error
8	—	Reserved When writing to this bit, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
7 to 5	ECMPE107 to ECMPE105	ECM Pseudo Error Trigger ECMPE107 to ECMPE105 correspond to error sources 39 to 37. 0: Pseudo error not generated 1: Generates corresponding pseudo error
4 to 0	—	Reserved When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.

31.3.22 ECMDTMCTL — ECM Delay Timer Control Register

The ECM delay timer control register is used to control the delay timer. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 31.1.7, Write-Protected Registers**, for the details of the protection unlock sequence.

Access: This register can be written in 8-bit units.

Address: <ECM_base> + 3C_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ECMSTP	ECMSTA
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	W

Table 31.28 ECMDTMCTL Register Contents

Bit Position	Bit Name	Function
7 to 2	—	Reserved When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
1	ECMSTP	Delay Timer Stop Writing 1 to this bit initializes the delay timer counter, causing the delay timer to stop. Simultaneously, the ECMSTA bit is set to 0.
0	ECMSTA	Delay Timer Stop Writing 1 to this bit starts the delay timer when an interrupt is generated. (Writing 0 to this bit stops the delay timer.)

31.3.23 ECMDTMR — ECM Delay Timer Register

The ECM delay timer register represents the value of the delay timer.

The delay timer counter is initialized by writing 1 to the ECMSTP bit or writing 0 to the ECMSTA bit of the ECM delay timer control register (ECMDTMCTL).

Access: This register can be read in 16-bit units.

Address: <ECM_base> + 40_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECMDTMR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

31.3.24 ECMDTMCMP — ECM Delay Timer Compare Register

A delay timer overflow signal is generated to set the ECMmSSE129n bit when this register matches with the value of the delay timer counter. Writing data to this register has to be conducted while the delay timer is stopped. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 31.1.7, Write-Protected Registers**, for the details of the protection unlock sequence.

Access: This register can be read/written in 16-bit units.

Address: <ECM_base> + 44_H

Value after reset: 0000_H

31.3.25 ECMDTMCFG0 — ECM Delay Timer Configuration Register 0

The ECM delay timer configuration register 0 is used to set enable/disable of the delay timer start caused by maskable interrupts in response to errors. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 31.1.7, Write-Protected Registers**, for the details of the protection unlock sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 48_H

Value after reset: 0000 0000_H

1, 0	ECMTE001, ECMTE000	ECM Delay Timer Start Control ECMTE001 and ECMTE000 correspond to maskable interrupts generated by error sources 1 and 0. 0: Delay timer start disabled 1: Delay timer start enabled

31.3.26 ECMDTMCFG1 — ECM Delay Timer Configuration Register 1

The ECM delay timer configuration register 1 is used to set enable/disable of the delay timer start caused by maskable interrupts in response to errors. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 31.1.7, Write-Protected Registers**, for the details of the protection unlock sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 4C_H

Value after reset: 0000 0000_H

12 to 9	ECMTE112 to ECMTE109	ECM Delay Timer Start Control ECMTE112 to ECMTE109 correspond to maskable interrupts generated by error sources 44 to 41. 0: Delay timer start disabled 1: Delay timer start enabled
8, 7	—	Reserved When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.
6, 5	ECMTE106, ECMTE105	ECM Delay Timer Start Control ECMTE106 and ECMTE105 correspond to maskable interrupts generated by error sources 38 and 37. 0: Delay timer start disabled 1: Delay timer start enabled
4 to 0	—	Reserved When read, the value after reset is returned. When writing to these bits, follow the procedure of the protection unlock sequence to write the value after a reset or the bitwise inverse of the value after a reset.

31.3.27 ECMDTMCFG2 — ECM Delay Timer Configuration Register 2

The ECM delay timer configuration register 2 is used to set enable/disable of the delay timer start caused by FE level interrupts in response to errors. You have to follow a predetermined protection unlock sequence for writing data to this register. Refer to **Section 31.1.7, Write-Protected Registers**, for the details of the protection unlock sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 50_H

Value after reset: 0000 0000_H

Section 32 Data CRC (DCRA)

This section explains the data CRC function A (DCRA).

Table 32.1 shows the register base address.

Table 32.1 Register Base Address

Base Address Name	Base Address
<DCRA0_base>	FFF7 0000 _H

32.1 Overview

32.1.1 Functional Overview

The data CRC function A can verify or generate data streams protected by CRC with various lengths and different bit widths.

- Generating polynomial: Either 32-Ethernet (32-bit CRC code generation) or 16-CCITT (16-bit CRC code generation) can be selected with a register.

The generating polynomials are as follows:

– 32-Ethernet

$$(x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1)$$

– 16-CCITT ($x^{16} + x^{12} + x^5 + 1$)

- When 32-Ethernet is selected, a 32-bit CRC code is generated to a data block of an arbitrary length in units of 8/16/32 bits as specified with a register.
- When 16-CCITT is selected, a 16-bit CRC code is generated to a data block of an arbitrary length in units of 8/16/32 bits as specified with a register.
- After setting an initial value in the CRC data register (DCRA0COUT), the calculation is carried out by transferring an input data to the CRC input register (DCRA0CIN), and the result of the calculation is stored in the CRC data register (DCRA0COUT).

- 16-CCITT

32.2 Register Specifications

32.2.1 List of Registers

Table 32.2 List of DCRA Registers

Register Name	Function	Address
DCRA0CIN	CRC input register	<DCRA0_base> + 00 _H
DCRA0COUT	CRC data register	<DCRA0_base> + 04 _H
DCRA0CTL	CRC control register	<DCRA0_base> + 20 _H

32.2.2 DCRA0CIN — CRC Input Register

The CRC input register is a 32-bit register that stores input data.

When data is set in this register, the CRC code corresponding to the input is generated.

The DCRA0ISZ1 and DCRA0ISZ0 bits of the CRC control register specify the effective bit width used in the CRC calculation circuit.

Access: This register can be read/written in 32-bit units.

Address: FFF7 0000_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DCRA0CIN															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCRA0CIN															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.3 DCRA0CIN Register Contents

Bit Position	Bit Name	Function
31 to 0	DCRA0CIN [31:0]	Input Data for CRC Calculation The effective bit widths are: <ul style="list-style-type: none"> • For 32 bits: DCRA0CIN[31:0] • For 16 bits: DCRA0CIN[15:0] • For 8 bits: DCRA0CIN[7:0]

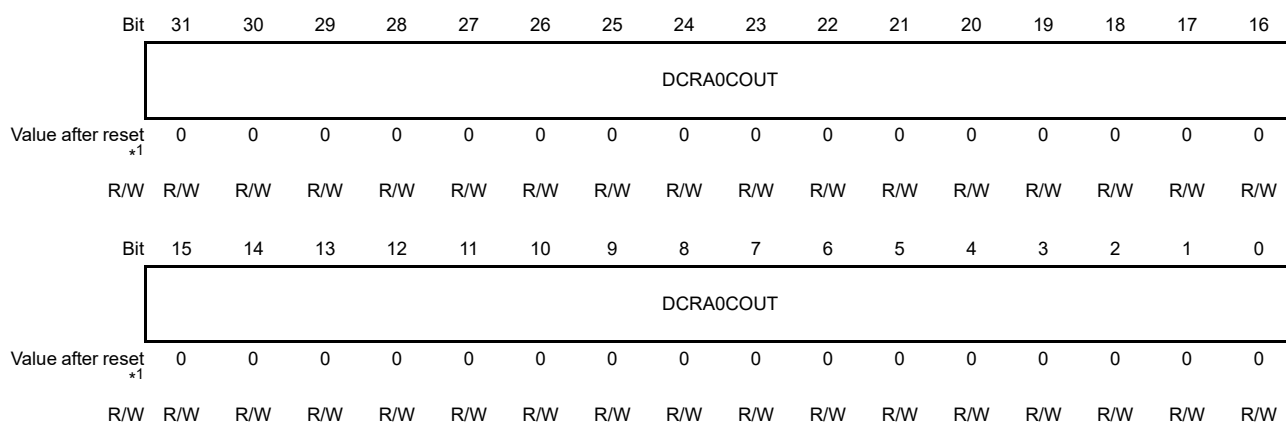

32.2.3 DCRA0COUT — CRC Data Register

The CRC data register is a 32-bit register that stores the result of CRC (32-Ethernet/16-CCITT) calculation.

Access: This register can be read/written in 32-bit units.

Address: FFF7 0004_H

Value after reset: 0000 0000_H

Note 1. The read value after reset is 0000 0000_H since the 32-bit Ethernet polynomial is selected as the CRC generating function after reset.

Table 32.4 DCRA0COUT Register Contents

Bit Position	Bit Name	Function
31 to 0	DCRA0COUT [31:0]	Result of the CRC Code Generation When the 16-bit CCITT polynomial is enabled, bits 15 to 0 show the CRC result. Bits 31 to 16 are undefined. The read value of this register is a value obtained by performing EXOR calculation for the following value: <ul style="list-style-type: none"> For 32-bit Ethernet polynomial: FFFF FFFF_H For 16-bit CCITT polynomial: 0000_H For example, when the 32-bit Ethernet polynomial is selected and DCRA0COUT is 5555 5555 _H , AAAA AAAA _H is read.

CAUTION

This register must be initialized (setting the initialized start value) before the first data of the data block is written to the DCRA0CIN register.

32.2.4 DCRA0CTL — CRC Control Register

The CRC control register is a bit register that controls CRC.

Access: This register can be read/written in 8-bit units.

Address: FFF7 0020_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	DCRA0ISZ[1:0]		DCRA0POL
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W

Table 32.5 DCRA0CTL Register Contents

Bit Position	Bit Name	Function
7 to 3	—	Reserved
2,1	DCRA0ISZ[1:0]	Input Data Width Selection These bits specify the effective input data width of the CRC input register. bit2 bit1 0 0: Sets the effective input data width to 32 bits (DCRA0CIN31-0) 0 1: Sets the effective input data width to 16 bits (DCRA0CIN15-0) 1 0: Sets the effective input data width to 8 bits (DCRA0CIN7-0) 1 1: Setting prohibited
0	DCRA0POL	CRC Generating Polynomial Selection This bit specifies the CRC generating polynomial. 0: Selects 32-Ethernet (32-bit CRC code generation) 1: Selects 16-CCITT (16-bit CRC code generation)

CAUTIONS

1. After changing the CRC generating function (DCRA0CTL.DCRA0POL), the DCRA0COUT register must be initialized.
2. The CRC bit width (DCRA0CTL.DCRA0ISZ[1:0]) must be set according to the data block bit width. Switching the CRC bit width is not allowed during processing of a data block. After the final CRC result is read from the DCRA0COUT register, the bit width can be changed. In this case, the DCRA0COUT register must be initialized (the initial start value must be set) afterwards.

32.3 Functions

The data CRC function A generates a CRC (cyclic redundancy check) of an arbitrary data block length. The data is transferred to the data CRC function in 8-, 16- or 32-bit units. The CRC polynomial can either be selected for 32-bit Ethernet or 16-bit CCITT.

The initial start value must be set in the DCRA0COUT register before the first write access to the CRC input register (DCRA0CIN) is performed.

The flow chart below shows the CRC generating procedure.

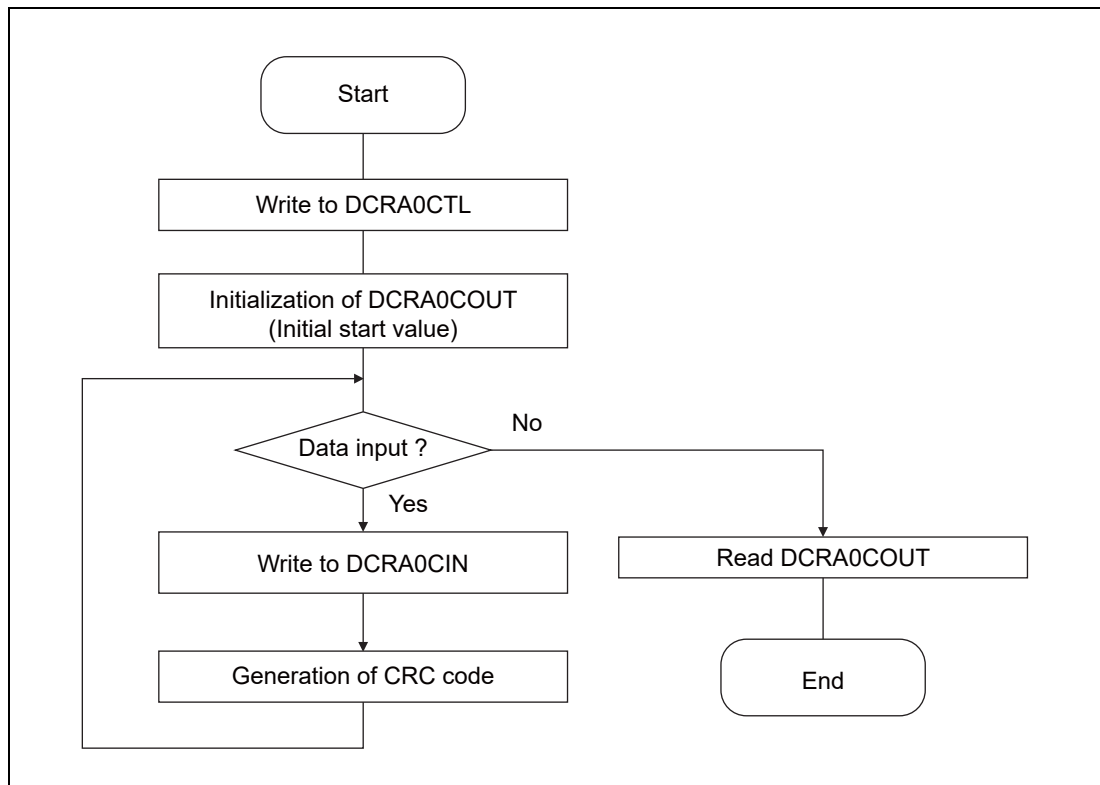

Figure 32.2 Flow of Data CRC Function A

NOTES

1. Before writing the first data to DCRA0CIN, the CRC output register DCRA0COUT must be initialized with the start value (initial start value).
2. Re-initialization of DCRA0COUT (initial start value) is also necessary when the polynomial is changed by changing DCRA0CTL.DCRA0POL.

Section 33 On-Chip Debugging Unit (OCD)

33.1 Debug Function

This microcontroller has an on-chip debug function. By using the on-chip debug emulator, programs can be debugged with the microcontroller mounted in the target system.

CAUTION

The debug functions described in this section are supported by the microcontroller but whether they are usable depends on the debugger. For details on debugging, see the user's manual of the debugger.

(1) Debug Interface

This microcontroller supports the NEXUS JTAG Interface, and low-pin debug interface (4-pin) (hereinafter referred to as LPD (4-pin)) as debug interfaces. Also it incorporates the AUD-RAM monitor and supports the AUD-RAM monitor interfaces to monitor and tune on-chip RAM data, peripheral registers, etc.

For the AUD-RAM monitor, see **Section 33.5, AUD-RAM Monitor (AUDR)**.

(2) Debug Monitoring

In debug mode, the monitoring program proceeds in the debugging-only area.

The basic debug functions below can be used by running a monitoring program.

- Downloading user programs
- Reading and writing user resources including the memory and registers while the user program is suspended
- Running the user program starting at any address

(3) On-chip Break Function

12 break points are included in the CPU1 and PCU each. Four of them can be designated for any access (access address and access data).

(4) Software Break Function

A software break point can be designated for any address.

(5) Forced Break Function

Execution of the user program can be forcibly suspended.

(6) Debug Interrupt Interface Function

Execution of the user program can be forcibly suspended by asserting an input signal on the $\overline{\text{EVTI}}$ pin from the outside.

(7) Forced Reset Function

The micro controller (this product) can be forcibly reset.

(8) Real-time RAM Monitoring (RRM)

The memory can be read during program execution. Because this read access uses debug-dedicated DMA, it has minimal effect on program execution.

(9) Dynamic Memory Modification (DMM)

The memory can be written during program execution. Because this write access uses debug-dedicated DMA, it has minimal effect on program execution.

(10) Timer Function

Using a 32-bit counter, the time for running the user program can be measured based on the clock for debug.

(11) Mask Function

A reset factor (external reset, software reset, and ECM reset) can be masked.

(12) Event Detection Function

Events can be detected by the following: execution address, access address, access data, range (comparison in size), and sequential execution.

(13) Trigger Input Interface

This microcontroller incorporates an event trigger input interface to accept external events. It can accept an external event in response to an input from the $\overline{\text{EVTI}}$ pin.

(14) Trigger Output Interface

An event trigger output interface is included in this microcontroller to notify the external debug device of event detection and the like. Output from the $\overline{\text{EVTO}}$ pin can output a trigger of event detection to the outside.

(15) Hot Plug-in Function

Debugging can be started in normal operating mode without an input of an external reset.

(16) Security Function

To prevent the contents of the flash memory from being read by an unauthorized person, a 128-bit ID code (OCD_ID) can be written to the microcontroller. If the code the user inputs when starting a debugger does not match the ID code written to the microcontroller, the flash memory cannot be accessed.

(17) Calibration Function

Emulating the flash memory and tuning ROM data can be executed by using the ERAM, the memory for emulation. For details, **Section 33.2, Calibration Function**.

(18) Tracing Function

Execution history, data changes, etc. of the user program can be obtained. For details, see **Section 33.3, Trace Control Function**.

(19) Multi Core Debug Function

The following functions are supported as the multi core debugger for the CPU1 and PCU: synchronization functions (including reset, execution, and break), synchronous setting, and simultaneous tracing for multiple cores.

33.2 Calibration Function

This microcontroller includes the emulation RAM as an emulation memory for the on-chip flash memory.

(1) Emulation RAM

A 8-Kbyte Emulation RAM is provided.

(2) Flash Emulation Function

The emulation RAM can be mapped to any areas in the flash area.

- Subblocks 0: 8 Kbytes

(3) Tuning Function

The ROM data can be dynamically tuned during execution of the user program via the ERAM that has mapped to the flash area.

(4) Flash Cache Clear Function

The flash cache is cleared when the ERAM mapping is set. This preserves coherency of the contents between the on-chip flash memory or the ERAM and the flash cache memory.

33.3 Trace Control Function

This microcontroller allows acquisition of the execution history of the user program, data changes, etc.

The software trace information can be output via the debug interface (LPD (4-pin)).

33.4 Peripheral Break Control

33.4.1 Overview

The peripheral break function stops the peripheral modules if the user program is stopped, for instance upon a breakpoint hit.

The on-chip modules can be classified into two by its operation at the time of peripheral break as follows:

1. Modules that are unconditionally stopped:
WDTA0, WDTA1, SWDT0, SWDT2
2. Modules that can select abeyance or continuation*¹:
OSTM0, OSTM1, OSTM2
TAPA2, TAPA3
TSG20, TSG21
ATU4
DMA

Note 1. When stopping the peripheral modules by peripheral break, TAPAn forcibly places TSG2n PWM output pins TSON1 to TSON6 in the Hi-Z state. Also, the value of the TAPAnHOF[10:8] bits in the TAPAnFLG register is set to 111_B.

33.5 AUD-RAM Monitor (AUDR)

33.5.1 Overview

This LSI includes the AUD (Advanced User Debugger) -RAM monitor (AUDR) to support debugging of a user program under conditions as if it were actually mounted in the system. The AUDR can read and write the resources mapped to memory spaces including an on-chip memory and a peripheral register during LSI operation.

Table 33.1 lists the outlines of the AUDR and **Figure 33.1** shows the block diagram of the AUDR.

Table 33.1 Outlines of the AUDR

Item	Outline
Transfer method	Clock-synchronous parallel interface (4 bits)
Transfer clock generation	Transfer clock is generated at the external host (RAM monitor tool) side.
Transfer clock frequency	Maximum 20 MHz
Access area	Physical address area on the system bus
Access data size	8, 16, 32, and 64 bits
Access address input bit width	8, 16, 24, and 32 bits The same values as those of the previous access address are used for the upper bits of access address, which are not input.
Data transfer method	<ul style="list-style-type: none"> • Single transfer: Single data is transferred to the access address that has been input. • Continuous transfer: Up to 16 data are continuously transferred from the access address that has been input. The access address is automatically incremented depending on data size.
I/O pin	7 pins (AUDRST, AUDCK, AUDSYNC, and AUDATA3 to AUDATA0)
Function	<ul style="list-style-type: none"> • RAM monitor function: Read and write are performed from a system bus to an accessible physical address area. This function enables reference to and modification of an on-chip memory, a peripheral register, and the like. • Configuration information retention (startup communication) function: The values of the AUDATA3 to AUDATA0 pins at the time of release from the internal reset state are retained. This function is used for communication with a RAM monitor tool. • Synchronization communication (message board) function: This flag register is used for communication of the firmware operated by the CPU with a RAM monitor tool.

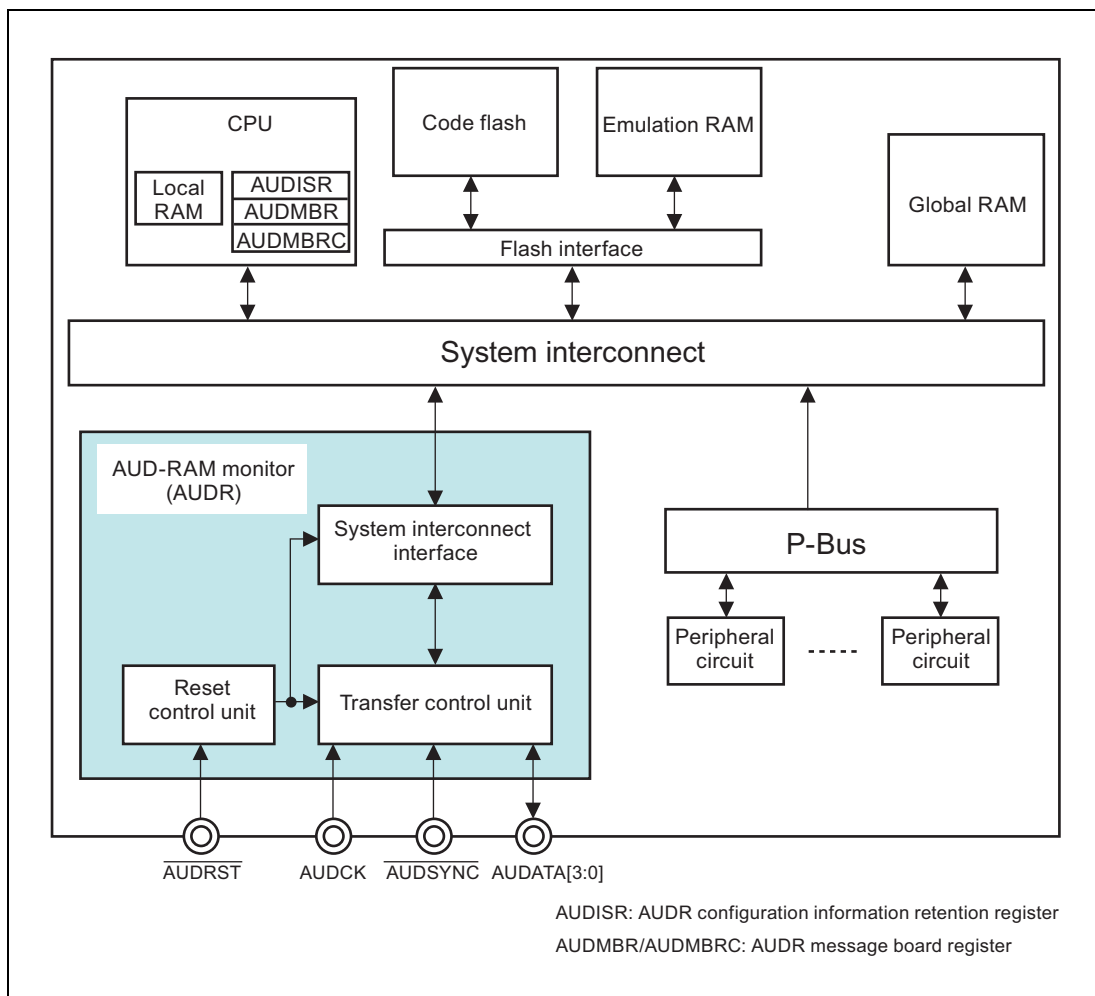

Figure 33.1 Block Diagram of the AUDR

33.5.2 I/O Pins

Table 33.2 lists the I/O pins of the AUDR.

Table 33.2 I/O Pins of AUDR

Pin Name	I/O	Description
AUDRST	Input	AUDR reset input pin. Inputting L to this pin resets the AUDR, but it does not initialize the AUDISR and AUDMBR/AUDMBRC (described below). When this pin is not connected, it is internally pulled-down.
AUDCK	Input	External clock input pin. The frequency of clock that can be input is less than 20 MHz. When this pin is not connected, it is internally pulled-up.
AUDSYNC	Input	Timing control signal input pin. L: A command, an address, and write data are input and the status flag is output. H: The read-out data is output, and it causes the idle state. When this pin is not connected, it is internally pulled-up. CAUTION This pin should not be negated (to H) until the ready state is entered by inputting a command or the like from the outside to the AUDATA. For details, see the protocol mentioned below.
AUDATA3 to AUDATA0	Input/output	4-bit parallel data I/O pin. The following information is input and output by time division. <ul style="list-style-type: none"> • Command (input) • Address (input) • Write data (input)/Read data (output) • Status flag (output) When this pin is not connected, it is internally pulled-up.

33.5.3 Description of Registers

Table 33.3 lists the registers related to the AUDR.

These registers can only be accessed by CPU1.

Table 33.3 List of Registers

Register Name	Abbreviation	Value after Reset	R/W	Address	Access Size	Reference Section
AUDR configuration information retention register	AUDISR	000X _H ^{*1}	R	FA00 5000 _H ^{*4}	16 ^{*5}	33.5.3.1
AUDR message board register	AUDMBR	0000 _H	R/W ^{*2}	FA00 5004 _H ^{*4}	16 ^{*5}	33.5.3.2
	AUDMBRC	0000 _H	R/W ^{*2,*3}	FA00 5008 _H ^{*4}	16 ^{*5}	

Note 1. The values of the AUDATA3 to AUDATA0 pins at the time of release from the internal reset state are retained in bit 3 to 0.

Note 2. Only 1 can be written to the bits that have been set to 0. 0 cannot be written to the bits that have been set to 1.

Note 3. All bits are cleared to 0 after read.

Note 4. The addresses of the AUDISR and AUDMBR/AUDMBRC bits differ when they are accessed from the program and the AUDR tool. Although these addresses are "Access prohibited" area, it is capable of accessing to this addresses for AUDR tool and communication.

Note 5. If an access in data sizes other than 16 bits (half-word) is performed, correct operation is not guaranteed.

33.5.3.1 AUDISR — AUDR Configuration Information Retention Register

AUDISR is a 16-bit readable register. Also it can be read out from the program and AUDR tool.

Use FA00 5000_H for an access from the program to the AUDISR.

Use F900 5000_H for an access from the AUDR tool to the AUDISR.

The AUDISR register is not initialized by AUDR reset. The AUDISR can be read out from the program during reset.

This register is used in the way described below.

- Retention of configuration information

On release from an internal reset, the register retains the values corresponding to the levels on pins AUDATA3 to AUDATA0.

Setting the levels on pins AUDATA3 to AUDATA0 in the emulator configuration allows programs to judge the connection configuration of the emulator.

If nothing is connected to the AUD RAM monitoring-related pins, pins AUDATA3 to AUDATA0 are pulled up and the register is read as 000F_H. If an AUD RAM monitoring tool is connected, the levels on pins AUDATA3 to AUDATA0 will correspond to a value other than 000F_H. Reading of the AUDISR by the CPU can then be used to judge that a tool is connected.

In addition, the values from pins AUDATA3 to AUDATA0 can be used to identify the vendor that is the source of the connected tool.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	DATA			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	Values of the AUDATA3 to AUDATA0 pins			
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 33.4 AUDISR Register Contents

Bit Position	Bit Name	Function
15 to 4	—	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	DATA	The values of the AUDATA3 to AUDATA0 pins at the time of release from the internal reset state are retained.

33.5.3.2 AUDMBR/AUDMBRC — AUDR Message Board Register

The AUDMBR/AUDMBRC register is a 16-bit readable/writable register. It can be read and written from the program and the AUDR tool.

Use FA00 5004_H or FA00 5008_H for access to AUDMBR/AUDMBRC from the program. Use F900 5004_H or F900 5008_H for access to AUDMBR/AUDMBRC of CPU1 from the AUDR tool.

When the program reads AUDMBRC at FA00 5008_H, all bits of AUDMBR/AUDMBRC are cleared to 0 after reading. When the program reads the AUDMBR at FA00 5004_H, the bits of AUDMBR/AUDMBRC are not cleared.

When AUDR tool reads AUDMBRC at F900 5008_H, all bits of AUDMBR/AUDMBRC are cleared to 0 after reading. When the AUDR tool reads AUDMBR at F900 5004_H, the bits of AUDMBR/AUDMBRC are not cleared.

The program and the AUDR tool can write to AUDMBR/AUDMBRC from the above addresses. However, writing 0 to the bits that have been set to 1 will be ignored (they can only be set to 1).

Table 33.6 summarizes the recommended accesses to AUDMBR/AUDMBRC.

The AUDMBR/AUDMBRC register is not initialized by AUDR reset. AUDMBR/AUDMBRC can be read and written from the program during AUDR reset.

AUDMBR and AUDMBRC are used in the way described below.

- Synchronous communications (message board) function
 The firmware (program) run by the CPU uses AUDMBR as a flag register for use in communications with the emulator, which reads AUDMBR by using the RAM monitoring function. This allows the emulator to follow the state of firmware (program) operations.

Table 33.5 AUDMBR/AUDMBRC Register Contents

Bit Position	Bit Name	Function
15 to 0	AUDMBR	Communication flag between the AUDR and the CPU

Table 33.6 Recommended Access to the AUDMBR/AUDMBRC

Accessing Master	Address	R/W	Access	Remarks
Program	FA00 5004 _H (AUDMBR)	Write	Only 1 can be written. Writing 0 is ignored.	—
		Read	Reading is enabled.	Not cleared after reading.
AUDR tool	F900 5008 _H (AUDMBRC)	Write	Only 1 can be written. Writing 0 is ignored.	—
		Read	Reading is enabled.	All bits are cleared to 0 after reading.

33.5.4 RAM Monitoring

33.5.4.1 Communication Protocol

Input a command, counter value, address, and data to the AUDATA pin in the format shown in **Figure 33.2**. For details, see **Section 33.5.4.2, Operation**.

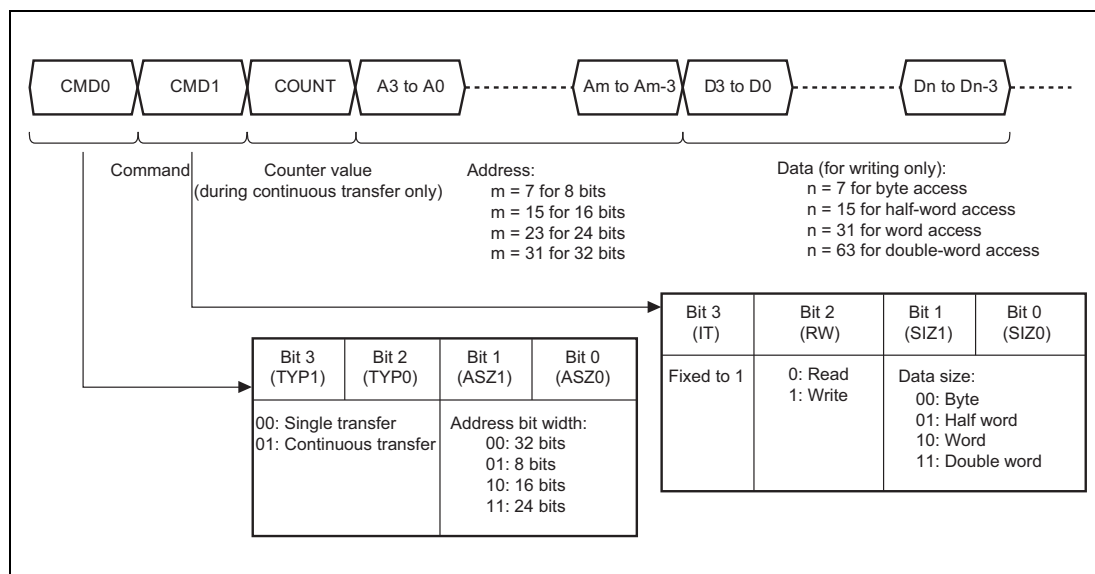

Figure 33.2 AUDATA Pin Input Format

33.5.4.2 Operation

(1) Single Transfer

Single transfer is a method of transmitting single data to an address that has been input for access.

Figure 33.3 shows an example of reading operation during single transfer and **Figure 33.4** shows an example of writing operation during single transfer.

When the $\overline{\text{AUDSYNC}}$ pin is asserted and a command, address and data (only for writing) are input to the AUDATA pin in the format shown in **Figure 33.2**, the AUDR starts reading or writing the specified address. The AUDR outputs the Not Ready flag (0000) to the AUDATA pin during this internal execution. After successful completion of the internal execution, the AUDR outputs the Ready flag (0001) to the AUDATA pin. (See **Figure 33.3** and **Figure 33.4**).

For reading, after the Ready flag is output and the $\overline{\text{AUDSYNC}}$ pin is negated, the read data is output from the AUDATA pin (see **Figure 33.3**).

After output of the read data and until input of the next command, at least one clock cycle is required for switching of the input/output states of the pins.

In addition, after the $\overline{\text{AUDSYNC}}$ pin is negated following the completion of processing for write access, when the next command is input, at least one clock cycle is required for switching of the input/output states of the pins. Therefore, the $\overline{\text{AUDSYNC}}$ pin is negated for two cycles.

If a command other than those shown in **Figure 33.2** is input to CMD0 and CMD1, the AUDR disables this processing as a command error and sets the CFLG bit in the Ready flag to 1. When a bus error occurs during the internal execution, the AUDR disables this processing and sets the BFLG bit in the Ready flag to 1 (see **Figure 33.5**). When an error is detected, the read data is not output.

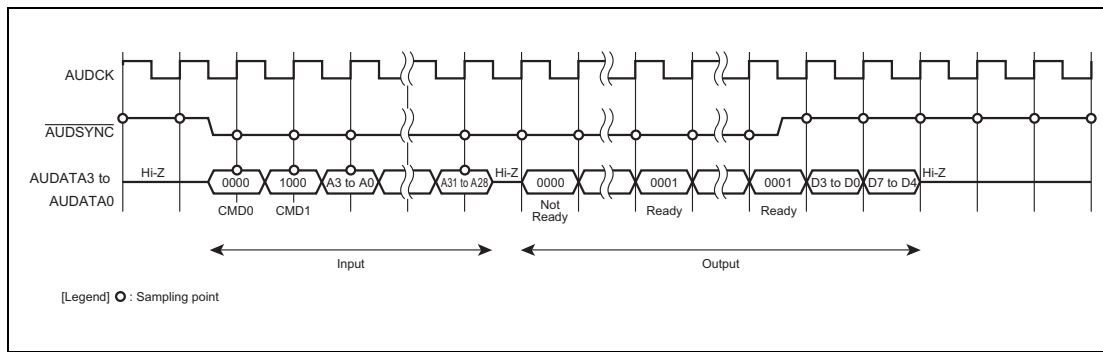

Figure 33.3 Example of Reading Operation in Single Transfer (Address 32 Bits; Byte Read)

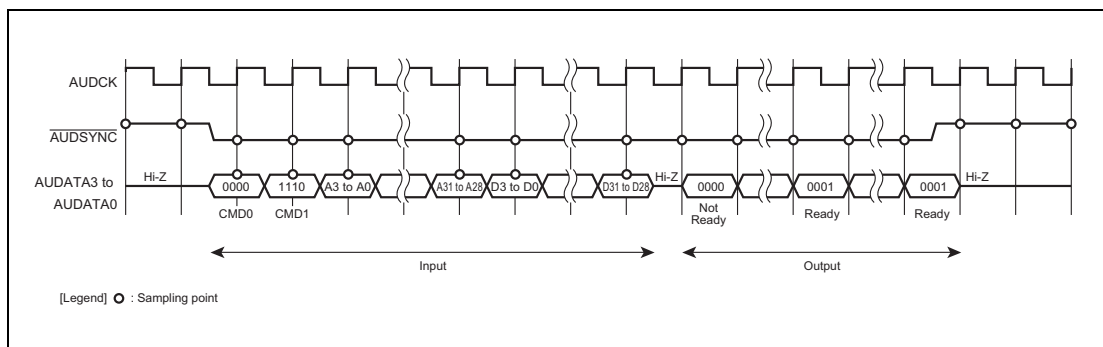

Figure 33.4 Example of Writing Operation in Single Transfer (Address 32 Bits; Word Write)

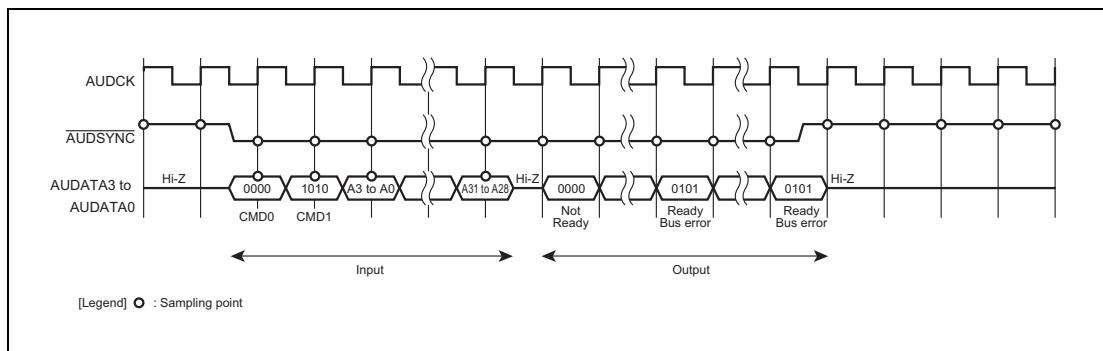

Figure 33.5 Example of Error Occurrence in Single Transfer (Address 32 Bits; Word Read)

(2) Continuous Transfer

Continuous transfer is a method of continuously transmitting up to 16 data to the address that has been input. The address to be accessed is automatically incremented depending on the data size after completion of each data transfer. **Figure 33.6** shows an example of reading operation during continuous transfer and **Figure 33.7** shows an example of writing operation during continuous transfer.

The first data transfer is equivalent to single transfer except that COUNT (counter value) shown in **Figure 33.2** should be input. The number of data to be transferred minus 1 is input to the COUNT.

In the second and subsequent data transfer, the input of CMD0, CMD1, COUNT, and addresses is skipped. The second and subsequent data transfer for reading and writing proceed as follows.

For reading, when the $\overline{\text{AUDSYNC}}$ pin is asserted after completion of the previous data transfer, the AUDR outputs the Not Ready flag (0000) to the AUDATA pin during this internal execution. After successful completion of the internal execution, the AUDR outputs the Ready flag (0001) to the AUDATA pin. Then after the $\overline{\text{AUDSYNC}}$ pin is negated, the read data is output from the AUDATA pin. This operation is repeated until the number of data specified in COUNT is read (see **Figure 33.6**).

For writing, when the $\overline{\text{AUDSYNC}}$ pin is asserted after completion of the previous data transfer, the AUDR inputs data to be written to the AUDATA pin. After that, the AUDR starts the internal execution. The AUDR outputs the Not Ready flag (0000) to the AUDATA pin during this operation. After successful completion of the internal execution, the AUDR outputs the Ready flag (0001) to the AUDATA pin. This operation is repeated until the number of data specified in the COUNT is written (see **Figure 33.7**).

When the $\overline{\text{AUDSYNC}}$ pin is re-asserted to input the next write data, at least two cycles are required for negating the $\overline{\text{AUDSYNC}}$ pin.

If a bus error occurs during the internal execution, the AUDR suspends data transfer and sets the BFLG bit in the Ready flag to 1 (see **Figure 33.8**).

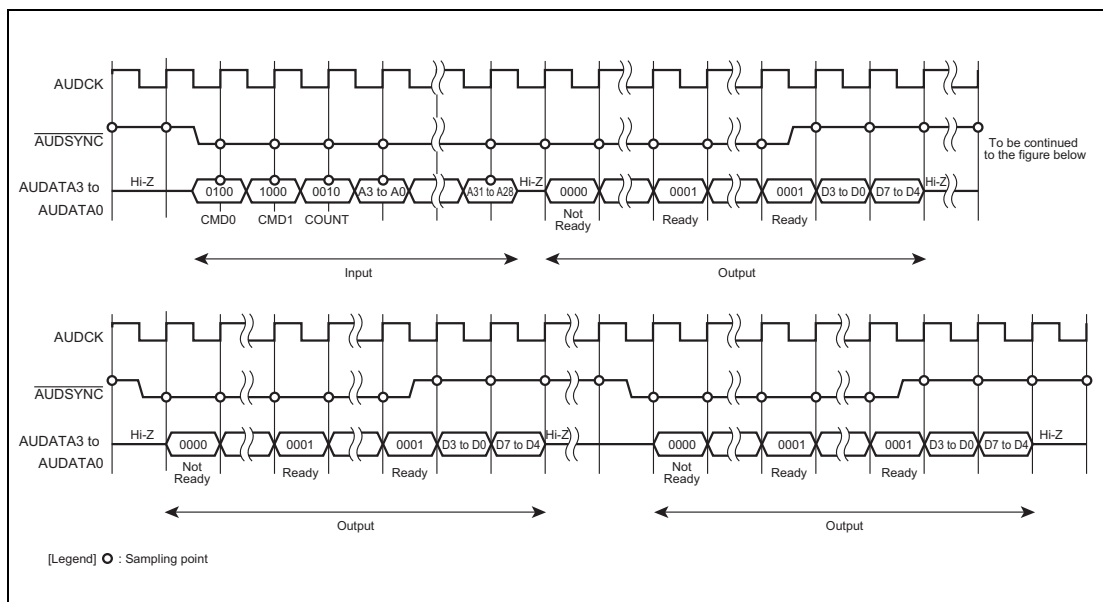

Figure 33.6 Example of Reading Operation in Continuous Transfer (Address 32 Bits; Byte Read × Three Units of Data)

Figure 33.7 Example of Writing Operation in Continuous Transfer (Address 32 Bits; Byte Write × Three Units of Data)

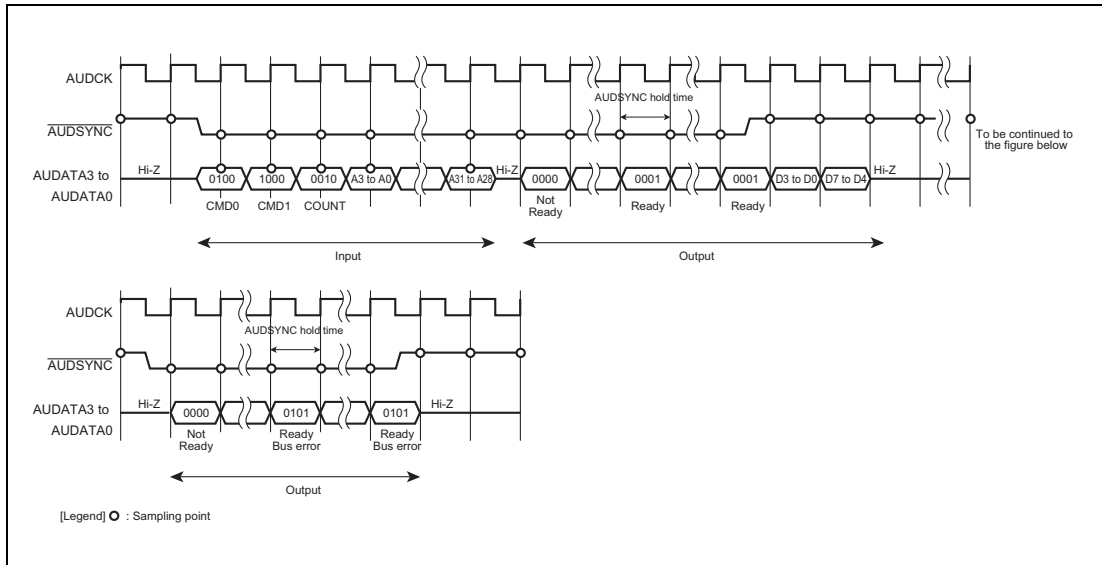

Figure 33.8 Example of Error Occurrence in Continuous Transfer (Address 32 Bits; Byte Read × Three Units of Data)

Control of the $\overline{\text{AUDSYNC}}$ pin after a ready response

Do not negate the $\overline{\text{AUDSYNC}}$ pin at the falling edge of AUDCK a half cycle after AUDATA is ready. This will lead to the state information inside AUDR becoming invalid. Wait for at least one clock cycle of AUDCK before negating the $\overline{\text{AUDSYNC}}$ pin.

(3) Command Error Conditions**Table 33.7 Command (CMD0) Error Conditions**

Bit 3 (TYP1)	Bit 2 (TYP0)	Bit 1 (ASZ1)	Bit 0 (ASZ0)	Description
0	0	0	0	Single transfer Address bit width: 32 bits
0	0	0	1	Single transfer Address bit width: 8 bits
0	0	1	0	Single transfer Address bit width: 16 bits
0	0	1	1	Single transfer Address bit width: 24 bits
0	1	0	0	Continued transfer Address bit width: 32 bits
0	1	0	1	Continued transfer Address bit width: 8 bits
0	1	1	0	Continued transfer Address bit width: 16 bits
0	1	1	1	Continued transfer Address bit width: 24 bits
1	x	x	x	Command error

Table 33.8 Command (CMD1) Error Conditions

Bit 3 (IT)	Bit 2 (RW)	Bit 1 (SIZ1)	Bit 0 (SIZ0)	Description
0	x	x	x	Command error
1	0	0	0	Read: Byte
1	0	0	1	Read: Half word
1	0	1	0	Read: Word
1	0	1	1	Read: Double word
1	1	0	0	Write: Byte
1	1	0	1	Write: Half word
1	1	1	0	Write: Word
1	1	1	1	Write: Double word

(4) Bus Error Conditions

- Half-word access is made to the address of $4n + 1$ and $4n + 3$.
- Word access is made to the address of $4n + 1$, $4n + 2$, and $4n + 3$.
- Double-word access is made to the address of $8n + 1$, $8n + 2$, $8n + 3$, $8n + 4$, $8n + 5$, $8n + 6$, and $8n + 7$.
- An error response is received from the system bus.

(5) AUDATA Pin Input Format

Table 33.9 Input Format Bit Position

Table 33.17 Read Data Format

Bit Name	Function	Description
D63 to D0	Output read data	The required number of bits depends on the setting of the SIZ[1:0] bits in CMD1 (for details, see Table 33.16).

33.5.4.3 Usage Notes on AUDR Function

- Do not negate the $\overline{\text{AUDSYNC}}$ pin until one cycle of AUDCK has elapsed after a command is input to the AUDATA pin and the Ready flag has been returned.
- When uninitialized memory is accessed through the AUDR, a bus error may occur due to ECC error detection.

33.5.4.4 Enabling and Disabling the RAM Monitor Function

Enabling or disabling of the AUDR can be specified using option bytes (stored in the flash memory and set by reset transfer).

AUDREN: AUDR Enable Bit

For setting of option bytes, see Section 34, Flash Memory.

NOTE

In serial programming mode, AUDR is disabled regardless of this setting.

33.6 Caution on Using On-Chip Debugger

- (1) Treatment of Devices Used for Debugging
Do not install a device that was used for debugging on a mass-produced product, because the flash memory was rewritten during system debugging and thus the number of write/erase count of flash memory cannot be guaranteed.
- (2) This product does not support hot plug out for power off (including removal of the connector) of the debug tool during debug mode. Do not turn off the power of the NEXUS tool (including removal of the connector) in debug mode.
- (3) When ending on-chip debugging, set the $\overline{\text{TRST}}$ pin and external reset pin to the low level.
- (4) When a debugger is used, the program written to the microcomputer before preparation for communications between the OCD emulator and microcomputer is complete is executed from the reset vector. For this reason, take care to ensure that this does not lead to any operations which you do not expect or intend.
This communications preparation period depends on the host PC environment of the OCD emulator and the operating frequency of the microcomputer.

Section 34 Flash Memory

This product incorporates code flash memory and data flash memory.

34.1 Features

- Code flash memory capacity: 4 Mbytes of user area and 32 Kbytes of user boot area
- Data flash memory capacity: 64 Kbytes of data area
- Methods of programming
 - Programming through transfer by a dedicated flash-memory programmer via a serial interface communication (serial programming)
 - Programming of flash memory by a user program (self-programming)
- Support for security functions to protect against illicit tampering and illicit reading with data in flash memory
- Support for protection functions to protect against erroneous overwriting of the flash memory
- Support for the detection and correction of errors in the flash memory
- Support for the BGO (Back Ground Operation) function
 - Code flash memory can be read while data flash memory is being programmed
- Interrupts acceptable during self-programming
- The initial settings of this product can be configured in the extended area (option bytes) of flash memory.

34.2 Structure of Memory

Figure 34.1 shows code flash memory map.

The user area in the code flash memory of this product is divided into 8- and 32-Kbyte blocks, which can be erased individually. The user area can be used to hold the user program. The user boot area can be used to hold a non-rewritable boot program during user program operation, such as a boot program for rewriting code flash memory through a selected user interface.

Figure 34.1 Code Flash Memory Map (8 Kbytes × 8 + 32 Kbytes × 126 configuration)

The data area of the data flash memory in this product is divided into 64-byte blocks, with each being a unit for erasure. **Figure 34.2** shows data flash memory map.

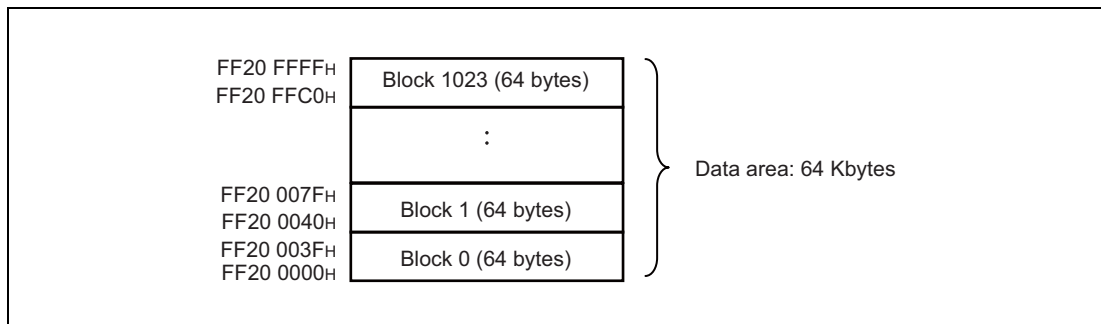

Figure 34.2 Data Flash Memory Map

34.3 Operating Modes Associated with Flash Memory

Figure 34.3 is a diagram of the mode transitions associated with the flash memory. For the procedures for setting the modes, refer to **Section 5, Operating Mode**.

Figure 34.3 Mode Transition Associated with Flash Memory

The flash memory areas which are programmable and erasable and the boot program after a reset depend on the selected mode. The differences between modes are indicated in **Table 34.1**.

Table 34.1 Differences between Modes

Item	Normal Operating Mode (User boot mode)*1	User Boot Mode	Serial Programming Mode
Programmable and erasable area	<ul style="list-style-type: none"> User area Data area 	<ul style="list-style-type: none"> User area Data area 	<ul style="list-style-type: none"> User area User boot area Data area
Boot program at a reset	Program in user area	Program in user boot area	Embedded program for serial programming

Note 1. See **Section 5 Operating Mode** for the details on each mode.

34.4 Functional Overview

By using a dedicated flash-memory programmer to program the flash memory of this device via a serial interface (serial programming), the device can be programmed regardless of whether this is before or after it is mounted on the target system.

Furthermore, security functions to prohibit updating of the user program written in the on-chip flash memory are incorporated, and this can prevent tampering by third parties.

Programming by the user program (self-programming) is suited for applications where the target system program may require updating after the production or shipment. Protection features for the safe rewriting of the flash memory area are also incorporated. Furthermore, interrupt processing during self-programming is supported, so programming can proceed at the same time as interrupt processing on an external communication control, etc., and this allows programming under various conditions.

Table 34.2 gives an overview of the methods of programming and the corresponding operating modes.

Table 34.2 Programming Methods

Programming Method	Functional Overview	Operating Mode
Serial programming	<p>A dedicated flash-memory programmer is capable of on-board programming the flash memory after the device is mounted on the target system.</p> <p>A dedicated flash memory programmer and dedicated programming adapter board allow off-board programming of the flash memory, i.e. programming of the device before it is mounted on the target system.</p>	Serial programming mode
Self-programming	<p>The user program that is written to code flash memory in advance by serial programming executing also allows updating the flash memory.</p> <p>The background operation capability makes it possible to fetch instructions or otherwise read data in code flash memory while the data flash memory is being programmed. For this reason, it is possible to update the data flash memory by executing a program written to the code flash memory.</p> <p>Instructions in the code flash memory cannot be fetched and data cannot be read while the code flash memory is being updated by self-programming. In such cases, a program for updating must be transferred to the local RAM or the global RAM in advance and executed.</p>	Normal operating mode, user boot mode

When executing self-programming, see the *RH850/E1x-FCC2 Flash Memory User's Manual: Hardware Interface* which this product targets.

Table 34.3 lists the functions of the on-chip flash memory. Dedicated flash memory programmer commands realize serial programming, while reading of the on-chip flash memory by interface operation of flash memory or the user program realizes self-programming.

Table 34.3 Basic Functions at a Glance

Function	Description in Overview	Level of Support (√: Supported, Δ: Conditionally Supported, ×: Not Supported)	
		Serial programming	Self-programming
Blank checking	This is used to check a specified block to ensure that writing to it has not already proceeded. Results of reading from code flash memory and data flash memory to which nothing has been written after erasure are not guaranteed, so use blank checking to confirm that writing to memory has not proceeded after erasure.	√	√
Block erasure	This is for erasing the contents of a specified block of memory.	√	√
Programming	This is for writing to a specified address.	√	√
Verification and checksum	Data that are read out from flash memory are compared with data transferred from the flash memory programmer.	√	√
Reading	Data that have been written to the flash memory are read out.	√	√
Setting for OTP (one-time programming)	A specified block of code flash memory is set for OTP (OTP can only be set, that is, it is not possible to release a block's OTP setting).	√	√
Setting an ID	An ID setting is made for use in controlling the connection of a dedicated flash memory programmer for serial programming, and programming of the code flash memory by self-programming.	√	√
Security settings	Security settings are for use in serial programming.	√	Δ (only when setting is prohibited after being permitted)
Protection settings	Lock bits for all blocks of code flash memory are provided.	√	√
Setting of option bytes	Option bytes are set to change them from the initial values for this product.	√	√
Clearing the configuration	ID setting, security settings, protection settings, and option byte settings are initialized.	√	×

For details on serial programming, refer to the *PG-FP5 Flash Memory Programmer User's Manual* and *Renesas Flash Programmer Flash Programming Software User's Manual*.

For details on self-programming, refer to the *RH850/E1x-FCC2 Flash Memory User's Manual: Hardware Interface* which this product targets.

The on-chip flash memory supports various security functions.

The OTP setting and authentication of the ID code are security functions for use with serial programming and self-programming.

In serial programming, authentication of the ID code, prohibiting connection of a dedicated flash memory programmer, and prohibition of commands (for block erasure, programming, and reading) are available for use as security functions.

Table 34.4 lists security functions that are supported by the on-chip flash memory and **Table 34.5** lists security setting operations.

Table 34.4 Summary of Security Functions

Function	Description
OTP	OTP can be individually set for each block of the user area and the user boot area of code flash memory. When the OTP setting is made for an area, programming by serial programming and by self programming is prohibited. Once set, the OTP setting cannot be released. Furthermore, since execution of the configuration clearing command is prohibited for any area for which OTP has been set, changing a security setting from "prohibited" to "permitted" is not possible.
ID authentication	The result of ID authentication can be used to control the connection of a dedicated flash memory programmer for serial programming. The result of ID authentication can also be used to control enabling of code flash memory writing by self-programming.
Prohibition of connection of a dedicated flash memory programmer	The connection of a dedicated flash memory programmer for serial programming is prohibited. Since execution of the configuration clearing command is also prohibited when the connection of a dedicated Flash Memory programmer is prohibited, changing a security setting from "prohibited" to "permitted" is not possible.
Prohibition of block erasure commands	Block erasure commands at the time of serial programming are prohibited. Since execution of the configuration clearing command is also prohibited when block erasure commands are prohibited, changing a security setting from "prohibited" to "permitted" is not possible.
Prohibition of programming commands	Block erasure commands and programming commands at the time of serial programming are prohibited. Block erasure commands can only be executed by erasing all user areas in the following order starting from block 0: erasure of all areas → erasure of user boot area → erasure of data areas starting from block 0. The prohibition setting can only be initialized by issuing the configuration clearing command.
Prohibition of read commands	Read commands at the time of serial programming are prohibited. Only through execution of the configuration clearing command can the prohibition be lifted.

Table 34.5 Available Operations and Security Settings

All Security Settings and Erasure, Programming, and Read Operations (√: Executable, ×: Not Executable, —: Not Supported)			Point for Caution Regarding the Security Setting	
Function	Serial programming	Self programming	Serial programming	Self programming
OTP	<ul style="list-style-type: none"> Areas for which OTP is set <ul style="list-style-type: none"> Block erasure commands: × Programming commands: × Read commands: √ Areas for which OTP is not set <ul style="list-style-type: none"> Block erasure commands: √ Programming commands: √ Read commands: √ 	<ul style="list-style-type: none"> Areas for which OTP is set <ul style="list-style-type: none"> Block erasure: × Programming: × Reading: √ Areas for which OTP is not set <ul style="list-style-type: none"> Block erasure: √ Programming: √ Reading: √ 	<ul style="list-style-type: none"> The OTP setting cannot be released. Execution of the configuration clearing command is not possible. 	The OTP setting cannot be released.
ID authentication	<ul style="list-style-type: none"> When the ID codes do not match <ul style="list-style-type: none"> Block erasure commands: × Programming commands: × Read commands: × When the ID codes match <ul style="list-style-type: none"> Block erasure commands: √ Programming commands: √ Read commands: √ 	<ul style="list-style-type: none"> When the ID codes do not match <ul style="list-style-type: none"> Code flash memory <ul style="list-style-type: none"> Block erasure: × Programming: × Reading: √ Data flash memory <ul style="list-style-type: none"> Block erasure: √ Programming: √ Reading: √ When the ID codes match <ul style="list-style-type: none"> Block erasure: √ Programming: √ Reading: √ 	<ul style="list-style-type: none"> The configuration clearing command can initialize the setting for prohibition. The setting for prohibition of block erasure commands is not available. The setting for prohibition of programming commands is not available. The setting for prohibition of read commands is not available. 	ID authentication is always in effect.
Prohibition of the connection of a dedicated flash memory programmer	<ul style="list-style-type: none"> Block erasure commands: × Programming commands: × Read commands: × 	<ul style="list-style-type: none"> Block erasure: √ Programming: √ Reading: √ 	Since execution of the configuration clearing command is prohibited, initialization of the setting for prohibition is not possible.	Initialization of the settings prohibited because the configuration clearing command is not supported.
Prohibition of block erasure commands	<ul style="list-style-type: none"> Block erasure commands: × Programming commands: √ Read commands: √ 	<ul style="list-style-type: none"> Block erasure: √ Programming: √ Reading: √ 	<ul style="list-style-type: none"> Since execution of the configuration clearing command is prohibited, initialization of the setting for prohibition is not possible. The setting for ID authentication to be effective for serial programming is not available. 	Initialization of the settings prohibited is impossible because the configuration clearing command is not supported.
Prohibition of programming commands	<ul style="list-style-type: none"> Block erasure commands: ×*1 Programming commands: × Read commands: √ 	<ul style="list-style-type: none"> Block erasure: √ Programming: √ Reading: √ 	<ul style="list-style-type: none"> Executing the configuration clearing command only can initialize the settings prohibited. The setting for ID authentication to be effective for serial programming is not available. 	Initialization of the settings prohibited is impossible because the configuration clearing command is not supported.
Prohibition of read commands	<ul style="list-style-type: none"> Block erasure commands: √ Programming commands: √ Read commands: × 	<ul style="list-style-type: none"> Block erasure: √ Programming: √ Reading: √ 	<ul style="list-style-type: none"> The setting for ID authentication to be effective for serial programming is not available. 	

Note 1. Block erasure commands can only be executed by erasing all user areas in the following order starting from block 0: erasure of all areas → erasure of user boot area → erasure of data areas starting from block 0. The prohibition setting can only be initialized by issuing the configuration clearing command.

The on-chip flash memory supports various security functions. **Table 34.6** lists protection functions that are supported by the on-chip flash memory.

Table 34.6 Summary of Protection Functions

Function	Description
Block protection	Lock bit settings can be individually made to enable or disable programming/erasure of each block of the user area of code flash memory. Programming and erasure by self programming of an area for which the lock bit is set and the lock bit function is enabled are prohibited. Programming or erasure can proceed again when the lock bit function is disabled after having been enabled. When a block of code flash memory is erased, the lock bit for that block is also erased.
User boot protection	Programming or erasure of the user boot area by self programming is prohibited. Programming or erasure of the user boot area by serial programming is available.

34.5 Serial Programming

A dedicated flash memory programmer can be used to program the flash memory in serial programming mode.

Serial Programming

The microcontroller is mounted on the system board at the time of serial programming. Providing a connector to the board enables programming of the target microcontroller by the flash memory programmer to proceed.

34.5.1 Environments for Programming

The recommended environments for programming the flash memory of the microcontroller with data are described below.

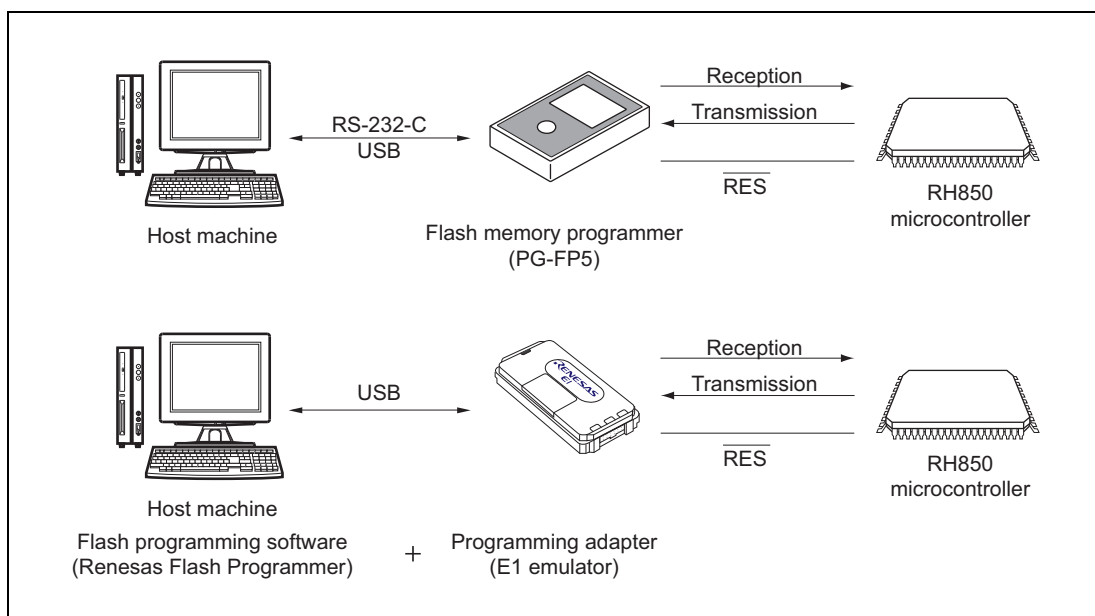

Figure 34.4 Environments for Programming Flash Memory

By using the PG-FP5 flash memory programmer or the combination of the Renesas Flash Programmer (software for writing to flash memory) running on the host machine and the E1 emulator as an programming adapter, the user is easily able to erase, program, and verify the contents of the on-chip memory of flash-memory-equipped microcontrollers from Renesas Electronics.

The PG-FP5 flash memory programmer handles programming from a host machine or programming in stand-alone mode while the Renesas Flash Programmer only handles programming from a host machine.

NOTE

For details on the PG-FP5, see the *PG-FP5 Flash Memory Programmer User's Manual*. For details on the Renesas Flash Programmer of flash programming software, see the *Renesas Flash Programmer Flash Programming Software User's Manual*.

34.6 Selection of the Communication Method

With this product, 2-wire UART connection or CSI (Clocked Serial Interface) connection is selectable as a method of serial communications by the level on the FLMODE pin. For details of the FLMODE pin setting, see **Section 5, Operating Mode**. For setting of programming environment in line with each communication method, see the *PG-FP5 Flash Memory Programmer User's Manual* and *Renesas Flash Programmer Flash Programming Software User's Manual*.

34.7 Self-Programming

34.7.1 Overview

This product supports programming of the flash memory by user program itself. The code flash and data flash memory can be programmed by using the commands of flash memory application command interface (FACI) for flash memory programming in user’s applications. Therefore, update of the user program and programming of constant data fields can be possible.

When the data flash memory is programmed, the background operation facility makes it possible to execute a programming program from the code flash memory to program the data flash memory. Furthermore, the programming program can be copied to the local RAM or the global RAM in advance and executed to program the data flash memory.

For comprehensive information on flash self-programming, see the *RH850/E1x-FCC2 Flash Memory User’s Manual: Hardware Interface* which this product targets.

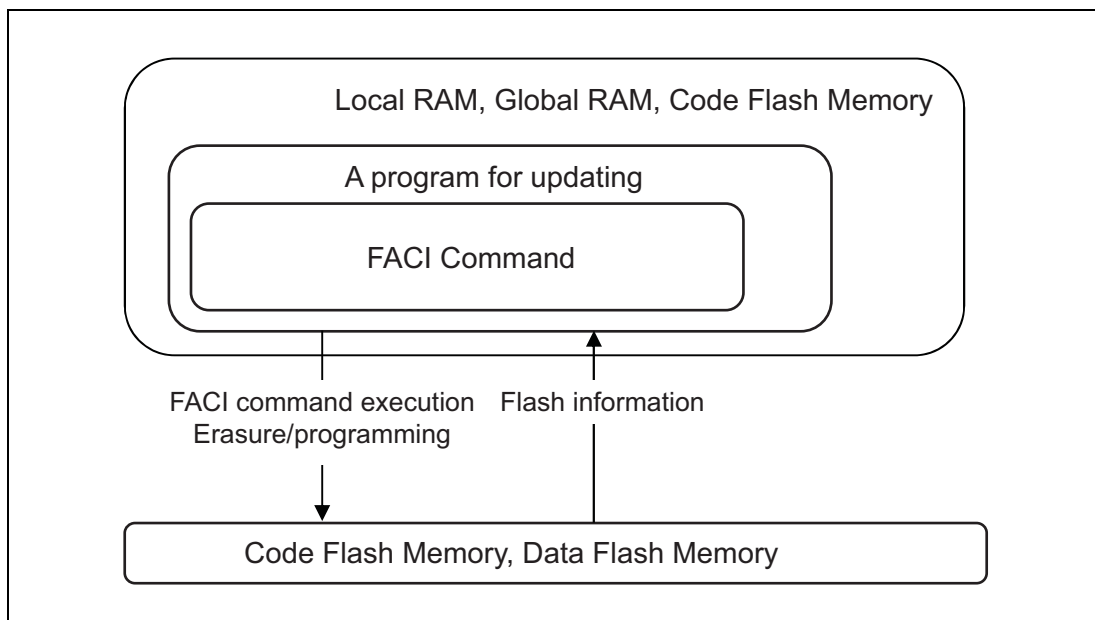

Figure 34.5 Concept of Self-Programming

34.7.2 Background Operation

Background operations can be used when the combination of the flash memory for writing and the flash memory for reading is any of those listed below.

Table 34.7 Conditions under which Background Operation is Usable

Range for Writing	Range for Reading
Data flash memory	Code flash memory

34.8 Reading Flash Memory

34.8.1 Reading Code Flash Memory

Special settings are not required to read code flash memory in normal mode and user boot mode. Data can simply be read out through access to addresses in the code flash memory.

Reading from an area of code flash memory that has been erased but not yet been programmed again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception. Furthermore, since the values of data cannot be guaranteed when an ECC error has been generated, use blank checking when you need to confirm that an area is in the non-programmed state. See **Section 30, Safety** for the details on ECC.

34.8.2 Reading Data Flash Memory

Configure the number of read cycles in the FRDCYCLD register prior to reading data from data flash memory in normal mode and user boot mode. Once this register is properly configured, data can be read by simply accessing addresses in the data flash memory. Once the setting for the number of cycles is made, data can simply be read out through access to addresses in the data flash memory.

Values read from data flash memory that has been erased but not yet been programming again are undefined. Use blank checking when you need to confirm that an area is in the non-programmed state.

34.9 Description of Registers

34.9.1 Registers Related to Data Flash Memory

Table 34.8 shows the list of registers related to data flash memory.

Table 34.8 List of Registers Related to Data Flash Memory

Register Name	Abbreviation	R/W	Value after rest	Address	Access Size
Data flash memory read cycle setting register	FRDCYCLD	R/W	0F _H	FFC5 9810 _H	8

34.9.1.1 FRDCYCLD — Data Flash Memory Read Cycle Setting Register

Access: This register can be read/written in 8-bit units.

Address: FFC5 9810_H

Value after reset: 0F_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	FRDCYCLD[3:0]			
Value after reset	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 34.9 FRDCYCLD Register Contents

Bit Position	Bit Name	Function
7 to 4	—	Reserved
3 to 0	FRDCYCLD[3:0]	Number of Data Flash Memory Read Cycles Data flash memory is read in setting value + 1 cycles. 00 _H to 02 _H : Setting prohibited 03 _H : Read cycle 4 04 _H : Read cycle 5 05 _H : Read cycle 6 06 _H : Read cycle 7 07 _H : Read cycle 8 08 _H : Read cycle 9 09 _H to 0F _H : Read cycle 10

34.9.2 Registers Related to Write and Erase Protection of Flash Memory

Table 34.10 shows the list of registers related to write and erase protection of flash memory.

Table 34.10 Registers Related to Write and Erase Protection of Flash Memory

Register Name	Abbreviation	R/W	Value after Reset	Address	Access Size
FHVE15 control register	FHVE15	R/W	0000 0000 _H	FFF8 A430 _H	32
FHVE3 control register	FHVE3	R/W	0000 0000 _H	FFF8 2410 _H	32

34.9.2.1 FHVE15 — FHVE15 Control Register

FHVE15 is a readable/writable register for software protection of flash memory against programming and erasure. Set both the FHVE15 and FHVE3 registers in the programmable and erasable state (0000 0001_H) to program or erase flash memory.

Access: This register can be read/written in 32-bit units.

Address: FFF8 A430_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 1	—	Reserved
0	FHVE15CNT	0: Programming and erasure are disabled. 1: Programming and erasure are enabled.

34.9.2.2 FHVE3 — FHVE3 Control Register

FHVE3 is a readable/writable register for software protection of flash memory against programming and erasure. Set both FHVE15 and FHVE3 in the programmable and erasable state (0000 0001_H) to program or erase flash memory.

Access: This register can be read/written in 32-bit units.

Address: FFF8 2410_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Note 1. This is the value indicated in **Table 34.14, Relationship between Product Model Name and Initial Value (Value after Reset) of PRDNAME.**

Table 34.15 List of Registers Related to Product Information

Bit Position	Bit Name	Function
31 to 0	PRDNAME _n [31:0]	Product name: Indicate product model names by using 16-byte ASCII code. PRDNAME1[31:0]: Fourth to first bytes of product model name PRDNAME2[31:0]: Eighth to fifth bytes of product model name PRDNAME3[31:0]: Twelfth to ninth bytes of the product model name PRDNAME4[31:0]: Sixteenth to thirteenth bytes of the product model name

34.10 Option Bytes

The flash memory has the extended area (option bytes) to store data specified by the user for various purposes. Changes in settings such as initial setting of peripheral functions using option bytes become effective after release from the reset state. **Table 34.16** shows option byte setting area. Reserved area is always read as 1. When writing, always write 1. For setting and reading option bytes, see the *PG-FP5 Flash Memory Programmer User's Manual* and *Renesas Flash Programmer Flash Programming Software User's Manual*, or the *RH850/E1x-FCC2 Flash Memory User's Manual: Hardware Interface*.

Table 34.16 Setting Area of Option Bytes

Option Byte Area (each 8 bits × 32 = Total 256 bits)	Setting Effective Area	Initial State of Shipped Product*1
Option bytes 4 to 1 (OPBT0)	Enable	7FFF FFFE _H
Option bytes 8 to 5 (OPBT1)	Reserved	FFFF FFFF _H
Option bytes 12 to 9 (OPBT2)	Enable	FFFF FFFF _H
Option bytes 16 to 13 (OPBT3)	Enable	7FFF FFFF _H
Option bytes 20 to 17 (OPBT4)	Reserved	FFFF FFFF _H
Option bytes 24 to 21 (OPBT5)	Enable	7FFF FFFF _H
Option bytes 28 to 25 (OPBT6)	Enable	FFFF FFFF _H
Option bytes 32 to 29 (OPBT7)	Reserved	FFFF FFFF _H

Note 1. This is the initial value of the shipped product. The value can be modified by setting the option bytes.

34.10.1 OPBT0 — Option Byte 4 to 1 Bit Arrangement

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

34.11 Usage Notes

(1) Reading areas where programming or erasure was interrupted

When programming or erasure of an area of flash memory is interrupted, the data stored in the area become undefined. To avoid undefined data that are read out becoming the source of faulty operation, take care not to fetch instructions or read data from areas where programming or erasure was interrupted.

(2) Reading the code flash memory that has been erased but not yet been programming again

Note that reading from an area of code flash memory that has been erased but not yet been programming again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception. Use blank checking when you need to confirm that an area is in the non-programmed state.

(3) Prohibition of additional writing

Writing to a given area twice is not possible. If you want to overwrite data in an area of flash memory after writing to the area has been completed, erase the area first.

(4) Resets during programming and erasure

In the case of an external reset during programming and erasure, wait for at least min width of reset pulse once the operating voltage is within the range stipulated in the electrical characteristics after assertion of the reset signal before releasing the device from the reset state.

(5) Allocation of vectors for interrupts and other exceptions during programming and erasure

When the FCUFAREA register is used to select the FCU firmware storage area for generation of an interrupt or other exception during transfer of FCU firmware or during programming or erasure of code flash memory, mask the interrupt or other exception beforehand or allocate the interrupt handler address table* and exception handlers to a space from which instructions can be fetched other than code flash memory.

* This applies to cases where the table reference method is used as the method of selection for the addresses of interrupt handlers.

For details, see the *RH850G3MH User's Manual: Software*.

(6) Abnormal termination of programming and erasure

Even if programming/erasure ends abnormally due to the generation of an external reset or power cutoff, the programming or erasure state of the flash memory with undefined data cannot be verified or checked. For the area where programming or erasure ends abnormally, the blank check function cannot judge whether the area is erased successfully or not. Erase the area again to prove that the corresponding area is completely erased before using.

If programming and erasure of code flash memory are not completed normally, the lock bit for the target area may be enabled (locked). In such cases, erase the block to erase the lock bit while the lock bit is in the disabled state (the area is not locked).

(7) Items prohibited during programming, erasure, and blank checking

Do not perform the following operations during programming, erasure, and blank checking.

- Have the operating voltage from the power supply go beyond the allowed range.
- Update the values of FHVE15 and FHVE3.
- Change the operating frequency of peripheral clock.

(8) Flash memory commands prohibited before completion of clock gear-up sequence

Various commands during serial programming and self-programming must be executed after clock gear-up sequence is complete. For details of clock gear-up sequence, see **Section 11, Clock Controller**.

(9) Securing coherency of instruction cache and data buffer

After the code flash memory is programmed or erased, a reset or instruction cache and data buffer clearing are required to secure coherency of the instruction cache and data buffer. For details of instruction cache and data buffer, see **Section 3, CPU System**.

Section 35 Security

To protect the code flash memory, data flash memory, and ID codes, this product has the functions described in **Section 34, Flash Memory**, and functions to restrict connection of the debug interface, which are described in this section.

For detailed descriptions of the security functions in serial programming mode and how to program the flash memory, see **Section 34, Flash Memory**.

In this section, the interfaces that may be used in on-chip debugging (the Nexus and 4-pin LPD) are referred to as “debug interfaces”. In addition, ID authentication to protect the code flash memory, data flash memory, and ID codes in user boot mode is referred to as “self ID authentication”, and ID authentication to protect against access through the on-chip debug functions is referred to as “OCD ID authentication”.

The data length of each ID code during self ID and OCD ID authentication as well as the ID code in the ID authentication stage of serial programming is 128 bits. In the initial state of the product at shipment, the ID codes are FFFF_FFFF_FFFF_FFFF_FFFF_FFFF_FFFF_FFFF_H.

35.1 Features

35.1.1 Protection of Code Flash Memory, Data Flash Memory, and ID Codes

This product includes the following security functions in user boot mode and serial programming mode to prevent any leaking of the user program programmed in the code flash memory.

35.1.1.1 Functions Unique to User Boot Mode

Self ID authentication protects against programming and erasure of code flash memory and reading of ID code.

(1) Security States

This mode has two security states, protection locked and protection unlocked. Transition between these two states can be made by changing self ID authentication and the ID codes.

1. Protection unlocked
Security functions have been unlocked by self ID authentication so that protection against programming and erasure of code flash memory and reading of ID codes is not applied.
2. Protection locked
Security functions have been enabled by self ID authentication and protection against programming and erasure of code flash memory and ID code reading is applied.

35.1.1.2 Functions Unique to Serial Programming Mode

Three functions are provided as security functions unique to serial programming mode: ID authentication, prohibition of programming, erasure, and read commands, and prohibition of serial programmer connection. Parallel use of these functions is not allowed.

(1) ID Authentication

ID codes are checked for authenticity to protect the code flash memory and data flash memory. Programming, erasure, and reading of the code flash and data flash memory can proceed upon successful ID authentication.

(2) Prohibition of Programming, Erasure, and Read Commands

Issuing of programming, erasure, and read commands can be enabled or disabled individually for the code flash memory and data flash memory. All commands are prohibited for both areas in the initial state of the product as shipped.

(3) Prohibition of Serial Programmer Connection

Issuing commands for programming, erasure, or reading to the code flash memory and data flash memory can be disabled in serial programming mode. Transitions to other functions are not possible once this state is set.

35.1.1.3 Common Function of User Boot Mode and Serial Programming Mode

(1) OTP (One Time Programming)

Setting an area of the code flash memory as OTP protects it against any further programming and erasure. For details of the setting, see **Section 34, Flash Memory**.

35.1.2 Connection Restriction Function of Debug Interface

This product is provided with unauthorized access protection via debug interfaces and two security levels are available.

- Security level 1:
Debug interfaces can be used. At this level, the on-chip debugging function is protected by OCD ID authentication. For OCD to be used, it must be unlocked by using OCD ID authentication.
- Security level 2:
At this level, the debug interfaces cannot be used.

As described above, restrictions on the connection of code flash and data flash memory, ID code protection, and availability of the debug interfaces differ according to the mode. **Table 35.1** summarizes security functions in each mode.

Table 35.1 Security Functions in Each Mode

Operation Mode	Code Flash, Data Flash, and ID Code Protection	Restriction on Debug Interface Connection
User boot mode	<ul style="list-style-type: none"> • SELF ID authentication • OTP (parallel use possible) 	<ul style="list-style-type: none"> • Security level 1 (OCD ID authentication) • Security level 2 (Debug interface connection is prohibited)
Serial programming mode	<ul style="list-style-type: none"> • ID authentication • Programming commands, block erasure commands, and read commands are prohibited. • Connection of serial programmers is prohibited. (The above three cannot be used in parallel.) • OTP (parallel use possible) 	<ul style="list-style-type: none"> • No function (Debug interface connection is always prohibited.)

35.2 Security in User Boot Mode

35.2.1 SELF ID Authentication

To prevent leakage of the user program written to the code flash memory, this product has security functions to enable or disable the programming and erasure of code flash memory and the reading of ID codes. The setting of enabling or disabling of these functions can be switched through self ID authentication with the ID code the user has set as the expected value.

35.2.2 SELF ID Authentication and Security State

Table 35.2 and Figure 35.1 show the security state by self ID authentication and conditions for transition.

Table 35.2 Security Setting State

State	Self ID Authentication	Protection against Programming and Erasure of Code Flash and Reading of ID Codes
Protection unlocked	Unlocked	Not protected
Protection locked	Locked	Protected

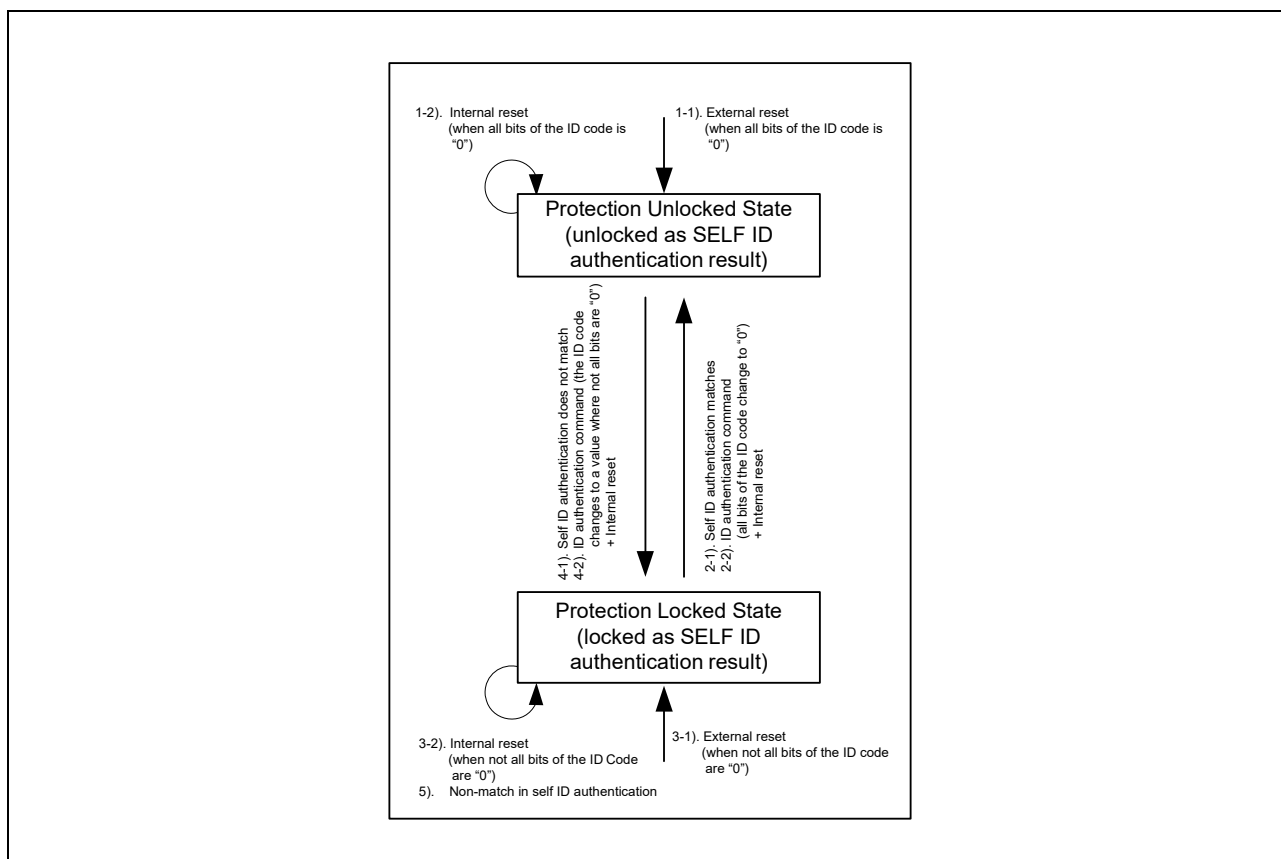

Figure 35.1 Security Setting State by SELF ID Authentication and Transition

The conditions for the transitions of security states shown in **Figure 35.1** are as follows.

- Conditions for Transitions to the Protection Unlocked State
 - 1). Startup when protection is unlocked
 - 1-1). When an external reset is applied while the ID code is all 0s, startup proceeds with protection unlocked.
 - 1-2). When an internal reset is applied without modification of the ID code while all bits of the ID code are 0, startup proceeds with protection in place.
 - 2). Transition from Protection Locked to Protection Unlocked
 - 2-1). A transition to the protection unlocked state follows a match in self ID authentication matches.
 - 2-2). When an internal reset is applied after changing the ID code has been changed from other than “all bits 0” to “all bits 0”, startup proceeds with protection unlocked.
- Conditions for Transitions to Protection Locked
 - 3). Startup with protection in place
 - 3-1). When an external reset is applied while the ID code is other than “all bits 0”, startup proceeds with protection in place.
 - 3-2). When an internal reset is applied without modification of the ID code while not all bits of the ID code are 0, startup proceeds with protection in place.
 - 4). Transition from protection unlocked to protection locked
 - 4-1). A transition to the protection locked state follows a non-match in self ID authentication.
 - 4-2). When an internal reset is applied after the ID code has been changed from other than “all bits 0” to “all bits 0”, startup proceeds with protection in place.
 - 5). To retain protection locked

Protection remains in place in case of a non-match in self ID authentication.

35.3 Security Functions in Serial Programming Mode

For details of security functions in serial programming mode, see **Section 34, Flash Memory**.

35.4 Restricting Connection with Debug Interfaces

This product is capable of restricting connection of the debug interfaces to protect against unauthorized access via the debug interfaces. This feature has two security levels.

- Security level 1: Restrict access to OCD functions by using OCD ID authentication
- Security level 2: Prohibit all connection to the debug interfaces

These security levels can be changed by bits 30 and 29 (OPJTAG1 and OPJTAG0) in option byte 2 in the extended area of the flash memory.

In this section, OPJTAG0 and OPJTAG1 are referred to as the OPJTAG bits.

35.4.1 Security Levels and State of Restricting the Connection of Debug Interfaces

Table 35.3 show each security level and the corresponding security states and Figure 35.2 shows the conditions for transitions.

Table 35.3 Security Levels and State of Restricting Connection to the Debug Interfaces

State	Result of OCD ID Authentication	OPJTAG Bit *1	Restriction on Debug Interface Connection
Security level 1	Unlocked	Other than 00 _B	No restriction on access via the debug interfaces
	Locked	Other than 00 _B	Restriction on access via the debug interfaces is in place.
Security level 2	—	00 _B	Connection to the debug interfaces is prohibited.

Note 1. For a detailed description of the OPJTAG bits, see Section 34, Flash Memory.

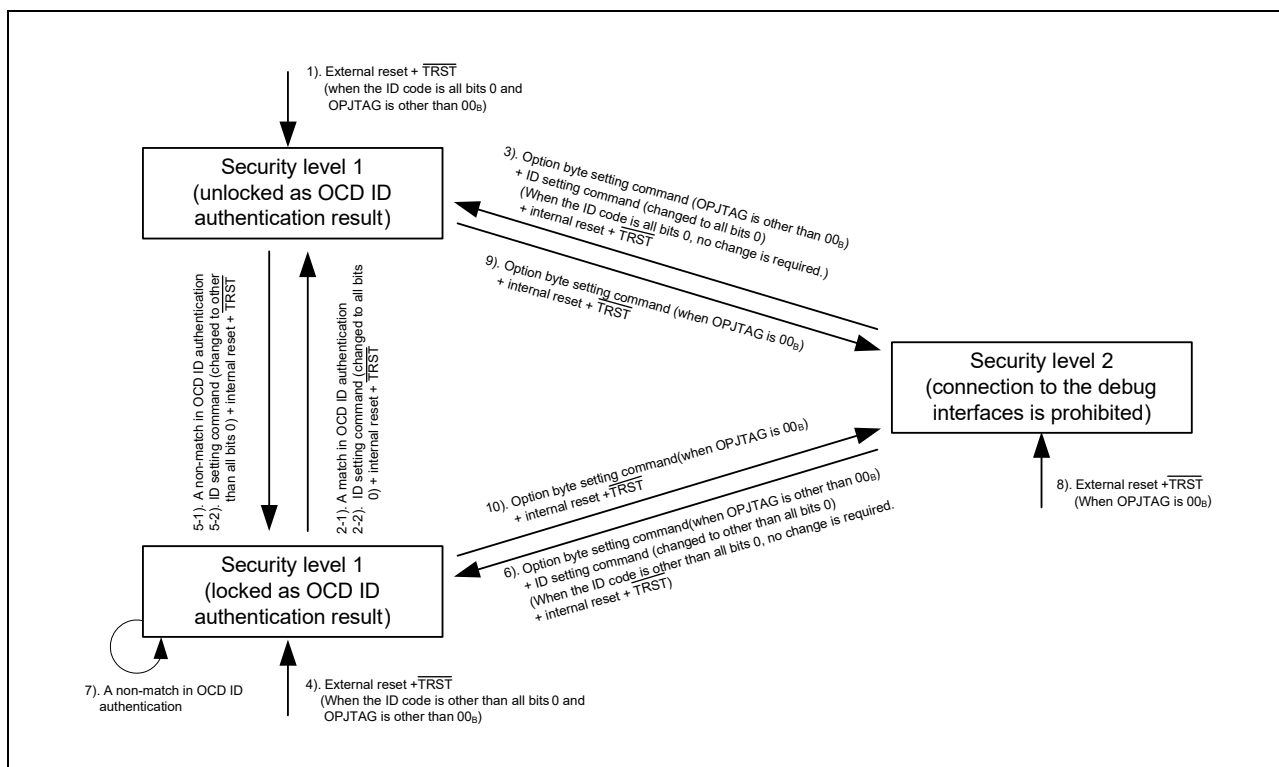

Figure 35.2 Transitions of Security Level

Conditions for transitions to each security level described in Table 35.3.

- Conditions for transitions to security level 1 (locked as OCD ID authentication result)
 - 1). Startup in the state of security level 1 (unlocked as OCD ID authentication result)

When an external reset and a reset by $\overline{\text{TRST}}$ are applied while the ID code is all 0s and while the value of the OPJTAG is other than 00_B, startup proceeds with security level 1 (unlocked as OCD ID authentication result).
 - 2). Transition from security level 1 (locked as OCD ID authentication result) to security level 1 (unlocked as OCD ID authentication result)
 - 2-1). Transition to security level 1 (unlocked as OCD ID authentication result) follows a match in OCD ID authentication.

- 2-2). When an internal reset or a reset by $\overline{\text{TRST}}$ is applied after changing the ID code to “all bits 0”, startup proceeds at security level 1 (unlocked as OCD ID authentication result).
- 3). Transition from security level 2 to security level 1 (unlocked as OCD ID authentication result)
When an internal reset or a reset by $\overline{\text{TRST}}$ is applied after changing the ID code to “all bits 0” and the value of the OPJTAG to other than 00_B, startup proceeds at security level 1 (unlocked as OCD ID authentication result).
- Conditions for Transitions to Security Level 1 (locked as OCD ID Authentication result)
 - 4). Startup in the state of security level 1 (locked as OCD ID authentication result)
When an external reset or a reset by $\overline{\text{TRST}}$ is applied while the ID code is “other than all bits 0” and the value of the OPJTAG is other than 00_B, startup proceeds at security level 1 (locked as OCD ID authentication result).
 - 5). Transition from security level 1 (unlocked as OCD ID authentication result) to security level 1 (locked as OCD ID authentication result)
 - 5-1). A transition to security level 1 (locked as OCD ID authentication result) follows a non-match in OCD ID authentication.
 - 5-2). When an internal reset or a reset by $\overline{\text{TRST}}$ is applied after changing the ID code to “other than all bits 0”, startup proceeds at security level 1 (locked as OCD ID authentication result).
 - 6). Transition from security level 2 to security level 1 (locked as OCD ID authentication result)
When an internal reset or a reset by $\overline{\text{TRST}}$ is applied after changing the ID code to “other than all bits 0” and the value of OPJTAG is other than 00_B, startup proceeds at security level 1 (locked as OCD ID authentication result).
 - 7). Retaining security level 1 (locked as OCD ID authentication result)
In case of a non-match in OCD ID authentication, security level 1 (failure in OCD ID authentication) remains in place.
 - Transition to security level 2
 - 8). Startup at security level 2
When an external reset or a reset by $\overline{\text{TRST}}$ is applied while the value of OPJTAG is 00_B, startup proceeds at security level 2.
 - 9). Transition from security level 1 (unlocked as OCD ID authentication result) to security level 2
When an internal reset or a reset by $\overline{\text{TRST}}$ is applied after changing the value of the OPJTAG to 00_B, startup proceeds at security level 2.
 - 10). Transition from security level 1 (locked as OCD ID authentication result) to security level 2
When an internal reset or a reset by $\overline{\text{TRST}}$ is applied after changing the value of the OPJTAG to 00_B, startup proceeds at security level 2.

Section 36 ICUS

For the ICUS (intelligent cryptographic unit (slave type), the separate document is provided.

Please contact our sales representatives for details.

Section 37 Secure Watchdog Timer (SWDT)

37.1 Functional Overview

The secure watchdog timer (SWDT) is a watchdog timer with extended functions for checking security.

To clear the counter of the SWDT, the CPU must execute the software allocated to a desired address specified in the code flash area (hereafter referred to as “secure software”).

This secure software checks for tampering with the code flash memory and the SWDT monitors for regular execution of the secure software to realize regular detection to identify tampering with the code flash memory.

Setting the range where the secure software is stored as one-time programming (OTP) can also prevent from tampering with the secure software itself.

37.1.1 Features of SWDT

- An SWDT is incorporated for each of the CPU cores (CPU1 and the PCU).
- When the counter overflows, an error request signal is output to the error control module (ECM). For details of the ECM, see **Section 31, Error Control Module (ECM)**.
- WDTACKI (250 [kHz]) is used as the clock for the counter. The overflow time can be set in the range from 2^9 to 2^{16} cycles (2 ms to 256 ms) (For WDTACKI, see **Section 11, Clock Controller**.)
- Operation after release from the reset state can be set by using an option byte. For details of the option bytes, see **Section 34, Flash Memory**.
- Execution of the secure software by the CPU is the condition for clearing of the counter. The secure software must be at an address range in the code flash area. For address specification, see **Section 37.3.1, Operation on Release from the Reset State**.

The table below shows the correspondence between the respective CPU cores and SWDTs.

Corresponding CPU Core	Name
CPU1	SWDT0
PCU	SWDT2

In this section, the individual channels of SWDT are identified by the index “n” (n = 0, 2).

SWDTn register addresses are given as offsets from the base addresses <SWDTn_base>.

Table 37.1 lists the base addresses <SWDTn_base>.

Table 37.1 Register Base Addresses <SWDTn_base>

SWDTn	SWDTn_base Address
SWDT0	FFED 3000 _H
SWDT2	FFED 5000 _H

SWDTn has the registers listed in **Table 37.2**.

Table 37.2 SWDTn Registers

Register Name	Symbol	Value after Reset	Address	Access Size
SWDT clear register	SWDTnCLR	00 _H	<SWDTn_base> + 00 _H	8
SWDT status register 0	SWDTnSTS0	00 _H	<SWDTn_base> + 04 _H	8
SWDT status register 1	SWDTnSTS1	00 _H	<SWDTn_base> + 08 _H	8
SWDT status clear register	SWDTnSTSC	00 _H	<SWDTn_base> + 0C _H	8
SWDT enable register	SWDTnWDTE	00 _H ^{*1}	<SWDTn_base> + 10 _H	8
SWDT mode register	SWDTnMD	70 _H ^{*2}	<SWDTn_base> + 14 _H	8

- Note 1. The SWDTnWDTE value after a reset depends on the setting of the option byte.
For details of SWDTnWDTE, see **Section 37.2.1, SWDTnWDTE — SWDT Enable Register**.
- Note 2. The SWDTnMD value after a reset depends on the setting of the option byte.
For details of SWDTnMD, see **Section 37.2.2, SWDTnMD — SWDT Mode Register**.

37.2 Description of Registers

37.2.1 SWDTnWDTE — SWDT Enable Register

The SWDTnWDTE register enables operation of SWDTn.

Access: This register can be read/written in 8-bit units.

Address: <SWDTn_base> + 10_H

Value after reset: The value depends on the option byte setting.

Bit	7	6	5	4	3	2	1	0
	SWDnRUN	—	—	—	—	—	—	—
Value after reset	SWDTn_ OPRUN	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R

Table 37.3 SWDTnWDTE Register Contents

Bit Position	Bit Name	Description
7	SWDnRUN	<p>This bit enables operation of SWDTn.</p> <p>The value of this bit after a reset is determined by an option byte (OPBTm[31]; m = 3, 5).</p> <p>In serial programming mode, this bit is set to 0 regardless of the setting of the option byte.</p> <p>For details of the option bytes, see Section 34, Flash Memory.</p> <p>Once this bit has been set to 1, it can only be cleared to 0 by a reset.</p> <p>Attempting to clear this bit by writing 0 to it has no effect.</p> <p>0: SWDTn operation is stopped.</p> <p>1: SWDTn operation is enabled.</p>

37.2.2 SWDTnMD — SWDT Mode Register

The SWDTnMD register is used to set the time until SWDTn overflows.

Writing to this register is only possible while operation is stopped (SWDnRUN = 0).

Writing to the register has no effect while operation is enabled (SWDnRUN = 1).

Access: This register can be read/written in 8-bit units.

Address: <SWDTn_base> + 14_H

Value after reset: The value depends on the option byte setting.

Bit	7	6	5	4	3	2	1	0
	—	SWDnOVF[2:0]			—	—	—	—
Value after reset	0	SWDTn_ OPWDOVF2	SWDTn_ OPWDOVF1	SWDTn_ OPWDOVF0	0	0	0	0
R/W	R	R/W	R/W	R/W	R	R	R	R

Table 37.4 SWDTnMD Register Contents

Bit Position	Bit Name	Description
6 to 4	SWDnOVF2-0	<p>These bits set the time until SWDTn overflows.</p> <p>The value of these bits after a reset depends on the setting of the option byte (OPBTm[30:28]; m = 3, 5).</p> <p>For details of the option bytes, see Section 34, Flash Memory.</p> <p>Settings of the overflow time in powers of two from 2⁹ to 2¹⁶ cycles of WDTACLK1, the counter clock for SWDTn, are available.</p> <p>000_B: Overflow in 2⁹ cycles 001_B: Overflow in 2¹⁰ cycles 010_B: Overflow in 2¹¹ cycles 011_B: Overflow in 2¹² cycles 100_B: Overflow in 2¹³ cycles 101_B: Overflow in 2¹⁴ cycles 110_B: Overflow in 2¹⁵ cycles 111_B: Overflow in 2¹⁶ cycles</p>

37.2.3 SWDTnCLR — SWDT Clear Register

The SWDTnCLR register is a trigger register for clearing the counter of SWDTn.

Writing to this register is only possible while the setting of the SWDnCLGF bit in the SWDTnSTS1 register is 1.

The read value is always 00_H.

Access: This register can be read/written in 8-bit units.

Address: <SWDTn_base> + 00_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	SWDnCLRT	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	W	R	R	R	R	R	R	R

Table 37.5 SWDTnCLR Register Contents

Bit Position	Bit Name	Description
7	SWDnCLRT	This is a trigger bit for clearing the counter of SWDTn. While operation is enabled (SWDnRUN = 1) and the SWDnCLGF bit of the SWDTnSTS1 register is set to 1, writing 1 to this bit leads to clearing of the counter of SWDTn. Writing 1 to this bit clears the counter of SWDTn. Writing 0 to it has no effect.

37.2.4 SWDTnSTS0 — SWDT Status Register 0

The SWDTnSTS0 register is a status register of SWDTn.

Access: This register can be read in 8-bit units.

Address: <SWDTn_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	SWDnCLSF	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 37.6 SWDTnSTS0 Register Contents

Bit Position	Bit Name	Description
4	SWDnCLSF	<p>This bit indicates the state of execution of clearing of the counter in SWDTn. This bit is set to 1 by writing 1 to the SWDnCLRT bit of the SWDTnCLR register while operation is enabled (SWDnRUN = 1), and its value remains 1 until clearing of the counter of SWDTn is completed.</p> <p>As long as the setting of this bit is 1, writing 1 to the SWDnCLRT bit of the SWDTnCLR register has no effect.</p> <p>Clearing of this bit to 0 indicates that clearing of the counter in SWDTn has been completed.</p> <p>When clearing the counter, be sure to confirm that this bit has been cleared to 0.</p> <p>0: Clearing of the counter is possible. 1: Clearing of the counter is in progress.</p>

37.2.5 SWDTnSTS1 — SWDT Status Register 1

The SWDTnSTS1 register is a status register of SWDTn.

Access: This register can be read in 8-bit units.

Address: <SWDTn_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	SWDnNMIF	SWDnSADF	SWDnCLGF	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 37.7 SWDTnSTS1 Register Contents

Bit Position	Bit Name	Description
6	SWDnNMIF	This flag indicates detection of an NMI. This flag is set to 1 on detection of input of an NMI while operation is enabled (SWDnRUN = 1). While SWDnSADF = 1, writing 1 to the SWDnSADCT bit of the SWDTnSTSC register leads to clearing of this flag. If the flag being set to 1 on detection of NMI input and clearing of the flag to 0 by writing 1 to the SWDnSADCT bit of the SWDTnSTSC register are in contention while operation is enabled (SWDnRUN = 1), the former is given priority. 0: Input of an NMI has not been detected. 1: Input of an NMI has been detected.
5	SWDnSADF	This is a flag indicating that execution of the secure software is being detected. This flag is set to 1 while execution of the secure software is being detected as long as operation is enabled (SWDnRUN = 1). While SWDnSADF = 1, writing 1 to the SWDnSADCT bit of the SWDTnSTSC register leads to clearing of this flag. 0: Execution of the secure software has not been detected. 1: Execution of the secure software has been detected.
4	SWDnCLGF	This is a flag indicating whether writing to the SWDTnCLR register is possible. This flag is set to 1 while execution of the secure software is being detected as long as operation is enabled (SWDnRUN = 1). Setting the SWDnNMIF bit to 1 or writing 1 to the SWDnCLGCT bit of the SWDTnSTSC register leads to clearing of this flag. If the flag being set to 1 on detection of the execution of the secure software and clearing of the flag to 0 when SWDnNMIF = 1 on detection of NMI input or by writing 1 to the SWDnCLGCT bit of the SWDTnSTSC register are in contention, the latter is given priority. 0: Writing to the SWDTnCLRT register has no effect. 1: Writing to the SWDTnCLRT register is valid.

37.2.6 SWDTnSTSC — SWDT Status Clear Register

SWDTnSTSC is a trigger register for clearing of the status register of SWDTn.

The read value is always 00_H.

Access: This register can be read/written in 8-bit units.

Address: <SWDTn_base> + 0C_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	SWDnSADCT	SWDnCLGCT	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	W	W	R	R	R	R

Table 37.8 SWDTnSTSC Register Contents

Bit Position	Bit Name	Description
5	SWDnSADCT	This is a trigger bit for clearing of the SWDnNMIF and SWDnSADF flags in the SWDTnSTS1 register. Writing 1 to this bit while SWDnSADF = 1 leads to clearing of the SWDnNMIF and SWDnSADF flags. Writing 0 to this bit has no effect.
4	SWDnCLGCT	This is a trigger bit for clearing of the SWDnCLGF flag in the SWDTnSTS1 register. Writing 1 to this bit leads to clearing of the SWDnCLGF flag. Writing 0 to this bit has no effect.

37.3 Operation

37.3.1 Operation on Release from the Reset State

By setting the bits of option bytes listed below for SWDTn, operation after release from the reset state can be selected.

For details of the option bytes, see **Section 34, Flash Memory**.

Option Byte	Target
OPBT3[31]	Value of the SWD0RUN bit of the SWDT0WDTE register after reset
OPBT3[30:28]	Value of the SWD0OVF[2:0] bit of the SWDT0MD register after reset
OPBT3[22:0]	Start address of the secure software for SWDT0
OPBT5[31]	Value of the SWD2RUN bit of the SWDT2WDTE register after reset
OPBT5[30:28]	Value of the SWD2OVF[2:0] bits of the SWDT2MD register after reset
OPBT5[22:0]	Start address of the secure software for SWDT2

Now, the method for detection of the execution of the secure software is described.

Execution of the secure software is detected by comparing the program counter (PC) value of the CPU and the secure software start address value set in the OPBTm[22:0] (m = 3, 5) bits of the option bytes with the value 0 appended as the higher-order 9 address bits.

This address range means that the only area to which the secure software can be allocated is the code flash area.

In addition, the address value which can be set with the option byte as the start address of the secure software must be even-numbered.

If an odd-numbered address is set, operation by SWDTn for detection of secure software execution is not guaranteed.

When the PC value matches the setting, SWDTn sets the SWDnSADF bit of the SWDTnSTS1 register to 1.

37.3.2 Counter Clearing by SWDTn

The figure below shows a flow of execution in counter clearing by SWDTn.

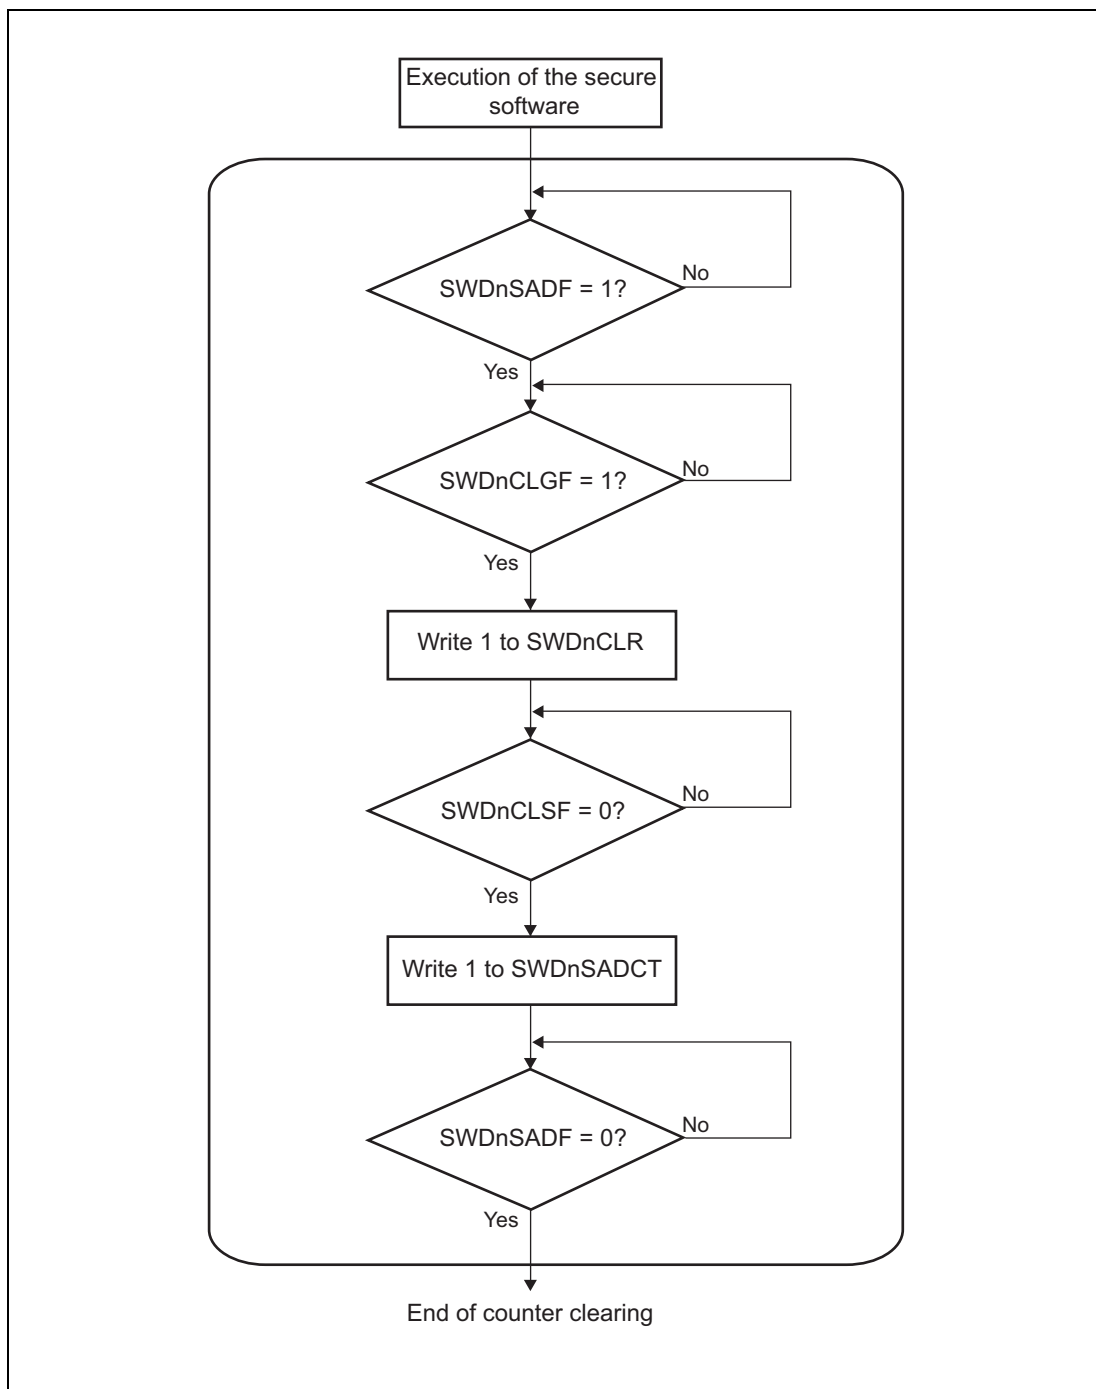

Figure 37.1 Flow of Counter Clearing by SWDT

CAUTION

If an NMI is detected while clearing of the counter is in progress, do this in accord with the NMI interrupt processing routine.

For details, of NMI interrupt processing, see Section 6, Interrupt.

Section 38 On-Chip RAM

38.1 List of On-Chip RAM

RH850/E1M-S2 includes the following RAMs.

- Local RAM (CPU1): 64 Kbytes
- Local RAM (PCU): 32 Kbytes
- Global RAM: 256 Kbytes (32 Kbytes of data is retained in power-off standby mode)
- Emulation RAM: 8 Kbytes (no RAM retention)

38.2 Features

Access:

The CPU1, PCU, DMAC, and H-BUS can access the local RAM (CPU1) and the global RAM.

The PCU also can access the local RAM (PCU).

The access latency from the CPU1 is the same as that of the local RAM (CPU1) and local RAM (self).

For details of address map and access, see **Section 4, Address Space**.

Emulation RAM (ERAM):

The specific area of the code flash can be replaced with this RAM in 8-Kbyte units. The access latency from the CPU after replacement is the same as that of the code flash.

RAM Retention:

32 Kbytes of data in the global RAM are retained in power-off standby mode.

ECC:

The local RAM (CPU1), local RAM (PCU), and global RAM include the ECC.

The local RAM (CPU1) and global RAM also include the address parity. For details, see **Section 30, Safety**.

38.3 RAM Data Retention

Simultaneous occurrence of write and reset in the RAM space that retains data does not damage RAM data in power-off standby mode.

38.4 Emulation RAM (ERAM)

38.4.1 About the ERAM

RH850/E1M-S2 products incorporate emulation RAM (ERAM) for the emulation of code flash memory. The ERAM can be overlaid on the code flash memory for use in the tuning of programs, etc. In RH850/E1M-S2 products, the code flash memory is in a two-bank configuration, and ERAM is allocated for each bank. Each ERAM has 8 KB (8 KB × 1 sub-block). The ERAM can be used in emulating the code flash memory as described below. Also, it is accessible by CPU1.

38.4.2 Code Flash Emulation using ERAM

The external debugger and calibration function unit (CFU) can be used to enable or disable mapping for each sub-block of the ERAM to the desired areas of the code flash area (up to 32 areas). Mapping ERAM to an area of the code flash memory replaces the flash memory with the RAM for emulating the code flash memory. Doing so allows dynamic changes to data in code flash memory during execution of the user program.

The code flash memory in the RH850/E1M-S2 is divided into two areas, bank A and bank B. The division of the overall capacity into banks A and B can be set by using an option byte (see **Section 34, Flash Memory**), so the setting can be changed to suit different applications. Two masters are able to separately and simultaneously access bank A and bank B, eliminating the need for a wait due to arbitration.

When the ERAM is used for emulation of the code flash, allocate ERAM sub-block 00 to the desired areas of banks A and B of the code flash memory.

Figure 38.1 shows the configuration of circuits around the ERAM.

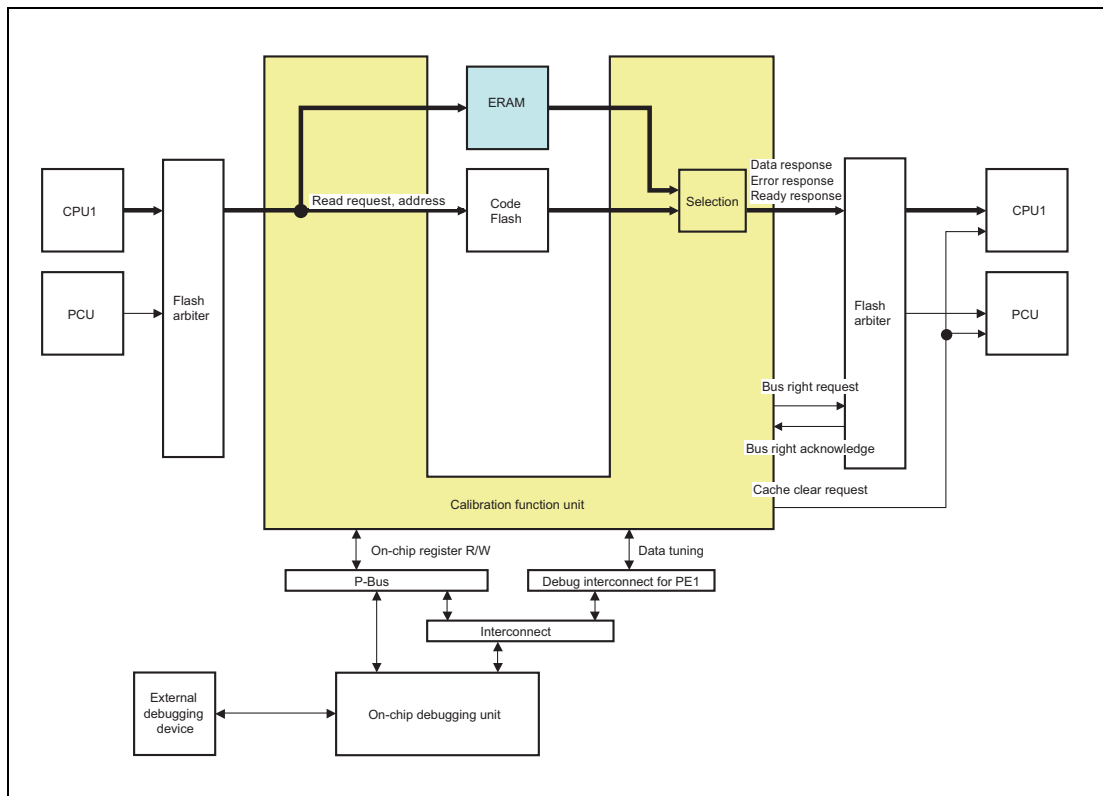

Figure 38.1 Circuit Configuration around the ERAM

38.4.3 Memory Map of ERAM

The memory map of the ERAM in this product is shown below.

Sub-block 00 of the ERAM has 8-Kbytes.

The ERAM area can only be read and written in 32-bit units.

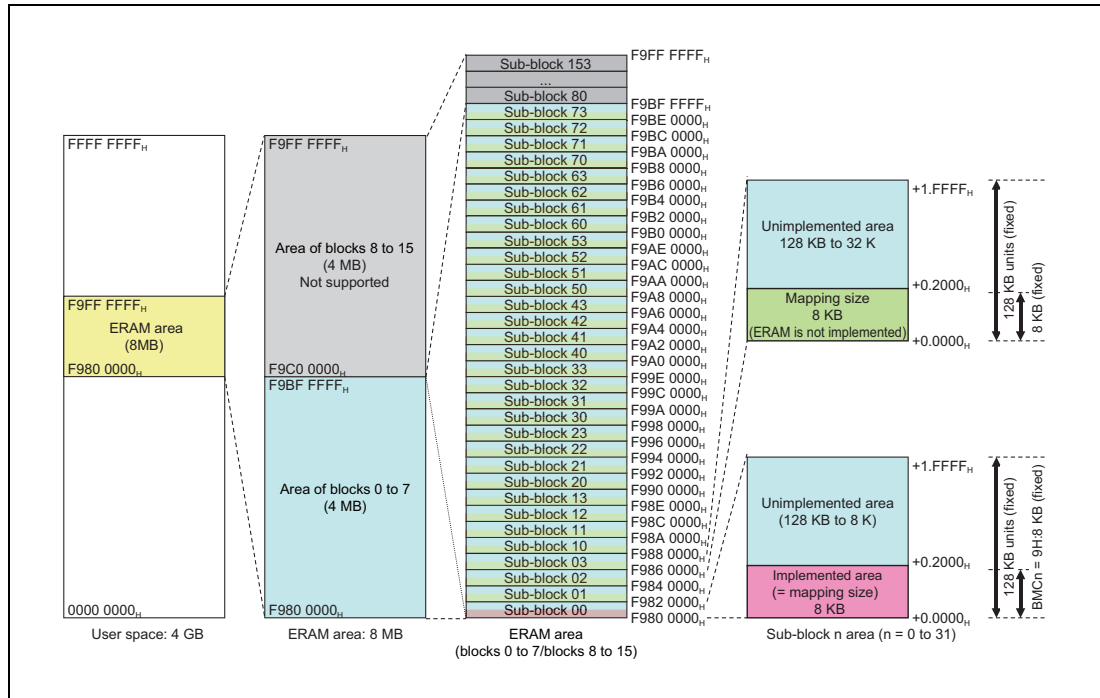

Figure 38.2 Memory Map of 8-MB ERAM

38.4.4 List of CFU Registers

The list below shows function registers that control operations of the calibration function unit (CFU).

The base address of the CFU is FFFF 7800_H.

Table 38.1 List of Function Registers

Address	Register Name	Function
<CFU_base>+08 _H	TM_CC	Cache clear operation register
<CFU_base>+10 _H	TM_ME	ERAM sub-blocks 0 mapping enable
<CFU_base>+14 _H	TM_MS	ERAM sub-blocks 0 mapping status
<CFU_base>+20 _H	TM_BNK	ERAM bank setting
<CFU_base>+24 _H	TM_ERR	ERAM bank setting error indication
<CFU_base>+28 _H	TM_FST	FLI mapping indication
<CFU_base>+30 _H	TM_BMC0	ERAM blocks 0 mapping size setting
<CFU_base>+40 _H	TM_MA00	ERAM sub-block 00 mapping address

38.4.5 TM_CC — Cache Clear Operation Register

The TM_CC register is used to issue requests for clearing of the unit (instruction cache or data buffer) that holds data from the code flash.

Access: This register can be read/written in 32-bit units.

Address: FFFF 7808_H

Value after reset 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 38.2 TM_CC Register Contents

Bit Position	Bit name	Functions
31 to 2	—	Reserved These bits are always read as 0. The write value should always be 0.
1	CCMK	Writing 1 to these bits masks cache clearing requests when the tuning memory mapping enable register TM_ME is updated. Cache clearing requests by writing 1 to the TM_CC.CCLR bit are not masked. 0: Cache clearing requests are not masked. 1: Cache clearing requests are masked.
0	CCLR	A cache clearing request is issued by writing 1 to this bit. Writing 0 has no effect. The value read is 1 if this bit is read before the response to a cache clearing request is completed and 0 after the response to a cache clearing request is completed.

CAUTION

- After 1 has been written to this bit, writing 1 to the bit is ignored if this is done before the response to the earlier cache clearing request is completed (the cache is not cleared in response to the latter request).
- After 1 has been written to this bit, if 0 is written before the response to the cache clearing request is completed, this will not cancel the response to the earlier request

0: A cache clearing request is not being processed or the response to a cache clearing request has been completed (when read).
1: A cache clearing request is issued (when written), or a cache clearing request is being processed (when read).

38.4.6 TM_ME — Tuning Memory Mapping Enable Register

This register is used to control mapping of ERAM sub-block 00 to the code flash area.

Access: This register can be read/written in 32-bit units.

Address: FFFF 7810_H

Value after reset 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TME00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 38.3 TM_ME Register Contents

Bit Position	Bit name	Functions
0	TME00	Tuning Memory Sub-Block mn Mapping Enable (m = 0; n = 0) These bits control mapping for the user space of ERAM sub-block mn (code flash area) (m = 0; n = 0). 0: Mapping is disabled. 1: Mapping is enabled.

- Note 1. When the mapping enable bit TMEn is updated (including writing of its current value again), the cache is cleared (m = 0; n = 0).
- Note 2. Before ERAM sub-block nm and tuning memory mapping address register nm (TM_MAnm register) are updated, the corresponding mapping enable bit TMEnm must be set to 0 (disabling mapping) (m = 0; n = 0).
- Note 3. After an update of the TM_ME register, wait and verify that the value in the TM_MS register has become the same as the setting of the TM_ME register.

38.4.7 TM_MS — Tuning Memory Mapping Status Register

This register indicates the state of mapping for ERAM sub-block 00 to the code flash area.

Access: This register can be read in 32-bit units.

Address: FFFF 7814_H

Value after reset 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 38.4 TM_MS Register Contents

Bit Position	Bit name	Functions
0	MES00	Tuning Memory Sub-Block mn Mapping Enable Status (m = 0; n = 0) These bits indicate the state of mapping for the user space of ERAM sub-block mn (code flash area) (m = 0; n = 0). 0: Mapping is disabled. 1: Mapping is enabled.

38.4.8 TM_BNK — Tuning Memory Mapping Bank Register

This register is used to set the bank of the code flash memory to which ERAM block 0 is mapped.

Access: This register can be read in 32-bit units.

Address: FFFF 7820_H

Value after reset 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 38.5 TM_BNK Register Contents

Bit Position	Bit name	Functions
31 to 2	—	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	BNK0[1:0]	Tuning Memory Bank 0 Setting These bits set the bank of the code flash area to which ERAM sub-block 00 is mapped. 0 _H : Bank A 1 _H : Bank B 2 _H : Setting prohibited 3 _H : Setting prohibited

CAUTION

Before the tuning memory mapping bank register (TM_BNK register) is updated, the corresponding mapping enable bit TMEn must be set to 0 (disabling mapping).

38.4.9 TM_ERR — Tuning Memory Mapping Error Register

This register indicates an error in the setting of mapping for ERAM sub-block 00 to the code flash area.

Access: This register can be read in 32-bit units.

Address: FFFF 7824_H

Value after reset 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	E00
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 38.6 TM_ERR Register Contents

Bit Position	Bit name	Functions
31 to 1	—	Reserved
0	E00	The value of this bit is 1 if the address setting in the tuning memory sub-block mapping error status TM_MA00 register is inconsistent with the state of bank assignment of ERAM sub-block 00 set in the TM_BNK register. Comparison proceeds at all times. 0: Consistent 1: Inconsistent

38.4.10 TM_FST — Tuning Memory Flash Bank Register

This register indicates the state of bank assignment of the code flash memory.

Access: This register can be read in 32-bit units.

Address: FFFF 7828_H

Value after reset 0000 00F0_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset *1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	FBM3	FBM2	FBM1	FBM0
Value after reset	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. This is the initial value of the shipped product. It reflects the setting of the option byte (OPBT6). For details, see **Section 34, Flash Memory**.

Table 38.7 TM_FST Register Contents

Bit Position	Bit name	Functions
31 to 4	—	Reserved
3	FBM3	Flash Bank Mapping Status 3 This bit indicates the state of bank assignment of the code flash (0030_0000 _H to 003F_FFFF _H). 0: Assigned to bank A. 1: Assigned to bank B.
2	FBM2	Flash Bank Mapping Status 2 This bit indicates the state of bank assignment of the code flash (0020_0000 _H to 002F_FFFF _H). 0: Assigned to bank A. 1: Assigned to bank B.
1	FBM1	Flash Bank Mapping Status 1 This bit indicates the state of bank assignment of the code flash (0010_0000 _H to 001F_FFFF _H). 0: Assigned to bank A. 1: Assigned to bank B.
0	FBM0	Flash Bank Mapping Status 0 This bit indicates the state of bank assignment of the code flash (0000_0000 _H to 000F_FFFF _H). 0: Assigned to bank A. 1: Assigned to bank B.

38.4.11 TM_BMC0 — Tuning Memory Bank Mapping Size Configuration Register 0

These registers are used to set the mapping size of sub-block 00 of the ERAM.

Access: This register can be read/written in 32-bit units.

Address: FFFF 7830_H

Value after reset 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	BMC00			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 38.8 TM_BMC0 Register Contents

Bit Position	Bit name	Functions
31 to 4	—	Reserved
3 to 0	BMC00	Sub-block 00 mapping size setting

The mapping size of each sub-block of the ERAM (sub-block 00) is set.

0 _H	Reserved (setting prohibited)	8 _H	Reserved (setting prohibited)
1 _H	Reserved (setting prohibited)	9 _H	8 Kbytes/sub-block
2 _H	Reserved (setting prohibited)	A _H	Reserved (setting prohibited)
3 _H	Reserved (setting prohibited)	B _H	Reserved (setting prohibited)
4 _H	Reserved (setting prohibited)	C _H	Reserved (setting prohibited)
5 _H	Reserved (setting prohibited)	D _H	Reserved (setting prohibited)
6 _H	Reserved (setting prohibited)	E _H	Reserved (setting prohibited)
7 _H	Reserved (setting prohibited)	F _H	Reserved (setting prohibited)

Only the following combinations of settings for mapping size are available.

ERAM Capacity	Sub-Block 00 Mapping Size Setting
8 Kbytes	9 _H (8 Kbytes/sub-block)
Setting of any combination other than the above prohibited	

Note: Before updating the tuning memory bank mapping size configuration register (TM_BMC0 register), be sure to set the corresponding mapping enable bit TME_mn to 0 (disabling mapping) (m = 0; n = 0).

38.4.12 TM_MA00 — Tuning Memory Mapping Address Register 00

These registers are used to set the address to which ERAM sub-block 00 is mapped.

Access: This register can be read/written in 32-bit units.

Address: FFFF 7840_H

Value after reset 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Bnk m[1:0]		TMAmn[29:16]													
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TMAmn[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 38.9 TM_MA00 Register Contents

Bit Position	Bit name	Functions
31, 30	Bnk m[1:0]	ERAM Bank m Setting Status (m = 0) These bits indicate the setting of bank m of the ERAM. These bits act as mirrors of the Bnkm bits of the TM_BNK register. Writing to these bits is prohibited.
29 to 0	TMAmn[29:0]	Tuning memory mapping address mn (m = 0; n = 0) These bits specify the address to which sub-block mn of the ERAM is mapped. Mapping is in units of 8 Kbytes per sub-block. CAUTION Values written to TMAmn29 to 23 and 12 to 0 are ignored.

CAUTIONS

1. The corresponding mapping enable bit TME_{mn} must be set to 0 (bank n is not mapped) before updating the tuning memory mapping address register n (TM_MA_{mn} registers: m = 0; n = 0).
2. Specify the address in the code flash area as the mapping address. Correct operation is not guaranteed if any other address is specified.

38.4.13 Flow of Processing for Tuning

The flow of processing for tuning is shown below.

(1)	Mapping initial setting handling
(1-1)	Set the size and address of sub-block 00 to be tuned* ¹ Tuning memory mapping bank register TM_BNK Tuning memory bank mapping size configuration register 0 (TM_BMC0) Tuning memory mapping address register 0 (TM_MA00)
(2)	Handling tuning data
(2-1)	Write data to the ERAM area for use in tuning.
(3)	Mapping the banks
(3-1)	Set the mapping enable bit TME00 for sub-block 00 for which tuning is complete to 1 (enabling mapping).
(3-2)	Read the mapping status bit MES00 to verify the completion of mapping settings.

Note 1. Set the corresponding mapping enable bit TME0 to 0 (disabling mapping) to update the register.

When data are tuned (programming of data in the ERAM area) in a mapped bank, the cache must be cleared after tuning of the data.

38.5 Usage Notes

- (1) When ECC error detection/correction is enabled for the local RAM and global RAM, initialize the RAM using a write instruction with the maximum bit length of its access size before using the RAM. For the maximum bit length of the RAM access size, see the applicable data width in **Section 30, Safety**.
If the RAM is accessed before its initialization, an ECC error may be detected. Also if initialization with the maximum bit length is not performed (e.g. if a 32-bit RAM is initialized by an 8-bit or 16-bit access), an ECC error may be detected.
- (2) Buffers are included for high-speed access between the following RAMs and the CPU.
 - Local RAM (PE1), Local RAM (PCU)

After a value has been written to an address, reading the value from the same address may lead to reading from the buffer instead of the RAM. Ways to make sure that values are being read from the RAM are as follows.

- For Local RAM (PE1)
 1. Only read the first byte to have been written after having written more than 32 bytes of data.
 2. Issue a SYNCM instruction between a write instruction and an instruction to read from the same address.
- For Local RAM (PCU)
 1. Only read the first byte to have been written after having written more than 4 bytes of data.
 2. Issue at least one instruction which is not accompanied by access to memory (an NOP instruction, SYNCM instruction, etc.) between a write instruction and an instruction to read from the same address.

Section 39 Boundary Scan

This LSI has the JTAG interface and provides the boundary scan function conforming to the IEEE1149.1 standard.

39.1 Features

- Five test signals (TCK, TDI, TDO, TMS, and $\overline{\text{TRST}}$)
- TAP controller
- Instruction register
- Bypass register
- Boundary scan register

The JTAG interface has six commands.

- BYPASS mode
Test mode conforming to the IEEE 1149.1
- EXTEST mode
Test mode conforming to the IEEE 1149.1
- SAMPLE/PRELOAD mode
Test mode conforming to the IEEE 1149.1
- CLAMP mode
Test mode conforming to the IEEE 1149.1
- HIGHZ mode
Test mode conforming to the IEEE 1149.1
- IDCODE mode
Test mode conforming to the IEEE 1149.1

Figure 39.1 shows a block diagram of the JTAG interface.

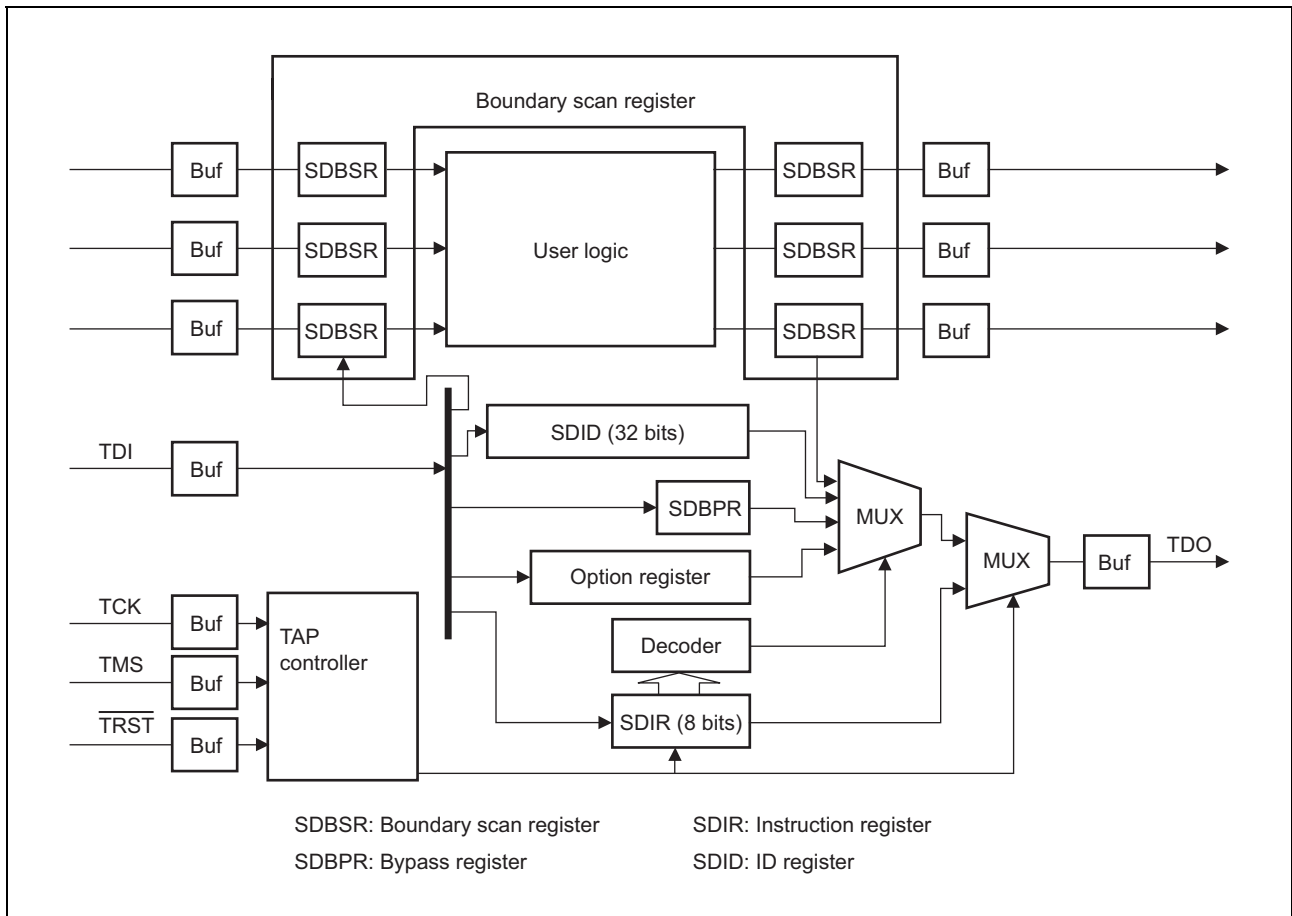

Figure 39.1 Block Diagram of JTAG Interface

39.2 Input/Output Pins

There are five JTAG control signals: TCK, TDI, TMS, TDO, and $\overline{\text{TRST}}$.

Table 39.1 shows the pin configuration.

Table 39.1 Pin Configuration

Pin Name	Description
TCK	Serial data input/output clock pin Data is supplied via the data input pin (TDI) and is output from the data output pin (TDO) in synchronization with this clock signal.
TMS	Mode select input pin Changing the level of this signal in synchronization with TCK changes the state of the TAP controller. For the protocol, refer to Figure 39.2 TAP Controller State Transition Diagram .
$\overline{\text{TRST}}$	Reset input pin A low-level input of this signal, which is accepted asynchronously with TCK, resets the JTAG interface. Even if the JTAG interface is not used, $\overline{\text{TRST}}$ must be held low for the specified time at a power on.
TDI	Serial data input pin Changing the state of this pin in synchronization with TCK allows data to be sent to the JTAG interface.
TDO	Serial data output pin Reading the state of this pin in synchronization with TCK allows data to be read from the JTAG interface.

39.3 Register Descriptions

The JTAG interface has the following registers. None of the registers can be accessed by the CPU.

- SDIR: Instruction register
- SDID: ID register
- SDBPR: Bypass register
- SDBSR: Boundary scan register

Table 39.2 Register Configuration

Register Name	Symbol	Access Size	Initial Value ^{*1}
Instruction register	SDIR	8	55 _H
ID register	SDID	32	*2
Bypass register	SDBPR	1	Undefined
Boundary scan register	SDBSR	—	Undefined

Note 1. Registers are initialized when the $\overline{\text{TRST}}$ pin is 0 or when TAP is in the test-logic-reset state.

Note 2. It is dependent on products. Contact our sales representative.

Commands can be serially transferred from the serial data input pin (TDI) and input to the instruction register (SDIR). The bypass register (SDBPR) is a 1-bit register, to which TDI and TDO are connected in BYPASS mode, CLAMP mode, and HIGHZ mode. The boundary scan register (SDBSR) is connected to TDI and TDO in SAMPLE/PRELOAD mode and EXTEST mode. The ID code register (SDID) is a 32-bit register, from which the ID code is output via TDO in IDCODE mode.

Table 39.3 shows the serial transfer types possible with the JTAG interface registers.

Table 39.3 Serial Transfer Types Possible with JTAG Interface Registers

Register	Serial Input	Serial Output
SDIR	Possible	Impossible ^{*1}
SDBPR	Possible	Possible
SDBSR	Possible	Possible
SDID	Impossible	Possible

Note 1. A fixed value is read out.

39.3.1 SDIR — Instruction Register

SDIR is an 8-bit register that holds a boundary scan command. SDIR is initialized when $\overline{\text{TRST}}$ is asserted or TAP is in the test-logic-reset state. Operation is not guaranteed when any reserved command is set in this register.

Table 39.4 Boundary Scan Commands

IR Code								Description
0	0	0	0	0	0	0	0	JTAG EXTEST
0	1	0	0	0	0	0	0	JTAG SAMPLE/PRELOAD
1	1	0	1	0	0	0	0	JTAG CLAMP
1	0	0	0	0	0	0	0	JTAG HIGHZ
0	1	0	1	0	1	0	1	JTAG IDCODE (initial value)
1	1	1	1	1	1	1	1	JTAG BYPASS
Other than above								Reserved

39.3.2 SDID — ID Register

SDID is a 32-bit register that indicates an LSI-specific ID.

SDID can be read via the JTAG interface pin when the IDCODE command is set but cannot be written to.

For the read values, refer to **Table 39.2, Register Configuration**.

39.3.3 SDBPR — Bypass Register

SDBPR is a 1-bit register. When SDIR is set to BYPASS mode, SDBPR is connected between TDI and TDO. The initial value is undefined. SDBPR is not initialized by a power-on reset or asserted $\overline{\text{TRST}}$.

39.3.4 SDBSR — Boundary Scan Register

SDBSR is a shift register located on the PADs for controlling the external I/O pins. When SDIR is set to SAMPLE/PRELOAD or EXTEST mode, SDBSR is connected between TDI and TDO. The initial value is undefined. SDBSR is not initialized by a power-on reset or asserted $\overline{\text{TRST}}$.

39.4 Operation

39.4.1 TAP Controller

Figure 39.2 shows the TAP controller internal states.

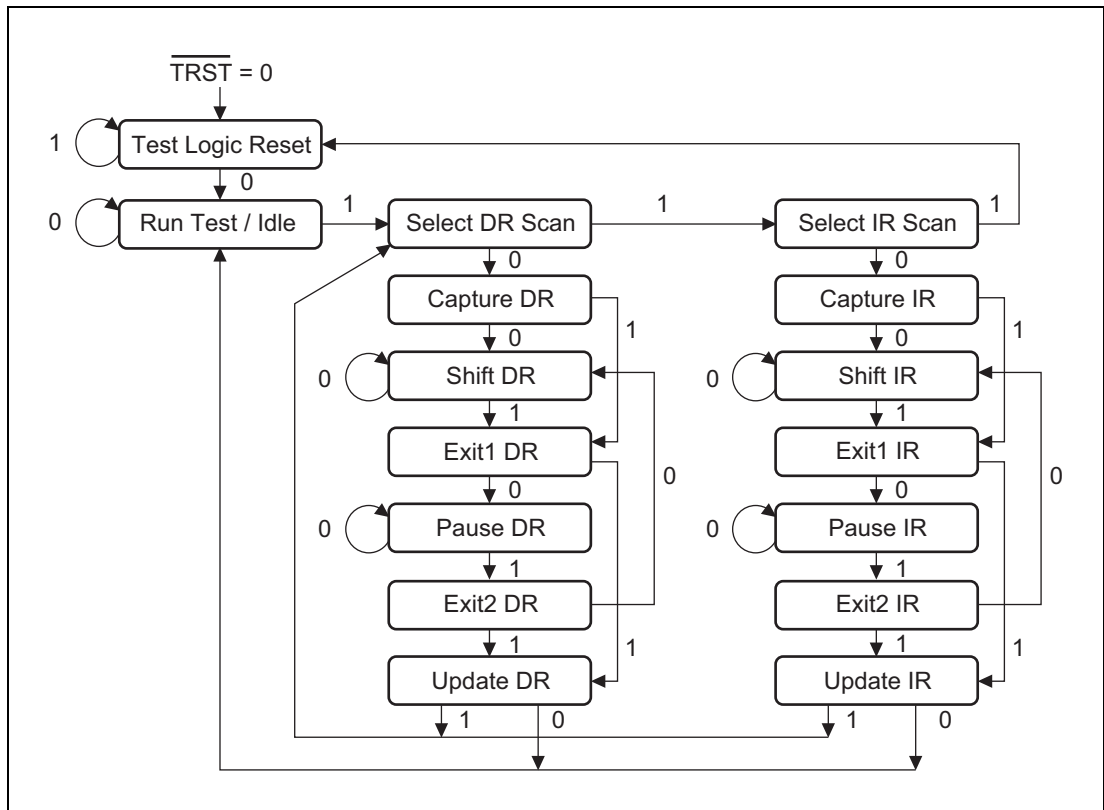

Figure 39.2 TAP Controller State Transition Diagram

Note 1. Transition is made according to the TMS value at the rising edge of TCK. The TDI value is sampled at the rising edge of TCK and is shifted at the falling edge. TDO is in the high-impedance state in the states other than Shift-DR and Shift-IR. Asserting $\overline{\text{TRST}}$ causes transition to the test-logic-reset state asynchronously with TCK.

39.4.2 Supported Commands

39.4.2.1 BYPASS

The BYPASS command is a standard command indispensable to bypass register operation. This command shortens the shift path to achieve high-speed serial data transfer of other LSIs on the printed-circuit board. During execution of this command, the test circuit has no effect on the system circuit.

39.4.2.2 SAMPLE/PRELOAD

The SAMPLE/PRELOAD command is used to input the value to the boundary scan register from the internal circuits of this LSI; to output the value from the scan path; and to load data onto the scan path. During execution of this command, the level of the input pin of this LSI is sent to the internal circuits as is, and the value of the internal circuits is output to the outside via the output pin as is. Executing this command has no effect on the system circuit of this LSI.

The SAMPLE operation allows taking in the snapshots of the value to be transferred to the internal circuits from the input pin or the value to be transferred to the output pin from the internal circuits to the boundary scan register and allows reading the snapshots from the scan path. Snapshots can be taken in without preventing the normal operation of this LSI.

The PRELOAD operation allows setting the initial value to the parallel output latch of the boundary scan register from the scan path prior to the EXTEST command. If the EXTEST command is executed without PRELOAD operation, the undefined value is output from the output pin until the first scan sequence is completed (transfer to the output latch) because the parallel output latch value is always output to the output pin with the EXTEST command.

39.4.2.3 EXTEST

The EXTEST command is used to test the external circuits when this LSI is mounted on the printed-circuit board. When this command is executed, the output pin is used to output the test data (previously set with the SAMPLE/PRELOAD command) from the boundary scan register to the printed-circuit board; whereas the input pin is used to take in the test result from the printed-circuit board to the boundary scan register. When the EXTEST command is executed N times for testing, the test data for the Nth execution is scanned in at the (N – 1)th scan-out.

If the data is loaded onto the boundary scan register of the output pin in the Capture-DR state of this command, it is not used for testing the external circuits (replaced through shift operation).

39.4.2.4 CLAMP

When the CLAMP command is selected, the output pin outputs the boundary scan register value that has been previously set with the SAMPLE/PRELOAD command. While the CLAMP command is selected, the boundary scan register retains the previous state regardless of the TAP controller state.

The bypass register is connected between TDI and TDO and operates in the same manner as when the BYPASS command is selected.

39.4.2.5 HIGHZ

When the HIGHZ command is selected, all the output pins go to the high-impedance state. While the HIGHZ command is selected, the boundary scan register retains the previous state regardless of the TAP controller state.

The bypass register is connected between TDI and TDO and operates in the same manner as when the BYPASS command is selected.

39.4.2.6 IDCODE

The IDCODE command sets the JTAG interface pins to IDCODE mode, which is defined by the JTAG standard. When the JTAG interface is initialized (by asserting $\overline{\text{TRST}}$ or placing TAP in the test-logic-reset state), IDCODE mode is set.

39.4.3 Notes

There are restrictions related to the JTAG interface as follows.

- The power supply/GND pins are not subjected to boundary scan.
- The reference voltage pins of the A/D converter (ADSVREFH, ADSVREFL, A0VREFH, and A1VREFH) are not subjected to boundary scan.
- The pins to be connected to a stabilizing capacitor (ADSVCL and RAMVCL) are not subjected to boundary scan.
- The EPT control pin (EPTVOUT) is not subjected to boundary scan.
- The NC pins are not subjected to boundary scan.

Table 39.5 lists the pins not subjected to boundary scan.

Table 39.5 Pins not Subjected to Boundary Scan

Type	Pins
Analog input	AN000/DSAN0P, AN001/DSAN0N, AN002/DSAN1P, AN003/DSAN1N, AN010/DSAN2P, AN011/DSAN2N, AN012/DSAN3P, AN013/DSAN3N, AN020/DSAN4P, AN021/DSAN4N, AN022/DSAN5P, AN023/DSAN5N, AN030/DSAN6P, AN031/DSAN6N, AN032/DSAN7P, AN033/DSAN7N, AN040, AN041, AN042, AN043, AN050, AN051, AN052, AN053, AN100, AN101, AN102, AN110, AN111, AN112, AN120, AN121, AN122, AN130, AN131, AN132, AN140, AN141, AN142, AN150, AN151, AN152, AN160, AN161, AN162, AN170, AN171, AN172
Debug system	AUDCK, $\overline{\text{DRDY}}$ /LPDCLKO, $\overline{\text{EVTI}}$, $\overline{\text{EVTO}}$, $\overline{\text{RES}}$, TCK/LPDCLKI, TDI/LPDI, TDO/LPDO, TMS/ $\overline{\text{EVTO}}$, $\overline{\text{TRST}}$ /LPDRST
LVDS	RHSB0FCLN, RHSB0FCLP, RHSB0SON, RHSB0SOP, RHSB1FCLN, RHSB1FCLP, RHSB1SON, RHSB1SOP
Mode setting	FLMODE, MD0, MD1
Clock	CK, EXTAL, XTAL

- The HIGHZ command is invalid for the pulled-up and pulled-down pins.

39.5 Usage Notes

1. Once a command is set, it is not modified until another command is issued again. To continuously issue the same commands, insert a command that has no effect on chip operation (such as BYPASS mode) between the desired commands.
2. To start the system in boundary scan mode, negate $\overline{\text{TRST}}$ while $\overline{\text{RES}}$ is high.
3. For the maximum clock frequency that can be input to TCK, refer to Section 40, Electrical Characteristics.
4. If the number of serially transferred bits exceeds the number of bits of the register connected between TDI and TDO, the data that is input from TDI is output from TDO after the serial data equal to the number of register bits are output.
5. If the serial transfer sequence is corrupted, be sure to reset $\overline{\text{TRST}}$. Here, start the transfer over again regardless of the point of transfer corruption.
6. Data is output via TDO synchronized with the falling edge of TCK.
7. To facilitate debugging, route $\overline{\text{TRST}}$ on the board in such a way that patterns can be easily cut.
8. No commands can be accepted in power-off standby mode.

Section 40 Electrical Characteristics

40.1 Absolute Maximum Ratings

Table 40.1 lists absolute maximum ratings.

Table 40.1 Absolute Maximum Ratings

Item	Symbol	Rated Value	Unit	Note
Power voltage* ¹	PLLVCC, SYSVCC, VCC	VCC	-0.3 to +4.3	V
	EVCC	EVCC	-0.3 to +6.5	V
	VDD	VDD	-0.3 to +1.8	V
	LVDVCC	VLVDVCC	-0.3 to +4.3	V
	TTLVCC	VTTLVCC	-0.3 to +6.5	V
Input voltage	SYSVCC power pin	V _{in}	-0.3 to SYSVCC +0.3	V See Table 40.3
	VCC power pin	V _{in}	-0.3 to VCC +0.3	V
	EVCC power pins	V _{in}	-0.3 to EVCC +0.3	V
	5 V tolerant pin* ²	V _{in}	-0.3 to +5.8	V
RHSB power voltage	LVDVCC	-0.3 to +4.3	V	
	TTLVCC	-0.3 to +6.5	V	
RHSB input voltage	V _{LVDSIN}	-0.3 to LVDVCC +0.3	V	
	V _{TTLIN}	-0.3 to TTLVCC +0.3	V	
Analog power voltage	A0VCC, A1VCC	-0.3 to +6.5	V	
	ADSVCC	-0.3 to +6.5	V	
Analog reference voltage	A0VREFH	-0.3 to A0VCC +0.3	V	
	A1VREFH	-0.3 to A1VCC +0.3	V	
	ADSVREFH	-0.3 to ADSVCC +0.3	V	
	ADSVREFL	-0.3 to ADSVSS +0.3	V	
Analog input voltage	V _{AIN}	-0.3 to A0VCC +0.3 -0.3 to A1VCC +0.3	V	
	V _{ADSIN}	-0.3 to ADSVCC +0.3	V	
VSS differential voltage* ³ (Condition: Between any two of VSS, A0VSS, A1VSS, ADSVSS, PLLVSS, and LVDVSS)		-0.1 to +0.1	V	
Maximum input current (per pin)	Digital input pin	I _{max}	-25 to +25	mA Only 1 pin simultaneously
	Analog input pin	I _{max}	-25 to +25	mA
Junction temperature* ¹	T _j	-40 to +150	°C	
Storage temperature	T _{stg}	-55 to +150	°C	After mounting

Note 1. Cumulative hours of operation of this LSI with T_j in the range from 125°C to 150°C must be kept within 3000 hours.

Note 2. Pins below described as "(5 V tol.)" in Table 40.2, Relationship between Power Name and Pin .
FLMODE, MD0, MD1, RES, TRST, NMI

Note 3. Of the digital power supplies on the board, short-circuit PLLVSS to VSS.

NOTE

Using this LSI without observing these absolute maximum ratings may result in permanent breakdown of the LSI. This product is used in combination of multiple power voltages simultaneously in some cases. Use this LSI conforming to power pin connections, conditions for combination of power voltages to be applied, voltages that can be applied to pins, and output voltage conditions, which are specified in the manual. Using this LSI with unspecified power connection or voltage may result in permanent breakdown of the LSI or damage to the system that contains this LSI.

40.2 DC Characteristics

40.2.1 Relationship between Power Name and Pin

Table 40.2 shows the relationship between power name and pin.

Table 40.2 Relationship between Power Name and Pin (1/7)

Table 40.2 Relationship between Power Name and Pin (7/7)

Pin Name	Port Group	Circuit Power Name	I/O	Maximum Input Voltage (V)	Input Buffer Type	Output Driving Ability	Note
SYSVCC							
TTLVCC*1							
VDD							
VDD (N.C.)							
RAMVCL							
VSS							
VSS (N.C.)							

Note 1. The ground for TTLVCC is LVDVSS (the same as the ground for LVDVCC).

Note 2. Though the pins listed with the names of power supply pins (and as N.C.) do not affect operation of the microcontroller even if they are open-circuit, we recommend connecting the pins to the power supply of the same name as those that do not include N.C. to ensure that the power supply is stable. In addition, be sure to mount solder balls on the substrate. The pins listed with the names of power supply pins (and as N.C.) are internally connected with the power supply of the same name as those that do not include N.C.

40.2.2 Operating Conditions

Table 40.3 Operating Conditions

Symbol	Min.	Typ.	Max.	Unit
SYSVCC	3.0	3.3	3.6	V
VCC	3.0	3.3	3.6	V
PLLVCC	3.0	3.3	3.6	V
VDD	1.15	1.25	1.35	V
EVCC	4.5	5.0	5.5	V
LVDVCC	3.0	3.3	3.6	V
TTLVCC	3.0	3.3	3.6	V
	4.5	5.0	5.5	V
A0VCC* ³ , A1VCC	4.5	5.0	5.5	V
ADSVCC* ³	4.5	5.0	5.5	V
A0VREFH, A1VREFH* ¹	4.5	5.0	5.5	V
ADSVREFH* ²	4.5	5.0	5.5	V

Note 1. Set a value less than A0VCC and A1VCC.

Note 2. Set a value less than ADSVCC.

Note 3. Operated under the condition of A0VCC = ADSVCC.

Note: Supply the specified voltages to all power-supply voltage connections when starting operation. Turn off all power voltages when stopping operation. In power-off standby mode, turn off power voltages other than SYSVCC.

40.2.3 Input Voltage Characteristics

Table 40.4 DC Characteristics (Input Voltage)

Conditions: EVCC = 4.5 V to 5.5 V, TTLVCC = 4.5 V to 5.5 V or 3.0 V to 3.6 V, A0VCC,
 A1VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC,
 ADSVCC = 4.5 V to 5.5 V, ADSVREFH = 4.5 V to ADSVCC, PLLVCC = 3.0 V to 3.6 V,
 SYSVCC = 3.0 V to 3.6 V, VCC = 3.0 V to 3.6 V, LVDVCC = 3.0 V to 3.6 V, VDD = 1.15 V to 1.35 V,
 VSS = PLLVSS = A0VSS = A1VSS = ADSVSS = ADSVREFL = LVDVSS = 0 V
 Tj = -40°C to 150°C

Item	Symbol	Min.	Typ.	Max.	Unit	Measurement Condition
Schmitt trigger input voltage (Buffer type A)	V_T^+ (V_{IH})	SYSVCC × 0.75 VCC × 0.75	—	5.5 + 0.3*1 VCC + 0.3*2	V	See Table 40.2 (Item of SchA input buffer type)

	TTLVCC power pin	15	—	90	μA Vin = 0 V, TTLVCC = 3.0 to 3.6 V	
		40	—	190	μA Vin = 0 V, TTLVCC = 4.5 to 5.5 V	
Pull-up MOS current	AUDATA3-0*1	—	—	350	μA Vin = 0 V VCC = 3.0 to 3.6 V	
Input pull-down MOS current	RES	I_{pd}	25	60	120	μA Vin = SYSVCC, SYSVCC = 3.6 V
			5	20	40	μA Vin = SYSVCC, SYSVCC = 2.0 V
	TRST	—	—	350	μA Vin = SYSVCC, SYSVCC = 3.0 to 3.6 V	
	FLMODE, MD0, MD1 (SYSVCC power pin)	15	—	120	μA Vin = SYSVCC, SYSVCC = 3.0 to 3.6 V	
	AUDRST	—	—	350	μA Vin = VCC, VCC = 3.0 to 3.6 V	
	NMI	15	—	120	μA Vin = VCC, VCC = 3.0 to 3.6 V	
	EVCC power pin	—	—	350	μA Vin = EVCC, EVCC = 4.5 to 5.5 V	
	TTLVCC power pin	15	—	120	μA Vin = TTLVCC, TTLVCC = 3.0 to 3.6 V	
		50	—	240	μA Vin = TTLVCC TTLVCC = 4.5 V to 5.5 V	

Note 1. The pull-up of AUDATA3-0 is valid not only in input but also in output.

40.2.6 Output Voltage Characteristics

Table 40.7 DC Characteristics (Output Voltage)

Conditions: EVCC = 4.5 V to 5.5 V, TTLVCC = 4.5 V to 5.5 V or 3.0 V to 3.6 V, A0VCC,
 A1VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC,
 ADSVCC = 4.5 V to 5.5 V, ADSVREFH = 4.5 V to ADSVCC, PLLVCC = 3.0 V to 3.6 V,
 SYSVCC = 3.0 V to 3.6 V, VCC = 3.0 V to 3.6 V, LVDVCC = 3.0 V to 3.6 V, VDD = 1.15 V to 1.35 V,
 VSS = PLLVSS = A0VSS = A1VSS = ADSVSS = ADSVREFL = LVDVSS = 0 V
 Tj = -40°C to 150°C

Item		Symbol	Min.	Typ.	Max.	Unit	Measurement Condition
Output high level voltage	EVCC power pin	V_{OH}	EVCC - 0.5	—	—	V	$I_{OH} = 200 \mu A$, EVCC = 4.5 V to 5.5 V
			EVCC - 1.0	—	—	V	$I_{OH} = 1 mA$, EVCC = 4.5 V to 5.5 V
	TTLVCC power pin		TTLVCC - 0.4	—	—	V	$I_{OH} = 2 mA$, TTLVCC = 4.5 V to 5.5 V
			TTLVCC - 0.4	—	—	V	$I_{OH} = 2 mA$, TTLVCC = 3.0 V to 3.6 V
	VCC power pin		VCC - 0.1	—	—	V	$I_{OH} = 50 \mu A$, VCC = 3.0 V to 3.6 V
			VCC - 1.0	—	—	V	$I_{OH} = 200 \mu A$, VCC = 3.0 V to 3.6 V
Output low level voltage	EVCC power pin	V_{OL}	—	—	0.4	V	$I_{OL} = 1.6 mA$ EVCC = 4.5 V to 5.5 V
			—	—	1.2	V	$I_{OL} = 4 mA$ EVCC = 4.5 V to 5.5 V
	TTLVCC power pin		—	—	0.4	V	$I_{OL} = 2 mA$, TTLVCC = 4.5 V to 5.5 V
			—	—	0.4	V	$I_{OL} = 2 mA$, TTLVCC = 3.0 V to 3.6 V
	VCC power pin		—	—	0.1	V	$I_{OL} = 50 \mu A$ VCC = 3.0 V to 3.6 V
			—	—	0.4	V	$I_{OL} = 1.6 mA$ VCC = 3.0 V to 3.6 V

40.2.7 Allowable Output Current

Table 40.8 DC Characteristics (Allowable Output Current)

Conditions: EVCC = 4.5 V to 5.5 V, TTLVCC = 4.5 V to 5.5 V or 3.0 V to 3.6 V, A0VCC,
 A1VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC,
 ADSVCC = 4.5 V to 5.5 V, ADSVREFH = 4.5 V to ADSVCC, PLLVCC = 3.0 V to 3.6 V,
 SYSVCC = 3.0 V to 3.6 V, VCC = 3.0 V to 3.6 V, LVDVCC = 3.0 V to 3.6 V, VDD = 1.15 V to 1.35 V,
 VSS = PLLVSS = A0VSS = A1VSS = ADSVSS = ADSVREFL = LVDVSS = 0 V
 Tj = -40°C to 150°C

Item	Symbol	Min.	Typ.	Max.	Unit
Output low-level allowable current (per pin)	I_{OL}	—	—	4.0	mA
Output low-level allowable current (total)	ΣI_{OL}	—	—	80	mA
Output high-level allowable current (per pin)	I_{OH}	—	—	2.0	mA
Output high-level allowable current (total)	ΣI_{OH}	—	—	25	mA

40.2.8 Injection Current

Table 40.9 DC Characteristics (Injection Current)

Conditions: EVCC = 4.5 V to 5.5 V, TTLVCC = 4.5 V to 5.5 V or 3.0 V to 3.6 V, A0VCC,
 A1VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC,
 ADSVCC = 4.5 V to 5.5 V, ADSVREFH = 4.5 V to ADSVCC, PLLVCC = 3.0 V to 3.6 V,
 SYSVCC = 3.0 V to 3.6 V, VCC = 3.0 V to 3.6 V, LVDVCC = 3.0 V to 3.6 V, VDD = 1.15 V to 1.35 V,
 VSS = PLLVSS = A0VSS = A1VSS = ADSVSS = ADSVREFL = LVDVSS = 0 V
 Tj = -40°C to 150°C

Item		Symbol	Min.	Typ.	Max.	Unit
DC injection current (per pin)	Logic pin	I_{IC}	-2.0	—	2.0	mA
	Analog pin		-3.0	—	3.0	mA
DC injection current (total)		$\Sigma I_{IC} $	-50.0	—	50.0	mA

40.2.9 LVDS Driver

Table 40.10 DC Characteristics (LVDS Driver Characteristics)

Conditions: EVCC = 4.5 V to 5.5 V, TTLVCC = 4.5 V to 5.5 V or 3.0 V to 3.6 V, A0VCC, A1VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC, ADSVCC = 4.5 V to 5.5 V, ADSVREFH = 4.5 V to ADSVCC, PLLVCC = 3.0 V to 3.6 V, SYSVCC = 3.0 V to 3.6 V, VCC = 3.0 V to 3.6 V, LVDVCC = 3.0 V to 3.6 V, VDD = 1.15 V to 1.35 V, VSS = PLLVSS = A0VSS = A1VSS = ADSVSS = ADSVREFL = LVDVSS = 0 V
 Tj = -40°C to 150°C

Item	Symbol	Min.	Typ.	Max.	Unit	Measurement Condition
Output high-level voltage	V_{OH}	—	—	1525	mV	Figure 40.1, Figure 40.2
Output low-level voltage	V_{OL}	875	—	—	mV	
Output differential voltage	V_{OD}	150	—	400	mV	
Offset voltage	V_{OS}	1075	—	1325	mV	
Output impedance	R0	40	—	140	Ω

Figure 40.2 Meaning of LVDS Driver Symbols

40.2.10 Input Capacitance

Table 40.11 DC Characteristics (Input Capacitance)

Conditions: EVCC = 4.5 V to 5.5 V, TTLVCC = 4.5 V to 5.5 V or 3.0 V to 3.6 V, A0VCC,
 A1VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC,
 ADSVCC = 4.5 V to 5.5 V, ADSVREFH = 4.5 V to ADSVCC, PLLVCC = 3.0 V to 3.6 V,
 SYSVCC = 3.0 V to 3.6 V, VCC = 3.0 V to 3.6 V, LVDVCC = 3.0 V to 3.6 V, VDD = 1.15 V to 1.35 V,
 VSS = PLLVSS = A0VSS = A1VSS = ADSVSS = ADSVREFL = LVDVSS = 0 V

Item		Symbol	Min.	Typ.	Max.	Unit	Measurement Condition
Input capacitance	All pins	C_{in}	—	10	20	pF	$V_{in} = 0\text{ V}$, $f = 1\text{ MHz}$, $T_j = 25^\circ\text{C}$

40.2.11 Supply Current Characteristics

Table 40.12 DC Characteristics (Supply Current)

Conditions: EVCC = 4.5 V to 5.5 V, TTLVCC = 4.5 V to 5.5 V or 3.0 V to 3.6 V, A0VCC, A1VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC, ADSVCC = 4.5 V to 5.5 V, ADSVREFH = 4.5 V to ADSVCC, PLLVCC = 3.0 V to 3.6 V, SYSVCC = 3.0 V to 3.6 V, VCC = 3.0 V to 3.6 V, LVDVCC = 3.0 V to 3.6 V, VDD = 1.15 V to 1.35 V, VSS = PLLVSS = A0VSS = A1VSS = ADSVSS = ADSVREFL = LVDVSS = 0 V
T_j = -40°C to 150°C

Item		Symbol	Min.	Typ.* ¹	Max.	Unit	Measurement Condition
Core supply current (VDD power)	Normal operation	I _{DD}	—	310	500	mA	Operation at 320 MHz
			—	240	450	mA	Operation at 240 MHz
	Current during reset	I _{DDrst}	10	170	300	mA	
VCC supply current (when EPT is not used)* ²	Normal operation (excluding erasure of code flash)	I _{CC}	—	10	23	mA	
	Erasure of code flash	I _{CC_cferase}	—	20	40	mA	
	Current during reset	I _{CCrst}	3	7	15	mA	
System supply current (SYSVCC)	Normal operation	I _{SYS}	—	0.25	1	mA	
	Current during reset	I _{SYSrst}	0.1	0.3	1	mA	
PLL supply current (PLLVCC)		I _{PLL}	2	3.5	5	mA	
RHSB supply current (LVDVCC)		I _{LVDS}	—	14	24	mA	
Analog power current (A0VCC, A1VCC)		I _{AVCC}	—	3.5	6	mA	
Analog power current(ADSVCC)		I _{ADSVCC}	—	12	15	mA	
ADC reference power current (A0VREFH, A1VREFH)		I _{AVREF}	—	220	500	μA	
ADC reference power current(ADSVREFH)		I _{AVREF_DS}	—	400	1000	μA	

Note 1. At T_j = 25°C

Note 2. When an EPT is to be used, calculate the current through the EPT from its current gain and the current from EPTVOUT, then add the result to the value for VCC.

CAUTIONS

1. When the A/D converter is not used or it is in the standby state, do not open the A0VCC pin, A1VCC pin, A0VREFH pin, AVREFH pin, ADSVREFH pin, ADSVREFL pin, A0VSS pin, and A1VSS pin.
2. Supply current values are with all output pins unloaded when V_{IHmin} = V_{CC} - 0.5 V EVCC - 0.5 V and V_{IL} = 0.5 V.

40.2.12 Standby Current

Table 40.13 DC Characteristics (Standby)

Conditions: EVCC = 0 V to EVCCstdby1, SYSVCC = SYSVCCLow to 3.6 V
 Other power supplies 0 V to operating voltage,
 VSS = PLLVSS = A0VSS = A1VSS = ADSVSS = ADSVREFL = LVDVSS = 0 V
 Tj = -40°C to 150°C

Item		Symbol	Min.	Typ.	Max.	Unit	Measurement Condition
Supply current (SYSVCC)	Power-off standby	I _{SB}	—	—	0.4	mA	-40°C < Tj ≤ 50°C
			—	—	0.7	mA	50°C < Tj ≤ 105°C
			—	—	1	mA	105°C < Tj ≤ 150°C

40.2.13 Power Voltage Monitoring Characteristics

Table 40.14 DC Characteristics (Power Voltage Monitoring)

Conditions: EVCC = 4.5 V to 5.5 V, TTLVCC = 4.5 V to 5.5 V or 3.0 V to 3.6 V, A0VCC,
 A1VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC,
 ADSVCC = 4.5 V to 5.5 V, ADSVREFH = 4.5 V to ADSVCC, PLLVCC = 3.0 V to 3.6 V,
 SYSVCC = 3.0 V to 3.6 V, VCC = 3.0 V to 3.6 V, LVDVCC = 3.0 V to 3.6 V, VDD = 1.15 V to 1.35 V,
 VSS = PLLVSS = A0VSS = A1VSS = ADSVSS = ADSVREFL = LVDVSS = 0 V
 Tj = -40°C to 150°C

Item		Symbol	Min.	Typ.	Max.	Unit	Measurement Condition
Power voltage monitoring upper-limit voltage	HDETCTL.VDDREF H 1/0 setting	00	—	1.40	1.50	1.60	V
Power voltage monitoring lower-limit voltage	LDETCTL.VDDREFL 1/0 setting	00	—	0.85	0.95	1.05	V

40.3 AC Characteristics

- Unless otherwise described, the following timing conditions are applied.
 $\text{SYSVCC} = \text{VCC} = \text{PLLVC} = \text{LVDVCC} = \text{TTLVCC} = 3.0 \text{ V to } 3.6 \text{ V}$
 $\text{EVCC} = 4.5 \text{ V to } 5.5 \text{ V}$, $\text{A0VCC} = \text{A1VCC} = 4.5 \text{ V to } 5.5 \text{ V}$, $\text{A0VREFH} = 4.5 \text{ V to A0VCC}$,
 $\text{A1VREFH} = 4.5 \text{ V to A1VCC}$,
 $\text{ADSVCC} = 4.5 \text{ V to } 5.5 \text{ V}$, $\text{ADSVREFH} = 4.5 \text{ V to ADSVCC}$, $\text{VDD} = 1.15 \text{ to } 1.35 \text{ V}$,
 $\text{VSS} = \text{PLLSS} = \text{A0VSS} = \text{A1VSS} = \text{ADSVSS} = \text{ADSVREFL} = \text{LVDVSS} = 0 \text{ V}$,
 $T_j = -40^\circ\text{C to } 150^\circ\text{C}$
- In the port control register, conditions where all output pins of the module used in the same channel are set to the same driving ability are applied to output pins whose driving ability is selectable. Unless otherwise specified, all driving ability settings are included.
- Unless otherwise described, AC measurement conditions described in **Figure 40.3** are applied.
 Input reference level High level: V_{IH} minimum value; Low level: V_{IL} maximum value
 Output reference level High level: 2.0 V; Low level: 0.8 V
 Input rising time, falling time: 1 ns

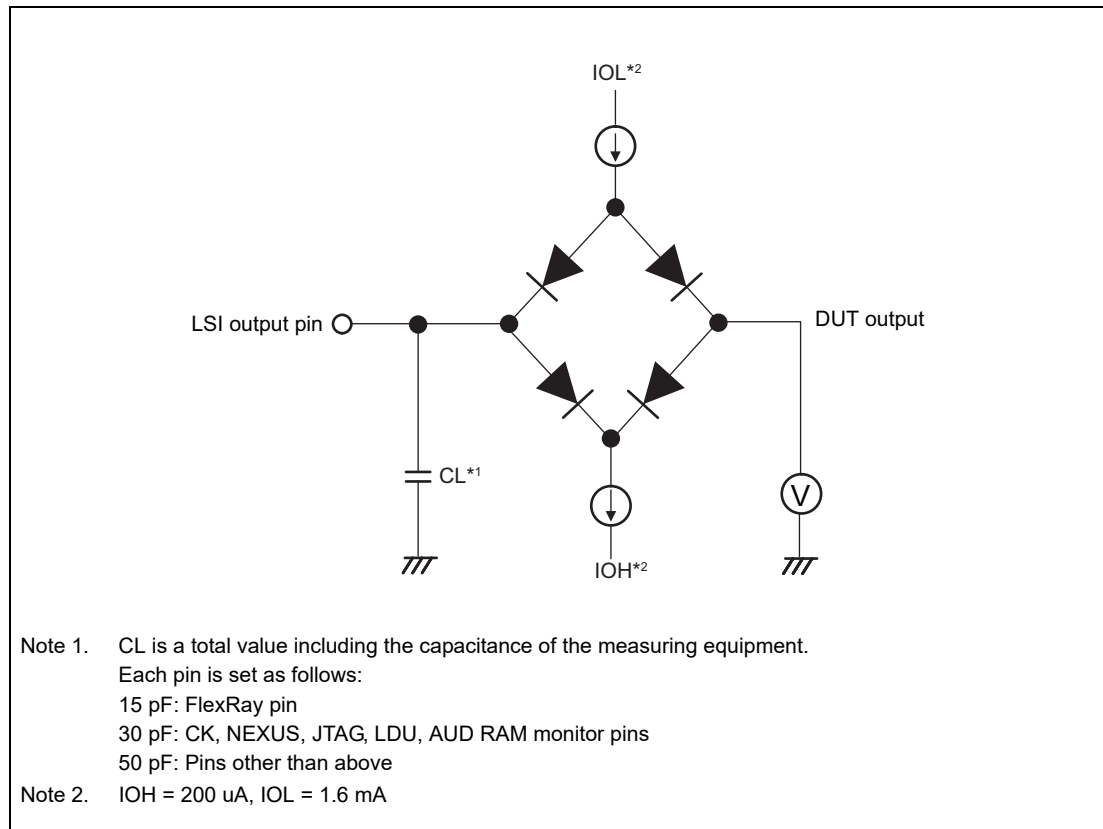

Figure 40.3 AC Measurement Conditions

40.3.1 Power On/Off Timings

Table 40.15 Power On/Off Timings

Item	Symbol	Min.	Max.	Unit	Note	Reference
External reset L time at power-on	tRESW1	10	—	ms	*1	Figure 40.4
External reset L time at power-off	tRESW2	2	—	μs	*2	
PLL1 lock in time	tPLL1L0	—	1	ms	*3	

Note 1. tRESW1 is the reset time required for the supply of internal clock signals to become stable after all power supplies are turned on. No restriction applies to potential differences between each power supply during power up.

Note 2. tRESW2 is the time from assertion of the reset signal until all of the power voltages have dropped below the lower-limit voltages.

Note 3. tPLL1L0 is the time required for PLL1 to lock in after MOSC oscillation has become stable.

CAUTION

- The states of I/O pins are not reset during the noise cancellation interval (max. 1.2 μs) of the reset signal following its assertion while power is being turned off. During that time, do not allow any input of mid-range potential to the pin or contention of output data.
- If power is disconnected during programming or erasure of flash memory, the flash memory may be destroyed.

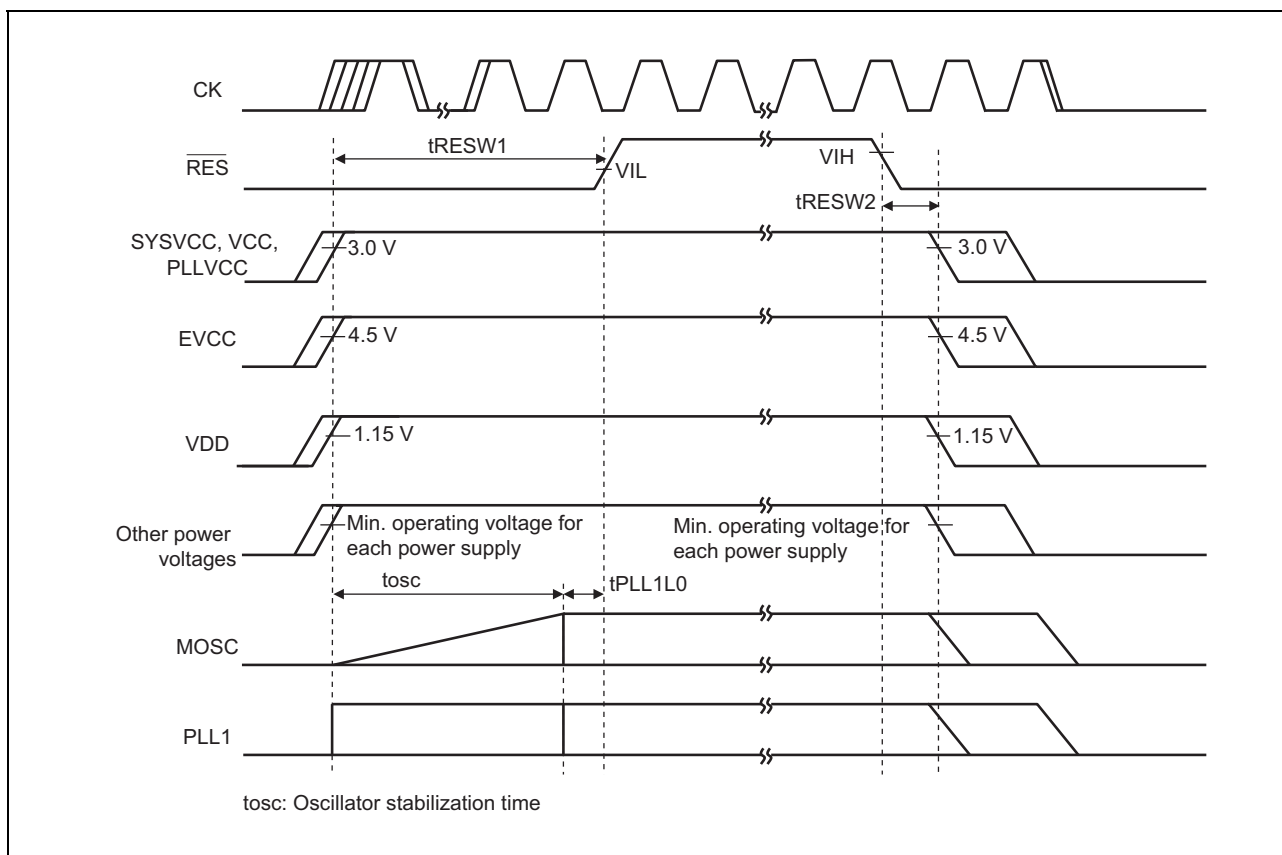

Figure 40.4 Power On/Off Timings When EPT is not Used

(2) When EPT is used

Table 40.16 Power On/Off Timings

Item	Symbol	Min.	Max.	Unit	Condition	Reference
External reset L time at power-on	tRESW4	10	—	ms	*1	Figure 40.5
External reset L time at power-off	tRESW5	2	—	μs	*2	
PPL1 lock-in time	tPLL1L0	—	1	ms	*3	

Note 1. tRESW4 is the reset time required for the supply of internal clock signals to become stable after all power supplies are turned on. No restriction applies to potential differences between each power supply during power up.

Note 2. tRESW5 is the time from assertion of the reset signal until all of the power voltages have dropped below the lower-limit voltages.

Note 3. tPLL1L0 is the time required for PLL1 to lock in after MOSC oscillation has become stable.

CAUTION

- The states of I/O pins are not reset during the noise cancellation interval (max. 1.2 μs) of the reset signal following its assertion while power is being turned off. During that time, do not allow any input of mid-range potential to the pin or contention of output data.
- If power is disconnected during programming or erasure of flash memory, the flash memory may be destroyed.

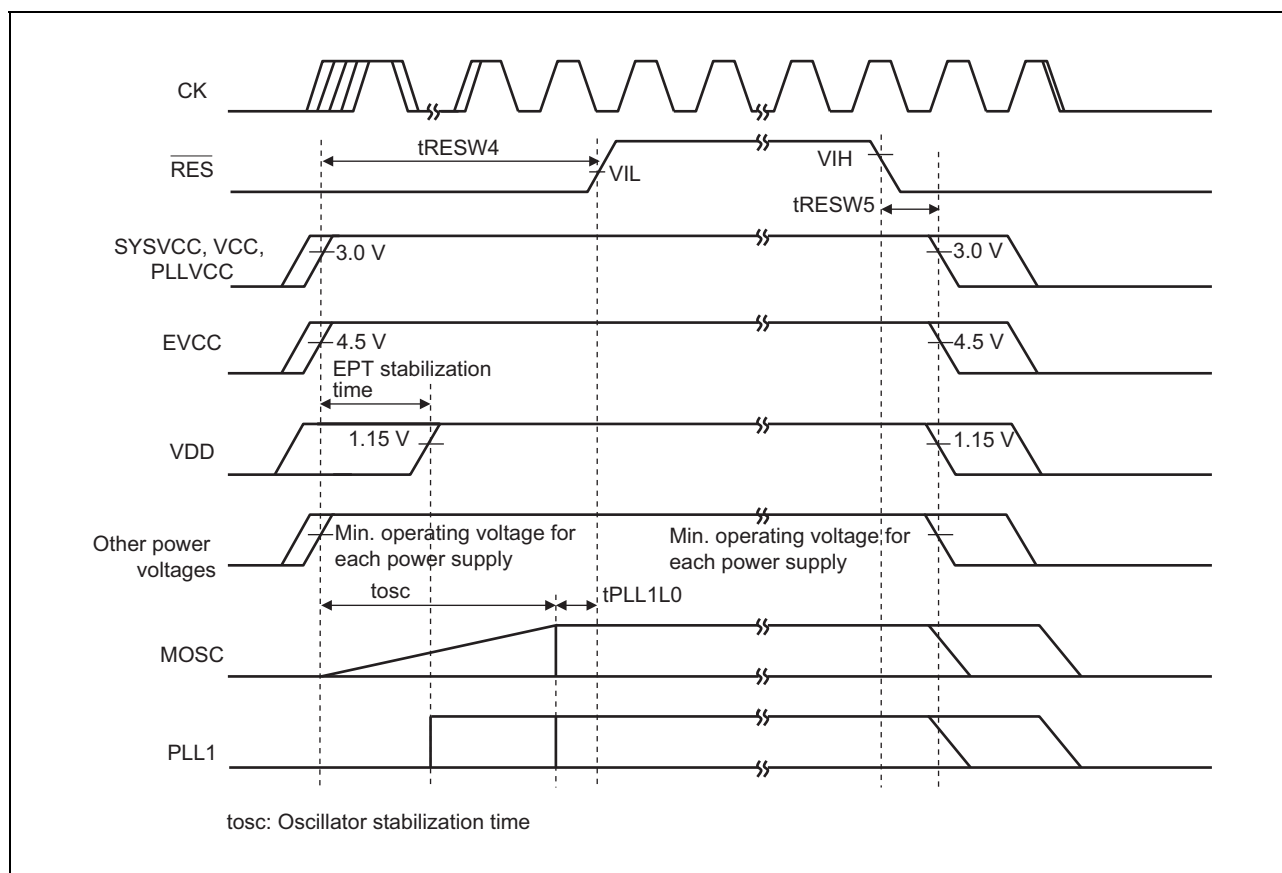

Figure 40.5 Power On Timing when EPT is Used

40.3.2 Standby Transition/Return Timings

Table 40.17 Power-Off Standby Timing

Item	Symbol	Condition	Min.	Max.	Unit	Reference
Reset assertion time before VCC off	tVCC		2	—	μs	Figure 40.6
Reset assertion time before VDD off	tVDD		2	—	μs	
Reset assertion time before EVCC off	tEVCC		2	—	μs	
Reset assertion time before power off other than VCC, VDD, and EVCC	tVoltage		2	—	μs	
Reset hold time at return from power-off standby mode	tRESW3	*1	tRESW1	—	ms	
		*2	tRESW4	—	ms	
EVCC voltage at transition to power-off standby mode	EVCCstdby1	*3	2.1	—	V	
EVCC voltage at return from power-off standby mode	EVCCstdby2	*4	—	2.5	V	
SYSVCC voltage in power-off standby mode	SYSVCCLow		2.7	3.6	V	

Note 1. When EPT is not used.

Note 2. When EPT is used.

Note 3. This is the EVCC voltage for transition to power-off standby mode. This value must be equal to or less than the min. EVCCstdby1 value.

Note 4. This is the EVCC voltage for return from power-off standby mode. This value must be equal to or more than the max. EVCCstdby2 value.

CAUTION

For resetting while flash memory is being programmed or erased, follow the specifications in the RH850/E1x-FCC2 Flash Memory User's Manual: Hardware Interface.

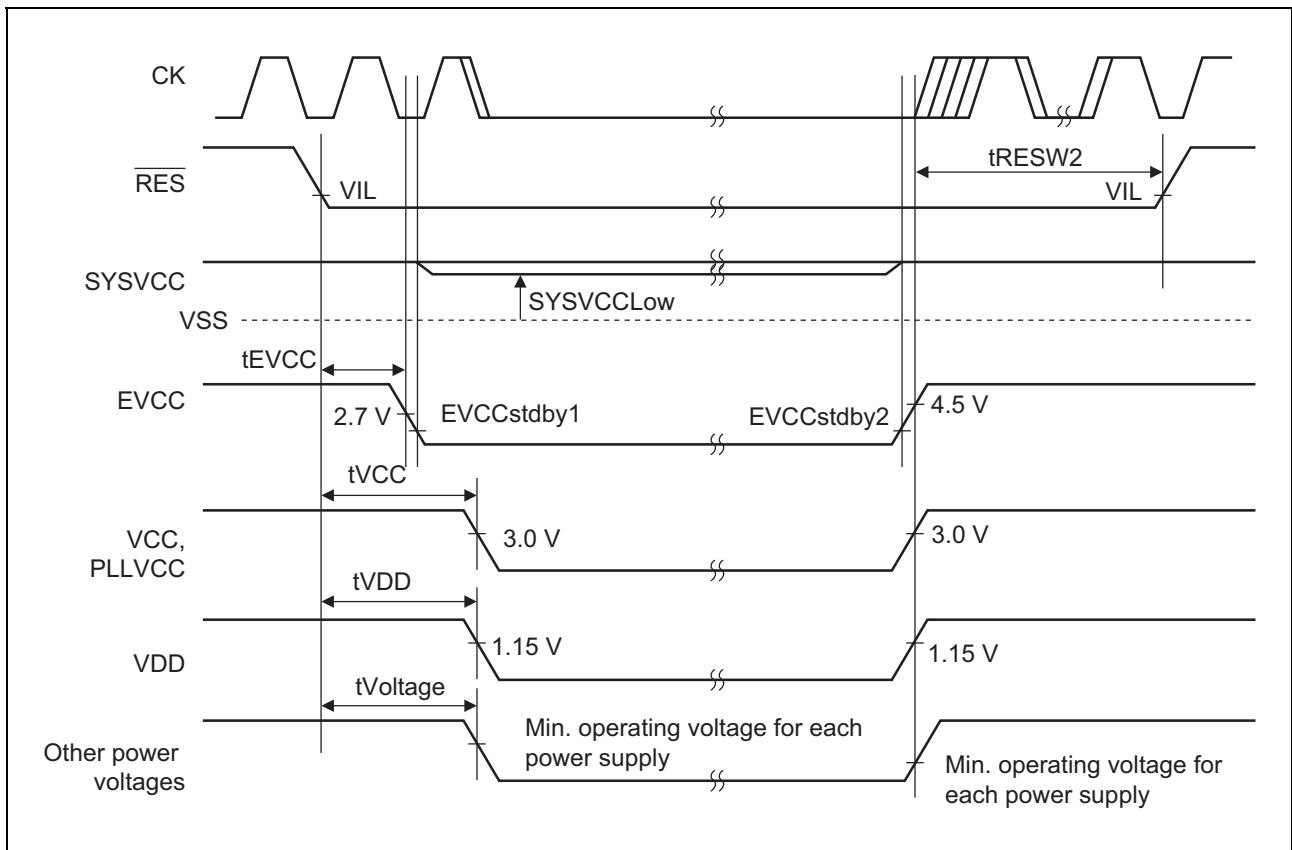

Figure 40.6 Power-Off Standby Timing

40.3.3 Clock Timing

40.3.3.1 External Clock and Output Clock

Table 40.18 Clock Timing

Item	Symbol	Min.	Typ.	Max.	Unit	Reference
EXTAL clock input frequency	f_{EX}	19.9	—	20	MHz	Figure 40.7
EXTAL clock input low-level pulse width	t_{EXL}	20	—	—	ns	
EXTAL clock input high-level pulse width	t_{EXH}	20	—	—	ns	
EXTAL clock input rising time	t_{EXR}	—	—	4	ns	
EXTAL clock input falling time	t_{EXF}	—	—	4	ns	
CK clock frequency*1	f_{op}	0.995	1	2	MHz	Figure 40.8
CK clock low-level pulse width	t_{CL}	230	—	—	ns	
CK clock high-level pulse width	t_{CH}	230	—	—	ns	
CK clock rising time*2	t_{CR}	—	—	15	ns	
CK clock falling time*2	t_{CF}	—	—	15	ns	

Note 1. The frequency of clock that is output from the CK pin is 1 MHz (when EXTAL input = 20 MHz), which is divided according to the setting by the baud rate generator (BRG). Clock jitter values depend on the board design.

Note 2. CL = 30pF

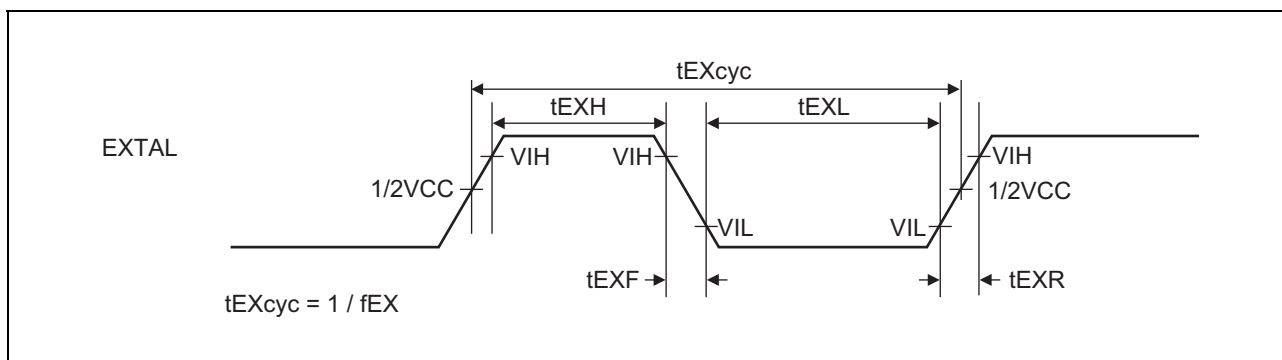

Figure 40.7 EXTAL Timing

RHSBnSI 1-bit length	tSIW		$8 \times tFCLcyc$	—	ns	

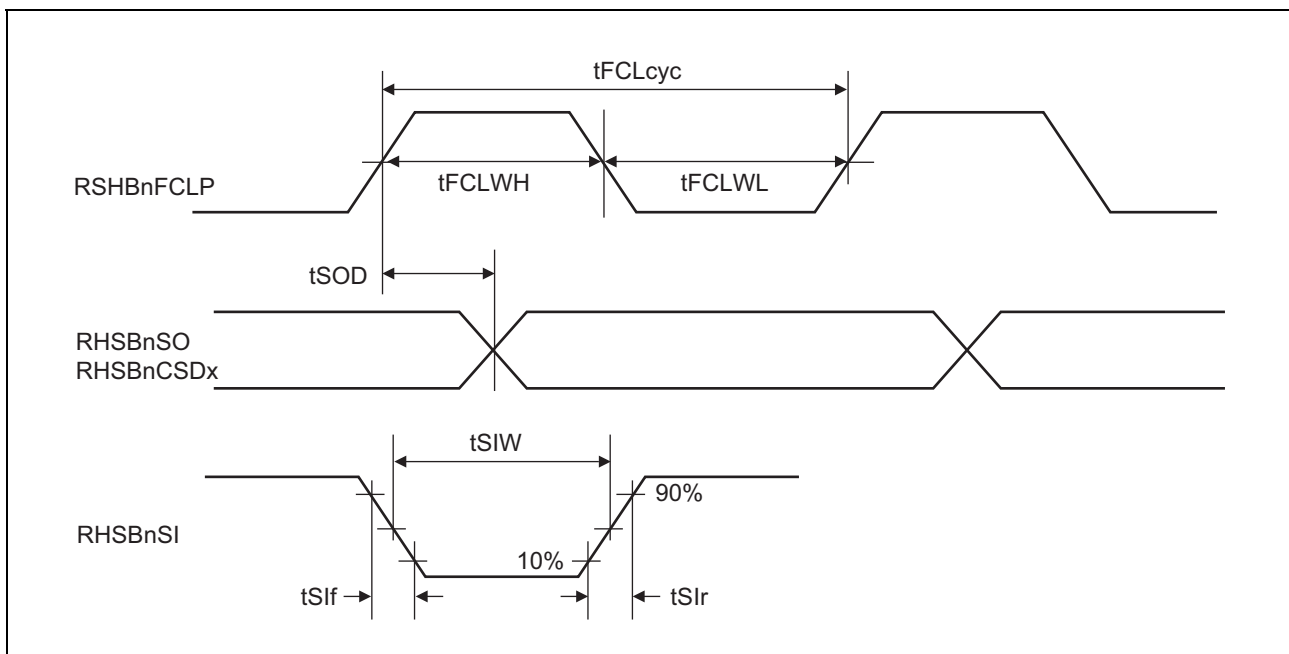

Figure 40.24 RSB Timing

CAUTION

1. When the following pins are not used as LVDS, leave the RSHB*N pins open. In that case, the pin load capacitance must be 0.2 pF or less.

[Pin pair]

- RSHBnFCLN/RSHBnFCLP (n = 0, 1)
- RSHBnSON/RSHBnSOP (n = 0, 1)

2. RSHBnCSDx does not satisfy the specification if Mid or Low is selected for the driving ability of output pins. When P13_0, P13_1, P13_5, or P13_6 is used as an RSHB pin, driving ability must be set to High.

40.3.12 JTAG/NEXUS Timing

40.4 A/D Converter Characteristics

Table 40.37 ADC Converter Characteristics

Item	Symbol	Min.	Typ.	Max.	Unit	Reference
Digital resolution	—	—	12	—	bit	
Voltage resolution*1	—	1.10	1.22	1.34	mV	
A/D conversion time	—	—	1.0	—	μs	
Non-linearity error	—	—	—	±4.0	LSB	
Offset error	—	—	—	±7.5	LSB	
Full-scale error	—	—	—	±7.5	LSB	
Quantization error	—	—	—	±0.5	LSB	
Absolute error	—	—	—	±8.0	LSB	
Self-diagnosis absolute error	A/D conversion circuit self-diagnosis is in use	—	—	—	±8.0	LSB
	Pin-level self-diagnosis is in use	—	—	—	±40	LSB
Analog input capacitance	Waiting	—	—	10	pF	
	During sampling	—	—	20	pF	
Allowable analog signal source impedance	—	—	—	3	kΩ	
T&H hold time	—	—	—	10	μs	
Input Voltage Range	When T&H is not used	—	0	A0VREFH, A1VREFH	V	
	When T&H is used	—	0.2	A0VREFH, A1VREFH – 0.2	V	

Note 1. When AnVREFH (n = 0, 1) = 4.5 V, the resolution is 1.10 mV. When AnVREFH (n = 0, 1) = 5.5 V, the resolution is 1.34 mV.

CAUTION

A current being injected to analog input pins while pin-level self-diagnosis is in use does not guarantee the conversion accuracy for the diagnostic voltage of the channels for these pins.

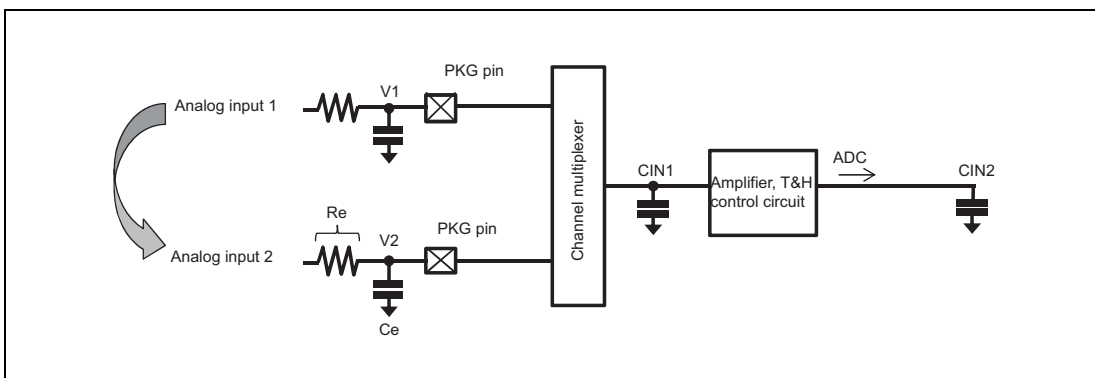

• Errors in the External Circuit of the A/D Converter

A formula for errors in sampled values due to the external circuit of the A/D converter is given below.

These errors will depend on the input circuit and conversion cycle. The formula given below for the errors is simplified for the calculation of sampling errors based on internal stray capacitance, amplifier offset, resistance of the signal source, and conversion cycle. This formula can also be used to calculate the effects of the signal source resistance and conversion cycle on these errors. The formula gives the error of analog input 2 as shown in the figure below when A/D conversion is performed in the order analog input 1 then 2.

$$\text{Conversion error (LSB)} = \left[\frac{|V2-V1| \times CIN1}{Ce + CIN1} + \frac{|Vvfaerr| \times CIN2}{Ce + CIN2} \right] \times \frac{1}{1 - e^{-T1/(Re + Ce)}} + \left(\frac{1}{T1} \times C1 \times V3 \times Re \right) \times \frac{4096}{Vavrefh}$$

Item	Symbol	Reference	Unit
Common capacitance of the final stage of channel multiplexer	CIN1	1.4	pF
Common capacitance of the final state of the amplifier and T&H control circuit	CIN2	10	pF
External capacitor on analog input pin	Ce	Depends on user board	μF
Signal source impedance	Re		KΩ
Conversion cycle of conversion pins	T1		ms
AnVREFH voltage (n = 0, 1)	Vavrefh		V
Potential difference between V1 and V2	V2-V1	5	V
Offset voltage of amplifier and T&H control circuit	Vvfaerr	50	mV
Parasitic capacitance of the last stage of channel multiplexer	C1	2	pF
AnVCC voltage /2.5 – measured pin voltage (V2) (n = 0, 1)	V3	Depends on user board	V

- Values for conversion error calculated by using this formula do not include error (absolute error, etc.) specified in the A/D converter characteristics.
- This formula is a desktop formula and theoretical. When the signal source has an extremely high resistance or when the conversion cycle is too short, calculated and measured values may differ. Actual error depends on the capacitor, resistor, capacitance and resistance of board wiring, so please evaluate and verify the error on the user board is no greater than the value produced by this formula (Re < 1.5 MΩ and T1 ≥ 10 μs, or 1.5 MΩ ≤ Re ≤ 2 MΩ and T1 ≥ 512 μs).

40.5 Code Flash Characteristics

Table 40.44 Code Flash Basic Characteristics

Item	Symbol	Conditions	Min.	Typ.	Max.	Unit
Programming endurance* ¹	CWRT	Retained for 20 years * ²	1000	—	—	Times
Temperature range of programming	TPRG	Tj	-40	—	+150	°C
Temperature range of reading	TREAD	Tj	-40	—	+150	°C

Note 1. Programming endurance is defined as the number of times each block is erased. Where programming endurance is n times (n = 1000 in this case), each block is erasable n times. For example, given a memory device that has 32-Kbyte erasure blocks, programming in the address range of each 256-byte programming block (128 programming operations, one for each block) in an erasure block and then erasing the block counts as one time in terms of programming endurance. However, programming of a given address range more than once after erasure is not possible (overwriting after programming is prohibited).

Note 2. This is the case when the average Ta is 85°C. This retained period is from when the erasure of the code flash memory has been normally completed.

Table 40.45 Code Flash Programming Characteristics

Conditions: EVCC = 4.5 V to 5.5 V, TTLVCC = 4.5 V to 5.5 V or 3.0 V to 3.6 V, A0VCC, A1VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC, ADSVCC = 4.5 V to 5.5 V, ADSVREFH = 4.5 V to ADSVCC, PLLVCC = 3.0 V to 3.6 V, SYSVCC = 3.0 V to 3.6 V, VCC = 3.0 V to 3.6 V, LVDVCC = 3.0 V to 3.6 V, VDD = 1.15 V to 1.35 V, VSS = PLLVSS = A0VSS = A1VSS = ADSVSS = ADSVREFL = LVDVSS = 0 V
Tj = -40°C to 150°C

Item	Condition	Block size	Min.	Typ.	Max.	Unit
Programming time	Programming endurance < 100 times	256 B	—	0.4* ¹	6* ¹	ms
		32 KB	—	80	360	ms
	Programming endurance ≥ 100 times	256 B	—	0.5* ¹	7.2* ¹	ms
		32 KB	—	96	432	ms
Erasing time	Programming endurance < 100 times	8 KB	—	39	120	ms
		32 KB	—	141	480	ms
	Programming endurance ≥ 100 times	8 KB	—	47	144	ms
		32 KB	—	169	576	ms

Note 1. Values are only for processing by hardware. Software overhead is not taken into account.

40.6 Data Flash Characteristics

Table 40.46 Data Flash Basic Characteristics

Item	Symbol	Condition	Min.	Typ.	Max.	Unit
Programming endurance* ¹	CWRT	Retained for 20 years* ²	125000	—	—	Times
		Retained for 3 years* ²	250000	—	—	Times
Temperature range of programming	TPRG	T _j	-40	—	+150	°C
Temperature range of reading	TREAD	T _j	-40	—	+150	°C

Note 1. Programming endurance is defined as the number of times each block is erased. Where programming endurance is n times (n = 125000 in this case), each block is erasable n times. For example, given a memory device that has 64-byte erasure blocks, programming in the address range of each 4-byte programming block (16 programming operations, one for each block) in an erasure block and then erasing the block counts as one time in terms of programming endurance. However, programming of a given address range more than once after erasure is not possible (overwriting after programming is prohibited).

Note 2. This is the case when the average T_a is 85°C. This retained period is from when the erasure of the data flash memory has been normally completed.

Table 40.47 Data Flash Programming Characteristics

Conditions: EVCC = 4.5 V to 5.5 V, TTLVCC = 4.5 V to 5.5 V or 3.0 V to 3.6 V, A0VCC, A1VCC = 4.5 V to 5.5 V, A0VREFH = 4.5 V to A0VCC, A1VREFH = 4.5 V to A1VCC, ADSVCC = 4.5 V to 5.5 V, ADSVREFH = 4.5 V to ADSVCC, PLLVCC = 3.0 V to 3.6 V, SYSVCC = 3.0 V to 3.6 V, VCC = 3.0 V to 3.6 V, LVDVCC = 3.0 V to 3.6 V, VDD = 1.15 V to 1.35 V, VSS = PLLVSS = A0VSS = A1VSS = ADSVSS = ADSVREFL = LVDVSS = 0 V
T_j = -40°C to 150°C

Item	Block size	Min.	Typ.	Max.	Unit
Programming time	4 B	—	0.16* ¹	1.7* ¹	ms
Erasing time	64 B	—	1.7* ¹	10 * ¹	ms
Blank check time	4 B	—	—	30* ¹	μs
	64 B	—	—	100* ¹	μs

Note 1. Values are only for processing by hardware. Software overhead is not taken into account.

40.7 Thermal Characteristics

40.7.1 Parameters

REVISION HISTORY

RH850/E1M-S2 User's Manual: Hardware

Rev.	Date	Description	
		Page	Summary
1.00	Jun 30, 2016	—	First Edition issued
1.10	Nov 30, 2017	Section 1 Overview	
		59	1.2 Features: CAN interface: The name of the conforming standard for RS-CAN mode and CAN-FD mode, modified CAN ISO-11898-1 (2003) → CAN ISO 11898-1: 2015 CAN-FD ISO-11898 (2014) → CAN-FD ISO 11898-1: 2015 The number of FlexRay channels, corrected
		78	Figure 1.3 Internal Block Diagram: GRAM interface unit, modified
		Section 2 Pins	
		105	2.1.4.6, (1) PCRn_m — Port Control Register: The description on the batch setting of multiple bits was moved to CAUTIONS. CAUTIONS added.
		105, 106	Table 2.28 PCRn_m Register Contents: The functional description of bits 31, 29 to 26, 23 to 20, 15 to 13, 11 to 9, 7, and 3 (reserved), modified
		143	Table 2.65 DNF Insertion Targets: Table heading, corrected (E1M-S BGA252 → E1M-S2 BGA304 BGA252)
		Section 3 CPU System	
		206	3.2.1.2, (5), (h) MCC — Memory protection setting check command register: The description, corrected
		211	Table 3.52 ICDATL Register Contents: The functional description, added
		212	Table 3.53 ICDATH Register Contents: The functional description, added
		213	3.2.1.2, (6), (h) ICERR — Instruction cache error register: The description, added. The name of bits 14 and 13 in the bit chart, corrected (ICHEW → ICHEWY)
		219	3.2.2.2 Instruction Cache Function: The description of "Data Array, DATA", added
		219	Figure 3.4 Data Alignment in the Instruction Cache: Added
		219	3.2.2.3 Data Buffer Function: The description, corrected (four-line → eight-line)
		221	3.2.4.1, (2) Protection Made by PEID and SPID: The description, corrected (16 Mbytes → 2 Mbytes)
		230	Table 3.71 Register Contents of IPGECRUM: CAUTION added to the functional description of the DS bit
		231	Table 3.72 Register Contents of IPGADRUM: CAUTION added to the functional description
		236	Table 3.78 SEGCONT Register Contents (2/2): The functional description of the LSUE bit, modified (implemented → unimplemented), The functional description, added.
		237	3.2.4.3, (2), (b) SEGFLAG — Error Occurrence Retention Register: The name of bits 7 and 5 in the bit chart, corrected (GBMF → GRMF, CFMF → CFBF)
		238	3.2.4.3, (2), (c) SEGADDR — Error Factor Retention Register (Address): The value after reset in the bit chart, corrected
		241	Table 3.82 Features of the RH850G3K Core: The caution when PCU is not in use, added
		246	3.3.1.2, (2), (b) EIPSW — Status save register when acknowledging EI level exception register: The name of bit 0 in the bit chart, corrected (V → Z)
		248	3.3.1.2, (2), (d) FEPSW — Status save register when acknowledging FE level exception register: The name of bit 0 in the bit chart, corrected (V → Z)
		249	3.3.1.2, (2), (e) PSW — Program status word register: The name of bit 0 in the bit chart, corrected (V → Z)
		260	Table 3.111 MCTL Register Contents: Note for the functional description of the MA bit, modified
		261	3.3.1.2, (3), (a) ISPR — Priority of interrupt being serviced register: The name of bits 15, 13, 11, and 9 in the bit chart, corrected (0 described)
		262	Table 3.114 PMR Register Contents: In the functional description of PM7-0, the priority of bit 7, corrected
		266	Table 3.118 MPM Register Contents: Note added to the SVP bit
		267	3.3.1.2, (5), (d) MPBRGN — MPU base region register: The bit width of the MPBRGN bit in the bit chart, corrected (4 to 0 → 3 to 0)

REVISION HISTORY

RH850/E1M-S2 User's Manual: Hardware

Rev.	Date	Description			
		Page	Summary		
1.10	Nov 30, 2017	267	Table 3.120 MPBRGN Register Contents: The bit width of the MPBRGN bit, corrected (4 to 0 → 3 to 0)		
		267	3.3.1.2, (5), (e) MPTRGN — MPU end region register: The bit width of the MPTRGN bit in the bit chart, corrected (4 to 0 → 3 to 0)		
		267	Table 3.121 MPTRGN Register Contents: The bit width of the MPTRGN bit, corrected (4 to 0 → 3 to 0)		
		277	3.5.1.1 When updated results in the control registers are reflected in the implementation of a subsequent instruction: Example 2: (4), corrected		
		Section 4 Address Space			
		282	Table 4.1 Address Space: Terms unified in the description of "Address Space Type" (0000 0000 _H to 003F FFFF _H : FCU firmware area → FCU firmware storage area, 0103 7000 _H to 0103 7FFF _H : FCU firmware area → FCU firmware storage area 2)		
		Section 6 Interrupt			
		291	Table 6.1 Interrupt Control: The "Access width" column, added		
		292	Table 6.2 External Interrupts, Software Interrupts, and NMI: The "Access width" column, added		
		292	Table 6.3 Interrupt Merge Function: The "Access width" column, added		
		292	Table 6.4 ATU-IV Interrupt Control: The "Access width" column, added		
		293	Table 6.5 EIC Register Contents (1/2): The functional description of the EIRFn bit, modified		
		294	Table 6.5 EIC Register Contents (2/2): The functional description of the EIMKn bit, corrected (PMF bit → PMEI bit)		
		306	6.2.11 TIMER — Timer Interrupt Mask Enable Register: The description of the IME2 bit, added		
		310	6.4 Interrupt Exception Handler and Priority Operations: CAUTION deleted		
		332	Figure 6.4 Example of Software Interrupt Processing Flow: The condition of Y/N judgment, corrected		
		Section 7 DMA			
		339	7.2.1.2 Executing a DMA Cycle: The description, added		
		355	7.3.2 Suspending, Resuming, and Aborting Transfer by a DMAC Channel: The description, added		
		359	Table 7.5 List of Functions for Suspending, Resuming, and Aborting Transfer: Note 3, added		
		360	7.4.2 DMA Transfer Error: The description, added		
		363	7.5.2.4 Illegal Access: The description, added		
		386	7.9.2.7 DTSER2 — DTS Error Register 2: The name of bit 31 in the bit chart, corrected (RMADED → RAMDED)		
		410	Table 7.42 DTCTn Register Contents (3/3): CAUTIONS 1, modified		
		423	Figure 7.12 Structure of the TI: The figure for TI-H, corrected		
		425	7.11.1.4 Caution about accessing the TI: The description, corrected (Bits 31 to 26 of the TI-H → Bits 31 to 23 of the TI-H)		
		426	Table 7.54 DTS Channel Register Address: Registers DTSA _{nnn} , DTD _{nnn} , and DTT _{Cnnn} of duplicated entries, deleted. Registers DTFST _{nnn} , DTFSS _{nnn} , and DTFSC _{nnn} , added.		
		Section 9 Power Supply Circuit			
		451	9.1 Features: Uses of power supply for TTLVCC, modified		
		Section 10 Power Supply Voltage Monitor			
		457	Table 10.1 Register Specifications: The "Access Protection" column, added		
		461	10.3.4 HDETCTL — Upper Limit Voltage Setting Register: The name of bits 1 and 0 in the bit chart, modified (VDDREFH1, VDDREFH0 → VDDREFH[1:0])		
		461	Table 10.5 HDETCTL Register Contents: The name of bits 1 and 0, modified (VDDREFH1, VDDREFH0 → VDDREFH[1:0])		
		462	10.3.5 LDETCTL — Lower Limit Voltage Register: The name of bits 1 and 0 in the bit chart, modified (VDDREFL1, VDDREFL0 → VDDREFL[1:0])		
		462	Table 10.6 LDETCTL Register Contents: The name of bits 1 and 0, modified (VDDREFL1, VDDREFL0 → VDDREFL[1:0])		

REVISION HISTORY

RH850/E1M-S2 User's Manual: Hardware

Rev.	Date	Description	
		Page	Summary
1.10	Nov 30, 2017	463	10.3.6 VSDETFCTL — Detection Signal Filter Control Register: The name of bits 1 and 0 in the bit chart, modified (DETF1, DETF0 → DETF[1:0])
		463	Table 10.7 VSDETFCTL Register Contents: The name of bits 1 and 0, modified (DETF1, DETF0 → DETF[1:0])
		Section 11 Clock Controller	
		467	11.1 Features: The description on the clock gear up, added. Note 1, added.
		468	Table 11.1 List of Clocks: Note 3, added
		484	11.5.1 Operation When the Divide Function Is Used: A duplicate of the reference in the description, deleted
		489	Table 11.16 Pin Specifications: The "Access Protection" column, added
		Section 12 Standby Controller	
		502	12.2.1 Power Off Standby Mode: The description, modified (SRAM → RAM, the reference added)
		504	Table 12.2 EPTCNT Register Contents: The functional description of bits 31 to 1 (reserved), modified
		Section 13 Clocked Serial Interface H (CSIH)	
		529	Figure 13.1 CSIH Block Diagram: The name of registers, corrected (CSIHnRX0 → CSIHnRX0W/H, CSIHnTX0 → CSIHnTX0W/H)
		539	Figure 13.7 Chip Select and RCB Example: The error in the figure, corrected (Inter-data time → Idle time, CSIHnCFG1.CSIHnID1[3:0] → CSIHnCFG1.CSIHnID1[2:0])
		547	13.5.7, (2) Data length greater than 16 bits: The error in the description of "Example", corrected (2 to 16 bits plus 8 bits → two 16-bit blocks plus 8 bits)
		Section 14 Serial Communication Interface 3 (SCI3)	
		600	Table 14.5 SCI3nSCR Register Contents (2/2): The functional description of bits CKE[1:0], modified (For asynchronous mode: 1X: External clock → 1X: Setting prohibited)
		603	14.3.8 SCI3nSCMR — Serial Transfer Format Register: R/W of bits 7 to 4, 1, and 0 in the bit chart, corrected
		604	14.3.9 SCI3nSEMR — Serial Extended Mode Register: R/W of bits 5, 4, 1, and 0 in the bit chart, corrected
		605	Table 14.9 Relationship between Setting N in SCI3nBRR and Bit Rate B: The calculation formula for "Bit Rate" and "Mean Error", modified
		611	14.4.2 Receive Data Sampling Timing and Reception Margin: The description of symbol N, modified
		612	14.4.3 Clock: The description, deleted
		614	14.4.6 Serial Data Transmission (Asynchronous Mode): Supplementary note on operation when data transmission in asynchronous mode is enabled, added
		615	Figure 14.7 Example of Serial Transmission Flowchart: The description of [1], modified
		616	Figure 14.8 Example Flowchart for Stopping the SCI3 after Serial Transmission: The error, corrected
		617	14.4.7 Serial Data Reception (Asynchronous Mode): The description in item 3, modified (transferred to RDR → transferred to SCI3nRDR) The error in the description of 5. modified (Reading the RDRF flag → Reading SCI3nRDR)
		624	Figure 14.15 Example of Multi-Processor Serial Reception Flowchart (1): The condition of Y/N judgment, corrected (Is ORER or RER set to 1? → Is ORER or FER set to 1?)
		637	14.8 Interrupt Sources: CAUTION was changed to Note. The description, added.
		638	14.9.2 Mark State and Break Output: Added
		Section 15 LIN Master Interface (RLIN2)	
		641	Table 15.5 Clock Supply: The errors in "Clock for the Unit" and "Supply Clock Name", corrected
		658	Table 15.23 RLN21nmLiMST Register Contents: The functional description of bits 7 to 2 (reserved), corrected
		660	15.3.3.10 RLN21nmLiST — LIN Status Register: The description of "ERR Flag", corrected (TER → FTER)

REVISION HISTORY

RH850/E1M-S2 User's Manual: Hardware

Rev.	Date	Description	
		Page	Summary
1.10	Nov 30, 2017	661	15.3.3.11 RLN21nmLiEST — LIN Error Status Register: The description of "Access", modified (read → read/written)
		666	15.3.3.14 RLN21nmLiCBr — LIN Checksum Buffer Register: The description, corrected (after frame transmission completion → after frame transmission/reception completion)
		667	15.3.3.15 RLN21nmLiDBRb — LIN Data Buffer b Register: The description when the error was detected, added to "For response reception"
		682	Table 15.35 Types of Statuses: The description of "Status" and "Status Set Condition" in "HTRC flag in RLN21nmLiST register", corrected (reception end → transmission end, received successfully → transmitted successfully)
		691	Figure 15.16 Block Diagram of Baud Rate Generation in LIN Master Mode: The error in Note 3, corrected (N + 1 (N = 0 to 255) → M + 1 (M = 0 to 255))
		Section 16 CANFD Interface (RS-CANFD)	
		696	Table 16.9 RS-CANFD Module Specifications (1/3): The number of receive buffers, modified (0 to 63 buffers → 0 to 64 buffers)
		698	16.2.3 Switching the CAN FD Protocol: The description, modified. The name of the conforming standard for CAN-FD mode, modified.
		700	16.3.1 List of Registers: Table 16.174 and Table 16.175 were added as the reference
		709	16.3.3.2 RSCANnCMCTR — Channel Control Register: The description of the ERRD bit, modified (RSCFDnCFDCmERFL → RSCANnCMERFL, the description added)
		726	Table 16.23 RSCANnGERFL Register Contents (1/2): The functional description of bits 15 to 3 (reserved), modified
		740	16.3.5.5 RSCANnGAFLP0j — Receive Rule Pointer 0 Register: The bit width of the GAFLRMDP[6:0] bits in the bit chart, corrected (14 to 9 → 14 to 8), R/W of bit 8, modified
		744	16.3.6.2 RSCANnRMNDy — Receive Buffer New Data Register y: The name of the bit in the bit chart, modified
		760	16.3.8.1 RSCANnCFCK — Transmit/Receive FIFO Buffer Configuration/Control Register: The description of the CFTML[3:0] bits, modified (the reference added)
		781	16.3.9.6 RSCANnCFSTIS — Transmit/Receive FIFO Buffer Transmit Interrupt Flag Status Register: The name of bit 1 in the bit chart, corrected (CH1TXIF1 → CF1TXIF)
		792	16.3.10.7 RSCANnTMIECy — Transmit Buffer Interrupt Enable Configuration Register: The name of the bit in the bit chart, modified
		794	16.3.11.1 RSCANnTMTRSTSy — Transmit Buffer Transmit Request Status Register: The name of the bit in the bit chart, modified
		796	16.3.11.2 RSCANnTMTARSTSy — Transmit Buffer Transmit Abort Request Status Register: The name of the bit in the bit chart, modified
		798	16.3.11.3 RSCANnTMTCASTSy — Transmit Buffer Transmit Complete Status Register: The name of the bit in the bit chart, modified
		800	16.3.11.4 RSCANnTMTASTSy — Transmit Buffer Transmit Abort Status Register: The name of the bit in the bit chart, modified
		803	16.3.12.1 RSCANnTXQCCm — Transmit Queue Configuration/Control Register: The description of the TXQDC[3:0] bits, modified (the reference added)
		804	Table 16.76 RSCANnTXQSTSm Register Contents: The functional description of bits 31 to 3 (reserved), corrected
		808	16.3.13.1 RSCANnTHLCCm — Transmit History List Configuration/Control Register: The description of the THLDTE and THLE bits, modified
		816	16.3.14.2 RSCANnGTSTCTR — Global Test Control Register: The description of the RTME bit, modified (the reference added)
		819	16.4.1 List of Registers: Table 16.174 and Table 16.175 were added as the reference
		825	16.4.3.1 RSCFDnCFDCmNCFG — Channel Nominal Bit Rate Configuration Register: The description of bits NBRP[9:0], added
		840	16.4.3.5 RSCFDnCFDCmDCFG — Channel Data Bit Rate Configuration register: The description of bits DBRP[7:0], added
841, 842	16.4.3.6 RSCFDnCFDCmFDCFG — Channel CAN FD Configuration Register: The name of bit 28 in the bit chart, corrected (FODE → FDOE). The description on the FDOE and GWBRS bits, modified		

REVISION HISTORY

RH850/E1M-S2 User's Manual: Hardware

Rev.	Date	Description	
		Page	Summary
1.10	Nov 30, 2017	846, 847	16.4.3.8 RSCFDnCFDCmFDSTS — Channel CAN FD Status Register: The name of bit 7 in the bit chart, corrected (TDCV → TDCVF). NOTE added.
		852	16.4.4.1 RSCFDnCFDGCFCFG — Global Configuration Register: The description on the CMPOC bit, added
		858	Table 16.106 RSCFDnCFDGERFL Register Contents (1/2): The functional description of bits 15 to 4 (reserved), modified
		864	Table 16.109 RSCFDnCFDGFDCFCFG Register Contents: The functional description of the RPED bit, modified
		864	16.4.4.7 RSCFDnCFDGFDCFCFG — Global FD Configuration Register: The name of the bit, corrected (PRED Bit → RPED Bit)
		871	16.4.5.5 RSCFDnCFDGAFLP0_j — Receive Rule Pointer 0 Register: The name of bit 15 in the bit chart, corrected (GAFLRVM → GAFLRMV)
		871	Table 16.114 RSCFDnCFDGAFLP0_j Register Contents (1/2): The functional description of the GAFLDLC[3:0] bits, modified (0 data bytes → DLC check is disabled)
		875	16.4.6.2 RSCFDnCFDRMNDy — Receive Buffer New Data Register: The name of the bit in the bit chart, modified
		894	16.4.8.1 RSCFDnCFDFCCK — Transmit/receive FIFO Buffer Configuration and Control Register k: The functional description of the CFTML[3:0] bits, modified (the reference added)
		905	Table 16.134 RSCFDnCFDCFFDCSTSk Register Contents: The functional description of bits 31 to 3 (reserved), added
		928	16.4.10.7 RSCFDnCFDTMIECy — Transmit Buffer Interrupt Enable Configuration Register: The name of the bit in the bit chart, modified
		930	16.4.11.1 RSCFDnCFDTMTRSTSy — Transmit Buffer Transmit Request Status Register: The name of the bit in the bit chart, modified
		932	16.4.11.2 RSCFDnCFDTMTARSTSy — Transmit Buffer Transmit Abort Request Status Register: The name of the bit in the bit chart, modified
		934	16.4.11.3 RSCFDnCFDTMTCSTSy — Transmit Buffer Transmit Complete Status Register: The name of the bit in the bit chart, modified
		936	16.4.11.4 RSCFDnCFDTMTASTSy — Transmit Buffer Transmit Abort Status Register: The name of the bit in the bit chart, modified
		939	16.4.12.1 RSCFDnCFDTXQCCm — Transmit Queue Configuration and Control Register: The functional description of the TXQDC[3:0] bits, modified (the reference added)
		940	Table 16.159 RSCFDnCFDTXQSTSm Register Contents: The functional description of bits 31 to 3 (reserved), modified
		952	16.4.14.2 RSCFDnCFDGTSTCTR — Global Test Control Register: The functional description of RTME bit, modified (the reference added)
		957	Figure 16.2 CAN Global Interrupt Block Diagram: The figure, modified (RSCFDn(CFD)CFDGCTR.CMPOFIE → RSCFDnCFDGCTR.CMPOFIE, RSCFDn(CFD)CFDGERFL.CMPOF → RSCFDnCFDGERFL.CMPOF)
		958	Figure 16.3 CAN Channel Interrupt Block Diagram: The figure, modified (RSCFDn(CFD)CTR.EOCOIE → RSCFDnCFDCmCTR.EOCOIE, RSCFDn(CFD)FDSTS.EOCO → RSCFDnCFDCmFDSTS.EOCO, RSCFDn(CFD)CTR.SOCOIE → RSCFDnCFDCmCTR.SOCOIE, RSCFDn(CFD)FDSTS.SOCO → RSCFDnCFDCmFDSTS.SOCO, RSCFDn(CFD)CTR.TDCVFIE → RSCFDnCFDCmCTR.TDCVFIE, RSCFDn(CFD)FDSTS.TDCVF → RSCFDnCFDCmFDSTS.TDCVF)
962	Figure 16.5 Channel Mode State Transition Chart: The description of the shift from the bus off state to the idle state, and from the bus off state to the transmission state, added. Note 3, added.		
966	Table 16.174 Registers Initialized in Global Reset Mode or Channel Reset Mode: SCNT[3:0] was added to the description of "Bit/Flag" for the RSCFDnCFDCmFDCRC register		
968	16.7 Reception Function: The description, modified (0 to 63 receive buffers → 0 to 64 receive buffers)		
969	Figure 16.6 Entry of Receive Rules (in the case of setting channel 0,1): The name of the register, modified		
971	16.7.1.3 Routing Processing: The description, added		

REVISION HISTORY

Rev.	Date	Description	
		Page	Summary
1.10	Nov 30, 2017	977	16.8.3.1 Interval Transmission Function: The description, added
		978	Figure 16.10 Interval Timer Block Diagram: Note 1, added
		986	16.10.5 RAM Test: The description, added
		990	16.11.1.2 Bit Timing Setting: The description, added
		997	Figure 16.21 Buffer Setting Procedure: The number of receive buffers, modified ((0 to 96) → (0 to 64))
		998	Figure 16.22 SSP timing: Note added
		998	16.11.1.6 Transmitter Delay Compensation (Only in CAN FD Mode): The description, added
		1017	Figure 16.36 Protection Release Procedure: The condition of the judgment, modified (RSCFDn(CFD)GCTR → RSCFDn(CFD)GSTS)
		1018	Figure 16.37 RAM Test Setting Procedure: Note 1, added
		1020	16.12 Notes on the RS-CANFD Module: The name of the register, modified (RSCFDn(CFD)TMTRSTS2 → RSCFDn(CFD)TMTRSTS1, RSCFDn(CFD)TMTARSTS2 → RSCFDn(CFD)TMTARSTS1, RSCFDn(CFD)TMTCASTS2 → RSCFDn(CFD)TMTCASTS1, RSCFDn(CFD)TMTASTS2 → RSCFDn(CFD)TMTASTS1, RSCFDn(CFD)TMIEC2 → RSCFDn(CFD)TMIEC1)
		Section 17 FlexRay	
		1022	17.1 FlexRay Module: The description, corrected (V2.1 Rev. A → V2.1)
		1023	17.1.1 Overview: The error in the specification of communication, corrected (V2.1 Rev. A → V2.1)
		1027	17.1.3 Block Diagram: The description of "Timer (TIM)", modified
		1051	17.2.4.3 FLXA0FREILS — FlexRay Error Interrupt Line Select Register: The name of bit 9 in the bit chart, corrected (IBAL → IIBAL)
		1068	Table 17.17 FLXA0FRT2C Register Contents: The error in the functional description of the T2RC bit, modified
		1074	Table 17.20 FLXA0FRSUCC1 Register Contents (2/2): The functional description of the CMD[3:0] bits, corrected (1011, deleted)
		1088	17.2.6.6 FLXA0FRPRTC2 — FlexRay PRT Configuration Register 2: The value after reset of bit 8 in the bit chart, modified
		1140	17.2.8.4 FLXA0FRFCL — FlexRay FIFO Critical Level Register: The value after reset of bit 7 in the bit chart, modified
		1151	17.2.9.5 FLXA0FRTRXQi — FlexRay Transmission Request i: The name of the bit in the bit chart, modified
		1152	17.2.9.6 FLXA0FRNDATi — FlexRay New Data Register i: The name of the bit in the bit chart, modified
		1153	17.2.9.7 FLXA0FRMBSCi — FlexRay Message Buffer Status Changed Register i: The name of the bit in the bit chart, modified
		1188	17.2.12.2, (6) FLXA0FROTC.OTCS: The description, modified (NDAT bits → ND bits, MBSC bits → MBC bits, FLXA0FRMBSC register → FLXA0FRMBSCi register)
		1201	17.2.13.2 FLXA0FROTS — FlexRay Output Transfer Status Register: The name of bits 11 and 10 in the bit chart, corrected (FWS → FWIS, OWS → OWIS)
		1216	Figure 17.6 Configuration of NIT Start and Offset Correction Start: The name of registers, corrected (FLXA0FRGTU2.MPC → FLXA0FRGTUC2.MPC, FLXA0FRGTU4.NIT → FLXA0FRGTUC4.NIT, FLXA0FRGTU4.OCS → FLXA0FRGTUC4.OCS)
		1241	17.3.9.4 Frame Transmission: The name of the register, modified (FLXA0FRTRXQ1 → FLXA0FRTRXQ1)
		1274	17.3.16.1, (3) Input pointer table: Equation 1, modified (((FLXA0FRITC.ITM + 1) × D × 2) × 4) → (((FLXA0FRITC.ITM + 1) × 2) × 4))
		1284	17.3.16.2, (3) Output pointer table: The description, modified (NDAT bit → ND bit, MBSC bit → MBC bit)
		1285	17.3.16.2, (5) Transfer function of dedicated message buffers: The name of the register and the flag, modified (FLXA0FRNDAT → FLXA0FRNDATi, NDAT → ND, FLXA0FRMBSC → FLXA0FRMBSCi, MBSC → MBC)

REVISION HISTORY

RH850/E1M-S2 User's Manual: Hardware

Rev.	Date	Description	
		Page	Summary
1.10	Nov 30, 2017	1295	17.3.16.5, (1) Read error during transfer from TBF to MBF: The description, modified (FLXA0FRNDAT flag → ND flag in the FLXA0FRNDATi register)
		1298	17.3.16.6, (2) System bus transfer time: Equation 8 , modified (XXXXX → XXXX * (2 + 68) + 3)
		Section 18 Renesas High-Speed Bus (RHSB)	
		1328	18.2.4.8 RHSBjDCD — Downstream Command Data Register: The name of the bit in the bit chart, modified
		1348	18.2.6.2 RHSBjIS — Interrupt Status Register: The name of bit 25 in the bit chart, corrected (RHSBjUE → RHSBjUEF)
		Section 19 Single Edge Nibble Transmission (RSENT)	
		All	Terms unified The following terms were unified to “status and communication nibbles”. status/communication nibbles communication and status nibble The following terms were unified to “channel message reception buffer”. channel message buffer channel receive buffer channel receive message buffer The following term was unified to “message reception buffer”. receive message buffer → message reception buffer
		1408	The description at the beginning of the section, deleted
		1410	Table 19.5 RSENTn Input/Output Signals: The functional description, modified (RSENT data input → RSENT receive data input, RSENT data output → RSENT SPC extension output)
		1411	19.2 Functions: The description, modified (rising edges → falling edges)
		1414	Table 19.7 RSENTnTSPC Register Contents: The functional description of the TTPV[6:0] bits, modified
		1416	19.3.2 RSENTnTSC — RSENT Timestamp Counter: The description when reading the timestamp value of RSENTnTSC.TS (Timestamp), deleted
		1434	19.3.10 RSENTnCSC — RSENT Communication Status Clear Register: The description of RSENTnCSC.SEC (Slow Channel Encoding Error Clear), added
		1438	19.3.13 RSENTnCPL — RSENT Calibration Pulse Length Register: The name of bit 16 in the bit chart, modified (CPLV16 → CPLV[16]). The description of RSENTnCPL.CPLV (Calibration Pulse Length Value), modified.
		1443	Figure 19.2 Transition between Operation Modes: The transition condition from OPERATION ACTIVE to OPERATION IDLE, modified
		1444	19.4.2 CONFIGURATION Mode: The description of “Write access”, modified (and RSENTnMDC → RSENTnMDC, and RSENTnCSC)
		1446	19.5.1.1 Timestamp Clock Configuration: The description, modified
		1447	Figure 19.4 Timestamp Counter Synchronization: The description of processing, modified (than RSENT module 0 → of RSENT module 0)
		1448	19.5.2.1 RX BRP Setting: The calculation formula, modified
		1449	19.6 RSENT Operation: “RSENTnRX” was added to “SPC single-wire system” in the table
		1463	19.6.2.8 Error Flagging: The description, modified
		1463	Table 19.27 Timing at which Error Flag is Set while SPC Mode is Disabled: Note modified
		1463	Table 19.28 Timing at which Error Flag is Set while SPC Mode is Enabled: Note modified
		Section 21 OS Timer (OSTM)	
		1485	21.2.2.2 OSTMnCNT — OSTM Counter Register: The description was added to the value after reset
		Section 22 Advanced Timer Unit IV (ATU-IV)	
		1566	22.2.2.3 NCMR — Noise Cancellation Mode Register: noise cancellation register: The name, modified (NCNTAx → NCRAX)
		1587	22.4.2.8, (1) NCKGA0 to 6 — Noise Canceler Clock Select G A0 to 6: The name of the noise canceler counter, modified (NCNTGA0 to 6 → NCNTA0 to 6)
		1595	Table 22.18 TILRA Register Contents: The name of bits 6 to 0, modified (TIALx → TIAL0x)
		1607	Figure 22.15 Timer B Block Diagram: The error of the AGCKM2 output selector, corrected

REVISION HISTORY

RH850/E1M-S2 User's Manual: Hardware

Rev.	Date	Description	
		Page	Summary
1.10	Nov 30, 2017	1626	22.5.2.12 TCNTB1 — Event Counter B1: The error of the description, modified
		1635	22.5.2.21 TCNTB2 — Reload Counter B2: The error of the description, modified
		1644	22.5.2.30 TCNTB3 — Correcting Event Counter B3: The error of the description, modified
		1646	22.5.2.32 TCNTB4 — Multiplied-and-Corrected Clock Counter B4: The error of the description, modified
		1666	Figure 22.27 Operation of TCNTB5 (with Correction at End of Cycle): The TCNTB3 values, modified (00040, 00060, 00000, 00020 → 00060, 00080, 00000, 00020)
		1667	Figure 22.28 Operation of TCNTB5 (without Correction at End of Cycle): The TCNTB3 values, modified (00040, 00060, 00000, 00020 → 00060, 00080, 00000, 00020)
		1671	Figure 22.31 Block Diagram of Timer C: The description of "Note", modified ((*2) → Note*)
		1690	22.6.2.8 GRCxy — General Registers Cxy: The description, added
		1695	22.6.2.11 OCRCxy — Output Compare Registers Cxy: The description, added
		1696	Table 22.71 TIERCx Register Contents: The name of bits 11 to 8, and 3 to 0, modified (OCRCEx → OCRCExy, GRCEx → GRCExy)
		1697	22.6.2.13 CUCRCx — Counter Upper-Limit Setting Compare Registers Cx: The description, added
		1706	22.6.3 Operation: The description of "PWM Function" modified (bit PWMx → bit PWMx0)
		1710	Figure 22.36 Operation when the Compare Register Is Modified during One-Shot Pulse Output: The vertical ruled line, modified
		1717	Figure 22.43 One-Shot Pulse Output Cancellation Timing Chart: The vertical ruled line, modified
		1719	22.7.1 Operation Overview: The description of the down-counter underflow interrupt, modified (40 lines → 20 lines, D0 to D9 → D0 to D4)
		1724	22.7.2.2, (1) OBREDx — Timer Offset Base Register Enable: The description, modified (2A or 2B signal from timer A, added)
		1739	Table 22.85 TSRDx Register Contents: The name of bits 3 to 0, corrected (CMFBDx2 to CMFBDx0 → CMFBDx3 to CMFBDx0)
		1742	22.7.2.12, (5) CMFBDxy — Compare Match B Flag Dxy: The description, modified (the output compare B register (OCR2Dxy) → the output compare register 2Dxy (OCR2Dxy))
		1747	22.7.2.16 TICTSELDx — Timer Input Capture Trigger Select Register Dx: Note 1 in the bit chart, modified
		1752	22.7.2.21 OCR1Dxy — Output Compare Registers 1Dxy: The description on "counter upper-limit setting function", added
		1753	22.7.2.22 RCR1Dx — Range Comparison Value Setting Register 1Dx: The error of the description, modified
		1755	22.7.2.23 OCR2Dxy — Output Compare Registers 2Dxy: The description on "counter upper-limit setting function", added. The description on the AD start triggers, modified (Subblocks 0, 1, and 6 → Subblocks 0, 2, 4, 6, and 9)
		1756	22.7.2.24 RCR2Dx — Range Comparison Value Setting Register 2Dx: The error of the description, modified
		1762	22.7.3 Operation Description: The description, modified
		1767	22.7.3 Operation Description: Range Comparison Function: The error of the description, modified
		1767	Figure 22.49 Operation of the Range Comparison Function: The error of the description, modified (RCR1D → "the range value specified by RCR1Dx")
		1812	Table 22.108 TCR2Fx Register Contents: The bit position of the EISELEFx bit, modified (7 to 5 → 7)
1902	Figure 22.77 Data DMA Trigger Selection Circuit: Input signal to "Synchronization circuit", modified		
1906	22.14.1.2 Contention between Writing to Counter and Input Capture: The status of "Timer J" in the table, modified (FDOVJx → FDOVFJx)		
1907	22.14.1.3 Contention between Setting and Clearing of Input Capture Status Flag: The flag of "Timer J" in the table, modified (FDOVJx → FDOVFJx)		

REVISION HISTORY

Rev.	Date	Description			
		Page	Summary		
1.10	Nov 30, 2017	1910	22.14.2.3 Contention between CYLRExy Write and Cycle Match of CYLRExy, TCNTExy: The compare (cycle) match register of "TCNTB6 Counter" in the table, modified (OCRB6 → OCRB6/OCRB7)		
		1913	22.14.2.7 Contention between Writing to TCNTExy and Counter Clearing by Cycle Match: The compare (cycle) match register of "TCNTB6 Counter" in the table, modified (OCRB6 → OCRB6/OCRB7)		
		1923	Figure 22.98 Contention between TCNT1H Counter Overflow and Compare Match: The TCNT1H value after the counter is cleared by compare match, modified		
		1923	22.14.4.5 Contention between Overflow and Counter Clearing by Compare Match: The description, modified (PWMx bit → PWMx0 bit)		
		1934	22.14.7.5 Contention between Clearing of the Counter to 0 by Timer B and Clearing of the Counter by the Counter Upper-Limit Setting Function: Added		
		1935, 1936	22.14.8 Different Specifications of Operation in Response to a Match in Comparison: Added		
		Section 23 APA			
		1951	23.4.2.2 APAAnCHEN — APAAn Channel Operation Enable Register: The index of section title, corrected (APAAn → APAAn). The name of bits 15 to 0 in the bit chart, modified		
		1953	23.4.2.3 APAAnCHST — APAAn Channel Output Status Register: The name of bits 15 to 0 in the bit chart, modified		
		1956	23.4.3.3 APAAnRFMXm — APAAn Reference Maximum Value Setting Registers m: The description of "Address", corrected (+ 0260 _H → + 0268 _H)		
		1961	23.4.4.2 APAAnEVSW — APAAn Software Event Register: The name of bits 5 to 0 in the bit chart, corrected		
		1964	23.4.4.4 APAAnESTA — APAAn Event Status Register A: The name of bits 31 to 0 in the bit chart, corrected		
		1982	Table 23.41 APAAnELMCm Register Contents (1/2): The name of bit 23, corrected (APAAELMOPTRN[1:0] → APAAELMOPTRN)		
		Section 24 Motor Control Timer (TSG2)			
		All	The index, corrected (m = 00 to 09 → m = 0 to 9, k = 01 to 09 → k = 1 to 9)		
			The error in the register bit name, corrected (TSG2nRCC4-TSG2nRCC0 → TSG2nRCC04-TSG2nRCC00)		
		2070, 2071	Table 24.18 TSG2nSTR2 Register Contents: The functional description of bits 9 to 5, 3, and 2, modified		
		2081	24.4.2.22 TSG2nCMP1W — TSG2n Compare Registers 1 and 2: The description of TSG2nCMP2 in "PWM Mode" in the table, modified		
		2082	24.4.2.23 TSG2nCMP5W — TSG2n Compare Registers 5 and 6: The description of TSG2nCMP6 in "120-DC Mode" in the table, modified		
		2090	24.4.2.31 TSG2nPAT0W — TSG2n Pattern Register 0: The description, modified (bits 2 to 1 → bits 2 to 0)		
		2091	24.4.2.32 TSG2nPAT1W — TSG2n Pattern Register 1: The description, modified (bits 2 to 1 → bits 2 to 0)		
		2106	Table 24.31 Active Width Setting in SP-PWM Mode: The register name, modified (TSG2nCMP1W → TSG2nUPW, TSG2nCMP5W → TSG2nVPW, TSG2nCMP9W → TSG2nWPW)		
		2109	24.5.3, (2) Operation Example of Reloading (Simultaneous Rewriting): The description, modified (TSG2nCTL3 → TSG2nCTL4)		
		2110	Figure 24.11 Simultaneous Rewriting Timing (2/2) (Example of PWM mode): The interrupt, modified (INTTSG2nIPEK → INTTSG2nI0)		
		2112	24.5.4, (1) Timer Output in Each Mode: The description, modified (TSON1-TSON6 and TSON7 → TSON0 to TSON7)		
		2115	Table 24.39 List of Interrupts in Each Mode (3/5): The description of the interrupt INTTSG2nI[11] in "PWM mode" and "120-DC mode", modified		
		2118	Figure 24.15 Interrupt Generation Example (1/2) (Example of HT-PWM Mode): The waveforms of INTTSG2nI[1] and INTTSG2nI[2], modified		

REVISION HISTORY

Rev.	Date	Description	
		Page	Summary
1.10	Nov 30, 2017	2122	Figure 24.18 TSO _n 0 Pin Output depending onTSG2 _n IOC1.TSG2 _n TOS Setting: The flag name when TSG2 _n TOS = 1, modified (TSG2 _n CUF → TSG2 _n SUF)
		2138	Figure 24.35 When TSG2 _n RMC = 0 and TSG2 _n RIA = 0 in TSG2 _n CTL3 (without Reload Skipping): The bit name and the buffer name, modified (TSG2 _n CC04-TSG2 _n CC00 → TSG2 _n RCC04-TSG2 _n RCC00)
		2143	Figure 24.38 When TSG2 _n PIE = 1, TSG2 _n VIE = 1, and TSG2 _n RCC04 to TSG2 _n RCC00 = 00 _B in TSG2 _n CTL4, and TSG2 _n ACC01 and TSG2 _n ACC00 = 00 _B in TSG2 _n CTL5 (HT-PWM Mode): The description of the figure, modified
		2144	Figure 24.39 When TSG2 _n PIE = 0, TSG2 _n VIE = 1, and TSG2 _n RCC04 to TSG2 _n RCC00 = 02 _B in TSG2 _n CTL4 and TSG2 _n ACC01 and TSG2 _n ACC00 = 00 _B in TSG2 _n CTL5 (HT-PWM Mode): The description of the figure, modified. The position of Note 1 was moved in the figure.
		2186	Table 24.59 Compare Registers and Dead Time Setting Register Functions in SP-PWM Mode: Registers TSG2 _n DCMP0W and TSG2 _n DCMP2, added
		2201, 2202	24.11.4.3 Control Methods in 120-DC Mode: The description, modified (TSG3 _n OPT0.TSG3 _n PSC → TSG2 _n OPT0.TSG2 _n PSC)
		2209, 2210	24.11.4.6 List of Output Patterns in 120-DC Mode: The description, modified
		2211	Figure 24.78 Control when Timer Output Starts in Normal Rotation (when Normal Pattern is Input): Modified
		2212	Figure 24.79 Control when Timer Output Starts in Reverse Rotation (when Normal Pattern is Input): The pattern name of the TSO _n 5 pin, modified (PAT1T → PAT2T)
		2224	Figure 24.91 Example of Switching from 120-DC Mode to Software Output Control Function: TSG2 _n STCI0 signal, deleted
		Section 25 Timer Option (TAPA)	
		2229	25.2.1 Registers Overview: R/W of registers TAPAnACTS, TAPAnACTT, TAPAnOPHS, and TAPAnOPHT in the table, modified
		2232	Table 25.6 TAPAnACTS Register Contents: The functional description of the TAPAnACTS bit, modified (TAPAnACE → TAPAnACWE)
		2233	Table 25.7 TAPAnACTT Register Contents: The functional description of the TAPAnACTT bit, modified (TAPAnACE=0 → TAPAnACWE=1)
		Section 26 Peripheral Interconnection (PIC)	
		All	The term, unified: channel Group → scan Group
		2265	Table 26.19 PIC2DSADTEN1 _n 0 Register Contents: The name of bits 15 to 8, modified
		Section 27 A/D Converter (ADCB)	
		2275	27.1 Features: The description of "A/D-converted value adding function" added
		2289	27.5.2 ADCBmDR _n — Data Register n: The description, modified
		2304	27.5.16 ADCBmULLMTBR0 to 2 — Upper Limit/Lower Limit Table Register 0 to 2: The description, modified (32-bit → 16/32-bit)
		2321	Figure 27.3 Initial Settings: The unnecessary trigger of "Trigger selection" deleted
		2335	27.7.9.2 A/D Converter Self-Diagnosis: The description, modified ((A/D core) self-diagnosis→self-diagnosis)
		2337	Figure 27.18 Timing Chart of Normal A/D Conversion Operation (Single Conversion): The error, corrected (tCONV → tSAR, tSCAN → tSG)
		2342	Figure 27.22 Scan Conversion End Interrupt Occurrence Timing: The error in the peripheral clock waveform, corrected
		2343	Figure 27.23 Timing of an MPX Interrupt Occurrence: The error in the peripheral clock waveform, corrected
		2344	Figure 27.24 Timing of A/D Error Interrupt and Parity Error Interrupt Generation: The error in the peripheral clock waveform, corrected
		2345	Figure 27.25 DFE/APA0/ASF Entry Timing: APA1 deleted
		2349	Table 27.42 Combination of the T&H Circuits and Pins where Injected Current will Affect the Accuracy of Conversion: The unit name, modified
		2349	Table 27.43 Combination of the T&H Circuits and Pins where Injected Current will Affect the Accuracy of Conversion (the ADCB _n VCRj.GCTRL bits are used): The unit name, modified

Rev.	Date	Description	
		Page	Summary
1.10	Nov 30, 2017	2350	27.9.4 Notes on Register Setting: The description, added
		2356	Table 27.50 ASF1nDRi Register Contents: The description of "Bit Position" for bits ASF1nDRi[16:0], corrected (31 to 0 → 31 to 15)
		Section 28 Delta-Sigma AD Converter (DS-ADC)	
		2391	Figure 28.3 Initial Setting Flow: Note 1, added
		2392	Table 28.22 A/D Conversion Processing Time (Unit: Pφ P-Bus Clock (40 MHz)): The description of "A/D conversion processing time" and "A/D conversion start delay time" in Usage Example1 to 4, corrected. Note 1, added.
		2393	Figure 28.4 A/D Conversion Start and End: The figure, modified. Note 1 and Note 2, added.
		2394	28.6.4 Starting A/D Conversion by an External Trigger: The description on "DSADCmADSR.ADACT" added
		2394	28.6.5 Terminating A/D Conversion by an External Trigger: The description on ADACT, modified
		Section 29 Digital Filter (DFE)	
		All	The error in the register name, corrected (DFCTLACH → CTLACH, DFCTLBCH → CTLBCH, DFDOCH → DOCH, DFST → ST, DFSTCH → STCH, DFCLRSTCH → CLRSTCH, DFHOLCH → HOLCH, DFHOHCH → HOHCH, DFHOLMCH → HOLMCH) The binary notation, unified (4bXXXX → XXXX _b)
		2401	Table 29.1 Data that Can be Input for Each Channel: The error, corrected (A duplicate of CH0 and CH1, deleted)
		2406 to 2409	Table 29.3 List of Control Registers: The value after reset was modified according to the number of register bits.
		2419	29.2.6 STCHn — Status Register (n = 0 to 15): Bits 31 to 16 in the bit chart, deleted. R/W of bits 12, 9, 8, and 5 to 0, modified
		2422	29.2.7 CLRSTCHn — Clear Status Register (n = 0 to 15): Bits 31 to 16 in the bit chart, deleted
		2422	Table 29.9 CLRSTCHn Register Contents (1/2): The functional description of the CLRPHIOW bit, added
		2423	29.2.8 ERMCHn — Error Mask Register: The error in the bit chart, corrected (bits 31 to 8, deleted)
		2424	Table 29.11 TRGCHn Register Contents (1/2): The error in the functional description of the PFE and AFE bits, corrected
		2426	29.2.10 TRHCHn — Trigger History Register: The error in the bit chart, corrected (bits 31 to 8, deleted)
		2429	29.2.13 ACA to ACD — Accumulation/Decimation Count Setting Registers: The error in the bit chart, corrected (bits 31 and 16, deleted)
		2431	29.2.15 TRG — Software Trigger Register: The error in the bit chart, corrected (bits 31 to 8, deleted)
		2433, 2434	Table 29.19 PITRG Register Contents: The error of the signal name in the functional description of the PITMTRG3 to PITMTRG0 bits, modified
		2435, 2436	Table 29.20 MITRG Register Contents: The error of the signal name in the functional description of the MITMTRG3 to MITMTRG0 bits, modified
		2437, 2438	Table 29.21 FITRG Register Contents: The error of the signal name in the functional description of the FITMTRG3 to FITMTRG0 bits, modified
		2439	29.2.20 PHUPDCn — Peak-Hold Update Notification Setting Register n: The error in the bit chart, corrected (bits 31 to 8, deleted)
		2442	Table 29.25 HOHCHn Register Contents: The description of "Bit Position" for the GURD bit, corrected (31 to 0 → 5 to 0)
		2455	29.4.7.1 Timer Trigger Input: The error of the description, modified
		2455	Figure 29.15 Timer Trigger Input: The error of the signal name, corrected
		2458	Table 29.32 Trigger Flag Functions and Processing: The "Peak-hold update notification" column, added
		2492	Figure 29.51 Operations for Clearing of the DOEN Flag: The error in the register name, corrected
		2502	29.5.9 Restrictions on Trigger Setting Registers: The error of the description, modified

REVISION HISTORY

		2769	Table 34.17 OPBT0 Contents: The functional description of the CANFDCRC bit, modified. The name of ISO standards, unified (ISO/DIS 11898-1 → ISO 11898-1: 2015, ISO/CD 11898-1 (version 2014-08-12) → ISO/CD 11898-1(August 12, 2014 version)
		2772	Table 34.19 OPBT3 Register Contents: The functional description of the SWDT0_SADU22 to SWDT0_SADU0 bits, modified (007F FFFF _H → 003F FFFF _H)
		2773	Table 34.20 OPBT5 Register Contents: The name of bits 30 to 28, modified (SWDT0_OPWDOVF2 to SWDT0_OPWDOVF0 → SWDT2_OPWDOVF2 to SWDT2_OPWDOVF0). The functional description of the SWDT2_SADU22 to SWDT2_SADU0 bits, modified (007F FFFF _H → 003F FFFF _H)
		2776	34.11, (7) Items prohibited during programming, erasure, and blank checking: The section title and the description, modified (and erasure → , erasure, and blank checking)
		Section 37 Secure Watchdog Timer (SWDT)	
		2787	37.2.2 SWDTnMD — SWDT Mode Register: The name of bits 6 to 4 in the bit chart, modified
		Section 38 On-Chip RAM	
		2807	38.4.12 TM_MA00 — Tuning Memory Mapping Address Register 00: The error of R/W for bits 14 and 13 in the bit chart, corrected (R → R/W)
		2807	Table 38.9 TM_MA00 Register Contents: The error in the CAUTION for the TMAm[29:0] bits, corrected
		2807	38.4.12 TM_MA00 — Tuning Memory Mapping Address Register 00: The error in Caution 2, corrected
		2809	38.5 Usage Notes: The description on buffers for high-speed access, added
		Section 40 Electrical Characteristics	
		2837	Table 40.13 DC Characteristics (Standby): Conditions modified (SYSVCLow to 3.6 V → SYSVCC = SYSVCLow to 3.6 V)
		2838	Figure 40.3 AC Measurement Conditions: The description added to Note 1 (15 pF, added). Note 1 and Note 2 were added to symbols (CL, IOL, IOH)
		2845	Figure 40.9 Output Signal Timing: The description, corrected (Selection of driveability → Selection of driving ability)
		2855	Table 40.28 SCI3 Timing (Master Mode): The description in the Note, corrected (SCI → SCI3)
		2855	Figure 40.19 SCI3 Clock Input/Output Timing: The figure title, corrected (SCI → SCI3)
		2855	Figure 40.20 SCI3 Input/Output Timing / Clock Synchronous Mode: The figure title, corrected (SCI → SCI3)
		2859	Figure 40.23 TSG2 Timing: The symbols, corrected (tTIH → tTIL, tTIL → tTIH)
		2861	Table 40.34 JTAG/NEXUS Timing: The max value for symbols, tTDOD and tRDYD, corrected (tTCKcyc → tTCKW)
		2862	Figure 40.26 LDU 4-Wire Timing: The symbols, corrected (tLPDCKr → tLPDCKR, tLPDCKf → tLPDCKF, tLPDCKOr → tLPDCKOR)
		2864	Table 40.37 ADC Converter Characteristics: The name of items, modified (A/D conversion time (fOP = 20 MHz, 40 MHz) → A/D conversion time), The description of "Self-diagnosis absolute error", modified
		2864	40.4 A/D Converter Characteristics: CAUTION added
		2870	Table 40.48 Thermal Resistance in RH850/E1M-S2: Parameter 4LΨjt, added. The parameter of Estimate 15, corrected (4LΘja → 4LΨjb). The description of "Remark" for parameters Θja and Ψjb, modified (JESD51-7 → JESD51-9)
		2870	Table 40.49 JESD51-9 Compliant Board (4 Layers): The table title, modified (JESD51-7 → JESD51-9). The board size and the area of "Board" modified
		Appendix List of Registers	
		—	The symbol of registers LR1STEADR2_PE1 and LR1STEADR3_PE1, deleted
		Appendix Package Dimensions	
		3194, 3195	Package Dimensions: PRBG0304GB-A and PRBG0252GB-A, added

RH850/E1M-S2 User's Manual: Hardware
