Renesas Electronics
www.renesas.com

Rev.1.00 Oct. 2017

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other disputes involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawing, chart, program, algorithm, application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copy or otherwise misappropriation of Renesas Electronics products.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots etc.
   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.
   Renesas Electronics products are neither intended nor authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems, surgical implantations etc.), or may cause serious property damages (space and undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for which the product is not intended by Renesas Electronics.
6. When using the Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat radiation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions or failure or accident arising out of the use of Renesas Electronics products beyond such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please ensure to implement safety measures to guard them against the possibility of bodily injury, injury or damage caused by fire, and social damage in the event of failure or malfunction of Renesas Electronics products, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures by your own responsibility as warranty for your products/system. Because the evaluation of microcomputer software alone is very difficult and not practical, please evaluate the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please investigate applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive carefully and sufficiently and use Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall not use Renesas Electronics products or technologies for (1) any purpose relating to the development, design, manufacture, use, stockpiling, etc., of weapons of mass destruction, such as nuclear weapons, chemical weapons, or biological weapons, or missiles (including unmanned aerial vehicles (UAVs)) for delivering such weapons, (2) any purpose relating to the development, design, manufacture, or use of conventional weapons, or (3) any other purpose of disturbing international peace and security, and you shall not sell, export, lease, transfer, or release Renesas Electronics products or technologies to any third party whether directly or indirectly with knowledge or reason to know that the third party or any other party will engage in the activities described above. When exporting, selling, transferring, etc., Renesas Electronics products or technologies, you shall comply with any applicable export control laws and regulations promulgated and administered by the governments of the countries asserting jurisdiction over the parties or transactions.
10. Please acknowledge and agree that you shall bear all the losses and damages which are incurred from the misuse or violation of the terms and conditions described in this document, including this notice, and hold Renesas Electronics harmless, if such misuse or violation results from your resale or making Renesas Electronics products available any third party.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

(Rev.3.0-1 November 2016)

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Handling of Unused Pins

   Handle unused pins in accordance with the directions given under Handling of Unused Pins in the manual.

   — The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.

2. Processing at Power-on

   The state of the product is undefined at the moment when power is supplied.

   — The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied.
   In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed.
   In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.

3. Prohibition of Access to Reserved Addresses

   Access to reserved addresses is prohibited.

   — The reserved addresses are provided for the possible future expansion of functions. Do not access these addresses; the correct operation of LSI is not guaranteed if they are accessed.

4. Clock Signals

   After applying a reset, only release the reset line after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.

   — When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.

5. Differences between Products

   Before changing from one product to another, i.e. to a product with a different part number, confirm that the change will not lead to problems.

   — The characteristics of Microprocessing unit or Microcontroller unit products in the same group but having a different part number may differ in terms of the internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

How to Use This Manual

1. Purpose and Target Readers

This manual is designed to provide the user with an understanding of the hardware functions and electrical characteristics of the LSI. It is intended for users designing application systems incorporating the LSI. A basic knowledge of electric circuits, logical circuits, and LSIs is necessary in order to use this manual.

The manual comprises an overview of the product; descriptions of the CPU, system control functions, peripheral functions, and electrical characteristics; and usage notes.

> Particular attention should be paid to the precautionary notes when using the manual. These notes occur within the body of the text, at the end of each section, and in the Usage Notes section.

The following documents apply to the RZ/G1C. Make sure to refer to the latest versions of these documents.

Document Type	Description	Document Title	Document No.
User's manual for Hardware	Overview of hardware, area map, pin assignment, pin multiplexing, pin function controller, general purpose I/O port pins, clock, reset, core functions, graphics, video processing, sound processing, and network modules, serial interfaces, storage, timers, other on-chip peripheral functions, debugging, and electrical characteristics of the RZ/G1C.	RZ/G1C User's Manual: Hardware	R01UH0695EJ0100

2. Notation of Numbers and Symbols

Bit notation: Bits are shown in high-to-low order from left to right.

Number notation: Binary numbers are given as B'XXXX, hexadecimal numbers are given as H'XXXX, and decimal numbers are given as XXXX.

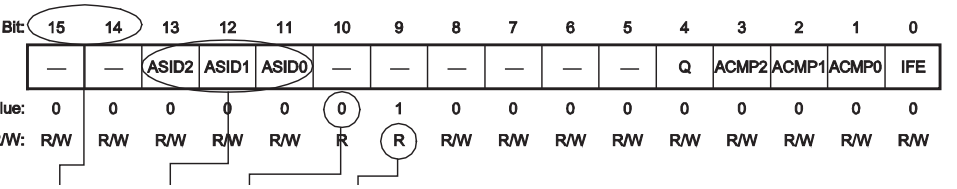
Signal notation: A number sign (#) after the name indicates that a signal or pin is active-low, unless otherwise specified.

Example: PRESET#

3. Register Notation

Each register description includes a bit chart, illustrating the arrangement of bits, and a table of bits, describing the meanings of the bit settings, unless otherwise specified.

[Bit Chart]



[Table of Bits]

(1) (2) (3) (4) (5)

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved
14	—	0	R	These bits are always read as 0.
13 to 11	ASID2 to ASID0	All 0	R/W	Address Identifier These bits enable or disable the pin function.
10	—	0	R	Reserved This bit is always read as 0.
9	—	1	R	Reserved This bit is always read as 1.
	—	0		

Note: The bit names and sentences in the above figure are examples, and have nothing to do with the contents of this manual.

(1) Bit
Indicates the bit number or numbers.
In the case of a 32-bit register, the bits are arranged in order from 31 to 0. In the case of a 16-bit register, the bits are arranged in order from 15 to 0.

(2) Bit name
Indicates the name of the bit or bit field.
When the number of bits has to be clearly indicated in the field, appropriate notation is included (e.g., ASID[3:0]).
A reserved bit is indicated by "–".
Certain kinds of bits, such as those of timer counters, are not assigned bit names. In such cases, the entry under Bit Name is blank.

(3) Initial value
Indicates the value of each bit immediately after a power-on reset, i.e., the initial value.
0: The initial value is 0.
1: The initial value is 1.
–: The initial value is undefined

(4) R/W
For each bit and bit field, this entry indicates whether the bit or field is readable or writable, or both writing to and reading from the bit or field are impossible.
The notation is as follows:

R/W: The bit or field is readable and writable.
R/(W): The bit or field is readable and writable.
However, writing is only performed to flag clearing.
R/WC0: The bit or field is readable and writable. Writing 0 to the bit initializes the bit.
Writing 1 to the bit is ignored.
R/WC1: The bit or field is readable and writable. Writing 1 to the bit initializes the bit.
Writing 0 to the bit is ignored.
R: The bit or field is readable.
"R" is indicated for all reserved bits. When writing to the register, write the value under Initial Value in the bit chart to reserved bits or fields.
W: The bit or field is writable.
Note that values read from write-only bits are not guaranteed, unless they are specified in the chart of bits.

(5) Description
Describes the function of the bit or field and specifies the values for writing.

Contents

1. Overview

1.1 Introduction

The RZ/G1C is MCU that features the basic functions for Rich Graphics Applications.

The RZ/G1C includes:

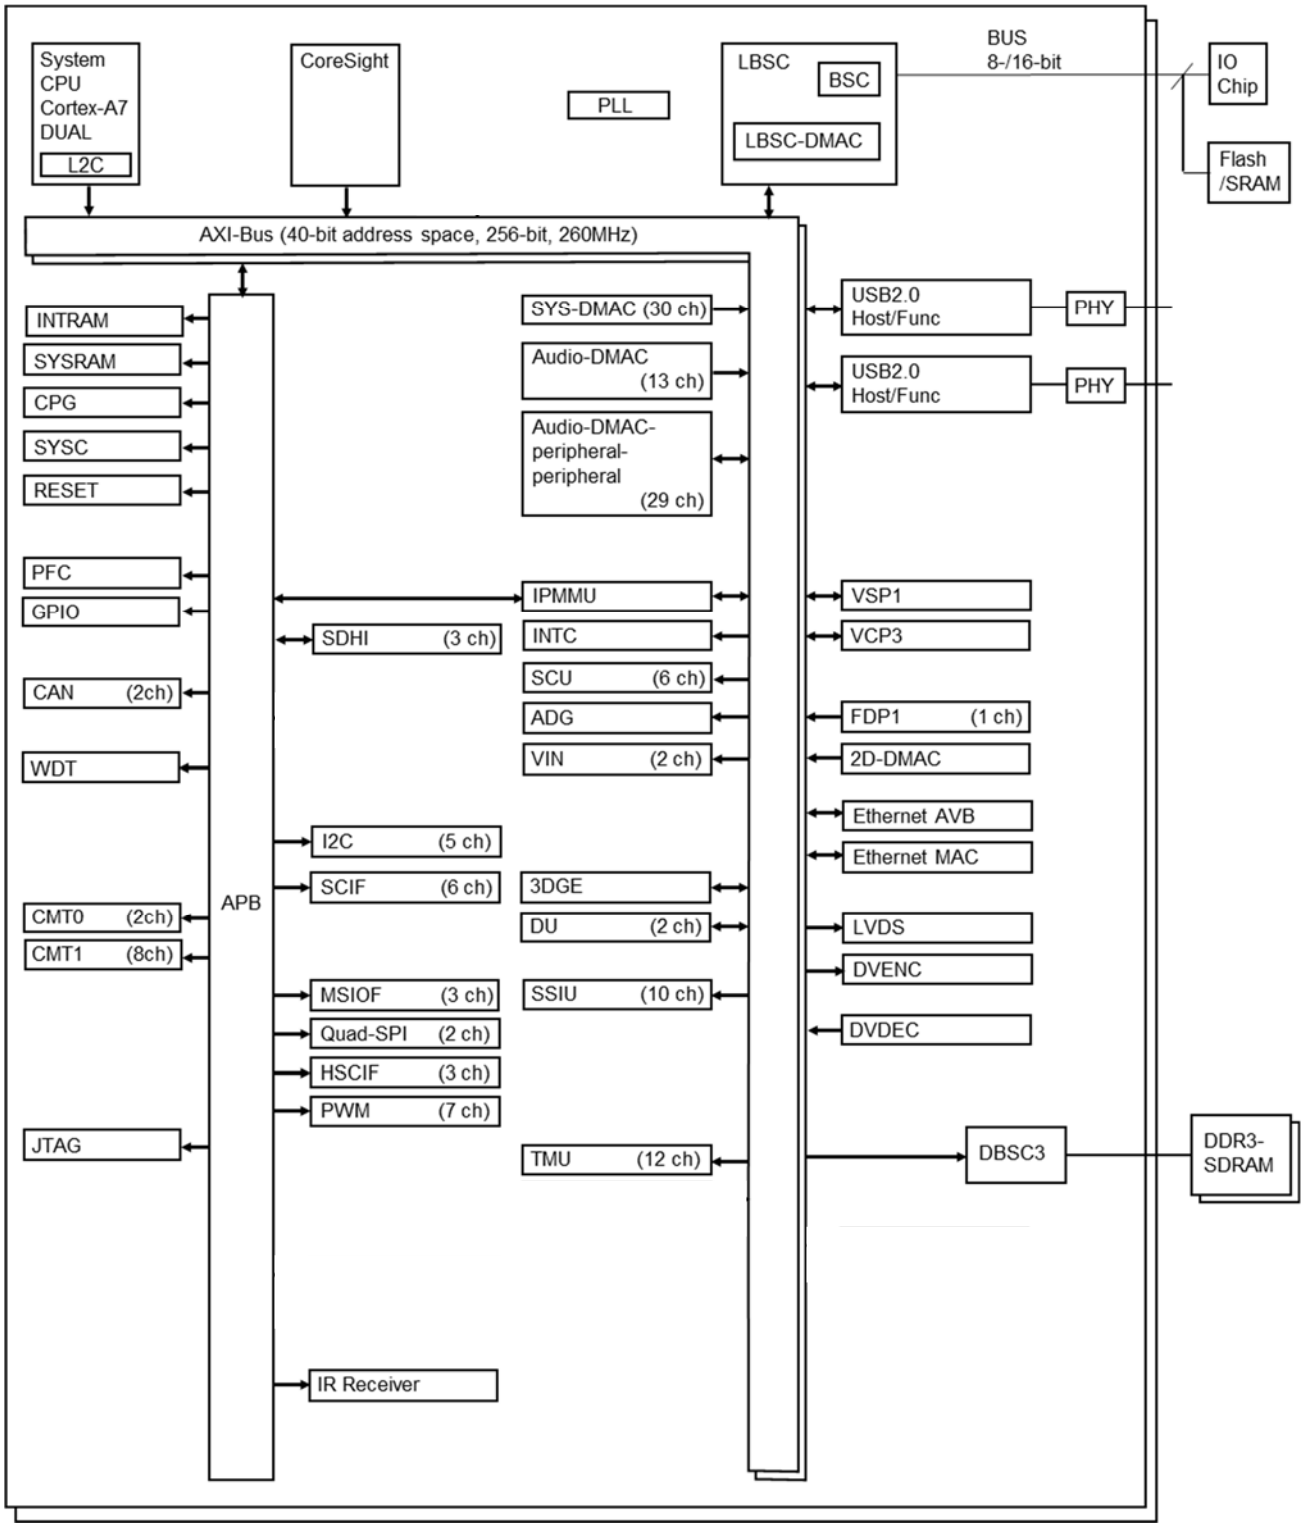
- Two 1.0 GHz ARM® Cortex®-A7 MPCore™ cores,
- Memory controller for DDR3-SDRAM (DDR3-1000) with 32 bits × 1 channel,
- Three-dimensional graphics engines,
- Video processing unit,
- 2 channels Display Output,
- 2 channels Video Input,
- Sound processing unit,
- SD card host interface,
- USB2.0 host/function interfaces,
- CAN interface,
- Digital video encoder / decoder, and
- LVDS display output interface.

Also, a full implementation of the extremely expandable and Internal AXI bus has been adopted for the RZ/G1C.

This bus structure is optimized for maximum system performance, leading to the realization of high-performance and cost-effective rich graphics applications.

Note: ARM and Cortex are registered trademark of ARM Limited. All other brands or product names are the property of their respective holders.

1.2 System Configuration Diagram



Note: For the description of each abbreviation, refer to following "item" column in table.

Figure 1.1 RZ/G1C System Configuration

1.3 List of Specifications

1.3.1 ARM Core

Item	Description
System CPU Cortex-A7 (Dual core)	• Cortex-A7 Dual MPCore 1.0 GHz • L1 I/D cache 32/32 KBytes, L2 cache 512 KBytes • NEON™/VFPv4 supported • Security extension supported
ARM debugger (ARM® CoreSight™)	• CoreSight system compliant • JTAG/SWD I/F supported • CoreSight ETR 16 KBytes for program flow trace • CoreSight ETR 4 KBytes for system trace

1.3.2 CPU Core Peripherals

Item	Description
Operating clock pulse generation circuit (CPG)	• Generates the clocks from external clock (EXTAL). — Maximum Cortex-A7 clock: 1.0 GHz — Maximum AXI-bus clock: 260 MHz — Maximum SDRAM bus clock: DDR3-1000 — Maximum media clock: 260 MHz — Maximum peripheral clock (HPϕ): 130 MHz • Module-standby mode supported • Includes module reset registers to control reset operation of individual on-chip peripheral modules
Reset (RESET)	• Includes one reset-signal external output port for external modules • Includes Boot Address Register etc.
Pin function controller (PFC)	• Setting multiplexed pin functions for LSI pins Function of the RZ/G1C pin selectable by setting the registers in the PFC module • Module selection Enable and disable the functions of RZ/G1C LSI pins to which pin functions from multiple pin groups are assigned by setting the registers in the PFC module. • Pull-up control for each LSI pin On/off of the pull-up resistor on each LSI pin can be controlled by setting the registers in the PFC module. • Control of SDIO functions SDIO functions, including the driving ability of pins for the SDIF, can be controlled by setting registers of the PFC
General-purpose I/O (GPIO)	• General-purpose I/O ports: 156 ports • Supports GPIO interrupts.

1.3.3 External Bus Module

Item	Description
Local bus state controller (LBSC)	• EX-BUS interface: max. 16-bit bus • Frequency: 65 MHz • External area divided into several areas and managed — Allocation to space of area 0 and area 1 or allocation to space of area 0 only is selected at startup time. — Area 0 supports 128-MByte memory space (startup mode). — I/F settings, bus width settings, and wait state insertion are possible for each area • SRAM interface — Wait states can be inserted through register settings Period of waiting is set in cycle unit, and the maximum value is 15. — EX_WAIT pin can be used for wait state insertion — Connectable bus widths: 16 bits or 8 bits • Burst ROM interface — Wait states can be inserted through register settings — Number of bursts can be set through register settings — Connectable bus widths: 16 bits or 8 bits • Byte-control SRAM interface (available with area 1 only) — Byte-control SRAM interface — Wait states can be inserted through register settings — EX_WAIT pin can be used for wait state insertion — Connectable bus widths: 16 bits or 8 bits • Supports external buffer enable/direction control
LBSC-DMAC	• Number of channels: LBSC-DMAC three channels • Address space: Physical address space • Transfer direction: Peripheral to memory (AXI-bus), memory (AXI-bus) to peripheral • Data packing for peripheral read data: Memory write data length is selectable as transfer data length to memory side. • Transfer data length: Peripheral (APB-bus) side: 1, 2, 4 bytes Memory (AXI-bus) side: 4 or 16 (channel 2), 32 (channel 0 and 1) bytes • Transfer burst length: 1, 8 (transfer with a burst length of 8 supported only for LBSCDMAC00, 01) • Number of transfers — Maximum number of transfers: 16 M (16,777,216 transfers), 64M (67,108,864 transfers), (64 M transfers supported only for LBSC-DMAC00) — Minimum number of transfers: One • Address mode: Dual address mode • Transfer modes: Single transfer mode, continuous transfer mode • Transfer end interrupt: Occurs at the end of the number of transfers specified in the register

Item	Description	
DDR3-SDRAM bus state controller (DBSC)	• 1 channel (32-bit bus) • DDR3-SDRAM can be connected directly. • Memory Size: Up to 2 GB (8-Gbit memory × 2) • Data bus width: 32 bits × 1 • Auto Refresh/Self Refresh/Partial Array Self Refresh supported • Auto Pre-charge Mode/Bank Active Mode	
Memory connections	DDR3-SDRAM compliant to JEDEC JESD79-3E	Supports from 512-Mbit to 8-Gbit memory unit configurations 32-bit DDR3-1000 (two units with 16-bit width)

1.3.4 Internal Bus Module

Item	Description
AXI-bus	• On-chip main bus — Bus protocol: AXI3 with QoS control — Frequency: 260 MHz — Bus width: 256 bits/128 bits
Direct memory access controller (SYS-DMAC)	• 30 channels for ARM domain • Address space: 4 GBytes on architecture • Data transfer length: Byte, word (2 Bytes), longword (4 Bytes), 8 Bytes, 16 Bytes, 32 Bytes and 64 Bytes • Maximum number of transfer times: 16,777,216 times • Transfer request: Selectable from on-chip peripheral module request and auto request • Bus mode: Selectable from normal mode and slow mode • Priority: Selectable from fixed channel priority mode and round-robin mode • Interrupt request: Supports interrupt request to CPU at the end of data transfer • Repeat function: Automatically resets the transfer source, destination, and count at the end of DMA transfer (by descriptor function) • Descriptor function (each channel) supported • MMU (each channel) supported • Channel bandwidth arbiter (each channel)
Direct memory access controller (Audio-DMAC)	• 13 channels for Audio domain • Address space: 4 GBytes on architecture • Data transfer length: Byte, word (2 Bytes), longword (4 Bytes), 8 Bytes, 16 Bytes, 32 Bytes and 64 Bytes • Maximum number of transfer times: 16,777,216 times • Transfer request: Selectable from on-chip peripheral module request and auto request • Bus mode: Selectable from normal mode and slow mode • Priority: Selectable from fixed channel priority mode and round-robin mode • Interrupt request: Supports interrupt request to CPU at the end of data transfer • Repeat function: Automatically resets the transfer source, destination, and count at the end of DMA transfer (by descriptor function) • Descriptor function (each channel) supported • MMU (each channel) supported • Channel bandwidth arbiter (each channel)
Direct memory access controller (Audio-DMAC-Peripheral-Peripheral)	Audio-DMAC (for transfer from Peripheral to Peripheral) • 29 channels for audio domain • Data transfer length: longword (4 Bytes) • Transfer count: Transfer count is not specified (DMA transfer is made from the transfer-start to transfer-stop settings.) • Transfer request: Selectable from on-chip audio peripheral module request • Priority: round-robin mode • Interrupt request: not supports interrupt request to CPU at the end of data transfer

Item	Description	
IPMMU	An IPMMU is a memory management unit (MMU) which provides address translation and access protection functionalities to processing units and interconnect networks.	
Interrupt controller (INTC)	INTC-SYS	• 10 interrupt pins which can detect external interrupts • Fall/rise/high level/low level detection is selectable • On-chip peripheral interrupts: Priority can be specified for each module • Max. 384 shared peripheral interrupts supported • 16 software interrupts that have been generated and 6 private peripheral interrupts supported • 32-level priority selectable • Trust Zone supported

1.3.5 Local Memory

Item	Description
Inter connect RAM (INTRAM)	• RAM0 of 72 KBytes • RAM1 of 4 Kbytes • RAM2 of 128 KBytes

1.3.6 Graphics Units

Item		Description
3D graphics engine (3DGE)		• Imagination Technologies PowerVR Series5 SGX531 (260 MHz) • Tile based architecture • Universal Scalable Shader Engine (USSE) • Advanced Shader Feature Set - in excess of Microsoft VS3.0, PS3.0 & OGL2.0 • Industry standard API support - OGL-ES 2.0 • Fine grained task switching, load balancing and power management • Advanced geometry DMA driven operation for minimum CPU interaction • Programmable high quality image anti-aliasing • Fully virtualized memory addressing for OS operation in an unified memory architecture
Display unit (DU)	Display channel	Two independently controllable channels
	Interface	• Digital RGB: Two channel (RGB888 × 2) • LVDS output: Four lanes × One channel • NTSC (CVBS) analog output × 1 channel • digital video encoder, D/A converter integrated
	Screen size and number of composite planes	• Maximum screen size: 4095 × 2047 • Number of planes specifiable: 1 (ARGB8888)
	CRT scanning method	Non-interlaced, interlaced sync, interlaced sync & video
	Synchronization method	Master, TV sync
	Internal color palette	Includes four color palette planes which can display 256 of 260 thousands colors at the same time.
	Digital RGB	• Two output channel • Output on rising and falling edges of the synchronizing signal (resolution for the same display) • 8-bit precision for each RGB color • Frequency: Dotclk 100 MHz (Single edge) Dotclk 50 MHz (Double edge)
	LVDS interface (1ch)	• Output: compliant with TIA/EIA-644; five pairs of differential output (Four pairs of data and one pair of clock) • Frequency: Dotclk 87 MHz • Selectable 8 output formats
	Blending ratio settings	Number of color palette planes with blending ratio: 4
	Dot clock	Switchable between external input and internal clock
	Digital Video encoder	See Digital Video encoder below

Item	Description	
Video input (VIN)	Input data format	• 8-, 10-, or 12-bit YCbCr422 (CbYCrY format) • 16-bit YCbCr422 (8 bits (Y) + 8 bits (CbCr) format) • 20-bit YCbCr422 (10 bits (Y) + 10 bits (CbCr) format) • 24-bit YCbCr422 (12 bits (Y) + 12 bits (CbCr) format) • 18-bit RGB666 • 24-bit RGB888
	Clipping function	Up to 2048 × 2048
	Horizontal scaling	Uses a 9-tap multi-phase filter. Up to two times, but only scaling down is possible for HD1080i or HD720P data.
	Vertical scaling	Scaling by linear interpolation Up to three times, but only scaling down is possible for HD1080i or HD720P data.
	Output format	RGB-565, ARGB-1555, YCbCr422, RGB888(channel 0,1), YC separation, and extraction of the Y component
	Video clock	100 MHz
Digital video decoder (DVDEC)	• Video input Composite video input (CVBS) • A/D converter for video signal input VIN0 and VIN1 pin input selection Low-pass filter (LPF) Sync tip clamp Programmable gain amplifier (PGA) (0 to 6.021 dB) 10-bit precision pipelined A/D converter • Sync separation Noise reduction LPF, auto level control sync slicer, horizontal auto frequency control (AFC), vertical count-down, interlace detection, auto gain control (AGC)/peak limiter control • Y/C separation NTSC 2D, PAL 2D, and SECAM 1D supported. • Chroma-key decoding NTSC, PAL, and SECAM supported. Color killer, auto color control (ACC), TINT correction, R-Y axis correction • Digital clamp Pedestal clamp (Y), center clamp (Cb/Cr), noise detection • Adjustment of output gain Contrast: 0 to approximately 2 times Color (Cb/Cr independently): 0 to approximately 2 times	

Item	Description	
Digital video encoder (DVENC)	NTSC encoder	• Input 480i data (8 bits for each of Y and CB/CR) • Output composite Y/C • NTSC, PAL, PAL-M, PAL-N, and PAL-60 encode processing • Y1+C composite (CVBS) signal generation • Image quality adjustment function (12 bits) Color TINT Skin tone correction Brightness Contrast Black stretch Sharpness/unsharpness • Correction • Superimposition of CGMS (525i) or WSS (625i) • Superimposition of closed caption • BPF processing for chroma (C) signal • Rovi's Rev. 7.1.L1 ACP encoding technology • Total gain control in response to changes in the full-scale voltage from the DAC
	Video DAC	• Supports the NTSC/PAL composite output. • Analog macro output voltage: 1.30 Vp-p (typ.) • Caution: AV33 = 3.3 V; Rload ≥ 10 kΩ; Cload ≤ 20 pF • Low-power-consumption function (power-down mode). • 10-bit digital signal output (8bit available) • Conversion on rising edges of the 27-MHz clock signal

1.3.7 Video Processing

Item	Description
Video signal processor 1 (VSP1)	The VSP1 is the successor IP of Renesas' VIO6-IP series, and has the following features. (1) Supports Various Data Formats and Conversion — Supports YCbCr444/422/420, RGB, αRGB, αplane — Color space conversion and changes to the number of colors by dithering — Color keying (2) Full HD Video Processing — Up and down scaling with arbitrary scaling ratio — Super resolution processing — Blending of four picture layers and raster operations (ROPs) (3) Full HD Picture Quality/Color Correction with 1D/3D Look Up Table(LUT) — Dynamic γ correction and gain correction — Correction of color (to adjust skin tones or colors in memory) — Hue, brightness, and saturation adjustment — 1D histogram (4) Direct Connection to Display Module — Display unit (DU) supported

Item	Description
Video processing unit (VCP3)	The VCP3 is a multi-codec module which provides encoding and decoding capabilities on the basis of multiple video coding schemes, e.g., H.264/AVC, MPEG-4, MPEG-2 and VC-1. This IP (Intellectual Property) is a multi codec that processes the frame or each field by controlling software for VCP3 executed on host CPU. The VCP3 has the following features: • Support for multiple codecs H.264/MPEG-4 AVC HP (High Profile) and MVC SHP (Stereo High Profile) encoding and decoding H.262/MPEG-2 MP (Main Profile) decoding MPEG-4 ASP (Advanced Simple Profile) decoding VC-1 SP/MP/AP (Simple, Main, Advanced Profile) decoding H.263 Baseline decoding AVS Jizhun Profile decoding VP8 decoding • Support for HDTV resolutions 1920 pixels × 1080 lines × 60 frames/second × 1channels Maximum performance will change with securable bus bandwidth. • Data handling on a picture-by-picture basis Encodes/decodes data one picture (frame or field) at a time. • High picture quality Supports the H.264 high-efficiency coding tools (CABAC, 8 × 8 frequency conversion, and quantization matrix). High-efficiency motion vector detection by a combination of discrete search and trace search Highly efficient real-time intra-prediction by Prediction from Original Image (POI) Optimal-mode selection by Rate-Distortion (RD) cost evaluation Picture quality control based on activity analysis results which match visual models • Low power dissipation Dynamically disables the clocks for the entire VCP3. Dynamically disables the clocks for individual submodules. • Includes its own dedicated 64-KByte cache
Fine display processor 1 (FDP1)	The FDP1 is the de-interlacing module which converts the interlaced video to progressive video, and has the following features. (1) Supports various data formats — Input: YCbCr444/422/420 — Output: YCbCr444/422/420 and RGB/αRGB (2) Full HD video processing performance (3) High image quality de-interlacing algorithm — Motion adaptive de-interlacing — Accurate still detection — Diagonal line interpolation (DLI)
2-dimensional DMAC (2D-DMAC)	• Supports conversion between various RGB formats. • Image extraction function: Capable of extracting an image and storing it as a separate image in the RAM. • Image rotation/reversal function: Reverses an image vertically/horizontally or rotates it by 90°/270°. • Simple scaling function: Capable of scaling an image two times in the X or Y direction. • Format conversion • Supports conversion from RGB to RGB and from YCbCr to YCbCr.

1.3.8 Sound Interface

Item	Description	
Sampling rate converter unit (SCU)	Overall specification	• Includes six SRC modules — Supports the quality suitable for audio sound (THD+N -132dB) : four modules — Supports the quality suitable for voice sound (THD+N -96dB) : two modules • The SRC module is capable of correcting phase change and delay (timing jitter) generated during data transfer over external memories or external devices. • The channel transfer unit (CTU), mixer (MIX), and digital mute and volume function (DVC) can be used on two fixed output channels.
	Sampling rate conversion (SRC)	• Capable of asynchronous sampling rate conversion • Supports resolutions up to 24 bits • Two kinds of filter type for SRC. — Supports the quality suitable for audio sound (THD+N -132dB) : Realized the filter by passband -1dB@0.4575FS, cutoff -18dB@0.5FS. — Supports the quality suitable for voice sound (THD+N -96dB) : Realized the filter by passband -1dB@0.4561FS, cutoff -72dB@0.5FS. (Characteristics of each filter is written in the equivalent/up-sampling cases.) • Automatically generates antialiasing filter coefficients • For monaural to eight-channel sound sources
	Channel transfer unit (CTU)	• Downmixing and splitter functions — Conversion of eight input channels into four output channels — Conversion of six input channels into two output channels — Conversion of two input channels into four sets of two output channels — Conversion of one input channel into eight sets of one output channel — No conversion
	Mixer (MIX)	• Mixing (adds) two to four sources into one • Ratio for adding sources is selectable • Ratio is dynamically changeable • Mixing with volume ramp is available (ramp period is selectable)
	Digital volume and mute function (DVC)	• Volume control function including digital volume, volume ramp, and zero-crossing mute • The digital volume function is specified by a 24-bit fixed-point value within the range from 0 to 8 times (mute, or -120 to 18 dB) • The volume ramp function can be used for soft mute, fade-in, fade-out, or desired volume adjustment • The volume ramp period can be changed within the sampling range from the 0th to 23rd power of 2 • The zero-crossing mute function silences the sound at the zero-crossing point of the audio data

Item	Description	
Serial sound interface unit (SSIU)	Overall specification	• Includes ten SSI modules functioning as interfaces with external devices. — Supports short and long formats — Supports TDM format (six modules of ten modules can be used for this function) • Max. 4 independent stereo sound sources in a TDM format can be distributed to each course within RZ/G1C. Moreover Max. 4 independent stereo sound source in RZ/G1C can be combined output in TDM format.
	Serial sound interface (SSI)	• Operating mode: non-compressed mode (Not support compressed mode) • Supports versatile serial audio formats (I2S/left justified/right justified) • Supports master/slave functions • Programmable word clock, bit clock generation functions • Multichannel format functions (up to four channels) • Supports 8-/16-/18-/20-/22-/24-/32-bit data formats • Supports TDM mode • Supports WS continue mode • The DMA controller or interrupts control the transfer of data to and from the SSI module. • Supports short and long frames for monaural data (valid data lengths are 8 and 16 bits) • Up to nine independent clock signals can be input.
Audio clock generator (ADG)	• Selection or division of audio clock signals	

1.3.9 Storage

Item	Description
USB2.0 host & function module (USB2.0)	• 2 channels (Host-Function 2 channel) • PHY integrated • USB Host (EHCI/OHCI) 2LINK • Compliant with USB2.0 • USB Function 2LINK • Compliant with USB2.0 (High-Speed) • Interrupt request • Internal dedicated DMA
SD host interface (SDHI)	• 3 channels — Interfaces 0 and 1: Support SDR104 class transfer rate at Max. 78 MBytes/sec. @ 156 MHz, and SDXC. Does not support CPRM. — Interfaces 1: Also support eMMC mode. eMMC 4.41 base — Data bus 1/4/8-bit MMC mode (not support SPI mode) — Interfaces 2: SDR50 class transfer rate at Max. 48 MBytes/sec. @ 97.5 MHz, and SDXC. Does not support CPRM. • Supports SD memory/SDIO interface (1-/4-bit SD buses). • Error check function: CRC7 (command/response), CRC16 (data) • Card detection function • Supports write protection

1.3.10 Network

Item	Description
CAN interface (CAN)	• 2 channels • Supports CAN specification 2.0B • ISO-11898-1 compliant • Maximum bit rate: 1 Mbps • Message box — Normal mode: 32 receive-only mailboxes and 32 mailboxes for transmission/reception — FIFO mode: 32 receive-only mailboxes and 24 mailboxes for transmission/reception, 4-stage FIFO for transmission, and 4-stage FIFO for reception • Reception — Data frame and remote frame can be received. — Selectable receiving ID format — Selectable overwrite mode (message overwritten) or overrun mode (message discarded) • Acceptance filter — Mask can be enabled or disabled for each mailbox. • Transmission — Data frame and remote frame can be transmitted. — Selectable transmitting ID format (only standard ID, only extended ID, or both IDs) — Selectable ID priority mode or mailbox number priority mode • Sleep mode for reducing power consumption
Ethernet AVB	• Supports IEEE802.1BA, IEEE802.1AS, IEEE802.1Qav and IEEE1722 functions • Supports transfer at 1000 Mbps and 100 Mbps • Magic packet detection • Supports Reception Filtering to separate streaming frames from different sources • Supports interface conforming to IEEE802.3 PHY GMII (Gigabit Media Independent Interface) and MII (Media Independent Interface)
Ethernet MAC	• IEEE802.3u MAC (Ether) function • Supports transfer at 10 and 100 Mbps • Flow control conforming to IEEE802.3x or back pressure system • Supports interface conforming to IEEE802.3u • Magic packet detection • Includes DMAC • Supports RMII (Reduced Media Independent Interface)

1.3.11 Timer

Item	Description
Watchdog timer (WDT)	• Single channel • Internal 16-bit watchdog timer operated by RCLK • Programmable overflow time-period: more than 1 hour count capable
Compare match timer 0 (CMT0)	• Two channels • 32-bit timer (16 bits/32 bits can be selected) • Source clock: RCLK clock • Compare match function provided • Interrupt requests
Compare match timer 1 (CMT1)	• Eight channels • 48-bit timer (16 bits/32 bits/48 bits can be selected) • Source clock: RCLK/system clock • Compare match function provided • Interrupt requests
Timer unit (TMU)	• 4 sets of 3-channel 32-bit timer • Auto-reload type 32-bit down counter • Internal prescaler • Interrupt request • 2 channels for input capture

1.3.12 Peripheral Module

Item	Description
Multi-master I2C bus interface (I2C)	• 5 channels for general purpose • Philips I2C bus interface method supported • Master/slave functions • Multi-master functions • Transfer rate up to 400 kbps supported • Programmable clock generation from the system clock

Item	Description	
Serial communication interface with FIFO (SCIF)	Overall specification	• 6 channels • Asynchronous, clock-synchronized modes • Asynchronous serial communication mode The SCIF performs serial data communication based on a character-by-character asynchronous system. This feature enables serial data communication with standard asynchronous communication chips that support Universal Asynchronous Receiver/Transmitter (UART) or Asynchronous Communication Interface Adapter (ACIA). There is a choice of eight serial data transfer formats. — Data length: 7 bits or 8 bits — Stop bits: 1 bit or 2 bits — Parity: Even/odd/none — Receive error detection: Parity, framing, and overrun errors — Break detection: A break is detected when a framing error lasts for more than 1 frame length at Space 0 (low level). When a framing error occurs, a break can also be detected by reading the RX pin level directly from the serial port register (SCSPTR). • Clock synchronous serial communication mode The SCIF performs serial data communication synchronized with a clock. This feature enables serial data communication with other LSIs that support synchronous communication. There is a single serial data communication format for clock synchronous serial communication. — Data length: 8 bits — Receive error detection: Overrun errors • Full-duplex communication capability The SCIF has an independent transmitter and receiver that enable simultaneous transmission and reception. The transmitter and receiver both have a 16-stage FIFO buffer structure, enabling continuous serial data transmission and reception. • On-chip baud rate generator, enabling any bit rate to be selected The SCIF enables choice of a clock source for transmission/reception: a clock from the on-chip baud rate generator based on the internal clock or an external clock. • Eight interrupt sources The SCIF has eight types of interrupt sources: receive-data-ready, receive-FIFO-data-full, break, transmit-FIFO-data-empty, transmit-end, receive-error, overrun-error and time-out and enables any of them to be requested independently. • DMA data transfer When the transmit FIFO register is empty or the receive FIFO register has received data, issuing a DMA transfer request activates the DMA controller (DMAC) to execute a data transfer. • The amount of data in the transmit/receive FIFO registers and the number of receive errors in receive data in the receive FIFO register are available. • In asynchronous mode, a receive data ready (DR) or a timeout error (TO) can be detected during reception.

Item	Description
Clock-synchronized serial interface with FIFO (MSIOF)	• 3 channels • Max. speed: 26 Mbps • Internal 64 stages transmit FIFOs/internal 128 stages receive FIFOs • Supports master and slave modes • Internal prescaler • Supports serial formats: IIS, SPI (master and slave modes) • Interrupt request, DMAC request
Quad-SPI (QSPI)	• 2 channels • Single/Dual/Quad-SPI: serial slave transfer enabled • Supports master mode • SPCLK clock rate: 1…4080 in master mode; Max. 97.5 MHz
High-speed serial communication interface with FIFO (HSCIF)	• 3 channels • Asynchronous serial communication mode • Capable of full-duplex communication • On-chip baud rate generator, enabling any bit rate to be selected • Eight interrupt sources • DMA data transfer • Modem control functions (HRTS and HCTS) are stored. • The amount of data in the transmit/receive FIFO registers and the number of receive errors in receive data in the receive FIFO register are available. • A receive data ready (DR) or a timeout error (TO) can be detected during reception.
PWM timer (PWM)	• 7 channels • Cycle width (10 bits) of PWM output can be set. • High-level periods (10 bits) of PWM output can be set. • Periods in the range from two to 2^{24} × 1024 cycles of the Pϕ clock can be set. • Continuous pulse or single pulse output selectable
IR Receiver (IR)	• Auto detection of a leader • Built-in circuit for synchronization protection (noise malfunction prevention) during the detection of a leader • Up to 64 bits of a code are receivable per frame. • Capable of receiving a maximum of two frames of code
Boot Function (BOOT)	• System startup with selectable boot mode at power-on reset • Program downloaded to internal memory (LRAM) • Autorun function for the downloaded program • LBSC area 0 boot support • QSPI boot (ch0 only) support • eMMC boot support

1.3.13 Others

Item	Description
JTAG	JTAG interface for CoreSight
Package	FC-BGA 501pin 21mm × 21mm 0.8mm ball pitch

1.4 Power Supply Voltages and Temperature Range

- Power supply voltage (typ.)
  1.8 V: (SD and JTAG)
  1.2 V: (Core)
  1.5 V: (DDR3-I/O SSTL)
  3.3 V: (Others)
- Temperature range
  Tc = –40°C to 115°C
  Ta = –40°C to 85°C

2. Area Map

Table 2.1 Address Space (Over 4-Gbyte Space)

Address			Space	Description
H'00_00000000	to	H'00_FFFFFFFF	Legacy 4-Gbyte space	LBSC, DBSC3, etc.
H'01_00000000	to	H'01_FFFFFFFF	DDR0/DBSC3 (DDR0)	DBSC3
H'02_00000000	to	H'02_FFFFFFFF	Reserved	—
H'03_00000000 (H'03_40000000	to to	H'03_FFFFFFFF H'03_BFFFFFFF)	DBSC3 (DDR0) shadow	DBSC3 (up to 2 Gbytes)
H'04_00000000	to	H'04_FFFFFFFF	DDR0 shadow	DBSC3
H'05_00000000	to	H'05_FFFFFFFF	Reserved	—
H'06_00000000	to	H'06_FFFFFFFF	DDR0 shadow	DBSC3
H'07_00000000	to	H'07_FFFFFFFF	Reserved	—
H'08_00000000	to	H'08_FFFFFFFF	CCI-AXI	CCI-AXI
H'09_00000000	to	H'09_FFFFFFFF	Reserved	—
H'0A_00000000	to	H'0A_FFFFFFFF	Reserved	—

3.2 Mode Pin Settings

Input fixed values for BSMODE and MD0 pins. These values cannot be changed after power is supplied. The values of pins MD1 to MD11, MD13, MD14, MD21, MDT0 and MDT1 are input upon power-on reset using the PRESET pin. Power-on reset results in switching to a different function.

Legend: "0" means logic low level input, "1" means logic high level input.
"—" means either "0" or "1", but its level must be fixed.

BSMODE	Reserved Fix to 0

MD0	Reserved Fix to 0

MD3	MD2	MD1	Boot Device Selection
0	0	0	External ROM boot (area 0)
0	0	1	eMMC boot via SDHI1
0	1	0	Serial flash ROM boot via QSPI; 16 KB transfer at 48.75 MHz
0	1	1	Reserved
1	0	0	Serial flash ROM boot via QSPI; 16 KB transfer at 39.0 MHz
1	0	1	Reserved
1	1	0	Serial flash ROM boot via QSPI; 4 KB transfer at 39.0 MHz
1	1	1	Reserved

MD4	Area Division
0	Area 0: 64 Mbytes
1	Area 0: 128 Mbytes

MD5	Reserved, fixed to 1

MD7	MD6	Master Boot Processor Selection
0	0	Setting prohibited
0	1	Booted through CPU0 in Cortex-A7
1	0	Setting prohibited
1	1	Setting prohibited

MD8	EXBUS Area 0 Data Bus Width
0	8-bit
1	16-bit

MD9	EXTAL/XTAL Pin Setting
0	Inputs an external clock to the EXTAL pin
1	Connects a crystal resonator to the EXTAL/XTAL pin

MD10	MD21, MD20	MD11	MDT [1:0]	JTAG	MMC	SDHI2
0	00	—	—	Boundary SCAN	Normal mode	Normal mode
	01	—	—	Reserved	Reserved	Reserved
	10	0	—	CoreSight debug port	Normal mode	Normal mode
		1	00		Reserved	Reserved
			01		Reserved	Normal mode
			10		Reserved	Reserved
			11		Normal mode	Reserved
	11	0	—	Reserved	Normal mode	Normal mode
		1	00		CoreSight debug port	Normal mode
1	—	—	—	Reserved	Reserved	Reserved

MD14	MD13	Resonator/ Input Clock	Internal Divider	PLL1	PLL0	PLL3
0	0	20 MHz	× 1/1	× 78*	× 80	× 50
0	1	26 MHz	× 1/1	× 60*	× 60	× 56
1	0	Reserved	—	—	—	—
1	1	30 MHz	× 1/1	× 52*	× 52	× 50

Note: * VCO = 1560 MHz

4. Pin Multiplexing

Legend for the Pin Multiplexing

pullup*	Pullup on/off is controllable in PFC register. Initial state is pullup on. When these pins are used as I2C interface, external pull-up resistors are mandatory.
pulldown*	Pulldown on/off is controllable in PFC register. Initial state is pulldown on.
*	Pull on/off is controllable in PFC register. Initial state is pull off.
—	Pullup Control Column: No pullup/pulldown Function Column: Setting prohibited

Following notes are related with section 4.1.

Notes 1 After negate PRESET#, pin state is Low output and then change to High output.
Regarding transition timing, refer to Hardware manual section.

2 MD4 = 0 (64MB mode) : High output.
MD4 = 1 (128MB mode) : Low output.

3 Depends on MD21, MD20, MD11, MD10, MDT[1:0] setting.

4 Depends on MD21, MD20, MD11, MD10, MDT[1:0] setting.
In case JTAG interface is selected, "—" (no pullup/pulldown) is selected.
In case of other settings, "*" (pullup on/off is controllable in PFC register. Initial state is pullup off) is selected.

5. Pin Function Controller (PFC)

5.1 Overview

The pin function controller (PFC) is a module that consists of registers for selecting the function of the multiplexed pins and controlling the pull resistor (up/down) on each LSI pin.

Notes: 1. Some functions are optional or internal.
2. Pin function name that has two or more functions is indicated by using "_" instead of "/".

5.1.1 Features

- Register access through APB bus interface.
- LSI pin multiplex function selecting:
  Functions of LSI pins are selected by setting the IPSR/GPSR registers in the PFC module. For details, refer to section from 5.3.1 to 5.3.41.
- Function groups selecting:
  Function has multiple group pins are selected by setting the module select registers (from MOD_SEL0 to MOD_SEL2). For details, refer to section from 5.3.26 to 5.3.28.
- Pull control
  Pull-up or pull-down resistors on LSI pins are controlled by setting PUPR registers (from PUPR0 to PUPR5).
- Driving ability control, power on control, RSEL, TDSEL
  Driving ability (DRV), power on control (POC) of some specific modules, RSEL, and TDSEL can be control by setting IOCTRL registers (from IOCRTL0 to IOCTRL6).

5.2 Register Configuration

All the registers in the PFC are mapped into the APB bus space. Table 5.1 shows the configuration of the registers provided in the PFC. Details on each register in the PFC are given in sections 5.3.1 to 5.3.41.

Table 5.1 Configuration of Registers in PFC

Name	Abbr.	R/W	Initial Value	Address	Access Size
LSI Multiplexed Pin Setting Mask Register	PMMR	R/W	H'0000 0000	H'E606 0000	32
GPIO/peripheral function select register 0	GPSR0	R/W	H'0000 001F	H'E606 0004	32
GPIO/peripheral function select register 1	GPSR1	R/W	H'007F FFFF (when md[3:1] = 000) H'0000 0000 (others case)	H'E606 0008	32
GPIO/peripheral function select register 2	GPSR2	R/W	H'07FF FFFF (when md[3:1] = 000) H'0000 0000 (others case)	H'E606 000C	32
GPIO/peripheral function select register 3	GPSR3	R/W	H'0000 0000	H'E606 0010	32
GPIO/peripheral function select register 4	GPSR4	R/W	H'0000 0000	H'E606 0014	32
GPIO/peripheral function select register 5	GPSR5	R/W	H'0000 0000	H'E606 0018	32
Peripheral function select register 0	IPSR0	R/W	H'0000 0000	H'E606 0040	32
Peripheral function select register 1	IPSR1	R/W	H'0000 0000	H'E606 0044	32
Peripheral function select register 2	IPSR2	R/W	H'0000 0000	H'E606 0048	32
Peripheral function select register 3	IPSR3	R/W	H'1111 1100	H'E606 004C	32
Peripheral function select register 4	IPSR4	R/W	H'6666 6660	H'E606 0050	32
Peripheral function select register 5	IPSR5	R/W	H'6666 6666	H'E606 0054	32
Peripheral function select register 6	IPSR6	R/W	H'6666 6666	H'E606 0058	32
Peripheral function select register 7	IPSR7	R/W	H'0000 6666	H'E606 005C	32
Peripheral function select register 8	IPSR8	R/W	H'0000 0000	H'E606 0060	32
Peripheral function select register 9	IPSR9	R/W	H'0000 0000	H'E606 0064	32
Peripheral function select register 10	IPSR10	R/W	H'0000 0000	H'E606 0068	32
Peripheral function select register 11	IPSR11	R/W	H'0000 0000	H'E606 006C	32
Peripheral function select register 12	IPSR12	R/W	H'0000 0000	H'E606 0070	32
Peripheral function select register 13	IPSR13	R/W	H'0000 0000	H'E606 0074	32
Peripheral function select register 14	IPSR14	R/W	H'0000 0000	H'E606 0078	32
Peripheral function select register 15	IPSR15	R/W	H'0000 0000	H'E606 007C	32
Peripheral function select register 16	IPSR16	R/W	H'0000 0000	H'E606 0080	32
Peripheral function select register 17	IPSR17	R/W	H'0000 0000	H'E606 0084	32
Module select register 0	MOD_SEL0	R/W	H'0000 0000	H'E606 00C0	32
Module select register 1	MOD_SEL1	R/W	H'0000 0000	H'E606 00C4	32
Module select register 2	MOD_SEL2	R/W	H'0000 0000	H'E606 00C8	32
LSI pin pull-up control register 0	PUPR0	R/W	H'7AA0 1801	H'E606 0100	32

Name	Abbr.	R/W	Initial Value	Address	Access Size
LSI pin pull-up control register 1	PUPR1	R/W	H'FFFF FFC3	H'E606 0104	32
LSI pin pull-up control register 2	PUPR2	R/W	H'0333 93FF	H'E606 0108	32
LSI pin pull-up control register 3	PUPR3	R/W	H'FFFF FF03	H'E606 010C	32
LSI pin pull-up control register 4	PUPR4	R/W	H'FFFF FFFF	H'E606 0110	32

POC control register	IOCTRL6	R/W	H'0000 0007	H'E606 00B0	32

5.3 Register Description

[Legend]

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R: Read-only. The write value should always be 0.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

W: Write-only. Reading this bit is prohibited. When the bit is reserved, the write value should always be 0.

-/W: Write-only. The read value is undefined.

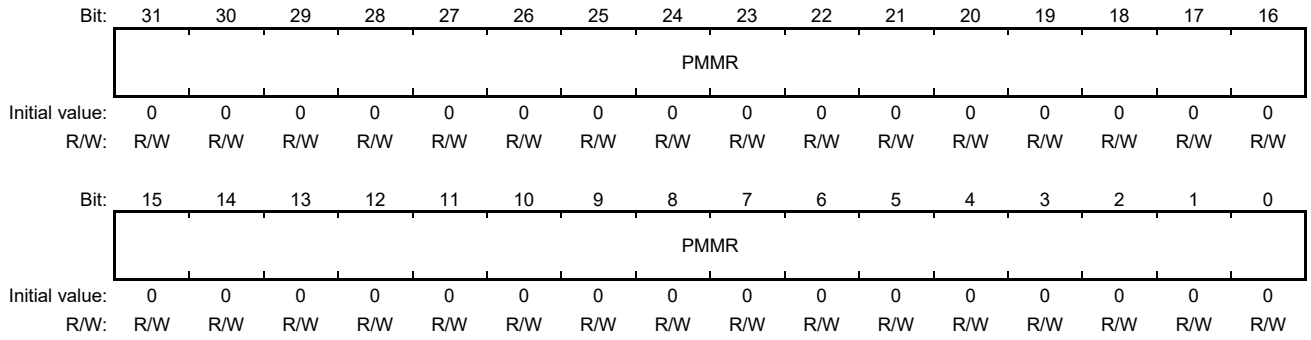
All the bits are active high unless otherwise specified, and deactivated on reset.

All access to registers is made in long word units.

The write value to a reserved bit should always be 0.

5.3.1 LSI Multiplexed Pin Setting Mask Register (PMMR)

Function: PMMR enables/disables writing to the multiplexed pin setting registers.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PMMR[31:0]	H'0000 0000	R/W	Multiplexed Pin Setting Mask Writing a value to any register from among the GPIO/peripheral function select registers GPSR0 to GPSR5, peripheral function select registers IPSR0 to IPSR17, drivability control registers DRVCTRL0-3, RSEL control register IOCTRL4, TDSEL control registers IOCRTL5, POC register IOCRL6, Pull control registers PUPR0-5 and Module select register MOD_SEL0-2 is enabled by writing the inverse of the value to this register.

Note: This register must be set before setting each of the GPIO/peripheral function select registers GPSR0 to GPSR5, peripheral function select registers IPSR0 to IPSR17, module select registers MOD_SEL0, MOD_SEL1, MOD_SEL2, IO cell control registers IOCTRL0 to IOCTRL6 and pull control registers PUPR0 to PUPR5.

5.3.2 GPIO/Peripheral Function Select Register 0 (GPSR0)

Function: GPSR0 selects the functions of the multiplexed LSI pins.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GP0[22]	GP0[21]	GP0[20]	GP0[19]	GP0[18]	GP0[17]	GP0[16]

5.3.26 Module Select Register 0 (MOD_SEL0)

Function: MOD_SEL selects the group for multiple LSI pins with multiplexed pin functions.

Each input or input/output signal of the ADG, CAN, I2C, and AVB is assigned to two or more groups of pins. Select one of these groups when using these signals. Do not use the module pins in the unselected group; if a module pin in the unselected group is used, correct operation is not guaranteed.

For some modules, however, although the output signals are assigned to two or more groups of pins, there is no bit for selecting the group. Select one of these pins for each output signal through the corresponding peripheral function select register. Also note that each pin can only be used in combination with the other input or input/output pins of the same group. Correct operation is not guaranteed when a pin is used in combination with pins from other groups.

5.3.27 Module Select Register 1 (MOD_SEL1)

Function: MOD_SEL1 selects the group for multiple LSI pins with multiplexed pin functions.

Each input or input/output signal of the SCIF, MSIOF, RCN, TMU and HSCIF is assigned to two or more groups of pins. Select one of these groups when using these signals. Do not use the module pins in the unselected group; if a module pin in the unselected group is used, correct operation is not guaranteed.

For some modules, however, although the output signals are assigned to two or more groups of pins, there is no bit for selecting the group. Select one of these pins for each output signal through the corresponding peripheral function select register. Also note that each pin can only be used in combination with the other input or input/output pins of the same group.

The purpose of RSEL: adjust to pull resistance value by power supply.

RSEL control register must be set according to IO voltage level that is supplied to the pin.

If 1.8v is supplied, RSEL bit of these LSI pins must set to Low.

If 3.3v is supplied, RSEL bit of these LSI pins must set to High.

5.4 Operation

5.4.1 Function Setting for Multiplexed Pins

Setting the LSI multiplexed pin setting mask register (PMMR) is necessary before setting each of the GPIO/peripheral function select registers 0 to 5 (GPSR0 to GPSR5) and peripheral function select registers 0 to 17 (IPSR0 to IPSR17). Specifically, the inverse of the value to be set in the select register must be written to the LSI multiplexed pin setting mask register. Otherwise, the GPIO/peripheral function select registers 0 to 5 (GPSR0 to GPSR5) and peripheral function select registers 0 to 17 (IPSR0 to IPSR17) cannot be set.

IPSR0 to IPSR17, MOD_SEL0, MOD_SEL1, and MOD_SEL2 registers shall be set before setting GPSR0 to GPSR5 registers in case that they need to be configured. MOD_SEL0, MOD_SEL1, and MOD_SEL2 registers can be set either earlier or later than setting IPSR0 to IPSR17 registers.

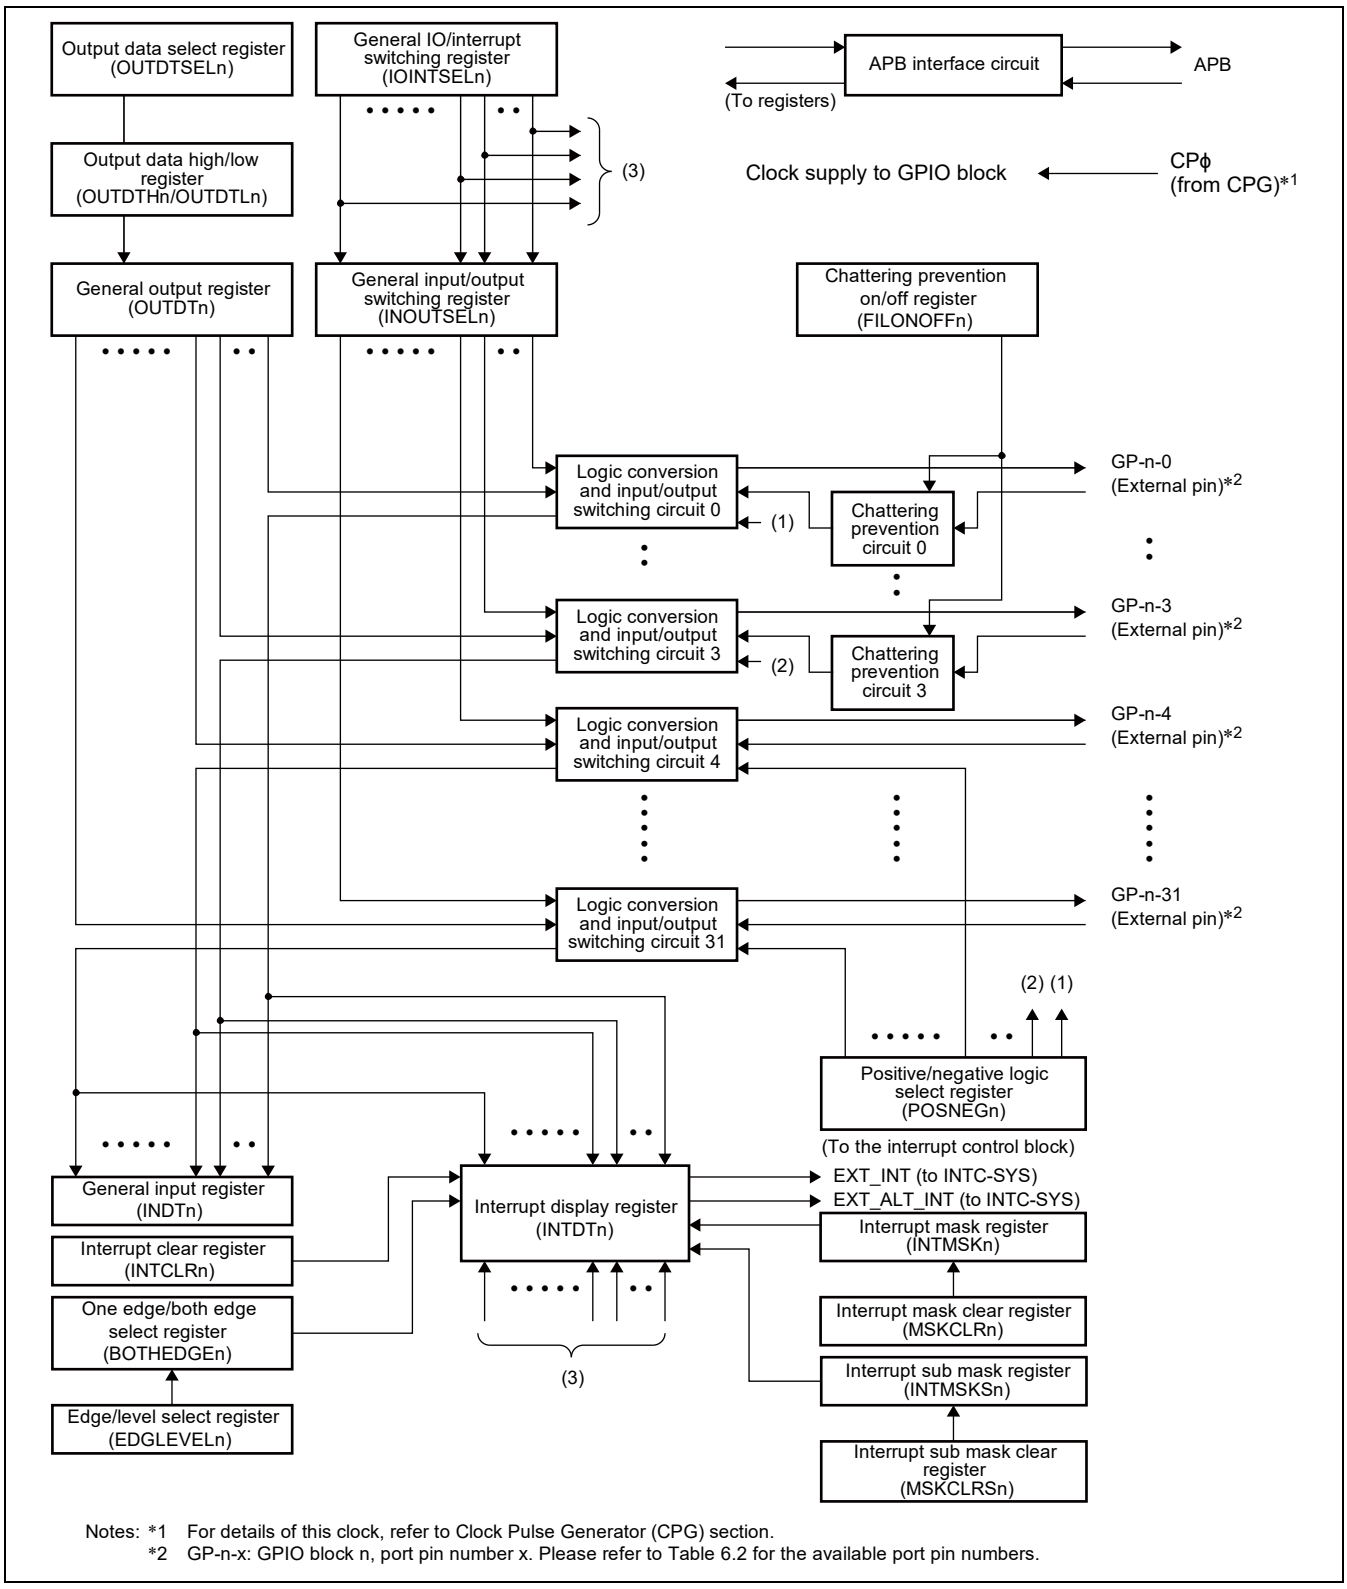
6. General-Purpose Input/Output Ports (GPIO)

6.1 Overview

The General-Purpose Input/Output Ports (GPIO) have six blocks, each of which is a functional block that supports up to 32 port pins for general input/output and interrupt input. When the relevant register is written to, a signal is output via the corresponding general output port pin. When a signal is input via the general input port pin, the corresponding register indicates the value of the input signal; specifically, when an interrupt is input via a general port pin, the relevant register indicates that it is currently receiving an interrupt input, and an interrupt is also requested to the CPU core via the interrupt control block. The functions (modes) can be assigned to each port pin as desired by some setting the corresponding registers. It is also possible to select the signal polarity (positive or negative logic) and the interrupt detection condition (one edge/both edge or level) for each port. In this LSI, general output data mode of GPIO can be set in normal mode (outputting data as normal) or high/low level data output mode. Particularly, a filtering function to prevent external chattering is also available for port pins 0 to 3 in input modes for each GPIO block.

6.1.1 GPIO Block Diagram (block n)



Notes: *1 For details of this clock, refer to Clock Pulse Generator (CPG) section.
*2 GP-n-x: GPIO block n, port pin number x. Please refer to Table 6.2 for the available port pin numbers.

Figure 6.1 GPIO Block Configuration

6.1.2 Input/Output Pins

Table 6.1 shows the pin configuration of the GPIO.

Table 6.1 Pin Configuration

Function	Pin Name	I/O	Descriptions
IO/interrupt input ports	GP-0-0 to GP-5-31	I/O	General input/output and interrupt input

Note: Numbers of available pin for each GPIO is defined as below
- GPIO0: 23 pins (GP-0-0 to GP-0-22)
- GPIO1: 23 pins (GP-1-0 to GP-1-22)
- GPIO2: 32 pins (GP-2-0 to GP-2-31)
- GPIO3: 20 pins (GP-3-0 to GP 3-16 and GP-3-27 to GP-3-29)
- GPIO4: 26 pins (GP-4-0 to GP-4-25)
- GPIO5: 32 pins (GP-5-0 to GP-5-31)

6.2 Port Pin Specifications

Each GPIO block is provided with up to 32 port pins for general input/output and external interrupt input ports. Table 6.2 specifies these pins.

6.3 Operations in Each Mode

6.3.1 Mode Switching

Two registers are used to switch modes of the general IO/interrupt input pins of the GPIO blocks. Each register is provided with up to 32 bits each controlling one of the GPIOn* port pins. The general IO/interrupt switching register is first used to select either general input/output mode or interrupt input mode for each port pin. When general input/output mode is selected, the setting of the relevant bit in the second register, i.e., the general input/output switching register, is used. Specifically, when a bit in the general input/output switching register is set for general output mode, the corresponding port pin is turned to the output direction and the route is formed so that the set value in the corresponding bit in the general output register should be output via the pin. Likewise, when set for the general input mode, the corresponding port pin is turned to the input direction and the route is formed so that the value received via the pin should be indicated by the corresponding bit in the general input register. When interrupt input mode is selected, the corresponding port pin is turned to the input direction and the route is formed so that the reception of the signal input via the pin should be indicated by the interrupt display register. Here, the setting of the second register, i.e., the general input/output switching register, is invalid.

Note: * n = 0 to 5

6.3.2 General Input/Output Mode

When a port is set for general input/output mode using the corresponding bit in the general IO/interrupt switching register, the corresponding port serves as a general input/output pin. In general input/output mode, either mode can be selected using the corresponding bit in the general input/output switching register. When a port is set for general output mode, the port outputs the value set in the corresponding bit in the general output register or output data high/output data low register with appropriate configuring in output data select register. Here, the polarity of the actual output signal is determined by the setting of the corresponding bit in the positive/negative logic select register. When a port is set for general input mode, the polarity of the input signal is also determined by the setting of the corresponding bit in the positive/negative logic select register. The general input register indicates the value accordingly. Note that the general input register does not hold the input signal using the FF.

6.3.3 Interrupt Input Mode

When a port is set for interrupt input mode using the corresponding bit in the general IO/interrupt switching register, the corresponding port serves as an interrupt input pin. In interrupt input mode, when the port receives an external interrupt, the corresponding bit in the interrupt display register indicates the input of an interrupt signal on the corresponding port pin, and an interrupt signal is output to the interrupt control block. In this mode, the polarity and detection conditions (edge or level) of the external input signal can be set for each port. The corresponding bits in the positive/negative logic select register and edge/level select register, one edge/both edge select register should be used to set the polarity and detection conditions, respectively.

If a port is set for edge detection using the corresponding bit in the edge/level select register, even when an external pulse interrupt signal is input, the corresponding bit in the interrupt display register holds the input using the FF and allows the level interrupt signal to be output to the interrupt control block. To stop all the interrupt signal outputs, all the bits in the interrupt clear register corresponding to the bits in the interrupt display register currently indicating the reception of the corresponding interrupt signals should be cleared to 0. Note that if a port is set for level detection using the corresponding bit in the edge/level select register and an external level interrupt signal is input, the corresponding bit in the interrupt display register does not use the FF to hold the input.

Interrupts indicated by the interrupt display register can be separately masked using the corresponding bits in the interrupt mask register and the interrupt sub mask register. When all the bits currently indicating the reception of the interrupt signals are masked, no interrupt signals are output to the interrupt control block. Masks can be canceled by writing 1 to the corresponding bits in the interrupt mask clear register or the interrupt sub mask clear register depending on the interrupt mask register or the interrupt sub mask register is used.

6.4 Registers in GPIO Blocks

Each GPIO block incorporates seventeen 32-bit registers. These registers can be accessed via the APB interface. Table 6.3 describes all the GPIO block registers.

Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined.

Table 6.3 Register Configuration

6.4.1 General IO/Interrupt Switching Register n (IOINTSELn)

Note: n = 0 to 5

IOINTSEL selects either general input/output mode or interrupt input mode for each of the port pins 0 to 31 of the GPIO block. When general input/output mode is selected for a port, it is also necessary to select either input or output mode for the port using the corresponding bit in the general input/output switching register. When interrupt input mode is selected for a port, the setting of the general input/output switching register for the port is ignored.

[Hardware default value: H'00000000 = general input/output mode is selected for all the ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IOINTSEL[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IOINTSEL[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	IOINTSEL[31:0]	All 0	R/W	Selects either general input/output mode or interrupt input mode for each port using the bits corresponding to the port numbers. 0: General input/output mode. 1: Interrupt input mode.

Note: Unused bits should be set to the initial values. Please refer to GPIO pin number from Table 6.2 to know what bit is unused. For example: GPIO 0 has 23 pins that mean only bit 0 to bit 23 is available.

6.4.2 General Input/Output Switching Register n (INOUTSELn)

Note: n = 0 to 5

INOUTSEL is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register. Specifically, INOUTSEL selects either general input or general output mode for a port using the bit corresponding to the port number. The INOUTSEL bits can be written to only when the corresponding bits in the general IO/interrupt switching register are 0. Note that after general input/output mode is changed to interrupt input mode, INOUTSEL retains the setting but is read as 0.

[Hardware default value: H'00000000 = general input mode is selected for all the ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INOUTSEL[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INOUTSEL[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INOUTSEL[31:0]	All 0	R/W	Selects either general input mode or general output mode for each port using the bits corresponding to the port numbers. 0: General input mode 1: General output mode

Note: Unused bits should be set to the initial values. Please refer to GPIO pin number from Table 6.2 to know what bit is unused. For example: GPIO 0 has 23 pins that mean only bit 0 to bit 23 is available.

6.4.3 General Output Register n (OUTDTn)

Note: n = 0 to 5

OUTDT is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register and then general output mode is selected by the general input/output switching register. Specifically, the value of the bit in OUTDT corresponding to the port number is inverted or not inverted depending on the setting of the positive/negative logic select register before being output from the corresponding port pin. Note that the polarity of the output signal should previously be set using the corresponding bit in the positive/negative logic select register. This register must be set after the output data select register is appropriately set to choose level of output data.

[Hardware default value: H'00000000 = 0 is output from all the ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OUTDT[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OUTDT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OUTDT[31:0]	All 0	R/W	Allows the port to output the value set in the bit corresponding to the port number when the port is appropriately set by IOINTSEL0 to IOINTSELn, INOUTSEL0 to INOUTSELn and OUTDTSEL0 to OUTDTSELn. (n = 5) 0: 0 is output. 1: 1 is output.

Note: The values set in OUTDT are not directly output from the GPIO pins; the above set values are processed according to the settings of the positive/negative logic select register before being output.
Unused bits should be set to the initial values. Please refer to GPIO pin number from Table 6.2 to know what bit is unused. For example: GPIO 0 has 23 pins that mean only bit 0 to bit 23 is available

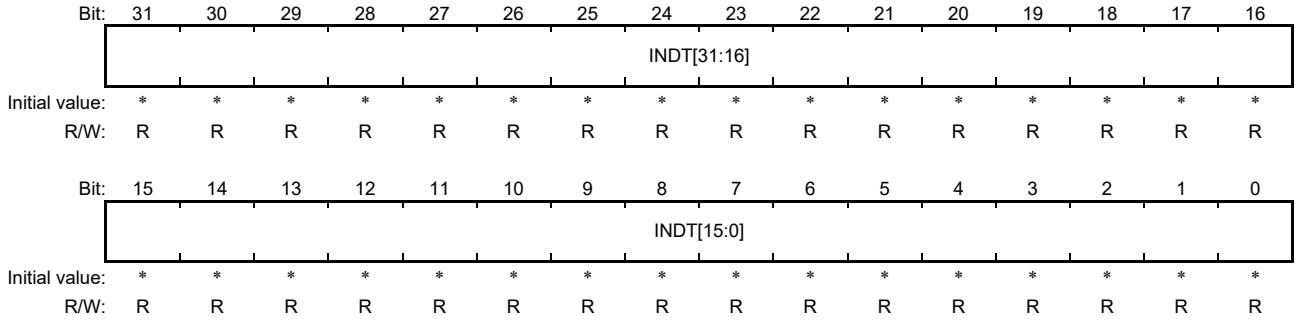
6.4.4 General Input Register n (INDTn)

Note: n = 0 to 5

INDT is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register and then general input mode is selected by the general input/output switching register. Each bit reflects the value received through the corresponding port pin.

Note that when a bit in the positive/negative logic select register is 1, the corresponding bit in INDT indicates the inverted value of the input signal.

[Hardware default value: state of the signals input to the port pins.]



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INDT[31:0]	*	R	Each bit reflects the value received through the corresponding port pin. 0: Input is 0. (assuming positive logic) 1: Input is 1. (assuming positive logic)

Note: Unused bits should be set to the initial values. Please refer to GPIO pin number from Table 6.2 to know what bit is unused. For example: GPIO 0 has 23 pins that mean only bit 0 to bit 23 is available.

* State of the signals input to the port pins.
* The GPIO input function is still enabled even if after the pin function has been set for any modules other than the GPIO; if the module pin setting is input, the input signal is also propagated to the GPIO block and the GPIO input related registers are updated by the latest input of the corresponding pin. It may occur an unexpected GPIO interrupt unless the GPIO interrupt is masked.
* The GPIO interrupt should be masked when the multiplexed pin is used for input of other than the GPIO function. Refer to section 6.4.7, INTMSKn for the GPIO interrupt mask.

6.4.5 Interrupt Display Register n (INTDTn)

Note: n = 0 to 5

INTDT is valid only when interrupt input mode is selected by the general IO/interrupt switching register. Specifically, when an interrupt is input via a port pin when INTDT is valid, the bit in INTDT corresponding to the port indicates whether the port has received an interrupt input or not. In interrupt input mode, the polarity and detection conditions (one edge/both edge or level) of the external input signal can be set for each port pin. Before using a port pin for interrupt input, the corresponding bits in the positive/negative logic select register and edge/level select register (one edge/both edge register should be appropriately configured if edge detection mode is selected) should be set, respectively.

If a port is set for edge detection using the corresponding bit in the edge/level select register, even when an external pulse interrupt signal is input, the corresponding bit in INTDT holds the input using the FF and allows the level interrupt signal to be output to the interrupt control block.

To stop all the interrupt signal outputs, all the bits in the interrupt clear register corresponding to the bits in INTDT currently indicating the reception of the corresponding interrupt signals should be cleared to 0. Note that if a port is set for level detection using the corresponding bit in the edge/level select register and an external level interrupt signal is input, the corresponding bit in INTDT does not use the FF to hold the input. Therefore, when an external input signal is stopped, the corresponding bit in INTDT is cleared automatically. When all the bits in INTDT are turned off (= 0), the GPIO stops outputting all the interrupt signals.

[Hardware default value: H'00000000 = no interrupt signals are input from ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INTDT[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INTDT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INTDT[31:0]	All 0	R	Each bit indicates the input of an interrupt signal on the corresponding port pin. 0: No interrupt signal has been input. 1: Interrupt signal has been input.

Conditions of Indicating Interrupt Input:

1. For level-sensitive interrupt input (EDGLEVEL = 0)
   - External input signals are constantly monitored and indicated. (When the negative logic is selected, the inverted value of the external input signal is indicated.)
2. For edge-sensitive interrupt input (EDGLEVEL = 1)
   - Clearing condition: When the interrupt clear register is cleared, indication is cleared regardless of the positive/negative logic select register.
   - Setting condition: With the positive logic (POSNEG = 0), when the rising edge of an external interrupt signal is detected, the interrupt input is indicated. With the negative logic (POSNEG = 1), when the falling edge is detected, the interrupt input is indicated. With both edge mode (BOTHEDGE = 1), when either the rising or falling edge, the interrupt input is indicated.

Notes: * The GPIO input function is still enabled even if after the pin function has been set for any modules other than the GPIO; if the module pin setting is input, the input signal is also propagated to the GPIO block and the GPIO input related registers are updated by the latest input of the corresponding pin. It may occur an unexpected GPIO interrupt unless the GPIO interrupt is masked.

* The GPIO interrupt should be masked when the multiplexed pin is used for input of other than the GPIO function. Refer to section 6.4.7, INTMSKn for the GPIO interrupt mask.

6.4.6 Interrupt Clear Register n (INTCLRn)

Note: n = 0 to 5

When the interrupt display register currently indicates the reception of the interrupt input on the port for which the edge detection is selected by the edge/level select register (with configuring for one edge/both edge select register) in interrupt input mode, INTCLR clears the indication. Specifically, writing 1 to the bits in INTCLR corresponding to port numbers can clear the corresponding bits in the interrupt display register. However, when the interrupt display register currently indicates the reception of the interrupt input on the port for which the level detection is selected by the edge/level select register, writing 1 to the corresponding bits in INTCLR cannot clear the corresponding bits in the interrupt display register. Only writing 1 to INTCLR is effective; INTCLR is always read as 0.

[Hardware default value: H'00000000 = interrupt indication is cleared for no ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INTCLR[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INTCLR[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INTCLR[31:0]	All 0	R/W	Writing 1 to bits corresponding to port numbers clears the corresponding bits in the interrupt display register. 0: No effect 1: Interrupt display register bit is cleared.

Note: Unused bits should be set to the initial values. Please refer to GPIO pin number from Table 6.2 to know what bit is unused. For example: GPIO 0 has 23 pins that mean only bit 0 to bit 23 is available.

6.4.7 Interrupt Mask Register n (INTMSKn)

Note: n = 0 to 5

INTMSK masks the interrupt requests indicated by the interrupt display register. Interrupts can be separately masked using the corresponding bits in INTMSK. When all the bits currently indicating the reception of the interrupt signals are masked, no interrupt signals are output to the interrupt control block. Masks can be canceled by writing 1 to the corresponding bits in the interrupt mask clear register. Only writing 0 to this register is effective.

[Hardware default value: H'00000000 = all the ports are masked.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INTMSK[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INTMSK[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INTMSK[31:0]	All 0	R/W	Setting a mask to the bit disables the corresponding interrupt signal to be output to the interrupt control block. 0: Interrupt is masked. 1: Interrupt is not masked.

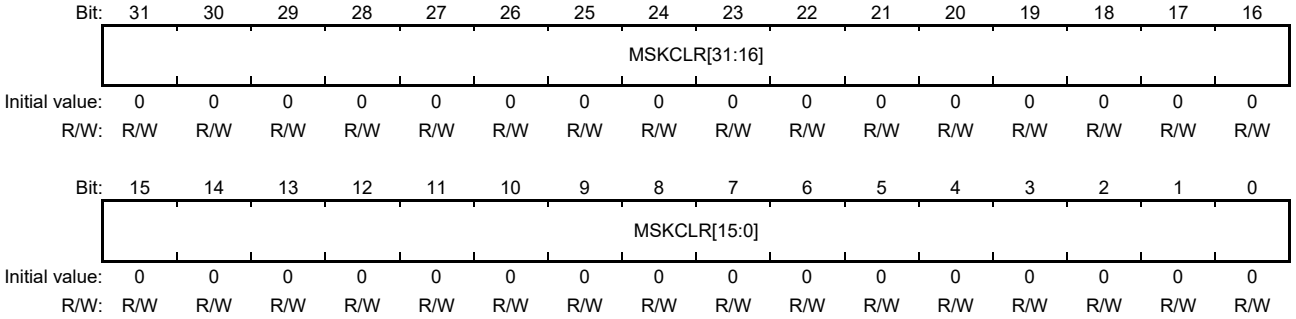
Note: Unused bits should be set to the initial values. Please refer to GPIO pin number from Table 6.2 to know what bit is unused. For example: GPIO 0 has 23 pins that mean only bit 0 to bit 23 is available.

6.4.8 Interrupt Mask Clear Register n (MSKCLRn)

Note: n = 0 to 5

MSKCLR cancels masks that are set by the interrupt mask register. Each mask can be canceled (cleared) by writing 1 to the corresponding bit in MSKCLR. Only writing 1 to MSKCLR is effective; MSKCLR is always read as 0.

[Hardware default value: H'00000000 = interrupt masks are cleared for no ports.]



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MSKCLR[31:0]	All 0	R/W	Setting a mask to the bit disables the corresponding interrupt signal to be output to the interrupt control block. 0: No effect 1: Interrupt is not masked.

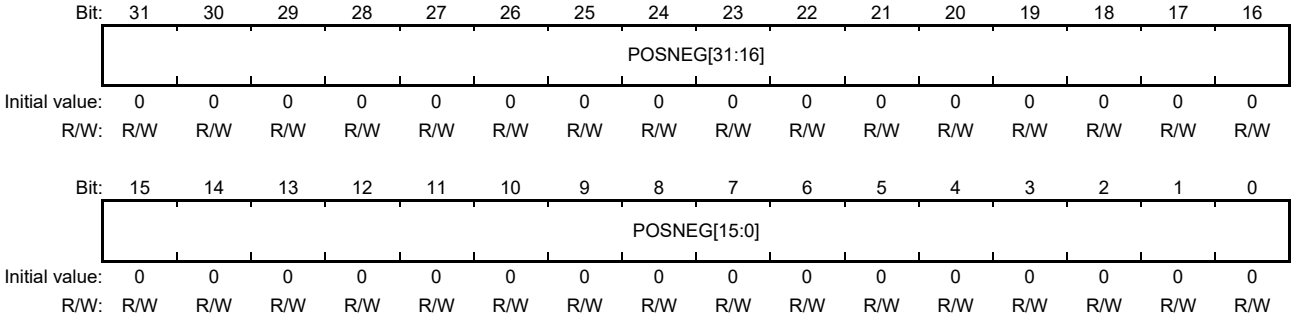
Note: Unused bits should be set to the initial values. Please refer to GPIO pin number from Table 6.2 to know what bit is unused. For example: GPIO 0 has 23 pins that mean only bit 0 to bit 23 is available.

6.4.9 Positive/Negative Logic Select Register n (POSNEGn)

Note: n = 0 to 5

POSNEG selects the polarity (positive or negative logic) of each port pin in general input mode, general output mode, or interrupt input mode. POSNEG should be set before mode selection.

[Hardware default value: H'00000000 = positive logic is selected for all the ports.]



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	POSNEG[31:0]	All 0	R/W	Selects the polarity (positive or negative logic) of each port pin. 0: Positive logic 1: Negative logic

Note: Unused bits should be set to the initial values. Please refer to GPIO pin number from Table 6.2 to know what bit is unused. For example: GPIO 0 has 23 pins that mean only bit 0 to bit 23 is available.

6.4.10 Edge/level Select Register n (EDGLEVELn)

Note: n = 0 to 5

EDGLEVEL is valid only for the ports for which interrupt input mode is selected by the general IO/interrupt switching register. Specifically, EDGLEVEL selects the detection conditions (edge or level) of the interrupt input signal on each port pin for which interrupt input mode is selected. EDGLEVEL should be set before selection of interrupt input mode.

[Hardware default value: H'00000000 = level detection is selected for all the ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EDGLEVEL[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EDGLEVEL[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	EDGLEVEL [31:0]	All 0	R/W	Selects the level or edge as detection conditions of the interrupt input signal on each port pin for which interrupt input mode is selected. 0: Level 1: Edge

Note: Unused bits should be set to the initial values. Please refer to GPIO pin number from Table 6.2 to know what bit is unused. For example: GPIO 0 has 23 pins that mean only bit 0 to bit 23 is available.

6.4.11 Chattering Prevention On/Off Register n (FILONOFFn)

Note: n = 0 to 5

FILONOFF prevents chattering input to the port pins 0 to 3 of each GPIO block and controls frequency of filter clock (generated from peripheral clock CPϕ) for chattering prevention function. For details, refer to section 6.5, Handling of Input Signals on Port Pins.

[Hardware default value: H'00000000 = chattering prevention function is turned off for all the ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CLKSEL[1:0]		—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	FILONOFF[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	CLKSEL[1:0]	00	R/W	Filter clock frequency setting. 00: CPϕ/25000. 01: CPϕ/12500. 10: CPϕ/6250. 11: CPϕ/3125.
29 to 4	—	0	R	Reserved. (These bits are always read as 0. The write value should always be 0)
3 to 0	FILONOFF[3:0]	All 0	R/W	Enables or disables the chattering prevention function. 0: Chattering prevention function is disabled. 1: Chattering prevention function is enabled. The bits FILONOFF[n] (n = 0 to 3) are used to control the port pin n.

Note: Unused bits should be set to the initial values.

6.4.12 Interrupt Sub Mask Register n (INTMSKSn)

Note: n = 0 to 5

INTMSKS masks the alternative interrupt requests indicated by the interrupt display register. Interrupts can be separately masked using the corresponding bits in INTMSKS. When all the bits currently indicating the reception of the interrupt signals are masked, no alternative interrupt signals are output to the interrupt control block. Masks can be canceled by writing 1 to the corresponding bits in the interrupt sub mask clear register. Only writing 0 to this register is effective.

[Hardware default value: H'00000000 = all the ports are masked.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INTMSKS[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INTMSKS[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INTMSKS[31:0]	All 0	R/W	Setting a mask to the bit disables the corresponding alternative interrupt signal to be output to the interrupt control block. 0: Interrupt is masked. 1: Interrupt is not masked.

Note: Unused bits should be set to the initial values. Please refer to GPIO pin number from Table 6.2 to know what bit is unused. For example: GPIO 0 has 23 pins that mean only bit 0 to bit 23 is available.

6.4.13 Interrupt Sub Mask Clear Register n (MSKCLRSn)

Note: n = 0 to 5

MSKCLRS cancels masks that are set by the interrupt sub mask register. Each mask can be canceled (cleared) by writing 1 to the corresponding bit in MSKCLRS. Only writing 1 to MSKCLRS is effective; MSKCLRS is always read as 0.

[Hardware default value: H'00000000 = alternative interrupt masks are cleared for no ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MSKCLRS[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSKCLRS[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MSKCLRS[31:0]	All 0	R/W	Setting a mask to the bit disables the corresponding alternative interrupt signal to be output to the interrupt control block. 0: No effect 1: Interrupt is not masked.

Note: Unused bits should be set to the initial values. Please refer to GPIO pin number from Table 6.2 to know what bit is unused. For example: GPIO 0 has 23 pins that mean only bit 0 to bit 23 is available.
(When GPIO is not selected by the pin multiplex settings, do not cancel the alternative interrupt mask.)

6.4.14 Output Data Select Register n (OUTDTSELn)

Note: n = 0 to 5

OUTDTSEL is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register and then general output mode is selected by the general input/output switching register. OUTDTSEL selects if OUTDT or OUTDTH/OUTDTL will be the output data of GPIO. When choosing OUTDT, configuration is performed as described in section 6.4.3, General Output Register n (OUTDT0 to OUTDTn). When choosing OUTDTH/OUTDTL, output data will be output by writing the appropriate data to the corresponding bits in OUTDTH or OUTDTL. Note that the polarity of the output signal should be previously set using the corresponding bit in the positive/negative logic select register. Furthermore, this register should be set before writing data to OUTDTH/OUTDTL registers.

[Hardware default value: H'00000000 = Out data register is used to output data.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OUTDTSEL[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OUTDTSEL[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OUTDTSEL [31:0]	All 0	R/W	Choosing whether output data is output by general output register OUTDT or output data high register OUTDTH/output data low register OUTDTL. 0: General output register is used to output the data. 1: Output data high register and output data low register is used to output the data.

Note: Unused bits should be set to the initial values. Please refer to GPIO pin number from Table 6.2 to know what bit is unused. For example: GPIO 0 has 23 pins that mean only bit 0 to bit 23 is available.

6.4.15 Output Data High Register n (OUTDTHn)

Note: n = 0 to 5

OUTDTH is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register and then general output mode is selected by the general input/output switching register, and the output data select register OUTDTSEL is configured to choose OUTDTH/OUTDTL register to output the data of GPIO. Only writing 1 to OUTDTH is effective. Otherwise, setting makes no changes. Reading OUTDTH returns the values of the latest data set to OUTDTH or OUTDTL right before that. Note that the polarity of the output signal should be previously set using the corresponding bit in the positive/negative logic select register. Furthermore, this register should be written and read after output data select register OUTDTSEL is set. Reading OUTDTH without appropriately configuring OUTDTSEL can return value of OUTDT register.

[Hardware default value: H'00000000 = 0 is output from all the ports with setting OUTDTSEL.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OUTDTH[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OUTDTH[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OUTDTH[31:0]	All 0	R/W	Outputting high value data. 0: Invalid data. 1: Valid data.

Note: Unused bits should be set to the initial values. Please refer to GPIO pin number from Table 6.2 to know what bit is unused. For example: GPIO 0 has 23 pins that mean only bit 0 to bit 23 is available.

6.4.16 Output Data Low Register n (OUTDTLn)

Note: n = 0 to 5

OUTDTL is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register and then general output mode is selected by the general input/output switching register, and the output data select register OUTDTSEL is configured to choose OUTDTH/OUTDTL register to output the data of GPIO. Only writing 0 to OUTDTL is effective. Otherwise, setting makes no changes. Reading OUTDTL returns the values of the latest data set to OUTDTL or OUTDTH right before that. Note that the polarity of the output signal should be previously set using the corresponding bit in the positive/negative logic select register. Furthermore, this register should be written or read after output data select registers OUTDTSEL is set. Reading OUTDTH without appropriately configuring OUTDTSEL can return value of OUTDT register.

[Hardware default value: H'00000000 = 0 is output from all the ports with setting OUTDTSEL.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OUTDTL[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OUTDTL[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OUTDTL[31:0]	All 0	R/W	Outputting low value data. 0: Valid data. 1: Invalid data.

Note: Unused bits should be set to the initial values. Please refer to GPIO pin number from Table 6.2 to know what bit is unused. For example: GPIO 0 has 23 pins that mean only bit 0 to bit 23 is available.

6.4.17 One Edge/Both Edge Select Register n (BOTHEDGEn)

Note: n = 0 to 5

BOTHEDGE is valid only when the edge detection mode is selected by the edge/level select registers. Specially, BOTHEDGE selects the detection condition (one edge or both edges) of the interrupt input signal on each port pin for which interrupt input mode (selected by the general IO/interrupt switching registers) and edge detection mode are selected. BOTHEDGE should be set before selection of interrupt input mode.

[Hardware default value: H'00000000 = both edge detection mode is disabled for all the ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BOTHEDGE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BOTHEDGE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BOTHEDGE [31:0]	All 0	R/W	Selecting one edge or both edge detection condition of the interrupt input signal on each port pin for which interrupt input mode and edge detection mode are selected. 0: One edge. 1: Both edges.

Note: Unused bits should be set to the initial values. Please refer to GPIO pin number from Table 6.2 to know what bit is unused. For example: GPIO 0 has 23 pins that mean only bit 0 to bit 23 is available.

6.5 Handling of Input Signals on Port Pins

6.5.1 Chattering

In general input mode and interrupt input modes, a filtering function can be used for the port pins 0 to 3 of each GPIO block to prevent external chattering input. Specifically, when a bit in the chattering prevention on/off register is set to use the function, the external input to the corresponding port pin is sampled four consecutive times based on the filter clock signal, which is internally generated by the GPIO. The external input is canceled except when the active input is detected four consecutive times. Therefore, when a filtering function is used, input to the port pins 0 to 3 of each GPIO block need to be at least four sampling clock cycles long (with the peripheral clock (CPϕ)).

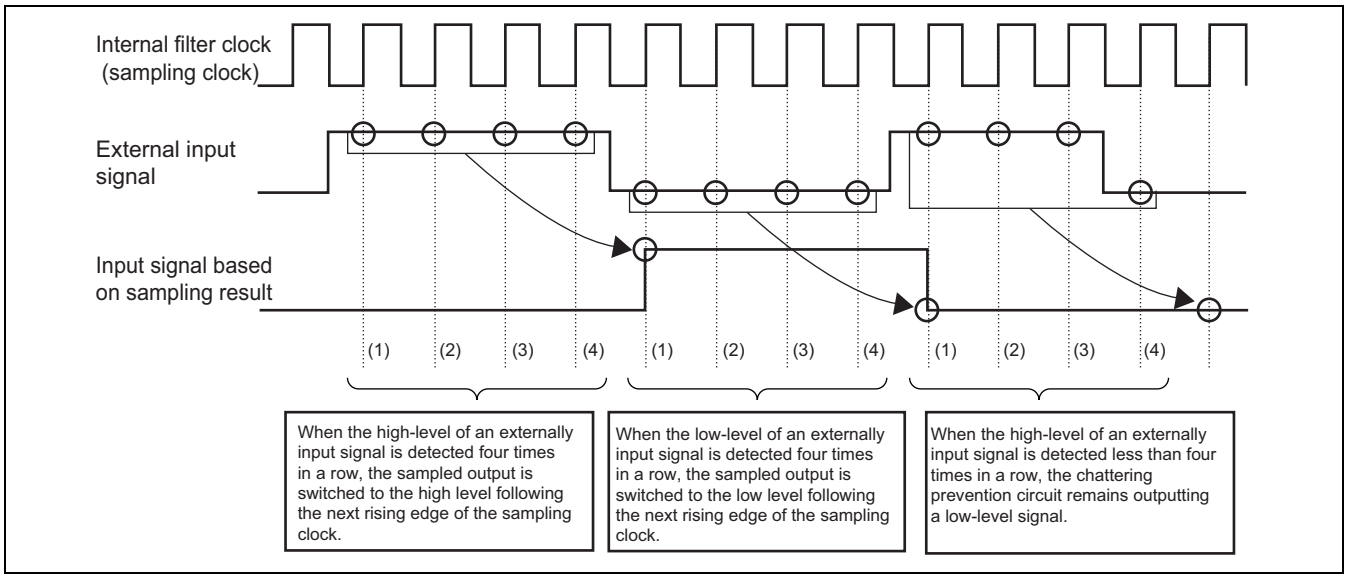


Figure 6.2 Sampling Timing Chart

6.5.2 Input Signal Synchronization

In general input mode and interrupt input mode, external input signals on all port pins are synchronized with the GPIO clock (CPϕ).

6.6 Interrupt Display Timing Charts

Figure 6.3 shows the interrupt display timing and Figure 6.4 shows the note on the timing. In both figures, the positive logic and edge-sensitive input are assumed.

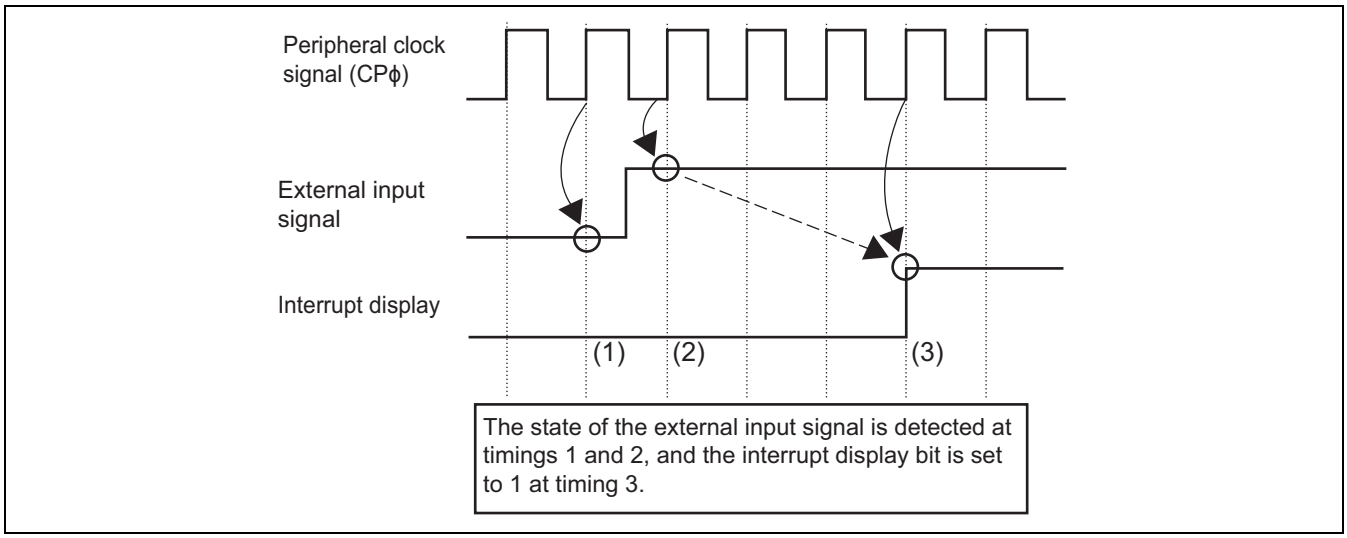

Figure 6.3 Interrupt Display Timing

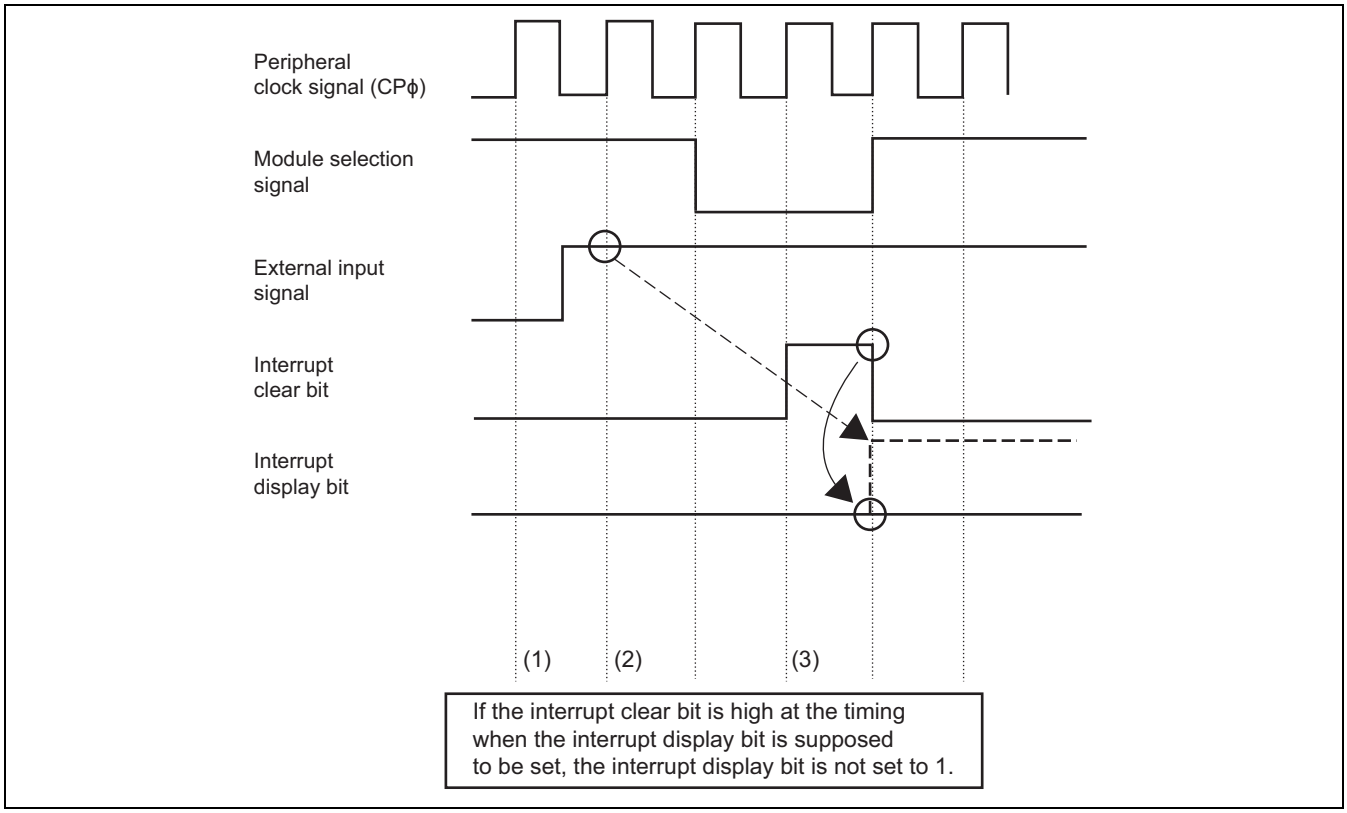

Figure 6.4 Notes on Interrupt Display Timing

6.7 Using GPIO

The following sections describe how to use the GPIO. If the GPIO is not used according to the procedures shown here, operations are not guaranteed.

6.7.1 Setting Edge-Sensitive Interrupt Input Mode

For setting edge-sensitive interrupt input mode, refer to the procedure shown in Figure 6.5.

Note that an unexpected interrupt might be generated in the module if setting (1), (2), (3) or (4) in the flowchart is changed. When changing the setting, (5) and (6) should be done.

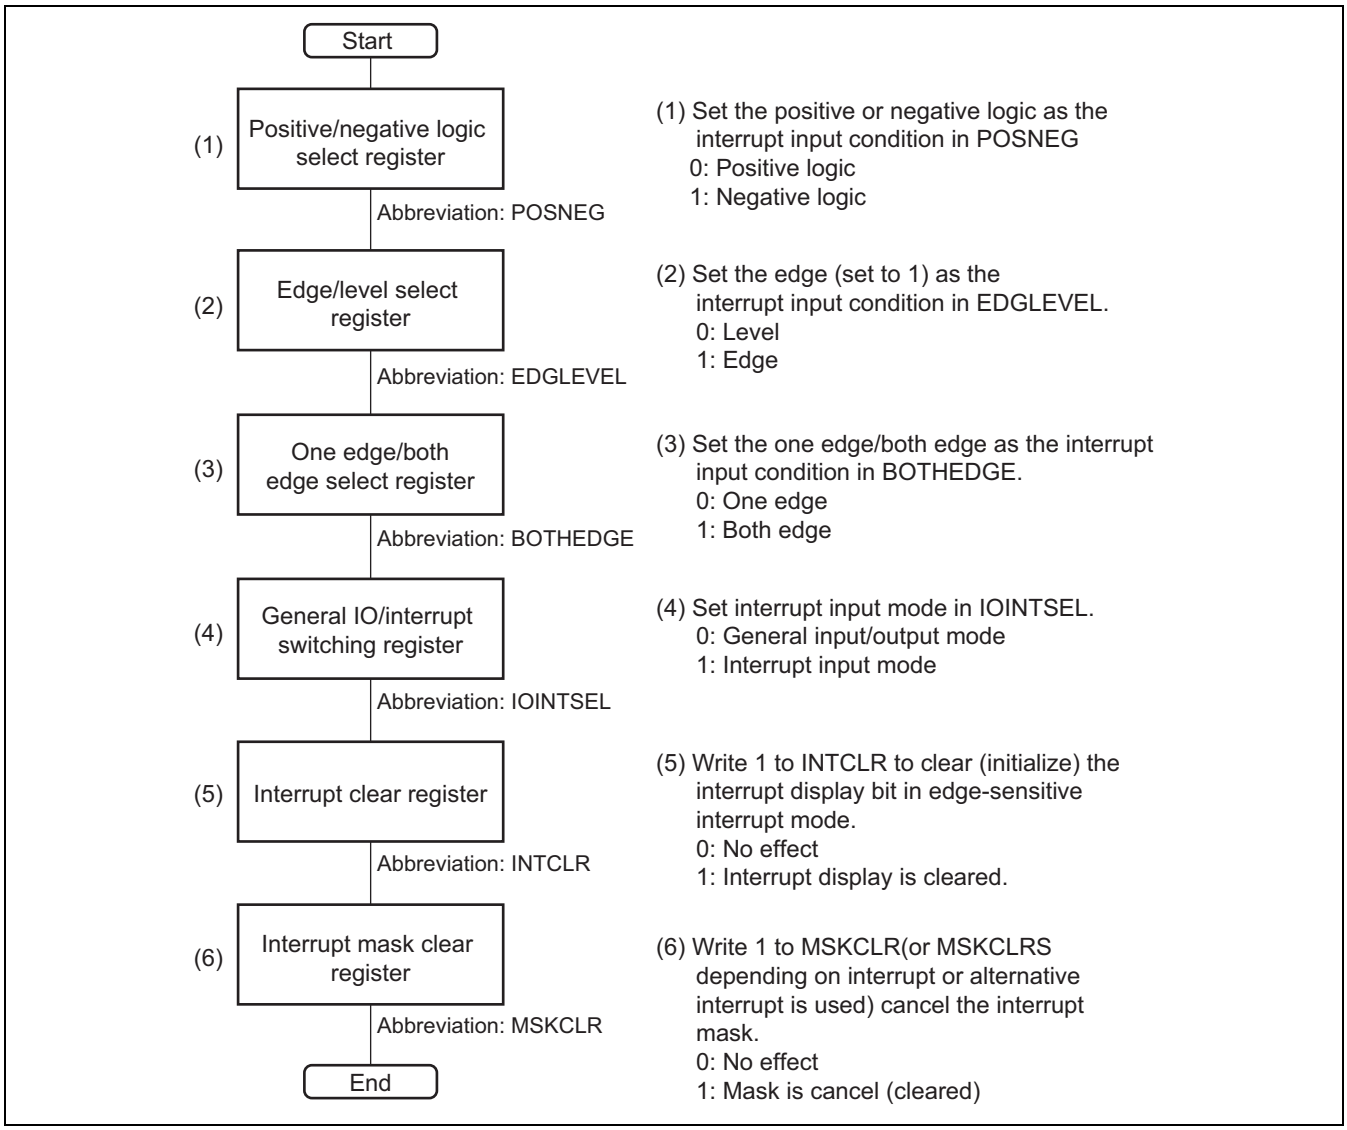

Figure 6.5 Flowchart of Setting the GPIO to Edge-Sensitive Interrupt Input Mode

6.7.2 Setting Level-Sensitive Interrupt Input Mode

For setting level-sensitive interrupt input mode, refer to the procedure shown in Figure 6.6.

Note that when an external level-sensitive interrupt input signal is stopped, the corresponding interrupt is canceled automatically. In level-sensitive interrupt input mode, the interrupt clear register is invalid.

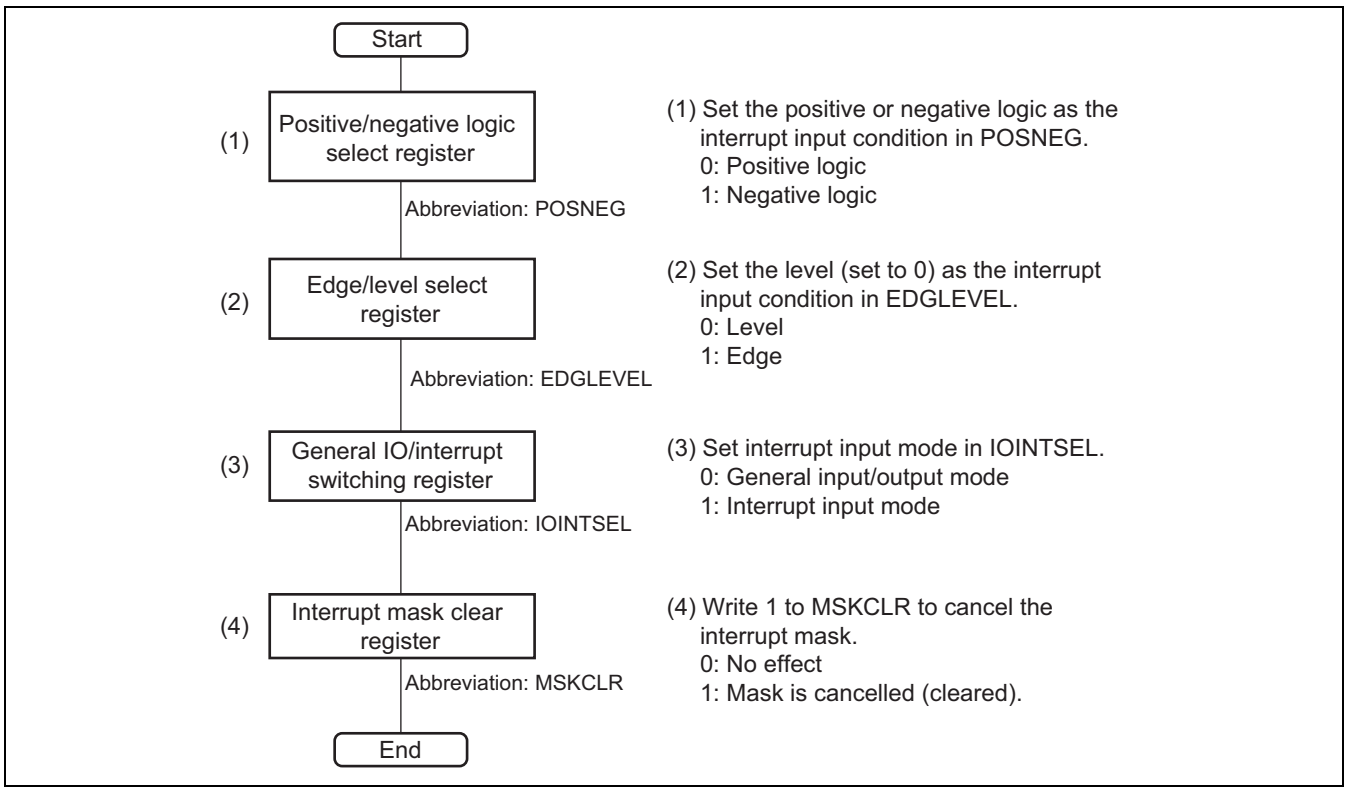

Figure 6.6 Flowchart of Setting the GPIO to Level-Sensitive Interrupt Input Mode

6.7.3 Setting General Output Mode

For setting general output mode, refer to the procedure shown in Figure 6.7.

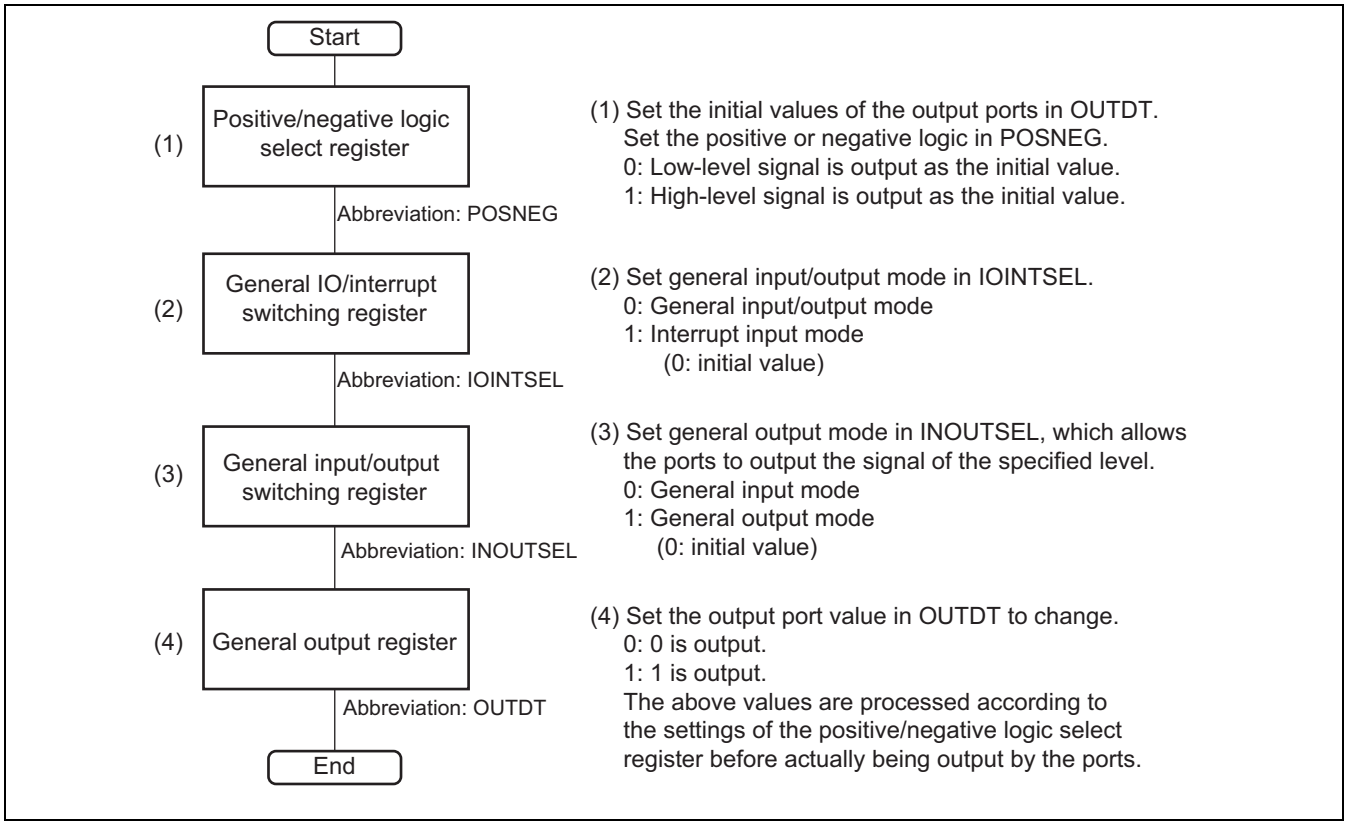

Figure 6.7 Flowchart of Setting the GPIO to General Output Mode

6.7.4 Setting Output data high/Output data low Mode

For setting output data high/output data low mode, refer to the procedure shown in Figure 6.8.

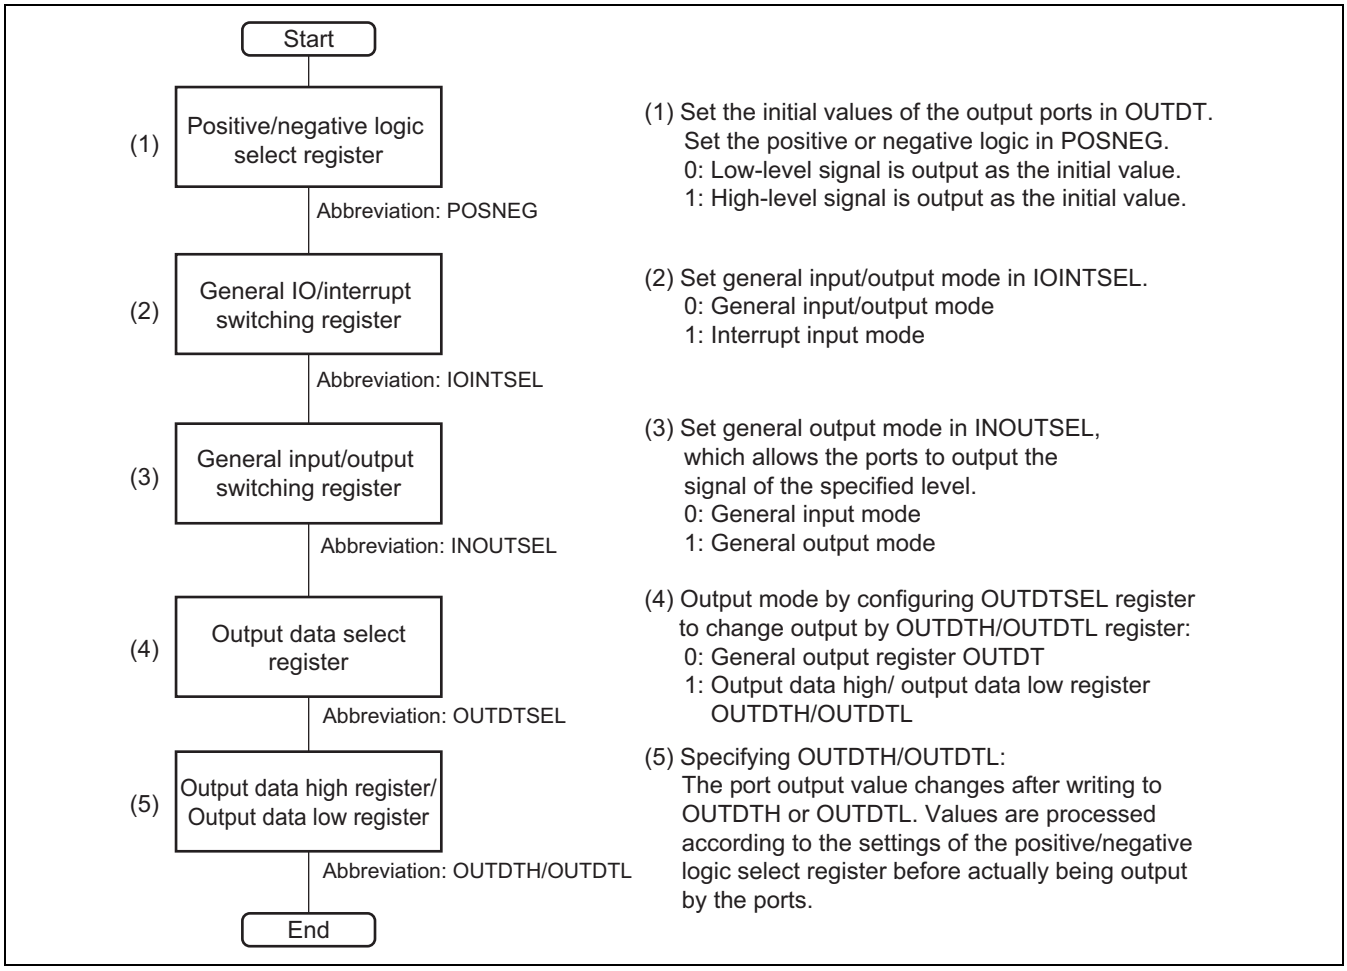

Figure 6.8 Flowchart of Setting the GPIO to Output data high/ Output data low Mode

6.7.5 Setting General Input Mode

For setting general input mode, refer to the procedure shown in Figure 6.9.

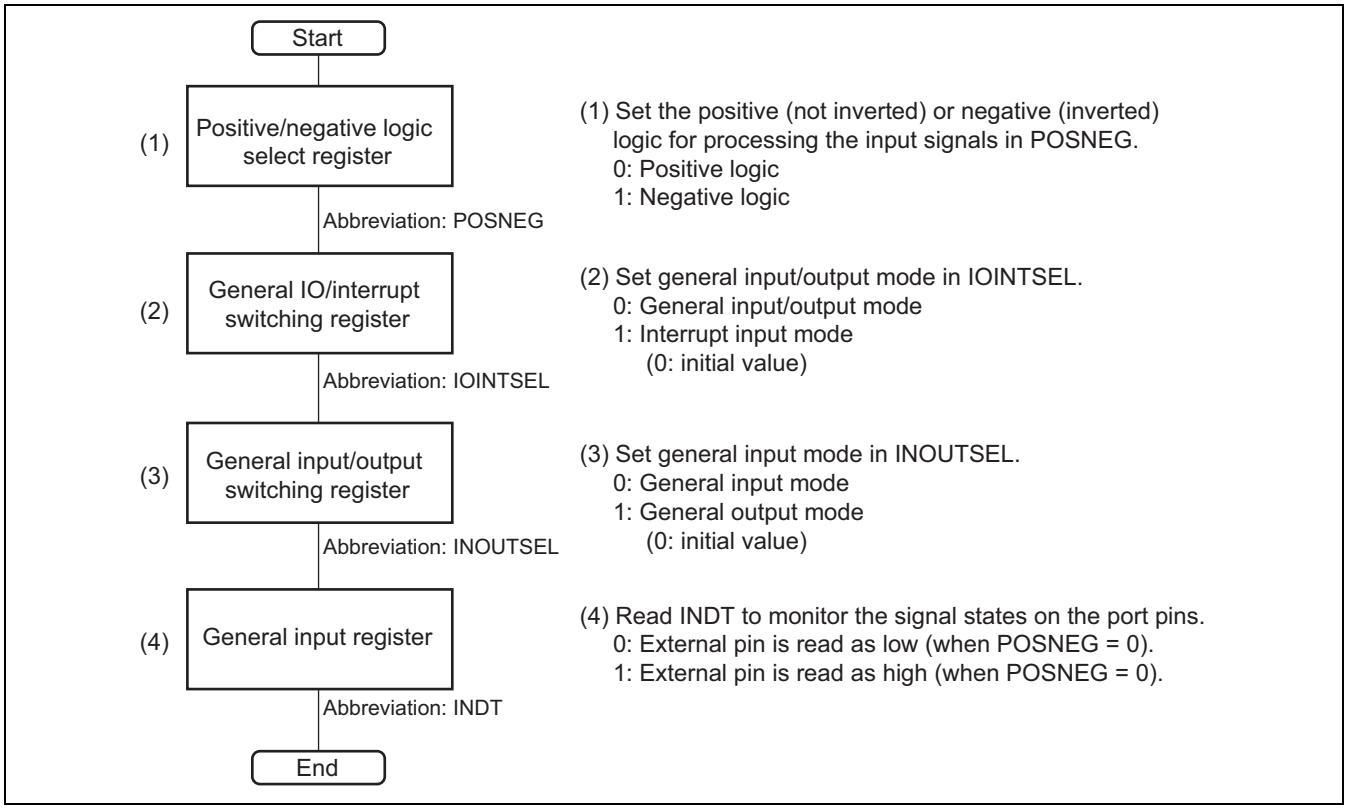

Figure 6.9 Flowchart of Setting the GPIO to General Input Mode

7. Clock Pulse Generator (CPG)

7.1 Overview

This LSI has a clock pulse generator (CPG). The CPG consists of oscillators, PLL circuit 0, PLL circuit 1, PLL circuit 3, clock dividers, and the control circuit. The CPG generates various clocks used by this LSI.

7.1.1 Features

- Generates various clocks for LSI internal operation.
  - 3 PLLs for common/application part modules
  - SYS-CPU divider, common divider and DDR divider for system basic operation.
  - Dedicated dividers for special clock
- Controls clock supply to modules according to the module status (power supply status, etc.)

A block diagram of the CPG is shown in Figure 7.1.

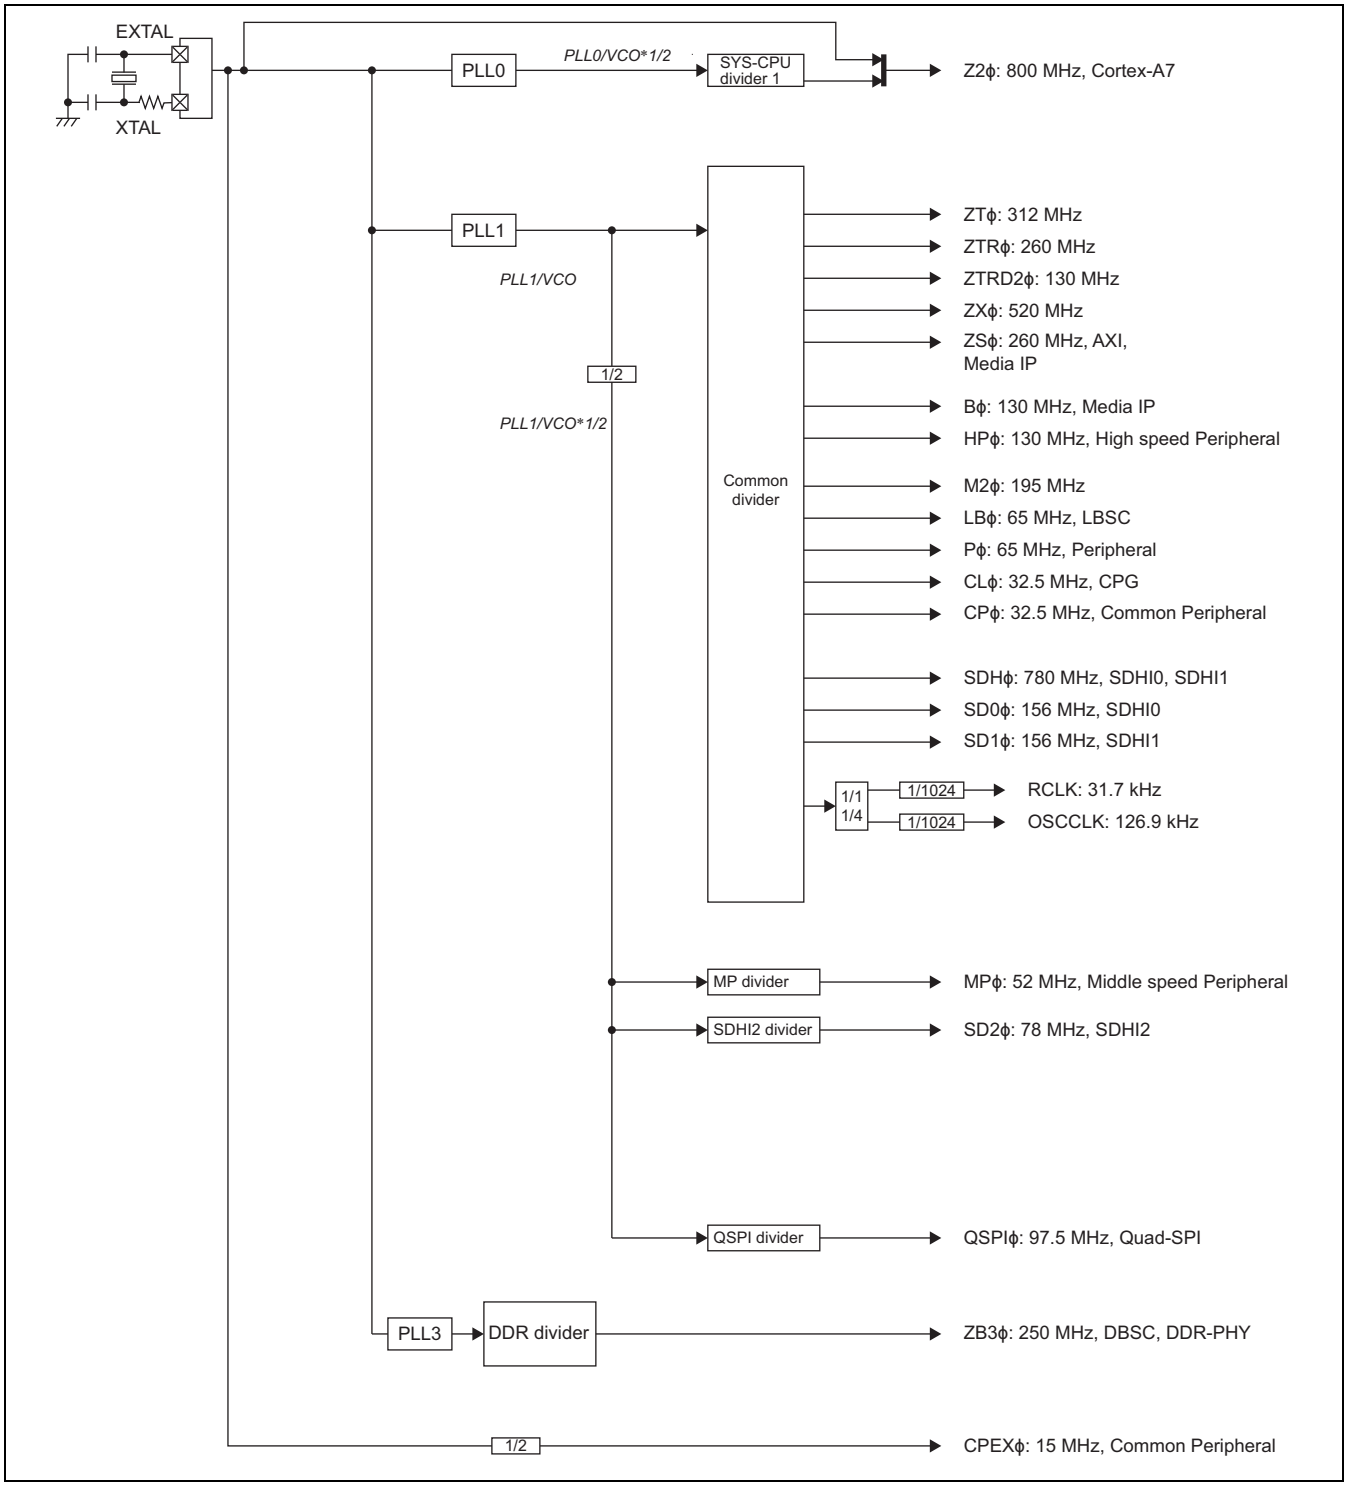

Figure 7.1 Block Diagram of CPG

Followings are the functions of each block of CPG.

(1) PLL circuit 0 (PLL0)

PLL circuit 0 multiplies EXTAL clock. The multiplication ratio is set by the PLL0CR.

(2) PLL circuit 1 (PLL1)

PLL circuit 1 multiplies the input clock from EXTAL by the multiplication ratio shown in Table 7.4.

(3) PLL Circuit 3 (PLL3)

PLL circuit 3 multiplies the input clock from EXTAL by the multiplication ratio shown in Table 7.4.

(4) SYS-CPU clock divider 1

The SYS-CPU clock divider 1 divides PLL0 output clock. This divider generates the AP-System core clocks (Z2ϕ).

(5) Common clock divider

The common clock divider divides PLL1 output clock. This divider generates various system clocks. The division ratio is set by the frequency control register B (FRQCRB).

(6) DDR clock divider

The DDR clock divider divides PLL3 output clock, and generates DDR-PHY clock and DBSC clock.

(7) Dedicated dividers

The each dedicated divider generates special clock for the related modules.

7.1.2 Input/Output Pins

Table 7.1 lists the CPG pin configuration.

Table 7.1 Pin Configuration and Functions of CPG

Pin Name	Function	I/O	Description
XTAL	Clock input pins	Output	Outputs amplified negative feedback of EXTAL
EXTAL		Input	Used as an external clock input pin
CLKOUT	External Bus Clock output pin	Output	Used as an external clock output pin
MD0	Mode 0	Input	Be sure to set MD0 to 0.
MD9	Mode 9	Input	EXTAL/XTAL pin setting
MD13	Mode 13	Input	PLL multiplication ratio setting
MD14	Mode 14	Input	PLL multiplication ratio setting

7.1.3 List of Clock Outputs

Table 7.2 lists the clock output of CPG.

Table 7.2 List of Clocks

Name	Clock Source	Frequency			Clock Domain, Function
		Dividing ratio	Maximum	Initial	
Z2ϕ	SYS-CPU divider 1	Variable	1 GHz	~800 MHz	System CPU (Cortex-A7) clock
ZTRϕ	Common divider	Variable	260 MHz	260 MHz	Trace interface clock
ZTRD2ϕ	Common divider	Variable	130 MHz	130 MHz	System trace interface clock
ZTϕ	Common divider	Variable	312 MHz	312 MHz	Internal trace clock
ZXϕ	Common divider	Fixed	520 MHz	520 MHz	
ZSϕ	Common divider	Fixed	260 MHz	260 MHz	AXI clock / media IP clock
HPϕ	Common divider	Fixed	130 MHz	130 MHz	High-speed peripheral clock
Bϕ	Common divider	Fixed	130 MHz	130 MHz	Media clock
LBϕ	Common divider	Fixed	65 MHz	65 MHz	LBSC clock
Pϕ	Common divider	Fixed	65 MHz	65 MHz	Peripheral clock
CLϕ	Common divider	Fixed	32.5 MHz	32.5 MHz	CPG
CPϕ	Common divider	Fixed	32.5 MHz	32.5 MHz	Common peripheral
M2ϕ	Common divider	Fixed	195 MHz	195 MHz	Media clock 2
ZB3ϕ	DDR divider	Fixed	400 MHz	400 MHz	DBSC/DDR-PHY clock
SDHϕ	Common divider	Variable	780 MHz	780 MHz	SDHI clock H
SD0ϕ	Common divider	Variable	156 MHz	97.5 MHz	SDHI clock 0
SD1ϕ	Common divider	Variable	156 MHz	97.5 MHz	SDHI clock 1
SD2ϕ	SDHI2 divider	Variable	78 MHz	48.75 MHz	SDHI clock 2
MPϕ	MP divider	Fixed	52 MHz	52 MHz	MP clock
QSPIϕ	QSPI divider	Variable	97.5 MHz	*1	QSPI clock
CPEXϕ	EXTAL	Fixed	15 MHz	*2	Common peripheral clock, EXTAL × 1/2
RCANϕ	USB_EXTAL	Fixed	8 MHz *4	*3	RCAN clock USB_EXTAL × 1/6
RCLK	Common divider	Fixed	31.7 kHz	31.7 kHz	
OSCCLK	Common divider	Fixed	126.9 kHz	126.9 kHz	

Notes: 1. The frequency of QSPIϕ depends on the value of MD3, MD2 and MD1.
When MD3 = L, MD2 = H, MD1 = L, QSPIϕ = 97.5 MHz.
In the other cases of MD3, MD2 and MD1 setting, QSPIϕ = 78 MHz.
2. The frequency of CPEXϕ is equal to EXTAL × 1/2. For example, when the frequency of EXTAL is equal to 20 MHz, the frequency of CPEXϕ is equal to 10 MHz.
3. The frequency of RCANϕ is equal to USB_EXTAL × 1/6.
4. The maximum value of the RCAN clock frequency is defined by calculating from the frequency of divided-by-6 of the USB clock. Note that external clock input from USB_EXTAL pin is not supported; use the crystal resonator for the USB clock.

7.1.4 Clock Operating Modes

Table 7.3 MD9 Settings

MD9	EXTAL/XTAL Pin Settings
0	Inputs an external clock to the EXTAL pin.
1	Connects the crystal resonator to the EXTAL and XTAL pins.

Table 7.4 PLL Multiplication Ratio

MD14	MD13	EXTAL Input Frequency (MHz)	Divider Setting of EXTAL Input	PLL0*1 Multiplication Ratio	PLL1*3 Multiplication Ratio	PLL3*2 Multiplication Ratio
0	0	20	× 1	× 80	× 78	× 50
0	1	26	× 1	× 60	× 60	× 56
1	0	Prohibited setting				
1	1	30	× 1	× 52	× 52	× 50

Notes: 1. PLL to create Z2ϕ for Cortex-A7

Example of frequency calculation (in the case MD14 = H, MD13 = H)
VCO output frequency of PLL0 = 30 MHz × 52 = 1560 MHz
Frequency of Z2ϕ = 1560 MHz × 1/2 (fixed divider) = 780 MHz

2. PLL to create clocks related to DBSC & DDR-PHY
3. PLL to create the other clocks

7.1.5 Register Configuration

Table 7.5 shows the CPG register configuration block. Table 7.6 shows the register states in each operating mode.

32bit-width access is only available when access to this register.

Table 7.5 Register Configurations

Register Name	Abbreviation	R/W	Address	Access Size
Frequency control register B	FRQCRB	R/W	H'E615 0004	32
PLL Enable Control Register	PLLECR	R	H'E615 00D0	32
PLL0 control register	PLL0CR	R/W	H'E615 00D8	32
RGX control register	RGXCR	R/W	H'E615 00B4	32
SDHI clock frequency control register	SDCKCR	R/W	H'E615 0074	32
SDHI2 clock frequency control register	SD2CKCR	R/W	H'E615 0078	32
RCAN clock frequency control register	RCANCKCR	R/W	H'E615 0270	32

Note: Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

Table 7.6 Register States in Each Operating Mode

Register	Power-On Reset

7.2 Register Description

Legend for Register Description

Initial value : Register value after a reset

— : Undefined value

R/W : Readable/writable. The written value can be read.

R : Read-only.

W : Write-only. The read value is undefined.

7.2.1 Frequency Control Register B (FRQCRB)

FRQCRB is a 32-bit readable/writable register. This register specifies the frequency division ratios of debug trace port clock (ZTRϕ), debug trace bus clock (ZTϕ), and debug clock (ZTRD2ϕ).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	KICK	—	—	—	—	—	—	—	ZTRFC[3:0]				ZTFC[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	1	1	1	1	0	0
R/W:	R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	ZTRD2FC[3:0]			
Initial value:	0	0	0	1	0	0	1	1	0	1	0	1	0	1	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	KICK	0	R/W	KICK bit Setting 1 to this register activates the FRQCRB setting. 0: Does not activate the FRQCRB settings. 1: Activates the FRQCRB settings. This bit is automatically cleared to 0 when the frequency division setting is completed after 1 is written to this bit.
30 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 20	ZTRFC[3:0]	0011	R/W	Debug Trace port Clock (ZTRϕ) Frequency Division Ratio 0011: × 1/6 0100: × 1/8 0101: × 1/12 0110: × 1/16 0111: × 1/18 1000: × 1/24 Other values: Setting prohibited Note: ZTRϕ is supplied only in debugging mode.

Bit	Bit Name	Initial Value	R/W	Description
19 to 16	ZTFC[3:0]	1100	R/W	Debug Trace bus Clock (ZTϕ) Frequency Division Ratio 1100: × 1/5 0011: × 1/6 0100: × 1/8 0101: × 1/12 0110: × 1/16 0111: × 1/18 1000: × 1/24 Other values: Setting prohibited Note: ZTϕ is supplied only in debugging mode.
15 to 12	—	0001	R	These bits are always read as 0001. The write value should always be 0001.
11 to 8	—	0011	R	These bits are always read as 0011. The write value should always be 0011.
7 to 4	—	0101	R	These bits are always read as 0101. The write value should always be 0101.
3 to 0	ZTRD2FC[3:0]	0101	R/W	Debug Clock (ZTRD2ϕ) Frequency Division Ratio 0101: × 1/12 0110: × 1/16 0111: × 1/18 1000: × 1/24 Other values: Setting prohibited Note: ZTRϕ is supplied only in debugging mode.

7.2.2 PLL Enable Control Register (PLLECR)

PLLECR is a 32-bit readable register that indicates the state of PLL0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PLL0ST	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	1	0	1	1	0	0	0	0	1	0	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
11	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
10	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
9	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
8	PLL0ST	1	R	PLL circuit 0 status Displays PLL circuit 0 status (on or off). 0: PLL circuit 0 is turned off. The main clock is supplied as a clock output. 1: PLL circuit 0 is turned on. The output from PLL circuit 0 is supplied as a clock output.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
3	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
2	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
1	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

7.2.3 PLL0 Control Register (PLL0CR)

PLL0CR is a 32-bit readable/writable register. This register specifies the multiplication ratio of PLL circuit 0. When writing to this register, change only bits STC[6:0] (Read-modify-write).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	STC[6:0]							—	—	—	—	—	—	—	—
Initial value:	0	*1	*1	*1	*1	*1	*1	*1	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 24	STC[6:0]	*1	R/W	PLL Circuit 0 Multiplication Ratio*2 PLL circuit 0 performs multiplication with a ratio of (setting + 1) The realized frequency has the following relationship. (PLL0/VCO) = (PLL0 reference clock) × (setting + 1) × 2 (PLL0 output) = (SYS-CPU divider1 input) = PLL0/VCO × 1/2 = (PLL0 reference clock) × (setting + 1) 0010011: × 40 0010100: × 42 ... 0100111: × 80 (Ex: 20 MHz × 80 = 1600 MHz) ... 0110001: × 100 (Ex: 20 MHz × 100 = 2000 MHz) Set the PLL circuit 0 frequency (PLL0 output frequency) between 475 MHz to 1 GHz.
23 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Notes: 1. Initial value of STC[6:0] is determined by MD14 and MD13 as shown in Table 7.4.
2. Actual multiplication ratio of PLL0 VCO to the reference clock of PLL0 is (setting + 1) × 2. The factor “2” is derived from the fixed divider in the PLL feedback loop. The input clock to the SYS-CPU divider 1 is generated by dividing PLL0 VCO by 2. That is why the input clock frequency to the SYS-CPU divider 1 is expressed as (STC[6:0] + 1) × (reference clock of PLL0).

7.2.4 RGX Control Register (RGXCR)

RGXCR is a 32-bit readable/writable register. This register enables/disables the external logic for SGX Series5.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SGXEX
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SGXEX	0	R/W	Disable external logic for SGX Series5 0: Enable external logic for SGX Series5 1: Disable external logic for SGX Series5
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

7.2.5 SDHI Clock Frequency Control Register (SDCKCR)

SDCKCR is a 32-bit readable/writable register. This register controls SDH clock (SDHϕ), SDHI0 clock (SD0ϕ) and SDHI1 clock (SD1ϕ) frequency. This register should be set before SDHI modules are operated. Do not access SDHI0 and SDHI1 modules during changing the clock frequency of SDHϕ, SD0ϕ, and SD1ϕ or stopping these clocks.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SDHFC[3:0]				SD0FC[3:0]				SD1FC[3:0]			
Initial value:	1	1	1	1	0	0	0	0	0	1	1	0	0	1	1	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 12	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
11 to 8	SDHFC [3:0]	0000	R/W	SDH clock (SDHϕ) Frequency Division Ratio 0000: × 1/2 0001: × 1/3 0010: × 1/4 0011: × 1/6 0100: × 1/8 0101: × 1/12 0110: × 1/16 0111: × 1/18 1000: × 1/24 1010: × 1/36 1011: × 1/48 Other values: Setting prohibited
7 to 4	SD0FC [3:0]	0110	R/W	SDHI0 clock (SD0ϕ) Frequency Division Ratio 1100: × 1/10 0101: × 1/12 0110: × 1/16 0111: × 1/18 1000: × 1/24 1010: × 1/36 1011: × 1/48 Other values: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	SD1FC [3:0]	0110	R/W	SDHI1 clock (SD1ϕ) Frequency Division Ratio 1100: × 1/10 0101: × 1/12 0110: × 1/16 0111: × 1/18 1000: × 1/24 1010: × 1/36 1011: × 1/48 Other values: Setting prohibited

7.2.6 SDHI2 Clock Frequency Control Register (SD2CKCR)

SD2CKCR is a 32-bit readable/writable register. This register controls SDHI2 clock (SD2ϕ) frequency. Do not access SDHI2 module during changing the clock frequency of SD2ϕ or stopping this clock.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W:	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	CKSTP	0	R/W	Clock Stop 0: Supplies SDHI2 clock 1: Stops SDHI2 clock
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	DIV[5:0]	001111	R/W	Division Ratio These bits set the frequency division ratio of SDHI2 clock divider. The clock source is divided by the division ratio of 1/(setting + 1).

7.2.7 RCAN Clock Frequency Control Register (RCANCKCR)

RCANCKCR is a 32-bit readable/writable register. This register controls the RCAN clock.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CKSTP	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	CKSTP	1	R/W	Clock Stop 0: Supplies clock to RCAN 1: Stops clock to RCAN
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

7.3 Operation

7.3.1 Changing Frequency

The clock frequencies controlled by the frequency control registers can be changed either by changing the multiplication ratio of PLL circuits 0 or by changing the division ratio of the dividers. They are controlled by software through the frequency control registers. The methods are described below.

(1) Changing Multiplication Ratio of PLL circuit 0

Changing the multiplication ratio of PLL circuit 0 can be done by modifying the STC[6:0] bits in PLL0CR. The PLL oscillation settling time is internally detected automatically. If the oscillation of PLL circuits is settled, 1 can be read through PLL0ST bit of PLLECR.

(2) Changing Division Ratio

Changing the frequency of ZTϕ, ZTRϕ, and ZTRD2ϕ can be done by modifying each set of bits for setting the division ratio in FRQCRB. After setting new ratio, write 1 to the KICK bit in FRQCRB to start the division ratio change. Before changing the division ratio, the KICK bit must be checked for 0. After 1 is written to the KICK bit in FRQCRB, 0 can be read when the change of new division ratio is completed. While the setting is being changed with the KICK bit being 1, do not modify FRQCRB. When the KICK bit is read as 1, do not write 0 into the KICK bit.

7.4 Usage Notes

7.4.1 Notes on Board Designing

(1) Bypass Capacitor

Insert laminated ceramic capacitors as bypass capacitors for each V_{SS}/V_{CC} pair. Mount the bypass capacitor near the power supply pins of the LSI. Use components with a frequency characteristic suitable for the operating frequency of the LSI, as well as a suitable capacitance value.

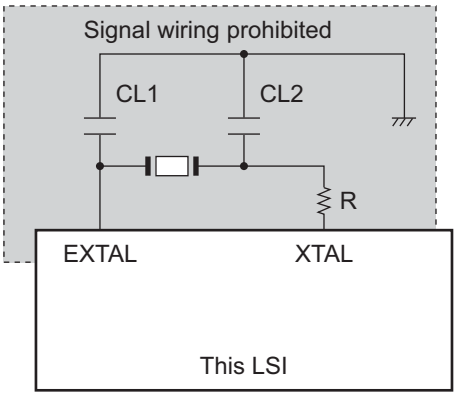
(2) Notes on Using a PLL Oscillation Circuit

Keep the wiring from the PLL V_{DD} and V_{SS} connection pattern to the power supply pins short, and make the pattern width large, to minimize the inductance component.

The analog power supply system of the PLL circuits is sensitive to noise. Therefore system malfunction may occur by the intervention with another power supply. Do not supply the analog power supply with the same resource as the digital power supply of V_{DD} and $V_{CC}Q$.

(3) When Using an External Crystal Resonator

Place the crystal resonator, capacitors CL1 and CL2, and damping resistor R as close to the XTAL, and EXTAL pins as possible. To minimize induction and thus obtain oscillation at the correct frequency, the capacitors to be attached to the resonator must be grounded to the same ground. Do not bring wiring patterns close to these components.



Note: The values for CL1, CL2, and damping resistor R should be determined after consultation with the crystal resonator manufacturer.

Figure 7.2 Note on Using a Crystal Resonator

(4) When Supplying External Clock from EXTAL Pin

Leave the XTAL pin open.

7A. Module Standby and Software Reset

The CPG functions related to module control are explained in this section. Under software control, the CPG is capable of turning the supply of clock signals to individual modules on or off and of resetting individual modules.

7A.1 Overview

7A.1.1 Features

- Module standby
  Clock supply to specified modules is stopped by setting the module stop control register bits.
  Two registers (MSTPSR and SMSTPCR) for one module, and supply of the clock signal to a module is stopped when all two register bits are set to 'stop'.
- Software Reset
  Initialize the specified module by setting the software reset register bit.

7A.1.2 Input/Output Pins

There is no input/output pin related with this function.

7A.1.3 Register Configuration

Table 7A.1 lists of the CPG registers for module standby and software reset. Table 7A.2 lists the register states in response to a reset.

Table 7A.1 Register Configurations

Register Name	Abbreviation	R/W	Address	Access Size
Module stop status register 0	MSTPSR0	R	H'E615 0030	32
Module stop status register 1	MSTPSR1	R	H'E615 0038	32
Module stop status register 2	MSTPSR2	R	H'E615 0040	32
Module stop status register 3	MSTPSR3	R	H'E615 0048	32

Note: Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

* SMSTPCRn is collectively indicated as MSTPCRn.

Table 7A.2 Register States in Response to a Reset

Register	Power-On Reset
All Registers	Initialized

7A.2 Register Description

Legend for Register Description

Initial value : Register value after a reset

— : Undefined value

R/W : Readable/writable. The written value can be read.

R : Read-only.

W : Write-only. The read value is undefined.

7A.2.1 Module Stop Status Register (MSTPSRn (n = 0 to 5, 7 to 10))

MSTPSRn is a 32-bit readable register that indicates whether the on-chip modules are in the module standby state.

Setting a bit in this register to 1 stops supply of the clock signal to the corresponding module and the setting a bit to 0 enables clock supply to the corresponding module.

Positions, names and initial values of each bit are shown below. The Tables from 7A.3 to 7A.12 show the assignment of modules to bits.

7A.2.1.1 Module Stop Status Register 0 (MSTPSR0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MSTP ST000
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

0: Supply of the clock signal to the corresponding module is enabled.

1: Supply of the clock signal to the corresponding module is stopped.

Notes: "—" indicates the bit is reserved. Set the value read from the bit.

1. When the MSTP1017 bit is set to 1, supply of the clock signal to the circuits assigned to bits MSTP1030 to MSTP1025, MSTP1021 to MSTP1018 is stopped simultaneously without writing 1 to these bits. When supply of the clock signal to any of the circuits assigned to bits MSTP1030 to MSTP1025, MSTP1021 to MSTP1018 is to be enabled, clear the MSTP1017 bit.
2. When the MSTP1005 bit is set to 1, supply of the clock signal to the SSI0 to SSI9 modules is stopped simultaneously without setting bits MSTP1015 to MSTP1006 to 1. When supply of the clock signal to any of the SSI0 to SSI9 modules is to be enabled, clear the MSTP1005 bit.

7A.2.2 Module Stop Control Register (SMSTPCRn (n = 0 to 5, 7 to 10))

SMSTPCRn is 32-bit readable/writable register which control supply of the clock signal to the modules assigned to the corresponding bits. SMSTPCRn register is for the AP system CPU core. When the control bit in SMSTPCRn is set to 1 (halt), input of the clock signal to the module is halted (the module is on standby). When a corresponding control bit in SMSTPCRn is 0, the clock signal is supplied. Whether the module is stopped or not can be checked through a corresponding bit in MSTPSRn register.

Setting a bit in this register to 1 requests that the module be placed on standby and setting a bit to 0 requests that the module operate.

The reserved bits should be set to the values read from the bits. Positions, names and initial values of each bit are shown below. The Tables from 7A.13 to 7A.22 show the assignment of modules to bits.

7A.2.2.1 System Module Stop Control Register 0 (SMSTPCR0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Assignment of modules to bits in SMSTPCR10
2	—
1	—
0	—

Notes: "—" indicates the bit is reserved. Set the value read from the bit.

1. When the MSTP1017 bit is set to 1, supply of the clock signal to the circuits assigned to bits MSTP1030 to MSTP1025, MSTP1021 to MSTP1018 is stopped simultaneously without writing 1 to these bits. When supply of the clock signal to any of the circuits assigned to bits MSTP1030 to MSTP1025, MSTP1021 to MSTP1018 is to be enabled, clear the MSTP1017 bit.
2. When the MSTP1005 bit is set to 1, supply of the clock signal to the SSI0 to SSI9 modules is stopped simultaneously without setting bits MSTP1015 to MSTP1006 to 1. When supply of the clock signal to any of the SSI0 to SSI9 modules is to be enabled, clear the MSTP1005 bit.

7A.2.3 Software Reset Register (SRCRn (n = 0 to 5, 7 to 10))

Each SRCRn is a 32-bit readable/writable register. Each effective bit is assigned to a module in the chip. Writing 1 to a given bit resets the corresponding module. Writing 1 to a given bit of the software reset clearing register (SRSTCLRn (n = 0 to 11)) clears the corresponding bit of SRCRn and releases the module from the reset state. SRCRn is written in a read-modify-write sequence but writing to SRSTCLRn can proceed by simply setting the target bits to 1. After writing 1 to a software reset bit in SRCRn, ensure that the module has actually been initialized by waiting for at least one cycle of the RCLK clock before writing 1 to the corresponding bit of SRSTCLRn to release the module from the reset state. Before applying a software reset to a module connected to the AXI, make sure that any data transfer to the module is complete.

Positions, names and initial values of each bit are shown below. The Tables from 7A.23 to 7A.32 show the assignment of modules to bits.

7A.2.3.1 Software Reset Register 0 (SRCR0)

7A.2.4 Software Reset Clearing Register n (SRSTCLRn (n = 0 to 5, 7 to 10))

Each SRSTCLRn is a 32-bit write only register. Each effective bit is assigned to a module in this chip. Writing 1 to a given bit clears the corresponding bit of SRCRn and releases the corresponding module from the reset state in which it was placed by writing 1 to the bit of SRCRn. Write 0 to the reserved bits of these registers.

Positions, names and initial values of each bit are shown below. The Tables from 7A.33 to 7A.42 show the assignment of modules to bits.

7B. Advanced Power Management Unit for AP-System Core (APMU)

7B.1 Overview

7B.1.1 Features

The AP-system core power management unit (APMU) is a module to control power supply and clock supply to the AP-system core.

This module includes the following function:

- Controls power supply to each CPU core and L2 cache area.

The APMU includes the following submodule:

- Power supply control unit (PCCU) which controls the power supply to each CPU core and L2 cache area.

7B.1.2 Input/Output Pins

There is no input/output pin related with this function.

7B.1.3 Register Configuration

Table 7B.1 lists the registers of the APMU. All registers listed in this table are cleared by the reset.

Table 7B.1 Register Configurations

Register Name	Abbreviation	R/W	Address	Access Size
Cortex-A7 CPU wake up control register	CA7WUPCR	R/W	H'E615 1010/H'E615 4010*1	32
Cortex-A7 power status register	CA7PSTR	R	H'E615 1040/H'E615 4040*1	32
Cortex-A7 CPU0 power status control register	CA7CPU0CR	R/W	H'E615 1100/H'E615 4100*1	32
Cortex-A7 CPU1 power status control register	CA7CPU1CR	R/W	H'E615 1110/H'E615 4110*1	32
Cortex-A7 debug resource reset control register	CA7DBGRCR	R/W	H'E615 1180	32
Cortex-A7 common power control register	CA7CPUCMCR	R/W	H'E615 1184/H'E615 4184*1	32

Notes: The register address maps both “H'E615 1xxx” and “H'E615 4xxx” are accessible by Cortex-A7.
1. Cortex-A7 access to this address is access to this register.

7B.2 Register Description

Legend for Register Description

Initial value : Register value after a reset

— : Undefined value

R/W : Readable/writable. The written value can be read.

R : Read-only.

W : Write-only. The read value is undefined.

7B.2.1 Cortex-A7 CPU*n* Power Status Control Register (CA7CPU*n*CR (*n* = 0 to 1))

Cortex-A7 CPU*n* power status control registers are 32-bit readable/writable registers of PCCU. These registers define the operation of related CPU when the CPU*n* core issues WFI instruction. Please write to these registers while the power of related CPU is ON.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	CPUPWR	00	R/W	CPU*n* PWR Bit Defines the power supply of corresponding CPU*n* when the CPU*n* issues WFI instruction. 00: Sleep mode 11: CoreStandby mode (power-cut of CPU core, L1$) Other than above: Setting prohibited These bits are automatically cleared to 00 when the PCCU completes CoreStandby instruction after 11 is written to these bits.

7B.2.2 Cortex-A7 Common Power Control Register (CA7CPUCMCR)

Cortex-A7 common power control registers are 32-bit readable/writable registers. These registers define power supply control of CPU peripheral (SCU and L2 cache controller) of AP-system core (Cortex-A7). The CMPWR bits of this register define the operation when all CPU cores are in the CoreStandby state.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	L2RST	0	R/W	CPU L2 Reset Control Bit Defines the power supply when all of the CPUs in the cluster are in CoreStandby mode (power-off). 0: Normal mode 1: L2 dormant mode
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	CMPWR	00	R/W	CPU Common Power Control Bit Defines the power supply when all of the CPUs in the cluster are in CoreStandby mode (power-off). 00: Normal mode, CPU peripheral (SCU and L2 cache controller) ON 01: Setting prohibited 10: L2 dormant mode, CPU peripheral (SCU and L2 cache controller) OFF 11: Setting prohibited

7B.2.3 Cortex-A7 CPU Wake Up Control Register (CA7WUPCR)

Cortex-A7 CPU wake up control registers are 32-bit readable/writable registers of PCCU. These registers request power on of each CPU core. Writing 1 to the CPU*n*WUP bit wakes up the corresponding CPU*n*, and the CPU*n* starts operation from the reset vector. Each bit is automatically cleared to 0 after the wake up procedure is finished.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPU1 WUP	CPU0 WUP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	CPU1WUP	0	R/W	CPU1 Wake Up Bit Write access: 0: Ignores. 1: Requests wake up of CPU1 (CPU1 power on). Read access: 0: CPU1 wakeup sequence is completed. 1: CPU1 wakeup sequence is in progress.
0	CPU0WUP	0	R/W	CPU0 Wake Up Bit Write access: 0: Ignores. 1: Requests wake up of CPU0 (CPU0 power on). Read access: 0: CPU0 wakeup sequence is completed. 1: CPU0 wakeup sequence is in progress.

7B.2.4 Cortex-A7 Power Status Register (CA7PSTR)

Cortex-A7 power status registers are 32-bit readable registers of PCCU. These registers show power status of AP-system CPU cores.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	—	0	0	0	—	0	0	0	—	0	0	0	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	CPU1ST[1:0]		—	—	CPU0ST[1:0]	
Initial value:	0	0	1	1	0	0	1	1	0	0	1	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: — stands for unknown value.

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0.
28	—	Undefined	R	Reserved This bit is always read as unknown value.
27 to 25	—	All 0	R	Reserved These bits are always read as 0.
24	—	Undefined	R	Reserved This bit is always read as unknown value.
23 to 21	—	All 0	R	Reserved These bits are always read as 0.
20	—	Undefined	R	Reserved This bit is always read as unknown value.
19 to 17	—	All 0	R	Reserved These bits are always read as 0.
16	—	Undefined	R	Reserved This bit is always read as unknown value.
15, 14	—	All 0	R	Reserved These bits are always read as 0.
13, 12	—	11	R	Reserved These bits are always read as 11.
11, 10	—	All 0	R	Reserved These bits are always read as 0.
9, 8	—	11	R	Reserved These bits are always read as 11.
7, 6	—	All 0	R	Reserved These bits are always read as 0.
5, 4	CPU1ST [1:0]	11	R	CPU1 Status Bit Displays CPU1 status. 00: Run mode 11: CoreStandby mode Other than above: Invalid

Bit	Bit Name	Initial Value	R/W	Description
3, 2	—	All 0	R	Reserved These bits are always read as 0.
1, 0	CPU0ST [1:0]	00	R	CPU0 Status Bit Displays CPU0 status. 00: Run mode 11: CoreStandby mode Other than above: Invalid

7B.2.5 Cortex-A7 Debug Resource Reset Control Register (CA7DBGRCR)

Cortex-A7 debug resource reset control registers are 32-bit readable/writable registers of PCCU. These registers enable the reset requests derived from power-shutoff to the AP-system CPU cores in the debug mode. When you write to these registers, please modify only the target bits you want to change (read-modify-write). In the debug mode, bits 24 to 19 must be set to all 1 before the AP-system cores first resume from power-shutoff. In the normal mode (i.e. not debug mode), writing all 1 to bits 24 to 19 doesn't disturb normal operation. Therefore the same code to write these registers can be applied for both debug mode and normal mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	DBGCPUREN	—	—	DBGCPU1REN	DBGCPU0REN	DBGCPUPREN	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	—	—
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	—	—	0	0	—	—	0	0	—	—	0	0	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	DBGCPUREN	0	R/W	Enable the reset request derived from power-shutoff to the circuits other than CPU cores in the debug mode. 0: Disables the reset request derived from power-shutoff to the circuits other than CPU cores in the debug mode. 1: Enables the reset request derived from power-shutoff to the circuits other than CPU cores in the debug mode.
23	—	0	R/W	Reserved The initial value of this bit is 0. The value of this bit doesn't affect the operation of RZ/G1C. Therefore the write value can be either 0 or 1.
22	—	0	R/W	Reserved The initial value of this bit is 0. The value of this bit doesn't affect the operation of RZ/G1C. Therefore the write value can be either 0 or 1.
21	DBGCPU1REN	0	R/W	Enable the reset request derived from power-shutoff to CPU1 in the debug mode. 0: Disables the reset request derived from power-shutoff to CPU1 in the debug mode. 1: Enables the reset request derived from power-shutoff to CPU1 in the debug mode.
20	DBGCPU0REN	0	R/W	Enable the reset request derived from power-shutoff to CPU0 in the debug mode. 0: Disables the reset request derived from power-shutoff to CPU0 in the debug mode. 1: Enables the reset request derived from power-shutoff to CPU0 in the debug mode.

Bit	Bit Name	Initial Value	R/W	Description
19	DBGCPUPREN	0	R/W	Enable the reset request derived from power-shutoff to CPU Peripheral (SCU and L2 cache controller) in the debug mode. 0: Disables the reset request derived from power-shutoff to CPU Peripheral (SCU and L2 cache controller) in the debug mode. 1: Enables the reset request derived from power-shutoff to CPU Peripheral (SCU and L2 cache controller) in the debug mode.
18	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
17, 16	—	Undefined	R	Reserved These bits are always read as unknown values. The write value should always be the same as read values (read-modify-write).
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	—	Undefined	R	Reserved These bits are always read as unknown values. The write value should always be the same as read values (read-modify-write).
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	—	Undefined	R	Reserved These bits are always read as unknown values. The write value should always be the same as read values (read-modify-write).
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	—	Undefined	R	Reserved These bits are always read as unknown values. The write value should always be the same as read values (read-modify-write).
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	—	Undefined	R	Reserved These bits are always read as unknown values. The write value should always be the same as read values (read-modify-write).

7B.3 Operation

7B.3.1 PCCU Function

(1) Power Control

The PCCU manages the CPU power supply when the CPU issues WFI instruction, and recovers from the low power state. Table 7B.2 shows power status of CPU.

Table 7B.2 CPU Power Mode

Power Mode	CPU#*n* Clock	CPU#*n* Power	CPU Peripheral (SCU and L2 Cache Controller) Power
Run mode	ON	ON	ON
Sleep mode	OFF	ON	ON
CoreStandby mode	OFF	ON	ON
L2 shutdown mode	OFF	ON	ON

The following is method to enter each mode.

Sleep mode

Issue WFI instruction when the CPUPWR bits of CA7CPUnCR are B'00.

CoreStandby mode

Issue WFI instruction with the CPUPWR bits of CA7CPUnCR are B'11.

The CPUPWR bits of CA7CPUnCR are automatically cleared to B'00 when the PCCU completes CoreStandby operation. So the interrupt to CPUn is masked while CPUPWR bits of CA7CPUnCR are B'11. In the case of cancel, it is cancelled by setting B'00 to the CPUPWR bits of CA7CPUnCR.

L2 shutdown mode

Issue WFI instruction when all of the conditions below are met:

Other CPU cores in the same CPU cluster are in the CoreStandby mode.

The CMPWR bits of CA7CPUCMCR are B'10.

The L2RST bit of CA7CPUCMCR is B'0.

The CPUPWR bits of CA7CPUnCR are B'11

Run mode

Interrupt and reset of CPU recovers each CPU to the RUN mode.

8. Reset (RST)

8.1 Overview

The reset (RST) consists of the bus interface block and registers related to reset control. Timing of the bus interface block is based on CPϕ.

8.1.1 Features

The following functions are implemented by RST.

- Register-based reset control for the Cortex-A7
- Latching of the levels on mode pins when PRESET# is negated
- Mode monitoring register
- Boot address registers for the Cortex-A7

8.1.2 Features of WDT reset

- WDT resets can be issued by the RWDT module.
- WDTRSTCR controls the permission or prohibition of WDT resets.
- The reset (RST) module is not initialized by a WDT reset.

8.1.3 Block Diagram

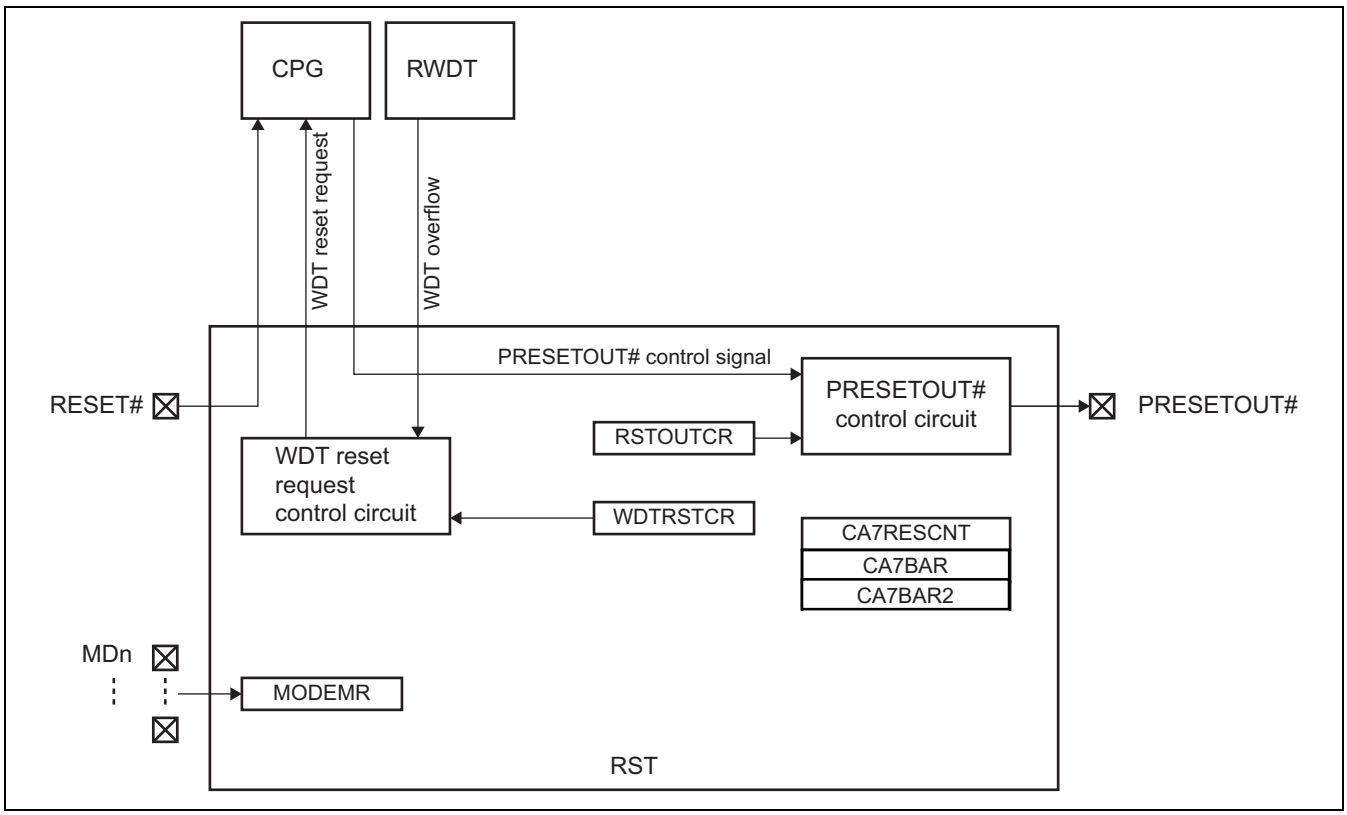

Figure 8.1 Block Diagram of RST

8.1.4 Input/Output Pins

The following table lists the pins connected to the RST.

Table 8.1 External Pins for RST

Pin Name	Function	Direction	Remarks
MD0 to MD11	Mode pins	IN	Mode pins
MD13 to MD14	Mode pins	IN	Mode pins
MD20 to MD21	Mode pins	IN	Mode pins
MDT0 to MDT1	Mode pins	IN	Mode pins
PRESET#	Power-on-reset	IN	Power-on-reset The low-level input on this pin places the LSI in the power-on-reset state.
PRESETOUT#	Indicates internal reset	OUT	Reset output

8.1.5 Register Configuration

Table 8.2 RST Register Details

Register Name	Mnemonic	R/W	Address	Access Size	Access Permission
Mode monitoring register	MODEMR	R	H'E616 0060	32	All
Cortex-A7 reset control register	CA7RESCNT	R/W	H'E616 0044	32	All
Watchdog timer reset control register	WDTRSTCR	R/W	H'E616 0054	32	All
PRESETOUT control register	RSTOUTCR	R/W	H'E616 0058	32	All
SYS boot address register	SBAR	R/W	H'E616 0010	32	Cortex-A7
SYS boot address register 2	SBAR2	R/W	H'E616 0014	32	Cortex-A7
Cortex-A7 boot address register	CA7BAR	R/W	H'E616 0030	32	All
Cortex-A7 boot address register 2	CA7BAR2	R/W	H'E616 0034	32	All

Note: Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

Table 8.3 State of the Registers on Reset

Mnemonic	Power-On Reset
MODEMR	Initialized*
CA7RESCNT	Initialized*
WDTRSTCR	Initialized*
RSTOUTCR	Initialized*
SBAR	Initialized*
SBAR2	Initialized*
CA7BAR	Initialized*
CA7BAR2	Initialized*

Note: * Initialized only on power-on reset caused by PRESET#.

8.2 Register Description

Legend for Register Description

Initial value : Register value after a reset

— : Undefined value

R/W : Readable/writable. The written value can be read.

R : Read-only.

W : Write-only. The read value is undefined.

8.2.1 Mode Monitoring Register (MODEMR)

MODEMR is a 32-bit read-only register, which can be accessed only in longwords.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	MDT1	MDT0	—	—	—	—	—	—	—	MD21	MD20	—	—	—	—
Initial value:	0	—	—	0	0	0	0	0	0	0	—	—	0	0	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	MD14	MD13	—	MD11	MD10	MD09	MD08	MD07	MD06	MD05	MD04	MD03	MD02	MD01	MD00
Initial value:	0	—	—	0	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved When read, returns 0.
30, 29	MDT[1:0]	Depend on mode setting	R	The value of MDT0 and MDT1
28 to 22	—	All 0	R	Reserved. These bits are always read as 0. Writing is inhibited.
21, 20	MD[21:20]	Depend on mode setting	R	The value of MD21 and MD20
19, 18	—	All 0	R	Reserved. These bits are always read as 0. Writing is inhibited.
17, 16	—	All 1	R	Reserved. These bits are always read as 1. Writing is inhibited.
15	—	0	R	Reserved When read, returns 0.
14, 13	MD[14:13]	Depend on mode setting	R	The value of MD14 and MD13
12	—	0	R	Reserved When read, returns 0.
11 to 0	MD[11:00]	Depend on mode setting	R	The value of MD11 to MD0

8.2.2 Cortex-A7 Reset Control Register (CA7RESCNT)

CA7RESCNT is a 32-bit readable/writable register, which can be accessed only in longwords.

This register specifies whether the reset is issued to Cortex-A7 CPUn (n = 0 to 1) or not. The upper word of the write value should always be the code value H'5A5A. If the code value is read, it is always read as 0.

This register is initialized on power on reset caused by PRESET#.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Code value (H'5A5A)															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CA7 CPU0R	CA7 CPU1R	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	MD7 | ~ MD6	1	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	Code value	H'0000	R/W	Code value (H'5A5A) When read, returns 0.
15 to 4	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
3	CA7CPU0R	MD7| ~ MD6	R/W	Issue reset to Cortex-A7 CPU0 0: Not assert the reset to Cortex-A7 CPU0 1: Assert the reset to Cortex-A7 CPU0
2	CA7CPU1R	1	R/W	Issue reset to Cortex-A7 CPU1 0: Not assert the reset to Cortex-A7 CPU1 1: Assert the reset to Cortex-A7 CPU1
1, 0	—	All 1	R	Reserved When read, returns 1. The write value should always be 1.

8.2.3 Watchdog Timer Reset Control Register (WDTRSTCR)

WDTRSTCR is a 32-bit readable/writable register, which can be accessed only in longwords.

This register specifies whether the watchdog timer overflow should be masked or not as a reset trigger. The upper word of the write value should always be the code value H'A55A. If the code value is read, it is always read as 0.

This register is initialized on power on reset caused by PRESET#.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Code value (H'A55A)															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RWDT_ RSTMSK
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	Code value	H'0000	R/W	Code value (H'A55A) When read, returns 0.
15 to 2	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
1	—	1	R	Reserved When read, returns 1. The write value should always be 1.
0	RWDT_ RSTMSK	1	R/W	RWDT Reset Mask This bit is used to mask the detection of RWDT overflow. 0: Reset request 1: Not reset request

8.2.4 PRESETOUT Control Register (RSTOUTCR)

RSTOUTCR is a 32-bit readable/writable register, which can be accessed only in longwords.

This register controls the output level of external LSI pin RESETOUT# by software.

This register is initialized on power on reset caused by PRESET#.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RESOUT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
0	RESOUT	1	R/W	PRESETOUT# control by software This bit is used to specify the output level of PRESETOUT#. 0: PRESETOUT# is asserted 1: PRESETOUT# is negated

8.2.5 SYS Boot Address Register (SBAR)

SBAR is a link to CA7BAR. SBAR is write-only register. Therefore read access to SBAR is prohibited.

If System CPU (Cortex-A7) accesses to SBAR, System CPU (Cortex-A7) can write to CA7BAR.

8.2.6 SYS Boot Address Register2 (SBAR2)

SBAR2 is a link to CA7BAR2. SBAR2 is write-only register. Therefore read access to SBAR2 is prohibited.

If System CPU (Cortex-A7) accesses to SBAR2, System CPU (Cortex-A7) can write to CA7BAR2.

8.2.7 Cortex-A7 Boot Address Register (CA7BAR)

CA7BAR is a 32-bit readable/writable register, which can be accessed only in longwords.

This register specifies the boot space of the System CPU (Cortex-A7).

This register is initialized on power on reset caused by PRESET#.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SBAR[39:24]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SBAR[23:18]						—	—	—	—	—	BAREN	—	—	BTMD[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0/1	0	0	00/10	
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	SBAR[39:18]	{H'00000, B'00}	R/W	System CPU (Cortex-A7) Boot Address When System CPU (Cortex-A7) accesses to the range of physical address from H'00 0000 0000 to H'00 0003 FFFF, the address bit in [39:18] is replaced by SBAR[39:18].
9 to 5	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
4	BAREN*2	0/1*1	R/W	BAREN bit 0: SBAR is not valid. 1: SBAR is valid.
3, 2	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
1, 0	BTMD[1:0]	00/10*1	R/W	Specifies the Boot area of System CPU (Cortex-A7) During Hardware Power On Reset the initial value of these bits depends upon MD3, MD2 and MD1 pin setting. 00: SBAR[39:18] is assigned to Boot address, set SBAR[17:0] to 0. 01: Prohibited. 10: Boots from Built-in memory. 11: Prohibited.

Notes: 1. Initial value depends upon MD3, MD2 and MD1 pin setting.

2. Do not rewrite BAREN = 1 simultaneously with SBAR and BTMD. After completing the setting of SBAR and BTMD with BAREN = 0, set only BAREN = 1.
   For example: Change SBAR[39:18] from A to B, and BTMD[1:0] = 00
   Step 1: Write SBAR[39:18] = B, BAREN = 0, BTMD[1:0] = 00
   Step 2: Write SBAR[39:18] = B, BAREN = 1, BTMD[1:0] = 00

8.2.8 Cortex-A7 Boot Address Register2 (CA7BAR2)

CA7BAR2 is a 32-bit readable/writable register, which can be accessed only in longwords. This register can be changed only in the secure mode.

This register specifies the boot space of the System CPU (Cortex-A7).

This register is initialized on power on reset caused by PRESET#.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SBAR2[39:24]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SBAR2[23:18]						—	—	—	—	—	BAREN	—	—	—	VLD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	SBAR2[39:18]	{H'00000, B'00}	R/W	System CPU (Cortex-A7) Boot Address2 When System CPU (Cortex-A7) accesses to the range of physical address from H'00 0000 0000 to H'00 0003 FFFF, the address bit in [39:18] is replaced by SBAR2[39:18].
9 to 5	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
4	BAREN*	0	R/W	BAREN bit 0: SBAR2 is not valid. 1: SBAR2 is valid.
3 to 1	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
0	VLD	0	R/W	VALID bit When 1 is set to this bit, System CPU (Cortex-A7) starts only from the address set to SBAR2. 0: System CPU (Cortex-A7) starts from the address set to SBAR. 1: System CPU (Cortex-A7) starts from the address set to SBAR2.

Note: * Do not rewrite BAREN = 1 simultaneously with SBAR2 and VLD. After completing the setting of SBAR2 and VLD with BAREN = 0, set only BAREN = 1.
For example: Change SBAR2[39:18] from A to B, and VLD = 1
Step 1: Write SBAR2[39:18] = B, BAREN = 0, VLD = 1
Step 2: Write SBAR2[39:18] = B, BAREN = 1, VLD = 1

8.3 Operation

8.3.1 Power-On Reset by PRESET# Pin

Since the PLL circuit is initialized when the LSI enters the power-on reset state, the PLL oscillation settling time needs to be secured. This means that a high level must not be input to the PRESET# pin during the PLL oscillation settling time. For the power-on oscillation settling time (tOSC), see section 51, Electrical Characteristics.

After the state on the PRESET# pin input is changed from a low level to high level, the internal reset state continues until the flash ROM reset time (longer than 50 µs), the flash ROM holding time (longer than 5 µs) and the reset holding time elapse.

(1) Sequence for Turning on the Power

When the power is turned on, ensure that a low level is input to the PRESET# pin. A low level input is also needed on the TRST# pin.

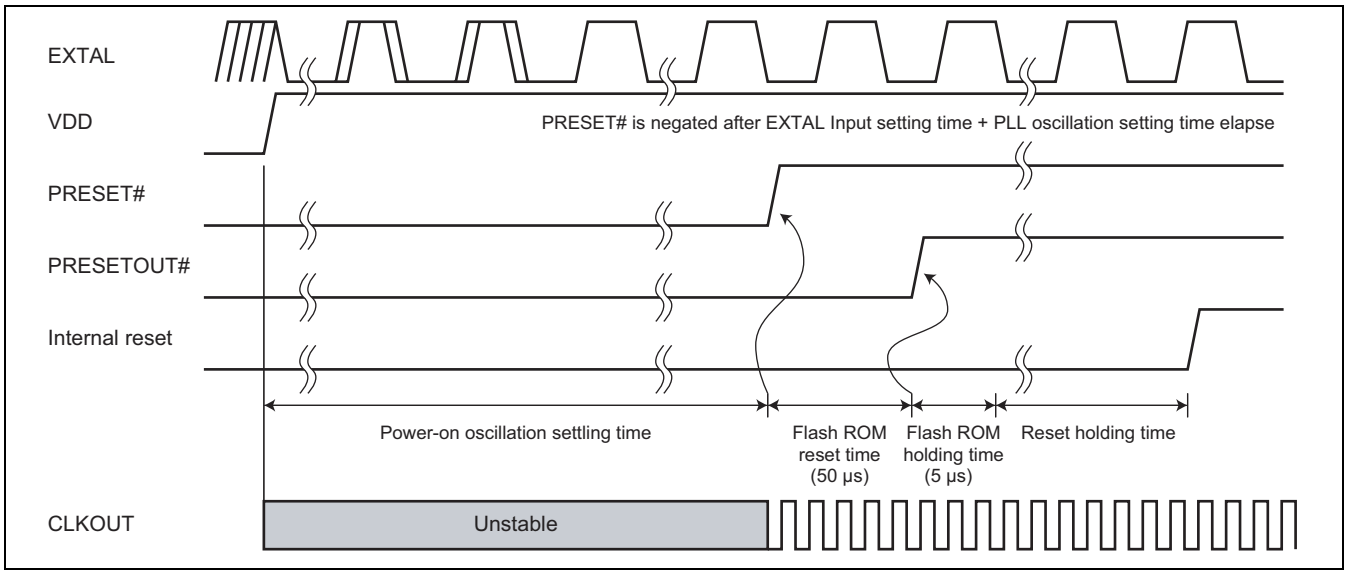

Figure 8.2 Free-Running Mode

8.4 Usage Notes

8.4.1 Usage of SYS Boot Address Register (SBAR) and SYS Boot Address Register 2 (SBAR2)

The SYS boot address register (SBAR) and SYS boot address register 2 (SBAR2) are write-only registers. Therefore read access to these registers is prohibited. Read CA7BAR and CA7BAR2, if read access is required.

8.4.2 Usage of Boot Address Register and Boot Address Register 2 (SBAR, SBAR2, CA7BAR, and CA7BAR2)

The boot address register and boot address register 2 (SBAR, SBAR2, CA7BAR and CA7BAR2) are not initialized by WDT reset. In the case of changing these boot address registers, the boot address must point to the address of internal RAMs. Because the internal RAMs are not initialized by WDT reset, the master boot processor can boot from them regardless of the selected boot device.

Read WOVF bit in the register RWTCSRA of RWDT by the program allocated on the internal RAMs pointed by the boot address registers and judge whether the cause of reset is WDT overflow or not. When the cause of reset is judged as WDT reset, apply appropriate processing, for example jump to the top address of mask ROM.

9. AP-System Core

9.1 Overview

The AP-System core is a core block equipped with Cortex-A7. For details on the functions of Cortex-A7, see the relevant Technical Reference Manual.

Table 9.1 Features of the AP-System Core Block (Cortex-A7)

Version	r0p5
Cluster number	Cluster 0
Number of CPUs	Dual CPU
L1 cache (per CPU)	I/ 32 KB (16 KB × 2 way) D/32 KB (8 KB × 4 way)
L2 cache	512 KB (64 KB × 8 way)
ECC	Not supported
MMU	Supported
NEON/VFP	NEON supported (SIMDv2) VFP supported (VFPv4)
Operating clock	CPU core: 1 GHz (Z2ϕ) L2-Tag RAMs: Z2ϕ L2-Data RAMs: 2-divided clock of Z2ϕ AXI bus: 520 MHz (ZXϕ)
Low power mode	Sleep mode (each CPU) Core standby mode (each CPU) AP-system core power down mode (CPUs and L2 cache shutdown)
Private peripherals	ARM Generic Timer supported

9.2 Generic Counter

For the general explanation about Generic Counter, and the details of the relation between Generic Counter and Generic Timer, refer to the ARM manual. In this section, it is explained that the frequency for count-up of the Generic Counter.

9.2.1 Frequency for Counting Up

The generic timer counts up by one every clock edge of the following frequency continuously.

Count-up clock frequency: ZSϕ × 1/8

The operating frequency of EXTAL is decided by mode pin setting. For details, see Table 7.4, PLL Multiplication Ratio in section 7, Clock Pulse Generator (CPG).

9.2.2 Counter Module Control and Status Registers

The base address of counter module control and status registers is H'E6080000.

For the details of these registers, refer to the ARM manual shown below.

DDI0406C2c_arm_architecture_reference_manual Appendix D.3 Counter module control and status registers.

9.2.3 How to Start a Generic Counter

Set bit 0 in CNTCR to 1 to start the Generic Counter when the CPU is placed in the secure mode.

9.2.4 Relation with a CoreSight Timestamp

The Generic Counter serves as the CoreSight Timestamp function.

For details, refer to the ARM manual shown below.

DDI0406C2c_arm_architecture_reference_manual Appendix D.1.2 Generic Timer relationship with CoreSight Timestamp counter.

9.3 Power-Down Mechanism

9.3.1 Overview

The AP-System core supports the following power-down modes.

- AP-System core power down mode
  (CPUs and L2 Cache shutdown)
- Core standby mode (each CPU)*[1]
- Sleep mode (clock stop, each CPU)
- L2 shutdown mode*[2]

However, this product doesn't support the power-gating in the AP-System core.

In AP-System core power down mode, the power of the AP-System core area is still supplied. The system boots up from the reset vector at its return from AP-System core power down mode. For detail of the AP-system core power down control, see section 49, System Controller (SYSC).

In Core standby mode, all memories including L1 cache of the relevant CPU do not keep its contents, but the contents of the SRAM of level 2 cache is retained.

In L2 shutdown mode, the contents of both L1s and L2 are not to be retained.

For details of Core standby mode and L2 shutdown mode, see section 7B, Advanced Power Management Unit for AP-System Core (APMU).

Notes: 1. If each CPU enters into the core standby mode, the clock supply for each CPU is stopped even if CPU core is always supplied power. After the power-on reset, the CPU other than the master CPU is in the core standby mode. When using the CPU in the core standby mode, follow the power-on sequence in order to start supply of the clock.

2. In L2 shutdown mode, all CPUs & L2 Cache (including both logic & memory) are still supplied power. However, after resuming from this mode, all CPUs & L2 Cache are reset. The contents of both L1 RAMs & L2 RAMs are not to be retained. Therefore, when using L2 shutdown mode, please follow the sequence that is described in Technical Reference Manual – section 2.4.2 - Multiprocessor device shutdown mode

10. Inter Connect RAM

10.1 Overview

The module provides a set of the Inter Connect RAM.

10.1.1 Features

- Memory size:
  Inter connect RAM0 : 72 Kbytes
  Inter connect RAM1 : 4 Kbytes
  Inter connect RAM2 : 128 Kbytes
- Undefined on power-on reset. Retained on other resets.
- Inter connect RAM takes charge of buffer between CPUs.

Table 10.1 Address Maps

Register Name	R/W	Address	Access Size
Inter connect RAM2 direct access space	R/W	H'E630 0000 to H'E631 FFFF	8, 16, 32
Inter connect RAM0 direct access space	R/W	H'E63A 0000 to H'E63B 1FFF	8, 16, 32
Inter connect RAM1 direct access space	R/W	H'E63C 0000 to H'E63C 0FFF	8, 16, 32

Note: Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

11. Interrupt Controller for AP-System Core (INTC-SYS)

This module handles system domain interrupt events.

11.1 Features

(1) INTC-SYS

- Interrupt controller for AP-system core
- 32 programmable priority levels
- ARM-IRQ interrupt generation
- INTC-SYS peripheral interrupt

(2) IRQC

- Common module to handle the external NMI/IRQ inputs
- Edge-triggered on rising, falling or both
- Level-sensitive on high or low values
- IRQ signal debouncing

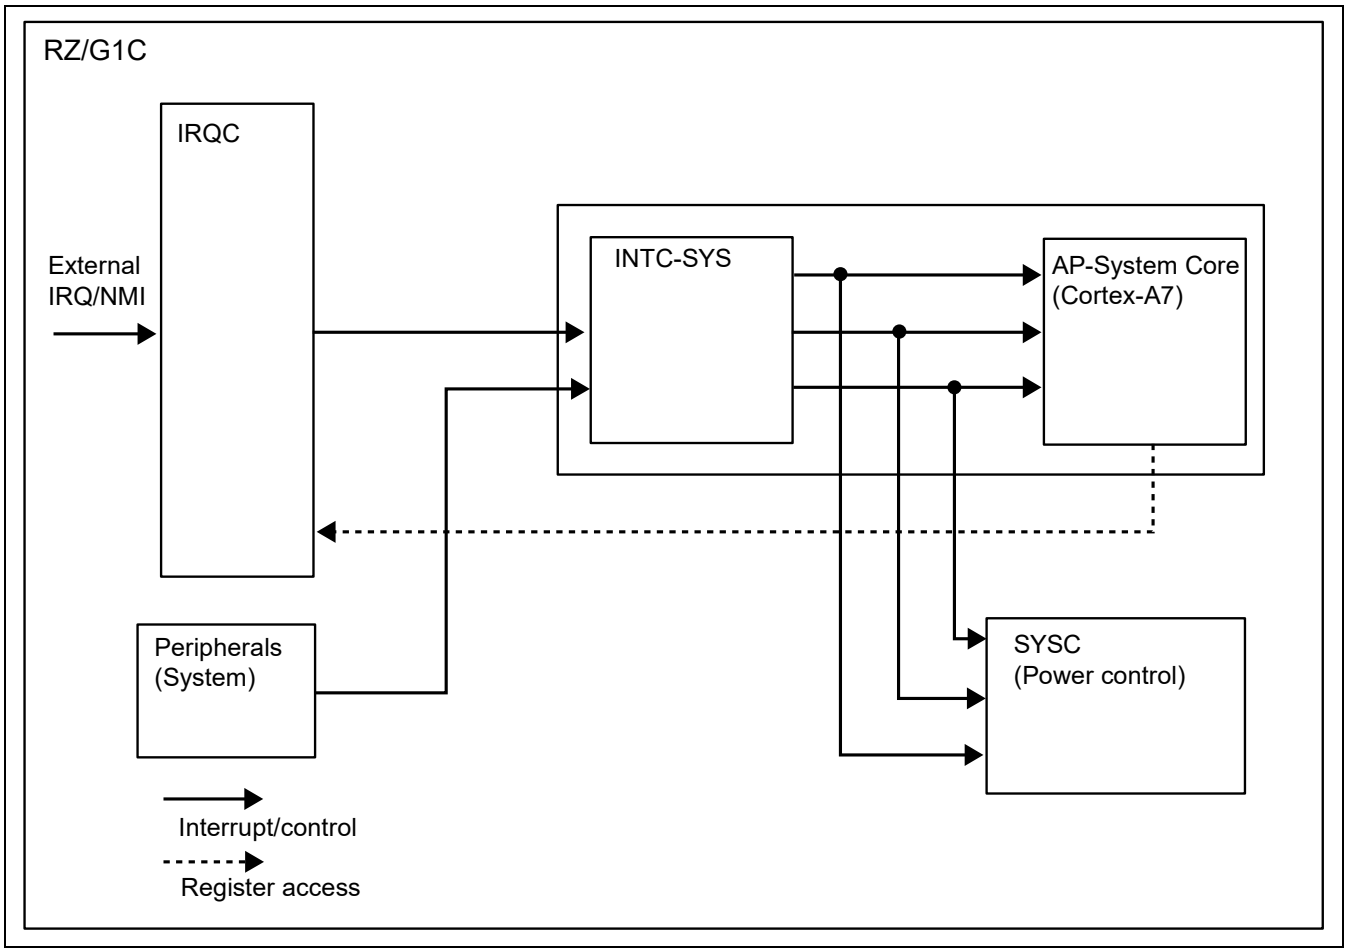

Figure 11.1 Block diagram of INTC

11.2 Interrupt Requests to AP-SYSTEM core

INTC-SYS is based on ARM Generic Interrupt Controller. For more information, see ARM Generic Interrupt Controller Architecture Specification and section 9, AP-System Core.

11.2.1 Interrupts Mapping

Table 11.1 shows the AP-system core interrupt controller (INTC-SYS) interrupt mapping.

Note: All interrupts should be level-sensitive configuration.

Table 11.1 AP-System core (INTC-SYS) Interrupt Mapping

11.3 Register Descriptions

This section describes the registers of INTC-SYS.

Module Name	Base Address
INTC-SYS CPU-IF	H'F100_2000
INTC-SYS Distributer-IF	H'F100_1000

11.3.1 INTC-SYS Register Configuration and Function Description

384 SPI interrupts are integrated into ID[415:32].

The INTC-SYS supports two CPU cores which are mapped as shown below.

Interface	CPU core
CPU0 interface	AP-System core (Cortex-A7) CPU0
CPU1 interface	AP-System core (Cortex-A7) CPU1
CPU2 interface	Reserved
CPU3 interface	Reserved
CPU4 interface	Reserved
CPU5 interface	Reserved
CPU6 interface	Reserved
CPU7 interface	Reserved

For more information of these registers, see Cortex-A7 Technical Reference Manual and ARM GIC-400 Generic Interrupt Controller Technical Reference Manual.

11.4 External Interrupt Controller (IRQC)

The IRQC is a common sub-module of interrupt controllers. This sub-module provides interrupt from external device and inter-domain communication.

11.4.1 Input/Output Pins

Table 11.2 shows the INTC pin configuration.

Table 11.2 Pin Configuration

Pin Name	Function	I/O	Description
MSIOF0_SCK_A	IRQ0 - External interrupt input pins	Input	Input of IRQ0 interrupt request signals from external device.
HRTS1#_A	IRQ1 - External non maskable Interrupt input pins	Input	Input of IRQ1 interrupt request signal from external device.
D15	IRQ2 - External non maskable Interrupt input pins	Input	Input of IRQ2 interrupt request signals from external device.
D4	IRQ3 - External non maskable Interrupt input pins	Input	Input of IRQ3 interrupt request signals from external device.
D0	IRQ4 - External non maskable Interrupt input pins	Input	Input of IRQ4 interrupt request signals from external device.
SDA0_A	IRQ5 - External non maskable Interrupt input pins	Input	Input of IRQ5 interrupt request signals from external device.
D7	IRQ6 - External non maskable Interrupt input pins	Input	Input of IRQ6 interrupt request signals from external device.
SD0_WP	IRQ7 - External non maskable Interrupt input pins	Input	Input of IRQ7 interrupt request signals from external device.
SSI_SDATA7_A	IRQ8 - External non maskable Interrupt input pins	Input	Input of IRQ8 interrupt request signals from external device.
SSI_SCK1_A	IRQ9 - External non maskable Interrupt input pins	Input	Input of IRQ9 interrupt request signals from external device.
NMI	NMI - External non maskable Interrupt input pins	Input	Input of NMI interrupt request signal from external device.

Note: All IRQ signals are always active.

11.4.2 Clocking and Pulse Width

This module uses 2 clocks:

Module clock: CPϕ.
Debounce clock: RCLK.

Because of sampling operation, the minimum pulse width on IRQ request signal is five module clock cycles.

11.4.3 Block Diagram

Figures 11.2 and 11.3 are block diagrams of IRQC.

The event detector block detects external IRQn, and supports noise reduction and edge detection.

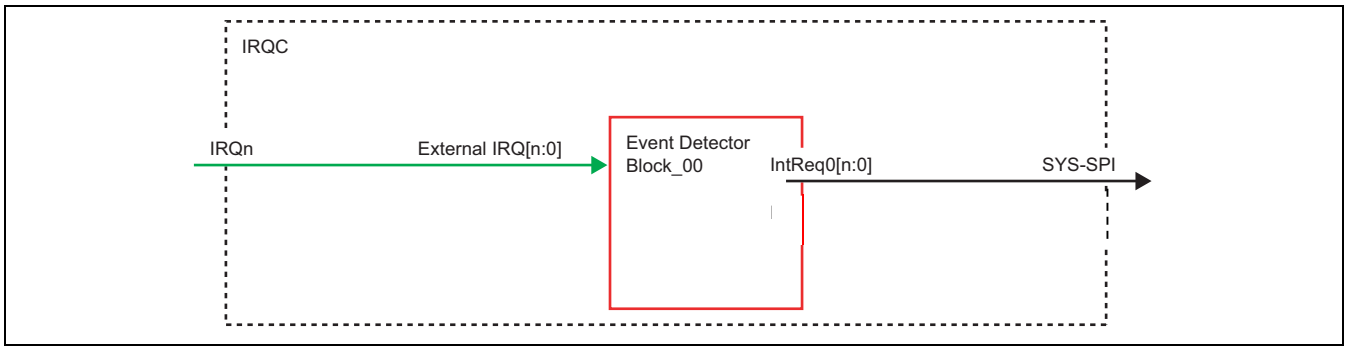

Figure 11.2 IRQC Block Diagram1

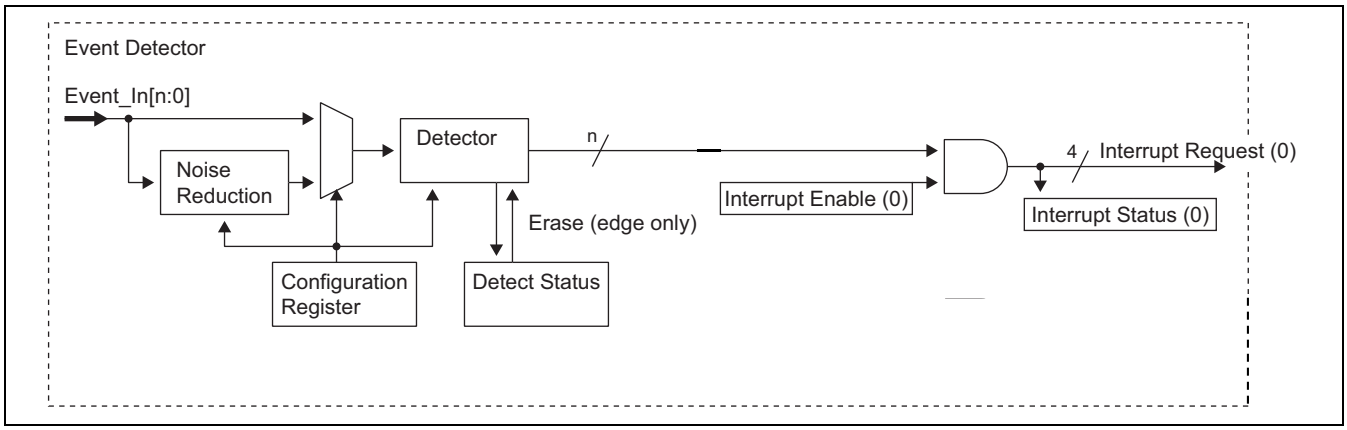

Figure 11.3 IRQC Event Detector

11.4.4 Register Descriptions

Table 11.3 shows the base address of each block and Tables 11.4 to 11.6 show register configuration.

Table 11.3 IRQC Base Address

Module Name	Base Address
IRQC	H'E61C 0000
IRQC event detector block	H'E61C 0000
NMI event detector block	H'E61C 0400
NMI mask lock block	H'E61C 0A00

Table 11.4 IRQC Event Detector Register Configuration

Register Name	Abbreviation	R/W	Address Offset	Access Size
Interrupt request status register 0	INTREQ_STS0	R	H'000	32
Interrupt enable status register 0	INTEN_STS0	R/WC1	H'004	32

IRQ5 configuration register	CONFIG_05	R/W	H'194	32
IRQ6 configuration register	CONFIG_06	R/W	H'198	32
IRQ7 configuration register	CONFIG_07	R/W	H'19C	32
IRQ8 configuration register	CONFIG_08	R/W	H'1A0	32
IRQ9 configuration register	CONFIG_09	R/W	H'1A4	32

Table 11.5 NMI Event Detector Register Configuration

Register Name	Abbreviation	R/W	Address Offset	Access Size
NMI request status register 0	NMIREQ_STS0	R	H'000	32
NMI enable status register 0	NMIEN_STS0	R/WC1	H'004	32
NMI enable set register 0	NMIEN_SET0	W	H'008	32
NMI detect status register	DETECT_STATUS_NMI	R/WC1	H'100	32
NMI signal level monitor register	MONITOR_NMI	R	H'104	32
NMI high level detect status register	HLVL_STS_NMI	R	H'108	32
NMI low level detect status register	LLVL_STS_NMI	R	H'10C	32
NMI sync rising edge detect status register	S_R_EDGE_STS_NMI	R	H'110	32
NMI sync falling edge detect status register	S_F_EDGE_STS_NMI	R	H'114	32
NMI async rising edge detect status register	A_R_EDGE_STS_NMI	R	H'118	32
NMI async falling edge detect status register	A_F_EDGE_STS_NMI	R	H'11C	32
NMI chattering reduction status register	CHTEN_STS_NMI	R	H'120	32
NMI debounce setting register	DEB_SET_NMI	R/W	H'140	32
NMI configuration 0 register	CONFIG0_NMI	R/W	H'180	32
NMI configuration 1 register	CONFIG1_NMI	R/W	H'184	32

Table 11.6 NMI Lock Register Configuration

Register Name	Abbreviation	R/W	Address Offset	Access Size
NMI mask lock set register	NMI_LCK	R/W*	H'000	32
NMI lock code register	NMI_LCKCODE	R/W*	H'004	32
NMI debug control enable register	NMI_DBG	R/W	H'008	32
NMI debug code register	NMI_DBGCODE	R/W	H'00C	32

Note: * It cannot update register value during lock.

11.4.4.1 Interrupt Request Status Register x (INTREQ_STSx [x = 0])

Note: x = 0: for INTC-SYS.

This register shows interrupt request status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	INTREQ[9:0]	All 0	R	Interrupt Status 0: Interrupt not generation 1: Interrupt generation

11.4.4.2 Interrupt Enable Status Register x (INTEN_STSx [x = 0])

Note: x = 0: for INTC-SYS.

This register shows interrupt enable status and clear interrupt enable.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	INTEN									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	INTEN[9:0]	All 0	R/WC1	Interrupt Enable Read 0: Interrupt generation is disabled Read 1: Interrupt generation is enabled Write 0: No functional effect Write 1: Interrupt enable clear

11.4.4.3 Interrupt Enable Set Register x (INTEN_SETx [x = 0])

Note: x = 0: for INTC-SYS.

This register set interrupt enable.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	INTENS									
Initial value:	0	0	0	0	0	0	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	INTENS[9:0]	—	W	Interrupt Enable Set Write 0: No functional effect Write 1: Interrupt enable set

11.4.4.4 IRQn Chattering Reduction Status Register (CHTEN_STS)

This register shows chattering reduction enable status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CHTEN									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	CHTEN[9:0]	All 0	R	Chattering Reduction Enable Status 0: Chattering reduction disabled 1: Chattering reduction enabled

Note: These bits need to reflect 3 rclk clock cycle.

11.4.4.5 IRQn Detect Status Register (DETECT_STATUS)

This register shows IRQn event detection status and provides the function to clear edge-triggered event. The status bit is cleared by writing 1 to the corresponding bit in edge-triggered mode. Writing 0 to this register bits does not affect to the register value.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	IRQnDET									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	IRQnDET[9:0]	All 0	R/WC1	IRQn Event Detection Status Edge-triggered mode: Read 0: No interrupt request occurred Read 1: Interrupt request occurred Write 0: No functional effect Write 1: Cleared detection. Level-sensitive mode: Read 0: No interrupt request occurred. Read 1: Interrupt request occurred Write 0: No functional effect. Write 1: No functional effect.

11.4.4.6 IRQn Signal Level Monitor Register (MONITOR)

This register provides external signal monitor.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	IRQnMON									
Initial value:	0	0	0	0	0	0	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	IRQnMON[9:0]	—	R	IRQn External Signal Level Monitor This function show input value of external PINS. 0: IRQn is low level 1: IRQn is high level

11.4.4.7 IRQn High Level Detect Status Register (HLVL_STS)

This register provides interrupt detail detect status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	SS					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	CHTEN	0	R/W	Chattering Reduction Enable 0: Chattering reduction disabled 1: Chattering reduction enabled
30 to 24	—	All0	R	Reserved These bits are always read as 0. The write value should always be 0.
23, 22	STS1	00	R/W	IRQn Scan Timing These bits provide chattering reduction timing. 00: 1 ms 01: 2 ms 10: 4 ms 11: 8 ms
21 to 16	STS2	H'00	R/W	IRQn Chattering Reduction Period The chattering reduction period is defined by STS1 × STS2. H'00: No reduction H'01 to H'3F: STS1 × STS2 Notes: 1. These bits should not be set to H'00 when chattering reduction enable. 2. Check chattering reduction is disabled completely with corresponding bit of chattering reduction status register (CHTEN_STS) when this bit change.
15 to 6	—	All 0	R	Reserved These bits are always read as 0. The writing value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
5 to 0	SS	000000	R/W	Sense Selection 000000: Disable event detection 000001: Enable low level sensitive 000010: Enable high level sensitive 000100: Enable synchronous falling edge triggered 001000: Enable synchronous rising edge triggered 001100: Enable synchronous both edge triggered 010000: Enable asynchronous falling edge triggered 100000: Enable asynchronous rising edge triggered 110000: Enable asynchronous both edge triggered Others: setting prohibit Note: The Asynchronous edge triggered can use only as follow conditions. + EXTAL1 off + Chattering reduction not use. The synchronous edge triggered can use always.

11.4.4.14 NMI Request Status Register x (NMIREQ_STSx [x = 0])

Note: x = 0: for INTC-SYS.

This register shows external NMI request status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CnSTS							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	CnSTS	All 0	R	NMI Status (n = 0 to 7)* 0: not during NMI service 1: during NMI service

Note: * x = 0, n = 0 CPU0 interface (INTC-SYS)
n = 1 CPU1 interface (INTC-SYS)
n = 2 to 7 Reserved
For the CPUn interface, see section 11.3.1, INTC-SYS Register Configuration and Function Description.

11.4.4.15 NMI Enable Status Register x (NMIEN_STSx [x = 0])

Note: x = 0: for INTC-SYS.

This register shows NMI interrupt enable status and clears NMI interrupt enable.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	CnSET							
Initial value:	0	0	0	0	0	0	0	0	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	CnSET	—	W	Interrupt Enable Set (n = 0 to 7)* Write 0: No functional effect Write 1: Interrupt enable set

Note: * x = 0, n = 0 CPU0 interface (INTC-SYS)
n = 1 CPU1 interface (INTC-SYS)
n = 2 to 7 Reserved
For the CPUn interface, see section 11.3.1, INTC-SYS Register Configuration and Function Description.

11.4.4.17 NMI Chattering Reduction Status Register (CHTEN_STS_NMI)

This register shows chattering reduction enable status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CHTEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	CHTEN	0	R	Chattering Reduction Enable Status 0: Chattering reduction disabled 1: Chattering reduction enabled

Note: These bits need to reflect 3 rclk clock cycle.

11.4.4.18 NMI Detect Status Register (DETECT_STATUS_NMI)

This register shows NMI event detection status and provides the function to clear edge-triggered event. The status bit is cleared by writing 1 to the corresponding bit in edge-triggered mode. Writing 0 to this register bits does not affect to the register value.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	NMInDET								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8 to 0	NMInDET	All 0	R/WC1	NMIn Event Detect Status (n = 0 to 8)* Edge-triggered mode: Read 0: No interrupt request occurred Read 1: Interrupt request occurred Write 0: No functional effect Write 1: Cleared detection Level-sensitive mode: Read 0: No interrupt request occurred Read 1: Interrupt request occurred Write 0: No functional effect Write 1: No functional effect

Note: * n = 0 CPU0 interface (INTC-SYS)
n = 1 CPU1 interface (INTC-SYS)
n = 2 to 8 Reserved
For the CPUn interface, see section 11.3.1, INTC-SYS Register Configuration and Function Description.

11.4.4.19 NMI Signal Level Monitor Register (MONITOR_NMI)

This register provides external signal monitor.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	NMIMON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	NMIMON	—	R	NMI External Signal Level Monitor This function show input value of external PINS. So, initial value depends on input value. 0: NMI is low level 1: NMI is high level

11.4.4.20 NMI Debounce Setting Register (DEB_SET_NMI)

This register provides noise reduction setting.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CHTEN	—	—	—	—	—	—	—	STS1		STS2					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	CHTEN	0	R/W	Chattering Reduction Enable 0: Chattering reduction disabled 1: Chattering reduction enabled
30 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23, 22	STS1	00	R/W	NMI Scan Timing These bits provide chattering reduction timing. 00: 1 ms 01: 2 ms 10: 4 ms 11: 8 ms
21 to 16	STS2	H'00	R/W	NMI Chattering Reduction Period The chattering reduction period is defined by STS1 × STS2. H'00: No reduction H'01 to H'3F: STS1 × STS2 Note 1. These bits should not be set H'00 when chattering reduction enable. 2. Check chattering reduction is disabled completely with bit of chattering reduction status register (CHTEN_STS) when this bit change.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The writing value should always be 0.

11.4.4.21 NMI High Level Detect Status Register (HLVL_STS_NMI)

This register provides interrupt detail detect status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	NMInHSTS								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The writing value should always be 0.
8 to 0	NMInHSTS	All 0	R	NMIn High Level Interrupt Status (n = 0 to 8)* 0: NMIn high level interrupt request not occurred 1: NMIn high level interrupt request occurred

Note: * n = 0 CPU0 interface (INTC-SYS)
n = 1 CPU1 interface (INTC-SYS)
n = 2 to 8 Reserved
For the CPUn interface, see section 11.3.1, INTC-SYS Register Configuration and Function Description.

11.4.4.22 NMI Low Level Detect Status Register (LLVL_STS_NMI)

This register provides interrupt detail detect status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	NMInLSTS								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The writing value should always be 0.
8 to 0	NMInLSTS	All 0	R	NMIn Low Level Interrupt Status (n = 0 to 8)* 0: NMIn low level interrupt request not occurred 1: NMIn low level interrupt request occurred

Note: * n = 0 CPU0 interface (INTC-SYS)
n = 1 CPU1 interface (INTC-SYS)
n = 2 to 8 Reserved
For the CPUn interface, see section 11.3.1, INTC-SYS Register Configuration and Function Description.

11.4.4.23 NMI Sync Rising Edge Detect Status Register (S_R_EDGE_STS_NMI)

This register provides interrupt detail detect status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	NMInSRSTS								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The writing value should always be 0.
8 to 0	NMInSRSTS	All 0	R	NMIn Synchronous Rise Edge Interrupt Status (n = 0 to 8)* 0: NMIn rise edge interrupt request not occurred 1: NMIn rise edge interrupt request occurred

Note: * n = 0 CPU0 interface (INTC-SYS)
n = 1 CPU1 interface (INTC-SYS)
n = 2 to 8 Reserved
For the CPUn interface, see section 11.3.1, INTC-SYS Register Configuration and Function Description.

11.4.4.24 NMI Sync Falling Edge Detect Status Register (S_F_EDGE_STS_NMI)

This register provides interrupt detail detect status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	NMInSFSTS								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The writing value should always be 0.
8 to 0	NMInSFSTS	All 0	R	NMIn Synchronous Fall Edge Interrupt Status (n = 0 to 8)* 0: NMIn fall edge interrupt request not occurred 1: NMIn fall edge interrupt request occurred

Note: * n = 0 CPU0 interface (INTC-SYS)
n = 1 CPU1 interface (INTC-SYS)
n = 2 to 8 Reserved
For the CPUn interface, see section 11.3.1, INTC-SYS Register Configuration and Function Description.

11.4.4.25 NMI Async Rising Edge Detect Status Register (A_R_EDGE_STS_NMI)

This register provides interrupt detail detect status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	NMInARSTS								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The writing value should always be 0.
8 to 0	NMInARSTS	All 0	R	NMIn Asynchronous Rise Edge Interrupt Status (n = 0 to 8)* 0: NMIn rise edge interrupt request not occurred 1: NMIn rise edge interrupt request occurred

Note: * n = 0 CPU0 interface (INTC-SYS)
n = 1 CPU1 interface (INTC-SYS)
n = 2 to 8 Reserved
For the CPUn interface, see section 11.3.1, INTC-SYS Register Configuration and Function Description.

11.4.4.26 NMI Async Falling Edge Detect Status Register (A_F_EDGE_STS_NMI)

This register provides interrupt detail detect status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	NMInAFSTS								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The writing value should always be 0.
8 to 0	NMInAFSTS	All 0	R	NMIn Asynchronous Fall Edge Interrupt Status (n = 0 to 8)* 0: NMIn fall edge interrupt request not occurred 1: NMIn fall edge interrupt request occurred

Note: * n = 0 CPU0 interface (INTC-SYS)
n = 1 CPU1 interface (INTC-SYS)
n = 2 to 8 Reserved
For the CPUn interface, see section 11.3.1, INTC-SYS Register Configuration and Function Description.

11.4.4.27 NMI Configuration n Register (CONFIGn_NMI)

Note: n = 0 CPU0 interface (INTC-SYS)
n = 1 CPU1 interface (INTC-SYS)
For the CPUn interface, see section 11.3.1, INTC-SYS Register Configuration and Function Description.

This register provides detection mode and noise reduction setting.

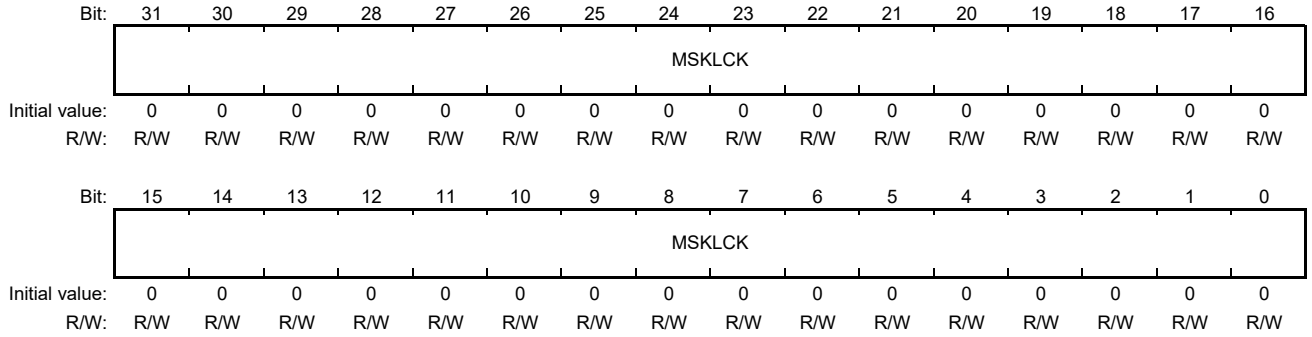
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	SS					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	SS	000000	R/W	Sense Selection 000000: Disable event detection 000001: Enable low level sensitive 000010: Enable high level sensitive 000100: Enable synchronous falling edge triggered 001000: Enable synchronous rising edge triggered 001100: Enable synchronous both edge triggered 010000: Enable asynchronous falling edge triggered 100000: Enable asynchronous rising edge triggered 110000: Enable asynchronous both edge triggered Others: setting prohibit Note: The Asynchronous edge triggered can be used only following conditions. - EXTAL1 off - Chattering reduction not be used. - Only low level sensitive can be used for ARM.

11.4.4.28 NMI Mask Lock Set Register (NMI_LCK)

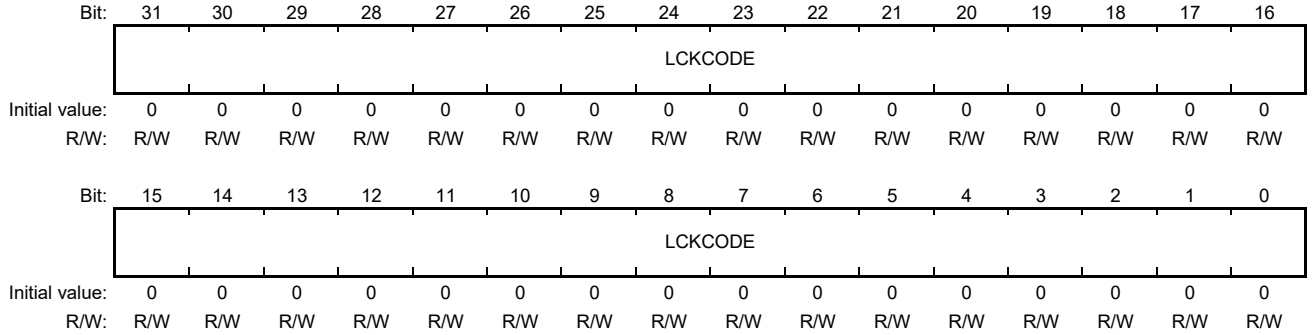
This register provides NMI mask locking feature. When set the same value as NMI_LCKCODE, then NMI cannot be masked by software (always accept NMI interrupt).



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MSKLCK	All 0	R/W	Lock code setting

11.4.4.29 NMI Lock Code Register (NMI_LCKCODE)

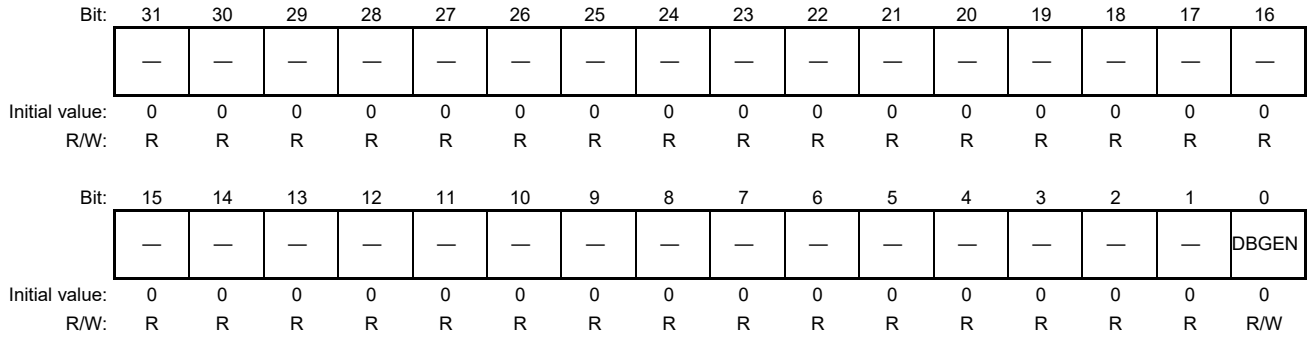
This register sets the value for lock code of NMI mask.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LCKCODE	All 0	R/W	NMI mask lock code setting

11.4.4.30 NMI Debug Control Enable Register (NMI_DBG)

This register enables the debug feature for NMI mask lock.

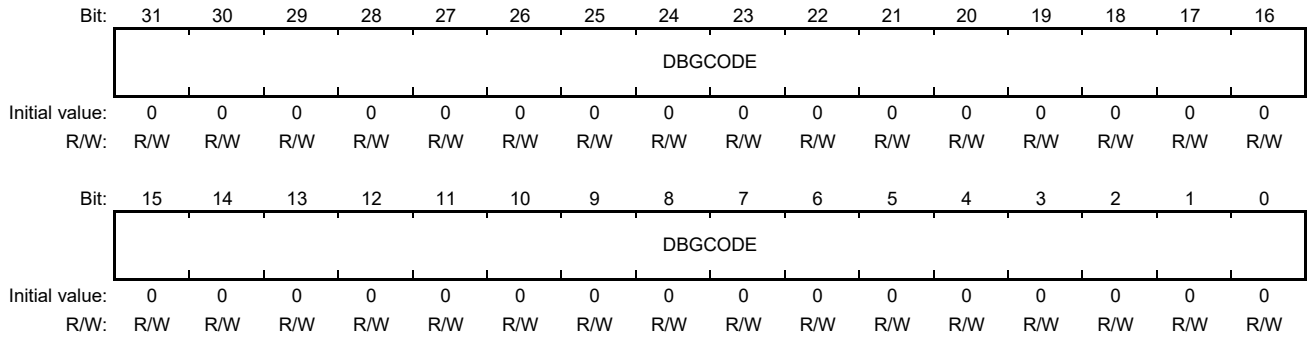


Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved
0	DBGEN	0	R/W	Enable debug for NMI mask lock feature

11.4.4.31 NMI Debug Code Register (NMI_DBGCODE)

This register sets value for debug code of NMI mask lock. When set the following value, then unlock this mask feature.

Debug code[31:0] = ~(lock code [0:31] (bit reversed))



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DBGCODE	All 0	R/W	NMI mask lock debug code setting

11.4.5 NMI Mask Lock Feature

NMI can be masked by setting NMI mask register. If you set the lock code to NMI lock code register and set the same lock code to NMI lock set register, then NMI cannot be masked by software (locked NMI mask). If you want to unlock NMI mask, you need to set DBGEN bit of NMI debug control register and set the unlock code to the NMI debug code register.

11.4.6 Procedure of NMI Mask Lock

- Lock feature

1. Write the lock code to NMI lock code register
   ex) Write32 (IRQC_BASE + H'0A04), H'00ACCE55
2. Write the lock code to NMI mask lock set register
   ex) Write32 (IRQC_BASE + H'0A00), H'00ACCE55
3. Write access to NMI lock code register and NMI mask lock set register
   — Check whether these registers cannot be updated

- Unlock feature

1. Set enable bit to NMI debug control register
   ex) Write32 (IRQC_BASE + H'0A08), H'00000001
2. Write unlock code to NMI debug code register
   ex) Write32 (IRQC_BASE + H'0A0C), H'558CCAFF
3. Write access to NMI lock code register and NMI mask lock register
   — Check whether these registers can be updated

12. AXI-bus

12.1 Overview

The AXI-bus is an on-chip interconnect bus based on the ARM® AMBA® Advanced eXtensible Interface (AXI) protocol specification. The AXI-bus has the following domains arranged in a hierarchical structure.

- Media domain AXI (MXI)
- Audio domain AXI
- System domain AXI
- ARM CPU domain AXI
- 3DGE AXI
- DMA domain AXI

12.1.1 Features

The AXI-bus has the following features.

- Frequency: 260 or 520 MHz
- Bus width: 256 bits or 128 bits
- High bandwidth and low latency
- Split transaction
- Separate data channels for reading and writing
- Quality-of-Service (QoS)
- Low-power function
- Secure access function

QoS is an extension to the standard AXI4 functionality, and allows control over the latency and bandwidth for the main memory.

12.1.2 Block Diagram

Figure 12.1 is a block diagram of the AXI-bus.

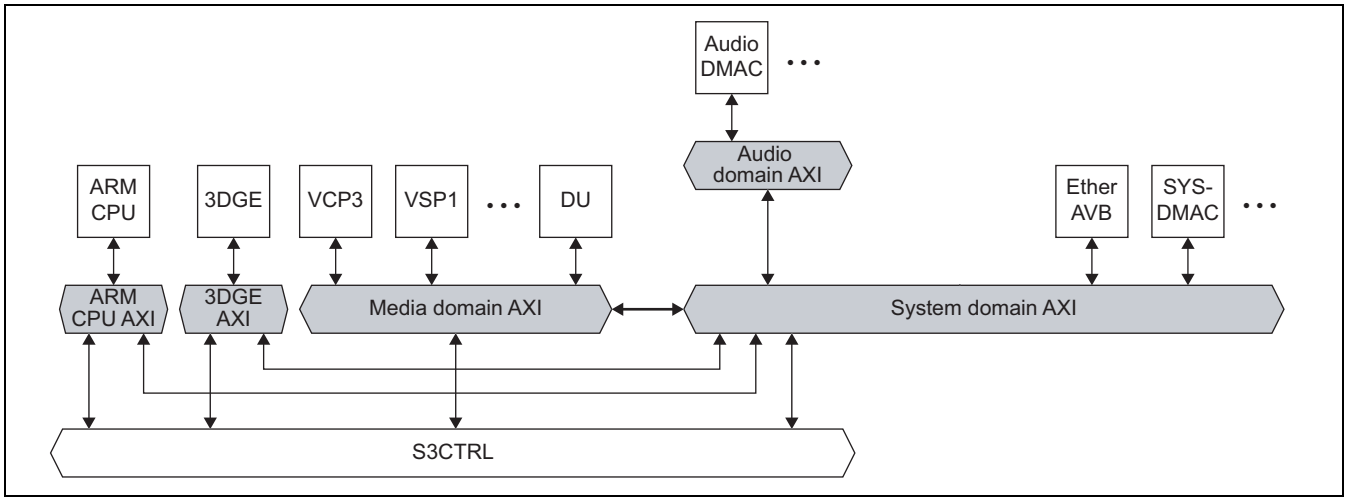


Figure 12.1 Block Diagram of AXI-bus

12.1.3 Input/Output Pins

No external pins are supported.

12.1.4 Register Base Address of AXI-bus

Base address of registers is allocated to following address. The method of setting is provided separately.

- H'FF80_0300 to H'FF80_21FF (system domain)
- H'FF82_0100 to H'FF82_21FF (audio domain)
- H'FF84_0100 to H'FF84_21FF (DMA domain)
- H'FF85_0100 to H'FF84_21FF (DMA domain)
- H'FF86_0100 to H'FF86_21FF (system domain)
- H'FF87_2000 to H'FF87_21FF (media domain)
- H'FF88_0100 to H'FF88_0FFF (ARM CPU domain)
- H'FF88_1100 to H'FF88_21FF (3DGE domain)
- H'FE96_4100 to H'FE96_7FFF (media domain)

12.1.5 Register Configuration

Table 12.1 shows a part of register configuration. Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined. Access the register in longword (32-bit) units. Operation cannot be guaranteed if access to a register is not in longword units.

Table 12.1 Register Configuration

Name	Abbreviation	R/W	Address	Initial Value	Access Size
MXI SDRAM address allocation register 0	MXSAAR0	R/W	H'FE96 0000	H'004000C0	32
MXI SDRAM address allocation register 1	MXSAAR1	R/W	H'FE96 0004	H'01000800	32
MXI read transaction control register	MXRTCR	R/W	H'FE96 0040	H'00000000	32
MXI write transaction control register	MXWTCR	R/W	H'FE96 0044	H'00000000	32

12.2 Register Description

Legend for Register Description

Initial value: Register value after a reset. H'xxxx represents a hexadecimal number. Others are represented in binary numbers.

—: Undefined value

R/W: Readable/writable. The written value can be read.

R: Read-only. The write value should always be 0.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

W: Write-only. Reading this bit is prohibited. When the bit is reserved, the write value should always be 0.

—/W: Write-only. The read value is undefined.

All access to registers must be in longword units.

12.2.1 MXI SDRAM Address Allocation Register 0 (MXSAAR0)

Function: The media domain AXI (MXI) can control the target port of transaction for DRAM access. The transaction of the address between SADD0 and EADD0 is issued to S3CTRL. Others are issued to the system domain AXI.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SADD0[39:24]															
Initial value:	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EADD0[39:24]															
Initial value:	0	0	0	0	0	0	0	0	1	1	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SADD0[39:24]	H'0040	R/W	Start Address 0 [39:24].
15 to 0	EADD0[39:24]	H'00C0	R/W	End Address 0 [39:24].

12.2.2 MXI SDRAM Address Allocation Register 1 (MXSAAR1)

Function: The media domain AXI (MXI) can control the target port of transaction for DRAM access. The transaction of the address between SADD1 and EADD1 is issued to S3CTRL. Others are issued to the system domain AXI.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SADD1[39:24]															
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EADD1[39:24]															
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SADD1[39:24]	H'0100	R/W	Start Address 1 [39:24].
15 to 0	EADD1[39:24]	H'0800	R/W	End Address 1 [39:24].

12.2.3 MXI Read Transaction Control Register (MXRTCR)

Function: This register controls the read transaction of the media domain AXI (MXI).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	KPAR	RQPUSHEN	—	RTHRES		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	KPAR	0	R/W	0: Switch arbitration based on each transaction's QoS while ARVALID = 1 in ROB 1: Keep arbitration while ARVALID = 1 in ROB
4	RQPUSHEN	0	R/W	This bit should be set to 1.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	RTHRES	000	R/W	These bits specify the unit of transaction threshold at which QoS arbitration is performed. The appropriate configuration depends on the system. 000: No limit 001: 1 010: 2 011: 4 100: 8 101: 16 110: 32 111: Reserved

12.2.4 MXI Write Transaction Control Register (MXWTCR)

Function: This register controls the write transaction of the media domain AXI (MXI).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	KPAW	WQPUSHEN	—	WTHRES		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	KPAW	0	R/W	0: Switch arbitration based on each transaction's QoS while AWVALID = 1 in ROB 1: Keep arbitration while AWVALID = 1 in ROB
4	WQPUSHEN	0	R/W	This bit should be set to 1.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	WTHRES	000	R/W	These bits specify the unit of transaction threshold at which QoS arbitration is performed. The appropriate configuration depends on the system. 000: No limit 001: 1 010: 2 011: 4 100: 8 101: 16 110: 32 111: Reserved

12.3 Operation

12.3.1 Media Domain AXI Access Control

The media domain AXI (MXI) can control the target port of transaction for DRAM access. One of the target ports of S3CTRL or system domain AXI can be chosen for DRAM access through MXSAAR0 and MXSAAR1 registers. The transaction of the address through MXSAAR0 or MXSAAR1 register is issued to S3CTRL port.

13. IPMMU

13.1 Overview

The IPMMU is a Memory Management Unit (MMU) which provides address translation and access protection functionalities to processing units and interconnect networks.

13.1.1 Features

IPMMU includes the following main features.

- MMU architecture compatible with ARMv7 VMSA including the Large Physical Address Extension (LPAE), the Security Extensions and the Multiprocessing Extensions
- PMB address translation
- Caching recently used page table entries in translation look-aside buffer (TLB)
- Performance monitoring for ARMv7 LPAE, VMSA
- Distributed Virtual Memory (DVM) messages through Cache Coherent Interconnect doesn’t support

Note: IPMMU for 3D graphics module (IPMMU-GP) supports the 40-bit translation system with the ARMv7 long-descriptor translation table format and the PMB address translation. The IPMMU-GP doesn't support address translation of short-descriptor formats.

For more information about ARMv7 VMSA, see ARM Architecture Reference Manual ARMv7-A and ARMv7-R edition.

13.1.2 Block Diagram

Figure 13.1 shows the IPMMU system integration. When a master (a processing unit or an interconnect) issues a transaction, a micro-TLB connected to the master sends a virtual address to the IPMMU. If the virtual address is not cached in a main TLB of the IPMMU, the IPMMU performs a page table walk through an interconnect and returns a physical address to the micro-TLB.

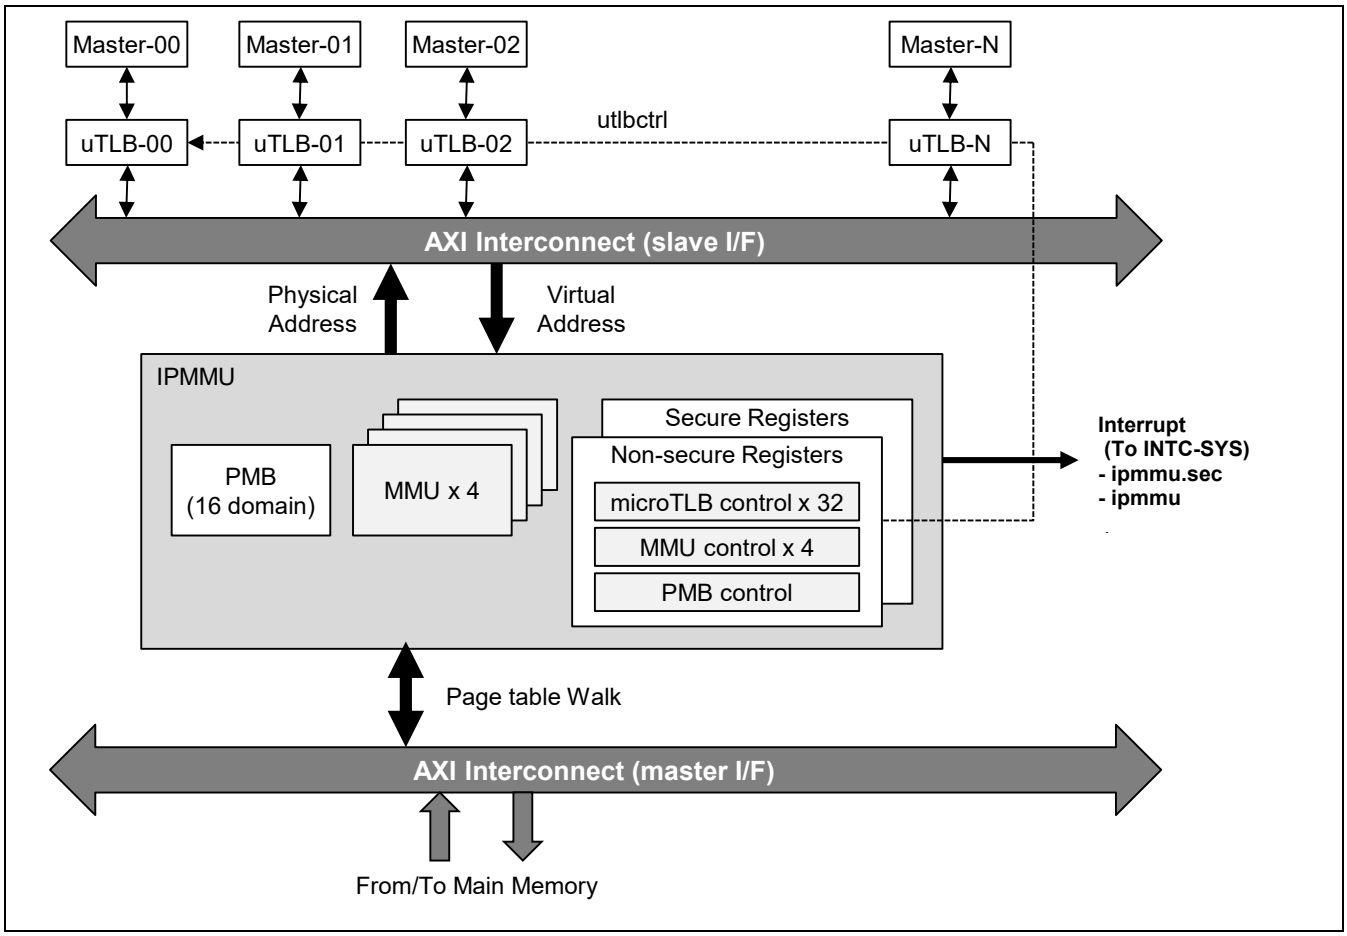

Figure 13.1 IPMMU Block Diagram

13.1.3 Input/Output Pins

There are no external pins in this module.

13.1.4 Register Configuration

Table 13.1 shows the IPMMU registers.

These registers are 32-bit access registers. When modifying reserved bits or read-only bits, write 0 to the bits.

Table 13.1 Register Configuration

Name	Abbreviation	R/W	Address	Size
MMU Control Register n (n = 0 to 3: * For IPMMU-GP, only n = 0)	IMCTRn IMSCTRn	R/W	H'0000 + H'40 × n	32
MMU Translation Table Base Control Register n	IMTTBCRn IMSTTBCRn	R/W	H'0008 + H'40 × n	32
MMU Translation Table Lower Base Register 0n	IMTTLBR0n IMSTTLBR0n	R/W	H'0010 + H'40 × n	32

Name	Abbreviation	R/W	Address	Size
Address alias of Non-secure registers *	—	R/W	H'0800 to H'0FFF	32

Note: * Non-secure registers (H'0000 to H'07FF) can be accessed through this address space in Secure state. In Non-secure state, this address space is always read as 0.

Table 13.2 shows the each IPMMU base address. Each IPMMU is connected to the each BUS modules.

Table 13.2 IPMMU Base Address

MMU	Base Address
IPMMU-SY0 (System domain AXI #0)	H'E6280000
IPMMU-SY1 (System domain AXI #1)	H'E6290000
IPMMU-DS (DMA domain AXI)	H'E6740000
IPMMU-MP (Audio domain AXI)	H'EC680000
IPMMU-MX (Media domain AXI)	H'FE951000
IPMMU-GP (3DGE AXI)	H'E62A0000

Table 13.3 shows the register state in each processing mode.

13.2 Register Description

13.2.1 MMU Control Register n (IMCTRn)

Note: n = 0 to 3

This register controls the behavior of the MMU.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TRE	AFE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	RTSEL[1:0]		TREN	INTEN	FLUSH	MMUEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17	TRE	0	R/W	TEX Remap Enable This field is used when EAE is 0. 0: TEX remap disabled. 1: TEX remap enabled. Note: For IPMMUGP, set 0 to this bit
16	AFE	0	R/W	Access Flag Enable 0: Behave as if AF bit is always set to 1. 1: Enable software management of the Access Flag.
15 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	RTSEL[1:0]	00	R/W	Retranslation Table Select When TREN is 1, RTSEL indicates the table number to retranslate. Note: For IPMMUGP, set 0 to this bit
3	TREN	0	R/W	MMU Retranslation Enable 0: Output PA as a physical address. 1: Output PA as an intermediate physical address to retranslate through 40-bit TLB. Note: For IPMMUGP, set 0 to this bit
2	INTEN	0	R/W	Interrupt Enable 0: Don’t assert an interrupt when an error occurs. 1: Assert an interrupt when an error occurs.
1	FLUSH	0	R/W	TLB Invalidate This bit is automatically cleared to 0. 1: Invalidate all TLB entries.
0	MMUEN	0	R/W	MMU Enable 0: MMU disabled 1: MMU enabled

13.2.2 MMU Translation Table Base Control Register n (IMTTBCRn)

Note: n = 0 to 3

This register controls the attribute of TLB managed by each MMU.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EAE	PMB	SH1[1:0]		ORGN1[1:0]		IRGN1[1:0]		—	—	—	—	—	TSZ1[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	SH0[1:0]		ORGN0[1:0]		IRGN0[1:0]		—	—	—	SL0	—	TSZ0[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	EAE	0	R/W	Extended Address Enable 0: Enable the 32-bit translation system with the ARMv7 Short-descriptor translation table format or PMB address translation. 1: Enable the 40-bit translation System with the ARMv7 Long-descriptor translation table format. Note: IPMMU-GP, set this bit to 1 (default).
30	PMB	0	R/W	PMB Enable 0: Disable PMB address translation. 1: Enable PMB address translation in the virtual address range from H'80000000 to H'BFFFFFFF. This field is used when EAE is 0.
29, 28	SH1[1:0]	00	R/W	Share ability attributes for the memory associated with the translation table walks using TTBR1n. 00: Non-shareable 01: Reserved 10: Outer shareable 11: Inner shareable
27, 26	ORGN1[1:0]	00	R/W	Outer Cache ability attributes for the memory associated with the translation table walks using TTBR1n. 00: Normal memory, Outer Non-cacheable 01: Normal memory, Outer Write-Back Write-Allocate Cacheable 10: Normal memory, Outer Write-Through Cacheable 11: Normal memory, Outer Write-Back no Write-Allocate Cacheable
25, 24	IRGN1[1:0]	00	R/W	Inner Cache ability attributes for the memory associated with the translation table walks using TTBR1n. 00: Normal memory, Inner Non-cacheable 01: Normal memory, Inner Write-Back Write-Allocate Cacheable 10: Normal memory, Inner Write-Through Cacheable 11: Normal memory, Inner Write-Back no Write-Allocate Cacheable
23 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
18 to 16	TSZ1[2:0]	000	R/W	The size offset of the TTBR1n addressed region, encoded as a 3-bit unsigned number, giving the size of the region as 2^(32-TSZ1).

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	SH0[1:0]	00	R/W	Share ability attributes for the memory associated with the translation table walks using TTBR0n. 00: Non-shareable 01: Reserved 10: Outer shareable 11: Inner shareable
11, 10	ORGN0[1:0]	00	R/W	Outer Cache ability attributes for the memory associated with the translation table walks using TTBR0n. 00: Normal memory, Outer Non-cacheable 01: Normal memory, Outer Write-Back Write-Allocate Cacheable 10: Normal memory, Outer Write-Through Cacheable 11: Normal memory, Outer Write-Back no Write-Allocate Cacheable
9, 8	IRGN0[1:0]	00	R/W	Inner Cache ability attributes for the memory associated with the translation table walks using TTBR0n. 00: Normal memory, Inner Non-cacheable 01: Normal memory, Inner Write-Back Write-Allocate Cacheable 10: Normal memory, Inner Write-Through Cacheable 11: Normal memory, Inner Write-Back no Write-Allocate Cacheable
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SL0	0	R/W	Starting level for translation table walks. 0: Start at second level 1: Start at first level
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TSZ0[2:0]	000	R/W	The size offset of the TTBR0n addressed region, encoded as a 3-bit unsigned number, giving the size of the region as 2^(32-TSZ0).

13.2.3 MMU Translation Table Upper Base Register 0/1n (IMTTUBR0/1n)

Note: n = 0 to 3

This register indicates the base address of the TLB managed by each MMU.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TTBR[39:32]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	TTBR[39:32]	H'00	R/W	Bits [39:32] of translation table base address This field is used when EAE is 1.

13.2.4 MMU Translation Table Lower Base Register 0/1n (IMTTLBR0/1n)

Note: n = 0 to 3

This register indicates the base address of the TLB managed by each MMU.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TTBR[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TTBR[15:4]												—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	TTBR[31:4]	All 0	R/W	Bits [31:4] of translation table base address
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

13.2.5 MMU Memory Attribute Indirection Register 0n (IMMAIR0n)

Note: n = 0 to 3

When using the Long-descriptor translation format, this register works as MAIR0, Memory Attribute Indirection Register in ARMv7 VMSA. When using the Short-descriptor translation format, this register works as PRRR, Primary Region Remap Register in ARMv7 VMSA.

(Long-descriptor translation format)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ATTR3[7:0]								ATTR2[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ATTR1[7:0]								ATTR0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ATTR3[7:0]	H'00	R/W	The memory attribute encoding for an AttrIndx[2:0] entry.
23 to 16	ATTR2[7:0]	H'00	R/W	
15 to 8	ATTR1[7:0]	H'00	R/W	
7 to 0	ATTR0[7:0]	H'00	R/W	

(Short-descriptor translation format)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	NOS7-0								—	—	—	—	NS1	NS0	DS1	DS0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TRn[1:0] (n = 0 to 7)															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	NOS7-0	All 0	R/W	Outer Shareable property mapping for memory attributes n. 0: Memory region is outer shareable. 1: Memory region is inner shareable.
23 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19	NS1	0	R/W	Mapping of S = 1 attribute for Normal memory. 0: Region is not shareable. 1: Region is shareable.

Bit	Bit Name	Initial Value	R/W	Description
18	NS0	0	R/W	Mapping of S = 0 attribute for Normal memory. 0: Region is not shareable. 1: Region is shareable.
17	DS1	0	R/W	Mapping of S = 1 attribute for Device memory. 0: Region is not shareable. 1: Region is shareable.
16	DS0	0	R/W	Mapping of S = 0 attribute for Device memory. 0: Region is not shareable. 1: Region is shareable.
15 to 0	TRn[1:0] (n = 0 to 7)	All 0	R/W	Primary TEX mapping for memory attributes n. n is the value of TEX[0], C and B bits. 00: Strongly-ordered 01: Device 10: Normal memory 11: Reserved

13.2.6 MMU Memory Attribute Indirection Register 1n (IMMAIR1n)

Note: n = 0 to 3

When using the Long-descriptor translation format, this register works as MAIR1, Memory Attribute Indirection Register in ARMv7 VMSA. When using the Short-descriptor translation format, this register works as NMRR, Normal Memory Remap Register in ARMv7 VMSA.

(Long-descriptor translation format)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ATTR7[7:0]								ATTR6[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ATTR5[7:0]								ATTR4[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ATTR7[7:0]	H'00	R/W	The memory attribute encoding for an AttrIndx[2:0] entry.
23 to 16	ATTR6[7:0]	H'00	R/W	
15 to 8	ATTR5[7:0]	H'00	R/W	
7 to 0	ATTR4[7:0]	H'00	R/W	

(Short-descriptor translation format)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ORn[1:0] (n = 0 to 7)															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IRn[1:0] (n = 0 to 7)															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	ORn[1:0] (n = 0 to 7)	All 0	R/W	Outer Cacheable property mapping for memory attributes n. 00: Region is non-cacheable. 01: Region is write-back, write-allocate. 10: Region is write-through, no write-allocate. 11: Region is write-back, no write-allocate.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	IRn[1:0] (n = 0 to 7)	All 0	R/W	Inner Cacheable property mapping for memory attributes n. 00: Region is non-cacheable. 01: Region is write-back, write-allocate. 10: Region is write-through, no write-allocate. 11: Region is write-back, no write-allocate.

13.2.7 MMU Error Status Register n (IMSTRn)

Note: n = 0 to 3

This register indicates the error status of during address translation.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	ERRLVL[1:0]		—	ERRCODE[2:0]			—	—	—	MHIT	—	ABORT	PF	TF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	ERRLVL [1:0]	00	R	indicate which level of page table walk caused the error
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10 to 8	ERRCODE [2:0]	000	R	Indicate error type 001: TLB format error (except “block” or “table”) 100: access permission error 101: secure access error Others: reserved
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	MHIT	0	R/W	Indicate that multiple TLB hits occurred.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	ABORT	0	R/W	This bit is set to 1 when the IPMMU received an error response during a page table walk.
1	PF	0	R/W	Page Fault This bit is set to 1 when an access right violation occurred.
0	TF	0	R/W	Translation Fault This bit is set to 1 when a translation fault occurred during a page table walk.

13.2.8 MMU Error Address Register n (IMEARn)

Note: n = 0 to 3

This register indicates the address which an address translation error occurred.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EAR[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EAR[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	EAR[31:0]	All 0	R/W	The faulting virtual address is set when an address translation error occurred.

13.2.9 PMB Control Register (IMPCTR)

This register controls the behavior of the PMB function.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	TTSEL[1:0]		TTEN	INTEN	—	PMBEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	TTSEL[1:0]	00	R/W	Translation Table Select Note: For IPMMU-GP, set 00 to this bit.
3	TTEN	0	R/W	TLB Translation Enable 0: Output PPN as a physical address. 1: Output PPN as an intermediate physical address to retranslate through 40-bit TLB. PPN[39:32] is not used in retranslation. Note: For IPMMU-GP, set 0 to this bit.
2	INTEN	0	R/W	Interrupt Enable 0: Don’t assert an interrupt when an error occurred. 1: Assert an interrupt when an error occurred.
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
0	PMBEN	0	R/W	PMB Enable 0: PMB disabled 1: PMB enabled

13.2.10 PMB Address Array n (IMPMBAn)

Note: n = 0 to 15

This register is used for setting the virtual page number.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VPN[31:24]								—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	V	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	VPN[31:24]	All 0	R/W	Virtual Page Number For 16-Mbyte page, VPN[31:24] is used. For 64-Mbyte page, VPN[31:26] is used. For 128-Mbyte page, VPN[31:27] is used. For 512-Mbyte page, VPN[31:29] is used.
23 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	V	0	R/W	Enable this page translation.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

13.2.11 PMB Data Array n (IMPMBDn)

Note: n = 0 to 15

This register is used for setting the physical page number and the memory size which PMB managed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PPN[31:24]								PPN[39:32]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	V	SZ[1]	—	—	SZ[0]	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	PPN[31:24]	All 0	R/W	Physical Page Number For 16-Mbyte page, PPN[31:24] is used. For 64-Mbyte page, PPN[31:26] is used. For 128-Mbyte page, PPN[31:27] is used. For 512-Mbyte page, PPN[31:29] is used.
23 to 16	PPN[39:32]	All 0	R/W	Upper Physical Page Number
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	V	0	R/W	Enable this page translation.
7	SZ[1]	0	R/W	This bit and SZ[0] (bit 4) specify the page size. SZ[1:0] = 00: 16-Mbyte page 01: 64-Mbyte page 10: 128-Mbyte page 11: 512-Mbyte page
6, 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SZ[0]	0	R/W	Page Size See the description of SZ[1] (bit 7).
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

13.2.12 PMB Status Register (IMPSTR)

This register indicates the error status of the address translation by PMB.

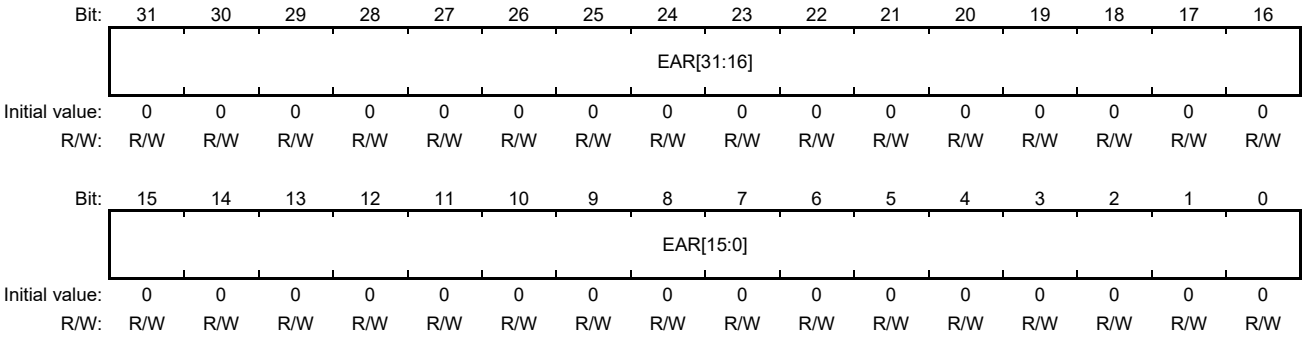
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	MHIT	—	—	—	TF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	MHIT	0	R/W	Multiple hit Indicate that multiple PMB hits occurred.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	TF	0	R/W	Translation Fault This bit is set to 1 when a translation fault occurred during a PMB translation.

13.2.13 PMB Error Address Register (IMPEAR)

This register indicates the address which an address translation error occurred.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	EAR[31:0]	All 0	R/W	The faulting virtual address is set when an address translation error occurred.

13.2.14 uTLB Control Register n (IMUCTRn)

Note: n = 0 to 31

This register controls the behavior of each uTLB.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FIXADDEN	—	—	—	—	—	—	—	FIXADD[39:32]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

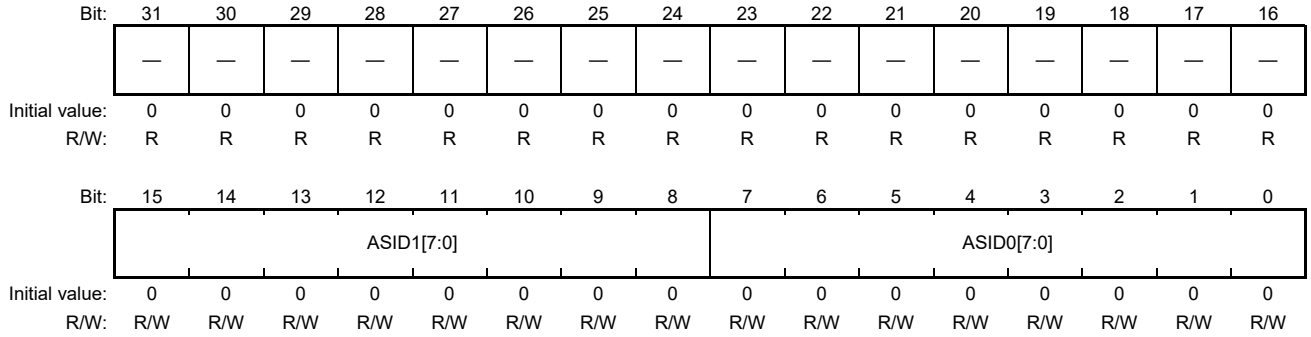
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TTSEL[3:0]				—	—	FLUSH	MMUEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	FIXADDEN	0	R/W	Fix the upper 8 bits of physical address Always output the upper 8 bits of physical address as FIXADD[39:32]. This bit must be used only in 32-bit translation mode. 0: Disable FIXADD[39:32]
30 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	FIXADD [39:32]	All 0	R/W	When FIXADDEN is 1, the upper 8bit of physical address is FIXADD[39:32]. This bit must be used only in 32-bit translation mode.
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 4	TTSEL[3:0]	0000	R/W	Translation Table 0000 to 0011: MMUn 0100 to 0111: Reserved 1000: PMB 1001 to 1111: Reserved Note: For IPMMU-GP, set 0000 or 1000 to these bits.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	FLUSH	0	R/W	micro-TLB Invalidate Invalidate all entries in the micro-TLB. This bit is automatically cleared to 0. 1: Invalidate all entries.
0	MMUEN	0	R/W	Address Translation Enable 0: Disable address translation 1: Enable address translation

13.2.15 uTLB ASID Register n (IMUASIDn)

Note: n = 0 to 31

This register is used for setting ASID of each uTLB.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	ASID1[7:0]	H'00	R/W	ASID1 This field indicates the ASID which the micro-TLB uses in the 2nd translation stage.
7 to 0	ASID0[7:0]	H'00	R/W	ASID0 This field indicates the ASID which the micro-TLB uses in the 1st translation stage.

13.2.16 MMU Performance Monitor Control Register (IMPFMMCTR)

This register is used to enable performance monitor function.

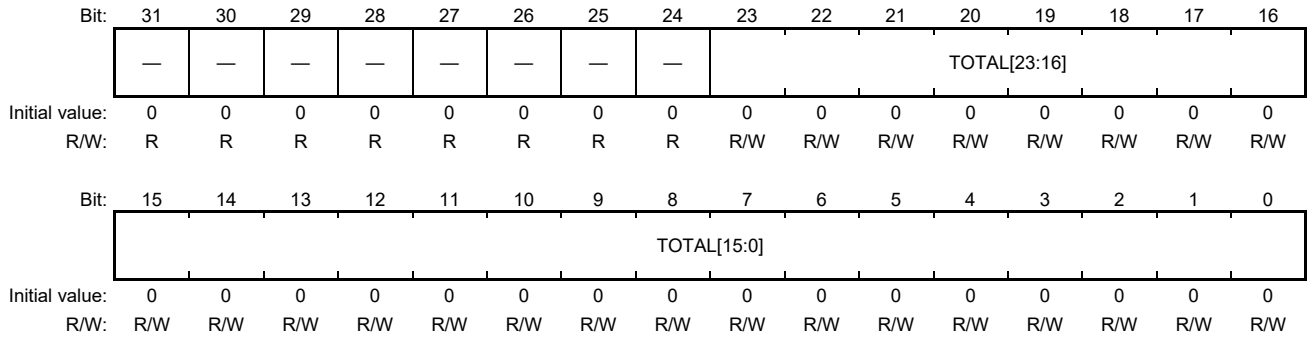
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	MD[1:0]		—	—	SEL[1:0]		—	—	—	—	—	—	RST	EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	MD[1:0]	00	R/W	Monitor Mode 00: Monitor all 40-bit MMUs 01: Monitor all 32-bit MMUs 10: Reserved 11: Monitor only MMUn (specified by the SEL bits)
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	SEL[1:0]	00	R/W	When MD is B'11, SEL indicates the MMU table number to be monitored.
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	RST	0	R/W	Reset all status and counter values. This bit is valid when EN = 1.
0	EN	0	R/W	Performance Monitor Enable 0: Stop to count 1: Start to count All counters stop and END is set to 1 when TOTAL bits get full.

13.2.17 MMU Performance Monitor Total Translation Counter (IMPFMMTOTAL)

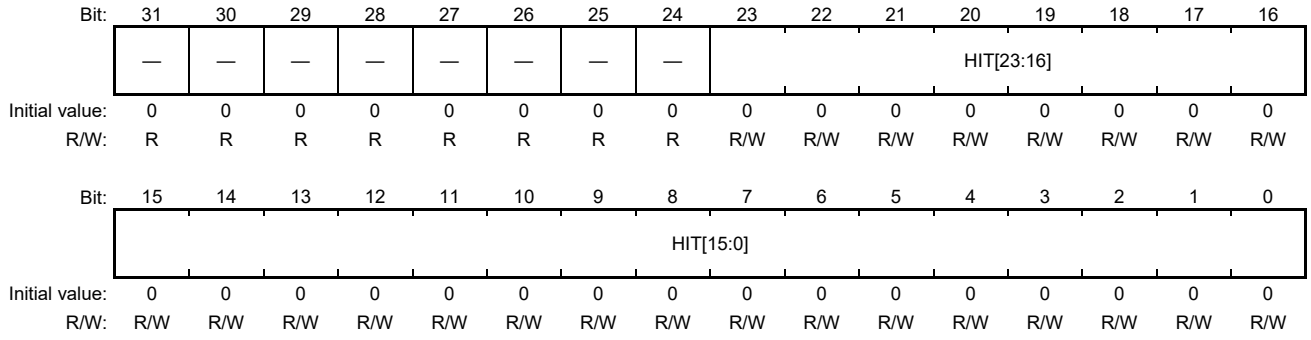
This register shows the total number of page table walk request when performance counter enabled.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	TOTAL[23:0]	H'00 0000	R/W	The total number of translation requests

13.2.18 MMU Performance Monitor Hit Counter (IMPFMHIT)

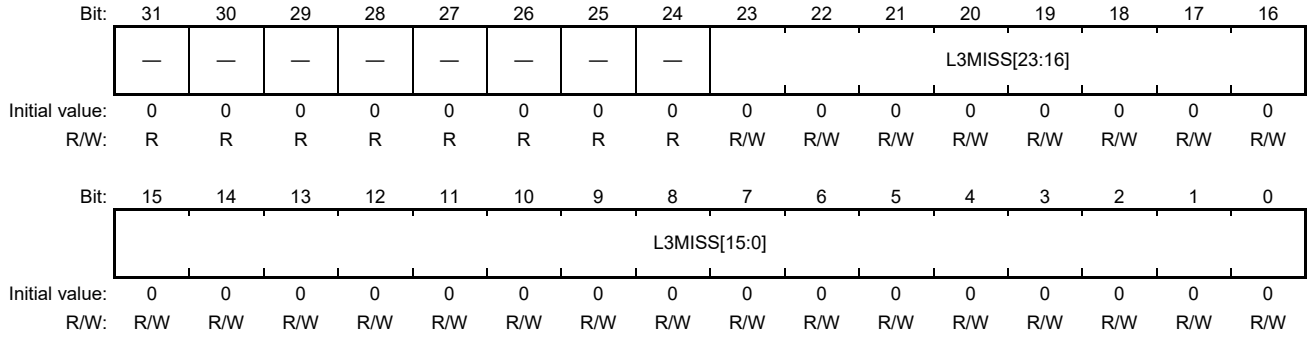
This register shows the total number of TLB hit when page table walk request received and performance monitor enabled.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	HIT[23:0]	H'00 0000	R/W	The total number of TLB hit requests = L3 TLB hit

13.2.19 MMU Performance Monitor L3 Miss Counter (IMPFML3MISS)

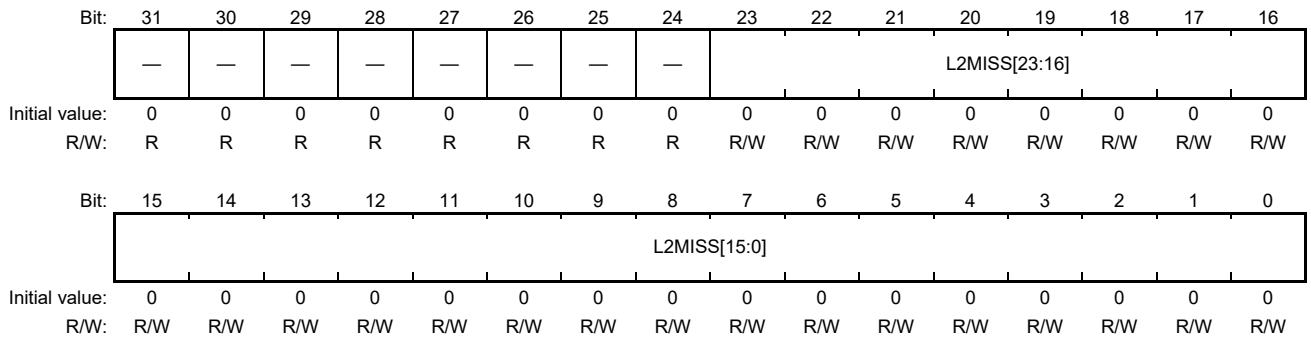
This register shows the total number of L3-TLB miss when page table walk request received and performance monitor enabled.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	L3MISS [23:0]	H'00 0000	R/W	The total number of L3 miss requests (not including L2 miss and L1 miss) = L2 TLB hit

13.2.20 MMU Performance Monitor L2 Miss Counter (IMPFML2MISS)

This register shows the total number of L2-TLB miss when page table walk request received and performance monitor enabled.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	L2MISS [23:0]	H'00 0000	R/W	The total number of L2 miss requests (not including L1 miss) = Page Table Walk

13.3 Operation

13.3.1 Address Translation Sequence in micro-TLBs

Each micro-TLB has independent entries and can translate from a virtual address to a physical address without sending translation requests to the IPMMU if the virtual address is cached in the micro-TLB.

When a translation error occurred in address translation, the micro-TLB blocks subsequent transactions until a valid page entry is registered. Set IMUCTRn.FLUSH = 1 after the entry registration.

Figure 13.2 shows the micro-TLB address translation sequence.

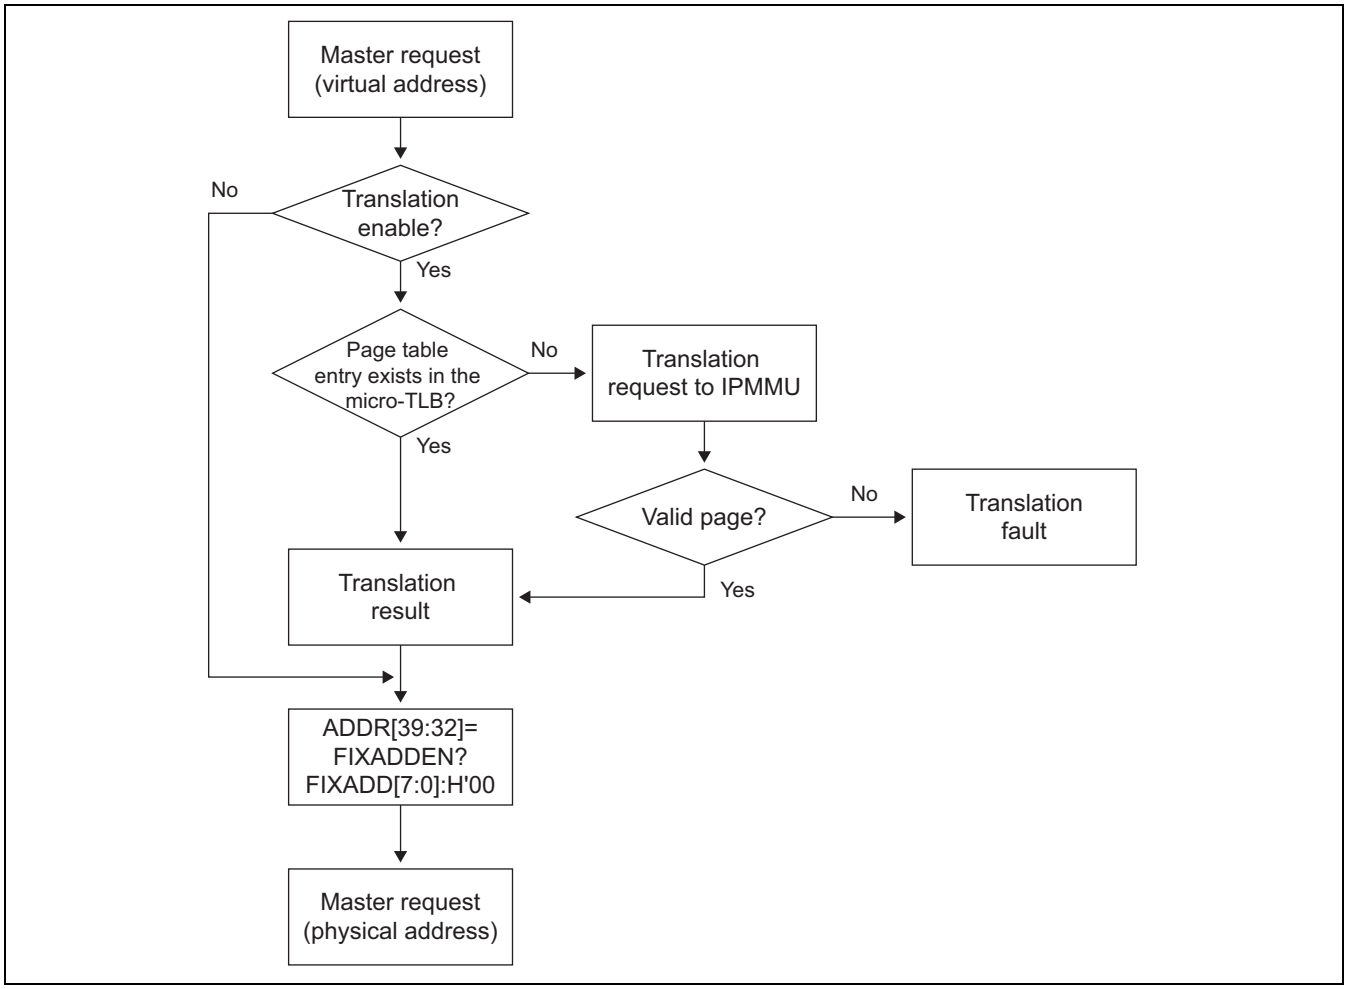


Figure 13.2 micro-TLB Address Translation Sequence

13.3.2 Address Translation Sequence in the IPMMU

(1) MMU Address Translation

The IPMMU has independent four non-secure page tables and four secure page tables which support two page table formats, the Short-descriptor format and the Long-descriptor format. When the IPMMU receives an address translation request from a micro-TLB, the IPMMU starts address translation sequence based on the page table specified by IMUCTRn.TTSEL.

Figure 13.3 shows the MMU address translation sequence.

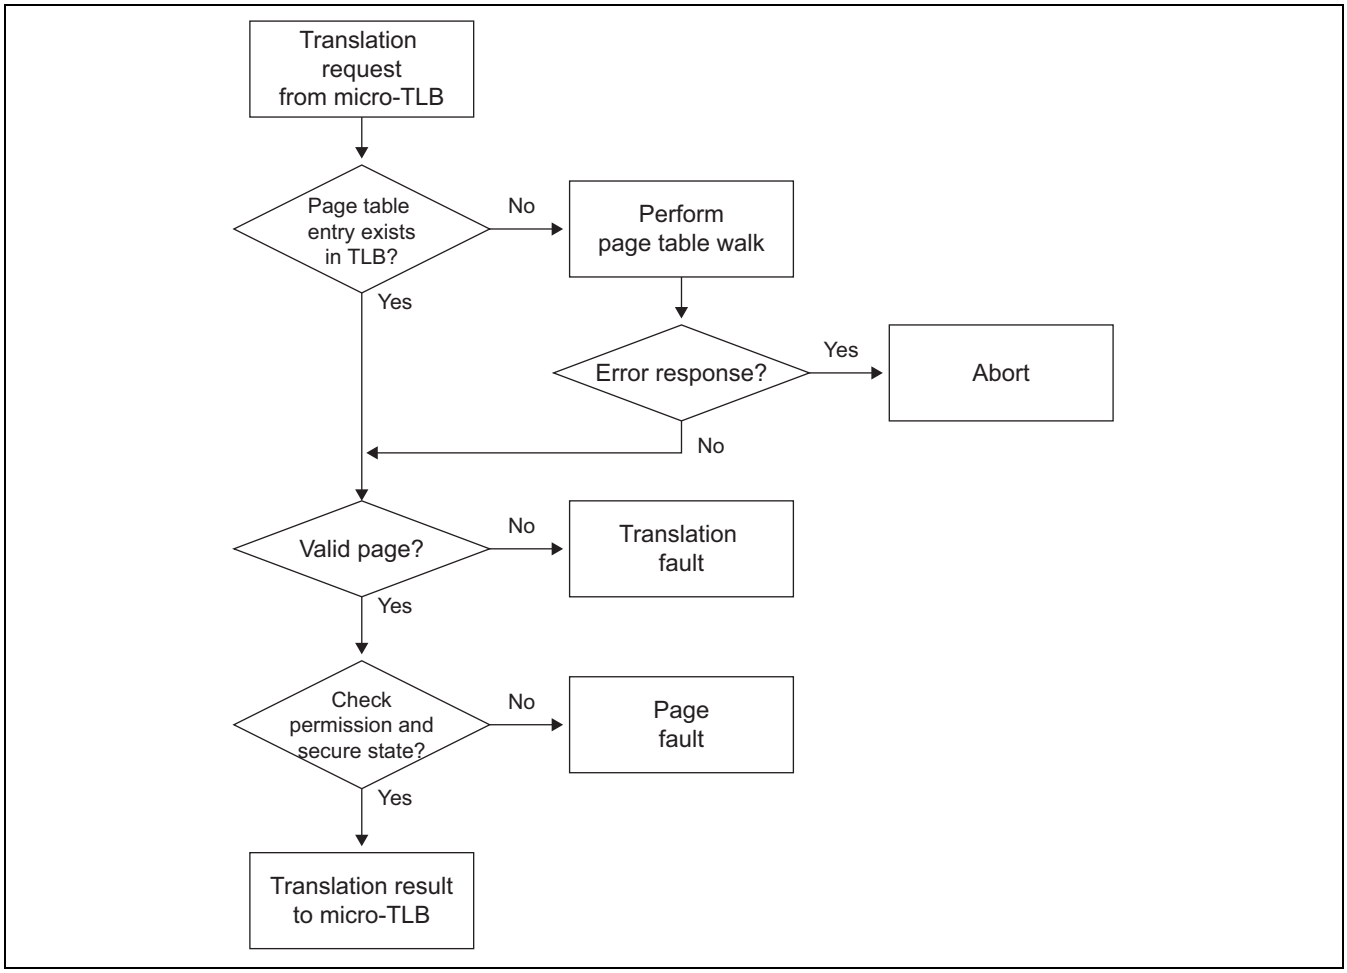

Figure 13.3 MMU Address Translation Sequence

(2) PMB Address Translation

PMB address translation is performed in two ways. When PMB address translation is chosen in IMUCTRn.TTSEL, all virtual addresses are translated by PMB. When PMB address translation is performed in a part of MMU translation (IMTTBCRn.PMB = 1), virtual addresses within H'80000000 to H'BFFFFFFF are translated to physical addresses by PMB.

Figure 13.4 shows the PMB translation flow.

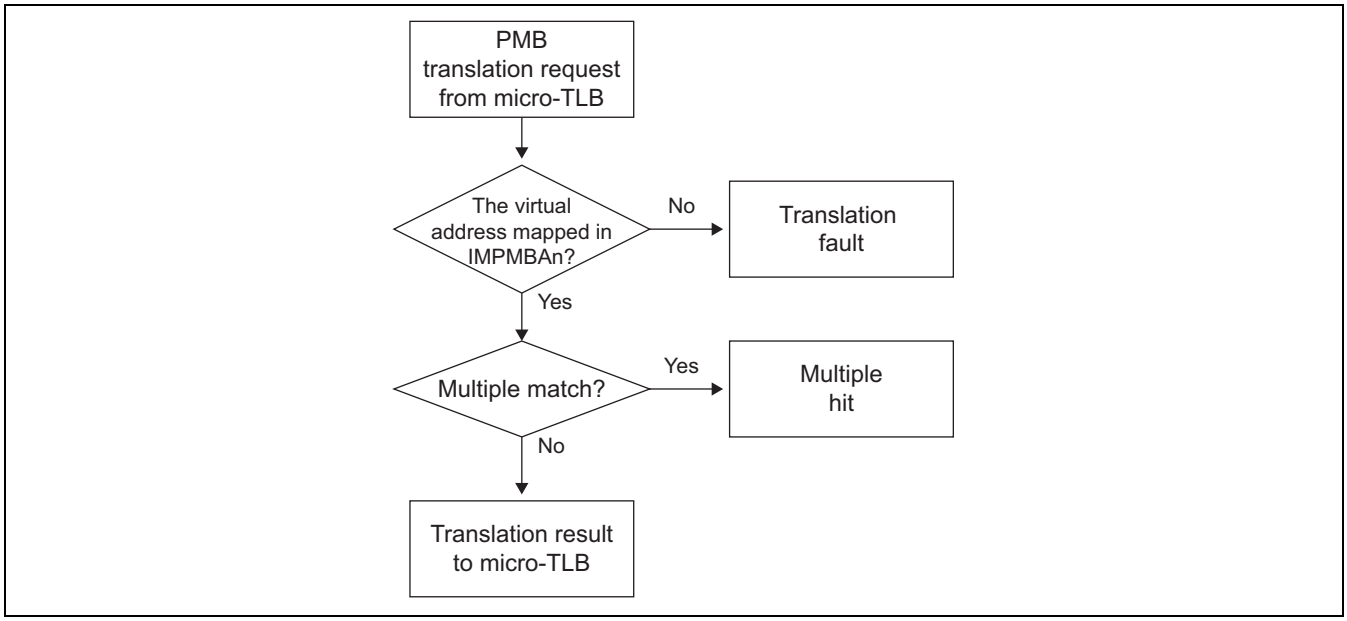

Figure 13.4 PMB Translation Flow

13.3.3 Address Space

(1) Short-descriptor

In the short-descriptor format, 32-bit virtual address space is translated to 32-bit physical address space managed by TTBR0/1. When IMTTBCRn.PMB = 1, translation address space is compatible with our previous products. In this mode, a virtual address within H'80000000 to H'BFFFFFFF is translated by PMB and a virtual address within H'C0000000 to H'FFFFFFFF is mapped to a physical address of the same value.

Note: IPMMU-GP doesn't support the Short-descriptor translation format.

Figure 13.5 shows the Short-descriptor address space.

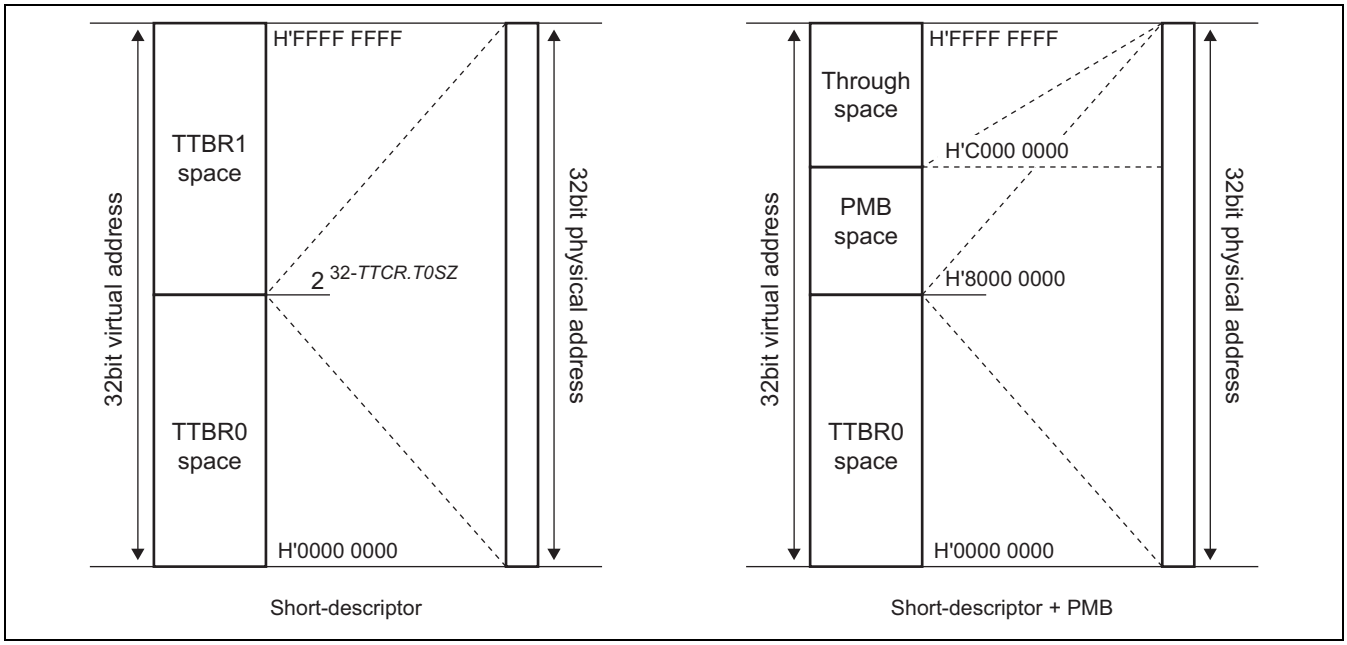

Figure 13.5 Short-descriptor Address Space

(2) Long-descriptor

In the long-descriptor format, 32-bit virtual address space is translated to 40-bit physical address space managed by TTBR0/1. The IPMMU supports the Secure PL1 and PL0 stage 1 translation and the Non-secure PL1 and PL0 stage 1 translation. The IPMMU doesn't support the Virtualization Extensions.

Figure 13.6 shows the Long-descriptor address space.

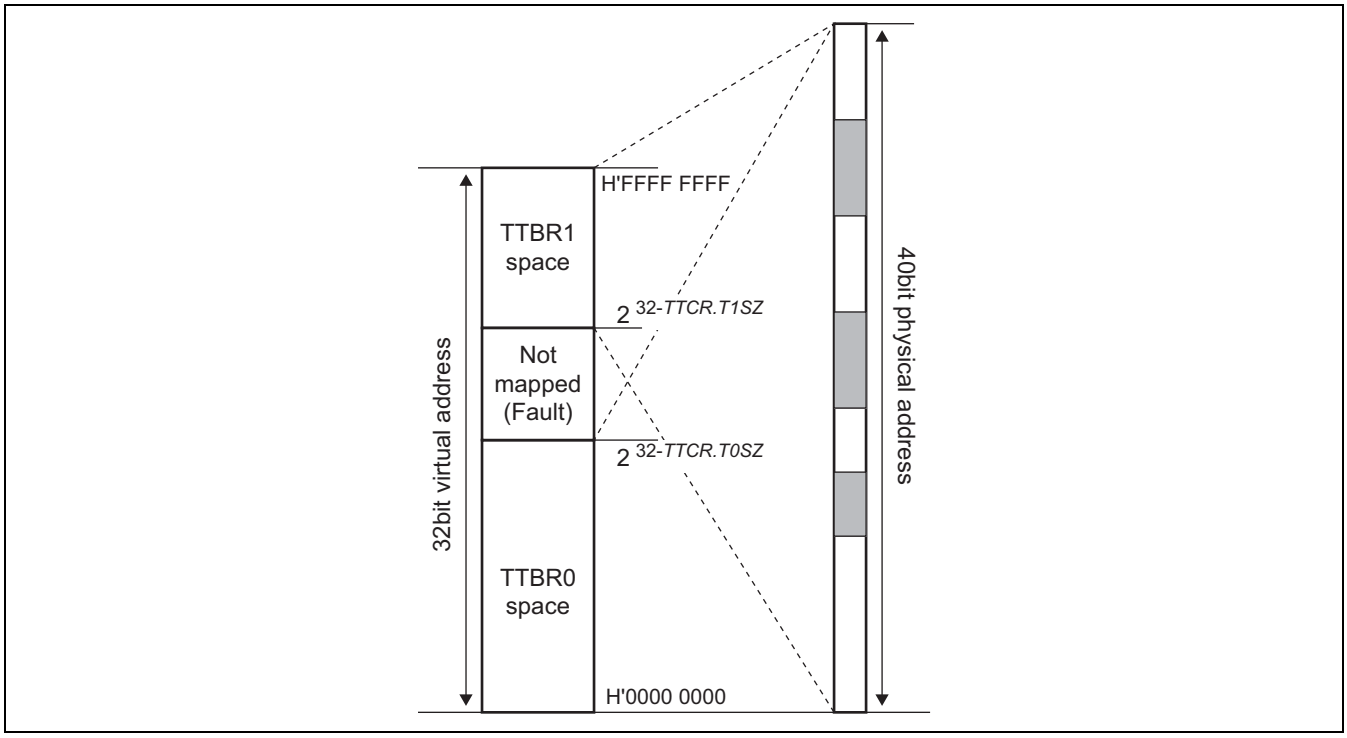

Figure 13.6 Long-descriptor Address Space

(3) PMB

The IPMMU supports the PMB address translation system. Figure 13.7 shows the PMB address space.

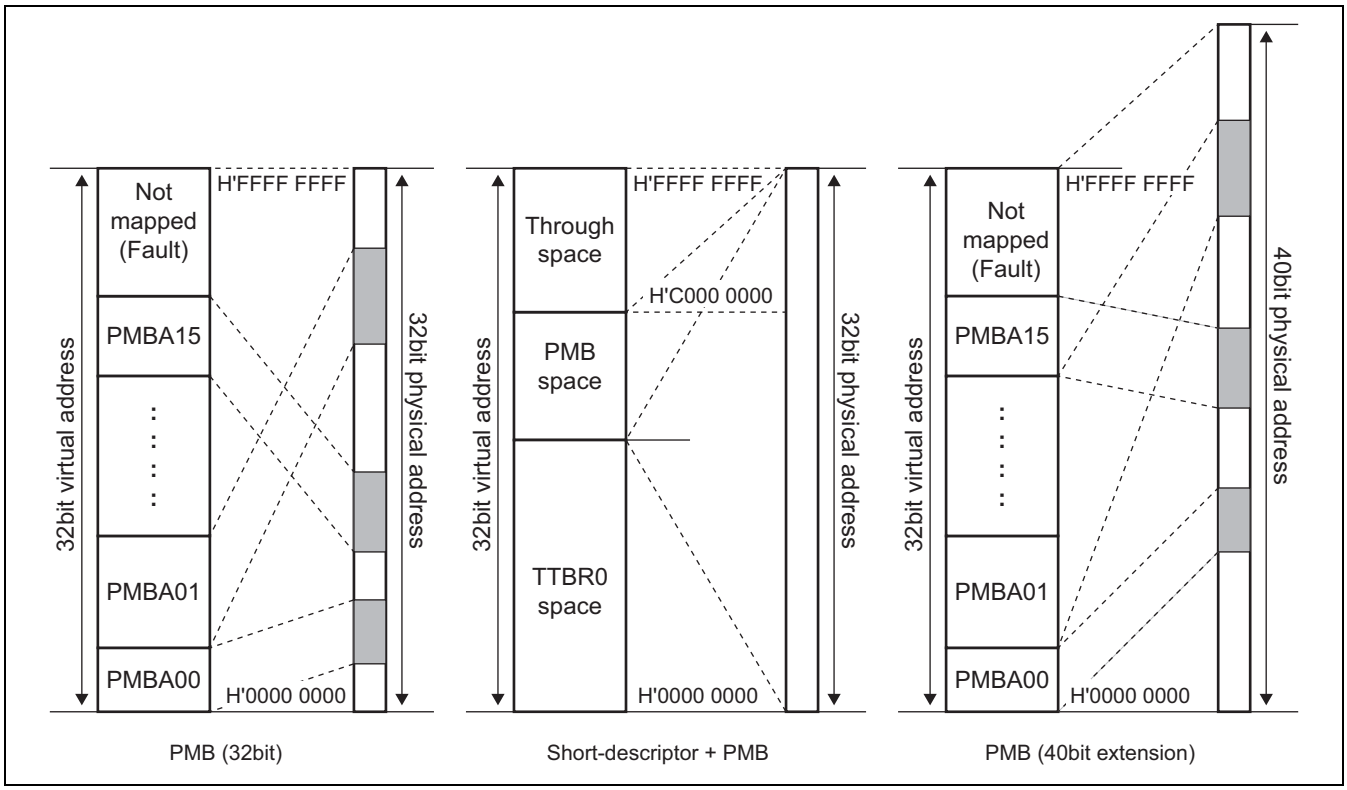

Figure 13.7 PMB Address Space

(4) 2-Stage Translation

The IPMMU supports 2-stage translation. At the 1st-stage, 32-bit address space is translated to 32-bit intermediate physical address (IPA) space. At the 2nd-stage, 32-bit IPA space is translated to 40-bit physical address space. In order to enable the 2-stage translation, set 1 to IMCTRn.TREN and set its 2nd-stage page table to IMCTRn.RTSEL.

Note: IPMMU-GP doesn't support the 2-stage translation.

Figure 13.8 shows the 2-stage translation address space.

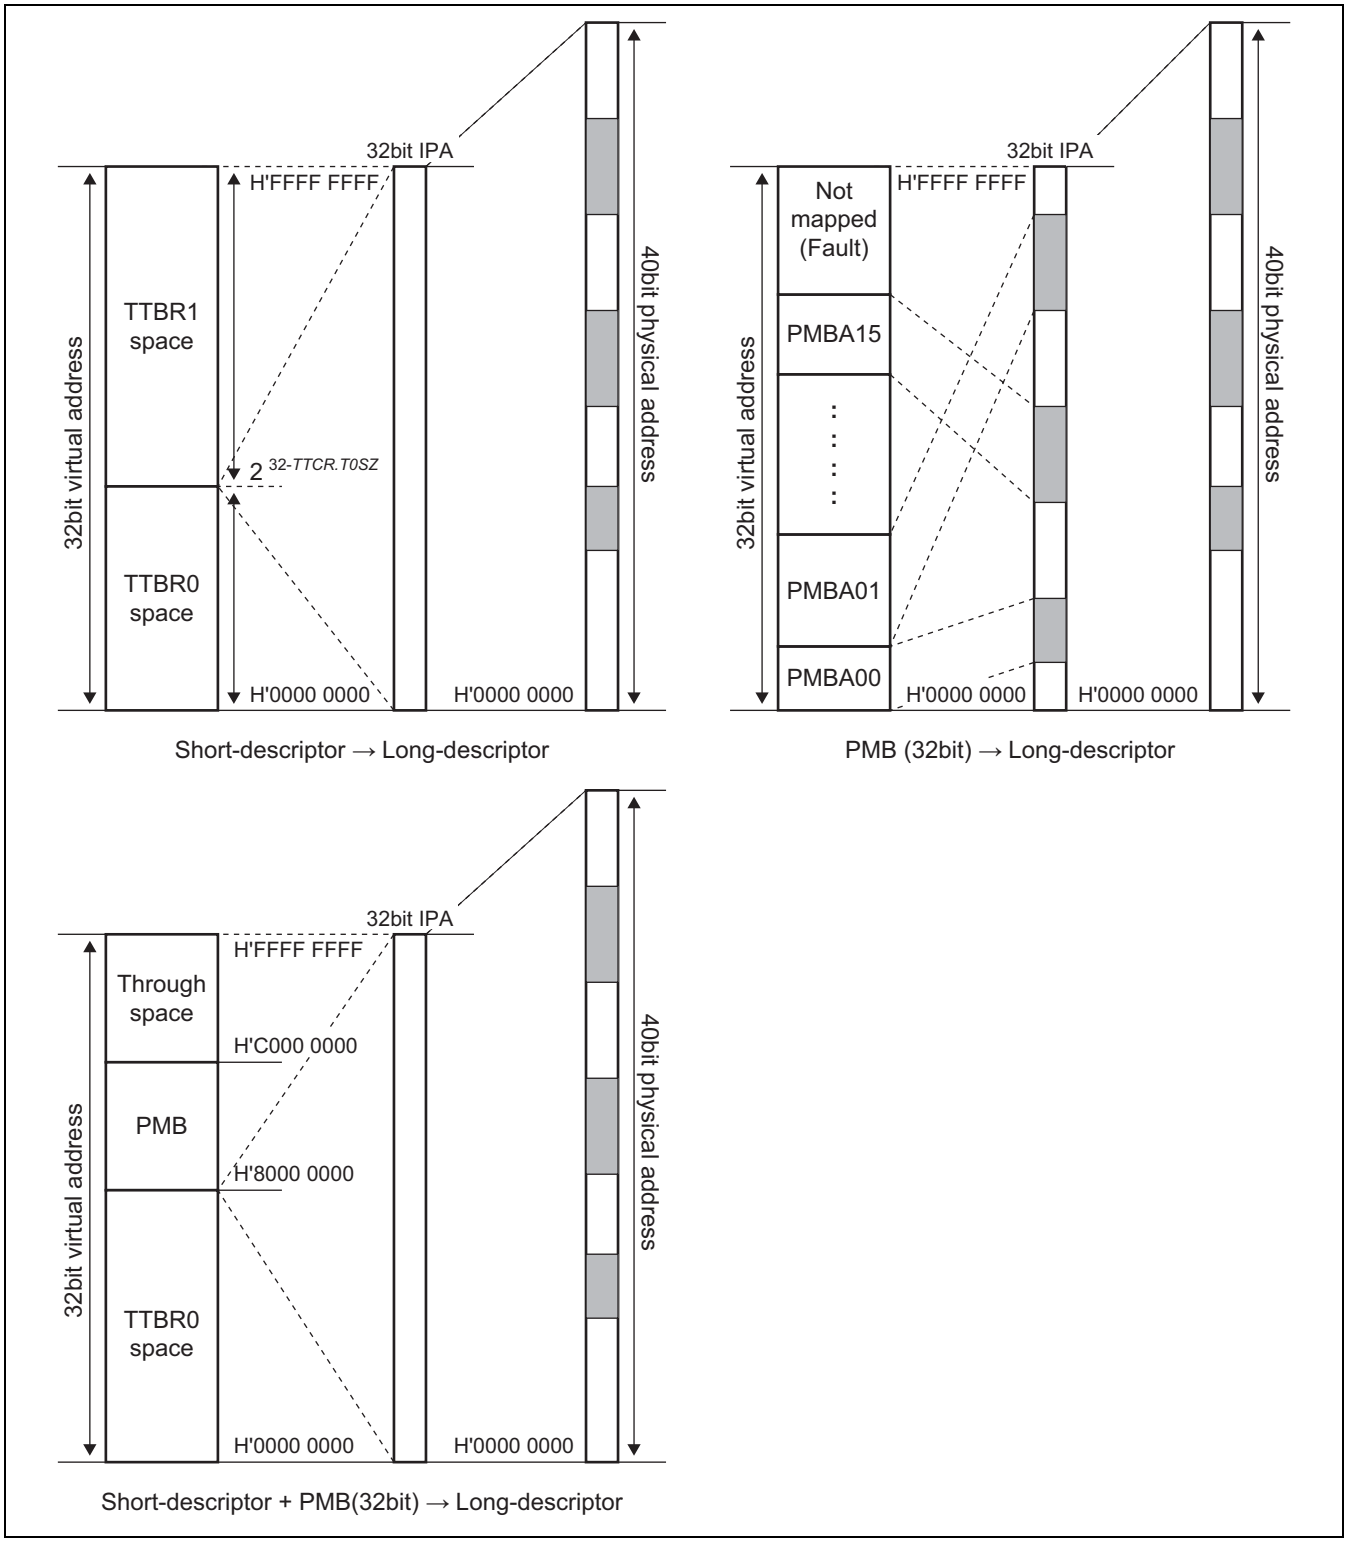

Figure 13.8 2-Stage Translation Address Space

13.3.4 Initialization Sequence

This section describes the initialization sequence of the IPMMU.

(1) Module Stop

The IPMMU doesn't support module stop control. The IPMMU can be used whenever a master requires address translation through the IPMMU. When a master doesn't require address translation, the corresponding IMUCTRn MMUEN must be disabled.

(2) micro-TLB

Before a master access, the corresponding micro-TLB registers which includes the translation mode and ASIDs must be configured.

13.3.5 TLB Maintenance

Some TLB maintenances between an IPMMU and the connected micro-TLBs are performed automatically by hardware.

Table 13.4 TLB Maintenance

Category	Software operation	TLB maintenance in IPMMU	TLB maintenance in micro-TLB
MMU Page Table	First entry registration	Not required	Not required
	Entry update	Invalidate the target TLB (IMCTRn.FLUSH = 1)	Automatically invalidated
	Entry release	Invalidate the target TLB (IMCTRn.FLUSH = 1)	Automatically invalidated
ASID	ASID update	Automatically invalidated	Automatically invalidated
MMU registers	MMU register values update	Invalidate the target TLB (IMCTRn.FLUSH = 1)	Automatically invalidated
PMB	PMB entry registration	Not required	Not required
	PMB entry update	Not required	Invalidate the target micro-TLB
	PMB entry release	Not required	Invalidate the target micro-TLB

13.3.6 Security Extensions

The IPMMU supports the ARMv7 Security Extensions and additional extensions.

(1) Banked Registers

The IPMMU has two copies of a register at the same address. They are banked with secure and non-secure. A Non-secure access can read and write only non-secure registers and a secure access can read and write secure registers. A secure access can also read and write non-secure registers through the alias address space to non-secure registers (from H'0800 to H'0FFF). Table 13.5 shows whether each IPMMU support the secure operation mode.

Table 13.5 Supported Secure Mode

IPMMU	Secure
IPMMUSY0	√
IPMMUSY1	√
IPMMUDS	√
IPMMUMP	√
IPMMUMX	√
IPMMUGP	√

(2) Address Translation

When a Secure master sends a translation request to an IPMMU through a micro-TLB, Secure MMU registers are referred to perform its page table walk. The Secure page table walk can read secure page table entries (NS = 0). In the case of a Non-secure translation request, Non-secure MMU registers are referred and the access to secure page table entries is ignored.

13.3.7 Error Handling

(1) IPMMU Interrupt Requests

Table 13.6 shows the error events which can cause interrupts. The errors in secure access are set in IMSSTRn registers and the errors in non-secure access are set in IMSTRn registers.

Table 13.6 IPMMU Error Events

Category	Error	Description
Long-descriptor Short-descriptor	Translation Fault	A virtual address was not mapped in the region defined by TTBR0 and TTBR1.*
		A descriptor was neither Table nor Block format
	Page Fault	AP (access permissions) / AF (access flag) bit mismatch occurred.
		NS bit mismatch occurred. Non-secure master read a Secure page table entry.
	Abort	The IPMMU got an error response from an Interconnect during a page table walk.
	Multiple Hit (MHIT)	Multiple TLB hits occurred.
PMB	Translation Fault	A virtual address was not mapped in IMPMBAn.
	Multiple Hit (MHIT)	Multiple PMB hits occurred.

Note: * This factor is only for long-descriptor.

(2) Error Handling Flow

When the micro-TLB cannot translate its virtual address because of some IPMMU errors, the micro-TLB stops to issue the following transactions. When the IPMMU detects an error, IMCTRn.FLUSH must be set after the IMSTRn/IMSSTRn register is cleared and page table entries are updated. After the TLB invalidation, the micro-TLB resumes to issue transactions.

Figure 13.9 shows the error handling flow.

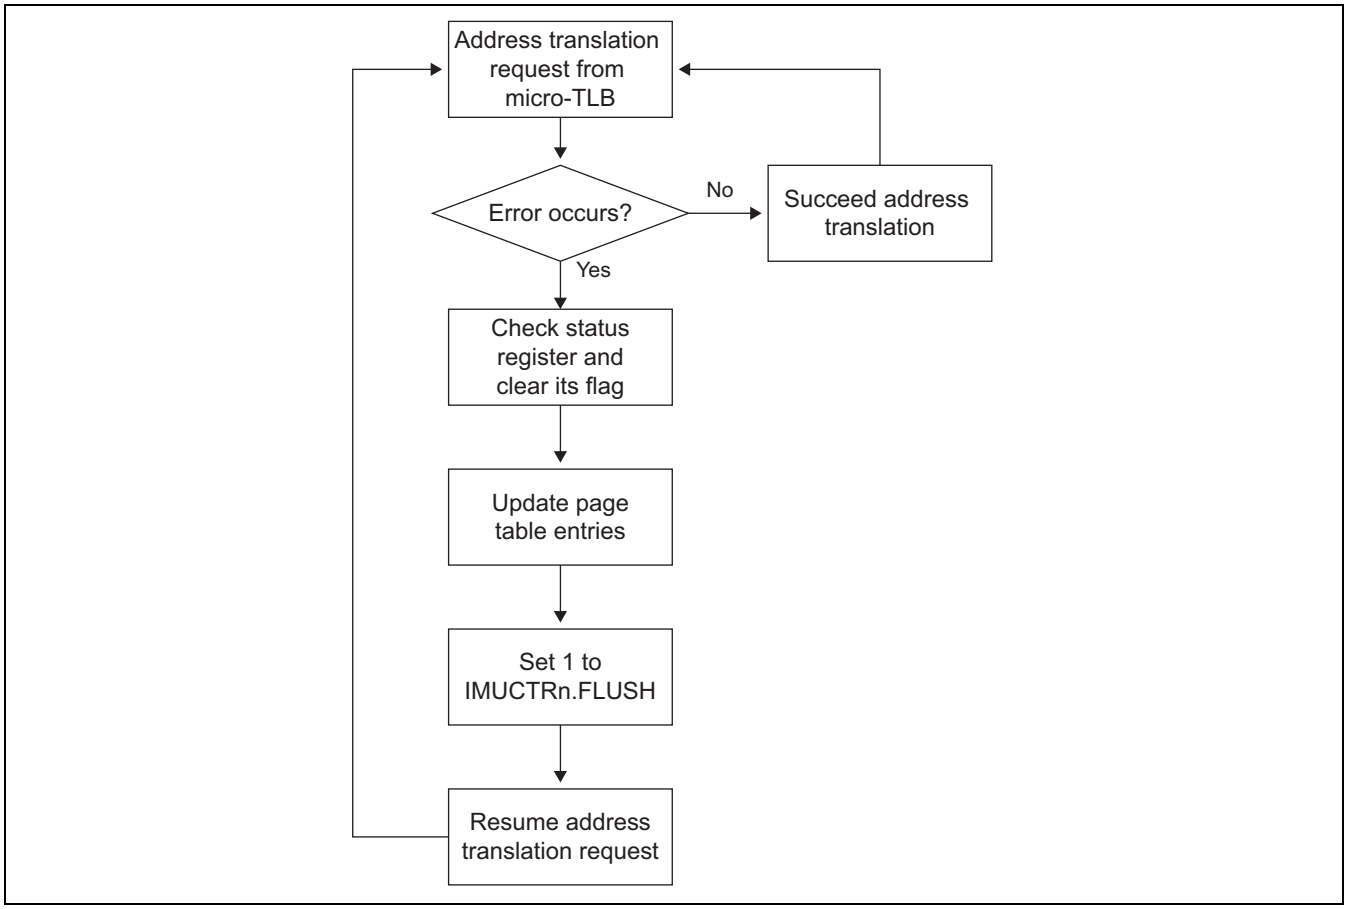

Figure 13.9 Error Handling Flow

14. LBSC within Bus Bridge

14.1 Overview

The LBSC performs bus arbitration and necessary interface conversion for the accesses from the CPU (AXI bus) and DMA accesses from LBSC-DMAC channels 0 to 2 and outputs them to the external buses. Further, for external bus access, various settings can be specified in the LBSC control registers for the selection of a connection interface type for each area on the external bus or for the adjustment of number of setup/hold cycles on addresses and chip select signals with respect to read/write enable signals. Thus, the LBSC configuration allows diversity in methodology for accessing various external devices that are assigned to their corresponding areas.

The frequency of the external bus clock CLKOUT signal is up to 65.0 MHz. The LBSC outputs bus signals in synchronization with the external bus clock.

14.2 Features

The key features of the LBSC include:

- Support for areas 0, 1
  - Each area is allocated to EX-BUS, and SRAM, or byte-control SRAM bus protocol can be selected.
  - Interface, bus size, and wait-cycle insertion can be controlled in each area.
  - Provides bus signals in synchronization with the CLKOUT signal (65.0 MHz).
- External DMA transfer (for details on DMAC, refer to section 17, LBSC-DMAC).
  - Three channels
  - Support of devices with the DACK signal
  - Support of edge-detection and level-detection external request signals
  - Synchronous/asynchronous DREQ and the polarity of DREQ, DACK, and DRACK can be inverted through register settings.
- SRAM interface
  - Wait-cycle insertion can be controlled through register settings.
  - Wait cycles can be inserted with the EX_WAIT pins.
  - Connectable bus size: 16 or 8 bits.
- Burst ROM interface (area 0 and CPU access only)
  - Wait-cycle insertion can be controlled through register settings.
  - Burst count can be specified through register settings (cases where this reaches an address branching point are automatically detected, after which the access is broken off).
  - Connectable bus size: 16 or 8 bits
- Byte-control SRAM interface (areas 1 only)
  - SRAM interface with byte control.
  - Wait-cycle insertion can be controlled through register settings.
  - Wait cycles can be inserted with the EX_WAIT pins.
  - Connectable bus size: 16 or 8 bits.
- Wait timeout
  - Wait timeout detection

    Detection time in ns = period in ns at EX-BUS operating frequency × (the time specified in the EX-BUS wait timeout base counter register (EXBCT) and EX-BUS wait timeout detection counter register (EXTCT))

14.3 Block Diagram

Figure 14.1 is a block diagram of the LBSC. Placed on the AXI bus, the LBSC outputs accesses from the CPU in sequence to an external bus according to the settings that are provided in internal registers of the LBSC. For the external bus EX-BUS, the SRAM bus protocol can be selected. In addition, the LBSC incorporates three LBSC-DMAC channels that control DMA transfers between an external bus and the DDR3-SDRAM. For details on the LBSC-DMAC, see the relevant section. Since the CPU and the LBSC-DMAC generate access contention for an external bus, the BSC uses an arbiter unit to arbitrate such access requests. The access request that was selected by means of arbitration is converted into an external bus waveform by the bus interface unit before being output. The LBSC has an external wait control input that controls the pulse width. When a request for access is received by an external device, the external device uses this to control the wait for a response to suit the situation at the time of access-request reception.

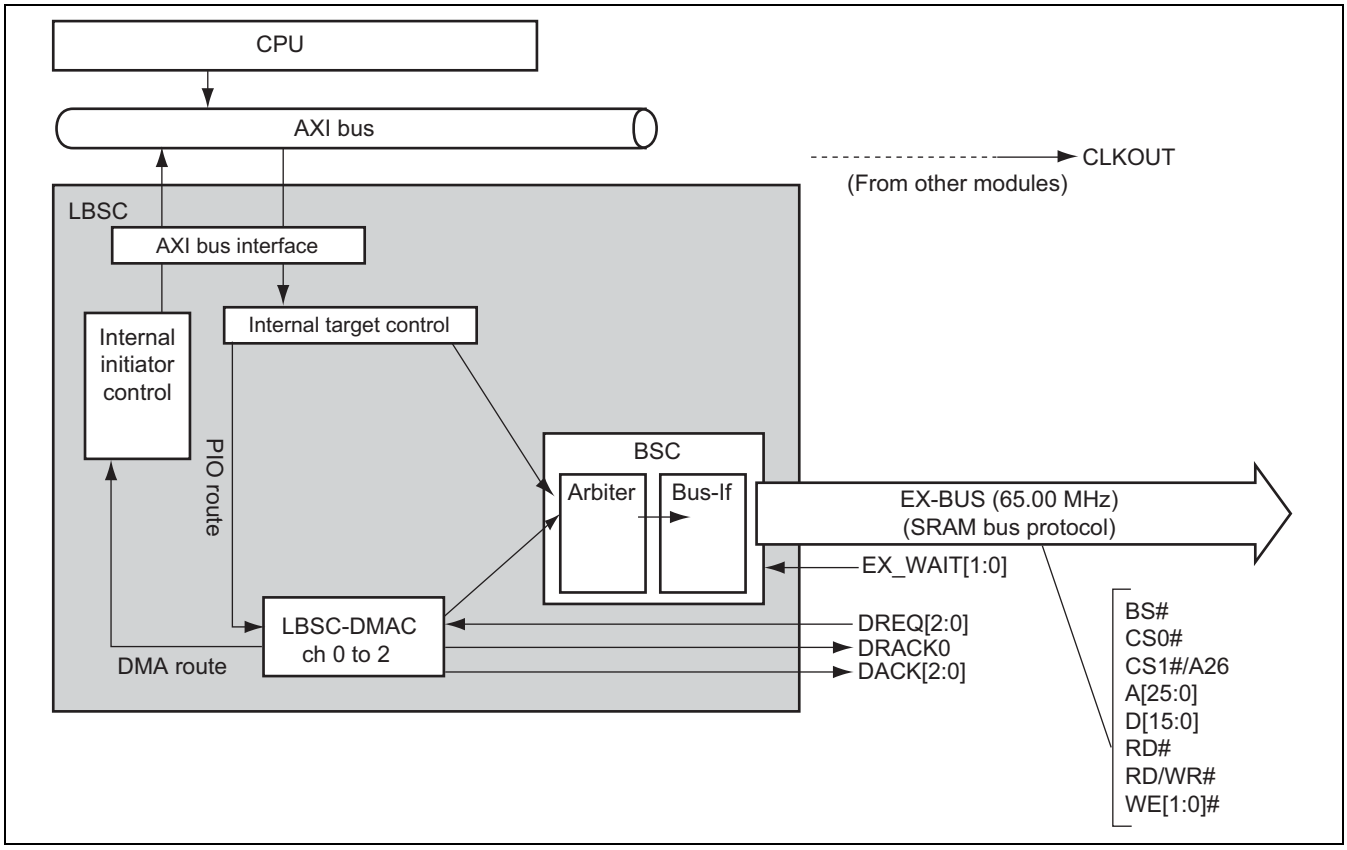

Figure 14.1 Block Diagram of LBSC

14.4 Input/Output Pins

The pin configuration of LBSC is shown in table 14.1. For detail, see section 5, Pin Function Controller (PFC).

Table 14.1 Pin Configuration

Name	Pin Name	I/O	Function
Address pin	DU0_DR0	O	Address bus A0
Address pin	DU0_DR1	O	Address bus A1
Address pin	DU0_DR2	O	Address bus A2
Address pin	DU0_DR3	O	Address bus A3
Address pin	DU0_DR4	O	Address bus A4
Address pin	DU0_DR5	O	Address bus A5
Address pin	DU0_DR6	O	Address bus A6
Address pin	DU0_DR7	O	Address bus A7
Address pin	DU0_DG0	O	Address bus A8
Address pin	DU0_DG1	O	Address bus A9
Address pin	DU0_DG2	O	Address bus A10
Address pin	DU0_DG3	O	Address bus A11
Address pin	DU0_DG4	O	Address bus A12
Address pin	DU0_DG5	O	Address bus A13
Address pin	DU0_DG6	O	Address bus A14
Address pin	DU0_DG7	O	Address bus A15
Address pin	DU0_DB0	O	Address bus A16
Address pin	DU0_DB1	O	Address bus A17
Address pin	DU0_DB2	O	Address bus A18
Address pin	DU0_DB3	O	Address bus A19
Address pin	DU0_DB4	O	Address bus A20
Address pin	DU0_DB5	O	Address bus A21
Address pin	DU0_DB6	O	Address bus A22
Address pin	DU0_DB7	O	Address bus A23
Address pin	DU0_DOTCLKIN	O	Address bus A24
Address pin	DU0_DOTCLKOUT0	O	Address bus A25
Data pins	D[15:0]	IO	Data bus pins D[15:0]
Chip select pin	QSPI0_IO2	O	Chip select CS0# signal for external memory or device.
Chip select pin	DU0_DOTCLKOUT1	O	Chip select CS1#/A26 signal for external memory or device.
Bus cycle start pin	QSPI0_MOSI/QSPI0_IO0	O	Bus cycle start (BS#) signal
DMA request pin	DU0_EXHSYNC/DU0_HSYNC	I	DMA request (DREQ0#)
DMA request pin	SSI_WS34	I	DMA request (DREQ1#)
DMA request pin	SSI_SDATA3	I	DMA request (DREQ2#)
DMA acknowledge pin	DU0_EXODDF/ DU0_ODDF_DISP_CDE	O	DMA request acknowledge (DRACK0)
DMA acknowledge pin	DU0_EXVSYNC/DU0_VSYNC	O	DMAC0 Acknowledge Signal (DACK0).
DMA acknowledge pin	SSI_SCK34	O	DMAC0 Acknowledge Signal (DACK1).
DMA acknowledge pin	SSI_SCK1_A	O	DMAC0 Acknowledge Signal (DACK2).

Name	Pin Name	I/O	Function
External wait pin	EX_WAIT0	I	External wait Signal 0 (EX_WAIT0).
External wait pin	SSI_SCK9_A	I	External wait Signal 1 (EX_WAIT1).
Data Enable pin	QSPI0_SPCLK	O	Data Enable 0 (WE0#)
Data Enable pin	QSPI0_SSL	O	Data Enable 1 (WE1#)
Read pin	QSPI0_IO3	O	Read data (RD#)
Read/Write pin	QSPI0_MISO/QSPI0_IO1	O	Read/Write direction (RD/RW#)
Clock output pin	CLKOUT	O	CLKOUT clock

14.5 LBSC Areas

14.5.1 LBSC Support Areas

Figure 14.2 shows LBSC response support areas from the CPU.

The basic configuration of the LBSC supports area 0 and area 1 as external spaces. For area 0 can be made into a 128-Mbyte space depending on the specific LSI startup mode (MD4 mode pin) in use (the MD4 mode pin = 1). In this case, however, area 1 is completely allocated as a space in area 0, and the CS1# signal is changed to the signal equivalent to A[26] in a bus address (addition of one bit to the address signal changes the capacity from 64 Mbytes to 128 Mbytes).

Registers of the BSC and LBSC-DMAC are provided in the internal register space of the LBSC.

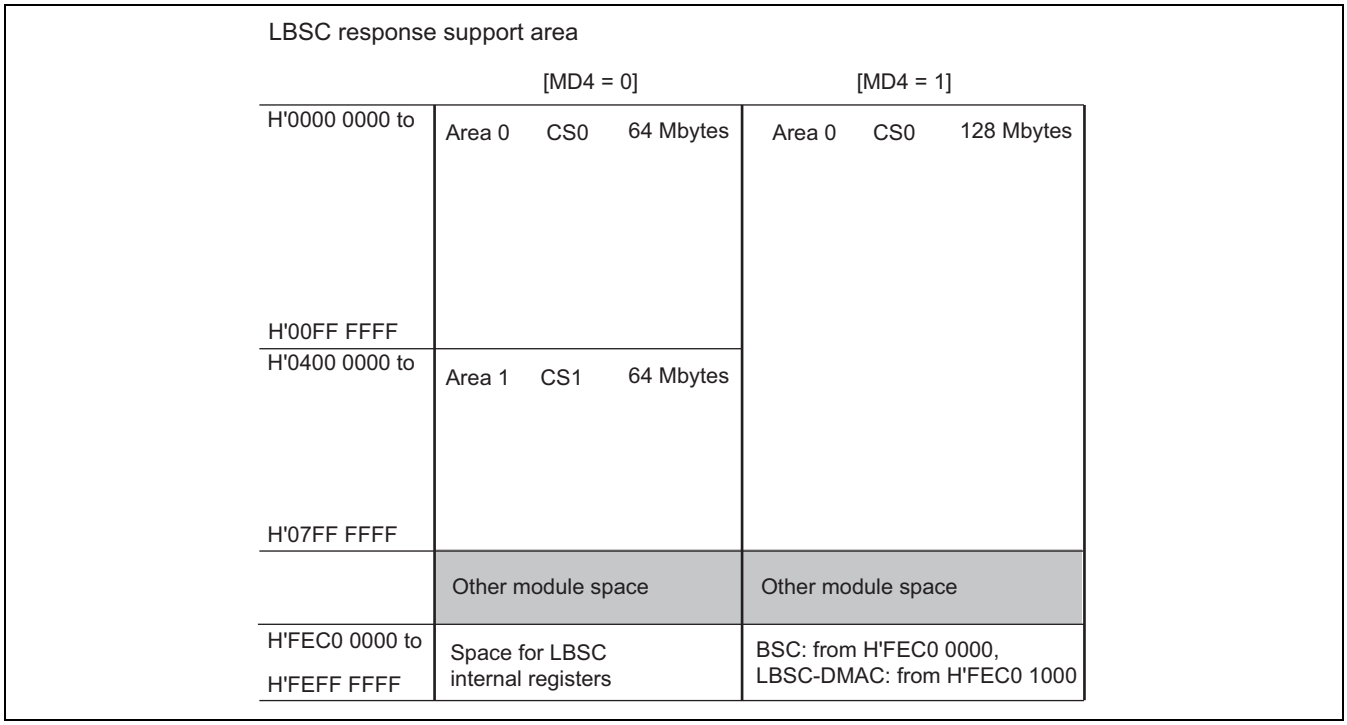

Figure 14.2 LBSC Response Support Areas from the CPU

14.5.2 Functionality Supported in Each Area

Table 14.2 lists the functions supported by the LBSC in each area on the EX-BUS.

Table 14.2 Functions Supported in Each Area on EX-BUS

Area	Bus	Capacity	Operating Mode	Guard interval	WAIT Function
0	8/16 bits	64/128 Mbytes selectable Area 0 divided MD4 pin specified	SRAM DMA Burst ROM	Disabled	Enabled
1	8/16 bits	Fixed to 64 Mbytes When area 0 = 128 Mbytes, no space exists.	SRAM DMA Byte-control SRAM	Enabled	Enabled

Notes: 1. The bus size for area 0 is specified with the LSI mode pins (MD8 = 0: 8 bits, MD8 = 1: 16 bits).
2. When using area 0 in 128-Mbyte mode (MD4 = 1), no space exists for area 1.
3. When accessing through EX-BUS, A[0] is output as byte address even if 16-bit bus is selected.
4. One DMAC channel cannot be allocated to two areas simultaneously.

14.6 Register Descriptions

The LBSC set registers to control the interface, bus size, RD/WE# signal pulse cycles, and setup and hold cycles for the CS# signal with respect to the RD/WE# signal, for each of externally connected devices. Table 14.3 lists registers of the LBSC. Note that correct operation is not guaranteed in principle if each register is modified during external bus access (for register modification in other cases, refer to the note under specific register description).

Table 14.3 LBSC Register Configuration

Register Name	Abbreviation	Access Type	Value after Power-On Reset	Address	Access Size	Remarks
Area 0 control register	CS0CTRL	R/W	Undefined	H'FEC0 0200	32	
Area 1 control register	CS1CTRL	R/W	H'0000 0020	H'FEC0 0204	32	
Area 0 RD/WE pulse control register	CSWCR0	R/W	H'FF70 FF70	H'FEC0 0230	32

LBSC-DMAC channel y RD/WE pulse control register	EXDMAWCRy	R/W	H'FF70 FF70	H'FEC0 0250 to H'FEC0 0258	32	y = 0 to 2
Area 0 external wait control register	CSPWCR0	R/W	H'0000 0000	H'FEC0 0280	32	
Area 1 external wait control register	CSPWCR1	R/W	H'0000 0000	H'FEC0 0284	32	
External wait input control register	EXWTSYNC	R/W	H'0000 0000	H'FEC0 02A0	32	
Area 0 burst control register	CS0BSTCTL	R/W	H'0000 0000	H'FEC0 02B0	32	
Area 0 burst pitch set register	CS0BTPH	R/W	H'0000 00F7	H'FEC0 02B4	32	
Area 1 guard setting register	CS1GDST	R/W	H'0000 0000	H'FEC0 02C0	32	
LBSC-DMAC channel y area allocation register	EXDMASETy	R/W	H'0000 0000	H'FEC0 02F0 to H'FEC0 02F8	32	y = 0 to 2
LBSC-DMAC channel y control register	EXDMCRy	R/W	H'0000 0000	H'FEC0 0310 to H'FEC0 0318	32	y = 0 to 2
BSC interrupt source status register	BCINTSR	R	H'0000 0000	H'FEC0 0330	32	
BSC interrupt source clear register	BCINTCR	—/WC1	H'0000 0000	H'FEC0 0334	32	
BSC interrupt enable register	BCINTMR	R/W	H'0000 0000	H'FEC0 0338	32	
EX-BUS priority level set register	EXBATLV	R/W	H'0000 0000	H'FEC0 0340	32	
External wait status register	EXWTSTS	R	Undefined	H'FEC0 0344	32	
EX-BUS wait timeout detection base counter register	EXBCT	R/W	H'0000 0000	H'FEC0 03C0	32	
EX-BUS wait timeout detection counter register	EXTCT	R/W	H'0000 0000	H'FEC0 03C4	32	

Register Name	Abbreviation	Access Type	Value after Power-On Reset	Address	Access Size	Remarks
EX-BUS wait timeout detection access source indication register	EXTSR	R/WC1	H'0000 0000	H'FEC0 0010	32	
EX-BUS wait timeout detection address indication register	EXTADR	R/W	H'0000 0000	H'FEC0 0014	32	

Note: Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

[Legend]

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/W: Write-only. The read value is undefined.

—/WC1: Write-only. Writing 1 initializes the bit. Writing 0 is ignored.

14.6.1 Area 0 Control Register (CS0CTRL)

Function: CS0CTRL specifies the interface in area 0 (EX-BUS).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	128B	—	—	CS0SZ		—	—	CS0IF	
Initial value:	1	0	0	0	0	0	0	—	0	0	—	—	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
14 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	128B	—	R	Area 0 Capacity Indication (These bits indicate the value specified by the LSI mode pin MD4.) 0: 64 Mbytes 1: 128 Mbytes
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	CS0SZ	—	R	Area 0 Bus Size Indication (These bits indicate the value specified by the LSI mode pin MD8.) 00: Setting prohibited 01: 8 bits 10: 16 bits 11: Setting prohibited
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	CS0IF	00	R/W	Area 0 Interface Selection 00: Standard (SRAM) 01: Burst ROM 10: Setting prohibited 11: Setting prohibited

Notes: 1. Even when the burst ROM interface is selected by setting CS0IF = B'01, burst ROM operation is not available unless appropriate setting is made in CS0BSTCTL. Be sure to specify both CS0BSTCTL and CS0BTPH before using the burst ROM interface.

2. Setting of burst ROM is valid for CPU access only. For DMA transfer access to area 0, SRAM interface (enabled when EXDMAWCR/CSPWCR0 is valid) is usually selected.

14.6.2 Area 1 Control Register (CS1CTRL)

Function: CS1CTRL specifies the interface in area 1 (EX-BUS).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	CS1SZ		—	CS1BRM	CS1IF	
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
15 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	CS1SZ	10	R/W	Area 1 Bus Size Selection 00: Setting prohibited 01: 8 bits 10: 16 bits 11: Setting prohibited
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	CS1BRM	0	R/W	Area 1 Byte-Control SRAM Mode Selection (valid only when CS1IF = 01) 0: Same cycle as CS# 1: Same cycle as RD#
1, 0	CS1IF	00	R/W	Area 1 Interface Selection 00: Standard (SRAM) 01: Byte-control SRAM 10: Setting prohibited 11: Setting prohibited

14.6.3 Area 0 RD/WE Pulse Control Register (CSWCR0)

Function: CSWCR0 specifies the RD/WE# pulse cycles and setup and hold cycles for the CS# signal and address during access to area 0 (EX-BUS). (The settings for read access are ignored when the burst ROM interface is selected.)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WRITE PULSE CYCLE					WRITE CS SETUP CYCLE			—	WRITE CS HOLD CYCLE			—	—	—	—
Initial value:	1	1	1	1	1	1	1	1	0	1	1	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	READ PULSE CYCLE					READ CS SETUP CYCLE			—	READ CS HOLD CYCLE			—	—	—	—
Initial value:	1	1	1	1	1	1	1	1	0	1	1	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	WRITE PULSE CYCLE	11111	R/W	These bits specify the WE# pulse cycles during writing to area 0. 00000: Setting prohibited 00001: 1-cycle pulse 00010: 2-cycle pulse 00011: 3-cycle pulse 00100: 4-cycle pulse : 11101: 29-cycle pulse 11110: 30-cycle pulse 11111: 31-cycle pulse
26 to 24	WRITE CS SETUP CYCLE	111	R/W	These bits specify the CS# and address setup cycles with respect to the WE# signal during writing to area 0. 000: 0 cycle for setup period 001: 1 cycle for setup period 010: 2 cycles for setup period : 110: 6 cycles for setup period 111: 7 cycles for setup period
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22 to 20	WRITE CS HOLD CYCLE	111	R/W	These bits specify the CS# and address hold cycles with respect to the WE# signal during writing to area 0. 000: 0 cycle for hold period 001: 1 cycle for hold period 010: 2 cycles for hold period : 110: 6 cycles for hold period 111: 7 cycles for hold period
19 to 16	—	0000	R	These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	READ PULSE CYCLE	11111	R/W	These bits specify the RD# pulse cycles during reading from area 0. 00000: Setting prohibited 00001: 1-cycle pulse 00010: 2-cycle pulse 00011: 3-cycle pulse 00100: 4-cycle pulse : 11101: 29-cycle pulse 11110: 30-cycle pulse 11111: 31-cycle pulse
10 to 8	READ CS SETUP CYCLE	111	R/W	These bits specify the CS# and address setup cycles with respect to the RD# signal during reading from area 0. 000: 0 cycle for setup period 001: 1 cycle for setup period 010: 2 cycles for setup period : 110: 6 cycles for setup period 111: 7 cycles for setup period
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 4	READ CS HOLD CYCLE	111	R/W	These bits specify the CS# and address hold cycles with respect to the RD# signal during reading from area 0. 000: 0 cycle for hold period 001: 1 cycle for hold period 010: 2 cycles for hold period : 110: 6 cycles for hold period 111: 7 cycles for hold period
3 to 0	—	0	R	These bits are always read as 0. The write value should always be 0.

Notes: 1. A minimum of two clock cycles are required for one EX-BUS access cycle and therefore, the setting must satisfy this lower limit.

Setting less than two clock cycles for one access cycle is not expected in the design of this LSI, and if attempted correct operation is not guaranteed.

Example: When CSSetupCycle = B'000, CSHoldCycle = B'000, and PulseCycle = B'00001, correct operation is not guaranteed.

2. When controlling wait insertion through LSI external pins (EX_WAIT1 to EX_WAIT0), set PulseCycle to B'00010 or a larger value. If B'00001 or a smaller value is specified, wait insertion through an external pin is disabled.
3. When the burst ROM interface is specified for area 0, the read access-related settings for area 0 in this register is ignored and settings in CS0BTPH are enabled.
4. DMA transfer access is performed according to the settings in the RD/WE pulse control register (EXDMAWCRy (y = 0 to 2)) for the respective LBSC-DMAC channel.
5. For details, refer to section 14.7.1, SRAM Interface (Basic Functionality).

14.6.4 Area 1 RD/WE Pulse Control Register (CSWCR1)

Function: CSWCR1 specifies the RD/WE# pulse cycles and setup and hold cycles for the CS# signal and address during access to area 1 (EX-BUS).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WRITE PULSE CYCLE					WRITE CS SETUP CYCLE			—	WRITE CS HOLD CYCLE			—	—	—	—
Initial value:	1	1	1	1	1	1	1	1	0	1	1	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	READ PULSE CYCLE					READ CS SETUP CYCLE			—	READ CS HOLD CYCLE			—	—	—	—
Initial value:	1	1	1	1	1	1	1	1	0	1	1	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	WRITE PULSE CYCLE	11111	R/W	These bits specify the WE pulse cycles during writing to area 0. 00000: Setting prohibited 00001: 1-cycle pulse 00010: 2-cycle pulse 00011: 3-cycle pulse 00100: 4-cycle pulse : 11101: 29-cycle pulse 11110: 30-cycle pulse 11111: 31-cycle pulse
26 to 24	WRITE CS SETUP CYCLE	111	R/W	These bits specify the CS# and address setup cycles with respect to the WE# signal during writing to area 1. 000: 0 cycle for setup period 001: 1 cycle for setup period 010: 2 cycles for setup period : 110: 6 cycles for setup period 111: 7 cycles for setup period
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22 to 20	WRITE CS HOLD CYCLE	111	R/W	These bits specify the CS# and address hold cycles with respect to the WE# signal during writing to area 1. 000: 0 cycle for hold period 001: 1 cycle for hold period 010: 2 cycles for hold period : 110: 6 cycles for hold period 111: 7 cycles for hold period
19 to 16	—	0000	R	These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	READ PULSE CYCLE	11111	R/W	These bits specify the RD# pulse cycles during reading from area 0. 00000: Setting prohibited 00001: 1-cycle pulse 00010: 2-cycle pulse 00011: 3-cycle pulse 00100: 4-cycle pulse : 11101: 29-cycle pulse 11110: 30-cycle pulse 11111: 31-cycle pulse
10 to 8	READ CS SETUP CYCLE	111	R/W	These bits specify the CS# and address setup cycles with respect to the RD# signal during reading from area 1. 000: 0 cycle for setup period 001: 1 cycle for setup period 010: 2 cycles for setup period : 110: 6 cycles for setup period 111: 7 cycles for setup period
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 4	READ CS HOLD CYCLE	111	R/W	These bits specify the CS# and address hold cycles with respect to the RD# signal during reading from area 1. 000: 0 cycle for hold period 001: 1 cycle for hold period 010: 2 cycles for hold period : 110: 6 cycles for hold period 111: 7 cycles for hold period
3 to 0	—	0000	R	These bits are always read as 0. The write value should always be 0.

Notes: 1. A minimum of two clock cycles are required for one EX-BUS access cycle and therefore, the setting must satisfy this lower limit.
Setting less than two clock cycles for one access cycle is not expected in the design of this LSI, and if attempted correct operation is not guaranteed.
Example: When CSSetupCycle = B'000, CSHoldCycle = B'000, and PulseCycle = B'00001, correct operation is not guaranteed.
2. When controlling wait insertion through LSI external pins (EX_WAIT1 to EX_WAIT0), set PulseCycle to B'00010 or a larger value. If B'00001 or a smaller value is specified, wait insertion through an external pin is disabled.
3. DMA transfer access to area 1 is performed according to the settings in the RD/WE pulse control register (EXDMAWCRy (y = 0 to 2)) for the respective LBSC-DMAC channel.
4. For details, refer to section 14.7.1, SRAM Interface (Basic Functionality).

14.6.5 LBSC-DMAC Channel y RD/WE Pulse Control Register (EXDMAWCRy (y = 0 to 2))

Function: EXDMAWCRy specifies the RD/WE# pulse cycles and setup and hold cycles for the CS# signal and address during access to EX-BUS in LBSC-DMAC channel y (y = 0 to 2).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WRITE PULSE CYCLE					WRITE CS SETUP CYCLE			—	WRITE CS HOLD CYCLE			—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	WRITE PULSE CYCLE	11111	R/W	These bits specify the WE# pulse cycles during writing to area 0. 00000: Setting prohibited 00001: 1-cycle pulse 00010: 2-cycle pulse 00011: 3-cycle pulse 00100: 4-cycle pulse : 11101: 29-cycle pulse 11110: 30-cycle pulse 11111: 31-cycle pulse
26 to 24	WRITE CS SETUP CYCLE	111	R/W	These bits specify the CS# and address setup cycles with respect to the WE# signal during write in channel y. 000: 0 cycle for setup period 001: 1 cycle for setup period 010: 2 cycles for setup period : 110: 6 cycles for setup period 111: 7 cycles for setup period
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22 to 20	WRITE CS HOLD CYCLE	111	R/W	These bits specify the CS# and address hold cycles with respect to the WE# signal during write in channel y. 000: 0 cycle for hold period 001: 1 cycle for hold period 010: 2 cycles for hold period : 110: 6 cycles for hold period 111: 7 cycles for hold period
19 to 16	—	0000	R	These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	READ PULSE CYCLE	11111	R/W	These bits specify the RD# pulse cycles during reading from area 0. 00000: Setting prohibited 00001: 1-cycle pulse 00010: 2-cycle pulse 00011: 3-cycle pulse 00100: 4-cycle pulse : 11101: 29-cycle pulse 11110: 30-cycle pulse 11111: 31-cycle pulse
10 to 8	READ CS SETUP CYCLE	111	R/W	These bits specify the CS# and address setup cycles with respect to the RD# signal during read in channel y. 000: 0 cycle for setup period 001: 1 cycle for setup period 010: 2 cycles for setup period : 110: 6 cycles for setup period 111: 7 cycles for setup period
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 4	READ CS HOLD CYCLE	111	R/W	These bits specify the CS# and address hold cycles with respect to the RD# signal during read in channel y. 000: 0 cycle for hold period 001: 1 cycle for hold period 010: 2 cycles for hold period : 110: 6 cycles for hold period 111: 7 cycles for hold period
3 to 0	—	0000	R	These bits are always read as 0. The write value should always be 0.

Notes: 1. A minimum of two clock cycles are required for one EX-BUS access cycle and therefore, the setting must satisfy this lower limit.
Setting less than two clock cycles for one access cycle is not expected in the design of this LSI, and if attempted correct operation is not guaranteed.
Example: When CSSetupCycle = B'000, CSHoldCycle = B'000, and PulseCycle = B'00001, correct operation is not guaranteed.
2. When controlling wait insertion through LSI external pins (EX_WAIT1 to EX_WAIT0), set PulseCycle to B'00010 or a larger value. If B'00001 or a smaller value is specified, wait insertion through an external pin is disabled.
3. External wait insertion is controlled according to the external wait control register for the area where the DMAC channel (0 to 2) is assigned.
4. For details, refer to section 14.7.3, LBSC-DMAC → DMA Interface.

14.6.6 Area 0 External Wait Control Register (CSPWCR0)

Function: CSPWCR0 makes settings for external wait signal during access to area 0 (EX-BUS) (the settings are ignored when the burst ROM interface is selected).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	V	RB	WINV	—	EXWT1	EXWT0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	V	0	R/W	Area 0 External Wait Signal Enable/Disable 0: Disabled 1: Enabled
4	RB	0	R/W	Area 0 READY/BUSY Logic Selection 0: BUSY logic 1: READY logic
3	WINV	0	R/W	Area 0 External Wait Signal Polarity 0: Does not invert the polarity of the area 0 external wait signal. 1: Inverts the polarity of the area 0 external wait signal.
2	—	0	R	The write value must always be 0. Operation is not guaranteed if setting 1.
1	EXWT1	0	R/W	Area 0 EX_WAIT1 Enable 0: Disables EX_WAIT1 for area 0. 1: Enables EX_WAIT1 for area 0.
0	EXWT0	0	R/W	Area 0 EX_WAIT0 Enable 0: Disables EX_WAIT0 for area 0. 1: Enables EX_WAIT0 for area 0.

Notes: 1. When this register setting is made valid (bit V = 1), any one of bits EXWT0 to EXWT1 must be set to 1. Simultaneously setting more than one of EXWT0 to EXWT1 to 1 is not expected in the design of this LSI, and attempted correct operation is not guaranteed.

2. When bit V = 0, the settings in EXWT0 to EXWT1 are ignored. In area 0, this register setting is ignored in read access when the burst ROM interface is selected. For details on wait control, refer to section 14.7.1, SRAM Interface (Basic Functionality).

14.6.7 Area 1 External Wait Control Register (CSPWCR1)

Function: CSPWCR1 makes settings for external wait input pins during access to area 1 (EX-BUS).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	V	RB	WINV	—	EXWT1	EXWT0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	V	0	R/W	Area 1 External Wait Signal Enable/Disable 0: Disabled 1: Enabled
4	RB	0	R/W	Area 1 READY/BUSY Logic Selection 0: BUSY logic 1: READY logic
3	WINV	0	R/W	Area 1 External Wait Signal Polarity 0: Does not invert the polarity of the area 1 external wait signal. 1: Inverts the polarity of the area 1 external wait signal.
2	—	0	R	The write value must always be 0. Operation is not guaranteed if setting 1.
1	EXWT1	0	R/W	Area 1 EX_WAIT1 Enable 0: Disables EX_WAIT1 for area 1. 1: Enables EX_WAIT1 for area 1.
0	EXWT0	0	R/W	Area 1 EX_WAIT0 Enable 0: Disables EX_WAIT0 for area 1. 1: Enables EX_WAIT0 for area 1.

Notes: 1. When this register setting is made valid (bit V = 1), any one of bits EXWT0 to EXWT1 must be set to 1. Simultaneously setting more than one of EXWT0 to EXWT1 to 1 is not expected in the design of this LSI, and attempted correct operation is not guaranteed.

2. When bit V = 0, the settings in EXWT0 to EXWT1 are ignored. For details on wait control, refer to section 14.7.1, SRAM Interface (Basic Functionality).

14.6.8 External Wait Input Control Register (EXWTSYNC)

Function: EXWTSYNC controls whether or not to synchronize the external wait pins (EX_WAIT1 to EXWAIT0).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EXWT SYNC1	EXWT SYNC0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	—	0	R/W	Reserved The write value should always be 0.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	—	0	R	The write value must always be 0. Operation is not guaranteed if setting 1.
1	EXWTSYNC1	0	R/W	0: Does not synchronize EX_WAIT1 (the original EX_WAIT1 is synchronous with CLKOUT). 1: Synchronizes EX_WAIT1 (the original EX_WAIT1 is asynchronous with CLKOUT).
0	EXWTSYNC0	0	R/W	0: Does not synchronize EX_WAIT0 (the original EX_WAIT0 is synchronous with CLKOUT). 1: Synchronizes EX_WAIT0 (the original EX_WAIT0 is asynchronous with CLKOUT).

Note: For details on wait control, refer to section 14.7.1, SRAM Interface (Basic Functionality).

14.6.9 Area 0 Burst Control Register (CS0BSTCTL)

Function: CS0BSTCTL specifies the burst length for area 0 when the burst ROM interface is selected.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	A0BST[2:0]			—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 11	A0BST[2:0]	000	R/W	Area 0 Burst Length for Burst ROM Interface 001: 4 access cycles 010: 8 access cycles 011: 16 access cycles 100: 32 access cycles Others: No burst transfer
10 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Notes: 1. This register is valid only when the burst ROM interface is selected (CS0IF = B'01 in CS0CTRL).
2. Set bits A0BST2 to A0BST0 to an appropriate value so that (area 0 bus size) × (burst length set in this register) becomes 32 bytes or less.
3. For details, refer to section 14.7.2, CPU (AXI Bus) → Burst ROM Interface.

14.6.10 Area 0 Burst Pitch Set Register (CS0BTPH)

Function: CS0BTPH specifies the burst pitches for the first access cycle and the second and later cycles for area 0 when the burst ROM interface is selected.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	A0H	A0W[3:0]				—	A0B[2:0]		
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	1	1	1
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	A0H	0	R/W	Specifies the CS# and address hold cycles with respect to the RD# signal for area 0 in the burst ROM interface. 0: 0 cycle for hold period 1: 1 cycle for hold period
7 to 4	A0W[3:0]	1111	R/W	These bits specify the burst pitch (wait cycles to be inserted) after the first burst cycle for area 0 in the burst ROM interface. 0000: Setting prohibited 0001: Setting prohibited 0010: 2 cycles 0011: 3 cycles 0100: 4 cycles : 1101: 13 cycles 1110: 14 cycles 1111: 15 cycles
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	A0B[2:0]	111	R/W	These bits specify the burst pitch (wait cycles to be inserted) after the second burst cycle for area 0 in the burst ROM interface. 000: Setting prohibited 001: 1 cycle 010: 2 cycles : 110: 6 cycles 111: 7 cycles

Notes: 1. Be sure to specify this register before specifying CS0BSTCTL.
2. For details, refer to section 14.7.2, CPU (AXI Bus) → Burst ROM Interface.

14.6.11 Area 1 Guard Setting Register (CS1GDST)

Function: CS1GDST specifies the guard interval (period of access prohibition) between sequential access cycles in area 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	CS1GD	TIMER_SET			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	CS1GD	0	R/W	0: Makes the TIMER_SET setting invalid. 1: Makes the TIMER_SET setting valid.
3 to 0	TIMER_SET	0000	R/W	Guard Interval (Period of Access Prohibition) between Sequential Access Cycles for Area 1 0000: 0 clock cycle 0001: 1 clock cycle 0010: 2 clock cycles 0011: 3 clock cycles 0100: 4 clock cycles : 1101: 13 clock cycles 1110: 14 clock cycles 1111: 15 clock cycles

Notes: 1. The TIMER_SET setting is ignored when CS1GD = 0.
2. This register must not be dynamically modified regardless of whether area 1 is being accessed.
3. The actual guard interval between sequential access cycles on the EX-BUS is (register setting) + (idle cycles due to hardware processing and EX-BUS arbitration).
4. For details, refer to section 14.7.1 (4), Controlling Guard Intervals.

14.6.12 LBSC-DMAC Channel y Area Assignment Register (EXDMASETy (y = 0 to 2))

Function: EXDMASETy specifies the area where LBSC-DMAC channel y is assigned (y = 0 to 2).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMyCS1	DMyCS0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	DMyCS1	0	R/W	0: Does not assign LBSC-DMAC channel y to area 1. 1: Assigns LBSC-DMAC channel y to area 1.
0	DMyCS0	0	R/W	0: Does not assign LBSC-DMAC channel y to area 0. 1: Assigns LBSC-DMAC channel y to area 0.

Notes: 1. Setting more than one bit to 1 in this register is prohibited. Such a setting is not expected in the design of this LSI, and if attempted correct operation is not guaranteed.
2. Be sure to specify this register before starting LBSC-DMAC access. If an LBSC-DMAC channel starts access before specifying this register, correct operation is not guaranteed (such access is not expected in the design of this LSI).
3. When CS0 area is used as a 128-Mbyte space, DMAC channel must not be assigned to CS1 area.
4. For details, refer to section 14.7.3, LBSC-DMAC → DMA Interface.

14.6.13 LBSC-DMAC Channel y Control Register (EXDMCRy (y = 0 to 2))

Function: EXDMCRy specifies conversion of DREQ[y], DACK[y], and DRACK[0] in the area where LBSC-DMAC channel y is assigned.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DRST	—	DSTS	DBST	—	EXQL	EXDY	EXDS	—	—	EXRS	EXRL	—	EXAL	DAKCTL	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	W	R	R	R/W	R	R/W	R/W	R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	DRST	0	W	DACK Signal Forcible Negation (Enabled when DBST = 1) 0: Writing 0 is ignored. 1: Forcibly negates the DACK signal being continuously asserted for 1 CLKOUT cycle
14	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
13	DSTS	0	R	DACK Signal Assert State Indication 0: The DACK signal is not currently asserted. 1: The DACK signal is currently asserted.
12	DBST	0	R/W	Specifies whether or not to continuously assert the DACK signal if DREQ is continuously asserted during the intervals between DMA bus transfers 0: Negates DACK after each bus transfer. 1: Continuously asserts DACK even during the intervals between bus transfers if DREQ is continuously asserted. (When negation of DREQ is detected, DACK is also negated.)
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	EXQL	0	R/W	0: Receives DREQ[y] signal at a low level. 1: Receives DREQ[y] signal at a high level.
9	EXDY	0	R/W	0: Does not synchronize the DREQ[y] signal. 1: Synchronizes the DREQ[y] signal.
8	EXDS	0	R/W	0: Detects DREQ[y] signal at a level. 1: Detects DREQ[y] signal at an edge.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	EXRS	0	R/W	0: Asserts DRACK[0] one clock cycle before CS#/DACK[0] is asserted. 1: Asserts DRACK[0] two clock cycles before CS#/DACK[0] is asserted.

Bit	Bit Name	Initial Value	R/W	Description
4	EXRL	0	R/W	0: Outputs DRACK[0] as a high-active signal. 1: Outputs DRACK[0] as a low-active signal.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	EXAL	0	R/W	0: Outputs DACK[y] as a high-active signal. 1: Outputs DACK[y] as a low-active signal.
1, 0	DAKCTL	00	R/W	Signals asserted for area where LBSC-DMAC channel y is assigned 00 and 11: Asserts the CS# signal and DACK[y] signal together for the area. 01: Asserts only the CS# signal for the area. 10: Asserts only the DACK[y] signal for the area.

Notes: 1. This register except for DRST bit must not be dynamically modified regardless of whether the respective area is being accessed.
2. The EXRL and EXRS settings are valid only for LBSC-DMAC channel 0 (DRACK[0]). LBSC-DMAC channels 1 and 2 do not have the DRACK signal.
3. For details on the DMA interface, refer to section 14.7.3, LBSC-DMAC → DMA Interface.

14.6.14 BSC Interrupt Source Status Register (BCINTSR)

Function: BCINTSR indicates the status of the BSC interrupt source.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EXWTE	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	EXWTE	0	R	EX-BUS Wait Timeout Error Status 0: The EX-BUS is working correctly. 1: An EX-BUS timeout error has occurred. (A timeout error occurs when an EX-BUS clock (CLKOUT) cycle of EXBCT and EXTCT setting values have elapsed.)
0	—	0	R	This bit is always read as 0. The write value should always be 0.

14.6.15 BSC Interrupt Source Clear Register (BCINTCR)

Function: BCINTCR clears the state of the BSC interrupt indicator.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EXWTEC	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	–/WC1	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	EXWTEC	0	–/WC1	EX-BUS Wait Timeout Error Status Clear 0: Writing 0 is ignored. 1: Clears the EX-BUS wait timeout error state.
0	—	0	R	The write value should always be 0.

Note: This register is always read as 0.

14.6.16 BSC Interrupt Enable Register (BCINTMR)

Function: BCINTMR enables or disables the BSC interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EXWTEM	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	EXWTEM	0	R/W	EX-BUS Wait Timeout Error Interrupt Enable 0: Disables output of an interrupt signal for this interrupt source. 1: Enables output of an interrupt signal for this interrupt source.
0	—	0	R	The write value must always be 0. Operation is not guaranteed if setting 1.

14.6.17 EX-BUS Priority Level Set Register (EXBATLV)

Function: Specifies the priority levels for EX-BUS arbitration.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EX-BLV
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	EX-BLV	0	R/W	Priority Level Setting for EX-BUS Arbitration (Access Selection) 0: Higher priority: PIO (AXI access) Lower priority: LBSC-DMAC 1: Higher priority: LBSC-DMAC Lower priority: PIO (AXI access)

Notes: 1. EX-BLV sets a fixed priority between PIO and LBSC-DMAC.
2. This register must not be dynamically modified except for initial setting.
3. For details on external bus arbitration, refer to section 14.7.6, EX-BUS Arbitration.

14.6.18 External Wait Status Register (EXWTSTS)

Function: EXWTSTS indicates the state of the external wait pins EX_WAITn (n = 0, 1).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EXWT1 STS	EXWT0 STS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	—	—	R	This bit is always read as 0. The write value should always be 0.
1	EXWT1STS	—	R	Indicates the EX_WAIT1 pin state.
0	EXWT0STS	—	R	Indicates the EX_WAIT0 pin state.

14.6.19 EX-BUS Wait Timeout Detection Base Counter Register (EXBCT)

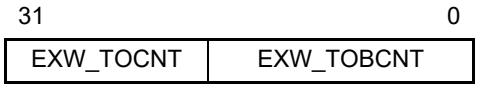
Function: EXBCT specifies the lower-order part of the value for counting to detect a timeout in waiting for access to the EX-BUS, which is monitored through pins EX_WAIT0, EX_WAIT1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EXWB_KEY								—	—	—	—	EXW_TOBCNT			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	W	W	W	W	W	W	W	W	R	R	R	R	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EXW_TOBCNT															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	EXWB_KEY	H'00	W	EX-BUS Wait Timeout Detection Base Counter Register Write Key For writing to this register to be effective, the value H’5A must be written to these bits. Values read from these bits are meaningless.
23 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 0	EXW_TOBCNT	H'0 0000	R/W	EX-BUS Wait Timeout Counter Setting Maximum value: H’0 0000 Minimum value: H’0 0001

Note: Counting to detect a timeout in waiting for access to the EX-BUS is handled by a 32-bit counter, which is formed by the EXW_TOBCNT bits in the EXBCT register and the EXW_TOCNT bits in the EXTCT register as shown below.



14.6.20 EX-BUS Wait Timeout Detection Counter Register (EXTCT)

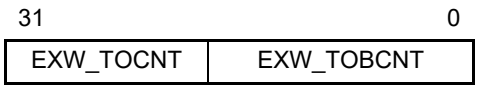
Function: EXTCT specifies the higher-order part of the value for counting to detect a timeout in waiting for access to the EX-BUS, which is monitored through pins EX_WAIT0, EX_WAIT1 and enables or disables the detection.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EXWB_KEY								—	—	—	—	—	—	—	EXW_TOEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	W	W	W	W	W	W	W	W	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	EXW_TOCNT											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	EXWB_KEY	H'00	W	EX-BUS Wait Timeout Detection Counter Register Write Key For writing to this register to be effective, the value H’5A must be written to these bits. Values read from these bits are meaningless.
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	EXW_TOEN	0	R/W	EX-BUS Wait Timeout Enable 0: Timeout in waiting for access to the EX-BUS has not been detected. 1: Timeout in waiting for access to the EX-BUS has been detected.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	EXW_TOCNT	H'000	R/W	EX-BUS Wait Timeout Counter Setting Maximum value: H’000 Minimum value: H’001

Note: Counting to detect a timeout in waiting for access to the EX-BUS is handled by a 32-bit counter, which is formed by the EXW_TOBCNT bits in the EXBCT register and the EXW_TOCNT bits in the EXTCT register as shown below.



14.6.21 EX-BUS Wait Timeout Detection Access Source Indication Register (EXTSR)

Function: EXTSR indicates the source of attempted access to the EX-BUS that reached timeout as detected through the EX_WAIT0, EX_WAIT1 pins.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EXW_TOSHW
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	EXW_TODC2	EXW_TODC1	EXW_TODC0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R/WC1	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	EXW_TOSHW	0	R/WC1	Indication of timeout in waiting for access to the EX-BUS from the AXI bus. 0: Timeout has not been reached. 1: Timeout has been reached. To clear this bit, write 1 to it.
15 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	EXW_TODC2	0	R/WC1	Indication of timeout in waiting for access to the EX-BUS by channel 2 of the LBSC-DMAC. 0: Timeout has not been reached. 1: Timeout has been reached. To clear this bit, write 1 to it.
1	EXW_TODC1	0	R/WC1	Indication of timeout in waiting for access to the EX-BUS by channel 1 of the LBSC-DMAC. 0: Timeout has not been reached. 1: Timeout has been reached. To clear this bit, write 1 to it.
0	EXW_TODC0	0	R/WC1	Indication of timeout in waiting for access to the EX-BUS by channel 0 of the LBSC-DMAC. 0: Timeout has not been reached. 1: Timeout has been reached. To clear this bit, write 1 to it.

14.6.22 EX-BUS Wait Timeout Detection Address Indication Register (EXTADR)

Function: EXTADR indicates the address at which access to the EX-BUS was attempted but timeout was detected through pins EX_WAIT0, EX_WAIT1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EXW_TOADR															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EXW_TOADR															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	EXW_TOADR	H'0000 0000	R/W	Indication of the address for which attempted access to the EX-BUS by the AXI bus reached timeout

Notes: 1. This register is readable and writable. To clear this register, write 0s to all bits.
2. This register only indicates the address to which access was attempted if this was from the AXI bus (i.e. addresses are not indicated if access was attempted from the LBSC-DMAC).

14.7 Operation

14.7.1 SRAM Interface (Basic Functionality)

The BSC reads access requests from the CPU stored in the FIFO mounted in the LBSC module and writes them to the EX-BUS. By default, all spaces, areas 0 and 1 are all set for SRAM interface. The pulse width for access signals in this SRAM access interface can be varied according to register settings. Thus, the SRAM interface has functionality for easily accommodating devices with various access specifications, connected on the EX-BUS. In addition, to support low-speed external devices, the guard-interval control functionality is provided for insertion of the appropriate interval for each bus access; and the SRAM interface receives wait-for-response requests (or access complete signals) from external devices on a synchronous/asynchronous-selectable and polarity-selectable basis, thus ensuring flexibility in bus design. Figures 14.3 and 14.4 show SRAM interface timing charts for AXI → EX-BUS conversions.

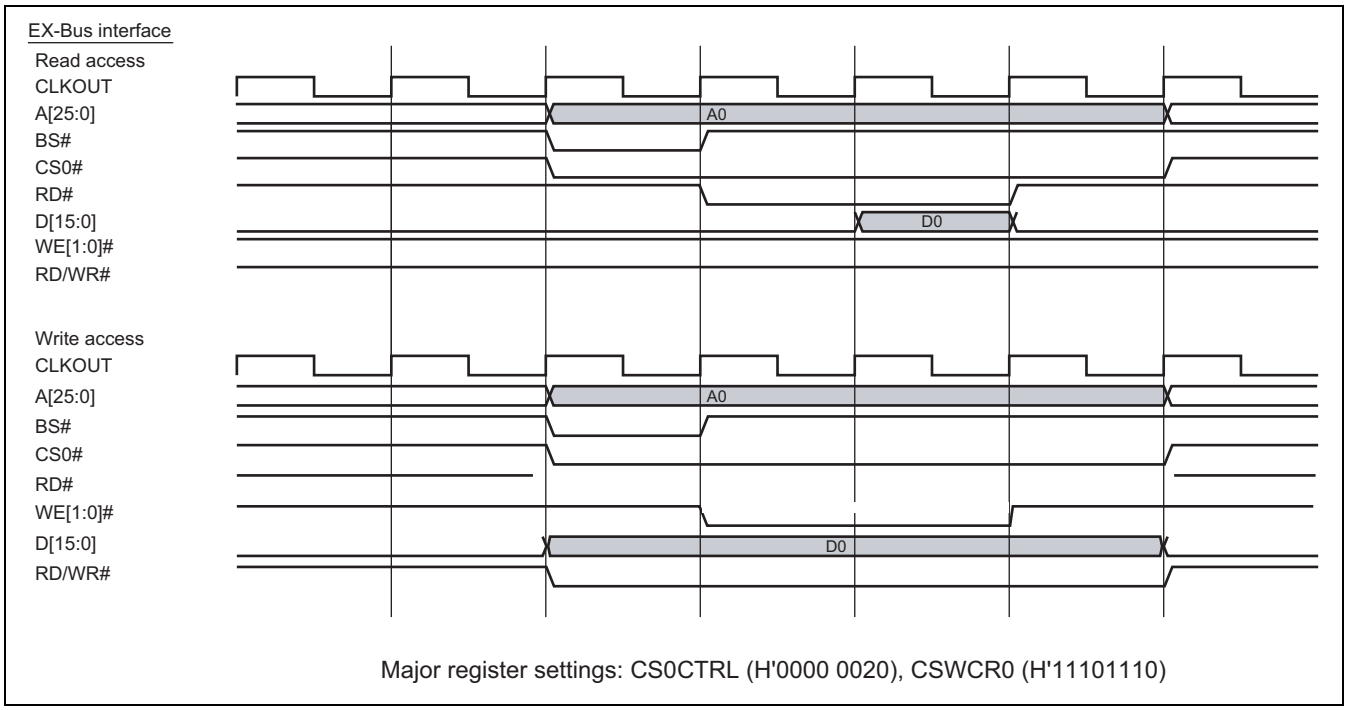


Figure 14.3 Basic Timing Chart for Access from AXI to SRAM (Area 0)

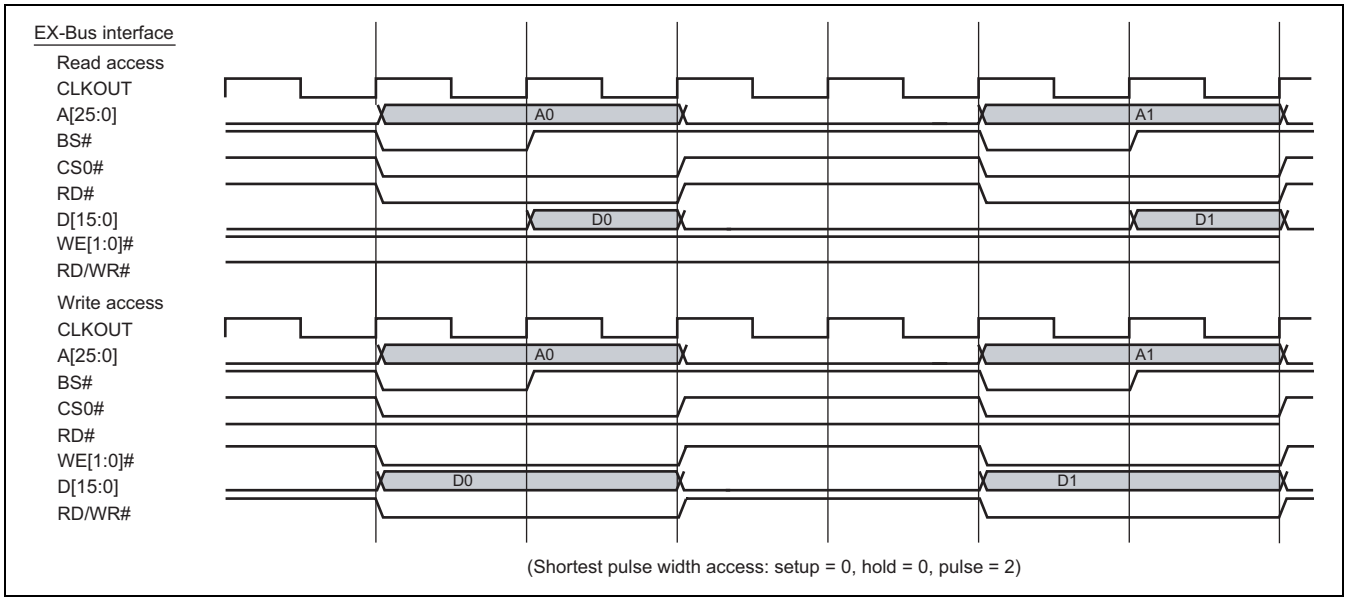

Figure 14.4 Basic Timing Chart for Access from AXI to SRAM (Shortest Pulse Width × Shortest PIO Consecutive Accesses)

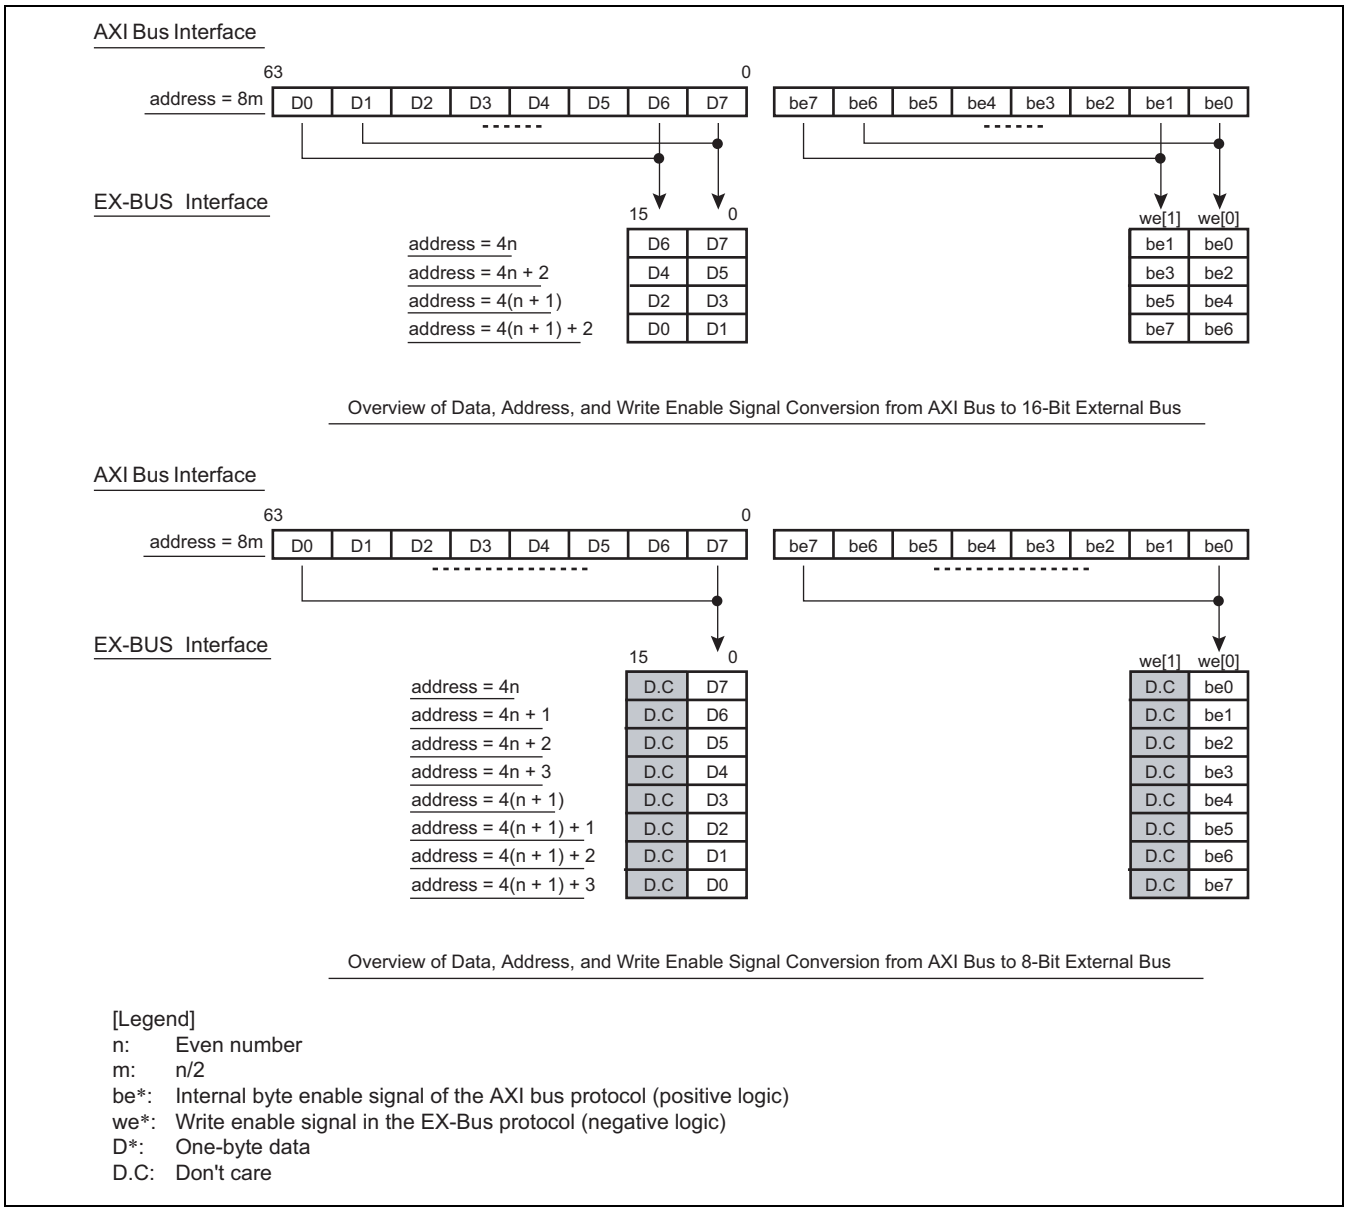
Figure 14.4 is an example of the basic SRAM interface waveform with the shortest pulse width, wherein the same waveform occurs twice in succession.

If consecutive PIO access requests are made from the CPU (AXI bus), the access interval will be 2 clock cycles, as indicated in the above waveforms, regardless of whether the preceding or succeeding access request is for the same area or for different areas. If a switching occurs, such as PIO → DMA or DMA → PIO, however, the access interval will be 1 clock cycle.

The access interval can be extended by means of the guard setting registers.

(1) Address Generation/Alignment

When making access to the EX-BUS as an SRAM interface, the LBSC generates addresses and performs data alignment conversions. Figure 14.5 provides an overview of address generation and data alignment/write enable conversions.



[Legend]
n: Even number
m: n/2
be*: Internal byte enable signal of the AXI bus protocol (positive logic)
we*: Write enable signal in the EX-Bus protocol (negative logic)
D*: One-byte data
D.C: Don't care

Figure 14.5 Overview of Data, Address, and Write Enable Signal Conversion from CPU (64-Bit AXI Bus) to External Bus

(2) Setting the Pulse Width for an Access Signal

When making access to the EX-BUS, the LBSC can set the setup or hold time for addresses, RD/WR#, and CS# signals based on WE# signals and RD# signals, and the pulse width for WE# and RD# signals in units of clock cycles, according to the values that are set for each area by means of the CSWCR0, CSWCR1 registers. (During a burst ROM read operation, however, the LBSC conforms to CS0BTPH settings rather than CSWCR0 settings. Similarly, during a DMA operation, it conforms to EXDMAWCR0 to EXDMAWCR2 settings rather than CSWCR0, CSWCR1 settings.) The pulse width for WE# or RD# signal that is stored in a register can be extended by an externally supplied EX_WAIT signal. The minimum total value that is set should be two clock cycles.

(3) External Wait Control

The LBSC controls the external wait signal (EX_WAIT) from a device connected to the EX-BUS based on settings that are provided on external wait control registers (CSPWCR0, CSPWCR1) and the external wait input control register (EXWTSYNC). The external wait control registers permit the selection of the four types of interfaces to accommodate various types of specifications, whether the wait signal input from an external device is based on the READY logic (posting a READY status) or BUSY logic (posting a BUSY status), or which signal polarity is in effect.

Figure 14.6 shows waveforms for the four wait signal patterns that can be input and the waveforms for the wait signals internal to the LBSC after conversion according to the register settings.

The external wait input control register allows the switching between the synchronous/asynchronous handling of external wait input signals. The default is to treat such signals on a synchronous basis. Figure 14.7 shows external wait input timings for synchronization/asynchronization. In the figure, the position indicated by the symbol * represents the point at which the LBSC determines whether or not external wait is in effect. Specifically, for synchronization, the position is one clock cycle before the point at which the WE# and RD# signals would normally be negated by pulse width settings. If external wait is in effect at this position, the pulse width for the WE# or RD# signal continues to extend until the wait status becomes the ready status. If the pulse width for the WE# or RD# signal is extended by the EX_WAIT signal, the address and the RD/WR# and CS# signals are negated when the hold time is satisfied. If the synchronization setting is switched to the asynchronization setting, any external wait is nullified unless there is an external wait two clock cycles before the * position, or three clock cycles before the point in which the WE# and RD# signals would normally be negated.

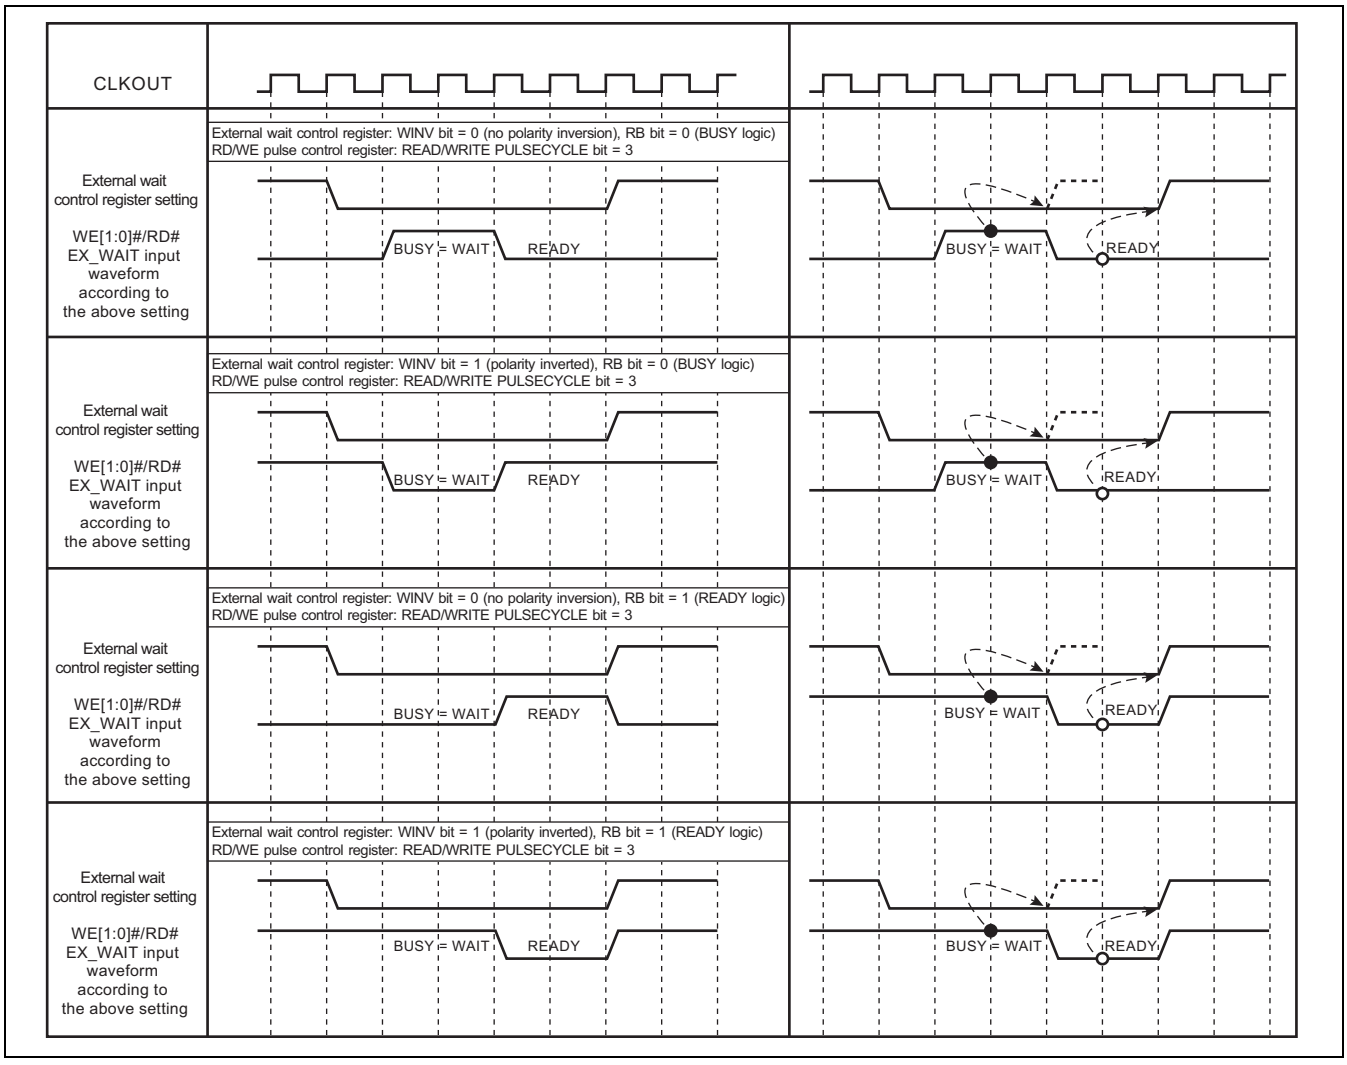


Figure 14.6 Waveforms of Converted External Wait Interface

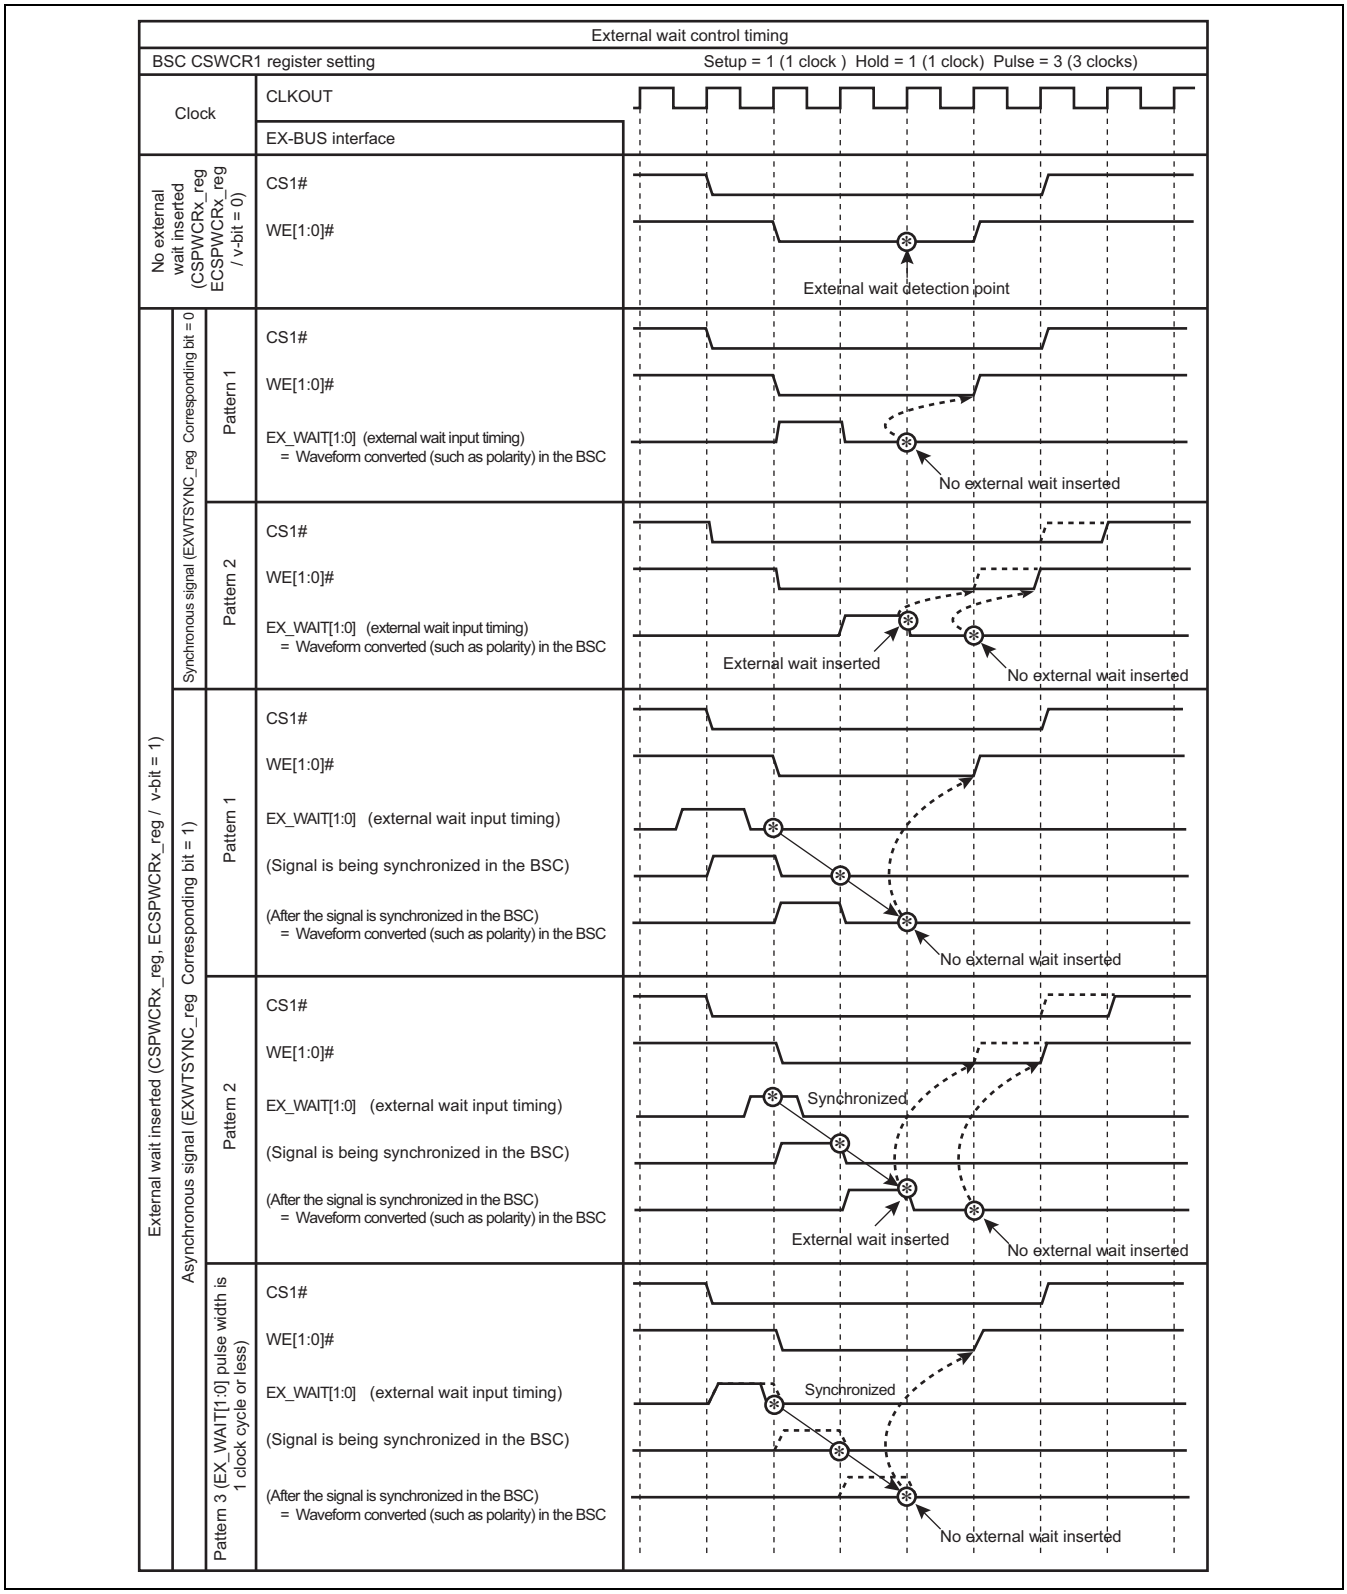

Figure 14.7 Waveforms of External Wait Input Signals

(4) Controlling Guard Intervals

For some external devices, the transition of the data lines to the high-Z state after completion of read access takes a relatively long time. To prevent any contention for the data bus when further access over the EX-BUS proceeds immediately after a read operation for such a device, the LBSC supports a function to guard against further access over a given interval following each bus access. The function is also effective for external devices that have difficulty coping with consecutive reception of access requests. Specifically, set the number of clock cycles over which guarding against access applies in the guard setting register (CS1GDST) for the given area. (Even if the value assigned to the guard setting register is 0, hardware processing before a further bus access request is issued requires at least 2 clock cycles between PIO and PIO, and at least 1 clock cycle between PIO and DMA. Therefore, in PIO accesses, the actual interval on the EX-BUS is 2 clock cycles when value in the guard setting register is 0 or 1. And it is 1 clock cycles plus the setting for number of clock cycles in the guard setting register when the setting value is 2 or more.)

After access to a given area, the guard interval is assigned corresponding to the register for that area, regardless of the kind of access or target space of the next access request. Note, however, that there is no guard setting register for area 0. Therefore, guard intervals are not set up for access that immediately follows access to this area. Since area 0 is supposed to be for the connection of general-purpose memory such as ROM, SRAM, or flash-ROM, guard intervals should not be necessary for this area. Figure 14.8 is a basic timing chart to illustrate the concept of guard-interval control.

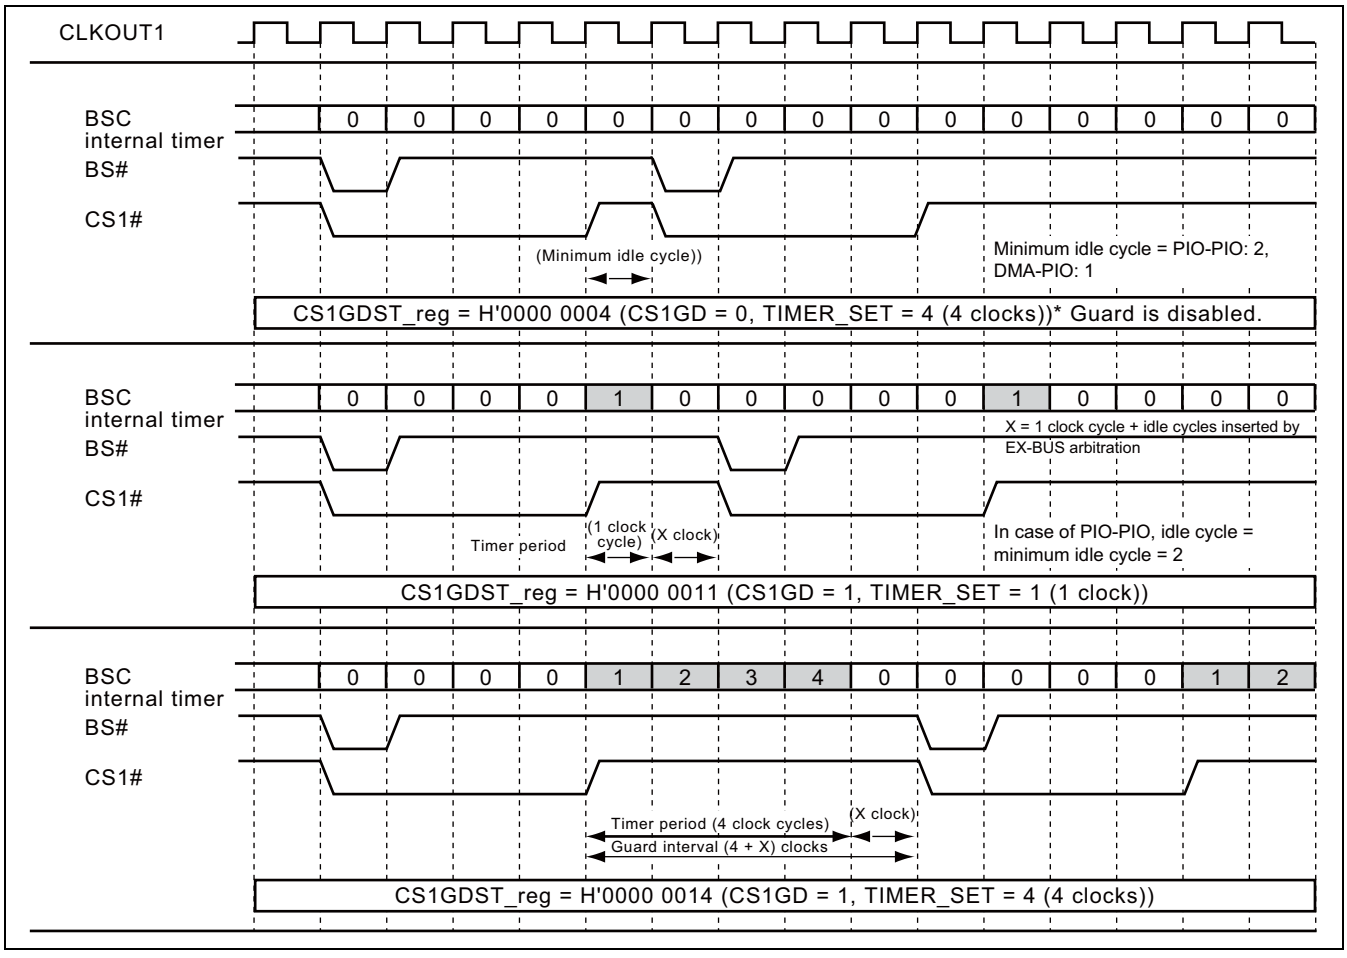

Figure 14.8 Concept of Guard-Interval Control

14.7.2 CPU (AXI Bus) → Burst ROM Interface

For area 0 on the EX-BUS, the BSC supports a page-mode read burst ROM interface. Switching to the burst ROM interface is performed by CS0CTRL settings. Because burst ROM access operations begin immediately after setting CS0CTRL, values must be pre-assigned to the CS0BTPH and CS0BSTCTL. In CS0BTPH, burst ROM access waveforms can be assigned, such as a first-cycle burst pitch, second and subsequent cycle burst pitches, and CS# signal hold cycles on the RD# signal. A burst access count (burst length) can be assigned to CS0BSTCTL. A burst access count should be assigned according to the component specifications for the actual external ROM that is connected.

In two kinds of exceptional cases, however, the BSC handles access with a burst count less than the specified burst count. The first are those cases where the CPU requests access to fewer data than the specified burst count. In such cases, access is terminated on completion of processing for the number of bytes requested by the CPU, even though the specified burst count has not been reached. The second are those cases where a variable burst address boundary is crossed in the midst of a specified burst count. In such cases, access is terminated immediately before the boundary is crossed, and the burst access is divided up, with the remainder of the access executed in a second round. The reason for this behavior is that the variable address boundaries for burst ROM devices, by which the LBSC must abide, are defined. Table 14.4 shows the LBSC's methodology for breaking off burst access.

Table 14.4 Methodology for Breaking off Bust Access

Burst Count Assigned in CS0BSTCTL	Bus Width	
	8-Bit Bus Width	16-Bit Bus Width
4	Break at a change of A2	Break at a change of A3 (A0 not connected)
8	Break at a change of A3	Break at a change of A4 (A0 not connected)
16	Break at a change of A4	Break at a change of A5* (A0 not connected)
32	Break at a change of A5*	(Setting prohibited)

Note: * Since A5 never changes in the midst of a 32-byte burst operation (a 32-byte boundary), access is not broken off in the case indicated by *, and the specified number of access operations proceed.

As described above, in burst ROM access, the LBSC performs a maximum of 32-byte access to accommodate CPU cache fill while performing access breakup. However, because this operation involves access on 32-byte boundaries, for setting a burst ROM device, the user should specify wrap-around settings instead of continuous burst operations.

Depending on the mode of burst ROM connection, burst operations can also be accommodated in the synchronous burst mode. When using the LBSC in synchronous burst mode, the user should not receive the Wait signals that are output by the burst ROM. Instead, a first-word data output latency should be assigned to the configuration register of the burst ROM, and CS0BTPH should be set as the pitch for the first word and this latency. For the second and subsequent words, a pitch count of 2 should be assigned to both the configuration register of the burst ROM and CS0BTPH. Subject to the AC characteristics of the burst ROM and given frequency for the EX-BUS, if a pitch count of 1 is assigned to, data reception timing can lag behind due to the fact that the burst ROM has a data output delay of approximately 13 ns. Figure 14.9 shows a basic timing chart for the burst ROM interface.

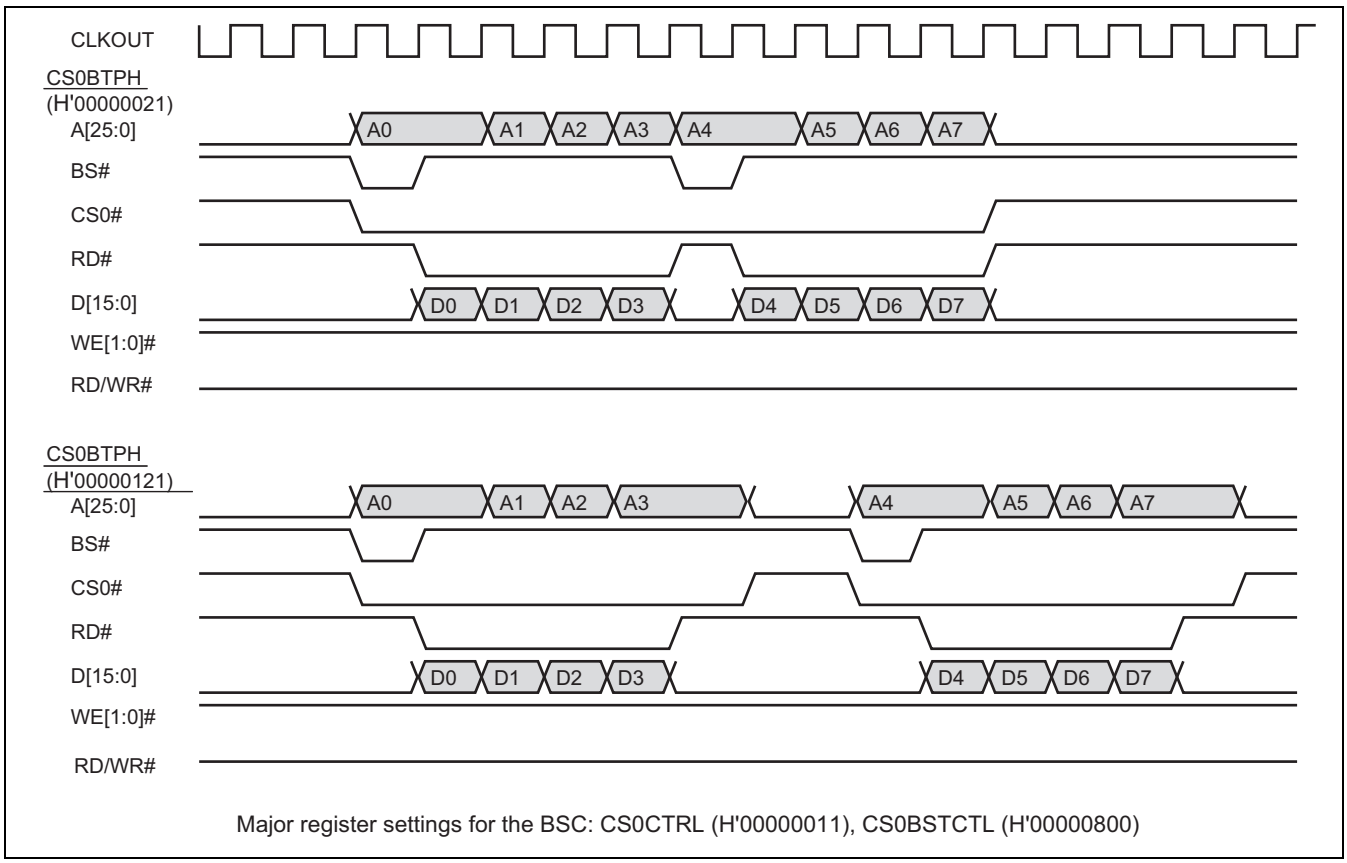

Figure 14.9 Timing Chart for Burst ROM Interface

14.7.3 LBSC-DMAC → DMA Interface

On the EX-BUS, three LBSC-DMAC channels (0 to 2) are assigned as DMACs that have external pins DREQ, DRACK, and DACK to support DMA transfer operations. Among these, channels 0 and 1 also support DMA with a burst length of 8.

All DMA channels operate in dual address mode. Table 14.5 provides a list of DMA pins by channel.

When operating a DMAC channel, first each DMAC should be assigned to the applicable area by using area assignment registers (EXDMASET0 to EXDMASET2) for the LBSC-DMAC channels. Also, in RD/WE pulse control registers (EXDMAWCR0 to EXDMAWCR2) for LBSC-DMAC channels, waveform pulse widths to be used during DMA bus access should be assigned (LBSC-DMAC channels 0 to 2 operate by the settings provided in EXDMAWCR0 to EXDMAWCR2, not by pulse width settings that are provided in CSWCR0, CSWCR1. In addition, methods by which DREQ, DACK, and DRACK signals are to be sent and received should be specified with the LBSC-DMAC channel control registers (EXDMCR0 to EXDMCR2).

Table 14.5 List of DMA Pins by Channel

DMAC Channel Number	Operating Mode	Pins			Remarks
		DREQ	DRACK	DACK	
Channel 0	Dual address mode (with 8-burst function)	DREQ0 (polarity and edge/level detection selectable)	DRACK0 (output timing adjustable and polarity selectable)	DACK0 (polarity selectable)	The burst count (8) does not depend on the access size; 8 consecutive bus accesses are executed for 8-bit and 16-bit bus widths equally.
Channel 1	Dual address mode (with 8-burst function)	DREQ1 (polarity and edge/level detection selectable)	—	DACK1 (polarity selectable)	DRACK1 does not exist as an LSI pin. The burst count (8) does not depend on the access size; 8 consecutive bus accesses are executed for 8-bit and 16-bit bus widths equally.
Channel 2	Dual address mode	DREQ2 (polarity and edge/level detection selectable)	—	DACK2 (polarity selectable)	DRACK2 does not exist as an LSI pin.

(1) Data Alignment during LBSC-DMAC Access

When receiving an access request from the LBSC-DMAC, the BSC translates the LBSC-DMAC interface into the EX-BUS protocol. During this operation, the BSC determines the area to be accessed based on the settings provided in the LBSC-DMAC area assignment registers (EXDMASET0 to EXDMASET2), and generates a chip select signal. For the data alignment of DMAC channels, one of two modes can be selected based on DMAC register settings.

- Fixed Alignment Mode

  In this operating mode, when performing a DMA transfer with a device on the EX-BUS, the LBSC determines that the access size from the LBSC-DMAC is equal to the data width used by the external device (not bound by the bus width specified in the CS0CTRL, CS1CTRL). In the fixed alignment mode, no alignment translation is performed in the BSC. Instead, data is output using the alignment received from the LBSC-DMAC. The LBSC, however, generates the WE1# to WE0# signals, depending on the access size received from the LBSC-DMAC. In the initial state, the LBSC operates in this mode. Table 14.6 shows the relationship between data widths and access sizes.

Table 14.6 Relationship between Data Widths and Access Sizes in Fixed Alignment Mode

Access Size Set in DMAC (Assumed to be Bus Width)	Data Bus Read/Write Position		Write Enable Signal Output Position	
	D15 to D8	D7 to D0	WE1#	WE0#
16 bits	Data 15 to 8	Data 7 to 0	Assert	Assert
8 bits	—	Data 7 to 0	—	Assert

- Variable Alignment Mode

  If the access size set in the DMAC is smaller than the bus width set in the BSC, variable alignment mode can be set up by DMAC register settings. In this case, the BSC changes byte lanes according to the specific access address to be serviced. Table 14.7 shows the relationship between data widths and access sizes in variable alignment mode. If the bus width set in the LBSC is equal to the DMAC access size, variable alignment mode operates in the same way as fixed mode.

Table 14.7 Relationship between Data Widths and Access Sizes in Variable Alignment Mode (Little Endian)

Bus Width Set in BSC	Access Size Set in DMAC	Data Bus Read/Write Position		Write Enable Signal Output Position	
		D15 to D8	D7 to D0	WE1#	WE0#
16 bits	16 bits	2n address		2n address	
	8 bits	2n+1 address	2n address	2n+1 address	2n address
8 bits	8 bits	—	n address	—	n address

(2) External Device DMA Transfer Request Detection Function

To provide generality, the LBSC supports a polarity and level/edge selection function as a method for the reception of external device DMA transfer request signals (DREQ). The selections are made by setting the relevant values in registers EXDMCR0 to EXDMCR2. In compliance with the settings, the BSC internally receives a DREQ signal and outputs the DMA transfer request signal from the BSC to the LBSC-DMAC. If level detection is selected, the BSC continues to output the DMA transfer request signal to the LBSC-DMAC as long as the DREQ signal from the external device is asserted. Conversely, if edge detection of the DREQ signal is selected, the BSC will not output a DMA transfer request signal to the LBSC-DMAC until an edge is detected, even if the DREQ signal from the external device continues to be asserted. In addition, even if more than one edge is detected during the period from the first edge detection to the start of DMA transfer, only one transfer request is issued.

(3) Role of the BSC between the LBSC-DMAC and an External Device

Figure 14.10 shows a basic timing chart for LBSC-DMAC-to-EX-BUS output translation. Upon receipt of an access request from the DMAC, the BSC first performs bus contention arbitration. When the LBSC-DMAC acquires the bus mastership, the BSC controls the pulse width of RD#, WE1# and WE0# that are output on the EX-BUS according to the settings provided in the LBSC-DMAC channel RD/WE pulse control registers (EXDMAWCR0 to EXDMAWCR2) that the BSC possesses, for the LBSC-DMAC access period.

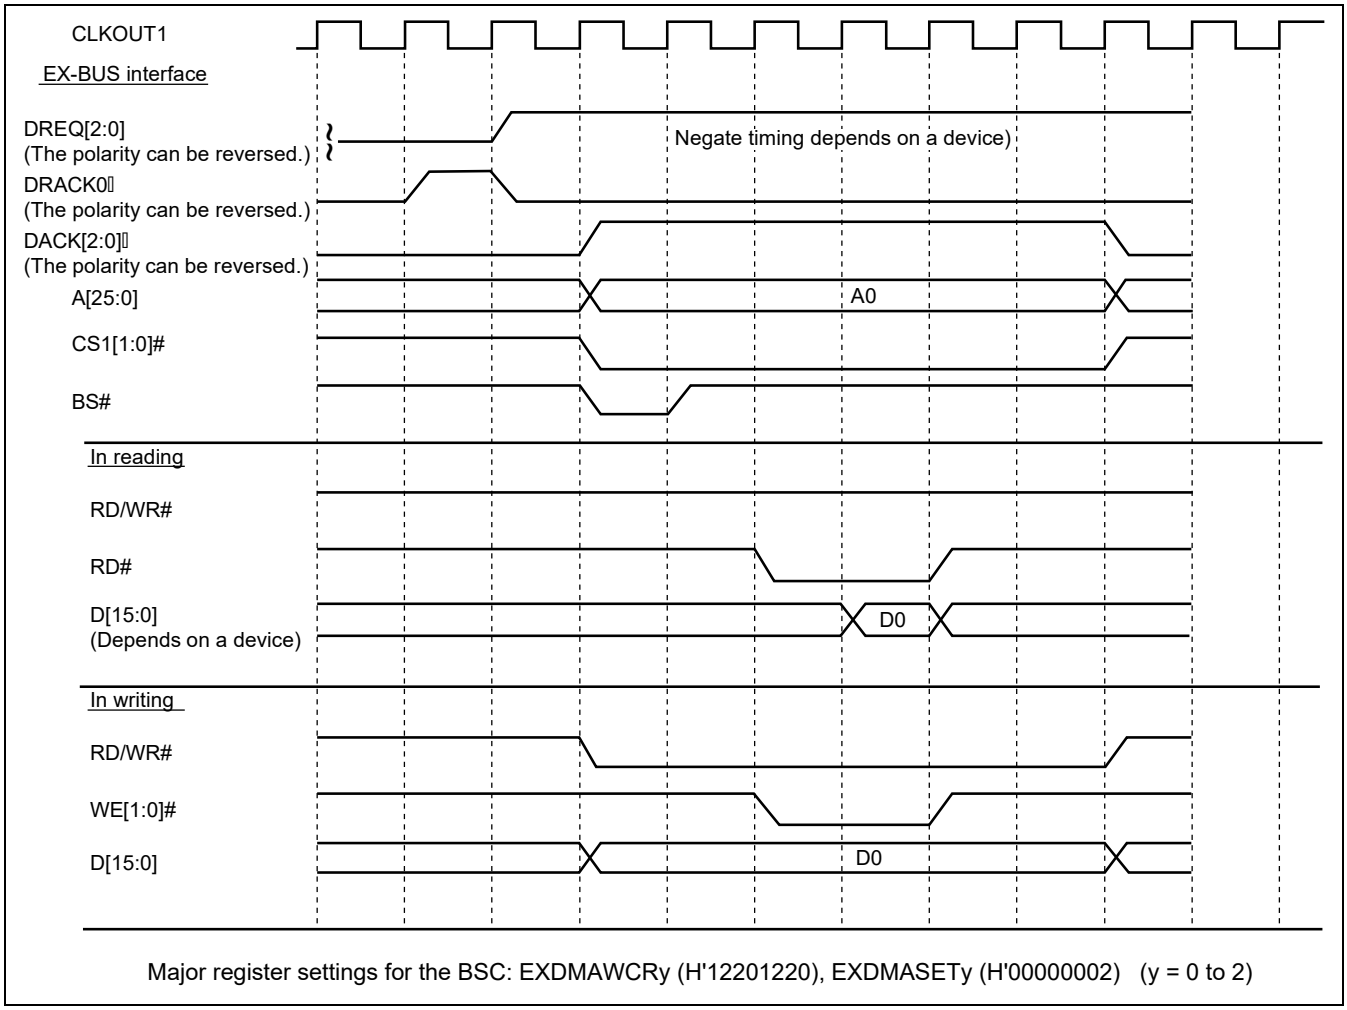

Figure 14.10 Basic Timing Chart for Access from LBSC-DMAC to EX-BUS

(4) LBSC-DMAC → EX-BUS Burst Access

The BSC supports the EX-BUS output function for burst access operations from the LBSC-DMAC (eight consecutive transfers irrespective of the access size). Figure 14.11 shows a timing chart on LBSC-DMAC burst access. The waveform for LBSC-DMAC burst access basically takes the form of repeated single-access waveforms. However, because external DMAC bus access does not release the bus mastership until the burst access is finished, PIO access from the CPU (AXI) does not result in a cycle stealing. In addition, transfer performance is enhanced because the DMAC treats data involving 8 transfer operations as a single packet and performs transfer operations with the destination.

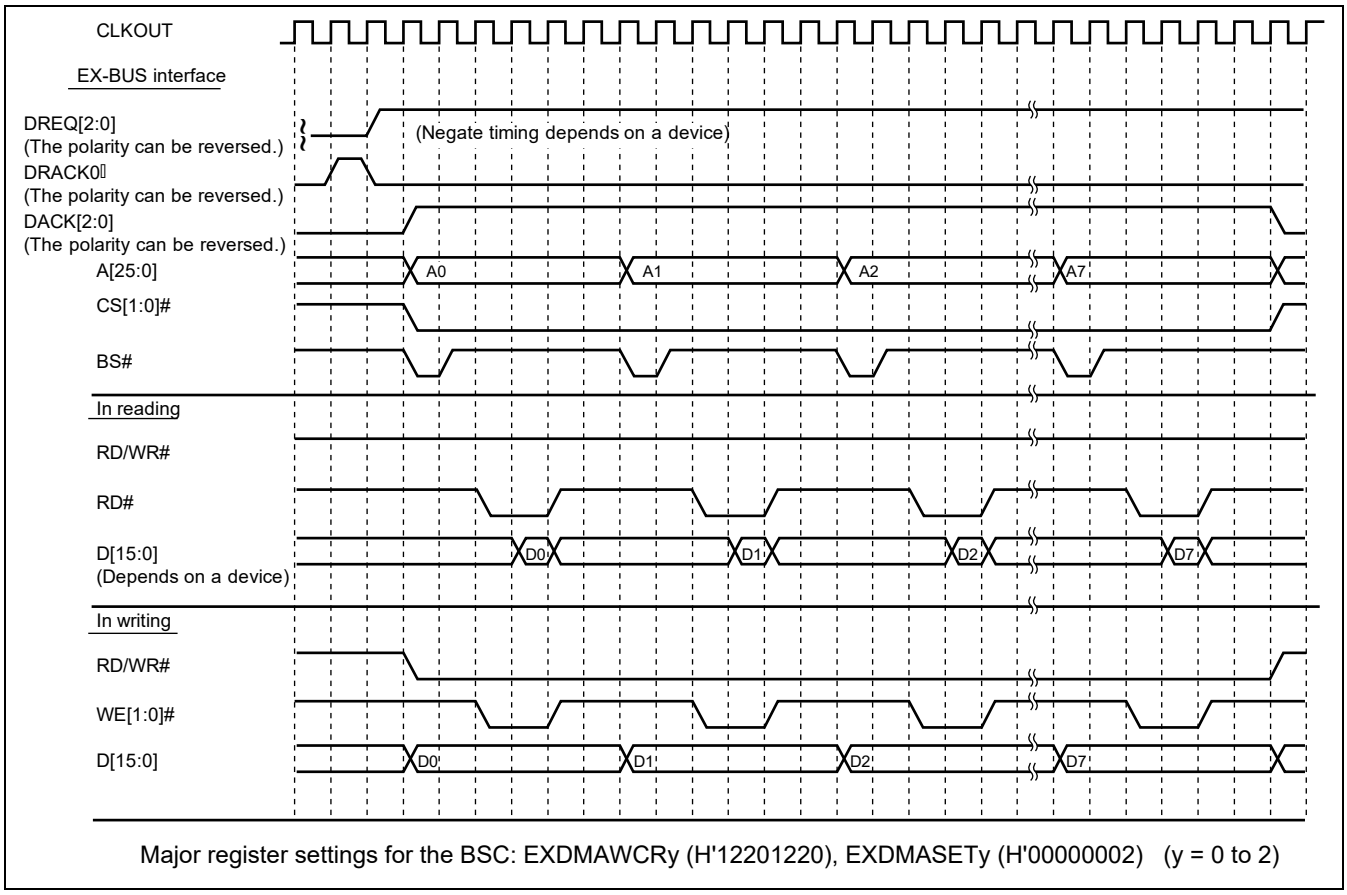

Figure 14.11 Basic Timing Chart for Burst Access from LBSC- DMAC to EX-BUS

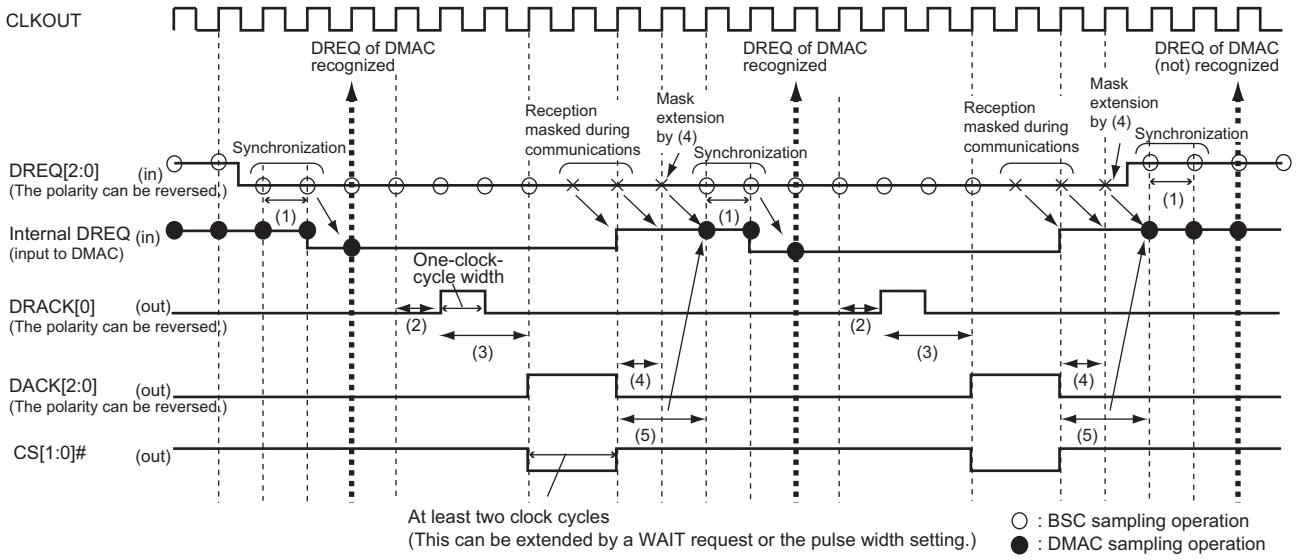
(5) DREQ Reception Timing

Figure 14.12 shows the timing at which a DMA request (DREQ) signal is set in the level reception mode and any continuation of an asserted state is regarded as another DMA request. The figure also shows DREQ negate timing that prevents the above condition from being mistaken as another DREQ request.



(1) Synchronization time for asynchronous DREQ
By setting an appropriate value in EXDMCR0 of the BSC within bus bridge, DREQ can also be treated as a synchronous signal.
The default is to treat it as a synchronous signal, in which case the above 1 clock cycle becomes 0 clock.

(2) EX-BUS arbitration time
The above 1 clock cycle represents the shortest time. In the case of contention, the time is extended until the access right is acquired.

(3) DRACK → DACK time
Either one or two clock cycles can be selected by means of EXDMCR0 of the BSC within bus bridge.
The above diagram is a case where the DRACK-to-DACK time is specified as two clock cycles.
Because IO-DMAC channels other than channel 0 do not have a DRACK, the interval in (3) will be 1clock cycle for the channels.

(4) Next DREQ recognition masking time (not available in the edge mode)
In the clock points following the CS# negate, the reception of the next DREQ can be masked.
The above diagram represents the case where a 1 clock cycle interval is masked.
This varies in a 0 to 15 clock-cycle range in DRMSKR of the DMAC within bus bridge.

Note: Setting (4) is not allowed in the edge mode, in which exists no such period of reception masking during communications as shown in the diagram above. Therefore, DREQ is detected on an edge basis even during the interval indicated as "Reception masked during communications" in the diagram above.

(5) Next DREQ for DMAC sampling resumption timing
This is the timing at which the DMAC resumes the sampling of another DREQ (a synchronized signal) from the CS# negate points.
The timing at which DREQ sampling is resumed, shown in the table below, varies with access mode.

Access Mode	Clock Cycle Count
Write access	Sampling resumed after two clock cycles
Read access	Sampling resumed after three clock cycles

According to the above diagram, in the case where setting (4) is 0, DREQ is detected as another DMA request unless DREQ is negated between the CS# negate points and the next clock cycle.

Figure 14.12 Next DREQ Signal Recognition Timing on EX-BUS

14.7.4 CPU (AXI Bus) → Byte-Control SRAM Interface

With respect to EX-BUS area 1, the LBSC supports byte-control SRAM interface from the CPU (AXI bus) or LBSC-DMAC (area 0 is excluded). Byte-control SRAM interface is a memory interface in which byte select strobe signal WE# is output in both read and write cycles. Write timing for byte-control SRAM interface is the same as that for SRAM interface. In read access, however, WE# is output at a different timing. In read access, WE# is output for a read byte only. The assertion timing of WE# can be selected with the CS1BRM bit in the CS1CTRL register to be the same as that of CS# or RD#. In default setting, SRAM operating mode is set for each area. Accordingly, along with the setting of assertion timing, byte-control SRAM mode should be set in the registers corresponding to a given area (CS1CTRL).

(1) Byte-control SRAM Interface

- The WE# assertion period can be selected by the CS1BRM bit to be the same as that of CS# or RD#.
- In read access, WE# is asserted only for a valid access byte. (For example, when a byte is read from a device with the byte-control SRAM interface and a bus width of 16 bits, any one of the WE# bits is asserted.)
- The waveform in write access is the same as that for SRAM interface.

(2) Basic Timing Charts

Figure 14.13 shows the basic timing chart for byte-control SRAM interface.

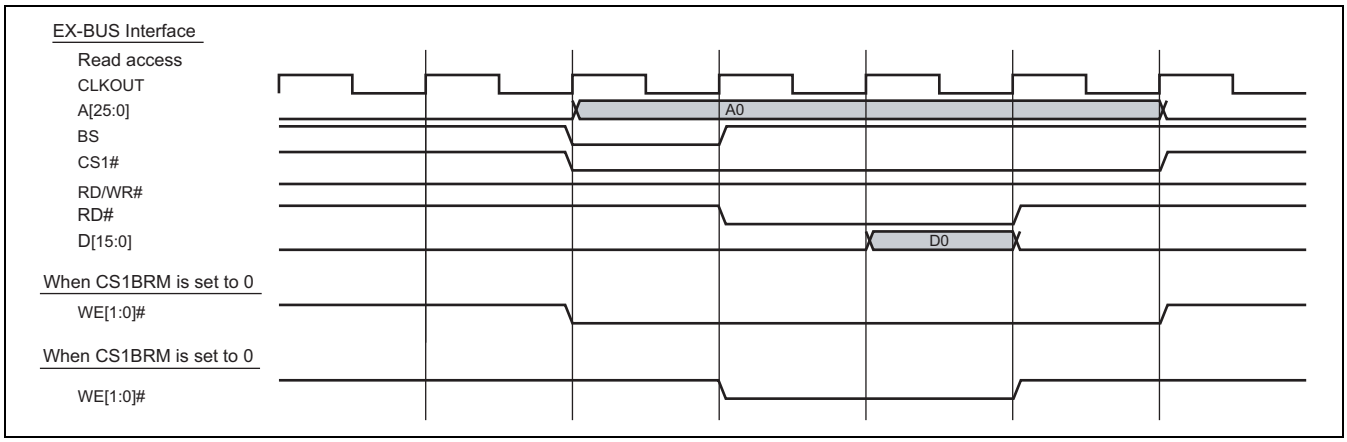


Figure 14.13 Waveforms for Byte-Control SRAM Interface

14.7.5 Wait Timeout

For the detection of timeout in waiting for access to the EX-BUS, the BSC monitors the states of the EX_WAIT1, and EX_WAIT0 signals from external devices. When an external device is waiting for more than a certain length of time, this is detected as an EX-BUS wait timeout error. The error is reflected in a register within the BSC, and forces the termination of access to the EX-BUS interface.

The value of the timeout counter is specified in a total of 32 bits, consisting of the EXW_TOBCNT bits in the EX-TIME wait timeout detection base counter register (EXBCT) and the EXW_TOCNT bits in the EX-BUS wait timeout detection counter register (EXTCT). EXW_TOBCNT is a 20-bit counter that operates at the EX-BUS operating frequency (CLKOUT). EXW_TOCNT is a 12-bit counter that counts up by one every time the EXW_TOBCNT bits overflow.

Writing 0s to all of the bits specifies the maximum time until overflow. The required detection time depends on the EX-BUS operating frequency as defined in the following formula.

Detection time in ns = period in ns at EX-BUS operating frequency × {EXW_TOCNT, EXW_TOBCNT}

14.7.6 EX-BUS Arbitration

To deal with the conflicts between the access requests from the CPU (AXI bus) and LBSC-DMAC channels 0 to 2, the EXBATLV register in the LBSC can set the priority levels for these accesses. Furthermore, to deal with the conflicts among the LBSC-DMAC channels 0 to 2, the three channels are grouped into two groups by the DMA memory access priority level control register (DMLVLR) in the LBSC-DMAC, and the priority levels are determined according to the round-robin scheme in each group.

Figure 14.14 shows a concept diagram for EX-BUS arbitration.

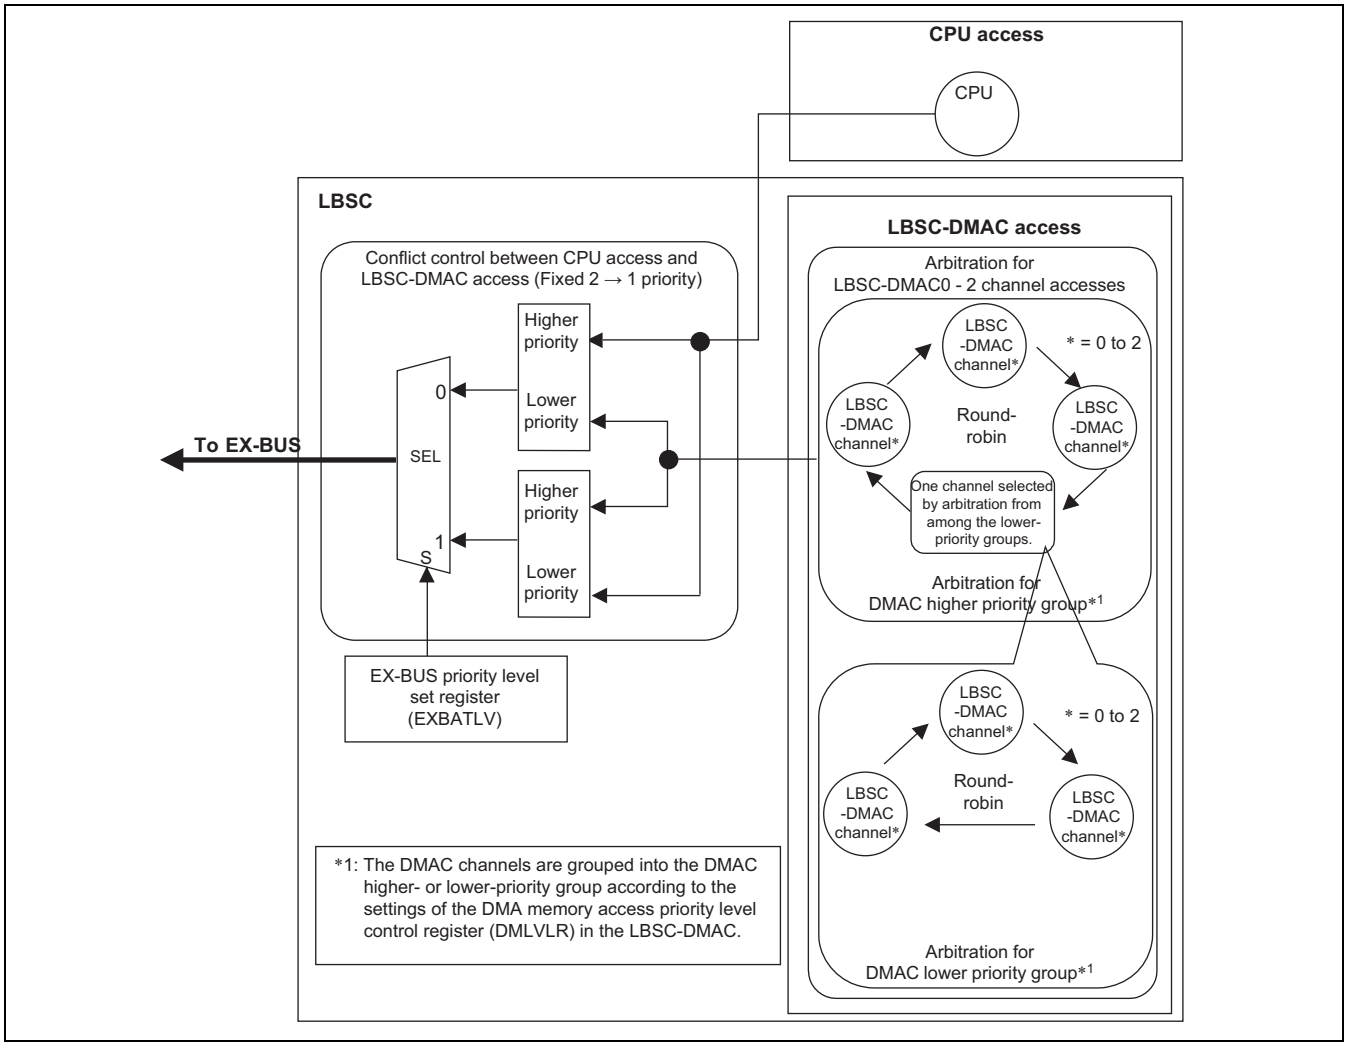

Figure 14.14 Concept Diagram for EX-BUS Arbitration

14.8 Usage Notes

Keep the following notes in mind when using this LBSC.

14.8.1 Pin Multiplexing

When starting this LSI, be sure to set multiplexed pins appropriately using the LSI pin multiplexing set register.

Also, make pull-up resistor settings using the LSI pin pull-up control registers.

For details on the specific set values, refer to section 5, Pin Function Controller (PFC).

14.8.2 Short period low driving at the end of SRAM write access

The external bus is instantaneously driven low at the end of SRAM write access with high write data as shown in Figure 14.15. If the external bus has high load due to system board composition, this short period low driving might cause overshoot on the external bus signals. In designing system board, note that this overshoot might cause voltage level that exceeds the input high voltage.

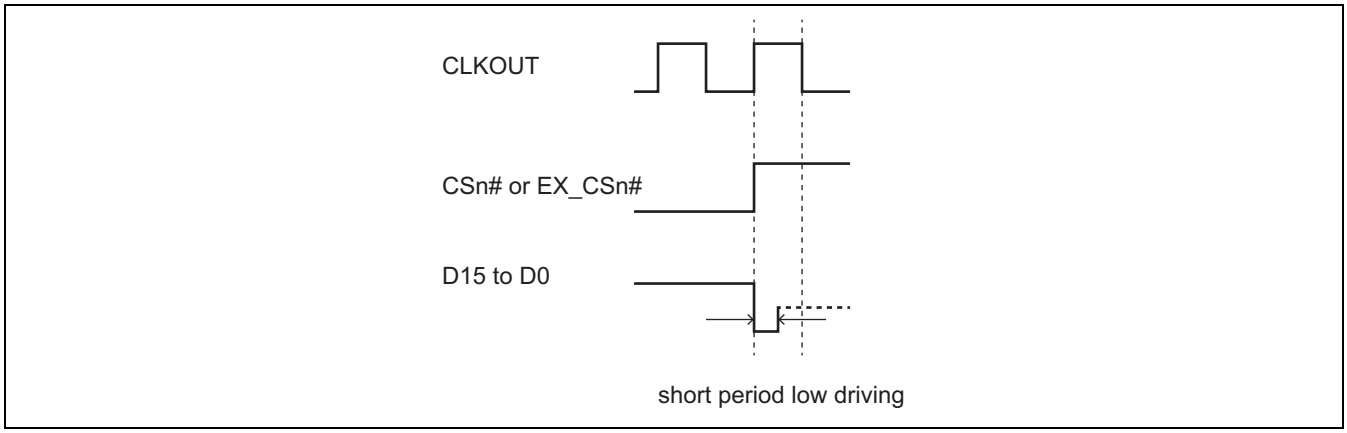

Figure 14.15 Short period low driving at the end of SRAM write access

14.8.3 Usage Note

When using QSPI or HSCIF booting by mode pins setting (MD[3:1]), the area 0 beginning 256-KByte space (H'00 0000 0000 to H'00 0003 FFFF) cannot be accessed from LBSC even after booting.

15. External Bus Controller for DDR3-SDRAM (DBSC3)

15.1 Overview

The external bus controller for DDR3-SDRAM (DBSC3) supports DDR3-SDRAM only. The DBSC3 contains bus control, device control, and register control units. The bus control unit receives requests from the bus and issues commands to the device control and register control units. The device control unit reads from and writes to the SDRAM according to the issued commands. Also, the device control unit refreshes the SDRAM. The register control unit reads from and writes to the control registers according to the issued commands.

15.1.1 Features

The DBSC3 enables the maximum use of SDRAM bus bandwidth using the following functions:

1. Multibank operation that improves the page hit rate.
2. DDR3-SDRAM operation with burst length 8 that reduces the number of SDRAM command issues.
3. Preceding execution of the bank precharge and activate commands for subsequent requests.

Table 15.1 shows the main functions of the DBSC3.

Table 15.1 DBSC3 Functions

Item	Function
Multibank supported	Supports 8-bank multibank operation
Number of banks	Supports eight banks
External bus width	32 bits
Preceding precharge/ activate functions	Determines the content of subsequent requests in a request queue and performs preceding precharge/activate processing for the bank to be accessed during an empty command cycle upon page-miss.
Operating modes	Burst length: 8 (fixed) Burst type: Sequential (fixed) DLL-off mode for the DDR3-SDRAM is not supported.
Power-down mode	Supports self-refresh mode, precharged power-down mode, and active power-down mode.
Address order (address translation function)	The addresses arranged in descending order are: rank address, row address, bank address, and column address. (The 3-bit bank address can be divided into two parts. One can be placed in the upper half of the row address and the other in the lower half. Register settings can be used to determine how to divide the bank address.)
Timing setting	The following timing settings can be specified: CAS latency, CAS write latency, ACT to READ or ACT to WRITE minimum period, PRE period, ACT to ACT or ACT to REF minimum period, ACT to PRE minimum period, ACT(A) to ACT(B) minimum period, four active window minimum period, READ to PRE minimum period, write recovery period, READ to WRITE minimum period, WRITE to READ minimum period, REF to ACT or REF to REF (all banks) minimum period, REF to ACT or REF to REF (per bank) minimum period, minimum period over which CKE is held high, and minimum period over which CKE is held low Only 0 is supported for additive latency (AL).
Refreshes	Average interval and the maximum post count are set by the register. If an empty cycle for request is found, preceding refresh can be performed.
Auto power-down operation	When there is no access for a specified period, power-down mode is automatically entered. The period before power-down mode is entered can be specified through register settings.

Item	Function
ZQ calibration operation	Supports the automatic ZQCS issuing function. After auto-refresh, the ZQCS command is issued to DDR3-SDRAM. The frequency of issuing ZQCS can be specified through register settings in units of the auto-refresh count. The intervals between auto-refresh and ZQCS and between ZQCS and auto-refresh can also be specified through register settings.
PHY interface	1-ch mode: 32-bit bus width
Memory to be connected	DDR3-SDRAM compliant with JEDEC JESD79-3E. (Supports memory with sizes from 512 Mbits to 8 Gbits. SDRAM with a data bus width of 4 bits and 8 bit is not supported.)
ECC	Not supported.
Parity	Not supported.

15.1.2 Definition of Terms and Symbols

The following terms and symbols are used throughout the DBSC3 specifications:

- DDR3-SDRAM is abbreviated as SDRAM in some cases.
- "ceil(x)" is the smallest integer which is greater than or equal to real number x.
- "floor(x)" is the greatest integer which is less than or equal to real number x.

15.1.3 Block Diagram

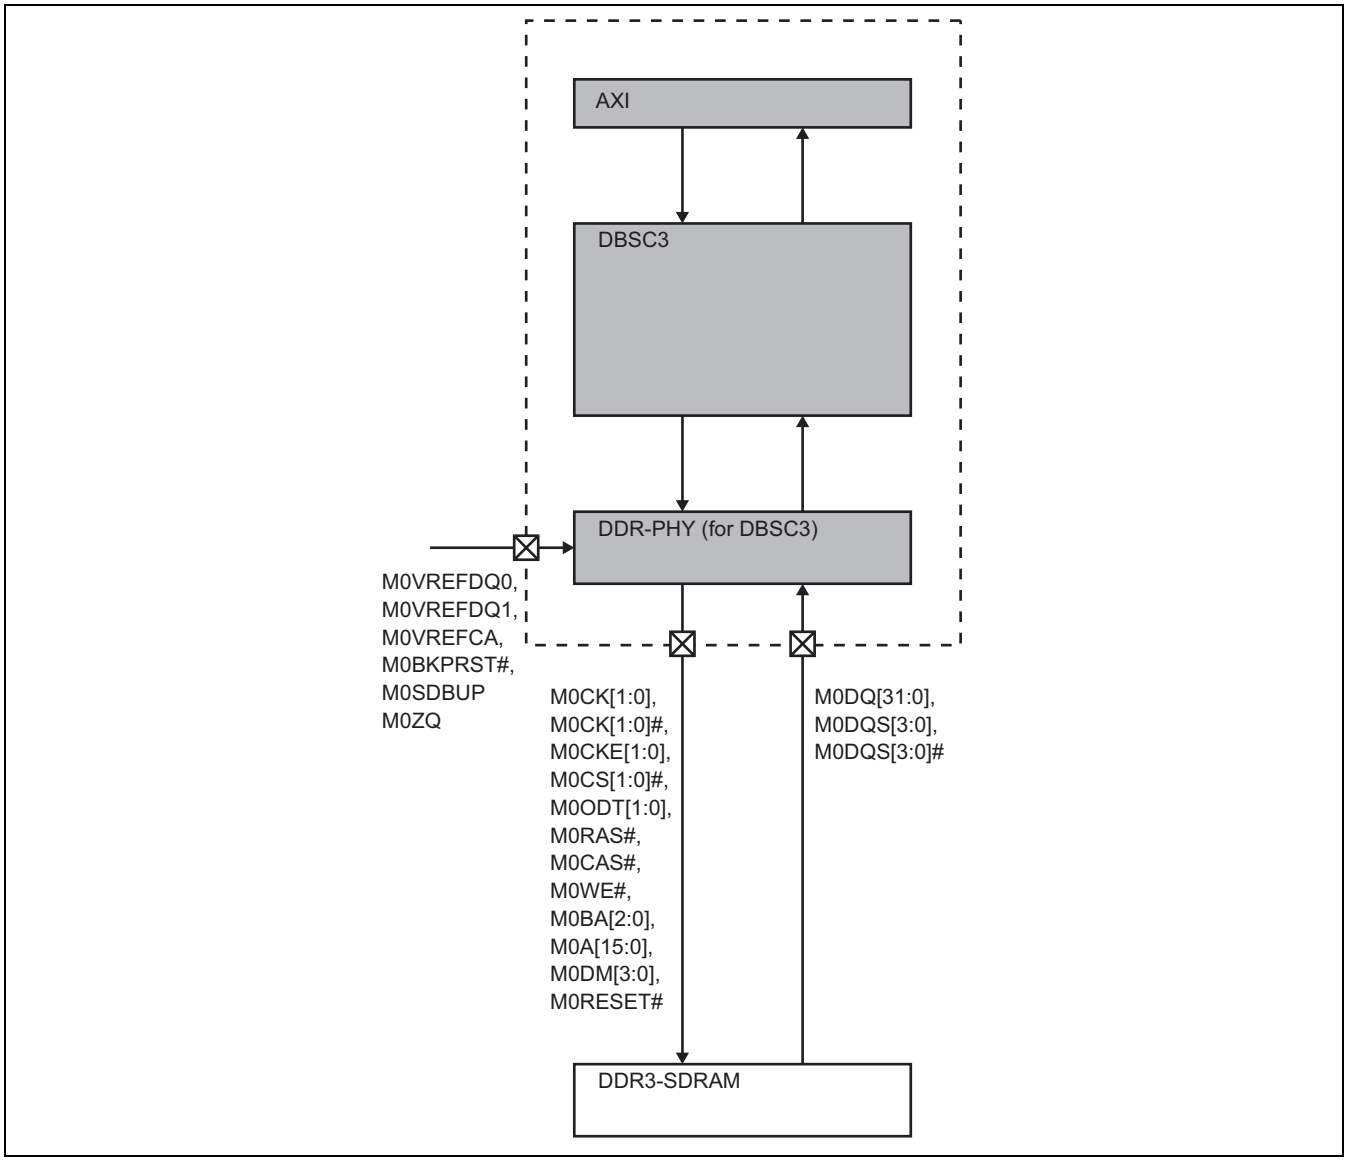

Figure 15.1 Block Diagram of the DBSC3

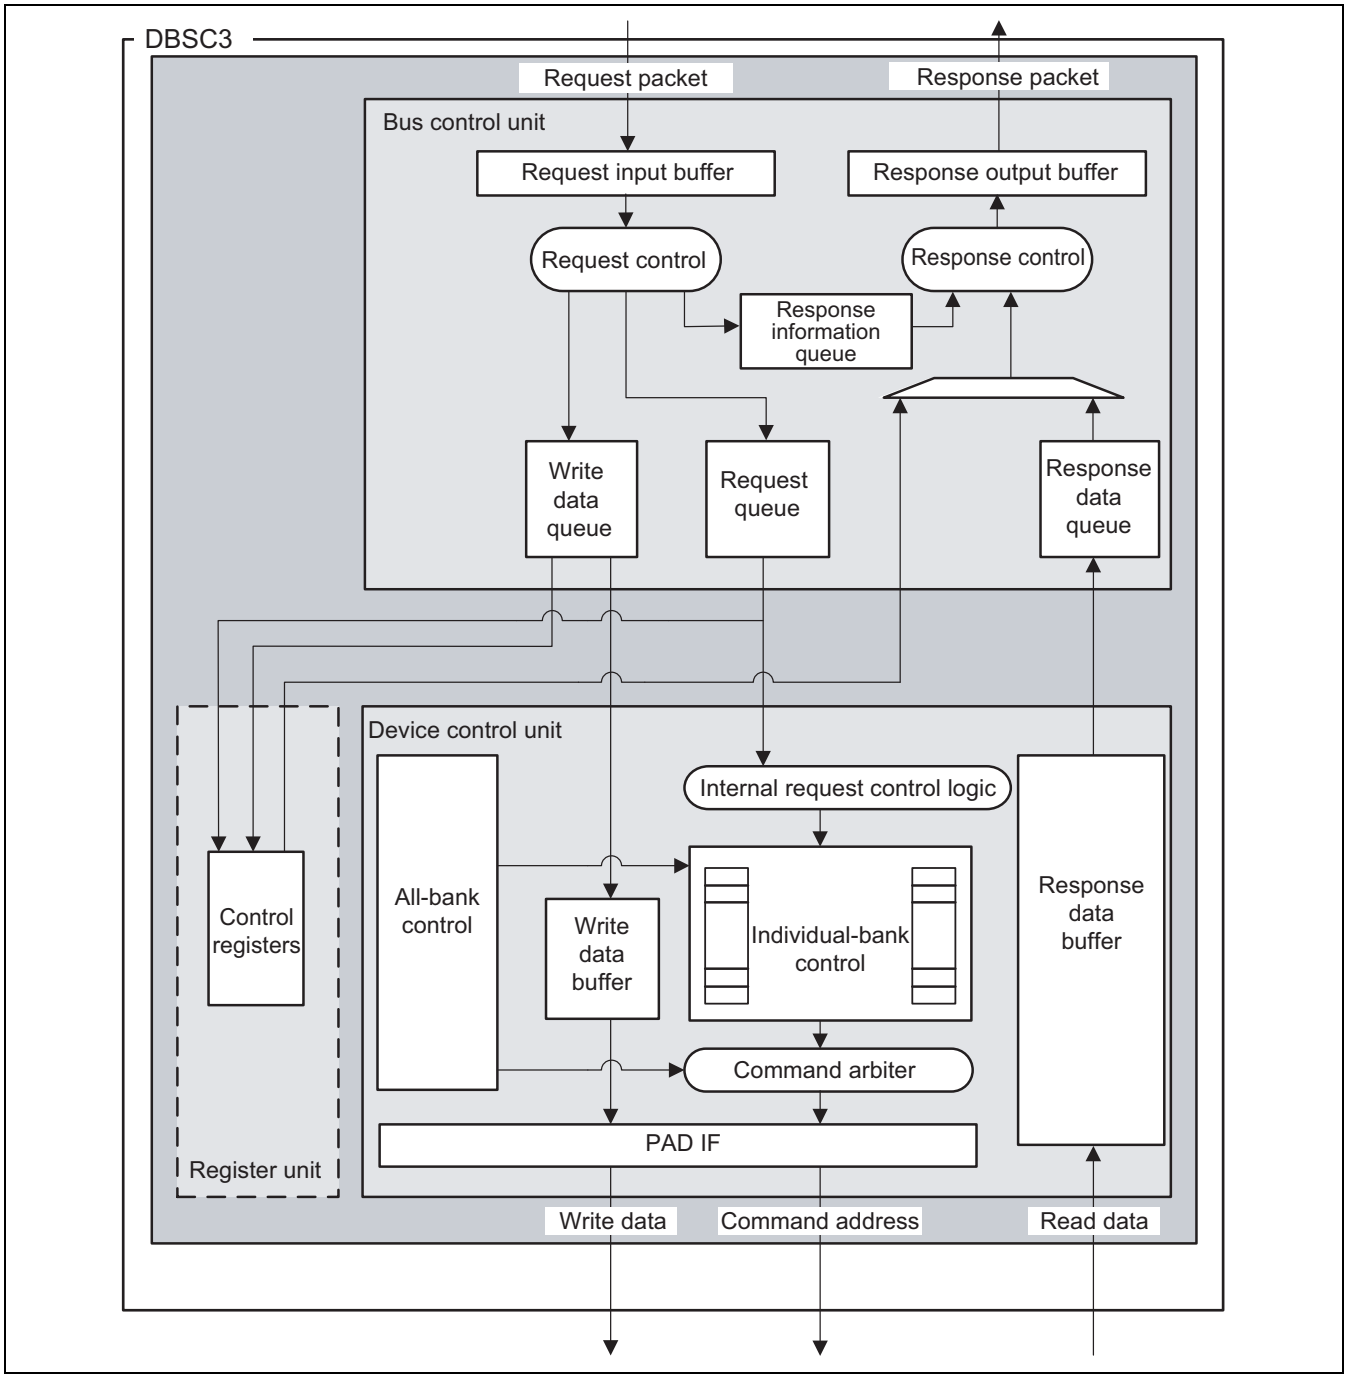

Figure 15.2 Internal Block Diagram of DBSC3

15.1.4 Input/Output Pins

Table 15.2 show the pin configuration of the DBSC3.

Table 15.2 Pin Configuration of the DBSC3

Name	Pin Name	I/O	Function
DDR3-SDRAM clock	M0CK[1:0]	Output	Clock output signals for the DDR3-SDRAM
DDR3-SDRAM clock	M0CK[1:0]#	Output	Clock output signals for the DDR3-SDRAM or M0CK[1:0] inverted clock output signals
Addresses	M0A[15:0]	Output	Address output signals for the DDR3-SDRAM
Bank address	M0BA[2:0]	Output	Bank address output signals
Chip select	M0CS[1:0]#	Output	Chip select output signals
Row address strobe	M0RAS#	Output	Row address strobe output signal
Column address strobe	M0CAS#	Output	Column address strobe output signal
Write enable	M0WE#	Output	Write enable output signal
Clock enable	M0CKE[1:0]	Output	CKE output signals
ODT enable	M0ODT[1:0]	Output	ODT enable output signals in the SDRAM
Power backup reset	M0BKPRST#	Input	When this pin is brought to the low level, M0CKE[1:0] pins are fixed to the low level and M0RESET# pin to the high level.
Power backup mode	M0SDBUP	Input	This pin must be held at the high level.
Reset	M0RESET#	Output	Reset output for the DDR3-SDRAM
Impedance matching	M0ZQ	I/O	Impedance matching Refer to section 15.4.1, Connection of M0ZQ Pin.
Data mask	M0DM[3:0]	Output	Data mask output signals
I/O data strobe	M0DQS[3:0]	I/O	Data strobe I/O signals
I/O data strobe	M0DQS[3:0]#	I/O	Data strobe I/O signals or M0DQS[3:0] inverted signals
Data	M0DQ[31:0]	I/O	Data I/O signals
Reference voltage input	M0VREFCA	Input	Should be fixed at GND.
Reference voltage input	M0VREFDQ0	Input	Input reference voltage
Reference voltage input	M0VREFDQ1	Input	Input reference voltage

15.1.5 Register Configuration

Table 15.3 shows the DBSC3 register mapping, followed by a description of each register. Register addresses are shown in the form of the sum of the DBSC3 register start address (DB_ADDR for DBSC3) and an offset (hexadecimal) from that start address.

Registers other than particular ones are initialized by power-on reset.

Access the DBSC3 registers 32 bits at a time. Otherwise, correct operation cannot be guaranteed.

DB_ADDR (DBSC3) = H'E679 0000

Table 15.3 DBSC3 Register Configuration

Register Name	Abbreviation	R/W	Address	Initial Value	Access Size (Bits)
DBSC3 status register 1	DBSTATE1	R	DB_ADDR + H'00C	H'000X 000X	32
SDRAM access enable register	DBACEN	R/W	DB_ADDR + H'010	H'0000 0000	32
Auto-refresh enable register	DBRFEN	R/W	DB_ADDR + H'014	H'0000 0000	32
Manual command-issuing register	DBCMD	R/W	DB_ADDR + H'018	H'0000 0000	32
Operation completion waiting register	DBWAIT	R	DB_ADDR + H'01C	H'0000 0000	32

Note: Do not write to addresses other than the listed above. Otherwise, correct operation is not guaranteed.

15.2 Register Description

The legends used in register descriptions have the following meanings.

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R: Read-only. The write value should always be 0.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

W: Write-only. Reading this bit is prohibited. When the bit is reserved, the write value should always be 0.

—/W: Write-only. The read value is undefined.

All access to registers is made in longword units.

Write 0 to the reserved bits.

15.2.1 DBSC3 Status Register 1 (DBSTATE1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RFU	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BKUP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	X
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
17, 16	RFU	Undefined	R	Reserved
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
0	BKUP	X	R	This bit reflects the signal level being input on the M0 SDBUP pin, corresponding to the following states.

15.2.2 SDRAM Access Enable Register (DBACEN)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ACCEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
0	ACCEN	0	R/W	SDRAM Access Enable Bit This bit enables data access to the SDRAM. Make data access to the SDRAM after setting this bit to 1. When this bit is 0, do not access the SDRAM area. 0: Disables access to the SDRAM. 1: Enables access to the SDRAM.

Note: When making the setting to disable access (writing 0 to this register), a precharge all or precharge command for the SDRAM may be issued automatically.

15.2.3 Auto-Refresh Enable Register (DBRFEN)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARFEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
0	ARFEN	0	R/W	Auto-Refresh Enable Bit This bit starts or stops the auto-refresh function. Writing 1 to this bit resets the refresh counter (refresh history) in the DBSC3 and starts the auto-refresh function. While this bit is 1, the DBSC3 issues a refresh command at regular intervals. The refresh cycle time and other settings depend on the values held in the refresh configuration registers 0 to 2 (DBRFCNF0 to DBRFCNF2) when 1 is written to this bit. 0: Stops the auto-refresh function. 1: Starts the auto-refresh function.

15.2.4 Manual Command-Issuing Register (DBCMD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	OPC						—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ARG															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
29 to 24	OPC	000000	R/W	Operation Code Bits Specify the type of command to be issued. Refer to Table 15.4. If Wait is specified through these bits, valid SDRAM commands are not output and no processing is performed except reserving the time until the next operation. These bits are read as undefined values.
23 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
15 to 0	ARG	H'0000	R/W	Parameter Bits The meaning can differ according to the operation code indicated by the OPC bits. When OPC indicates Mode Register Set (MRS0 to MRS3), the ARG bits specify the value to be issued on the address pins (MA) of SDRAM. When OPC is any other value, the ARG bits specify the minimum interval to issuing of the next command in SDRAM cycles. When ARG = 0, however, the values default to those given in "Interval" column of Table 15.4. These bits are read as undefined values.

The manual command-issuing register (DBCMD) is used to issue the required commands for the sequence of initializing the SDRAM and of transitions to and from the self-refresh mode. The command corresponding to the OPC bits is issued once as a result of writing to this register. For instance, issuing the refresh command twice requires that "001100" be written to the OPC bits twice. Do not write to this register while access to the SDRAM is enabled (ACCEN = 1 in the DBACEN register). The timing with which an operation is complete (i.e. the timing with which the specified SDRAM command is output to the PHY unit from DBSC3) may be later than the response of DBSC3 to writing to this register. If you wish to wait until actual output of the specified SDRAM command to SDRAM; do this by reading the DBWAIT register (described later).

When this register is used to issue a command, the issuing of a subsequent SDRAM command is delayed by a certain period of time from the moment at which each operation is completed (i.e. from the time when the specified SDRAM command is output to SDRAM). This facilitates securing of the required amounts of time between commands in the issuing of multiple consecutive commands.

These periods are given in the "Interval" column of Table 15.4. They can also be customized by using the ARG bits (except in cases where the OPC bits indicate MRS0 to MRS3).

Table 15.4 Manual Command Issue Functions

OPC	Code	Operation	Interval (Number of SDRAM Cycles)	ARG Function
00 0000	Wait	Issue "Device Deselected" (and insert wait cycles)	4	Customizing the interval (for ARG = 0, the value is that given at left)
00 0010	ZQCS	Issue "ZQ Calibration Short"	4	
00 0011	ZQCL	Issue "ZQ Calibration Long"	4	
00 1011	PREA	Issue "Precharge All"	TRPA	
00 1100	Ref	Issue "Refresh"	TRFC	
01 0000	PDEn	Power Down Entry	4	
01 0001	PDXt	Power Down Exit	4	
01 1000	SREn	Self-Refresh Entry	4	
01 1001	SRXt	Self-Refresh Exit	TRFC	
10 0000	RstL	Set Reset Pins to Low	4	
10 0001	RstH	Set Reset Pins to High	4	
10 1000	MRS0	Issue "ModeRegisterSet" (for MRS/MR0)"	TMOD	Specifying the setting for SDRAM mode register
10 1001	MRS1	Issue "ModeRegisterSet" (for EMRS1/MR1)	TMOD	
10 1010	MRS2	Issue "ModeRegisterSet" (for EMRS2/MR2)	TMOD	
10 1011	MRS3	Issue "ModeRegisterSet" (for EMRS3/MR3)	TMOD	

Notes: 1. TRPA, TRFC, and TMOD in the "Interval" column of the above table indicate timing registers. The intervals in these cases are determined by the corresponding register settings.

2. Only write to this register after having disabled SDRAM access (i.e. the ACCEN bit in the DBACEN register = 0).

3. Only write to this register after having stopped the auto-refresh function (i.e. the ARFEN bit in the DBRFEN register = 0). However, sequences described in section 15.3, Operation, are not limited to these. If Wait is specified in the OPC bits in this register during auto-refresh operations, the auto-refresh function may issue a refresh command during the time secured for the Wait command.

15.2.5 Operation Completion Waiting Register (DBWAIT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WAIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
0	WAIT	0	R	Operation Completion Waiting Bit This value is meaningless. This bit is always read as 0.

When this register is read, a response is returned after all command issuing that has been specified by using the DBCMD register by that time is completed (i.e., after command output from the DBSC3 to the PHY unit).

This register can be used to guarantee correctness for the relationship between the timing with which SDRAM commands are issued by DBSC3 and timing that is not managed by DBSC3 (e.g. clock control).

15.2.6 SDRAM Type Setting Register (DBKIND)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	DDCG		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
2 to 0	DDCG	000	R/W	SDRAM Type Bits These bits can set the type of SDRAM. 111: DDR3-SDRAM Other settings are prohibited.

Notes: 1. This register must only be written from within the initialization sequence (see section 15.3.4, Initialization Sequence).
2. Writing to this register should only be performed when the following conditions are met.
   • Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   • Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)
3. Set the defined value in each group.
4. Specify the same SDRAM type as the SDRAM specified at power-on.

15.2.7 SDRAM Configuration Setting Register 0 (DBCONF0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	AWRW0					—	—	—	AWRK0	—	—	AWBK0	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	AWCL0				—	—	—	—	—	—	DW0	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
28 to 24	AWRW0	00000	R/W	Row Address Bit Width Setting Bits These bits specify the width, in bits, of row addresses. 01100: 12 bits : 10000: 16 bits Other settings are prohibited.
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
20	AWRK0	0	R/W	Number of Ranks Setting Bits These bits specify the number of ranks. 0: One rank 1: Setting prohibited
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
17, 16	AWBK0	00	R/W	Number of Banks Setting Bits These bits specify the number of banks. 11: Eight banks Other settings are prohibited.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
11 to 8	AWCL0	0000	R/W	Column Address Bit Width Setting Bits These bits specify the width, in bits, of column addresses. 1010: 10 bits 1011: 11 bits Other settings are prohibited.

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
1, 0	DW0	00	R/W	External Data Bus Width Setting Bits These bits specify the width of the external bus. 10: 32 bits Other settings are prohibited.

This register sets the memory configuration to be used.

Refer to section 15.3.9, Setting the SDRAM Configuration Setting Register, for details on the memory configurations supported by DBSC3. For details on the relationship between the chip select and address pins of the SDRAM and the logical addresses of this LSI, refer to section 15.3.10, Address Multiplexing.

Notes: 1. Memory Configuration Supported
• 32-bit bus configuration connected with two 16-bit wide SDRAM modules
2. Although DBSC3 supports the connection of multiple SDRAM modules, the electrical characteristics of some chips may impose a limitation on the number of connectable SDRAM modules.
3. This register must only be written from within the initialization sequence (see section 15.3.4, Initialization Sequence).
4. Writing to this register should only be performed when the following conditions are met:
• Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
• Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)
5. Specify predetermined bit values based on the product type.

15.2.8 PHY Type Setting Register (DBPHYTYPE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PHYTYPE	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
1, 0	PHYTYPE	00	R/W	PHY Type Setting Bits 00: initial setting Other settings are prohibited.

Notes: 1. This register must only be written from within the initialization sequence (see section 15.3.4, Initialization Sequence).

2. Writing to this register should only be performed when the following conditions are met.
   - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.9 SDRAM Timing Register 0 (DBTR0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CL			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
3 to 0	CL	0000	R/W	CAS Latency Setting Bits These bits are for setting the CAS latency of the SDRAM. 0011: 3 cycles : 1110: 14 cycles Other settings are prohibited.

DBTR0 is used to set a timing parameter for the SDRAM.

Notes: 1. The setting is in cycles of the SDRAM operating clock.
2. Writing to this register should only be performed when the following conditions are met.
   • Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   • Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.10 SDRAM Timing Register 1 (DBTR1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CWL			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
3 to 0	CWL	0000	R/W	CAS Write Latency Setting Bits These bits are for setting the CAS-write latency of the SDRAM. 0010: 2 cycles : 1010: 10 cycles Other settings are prohibited.

DBTR1 is used to set a timing parameter for the SDRAM.

Notes: 1. The setting is in cycles of the SDRAM operating clock.
2. Writing to this register should only be performed when the following conditions are met.
   • Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   • Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.11 SDRAM Timing Register 2 (DBTR2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	AL			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
3 to 0	AL	0000	R/W	Additive Latency Setting Bits These bits are for setting the additive latency of the SDRAM. 0000: 0 cycles Other settings are prohibited.

DBTR2 is used to set a timing parameter for the SDRAM.

Notes: 1. The setting is in cycles of the SDRAM operating clock.
2. Writing to this register should only be performed when the following conditions are met.
   • Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   • Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.12 SDRAM Timing Register 3 (DBTR3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TRCD				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
4 to 0	TRCD	00000	R/W	ACT to READ/ACT to WRITE Interval Setting Bits These bits set the minimum interval from an ACT command to a READ/WRITE command. 00011: 3 cycles : 11111: 31 cycles Other settings are prohibited.

DBTR3 is used to set a timing parameter for the SDRAM.

Notes: 1. The setting is in cycles of the SDRAM operating clock.
2. Writing to this register should only be performed when the following conditions are met.
   • Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   • Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.13 SDRAM Timing Register 4 (DBTR4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	TRPA				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TRP				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
20 to 16	TRPA	00000	R/W	PREA Time Setting Bits These bits set the minimum interval from a PREA (precharge all banks) command to an ACT/REF command. The value set in these bits must be greater than or equal to that in the TRP bits. 00011: 3 cycles : 11111: 31 cycles Other settings are prohibited.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
4 to 0	TRP	00000	R/W	PRE Time Setting Bits These bits set the minimum interval from a PRE (precharge) command to an ACT/REF command. 00011: 3 cycles : 11111: 31 cycles Other settings are prohibited.

DBTR4 is used to set timing parameters for the SDRAM.

Notes: 1. The setting is in cycles of the SDRAM operating clock.
2. The following conditions must be satisfied:
TRPA ≥ TRP
TRC – TRP < 32
3. Writing to this register should only be performed when the following conditions are met.
• Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
• Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.14 SDRAM Timing Register 5 (DBTR5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	TRC					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
5 to 0	TRC	000000	R/W	ACT to ACT/ACT to REF Interval Setting Bits These bits set the minimum interval from one ACT command to another ACT command (for the same bank) or to a REF command. 000110: 6 cycles : 111111: 63 cycles Other settings are prohibited.

DBTR5 is used to set a timing parameter for the SDRAM.

Notes: 1. The setting is in cycles of the SDRAM operating clock.
2. The following condition must be satisfied: TRC – TRP < 32
3. Writing to this register should only be performed when the following conditions are met.
   • Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   • Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.15 SDRAM Timing Register 6 (DBTR6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	TRAS					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
5 to 0	TRAS	000000	R/W	ACT to PRE Interval Setting Bits These bits set the minimum interval from an ACT command to a PRE command. 000011: 3 cycles : 100010: 34 cycles Other settings are prohibited.

DBTR6 is used to set a timing parameter for the SDRAM.

Notes: 1. The setting is in cycles of the SDRAM operating clock.

2. Writing to this register should only be performed when the following conditions are met.
   - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.16 SDRAM Timing Register 7 (DBTR7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	TRRD			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
3 to 0	TRRD	0000	R/W	ACT(A) to ACT(B) Interval Setting Bits These bits set the minimum interval between ACT commands issued for different banks. 0010: 2 cycles : 1111: 15 cycles Other settings are prohibited.

DBTR7 is used to set a timing parameter for the SDRAM.

Notes: 1. The setting is in cycles of the SDRAM operating clock.

2. Writing to this register should only be performed when the following conditions are met.
   - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.17 SDRAM Timing Register 8 (DBTR8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TFAW							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
7 to 0	TFAW	00000000	R/W	Four Activate Window Length Setting Bits These bits set the length of the four activate window. The value of these bits must be at least four times as large as that of the TRRD bits in DBTR7. 00001000: 8 cycles : 00111111: 63 cycles Other settings are prohibited.

DBTR8 is used to set a timing parameter for the SDRAM.

Notes: 1. The setting is in cycles of the SDRAM operating clock.
2. The following condition must be satisfied: TFAW $\geq 4 \times$ TRRD.
3. Writing to this register should only be performed when the following conditions are met.
   • Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   • Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.18 SDRAM Timing Register 9 (DBTR9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	TRDPR			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
3 to 0	TRDPR	0000	R/W	READ-PRE Interval Setting Bits These bits set the minimum interval from a READ command to a PRE command. 0100: 4 cycles : 1111: 15 cycles Other settings are prohibited.

DBTR9 is used to set a timing parameter for the SDRAM.

Notes: 1. The setting is in cycles of the SDRAM operating clock.
2. The following condition must be satisfied: TRDPR ≥ BL/2.
3. If the SDRAM in use conforms to the JEDEC standard, the value of the bits can be calculated from the following formula.
   TRDPR = max {4, ceil(tRTP / tCK)}
4. Writing to this register should only be performed when the following conditions are met.
   • Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   • Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.19 SDRAM Timing Register 10 (DBTR10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	TWR			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
3 to 0	TWR	0000	R/W	Write-Recovery Period Setting Bits These bits set the write-recovery period. 0011: 3 cycles 0100: 4 cycles : 1110: 14 cycles Other settings are prohibited.

DBTR10 is used to set a timing parameter for the SDRAM.

Notes: 1. The setting is in cycles of the SDRAM operating clock.
2. Writing to this register should only be performed when the following conditions are met.
   • Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   • Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.20 SDRAM Timing Register 11 (DBTR11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	TRDWR					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
5 to 0	TRDWR	000000	R/W	READ to WRITE Interval Setting Bits These bits set the minimum interval from a READ command to a WRITE command. 000110: 6 cycles 000111: 7 cycles : 001111: 15 cycles Other settings are prohibited.

DBTR11 is used to set a timing parameter for the SDRAM.

Notes: 1. The setting is in cycles of the SDRAM operating clock.

2. If the SDRAM in use conforms to the JEDEC standard, the value of the bits can be calculated from the following formula.

   When the number of (CL + (BL/2) + 2 - CWL) is even:

   $$TRDWR > CL + (BL/2) + 2 - CWL$$

   Otherwise:

   $$TRDWR \geq CL + (BL/2) + 2 - CWL$$

3. Writing to this register should only be performed when the following conditions are met.
   - Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   - Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.21 SDRAM Timing Register 12 (DBTR12)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	TWRRD					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
5 to 0	TWRRD	000000	R/W	WRITE to READ Interval Setting Bits These bits set the minimum interval from a WRITE command to a READ command. 000110: 6 cycles : 011111: 31 cycles Other settings are prohibited.

DBTR12 is used to set a timing parameter for the SDRAM.

Notes: 1. The setting is in cycles of the SDRAM operating clock.
2. The following condition must be satisfied: TWRRD ≥ CWL + BL/2.
3. If the SDRAM in use conforms to the JEDEC standard, the value of the bits can be calculated from the following formula.
   TWRRD = CWL + 4 + ceil(tWTR / tCK)
4. Writing to this register should only be performed when the following conditions are met.
   • Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   • Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.22 SDRAM Timing Register 13 (DBTR13)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	TRFC/TRFCAB											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
11 to 0	TRFC/TRFCAB	H'000	R/W	REF to ACT/REF or All Bank REF to ACT/REF Interval Setting Bits These bits set the minimum interval from a REF (refresh) command for all the banks to an ACT/REF command. H'008: 8 cycles : H'1FF: 511 cycles Other settings are prohibited.

DBTR13 is used to set a timing parameter for the SDRAM.

Notes: 1. The setting is in cycles of the SDRAM operating clock.
2. Writing to this register should only be performed when the following conditions are met.
   • Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   • Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.23 SDRAM Timing Register 14 (DBTR14)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	TCKEHDLL							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TCKEH							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
23 to 16	TCKEHDLL	H'00	R/W	CKEH (DLL-LOCK) Period Setting Bits These bits set the minimum interval from the time the CKE signal goes high until the issuing of a further valid command that requires the DLL to be locked. H'02: 2 cycles : H'17: 23 cycles Other settings are prohibited.
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
7 to 0	TCKEH	H'00	R/W	CKEH Period Setting Bits These bits set the minimum interval from the time the CKE signal goes high until the issuing of a further valid command. H'02: 2 cycles : H'0F: 15 cycles Other settings are prohibited.

DBTR14 is used to set timing parameters for the SDRAM.

Notes: 1. The setting is in cycles of the SDRAM operating clock.

2. The following condition must be satisfied: TCKEH ≤ TCKEHDLL.
3. When the power-down mode is to be used, this register must be set accordingly.
   If the SDRAM in use conforms to the JEDEC standard, the value of the bits can be calculated from the following formula.
   TCKEHDLL = ceil(tXPDLL / tCK)
   TCKEH = ceil(tXP / tCK)
4. Writing to this register should only be performed when the following conditions are met.
   • Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   • Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.24 SDRAM Timing Register 15 (DBTR15)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	TCKESR			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	TCKEL			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
19 to 16	TCKESR	0000	R/W	CKESR Period Setting Bits These bits set the minimum time for self-refresh from the time the CKE signal goes low until it goes high. 0010: 2 cycles 0011: 3 cycles : 1111: 15 cycles Other settings are prohibited.
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
3 to 0	TCKEL	0000	R/W	CKEL Period Setting Bits These bits set the minimum time for power down from the time the CKE signal goes low until it goes high. 0010: 2 cycles 0011: 3 cycles : 0111: 7 cycles Other settings are prohibited.

DBTR15 is used to set a timing parameter for the SDRAM.

Notes: 1. The setting is in cycles of the SDRAM operating clock.
2. Writing to this register should only be performed when the following conditions are met.
   • Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   • Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.25 SDRAM Timing Register 16 (DBTR16)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DQIENLTNCY				—	—	—	—	—	—	DQL					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DQENLTNCY				—	—	—	—	—	—	—	—	WDQL			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	DQIENLTNCY	0000	R/W	dqienltncy Setting Bits 0001: One cycles Other settings are prohibited.
27 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
21 to 16	DQL	000000	R/W	dqltncy Setting Bits These bits set the latency from issuing of a read command to the PHY unit 000111: 7 cycles : 111111: 63 cycles Other settings are prohibited.
15 to 12	DQENLTNCY	0000	R/W	dqenltncy Setting Bits 0001: One cycle Other settings are prohibited.
11 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
3 to 0	WDQL	0000	R/W	wdqltncy Setting Bits These bits set the latency from issuing of a write command until the write data is output. 0001: One cycle Other settings are prohibited.

DBTR16 is used to set a timing parameter for the SDRAM.

Notes: 1. The setting is in cycles of the SDRAM operating clock.
2. The DQL setting should satisfy the following conditions:
Minimum value for DDR3-800 (MCK[*] is 400 MHz or lower): CL + 15
Minimum value for DDR3-800 (MCK[*] is higher than 400 MHz): CL + 16
3. Writing to this register should only be performed when the following conditions are met.
• Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
• Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.26 SDRAM Timing Register 17 (DBTR17)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	TMOD					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
21 to 16	TMOD	000000	R/W	MRS Time Setting Bits These bits indicate the minimum interval from an MRS (mode register set) command to a subsequent command. 000010: 2 cycles : 001111: 15 cycles Other settings are prohibited.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.

DBTR17 is used to set timing parameters for the SDRAM.

Notes: 1. The setting is in cycles of the SDRAM operating clock.
2. Writing to this register should only be performed when the following conditions are met.
   • Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   • Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.27 SDRAM Timing Register 18 (DBTR18)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	RODTL			—	—	—	—	—	RODTA		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	WODTL			—	—	—	—	—	WODTA		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
26 to 24	RODTL	000	R/W	Bits for ODT Assert Period Setting at Read These bits set the assert period of the ODT signal that is output when a read command is output. 000: BL/2 cycles 001: BL/2 + 1 cycle : 111: BL/2 + 7 cycles Other settings are prohibited.
23 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
18 to 16	RODTA	000	R/W	Bits for ODT Assert Start Timing Setting Bits Read These bits set the assert start timing for the ODT signal that is output when a read command is output. 000: Simultaneous with the read command 001: One cycle after the read command 010: Two cycles after the read command 011: Three cycles after the read command Other settings are prohibited.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
10 to 8	WODTL	000	R/W	Bits for ODT Assert Period Setting at Write These bits set the assert period of the ODT signal that is output when a write command is output. 000: BL/2 cycles 001: BL/2 cycles + 1 cycle : 111: BL/2 cycles + 7 cycles Other settings are prohibited.
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
2 to 0	WODTA	000	R/W	Bits for ODT Assert Start Timing Setting at Write These bits set the assert start timing for the ODT signal that is output when a write command is output. 000: Simultaneous with the write command 001: One cycle after the write command 010: Two cycles after the write command 011: Three cycles after the write command Other settings are prohibited.

DBTR18 is used to set timing parameters for the SDRAM.

Notes: 1. The setting is in cycles of the SDRAM operating clock.
2. Writing to this register should only be performed when the following conditions are met.
   • Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   • Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)
3. The following conditions must be satisfied when setting this register:
   RODTL + RODTA ≤ 7
   WODTL + WODTA ≤ 7

15.2.28 SDRAM Timing Register 19 (DBTR19)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TZQCS							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
7 to 0	TZQCS	00000000	R/W	Calibration Period Setting Bits These bits specify the minimum interval from a ZQCS (short calibration) command to the next command. 00000110: 6 cycles 00000111: 7 cycles : 01000000: 64 cycles : 11111111: 255 cycles Other settings are prohibited.

DBTR19 is used to set a timing parameter for the SDRAM.

Notes: 1. The setting is in cycles of the SDRAM operating clock.
2. The following condition must be satisfied:
TZQCS ≥ TMOD
3. Writing to this register should only be performed when the following conditions are met.
• Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
• Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.29 SDRAM Operation Setting Register (DBBL)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BL	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
1, 0	BL	00	R/W	Burst Length Setting Bits These bits specify the burst length of SDRAM. 00: Fixed to 8 Other settings are prohibited.

DBBL is used to set a burst operation mode of the memory.

Notes: 1. The setting is in cycles of the SDRAM operating clock.
2. Writing to this register should only be performed when the following conditions are met.
   • Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   • Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.30 DBSC3 Operation Adjustment Register 0 (DBADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FREQRATIO	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CAMODE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
17, 16	FREQRATIO	00	R/W	PHY Frequency Ratio Setting Bits These bits should be set to 01 (1:2 operating mode). 01: DBSC3: PHY frequency ratio is 1:2. Other settings are prohibited.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
0	CAMODE	0	R/W	Command/Address Output Mode Setting Bit When the CAMODE bit is 1, the DBSC3 outputs a single command per two clock cycles. In this case, command signals and address signals, except for the M0CS[1:0]# signals of SDRAM, are kept constant for two clock cycles. During this period, the CS# signal becomes low only in the latter one clock cycle. 0: Setting prohibited 1: One command output in two clock cycles

DBADJ0 adjusts the DBSC3 operation.

Note: Writing to this register should only be performed when access to the SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0).

15.2.31 DBSC3 Operation Adjustment Register 2 (DBADJ2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ACAPC0								—	—	—	—	ACAPX0			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
15 to 8	ACAPC0	H'00	R/W	H'20 (fixed value) Other settings are prohibited.
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
3 to 0	ACAPX0	H'0	R/W	Bits for Setting Transaction Count Acceptable by Device Control Unit (for the low priority port) These bits set the number of requests acceptable by the device control unit (for the low priority port) in the DBSC3 in transaction units. H'4: fewer value H'8: default value Other settings are prohibited. If you want to reduce average access latency, please set this bit to H'8. If you want to reduce worst access latency, please set this bit to H'4.

DBADJ2 adjusts the DBSC3 operation.

Notes: 1. Writing to this register should only be performed when access to the SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0).

2. The display unit module requires to set ACAPX0 and ACAPX1 to H'4.

15.2.32 Refresh Configuration Register 0 (DBRFCNF0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	REFTHF											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
11 to 0	REFTHF	H'000	R/W	Forcible Auto-Refresh Threshold Setting Bits These bits set the timing for forcible refreshing regardless of bus requests. The value represented by these bits affects the amount of jitter in the refresh interval and performance in access to memory. A smaller value means less jitter in the refresh interval but may reduce performance in access. For details on the amount of jitter in the refresh interval, see section 15.2.33, Refresh Configuration Register 1 (DBRFCNF1). H'080: 128 cycles : H'1FF: 511 cycles Other settings are prohibited.

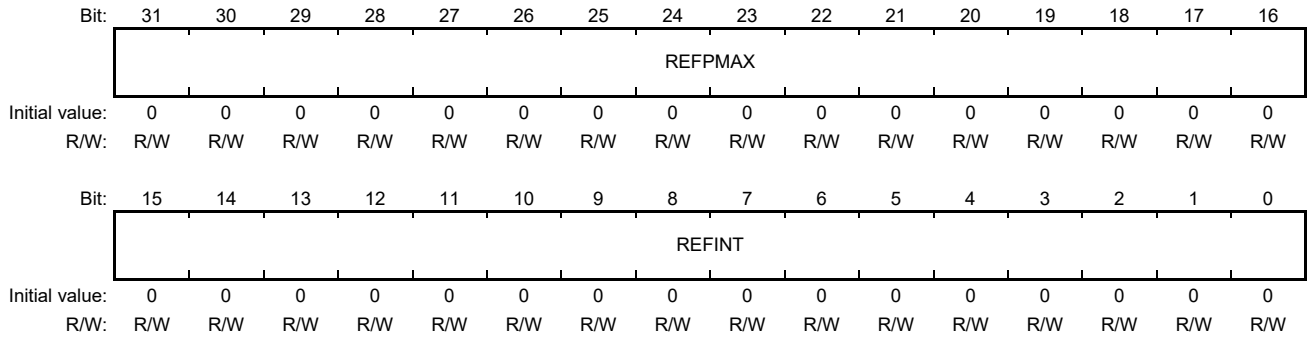
DBRFCNF0 is used to set the timing for refreshing of the SDRAM.

If you change the value of this register while auto-refresh is active (i.e. the ARFEN bit in the DBRFEN register is 1), the auto-refresh facility must be re-activated to reflect the new value in refreshing. To re-activate the auto-refresh facility, write 1 to the ARFEN bit in the DBRFEN register.

Notes: 1. If auto-refresh is activated (i.e. the ARFEN bit in the DBRFEN register is set to 1) after a value smaller than the minimum value defined in the above table has been set in this register, correct operation cannot be guaranteed.

2. The following conditions must be satisfied:
   REFTHF ≥ (TCKEL + TCKEH) + REFTH0
   (REFTH0 = max (TRDPR, CWL + (BL/2) + TWR, TRAS, TRC – TRP) + TRPA + 24)

15.2.33 Refresh Configuration Register 1 (DBRFCNF1)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	REFPMAX	H'0000	R/W	Maximum Post Number of Refresh Commands Setting Bits These bits set the maximum number of refresh commands (post number) accumulated by auto-refresh. As long as the number of refresh commands that has been accumulated is smaller than REFPMAX, refresh commands are issued while there are no bus requests. H'0002: Two (minimum amount of jitter in the refresh interval) : H'0008: Eight cycles (maximum amount of jitter in the refresh interval) Other settings are prohibited.
15 to 0	REFINT	H'0000	R/W	Average Refresh Interval Setting Bits These bits set the average interval for issuing of refresh commands. When the REFINTS bit of the DBRFCNF2 register is 0, the average interval (in cycles) is REFINT. When the REFINTS bit of the DBRFCNF2 register is 1, on the other hand, the average interval (in cycles) is floor (REFINT/2). This average interval is hereafter referred to as REFINT_E. Thus, REFINT_E = REFINT >> REFINTS (>>: logical right-shift operator). H'0080: 128 cycles H'0081: 129 cycles : H'3FFF: 16383 cycles Other settings are prohibited.

DBRFCNF1 is used to set the timing for refreshing of the SDRAM.

If you change the value of this register while auto-refresh is active (i.e. the ARFEN bit in the DBRFEN register is 1), the auto-refresh facility must be re-activated to reflect the new value in refreshing. To re-activate the auto-refresh facility, write 1 to the ARFEN bit in the DBRFEN register.

In the descriptions below, the "number of cycles" unless otherwise specified means the value measured with the SDRAM clock.

(1) Register Settings and Refresh Generation Timing

The following is an example of the settings in refresh configuration registers 1 and 2 and the timing of refresh generation.

In the explanations, "a ± b" indicates the range of values from a - b to a + b.

(a) To make the refresh interval flexible

Set REFPMAX to a value greater than or equal to 2.

REFINT holds the setting for the average refresh interval (tREFI in the normal range of operating temperatures), which is given in memory-vendor datasheets as an integer number of cycles. Set a value that has been rounded down from this integer. Set REFINTS to 0 or 1 according to the temperature at the time.

In this case, taking n as a positive integer, the time from one round of refresh generation to refresh generation n rounds later is (n × REFINT_E + REFPMAX × REFINT_E cycles) or shorter. However, this is on the assumption of no writing to the DBRFEN register during this period.

The following condition must be satisfied:

REFINT ≥ (TCALRZ + TCALZR + REFTHF × 2) << REFINTS

Notes: 1. If auto-refresh is activated (i.e. the ARFEN bit in the DBRFEN register is set to 1) after a value smaller than the minimum value defined in the above table has been set in this register, correct operation cannot be guaranteed.
2. Other restrictions not mentioned in the above may apply to some types of SDRAM according to the PHY unit specifications.

15.2.34 Refresh Configuration Register 2 (DBRFCNF2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	REFPMIN			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	REF INTS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

In the descriptions below, the number of cycles means the value measured with the SDRAM clock unless otherwise specified.

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
19 to 16	REFPMIN	H'0	R/W	Minimum Post Number of Refresh Commands Setting Bits These bits set the minimum number of refresh commands (post number) accumulated by auto-refresh. As long as the number of refresh commands that has been accumulated is smaller than REFPMIN, refresh commands are issued irrespective of the bus request state. H'1: 1 Other settings are prohibited.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
0	REFINTS	0	R/W	Average Refresh Interval Adjustment Bit When this bit is 0, the average interval (in cycles) is the value set in the REFINT bits. When this bit is 1, on the other hand, the average interval (in cycles) is floor (REFINT/2). 0: Average interval is REFINT 1: Average interval is 1/2 REFINT

DBRFCNF2 is used to set the timing for refreshing of the SDRAM.

If you change the value of this register while auto-refresh is active (i.e. the ARFEN bit in the DBRFEN register is 1), the auto-refresh facility must be re-activated to reflect the new value in refreshing. To re-activate the auto-refresh facility, write 1 to the ARFEN bit in the DBRFEN register.

The following condition must be satisfied:
REFPMAX ≥ REFPMIN

15.2.35 DDR3-SDRAM Calibration Configuration Register (DBCALCNF)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	CALEN	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CALINT															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
24	CALEN	0	R/W	DDR3-SDRAM Calibration Enable Bit While this bit is set to 1, calibration of DDR3-SDRAM is executed (ZQCS command is issued) at regular intervals. 0: DDR3-SDRAM calibration is disabled. 1: DDR3-SDRAM calibration is enabled.
23 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
15 to 0	CALINT	H'0000	R/W	DDR3-SDRAM Calibration Frequency Setting Bits These bits adjust the frequency of DDR3-SDRAM calibration. When the CALINT bits are set to n, the ZQCS command is issued once every time the refresh command has been issued for n times by the auto-refresh function. H'0000: Executed only once after auto-refresh executed immediately after the CALEN bit is set to 1. H'0001: Executed at every auto-refresh. H'0002: Executed at every two times of auto-refresh. : H'FFFF: Executed at every 65535 times of auto-refresh.

DBCALCNF controls the function for calibrating DDR3-SDRAM at regular intervals.

Notes: 1. When CALINT = 0, calibration is executed (ZQCS command is issued) only once after auto-refresh executed immediately after 1 is written to the CALEN bit; no calibration is executed after that. To execute calibration again, write 1 to the CALEN bit.

2. Even when the CALEN bit is set to 1, the ZQCS command is not issued when the auto-refresh function is stopped (i.e. the ARFEN bit in the DBRFEN register is 0).
3. Writing a value other than H'0100 0000 to this register should only be performed when the following conditions are met.
   • Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   • Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)
4. Writing H'0100 0000 to this register should only be performed when the following condition is met.
   • Auto-refresh is enabled (i.e. the ARFEN bit in the DBRFEN register is 1)

15.2.36 DDR3-SDRAM Calibration Timing Register (DBCALTR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	TCALRZ											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	TCALZR											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
27 to 16	TCALRZ	H'000	R/W	DDR3-SDRAM Calibration Timing Setting (REF to ZQCS Interval Setting) Bits These bits specify the minimum interval between a REF and ZQCS commands for calibration execution. H'080: 128 cycles : H'FFF: 4095 cycles Other settings are prohibited.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
11 to 0	TCALZR	H'000	R/W	DDR3-SDRAM Calibration Timing Setting (ZQCS to REF Interval Setting) Bits These bits specify the minimum interval between a ZQCS command for calibration and a REF command for the next auto-refresh execution. H'080: 128 cycles : H'FFF: 4095 cycles Other settings are prohibited.

DBCALTR specifies the command interval limitations for DDR3-SDRAM calibration executed at regular intervals.

Notes: 1. This register value has no effect when CALEN = 0.
2. The setting is in cycles of the SDRAM operating clock.
3. The following conditions must be satisfied:
   TCALRZ ≥ max (128, TRFC + (7 × TFAW ÷ 4) + tACTANY + 32)
   TCALZR ≥ max (128, TZQCS + (7 × TFAW ÷ 4) + tACTANY + 32)
   REFINT ≥ (TCALRZ + TCALZR + (REFTHF × 2)) << REFINTS
   (tACTANY = max (TRCD, TRAS, TRC – TRPA, TFAW))
4. Writing to this register should only be performed when the following conditions are met.
   • Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
   • Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.37 ODT Operation Setting Register (DBRNK0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RODT OUT0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WODT OUT0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
16	RODTOUT0	0	R/W	Bit for ODT Output Level Setting at Read This bit set the ODT output level at read. 0: ODT output level at read is set to 0. 1: ODT output level at read is set to 1.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
0	WODTOUT0	0	R/W	Bit for ODT Output Level Setting at Write This bit set the ODT output level at write. 0: ODT output level at write is set to 0. 1: ODT output level at write is set to 1.

DBRNK0 specifies the ODT output level of SDRAM.

Note: Writing to this register should only be performed when the following conditions are met.

- Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
- Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.38 Power-Down Configuration Register (DBPDNCNF)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PDWAIT								—	—	—	PDDLL	—	—	PDMODE	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
15 to 8	PDWAIT	H'00	R/W	Power-Down Wait Bits These bits set the number of cycles it takes to enter power-down mode after memory accesses no longer occur. H'10: 16 cycles : H'FF: 255 cycles Other settings are prohibited.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
4	PDDLL	0	R/W	Power-Down DLL Control Bit This bit turns on or off the DLL of SDRAM when entering power-down mode. 0: DLL is turned off at a precharged power-down. DLL is turned on at an active power-down 1: DLL is turned on at a power-down.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
1, 0	PDMODE	00	R/W	Power-Down Mode Bits When these bits are set to "01" and there has been no memory access for a certain period, the power-down entry command is issued to place the SDRAM in power-down mode. 00: Auto power-down mode is off. 01: Auto power-down mode is on. Other settings are prohibited.

DBPDNCNF controls the auto power-down function.

Notes: 1. The setting is in cycles of the SDRAM operating clock.
2. Return from a power-down mode incurs a time penalty of max(3, TCKEH) - 3 cycles.
3. Writing to this register should only be performed when the following conditions are met.
• Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
• Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.39 PHY Unit Control Register 0 (DBPDCNT0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BW32	—	—	—	—	—	—	—	—	—	—	ODT_DIS	—	—	ODT_TSEL	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	BW32	0	R/W	PHY Unit 32-Bit Mode Setting Bit Set either the BW32 bit. Set this bit and the DW0 bit in DBCONF0 to the same value. 1: PHY unit 32-bit mode
30 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
20	ODT_DIS	0	R/W	Internal ODT Enable Bit This bit enables or disables the ODT in the PHY unit. Set this bit to 0 in most cases. 0: ODT is enabled. 1: ODT is disabled.
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
17, 16	ODT_TSEL	00	R/W	Internal ODT Impedance Setting Bits These bits set the ODT impedance in the PHY unit. 01: 60 Ω for DDR3 (normal setting) Other settings are prohibited.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.

DBPDCNT0 is used to set parameters for the PHY unit.

Note: Writing to this register should only be performed when the following conditions are met.
- Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
- Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.40 PHY Unit Control Register 1 (DBPDCNT1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.

DBPDCNT1 is used to set parameters for the PHY unit.

Note: Writing to this register should only be performed when the following conditions are met.

- Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
- Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.41 PHY Unit Control Register 2 (DBPDCNT2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	NC_SIG									NC_FIX	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
26 to 18	NC_SIG	H'000	R/W	Fixed Control Signal Setting Bits These bits select the signals that output the fixed value specified in the NC_FIX bits. When a bit is set to 1, the corresponding signal outputs the fixed value. NC_SIG[8]: M0(/1)RESET# NC_SIG[7]: M0(/1)A[15] NC_SIG[6]: M0(/1)A[14] NC_SIG[5]: M0(/1)A[13] NC_SIG[4]: M0(/1)BA[2] NC_SIG[3]: M0(/1)CS[1]#, M0(/1)CKE[1], and M0(/1)ODT[1] NC_SIG[2]: M0(/1)CS[0]#, M0(/1)CKE[0], and M0(/1)ODT[0] NC_SIG[1]: M0(/1)CK[1] and M0(/1)CK[1]# NC_SIG[0]: M0(/1)CK[0] and M0(/1)CK[0]#
17, 16	NC_FIX	00	R/W	Control Signal Fixed Value Setting Bits These bits specify the state of the signals selected by the NC_SIG bits. 00: Not fixed 01: Initial value (reset state) 10: Hi-Z state 11: Setting prohibited
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.

DBPDCNT2 is used to set parameters for the PHY unit.

Note: Writing to this register should only be performed when the following conditions are met.

- Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
- Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.42 PHY Unit Control Register 3 (DBPDCNT3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PLL2_RESET	—	STBY		COM_HIZ	—	—	DLL_RESET	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R/W	R/W	R/W	R	R	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	IO_ENABLE	—	CAL MODE	CAL EN	—	PTRRST	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R	R/W	R/W	R	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	PLL2_RESET	0	R/W	Reset Signal Bit for PLL2 in PHY Unit This bit resets PLL2 in the PHY unit. For details, refer to section 15.3.4, Initialization Sequence. 0: PLL2 is reset. 1: PLL2 reset is released.
30	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
29, 28	STBY	00	R/W	Clock Signal Standby Setting Bits These bits specify the standby state for the clock signals. When this bit is set to 0, the clock signals enter standby state. This setting takes priority over the NC_SIG and NC_FIX bit settings. For details, refer to section 15.3.4, Initialization Sequence. STBY[1]: M0(/1)CK[1] and M0(/1)CK[1]# STBY[0]: M0(/1)CK[0] and M0(/1)CK[0]#
27	COM_HIZ	0	R/W	Control Signal Hi-Z Setting Bit When this bit is set to 1, the I/O pins, except for M0(/1)CK[1:0], M0(/1)CK[1:0]#, M0(/1)CKE[1:0], and M0(/1)RESET#, enter Hi-Z state. This setting is not applied to the pins specified by the NC_SIG and NC_FIX bits.
26, 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
24	DLL_RESET	0	R/W	DLL Reset Bit When this bit is set to 0, the DLL is reset. When this bit is set to 1, the DLL reset state is released. For details, refer to section 15.3.4, Initialization Sequence. 0: DLL is reset. 1: DLL reset is released.
23 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
13	IO_ENABLE	0	R/W	I/O Enable Setting Bit This bit enables I/O operation. For details, refer to section 15.3.4, Initialization Sequence. 0: I/O operation is disabled. 1: I/O operation is enabled.
12	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
11	CALMODE	0	R/W	Calibration Mode Setting Bit This bit specifies the calibration mode. For details, refer to section 15.3.4, Initialization Sequence. 0: External control mode 1: Automatic calibration mode
10	CALEN	0	R/W	Automatic Calibration Setting Bit This bit enables automatic calibration. This bit setting is valid only when CALMODE = 1. For details, refer to section 15.3.4, Initialization Sequence. 0: Automatic calibration is disabled. 1: Automatic calibration is enabled.
9	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
8	PTRRST	0	R/W	Pointer Reset Bit When this bit is set to 1, the point is reset. When this bit is cleared to 0, the pointer reset state is released. For details, refer to section 15.3.4, Initialization Sequence. 1: Pointer is reset. 0: Pointer reset is released.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.

DBPDCNT3 is used to set parameters for the PHY unit.

Note: Writing to this register should only be performed when the following conditions are met.

- Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)
- Auto-refresh is disabled (i.e. the ARFEN bit in the DBRFEN register is 0)

15.2.43 Bus Control Unit 0 Control Register 1 (DBBS0CNT1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BKADM	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
1, 0	BKADM	00	R/W	Bank Assignment Setting Bits These bits are used to set the method for assigning the SDRAM banks to the logical address space, i.e. whether and how logical addresses are divided into multiple blocks to which different SDRAM banks are assigned. For details on the relation between the logical addresses and SDRAM addresses, refer to section 15.3.10, Address Multiplexing. 00: The whole logical address space is regarded as one block. Other settings are prohibited.

Notes: 1. This register must only be written from within the initialization sequence (see section 15.3.4, Initialization Sequence).

2. Writing to this register should only be performed when the following conditions are met.
   • Access to SDRAM is disabled (i.e. the ACCEN bit in the DBACEN register is 0)

15.2.44 AXI Port Setting Register 0 (DBWT0CNF0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	WASYN		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	WCN		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
18 to 16	WASYN	000	R/W	"010" Other settings are prohibited.
15 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
2 to 0	WCN	000	R/W	AXI Clock to Memory Clock Ratio Setting Bits These bits specify the ratio of the memory clock/4 (MCLK) to the AXI clock (AXICLK). When WASYN = 010, 000: 0.5 MCLK < AXICLK < MCLK (default) 001: MCLK < AXICLK < 1.2 MCLK 010: 1.2 MCLK < AXICLK < 1.4 MCLK 011: 1.4 MCLK < AXICLK < 1.6 MCLK 100: 1.6 MCLK < AXICLK < 1.8 MCLK 101: 1.8 MCLK < AXICLK < 2 MCLK Other settings are prohibited.

Note: This register should only be written to only during the initialization sequence (refer to section 15.3.4, Initialization Sequence) or while AXI bus access and external memory access are idle.

15.2.45 AXI Port Setting Register 4 (DBWT0CNF4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	RDFIIFONUM				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. If a value other than 0 is written, correct operation cannot be guaranteed.
4 to 0	RDFIIFONUM	00000	R/W	This bit specifies the capacity of the read data FIFO. 11111: 32 Other settings are prohibited.

Note: This register should only be written to only during the initialization sequence (refer to section 15.3.4, Initialization Sequence).

15.3 Operation

15.3.1 Supported SDRAM Commands

Table 15.5 lists the SDRAM commands issued by the DBSC3. These commands are issued to the SDRAM in synchronously with the M0CK[1:0] and M0CK[1:0]# signals. In the table, "n-1" indicates the state of the signal applied to the SDRAM one cycle before SDRAM command issue; n indicates the state of the signal at the time of command issue.

Table 15.5 SDRAM Commands Issued by the DBSC3

Function	Symbol	MCKE[1:0]		MCS [1:0]#	MRAS#	MCAS#	MWE#	MBA [2:0]	MA [15:3]	MA12 /BC	MA10 /AP	MA11, MA[9:0]
		n-1	n

[Legend]

H: High level

L: Low level

X: High or low level (don't care)

V: Valid data

In the table, corrective names are used for signals. For example, MCKE and MA indicate M0CKE and M0A signals, respectively.

The above DES command is issued when the SDRAM is not accessed, and so cannot be explicitly issued by the user.

15.3.2 Data Alignment in DDR3-SDRAM

The DBSC3 accesses DDR3-SDRAM with a fixed burst length of 8 (Figure 15.3). As shown in table 15.6, invalid read data is discarded during reading, and data mask signals are used to mask invalid data during writing, according to the access size. The access times in table 15.6, correspond to the burst times during reading/writing shown in Figure 15.3. For example, in the case of little endian, the second access (falling edge of MDQS) includes valid data if a byte access of address (8n + 0, 1, 2, 3) occurs.

Tables 15.7 and 15.8 show the correspondence with data on the external data bus for each access size.

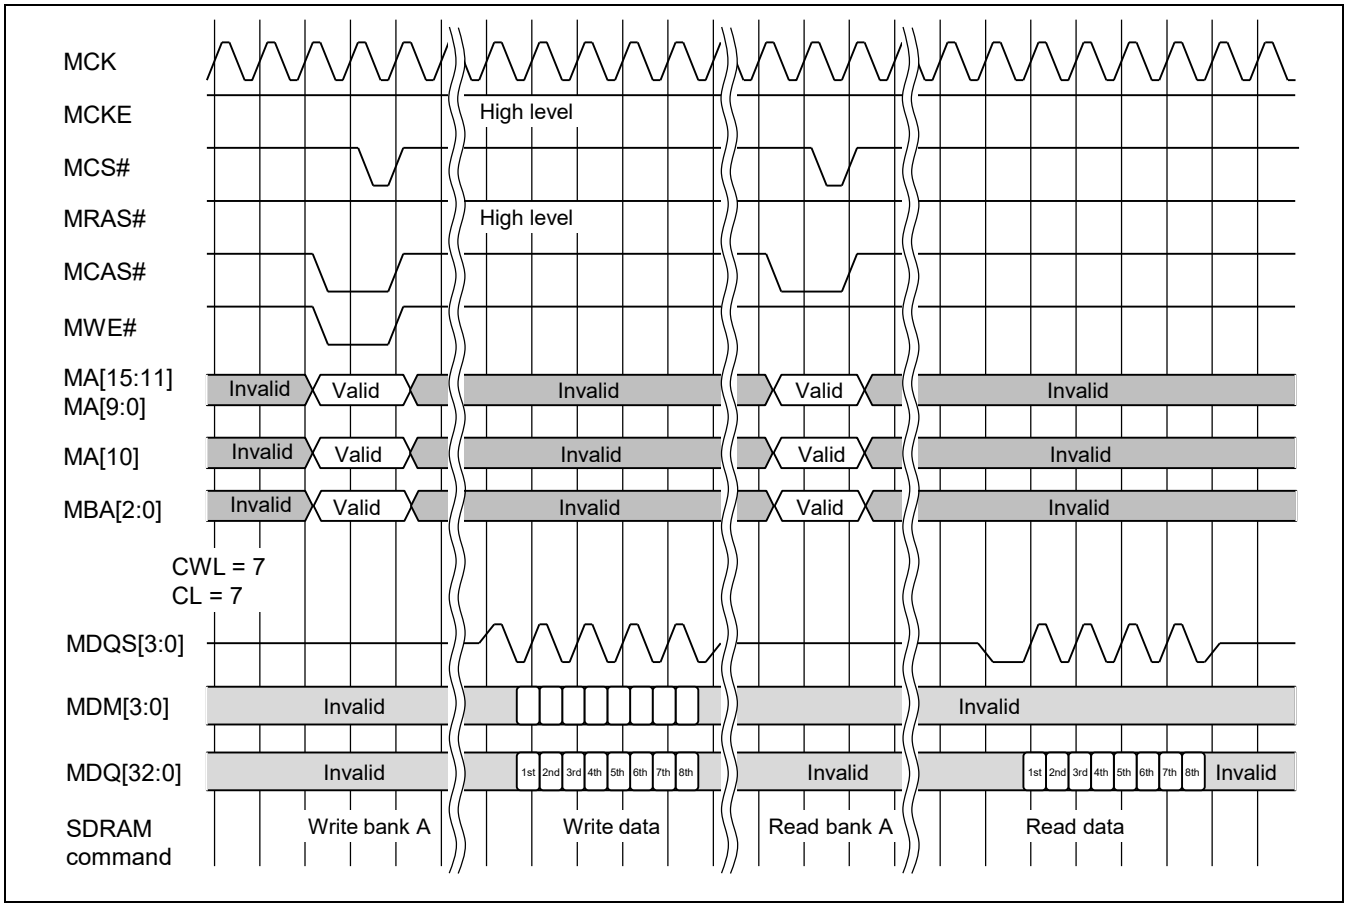

Figure 15.3 Burst Access Operation

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK and M0A signals, respectively.

Table 15.6 Positions of Valid Data for Access with Burst Length of 8 (32-Bit Mode)

Address	First Access	Second Access	Third Access	Fourth Access	Fifth Access	Sixth Access	Seventh Access	Eighth Access
Byte access (address 8n + 0, 1, 2, 3)	Invalid	Valid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid
Byte access (address 8n + 4, 5, 6, 7)	Valid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid	Invalid

15.3.3 SDRAM Command Issue

(1) Basic Access

The DBSC3 stores in a queue the requests received via the AXI. The order for the start of request processing changes according to whether or not this is preceded by processing for precharging or activation, but processing is executed in the order allowed in AXI protocol to improve the memory efficiency.

When SDRAM initialization is completed, upon receiving a read/write request, a page miss occurs with all banks in the closed state. Hence the DBSC3 first issues an activate (ACT) command, to open the corresponding bank. After opening the bank, the read/write command of the SDRAM corresponding to the read/write request is issued. At this time, the number of issued read/write commands differs depending on the bus width and the request size (1/2/4/8/16/32 bytes), as indicated in Figure 15.4. For example, when performing 32-byte reading from the AXI bus with an external data bus width of 16 bits, two read commands are issued. When issuing the read command in the first cycle, data is read with a burst length of 8 (four DDR clock cycles), so that it is necessary to wait until the fifth cycle to issue the second read command.

When access ends, the DBSC3 leaves the bank open, without using a precharge (PRE) command. The bank is closed when (1) the following request is for the same bank with a different row address; (2) there is an auto-refresh request; or (3) the user issues a precharge-all (PREA) command using the SDRAM command control register, for self-refresh processing.

Thus in normal access other than self-refresh, the DBSC3 uses hardware for bank management, so that except for the register settings upon initialization, the user need not execute control.

Furthermore, the DBSC3 performs multibank operation of eight banks. Hence the maximum number of banks that can be opened simultaneously is eight. Refer to section 15.3.10, Address Multiplexing, for the correspondence between access addresses from the AXI and SDRAM bank/row addresses.

Usage Note:

In a command processing, the DBSC3 may change the order of the command execution after acceptance of the command request to improve the memory efficiency. This change is done by the DBSC3 automatically within the allowance of the AXI-bus protocol, so they cannot be explicitly issued by software.

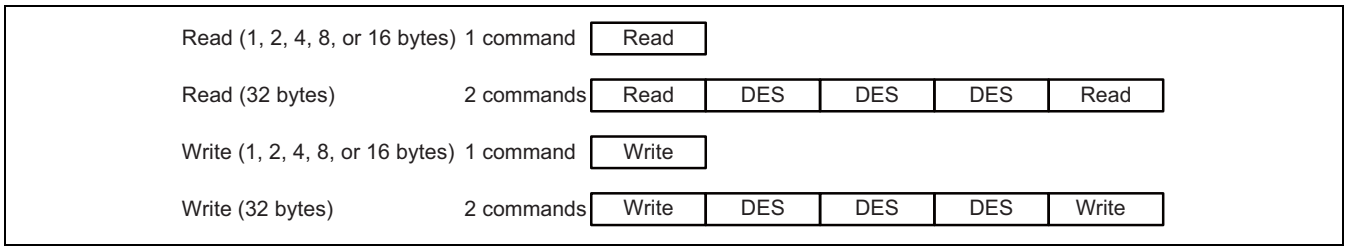

Figure 15.4 Read/Write Command Issued to the SDRAM in Response to the Request from the AXI

(2) Preceding Precharge/Activate Processing

In order to utilize SDRAM multibank functions to reduce SDRAM command vacant cycles insofar as possible and improve the efficiency of bus use, the DBSC3 issues in advance a PRE/ACT command corresponding to the following request queue page miss processing. Only the PRE/ACT command is issued in advance, so there is no change in the read/write order. A PRE/ACT command is issued in advance only when the following request (1) results in a page miss, and moreover (2) entails access of a bank different from that of the request currently being processed. Figure 15.5 shows an example of execution of preceding precharge/activate processing (as an example for operational description). This is an example of a command issued to the SDRAM when the external data bus width is 16 bits, the PRE-ACT minimum time constraint is 4 cycles, the ACT-READ/WRITE minimum time constraint is 4 cycles, and the ACT-ACT minimum time constraint is 2 cycles. In this example, the first through fourth requests are accumulated, and the first request is the request initially provided to the queue.

The DBSC3 issues one command each time it has received two memory clock pulses. Thus, there are always an even number of clock pulses between commands. At time 1, the DBSC3 issues to the SDRAM a PRE command for processing the first read (16-byte) request. Then, when determining the command to be issued at time 3, due to timing constraints it is not possible to issue at time 3 the ACT command necessary as request processing for the first read (16-byte) request, which has higher priority. Hence the DBSC3 searches for a command to be issued at time 3 from the following request queue. From the search results it is seen that preceding precharge processing can be executed for the third read (8-byte) request. Because the DBSC3 gives priority to preceding requests, it decides to perform preceding precharge processing for the third read (8-byte) request, and issues a PRE command to the SDRAM.

At time 5, the DBSC3 can process the first read (16-byte) request and it issues an ACT command to the SDRAM. At time 7, it issues an ACT command to the SDRAM for the first read (8-byte) request processing. After issuing the read command for the first read (16-byte) request processing, it issues a PRE command to the SDRAM for the fourth read (16-byte) request processing at time 11.

Thereafter, the processing described above is repeated.

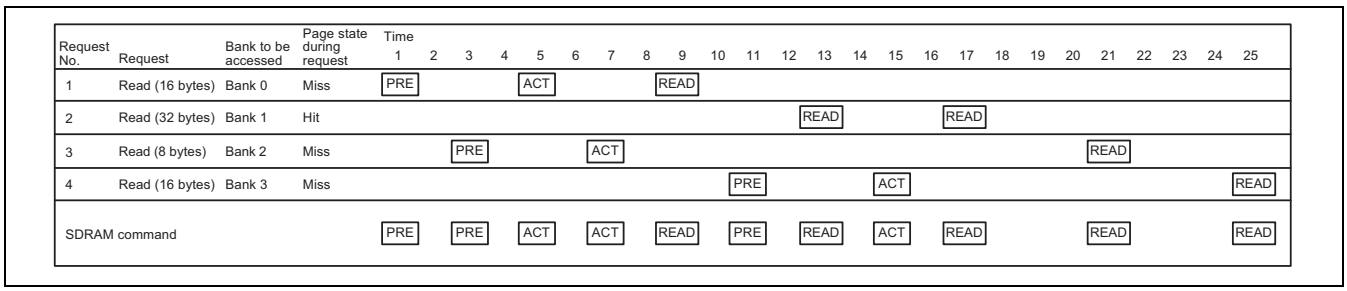

Figure 15.5 Example of Preceding Precharge/Activate Processing

15.3.4 Initialization Sequence

The following shows examples of initialization sequence for each memory type. The initialization sequence should be executed to enable SDRAM access after power to the DBSC3 is turned on.

Note that the sequence differs depending on the specifications of the target memory.

For detailed information such as the power supply and timing parameters, refer to the datasheet for the SDRAM being used.

15.3.4.1 Starting the System

(1) 32 Bits × 1-ch Mode

(a) After power is turned on, apply a power-on reset and wait until the DBSC3 is released from the reset state.

1. Wait until the supplied power, reference voltage, and clock settle (it takes at least 200 µs until the clock settles). Apply a power-on reset to the DBSC3 through the reset pin of the LSI.
2. Set the M0BKPRST# pin to the high level.
3. Write H'0000A55A to DB_ADDR + H'4000.
4. Write H'00000001 to DB_ADDR + H'4008.
5. Use the manual command-issuing register (DBCMD) to set the M0RESET pin of the SDRAM to the low level. The value written to this register should be OPC = RstL, ARG = 0.
6. Use the manual command-issuing register (DBCMD) to set the M0CKE[1:0] pins of SDRAM to the low level. The value written to this register should be OPC = PDEn, ARG = 100 µs.
7. Set the M0SDBUP pin to the high level.

(b) DBSC3 Setting 1

1. SDRAM type setting register (DBKIND)
2. SDRAM configuration setting register 0 (DBCONF0)
3. PHY type setting register (DBPHYTYPE)
4. SDRAM operation setting register (DBBL)
5. SDRAM timing registers 0 to 19 (DBTR0 to DBTR19)
6. ODT operation setting register 0 (DBRNK0)
7. Set the CAMODE bit to 1 in DBSC3 operation adjustment register 0 (DBADJ0).
8. Set the FREQRATIO bit to H'01 in DBSC3 operation adjustment register 0 (DBADJ0).
9. Set the ACAPX0 bits to H'8 in DBSC3 operation adjustment register 2 (DBADJ2).
10. Set the ACAPC0 bits to H'20 in DBSC3 operation adjustment register 2 (DBADJ2).
11. AXI port setting registers 0 and 4 (DBWT0CNF0, DBWT0CNF4)

(c) PHY Setting 1

1. Write to the PHY unit access register3 (DBPDCNT3) as follows.
   - Set the PTRRST bit to 1 in PHY unit control register 3 (DBPDCNT3).
   - Clear the PTRRST bit to 0 in PHY unit control register 3 (DBPDCNT3).
   - Set the CALMODE bit to 1 in PHY unit control register 3 (DBPDCNT3).
   - Set the CALEN bit to 1 in PHY unit control register 3 (DBPDCNT3).
   - Set the DLL_RESET bit to 1 in PHY unit control register 3 (DBPDCNT3).
2. Ensure that the software allows the required waiting time (at least 50 µs).
3. Write to the PHY unit access register3 (DBPDCNT3) as follows. Set the IO_ENABLE bit to 1 in PHY unit control register 3 (DBPDCNT3).
4. Set the PLL2_RESET bit to 1 in PHY unit control register 3 (DBPDCNT3).
5. Ensure that the software allows the required waiting time (at least 100 µs).
6. Set the STBY bit to 1 in PHY unit control register 3 (DBPDCNT3) and the clock is output through the MCK pins.
7. Set the BW32 bit to 1 in PHY unit control register 0 (DBPDCNT0).
8. Make other necessary settings in PHY unit control registers 0 to 3 (DBPDCNT0 to DBPDCNT3).

Usage Note:

However there is no number of order for these sequences, they must be executed in above order from top-bullet to bottom-bullet.

(d) DDR3-SDRAM setting

1. Use the manual command-issuing register (DBCMD) to insert a waiting time. The value written to this register should be OPC = Wait, ARG = 100 µs.
2. Use the manual command-issuing register (DBCMD) to set the M0RESET pin of SDRAM to the high level. The value written to this register should be OPC = RstH, ARG = 100 µs.
3. Use the manual command-issuing register (DBCMD) to insert a waiting time. Write OPC = Wait, ARG = 100 µs to this register four times.
4. Use the manual command-issuing register (DBCMD) to set the M0CKE[1:0] pins of SDRAM to the high level.
5. The value written to this register should be OPC = PDXt, ARG = tXPR (normally tRFC + 10 ns).
6. Use the manual command-issuing register (DBCMD) to issue the MRS (MR2) command. Adjust the setting for CWL to the setting of the CWL bits in SDRAM timing register 1 (DBTR1).
7. Use the manual command-issuing register (DBCMD) to issue the MRS (MR3) command. Set the MPR for normal operation.
8. Use the manual command-issuing register (DBCMD) to issue the MRS (MR1) command. Set the additive latency to 0, and the DLL Enable to enabled.
9. Use the manual command-issuing register (DBCMD) to issue the MRS (MR0) command. At this time, set the mode of operation to normal, the DLL to reset, the burst length to eight, and the burst type to sequential.

   Also adjust the setting of the CAS latency to match the setting of the CL bits in SDRAM timing register 0 (DBTR0). Adjust the setting of WR to match the settings of the TWR bits in the
10. Use the manual command-issuing register (DBCMD) to issue the ZQ Calibration Long command. The value written to this register should be OPC = ZQCL, ARG = max {tZQinit, tDLLK – tMOD}

(e) DBSC3 Setting 2

1. Make other necessary settings in DBSC3.
   - DBSC3 operation adjustment registers 0 to 3 (DBADJ0 to DBADJ3)
   - Bus control unit 0 control registers 0 and 1 (DBBS0CNT0 and DBBS0CNT1)
   - DDR3-SDRAM calibration configuration register (DBCALCNF)

- DDR3-SDRAM calibration timing register (DBCALTR)
- Power-down configuration register (DBPDNCNF)

2. Make settings in refresh configuration registers 0 to 2 (DBRFCNF0 to DBRFCNF2).
3. Set the ARFEN bit to 1 in the auto-refresh enable register (DBRFEN).
4. Write H'00000000 to DB_ADDR + H'4008.
5. Write H'00000000 to DB_ADDR + H'4000.
6. Set the ACCEN bit to 1 (access enabled) in the SDRAM access enable register (DBACEN).
7. Read the operation completion waiting register (DBWAIT) and wait for the response.

End of initialization sequence

Usage Note:

However there is no number of order for these sequences, they must be executed in above order from top-bullet to bottom-bullet.

15.3.5 Self-Refresh Operation

If it is not necessary to access the SDRAM, the SDRAM can be put in self-refresh mode to reduce power consumption while still retaining data contents.

Since access to the SDRAM is disabled in self-refresh mode, requesting an SDRAM data access to the DBSC3 will cause an error.

The following procedure should be used to enter or release self-refresh mode.

(1) Self-Refreshing (When the Clock is Not Stopped)

Use the following procedure to enter self-refresh mode.

1. Set the ACCEN bit to 0 (access disabled) in the SDRAM access enable register (DBACEN).
2. Use the manual command-issuing register (DBCMD) to issue the PREA (precharge all) command. The value written to this register should be OPC = PreA, ARG = 0.
3. Use the manual command-issuing register (DBCMD) to issue the Self-Refresh Entry command. The value written to this register should be OPC = SREn, ARG = 0.
4. Set the ARFEN bit to 0 in the auto-refresh enable register (DBRFEN).

Use the following procedure to release self-refresh mode.

1. Set the ARFEN bit to 1 in the auto-refresh enable register (DBRFEN).
2. Use the manual command-issuing register (DBCMD) to issue the Self-Refresh Exit command. The value written to this register should be OPC = SRXt, ARG = 0.
3. Use the manual command-issuing register (DBCMD) to insert wait cycles until access to the SDRAM is enabled. The value written to this register should be OPC = Wait, ARG = tXSDLL (normally, 512).
4. Set the ACCEN bit to 1 (access enabled) in the SDRAM access enable register (DBACEN).

(2) Self-Refreshing (When the Clock is Stopped or Clock Frequency is Changed)

Use the following procedure to enter self-refresh mode.

1. Set the ACCEN bit to 0 (access disabled) in the SDRAM access enable register (DBACEN).
2. Use the manual command-issuing register (DBCMD) to issue the PREA (precharge all) command. The value written to this register should be OPC = PreA, ARG = 0.
3. Use the manual command-issuing register (DBCMD) to issue the Self-Refresh Entry command. The value written to this register should be OPC = SREn, ARG = 0.

4. Set the ARFEN bit to 0 in the auto-refresh enable register (DBRFEN).
5. Use the manual command-issuing register (DBCMD) to insert wait cycles for the clock to stop. The value written to this register should be OPC = Wait, ARG = tCKSRE (normally, max {5, 10 ns}).
6. Read the operation completion waiting register (DBWAIT) and wait for the response.
7. The clock supplied to the DBSC3 can be stopped at this point

Use the following procedure to release self-refresh mode.

1. Restart the clock supply and wait until the clock settles.
2. Reconfigure the PHY unit.
    - Set the PTRRST bit to 1 in PHY unit control register 3 (DBPDCNT3).
    - Clear the PTRRST bit to 0 in PHY unit control register 3 (DBPDCNT3).
    - Set the CALMODE bit to 1 in PHY unit control register 3 (DBPDCNT3).
    - Set the CALEN bit to 1 in PHY unit control register 3 (DBPDCNT3).
    - Set the DLL_RESET bit to 1 in PHY unit control register 3 (DBPDCNT3).
    - Ensure that the software allows the required waiting time (at least 50 µs).
    - Set the IO_ENABLE bit to 1 in PHY unit control register 3 (DBPDCNT3).
    - Set the PLL2_RESET bit to 1 in PHY unit control register 3 (DBPDCNT3).
    - Ensure that the software allows the required waiting time (at least 100 µs).
    - Set the STBY bit to 1 in PHY unit control register 3 (DBPDCNT3) and the clock is output through the MCK pins.
    - Set either the BW32 or BW16 bit to 1 in PHY unit control register 0 (DBPDCNT0).
    - Make other necessary settings in PHY unit control registers 0 to 3 (DBPDCNT0 to DBPDCNT3).
3. Use the manual command-issuing register (DBCMD) to insert wait cycles until self-refresh mode is released. The value written to this register should be OPC = Wait, ARG = tCKSRX (normally, max {5, 10 ns}).
4. Set the ARFEN bit to 1 in the auto-refresh enable register (DBRFEN).
5. Use the manual command-issuing register (DBCMD) to issue the Self-Refresh Exit command. The value written to this register should be OPC = SRXt, ARG = 0.
6. Use the manual command-issuing register (DBCMD) to insert wait cycles until access to the SDRAM is enabled. The value written to this register should be OPC = Wait, ARG = tXSDLL (normally, 512).
7. Set the ACCEN bit to 1 (access enabled) in the SDRAM access enable register (DBACEN).

Usage Note:

However there is no number of order for these sequences, they must be executed in above order from top-bullet to bottom-bullet.

15.3.6 Power-Down Operation

If there is no need to access SDRAM, entering the power-down mode can place the SDRAM internal clock in inactive state, which can effectively lower the power consumption in the device. Even in a power-down mode, the clock and power need to be supplied.

Use the following procedure to enter the power-down mode.

1. Set the ACCEN bit to 0 (access disabled) in the SDRAM access enable register (DBACEN).
2. Use the manual command-issuing register (DBCMD) to issue the Power Down Entry command. The value written to this register should be OPC = PDEn, ARG = 0.

Use the following procedure to release the power-down mode.

1. Use the manual command-issuing register (DBCMD) to issue the Power Down Exit command. The value written to this register should be OPC = PDXt, ARG = 0.
2. Set the ACCEN bit to 1 (access enabled) in the SDRAM access enable register (DBACEN).

To keep holding the SDRAM data in power-down mode, a refresh command needs to be issued at regular intervals in the same way as in normal operation. In the DBSC3, by entering the power-down mode with the auto-refresh function operating (ARFEN = 1 in the DBRFEN register), refresh is performed regularly and the SDRAM data is held even in the power-down mode.

Since access to the SDRAM is disabled in self-refresh mode, requesting an SDRAM data access to the DBSC3 will cause an error.

15.3.7 Modifying Refresh Settings during Operation

In the DBSC3, refresh settings (such as refresh frequency) can be modified during operation. The following gives the procedure for it. Note that it is assumed that the ACCEN bit in the DBACEN register has been set to 1 (access is enabled) and the ARFEN bit in the DBRFEN register has been set to 1 (auto-refresh is active) in advance.

1. Write to refresh configuration registers 0 to 2 (DBRFCNF0 to DBRFCNF2) to modify settings.
2. Write 1 to the ARFEN bit in the auto-refresh enable register (DBRFEN).

After step 2, the new settings made in step 1 are applied to the refresh operation.

15.3.8 Restrictions on AXI Bus Interface

This section describes the restrictions on the AXI bus interface.

(1) Fixed Burst Transfer

Only a burst length of 1 is supported for the fixed burst length transfer. The DBSC3 returns an error response to the transactions with the other burst length.

15.3.9 Setting the SDRAM Configuration Setting Register

(1) DDR3-SDRAM (32-Bit External Bus)

Capacity	Memory Configuration	Rank	Bank [No. of Banks]	Row [No. of Bits]	Column [No. of Bits]	DBCONF0 Setting				
						AWRW0	AWRK0	AWBK0	AWCL0	DW0
128 Mbytes	32 M × 16 bits "512 Mbits" (2 modules)	1	8	12	10	01100	0	11	1010	10
256 Mbytes	64 M × 16 bits "1 Gbit" (2 modules)	1	8	13	10	01101	0	11	1010	10
512 Mbytes	128 M × 16 bits "2 Gbits" (2 modules)	1	8	14	10	01110	0	11	1010	10
1 Gbyte	256 M × 16 bits "4 Gbits" (2 modules)	1	8	15	10	01111	0	11	1010	10
2 Gbytes	512 M × 16 bits "8 Gbits" (2 modules)	1	8	16	10	10000	0	11	1010	10

15.3.10 Address Multiplexing

Memory of various sizes can be connected through the settings of the SDRAM configuration setting register 0 (DBCONF0). The DW0 bits are used to set the external data bus width, and the AWRW0 and AWCL0 bits are used to set the size of the memory connected. The AWBK0 bits are used to specify the number of banks; depending on the application the possibility of page hits may be increased.

(1) DDR3-SDRAM (32-Bit External Bus)

Table 15.9 Relation between Address Pins and Logical Addresses (BKADM = B'00) (When Two 16-Bit-Width SDRAM Modules are Connected)

Memory Type		BA2	BA1	BA0	MA15	MA14	MA13	MA12	MA11	MA10	MA9	MA8	MA7	MA6	MA5	MA4	MA3	MA2	MA1	MA0

	COL	A14	A13	A12	0	0	0	BC#	0	AP	A11	A10	A9	A8	A7	A6	A5	A4	0	0

Notes: 1. A31 to A0 are the logical address bits in byte units. A31 represents the MSB, and A0 the LSB.
2. AP is an abbreviation of auto precharge option.
3. BC# is an abbreviation of burst chop option.

15.3.11 SDRAM Access and Timing Constraints

In this section, waveforms at the various pins during basic SDRAM access are explained first and then the relation between SDRAM access and the CAS latency (CL, CWL), tRAS, tRFC, tRCD, tRP, tRRD, tWR, tRTP, tRC, READ to WRITE minimum interval, and WRITE to READ minimum interval set using SDRAM timing registers 0 to 19 (DBTR0 to DBTR19) is explained.

(1) Basic SDRAM Access

In this section, waveforms at the various pins during basic SDRAM access, including reading, writing, auto-refresh, and self-refresh operations, are explained.

Figure 15.6 shows waveforms for 1-/2-/4-/8-/16-byte reading. In this case, single reading is performed in which the READ command is issued once. In this example, read access processing is executed for bank A after the ACT command is issued, but when there is a page hit, access begins with the issue of the READ command.

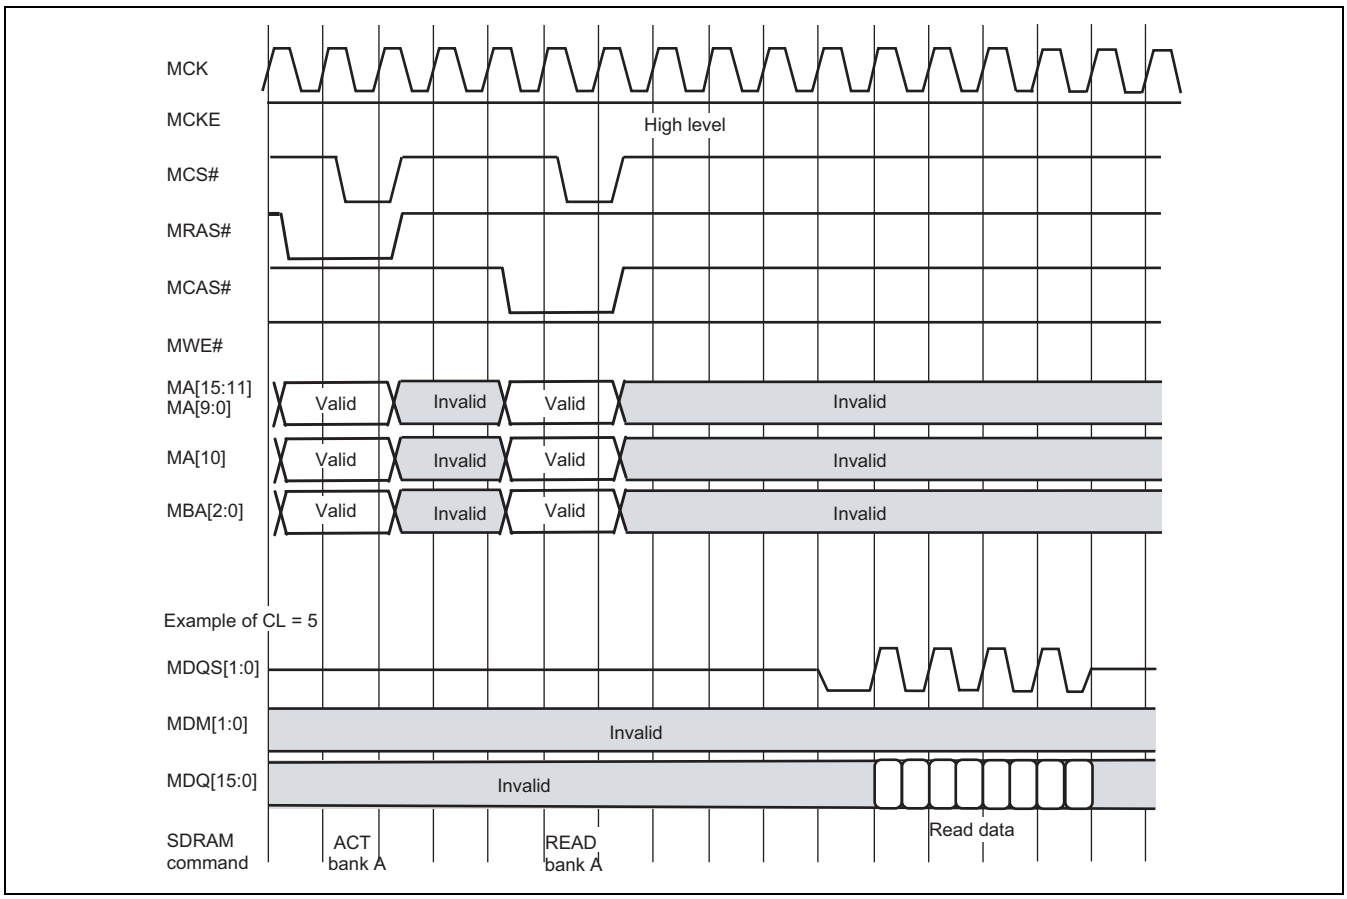

Figure 15.6 Waveforms for 1/2/4/8/16-Byte Reading

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK and M0A signals, respectively.

Figure 15.7 shows waveforms for 1-/2-/4-/8-/16-byte writing. In this case, single writing is performed in which the WRITE command is issued once. In this example, write access processing is executed for bank A after the ACT command is issued, but when there is a page hit, access begins with the issue of the WRITE command.

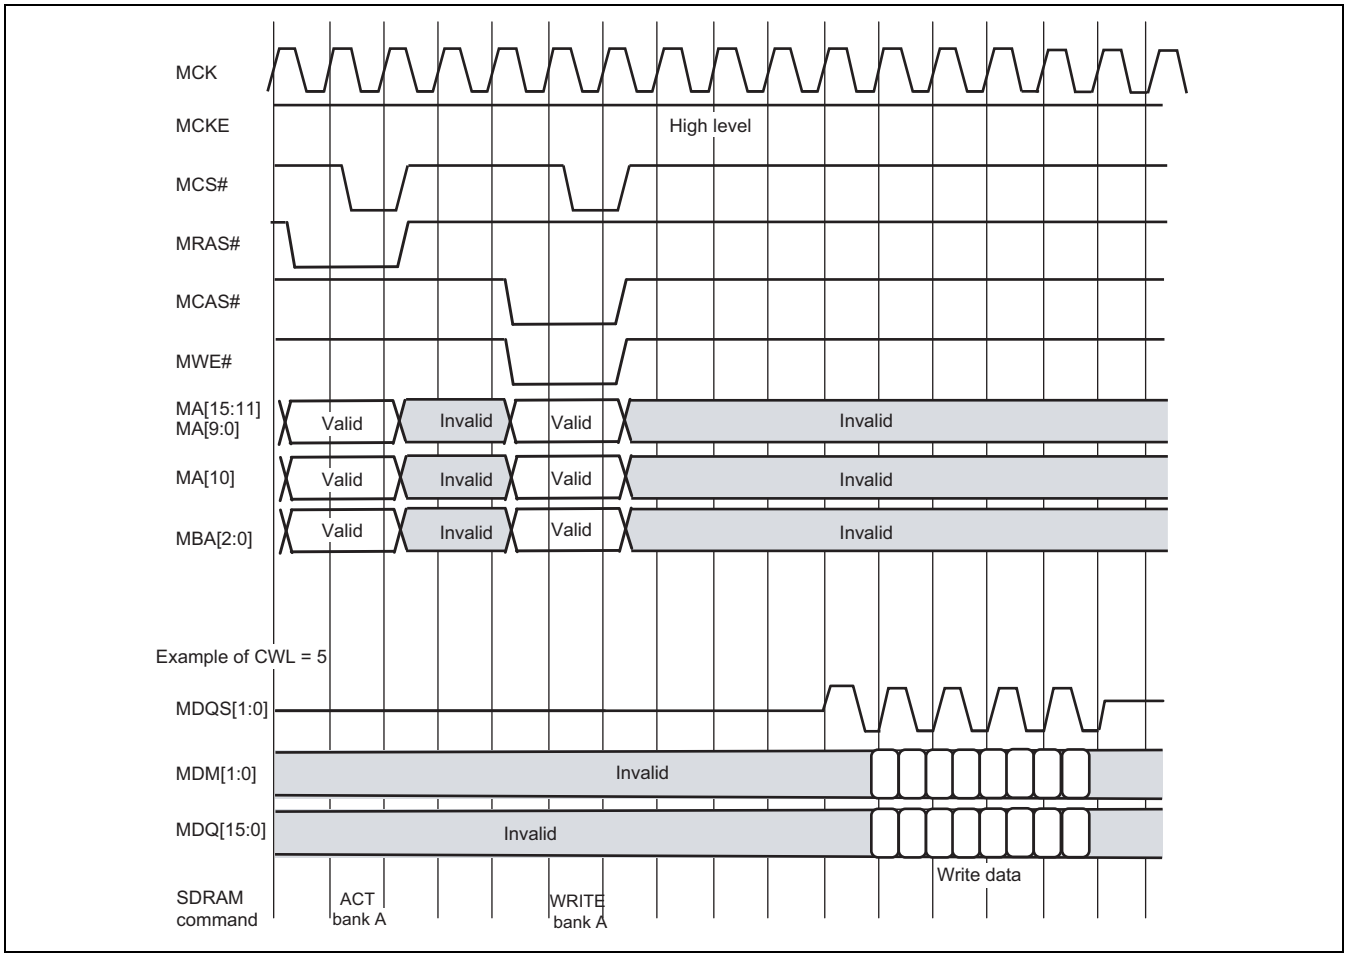

Figure 15.7 Waveforms for 1/2/4/8/16-Byte Writing

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK and M0A signals, respectively.

Figure 15.8 shows waveforms during auto-refresh operation resulting from settings of the refresh configuration registers 0 to 2. The DBSC3 issues a REF command automatically after the PALL command is issued when at least one SDRAM bank is activated before the REF command. Consequently, there is no need to use software to manage precharging of all the banks for the auto-refresh operation.

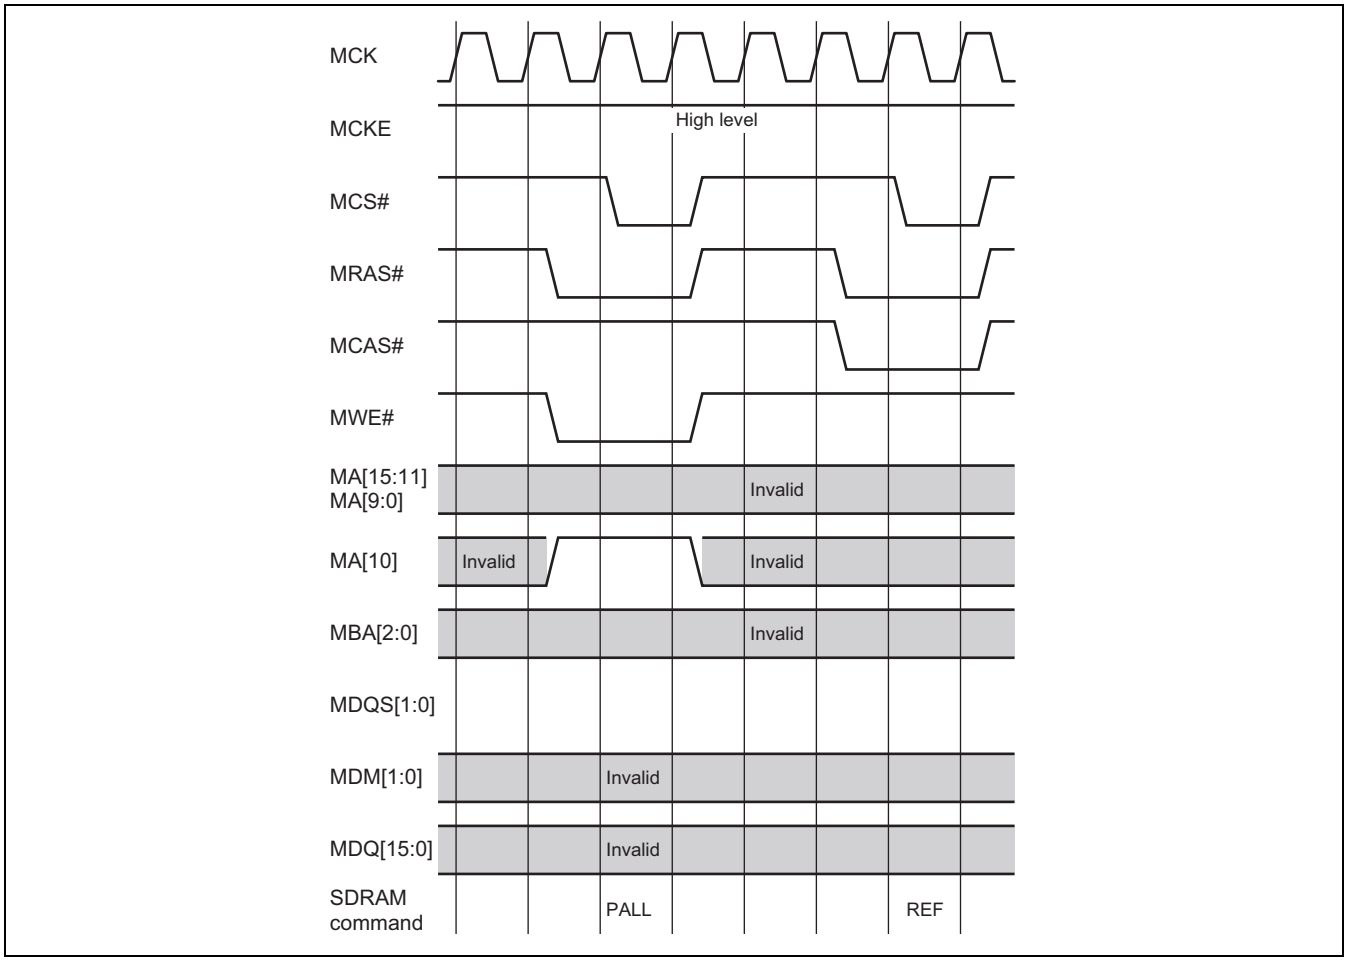

Figure 15.8 Auto-Refresh Operation

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK and M0A/ signals, respectively.

Figure 15.9 shows the self-refresh operation. In order to perform self-refresh operation, the specified sequence must be observed. For details, refer to section 15.3.5, Self-Refresh Operation.

When performing processing according to the sequence in section 15.3.5, Self-Refresh Operation, commands to be issued to the SDRAM are those shown in Figure 15.9. Before the transition to self-refresh, the PALL command is issued by software. Then, software is used to issue the REF command and the SRX (self-refresh entry from IDLE) command. The SDRAM is in self-refresh mode until self-refresh is released by software. After issuing the SRX (self-refresh exit) command by software, it is necessary to wait for the time (tXSNR) specified in the datasheet for the SDRAM being used until issuing a REF command. A wait example is shown in section 15.3.4.12, Method for Securing Time Required for Initialization, Self-Refresh Release, etc.

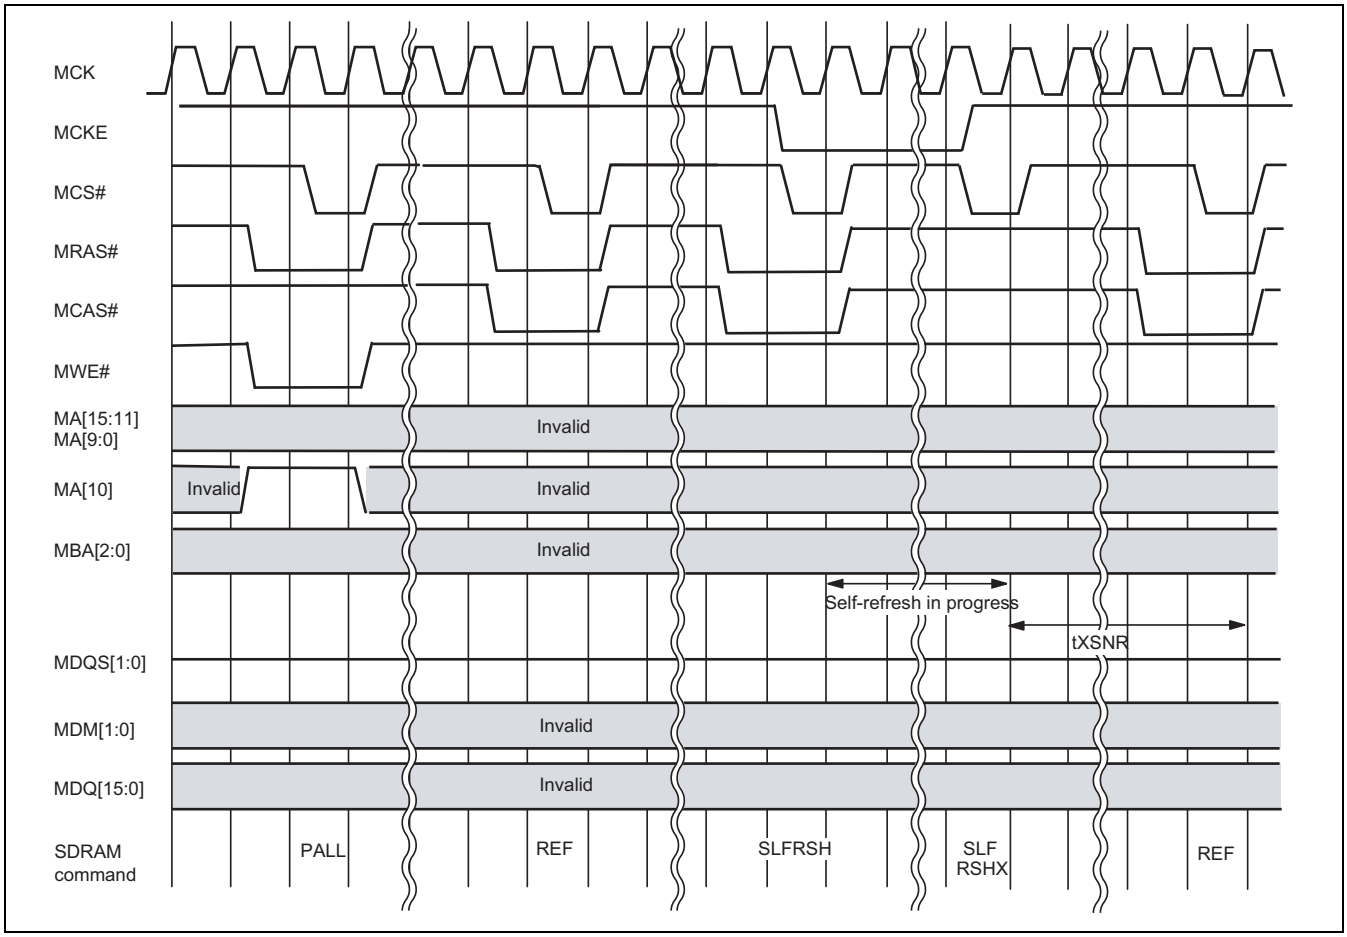

Figure 15.9 Self-Refresh Operation

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK and M0A signals, respectively.

(2) Timing Constraints

Figure 15.10 shows the relation between the settings of CL, tRAS, tRCD, and tRP, and the issuing of commands. Figure 15.11 shows the relation to tRRD and tRTP, Figure 15.12 shows the relation to tWR, Figure 15.13 shows the relation to tRC, Figure 15.14 shows the relation to READ-WRITE, Figure 15.15 shows the relation to WRITE-READ, and Figure 15.16 shows the relation to tRFC.

Figure 15.10 corresponds to operation in a case in which bank A is open, there is read access of bank A, and a page miss occurs. The constraint tRP between the PRE command and ACT command, the constraint tRCD between the ACT command and READ command, and the constraint tRCD between the ACT command and the PRE command are involved. The DBSC3 waits to issue commands until each of the constraints is satisfied.

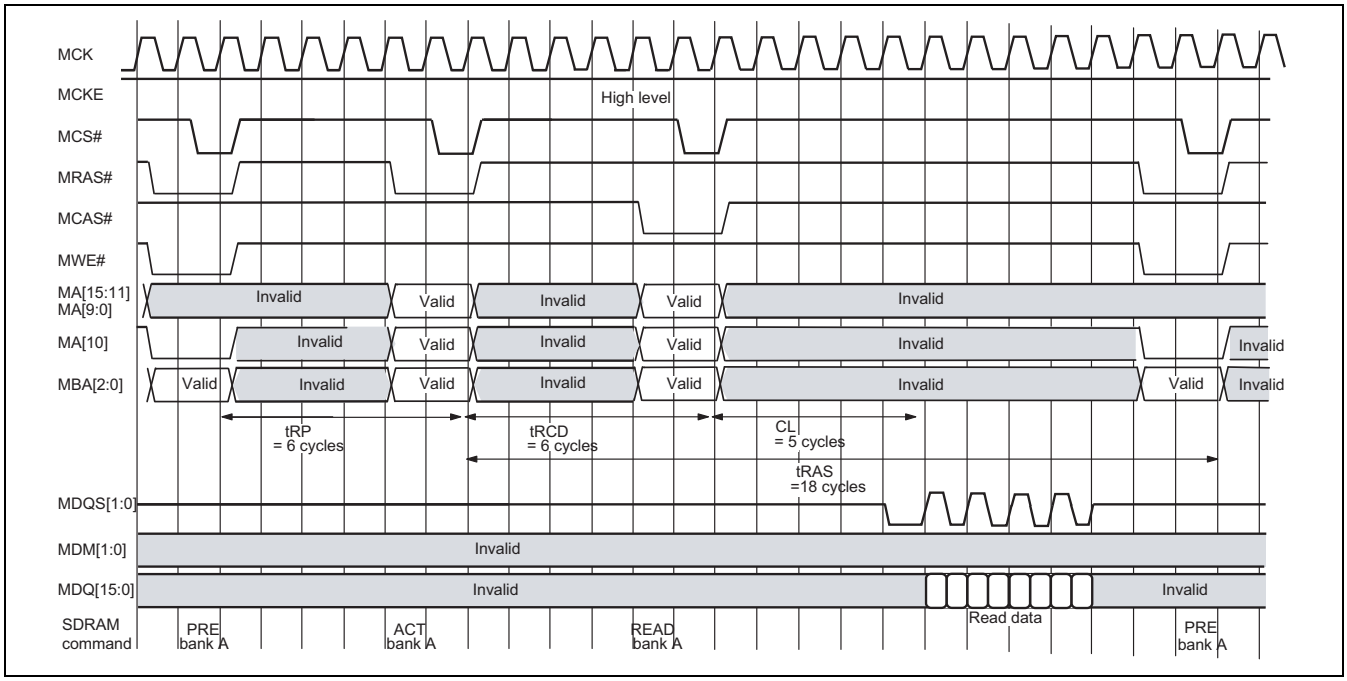

Figure 15.10 tRP, tRCD, CL, and tRAS

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK and M0A signals, respectively.

Figure 15.11 shows a case in which the pages for both of banks A and B are closed, the page for bank C is open, and a page hit has occurred. When the tRRD time constraint has been satisfied starting from issue of the ACT command for bank A, the ACT command for bank B is issued. Because time tRCD has elapsed from the issue of the ACT command for bank A, a READ command can be used. The READ command has a burst length of 8, so after four cycles a READ command for bank B can be issued. A further four cycles later, a READ command for bank C can be issued. However, the next request is access for which bank C must be closed, and so after the elapse of time tRTP, a PRE command is issued.

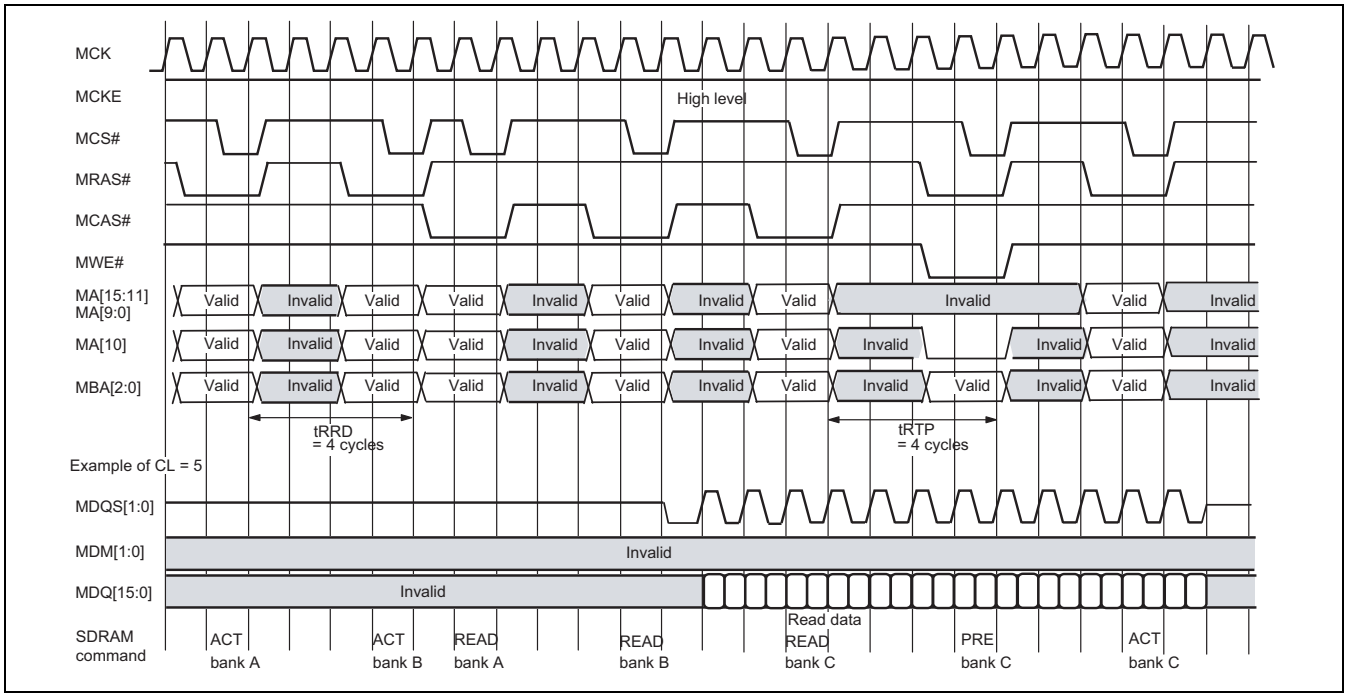

Figure 15.11 tRRD and tRTP

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK and M0A signals, respectively.

Figure 15.12 shows a case in which, after a write request, access occurs requiring that bank B be closed. After the issue of a WRITE command, it is necessary to wait for time tWR or longer after output of the write data before issuing a PRE command.

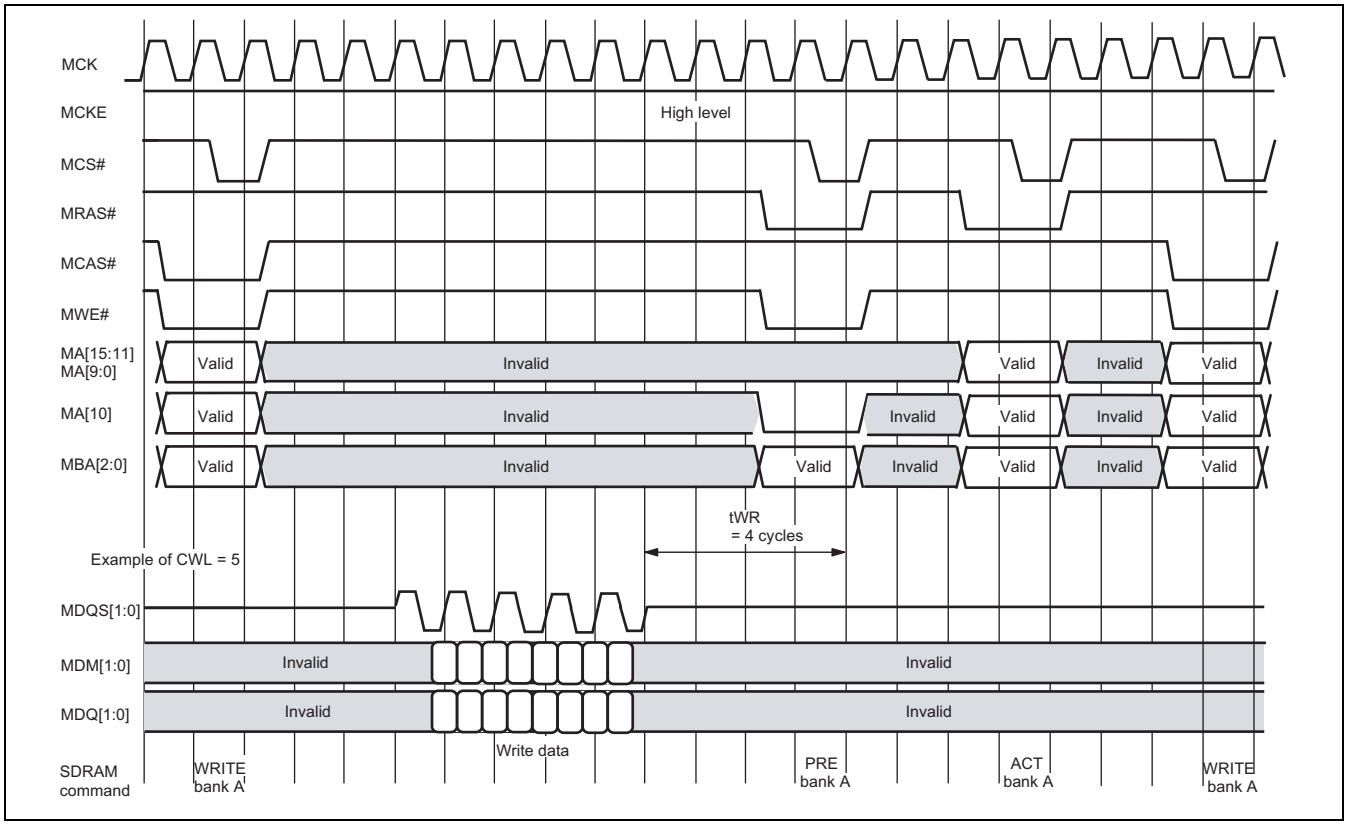

Figure 15.12 tWR

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK and M0A signals, respectively.

Figure 15.13 shows an example of performing auto-refresh after read access of bank A, the page for which had been closed. After issuing an ACT command and READ command for bank A and performing data reading, a PALL command must be used to close all banks in order to perform auto-refresh. In order to issue the PREA command, the tRAS time constraint must be satisfied and issuing of the PREA command is delayed until this time. Then, when issuing the REF command, both of time constraints tRPA and tRC must be satisfied simultaneously. When these constraints are both satisfied, the REF command is issued and auto-refresh is performed.

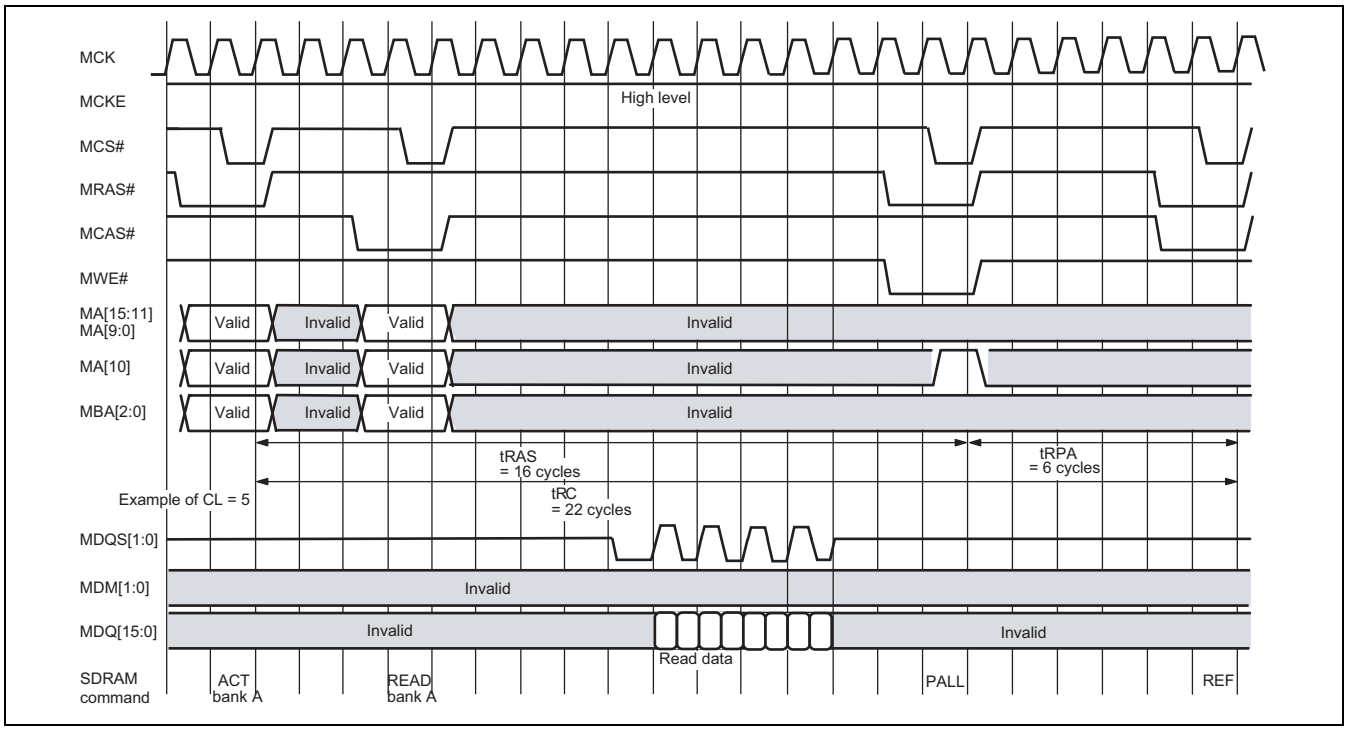

Figure 15.13 tRC

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK and M0A signals, respectively.

Figure 15.14 shows an example of a case in which, after issuing a READ command, a WRITE command is issued. In order to issue the WRITE command after issuing the READ command, the DBSC3 waits for a minimum time stipulated by the RDWR bits.

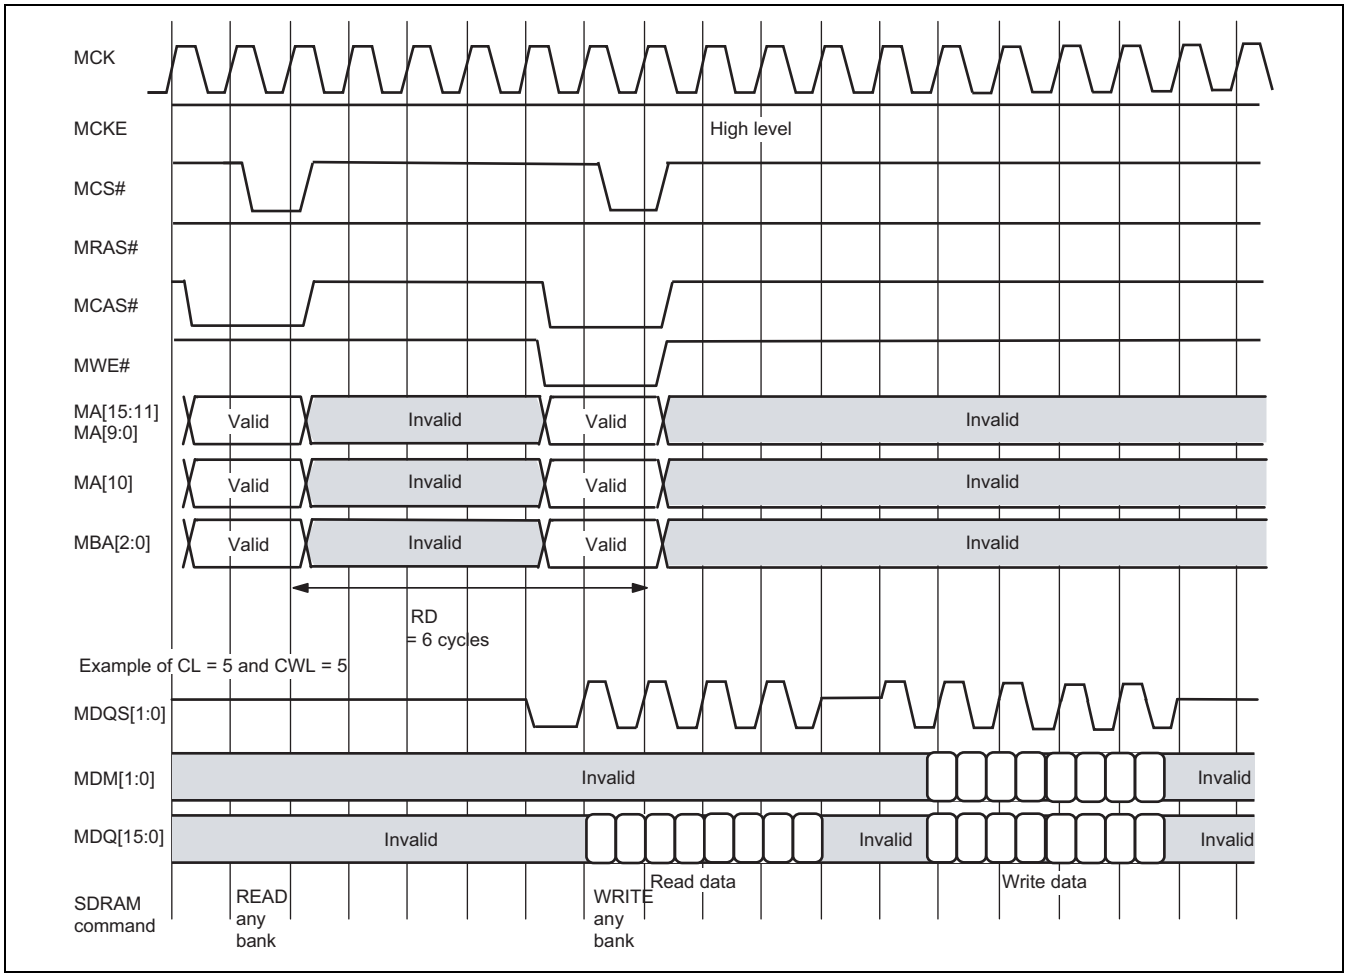

Figure 15.14 READ-WRITE Minimum Time

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK and M0A signals, respectively.

Figure 15.15 shows an example of a case in which, after issuing a WRITE command, a READ command is issued. In order to issue the READ command after issuing the WRITE command, the DBSC3 waits for a minimum time stipulated by the WRRD bits.

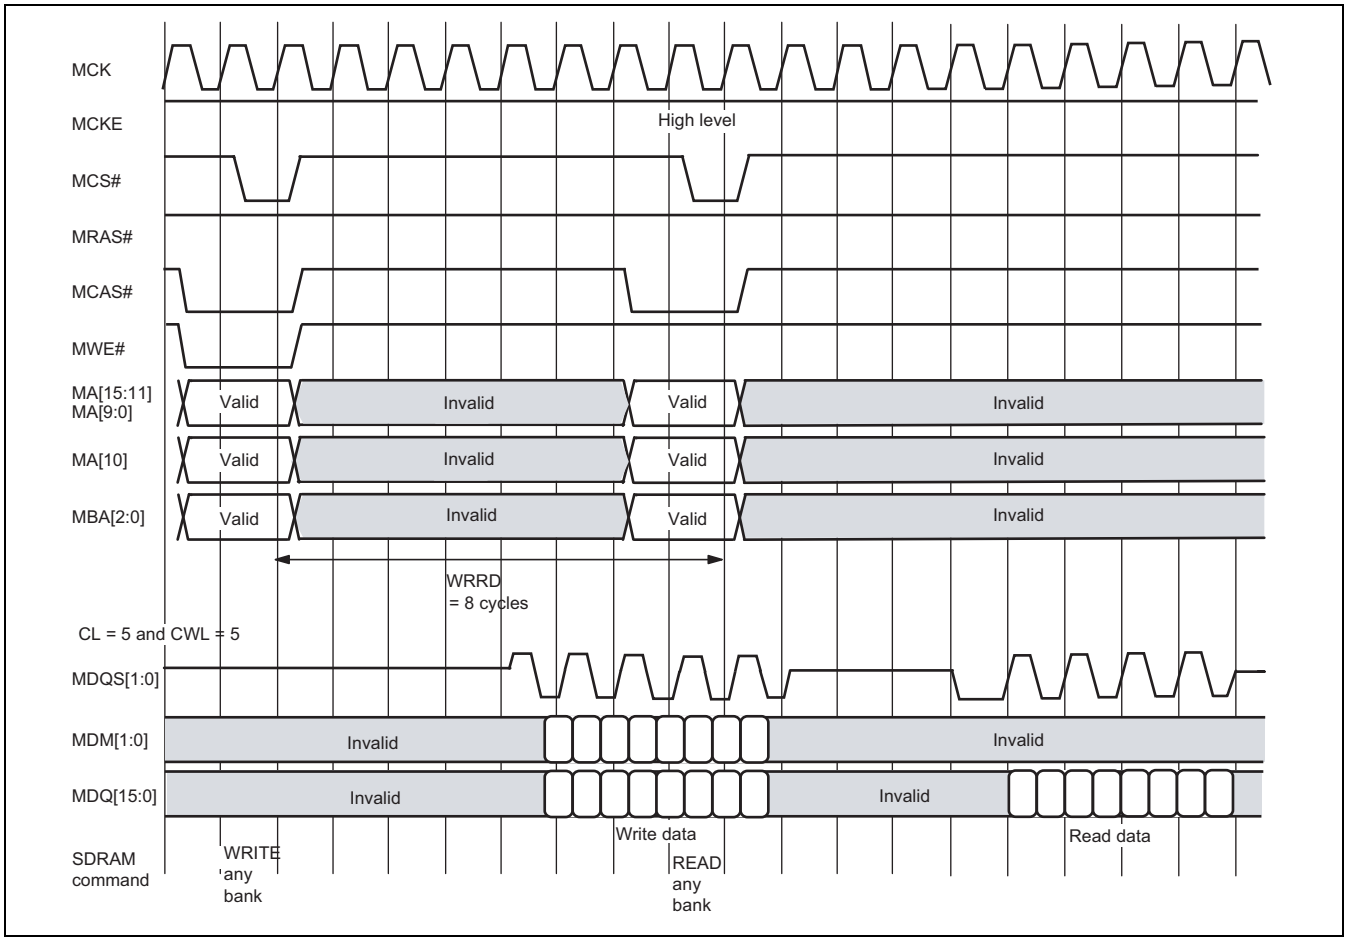

Figure 15.15 WRITE-READ Minimum Time

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK and M0A signals, respectively.

Figure 15.16 shows an example of a case in which, after issuing a REF command, a READ request is issued. In order to issue the ACT command after issuing the REF command, the DBSC3 waits for a time stipulated by tRFC.

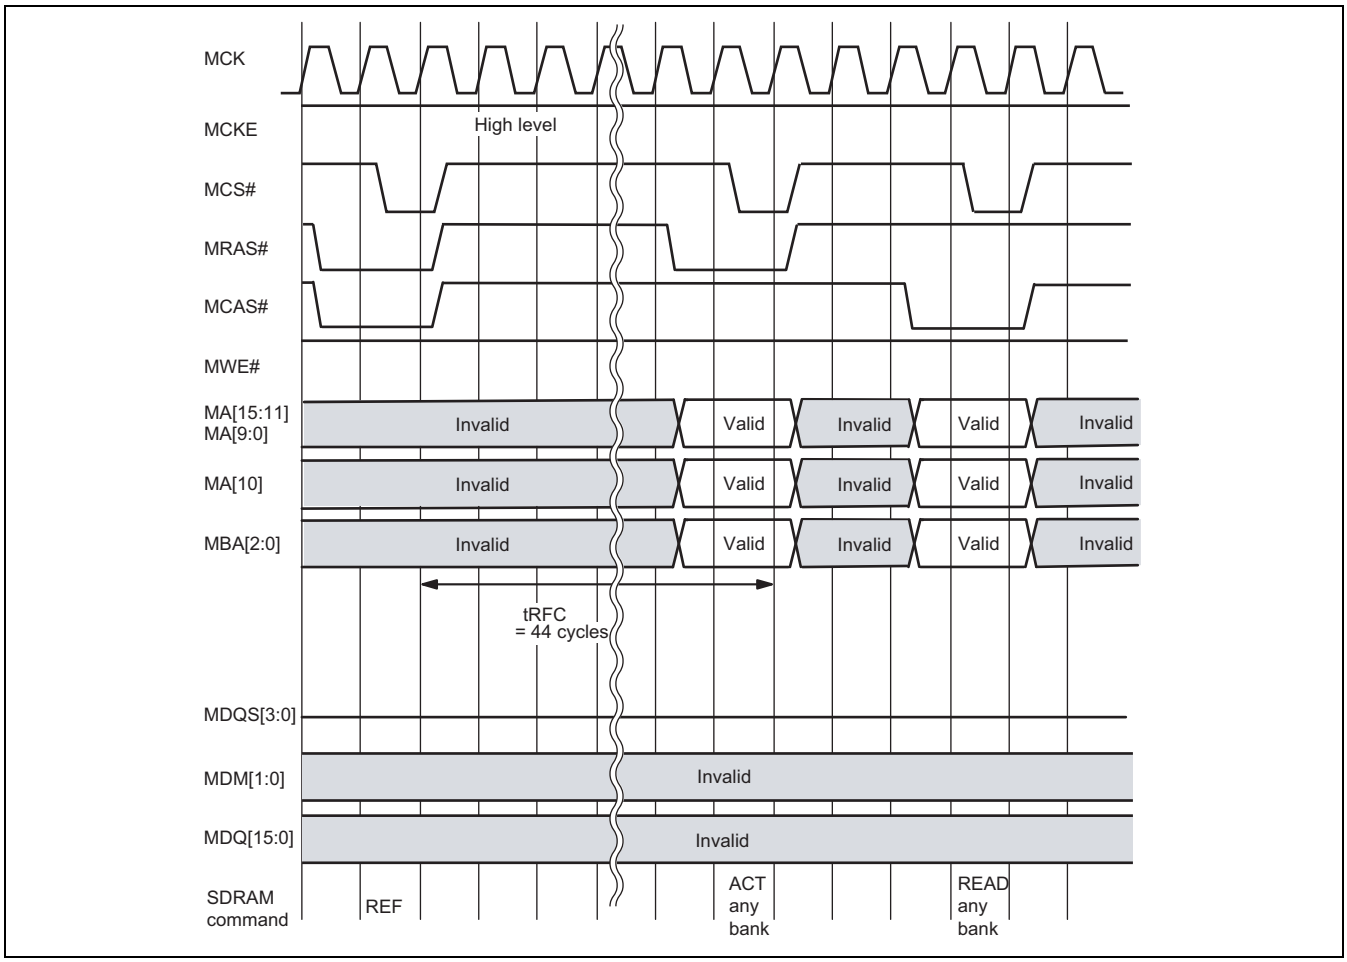

Figure 15.16 tRFC

Note: In the figure, collective names are used for signals. For example, MCK and MA indicate M0CK and M0A signals, respectively.

15.3.12 Method for Securing Time Required for Initialization, Self-Refresh Release, etc.

When using DBSC3 register settings to set initialization or release the self-refresh state, there is a need to wait for the time defined in the SDRAM specifications. To reserve this waiting time, read from the DBSC3 status register 1 (DBSTATE1). When this is done, at least seven memory clock cycles elapse. For 250-MHz operation, about 28 ns elapse upon one DBSTATE1 read. This can be utilized to secure the required time, by repeating read access the necessary number of times.

15.4 Notes on Board Design

15.4.1 Connection of M0ZQ Pin

A resistor having the following value should be connected to the M0ZQ pin outside this LSI.

DDR3-SDRAM: 120 Ω (± 1%)

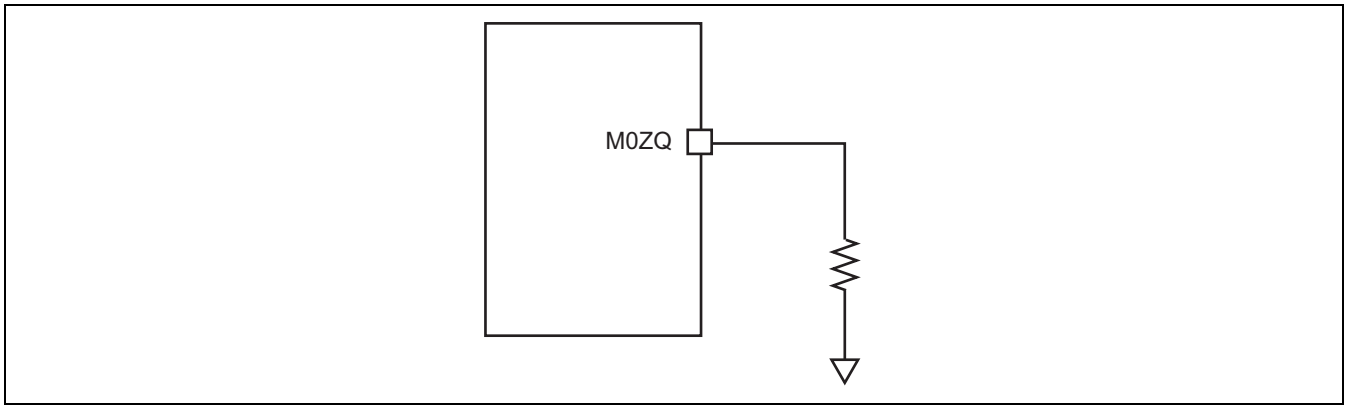

Figure 15.17 Connection of M0ZQ Pin

15A. S3 Controller (S3CTRL)

15A.1 Overview

The S3 controller (S3CTRL) includes a local interconnect placed between AXI-bus interconnects and DBSC memory controller.

15A.1.1 Features

The S3CTRL include the following features.

- XY command decoder (media domain only)
- Support 8 entries of system CPU's exclusive access command.

15A.1.2 Block Diagram

Figure 15A.1 is a block diagram of the S3CTRL.

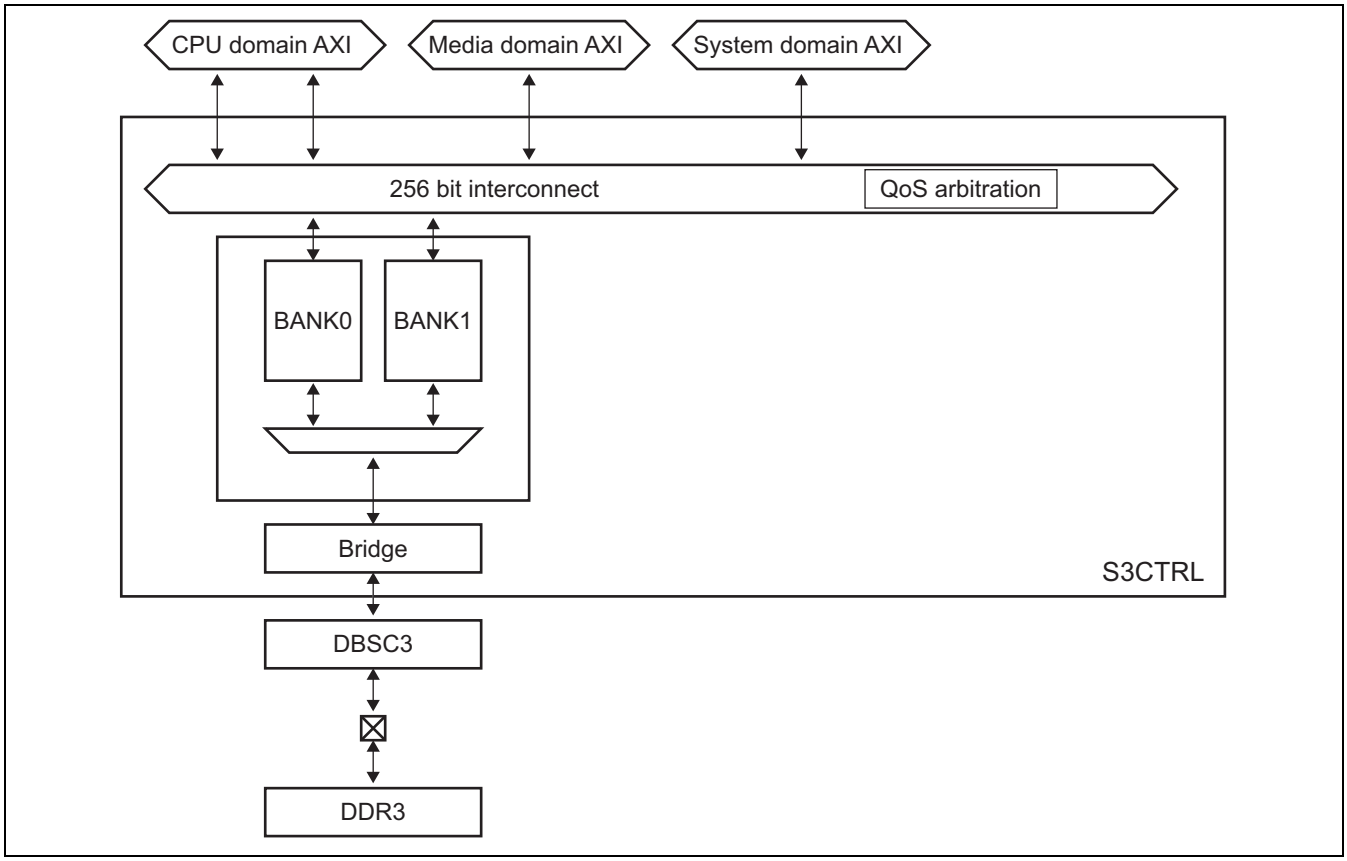

Figure 15A.1 Block Diagram of S3CTRL

15A.1.3 Input / Output Pins

No external pins are supported.

15A.1.4 Register Configuration

Table 15A.1 shows the register configuration. Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined. Access the register as a long-word (32 bits). Operation cannot be guaranteed if the register is not accessed as a long-word.

Table 15A.1 Register Configuration

Name	Abbreviation	R/W	Address	Initial Value	Access Size
Exclusive Address Mask Register	S3CEXCLADDMSK	R/W	H'E678 4000	H'FFFFFFFF	32

15A.2 Register Description

Legend for Register Description

Initial value: Register value after a reset. H'xxxx represents a hexadecimal number. Others are represented in binary numbers.

—: Undefined value

R/W: Readable/writable. The written value can be read.

R: Read-only. The write value should always be 0.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

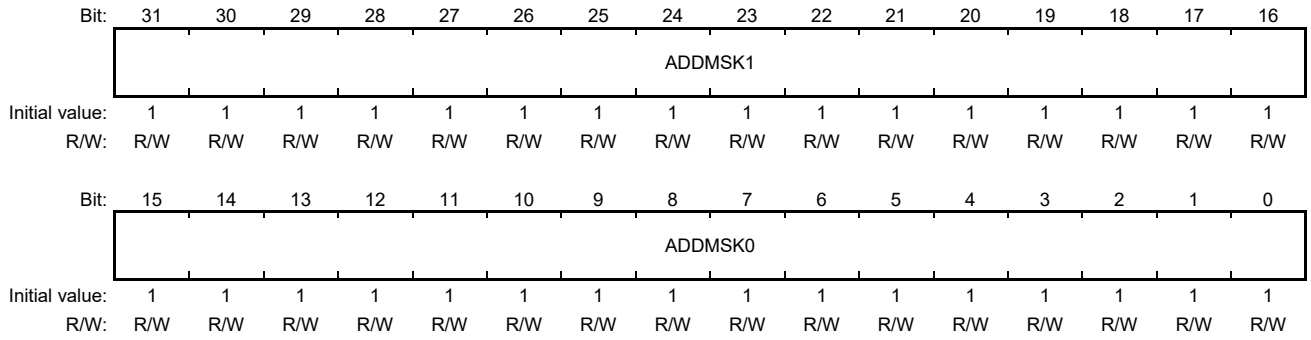
W: Write-only. Reading this bit is prohibited. When the bit is reserved, the write value should always be 0.

—/W: Write-only. The read value is undefined.

All access to registers is made in long-word units.

15A.2.1 Exclusive Address Mask Register (S3CEXCLADDMSK)

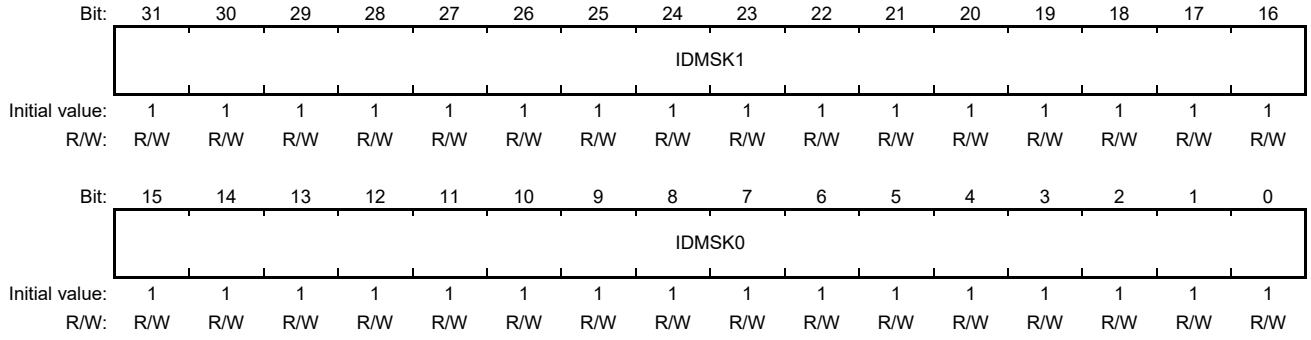
Function: Address bit mask of exclusive access. Lower 16-bit address can be masked.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	ADDMSK1	H'FFFF	R/W	Reserved These bits are always read as H'FFFF. The write value should always be H'FFFF.
15 to 0	ADDMSK0	H'FFFF	R/W	Exclusive address mask (Lower 16 bits) enable bit for DBSC channel 0 0: Disable bit 1: Enable bit

15A.2.2 Exclusive ID Mask Register (S3CEXCLIDMSK)

Function: ID bit mask of exclusive access



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	IDMSK1	H'FFFF	R/W	Reserved These bits are always read as H'FFFF. The write value should always be H'FFFF.
15 to 0	IDMSK0	H'FFFF	R/W	Exclusive ID mask (Lower 16 bits) enable bit for DBSC channel 0 0: Disable bit 1: Enable bit

15A.2.3 S3C Read Outstanding Regulation Register (S3CRORR)

Function: S3CTRL can control the number of read transaction at every QoS level to prevent DBSC's queue with low priority transactions. Transaction number is set by QOSTHn + 1. When QOSTHn = H'1F, its transaction number is not limited.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RST	—	—	QOSTH3					—	—	—	QOSTH2				
Initial value:	0	0	0	0	1	1	1	1	0	0	0	0	1	1	0	1
R/W:	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	QOSTH1					—	—	—	QOSTH0				
Initial value:	0	0	0	0	1	0	1	1	0	0	0	0	0	1	1	1
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	RST	0	R/W	Reset the read transaction counter.
30, 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 24	QOSTH3	H'0F	R/W	The threshold queue length which the read transactions of QOS-Level3 can fill.
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	QOSTH2	H'0D	R/W	The threshold queue length which the read transactions of QOS-Level2 can fill.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	QOSTH1	H'0B	R/W	The threshold queue length which the read transactions of QOS-Level1 can fill.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	QOSTH0	H'07	R/W	The threshold queue length which the read transactions of QOS-Level0 can fill.

15A.2.4 S3C Write Outstanding Regulation Register (S3CWORR)

Function: S3CTRL can control the number of write transaction at every QoS level to prevent DBSC's queue with low priority transactions. Transaction number is set by QOSTHn + 1. When QOSTHn = H'1F, its transaction number is not limited.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RST	—	—	QOSTH3					—	—	—	QOSTH2				
Initial value:	0	0	0	0	1	1	1	1	0	0	0	0	1	1	0	1
R/W:	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	RST	0	R/W	Reset the write transaction counter.
30, 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 24	QOSTH3	H'0F	R/W	The threshold queue length which the write transactions of QOS-Level3 can fill.
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	QOSTH2	H'0D	R/W	The threshold queue length which the write transactions of QOS-Level2 can fill.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	QOSTH1	H'0B	R/W	The threshold queue length which the write transactions of QOS-Level1 can fill.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	QOSTH0	H'07	R/W	The threshold queue length which the write transactions of QOS-Level0 can fill.

15A.2.5 XY TL Area Control Register A0 to A7 (XYTLAREAAn (n = 0 to 7))

Function: This register sets XY TL area. To change the value, set EN bit to 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EN	—	—	—	—	—	—	—	—	BA[34:28]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

15A.3 Operation

15A.3.1 SDRAM Address Space

The S3CTRL supports one independent SDRAM memory controllers (DBSC) and 2 Gbytes address space on this controller. The SDRAM address mapping is managed on 40-bit physical address. Legacy address space is mapped to H'01 0000 0000 to H'01 7FFF FFFF.

Figure 15A.2 is shown SDRAM address map related to S3CTRL.

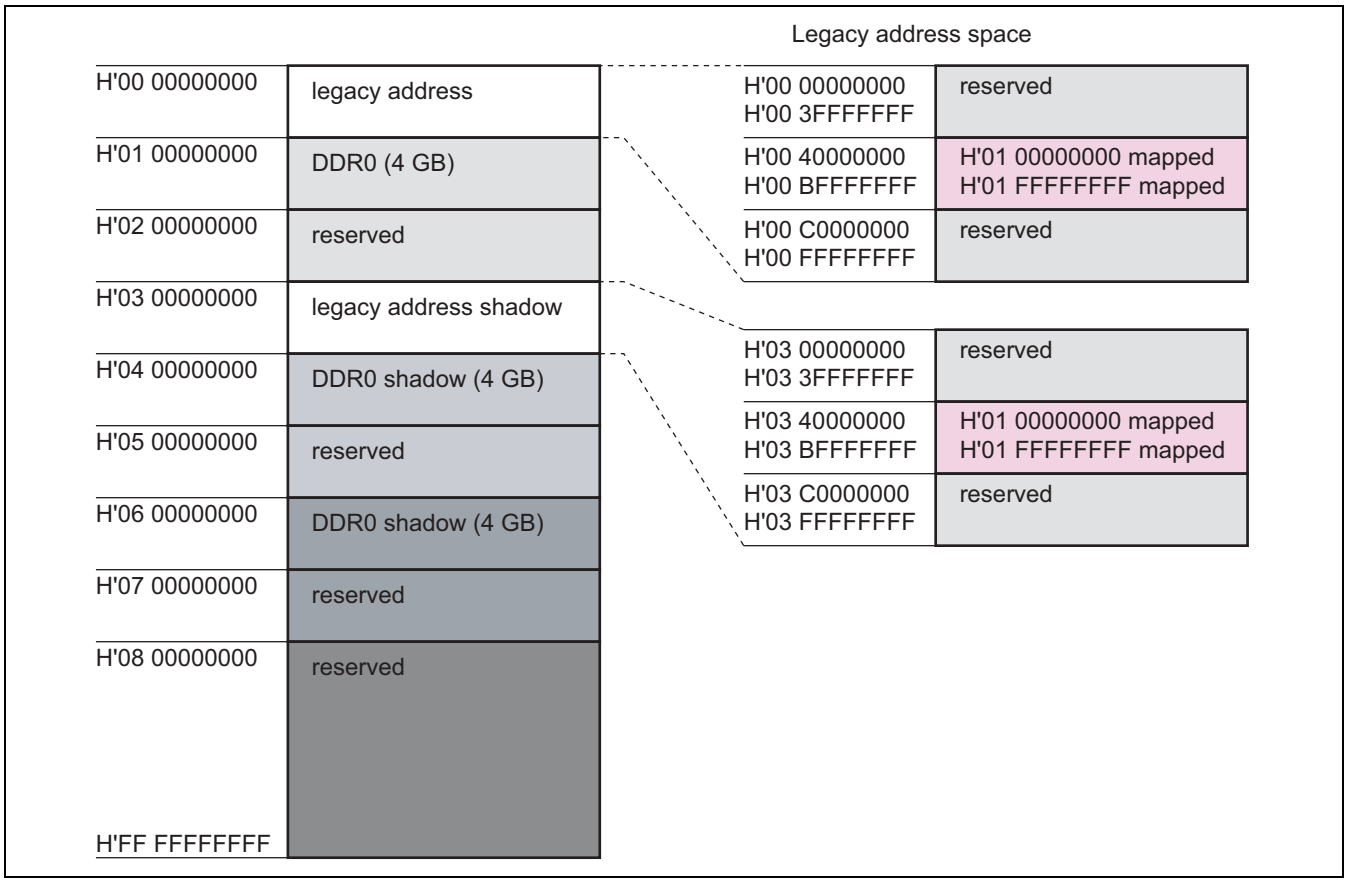

Figure 15A.2 SDRAM Address Map (Concerned with S3CTRL)

15A.3.2 XY Command Address Area

S3CTRL supports XY operation from Media domain. The address area accessed by XY operation is defined as Tile-Linear translated area. This area can be defined up to 8 areas. This Tile-Linear translated area also can be accessed by normal (linear) transaction from Media domain.

15A.3.3 QoS Arbitration

Every AXI domain has their own QoS level generator which can change a priority value of transactions dynamically based on its mode. The value is used when choosing the highest priority transaction at arbitration points. Read/Write transaction queues before a memory controller can limit the maximum number of transaction that can be enquired at every QoS level through S3CRORR/S3CWORR register. That allows low QoS transactions not to fill the queues and reserves space for higher QoS transactions.

15A.3.4 About Exclusive Instruction Monitor

The S3CTRL provides 8 exclusive access monitors for the memory controller. In the AXI specification, the AXI IDs and the addresses of the exclusive read and the exclusive write must be identical. However, the S3CTRL can specify the valid range of the IDs and the address through S3CEXCLADMSK and S3CEXCLIDMSK registers.

16. Direct Memory Access Controller for System (SYS-DMAC)

This LSI includes a direct memory access controller for system (SYS-DMAC). The SYS-DMAC can be used in place of the CPU to handle high-speed data transfer to and from an external memory, the on-chip memory, memory-mapped external devices, or on-chip peripheral modules.

16.1 Features

- Up to 30 channels are available.
- 4-Gbyte physical address space
- Transfer data length: Byte, word (2 bytes), longword (4 bytes), 8 bytes, 16 bytes, 32 bytes, and 64 bytes
- Maximum number of transfer times: 16,777,215
- Address mode: Dual address mode
- Transfer requests:

  Requests from on-chip peripheral modules or auto requests can be selected. The following modules can issue on-chip peripheral module requests.

  MSIOF0/1/2, HSCIF0/1/2, SCIF0/1/2/3/4/5, SDHI0/2, QSPI0/1
- Selectable bus modes:

  Normal speed mode or slow mode can be selected for each channel.
- Either fixed priority or round-robin arbitration can be selected for use in arbitration among the transfer channels.
- Interrupt request:

  The SYS-DMAC can be set up to generate an interrupt request for the CPU upon completion of transfer under the control of one stage of the descriptor memory, at the end of the data transfer, in response to an MMU error, and in response to an address error.
- Descriptor memory function:

  Up to 128 sets of the settings for the source address register, destination address register, and transfer count register are available (if use of the descriptor memory is only enabled for one channel) for use in setting up consecutive DMA transfers (the memory can hold register values for up to 256 stages of transfer when the external memory is selected). An infinite repeat mode is also available.

Figure 16.1 shows the block diagram of the SYS-DMAC.

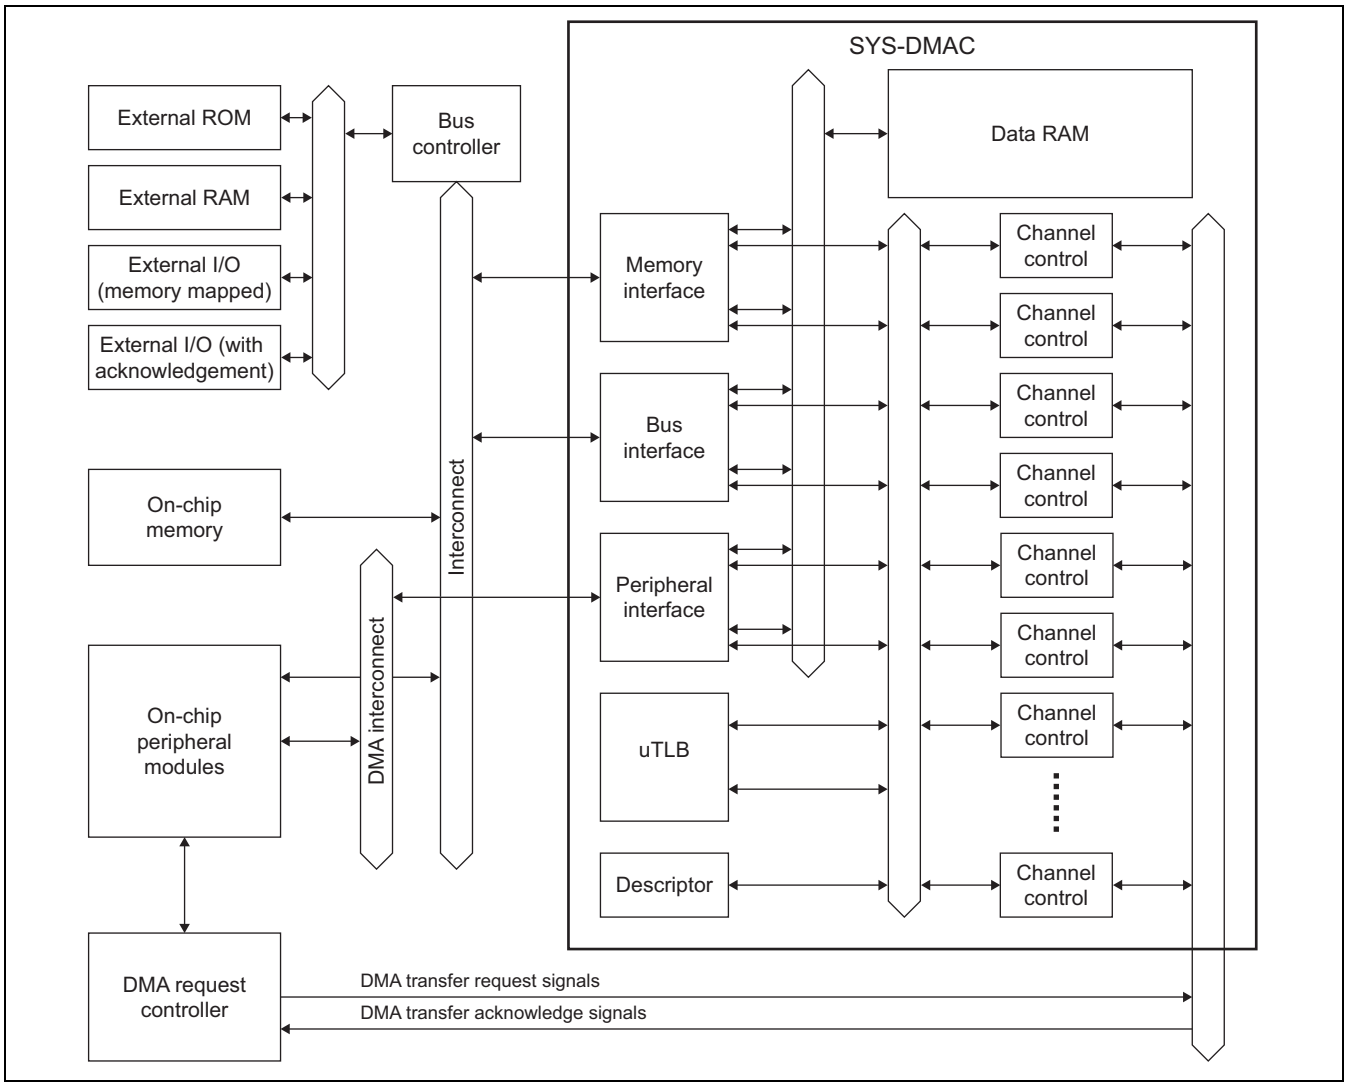

Figure 16.1 Block Diagram of the SYS-DMAC

16.2 Input/Output Pins

There are no external pins relevant to the SYS-DMAC.

16.3 Register Descriptions

Table 16.1 lists the registers of the SYS-DMAC. Table 16.2 shows the register states of the SYS-DMAC in each operating mode.

Table 16.1 Register Configuration of the SYS-DMAC

Name	Abbreviation	R/W	Address	Access Size
DMA interrupt status register (for lower-numbered channels)	DMAISTA_L	R	H'E670 0020	32

0	I0	0	R	Interrupt State in Channel 0 0: An interrupt is not present. 1: An interrupt is present.

16.3.2 DMA Interrupt Status Register for Higher-Numbered Channels (DMAISTA_U)

DMAISTA_U is a 32-bit readable register that indicates the states of the interrupt signals for each of the higher-numbered channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	I29	I28	I27	I26	I25	I24	I23	I22	I21	I20	I19	I18	I17	I16	I15
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14	I29	0	R	Interrupt State in Channel 29 0: An interrupt is not present. 1: An interrupt is present.
13	I28	0	R	Interrupt State in Channel 28 0: An interrupt is not present. 1: An interrupt is present.
12	I27	0	R	Interrupt State in Channel 27 0: An interrupt is not present. 1: An interrupt is present.
11	I26	0	R	Interrupt State in Channel 26 0: An interrupt is not present. 1: An interrupt is present.
10	I25	0	R	Interrupt State in Channel 25 0: An interrupt is not present. 1: An interrupt is present.
9	I24	0	R	Interrupt State in Channel 24 0: An interrupt is not present. 1: An interrupt is present.
8	I23	0	R	Interrupt State in Channel 23 0: An interrupt is not present. 1: An interrupt is present.
7	I22	0	R	Interrupt State in Channel 22 0: An interrupt is not present. 1: An interrupt is present.
6	I21	0	R	Interrupt State in Channel 21 0: An interrupt is not present. 1: An interrupt is present.

Bit	Bit Name	Initial Value	R/W	Descriptions
5	I20	0	R	Interrupt State in Channel 20 0: An interrupt is not present. 1: An interrupt is present.
4	I19	0	R	Interrupt State in Channel 19 0: An interrupt is not present. 1: An interrupt is present.
3	I18	0	R	Interrupt State in Channel 18 0: An interrupt is not present. 1: An interrupt is present.
2	I17	0	R	Interrupt State in Channel 17 0: An interrupt is not present. 1: An interrupt is present.
1	I16	0	R	Interrupt State in Channel 16 0: An interrupt is not present. 1: An interrupt is present.
0	I15	0	R	Interrupt State in Channel 15 0: An interrupt is not present. 1: An interrupt is present.

16.3.3 DMA Secure Control Register for Lower-Numbered Channels (DMASEC_L)

DMASEC_L is a 32-bit readable/writeable register that controls the security attribute of each of the lower-numbered channels. Only the initiator in the secure mode can change the setting of this register.

Only secure access is allowed to registers of channels with the secure mode setting. The following registers are protected by the secure mode.

DMASAR, DMADAR, DMATCR, DMATSR, DMACHCR, DMATCRB, DMATSRB, DMACHCRB, DMARS, DMABUFCR, DMADPBASE, DMADPCR, DMAFIXSAR, DMAFIXDAR, and DMAFIXDPBASE

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

0	S0	0	R/W	Secure Mode Setting for Channel 0 0: Non-secure mode 1: Secure mode

16.3.4 DMA Secure Control Register Higher-Numbered Channels (DMASEC_U)

DMASEC_U is a 32-bit readable/writeable register that controls the security attribute of each of the higher-numbered channels. Only the initiator in the secure mode can change the setting of this register.

Only secure access is allowed to registers of channels with the secure mode setting. The following registers are protected by the secure mode.

DMASAR, DMADAR, DMATCR, DMATSR, DMACHCR, DMATCRB, DMATSRB, DMACHCRB, DMARS, DMABUFCR, DMADPBASE, DMADPCR, DMAFIXSAR, DMAFIXDAR, and DMAFIXDPBASE

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

16.3.5 DMA Operation Register for Lower-Numbered Channels (DMAOR_L)

DMAOR_L is a 16-bit readable/writable register that enables DMA transfer on all lower-numbered channels and specifies the method used to determine the priority levels for all lower-numbered DMA channels. This register also indicates address errors.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PR[1:0]		—	—	—	—	—	AE	—	DME
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R/(W)*	R	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	PR[1:0]	00	R/W	Priority Mode Select the method for setting the order of priority of channels when transfer requests for multiple channels arrive simultaneously. 00: Fixed CH0 > CH1 > ... > CH13 > CH14 11: Round-robin priority Other than above: Setting prohibited
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	AE	0	R/(W)*	Address Error Flag Indicates that an address error interrupt occurred during DMA transfer. This bit is set under the following conditions: The value set in DMASAR or DMADAR does not fall on a boundary corresponding to the transfer size. The source or destination for transfer is in an invalid space. The source or destination for transfer is in module stop mode. If this bit is set, DMA transfer through the channel is not possible even if the DE bit is set to 1. To clear the AE bit, write 0 to the AE bit after reading 1 from it or clear the CAE bit for each channel for which it is set. Clearing the AE bit clears the channel address error bits for all channels. 0: A SYS-DMAC address error interrupt is not present. [Clearing condition] (*) Writing CAE = 0 after reading CAE = 1 1: A SYS-DMAC address error interrupt being generated during DMA transfer.
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Descriptions
0	DME	0	R/W	DMA Master Enable Enables or disables DMA transfer on all channels. If the DME bit and the DE bit in DMACHCR are both set to 1, DMA transfer is enabled. At this time all AE bits in DMAOR_L must have the value 0. For DMA transfer on a channel to then proceed, the TE bit in DMACHCR for the channel must also have the value 0. Clearing this bit during transfer aborts transfer on all channels. 0: Disables DMA transfers on all channels 1: Enables DMA transfers on all channels

16.3.6 DMA Operation Register for Higher-Numbered Channels (DMAOR_U)

DMAOR_U is a 16-bit readable/writable register that enables DMA transfer on all higher-numbered channels and specifies the method used to determine the priority levels for all higher-numbered DMA channels. This register also indicates address errors.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PR[1:0]		—	—	—	—	—	AE	—	DME
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R/(W)*	R	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	PR[1:0]	00	R/W	Priority Mode Select the method for setting the order of priority of channels when transfer requests for multiple channels arrive simultaneously. 00: Fixed CH15 > CH16 > ... > CH28 > CH29 11: Round-robin priority Other than above: Setting prohibited
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	AE	0	R/(W)*	Address Error Flag Indicates that an address error interrupt occurred during DMA transfer. This bit is set under the following conditions: The value set in DMASAR or DMADAR does not fall on a boundary corresponding to the transfer size. The source or destination for transfer is in an invalid space. The source or destination for transfer is in module stop mode. If this bit is set, DMA transfer through the channel is not possible even if the DE bit is set to 1. To clear the AE bit, write 0 to the AE bit after reading 1 from it or clear the CAE bit for each channel for which it is set. Clearing the AE bit clears the channel address error bits for all channels. 0: A SYS-DMAC address error interrupt is not present. [Clearing condition] (*) Writing CAE = 0 after reading CAE = 1 1: A SYS-DMAC address error interrupt being generated during DMA transfer.
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Descriptions
0	DME	0	R/W	DMA Master Enable Enables or disables DMA transfer on all channels. If the DME bit and the DE bit in DMACHCR are both set to 1, DMA transfer is enabled. At this time all AE bits in DMAOR_U must have the value 0. For DMA transfer on a channel to then proceed, the TE bit in DMACHCR for the channel must also have the value 0. Clearing this bit during transfer aborts transfer on all channels. 0: Disables DMA transfers on all channels 1: Enables DMA transfers on all channels

16.3.7 DMA Channel Clear Register for Lower-Numbered Channels (DMACHCLR_L)

DMACHCLR_L is a 32-bit writable register that initializes each of the lower-numbered channels.

When a bit of this register is set, the state of the corresponding channel is completely initialized.
This includes initialization of the following registers.

DMASAR, DMADAR, DMATCR, DMATSR, DMACHCR, DMATCRB, DMATSRB, DMACHCRB, DMARS, DMABUFCR, DMADPBASE, DMADPCR, DMAFIXSAR, DMAFIXDAR, and DMAFIXDPBASE

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14 to 0	CLR[14:0]	All 0	W	Writing to a bit leads to clearing of all registers for the corresponding channel. CLR[0] 0: Ignored 1: All registers for channel 0 are cleared. CLR[1] 0: Ignored 1: All registers for channel 1 are cleared. CLR[2] 0: Ignored 1: All registers for channel 2 are cleared. ... CLR[14] 0: Ignored 1: All registers for channel 14 are cleared. When writing to this register, confirm that the DE bit is set to 0.

16.3.8 DMA Channel Clear Register for Higher-Numbered Channels (DMACHCLR_U)

DMACHCLR_U is a 32-bit writable register that initializes each of the higher-numbered channels.

When a bit of this register is set, the state of the corresponding channel is completely initialized.
This includes initialization of the following registers.

DMASAR, DMADAR, DMATCR, DMATSR, DMACHCR, DMATCRB, DMATSRB, DMACHCRB, DMARS, DMABUFCR, DMADPBASE, DMADPCR, DMAFIXSAR, DMAFIXDAR, and DMAFIXDPBASE

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14 to 0	CLR[29:15]	All 0	W	Writing to a bit leads to clearing of all registers for the corresponding channel. CLR[15] 0: Ignored 1: All registers for channel 15 are cleared. CLR[16] 0: Ignored 1: All registers for channel 16 are cleared. ... CLR[29] 0: Ignored 1: All registers for channel 29 are cleared. When writing to this register, confirm that the DE bit is set to 0.

16.3.9 DPRAM Secure Control Register for Lower-Numbered Channels (DMADPSEC_L)

DMADPSEC_L is a 32-bit readable/writeable register that controls the security attribute of the descriptor memory. Only the initiator in the secure mode can change the setting of this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SEC	—	—	—	—	—	—	SA[8:0]								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SM[8:0]								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	SEC	0	R/W	Security Attribute Setting for Descriptor Memory Specifies the security attribute of the address space used for the descriptor memory. 0: Non-secure 1: Secure
30 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24 to 16	SA[8:0]	H'000	R/W	Security Attribute Setting for Base Address of Descriptor Memory Specify the base address of the descriptor memory to be assigned the security attribute. H'000: H'A000 H'001: H'A004 ... H'1FF: H'A7FC
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8 to 0	SM[8:0]	H'000	R/W	Security Attribute Setting for Base Address Mask of Descriptor Memory Specify the security attribute base address mask of the descriptor memory. The range of memory to be assigned the security attribute is specified by this register. See Figure 16.4.

16.3.10 DPRAM Secure Control Register for Higher-Numbered Channels (DMADPSEC_U)

DMADPSEC_U is a 32-bit readable/writeable register that controls the security attribute of the descriptor memory. Only the initiator in the secure mode can change the setting of this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SEC	—	—	—	—	—	—	SA[8:0]

	—	—	—	—	—	—	—	SM[8:0]								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	SEC	0	R/W	Security Attribute Setting for Descriptor Memory Specifies the security attribute of the address space used for the descriptor memory. 0: Non-secure 1: Secure
30 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24 to 16	SA[8:0]	H'000	R/W	Security Attribute Setting for Base Address of Descriptor Memory Specify the base address of the descriptor memory to be assigned the security attribute. H'000: H'A000 H'001: H'A004 ... H'1FF: H'A7FC
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8 to 0	SM[8:0]	H'000	R/W	Security Attribute Setting for Base Address Mask of Descriptor Memory Specify the security attribute base address mask of the descriptor memory. The range of memory to be assigned the security attribute is specified by this register. See Figure 16.4.

16.3.11 DMA Source Address Registers 0 to 29 (DMASAR_0 to DMASAR_29)

DMASAR is a 32-bit readable/writable register that specifies the source address of a DMA transfer. While a DMA transfer is in progress, this register indicates the next source address.

When the address mode is increment, sources in memory only have byte boundaries. For details, refer to Table 16.3.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SAR[31:16]

16.3.12 DMA Destination Address Registers 0 to 29 (DMADAR_0 to DMADAR_29)

DMADAR is 32-bit readable/writable register that specify the destination address of a DMA transfer. While a DMA transfer is in progress, this register indicates the next destination address.

When the address mode is increment, destinations in memory only have byte boundaries. For details, refer to Table 16.3.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DAR[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DAR[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.3 SAR/DAR Address Restriction

Resource Selection	Address Mode	Restriction
Auto request	Increment	No restriction (byte boundaries)
	Others	Boundary corresponding to the DMA transfer size
On-chip peripheral module request Transmission/DAR, Reception/SAR	All	Boundary corresponding to the DMA transfer size
On-chip peripheral module request Transmission/SAR, Reception/DAR	Increment	No restriction (byte boundaries)
	Others	Boundary corresponding to the DMA transfer size

16.3.13 DMA Transfer Count Registers 0 to 29 (DMATCR_0 to DMATCR_29)

DMATCR is a 32-bit readable/writable register that specifies the number of rounds of DMA transfer. The number of rounds of DMA transfer is 1 when the setting is H'00000001, 16,777,215 when the setting is H'00FFFFFF (the maximum). During a DMA transfer, this register indicates the remaining number of rounds of transfer.

The SYS-DMAC includes independent data buffers for reading and writing. Therefore, the read transfer counter and write transfer counter have different values. This register indicates the counter value used in reading.

The eight higher-order bits of DMATCR are always read as 0, and the write value should always be 0.

The value of this register should be set before DMA transfer starting.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	TCR[23:16]

16.3.14 DMA Transfer Count Registers B_0 to 29 (DMATCRB_0 to DMATCRB_29)

DMATCRB is a 32-bit readable/writable register that specifies the number of rounds of DMA transfer. The number of rounds of DMA transfer is 1 when the setting is H'00000001, 16,777,215 when the setting is H'00FFFFFF (the maximum). During a DMA transfer, this register indicates the remaining number of rounds of transfer.

The SYS-DMAC includes independent data buffers for reading and writing. Therefore, the read transfer counter and write transfer counter have different values. This register indicates the counter value used in writing.

The eight higher-order bits of DMATCRB are always read as 0, and the write value should always be 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	TCR[23:16]

16.3.15 DMA Transfer Size Registers 0 to 29 (DMATSR_0 to DMATSR_29)

DMATSR is a 32-bit readable/writable register that specifies a total amount of memory to be transferred. The total size of DMA transfer is 1 byte when the setting is H'00000001, 4,294,967,295 bytes when the setting is H'FFFFFFFF, and 4,294,967,296 bytes (the maximum) when the setting is H'00000000. During a DMA transfer, this register indicates the remaining amount of memory to be transferred. This register is used in total size transmission.

The SYS-DMAC includes independent data buffers for reading and writing. Therefore, reading and writing will have different transfer sizes. This register indicates the value of the read transfer size.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TSR[31:16]

16.3.16 DMA Transfer Size Registers B_0 to 29 (DMATSRB_0 to DMATSRB_29)

DMATSRB is a 32-bit readable/writable register that specifies a total amount of memory to be transferred. The total size of DMA transfer is 1 byte when the setting is H'00000001, 4,294,967,295 bytes when the setting is H'FFFFFFFF, and 4,294,967,296 bytes (the maximum) when the setting is H'00000000. During a DMA transfer, this register indicates the remaining amount of memory to be transferred. This register is used in total size transmission.

The SYS-DMAC includes independent data buffers for reading and writing. Therefore, reading and writing will have different transfer sizes. This register indicates the value of the write transfer size.

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/(W)*	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
31	CAE	0	R/(W)*	Channel Address Error Flag Indicates that an address error interrupt occurred during DMA transfer. This bit is set under the following conditions: The value set in DMASAR or DMADAR does not fall on a boundary corresponding to the transfer size. The source or destination for transfer is in an invalid space. The source or destination for transfer is in module stop mode. If this bit is set, DMA transfer through the channel is not possible even if the DE bit is set to 1. To clear the CAE bit, write 0 to the CAE bit after reading 1 from it or clear the AE bit in DMAOR. Clearing the CAE bit clears the channel address error bits for all channels. 0: A SYS-DMAC address error interrupt is not present. [Clearing condition] (*)Writing CAE = 0 after reading CAE = 1 1: A SYS-DMAC address error interrupt being generated during DMA transfer.
30	CAIE	0	R/W	Channel Address Error Interrupt Enable Enables or disables the generation of interrupt requests for the CPU when address errors occur. When the CAIE bit is set to 1, if the CAE bit is also set, an interrupt (DEI 0 to 29) from the corresponding channel will be generated for the CPU in response to address errors. Note: An address error interrupt (DADERR) is also asserted simultaneously. See section 11, Interrupt Controller for AP-System Core (INTC-SYS) for more details. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.
29, 28	DPM[1:0]	00	R/W	Operating Mode of Descriptor Memory Enable or disable the descriptor memory and specify its operating mode. 00: Disabled (normal use) 01: Enabled (normal mode) 10: Enabled (repeat mode) 11: Enabled (read-out interrupt mode, infinite repeat mode)

Bit	Bit Name	Initial Value	R/W	Descriptions
27 to 25	RPT[2:0]	000	R/W	Descriptor Setting Update Specify the parameters to be updated from the descriptor memory. RPT[2]: Enables or disables updating of the source address register RPT[1]: Enables or disables updating of the destination address register RPT[0]: Enables or disables updating of the transfer count register 0: Disabled 1: Enabled
24, 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22	DPB	0	R/W	Descriptor Start Specifies configuration to be loaded when transfer under control of the descriptor memory begins. This bit is cleared after the descriptor memory is read. 0: Processing starts with the values in DMASAR, DMADAR, and DMATCR. 1: Processing starts after the first set of descriptors is read out.
21, 20	TS[3:2]	00	R/W	DMA Transfer Size In combination with TS[1:0], these bits specify the DMA transfer size. When the transfer source or transfer destination is a register of an on-chip peripheral module for which a transfer size is specified, be sure to select the specified transfer size. For the transfer source or destination address specified by DMASAR or DMADAR, an appropriate boundary address should be set according to the transfer data size. Note. Transfer size must be specified to satisfy both source and destination access sizes. For example, the MSIOF must be accessed by 4-byte unit (TS [3:0] = B'0010) only except for SITSCR. TS[3:2] + TS[1:0] (“+” here indicates concatenation, not addition) 0000: Transfer is in byte units. 0001: Transfer is in word (2-byte) units. 0010: Transfer is in longword (4-byte) units. 0011: Transfer is in 16-byte units. 0100: Transfer is in 32-byte units. 0101: Transfer is in 64-byte units. 0111: Transfer is in 8-byte units. Other than above: Setting prohibited
19	DSE	0	R/(W)*	Descriptor Stage End (*)When the DSIE bit is set to 1 and the descriptor memory is enabled, the DSE bit is set to 1 on completion of the DMA transfer. This bit is not set when the DPM bit is set to 0 (descriptors are disabled). To clear the DSE bit, start by reading it as 1, and then write 0 to the bit. 0: DMA transfer is still running or has been aborted. 1: Transfer under the control of one stage of the descriptor memory has been completed.

Bit	Bit Name	Initial Value	R/W	Descriptions
18	DSIE	0	R/W	Descriptor Stage End Interrupt Enable Specifies whether an interrupt request is generated for the CPU on completion of transfer under the control of one stage of the descriptor memory. When this bit is set to 1, an interrupt (DEI) is generated for the CPU whenever the DSE is set to 1. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.
17, 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15, 14	DM[1:0]	00	R/W	Destination Address Mode Specify whether the DMA destination address is incremented, fixed, or decremented. The unit of transfer (transfer size) determines the size of the increment. 00: Destination address is fixed. 01: Destination addresses are incremented. + 1 when transfer is in byte units. + 2 when transfer is in word units. + 4 when transfer is in longword units. + 8 when transfer is in 8-byte units. + 16 when transfer is in 16-byte units. + 32 when transfer is in 32-byte units. + 64 when transfer is in 64-byte units. 10: Destination addresses are decremented. – 1 when transfer is in byte units. – 2 when transfer is in word units. – 4 when transfer is in longword units. Setting prohibited when transfer is in 8-, 16-, 32-, or 64-byte units. 11: Setting Prohibited
13, 12	SM[1:0]	00	R/W	Source Address Mode Specify whether the DMA source address is incremented, fixed, or decremented. The unit of transfer (transfer size) determines the size of the increment. 00: Source address is fixed. 01: Source addresses are incremented. + 1 when transfer is in byte units. + 2 when transfer is in word units. + 4 when transfer is in longword units. + 8 when transfer is in 8-byte units. + 16 when transfer is in 16-byte units. + 32 when transfer is in 32-byte units. + 64 when transfer is in 64-byte units. 10: Source addresses are decremented. – 1 when transfer is in byte units. – 2 when transfer is in word units. – 4 when transfer is in longword units. Setting prohibited when transfer is in 8-, 16-, 32-, or 64-byte units. 11: Setting Prohibited

Bit	Bit Name	Initial Value	R/W	Descriptions
11 to 8	RS[3:0]	0000	R/W	Resource Selection Specify the source of transfer requests. Only change the transfer request source while the DMA enable bit (DE) is set to 0. 0100: Auto request 1000: Source is selected by the DMA extended resource selector. Other than above: Settings prohibited
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4, 3	TS[1:0]	00	R/W	DMA Transfer Size See the description of TS[3:2] (bits 21 and 20).
2	IE	0	R/W	Interrupt Enable Specifies whether or not an interrupt request is generated for the CPU on completion of DMA transfer. When this bit is set to 1, an interrupt request (DEI) for the CPU is generated whenever the TE bit is set to 1. 0: Interrupt request is disabled. 1: Interrupt request is enabled.
1	TE	0	R/(W)*	Transfer End Flag When the descriptor memory is not in use, the TE bit is set to 1 when DMATCR and DMATSR become 0 on completion of the DMA transfer. When the descriptor memory is in use, the TE bit is set to 1 on completion of all transfers set up in the descriptor memory. The TE bit is not set to 1 in the following cases. • DMA transfer ends due to a DMA address error before DMATCR and DMATSR become 0. • DMA transfer is aborted by clearing the DE and DME bits in DMAOR. To clear the TE bit, start by reading it as 1, and then write 0 to it. When the TE bit is set to 1, transfer is not possible even if the DE bit is set to 1. 0: DMA transfer is in progress or was aborted [Clearing condition] (*)Writing of 0 after reading of 1 1: DMA transfer ended on the specified count (TCR = 0 and TSR = 0)
0	DE	0	R/W	DMA Enable Enables or disables DMA transfer. In the auto request mode, a DMA transfer is started by setting the DE and DME bits in DMAOR to 1. At this time, the setting of both the AE and TE bits in DMAOR must be 0. In a peripheral module request, a DMA transfer starts if the transfer request is generated by the selected device or on-chip peripheral module after setting the DE and DME bits to 1. In this case too, the settings of both the TE and AE bits must be 0. Clearing the DE bit to 0 aborts all DMA transfer. Note: Ensure that the setting of the DE bit is actually 0 after clearing it. 0: DMA transfer is disabled. 1: DMA transfer is enabled.

Note: * Writing 0 is possible to clear the flag.

16.3.18 DMA Channel Control Register B_0 to 29 (DMACHCRB_0 to DMACHCRB_29)

DMACHCRB is a 32-bit readable/writable register that controls the DMA transfer mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DCNT[7:0]								DPTR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DRST	—	—	—	—	—	—	DTS	SLM[3:0]				PRI[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 24	DCNT[7:0]	H'00	R/W	Number of Stages of Descriptor Memory Specify the number of stages of the descriptor memory as DCNT + 1. When the descriptor memory is enabled, a transfer end (TE) interrupt is only generated for the CPU on completion of transfer under control of the specified number of stages.
23 to 16	DPTR[7:0]	H'00	R	Descriptor Pointer This bit indicates the pointer to the next descriptor to be read. It is cleared to 0 when the last descriptor of the number of stages specified by DCNT[7:0] is read. It is also cleared to 0 when 1 is written to DRST.
15	DRST	0	W	Descriptor Reset Resets the descriptor pointer. Before the descriptor memory is used, the pointer must be reset by writing 1 to this bit. This bit is always read as 0.
14 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	DTS	0	R/W	Total Size Transmission under Descriptor Control This bit is only effective when total size transmission is selected. 0: The TCR fields of the descriptors are used as transfer count settings. 1: The TCR fields of the descriptors are used as total size settings.
7 to 4	SLM[3:0]	0000	R/W	DMA Transfer Low-Speed Mode Specify the number of cycles of the clock (ZS) for the DMA transfer. One round of DMA transfer is executed in the number of cycles of the clock specified by this bit. 0000: Normal mode 1000: On round in 256 cycles of the clock. 1001: On round in 512 cycles of the clock. 1010: On round in 1024 cycles of the clock. : 1111: On round in 32768 cycles of the clock. Other than above: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Descriptions
3 to 0	PRI[3:0]	0000	R/W	Channel Request Priority Setting These bits set the priority of requests for transfer on the given channel. 1111: Highest priority : 0111 to 0000: Lowest priority

16.3.19 DMA Buffer Control Registers 0 to 29 (DMABUFCR_0 to DMABUFCR_29)

DMABUFCR is a 32-bit readable/writable register that controls the upper limit on buffer size in and burst unit for the SDRAM.

Use this register when the upper limit on buffering requires control.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	MBU[8:0]								
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ULB[9:0]									
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24 to 16	MBU[8:0]	H'080	R/W	Maximum Burst Unit for SDRAM This register is only effective for SDRAM access, and everything other than that is under control of the transfer size (unit). Settings bigger than UBL are prohibited. Power-of-two settings are recommended. Maximum value is 256 (bytes).
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	ULB[9:0]	H'100	R/W	Upper Limit on Buffer Size This register controls the upper limit value for buffering. Power-of-two settings are recommended. Maximum value is 512 (bytes).

16.3.20 DMA Extended Resource Selectors 0 to 29 (DMARS_0 to DMARS_29)

DMARS is a 16-bit readable/writable register that specifies the on-chip peripheral module to be the source of the DMA transfer request for the given channel. DMARS_0 specifies the source for channel 0, DMARS_1 specifies the source for channel 1 and so on.

When bits MID and RID are set to a value other than the values listed in Table 16.4, the operation of this LSI is not guaranteed. Transfer requests from the source selected in DMARS are only valid when the resource selection bits (RS[3:0]) in DMACHCR have been set to B'1000. Otherwise, even if DMARS has been set, requests from the corresponding transfer request source are not accepted.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	MID[5:0]						RID[1:0]	
Initial value:	—	—	—	—	—	—	—	—	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
15 to 8	—	—	R	Reserved These bits are always read as an undefined value. The write value should always be 0.
7 to 2	MID[5:0]	000000	R/W	DMA Request Source Adoption ID5 to ID0 (MID) See Table 16.4.
1, 0	RID[1:0]	00	R/W	DMA Request Source Adoption ID1 and ID0 (RID) See Table 16.4.

16.3.21 DMA Descriptor Base Address Registers 0 to 29 (DMADPBASE_0 to DMADPBASE_29)

DMADPBASE specifies the base address of the descriptor memory. The address range of the descriptor memory is specified by setting this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DPBASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DPBASE[15:4]												—	—	—	SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 4	DPBASE[31:4]	All 0	R/W	Base Address of Descriptor Memory Place each stage of the descriptor memory on a 16-byte boundary. Setting example: When Built-in memory is used, [SYS-DMAC Lower]: H'E670 A00 to H'E670 A7F [SYS-DMAC Higher]: H'E672 A00 to H'E672 A7F When External memory is used, Other memory area on a 16-byte boundary
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SEL	0	R/W	Descriptor Memory Selection Selects the memory to be used as descriptor memory. 0: Setting Prohibited 1: Built-in memory or External memory is used.

16.3.22 DMA Descriptor Control Registers 0 to 29 (DMADPCR_0 to DMADPCR_29)

DMADPCR is a 32-bit readable/writable register that controls the timing with which interrupts are output in read-out interrupt mode (descriptor mode 3).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DIPT[7:0]								—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 24	DIPT[7:0]	All 0	R/W	Descriptor Read-out Interrupt Pointer The number of stages for which descriptor read-out interrupts are generated in descriptor mode 3. DIPT + 1 specifies the number of descriptor stages.
23 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

16.3.23 DMA Fixed Source Address Registers 0 to 29 (DMAFIXSAR_0 to DMAFIXSAR_29)

DMAFIXSAR is a 32-bit readable/writable register that specifies the most significant 8 bits of the 40-bit source address for a DMA transfer.

This register is not incremented by carrying when DMASAR overflows.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

16.3.24 DMA Fixed Destination Address Registers 0 to 29 (DMAFIXDAR_0 to DMAFIXDAR_29)

DMAFIXDAR is a 32-bit readable/writable register that specifies the most significant 8 bits of the 40-bit destination address for a DMA transfer.

This register is not incremented by carrying when DMADAR overflows.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	DAR[39:32]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

16.3.25 DMA Fixed Descriptor Base Address Registers 0 to 29 (DMAFIXDPBASE_0 to DMAFIXDPBASE_29)

DMAFIXDPBASE is a 32-bit readable/writable register that specifies the most significant 8 bits of the 40-bit descriptor base address for a DMA transfer.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

16.3.26 Descriptor Memory (DescriptorMEM)

See section 16.4.4, Descriptor Memory.

16.4 Operation

When there is a DMA transfer request, the DMAC starts the transfer according to the predetermined channel priority; when the transfer end conditions are satisfied, it ends the transfer. Transfers can be requested in two modes: auto request and on-chip peripheral module request. The bus mode can be selected from normal speed mode and slow speed mode.

16.4.1 DMA Transfer Requests

Most commonly, DMA transfer requests are generated by either the source or destination for transfer, but they can also be generated by on-chip peripheral modules that are neither the source nor the destination. Transfers can be requested in two modes: auto request, and on-chip peripheral module request. The request mode is selected for each channel by DMARS.

(1) Auto-Request Mode

When there is no transfer request signal from an external source, as in a memory-to-memory transfer or a transfer between memory and an on-chip peripheral module unable to request a transfer, auto-request mode allows the SYS-DMAC to automatically generate a transfer request signal internally. When the DE bit in DMACHCR and the DME bit in DMAOR are set to 1 for the target channel, the transfer begins so long as the CAE bit in DMACHCR is 0.

(2) On-Chip Peripheral Module Request Mode

In this mode, a transfer is performed at the transfer request signal of an on-chip peripheral module. The source (on-chip peripheral module) of the DMA transfer request is specified by DMARS.

When this mode is selected, if the DMA transfer is enabled (DE = 1, DME = 1, TE = 0, CAE = 0), a transfer is performed upon the input of a transfer request signal.

When a transmit data empty transfer request of the SCIF is set as the transfer request, the transfer destination must be the SCIF's transmit data register. Likewise, when receive data full transfer request of the SCIF is set as the transfer request, the transfer source must be the SCIF's receive data register. These conditions also apply to the other on-chip peripheral modules.

The number of the receive FIFO triggers can be set as a transfer request depending on an on-chip peripheral module. Data needs to be read after the DMA transfer is ended, because data may be left in the receive FIFO when the receive FIFO trigger condition is not satisfied.

Table 16.4 Selecting On-Chip Peripheral Module Request Modes

DMARS MID + RID	DMA Transfer Request Source	DMA Transfer Request Signal	Source	Destination
H'39	HSCIF0 transmitter	TXI (Transmit FIFO data empty)	Arbitrary	Data register
H'3A	HSCIF0 receiver	RXI (Receive FIFO data full)	Data register	Arbitrary
H'4D	HSCIF1 transmitter	TXI (Transmit FIFO data empty)	Arbitrary	Data register
H'4E	HSCIF1 receiver	RXI (Receive FIFO data full)	Data register	Arbitrary
H'3B	HSCIF2 transmitter	TXI (Transmit FIFO data empty)	Arbitrary	Data register
H'3C	HSCIF2 receiver	RXI (Receive FIFO data full)	Data register	Arbitrary
H'29	SCIF0 transmitter	TXI (Transmit FIFO data empty)	Arbitrary	Data register
H'2A	SCIF0 receiver	RXI (Receive FIFO data full)	Data register	Arbitrary
H'2D	SCIF1 transmitter	TXI (Transmit FIFO data empty)	Arbitrary	Data register
H'2E	SCIF1 receiver	RXI (Receive FIFO data full)	Data register	Arbitrary

MSIOF0/1/2			√				
QSPI0/1	√	√	√				
SDHI0/2		√	√		√	√	

Note: Module request mode will be used for data transfer.

16.4.2 Channel Priority

When the SYS-DMAC receives simultaneous transfer requests on two or more channels, it transfers data according to a predetermined priority. Two modes (fixed mode and round-robin mode) are selected by the PR[1:0] bits in DMAOR.

(1) Fixed Mode

In this mode, the priority levels among the channels remain fixed.

CH0 > CH1 > ... > CH13 > CH14, CH15 > CH16 > ... > CH28 > CH29

(2) Round-Robin Mode

In round-robin mode, each time data of one transfer unit (byte, word, long-word, 8-byte, or 16-byte units) is transferred on one channel, the priority is rotated. The channel on which the transfer was just finished rotates to the bottom of the priority. The priority of round-robin mode is CH0 > CH1 > ... > CH13 > CH14 and CH15 > CH16 > ... > CH28 > CH29 immediately after reset.

16.4.3 Slow Speed Mode

In the slow-speed mode, a single round of DMA transfer is performed every time the number of clock cycles specified by the SLM bits in DMACHCRB elapse. This mode can be selected per DMA channel. Transfer on other channels can proceed after each round of transfer for a channel in the slow-speed mode is completed.

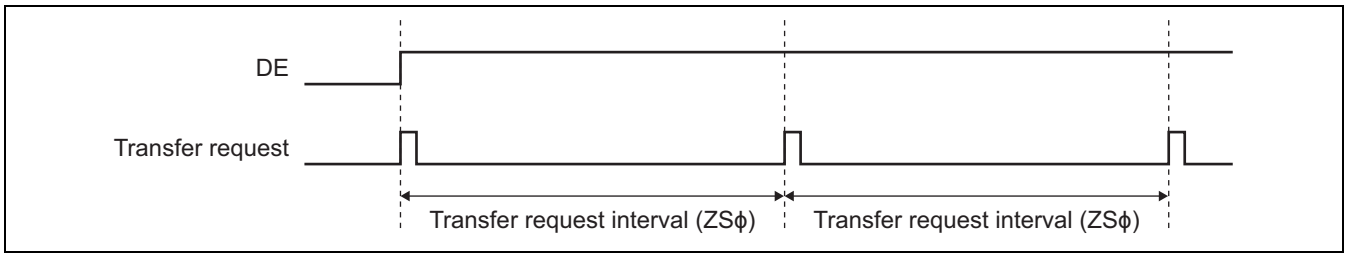

Figure 16.2 Slow Speed Mode

16.4.4 Descriptor Memory

The descriptor memory function is selected by setting the DPM[1:0] bits in DMACHCR to B'01, B'10, or B'11. When DMATCR is set to 0 and the DMA transfer is completed, the next set of settings is read, and if only a single channel is enabled, the contents defined by up to 128 stages of descriptor memory can be consecutively transferred when the built-in descriptor memory is used. External memory can also be used as the descriptor memory. In that case, the contents defined by up to 256 stages of descriptor memory can be transferred.

The following initial settings are required to use the descriptor memory.

- Set the base address of the descriptor memory for the DMA transfer in DMADPBASE.
- Set the DRST bit in DMACHCRB to reset the descriptor memory.
- Set the number of stages of the descriptor memory in the DCNT bits of DMACHCRB.

The descriptor memory is shared between all channels. Ensure that the areas of descriptor memory for use by each of the channels do not overlap. It is necessary to arrange each stage of the descriptor memory on a 16-byte boundary.

There are two methods to activate the descriptor memory as follows.

- Specify the first DMA transfer settings in DMASAR, DMADAR, and DMATCR, and specify the subsequent settings in the descriptor memory. Then, set the DPB bit in DMACHCR to 0 to activate the descriptor memory. In this case, after completion of the transfer specified in DMASAR, DMADAR, and DMATCR, transfer continues after new settings are read from the descriptor memory. Note, however, that when the operating mode of the descriptor memory is set to the repeat mode, the values specified in DMASAR, DMADAR, and DMATCR are not read, and the transfer starts and is repeated from the head of the descriptor memory.
- Write the DMA transfer settings to the descriptor memory, and write 1 to the DPB bit in DMACHCR to activate the descriptor memory. In this case, the DMA transfer starts from the first settings in the descriptor memory.

There are three operating modes of the descriptor memory, which can be selected by setting the DPM bits in DMACHCR.

For details on these operating modes, see the descriptions of each operating mode in this section.

(1) Configuration of Descriptor Memory

Figure 16.3 shows the configuration of the built-in descriptor memory.

The capacity of the built-in descriptor memory is 16 bytes per stage × 128 stages.

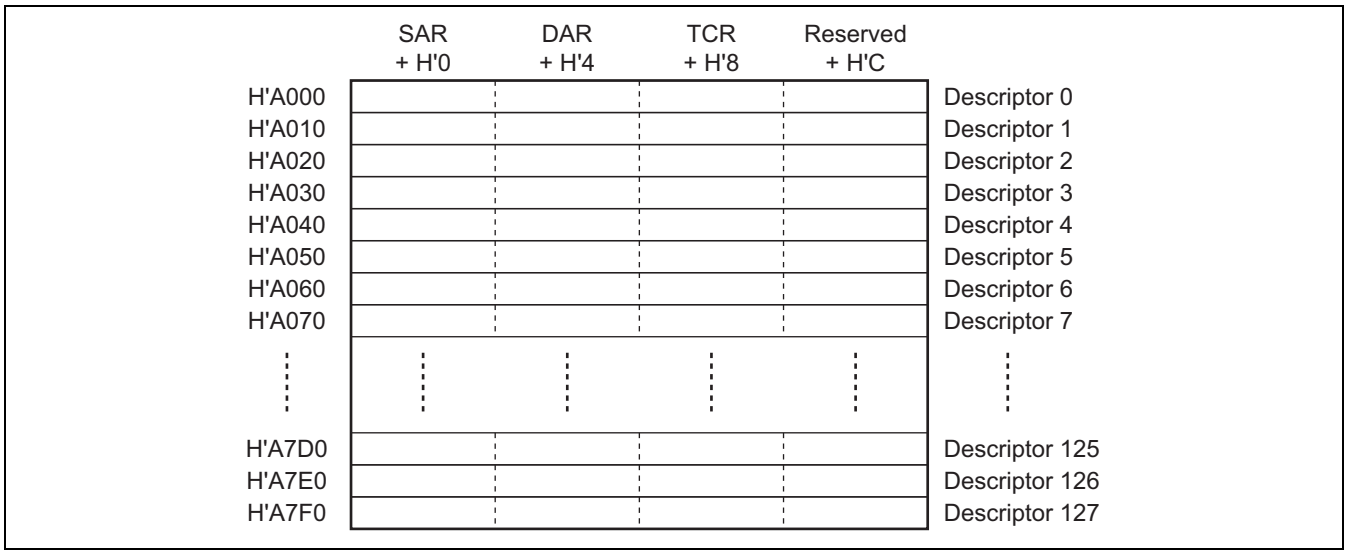

Figure 16.3 Configuration of Built-in Descriptor Memory

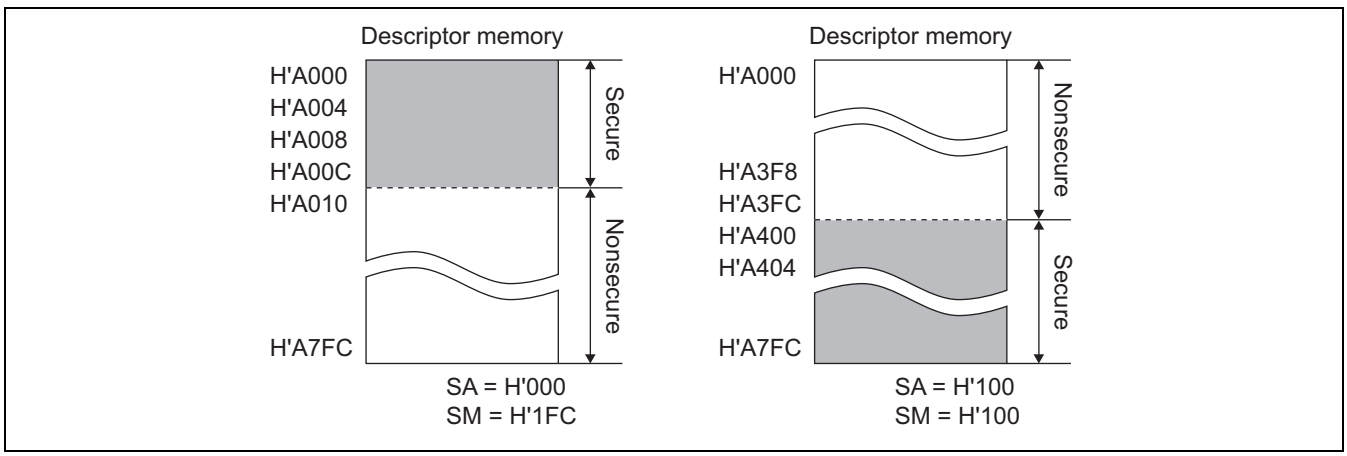

Figure 16.4 Example of DMADPSEC Setting

(2) Flow of Updating from Descriptor Memory

The RPT bits in DMACHCR can be used to specify which registers are to be updated from the descriptor memory.

The DPTR bits in DMACHCRB are incremented when updating from the descriptor memory is completed. If the DPTR value matches the DCNT value, the DPTR value is reset to 0.

This flow is automatically processed by hardware.

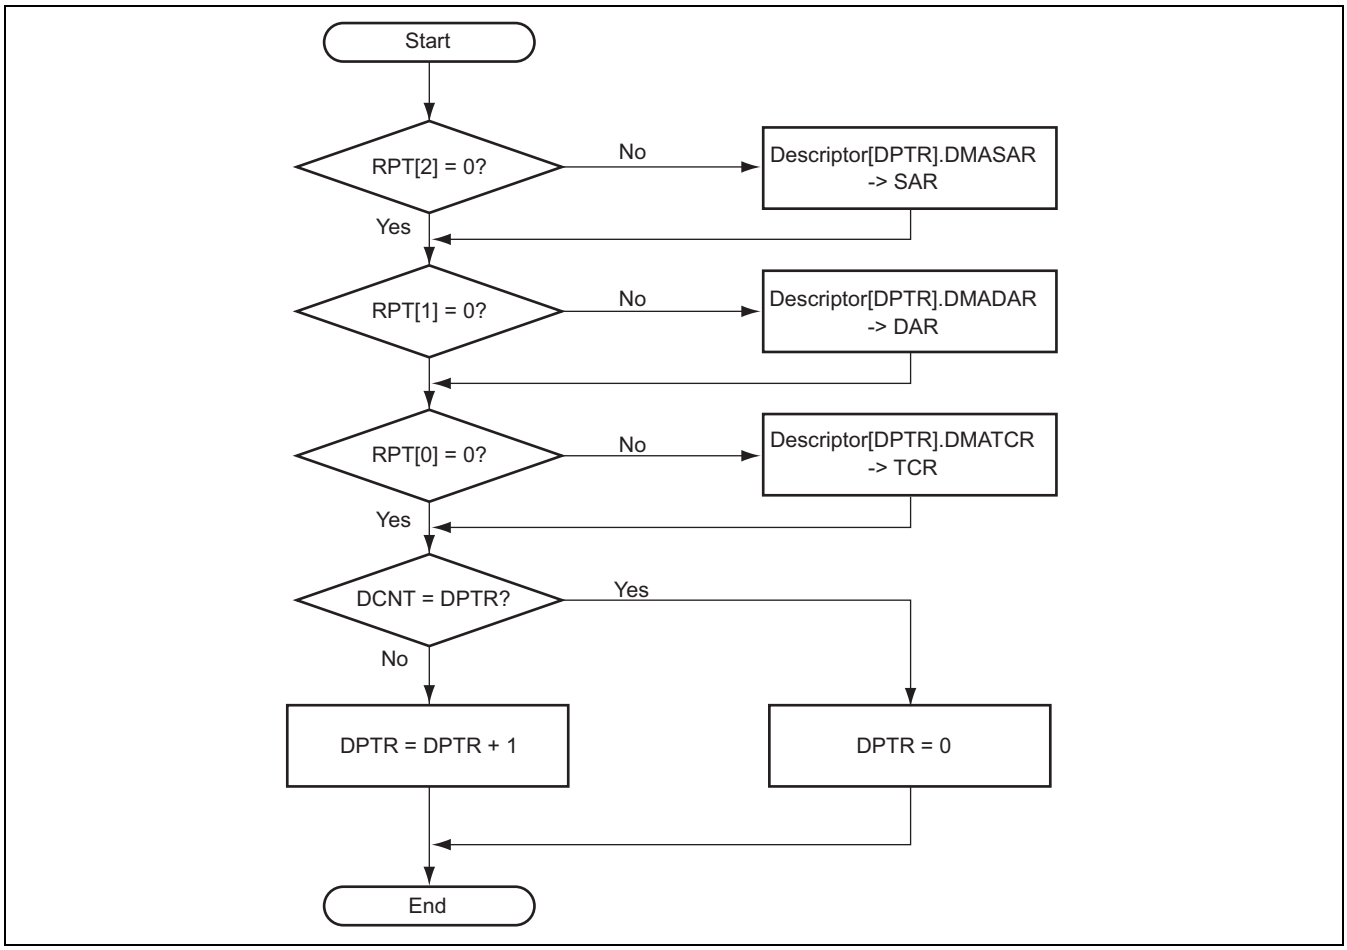

Figure 16.5 Flow of Updating from Descriptor Memory

(3) Operating Mode 1 of Descriptor Memory

Set the DPM bits in DMACHCR to B'01 to select operating mode 1 (normal mode). This mode allows consecutive transfer under control of the descriptor memory.

In this mode, the DMA transfer is complete when the TE bit in DMACHCR is set to 1 after transfer under control of the number of stages of the descriptor memory specified in the DCNT bits in DMACHCRB.

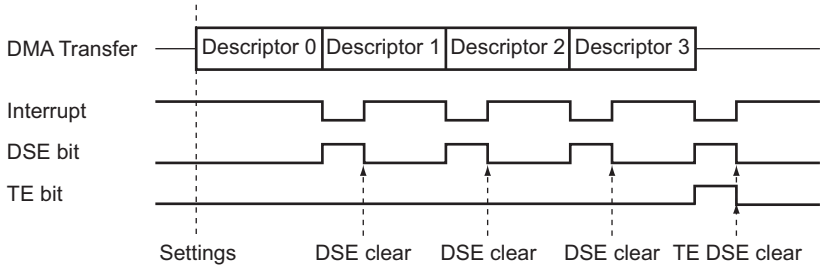
When the DSIE bit in DMACHCR is set to 1, a DSE interrupt is generated every time transfer under the control of one stage of descriptor memory is complete. If a first DSE interrupt has not been processed when a further DSE interrupt is generated, the contents of the next stage of the descriptor memory are not read and the DMA transfer is aborted. Clearing the DSE bit only causes clearing of the first interrupt and reading of the next stage of the descriptor memory.

Figure 16.6 is an example of transfer when operating mode 1 is selected and the TE and DSE bits are set to 1.

Figure 16.7 is an example of transfer when there is a delay in processing of the DSE interrupt when operating mode 1 is selected and the TE and DSE bits are set to 1.

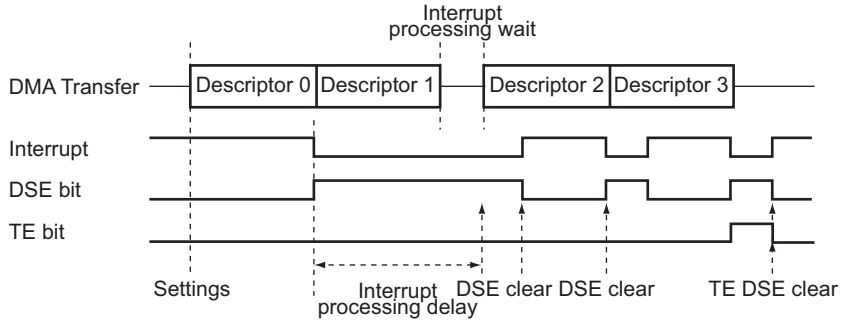
Figure 16.8 is an example of transfer when operating mode 1 is selected and the TE bit is set to 1.

In each example, there are four descriptor stages.



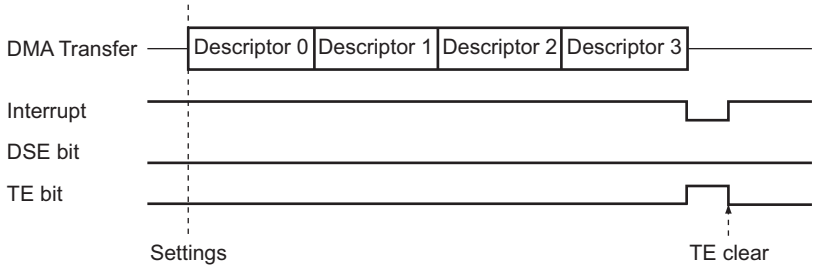
Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'01, DRST = B'1, DB = B'1, DSIE = B'1, IE = B'1).

Figure 16.6 Operating Mode 1 (Example 1)



Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'01, DRST = B'1, DB = B'1, DSIE = B'1, IE = B'1).

Figure 16.7 Operating Mode 1 (Example 2)



Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'01, DRST = B'1, DB = B'1, DSIE = B'0, IE = B'1).

Figure 16.8 Operating Mode 1 (Example 3)

(4) Operating Mode 2 of Descriptor Memory

Set the DPM bits in DMACHCR to B'10 to select operating mode 2 (repeat mode). This mode allows consecutive transfer under control of the descriptor memory.

In this mode, after transfer under control of the number of stages of descriptor memory specified in the DCNT bits in DMACHCRB, the TE bit in DMACHCR is set to 1. This operation is then repeated from the head of the descriptor memory.

When the DSIE bit in DMACHCR is set to 1, a DSE interrupt is generated every time transfer under the control of one stage of descriptor memory is complete. If a first DSE interrupt has not been processed when a further DSE interrupt is generated, the contents of the next stage of the descriptor memory are not read and the DMA transfer is aborted. Clearing the DSE bit only causes clearing of the first interrupt and reading of the next stage of the descriptor memory.

When the DSIE bit in DMACHCR is set to 0, after transfer under control of all stages of the descriptor memory is complete, the TE bit in DMACHCR is set to 1 and a TE interrupt is generated. If a TE interrupt has not been processed when a further DSE interrupt is generated, the contents of the next stage of the descriptor memory are not read and the DMA transfer is aborted. Clearing the TE bit only causes clearing of the first interrupt and reading of the next stage of the descriptor memory.

To end operation in mode 2, change the mode to mode 1 by using the TE interrupt processing. When the mode is changed to mode 1, the DMA transfer is completed when the next TE interrupt is generated.

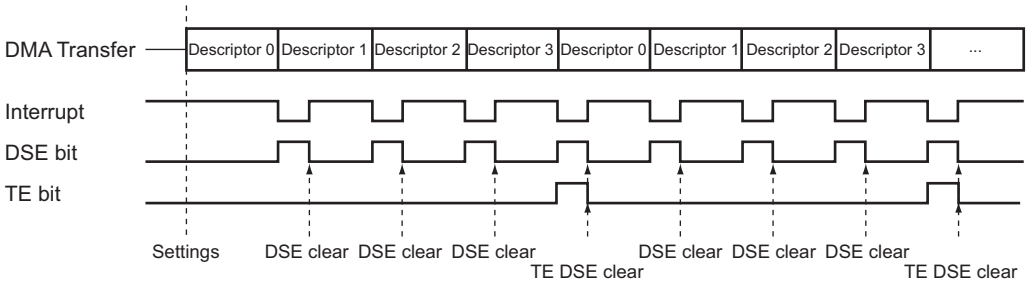
Figure 16.9 is an example of transfer when operating mode 2 is selected and the TE and DSE bits are set to 1.

Figure 16.10 is an example of transfer when there is a delay in processing of the DSE interrupt when operating mode 2 is selected and the TE and DSE bits are set to 1.

Figure 16.11 is an example of transfer when operating mode 2 is selected and the TE bit is set to 1.

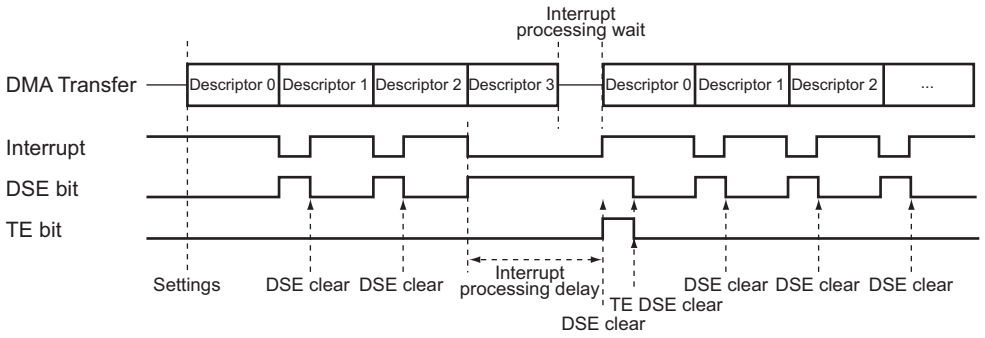
Figure 16.12 is an example of transfer when there is a delay in processing of the DSE interrupt when operating mode 2 is selected and the TE is set to 1.

In each example, there are four descriptor stages.



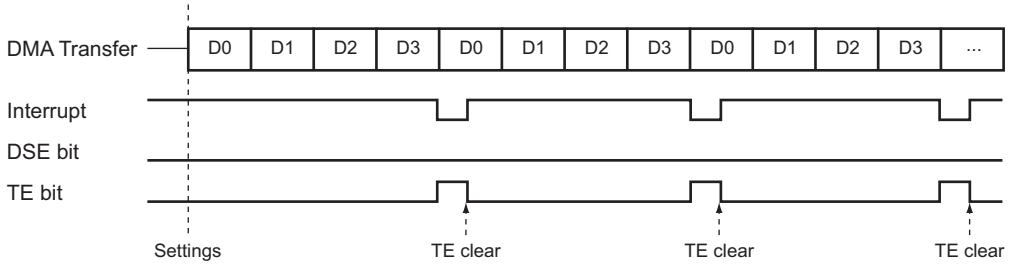
Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'10, DRST = B'1, DB = B'1, DSIE = B'1, IE = B'1).

Figure 16.9 Operating Mode 2 (Example 1)



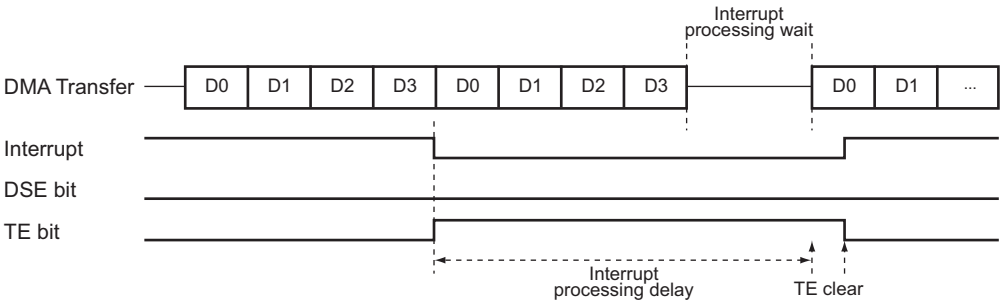
Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'10, DRST = B'1, DB = B'1, DSIE = B'1, IE = B'1).

Figure 16.10 Operating Mode 2 (Example 2)



Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'10, DRST = B'1, DB = B'1, DSIE = B'0, IE = B'1).

Figure 16.11 Operating Mode 2 (Example 3)



Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'10, DRST = B'1, DB = B'1, DSIE = B'0, IE = B'1).

Figure 16.12 Operating Mode 2 (Example 4)

(5) Operating Mode 3 of Descriptor Memory

Set the DPM bits in DMACHCR to B'11 to select operating mode 3 (infinite repeat mode). This mode allows consecutive transfer under control of the descriptor memory.

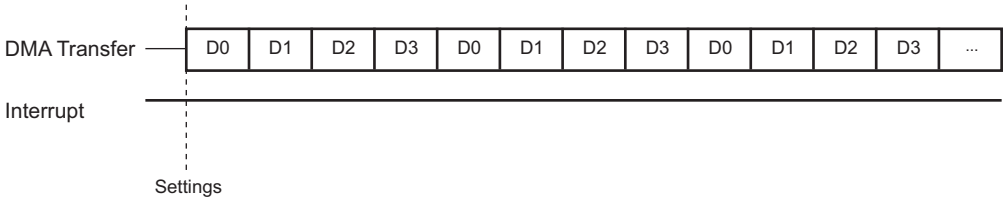
In this mode, after transfer under control of the number of stages of descriptor memory specified in the DCNT bits in DMACHCRB, the TE bit in DMACHCR is set to 1. This operation is then repeated from the head of the descriptor memory.

When the DSIE bit in DMACHCR is set to 1, a DSE interrupt is generated every time transfer under the control of one stage of descriptor memory is complete. Even if a first DSE interrupt has not been processed when a further DSE interrupt is generated, the DMA transfer is not aborted. Regardless of the number of DSE interrupts that have been generated, the TE bit can be cleared by writing to it once. Similarly, even if a first TE interrupt has not been processed when a further TE interrupt is generated, the DMA transfer is not aborted. Regardless of the number of TE interrupts that have been generated, the TE bit can be cleared by writing to it once.

Figure 16.13 is an example of transfer when infinite repeat mode is selected.

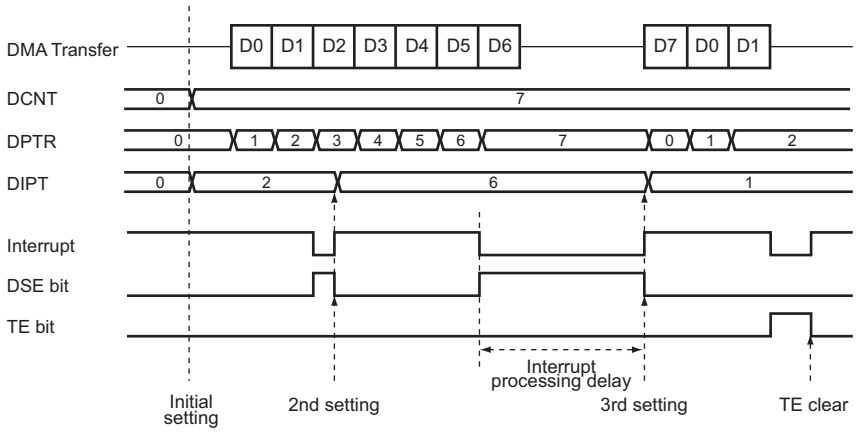
Figure 16.14 is an example of transfer when read-out interrupt mode is selected.

In each example, there are four descriptor stages.



Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'11, DRST = B'1, DB = B'1, DSIE = B'0, IE = B'0).

Figure 16.13 Operating Mode 3 (Infinite Repeat Mode)



Initial setting:
1. Set the DMACHCRB register (DCNT = 7).
2. The descriptor has three setting (DMASAR, DMADAR, DMATCR) stages.
3. Set the DMADPCR register (DIPT = 2).
4. Set the DMACHCR register (DPM = B'11, DRST = B'1, DB = B'1, DSIE = B'1, IE = B'0).

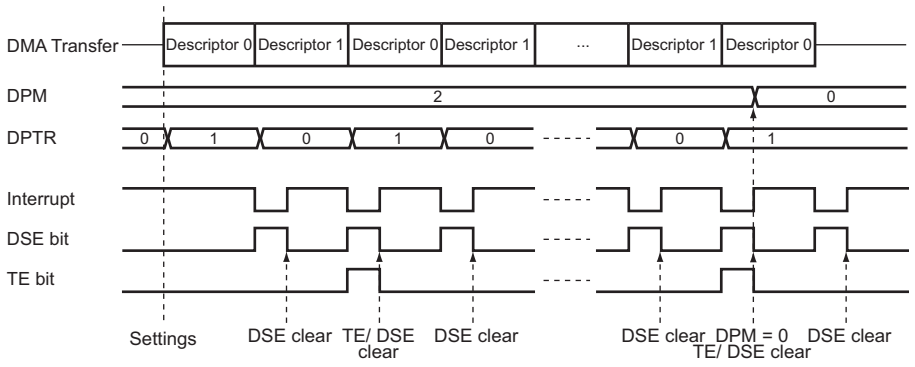
2nd setting:
1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMADPCR register (DIPT = 6).
   (3 stages + 4 stages -1) mod 8 = 6
3. Clear DSE.

3rd setting: (Transfer end)
1. The descriptor has three setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMADPCR register (DIPT =1).
   (3 stages + 4 stages + 3 stages -1) mod 8 = 1
3. Clear the DSE bit and set the DMACHCR register (DPM = B'11, DB = B'0, DSIE = B'0, IE = B'1).

Figure 16.14 Operating Mode 3 (Read-Out Interrupt Mode)

(6) Using the Descriptor Memory for Double Buffering

To use the descriptor memory for double buffering, set the number of stages of descriptor memory to 2, set the buffer configuration to the descriptor memory, and activate the memory in operating mode 2. The DSE interrupt is used in double buffering. To end the use of double buffering, disable the descriptor operating mode, which stops the transfer on completion of the transfer currently in progress.



Settings: 1. The descriptor has two setting (buffer A, buffer B) stages.
2. Set the DMACHCRB register (DCNT = 1).
3. Set the DMACHCR register (DPM = B'10, DRST = B'1, DB = B'1, DSIE = B'1, IE = B'0).

Figure 16.15 Using the Descriptor Memory for Double Buffering

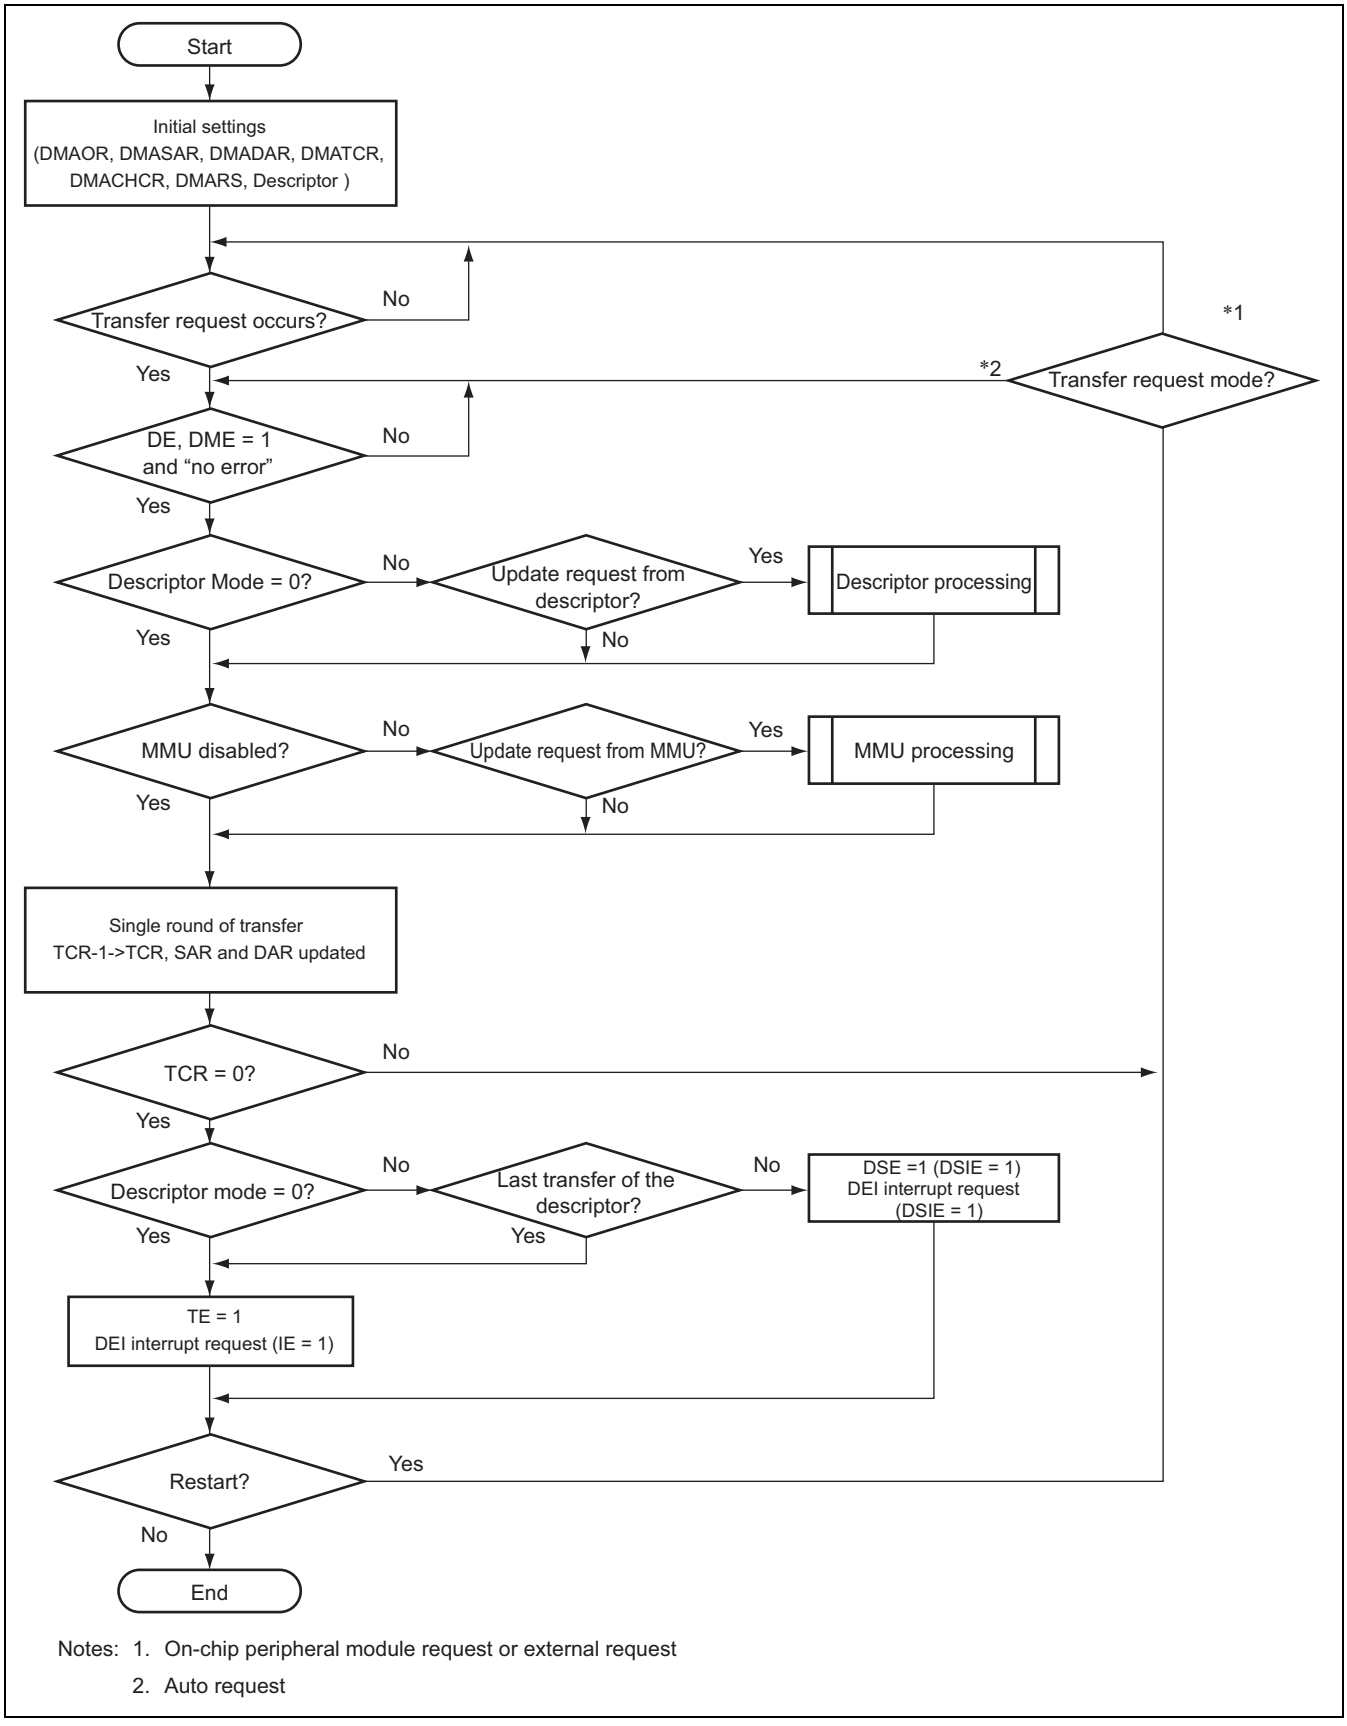
16.4.5 Transmission Flow

Set the transfer conditions as required in the following registers:

DMA source address register (DMASAR), DMA destination address register (DMADAR), DMA transfer count register (DMATCR), DMA Channel control register (DMACHCR), DMA operation register (DMAOR) and DMA extended resource selector (DMARS)

The DMAC then transmits data in the following order.

- A transfer request is generated and the controller checks whether the transfer is allowed (DE = 1, DME = 1, TE = 0, DSE = 0, CAE = 0). When a channel is in the auto request mode, the transfer starts automatically.
- The controller checks whether updating from the descriptor memory is required.
  Updating from the descriptor memory proceeds when the DPB bit in DMACHCR is set to 1 or the descriptor memory is enabled, if DMATCR is set to 0.
  For updating by using the descriptor memory, see section 16.4.4, Descriptor Memory.
- Check whether address translation by the IPMMU is required.
  Address translation by the IPMMU proceeds if the address exceeds the effective size for address translation when the DE bit in DMACHCR is enabled and updating of transfer settings from the descriptor memory is executed.
- Each time a transfer request is generated, the amount of data for a single round of transfer (specified by the TS[3:0] bits) is transmitted. The value in DMATCR is decremented by 1 every time the DMA transfer is completed.
- When the specified number of rounds of transfer are completed (the value in DMATCR is set to 0), the transfer ends normally. A TE interrupt is generated for the CPU upon the end of the transfer if the IE bit in DMACHCR is set to 1. If the descriptor memory is enabled, the processing differs with the mode of the descriptor memory. For more details, see section 16.4.4, Descriptor Memory.
- Transfer is aborted when the DMAC encounters an address error. Transfer is also aborted when the DE bit in DMACHCR or the DME bit in DMAOR is set to 0.



Notes: 1. On-chip peripheral module request or external request
2. Auto request

Figure 16.16 Transmission Flow

16.4.6 Total Size Transmission

The amount of data for total size transmission can be set in DMATSR (in bytes), and this setting is effective regardless of the size specified in the TS bits in DMACHCR. Thereby, the desired size can be transmitted in a single round of DMA transfer.

To use this function, make the settings for total size transmission in DMASAR, DMADAR, DMATSR, DMATSRB and DMACHCR.

Total size is set in the TCR (TSR) field of descriptors and 1 is set in DMACHCRB.DTS when total size transmission and descriptors are in use.

16.5 Usage Notes

Pay attention to the following notes when using the SYS-DMAC.

16.5.1 DMA Transfer for Peripheral Modules

When executing DMA transfer for an on-chip peripheral module, set addresses on the appropriate boundary (in terms of the amount of data for each round of transfer) for the transfer source and destination addresses. Otherwise, an address error may occur.

16.5.2 Module Stop

While the SYS-DMAC is operating, the module stop register (MSTPCR2) should not be set to stop the SYS-DMAC. If the SYS-DMAC is stopped in this way, results of the transfer that was in progress cannot be guaranteed.

16.5.3 Address Error

When a DMA address error is generated, reset the registers of the channel on which the error has occurred and then start transfer anew.

16.5.4 Aborting DMA Transfer

To abort a DMA transfer, disable the interrupt signal and set the DE bit in the DMA channel control register (DMACHCR) to 0 to disable the DMA transfer. If the TE and DSE bits are set when DMA transfer is aborted, these bits should be initialized. There is a possibility that TE and DSE will not be set with synchronized timing after transmission, so it's necessary to recognize the following three possibilities and take measures accordingly.

1. The DSE and TE bits are set to 1 before initialization of DMACHCR, but after the interrupt was disabled.
   The TE and DSE bits are initialized within the DMA transfer initialization sequence.
2. The DSE and TE bits are set to1 and the controller fails to abort the transfer, after the interrupt was disabled.
   When the DE bit has become 0 after DMA transfer initialization, check the TE and DSE bits. If the TE or DSE bit is 1, go through the DMA transfer initialization process.
3. The TE and DSE bits are not cleared to 0 but the transfer is aborted, after the interrupt is disabled.
   The TE or DSE bits are not set because data for transfer still remain after transfer is aborted.

Note: Initialization of DMA transfer during execution of the last transfer leads to a delay in setting of the TE and DSE bits, so include a dummy read.

Figure 16.17 shows an example of processing to abort DMA transfer.

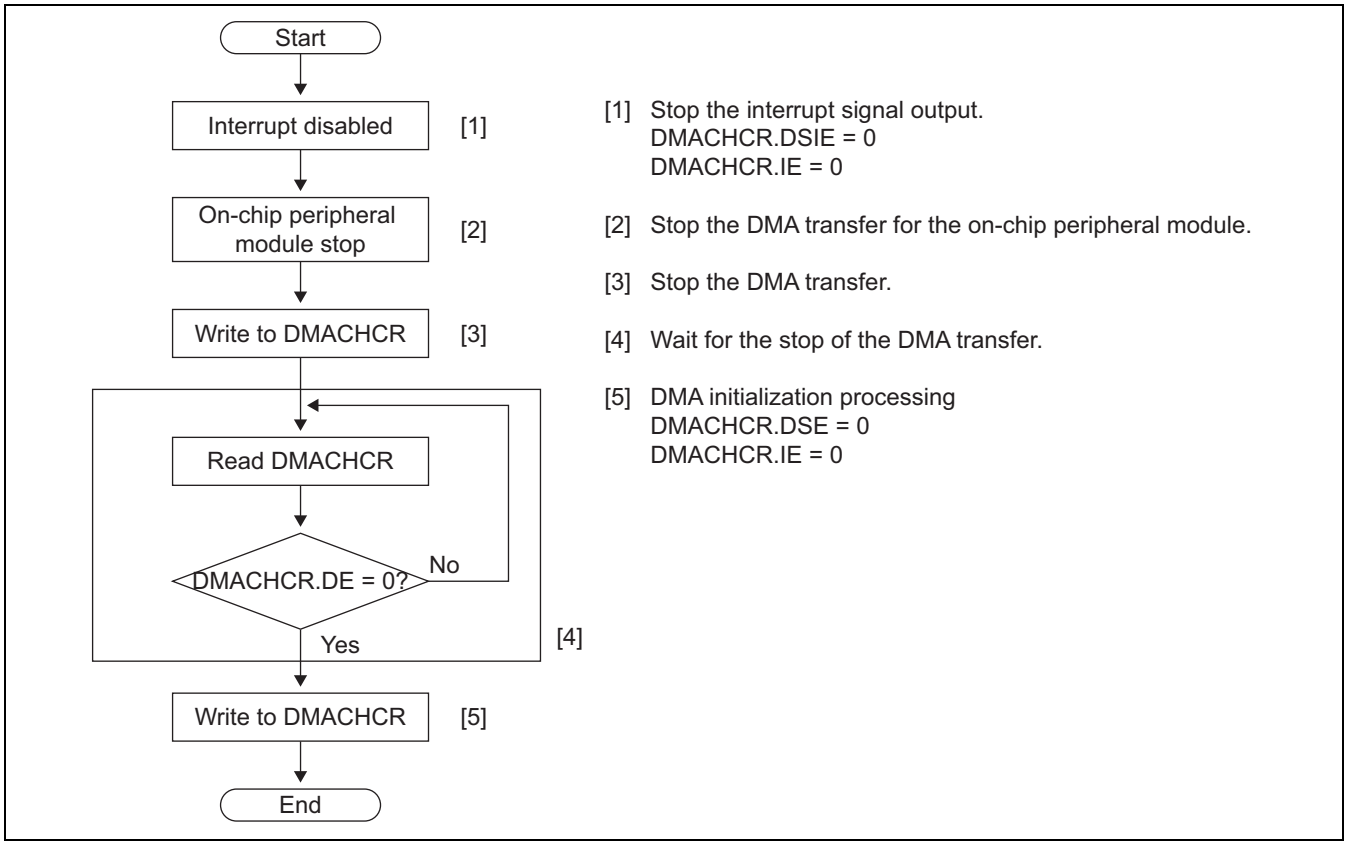


Figure 16.17 Example of Processing to Abort DMA Transfer

17. LBSC-DMAC

17.1 Overview

The LBSC-DMAC performs DMA transfer between the external bus (EX-BUS) and DDR3-SDRAM. The LBSC-DMAC is assigned channel numbers 0 to 2. These DMA channels are capable of independent parallel operation and a different transfer destination can be selected for each.

Different data transfer modes are selectable for each channel. In this section, the character "n" refers to one of the 3 DMA channels of the DMACs.

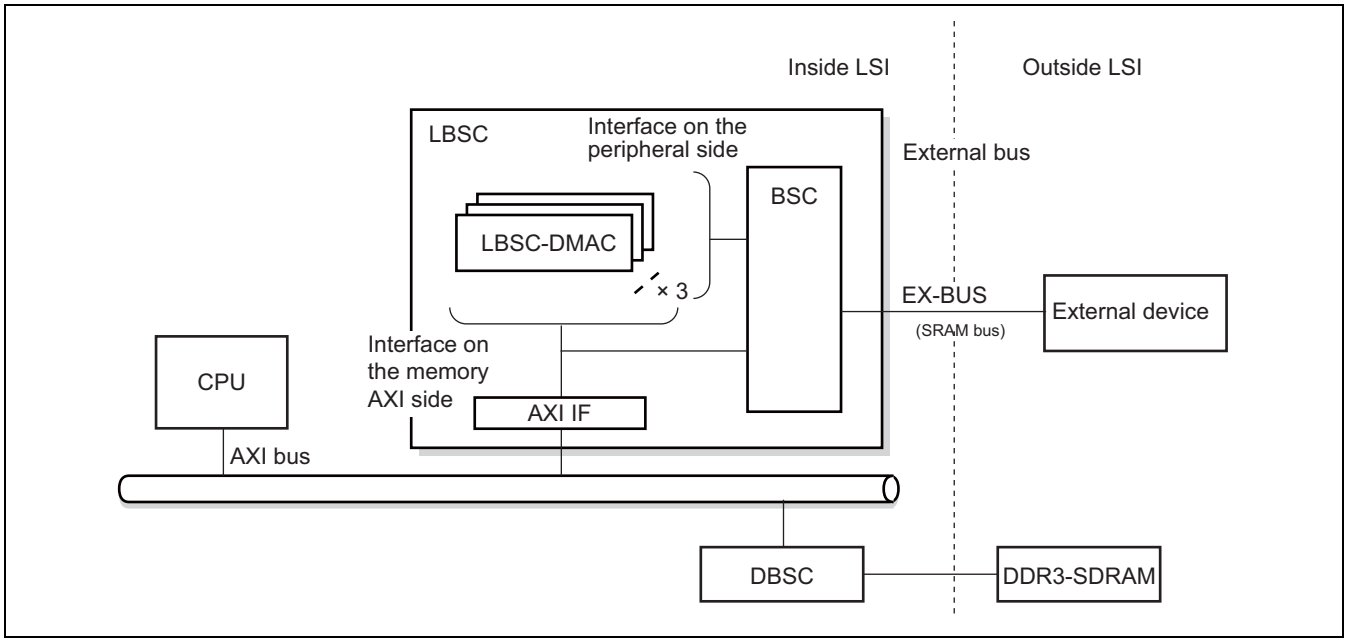

Figure 17.1 Context of LBSC-DMAC

Figure 17.1 shows the context of the LBSC-DMAC. The DMACs are connected to DDR3-SDRAM outside the chip via the DBSC, connected via a memory-side (AXI-bus) interface, and to peripherals connected to the external bus via the peripheral-side interface. Register settings within each of the DMACs select the connected (source and destination) peripheral module or memory. Of these, the LBSC-DMAC supports DMA transfers with general-purpose external devices on the EX-BUS (SRAM bus), and transfer can be performed under handshaking control by the DMA request and DMA acknowledge signals (these channels also support an auto-request mode with no handshaking).

17.2 Features

The LBSC-DMAC has the following features.

- Number of channels: Three channels (channels 0 to 2)
- Address space: Physical address space
- Transfer direction: Capable of transfer from a peripheral module to a memory (AXI bus), or from a memory (AXI bus) to a peripheral module
- Transfer data length:
  - For peripherals: Selectable from 1, 2, or 4 bytes.
  - For memory (AXI bus):

    When the SWMD bit in the DCR register is cleared to 0: Access size specified for a memory (AXI bus) (For details on each channel access size, see section 17.4.8, DMA Control Register (DCR).)
    When the SWMD bit in the DCR register is set to 1: 4 bytes
    When final packing processing is performed while the PKMD bit in the DCR register is set to 1: 1 byte or the access size specified for a memory (AXI bus)
- Transfer burst length: 1 or 8 (Transfer with a burst length of 8 is supported only for channels 0 and 1.)
- Transfer count:
  - Maximum: 16 M (16,777,216) or 64 M (67,108,864) times (64 M is supported only for channel 0 of LBSC-DMAC.)
  - Minimum: One time
- Address mode: Dual address mode
  - Dual address mode

    Both the transfer source and transfer destination are accessed by using addresses.

    Values set in the DMAC's internal registers indicate the addresses for both the transfer source and the transfer destination. (Registers: DMA source address register (DSAR0 or DSAR1), DMA destination address register (DDAR0 or DDAR1), and DMA control register (DCR; bits SPDAM and DPDAM))
- Transfer requests: The external requests, peripheral requests, auto-requests, and timer requests are supported.
  - External requests

    Requests from three external DREQ pins. Low or high level detection or edge detection can be specified for the request signals (DREQ) in the LBSC register. Either the active high or active low logic can be specified by LBSC for the request acknowledge level signal (DRACK) and the acknowledge level signal (DACK). (DRACK is supported for only channel 0 of the LBSC-DMAC.)
  - Peripheral request

    Transfer requests from on-chip peripheral modules.
  - Auto-request
  - Initiates DMA transfer according to the DMAC internal timing.
  - Timer request

    A transfer request is generated at an interval specified by a timer in the DMAC.
- Transfer modes: Single transfer and continuous transfer modes are supported.
  - Single transfer mode

    DMA transfer ends when transfer is completed for the transfer count specified by the DMA transfer count register.
  - Continuous transfer mode

    Available in all channels. If there is a next DMA transfer request (DNXT) when transfer is completed for the transfer count specified by the DMA transfer count register, the next DMA transfer information is fetched and the next DMA transfer is continued. If no next DMA transfer request (DNXT) is found, the DMAC waits until a next DMA transfer request is specified. The continuous transfer mode is terminated by the DQEND bit in the DMA command register (DCMDR).

- DMA information can be specified in two modes: one mode uses one of two sets of DMA information registers (registers in which the offset of the address is in the range from H'0000_0000 to H'0000_0014) repeatedly, and the other uses the two sets alternately.
- The DMAC also provides the automatic continuous transfer mode. The automatic continuous transfer mode is enabled by setting the ACMD bit in the DMA control register (DCR) to 1 while the continuous transfer mode is enabled (the CT bit in DCR is set to 1). In this mode, when transfer is completed for the transfer count specified by the DMA transfer count register, the DMAC fetches the next DMA transfer information and continues DMA transfer regardless of whether there is a next DMA transfer request (DNXT). This mode is terminated by the DQEND bit in the DMA command register (DCMDR).
- Transfer end interrupt: An interrupt request can be sent to the CPU on completion of the number of transfers specified for each DMA information unit.

17.3 DMA Transfer Method in LBSC-DMAC

The relation of each DMA channel to peripherals is shown below. Transfers can be performed with between various functional blocks over different channels, but if destination is on the memory (AXI) side, DDR3-SDRAM via the DBSC and so on becomes the destination for transfer according to the address setting.

Channel	Application	Communication Type	Selection of Transfer Destination (On-Chip Peripheral Function)
LBSC-DMA00	Communication with general-purpose device via EX-BUS	Dual address transfer, single transfer or 8-burst transfer, DREQ/DACK handshake (Channel 0 can select DRACK	DREQ/DACK number and DMA channel number correspond. External bus spaces allocated to each DMAC are specified in the LBSC internal register.
LBSC-DMA01			
LBSC-DMA02		Dual address transfer single transfer, DREQ/DACK handshake	

17.4 Register Descriptions

Registers shown below can be accessed from both ARM CPUs. The DMAC has three channels; some registers are prepared for each individual channel and some are used by all channels in common.

17.4.1 LBSC-DMAC Register Map

Table 17.1 List of LBSC-DMAC Registers

Register Name		Abbr.	Access Type	Address	Access Size
DMA source address register 0	DMA information register set 0	DSAR0	R/W	H'FEC01000 + H'40 × [n]	32
DMA destination address register 0		DDAR0	R/W	H'FEC 01004 + H'40 × [n]	32
DMA transfer count register 0		DTCR0	R/W	H'FEC 01008 + H'40 × [n]	32
DMA source address register 1	DMA information register set 1	DSAR1	R/W	H'FEC 0100C + H'40 × [n]	32
DMA destination address register 1		DDAR1	R/W	H'FEC 01010 + H'40 × [n]	32
DMA transfer count register 1		DTCR1	R/W	H'FEC 01014 + H'40 × [n]	32
DMA source address status register		DSASR	R	H'FEC 01018 + H'40 × [n]	32
DMA destination address status register		DDASR	R	H'FEC 0101C + H'40 × [n]	32
DMA transfer count status register		DTCSR	R	H'FEC 01020 + H'40 × [n]	32
DMA control register		DCR	R/W	H'FEC 01028 + H'40 × [n]	32

LBSC-DMA AXI priority control register		LBSC-DMASPR	R/W	H'FEC 01490	32

Notes: 1. n: LBSC-DMAC channel number
2. The CPU should access the above register in long word units (32 bits). The CPU should not access the above register in byte or word units.
3. Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than listed above are undefined.

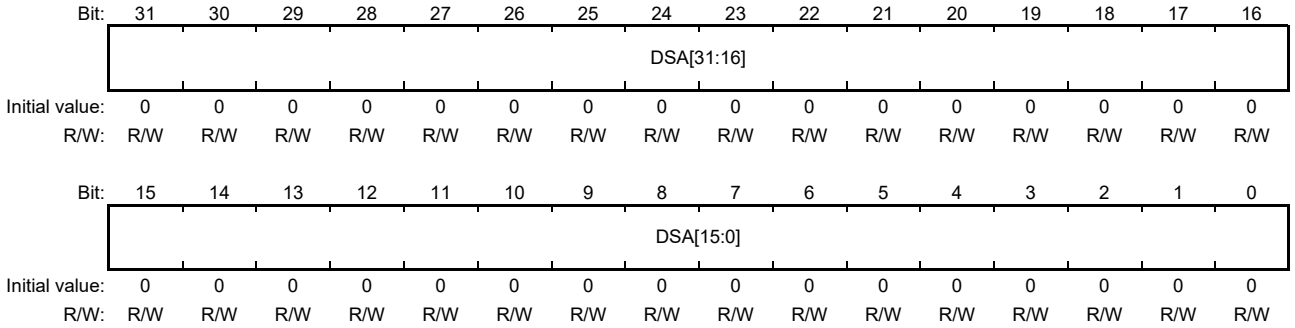
[Legend]

Initial value:	Register value after a reset
—:	Undefined value
R/W:	Readable/writable. The written value can be read.
R/WC1:	Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
R:	Read-only. The write value should always be 0.
—/W:	Write-only. The read value is undefined.

All signals for the control registers and status registers are active-high.

17.4.2 DMA Source Address Registers 0, 1 (DSAR0, DSAR1)

Function: Each register specifies the DMA start address of the transfer source.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSA	All 0	R/W	DMA Transfer Source Start Address The transfer source start address indicates a memory address, a peripheral module address, or an external module address according to the SMDL bit value in the DMA control register (DCR). When SMDL = 0: Transfer source address = Memory (AXI bus) address When SMDL = 1: Transfer source address = Peripheral address or external module address

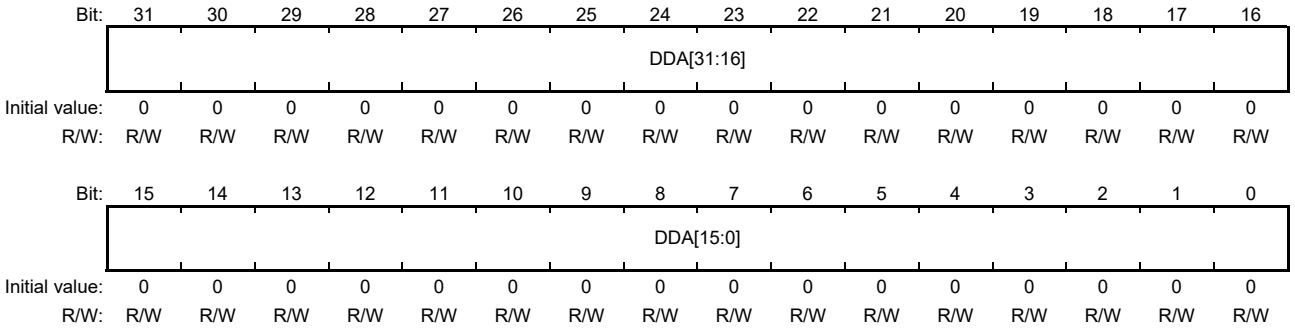
Notes: 1. When the address setting is a memory address, the following address boundary should be used.

	LBSC-DMAC Channel Number	
SWMD Bit in the DCR Register	Channels 0 and 1	Channel 2
0	32-byte boundary	16-byte boundary
1	4-byte boundary	

2. When the address set is an external module address, and in addition the SPDS or DPDS bit in DCR selects an 8-bit access size, up to an 8-bit boundary can be set.
3. In the case of note 2, when the DMAC external module data access size is smaller than the external bus width setting in LBSC, the DMALGR register in the DMAC can be used to specify whether there is a change in data alignment (data access byte lane according to the address value). See section 17.4.22, External DMA Data Alignment Control Register (DMALGR) and specifications of section 14, LBSC within Bus Bridge.
4. When an address setting is an external module address, the upper address bits 31 to 26 are not connected to the external bus. These are provided for ease in understanding the contents of software settings. Also, CS1 identification using these upper bits is not performed. DMAC access destination space is identified through the LBSC external DMAC channel area allocation register.
5. When an address setting is for a peripheral device, the upper address is provided for ease of understanding of the contents of software settings, and is not used for identification of access destination space specific to the peripheral.

17.4.3 DMA Destination Address Registers 0, 1 (DDAR0, DDAR1)

Function: Each register specifies the DMA start address of the transfer destination.

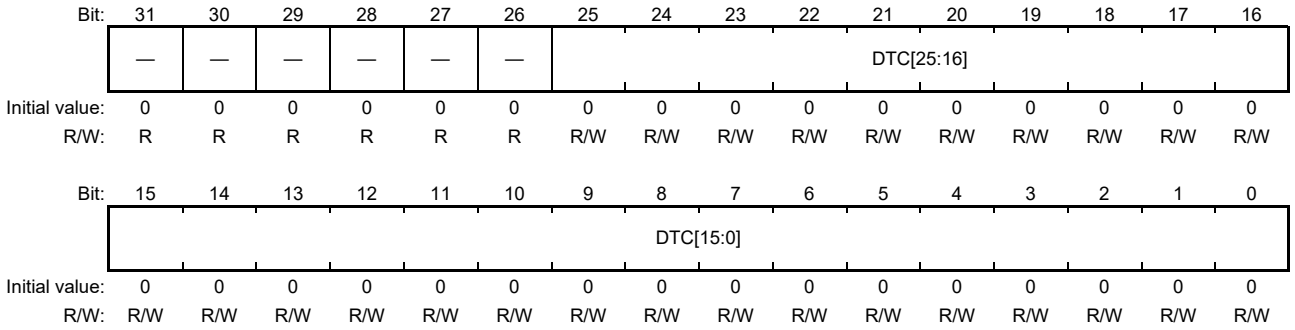


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DDA	All 0	R/W	DMA Transfer Destination Start Address The transfer destination start address indicates a memory address, a peripheral module address, or an external module address according to the DMDL bit value in the DMA control register (DCR). When DMDL = 0: Transfer destination address = Memory (AXI bus) address When DMDL = 1: Transfer destination address = Peripheral module or external module address

Note: See the notes 1 to 5 in section 17.4.2, DMA Source Address Registers 0, 1 (DSAR0, DSAR1). Those notes also apply to this register.

17.4.4 DMA Transfer Count Registers 0, 1 (DTCR0, DTCR1)

Function: Each register specifies the DMA transfer count.

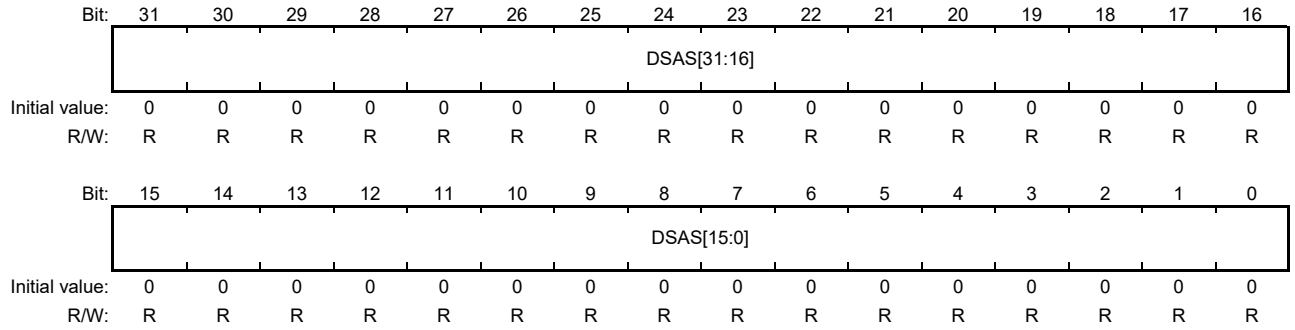


Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 0	DTC	All 0	R/W	DMA Transfer Count These bits specify the DMA transfer count (number of bytes, words, or long words). LBSC-DMAC channel 0: The maximum count is DTC = H'0, which indicates 64 M (67,108,864) times. Other than LBSC-DMAC channel 0: The maximum count is DTC = H'0, which indicates 16 M (16,777,216) times.

Note: This register specifies the transfer count on the peripheral side for transfer from a peripheral to a memory (AXI bus) or from a memory (AXI bus) to a peripheral. For 8-burst DMA operation, one count for each 8-burst operation.

17.4.5 DMA Source Address Status Register (DSASR)

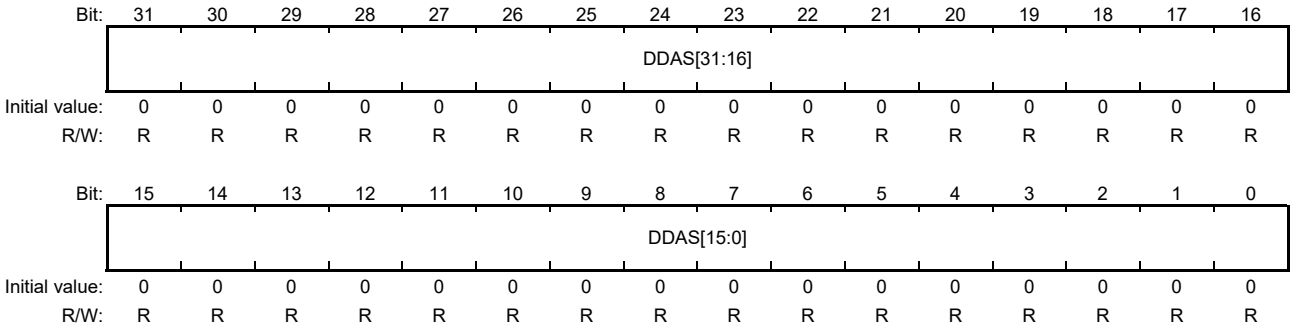
Function: DSASR indicates the transfer source address.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSAS	All 0	R	These bits indicate the latest source address for which DMA transfer has been completed.

17.4.6 DMA Destination Address Status Register (DDASR)

Function: DDASR indicates the transfer destination address.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DDAS	All 0	R	These bits indicate the latest destination address for which DMA transfer has been completed.

17.4.7 DMA Transfer Count Status Register (DTCSR)

Function: DTCSR indicates the remaining count of the current transfer.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	DTCS[25:16]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DTCS[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 0	DTCS	All 0	R	Remaining DMA Transfer Count These bits indicate the remaining count of the current DMA transfer (number of bytes, words, or long words). Note that bits 25 to 0 are used only for the LBSC-DMAC channel 0 and bits 23 to 0 are used for the other channels. The number of transferred bytes depends on the peripheral's data bus width.

Note: This register indicates the remaining transfer count on the peripheral side for transfer from a peripheral to a memory (AXI bus) or from a memory (AXI bus) to a peripheral.

17.4.8 DMA Control Register (DCR)

Function: DCR specifies the transfer mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	DTAMD	DTAC	DTAU	DTAU1	SWMD	BTMD	PKMD	—	CT	ACMD	DIP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	SMDL	SPDAM	SDRMD		SPDS		—	—	DMDL	DPDAM	DDRMD		DPDS	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26	DTAMD	0	R/W	Specifies the data alignment conversion mode when a memory is accessed in DMA transfer (see section 17.5.7, Data Alignment in AXI Bus Interface). 0: Conversion according to the combination of the input pin (little: endian mode) and the AXI width. 1: Conversion according to the combination of DTAC (DMA data alignment conversion), DTAU (DMA data alignment unit), and DTAU1 (8-byte conversion in 4-byte units).
25	DTAC	0	R/W	Enables or disables data alignment conversion when a memory is accessed in DMA transfer (see section 17.5.7, Data Alignment in AXI Bus Interface). This setting is valid when DTAMD = 1. 0: Disables data alignment conversion. 1: Enables data alignment conversion.
24	DTAU	0	R/W	Specifies the unit for data alignment conversion (see section 17.5.7, Data Alignment in AXI Bus Interface). This setting is valid when DTAMD = 1. 0: Byte units 1: Word units
23	DTAU1	0	R/W	Specifies whether 8-byte data alignment is performed in 4 bytes unit (see section 17.5.7, Data Alignment in AXI Bus Interface). The setting value is valid when DTAMD = 1. 0: Not performed. 1: Performed.
22	SWMD	0	R/W	Specifies memory (AXI bus) access size. 0: * (Clearing this bit to 0 is recommended when DDR3-SDRAM is specified.) 1: 4 bytes
21	BTMD	0	R/W	Specifies the burst DMA transfer (only for LBSC-DMAC channels 0 and 1). Burst DMA transfer is performed for peripherals. 0: Does not transfer in burst mode. 1: Transfers in burst mode (burst length is fixed to eight).

Bit	Bit Name	Initial Value	R/W	Description
20	PKMD	0	R/W	Enables or disables packing of data read from a peripheral for DMA transfer from the peripheral to the AXI bus. 0: Disables packing. 1: Enables packing.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18	CT	0	R/W	Specifies continuous DMA transfer. 0: Does not transfer in continuous mode. 1: Transfers in continuous mode.
17	ACMD	0	R/W	Specifies automatic continuous DMA transfer (valid only when CT = 1). 0: Does not transfer in automatic continuous mode (checks DNXT = 1 in DCMDR). 1: Transfers in automatic continuous mode (regardless of the DNXT bit in DCMDR).
16	DIP	0	R/W	Specifies the valid DMA information set(s). 0: Uses one DMA information set repeatedly. 1: Uses two DMA information sets alternately.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	SMDL	0	R/W	Selects the transfer source module. 0: Memory (AXI bus) 1: Peripheral
12	SPDAM	0	R/W	Specifies whether to fix or increment the transfer source peripheral address. 0: Fixes the peripheral address at the value specified in DSAR0 or DSAR1. 1: Increments the peripheral address (increments by one for 8-bit transfer, by two for 16-bit transfer, or by 4 for 32-bit transfer). When SMDL = 0, the address for memory access (via the AXI bus) is incremented regardless of the setting of this bit.
11, 10	SDRMD	00	R/W	These bits specify the DMA request mode for the transfer source. 00: Module request (external request or peripheral module request) 01: Auto-request 10: Timer request 11: Setting prohibited When SMDL = 0, clear the SDRMD bits to B'00 or set them to the same value as that of the DDRMD bits.
9, 8	SPDS	00	R/W	These bits specify the data bus width for the transfer source peripheral. 00: 8 bits 01: 16 bits 10: 32 bits 11: Setting prohibited When SMDL = 0, clear the SPDS bits to B'00 or set them to the same value as that of the DPDS bits.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	DMDL	0	R/W	Selects the transfer destination module. 0: Memory (AXI bus) 1: Peripheral

Bit	Bit Name	Initial Value	R/W	Description
4	DPDAM	0	R/W	Specifies whether to fix or increment the transfer destination peripheral address. 0: Fixes the peripheral address at the value specified in DDAR0 or DDAR1. 1: Increments the peripheral address (increments by one for 8-bit transfer, by two for 16-bit transfer, or by 4 for 32-bit transfer). When DMDL = 0, the address for memory access (via the AXI bus) is incremented regardless of the setting of this bit.
3, 2	DDRMD	00	R/W	These bits specify the DMA request mode for the transfer destination. 00: Module request (external request or peripheral module request) 01: Auto-request 10: Timer request 11: Setting prohibited When DMDL = 0, clear the DDRMD bits to B'00 or set them to the same value as that of the SDRMD bits.
1, 0	DPDS	00	R/W	These bits specify the data bus width for the transfer destination peripheral. 00: 8 bits 01: 16 bits 10: 32 bits 11: Setting prohibited When DMDL = 0, clear the DPDS bits to B'00 or set them to the same value as that of the SPDS bits.

Notes: 1. When SMDL and DMDL = 1 and 0, data is transferred from a peripheral to a memory.
When SMDL and DMDL = 0 and 1, data is transferred from a memory to a peripheral.
Setting SMDL and DMDL = "1 and 1" or "0 and 0" is prohibited.

2. Not all DMAC functions can be applied to every peripheral. DMAC functions must be specified appropriately according to the functions and restrictions of each peripheral.

3. Since the width of the EX-BUS is 16 bits, setting of the SPDS or DPDS bits for the LBSC-DMAC to B'10 (selecting a transfer source or destination width of 32 bits, respectively) is prohibited.

* The following table summarizes the memory (AXI) access size in each DMAC channel when SWMD bit is cleared to 0.

	LBSC-DMAC Channel Number	
SWMD Bit in DCR Register	Channels 0 and 1	Channel 2
0	32 bytes	16 bytes

17.4.9 DMA Command Register (DCMDR)

Function: DCMDR activates or stops DMA transfer.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	BDOUT	DQSPD	DQSPC	DMSPD	DMSPC	DQEND	DNXT	DMEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	BDOUT	0	—/W	1: Forcibly writes the data read from a peripheral to the AXI bus side (Transfer direction: from a peripheral to the AXI bus). Writing 1 to this bit forcibly writes to the AXI bus side, and then terminates DMA transfer.
6	DQSPD	0	—W	1: Temporarily stops transfer in DMA information units.
5	DQSPC	0	—/W	1: Cancels temporary transfer stop in DMA information units.
4	DMSPD	0	—/W	1: Temporarily stops transfer in bus cycle units.
3	DMSPC	0	—/W	1: Cancels temporary transfer stop in bus cycle units.
2	DQEND	0	—/W	1: Terminates continuous DMA transfer mode. Only the DMA information specified before is transferred, and then continuous transfer mode is terminated.
1	DNXT	0	—/W	1: Requests the next DMA transfer. In continuous transfer mode, after the current DMA information is transferred, the next DMA information is transferred.
0	DMEN	0	—/W	1: Activates DMA transfer.

Note: For use of BDOUT, see sections 17.5.3, Packing Data Read from Peripheral or External Module and 17.5.4, Limitations on Packing of Data Read from Peripheral or External Module.

17.4.10 DMA Forced Stop Register (DSTPR)

Function: DSTPR forcibly terminates DMA transfer.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMSTP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	—/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	DMSTP	0	—/W	1: Forcibly terminates DMA transfer. After the current bus cycle is completed, DMA transfer is terminated. (Values set for the DMA transfer status registers (DSASR, DDASR, and DTCSR) are retained.)

17.4.11 DMA Status Register (DSTSR)

Function: DSTSR indicates the DMA transfer status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	NDP1	NDP0	DQSPS	DMSPS	DQSTS	DRSTS	DMSTS
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

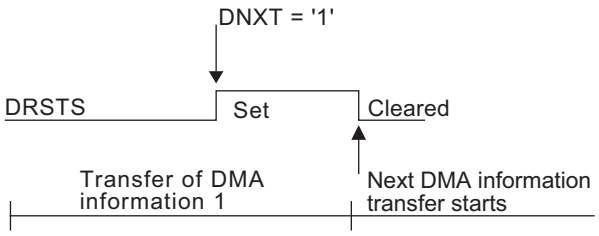
Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6	NDP1	0	R	Next DMA Transfer Information Register Status 1 0: Does not transfer DMA information in DMA information register set 1 in the next DMA information transfer. 1: Transfers DMA information in DMA information register set 1 in the next DMA information transfer.
5	NDP0	1	R	Next DMA Transfer Information Register Status 0 0: Does not transfer DMA information in DMA information register set 0 in the next DMA information transfer. 1: Transfers DMA information in DMA information register set 0 in the next DMA information transfer.
4	DQSPS	0	R	Temporary Stop Status of DMA Information Updating 0: Normal operation 1: DMA information updating is temporarily stopped.
3	DMSPS	0	R	Temporary Stop Status of DMA Transfer 0: Normal operation 1: DMA transfer is temporarily stopped.
2	DQSTS	0	R	DMA Acceptance End Status 0: DMA information can be accepted. 1: DMA information acceptance is stopped.
1	DRSTS	0	R	DMA Transfer Request Status 0: Next DMA transfer has not been requested. 1: Next DMA transfer has been requested.
0	DMSTS	0	R	DMA Status 0: DMA transfer has been completed. 1: DMA transfer is active.

Note: Either NDP0 or NDP1 (next DMA transfer information register status 0 or 1) is always set to 1.

The following shows the transition of each bit status in DSTSR.

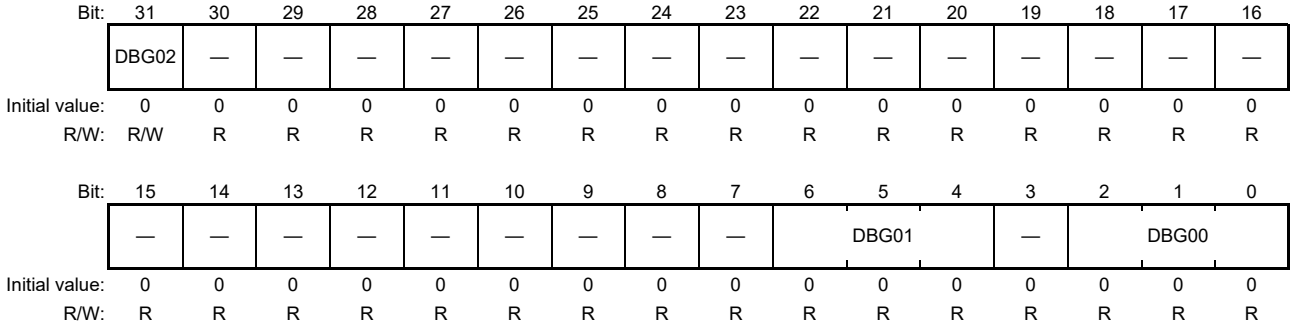
		Conditions of Status Transition	
	0 ⟶	1 ⟶	0
NDP1	Initial state	Continuous transfer mode is selected and information register sets 0 and 1 are used alternately (DIP in DCR = 1): DMA transfer for information register set 0 is in progress.	Continuous transfer mode is selected and information register sets 0 and 1 are used alternately (DIP in DCR = 1): DMA transfer for information register set 1 is in progress.
NDP0	—	1. Initial state 2. Single transfer mode: Always 3. Continuous transfer mode is selected and information register set 0 is used repeatedly (DIP in DCR = 0): Always 4. Continuous transfer mode is selected and information register sets 0 and 1 are used alternately (DIP in DCR = 1): DMA transfer for information register set 1 is in progress.	Continuous transfer mode is selected and information register sets 0 and 1 are used alternately (DIP in DCR = 1): DMA transfer for information register set 0 is in progress.
DQSPS	Initial state	DMA transfer is temporarily stopped in DMA information units (DQSPD in DCMDR = 1) and the current information transfer is completed.	Temporary stop of DMA transfer in DMA information units is canceled (DQSPC in DCMDR = 1).
DMSPS	Initial state	DMA transfer is temporarily stopped in bus cycle units (DMSPD in DCMDR = 1) and the current bus cycle is completed.	Temporary stop of DMA transfer in bus cycle units is canceled (DMSPC in DCMDR = 1).
DQSTS	Initial state	Continuous transfer mode is selected (CT in DCR = 1) and DMA continuous transfer is terminated (DQEND = 1) during transfer of DMA information 1.	Transfer of DMA transfer information ends.

		Conditions of Status Transition 0 → 1	1 → 0
DRSTS	Initial state	Continuous transfer mode is selected (CT in DCR = 1) and next DMA transfer information is requested (DNXT = 1) during transfer of DMA information 1.	Next DMA information transfer is started.
DMSTS	Initial state	DMA is activated (DMEN in DCMDR = 1).	End state (remains in the idle state). 1. Transfer end a. Single transfer mode: Transfer of one DMA information set is completed. b. Continuous transfer mode: DRSTS = 0 and DQSTS = 1 in DSTSR and transfer of current DMA information is completed. 2. Forced stop DMSTP in DSTPR is set to 1 and DMA transfer is terminated after the current bus cycle is completed.



17.4.12 DMA Channel Debugging Register (DDBGR)

Function: DDBGR is used for debugging.



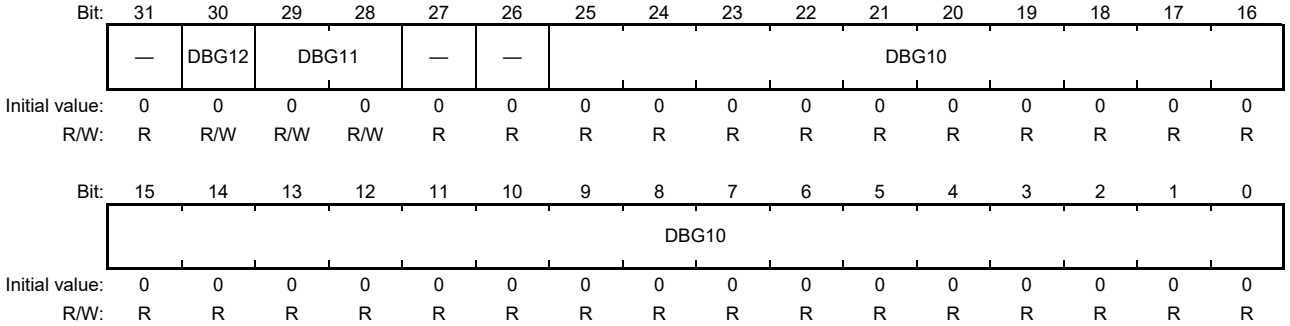
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DBG02	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	DBG01			—	DBG00		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	DBG02	0	R/W	Test Bit This bit is a test bit and cannot be written to. If this bit is written to, correct operation cannot be guaranteed.
30 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 4	DBG01	All 0	R	Test Bits
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	DBG00	All 0	R	Test Bits

17.4.13 DMA Channel Debugging Register 2 (DDBGR2)

Function: DDBGR2 is used to for debugging.



Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30	DBG12	0	R/W	Test Bit This bit is a test bit and cannot be written to. If this bit is written to, correct operation cannot be guaranteed.
29, 28	DBG11	All 0	R/W	Test Bits These bits are test bits and cannot be written to. If these bits are written to, correct operation cannot be guaranteed.
27, 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 0	DBG10	All 0	R	Test Bits

17.4.14 DMA Timer Control Register (DTIMR)

Function: DTIMR specifies the timer cycle in the DMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DTIM[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	DTIM	All 0	R/W	DMAC Internal Timer Cycle Set Request mode: Specify the DMA request interval in timer request mode. Request interval: DTIM × peripheral-side bus clock cycle (ns) Peripheral-side bus clock cycle (ns) for LBSC-DMAC: Approximately 15 ns (EX-BUS frequency 65.00 MHz) Note: Even in timer request mode, operation is the same as that in auto-request mode when the value of DTIM is 0.

17.4.15 DMA Request Mask Control Register (DRMSKR)

Function: DRMSKR0 specifies the timing for detecting DMA requests in the external-bus DMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DRMSK2[3:0]				DRMSK1[3:0]				DRMSK0[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	DRMSK2	All 0	R/W	These bits specify the number of clock cycles from the completion of a DMA transfer (at the time of CS# signal negation) until the next DMA request is detected, for each DMAC channel corresponding to each field. Request detection cycle: DRMSK × external bus clock cycle (ns)
7 to 4	DRMSK1	All 0	R/W	
3 to 0	DRMSK0	All 0	R/W	

Note: Settings for DRMSK2 to DRMSK0 are only valid when level-detection is specified for the external DREQ signal (specified by EXDMCRy in the LBSC) for the channel. In edge-detection mode, set the bits to 0.

17.4.16 DMA Memory Access Priority Level Control Register (DMLVLR)

Function: DMLVLR specifies the access priority level (1 or 2).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	DMLV2	DMLV1	DMLV0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	DMLV2	0	R/W	These bits specify the external bus arbitration priority group for each DMAC channel which corresponds to each bit. 0: Level 2 (Low: Group 2) 1: Level 1 (High: Group 1)
1	DMLV1	0	R/W	
0	DMLV0	0	R/W	

17.4.17 DMA Transfer End Interrupt Status Register (DINTSR)

Function: DINTSR indicates the DMA transfer end interrupt status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	DTE2	DTE1	DTE0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	DTE2	0	R	DMA Transfer End Interrupt Status Each bit indicates the DMA transfer status (n: DMA channel number). 0: Initial state or data is being transferred before the count specified by DTCR is reached. 1: Transfer has been completed for the count specified by DTCR.
1	DTE1	0	R	
0	DTE0	0	R	

17.4.18 DMA Transfer End Interrupt Status Clear Register (DINTCR)

Function: DINTCR clears the DMA transfer end interrupt status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	DTEC2	DTEC1	DTEC0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	—/W	—/W	—/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	DTEC2	0	—/W	DMA Transfer End Interrupt Status Clear Writing 1 to each bit clears the corresponding DMA transfer end interrupt status (n: DMAC channel number) Writing 0 to these bits is ignored. Each bit is always read as 0.
1	DTEC1	0	—/W	
0	DTEC0	0	—/W	

17.4.19 DMA Transfer End Interrupt Enable Register (DINTMR)

Function: DINTMR controls output of DMA transfer end interrupts.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	DTEM2	DTEM1	DTEM0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	DTEM2	0	R/W	DMA Transfer End Interrupt Output Control An interrupt signal is output as a level signal (n: DMA channel number). 0: Does not output an interrupt on completion of a DMA transfer. 1: Outputs an interrupt on completion of a DMA transfer.
1	DTEM1	0	R/W	
0	DTEM0	0	R/W	

17.4.20 DMA Activation Status Register (DACTSR)

Function: DACTSR indicates the activation status of each channel.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	DS2	DS1	DS0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	DS2	0	R	DMA Channel n Status (n: DMA channel number) 0: Idle state 1: Active state
1	DS1	0	R	
0	DS0	0	R	

17.4.21 Software-Reset Registers (LSRSTR0 to LSRSTR2)

Function: Each register resets DMA channel n.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SRST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SRST	0	R/WC1	Software Reset Resets DMA channel n. 0: Writing 0 is ignored. 1: Resets DMA channel n. This register is always read as 0.

Note: Writing 1 resets the DMAC regardless of the DMA transfer status. The same registers are reset as when a power-on reset is performed. Accordingly, a software reset should be used only while DMA transfer is not in progress (e.g., during system debugging). To stop operation, forced termination or temporary stop should be specified instead of software reset. In the registers used by all channels in common (DMA transfer end interrupt status register (DINTSR) and DMA transfer end interrupt enable register (DINTMR)), only the bits corresponding to the software-reset channel are initialized.

17.4.22 External DMA Data Alignment Control Register (DMALGR)

Function: DMALGR specifies whether there is a data alignment conversion in external bus access by the external bus DMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DMLG2				DMLG1				DMLG0			
					exbwe	exac	exbw		exbwe	exac	exbw		exbwe	exac	exbw	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	DMLGn exbwe	0	R/W	Specifies whether there is an EX-BUS data alignment conversion for each DMAC channel (n: DMAC channel number). When the DMAC/DCR setting DMA access bus width is smaller than the external bus width for the relevant DMA area set in LBSC. 0: Access byte lanes fixed 1: Access byte lanes variable
	DMLGn exac	0	R/W	Specifies endian setting when there is alignment conversion with the exbwe bit set to 1 (n: DMAC channel number). 0: Big endian 1: Little endian
	DMLGn exbw	00	R/W	Specifies the unit for data alignment conversion with the exbwe bit set to 1 (n: DMAC channel number). 00: 8 bits 01: 16 bits 10: Setting prohibited 11: Invalid

Note: Does not need to be set when the bus width set in LBSC and the DMA access size set in DMAC/DCR are the same. For details, see section 14.7.3 (1), Data Alignment during LBSC-DMAC Access in specifications for LBSC within Bus Bridge.

17.4.23 LBSC-DMA AXI Priority Control Register (LBSC-DMASPR)

Function: LBSC-DMASPR specifies the AXI bus access priority level for external DMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SPRR2				SPRR1				SPRR0			
Initial value:	0	0	0	0	1	0	0	0	1	0	0	0	1	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SPRRn	H'8	R/W	Specify the AXI bus access priority level for each DMAC channel (n: DMAC channel number). Priority: H'0 (lowest) to H'F (highest)

Note: Since AXI bus access priority level settings relate to priority control for the AXI bus overall, priority levels with other access modules must be confirmed when making settings.

17.5 Operation

17.5.1 DMA Transfer Procedure

The following describes the DMA transfer procedure.

1. Making the initial setting for the DMAC
   Specify transfer conditions in the DMA control register (DCR).
2. Specifying DMA transfer information
   Make appropriate settings in the following registers according to the DIP bit setting (input mode: using one information set repeatedly or two information sets alternately) in DCR:
   DMA source address register (DSAR)
   DMA destination address register (DDAR)
   DMA transfer count register (DTCR)
   When the DIP bit specifies that one information set is used repeatedly, make the appropriate settings in DSAR0, DDAR0, and DTCR0.
3. Activating the DMAC
   Activate the DMAC by setting the DMEN bit in the DMA command register (DCMDR).
4. Reading the specified DMA transfer information
   The specified DMA transfer information is read from DMA information registers 0 and 1 in that order.
5. Clearing the DMA transfer request
   The DMA transfer request status signal is cleared.
6. Starting DMA transfer
   When the auto-request mode is selected as the transfer request mode, transfer automatically starts at the DMAC transfer timing after the transfer information is obtained.
   When the external request or peripheral request mode is selected, DMA transfer is performed for one bus access cycle when a transfer request is accepted.
   When the timer request is selected, transfer automatically starts at the intervals specified in the DMAC internal timer after the transfer information is obtained.
7. Issuing an interrupt for the end of a specified number of transfers
   In single transfer mode, DMA transfer stops when transfer is completed for the specified number of times, and the CPU is notified of the end of transfer through an interrupt.
   In continuous transfer mode, the CPU is notified of the end of transfer in DMA transfer information units through an interrupt.
   The interrupt signal is controlled according to the setting in the DMA transfer end interrupt enable register (DINTMR).
8. Reading the next DMA transfer information (continuous transfer mode)
   If the next DMA transfer request is specified, the information of the transfer is read and data is transferred in the same way as described in step 6.
   If no additional DMA transfer request is specified (DRSTS = 0), the continuous DMA transfer mode is terminated when DQSTS = 1, or the next DMA transfer request is waited for when DQSTS = 0.
9. Adding DMA transfer information (continuous transfer mode)
   If new DMA transfer information should be added, specify the information in the DMA transfer information set that will be used for the next transfer (the next DMA transfer information set can be checked with the NDP1 and NDP0 bits in the DMA status register (DSTSR)).
   If no DMA transfer information should be added, write 1 to the DQEND bit in the DMA command register (DCMDR) to terminate the continuous transfer mode.

Note: Actually, the source bus and destination bus operate independently.

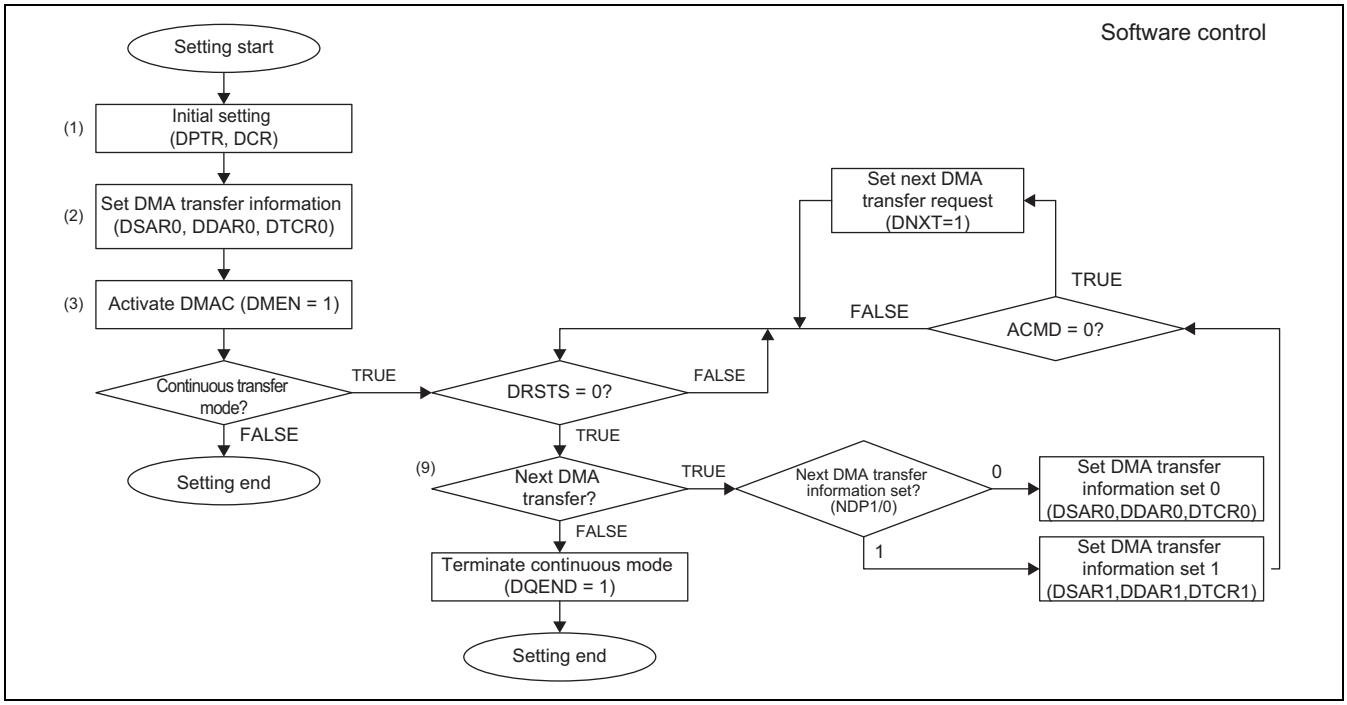


Figure 17.2 DMA Transfer Flowchart (1)

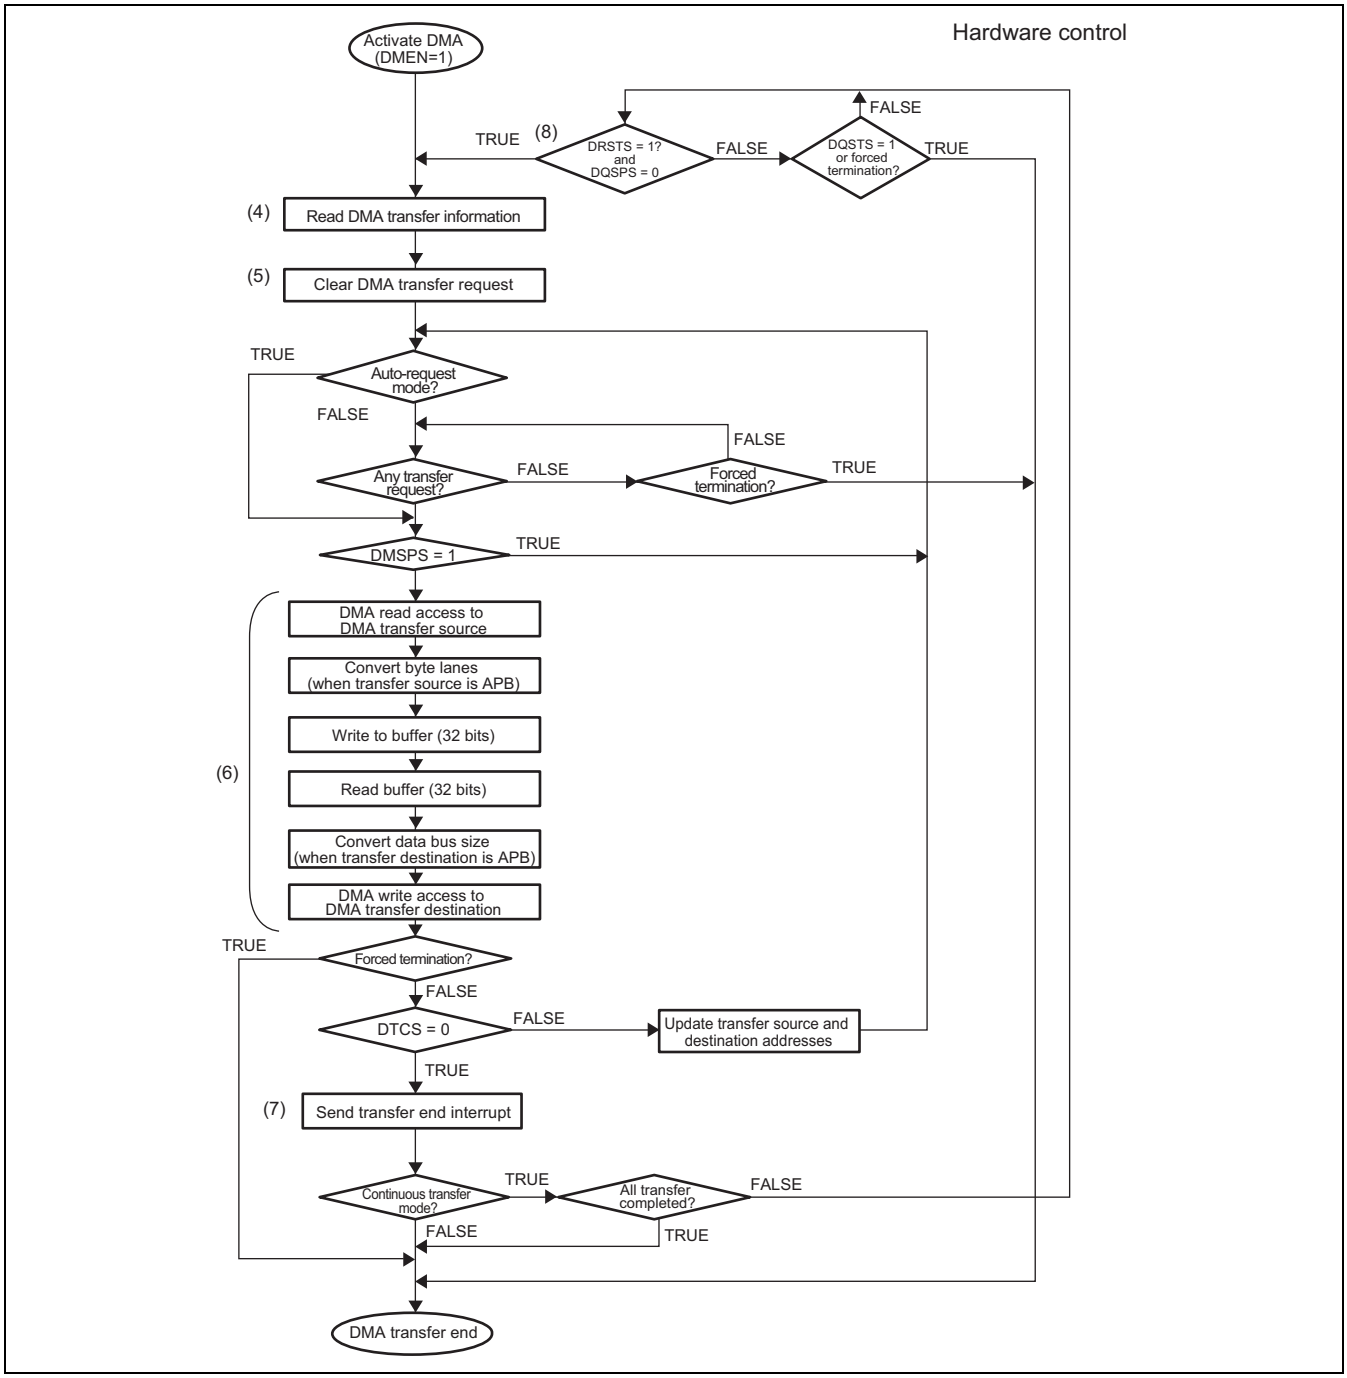

Figure 17.3 DMA Transfer Flowchart (2)

17.5.2 Continuous DMA Transfer Operation

The following shows the relationship between addition of DMA transfer information by software and DMA transfer information read and data transfer operation by hardware, which are described in step 9 in section 17.5.1, DMA Transfer Procedure. Figures 17.4 and 17.5 show transfer using DMA information set 0 repeatedly, and Figures 17.6 and 17.7 show transfer using DMA information sets 0 and 1 alternately.

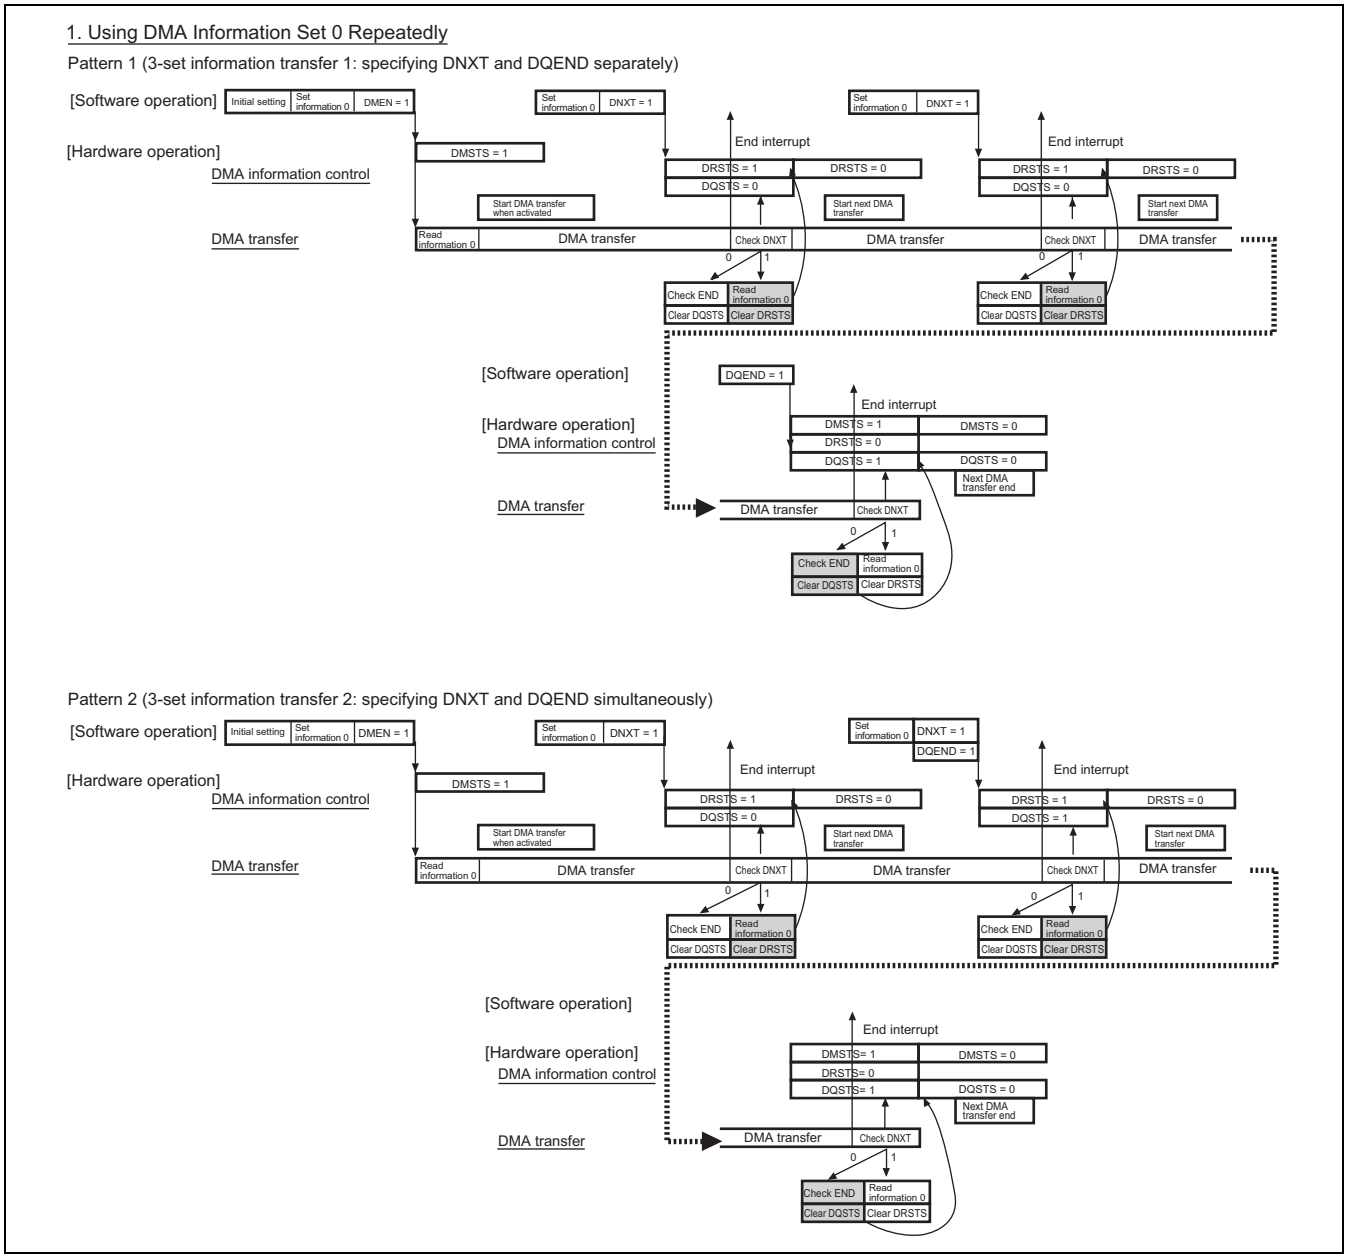

Figure 17.4 Transfer Using DMA Information Set 0 Repeatedly (1)

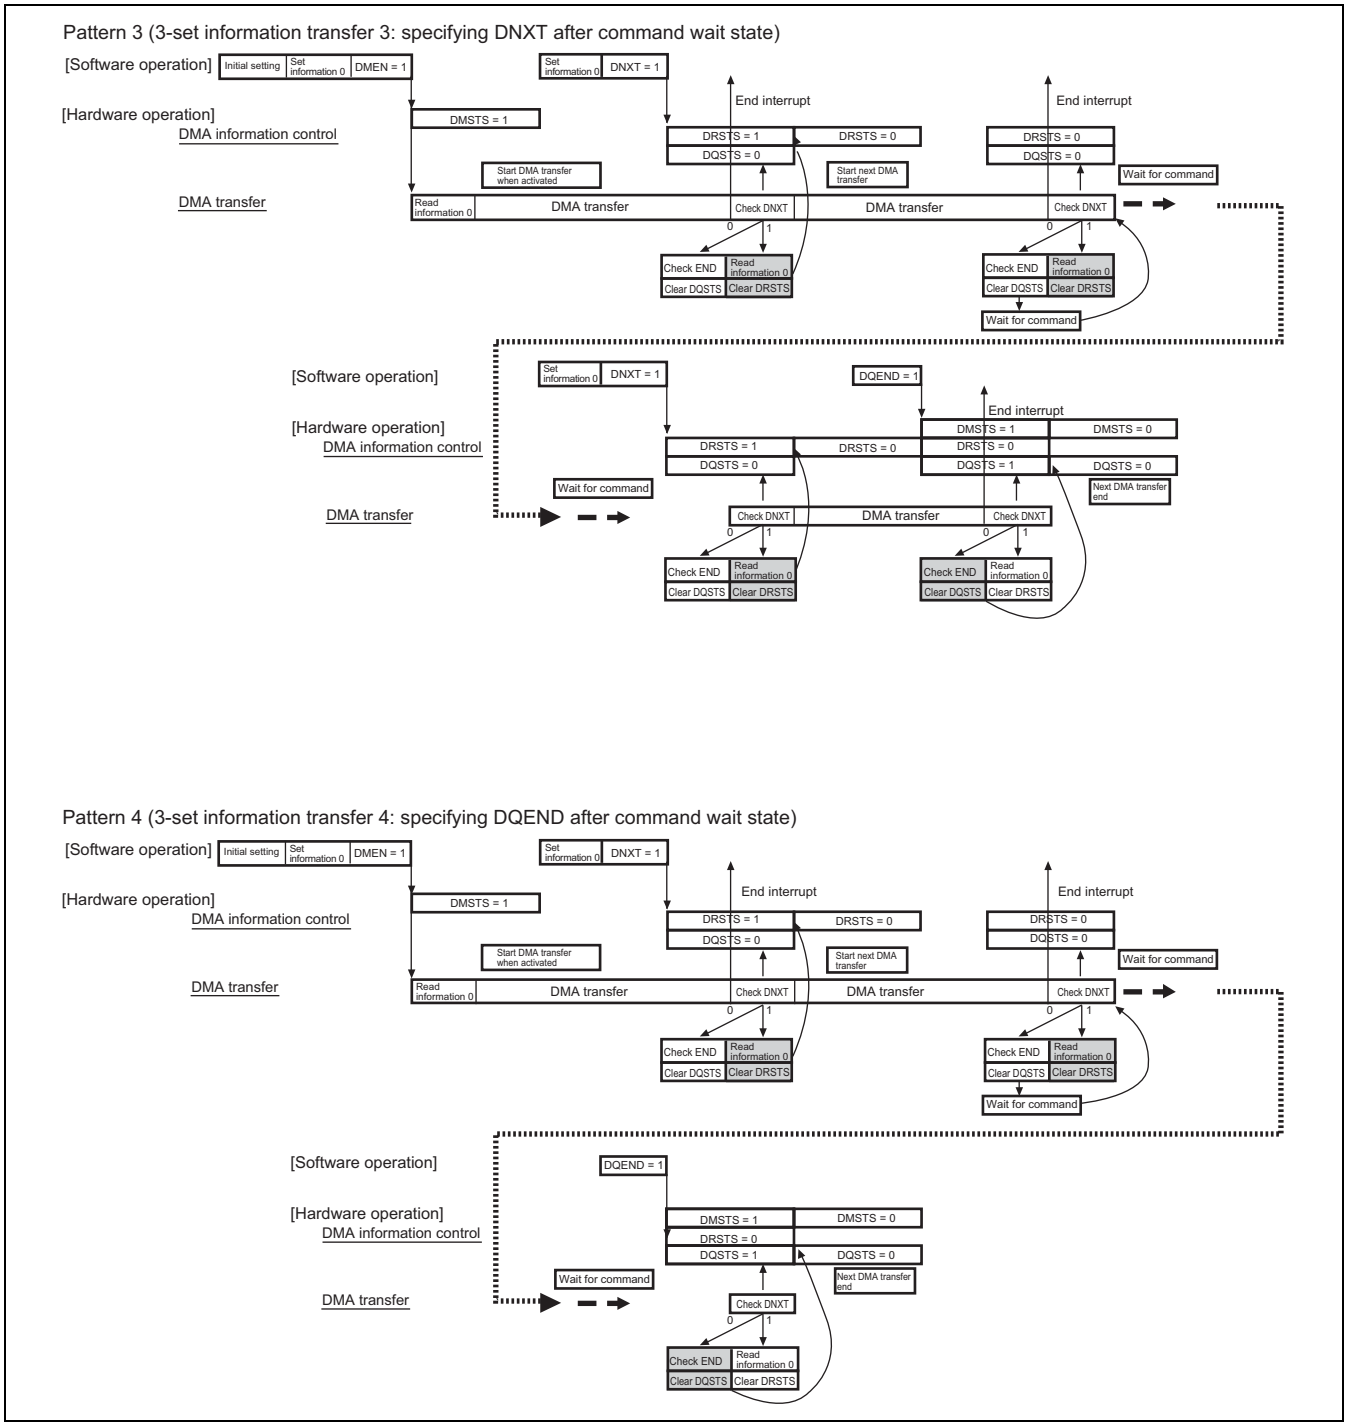

Figure 17.5 Using DMA Information Set 0 Repeatedly (2)

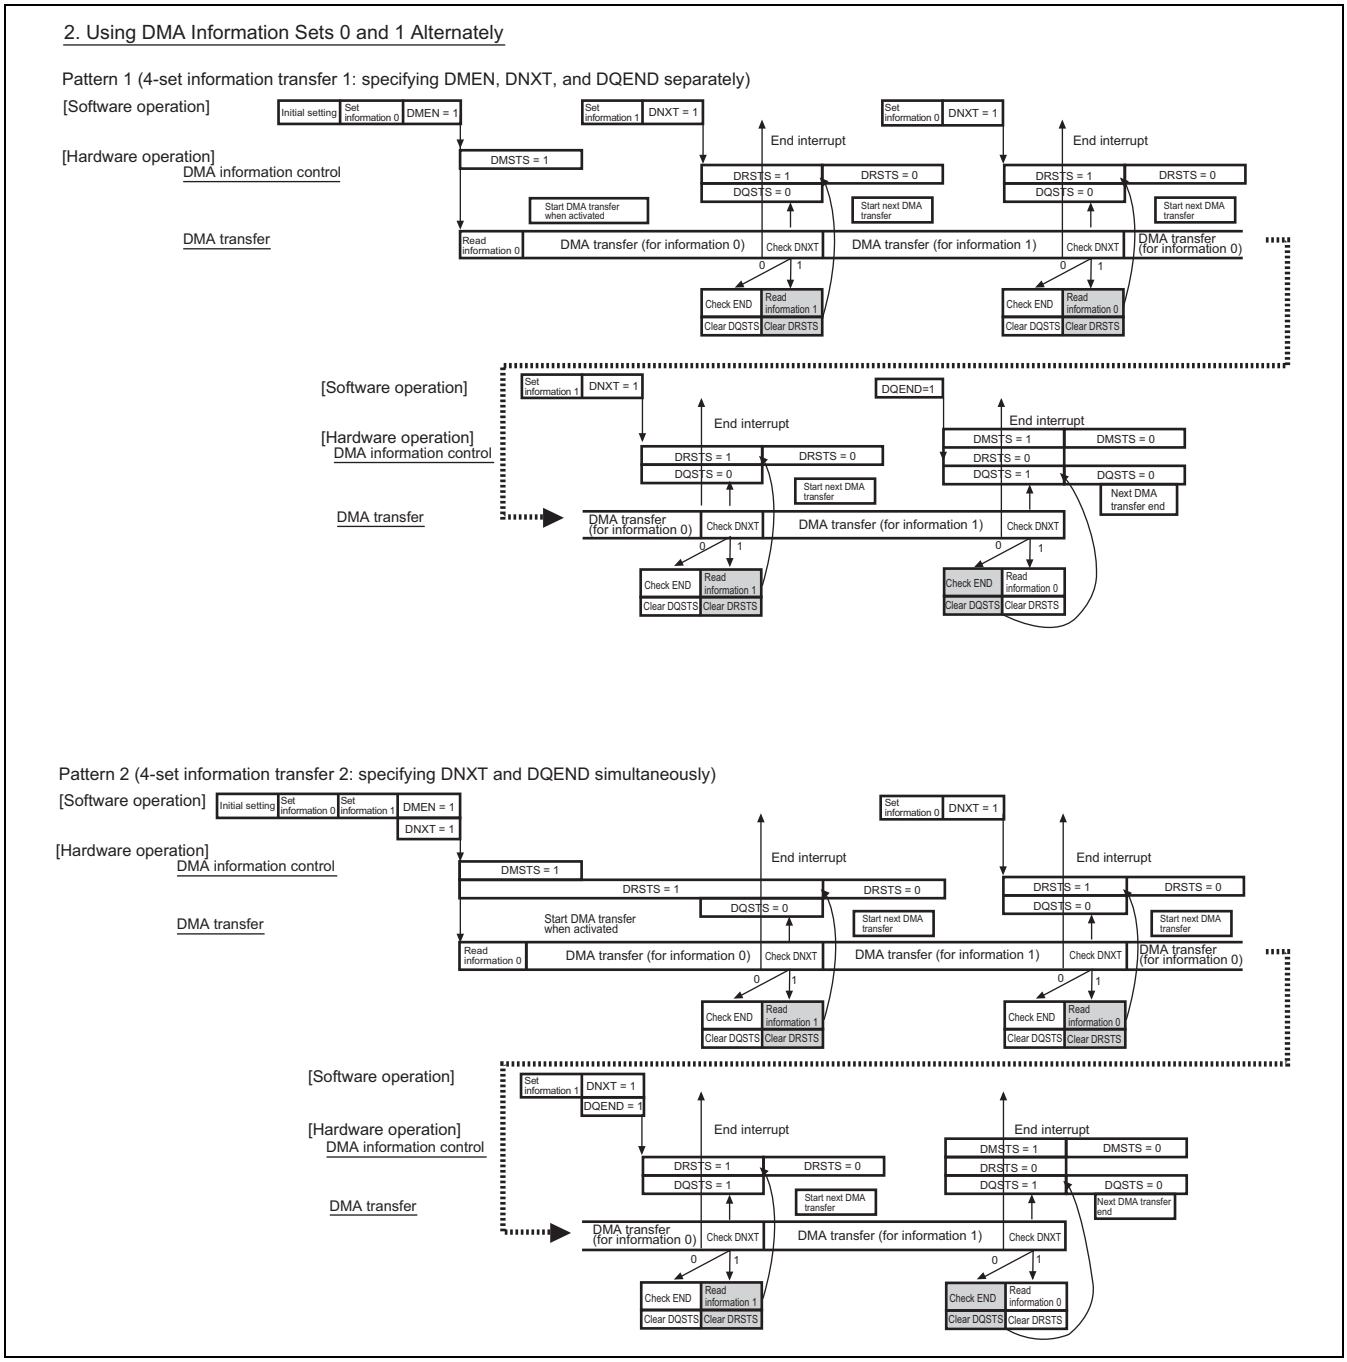

Figure 17.6 Using DMA Information Sets 0 and 1 Alternately (1)

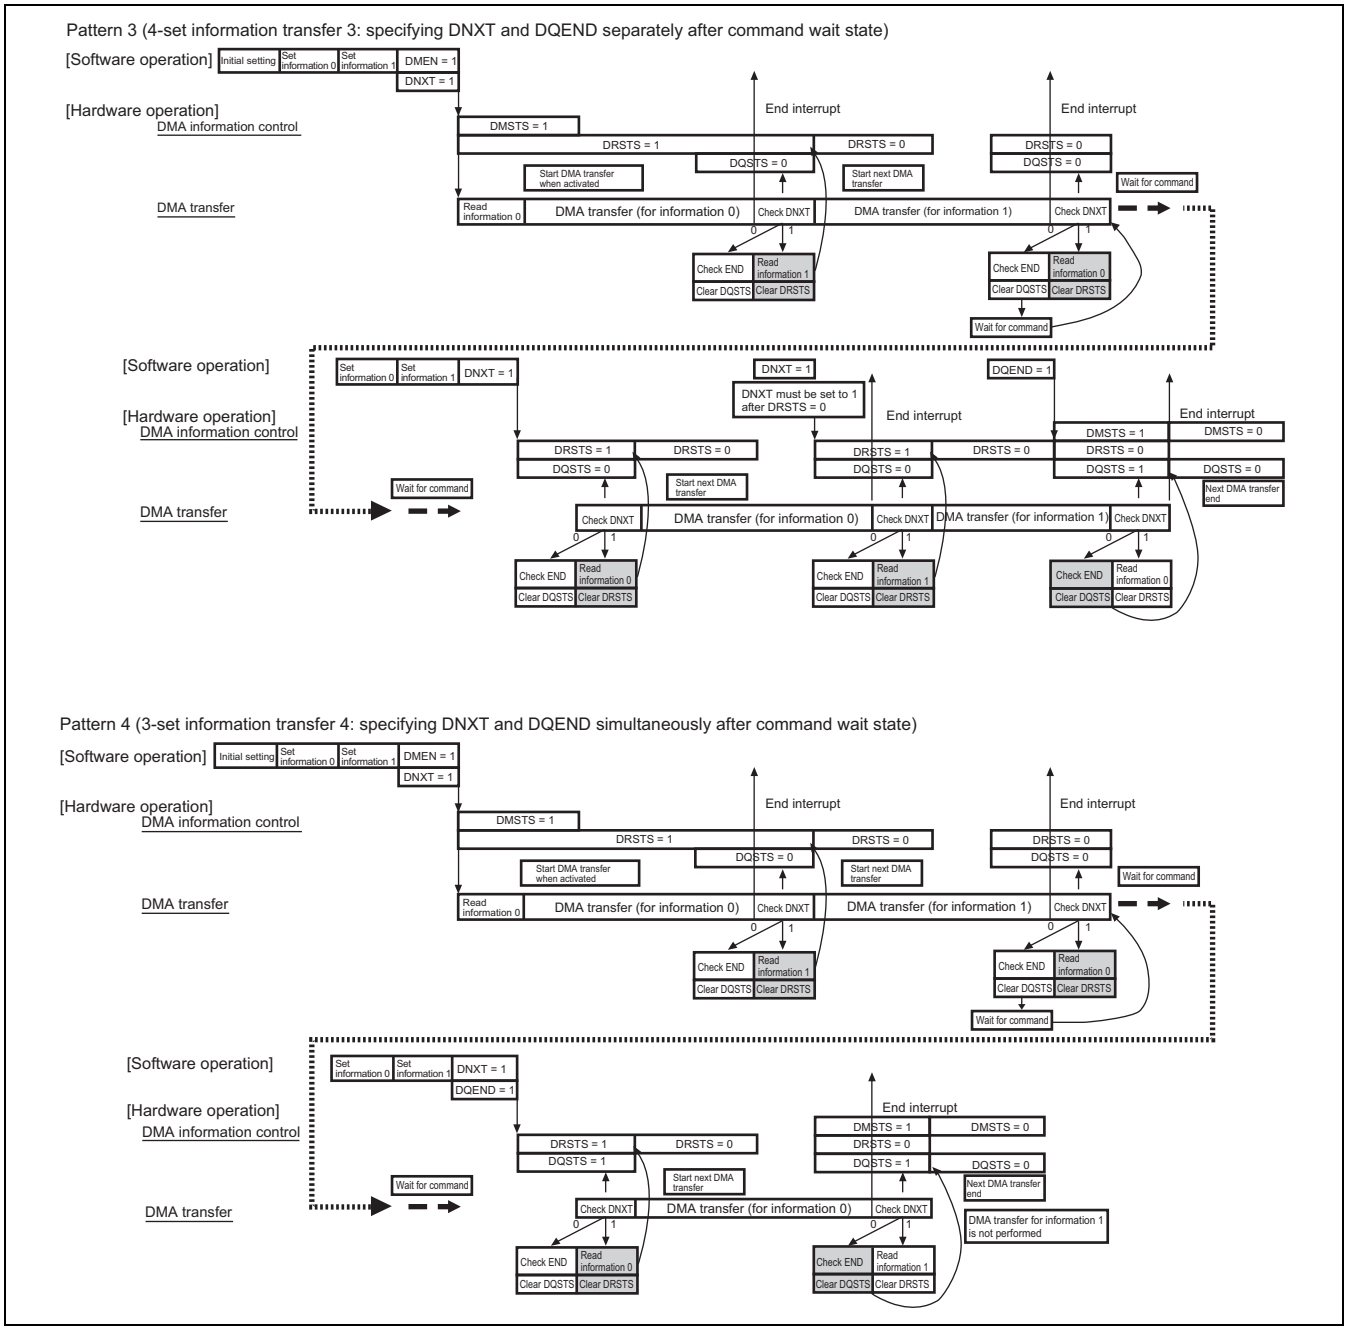

Figure 17.7 Using DMA Information Sets 0 and 1 Alternately (2)

17.5.3 Packing Data Read from Peripheral or External Module

Writing 1 to the PKMD bit when making necessary settings in the DMA control register (DCR) in the usual DMA activation procedure enables packing of data read from a peripheral or external module and then writing the data to memory (the AXI bus). Packing size can be specified to either 4 bytes or byte units shown in * in the DCR register description by the SWMD bit in DCR. However, when the transfer destination on the AXI side is memory (DDR-DRAM), packing size in a byte unit shown in * in the DCR register description is recommended in order to use memory and the AXI efficiently. The data packing of an access size when SWMD in DCR = 0 cannot be specified for the LBSC-DMAC (for details on access size in each channel, see * in the DCR register description), because size of data written from peripheral modules connected to the APB to registers is equal to or less than 4 bytes when the transfer destination on the AXI side is one of the units connected to the APB.

During the packing operation, even if the DMAC holds data less than the specified packing size when the DMAC completes the specified count of transfer, the DMAC writes fetched data to memory and indicates the end of DMA transfer by setting the DTEn bit in the DMA transfer end interrupt status register (DINTSR). If the peripheral or external module completes a DMA request before the specified transfer count is reached, DMA transfer can be terminated by writing 1 to the BDOUT bit in the DMA command register (DCMDR). In this case, if data which is being packed remains in the DMAC, the DMAC writes the data to memory (AXI). The DTE[n] bit in the DMA transfer end interrupt status register (DINTSR) is set and a transfer end interrupt is generated. Note that zero padding does not occur during write to memory. If no data remains in the DMAC, the DMAC terminates DMA transfer without accessing memory and generates a transfer end interrupt in the same way as when data remains in the DMAC.

When transfer is terminated by the BDOUT bit setting in continuous transfer mode, the DMAC transfers the next DMA information if the next DMA information transfer is requested through the DNXT bit in DCMDR, and then terminates DMA transfer in the continuous transfer mode termination procedure. In this mode, DMA requests (DREQ) from peripheral or external modules are masked (not accepted) before a transfer end interrupt occurs after the BDOUT bit is set to 1.

17.5.4 Limitations on Packing of Data Read from Peripheral or External Module

The transfer count is specified in DMA transfer count registers 0 and 1 (DTCR0 and DTCR1) in the DMAC.

If DMA transfer from a peripheral or external module is completed before the specified transfer count is reached, the DMAC cannot distinguish whether data is being transferred or the transfer has been completed, and data of less than packing size may remain in the DMAC internal buffer. When the size of remaining data is the same as the specified packing size, the data is transferred to memory.

Data remaining in the DMAC internal buffer is written to memory through a forced write executed by setting the BDOUT bit in the DMA command register (DCMDR). (Zero padding does not occur because the transfer destination is memory. For example, if 3-byte data remains in the DMAC un-transferred to memory, the 3-byte data is written to the memory as is.)

A forced write can be triggered by a communication completion interrupt from a peripheral or external module. Note that whether DMA transfer from the peripheral or external module is completed when the communication end interrupt occurs depends on the specifications of the peripheral or external module. Accordingly, check the specifications of the module before executing a forced write.

17.5.5 Notification of the End of DMA Transfer

The DMAC notifies the CPU of the end of transfer by outputting transfer end interrupt signal (a level signal) through INTC (SYS) when transfer is completed for the transfer count specified in DMA transfer information in single transfer mode. In continuous transfer mode, the DMAC outputs transfer end interrupt signal every time transfer is completed for the transfer count specified in one DMA transfer information set.

The transfer end interrupt signal is controlled according to the setting in the DMA transfer end interrupt enable register (DINTMR). Writing 1 to the DMA transfer end interrupt status clear register (DINTCR) clears the transfer end interrupt signal.

17.5.6 DMA Transfer Stop, and Resume Procedures

This section describes the procedures for stopping, and resuming DMA transfer.

- To stop (cancel) DMA transfer during operation

Step	Overview	Register Operation	Operation after Register Write
1 ↓	Specify forced termination for DMAC.	Write 1 to DMSTP of DSTPR in DMAC.	The DMAC stops DMA transfer as soon as the current DMA bus cycle is completed, and then enters the idle state. Unfinished transfer data remaining in the buffer is discarded. The registers retain the values. No end interrupt is issued.
2 ↓	Check that the DMAC has entered the idle state.	If DMSTS of DSTSR in DMAC is 0, the DMAC is in the idle state.	—
3	Specify forced termination for external devices.	(Depends on the external devices.)	The external devices stop sending DMA requests.

Note: Step 2 can be done after step 3.

- To temporarily stop (pause) DMA transfer during operation and then resume it

Step	Overview	Register Operation	Operation after Register Write
1 ↓	Specify temporary stop for DMAC.	Write 1 to DMSPD of DCMDR in DMAC.	The DMAC temporarily stops DMA transfer as soon as the current DMA bus cycle is completed. The DMAC retains its internal status, including unfinished transfer data remaining in the buffer, without change.
2 ↓	Check that the DMAC has entered the temporary stop state.	If DMSPS of DSTSR in DMAC is 1, the DMAC is in the suspended state.	—
3 ↓	A certain period of time has elapsed (the LBSC may detect a DREQ signal from an external device during this period, but the DMAC keeps the temporary stop and the external devices continue to wait for DMA transfer).		
4	Specify cancel of temporary stop (resume transfer).	Write 1 to DMSPC of DCMDR in DMAC.	The paused state is canceled, and the DMAC resumes its operation with the DMA transfer for the DREQ detected by the LBSC.

Note: Step 2 can be done between steps 3 and 4.

- To temporarily stop (pause) DMA transfer during operation and then terminate (cancel) operation

Step	Overview	Register Operation	Operation after Register Write
1 ↓	Specify temporary stop for DMAC.	Write 1 to DMSPD of DCMDR in DMAC.	The DMAC temporarily stops DMA transfer as soon as the current DMA bus cycle is completed. The DMAC retains its internal status, including unfinished transfer data remaining in the buffer, without change.
2 ↓	Check that the DMAC has entered the temporary stop state.	If DMSPS of DSTSR in DMAC is 1, the DMAC is in the suspended state.	—
3 ↓	A certain period of time has elapsed (the LBSC may detect a DREQ signal from an external device during this period, but the DMAC keeps the temporary stop and the external devices continue to wait for DMA transfer).		
4 ↓	Specify forced termination for DMAC.	Write 1 to DMSTP of DSTPR in DMAC.	The DMAC exits the temporary stop state and enters the idle state. Unfinished transfer data remaining in the buffer is discarded. The registers retain the values. No end interrupt is issued.
5 ↓	Check that the DMAC has entered the idle state.	If DMSTS of DSTSR in DMAC is 0, the DMAC is in the idle state.	—
6	Specify forced termination for external devices.	(Depends on the external devices.)	The external devices stop sending DMA requests.

Notes: 1. Step 2 can be done between steps 3 and 4.
2. Step 5 can be done after step 6.

17.5.7 Data Alignment in AXI Bus Interface

The AXI bus is always accessed through a handshake using an access request and a request acknowledge. Alignment of data read or written during the access to memory through the AXI bus is always converted.

When the DTAMD bit in the DMA control register (DCR) is 0, the AXI bus data alignment is converted according to the endian mode signal (DMAC input signal: little) and the peripheral data bus width (the SPDS1 and SPDS0 bits or DPDS1 and DPDS0 bits in DCR). When the DTAMD bit in DCR is 1, data alignment is converted according to the DTAC, DTAU, and DTAU1 bit settings in DCR.

The following table shows the AXI bus data alignment control according to the DTAMD bit in DCR, endian mode signal (DMAC input signal: little), peripheral data bus width (the SPDS1 and SPDS0 bits or DPDS1 and DPDS0 bits in DCR), and DTAC, DTAU, and DTAU1 bits in DCR.

Table 17.2 Data Alignment Control According to Bit and Signal Settings

No.	DTAMD	little (MD[8])	PDS [1:0]	DTAC	DTAU	DTAU1	Data Alignment of 4 Bytes	Unit for 4-Byte Data Alignment	8-Byte Data Alignment in 4-Byte Unit	Conversion Pattern	Remarks
1	0	0	00 (8 bits)	*	*	*	Not controlled	8 bits	Not controlled	CP1 (3)	Standard conversion (Software must specify only PDS[1:0])
2	0	0	01 (16 bits)	*	*	*	Not controlled	16 bits	Not controlled	CP2 (3)	
3	0	0	10 (32 bits)	*	*	*	Not controlled	8 bits	Not controlled	CP3 (2)	
4	0	1	00 (8 bits)	*	*	*	Controlled	8 bits	Controlled	CP1 (1)	
5	0	1	01 (16 bits)	*	*	*	Controlled	16 bits	Controlled	CP2 (1)	
6	0	1	10 (32 bits)	*	*	*	Not controlled	8 bits	Controlled	CP3 (1)	
7	1	*	*	0	0	0	Not controlled	8 bits	Not controlled	CP1 (3)	Special conversion (Software must specify the alignment mode)
8	1	*	*	0	0	1	Not controlled	8 bits	Controlled	CP3 (1)	
9	1	*	*	0	1	0	Not controlled	16 bits	Not controlled	CP2 (3)	
10	1	*	*	0	1	1	Not controlled	16 bits	Controlled	CP3 (1)	
11	1	*	*	1	0	0	Controlled	8 bits	Not controlled	CP1 (2)	
12	1	*	*	1	0	1	Controlled	8 bits	Controlled	CP1 (1)	
13	1	*	*	1	1	0	Controlled	16 bits	Not controlled	CP2 (2)	
14	1	*	*	1	1	1	Controlled	16 bits	Controlled	CP2 (1)	

*: Don't care

The following shows data alignment conversion in the DMAC. Conversion pattern numbers in the table above correspond to the conversion numbers below.

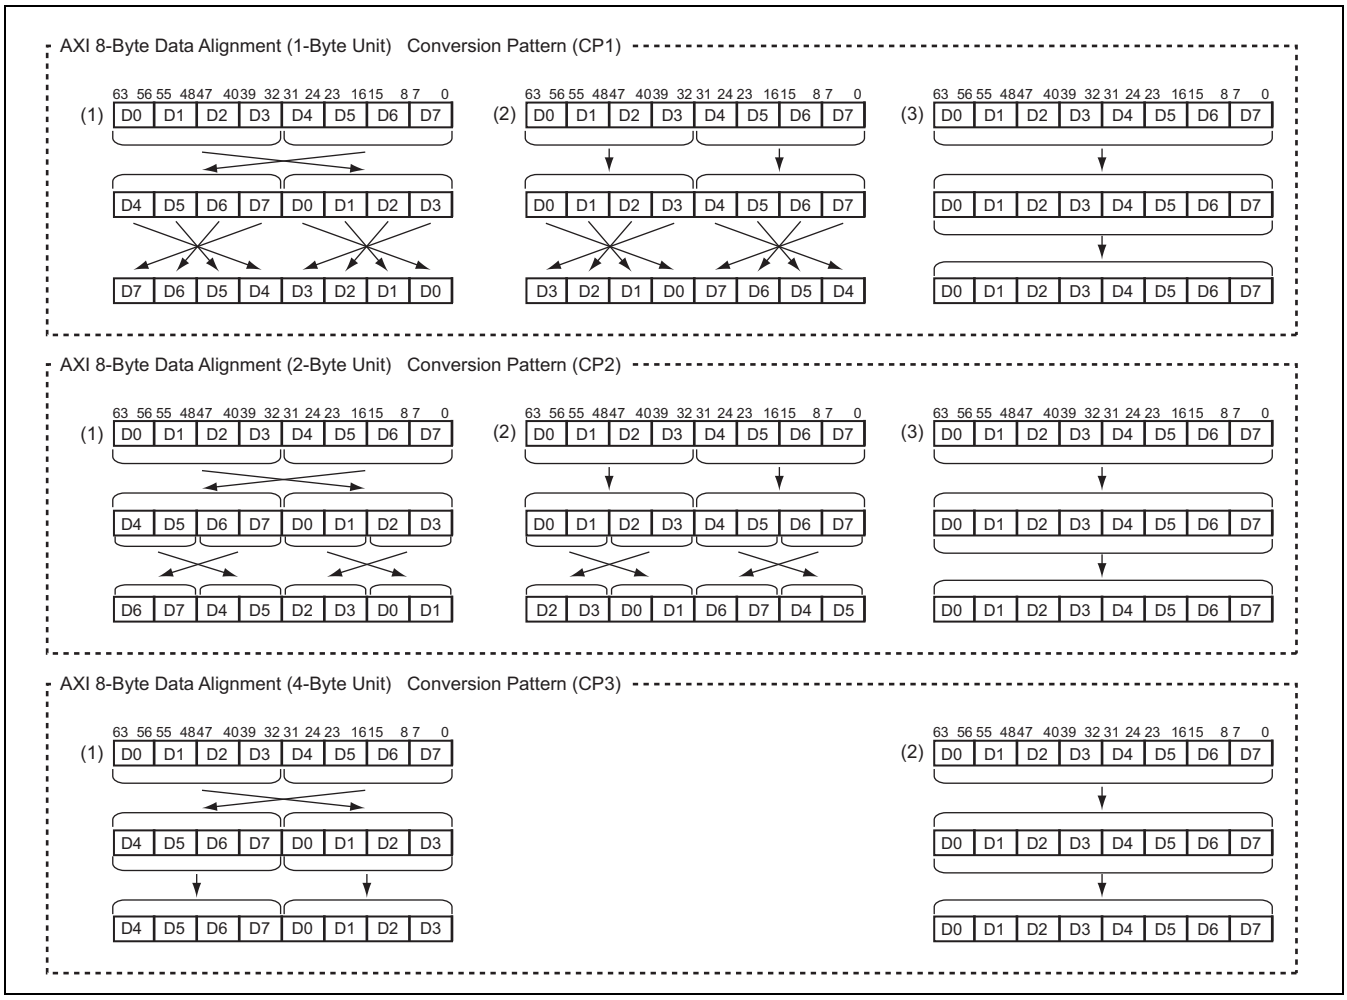

Figure 17.8 Data Alignment Conversion in the DMAC

17.5.8 Data Alignment in EX-BUS Interface

Setting the DMALGR register in the DMAC allows variable alignment mode for the external bus access as the mode of alignment conversion. For the CPU operation in a variable alignment mode, see section 14.7.3 (1), Data Alignment during LBSC-DMAC Access, in section 14, LBSC within Bus Bridge.

17.5.9 Timing Charts

Timing charts are given for DMA operation during the external SRAM bus operation. In the timing charts, the DREQ, DRACK, and DACK signal polarity is indicated as negative; however, these polarity settings, assertion of either the CS# or DACK signal, and switching DREQ to a level signal or to edge detection mode, can be set. In all cases these settings should be made using LBSC internal registers.

(1) EX-BUS DMA single-read/write operation

In SRAM bus operation, upon receiving a DREQ signal a DRACK is asserted to send notification of detection of a DMA request. There are no DRACK signals for other than LBSC-DMAC channel 0. In these cases, the device which is the DMA request source must negate the DREQ signal until the end of the bus operation through the DACK signal indicating that the DMA transfer has actually started. The DMAC starts the next DREQ sampling from the next clock cycle after the end of the DMA bus transfer (LBSC-DMAC DMA request mask control register (DRMSKR) settings can be used to delay the start of the next sampling), and upon detection, starts the next DMA transfer bus operation.

In DMA single read and write operations, the number of clock cycles from CS# assertion to RD# (or WE#) signal assertion, the number of RD# (or WE#) pulse clock cycles, and the number of clock cycles from RD# (or WE#) negation to CS# negation, can be set through the LBSC internal register. During the period of RD# (or WE#) assertion, if a WAIT signal from the DMA request source is detected, then during the WAIT assertion period, the RD# (or WE#) pulse width is extended. With respect to specification of WAIT signal sampling also, the internal LBSC register should be used.

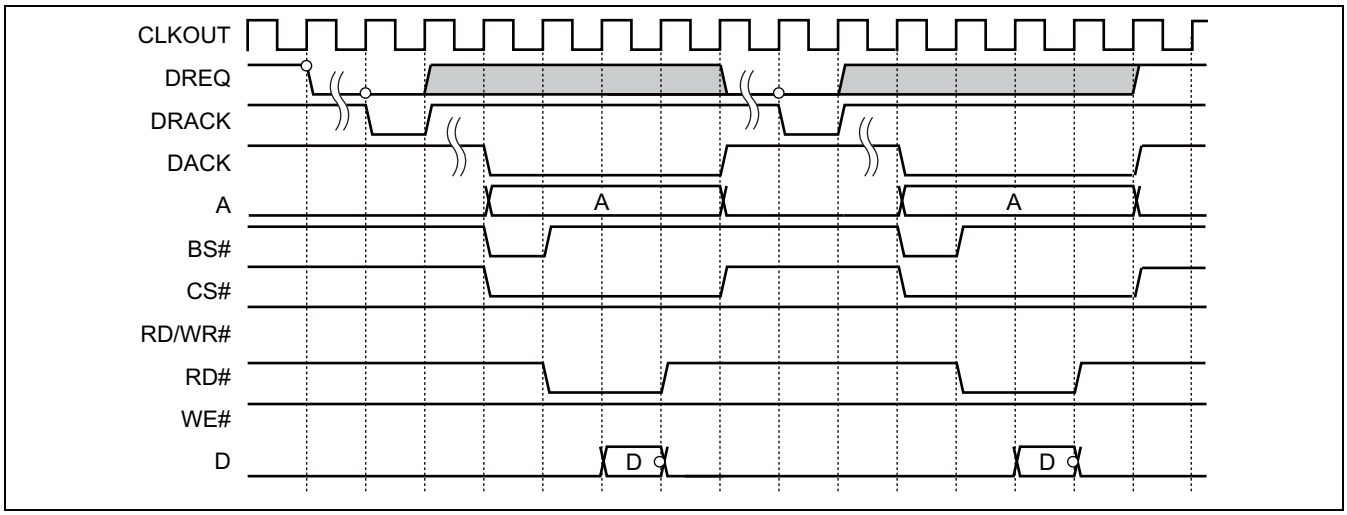

Figure 17.9 External Bus DMA Read Operation (SRAM Bus Single Read)

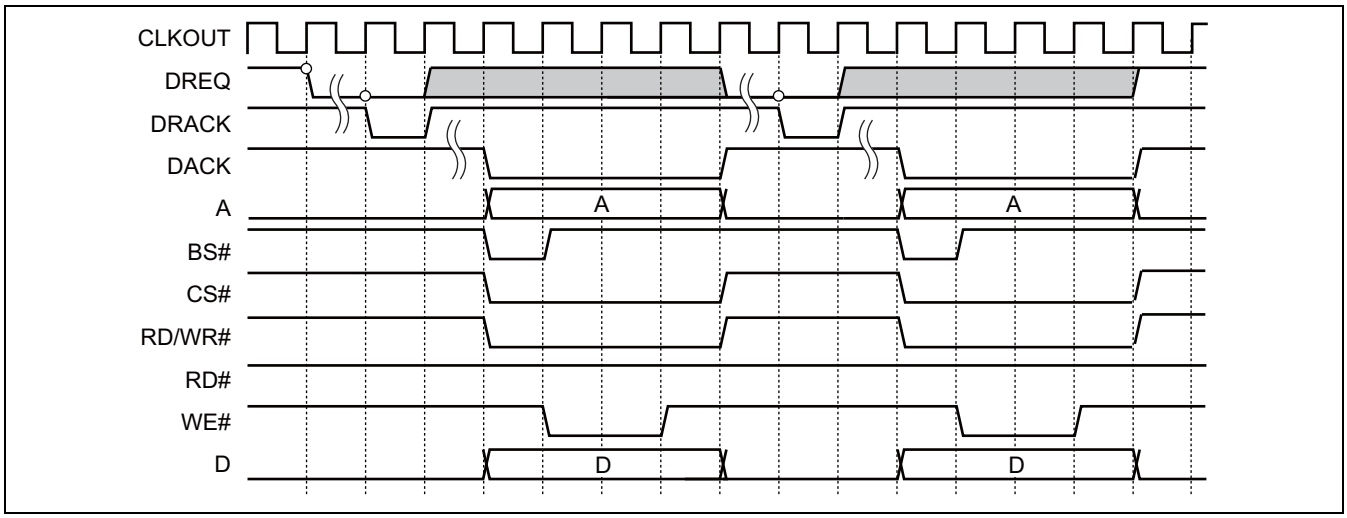

Figure 17.10 External Bus DMA Write Operation (SRAM Bus Single Write)

(2) EX-BUS DMA 8-burst read/write operation

In DMA 8-burst operation, 8-burst bus transfer operation is performed upon detection of a single DREQ signal. In SRAM bus operation, upon receiving a DREQ signal a DRACK is asserted to send notification of detection of a DMA request. There are no DRACK signals for other than LBSC-DMAC channel 0, so that in these cases the device which is the DMA request source must negate the DREQ signal until the end of the 8-burst bus operation through the DACK signal indicating that the DMA transfer has actually started. The DMAC starts the next DREQ sampling from the next clock cycle after the end of the DMA bus operation (LBSC-DMAC DMA request mask control register (DRMSKR) settings can be used to delay the start of the next sampling), and upon detection, starts 8-burst bus operation for the next DMA transfer.

Also in DMA 8-burst operations, the number of clock cycles from CS# assertion to RD# (or WE#) signal assertion, the number of RD# (or WE#) pulse clock cycles, and the number of clock cycles from RD# (or WE#) negation to CS# negation, can be set through the LBSC internal register. During the period of RD# (or WE#) assertion, if a WAIT signal from the DMA request source is detected, then during the WAIT assertion period, the RD# (or WE#) pulse width can be extended. With respect to WAIT signal control also, the internal LBSC register should be used.

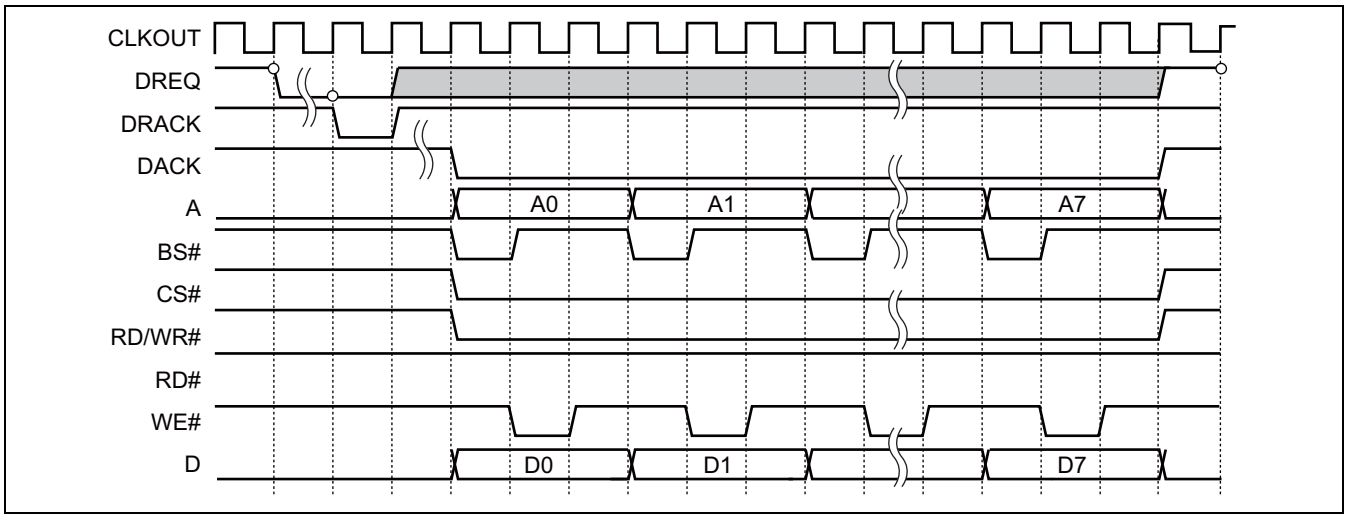

Figure 17.12 External Bus DMA Write Operation (SRAM Bus Burst Write)

18. Booting

18.1 Overview

In this product, the levels on the MD7 and MD6 pins can be set to select the master boot processor. When the Cortex-A7 is selected as the master boot processor, the levels on the MD[3:1] pins can select booting up from the serial flash ROM connected to the QSPI or from devices connected to the eMMC.

18.2 Features

- The levels on the MD7 and MD6 pins can select the Cortex-A7 as the master boot processor.
- The external boot device can be selected as either external ROM (area 0) or on-chip ROM by the levels on the MD3 to MD1 pins.

- Booting from the serial flash ROM connected to the QSPI is supported.
  - The master boot processor (if this is the Cortex-A7) executes the instructions in the on-chip ROM, and the specified amount of data are transferred from the serial flash ROM to the on-chip RAM at the specified QSPI clock frequency. After transfer, execution jumps to the top address of the on-chip RAM.
  - After 16 or 4 Kbytes of code are transferred to the on-chip RAM at 39 MHz, execution jumps to the top address of the on-chip RAM.
  - After 16 Kbytes of code are transferred to the on-chip RAM at 48.75 MHz, execution jumps to the top address of the on-chip RAM.

- Booting from the eMMC device connected to the MMC0 (SDHI1) is supported.
  - The master boot processor (if this is the Cortex-A7) executes the instructions in the on-chip ROM, and the specified amount of data are transferred from the eMMC device to the on-chip RAM at the specified MMC clock frequency. After transfer, execution jumps to the top address of the on-chip RAM.
  - After 16 Kbytes of code are transferred to the on-chip RAM, execution jumps to the top address of the on-chip RAM.

18.3 Input/Output Pins

Table 18.1 Mode Pin Configuration

Name	Pin Name	I/O	Function
Mode pin	MD7 and MD6	Input	Select a master boot processor.

MD7	MD6	Description
0	0	Setting prohibited
0	1	Booted through CPU0 in Cortex-A7
1	0	Reserved
1	1	Setting prohibited

Name	Pin Name	I/O	Function
Mode pin	MD3 to MD1	Input	Select a boot device.

MD3	MD2	MD1	Description
0	0	0	External ROM boot (area 0)
0	0	1	eMMC boot via SDHI1; 16 Kbytes transferred.
0	1	0	Serial flash ROM boot via QSPI; 16 Kbytes transferred at 48.75 MHz
0	1	1	Reserved
1	0	0	Serial flash ROM boot via QSPI; 16 Kbytes transferred at 39 MHz
1	0	1	Reserved
1	1	0	Serial flash ROM boot via QSPI; 4 Kbytes transferred at 39 MHz
1	1	1	Reserved

18.4 Operation

18.4.1 Booting Up

Figure 18.1 shows the flow of booting up.

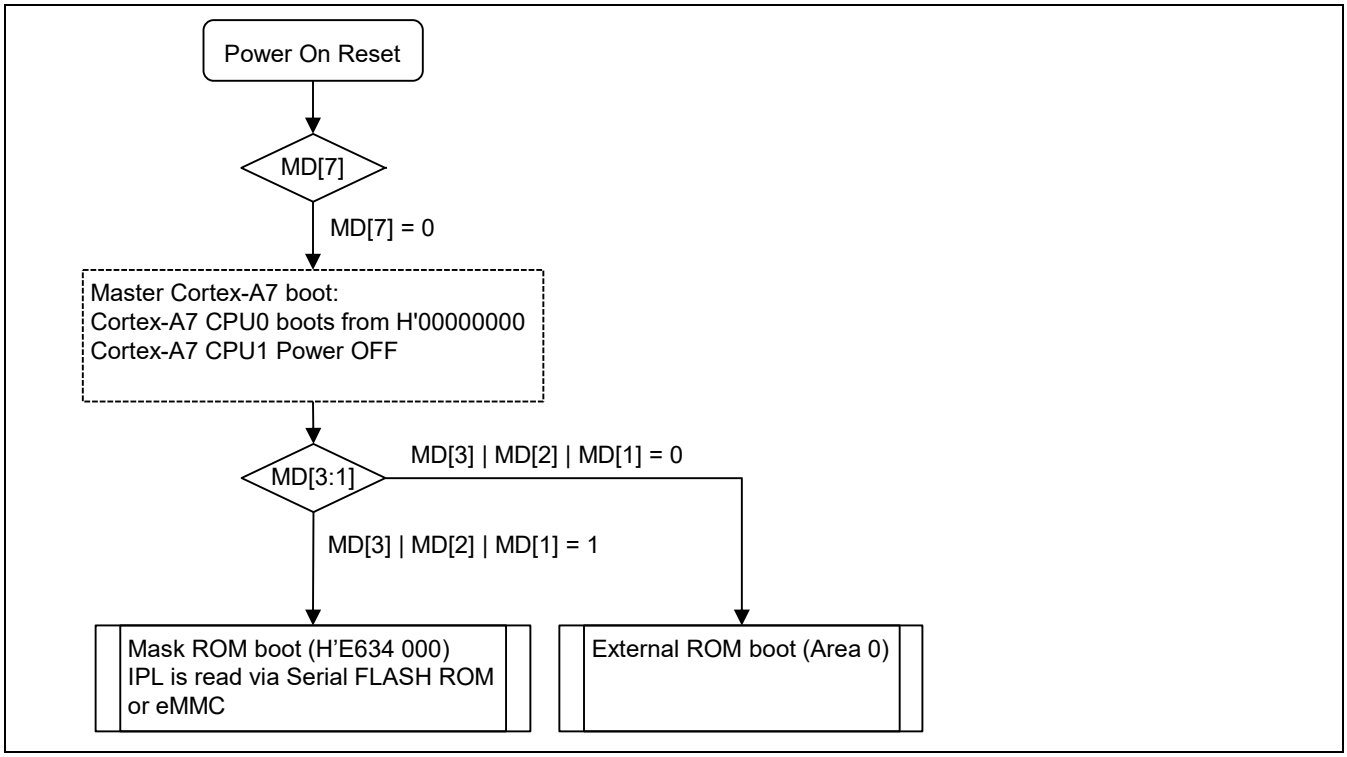

Figure 18.1 Flow of Booting Up

18.5 Serial Flash ROM Boot

18.5.1 Serial Flash ROM Boot [QSPI]

In QSPI boot, the boot program in the on-chip ROM starts up the QSPI and SYS-DMAC channel 1, and transfers the loader program previously stored in the serial flash ROM to the on-chip RAM via the QSPI module. Here, the QSPI module reads the serial flash ROM with the fast read mode. After loader program is transferred, the program automatically jumps to the top address of the loader program. The amount of data to be transferred and QSPI IF frequency depend on the MD[3:1] pin setting. Controlling the device-specific quad serial flash ROM through the loader program enables reduction of program load time after loader program transfer.

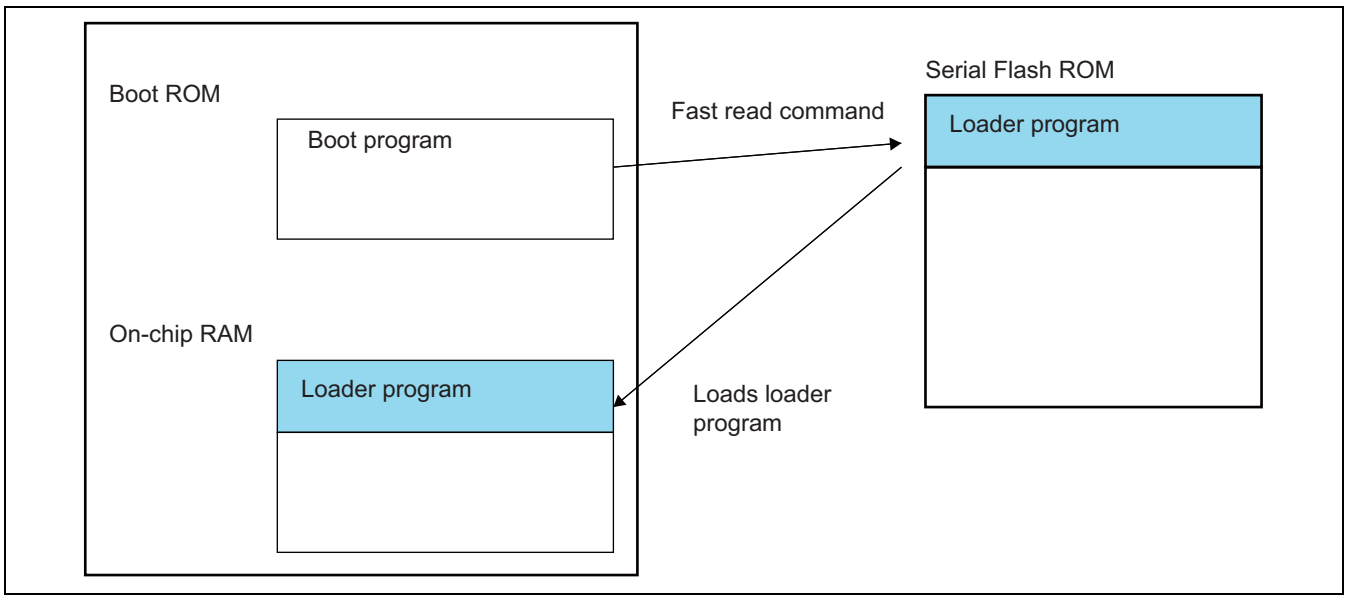

Figure 18.2 Address Space in Serial Flash Memory Boot Mode

18.5.2 Usage of QSPI Pins

Table 18.2 QSPI Pin Configuration

Name	Pin Name	Function Name	I/O	Function
Serial clock	QSPI0_SPCLK	SPCLK	Output	Outputs serial clock.
Transmit data	QSPI0_MOSI_IO0	MOSI	Output	Outputs transmit data.
Receive data	QSPI0_MISO_IO1	MISO	Input	Inputs receive data.
Chip select	QSPI0_SSL	SSL	Output	Outputs chip select signal. To be set to active low using boot ROM code

Note: IO2 (QSPI0_IO2) and IO3 (QSPI0_IO3) pins are set in High level by the boot program in the on-chip ROM.

18.5.3 Serial Flash ROM Boot Flow

Figure 18.3 shows the serial flash ROM boot flow by the on-chip ROM boot program.

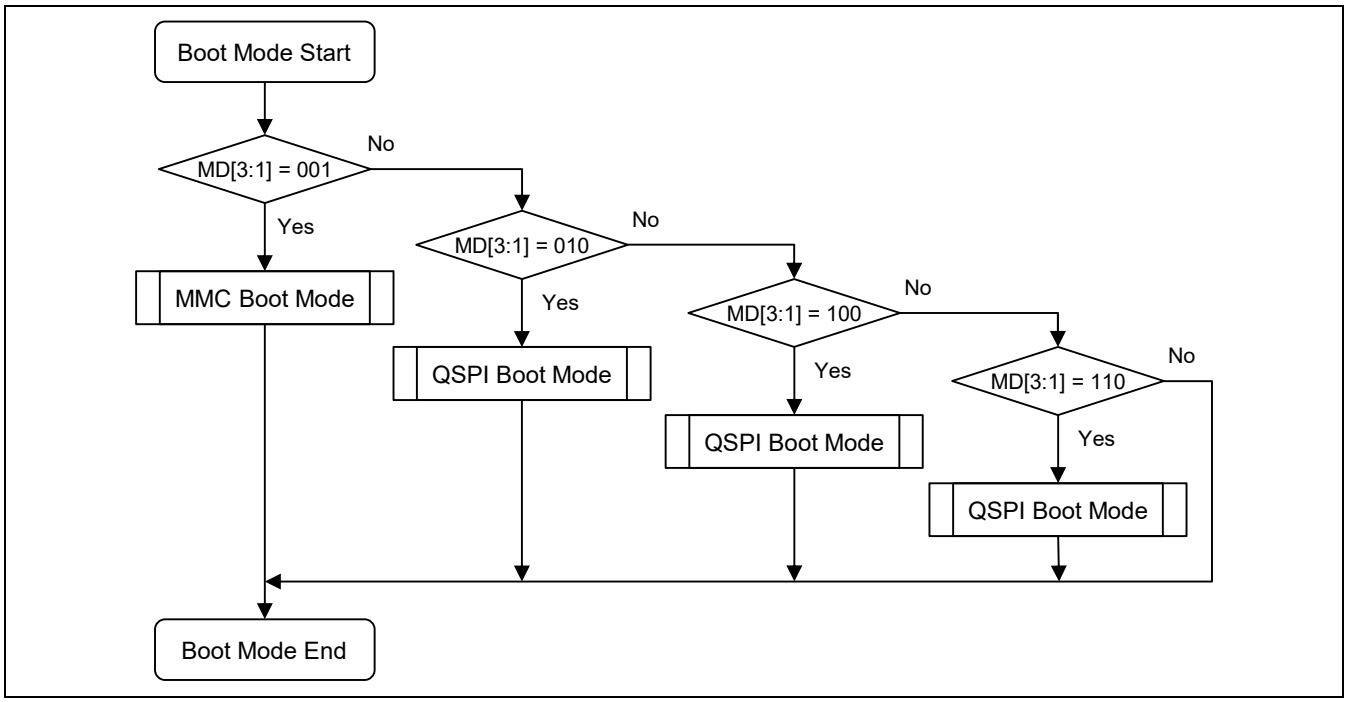

Figure 18.3 Serial Flash ROM Boot Flow by the On-chip ROM Boot Program

18.5.4 Note

The boot ROM program does not issue a reset command or mode bit reset command to the serial flash ROM; using a serial flash ROM with a reset pin is recommended.

18.6 eMMC Boot

18.6.1 Features

This LSI has three SD card interfaces (SDHI0 to SDHI2), one of which can also be used as MMC interfaces (SDHI1).

In eMMC Boot, this LSI would execute eMMC Boot operation using SDHI1.

18.6.2 Usage of SDHI1(MMC) Pins

Table 18.3 eMMC Pin Configuration

Name	Pin Name	Function Name	I/O	Function
Clock	MMC0_CLK	CLK	Output	Output clock
Command	MMC0_CMD	CMD	Input/Output	eMMC command data
DATA[7]	MMC0_D7	DATA[7]	Input/Output	eMMC data
DATA[6]	MMC0_D6	DATA[6]	Input/Output	eMMC data
DATA[5]	MMC0_D5	DATA[6]	Input/Output	eMMC data
DATA[4]	MMC0_D4	DATA[4]	Input/Output	eMMC data
DATA[3]	MMC0_D3	DATA[3]	Input/Output	eMMC data
DATA[2]	MMC0_D2	DATA[2]	Input/Output	eMMC data
DATA[1]	MMC0_D1	DATA[1]	Input/Output	eMMC data
DATA[0]	MMC0_D0	DATA[0]	Input/Output	eMMC data

18.6.3 Boot operation

Cortex-A7 master boot processor executes the instructions in the on-chip ROM, and 16K byte data are transferred from eMMC to the on-chip RAM. After transfer, the program jumps to the top address of loader program of the on-chip RAM.

Note: A Loader program of eMMC boot has no offset address. (H'00000000)

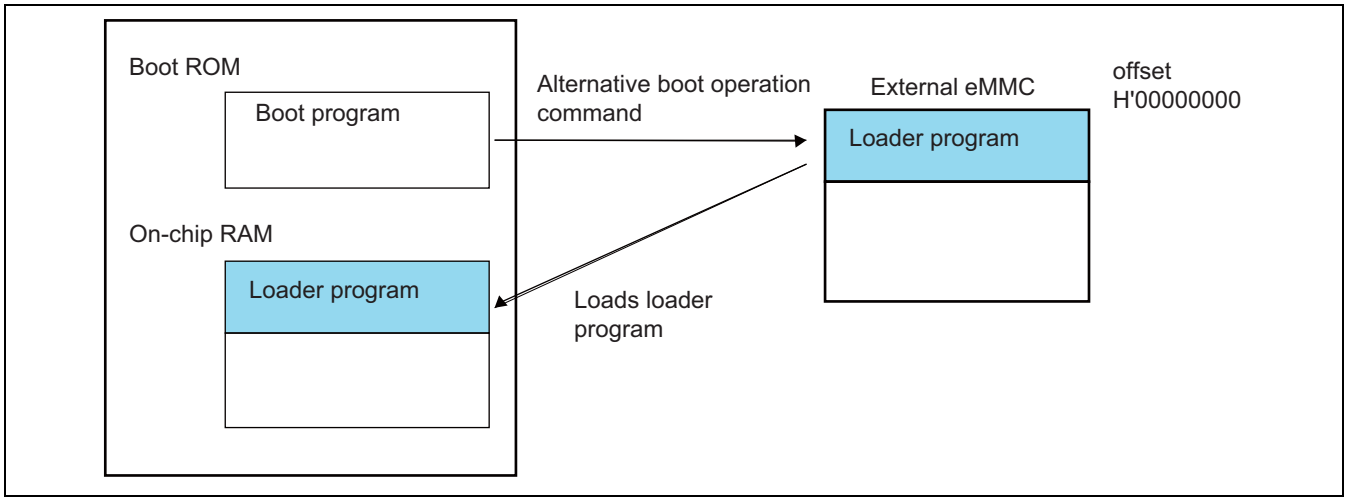

Figure 18.4 Address Space in eMMC Boot Mode

Data transfer specification in eMMC boot with Boot mode is the followings.

- eMMC 4.41 (JESD84-A441) standard
- Alternative boot operation
- Use Boot partition 1 or 2
- MMC0_CLK 48.75 MHz
- 8-bit bus width

Also, the eMMC device needs to meet the following conditions (a) and (b).

(a) BOOT_PARTITION_ENABLE in PARTITION_CONFIG of EXT_CSD must be set to H'1 or H'2.

(b) BOOT_BUS_WIDTH of EXT_CSD must be set to H'2 (8-bit bus). And BOOT_MODE of EXT_CSD must be set to H'1 (0x1: Use single data rate + high speed timings in boot operation mode).

18.7 Boot Program in On-Chip ROM

The on-chip ROM contains the program to control QSPI and eMMC as the standard boot ROM program. Modifying the ROM code enables booting through another peripheral module.

19. 3D Graphics Engine

19.1 Overview

This section only introduces the features of SGX531. The graphics processing performed by graphics engine is provided as the graphics driver software.

19.2 PowerVR Series5 SGX531

The description of this section is quoted from ‘POWERVR SGX Series5 Factsheet’.

(PowerVR_SGX_Series5_IP_Core_Family_[3.4].pdf, available at www.imgtec.com).

19.2.1 Features of POWERVR SGX Series5

The POWERVR SGX Series5 GPU IP core family is a series of highly efficient graphics acceleration IP cores that meet the multimedia requirements of the next generation of consumer, communications and computing applications.

POWERVR SGX Series5 architecture is fully scalable for a wide range of area and performance requirements, enabling it to target markets from low cost feature-rich mobile multimedia products to very high performance consoles and computing devices.

The family incorporates the revolutionary Universal Scalable Shader Engine (USSE), with a feature set that exceeds the requirements of OpenGL 2.0 and Microsoft Shader Model 3, enabling 2D, 3D and general purpose (GP-GPU) processing in a single core.

- Most comprehensive IP core family and roadmap in the industry
- Series5 shader-driven tile-based deferred rendering (TBDR) architecture
- Fully programmable GPU using unique USSE architecture
- Support for all industry standard mobile and desktop graphics APIs and operating systems
- Fully backwards compatible with PowerVR MBX

19.2.2 Register Base Address

Base address of registers is allocated to H'FD80 0000.

20. Display Unit (DU)

20.1 Overview

20.1.1 Features

(1) Display Channel

Two independently controllable channels are provided. Using the DU0 and DU1, different images or the same image can be displayed on two monitors.

(2) Plane

The display surfaces normally called the foreground, background, and cursor, are called planes in this section. Parameters for each plane can be set independently through the settings of an internal register. The internal register settings can also be used to set the display priority order.

- Display size
- Display position
- Display data format (8-bit/pixel, 16-bit/pixel, 32-bit/pixel, ARGB, or YC)
- Plane superpositioning
- Scrolling
- Wrapping-around
- Blinking
- Buffering control

The internal register settings can be used to select four different control modes.

- Auto rendering mode (double buffering)
- Manual display change mode (double buffering)
- Auto display change mode (double buffering)
- Video capture mode (triple buffering)

(3) Type and Number of Planes

In the DU0 or DU1, there are eight planes (display planes) available, each using both image data and an alpha ratio. Also, there are two special planes (alpha-ratio planes) available, each using only an alpha ratio.

Up to eight display planes can be superposed on each other. Correspondences between the DU0 and DU1 planes are not fixed but can be selected as desired through register settings.

For the number of planes which can be used at the same time, refer to the description in section 1, Overview.

(4) Synchronization Method

Internal register settings can be used to select any of three synchronization modes for the display output timing.

- Master mode (internal sync mode)
- TV sync mode (external sync mode)
- Sync method switching mode

(5) CRT Scan Mode (CRT Scan Method)

Internal register settings can be used to select from among three scan modes.

- Non-interlaced mode
- Interlaced sync mode
- Interlaced sync & video mode

(6) YC → RGB Color Space Conversion Functions

Image data stored in YC format can be converted into the RGB color space and displayed in a window. The conversion coefficients can be set in a register.
However, data for two or more pixels cannot be converted into the RGB color space at the same time.
Data in YUV422 and YUV420 format are convertible into the RGB color space.

(7) RGB → YC Color Space Conversion Functions

Display data superposed in RGB format can be converted into the YC color space and output from either the DU0 pin or the DU1 pin as the YC data.

(8) Color Palette

Four internal color palette planes are provided, capable of simultaneously displaying 256 colors out of 262 thousand colors

Eight-bit blending ratios are provided for every 256 colors. The color palettes are only accessible by superposition processors 0

(9) Display Capture

The RGB-888 or RGB-666 data for output on the two display channels is convertible into ARGB-888 or RGB-565 or ARGB-1555 data for separate storage in external memory.

(10) Register Access Control

The module has internal control registers; these are writable/readable by the APB protocol over the APB. The unit of access is fixed to 32 bits.

(11) VSP1 Connection

Connection with the VSP1 allows the image data processed by the VSP1 to be output directly to the display unit without an external memory. VSP1 has been connected with plane1 for the DU0 or DU1.

(12) LVDS Connection

Connection with the LVDS allows the output of image data from the LVDS. Either the DU0 or the DU1 can be connected with the LVDS.

(13) DPAD Connection

Connection with the DPAD allows the output of the digital RGB data from a pin.

Connection with the DPAD allows the output of the digital RGB data from a pin separately for each channel.

(14) Digital video encoder Connection

Connection with the Digital video encoder allows the out put of the analog output composite signal. Ether the DU0 or the DU1 can be connected with the Digital video encoder.

20.1.2 Block Diagram

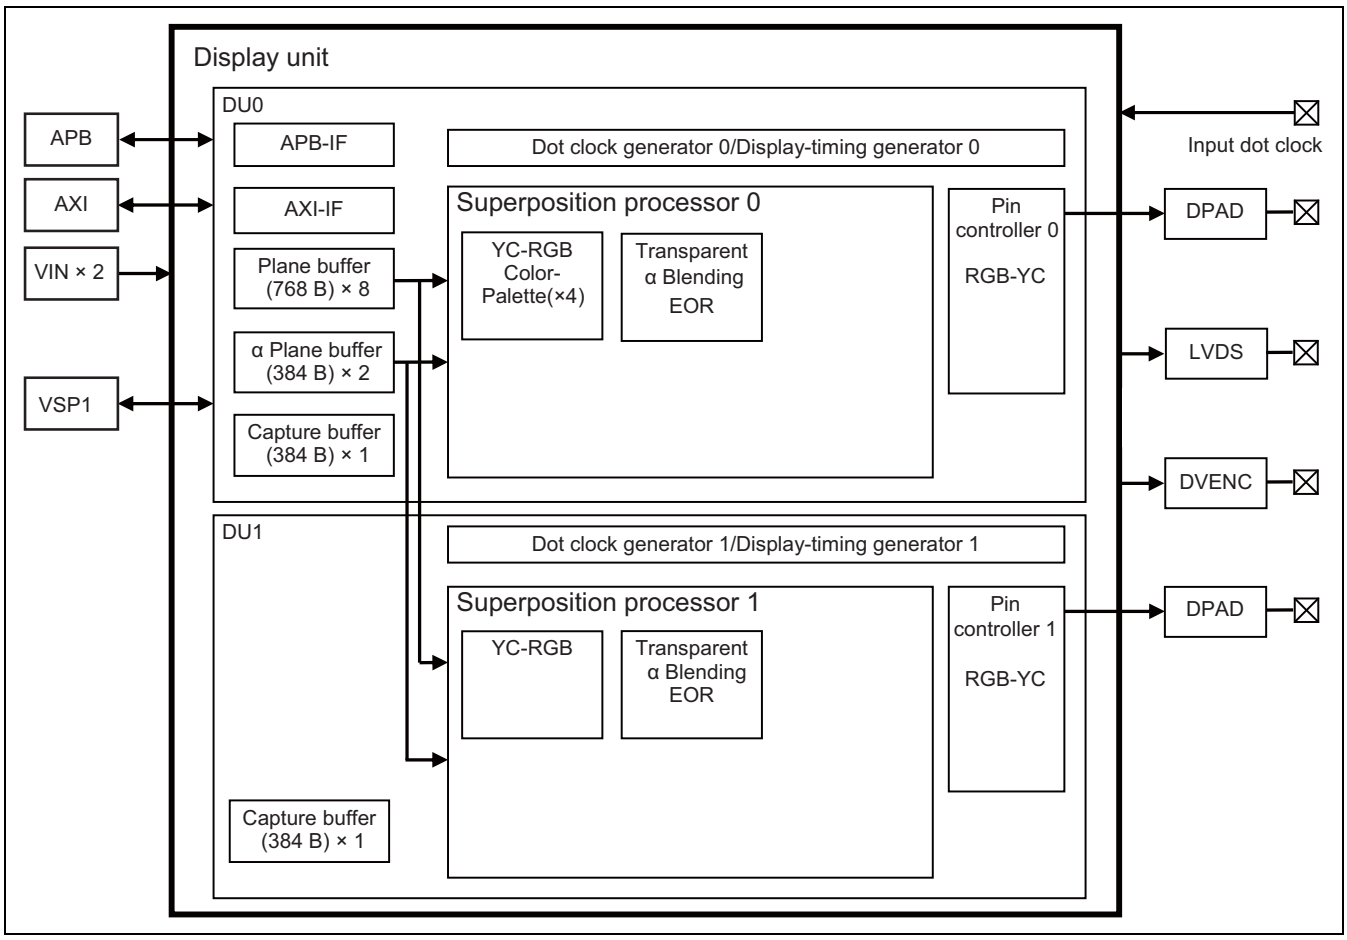

Figure 20.1 Block Diagram of the Display Unit (DU)

20.1.3 Input/Output Pins

Table 20.1a Pin Functions (DU0)

Name	Pin Name	I/O	Function	Signal Name Used in This Section
DU0 input dot clock	DU0_DOTCLKIN	Input	DU0 input dot clock (Initial value) DU1 input dot clock	DCLKIN
DU0 output dot clock 0	DU0_DOTCLKOUT0	Output	DU0 output dot clock (normal phase)	DCLKOUT

DU1 display data	DU1_DB2	Output	DU1 digital blue 2	Digital RGB or YC *4
	DU1_DB3	Output	DU1 digital blue 3	
	DU1_DB4	Output	DU1 digital blue 4	
	DU1_DB5	Output	DU1 digital blue 5	
	DU1_DB6	Output	DU1 digital blue 6	
	DU1_DB7	Output	DU1 digital blue 7	

Notes: 1. These are expressed as EXHSYNC, EXVSYNC, and EXODDF in explanations of the functions as input signals and as HSYNC, VSYNC and ODDF otherwise.
2. Synchronization for the output of digital 1 only is in accord with the setting of the output signal timing adjustment register 1 (OTAR1).
3. In this section, unless otherwise noted, "dot clock" refers to the output dot clock.
4. In YC format display, please refer to Table 20.39.

20.2 Register Configuration

In the display unit (DU), register update methods include external update and internal update.

(1) External Update

An "external update" is an update which reflects the address-mapped register settings made by the CPU after the end of CPU access. Registers related to display control (for example, the display unit system control register) and the settings of which are updated through external updates can be overwritten without display flicker by using bits 11 and 14 in the display unit status register n (DSSRn) *2 indicating the start position of the vertical blanking interval.

(2) Internal Update

An "internal update" is an update that reflects the address-mapped register settings with the internal update timing of the display unit (DU). Hence in the case of a register with an internal update function, even when the CPU overwrites address-mapped registers related to display operation without being aware of the display timing, display flicker can be prevented.

An internal update is performed during the interval in which the display reset (DRES) bit in the display unit system control register 0 (DSYSR0) is 1 and at the beginning of each frame. The internal update performed at the beginning of each frame is disabled using the internal update disable (IUPD) bit in the display unit system control register 0 (DSYSR0).

Bits which are internally updated in response to setting of the display reset (DRES) bit in the display unit system control register 0 (DSYSR0) are listed in the column headed "Bit with Internal Update Function" in tables on the following pages.

The registers for the X and Y start positions for plane n in the interlaced sync & video mode (PnSPXR*1, PnSPYR*1) are also internally updated at the beginning of a field.

Updates are performed at the falling edge of VSYNC output when the sync method of the display unit system control register n (DSYSRn)*2 is master mode (bit 7 = 0, bit 6 = 0), or at the falling edge of EXVSYNC detected in TV sync mode (bit 7 = 1, bit 6 = 0). In sync transition mode (bit 7 = 0, bit 6 = 1), internal updates are not performed.

However, plane n display area start address 0 register (PnDSA0R*1), plane n display area start address 1 register (PnDSA1R*1), and plane n display area start address 2 register (PnDSA2R*1) are internally updated in display operation and externally updated when the video data and rendering data are written to addresses specified for these registers.

The address-mapped registers with an internal update function are shown in Tables 20.2 to 20.23. The initial settings for these registers should be made during the interval in which the DRES bit in DSYSR0 is 1.

Notes: 1. n = 1 to 8
2. n = 0 and 1

(3) Register Configuration

The suffixes n which are added to the register names and their abbreviations represent the DU channel numbers (n = 0 and 1).

(a) Display Unit System Control Register Configuration

Table 20.2 Display Unit System Control Register Configuration (1)

Base address: DU0: H'FEB0 0000 (suffix 0)
DU1: H'FEB3 0000 (suffix 1)

Register Name	Abbr.	R/W	Offset Address	Access Size	Bit with Internal Update Function*
Display unit system control register 0	DSYSR0	R/W	H'0000	32 bits	DSEC (bit 20) DEN (bit 8)
Display unit system control register 1	DSYSR1	R/W	H'0000	32 bits	DSEC2 (bit 20)
Display unit mode register n	DSMRn	R/W	H'0004	32 bits	All bits However, the following bits are updated with DRES: VSPM (bit 28) ODPM (bit 27) DIPM (bits 26, 25) CSPM (bit 24) DIL (bit 19) VSL (bit 18) HSL (bit 17)
Display unit status register n	DSSRn	R	H'0008	32 bits	None
Display unit status register clear register n	DSRCRn	W	H'000C	32 bits	None
Display unit interrupt enable register n	DIERn	R/W	H'0010	32 bits	None
Color palette control register	CPCR	R/W	H'0014	32 bits	All bits
Display plane priority register	DPPR	R/W	H'0018	32 bits	All bits
Display unit extensional function control register 0	DEFR0	R/W	H'0020	32 bits	The following bits are updated with DRES: DODF (bits 9, 8)
Display unit extensional function control register 1	DEFR1	R/W	H'0020	32 bits	The following bits are updated with DRES: EXSL1 (bit 12) DODF1 (bits 9, 8) VCUP1 (bit 4)
Display alpha ratio plane control register	DAPCR	R/W	H'0024	32 bits	All bits
Display capture control register	DCPCR	R/W	H'0028	32 bits	All bits
Display unit extensional function control 2 register	DEF2R	R/W	H'0034	32 bits	All bits Updated with DRES
Display unit extensional function control 3 register	DEF3R	R/W	H'0038	32 bits	All bits Updated with DRES
Display unit extensional function control 4 register	DEF4R	R/W	H'003C	32 bits	All bits Updated with DRES
Display unit video capture status register	DVCSR	R	H'00D0	32 bits	None

Register Name	Abbr.	R/W	Offset Address	Access Size	Bit with Internal Update Function*
Display unit extensional function control 5 register	DEF5R	R/W	H'00E0	32 bits	All bits However, the following bit is updated with DRES: DEFE5 (bit 0)
Display unit data latency adjustment register	DDLTR	R/W	H'00E4	32 bits	All bits Updated with DRES
Display unit extensional function control 6 register	DEF6R	R/W	H'00E8	32 bits	All bits Updated with DRES

Base address: DU0 (suffix 0) and DU1 (suffix 1) common: H'FEB2 0000

Register Name	Abbr.	R/W	Offset Address	Access Size	Bit with Internal Update Function*
Display unit domain 1 status register 0	DD1SSR0	R	H'0008	32 bits	None
Display unit domain 1 status register 1	DD1SSR1	R	H'8008	32 bits	None
Display unit domain 1 status register clear register 0	DD1SRCR0	W	H'000C	32 bits	None
Display unit domain 1 status register clear register 1	DD1SRCR1	W	H'800C	32 bits	None
Display unit domain 1 interrupt enable register 0	DD1IER0	R/W	H'0010	32 bits	None
Display unit domain 1 interrupt enable register 1	DD1IER1	R/W	H'8010	32 bits	None
Display unit extensional function control 8 register	DEF8R	R/W	H'0020	32 bits	All bits Updated with DRES
Display unit output signal fixed level register	DOFLR	R/W	H'0024	32 bits	None
Display unit input dot clock select register	DIDSR	R/W	H'0028	32 bits	All bits Updated with DRES

Notes: 1. n = 0 and 1
2. The register available code is excluded. There is no internal update function for the register available code.

Table 20.3 Display Unit System Control Register Configuration (2)

Register Name	Abbr.	Power-on Reset
Display unit system control register 0	DSYSR0	H'******8*
Display unit system control register 1	DSYSR1	H'******8*
Display unit mode register n	DSMRn	H'*0*00***

20.3 Register Description

Legend for Register Description

Initial value: Register value after a reset.

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R: Read-only. The write value should always be 0.

—/W: Write-only. The read value is undefined.

Plane n: Indicates plane 1 to plane 8

Note: Do not access locations that appear empty in the address map. Operation is not guaranteed in case of access to change the value at any location other than those of the registers listed in Tables 20.2 to 20.23.

20.3.1 Display Unit System Control Registers

20.3.1.1 Display Unit System Control Register 0 (DSYSR0)

Address: DU0: H'FEB0 0000

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	ILTS	—	—	—	—	—	—	—	—	DSEC	—	—	—	IUPD
Initial value:	—	—	0	—	—	—	—	—	—	—	—	0	—	—	—	0
R/W:	R	R	R/W	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	DRES	DEN	TVM		SCM		—	—	—	—
Initial value:	—	—	—	—	—	—	1	0	1	0	0	0	—	—	—	—
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31, 30	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
29	ILTS	0	R/W	Not available	Input Pad Latch Timing Select To enable this bit, the DEFE bit in the display unit extensional function control register 0 (DEFR0) should be set to 1. In the initial state, this bit is fixed to 0. 0: A signal of the input pad is latched at the DCLKIN rising edge. 1: A signal of the input pad is latched at the DCLKIN falling edge. Electrical characteristics do not apply.
28 to 21	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
20	DSEC	0	R/W	Available	Display Data Endian Change For details on data swapping, see section 20.4.7, Endian Conversion. 0: Display data on memory is not swapped in byte or word units. 1: Display data on memory is swapped in byte or word units.
19 to 17	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
16	IUPD	0	R/W	Not available	Internal Updating Disable When DRES = 1, internal register updating occurs regardless of this bit setting. For details on internal updating, see section 20.2 (2), Internal Update. 0: Internal register updating occurs for each vertical synchronous signal (VSYNC) assertion. 1: If this bit is set to 1, internal register updating does not occur. • If this bit is set to 0, register updating occurs according to the next vertical synchronous signal (VSYNC). • This bit is shared by DU0 and DU1.
15 to 10	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
9	DRES	1	R/W	Not available	Display Reset
8	DEN	0	R/W	Available	Display Enable 00: Display synchronous operation starts. If any register has not been set yet, the display unit may perform unexpected operation, thus set DRES to 0 after setting all registers in the display unit. For DEN = 0, the display data becomes values set with the display off mode output register n (DOORn). 01: Display synchronous operation starts. If any register has not been set yet, the display unit may perform unexpected operation, thus set DRES = 0, DEN = 1 after setting all registers in the display unit. To re-set DRES to 1 following the start of operations for synchronization of the display with this setting, proceed with steps 1 and 2 in section 20.6.2, Transition to Module Standby Mode before doing so. For DEN = 1, the display data becomes values stored on the unified memory from the next frame. 10: Display operation stops. Display operation and synchronization operation stop. The set values except for the following bits in the display unit status register n (DSSRn) are retained. In this setting, the following operations occur: 1. All 0s are output as display data. 2. The following bits of the display unit status register n (DSSRn) are cleared to 0: TV synchronization signal error flag (TVR and TVR1) Frame flag (FRM and FRM1) Vertical blanking flag (VBK and VBK1) Raster interrupt flag (RINT and RINT1) Horizontal blanking flag (HBK and HBK1) 3. HSYNC, VSYNC, and ODDF pins function as inputs. However, the ODDF pin functions as a CLAMP output when the ODPM bit in the display unit mode register 0 (DSMR0) is 1. 11: Setting prohibited • This bit is shared by DU0 and DU1.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
7, 6	TVM	10	R/W	Not available	TV Synchronized Mode 00: Master Mode HSYNC, VSYNC, and CSYNC are output. 01: The switching mode of synchronous mode is set. Use this mode if necessary when switching from TV synchronized mode to master mode or vice versa is performed. In this mode, display operation forcibly stops and the DISP pin outputs the low level. Moreover, clock supply to DCLKIN can be stopped (input invalid) (the inside of the LSI is fixed to the high level). The EXHSYNC, EXVSYNC, and EXODDF pins are used as input pins. 10: TV synchronized mode EXHSYNC, EXVSYNC, and EXODDF are input. When the ODPM bit in the display unit mode register 0 (DSMR0) is set to 1, the ODDF pin functions as an output pin. 11: Setting prohibited
5, 4	SCM	00	R/W	Not available	Scan Mode 00: Non-interlaced mode 01: Setting prohibited 10: Interlace sync mode 11: Interlace sync & video mode
3 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Note: n = 0 and 1

20.3.1.2 Display Unit System Control Register 1 (DSYSR1)

Address: DU1: H'FEB3 0000

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	ILTS1	—	—	—	—	—	—	—	—	DSEC1	—	—	—	—
Initial value:	—	—	0	—	—	—	—	—	—	—	—	0	—	—	—	—
R/W:	R	R	R/W	R	R	R	R	R	R	R	R	R/W	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TVM1		SCM1		—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	1	0	0	0	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R

- Bits 16, 9, and 8 of display unit system control register 0 (DSYSR0) are shared by DU0 and DU1. Thus, the bits in this register do not have a function.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31, 30	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
29	ILTS1	0	R/W	Not available	Input Pad Latch Timing Select 1 To enable this bit, the DEFE bit in the display unit extensional function control register 0 (DEFR0) should be set to 1. In the initial state, this bit is fixed to 0. 0: A signal of the input pad is latched at the DCLKIN rising edge. 1: A signal of the input pad is latched at the DCLKIN falling edge. Electrical characteristics do not apply.
28 to 21	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
20	DSEC1	0	R/W	Available	Display Data Endian Change 1 For details on data swapping, see section 20.4.7, Endian Conversion. 0: Display data on memory is not swapped in byte or word units. 1: Display data on memory is swapped in byte or word units.
19 to 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7, 6	TVM1	10	R/W	Not available	TV Synchronized Mode 1 00: Master Mode HSYNC, VSYNC, and CSYNC are output. 01: The switching mode of synchronous mode is set. Use this mode if necessary when switching from TV synchronized mode to master mode or vice versa is performed. In this mode, display operation forcibly stops and the DISP pin outputs the low level. Moreover, clock supply to DCLKIN can be stopped (input invalid) (the inside of the LSI is fixed to the high level). The EXHSYNC, EXVSYNC, and EXODDF pins are used as input pins. 10: TV synchronized mode EXHSYNC, EXVSYNC, and EXODDF are input. When the ODPM bit in the display unit mode register 1 (DSMR1) is set to 1, the ODDF pin functions as an output pin. 11: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
5, 4	SCM1	00	R/W	Not available	Scan Mode 1 00: Non-interlaced mode 01: Setting prohibited 10: Interlace sync mode 11: Interlace sync & video mode
3 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

20.3.1.3 Display Unit Mode Register n (DSMRn)

Note: n = 0 and 1

Address: DU0: H'FEB0 0004, DU1: H'FEB3 0004

All bit in this register setting is also available for the display data output via the LVDS.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 29	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
28	VSPM	0	R/W	DRES	VSYNC Pin Mode 0: The VSYNC signal is output to the VSYNC pin. 1: The CSYNC signal is output to the VSYNC pin. "VSYNC pin" refers to the DU0_VSYNC/DU0_EXVSYNC pin indicated in Table 20.1a or the DU1_VSYNC/DU1_EXVSYNC pin indicated in Table 20.1b.
27	ODPM	0	R/W	DRES	ODDF Pin Mode 0: The ODDF signal is output to the ODDF pin. 1: The CLAMP signal is output to the ODDF pin. Even if bits 7 and 6 in the display unit system control register n (DSYSRn) indicate TV synchronized mode, the ODDF pin becomes an output. "ODDF pin" refers to the DU0_ODDF/DU0_EXODDF pin indicated in Table 20.1a or the DU1_ODDF/DU1_EXODDF pin indicated in Table 20.1b.
26, 25	DIPM	00	R/W	DRES	DISP Pin Mode 00: The DISP signal is output to the DISP pin. 01: The CSYNC signal is output to the DISP pin. 10: Setting prohibited. (Fixed to 0.) 11: The DE signal is output to the DISP pin. "DISP pin" refers to the DU0_ DISP pin indicated in Table 20.1a or the DU1_ DISP pin indicated in Table 20.1b.
24	CSPM	0	R/W	DRES	CSYNC Pin Mode 0: The CSYNC signal is output to the CSYNC pin. 1: The HSYNC signal is output to the CSYNC pin. "CSYNC pin" refers to the DU0_HSYNC/DU0_EXHSYNC pin indicated in Table 20.1a or the DU1_HSYNC/DU1_EXHSYNC pin indicated in Table 20.1b.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
23 to 20	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
19	DIL	0	R/W	DRES	DISP Polarity Select 0: The DISP signal becomes a high level during display period. 1: The polarity of the DISP signal is inverted.
18	VSL	0	R/W	DRES	VSYNC Polarity Select 0: The VSYNC signal becomes active low. 1: The polarity of VSYNC is inverted.
17	HSL	0	R/W	DRES	HSYNC Polarity Select 0: The HSYNC signal becomes active low. 1: The polarity of the HSYNC signal is inverted.
16	DDIS	0	R/W	Available	DISP Disable 0: The DISP signal is output. 1: The DISP signal is not output.
15	CDEL	0	R/W	Available	CDE Polarity Select 0: The CDE signal becomes high when the output display data and color detection register n (CDERn) match. 1: The polarity of the CDE signal is inverted.
14, 13	CDEM	00	R/W	Available	CDE Output Mode 00: The CDE signal is output as is. 01: The CDE signal is output as is. 10: The low level is output outside the display period. 11: The high level is output outside the display period.
12	CDED	0	R/W	Available	CDE Disable 0: The CDE signal is output. 1: The CDE signal output is prohibited.
11 to 9	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
8	ODEV	0	R/W	Available	Odd Even Location for ODDF Signal 0: The odd field (ODDF = low) is located in the first half of the same frame of the interlace display. 1: The odd field (ODDF = low) is located in the second half of the same frame of the interlace display.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
7, 6	CSY	00	R/W	Available	CSYNC Mode 00: A waveform obtained by performing exclusive logical OR for VSYNC and HSYNC is output as CSYNC. 01: Setting prohibited 10: During intervals of 3 rasters from the VSYNC falling edge, the equalizing pulse is output. After that, during intervals of 3 rasters, the serration pulse is output. After that, during intervals of 3 rasters, the equalizing pulse is output. During other intervals, the HSYNC waveform is output as CSYNC. 11: After 1/2 rasters from the VSYNC falling edge, the equalizing pulse is output during intervals of 2.5 rasters. After that, during intervals of 2.5 rasters, the serration pulse is output. After that, during intervals of 2.5 rasters, the equalizing pulse is output. During other intervals, the HSYNC waveform is output as CSYNC.
5 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

20.3.1.4 Display Unit Status Register 0 (DSSR0)

Address: DU0: H'FEB0 0008

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: * For reserved bit (bit name: —), initial value is undefined. For details, refer to following table.

- Video capture is the same as video input.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31, 30	VC1FB	00	R	Not available	Video Capture 1 Frame Buffer Flag Set the DEFE bit in the display unit extensional function control register 0 (DEFR0) to 1 to enable bits 31 and 30. In the initial state, bits 31 and 30 are fixed to 0. 00: In the plane set for video capture 1, the address indicated with PnDSA0R* is in use as the display area start address. 01: In the plane set for video capture 1, the address indicated with PnDSA1R* is in use as the display area start address. 10: In the plane set for video capture 1, the address indicated with PnDSA2R* is in use as the display area start address. 11: The video capture 1 module is in the initial state.
29, 28	VC0FB	11	R	Not available	Video Capture 0 Frame Buffer Flag 00: In the plane set for video capture 0, the address indicated with PnDSA0R* is in use as the display area start address. 01: In the plane set for video capture 0, the address indicated with PnDSA1R* is in use as the display area start address. 10: In the plane set for video capture 0, the address indicated with PnDSA2R* is in use as the display area start address. 11: The video capture 0 module is in the initial state.
27, 26	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
25	DFB10	0	R	Not available	Display Frame Buffer 10 Flag 0: In α plane 2, the address indicated with AP2DSA0R is in use as the display area start address. 1: In α plane 2, the address indicated with AP2DSA1R is in use as the display area start address.
24	DFB9	0	R	Not available	Display Frame Buffer 9 Flag 0: In α plane 1, the address indicated with AP1DSA0R is in use as the display area start address. 1: In α plane 1, the address indicated with AP1DSA1R is in use as the display area start address.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
23	DFB8	0	R	Not available	Display Frame Buffer 8 Flag 0: In plane 8, the address indicated with P8DSA0R is in use as the display area start address. 1: In plane 8, the address indicated with P8DSA1R is in use as the display area start address.
22	DFB7	0	R	Not available	Display Frame Buffer 7 Flag 0: In plane 7, the address indicated with P7DSA0R is in use as the display area start address. 1: In plane 7, the address indicated with P7DSA1R is in use as the display area start address.
21	DFB6	0	R	Not available	Display Frame Buffer 6 Flag 0: In plane 6, the address indicated with P6DSA0R is in use as the display area start address. 1: In plane 6, the address indicated with P6DSA1R is in use as the display area start address.
20	DFB5	0	R	Not available	Display Frame Buffer 5 Flag 0: In plane 5, the address indicated with P5DSA0R is in use as the display area start address. 1: In plane 5, the address indicated with P5DSA1R is in use as the display area start address.
19	DFB4	0	R	Not available	Display Frame Buffer 4 Flag 0: In plane 4, the address indicated with P4DSA0R is in use as the display area start address. 1: In plane 4, the address indicated with P4DSA1R is in use as the display area start address.
18	DFB3	0	R	Not available	Display Frame Buffer 3 Flag 0: In plane 3, the address indicated with P3DSA0R is in use as the display area start address. 1: In plane 3, the address indicated with P3DSA0R is in use as the display area start address.
17	DFB2	0	R	Not available	Display Frame Buffer 2 Flag 0: In plane 2, the address indicated with P2DSA0R is in use as the display area start address. 1: In plane 2, the address indicated with P2DSA1R is in use as the display area start address.
16	DFB1	0	R	Not available	Display Frame Buffer 1 Flag 0: In plane 1, the address indicated with P1DSA0R is in use as the display area start address. 1: In plane 1, the address indicated with P1DSA1R is in use as the display area start address.
15	TVR	0	R	Not available	TV Synchronization Error Flag 0: Indicates that, after the TVR bit is cleared with the DRES bit of the display unit system control register 0 (DSYSR0) or the TVCL bit of the display unit status register clear register 0 (DSRCR0), the EXVSYNC rising edge is detected every time within the vertical cycle determined with the setting of the vertical cycle register 0 (VCR0). 1: Indicates that, in TV synchronized mode, the EXVSYNC rising edge was not detected within the vertical cycle determined with the setting of the vertical cycle register 0 (VCR0). The TVR bit retains its status until it is cleared with the DRES or TVCL bit.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
14	FRM	0	R	Not available	Frame Flag 0: Indicates the period from the time when the FRM bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the FRCL bit of the display unit status register clear register 0 (DSRCR0) to the time when display of the next field is completed in the non-interlaced mode, or when display of the next even field is completed in interlace sync mode or interlace sync & video mode. 1: Indicates the period (in units of frames) from the start of the vertical blanking period of the first even field after the FRM bit is cleared by the DRES or FRCL bit, to the time when the FRM bit is cleared again.
13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12	BUF	0	R	Not available	Buffer Underflow Flag Set the DEFE8 bit in the display unit extensional function control register (DEF8R) to 1 to enable bit 12. In the initial state, bit 12 is fixed to 0. 0: The buffer underflow has not occurred. 1: The buffer underflow has occurred.
11	VBK	0	R	Not available	Vertical Blanking Flag 0: Indicates the period from the time when the VBK bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the VBCL bit of the display unit status register clear register 0 (DSRCR0) to the time when display of the next field is completed. 1: Indicates the period (in units of fields) from the start of the first vertical blanking period after the VBK bit is cleared by the DRES or VBCL bit, to the time when the VBK bit is cleared again.
10	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
9	RINT	0	R	Not available	Raster Interrupt Flag 0: Indicates the period from the time when the RINT bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the RICL bit of the display unit status register clear register 0 (DSRCR0) to the time when the period of the rasters set in the raster interrupt offset register 0 (RINTOFSR0) has elapsed after the beginning of the next field display. 1: Indicates the period from the time when the period of the rasters set in the raster interrupt offset register 0 (RINTOFSR0) has elapsed after the beginning of the next field display after the RINT bit is cleared by the DRES or RICL bit, to the time when the RINT bit is cleared again.
8	HBK	0	R	Not available	Horizontal Blanking Flag 0: Indicates the period from the time when the HBK bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the HBCL bit of the display unit status register clear register 0 (DSRCR0) to the time of the next HSYNC assertion. 1: Indicates the period from the start of the first horizontal blanking period after the HBK bit is cleared by the DRES or HBCL bit, to the time when the HBK bit is cleared again.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
7	ADC8	0	R	Not available	Auto Rendering Display Change Flag 8 0: Indicates that the frame buffer for plane 8 has not been switched. 1: Indicates that the frame buffer for plane 8 has been switched. The ADC8 bit state is held until it is cleared.
6	ADC7	0	R	Not available	Auto Rendering Display Change Flag 7 0: Indicates that the frame buffer for plane 7 has not been switched. 1: Indicates that the frame buffer for plane 7 has been switched. The ADC7 bit state is held until it is cleared.
5	ADC6	0	R	Not available	Auto Rendering Display Change Flag 6 0: Indicates that the frame buffer for plane 6 has not been switched. 1: Indicates that the frame buffer for plane 6 has been switched. The ADC6 bit state is held until it is cleared.
4	ADC5	0	R	Not available	Auto Rendering Display Change Flag 5 0: Indicates that the frame buffer for plane 5 has not been switched. 1: Indicates that the frame buffer for plane 5 has been switched. The ADC5 bit state is held until it is cleared.
3	ADC4	0	R	Not available	Auto Rendering Display Change Flag 4 0: Indicates that the frame buffer for plane 4 has not been switched. 1: Indicates that the frame buffer for plane 4 has been switched. The ADC4 bit state is held until it is cleared.
2	ADC3	0	R	Not available	Auto Rendering Display Change Flag 3 0: Indicates that the frame buffer for plane 3 has not been switched. 1: Indicates that the frame buffer for plane 3 has been switched. The ADC3 bit state is held until it is cleared.
1	ADC2	0	R	Not available	Auto Rendering Display Change Flag 2 0: Indicates that the frame buffer for plane 2 has not been switched. 1: Indicates that the frame buffer for plane 2 has been switched. The ADC2 bit state is held until it is cleared.
0	ADC1	0	R	Not available	Auto Rendering Display Change Flag 1 0: Indicates that the frame buffer for plane 1 has not been switched. 1: Indicates that the frame buffer for plane 1 has been switched. The ADC1 bit state is held until it is cleared.

Note: * n = 1 to 8

- Description of the ADC bits

  For animation, although the display of moving images can be performed in auto rendering mode, at this time

  1. A check for a TRAP interrupt proceeds,
  2. A check for a VBK interrupt proceeds, and
  3. Rendering starts after a VBK interrupt has occurred, so two rounds of flag checking are required before this.

  With these flag bits (ADC), an ADC interrupt is generated after a single flag check, and rendering can then start.

20.3.1.5 Display Unit Status Register 1 (DSSR1)

Address: DU1: H'FEB3 0008

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: * For reserved bit (bit name: —), initial value is undefined. For details, refer to following table.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15	TVR1	0	R	Not available	TV Synchronization Error Flag 1 0: Indicates that, after the TVR1 bit is cleared with the DRES bit of the display unit system control register 0 (DSYSR0) or the TVCL1 bit of the display unit status register clear register 1 (DSRCR1), the EXVSYNC rising edge is detected every time within the vertical cycle determined with the setting of the vertical cycle register 1 (VCR1). 1: Indicates that, in TV synchronized mode, the EXVSYNC rising edge was not detected within the vertical cycle determined with the setting of the vertical cycle register 1 (VCR1). The TVR1 bit retains its status until it is cleared with the DRES or TVCL1 bit.
14	FRM1	0	R	Not available	Frame Flag 1 0: Indicates the period from the time when the FRM1 bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the FRCL1 bit of the display unit status register clear register 1 (DSRCR1) to the time when display of the next field is completed in the non-interlaced mode, or when display of the next even field is completed in interlace sync mode or interlace sync & video mode. 1: Indicates the period (in units of frames) from the start of the vertical blanking period of the first even field after the FRM1 bit is cleared by the DRES or FRCL1 bit, to the time when the FRM1 bit is cleared again.
13, 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11	VBK1	0	R	Not available	Vertical Blanking Flag 1 0: Indicates the period from the time when the VBK1 bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the VBCL1 bit of the display unit status register clear register 1 (DSRCR1) to the time when display of the next field is completed. 1: Indicates the period (in units of fields) from the start of the first vertical blanking period after the VBK1 bit is cleared by the DRES or VBCL1 bit, to the time when the VBK1 bit is cleared again.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
10	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
9	RINT1	0	R	Not available	Raster Interrupt Flag 1 0: Indicates the period from the time when the RINT1 bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the RICL1 bit of the display unit status register clear register 1 (DSRCR1) to the time when the period of the rasters set in the raster interrupt offset register 1 (RINTOFSR1) has elapsed after the beginning of the next field display. 1: Indicates the period from the time when the period of the rasters set in the raster interrupt offset register 1 (RINTOFS1) has elapsed after the beginning of the next field display after the RINT1 bit is cleared by the DRES or RICL1 bit, to the time when the RINT1 bit is cleared again.
8	HBK1	0	R	Not available	Horizontal Blanking Flag 1 0: Indicates the period from the time when the HBK1 bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the HBCL1 bit of the display unit status register clear register 1 (DSRCR1) to the time of the next HSYNC assertion. 1: Indicates the period from the start of the first horizontal blanking period after the HBK1 bit is cleared by the DRES or HBCL1 bit, to the time when the HBK1 bit is cleared again.
7 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

The display unit interrupt enable register 0 (DIER0) allows the generation of interrupts for the CPU by aspects of the internal state of the display unit as reflected in bits of the display unit status register 0 (DSSR0) as the sources. When a bit of this register is set, setting of the bit in the same position within DSSR 0 will lead to the generation of an interrupt for the CPU.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15	TVE	0	R/W	Not available	TV Synchronization Signal Error Interrupt Enable 0: Disables the TVR flag interrupt of the display unit status register 0 (DSSR0). 1: Enables the TVR flag interrupt of the display unit status register 0 (DSSR0).
14	FRE	0	R/W	Not available	Frame Flag Interrupt Enable 0: Disables the FRM flag interrupt of the display unit status register 0 (DSSR0). 1: Enables the FRM flag interrupt of the display unit status register 0 (DSSR0).
13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12	BUE	0	R/W	Not available	Buffer Underflow Flag Interrupt Enable Set the DEFE8 bit in the display unit extensional function control 8 register (DEF8R) to 1 to enable bit 12. In the initial state, bit 12 is fixed to 0. 0: Disables the BUF flag interrupt of the display unit status register 0 (DSSR0). 1: Enables the BUF flag interrupt of the display unit status register 0 (DSSR0).
11	VBE	0	R/W	Not available	Vertical Blanking Flag Interrupt Enable 0: Disables the VBK flag interrupt of the display unit status register 0 (DSSR0). 1: Enables the VBK flag interrupt of the display unit status register 0 (DSSR0).
10	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
9	RIE	0	R/W	Not available	Raster Interrupt Flag Interrupt Enable 0: Disables the RINT flag interrupt of the display unit status register 0 (DSSR0). 1: Enables the RINT flag interrupt of the display unit status register 0 (DSSR0).
8	HBE	0	R/W	Not available	HBK Flag Interrupt Enable 0: Disables the HBK flag interrupt of the display unit status register 0 (DSSR0). 1: Enables the HBK flag interrupt of the display unit status register 0 (DSSR0).
7	ADCE8	0	R/W	Not available	Auto Rendering Display Change Flag 8 Interrupt Enable 0: Disables the ADC flag 8 interrupt of the display unit status register 0 (DSSR0). 1: Enables the ADC flag 8 interrupt of the display unit status register 0 (DSSR0).
6	ADCE7	0	R/W	Not available	Auto Rendering Display Change Flag 7 Interrupt Enable 0: Disables the ADC flag 7 interrupt of the display unit status register 0 (DSSR0). 1: Enables the ADC flag 7 interrupt of the display unit status register 0 (DSSR0).
5	ADCE6	0	R/W	Not available	Auto Rendering Display Change Flag 6 Interrupt Enable 0: Disables the ADC flag 6 interrupt of the display unit status register 0 (DSSR0). 1: Enables the ADC flag 6 interrupt of the display unit status register 0 (DSSR0).
4	ADCE5	0	R/W	Not available	Auto Rendering Display Change Flag 5 Interrupt Enable 0: Disables the ADC flag 5 interrupt of the display unit status register 0 (DSSR0). 1: Enables the ADC flag 5 interrupt of the display unit status register 0 (DSSR0).
3	ADCE4	0	R/W	Not available	Auto Rendering Display Change Flag 4 Interrupt Enable 0: Enables the ADC flag 4 interrupt of the display unit status register 0 (DSSR0). 1: Enables the ADC flag 4 interrupt of the display unit status register 0 (DSSR0).
2	ADCE3	0	R/W	Not available	Auto Rendering Display Change Flag 3 Interrupt Enable 0: Disables the ADC flag 3 interrupt of the display unit status register 0 (DSSR0). 1: Enables the ADC flag 3 interrupt of the display unit status register 0 (DSSR0).
1	ADCE2	0	R/W	Not available	Auto Rendering Display Change Flag 2 Interrupt Enable 0: Disables the ADC flag 2 interrupt of the display unit status register 0 (DSSR0). 1: Enables the ADC flag 2 interrupt of the display unit status register 0 (DSSR0).
0	ADCE1	0	R/W	Not available	Auto Rendering Display Change Flag 1 Interrupt Enable 0: Enables the ADC flag 1 interrupt of the display unit status register 0 (DSSR0). 1: Enables the ADC flag 1 interrupt of the display unit status register 0 (DSSR0).

The following are conditions, based on DSSR0, DIER0, DSSR1, and DIER1, for issuing an interrupt to the CPU from the DU0/DU1.
Conditions for issuing an interrupt from the DU0/DU1 = a + b + c + d + e + f + g + h + i + j + k+ l + m + n + o + p + q + r + s + t

- a = TVR & TVE
- b = FRM & FRE
- c = VBK & VBE
- d = RINT & RIE
- e = HBK & HBE
- f = ADC6 & ADCE6
- g = ADC5 & ADCE5
- h = ADC4 & ADCE4
- i = ADC3 & ADCE3
- j = ADC2 & ADCE2
- k = ADC1 & ADCE1
- l = ADC8 & ADCE8
- m = ADC7 & ADCE7
- n = TVR1 & TVE1
- o = FRM1 & FRE1
- p = VBK1 & VBE1
- q = RINT1 & RIE1
- r = HBK1 & HIBE1
- s = BUF & BUE
- t = BUK1 & BUE1

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15	TVR	0	R	Not available	TV Synchronization Error Flag 0: Indicates that, after the TVR bit is cleared with the DRES bit of the display unit system control register 0 (DSYSR0) or the TVCL bit of the display unit domain 1 status register clear register 0 (DD1SRCR0), the EXVSYNC rising edge is detected every time within the vertical cycle determined with the setting of the vertical cycle register 0 (VCR0). 1: Indicates that, in TV synchronized mode, the EXVSYNC rising edge was not detected within the vertical cycle determined with the setting of the vertical cycle register 0 (VCR0). The TVR bit retains its status until it is cleared with the DRES or TVCL bit.
14	FRM	0	R	Not available	Frame Flag 0: Indicates the period from the time when the FRM bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the FRCL bit of the display unit domain 1 status register clear register 0 (DD1SRCR0) to the time when display of the next field is completed in the non-interlaced mode, or when display of the next even field is completed in interlace sync mode or interlace sync & video mode. 1: Indicates the period (in units of frames) from the start of the vertical blanking period of the first even field after the FRM bit is cleared by the DRES or FRCL bit, to the time when the FRM bit is cleared again.
13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12	BUF	0	R	Not available	Buffer Underflow Flag Set the DEFE8 bit in the display unit extensional function control 8 register (DEF8R) to 1 to enable bit 12. In the initial state, bit 12 is fixed to 0. 0: The buffer underflow has not occurred. 1: The buffer underflow has occurred.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
11	VBK	0	R	Not available	Vertical Blanking Flag 0: Indicates the period from the time when the VBK bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the VBCL bit of the display unit domain 1 status register clear register 0 (DD1SRCR0) to the time when display of the next field is completed. 1: Indicates the period (in units of fields) from the start of the first vertical blanking period after the VBK bit is cleared by the DRES or VBCL bit, to the time when the VBK bit is cleared again.
10	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
9	RINT	0	R	Not available	Raster Interrupt Flag 0: Indicates the period from the time when the RINT bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the RICL bit of the display unit domain 1 status register clear register 0 (DD1SRCR0) to the time when the period of the rasters set in the raster interrupt offset register 0 (RINTOFSR0) has elapsed after the beginning of the next field display. 1: Indicates the period from the time when the period of the rasters set in the raster interrupt offset register 0 (RINTOFSR0) has elapsed after the beginning of the next field display after the RINT bit is cleared by the DRES or RICL bit, to the time when the RINT bit is cleared again.
8	HBK	0	R	Not available	Horizontal Blanking Flag 0: Indicates the period from the time when the HBK bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the HBCL bit of the display unit domain 1 status register clear register 0 (DD1SRCR0) to the time of the next HSYNC assertion. 1: Indicates the period from the start of the first horizontal blanking period after the HBK bit is cleared by the DRES or HBCL bit, to the time when the HBK bit is cleared again.
7	ADC8	0	R	Not available	Auto Rendering Display Change Flag 8 0: Indicates that the frame buffer for plane 8 has not been switched. 1: Indicates that the frame buffer for plane 8 has been switched. The ADC8 bit state is held until it is cleared.
6	ADC7	0	R	Not available	Auto Rendering Display Change Flag 7 0: Indicates that the frame buffer for plane 7 has not been switched. 1: Indicates that the frame buffer for plane 7 has been switched. The ADC7 bit state is held until it is cleared.
5	ADC6	0	R	Not available	Auto Rendering Display Change Flag 6 0: Indicates that the frame buffer for plane 6 has not been switched. 1: Indicates that the frame buffer for plane 6 has been switched. The ADC6 bit state is held until it is cleared.
4	ADC5	0	R	Not available	Auto Rendering Display Change Flag 5 0: Indicates that the frame buffer for plane 5 has not been switched. 1: Indicates that the frame buffer for plane 5 has been switched. The ADC5 bit state is held until it is cleared.
3	ADC4	0	R	Not available	Auto Rendering Display Change Flag 4 0: Indicates that the frame buffer for plane 4 has not been switched. 1: Indicates that the frame buffer for plane 4 has been switched. The ADC4 bit state is held until it is cleared.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
2	ADC3	0	R	Not available	Auto Rendering Display Change Flag 3 0: Indicates that the frame buffer for plane 3 has not been switched. 1: Indicates that the frame buffer for plane 3 has been switched. The ADC3 bit state is held until it is cleared.
1	ADC2	0	R	Not available	Auto Rendering Display Change Flag 2 0: Indicates that the frame buffer for plane 2 has not been switched. 1: Indicates that the frame buffer for plane 2 has been switched. The ADC2 bit state is held until it is cleared.
0	ADC1	0	R	Not available	Auto Rendering Display Change Flag 1 0: Indicates that the frame buffer for plane 1 has not been switched. 1: Indicates that the frame buffer for plane 1 has been switched. The ADC1 bit state is held until it is cleared.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15	TVR1	0	R	Not available	TV Synchronization Error Flag 1 0: Indicates that, after the TVR1 bit is cleared with the DRES bit of the display unit system control register 0 (DSYSR0) or the TVCL1 bit of the display unit domain 1 status register clear register 1 (DD1SRCR1), the EXVSYNC rising edge is detected every time within the vertical cycle determined with the setting of the vertical cycle register 1 (VCR1). 1: Indicates that, in TV synchronized mode, the EXVSYNC rising edge was not detected within the vertical cycle determined with the setting of the vertical cycle register 1 (VCR1). The TVR1 bit retains its status until it is cleared with the DRES or TVCL1 bit.
14	FRM1	0	R	Not available	Frame Flag 1 0: Indicates the period from the time when the FRM1 bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the FRCL1 bit of the display unit domain 1 status register clear register 1 (DD1SRCR1) to the time when display of the next field is completed in the non-interlaced mode, or when display of the next even field is completed in interlace sync mode or interlace sync & video mode. 1: Indicates the period (in units of frames) from the start of the vertical blanking period of the first even field after the FRM1 bit is cleared by the DRES or FRCL1 bit, to the time when the FRM1 bit is cleared again.
13, 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11	VBK1	0	R	Not available	Vertical Blanking Flag 1 0: Indicates the period from the time when the VBK1 bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the VBCL1 bit of the display unit domain 1 status register clear register 1 (DD1SRCR1) to the time when display of the next field is completed. 1: Indicates the period (in units of fields) from the start of the first vertical blanking period after the VBK1 bit is cleared by the DRES or VBCL1 bit, to the time when the VBK1 bit is cleared again.
10	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
9	RINT1	0	R	Not available	Raster Interrupt Flag 1 0: Indicates the period from the time when the RINT1 bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the RICL1 bit of the display unit domain 1 status register clear register 1 (DD1SRCR1) to the time when the period of the rasters set in the raster interrupt offset register 1 (RINTOFSR1) has elapsed after the beginning of the next field display. 1: Indicates the period from the time when the period of the rasters set in the raster interrupt offset register 1 (RINTOFS1) has elapsed after the beginning of the next field display after the RINT1 bit is cleared by the DRES or RICL1 bit, to the time when the RINT1 bit is cleared again.
8	HBK1	0	R	Not available	Horizontal Blanking Flag 1 0: Indicates the period from the time when the HBK1 bit is cleared by the DRES bit of the display unit system control register 0 (DSYSR0) or by the HBCL1 bit of the display unit domain 1 status register clear register 1 (DD1SRCR1) to the time of the next HSYNC assertion. 1: Indicates the period from the start of the first horizontal blanking period after the HBK1 bit is cleared by the DRES or HBCL1 bit, to the time when the HBK1 bit is cleared again.
7 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

20.3.1.12 Display Unit Domain 1 Status Register Clear Register 0 (DD1SRCR0)

Address: DU0: H'FEB2 000C

The specifications shown in section 20.3.1.7, Display Unit Status Register Clear Register 0 (DSRCR0), are also applied to this register.

20.3.1.13 Display Unit Domain 1 Status Register Clear Register 1 (DD1SRCR1)

Address: DU1: H'FEB2 800C

The specifications shown in section 20.3.1.8, Display Unit Status Register Clear Register 1 (DSRCR1), are also applied to this register.

20.3.1.14 Display Unit Domain 1 Interrupt Enable Register 0 (DD1IER0)

Address: DU0: H'FEB2 0010

The specifications shown in section 20.3.1.10, Display Unit Interrupt Enable Register 0 (DIER0), are also applied to this register.

20.3.1.15 Display Unit Domain 1 Interrupt Enable Register 1 (DD1IER1)

Address: DU1: H'FEB2 8010

The specifications shown in section 20.3.1.11, Display Unit Interrupt Enable Register 1 (DIER1), are also applied to this register.

20.3.1.16 Color Palette Control Register (CPCR)

Address: DU0: H'FEB0 0014

- Defines the order of planes in image composition and turns the display of planes on or off
- When the DPRS bit in the display unit output route control register (DORCR) is 0, the display of planes from among planes 1 to 8 for which display is enabled is switched on.
- This register can only be used to set the priority order for superposition processor m. To use superposition processor 1, set the DPRS bit in the display unit output route control register (DORCR) to 1 and make other settings as required in the display superimpose 1 priority register.
- After setting a desired value in a register listed in section 20.3.4, Display Plane Registers (Alpha-ratio Plane Registers), set the corresponding bit in the DPPR (bit 31, 27, 23, 19, 15, 11, 7, or 3) to 1.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31	DPE8	0	R/W	Available	Display Plane Priority 8 Enable
30 to 28	DPS8	111	R/W	Available	Display Plane Priority 8 Select 1000: Assigns priority 8 to plane 1 and displays plane 1. 1001: Assigns priority 8 to plane 2 and displays plane 2. 1010: Assigns priority 8 to plane 3 and displays plane 3. 1011: Assigns priority 8 to plane 4 and displays plane 4. 1100: Assigns priority 8 to plane 5 and displays plane 5. 1101: Assigns priority 8 to plane 6 and displays plane 6. 1110: Assigns priority 8 to plane 7 and displays plane 7. 1111: Assigns priority 8 to plane 8 and displays plane 8. 0---: Priority 8 is not displayed.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
27	DPE7	0	R/W	Available	Display Plane Priority 7 Enable
26 to 24	DPS7	110	R/W	Available	Display Plane Priority 7 Select 1000: Assigns priority 7 to plane 1 and displays plane 1. 1001: Assigns priority 7 to plane 2 and displays plane 2. 1010: Assigns priority 7 to plane 3 and displays plane 3. 1011: Assigns priority 7 to plane 4 and displays plane 4. 1100: Assigns priority 7 to plane 5 and displays plane 5. 1101: Assigns priority 7 to plane 6 and displays plane 6. 1110: Assigns priority 7 to plane 7 and displays plane 7. 1111: Assigns priority 7 to plane 8 and displays plane 8. 0---: Priority 7 is not displayed.
23	DPE6	0	R/W	Available	Display Plane Priority 6 Enable
22 to 20	DPS6	101	R/W	Available	Display Plane Priority 6 Select 1000: Assigns priority 6 to plane 1 and displays plane 1. 1001: Assigns priority 6 to plane 2 and displays plane 2. 1010: Assigns priority 6 to plane 3 and displays plane 3. 1011: Assigns priority 6 to plane 4 and displays plane 4. 1100: Assigns priority 6 to plane 5 and displays plane 5. 1101: Assigns priority 6 to plane 6 and displays plane 6. 1110: Assigns priority 6 to plane 7 and displays plane 7. 1111: Assigns priority 6 to plane 8 and displays plane 8. 0---: Priority 6 is not displayed.
19	DPE5	0	R/W	Available	Display Plane Priority 5 Enable
18 to 16	DPS5	100	R/W	Available	Display Plane Priority 5 Select 1000: Assigns priority 5 to plane 1 and displays plane 1. 1001: Assigns priority 5 to plane 2 and displays plane 2. 1010: Assigns priority 5 to plane 3 and displays plane 3. 1011: Assigns priority 5 to plane 4 and displays plane 4. 1100: Assigns priority 5 to plane 5 and displays plane 5. 1101: Assigns priority 5 to plane 6 and displays plane 6. 1110: Assigns priority 5 to plane 7 and displays plane 7. 1111: Assigns priority 5 to plane 8 and displays plane 8. 0---: Priority 5 is not displayed.
15	DPE4	0	R/W	Available	Display Plane Priority 4 Enable
14 to 12	DPS4	011	R/W	Available	Display Plane Priority 4 Select 1000: Assigns priority 4 to plane 1 and displays plane 1. 1001: Assigns priority 4 to plane 2 and displays plane 2. 1010: Assigns priority 4 to plane 3 and displays plane 3. 1011: Assigns priority 4 to plane 4 and displays plane 4. 1100: Assigns priority 4 to plane 5 and displays plane 5. 1101: Assigns priority 4 to plane 6 and displays plane 6. 1110: Assigns priority 4 to plane 7 and displays plane 7. 1111: Assigns priority 4 to plane 8 and displays plane 8. 0---: Priority 4 is not displayed.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
11	DPE3	0	R/W	Available	Display Plane Priority 3 Enable
10 to 8	DPS3	010	R/W	Available	Display Plane Priority 3 Select 1000: Assigns priority 3 to plane 1 and displays plane 1. 1001: Assigns priority 3 to plane 2 and displays plane 2. 1010: Assigns priority 3 to plane 3 and displays plane 3. 1011: Assigns priority 3 to plane 4 and displays plane 4. 1100: Assigns priority 3 to plane 5 and displays plane 5. 1101: Assigns priority 3 to plane 6 and displays plane 6. 1110: Assigns priority 3 to plane 7 and displays plane 7. 1111: Assigns priority 3 to plane 8 and displays plane 8. 0---: Priority 3 is not displayed.
7	DPE2	0	R/W	Available	Display Plane Priority 2 Enable
6 to 4	DPS2	001	R/W	Available	Display Plane Priority 2 Select 1000: Assigns priority 2 to plane 1 and displays plane 1. 1001: Assigns priority 2 to plane 2 and displays plane 2. 1010: Assigns priority 2 to plane 3 and displays plane 3. 1011: Assigns priority 2 to plane 4 and displays plane 4. 1100: Assigns priority 2 to plane 5 and displays plane 5. 1101: Assigns priority 2 to plane 6 and displays plane 6. 1110: Assigns priority 2 to plane 7 and displays plane 7. 1111: Assigns priority 2 to plane 8 and displays plane 8. 0---: Priority 2 is not displayed.
3	DPE1	0	R/W	Available	Display Plane Priority 1 Enable
2 to 0	DPS1	000	R/W	Available	Display Plane Priority 1 Select 1000: Assigns priority 1 to plane 1 and displays plane 1. 1001: Assigns priority 1 to plane 2 and displays plane 2. 1010: Assigns priority 1 to plane 3 and displays plane 3. 1011: Assigns priority 1 to plane 4 and displays plane 4. 1100: Assigns priority 1 to plane 5 and displays plane 5. 1101: Assigns priority 1 to plane 6 and displays plane 6. 1110: Assigns priority 1 to plane 7 and displays plane 7. 1111: Assigns priority 1 to plane 8 and displays plane 8. 0---: Priority 1 is not displayed.

20.3.1.18 Display Unit Extensional Function Control Register 0 (DEFR0)

Address: DU0: H'FEB0 0020

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CODE															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	EXSL	EXVL	—	—	—	—	—	EXUP	VCUP	—	—	—	DEFE
Initial value:	—	—	—	0	0	—	—	—	—	—	0	0	—	—	—	0
R/W:	R	R	R	R/W	R/W	R	R	R	R	R	R/W	R/W	R	R	R	R/W

Note: * For reserved bit (bit name: —), initial value is undefined, writing is not available and writing value should be specified. For details of bit description, refer to following table.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	CODE	—	—/W	Not available	DEFR0 Enabling Code (register available code) For a value written to DEFR0 to be effective, the value must include H'7773 in these bits.
15 to 13	—	—	R	—	Reserved. The read value is undefined. The write value should always be 0.
12	EXSL	0	R/W	DRES	External Sync Signal Select 0: External SYNC signals (EXVSYNC, EXHSYNC) allow signals from the pins to be directly read in terms of post-division clocks. 1: External SYNC signals (EXVSYNC, EXHSYNC) allow the signals that were read in terms of pre-division clock to be read again as post-division clocks.
11	EXVL	0	R/W	Not available	External Vsync Latch Select 0: External VSYNC signal (EXVSYNC) allows the signal from the pin to be latched every clock cycle. 1: External VSYNC signal (EXVSYNC) allows the signal from the pin to be latched at the rising edge of the external HSYNC signal.
10 to 6	—	—	R	—	Reserved. The read value is undefined. The write value should always be 0.
5	EXUP	0	R/W	DRES	External Updating Mode 0: Internally updates the internal update function bit. 1: Externally updates the internal update function bit without updating it internally. This bit takes precedence over the display unit system control register 0 (DSYSR0)/IUPD.
4	VCUP	0	R/W	DRES	Vertical Cycle Register Update Timing Select 0: The internal updating is based on the falling VSYNC. 1: The internal updating is based on the rising VSYNC. By setting the internal updating of the vertical scanning cycle register as a VSYNC rise, any disturbance of VSYNC signals during vertical scanning cycle register switching can be prevented.
3 to 1	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
0	DEFE	0	R/W	DRES	Display Unit Extensional Function Enable 0: Disables the extensional functions 1: Enables the following extensional functions: Enables bits 27 and 26 in the plane n mode register (PnMR*1). Enables bits 31 to 29 of plane n display area start address 0 to 2 registers (P2DSA0R to P2DSA2R*1) and display capture n area start address register (DCnSAR*2). Enables bits 25 and 5 in the external synchronization control register m (ESCRm*3). Enables bit 10 in the plane n blending ratio register (PnALPHAR*1). Enables bit 29 in the display unit system control register m (DSYSRm*3).

Notes: 1. n = 1 to 8
2. n = no number or 2
3. m = 0 and 1

20.3.1.19 Display Unit Extensional Function Control Register 1 (DEFR1)

Address: DU1: H'FEB3 0020

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CODE															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	EXSL1	EXV1L	—	DODF1		—	—	—	VCUP1	—	—	—	—
Initial value:	—	—	—	0	0	—	0	0	—	—	—	0	—	—	—	—
R/W:	R	R	R	R/W	R/W	R	R/W	R/W	R	R	R	R/W	R	R	R	R

Note: * For reserved bit (bit name: —), initial value is undefined, writing is not available and writing value should be specified. For details of bit description, refer to following table.

- Since the bits 5 and 0 of the display expanded-function control register 0 (DEFR0) are made to serve a double purpose by DU0 and DU1, this register does not have a function.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	CODE	—	—/W	Not available	DEFR1 Enabling Code (register available code) For a value written to DEFR1 to be effective, the value must include H'7773 in these bits.
15 to 13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12	EXSL1	0	R/W	DRES	External Sync Signal Select 1 0: External SYNC signals (EXVSYNC, EXHSYNC) allow signals from the pins to be directly read in terms of post-division clocks. 1: External SYNC signals (EXVSYNC, EXHSYNC) allow the signals that were read in terms of pre-division clock to be read again as post-division clocks.
11	EXV1L	0	R/W	Not available	External Vsync Latch Select 1 0: External VSYNC signal (EXVSYNC) allows the signal from the pin to be latched every clock cycle. 1: External VSYNC signal (EXVSYNC) allows the signal from the pin to be latched at the rising edge of the external HSYNC signal.
10	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
9, 8	DODF1	00	R/W	DRES	Display Output Data Format. 00: Sets the DU1 display output to RGB data format. 01: Setting prohibited 10: Sets the DU1 display output to non-multiplexed YC data format. Y (luminance) and C (chrominance) are output in parallel. 11: Sets the DU1 display output to multiplexed YC data format. Y (luminance) and C (chrominance) are output in multiplexed format. When YC format is displayed by the timing as shown in Figure 20.22 and Figure 20.23, set 1 bits to DCKOSEL and FRQSEL (division by 2) in the external synchronization control register 1 (ESCR1). Non-multiplexed YC format can be displayed in Figure 20.22a and Figure 20.22b, this setting is not required.
7 to 5	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
4	VCUP1	0	R/W	DRES	Vertical cycle register update timing select 0: The internal updating is based on the falling VSYNC. 1: The internal updating is based on the rising VSYNC. By setting the internal updating of the vertical scanning cycle register as a VSYNC rise, any disturbance of VSYNC signals during vertical scanning cycle register switching can be prevented.
3 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

20.3.1.20 Display Alpha Ratio Plane Control Register (DAPCR)

Address: DU0: H'FEB0 0024

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CODE															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	AP2E	—	—	—	AP1E
Initial value:	—	—	—	—	—	—	—	—	—	—	—	0	—	—	—	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Note: * For reserved bit (bit name: —), initial value is undefined, writing is not available and writing value should be specified. For details of bit description, refer to following table.

After setting a desired value in a register listed in section 20.3.4, Display Plane Registers (Alpha-ratio Plane Registers), set the corresponding bit in the DAPCR to 1.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	CODE	—	—/W	Not available	DAPCR Enabling Code (register available code) For a value written to DAPCR to be effective, the value must include H'7773 in these bits.
15 to 5	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
4	AP2E	0	R/W	Available	Alpha Ratio Plane 2 Enable 0: α plane 2 cannot be used. 1: α plane 2 can be used.
3 to 1	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
0	AP1E	0	R/W	Available	Alpha Ratio Plane 1 Enable 0: α plane 1 cannot be used. 1: α plane 1 can be used.

20.3.1.21 Display Capture Control Register (DCPCR)

Address: DU0: H'FEB0 0028

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CODE															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—		CA2B	CD2F	—	—	—	DC2E	—		CAB	CDF	—	—	—	DCE
Initial value:	0	0	0	0	—	—	—	0	—	—	0	0	—	—	—	0
R/W:	R	R	R/W	R/W	R	R	R	R/W	R	R	R/W	R/W	R	R	R	R/W

After setting a desired value in a register listed in section 20.3.5, Display Capture Registers, set the corresponding bit in the DCPCR (bit 8 or 0) to 1.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	CODE	—	—/W	Not available	DCPCR Enabling Code (register available code) For a value written to DCPCR to be effective, the value must include H'7773 in these bits.
15, 14	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
13	CA2B	0	R/W	Available	Display Capture A Bit 2 Function Select To enable this bit, DEFE3 bit in the display unit extensional function control 3 register (DEF3R) should be set to 1. In the initial state, this bit is fixed to 0. 0: When the display capture data 2 format is ARGB1555, the A value is 0. 1: When the display capture data 2 format is ARGB1555, the A value is 1.
12	CD2F	0	R/W	Available	Display Capture Data 2 Format To enable this bit, the DEFE3 bit in the display unit extensional function control 3 register (DEF3R) should be set to 1. In the initial state, this bit is fixed to 0. 0: Display capture data format in the superposition processor 1 is RGB565. 1: Display capture data format in the superposition processor 1 is ARGB1555. The A value is determined by bit 13 in this register.
11 to 9	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
8	DC2E	0	R/W	Available	Display Capture 2 Enable To enable this bit, DEFE3 bit in the display unit extensional function control 3 register (DEF3R) should be set to 1. In the initial state, this bit is fixed to 0. 0: Display data in the superposition processor 1 is not captured. 1: Display data in the superposition processor 1 is captured when the DRES and DEN bits in the display unit system control register 0 (DSYSR0) are B'01. After this bit is set to 1, data capture is started in the subsequent frame.
7, 6	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
5	CAB	0	R/W	Available	Display Capture A Bit Function Select To enable this bit, the DEFE2G bit in the display unit extensional function control 2 register (DEF2R) should be set to 1. In the initial state, this bit is fixed to 0. 0: When the display capture data format is ARGB1555, the A value is 0. 1: When the display capture data format is ARGB1555, the A value is 1.
4	CDF	0	R/W	Available	Display Capture Data Format To enable this bit, the DEFE2G bit in the display unit extensional function control 2 register (DEF2R) should be set to 1. In the initial state, this bit is fixed to 0. 0: Display capture data format in the superposition processor m is RGB565. 1: Display capture data format in the superposition processor m is ARGB1555. The A value is determined by bit 5 in this register.
3 to 1	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
0	DCE	0	R/W	Available	Display Capture Enable 0: Display data in the superposition processor 0 is not captured. 1: Display data in the superposition processor 0 is captured when the DRES and DEN bits in the display unit system control register 0 (DSYSR0) are B'01. After this bit is set to 1, data capture is started in the subsequent frame.

20.3.1.22 Display Unit Extensional Function Control 2 Register (DEF2R)

Address: DU0: H'FEB0 0034

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CODE															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	CODE	—	—/W	Not available	DEF4R Enabling Code (register available code) For a value written to DEF4R to be effective, the value must include H'7777 in these bits.
15 to 6	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
5	LRUO	0	R/W	DRES	LRU Function Off 0: Requests for the AXI from the individual planes are arbitrated by the LRU system. 1: Requests for the AXI from the individual planes are arbitrated according to the following decreasing order of priority: plane 1, plane 2, plane 3, plane 4, plane 5, plane 6, plane 7, plane 8, α plane 1, α plane 2, display capture1, and display capture 2. When the display is 32-bit/pixel, set this bit to 1.
4 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

20.3.1.25 Display Unit Video Capture Status Register (DVCSR)

Address: DU0: H'FEB0 00D0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	VC1FB1		VC0FB1	
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	VC1FB		VC0FB	
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: * For reserved bit (bit name: —), initial value is undefined. For details, refer to following table.

- To enable this register, set the DEFE3 bit in the display unit extensional function control 3 register (DEF3R) to 1. The value read from this register in its initial state is fixed to 0. Video Capture is the same as VideoInput.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 20	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
19, 18	VC1FB1	00	R	Not available	Video Capture 1 Frame Buffer Flag 1 These bits are updated with the same timing as internal updating of timing generator 1. 00: In the plane set for video capture 1, the display area starts at the address indicated by PnDSA0R. 01: In the plane set for video capture 1, the display area starts at the address indicated by PnDSA1R. 10: In the plane set for video capture 1, the display area starts at the address indicated by PnDSA2R. 11: The video capture 1 module is in its initial state.
17, 16	VC0FB1	00	R	Not available	Video Capture 0 Frame Buffer Flag 1 These bits are updated with the same timing as internal updating of timing generator 1. 00: In the plane set for video capture 0, the display area starts at the address indicated by PnDSA0R. 01: In the plane set for video capture 0, the display area starts at the address indicated by PnDSA1R. 10: In the plane set for video capture 0, the display area starts at the address indicated by PnDSA2R. 11: The video capture 0 module is in its initial state.
15 to 4	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
3, 2	VC1FB	00	R	Not available	Video Capture 1 Frame Buffer Flag These bits are updated with the same timing as internal updating of timing generator 0. 00: In the plane set for video capture 1, the display area starts at the address indicated by PnDSA0R. 01: In the plane set for video capture 1, the display area starts at the address indicated by PnDSA1R. 10: In the plane set for video capture 1, the display area starts at the address indicated by PnDSA2R. 11: The video capture 1 module is in its initial state.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
1, 0	VC0FB	00	R	Not available	Video Capture 0 Frame Buffer Flag These bits are updated with the same timing as internal updating of timing generator 0. 00: In the plane set for video capture 0, the display area starts at the address indicated by PnDSA0R. 01: In the plane set for video capture 0, the display area starts at the address indicated by PnDSA1R. 10: In the plane set for video capture 0, the display area starts at the address indicated by PnDSA2R. 11: The video capture 0 module is in its initial state.

20.3.1.26 Display Unit Extensional Function Control 5 Register (DEF5R)

Address: DU0: H'FEB0 00E0

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R/W

Note: * For reserved bit (bit name: —), initial value is undefined, writing is not available and writing value should be specified. For details, refer to following table.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	CODE	—	—/W	Not available	DEF5R Enabling Code (register available code) For a value written to DEF5R to be effective, the value must include H'66 in these bits.
23 to 19	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
18	NTEE	0	R/W	DRES	DVENC Enable 0: DVENC (Digital video encoder) is disabled. 1: DVENC (Digital video encoder) is enabled.
17 to 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7, 6	RGBYC1	00	R/W	DRES	RGB-YC Converted Output 1 00: DU1 display output is RGB data format. 01: DU1 display output is RGB-YC converted multiplexed YC data format. 10: DU1 display output is RGB-YC converted non-multiplexed YC data format. 11: Setting prohibited For YC data format, set to 1 bits DCKOSEL and FRQSEL (division by 2) in the External Synchronization Control Register 0 (ESCR1). For performing RGB-YC conversion, the display capture function (section 20.4.18) or the color detection function (section 20.5.4) cannot be used.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
5, 4	RGBYC0	00	R/W	DRES	RGB-YC Converted Output 0 00: DU0 display output is RGB data format. 01: DU0 display output is RGB-YC converted multiplexed YC data format. 10: DU0 display output is RGB-YC converted non-multiplexed YC data format. 11: Setting prohibited For YC data format, set to 1 bits DCKOSEL and FRQSEL (division by 2) in the External Synchronization Control Register 0 (ESCR0). For performing RGB-YC conversion, the display capture function (section 20.4.18) or the color detection function (section 20.5.4) cannot be used.
3 to 1	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
0	DEFE5	0	R/W	DRES	Display Unit Extensional Function Enable 5 0: Extensional functions are disabled. 1: Extensional functions are enabled. The following extensional function is enabled. The number of bits is increased by one for the following registers: Display timing generation registers HDSRn*1, HDERn*1, VDERn*1, HCRn*1, VCRn*1, VSPRn*1, CLAMPSRn*1, CLAMPWRn*1, DESRn*1, and DEWRn*1 Display attribute registers RINTOFSRn*1 Display plane registers (alpha-ratio plane registers) PnDSXR*2, PnDSYR*2, PnDPXR*2, and PnDPYR*2

Notes: 1. n = 0 and 1.
2. n = 1 to 8

20.3.1.27 Display Unit Data Latency Adjustment Register (DDLTR)

Address: DU0: H'FEB0 00E4

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CODE															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	DLAR1	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	0	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R

Note: * For reserved bit (bit name: —), initial value is undefined, writing is not available and writing value should be specified. For details, refer to following table.

This register is used to adjust the latency of two display data items output from the DU0 and DU1 when two image data items are output from the DU pins on both edges (rising and falling edges) of the output dot clock. This register should not be changed from its initial value when the DR0D bit in the display unit output route control register (DORCR) is 0. When the DR0D bit is set to 1 (when two image data items are output from the DU pins on both edges of the output dot clock), set the necessary bits in this register to 1.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	CODE	—	—/W	Not available	DDLTR Enabling Code (register available code) For a value written to DDLTR to be effective, the value must include H'7766 in these bits.
15 to 7	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
6	DLAR1	0	R/W	DRES	Display Data Latency Adjustment RGBYC1 Set this bit to 1 in order to adjust the latency on the DU1 side when the RGBYC0 bit in the display unit extensional function control 5 register (DEF5R) is set to B'10 (RGB-YC conversion is performed). 0: DU1 display data is output without delay. 1: DU1 display data is output with a delay corresponding to the latency of RGB-YC conversion on the DU0 side.
5 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

20.3.1.28 Display Unit Extensional Function Control 6 Register (DEF6R)

Address: DU0: H'FEB0 00E8

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CODE															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W

11	ODDFL1	0	R/W	Not available	ODDF (DU1) Signal Fixed Low Level 0: ODDF (DU1) output is normal. 1: ODDF (DU1) output is fixed low. This bit setting is effective only in master mode.
10	DISPFL1	0	R/W	Not available	DISP (DU1) Signal Fixed Low Level 0: DISP (DU1) output is normal. 1: DISP (DU1) output is fixed low.
9	CDEFL1	0	R/W	Not available	CDE (DU1) Signal Fixed Low Level 0: CDE (DU1) output is normal. 1: CDE (DU1) output is fixed low.
8	RGBFL1	0	R/W	Not available	RGB (DU1) Signal Fixed Low Level 0: RGB (DU1) output is normal. 1: RGB (DU1) output is fixed low.
7, 6	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
5	HSYCFL0	0	R/W	Not available	HSYNC (DU0) Signal Fixed Low Level 0: HSYNC (DU0) output is normal. 1: HSYNC (DU0) output is fixed low. This bit setting is effective only in master mode.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
4	VSYCFL0	0	R/W	Not available	VSYNC (DU0) Signal Fixed Low Level 0: VSYNC (DU0) output is normal. 1: VSYNC (DU0) output is fixed low. This bit setting is effective only in master mode.
3	ODDFL0	0	R/W	Not available	ODDF (DU0) Signal Fixed Low Level 0: ODDF (DU0) output is normal. 1: ODDF (DU0) signal at fixed low level. This bit setting is effective only in master mode.
2	DISPFL0	0	R/W	Not available	DISP (DU0) Signal Fixed Low Level 0: DISP (DU0) output is normal. 1: DISP (DU0) output is fixed low.
1	CDEFL0	0	R/W	Not available	CDE (DU0) Signal Fixed Low Level 0: CDE (DU0) output is normal. 1: CDE (DU0) output is fixed low.
0	RGBFL0	0	R/W	Not available	RGB (DU0) Signal Fixed Low Level 0: RGB (DU0) output is normal. 1: RGB (DU0) output is fixed low.

20.3.1.31 Display Unit Input Dot Clock Select Register (DIDSR)

Address: H'FEB2 0028

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CODE															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	LDCS1		LDCS0		—	—	—	—	PDCS1		PDCS0	
Initial value:	—	—	—	—	0	0	0	0	—	—	—	—	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Note: * For reserved bit (bit name: —), initial value is undefined, writing is not available and writing value should be specified. For details of bit description, refer to following table.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	CODE	—	—/W	Not available	DIDSR Enabling Code (register available code) For a value written to DIDSR to be effective, the value must include H'7790 in these bits.
15 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11, 10	LDCS1	00	R/W	DRES	DU1 LVDS Dot Clock Select 0-: The DU1 input dot clock source is the DU1_DOTCLKIN pin. 10: The DU1 input dot clock source is the LVDS pin*1. 11: The DU1 input dot clock source is the DVENC pin*2.
9, 8	LDCS0	00	R/W	DRES	DU0 LVDS Dot Clock Select 0-: The DU0 input dot clock source is the DU0_DOTCLKIN pin. 10: The DU0 input dot clock source is the LVDS pin*1. 11: The DU0 input dot clock source is the DVENC pin*2.
7 to 4	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
3, 2	PDCS1	00	R/W	DRES	DU1 Pad Dot Clock Select -0: The DU1 input dot clock source is the DU1_DOTCLKIN pin. 01: The DU1 input dot clock source is the DU0_DOTCLKIN pin. 11: Setting prohibited.
1, 0	PDCS0	00	R/W	DRES	DU0 Pad Dot Clock Select -0: The DU0 input dot clock source is the DU0_DOTCLKIN pin. 01: The DU0 input dot clock source is the DU1_DOTCLKIN pin. 11: Setting prohibited.

Notes: 1. LVDS pin means the equivalence clock of the internal clock from the LVDS PLL. When setting B'10, the LVDS must be enabled.

2. DVENC pin means the equivalence clock of the internal clock from the VIDEO_X1. When setting B'11, the DVENC must be enabled.

20.3.2 Display Timing Generation Registers

The sets of display timing generation registers are for the respective channels and have the same functions; they are described as one here.

In section 20.3.2, n = 0 and 1 for this product.

20.3.2.1 Horizontal Display Start Register n (HDSRn)

Address: DU0: H'FEB0 0040, DU1: H'FEB3 0040

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	HDS									
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 10	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
9 to 0	HDS	—	R/W	Available	Horizontal Display Start To enable bit 9, set the DEFE5 bit in the display unit extensional function control 5 register (DEF5R) to 1. In the initial state, bit 9 cannot be written to. These bits are used to set the horizontal display start position in dot clock units. The set value is retained at a reset.

20.3.2.2 Horizontal Display End Register n (HDERn)

Address: DU0: H'FEB0 0044, DU1: H'FEB3 0044

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	HDE											
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	HDE	—	R/W	Available	Horizontal Display End To enable bit 11, set the DEFE5 bit in the display unit extensional function control 5 register (DEF5R) to 1. In the initial state, bit 11 cannot be written to. These bits are used to set the horizontal display end position in dot clock units. The set value is retained at a reset.

20.3.2.3 Vertical Display Start Register n (VDSRn)

Address: DU0: H'FEB0 0048, DU1: H'FEB3 0048

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	VDS								
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 9	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
8 to 0	VDS	—	R/W	Available	Vertical Display Start These bits are used to set the vertical display start position in raster line units. The set value is retained at a reset.

20.3.2.4 Vertical Display End Register n (VDERn)

Address: DU0: H'FEB0 004C, DU1: H'FEB3 004C

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	VDE										
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 11	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
10 to 0	VDE	—	R/W	Available	Vertical Display End To enable bit 10, set the DEFE5 bit in the display unit extensional function control 5 register (DEF5R) to 1. In the initial state, bit 10 cannot be written to. These bits are used to set the vertical display end position in raster line units. The set value is retained at a reset.

20.3.2.5 Horizontal Cycle Register n (HCRn)

Address: DU0: H'FEB0 0050, DU1: H'FEB3 0050

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	HC											
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	HC	—	R/W	Available	Horizontal Cycle To enable bit 11, set the DEFE5 bit in the display unit extensional function control 5 register (DEF5R) to 1. In the initial state, bit 11 cannot be written to. These bits are used to set one horizontal scan cycle including the horizontal blanking period in dot clock units. In TV synchronized mode, set this register so that the HSYNC cycle set with this register is equal to or greater than the EXHSYNC cycle. The set value is retained at a reset.

20.3.2.6 Horizontal Sync Width Register n (HSWRn)

Address: DU0: H'FEB0 0054, DU1: H'FEB3 0054

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	HSW								
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 9	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
8 to 0	HSW	—	R/W	Available	Horizontal Sync Width These bits are used to set the low-level pulse width of the horizontal synchronous signal in dot clock units. The set value is retained at a reset.

20.3.2.7 Vertical Cycle Register n (VCRn)

Address: DU0: H'FEB0 0058, DU1: H'FEB3 0058

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	VC										
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 11	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
10 to 0	VC	—	R/W	Available	Vertical Cycle To enable bit 10, set the DEFE5 bit in the display unit extensional function control 5 register (DEF5R) to 1. In the initial state, bit 10 cannot be written to. These bits are used to set the vertical scan cycle including the vertical blanking period in raster line units. In TV synchronized mode, set the time limit of the EXVSYNC rising edge detection. If the EXVSYNC rising edge is not detected within the time limit, the result is reflected in bit 15 of the display unit status register n (DSSRn). The set value is retained at a reset.

20.3.2.8 Vertical Sync Point Register n (VSPRn)

Address: DU0: H'FEB0 005C, DU1: H'FEB3 005C

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 11	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
10 to 0	VSP	—	R/W	Available	Vertical Sync Point To enable bit 10, set the DEFE5 bit in the display unit extensional function control 5 register (DEF5R) to 1. In the initial state, bit 10 cannot be written to. These bits are used to set the vertical synchronous signal start position in raster line units. In TV synchronized mode, set this register so that the VSYNC falling edge setting position set with this register is the same as or comes after that of the EXVSYNC falling edge. The set value is retained at a reset.

20.3.2.9 Equal Pulse Width Register n (EQWRn)

Address: DU0: H'FEB0 0060, DU1: H'FEB3 0060

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	EQW						
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 7	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
6 to 0	EQW	—	R/W	Available	Equal Pulse Width These bits are used to set the low-level equalizing pulse width of the CSYNC signal in dot clock units. To validate this setting, set bit 7 in the display unit mode register n (DSMRn)/CSYNC mode (CSY) to 1. The set value is retained at a reset.

20.3.2.10 Serration Width Register n (SPWRn)

Address: DU0: H'FEB0 0064, DU1: H'FEB3 0064

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SPW									
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 10	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
9 to 0	SPW	—	R/W	Available	Serration Width These bits are used to set the low-level serration pulse width of the CSYNC signal in dot clock units. Set a value smaller than 1/2 of HC. To validate this setting, set bit 7 in the display unit mode register n (DSMRn)/CSYNC mode (CSY) to 1. The set value is retained at a reset.

20.3.2.11 CLAMP Signal Start Register n (CLAMPSRn)

Address: DU0: H'FEB0 0070, DU1: H'FEB3 0070

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CLAMPS											
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	CLAMPS	—	R/W	Available	CLAMP Signal Start To enable bit 11, set the DEFE5 bit in the display unit extensional function control 5 register (DEF5R) to 1. In the initial state, bit 11 cannot be written to. These bits are used to set the CLAMP signal rising edge position in dot clock units, using as the reference the HSYNC signal falling edge. The CLAMP signal rises (setting value + 1) cycle after the HSYNC signal falls. Therefore, the CLAMP signal cannot rise in the same cycle as the HSYNC signal falling edge. The set value is retained at a reset.

20.3.2.12 CLAMP Signal Width Register n (CLAMPWRn)

Address: DU0: H'FEB0 0074, DU1: H'FEB3 0074

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CLAMPW											
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	CLAMPW	—	R/W	Available	CLAMP Signal Width To enable bit 11, set the DEFE5 bit in the display unit extensional function control 5 register (DEF5R) to 1. In the initial state, bit 11 cannot be written to. These bits are used to set the high-level width of the CLAMP signal in dot clock units. When the CLAMP signal is high, if the HSYNC signal falls, the CLAMP signal falls. The set value is retained at a reset.

20.3.2.13 DE Signal Start Register n (DESRn)

Address: DU0: H'FEB0 0078, DU1: H'FEB3 0078

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DES											
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	DES	—	R/W	Available	DE Signal Start To enable bit 11, set the DEFE5 bit in the display unit extensional function control 5 register (DEF5R) to 1. In the initial state, bit 11 cannot be written to. These bits are used to set the DE signal rising edge position in dot clock units, using as the reference the HSYNC signal falling edge. The DE signal rises (setting value + 1) cycle after the HSYNC signal falls. Therefore, the DE signal cannot rise in the same cycle as the HSYNC signal falling edge. During a vertical blanking period, the DE signal is fixed to the low level. The set value is retained at a reset.

20.3.2.14 DE Signal Width Register n (DEWRn)

Address: DU0: H'FEB0 007C, DU1: H'FEB3 007C

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DEW											
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	DEW	—	R/W	Available	DE Signal Width To enable bit 11, set the DEFE5 bit in the display unit extensional function control 5 register (DEF5R) to 1. In the initial state, bit 11 cannot be written to. These bits are used to set the high-level width of the DE signal in dot clock units. When the DE signal is high, if the HSYNC signal falls, the DE signal falls. The set value is retained at a reset.

20.3.3 Display Attribute Registers

In section 20.3.3, n = 0 and 1 for this product.

20.3.3.1 Color Palette 1 Transparent Color Register (CP1TR)

Address: DU0: H'FEB0 0080

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15	CP1IF	0	R/W	Available	Color Palette 1 Index F This bit is used to specify the color palette 1 transparent color. 0: Does not set the color of the color palette 1 index F to the transparent color. 1: Sets the color of the color palette 1 index F to the transparent color.
14	CP1IE	0	R/W	Available	Color Palette 1 Index E This bit is used to specify the color palette 1 transparent color. 0: Does not set the color of the color palette 1 index E to the transparent color. 1: Sets the color of the color palette 1 index E to the transparent color.
13	CP1ID	0	R/W	Available	Color Palette 1 Index D This bit is used to specify the color palette 1 transparent color. 0: Does not set the color of the color palette 1 index D to the transparent color. 1: Sets the color of the color palette 1 index D to the transparent color.
12	CP1IC	0	R/W	Available	Color Palette 1 Index C This bit is used to specify the color palette 1 transparent color. 0: Does not set the color of the color palette 1 index C to the transparent color. 1: Sets the color of the color palette 1 index C to the transparent color.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
11	CP1IB	0	R/W	Available	Color Palette 1 Index B This bit is used to specify the color palette 1 transparent color. 0: Does not set the color of the color palette 1 index B to the transparent color. 1: Sets the color of the color palette 1 index B to the transparent color.
10	CP1IA	0	R/W	Available	Color Palette 1 Index A This bit is used to specify the color palette 1 transparent color. 0: Does not set the color of the color palette 1 index A to the transparent color. 1: Sets the color of the color palette 1 index A to the transparent color.
9	CP1I9	0	R/W	Available	Color Palette 1 Index 9 This bit is used to specify the color palette 1 transparent color. 0: Does not set the color of the color palette 1 index 9 to the transparent color. 1: Sets the color of the color palette 1 index 9 to the transparent color.
8	CP1I8	0	R/W	Available	Color Palette 1 Index 8 This bit is used to specify the color palette 1 transparent color. 0: Does not set the color of the color palette 1 index 8 to the transparent color. 1: Sets the color of the color palette 1 index 8 to the transparent color.
7	CP1I7	0	R/W	Available	Color Palette 1 Index 7 This bit is used to specify the color palette 1 transparent color. 0: Does not set the color of the color palette 1 index 7 to the transparent color. 1: Sets the color of the color palette 1 index 7 to the transparent color.
6	CP1I6	0	R/W	Available	Color Palette 1 Index 6 This bit is used to specify the color palette 1 transparent color. 0: Does not set the color of the color palette 1 index 6 to the transparent color. 1: Sets the color of the color palette 1 index 6 to the transparent color.
5	CP1I5	0	R/W	Available	Color Palette 1 Index 5 This bit is used to specify the color palette 1 transparent color. 0: Does not set the color of the color palette 1 index 5 to the transparent color. 1: Sets the color of the color palette 1 index 5 to the transparent color.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
4	CP1I4	0	R/W	Available	Color Palette 1 Index 4 This bit is used to specify the color palette 1 transparent color. 0: Does not set the color of the color palette 1 index 4 to the transparent color. 1: Sets the color of the color palette 1 index 4 to the transparent color.
3	CP1I3	0	R/W	Available	Color Palette 1 Index 3 This bit is used to specify the color palette 1 transparent color. 0: Does not set the color of the color palette 1 index 3 to the transparent color. 1: Sets the color of the color palette 1 index 3 to the transparent color.
2	CP1I2	0	R/W	Available	Color Palette 1 Index 2 This bit is used to specify the color palette 1 transparent color. 0: Does not set the color of the color palette 1 index 2 to the transparent color. 1: Sets the color of the color palette 1 index 2 to the transparent color.
1	CP1I1	0	R/W	Available	Color Palette 1 Index 1 This bit is used to specify the color palette 1 transparent color. 0: Does not set the color of the color palette 1 index 1 to the transparent color. 1: Sets the color of the color palette 1 index 1 to the transparent color.
0	CP1I0	0	R/W	Available	Color Palette 1 Index 0 This bit is used to specify the color palette 1 transparent color. 0: Does not set the color of the color palette 1 index 0 to the transparent color. 1: Sets the color of the color palette 1 index 0 to the transparent color.

20.3.3.2 Color Palette 2 Transparent Color Register (CP2TR)

Address: DU0: H'FEB0 0084

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15	CP2IF	0	R/W	Available	Color Palette 2 Index F This bit is used to specify the color palette 2 transparent color. 0: Does not set the color of the color palette 2 index F to the transparent color. 1: Sets the color of the color palette 2 index F to the transparent color.
14	CP2IE	0	R/W	Available	Color Palette 2 Index E This bit is used to specify the color palette 2 transparent color. 0: Does not set the color of the color palette 2 index E to the transparent color. 1: Sets the color of the color palette 2 index E to the transparent color.
13	CP2ID	0	R/W	Available	Color Palette 2 Index D This bit is used to specify the color palette 2 transparent color. 0: Does not set the color of the color palette 2 index D to the transparent color. 1: Sets the color of the color palette 2 index D to the transparent color.
12	CP2IC	0	R/W	Available	Color Palette 2 Index C This bit is used to specify the color palette 2 transparent color. 0: Does not set the color of the color palette 2 index C to the transparent color. 1: Sets the color of the color palette 2 index C to the transparent color.
11	CP2IB	0	R/W	Available	Color Palette 2 Index B This bit is used to specify the color palette 2 transparent color. 0: Does not set the color of the color palette 2 index B to the transparent color. 1: Sets the color of the color palette 2 index B to the transparent color.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
10	CP2IA	0	R/W	Available	Color Palette 2 Index A This bit is used to specify the color palette 2 transparent color. 0: Does not set the color of the color palette 2 index A to the transparent color. 1: Sets the color of the color palette 2 index A to the transparent color.
9	CP2I9	0	R/W	Available	Color Palette 2 Index 9 This bit is used to specify the color palette 2 transparent color. 0: Does not set the color of the color palette 2 index 9 to the transparent color. 1: Sets the color of the color palette 2 index 9 to the transparent color.
8	CP2I8	0	R/W	Available	Color Palette 2 Index 8 This bit is used to specify the color palette 2 transparent color. 0: Does not set the color of the color palette 2 index 8 to the transparent color. 1: Sets the color of the color palette 2 index 8 to the transparent color.
7	CP2I7	0	R/W	Available	Color Palette 2 Index 7 This bit is used to specify the color palette 2 transparent color. 0: Does not set the color of the color palette 2 index 7 to the transparent color. 1: Sets the color of the color palette 2 index 7 to the transparent color.
6	CP2I6	0	R/W	Available	Color Palette 2 Index 6 This bit is used to specify the color palette 2 transparent color. 0: Does not set the color of the color palette 2 index 6 to the transparent color. 1: Sets the color of the color palette 2 index 6 to the transparent color.
5	CP2I5	0	R/W	Available	Color Palette 2 Index 5 This bit is used to specify the color palette 2 transparent color. 0: Does not set the color of the color palette 2 index 5 to the transparent color. 1: Sets the color of the color palette 2 index 5 to the transparent color.
4	CP2I4	0	R/W	Available	Color Palette 2 Index 4 This bit is used to specify the color palette 2 transparent color. 0: Does not set the color of the color palette 2 index 4 to the transparent color. 1: Sets the color of the color palette 2 index 4 to the transparent color.
3	CP2I3	0	R/W	Available	Color Palette 2 Index 3 This bit is used to specify the color palette 2 transparent color. 0: Does not set the color of the color palette 2 index 3 to the transparent color. 1: Sets the color of the color palette 2 index 3 to the transparent color.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
2	CP2I2	0	R/W	Available	Color Palette 2 Index 2 This bit is used to specify the color palette 2 transparent color. 0: Does not set the color of the color palette 2 index 2 to the transparent color. 1: Sets the color of the color palette 2 index 2 to the transparent color.
1	CP2I1	0	R/W	Available	Color Palette 2 Index 1 This bit is used to specify the color palette 2 transparent color. 0: Does not set the color of the color palette 2 index 1 to the transparent color. 1: Sets the color of the color palette 2 index 1 to the transparent color.
0	CP2I0	0	R/W	Available	Color Palette 2 Index 0 This bit is used to specify the color palette 2 transparent color. 0: Does not set the color of the color palette 2 index 0 to the transparent color. 1: Sets the color of the color palette 2 index 0 to the transparent color.

20.3.3.3 Color Palette 3 Transparent Color Register (CP3TR)

Address: DU0: H'FEB0 0088

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15	CP3IF	0	R/W	Available	Color Palette 3 Index F This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index F to the transparent color. 1: Sets the color of the color palette 3 index F to the transparent color.
14	CP3IE	0	R/W	Available	Color Palette 3 Index E This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index E to the transparent color. 1: Sets the color of the color palette 3 index E to the transparent color.
13	CP3ID	0	R/W	Available	Color Palette 3 Index D This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index D to the transparent color. 1: Sets the color of the color palette 3 index D to the transparent color.
12	CP3IC	0	R/W	Available	Color Palette 3 Index C This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index C to the transparent color. 1: Sets the color of the color palette 3 index C to the transparent color.
11	CP3IB	0	R/W	Available	Color Palette 3 Index B This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index B to the transparent color. 1: Sets the color of the color palette 3 index B to the transparent color.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
10	CP3IA	0	R/W	Available	Color Palette 3 Index A This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index A to the transparent color. 1: Sets the color of the color palette 3 index A to the transparent color.
9	CP3I9	0	R/W	Available	Color Palette 3 Index 9 This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index 9 to the transparent color. 1: Sets the color of the color palette 3 index 9 to the transparent color.
8	CP3I8	0	R/W	Available	Color Palette 3 Index 8 This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index 8 to the transparent color. 1: Sets the color of the color palette 3 index 8 to the transparent color.
7	CP3I7	0	R/W	Available	Color Palette 3 Index 7 This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index 7 to the transparent color. 1: Sets the color of the color palette 3 index 7 to the transparent color.
6	CP3I6	0	R/W	Available	Color Palette 3 Index 6 This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index 6 to the transparent color. 1: Sets the color of the color palette 3 index 6 to the transparent color.
5	CP3I5	0	R/W	Available	Color Palette 3 Index 5 This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index 5 to the transparent color. 1: Sets the color of the color palette 3 index 5 to the transparent color.
4	CP3I4	0	R/W	Available	Color Palette 3 Index 4 This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index 4 to the transparent color. 1: Sets the color of the color palette 3 index 4 to the transparent color.
3	CP3I3	0	R/W	Available	Color Palette 3 Index 3 This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index 3 to the transparent color. 1: Sets the color of the color palette 3 index 3 to the transparent color.
2	CP3I2	0	R/W	Available	Color Palette 3 Index 2 This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index 2 to the transparent color. 1: Sets the color of the color palette 3 index 2 to the transparent color.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
1	CP3I1	0	R/W	Available	Color Palette 3 Index 1 This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index 1 to the transparent color. 1: Sets the color of the color palette 3 index 1 to the transparent color.
0	CP3I0	0	R/W	Available	Color Palette 3 Index 0 This bit is used to specify the color palette 3 transparent color. 0: Does not set the color of the color palette 3 index 0 to the transparent color. 1: Sets the color of the color palette 3 index 0 to the transparent color.

20.3.3.4 Color Palette 4 Transparent Color Register (CP4TR)

Address: DU0: H'FEB0 008C

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15	CP4IF	0	R/W	Available	Color Palette 4 Index F This bit is used to specify the color palette 4 transparent color. 0: Does not set the color of the color palette 4 index F to the transparent color. 1: Sets the color of the color palette 4 index F to the transparent color.
14	CP4IE	0	R/W	Available	Color Palette 4 Index E This bit is used to specify the color palette 4 transparent color. 0: Does not set the color of the color palette 4 index E to the transparent color. 1: Sets the color of the color palette 4 index E to the transparent color.
13	CP4ID	0	R/W	Available	Color Palette 4 Index D This bit is used to specify the color palette 4 transparent color. 0: Does not set the color of the color palette 4 index D to the transparent color. 1: Sets the color of the color palette 4 index D to the transparent color.
12	CP4IC	0	R/W	Available	Color Palette 4 Index C This bit is used to specify the color palette 4 transparent color. 0: Does not set the color of the color palette 4 index C to the transparent color. 1: Sets the color of the color palette 4 index C to the transparent color.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
11	CP4IB	0	R/W	Available	Color Palette 4 Index B This bit is used to specify the color palette 4 transparent color. 0: Does not set the color of the color palette 4 index B to the transparent color. 1: Sets the color of the color palette 4 index B to the transparent color.
10	CP4IA	0	R/W	Available	Color Palette 4 Index A This bit is used to specify the color palette 4 transparent color. 0: Does not set the color of the color palette 4 index A to the transparent color. 1: Sets the color of the color palette 4 index A to the transparent color.
9	CP4I9	0	R/W	Available	Color Palette 4 Index 9 This bit is used to specify the color palette 4 transparent color. 0: Does not set the color of the color palette 4 index 9 to the transparent color. 1: Sets the color of the color palette 4 index 9 to the transparent color.
8	CP4I8	0	R/W	Available	Color Palette 4 Index 8 This bit is used to specify the color palette 4 transparent color. 0: Does not set the color of the color palette 4 index 8 to the transparent color. 1: Sets the color of the color palette 4 index 8 to the transparent color.
7	CP4I7	0	R/W	Available	Color Palette 4 Index 7 This bit is used to specify the color palette 4 transparent color. 0: Does not set the color of the color palette 4 index 7 to the transparent color. 1: Sets the color of the color palette 4 index 7 to the transparent color.
6	CP4I6	0	R/W	Available	Color Palette 4 Index 6 This bit is used to specify the color palette 4 transparent color. 0: Does not set the color of the color palette 4 index 6 to the transparent color. 1: Sets the color of the color palette 4 index 6 to the transparent color.
5	CP4I5	0	R/W	Available	Color Palette 4 Index 5 This bit is used to specify the color palette 4 transparent color. 0: Does not set the color of the color palette 4 index 5 to the transparent color. 1: Sets the color of the color palette 4 index 5 to the transparent color.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
4	CP4I4	0	R/W	Available	Color Palette 4 Index 4 This bit is used to specify the color palette 4 transparent color. 0: Does not set the color of the color palette 4 index 4 to the transparent color. 1: Sets the color of the color palette 4 index 4 to the transparent color.
3	CP4I3	0	R/W	Available	Color Palette 4 Index 3 This bit is used to specify the color palette 4 transparent color. 0: Does not set the color of the color palette 4 index 3 to the transparent color. 1: Sets the color of the color palette 4 index 3 to the transparent color.
2	CP4I2	0	R/W	Available	Color Palette 4 Index 2 This bit is used to specify the color palette 4 transparent color. 0: Does not set the color of the color palette 4 index 2 to the transparent color. 1: Sets the color of the color palette 4 index 2 to the transparent color.
1	CP4I1	0	R/W	Available	Color Palette 4 Index 1 This bit is used to specify the color palette 4 transparent color. 0: Does not set the color of the color palette 4 index 1 to the transparent color. 1: Sets the color of the color palette 4 index 1 to the transparent color.
0	CP4I0	0	R/W	Available	Color Palette 4 Index 0 This bit is used to specify the color palette 4 transparent color. 0: Does not set the color of the color palette 4 index 0 to the transparent color. 1: Sets the color of the color palette 4 index 0 to the transparent color.

20.3.3.5 Display Off Mode Output Register n (DOORn)

Address: DU0: H'FEB0 0090, DU1: H'FEB3 0090

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	DOR						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DOG						—	—	DOB						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R

The two registers are for the respective channels and have the same functions.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
23 to 18	DOR	—	R/W	Available	Display Off Mode Output Red These bits are used to set the red display data to be output when the display is off (DRES and DEN bits in the display unit system control register 0 (DSYSR0) are B'00). The set value is retained at a reset.
17, 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15 to 10	DOG	—	R/W	Available	Display Off Mode Output Green These bits are used to set the green display data to be output when the display is off (DRES and DEN bits in the display unit system control register 0 (DSYSR0) are B'00). The set value is retained at a reset.
9, 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 2	DOB	—	R/W	Available	Display Off Mode Output Blue These bits are used to set the blue display data to be output when the display is off (DRES and DEN bits in the display unit system control register 0 (DSYSR0) are B'00). The set value is retained at a reset.
1, 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

20.3.3.6 Color Detection Register n (CDERn)

Address: DU0: H'FEB0 0094, DU1: H'FEB3 0094

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CDR						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CDG						—	—	CDB						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R

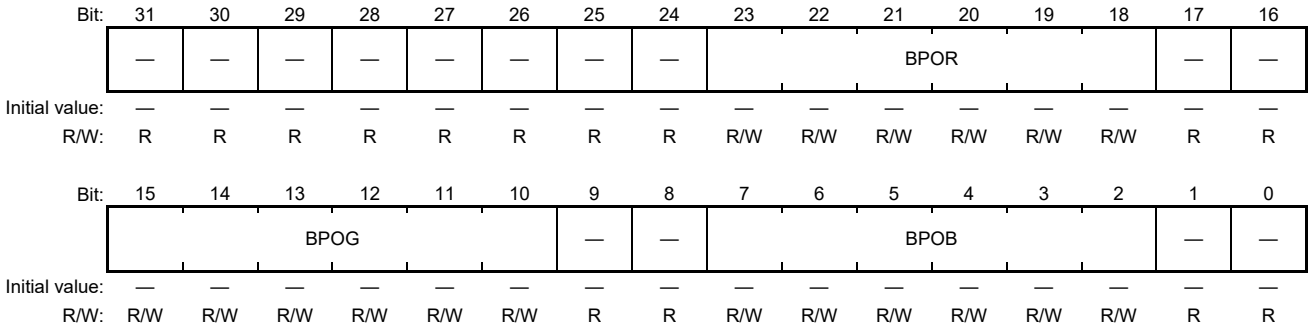
The two registers are for the respective channels and have the same functions.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
23 to 18	CDR	—	R/W	Available	Color Detection Red These bits are used to set the red data for color detection. The set value is retained at a reset.
17, 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15 to 10	CDG	—	R/W	Available	Color Detection Green These bits are used to set the green data for color detection. The set value is retained at a reset.
9, 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 2	CDB	—	R/W	Available	Color Detection Blue These bits are used to set the blue data for color detection. The set value is retained at a reset.
1, 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Note: When output data matches the setting value of this register, the high level is output from the CDE pin. For details about the output color data format, see section 20.4.6, Data Formats for Output and Display Capture.

20.3.3.7 Background Plane Output Register n (BPORn)

Address: DU0: H'FEB0 0098, DU1: H'FEB3 0098



The two registers are for the respective channels and have the same functions.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
23 to 18	BPOR	—	R/W	Available	Background Plane Output Red These bits are used to set the red color to be displayed if no plane to be displayed exists due to a display size, transparent color, and so on. The set value is retained at a reset.
17, 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15 to 10	BPOG	—	R/W	Available	Background Plane Output Green These bits are used to set the green color to be displayed if no plane to be displayed exists due to a display size, transparent color, and so on. The set value is retained at a reset.
9, 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 2	BPOB	—	R/W	Available	Background Plane Output Blue These bits are used to set the blue color to be displayed if no plane to be displayed exists due to a display size, transparent color, and so on. The set value is retained at a reset.
1, 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

20.3.3.8 Raster Interrupt Offset Register n (RINTOFSRn)

Address: DU0: H'FEB0 009C, DU1: H'FEB3 009C

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	RINTOFS										
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The two registers are for the respective channels and have the same functions.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 11	—	—	R	—	Reserved
10 to 0	RINTOFS	—	R/W	Available	Raster Interrupt Offset To enable bit 10, set the DEFE5 bit in the display unit extensional function control 5 register (DEF5R) to 1. In the initial state, bit 10 cannot be written to. These bits are used to set the raster offset value (number of Hs) that is based on the number of rasters set with the vertical display start register n (VDSRn). If the offset value is assumed to be n, bit 9 in the display unit status register n (DSSRn) is set to 1 at the HSYNC falling edge after the horizontal display period of (VDS + n-th raster). The set value is retained at a reset.

Note: n = 0 and 1.

20.3.4 Display Plane Registers (Alpha-ratio Plane Registers)

In descriptions of registers that are common to planes 1 to 8, the planes are generically referred to as plane n. The meanings of characters n and # are given below.

n: 1 to 8 for this product.

#: Replaces n (in hexadecimal) in addresses. For example, address H'FEB00#00 for the plane 3 mode register corresponds to H'FEB00300.

Descriptions of the registers for the alpha-ratio planes are also given in this section, because a given register for the alpha-ratio planes has almost the same functionality as the corresponding register for the display planes.

Register names:

The names of corresponding registers for the alpha-ratio planes start with the string "Alpha".

Abbreviation:

Abbreviations of the names of corresponding registers for the alpha-ratio planes start with "A".
For alpha-ratio plane registers, n is given as follows;
n: 1, 2 for this product.

Address:

The addresses of registers for the alpha-ratio planes are given to the right of the address information for the corresponding display-plane registers (# = 1, 2 for this product).

The plane n memory width register (PnMWR) for the alpha-ratio planes, for example, is the alpha-ratio plane n memory width register (APnMWR).

The alpha-ratio plane n mode register (APnMR) is described separately because its functionality differs from that of a plane n mode register (PnMR).

20.3.4.1 Plane n Mode Register (PnMR)

Address: DU0: H'FEB00#00 (for alpha-ratio planes; refer to section 20.3.4.24, Alpha-ratio Plane n Mode Register (APnMR))

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	PnVISL		—	—	—	—	—	Pn YCDF	—	—	PnTC	PnWAE
Initial value:	—	—	—	—	0	0	—	—	—	—	—	0	—	—	0	0
R/W:	R	R	R	R	R/W	R/W	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	PnSPIM			—	PnCPSL			PnDC	—	PnBM		—	—	PnDDF	
Initial value:	—	0	0	0	—	0	0	0	0	—	0	0	—	—	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R	R/W	R/W	R	R	R/W	R/W

Note: * For reserved bit (bit name: —), initial value is undefined, writing is not available and writing value should be specified. For details of bit description, refer to following table.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 28	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
27, 26	PnVISL	00	R/W	Available	Plane n Video Input Select To enable these bits, set the DEFE bit in the display unit extensional function control register 0 (DEFR0) to 1. In the initial state, these bits cannot be set to 1. 00: Video input 0 (VIN0) is selected. 01: Video input 1 (VIN1) is selected. 10: Setting prohibited 11: Setting prohibited
25 to 21	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
20	PnYCDF	0	R/W	Available	Plane n YC Data Format 0: Sets the alignment of YC data to UYVY format. 1: Sets the alignment of YC data to YUYV format.
19, 18	—	—	R	—	Reserved The setting is invalid when an 8-bit/pixel display has not been selected.
17	PnTC	0	R/W	Available	Plane n Transparent Color 0: When an 8-bit/pixel display has been selected, the transparent color is that indicated by the value of PnTC1R 1: When an 8-bit/pixel display has been selected, the transparent color is that indicated by the value of CPT1R to CPT4R The setting is invalid when an 8-bit/pixel display has not been selected. For details, refer to section 20.4.9 (2), Transparent Colors.
16	PnWAE	0	R/W	Available	Plane n Wrap-Around Enable 0: Wrapping-around for plane n is disabled. 1: Wrapping-around for plane n is enabled.
15	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
14 to 12	PnSPIM	000	R/W	Available	Plane n Super Impose Mode 000: Transparent color processing is performed for plane n. When plane n is in the transparent color, the lower plane is displayed. 001: α blending of plane n and the lower plane is performed. When plane n is the transparent color, α blending is not performed, and the lower plane is displayed. 010: An EOR operation is performed on plane n and the lower plane. When plane n is the transparent color the EOR operation is not performed, and the lower plane is displayed. 011: Setting prohibited 100: Transparent color processing is not performed for plane n. Plane n is displayed. 101: α blending of plane n and the lower plane is performed. The transparent color specification for plane n is ignored, and α blending is performed between all the pixels of plane n and the lower plane. 110: An EOR operation is performed on plane n and the lower plane. The transparent color specification for plane n is ignored, and EOR operation is performed on all the pixels of plane n and the lower plane. 111: Setting prohibited Transparent color processing for YC data is not possible. Transparent color processing is not possible when the PnLRGB1 bit or PnLRGB0 bit in the plane n display data control register (PnDDCR) specifies 32-bit/pixel data. Transparent color processing is possible when 32-bit/pixel data is specified by plane n display data control 4 register (PnDDC4R).
11	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
10 to 8	PnCPSL	000	R/W	Available	Plane n Color Palette Select These bits indicate whether the color palette is to be used when the value of the PnDDF bits is B'00 (i.e. the plane n display data format is 8-bit/pixel). 000: Use color palette 1 001: Use color palette 2 010: Use color palette 3 011: Use color palette 4 100: Setting prohibited 101: Setting prohibited 110: Setting prohibited 111: Setting prohibited
7	PnDC	0	R/W	Available	Plane n Display Area Change 0: In manual display change mode, switching of the frame buffer is not performed. 1: In manual display change mode, switching of the frame buffer is performed. When the PnDC bit is 0, bit setting is possible. Switching is performed in frame units. After frame buffer switching (after vertical blanking detection), this bit is cleared to 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
6	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
5, 4	PnBM	00	R/W	Available	Plane n Buffer Mode 00: Manual display change mode 01: Auto rendering mode 10: Auto display change mode (blinking mode) 11: Video capture mode In manual display change mode, auto rendering mode, or auto display change mode (blinking mode), double-buffering control is performed using addresses 0 and 1, respectively indicated by the PnDSA0 and PnDSA1 bits in PnDSA0R and PnDSA1R. In video capture mode, triple-buffering control is performed using addresses 0 to 2 indicated by bits 31 to 26 of the display unit status register 0 (DSSR0) or the display unit video capture status register (DVCSR).
3, 2	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
1, 0	PnDDF	00	R/W	Available	Plane n Display Data Format 00: 8-bit/pixel 01: 16-bit/pixel 10: ARGB (ARGB1555) 11: YC (YUV422 is converted to RGB888). When bits 9 and 8 in the display unit extensional function control register 1 (DEFR1) are set to B'10 or B'11, conversion to RGB888 is not performed. In the case of 32-bit/pixel data, set these bits to B'01.

20.3.4.2 Plane n Memory Width Register (PnMWR)

Address: DU0: H'FEB00#04 (Alpha ratio plane address: DU0: H'FEB0A#04)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12 to 4	PnMWX	—	R/W	Available	Plane n Memory Width X The plane n memory width should be set in the range 16 pixels to 4096 pixels, in 16-pixel units. If the image data are in 32-bit/pixel format, and the scan mode is set as the interlaced sync & video mode, specify a value corresponding to double the desired size in the PnMWX bits. The value is retained during a reset.
3 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

20.3.4.3 Plane n Blending Ratio Register (PnALPHAR)

Address: DU0: H'FEB00#08 (unused for the alpha-ratio planes)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	PnABIT		—	PnBRSL			PnALPHA							
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 14	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
13, 12	PnABIT	—	R/W	Available	Plane n A Bit Function Select This facility is not available for 32-bit/pixel data. In the initial state, these bits are fixed to 0. To enable these bits, set the DEFE2G bit in DEF2R to 1. 00: In ARGB mode (i.e. when the value of the PnDDF bits in PnMR is B'10), α blending is performed when the value of A is 1. 01: In ARGB mode (i.e. when the value of the PnDDF bits in PnMR is B'10), α blending is performed when the value of A is 0. 1-: In ARGB mode (i.e. when the value of the PnDDF bits in PnMR is B'10), α blending is performed regardless of the value of A. The value is retained during a reset.
11	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
10 to 8	PnBRSL	—	R/W	Available	Plane n Blending Ratio Select This bit is valid when the value of the PnSPIM bits in PnMR allows α blending. In the initial state, bit 10 is fixed to 0. To enable bit 10, set the DEFE bit in DEFR0 to 1. -00: The value of bits 7 to 0 in this register is taken to be the alpha ratio. -01: Setting prohibited -10: Bits 31 to 24 of the color palette register specified by the PnCPSL bits in PnMR are taken to be the alpha ratio. Note: This setting is only effective when the display data format specified by the PnDDF bits in PnMR is 8-bit/pixel. For formats other than 8-bit/pixel, the value of bits 7 to 0 in this register is taken to be the alpha ratio. 011: The display data for the plane specified by bits 2 to 0 in this register is taken to be the alpha ratio. Bits 2 to 0 = 000: Display data for plane 1 is the alpha ratio Bits 2 to 0 = 001: Display data for plane 2 is the alpha ratio Bits 2 to 0 = 010: Display data for plane 3 is the alpha ratio Bits 2 to 0 = 011: Display data for plane 4 is the alpha ratio Bits 2 to 0 = 100: Display data for plane 5 is the alpha ratio Bits 2 to 0 = 101: Display data for plane 6 is the alpha ratio Bits 2 to 0 = 110: Display data for plane 7 is the alpha ratio Bits 2 to 0 = 111: Display data for plane 8 is the alpha ratio Notes: 1. When the register's own plane is specified, the value of bits 7 to 0 in this register is taken to be the alpha ratio. 2. The specified plane should satisfy the following conditions. If the conditions are not satisfied, the alpha ratio is undefined. - The display should be turned on by using DPPR. - The display data format should be set to 8-bit/pixel. - The display size should be greater than or equal to the size of the plane for this register. - Ensure that display positions (X and Y) are the same as those in the plane for this register.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
10 to 8	PnBRSL	—	R/W	Available	111: The display data for the alpha-ratio plane specified by bits 2 to 0 in this register is taken to be the alpha ratio. Bits 2 to 0 = 000: Display data for α plane 1 is the alpha ratio Bits 2 to 0 = 001: Display data for α plane 2 is the alpha ratio Take the following steps before setting PnBRSL = 111. 1. Set the desired value in a register listed in section 20.3.4, Display Plane Registers (Alpha-ratio Plane Registers) 2. Set the AP1E or AP2E bit in DAPCR to 1. 3. Make the timing and dot clock settings in DPTSR and DAPTSR. The settings in DPTSR and DAPTSR should be the same. The value is retained during a reset.
7 to 0	PnALPHA	—	R/W	Available	Plane n Blending Ratio These bits indicate the alpha ratio (α), which determines the blending ratio for plane n. This facility is not available for 32-bit/pixel data. Blending result ≈ (plane n × α/255) + lower plane × (1 - α/255) (Approximation) Note: Blending result, α, plane n, and lower plane in the above formula are all 8-bit data. The value is retained during a reset.

20.3.4.4 Plane n Display Size X Register (PnDSXR)

Address: DU0: H'FEB00#10 (Alpha ratio plane address: DU0: H'FEB0A#10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	PnDPX	—	R/W	Available	Plane n Display Position X To enable bit 11, set the DEFE5 bit in the display unit extensional function control 5 register (DEF5R) to 1. In the initial state, bit 11 cannot be written to. The horizontal start position on the display monitor of plane n should be set in dot clock units, taking as the origin the upper-left corner of the display monitor. Note: When YC has been selected by the RGBYC0 bit in the display unit extensional function control 5 register (DEF5R) during display output from DU0, this value should be set to an even number. When YC has been selected by the DODF1 bit in the display unit extensional function control register 1 (DEFR1) / DODF1 during display output from DU1, this value should be set to an even number. The value is retained during a reset.

20.3.4.7 Plane n Display Position Y Register (PnDPYR)

Address: DU0: H'FEB00#1C (Alpha ratio plane address: DU0: H'FEB0A#1C)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	PnDPY										
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 11	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
10 to 0	PnDPY	—	R/W	Available	Plane n Display Position Y To enable bit 10, set the DEFE5 bit in the display unit extensional function control 5 register (DEF5R) to 1. In the initial state, bit 10 cannot be written to. The vertical start position on the display monitor of plane n should be set in raster line units, taking as the origin the upper-left corner of the display monitor. For interlaced sync & video display, the display starts at the position one bit shifted from the PnDPY bit setting value. PnDPY Vertical start position 0 0 1 0 2 1 3 1 4 2 For non-interlaced and interlaced sync display, the display starts at the position specified by the PnDPY bit. • When you set one or more values to this register at the time of interlace sync & video, please add one half of the preset values of this register to the VDE bits of the vertical display end register n (VDERn) (n = 0 and 1). Add further 1, when the number of preset values is odd -- when you have set up by two or more planes, please add the maximum. Adding to the value of VDERn can lead to the effects described against (1) and (2) below. Depending on the monitor, these may make display impossible. Use of this register when such cases arise in interlace sync & video mode is prohibited. (1) Although the DISP signal was originally at the low level in the vertical blanking interval, the DISP signal will be at the high level until the next falling edges of the VSYNC and HSYNC signals. (2) Although all bits of the data for display were 0 in the vertical blanking interval, values become non-zero in the same interval as effect (1). This becomes the value of the DDR for the display data if settings of the PnDSY and PnDPY bit fields cause the display to jut out in the vertical direction and the value of the BPORn field if the display does not jut out (n is 0 or 1). In the case of a non-interlace and an interlace sync, the necessity for addition is not. The value is retained during a reset.

20.3.4.8 Plane n Display Area Start Address 0 Register (PnDSA0R)

Address: DU0: H'FEB00#20 (Alpha ratio plane address: DU0: H'FEB0A#20)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PnDSA0															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PnDSA0												—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 4	PnDSA0	—	R/W	Available	Plane n Display Area Start Address 0 To enable bits 31 to 29, the DEFE bit in DEFR0 must be set to 1. In the initial state, these bits are not enabled. When the buffer mode for plane n is manual display, auto rendering, auto display change, or video capture, the area indicated by this register is used as frame buffer 0. The value is retained during a reset.
3 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

20.3.4.9 Plane n Display Area Start Address 1 Register (PnDSA1R)

Address: DU0: H'FEB00#24 (Alpha ratio plane address: DU0: H'FEB0A#24)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PnDSA1

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	PnWAMWY	—	R/W	Available	Plane n Wrap-Around Memory Width Y The memory width for wrap-around in the Y-direction should be set to a number corresponding to a value in the range from 240 to 4095 raster lines. If an image data is in 32-bit/pixel data format, specify a value that is twice a desired value to the PnWAMWY bit. The value is retained during a reset.

20.3.4.15 Plane n Blinking Time Register (PnBTR)

Address: DU0: H'FEB00#40 (Alpha ratio plane address: DU0: H'FEB0A#40)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PnBTA								PnBTB							
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15 to 8	PnBTA	0000 0001	R/W	Available	Plane n Blinking Time A
7 to 0	PnBTB	0000 0001	R/W	Available	Plane n Blinking Time B

Note: When the PnBM bits in PnMR are set to select the auto display change mode (blinking mode), specify, as numbers of fields, the times over which plane n display area start address registers 0 and 1 (PnDSA0R and PnDSA1R) are to be displayed. Blinking operation employs the settings in PnDSA0R and PnDSA1R.
Setting this register to 1 (the value should be other than 0) leads to switching between the buffers at the addresses indicated by the plane n display area start address registers 0 and 1 (PnDSA0R and PnDSA1R) on each field unit.

20.3.4.16 Plane n Transparent Color 1 Register (PnTC1R)

Address: DU0: H'FEB00#44 (unused for the alpha-ratio planes)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	PnTC1							
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 0	PnTC1	—	R/W	Available	Plane n Transparent Color 1 for 8-bit/pixel This setting is for a transparent color for plane n in the 8-bit/pixel data format. To enable the transparent color setting in this register, the PnTC bit in PnMR must be set to 0. The value is retained during a reset.

20.3.4.17 Plane n Transparent Color 2 Register (PnTC2R)

Address: DU0: H'FEB00#48 (unused for the alpha-ratio planes)

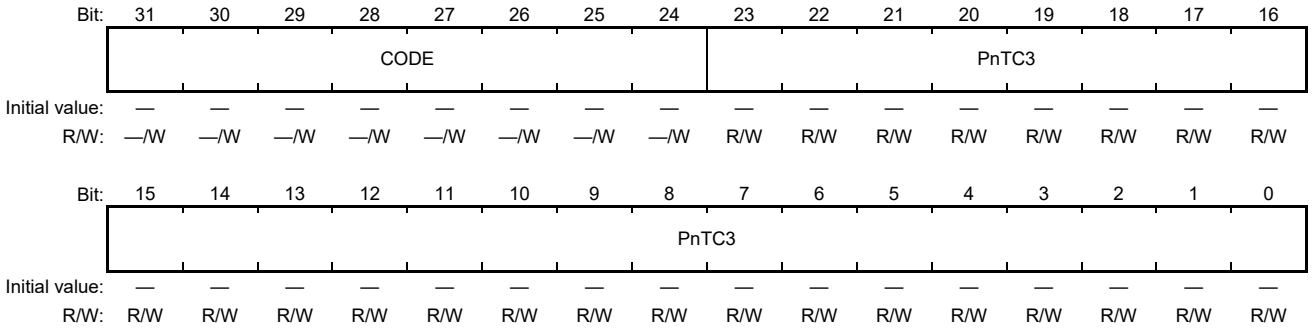
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PnTC2															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15 to 0	PnTC2	—	R/W	Available	Plane n Transparent Color 2 for 16-bit/pixel This setting is for a transparent color for plane n in the 16-bit/pixel or ARGB data format. In the case of ARGB, comparison is with bits 14 to 0 of this register, i.e. bit 15 is ignored. The value is retained during a reset.

20.3.4.18 Plane n Transparent Color 3 Register (PnTC3R)

Address: DU0: H'FEB00#4C (unused for the alpha-ratio planes)



Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	CODE	—	—/W	Not available	PnTC3R Enabling Code (register available code) For a value written to PnTC3R to be effective, the value must include H'66 in these bits.
23 to 0	PnTC3	—	R/W	Available	Plane n Transparent Color 3 These bits are used to specify the transparent color for the ARGB8888, RGB888, or RGB666 data format. See Table 20.24 for the bits to be compared.

Table 20.24 Data Comparison by Plane n Transparent Color 3 Register (PnTC3R)

Bits in PnTC3R	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARGB8888 or RGB888	R7	R6	R5	R4	R3	R2	R1	R0	G7	G6	G5	G4	G3	G2	G1	G0	B7	B6	B5	B4	B3	B2	B1	B0
RGB666	R5	R4	R3	R2	R1	R0	X	X	G5	G4	G3	G2	G1	G0	X	X	B5	B4	B3	B2	B1	B0	X	X

Note: "X" is not compared.

20.3.4.19 Plane n Memory Length Register (PnMLR)

Address: DU0: H'FEB00#50 (Alpha ratio plane address: DU0: H'FEB0A#50)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PnMLY
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PnMLY															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 17	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
16 to 0	PnMLY	H'00000	R/W	Available	Plane n Memory Length Y These bits indicate the length in memory (memory area in the Y-direction) of plane n. When the actual display is beyond this area, the data selected in BPORn will be displayed. When the value is 0 (initial value), the area is handled as an infinite area. Thus the data selected in BPORn will never be displayed. (n = 0 and 1) If an image data is in 32-bit/pixel data format and a value other than 0 is specified in PnSPYR, add a value that is half the PnSPYR bit setting value to this bit value.

20.3.4.20 Plane n SWAP Control Register (PnSWAPR)

Address: DU0: H'FEB00#80 (Alpha ratio plane address: DU0: H'FEB0A#80)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CODE															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	Pn DIGN	Pn SPQW	Pn SPLW	Pn SPWD	Pn SPBY
Initial value:	—	—	—	—	—	—	—	—	—	—	—	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	CODE	—	—/W	Not available	PnSWAPR Enabling Code (register available code) For a value written to PnSWAPR to be effective, the value must include H'7775 in these bits.
15 to 5	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
4	PnDIGN	0	R/W	Available	Plane n Display Data Format Invalid This bit is used in combination with bit 0 to control swapping of data in byte (8-bit) units. Also see the description of bit 0. The setting of this bit does not affect the values of bits 3 to 1.
3	PnSPQW	0	R/W	Available	Plane n Quadword Swap Enable 0: Data are not swapped. 1: Data are swapped in quadword (64-bit) units if bit 20 of DSYSRn is 0. (n = 0 and 1)
2	PnSPLW	0	R/W	Available	Plane n Longword Swap Enable 0: Data are not swapped. 1: Data are swapped in longword (32-bit) units if bit 20 of DSYSRn is 0. (n = 0 and 1)
1	PnSPWD	0	R/W	Available	Plane n Word Swap Enable 0: Data are not swapped. 1: Data are swapped in word (16-bit) units if bit 20 of DSYSRn is 0. (n = 0 and 1)
0	PnSPBY	0	R/W	Available	Plane n Byte Swap Enable This bit is used in combination with bit 4 to control swapping of data in byte (8-bit) units. The following combinations of values are possible when bit 20 of DSYSRn is 0. (n = 0 and 1) 00: Data are not swapped. 01: Data are not swapped. 10: Data are swapped in byte (8-bit) units if the value of the PnDDF bits in PnMR is 00 or 11. In other cases, data are not swapped. 11: Data are swapped in byte (8-bit) units.

Note: The settings of bit 20 (DSEC) of the display unit system control register n (DSYSRn), the PnDDF bit of the plane n mode register (PnMR), and this register are listed with their results below (n = 0 and 1).

All combinations of the values of the bits in PnSWAPR, the DSEC bit in DSYSRn, and the PnDDF bits in PnMR are shown below.

Table 20.25 Summary of Endian Conversion

DSEC	PnSPQW	PnSPLW	PnSPWD	PnSPBY	PnDIGN	PnDDF	Data Format	Swap Unit
1	—	—	—	—	—	00	8-bit/pixel	128 bits in byte units
						01	16-bit/pixel (RGB data)	128 bits in word units
						10	ARGB	128 bits in word units
						11	YC	128 bits in byte units
0	0	0	0	0	—	—	—	No conversion
	1	—	—	—	—	—	—	64 bits units
	—	1	—	—	—	—	—	32 bits units
	—	—	1	—	—	—	—	16 bits units
	—	—	—	1	0	00	8-bit/pixel	8 bits units
						01	16-bit/pixel (RGB data)	No conversion
						10	ARGB	No conversion
						11	YC	8 bits units
					1	—	—	8 bits units

20.3.4.21 Plane n Display Data Control Register (PnDDCR)

Address: DU0: H'FEB00#84 (unused for the alpha-ratio planes)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CODE															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W	—/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	Pn LRGB1	Pn LRGB0	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	0	0	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	CODE	—	—/W	Not available	PnDDCR Enabling Code (register available code) For a value written to PnDDCR to be effective, the value must include H'7775 in these bits.
15 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11	PnLRGB1	0	R/W	Available	Plane n 32-bit/pixel display control 1 (Plane n Long (32 bits) RGB1) 0: Data are not handled as 32-bit/pixel (ARGB8888). 1: Data in the plane are used as the lower-order bits (G: 8 bits and B: 8 bits) of 32-bit/pixel data (ARGB8888). When a 32-bit/pixel display is specified with this bit, the following restrictions apply. When specifying a 32-bit/pixel display with the PnEDF bits in plane n display data control 4 register (PnDDC4R), refer to the description of the PnEDF bits. Only ARGB8888 can be specified for 32-bit/pixel data. This bit must be set for plane n after setting of bit 10 for plane n–1 to 1. For example, if bit 10 of P1DDCR is set to 1, bit 11 of P2DDCR must be set to 1. The value of the PnDDF bits in PnMR must be 01. Do not set bits 11 and 10 to 1 at the same time. When bit 10 is set to 1, data are handled as 32-bit/pixel even if bit 11 is set to 0, and thus the function that bit 10 is set to 1 is realized. Since transparent color processing is not possible with 32-bit/pixel data, set the PnSPIM bit in PnMR to 1. α blending or EOR operations for 32-bit/pixel data and a lower plane must be performed in an area where the lower plane exists. If there is no lower plane, display of 32-bit/pixel data will not be possible after α blending or an EOR operation.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
10	PnLRGB0	0	R/W	Available	Plane n Long (32 Bits) RGB 0 0: Data are not handled as 32-bit/pixel (ARGB8888). 1: Data in the plane are used as the higher-order bits (A: 8 bits and R: 8 bits) of 32-bit/pixel data (ARGB8888). When a 32-bit/pixel display is specified with this bit, the following restrictions apply. When specifying a 32-bit/pixel display with the PnEDF bits in plane n display data control 4 register (PnDDC4R), refer to the description of the PnEDF bits. Only ARGB8888 can be specified for 32-bit/pixel data. The value of A (8 bits) will be used as the alpha ratio. This means that the alpha ratio selected in the plane n blending ratio register (PnALPHAR) is invalid. Also, the value of the PnDDF bits in PnMR must be B'01. Use planes 1 and 2 for a 32-bit/pixel display. Do not set bits 11 and 10 to 1 at the same time. When bit 11 is set to 1, data are handled as 32-bit/pixel even if bit 10 is set to 0, and thus the function that bit 11 is set to 1 is realized. Since transparent color processing is not possible with 32-bit/pixel data, set the PnSPIM bit in PnMR to 1. α blending or EOR operations for 32-bit/pixel data and a lower plane must be performed in an area where the lower plane exists. If there is no lower plane, display of 32-bit/pixel data will not be possible after α blending or an EOR operation.
9 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Use planes 1 and 2 if the display is to have 32-bit/pixel. In this display unit, a 32-bit/pixel display by a single plane is possible. For a 32-bit/pixel display using a single plane, refer to the description of the PnEDF bits in plane n display data control 4 register (PnDDC4R). Register settings for using planes 1 and 2 in a 32-bit/pixel display are given below. Note that the setting of (d) shown below must be made at the last. All other settings can be made in any order.

(a) Set the LRUO bit in display unit extensional function control 4 register (DEF4R) to 1.

(b) The settings for this register are shown below.

Bit:	15	14	13	12	11	10	9	8
					PnLRGB1	PnLRGB0		
Plane 1 (A, R)	—	—	—	—	0	1	—	—
Plane 2 (G, B)	—	—	—	—	1	0	—	—

(c) The same settings should be made in the plane 1 and plane 2 registers of display plane registers other than this register.

(d) Turn on the display of planes 1 and 2, and give plane 2 the next order of priority for processing after plane 1. For details on turning on the display, see section 20.4.2, Display On/Off.

(e) A 32-bit/pixel display should always be specified in lower-numbered planes. For example, when the 32- and 16-bit /pixel display planes are to be superimposed, the 32-bit/pixel display should be specified in planes 1 and 2, and the 16-bit/pixel display should be specified in plane 3 or in higher-numbered planes.

(f) When the video input module is to be used, refer to the specifications for the video input module.

(g) If the DU operates in big-endian, set bits 3 and 2 in the plane n swap control register (PnSWAPR) to 1 and bits 1 and 0 to 0. Bit 4 may be set to either 1 or 0. Set bit 20 in the display system control register n (DSYSRn) to 0 (n = 0 and 1).

20.3.4.22 Plane n Display Data Control 2 Register (PnDDC2R)

Address: DU0: H'FEB00#88 (unused for the alpha-ratio planes)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CODE															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	Pn NV21	Pn Y420	—	—	Pn DIVU	Pn DIVY
Initial value:	—	—	—	—	—	—	—	—	—	—	0	0	—	—	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	CODE	—	—/W	Not available	PnDDC2R Enabling Code (register available code) For a value written to PnDDC2R to be effective, the value must include H'7776 in these bits.
15 to 6	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
5	PnNV21	0	R/W	Available	Plane n NV21 Data Format This bit is only effective when bits 1 and 4 have been set to 1. 0: When YUV420 data are divided up for storage in memory, the order of the UV portion is NV12. 1: When YUV420 data are divided up for storage in memory, the order of the UV portion is NV21.
4	PnY420	0	R/W	Available	Plane n YUV420 Data Format This bit is only effective if bit 1 has been set to 1. When bit 1 is 0, the data format will be YUV422. 0: The YUV data to be divided up for storage in memory is YUV422. 1: The YUV data to be divided up for storage in memory is YUV420. For divided YUV display, see section 20.4.20, Divided YUV Display.
3, 2	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
1	PnDIVU	0	R/W	Available	Plane n UV Data from Divided YUV 0: The data format will be determined by the setting of the PnDDF bits in PnMR. 1: The setting of the PnDDF bits in PnMR is ineffective and the plane contains the UV data from YUV data that have been divided up for storage in memory. To validate the YC→RGB color space functions, set the PnDDF bits in PnMR to B'11 (YC format). Do not set bits 1 and 0 in this register at the same time. When bit 0 is set to 1, the data format will not be determined by the setting of the PnDDF bits in PnMR even if this bit is set to 0. The data format will be determined by bit 0 in this register being set to 1. For divided YUV display, see section 20.4.20, Divided YUV Display.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
0	PnDIVY	0	R/W	Available	Plane n Y Data from Divided YUV 0: The data format will be determined by the setting of the PnDDF bits in PnMR. 1: The setting of the PnDDF bits in PnMR is ineffective and the data format is the Y data from YUV data that have been divided up for storage in memory. To validate the YC→RGB color space functions, set the PnDDF bits in PnMR to B'11 (YC format). Do not set bits 1 and 0 in this register at the same time. When bit 1 is set to 1, the data format will not be determined by the setting of the PnDDF bits in PnMR even if this bit is set to 0. The data format will be determined by bit 1 in this register being set to 1. For divided YUV display, see section 20.4.20, Divided YUV Display.

20.3.4.23 Plane n Display Data Control 4 Register (PnDDC4R)

Address: DU0: H'FEB00#90 (Alpha ratio plane address: DU0: H'FEB0A#90)

Note: * For reserved bit (bit name: —), initial value is undefined, writing is not available and writing value should be specified. For details of bit description, refer to following table.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	CODE	—	—	Not available	PnDDC4R Enabling Code (register available code) For a value written to PnDDC4R to be effective, the value must include H'7766 in these bits.
15, 14	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
13	PnVSPS	0	R/W	Available	Plane n VSP1 Select To enable bit 13, set the DEFE8 bit in the display unit extensional function control 8 register (DEF8R) to 1. Bit 13 is fixed to 0 in its initial state. 0: Uses image data in memory. 1: Uses image data in VSP1. This data can be used only in plane 1. Transparent color processing for VSP1 data is not possible. The format of the pixel data is either ARGB8888 or RGB888. Only the value A for VSP1 is applied as the alpha value in ARGB8888.
12 to 3	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
2 to 0	PnEDF	000	R/W	Available	Plane n Extensional Data Format 000: The data format will be determined by the PnDDF bits in PnMR, the PnLRGB1 or PnLRGB0 bit in PnDDCR, or the PnDIVU or PnDIVY bit in PnDDC2R. 001: ARGB8888 010: RGB888 011: RGB666 100: Setting prohibited 101: Setting prohibited 110: Setting prohibited 111: Setting prohibited This data format cannot be used for alpha-ratio planes. If the DU operates in big-endian, set bits 3 and 2 in PnSWAPR to 1 and bits 1 and 0 to 0. Bit 4 may be set to either 1 or 0. Set bit 20 in DSYSRn to 0 (n = 0 and 1).

20.3.4.24 Alpha-ratio Plane n Mode Register (APnMR)

Address: DU0: H'FEB0A#00

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PnWAE
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	PnDC	—	PnBM		—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	0	—	0	0	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 17	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
16	PnWAE	0	R/W	Available	Plane n Wrap-Around Enable 0: Wrapping-around for plane n is disabled. 1: Wrapping-around for plane n is enabled.
15 to 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7	PnDC	0	R/W	Available	Plane n Display Area Change 0: In manual display change mode, switching of the frame buffer is not performed. 1: In manual display change mode, switching of the frame buffer is performed. When the PnDC bit is 0, bit setting is possible. Switching is performed in frame units. After frame buffer switching (after vertical blanking detection), this bit is cleared to 0.
6	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
5, 4	PnBM	00	R/W	Available	Plane n Buffer Mode 00: Manual display change mode 01: Setting prohibited 10: Auto display change mode (blinking mode) 11: Setting prohibited In manual display change mode or auto display change mode (blinking mode), double-buffering control is performed using addresses 0 and 1, respectively indicated by the PnDSA0 and PnDSA1 bits in PnDSA0R and PnDSA1R.
3 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

The functions of the plane n mode register (PnMR) are partially unavailable in the alpha-ratio plane n mode register (APnMR) because the functions of the planes dedicated to the α value are limited more than those of the display planes. The following bits are unavailable, and thus absent.

Bit 20 (PnYCDF) is absent because the display data format is fixed to 8-bit/pixel.

Bit 17 (PnTC) is absent because the alpha ratios cannot be treated as a transparent color.

Bits 14 to 12 (PnSPIM) are absent because superpositioning is not available.
Bits 10 to 8 (PnCPSL) are absent because the use of a color palette is not possible.
Bits 1 and 0 (PnDDF) are absent because the display data format is fixed to 8-bit/pixel.

20.3.5 Display Capture Registers

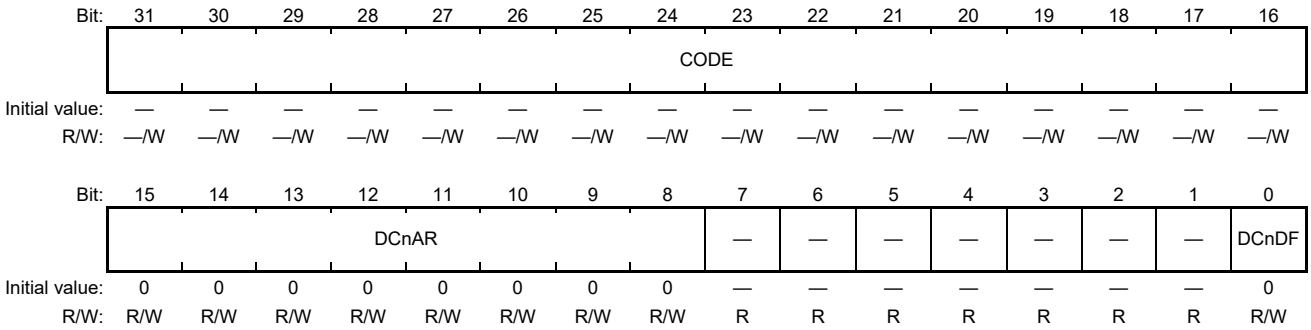
In descriptions that are common to display capture units 1 and 2, the display capture units are generically referred to as display capture n. This meaning of character n and the meaning of # are given below.

n: no number or 2

#: Corresponds to n but represents a hexadecimal digit in an address. For example, address H'FEB0C#04 for the capture 1 memory width register corresponds to H'FEB0C104.

20.3.5.1 Display Capture n Mode Register (DCnMR)

Address: DU0: H'FEB0C#00



Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	CODE	—	—/W	Not available	DCnMR Enabling Code (register available code) For a value written to DCnMR to be effective, the value must include H'7790 in these bits.
15 to 8	DCnAR	0	R/W	Available	Display Capture n Alpha Ratio This bit is effective when bit 0 in this register is set to 1.
7 to 1	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
0	DCnDF	0	R/W	Available	Display Capture n Data Format 0: The data format is determined by bits 5 and 4 in DCPCR. 1: The data format is ARGB8888. The “A” value is specified by bits 15 to 8 in this register.

20.3.5.2 Display Capture n Memory Width Register (DCnMWR)

Address: DU0: H'FEB0C#04

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	DCnMWX									—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12 to 4	DCnMWX	—	R/W	Available	Display Capture n Memory Width X Select the memory width for display capture n to a value between 16 and 4096 pixels, in 16-pixel units. When the width of captured data exceeds this size, the excess data will not be captured. The value is retained during a reset.
3 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

20.3.5.3 Display Capture n Area Start Address Register (DCnSAR)

Address: DU0: H'FEB0C#20

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DCnSA															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCnSA												—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 4	DCnSA	—	R/W	Available	Display Capture n Area Start Address To enable bits 31 to 29, the DEFE bit in DEFR0 must be set to 1. In the initial state, these bits are not enabled. The value is retained during a reset.
3 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

20.3.5.4 Display Capture n Memory Length Register (DCnMLR)

Address: DU0: H'FEB0C#50

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DCnMLY
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCnMLY															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 17	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
16 to 0	DCnMLY	H'0 0000	R/W	Available	Display Capture n Memory Length Y Select the memory length (Y-direction memory area) for display capture n. When the value of these bits is 0 (default), the size is unlimited.

20.3.6 Color Palette Registers

20.3.6.1 Color Palette 1 (000 to 255) Register (CP1_000R to CP1_255R)

Address: DU0: H'FEB01000 to H'FEB013FC

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CP1_000A								CP1_000R						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CP1_000G						—	—	CP1_000B						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R

..

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CP1_255A								CP1_255R						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CP1_255G						—	—	CP1_255B						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	CP1_000A to CP1_255A	—	R/W	Available	Color Palette 1_000 to 255 Blending Ratio When the PnBRSL bits in PnALPHAR are B'10, the value is the alpha ratio, which is the α blending ratio. The value is retained during a reset.
23 to 18	CP1_000R to CP1_255R	—	R/W	Available	Color Palette 1_000 to 255 Red Red-color data of color palette 1. The value is retained during a reset.
17, 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15 to 10	CP1_000G to CP1_255G	—	R/W	Available	Color Palette 1_000 to 255 Green Green-color data of color palette 1. The value is retained during a reset.
9, 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 2	CP1_000B to CP1_255B	—	R/W	Available	Color Palette 1_000 to 255 Blue Blue-color data of color palette 1. The value is retained during a reset.
1, 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Note: CP1_000R to CP1_255R form a group of 256 registers in which six bits are set for each of the R, G, and B components of a color, setting up the color palette of 256 colors from among the 262 thousand colors for display. The values are valid for 8-bit/pixel data display.

After the CP1CE bit in CPCR has been set to 1, settings for CP1_000R to CP1_255R become effective on the next falling edge of VSYNC (timing of an internal update) or when the display is reset. When you update the color palette, rewrite the entire palette. Reading of the color palette by the CPU must proceed before the CP1CE bit has been set to 1. The color palette is accessible in longword units.

20.3.6.2 Color Palette 2 (000 to 255) Register (CP2_000R to CP2_255R)

Address: DU0: H'FEB02000 to H'FEB023FC

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CP2_000G						—	—	CP2_000B						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R

..

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CP2_255A								CP2_255R						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

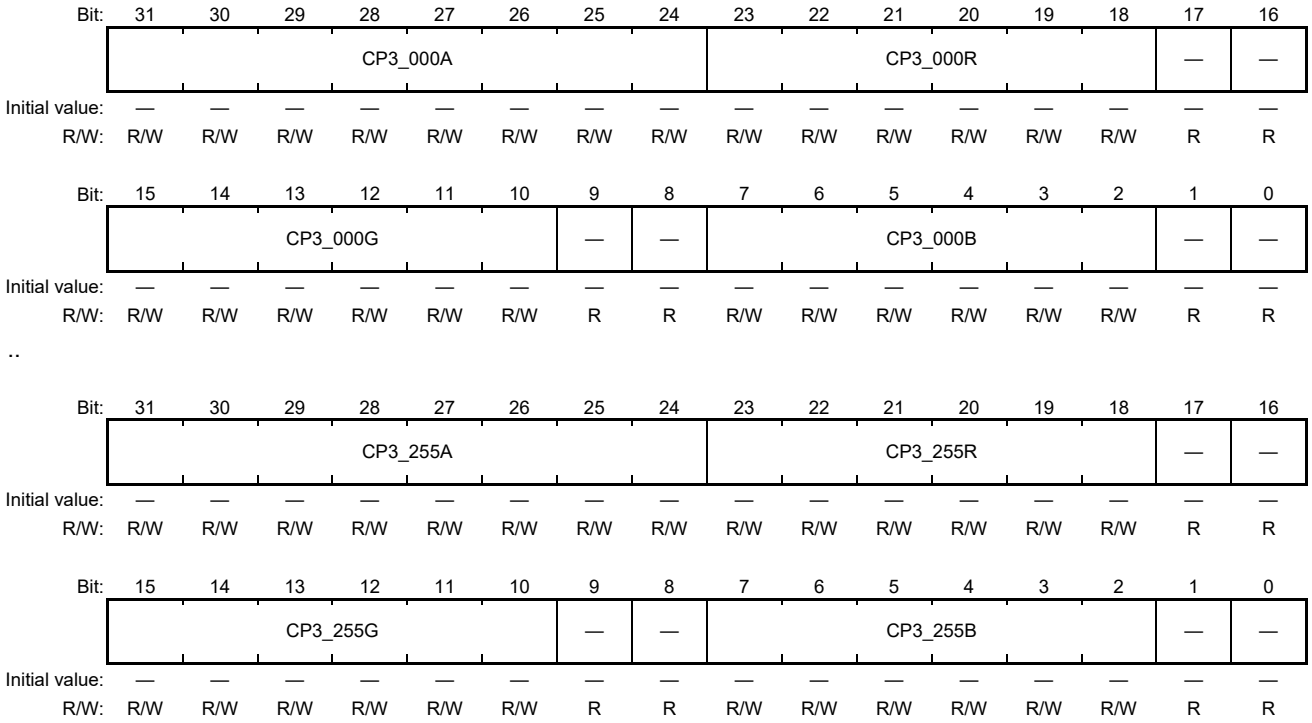
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CP2_255G						—	—	CP2_255B						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	CP2_000A to CP2_255A	—	R/W	Available	Color Palette 2_000 to 255 Blending Ratio When the PnBRSL bits in PnALPHAR are B'10, the value is the alpha ratio, which is the α blending ratio. The value is retained during a reset.
23 to 18	CP2_000R to CP2_255R	—	R/W	Available	Color Palette 2_000 to 255 Red Red-color data of color palette 2. The value is retained during a reset.
17, 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15 to 10	CP2_000G to CP2_255G	—	R/W	Available	Color Palette 2_000 to 255 Green Green-color data of color palette 2. The value is retained during a reset.
9, 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 2	CP2_000B to CP2_255B	—	R/W	Available	Color Palette 2_000 to 255 Blue Blue-color data of color palette 2. The value is retained during a reset.
1, 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Note: CP2_000R to CP2_255R form a group of 256 registers in which six bits are set for each of the R, G, and B components of a color, setting up the color palette of 256 colors from among the 262 thousand colors for display. The values are valid for 8-bit/pixel data display.
After the CP2CE bit in CPCR has been set to 1, settings for CP2_000R to CP2_255R become effective on the next falling edge of VSYNC (timing of an internal update) or when the display is reset. When you update the color palette, rewrite the entire palette. Reading of the color palette by the CPU must proceed before the CP2CE bit has been set to 1. The color palette is accessible in longword units.

20.3.6.3 Color Palette 3 (000 to 255) Register (CP3_000R to CP3_255R)

Address: DU0: H'FEB03000 to H'FEB033FC

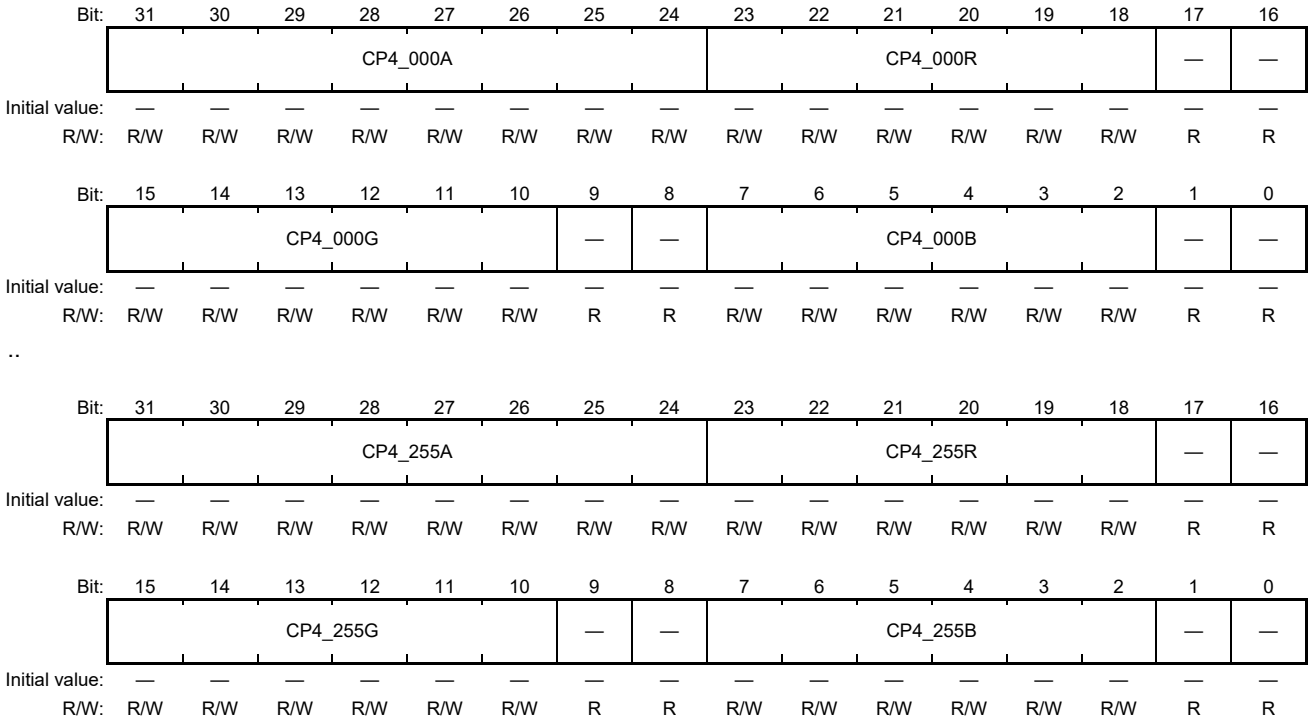


Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	CP3_000A to CP3_255A	—	R/W	Available	Color Palette 3_000 to 255 Blending Ratio When the PnBRSL bits in PnALPHAR are B'10, the value is the alpha ratio, which is the α blending ratio. The value is retained during a reset.
23 to 18	CP3_000R to CP3_255R	—	R/W	Available	Color Palette 3_000 to 255 Red Red-color data of color palette 3. The value is retained during a reset.
17, 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15 to 10	CP3_000G to CP3_255G	—	R/W	Available	Color Palette 3_000 to 255 Green Green-color data of color palette 3. The value is retained during a reset.
9, 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 2	CP3_000B to CP3_255B	—	R/W	Available	Color Palette 3_000 to 255 Blue Blue-color data of color palette 3. The value is retained during a reset.
1, 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Note: CP3_000R to CP3_255R form a group of 256 registers in which six bits are set for each of the R, G, and B components of a color, setting up the color palette of 256 colors from among the 262 thousand colors for display. The values are valid for 8-bit/pixel data display.
After the CP3CE bit in CPCR has been set to 1, settings for CP3_000R to CP3_255R become effective on the next falling edge of VSYNC (timing of an internal update) or when the display is reset. When you update the color palette, rewrite the entire palette. Reading of the color palette by the CPU must proceed before the CP3CE bit has been set to 1. The color palette is accessible in longword units.

20.3.6.4 Color Palette 4 (000 to 255) Register (CP4_000R to CP4_255R)

Address: DU0: H'FEB04000 to H'FEB043FC



Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	CP4_000A to CP4_255A	—	R/W	Available	Color Palette 4_000 to 255 Blending Ratio When the PnBRSL bits in PnALPHAR are B'10, the value is the alpha ratio, which is the α blending ratio. The value is retained during a reset.
23 to 18	CP4_000R to CP4_255R	—	R/W	Available	Color Palette 4_000 to 255 Red Red-color data of color palette 4. The value is retained during a reset.
17, 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15 to 10	CP4_000G to CP4_255G	—	R/W	Available	Color Palette 4_000 to 255 Green Green-color data of color palette 4. The value is retained during a reset.
9, 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 2	CP4_000B to CP4_255B	—	R/W	Available	Color Palette 4_000 to 255 Blue Blue-color data of color palette 4. The value is retained during a reset.
1, 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Note: CP4_000R to CP4_255R form a group of 256 registers in which six bits are set for each of the R, G, and B components of a color, setting up the color palette of 256 colors from among the 262 thousand colors for display. The values are valid for 8-bit/pixel data display.
After the CP4CE bit in CPCR has been set to 1, settings for CP4_000R to CP4_255R become effective on the next falling edge of VSYNC (timing of an internal update) or when the display is reset. When you update the color palette, rewrite the entire palette. Reading of the color palette by the CPU must proceed before the CP4CE bit has been set to 1. The color palette is accessible in longword units.

20.3.7 External Synchronization Control Registers

The three sets of external synchronization control registers are for the respective channels and have the same functions; they are described as one here.

In section 20.3.7, n = 0 and 1 for this product.

20.3.7.1 External Synchronization Control Register n (ESCRn)

Address: DU0: H'FEB10000, DU1: H'FEB31000

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	DCKOINV	DCKOSEL	—	—	—	DCLKSEL	—	—	—	DCLKDIS
Initial value:	—	—	—	—	—	—	0	0	—	—	—	0	—	—	—	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SYNCSEL		—	—	FRQSEL					
Initial value:	—	—	—	—	—	—	0	0	—	—	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Note: * Value of reserved bit (bit name: —) is undefined. For details of bit description, refer to following table.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 26	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
25	DCKOINV	0	R/W	Not available	DCLKOUT Invert To enable this bit, set the DEFE bit in the display unit extensional function control register 0 (DEFR0) to 1. In the initial state, this bit is fixed to 0. 0: DCLKOUT is output in normal phase. 1: DCLKOUT is output in counter phase.
24	DCKOSEL	0	R/W	Not available	Output Dot Clock Select (DCLKOUT Select) To enable this bit, set DEFE to 1 in the display unit extensional function control register 0 (DEFR0). In the initial state, this bit is fixed at 0. Set this bit to 1 to specify display output in YC data format. 0: The DCLKOUT division ratio is determined by bits 5 to 0 in this register. 1: DCLKIN is used as DCLKOUT, regardless of the division ratio.
23 to 21	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
20	DCLKSEL	0	R/W	Not available	DCLKIN Select 0: The input dot clock source is the DCLKIN pin 1: The input dot clock source is the ZXϕ clock. If this setting is made, ensure that the frequency of the input dot clock is divided by two or a greater value (so that the result of dividing the frequency is more than or equal to half the ZXϕ frequency).
19 to 17	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
16	DCLKDIS	0	R/W	Not available	DCLKOUT Disable 0: DCLKOUT is output. 1: DCLKOUT is not output. DCLKOUT is fixed to low level.
15 to 10	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
9, 8	SYNCSEL	00	R/W	Not available	SYNC Select 00: Phases are not synchronized 01: Phases are not synchronized 10: Phases are synchronized by using the EXVSYNC signal 11: Phases are synchronized by using the EXHSYNC signal
7, 6	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
5 to 0	FRQSEL	000000	R/W	Not available	Frequency Select To enable bit 5, the DEFE bit in DEFR0 must be set to 1. In the initial state, bit 5 is fixed to 0. If frequency division is by an odd number, the duty cycle of the frequency divided dot clock will be below 50%. 000000: Frequency division of the input dot clock (clock for division) is not performed. 000001: Division by 2 of the input dot clock (clock for division) 000010: Division by 3 of the input dot clock (clock for division) 000011: Division by 4 of the input dot clock (clock for division) 000100: Division by 5 of the input dot clock (clock for division) 000101: Division by 6 of the input dot clock (clock for division) 000110: Division by 7 of the input dot clock (clock for division) 000111: Division by 8 of the input dot clock (clock for division) 001000: Division by 9 of the input dot clock (clock for division) 001001: Division by 10 of the input dot clock (clock for division) 001010: Division by 11 of the input dot clock (clock for division) 001011: Division by 12 of the input dot clock (clock for division) 001100: Division by 13 of the input dot clock (clock for division) 001101: Division by 14 of the input dot clock (clock for division) 001110: Division by 15 of the input dot clock (clock for division) 001111: Division by 16 of the input dot clock (clock for division) 010000: Division by 17 of the input dot clock (clock for division) 010001: Division by 18 of the input dot clock (clock for division) 010010: Division by 19 of the input dot clock (clock for division) 010011: Division by 20 of the input dot clock (clock for division) 010100: Division by 21 of the input dot clock (clock for division) 010101: Division by 22 of the input dot clock (clock for division) 010110: Division by 23 of the input dot clock (clock for division) 010111: Division by 24 of the input dot clock (clock for division) 011000: Division by 25 of the input dot clock (clock for division) 011001: Division by 26 of the input dot clock (clock for division) 011010: Division by 27 of the input dot clock (clock for division) 011011: Division by 28 of the input dot clock (clock for division) 011100: Division by 29 of the input dot clock (clock for division)

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
5 to 0	FRQSEL	000000	R/W	Not available	011101: Division by 30 of the input dot clock (clock for division) 011110: Division by 31 of the input dot clock (clock for division) 011111: Division by 32 of the input dot clock (clock for division) 100000: Division by 33 of the input dot clock (clock for division) 100001: Division by 34 of the input dot clock (clock for division) 100010: Division by 35 of the input dot clock (clock for division) 100011: Division by 36 of the input dot clock (clock for division) 100100: Division by 37 of the input dot clock (clock for division) 100101: Division by 38 of the input dot clock (clock for division) 100110: Division by 39 of the input dot clock (clock for division) 100111: Division by 40 of the input dot clock (clock for division) 101000: Division by 41 of the input dot clock (clock for division) 101001: Division by 42 of the input dot clock (clock for division) 101010: Division by 43 of the input dot clock (clock for division) 101011: Division by 44 of the input dot clock (clock for division) 101100: Division by 45 of the input dot clock (clock for division) 101101: Division by 46 of the input dot clock (clock for division) 101110: Division by 47 of the input dot clock (clock for division) 101111: Division by 48 of the input dot clock (clock for division) 110000: Division by 49 of the input dot clock (clock for division) 110001: Division by 50 of the input dot clock (clock for division) 110010: Division by 51 of the input dot clock (clock for division) 110011: Division by 52 of the input dot clock (clock for division) 110100: Division by 53 of the input dot clock (clock for division) 110101: Division by 54 of the input dot clock (clock for division) 110110: Division by 55 of the input dot clock (clock for division) 110111: Division by 56 of the input dot clock (clock for division) 111000: Division by 57 of the input dot clock (clock for division) 111001: Division by 58 of the input dot clock (clock for division) 111010: Division by 59 of the input dot clock (clock for division) 111011: Division by 60 of the input dot clock (clock for division) 111100: Division by 61 of the input dot clock (clock for division) 111101: Division by 62 of the input dot clock (clock for division) 111110: Division by 63 of the input dot clock (clock for division) 111111: Division by 64 of the input dot clock (clock for division)

20.3.7.2 Output Signal Timing Adjustment Register n (OTARn)

Address: DU0: H'FEB10004, DU1: H'FEB31004

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	DEA			—	CLAMPA			—	DRGBA			—	—	—	—
Initial value:	—	0	0	0	—	0	0	0	—	0	0	0	—	—	—	—
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	CDEA			—	DISPA			—	SYNCA		
Initial value:	—	—	—	—	—	0	0	0	—	0	0	0	—	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
30 to 28	DEA	000	R/W	DRES	DE Output Timing Adjustment 000: Adjustment of output timing is not performed. The DE signal is output on the rising edge of the dot clock, with the reference timing. 001: The DE signal is output on the rising edge, delayed one dot clock cycle relative to the reference timing. 010: The DE signal is output on the rising edge, delayed two dot clock cycles relative to the reference timing. 011: The DE signal is output on the rising edge, delayed three dot clock cycles relative to the reference timing. 100: The DE signal is output on the falling edge, preceding the reference timing by 1/2 dot clock cycle. 101: The DE signal is output on the falling edge, delayed 1/2 dot clock cycle relative to the reference timing. 110: The DE signal is output on the falling edge, delayed (1+1/2) dot clock cycles relative to the reference timing. 111: The DE signal is output on the falling edge, delayed (2+1/2) dot clock cycles relative to the reference timing.
27	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
26 to 24	CLAMPA	000	R/W	DRES	CLAMP Output Timing Adjustment 000: Adjustment of output timing is not performed. The CLAMP signal is output on the rising edge of the dot clock, with the reference timing. 001: The CLAMP signal is output on the rising edge, delayed one dot clock cycle relative to the reference timing. 010: The CLAMP signal is output on the rising edge, delayed two dot clock cycles relative to the reference timing. 011: The CLAMP signal is output on the rising edge, delayed three dot clock cycles relative to the reference timing. 100: The CLAMP signal is output on the falling edge, preceding the reference timing by 1/2 dot clock cycle. 101: The CLAMP signal is output on the falling edge, delayed 1/2 dot clock cycle relative to the reference timing. 110: The CLAMP signal is output on the falling edge, delayed (1+1/2) dot clock cycles relative to the reference timing. 111: The CLAMP signal is output on the falling edge, delayed (2+1/2) dot clock cycles relative to the reference timing.
23	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
22 to 20	DRGBA	000	R/W	DRES	Digital RGB Output Timing Adjustment 000: Adjustment of output timing is not performed. The digital RGB signal is output on the rising edge of the dot clock, with the reference timing. 001: The digital RGB signal is output on the rising edge, delayed one dot clock cycle relative to the reference timing. 010: The digital RGB signal is output on the rising edge, delayed two dot clock cycles relative to the reference timing. 011: The digital RGB signal is output on the rising edge, delayed three dot clock cycles relative to the reference timing. 100: The digital RGB signal is output on the falling edge, preceding the reference timing by 1/2 dot clock cycle. 101: The digital RGB signal is output on the falling edge, delayed 1/2 dot clock cycle relative to the reference timing. 110: The digital RGB signal is output on the falling edge, delayed (1+1/2) dot clock cycles relative to the reference timing. 111: The digital RGB signal is output on the falling edge, delayed (2+1/2) dot clock cycles relative to the reference timing. If you intend to use the output dot clock to control the timing of the switching of data for display, do not select the falling edge (i.e. do not set bit 22 to 1). The value of bits 22 to 20 of output signal timing adjustment register 0 (OTAR0) must be the same as that of bits 22 to 20 in output signal timing adjustment register 1 (OTAR1).
19 to 11	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
10 to 8	CDEA	000	R/W	DRES	CDE Output Timing Adjustment 000: Adjustment of output timing is not performed. The CDE signal is output on the rising edge of the dot clock, with the reference timing. 001: The CDE signal is output on the rising edge, delayed one dot clock cycle relative to the reference timing. 010: The CDE signal is output on the rising edge, delayed two dot clock cycles relative to the reference timing. 011: The CDE signal is output on the rising edge, delayed three dot clock cycles relative to the reference timing. 100: The CDE signal is output on the falling edge, preceding the reference timing by 1/2 dot clock cycle. 101: The CDE signal is output on the falling edge, delayed 1/2 dot clock cycle relative to the reference timing. 110: The CDE signal is output on the falling edge, delayed (1+1/2) dot clock cycles relative to the reference timing. 111: The CDE signal is output on the falling edge, delayed (2+1/2) dot clock cycles relative to the reference timing.
7	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
6 to 4	DISPA	000	R/W	DRES	DISP Output Timing Adjustment 000: Adjustment of output timing is not performed. The DISP signal is output on the rising edge of the dot clock, with the reference timing. 001: The DISP signal is output on the rising edge, delayed one dot clock cycle relative to the reference timing. 010: The DISP signal is output on the rising edge, delayed two dot clock cycles relative to the reference timing. 011: The DISP signal is output on the rising edge, delayed three dot clock cycles relative to the reference timing. 100: The DISP signal is output on the falling edge, preceding the reference timing by 1/2 dot clock cycle. 101: The DISP signal is output on the falling edge, delayed 1/2 dot clock cycle relative to the reference timing. 110: The DISP signal is output on the falling edge, delayed (1+1/2) dot clock cycles relative to the reference timing. 111: The DISP signal is output on the falling edge, delayed (2+1/2) dot clock cycles relative to the reference timing.
3	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
2 to 0	SYNCA	000	R/W	DRES	SYNC* Output Timing Adjustment 000: Adjustment of output timing is not performed. The SYNC* signal is output on the rising edge of the dot clock, with the reference timing. 001: The SYNC* signal is output on the rising edge, delayed one dot clock cycle relative to the reference timing. 010: The SYNC* signal is output on the rising edge, delayed two dot clock cycles relative to the reference timing. 011: The SYNC* signal is output on the rising edge, delayed three dot clock cycles relative to the reference timing. 100: The SYNC* signal is output on the falling edge, preceding the reference timing by 1/2 dot clock cycle. 101: The SYNC* signal is output on the falling edge, delayed 1/2 dot clock cycle relative to the reference timing. 110: The SYNC* signal is output on the falling edge, delayed (1+1/2) dot clock cycles relative to the reference timing. 111: The SYNC* signal is output on the falling edge, delayed (2+1/2) dot clock cycles relative to the reference timing. Note: * HSYNC, VSYNC, CSYNC, and ODDF signals

Note: When signals are to be output on the falling edge, the electrical characteristics do not apply.

20.3.8 Dual Display Output Control Registers

20.3.8.1 Display Unit Output Route Control Register (DORCR)

Address: DU0: H'FEB11000

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DPRS
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
30	PG1T	1	R/W	DRES	Pin Generate 1 Timing Select Selects the source of timing for pin controller 1. 0: Display-timing generator 0 1: Display-timing generator 1
29	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
28	DK1S	1	R/W	DRES	Dot Clock Select 1 0: Dot-clock generator 0 supplies the dot clock for display-timing generator 1 and pin controller 1. 1: Dot-clock generator 1 supplies the dot clock for display-timing generator 1 and pin controller 1. When the TVM1 bits in the display unit system control register 1 (DSYSR1) are set to TV synchronized mode, do not set this bit to 0.
27, 26	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
25, 24	PG1D	01	R/W	DRES	Pin Generate 1 Input Data Select Selects the source of input data for pin controller 1. 00: Data from superposition processor 0 are input to pin controller 1. For the timing of superposition processor 1, refer to section 20.4.19 (4), Combinations of Blocks for Dual Display Output. 01: Data from superposition processor 1 are input to pin controller 1. For the timing of superposition processor 1, refer to section 20.4.19 (4), Combinations of Blocks for Dual Display Output. 10: Input to pin controller 1 is fixed to 0. The value of the CDE pin is fixed to 0. 11: The value of DOOR1 is input to pin controller 1. The value of the CDE pin is fixed to 0. The combination of the DRES and DEN bits of DSYSR0 determines the data to be superposed. DRES/DEN = 00: The value of DOOR1 DRES/DEN = 01: The data in unified memory DRES/DEN = 10: 0 DRES/DEN = 11: Setting prohibited (data: 0)
23, 22	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
21	DR0D	0	R/W	DRES	Display Output Route 0 Data Select 0: Data from pin controller 0 are output from the DU0 pins. 1: On the DU0 pins, data from pin controller 0 are output on rising edges of the output dot clock and data from pin controller 1 are output on falling edges of the output dot clock. If this setting is made, the frequency of the output dot clock has to be at least half of the frequency of the input dot clock.
20 to 18	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
17, 16	PG0D	00	R/W	DRES	Pin Generate 0 Input Data Select Selects the source of input data for pin controller 0. 00: Data from superposition processor 0 are input to pin controller 0. For the timing of superposition processor 0, refer to section 20.4.19 (4), Combinations of Blocks for Dual Display Output. 01: Data from superposition processor 1 are input to pin controller 0. For the timing of superposition processor 1, refer to section 20.4.19 (4), Combinations of Blocks for Dual Display Output. 10: Input to pin controller 0 is fixed to 0. The value of the CDE pin is fixed to 0. 11: The value of DOOR0 is input to pin controller 0. The value of the CDE pin is fixed to 0. The combination of the DRES and DEN bits of DSYSR0 determines the data to be superposed. DRES/DEN = 00: The value of DOOR0 DRES/DEN = 01: The data in unified memory DRES/DEN = 10: 0 DRES/DEN = 11: Setting prohibited (data: 0)

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
15 to 1	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
0	DPRS	0	R/W	DRES	Display Priority Register Select 0: The order of priority for the planes is set in DPPR. Superposition processor 0 can be used to superpose planes 1 to 8. Superposition processor 1 is not available. 1: The order of priority for the planes is set in DS0PR or DS1PR. Superposition processors 0 and 1 can be used to superpose planes 1 to 8.

- The setting of this register is valid when the DPRS bit in the display unit output route control register (DORCR) is 1.
- After setting a desired value in a register listed in section 20.3.4, Display Plane Registers (Alpha-ratio Plane Registers), set DS0PR to the value indicating the plane number (0001 to 1000).

20.3.9 YC-RGB Conversion Coefficient Registers

Registers at addresses H'FEB11080 to H'FEB1109C is for the YC→RGB conversion circuit located in the initial stage of the superposition processor in Figure 20.1.

20.3.9.1 Y Normalization Coefficient Register (YNCR)

Address: DU0: H'FEB11080

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	YNC1											
Initial value:	—	—	—	—	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	YNC0											
Initial value:	—	—	—	—	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 28	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
27 to 16	YNC1	H'800	R/W	Available	Y Normalization Coefficient 1 This coefficient is for normalization of Y values in YC-RGB conversion by the YC-RGB conversion generation by superposition processor 1. The coefficient is a fixed-point 12-bit value. The 11th bit represents the integer one or zero and the 10th to 0th bits represent the value below the fixed point. The default value is 1.
15 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	YNC0	H'800	R/W	Available	Y Normalization Coefficient 0 This coefficient is for normalization of Y values in YC-RGB conversion by the YC-RGB conversion generation by superposition processors 0. The coefficient is a fixed-point 12-bit value. The 11th bit represents the integer one or zero and the 10th to 0th bits represent the value below the fixed point. The default value is 1.

20.3.9.2 Y Normalization Offset Register (YNOR)

Address: DU0: H'FEB11084

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	YNO1							
Initial value:	—	—	—	—	—	—	—	—	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	YNO0							
Initial value:	—	—	—	—	—	—	—	—	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
23 to 16	YNO1	H'00	R/W	Available	Y Normalization Offset 1 This offset is to be subtracted from Y values before they are normalized in YC-RGB conversion by the YC-RGB conversion generation by superposition processor 1. The offset is an unsigned 8-bit integer. Its default value is 0.
15 to 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 0	YNO0	H'00	R/W	Available	Y Normalization Offset 0 This offset is to be subtracted from Y values before they are normalized in YC-RGB conversion by the YC-RGB conversion generation by superposition processors 0. The offset is an unsigned 8-bit integer. Its default value is 0.

20.3.9.3 Cr Normalization Offset Register (CRNOR)

Address: DU0: H'FEB11088

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CRNO1							
Initial value:	—	—	—	—	—	—	—	—	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CRNO0							
Initial value:	—	—	—	—	—	—	—	—	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
23 to 16	CRNO1	H'80	R/W	Available	Cr Normalization Offset 1 This offset is to be subtracted from Cr values before they are normalized in YC-RGB conversion by the YC-RGB conversion generation by superposition processor 1. The offset is an unsigned 8-bit integer. Its default value is 128.
15 to 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 0	CRNO0	H'80	R/W	Available	Cr Normalization Offset 0 This offset is to be subtracted from Cr values before they are normalized in YC-RGB conversion by the YC-RGB conversion generation by superposition processors 0. The offset is an unsigned 8-bit integer. Its default value is 128.

20.3.9.4 Cb Normalization Offset Register (CBNOR)

Address: DU0: H'FEB1108C

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CBNO1							
Initial value:	—	—	—	—	—	—	—	—	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CBNO0							
Initial value:	—	—	—	—	—	—	—	—	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
23 to 16	CBNO1	H'80	R/W	Available	Cb Normalization Offset 1 This offset is to be subtracted from Cb values before they are normalized in YC-RGB conversion by the YC-RGB conversion generation by superposition processor 1. The offset is an unsigned 8-bit integer. Its default value is 128.
15 to 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 0	CBNO0	H'80	R/W	Available	Cb Normalization Offset 0 This offset is to be subtracted from Cb values before they are normalized in YC-RGB conversion by the YC-RGB conversion generation by superposition processors 0. The offset is an unsigned 8-bit integer. Its default value is 128.

20.3.9.5 Red Cr Coefficient Register (RCRCR)

Address: DU0: H'FEB11090

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	RCRC1											
Initial value:	—	—	—	—	1	0	1	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	RCRC0											
Initial value:	—	—	—	—	1	0	1	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 28	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
27 to 16	RCRC1	H'AF0	R/W	Available	Red Cr Coefficient 1 Cr is multiplied by this coefficient to create the red component in YC-RGB conversion by the YC-RGB conversion generation by superposition processor 1. The coefficient is a fixed-point 12-bit value. The 11th bit represents the integer one or zero and the 10th to 0th bits represent the value below the fixed point. The default value is 1.37.
15 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	RCRC0	H'AF0	R/W	Available	Red Cr Coefficient 0 Cr is multiplied by this coefficient to create the red component in YC-RGB conversion by the YC-RGB conversion generation by superposition processors 0. The coefficient is a fixed-point 12-bit value. The 11th bit represents the integer one or zero and the 10th to 0th bits represent the value below the fixed point. The default value is 1.37.

20.3.9.6 Green Cr Coefficient Register (GCRCR)

Address: DU0: H'FEB11094

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	GCRC1											
Initial value:	—	—	—	—	0	1	0	1	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	GCRC0											
Initial value:	—	—	—	—	0	1	0	1	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 28	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
27 to 16	GCRC1	H'590	R/W	Available	Green Cr Coefficient 1 Cr is multiplied by this coefficient to create the green component in YC-RGB conversion by the YC-RGB conversion generation by superposition processor 1. The coefficient is a fixed-point 12-bit value. The 11th bit represents the integer one or zero and the 10th to 0th bits represent the value below the fixed point. The default value is 0.698.
15 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	GCRC0	H'590	R/W	Available	Green Cr Coefficient 0 Cr is multiplied by this coefficient to create the green component in YC-RGB conversion by the YC-RGB conversion generation by superposition processors 0. The coefficient is a fixed-point 12-bit value. The 11th bit represents the integer one or zero and the 10th to 0th bits represent the value below the fixed point. The default value is 0.698.

20.3.9.7 Green Cb Coefficient Register (GCBCR)

Address: DU0: H'FEB11098

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	GCBC1

R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	GCBC0											
Initial value:	—	—	—	—	0	0	1	0	1	0	1	1	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 28	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
27 to 16	GCBC1	H'2B0	R/W	Available	Green Cb Coefficient 1 Cb is multiplied by this coefficient to create the green component in YC-RGB conversion by the YC-RGB conversion generation by superposition processor 1. The coefficient is a fixed-point 12-bit value. The 11th bit represents the integer one or zero and the 10th to 0th bits represent the value below the fixed point. The default value is 0.336.
15 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	GCBC0	H'2B0	R/W	Available	Green Cb Coefficient 0 Cb is multiplied by this coefficient to create the green component in YC-RGB conversion by the YC-RGB conversion generation by superposition processors 0. The coefficient is a fixed-point 12-bit value. The 11th bit represents the integer one or zero and the 10th to 0th bits represent the value below the fixed point. The default value is 0.336.

20.3.9.8 Blue Cb Coefficient Register (BCBCR)

Address: DU0: H'FEB1109C

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	BCBC1											
Initial value:	—	—	—	—	1	1	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	BCBC0											
Initial value:	—	—	—	—	1	1	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 28	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
27 to 16	BCBC1	H'DE0	R/W	Available	Blue Cb Coefficient 1 Cb is multiplied by this coefficient to create the blue component in YC-RGB conversion by the YC-RGB conversion generation by superposition processor 1. The coefficient is a fixed-point 12-bit value. The 11th bit represents the integer one or zero and the 10th to 0th bits represent the value below the fixed point. The default value is 1.73.
15 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	BCBC0	H'DE0	R/W	Available	Blue Cb Coefficient 0 Cb is multiplied by this coefficient to create the blue component in YC-RGB conversion by the YC-RGB conversion generation by superposition processors 0. The coefficient is a fixed-point 12-bit value. The 11th bit represents the integer one or zero and the 10th to 0th bits represent the value below the fixed point. The default value is 1.73.

20.3.10 RGB-YC Conversion Coefficient Registers

20.3.10.1 Y Calculation R Coefficient Register (YCLRP)

Address: DU0: H'FEB14000

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	YCLRP1												
Initial value:	—	—	—	0	0	0	1	0	0	1	1	0	0	1	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	YCLRP0												
Initial value:	—	—	—	0	0	0	1	0	0	1	1	0	0	1	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 29	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
28 to 16	YCLRP1	H'0264	R/W	Available	Y Calculation R Coefficient 1 This coefficient is for R to generate the Y values in RGB-YC conversion by the RGB-YC conversion circuit by superposition processor 1. The default value is H'264. The coefficient is a 13-bit value of 1 sign bit + 12 fixed-point bits. The 12th bit represents the sign, the 11th bit represents the integer, and the 10th to 0th bits represent the value below the fixed point. 12th sign bit 0: + 1: - 11th to 0th bits A fixed-point absolute value should be set.
15 to 13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12 to 0	YCLRP0	H'0264	R/W	Available	Y Calculation R Coefficient 0 This coefficient is for R to generate the Y values in RGB-YC conversion by the RGB-YC conversion circuit by superposition processor 0. The default value is H'264. The coefficient is a 13-bit value of 1 sign bit + 12 fixed-point bits. The 12th bit represents the sign, the 11th bit represents the integer, and the 10th to 0th bits represent the value below the fixed point. 12th sign bit 0: + 1: - 11th to 0th bits A fixed-point absolute value should be set.

20.3.10.2 Y Calculation G Coefficient Register (YCLGP)

Address: DU0: H'FEB14004

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	YCLGP1												
Initial value:	—	—	—	0	0	1	0	0	1	0	1	1	0	0	1	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	YCLGP0												
Initial value:	—	—	—	0	0	1	0	0	1	0	1	1	0	0	1	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 29	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
28 to 16	YCLGP1	H'04B2	R/W	Available	Y Calculation G Coefficient 1 This coefficient is for G to generate the Y values in RGB-YC conversion by the RGB-YC conversion circuit by superposition processor 1. The default value is H'4B2. The coefficient is a 13-bit value of 1 sign bit + 12 fixed-point bits. The 12th bit represents the sign, the 11th bit represents the integer, and the 10th to 0th bits represent the value below the fixed point. 12th sign bit 0: + 1: - 11th to 0th bits A fixed-point absolute value should be set.
15 to 13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12 to 0	YCLGP0	H'04B2	R/W	Available	Y Calculation G Coefficient 0 This coefficient is for G to generate the Y values in RGB-YC conversion by the RGB-YC conversion circuit by superposition processor 0. The default value is H'4B2. The coefficient is a 13-bit value of 1 sign bit + 12 fixed-point bits. The 12th bit represents the sign, the 11th bit represents the integer, and the 10th to 0th bits represent the value below the fixed point. 12th sign bit 0: + 1: - 11th to 0th bits A fixed-point absolute value should be set.

20.3.10.3 Y Calculation B Coefficient Register (YCLBP)

Address: DU0: H'FEB14008

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	YCLBP1												
Initial value:	—	—	—	0	0	0	0	0	1	1	1	0	1	0	0	1
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	YCLBP0												
Initial value:	—	—	—	0	0	0	0	0	1	1	1	0	1	0	0	1
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 29	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
28 to 16	YCLBP1	H'00E9	R/W	Available	Y Calculation B Coefficient 1 This coefficient is for B to generate the Y values in RGB-YC conversion by the RGB-YC conversion circuit by superposition processor 1. The default value is H'E9. The coefficient is a 13-bit value of 1 sign bit + 12 fixed-point bits. The 12th bit represents the sign, the 11th bit represents the integer, and the 10th to 0th bits represent the value below the fixed point. 12th sign bit 0: + 1: - 11th to 0th bits A fixed-point absolute value should be set.
15 to 13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12 to 0	YCLBP0	H'00E9	R/W	Available	Y Calculation B Coefficient 0 This coefficient is for B to generate the Y values in RGB-YC conversion by the RGB-YC conversion circuit by superposition processor 0. The default value is H'E9. The coefficient is a 13-bit value of 1 sign bit + 12 fixed-point bits. The 12th bit represents the sign, the 11th bit represents the integer, and the 10th to 0th bits represent the value below the fixed point. 12th sign bit 0: + 1: - 11th to 0th bits A fixed-point absolute value should be set.

20.3.10.4 Y Calculation Addition Constant Register (YCLAP)

Address: DU0: H'FEB1400C

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	YCLAP1							
Initial value:	—	—	—	—	—	—	—	—	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	YCLAP0							
Initial value:	—	—	—	—	—	—	—	—	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
23 to 16	YCLAP1	H'10	R/W	Available	Y Calculation Addition Constant 1 This addition constant is used to generate the Y values in RGB-YC conversion by the RGB-YC conversion circuit by superposition processor 1. This addition constant is an unsigned 8-bit integer. The default value is H'10.
15 to 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 0	YCLAP0	H'10	R/W	Available	Y Calculation Addition Constant 0 This addition constant is used to generate the Y values in RGB-YC conversion by the RGB-YC conversion circuit by superposition processor 0. This addition constant is an unsigned 8-bit integer. The default value is H'10.

20.3.10.5 Cb Calculation R Coefficient Register (CBCLRP)

Address: DU0: H'FEB14010

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	CBCLRP1												
Initial value:	—	—	—	1	0	0	0	1	0	1	0	1	1	0	1	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 29	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
28 to 16	CBCLRP1	H'115A	R/W	Available	Cb Calculation R Coefficient 1 This coefficient is for R to generate the Cb values in RGB-YC conversion by the RGB-YC conversion circuit by superposition processor 1. The default value is H'115A. The coefficient is a 13-bit value of 1 sign bit + 12 fixed-point bits. The 12th bit represents the sign, the 11th bit represents the integer, and the 10th to 0th bits represent the value below the fixed point. 12th sign bit 0: + 1: - 11th to 0th bits A fixed-point absolute value should be set.
15 to 13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12 to 0	CBCLRP0	H'115A	R/W	Available	Cb Calculation R Coefficient 0 This coefficient is for R to generate the Cb values in RGB-YC conversion by the RGB-YC conversion circuit by superposition processor 0. The default value is H'115A. The coefficient is a 13-bit value of 1 sign bit + 12 fixed-point bits. The 12th bit represents the sign, the 11th bit represents the integer, and the 10th to 0th bits represent the value below the fixed point. 12th sign bit 0: + 1: - 11th to 0th bits A fixed-point absolute value should be set.

20.3.10.6 Cb Calculation G Coefficient Register (CBCLGP)

Address: DU0: H'FEB14014

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	CBCLGP1

23 to 16	CRCLAP	H'80	R/W	Available	Cr Calculation Addition Constant 1 This addition constant is used to generate the Cr values in RGB-YC conversion by the RGB-YC conversion circuit by superposition processor 1. This addition constant is an unsigned 8-bit integer. The default value is H'80.
15 to 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 0	CRCLAP0	H'80	R/W	Available	Cr Calculation Addition Constant 0 This addition constant is used to generate the Cr values in RGB-YC conversion by the RGB-YC conversion circuit by superposition processor 0. This addition constant is an unsigned 8-bit integer. The default value is H'80.

20.4 Display Function

Note: From section 20.4 on, descriptions of suffixes n and m are provided as the last paragraph or a note for the last table in each subsection.

20.4.1 Configuration of Output Screen

The display unit (DU) executes window displays with up to a maximum of eight window layers. Each of these windows is called a "plane", and the order of stacking of the planes can be set arbitrarily. For each plane, display can be turned on and off, and the display data format (8-bit/pixel, 16-bit/pixel, 32-bit/pixel, ARGB, YC), blending functions, and other settings can be changed independently. In addition to the window display plane, a plane that is dedicated to the α value can be synthesized (a maximum of one layer).

Each plane has a double-buffer configuration (triple buffer only for a video capture plane), so that smooth display is possible.

Note: In cases of high-resolution display, the unified memory traffic volume may be considerable depending on the number of combined planes and display size, and constraints may arise owing to the traffic volume; but there are no constraints on display functions.

Table 20.26 Display Functions of Planes

		Display Data Format										
	Display On/Off	**8-bit/ pixel**	**16-bit/ pixel**	**ARGB**	**YC**	**32-bit/ pixel**	**Super-positioning**	**Blinking**	**Size**	**Scroll-ing**	**Wrap-around**	**α-Ratio Plane**
Plane 1	✓	✓*1	✓	✓	✓*2	✓*5	α blending/ transparent color*5/ EOR operation	✓	X, Y (as desired)	✓	✓	✓
Plane 2	✓	✓*1	✓	✓	✓*2	✓*5	Same as above	✓	Same as above	✓	✓	✓
Plane 3	✓	✓*1	✓	✓	✓*2	✓*5	Same as above	✓	Same as above	✓	✓	✓
Plane 4	✓	✓*1	✓	✓	✓*2	✓*5	Same as above	✓	Same as above	✓	✓	✓
Plane 5	✓	✓*1	✓	✓	✓	✓*5	Same as above	✓	Same as above	✓	✓	✓
Plane 6	✓	✓*1	✓	✓	✓	✓*5	Same as above	✓	Same as above	✓	✓	✓
Plane 7	✓	✓*1	✓	✓	✓	✓*5	Same as above	✓	Same as above	✓	✓	✓
Plane 8	✓	✓*1	✓	✓	✓	✓*5	Same as above	✓	Same as above	✓	✓	✓
α plane 1	✓	✓	—	—	—	—	—	✓	Same as above	✓	✓	✓
α plane 2	✓	✓	—	—	—	—	—	✓	Same as above	✓	✓	✓
Back-ground color*3	—	—	—	—	—	—	—	—	—	—	—	—

Notes: 1. Any among color palettes 1, 2, 3, and 4 is selected.
2. YC → RGB conversion can be performed only for the YUV data of the uppermost plane.
3. The data format for background color is RGB666.

4. A 32-bit/pixel display specified with the PnLRGB1 or PnLRGB0 bit in the plane n display data control register (PnDDCR) involves the use of two planes. For example, planes 1 and 2 are combined to display 32-bit/pixel. When the PnEDF bits in plane n display data control 4 register (PnDDC4R) are used to specify a 32-bit/pixel display, only one plane is used.
5. Transparent color processing is not possible for a 32-bit/pixel display specified with the PnLRGB1 or PnLRGB0 bit in PnDDCR. Transparent color processing is possible when the PnEDF bits in PnDDC4R are used to specify a 32-bit/pixel display.
6. n = 1 to 8

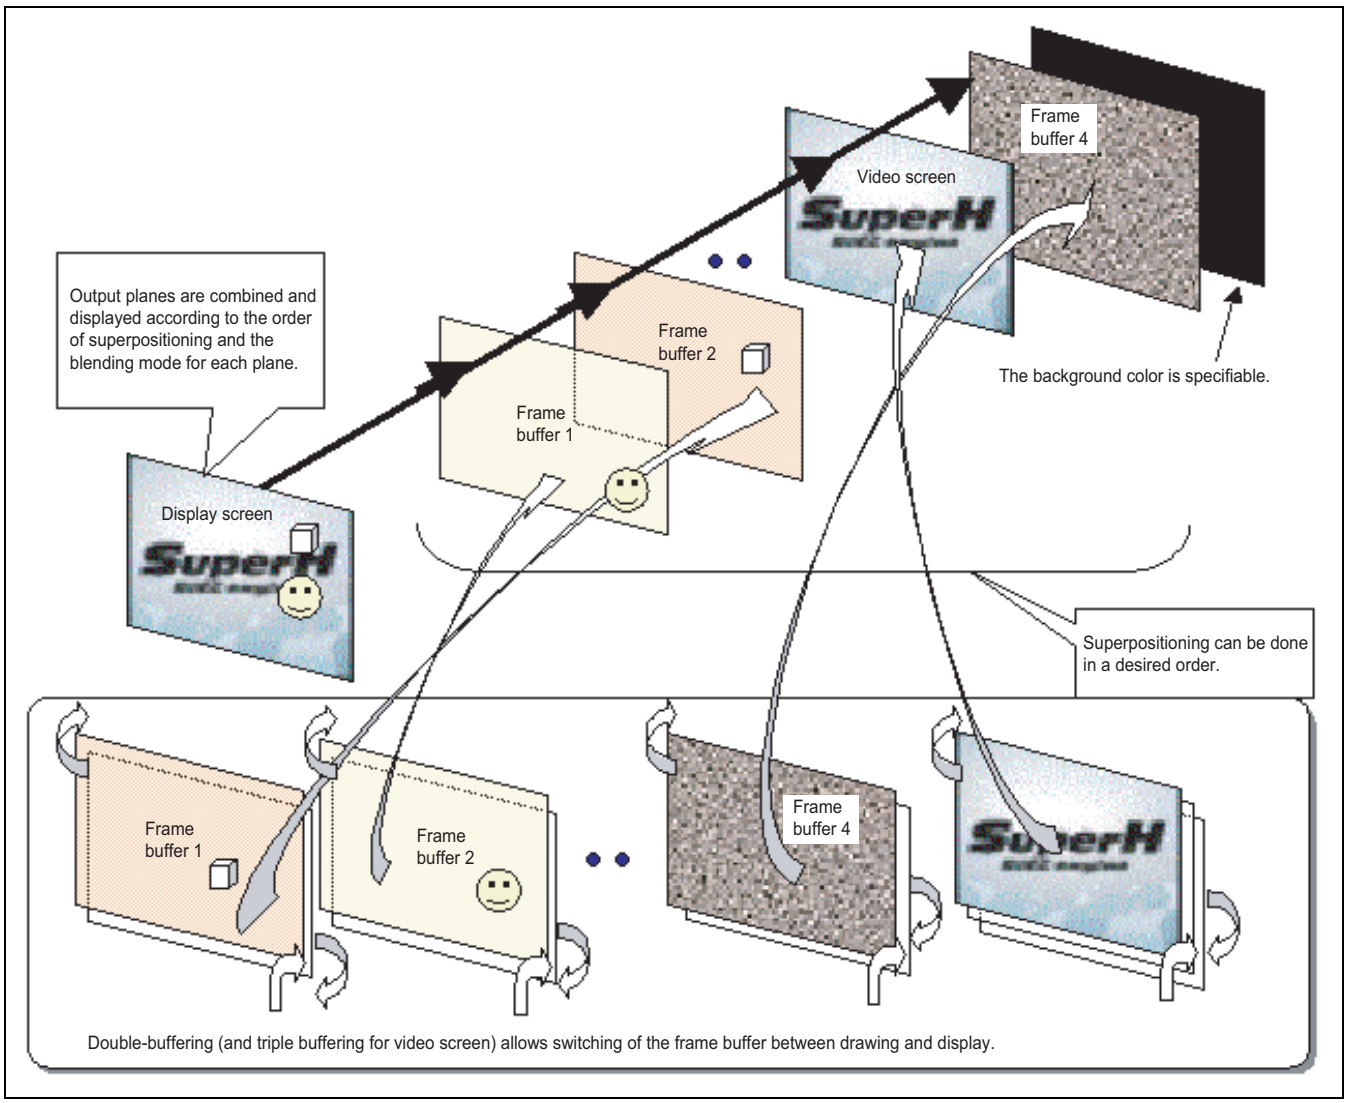

Figure 20.2 Block Diagram of Plane Configuration and Superpositioning

20.4.2 Display On/Off

All plane display can be turned on and off using the DEN bit in DSYSR0. When the DEN bit is 0, the display data set in DOORn*1 is displayed.

When the value of the DPRS bit in DORCR is 0, DPPR is used to turn the display of planes 1 to 8 on and off. When the value of the DPRS bit in DORCR is 1, on the other hand, DS0PR and DS1PR are used to turn the display of planes 1 to 8 on and off. Under the following display conditions, display data set in BPORn*1 is displayed.

1. When display of all planes 1 to 8 is turned off
2. In an area with no plane for display, due to the display size and display position
3. When the pixels in a plane for display are all a transparent color

Table 20.27 Turning On and Off the Display of Planes 1 to 8 (when the DPRS Bit of DORCR is 0)

Display Plane	Display Plane Priority Register (DPPR)
Plane 1	Plane 1 is selected in one among priority positions 1 to 8, and the corresponding enable bit is set to 1
Plane 2	Plane 2 is selected in one among priority positions 1 to 8, and the corresponding enable bit is set to 1
Plane 3	Plane 3 is selected in one among priority positions 1 to 8, and the corresponding enable bit is set to 1
Plane 4	Plane 4 is selected in one among priority positions 1 to 8, and the corresponding enable bit is set to 1
Plane 5	Plane 5 is selected in one among priority positions 1 to 8, and the corresponding enable bit is set to 1
Plane 6	Plane 6 is selected in one among priority positions 1 to 8, and the corresponding enable bit is set to 1
Plane 7	Plane 7 is selected in one among priority positions 1 to 8, and the corresponding enable bit is set to 1
Plane 8	Plane 8 is selected in one among priority positions 1 to 8, and the corresponding enable bit is set to 1

Table 20.28 Turning On and Off the Display of Planes 1 to 8 (when the DPRS Bit of DORCR is 1)

Display Plane	Display Superimpose 0 Priority Register (DS0PR) Display Superimpose 1 Priority Register (DS1PR)
Plane 1	Plane 1 is selected in one among priority positions 1 to 8 (setting to select the plane: 0001)
Plane 2	Plane 2 is selected in one among priority positions 1 to 8 (setting to select the plane: 0010)
Plane 3	Plane 3 is selected in one among priority positions 1 to 8 (setting to select the plane: 0011)
Plane 4	Plane 4 is selected in one among priority positions 1 to 8 (setting to select the plane: 0100)
Plane 5	Plane 5 is selected in one among priority positions 1 to 8 (setting to select the plane: 0101)
Plane 6	Plane 6 is selected in one among priority positions 1 to 8 (setting to select the plane: 0110)
Plane 7	Plane 7 is selected in one among priority positions 1 to 8 (setting to select the plane: 0111)
Plane 8	Plane 8 is selected in one among priority positions 1 to 8 (setting to select the plane: 1000)

Note: Even if display on is set using DPPR, DS0PR, or DS1PR under the following conditions, the setting is handled as display off, and the corresponding plane is not displayed.

- Planes for which the value set in PnDPXR*2 is greater than the screen size (horizontal display end (HDE) - horizontal display start (HDS))
- Planes for which the value set in PnDPYR*2 is greater than the screen size (vertical display end (VDE) - vertical display start (VDS))
- Planes for which the value set in PnDSXR*2 is 0
- Planes for which the value set in PnDSYR*2 is 0
- Planes for which the value set in PnMWR*2 is 0
- Planes for which the value set in PnSPXR*2 is equal to or greater than twice the value set in PnMWR*2

1. n = 0 and 1
2. n = 1 to 8

20.4.3 Plane Parameter

For each plane, a display area start position, memory width, display start position, and display size are set using registers.

The followings are the schematic diagram of start positions and sizes related to planes and the registers used for setting start positions and sizes.

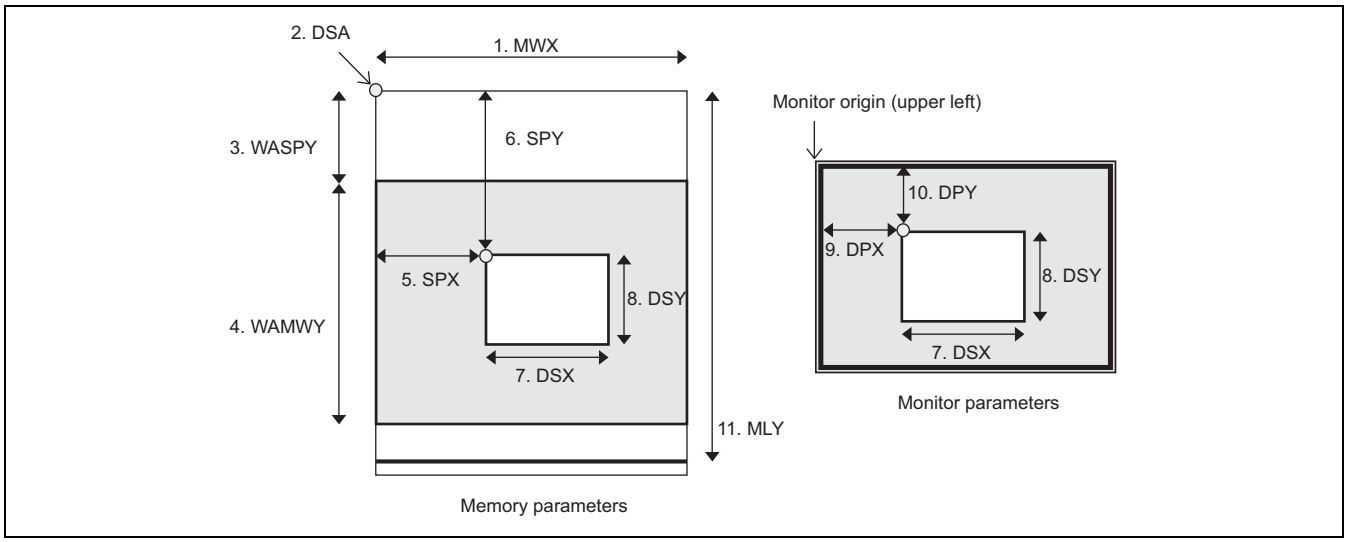

Figure 20.3 Parameters

Table 20.29 Memory Parameter/Monitor Parameter Setting Registers

No.	Name Used in the Figure	Register	Description
1	MWX (Plane memory width)	PnMWR	The plane X-direction memory width is set between 16 and 4096 pixels, in 16 pixel units.
2	DSA (Display area start address)	PnDSA0R to PnDSA2R	The start address in memory area is set for plane.
3	WASPY (Wrap-around start position)	PnWASPR	The Y direction start position of the wrap-around area is set in line units, with the address set by DSA as reference.
4	WAMWY (Wrap-around memory width)	PnWAMWR	The wrap-around Y-direction memory width is set to a desired value in the range from 240 to 4095 (representing line units).
5	SPX (Start position X)	PnSPXR	The distance in the X direction to the display start position is set in pixel units, taking the address set by DSA as the origin.
6	SPY (Start position Y)	PnSPYR	The distance in the Y direction to the display start position is set in raster line units, taking the address set by DSA as the origin.
7	DSX (Display size X)	PnDSXR	The X-direction display size of plane is set in dot-clock units.
8	DSY (Display size Y)	PnDSYR	The Y-direction display size of plane is set in raster line units.
9	DPX (Display position X)	PnDPXR	The X-direction distance to the display position is set in dot-clock units, taking the upper-left corner of the monitor as the origin.
10	DPY (Display position Y)	PnDPYR	The Y-direction distance to the display position is set in raster line units, taking the upper-left corner of the monitor as the origin.
11	MLY (Memory length Y)	PnMLR	The Y-direction memory area of plane is set in line units.

Note: n = 1 to 8

20.4.4 Memory Allocation

A display start address for the display screen, drawing screen 1, and drawing screen 2 used for video display can be set individually for each plane. The start addresses for the memory areas used are set in each of the display area start address registers.

In the display unit (DU), when the display plane is video captured, the display area start addresses 0, 1, and 2 for each plane are used to perform triple-buffering control and display the plane. When the display plane is not video captured, the display area start addresses 0 and 1 for each plane are used to perform double-buffering control and display the plane.

The double-buffering control can be performed for alpha-ratio planes. In display capture, only a single area can be set to store the data.

Below is a list of display area start address registers used for each of the planes.

Table 20.30 Memory Allocation Registers

Display Screen	Register Name	
Plane n	Plane n display area start address 0 register	PnDSA0R
	Plane n display area start address 1 register	PnDSA1R
	Plane n display area start address 2 register	PnDSA2R
α plane m	Alpha-ratio plane m display area start address 0 register	APmDSA0R
	Alpha-ratio plane m display area start address 1 register	APmDSA1R
Display capture	Display capture area start address register	DCSAR
Display capture 2	Display capture 2 area start address register	DC2SAR

Notes: n = 1 to 8
m = 1 and 2

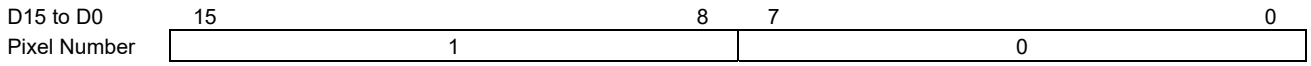
20.4.5 Display Data Format

The following format is used for color data used in display. A data configuration is shown in which data is allocated to the unified memory in little endian.

(1) 8-bit/pixel

A color palette index is used. The color palette is used to convert and display image data into RGB data with 6 bits for each RGB color (RGB666).

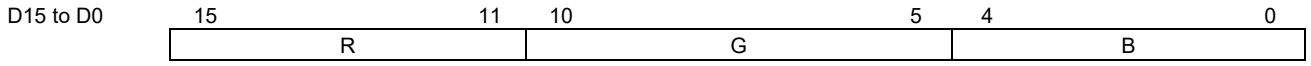
8-bit/pixel data (index color)



(2) 16-bit/pixel: RGB

The RGB levels are represented using 5 bits for R, 6 bits for G, and 5 bits for B (RGB565).

16-bit/pixel data (RGB data) format

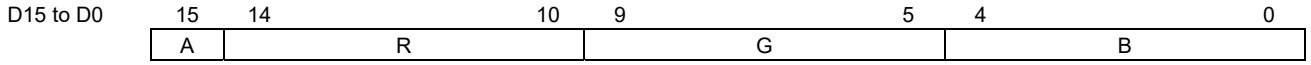


(3) 16-bit/pixel: ARGB

Levels for A, R, G, and B are represented by 1, 5, 5, and 5 bits respectively (ARGB1555). In addition to the R, G, and B values, this format includes a bit that represents α blending control. In this section, "ARGB" indicates ARGB1555 and "ARGB8888" indicates the 32-bit/pixel format unless otherwise specified.

α blending control using the A value is valid when the PnSPIM* bit in PnMR* is set to perform α blending. When the PnABIT* bits of PnALPHAR* are B'00, α blending is performed when A = 1. When the PnABIT* bits are B'01, α blending is performed when A = 0. When the PnABIT* bits are B'10 or B'11, α blending is performed regardless of the A value. When the PnSPIM* bit is not set to perform α blending, α blending is not performed regardless of the A value.

16-bit/pixel data (ARGB data) format



(4) YC: YUV422

Image data has the format YC (YCbCr) = 4:2:2. A calculation circuit is used to convert each of the 8 bits of the RGB colors (RGB888) of image data. Transparent color processing is not possible.

The YC data order corresponds to the UYVY format and YUYV format. The UYVY format and YUYV format can be selected using the PnYCDF* bits in PnMR*.

The formulae for YC-RGB conversion are given below. The underlined coefficients are defined by the settings in the corresponding registers.

$$R = YNC \times (Y - YNO) + RCRC \times (Cr - CRNO)$$
$$G = YNC \times (Y - YNO) - GCRCR \times (Cr - CRNO) - GCBC \times (Cb - CBNO)$$
$$B = YNC \times (Y - YNO) + BCBC \times (Cb - CBNO)$$

The formulae for YC-RGB conversion in the default state are thus as follows.

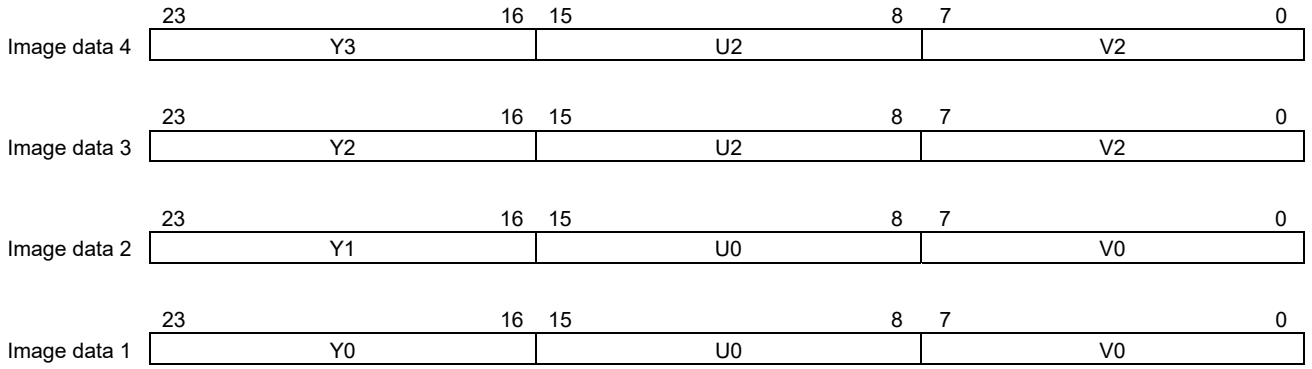
$$R = Y + 1.37 \times (Cr - 128)$$

$$G = Y - 0.698 \times (Cr - 128) - 0.336 \times (Cb - 128)$$
$$B = Y + 1.73 \times (Cb - 128)$$

(a) UYVY format

(b) YUYV format

(c) RGB color-space conversion format



(5) YC: YUV420

Image data has the format YC (YCbCr) = 4:2:0. A calculation circuit is used to convert each of the 8 bits of the RGB colors (RGB888) of image data. Transparent color processing is not possible.

The UV data order corresponds to the NV12 format and NV21 format. The NV12 format and NV21 format can be selected using the PnNV21* bit in PnDDC2R*.

The formulae for YC-RGB conversion are the same as those for YC:YUV422.

(a) Y data

	63	56	55	48
D63 to D48 Image data 8 and 7	Y7		Y6	

	47	40	39	32
D47 to D32 Image data 6 and 5	Y5		Y4	

	31	24	23	16
D31 to D16 Image data 4 and 3	Y3		Y2	

	15	8	7	0
D15 to D0 Image data 2 and 1	Y1		Y0	

(b) UV data (NV12)

	63	56	55	48
D63 to D48 Image data 8 and 7	V6		U6	

	47	40	39	32
D47 to D32 Image data 6 and 5	V4		U4	

	31	24	23	16
D31 to D16 Image data 4 and 3	V2		U2	

	15	8	7	0
D15 to D0 Image data 2 and 1	V0		U0	

(c) UV data (NV21)

	63	56	55	48
D63 to D48 Image data 8 and 7	U6		V6	

	47	40	39	32
D47 to D32 Image data 6 and 5	U4		V4	

	31	24	23	16
D31 to D16 Image data 4 and 3	U2		V2	

	15	8	7	0
D15 to D0 Image data 2 and 1	U0		V0	

(d) RGB color-space conversion format

	23	16	15	8	7	0
Image data 4 (Line 0)	Y3 (Line 0)		U2 (Line 0)		V2 (Line 0)	
Image data 3 (Line 0)	Y2 (Line 0)		U2 (Line 0)		V2 (Line 0)	
Image data 2 (Line 0)	Y1 (Line 0)		U0 (Line 0)		V0 (Line 0)	
Image data 1 (Line 0)	Y0 (Line 0)		U0 (Line 0)		V0 (Line 0)	
Image data 4 (Line 1)	Y3 (Line 1)		U2 (Line 0)		V2 (Line 0)	
Image data 3 (Line 1)	Y2 (Line 1)		U2 (Line 0)		V2 (Line 0)	
Image data 2 (Line 1)	Y1 (Line 1)		U0 (Line 0)		V0 (Line 0)	
Image data 1 (Line 1)	Y0 (Line 1)		U0 (Line 0)		V0 (Line 0)	

(6) 32-bit/pixel: ARGB8888

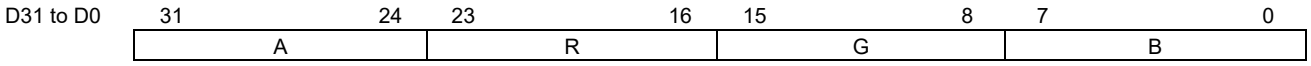
Levels for A, R, G, and B are represented by 8 bits each (ARGB8888). Note that the format includes a setting for alpha ratio in addition to the R, G, and B values. In this section, "32-bit/pixel" refers to the ARGB8888 format unless otherwise specified.

α blending control using the A value is valid when the PnSPIM* bit in PnMR* is set so that α blending is performed. This means that the blending ratio selected in the plane n blending ratio register (PnALPHAR*) is invalid.

A 32-bit/pixel (ARGB8888) display should be specified with the PnLRGB1* or PnLRGB0* bit in the plane n display data control register (PnDDCR*) or the PnEDF* bits in plane n display data control 4 register (PnDDC4R*). When using the PnLRGB1* or PnLRGB0* bit in PnDDCR*, the following restrictions apply.

- Two planes, plane 1 and plane 2, need to be used.
- Transparent color processing is not possible.
- α blending or EOR operations must be performed in an area where a lower plane exists. If the setting of the PnSPIM* bits allows α blending or an EOR operation but there is no lower plane, display of 32-bit/pixel data will not be possible without superposition.

32-bit/pixel data (ARGB8888 data) format

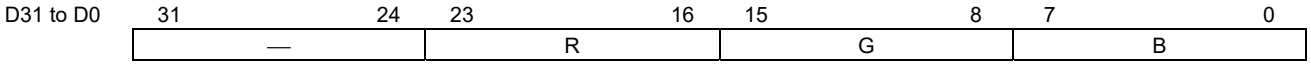


(7) 32-bit/pixel: RGB888

Levels for R, G, and B are represented by 8 bits each (RGB888). "—" indicates any desired value.

A 32-bit/pixel (RGB888) display should be specified with the PnEDF* bits in plane n display data control 4 register (PnDDC4R*).

32-bit/pixel data (RGB888 data) format

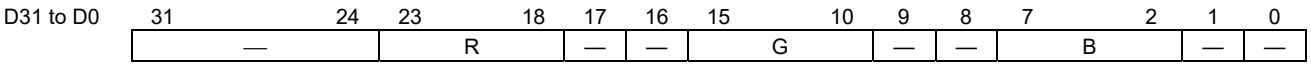


(8) 32-bit/pixel: RGB666

Levels for R, G, and B are represented by 6 bits each (RGB666). "—" indicates any desired value.

A 32-bit/pixel (RGB666) display should be specified with the PnEDF* bits in plane n display data control 4 register (PnDDC4R*).

32-bit/pixel data (RGB666 data) format



Note: * n = 1 to 8

20.4.6 Data Formats for Output and Display Capture

In the case of digital RGB output from a display unit (DU), superpositioning in the form of α blending and EOR operations is performed after the display data format has been expanded into the RGB888 format, and then the data are output. In data capture, display data are captured and stored as RGB888 or the five higher-order bits from both the red pins and blue pins and six bits from the green pins. The supplementary formats and data formats in the case of expansion to RGB888 are as indicated in the following table.

Table 20.31 Output Data Format

		Red								Green								Blue							
		7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
Expanded data	8-bit/pixel (after conversion from a color palette)	R (6 bits)						0	0	G (6 bits)						0	0	B (6 bits)						0	0
	16-bit/pixel	R (5 bits)					0	0	0	G (6 bits)					0	0	0	B (5 bits)					0	0	0
	ARGB	R (5 bits)					0	0	0	G (5 bits)					0	0	0	B (5 bits)					0	0	0
	YC after RGB conversion	R (8 bits)								G (8 bits)								B (8 bits)							
	32-bit/pixel (ARGB8888)	R (8 bits)								G (8 bits)								B (8 bits)							
	32-bit/pixel (RGB888)	R (8 bits)								G (8 bits)								B (8 bits)							
	32-bit/pixel (RGB666)	R (6 bits)						0	0	G (6 bits)						0	0	B (6 bits)						0	0
After superpositioning		R (8 bits)								G (8 bits)								B (8 bits)							
DU0 display data		R (8 bits)								G (8 bits)								B (8 bits)							
DU1 display data		R (8 bits)								G (8 bits)								B (8 bits)							

20.4.7 Endian Conversion

The display unit (DU) can perform big-endian/little-endian conversion according to the setting of bit 20 in DSYSRn*1. If image data are in 32-bit/pixel format, big-endian/little-endian conversion for the data involves the use of the plane n swap control register (PnSWAPR*2). Then set bit 20 in DSYSRn*1 to 0.

The internal data format in the display unit (DU) is fixed to little-endian; by setting bit 20 in DSYSRn*1 to 1, image data arranged in big-endian format in memory are converted into little-endian format and read.

The unit for endian conversion (byte/word) is determined by the setting of the PnDDF*2 bits in PnMR*2.

Table 20.32 Endian Conversion

PnMR/PnDDF*2	Data Format	Units for Endian Conversion
B'00	8-bit/pixel	Byte
B'01	16-bit/pixel	Word
B'10	ARGB	Word
B'11	YC	Byte

Endian conversion in each of the units indicated below is shown in Figure 20.4.

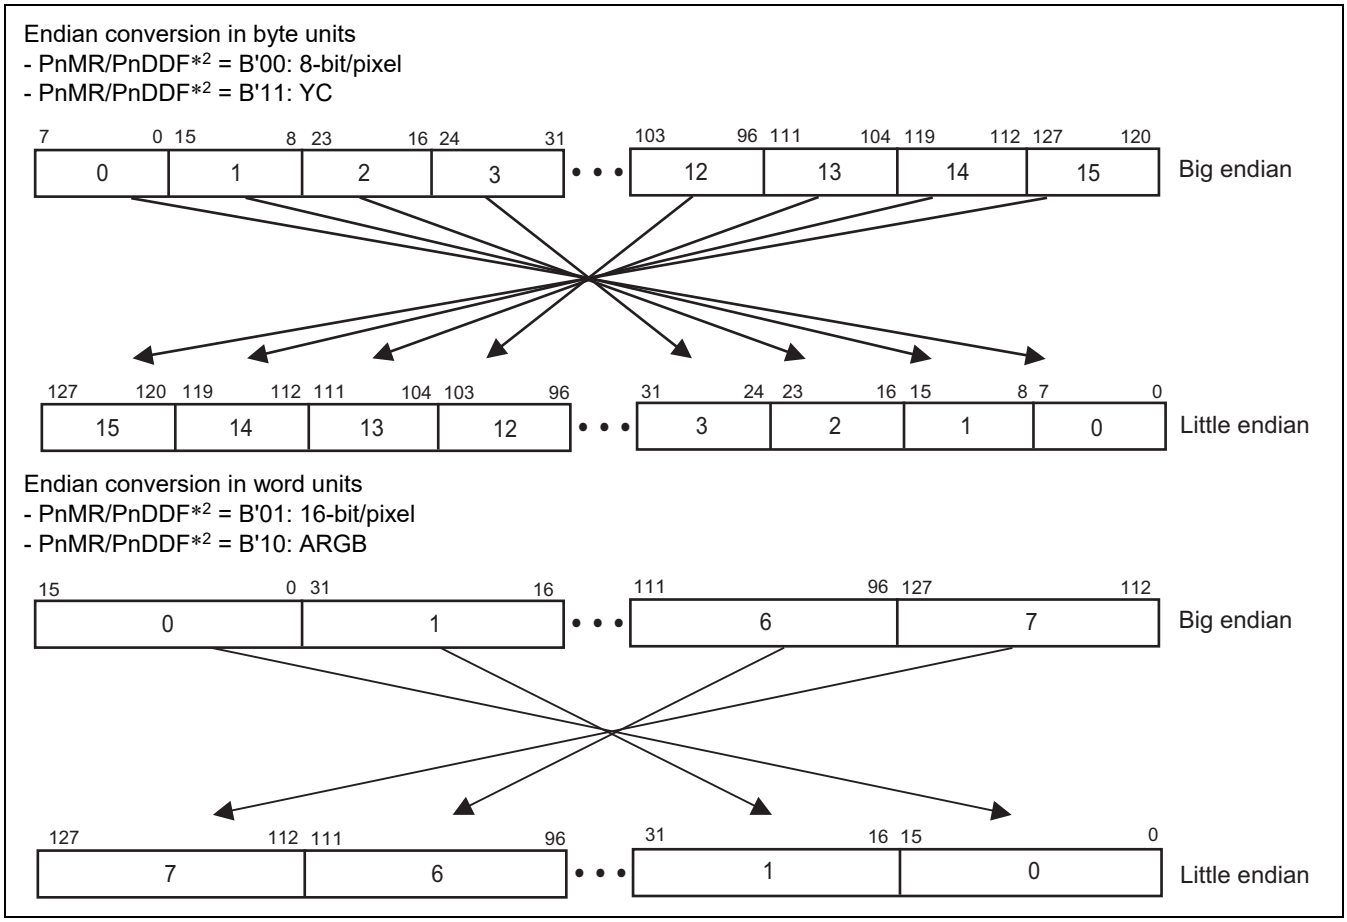


Figure 20.4 Endian Conversion

Since bits 3 and 2 in the plane n swap control register (PnSWAPR*2) are set to 1 and bits 1 and 0 in PnSWAPR*2 are set to 0 in the 32-bit/pixel case, the endian must be converted as shown in the figure below. Bit 4 in PnSWAPR*2 may be set to either 1 or 0. At this time, set bit 20 in the display unit system control register n (DSYSRn*1) to 0.

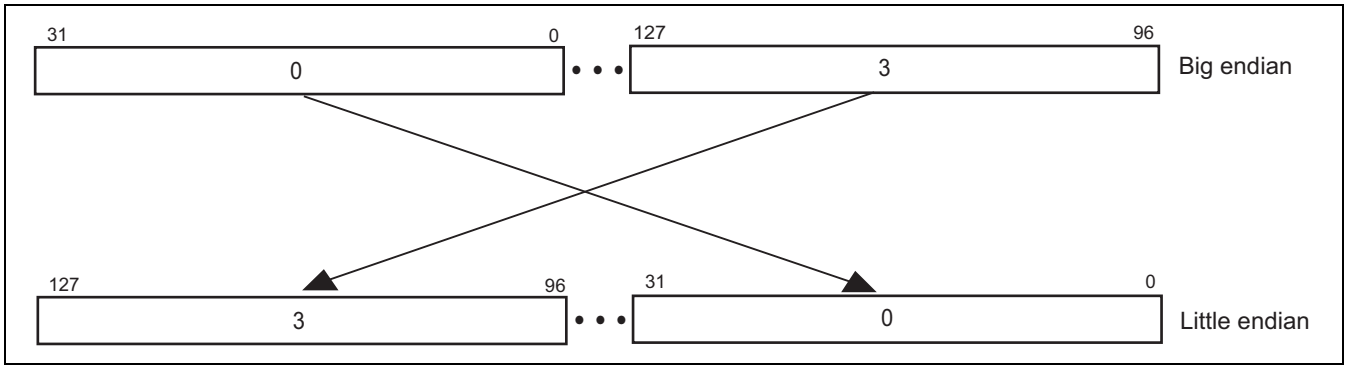

Figure 20.5 Endian Conversion for 32-bit/pixel

Notes: 1. n = 0 and 1
2. n = 1 to 8

20.4.8 Color Palette

8-bit/pixel data employs color palettes. The DU has four color palettes which are only accessible to superposition processors 0.

The color palette for use in plane n is determined by the setting of the PnCPSL* bits in PnMR*. Each of the color palettes consists of two alternate buffers; one serves as a display buffer, and the other is for CPU access. After setting each color palette, by setting the color palette switching enable bit CP4CE, CP3CE, CP2CE, or CP1CE in CPCR to 1, the color palette thus set becomes valid at the next VSYNC falling edge (internal update timing), or upon display reset (when the DRES bit in DSYSR0 is changed from 1 to 0).

(1) Notes on Use of Color Palettes

1. Because palettes consist of alternate buffers, complete overwriting is necessary upon a color palette update. However, when the details of color palette updates are being managed, there is no problem with overwriting only the relevant part.
2. Upon completion of color palette settings, the switching enable bit must always be set to 1.
3. When reading a color palette from the CPU, reading should be performed before setting the switching enabled bit to 1.

(2) Procedure for Setting a Color Palette

(a) Procedure for switching from the initial state

The initial state (after power-on reset) is the display reset state.

1 Set the display unit system control register.
2. Set color palette 1, 2, 3, or 4.
3. After setting the color palette, set the color palette switching enable bit to 1.
4. Cancel the display reset.

(b) Procedure for switching from display state

In the display state, the DRES bit and DEN bit in DSYSR0 are 0 and 1 respectively.

1. Confirm that the color palette switching enable bit is 0.

2. Set color palette 1, 2, 3, or 4.
3. After setting the color palette, set the color palette switching enable bit to 1.

Note: * n = 1 to 8

20.4.9 Superpositioning of Planes

For each plane, three types of combined superpositioning are possible: α blending, transparent colors, and EOR operations. By setting the PnSPIM*3 bits in PnMR*3, the superpositioned display type can be selected.

However, α blending and EOR operation cannot be performed simultaneously on the same plane.

Transparent color processing for YC data is not possible.

When 32-bit/pixel data is specified with the PnLRGB1*3 or PnLRGB0*3 bit in the plane n display data control register (PnDDCR*3), the following restrictions apply to superpositioning. These restrictions do not apply when using the PnEDF*3 bits in plane n display data control 4 register (PnDDC4R*3).

- Transparent color processing is not possible. Bit 2 in PnSPIM*3 must be set to 1.
- When α blending or an EOR operation has been specified but all of the lower planes are off, the display of 32-bit/pixel data is not possible.
- The alpha ratio of the 32-bit/pixel data (ARGB8888) can only be the higher-order eight bits (A value).

Table 20.33 Superpositioning

PnSPIM	Superpositioning	YC Data or 32-bit/pixel Data*2
B'000	Transparent color processing is performed for the specified plane. When the specified plane is a transparent color, the lower plane is displayed. (Default)	Prohibited
B'001	Blending of the specified plane with the lower plane is performed. When the specified plane is a transparent color, blending is not performed and the lower plane is displayed.	Prohibited
B'010	EOR operation of the specified plane and the lower plane is performed. When the specified plane is a transparent color, EOR operation is not performed and the lower plane is displayed.	Prohibited
B'011	Setting prohibited (The lower plane is displayed.)	Prohibited
B'100	Transparent color processing is not performed for the specified plane. The specified plane is displayed.	Possible
B'101	Blending of the specified plane with the lower plane is performed. Transparent color specification for the specified plane is ignored, and blending of all the pixels in the specified plane with the lower plane is performed.	Possible*1
B'110	EOR operation of the specified plane and the lower plane is performed. Transparent color specification for the specified plane is ignored, and EOR operation of all the pixels in the specified plane and the lower plane is performed	Possible*1
B'111	Setting prohibited (The lower plane is displayed.)	Prohibited

After the image data format has been expanded to RGB888, α blending or EOR operation is performed. The complementary format of each display data format is shown in Table 20.31. α blending and EOR operation are performed in the sequence of the lower plane to the upper plane. The block diagram is shown below.

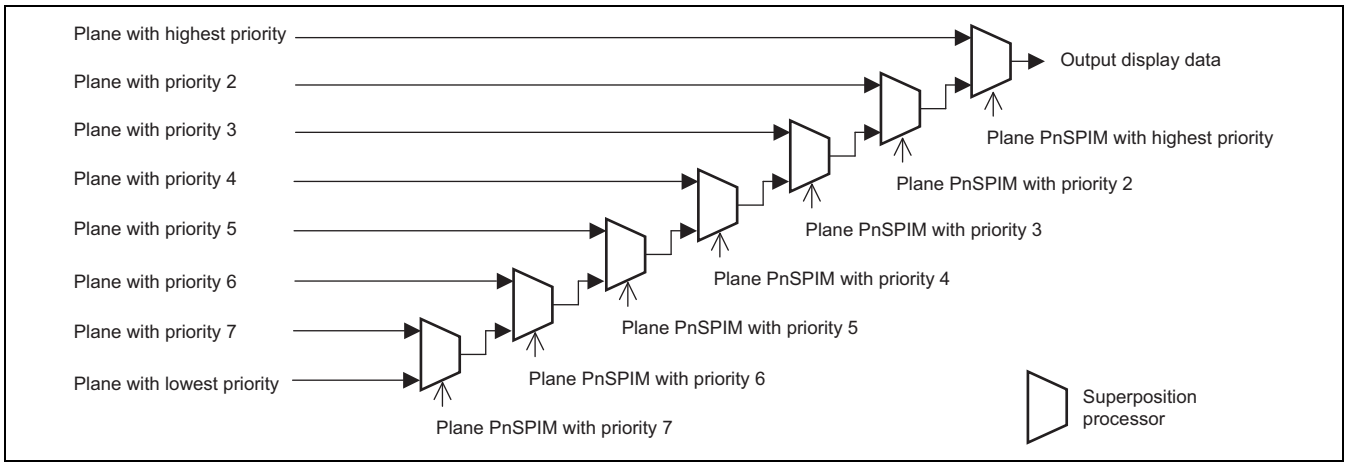

Figure 20.6 Plane Processing Sequence in α Blending and EOR Operation

When the format of display data for α blending or EOR operation is 8-bit/pixel, after selection in advance of the color palette to be used, the α blending or EOR operation on/off should be specified. At this time, when both planes for α blending or for EOR operation have the same color palette selected (color palette contention), only the specified plane is displayed, with no α blending or EOR operation performed. When display of all lower planes is turned off, the specified plane is displayed. That is, α blending or EOR operation of the specified plane with the image data specified in BPORn*3 is not performed. Note however that when a 32-bit/pixel display is set by the PnLRGB1*3 or PnLRGB0*3 bit in the plane n display data control register (PnDDCR*3), display of 32-bit/pixel data is not possible when α blending or an EOR operation has been specified but all of the lower planes are off.

(1) α Blending

In α blending, blending processing is performed according to the alpha (α) ratio set by the PnALPHA*3 bits in PnALPHAR*3, the alpha (α) ratio set by the blending ratio bits in the color palette, the alpha (α) ratio of the image data of the display plane, or the data in an α plane.

In the case of 32-bit/pixel data (ARGB8888), the alpha ratio can only be the higher-order eight bits (A value) of the 32-bit/pixel data (ARGB8888).

$$\text{Result of blending} \approx (\text{specified plane} \times \alpha/255 + \text{lower plane} \times (1 - \alpha/255) \quad \text{(Approximation)}$$

In the above formula, the blending result, α, the specified plane, and the lower plane are all given as 8-bit data.

When the alpha ratio is set to H'00, only the lower plane is displayed. When the alpha ratio is set to H'FF, only the specified plane is displayed. When the PnDDF*3 bits in PnMR*3 are set to ARGB, and moreover the PnSPIM*3 bit in PnMR*3 is set to perform α blending, α blending is performed according to the A value of the ARGB data format and by the α value specified by the PnALPHA*3 bits in PnALPHAR*3.

When the PnABIT*3 bits of PnALPHAR*3 are B'00, α blending is performed when the A value is 1. When the PnABIT*3 bits are B'01, α blending is performed when the A value is 0. When the PnABIT*3 bits are B'10 or B'11, α blending is performed regardless of the A value.

(2) Transparent Colors

For each plane, transparent color processing can be performed between the specified plane and the lower plane by setting PnSPIM*3 bit in PnMR*3 to 0. However, transparent color processing cannot be performed for YC data and 32-bit/pixel data (when set with the PnLRGB1*3 or PnLRGB0*3 bit in PnDDCR*3).

(a) 8-bit/pixel Mode

When the PnTC*3 bit in PnMR*3 is 0 (initial value), transparent color processing is performed according to the setting in the plane n transparent color 1 register (PnTC1R*3). When the PnTC*3 bit in PnMR*3 is 1, CP1TR*3 to CP4TR*3 can be used to set up to 16 colors in each of color palettes 1 to 4 as transparent colors. Only the indexes H'00 to H'0F can be specified as transparent colors; H'10 to H'FF cannot be specified as transparent colors.

The color palette 1 to 4 transparent color registers (CP1TR*3 to CP4TR*3) can be selected using the PnCPSL*3 bits in PnMR*3.

(b) 16-bit/pixel Mode and ARGB Mode

Transparent color processing is performed according to PnTC2R*3, regardless of the setting of the PnTC*3 bit in PnMR*3.

In the case of ARGB, bits 14 to 0 of PnTC2R*3 are compared, and bit 15 is ignored.

(c) 32-bit/pixel Mode

Transparent color processing is performed according to PnTC3R*3, regardless of the setting of the PnTC*3 bit in PnMR*3.

For the bits to be compared, see Table 20.24.

The above is summarized in Table 20.34, which indicates the transparent color specification registers which are valid when the PnTC*3 bit is 0 and 1.

Table 20.34 Transparent Color Specification Registers

Data Format	Transparent Color Specification Bit (PnMR*3) /PnTC*3	Color Palette Select Bit (PnMR*3) /PnCPSL*3	Transparent Color Specification Register
8-bit/pixel	0	—	PnTC1R*3
	1	B'000	CP1TR
	1	B'001	CP2TR
	1	B'010	CP3TR
	1	B'011	CP4TR
16-bit/pixel	—	—	PnTC2R*3
ARGB	—	—	PnTC2R*3
32-bit/pixel	—	—	PnTC3R*3

(3) EOR Operation

EOR operation of the specified plane with the lower plane is performed.

Notes: 1. Display of 32-bit/pixel data is not possible when all of the lower planes are off.
2. When a 32-bit/pixel display is set by the PnLRGB1*3 or PnLRGB0*3 bit in PnDDCR*3.
3. n = 1 to 8

20.4.10 Contention

(1) Contention for a Color Palette

When the same color palette has been specified for two or more planes in the 8-bit/pixel format, contention for that color palette between the planes may arise in α blending and EOR operations. Whether or not contention has occurred is judged on a per-pixel rather than per-plane basis.

In the figure below, planes 1 to 3 are in 8-bit/pixel format with α blending specified for plane 1 and an EOR operation specified for planes 2 and 3. The figure shows the results in cases where contention has arisen because the same color palette has been specified for all of the planes (we assume that none of these planes includes transparent-color pixels).

In the event of contention, α blending and EOR operations do not proceed and the uppermost plane is displayed.

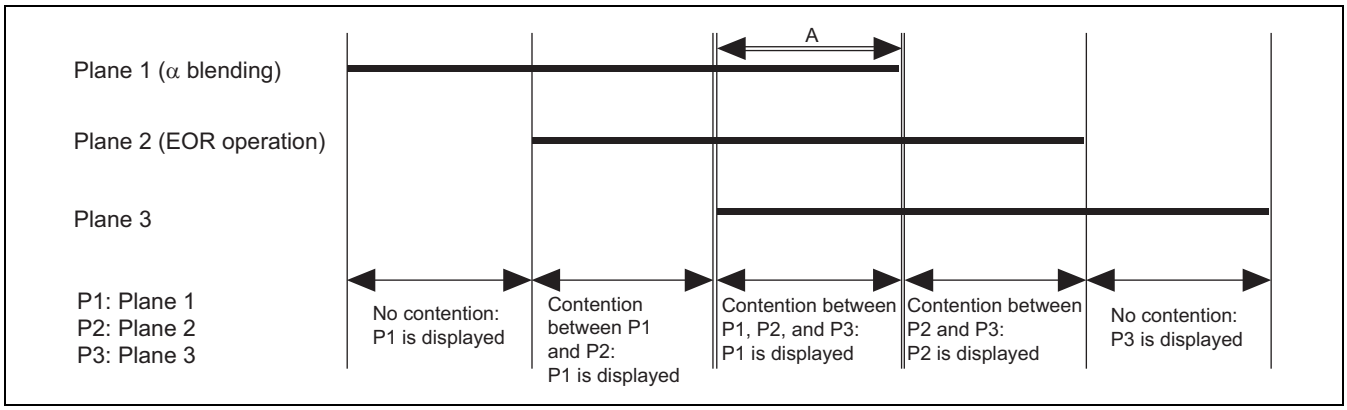

Figure 20.7 Contention for a Color Palette (When Multiple Planes Have the Same Color Palette)

Figure 20.8 shows the results of all patterns of contention and the presence of transparent colors to be displayed during period A in the above figure.

- P1 α P2 indicates α blending of planes 1 and 2.
- P2 ⊙ P3 indicates an EOR operation for planes 2 and 3.
- P1 α (P2 ⊙ P3) indicates α blending of plane 1 with the result of the EOR operation for planes 2 and 3.
- BPOR indicates data specified by the background plane output register n (BPORn*).

Note: * n = 0 and 1.

				✓: Contention, —: No contention				
				P1	✓	✓	✓	—	—
				P2	✓	✓	—	✓	—
				P3	✓	—	✓	✓	—
○: Transparent, ●: Non-transparent	P1	P2	P3						
	●	●	●		P1	P1	P1 α P2	P1 α P2	P1 α (P2⊙P3)
	●	●	○		P1	P1	P1 α P2	P1 α P2	P1 α P2
	●	○	●		P1	P1 α P3	P1	P1 α P3	P1 α P3
	●	○	○		P1	P1	P1	P1	P1
	○	●	●		P2	P2⊙P3	P2⊙P3	P2	P2⊙P3
	○	●	○		P2	P2	P2	P2	P2
	○	○	●		P3	P3	P3	P3	P3
	○	○	○		BPOR	BPOR	BPOR	BPOR	BPOR

Figure 20.8 Contention for a Color Palette and Transparent Colors

(2) YC Data Contention

The display unit (DU) has only one YC-RGB conversion circuit internally, and so YC-RGB conversion cannot be performed simultaneously for two or more planes. When there are pixels requiring YC-RGB conversion on two or more planes simultaneously, the pixels on the uppermost plane are YC-RGB converted, and the lower plane is not displayed. Figure 20.9 describes YC-RGB conversion when the data for three planes is in YC format.

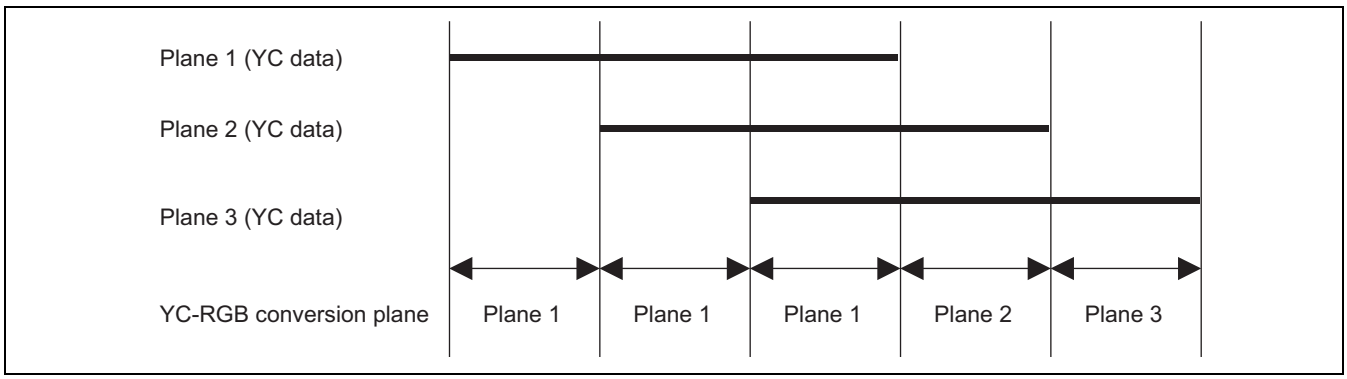

Figure 20.9 YC Data Contention

(3) Plane Priority Order

The display priority order for planes is set using DPPR, DS0PR, or DS1PR; if one plane is set in two or more places in the priority order, the place with highest priority is selected.

For example, if the setting in DPPR is H'00CB_D888, then the results of the priority order and display on/off settings are as follows.

Plane with priority 1	Plane 1
Plane with priority 2	No corresponding plane
Plane with priority 3	No corresponding plane
Plane with priority 4	Plane 6
Plane with priority 5	Plane 4
Plane with lowest priority	Plane 5
Display off planes	Plane 2, plane 3, plane 7, and plane 8

20.4.11 Blinking

For each plane, blinking operation can be performed by using the display area start addresses 0 and 1.

Usually, double-buffering control is performed for each plane according to the setting of the PnBM* bit in PnMR*. However, blinking is performed with the period specified by the PnBTA* and PnBTB* bits in PnBTR* by setting the PnBM* bits in PnMR* to B'10 (auto display change mode (blinking mode)). When the blinking period is set to 1, the display area start addresses 0 and 1 can be switched for every VSYNC; the same function as the auto display change mode can be achieved.

Note: Set a value other than 0 to the PnBTA* and PnBTB* bits in PnBTR*.
* n = 1 to 8

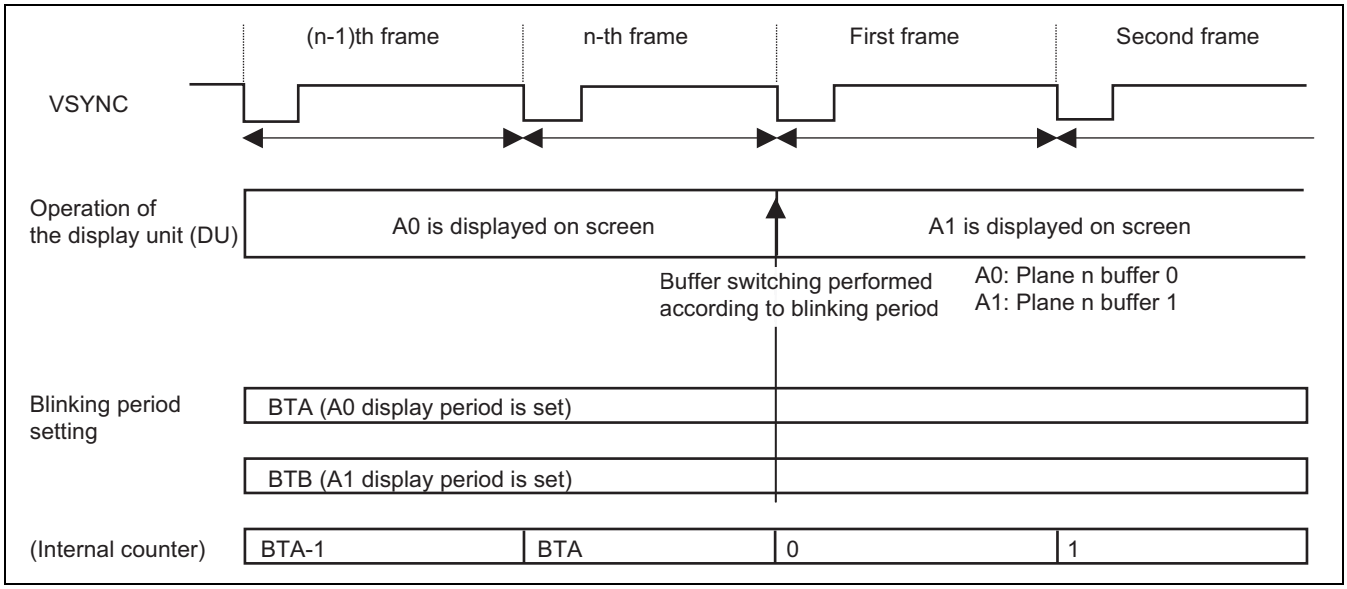

Figure 20.10 Blinking

20.4.12 Scroll Display

By setting display area and display screen sizes and start positions independently for each plane, smooth scroll processing can be performed independently for each plane.

The display can be scrolled by cyclically setting the values of display start positions X and Y (coordinates specified by PnSPXR* and PnSPYR*), taking as the origin the start address in memory specified by PnDSA0R* to PnDSA2R* for each plane.

Figure 20.11 summarizes display scrolling. The display is scrolled by setting the display start position from A to B.

Note: Display sizes and other area settings for each plane should be set such that there is no data display outside the memory configuration area.

* n = 1 to 8

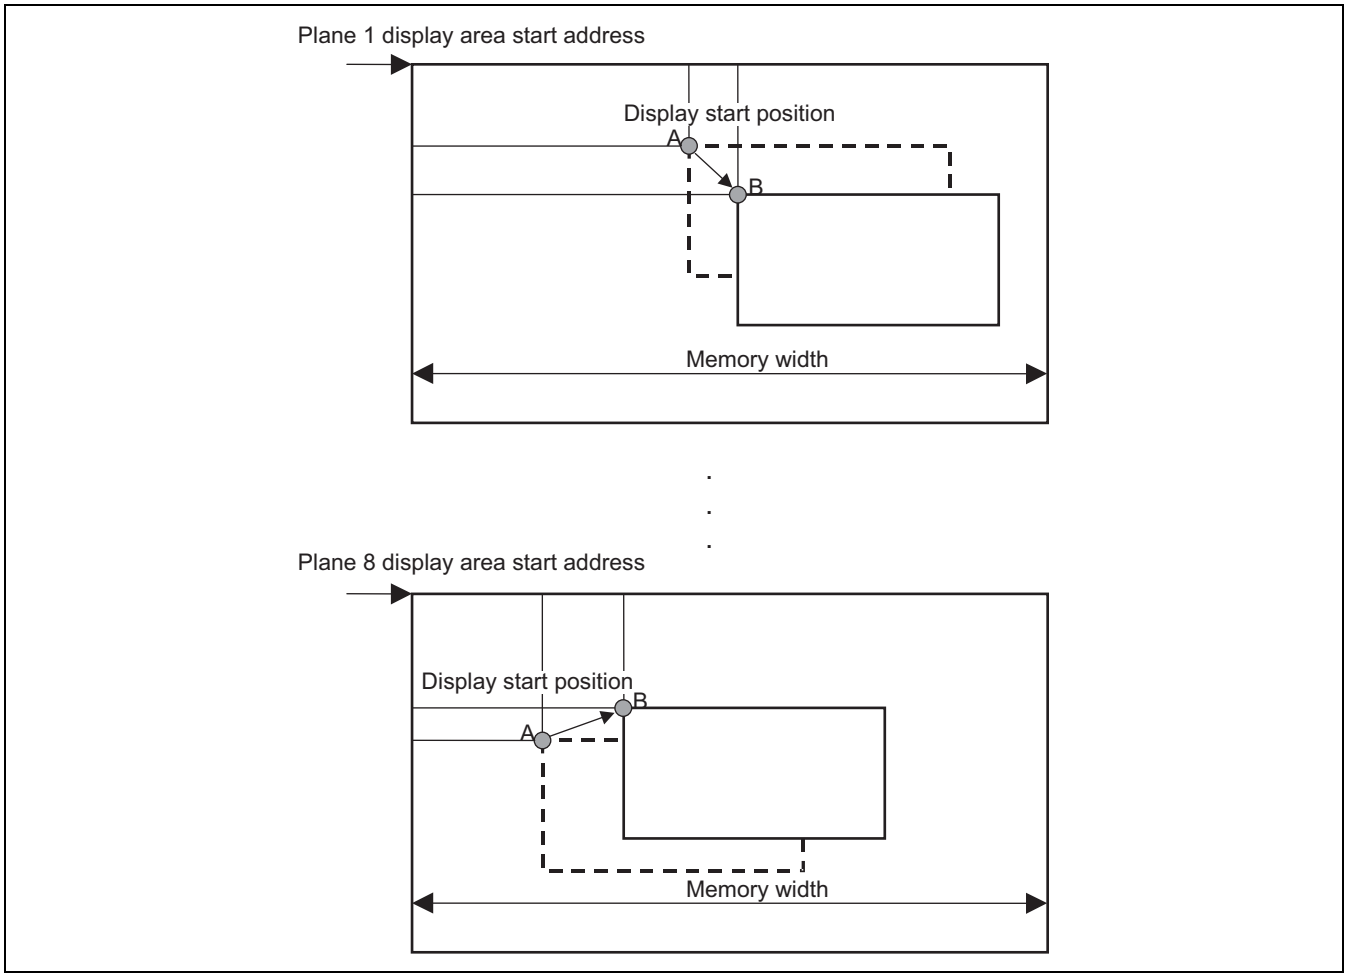

Figure 20.11 Schematic Diagram of Scroll Display

20.4.13 Wrap-Around Display

In addition to display scrolling, wrap-around display, which can be used in spherical scrolling, is possible for each plane. When enabling wrap-around display, the PnWAE*1 bit in PnMR*1 is set to 1. As a result of changing the values of display start positions X and Y (the plane n start position X set in PnSPXR*1 and the plane n start position Y set in PnSPYR*1) in order to scroll the display, even when plane n overflows the wrap-around area, the wrap-around area is seen as a spherical surface in wrap-around display, as in Figure 20.12, and the part overflowing is complemented and displayed. The method used to specify the wrap-around area is described below.

1. The start address of the memory used for plane n is specified in PnDSA0R*1 to PnDSA2R*1.
2. With the beginning of the specified memory as origin, the upper-left coordinates of the wrap-around area are specified in PnWASPR*1. The X-direction width of the wrap-around area is the memory width set in PnMWR*1.
3. The Y-direction width of the wrap-around area is set in PnWAMWR*1.

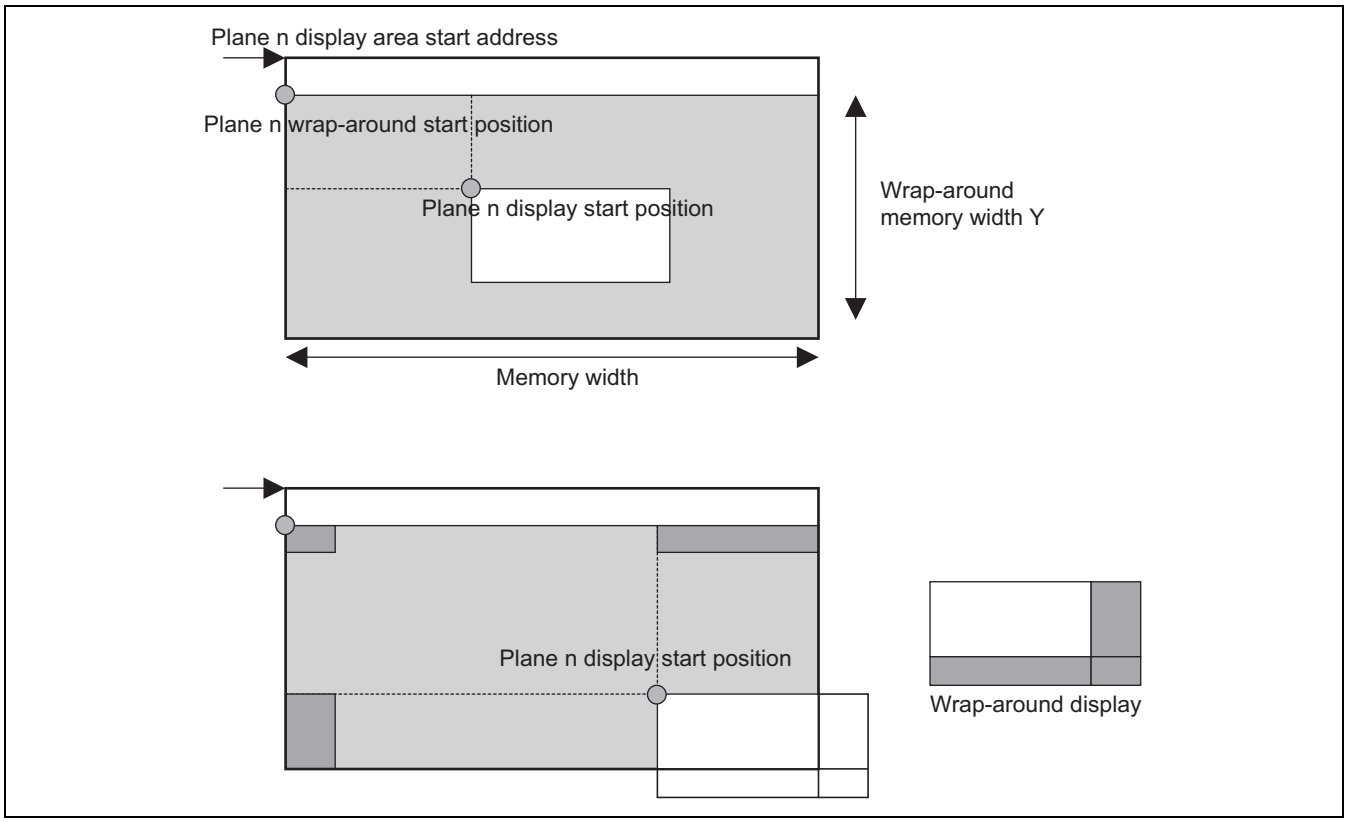

Figure 20.12 Schematic Diagram of Wrap-Around Display

Notes: When wrap-around display is disabled (when the PnWAE*1 bit in PnMR*1 is 0), the part overflowing the wrap-around area becomes the color specified by BPORn*2, and superposition processing using this color is performed.

1. n = 1 to 8
2. n = 0 and 1

20.4.14 Upper-Left Overflow Display

For each plane, a display start position in memory (PnSPXR*, PnSPYR*) and display size (PnDSXR*, PnDSYR*) can be set arbitrarily, so that by combining and using these registers, areas overflowing the upper-left relative to the monitor origin (upper-left corner) can be displayed without overwriting display data in memory.

For a picture of size (DSX, DSY) and with start position (SPX, SPY), by setting the size to (DSX-ΔX, DSY-ΔY) and the start position to (SPX+ΔX, SPY+ΔY), the ΔX part overflowing on the left side and the ΔY part overflowing on top can be displayed. At this time, the display position (PnDPXR*, PnDPYR*) is fixed at 0.

Note: * n = 1 to 8

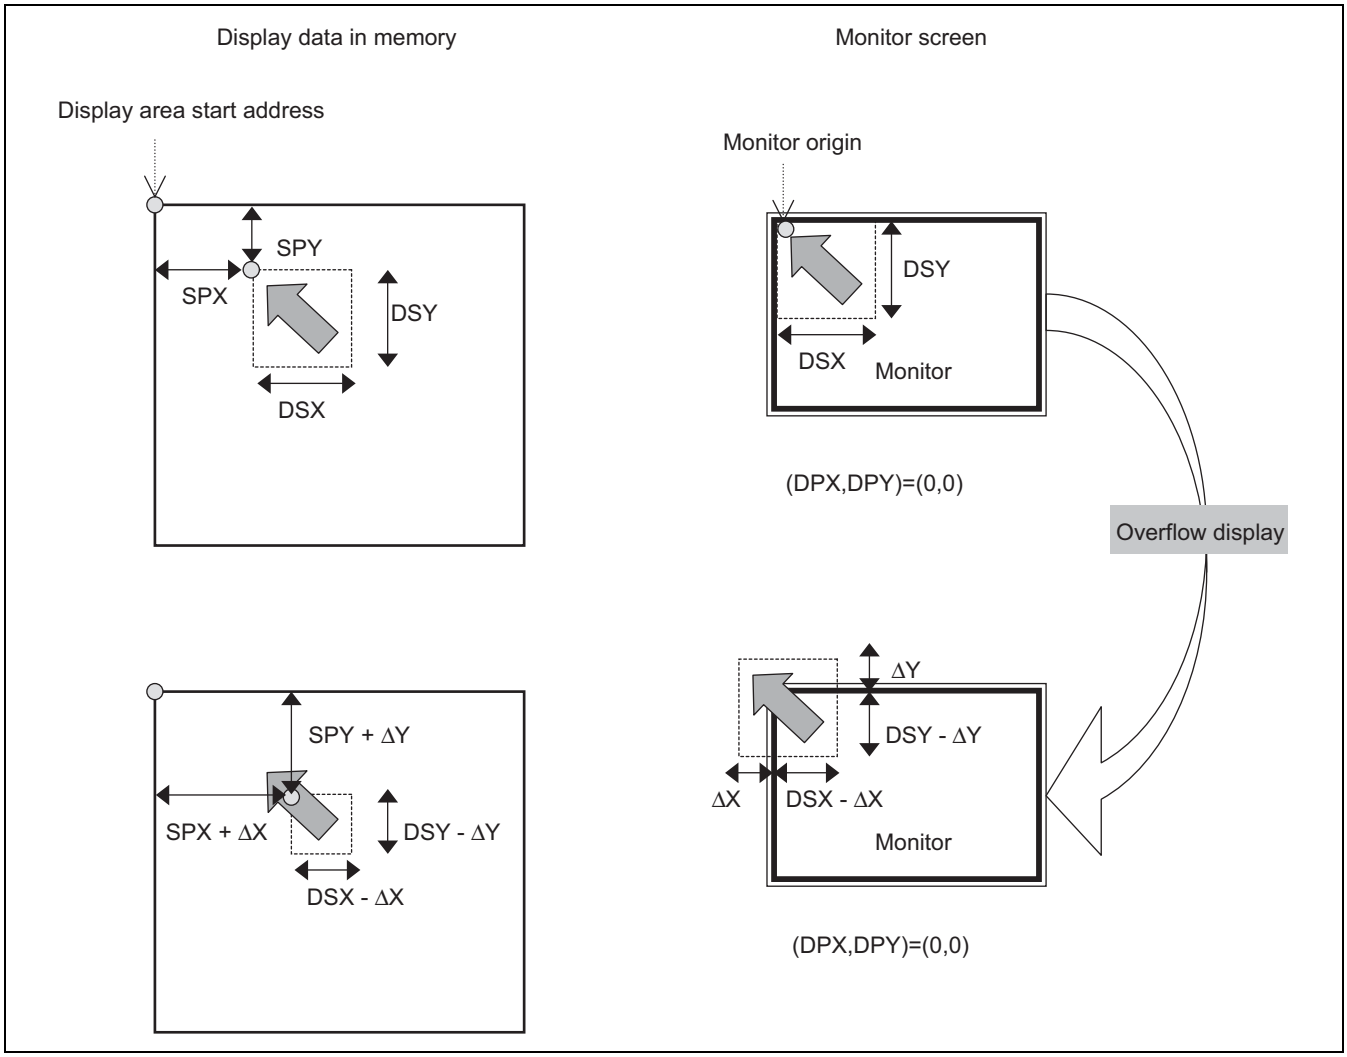

Figure 20.13 Schematic Diagram of Upper-Left Overflow Display

20.4.15 Double-Buffering Control

The double-buffering control of the display unit (DU) includes four types of functions, which are an auto rendering mode that does not switch the display until drawing is completed, a manual display change mode in which display or drawing switching is all controlled by software, an auto display change mode that realize blinking, and a video capture mode that is based on a frame ID of the video input (VIN) module.

In the case of auto rendering mode and manual display change mode, the display change is performed in frame units for non-interlaced and interlaced sync display, and in field units for interlaced sync & video display. In the case of auto display change mode, all switching is performed in field units. For video capture mode, all switching is performed in frame units.

Auto Rendering Mode: In auto rendering mode, display is not switched until drawing is completed. Even if drawing is not completed within a single frame period, drawing operation continues as it is.

Manual Display Change Mode: In manual display change mode, display frame switching and start of drawing are controlled by software. Display switching can either be performed by software using the PnDC* bit in PnMR*, or by setting the buffer 0 or buffer 1 start address in PnDSA0R* and PnDSA1R* indicated by the DFBn* bit in DSSR0.

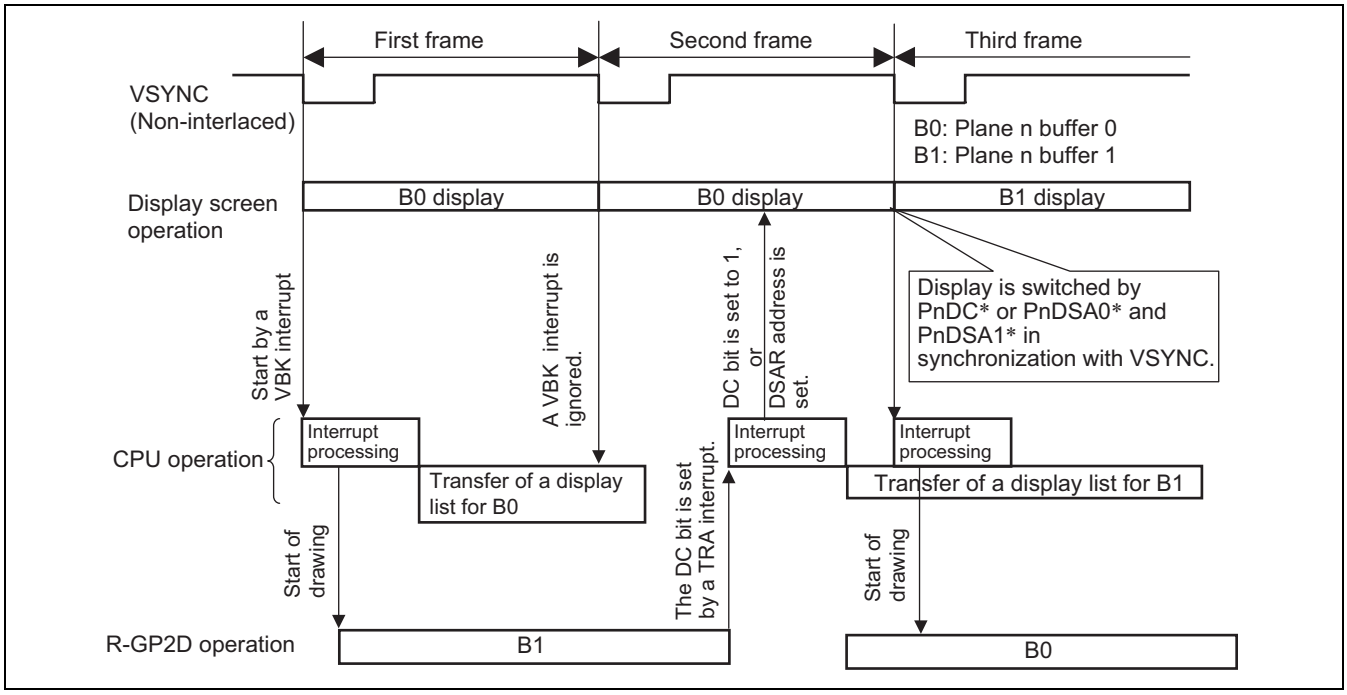

Figure 20.14 Manual Display Change Mode

Auto Display Change Mode: For information on the auto display change mode, refer to section 20.4.11, Blinking.

Video Capture Mode: In video capture mode, a display frame buffer is switched in frame units according to a frame ID, indicating the latest capture frame, output from the video input modules 0 to 1 (VIN0 to VIN1).

The video input modules 0 to 1 (VIN0 to VIN1) are selected by the PnVISL* bit in the plane n mode register (PnMR*).

Note: * n = 1 to 8

20.4.16 Sync Mode

In order to facilitate synchronization with external equipment, in addition to master mode, a TV synchronization function is provided. Selection of master mode and TV sync mode is performed using bits 7 and 6 in DSYSRn*. In master mode (internal sync mode), the position of the falling edge of the vertical sync signal (VSYNC) set by VSPRn* is detected. In TV sync mode (external sync mode), the position of the falling edge of the EXVSYNC signal is detected. The results are then reflected in the bits 14 and 11 of DSSRn*.

Master Mode (Internal Sync Mode): By setting the period and pulse width of the horizontal and vertical sync signals (HSYNC, VSYNC) in the display timing generation registers, the corresponding waveforms are output. Also, display data is output in sync with these signals.

In interlaced sync mode and interlaced sync & video mode, a signal is output to the ODDF pin indicating odd/even fields.

TV Sync Mode (External Sync Mode): In TV sync mode, display data is output in sync with a horizontal sync signal and vertical sync signal (EXHSYNC, EXVSYNC) input from a TV, video, or other external sync signal generation circuit. Display data is output with reference to the falling edge of the EXHSYNC signal and the rising edge of the EXVSYNC signal.

The horizontal sync signal, vertical sync signal, and clock signal from the external sync signal generation circuit are input to the EXHSYNC, EXVSYNC, and DCLKIN pins, respectively. CSYNC is at high level. In interlaced sync mode and interlaced sync & video mode, a signal should be input to the EXODDF pin indicating odd/even fields. In non-interlaced mode, the input to the EXODDF pin should be fixed at low level or at high level.

When operating the unit in TV sync mode also, values must be set in horizontal sync width register n (HSWRn*), horizontal cycle register n (HCRn*), vertical sync point register n (VSPRn*), and vertical cycle register n (VCRn*) in section 20.3.2, Display Timing Generation Registers.

When the EXVSYNC signal is input, either before or after completion of display of the display size portion set in the display unit (DU), the display unit (DU) performs vertical display completion operation and transitions to control for the next screen. When the EXVSYNC signal is not input, the unit continues to wait for the EXVSYNC signal while remaining in the vertical blanking interval (auto-control is not performed). Similarly, when the EXHSYNC signal is input the display unit (DU) performs horizontal display completion operation and transitions to control for the next raster line; but if the EXHSYNC signal is not input, the unit continues to wait for the EXHSYNC signal while remaining in the horizontal blanking interval (auto-control is not performed).

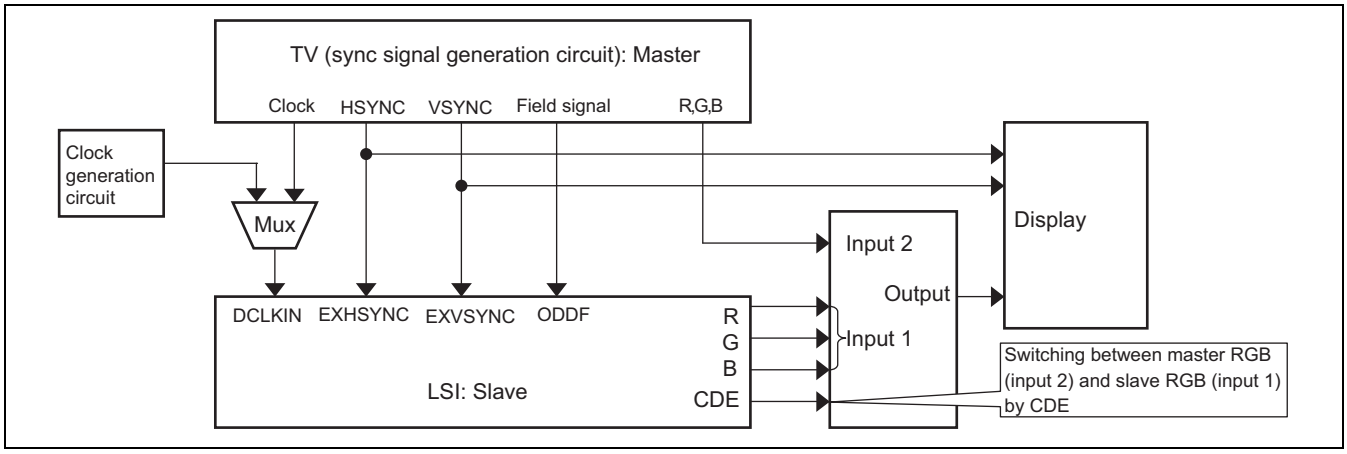

Figure 20.15 Signal Flow in TV Sync Mode

Sync Method Switching Mode: When switching from master mode into TV sync mode, or from TV sync mode into master mode, when necessary this mode should be switched into first. Even if a transition to this mode is not made first, switching of the synchronization method is possible.

In this mode, input/output pins connected to the display unit (DU) are for input, and so collision of pin signals can be avoided. Also, in this mode the internal dot clock is stopped, so that disorder in the input dot clock has no effect on display operation.

Note: * n = 0 and 1

20.4.17 Alpha-Ratio Planes

α blending can be performed by using the eight planes (display planes) that can display the current image data with the alpha ratio, plus two planes for the alpha ratio (alpha-ratio planes). Data in the alpha ratio planes are limited to the alpha ratio; they cannot be composed as display data.

To enable the alpha-ratio planes, set the AP1E or AP2E bit of DAPCR to 1. PnALPHAR* is used to select the alpha-ratio planes. Set the PnBRSL* bits in PnALPHAR* to B'111 and bits 2 to 0 in PnALPHA* to B'000, B'001 or B'010.

Notes: These alpha-ratio planes are not usable when 32-bit/pixel data are being displayed.
* n = 1 to 8

20.4.18 Display Capture

In display capture, display data (RGB888 or RGB666) that have been composed for output on the relevant pins are converted to ARGB888, RGB565 or ARGB1555 data, stored in a buffer having the same configuration as the read buffer, and then stored in the area specified by DCnSAR* via AXI. To capture the display data, set the DCE or DC2E bit of DCPCR to 1. Capturing starts from the next frame after this setting has been made. The specifications for display capturing are as follows:

Data formats: Refer to Table 20.31, Output Data Format. In the case of ARGB1555, the A value is determined by the setting of DCPCR. In the case of ARGB8888, the A value is determined by the setting of DCnMR.

Capture area start address: Only a single address can be specified.

Capture size X: The same as the monitor size (horizontal display end position (HDE) – horizontal display start position (HDS)

Capture size Y: The same as the monitor size (vertical display end position (VDE) – vertical display start position (VDS)

Memory width X: Specified by a register. Writing to the buffer ends when the memory width is exceeded.

Memory length Y: Specified by a register. Storage of data in the memory ends when the memory length (in lines) is exceeded.

When the following display functions are set, the display capture function cannot be used.

- RGB-YC conversion performed by setting the RGBYC0 bits in the display unit extensional function control 5 register (DEF5R)

Note: * n = no number or 2.

20.4.19 Dual Display Output

The display unit (DU) has superposition processors, display-timing generators, pin controllers, and dot-clock generators, each of which is independently controllable. The DU0 and DU1 realize various types of display because two channels are available for selecting from among the eight display planes and two alpha-ratio planes.

This section describes the dual display output using the DU0 and DU1.

(1) Independent Display

Different images can be displayed with different sizes by specifying different superposition processors, display-timing generators, pin controllers, and dot-clock generators. Captured video data can also be separately stored.
However, separate output images cannot be produced from a single plane. To display a single set of image data in separate output images, two planes must be used.
It is impossible to output the image data only via the LVDS pins or DVENC pins since they both are only one channel available for each. Combination of both digital RGB pins, digital RGB pins and LVDS pins, digital RGB pins and DVENC pins, LVDS pins and DVENC pins can be used.

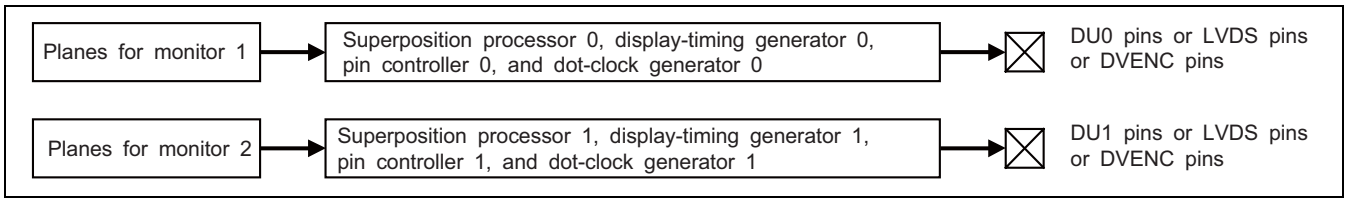

Figure 20.16 Independent Display

(2) Display of Different Images on Monitors of the Same Size

Different images can be displayed on monitors of the same size when the same display-timing generator and dot-clock generator have been specified but the superposition processors and pin controllers are different. Captured video data can also be separately stored.

Images can be output to two monitors through a single set of pins by switching the display data in synchronization with the output dot clock. Output through two sets of pins is also possible.

When images are output to two monitors through a single set of pins, the image data can be output only via the digital RGB or LVDS.

When images are output through two sets of pins, it is impossible to output the image data only via the LVDS pins; the image data is output only via the digital RGB pins or via both the LVDS pins and digital RGB pins.

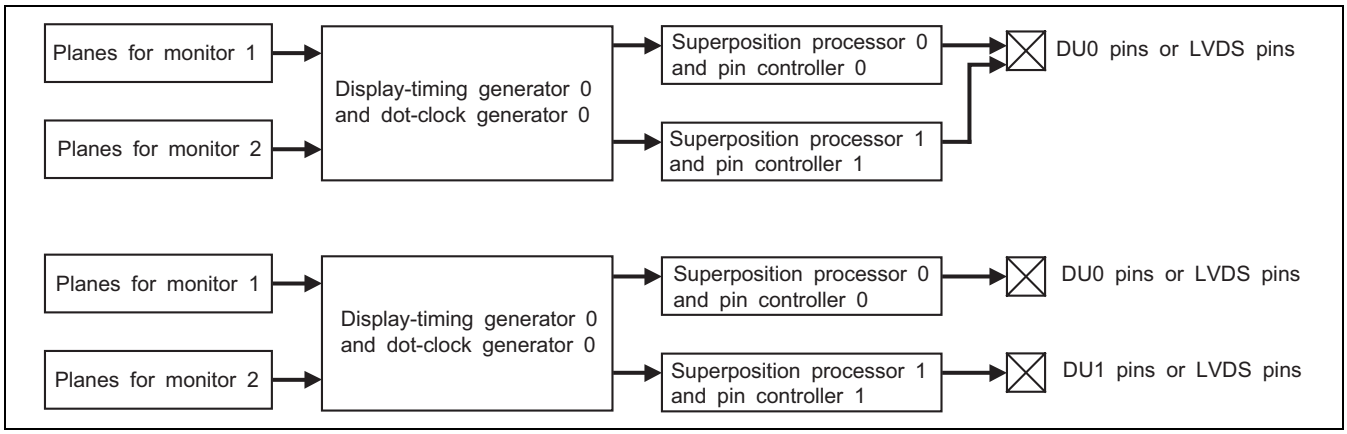

Figure 20.17 Display of Different Images on Monitors of the Same Size

(3) Display of the Same Image on Monitors of the Same Size

The same image can be displayed on different monitors when the same superposition processor, display-timing generator, and dot-clock generator have been specified but the pin controllers are different.

Images can be output to two monitors through a single set of pins by switching the display data in synchronization with the output dot clock. Output through two sets of pins is also possible.

When images are output to two monitors through a single set of pins, the image data can be output only via the digital RGB.

When images are output through two sets of pins, it is impossible to output the image data only via the LVDS pins; the image data is output via both the LVDS pins and digital RGB pins

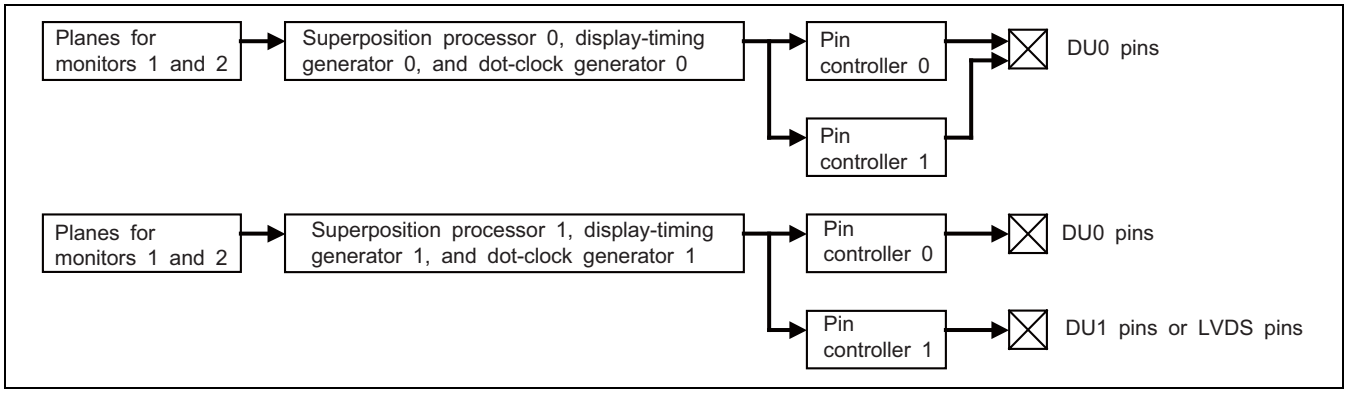

Figure 20.18 Display of the Same Image on Monitors of the Same Size

The timing for switching of display data in synchronization with the output dot clock is shown below. This feature is only supported by DU0 or DU0 via LVDS.

With the DU1 pin, data cannot be displayed by switching in synchronization with the output dot clock. For switching display data in synchronization with the output dot clock, the output dot clock should be set to be division by two or more of the input dot clock.

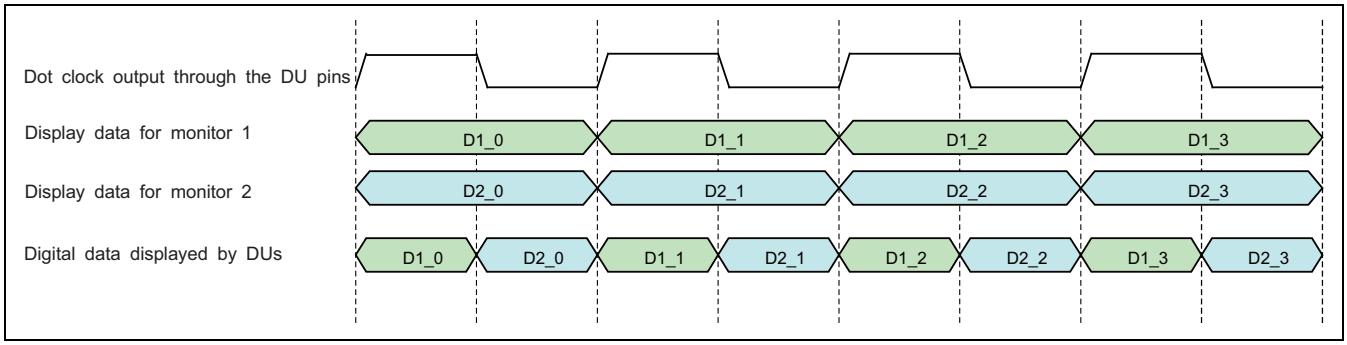

Figure 20.19 Switching Display Data in Synchronization with the Output Dot Clock

(4) Combinations of Blocks for Dual Display Output

For dual display output, the dot clock to be supplied to blocks in the display unit (DU), timing signals including SYNC, and display data are specifiable by setting the corresponding registers. Table 20.35 is a matrix of the combinations of blocks, and Table 20.36 gives the meanings of the symbols used in Table 20.35.

When the input block is superposition processor 0, for example, the information indicated in the table is as follows.

- The dot clock is that from dot-clock generator 0 or 1 as selected by the DR0D and DK1S bits of DORCR (No. 5 in the table).
- The timing signal is that from display-timing generator 0 or 1 as selected by the DR0D and PG1T bits of DORCR (No. 3 in the table).
- The planes for superpositioning of data are selected in DS0PR (No. 15 in the table).

Take care with register settings because timing signals such as the dot clock, sync signals and so on are freely specifiable, but if the dot clock or other timing signals differ from block to block, a normal display will not be possible.

Table 20.35 Combinations of Blocks

		Output Block															
		Dot-clock generator 0(clock)	Dot-clock generator 0 (external SYNC)	Dot-clock generator 1 (clock)	Dot-clock generator 1 (external SYNC)	Display-timing generator 0	Display-timing generator 1	Superposition processor 0	Superposition processor 1	Pin controller (output timing adjustment) 0	Pin controller (output timing adjustment) 1	Planes 1 to 8	Alpha-ratio planes 1 to 2	Display capture 1	Display capture 2	DU0 pins	DU1 pins

20.4.20 Divided YUV Display

An image that has been divided up into separate Y and UV data for separate storage in memory can be displayed as YUV422 or YUV420 data by using two planes.

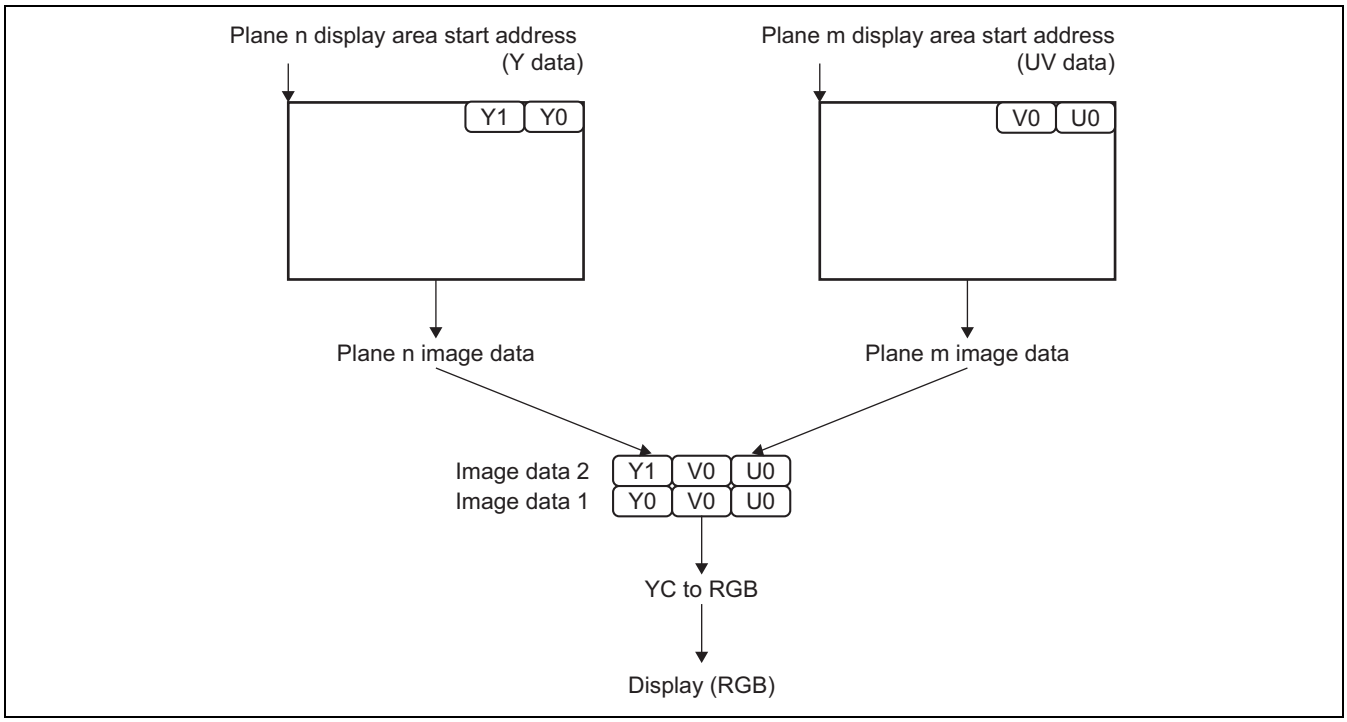

Figure 20.20 Overview of Divided YUV Display Function (Little Endian)

(1) Image Data Format

The following figures show the configuration of YUV422 data divided for separate storage in little endian in memory. The configuration of YUV420 data is the same as that shown in section 20.4.5 (5), YC: YUV420.

The formulae for YC-RGB conversion are the same as those shown in section 20.4.5 (4), YC: YUV422.

(a) Y data

	31	24	23	16
D31 to D16 Image data 4 and 3	Y3		Y2	

	15	8	7	0
D15 to D0 Image data 2 and 1	Y1		Y0	

(b) UV data

	31	24	23	16
D31 to D16 Image data 4 and 3	V2		U2	

	15	8	7	0
D15 to D0 Image data 2 and 1	V0		U0	

(2) Register Setting Examples

Two planes are used to display the divided YUV data. The methods for specifying Y data in plane 1 and UV data in plane 2 to display the divided YUV data are described below.

1. The following is the setting made by the plane n display data control 2 register (PnDDC2R[*1]).

YUV422 data

Bit :	7	6	5	4	3	2	1	0
			PnNV21	PnY420			PnDIVU	PnDIVY
Plane 1 (Y data)	–	–	0	0	–	–	0	1
Plane 2 (UV data)	–	–	0	0	–	–	1	0

YUV420 data

Bit :	7	6	5	4	3	2	1	0
			PnNV21	PnY420			PnDIVU	PnDIVY
Plane 1 (Y data)	–	–	0	0	–	–	0	1
Plane 2 (UV data)	–	–	0/1	1	–	–	1	0

2. Set the start address of Y data in the plane 1 display area start address 0 to 2 registers (P1DSA0R to P1DSA2R).
3. Set the start address of UV data in the plane 2 display area start address 0 to 2 registers (P2DSA0R to P2DSA2R).
4. The same settings should be made in the plane 1 and plane 2 registers of display plane registers other than the registers described above (PnDDC2R*[1], P1DSA0R to P1DSA2R, and P2DSA0R to P2DSA2R). Set the PnDDF[*1] bits in the plane n mode register (PnMR[*1]) to B'11.
5. Set bit 20 in the display unit system control register n (DSYSRn[*2]) to 1 if data is stored in big endian in memory.
6. Turn on the display of planes 1 and 2, and give plane 2 the next order of priority for processing after plane 1. For details on turning on the display, see section 20.4.2, Display On/Off.

(3) Combinations of Planes

Display as YUV422 or YUV420 data is obtained by using the combinations of planes listed below. UV data should be on the plane immediately below that for the Y data.

Table 20.37 Possible Combinations of Planes

Y Data Obtained by Dividing up YUV	UV Data Obtained by Dividing up YUV
Plane 1	Plane 2
Plane 2	Plane 3
Plane 3	Plane 4
Plane 4	Plane 5
Plane 5	Plane 6
Plane 6	Plane 7
Plane 7	Plane 8
Plane 8	Plane 1

Notes: 1. n = 1 to 8
2. n = 0 and 1.

20.4.21 Multiple Output Display

The 24-bit data of the DU0/DU1 display digital data (RGB888) can be multiplexed 12 bits each and output. For a DU0 multiple output, set both the MLOS0 bit in display unit extensional function control 6 register (DEF6R) and the DCKOINV bit in the external synchronization control register 0 (ESCR0) to 1. For a DU1 multiple output, set both the MLOS1 bit in display unit extensional function control 6 register (DEF6R) and the DCKOINV bit in the external synchronization control register 1(ESCR1) to 1.

The output dot clock should be set so that its frequency is equal to or smaller than half of the input dot clock frequency. The pin functions for a multiple output display are shown in Table 20.38.

Figure 20.21 shows the timing of the output dot clock, display control signal, and display digital data. The display control signal is output in synchronization with the falling edge of the output dot clock. As for display digital data, the Df data (Table 20.38) is output in synchronization with the falling edge of the output dot clock and the Dr data (Table 20.38) is output in synchronization with the rising edge.

Table 20.38 Pin Functions of Multiple Output Display

	DU0 Display Digital Data	
Pin Name	**Df Data**	**Dr Data**
DU0_DR0	DU0 digital red 0	DU0 digital green 4
DU0_DR1	DU0 digital red 1	DU0 digital green 5
DU0_DR2	DU0 digital red 2	DU0 digital green 6
DU0_DR3	DU0 digital red 3	DU0 digital green 7
DU0_DR4	DU0 digital red 4	DU0 digital blue 0

DU0_DR6	DU0 digital red 6	DU0 digital blue 2
DU0_DR7	DU0 digital red 7	DU0 digital blue 3
DU0_DG0	DU0 digital green 0	DU0 digital blue 4
DU0_DG1	DU0 digital green 1	DU0 digital blue 5
DU0_DG2	DU0 digital green 2	DU0 digital blue 6
DU0_DG3	DU0 digital green 3	DU0 digital blue 7

	DU1 Display Digital Data	
Pin Name	**Df Data**	**Dr Data**
DU1_DR0	DU1 digital red 0	DU1 digital green 4
DU1_DR1	DU1 digital red 1	DU1 digital green 5
DU1_DR2	DU1 digital red 2	DU1 digital green 6
DU1_DR3	DU1 digital red 3	DU1 digital green 7
DU1_DR4	DU1 digital red 4	DU1 digital blue 0
DU1_DR5	DU1 digital red 5	DU1 digital blue 1
DU1_DR6	DU1 digital red 6	DU1 digital blue 2
DU1_DR7	DU1 digital red 7	DU1 digital blue 3
DU1_DG0	DU1 digital green 0	DU1 digital blue 4
DU1_DG1	DU1 digital green 1	DU1 digital blue 5
DU1_DG2	DU1 digital green 2	DU1 digital blue 6
DU1_DG3	DU1 digital green 3	DU1 digital blue 7

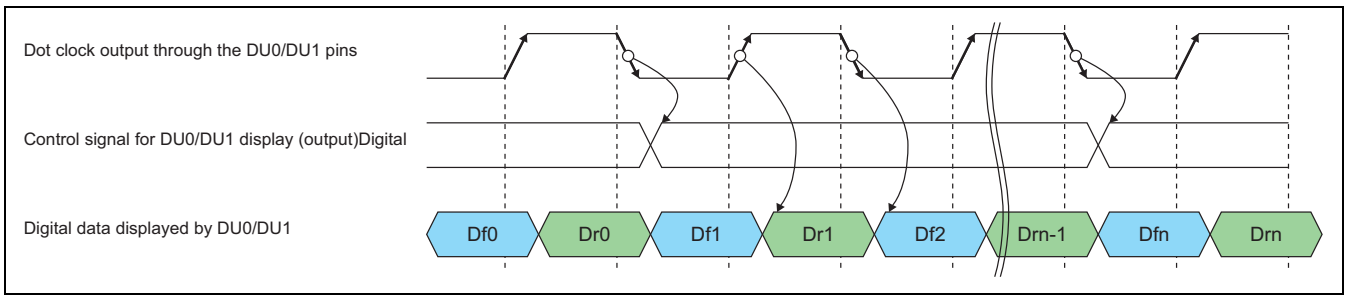

Figure 20.21 Multiple Output Display Timing

20.4.22 YC Format Display

In addition to RGB format display, data stored in YC format can be displayed unmodified in YC format. RGB format display data can also be RGB-YC converted and displayed as YC format. Data stored in YC format cannot be superpositioned; however, different planes can be displayed on the different display areas in the divided screen.

In DU1, to display data stored in YC format unmodified in YC format, select YC format rather than RGB format by setting bits 9 and 8 in the display unit extended function control register 1 (DEFR1). Bits 9 and 8 setting of B'10 selects 16-bit YC format display (non-multiplexed), and a setting of B'11 selects 8-bit YC format display (multiplexed). A setting of B'00 selects RGB format.

In DU0, to use RGB-YC conversion for YC format display, set the RGBYC0 bits in display unit extended function control 5 register (DEF5R). A RGBYC0 setting of B'10 selects 18-bit display (non-multiplexed), and a setting of B'01 selects 10-bit display (multiplexed).

When YC format is displayed by the timing as shown in Figure 20.22 and Figure 20.23, input 2 clocks to DCLKIN and specify division by 2. Also output 2 clocks from DCLKOUT. Both 2 clocks output and division by 2 are specified by settings in the external synchronization control register n (ESCRn*2). Non-multiplexed YC format can be displayed in Figure 20.22a and Figure 20.22b, this setting is not required.

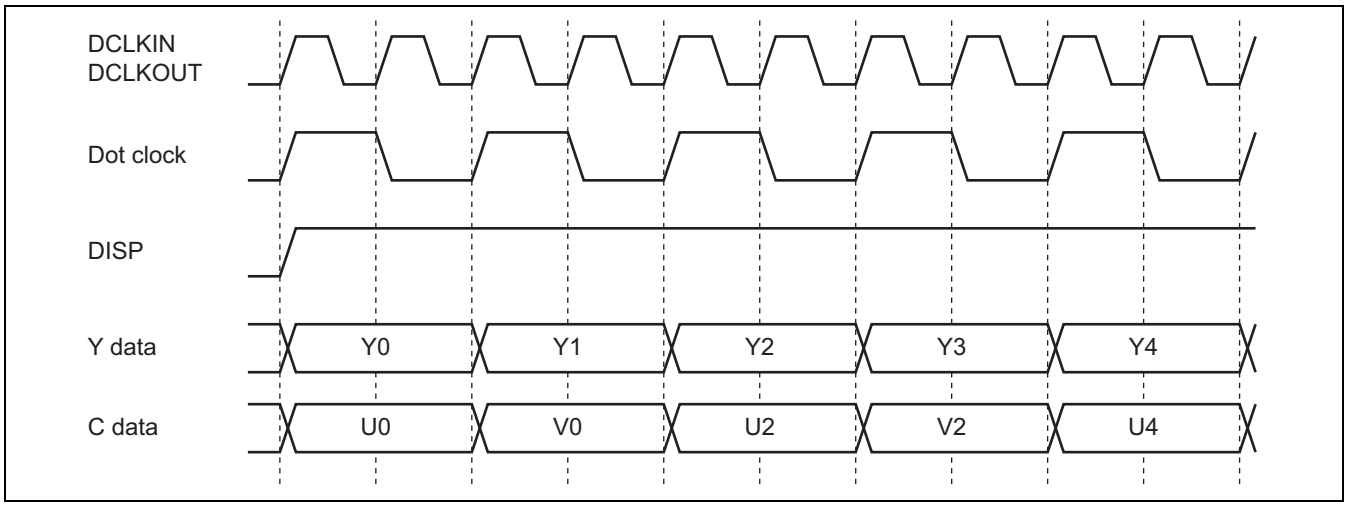

Figure 20.22 YC Non-Multiplexed

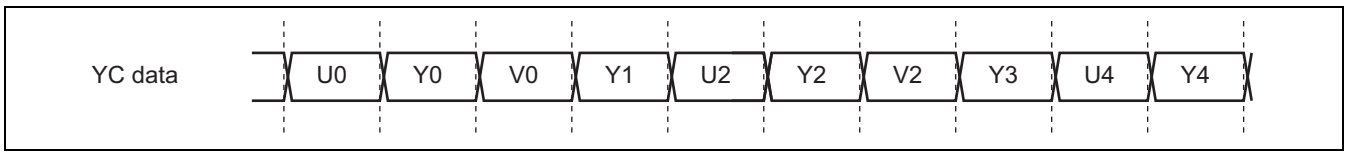

Figure 20.23 YC Multiplexed

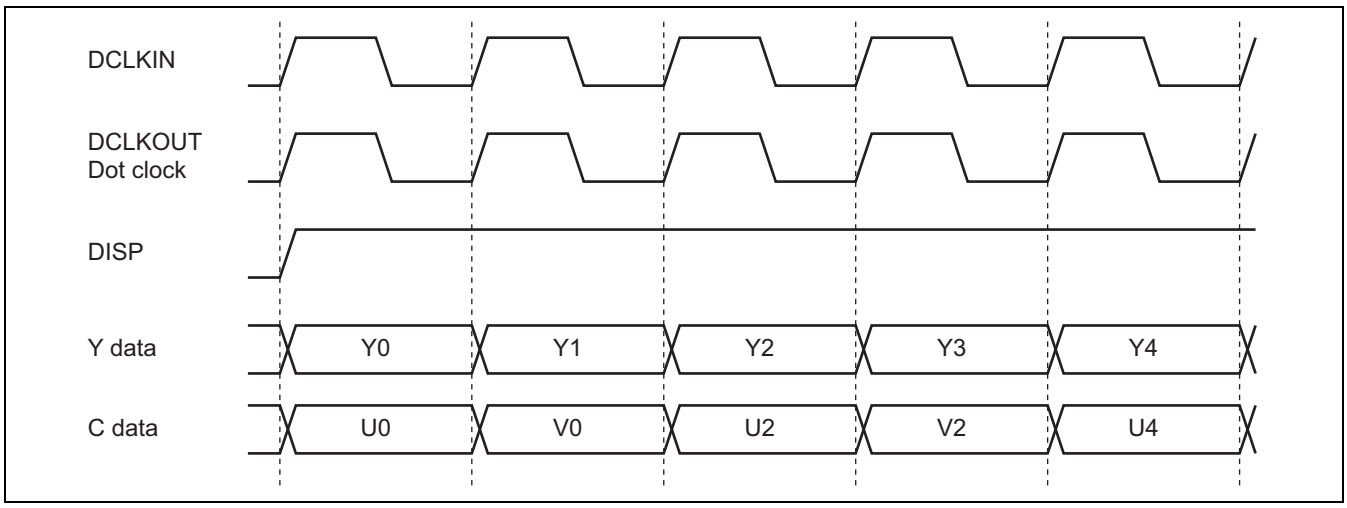

Figure 20.22a YC Non-Multiplexed (no division)

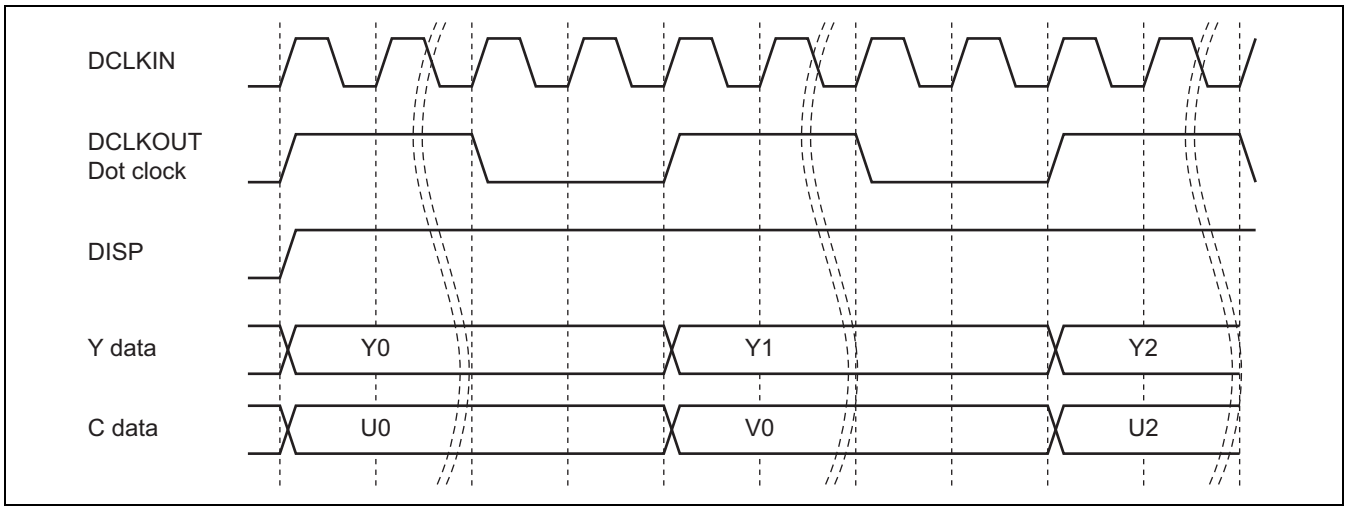

Figure 20.22b YC Non-Multiplexed (division by x)

Table 20.39 Pin Names and YC Data for YC Format Display

		YC Format Display (Only for DU1 Pin)		RGB-YC Conversion Display (Only for DU0 Pin)

DU0_DB7	DU1_DB7	C5	—	C7	—

20.4.23 RGB → YC Color Space Conversion Formula

The formulae for RGB-YC conversion are given below. The underlined coefficients are defined by the settings in the corresponding registers.

$$Y = YCLRP \times R + YCLGP \times G + YCLBP \times B + YCLAP$$
$$Cb = CBCLRP \times R + CBCLGP \times G + CBCLBP \times B + CBCLAP$$
$$Cr = CRCLRP \times R + CRCLGP \times G + CRCLBP \times B + CRCLAP$$

Values to be set for full scale to ITU-R BT.601 conversion are as follows.

$$Y = 0.257 \times R + 0.504 \times G + 0.098 \times B + 16$$
$$Cb = -0.148 \times R - 0.291 \times G + 0.439 \times B + 128$$
$$Cr = 0.439 \times R - 0368 \times G - 0.071 \times B + 128$$

Values to be set for full scale to full scale conversion are as follows.

$$Y = 0.299 \times R + 0.587 \times G + 0.114 \times B + 0$$
$$Cb = -0.169 \times R - 0.331 \times G + 0.550 \times B + 128$$
$$Cr = 0.500 \times R - 0419 \times G - 0.081 \times B + 128$$

20.5 Display Control

20.5.1 Display Timing Generation

In the display unit (DU), display timing is generated for the horizontal direction and vertical direction of the display screen. Display timing is set by using display timing generation registers in section 20.3.2. Figure 20.24 shows the display timing in non-interlaced mode. Here, the display screen is defined in terms of the variables of Table 20.40.

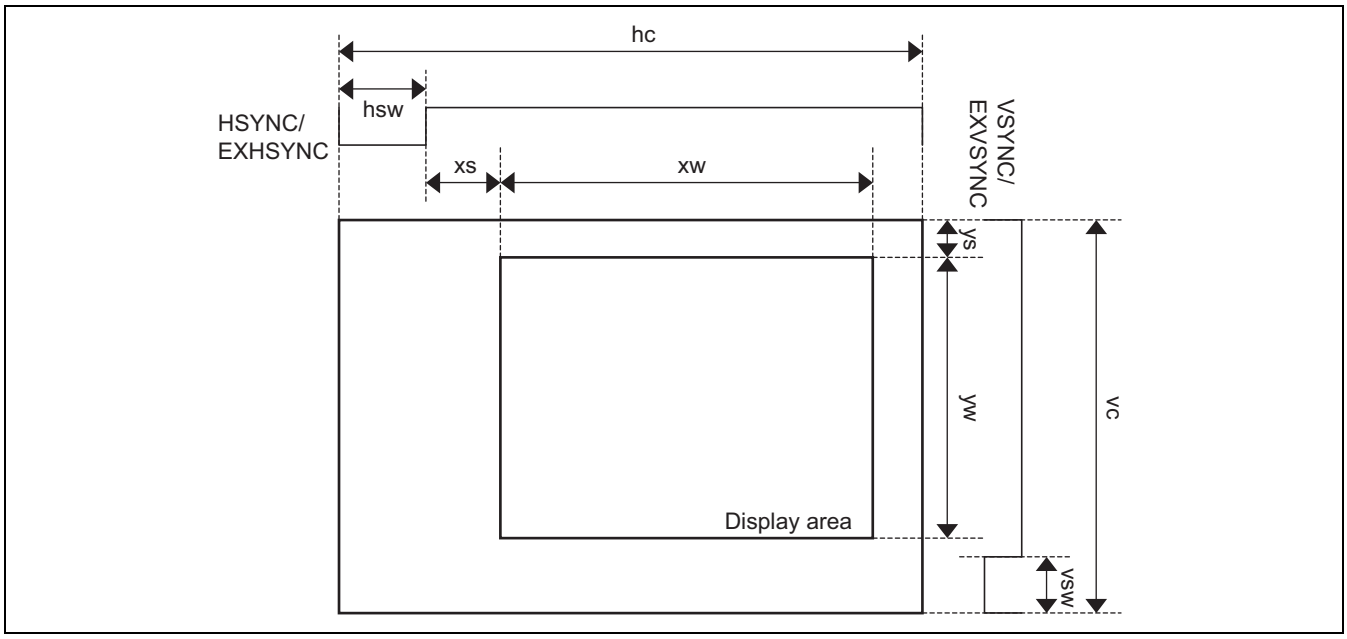

Figure 20.24 Display Timing Generation for Horizontal Direction and Vertical Direction of Display Screen

Table 20.40 Variables Defined in Display Screen

Variables	Contents	Units
hc*1	Horizontal scan period	Dot clock
hsw	Horizontal sync pulse width	Dot clock
xs	From rise of HSYNC to display start position in the horizontal direction of the display screen	Dot clock
xw	Display width per 1 raster of display screen	Dot clock
vc*2	Vertical scan period	Raster line
vsw	Vertical sync pulse width	Raster line
ys	From rise of VSYNC to display start position in the vertical direction of the display screen	Raster line
yw	Vertical display period of display screen	Raster line

Notes: 1. Should be set such that hsw + xs + xw < hc
2. Should be set such that vsw + ys + yw < vc

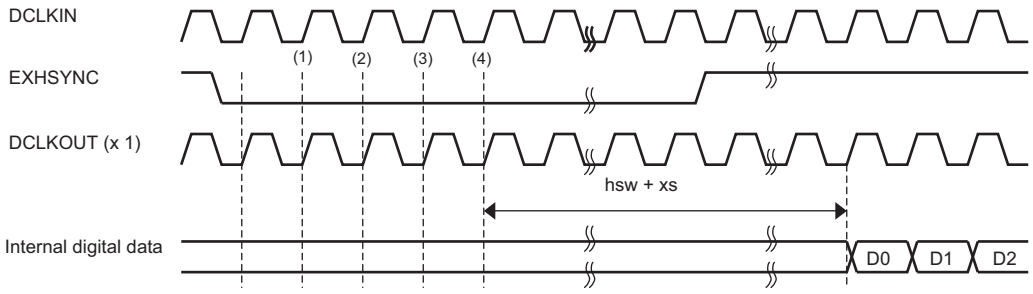
The display timing generation register settings are different depending on the scan method and synchronization method. Hence the value of the display timing generation registers should be set after performing calculations like those indicated in Table 20.41.

Table 20.41 Correspondence Table of Settings of Display Timing Generation Registers

		Synchronization Method	
Register Name	**Bit Name**	**Master Mode**	**TV Sync Mode**
Horizontal display start register n (HDSRn)	HDS	hsw + xs – 19*5, (hsw + xs – 19 – 1 when DVENC is used)	hsw + xs - 25*2*5
Horizontal display end register n (HDERn)	HDE	hsw + xs – 19*5 + xw, (hsw + xs – 19 – 1 + xw when DVENC is used)	hsw + xs – 25 + xw*2*5
Vertical display start register n (VDSRn)	VDS	ys – 2*3	ys – 2*3
Vertical display end register n (VDERn)	VDE	ys – 2 + yw	ys – 2 + yw
Horizontal synch width register n (HSWRn)	HSW	hsw – 1	hsw – 1
Horizontal cycle register n (HCRn)	HC	hc – 1	hc – 1
Vertical synch point register n (VSPRn)	VSP	vc – vsw – 1	vc – vsw – 1
Vertical cycle register n (VCRn)	VC	vc – 1	vc – 1

Notes: n = 0 and 1

1. In all scan modes, VDS, VDE, VSP, VC settings are in single-field units.
2. The values of HDS and HDE are from the fourth rising edge of DCLKOUT after detection of the falling edge of EXHSYNC through the rising edge of DCLKOUT.



3. VDS should be set to 1 or greater.
4. HC should be set so as to satisfy HC > HDE.
5. If the function below is used, the following correction value is subtracted from both HDS and HDE in Table 20.41.

When using the RGB-YC conversion function (RGBYC0 or RGBYC1 bits in the display unit extensional function control 5 register (DEF5R) are set to 1), 3 should be subtracted.

20.5.2 CSYNC

In master mode, a CSYNC (composite sync) signal is output. EQWRn* is used to set the low-level pulse width of the CSYNC equivalent pulse. SPWRn* is used to set the low-level pulse width of the CSYNC serration pulse.

The CSYNC waveform is selected using the CSY bit in DSMRn*.

Note: * n = 0 and 1

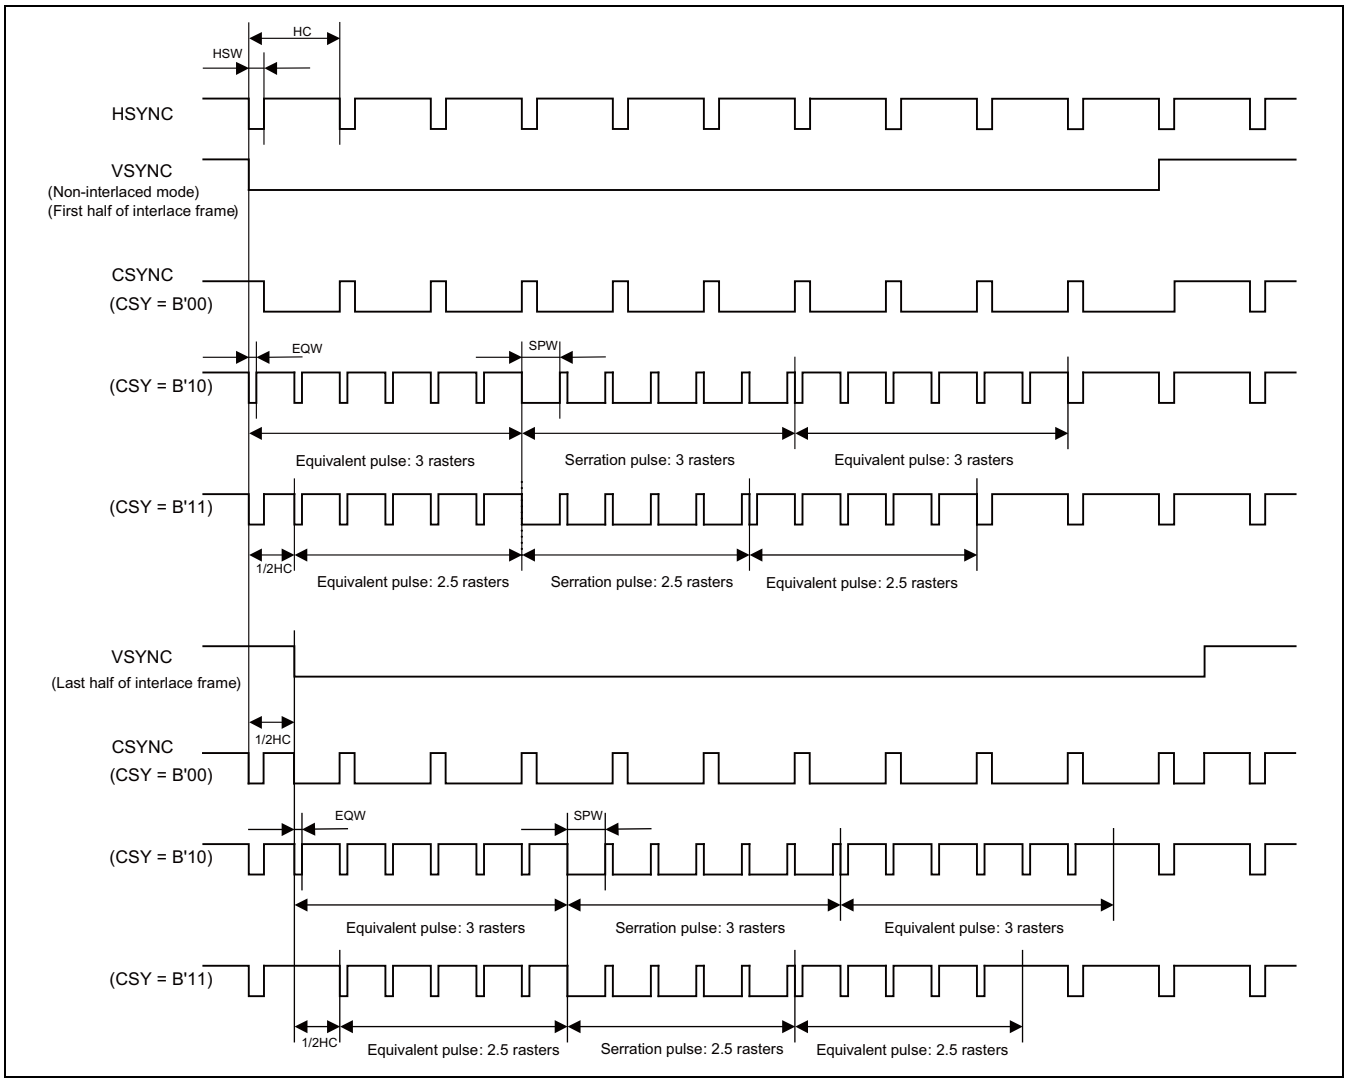


Figure 20.25 CSYNC Timing Chart

20.5.3 Scan Method

The scan method can be selected from among non-interlaced mode, interlaced sync mode, and interlaced sync & video mode. The mode is selected using bit 5 and bit 4 in DSYSRn*.

- Non-interlaced mode
  In this scan method, one frame consists of a single field.
- Interlaced sync mode
  In this scan method, one frame consists of two fields. The two fields are an even field and an odd field, displaying the same data.
- Interlaced sync & video mode
  In this scan method, one frame consists of two fields. The two fields are an even field and an odd field, displaying different data.

The ODEV bit in DSMRn* is used to set the display order of fields in interlaced sync mode and in interlaced sync & video mode. When the ODEV bit is 0, the display order for one frame is odd field, then even field; when the ODEV bit is 1, the order for one frame is even field, then odd field.

In master mode, high level is output from the ODDF pin during even field display, and low level is output during odd field display. In TV sync mode, high level is input to the EXODDF pin to cause display of the even field, and low level is input to cause display of the odd field.

Note: When non-interlaced mode is selected in TV sync mode, the EXODDF pin should be fixed at low level or high level.

* n = 0 and 1.

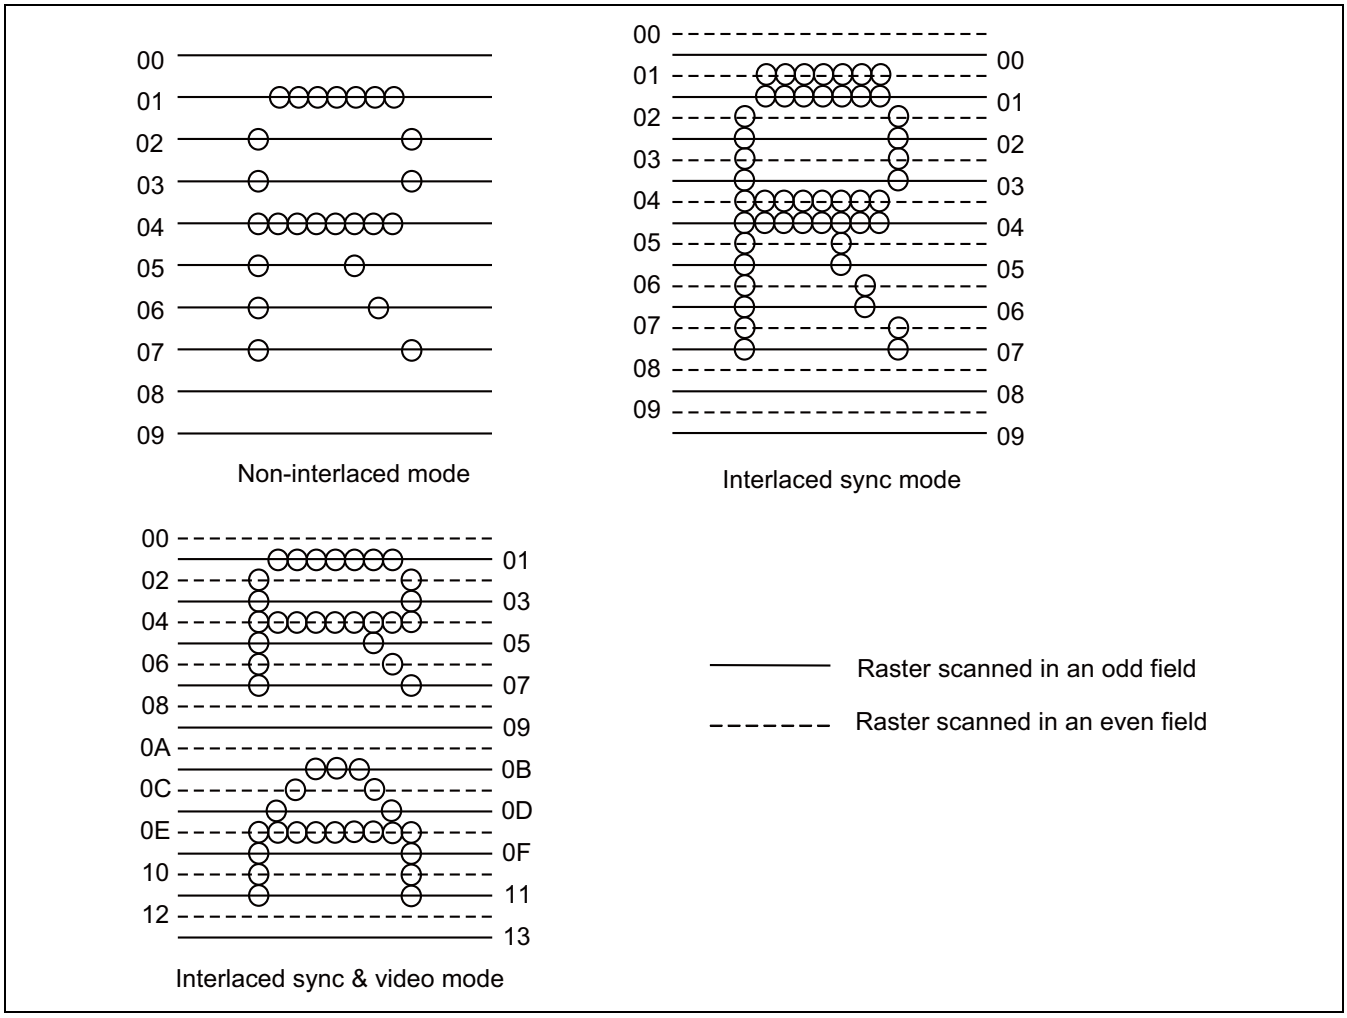

Figure 20.26 Example of Display in Each Scan Mode

- Example of vertical scan period
  Non-interlaced mode: 1/60 second/field, 1/30 second/field
  Interlaced sync mode: 1/30 second/frame
  Interlaced sync & video mode: 1/30 second/frame
- Display in non-interlaced method
  In this method, all lines are displayed at once without providing intervals between input video signals.
  This input method is for monitors capable of high-resolution display.

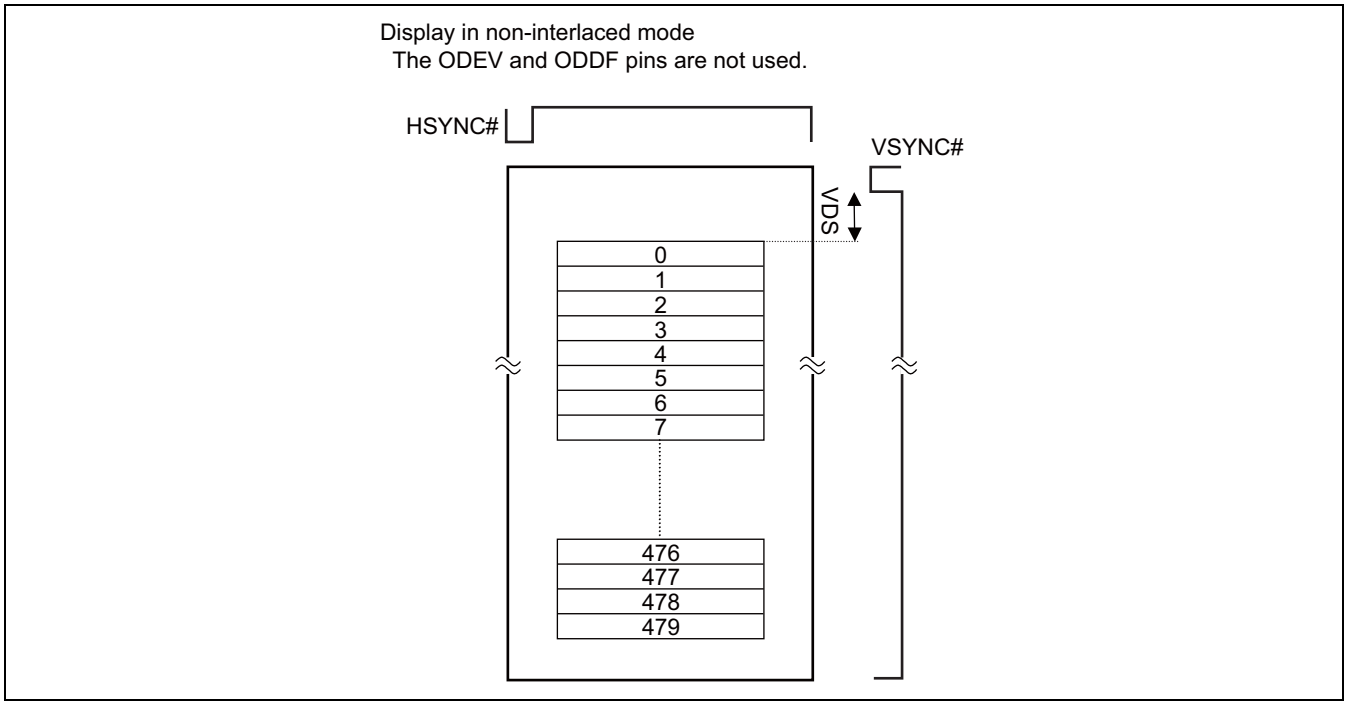

Figure 20.27 Display in Non-Interlaced Method

- Display in interlaced method

  At every scan period VC of the input video signal, even lines and odd lines are switched and displayed in alternation, and a single screen (one frame) is combined and displayed (with the afterimage of the preceding VC) with a period of 2VC. This is a basic TV input method.

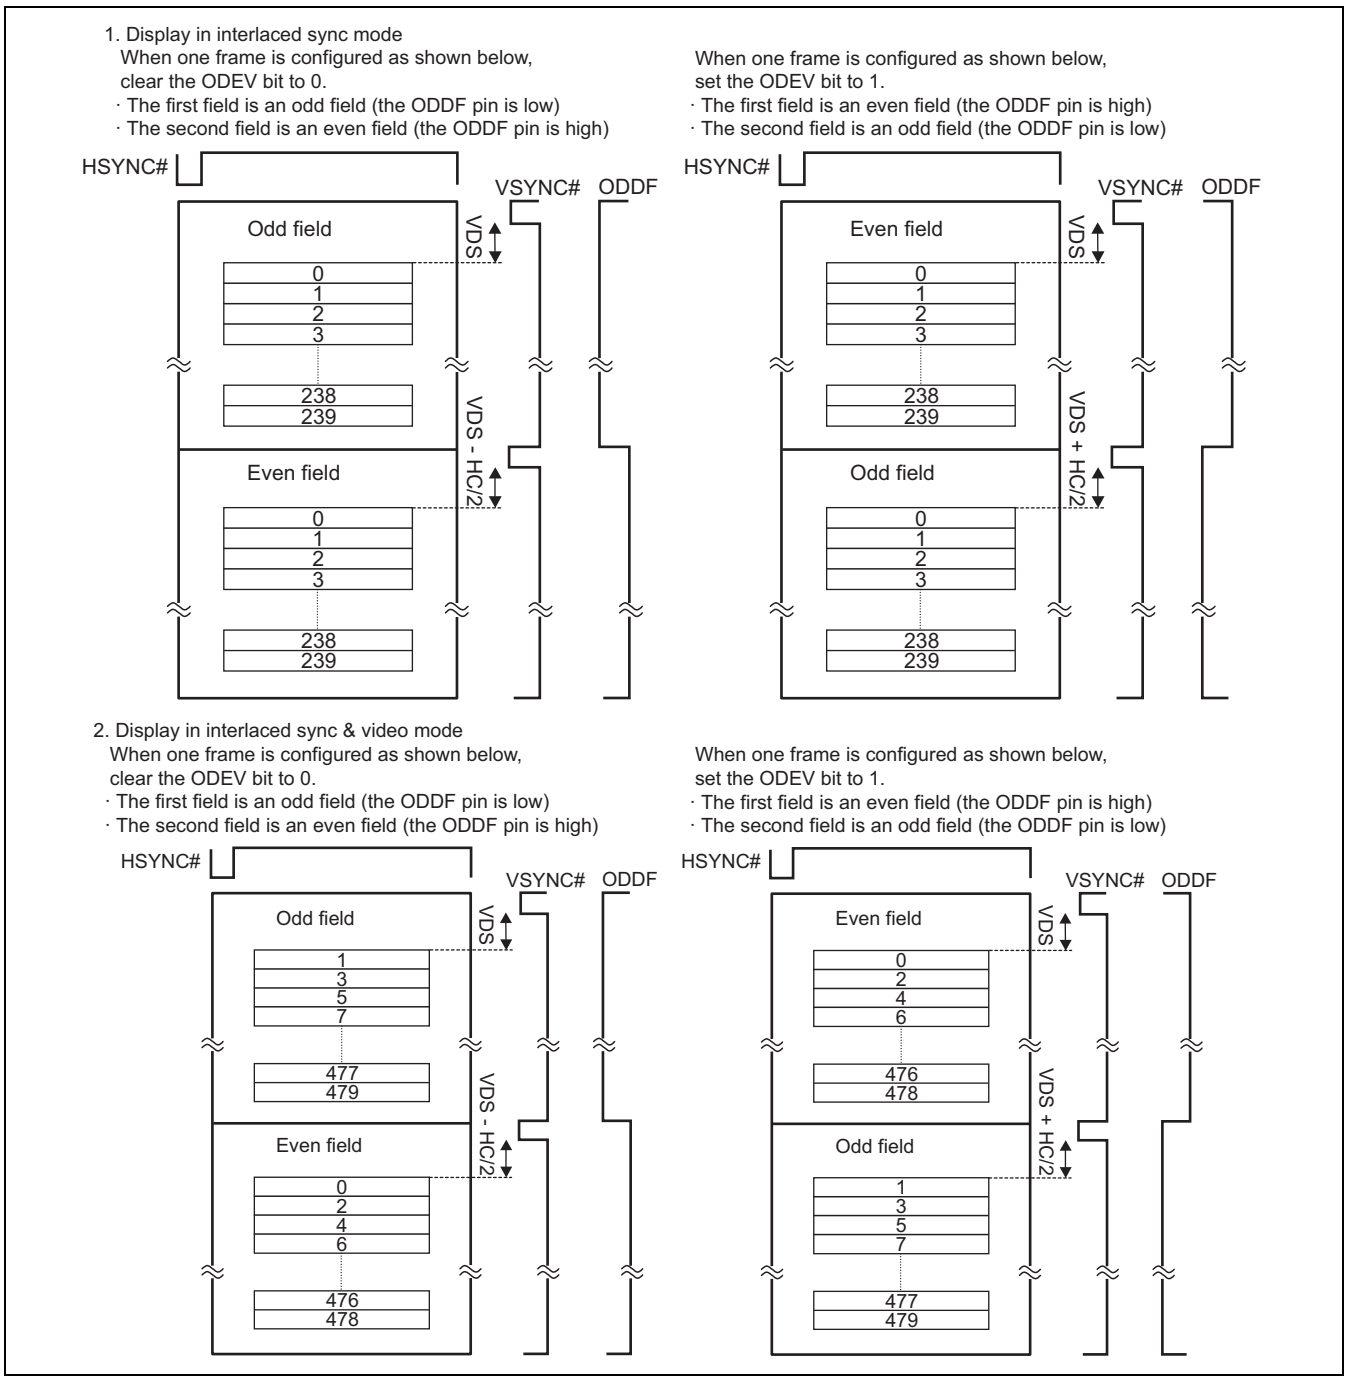

Figure 20.28 Display in Interlaced Method

20.5.4 Color Detection

When output display data matches a color set in CDERn*, high level is output from the CDE pin. The CDEM bit in DSMRn* can be used to fix the level outside display intervals. Also, the CDEL bit in DSMRn* can be used to select the polarity of the output level.

When the following display functions are set, the color detection function cannot be used.

- RGBYC processing performed by setting the RGBYC0 or RGBYC1 bits in the display unit extensional function control 5 register (DEF5R)

Note: * n = 0 and 1.

Table 20.42 Output Level of the CDE Pin

		The CDE pin in display intervals		The CDE pin outside display intervals	
		Result of Comparison of Output Display Data and Color Detection Register		Value of Color Detection Register*	
CDEL	CDEM	Same	Different	0	Other than 0
0	B'00	High level	Low level	High level	Low level
0	B'01	High level	Low level	High level	Low level
0	B'10	High level	Low level	Low level	Low level
0	B'11	High level	Low level	High level	High level
1	B'00	Low level	High level	Low level	High level
1	B'01	Low level	High level	Low level	High level
1	B'10	Low level	High level	High level	High level
1	B'11	Low level	High level	Low level	Low level

Note: * Output display data is 0 outside display intervals.

20.5.5 External Sync Control

In TV-sync mode, the display unit (DU) is capable of using an externally input dot clock (clock signal for frequency multiplication: DCLKIN) to generate a dot clock (output dot clock: DCLKOUT) that is in accord with external synchronizing signals (EXHSYNC, EXVSYNC). Supply the externally input dot clock (multiplication clock: DCLKIN) and set the following parameters in ESCRn*.

Table 20.43 External Sync Control Parameters

Variable	Function
ESCRn*/SYNCSEL	Selects the sync signal (EXHSYNC or EXVSYNC) to use in phase matching of the dot clock.
ESCRn*/FRQSEL	Selects the dot-clock division ratio.

1. Use the SYNCSEL bits of ESCRn* to set the sync timing of the dot clock (output dot clock: DCLKOUT) generated from the internal dot clock.
2. Use the FRQSEL bits of ESCRn* to set the division ratio for generation of the internal dot clock. The following figure shows the internal dot clock timing where the input dot clock has been synchronized with EXHSYNC and then divided by four.

Note * n = 0 and 1.

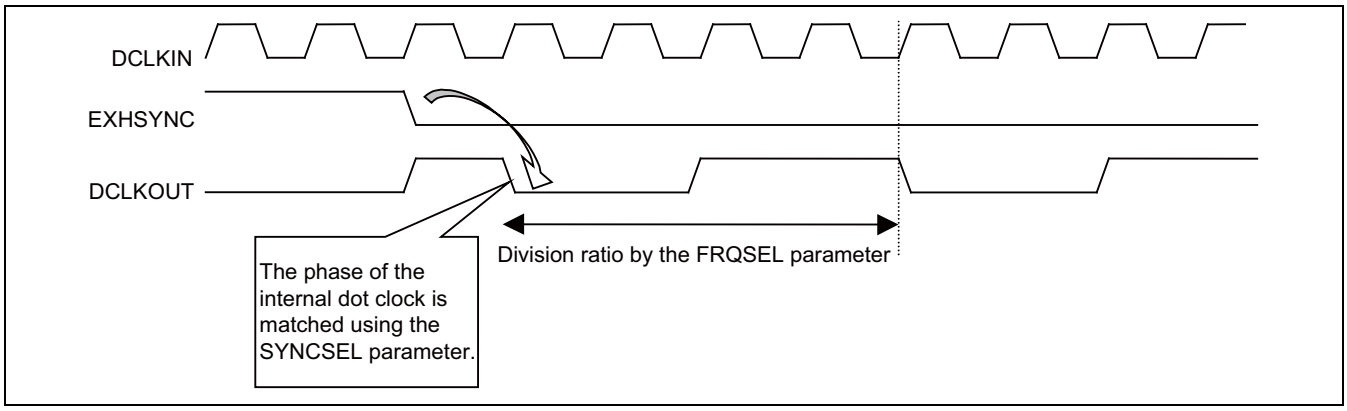

Figure 20.29 DCLKOUT Timing Chart where DCLKIN Synchronized with EXHSYNC is divided by Four

20.5.6 Output Signal Timing Adjustment

The display unit (DU) enables selection of output timing, with respect to the output dot clock, of the various output signals (the four sync signals HSYNC, VSYNC, CSYNC, ODDF, as well as DISP, CDE, CLAMP, DE, digital RGB signals). Timing is selected by setting OTARn*.

Note: * n = 0 and 1.

Table 20.44 Output Signal Timing Setting Parameters

Variable	Description
SYNCA	Sets output timing of the HSYNC, VSYNC, CSYNC, ODDF signal
DISPA	Sets output timing of the DISP signal
CDEA	Sets output timing of the CDE signal
DRGBA	Sets output timing of digital RGB signal
CLAMPA	Sets output timing of the CLAMP signal
DEA	Sets output timing of the DE signal

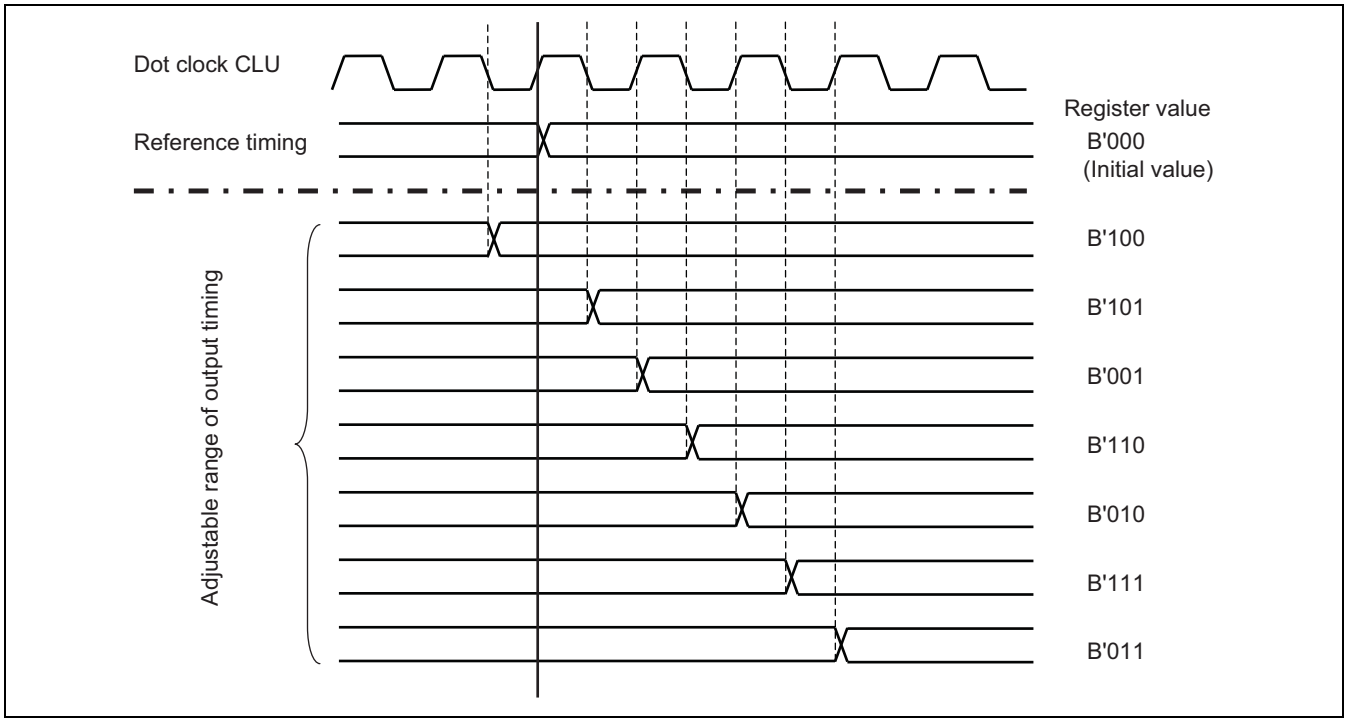

Figure 20.30 Adjustable Range of Output Timing

20.6 Notes on Usage

20.6.1 Module Standby Mode

Module Standby mode, in which supply of the clock signal to the display unit (DU) is stopped, is supported.

Even when the display unit (DU) enters the standby mode, the register values are retained. Do not access the display unit (DU) during periods in standby mode.

20.6.2 Transition to Module Standby Mode

1. Set both the DEN and DRES bits in DSYSR0 to 0 to stop access to the AXI.
2. Test bit 11 in DSSRn* to confirm the next VBK flag. The setting made in step 1 becomes effective with the timing of VBK and access to AXI is stopped. The value of the display data becomes the value set in DOORn*
   When DU0 and DU1 are running, test bit 11 of both DSSR0 and DSSR1.
3. Stop the clock.

Note: * n = 0 and 1.

20.6.3 Release from Module Standby Mode and Restarting Display

1. Start the clock.
2. Make settings to turn the display on by setting the DEN and DRES bits in DSYSR0 to 1 and 0 respectively.

20.6.4 Acquisition of External Sync Signal

The following three ways of acquiring the external SYNC signal are available.

(a) The SYNC signal is acquired on rising edges of DCLKIN (or the frequency-divided clock signal derived from this if division has been set up).
(b) The SYNC signal is acquired on falling edges of DCLKIN (or the frequency-divided clock signal derived from this if division has been set up).
(c) Assuming that division has been set up, the SYNC signal that is acquired by the pre-division clock signal is latched on edges of the frequency-divided clock signal.

The electrical characteristics (AC spec.) are only guaranteed for case (a) above. There is no guarantee of electrical characteristics (AC spec.) for cases (b) and (c).

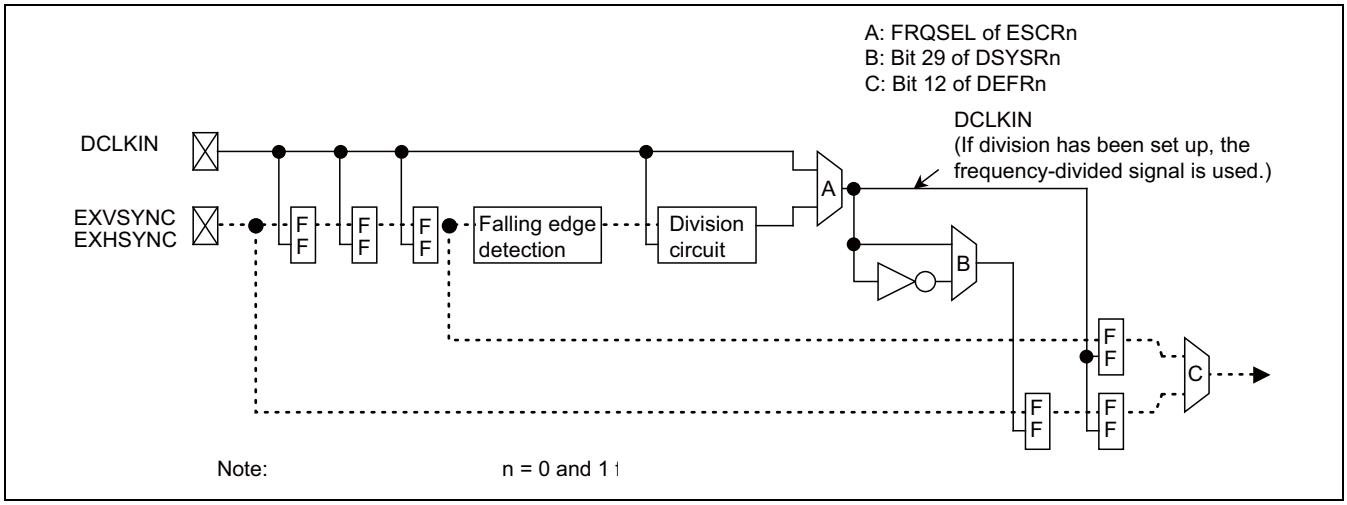

Figure 20.31 Diagram of Circuit that Generates the Display Timing from an External Sync Signal

20.6.5 Restrictions on Changing the Synchronization of the External SYNC Signal

When electrical characteristics (AC spec.) related to the acquisition of an external signal are not satisfied, ensure an interval of at least two cycles between changes of EXHSYNC or EXVSYNC, i.e. the external SYNC signals.

The frequency-divided dot clock is used as the basis of the cycle period when bit 12 of DEFRn* is 0. The pre-division dot clock is used when bit 12 is 1.

Note: * n = 0 and 1.

20.6.6 Note on Register Settings

At the time of a reset, some registers of the DU have fixed initial values but others do not. The initial values of the latter when the power for the LSI is turned on can be either 0 or 1. From the initial state after power is switched on, be sure to set all of the registers in the DU to the desired values before starting synchronization of the display*[1].

If turning on the display*[2], α planes*[3], or capturing*[4] is attempted while values in registers are unknown, operation may be incorrect due to access by the DU to areas other than those intended (the DU is capable of access to any area).

Notes: 1. Setting (a) or (b) starts synchronization of the display.
(a) The DRES and DEN bits in DSYSR0 are B'00.
(b) The DRES and DEN bits in DSYSR0 are B'01.

2. Setting (a) or (b) turns the display on.
(a) When the DPRS bit in DORCR is 0:
With setting (b) in note 1, setting any of bits DPE8 to DPE1 in DPPR to 1.
(b) When the DPRS bit in DORCR is 1:
With setting (b) in note 1, setting bits S0S8 to S0S1 in DS0PR or bits S1S8 to S1S1 in DS1PR to any value from B'0001 to B'1000.

3. α planes are turned on by the combination of setting (b) in note 1 and any of bits AP2E or AP1E in DAPCR being set to 1.

4. Capturing is turned on by the combination of setting (b) in note 1 and the DC2E or DCE bit in DCPCR being set to 1.

20A. Digital Video Encoder

20A.1 Overview

This module (DVENC) incorporates the interlace DENC and outputs the encoded data to the Video DAC. The interlace DENC generates analog output composite Y/C from the input data (8 bits for each of Y and CB/CR). The DVENC supports the internal image quality adjustment function with 12-bit accuracy.

The D/A converter uses a p-channel source follower with an R-string D/A converter. It latches the 10-bit digital signal output from the NTSC/PAL encoder for conversion on rising edges of the 27-MHz clock signal and outputs a voltage corresponding to the input digital signal via the analog output pin, VO.

20A.1.1 Functions

- NTSC, PAL, PAL-M, PAL-N, and PAL-60 encode processing
- Y1+C composite (CVBS) signal generation
- Image quality adjustment function (12 bits)
  Color
  TINT
  Skin tone correction
  Brightness
  Contrast
  Black stretch
  Sharpness/ unsharpness
  γ correction
- Superimposition of CGMS (525i) or WSS (625i)
- Superimposition of closed caption
- BPF processing for chroma (C) signal
- Total gain control in response to changes in the full-scale voltage from the DAC
- The input signal from DU is 4:4:4 format only.
- Supports the NTSC/PAL composite output.
- Analog macro output voltage: 1.30 Vp-p (typ.)
  Caution: VCCQA_DAC = 3.3 V; Rload ≥ 10 kΩ; Cload ≤ 20 pF
  Refer to the section 20A.6 for the DAC pin connection example.
- Low-power-consumption function (power-down mode).

20A.1.2 Block Diagram

Figure 20A.1 shows a block diagram of the DVENC (The DU is connected to the DENC).

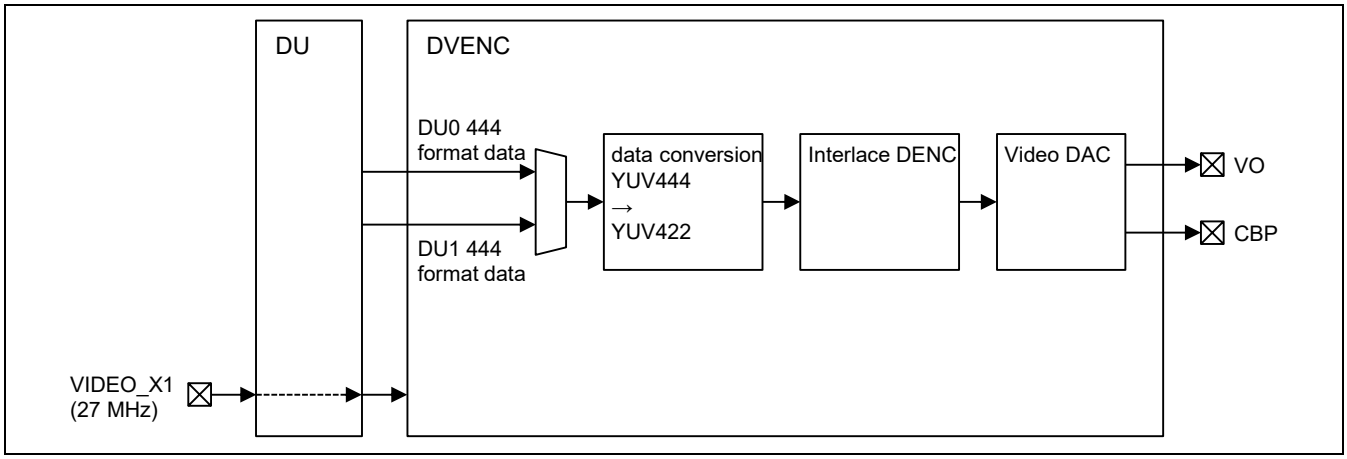

Figure 20A.1 DVENC Block Diagram

DAC power down and DU data select control	MOD_SEL5	R/W	H'E606 00D0*	H'0000 0000	32

Note: * A base address is different from DVENC register. Pin Function Controller (PFC) register (MOD_SEL5).

Table 20A.3 Register State in Each Processing Mode

	Power-On Reset	Module Standby
All registers	Initialized	Retained

20A.1.5 Low-Power-Consumption Mode

In addition to normal operating mode, this module has a low-power-consumption mode (power-down mode) in which the D/A converter is stopped. The module is placed in power-down mode by setting the DACPDB bit (bit4) to 0 in Pin Function Controller (PFC) register (MOD_SEL5). Similarly, the module is placed in power-down mode by setting the MSTP727 bit to 1 in module stop control register 7 (MSTPCR7). The module is released from the mode by setting the DACPDB bit to 1 and the MSTP727 bit to 0.

D/A conversion is restarted when the specified power up time (tup) has elapsed after setting of the DACPDB bit in MOD_SEL5 to 1 and the MSTP727 bit in MSTPCR7 to 0.

Table 20A.4 DACPDB, MSTP Bit and Operating Mode

MSTP727 Bit	DACPDB Bit	Operating Mode	Operation
0	1	Normal operating mode	D/A conversion is continued.
Others		Power-down mode	D/A conversion is stopped and the module is placed in low-power-consumption mode.

Note: default: MSTP727 = 1, DACPDB = 0

20A.2 Register Description

20A.2.1 DVENC Setting Register (VSET)

This address is “Write only”. Do not "Read".

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	VESEL	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	W	Reserved. The write value should always be 0.
14	VESEL	0	W	NTE* output of DU is input the encoder. When using the Digital video encoder, set this bit to ‘1’.
13 to 0	—	All 0	W	Reserved. The write value should always be 0.

Note: * for Digital video encoder

20A.2.2 DAC Output Setting Register (DENCOUT)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

20A.2.3 DAC Output Setting Register (DENCOUT2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	HDPD0[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 4	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
3 to 0	HDPD0[3:0]	0000	R/W	DAC Output Pin Output Select To output data to Video DAC, set to B'0011.

20A.2.4 DENC Output Select Register (DENCO20)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	YSEL[9:0]									
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
9 to 0	YSEL[9:0]	H'3FF	R/W	DAC Output Select All 0: Outputs data to DAC. All 1: Initial state Other than above: Setting prohibited

20A.2.5 NTSC/PAL Encoder Operating Mode Setting Register 1 (IDENCMD1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	R12	—	—	R9	R8	—	R6	R5	R4	—	—	R1	R0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R/W	R/W	R	R/W	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	—	0	R	Reserved. When using this module, set 1 to this bit.
12	R12	0	R/W	Slew Rate Limiter (CVBS) 0: Slew rate limiter disabled 1: Slew rate limiter enabled
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	R9	0	R/W	Field 2 Closed Caption Data Transfer Flag (CVBS) 0: Data update is set. 1: Data transfer is completed. Closed Caption data is updated in line 21 by writing 0 to this bit. After update is complete, R9 is set to 1.
8	R8	0	R/W	Field 1 Closed Caption Data Transfer Flag (CVBS) 0: Data update is set. 1: Data transfer is completed. Closed Caption data is updated in line 21 by writing 0 to this bit. After update is complete, R8 is set to 1.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	R6	0	R/W	WSS ON/OFF (CVBS) 0: OFF 1: ON (Set 0 for the 525-line/60-Hz operation.)
5	R5	0	R/W	Subcarrier Frequency 0: 3.58 MHz 1: 4.43 MHz
4	R4	0	R/W	Subcarrier Phase Control 0: Control ON 1: Control OFF (free-running)
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	R1	0	R/W	Field Frequency 0: 525 lines/60 Hz 1: 625 lines/ 50 Hz

Bit	Bit Name	Initial Value	R/W	Description
0	R0	0	R/W	NTSC/PAL Color-Difference Modulation 0: NTSC 1: PAL

20A.2.6 NTSC/PAL Encoder Operating Mode Register 2 (IDENCMD2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

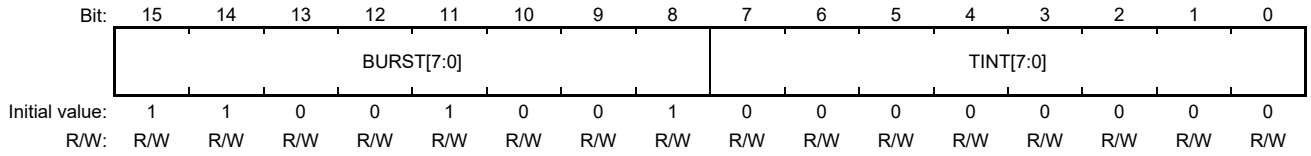
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W

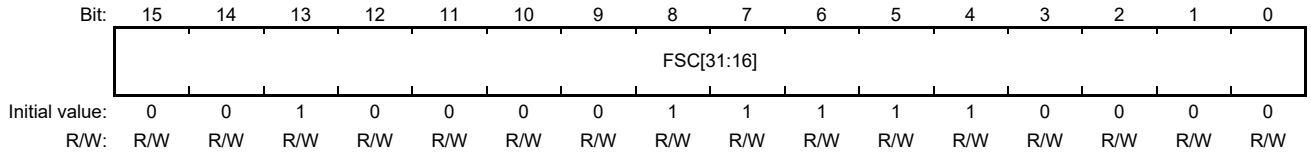
Bit	Bit Name	Initial Value	R/W	Description
15	R15	0	R/W	Upper Limit ON/OFF of Color Difference Signal after Image Quality Adjustment 0: Limit OFF 1: Limit ON
14	R14	0	R/W	Lower Limit ON/OFF of Color Difference Signal after Image Quality Adjustment 0: Limit OFF 1: Limit ON
13	R13	0	R/W	Upper Limit ON/OFF of Luminance Signal after Image Quality Adjustment 0: Limit OFF 1: Limit ON
12	R12	0	R/W	Lower Limit ON/OFF of Luminance Signal after Image Quality Adjustment 0: Limit OFF 1: Limit ON
11	R11	0	R/W	Upper Limit ON/OFF of Input Color Difference Signal 0: Limit OFF 1: Limit ON
10	R10	0	R/W	Lower Limit ON/OFF of Input Color Difference Signal 0: Limit OFF 1: Limit ON
9	R9	0	R/W	Upper Limit ON/OFF of Input Luminance Signal 0: Limit OFF 1: Limit ON
8	R8	0	R/W	Lower Limit ON/OFF of Input Luminance Signal 0: Limit OFF 1: Limit ON
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	Y1SETUP [1:0]	00	R/W	Luminance Signal Setup (CVBS) 00: Setup OFF 01: +7.5IRE Setup 10: -7.5IRE Setup 11: Setting prohibited

20A.2.7 TINT Burst Amplitude Setting Register for Interlace Output (ITNTBLEV)



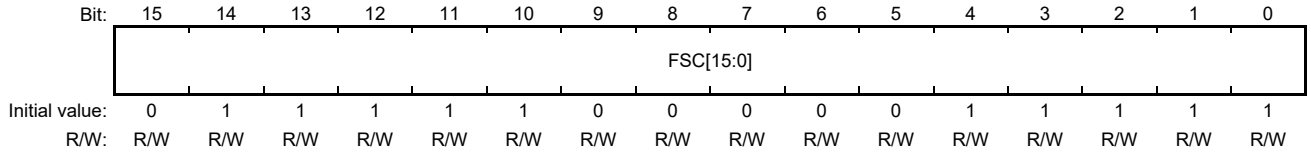
Bit	Bit Name	Initial Value	R/W	Description
15 to 8	BURST[7:0]	H'C9	R/W	Burst Amplitude Level Amplitude = (BURST – 256) × 16/4095 × Vp-p (for NTSC)
7 to 0	TINT[7:0]	H'00	R/W	Color Difference Signal (C) TINT (Hue) Hue (degree) = (TINT – ICSP[15:8]) × 1.4 Settable range: 0 to 357 [degrees]

20A.2.8 Subcarrier Frequency (MSB) Setting Register (IFSCH)



Bit	Bit Name	Initial Value	R/W	Description
15 to 0	FSC[31:16]	H'21F0	R/W	Subcarrier Frequency *1: Refer to a “20A.2.9 Note *”.

20A.2.9 Subcarrier Frequency (LSB) Setting Register (IFSCL)



Bit	Bit Name	Initial Value	R/W	Description
15 to 0	FSC[15:0]	H'7C1F	R/W	Subcarrier Frequency *

Note: * FSC [31:0] = {IFSCH Register, IFSCL Register}
Frequency = (27/232) × FSC [31:0]
M-NTSC: H'21F07C1F
B/G/I-PAL: H'2A098ACB
M-PAL: H'21E6EFE3
N-PAL: H'21F69447

20A.2.10 Delay Amount Setting Register for Interlace Output (IDLYSET)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	Y1DLY[5:0]						—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 8	Y1DLY[5:0]	000000	R/W	Luminance Signal (Y on CVBS) Output Delay from C (indicated by 2's complement)
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

20A.2.11 Luminance Signal Synchronization Level Setting Register for Interlace Output (ISYNSET)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	SYNDLY[4:0]					Y1SYNC LEVEL[7:0]							
Initial value:	0	0	0	1	0	1	0	1	1	1	0	1	1	0	1	1
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

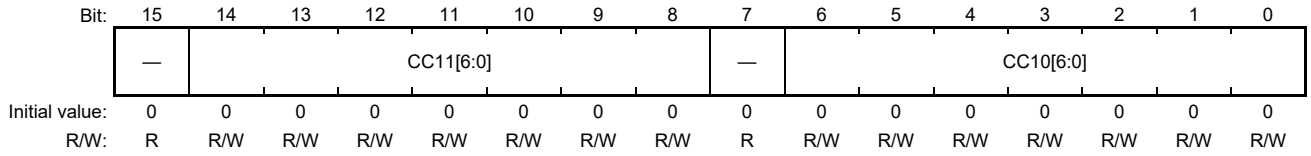
Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	SYNDLY [4:0]	H'15	R/W	Synchronization Setting Set to H'15.
7 to 0	Y1SYNC LEVEL[7:0]	H'DB	R/W	Luminance Signal (CVBS) Synchronization Amplitude Level Synchronization signal amplitude = SYNCLEVEL × 4/4095 × Vp-p

20A.2.12 Closed-Caption, CGMS, WSS Setting Mode Register for Interlace Output (ICCCGWS)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	R6	R5	—	—	Y1CC[1:0]		R0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6	R6	0	R/W	Closed Caption Automatic Null Code Generation ON/OFF (CVBS) 0: ON 1: OFF
5	R5	0	R/W	VBI Bypass Setting (CVBS) 0: Bypasses the VBI signal multiplexed to lines 10 to 19 or lines 273 to 282 during the 525-line/60-Hz operation. Bypasses the VBI signal multiplexed to lines 6 to 22 or lines 318 to 335 during the 625- line/50-Hz operation. 1: Outputs the above lines as blanking levels. Note: Set the R5 bit to 1 for interlace output.
4, 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2, 1	Y1CC[1:0]	00	R/W	Closed Caption Setting (CVBS) 00: OFF 01: For field 1 only 10: For field 2 only 11: For both fields
0	R0	0	R/W	CGMS ON/OFF Setting (CVBS) 0: OFF 1: ON Set the R0 bit to 0 for the 625-line/50-Hz operation (field frequency setting).

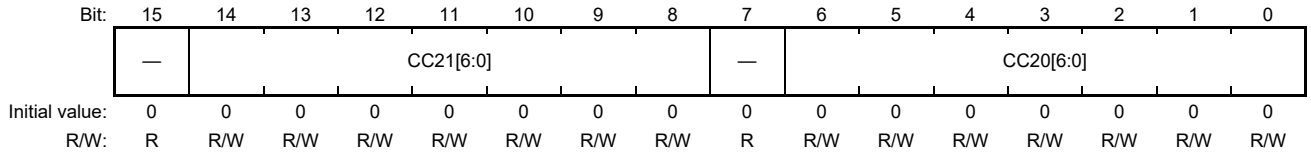
20A.2.13 CVBS Closed-Caption Data (1st Field) Setting Register (ICCD1)



Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	CC11[6:0]							—	CC10[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 8	CC11[6:0]	H'00	R/W	Second-Byte Closed Caption Data to be Multiplexed to First Field (The odd parity is computed in the LSI using 7-bit data.)
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 0	CC10[6:0]	H'00	R/W	First-Byte Closed Caption Data to be Multiplexed to First Field (The odd parity is computed in the LSI using 7-bit data.)

20A.2.14 CVBS Closed-Caption Data (2nd Field) Setting Register (ICCD2)



Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	CC21[6:0]							—	CC20[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 8	CC21[6:0]	H'00	R/W	Second-Byte Closed Caption Data to be Multiplexed to Second Field (The odd parity is computed in the LSI using 7-bit data.)
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 0	CC20[6:0]	H'00	R/W	First-Byte Closed Caption Data to be Multiplexed to Second Field (The odd parity is computed in the LSI using 7-bit data.)

20A.2.15 CVBS CGMS/WSS Data Setting Register for Interlace Output (ICGWSD)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	CGWS[13:0]													
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

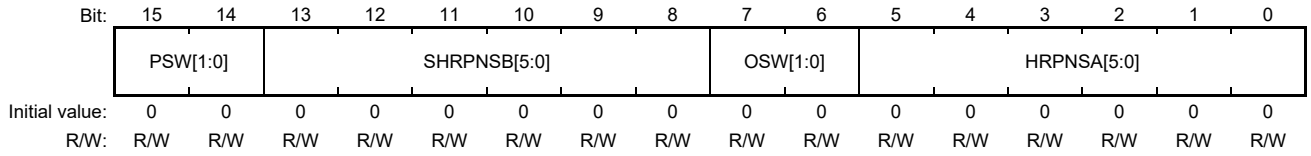
Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 0	CGWS[13:0]	H'0000	R/W	Sets the CGMS or WSS data. During the 525-line/60-Hz operation: CGMS data is set. (CRCC is computed in the LSI using 6-bit data.) During the 625-line/50-Hz operation: WSS data is set.

20A.2.16 Black Stretch and Sharpness Setting Register for Interlace Output (IBLKSHP)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	R15	SHLMT[6:0]							GAMMA_MODE[4:0]					—	BKPNT[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W

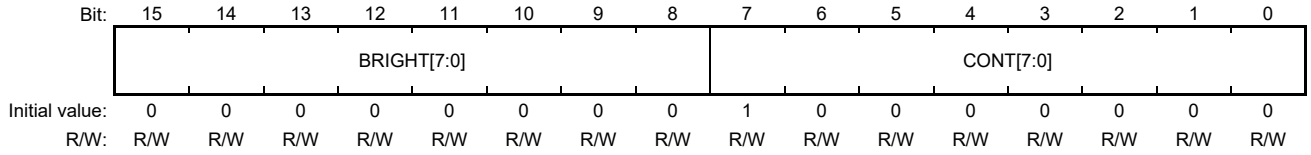
Bit	Bit Name	Initial Value	R/W	Description
15	R15	0	R/W	Unsharpness Function 0: OFF 1: ON
14 to 8	SHLMT[6:0]	H'00	R/W	Sharpness Operation Limit Level Sharpness correction is ON when the signal change amount is larger than SHLMT.
7 to 3	GAMMA_ MODE[4:0]	00000	R/W	γ Correction Mode (γ value) 00000: γ correction OFF When GAMMA_MODE[4] = 0, the γ value is: Y = 1/(1 + 0.05 × N) N = 1, 2, 3, 4, 5, 6, 8, 12, 20, or 40 B'0001: ≤ GAMMA_MODE[3:0] ≤ B'1010 When GAMMA_MODE[4] = 1, the γ value is: Y = 1 + 0.05 × N N = 1, 2, 3, 4, 5, 6, 8, 12, 20, or 40 B'0001: ≤ GAMMA_MODE[3:0] ≤ B'1010
2	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
1, 0	BKPNT[1:0]	00	R/W	Black Stretch Operating Mode 00: Black stretch OFF 01: Black stretch mode 1 10: Black stretch mode 2 11: Black stretch mode 3

20A.2.17 Sharpness Setting Register for Interlace Output (ISHRPSET)



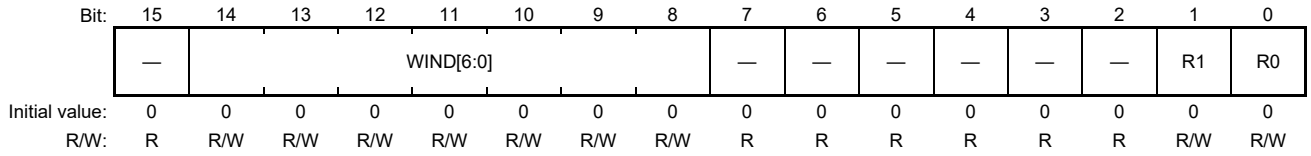
Bit	Bit Name	Initial Value	R/W	Description
15, 14	PSW[1:0]	00	R/W	Pre-Shoot Width Setting 00: 0T 01: 1T Other than above: 2T (T = 13.5 MHz, 1 clock)
13 to 8	SHRPNSB [5:0]	000000	R/W	Pre-Shoot Amplitude Setting Amplitude = (signal change amount) × SHRPNSB/128
7, 6	OSW[1:0]	00	R/W	Over-Shoot Width Setting 00: 0T 01: 1T Other than above: 2T (T = 13.5 MHz, 1 clock)
5 to 0	SHRPNSA [5:0]	000000	R/W	Over-Shoot Amplitude Setting Amplitude = (signal change amount) × SHRPNSA/128

20A.2.18 Brightness and Contrast Setting Register for Interlace Output (IBRTCON)



Bit	Bit Name	Initial Value	R/W	Description
15 to 8	BRIGHT[7:0]	H'00	R/W	Brightness Setting (2's complement) Output = Input + BRIGHT × 16
7 to 0	CONT[7:0]	H'80	R/W	Contrast Setting Output = (Input – 256) × CONT/128 + 256

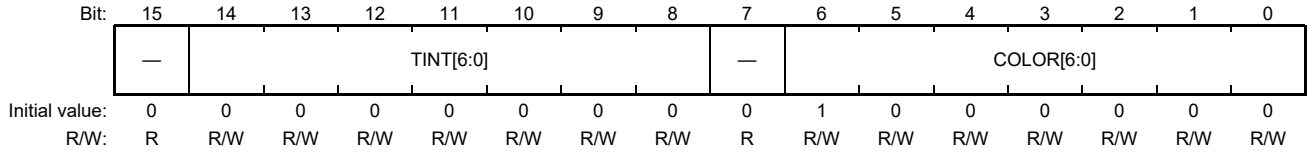
20A.2.19 Skin Tone Setting Register for Interlace Output (IHADA)



Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	WIND[6:0]							—	—	—	—	—	—	R1	R0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 8	WIND[6:0]	H'00	R/W	Skin Tone Correction Area Setting A window is set when WIND > | R + B |
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	R1	0	R/W	Skin Tone Correction Area B Control 0: Area B OFF 1: Area B ON
0	R0	0	R/W	Skin Tone Correction Area A Control 0: Area A OFF 1: Area A ON

20A.2.20 Color and TINT Setting Register for Interlace Output (ITNTCOL)



Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	TINT[6:0]							—	COLOR[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 8	TINT[6:0]	H'00	R/W	TINT (Phase) of Color Difference Signal Sets TINT in the unit of degrees (2's complement). Settable range: -45 to +45 degrees
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 0	COLOR[6:0]	H'40	R/W	Color Saturation of Color Difference Signal Cout = Cinput × COLOR/64

20A.2.21 Output Color Difference (C) Gain Adjustment Register for Interlace Output (ICGAIN)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CGAIN[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	CGAIN[11:0]	H'000	R/W	Output Color Difference (C) Gain Adjustment (indicated by 2's complement) Output = (Input – 2048) × (1 + CGAIN/4096) + 2048

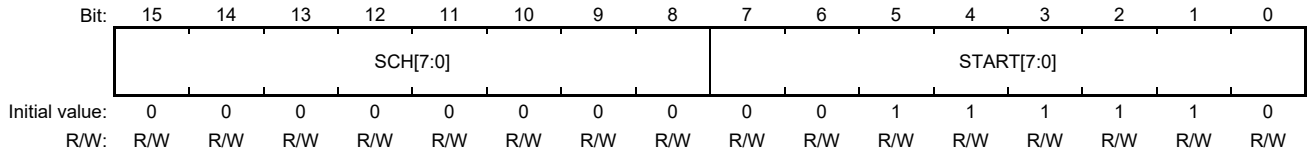
20A.2.22 Burst Insertion Position Setting Register for Interlace Output (IBURST)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	START[7:0]								END[7:0]							
Initial value:	0	1	0	0	0	1	0	1	0	1	1	0	0	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	START[7:0]	H'45	R/W	Burst Start Position Sets the period from Hsync to the burst start position. START + 4/13.5 MHz
7 to 0	END[7:0]	H'67	R/W	Burst End Position Sets the period from Hsync to the burst end position. END + 4/13.5 MHz

Recommended value: NTSC IBURST = H'4565
PAL-M IBURST = H'496B
PAL-60 IBURST = H'4765
PAL IBURST = H'4765
PAL-N IBURST = H'4765

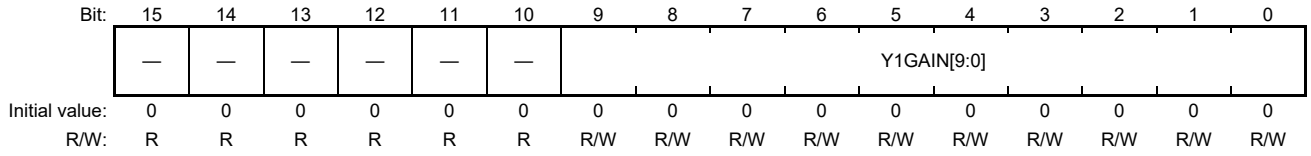
20A.2.23 Burst Advanced Start Position Setting Register for Interlace Output (ICSP)



Bit	Bit Name	Initial Value	R/W	Description
15 to 8	SCH[7:0]	H'00	R/W	SCH Timing Adjustment Adjusts the SCH in 1.4° steps. H'00 is recommended during NTSC operation.
7 to 0	START[7:0]	H'3E	R/W	Burst Advanced Start Position (START + 3.5)/13.5 MHz

Recommended value: NTSC ICSP = H'003D
PAL-M ICSP = H'0042
PAL-60 ICSP = H'0041
PAL ICSP = H'0041
PAL-N ICSP = H'0041

20A.2.24 Output Luminance Gain Adjustment Register for Interlace Output (IY1GAIN)



Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	Y1GAIN[9:0]	H'000	R/W	Output Luminance (Y1) Gain Adjustment (indicated by 2's complement) Output = (Input – 1024) × (1 + Y1GAIN/4096) + 1024

20A.2.25 DAC power down and DU data select control (MOD_SEL5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	DACPDB	—	—	—	DU1_SEL_MODE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
32 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	DACPDB	0	R/W	Controls power-down for the DAC. 0: Power-down state 1: Normal operation
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	DU1_SEL_MODE	0	R/W	DU data select 0: DU0 YUV 444 format data select 1: DU1 YUV 444 format data select Note: DU0/1 change make select in the state that stopped DU module.

Note: Setting mask register (H'E606 0000) immediately before setting this register. Write the inversion of the value to set.

20A.3 Operation

20A.3.1 Input/Output Specifications

The input/output video signal levels of the DENC block are shown below:

Input Video Signal

- 720 dots × 480 lines 4:2:2 format
- Y = 8 bits/27 Mbps 16 to 235 straight binary
- Cb/Cr = 8 bits/27 Mbps 16 to 240 128 offset binary

Output Video Signal

- 720 dots × 480 lines 4:4:4 format
- CVBS = 10 bits/27 Mbps 256 to 985 straight binary + Sync (pedestal = 256)

[Supplementary Note]

Figure 20A.3 shows the input waveform of the 525i.

In this LSI, the input signal to the DVENC is generate by the DU (DU0/DU1).

DU setting the following register is required.

Case when the 525i setting: DU0

```
// DU0 clock setting
DIDSR = H'77900300     : When you use the DU0, set this by all means.
DEFR0 = H'77730001     : bit0 DEFE DU0/1 common setting
ESCR0 = H'00000001     : select input clock, division setting
DSMR0 = H'01000100     : DU terminal setting
DEF5R = H'66040021     : Interface behaviour of the NTSC encoder, selected non-multiplexed YC

// DU0 timing setting
HDSR0 = H'00000066     : 102, Horizontal display start point
HDER0 = H'00000336     : 822, Horizontal display end point
VDSR0 = H'0000000A     : 10, Vertical display start point
VDER0 = H'000000FA     : 250, Vertical display end point
HSWR0 = H'0000003B     : 59, Horizontal sync pulse width
HCR0 = H'00000359      : 857, Horizontal scanning period
VSPR0 = H'000000FF     : 255, Vertical sync point
VCR0 = H'00000105      : 261, Vertical scanning sync point

// DU0 sample of setting from RGB to YUV conversion factor
YCLRP = H'0000020E
YCLGP = H'00000408
YCLBP = H'000000C9
YCLAP = H'00000010;
CBCLRP = H'0000112F;
CBCLGP = H'00001254;
CBCLBP = H'00000383;
CBCLAP = H'00000080;
```

```
CRCLRP = H'00000383;
CRCLGP = H'000012F2;
CRCLBP = H'00001091;
CRCLAP = H'00000080;

// DU0 data selector (Chapter 5.Pin Function Controller (PFC) Register: MOD_SEL5 bit0 DU1_SEL_MODE)
// DU1_SEL_MODE = 0 (DU0 select Register default)
H'E6060000 = H'FFFFFFEF;
H'E60600D0 = H'00000010;
```

Case when the 525i setting: DU1

```
// DU1 clock setting
DIDSR = H'77900C00     : When you use the DU1, set this by all means.
DEFR0 = H'77730001     : bit0 DEFE DU0/1 common setting
ESCR1 = H'00000001     : select input clock, division setting
DSMR1 = H'01000100     : DU terminal setting
DEF5R = H'66040081     : Interface behaviour of the NTSC encoder, selected non-multiplexed YC

// DU1 timing setting
HDSR1 = H'00000066     : 102, Horizontal display start point
HDER1 = H'00000336     : 822, Horizontal display end point
VDSR1 = H'0000000A     : 10, Vertical display start point
VDER1 = H'000000FA     : 250, Vertical display end point

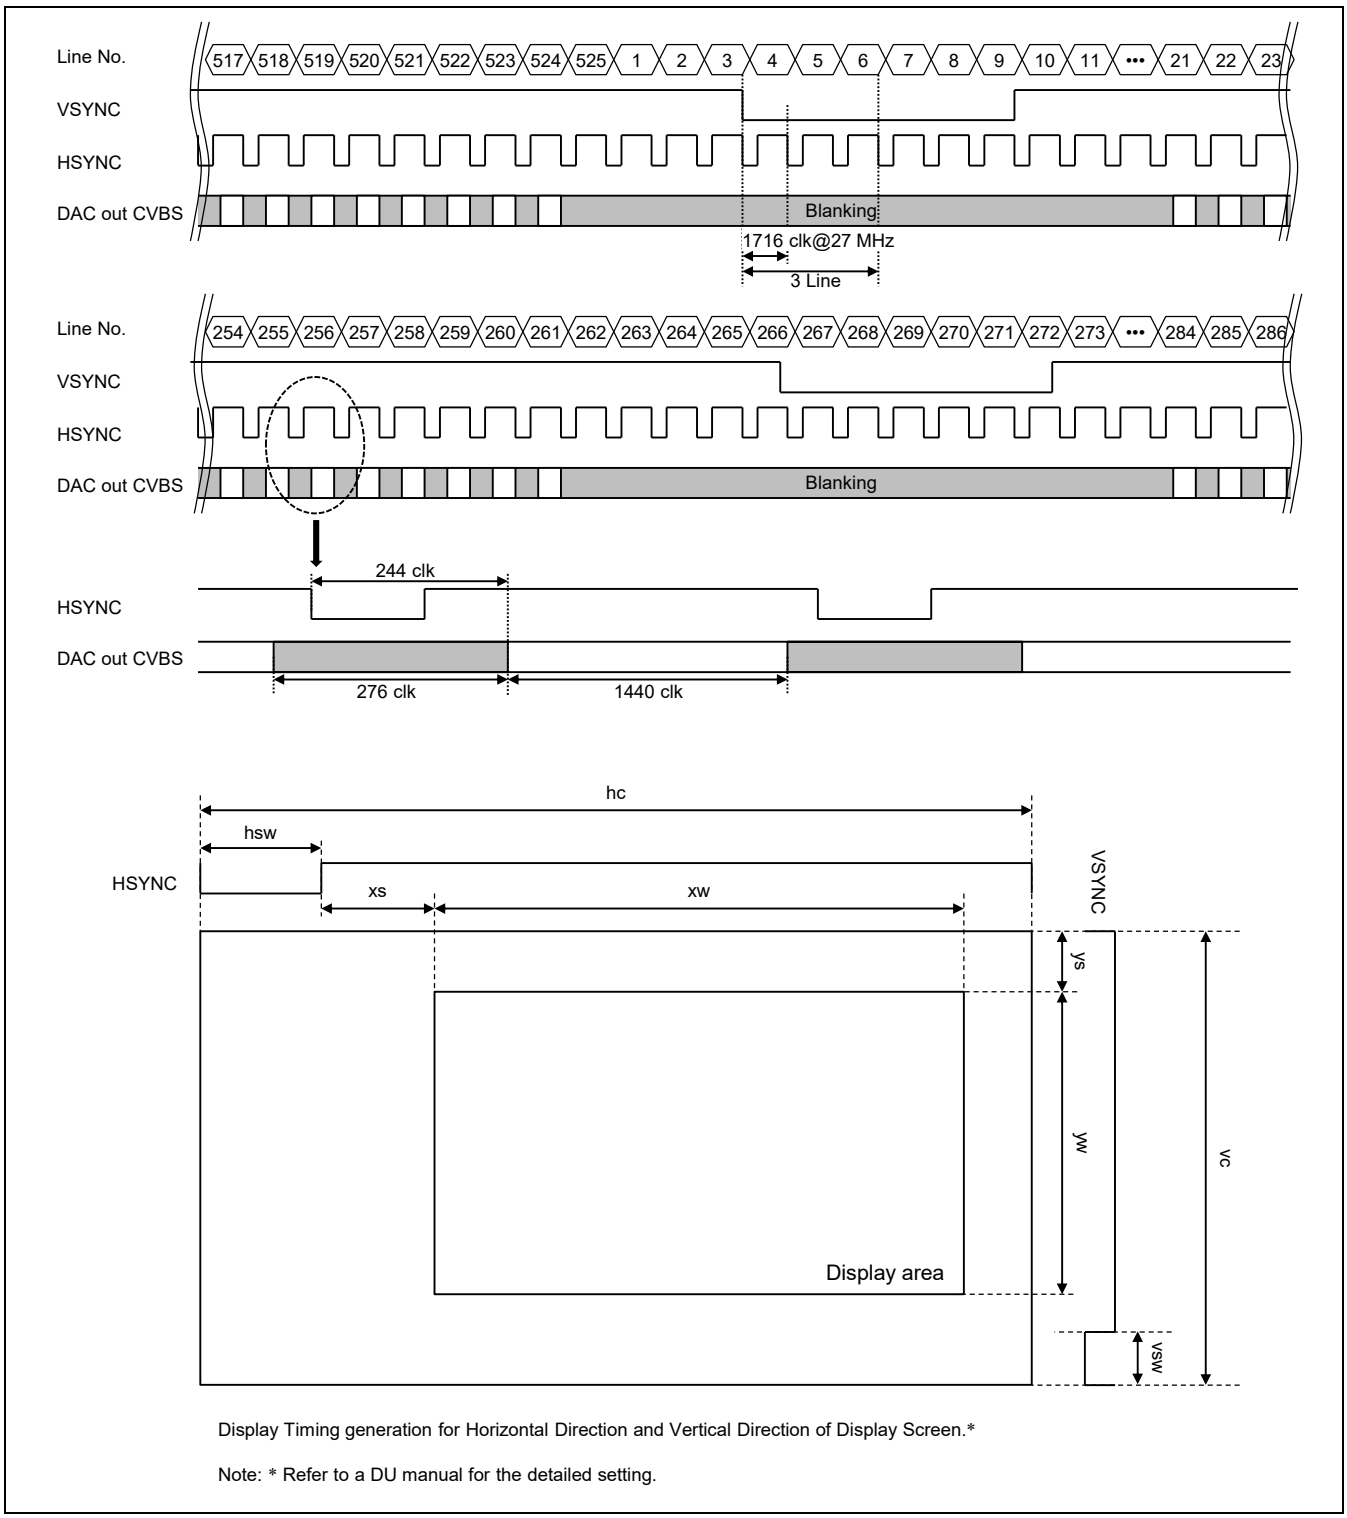
CRCLRP = H'03830000;
CRCLGP = H'12F20000;
CRCLBP = H'10910000;
CRCLAP = H'00800000;

// DU1 data selector (Chapter 5.Pin Function Controller (PFC) Register: MOD_SEL5 bit0 DU1_SEL_MODE)
// DU1_SEL_MODE = 1 (DU1 select)
H'E6060000 = H'FFFFFFEE;
H'E60600D0 = H'00000011;
```



Display Timing generation for Horizontal Direction and Vertical Direction of Display Screen.*

Note: * Refer to a DU manual for the detailed setting.

Figure 20A.3 input waveform of the 525i

20A.4 Specifications for the Inside of Interlace DENC

This section describes the specifications for blocks of the interlace DENC.

20A.4.1 Input/Output Specifications

This module performs limiter processing depending upon the settings of bits R8, R9, R10, and R11 of the IDENCMD2 register. The processing is skipped when these bits are set to 0 (through).

IDENCMD2.R11 = 1: C ≤ 240 (H'F0)

IDENCMD2.R10 = 1: 16 (H'10) ≤ C

IDENCMD2.R9 = 1: Y ≤ 235 (H'EB)

IDENCMD2.R8 = 1: 16 (H'10) ≤ Y

In addition, the block multiplexes into one signal in a time division manner the color difference signals that are separately input as Cb/Cr (a signal that indicates the distinction between Cb/Cr is also output).

20A.4.2 Image Quality Adjustment Functions

Of the image quality adjustment functions, the sharpness, contrast, brightness, and γ correction adjustments are performed on luminance signals; and the color correction, TINT correction, and skin tone correction adjustments are performed on color difference signals.

20A.4.3 Video Signal Generation Function

With respect to the luminance and color difference signals that have undergone image quality adjustments, the block performs modulation processing based upon various video signal standards. The output signal for the later-stage oversampling filter unit is 10-bit Y1/C (CVBS).

20A.4.4 Color Matrix

This block performs the standardization of the R/G/B and color difference signals; it does not perform any processing on Y or C (U/V).

20A.4.5 SYNC/Blanking Addition of Luminance Signals

This block performs the standardization, blanking, slew-rate limiter processing, and C-SYNC addition processing on luminance signals. These processing operations are the same as the progressive SYNC/Blanking additions.

20A.4.6 Blanking Addition of Color Difference Signals

In this block, the output of color difference signals during the blanking period is fixed to the blanking level (2048).

20A.4.7 Burst Addition

This block performs U/V conversion and standardization, blanking, and burst signal addition with respect to color difference signals.

(1) U/V conversion and standardization

The standardization of luminance signals can vary in terms of processing depending upon the settings of the Y1SETUP[1:0] bits of IDENCMD2 register, as follows:

B'00: ± 0IRE Setup, B'10: -7.5IRE Setup

→ $U = (Cb \times 219/224 \times 1.772/2.03) \times 0.625$

$V = (Cr \times 219/224 \times 1.402/1.14) \times 0.625$

B'01: + 7.5IRE Setup

→ $U = (Cb \times 219/224 \times 1.772/2.03) \times 0.625 \times 0.925$

$V = (Cr \times 219/224 \times 1.402/1.14) \times 0.625 \times 0.925$

B'11: Setting prohibited

The above conversions are implemented in the RTL in terms of the following processing operations:

B'00: ± 0IRE Setup, B'10: -7.5IRE Setup

→ $U = (2^{-1} + 2^{-5} + 2^{-9}) \times Cb \times 0.625$

$V = (2^{-1} + 2^{-2} + 2^{-10}) \times Cr \times 0.625$

B'01: + 7.5IRE Setup

→ $U = (2^{-1} - 2^{-7} + 2^{-10}) \times Cb \times 0.625$

$V = (2^{-1} + 2^{-2} - 2^{-4} + 2^{-7}) \times Cr \times 0.625$

(2) Blanking

The output during the U/V blanking period is fixed to the blanking level (0).

(3) Burst signal addition

The amplitude of the burst signal to be added can be adjusted in terms of BURSTLVL[7:0] bits.

NTSC: amplitude = (BURSTLVL[7:0] – 256) × 4

Note: Because the value of (BURSTLVL[7:0] – 256) × 2, after addition in the U direction, is modulated by U × sinα+ V × cosα, the amplitude is further multiplied by 2 (for a total of 4x).

PAL: amplitude = (BURSTLVL[7:0] – 256) × 4√2

Note: Because the value of (BURSTLVL[7:0] - 256) × 2, after addition in the U and V directions, respectively, is modulated by U × sinα+ V × cosα, the amplitude is further multiplied by 2√2 (for a total of 4√2x).

20A.4.8 Subcarrier Generation

By the setting of the IFSCH[15:0] and IFSCL[15:0] bits that determine the frequency and by the operation of the NCO adder, this block generates subcarriers for the modulation of the chroma. A subcarrier generation circuit diagram and a timing chart are shown in Figure 20A.4.

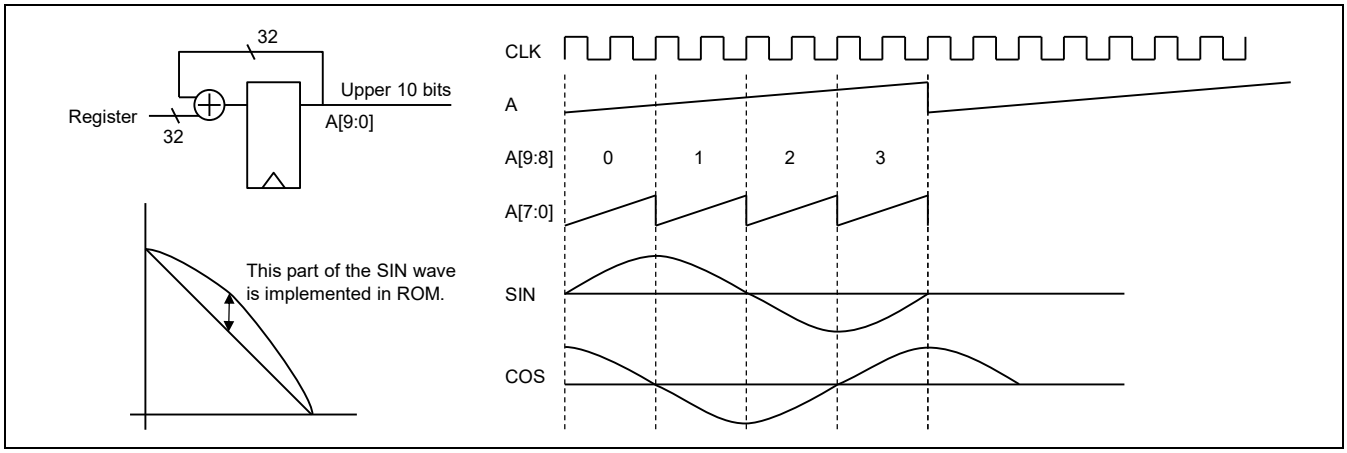


Figure 20A.4 Subcarrier Generation Circuit Diagram and Timing Chart

As indicated in the timing chart, the position in which the NCO adder overflows is the subcarrier frequency. Therefore, the following subcarrier formula applies:

Register settings × 27/232 [MHz]

In order to reduce the circuit size, of the SIN wave/COS wave, only the part shown in Figure 20A.4 is implemented in ROM, the part is divided into cases in terms of the upper 2 bits of the NCO adder output A[9:0], and SIN/COS waveforms are generated. The generated subcarrier is used by the subsequent-stage chroma encoder for the modulation of color signals (chroma).

20A.4.9 Chroma Encoder

This block performs the following processing:

(1) Chroma encoding

Using a subcarrier, the block performs chroma encoding (modulating) according to the following equation:

$C = U \times \sin A + V \times \cos A$

(2) BPF

Using a BPF, the block removes the harmonic components generated by the chroma encoding. The BPF has the following filter coefficients:

For NTSC (3.58 [MHz]):

$\rightarrow -5 \times Z^{-4} - 6 \times Z^{-3} - 1 \times Z^{-2} + 6 \times Z^{-1} + 4 \times Z^{0} + 6 \times Z^{1} - 1 \times Z^{2} - 6 \times Z^{3} - 5 \times Z^{4}$

For PAL (4.43 [MHz]):

$\rightarrow -1 \times Z^{-4} - 7 \times Z^{-3} - 3 \times Z^{-2} + 2 \times Z^{-1} + 12 \times Z^{0} + 2 \times Z^{1} - 3 \times Z^{2} - 7 \times Z^{3} - 1 \times Z^{4}$

20A.4.10 Video ID Addition

The block multiplexes the video ID signal, similar to the progressive case, in lines 20/283 in the luminance signal during a 525-line/60-Hz operation. The multiplexing can be turned ON/OFF and video ID data can be set by setting ICCCGWS register and CGWS [13:0] bits of ICGWSD register. The video ID data that is actually multiplexed on the output signal is created by generating a 6-bit error correction code (CRC) from the 14-bit register settings data and adding it to the end of the 14-bit data for a total of 20 bits, and the resultant data is modulated and multiplexed.

By setting the ICCCGWS register, the CGMS that is multiplexed in the luminance signal can be output as is.

Figure 20A.5 shows an example of a multiplexed video ID signal.

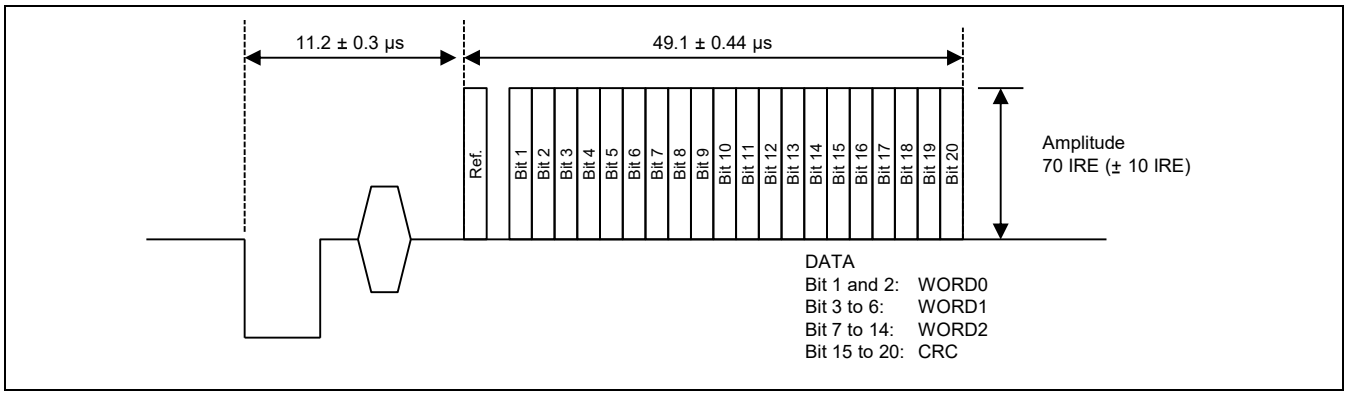

Figure 20A.5 Video ID Signal waveforms

20A.4.11 WSS Addition

This block multiplexes the WSS (Wide Screen Signaling), similar to the progressive case, to line 23 in the luminance signal during a 625-line/50-Hz operation. The multiplexing process can be turned ON/OFF and the WSS data can be set by appropriately setting the WSS and CGWS[13:0] bits. For the WSS data that is actually multiplexed to the output signal, the 14-bit data in the register settings are used to generate data Run-in, Start-code, Aspect-ratio, Enhanced-service, Subtitles, and Others for a total of 43 bits, and the results are modulated and multiplexed.

By setting the ICCCGWS register, the WSS that is multiplexed in the luminance signal can be output as is.

Figure 20A.6 shows an example of a multiplexed WSS signal.

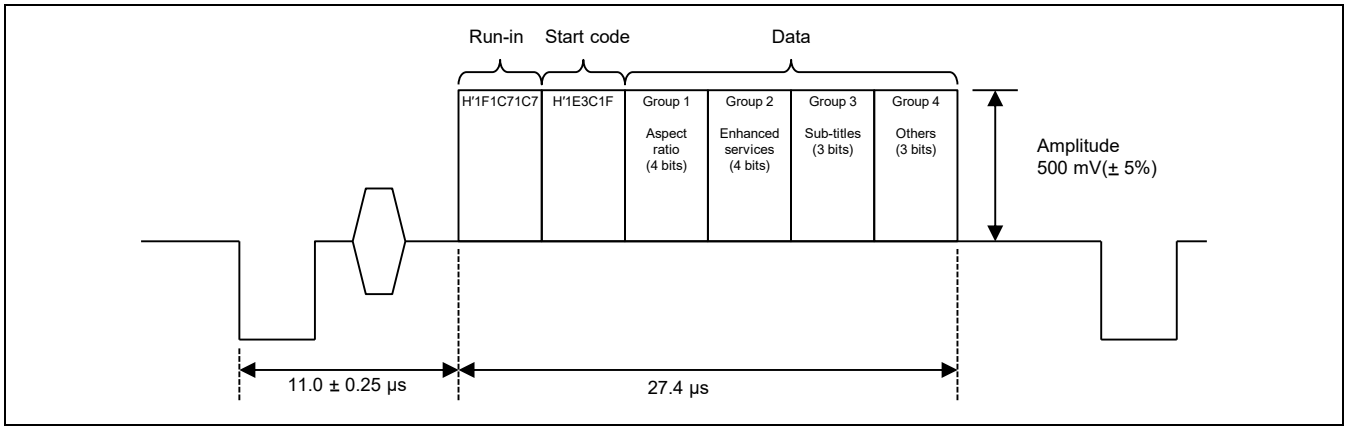

Figure 20A.6 WSS waveforms

20A.4.12 CC Addition

The CC (Closed Caption) signal represents a technology developed for hearing-impaired persons, wherein character information is transmitted by inserting it into NTSC broadcasting signals; it is multiplexed in lines 21/284 of the luminance signal. The CC data that is actually multiplexed to the output signal is created by generating ODD parity from the 7-bit (x4 set) of the register settings, modulating the resulting 8-bit (x4 set) total data, and multiplexing it to lines 21/284. By bit settings, the following functions can be provided:

1. Y1CC[1:0], Y2CC[1:0]: CC multiplexing ON/OFF settings
   (B'00 = OFF, B'01 = set exclusively to field 1, B'10 = set exclusively to field 2, B'11 = set to both fields)
2. y{1,2}cc{10, 11, 20, 21, 30, 31, 40, 41}[6:0]: set CC data
3. y{1,2}ccmode: when ON (1), automatically multiplexes Null codes until a CC updating signal is generated.
4. y{1,2}cc_if: outputs the CC data as is that is multiplexed in the luminance signal.

Figure 20A.7 shows an example of a CC signal that is multiplexed.

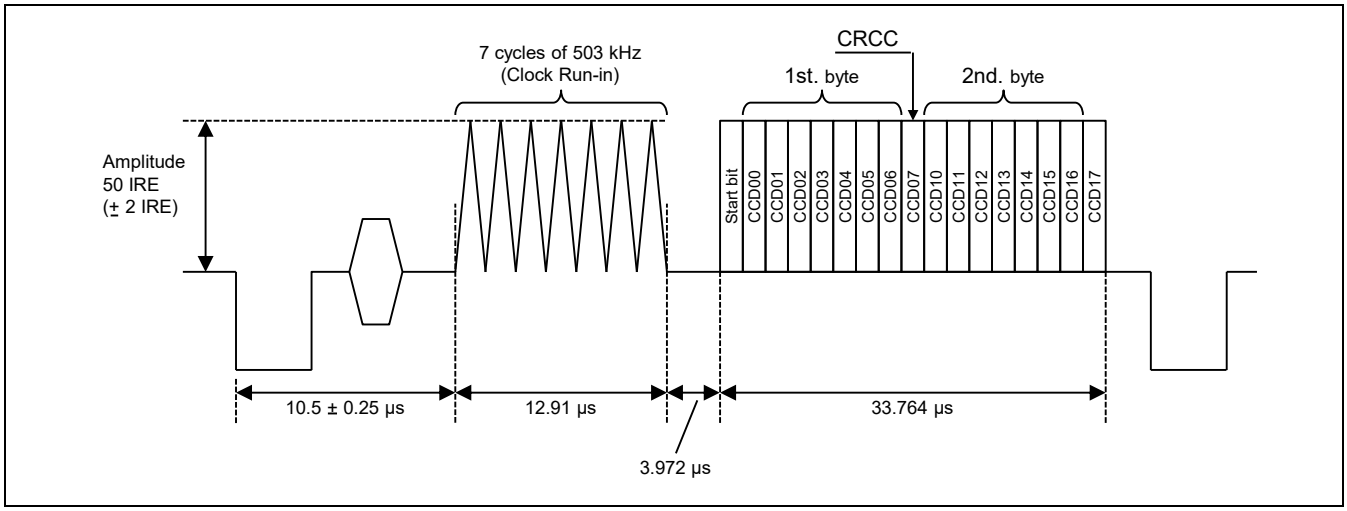

Figure 20A.7 CC Signal waveforms

20A.4.13 Output Gains Adjustment

In order to provide an adequate amount of width to the full-scale voltage compatibility of the DAC, gain adjustments can be performed in the following ranges by the GAIN[9:0] bits ([11:0] for C) and GTHR[15:0] bits (none for C/Cb/Cr):

Y1 = (din - 4(256)) × (1 + IY1GAIN[9:0]/4096) + 4(256)

C = (din - 2048) × (1 + CGAIN[11:0]/4096) + 2048

20A.5 Recommended register values

Recommended values for setting the interlace registers are listed in Table 20A.5.

Table 20A.5 is a recommended value of the NTSC/PAL system.

Table 20A.5 Interlace Register Settings

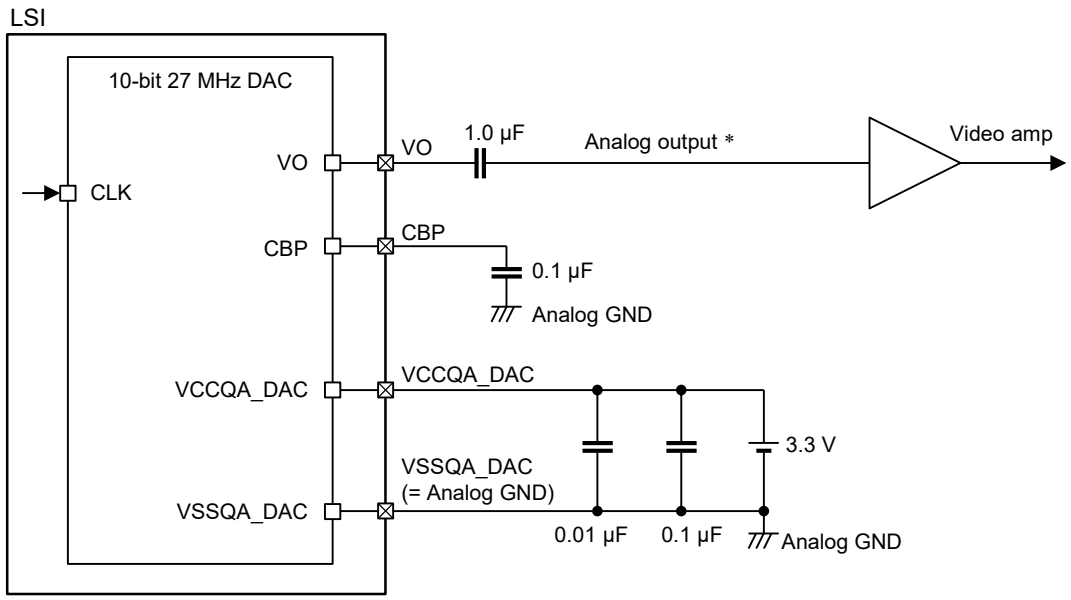
20A.6 Connection Example

Figure 20A.8 shows a pin connection example of DAC.



Note: * A 1.0-µF external capacitor should be connected with VO output by capacitive coupling and input impedance of the connected device should be more than 10 kΩ.
Buffer device like video amplifier is recommended to be connected with capacitor.

Figure 20A.8 Pin Connection Example

20B. Digital Video Decoder

20B.1 Overview

20B.1.1 Features

This LSI incorporates one channel of digital video decoder. This module consists of an A/D converter for video signal input, a sync separator circuit, a burst controlled oscillator (BCO), a 2D Y/C separator circuit, chroma decoding circuit, a digital clamp circuit, and an output gain adjustment circuit. Table 20B.1 shows the digital video decoder functions.

Table 20B.1 Digital Video Decoder Functions

Item	Function
Input signal	Video signal • Composite video signal (CVBS)
Functional outline	• A/D converter for video signal input — VIN1A and VIN2A pin input selection — Low-pass filter (LPF) — Sync tip clamp — Programmable gain amplifier (PGA) (0 to 6.021 dB) — 10-bit precision pipelined A/D converter • Sync separation — Noise reduction LPS, auto level control sync slicer, horizontal auto frequency control (AFC), vertical count-down, interlace detection, auto gain control (AGC)/peak limiter control • Burst controlled oscillator (BCO) — Color sub-carrier reproduction, color system detection (For details, see Table 20B.3.) • Y/C separation (For details, see Table 20B.2.) — Supporting NTSC 2D, PAL 2D, SECAM 1D • Chroma decoding — Supporting NTSC, PAL SECAM — Color killer, auto color control (ACC), TINT correction, R-Y axis correction • Digital clamp — Pedestal clamp (Y), center clamp (Cb/Cr), noise detection • Output gain adjustment — Contrast adjustment: 0 to approx. two times — Color adjustment (Cb/Cr independent): 0 to approx. two times • Selecting input Signals for video input module (VIN) — The input controller selects either video decoder output signals or signals supplied via external input pins.

Table 20B.2 Supported Y/C Separation Operation

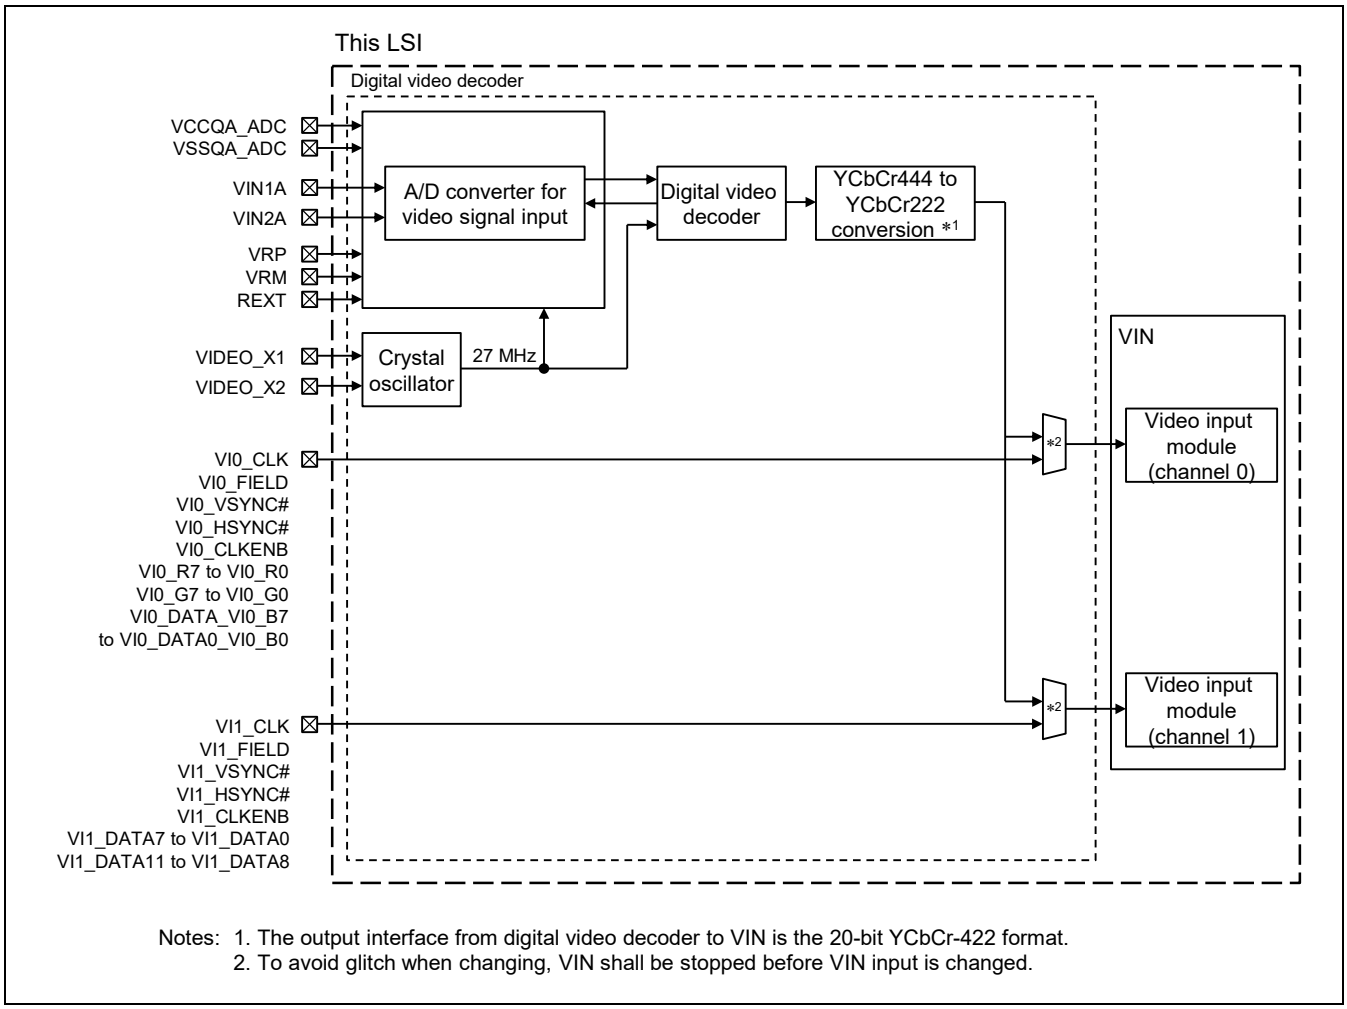
Color System	Y/C Separation Operation
NTSC-3.58	Two dimensional
NTSC-4.43	Two dimensional
PAL-M	Two dimensional
PAL-N	Two dimensional
PAL-4.43	Two dimensional
SECAM	One dimensional

Table 20B.3 Color System Detection

COLORSY[1:0]	FSCMODE	FVMODE	Detection Result
0: NTSC	0: 3.58 MHz	Don't care	NTSC-M
0: NTSC	1: 4.43 MHz	Don't care	NTSC-4.43
1: PAL	0: 3.58 MHz	0: 50 Hz	PAL-N
1: PAL	0: 3.58 MHz	1: 60 Hz	PAL-M
1: PAL	1: 4.43 MHz	0: 50 Hz	PAL-B, H, I, G, D
1: PAL	1: 4.43 MHz	1: 60 Hz	PAL-60
2: SECAM	—	—	SECAM
3: Unknown	—	—	Cannot be detected

20B.1.2 Block Diagram

Figure 20B.1 shows a block diagram of this module.



Notes: 1. The output interface from digital video decoder to VIN is the 20-bit YCbCr-422 format.
2. To avoid glitch when changing, VIN shall be stopped before VIN input is changed.

Figure 20B.1 Block Diagram

Figure 20B.2 shows a block diagram (A/D converter and digital video decoder).

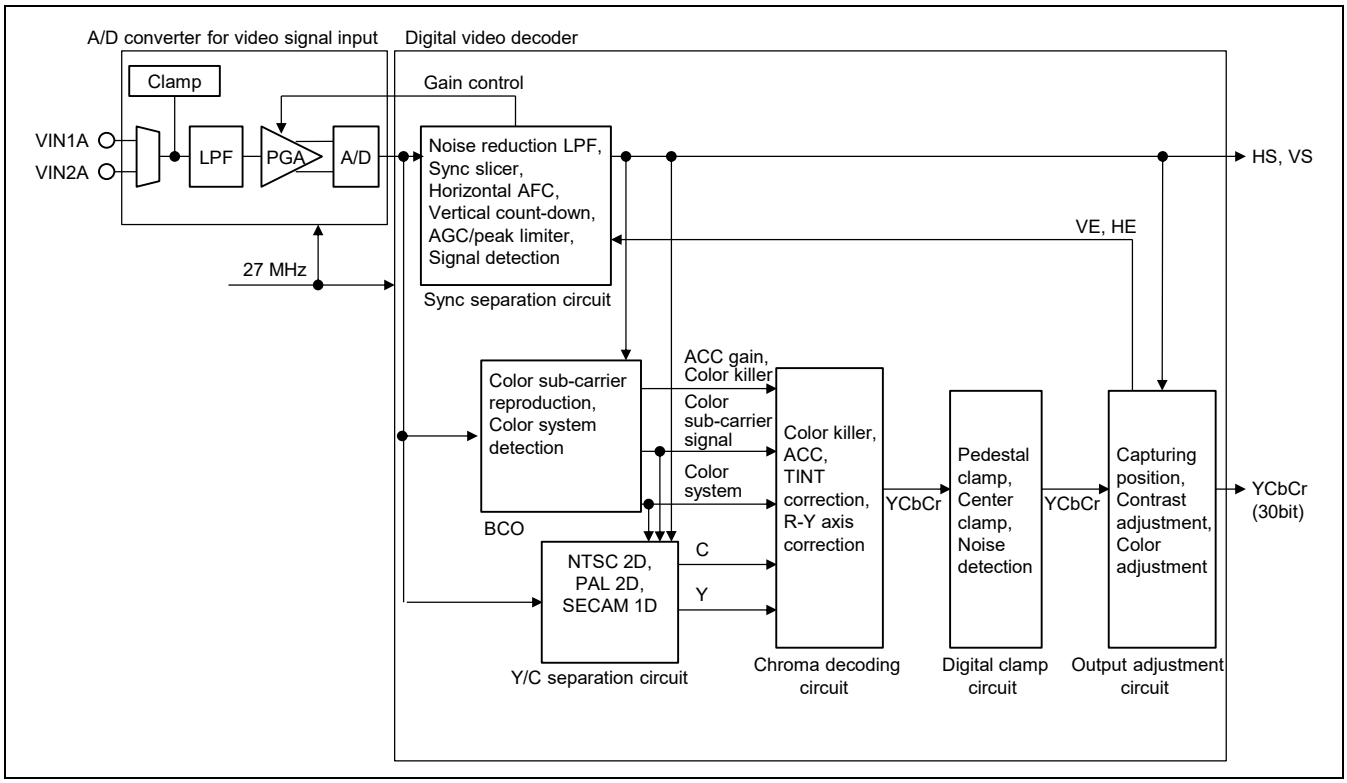


Figure 20B.2 Block Diagram (A/D converter and Digital video decoder)

20B.1.3 Input/Output Pins

Table 20B.4 shows the pin configuration.

Table 20B.4 Pin Configuration

Name	Pin Symbol	I/O	Description
Composite video signal input	VIN1A	Input	Composite video signal (CVBS) input pin 1
	VIN2A	Input	Composite video signal (CVBS) input pin 2
Crystal oscillator/ external clock	VIDEO_X1	Input	Connect to a crystal resonator for the digital video decoder. The VIDEO_X1 pin can also be used for external clock input.
	VIDEO_X2	Output	
TOP reference voltage	VRP	Output	TOP reference voltage pin for the A/D converter for video signal input Connect to the VSSQA_ADC via a 0.1-µF capacitor.
BOTTOM reference voltage	VRM	Output	BOTTOM reference voltage pin for the A/D converter for video signal input Connect to the VSSQA_ADC via a 0.1-µF capacitor.
Reference voltage	REXT	Output	Reference voltage pin for the A/D converter for video signal input Connect to the VSSQA_ADC via a 22-kΩ ±1% resistor.
Analog power supply	VCCQA_ADC	Input	Power supply pin for the A/D converter for video signal input
Analog ground	VSSQA_ADC	Input	Ground pin for the A/D converter for video signal input

20B.1.4 Register Configuration

Table 20B.5 shows the register configuration.

Table 20B.5 Register Configuration

Register Name	Abbreviation	R/W	Address	Initial Value	Access Size
ADC control register 1	ADCCR1	R/W	H'FEB81008	H'0000	16
Timing generation control register 1	TGCR1	R/W	H'FEB8100E	H'013C	16
Timing generation control register 2	TGCR2	R/W	H'FEB81010	H'50E8	16
Timing generation control register 3	TGCR3	R/W	H'FEB81012	H'0500	16
Sync separation control register 1	SYNSCR1	R/W	H'FEB8101A	H'6C0A	16
Sync separation control register 2	SYNSCR2	R/W	H'FEB8101C	H'03CA	16

20B.2 Register Description

20B.2.1 ADC Control Register 1 (ADCCR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	AGC MODE	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	AGCMODE	0	R/W	A/D Converter AGC ON/OFF Control 0: AGC OFF 1: AGC ON
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(1) AGC Control

The AGCMODE bit controls the AGC ON/OFF. When AGCMODE is 1, the AGC operation is performed by detecting the sync amplitude and video peak amplitude and controlling the PGA gain of the ADC.

When PGACR.PGA_GAIN_SEL is 1, the PGA gain can be directly controlled with the PGACR.PGA_GAIN value. At this time, the AGCMODE setting is invalid.

Setting AGCMODE to 0 and PGACR.PGA_GAIN_SEL to 0 simultaneously is prohibited.

20B.2.2 Timing Generation Control Register 1 (TGCR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SRCLEFT[8:0]								
Initial value:	0	0	0	0	0	0	0	1	0	0	1	1	1	1	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8 to 0	SRCLEFT[8:0]	H'13C	R/W	Left End of Input Video Signal Capturing Area Set the position from the horizontal sync reference in 27-MHz clock cycle units.

(1) Timing Generation (Horizontal Start Position) Control

SRCLEFT sets the start position of the horizontal enable signal of the output video signal from the horizontal sync reference in 27-MHz clock cycle units.

20B.2.3 Timing Generation Control Register 2 (TGCR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SRCTOP[5:0]						SRCHEIGHT[9:0]									
Initial value:	0	1	0	1	0	0	0	0	1	1	1	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	SRCTOP[5:0]	H'14	R/W	Top End of Input Video Signal Capturing Area Set the position from the vertical sync reference in one-line units.
9 to 0	SRCHEIGHT [9:0]	H'0E8	R/W	Height of Input Video Signal Capturing Area Set the vertical active period in one-line units.

Note: All the bits in this register are updated when the vertical sync signal is asserted with the NEWSETTING bit in RUPDCR being 1.

(1) Timing Generation (Vertical Start Position) Control

SRCTOP sets the start position of the vertical enable signal of the output video signal from the vertical sync reference in one-line units.

(2) Timing Generation (Vertical Width) Control

SRCHEIGHT sets the height of the vertical enable signal of the output video signal in one-line units.

20B.2.4 Timing Generation Control Register 3 (TGCR3)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SRCWIDTH[10:0]										
Initial value:	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SRCWIDTH [10:0]	H'500	R/W	Width of Input Video Signal Capturing Area Set the horizontal active period in 27-MHz clock cycle units.

Note: All the bits in this register are updated when the vertical sync signal is asserted with the NEWSETTING bit in RUPDCR being 1.

(1) Timing Generation (Horizontal Width) Control

SRCHEIGHT sets the width of horizontal enable signal of the output video signal in 27-MHz clock cycle units.

Figure 20B.3 to Figure 20B.7 show the timings generated with the NTSC (59.94 Hz) and PAL/SECAM (50.00 Hz) formats.

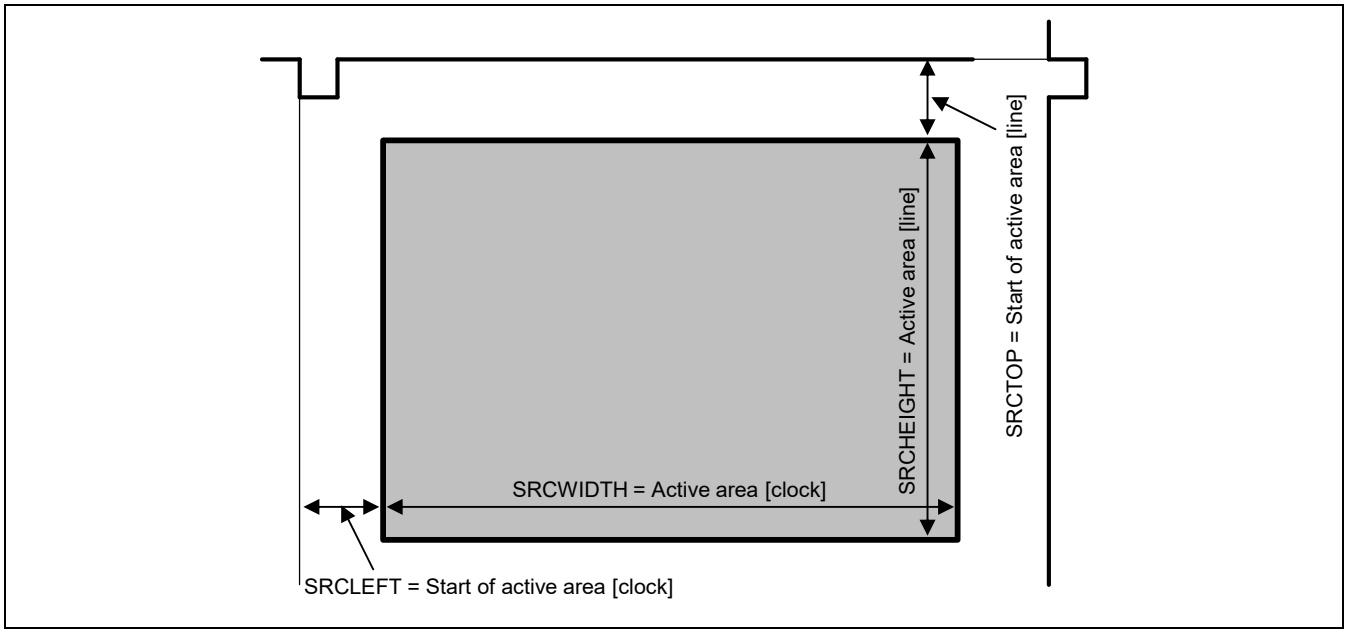

Figure 20B.3 Active Image Area Setting

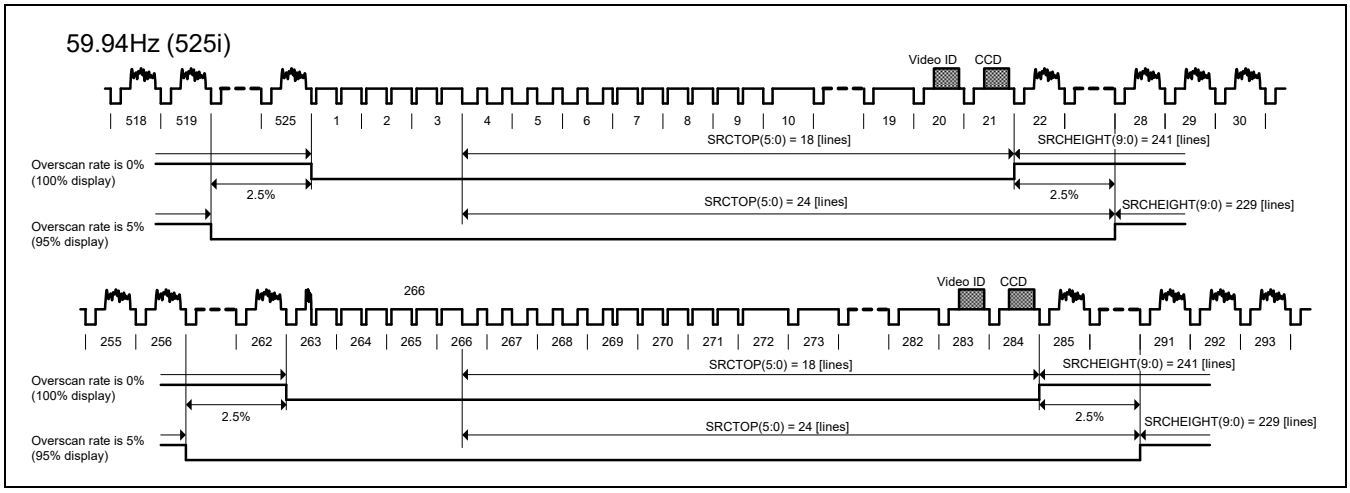

Figure 20B.6 Example of Vertical Active Image Period (59.94 Hz (525i))

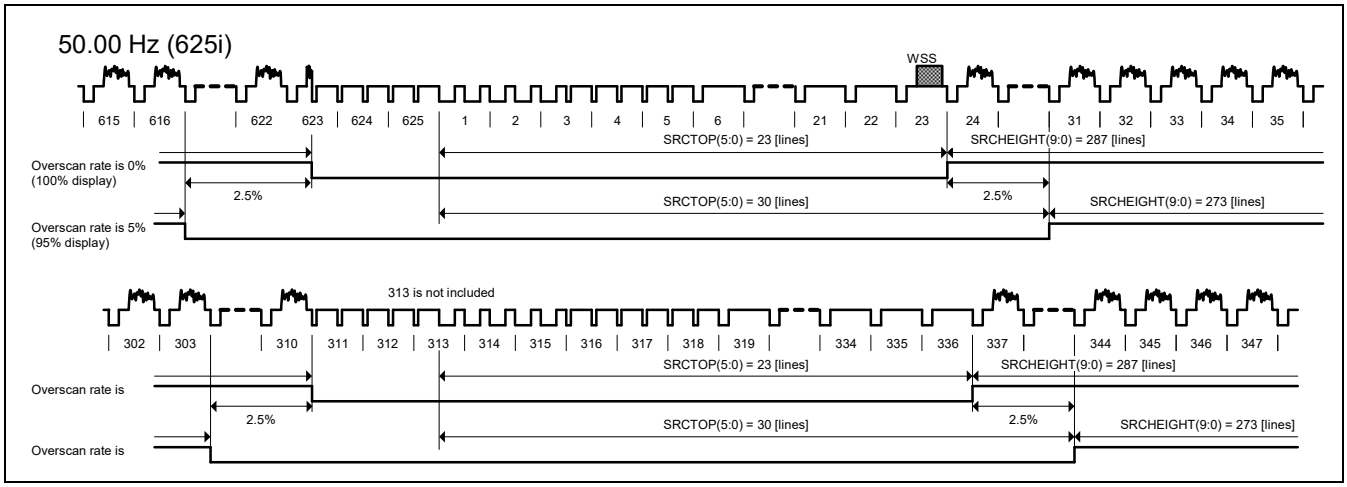

Figure 20B.7 Example of Vertical Active Image Period (50.00 Hz (625i))

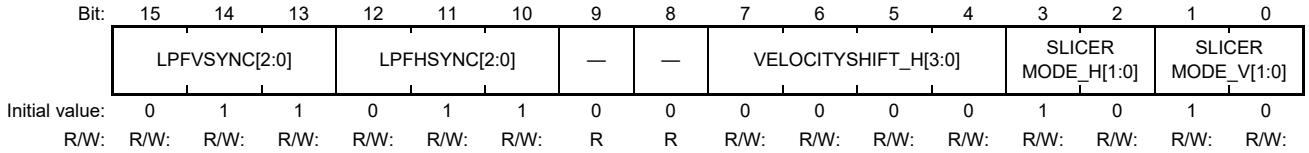
The active period width should not be larger than necessary.

The settings of TGCR1 to TGCR3 such as valid period setting for the peak limiter are applied only to this module. To set the display size of the input video, SCL0_DS2 and SCL0_DS3 of the video display controller 5 scaler should be used.

20B.2.5 Sync Separation Control Register 1 (SYNSCR1)



Bit	Bit Name	Initial Value	R/W	Description
15 to 13	LPFVSYNC[2:0]	011	R/W	Low-Pass Filter Cutoff Frequency before Vertical Sync Separation 000: None 001: 0.94 MHz 010: 0.67 MHz 011: 0.54 MHz 100: 0.47 MHz 101: 0.34 MHz 110: 0.27 MHz 111: 0.23 MHz
12 to 10	LPFHSYNC[2:0]	011	R/W	Low-Pass Filter Cutoff Frequency before Horizontal Sync Separation 000: None 001: 2.15 MHz 010: 1.88 MHz 011: 1.34 MHz 100: 1.07 MHz 101: 0.94 MHz 110: 0.67 MHz 111: 0.54 MHz
9, 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 4	VELOCITYSHIFT_H[3:0]	0000	R/W	Reference Level Operation Speed Control for Composite Sync Separation (for horizontal sync signal) 0000: ×1 0001: ×2 0010: ×4 0011: ×8 0100: ×16 0101: ×32 0110: ×64 0111: ×128 Others: ×256 Standard speed (×1) ↔ High speed (×256)
3, 2	SLICERMODE_H[1:0]	10	R/W	Auto-Slice Level Setting for Composite Sync Separation Circuit (for horizontal sync signal) 00: Manual setting by CSYNCSLICE_H 01: 25% of sync depth (Auto) 10: 50% of sync depth (Auto) 11: 75% of sync depth (Auto)

Bit	Bit Name	Initial Value	R/W	Description
1, 0	SLICERMODE_V [1:0]	10	R/W	Auto-Slice Level Setting for Composite Sync Separation Circuit (for vertical sync signal) 00: Manual setting by CSYNCSLICE_V 01: 25% of sync depth (Auto) 10: 50% of sync depth (Auto) 11: 75% of sync depth (Auto)

(1) Low-Pass Filter Control before Vertical Sync Separation

LPFVSYNC sets the noise reduction low-pass filter for the input video signal fed to a sync separator in order to avoid sync separation error caused by noise. A low-pass filter cutoff frequency should be set not to deteriorate (i.e. to enable to detect) the composite sync signal components.

Table 20B.6 Low-Pass Filter Cutoff Frequency before Vertical Sync Separation

For Vertical Sync Separation

LPFVSYNC[2:0]	t	fc (MHz)
000	—	—
001	0.109375	0.939647766
010	0.078125	0.671176976
011	0.0625	0.536941581
100	0.0546875	0.469823883
101	0.0390625	0.335588488
110	0.003125	0.26847079
111	0.0273438	0.234911942

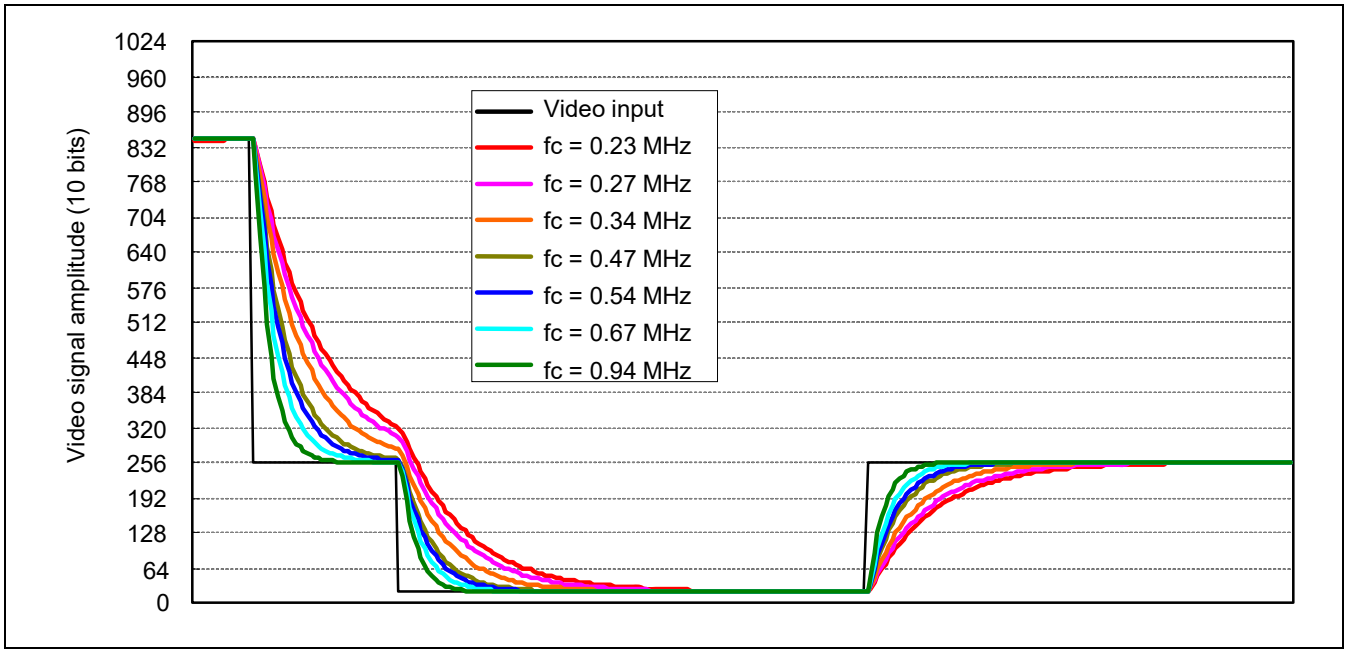


Figure 20B.8 Low-Pass Filter Output Waveform near Vertical Sync Signal during 100% White Signal Input (Vertical: Pattern Diagram)

(2) Low-Pass Filter Control before Horizontal Sync Separation

LPFHSYNC sets the noise reduction low-pass filter for the input video signal fed to a sync separator in order to avoid sync separation error caused by noise. A low-pass filter cutoff frequency should be set not to deteriorate (i.e. to enable to detect) the composite sync signal components.

Table 20B.7 Low-Pass Filter Cutoff Frequency before Horizontal Sync Separation

For Horizontal Sync Separation

LPFHSYNC[2:0]	t	fc (MHz)
000	—	—
001	0.25	2.147766323
010	0.21875	1.879295533
011	0.15625	1.342353952
100	0.125	1.073883162
101	0.10938	0.939647766
110	0.07813	0.671176976
111	0.0625	0.536941581

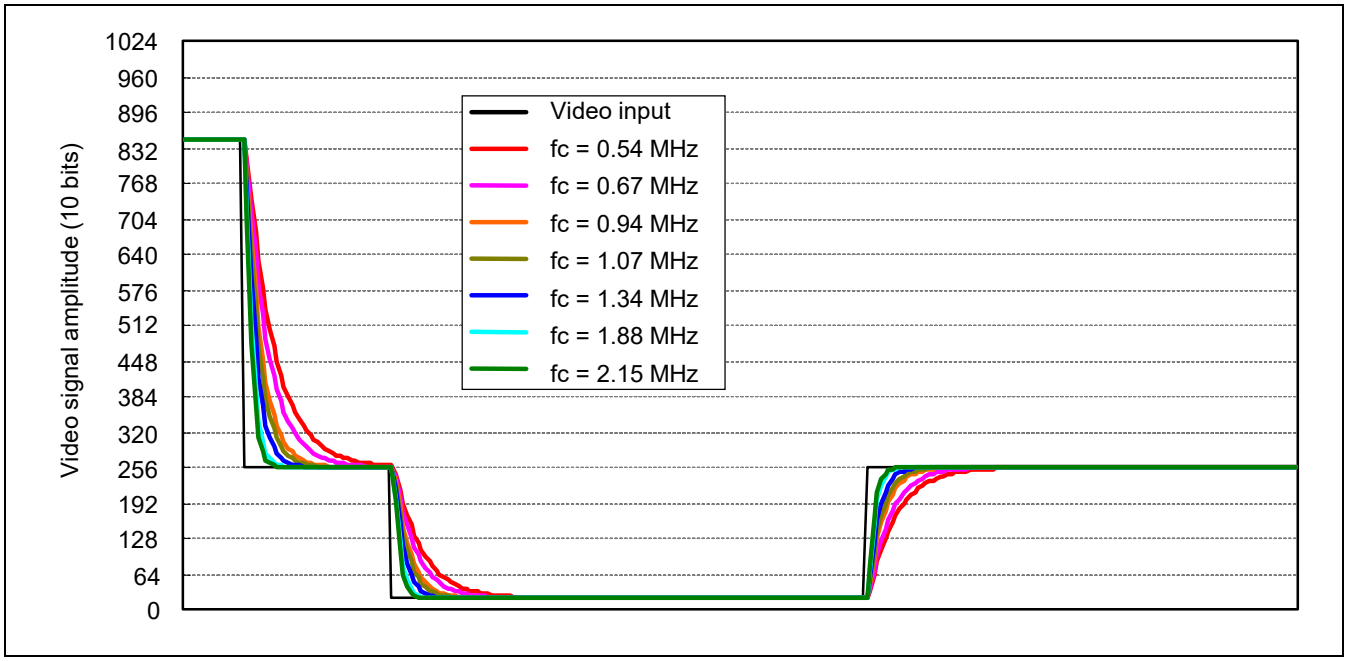

Figure 20B.9 Low-Pass Filter Output Waveform near Horizontal Sync Signal during 100% White Signal Input (Horizontal: Pattern Diagram)

(3) Reference Level Operation Speed Control for Sync Separation

VELOCITYSHIFT_H controls the speed for automatically determining the slice level.

If sync skew is caused by sync sag, it can be improved by raising the determination speed using VELOCITYSHIFT_H.

(4) Horizontal Sync Slicer Control

SLICERMODE_H controls composite sync signal separation from the video signals.

The slice level for composite sync signal separation can be set either manually or automatically. When automatic setting is used, the level is automatically set using the sync signal amplitude detection result, which is described later. The sync slicer can be controlled separately for horizontal and vertical sync signals.

(5) Vertical Sync Slicer Control

SLICERMODE_V controls composite sync signal separation from the video signals.

The slice level for composite sync signal separation can be set either manually or automatically. When automatic setting is used, the level is automatically set using the sync signal amplitude detection result, which is described later. The sync slicer can be controlled separately for horizontal and vertical sync signals.

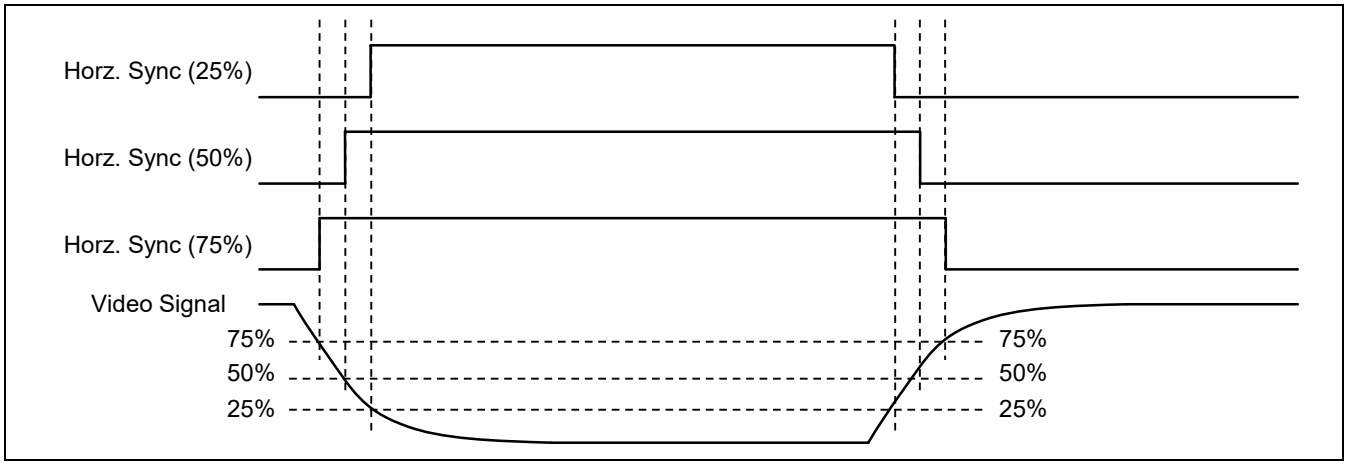

Figure 20B.10 Auto Slice Level Setting

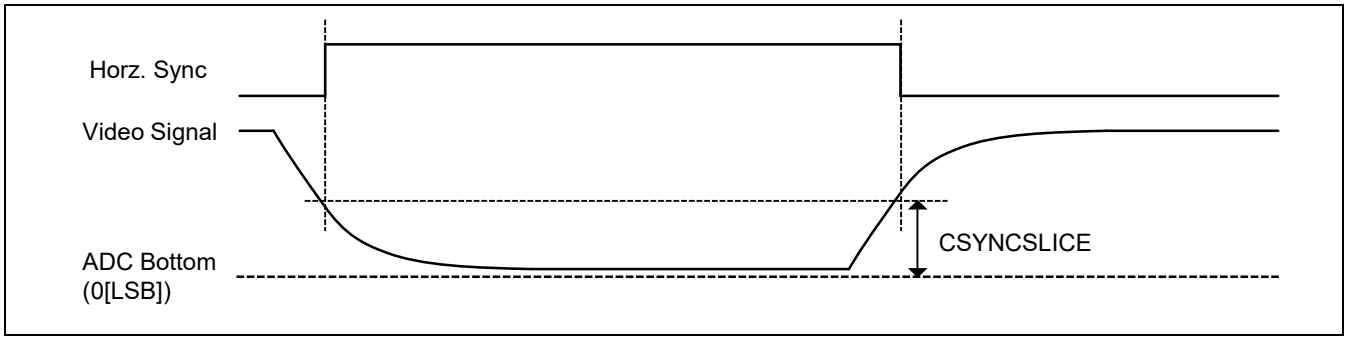

Figure 20B.11 Manual Slice Level Setting

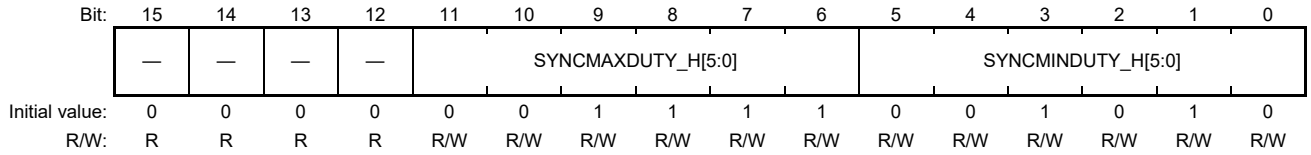
20B.2.6 Sync Separation Control Register 2 (SYNSCR2)



Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 6	SYNCMAXDUTY_H [5:0]	001111	R/W	Max Ratio of Horizontal Cycle to Horizontal Sync Signal Pulse Width Valid when auto slice level setting is active (SLICERMODE_H ≠ 0).
5 to 0	SYNCMINDUTY_H [5:0]	001010	R/W	Min Ratio of Horizontal Cycle to Horizontal Sync Signal Pulse Width Valid when auto slice level setting is active (SLICERMODE_H ≠ 0).

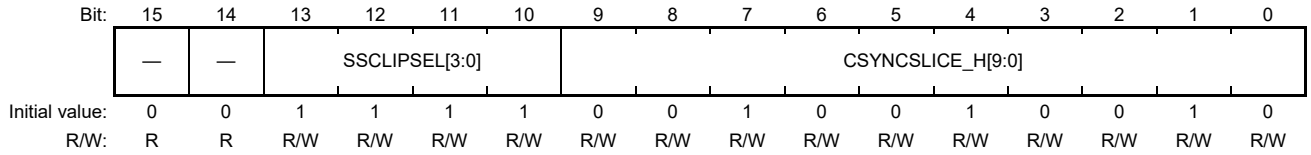
(1) Sync Amplitude Detection Control for Horizontal Sync Separation

SYNCMAXDUTY_H and SYNCMINDUTY_H control the sync signal amplitude detection of composite sync signal included in the video signal.

Table 20B.8 Auto Slice Level Register Settings for Composite Sync Separation

	Horizontal Period (µsec)	Horizontal Sync Width (µsec)	Video Active Period (µsec)	Horizontal Blanking Interval (µsec)	SYNCMAXDUTY_H [5:0] Recommended Value	SYNCMINDUTY_H [5:0] Recommended Value
525i/59.94 Hz	63.56	4.70	52.66	10.90	001111	001010
625i/50 Hz	64.00	4.70	52.00	12.00	001111	001010

20B.2.7 Sync Separation Control Register 3 (SYNSCR3)



Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 10	SSCLIPSEL[3:0]	1111	R/W	Clipping Level Clip the video signal supplied to the vertical/horizontal sync separation low-pass filter Bit value = Clipping level (amplitude 50% to no clipping) 0000: 512, 0001: 546 0010: 580, 0011: 614 0100: 648, 0101: 682 0110: 716, 0111: 750 1000: 785, 1001: 819 1010: 853, 1011: 887 1100: 921, 1101: 955 1110: 989, 1111: 1023
9 to 0	CSYNCSLICE_H[9:0]	0010010010	R/W	Slice Level for Composite Sync Signal Separation (for horizontal sync signal) Valid when manual slice level setting is active (SLICERMODE_H = 0).

(1) Video Signal Clipping Setting for Sync Separation

For input video signals supplied to the sync separator circuit, the level to clip the high tone component of the video signal is specified to reduce amplitude-dependency of the video signal. The video clipping level should be set not to deteriorate (i.e. to enable to detect) the composite sync signal components.

(2) Slice Level Setting for Horizontal Sync Separation

CSYNCSLICE_H sets the slice level for sync separation. This bit is valid only when SLICERMODE_H = 0.

20B.2.8 Sync Separation Control Register 4 (SYNSCR4)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SYNCMAXDUTY_V[5:0]						SYNCMINDUTY_V[5:0]					
Initial value:	0	0	0	0	0	0	1	1	1	1	0	0	1	0	1	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 6	SYNCMAXDUTY_V [5:0]	001111	R/W	Max Ratio of Horizontal Cycle to Vertical Sync Signal Pulse Width Valid when auto slice level setting is active (SLICERMODE_V ≠ 0).
5 to 0	SYNCMINDUTY_V [5:0]	001010	R/W	Min Ratio of Horizontal Cycle to Horizontal Sync Signal Pulse Width Valid when auto slice level setting is active (SLICERMODE_V ≠ 0).

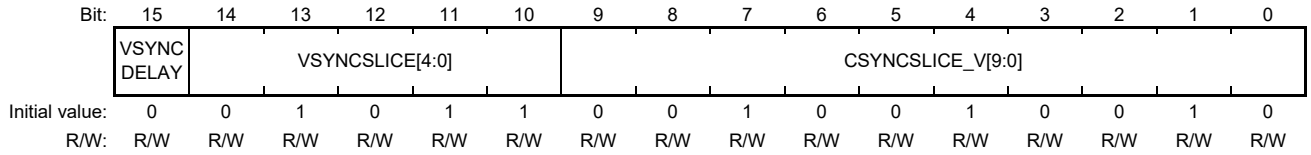
(1) Sync Amplitude Detection Control for Vertical Sync Separation

SYNCMAXDUTY_V and SYNCMINDUTY_V control the sync signal amplitude detection of composite sync signal included in the video signal.

Table 20B.9 Auto Slice Level Register Settings for Composite Sync Separation

	Horizontal Period (µsec)	Horizontal Sync Width (µsec)	Video Active Period (µsec)	Horizontal Blanking Interval (µsec)	SYNCMAXDUTY_V [5:0] Recommended Value	SYNCMINDUTY_V [5:0] Recommended Value
525i59.94 Hz	63.56	4.70	52.66	10.90	001111	001001
625i/50 Hz	64.00	4.70	52.00	12.00	001111	001001

20B.2.9 Sync Separation Control Register 5 (SYNSCR5)



Bit	Bit Name	Initial Value	R/W	Description
15	VSYNCDELAY	0	R/W	Delays the separated vertical sync signal for 1/4 horizontal cycle. 0: Disable 1/4fH delay 1: Enable 1/4fH delay Note: Stability of the field determination result may be improved by changing VSYNCDELAY.
14 to 10	VSYNCSLICE [4:0]	01011	R/W	Threshold for Vertical Sync Separation The greater the value, the wider pulse width is needed.
9 to 0	CSYNCSLICE_ V[9:0]	0010010010	R/W	Slice Level for Composite Sync Signal Separation (for vertical sync signal) Valid when manual slice level setting is active (SLICERMODE_V = 0).

(1) Vertical Sync Separation Control

VSYNCDELAY controls the phases of vertical sync signal and horizontal sync signal. When VSYNCDELAY is 1, the stability of the field determination result may be improved by delaying the vertical sync signal for 1/4 fH.

(2) Vertical Sync Separation Control

VSYNCSLICE controls the threshold for separating vertical sync signal from composite sync signal. The value will be set depending on the serration pulse width of each video signal format. Table 20B.10 shows the recommended set values.

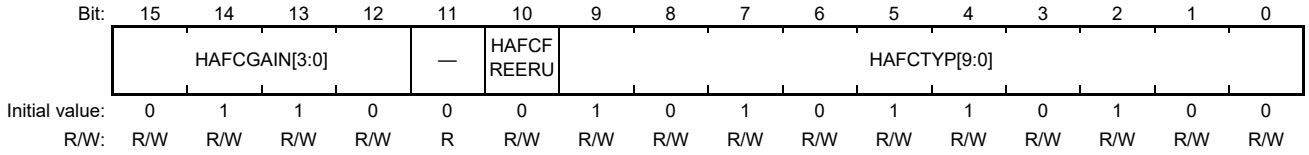
Table 20B.10 Recommended Threshold and Serration Pulse Width (for reference)

	Serration Pulse Width [µsec]	VSYNCSLICE[4:0]
525i/59.94Hz	27.08	01010
625i/50Hz	27.30	01010

(3) Slice Level Setting for Vertical Sync Separation

CSYNCSLICE_V sets the slice level for sync separation. This bit is valid only when SLICERMODE_V = 0.

20B.2.10 Horizontal AFC Control Register 1 (HAFCCR1)



Bit	Bit Name	Initial Value	R/W	Description
15 to 12	HAFCGAIN [3:0]	0110	R/W	Horizontal AFC Loop Gain 0000 to 0101: A smaller value needs a longer time for synchronization. 0110: Standard value 0111 to 1111: A larger value needs a shorter time for synchronization.
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	HAFCFREERUN	0	R/W	Horizontal AFC Free-Run Oscillation Mode ON/OFF 0: OFF 1: ON
9 to 0	HAFCTYP[9:0]	1010110100	R/W	Horizontal AFC Center Oscillation Frequency Set an offset from 1024th clock pulse in 27-MHz clock cycle units.

(1) Horizontal AFC Loop Gain Control

HAFCGAIN sets the loop gain (response speed) of the horizontal AFC. The larger the value is, the faster the response speed is. However, setting a larger value will result in higher susceptibility to noise.

(2) Horizontal AFC Free-Run Control

HAFCFREERUN controls the horizontal AFC free-run operation. When HAFCFREERUN is 1, the horizontal AFC operates independently of the inputs and performs free-run operation. HAFCFREERUN should usually be set to 0.

(3) Horizontal AFC Lock Range (Horizontal) Control

HAFCMIN, HAFCTYP, and HAFCMAX set the horizontal AFC center oscillation frequency and lock range. The horizontal AFC function is controlled to stabilize the horizontal sync signal when the signals are deteriorated by trick playback of VCR or a weak electric field.

HAFCMIN[9:0]	Min oscillation frequency of horizontal AFC
HAFCTYP[9:0]	Center oscillation frequency of horizontal AFC
HAFCMAX[9:0]	Max oscillation frequency of horizontal AFC

Horizontal AFC lock range can be indicated by the following formula.

HAFCMIN < HAFCTYP < HAFCMAX …(1)

where

HAFCMIN	= HAFCTYP – allowable deviation
HAFCTYP	= N × M – 1024
HAFCMAX	= HAFCTYP + allowable deviation
M:	Number of clock pulses per horizontal cycle (27MHz sampling)
N:	Double speed setting 2 (double speed): M < 1024 1 (normal speed): M ≥ 1024

The horizontal AFC is locked if the formula indicated by (1) is satisfied.

When the horizontal AFC is locked, FHLOCK in VSYNCSR is set to 1. Otherwise, FHLOCK is 0.

Table 20B.11 Horizontal AFC Lock Range Setting

Signal Format	fH Horizontal Cycle	M fH@ 27.0MHz	N-Times Speed Setting	HAFCMAX [9:0]	HAFCTYP [9:0]	HAFCMIN [9:0]	Deviation		Unit
525i	63.56 [µsec]	1716 [clk]	1	771	692	618	79	-74	[clk]
				15.034	15.734	16.434	-0.700	0.700	[kHz]
625i	64.00 [µsec]	1728 [clk]	1	785	704	629	81	-75	[clk]
				14.925	15.625	16.325	-0.700	0.700	[kHz]

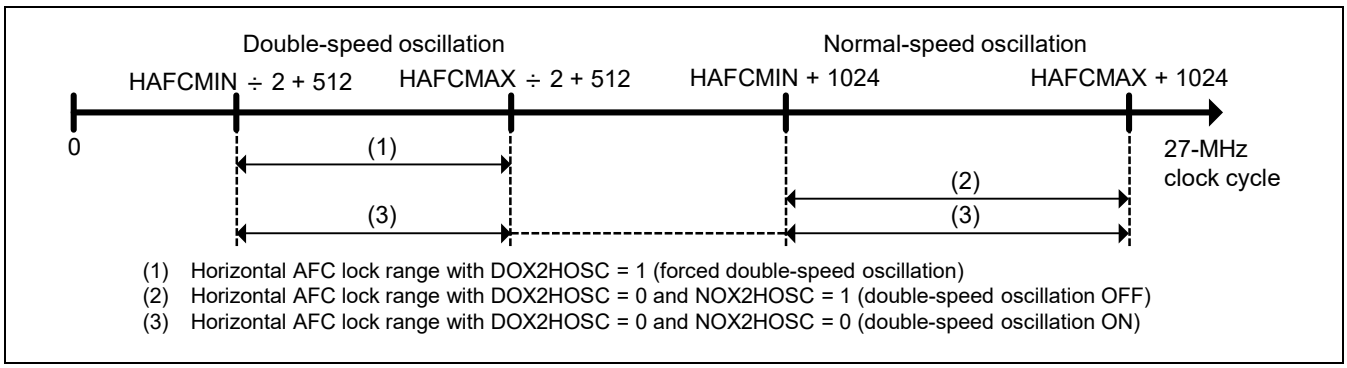


Figure 20B.12 Horizontal AFC Lock Range (Horizontal)

20B.2.11 Horizontal AFC Control Register 2 (HAFCCR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HAFCSTART[3:0]				NOX2H OSC	DOX2H OSC	HAFCMAX[9:0]									
Initial value:	0	0	0	0	0	0	1	0	1	1	1	0	0	1	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	HAFCSTART [3:0]	0000	R/W	Start Line of Horizontal AFC Normal Operation (= VBI process end line) Start the phase comparison at the Nth line after the vertical sync signal.
11	NOX2HOSC	0	R/W	Disable of Horizontal AFC Double Speed Detection 0: Auto control 1: Double speed oscillation disabled
10	DOX2HOSC	0	R/W	Horizontal AFC Forced Double-Speed Oscillation 0: Auto control 1: Forced double-speed oscillation
9 to 0	HAFCMAX [9:0]	1011100110	R/W	Maximum Oscillation Frequency of Horizontal AFC Set an offset from 1024th clock pulse in 27-MHz clock cycle units.

(1) Horizontal AFC Lock Range (Vertical) Control

HAFCSTART and HAFCEND specify the horizontal AFC operation range. The horizontal AFC operation should be normally stopped from several lines before the vertical sync signal to the vertical sync signal to avoid a malfunction occurring in the VCR head switch part.

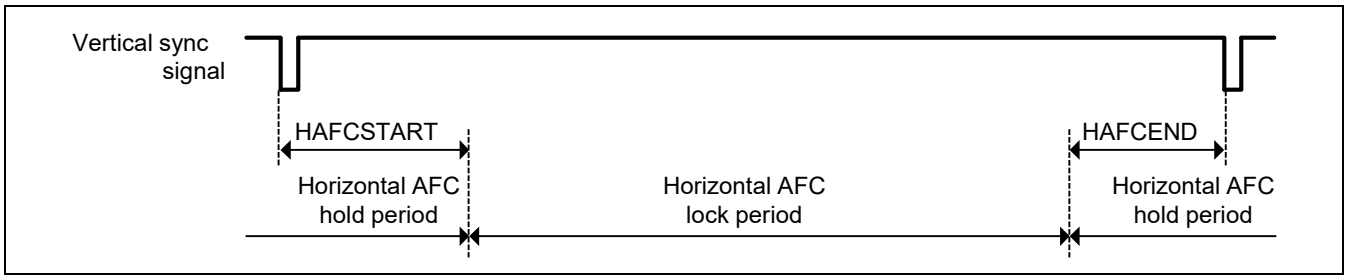

Figure 20B.13 Horizontal AFC Lock Range (Vertical)

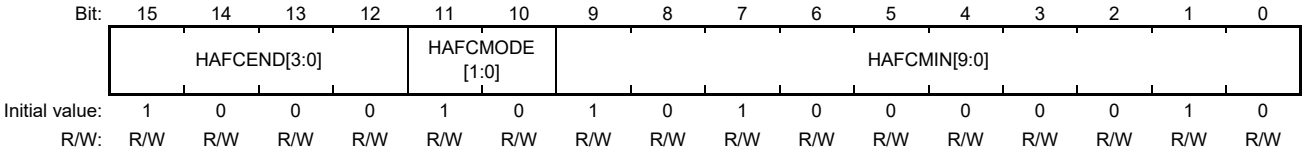
(2) Horizontal AFC Double-Speed Control

NOX2HOSC and DOX2HOSC control the horizontal AFC double speed detection. In the NTSC, PAL and SECAM formats, DOX2HOSC should always be 0.

20B.2.12 Horizontal AFC Control Register 3 (HAFCCR3)



Bit	Bit Name	Initial Value	R/W	Description
15 to 12	HAFCEND[3:0]	1000	R/W	End line of Horizontal AFC Normal Operation (= VBI process start line) Stop the phase comparison at the Nth line before the vertical sync signal.
11, 10	HAFCMODE [1:0]	10	R/W	Horizontal AFC VBI Period Operating Mode [1] Loop gain control for low S/N 0: Loop gain is fixed. 1: Loop gain is automatically controlled. [0] Horizontal AFC control during VBI period 0: Phase comparison is stopped during VBI period. 1: Loop gain is reduced during VBI period.
9 to 0	HAFCMIN[9:0]	1010000010	R/W	Min Oscillation Frequency of Horizontal AFC Set an offset from 1024th clock pulse in 27-MHz clock cycle units.

(1) Horizontal AFC Operation Control during VBI Period

The malfunction caused by noise can be avoided by setting HAFCMODE[1] to 1 to reduce the loop gain for low S/N (VSYNCSR.ISNOISY = 1). The recommended value for HAFCMODE[1] is 1.

HAFCMODE[0] controls the horizontal AFC operation during the VBI period. The recommended value for HAFCMODE[0] is 0.

20B.2.13 Vertical Countdown Control Register 1 (VCDWCR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VCDFREERUN	NOVCD50	NOVCD60	VCDDEFAULT[1:0]		VCDWINDOW[5:0]						VCDOFFSET[4:0]				
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	1	0	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	VCDFREERUN	0	R/W	Vertical Countdown Free-Run Oscillation Mode ON/OFF 0: OFF 1: ON
14	NOVCD50	0	R/W	Vertical Countdown 50-Hz Oscillation Mode OFF 0: 50-Hz oscillation ON 1: 50-Hz oscillation OFF
13	NOVCD60	0	R/W	Vertical Countdown 60-Hz (59.94-Hz) Oscillation Mode OFF 0: 60-Hz oscillation ON 1: 60-Hz oscillation OFF
12, 11	VCDDEFAULT[1:0]	00	R/W	Vertical Countdown Center Oscillation Frequency 00: Auto-detection 01: 50.00 Hz 10: 59.94 Hz 11: 60.00 Hz
10 to 5	VCDWINDOW[5:0]	010100	R/W	Vertical Countdown Sync Area Set a value in 0.1-ms units.
4 to 0	VCDOFFSET[4:0]	01010	R/W	Vertical Countdown Minimum Oscillation Frequency Set the shift from the center frequency in 0.1-ms units.

(1) Vertical Countdown Free-Run Operation Control

VCDFREERUN controls the vertical countdown free-run operation. When VCDFREERUN is 1, the vertical countdown free-run operation is performed independently of the inputs. VCDFREERUN should usually be set to 0.

(2) Vertical Countdown Free-Run Operation Control

NOVD50 controls 50-Hz oscillation. When NOVCD50 is 1, the vertical countdown operation is not locked to 50 Hz.

(3) Vertical Countdown Free-Run Operation Control

NOVD60 controls 60-Hz oscillation. When NOVCD60 is 1, the vertical countdown operation is not locked to 60 Hz.

(4) Vertical Countdown Free-Run Operation Control

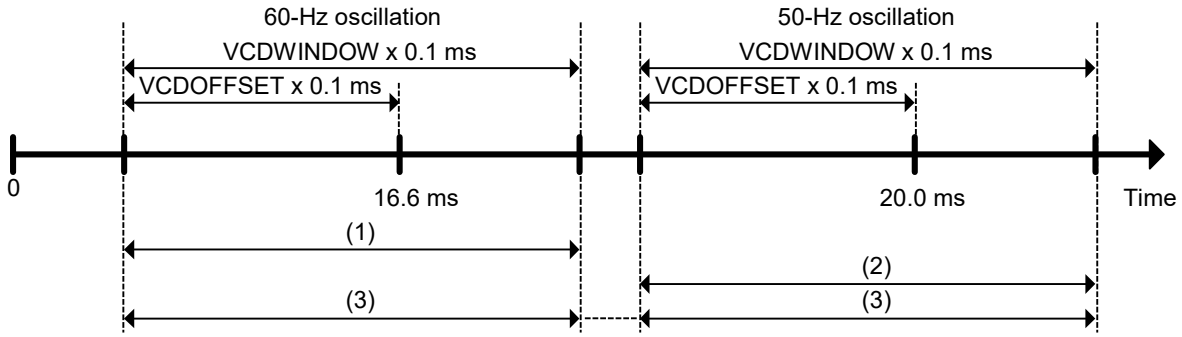
VCDDEFAULT sets the center frequency for the vertical countdown.

Table 20B.12 Vertical Countdown Operating Modes

VCDDEFAULT[1:0]	Operating Mode
00	Auto-detection
01	50.00 Hz
10	59.94 Hz
11	60.00 Hz

(5) Vertical Countdown Lock Range Control

VCDWINDOW and VCDOFFSET control the vertical countdown lock range. Figure 20B.14 shows the bit settings and lock ranges.



(1) Vertical countdown lock range with NOVCD 50 = 1 and NOVCD60 = 0 (60-Hz oscillation mode)
(2) Vertical countdown lock range with NOVCD 50 = 0 and NOVCD60 = 1 (50-Hz oscillation mode)
(3) Vertical countdown lock range with NOVCD 50 = 0 and NOVCD60 = 0 (auto detection mode)

Figure 20B.14 Vertical Countdown Lock Ranges

20B.2.14 Digital Clamp Control Register 1 (DCPCR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCPMODE_Y	—	—	—	DCPCHECK	—	BLANKLEVEL_Y[9:0]									
Initial value:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	DCPMODE_Y	1	R/W	Clamp Level Setting Mode (Y signal) 0: Manual clamp level setting 1: Auto clamp level setting
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	DCPCHECK	0	R/W	Digital Clamp Pulse Position Check The offset given by BLANKLEVEL is added to the clamp position.
10	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
9 to 0	BLANKLEVEL_Y [9:0]	0000000000	R/W	Clamp Offset Level (Y signal) Set the subtraction value. Set a value in 1-LSB units. 2s complement

(1) Y-Signal Clamp Operation Control

DCPMODE_Y controls the clamp level of Y signal.

When DCPMODE_Y = 0, the value set by BLANKLEVEL_Y is subtracted from the video signal.

Y signal output = Y signal input – BLANKLEVEL_Y

When DCPMODE_Y is 1, the video signal level at the digital clamp pulse position (pedestal level) and BLANKLEVEL_Y are added together and the resulting value is subtracted from the video signal.

Y signal output = Y signal input – (detected value + BLANKLEVEL_Y)

(2) Digital Clamp Pulse Position Check Control

DCPCHECK allows the digital clamp pulse position to be displayed and checked on the screen. The following shows the steps to check the position.

1. Set DCPCHECK (digital clamp pulse position check bit) to 1.
2. Set SRCLEFT (left end of input video signal capturing area bit) and RES_HS[10:0] in SCL0_DS3 of the video display controller 5 scaler to 0.
3. Set clamp offset level of the signal to be monitored to Min value (−512 for BLANKLEVL_Y, (−32 for BLANKLEVL_Cb/Cr).
4. Adjust the pulse position and width using DCPPOS_Y (or DCPPOS_C) and DCPWIDTH.

20B.2.15 Digital Clamp Control Register 2 (DCPCR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCPMODE_C	—	—	—	BLANKLEVEL_CB[5:0]						BLANKLEVEL_CR[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	DCPMODE_C	0	R/W	Clamp Level Setting Mode (Cb/Cr signal) 0: Manual clamp level setting 1: Auto clamp level setting
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 6	BLANKLEVEL_CB[5:0]	000000	R/W	Clamp Offset Level (Cb signal) Set the subtraction value. Set a value in 1-LSB units. 2s complement
5 to 0	BLANKLEVEL_CR[5:0]	000000	R/W	Clamp Offset Level (Cr signal) Set the subtraction value. Set a value in 1-LSB units. 2s complement

(1) Cb/Cr-Signal Clamp Operation Control

DCPMODE_C controls the clamp level of Cb/Cr-signal.

When DCPMODE_C = 0, the value set by BLANKLEVEL_CB/BLANKLEVEL_CR is subtracted from the video signal.

Cb signal output = Cb signal input – BLANKLEVEL_CB

Cr signal output = Cr signal input – BLANKLEVEL_CR

When DCPMODE_C = 1, sum of the video signal level (center level) in the digital clamp pulse position and BLANKLEVEL_CB/CR is subtracted from the video signal.

Cb signal output = Cb signal input – (detected value + BLANKLEVEL_CB)

Cr signal output = Cr signal input – (detected value + BLANKLEVEL_CR)

20B.2.16 Digital Clamp Control Register 3 (DCPCR3)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	DCPRESPONSE[2:0]			—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 12	DCPRESPONSE [2:0]	101	R/W	Digital Clamp Response Speed The larger the value is, the faster the response speed is. However, that will result in higher susceptibility to noise.
11 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(1) Digital Clamp Response Speed

DCPRESPONSE sets the digital clamp response speed.

Though the larger value makes the response faster, that will result in higher susceptibility to noise.

DCPRESPONSE is used in common to Y, Cb, and Cr signals.

20B.2.17 Digital Clamp Control Register 4 (DCPCR4)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCPSTART[5:0]						—	—	—	—	—	—	—	—	—	—
Initial value:	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	DCPSTART[5:0]	010000	R/W	Digital Clamp Start Line (in 1-line units) Start clamp pulses at the Nth line after the vertical sync signal.
9 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

20B.2.18 Digital Clamp Control Register 5 (DCPCR5)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCPEND[5:0]						—	—	—	—	—	—	—	—	—	—
Initial value:	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	DCPEND [5:0]	010000	R/W	Digital Clamp End Line (in 1-line units) Stop clamp pulses at the Nth line before the vertical sync signal.
9 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(1) Digital Clamp Pulse Control (Vertical)

DCPSTART and DCPEND control the digital clamp pulses in the vertical direction. Figure 20B.15 shows the bit settings and digital clamp timing.

DCPSTART and DCPEND are used in common to Y, Cb, and Cr signals.

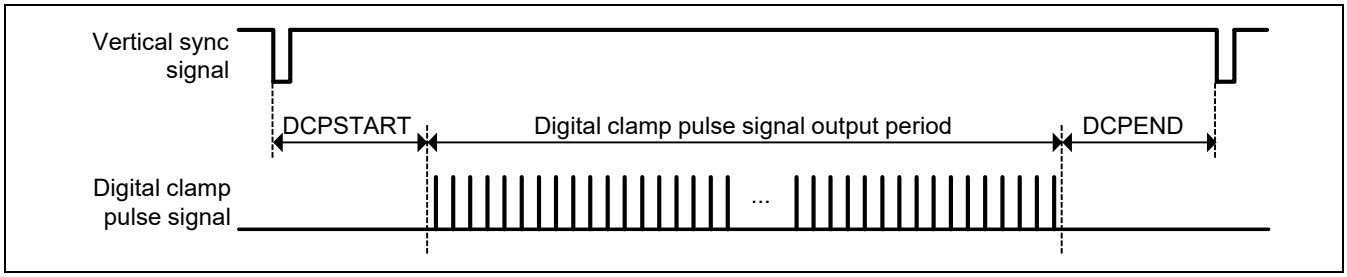

Figure 20B.15 Digital Clamp Timing (Vertical)

20B.2.19 Digital Clamp Control Register 6 (DCPCR6)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	DCPWIDTH[6:0]							—	—	—	—	—	—	—	—
Initial value:	0	0	1	1	0	1	1	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 8	DCPWIDTH [6:0]	0110110	R/W	Digital Clamp Pulse Width Set a value in 27-MHz clock cycle units.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

20B.2.20 Digital Clamp Control Register 7 (DCPCR7)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCPPOS_Y[7:0]								—	—	—	—	—	—	—	—
Initial value:	1	0	1	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	DCPPOS_Y[7:0]	10100010	R/W	Digital Clamp Pulse Horizontal Start Position (Y signal) Set a value in 27-MHz clock cycle units.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

20B.2.21 Digital Clamp Control Register 8 (DCPCR8)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCPPOS_C[7:0]								—	—	—	—	—	—	—	—
Initial value:	0	0	0	1	1	0	1	1	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	DCPPOS_C[7:0]	00011011	R/W	Digital Clamp Pulse Horizontal Start Position (Cb/Cr signal) Set a value in 27-MHz clock cycle units.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(1) Digital Clamp Pulse Control (Horizontal)

DCPWIDTH, DCPPOS_Y, and DCPPOS_C control the digital clamp pulses in the horizontal direction. Figure 20B.16 shows the bit settings and digital clamp timing.

DCPPOS_Y is used for Y signal and DCPPOS_C is for Cb/Cr signal. DCPWIDTH is used in common to Y, Cb, and Cr signals.

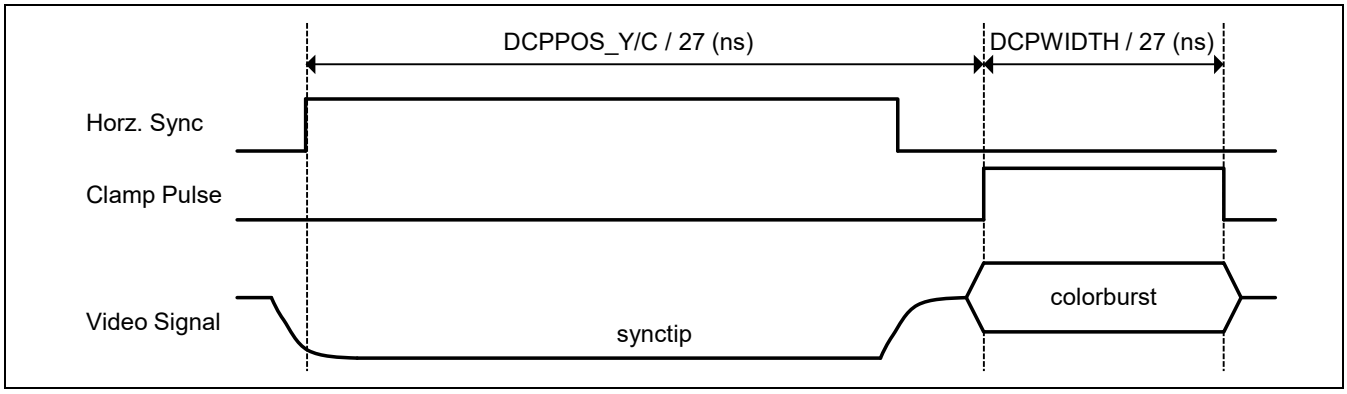

Figure 20B.16 Digital Clamp Timing (Horizontal)

20B.2.22 Noise Detection Control Register (NSDCR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	ACFINPUT[1:0]		—	—	—	ACFLAGTIME[4:0]					—	—	ACFFILTER[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	ACFINPUT[1:0]	00	R/W	Video Signal for Autocorrelation Function 00: Y signal 01: Cb signal 10, 11: Cr signal
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8 to 4	ACFLAGTIME [4:0]	00000	R/W	Delay Time for Autocorrelation Function Calculation 0 to 31 clock pulses @ 27-MHz clock The NSDSR.AFCSTRENGTH value almost corresponds to noise power when the delay time is set to 0.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	ACFFILTER[1:0]	00	R/W	Smoothing Parameter of Autocorrelation Function Data The smaller the ACFFILTER value is, the longer the time period is taken. The time period varies from 1 field to several seconds.

(1) Input for Noise Detection

ACFINPUT controls inputs for noise detection.

Table 20B.13 Input Selection for Noise Detection

ACFINPUT[1:0]	Input Signal
00	Y signal
01	Cb signal
10, 11	Cr signal

(2) Autocorrelation Function Control for Noise Detection

ACFLAGTIME controls autocorrelation function for noise detection.

The NSDSR.AFCSTRENGTH value almost corresponds to noise power when the delay time is set to 0.

(3) Smoothing Filter Control for Noise Detection

ACFFILTER controls smoothing function for noise detection inputs.

The smaller the ACFFILTER value is, the larger the field integration is (the longer time period is taken for noise detection).

20B.2.23 Burst Lock/Chroma Decoding Control Register (BTLCR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LOCKRANGE [1:0]		LOOPGAIN [1:0]		LOCKLIMIT [1:0]		BCOFREERUN	—	DEFAULTSYS [1:0]		NONTSC358	NONTSC443	NOPALM	NOPALN	NOPAL443	NOSECAM
Initial value:	0	1	0	1	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	LOCKRANGE [1:0]	01	R/W	Burst Lock PLL Lock Range 00: ±400 Hz 01: ±800 Hz 10: ±1200 Hz 11: ±1600 Hz
13, 12	LOOPGAIN[1:0]	01	R/W	Burst Lock PLL Loop Gain The larger value makes the response faster, but the noise is more easily picked up.
11, 10	LOCKLIMIT[1:0]	10	R/W	Level for Burst Lock PLL to Re-Search Free-Run Frequency The larger value more easily unlocks the PLL to start re-search.
9	BCOFREERUN	0	R/W	Burst Lock PLL Free-Run Oscillation Mode ON/OFF 0: OFF 1: ON
8	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
7, 6	DEFAULTSYS [1:0]	00	R/W	Default Color System 00: NTSC 01: PAL 10: SECAM 11: Not specified
5	NONTSC358	0	R/W	NTSC-M Detection Control 0: NTSC-M detection ON 1: NTSC-M detection OFF
4	NONTSC443	0	R/W	NTSC-4.43 Detection Control 0: NTSC-4.43 detection ON 1: NTSC-4.43 detection OFF
3	NOPALM	0	R/W	PAL-M Detection Control 0: PAL-M detection ON 1: PAL-M detection OFF
2	NOPALN	0	R/W	PAL-N Detection Control 0: PAL-N detection ON 1: PAL-N detection OFF
1	NOPAL443	0	R/W	PAL-B, G, H, I, D Detection Control 0: PAL-B, G, H, I, D detection ON 1: PAL-B, G, H, I, D detection OFF
0	NOSECAM	0	R/W	SECAM Detection Control 0: SECAM detection ON 1: SECAM detection OFF

(1) Lock Range of Burst Lock PLL

LOCKRANGE controls the lock range of the burst lock PLL.

Table 20B.14 Lock Range of Burst Lock PLL

LOCKRANGE[1:0]	Lock Range of Burst Lock PLL
00	0: ±400 Hz
01	1: ±800 Hz
10	2: ±1200 Hz
11	3: ±1600 Hz

(2) Burst Lock PLL Loop Gain Control

LOOPGAIN controls the loop gain of the burst lock PLL.

The larger value makes the response faster, but the noise is more easily picked up.

(3) Burst Lock PLL Lock Limit Control

LOCKLIMIT controls the lock limit of the burst lock PLL.

The larger the LOCKLIMIT value is, the more easily the PLL free-run frequency is unlocked to start re-search.

(4) Burst Lock PLL Free-Run Operation Control

BCOFREERUN controls the free-run operation of burst lock PLL.

When BCOFREERUN is 1, the burst lock PLL performs free-run operation independently of the inputs. BCOFREERUN should usually be set to 0.

(5) Default Color System during Chroma Decoding

DEFAULTSYS sets the default color system when automatic judgement of the color system for use in chroma decoding is not possible.

Table 20B.15 Default Color System

DEFAULTSYS[1:0]	Color System for No Signal State
00	NTSC
01	PAL
10	SECAM
11	Not specified

(6) Color System Detection Control

NONTSC358, NONTSC443, NOPALM, NOPALN, NOPAL443, and NOSECAM control the color system detection.

Color system detection can be fully automatic, manual, or semi-automatic (detecting the specified color system only). If the detection result does not apply to any color system type, a color system selected by DEFAULTSYS is used for the operation.

Color system detection can be controlled (ON or OFF) individually for each type. By enabling one particular color system to be detected, the color system can be fixed. Table 20B.16 shows the color system detection control methods.

Table 20B.16 Color System Detection Control

	NOSECAM	NOPAL443	NOPALN	NOPALM	NONTSC443	NONTSC358
Auto	0	0	0	0	0	0
NTSC-3.58(M)	1	1	1	1	1	0
NTSC-4.43	1	1	1	1	0	1
PAL-M	1	1	1	0	1	1
PAL-N	1	1	0	1	1	1
PAL-4.43	1	0	1	1	1	1
SECAM	0	1	1	1	1	1

In auto mode, the color system detection result is stored into the register.

Table 20B.17 and Table 20B.18 show color system detection and detection result setting.

Table 20B.17 Color System Detection Result (1)

COLORSYS[1:0]	FSCMODE	FVMODE	Detection Result
0: NTSC	0: 3.58MHz	don't care	NTSC-M
0: NTSC	1: 4.43MHz	don't care	NTSC-4.43
1: PAL	0: 3.58MHz	0: 50Hz	PAL-N
1: PAL	0: 3.58MHz	1: 60Hz	PAL-M
1: PAL	1: 4.43MHz	0: 50Hz	PAL-B, H, I, G, D
1: PAL	1: 4.43MHz	1: 60Hz	PAL-60
2: SECAM	—	—	SECAM
3: Unknown	—	—	Undetectable

Table 20B.18 Color System Detection Result (2)

	ISNTSC	ISPAL	ISSECAM
Undetectable	0	0	0
NTSC	1	0	0
PAL	0	1	0
SECAM	0	0	1

20B.2.24 Burst Gate Pulse Control Register (BTGPCR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BGPCHECK	BGPWIDTH[6:0]							BGPSTART[7:0]							
Initial value:	0	0	1	0	0	1	0	0	1	0	0	0	0	0	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	BGPCHECK	0	R/W	Burst Gate Pulse Position Check Displays the front and end edges of burst gate pulses by white lines.
14 to 8	BGPWIDTH [6:0]	0100100	R/W	Burst Gate Pulse Width Specify the offset from the 64th clock pulse width in 27-MHz clock cycle units.
7 to 0	BGPSTART [7:0]	10000010	R/W	Burst Gate Pulse Start Position Specify the position from the horizontal sync signal reference in 27-MHz clock cycle units.

(1) Burst Gate Pulse Control

BGPWIDTH and BGPSTART control the burst gate pulse timing.

The burst gate pulse position is specified to extract color burst from the video signal which is considered as a reference signal for the burst lock PLL. Usually, the burst gate pulse should be set so that it should start at the latter part of the horizontal sync signal and include the reference position in order to respond to an insert position shift of color burst caused by VCR.

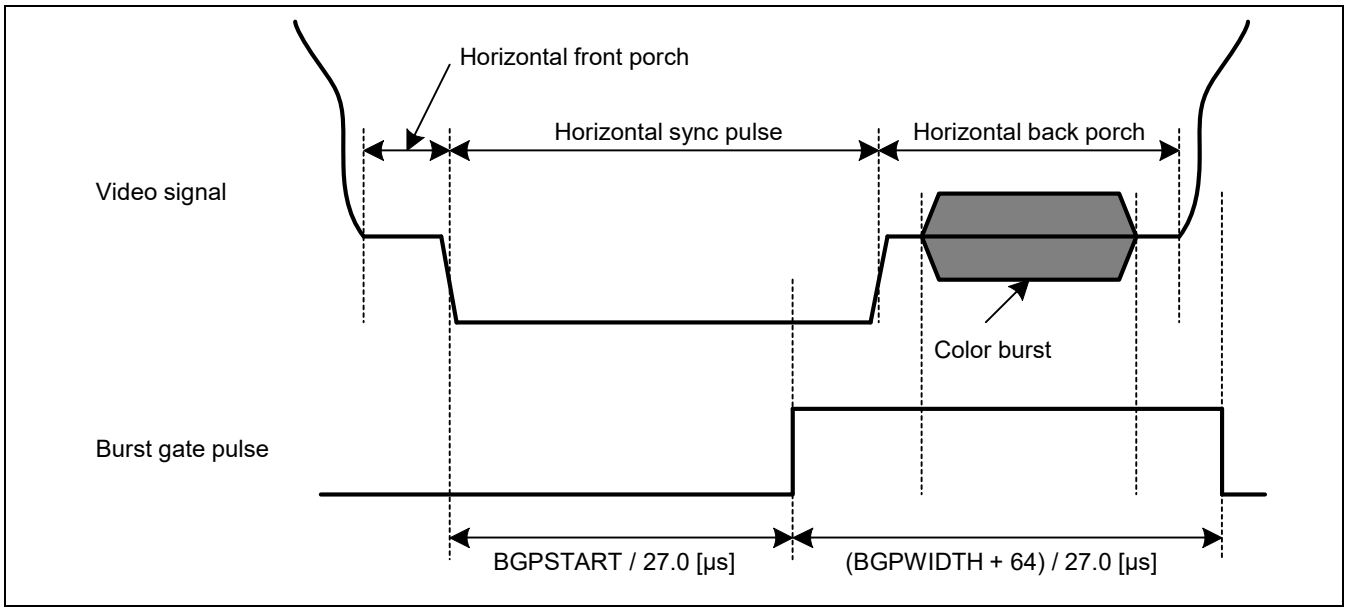

Figure 20B.17 Burst Gate Pulse Generation Timing

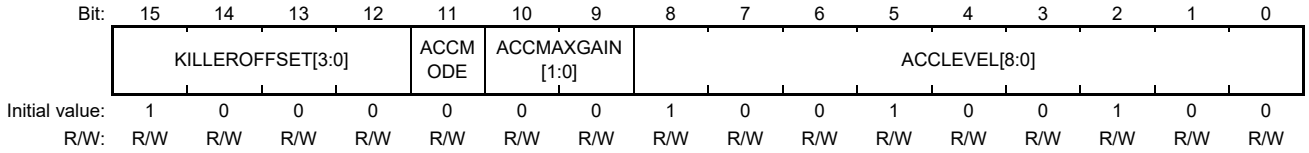
(2) Burst Gate Pulse Position Check

BGPCHECK controls the burst gate pulse position check on screen. The following shows the steps to check the position:

- Burst gate position check: Set BGPCHECK to 1.
- Input video signal capturing left end setting: Set SRCLEFT to 0 and RES_HS[10:0] in SCL0_DS3 of the video display controller 5 scaler to 0.
- Adjust the pulse position and width with BGPSTART and BGPWIDTH.

20B.2.25 ACC Control Register 1 (ACCCR1)



Bit	Bit Name	Initial Value	R/W	Description
15 to 12	KILLEROFFSET [3:0]	1000	R/W	The levels of these bits and KILLERLEVEL are added together to be the level to turn off the color killer. This level corresponds to the Peak-to-Peak amplitude of the color burst signal.
11	ACCMODE	0	R/W	ACC Operating Mode 0: Auto gain 1: Manual gain
10, 9	ACCMAXGAIN [1:0]	00	R/W	Maximum ACC Gain Valid when ACCMODE = 0 (auto gain setting). 00: 6 times 01: 8 times 10: 12 times 11: 16 times
8 to 0	ACCLEVEL[8:0]	100100100	R/W	ACC Reference Color Burst Amplitude Valid when ACCMODE = 0 (auto gain setting). Set Peak-to-Peak amplitude in 1-LSB units.

(1) Color Killer Offset Control

KILLEROFFSET sets the hysteresis to make the color killer OFF.

If the KILLEROFFSET value is too large, the color killer cannot be turned off as long as the burst amplitude is not large enough. If the KILLEROFFSET value is too small, the color killer is turned on and off repeatedly due to noise.

The standard value is between 4 and 10.

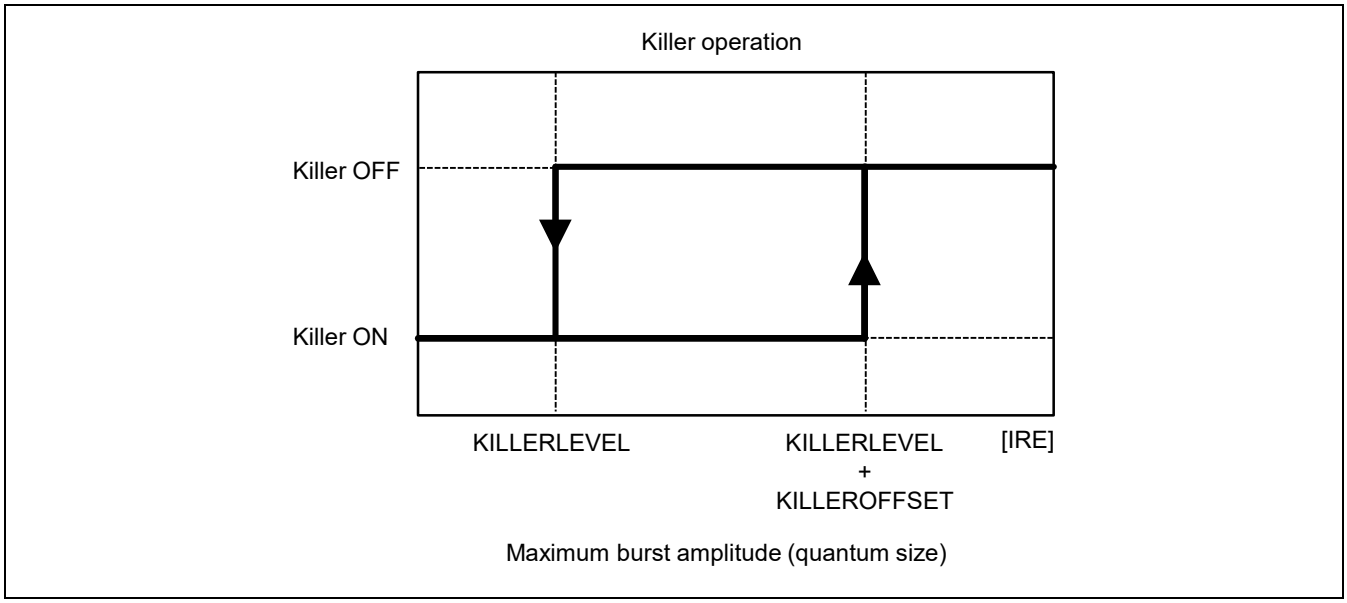


Figure 20B.18 Color Killer Operation

(2) ACC Operation Control

ACCMODE controls the ACC operation.

Table 20B.19 ACC Operating Modes

ACCMODE	Color Gain Adjustment
0	Auto gain
1	Manual gain

(3) Maximum ACC Gain Control

ACCMAXGAIN controls the maximum ACC gain. ACCMAXGAIN is valid only when ACCMODE = 0.

Table 20B.20 Maximum ACC Gain

ACCMAXGAIN[1:0]	Maximum Color Gain
00	6 times
01	8 times
10	12 times
11	16 times

(4) ACC Level Control

ACCLEVEL sets the burst amplitude of the chroma signal after gain correction. ACCLEVEL is valid only when ACCMODE = 1.

The ACC adjusts the gain so that the input chroma signal burst amplitude should be the same level as the ACCLEVEL value.

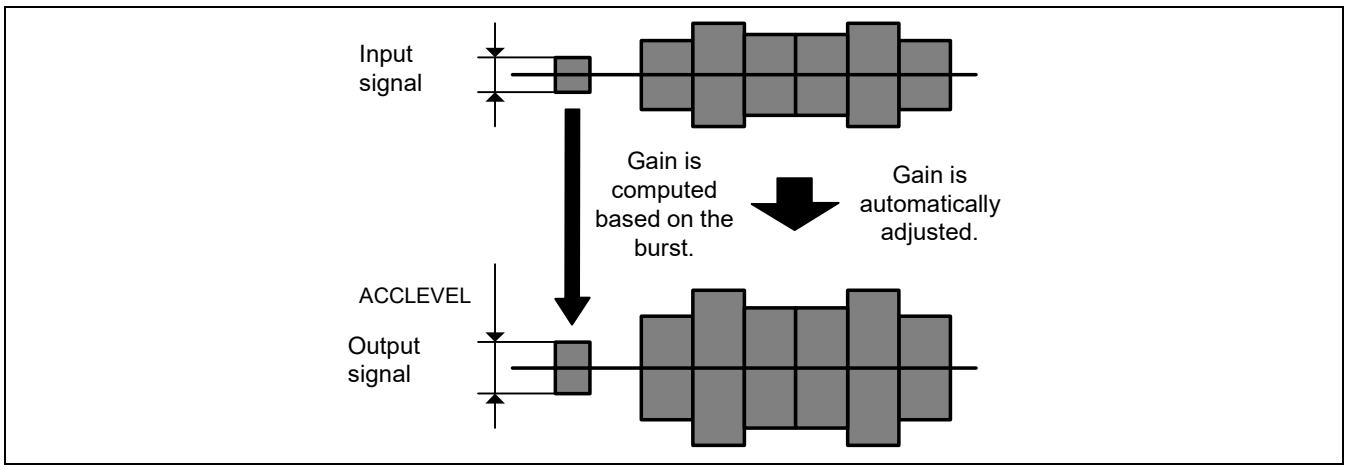

Figure 20B.19 ACC Level Setting

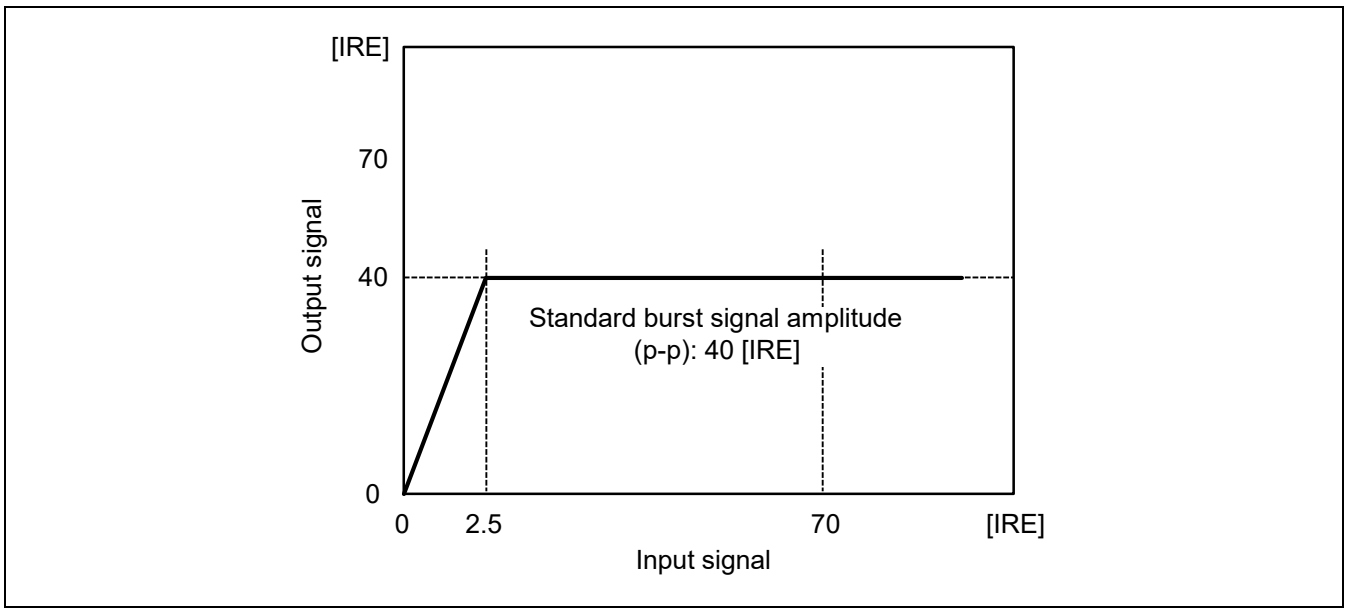

Figure 20B.20 ACC Input/Output Characteristics

Table 20B.21 ACC Characteristics

Input Burst Signal Level	Output Burst Signal Level
More than 24.1 [dB]	Reference amplitude (variable) ± acceptable error (variable)
24.1[dB] or less	Decreased in proportion to input level

20B.2.26 ACC Control Register 2 (ACCCR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	CHROMASUBGAIN[1:0]		CHROMAMAINGAIN[8:0]								
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10, 9	CHROMASUBGAIN[1:0]	00	R/W	Chroma Manual Gain (sub) Valid when ACCMODE = 1 (manual gain setting) 00: 1 time 01: 2 times 10: 4 times 11: 8 times
8 to 0	CHROMAMAINGAIN[8:0]	100000000	R/W	Chroma Manual Gain (main) Valid when ACCMODE = 1 (manual gain setting) The value 256 corresponds to 1 time.

(1) Chroma Gain Adjustment (Manual) Control

CHROMASUBGAIN and CHROMAMAINGAIN control the chroma gain. CHROMASUBGAIN and CHROMAMAINGAIN are valid only when ACCMODE is 1.

C signal output = C signal input × (CHROMASUBGAIN + CHROMAMAINGAIN/256)

20B.2.27 ACC Control Register 3 (ACCCR3)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ACC RESPONSE[1:0]		ACCPRECIS[5:0]						KILLER MODE	KILLERLEVEL[5:0]						—
Initial value:	0	1	0	1	0	1	0	0	0	0	0	1	0	0	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
15, 14	ACCRESPONSE [1:0]	01	R/W	ACC Response Speed The larger value makes the response faster, but the noise is more easily picked up.
13 to 8	ACCPRECIS[5:0]	010100	R/W	ACC Gain Adjustment Accuracy Set the acceptable error level of color burst signal amplitude after ACC adjustment by 1 LSB of 10-bit accuracy.
7	KILLERMODE	0	R/W	Forced Color Killer Mode ON/OFF 0: Auto-detection 1: Killer mode is forcedly ON.
6 to 1	KILLERLEVEL[5:0]	001001	R/W	Color Killer Operation Start Point Set the half value of Peak-to-Peak amplitude by 1 LSB of 10-bit accuracy.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

(1) ACC Response Speed Control

ACCRESPONSE controls the ACC response speed.

The larger value makes the response faster, and the smaller value makes it slower. However, the large value causes the noise to be more easily picked up.

(2) ACC Acceptable Error Range Control

ACCPRECIS controls the acceptable error range of the output burst signal amplitude based on ACCLEVEL (target value).

If ACCLEVEL = 236 and ACCPRECIS = 20, the ACC gain is fixed within the following range:

(236 – 20) < Output signal burst signal amplitude < (236 + 20)

(3) Killer Operating Mode Control

KILLERMODE controls the killer operating mode.

When KILLERMODE = 1, the killer is forcedly turned ON.

(4) Killer Level Control

KILLERLEVEL controls the level to make the killer ON.

For details, see section 20B.2.25(1) Color Killer Offset Control.

20B.2.28 TINT Control Register (TINTCR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TINTSUB[5:0]						TINTMAIN[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	TINTSUB [5:0]	000000	R/W	Fine Adjustment of R-Y Demodulation Axis (only valid for NTSC/PAL) Set a value by 360/1024 degrees. 2s complement
9 to 0	TINTMAIN [9:0]	0000000000	R/W	Hue Adjustment Level (only valid for NTSC/PAL) Set a value by 360/1024 degrees. 2s complement

(1) R-Y Axis Correction Control

TINTSUB controls the phase of R-Y axis by ±11.25 degrees.

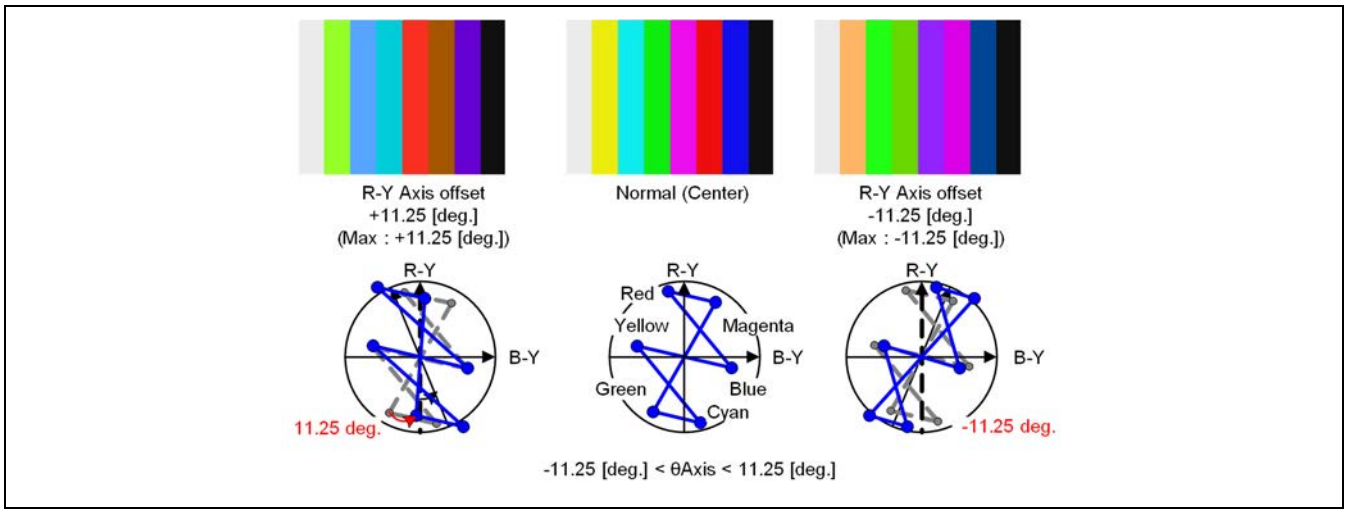

Figure 20B.21 Example of R-Y Axis Correction

(2) Hue Adjustment (TINT) Correction Control

TINTMAIN controls the phase of demodulation axis by 0 to 360 degrees.

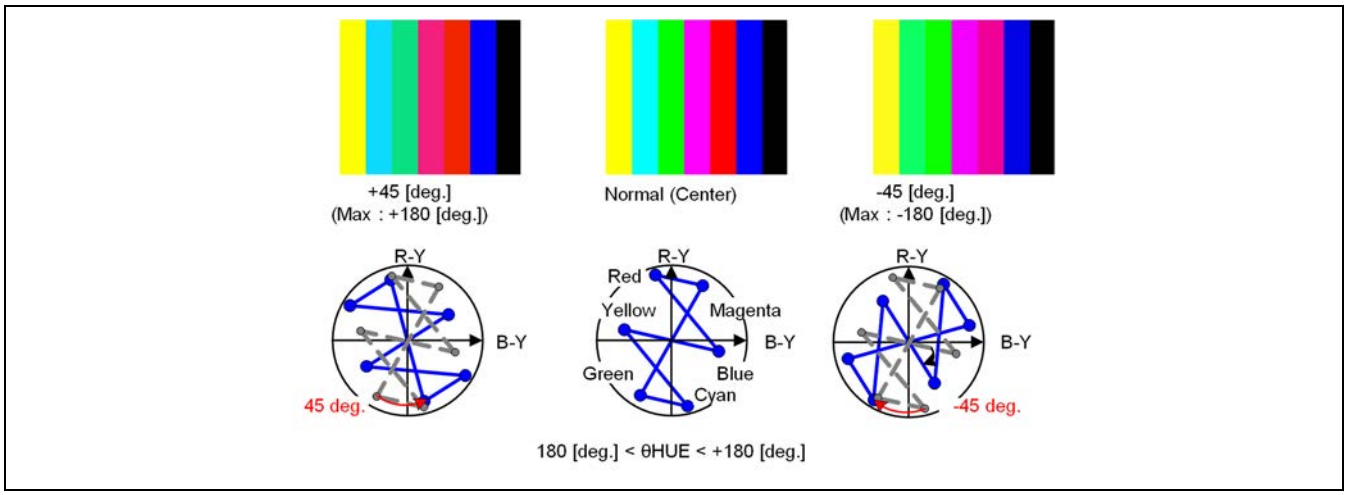

Figure 20B.22 Example of Hue Adjustment (TINT) Correction

20B.2.29 Y/C Delay/Chroma Decoding Control Register (YCDCR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LUMADELAY[4:0]					—	CHRO MALPF	DEMODMODE [1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8 to 4	LUMADELAY [4:0]	00000	R/W	Luminance Signal Delay Adjustment –16 to +15 clock pulses Set a value by the 2s complement.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	CHROMALPF	0	R/W	LPF for Demodulated Chroma 0: Not used 1: Used
1, 0	DEMODMODE [1:0]	10	R/W	Averaging Processing for Pre-Demodulated Line 00: No processing 01: Setting prohibited 10: For PAL 11: Setting prohibited

(1) Y/C Delay Adjustment Control

LUMADELAY controls the Y/C delay.

Table 20B.22 Y/C Delay Adjustment

LUMADELAY[4:0]	Operation
00000	No delay
00001	Delays Y signal by 1 [clk]
:	:
01111	Delays Y signal by 15 [clk]
10000	Advances Y signal by 16 [clk]
:	:
11111	Advances Y signal by 1 [clk]

(2) Frequency Band Limiting after Demodulation

CHROMALPF turns on or off the frequency band limiting filter after demodulation.

Table 20B.23 Frequency Band Limiting after Demodulation

CHROMALPF	Operation
0	Frequency band-limiting filter OFF
1	Frequency band-limiting filter ON

(3) Chroma Decoding Operation Control

DEMODMODE controls operating modes of chroma demodulation.

Table 20B.24 Chroma Decoding Operation Modes

DEMODMODE[1:0]	Operation
00	One-line demodulation
10	Two-line demodulation for PAL only
01 and 11	Setting prohibited

20B.2.30 AGC Control Register 1 (AGCCR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	1	0	1	0	1	1	1	0	1	1	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	DUREDUCE	0	R/W	Manual Control of Sync Signal Amplitude Detection during VBI Period 0: Sets sync amplitude to AGC standard value. 1: Sets AGC gain to 3/4 times the normal gain value.
12	NOREDUCE	0	R/W	Control of Sync Signal Amplitude Detection during VBI Period 0: Detects sync amplitude. 1: Does not detect sync amplitude.
11 to 9	AGCRESPONSE [2:0]	101	R/W	AGC Response Speed The larger register value makes the response faster. However, the larger value causes the noise to be more easily picked up.
8 to 0	AGCLEVEL[8:0]	011101100	R/W	Sync Signal Reference Amplitude 10-bit unsigned value

(1) Sync Signal Amplitude Detection during VBI Period

DOREDUCE and NOREDUCE control detection of the AGC sync signal amplitude fluctuation during VBI period.

Table 20B.25 Sync Signal Amplitude Detection Operation during VBI Period

DOREDUCE	Sync Signal Amplitude Detection Operation during VBI Period
0	Sets sync amplitude to AGC standard
1	Sets AGC gain to 3/4 times the normal gain value

Table 20B.26 Sync Signal Amplitude Detection during VBI Period

NOREDUCE	Sync Signal Amplitude Detection during VBI Period
0	Detects sync amplitude.
1	Does not detect sync amplitude.

(2) AGC Response Speed Control

AGCRESPONSE controls the AGC response speed.

The larger register value makes the response faster, and smaller value makes it slower. (The large value causes the noise to be more easily picked up.)

The recommended value is 4 to avoid a malfunction caused by trick playback of VCR (fast-forward play/rewind play) or a weak electric field.

(3) AGC Level Control

AGCLEVEL controls the AGC target level.

When NTSC signals are quantized by a 10-bit A/D converter, sync signal amplitude for full range of the A/D converter can be provided by:

1023[LSB] × (40[IRE] ÷ 173[IRE]) = 236.53179[LSB]

Table 20B.27 shows the ideal AGC level for each input signal format.

Table 20B.27 AGC Level Setting Values (Ideal Values)

Input Signal Format	AGCLEVEL[8:0]
NTSC	236
PAL/SECAM	248

Table 20B.28 AGC Characteristics

Input Sync Signal Level	Output Sync Signal Level
0 or more [dB]	Increased in proportion to input level
–8.52 to 0 [dB]	Reference amplitude (variable) ± acceptable error (variable)
–8.52 or less [dB]	Decreased in proportion to input level

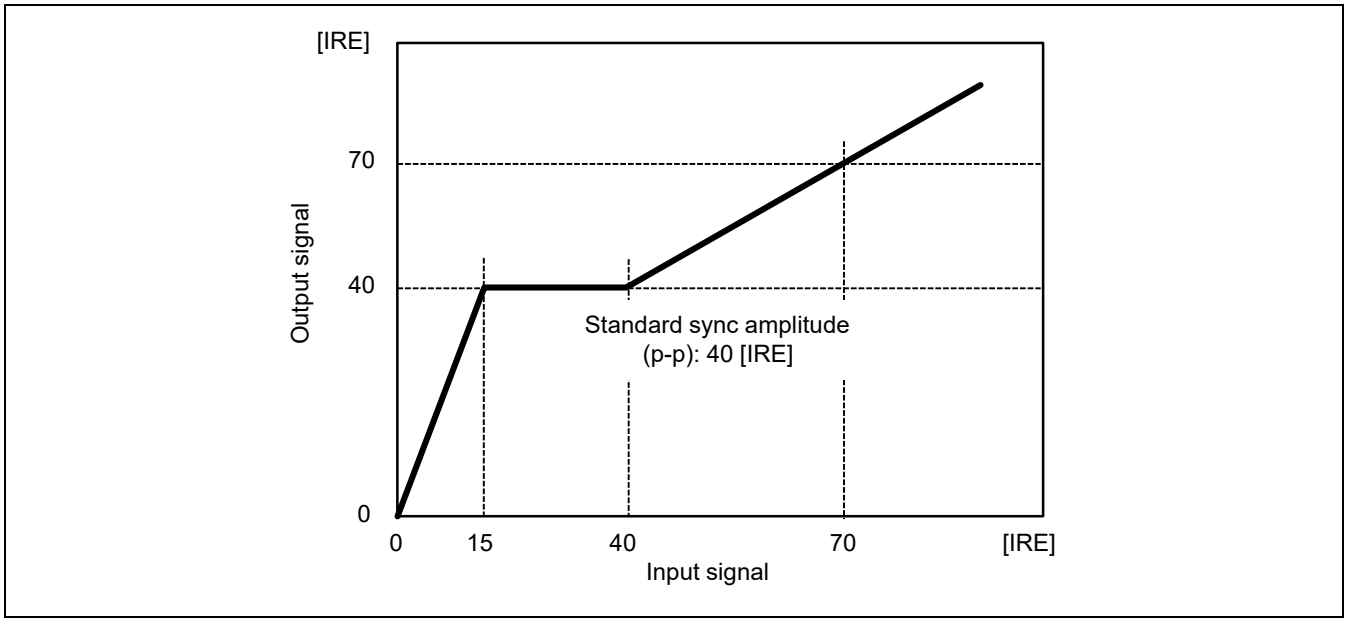

Figure 20B.23 AGC Characteristics (Sync Signal Amplitude Reference)

20B.2.31 AGC Control Register 2 (AGCCR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	AGCPRECIS[5:0]						—	—	—	—	—	—	—	—
Initial value:	1	1	0	0	1	0	1	0	0	1	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
13 to 8	AGCPRECIS [5:0]	001010	R/W	AGC Gain Adjustment Accuracy Set acceptable error level for sync pulse amplitude after AGC adjustment by 1 LSB of 10-bit accuracy.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(1) AGC Acceptable Error Range Control

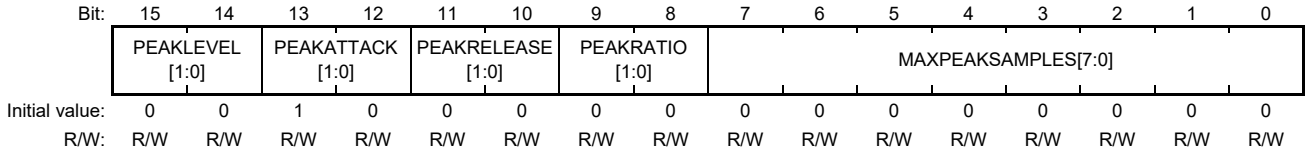
AGCPRECIS controls the acceptable error range of the output sync signal amplitude based on AGCLEVEL (target value).

If AGCLEVEL = 236 and AGCPRECIS = 10, AGC gain is fixed within the following range:

(236 – 10) < Output sync signal amplitude < (236 + 10)

In this case, the PGA gain can fall within a 2-step range. For video image with stabilized sync signal amplitude, AGCPRECIS = 4 is recommended, which enables the PGA gain to fall within a 1-step range, when the electric field is strong. For the above setting, the recommended value is 10 to avoid hunting in a weak electric field.

20B.2.32 Peak Limiter Control Register (PKLIMITCR)



Bit	Bit Name	Initial Value	R/W	Description
15, 14	PEAKLEVEL[1:0]	00	R/W	Peak Luminance Value Limited by Peak Limiter (video signal level) 00: Limiter OFF 01: 1008 LSB 10: 992 LSB 11: 960 LSB Peak limiter is not operated if AGC is OFF irrespective of PEAKLEVEL value.
13, 12	PEAKATTACK [1:0]	10	R/W	Response Speed with Peak Limiter Gain Decreased The larger value makes the response faster.
11, 10	PEAKRELEASE [1:0]	00	R/W	Response Speed with Peak Limiter Gain Increased The larger value makes the response faster.
9, 8	PEAKRATIO[1:0]	00	R/W	Maximum Compression Rate of Peak Limiter 00: Compressed up to 50% 01: Compressed up to 25% 10: Compressed up to 12.5% 11: Compressed up to 0%
7 to 0	MAXPEAK SAMPLES[7:0]	00000000	R/W	Allowable Number of Overflowing Pixels Set a value by 1024 pixels. Exceeding this value will start peak limiter operation.

(1) Peak Limiter Level Control

PEAKLEVEL controls the peak luminance limited by the peak limiter.

If the number of pixels counted exceeds the value set in PEAKLEVEL and there exist pixels more than the value set in MAXPEAKSAMPLES, the peak limiter function is activated to reduce the gain.

Table 20B.29 Peak Limiter Level Control

PEAKLEVEL[1:0]	Output Sync Signal Level
00	Peak limiter OFF
01	Peak limiter is activated at 1008 LSB
10	Peak limiter is activated at 992 LSB
11	Peak limiter is activated at 960 LSB

(2) Peak Limiter Response Speed Control

PEAKATTACK controls the response speed when the peak limiter gain is reduced.

The larger value makes the response faster.

(3) Peak Limiter Response Speed Control

PEAKRELEASE controls the response speed when the peak limiter gain is increased.

The larger value makes the response faster.

(4) Peak Limiter Gain Down Control

PEAKRATIO sets the maximum compression rate of the peak limiter.

Specifically, PEAKRATIO controls the amount of gain reduction (compression ratio) using the peak limiter function.

Table 20B.30 Peak Limiter Gain Down Control

PEAKRATIO[1:0]	Output Sync Signal Level
00	Compressed up to 50%
01	Compressed up to 25%
10	Compressed up to 12.5%
11	Compressed up to 0%

(5) Peak Limiter Determination Control

MAXPEAKSAMPLES controls the number of overflowing pixels allowed.

If the number of pixels counted during the vertical active period exceeds the value set in PEAKLEVEL and there exist pixels more than the value set in MAXPEAKSAMPLES, the peak limiter function is activated to reduce the gain.

The maximum allowable value is obtained by MAXPEAKSAMPLES × 1024.

20B.2.33 Over-Range Control Register 1 (RGORCR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RADJ_O_LEVEL0[9:0]

R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	RADJ_O_LEVEL0 [9:0]	1111111111	R/W	A/D Over-Threshold Level (Between levels 0 and 1) Level 0 (normal) to level 3 (completely over the range) are available.

(1) A/D Over-Threshold Level (Between Levels 0 and 1) Control

RADJ_O_LEVEL0 controls the A/D over-threshold level (between levels 0 and 1).

Figure 20B.24 shows the register values and threshold levels.

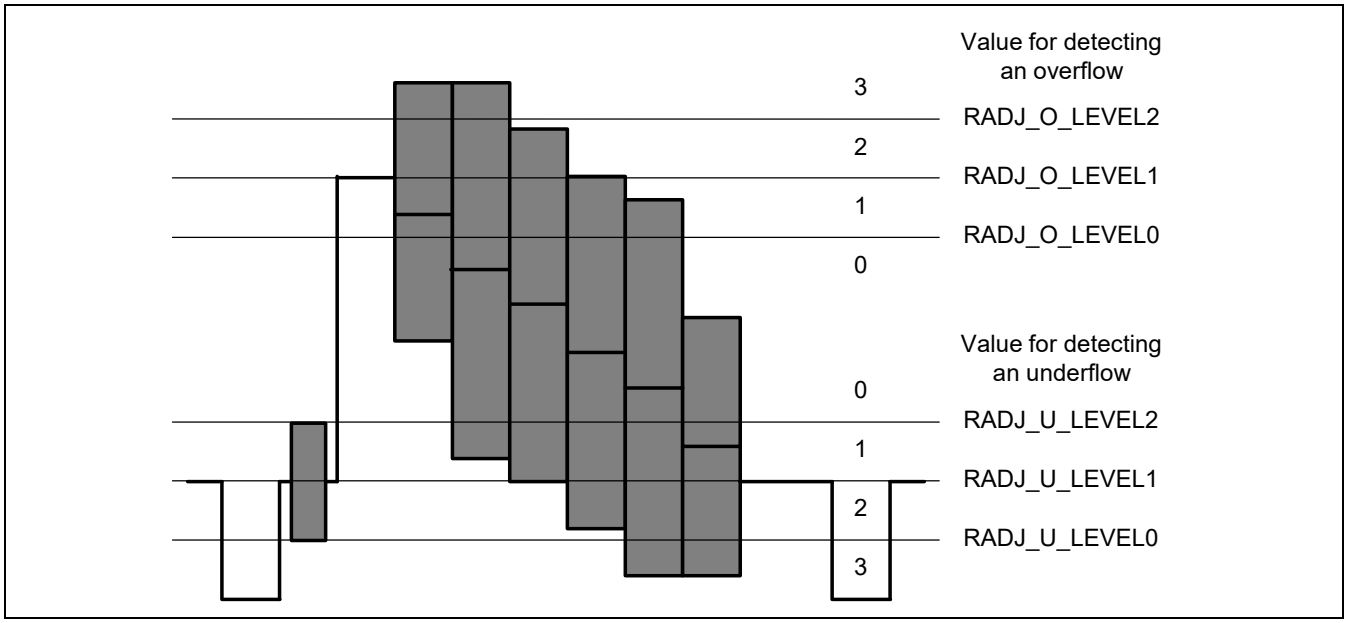

Figure 20B.24 Over-Range Determination Areas

20B.2.34 Over-Range Control Register 2 (RGORCR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RADJ_U_LEVEL0[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	RADJ_U_ LEVEL0[9:0]	0000000000	R/W	A/D Under-Threshold Level (Between levels 2 and 3) Level 0 (normal) to level 3 (completely under the range) are available.

(1) A/D Under-Threshold Level (Between Levels 2 and 3) Control

RADJ_U_LEVEL0 controls the A/D under-threshold level (between levels 2 and 3).

For the register values and threshold levels, see section 20B.2.33, Over-Range Control Register 1 (RGORCR1).

20B.2.35 Over-Range Control Register 3 (RGORCR3)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 12	TEST_MONI[2:0]	000	R/W	Test Mode 000 to 011: Normal operation 100: Level 0 part is output as black. 101: Level 1 part is output as black. 110: Level 2 part is output as black. 111: Level 3 part is output as black.
11 to 9	RADJ_MIX_K_FIX [2:0]	000	R/W	Forced Range Over/Under Mode 000 to 011: Auto detection 100: Fixed to Level 0 (normal state) 101: Fixed to level 1 (almost normal) 110: Fixed to level 2 (almost over the range) 111: Fixed to level 3 (completely over the range)
8 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	UCMP_SW	0	R/W	Over-Range Detection Enable 0: Disables over-range detection 1: Enables over-range detection
1	DCMP_SW	0	R/W	Under-Range Detection Enable 0: Disables under-range detection 1: Enables under-range detection
0	HWIDE_SW	1	R/W	Horizontal Enlargement of Over/Under-Range Level 0: Does not provide horizontal enlargement 1: Provides horizontal enlargement

(1) Over-Range Test Control

TEST_MONI controls the over-range test.

(2) Forced Over/Under-Range Mode Control

RADJ_MIX_K_FIX controls the forced over-/under-range detection.

(3) Over-Range Detection Control

UCMP_SW enables the over-range detection.

(4) Under-Range Detection Control

DCMP_SW enables the under-range detection.

(5) Horizontal Enlargement at Over/Under-Range Level

HWIDE_SW controls the horizontal enlargement of the over/under-range level.

20B.2.40 Feedback Control Register for Horizontal AFC Phase Comparator (AFCPFCR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	PHDET_FIX	—	PHDET_DIV[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	PHDET_FIX	0	R/W	Forcible or LOWGAIN Control 0: LOWGAIN determination result used 1: Forcibly controlled (adjusted with PHDET_DIV)
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	PHDET_DIV [2:0]	101	R/W	Phase Comparator Feedback Adjust for Low Sync Signal Lock Stability 000: 1/1 001: 1/2 010: 1/4 011: 1/8 100: 1/16 101: 1/32 110 and 111: Setting prohibited

(1) Phase Comparator Feedback Adjust

PHDET_DEV adjusts the feedback amount as the phase comparison result when the lock stability is low. The greater the denominator is, the slower the reaction speed to the signal is.

Table 20B.31 Phase Comparator Feedback Adjust

LOWGAIN	PHDET_FIX	PHDET_DIV [2:0]	Output
—	1	000	1/1
		001	1/2
		010	1/4
		011	1/8
		100	1/16
		101	1/32
0	0	—	1/1
1	—	000	1/1
		001	1/2
		010	1/4
		011	1/8
		100	1/16
		101	1/32

20B.2.41 Register Update Enable Register (RUPDCR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NEWSETTING	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	NEWSETTING	0	R/W	V Update Enable for TGCR1 to TGCR3 1: Enables update. 0: Disables update.
14 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(1) V Update Enable for TGCR1 to TGCR3

NEWSETTING enables/disables TGCR1 to TGCR3 to execute V update.

20B.2.42 Sync Separation Status/Vertical Cycle Read Register (VSYNCSR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FHCOUNT[0]	FHLOCK	ISNOISY	FHMODE	NOSIGNAL	FVLOCK	FVMODE	INTERLACED	FVCOUNT[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	FHCOUNT[0]	0	R	Horizontal AFC Oscillation Cycle (bit 0) Set a value by 1/64 of 27-MHz clock.
14	FHLOCK	0	R	Horizontal AFC Lock Detection Result 0: Unlocked 1: Locked
13	ISNOISY	0	R	Detection Result of Low S/N Signal by Sync Separation 0: Not low S/N signal 1: Low S/N signal
12	FHMODE	0	R	Speed Detection Result 0: Normal speed (525i/625i, etc.) 1: Multiplied speed (525p/625p, etc.)
11	NOSIGNAL	0	R	No-Signal Detection Result 0: Vertical sync signal detected 1: No vertical sync signal detected
10	FVLOCK	0	R	Vertical Countdown Lock Detection Result 0: Unlocked 1: Locked
9	FVMODE	0	R	Vertical Countdown Oscillation Mode 0: 50Hz 1: 60Hz
8	INTERLACED	0	R	Interlace Detection Result 0: Progressive 1: Interlace
7 to 0	FVCOUNT[7:0]	00000000	R	Vertical Cycle Measurement Result (in 0.1-ms units)

(1) Horizontal AFC Oscillation Cycle Read

FHCOUNT indicates bit 0 of the horizontal AFC oscillation cycle.

(2) Horizontal AFC Lock Detection Result Read

FHLOCK indicates the horizontal AFC lock detection result.

(3) Sync Separation Low S/N Signal Detection Result Read

ISNOISY indicates the detection result of low S/N signal by sync separation.

(4) Speed Detection Result Read

FHMODE indicates the speed detection result.

(5) No-Signal Detection Result Read

NOSIGNAL indicates the no-signal detection result.

(6) Vertical Countdown Lock Detection Result Read

FVLOCK indicates the vertical countdown lock detection result.

(7) Interlace Detection Result Read

INTERFACED indicates the interlace detection result.

(8) Vertical Cycle Measurement Result Read

FVCOUNT indicates the vertical cycle measurement result.

20B.2.43 Horizontal Cycle Read Register (HSYNCSR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FHCOUNT[16:1]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	FHCOUNT [16:1]	H'0000	R	Horizontal AFC Oscillation Cycle (bit 16 to bit 1) Set a value by 1/64 of 27-MHz clock.

(1) Horizontal AFC Oscillation Cycle Read

FHCOUNT indicates the upper bits of the horizontal AFC oscillation cycle.

20B.2.44 Digital Clamp Read Register 1 (DCPSR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CLAMPLEVEL_CB[5:0]						CLAMPLEVEL_Y[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	CLAMPLEVEL_CB [5:0]	000000	R	Digital Clamp Subtraction Value (Cb signal) Offset from the reference black level Set a value in 1-LSB units. 2s complement
9 to 0	CLAMPLEVEL_Y [9:0]	0000000000	R	Digital Clamp Subtraction Value (Y signal) Offset from the reference black level Set a value in 1-LSB units. 2s complement

(1) Reading Digital Clamp Subtraction Value of Cb Signal

CLAMPLEVEL_CB indicates the digital clamp subtraction value of Cb signal.

(2) Reading Digital Clamp Subtraction Value of Y in Composite Signal

CLAMPLEVEL_Y indicates the digital clamp subtraction value of Y signal.

20B.2.45 Digital Clamp Read Register 2 (DCPSR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CLAMPLEVEL_CR[5:0]						—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	CLAMPLEVEL_CR [5:0]	000000	R	Digital Clamp Subtraction Value (Cr signal) Offset from the reference black level Set a value in 1-LSB units. 2s complement
9 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(1) Reading Digital Clamp Subtraction Value of Cr Signal

CLAMPLEVEL_CR indicates the digital clamp subtraction value of Cr signal.

20B.2.46 Noise Detection Read Register (NSDSR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ACFSTRENGTH[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	ACFSTRENGTH [15:0]	H'0000	R	Noise Autocorrelation Strength at Digital Clamp Pulse Position (normally in the pedestal position) When ACFLAGTIME = 0, ACFSTRENGTH almost corresponds to the noise power in the pedestal position. Square root and logarithm of detection result almost correspond to noise amplitude and S/N (relative value), respectively.

(1) Reading Noise Autocorrelation Strength at Digital Clamp Pulse Position

ACFSTRENGTH indicates the noise correlation strength at the digital clamp pulse position (normal pedestal position).

20B.2.47 Chroma Decoding Read Register 1 (CROMASR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	COLORSYS[1:0]		FSCMODE	FSCLOCK	NOBURST	ACCSUBGAIN[1:0]		ACCMAINGAIN[8:0]								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15, 14	COLORSYS[1:0]	00	R	Color System Detection Result 00: NTSC 01: PAL 10: SECAM 11: Undetectable
13	FSCMODE	0	R	Color Sub-Carrier Frequency Detection Result 0: 3.58 MHz 1: 4.43 MHz
12	FSCLOCK	0	R	Burst Lock PLL Lock State Detection Result 0: Unlocked 1: Locked
11	NOBURST	0	R	Color Burst Detection Result 0: Color burst present 1: No color burst present
10, 9	ACCSUBGAIN [1:0]	00	R	Current ACC Gain Value (Sub) 00: 1 time 01: 2 times 10: 4 times 11: 8 times
8 to 0	ACCMAINGAIN [8:0]	000000000	R	Current ACC gain value (Main) The value 256 corresponds to 1 time.

(1) Color System Detection Result Read

COLORSYS indicates the color system detection result.

(2) Color Sub-Carrier Frequency Detection Result Read

FSCMODE indicates the color sub-carrier frequency detection result.

(3) Burst Lock PLL Lock State Detection Result Read

FSCLOCK indicates the lock state detection result of the burst lock PLL.

(4) Color Burst Detection Result Read

NOBURST indicates the color burst detection result.

(5) Current ACC Gain (Sub) Value Read

ACCSUBGAIN indicates the current ACC gain (sub) value.

(6) Current ACC Gain (Main) Value Read

ACCMAINGAIN indicates the current ACC gain (main) value.

20B.2.48 Chroma Decode Read Register 2 (CROMASR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	ISSECAM	ISPAL	ISNTSC	—	—	LOCKLEVEL[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	ISSECAM	0	R	SECAM Detection Result 0: Not SECAM signal 1: SECAM signal
11	ISPAL	0	R	PAL Detection Result 0: Not PAL signal 1: PAL signal
10	ISNTSC	0	R	NTSC Detection Result 0: Not NTSC signal 1: NTSC signal
9, 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	LOCKLEVEL [7:0]	00000000	R	Low S/N Signal Detection Result by Burst Lock PLL The larger value corresponds to a higher S/N.

(1) SECAM Signal Detection Result Read

ISSECAM indicates the SECAM signal detection result.

(2) PAL Signal Detection Result Read

ISPAL indicates the PAL signal detection result.

(3) NTSC Signal Detection Result Read

ISNTSC indicates the NTSC signal detection result.

(4) Read of Low S/N Signal Detection Result by Burst Lock PLL

LOCKLEVEL indicates the low S/N signal detection result by the burst lock PLL.

20B.2.49 Sync Separation Read Register (SYNCSSR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	ISREDUCED	—	—	SYNCDEPTH[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	ISREDUCED	0	R	Sync Amplitude Detection Result during VBI Period 0: Amplitude is larger than that in image active period. 1: Amplitude is equal to that in image active period.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SYNCDEPTH [9:0]	0000000000	R	Sync Pulse Amplitude Detection Result

(1) Reading Sync Amplitude Detection Result during VBI Period

ISREDUCED indicates the sync amplitude detection result during VBI period.

(2) Reading Sync Pulse Level Amplitude Detection Result

SYNCDEPTH indicates the sync pulse amplitude detection result.

20B.2.50 AGC Control Read Register 1 (AGCCSR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HIGHSAMPLES[7:0]								PEAKSAMPLES[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	HIGHSAMPLES[7:0]	00000000	R	Number of Pixels Which Have Larger Luminance Value Than Peak Luminance Limited by Peak Limiter Indicated by 1024 pixels
7 to 0	PEAKSAMPLES[7:0]	00000000	R	Number of Overflowing Pixels Indicated by 1024 pixels

(1) Reading Number of Pixels Which Have Larger Luminance Value Than Peak Luminance Limited by Peak Limiter

HIGHSAMPLES indicates the number of pixels which have larger luminance value than the peak luminance limited by the peak limiter.

(2) Number of Overflowing Pixels

PEAKSAMPLES indicates the number of overflowing pixels.

20B.2.51 AGC Control Read Register 2 (AGCCSR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	AGCCONVERGE	AGCGAIN[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	AGCCONVERGE	0	R	AGC Convergence Detection Result 0: Not converged 1: Converged
7 to 0	AGCGAIN[7:0]	01000000	R	Current AGC Gain Value The value 64 corresponds to ×1.

(1) Reading AGC Convergence Detection Result

AGCCONVERGE indicates the AGC convergence detection result.

(2) Reading Current AGC Gain

AGCGAIN indicates the current AGC gain.

20B.2.52 Y/C Separation Control Register 3 (YCSCR3)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	K15[3:0]				K13[5:0]						K11[5:0]					
Initial value:	0	0	1	0	0	0	1	0	0	0	0	0	0	1	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	K15[3:0]	0010	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the horizontal BPF is applied to the narrower range.
11 to 6	K13[5:0]	001000	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the horizontal BPF is applied to the narrower range.
5 to 0	K11[5:0]	000100	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the horizontal BPF is applied to the narrower range.

(1) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K15 controls the two-dimensional Y/C separation filter select coefficient.

For details, refer to section 20B.3.5(3), Horizontal and Vertical Correlation Detection Block.

(2) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K13 controls the two-dimensional Y/C separation filter select coefficient.

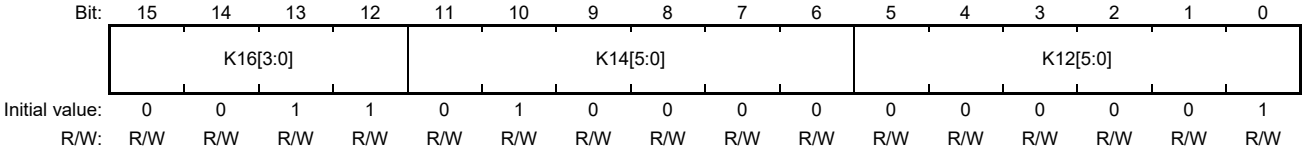
For details, refer to section 20B.3.5(3), Horizontal and Vertical Correlation Detection Block.

(3) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K11 controls the two-dimensional Y/C separation filter select coefficient.

For details, refer to section 20B.3.5(3), Horizontal and Vertical Correlation Detection Block.

20B.2.53 Y/C Separation Control Register 4 (YCSCR4)



Bit	Bit Name	Initial Value	R/W	Description
15 to 12	K16[3:0]	0011	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the horizontal BPF is applied to the narrower range.
11 to 6	K14[5:0]	010000	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the horizontal BPF is applied to the narrower range.
5 to 0	K12[5:0]	000001	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the horizontal BPF is applied to the narrower range.

(1) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K16 controls the two-dimensional Y/C separation filter select coefficient.

For details, refer to section 20B.3.5(3), Horizontal and Vertical Correlation Detection Block.

(2) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K14 controls the two-dimensional Y/C separation filter select coefficient.

For details, refer to section 20B.3.5(3), Horizontal and Vertical Correlation Detection Block.

(3) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K12 controls the two-dimensional Y/C separation filter select coefficient.

For details, refer to section 20B.3.5(3), Horizontal and Vertical Correlation Detection Block.

20B.2.54 Y/C Separation Control Register 5 (YCSCR5)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	K22A[7:0]								—	—	K21A[5:0]					
Initial value:	0	1	0	0	0	0	0	0	0	0	0	0	0	1	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	K22A[7:0]	01000000	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the vertical BPF is applied to the narrower range.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	K21A[5:0]	000110	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the vertical BPF is applied to the narrower range.

(1) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K22A controls the two-dimensional Y/C separation filter select coefficient.

For details, refer to section 20B.3.5(3), Horizontal and Vertical Correlation Detection Block.

(2) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K21A controls the two-dimensional Y/C separation filter select coefficient.

For details, refer to section 20B.3.5(3), Horizontal and Vertical Correlation Detection Block.

20B.2.55 Y/C Separation Control Register 6 (YCSCR6)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	K22B[7:0]								—	—	K21B[5:0]					
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	K22B[7:0]	00010000	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the vertical BPF is applied to the narrower range.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	K21B[5:0]	000110	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the vertical BPF is applied to the narrower range.

(1) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K22B controls the two-dimensional Y/C separation filter select coefficient.

For details, refer to section 20B.3.5(3), Horizontal and Vertical Correlation Detection Block.

(2) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K21B controls the two-dimensional Y/C separation filter select coefficient.

For details, refer to section 20B.3.5(3), Horizontal and Vertical Correlation Detection Block.

20B.2.56 Y/C Separation Control Register 7 (YCSCR7)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	K23B[3:0]				K23A[3:0]				—	—	—	K24[4:0]				
Initial value:	0	1	1	0	0	0	1	1	0	0	1	0	0	1	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	K23B[3:0]	0110	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the vertical BPF is applied to the narrower range.
11 to 8	K23A[3:0]	0011	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the vertical BPF is applied to the narrower range.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
4 to 0	K24[4:0]	00101	R/W	Two-Dimensional Y/C Separation Filter Select Coefficient As the value becomes larger, the vertical BPF is applied to the wider range.

(1) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K23B controls the two-dimensional Y/C separation filter select coefficient.

For details, refer to section 20B.3.5(3), Horizontal and Vertical Correlation Detection Block.

(2) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K23A controls the two-dimensional Y/C separation filter select coefficient.

For details, refer to section 20B.3.5(3), Horizontal and Vertical Correlation Detection Block.

(3) Two-Dimensional Y/C Separation Filter Select Coefficient Control

K24 controls the two-dimensional Y/C separation filter select coefficient.

For details, refer to section 20B.3.5(3), Horizontal and Vertical Correlation Detection Block.

20B.2.57 Y/C Separation Control Register 8 (YCSCR8)

In two-dimensional Y/C separation, horizontal BPF, vertical BPF, and horizontal/vertical BPF are adaptively switched. For the horizontal BPF and horizontal/vertical BPF, horizontal properties can be selected.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HBPF_NARROW	HVBPF_NARROW	HBPF1_9TAP_ON	HVBPF1_9TAP_ON	HFIL_TAP_SEL	—	—	—	—	—	—	—	—	—	—	—
Initial value:	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	HBPF_NARROW	1	R/W	Latter-Stage Horizontal BPF Select 0: Bypass 1: 17 TAP
14	HVBPF_NARROW	1	R/W	Latter-Stage Horizontal/Vertical BPF Select 0: Bypass 1: 17 TAP
13	HBPF1_9TAP_ON	0	R/W	Former-Stage Horizontal BPF Select 0: 17 TAP 1: 9 TAP
12	HVBPF1_9TAP_ON	0	R/W	Former-Stage Horizontal/Vertical BPF Select 0: 17 TAP 1: 9 TAP
11	HFIL_TAP_SEL	0	R/W	Horizontal Filter and Horizontal/Vertical Filter Bandwidth Switch Signal 0: 17 TAP 1: 9 TAP
10 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(1) Horizontal BPF Select Control

HBPF_NARROW selects the latter-stage horizontal BPF.

For details, refer to section 20B.3.5 (2), Horizontal and Vertical Filter Block.

(2) Horizontal/Vertical BPF Select Control

HVBPF_NARROW selects the latter-stage horizontal/vertical BPF.

For details, refer to section 20B.3.5 (2), Horizontal and Vertical Filter Block.

(3) Horizontal BPF (Broadband) Select Control

HBPF1_9TAP_ON selects the former-stage horizontal BPF.

For details, refer to section 20B.3.5 (2), Horizontal and Vertical Filter Block.

(4) Horizontal/Vertical BPF (Broadband) Select Control

HVBPF1_9TAP_ON selects the former-stage horizontal/vertical BPF.

For details, refer to section 20B.3.5 (2), Horizontal and Vertical Filter Block.

(5) Horizontal BPF Bandwidth Switch Control

HFIL_TAP_SEL switches the horizontal BPF bandwidths used for mixing.

For details, refer to section 20B.3.5 (5), Horizontal and Vertical Signal Mixing Block.

20B.2.58 Y/C Separation Control Register 9 (YCSCR9)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DET2_ON	—	—	—	HSEL_MIX_Y[3:0]				VSEL_MIX_Y[3:0]				HVSEL_MIX_Y[3:0]			
Initial value:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	DET2_ON	1	R/W	Two-Dimensional Filter Mixing Select 0: Signals are not mixed after passing the correlation detection filter. 1: Signals are mixed after passing the correlation detection filter.
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	HSEL_MIX_Y[3:0]	0000	R/W	Mixing Ratio of Signal after Passing Horizontal Filter to Signal after Passing Former-Stage Horizontal Filter 0000: Horizontal filter 100.0% 0001: Horizontal filter 87.5% to former-stage horizontal filter 12.5% 0010: Horizontal filter 75.0% to former-stage horizontal filter 25.0% 0011: Horizontal filter 62.5% to former-stage horizontal filter 37.5% 0100: Horizontal filter 50.0% to former-stage horizontal filter 50.0% 0101: Horizontal filter 37.5% to former-stage horizontal filter 62.5% 0110: Horizontal filter 25.0% to former-stage horizontal filter 75.0% 0111: Horizontal filter 12.5% to former-stage horizontal filter 87.5% 1000: Former-stage horizontal filter 100% 1001 to 1111: Setting prohibited
7 to 4	VSEL_MIX_Y[3:0]	0000	R/W	Mixing Ratio of Signal after Passing Vertical Filter to Signal after Passing Former-Stage Horizontal/Vertical Filter 0000: Vertical filter 100.0% 0001: Vertical filter 87.5% to former-stage horizontal/vertical filter 12.5% 0010: Vertical filter 75.0% to former-stage horizontal/vertical filter 25.0% 0011: Vertical filter 62.5% to former-stage horizontal/vertical filter 37.5% 0100: Vertical filter 50.0% to former-stage horizontal/vertical filter 50.0% 0101: Vertical filter 37.5% to former-stage horizontal/vertical filter 62.5% 0110: Vertical filter 25.0% to former-stage horizontal/vertical filter 75.0% 0111: Vertical filter 12.5% to former-stage horizontal/vertical filter 87.5% 1000: Former-stage horizontal/vertical filter 100% 1001 to 1111: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	HVSEL_MIX_Y[3:0]	0000	R/W	Mixing Ratio of Signal after Passing Horizontal/Vertical Filter to Signal after Passing Former-Stage Horizontal/Vertical Filter 0000: Horizontal/vertical filter 100.0% 0001: Horizontal/vertical filter 87.5% to former-stage horizontal/vertical filter 12.5% 0010: Horizontal/vertical filter 75.0% to former-stage horizontal/vertical filter 25.0% 0011: Horizontal/vertical filter 62.5% to former-stage horizontal/vertical filter 37.5% 0100: Horizontal/vertical filter 50.0% to former-stage horizontal/vertical filter 50.0% 0101: Horizontal/vertical filter 37.5% to former-stage horizontal/vertical filter 62.5% 0110: Horizontal/vertical filter 25.0% to former-stage horizontal/vertical filter 75.0% 0111: Horizontal/vertical filter 12.5% to former-stage horizontal/vertical filter 87.5% 1000: Former-stage horizontal/vertical filter 100% 1001 to 1111: Setting prohibited

(1) Two-Dimensional Filter Mixing Select Control

DET2_ON selects two-dimensional filter mixing.

For details, refer to section 20B.3.5(5), Horizontal and Vertical Signal Mixing Block.

(2) Control of Mixing Ratio of Signal after Passing Horizontal Filter to Signal after Passing Former-Stage Horizontal Filter

HSEL_MIX_Y controls the mixing ratio of the signal after passing a horizontal filter to the signal after passing the former-stage horizontal filter.

For details, refer to section 20B.3.5(5), Horizontal and Vertical Signal Mixing Block.

(3) Control of Mixing Ratio of Signal after Passing Vertical Filter to Signal after Passing Former-Stage Horizontal/Vertical Filter

VSEL_MIX_Y controls the mixing ratio of the signal after passing a vertical filter to the signal after passing the former-stage horizontal/vertical filter.

For details, refer to section 20B.3.5(5), Horizontal and Vertical Signal Mixing Block.

(4) Control of Mixing Ratio of Signal after Passing Horizontal/Vertical Filter to Signal after Passing Former-Stage Horizontal/Vertical Filter

HVSEL_MIX_Y controls the mixing ratio of the signal after passing a horizontal/vertical filter to the signal after passing the former-stage horizontal/vertical filter.

For details, refer to section 20B.3.5(5), Horizontal and Vertical Signal Mixing Block.

20B.2.59 Y/C Separation Control Register 11 (YCSCR11)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	V_Y_LEVEL[8:0]								
Initial value:	1	1	0	1	1	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12, 11	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
10, 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8 to 0	V_Y_LEVEL [8:0]	000000011	R/W	Vertical Luminance Detection Level for Correlation Detection Filter The luminance is detected when lower than the set value.

(1) Vertical Luminance Detection Level for Correlation Detection Filter

V_Y_LEVEL[8:0] select the vertical luminance detection level for correlation detection filter.

Be sure to set 0 to all the bits in this field when this module is in use.

20B.2.60 Y/C Separation Control Register 12 (YCSCR12)

During two-dimensional Y/C separation, the horizontal bandwidth can be further narrowed using the cascade horizontal BPF after horizontal BPF, vertical BPF, and horizontal/vertical BPF are switched.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
0	FIL2_NARROW_2D	1	R/W	Two-Dimensional Cascade Filter Select 0: Bypass 1: 17 TAP

(1) Mixing Ratio of C Signal after Passing Horizontal/Vertical Adaptive Filter to Signal after Passing Correlation Detection Filter

DET2_MIX_C controls the mixing ratio of the chroma signal (after adaptation) to the signal after passing the correlation detection filter.

For details, refer to section 20B.3.5(6), Correlation Detection Value Mixing Block.

(2) Mixing Ratio of C Signal for Y Generation after Passing Horizontal/Vertical Adaptive Filter to Signal after Passing Correlation Detection Filter

For details, refer to section 20B.3.5(6), Correlation Detection Value Mixing Block.

(3) Two-Dimensional Cascade/TAKE-OFF Filter Mode Select

FIL2_MODE_2D selects the two-dimensional cascade/TAKE-OFF filter mode.

For details, refer to section 20B.3.5(8), Cascade Filter Block.

(4) Two-Dimensional Cascade Filter Select

FIL2_NARROW_2D selects the two-dimensional cascade filter.

For details, refer to section 20B.3.5(8), Cascade Filter Block.

20B.2.61 Digital Clamp Control Register 9 (DCPCR9)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	CLP_HOLD_ON_Y	CLP_HOLD_ON_CB	CLP_HOLD_ON_CR	—	—	—	—	—	—	—	—	—	—
Initial value:	1	1	1	1	1	1	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
12	CLP_HOLD_ON_Y	1	R/W	Clamp Data Hold Processing ON/OFF (Y) 0: Hold processing ON 1: Hold processing OFF
11	CLP_HOLD_ON_CB	1	R/W	Clamp Data Hold Processing ON/OFF (Cb) 0: Hold processing ON 1: Hold processing OFF
10	CLP_HOLD_ON_CR	1	R/W	Clamp Data Hold Processing ON/OFF (Cr) 0: Hold processing ON 1: Hold processing OFF
9 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(1) Clamp Data Hold Processing ON/OFF Control (Y)

CLP_HOLD_ON_Y selects ON/OFF of hold processing for Y signal clamp data.

Be sure to set 0 to this bit when this module is in use.

(2) Clamp Data Hold Processing ON/OFF Control (Cb)

CLP_HOLD_ON_CB selects ON/OFF of hold processing for Cb signal clamp data.

Be sure to set 0 to this bit when this module is in use.

(3) Clamp Data Hold Processing ON/OFF Control (Cr)

CLP_HOLD_ON_CR selects ON/OFF of hold processing for Cr signal clamp data.

Be sure to set 0 to this bit when this module is in use.

20B.2.62 Chroma Filter TAP Coefficient (WA_F0 to WA_F8) Registers for Y/C Separation (YCTWA_F0 to YCTWA_F8)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	FIL2_2D_WA_F0 to FIL2_2D_WA_F8[12:0]												
Initial value:	0	0	0	*	*	*	*	*	*	*	*	*	*	*	*	*
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	FIL2_2D_WA_F0 to FIL2_2D_WA_F8 [12:0]	*	R/W	Two-Dimensional Cascade Broadband (3.58/4.43/SECAM-DR)/TAKE-OFF Filter TAP Coefficients 0 to 8 [12]: Sign [11:0]: Absolute value * Initial values: FIL2_2D_WA_F0: H'0018 FIL2_2D_WA_F1: H'002C FIL2_2D_WA_F2: H'0014 FIL2_2D_WA_F3: H'1034 FIL2_2D_WA_F4: H'1080 FIL2_2D_WA_F5: H'1080 FIL2_2D_WA_F6: H'100C FIL2_2D_WA_F7: H'0084 FIL2_2D_WA_F8: H'00C8

(1) Two-Dimensional Cascade Broadband (3.58/4.43/SECAM-DR)/TAKE-OFF Filter TAP Coefficients 0 to 8 Control

FIL2_2D_WA_F0 to FIL2_2D_WA_F8[12:0] control two-dimensional cascade broadband (3.58/4.43/SECAM-DR)/ TAKE-OFF filter TAP coefficients 0 to 8.

The transfer function is defined as follows:

$$H(z) = \{F0(z^{-8} + z^{+8}) + F1(z^{-7} + z^{+7}) + F2(z^{-6} + z^{+6}) + F3(z^{-5} + z^{+5}) + F4(z^{-4} + z^{+4}) + F5(z^{-3} + z^{+3}) + F6(z^{-2} + z^{+2}) + F7(z^{-1} + z^{+1}) + F8(z^{0})\} /1024$$

The coefficient value is represented using the MSB for a sign and the other bits for the effective value in the absolute value.

Table 20B.32 TAP Coefficient Settings

Most Significant Bit	Other Than MSB	Setting Value
0	0 to 4095	0 to +4095
1	0 to 4095	0 to -4095

For the recommended setting value for each filter, see section 20B.3.5(8), Cascade Filter Block.

20B.2.63 Chroma Filter TAP Coefficient (WB_F0 to WB_F8) Registers for Y/C Separation (YCTWB_F0 to YCTWB_F8)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	FIL2_2D_WB_F0 to FIL2_2D_WB_F8[12:0]												
Initial value:	0	0	0	*	*	*	*	*	*	*	*	*	*	*	*	*
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	FIL2_2D_WB_F0 to FIL2_2D_WB_F8 [12:0]	*	R/W	Two-Dimensional Cascade Broadband (SECAM-DB) Filter TAP Coefficients 0 to 8 [12]: Sign [11:0]: Absolute value * Initial values: FIL2_2D_WB_F0: H'100C FIL2_2D_WB_F1: H'0028 FIL2_2D_WB_F2: H'003C FIL2_2D_WB_F3: H'000C FIL2_2D_WB_F4: H'1068 FIL2_2D_WB_F5: H'109C FIL2_2D_WB_F6: H'1040 FIL2_2D_WB_F7: H'0078 FIL2_2D_WB_F8: H'00D0

(1) Two-Dimensional Cascade Broadband (SECAM-DB) Filter TAP Coefficients 0 to 8 Control

FIL2_2D_WB_F0 to FIL2_2D_WB_F8[12:0] control two-dimensional cascade broadband (SECAM-DB) filter TAP coefficients 0 to 8.

The transfer function is defined as follows:

$$H(z) = \{F0(z^{-8} + z^{+8}) + F1(z^{-7} + z^{+7}) + F2(z^{-6} + z^{+6}) + F3(z^{-5} + z^{+5}) + F4(z^{-4} + z^{+4}) + F5(z^{-3} + z^{+3}) + F6(z^{-2} + z^{+2}) + F7(z^{-1} + z^{+1}) + F8(z^{0})\} /1024$$

The coefficient value is represented using the MSB for a sign and the other bits for the effective value in the absolute value.

Table 20B.33 TAP Coefficient Settings

Most Significant Bit	Other Than MSB	Setting Value
0	0 to 4095	0 to +4095
1	0 to 4095	0 to -4095

For the recommended setting value for each filter, see section 20B.3.5(8), Cascade Filter Block.

20B.2.64 Chroma Filter TAP Coefficient (NA_F0 to NA_F8) Registers for Y/C Separation (YCTNA_F0 to YCTNA_F8)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	FIL2_2D_NA_F0 to FIL2_2D_NA_F8[12:0]												
Initial value:	0	0	0	*	*	*	*	*	*	*	*	*	*	*	*	*
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	FIL2_2D_NA_F0 to FIL2_2D_NA_F8[12:0]	*	R/W	Two-Dimensional Cascade Narrowband (3.58/4.43/SECAM-DR) Filter TAP Coefficients 0 to 8 [12]: Sign [11:0]: Absolute value * Initial values: FIL2_2D_NA_F0: H'0018 FIL2_2D_NA_F1: H'002C FIL2_2D_NA_F2: H'0014 FIL2_2D_NA_F3: H'1034 FIL2_2D_NA_F4: H'1080 FIL2_2D_NA_F5: H'1080 FIL2_2D_NA_F6: H'100C FIL2_2D_NA_F7: H'0084 FIL2_2D_NA_F8: H'00C8

(1) Two-Dimensional Cascade Narrowband (3.58/4.43/SECAM-DR) Filter TAP Coefficients 0 to 8 Control

FIL2_2D_NA_F0 to FIL2_2D_NA_F8[12:0] control two-dimensional cascade narrowband (3.58/4.43/SECAM-DR) filter TAP coefficients 0 to 8.

The transfer function is defined as follows:

$$H(z) = \{F0(z^{-8} + z^{+8}) + F1(z^{-7} + z^{+7}) + F2(z^{-6} + z^{+6}) + F3(z^{-5} + z^{+5}) + F4(z^{-4} + z^{+4}) + F5(z^{-3} + z^{+3}) + F6(z^{-2} + z^{+2}) + F7(z^{-1} + z^{+1}) + F8(z^{0})\} /1024$$

The coefficient value is represented using the MSB for a sign and the other bits for the effective value in the absolute value.

Table 20B.34 TAP Coefficient Settings

Most Significant Bit	Other Than MSB	Setting Value
0	0 to 4095	0 to +4095
1	0 to 4095	0 to -4095

For the recommended setting value for each filter, see section 20B.3.5(8), Cascade Filter Block.

20B.2.65 Chroma Filter TAP Coefficient (NB_F0 to NB_F8) Registers for Y/C Separation (YCTNB_F0 to YCTNB_F8)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	FIL2_2D_NB_F0 to FIL2_2D_NB_F8[12:0]												
Initial value:	0	0	0	*	*	*	*	*	*	*	*	*	*	*	*	*
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	FIL2_2D_NB_F0 to FIL2_2D_NB_F8[12:0]	*	R/W	Two-Dimensional Cascade Narrowband (SECAM-DB) Filter TAP Coefficients 0 to 8 [12]: Sign [11:0]: Absolute value * Initial values: FIL2_2D_NB_F0: H'1438 FIL2_2D_NB_F1: H'0AF0 FIL2_2D_NB_F2: H'1CEC FIL2_2D_NB_F3: H'065C FIL2_2D_NB_F4: H'05A4 FIL2_2D_NB_F5: H'1CEC FIL2_2D_NB_F6: H'085C FIL2_2D_NB_F7: H'0178 FIL2_2D_NB_F8: H'1568

(1) Two-Dimensional Cascade Narrowband (SECAM-DB) Filter TAP Coefficients 0 to 8 Control

FIL2_2D_NB_F0 to FIL2_2D_NB_F8[12:0] control two-dimensional cascade narrowband (SECAM-DB) filter TAP coefficients 0 to 8.

The transfer function is defined as follows:

$$H(z) = \{F0(z^{-8} + z^{+8}) + F1(z^{-7} + z^{+7}) + F2(z^{-6} + z^{+6}) + F3(z^{-5} + z^{+5}) + F4(z^{-4} + z^{+4}) + F5(z^{-3} + z^{+3}) + F6(z^{-2} + z^{+2}) + F7(z^{-1} + z^{+1}) + F8(z^{0})\} /1024$$

The coefficient value is represented using the MSB for a sign and the other bits for the effective value in the absolute value.

Table 20B.35 TAP Coefficient Settings

Most Significant Bit	Other Than MSB	Setting Value
0	0 to 4095	0 to +4095
1	0 to 4095	0 to -4095

For the recommended setting value for each filter, see section 20B.3.5(8), Cascade Filter Block.

20B.2.66 Luminance (Y) Signal Gain Control Register (YGAINCR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	Y_GAIN2[9:0]									
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	Y_GAIN2 [9:0]	1000000000	R/W	Y Signal Gain Coefficient (0 = 0 times, 512 = 1.0 times, 1023 ≈ 2.0 times)

(1) Y Signal Output Gain Control Y Signal Output Gain Control

Y_GAIN2 controls the Y signal output gain.

Y signal output = Y signal after decoding × (Y_GAIN2/512)

20B.2.67 Color Difference (Cb) Signal Gain Control Register (CBGAINCR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CB_GAIN2[9:0]									
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	CB_GAIN2 [9:0]	1000000000	R/W	Cb Signal Gain Coefficient (0 = 0 times, 512 = 1.0 times, 1023 ≈ 2.0 times)

(1) Cb Signal Output Gain Control

CB_GAIN2 controls the Cb signal output gain.

Cb signal output = Cb signal after decoding × (CB_GAIN2/512)

20B.2.68 Color Difference (Cr) Signal Gain Control Register (CRGAINCR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CR_GAIN2[9:0]									
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	CR_GAIN2 [9:0]	1000000000	R/W	Cr Signal Gain Coefficient (0 = 0 times, 512 = 1.0 times, 1023 ≈ 2.0 times)

(1) Cr Signal Output Gain Control

CR_GAIN2 controls the Cr signal output gain.

Cr signal output = Cr signal after decoding × (CR_GAIN2/512)

20B.2.69 PGA Register Update (PGA_UPDATE)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PGA_ VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	PGA_VEN	1	R/W	PGACR Register V Update Enable 1: Enable 0: Disable

(1) PGACR Register V Update Enable

PGA_VEN enables or disables V update of PGACR register.

20B.2.70 PGA Control Register (PGACR)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	PGA_GAIN_SEL	PGA_GAIN[5:0]						—	—	—	—	—	—	—	—
Initial value:	0	0	0	1	0	1	0	1	0	0	0	0	1	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	PGA_GAIN_SEL	0	R/W	PGA Switch 0: Automatic (AGC) 1: Manual (refer to the PGA_GAIN description below.)
13 to 8	PGA_GAIN[5:0]	010101	R/W	PGA Gain 0 (0.8 Vpp) to 63 (1.6 Vpp)
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: All the bits in this register are updated when the vertical sync signal is asserted with PGA_VEN in PGA_UPDATE being 1.

(1) PGA Switch

When PGA_GAIN_SEL is 0 and ADCCR1.AGCMODE is 1, the AGC-controlled value is reflected on the PGA gain. When PGA_GAIN_SEL is 1, the PGA_GAIN value is directly reflected on the PGA gain. In this case, the ADCCR1.AGCMODE setting is invalid.

Setting ADCCR1.AGCMODE to 0 and PGA_GAIN_SEL to 0 simultaneously is prohibited.

(2) PGA Gain

When PGA_GAIN_SEL is 1, the PGA_GAIN value is reflected on the PGA gain. One of 64 levels of gain values can be set for the PGA of this LSI.

20B.2.71 ADC Control Register 2 (ADCCR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADC_VINSEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ADC_VINSEL	0	R/W	Input Pin Control 0: VIN1A pin input 1: VIN2A pin input

(1) Input Pin Control

ADC_VINSEL selects the pin for inputting composite video signals.

20B.2.72 ADC Control Register 3 (ADCCR3)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	PSAVON	—	—	—	—
Initial value:	0	0	0	0	0	0	1	0	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	—	1	R	Reserved These bits are always read as 1. The write value should always be 1.
8 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	PSAVON	1	R/W	When the PSAVON bit is set to 1, the clock supply to the A/D converter is halted. 0: The A/D converter runs. 1: Clock supply to the A/D converter is halted.
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: When Video decoder output signals are not used, set PSAVON to 1.

(1) The clock supply control to the A/D converter

When PSAVON is 1, the clock supply to the A/D converter is halted.

When PSAVON is 0, the A/D converter runs.

20B.2.73 ADC Control Register 4 (ADCCR4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W:	R/W:

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	VIN1SEL	0	R/W	Video Input Module channel 1 input Select *1, *3 0: Signals supplied via the external input pins 1: Video decoder output signals *2
0	VIN0SEL	0	R/W	Video Input Module channel 0 input Select *1, *3 0: Signals supplied via the external input pins 1: Video decoder output signals *2

Notes: 1. To enable this register to be set, appropriately set the LSI multiplexed pin setting mask register (PMMR) immediately before setting this register.
2. The output interface from digital video decoder to VIN is the 20-bit YCbCr-422 format.
3. To avoid glitch when changing, VIN shall be stopped before VIN input is changed.

(1) Video Input Module channel 1 input Control

VIN1SEL selects input for the channel 1 of Video Input module. The following shows the steps to select video the decoder output signals for the input.

1. Set PMMR to H'FFFFFFFD (32 bit access size).
2. Set ADCCR4 to H'00000002 (32 bit access size).

(2) Video Input Module channel 0 input Control

VIN0SEL selects input for the channel 0 of Video Input module. The following shows the steps to select video the decoder output signals for the input.

1. Set PMMR to H'FFFFFFFE (32 bit access size).
2. Set ADCCR4 to H'00000001 (32 bit access size).

20B.3 Operation

20B.3.1 Overview

This module decodes composite video signals (CVBS) and separates them into horizontal/vertical sync signals, luminance signals (Y), and color difference signals (Cb/Cr). Supported color systems are NTSC, PAL, and SECAM. This module consists of an A/D converter for video signal input, sync separator circuit, burst controlled oscillator (BCO), a Y/C separator circuit, a chroma decoding circuit, a digital clamp circuit, and an output gain adjustment circuit. Figure 20B.25 shows an overall block diagram.

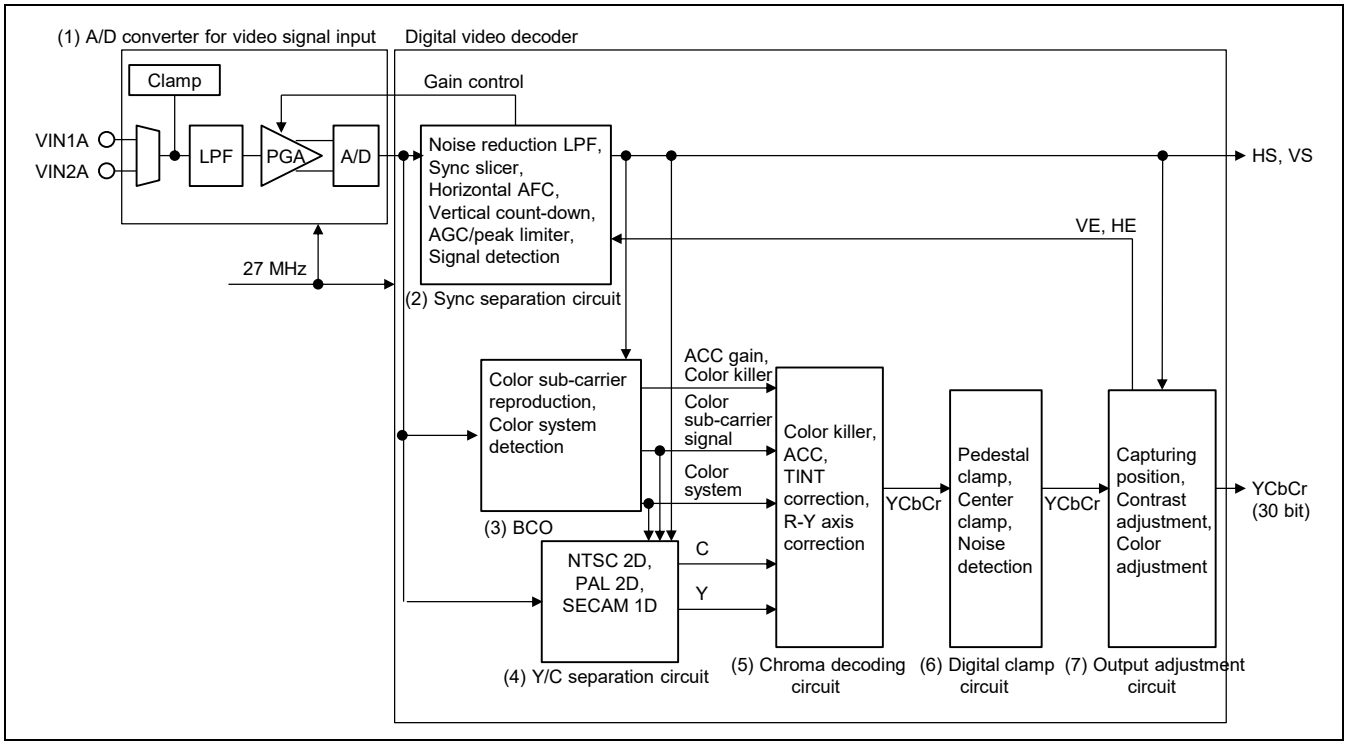

Figure 20B.25 Overall Block Diagram

(1) A/D Converter for Video Signal Input

The A/D converter processes the composite video signal (CVBS) using the sync tip clamp block, the low-pass filter (LPF), and the programmable gain amplifier (PGA) and then A/D-converts the signal. The composite video signals from either VIN1A or VIN2A pin are selected.

(2) Sync Separator Circuit

The sync separator circuit extracts the horizontal and vertical sync signals from the composite video signal. This circuit also detects the amplitude of the sync signals and automatically adjusts the PGA gain (Automatic Gain Control = AGC).

(3) Burst Controlled Oscillator (BCO)

The BCO extracts the color burst signal from the composite video signal and reproduces the color sub-carrier signal required for color demodulation. The BCO also acquires phase and frequency information from the color burst signal and detects the color system used.

(4) Y/C Separator Circuit

The Y/C separator circuit separates the composite video signal of the NTSC, PAL, or SECAM format into the Y and C signals. Two-dimensional adaptive separation is used for NTSC and PAL and one-dimensional separation for SECAM.

(5) Chroma Decoding Circuit

The chroma decoding circuit demodulates the C signal extracted by the Y/C separator circuit into the Cb/Cr signal. This circuit has the automatic color control function (ACC), in which the amplitude of the color burst signal is detected to adjust the color gain automatically and also has the TINT/R-Y axis correction function, in which hue is adjusted at demodulation.

(6) Digital Clamp Circuit

The digital clamp circuit provides pedestal clamp for the Y signals and center clamp for the Cb/Cr signals at any position. This circuit also detects the amount of noise using the autocorrelation function.

(7) Output Adjustment Circuit

The output adjustment circuit sets the capturing position and adjusts the contrast and color.

20B.3.2 A/D Converter for Video Signal Input

The A/D converter processes the composite video signal (CVBS) using the sync tip clamp block, the low-pass filter (LPF), and the programmable gain amplifier (PGA) and then A/D-converts the signal.

Figure 20B.26 shows the block diagram of the A/D converter for video signal input.

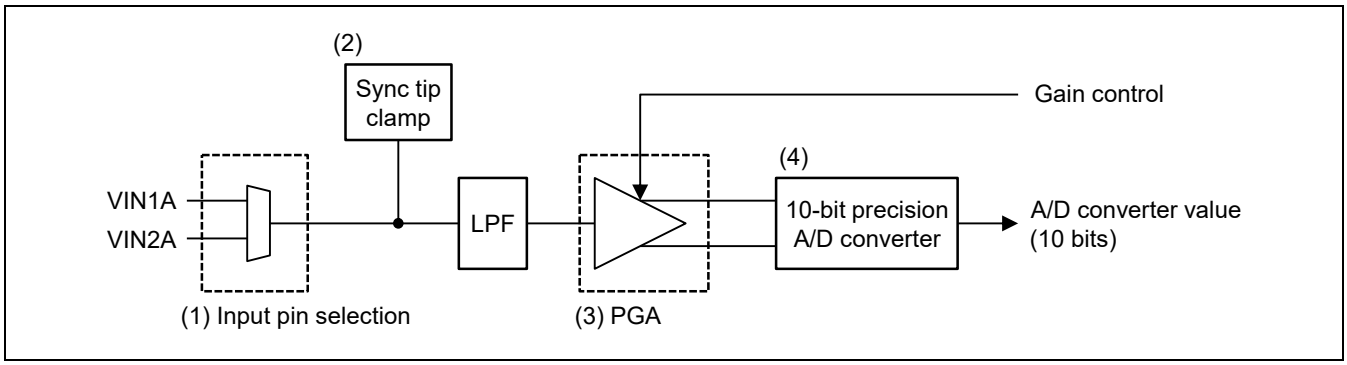

Figure 20B.26 Block Diagram of A/D Converter for Video Signal Input

Figure 20B.27 shows the waveforms when a video signal is A/D-converted.

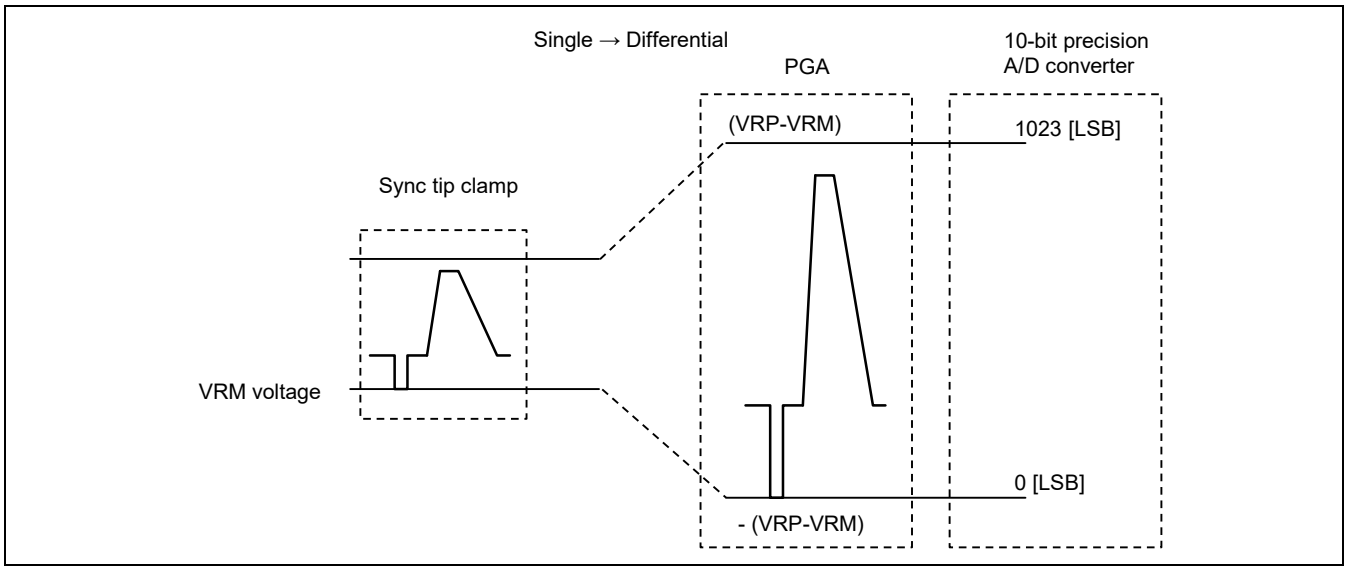

Figure 20B.27 A/D Conversion Image

(1) Input Pin Selection Block

The input pin selection block selects either the VIN1A or VIN2A pin for inputting the signal according to the ADCCR2.ADC_VINSEL setting.

(2) Sync Tip Clamp Block

The sync tip clamp block clamps the sync tip level to about 0.5 V.

(3) Programmable Gain Amplifier (PGA)

The PGA adjusts the gain so that the input video signal voltage (≈ 0.8 Vpp to 1.6 Vpp) should be the level to be input to the A/D converter (≈ 2.0 Vpp). One of 64 levels of gain values can be set. One level corresponds to gain of 0.1 dB (typ.). The minimum gain is 0 dB (typ.) and maximum gain is 6.02 dB (typ.).

Table 20B.36 shows the PGA gain setting and gain values.

Table 20B.36 PGA Gain Setting and Gain Values (dB)

PGA Gain Setting	Input Range (Vpp)	Gain Value (dB)
0	1.600	0
1	1.587	0.069
2	1.575	0.138
3	1.562	0.209
4	1.549	0.280
5	1.537	0.351
6	1.524	0.423
7	1.511	0.496
8	1.498	0.569
9	1.486	0.643
:	:	:
59	0.851	5.48
60	0.838	5.61
61	0.825	5.74
62	0.813	5.88
63	0.800	6.02

The PGA gain can be set using PGACR.PGA_GAIN[5:0] with PGACR.PGA_GAIN_SEL = 1. When the AGC function is on (ADCCR1.AGCMODE = 1), the gain is automatically set.

(4) 10-Bit Precision A/D Converter

The 10-bit precision A/D converter receives the gain-adjusted video signal from the PGA and A/D-converts the signal. The converter has 10-bit resolution and performs sampling at 27 MHz, which is the frequency of the clock signal input via VIDEO_X1 or VIDEO_X2.

20B.3.3 Sync Separator Circuit

The sync separator circuit extracts the horizontal and vertical sync signals from the composite video signal. This circuit also detects the amplitude of the sync signals and automatically adjusts the PGA gain (Automatic Gain Control = AGC).

Figure 20B.28 shows the block diagram of the sync separator circuit.

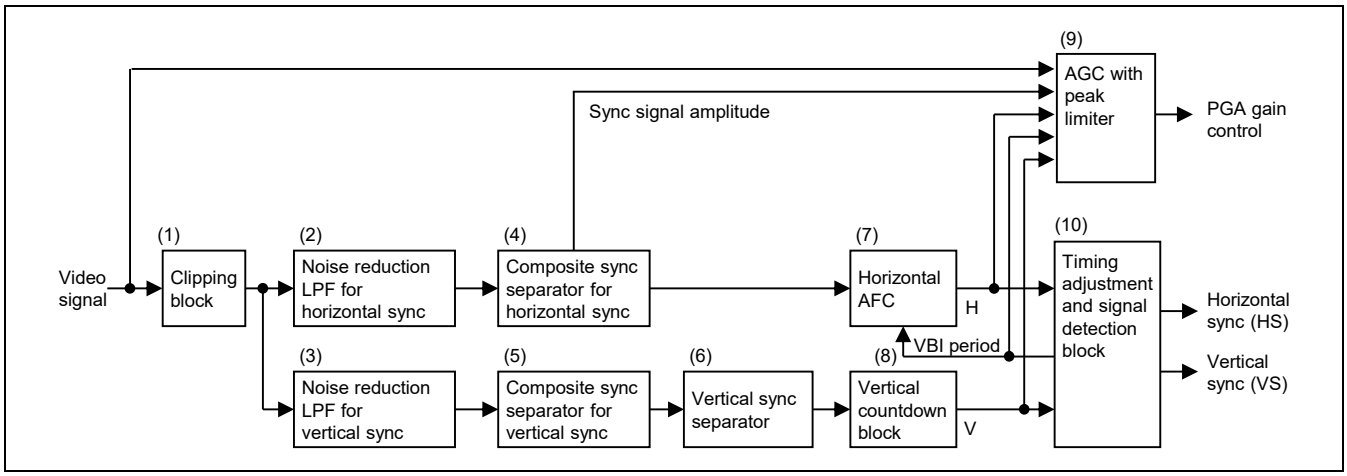

Figure 20B.28 Block Diagram of Sync Separator Circuit

(1) Clipping Block

The clipping block clips the high tone component of the video signal to reduce amplitude-dependency of the video signal. The specific clipping level can be set using SYNSCR3.SSCLIPSEL[3:0].

The clipping level should be within the range so that the composite sync signal component should not be deteriorated (should be detectable).

(2) Noise Reduction Low-Pass Filter (LPF) for Horizontal Sync

The noise reduction LPF reduces the superimposed noise on the video signals before composite sync signal separation. The LPFs can be separately set for the horizontal sync and vertical sync. The cutoff frequency of the horizontal sync LPF can be set using SYNSCR1.LPFHSYNC[2:0]. The cutoff frequency should be within the range so that the composite sync signal component should not be deteriorated (should be detectable).

(3) Noise Reduction Low-Pass Filter (LPF) for Vertical Sync

The noise reduction LPF reduces the superimposed noise on the video signals before composite sync signal separation. The LPFs can be separately set for the horizontal sync and vertical sync. The cutoff frequency of the vertical sync LPF can be set using SYNSCR1.LPFVSYNC[2:0]. The cutoff frequency should be within the range so that the composite sync signal component should not be deteriorated (should be detectable).

(4) Composite Sync Separator for Horizontal Sync

The composite sync separator separates the composite sync signal from the video signal according to the slice level. The composite sync slice levels can be separately set for the horizontal and vertical sync signals. The slice level can be set either automatically or manually according to the SYNSCR1.SLICERMODE_H[1:0] setting.

When automatic setting is used, the slice level is automatically set according to the SYNSCR1.SLICERMODE_H[1:0], SYNSCR2.SYNCMAXDUTY_H[5:0], and SYNSCR2.SYNCMINDUTY_H[5:0] setting. The slice level detection speed can be set using SYNSCR1.VELOCITYSHIFT_H[3:0].

When manual setting is used, the slice level is determined by SYNSCR3.CSYNCSLICE_H[9:0].

(5) Composite Sync Separator for Vertical Sync

The composite sync separator separates the composite sync signal from the video signal according to the slice level. The composite sync slice levels can be separately set for the horizontal and vertical sync signals. The slice level can be set either automatically or manually according to the SYNSCR1.SLICERMODE_V[1:0] setting.

When automatic setting is used, the slice level is automatically set according to the SYNSCR1.SLICERMODE_V[1:0], SYNSCR4.SYNCMAXDUTY_V[5:0], and SYNSCR4.SYNCMINDUTY_V[5:0] setting.

When manual setting is used, the slice level is determined by SYNSCR5.CSYNCSLICE_V[9:0].

(6) Vertical Sync Separator

The vertical sync separator extracts the vertical sync signal from the composite video signal separated using (5) above. The threshold value for separating the vertical sync signal can be set using SYNSCR5.VSYNCSLICE[4:0]. The value should be set depending on the serration pulse width of each video signal format.

(7) Horizontal Automatic Frequency Control (AFC) Block

The horizontal AFC, which is a digital PLL, extracts the horizontal sync signal from the composite video signal separated using (4) above. The AFC removes the pseudo horizontal sync signal and interpolates the incomplete horizontal sync signal to generate a stable horizontal sync signal.

The center frequency and lock range of the horizontal AFC can be set using HAFCCR1.HAFCTYP[9:0], HAFCCR2.HAFCMAX[9:0], and HAFCCR3.HAFCMIN[9:0]. If the horizontal AFC is locked, VSYNCSR.FHLOCK becomes 1; and if the horizontal AFC is unlocked, VSYNCSR.FHLOCK becomes 0. The horizontal AFC oscillation cycle can be checked by reading HSYNCSR.FHCOUNT[16:1] and VSYNCSR.FHCOUNT[0].

The loop gain (response speed) of the horizontal AFC can be set using HAFCCR1.HAFCCGAIN[3:0]. As the speed is increased, the lockup time becomes shorter. However, the horizontal oscillation frequency will be more susceptible to noise. With HAFCCR3.HAFCMODE[1], AFCPFCR.PHDET_FIX, and AFCPFCR.PHDET_DIV[2:0], the loop gain can be reduced when S/N is low to prevent malfunction attributed to noise. Whether S/N is low or not can be checked with VSYNCSR.ISNOISY.

The loop gain during the vertical blanking period (VBI) can be set using HAFCCR2.HAFCSTART[3:0], HAFCCR3.HAFCEND[3:0], and HAFCCR3.HAFCMODE[0]. This is usually used to avoid malfunction in the VCR head switch.

(8) Vertical Countdown Block

The vertical countdown block removes the pseudo vertical sync signal from the vertical sync signal separated using (6) above and interpolates the incomplete vertical sync signal to generate a stable vertical sync signal.

The oscillation cycle of the vertical countdown block can be set using VCDWCR1.VCDDEFAULT[1:0]. When set to 0, the input vertical sync signal is detected and the oscillation cycle is automatically set appropriately. The detection result of the input vertical sync signal is indicated by VSYNCSR.FVMODE. When set to 1, 50.00-Hz oscillation mode is set. Here, it is recommended to set VCDWCR1.NOVCD60 to 1 (60-Hz oscillation off) to avoid unexpected malfunction. When set to 2 or 3, 59.94-/60.00-Hz oscillation mode is set. Here, it is recommended to set VCDWCR1.NOVCD50 to 1 (50-Hz oscillation off) to avoid unexpected malfunction.

The lock range of the vertical countdown block can be set using VCDWCR1.VCDWINDOW[5:0] and VCDWCR1.VCDOFFSET[4:0]. If the vertical countdown block is locked, VSYNCSR.FVLOCK becomes 1; and if the vertical countdown block is unlocked, VSYNCSR.FVLOCK becomes 0.

The cycle of the input vertical sync signal can be checked by reading VSYNCSR.FVCOUNT[7:0]. When the vertical sync signal input cannot be detected, VSYNCSR.NOSIGNAL is set to 1.

(9) Automatic Gain Control (AGC) Block with Peak Limiter

The AGC block detects the amplitude of the sync signal and automatically controls the PGA gain to the target value. The AGC function is activated with ADCCR1.AGCMODE = 1.

- Gain Control according to Sync Amplitude

  The target sync signal amplitude can be set using AGCCR1.AGCLEVEL[8:0] and AGCCR2.AGCPRECIS[5:0]. For example, when NTSC signals are quantized by the 10-bit A/D converter, the sync signal amplitude for the full range of the A/D converter can be provided by:

  $1023[LSB] \times (40[IRE] \div 173[IRE]) = 236.53179[LSB]$

  Therefore, 236[LSB] should be set to AGCCR1.AGCLEVEL[8:0]. The gain is fixed when it falls within the following range.

  Target value (= AGCCR1.AGCLEVEL[8:0]) ± AGCCR2.AGCPRECIS[5:0]

  Whether the gain is fixed or not can be checked by reading AGCCSR2.AGCCONVERGE. The detected sync signal amplitude can be checked using SYNCSSR.SYNCDEPTH[9:0]. The AGC response speed can be set using AGCCR1.AGCRESPONSE[2:0]. As the speed is increased, the input signal is tracked more quickly; however, it will result in higher susceptibility to noise.

  The currently set gain value can be checked using AGCCSR2.AGCGAIN[7:0]. The actual PGA gain setting can be roughly calculated as follows:

  $1.203008 \times (AGCCSR2.AGCGAIN[7:0] - 48)$

  For example, when AGCCSR2.AGCGAIN[7:0] is 64 (corresponding to ×1),

  $PGA\ gain\ setting = 1.203008 \times (64 - 48) \approx 19.24$

  As a result, the PGA gain setting is 19 or 20. One of 0 to 63 can be set as the PGA gain value.

  The gain during vertical blanking period (VBI) can be set using AGCCR1.DOREDUCE and AGCCR1.NOREDUCE. The sync amplitude detection result during VBI can be read from SYNCSSR.ISREDUCED.

- Peak Limiter

  The peak limiter works when the ratio of the video signal amplitude to the sync signal amplitude is inappropriate. If the ratio is smaller than expected, the PGA gain becomes smaller, and the video signal after gain adjustment becomes smaller than the full range of the A/D converter. Contrarily, if the ratio is larger than expected, the PGA gain becomes larger, and the video signal after gain adjustment becomes larger than the full range of the A/D converter.

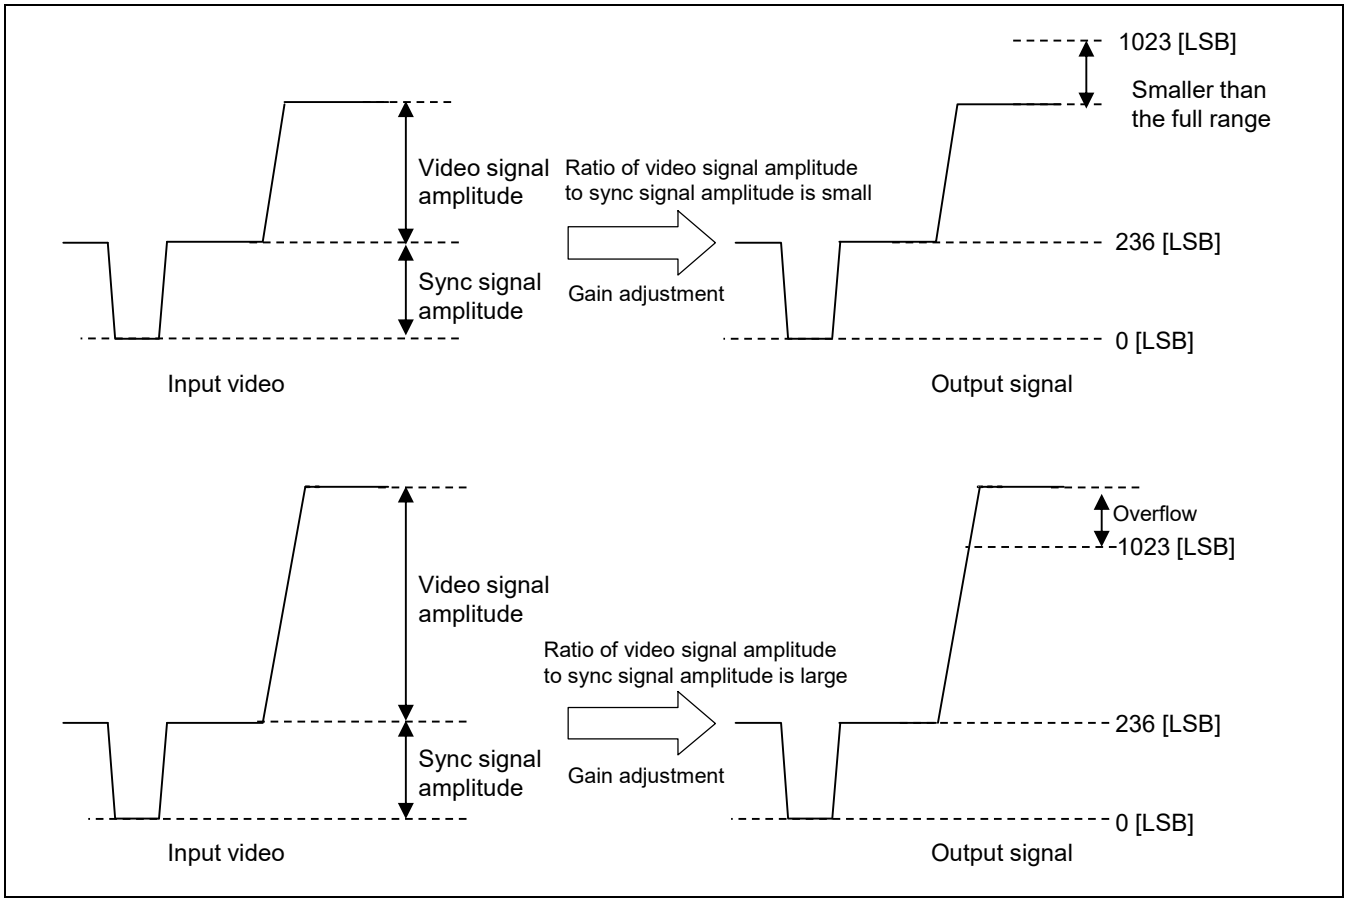

Figure 20B.29 Cases in which Ratio of Video Signal Amplitude to Sync Signal Amplitude is Inappropriate

To deal with this problem, the peak limiter adjusts the PGA gain based on the sampled video signal peak value. The peak value used to control the gain can be set using PKLIMITCR.PEAKLEVEL[1:0]. When the peak value of the sampled video signal is smaller than the value set using PKLIMITCR.PEAKLEVEL[1:0], the gain is increased. Contrarily, when the peak value of the sampled video signal is larger than the value set using PKLIMITCR.PEAKLEVEL[1:0] exceeding the maximum allowable value set using PKLIMITCR.MAXPEAKSAMPLES[7:0], the gain is decreased.

The gain increase/decrease response speed and maximum compression ratio can be set using PKLIMITCR.PEAKATTACK[1:0], PKLIMITCR.PEAKRELEASE[1:0], and PKLIMITCR.PEAKRATIO[1:0]. The number of pixels with the peak value larger than the value set using PKLIMITCR.PEAKLEVEL[1:0] can be checked with AGCCSR1.HIGHSAMPLES[7:0]; and the number of overflowing pixels (exceeding 1023[LSB]) can be checked with AGCCSR1.PEAKSAMPLES[7:0].

- Manual Setting

  Manual setting of the PGA gain can be enabled by setting PGACR.PGA_GAIN_SEL to 1. Here, the value set using PGACR.PGA_GAIN[5:0] is actually set as the PGA gain. When PGACR.PGA_GAIN_SEL is 1, ADCCR1.AGCMODE setting is invalid. Setting PGACR.PGA_GAIN_SEL to 0 (automatic setting) and ADCCR1.AGCMODE to 0 (AGC off) simultaneously is prohibited.

(10) Timing Adjustment and Signal Detection Block

The timing adjustment and signal detection block adjusts the output timing of the horizontal and vertical sync signals generated using (7) and (8) above. This block also detects the field; whether the interlaced or progressive system is used can be checked with VSYNCSR.INTERLACED. If the field detection function is unstable, setting SYNSCR5.VSYNCDELAY to 1 may improve the function.

20B.3.4 Burst Controlled Oscillator (BCO)

The BCO extracts the color burst signal from the composite video signal and reproduces the color sub-carrier signal required for color demodulation. It also acquires the phase and frequency information from the color burst signal and detects the color system used.

Figure 20B.30 shows the block diagram of the BCO.

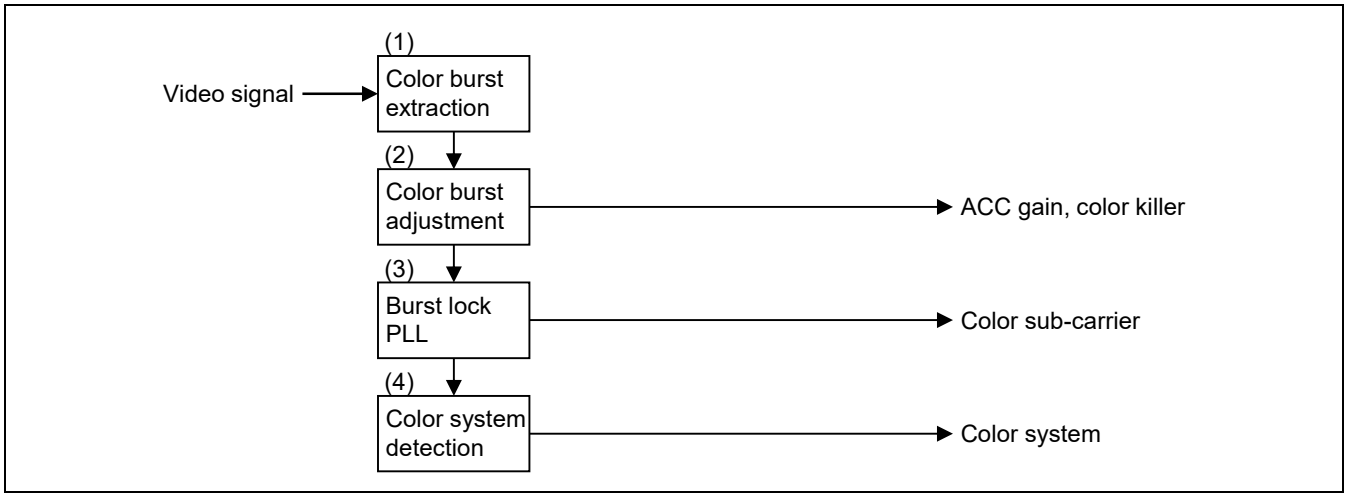

Figure 20B.30 Block Diagram of Burst Controlled Oscillator

(1) Color Burst Extraction Block

The color burst extraction block extracts the color burst signal. The position of the color burst signal to be extracted can be adjusted using BTGPCR.BGPWIDTH[6:0] and BTGPCR.BGPSTART[7:0]. The extraction result of the color burst signal can be checked by reading CROMASR1.NOBURST.

(2) Color Burst Adjustment Block

The color burst adjustment block adjusts the amplitude of the extracted color burst signal. For details, refer to section 20B.3.6(1), Automatic Color Control (ACC) Block. This block also outputs the signal to turn on or off the color killer according to the amplitude of the input color burst signal. For details, refer to section 20B.3.6(2), Color Killer.

(3) Burst Lock PLL

The burst lock PLL is a digital PLL which reproduces the color sub-carrier signal from the adjusted color burst signal.

The lock range of the burst lock PLL can be set using BTLCR.LOCKRANGE[1:0]. If the burst lock PLL is locked, CROMASR1.FSCLOCK becomes 1; and if unlocked, CROMASR1.FSCLOCK becomes 0.

The loop gain of the burst lock PLL can be set using BTLCR.LOOPGAIN[1:0] and BTLCR.LOCKLIMIT[1:0]. As the response speed is increased and the frequency search is started earlier, the lockup time becomes shorter. However, the PLL becomes unstable and unlocked more easily due to noise.

The S/N of the color burst signal can be checked using CROMASR2.LOCKLEVEL[7:0].

(4) Color System Detection Block

The color system detection block detects the color system of the input video signal based on the oscillation frequency of the burst lock PLL and phase information of the color burst signal. The color system can be detected using BTLCR.NONTSC358, BTLCR.NONTSC443, BTLCR.NOPALM, BTLCR.NOPALN, BTLCR.NOPAL443, and BTLCR.NOSECAM. Color system detection can be set to fully automatic, manual, or semi-automatic (detecting the specified color system only). If the detection result does not apply to any color system type, the color system selected with BTLCR.DEFAULTSYS[1:0] is assumed.

When an NTSC, PAL, or SECAM signal is detected, 1 is read from CROMASR2.ISNTSC, CROMASR2.ISPAL, or CROMASR2.ISSEAM, respectively. The currently used color system can be checked by reading CROMASR1.COLORSYS[1:0].

The color sub-carrier frequency can be checked by reading CROMASR1.FSCMODE.

20B.3.5 Y/C Separator Circuit

The Y/C separator circuit separates the composite video signal of the NTSC, PAL, or SECAM format into the Y and C signals. Two-dimensional adaptive separation is used for NTSC and PAL and one-dimensional separation for SECAM.

Figure 20B.31 shows a block diagram of the Y/C separator circuit.

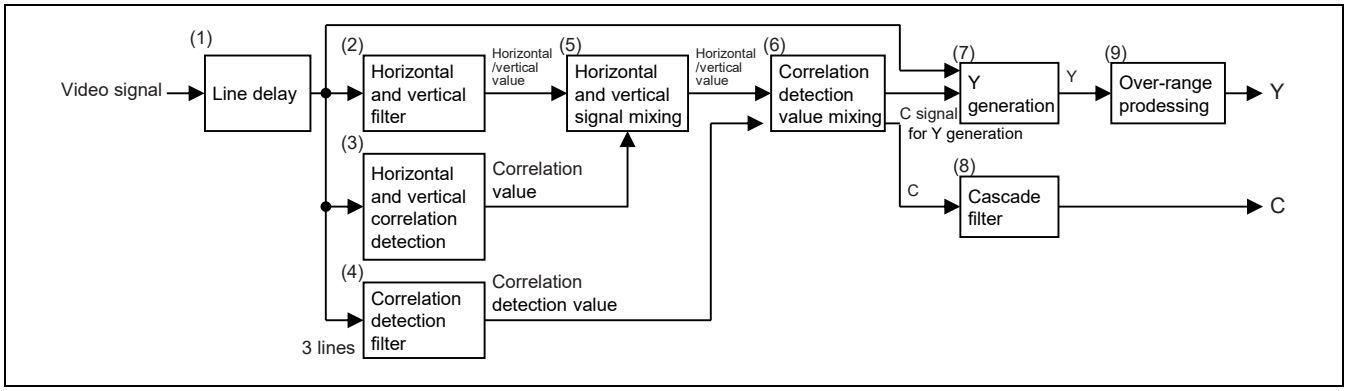

Figure 20B.31 Block Diagram of Y/C Separator Circuit

Table 20B.37 shows the operation of the Y/C separator circuit for each color format.

Table 20B.37 Y/C Separation Operation for Each Color Format

Color Format	YC Separation Operation
NTSC-3.58	Two dimensional
NTSC-4.43	Two dimensional
PAL-M	Two dimensional
PAL-N	Two dimensional
PAL-4.43	Two dimensional
SECAM	One dimensional

(1) Line Delay Block

In two-dimensional Y/C separation, three lines of data is required (directly adjacent three lines for NTSC and adjacent three lines on every second line for PAL). This block delays video signals to hold three lines of data.

(2) Horizontal and Vertical Filter Block

In two-dimensional adaptive Y/C separation, the horizontal band pass filter (BPF), vertical band pass filter (BPF), and horizontal/vertical band pass filter (BPF) are adaptively switched according to the correlation between the horizontally-/vertically-adjacent pixels. This block processes the input signals using the horizontal BPF, vertical BPF, or horizontal/vertical BPF. In one-dimensional Y/C separation, only the horizontal BPF is used. Figure 20B.32 shows the filter configuration.

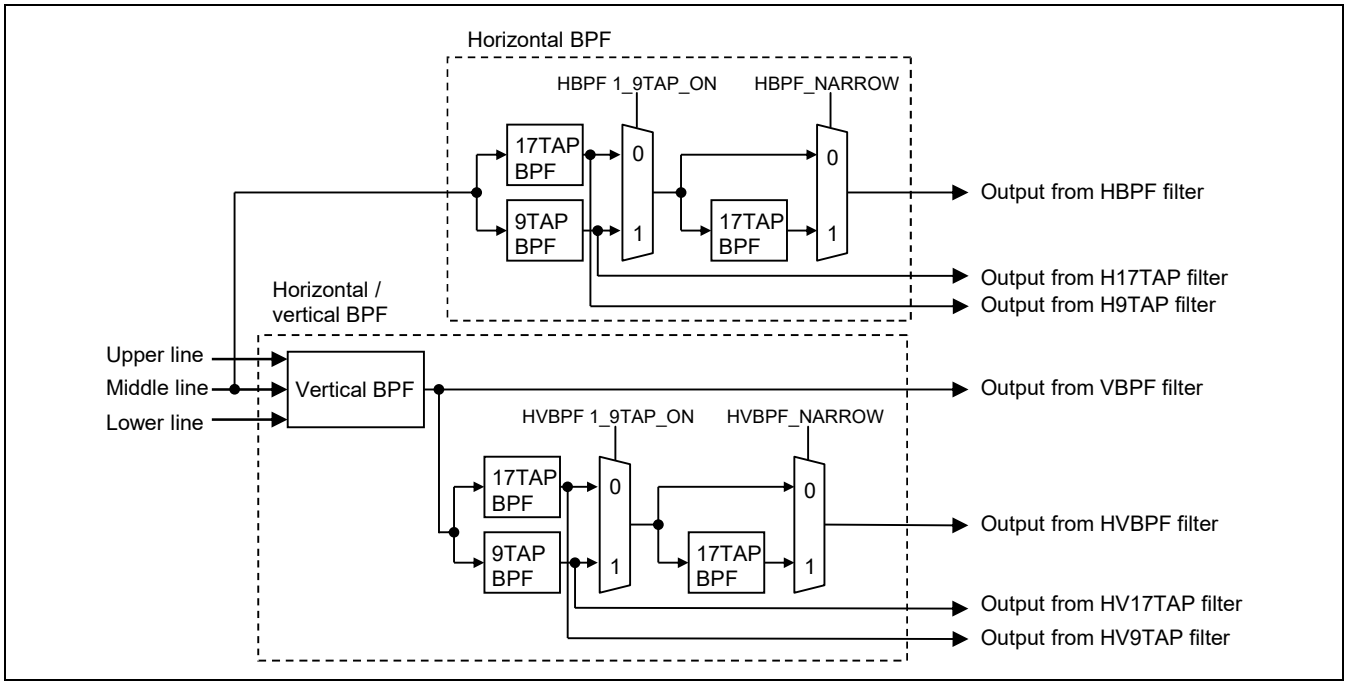

Figure 20B.32 Horizontal and Vertical Filter Configuration

The horizontal BPF is composed of two stages. Either the 9-TAP or 17-TAP BPF is selected at the former stage. When YCSCR8.HBPF1_9TAP_ON/HVBPF1_9TAP_ON is 0, the 17-TAP BPF is selected; and when 1, the 9-TAP BPF is selected. Either bypass operation or the 17-TAP BPF is selected at the latter stage. When YCSCR8.HBPF_NARROW/HVBPF_NARROW is 0, bypass operation is selected; and when 1, the 17-TAP BPF is selected.

(3) Horizontal and Vertical Correlation Detection Block

The horizontal and vertical correlation detection block detects the correlation value between the horizontal pixels, vertical pixels, and horizontal/vertical pixels. The value obtained by mixing the detected correlation value and the two-dimensional Y/C separation filter select coefficient is used for selecting the appropriate horizontal, vertical, or horizontal/vertical filter.

Table 20B.38 shows the two-dimensional Y/C separation filter select coefficients.

Table 20B.38 Two-Dimensional Y/C Separation Filter Select Coefficients

Category	Bit Name	Description	Bit Correlation
Vertical Y/C separation select coefficients	YCSCR5.K21A[5:0]	As the value becomes larger, the vertical BPF is applied to the narrower range.	There is correlation between these bits. When horizontal dot crawl is conspicuous, make the bit field value smaller (make the K24 value larger). However, when the value is too small (K24 is too large), vertical dot crawl is produced.
	YCSCR5.K22A[7:0]	As the value becomes larger, the vertical BPF is applied to the narrower range.	
	YCSCR7.K23A[3:0]	As the value becomes larger, the vertical BPF is applied to the narrower range.	
	YCSCR7.K24[4:0]	As the value becomes larger, the vertical BPF is applied to the wider range.	
	YCSCR6.K21B[5:0]	As the value becomes larger, the vertical BPF is applied to the narrower range.	There is correlation between these bits. When horizontal dot crawl is conspicuous, make the bit field value smaller. However, when the value is too small, vertical dot crawl is produced.
	YCSCR6.K22B[7:0]	As the value becomes larger, the vertical BPF is applied to the narrower range.	
	YCSCR7.K23B[3:0]	As the value becomes larger, the vertical BPF is applied to the narrower range.	
Horizontal Y/C separation select coefficients	YCSCR3.K11[5:0]	As the value becomes larger, the horizontal BPF is applied to the narrower range.	There is correlation between these bits. When vertical dot crawl is conspicuous, make the bit field value smaller. However, when the value is too small, horizontal dot crawl is produced.
	YCSCR3.K13[5:0]	As the value becomes larger, the horizontal BPF is applied to the narrower range.	
	YCSCR3.K15[3:0]	As the value becomes larger, the horizontal BPF is applied to the narrower range.	
	YCSCR4.K12[5:0]	As the value becomes larger, the horizontal BPF is applied to the narrower range.	There is correlation between these bits. When vertical dot crawl is conspicuous, make the bit field value smaller. However, when the value is too small, horizontal dot crawl is produced.
	YCSCR4.K14[5:0]	As the value becomes larger, the horizontal BPF is applied to the narrower range.	
	YCSCR4.K16[3:0]	As the value becomes larger, the horizontal BPF is applied to the narrower range.	

(4) Correlation Detection Filter Block

The correlation detection filter block, specific to this module, attaches greater importance to the correlation between lines to reduce dot crawl, especially at the intersection of a cross. By mixing the signals after correlation detection filter block, dot crawl can be reduced when dot crawl is not fully removed by the horizontal and vertical filter block.

(5) Horizontal and Vertical Signal Mixing Block

The horizontal and vertical signal mixing block mixes the signals output from the horizontal, vertical, and horizontal/vertical filter blocks with the signals output from the horizontal and horizontal/vertical filters of the former stage. After that, the appropriate signal is selected from among the signals output from the horizontal, vertical, and horizontal/vertical filters according to the correlation value obtained using (3). Figure 20B.33 shows the configuration of the horizontal and vertical signal mixing block.

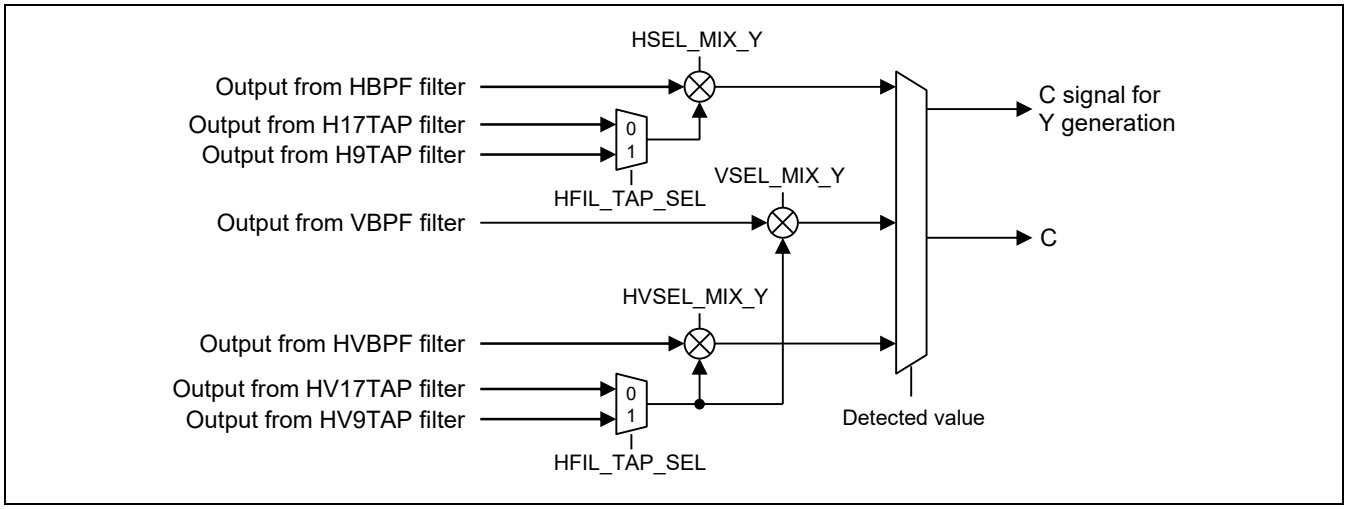

Figure 20B.33 Configuration of Horizontal and Vertical Signal Mixing Block

The signal to be mixed, which is output from either the horizontal or horizontal/vertical filter of the former stage, can be selected with YCSCR8.HFIL_TAP_SEL. When YCSCR8. HFIL_TAP_SEL is 0, the signal output from the 17-TAP filter is selected; and when 1, the signal output from the 9-TAP filter is selected.

This block mixes the signals output from the horizontal filter with the signals output from the above described horizontal filter of the former stage. The mixing ratio can be set with YCSCR9.HSEL_MIX_Y[3:0]. Similarly, this block mixes the signals output from the vertical or horizontal/vertical filter with the signals output from the above described horizontal/vertical filter of the former stage. The mixing ratio can be set with YCSCR9.VSEL_MIX_Y[3:0] and YCSCR9.HVSEL_MIX_Y[3:0].

This block selects the appropriate signal from among the signals output from the horizontal, vertical, and horizontal/vertical filters according to the correlation value obtained using (3).

(6) Correlation Detection Value Mixing Block

The correlation detection value mixing block mixes the C signal for Y generation and the C signal generated using (5) with the signals after correlation detection filter block (4).

Figure 20B.34 shows the configuration of the correlation detection value mixing block.

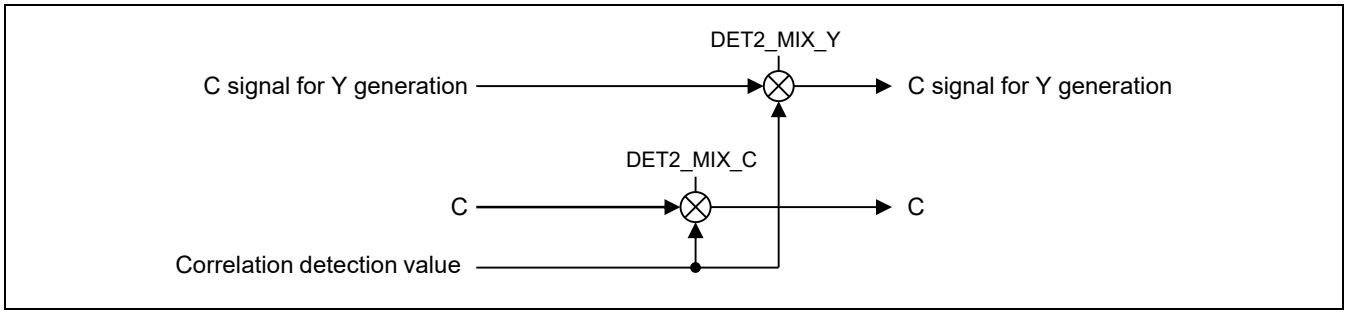

Figure 20B.34 Configuration of Correlation Detection Value Mixing Block

When YCSCR9.DET2_ON is 1, this block mixes the signal after the correlation detection filter block. The mixing ratio of the C signal for Y generation to the signal after the correlation detection filter block can be set with YCSCR12.DET2_MIX_Y[3:0]. Similarly, the mixing ratio of the C signal to the signal after the correlation detection filter block can be set with YCSCR12.DET2_MIX_C[3:0].

When YCSCR9.DET2_ON is 0, this block outputs the signal after the horizontal and vertical filter block without mixing.

(7) Y Generation Block

The Y generation block generates the Y signal by subtracting the C signal for Y generation from the video signal.

(8) Cascade Filter Block

The cascade filter block allows the C signal to pass through the cascade filter or TAKE-OFF filter to further narrow the bandwidth.

Figure 20B.35 shows the configuration of the cascade filter block.

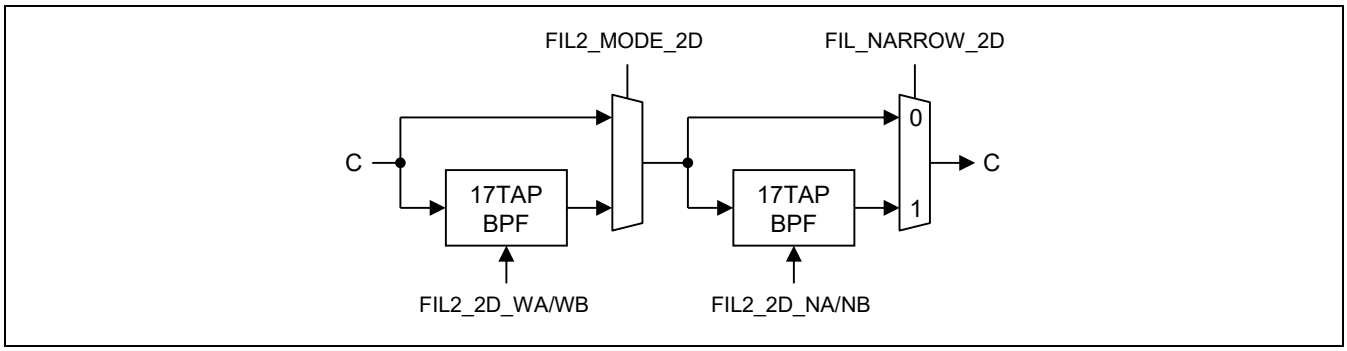

Figure 20B.35 Configuration of Cascade Filter Block

The cascade filter block is composed of two stages. Either bypass operation or 17-TAP filter is selected at the former stage. Bypass operation, cascade, or TAKE-OFF filter can be selected at the former stage with YCSCR12.FIL2_MODE_2D[1:0].

Similarly, either bypass operation or 17-TAP filter can be selected at the latter stage with YCSCR12.FIL2_NARROW_2D.

Both of the former- and latter-stage filters are universal and can be set with YCTWA_F0 to YCTWA_F8, YCTWB_F0 to YCTWB_F8, YCTNA_F0 to YCTNA_F8, and YCTNB_F0 to YCTNB_F8.

Table 20B.39 to Table 20B.41 show the recommended setting for each filter.

Table 20B.39 Recommended Settings for Two-Dimensional Y/C Filters (NTSC)

	NTSC						NTSC				
		Cascade Filter		TAKE-OFF Filter				Cascade Filter		TAKE-OFF Filter	
Bit Name	Bypass Operation	1 Stage	2 Stages	Broad-band	Narrow-band	Bit Name	Bypass Operation	1 Stage	2 Stages	Broad-band	Narrow-band
FIL2_MODE_2D	0	1		2		FIL2_MODE_2D	0	1		2	
FIL2_NARROW_2D	—	0	1	—	—	FIL2_NARROW_2D	—	0	1	—	—
FIL2_2D_WA_F0	—	24	24	0	0	FIL2_2D_NA_F0	—	—	24	—	—

(9) Over-Range Control Block

If overflow or underflow occurs at the top or bottom of the color amplitude of video signals, Y/C separation may not be correctly performed thus causing vertical lines to appear as dot crawl. To reduce this phenomenon, the over-range control block automatically inserts the low-pass filter for Y signals (cuts off the frequency components of the vertical lines) Setting RGORCR7.UCMP_SW to 1 enables over-range control, and setting RGORCR7.DCMP_SW to 1 enables under-range control. One of four over-range levels can be set with RGORCR1.RADJ_O_LEVEL0[9:0], RGORCR3.RADJ_O_LEVEL1[9:0], and RGORCR5.RADJ_O_LEVEL2[9:0]. Similarly, one of four under-range levels can be set with RGORCR2.RADJ_U_LEVEL0[9:0], RGORCR4.RADJ_U_LEVEL1[9:0], and RGORCR6.RADJ_U_LEVEL2[9:0]. The filter to be inserted is appropriately selected according to the over-range and under-range levels.

Setting HWIDE_SW to 1 enables detection of the maximum (minimum) level of five pixels in the horizontal direction in addition to the currently processed pixel to detect over-range or under-range occurrence.

20B.3.6 Chroma Decoding Circuit

The chroma decoding circuit demodulates the C signal extracted by the Y/C separator circuit into the Cb/Cr signal. This circuit has the automatic color control function (ACC), in which the amplitude of the color burst signal is detected to adjust the color gain automatically and also has the TINT/R-Y axis correction function, in which hue is adjusted at demodulation.

Figure 20B.36 shows the block diagram of the chroma decoding circuit.

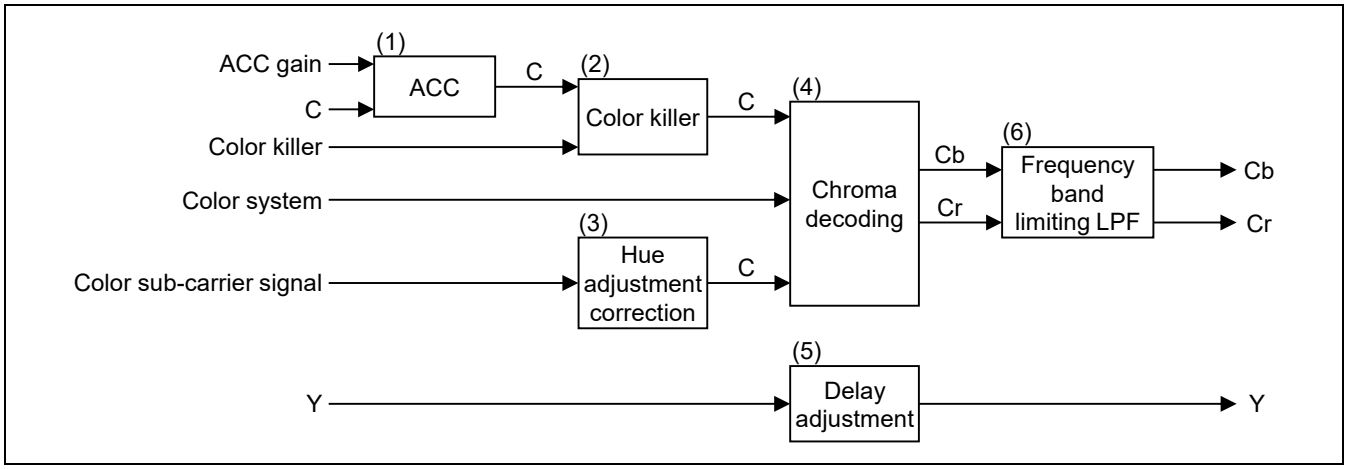

Figure 20B.36 Block Diagram of Chroma Decoding Circuit

(1) Automatic Color Control (ACC) Block

The ACC block detects the amplitude of the color burst signal and automatically controls the C signal gain so that the amplitude should be controlled to the target value. The ACC function is activated with ACCCR1.ACCMODE = 0. The target amplitude of the color burst signal can be set with ACCCR1.ACCLEVEL[8:0]. The gain is fixed when the amplitude falls within ACCCR1.ACCLEVEL[8:0] ± ACCCR3.ACCPRECIS[5:0]. The maximum ACC gain can be controlled with ACCCR1.ACCMAXGAIN[1:0]. The currently set gain value can be checked by reading CROMASR1.ACCMAINGAIN[8:0] (main) and CROMASR1.ACCSUBGAIN[1:0] (sub).

The C signal gain can also be set manually by setting ACCCR1.ACCMODE to 1. The specific gain value can be set with ACCCR2.CHROMAMAINGAIN[8:0] (main) and ACCCR2.CHROMASUBGAIN[1:0] (sub).

(2) Color Killer

The color killer deletes color information when the color bust signal amplitude is small in a weak electric field. The color killer is turned on or off based on the hysteresis; specifically, it is turned on when the amplitude reaches the value set with ACCCR3.KILLERLEVEL[5:0] and turned off when the amplitude reaches the value determined by ACCCR3.KILLERLEVEL[5:0] + ACCCR1.KILLEROFFSET[3:0].

The color killer can also be turned on forcibly by so setting ACCCR3.KILLERMODE.

(3) Hue Adjustment Correction Block

The hue adjustment correction block adjusts the color sub-carrier signal phase to adjust the Cb/Cr hue after chroma decoding. This function can be used only for the NTSC and PAL systems. The phase of the demodulation axis is controlled with TINTCR.TINTMAIN[9:0] and the phase of the R-Y axis is controlled with TINTCR.TINTSUB[5:0].

(4) Chroma Decoding Block

The chroma decoding block demodulates the Cb/Cr signal from the C signal. Line averaging can be carried out before demodulation according to YCDCR.DEMODMODE[1:0] setting. YCDCR.DEMODMODE[1:0] should usually be set to 2 (two-line demodulation for PAL only; one-line demodulation for NTSC).

(5) Delay Adjustment Block

The delay adjustment block delays the Y signal to adjust the Y/C signal delay. The Y signal can be delayed by -16 to 15 clock pulses with YCDCR.LUMADELAY[4:0].

(6) Frequency Band Limiting LPF

The frequency band limiting LPF limits the frequency band of the Cb/Cr signal after chroma decoding. This LPF is turned on or off according to YCDCR.CHROMALPF setting.

20B.3.7 Digital Clamp Circuit

The digital clamp circuit provides pedestal clamp for the Y signals and center clamp for the Cb/Cr signals at any position. This circuit also detects the amount of noise using the autocorrelation function.

Figure 20B.37 shows the block diagram of the digital clamp circuit.

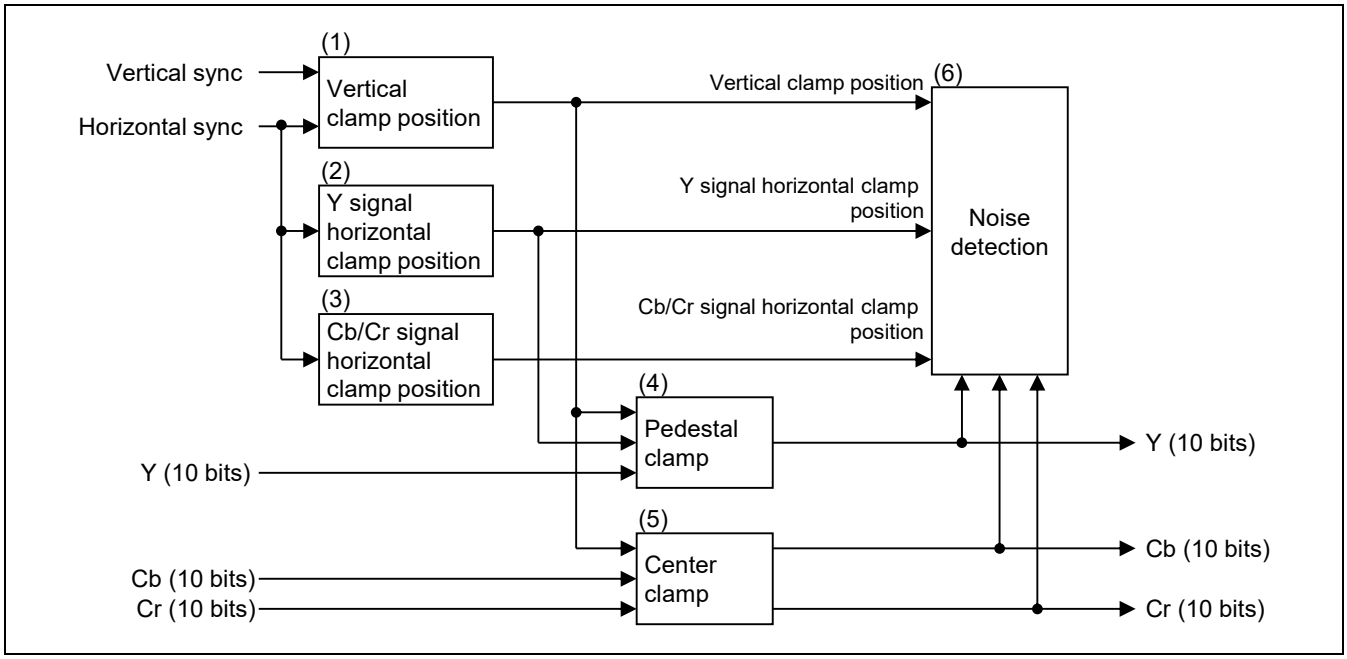

Figure 20B.37 Block Diagram of Digital Clamp Circuit

(1) Vertical Clamp Position Control Block

The vertical clamp position can be set with DCPCR4.DCPSTART[5:0] and DCPCR5.DCPEND[5:0]. The setting is used in common to Y, Cb, and Cr signals.

(2) Y Signal Horizontal Clamp Position Control Block

The horizontal clamp start position of the Y signal can be set with DCPCR7.DCPPOS_Y[7:0]. The horizontal clamp width can be set with DCPCR6.DCPWIDTH[6:0].

The horizontal clamp width setting is used in common to Y, Cb, and Cr signals.

(3) Cb/Cr Signal Horizontal Clamp Position Control Block

The horizontal clamp start position of the Cb/Cr signal can be set with DCPCR8.DCPPOS_C[7:0]. The horizontal clamp width can be set with DCPCR6.DCPWIDTH[6:0].

The horizontal clamp width setting is used in common to Y, Cb, and Cr signals.

(4) Pedestal Clamp Control Block

The pedestal clamp control block stabilizes the Y signal pedestal level.

When DCPCR1.DCPMODE_Y is 0, the value set with DCPCR1.BLANKLEVEL_Y[9:0] is subtracted from the Y signal, which is expressed as:

Y signal output = Y signal input – DCPCR1.BLANKLEVEL_Y[9:0]

When DCPCR1.DCPMODE_Y is 1, the Y signal level detected at the set clamp position and DCPCR1.BLANKLEVEL_Y[9:0] are added together and the resulting value is subtracted from the Y signal, which is expressed as:

Y signal output = Y signal input – (detected value + DCPCR1.BLANKLEVEL_Y[9:0])

The detected value can be read from DCPSR1.CLAMPLEVEL_Y[9:0].

The clamp response speed can be set with DCPCR3.DCPRESPONSE[2:0]. The setting is used in common to Y, Cb, and Cr signals.

(5) Center Clamp Control Block

The center clamp control block stabilizes the Cb/Cr signal center level.

When DCPCR2.DCPMODE_C is 0, the value set with DCPCR2.BLANKLEVEL_CB/DCPCR2.BLANKLEVEL_CR[5:0] is subtracted from the Cb/Cr signal, which is expressed as:

Cb signal output = Cb signal input – DCPCR2.BLANKLEVEL_CB[5:0]

Cr signal output = Cr signal input – DCPCR2.BLANKLEVEL_CR[5:0]

When DCPCR2.DCPMODE_C is 1, the Cb/Cr signal level detected at the set clamp position and DCPCR2.BLANKLEVEL_CB/DCPCR2.BLANKLEVEL_CR[5:0] are added together and the resulting value is subtracted from the Cb/Cr signal, which is expressed as:

Cb signal output = Cb signal input – (detected value + DCPCR2.BLANKLEVEL_CB[5:0])

Cr signal output = Cr signal input – (detected value + DCPCR2.BLANKLEVEL_CR[5:0])

The detected value can be read from DCPSR1.CLAMPLEVEL_CB[5:0] and DCPSR2.CLAMPLEVEL_CR[5:0].

The clamp response speed can be set with DCPCR3.DCPRESPONSE[2:0]. The setting is used in common to Y, Cb, and Cr signals.

(6) Noise Detection Block

Using the autocorrelation function, the noise amount at the set clamp position can be detected. With NSDCR.ACFINPUT[1:0], either Y, Cb, or Cr signal can be selected for which to calculate the autocorrelation function. The delay time for autocorrelation function calculation can be set with NSDCR.ACFLAGTIME[4:0] and accumulated field amount of autocorrelation function can be set with NSDCR.ACFFILTER[1:0]. The autocorrelation function (correlation coefficient) can be read from NSDSR.ACFSTRENGTH[15:0].

20B.3.8 Output Control Circuit

The output control circuit sets the signal capturing position and adjusts the contrast and color.

Figure 20B.38 shows the block diagram of the output control circuit.

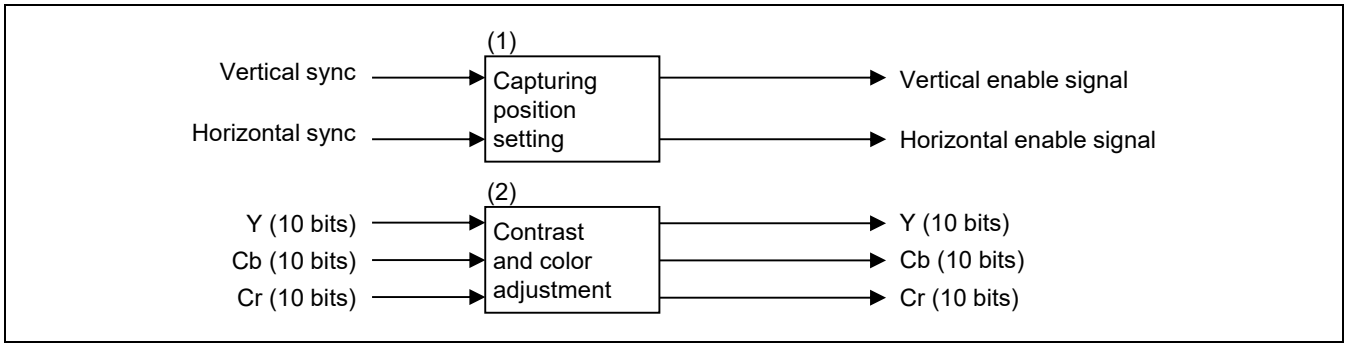

Figure 20B.38 Block Diagram of Output Control Circuit

(1) Capturing Position Setting Block

The capturing position setting block sets the position to capture the input video signals. The position can be set with TGCR1.SRCLEFT[8:0], TGCR2.SRCTOP[5:0], TGCR2.SRCHEIGHT[9:0], and TGCR3.SRCWIDTH[10:0]. These settings are applied only to this module. To set the display size of the input video signals, the vertical capture size register (SCL0_DS2) and horizontal capture size register (SCL0_DS3) of the scaler of video display controller 5 should be used.

(2) Contrast and Color Adjustment Block

The contrast and color adjustment block adjusts the gain of the output Y/Cb/Cr signals. The contrast (Y signal gain) can be adjusted with YGAINCR.Y_GAIN2[9:0] and the color (Cb/Cr signal gain) can be adjusted with CBGAINCR.CB_GAIN2[9:0] and CRGAINCR.CR_GAIN2[9:0].

20B.4 Usage Notes

20B.4.1 Recommended Setting

20B.4.2 Connection Example

Figure 20B.39 shows a pin connection example of this module.

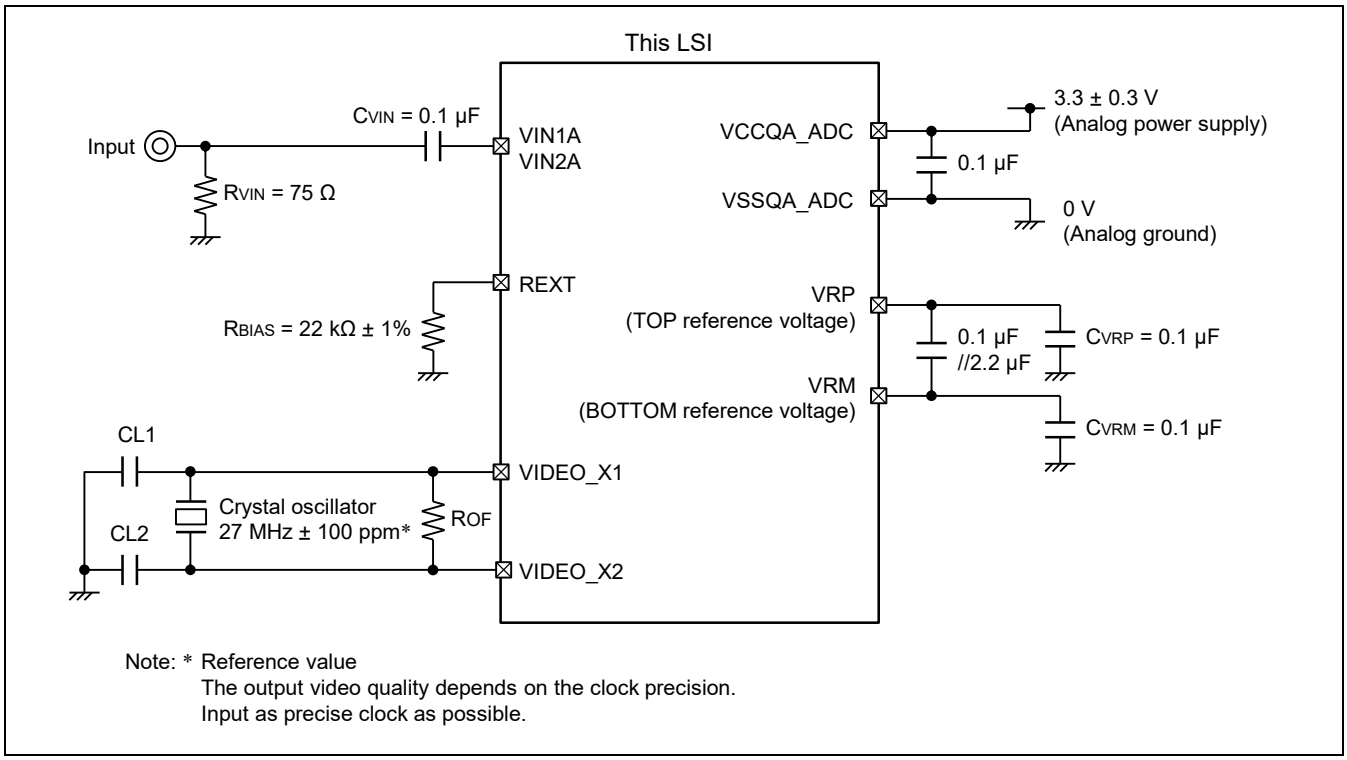

Figure 20B.39 Pin Connection Example

21. LVDS Interface

21.1 Overview

The LVDS (low voltage differential signaling) module converts an RGB signal output by the DU module to the LVDS format and outputs those signals.

The LVDS interface supports 8 output data formats with the conversion formats selected by register settings. The output control signals can also be selected freely.

It has a dedicated phase-locked loop (PLL) circuit, which can generate a clock with a desired frequency by dividing or multiplying the input clock frequency.

This PLL is called LVDS PLL in this section.

21.1.1 Features

- Five pairs of differential output conforming to the TIA/EIA-644 standard (four pairs for data and one pair for the clock)
- LVDS PLL for generating a clock with a desired frequency
- LVDS PLL power-down function
- Support eight output data formats
- Operating frequency: A maximum dot clock frequency of 13.40 to 87 MHz

21.1.2 Block Diagram

Figure 21.1 shows a block diagram of the LVDS output interface configuration.

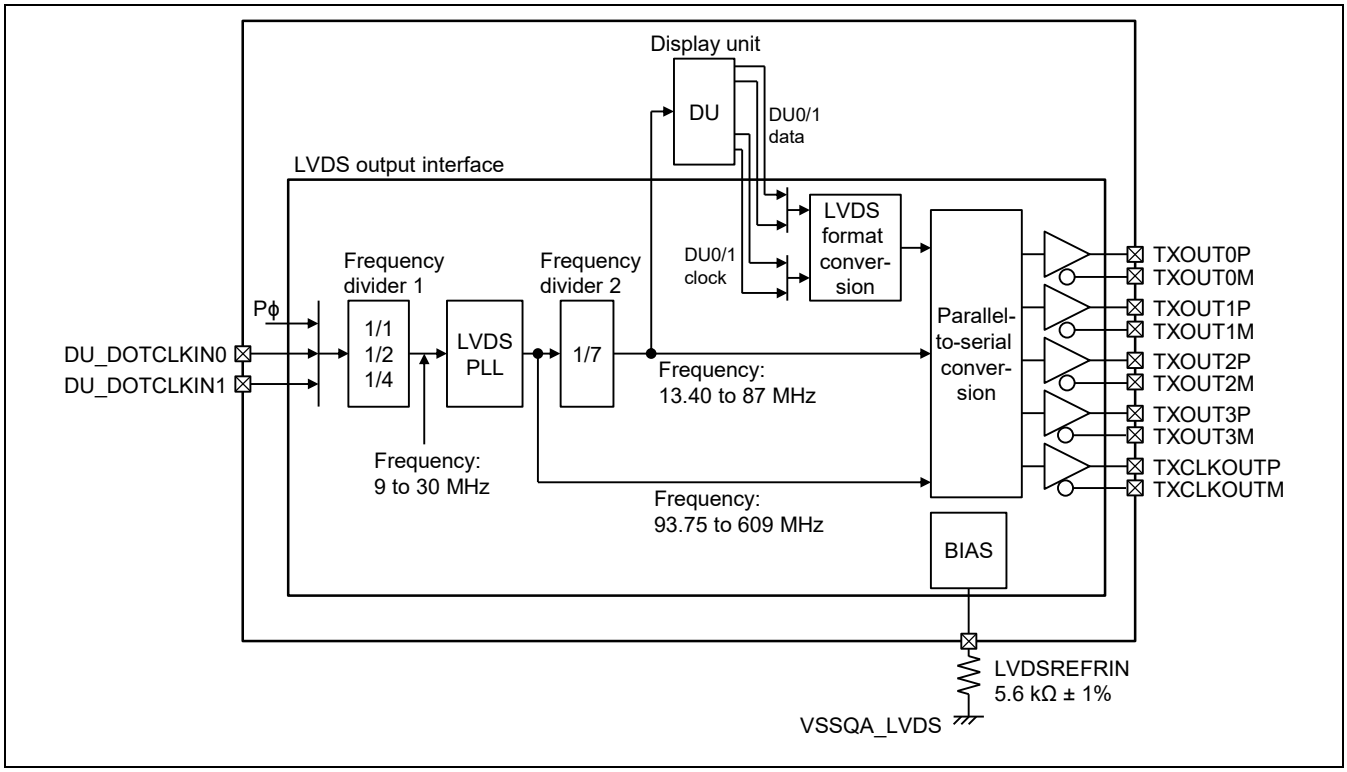

Figure 21.1 Block Diagram of LVDS Output Interface Configuration

21.1.3 Input/Output Pins

Table 21.1 shows the pin configuration.

Table 21.1 Pin Configuration

Name	Pin Name	I/O	Function
LVDS analog power supply pin	VCCQA_LVDS	Input	Power supply pin for LVDS output
LVDS analog ground pin*	VSSQA_LVDS	Input	Ground pin for LVDS output
LVDS PLL power supply pin	VDDA_LVDSPLL	Input	Power supply pin for LVDS PLL
LVDS resistor connection pin	LVDSREFRIN	Input	Reference resistor connection pin Connect to VSSQA_LVDS via a resistor with a value of 5.6 kΩ ± 1%.
LVDS data output pin 0P	TXOUT0P	Output	LVDS Ch0 data output pins (positive)
LVDS data output pin 0M	TXOUT0M	Output	LVDS Ch0 data output pins (negative)
LVDS data output pin 1P	TXOUT1P	Output	LVDS Ch1 data output pins (positive)
LVDS data output pin 1M	TXOUT1M	Output	LVDS Ch1 data output pins (negative)
LVDS data output pin 2P	TXOUT2P	Output	LVDS Ch2 data output pins (positive)
LVDS data output pin 2M	TXOUT2M	Output	LVDS Ch2 data output pins (negative)
LVDS data output pin 3P	TXOUT3P	Output	LVDS Ch3 data output pins (positive)
LVDS data output pin 3M	TXOUT3M	Output	LVDS Ch3 data output pins (negative)
LVDS clock output pin CP	TXCLKOUTP	Output	LVDS clock output pins (positive)
LVDS clock output pin CM	TXCLKOUTM	Output	LVDS clock output pins (negative)

21.1.4 Register Configuration

Table 21.2 shows the register configuration.

Base address: H'FEB9 0000

Table 21.2 Register Configuration

Name	Abbreviation	R/W	Address	Initial Value	Access Size
LVDS clock select register	LCLKSELR	R/W	H’FEB9 0000	H’00000000	32

CTR Control Register	LVDCTRCR	R/W	H’FEB9 0014	H’00000000	32
CH Control Register	LVDCHCR	R/W	H’FEB9 0018	H’00000000	32

21.2 Register Description

21.2.1 LVDS Clock Select Register (LCLKSELR)

LCLKSELR specifies the input clock, the frequency dividing values for frequency dividers 1, and controls power-down in the LVDS BIAS.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	LVDS_IN_CLK_SEL[2:0]			—	—	—	—	—	—	LVDS_NIDIV_SET[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	LVDS_CLK_EN	—	—	LVDS_BIAS_PDN	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26, 25	LVDS_IN_CLK_SEL [2:1]	00	R/W	These bits select the clock input to frequency divider 1. 00: Pϕ When you choose this clock(Pϕ), set “bit17,16 LVDS_NIDIV_SET[1:0] = 10(NIDIV = 4)” by all means. 01: DU_DOTCLKIN0 10: DU_DOTCLKIN1 11: Setting prohibited
24	LVDS_IN_CLK_SEL [0]	0	R/W	These bits select the clock input of DU data. 0: DU0 clock (“LVDCR0.DUSEL = 0” is necessary) Choose it at the time of DU0 use. Set the DU register as follows at the same time. DIDSR(H’FEB20028) = H’77900200 1: DU1 clock (“LVDCR0.DUSEL = 1” is necessary) Choose it at the time of DU1 use. Set the DU register as follows at the same time. DIDSR(H’FEB20028) = H’77900800
23 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	LVDS_NIDIV_SET [1:0]	00	R/W	These bits specify the frequency dividing value (NIDIV) for frequency divider 1. NIDIV = 1, 2, or 4 00: NIDIV = 1 01: NIDIV = 2 10: NIDIV = 4 11: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	LVDS_CLK_EN	0	R/W	Enables the LVDS PLL output. 0: Output from the PLL is disabled. 1: Output from the PLL is enabled. Note: Be sure to clear this bit to 0 before making settings in any other register described in this section. In addition, before modifying this bit, be sure to clear the enable bits in DU(display unit) to 0.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	LVDS_BIAS_PDN	0	R/W	Controls power-down for the LVDS BIAS. 0: Power-down state 1: Normal operation
0	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.

21.2.2 LVDS PLL Setting Register (LPLLSETR)

LPLLSETR specifies the frequency dividing value and controls power-down in the LVDS PLL.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LVDSPLL_BP	—	—	—	—	LVDSPLL_FD[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	LVDSPLL_RD[4:0]					—	—	LVDSPLL_OD[1:0]		—	—	—	LVDSPLL_PD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R/W	R	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	LVDSPLL_BP	0	R	Makes the input signal bypass the LVDS PLL and outputs it without change. 0: Normal operation 1: Bypass output Note: When selecting the bypass output, set LVDSPLL_OD = 0.
30 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	LVDSPLL_FD[10:0]	All 0	R/W	These bits specify the frequency dividing value (NFD) for the feedback frequency in the LVDS PLL. 24 to 2047: NFD = LVDSPLL_FD value 0 to 23: Setting prohibited Note: The following values are also prohibited: 28 to 31, 37 to 39, 46, 47, and 55
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	LVDSPLL_RD[4:0]	All 0	R/W	These bits specify the frequency dividing value (NRD) for the input frequency in the LVDS PLL. NRD = LVDSPLL_RD value + 1
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	LVDSPLL_OD[1:0]	All 0	R/W	These bits specify the frequency dividing value (NOD) for the output frequency in the LVDS PLL. NOD = 2 ^ LVDSPLL_OD value
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	LVDSPLL_PD	1	R/W	Controls power-down for the LVDS PLL. 0: Normal operation 1: Power-down state

21.2.3 LVDS PLL Monitor Register (LPLLMONR)

LPLLMONR monitors the status of the LVDS PLL.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LVDSPLL_LD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	LVDSPLL_LD	0	R	Detects the locked state of the LVDS PLL. 0: Unlocked 1: Locked

21.2.4 LVDS Interface Control Register 0 (LVDCR0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DUSEL	—	—	—	LVMD[3:0]				—	—	—	—	—	—	—	LVRES
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	DUSEL	0	R/W	DU Channel Select Selects the DU channel for LVDS input. 0: DU0 is selected (“LCLKSELR.LVDS_IN_CLK_SEL[0] = 0” is necessary) 1: DU1 is selected (“LCLKSELR.LVDS_IN_CLK_SEL[0] = 1” is necessary)
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	LVMD[3:0]	0000	R/W	LVDS Interface Mode Selects the LVDS Interface module output data format (see Figure 21.4). 0000: MODE0 0001: MODE1 0010: MODE2 0011: MODE3 0100: MODE4 0101: MODE5 0110: MODE6 0111: MODE7 All other values: Setting prohibited
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	LVRES	0	R/W	LVDS Interface Reset Bit Controls the LVDS output. 0: Output off 1: Output on

21.2.5 CTR Control Register (LVDCTRCR)

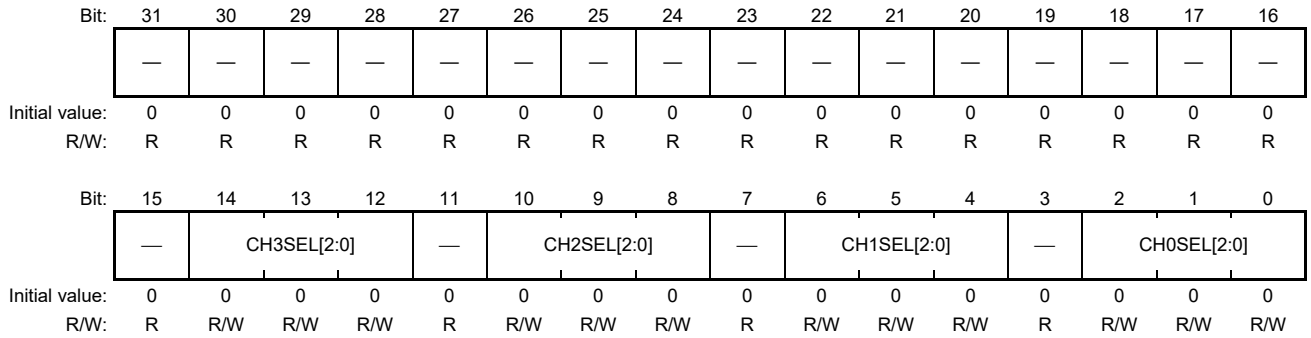
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	CTR3SEL[2:0]			—	CTR2SEL[2:0]			—	CTR1SEL[2:0]			—	CTR0SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14 to 12	CTR3SEL [2:0]	000	R/W	Ctrl3 Select Selects data to be output to Ctrl3 (see section 21.3.3 Ctrl Signal Selection). 000: 0 001: Odd/even 010: CDE Other settings are prohibited.
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10 to 8	CTR2SEL [2:0]	000	R/W	Ctrl2 Select Selects data to be output to Ctrl2 (see section 21.3.3 Ctrl Signal Selection). 000: DISP 001: Odd/even 010: CDE 011: HSYNC 100: VSYNC Other settings are prohibited.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 4	CTR1SEL [2:0]	000	R/W	Ctrl1 Select Selects data to be output to Ctrl1 (see section 21.3.3 Ctrl Signal Selection). 000: VSYNC 001: DISP 010: Odd/even 011: CDE 100: HSYNC Other settings are prohibited.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	CTR0SEL [2:0]	000	R/W	Ctrl0 Select Selects data to be output to Ctrl0 (see section 21.3.3 Ctrl Signal Selection). 000: HSYNC 001: VSYNC 020: DISP 010: Odd/even 100: CDE Other settings are prohibited.

21.2.6 CH Control Register (LVDCHCR)



Bit	Bit Name	Initial Value	R/W	Description
31 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14 to 12	CH3SEL	000	R/W	CH3 Select Selects data to be output to LVDS0_CH3_P/N (see section 21.3.4 CH Selection). 000: CH3 001: CH0 010: CH1 011: CH2 Other settings are prohibited.
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10 to 8	CH2SEL	000	R/W	CH2 Select Selects data to be output to LVDS0_CH2_P/N (see section 21.3.4 CH Selection). 000: CH2 001: CH3 010: CH0 011: CH1 Other settings are prohibited.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 4	CH1SEL	000	R/W	CH1 Select Selects data to be output to LVDS0_CH1_P/N (see section 21.3.4 CH Selection). 000: CH1 001: CH2 010: CH3 011: CH0 Other settings are prohibited.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	CH0SEL	000	R/W	CH0 Select Selects data to be output to LVDS0_CH0_P/N (see section 21.3.4 CH Selection). 000: CH0 001: CH1 010: CH2 011: CH3 Other settings are prohibited.

21.3 Operation

This module receives the RGB888 signals output from display unit(DU) and the SYNC signal, converts the video signals to the LVDS format, and outputs them. The operating clock is generated in the LVDS PLL.

21.3.1 LVDS PLL Settings

The input clock select circuit, frequency dividers 1, 2, and LVDS PLL circuit are used to generate operating clocks. For input and output of each circuit, allowable frequency ranges are determined; be sure to make appropriate settings to generate input and output frequencies within the ranges.

Before modifying various setting registers, check that clock operation in display unit(DU) is disabled and the LVDS PLL output is disabled (LPLLSETR.LVDS_CLK_EN = 0).

Figure 21.2 shows a block diagram of the LVDS PLL and its peripheral circuits.

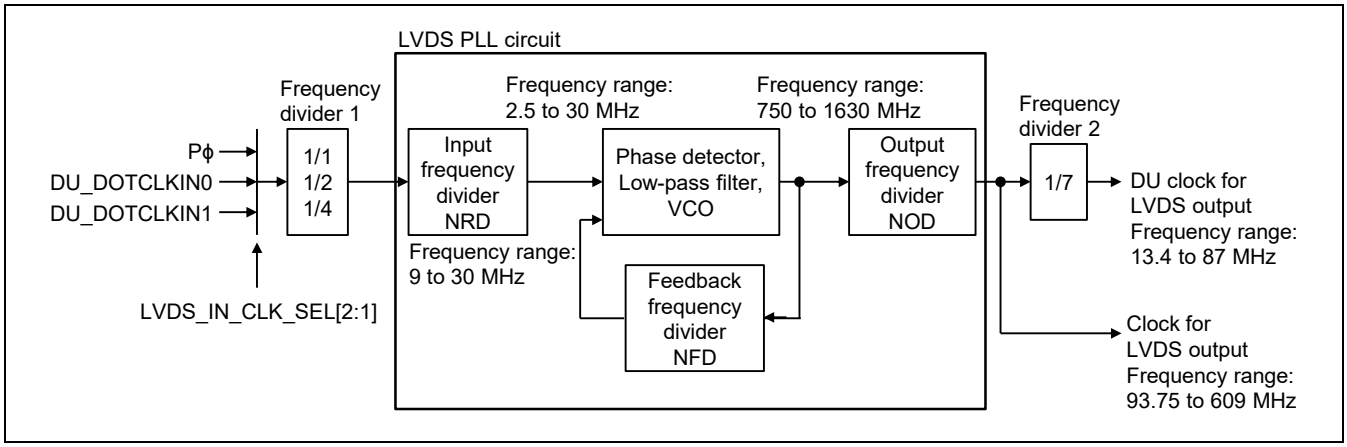


Figure 21.2 Block Diagram of LVDS PLL and Peripheral Circuits

(1) Clock Input to LVDS PLL

The clock input to the LVDS PLL can be selected from among Pϕ, DU_DOTCLKIN0, and DU_DOTCLKIN1 clocks through the LVDS_IN_CLK_SEL[2:1] bit setting in LVDS_CLKSELR.

The frequency of this input clock should be within the range from 9 to 30 MHz. When the input clock frequency is higher than the upper limit of this range, use frequency divider 1 placed before the LVDS PLL and reduce the frequency so that it is within the allowed range.

(2) LVDS PLL Frequency Setting

The LVDS PLL has three internal frequency dividers: input frequency divider NRD, feedback frequency divider NFD, and output frequency divider NOD.

The frequency of the clock output from the LVDS PLL is calculated by the following equations. Note that the reference frequency, VCO output frequency, LVDS PLL input frequency, and LVDS PLL output frequency should be within the respective ranges shown below the equations.

FVCO = FIN × NFD / NRD (VCO output frequency)
FOUT = FIN × NFD / (NRD × NOD) (LVDS PLL output frequency)

Note: FVCO: VCO output frequency. Frequency range = 750 MHz to 1630 MHz
FIN: LVDS PLL input frequency. Frequency range = 9 MHz to 30 MHz
FOUT: LVDS PLL output frequency. Frequency range = 609 MHz max.

(3) LVDS PLL Frequency Setting Timing

Before making settings for each frequency divider in the PLL circuit described in (2), place the PLL in the power-down state (PD = 1) and wait for at least 0.5 µs. After making frequency divider settings, wait for a retention period of at least 0.5 µs and release the power-down state (PD = 0). Figure 21.3 shows this timing.

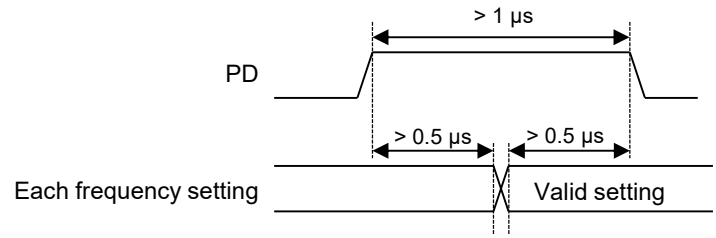

Figure 21.3 PLL Setting Timing

(4) LVDS PLL Output Enable Timing

Output of the clock from the LVDS PLL can be enabled or disabled through the LVDS_CLK_EN bit setting in LCLKSELR.

To allow time for stabilization of oscillation by the PLL, wait for at least 200 us after release from the power-down state before enabling the LVDS PLL output. The LVDS_CLK_EN bit in LCLKSELR should be modified only while the clock operation in display unit(DU) is disabled.

(5) LVDS PLL Output Clock Frequency Setting

When using the clock output from the LVDS PLL as the clock for the LVDS output interface, select the clock from frequency divider 2 (divided by 7) as the clock for display unit(DU).

21.3.2 Mode Selection

The mode is selected by the LVMD bits in the LVDS Interface control register 0. Figure 21.4 shows the modes that can be set.

Here, R0 to R7, G0 to G7, and B0 to B7 are the RGB signals and Ctrl0 to Ctrl3 are control signals (such as HSYNC and VSYNC). The Ctrl signals can be set by the CTR control register.

CH0, CH1, CH2 and CH3 are buffers that hold data temporarily. The default is for the CH0, CH1, CH2 and CH3 data to be output directly without change to TXOUT0P/M, TXOUT1P/M, TXOUT2P/M and TXOUT3P/M. The CH assignment can be switched with the CH control register settings.

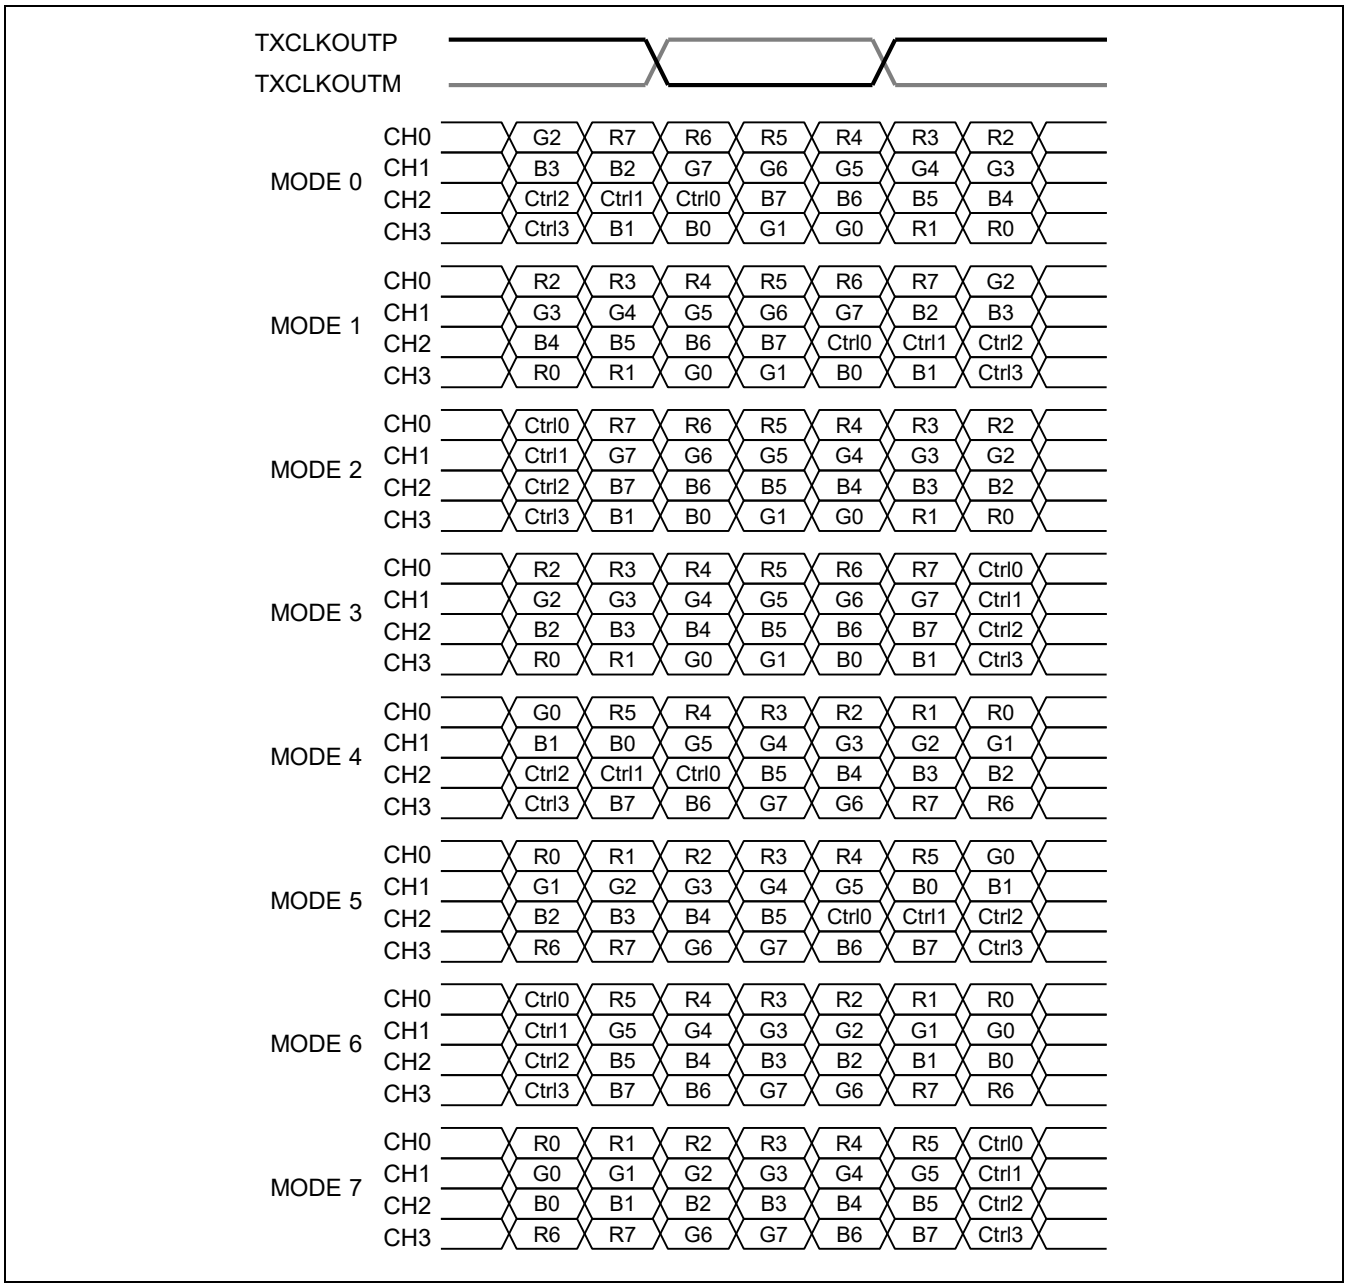

Figure 21.4 Output Data Format

21.3.3 Ctrl Signal Selection

The two stage settings shown below are required to select the Ctrl signals.

(1) DU Output Signal Selection

The DU output ports are multiplexed. The signals that you want to output are set up with the corresponding register. The specified signals are input to the LVDS Interface module ports.

(2) LVDS Port Selection

The LVDS ports used to output to the Ctrl signals are selected with the CTR control register (LVDCTRCR). This results in the signals input to the LVDS ports being output as Ctrl signals.

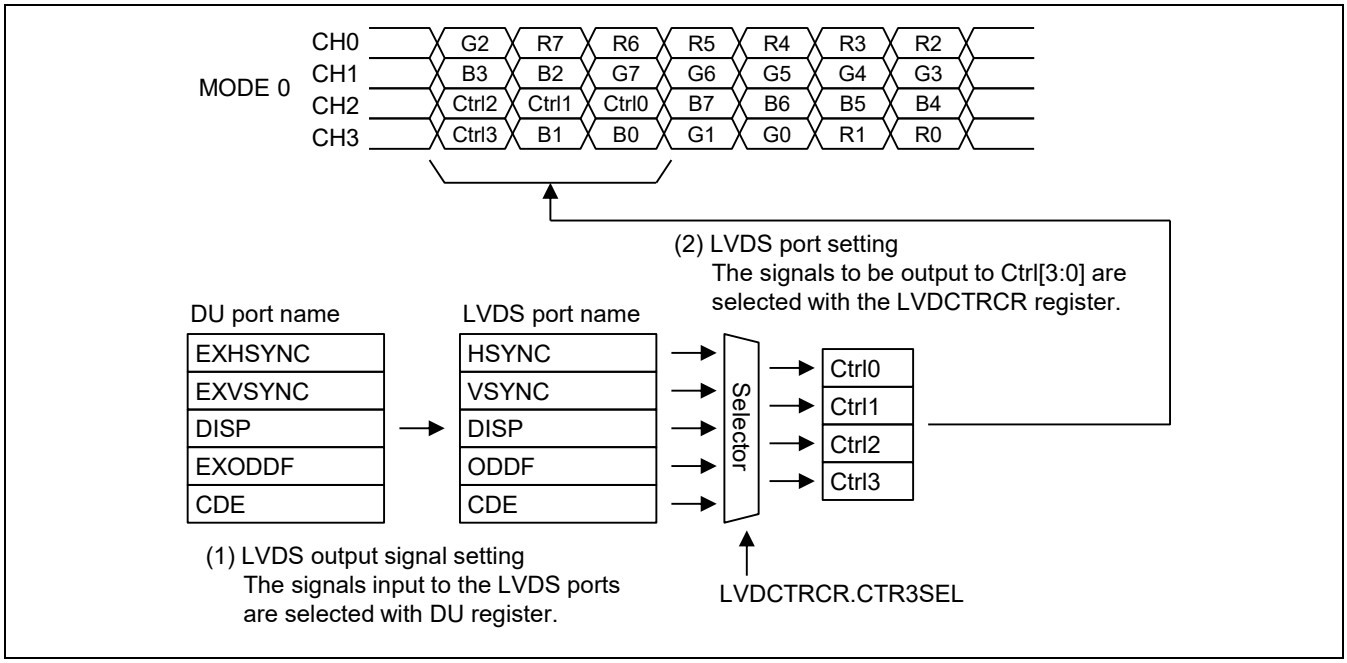

Figure 21.5 Ctrl Signal Selection

Set the desired Ctrl signal characteristics with the DU registers.

For example, to reverse the polarity of the HSYNC signal, the polarity must be set with DU register settings. (The LVDS Interface module only converts the signals output from DU to the LVDS format.)

An example of Ctrl signal settings is shown below.

(1) Ctrl0 = HSYNC, Ctrl1 = VSYNC, and Ctrl2 = DISP

Set the DU registers so that HSYNC, VSYNC, and DISP are output.

Then set the CTR control register (LVDCTRCR) so that CTR0SEL = B'000, CTR1SEL = B'000, and CTR2SEL = B'000.

(2) Ctrl0 = CSYNC, Ctrl1 = ODDF, and Ctrl2 = CDE

Set the DU registers so that CSYNC, ODDF, and CDE are output.

Then set the LVDS Interface register (LVDCTRCR) so that CTR0SEL = B'000, CTR1SEL = B'010, and CTR2SEL = B'010.

(Note that since CSYNC can also be output from other ports, CTR0SEL must be set to match the port from which DU outputs CSYNC.)

21.3.4 CH Selection

The LVDS Interface module stores the RGB signal data in CH0, CH1, CH2, and CH3 according to the mode selection and Ctrl signal selection registers.

21.3.5 Dot clock Settings

The LVDS Interface module dot clock frequency is determined by LVDS PLL setting. This section describes how this frequency is set.

The individual settings are made with the DU (Display Unit) and LVDS registers. Refer to the corresponding sections for details on the registers, notes, and other information on these settings.

(1) Clock source selection

The clock source can be selected to be either the internal clock or an external input (LCLKSELR).

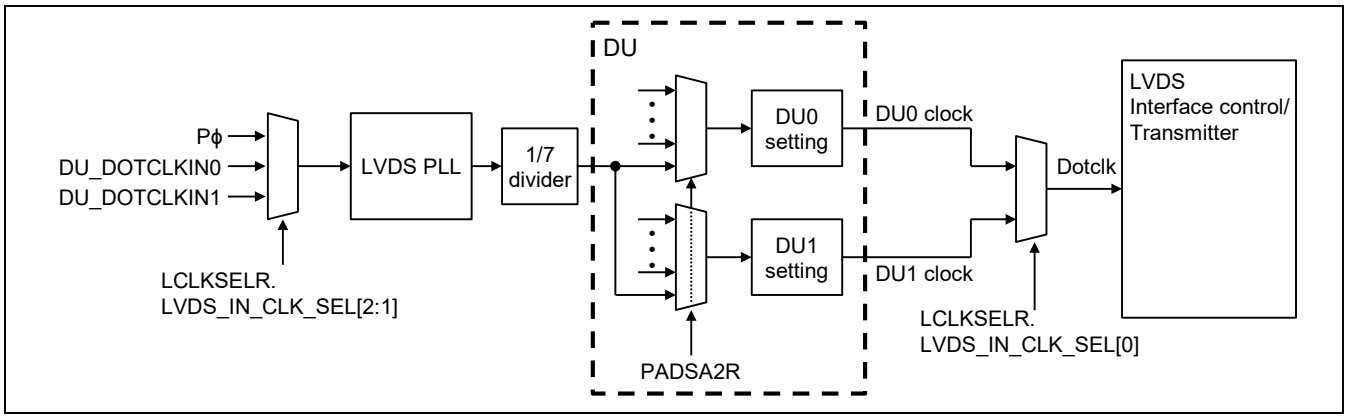

Figure 21.6 Dotclk Settings

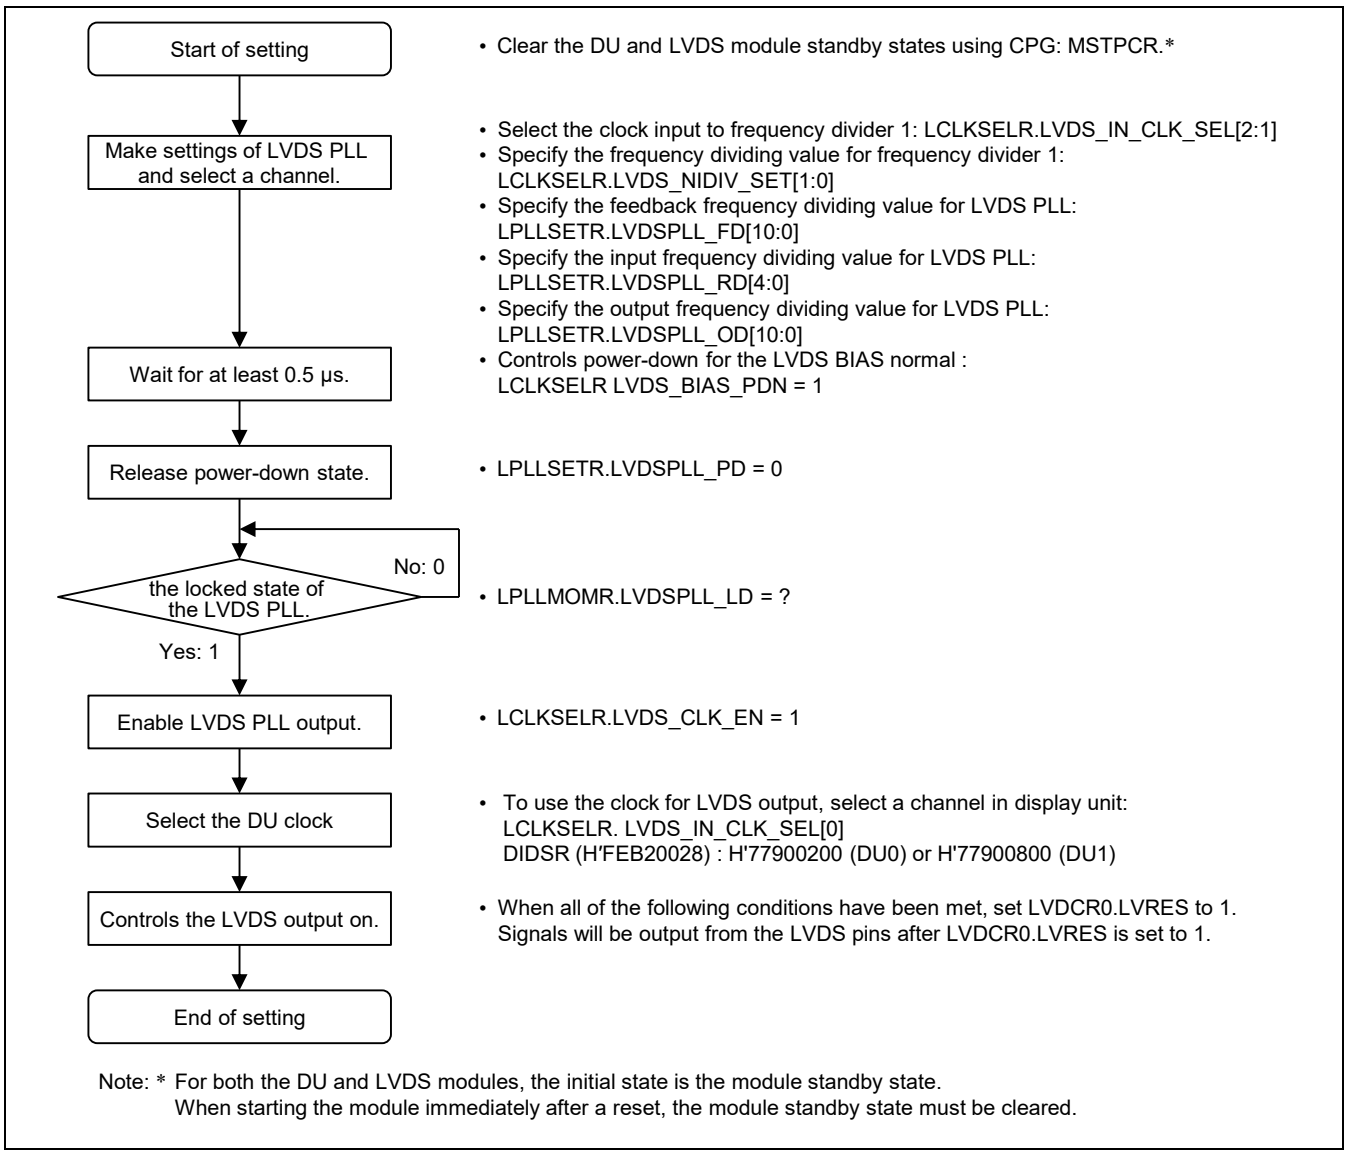
21.3.6 Procedures for Register Settings

(1) Initial Settings after Power-on Reset

The following shows an example of initial settings after a power-on reset.



Note: * For both the DU and LVDS modules, the initial state is the module standby state.
When starting the module immediately after a reset, the module standby state must be cleared.

Figure 21.7 Example of Initial Settings after Power-On Reset

(2) Frequency Modification Settings

The following shows an example of modifying frequencies.

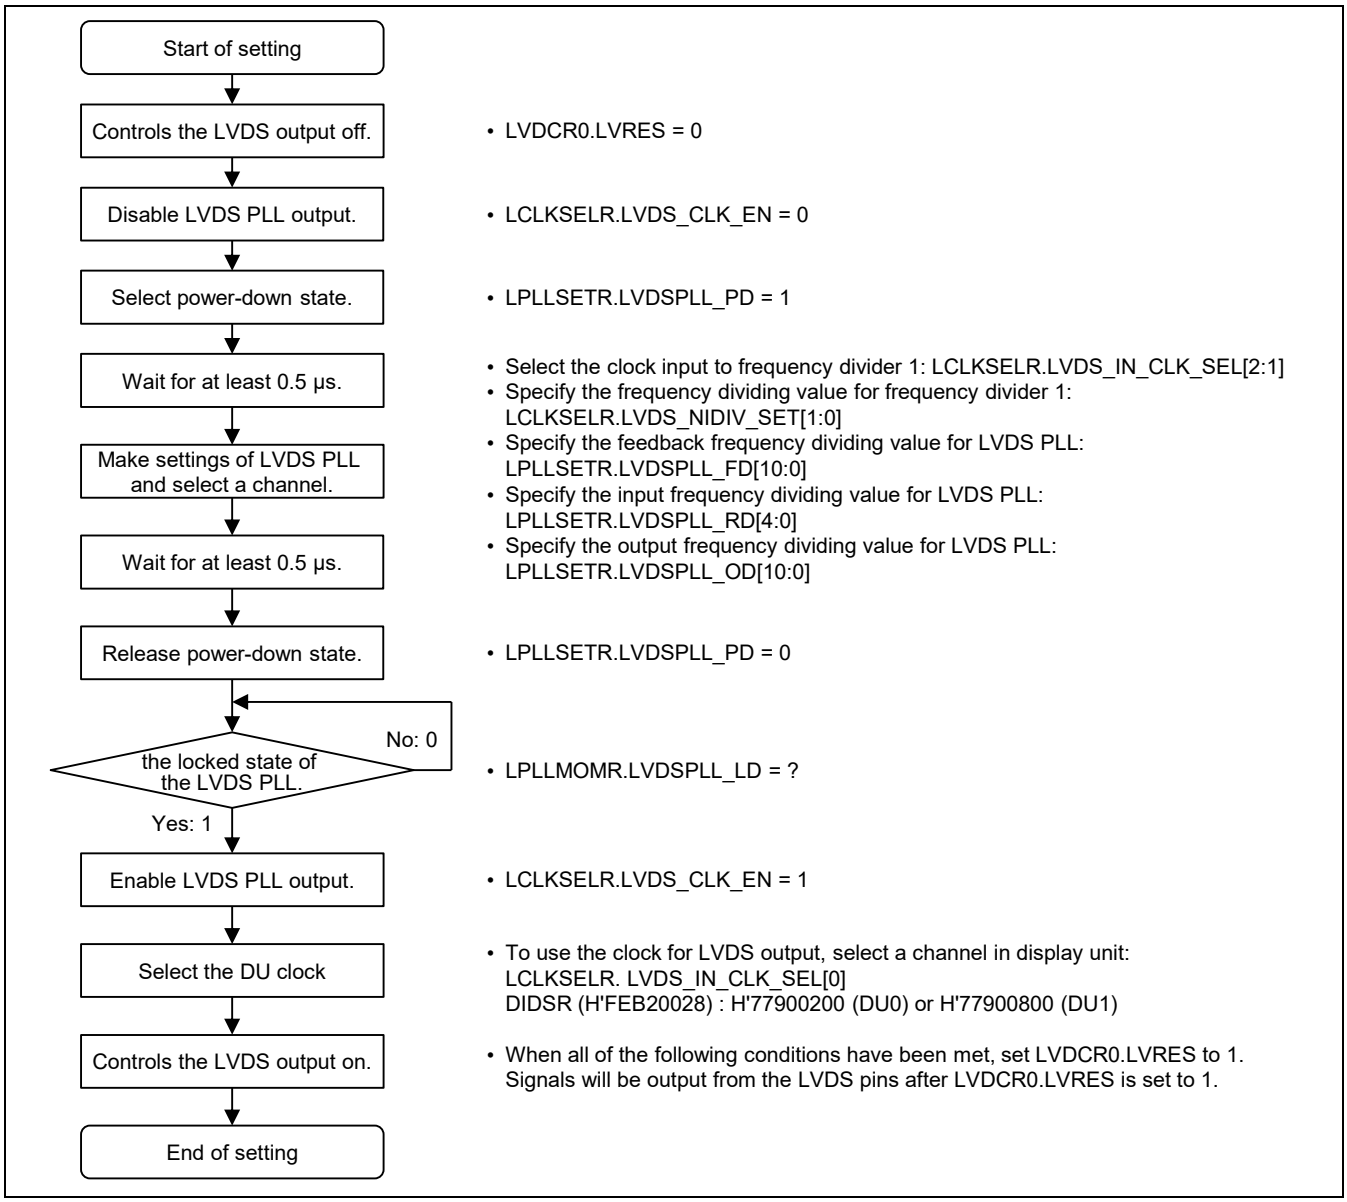


Figure 21.8 Example of Modifying Frequencies for LVDS Output

21.4 Usage Notes

The following notes must be observed when using the LVDS Interface module.

Incorrect operation and damage to the device itself may occur if these notes are not followed.

- Since the LVDS interface module includes logic that operates from the dot clock (Dotclk) signal output by the DU module, incorrect operation may occur if the DU registers are not set appropriately. Also, do not change any DU register values during LVDS interface operation. (If Dotclk output is not stable, thus operation cannot be guaranteed.) There are two DU registers related to Dotclk: Display unit SYStem control Register n (DSYSRn, n = 0, 1) and External Synchronization Control Register n (ESCRn, n = 0, 1). These registers must not be changed during LVDS operation.
- Set the Dotclk signal input to the LVDS interface module to a frequency within the LVDS interface module's guaranteed operating range (13.4 to 87 MHz).
- Set the clock signal input to the LVDS PLL module to a frequency within the LVDS PLL module's guaranteed operating range (9 to 30 MHz).
- Application systems should be implemented in a failsafe manner, such as by connecting the LVDS outputs to a failsafe receiver or by connecting terminators, so that no problems in or damage to the application can occur if the LVDS pins become unstable (for example, going to the high-impedance state or the differential outputs going to the same level).

22. Video Input Module (VIN)

22.1 Overview

The video input module (hereinafter abbreviated as VIN) is a video capture module that stores in external memory YCbCr-422 data through the ITU-R BT.601, ITU-R BT.656, or ITU-R BT.709 interface and RGB data through the ITU-R BT.601 or ITU-R BT.709 interface.

The module has up to six video channels that can independently control the capture of data into a capture area of up to 2048 × 2048 pixels. It can also provide vertical and horizontal scaling of the data by up to three and two times, respectively.

For captured video data, the VIN provides a color space conversion function from YCbCr-422 to RGB, a format conversion function from RGB to ARGB.

As the VIN internally generates a field signal, it can capture progressive data.

Notes: 1. The maximum frequency of the video clock is 100 MHz when bit 31 (FAST) in the main control register is set to support the 100 MHz clock input, except during vertical or horizontal scaling up.
2. When the ITU-R BT.709 interface is in use, the maximum frequency of the video clock is 74.5 MHz.
3. The number of video input channels for each product is as follows:
2 channels

22.1.1 Features

(1) Video Channel 0

The following input interfaces can be selected for these channels.

Table 22.1 Input Interface for Video Channel 0

Interface	Data Width	Data Type
ITU-R BT.601/BT.709*1, *3	8/10/12 bits	YCbCr-422 data (UYVY format)
ITU-R BT.601/BT.709*3/BT.1358*2	16/20/24 bits	YCbCr-422 data (8/10/12 bits (Y) + 8/10/12 bits (CbCr) format)
ITU-R BT.656*1	8/10/12 bits	YCbCr-422 data (UYVY format)
ITU-R BT.601/BT.709*3	18 bits	RGB-666 data
ITU-R BT.601/BT.709*3	24 bits	RGB-888 data

Notes: 1. Disable the XY scaling settings when using the 10/12-bit YCbCr-422 format in the ITU-R BT.601, BT.709, or BT.656 interface (only the 100% scaling is enabled).
2. Disable the XY scaling settings when using the 20/24-bit YCbCr-422 format in the ITU-R BT.601, BT.709, or BT.1358 interface (only the 100% scaling is enabled).
3. When the ITU-R BT.709 interface is in use, the maximum frequency of the video clock is 74.5 MHz.

(2) Video Channel 1

The following input interfaces can be selected for this channel.

Table 22.2 Input Interface for Video Channel 1

Interface	Data Width	Data Type
ITU-R BT.601*1/BT.709*2	8/10/12 bits	YCbCr-422 data (UYVY format)
ITU-R BT.656*1	8/10/12 bits	YCbCr-422 data (UYVY format)

Notes: 1. Disable the XY scaling settings when using the 10/12-bit YCbCr-422 format in the ITU-R BT.601, BT.709, or BT.656 interface. (Only the 100% scaling is enabled.)
2. When the ITU-R BT.709 interface is in use, the maximum frequency of the video clock is 74.5 MHz.

(3) Internal Sync Signal Generation

For video data capturing through the ITU-R BT.601 or ITU-R BT.709 interface, the field signal can be internally generated even if the input sync signals stop (In video data capture through the ITU-R BT.656 interface, only the field signal is generated).

(4) Capture Mode

The following four modes can be selected to capture the interlace images. In addition, single frame capture or continuous frame capture mode can be selected.

Triple-buffering control is provided in accordance with the captured field image and frame image to coordinate with the video capture mode of the display module.

The channel that the cooperation control with the display module is possible becomes 2 channels from VIN0 to VIN1 (for details of the cooperation control with the display module, see section 20, Display Unit (DU)).

- Odd-field capture mode
- Even-/odd-field capture mode
- Even-field capture mode
- Full interlace capture mode

(5) Vertical and Horizontal Scaling

The image can be scaled up and down up to three times in the vertical and two times in the horizontal directions.

(6) Size Clipping

The VIN has two clipping circuits, which independently handle images with up to 2048 × 2048 pixels. Any capture size within this limit can be specified before or after scaling.

(7) Color Space Conversion

Color space conversion can be performed from YC to RGB or from RGB to YC. Desired conversion coefficients can be specified through registers to adjust colors.

(8) Lookup Table (LUT) Density Conversion

The lookup table (LUT) density can be converted from 10 bits to 8 bits for each pixel according to the color space conversion result.

Note: When the density conversion function is not used, the upper 8 bits of data are output.

(9) Image Data Format Conversion

To the density-converted YCbCr444 or RGB888 image data, the following data format conversions are available:

- YCbCr image data
  - Y/Cb/Cr 8-bit multiplex conversion
  - YCbCr444 → YC separation (separated into Y and CbCr components.)
  - YCbCr444 → Y component extraction
- RGB image data
  - RGB-888 → 32 bits/pixel conversion
  - RGB-888 → RGB-565 (16 bits/pixel) conversion
  - RGB-888 → ARGB-1555 (16 bits/pixel) conversion
  - RGB-888 → ARGB-888 (32 bits/pixel) conversion

Note: The lookup table is common to the YCbCr and RGB formats.

(10) Memory Output Data Format

Format-converted image data can be transferred to the memory. The following shows the available formats of the data stored.

- YCbCr image data
  - Y/Cb/Cr, 8-bit multiplexed
  - YC separation, YCbCr422, Y, 8-bit Cb/Cr, 8-bit multiplexed
  - YC separation, YCbCr422, Y, 10-bit Cb/Cr, 8-bit multiplexed
  - YC separation, YCbCr422, Y, 12-bit Cb/Cr, 8-bit multiplexed
  - YC separation, Y data, 8-bit
  - YC separation, Y data, 10-bit
  - YC separation, Y data, 12-bit
- RGB image data
  - RGB-565 (16 bits/pixel)
  - ARGB-1555 (16 bits/pixel)
  - RGB-888 (32 bits/pixel)
  - ARGB-8888 (32 bits/pixel)

22.1.2 Block Diagram

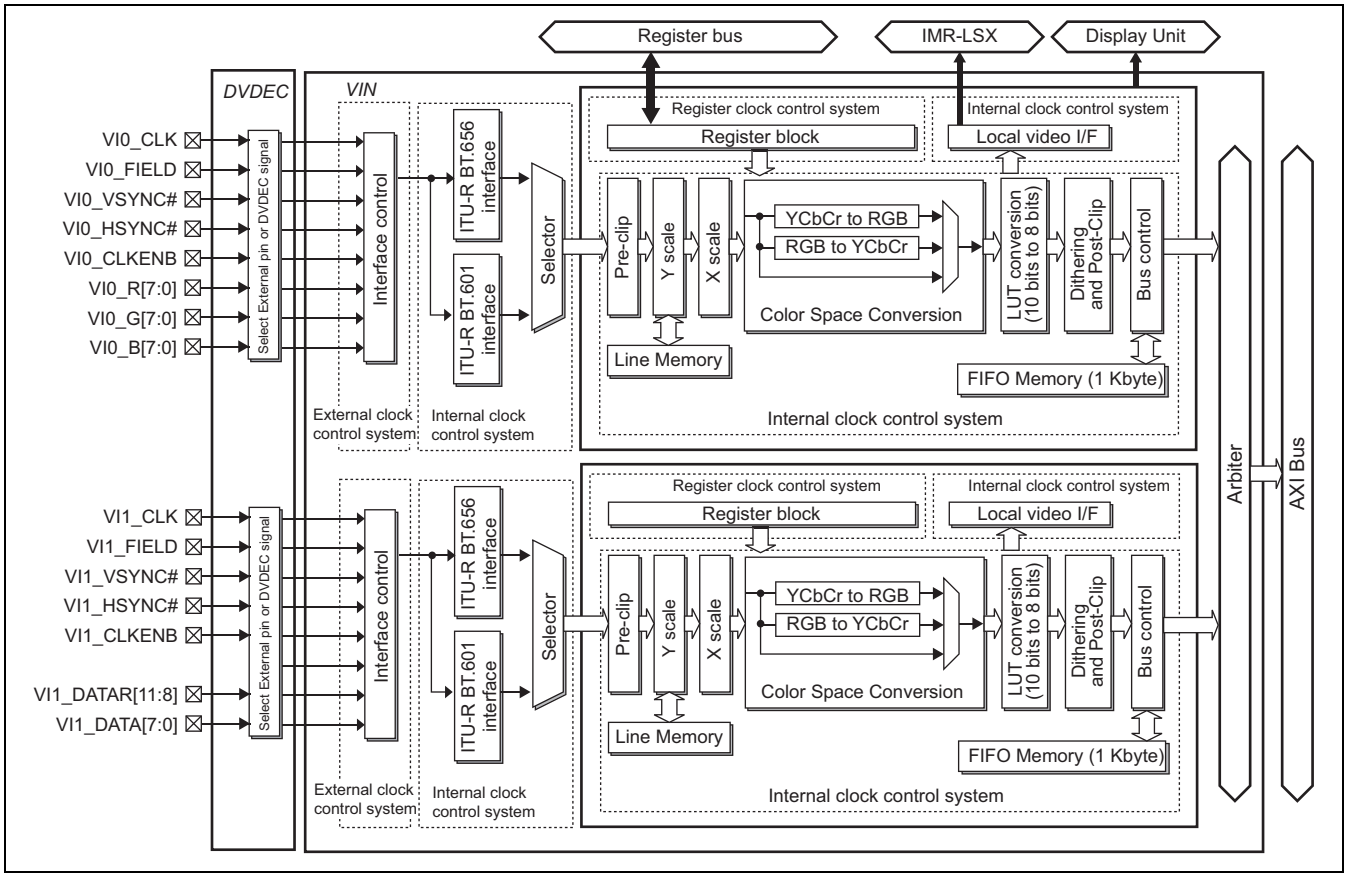

Figure 22.1 VIN Channel n (VINn) Functional Block Diagram

22.1.3 Input/Output Pins

Table 22.3 Pin Configuration

Function	Pin Name	I/O	Description
VIN0 video clock (clock)	VI0_CLK	Input	External video clock in the ITU-R BT.601, ITU-R BT.656, ITU-R BT.1358, or ITU-R BT.709 interface
VIN0 field signal (control)	VI0_FIELD	Input	Field signal in the ITU-R BT.601 or ITU-R BT.709 interface Fix this pin high or low when the pin is not used.
VIN0 vertical sync signal (control)	VI0_VSYNC#	Input	Vertical sync signal in the ITU-R BT.601, ITU-R BT.1358, or ITU-R BT.709 interface Fix this pin high or low when the pin is not used.
VIN0 horizontal sync signal (control)	VI0_HSYNC#	Input	Horizontal sync signal in the ITU-R BT.601, ITU-R BT.1358, or ITU-R BT.709 interface Fix this pin high or low when the pin is not used.
VIN0 data enable (control)	VI0_CLKENB	Input	Data enable signal in the ITU-R BT.601, ITU-R BT.1358, or ITU-R BT.709 interface Fix this pin high or low when the pin is not used. If the signal is not present in the ITU-R BT.601, ITU-R BT.1358, or ITU-R BT.709 interface, connect the pin to a horizontal sync signal.
VIN0 video data (video data)	VI0_R7 to VI0_R0 VI0_G7 to VI0_G0 VI0_DATA7/VI0_B7 to VI0_DATA0/VI0_B0		Data signals in the ITU-R BT.601, ITU-R BT.656, ITU-R BT.1358, or ITU-R BT.709 interface Fix these pins high or low respectively when these pins are not used in whole or in part.
VIN1 video clock (clock)	VI1_CLK	Input	External video clock in the ITU-R BT.601, ITU-R BT.656, ITU-R BT.1358, or ITU-R BT.709 interface
VIN1 field signal (control)	VI1_FIELD	Input	Field signal in the ITU-R BT.601 or ITU-R BT.709 interface Fix this pin high or low when the pin is not used.
VIN1 vertical sync signal (control)	VI1_VSYNC#	Input	Vertical sync signal in the ITU-R BT.601, ITU-R BT.1358, or ITU-R BT.709 interface Fix this pin high or low when the pin is not used.
VIN1 horizontal sync signal (control)	VI1_HSYNC#	Input	Horizontal sync signal in the ITU-R BT.601, ITU-R BT.1358, or ITU-R BT.709 interface Fix this pin high or low when the pin is not used.
VIN1 data enable (control)	VI1_CLKENB	Input	Data enable signal in the ITU-R BT.601, ITU-R BT.1358, or ITU-R BT.709 interface Fix this pin high or low when the pin is not used. If the signal is not present in the ITU-R BT.601, ITU-R BT.1358, or ITU-R BT.709 interface, connect the pin to a horizontal sync signal.
VIN1 video data (video data)	VI1_DATA7 to VI1_DATA0 VI1_DATA11 to VI1_DATA8 (VI1_G3_B to VI1_G0_B)		Data signals in the ITU-R BT.601, ITU-R BT.656, ITU-R BT.1358, or ITU-R BT.709 interface Fix these pins high or low respectively when these pins are not used in whole or in part.

Table 22.4 Channel 0 Data Pin Connections

Input data format	VI0_R[7:0]								VI0_G[7:0]								VI0_DATA[7:0]/VI0_B[7:0]							
	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0

ITU-R BT.601/BT.709/BT.656 12-bit YCbCr-422	*	*	*	*	Y/Cb/Cr video data[11:0]											

Note: * Fix the pins at a high or low level.

22.1.4 Register Configuration

Table 22.6 (1) through Table 22.6 (2) show the VIN register configuration for each channel.

Notes: Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined.

* For the internal update mode, refer to the description of the VUP bit in the main control register (VnMC).

Δ: The internal update mode supports VnMC.FAST, VnMC.CLP[1:0], VnMC.FOC and VnMC.LUTE bit only.

(1) Channel 0

Table 22.6 (1) VIN Registers

Channel 0

Channel	Name	Symbol	R/W	Address	Initial Value	Access Size	Internal Update Mode Support*
0	Video 0 main control register	V0MC	R/W	H'E6EF0000	H'00000000	32	Δ

22.2 Register Descriptions

[Legend]

—: Reserved. The write value should always be 0.

Initial value: Register value after a reset

R/W: Readable/writable. The written value can be read.

R: Read-only. The write value should always be 0.

Vn: Video Channel n

22.2.1 Video n Main Control Register (VnMC)

Note: Availability of channels:
n = 0 to 1

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31	FAST	0	R/W	High-Speed Video Clock Support Mode Set this bit to 1 to input 100-MHz video clock. 0: 100-MHz video clock input is not supported. 1: 100-MHz video clock input is supported. Note: Do not perform vertical or horizontal scaling up when this bit is 1.
30	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
29, 28	CLP[1:0]	00	R/W	Pixel Data Clipping When the input image data is in the YCbCr format, these bits specify the data clip value for clipping the YCbCr-RGB color conversion input data to the nominal range prescribed in the ITU-R BT.601 standard.

CLP	Luminance	Color Difference	
00	No clipping	16 or a smaller value is clipped to 16. 240 or a greater value is clipped to 240.	Initial value
01	16 or a smaller value is clipped to 16. 240 or a greater value is clipped to 240.	16 or a smaller value is clipped to 16. 240 or a greater value is clipped to 240.	
10	No clipping	16 or a smaller value is clipped to 128. 240 or a greater value is clipped to 128.	
11	No clipping	No clipping	

Note: These bits support the internal update mode.

Bit	Bit Name	Initial Value	R/W	Description
27 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21	FOC	0	R/W	Field Order Control This bit controls the field order for full interlace capturing. 0: Top field = Odd field (field 1) 1: Top field = Even field (field 2) Note: This bit supports the internal update mode.

Bit	Bit Name	Initial Value	R/W	Description
20	LUTE	0	R/W	Lookup Table Enable This bit enables lookup table conversion from 10 bits to 8 bits. 0: LUT is not used. 1: LUT is used. Notes: 1. To perform LUT conversion, the conversion table should be set with VnLUTP and VnLUTD. 2. This bit supports the internal update mode.
19	YCAL	0	R/W	YCbCr-422 Input Data Alignment This bit controls data alignment for YCbCr-422 input. 0: When the multiplexed CbCr interface is set, capturing is performed with Y in the upper bits and CbCr in the lower bits. 1: When the multiplexed CbCr interface is set, capturing is performed with CbCr in the upper bits and Y in the lower bits.
18 to 16	INF[2:0]	000	R/W	Input Interface Format These bits specify the image format input to the VIN. 000: ITU-R BT.656 8-bit YCbCr-422 or ITU-R BT.656 8-bit YCbCr422 4-bit input*1 001: ITU-R BT.601/BT.709 8-bit YCbCr-422 or ITU-R BT.601/BT.709 8-bit YCbCr422 4-bit input *1 010: ITU-R BT.656 10/12-bit YCbCr-422*1 011: ITU-R BT.601/BT.709 10/12-bit YCbCr-422*1 100: Setting prohibited 101: ITU-R BT.601/BT.1358 16-bit YCbCr-422 or ITU-R BT.601/BT.709/BT.656 8-bit YCbCr422 8-bit input*1 110: ITU-R BT.601/BT.709 24-bit RGB-888*1 111: ITU-R BT.601/BT.709 18-bit RGB-666 or ITU-R BT.601/BT.709 RGB-888 12-bit input*1
15, 14	DC[1:0]	00	R/W	Dithering Mode Control These bits select the dithering mode for conversion from RGB888 to RGB565/ARGB1565. 00: Dithering with cumulative addition 01: Ordered dithering 10: Setting prohibited 11: Setting prohibited
13, 12	EXINF[1:0]	00	R/W	Extension Interface Select 00: Data extension is not performed 01: Combined with the INF setting, 8-bit data extension is performed. 10: Combined with the INF setting, 10-bit data extension is performed. 11: Combined with the INF setting, 12-bit data extension is performed.
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	VUP	0	R/W	VIN Register Update Control This bit specifies the internal register update timing after register writing. See the list of registers for applicable registers. 0: The register contents are updated immediately after register writing. 1: The register contents are updated after a valid field is detected in the ITU-R BT.601 data or the field (F) bit changes in the ITU-R BT.656 data.
9 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
6	EN	0	R/W	Endian Type This bit specifies the endian type for data to be output to external memory. 0: Image data is packed and allocated in little endian. 1: Image data is packed and allocated in big endian. Note: When allocating the YCbCr422 (UYVY format) data in big endian, be sure to set the BPSM bit in VnDMR to 1.
5	EC	0	R/W	Error Correction Control This bit specifies whether error correction with the parity bit is performed on the ITU-R BT.656 input. 0: Error correction is not performed on the ITU-R BT.656 input. 1: Error correction with the parity bit is performed on the ITU-R BT.656 input. Error correction must not be performed in the following cases: • When data is captured in the ITU-R BT.601 interface • When input data does not meet the standard of the ITU-R BT.656 parity bit
4, 3	IM[1:0]	00	R/W	Interlace Mode These bits specify the capture mode. Do not modify this setting during capture operation. 00: Odd-field (field 1) capture mode Handles only odd fields as frames and stores them in external memory. 01: Odd-/even-field capture mode Handles odd and even fields as separate frames and stores them in external memory. This mode is available only in continuous frame capture mode. 10: Even-field (field 2) capture mode Handles only even fields as frames and stores them in external memory. 11: Full interlace mode Handles combinations of odd and even fields as single frames and stores them in external memory.
2	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
1	BPS	0	R/W	Color Space Conversion Bypass Mode 0: The input YCbCr data is converted into the RGB color space and RGB data is converted into the YCbCr color space*2. 1: Color space conversion is not performed. Note: YCbCr→RGB or RGB→YCbCr conversion is performed with the coefficients specified by the YC-RGB conversion coefficient register or RGB-YC coefficient register.
0	ME	0	R/W	Module Enable This is the enable bit for the VIN. Set this bit before setting the Frame Capture (VnFC) register. 0: The module operation is stopped. 1: The module operation is enabled. *3

Notes: 1. Table 22.7 shows the combinations of interfaces which can be set by the input interface format (the INF bits in VnMC) and extension interface select (the EXINF bit in VnMC). Do not make the other settings.
2. Table 22.8 shows the image data which can be converted according to the color space conversion bypass mode settings (set by the BPS bit in VnMC).
3. To stop capturing operation, only set the ME bit to 0. Do not change the other bit settings.

Table 22.7 Capture Interface Settings

Interface		VnMC/EXINF	VnMC/INF
ITU-R BT.656 (multiplexed YCbCr422)	8 bits	00	000
	10 bits	00	010
	12 bits	11	010
ITU-R BT.601/BT.709 (multiplexed YCbCr422)	8 bits	00	001
	10 bits	00	011
	12 bits	11	011
ITU-R BT.601/BT.709/BT.1358 (non-multiplexed Y/multiplexed CbCr)	16 bits	00	101
	20 bits	10	101
	24 bits	11	101
ITU-R BT.601/BT.709 (RGB666)	18 bits	00	111
ITU-R BT.601/BT.709 (RGB888)	24 bits	00	110

Table 22.8 Captured Data Formats

Input Data Format	VnMC/INF	VnMC/BPS	Captured Data Format
ITU-R BT.656/BT.601/BT.709/BT.1358 YCbCr	000/001 010/011 100/101	0	RGB format
		1	YCbCr format
ITU-R BT.601/BT.709 RGB	110/111	0	YCbCr format
		1	RGB format

22.2.2 Video n Module Status Register (VnMS)

Note: Availability of channels:
n = 0 to 1

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	FBS[1:0]		FS	AV	CA
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4, 3	FBS[1:0]	11	R	Frame Buffer Status These bits show the frame buffer status. 00: The latest valid frame buffer has the base address defined by the memory base 1 register. 01: The latest valid frame buffer has the base address defined by the memory base 2 register. 10: The latest valid frame buffer has the base address defined by the memory base 3 register. 11: There is no valid frame buffer.
2	FS	0	R	Field Status This bit shows the type of the current capture field. 0: The current field is an odd field (field 1). 1: The current field is an even field (field 2).
1	AV	0	R	Active Video Status This bit shows whether the current field is in the active video area defined by the pre-clipping register. 0: The current field is not in the active video area. 1: The current field is in the active video area. Note: This bit will be 0 if no input data is captured.
0	CA	0	R	Video Capture Active Status This bit shows the current video capture operation status. This bit is updated by the captured field signal. 0: Video capture is not operating. 1: Video capture is operating. Note: In field capture mode, this bit is set to 1 even for the field that does not capture data.

22.2.3 Video n Frame Capture Register (VnFC)

Note: Availability of channels:
n = 0 to 1

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CC	SC
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	CC	0	R/W	Continuous Frame Capture Mode This bit specifies the continuous frame capture mode. In this mode, the first capture frame is written into the memory address specified by the memory base 1 (VnMB1) register. After that, the capture operation is repeated in the order of MB2, MB3, MB1, MB2, and such. Writing 0 into this bit during continuous capture operation will immediately terminate the capture operation if the current frame is completed or it has not been captured. 0: The continuous frame capture mode is not set. 1: The continuous frame capture mode is set.
0	SC	0	R/W	Single Frame Capture Mode This bit specifies the single frame capture mode. In this mode, the capture frame is written into the memory address specified by the memory base 1 (VnMB1) register. Immediately after this bit is set to 1, the frame buffer status (FBS) bits in MS are initialized and the SC bit is also cleared to 0. 0: The single frame capture mode is not set. 1: The single frame capture mode is set. Note: Do not set this bit to 1 when the interlace mode (IM) bits in the main control register (VnMC) are set to 01 (odd-/even-field capture mode).

Note: Do not specify the single frame capture mode and continuous frame capture mode at the same time.

22.2.4 Video n Start Line Pre-Clip Register (VnSLPrC)

Note: Availability of channels:
n = 0 to 1

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SLPrC[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SLPrC[10:0]	H'000	R/W	Start Line Pre-Clip These bits specify the (pre-clipping start line – 1) value in line units. This value is used before scaling. Specify a value in the range from 0 to 2046 so that the number of lines after pre-clipping will be 2 or more. (The value of 0 indicates the first valid line.)

22.2.5 Video n End Line Pre-Clip Register (VnELPrC)

Note: Availability of channels:
n = 0 to 1

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SPPrC[10:0]	H'000	R/W	Start Pixel Pre-Clip These bits specify the (pre-clipping start pixel – 1) value in pixel units. This value is used before scaling. Specify a value in the range from 0 to 2042 so that the number of pixels after pre-clipping will be an even number than 6. Notes: 1. When SPPrC is set to 0x0, the first valid pixel is specified. 2. Specify an even number. 3. The capacity of the internal buffer is limited, so if the horizontal scaling up function is in use, the value here should be such that EPPrC – SPPrC is no greater than 2048 pixels.

22.2.7 Video n End Pixel Pre-Clip Register (VnEPPrC)

Note: Availability of channels:
n = 0 to 1

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SPPoC[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SPPoC[10:0]	H'000	R/W	Start Pixel Post-Clip These bits specify the (post-clipping start pixel – 1) value in pixel units. This value is used after scaling. Specify a value in the range from 0 to 2042 so that the number of pixels after post-clipping will be 5 or more.

22.2.11 Video n End Pixel Post-Clip Register (VnEPPoC)

Note: Availability of channels:
n = 0 to 1

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	EPPoC[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	EPPoC[10:0]	H'000	R/W	End Pixel Post-Clip These bits specify the (post-clipping end pixel – 1) value in pixel units. This value is used after scaling. Specify a value in the range from 5 to 2047 so that the number of pixels after post-clipping will be 5 or more.

Note: When the output format is YCbCr-422, even if the settings produce a post-clipping size in pixels that is an odd number, the output to memory will be in even pixel units. Note that if the clipping values specify an odd size (i.e. if EPPoC – SPPoC is odd), one will be added to round the value up to an even number.

Example: When SPPoC is set to 0 and EPPoC is set to 62:

The actual processing is done for 64 pixels.
62 - 0 = 62 (63 pixels)
63 pixels + 1 = 64 pixels

22.2.12 Video n Image Stride Register (VnIS)

Note: Availability of channels:
n = 0 to 1

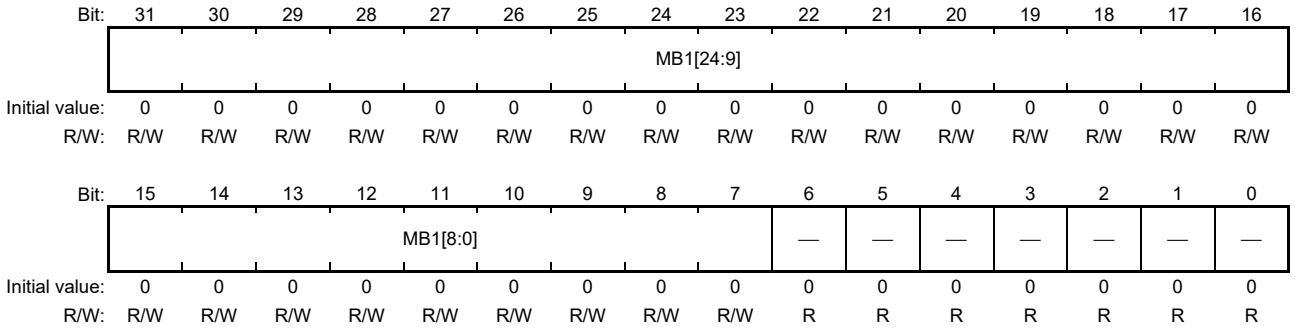
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	IS[8:0]									—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 4	IS[8:0]	H'000	R/W	Image Stride These bits specify the width of the transfer destination memory. Specify a value no less than the post-clipping width (EPPoC - SPPoC) and aligned with a 32-byte boundary (i.e. bit 4 should be specified as 0). For 16 bits/pixel data, word addresses are generated. For 8 bits/pixel data in YC separation mode, byte addresses are generated.
3 to 0	—	All 0	R	Reserved bits that indicate the lower-order four bits of the image stride. These bits are always read as 0. The write value should always be 0.

22.2.13 Video n Memory Base 1 Register (VnMB1)

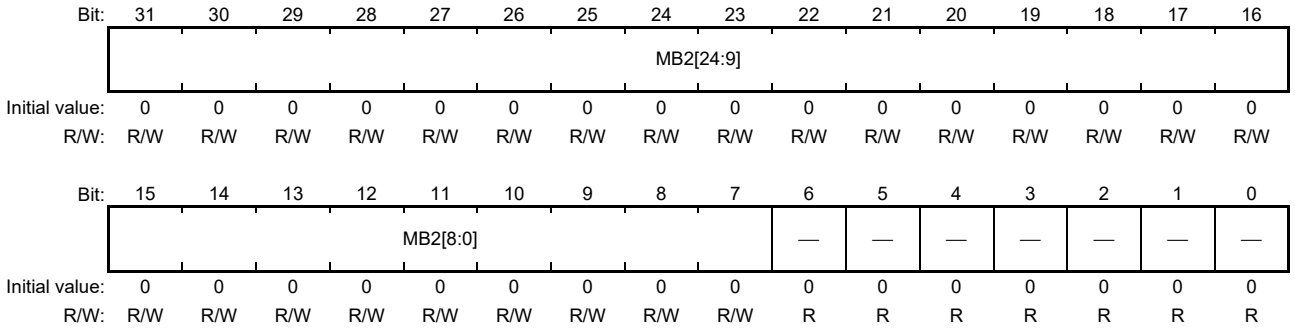
Note: Availability of channels:
n = 0 to 1



Bit	Bit Name	Initial Value	R/W	Description
31 to 7	MB1[24:0]	H'0000000	R/W	Memory Base Address 1 These bits specify the transfer start address in frame buffer 1. Specify a value for physical address bits [31:7] in units of 128 bytes. If the module is in continuous frame capture mode, this value is used as the MB1 address in the following capture sequence: MB1 → MB2 → MB3 → MB1 → MB2 → MB3. In single frame capture mode, this value is used as the capture address. Specify a memory address taking into account the image size so that the image data does not exceed an area boundary on the address map.
6 to 0	—	All 0	R	Reserved bits that indicate the lower-order seven bits of memory base address 1 (a multiple of 128 bytes). These bits are always read as 0. The write value should always be 0.

22.2.14 Video n Memory Base 2 Register (VnMB2)

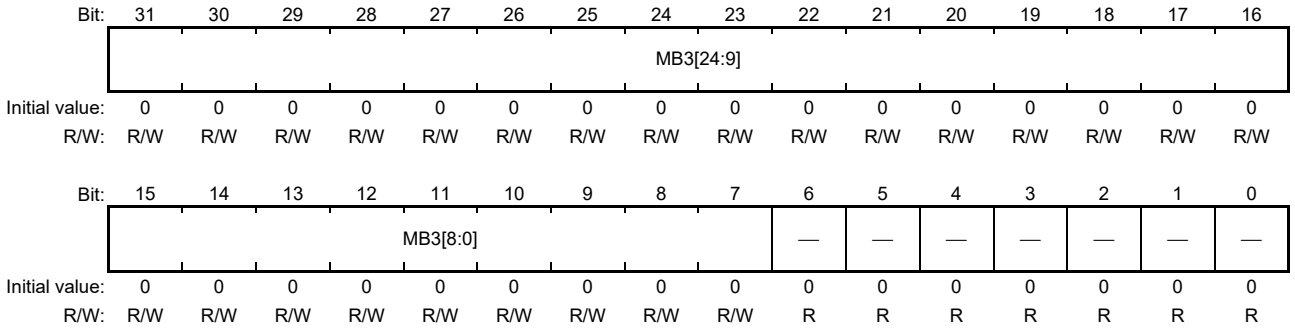
Note: Availability of channels:
n = 0 to 1



Bit	Bit Name	Initial Value	R/W	Description
31 to 7	MB2[24:0]	H'0000000	R/W	Memory Base Address 2 These bits specify the transfer start address in frame buffer 2. Specify a value for physical address bits [31:7] in units of 128 bytes. If the module is in continuous frame capture mode, this value is used as the MB2 address in the following capture sequence: MB1 → MB2 → MB3 → MB1 → MB2 → MB3. Specify a memory address taking into account the image size so that the image data does not exceed an area boundary on the address map.
6 to 0	—	All 0	R	Reserved bits that indicate the lower-order seven bits of memory base address 2 (a multiple of 128 bytes). These bits are always read as 0. The write value should always be 0.

22.2.15 Video n Memory Base 3 Register (VnMB3)

Note: Availability of channels:
n = 0 to 1



Bit	Bit Name	Initial Value	R/W	Description
31 to 7	MB3[24:0]	H'0000000	R/W	Memory Base Address 3 These bits specify the transfer start address in frame buffer 3. Specify a value for physical address bits [31:7] in units of 128 bytes. If the module is in continuous frame capture mode, this value is used as the MB3 address in the following capture sequence: MB1 → MB2 → MB3 → MB1 → MB2 → MB3. Specify a memory address taking into account the image size so that the image data does not exceed an area boundary on the address map.
6 to 0	—	All 0	R	Reserved bits that indicate the lower-order seven bits of memory base address 3 (a multiple of 128 bytes). These bits are always read as 0. The write value should always be 0.

22.2.16 Video n Line Count Register (VnLC)

Note: Availability of channels:
n = 0 to 1

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	LC[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	LC[11:0]	All 0	R	Line Count These bits show the line position in the current capture field.

22.2.17 Video n Interrupt Enable Register (VnIE)

Note: Availability of channels:
n = 0 to 1

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FIE2	—	—	—	—	—	—	—	—	—	—	—	—	—	VFE	VRE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	FIE	CEE	SIE	EFE	FOE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	FIE2	0	R/W	Field Interrupt Enable 2 This bit enables or disables INTC output for field interrupts. Interrupt signals by this enable bit is asserted irrespective of whether capture is taking place. 0: Field interrupts are disabled. 1: Field interrupts are enabled.
30 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17	VFE	0	R/W	VSYNC Falling Edge Detect Interrupt Enable This bit enables or disables VSYNC falling edge detect interrupts. Interrupt signals by this enable bit is asserted irrespective of whether capture is taking place. 0: VSYNC falling edge detect interrupts are disabled. 1: VSYNC falling edge detect interrupts are enabled.
16	VRE	0	R/W	VSYNC Rising Edge Detect Interrupt Enable This bit enables or disables VSYNC rising edge detect interrupts. Interrupt signals by this enable bit is asserted irrespective of whether capture is taking place. 0: VSYNC rising edge detect interrupts are disabled. 1: VSYNC rising edge detect interrupts are enabled.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	FIE	0	R/W	Field Interrupt Enable This bit enables or disables field-switching interrupts. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: Field-switching interrupts are disabled. 1: Field-switching interrupts are enabled.
3	CEE	0	R/W	Correction Error Interrupt Enable This bit enables or disables interrupts due to error correction in the timing reference code (SAV/EAV) described in the ITU-R BT.656 specification. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: ITU-R BT.656 timing reference code error interrupts are disabled. 1: ITU-R BT.656 timing reference code error interrupts are enabled.

Bit	Bit Name	Initial Value	R/W	Description
2	SIE	0	R/W	Scanline Interrupt Enable This bit enables or disables scanline interrupts. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: Scanline interrupts are disabled. 1: Scanline interrupts are enabled.
1	EFE	0	R/W	End of Frame Interrupt Enable This bit enables or disables end of frame interrupts. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: End of frame interrupts are disabled. 1: End of frame interrupts are enabled.
0	FOE	0	R/W	FIFO Overflow Interrupt Enable This bit enables or disables FIFO overflow interrupts. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: FIFO overflow interrupts are disabled. 1: FIFO overflow interrupts are enabled.

22.2.18 Video n Interrupt Status Register (VnINTS)

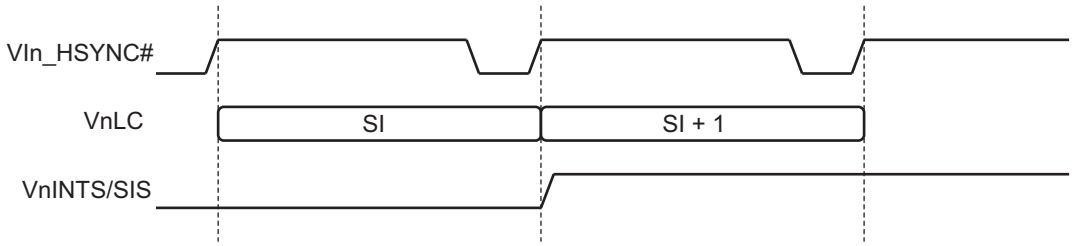
Note: Availability of channels:
n = 0 to 1

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FIS2	—	—	—	—	—	—	—	—	—	—	—	—	—	VFS	VRS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	FIS	CES	SIS	EFS	FOS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	FIS2	0	R/W	Field Interrupt Status 2 This bit shows that the field has changed. This bit is set to 1 when a valid field is detected in the ITU-R BT.601 interface or the F bit defined in ITU-R BT.656 changes. After being set to 1, this bit is cleared to 0 by writing 1. Note: This bit is set to 1 irrespective of whether or not capture is taking place. Be sure to clear this bit to 0 before using it.
30 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17	VFS	0	R/W	VSYNC Falling Edge Detect Interrupt Status This bit shows that a VSYNC falling edge has been detected in the ITU-R BT.601 input. After being set to 1, this bit is cleared to 0 by writing 1. Note: This bit is set to 1 irrespective of whether or not capture is taking place. Be sure to clear this bit to 0 before using it.
16	VRS	0	R/W	VSYNC Rising Edge Detect Interrupt Status This bit shows that a VSYNC rising edge has been detected in the ITU-R BT.601 input. After being set to 1, this bit is cleared to 0 by writing 1. Note: This bit is set to 1 irrespective of whether or not capture is taking place. Be sure to clear this bit to 0 before using it.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	FIS	0	R/W	Field Interrupt Status This bit shows that a field has been captured in the active capture operation. This bit is set to 1 when a valid field is detected in the ITU-R BT.601 interface or the F bit defined in ITU-R BT.656 changes. After being set to 1, this bit is cleared to 0 by writing 1.
3	CES	0	R/W	Correction Error Interrupt Status This bit shows that the timing reference code in the active capture operation has an error involving at least two bits. After being set to 1, this bit is cleared to 0 by writing 1. This bit is set to 1 if the EC bit in VnMC is enabled and the timing reference code has an error involving at least two bits. If a 1-bit error occurs when the EC bit is enabled, this bit is not set to 1.

Bit	Bit Name	Initial Value	R/W	Description
2	SIS	0	R/W	Scanline Interrupt Status This bit shows that the number of lines specified by VnSI has been reached in the active capture operation. After being set to 1, this bit is cleared to 0 by writing 1. This bit is set to 1 at the next line start timing after the value in the VnLC register matches the VnSI register setting. This timing is shown in Figure 22.2, Scanline Interrupt Status Generation Timing.
1	EFS	0	R/W	End of Frame Interrupt Status This bit shows that the last frame has been reached in the active capture operation. This bit is set to 1 at the end of even field (field 2). After being set to 1, this bit is cleared to 0 by writing 1.
0	FOS	0	R/W	FIFO Overflow Interrupt Status This bit shows that the FIFO has overflowed in the active capture operation. After being set to 1, this bit is cleared to 0 by writing 1. If the FIFO overflows, the FIFO data is overwritten by the pixel data captured after the overflow, and the resultant data is sent to the frame buffer.



Note:The SIS bit is set at the next line start timing after the VnSI value is reached.

Figure 22.2 Scanline Interrupt Status Generation Timing

22.2.19 Video n Scanline Interrupt Register (VnSI)

Note: Availability of channels:
n = 0 to 1

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

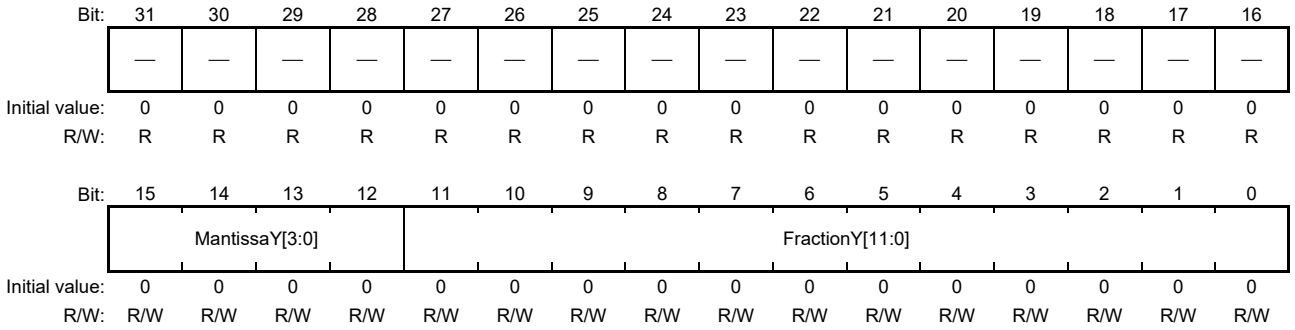
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SI[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SI[11:0]	All 0	R/W	Scanline Interrupt Setting These bits specify a value to be compared with the VnLC register value in each field while the SIE bit in the VnIE register is set to 1. When this value matches the VnLC register value, an interrupt signal is asserted.

22.2.20 Video n Y Scale Register (VnYS)

Note: Availability of channels:
n = 0 to 1

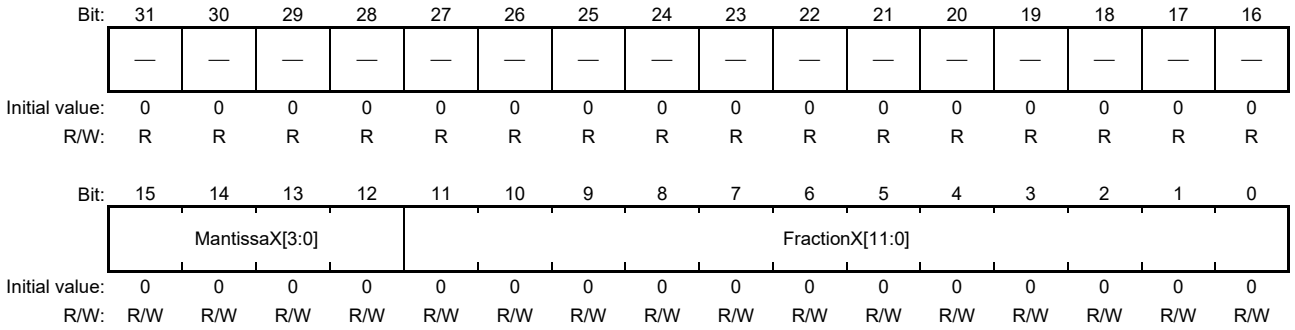


Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 12	MantissaY [3:0]	H'0	R/W	The scaling ratio in the Y direction should be specified through MantissaY and FractionY. This register specifies the value of (number of lines output to memory per field) / (number of capture lines per field) and it is calculated from MantissaY and FractionY by the following equation. Y scaling = 4096/(4096 × MantissaY + FractionY) For example, to obtain a Y scaling ratio of 1/2, specify MantissaY = H'2 and FractionY = H'000. Note that the maximum scaling-up ratio is × 3. When both MantissaY and FractionY are set to 0, the scaling function is disabled. To specify a scaling ratio of × 1, disabling of the scaling function is recommended.
11 to 0	FractionY [11:0]	H'000	R/W	

Notes: 1. Do not make the scaling-up setting when the FAST bit in MC is set to enable the applicable function.
2. Disable the scaling function when using the 10/12-bit YCbCr-422 format in the ITU-R BT.601, BT.709, or BT656 interface or the 20/24-bit YCbCr-422 format in the ITU-R BT.1358 interface.
3. The minimum scaling-down ratio is:
Mantissa[3:0] = H'E, Fraction[11:0] = H'FFF

22.2.21 Video n X Scale Register (VnXS)

Note: Availability of channels:
n = 0 to 1



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 12	MantissaX [3:0]	H'0	R/W	The scaling ratio in the X direction should be specified through MantissaX and FractionX. This register specifies the value of (number of pixels output to memory per line) / (number of input pixels per line) and it is calculated from MantissaX and FractionX by the following equation. X scaling = 4096/(4096 × MantissaX + FractionX) As the multiphase filter specified by the coefficient set CmA (m = 1 to 8) registers are used for scaling, be sure to specify the coefficient set registers for scaling. Note that the maximum scaling-up ratio is ×2. When both MantissaX and FractionX are set to 0, the scaling function is disabled. To specify a scaling ratio of ×1, set both the mantissaX and fractionX to 0. Typical examples of this register setting and scaling ratio for 720 input pixels are shown in Table 22.13.
11 to 0	FractionX [11:0]	H'000	R/W	

Notes: 1. Do not make the scaling-up setting when the FAST bit in MC is set to enable the applicable function.
2. Disable the scaling function when using the 10/12-bit YCbCr-422 format in the ITU-R BT.601, BT.709, or BT656 interface or the 20/24-bit YCbCr-422 format in the ITU-R BT.1358 interface.

Table 22.9 Examples of Scaling Setting (Input Pixels: 720 Pixels)

Output Pixels	Scaling Ratio	Setting
680	0.943	H'10F8
800	1.111	H'0E68
854	1.185	H'0D80

22.2.22 Video n Data Mode Register (VnDMR)

Note: Availability of channels:
n = 0 to 1

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	A8BIT[7:0]								—	—	—	—	—	—	—	EVA

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	A8BIT[7:0]	H'00	R/W	Alpha 8 These bits set the alpha value for the ARGB8888 format output.
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	EVA	0	R/W	Even Field Address Offset This bit specifies the address offset of the even field (field 2) in memory in odd-/even-field capture mode. 0: Data are stored from the base address in external memory. 1: Data are stored from the base address plus the memory width in external memory.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 12	YMODE[2:0]	000	R/W	YC Data Transfer Mode These bits specify the transfer method of Y/CbCr when the data conversion mode (DTMD) is 10 (YC separation). 000: Both Y and CbCr data are transferred to memory 001: Only Y data is transferred to memory as 8-bit data 010: 10-bit Y data is converted to 16-bit data and both Y and CbCr data are transferred to memory. 011: 10-bit Y data is converted to 16-bit data and only Y data is transferred to memory. 100: 12-bit Y data is converted to 16-bit data and both Y and CbCr data are transferred to memory. 101: 12-bit Y data is converted to 16-bit data and only Y data is transferred to memory. 110: Setting prohibited 111: Setting prohibited
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	EXRGB	0	R/W	Extension RGB Conversion Mode 0: RGB data extension processing is not performed. 1: Data is extended to 32-bit RGB conversion when DTMD[1:0] is set to 00 or 01 as the data conversion mode.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
4	BPSM	0	R/W	Output Data Byte Swap Mode 0: Bytes are not swapped in output data. 1: Bytes are swapped in output data. Note: When YCbCr-422 data is output in big endian, data is transferred in the YUYV format in most cases. To transfer data in the UYVY format, set this bit to 1.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	ABIT	0	R/W	Alpha Bit This bit specifies the alpha value for data in ARGB-1555 output mode. 0: The alpha value is set to 0. 1: The alpha value is set to 1.
1, 0	DTMD[1:0]	00	R/W	Data Conversion Mode These bits set the format for storing RGB888 or YCbCr444 data after LUT conversion, in the external memory.*1 00: Data is not converted. 01: RGB is converted to ARGB before output. 10: YC is separated before output.*2 11: Setting prohibited.

Notes: 1. The data conversion modes that can be set are shown in Table 22.13. Do not set any other mode that is not listed in the table. RGB and YCbCr data after LUT conversion should be set as shown in Tables 22.11 and 22.12.

2. Do not set for any other data format except for YCbCr422; set YC separation only for YCbCr data format.

Table 22.10 Data Conversion Settings

- RGB Data Conversion Modes

Format of Data Stored in Memory	VnDMR/ YMODE[2:0]	VnDMR/ EXRGB	VnDMR/ DTMD[1:0]	Remarks
RGB-565 (16 bits/pixel) format	000	0	00	
RGB-888 (32 bits/pixel) format	000	1	00	
ARGB-1555 (16 bits/pixel) format	000	0	01	The alpha bit is set with the ABIT bit in VnDMR.
ARGB-8888 (32 bits/pixel) format	000	1	01	The alpha bit is set with the A8BIT bit in VnDMR.

- YCbCr Data Conversion Modes

Format of Data Stored in Memory	VnDMR/ YMODE[2:0]	VnDMR/ EXRGB	VnDMR/ DTMD[1:0]	Remarks
YCbCr-422 (8 bits) transfer	000	0	00	Set the BPSM bit in VnDMR to 1 to transfer in UYVY format in big endian.
Y (8 bits)/CbCr separation transfer	000	0	10	CbCr transfer destination is determined by the VnUVAOF register setting.
Y (8 bits) transfer	001	0	10	
Y (16 bits)/CbCr separation transfer	010/100	0	10	CbCr transfer destination is determined by the VnUVAOF register setting.
Y (16 bits) transfer	011/101	0	10	

Note: If any combination of values not listed above is specified, correct operation is not guaranteed.

22.2.23 Video n Data Mode Register 2 (VnDMR2)

Note: Availability of channels:
n = 0 to 1

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FPS	VPS	HPS	CES	DES	—	—	—	CHS	YDS	—	—	—	—	FT EV	FT EH
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VLV[3:0]				HLV[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	FPS	0	R/W	Field Signal Polarity Select This bit specifies the polarity of the input field signal in the ITU-R BT.601 interface. 0: 0/1 = Odd field (field 1)/Even field (field 2) 1: 0/1 = Even field (field 2)/Odd field (field 1)
30	VPS	0	R/W	Vsync Signal Polarity Select This bit specifies the polarity of the input vertical sync signal in the ITU-R BT.601 interface. 0: Active low 1: Active high
29	HPS	0	R/W	Hsync Signal Polarity Select This bit specifies the polarity of the input horizontal sync signal in the ITU-R BT.601 interface. 0: Active low 1: Active high
28	CES	0	R/W	Clock Enable Signal Polarity Select This bit specifies the polarity of the input clock enable signal in the ITU-R BT.601. 0: Active high 1: Active low
27	DES	0	R/W	Data Extension Select This bit is used to select how data are expanded to 12 bits within the VIN module. 0: Empty bits in the input data are repeatedly expanded from the highest-order bit. 1: Empty bits will be padded with zeros. This bit must be set to 1 when the YCbCr-422 interface is in use.
26 to 24	—	000	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
23	CHS	0	R/W	Clock Enable Hsync Select The HSYNC signal (VIn_HSYNC#) input from the pin is internally used as the clock enable signal. 0: Clock enable signal (VIn_CLKENB) input from the pin is internally used as the clock enable signal. 1: HSYNC signal (VIn_HSYNC#) input from the pin is internally used as the clock enable signal. Note: When using ITU-R BT.601, BT.709, BT.1358 interface, and the VIn_CLKENB pin is unused, the CHS bit must be set to 1.
22	YDS	0	R/W	YCbCr422 8-bit Data Input Pin Select This bit specifies the YCbCr422 8-bit data input pins. 0: VIn_B[7:0] pins 1: VIn_G[7:0] pins Note: This bit can only be set when the YCbCr-422 interface is in use.
21 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17	FTEV	0	R/W	VSYNC Field Toggle Mode Enable The VSYNC field toggle mode changes the capture field signal level according to the count of input VSYNC signal assertion. As the VIN controls capture operation only when the input field signal level changes, select the VSYNC field toggle mode when capturing progressive images. 0: The field toggle function according to the VSYNC count is disabled. 1: The field toggle function according to the VSYNC count is enabled. The period before a toggle should be specified in the VLV bits. Note: Do not set both FTEH and FTEV at the same time.
16	FTEH	0	R/W	HSYNC Field Toggle Counter Enable 0: The field toggle function according to the capture active line is disabled. 1: The field toggle function according to the capture active line is enabled. The period before a toggle should be specified in the HLV bits. Note: Do not set both FTEH and FTEV at the same time.
15 to 12	VLV[3:0]	H'0	R/W	VSYNC Field Toggle Mode Transition Period These bits specify the count of vertical sync signal input before the VSYNC field toggle mode is entered. After a transition to the VSYNC field toggle mode, the capture field signal is toggled every time VSYNC is input. When a change in the input field signal is detected, the toggle mode is canceled. H'0: The field signal is toggled at every VSYNC input. H'1: Toggle mode is entered after VSYNC is input once. H'2: Toggle mode is entered after VSYNC is input two times. H'3: Toggle mode is entered after VSYNC is input three times. : H'E: Toggle mode is entered after VSYNC is input 14 times H'F: Toggle mode is entered after VSYNC is input 15 times. Note: If the field signal changes while the transition period is counted, the counter is initialized.

Bit	Bit Name	Initial Value	R/W	Description
11 to 0	HLV[11:0]	H'000	R/W	HSYNC Field Toggle Count Value The HSYNC field toggle counter counts the capture active lines. If the external field signal does not change before the prespecified counter value is reached, the capture field signal is toggled. H'000: The field signal is toggled for every valid line. H'001: The field signal is toggled for every single valid line. H'002: The field signal is toggled for every two valid lines. : H'FFF: The field signal is toggled for every 4095 valid lines. Note: For the period before a toggle, specify a value greater than one VSYNC period.

22.2.24 Video n UV Address Offset Register (VnUVAOF)

Note: Availability of channels:
n = 0 to 1

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UVAOF															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UVAOF									—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	UVAOF[24:0]	All 0	R/W	UV Data Address Offset These bits specify the transfer offset address for the YC separation YCbCr-422 UV data. Specify bits 31 to 7 of the physical address in 128-byte units. Note: The specified address should be equal to or greater than the Y transfer size. Otherwise, the overwriting of Y data occurs.
6 to 0	—	All 0	R	Reserved bits that indicate the 128-byte boundary of the UVAOF value. These bits are always read as 0. The write value should always be 0.

22.2.25 YC-RGB Conversion Coefficient Registers

YC→RGB color space conversion is performed with the following formula. Each of the coefficients can be set through the registers. Here, if 8-bit data format is set, the coefficient registers set with the YMUL, CSUB, and YSUB bits in the VnCSCC1 register, RCRMU and GCRMUL bits in the VnCSCC2 register and GCBMUL and BCBMUL bits in the VnCSCC3 register are used to convert the color space. When 10-bit/12-bit data format is set, the YMUL2 bit in the VnCSCE1 register, CSUB2 and YSUB2 bits in the VnCSCE2 register, RCRMUL2 and GCRMUL2 bits in the VnCSCE3 register, GCBMUL2 and BCBMUL2 bits in the VnCSCE4 register are used in color space conversion.

$$R = \left(\begin{array}{c}VnCSCC1/\\YMUL[9:0]\\or\\VnCSCE1/\\YMUL2[13:0]\end{array}\right) \times (Y - \left(\begin{array}{c}VnCSCC1/\\YSUB[7:0]\\or\\VnCSCE1/\\YSUB2[11:0]\end{array}\right)) + \left(\begin{array}{c}VnCSCC2/\\RCRMUL[9:0]\\or\\VnCSCE3/\\RCRMUL2[13:0]\end{array}\right) \times (Cr - \left(\begin{array}{c}VnCSCC1/\\CSUB[7:0]\\or\\VnCSCE1/\\CSUB2[11:0]\end{array}\right))$$

$$G = \left(\begin{array}{c}VnCSCC1/\\YMUL[9:0]\\or\\VnCSCE1/\\YMUL2[13:0]\end{array}\right) \times (Y - \left(\begin{array}{c}VnCSCC1/\\YSUB[7:0]\\or\\VnCSCE1/\\YSUB2[11:0]\end{array}\right)) - \left(\begin{array}{c}VnCSCC2/\\GCRMUL[9:0]\\or\\VnCSCE3/\\GCRMUL2[13:0]\end{array}\right) \times (Cr - \left(\begin{array}{c}VnCSCC1/\\CSUB[7:0]\\or\\VnCSCE1/\\CSUB2[11:0]\end{array}\right)) - \left(\begin{array}{c}VnCSCC3/\\GCBMUL[9:0]\\or\\VnCSCE4/\\GCBMUL2[13:0]\end{array}\right) \times (Cb - \left(\begin{array}{c}VnCSCC1/\\CSUB[7:0]\\or\\VnCSCE1/\\CSUB2[11:0]\end{array}\right))$$

$$B = \left(\begin{array}{c}VnCSCC1/\\YMUL[9:0]\\or\\VnCSCE1/\\YMUL2[13:0]\end{array}\right) \times (Y - \left(\begin{array}{c}VnCSCC1/\\YSUB[7:0]\\or\\VnCSCE1/\\YSUB2[11:0]\end{array}\right)) + \left(\begin{array}{c}VnCSCC3/\\BCBMUL[9:0]\\or\\VnCSCE4/\\BCBMUL2[13:0]\end{array}\right) \times (Cb - \left(\begin{array}{c}VnCSCC1/\\CSUB[7:0]\\or\\VnCSCE1/\\CSUB2[11:0]\end{array}\right))$$

Note: Set the coefficients for ITU-R BT.601 (8 bits) as the initial value.

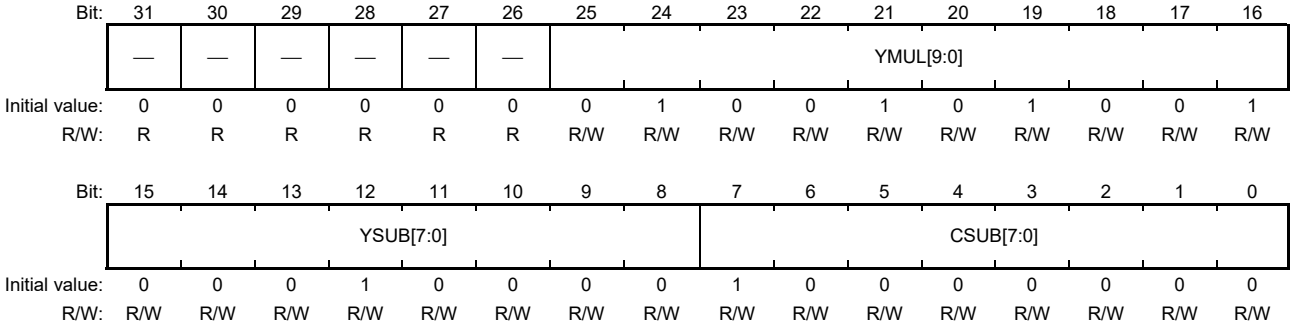
$R = 1.164 \times (Y - 16) + 1.596 \times (Cr - 128)$

$G = 1.164 \times (Y - 16) - 0.813 \times (Cr - 128) - 0.392 \times (Cb - 128)$

$B = 1.164 \times (Y - 16) + 2.017 \times (Cb - 128)$

22.2.25.1 Video n Color Space Change Coefficient 1 Register (VnCSCC1)

Note: Availability of channels:
n = 0 to 1



Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	YMUL[9:0]	H'129	R/W	Y Data Multiplication Coefficient These bits specify the multiplication coefficient for Y data in YCbCr-444 → RGB-888 color space conversion. (Initial value: 1.164) Specify an unsigned 10-bit integer obtained by multiplying the desired coefficient value by 256.
15 to 8	YSUB[7:0]	H'10	R/W	Y Data Subtraction Coefficient These bits specify the subtraction coefficient for Y data in YCbCr-444 → RGB-888 color space conversion. (Initial value: H'16) Specify an unsigned 8-bit integer.
7 to 0	CSUB[7:0]	H'80	R/W	CbCr Data Subtraction Coefficient These bits specify the subtraction coefficient for Cb and Cr data in YCbCr-444 → RGB-888 color space conversion. (Initial value: H'128) Specify an unsigned 8-bit integer.

22.2.25.2 Video n Color Space Change Coefficient 2 Register (VnCSCC2)

Note: Availability of channels:
n = 0 to 1

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 16	GCBMUL2[13:0]	H'0645	R/W	Cb Multiplication Coefficient 2 for G Calculation These bits specify the Cb multiplication coefficient for the G data calculation equation in YCbCr-444 → RGB-101010/RGB121212 color space conversion. (Initial value: 0.392) Specify an unsigned 14-bit integer obtained by multiplying the desired coefficient value by 4096.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 0	BCBMUL2[13:0]	H'2045	R/W	Cb Multiplication Coefficient 2 for B Calculation These bits specify the Cb multiplication coefficient for the B data calculation equation in YCbCr-444 → RGB-101010/RGB121212 color space conversion. (Initial value: 2.017) Specify an unsigned 14-bit integer obtained by multiplying the desired coefficient value by 4096.

22.2.26 Video n Coefficient Set Registers

The coefficient set registers specify the coefficients used for calculation of X scaling specified in XS. The X scaling function processes input pixels with 8-step resolution and generates scaled pixels by using nine calculation coefficients (nine taps) around the determined pixel.

The following is an overview of nine tap coefficients. The MSB of each coefficient is a sign bit.

Table 22.11 Bit Count for Tap Coefficients

Register Name (m = 1 to 8)	CmA			CmC			CmB		
Nine tap coefficients	L1	L2	L3	L4	M	R4	R3	R2	R1
Bit width	10	10	10	10	10	10	10	10	10

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
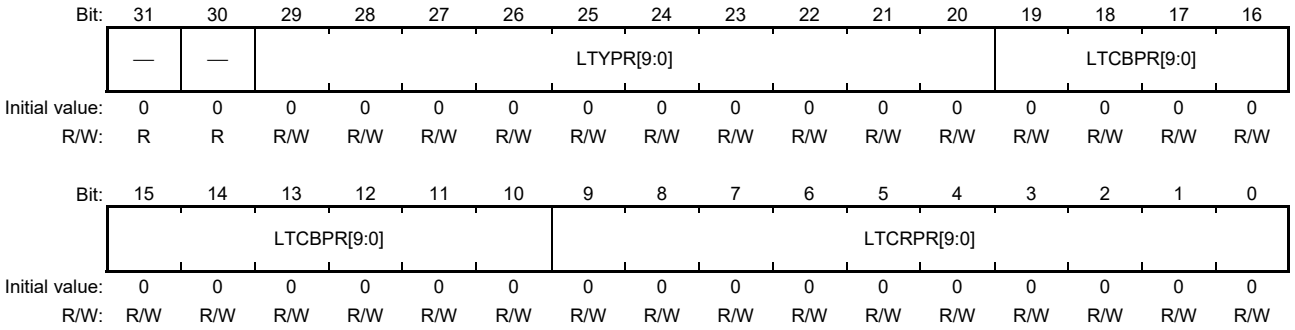
29 to 20	R4[9:0]	H'000	R/W	R4 coefficient
19 to 10	L4[9:0]	H'000	R/W	L4 coefficient
9 to 0	M[9:0]	H'000	R/W	M coefficient

22.2.27 Video n Lookup Table Pointer (VnLUTP)

Note: Availability of channels:
n = 0 to 1



Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 20	LTYPR[9:0]	All 0	R/W	Lookup Table Y Pointer These bits set the LUT pointer to Y and R data after color space conversion.
19 to 10	LTCBPR[9:0]	All 0	R/W	Lookup Table Cb Pointer These bits set the LUT pointer to Cb and G data after color space conversion.
9 to 0	LTCRPR[9:0]	All 0	R/W	Lookup Table Cr Pointer These bits set the LUT pointer to Cr and G data after color space conversion.

Note: Set the LUT pointer to the upper 10 bits of the 12-bit data for the color space conversion result.
The access pointer to the LUT will be automatically incremented by writing to the VnLUTD register.
There will be no automatic increment at read access.

22.2.28 Video n Lookup Table Data Register (VnLUTD)

Note: Availability of channels:
n = 0 to 1

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	LTYDT[7:0]							
Initial value:	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LTCBDT[7:0]								LTCRDT[7:0]							
Initial value:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	LTYDT[7:0]	H'x	R/W	Lookup Table Y Data These bits set the LUT conversion data for Y and R data after color space conversion.
15 to 8	LTCBDT[7:0]	H'x	R/W	Lookup Table Cb Data These bits set the LUT conversion data for Cb and G data after color space conversion.
7 to 0	LTCRDT[7:0]	H'x	R/W	Lookup Table Cr Data These bits set the LUT conversion data for Cr and B data after color space conversion.

Note: The 8-bit data after LUT conversion is subjected to upper shift to carry out capture control as 12-bit data.
As for reading from the VnLUTD register, the data read the second time, including dummy read, after the VnLUTP register has been set is valid.

22.2.29 RGB-YC Conversion Coefficient Registers

Color space conversion from RGB to YC is done with the following formula. Each of the coefficients can be set with the registers.

$$Y = YCLRP \times R + YCLGP \times G + YCLBP \times B + YCLAP$$
$$Cb = CBCLRP \times R + CBCLGP \times G + CBCLBP \times B + CBCLAP$$
$$Cr = YCLRP \times R + YCLGP \times G + YCLBP \times B + YCLAP$$

Note: Set the coefficients for ITU-R BT.601 (8 bits) as the initial value.

$$Y = 0.257 \times R + 0.504 \times G + 0.098 \times B + 16$$
$$Cb = -0.148 \times R - 0.291 \times G + 0.439 \times B + 128$$
$$Cr = 0.439 \times R - 0.368 \times G - 0.071 \times B + 128$$

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 24	PRIH[3:0]	H'A	R/W	Priority High Level Value Setting These bits specify priority high level for second packet from VIN I/F. Please do not change value from H'A.
23 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 16	PRIL[3:0]	H'8	R/W	Priority Low Level Value Setting. These bits specify priority low level for first packet from VIN I/F. H'8: normal priority H'9: high priority than other VIN channel. Set these bits to H'9 on high bit rate channel when a system input video data more than two channel.
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SIZE	1	R/W	Transaction Size Unit setting. 0: 16-Byte unit 1: 32-Byte unit (default) These bits set the LUT conversion data for Cr and B data after color space conversion.
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	BSIZE[3:0]	H'8	R/W	Burst Size Setting These bits specify VIN's burst transaction size. When bit SIZE is set to 0: H'0: No transfer (prohibited) H'1: 16-Byte H'2: 32-Byte … H'F: 240-Byte When bit SIZE is set to 1: H'0: No transfer (prohibited) H'1: 32-Byte H'2: 64-Byte (recommended setting) … H'8: 256-Byte (default) … H'F: 480-Byte (prohibited) Set these bits to specify burst size less than 256-Byte. SIZE = 1, BSIZE[3:0] = H'2 is recommended setting to consider VIN capture stability.

22.3 Operation

22.3.1 Input Interface

The VIN captures video data in the ITU-R BT.601, ITU-R BT.656, ITU-R BT.1358, or ITU-R BT.709 interface and stores it in external memory. The module has four input-interface channels. The interface and data format can be set as desired for each video channel.

The following tables show the interface and data format supported in each product and its channels.

Note: When the ITU-R BT.709 interface is in use, the maximum frequency of the video clock is 74.5 MHz.

Table 22.12 Video Channels and Supported Interfaces

				Channel 0	Channel 1
Input interface	ITU-R BT.656	YCbCr-422	8 bits	Supported	Supported
			10 bits	Supported	Supported
			12 bits	Supported	Supported
	ITU-R BT.1358/ ITU-R BT.601/ ITU-R BT.709	YCbCr-422	16 bits	Supported	—
			20 bits	Supported	—
			24 bits	Supported	—

		RGB-888	24 bits	Supported	—
Output interface	RGB output	RGB-565	16 bits	Supported	Supported
		ARGB-1555	16 bits	Supported	Supported
		RGB-888	32 bits	Supported	Supported
		ARGB-8888	32 bits	Supported	Supported
	YCbCr output	YCbCr-422 multiplexed	8 bits	Supported	Supported
		YCbCr-422 separated Y/CbCr	Y: 8 bits CbCr: 8 bits	Supported	Supported
			Y: 10 bits CbCr: 8 bits	Supported	Supported
			Y: 12 bits CbCr: 8 bits	Supported	Supported
		YCbCr-422 separated Only Y	8 bits	Supported	Supported
			10 bits	Supported	Supported
			12 bits	Supported	Supported

Notes: 1. When capturing progressive images, be sure to enable the internal field signal generation function.
2. Dithering is performed for RGB-888→RGB-565 conversion.
3. RGB data is converted and transferred to memory from the video module after 8-bit precision conversion.
4. For details of output interfaces, see section 22.3.10, Output Data Format.

(1) Multiplexed YCbCr-422 Data Format in ITU-R BT.601 Interface

Data in the multiplexed YCbCr-422 format is a UYVY format (U0Y0V0Y1 format) YCbCr data. The Y, Cb, Cr image data is captured at the rising edges of the input video clock signal.

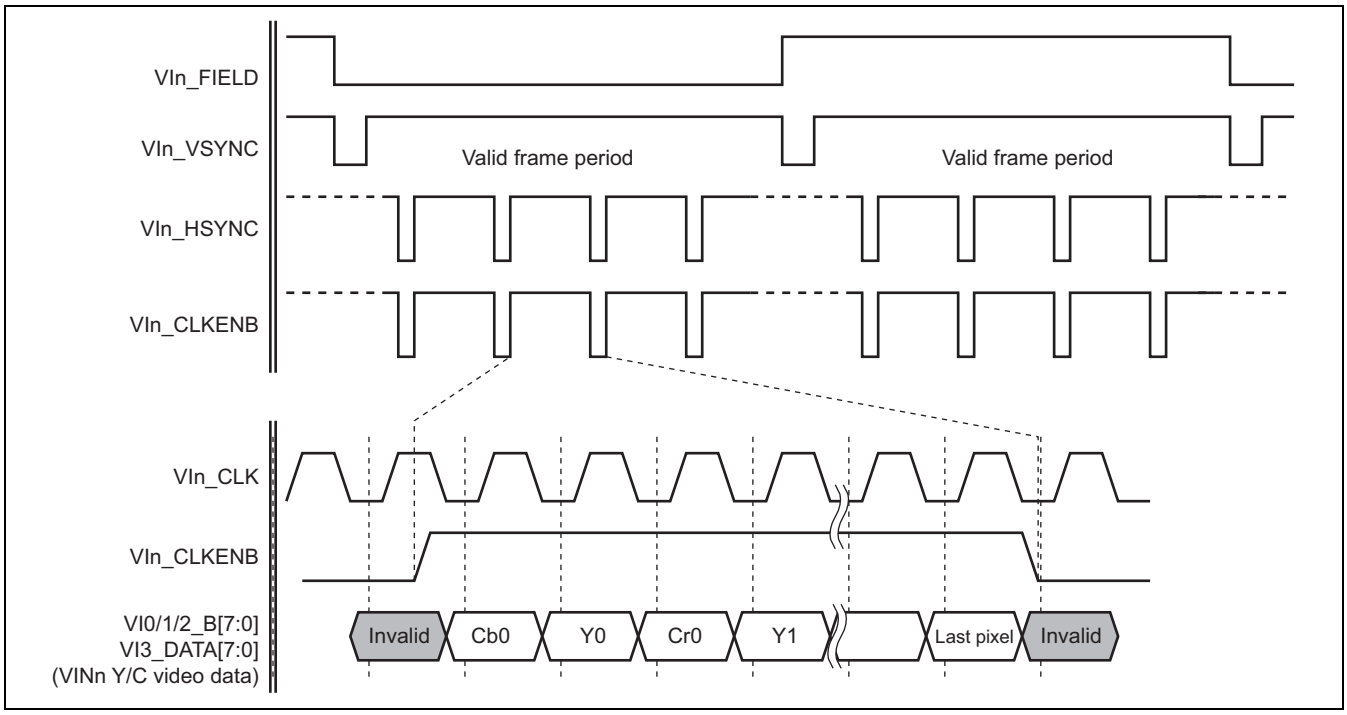

Figure 22.4 Multiplexed YCbCr-422 Data Format

(2) CbCr Multiplexed YCbCr-422 Data Format in ITU-R BT.601/1358 Interface

Data in the CbCr multiplexed YCbCr-422 format is YCbCr data with only the CbCr data being multiplexed. The Y and CbCr image data are captured at the rising edges of the input video clock signal.

Setting the YCAL bit in VnMC to 1 enables the capturing of image data with CbCr data in the upper bits and Y data in the lower bits.

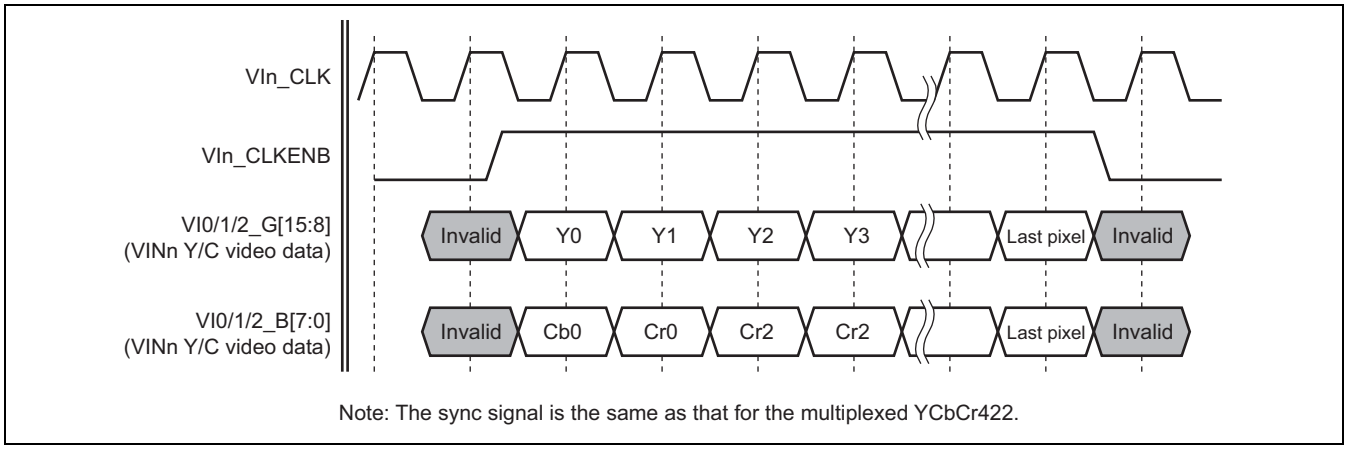

Figure 22.5 CbCr Multiplexed YCbCr-422 Data Format (Y Data in Upper Bits)

(3) RGB-666 Data Format in ITU-R BT.601 Interface

This data format can be used for the color conversion space in the RGB=4:4:4 format defined in the ITU-R BT.601 standard. The R, G, B image data are captured at the rising edges of the input video clock signal.

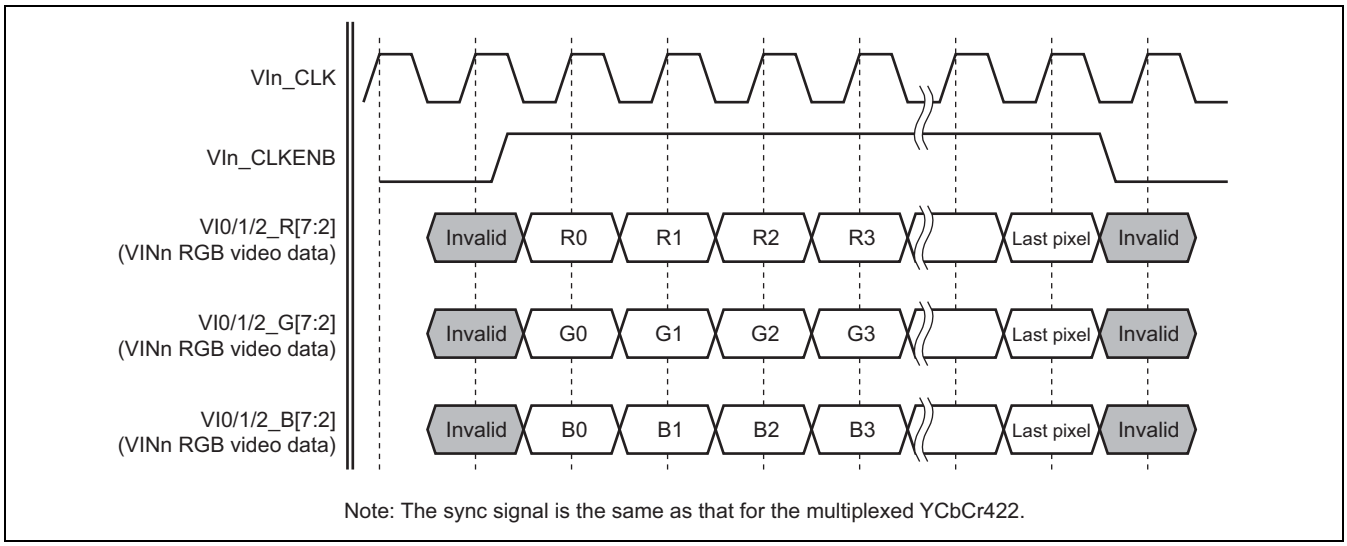

Figure 22.6 RGB-666 Data Format

(4) RGB-888 (24 bits) Data Format in ITU-R BT.601 Interface

This data format can be used for the color conversion space in the RGB=4:4:4 format defined in the ITU-R BT.601. The R, G, B image data are captured at the rising edges of the input video clock signal.

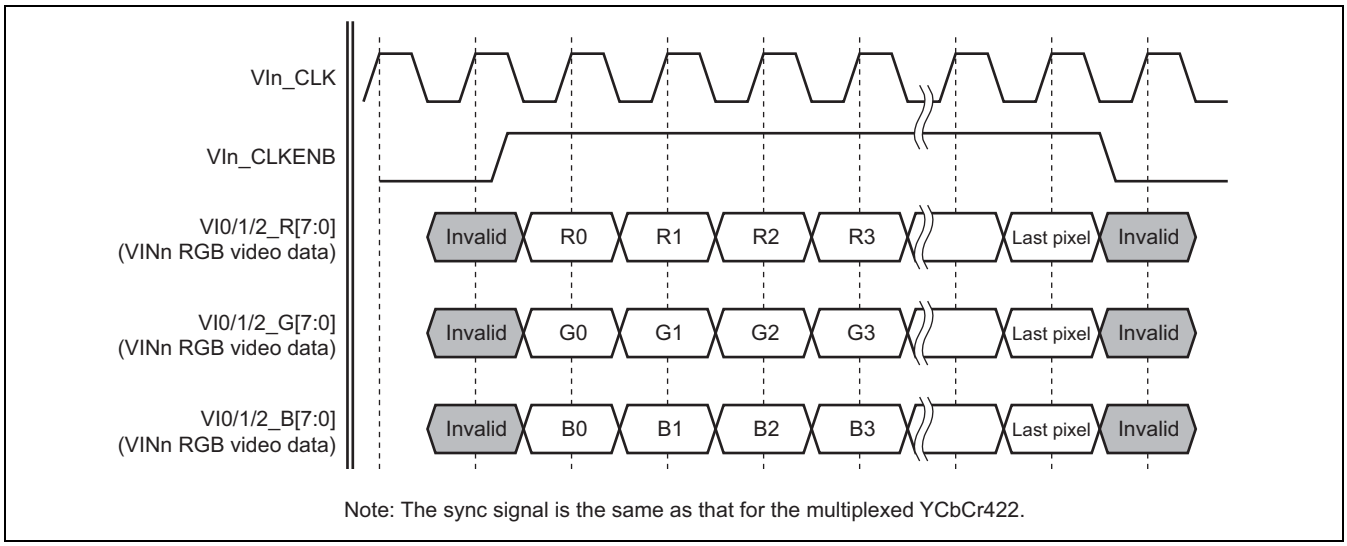

Figure 22.7 RGB-888 (24 Bits) Data Format

(5) Multiplexed YCbCr-422 Data Format in ITU-R BT.656 Interface

In the ITU-R BT.656 interface, active data between the start of active video (SAV) and the end of active video (EAV) indicated with the timing reference code is captured.

Table 22.13 Video Timing Reference Code

VINn Image Data			First Word	Second Word	Third Word	Fourth Word (XY)	
12 bits	10 bits	8 bits					
VIn_G[3]	VIn_G[1]	VIn_B[7]	1	0	0	1	
VIn_G[2]	VIn_G[0]	VIn_B[6]	1	0	0	F	0: Field 1 1: Field 2
VIn_G[1]	VIn_B[7]	VIn_B[5]	1	0	0	V	0: elsewhere 1: Field Blanking
VIn_G[0]	VIn_B[6]	VIn_B[4]	1	0	0	H	0: SAV 1: EAV
VIn_B[7]	VIn_B[5]	VIn_B[3]	1	0	0	P3	Protection bit 3
VIn_B[6]	VIn_B[4]	VIn_B[2]	1	0	0	P2	Protection bit 2
VIn_B[5]	VIn_B[3]	VIn_B[1]	1	0	0	P1	Protection bit 1
VIn_B[4]	VIn_B[2]	VIn_B[0]	1	0	0	P0	Protection bit 0
VIn_B[3]	VIn_B[1]	—	1	0	0	0	
VIn_B[2]	VIn_B[0]	—	1	0	0	0	
VIn_B[1]	—	—	1	0	0	0	
VIn_B[0]	—	—	1	0	0	0	

Active data is available with the multiplexed YCbCr-422 data format in the UYVY (U0Y0V0Y1) format. In this interface, timing reference and Y, Cb, Cr image data are captured at the rising edges of the input clock signal.

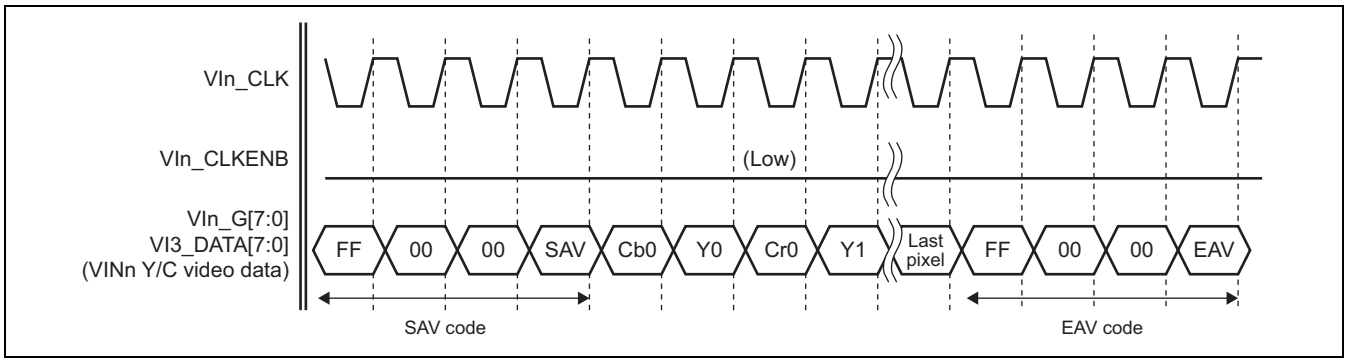

Figure 22.8 Multiplexed YCbCr-422 Data Format

Capturing is controlled based on field information. Therefore, the field signal and timing reference codes should be correct.

22.3.2 Error Correction

At the time of capturing with ITU-R BT.656, the VIN allows errors to be corrected with the timing reference code (SAV/EAV). The timing reference code (SAV/EAV) of ITU-R BT.656 has four protection bits, which can be used to correct only one-bit errors in the interface.

If the VIN cannot correct errors while the CEE bit in the interrupt enable register (VnIE) has been set to 1, an interrupt signal is generated as soon as the CES bit in the interrupt status (VnINTS) register is set. Note that no interrupt signal is generated if errors can be corrected.

22.3.3 Capture Mode

With the VIN, either of the single frame capture mode or continuous frame capture mode can be selected.

Specifying the capture field in IM bits of the main control (VnMC) register and then setting the SC bit in the frame capture (VnFC) register to 1 provides single frame capture mode. In this mode, the current frame is captured when the SC bit write timing (current scanline position) is smaller than the value of the start line pre-clip (VnSLPrC) register, or the next frame is captured in other cases. The capture data is transferred to the memory address that is set in the memory base 1 (VnMB1) register.

Specifying the capture field in IM bits of VnMC and then setting the CC bit of VnFC to 1 provides continuous frame capture mode, in which capture data is sequentially transferred to the addresses that are set in MB1 to MB3. In this case, the latest captured frame ID is shown in the FBS bits in the module status (VnMS) register.

When the IM bits in VnMC are set to the full interlace mode, data in the capture start field is stored in every other line in the memory as the odd field (field 1) data and then data in the next field is stored as the even field (field 2) between the written lines so that the top and bottom field lines alternate with each other for interlace composition. The capture start field (top field) can be changed through the FOC bit in VnMC.

The following is a schematic diagram of capturing in full interlace mode when the odd field (field 1) is selected as the top field, the memory width is set to H'200, and VnMB1 is set to H'0000.

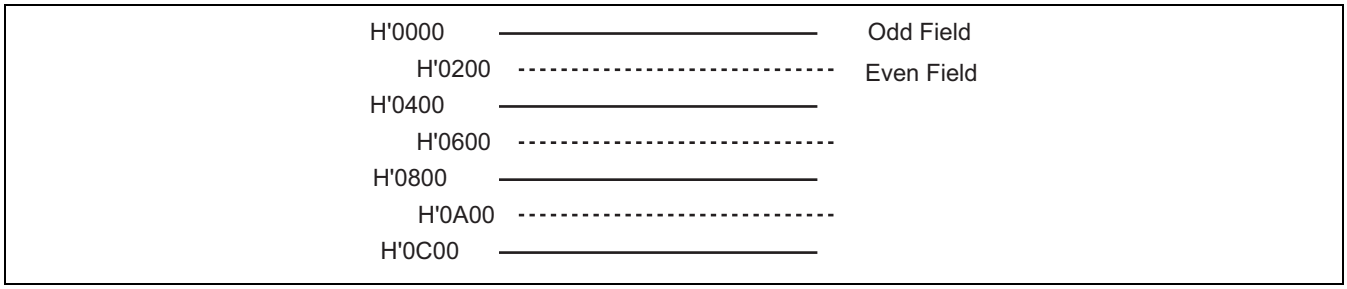

Figure 22.9 Example of Capturing Full Interlace

The VIN starts capture operation after detecting a frame signal switching in the ITU-R BT.601 or 656 interface. When capturing progressive data, in which the field signal does not change, use the internal field signal generation function to toggle the internal field signal.

22.3.4 Size Clipping

Image data that has been captured is pre-clipped according to the settings of the following registers: start line pre-clip (VnSLPrC), end line pre-clip (VnELPrC), start pixel pre-clip (VnSPPrC), and end pixel pre-clip (VnEPPrC).

After the horizontal and vertical scaling, post-clipping takes place according to the settings of the following registers: start line post-clip (VnSLPoC), end line post-clip (VnELPoC), start pixel post-clip (VnSPPoC), and end pixel post-clip (VnEPPoC). The following shows an example of size clipping.

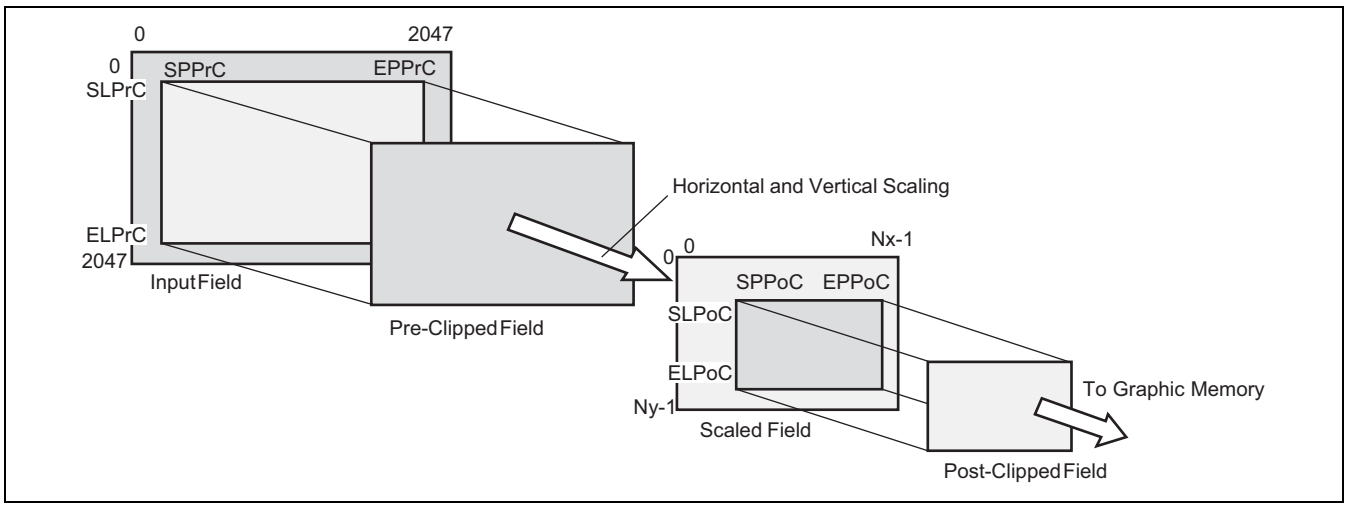

Figure 22.10 Example of Clipping

For all the post-clipped lines, the lengths of individual lines written into the memory are defined by the image stride (VnIS) register. The setting can be larger than the post-clipped frame width, but cannot be smaller than the width. The VnIS register must be filled with a value larger than the horizontal post-clipping width. The input field in the above figure shows an effective image area from the video decoder; the VIN does not allow anything exceeding the image area to be captured.

Note: Each of the following registers specifies a distance from the starting point in the effective image area: start line pre-clip (VnSLPrC), end line pre-clip (VnELPrC), start pixel pre-clip (VnSPPrC), and end pixel pre-clip (VnEPPrC). Specifically, in ITU-R BT.601, the distance is from the starting point of VIn_CLKENB (data enable); in ITU-R BT.656, the distance is from the SAV (start of active video) signal.

22.3.5 Vertical Scaling

The vertical scaling function in the VIN creates lines by scaling up or down in the vertical direction through interpolation between two points in the neighborhood of captured lines. With the combinations of mantissaY and fractionY in the Y scaling (VnYS) register, the vertical scaling creates new lines by selecting line positions from captured lines.

The Y scaling function is disabled if mantissaY and fractionY are both cleared to 0 in VnYS.

Scaling down is implemented by creating fewer lines than captured lines. Examples of scaling up and down are shown in the following figure.

Note: When vertical scaling up is specified in full interlace capture mode, the scaling-up processing is applied separately to each field before full interlace composition on memory. Accordingly, the top and bottom field lines are inverted in some cases depending on the scaling ratio. Be sure to evaluate the scaled image quality before practical application.

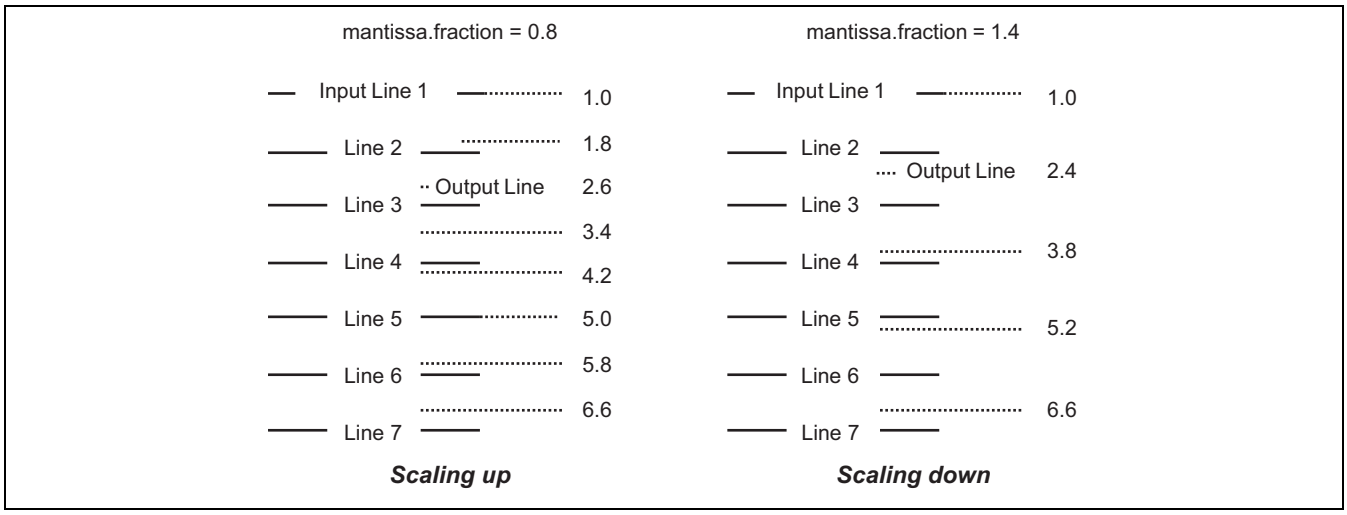

Figure 22.11 Examples of Scaling Up and Down in Vertical Direction

The number of lines created by the vertical scaling block is expressed by the following equation:

$$Ny = \begin{cases} \dfrac{4096 \times (ELPrC - SLPrC)}{4096 \times MantissaY + FractionY} - 1, \\ \qquad \text{when } \{4096 \times (ELPrC - SLPrC)\}\%(4096 \times MantissaY + FractionY) = 0 \\ Int\left(\dfrac{4096 \times (ELPrC - SLPrC)}{4096 \times MantissaY + FractionY}\right), \text{ otherwise} \end{cases}$$

where:
ELPrC is the value in the end line pre-clip (VnELPrC) register.
SLPrC is the value in the start line pre-clip (VnSLPrC) register.
MantissaY and FractionY are the values in VnYS.

22.3.6 Horizontal Scaling

Using a 9-tap multiphase filter, the VIN creates pixels by scaling down in the horizontal direction. The horizontal scaling-up doubles the number of input pixels captured and provides the function of expansion of up to two-fold by the scaling-down in the 9-tap multiphase filter. The horizontal scaling, which is set through combinations of mantissaX and fractionX in the X scale (VnXS) register, determines the position of new pixels with a poly-phase filter. The selected coefficient, which is one of the eight coefficients, is determined by the position of output pixels.

In the example shown below, mantissaX and fractionX are set at 1.2. In this case, coefficient set C2 is selected.

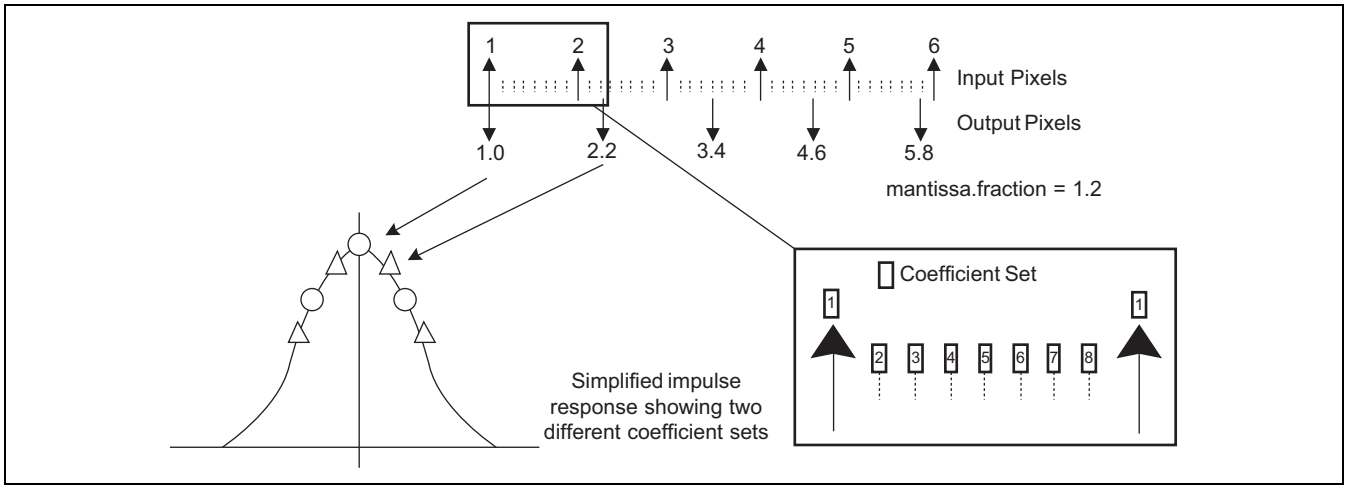

Figure 22.12 Pixel Position and Coefficient Set

The following figure shows an example in which different coefficient sets are used for different output pixel positions. Nine coefficient sets are assigned to each. A total of 72 coefficients are used in the horizontal scaling. Each of the coefficients in these sets has a width of 10 bits, where the MSB serves as the sign bit. By setting the same coefficients into the entire eight coefficient set registers, the horizontal scaling allows the use of a multiphase filter just like a single-phase filter.

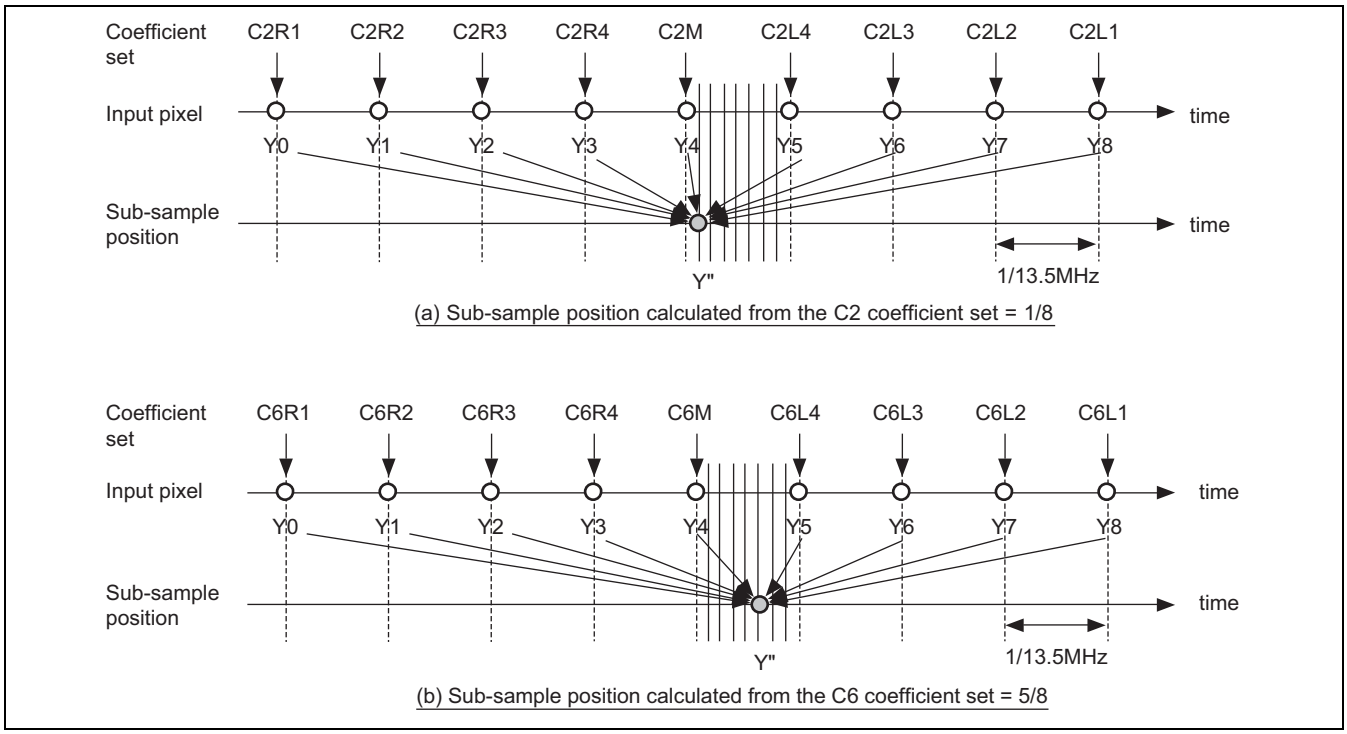

Figure 22.13 Example of Coefficients in Selected Coefficient Set

This scaling mechanism requires different coefficient values dependent on the scaling ratio. Here is an example of coefficient sets to be selected. The coefficients, CmM, CmLi, and CmRi (m = 1, 2, 3, - - -, 8; i = 1, 2, 3, and 4), are determined by the following equations:

$$C_nM = \beta \times h(-(n-1))$$

$$C_nRi = \beta \times h(-(n-1) - 8(5-i))$$

$$C_nLi = \beta \times h(-(n-1) + 8(5-i))$$

$$h(t) = \frac{\sin\left(\frac{\pi t}{T}\right)}{\frac{\pi t}{T}} \times \frac{\cos\left(\frac{\alpha\pi t}{T}\right)}{1 - \frac{4\alpha^2 t^2}{T^2}}$$

$$T = 8 \times MantissaX + FractionX\ [11:9]$$

Mantissa X and Fraction X are the values in VnXS.

The parameter β is a standardized one. In the equation, h(t) follows the cosine characteristic and is executed with a 9-tap filter if the value of α is in the $0 < \alpha \leq 1$ range.

Obtaining dependable scale images requires you to use and meet the following equation in which all the coefficient sets are standardized.

This must be executed with the inherent β value that has been selected from the equation above.

$$CnM + \sum_{i=1}^{4} CnRi + \sum_{i=1}^{4} CnLi = 512$$

The number of pixels created by the horizontal scaling block is calculated by the following equation.

$$Nx = Int\left(\frac{4096 \times (EPPrC - SPPrC)}{4096 \times MantissaX + FractionX}\right) + 1$$

where:
EPPrC is the value in the end pixel pre-clip (VnEPPrC) register.
SPPrC is the value in the start pixel pre-clip (VnSPPrC) register.
Mantissa X and Fraction X are the values in VnXS.

22.3.7 Color Conversion Function

(1) YC-RGB Color Conversion

When the data input format is YCbCr, set the BPS bit in the VnMC register to 0 to convert YCbCr data to RGB data. If an 8-bit data format is used for the capture interface, the color conversion is carried out according to the matrix coefficients set in the VnCSCC1, VnCSCC2, and VnCSCC3 registers. Otherwise, it is carried out according to the matrix coefficients set in the VnCSCE1, VnCSCE2, VnCSCE3, and VnCSCE4 registers. All of the input YCbCr data is extended to 12-bit data before carrying out color conversion.

Here, if the BPS bit in VnMC is set to 1, the data is stored in memory as it is in YCbCr format.

$$R = \left(\begin{array}{c}VnCSCC1/\\YMUL[9:0]\\or\\VnCSCE1/\\YMUL2[13:0]\end{array}\right) \times \left(Y - \left(\begin{array}{c}VnCSCC1/\\YSUB[7:0]\\or\\VnCSCE1/\\YSUB2[11:0]\end{array}\right)\right) + \left(\begin{array}{c}VnCSCC2/\\RCRMUL[9:0]\\or\\VnCSCE3/\\RCRMUL2[13:0]\end{array}\right) \times \left(Cr - \left(\begin{array}{c}VnCSCC1/\\CSUB[7:0]\\or\\VnCSCE1/\\CSUB2[11:0]\end{array}\right)\right)$$

$$G = \left(\begin{array}{c}VnCSCC1/\\YMUL[9:0]\\or\\VnCSCE1/\\YMUL2[13:0]\end{array}\right) \times \left(Y - \left(\begin{array}{c}VnCSCC1/\\YSUB[7:0]\\or\\VnCSCE1/\\YSUB2[11:0]\end{array}\right)\right) - \left(\begin{array}{c}VnCSCC2/\\GCRMUL[9:0]\\or\\VnCSCE3/\\GCRMUL2[13:0]\end{array}\right) \times \left(Cr - \left(\begin{array}{c}VnCSCC1/\\CSUB[7:0]\\or\\VnCSCE1/\\CSUB2[11:0]\end{array}\right)\right) - \left(\begin{array}{c}VnCSCC3/\\GCBMUL[9:0]\\or\\VnCSCE4/\\GCBMUL2[13:0]\end{array}\right) \times \left(Cb - \left(\begin{array}{c}VnCSCC1/\\CSUB[7:0]\\or\\VnCSCE1/\\CSUB2[11:0]\end{array}\right)\right)$$

$$B = \left(\begin{array}{c}VnCSCC1/\\YMUL[9:0]\\or\\VnCSCE1/\\YMUL2[13:0]\end{array}\right) \times \left(Y - \left(\begin{array}{c}VnCSCC1/\\YSUB[7:0]\\or\\VnCSCE1/\\YSUB2[11:0]\end{array}\right)\right) + \left(\begin{array}{c}VnCSCC3/\\BCBMUL[9:0]\\or\\VnCSCE4/\\BCBMUL2[13:0]\end{array}\right) \times \left(Cb - \left(\begin{array}{c}VnCSCC1/\\CSUB[7:0]\\or\\VnCSCE1/\\CSUB2[11:0]\end{array}\right)\right)$$

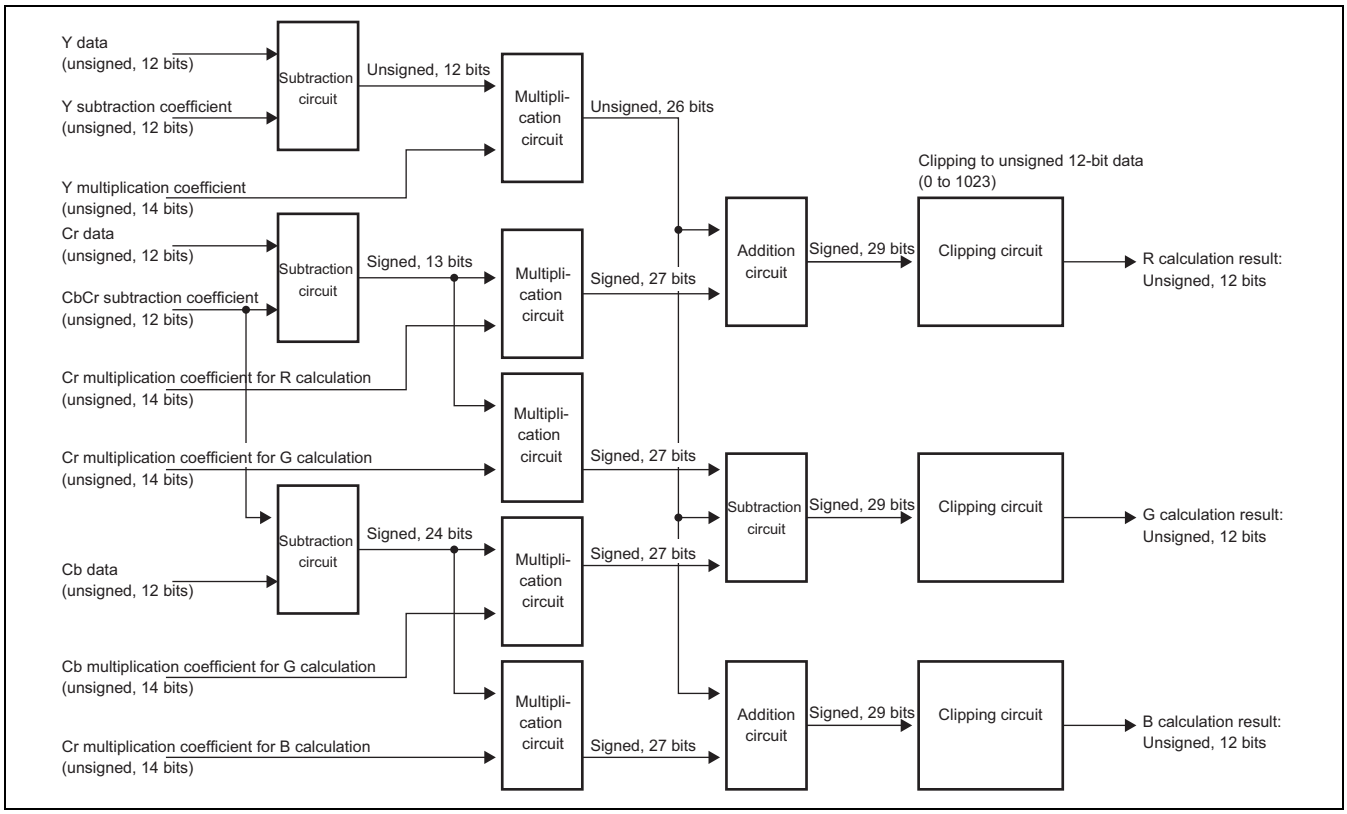

Figure 22.14 YCbCr → RGB Calculation Circuit Configuration

Examples of color space that can be set in YC-RGB conversion coefficient registers are shown below. See the register descriptions for details of the coefficients.

Table 22.14 Examples of YC-RGB Conversion Coefficient Register Settings

YC-RGB Conversion Coefficient	YMUL	YSUB	CSUB	RCRMUL	GCRMUL	GCBMUL	BCBMUL
ITU-R BT.601 (initial value) 16 ≤ Y ≤ 235, 16 ≤ Cb, Cr ≤ 240	1.164	16	128	1.596	0.813	0.392	2.017
Luminance expansion example 1 ≤ Y ≤ 254, 16 ≤ Cb, Cr ≤ 240	1.008	1	128	1.596	0.392	0.813	2.017

Specify an integer in each addition coefficient bit field. For each multiplication coefficient, specify a value obtained by multiplying the desired coefficient value by 256.

Example: When the desired multiplication coefficient is 1.164

$1.164 \times 256 = 297$ (set value: B'0100101001)

Notes: 1. In order to process the data outside the range prescribed by the ITU-R BT.601 standard, set the CLP[1:0] bits in VnMC to 11. The data is clipped to the specified value before color space conversion.
2. The YC-RGB color conversion data is unconditionally rounded to the 0 ≤ R, G, B ≤ 255 range.

(2) RGB-YC Color Conversion

When the data input format is RGB, set the BPS bit in VnMC to 0 for color conversion of RGB data into YCbCr data format. Color conversion from RGB to YCbCr is done according to the matrix coefficients set in RGB-YC conversion coefficient registers (VnYCCR1-VnYCCR3/VnCBCCR1-VnCBCCR3/VnCRCCR1-VnCRCCR3). All of the input RGB data is extended to 12-bit data before color conversion.

If 1 is set to the BPS bit in VnMC, the data will be stored in the memory as it is in RGB format.

$$Y = ((YCLRP \times R + YCLGP \times G + YCLGP \times B) \times 2^{YCLSFT}) + YCALP$$
$$Cb = ((CBCLRP \times R + CBCLGP \times G + CBCLGP \times B) \times 2^{CBCLSFT}) + CBCALP$$
$$Cr = ((CRCLRP \times R + CRCLGP \times G + CRCLGP \times B) \times 2^{CRCLSFT}) + CRCALP$$

The following data rounding functions of RGB-YCbCr color conversion function can be independently set to each pixel. The circuit configuration of Y data is given below.

Table 22.15 Data Rounding Functions of RGB-YC Color Conversion Function

Function	Symbol	Description
Sign extension enable	YEXPEN	Enables/disables signed bits of the matrix multiplication result.
Multiplication result shift down amount	YCLSFT[4:0]	Amount of shift down in the matrix multiplication result
Rounding off enable	YCLHEN	Enables/disables rounding off to the shift down amount.
Clipping enable	YCLCEN	Enables/disables data rounding process between 0 to 1023 of the output data.

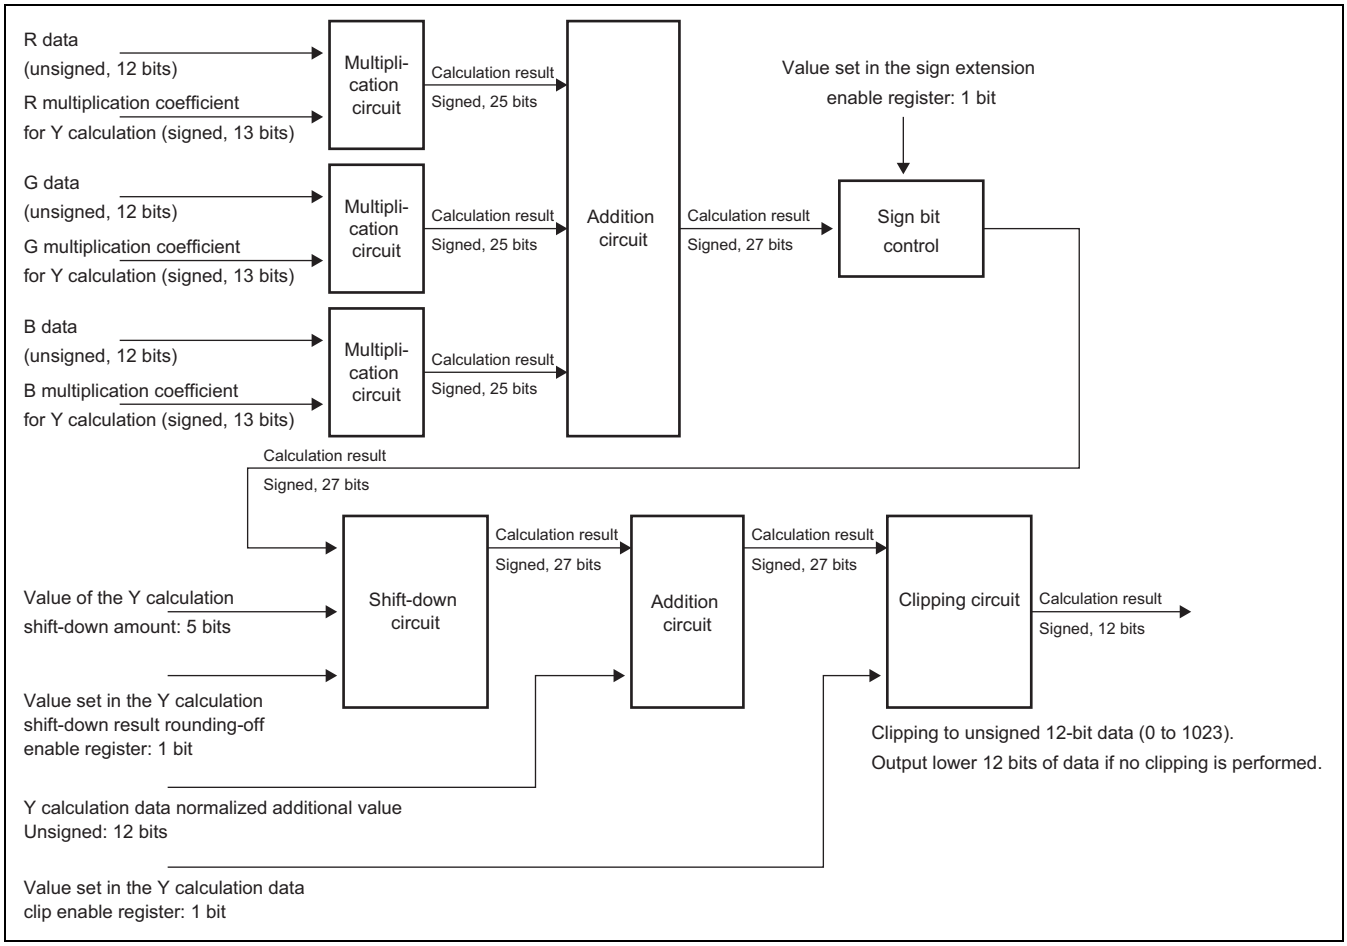

Figure 22.15 Y Data Circuit Configuration of RGB → YCbCr Color Conversion Function

22.3.8 Image Data Format Conversion Functions

(1) Lookup Table (LUT) Density Conversion Function

Set the LUTE bit in VnMC to 1 to enable table conversion of each pixel data of Y, Cb, Cr and R, G, B data after color conversion.

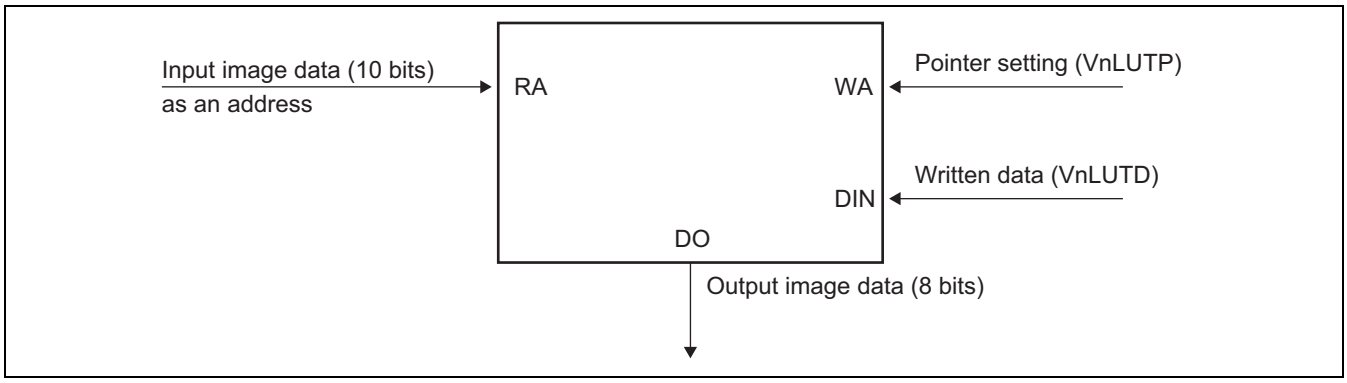

Figure 22.16 Lookup Table

Pointer Access:

The pointer is incremented every time a write access to the VnLUTD register is made.

The incremented data is read when the VnLUTP register is read. Since data is not incremented at read access, the pointer should be set just before reading.

The procedure given below must be followed to access the lookup table.

The lookup table cannot be accessed from the CPU during the conversion process.

(For write/read access to the LUT from the CPU, the LUTE bit in VnMC should be 0.)

Write access:

1. Write the access destination address in VnLUTP.
2. Write the data in VnLUTD.
   Thereby the data will be reflected in the lookup table.
   Also the pointer will automatically increase by 1.
3. Writing to VnLUTD will consecutively update the lookup table.

Read Access:

1. Write the access destination address in VnLUTP.
2. Read VnLUTD. This is dummy read; thus the read data needs to be discarded.
3. Read VnLUTD. This reading allows the address data written in VnLUTP to be acquired.

[Notes on Using the Lookup Table]

1. Set the lookup table only after capture operation has stopped.
2. Rewrite all before using the lookup table.
3. Data set to the lookup table should be within the range compatible to the input bit width.

(2) YCbCr444 → YC Separation Function

When transferring YCbCr data to memory, Y data and CbCr data can be separated and transferred to different address spaces.

To perform YCbCr separation transfer, set the DTMD[1:0] bits in the VnDMR register to B'10. In this case, the Y data will be transferred to the address set in the memory base address register and CbCr data will be transferred to the address obtained by adding the value set in the VnUVAOF register to the memory base address register.

If the YMODE[2:0] bits in the VnDMR register are set, only Y data will be transferred to memory and CbCr data is not transferred to memory.

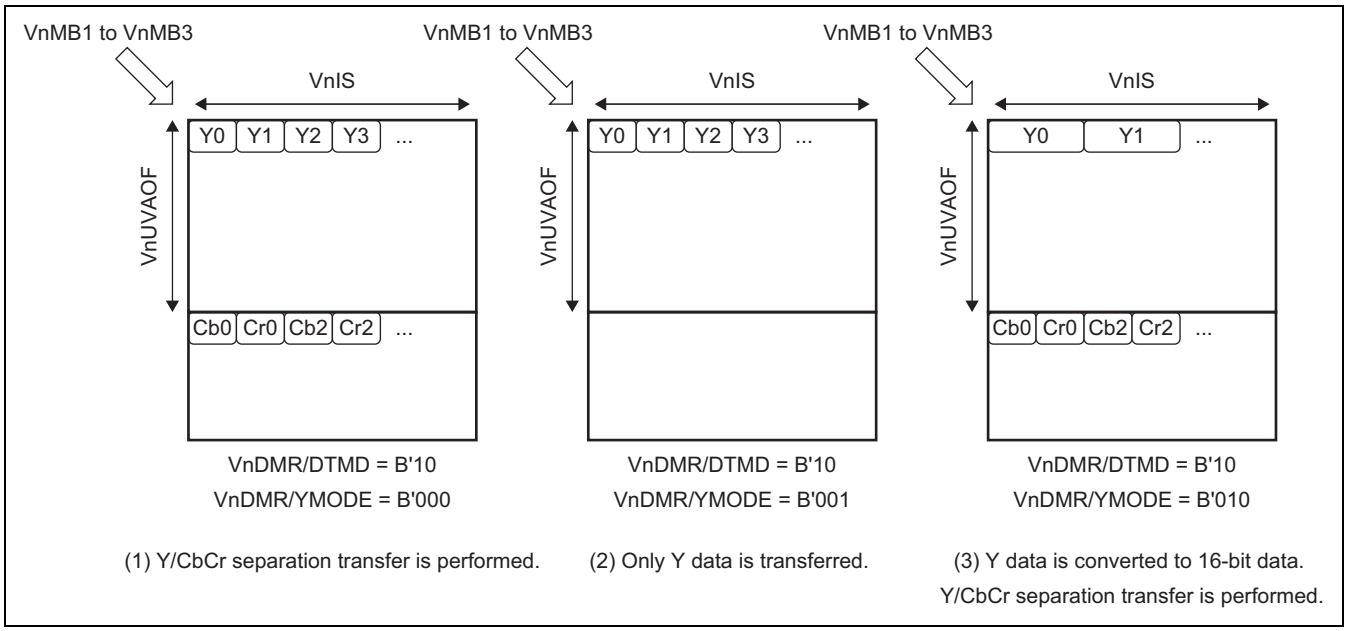

Figure 22.17 Y/Cb/Cr Separation in Big Endian

(3) Dithering Function

Dithering is performed when the internal RGB-888 format after color space conversion is converted to the RGB-565 or RGB-1555 format. The dithering mode can be selected with the DC[1:0] bits in VnMC.

(a) Dithering with Cumulative Addition

Set the DC[1:0] bits in VnMC to B'00 to perform dithering using the cumulative addition method in horizontal pixel units.

$$R_n\,[7:3] \leq (R_x[7:0]) + R_{n-1}[2:0]) >> 3$$
$$G_n\,[7:2] \leq (G_x[7:0]) + G_{n-1}[1:0]) >> 2$$
$$B_n\,[7:3] \leq (B_x[7:0]) + B_{n-1}[2:0]) >> 3$$

Where:
(R_n, G_n, B_n) = Output RGB-565 pixel
(R_x, G_x, B_x) = Input RGB-888 pixel
(R_{n-1}, G_{n-1}, B_{n-1}) = Pseudo random error (LSB of the cumulative error)

(b) Ordered Dithering

Set the DC[1:0] bits in VnMC to B'01 to perform dithering using the ordered dithering method.

$$R_n\,[7:3] \leq (R_x[7:0]) + D\,42_{xy}) >> 3$$
$$G_n\,[7:2] \leq (G_x[7:0]) + D\,22_{xy}) >> 2$$
$$B_n\,[7:3] \leq (B_x[7:0]) + D\,42_{xy}) >> 3$$

Where:
(R_n, G_n, B_n) = Output RGB-565 pixel
(R_x, G_x, B_x) = Input RGB-888 pixel
($D22_{xy}$, $D42_{xy}$) = Input x, y coordinate dithering matrix result

$$D22 = \begin{bmatrix} 0 & 3 \\ 2 & 1 \end{bmatrix}, D42 = \begin{bmatrix} 0 & 3 & 4 & 7 \\ 2 & 1 & 6 & 5 \end{bmatrix}$$

22.3.9 Internal Field Signal Generation

As the video input module controls capture of data in interlaced mode, correct capture control is not achieved if the external field signal level does not change.

Through the internal field signal generation function, the VIN can control the capture field signal even when the input field signal does not change, such as during progressive data capturing. The following settings can be made for the internal field generation function through the FTEV and FTEH bits in the data mode register 2 (VnDMR2).

- VSYNC field toggle mode (FTEV = 1 in VnDMR2)
  When this setting is made, the VSYNC field toggle mode is entered for capture field signal control if the input field signal does not change for the VSYNC cycles specified by the VLV bits in VnDMR2. The toggle mode is canceled when a change in the external field signal level is detected (the capture operation is controlled according to the input field signal).
- HSYNC field toggle counter (FTEH = 1 in VnDMR2)
  This counter counts the capture active lines. If the external field signal does not change until the count reaches the HLV setting in VnDMR2, the capture field signal is controlled.

Notes: 1. Do not set both the FTEV and FTEH bits in VnDMR2 at the same time.
2. Immediately after cancellation of the toggle mode, capture control is skipped for one VSYNC cycle in some cases depending on the input field signal state.

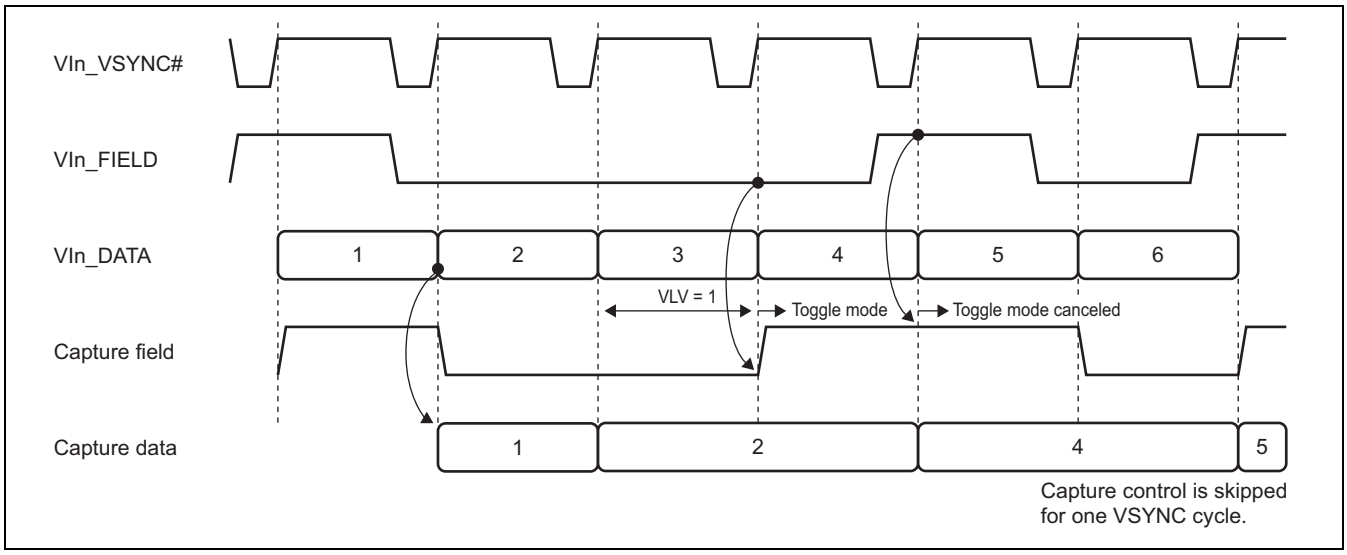

Figure 22.18 Overview and Notes of VSYNC Field Toggle Mode

22.3.10 Output Data Format

The VIN can output image data in the following formats. The figures in this section assume that data is stored in unified memory in little endian.

(1) YC: YCbCr-422, 8 bits

The 8-bit YUV image data in the YC (YCbCr) = 4:2:2 format is shown below. YC data can be switched between the UYVY format and YUYV format through the BPSM bit in VnDMR.

- BPSM = 0 in VnDMR: UYVY format

8-bit YCbCr-422 data (UYVY format)

	63	56	55	48
D63 to D48				
Image data 3 and 4	Y3[7:0]		Cr2[7:0]	
D47 to D32	47	40	39	32
Image data 3 and 4	Y2[7:0]		Cb2[7:0]	
D31 to D16	31	24	23	16
Image data 1 and 2	Y1[7:0]		Cr0[7:0]	
D15 to D0	15	8	7	0
Image data 1 and 2	Y0[7:0]		Cb0[7:0]	

- BPSM = 1 in VnDMR: YUYV format

8-bit YCbCr-422 data (YUYV format)

	63	56	55	48
D63 to D48				
Image data 3 and 4	Cr2[7:0]		Y3[7:0]	
D47 to D32	47	40	39	32
Image data 3 and 4	Cb2[7:0]		Y2[7:0]	
D31 to D16	31	24	23	16
Image data 1 and 2	Cr0[7:0]		Y1[7:0]	
D15 to D0	15	8	7	0
Image data 1 and 2	Cb0[7:0]		Y0[7:0]	

(2) YC: YC Separation YCbCr-422, 8 bits

This is 8-bit YUV image data in the YC separated YC (YCbCr) = 4:2:2 format. UV data is supported by the NV12 format only.

If the YMODE[2:0] bits in the data mode register (VnDMR) are set to B'000 or B'001, setting the DTMD[1:0] bits in VnDMR to B'10 changes the format to 4:2:2 and transfers the UV data to an address which is specified by the addition of the value set in the UV address offset register (VnUVAOF) to the Memory Base. If the YMODE[2:0] bits in VnDMR are set to B'001, only Y data can be transferred and UV data cannot be transferred.

Y data

D31 to D16	31	24	23	16
Image data 3 and 4	Y3[7:0]		Y2[7:0]	

D15 to D0	15	8	7	0
Image data 1 and 2	Y1[7:0]		Y0[7:0]	

Cb, Cr data

D31 to D16	31	24	23	16
Image data 3 and 4	Cr2[7:0]		Cb2[7:0]	

D15 to D0	15	8	7	0
Image data 1 and 2	Cr0[7:0]		Cb0[7:0]	

(3) YC: YC Separation YCbCr-422, 10 bits

This is 10-bit YUV image data in the YC separated YC (YCbCr) = 4:2:2 format. UV data is supported by the NV12 format only.

If the YMODE[2:0] bits in the data mode register (VnDMR) are set to B'010 or B'011, setting the DTMD[1:0] bits in VnDMR to B'10 converts 10-bit Y data to 16-bit and changes the format to 4:2:2. UV data is transferred to the address obtained by adding the value set in the UV address offset register (VnUVAOF) to Memory Base. If the YMODE[2:0] bits in VnDMR are set to B'011, only Y data can be transferred and UV data cannot be transferred.

Notes: 1. A word address is output for Y data according to the VnIS register setting.
2. A byte address is output for CbCr data according to the VnIS register setting.

Y data

D31 to D16	31					26	25									16
Image data 3 and 4	0	0	0	0	0	0	Y1[9:0]									

D15 to D0	15					10	9									0
Image data 1 and 2	0	0	0	0	0	0	Y0[9:0]									

Cb, Cr data

D31 to D16	31								24	23							16
Image data 3 and 4	Cr2[7:0]									Cb2[7:0]							

D15 to D0	15								8	7							0
Image data 1 and 2	Cr0[7:0]									Cb0[7:0]							

(4) YC: YC Separation YCbCr-422, 12 bits

This is 12-bit YUV image data in the YC separated YC (YCbCr) = 4:2:2 format. UV data is supported by the NV12 format only.

If the YMODE[2:0] bits in the data mode register (VnDMR) are set to B'100 or B'101, setting the DTMD[1:0] bits in VnDMR to B'10 converts 12-bit Y data to 16-bit and changes the format to 4:2:2. UV data is transferred to the address obtained by adding the value set in the UV address offset register (VnUVAOF) to Memory Base. If the YMODE[2:0] bits in VnDMR are set to B'101, only Y data can be transferred and UV data cannot be transferred.

Notes: 1. A word address is output for Y data according to the VnIS register setting.
2. A byte address is output for CbCr data according to the VnIS register setting.

Y data

D31 to D16	31			28	27											16
Image data 3 and 4	0	0	0	0	Y1[11:0]											

D15 to D0	15			12	11											0
Image data 1 and 2	0	0	0	0	Y0[11:0]											

Cb, Cr data

D31 to D16	31							24	23							16
Image data 3 and 4	Cr2[7:0]								Cb2[7:0]							

D15 to D0	15							8	7							0
Image data 1 and 2	Cr0[7:0]								Cb0[7:0]							

(5) 16 Bits/Pixel: RGB-565

The RGB levels are expressed through 5 bits for R, 6 bits for G, and 5 bits for B.

16 bits/pixel data (RGB data) format

D15 to D0	15				11	10				5	4				0
Image data	R[4:0]					G[5:0]					B[4:0]				

(6) 16 Bits/Pixel: ARGB-1555

The ARGB levels are expressed through 1 bit for A, 5 bits for R, 5 bits for G, and 5 bits for B. For data conversion to ARGB-1555, the lowest bit of the G data in RGB-565 data is truncated, and the A value specified through the register is added.

Set the DTMD[1:0] bits in the data mode register (VnDMR) to B'01 to specify conversion to ARGB-1555, and specify the A value in the ABIT bit in VnDMR.

16 bits/pixel data (ARGB data) format

D15 to D0	15	14				10	9				5	4				0
Image data	A	R[4:0]					G[4:0]					B[4:0]				

(7) 32 Bits/Pixel: RGB-888

The RGB levels are expressed through 8 bits for R, 8 bits for G, and 8 bits for B. Bits 31 to 24 are fixed to 0.

32 bits/pixel data (RGB data) format

D31 to D16	31							24	23							16
Image data	0	0	0	0	0	0	0	0	R[7:0]							

D15 to D0	15							8	7							0
Image data	G[7:0]								B[7:0]							

(8) 32 Bits/Pixel: ARGB-8888

The ARGB levels are expressed through 8 bits for A, 8 bits for R, 8 bits for G, and 8 bits for B. The A value specified by the A8BIT[7:0] bits in VnDMR is set in bits 31 to 24.

32 bits/pixel data (ARGB data) format

D31 to D16	31							24	23							16
Image data	A[7:0]								R[7:0]							

D15 to D0	15							8	7							0
Image data	G[7:0]								B[7:0]							

22.3.11 Endian Conversion

The VIN stores captured data in memory in little endian with the initial settings. Set the EN bit in the main control register (VnMC) to 1 to convert data into big endian before storing in memory.

Endian conversion in word units is controlled through the EN bit in VnMC, and swapping in byte units is controlled through the BPSM bit in the data mode register (VnDMR). For conversion to big endian, specify the BPSM bit as shown in the following table according to the data format specified through the DTMD bits in VnDMR and BPS bit in VnMC.

Table 22.16 Endian Conversion Unit

Data Format	BPS in VnMC	DTMD[1:0] in VnDMR	EXRGB in VnDMR	BPSM in VnDMR	Endian Conversion Unit
RGB-565	0	00	0	0	Word units
RGB-888	0	00	1	0	Longword units
YCbCr-422	1	00	0	1	Byte units
ARGB-1555	0	01	0	0	Word units
ARGB-8888	0	01	1	0	Longword units
YC	1	10	0	0	Byte units

The following figures show endian conversions in byte, word, and longword units.

Endian conversion in byte units:

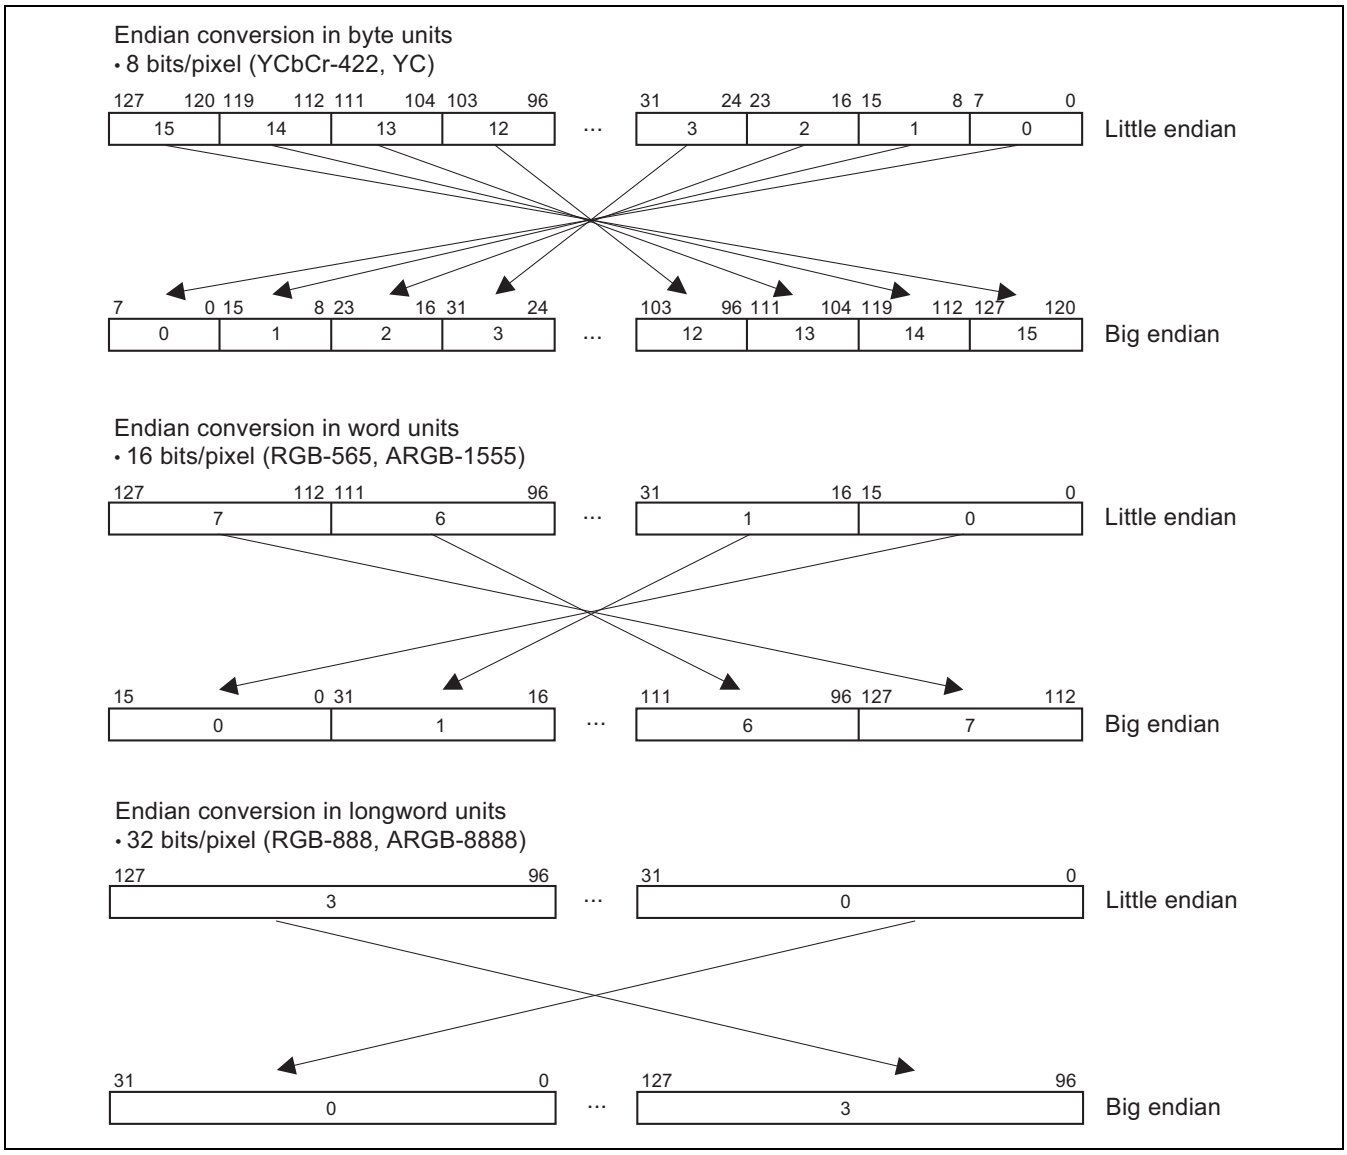

Figure 22.19 Data Alignment Conversion from Little Endian to Big Endian

22.4 Usage Notes

22.4.1 Module Standby Mode

The LSI supports module standby mode in which clock supply to the VIN is stopped. The video input module should not be accessed during module standby mode.

22.4.2 Transition to Module Standby Mode

1. Clear the module enable (ME) bit in the main control register (VnMC) and the continuous frame capture (CC) bit and the single frame capture (SC) bit in the frame capture register (VnFC) to 0 to stop the video input module.
2. Confirm that the capture active (CA) bit in the module status register (VnMS) is cleared to 0.
3. Stop the clock supply.

22.4.3 Cancellation of Module Standby Mode and Restarting of Video Input Module

1. Start the clock supply.
2. Set the module enable (ME) bit in the main control register (VnMC) to 1 to start the video input module.
3. Set the continuous frame capture (CC) bit or the single frame capture (SC) bit in the frame capture register (VnFC) to 1.

22.4.4 Limitations on Usage

The VIN does not operate correctly in some cases depending on the usage. The following shows cases that require attention.

Table 22.17 Limitations on Usage

<table>
<tr><th>Item</th><th>Description</th></tr>
<tr><td>Limits on input video clock</td><td>The upper limit on frequency of the input video clock varies with the clock mode, capture interface and scaling ratio. The upper limits on frequency of the video clock for this module as a stand-alone unit are shown below. Usage of other modules may make reaching the upper limits impossible. Fully evaluate performance before deciding on the settings for the input video clock, particularly if you are using magnification.
Upper limits on video-clock frequency for this module as a stand-alone unit

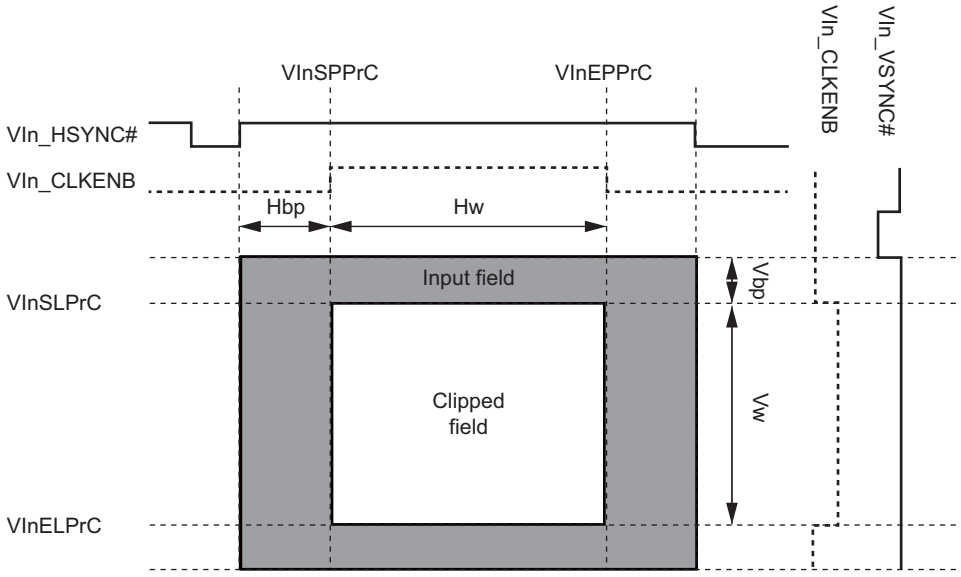
Be sure to evaluate the image quality before practical application.</td></tr>
<tr><td>Interrupt event timing</td><td>Interrupt event asserted by this module indicates the time when an interrupt event occurs in VIN, not the time when the transfer of capture data to memory is completed.</td></tr>
</table>

Item	Description
Pixel post-clip setting	When the output format is YCbCr-422, after pixel post-clip setting is performed for the clipping data, this data is transferred in YCbCr-422 data format to memory. Therefore, if the EPPoC-SPPoC clipping size is an odd number, it is normalized to an even size which is the sum of that odd number and 1.
Coefficient settings for color space conversion	Specify appropriate values in the color space change coefficient 1 to 3 registers (VnCSCC1 to VnCSCC3) to keep the RGB image data within the range 0 ≤ R', G', B' ≤ 255. After calculation for color space conversion, minus pixel data is normalized to 0 and pixel data more than or equal to 255 is normalized to 255.
Scaling up	When horizontal and vertical scaling up is specified, the amount of memory transfer becomes greater with an increase in traffic. Note the amount of traffic on the entire system when using the scaling-up function because the overall transfer efficiency of the system might degrade due to the increased use of the internal buses.
YC Restrictions on YC separation function	Set the offset register that stores UV data (VnUVAOF) such that the storage areas of Y and UV data are not the same. If the same storage area is set for both data, Y data will be overwritten.
	It is not allowed to set the YC separate transfer or Y transfer with the vertical scaling-up.
RGB-888→RGB-565 conversion function	In the dithering process by cumulative addition, if the same color is captured as in blue back image, periodic noise may be generated by the cumulative addition process (carried by addition). In this case, set the DC[1:0] bits in VnMC to the ordered dithering.
Video display operation	This module performs capture control based on the external input synchronization signal. Note that it is not synchronous to the timing of frame update set in the Display Unit and thus video display in sync with the capture frame is disabled.

Item	Description
The maximum size that can be captured when the HSYNC signal is connected to the VIn_CLKENB pin (including the case where the CHS bit of the VnDMR2 register is set to 1).	



Hbp: Horizontal back porch period
Hw: Horizontal valid pixels
Vbp: Vertical back porch period
Vw: Vertical valid lines

Capture area when the HSYNC signal is connected to the VIn_CLKENB pin

When the ITU-R BT.601/709/1358 interface is in use, so the HSYNC signal is connected to the VIn_CLKENB pin (including the case where the CHS bit of the VnDMR2 register is set to 1), the VIN also captures data during the horizontal and vertical back porch periods (Hbp and Vbp). Thus, capturing only the valid data is required by setting the clipping registers as shown below.

- VnSLPrC (start line pre-clip register) = vertical back porch period (Vbp)
- VnELPrC (end line pre-clip register) = vertical back porch period (Vbp) + number of valid lines (Vw) – 1
- VnSPPrC (start pixel pre-clip register) = horizontal back porch period (Hbp)
- VnEPPrC (end pixel pre-clip register) = horizontal back porch period (Hbp) + number of valid pixels (Hw) – 1

The maximum number of lines and pixels that can be captured at this time is as shown below. When this size is exceeded, use the VIN with the data enable signal connected to the VIn_CLKENB pin.

- The maximum number of lines that can be captured = 2048 (the maximum value of the clipping register) – vertical back porch period (Vbp)
- The maximum number of pixels that can be captured = 2048 (the maximum value of the clipping register) – horizontal back porch period (Hbp)

22.5 Supplementary Information

22.5.1 Example of Coefficient Set Register Settings for Horizontal Scaling

Table 22.18 shows the example of coefficient set register settings for horizontal (X) scaling (Recommended values).

Table 22.18 Coefficient Set Register Settings

- α = 0.6 and X Scale (XS) = H'0000 1600

23. VCP3

23.1 Overview

The VCP3 is a multi-codec module which provides encoding and decoding capabilities on the basis of multiple video coding schemes, e.g., H.264/AVC, MPEG-4, MPEG-2 and VC-1. This module is a multi codec that processes the frame or each field by controlling software for VCP3 executed on host CPU.

23.1.1 Features

The VCP3 has the following excellent features.

- Support for multiple codecs
  - H.264/MPEG-4 AVC HP (High Profile) and MVC SHP (Stereo High Profile) encoding and decoding
  - H.262/MPEG-2 MP (Main Profile) decoding
  - MPEG-4 ASP (Advanced Simple Profile) decoding
  - VC-1 SP/MP/AP (Simple, Main, Advanced Profile) decoding
  - H.263 Baseline and decoding
  - AVS Jizhun Profile decoding
  - VP8 decoding Support for HDTV resolutions
  - 1,920 pixels × 1,080 lines @ 60 frames/second
- Number of channels
  - One channel
- Data handling on a picture-by-picture basis
  - Encode/decode data one picture (frame or field) at a time.
- High picture quality
  - Support the H.264 high-efficiency coding tools (CABAC, 8 × 8 frequency conversion, and quantization matrix).
  - High-efficiency motion vector detection by a combination of discrete search and trace search
  - Highly efficient real-time intra-prediction by Prediction from Original Image (POI)
  - Optimal-mode selection by Rate-Distortion (RD) cost evaluation
  - Picture quality control based on activity analysis results which match visual models
- Dedicated cache memory for VCP3 is integrated on this LSI. (64 Kbytes)

Table 23.1 Main Function of VCP3

Item	Description
Encoding standard supported	• H.264/AVC High Profile@Level 4.2, Main Profile@Level 4.2, Baseline Profile@Level 3 • H.264/MVC Stereo High Profile@Level 4.1
Decoding standard supported	• H.264/AVC High Profile@Level 4.2, Main Profile@Level 4.2, Baseline Profile@Level 3, Constrained Baseline Profile@Level 4.2 H.264/MVC (Error resilience tools (ASO, FMO, and RS) are not supported.) Stereo High Profile@Level 4.1 • MPEG-2 Main Profile@High Level • MPEG-4 Advanced Simple Profile3@Level 5 (GMC and QMC are not supported), Simple Profile@Level 6 • VC-1 Simple Profile@Medium Level, Main Profile@High Level, Advanced Profile@Level 3 • H.263 Baseline@Level 40 • VP8 • AVS Jizhun Profile@Level 6.2 (picture format 4:2:0 only)
Maximum throughput	1,920 × 1,080p, 60 frame In VP8 decoding, the maximum ratio of non-display frame is once every five frames.
Maximum bit rate	80 Mbps (40 Mbps × 2 ch). For MPEG-4 Data Partition, and VP8, the maximum bit rate is 60 (30 Mbps × 2 ch).
Picture size supported	Minimum: Horizontal 80 pixels × Vertical 80 lines (except for H.263), 128 pixels × Vertical 96 lines (H.263) Maximum: Horizontal 1,920 pixels × Vertical 1,088 lines Horizontal size is a multiple of 2 pixels, and vertical size is a multiple of 2 lines. 1,080 × 1,920 and 1,088 × 1,920 are supported.
Color format	YCbCr 4:2:0 format NV12, NV21, YV12 and IYUV are supported.
Bit stream format	Video elementary stream. Table 23.2 shows the range of data which can be encoded and decoded. Function to add/remove the emulation prevention byte in the H.264 VCL-NAL unit. (VCL (Video Coding Layer), NAL (Network Abstraction Layer)) Function to remove the emulation prevention byte in the VC-1 AP bit stream data unit. Function to remove the emulation prevention bit for AVS.
Picture structure	Frame structure and field structure

Item	Description
Motion detection	Motion search accuracy: 1/4 pixels (1/2 pixels for MPEG-2. MPEG-4, and H.263) Motion search range: 1. frame reference Horizontal ± 64 pixels, Vertical ± 32 lines 2. frame references (Wide side) Horizontal ± 48 pixels, Vertical ± 24 lines (Narrow side) Horizontal ± 32 pixels, Vertical ± 16 lines

Table 23.2 Data Format Handled by the VCP3

Standard	Encoding Range	Decoding Range
MPEG-4	Not supported	Video packet header/Motion shape texture and subsequent data
H.264	Slice header and subsequent data	Slice header and subsequent data (Except for first slice header in a picture)
H.263	Not supported	Macroblock and subsequent data
MPEG-2	Not supported	Picture data and subsequent data
MPEG-1	Not supported	Picture data and subsequent data
VC-1	Not supported	Slice data and subsequent data
AVS	Not supported	Picture data and subsequent data
VP8	Not supported	Frame header and subsequent data

23A. Video Processing Unit Cache (VPC)

23A.1 Overview

This LSI incorporates cache memory exclusively for use in image reference by the VCP3. This can reduce the amount of bus access for decoding.

23A.1.1 Features

The video processing unit cache (VPC) has the following features.

- 64-Kbyte cache
- Eight-way set-associative cache
- Line size: 64 or 128 bytes
- Number of entries: 128 entry/way (64-byte line size) or 64 entry/way (128-byte line size)
- Exclusively for reading
- FIFO (first-in first-out) replacement algorithm

23A.1.2 Block Diagram

Figure 23A.1 shows connection between VCP3, VPC, and system bus.

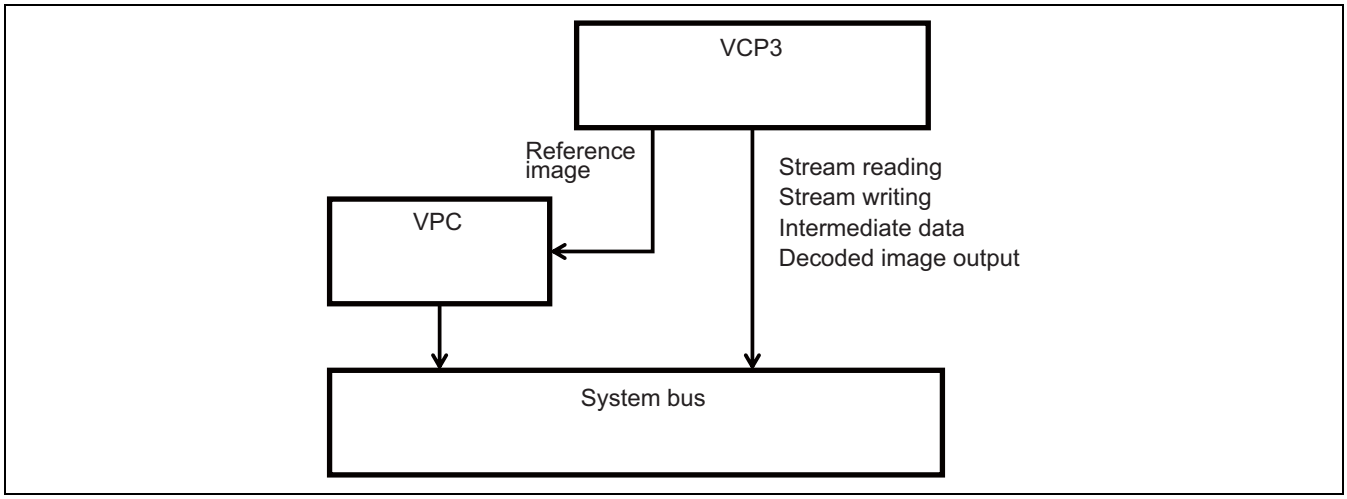

Figure 23A.1 Connection between VCP3, VPC, and System Bus

23A.1.3 Register Configuration

Table 23A.1 shows the VPC register configuration and Table 23A.2 shows the states of the registers in each of the processing modes. The registers can be accessed only in longwords.

Base address:

VPC for VCP3 (VPC0_BASE): H'FE90 8000

Table 23A.1 Register Configuration

Register Name	Abbreviation	R/W	Address	Access Size
VPC control register	VPCCTL	R/W	VPC0_BASE + H'0004	32
VPC status register	VPCSTS	R	VPC0_BASE + H'0008	32
VPC configuration register	VPCCFG	R/W	VPC0_BASE + H'0078	32
VPC XY setting register for ch0	VPC0XY	R/W	H'FE96 0380	32

Note: Do not access addresses other than those listed above. Operations cannot be guaranteed if access is attempted.

Table 23A.2 States of Registers in Each Processing Mode

Register Abbreviation	Power-On Reset	Module Standby
All registers	Initialized	Retained

23A.2 Register Descriptions

23A.2.1 VPC Control Register (VPCCTL)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	F64	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	LWS WAP	—	—	—	—	—	—	—	—	STRIDE		CLR	ENB
Initial value:	0	0	0	0	1	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved The write value should always be 0.
28	F64	0	R/W	64 Byte/Line Cache Mode When this bit is set to 1, the cache is configured as 64 bytes per line mode. 128 bytes per line mode is selected as initial value setting. On this product, this bit should be set to 1.
27 to 13	—	All 0	R	Reserved The write value should always be 0.
12	LWSWAP	0	R/W	Longword Swap 0: No longword swap 1: Longword swap When 8-, 16-, or 32-byte access is made with this bit set to 1, the read data is swapped in longwords.
11 to 8	—	H'A	R	Reserved Modifying these bits may affect the performance; usually leave the initial value unmodified.
7 to 4	—	H'8	R	Reserved Modifying these bits may affect the performance; usually leave the initial value unmodified.
3, 2	STRIDE	00	R/W	VPC Stride Setting These bits set the stride for VPC operation. 00: 256-byte stride mode 01: 512-byte stride mode 10: 1024-byte stride mode 11: 2048-byte stride mode The VPC access hit ratio depends on this setting; set these bits appropriately for the size to be processed. Note: XY mode case by setting VPCCFG.MODE to 1. Be sure the stride size of VCP3 is same as this setting.

Bit	Bit Name	Initial Value	R/W	Description
1	CLR	0	R/W	VPC Clear Clears the VPC state. 0: VPC operates normally. 1: VPC is cleared. Before modifying the VPC stride setting, write 1 to this bit to clear the VPC. After the VPC is cleared by writing 1 to this bit, this bit automatically returns to 0.
0	ENB	0	R/W	VPC Enable Enables the VPC. 0: Disables the VPC 1: Enables the VPC Set this bit to 1 to use the VPC. Do not modify this bit during VCP3 operation; otherwise, correct operation cannot be guaranteed. (Modify this bit after checking the VPCSTS register.)

23A.2.2 VPC Status Register (VPCSTS)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IDL
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	—	R	Reserved The read value is undefined. The write value should be 0 or 1, which has been read immediately before writing (read-modify-write).
0	IDL	—	R	VPC Idle 0: VPC is operating. 1: VPC is in the idle state. Indicates the VPC processing state. Confirm that this bit is 1 before clearing the cache.

23A.2.3 VPC Configuration Register (VPCCFG)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	CTLH			CTLW		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	YTLH			YTLW			TL	MODE
Initial value:	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved The write value should always be 0.
21 to 19	CTLH	000	R/W	Tile Height Size Setting for Chroma (CbCr) data 000: 32 001: 64 010: 128 011: 256 100: 512 101: 16 Others: Settings are prohibited.
18 to 16	CTLW	000	R/W	Tile Width Size Setting for Chroma (CbCr) data 000: 32 001: 64 010: 128 011: 256 100: 512 101: 16 Others: Settings are prohibited.
15 to 8	—	H'03	R	Reserved The write value should always be H'03.
7 to 5	YTLH	000	R/W	Tile Height Size Setting for Luminance (Y) data 000: 32 001: 64 010: 128 011: 256 100: 512 101: 16 Others: Settings are prohibited.

Bit	Bit Name	Initial Value	R/W	Description
4 to 2	YTLW	000	R/W	Tile Width Size Setting for Luminance (Y) data 000: 32 001: 64 010: 128 011: 256 100: 512 101: 16 Others: Settings are prohibited.

0	MODE	0	R/W	VPC addressing mode select 0: Linear addressing 1: XY addressing

23A.2.4 VPC XY Setting Register for ch0 (VPC0XY)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	STRIDE								AC	—	BT	AD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved The write value should always be 0.
11 to 4	STRIDE	H'00	R/W	This value should always be set as same as VPCCTL.STRIDE.
3	AC	0	R/W	This value should always be set to 0.
2	—	0	R	Reserved. The write value should always be 0.
1	BT	1	R/W	This value should be set based on the value of VPCCFG.MODE VPCCFG.MODE = 1 set this bit to 1. VPCCFG.MODE = 0 set this bit to 0.
0	AD	1	R/W	This value should be set based on the value of VPCCFG.MODE VPCCFG.MODE = 1 set this bit to 1. VPCCFG.MODE = 0 set this bit to 0.

23A.3 Operation

23A.3.1 Initialization

When using the VPC, before accessing the VPC from the VCP3, be sure to make the necessary settings as described in 1 to 4 below.

1. Set the stride and cache line size.
   Set the stride appropriate for the image size to be processed. (Set as same stride size as VCP3 stride size)
   The stride can be set using bits 3 and 2 in the VPCCTL register.
   Set the cache line size to 64 byte / line by setting bit 29 in VPCCTL register to 1.
2. Set the VPC mode
   Set the VPC mode by setting VPCCFG.MODE.
   VPCCFG.MODE = 0
      Set H'0000 0000 to VPC0XY register.
      Set bits[11:8] in S3CTRL.XYMODECONF to H'F.
   VPCCFG.MODE = 1
      Set bits [11:8] in S3CTRL.XYMODECONF to H'F
3. Set the tile size
   Set appropriate tile size in the VPCCFG register
   The tile size can be set using bit 21 to 16 and bit 7 to 2 for Chroma data and Luminance data respectively.
3. Clear the VPC.
   Clear the VPC after confirming that bit 0 in the VPCSTS register is 1.
   The VPC can be cleared by writing 1 to bit 1 in the VPCCTL register.
4. Enable the VPC.
   Enable the VPC after confirming that bit 0 in the VPCSTS register is 1.
   The VPC can be enabled by writing 1 to bit 0 in the VPCCTL register.

23A.3.2 Clearing VPC at the Beginning of a Frame

Before accessing the beginning of a frame, clear the VPC following steps 1 and 2 below.

1. Check the status.
   Confirm that bit 0 in the VPCSTS register is 1.
2. Clear the VPC.
   Clear the VPC by writing 1 to bit 1 in the VPCCTL register.

23A.4 Usage Notes

23A.4.1 Coherency

At the beginning of a frame, be sure to clear the VPC according to the procedure given in section 23A.3.2, Clearing VPC at the Beginning of a Frame.

23A.4.2 Tile Size

Appropriate tile size for this LSI: 128 × 32

24. Fine Display Processor (FDP1)

24.1 Functional Description

24.1.1 Overview

The FDP1 is the de-interlacing module which converts the interlaced video to progressive video. This product provides one channel. This module has the following features.

1. Supports various data formats
   - Input: YCbCr444/422/420
   - Output: YCbCr444/422/420 and RGB/αRGB
2. Full HD video processing performance
   - Can process maximum Full-HD 60i to 60p at 266 MHz operating frequency.
3. High image-quality de-interlacing algorithm (basing on luma component only)
   - Motion adaptive de-interlacing
   - Accurate still detection
   - Diagonal line interpolation (DLI)

24.1.2 FDP1 Architecture

Figure 24.1 shows the block diagram of the FDP1. In this figure, "Previous field image" and "Next field Image" are luma image only.

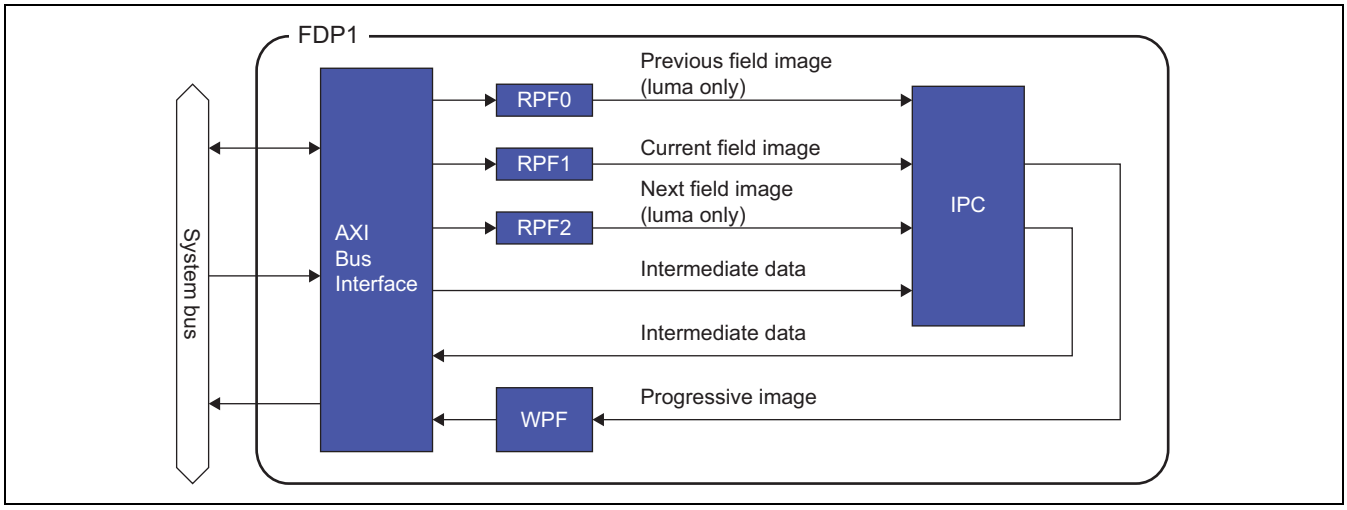

Figure 24.1 FDP1 Block Diagram

The following gives an overview of each block function shown in Figure 24.1. The operation of these functions is determined by the register setting explained in section 24.3. Refer to section 24.3 for the relationship between the register setting and the functional behavior.

(1) ABI (AXI Bus Interface)

The FDP1 applies processing to the image data stored in the external memory and writes the resultant data back to the external memory. The data transfer between the external memory and FDP1 necessary for this operation is done by the ABI, which works as the bus master, according to the register settings. The ABI executes this data transfer between the external memory and FDP1.

(2) RPF (Read Pixel Formatter)

The RPF reads image data from the external memory through the ABI, unpacks data according to the specified format, and outputs the resultant data to the IPC. The input format unpacking unit expands the image data input from the ABI into the image format for internal processing.

The FDP1 provides three RPF modules (RPF0 to RPF2). RPF0 reads the previous field, RPF1 reads the current field and RPF2 reads the next field for processing de-interlacing operation.

(3) IPC (Interlace to Progressive Converter)

The IPC is the de-interlacing module which reads the field image through RPFn and writes back the progressive image to the external memory through WPF. The IPC uses the motion adaptive algorithm which enhances the image resolution of still pixels compared with conventional 2D de-interlacing.

Note: The motion adaptive algorithm is applied to only luma component. Conventional 2D de-interlacing is applied to chroma component.

(4) WPF (Write Pixel Formatter)

The WPF is an output module that receives image data from the IPC, converts the color space, number of colors, and format of the data, and outputs the results of FDP1 image processing to external memory through the ABI. The WPF is mainly configured from a color space converter and an output format converter (the packing unit).

The color space converter converts the color space between RGB and YCbCr, and the packing unit converts the format into the picture plane storing format. The FDP1 provides one WPF.

24.2 Function List

Table 24.1 shows a functional overview of the FDP1 module.

Table 24.1 Function List

Read Pixel Formatter (RPF)

Number of channels			Three channels (RPF0 to RPF2)
Image Format	Input*3	YCbCr	YCbCr444-PL, SP, ILV*1 YCbCr422-PL, SP, ILV*1 YCbCr420-PL, SP*1
		Maximum size	H2048 × V2048 pixels (Frame) H2048 × V1024 pixels (Field)
		Minimum size	H80 × V80 pixel (Frame) H80 × V40 pixel (Field)
		Size setting unit	YCbCr420: 2-pixel units both horizontally and vertically. YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.

Write Pixel Formatter (WPF)

Number of channels			One channel (WPF)
Image format	Output	RGB	RGB332, RGB444, RGB565, RGB666, RGB888, αRGB8666, αRGB8888, αRGB4444, αRGB1555 α value is fixed.
		YCbCr	YCbCr444-PL, SP, ILV*1 YCbCr422-PL, SP, ILV*1 YCbCr420-PL, SP*1
		Maximum size	H2048 × V2048 pixels
		Minimum size	H80 × V80 pixel
		Size setting unit	YCbCr420: 2-pixel units both horizontally and vertically. YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.
Color space conversion	YCbCr to RGB	Conversion expression	BT.601 (16, 235/240) to RGB (0, 255) BT.709 (16, 235/240) to RGB (0, 255) BT.601 (0, 255) to RGB (0, 255) BT.709 (16, 235/240) to RGB (16, 235)
Changing number of colors	Output	Reducing RGB color depth	Dithering, lower-order bit truncation, or rounding
		YCbCr422/420	CbCr skipping or CbCr vertical skipping and horizontal skipping

Interlace to Progressive Converter (IPC)

De-interlacing	Mode	Frame rate	Equal rate (60i to 60p) Half rate (60i to 30p)
		Interpolation (luma)	2D-3D adaptive*2 2D fixed 3D fixed*2
		Interpolation (chroma)	2D fixed
	Algorithm		Motion adaptive (luma only)
Diagonal line interpolation			Supported (luma only)

Notes: 1. PL: Planar, SP: Semi-planar, ILV: Interleaved
2. Source picture structures (field-structure or frame-structure) should be the same structure among the all input pictures.
3. Chroma component (Cb, Cr or U, V) of RPF0, RPF2 is not read from bus in case of planar or semi-planar format and discarded after reading in package with luma component in case of interleaved format because it is processed in fixed 2D de-interlacing.

Preface

Definition of operators and functions

The following operators, notations are defined for explaining the functions of the FDP1.

$\langle x \rangle$

Discard decimal places of value x

H'

The notation “H'” is used as prefix for hexadecimal numbers. For example, H'80 means 80 in hexadecimal and 128 in decimal.

B'

The notation “B'” is used as prefix for binary numbers. For example, B'10000000 means 80 in hexadecimal and 128 in decimal. When a number is used without prefix, it means decimal number.

_

The notation “_” is used as a separator of binary digit for binary number. There is no functional and logical meaning. The meaning of B'10101 and B'1_0101 is the same.

[msb:lsb]

This notation specifies a part of bits or all bits of registers and signals. For example, eval[3:0] means bits 3 to 0 of the signal or register whose name is “eval”.

clip0 (*x*)

Clip to 0 value if x is less than 0. [x = (x < 0)? 0 : x]

clip3 (min., max., x)

The value x shall be clipped so that x shall be min. < x < max. [x = (x < min)? min : ((x > max)? max : x)]

Unit

The unit is defined here for explaining FDP1’s functions.

[bpp]: bits per pixel

The FDP1 can handle a number of image formats. Each image format has different number of data bits. The unit [bpp] shows a number of data bits for one pixel. For example, RGB 8 bpp means that its format is RGB and the pixel consists of 8 data bits.

24.3 Registers

24.3.1 Access Restrictions

FDP1 supports only 32-bit access to read or write all addresses in FDP1 area. Do not access any of otherwise access units.

24.3.2 Register Type Definitions

There are 3 types of registers in FDP1: immediate register, V-update Register and V-update Status Register. The values of immediate registers are reflected to H/W behavior immediately after the changing its values. Hence, do not change these immediate registers while FDP1 is processing unless this manual allows it explicitly. The values of V-update registers are reflected to H/W behavior at the timing of V-interruption (at the timing of FD1_CTL_IRQSTA.VINT is set to 1). Users can change these V-update registers while FDP1 is processing. To reflect V-update registers to the H/W, users have to set FD1_CTL_REGEND.REGEND to 1 after the all V-update registers which are intended to be changed are completely set. The values of V-update Status Registers are updated at the timing of V-interruption. Therefore, the status (FD1_CTL_STATUS) of de-interlacing process which is conducted before a V-interruption must be referred after that V-interruption.

To confirm the types of registers, refer to Table 24.4.

24.3.3 Notational Conventions for Registers and Bit Fields

This document uses the following notational conventions for the FDP1 registers and bit fields.

1. The names of registers and bits are written in uppercase.
2. A bit or bit field in a register is indicated as [register name.bit name]. For example, the STRCMD bit in the FD1_CTL_CMD register is indicated as FD1_CTL_CMD.STRCMD.
3. Lowercase "n" in a register name or a bit name indicates an integer and the range of value n is defined when necessary. For example, FD1_RPFn_ADDR_Y.PSRC_ADDR (n = 0, 1, 2) indicates the PSRC_ADDR bits in three registers FD1_RPF0_ADDR_Y.PSRC_ADDR and FD1_RPF1_ADDR_Y.PSRC_ADDR, and FD1_RPF2_ADDR_Y.PSRC_ADDR. For RPFn when the range of value n is not defined, RPFn (n = 0, 1, 2) are assumed.
4. In each subsection for register description in section 24.3, when only a bit name is written without showing its register name, the bit is in the register described in that subsection.
5. A wildcard (*) indicates any characters in a name and represents all registers or bits that match the specified first part of a name. For example, when there are three registers FD1_RPF0_ADDR_Y, FD1_RPF1_ADDR_C0 and FD1_RPF1_ADDR_C1, FD1_RPF1_ADDR_* indicates three registers.

24.3.4 Register Configuration

The FDP1 registers are arranged in the following order; the general control registers control the operation of the entire FDP1, and the other registers control each image processing and specify parameters for the processing. The functions of the registers are described in this order starting from section 24.3.7.

1. General control registers (FD1_CTL_*)
2. RPF control registers (FD1_RPF_*)
3. WPF control registers (FD1_WPF_*)
4. IPC control registers (FD1_IPC_*)

24.3.5 Restrictions on Access to Registers and Lookup Tables

The FDP1 has control registers and lookup tables. When accessing the addresses where these registers and lookup tables are allocated, the following restrictions should be satisfied. If any restriction is violated, the FDP1 will not operate correctly.

1. For the read-only bits and reserved bits in all FDP1 registers, writing 1 is prohibited unless otherwise specified.
2. Addresses undefined in section 24.3.7, Memory Map, are reserved areas and write access is prohibited in these areas.
3. For all immediate registers and lookup tables, except FD1_CTL_SGCMD, FD1_CTL_SRESET and FD1_CTL_IRQ*, modifying register values during operation of the module is prohibited. Modify registers while the FDP1 is stopped. For the operating status of the FDP1, refer to section 24.3.8.8.

24.3.6 Procedure of FDP1 Start and Stop

24.3.6.1 Register usages for FDP1 Start and Stop

Registers FD1_CTL_CMD, FD1_CTL_SGCMD, and FD1_CTL_REGEND must be used correctly in the procedures of FDP1 start and stop as specified in Tables 24.2 and 24.3.

Table 24.2 Register Usages for Starting FDP1

Register	Start the First Frame (FR[0])	Start the Second or Later Frame (FR[f], f = 1, 2, 3, …)
FD1_CTL_SGCMD.SGEN	After all registers have been set completely, it must be set as 1 to generate V-Interruption.	It must be kept as 1 from the previous frame FR[f-1].
FD1_CTL_REGEND.REGEND	After all registers except FD1_CTL_SGCMD.SGEN have been set completely, it must be set 1. As the results, at the first V-interruption, all V-update registers are reflected for hardware reference, FD1_CTL_CMD.STRCMD is referred to start the first frame.	After V-interruption of starting the previous frame FR[f-1], it must be set 1 after all registers about FR[f] have been set completely. As the results, at the V-interruption of the end of frame FR[f-1], the V-update registers will be reflected to hardware reference, FD1_CTL_CMD.STRCMD is referred to start the frame FR[f].
FD1_CTL_CMD.STRCMD	It must be set 1 when all registers except FD1_CTL_SGCMD.SGEN, FD1_CTL_REGEND.REGEND are set. At the first V-Interruption it is referred by hardware to start the frame.	It must be set 1 when all registers except FD1_CTL_REGEND.REGEND are set At the next V-Interruption (boundary between FR[t-1] and FR[t]) it is referred by hardware to start the frame.

Table 24.3 Register Usages for Stopping FDP1

Register	Stopping Immediately by Software Reset	Stopping after Current Process Finished
FD1_CTL_SGCMD.SGEN	It must be cleared before setting the value of FD1_CTL_SRESET.SRST as 1 so that no more V-Interruption after FDP1 stopped.	After V-interruption at the final frame end (FD1_CTL_IRQSTA.FRE is set as 1) occurred, it must be cleared so that no more V-Interruption is generated after FDP1 stopped
FD1_CTL_REGEND.REGEND		No Interrupt Mode After V-interruption of starting the final frame, it must be set 1 right after clearing FD1_CTL_CMD.STRCMD so that the final V-interruption occurs and operation status of the final frame is updated to V-update status registers for Software reference. Other modes Right after V-interruption at starting the final frame, it must be set 1 right after clearing FD1_CTL_CMD.STRCMD so that operation status of the final frame is updated to V-update status registers for Software reference.
FD1_CTL_CMD.STRCMD	After FDP1 stopped successfully (FD1_CTL_IRQSTA.FRE is set as 1), it must be cleared to prevent wrong operation when the FDP1 is restarted.	After V-interruption of starting the final frame, it must be cleared to prevent wrong operation when the FDP1 is restarted.

24.3.6.2 Register Setting Order for FDP1 Start and Stop

(1) Interrupt Mode or Best Effort Mode

(a) To start the first frame of FDP1 process, set registers in following order.

1. Set all registers other than FD1_CTL_CMD, FD1_CTL_SGCMD, and FD1_CTL_REGEND.
   Set FD1_CTL_CMD.STRCMD to the value 1.
2. Set FD1_CTL_REGEND.REGEND to the value 1.
3. Set FD1_CTL_SGCMD.SGEN to the value 1, then FDP1 starts its process. FD1_CTL_SGCMD.SGEN must be not cleared to continue the second or later frames.

(b) To start the second or later frame, set registers in following order:

1. After V-interruption of the previous frame start timing occurred, set all registers other than FD1_CTL_CMD and FD1_CTL_REGEND.
2. Set FD1_CTL_CMD.STRCMD to the value 1.
3. Set FD1_CTL_REGEND.REGEND to the value 1.
4. At the V-interruption of the previous frame end timing, FDP1 starts the target frame. The V-interruption of the previous frame end timing and the one of the target frame start timing are the same.

(c) To stop FDP1 operation after currently frame finished, set registers as the following.

1. After V-interruption of the current frame start timing occurred, set FD1_CTL_CMD.STRCMD to the value 0. Set FD1_CTL_REGEND.REGEND to the value 1. If this register was completed before the V-Interruption of frame end timing, FDP1 stops its operation and currently frame becomes the last frame of the image sequence. If these register setting could not be completed before the V-Interruption of frame end timing, FDP1 stops its operation in the next V-

interruption. In the latter case, V-update status registers are not updated at V-interruption of frame end but at the next V-interruption at which DF1_CTL_REGEND.REGEND is set as 1.

2. Set FD1_CTL_SGCMD.SGEN to the value 0, then FDP1 will stop generating V-interruption.

(d) To stop FDP1 operation immediately, set registers as the following.

1. Set FD1_CTL_SGCMD.SGEN to the value 0, then FDP1 will stop generating V-interruption.
2. Set FD1_CTL_SRESET.SRST to the value 1. FDP1 will invoke termination process immediately.
3. Wait frame end interrupt from FDP1 or until the register bit FD1_CTL_IRQSTA.FRE is set to 1. After it occurs, FDP1 have finished its processing. With this operation, FDP1 can stop its process quickly, but the output frame of the last frame is corrupted.

(2) No interrupt mode

(a) To start the first frame, set registers in following order.

Same as (1) (a).

(b) To start the second or later frame, set registers in following order.

Same as (1) (b).

(c) To stop FDP1 operation after current frame finished, set registers as the following.

1. After V-interruption of the current frame start timing occurred, set FD1_CTL_CMD.STRCMD to the value 0.
2. Set FD1_CTL_REGEND.REGEND to the value 1. At the V-Interruption of frame end timing, FDP1 stops its operation and current frame becomes the last frame of the image sequence.
3. Set FD1_CTL_SGCMD.SGEN to the value 0, then FDP1 will stop generating V-interruption.

(d) To stop FDP1 operation after current frame finished, set registers as the following.

Same as (1) (d).

24.3.7 Memory Map

Table 24.4 shows the FDP1 memory map. Immediate registers are specified as “Imm”, the V-update registers are indicated as “Vupdt” and the V-update status registers are indicated as “VupdtSt” in register type column in Table 24.4.

Base address of each FDP1:

Ch0: H'FE94 0000

Table 24.4 FDP1 Memory Map

Space	Register Type	Register Name	Abbreviation	Relative Address	Register Type

24.3.8 General Control Registers

24.3.8.1 FDP1 Start Register (FD1_CTL_CMD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STR CMD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	STRCMD	0	R/W	Start Command FDP1 starts the de-interlacing processing if this bit is set to 1. Set this bit after all relevant registers are surely set except for FD1_CTL_REGEND and FD1_CTL_SGCMD. Set this bit to 1 before the FD1_CTL_REGEND.REGEND and FD1_CTL_SGCMD. if FDP1 has to execute process. This bit will keep the value 1 after the set. To clear this bit, write the value 0 to this bit. 0: NOP or stops process at the next timing of V-Interruption. 1: Start FDP1 process at the next timing of V-Interruption. Note that setting of this register is valid if the register FD1_CTL_REGEND.REGEND is set to the value 1 at the timing of next V-Interruption.

24.3.8.2 Sync Generator Register (FD1_CTL_SGCMD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SGEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SGEN	0	R/W	V-Interruption Generator Enable This bit controls V-Interruption. This bit should be set to the value 1 after other all registers are set, and only at the first field of the sequence. Set this bit to the value 1 to execute process in all V-Interruption modes described in section 24.3.8.5. 0: Disable V-Interruption 1: Enable V-Interruption [Important] In case of software reset (FD1_CTL_SRESET.SRST), set this SGEN bit to the value 0. If this bit is cleared during process V-interruption will not occur after FDP1 finished current frame. As a result, FDP1 will not start the next frame because STRCMD is not captured and V-update status registers will not be updated about process information of current frame.

24.3.8.3 Register Set End Register (FD1_CTL_REGEND)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	REG END
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	REGEND	0	R/W	Register Setting Ready Flag Set the value 1 to this bit after completing the setting of parameter registers. Do not write the value 0 to this bit. This bit will be cleared by FDP1 automatically. 0: Writing 0 is prohibited except for after the completion of S/W reset sequence. 1: Registers which are set by SW is ready to be reflected for Hardware reference. The V-update status registers is ready to be reflected for Software reference. The second or later V-interruption in the case No interrupt mode can be generated.

24.3.8.4 Channel Activation Register (FD1_CTL_CHACT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SMW	WR	—	—	—	—	SMR	RD[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	SMW	0	R/W	Refer to Table 24.5 for setting these register fields. The setting of each register field depends on the setting of FD1_IPC_MODE.DIM register bits. Do not set the other values which are specified in Table 24.5.
8	WR	0	R/W	
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	SMR	0	R/W	Refer to Table 24.5 for setting these register fields. The setting of each register field depends on the setting of FD1_IPC_MODE.DIM register bits. Do not set the other values which are specified in Table 24.5.
2 to 0	RD[2:0]	000	R/W	

Table 24.5 FD1_CTL_CHACT Setting for FD1_IPC_MODE.DIM Parameter

PRG*1	DIM [2:0]*2		SMW	WR	SMR	RD2	RD1	RD0	LWord Expression
0 (Interlace Mode)	B’000 (Adaptive 2D/3D)	First field	1	1	0	0	1	0	H'0000 0302
		Second field	1	1	0	1	1	1	H'0000 0307
		Final field	0	1	0	0	1	0	H'0000 0102
		Otherwise	1	1	1	1	1	1	H'0000 030F
	B’010 (Fixed 3D)	First field	0	1	0	0	1	0	H'0000 0102
		Second field	0	1	0	1	1	1	H'0000 0107
		Final field	0	1	0	0	1	0	H'0000 0102
		Otherwise	0	1	0	1	1	1	H'0000 0107
	B’001 (Fixed 2D)		0	1	0	0	1	0	H'0000 0102
	B'011 (Previous field)		0	1	0	0(*3)	1	1	H'0000 0103
	B'100 (Next field)		0	1	0	1	1	0(*3)	H'0000 0106
1 (Progressive Mode)	Set DIM [2:0] as B'001		0	1	0	0	1	0	H'0000 0102

Note: Field order means an input field order to the FDP1.
For example, the first field is the first input field to the FDP1; the first field is processed but not output.
(*1) FD1_CTL_OPMODE.PRG, (*2) FD1_CTL_IPC_MODE.DIM [2:0], (*3) Value 1 can be set but the corresponding data is not read

24.3.8.5 Operation Mode Register (FD1_CTL_OPMODE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	PRG	0	R/W	Progressive Mode When the register field is set to 1, the de-interlacing processing is not executed and the incoming image data is passed through IPC module. 0: Interlace Mode 1: Progressive Mode
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	VIMD[1:0]	00	R/W	V-Interruption Mode This register field sets V-Interruption mode of FDP1. Refer to Table 24.6 for detail. 00: Normal 01: Best Effort 10: No interrupt

Table 24.6 V-Interruption Mode

VIMD[1:0]	V-Interruption Mode Timing		STRCMD Captured Timing
	First Time	Second Time or Later	
B'00 (Normal)	V-Interruption occurs when changes FD1_CTL_SGCMD.SGEN from 0 to 1 and FDP1 is not doing de-interlacing process.	Fixed period interrupt specified by FD1_CTL_VPERIOD in spite of the de-interlacing processing.	Captured at V-Interruption
B'01 (Best effort)		Fixed period interrupt specified by FD1_CTL_VPERIOD If the de-interlacing processing is not completed at the timing specified by FD1_CTL_VPERIOD, V-Interruption is deferred to the end of the processing.	
B'10 (No interrupt)		If FD1_CTL_REGEND is set 1 before the end of the processing (frame end interruption FD1_CTL_IRQSTA .FRE is set as 1) V-Interruption occurs right after the end of the processing. If FD1_CTL_REGEND is set 1 after the end of processing (frame end interruption FD1_CTL_IRQSTA .FRE is set as 1) V-Interruption occurs right after FD1_CTL_REGEND is set. If FD1_CTL_REGEND is not set 1 V-Interruption does not occur.

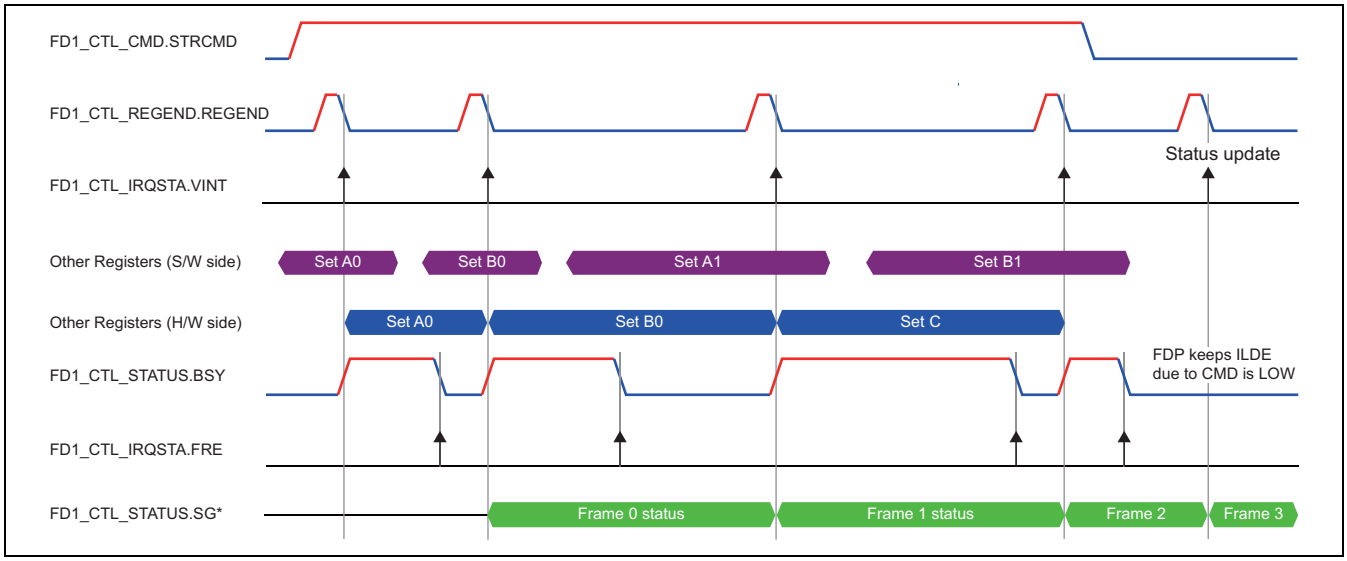

Figure 24.5 Timing Chart of No Interrupt Mode (VIMD = 2)

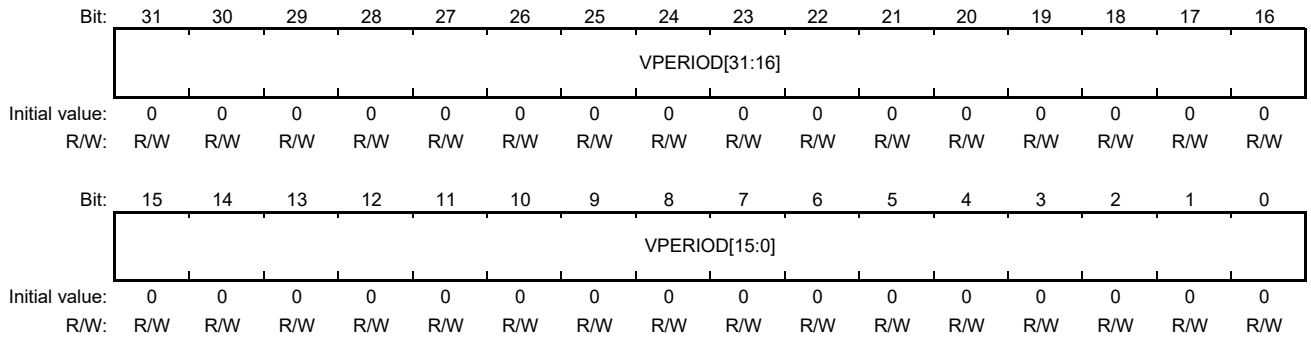
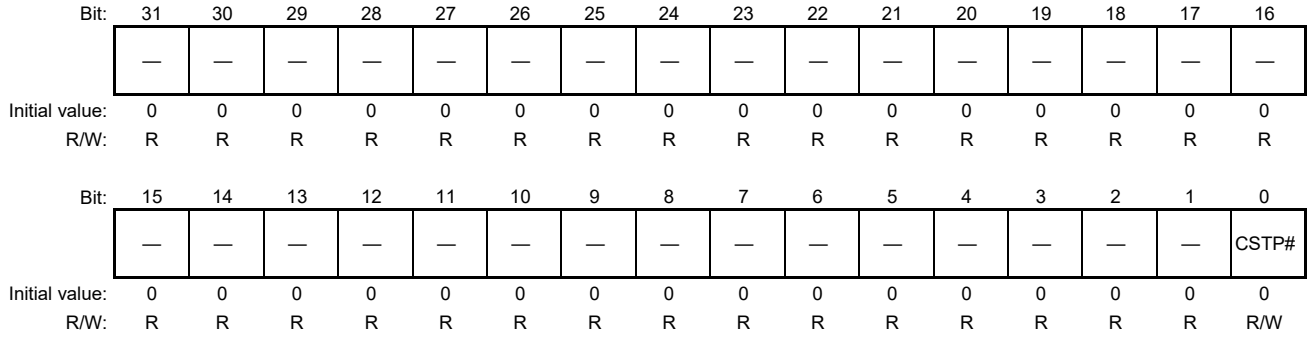
24.3.8.6 V-Period Register (FD1_CTL_VPERIOD)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	VPERIOD [31:0]	All 0	R/W	V-Sync Period Set the period from the V-Sync to the next V-Sync in the unit of FDP1 clock frequency cycles.

24.3.8.7 Clock Control Register (FD1_CTL_CLKCTRL)



Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
0	CSTP#	0	R/W	Set the value 1 to this bit

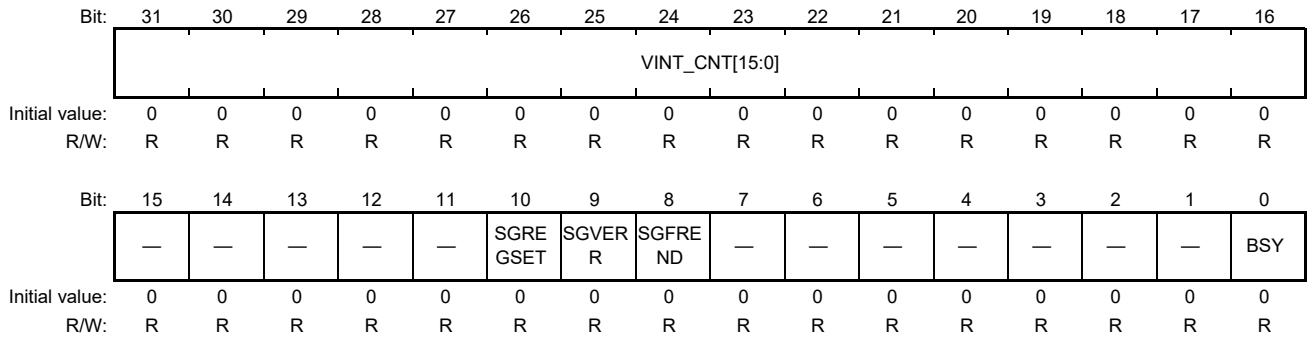
24.3.8.8 Software Reset Register (FD1_CTL_SRESET)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SRST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

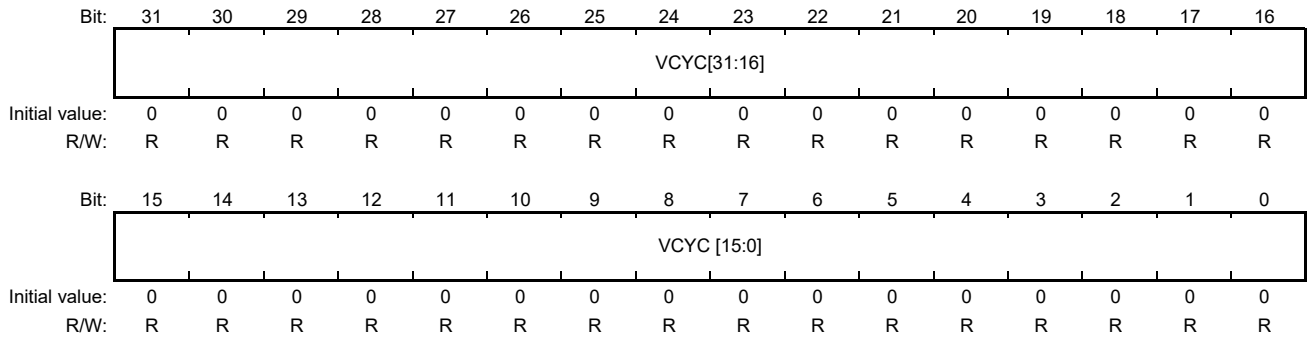
Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SRST	0	R/W	FDP1 Software Reset FDP1 stops its operation after this bit is set to 1. FDP1 aborts all processings and quits bus/memory accesses. Do not start next process by FD1_CTL_CMD until the software processing is completed. When this processing is completed, the FD1_CTL_IRQSTA.FRE interrupt source bit is set to 1, when the FRE interrupt is enabled. This interrupt notifies the end of the reset processing. The end of software reset processing is notified through the FRE bit, but the software reset issued while FDP1 is stopped is ignored as NOP. As it takes a while until the reset is actually issued after the reset bit is set, the FDP1 may complete operation before the reset is actually issued. In this case, no interrupt is output for the software reset that is issued after the FDP1 completes operation. But even through in this case, not that the output image may be destroyed due to software reset process. This bit is always read as 0. 0: NOP 1: Software Reset [Important] Set FD1_CTL_SGCMD.SGEN to the value 0 before write 1 to this SRST bit.

24.3.8.9 Operating Status Register (FD1_CTL_STATUS)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	VINT_CNT [15:0]	H'0000	R	V-Sync Interrupt Counter Status This bit field shows the number of interruption times of V-Sync interrupt. Hence, the value of this bit indicates the number of progressive output frames which is generated by FDP1. This counter value is reset to 0 when FD1_CTL_SGCMD.SGEN is set to 1.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10	SGREGSET	0	R	Register Set End Status This bit represents the register set status updated at V-Sync. The status is controlled by FD1_CTL_REGEND.REGEND bit and the internal timing. 0: Registers are not set for the operation 1: Registers are set for the operation
9	SGVERR	0	R	V-Sync End Error Status This bit represents the V-Sync end error status updated at V-Sync. 0: No error 1: V-Sync end error (De-interlacing cannot be finished by the timing of V-Sync)
8	SGFREND	0	R	Frame End Status This bit represents the frame end status updated at V-Sync. 0: The de-interlacing is not finished 1: Frame end (The de-interlacing is finished)
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BSY	0	R	FDP1 Operating Status This bit indicates the operating or stopped state of control FDP1. 0: FDP1 is stopped. 1: FDP1 is operating.

24.3.8.10 V-Cycles Status Register (FD1_CTL_VCYCLE_STAT)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	VCYC[31:0]	H'0000_0000	R	Number of Cycles of the Previous Frame Processing This status register shows the number of cycles of previous frame de-interlacing processing. FDP1 updates this register at the timing of V-Sync interrupt.

24.3.8.11 Interrupt Enable Register (FD1_CTL_IRQENB)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VERE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	VINTE	—	—	—	FREE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	VERE	0	R/W	Interrupt Enable for V-Sync End Error The interrupt of V-Sync end error is asserted at the timing that FDP1 does not complete the de-interlacing processing at the V-Sync. 0: Interrupt Disabled 1: Interrupt Enabled
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	VINTE	0	R/W	Interrupt Enable for V-Sync The interrupt of V-Sync is asserted at the timing of V-Sync specified by FD1_CTL_OPMODE.VIMD register field. If VIMD is set to 2, this interrupt is not asserted. 0: Interrupt Disabled 1: Interrupt Enabled
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	FREE	0	R/W	Interrupt Enable for Frame End The interrupt of frame end is asserted at the timing that FDP1 completes the de-interlacing processing. 0: Interrupt Disabled 1: Interrupt Enabled

Each bit controls the interrupt enable of the corresponding interrupt source.

Each bit in FD1_CTL_IRQSTA is set to 1 when the corresponding interrupt source is generated. FD1_CTL_IRQENB specifies whether to output an interrupt signal for the generated source. When an interrupt is disabled in this register, no interrupt signal is generated even when the corresponding bit in FD1_CTL_IRQSTA is set to 1. When an interrupt is enabled in this register, an interrupt signal is output when the corresponding bit in FD1_CTL_IRQSTA is set to 1.

24.3.8.12 Interrupt Status Register (FD1_CTL_IRQSTA)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VER
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	VINT	—	—	—	FRE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	VER	0	R/W	Interrupt Status and Clear for V-Sync End Error [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	VINT	0	R/W	Interrupt Status and Clear for V-Sync [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	FRE	0	R/W	Interrupt Status and Clear for Frame End [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value

The read value from each bit is the status of the interrupt source, and the write access to each bit controls the interrupt status.

FD1_CTL_IRQSTA indicates the state of the interrupt sources generated in the FDP1. Whether to output a FDP1 interrupt when an interrupt source is generated and the corresponding bit is set to 1 is determined by the corresponding bit setting in FD1_CTL_IRQENB.

While an interrupt is disabled in FD1_CTL_IRQENB, the FDP1 does not output an interrupt signal even when an interrupt source is generated, but the source flag in this register is set to 1.

24.3.8.13 Interrupt Control Register (FD1_CTL_IRQFSET)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VER
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	VINT	—	—	—	FRE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	VER	0	R/W	Set the value 0 to this bit.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	VINT	0	R/W	Set the value 0 to this bit.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	FRE	0	R/W	Set the value 0 to this bit.

24.3.9 RPF Control Registers

24.3.9.1 Source Picture Size Register (FD1_RPF_SIZE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	HSIZE[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	VSIZE[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	HSIZE[10:0]	H'000	R/W	Horizontal Source Picture Size Specify the horizontal picture size of each input field in unit of pixels.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	VSIZE[10:0]	H'000	R/W	Vertical Source Picture Size Specify the vertical picture size of each input field in unit of pixels.

24.3.9.2 Source Picture Format Register (FD1_RPF_FORMAT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CIPM
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	RSPYCS	RSPUVS	—	—	—	CF	—	RDFMT[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CIPM	0	R/W	Set 0 when FD1_CTL_OPMODE.PRG is set to 1, otherwise set the value 1 to this bit.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	RSPYCS	0	R/W	RPF Input Mode Setting 1 When the input format is YUY2, set this bit to 1 and set the RDFMT bits to 71 (H'47). When the input format is YVYU, set this bit and the RSPUVS bit to 1 and set the RDFMT bits to 71 (H'47). In other cases, set this bit to 0.
12	RSPUVS	0	R/W	RPF Input Mode Setting 2 When the input format is NV61, set this bit to 1 and set the RDFMT bits to 65 (H'41). When the input format is NV21, set this bit to 1 and set the RDFMT bits to 66 (H'42). When the input format is YVYU, set this bit and the RSPYCS bit to 1 and set the RDFMT bits to 71 (H'47). In other cases, set this bit to 0.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	CF	0	R/W	Current Field This bit specifies current field parity. Note that the previous or next field pictures should be the opposite parity of the current field specified by this bit. 0: Current field is top field 1: Current field Bottom field
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
6 to 0	RDFMT [6:0]	H'00	R/W	RPF Input Image Format Setting These bits select the format of the image input from the external SDRAM to the RPFn. Select a value corresponding to the desired format from those shown in Table 24.7. Note: Number of input pixels When YCbCr4:2:2 is selected through the RDFMT bits, the horizontal size of the input image should be specified in 2-pixel units. When YCbCr4:2:0 is selected, the vertical and horizontal sizes should be specified in 2-pixel units.

Table 24.7 YCbCr Formats for RPF Input*5 and WPF Output*4

RDFMT[6:0], WRFMT[6:0]	Packed YCbCr Input Format	Reference
H'00 to H'3F	Reserved	—
H'40	YCbCr4:4:4 semi-planar	Figure 24.6
H'41	YCbCr4:2:2 semi-planar (NV16, NV61*1)	
H'42	YCbCr4:2:0 semi-planar (NV12, NV21*1)	
H'43 to H'45	Reserved	—
H'46	YCbCr4:4:4 interleaved	Figure 24.7
H'47	YCbCr4:2:2 interleaved type 0 (UYVY, YUY2*2, YVYU*3)	
H'48	YCbCr4:2:2 interleaved type 1	
H'49	Reserved	
H'4A	YCbCr4:4:4 planar	Figure 24.8
H'4B	YCbCr4:2:2 planar (YV16)	
H'4C	YCbCr4:2:0 planar (YV12, YU12)	
H'4D to H'7F	Reserved	—

Notes: 1. When the input format is NV61 or NV21, set the RSPUVS bit to 1.
2. When the input format is YUY2, set the RSPYCS bit to 1.
3. When the input format is YVYU, set the RSPUVS bit to 1 and RSPYCS bit to 1.
4. The performance of FDP1 depends on the format because of the limited bus buffer size. The following formats may decrease the tolerance of the bus latency and may decrease the performance of FDP1.
   - YCbCr 4:4:4 interleaved
   - YCbCr 4:4:4 semi-planar
   - YCbCr 4:2:2 interleaved type0 and 1
5. Chroma component (Cb, Cr or U, V) of RPF0, RPF2 is not read from bus in case of YCbCr planar, YCbCr semi planar formats, and discarded after reading in package with luma component in case YcbCr interleaved formats because it is processed in fixed 2D de-interlacing.

In write format case shown in section 24.3.10.1, FD1_WPF_FORMAT.WSPYCS and WSPUVS correspond to RSPYCS and RSPUVS, respectively.

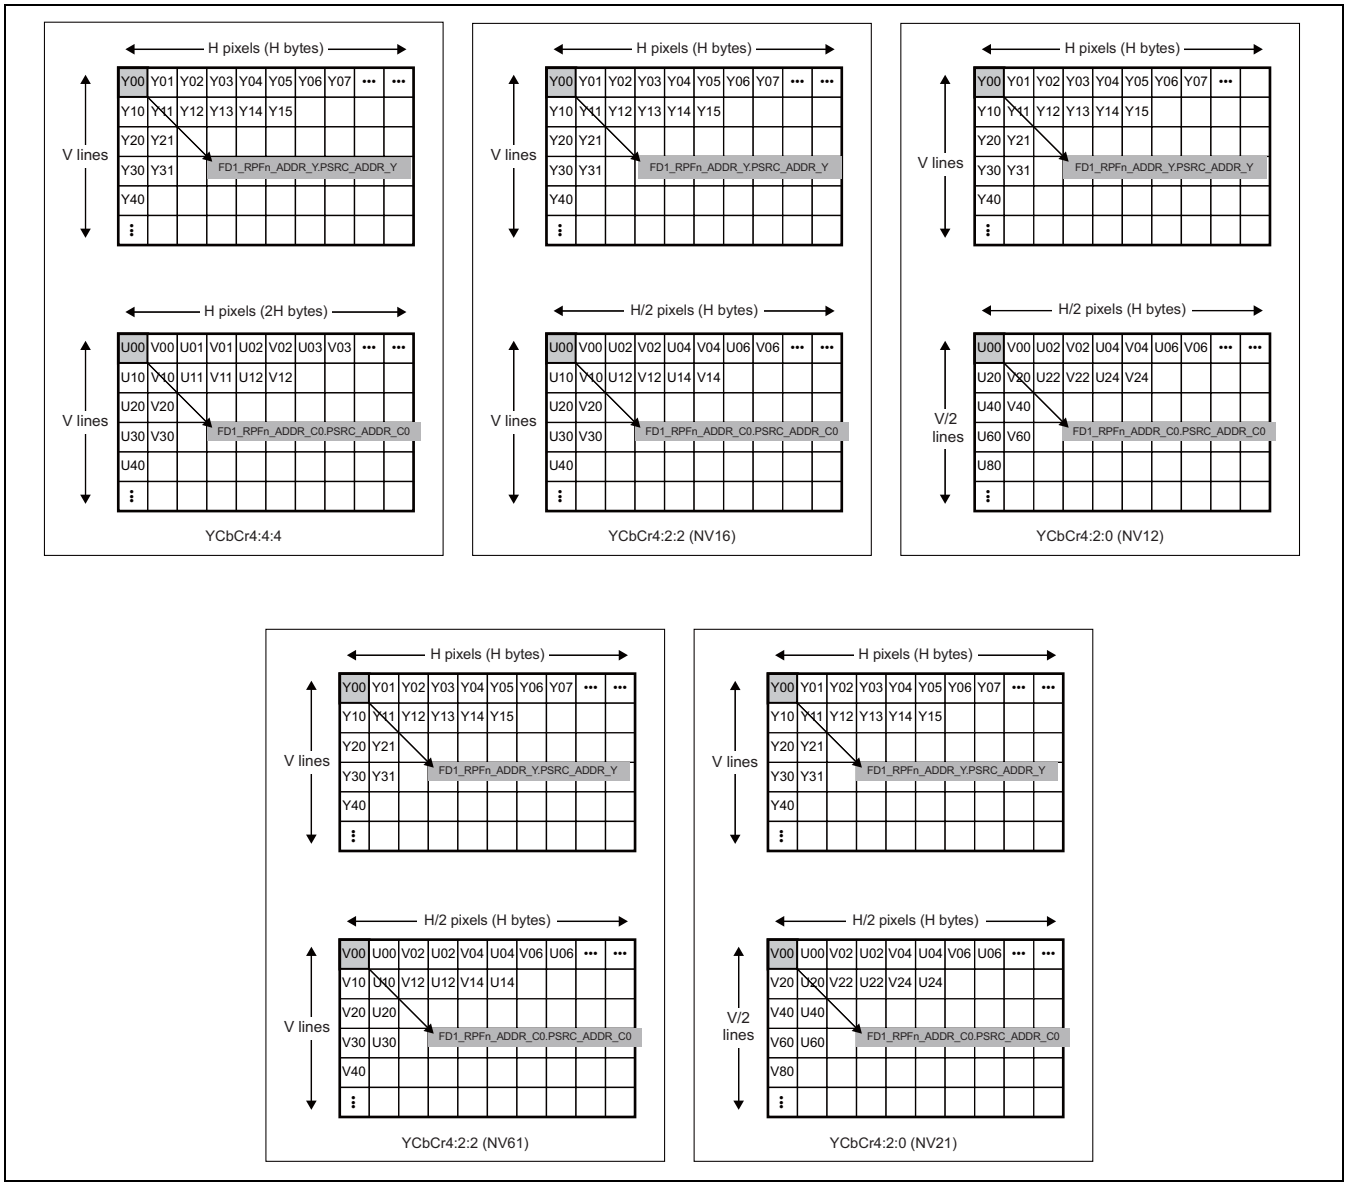


Figure 24.6 YCbCr Semi-Planar Formats

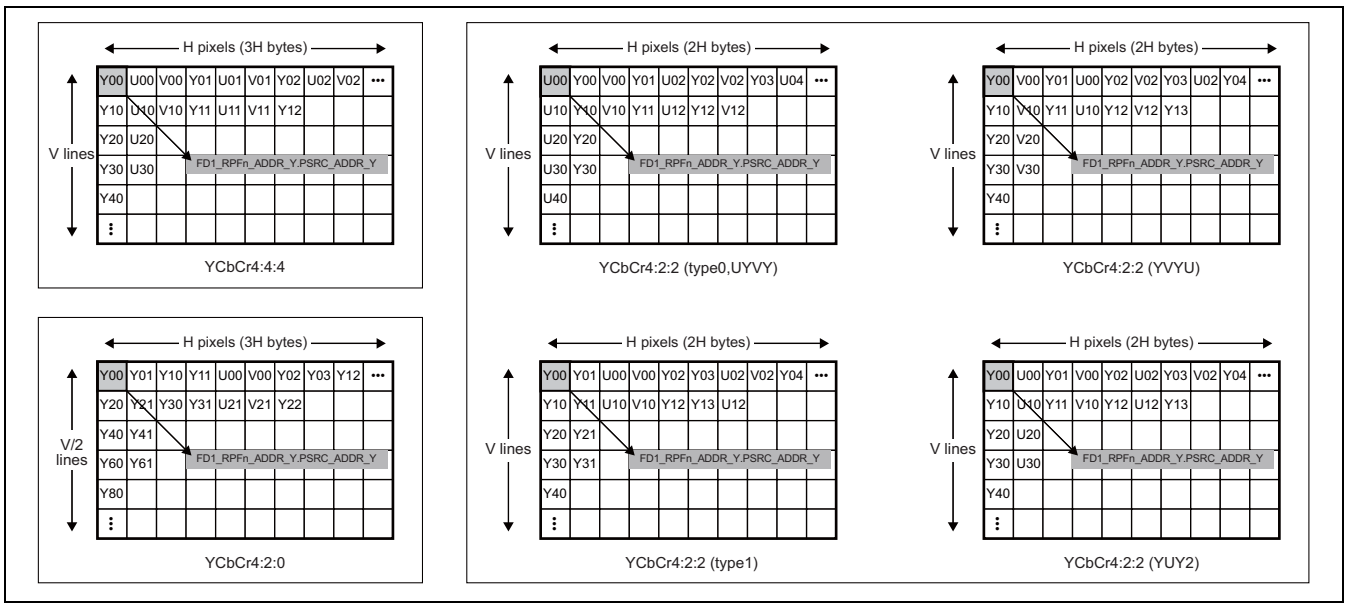

Figure 24.7 YCbCr Interleaved Formats

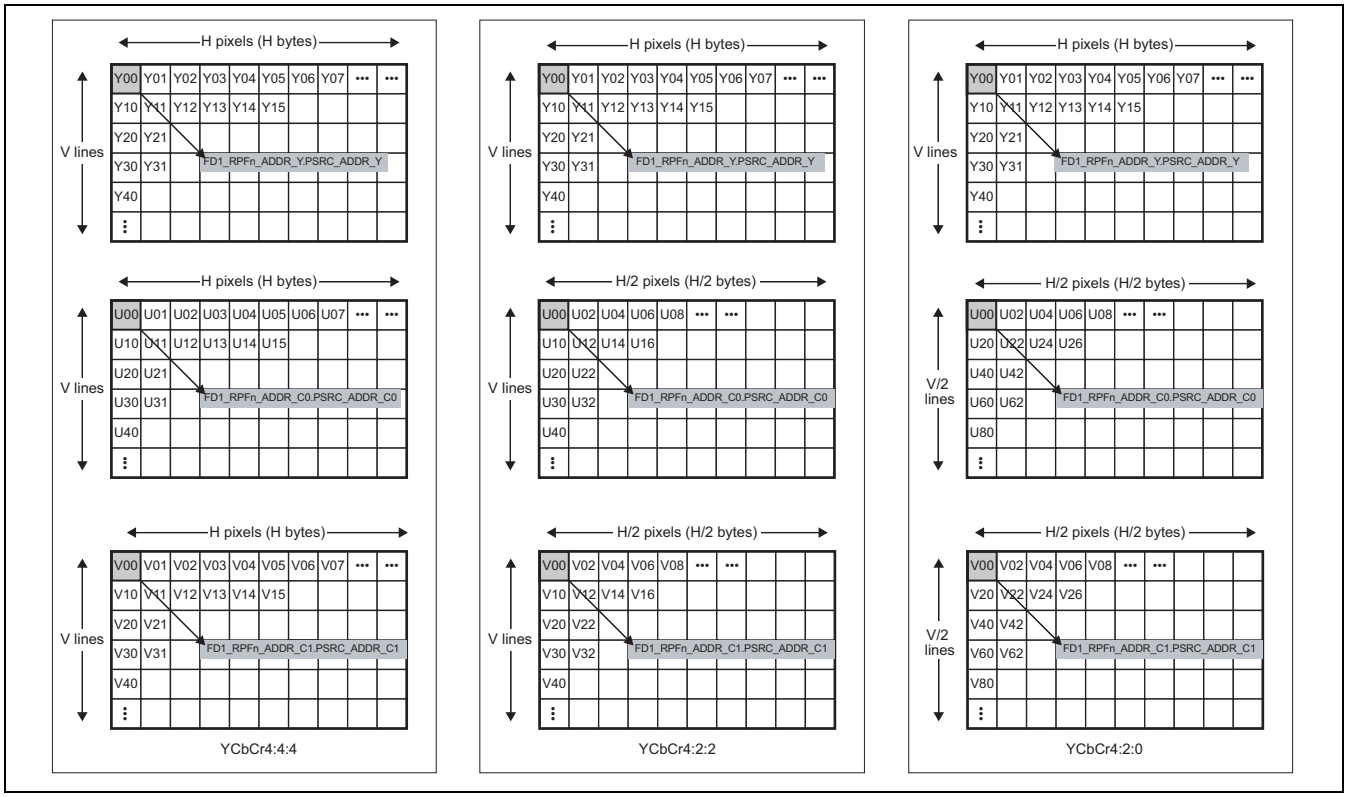

Figure 24.8 YCbCr Planar Formats

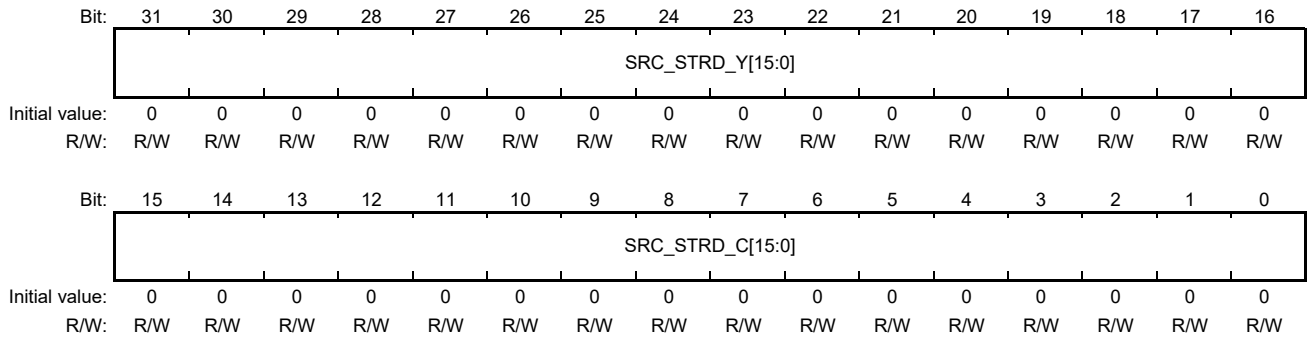
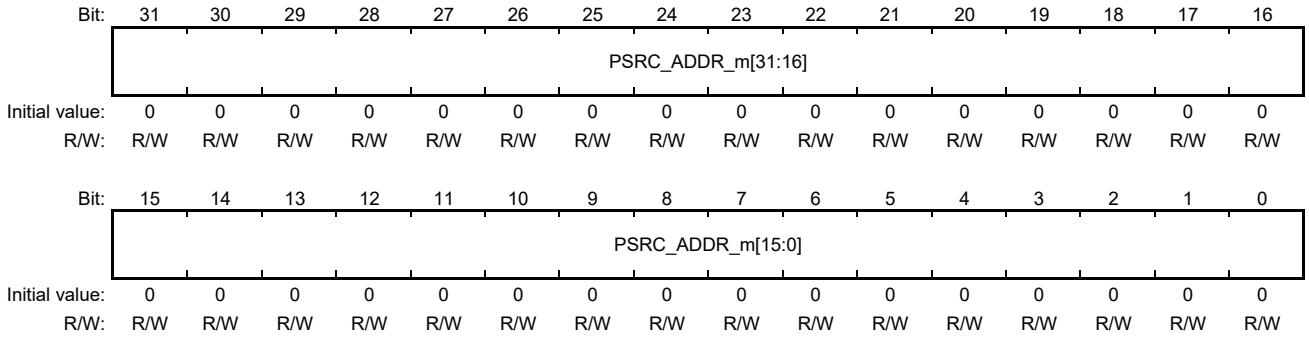
24.3.9.3 Source Picture Stride Register (FD1_RPF_PSTRIDE)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SRC_STRD_Y [15:0]	H'0000	R/W	Memory Stride of Source Picture Y Plane These bits specify in 1-byte units the memory stride of the source picture Y plane read by the RPFn (n = 0, 1, 2). A value from H'0050 to H'1FFE can be specified.
15 to 0	SRC_STRD_C [15:0]	H'0000	R/W	Memory Stride of Source Picture C Plane These bits specify in 1-byte units the memory stride of the source picture C plane read by the RPF1. A value from H'0050 to H'1FFE can be specified. In the YCbCr planar format, this setting is used as the memory stride of the Cb and Cr planes.

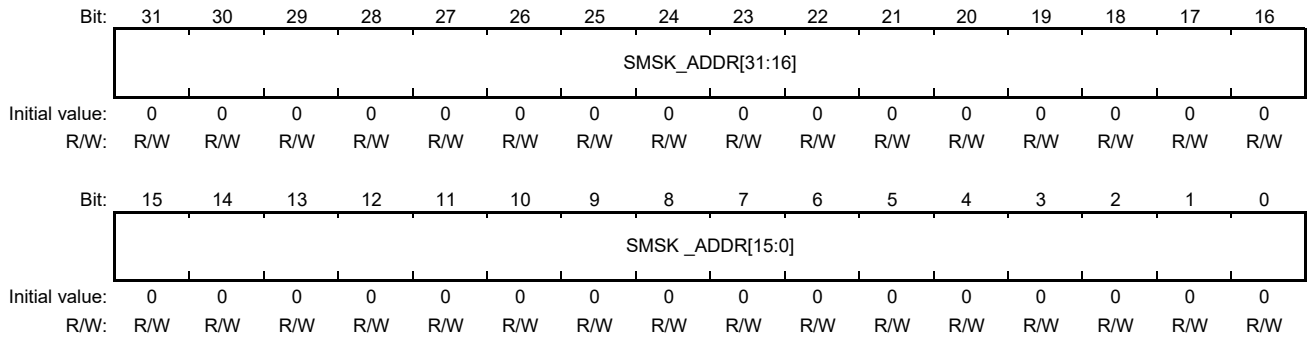
Note: As described above, stride value of source pictures (past, current, future) are common one. Therefore frame structures of all input pictures should be the same format. For example, the case that past picture which is supplied to RPF0 is frame-structure, and other input pictures to RPF1 and 2 are field picture, is prohibited.

24.3.9.4 RPFn Source Component-m Address Register (FD1_RPFn_ADDR_m:{n,m} is one of {0,Y},{1,Y},{1,C0},{1,C1},{2,Y})



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PSRC_ADDR_m [31:0]	H'0000_0000	R/W	RPFn Source Field Address for Component-m ({n,m} is one of {0,Y},{1,Y},{1,C0},{1,C1},{2,Y}) These bits specify in 1-byte units the start address of the source component-m plane read by the RPFn. A value from H'0000_0000 to H'FFFF_FFFF can be specified.

24.3.9.5 Still Mask Address Register (FD1_RPF_SMSK_ADDR)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SMSK_ADDR [31:0]	H'0000_0000	R/W	Still Mask Buffer Address. These bits specify the memory address which the still mask data is located. These bits should be set to a value ranging from H'0000_0000 to H'FFFF_FFFF. The still mask is intermediate data generated during IP conversion only when adaptive 2D/3D (FD1_CTL_OPMODE.PRG = 0 and FD1_CTL_IPC_MODE.DIM [2:0] = 0) is specified. This still mask setting is effective when either of bits FD1_CTL_CHACT.SMW or FD1_CTL_CHACT.SMR is set to 1. The still mask data is generated and repeatedly used by the FDP1. The still mask data should be stored in the SDRAM. The FDP1 needs two separated buffers of the same size for this data, one is common to all top fields and the other is common to all bottom fields. Therefore, the top and bottom fields must have different source addresses. When FD1_RPF_FORMAT.CF is 0, set the buffer address of the top filed in these bits. Otherwise set the buffer address of the bottom filed in these bits. The memory stride of each buffer is expressed as the following equation. 2 × {(FD1_RPF_SIZE.HSIZE + 7)/8} [byte] The memory space of each buffer is expressed as below. 2 × {(FD1_RPF_SIZE.HSIZE + 7)/8} × FD1_RPF_SIZE.VSIZE [byte] The Figure 24.9 shows the usage of the still mask data buffers and Table 24.8 shows how to set this register.

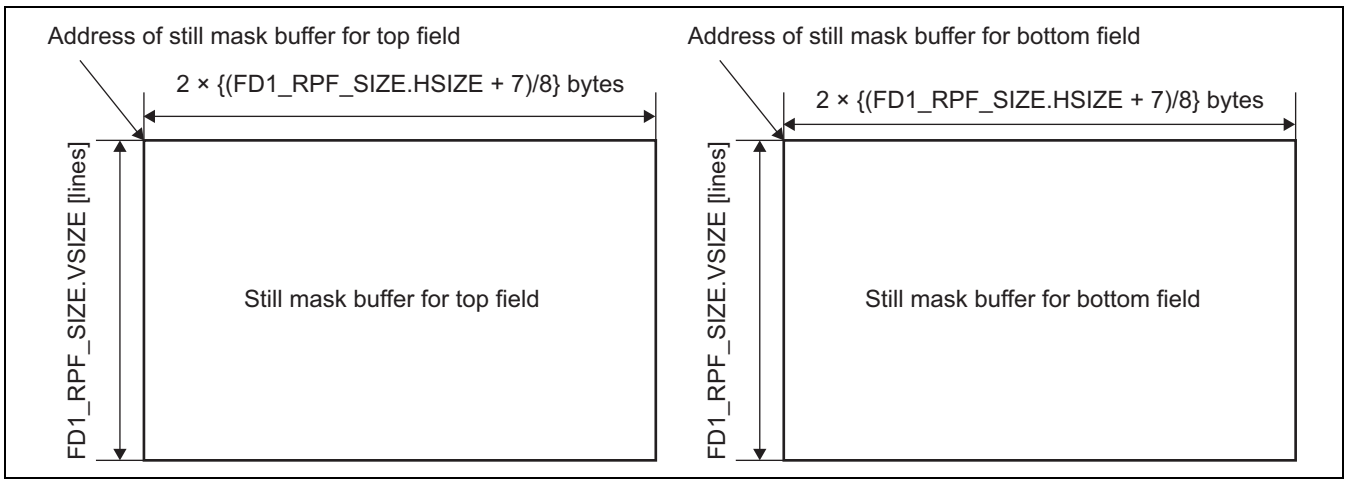


Figure 24.9 Usage of still mask buffers

Table 24.8 Setting of still mask buffer address register

Current Field Parity	FD1_RPF_FORMAT.CF	FD1_RPF_SMSK_ADDR.SMSK_ADDR
Top Field	0	Address of still mask buffer for top field
Bottom Field	1	Address of still mask buffer for bottom field

24.3.9.6 RPF Data Swap Register (FD1_RPF_SWAP)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	PDV[7:0]	H'00	R/W	PAD Value in Output Packed Data These bits specify the value to be stored in the bit field indicated as PAD or P in the output formats shown in Table 24.7. A value from 0 to 255 can be specified.
23 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	WSPYCS	0	R/W	WPF Output Mode Setting 1 When the output format is YUY2, set this bit to 1 and set the WRFMT bits to 71 (H'47). When the output format is YVYU, set this bit and the WSPUVS bit to 1 and set the WRFMT bits to 71 (H'47). In other cases, set this bit to 0.
14	WSPUVS	0	R/W	WPF Output Mode Setting 2 When the output format is NV61, set this bit to 1 and set the WRFMT bits to 65 (H'41). When the output format is NV21, set this bit to 1 and set the WRFMT bits to 66 (H'42). When the output format is YVYU, set this bit and the WSPYCS bit to 1 and set the WRFMT bits to 71 (H'47). In other cases, set this bit to 0.
13, 12	DITH[1:0]	00	R/W	Dithering Enable/Disable When the output format specified through the WRFMT bits is RGB with 18 bpp (262144 colors) or less, the color reduction processing is applied to match the number of colors. The color reduction processing may generate the artifacts of pseudo gradation, which can be suppressed through dithering. The DITH bits enable or disable dithering during color reduction. When the output format specified through the WRFMT bits is YCbCr, specify 0 in these bits. 00: Dithering is disabled 01: Setting prohibited 10: Setting prohibited 11: Dithering is enabled

Bit	Bit Name	Initial Value	R/W	Description
11 to 9	WRTM[2:0]	000	R/W	CSC Conversion Expression Setting These bits select the expression for color space conversion. The conversion direction is RGB to YCbCr when the format specified in the WRFMT bits is RGB, or YCbCr to RGB when the format is YCbCr. 000: BT.601 YCbCr [16,235/240] → RGB [0,255] 001: BT.601 YCbCr [0,255] → RGB [0,255] 010: BT.709 YCbCr [16,235/240] → RGB [0,255] 011: BT.709 YCbCr [16,235/240] → RGB [16,235] 100 to 111: Setting prohibited
8	CSC	0	R/W	Color Space Conversion Setting Enables or disables YCbCr ↔ RGB color space conversion to be executed in the WPF. The characteristics of color space conversion are determined by the WRTM setting. 0: Color space is not converted. 1: Color space is converted.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 0	WRFMT[6:0]	H'00	R/W	WPF Output Image Format Setting These bits select the format of the image output from the WPF to the external memory from among those listed in Table 24.10 and Table 24.7. Note: Number of output pixels When YCbCr4:2:2 is specified through WRFMT, the horizontal size of the output image should be a multiple of 2 pixels. When YCbCr4:2:0 is specified, the vertical and horizontal sizes of the output image should be multiples of 2 pixels.

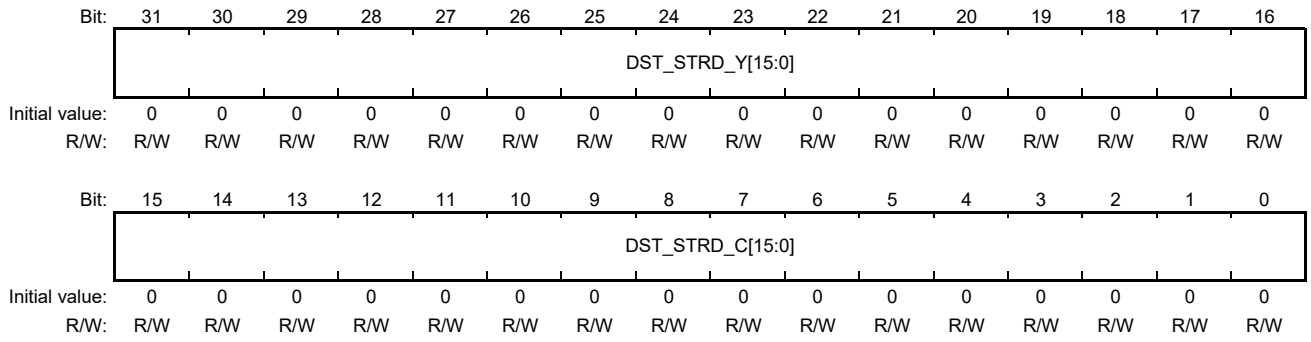
24.3.10.2 Destination Picture Rounding Control Register (FD1_WPF_RNDCTL)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	CBRM	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	CLMD[1:0]		—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

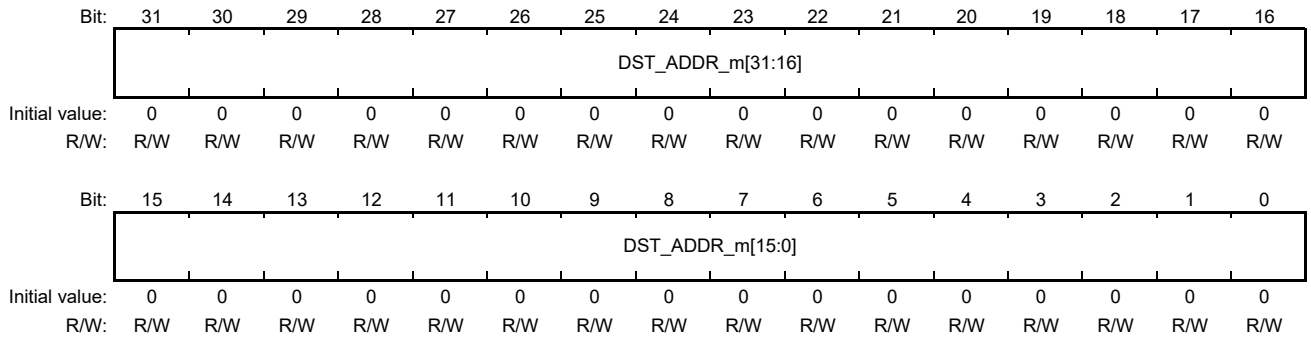
Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	CBRM	0	R/W	Bit Count Reduction Selection for Data Storage in Packed RGB This bit specifies the method for reducing the number of bits when data is stored in the bit fields indicated as R, G, and B in Table 24.10 and the target bit fields are not eight bits. 0: Bit count conversion: The lower-order bits are truncated 1: Bit count conversion: Rounding (rounding off)
27 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	CLMD[1:0]	00	R/W	Color Data Clipping These bits specify the method for clipping the YCbCr color data output from the WPF. When RGB color data is output from the WPF, specify 0 in these bits. 00: Output value is not clipped (0-255) 01: Output value is clipped: YCbCr mode 1 (16-235 (Y), 16-240 (Cb/Cr)) 10: Output value is clipped: YCbCr mode 2 (Y/Cb/Cr = 1-254) 11: Setting prohibited
11 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

24.3.10.3 Destination Picture Stride Register (FD1_WPF_PSTRIDE)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	DST_STRD_Y [15:0]	H'0000	R/W	Memory Stride of Destination Picture Y/RGB Plane These bits specify in 1-byte units the memory stride of the destination picture in the external memory to be written to by the WPF. A value from H'0050 to H'1FFE can be specified.
15 to 0	DST_STRD_C [15:0]	H'0000	R/W	Memory Stride of Destination Picture C Plane These bits specify in 1-byte units the memory stride for the C plane of the destination picture in the external memory to be written to by the WPF. When the WPF outputs images in an RGB format, this setting is not used. When the WPF outputs images in YCbCr planar format, this setting is applied to both the Cb and Cr planes. A value from H'0050 to H'1FFE can be specified.

24.3.10.4 Destination Component-m Address Register (FD1_WPF_ADDR_m: m = Y, C0, C1)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DST_ADDR_m [31:0]	H'0000_0000	R/W	Destination Address for Component-m (m = Y, C0, C1) These bits specify in 1-byte units the address for storing the destination component-m plane to be written to the external memory by the WPF. A value from H'0000_0000 to H'FFFF_FFFF can be specified.

24.3.10.5 WPF Data Swap Register (FD1_WPF_SWAP)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	SSWAP[3:0]				OSWAP[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 4	SSWAP[3:0]	H'0	R/W	Set the same value with FD1_RPF_SWAP.ISWAP.
3 to 0	OSWAP[3:0]	H'0	R/W	Output Swap Setting for Image Data This bit field specifies the data swapping function. Each bit corresponds to the following data swapping. Refer to Table 24.8 for the data alignment after data swapping. Bit[3]: Long longword (64-bit) swap Bit[2]: Longword (32-bit) swap Bit[1]: Word (16-bit) swap Bit[0]: Byte (8-bit) swap

24.3.11 IPC Control Registers

Table 24.11 shows registers categorized in function of IPC.

Table 24.11 IPC registers categorized in function

Function	Registers
IP Conversion Control	FD1_IPC_MODE
3D de-interlace	FD1_IPC_COMB_DET
Adaptive 2D/3D de-interlacing	FD1_IPC_MOTDEC
Diagonal line interpolation	FD1_IPC_DLI_BLEND
	FD1_IPC_DLI_HGAIN
	FD1_IPC_DLI_SPRS
	FD1_IPC_DLI_ANGLE
	FD1_IPC_DLI_ISOPIX0
	FD1_IPC_DLI_ISOPIX1
Film detection	FD1_SENSOR_m (m = 0, 1,…, 17)
	FD1_SENSOR_CTL0
	FD1_SENSOR_CTL1
	FD1_SENSOR_CTL2
	FD1_SENSOR_CTL3
	SENSOR_TH0
	SENSOR_TH1

For chroma component, IPC cannot process 3D de-interlace, adaptive 2D/3D de-interlacing, diagonal line interpolation and film detection but can process fixed 2D IP conversion.

24.3.11.1 IPC Mode Register (FD1_IPC_MODE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DLI	—	—	—	—	—	DIM[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	DLI	0	R/W	Set the value 1 to this bit.
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	DIM[2:0]	000	R/W	De-Interlacing Mode of luma component as following These bits specify the de-interlacing mode. 000: Adaptive 2D/3D de-interlacing 001: Fixed 2D de-interlacing 010: Fixed 3D de-interlacing 011: Select previous field for interpolated lines 100: Select next field for interpolated lines The de-interlacing process of chroma component is fixed 2D de-interlacing regardless of these bits.

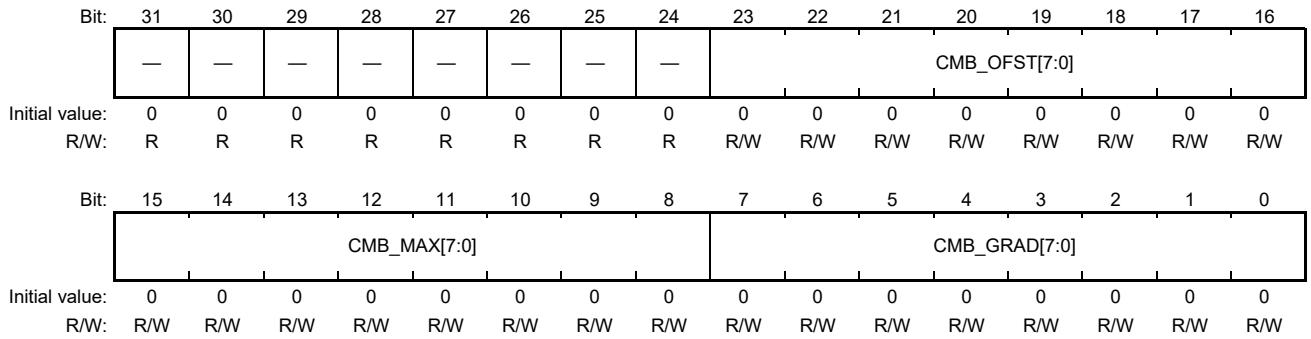
24.3.11.2 Still Mask Threshold Register (FD1_IPC_SMSK_THRESH)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FSM0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	SMSK_TH[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

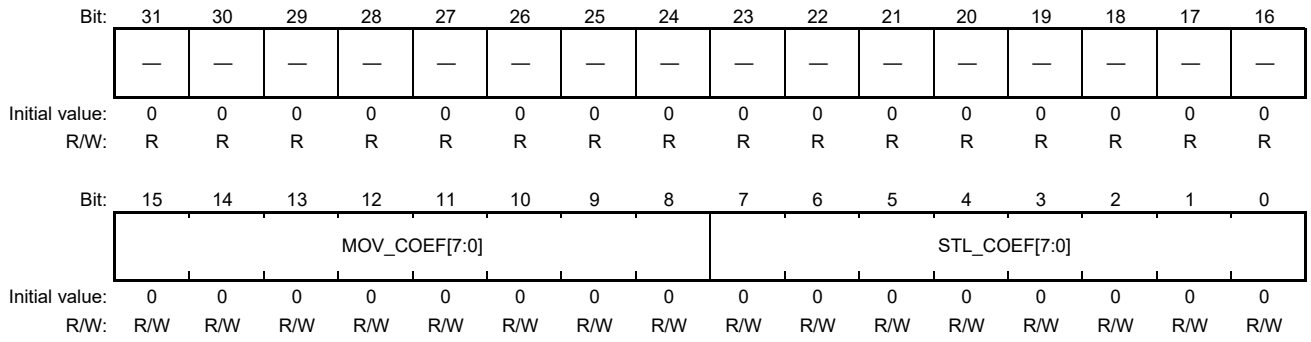
Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	FSM0	0	R/W	Set the value 1 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	SMSK_TH [7:0]	H'00	R/W	Set the value 2 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

24.3.11.3 Comb Detection Parameter Register (FD1_IPC_COMB_DET)



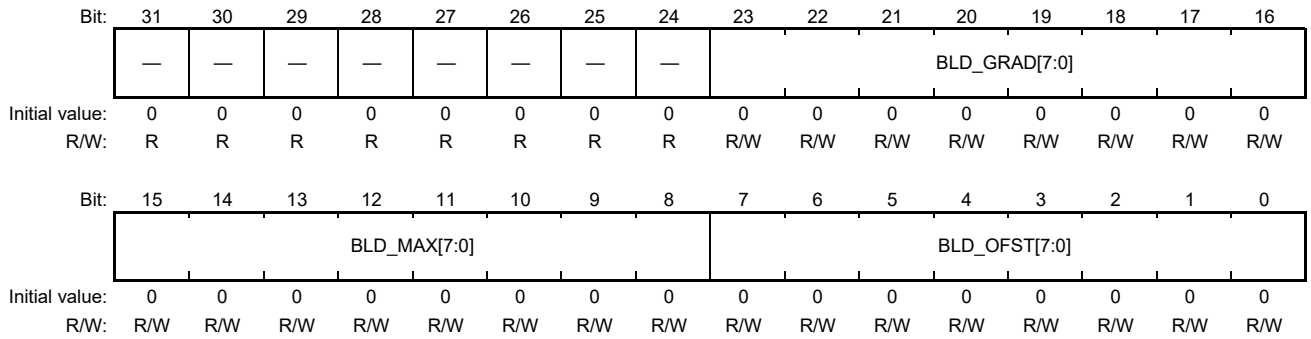
Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	CMB_OFST [7:0]	H'00	R/W	Set the value H'20 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
15 to 8	CMB_ MAX [7:0]	H'00	R/W	Set the value 0 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 0	CMB_GRAD [7:0]	H'00	R/W	Set the value H'40 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

24.3.11.4 Motion Decision Parameter Register (FD1_IPC_MOTDEC)



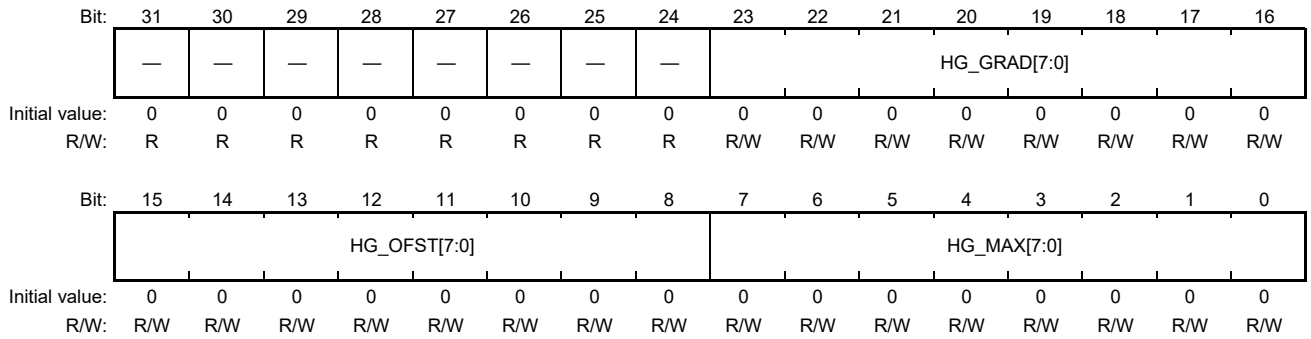
Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	MOV_COEF [7:0]	H'00	R/W	Set the value H'80 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 0	STL_COEF [7:0]	H'00	R/W	Set the value H'20 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

24.3.11.5 DLI Blend Parameter Register (FD1_IPC_DLI_BLEND)



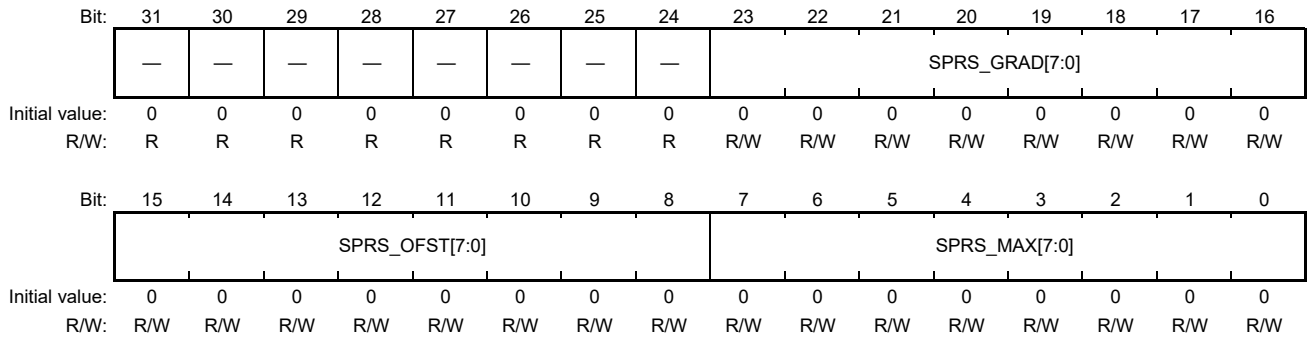
Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	BLD_GRAD [7:0]	H'00	R/W	Set the value H'80 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
15 to 8	BLD_MAX [7:0]	H'00	R/W	Set the value H'FF to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 0	BLD_OFST [7:0]	H'00	R/W	Set the value H'02 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

24.3.11.6 DLI Horizontal Frequency Gain Register (FD1_IPC_DLI_HGAIN)



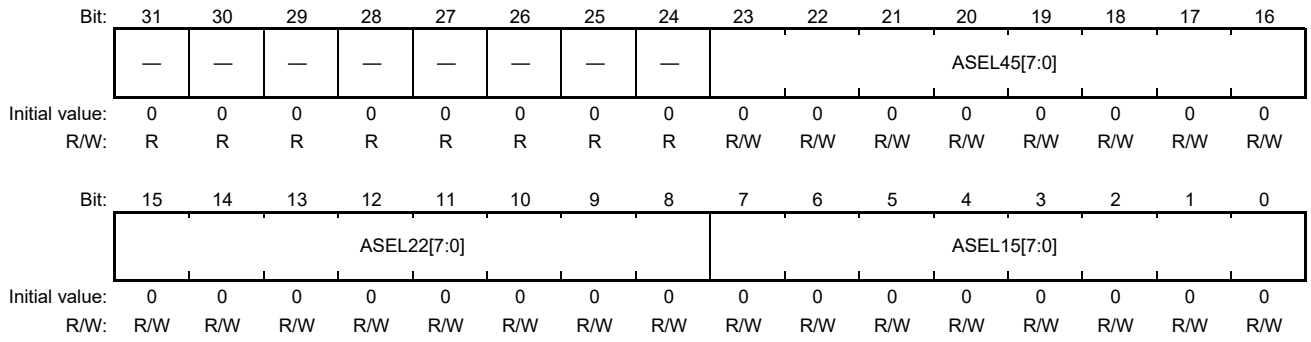
Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	HG_GRAD [7:0]	H'00	R/W	Set the value H'10 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
15 to 8	HG_OFST [7:0]	H'00	R/W	Set the value H'00 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 0	HG_MAX [7:0]	H'00	R/W	Set the value H'FF to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

24.3.11.7 DLI Suppression Parameter register (FD1_IPC_DLI_SPRS)



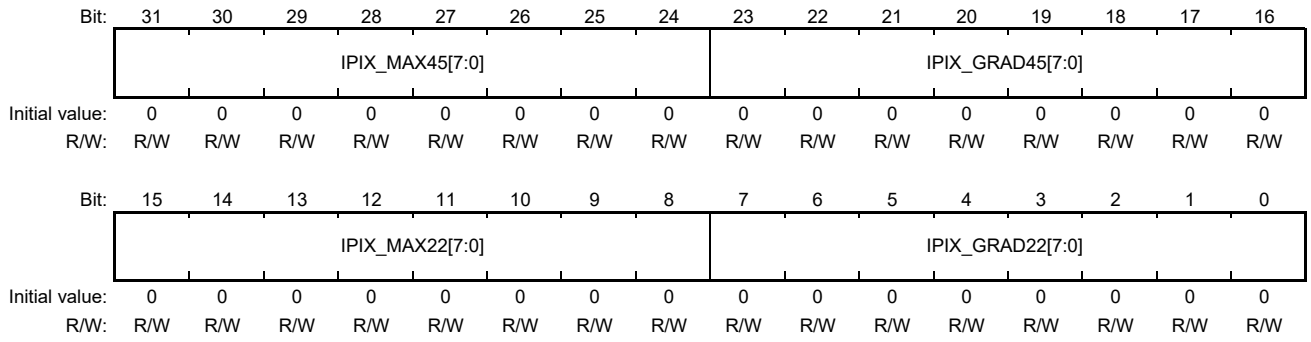
Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	SPRS_GRAD [7:0]	H'00	R/W	Set the value H'90 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
15 to 8	SPRS_OFST [7:0]	H'00	R/W	Set the value H'04 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 0	SPRS_MAX [7:0]	H'00	R/W	Set the value H'FF to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

24.3.11.8 DLI Angle Parameter Register (FD1_IPC_DLI_ANGLE)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	ASEL45[7:0]	H'00	R/W	Set the value H'04 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
15 to 8	ASEL22[7:0]	H'00	R/W	Set the value H'08 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 0	ASEL15[7:0]	H'00	R/W	Set the value H'0C to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

24.3.11.9 DLI Isolated Pixel Parameter Register 0 (FD1_IPC_DLI_ISOPIX0)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	IPIX_MAX45 [7:0]	H'00	R/W	Set the value H'FF to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
23 to 16	IPIX_GRAD45 [7:0]	H'00	R/W	Set the value H'10 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
15 to 8	IPIX_MAX22 [7:0]	H'00	R/W	Set the value H'FF to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 0	IPIX_GRAD22 [7:0]	H'00	R/W	Set the value H'10 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

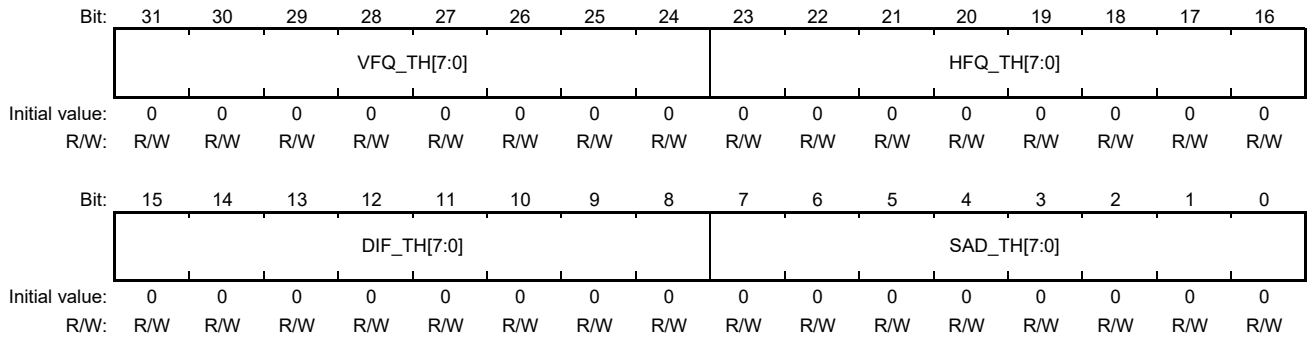
24.3.11.10 DLI Isolated Pixel Parameter Register 1 (FD1_IPC_DLI_ISOPIX1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IPIX_MAX15[7:0]								IPIX_GRAD15[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

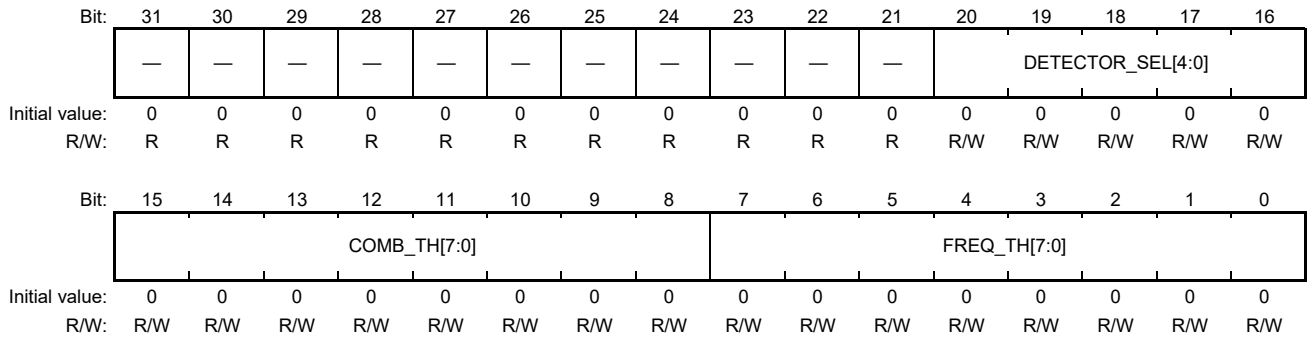
Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	IPIX_MAX15 [7:0]	H'00	R/W	Set the value H'FF to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 0	IPIX_GRAD15 [7:0]	H'00	R/W	Set the value H'10 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

24.3.11.11 IPC Sensor Threshold Register 0 (FD1_IPC_SENSOR_TH0)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	VFQ_TH[7:0]	H'00	R/W	Set the value H'20 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
23 to 16	HFQ_TH[7:0]	H'00	R/W	Set the value H'20 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
15 to 8	DIF_TH[7:0]	H'00	R/W	Set the value H'80 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 0	SAD_TH[7:0]	H'00	R/W	Set the value H'80 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

24.3.11.12 IPC Sensor Threshold Register 1 (FD1_IPC_SENSOR_TH1)



Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	DETECTOR_SEL[4:0]	H'00	R/W	Set the value H'00 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
15 to 8	COMB_TH[7:0]	H'00	R/W	Set the value H'00 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 0	FREQ_TH[7:0]	H'00	R/W	Set the value H'00 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

24.3.11.13 Sensor Control Register 0 (FD1_SENSOR_CTL0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FRM_LVTH[3:0]				FLD_LVTH[3:0]				—	—	—	—	—	—	—	FD_EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 12	FRM_LVTH [3:0]	H'0	R/W	Set the value 2 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
11 to 8	FLD_LVTH [3:0]	H'0	R/W	Set the value 2 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	FD_EN	0	R/W	Set the value 1 to this bit.

24.3.11.14 Sensor Control Register 1 (FD1_SENSOR_CTL1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	XS[12:0]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	YS[12:0]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	XS[12:0]	H'0000	R/W	Set the value H'0000 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	YS[12:0]	H'0000	R/W	Set the value H'0000 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

24.3.11.15 Sensor Control Register 2 (FD1_SENSOR_CTL2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	XE[12:0]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	YE[12:0]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	XE[12:0]	H'0000	R/W	Set the value (FD1_RPF_SIZE.HSIZE – 1) to this bit.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	YE[12:0]	H'0000	R/W	Set the value (FD1_RPF_SIZE.VSIZE – 1) to this bit if input picture is progressive. Set the value (FD1_RPF_SIZE.VSIZE × 2 – 1) to this bit if input picture is interlaced.

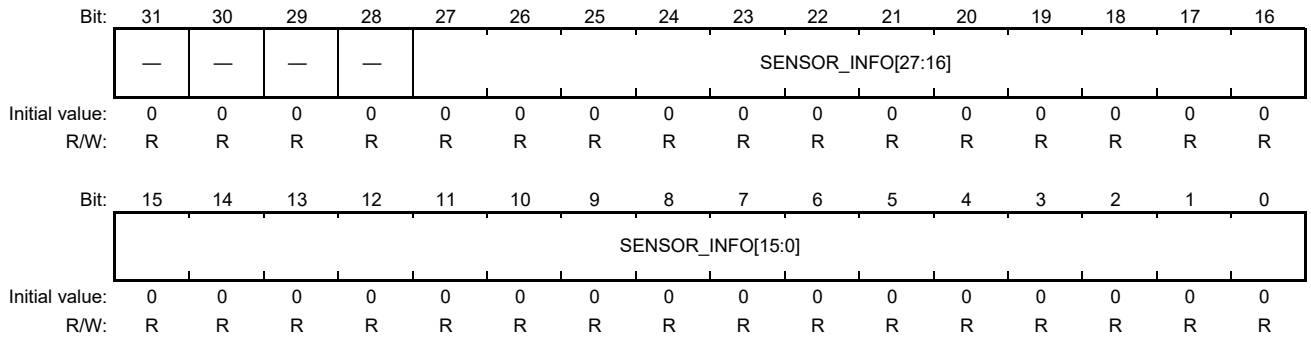
24.3.11.16 Sensor Control Register 3 (FD1_SENSOR_CTL3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	POSX0[12:0]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	POSX1[12:0]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

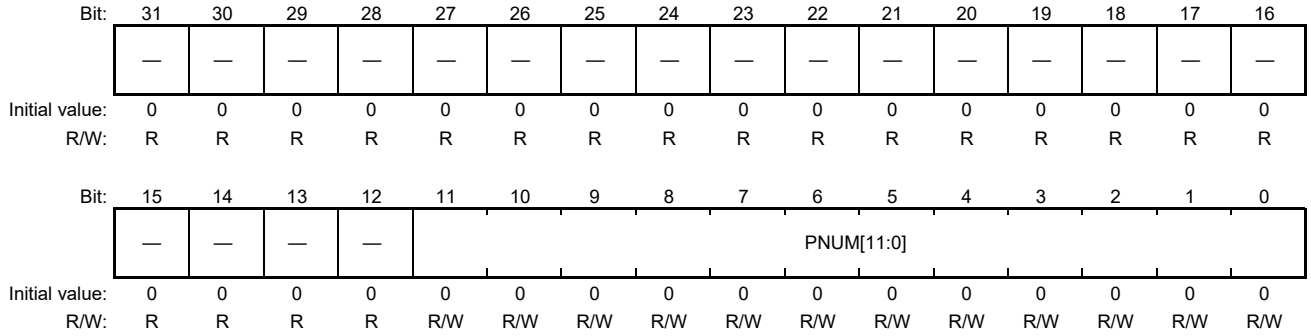
Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	POSX0[12:0]	H'0000	R/W	Set the value INT (FD1_RPF_SIZE.HSIZE/3) to this bit.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	POSX1[12:0]	H'0000	R/W	Set the value INT (2 × FD1_RPF_SIZE.HSIZE/3) to this bit.

24.3.11.17 Sensor Register (FD1_SENSOR_m: m = 0, 1, … 17)



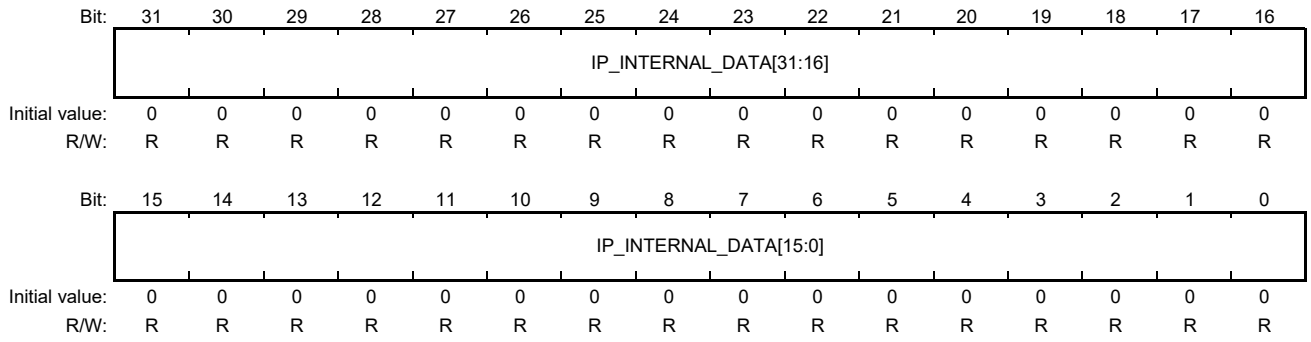
Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 0	SENSOR_INFO[27:0]	H'000 0000	R	Sensor information of FDP1

24.3.11.18 Line Memory Pixel Number Register (FD1_IPC_LMEM)



Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	PNUM[11:0]	H'000	R/W	Specify 1024 in decimal (H'400)

24.3.11.19 IP Internal Data Register (FD1_IP_INDATA)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	IP_INTERNAL_DATA [31:0]	All 0	R	Internal data

24.4 Input/Output Data Format

The FDP1 input/output data should be stored in a format where the address is incremented in the direction from the MSB to the LSB as in big endian. For example, the FDP1 reads and writes data to and from the external memory through the dedicated bus interface with a 128-bit width, and the data that should come first should be stored in the MSB side regardless of the unit data size as shown in Figure 24.10.

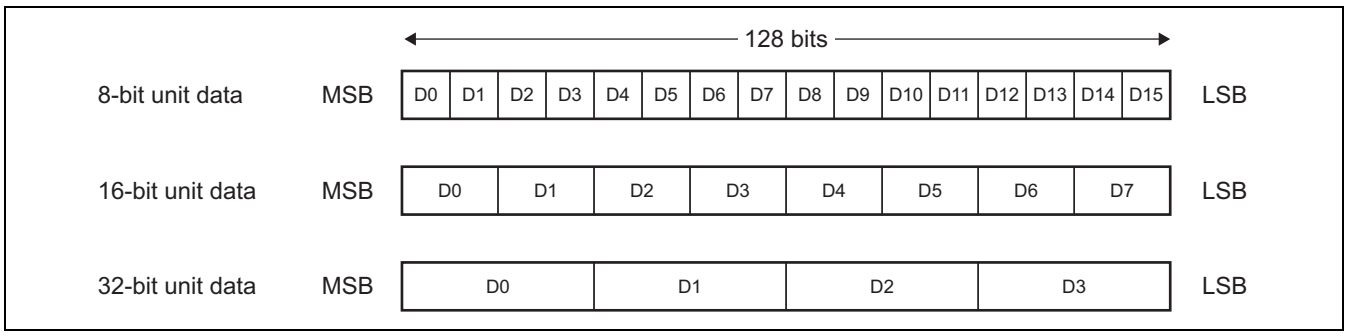


Figure 24.10 FDP1 Input/Output Data Format

However, data may be arranged in a way unexpected by the FDP1 depending on the address handling method (such as little endian) of the FDP1 access destination in some cases as in the external memory format shown in Figure 24.11. In such a case, use the data swapping function (refer to sections 24.3.9.6 and 24.3.10.5) in the FDP1 to convert the data format to be suitable for the FDP1.

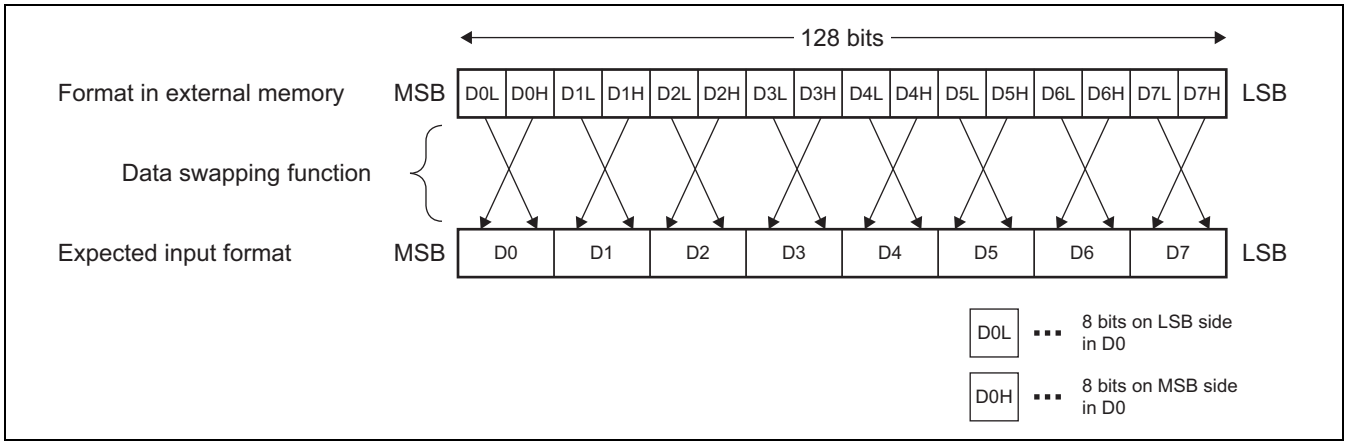

Figure 24.11 Input Data Alignment by Data Swapping Function

24.5 Lookup Table (LUT) Setting

FDP1 has the lookup tables (LUT) shown in Table 24.12 to change the characteristic of the de-interlacing function. The LUT is an 8-bit entry and 8-bit output table. Note that users can access to LUT only by 32 bits access. Do not access other bit length such as 8 bits access or 16 bits access. LUT behaves like immediate registers described in section 24.3.2, so do not change the value in LUT while FDP1 is under processing.

Table 24.12 List of LUT

LUT Name
DIF_ADJ
SAD_ADJ
BLD_GAIN
DIF_GAIN
MDET

The LUT is used for making the non-linear characteristic shown in Figure 24.12 where X and Y are input and output of LUT respectively.

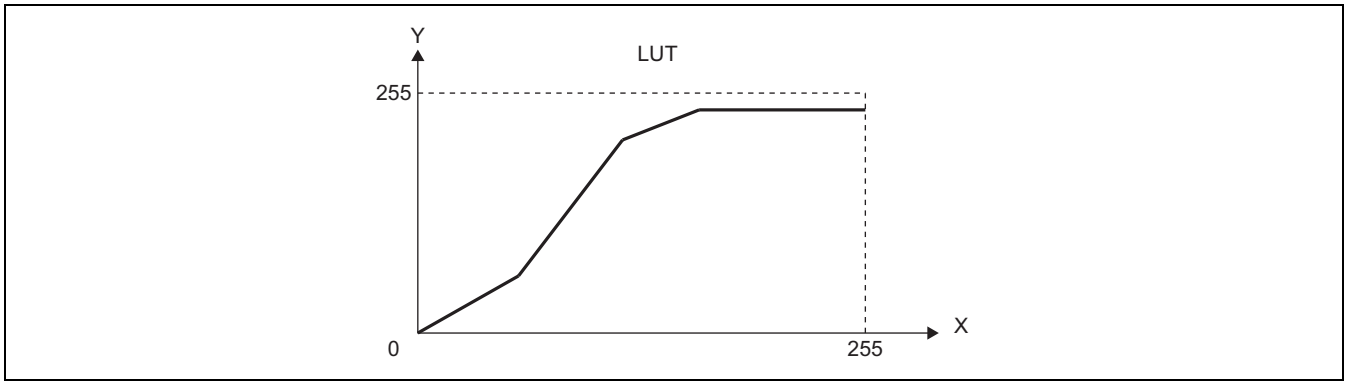

Figure 24.12 LUT for Changing the De-Interlacing Characteristic

For MDET-LUT, the 2D interpolating likelihood is the input to the LUT and the blending coefficient (Alpha) is the output from the LUT. The final output image is expressed by the following equation.

(Output image) = (Alpha/255) × (2D interpolated image) + ((255-Alpha)/255) × (3D interpolated image)

When the output value of the LUT is set to 0 for all input value, the output image from FDP1 is always 3D interpolated image in spite of the motion in the video.

Table 24.13 indicates the setting of each LUT. Note that other setting is used for purpose of h/w debugging. Do not set other value to LUT except for MDET.

Table 24.13 Meaning of X/Y Axis of LUT

Index	DIF_ADJ[ ]	SAD_ADJ[ ]	BLD_GAIN[ ]	DIF_GAIN[ ]	MDET[ ]
0	H'00	H'00	H'80	H'80	H'00

25. VSP1

This section describes the configurations of VSP1 on this LSI. Descriptions in this section show the full-function specifications of the VSP1 IP. Some of the functions described in this section are not available on VSP1 with restrictions written here.

Configurations of VSP1

This LSI incorporates three different types of VSP1 modules (VSPS, VSPD) as image processing systems.

VSPS: VSPS stands for VSP Standard which supports various functions of the VSP1 IP.
VSPD: VSPD stands for VSP for the display unit (DU) which outputs the display data to DU directly. Single channel is supported for RZ/G1C.

Table 25.1 to Table 25.2 show the restrictions of each type of VSP1 unit on this LSI.

All the registers and functions listed in Table 25.1 to Table 25.2 should be treated as un-implemented functions in each VSP1 unit. Do not set any registers related to the restricted function without any statement.

Table 25.1 VSPS Configuration

Category	Restriction Target	Restriction Description
Module	UDS1-2	These modules listed at left column are not implemented on VSPS. Functions and registers cannot be used. In addition, a setting of DPR routing with these modules is prohibited.
Function	RPF/CLUT	CLUT is only available on RPF ch1 and ch2 (not available on ch0, ch3, and ch4). Related register: VI6_RPFn_INFMT.RDFMT, VI6_CLUT0_TBL*, VI6_CLUT3_TBL*, VI6_CLUT4_TBL*

Table 25.2 VSPD Configuration

Category	Restriction Target	Restriction Description
Module	RPF4	These modules listed at left column are not implemented on VSPD. Functions and registers cannot be used. In addition, a setting of DPR routing with these modules is prohibited.
	CLU	
	UDS1-2	
	SRU	
	WPF1-3	
	HGT	
Function	RPF/CLUT	CLUT is only available on RPF ch2 (not available on ch0, ch1, and ch3). Related register: VI6_RPFn_INFMT.RDFMT, VI6_CLUT0_TBL*, VI6_CLUT1_TBL*, VI6_CLUT3_TBL*
	WPF/Vertical Flipping	Vertical flipping function is not implemented. Related register: VI6_WPF0_OUTFMT.FLP

Preface

Terminology

The terminology for VSP1. Refer to section 25.1, Overview for detail.

Read Pixel Formatter (RPF)

The RPF can read image data from external memory such as SDRAM. The RPF supplies image data to the internal sub modules in VSP1. At the same time, RPF can execute format conversion, color space conversion and color keying for each input image source. There are five RPFs in VSP1, and each RPF is called as RPF0, RPF1 and so on.

Virtual RPF

There is an image compositing sub module named as BRU which can execute image blending or raster operation. The BRU has 4 input ports for compositing multiple images. There must be a RPF module as the start of data processing. Each RPF can be a source of data input to BRU. In addition to these RPF modules, the BRU has a function which generates monochrome color image internally. This functionality is useful because the data access to an external memory is not required. This function is called as virtual RPF.

Refer to sections 25.2.8.1, 25.2.16.2, 25.2.16.3 and 25.2.16.4 for virtual RPF.

Write Pixel Formatter (WPF)

The WPF can input image data from internal image processing and output to the external memory such as SDRAM. At the same time, the WPF can execute color space conversion and format conversion. There are four WPFs in VSP1, and each WPF is called as WPF0, WPF1 and so on. The start of VSP1 equals to the start of each WPF by setting registers shown in section 25.2.5.1.

Target WPF

The VSP1 has five RPFs (RPF 0 to 4) and four WPFs (WPF0 to 3) and execute image processing. One data path consists of more than one RPF, one WPF and other image functional modules if necessary. The WPF which is reached from specific RPF(s) in the data path is called as target WPF for the RPF(s). The number of target WPFs is always one for the data path.

Source RPF

The data source in the data path for the specific WPF is called as source RPF for that WPF. The number of source RPFs is not always one, may be more than one for image blend operation or raster operation.

Layer

In case of image composite operation such as image blending or raster operation for multiple images, there is hierarchical relationship for each image. One layer is assigned to one RPF or one virtual RPF indicating one image in hierarchical relationship.

Master Layer

The master layer is a base layer for image compositing of multiple images, and the size of the master layer equals to that of BRU output. When the image compositing is not applied, there is one layer. This layer is also called as the master layer.

Sub Layer

The Layers except the master layer are called as sub layer.

Alpha

The VSP1 can execute both color data and its transparent data. The alpha is 8-bit data and expresses the transparency of pixel. The value H'FF represents opaque pixel, and the value H'00 represents transparent pixel.

Plane

One layer consists of color components such as R/G/B or Y/Cb/Cr, and alpha data representing its transparency of the pixel. The frame which is one of color components and alpha data is called as a plane.

Picture Plane

The picture plane represents color data in one layer.

Alpha Plane

The alpha plane represents transparent data in one layer.

Blending

The image blending means the image composite operation with alpha data. The composite ratio of image blending depends on the relationship of each layer and alpha values.

Raster Operation (ROP)

The bitwise operation such as AND or OR is called as raster operation (ROP).

Color Space Conversion (CSC)

The CSC means the conversion of YCbCr, RGB and HSV color spaces.

Definition of operators and functions

The following operators, notations are defined for explaining the functions of VSP1.

$\langle x \rangle$

Discard decimal places of value x

H'

The notation “H'” is used as prefix for hexadecimal numbers. For example, H'80 means 80 in hexadecimal and 128 in decimal.

B'

The notation “B'” is used as prefix for binary numbers. For example, B'10000000 means 80 in hexadecimal and 128 in decimal. When a number is used without prefix, it means decimal number.

_

The notation “_” is used as a separator of binary digit for binary number. There is no functional and logical meaning. The meaning of B'10101 and B'1_0101 is the same.

[msb:lsb]

This notation specifies a part of bits or all bits of registers and signals. For example, eval[3:0] means bit 3 to 0 of the signal or register which name is “eval” .

clip0 (x)

Clip to 0 value if x is less than 0. [$x = (x < 0)? 0 : x$]

clip3 (min, max, x)

The value x shall be clipped so that x shall be $min < x < max$.
[$x = (x < min)? min : ((x > max)? max : x)$]

Unit

The unit is defined here for explaining VSP1’s functions.

[bpp] : bits per pixel

VSP1 can handle a number of image formats. Each image format has different number of data bits. The unit [bpp] shows a number of data bits for one pixel. For example, RGB 8 bpp means that its format is RGB and the pixel consists of 8 data bits.

25.1 Overview

The VSP1 is the successor IP of Renesas' VIO6-IP series which supports image processing such as image enhancing, up/down scaling, color management function with lookup tables, image blending.

25.1.1 Features

1. Supports Various Data Formats and Conversion
   - Supports YCbCr444/422/420, RGB, αRGB, α plane
   - Color space conversion and changes to the number of colors by dithering
   - Color keying
   - Vertical flipping
2. Full HD Video Processing
   - Up and down scaling with arbitrary scaling ratio
   - Super resolution processing
   - Blending of four picture layers and raster operations (ROPs)
3. Full HD Picture Quality/Color Correction
   - γ correction and gain correction
   - Correction of color (to adjust skin tones or colors in memory)
   - Hue, brightness, and saturation adjustment
   - 1D and 2D histogram
4. Direct Connection to Display Module
   - Display Unit (DU) supported

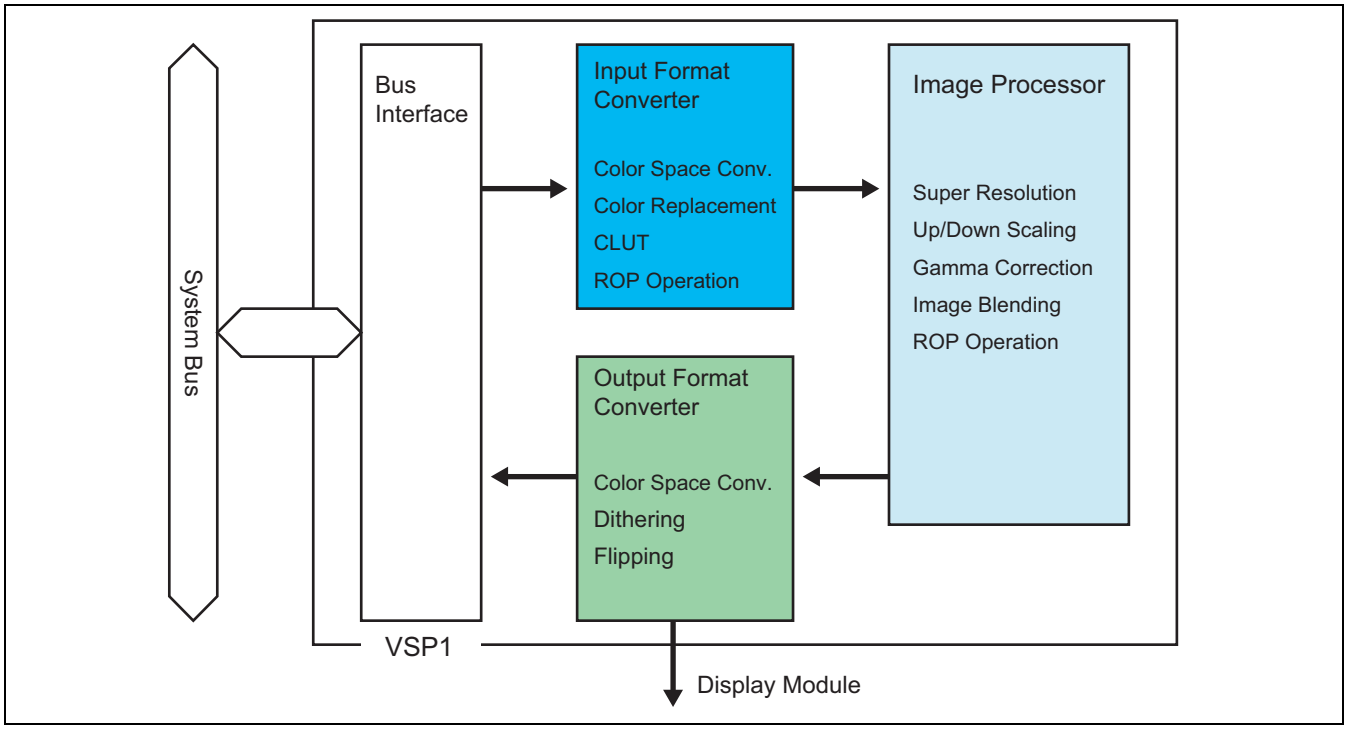

Figure 25.1 Top Level Architecture of VSP1

25.1.2 Block diagram

Figure 25.2 shows the configuration of VSP1 sub modules.

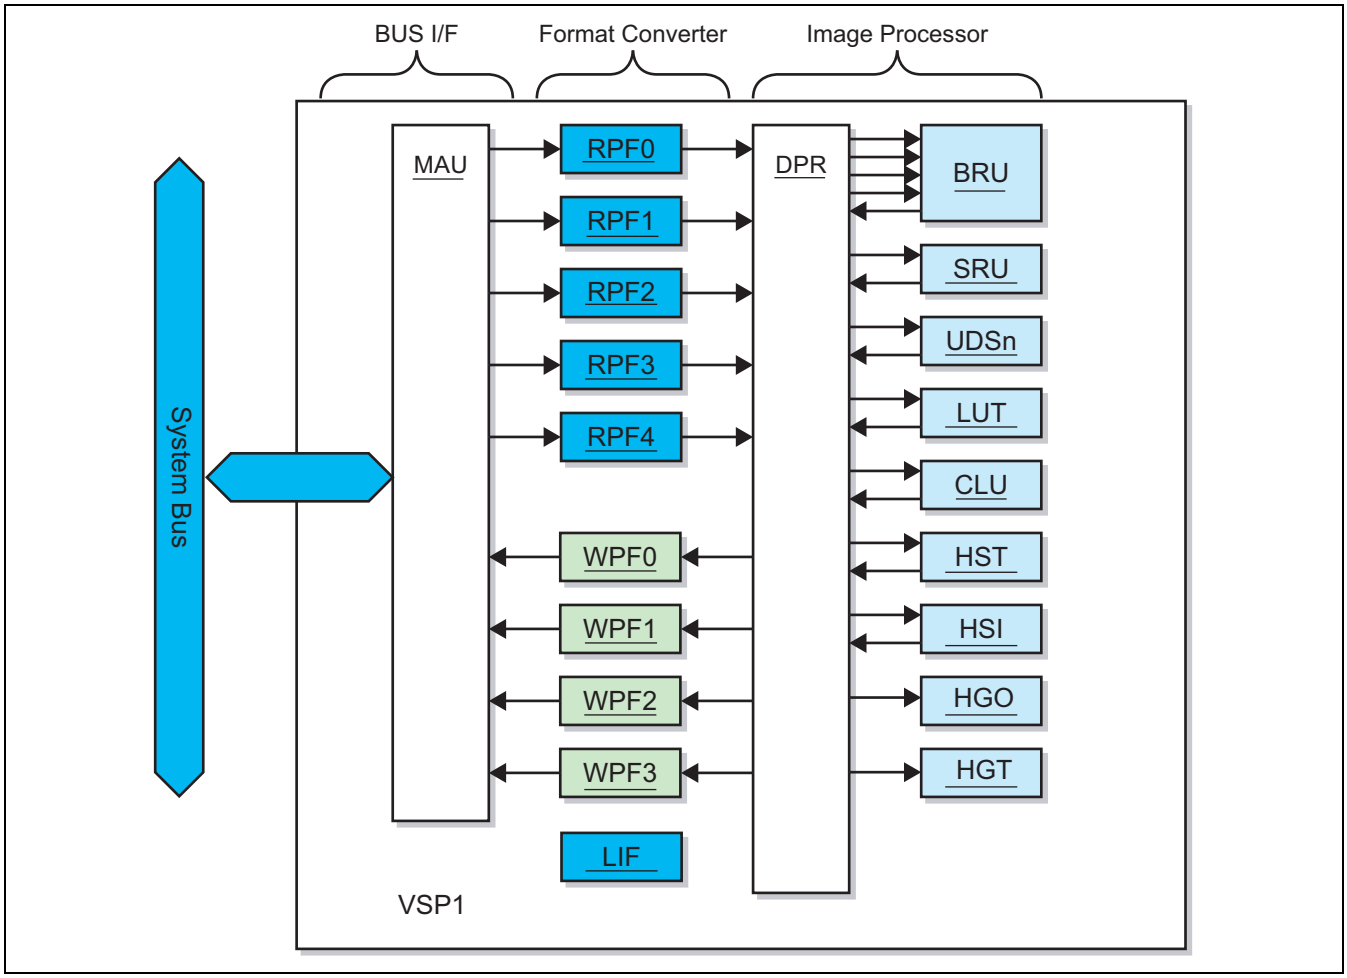

Figure 25.2 VSP1 Module Configuration

The following gives an overview of each block function shown in Figure 25.2. The operation of these functions is determined by the register setting explained in section 25.2. Refer to section 25.2 for the relationship between the register setting and the functional behavior.

(1) Memory Access Unit (MAU)

The VSP1 applies processing to the image data stored in the external memory and writes the resultant data back to the external memory. The data transfer between the external memory and VSP1 necessary for this operation is done by the MAU, which works as the bus master, according to the register settings. The MAU executes this data transfer between the external memory and VSP1.

(2) Command Transfer Unit (CTU)

The VSP1 can directly read register parameters for image processing by display lists stored in external memory. The CTU module is a bus interface and controls display lists when the CTU reads display lists as a bus master.

(3) Read Pixel Formatter (RPF)

The RPF reads image data from the external memory through the MAU, unpacks data according to the specified format, converts the color space, converts the number of colors, executes color keying, ROP operation, and OSD processing, and outputs the resultant data to the DPR. The RPF has an input format unpacking unit, an index color expanding unit (OSD-CLUT), a 1-bit mask generator, a raster operation unit (ROP unit), a color keying unit, and a color space converter. Figure 25.3 shows the processing flow in the RPF.

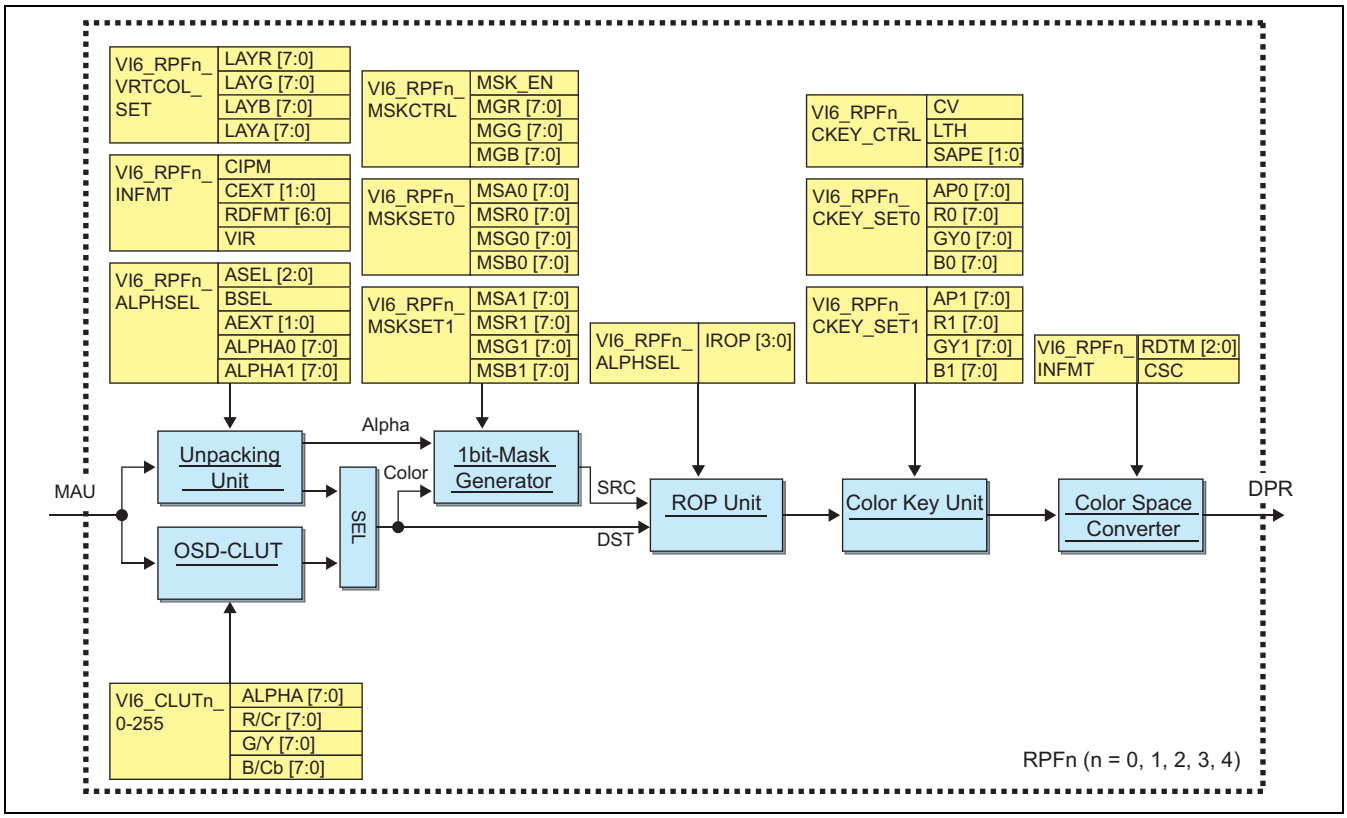

Figure 25.3 RPF Processing Flow

The input format unpacking unit and index color expanding unit (OSD-CLUT) expand the image data input from the MAU into the image format for internal processing, and the 1-bit mask generator generates a 1-bit image mask from the image data expanded through the unpacking unit and OSD-CLUT. Alternately, a 1-bit image mask can be generated from the alpha plane that is different from the picture plane read through the MAU.

The raster operation unit (ROP unit) executes raster operation between the data from the 1-bit mask generator and the image data expanded from the input format, and the color keying unit applies color replacement and specifies the transparent color for the image data input from the ROP unit. The color space converter converts the color space (RGB-YCbCr) of the image data input from the color keying unit as necessary.

The VSP1 provides maximum five RPF modules (RPF0 to RPF4). The implementation of OSD-CLUT depends on the configuration of each LSI.

(4) Data Path Router (DPR)

The DPR controls the data paths among RPFs, function modules, and WPFs. The DPR selects one of the images input from RPFs, outputs it to a function module (BRU, SRU, UDSn (n = 0 to 2), MED, LUT, CLU, HST, HSI, HGO, HGT or ILV), and selects one of WPFs as the destination where the image data processed in the function module will be output. Before output to the WPF, the output from each function module can be input to another function module, which enables multiple image processing functions to be executed continuously without involving the external memory.

(5) Super Resolution Unit (SRU)

The SRU is a module connected to the DPR, which executes the super resolution processing.

(6) Up/Down Scaler (UDS)

The UDS is a module connected to the DPR, which upscales or downscales the image size. It can also upscale or downscale the alpha value.

(7) LUT (LookUp Table)

This is a 1D-LUT that converts each of three color components by using a lookup table. The LUT is connected to the DPR and can be used for gamma correction, negative-positive conversion, posterization, and binarization through desired tone curve settings.

(8) Blend ROP Unit (BRU)

The BRU is a module connected to the DPR, which executes the image blending processing and ROP operation. The BRU has four blend/ROP operation units (blend/ROP unit m, m = A to D), an ROP operation unit, a blend/ROP input switch (SEL) for selecting the input to these operation units, and a divider for normalization (div unit).

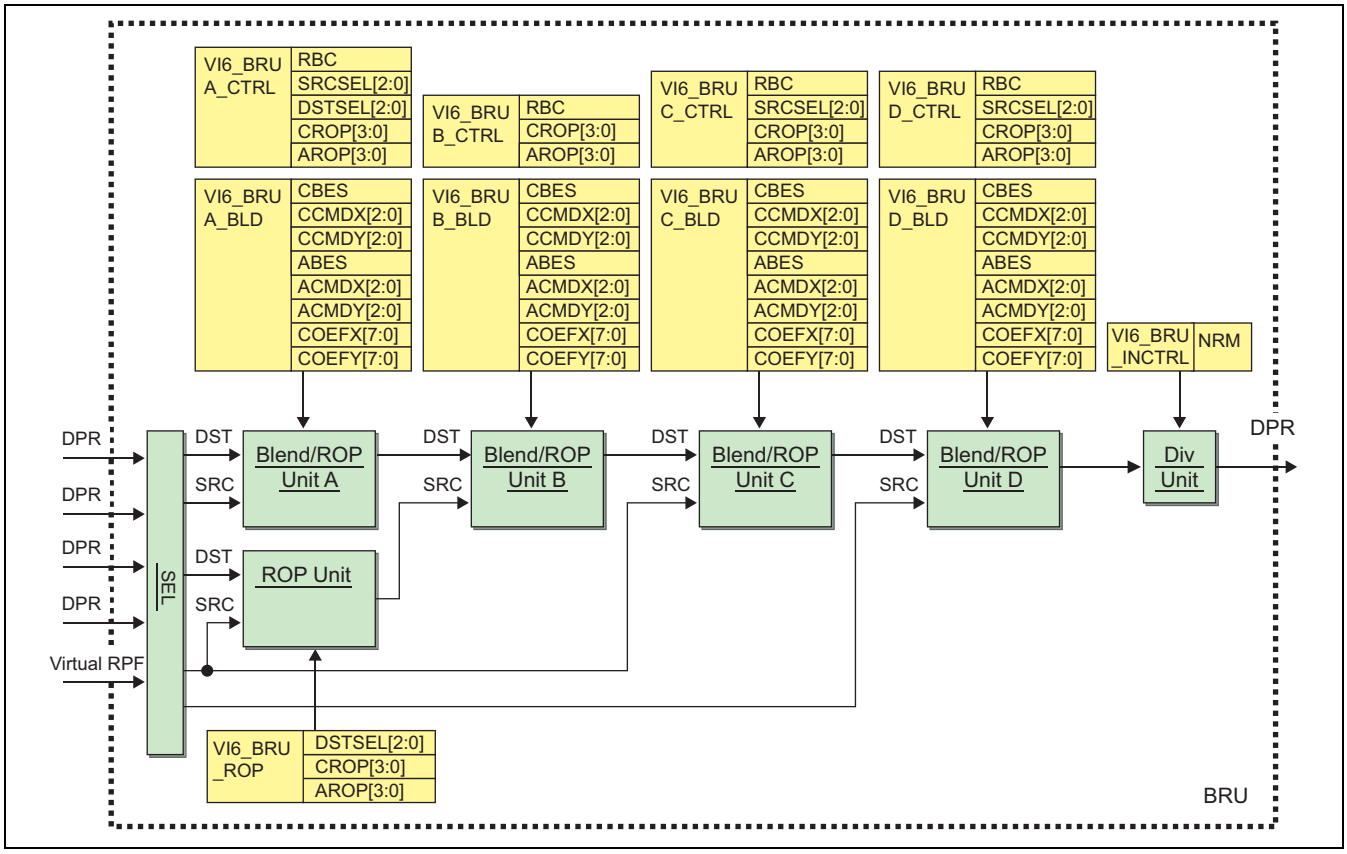

Figure 25.4 BRU Processing Flow

Each of the four blend-ROP operation units (blend/ROP unit m) receives the output from the SEL, blend/ROP Unit m, or ROP unit, and executes blending or raster operation (ROP) of images. The ROP unit receives the output from the SEL and executes 2-input raster operation (ROP2). By combining the ROP operation in the blend/ROP unit m and ROP2 operation in the ROP unit, 256-type 3-input raster operation (ROP3) can be implemented.

The divider for normalization (div unit) divides the pixel value by the α value.

(9) Write Pixel Formatter (WPF)

The WPF is an output module that receives image data from the DPR, converts the color space, number of colors, and format of the data, and outputs the results of VSP1 image processing to external memory through the MAU. The WPF is mainly configured from a color space converter and an output format converter (the packing unit).

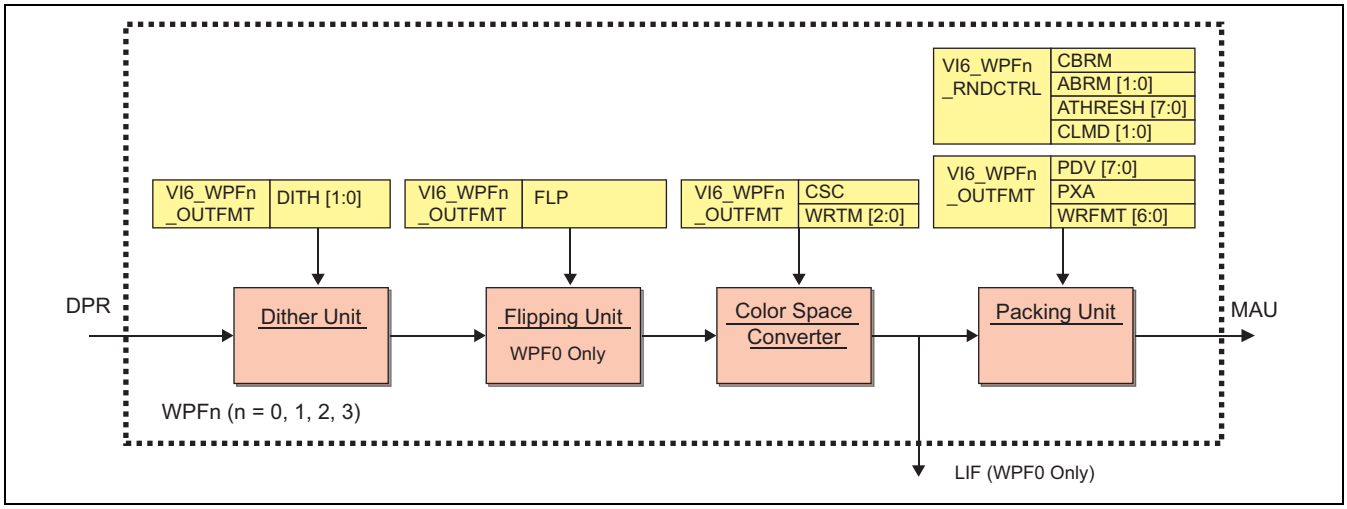

Figure 25.5 WPF Processing Flow

The color space converter converts the color space between RGB and YCbCr, and the packing unit converts the format into the picture plane storing format. The VSP1 provides maximum four WPFs (WPF0 to WPF3). The WPF0 has the output to LIF module after the color space conversion for transferring the video data to the display module.

(10) Cubic LookUp table (CLU)

This is a three-dimensional LUT (3D-LUT) that converts the input three-color-component data into desired three color components by using a lookup table. The 1D-LUT can only control each of three color components separately, but the 3D-LUT can convert a specified color into a different color. The CLU is connected to the DPR and can be used for specific color adjustment, such as correction to memorable color.

(11) Hue Saturation value Transform (HST)

The HST is a module connected to the DPR, which converts the RGB color space into the HSV color space. The HSV color space can represent a color with the hue, saturation, and value (brightness), and it makes color control through the LUT easier than in the RGB color space.

(12) Hue Saturation value Inverse transform (HSI)

The HSI is a module connected to the DPR, which converts the HSV color space into the RGB color space. It executes conversion in the direction opposite to that of the HST.

(13) Histogram Generator-One dimension (HGO)

The HGO is a module connected to the DPR and generates the one-dimensional histogram for the dynamic gamma correction. There is no output port of the image data. The middleware of the dynamic gamma correction will be released by Renesas.

(14) Histogram Generator-Two dimension (HGT)

The HGT is a module connected to the DPR and generates the two-dimensional histogram for the dynamic color correction. There is no output port of the image data. The middleware of the dynamic color correction will be released by Renesas.

(15) Lcdc InterFace (LIF)

The LIF module is used for transferring image data to the display module such as DU (Display Unit). The input port of the LIF module is connected to WPF0, and the output port of the LIF module is connected to DU.

25.1.3 Function List

Table 25.3 shows a functional overview of the VSP1 module.

Table 25.3 Functional Overview of VSP1

Data Transfer Function			
Bus interface	Data alignment	Conversion method	Byte, Word, LW, or LLW data swapping
	Data alignment Input	Channel	Data alignment can be specified separately for each input/output channel
		Address setting	1-byte units
Image memory	Output	Address setting	1-byte units
	Output Supported by RPF0 to RPF4	Memory area	Images can be written to the same memory area where the master layer is stored. Note the restrictions shown in Table 25.4.
Tile transfer mode			Interleaved, planer, or semi-planer

Read Pixel Formatter (RPF)

Number of channels			Five channels (RPF0 to RPF4)
Image format	Input	RGB	RGB888, RGB565, RGB666, αRGB8888, αRGB4444, αRGB1555, α plane (8 bpp, 1 bpp)
		YCbCr	YCbCr4:4:4/YCbCr4:2:2/YCbCr4:2:0 α plane (8 bpp, 1 bpp)
		Maximum size	8,190 × 8,190 pixels. The internal data path modules have separate restrictions on the maximum image size. For details, refer to Table 25.5.
		Minimum size	1 × 1 pixel The internal data path modules have separate restrictions on the minimum image size. For details, refer to Table 25.5.
		Size setting unit	YCbCr420: 2-pixel units both horizontally and vertically. YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.
Color keying	Color replacement	Compared data	RGB888 or Y
		Replaced data	αRGB8888 or αYCbCr
		Comparison Mode	Matched color mode
		Input source	RPF0 to RPF4
	Transparent color	Compared data	RGB888 or Y
		Replaced data	α
		Comparison Mode	Matched color mode, luma threshold mode
		Input source	RPF0 to RPF4
OSD/CLUT	Format	Memory storage format	8 bpp
		Image format	αRGB32 or αYCbCr32
	Input channel		RPF0 to RPF4
Raster operation	ROP2 (within input channels)	Operator	16 types (OpenGL2.0 is supported)
		Sources of operation	ROP2 operation between the 1-bpp α plane and RGB/YCbCr data in RPF0 to RPF4. Note that 1-bpp α is converted to αRGB888 or αYCbCr4:4:4.
Color space conversion	RGB to YCbCr	Conversion expression	RGB (0, 255) to BT601 (16, 235/240) RGB (0, 255) to BT709 (16, 235/240) RGB (0, 255) to BT601 (0, 255) RGB (16, 235) to BT709 (16, 235/240)
		Target of conversion	RPF0 to RPF4
	YCbCr to RGB	Conversion expression	BT.601 (16, 235/240) to RGB (0, 255) BT.709 (16, 235/240) to RGB (0, 255) BT.601 (0, 255) to RGB (0, 255) BT.709 (16, 235/240) to RGB (16, 235)
		Target of conversion	RPF0 to RPF4

Read Pixel Formatter (RPF)

Changing number of colors	Reducing RGB color depth	Target format	RGB666, RGB565, RGB555, RGB444, or RGB332
		Target of conversion	RPF0 to RPF4
	Increasing RGB color depth		Padded with 0. Copied from the most significant bits.
	YCbCr444 generation		CbCr copying or CbCr vertical copying and horizontal interpolation.
Virtual display	RPF0 to RPF4	Color format	αRGB8888 or αYCbCr4:4:4 single-color
		Display size	Same as the size of the input channel
	Virtual RPF	Color format	αRGB8888 or αYCbCr4:4:4 single-color
		Display size	Maximum: 8,190 × 8,190 pixels Minimum: 4 × 4 pixels
α bit count conversion	Input	Bit increase	Padded with 0. Copied from the most significant bits.

Write Pixel Formatter (WPF)

Number of channels			Four channels (WPF0 to WPF3)
Image format	Output	RGB	RGB332, RGB444, RGB565, RGB666, RGB888, αRGB8666, αRGB8888, αRGB4444, αRGB1555
		YCbCr	YCbCr4:4:4, YCbCr4:2:2, YCbCr4:2:0
		Maximum size	2,048 × 2,048 The internal data path modules have separate restrictions on the maximum image size. For details, refer to Table 25.5.
		Minimum size	1 × 1 pixel The internal data path modules have separate restrictions on the minimum image size. For details, refer to Table 25.5.
		Size setting unit	YCbCr420: 2-pixel units both horizontally and vertically. YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.
Color space conversion	RGB to YCbCr	Conversion expression	RGB (0, 255) to BT.601 (16, 235/240) RGB (0, 255) to BT.709 (16, 235/240) RGB (0, 255) to BT.601 (0, 255) RGB (16, 235) to BT.709 (16, 235/240)
		Target of conversion	WPF0 to WPF3
	YCbCr to RGB	Conversion expression	BT.601 (16, 235/240) to RGB (0, 255) BT.709 (16, 235/240) to RGB (0, 255) BT.601 (0, 255) to RGB (0, 255) BT.709 (16, 235/240) to RGB (16, 235)
		Target of conversion	WPF0 to WPF3
Changing number of colors	Output	Reducing RGB color depth	Dithering, lower-order bit truncation, or rounding
		YCbCr422/420	CbCr skipping or CbCr vertical skipping and horizontal skipping
α bit count conversion	Output	Bit reduction	Truncation, rounding, or comparison with threshold (for 1 bpp)

Image Compositing

α blending	Input α value selection	RGB	Pixel α, fixed α value, α plane, or 1-bit α converted from the color specified for pixels
		YCbCr	α plane, fixed α value, or 1-bit α converted from the color specified for pixels
	α blending expression	Plane A: Upper plane Plane B: Lower plane	xA + yB, xA – yB Coefficients x and y should be selected from the following. Fixed α value, (α for plane A), (1 - α for plane A), (α for plane B), (1 - α for plane B)
α blending	Output α value selection	RGB	Fixed α value, x·(α for plane A) + y·(α for plane B), x·(α for plane A) – y·(α for plane B) Coefficients x and y should be selected from the following. Fixed α value, (α for plane A), (1 – α for plane A), (α for plane B), (1 – α for plane B)
	Blending planes	Number of planes	Four planes selected from RPF0 to RPF4 and video processing function output, and virtual RPF; five planes in total
		Order of planes	The order of five planes selected from RPF0 to RPF4, virtual RPF, and video processing function output can be changed as desired.
	α plane	Format	8 bpp or 1 bpp (α value can be specified through register)
		Input source	RPF0 to RPF4
	Fixed α value	Format	8 bpp
		Input source	RPF0 to RPF4, virtual RPF, or video processing function output
Raster operation	ROP2 (between input channels)	Operator	16 types (OpenGL2.0 is supported)
		Sources of operation	RPF0 to RPF4, virtual RPF, and video processing function output
		Operation control	RGB/YCbCr and α are operated separately.
	ROP3 (between input channels)	Operator	256-type ROP3 is available by combining ROP2 operations
		Sources of operation	RPF0 to RPF4, virtual RPF, and video processing function output
		Operation control	RGB/YCbCr and α are operated separately.

Video Processing Functions

Super resolution	Processing method		Processing within one frame
	Scaling ratio		× 1 (same size) or × 2
	Arbitrary scaling ratio		Super resolution processing can be combined with the arbitrary ratio scaling function.
	α processing		Fixed α output
Scaler with arbitrary scaling ratio	Scaling factor		1/16 to 16
	Scaling ratio setting	Expression	1/[Mant.Frac]
		Precision	Mant = 4 bits, Frac = 12 bits
	α processing		Supported (for scale-up or scale-down to 1/4 to 1/1)
Simultaneous processing			All video processing functions and color adjustment functions can be processed simultaneously (the order of function execution is limited).

Color Adjustment Function

1D-LUT	LUT configuration	Independent R/Y, G/Cb, and B/Cr. 256 entries each
3D-LUT	Number of grid points	17 × 17 × 17
HSV color space conversion	RGB to HSV	Eight bits each for H/S/V
	HSV to RGB	Eight bits each for H/S/V
1D Histogram	Letter box detection	Supported
	Number of bins	64 for each color component
2D Histogram	Letter box detection	Supported
	Number of hue areas	6
	Number of bins	32 for each hue area

When the data output from the VSP1 is written back to the same memory area where the input data for the VSP1 has been read, the VSP1 has the following restrictions.

1. The access order and format on the frame memory are the same between the input pixels and output pixels.
2. Specifying a larger output image size than the input image size, either vertically or horizontally or both vertically and horizontally, is prohibited.
3. When the YCbCr4:2:0 format is input, operation between color components is prohibited.

These restrictions are summarized in Table 25.4. Refer to the descriptions of the registers related to each restriction. In the table, RPF_m indicates the RPFn that inputs the master layer, and WPF_{wb} indicates the WPFn that writes back the output image to the source image area for the master layer.

Table 25.4 Restrictions on Use when Output Data is Written Back to Input Data Area

No.	Restriction	Related Registers
Restriction 1	The RPF_m input format and the WPF_{wb} output format should be the same.	VI6_RPFn_INFMT.RDFMT VI6_RPFn_INFMT.VIR
	The RPF_m source image storing address and the WPF_{wb} destination address should be the same.	VI6_RPFn_SRCM_ADDR_*
	The RPF_m source picture memory stride and the WPF_{wb} destination memory stride should be the same.	VI6_RPFn_SRCM_PSTRIDE VI6_RPFn_SRCM_ASTRIDE
	The RPF_m and WPF_{wb} data swapping settings should be the same.	VI6_WPFn_DSWAP
	The image vertical flipping function cannot be used if WPF_{wb} is WPF0.	VI6_WPFn_OUTFMT.FLP
Restriction 2	Super resolution processing with double scale-up by the SRU is prohibited (super resolution processing of the same size is allowed).	VI6_SRU_CTRL0
	Scale-up and color filling by UDSn is prohibited.	VI6_UDSn_SCALE VI6_UDSn_CLIP_SIZE
	The value of scaling filter horizontal and vertical phase registers should be zero in case of using UDSn.	VI6_UDSn_IPC
	The RPF_m basic read size and extended read size should be the same.	VI6_RPFn_SRC_BSIZE VI6_RPFn_SRC_ESIZE
Restriction 3*	Color space conversion is prohibited in RPF_m and WPF_{wb}.	VI6_RPFn_INFMT.CSC VI6_WPFn_OUTFMT.CSC
	Use of the CLU is prohibited. Make sure that the CLU is not used in DPR routing.	VI6_DPR_CLU_ROUTE.RT
	NOP should be specified for IROP operation.	VI6_RPFn_ALPH_SEL.IROP
	Color keying is prohibited.	VI6_RPFn_CKEY_CTRL.CV

Note: * When the input format is not YCbCr4:2:0, restriction 3 in not applied.

25.1.4 VSP1 Input Size

Table 25.5 is a list of input size specifications.

Table 25.5 List of Input Size Specifications

Module	Min. Input Size	Max. Input Size	Restrictions on Setting Unit
RPF	1 (horizontal) × 1 (vertical) pixel	8,190 (horizontal) × 8,190 (vertical) pixels	YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. YCbCr420: 2-pixel units both horizontally and vertically. Other formats: 1-pixel units both horizontally and vertically. Notes: 1. When the 1-bpp alpha plane*1 is input, the size can always be specified in 8-pixel units both horizontally and vertically regardless of the input format. 2. These restrictions including note 1 are applied to the following. VI6_RPFn_SRC_BSIZE VI6_RPFn_SRC_ESIZE
SRU	4 (horizontal) × 4 (vertical) pixels	Without scaling (same size): 2,048 (horizontal) × 8,190 (vertical) pixels With double scale-up: 1,024 (horizontal) × 4,095 (vertical) pixels	1-pixel units both horizontally and vertically.
UDSn (n = 0, 1, 2)	4 (horizontal) × 4 (vertical) pixels	8,190 (horizontal)*2 × 8,190 (vertical) pixels	1-pixel units both horizontally and vertically.
LUT	1 (horizontal) × 1 (vertical) pixel	8,190 (horizontal) × 8,190 (vertical) pixels	1-pixel units both horizontally and vertically.
CLU	1 (horizontal) × 1 (vertical) pixel	8,190 (horizontal) × 8,190 (vertical) pixels	1-pixel units both horizontally and vertically.
HST	1 (horizontal) × 1 (vertical) pixel	8,190 (horizontal) × 8,190 (vertical) pixels	1-pixel units both horizontally and vertically.
HSI	1 (horizontal) × 1 (vertical) pixel	8,190 (horizontal) × 8,190 (vertical) pixels	1-pixel units both horizontally and vertically.
BRU	1 (horizontal) × 1 (vertical) pixel	8,190 (horizontal) × 8,190 (vertical) pixels	1-pixel units both horizontally and vertically.
HGO	1 (horizontal) × 1 (vertical) pixel	8,190 (horizontal) × 8,190 (vertical) pixels	1-pixel units both horizontally and vertically.
HGT	1 (horizontal) × 1 (vertical) pixel	8,190 (horizontal) × 8,190 (vertical) pixels	1-pixel units both horizontally and vertically.
LIF	1 (horizontal) × 1 (vertical) pixel	8,190 (horizontal) × 8,190 (vertical) pixels	1-pixel units both horizontally and vertically.
WPF	1 (horizontal) × 1 (vertical) pixel	2,048 (horizontal) × 2,048 (vertical) pixels	YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. YCbCr420: 2-pixel units both horizontally and vertically. Other formats: 1-pixel units both horizontally and vertically. Note: This restriction on the WPF only applies to the WPF output size. The WPF input size should be specified in 1-pixel units.

Notes: 1. When VI6_RPFn_ALPH_SEL.ASEL is set to B'011.

2. When the image size is downscaled and the horizontal UDS output size is 2,048 pixels or smaller, the UDS input size can be 2,048 pixels or larger.

The most important restriction shown in Table 25.5 is the setting unit. Make appropriate register settings so that the size of the image input to each module does comply with setting units and does not exceed the limits shown in Table 25.5. Especially for the register settings of SRU and UDSn, where the size can be changed within the modules, be careful not to exceed the input size limit for the module connected behind each of them.

25.1.5 VSP1 Output Size

The size of the output from each WPF is determined by the results of processing in the modules connected with the DPR. As shown in Figure 25.2, the data input to the VSP1 is sent to the WPF output modules through the RPF and the modules connected with the DPR. When there is no processing that changes the image size through this data path, the WPF output size is the same as the RPF input size. Table 25.6 is a list of the processing that changes image size.

Table 25.6 Image Processing that Changes Image Size

Module	Function*1	Related Register	Size of Output from Module
SRU	Super resolution with double scale-up	VI6_SRU_CTRL0	Super resolution without scaling (same size): Input size Super resolution with double scale-up: Input size × 2
UDSn	Output size clipping	VI6_UDSn_CLIP_SIZE	Horizontal output size: VI6_UDSn_CLIP_SIZE.CL_HSIZE setting Vertical output size: VI6_UDSn_CLIP_SIZE.CL_VSIZE setting
WPF	Input size clipping	VI6_WPFn_HSZCLIP VI6_WPFn_VSZCLIP	When this function is disabled, the input size and the output size are the same. When this function is enabled, the output is in the following size. Horizontal output size: VI6_WPFn_HSZCLIP.HCL_SIZE *2 setting Vertical output size: VI6_WPFn_VSZCLIP.VCL_SIZE *2 setting

Notes: 1. For details of each function, refer to the descriptions of the related registers.
2. Refer to section 25.2.1, Notational Conventions for Registers and Bit Fields for explanation of register bit field.

The input image size can be changed only with the modules and functions shown in Table 25.6. With the other modules and functions, the input size and output size are the same. Accordingly, after module connections with the DPR are determined, the VSP1 output size can also be determined through the following steps.

1. The image size (VI6_RPFn_SRC_ESIZE) read from the external memory and sent to the DPR by the RPFn is the initial value.
2. When the module connected with the DPR is not a module (function) shown in Table 25.6, the output size from the module is the same as the input size; the image size does not need to be updated.
3. When a module connected with the DPR is a module (function) shown in Table 25.6, the output image size should be updated to the size shown in the table, which should be used as the input image size for the module connected behind it.
4. When the final image size at the WPFn is determined, this size is the VSP1 output size for that WPFn path.

Figure 25.6 shows how to determine the image size in a sample DPR connection through the above steps. The related conditions that determine the image size are also shown.

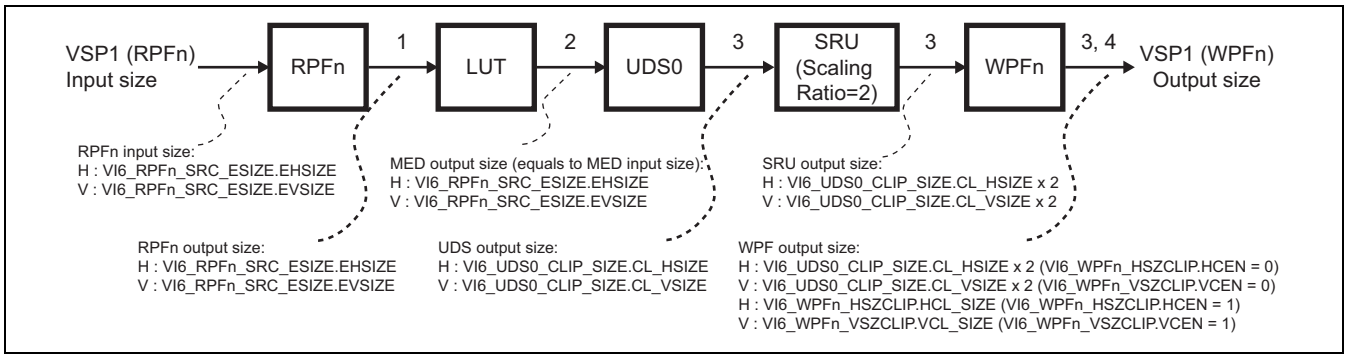

Figure 25.6 Input/Output Size for Each Module in a Sample DPR Connection

Make appropriate register settings in each module so that the VSP1 output image size determined as shown in the figure does not violate the restrictions shown in Table 25.6.

25.1.6 Input/Output Data Format

The VSP1 input/output data should be stored in a format where the address is incremented in the direction from the MSB to the LSB as in big endian. For example, the VSP1 reads and writes data to and from the external memory through the dedicated bus interface with a 128-bit width, and the data that should come first should be stored in the MSB side regardless of the unit data size as shown in Figure 25.7.

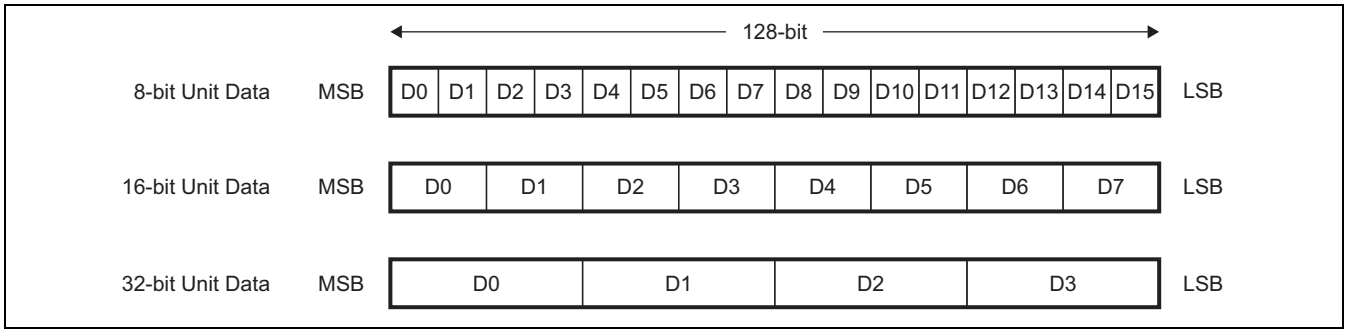

Figure 25.7 VSP1 Input/Output Data Format

However, data may be arranged in a way unexpected by the VSP1 depending on the address handling method (such as little endian) of the VSP1 access destination in some cases as in the external memory format shown in Figure 25.8. In such a case, use the data swapping function (refer to sections 25.2.7.4 and 25.2.8.5) in the VSP1 to convert the data format to be suitable for the VSP1.

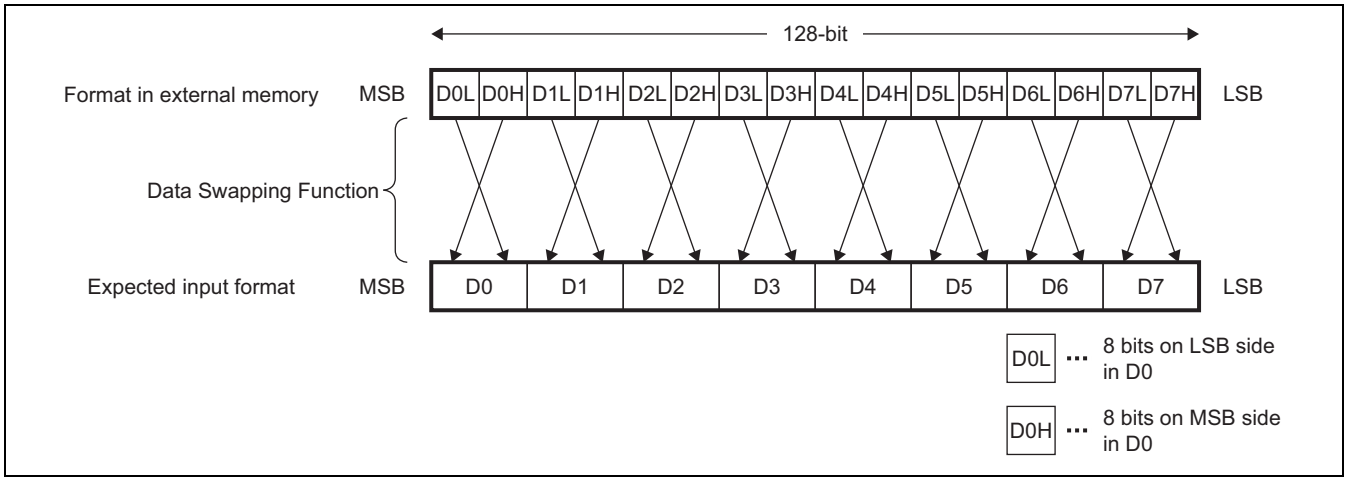

Figure 25.8 Input Data Alignment by Data Swapping Function

25.1.7 Concept of VSP1 Operation Starting and Stopping

The VSP1 provides four channels of image processing. Each channel is started by setting the corresponding start register. Here, starting a processing channel means starting one of WPF0 to WPF3, which are output modules of the VSP1. Use the start registers shown in Table 25.7 to start WPF modules.

After a WPF module is started and specified processing is completed, the corresponding channel stops operation and notifies the end of processing through an end interrupt. End interrupts are generated through the end interrupt source registers shown in Table 25.7; clearing a source register cancels the corresponding interrupt signal (for details of interrupt processing, refer to section 25.1.9, Interrupt Processing). Each of the operating status registers shown in the table indicates the busy state after the corresponding channel is started through the start register until processing is completed and operation stops. Figure 25.9 shows these operation timings.

Table 25.7 Target Module and Corresponding Registers for Starting and Stopping Operation

Target Module	Start Register	End Interrupt Source Register	Operating Status Register
WPF0	VI6_CMD0.STRCMD	VI6_WPF0_IRQ_STA. FRE	VI6_STATUS.SYS0_ACT
WPF1	VI6_CMD1.STRCMD	VI6_WPF1_IRQ_STA. FRE	VI6_STATUS.SYS1_ACT
WPF2	VI6_CMD2.STRCMD	VI6_WPF2_IRQ_STA. FRE	VI6_STATUS.SYS2_ACT
WPF3	VI6_CMD3.STRCMD	VI6_WPF3_IRQ_STA. FRE	VI6_STATUS.SYS3_ACT

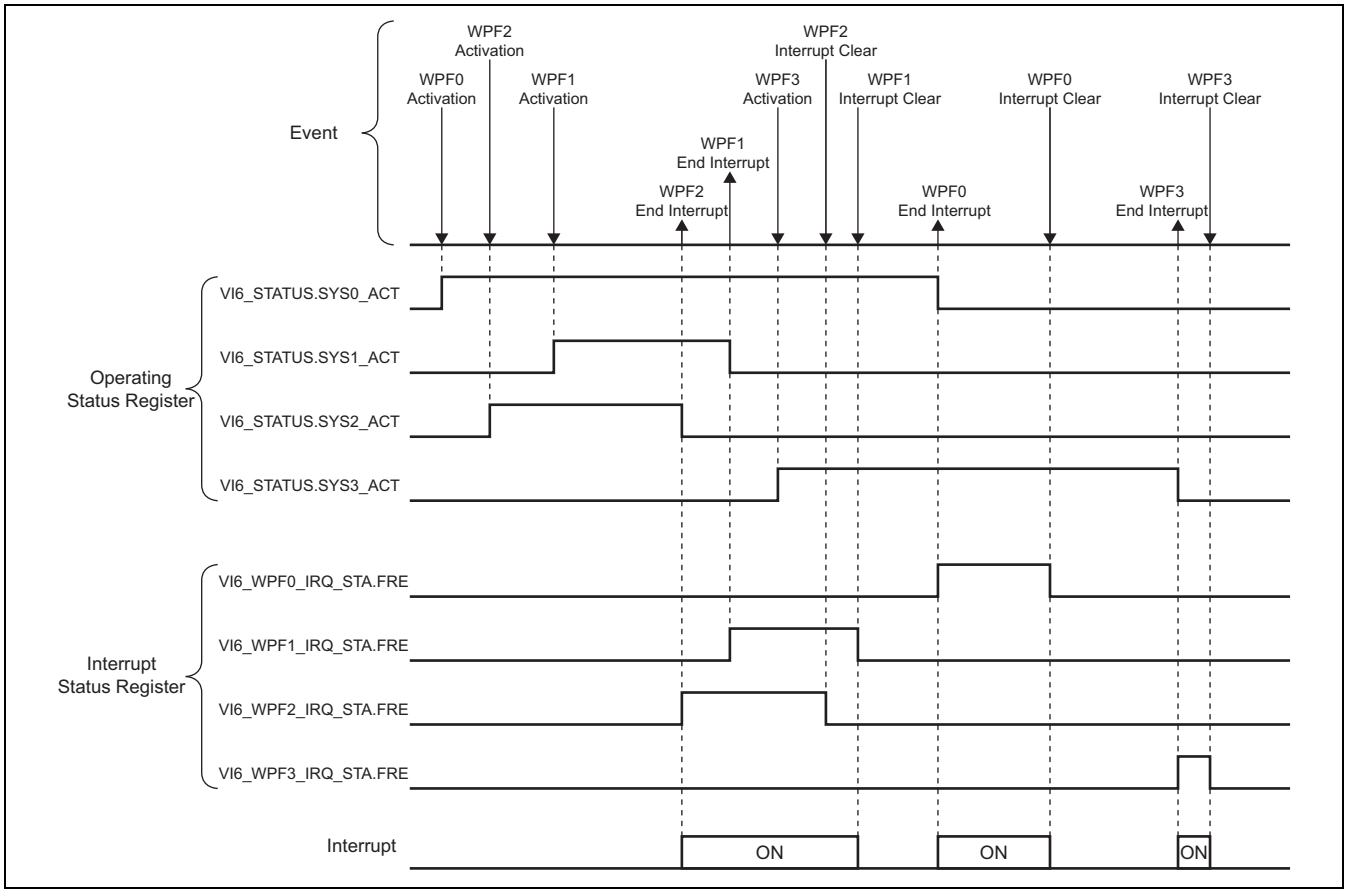

Figure 25.9 VSP1 Startup and Status of Each Register and Interrupt

The following describes the operating states (operating or stopped) of VSP1 internal modules. As described in section 25.1.2, the VSP1 has several image processing modules and the connections between modules are determined by the DPR. Accordingly, the operating state of a module is the same as that of the target WPF for that module. For example, when the target WPF for the CLU is WPF2, the CLU operating state is the same as that of WPF2; that is, the CLU operating state is indicated by the VI6_STATUS.SYS2_ACT as shown in Table 25.7 and the status change timing is shown as VI6_STATUS.SYS 2_ACT in Figure 25.9. Likewise, the operating states of all modules connected to WPF2 are indicated by VI6_STATUS.SYS 2_ACT.

After connections through the DPR are changed and the target WPF for a module is changed, refer to the correct register for the new target WPF to check the operating state of that module. In the above example, after the target WPF for the CLU is changed from WPF2 to WPF0, the CLU operating state is indicated by VI6_STATUS.SYS 0_ACT.

Connections should be changed through the DPR-related registers (described later) while all modules to be affected by any change in connections are stopped. If connections through the DPR are changed during operation, the VSP1 will hang.

25.1.8 Display List

(1) Functional Description

The VSP1 provides the display list function. As a display list, the VSP1 automatically downloads the register settings except for the control registers (sections 25.2.5 and 25.2.6) from external memory and stores the settings in the VSP1 registers. This function is advantageous in that the interrupt processing or register setting modification processing can be executed without CPU intervention during multiple-frame processing because the register settings used for VSP1 processing are prepared in advance in external memory such as SDRAM.

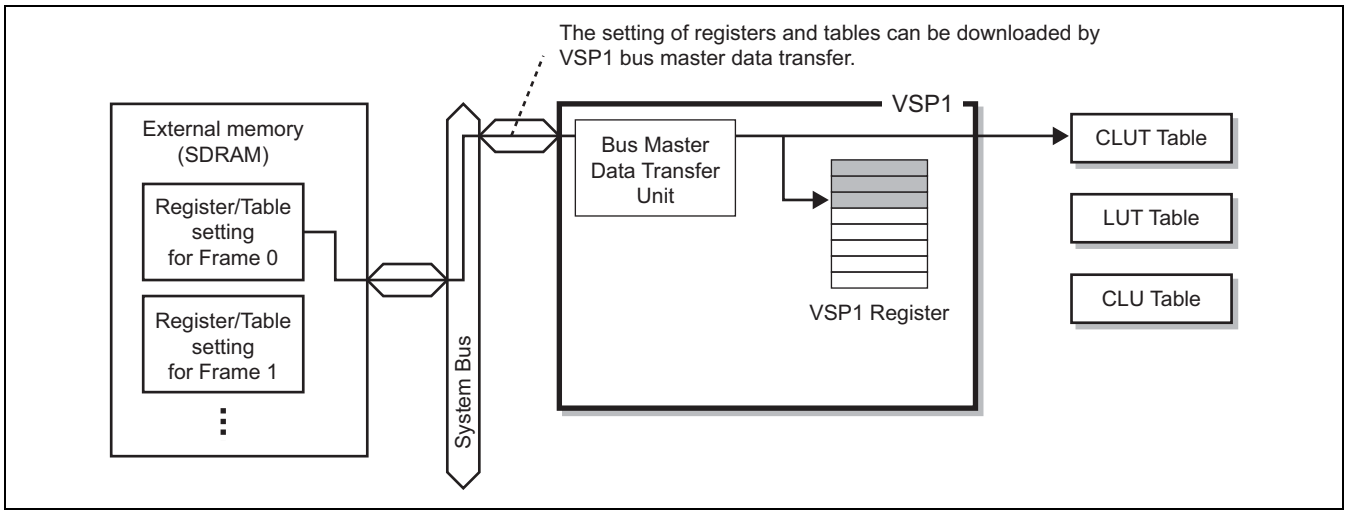

Figure 25.10 Concept of Display List

To use display lists, specify the external memory addresses to the display list control registers described in section 25.2.6. The register settings or various types of information should be stored in external memory in the format described in section 25.1.8 (2).

Figure 25.11 shows the difference between VSP1 operation through normal register settings and through display lists.

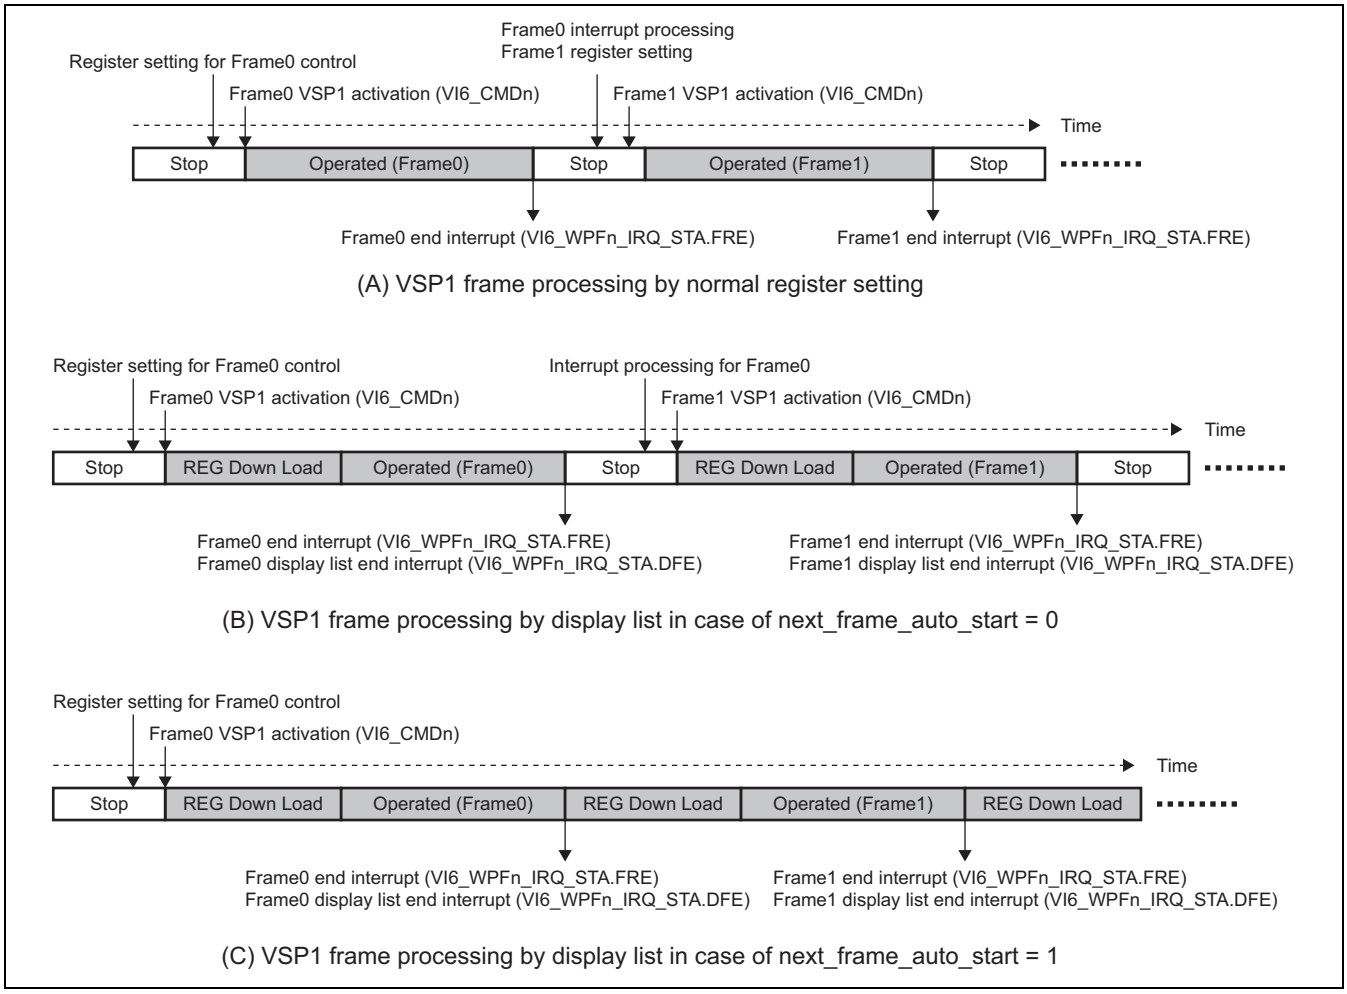

Figure 25.11 Comparison of VSP1 Operation between Normal Register Settings and Display Lists

As shown in Figure 25.11 (A), in the VSP1 processing through normal register settings, all registers should be set up before the VSP1 is started for each frame. After the VSP1 processing is completed, the VSP1 outputs a frame end interrupt (VI6_WPFn_IRQ_STA.FRE). This method requires a certain amount of time for register settings or interrupt processing by the CPU between frames. In contrast, when display lists are used, the VSP1 automatically downloads register settings from external memory as shown in Figure 25.11 (B) and (C), which reduces the load on the CPU between frames.

Figure 25.11 (B) shows the display list usage where the VSP1 stops at the end of every frame; only the VSP1 start processing for each frame is done by the CPU. This is suitable for the cases when the CPU controls synchronization of frame processing in frame buffer management or when the amount of register values or table data to be set in the VSP1 is large. In the case shown in Figure 25.11 (C), as soon as the frame processing ends, the VSP1 automatically begins next frame operation and starts downloading new register settings. This is the fastest operation using display lists.

Table 25.8 shows the modes of the display list and the supported functions for each mode. The detail of each mode is described in the following sections.

Table 25.8 Display List Mode and Supported Functions

Mode	Extended Display List	Continuous Frames
Normal Display List Mode	Supported	Controlled by “next_frame_auto_start” in the header of the display list.
Header-less Display List Mode	Not Supported	Controlled by VI6_DL_CTRL.CFM0 bit.

(2) Normal Display List Mode

The VSP1 display lists include control information as well as simple register settings in order to control multiple-frame processing in an optimum way for each application. Figure 25.12 shows the display list structure.

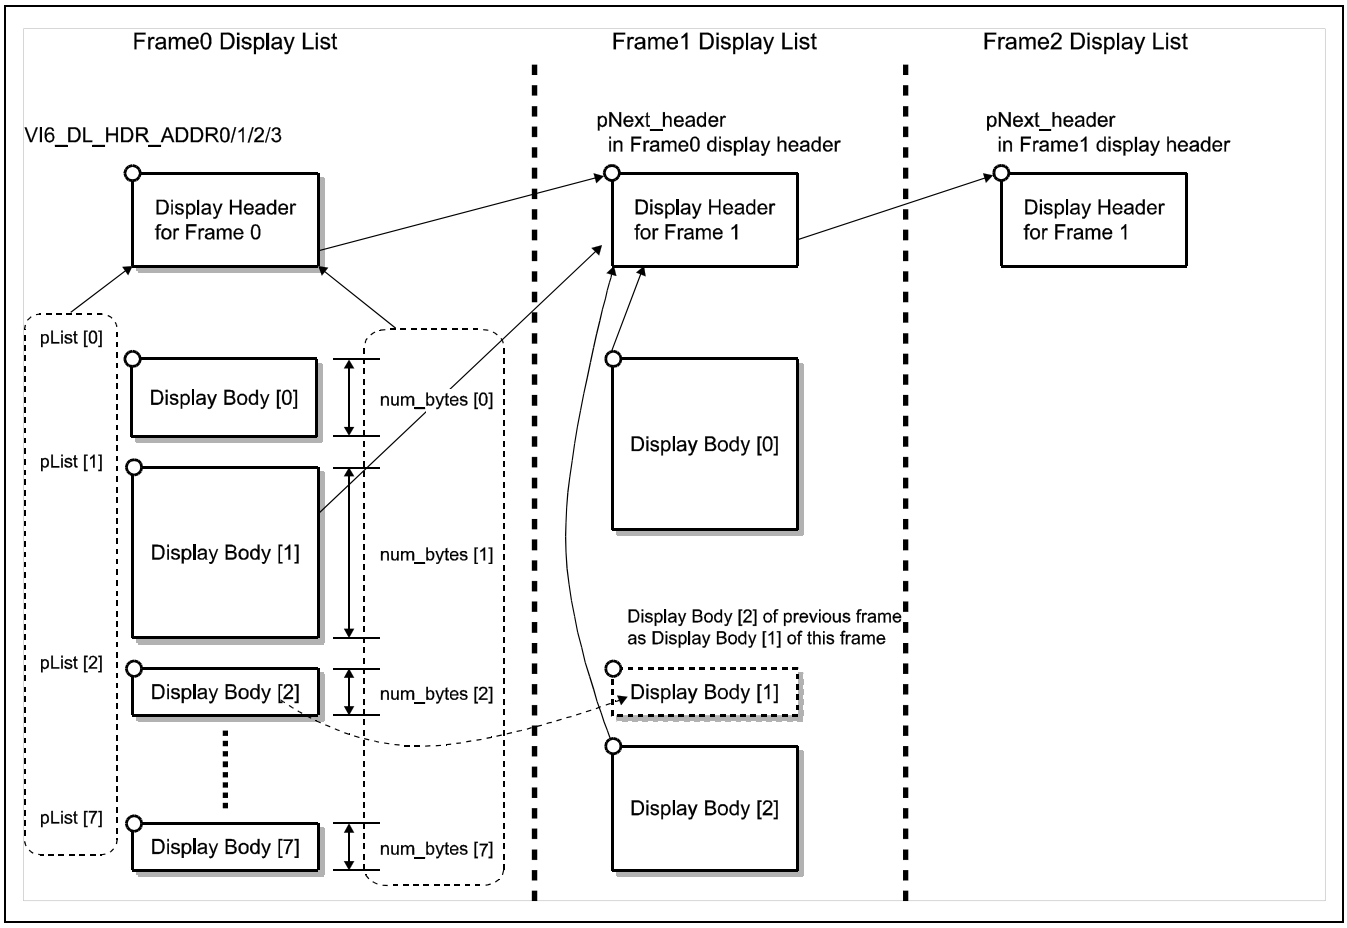

Figure 25.12 Structure and Concept of VSP1 Display List

A VSP1 display list consists of two sections; a header section for storing various information and control flags and a body section for storing register and table settings. A combination of these two sections is defined as a display list for a frame. The register and table settings can be divided and stored in up to eight separate bodies allocated in memory. Therefore, the separate bodies storing the register settings for one frame (for example, frame 0) can have non-sequential start addresses; that is, the bodies for one frame can be allocated to areas distant from each other in memory. To gather these bodies and configure the register settings for one frame, a header is used. A display header stores the number of bodies linked with the header and the start address and size of each body.

The VSP1 analyzes the header to gather register and table settings stored in separate memory areas and reconfigure the complete register settings.

The addresses of display headers should be specified in the VSP1 registers described in section 25.2.6. When activated in a mode that uses display lists, the VSP1 downloads display headers from the addresses specified in VI6_DL_HDR_ADDR0/1/2/3 (numbers 0 to 3 correspond to the WPF channel index numbers), analyzes the numbers of bodies and the address and data size of each body, downloads the bodies, and completes register and table settings. After display list downloading is completed, the VSP1 becomes ready for frame image processing; the VSP1 then starts the actual frame processing.

After processing of a frame ends, the VSP1 proceeds to the next frame processing. Here, there are two modes for starting the next frame processing as shown in Figure 25.11. In one mode, the VSP1 stops operation and waits for the next activation by the CPU in the same way as when display lists are not used. In this mode, the address used for downloading

the display header of the next frame is kept by the internal hardware. Therefore, if valid address information is not stored in the display header for the previous frame, a correct value should be specified in VI6_DL_HDR_ADDR0/1/2/3 while the VSP1 is stopped. When the VSP1 is started after a correct value is specified, the VSP1 starts next frame processing with the same procedure for the previous frame. In contrast to this mode, which stops the VSP1 after the end of one-frame processing, there is another mode for automatically starting next frame processing. In automatic start mode, the VSP1 downloads the next display header as soon as the previous frame processing ends. After downloading ends, the VSP1 starts image processing. The information regarding mode selection, that is, whether to automatically start next frame processing, should be stored in the display header downloaded for the previous frame.

In the automatic start mode, the VSP1 continues processing until the display header for a frame specifies that the next frame should not be started automatically. To stop processing during automatic execution, use a software reset (VI6_SRESET).

To strictly define the display list format described above, the following shows the grammatical structure of a display list using pseudo-code. First, to simplify the description of the display list format in the following pages, Table 25.9 defines a function. Function zero_bits (num_bits) generates a string of one-bit 0s for the number of bits specified by the parameter for the function. By using this function, Table 25.10 defines the header section format of a display list and Table 25.11 defines the body section format.

Table 25.9 Definition of a Function for Simple Description

Syntax	Bit Count
zero_bits (num_bits)	
{	
for (i=0; i<num_bits; i++) {	
zero_bit	1
}	
}	

Bit String	Contents
zero_bit	zero_bit indicates a 1-bit integer having a value of 0.

Table 25.10 Format of Display List Header Section

Syntax	Bit Count
display_header () /* Fixed length */	
{	
zero_bits (29)	
num_list_minus1	3
for (i=0; i<8; i++) {	
zero_bits (15)	
num_bytes [i]	17
pList [i]	32
}	
pNext_header	32
zero_bits (30)	
current_frame_int_enable	1
next_frame_auto_start /* 76 bytes from the beginning of this header*/	1
if (VI6_DL_EXT_CTRL.EXT) {	
zero_bits (32) /* padding zero 4 bytes for alignment */	
zero_bits (6)	
pre_ext_dl_exec	1
post_ext_dl_exec	1
zero_bits (8)	
pre_ext_dl_num_cmd	16
pre_ext_dl_pList	32
zero_bits (16)	
post_ext_dl_num_cmd	16
post_ext_dl_pList /* 96 bytes from the beginning of this header*/	32
}	
}	

Bit String	Contents
num_list_minus1	Specifies the value obtained by subtracting 1 from the total number of display list bodies linked with the display header. For example, when this bit field is set to 0, this display list uses one body.
num_bytes [i]	Specifies the number of bytes in the i-th display list body (indicated by index i). Be sure to specify a multiple of eight bytes. For the bodies that are not defined in num_list_minus1 (for example, i = 5 to 7 when num_list_minus1 is set to 4), specify 0.
pList [i]	Specifies the start address of the i-th display list body (indicated by index i). Be sure to specify an address aligned with an 8-byte boundary (the lower-order three bits are 0). For the bodies that are not defined in num_list_minus1 (for example, i = 5 to 7 when num_list_minus1 is set to 4), specify 0.
pNext_header	Specifies the address of the display list header for the next frame. After display list downloading ends, the VSP1 keeps its value in the internal memory and uses it in the next display list header downloading.
current_frame_int_enable	This is a flag that indicates whether to set the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) to 1 when the current frame processing ends. If this flag is set to 0, the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) is not set to 1 when one-frame processing by this display header ends. In this state, even if the display list end interrupt is enabled (VI6_WPFn_IRQ_ENB.DFEE is set to 1), no interrupt will be generated. If this flag is set to 1, the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) is set to 1 when one-frame processing by this display header ends. In this state, if the display list end interrupt is enabled (VI6_WPFn_IRQ_ENB.DFEE is set to 1), the VSP1 generates an interrupt.
Next_frame_auto_start	Enables or disables automatic start of next frame processing when one-frame processing by this display header ends. If this bit is set to 1, the VSP1 starts next frame processing as soon as one-frame processing by this display header ends, and starts downloading the next frame display header from the pNext_header address specified in this display header. If this bit is set to 0, the VSP1 stops operation when one-frame processing by this display header ends. In this case, start the VSP1 through VI6_CMDn to process the next frame.
pre_ext_dl_exec	Enables execution of the extended display list for frame preprocessing when VI6_DL_EXT_CTRL.EXT is 1. If this bit is set to 1, the VSP1 executes the extended display list for frame preprocessing. The VSP1 does not execute it if this bit is set to 0. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
post_ext_dl_exec	Enables execution of the extended display list for frame post processing when VI6_DL_EXT_CTRL.EXT is 1. If this bit is set to 1, the VSP1 executes the extended display list for frame post processing. The VSP1 does not execute it If this bit is set to 0. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
pre_ext_dl_num_cmd	Specifies the number of commands in the extended display list body section for frame preprocessing when VI6_DL_EXT_CTRL.EXT is 1. The number of commands that can be specified is 1 to 65,535, and a command is 16 bytes. When pre_ext_dl_exec is set to 0, the extended display list for frame preprocessing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
pre_ext_dl_pList	Specifies the start address of the area where the extended display list body section for frame preprocessing is stored when VI6_DL_EXT_CTRL.EXT is 1. Be sure to specify an address aligned with a 16-byte boundary (lower-order four bits are 0). When pre_ext_dl_exec is set to 0, the extended display list for frame preprocessing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
post_ext_dl_num_cmd	Specifies the number of commands in the extended display list body section for frame post processing when VI6_DL_EXT_CTRL.EXT is 1. The number of commands that can be specified is 1 to 65,535, and a command is 16 bytes. When post_ext_dl_exec is set to 0, the extended display list for frame post processing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.

Bit String	Contents
post_ext_dl_pList	Specifies the start address of the area where the extended display list body section for frame post processing is stored when VI6_DL_EXT_CTRL.EXT is 1. Be sure to specify an address aligned with a 16-byte boundary (lower-order four bits are 0). When post_ext_dl_exec is set to 0, the extended display list for frame post processing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.

Table 25.11 Format of Display List Body Section

Syntax	Bit Count
display_list (num_bytes) /* Variable length (num_bytes) */	
{	
for (i = 0; i<num_bytes; i+=8) {	
set_address	32
set_data	32
}	
}	

Bit String	Contents
set_address	Specifies the address where the value specified by set_data is to be stored. Specify a register address.
set_data	Specifies the value to be stored in the address specified by set_address. Specify a value to be set in a register.

Table 25.12 Format of Extended Display List Body Section

Syntax	Bit width
ext_dl_display_list (num_llw) /* Variable length (pre/post_ext_dl_num_bytes) */	
{	
for (i = 0; i<num_llw; i+=2) {	
ext_dl_cmd	64
ext_dl_data	64
}	
}	

Bit string	Contents
ext_dl_cmd	ext_dl_cmd specifies a 64-bit control command for the extended display list. The upper-order 32 bits hold a command and the lower-order 32 bits are bits for masking or enabling data to be handled by the command. In the upper-order 32 bits (command), bits 63 to 43 should always be set to 0, bits 42 to 40 specify data swapping during command execution (described later), and bits 39 to 32 specify the command type. Bit 42: Data swapping in long word (32-bit) units during command execution When this bit is 1, the data read or written for command execution is swapped in long word (32-bit) units. Bit 41: Data swapping in word (16-bit) units during command execution When this bit is 1, the data read or written for command execution is swapped in word (16-bit) units. Bit 40: Data swapping in byte (8-bit) units during command execution When this bit is 1, the data read or written for command execution is swapped in byte (8-bit) units. Bits 39 to 32 are H'00: Write Data The value stored in ext_dl_data [31:0] is written to the address stored in ext_dl_data [63:32] specified after this command. In the lower-order 32 bits of this command (ext_dl_cmd [31:0]), specify the bits whose value should be updated with the value of ext_dl_data [31:0]. Specify 1 for the bits whose value should be updated, and specify 0 for the bits whose current value should be retained. Bits 39 to 32 are H'01: Wait Event Until the value stored in the address indicated by ext_dl_data [63:32] specified after this command matches the value stored in ext_dl_data [31:0], processing of this extended display list body section is stalled. The bits used for comparison are masked with the lower-order 32 bits of this command (ext_dl_cmd [31:0]). To compare all bits, the lower-order 32 bits of this command should be set to all 1s.
ext_dl_data	Specifies the data used by ext_dl_cmd [63:0]. When ext_dl_cmd [39:32] is H'0000, specify these bits as follows. ext_dl_data [63:32]: Write destination address ext_dl_data [31:0]: Write data When ext_dl_cmd [39:32] is H'0001, specify these bits as follows. ext_dl_data [63:32]: Reference address ext_dl_data [31:0]: Comparison data

(3) Header-less Display List Mode

The header-less display list does not have the display header listed in Table 25.10, and it has the simplest structure that has only single body. The extended display list function is not available in case of the header-less display list mode. Set the value 1 to VI6_DL_CTRL.NH0 (see section 25.2.6.1) to use the header-less display list. The start address downloaded by the header-less display list should be set to VI6_DL_HDR_ADDR0. And the size of the display body which is originally defined in the display header should be set to VI6_DL_BODY_SIZE0. The header-less display list is available only in WPF0.

(4) Restrictions on Display List Usage

Access to the general control registers and display list control registers through a display list is prohibited. When using display lists, be sure to observe the following restrictions on register access by the CPU.

1. Do not execute write access to the same register (same address) from the CPU and through a display list at the same time. If such a conflict occurs, correct operation of the VSP1 is not guaranteed.
2. Do not execute write access to the same CLUT, CLU, or LUT lookup table from the CPU and through a display list at the same time. If such a conflict occurs, correct operation of the VSP1 is not guaranteed. Here, the same lookup table means the address space having the same space name shown in Table 25.36 or Table 25.37.
3. When read access by the CPU and write access through a display list to the same register (same address) occur at the same time, the read value returned to the CPU is not guaranteed.
4. When read access by the CPU and write access through a display list to the same CLUT, CLU, or LUT lookup table occur at the same time, the read value returned to the CPU is not guaranteed. Here, the same lookup table means the address space having the same space name shown in Table 25.36 or Table 25.37.
5. For other restrictions on values and timing of register setting through display lists, refer to the restrictions on normal register settings described in section 25.2.3.
6. Manipulation and setting of the registers described in sections 25.2.4 and 25.2.6 through a display list is prohibited.
7. Do not use extended display lists on this LSI.

25.1.9 Interrupt Processing

The VSP1 provides multiple image processing channels (WPF0 to WPF3) and they can operate simultaneously in parallel. When a WPF module generates an internal source that should be notified, an interrupt signal is output. As internal sources are generated in each WPF independently, the VSP1 has the following registers to control interrupts in each WPF.

- WPF Interrupt Enable Registers (VI6_WPFn_IRQ_ENB: n = 0, 1, 2, 3) (refer to section 25.2.5.5)
- WPF Interrupt Status Registers (VI6_WPFn_IRQ_STA: n = 0, 1, 2, 3) (refer to section 25.2.5.6)

While multiple WPF modules operate in parallel, they may output interrupt requests at the same time (this is called a multiple interrupt state). Read the WPF Interrupt Status Registers (VI6_WPFn_IRQ_STA: n = 0, 1, 2, 3) in sequence and execute the interrupt response processing for each interrupt source.

Note: To use interrupts, enable them through WPF interrupt enable registers. If an interrupt source register has already been set to 1 for some reason, an unintended interrupt will occur as soon as the corresponding interrupt enable register is set as enabled. To avoid this, before enabling interrupts through WPF interrupt enable registers, be sure to clear all WPF interrupt sources to be enabled to 0. Be careful about this procedure when setting up registers before starting the VSP1.

25.2 Registers Description

25.2.1 Notational Conventions for Registers and Bit Fields

This document uses the following notational conventions for the VSP1 registers and bit fields.

1. The names of registers and bits are written in uppercase.
2. A bit or bit field in a register is indicated as [register name.bit name]. For example, the STRCMD bit in the VI6_CMD0 register is indicated as VI6_CMD0.STRCMD.
3. Lowercase "n" in a register name or a bit name indicates an integer and the range of value n is defined when necessary. For example, VI6_CMDn.STRCMD (n = 0, 1) indicates the STRCMD bit in two registers VI6_CMD0.STRCMD and VI6_CMD1.STRCMD. For RPFn, WPFn, and UDSn, when the range of value n is not defined, RPFn (n = 0, 1, 2, 3, 4), WPFn (n = 0, 1, 2, 3), and UDSn (n = 0, 1, 2) are assumed.
4. In each subsection for register description in section 25.2, when only a bit name is written without showing its register name, the bit is in the register described in that subsection.
5. A wildcard (*) indicates any characters in a name and represents all registers or bits that match the specified first part of a name. For example, VI6_RPF_SRC_* indicates both VI6_RPF_SRC_BSIZE and VI6_RPF_SRC_ESIZE register.

25.2.2 Register Configuration

The VSP1 registers are arranged in the following order; the general control registers to frame sync control registers control operation of the entire R-VSP1, and the other registers control each image processing and specify parameters for the processing. The functions of the registers are described in this order starting from section 25.2.4.

1. General control registers (VI6_CMDn (n = 0, 1, 2, 3), VI6_SRESET, VI6_STATUS, VI6_WPFn_IRQ_* (n = 0, 1, 2, 3))
2. Display list control registers (VI6_DL_*)
3. RPF control registers (VI6_RPFn_* (n = 0, 1, 2, 3, 4))
4. WPF control registers (VI6_WPFn_* (n = 0, 1, 2, 3))
5. DPR control registers (VI6_DPR_*)
6. SRU control registers (VI6_SRU_*)
7. UDSn control registers (VI6_UDSn_* (n = 0, 1, 2))
8. LUT control register (VI6_LUT_CTRL)
9. CLU control register (VI6_CLU_CTRL)
10. HST control register (VI6_HST_CTRL)
11. HSI control register (VI6_HSI_CTRL)
12. BRU control registers (VI6_BRU_*)
13. HGO control registers (VI6_HGO_*)
14. HGT control registers (VI6_HGT_*)
15. LIF control registers (VI6_LIF_*)
16. Security control registers (VI6_SECURE_*)

The VSP1 has five RPF channels and the register configuration is the same for all of RPF0 to RPF4. However, some bit fields have restrictions in certain RPFs. These restrictions are included in the description of the corresponding bit fields and registers. Likewise, the register configuration is the same for all four WPF channels (WPF0 to WPF3), but some bit fields have restrictions in certain WPFs; the restrictions are included in the description of the corresponding bit fields and registers.

For each register address, refer to section 25.2.4, Memory Map.

25.2.3 Restrictions on Access to Registers and Lookup Tables

The VSP1 has control registers and lookup tables. When accessing the addresses where these registers and lookup tables are allocated, the following restrictions should be satisfied. If any restriction is violated, the VSP1 will not operate correctly.

1. For the read-only bits and reserved bits in all VSP1 registers, writing 1 is prohibited unless otherwise specified.
2. Addresses undefined in section 25.2.4, Memory Map, are reserved areas and write access is prohibited in these areas.
3. For all registers and lookup tables, except VI6_SRESET and VI6_*IRQ*, modifying register values during operation of the module is prohibited. Modify registers while the corresponding module is stopped. For the operating status of the target module, refer to section 25.1.7.

Table 25.13 Correspondence between Modules and Register Names

Module Name	Register Name
RPFn (n = 0 to 4)	VI6_RPFn_*
WPFn (n = 0 to 3)	VI6_WPFn_*
DPR	VI6_DPR_*
SRU	VI6_SRU_*
UDSn (n = 0 to 2)	VI6_UDSn_*
LUT	VI6_LUT_CTRL
CLU	VI6_CLU_CTRL
HST	VI6_HST_CTRL
HSI	VI6_HSI_CTRL
BRU	VI6_BRU_*
HGO	VI6_HGO_*
HGT	VI6_HGT_*
LIF	VI6_LIF_*

25.2.4 Memory Map

(1) Base Address

Below are the base addresses of each VSP unit ($VSP_BASE) in this LSI:

VSPS: H'FE92 8000
VSPD0: H'FE93 0000

(2) Register/Table Address

Table 25.14 shows the VSP1 memory map (represents in relative address).

Table 25.14 VSP1 Memory Map

Space	Register Type	Register Name	Relative Address from Base Address of Each VSP Unit
Register	General control registers	VI6_CMD0	$VSP_BASE + H'0000
		VI6_CMD1 (VSPS only)	$VSP_BASE + H'0004
		VI6_CMD2 (VSPS only)	$VSP_BASE + H'0008
		VI6_CMD3 (VSPS only)	$VSP_BASE + H'000C
		VI6_CLK_DCSWT	$VSP_BASE + H'0018
		VI6_SRESET	$VSP_BASE + H'0028
		VI6_STATUS	$VSP_BASE + H'0038
		VI6_WPF0_IRQ_ENB	$VSP_BASE + H'0048
		VI6_WPF0_IRQ_STA	$VSP_BASE + H'004C

25.2.5 General Control Registers

25.2.5.1 VSP1 Start Registers n (VI6_CMDn: n = 0, 1, 2, 3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STRCMD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	STRCMD	0	R/W	Start Command VSP1 has four output channels (WPFs). Starting WPF0 to WPF3 starts operation of VSP1. Only a single WPF can be started, and all four WPFs can also be started at the same time. VI6_CMD0.STRCMD to VI6_CMD3.STRCMD respectively control WPF0 to WPF3. Writing 1 to this bit starts WPFn in VSP1. Set this bit for activation only after all register settings in each output channel have been completed. This bit is always read as 0. 0: NOP 1: WPFn is started (VSP1 is started).

The basic concept of image processing operation started by activating the VSP1 is shown in Figure 25.13. The actual data input/output is executed by the MAU, which is the bus interface module, as described in section 25.1.2, but conceptually the RPF works as the data entry point to the VSP1 and the WPF works as the data exit point. To process images through the VSP1, the RPF (entrance) and WPF (exit) should be connected and a data path from the RPF to the WPF should be formed.

To connect RPFn to WPFn, specify RPFn as the source RPF for WPFn in VI6_WPFn_SRCRPF, which is a register for WPFn (refer to section 25.2.8.1). This setting determines that RPFn will be started when WPFn is started through VI6_CMDn.

A data path to execute desired image processing should then be formed between the RPF (entrance) and WPF (exit). To form a data path, connect the necessary function modules in the VSP1 between RPF and WPF. This function is provided by the DPR; specify the information for each module connection in data path routing registers VI6_DPR_*_ROUTE (refer to section 25.2.9).

After a data path is formed (RPFn → WPFn) as described above, starting output module WPFn in the VSP1 through VI6_CMDn starts all function modules connected to WPFn and the desired image processing is executed. According to this design concept, starting a WPF module means starting the VSP1.

There are two types of data path configuration in the VSP1; one is "a single input module to a single output module" as shown in Figure 25.13 (A), and the other is "multiple input modules to a single output module" as shown in Figure 25.13 (B). Figure 25.13 (A) shows an example of a configuration where modules with single input and single output are

implemented through the DPR. Figure 25.13 (B) shows another configuration example where the module with multiple input and single output is implemented through the DPR. As shown in the figure, there is no conflict over internal module resources between these two connection examples, and the data paths in Figure 25.13 (A) and (B) can be started at the same time (for details of the DPR, refer to section 25.2.9). To start them together, make the register settings related to the modules used in each data path, and then set VI6_CMD0 and VI6_CMD2 to start WPF0 and WPF2, respectively. These two paths are completely independent. Even if the register settings for path (B) are incomplete, path (A) can be started regardless of the state of path (B) when the register settings for path (A) are complete.

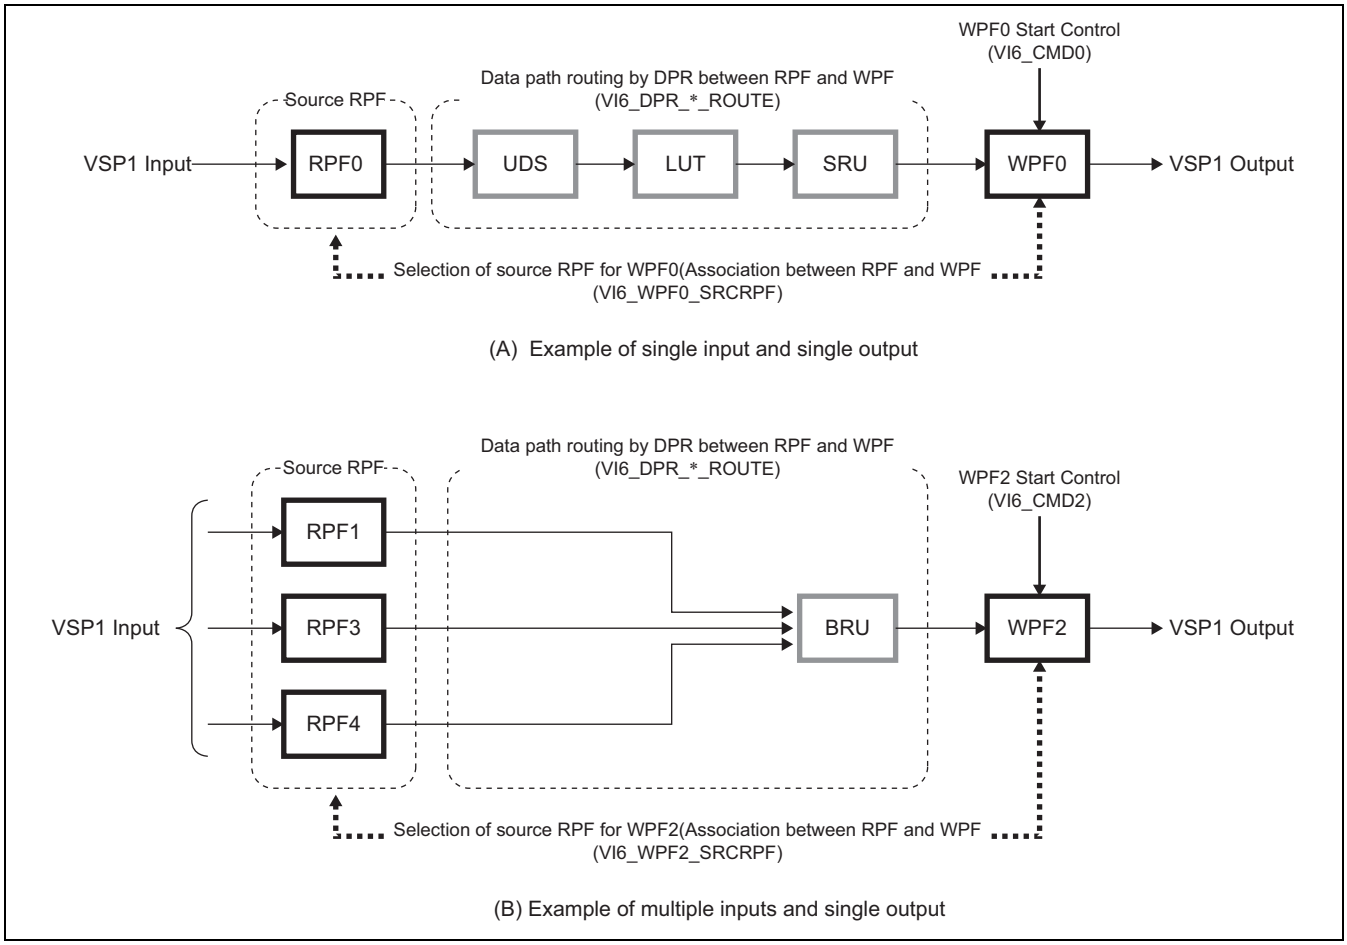

Figure 25.13 Basic Concept of VSP1 Startup

The DPR in the VSP1 can realize more advanced data paths than those shown in Figure 25.13. For example, two activations are necessary for the combination of paths (A) and (B) in Figure 25.13. However, the same processing may be started through one activation by improving the data path configuration, depending on the data processing flow in some cases, as shown in Figure 25.14. When the data path configuration is improved, the capacity of memory used and the amount of bus transfer in the system can be reduced. When determining the starting units in the VSP1, carefully examine the data processing flow and configure an optimal data path.

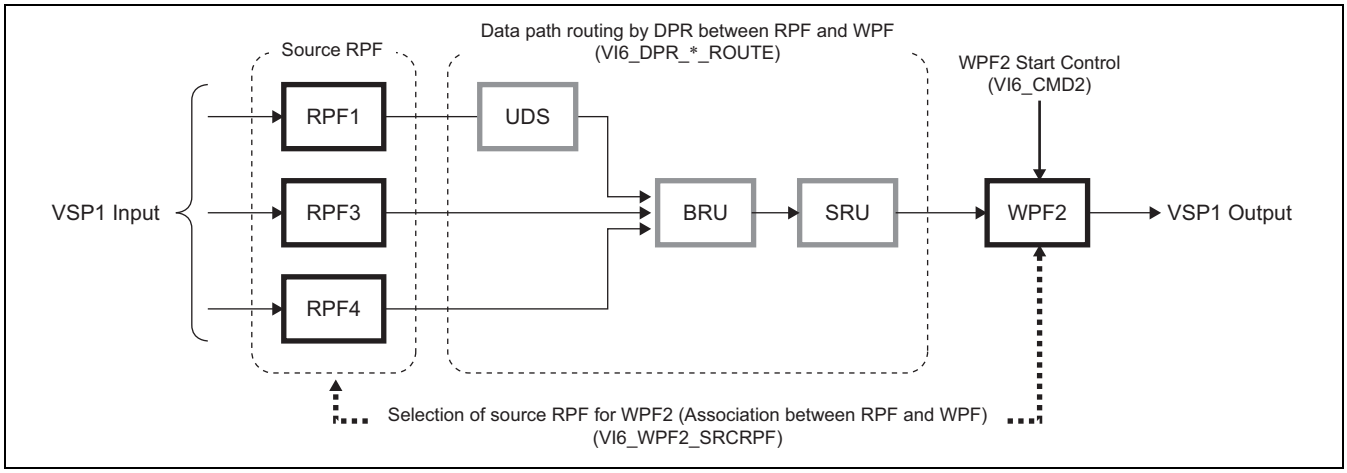

Figure 25.14 Sample Configuration of Combining Data Paths in Figure

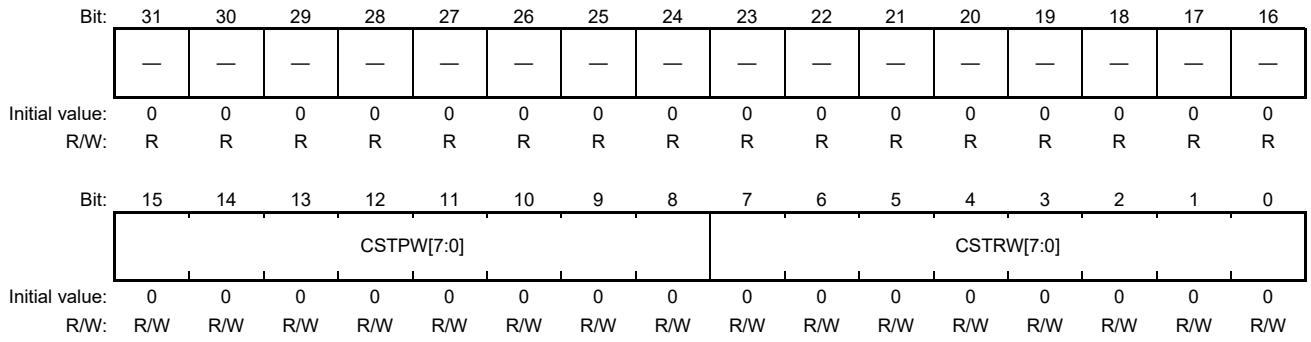
25.2.5.2 Dynamic Clock Stop Control Register (VI6_CLK_DCSWT)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	CSTPW[7:0]	H'00	R/W	Dynamic Clock Stop Control 1 Always specify 8.
7 to 0	CSTRW[7:0]	H'00	R/W	Dynamic Clock Stop Control 2 Always specify 8.

25.2.5.3 Software Reset Register (VI6_SRESET)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	SRST3	SRST2	SRST1	SRST0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	SRST3	0	R/W	WPFn Software Reset (SRSTn, n = 0 to 3) Writing 1 to this bit aborts the current processing in WPFn (the partially-completed image undergoing processing is output). The period until this software reset processing is completed depends on the bus state. When this reset processing is completed, the VI6_WPFn_IRQ_STA.FRE interrupt source bit is set to 1; when the FRE interrupt is enabled, the FRE end interrupt is output to notify the end of the reset processing. This bit is always read as 0. 0: NOP 1: WPF3 software reset*
2	SRST2	0	R/W	
1	SRST1	0	R/W	
0	SRST0	0	R/W	

Notes: * Applying a software reset to each WPF has the following restrictions.

1. A software reset can be applied to only one of WPF0 to WPF3 through single write access to VI6_SRESET.
2. After a software reset is issued, no more software reset can be issued to another WPF until the issued software reset processing is completed
3. After a software reset is issued to a channel, correct operation of other channels cannot be guaranteed; apply software reset to all channels in sequence.
4. The end of software reset processing is notified through the FRE bit in VI6_WPFn_IRQ_STA, but the software reset issued while WPF is stopped is ignored as NOP. As it takes a while until the reset is actually issued after the reset bit is set, the VSP1 may complete operation before the reset is actually issued. In this case, no interrupt is output for the software reset that is issued after the VSP1 completes operation.
5. If a software reset is issued during downloading of a display list, the downloading processing is not aborted. After the end of downloading that is in progress when a software reset is issued, a frame end interrupt is output.

25.2.5.4 Operating Status Register (VI6_STATUS)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SYS3_ ACT	SYS2_ ACT	SYS1_ ACT	SYS0_ ACT	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are read as 0 or 1. Don’t care about this value. Write access is prohibited.
11	SYS3_ACT	0	R	WPFn Operating Status (SYSn_ACT, n = 0 to 3) Each bit indicates the operating or stopped state of control channel n (WPFn). 0: WPFn is stopped. 1: WPFn is operating.
10	SYS2_ACT	0	R	
9	SYS1_ACT	0	R	
8	SYS0_ACT	0	R	
7 to 4	—	All 0	R	Reserved These bits are read as 0 or 1. Don’t care about this value. Write access is prohibited.
3	—	0	R	WPFn Internal Control Monitor Signal Each bit indicates a value of 0 or 1. Don’t use the value read from this bit.
2	—	0	R	
1	—	0	R	
0	—	0	R	

25.2.5.5 WPF Interrupt Enable Registers (VI6_WPFn_IRQ_ENB: n = 0, 1, 2, 3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DFEE	FREE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	DFEE	0	R/W	Interrupt Enable for WPFn (n = 0 to 3) Display List Frame End 0: Interrupt Disabled 1: Interrupt Enabled
0	FREE	0	R/W	Interrupt Enable for WPFn (n = 0 to 3) Frame End 0: Interrupt Disabled 1: Interrupt Enabled

Each bit in VI6_WPFn_IRQ_STA is set to 1 when the corresponding interrupt source is generated. VI6_WPFn_IRQ_ENB specifies whether to output an interrupt signal for the generated source. When an interrupt is disabled in this register, no interrupt signal is generated even when the corresponding bit in VI6_WPFn_IRQ_STA is set to 1. When an interrupt is enabled in this register, an interrupt signal is output when the corresponding bit in VI6_WPFn_IRQ_STA is set to 1.

25.2.5.6 WPF Interrupt Status Registers (VI6_WPFn_IRQ_STA: n = 0, 1, 2, 3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DFE	FRE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are read as 0 or 1. Don't care about this value. The write value should always be 0.
1	DFE	0	R/W	Interrupt Status and Clear for WPFn (n = 0 to 3) Display List Frame End This interrupt source bit is set to 1 when VSP1 completes one-frame processing while the current_frame_int_enable value stored in the display list header is 1 (refer to section 25.1.8 (2)). When display lists are not used, this bit is not used. In this case, clear VI6_WPFn_IRQ_ENB.DFEE to 0 to mask the interrupt generation by this interrupt source. [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value
0	FRE	0	R/W	Interrupt Status and Clear for WPFn (n = 0 to 3) Frame End This interrupt source bit is set to 1 when VSP1 completes one-frame processing. This bit is also set to 1 when one-frame processing using a display list is completed. [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value

VI6_WPFn_IRQ_STA indicates the state of the interrupt sources generated in the VSP1. Whether to output a VSP1 interrupt when an interrupt source is generated and the corresponding bit is set to 1 is determined by the corresponding bit setting in VI6_WPFn_IRQ_ENB. While an interrupt is disabled in VI6_WPFn_IRQ_ENB, the VSP1 does not output an interrupt signal even when an interrupt source is generated, but the source flag in this register is set to 1.

Note that the interrupt source bits in this register cannot be cleared by write access using a display list.

25.2.5.7 Display Interrupt Enable Register (VI6_DISP_IRQ_ENB)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DST	—	—	MAE	LNE4	LNE3	LNE2X	LNE1	LNE0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	DST	0	R/W	Interrupt Status and Clear for Display Start This bit is set to 1 when LIF module transfers the first data to the display module at the beginning of each frame. The timing depends on the output buffer status of LIF module. [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	MAE	0	R/W	Interrupt Status and Clear for Display Read Data End This bit is set to 1 when all RPFs transfer the last data of the frame to LIF module. The RPF module which is not used by LIF module does not affect this bit. [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value
4	LNE4	0	R/W	Interrupt Status and Clear for 1 Line Data Read End of RFP4 This bit is set to 1 when RPF4 completes 1-line data transfer. [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value

Bit	Bit Name	Initial Value	R/W	Description
3	LNE3	0	R/W	Interrupt Status and Clear for 1 Line Data Read End of RFP3 [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value
2	LNE2X	0	R/W	Interrupt Status and Clear for 1 Line Data Read End of RFP2 [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value
1	LNE1	0	R/W	Interrupt Status and Clear for 1 Line Data Read End of RFP1 [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value
0	LNE0	0	R/W	Interrupt Status and Clear for 1 Line Data Read End of RFP0 [Read Access] Interrupt Status 0: No interrupt 1: Interrupt activated [Write Access] Interrupt Clear 0: The interrupt status is cleared to 0 1: Hold the interrupt status value

25.2.5.9 WPFn Output Line Count Register (VI6_WPFn_LINE_CNT: n = 0, 1, 2, 3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	LINE_CNT[20:16]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LINE_CNT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 0	LINE_CNT [20:0]	All 0	R	Number of WPFn Output Lines From the value read from these bits, the number of lines output from VSP1 can be obtained. The value of these bits can be read only within a limited period; read these bits with the timing described later. These bits indicate the number of lines output from WPFn as an immediate value. In the frame buffer starting from VI6_WPFn_DSTM_ADDR_*, WPFn has completed data output up to the line number indicated in these bits. For example, when these bits are set to 1, valid data is output only in the first line. When one-frame processing is competed correctly, this value indicates the number of lines output from WPFn.

The LINE_CNT value is valid only for the period between a frame end interrupt (section 25.2.5.6) and next frame startup (section 25.2.5.1) or the period between a display list frame end interrupt (section 25.2.5.6) and next frame startup. This register value read outside these periods cannot be used.

The LINE_CNT value depends on the flipping mode (VI6_WPFn_OUTFMT.FLP) as shown in Figure 25.15. This correspondence is shown in Table 25.15.

Table 25.15 VSP1 Output Line Count According to VI6_WPFn_OUTFMT.FLP Setting

VI6_WPFn_OUTFMT.FLP Setting	Corresponding Case Shown in Figure 25.15
0	case 1
1	case 2

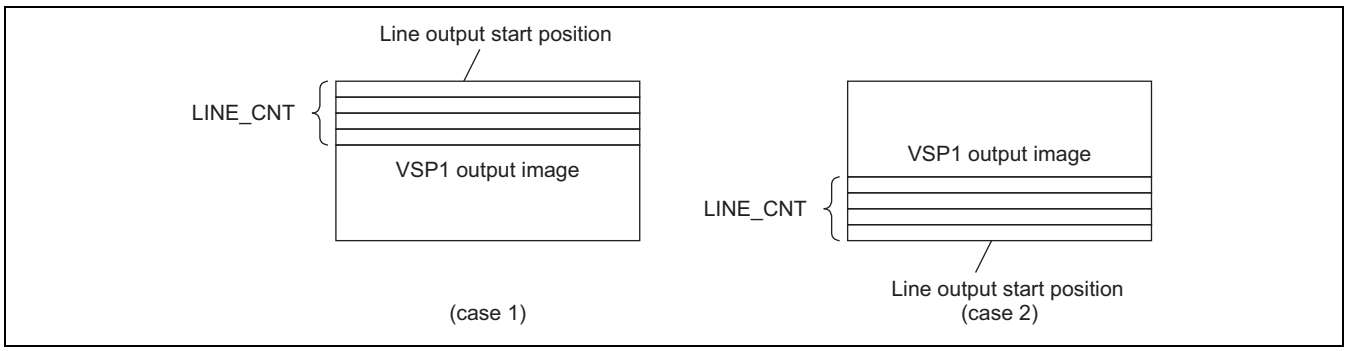

Figure 25.15 Definition of VSP1 Output Line Count

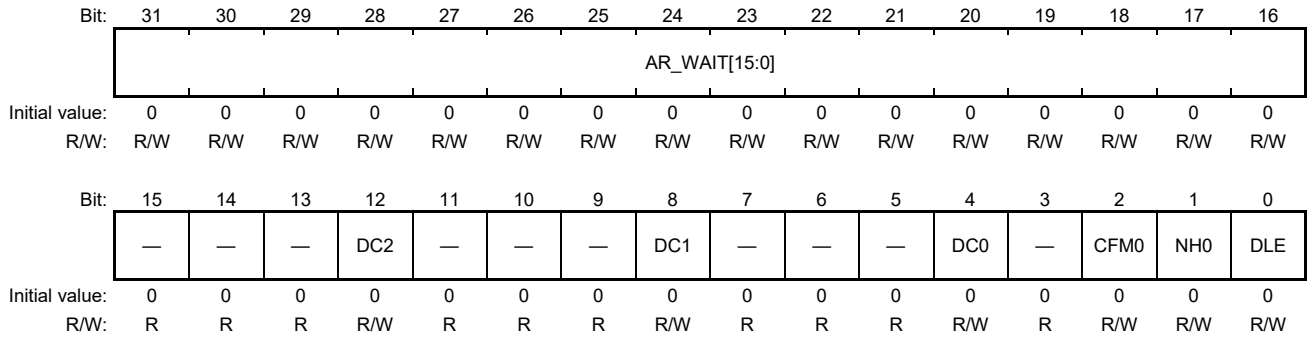
25.2.6 Display List Control Registers

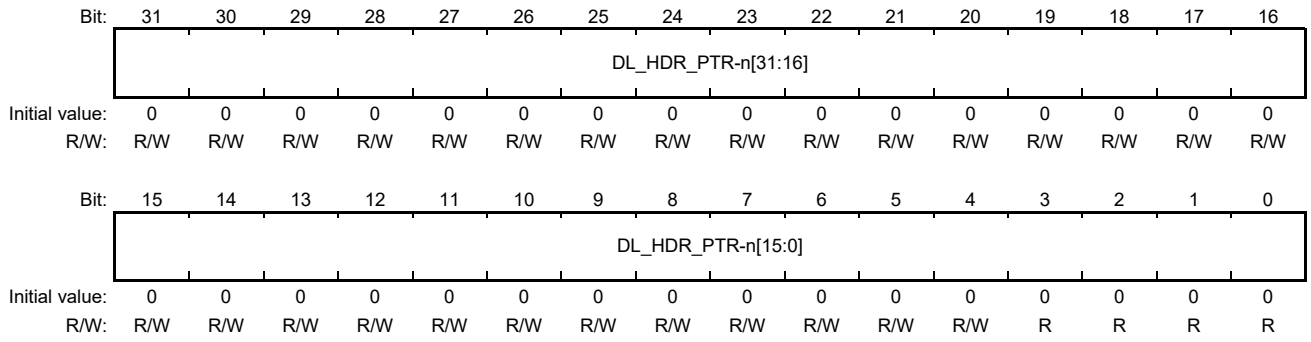
25.2.6.1 Display List Control Register (VI6_DL_CTRL)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	AR_WAIT [15:0]	H'0000	R/W	Display List Control Setting Always specify 256.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	DC2	0	R/W	Display List Control 2 Specify the same value as the DLE bit.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	DC1	0	R/W	Display List Control 1 Specify the same value as the DLE bit.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	DC0	0	R/W	Display List Control 0 Specify the same value as the DLE bit.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	CFM0	0	R/W	Continuous Frame Mode for Header-less Display List This bit determines whether the next frame is automatically started or not. When the updated flag of the display list, VI6_DL_BODY_SIZE0.UPD0, is not updated, the display list of the next frame is not transferred and the same register values are used for the next frame. When the value of VI6_DL_BODY_SIZE0.UPD0 is updated, the new display list is transferred. 0: Stopped at the end of every frame 1: The next frame is automatically started

Bit	Bit Name	Initial Value	R/W	Description
1	NH0	0	R/W	Header-less Display List Mode This bit is used for specifying the header-less display list mode. In case of header-less mode, the number of the display lists is 1. The address of the display body is set in VI6_DL_HDR_ADDR0 register, and the body size is set in VI6_DL_BODY_SIZE0 register. When this bit is changed, make sure that VSP1 is stopped. And also make sure the following before starting VSP1. - Header Address (VI6_DL_HDR_ADDR0) - Body Size (VI6_DL_BODY_SIZE0) in case of header-less mode 0: Use Display List Header (Normal DL Mode) 1: Don’t use Display List Header (Header-less Mode) Note: Only WPF0 supports header-less display list. WPFn (n = 1 to 3) work as the normal display list mode even if the WPF0 is set to header-less display list mode.
0	DLE	0	R/W	Display List Enable/Disable Enables or disables the VSP1 display list function. When the display list function is enabled through this bit, all WPF processing channels work in display list mode. When using display lists, note the restrictions in section 25.2.3. 0: The display list function is disabled 1: The display list function is enabled

25.2.6.2 Display List-n Header Address Register (VI6_DL_HDR_ADDRn: n = 0, 1, 2, 3)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DL_HDR_PTR-n [31:0]	H'0000 0000	R/W [31:4] R [3:0]	Display List-n Header Address These bits specify the address of the display list header to be read for display list-n in 16-byte units (the lower-order four bits are read-only). When WPFn is first started in display list mode, the display list header is loaded from the address specified in this register. After loading of the header is completed, the register value of the display list address is updated to the next header address stored in the loaded header to prepare for loading of the next display list header. After that, this header address updating is repeated. A value from H'00000000 to H'FFFFFFF0 can be specified.

25.2.6.3 Display List Data Swapping Register (VI6_DL_SWAP)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	LWS	WDS	BTS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	LWS	0	R/W	Display List Data Swapping in Longword Units 0: Data swapping in longword (32-bit) units is disabled 1: Data swapping in longword (32-bit) units is enabled
1	WDS	0	R/W	Display List Data Swapping in Word Units 0: Data swapping in word (16-bit) units is disabled 1: Data swapping in word (16-bit) units is enabled
0	BTS	0	R/W	Display List Data Swapping in Byte Units 0: Data swapping in byte (8-bit) units is disabled 1: Data swapping in byte (8-bit) units is enabled

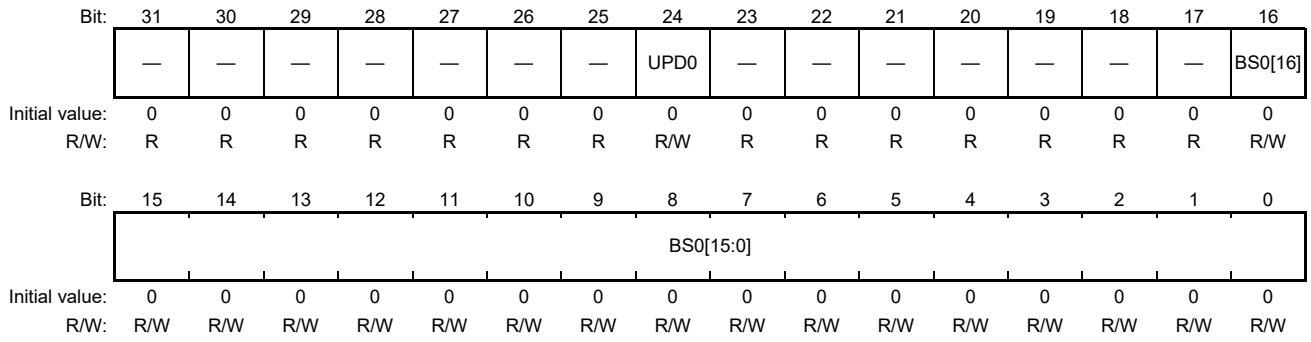
25.2.6.4 Extended Display List Control Register (VI6_DL_EXT_CTRL)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	NWE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	POLINT[5:0]						—	—	DLPRI	EXPRI	—	—	—	EXT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	NWE	0	R/W	No Wait for Polling When this bit is set to 1, the polling condition for extended display lists is always assumed to be true.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 8	POLINT[5:0]	All 0	R/W	Extended Display List Command Control Always specify 2.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	DLPRI	0	R/W	Display List Control 0 Always specify 1.
4	EXPRI	0	R/W	Display List Control 1 Always specify 0.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	EXT	0	R/W	Extended Display List Enables or disables the extended display list function. When extended display lists are used, the display list header size is 96 bytes; when they are not used, the header size is 80 bytes. 0: No extended display lists are used 1: Extended display lists are used Note: When using extended display lists, be sure to also use normal display list mode (VI6_DL_CTRL.DLE); executing only extended display lists is not possible. When the header-less display list mode is activated, this bit should be set to 0. The extended display list cannot be used with the header-less display list mode.

25.2.6.5 Display List Body Size Register-n (VI6_DL_BODY_SIZEn: n = 0)



Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	UPD0	—	—	—	—	—	—	—	BS0[16]
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BS0[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	UPD0	0	R/W	Update Flag This bit controls the download of the display list at the next downloading timing in case that the header-less display list mode is used. When this bit is set to 1, the value of VI6_DL_HDR_ADDRn and VI6_DL_BODY_SIZEn.BS0 (n = 0) should not be changed. 0: Display List is not downloaded (Registers are not updated) 1: Display List is downloaded (Registers are updated)
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16 to 0	BS0[16:0]	H'00000	R/W	Header-less Display List Body Size (WPFn, n = 0) These bits are used for specifying the body size of the display list in case of header-less display list mode. The unit of the size is byte. The value should be set in multiples of 8.

25.2.7 RPF Control Registers

25.2.7.1 RPFn Basic Read Size Registers (VI6_RPFn_SRC_BSIZE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	BHSIZE[12:0]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	BVSIZE[12:0]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	BHSIZE [12:0]	H'0000	R/W	Horizontal Size of RPF Basic Read Area These bits specify the horizontal size of the basic area to be read from the external RAM by the RPFn. When the input format is YCbCr4:2:2 or YCbCr4:2:0, specify the size in 2-pixel units. A value from 1 to 8,190 can be specified. Specify a value equal to or smaller than the extended read size (VI6_RPFn_SRC_ESIZE.EHSIZE).
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	BVSIZE [12:0]	H'0000	R/W	Vertical Size of RPF Basic Read Area These bits specify the vertical size of the basic area to be read from the external RAM by the RPFn. When the input format is YCbCr4:2:0, specify the size in 2-pixel units. A value from 1 to 8,190 can be specified. Specify a value equal to or smaller than the extended read size (VI6_RPFn_SRC_ESIZE.EVSIZE).

Figure 25.16 shows the relationship between the basic read size and extended read size. The RPF reads data from the source memory area specified by the basic read size. The RPF repeats reading the basic read area in the horizontal and vertical directions up to the extended read size and sends the read data to the processing modules in the VSP1.

For basic read size reading, the reading start address, called the RPFn source image storing address, should be specified in VI6_RPFn_SRCM_ADDR_*. In the memory area where the basic read area image is stored, the distance (number of bytes) between addresses for lines n and n + 1 of two-dimensional image data, called the memory stride, should be specified in VI6_RPFn_SRCM_PSTRIDE.

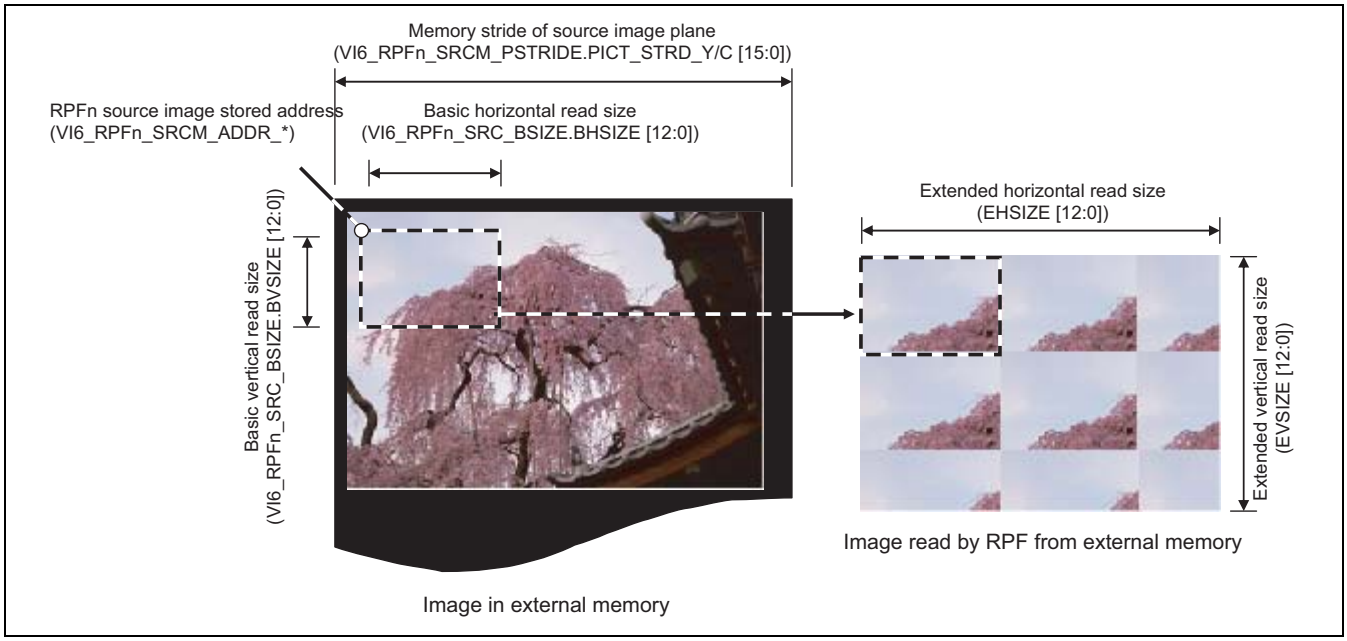


Figure 25.16 Relationship between Basic Read Size and Extended Read Size

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	EHSIZE [12:0]	H'0000	R/W	RPF Extended Horizontal Read Size These bits specify the horizontal size of the extended read area to which the RPFn reads data from the external RAM. As shown in Figure 25.16, the basic read area image is repeatedly placed in the extended read area; in the EHSIZE bits, specify a value not smaller than the horizontal size of the basic read area. When the input format is YCbCr4:2:2 or YCbCr4:2:0, specify the size in 2-pixel units (an even value). A value from 1 to 8,190 can be specified.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	EVSIZE [12:0]	H'0000	R/W	RPF Extended Vertical Read Size These bits specify the vertical size of the extended read area to which the RPFn reads data from the external RAM. As shown in Figure 25.16, the basic read area image is repeatedly placed in the extended read area; in the EVSIZE bits, specify a value not smaller than the vertical size of the basic read area. When the input format is YCbCr4:2:0, specify the size in 2-pixel units (en even value). A value from 1 to 8,190 can be specified.

VI6_RPFn_SRC_ESIZE specifies the extended size for RPFn. The extended horizontal and vertical sizes should be equal to or greater than the basic sizes specified in VI6_RPFn_SRC_BSIZE. The RPF internal data processing described later and image processing described in section 25.2.9 and later sections are all applied to the image in the extended read size shown on the right side in Figure 25.16.

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	VIR	0	R/W	Virtual Input Enable Enables or disables the virtual input function of the RPFn. The image to be processed by the RPFn is usually read from the external memory by the MAU. Instead of this input, the virtual input function generates a single-color image within the RPFn and sends it to the modules in VSP1. When the virtual input function is enabled, the fixed value specified in VI6_RPFn_VRTCOL_SET is used as the input to the RPFn. While the virtual input function is enabled, data is not read from the external memory; that is, the α plane is not read and the IROP calculation thus cannot be executed. In this case, set VI6_RPFn_ALPH_SEL.ASEL to 4. Neither the color space conversion through CSC nor the color keying described in section 25.2.7.11 can be used. 0: RPFn uses general input. 1: RPFn uses virtual input.
27 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CIPM	0	R/W	Horizontal Chrominance Interpolation Method Setting Image data is processed in the YCbCr444 format inside VSP1 in case of YCbCr color space. When the chrominance format of the input image is YCbCr422 or YCbCr420, data is upsampled as shown in Figure 25.17 for internal processing. This bit specifies the method of upsampling for this purpose. 0: The nearest-neighbor method is used for horizontal chrominance interpolation. 1: The bilinear method is used for horizontal chrominance interpolation.
15	SPYCS	0	R/W	RPF Input Mode Setting 1 When the input format is YUY2, set this bit to 1 and set the RDFMT bits to 71 (H'47). When the input format is YVYU, set this bit and the SPUVS bit to 1 and set the RDFMT bits to 71 (H'47). In other cases, set this bit to 0.

Bit	Bit Name	Initial Value	R/W	Description
14	SPUVS	0	R/W	RPF Input Mode Setting 2 When the input format is NV61, set this bit to 1 and set the RDFMT bits to 65 (H'41). When the input format is NV21, set this bit to 1 and set the RDFMT bits to 66 (H'42). When the input format is YVYU, set this bit and the SPYCS bit to 1 and set the RDFMT bits to 71 (H'47). In other cases, set this bit to 0.
13, 12	CEXT[1:0]	00	R/W	Lower-Bit Color Data Extension Method Setting When an RGB input format where each color component is expressed in less than eight bits are selected from Table 25.17 through the RDFMT bits, VSP1 internally extends each color component to eight bits before using the data. These bits select this extension method. 00: Lower-order bits of color data are extended with 0. 01: Upper-order bits of color data are copied to the lower -order bits. 10: Lower-order bits of color data are extended with 0. The maximum value is limited to H'FF. 11: Setting prohibited
11 to 9	RDTM[2:0]	000	R/W	CSC Conversion Expression Setting These bits select the expression used for color space conversion. The conversion direction is RGB → YCbCr when RGB is selected through the RDFMT bits; the direction is YCbCr → RGB when YCbCr is selected. 000: BT.601 YCbCr [16,235/240] ↔ RGB [0,255] 001: BT.601 YCbCr [0,255] ↔ RGB [0,255] 010: BT.709 YCbCr [16,235/240] ↔ RGB [0,255] 011: BT.709 YCbCr [16,235/240] ↔ RGB [16,235] 100 to 111: Setting prohibited
8	CSC	0	R/W	Color Space Conversion Enable Enables or disables color space conversion between YCbCr and RGB to be executed in RPFn. The characteristics of color space conversion are determined by the RDTM bit setting.* When using the virtual input (VIR = 1), specify 0. 0: Color space conversion is disabled. 1: Color space conversion is enabled.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
6 to 0	RDFMT [6:0]	H'00	R/W	RPF Input Image Format Setting These bits select the format of the image input from the external RAM to the RPFn. Select a value corresponding to the desired format from those shown in Table 25.17 and Table 25.18. When the virtual input function is used (VIR = 1), the color information for the virtual input should be specified in VI6_RPFn_VRTCOL_SET. If this color information is in the RGB format, set the RDFMT bits to 19. If the color information is in the YCbCr format, set these bits to 64. Notes: 1. Number of input pixels When YCbCr4:2:2 is selected through the RDFMT bits, the horizontal size of the input image should be specified in 2-pixel units. When YCbCr4:2:0 is selected, the vertical and horizontal sizes should be specified in 2-pixel units. Observe these restrictions when specifying the image size in VI6_RPFn_SRC_BSIZE and VI6_RPFn_SRC_ESIZE. 2. CLUT Setting When the RDFMT bits are set to H'3F, RGB color data should be stored in the CLUT. When these bits are set to H'7F, YCbCr color data should be stored in the CLUT. Note that while the target WPF is operating, the RPF is also operating and the CLUT cannot be read or written to.

Note: * Note on color space settings

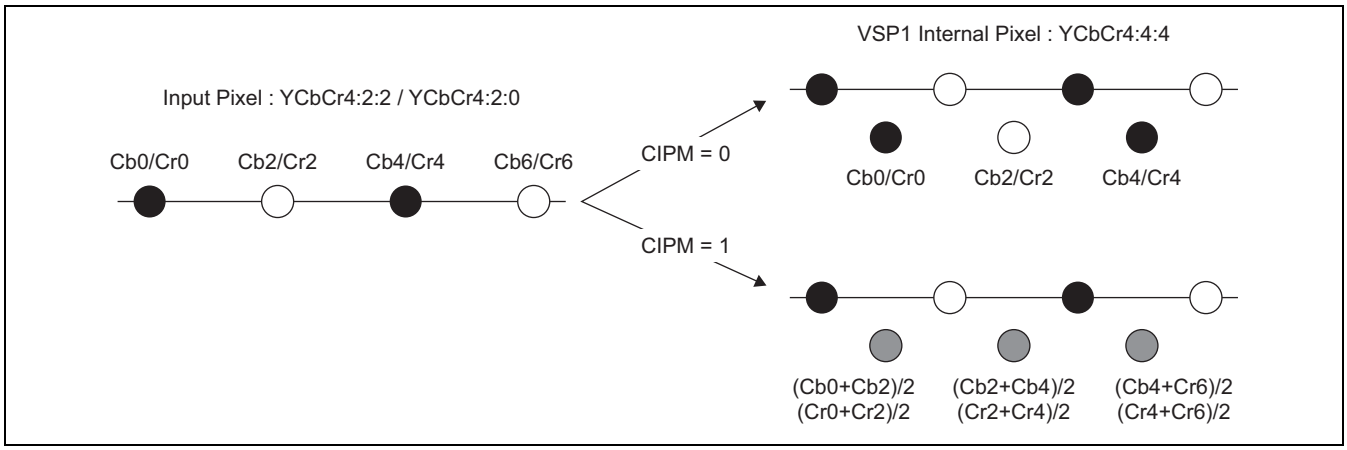

Figure 25.17 Chrominance Interpolation Methods Selectable through CIPM Setting

The color space for the image output from the RPF to VSP1 internal modules is determined by the combination of the color space for the image input to the RPF, which is selected through the VI6_RPFn_INFMT.RDFMT setting, and the enabled or disabled state of the color space conversion function, which is selected through the VI6_RPFn_INFMT.CSC setting (Table 25.16). For example, when the image input to the RPF is in the YCbCr format, the RPF outputs data to VSP1 internal modules in the YCbCr format if color space conversion is disabled through the CSC bit, and the RPF outputs data in the RGB format if color space conversion is enabled. When the image input to the RPF is in the RGB format, the relationship between the output format and the color space conversion setting is the opposite of the YCbCr case. For some VSP1 internal modules, the YCbCr format is recommended for image processing because of the characteristics of the processing, or the same color space needs to be specified between multiple RPF outputs. In these cases, set VI6_RPFn_INFMT.RDFMT and VI6_RPFn_INFMT.CSC appropriately so that the RPFs can output the required color space according to the color space conditions described above.

Table 25.16 RPFn Input Color Space and Output Color Space

RPFn Input Color Space (VI6_RPFn_INFMT. RDFMT)		Color Space Conversion Setting (VI6_RPFn_INFMT.CSC)		RPFn Output Color Space
RGB	(H'00 to H'3F)*	Disabled	(0) *	RGB
		Enabled	(1) *	YCbCr
YCbCr	(H'40 to H'7F)*	Disabled	(0) *	YCbCr
		Enabled	(1) *	RGB

Note: * Value specified in the register

A color space conversion function equivalent to that in the RPFn is also provided by the WPF. As shown in Table 25.16, the color space (YCbCr or RGB) output from the RPF becomes the input format for the WPF. Here, the color space of the output image obtained by the color space conversion function of the WPF must match the color space of the format specified through VI6_WPFn_OUTFMT.WRFMT.

Figure 25.18 shows the relationship between the input/output format and color space. The input color space for the RPF is determined when the input image format for the RPF is specified through the RDFMT bits. The color space for the image output from the RPF to subsequent VSP1 internal modules depends on the combination of the RPF input format and CSC (color space conversion function) enabled or disabled state in the RPF as shown in Table 25.16 and Figure 25.18. The user should first determine whether the image processing in the VSP1 is done in YCbCr or RGB, and then specify the RPF input format and CSC enabled or disabled state to obtain the desired color space. The color space of the RPF output image is also that of the WPF input image; the color space of the data output from the WPF to the outside of VSP1 depends on the combination of the WPF input color space and the enabled or disabled state of the CSC implemented in the WPF as shown in Figure 25.18. The color space of the WPF output image must match that of the WPF output format (determined by VI6_WPFn_OUTFMT.WRFMT). For example, in the flow shown in Figure 25.18, YCbCr should not be specified as the WPF output format regardless of the fact that the color space of the WPF output image is in RGB format.

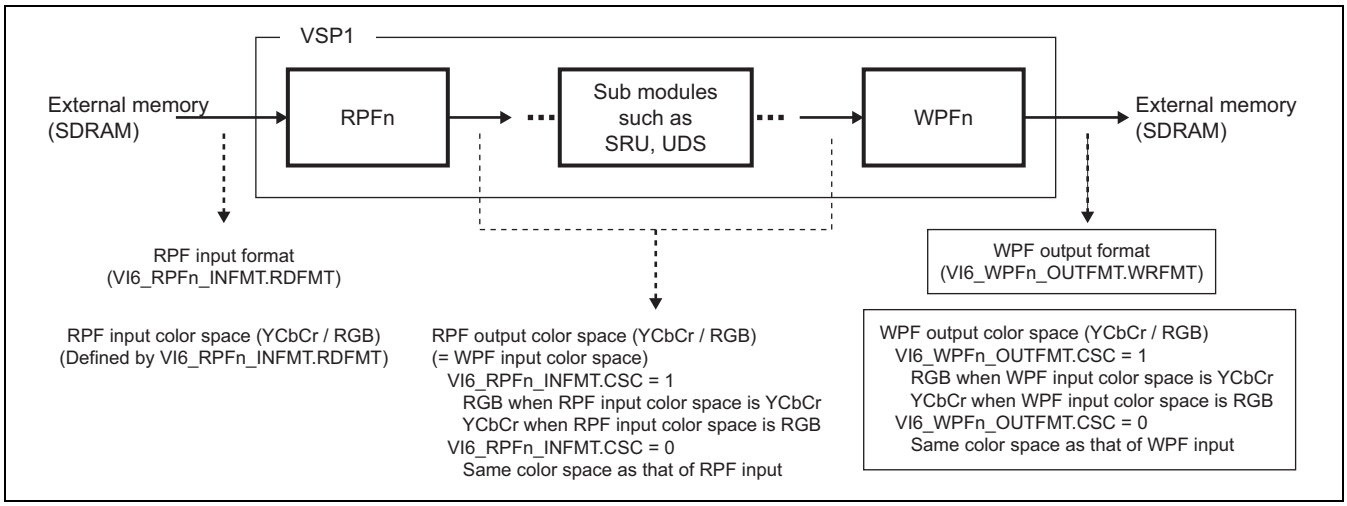

Figure 25.18 Relationship between Input/Output Format and Color Space

H'3F	—	—	RGB_CLUT_DATA0								RGB_CLUT_DATA1								RGB_CLUT_DATA2								RGB_CLUT_DATA3							

When the RDFMT[6:0] bits are set to H'3F, it is necessary to set up the CLUT in the RGB color space.

Table 25.18 Packed YCbCr Formats for RPF Input

RDFMT [6:0]	Packed YCbCr Input Format	Reference
H'40	YCbCr4:4:4 semi-planar	Figure 25.19
H'41	YCbCr4:2:2 semi-planar (NV16, NV61*1)	
H'42	YCbCr4:2:0 semi-planar (NV12, NV21*1)	
H'43 to H'45	Reserved	—
H'46	YCbCr4:4:4 interleaved	Figure 25.20
H'47	YCbCr4:2:2 interleaved type 0 (UYVY, YUY2*2, YVYU*3)	
H'48	YCbCr4:2:2 interleaved type 1	
H'49	YCbCr4:2:0 interleaved	
H'4A	YCbCr4:4:4 planar	Figure 25.21
H'4B	YCbCr4:2:2 planar (YV16)	
H'4C	YCbCr4:2:0 planar (YV12, YU12)	
H'4D to H'7E	Reserved	—
H'7F	YCBCR_CLUT_DATA*4 *5	—

Notes: 1. When the input format is NV61 or NV21, set the SPUVS bit to 1.
2. When the input format is YUY2, set the SPYCS bit to 1.
3. When the input format is YVYU, set the SPUVS bit to 1 and SPYCS bit to 1.
4. When the RDFMT[6:0] bits are set to H'7F, it is necessary to set up the CLUT in the YCbCr color space.
5. The Monochrome format can be implemented through the CLUT.

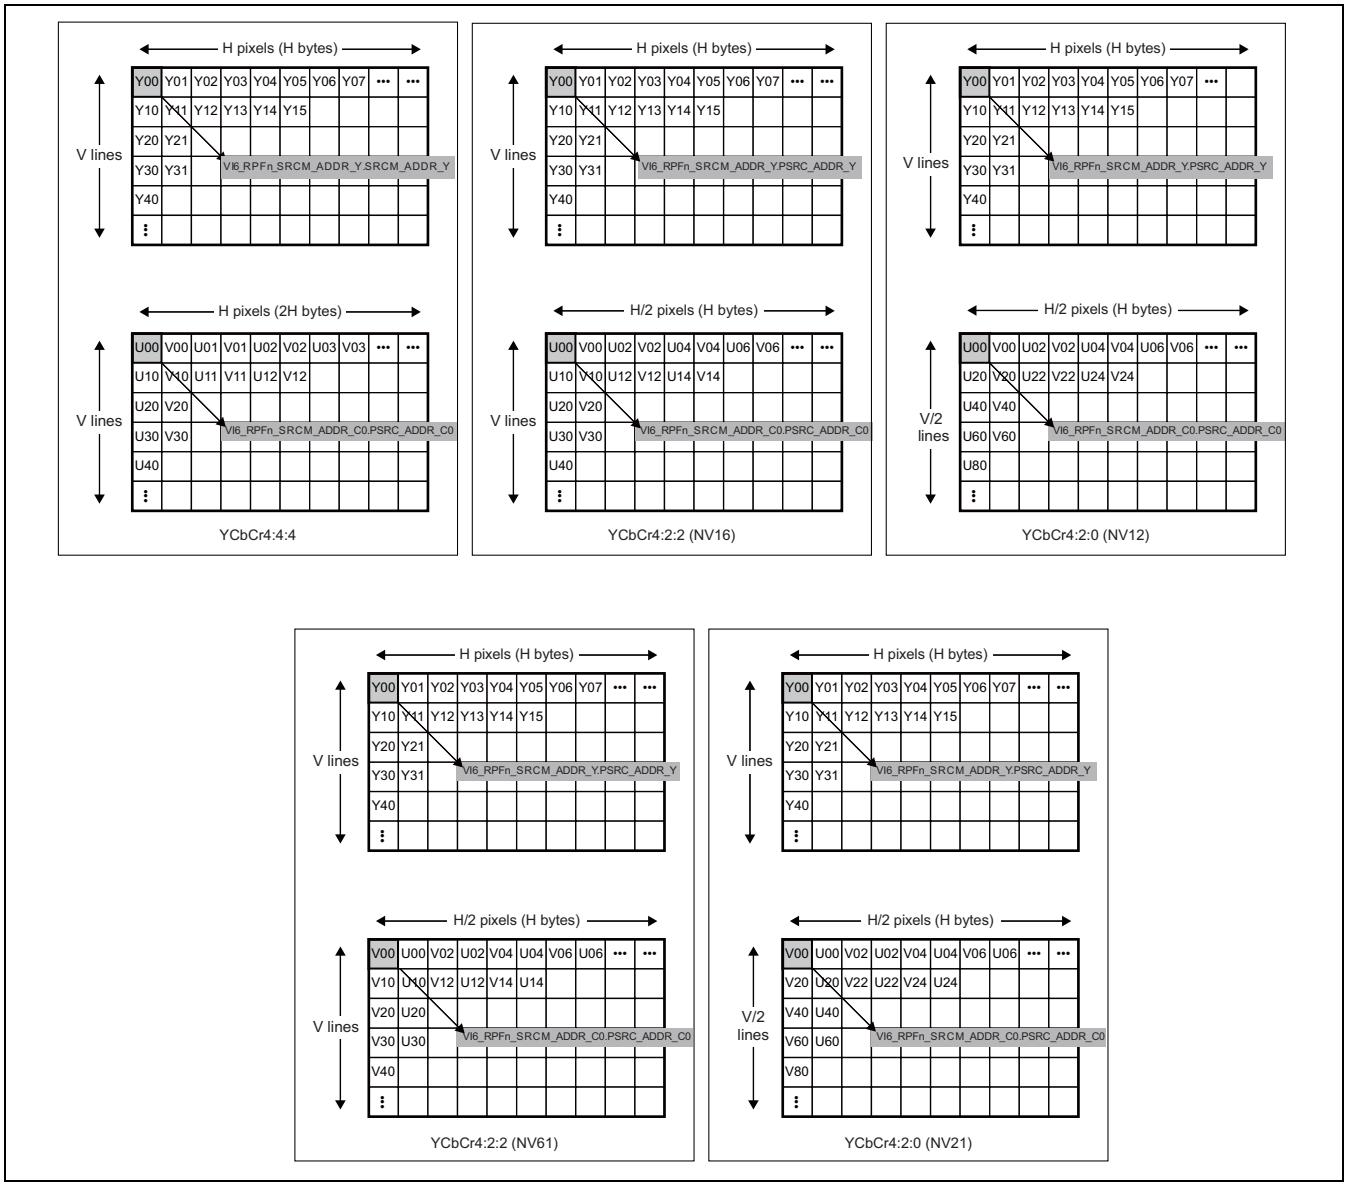

Figure 25.19 YCbCr Semi-Planar Formats

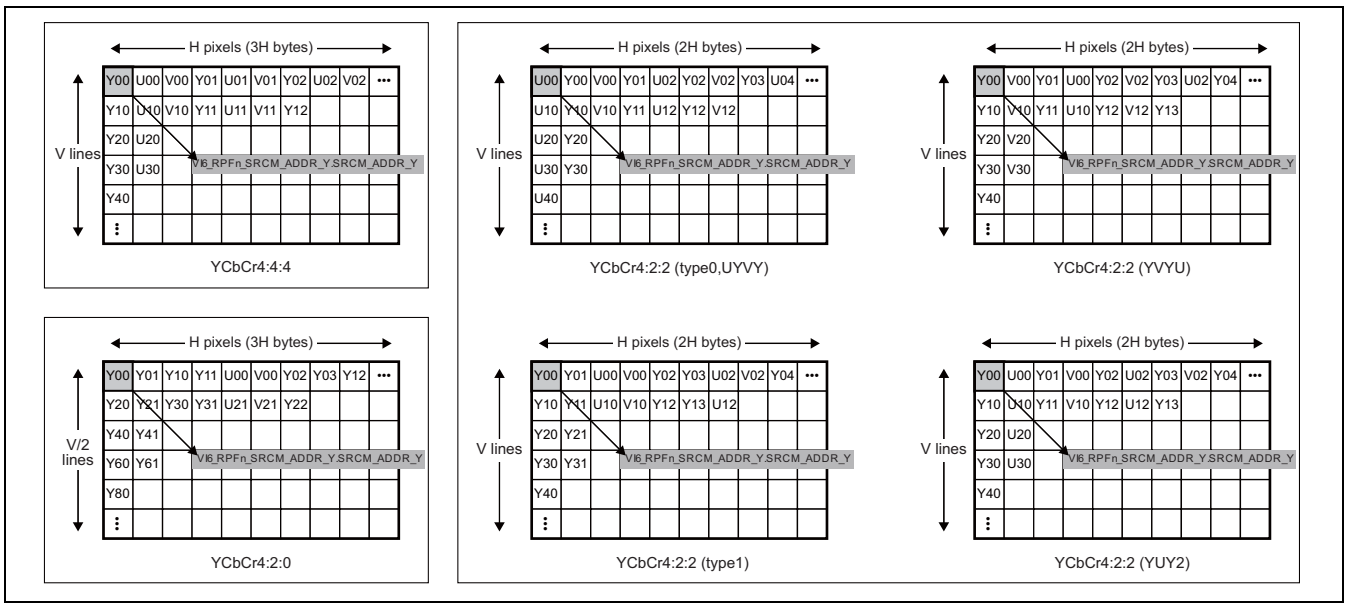

Figure 25.20 YCbCr Interleaved Formats

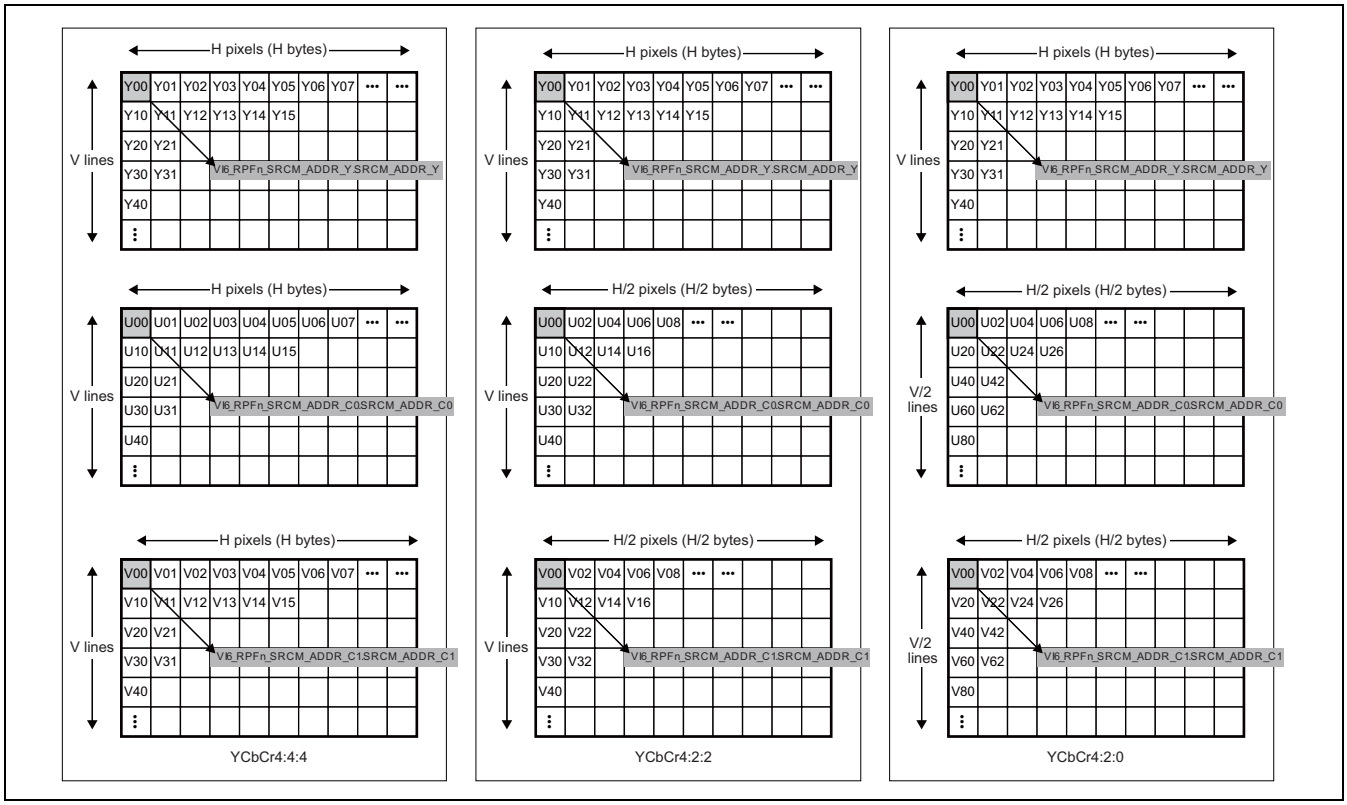

Figure 25.21 YCbCr Planar Formats

[CLUT Setting]

To set up the CLUT, store the values to replace each of R (Cr), G (Y), and B (Cb) components in the CLUT allocated as shown in Table 25.19. The CLUT space has 256 32-bit entries, which should be accessed in 32 bits in the same way as for register access. The address for each entry is obtained from the start address of each space (Table 25.19) + entry number × 4. For example, the CLUT address of entry 7 for RPF2 is $VSP_BASE + H'481C.

Figure 25.22 shows the CLUT format.

Table 25.19 CLUT Space for Each RPF

RPF	Address Area for CLUT Space
RPF0	$VSP_BASE + H'4000 to $VSP_BASE + H'43FF
RPF1	$VSP_BASE + H'4400 to $VSP_BASE + H'47FF
RPF2	$VSP_BASE + H'4800 to $VSP_BASE + H'4BFF
RPF3	$VSP_BASE + H'4C00 to $VSP_BASE + H'4FFF
RPF4	$VSP_BASE + H'5000 to $VSP_BASE + H'53FF

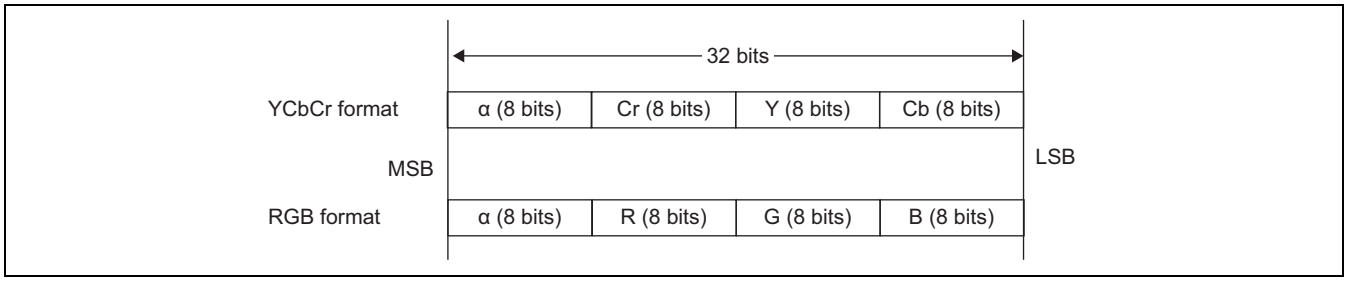

Figure 25.22 CLUT Format

According to the specified 256-entry replacement table (CLUT), input data is replaced as shown in Figure 25.23. Input data is eight bits but output data is 32 bits including α and RGB or YCbCr components.

When writing to an entry in the CLUT, the host CPU writes all components at the same time. Therefore, specify replacement data for all components in the CLUT at the same time as shown in Figure 25.22.

Note that write access to the CLUT space is prohibited while the RPF is operating.

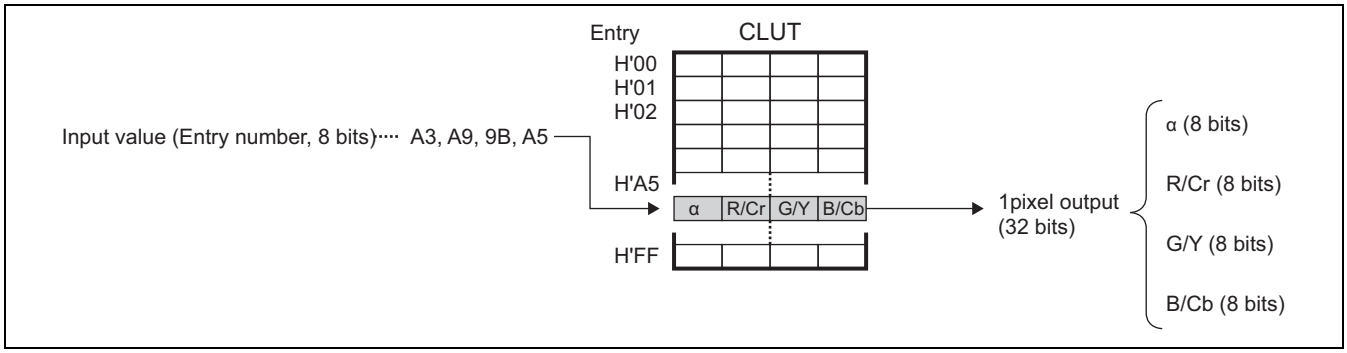

Figure 25.23 Replacement of Input Data with Pixel Values Specified in CLUT

25.2.7.4 RPFn Data Swapping Registers (VI6_RPFn_DSWAP)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
0	P_BTS	0	R/W	Picture Plane Data Swapping in Byte Units 0: Data swapping in byte (8-bit) units is disabled 1: Data swapping in byte (8-bit) units is enabled

When the virtual input function of the RPFn is used (VI6_RPFn_INFMT.VIR = 1), this register setting is ignored. Swapping of RPF input data can be specified separately for the α plane and picture plane. Table 25.20 shows the data order before and after swapping according to the LONG LWORD, longword, word, and byte swapping settings.

Table 25.20 Data Order after Swapping according to Swapping Register Settings

VI6_PRFn_DSWAP					Changed Order of Data (Each value indicates one byte)															
*_LLS	*_LWS	*_WDS	*_BTS	Input →	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	VCOORD[12:0]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	HCOORD [12:0]	All 0	R/W	Horizontal Coordinate of Sub layer Display Location on Master Layer These bits specify the left-end location of the sub layer displayed by the RPFn and the subsequent module connected through the DPR. Specify the horizontal coordinate of the location in pixel units with the left-end pixel of the master layer set at coordinate 0. When the RPFn is the master layer, set these bits to 0. If the sub layer extends beyond the master layer according to the HCOORD setting, the extended section is cut off at the right end of the master layer. Even in this case, however, a bus transfer that is unnecessary for output image generation is executed since the whole sub layer data is read from the external memory. Appropriate coordinate setting is recommended so that the sub layer does not extend beyond the right end of the master layer. If the HCOORD value is larger than the horizontal size of the master layer image, the entire sub layer goes outside of the master layer. Such setting is prohibited. A value from 0 to 8,189 can be specified.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	VCOORD [12:0]	All 0	R/W	Vertical Coordinate of Sub layer Display Location on Master Layer These bits specify the top-end location of the sub layer displayed by the RPFn and the subsequent module connected through the DPR. Specify the vertical coordinate of the location in pixel units with the top-end pixel of the master layer set at coordinate 0. When the RPFn is the master layer, set these bits to 0. If the sub layer extends beyond the master layer according to the VCOORD setting, the extended section is cut off at the bottom end of the master layer. Even in this case, however, a bus transfer that is unnecessary for output image generation is executed since the whole sub layer data is read from the external memory. Appropriate coordinate setting is recommended so that the sub layer does not extend beyond the bottom end of the master layer. If the VCOORD value is larger than the vertical size of the master layer image, the entire sub layer goes outside of the master layer. Such setting is prohibited. A value from 0 to 8,189 can be specified.

Figure 25.24 shows an example of RPF1 and RPF2 offsets with respect to master layer RPF0. Although this figure only shows sub layers RPF1 and RPF2, specify offsets for all RPFs other than the master layer in the same way as shown in this example.

Whether an RPFn is the master layer or a sub layer is determined through the selection of the source RPF for WPFn (the VI6_WPFn_SRCRPF setting). For details, refer to section 25.2.8.1.

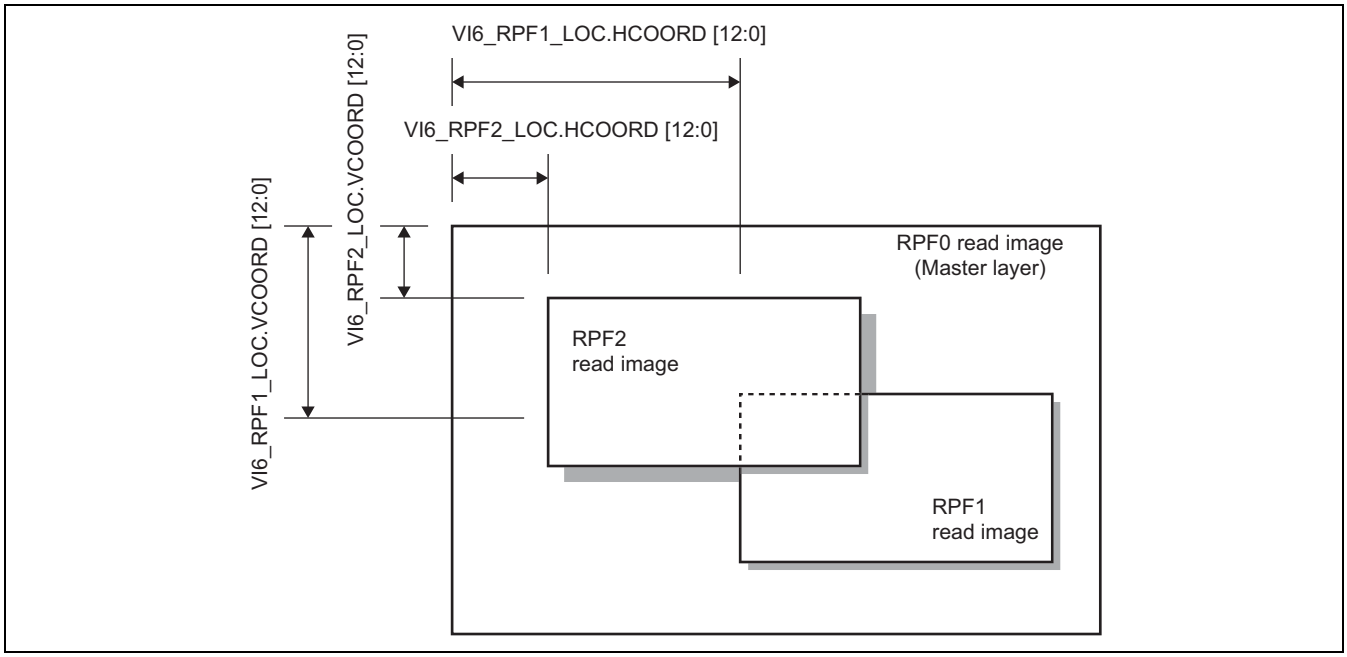

Figure 25.24 RPF1 and RPF2 Offsets from Master Layer

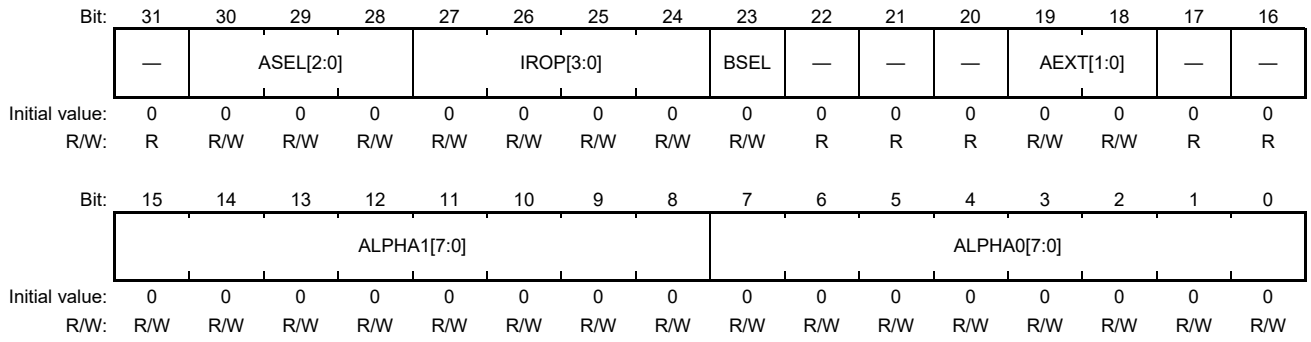
25.2.7.6 RPFn α Plane Selection Control Registers (VI6_RPFn_ALPH_SEL)



Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 28	ASEL[2:0]	000	R/W	α Format and Processing Method Select These bits select how to handle the α value to be used. The RPF handles two types of α value; 8-bit and 1-bit values. When a 1-bit α value is used, VSP1 assumes that the 1-bpp α value for each pixel is stored in the order from MSB to LSB in each byte (big endian). The α value is used as either transparency information or mask information. Transparency information is included in the α plane read from external memory when the ASEL bits are set to 1 or 3 and in the α value stored in the packed RGB bit field when these bits are set to 0 or 2. The α value as transparency information is sent as the destination value to the IROP as shown in Figure 25.25 and then output to the subsequent modules. The output α value is used, for example, for blending in the BRU. The α value as mask information is used for IROP operation in the RPF. The mask information is included in the α plane read from external RAM when the ASEL bits are set to 0 or 2 and the source value is used in IROP operation (IROP setting other than 0, 5, 10, or 15). This α value is sent as the source value to the IROP as shown in Figure 25.25. Note that the α value selected through the ASEL bits has a lower priority than the VI6_RPFn_CKEY_SET*.AP* value replaced through the color keying function. When the color keying function is used, the α value may be replaced with the VI6_RPFn_CKEY_SET*.AP* value regardless of the ASEL bit setting. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), specify 4.

Bit	Bit Name	Initial Value	R/W	Description
30 to 28	ASEL[2:0]	000	R/W	000: 1, 4, or 8-bit packed α + plane α (IROP ! = 0, 5, 10, 15) The α bit field in 1, 4, or 8-bit packed α is handled as transparency information. Be sure to specify the packed format that includes α through VI6_RPFn_INFMT.RDFMT. When VI6_RPFn_MSKCTRL.MSK_EN is 0 and the IROP bit value is not 0, 5, 10, or 15, the α plane should be read as mask information. Specify the number of α data bits (BSEL) stored in the α plane and the α plane read start address (VI6_RPFn_SRCM_ADDR_AI). When the IROP bits are set to 0, 5, 10, or 15, the α plane is not read. 001: 8-bit plane α The 8-bit α plane is read from external RAM as transparency information. When the packed RGB format has a bit field for α, the information in the α bit field is discarded. The α plane read start address (VI6_RPFn_SRCM_ADDR_AI) should be specified. The α value goes through the 8-bit transparent α generator shown in Figure 25.25 without change. When VI6_RPFn_MSKCTRL.MSK_EN is 0, IROP operation cannot be executed; set the IROP bits to 0 in this case. When VI6_RPFn_MSKCTRL.MSK_EN is 1. IROP operation can be executed. 010: 1-bit packed α + plane α (IROP ! = 0, 5, 10, 15) The 1-bit packed α input is converted by the 8-bit transparent α generator shown in Figure 25.25 according to the ALPHA0/1 setting into the 8-bit α value as transparency information. Select the packed input format that includes a 1-bit α field. When VI6_RPFn_MSKCTRL.MSK_EN is 0 and the IROP value is not 0, 5, 10, or 15, the α plane should be read as mask information. Specify the number of α data bits (BSEL) stored in the α plane and the α plane read start address (VI6_RPFn_SRCM_ADDR_AI). When the IROP bits are set to 0, 5, 10, or 15, the α plane is not read. 011: 1-bit plane α The 1-bit α plane is read from external RAM and converted by the 8-bit transparent α generator shown in Figure 25.25 according to the ALPHA0/1 setting into the 8-bit α value as transparency information. When the packed RGB format has a bit field for α, the information in the α bit field is discarded. The α plane read start address (VI6_RPFn_SRCM_ADDR_AI) should be specified. When VI6_RPFn_MSKCTRL.MSK_EN is 0, IROP operation cannot be executed; set the IROP bits to 0 in this case. When VI6_RPFn_MSKCTRL.MSK_EN is 1. IROP operation can be executed. 100: Fixed α The fixed α value (VI6_RPFn_VRTCOL_SET.LAYA value) is output from the RPF. IROP operation cannot be executed; set the IROP bits to 0 in this case. 101 to 111: Setting prohibited.

Bit	Bit Name	Initial Value	R/W	Description
27 to 24	IROP[3:0]	0000	R/W	IROP Operation Setting These bits specify the operator to be executed in the IROP operation unit shown in Figure 25.25. The source (S) for the IROP operation is the pixel data and α data specified in the VI6_RPFn_MSKSET0 or VI6_RPFn_MSKSET1 IROP input value register, which is selected according to the value (0 or 1) generated by the 1-bit mask generator. The destination (D) is the image data (RGB/YCbCr) and 8-bit α data output from the unpack/OSD processor. IROP operation is applied both for the image data and α data between the source and destination data. If these bits are set to the operation that involves the source (S) (IROP setting other than 0, 5, 10, or 15) while VI6_RPFn_MSKCTRL.MSK_EN is 0, the α plane is read from the external RAM to be used for the α value for IROP operation; specify the α plane read start address (VI6_RPFn_SRCM_ADDR_A). When the virtual input function is used (VI6_RPFn_INFMT.VIR = 1), IROP operation is not available; set these bits to B'0000. 0000: NOP(D) 0001: AND(S & D) 0010: AND_REVERSE(S & ~D) 0011: COPY(S) 0100: AND_INVERTED(~S & D) 0101: CLEAR(0) 0110: XOR(S ^ D) 0111: OR(S | D) 1000: NOR(~(S | D)) 1001: EQUIV(~(S ^ D)) 1010: INVERT(~D) 1011: OR_REVERSE(S | ~D) 1100: COPY_INVERTED(~S) 1101: OR_INVERTED(~S | D) 1110: NAND(~(S & D)) 1111: SET(all 1)
23	BSEL	0	R/W	α Bit Count Conversion Selection for 1-Bit Mask Generator Specifies the number of bits in the α plane to be read as mask information from the external RAM. The α value in mask information is used for the source (S) in IROP. When α plane data is eight bits, it is converted to one bit through the 1-bit mask generator shown in Figure 25.25. Note that this bit setting is valid when the ASEL bits are set to 0 or 2 and VI6_RPFn_MSKCTRL.MSK_EN is set to 0. In other cases, this bit setting has no effect. 0: 8-bit α is converted to 1-bit α through the 1-bit mask generator. When the 8-bit α value input to the RPF is not 0, it is converted to 1; when the value is 0, it is converted to 0. 1: α value goes through the 1-bit mask generator. The 1-bit α value input to the RPF is output through the 1-bit mask generator without change.
22 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
19, 18	AEXT[1:0]	00	R/W	Lower-Bit α Value Extension Method Set These bits specify the method for extending the input α data to eight bits through the unpack processing. 00: The lower-order bits of α value are extended with 0. 01: The upper-order bits of α value are copied to the lower-order bits. 10: The lower-order bits of α value are extended with 0. The maximum value is limited to H'FF. 11: Setting prohibited
17, 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	ALPHA1 [7:0]	H'00	R/W	8-Bit α Value Output when 1-Bit α Value is 1 These bits specify the 8-bit α value to be output when 1-bit α data is input and the α value input to the 8-bit transparent α generator shown in Figure 25.25 is 1. This setting is valid when the ASEL bits are set to B'010 or B'011. A value from 0 to 255 can be specified.
7 to 0	ALPHA0 [7:0]	H'00	R/W	8-Bit α Value Output when 1-Bit α Value is 0 These bits specify the 8-bit α value to be output when 1-bit α data is input and the α value input to the 8-bit transparent α generator shown in Figure 25.25 is 0. This setting is valid when the ASEL bits are set to B'010 or B'011. A value from 0 to 255 can be specified.

Figure 25.25 shows the relationship between the α selector, IROP operation unit, color keying unit, and related registers (color space conversion is omitted but is behind the color keying unit as shown in Figure 25.3). The IROP operation unit receives two inputs, source and destination. The image data input from the external memory is processed through the unpack processor and 8-bit transparent α generator and then input to the IROP operation unit as destination data. The α plane data input from the external memory is sent to the 8-bit transparent α generator when the ASEL bits are set to 1 or 3, or sent to the 1-bit mask α generator when the ASEL bits are set to 0 or 2. For the pixel data and 8-bit α value on the source side of the IROP operation unit, either the VI6_RPFn_MSKSET0 value or VI6_RPFn_MSKSET1 values will be selected according to the 1-bit α value output by the 1-bit mask α generator.

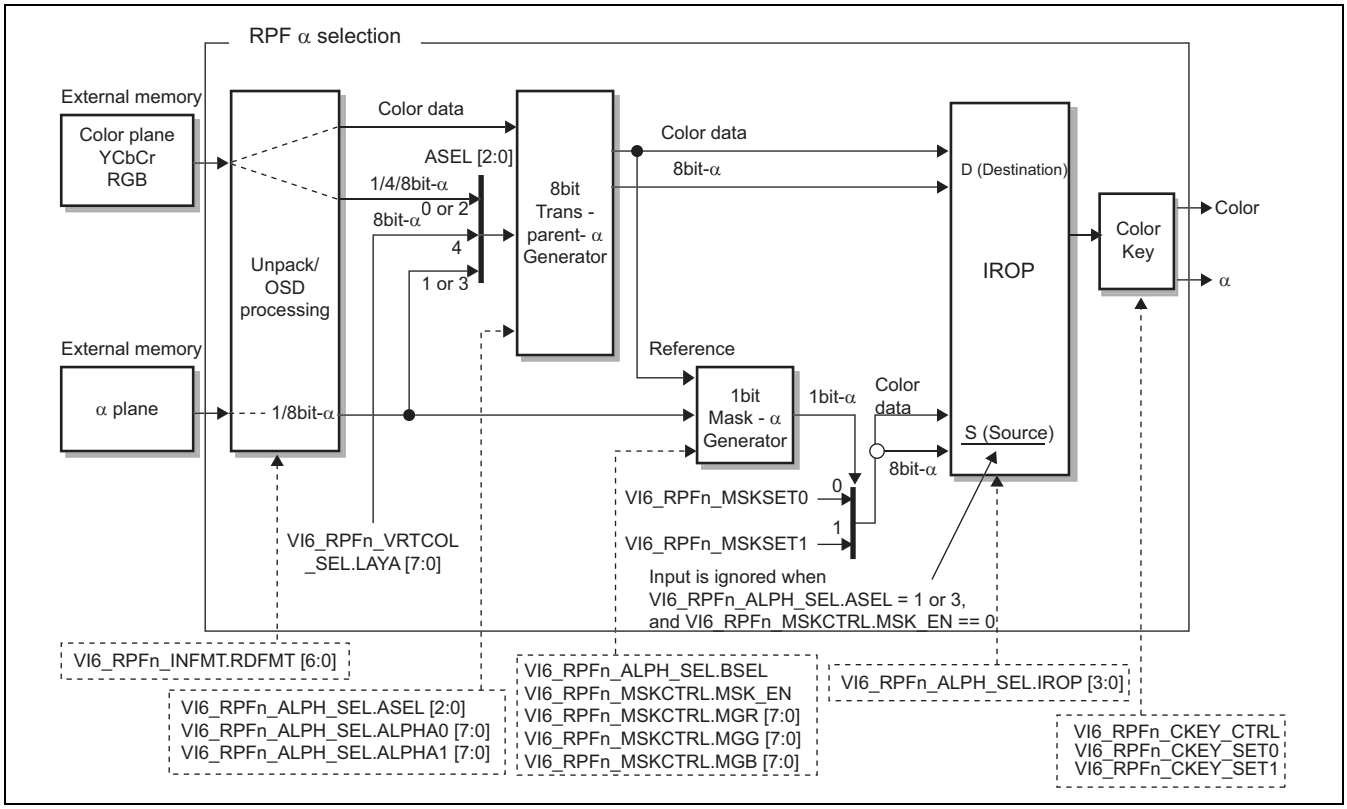


Figure 25.25 Configuration of α Selector and IROP Operation Unit in RPF

The following describes the function of each block shown in Figure 25.25. Read the following while referring to the figure as necessary.

Unpack/OSD processor:

Unpacks each component and α value of the image data according to the packed format specified in VI6_RPFn_INFMT.RDFMT.

8-bit transparent α generator:

Converts the input α value into 8-bit α when the input α is four bits or one bit.

When VI6_RPFn_ALPH_SEL.ASEL are set to 0 (8-, 4-, or 1-bit packed α), this generator outputs the input α value without change if the α bit field in the packed α data is eight bits; if the α bit field is less than eight bits, it is converted to an 8-bit α value by extending the LSB side according to the VI6_RPFn_ALPH_SEL.AEXT setting.

When VI6_RPFn_ALPH_SEL.ASEL are set to 1 (8-bit plane α) or 4 (fixed α), this generator outputs the input 8-bit plane α without change. If a packed α value is included in RGB data, it is discarded.

When VI6_RPFn_ALPH_SEL.ASEL are set to 2 (1-bit packed α) or 3 (8-bit α generated from 1-bit plane α), an 8-bit α value is generated by using the VI6_RPFn_ALPH_SEL.ALPHA0[7:0] value when the input 1-bit α value is 0 or by using the VI6_RPFn_ALPH_SEL.ALPHA1[7:0] value when the input 1-bit α value is 1. When VI6_RPFn_ALPH_SEL.ASEL is set to 3, a packed α value that is included in RGB data is discarded.

1-bit mask α generator:

Generates 1-bit α data from the input 8-bit α data or pixel data. When the input α data is one bit, this generator outputs it without change.

When VI6_RPFn_ALPH_SEL.ASEL are set to 0 (8-, 4-, or 1-bit packed α) or 2 (plane α) and VI6_RPFn_MSKCTRL.MSK_EN is set to 0, the α plane read from the external memory to be used in IROP is converted to 1-bit α data when necessary. When the α plane data read from the external RAM is eight bits (BSEL = 0), if the value is 0, a 1-bit α value of 0 is generated; if the value is not 0, a 1-bit α value of 1 is generated. When the α plane data is one bit (BSEL = 1), this generator outputs it without change.

When the value of the 1-bit α generated by the 1-bit mask α generator is 0, the 8-bit α and pixel data specified in VI6_RPFn_MSKSET0 are output as the source. When the generated 1-bit α value is 1, the 8-bit α and pixel data specified in VI6_RPFn_MSKSET1 are output as the source.

As shown in Figure 25.25, when VI6_RPFn_ALPH_SEL.ASEL are set to 1 (8-bit plane α) or 3 (1-bit plane α), the α plane read from the external RAM is sent to the 8-bit transparent α generator as transparency information. When VI6_RPFn_MSKCTRL.MSK_EN is set to 0, the 1-bit α for masking is generated according to the input α plane (refer to section 25.2.7.8), but the 1-bit mask α generator does not refer to the input α plane because it is input to the 8-bit transparent α generator as transparency information. Accordingly, the 1-bit mask α generator does not generate a 1-bit α for masking and the data on the source side becomes invalid; that is, IROP operation cannot be executed. Set the IROP bits to 0 in this case. In contrast, when VI6_RPFn_MSKCTRL.MSK_EN is set to 1, the 1-bit mask α generator creates α data for masking according to the pixel data instead of the input α plane data, and IROP operation can be executed in this case.

IROP operation unit

Executes ROP operation according to the opcode specified in VI6_RPFn_ALPH_SEL.IROP. For ROP operation (other than NOP), valid values should be input both for the source and destination. As described in the above (description of the 1-bit mask α generator), when VI6_RPFn_ALPH_SEL.ASEL are set to 1 or 3 and VI6_RPFn_MSKCTRL.MSK_EN is set to 0, the source data for the IROP operation unit is treated as invalid; set VI6_RPFn_ALPH_SEL.IROP to 0 (NOP). When VI6_RPFn_ALPH_SEL.ASEL are set to 4, a fixed α value is output from the RFP and IROP operation is not available. In the same way as the above case, set VI6_RPFn_ALPH_SEL.IROP to 0 (NOP).

To specify a valid source value for the IROP operation unit and execute IROP operation (specify an opcode other than NOP in the IROP bits), specify register values as shown in Table 25.21. Where the source input state is indicated as "Valid" in the table, IROP operation can be executed. In the cases where IROP operation is not available, set the IROP bits to 0 (NOP).

Table 25.21 Source Input State in IROP Operation Unit

VI6_RPFn_ALPH_SEL.ASEL [2:0]		VI6_RPFn_MSKCTRL.MSK_EN = 0 (Source data is generated according to input α plane)		VI6_RPFn_MSKCTRL.MSK_EN = 1 (Source data is generated according to the destination-side pixel data)
B'000	(1-, 4-, or 8-bit packed α + plane α)	Valid	(α plane input)	Valid
B'001	(8-bit α plane)	Invalid	(IROP operation is not available; α plane is output to the subsequent modules behind RPF)	Valid
B'010	(8-bit α generated from 1-bit packed α + plane α)	Valid	(α plane input)	Valid
B'011	(8-bit α generated from 1-bit plane α)	Invalid	(IROP operation is not available; α plane is output to the subsequent modules behind RPF)	Valid
B'100	(Fixed α)	Invalid (IROP operation is not available; fixed α is output to the subsequent modules behind RPF)		

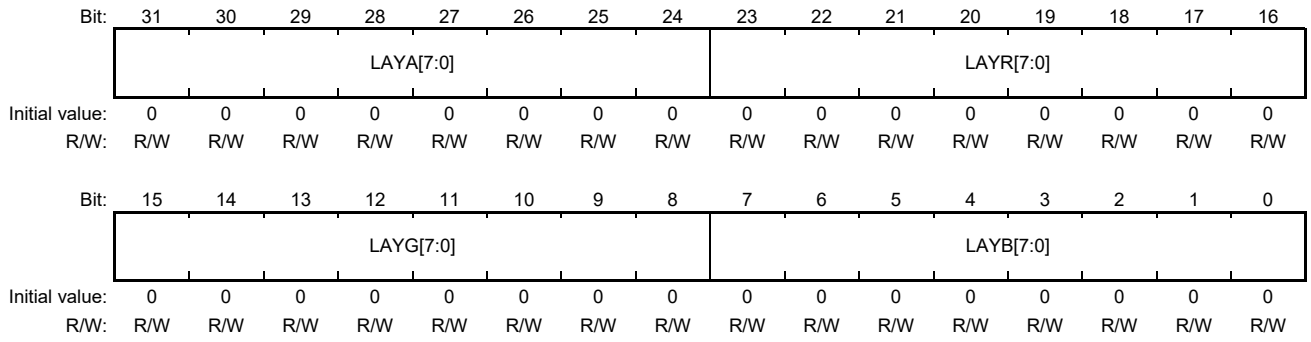
For the handling of the α values shown in Figure 25.25 and Table 25.21, the relationship between the RPF input format and RPF output α value is shown in Table 25.22. Where only bit names are shown in the table, the bits are in VI6_RPFn_ALPH_SEL described in this section.

Table 25.22 α Value Selected and Output according to ASEL Bits in Each Input Format

ASEL Setting		α Value Output for Each Input Format		
		RGB	YCbCr	OSD-CLUT
B'000	(8-, 4-, or 1-bit packed α is input)	1- ,4-, or 8-bit pixel α	H'FF*	α value in CLUT
B'001	(8-bit plane α is input)	8-bit α plane	8-bit α plane	8-bit α plane
B'010	(8-bit α is generated from the 1-bit packed α input)	ALPHA0 or ALPHA1 setting	H'FF*	H'FF
B'011	(8-bit α is generated from the 1-bit plane α input)	ALPHA0 or ALPHA1 setting	ALPHA0 or ALPHA1 setting	ALPHA0 or ALPHA1 setting
B'100	(Fixed α is output)	VI6_RPFn_VRTCOL_SET.LAYA setting		

Note: * Fixed value H'FF is output because packed α is not included in YCbCr.

25.2.7.7 RPFn Virtual Plane Color Information Registers (VI6_RPFn_VRTCOL_SET)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	LAYA[7:0]	H'00	R/W	Virtual-Input Fixed α Value These bits specify the fixed α value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When the virtual input function is disabled (VI6_RPFn_INFMT.VIR = 0), these bits are used to specify the fixed α value to be output from the RPF while VI6_RPFn_ALPH_SEL.ASEL are set to 4. A value from 0 to 255 can be specified.
23 to 16	LAYR[7:0]	H'00	R/W	Virtual-Input Fixed R/Cr Component Value These bits specify the fixed R or Cr value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the R value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Cr value. A value from 0 to 255 can be specified.
15 to 8	LAYG[7:0]	H'00	R/W	Virtual-Input Fixed G/Y Component Value These bits specify the fixed G or Y value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the G value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Y value. A value from 0 to 255 can be specified.
7 to 0	LAYB[7:0]	H'00	R/W	Virtual-Input Fixed B/Cb Component Value These bits specify the fixed B or Cb value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the B value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Cb value. A value from 0 to 255 can be specified.

25.2.7.8 RPFn Mask Control Registers (VI6_RPFn_MSKCTRL)

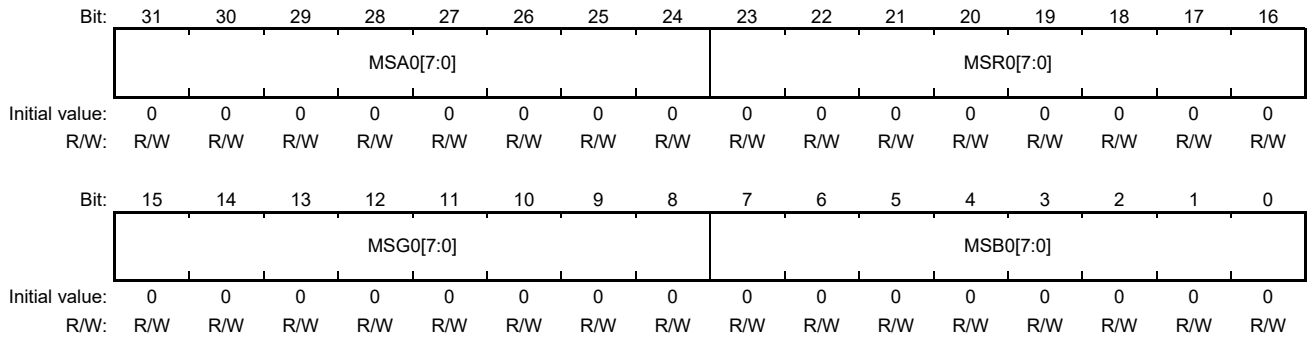
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	MSK_EN	MGR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MGG[7:0]								MGB[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	MSK_EN	0	R/W	Mask Generation Specification Specifies the method of α value generation in the 1-bit mask α generator shown in Figure 25.25. 0: A 1-bit mask value is generated according to the input α plane value. When the input α is in the 1-bit format (VI6_RPFn_ALPH_SEL.BSEL = 1), the 1-bit mask value is output without change. When the input α is in the 8-bit format (VI6_RPFn_ALPH_SEL.BSEL = 0), the 1-bit mask value is 0 if the α value is H'00; otherwise, the 1-bit mask value is 1. 1: The R/Cr, G/Y, and B/Cb components of the image input to the destination side of the IROP operation unit are compared with the values specified in the MGR, MGG, and MGB bits, respectively. When all values match, 1 is output as the 1-bit mask value, and in other cases, 0 is output. When the generated 1-bit mask data is not used, set VI6_RPFn_ALPH_SEL.IROP to 0.
23 to 16	MGR[7:0]	H'00	R/W	R/Cr Comparison Value for 1-Bit α Generation These bits specify the R/Cr value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R value for comparison. When YCbCr is specified, specify a Cr value for comparison. This setting is ignored when the MSK_EN bit is set 0. A value from 0 to 255 can be specified.
15 to 8	MGG[7:0]	H'00	R/W	G/Y Comparison Value for 1-Bit α Generation These bits specify the G/Y value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G value for comparison. When YCbCr is specified, specify a Y value for comparison. This setting is ignored when MSK_EN is set to 0. A value from 0 to 255 can be specified.

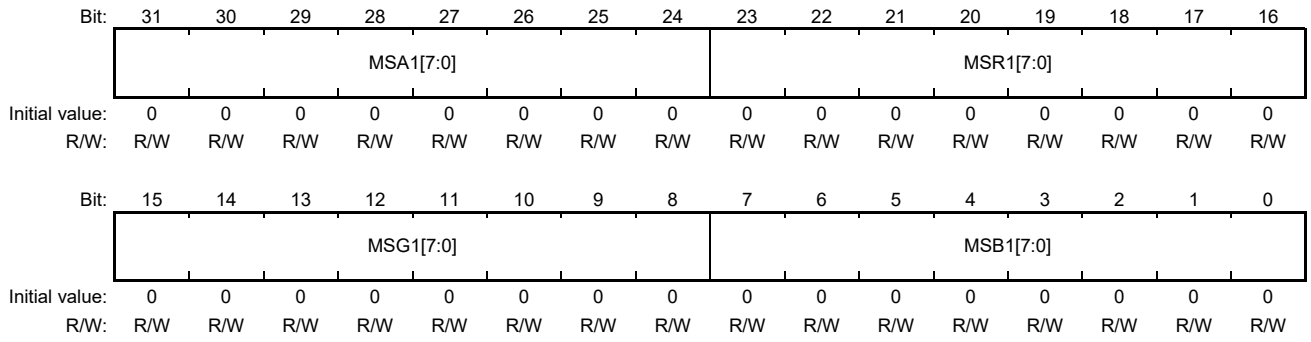
Bit	Bit Name	Initial Value	R/W	Description
7 to 0	MGB[7:0]	H'00	R/W	B/Cb Comparison Value for 1-Bit α Generation These bits specify the B/Cb value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B value for comparison. When YCbCr is specified, specify a Cb value for comparison. This setting is ignored when MSK_EN is set to 0. A value from 0 to 255 can be specified.

25.2.7.9 RPFn IROP-SRC Input Value Registers 0 (VI6_RPFn_MSKSET0)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MSA0[7:0]	H'00	R/W	IROP-Source Input α Value when 1-Bit α is 0 These bits specify the 8-bit α value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (Figure 25.25). A value from 0 to 255 can be specified.
23 to 16	MSR0[7:0]	H'00	R/W	IROP-Source Input R/Cr Value when 1-Bit α is 0 These bits specify the R/Cr value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (Figure 25.25). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R component value. When YCbCr is specified, specify a Cr component value. A value from 0 to 255 can be specified.
15 to 8	MSG0[7:0]	H'00	R/W	IROP-Source Input G/Y Value when 1-Bit α is 0 These bits specify the G/Y value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (Figure 25.25). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G component value. When YCbCr is specified, specify a Y component value. A value from 0 to 255 can be specified.
7 to 0	MSB0[7:0]	H'00	R/W	IROP-Source Input B/Cb Value when 1-Bit α is 0 These bits specify the B/Cb value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (Figure 25.25). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B component value. When YCbCr is specified, specify a Cb component value. A value from 0 to 255 can be specified.

25.2.7.10 RPFn IROP-SRC Input Value Registers 1 (VI6_RPFn_MSKSET1)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MSA1[7:0]	H'00	R/W	IROP-Source Input α Value when 1-Bit α is 1 These bits specify the 8-bit α value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1. A value from 0 to 255 can be specified (Figure 25.25).
23 to 16	MSR1[7:0]	All 0	R/W	IROP-Source Input R/Cr Value when 1-Bit α is 1 These bits specify the R/Cr value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (Figure 25.25). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R component value. When YCbCr is specified, specify a Cr component value. A value from 0 to 255 can be specified.
15 to 8	MSG1[7:0]	All 0	R/W	IROP-Source Input G/Y Value when 1-Bit α is 1 These bits specify the G/Y value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (Figure 25.25). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G component value. When YCbCr is specified, specify a Y component value. A value from 0 to 255 can be specified.
7 to 0	MSB1[7:0]	All 0	R/W	IROP-Source Input B/Cb Value when 1-Bit α is 1 These bits specify the B/Cb value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (Figure 25.25). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B component value. When YCbCr is specified, specify a Cb component value. A value from 0 to 255 can be specified.

25.2.7.11 RPFn Color Keying Control Registers (VI6_RPFn_CKEY_CTRL)

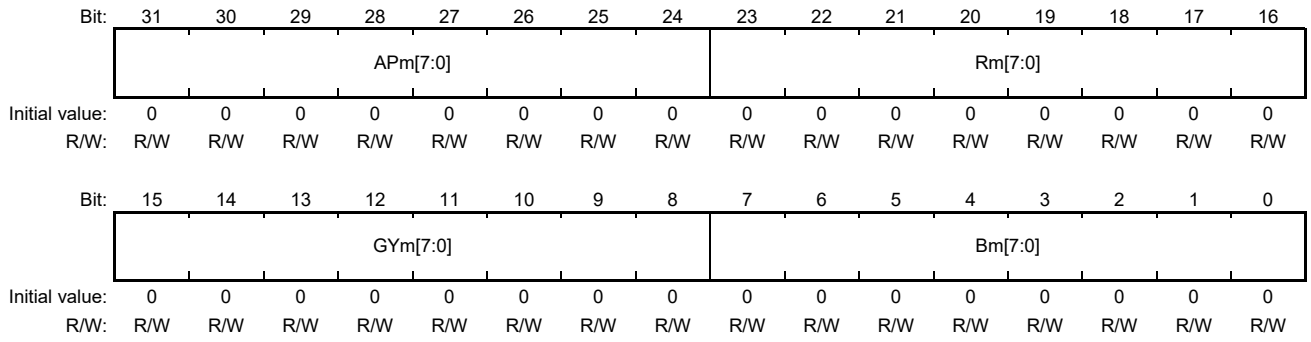
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	CV	—	—	SAPE1	SAPE0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	CV	0	R/W	Color Replacement Control This bit controls the color replacement function in the color keying module shown in Figure 25.3. When an RGB format is specified as the color space of the RPFn input data through VI6_RPFn_INFMT.RDFMT, and if all components of an input pixel match the color components specified in VI6_RPFn_CKEY_SET0, the color replacement function replaces the values of the input α and all RGB components with the α and color components specified in VI6_RPFn_CKEY_SET1. When a YCbCr format is specified as the color space of the RPFn input data through VI6_RPFn_INFMT.RDFMT, only the Y data is compared; if the luminance component of an input pixel matches the value specified in VI6_RPFn_CKEY_SET0.GY0, the color replacement function replaces the values of the input α and all YCbCr components with the α and color components specified in VI6_RPFn_CKEY_SET1. When the CV bit is set to 1, the color replacement function is enabled. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), set this bit to 0. 0: Color replacement function is disabled (transparent color mode). 1: Color replacement function is enabled.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1	SAPE1	0	R/W	Comparison Color Data Setting 1 Enable/Disable This bit enables or disables comparison color data setting 1 in the transparent color-matched color mode for the color keying module. This bit setting is valid only when the CV bit is set to 0 and LTH bit is set to 0; it is ignored when the CV bit is set to 1 or LTH bit is set to 1. In transparent color-matched color mode, color information 1 (VI6_RPFn_CKEY_SET1.R1/GY1/B1) specified in VI6_RPFn_CKEY_SET1 is compared with the input component values. When the input data is in an RGB format, and if all input values match the specified color information, the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET1.AP. When the input data is in YCbCr format, only the Y data is compared. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), set this bit to 0. 0: Comparison color data setting 1 is disabled. 1: Comparison color data setting 1 is enabled.
0	SAPE0	0	R/W	Comparison Color Data Setting 0 Enable/Disable This bit enables or disables comparison color data setting 0 in the transparent color-matched color mode for the color keying module. This bit setting is valid only when the CV bit is set to 0 and LTH bit is set to 0; it is ignored when the CV bit is set to 1 or LTH bit is set to 1. In transparent color-matched color mode, color information 0 (VI6_RPFn_CKEY_SET0.R0/GY0/B0) specified in VI6_RPFn_CKEY_SET0 is compared with the input component values. When the input data is in an RGB format, and if all input values match the specified color information, the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET0.AP. When the input data is in YCbCr format, only the Y data is compared. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), clear this bit to 0. 0: Comparison color data setting 0 is disabled. 1: Comparison color data setting 0 is enabled.

25.2.7.12 RPFn Color Keying Color Setting Registers-m (VI6_RPFn_CKEY_SETm: m = 0, 1)

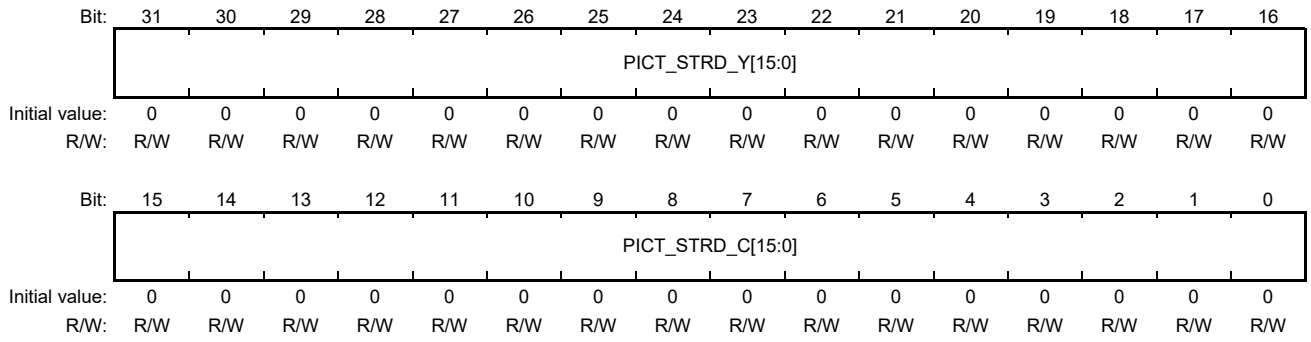


Bit	Bit Name	Initial Value	R/W	Description
31 to 24	APm[7:0]	H'00	R/W	α Data in Color Keying Color Information-m • In transparent color-matched color mode for color keying When the input data matches color setting-m (Rm, GYm, and Bm) for transparent color comparison in the color keying module, the input α value is replaced with the value specified in these bits. Specify the α value to replace the input value. • In transparent color-luma threshold mode for color keying When the input data is in YCbCr format, and if input Y value is equal to or smaller than GY0, the input α value is replaced with the value specified in this bit field (AP0). Specify the α value in this bit field (AP0) to replace the input value. AP1 is not used in this mode. Set AP1 to 0 value. • In color replacement mode for color keying These bits are not used in this mode. Clear them to 0. α value replacement through these bits in transparent color mode for color keying takes priority over the α value selected through the VI6_RPFn_ALPH_SEL.ASEL setting. A value from 0 to 255 can be specified.
23 to 16	Rm[7:0]	H'00	R/W	R*/Cr Component Data in Color Keying Color Information-m • In transparent color-matched color mode for color keying Specify the R component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPEm setting. When the RPFn input is in YCbCr format, the color keying module does not compare the Cr component, and the setting of these bits is ignored. • In transparent color-luma threshold mode for color keying The color keying module does not refer this bit field, and the setting of these bits is ignored. • In color replacement mode for color keying Specify the R component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	GYm[7:0]	H'00	R/W	G*/Y Component Data in Color Keying Color Information-m • In transparent color-matched color mode for color keying Specify the G/Y component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPEm setting. • In transparent color-luma threshold mode for color keying Specify the Y component value in the GY0 to be compared. • In color replacement mode for color keying Specify the G/Y component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.
7 to 0	Bm[7:0]	H'00	R/W	B*/Cb Component Data in Color Keying Color Information-m • In transparent color-matched color mode for color keying Specify the B component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPEm setting. When the RPFn input is in YCbCr format, the color keying module does not compare the Cb component, and the setting of these bits is ignored. • In transparent color-luma threshold mode for color keying The color keying module does not refer this bit field, and the setting of these bits is ignored. • In color replacement mode for color keying Specify the B component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.

Note: * When comparison data is specified in an RGB format, if a packed format is selected for RGB input and each of the RGB components is not eight bits, the lower-order bits of input data are extended as specified through VI6_RPFn_INFMT.CEXT before comparison. The RGB components to be compared with the input should also be extended in the same way and the extended values should be specified in this register.

25.2.7.13 RPFn Source Picture Memory Stride Setting Registers (VI6_RPFn_SRCM_PSTRIDE)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	PICT_STRD_Y [15:0]	H'0000	R/W	Memory Stride of Source Picture Y/RGB Plane These bits specify in 1-byte units the memory stride of the source picture Y/RGB plane read by the RPFn. A value from 0 to 65,535 can be specified. Refer to Figure 25.26 for settings.
15 to 0	PICT_STRD_C [15:0]	H'0000	R/W	Memory Stride of Source Picture C Plane These bits specify in 1-byte units the memory stride of the source picture C plane read by the RPFn. When an RGB-format picture is read, these bits do not need to be set. A value from 0 to 65,535 can be specified. Refer to Figure 25.26 for settings. In the YCbCr planar format, this setting is used as the memory stride of the Cb and Cr planes.

This register specifies the memory stride of the picture planes in the source area as shown in Figure 25.26. The memory stride of the α plane should be specified through VI6_RPFn_SRCM_ASTRIDE.ALPH_STRD. When the RPF input is in an RGB format, only the RGB plane is read; when the input is in YCbCr format, the Y and C planes are read as shown in Figure 25.26. When the α plane is used, the α plane is also read. According to the image format and the necessity of the α plane, specify the necessary addresses where the source image is stored (VI6_RPFn_SRCM_ADDR_Y, VI6_RPFn_SRCM_ADDR_C, and VI6_RPFn_SRCM_ADDR_AI).

Whether the α plane needs to be read is determined according to the α plane selection method and IROP operation type. For details, refer to section 25.2.7.6.

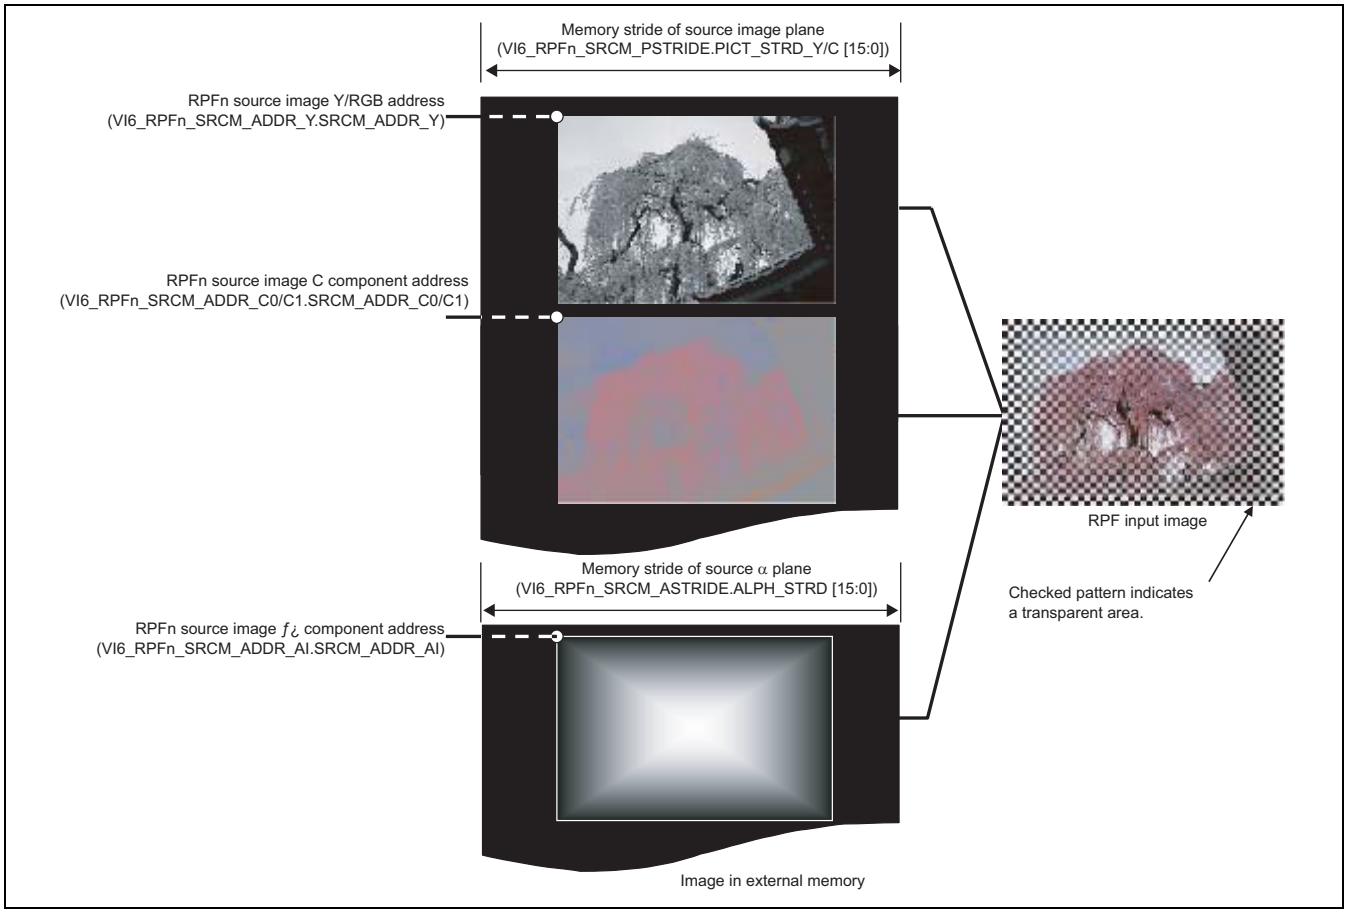


Figure 25.26 Reading an Image from RPFn Source Area

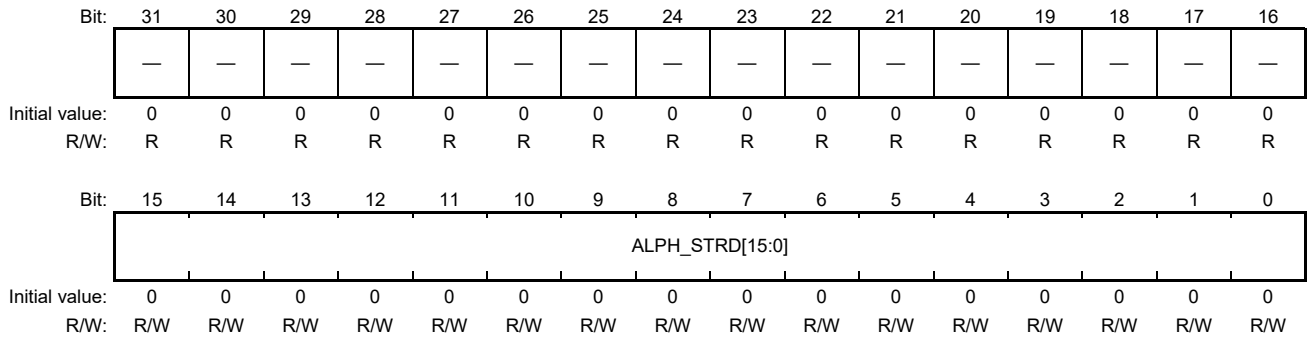
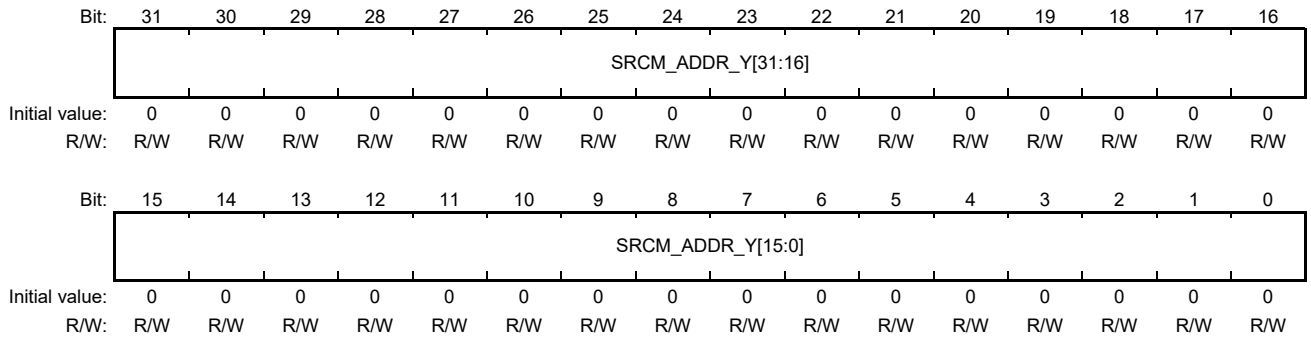
25.2.7.14 RPFn Source α Memory Stride Setting Registers (VI6_RPFn_SRCM_ASTRIDE)



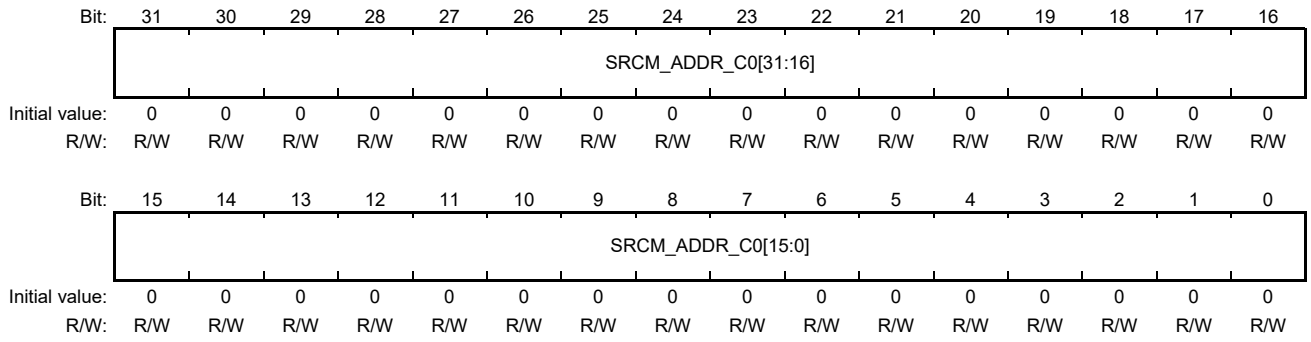
Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	ALPH_STRD [15:0]	H'0000	R/W	Memory Stride of Source α Plane These bits specify in 1-byte units the memory stride of the source α plane read by the RPFn. A value from 0 to 65,535 can be specified. Refer to Figure 25.26 for settings.

25.2.7.15 RPFn Source Y/RGB Address Registers (VI6_RPFn_SRCM_ADDR_Y)



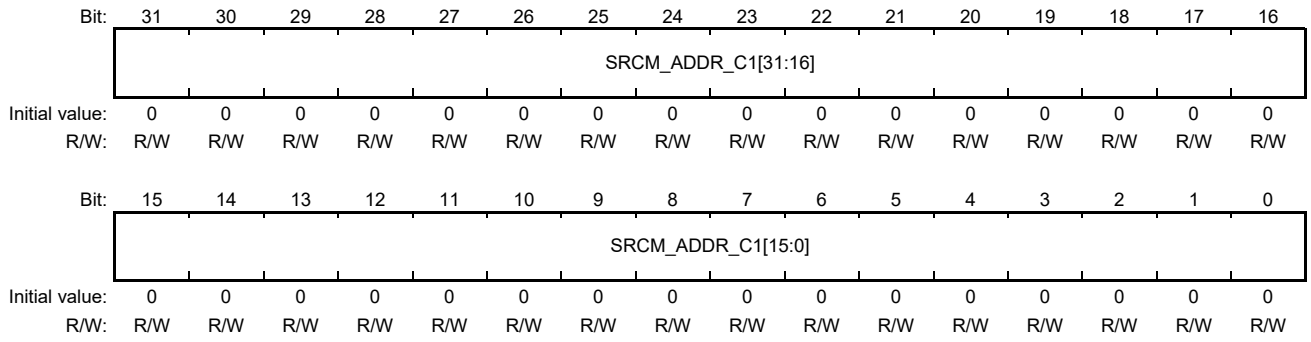
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ ADDR_Y [31:0]	H'0000 0000	R/W	Source Image Y/RGB Plane Storing Address These bits specify in 1-byte units the start address of the source image Y plane and packed RGB plane read by the RPFn. A value from H'00000000 to H'FFFFFFFF can be specified. Refer to Figure 25.26 in section 25.2.7.13 for settings.

25.2.7.16 RPFn Source Chroma Address Registers 0 (VI6_RPFn_SRCM_ADDR_C0)



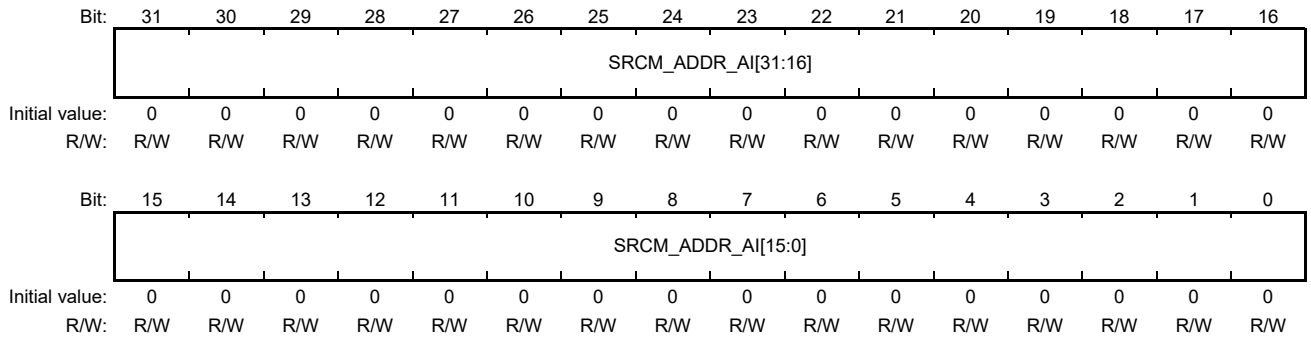
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ ADDR_C0 [31:0]	H'0000 0000	R/W	Source Image C Plane Storing Address 0 These bits specify in 1-byte units the start address of the source image C plane read by the RPFn. Here, the C plane indicates the combined CbCr plane when a semi-planar format is selected from the packed YCbCr formats shown in Table 25.18 or the Cb plane when a planar format is selected. When an interleaved format is selected or the RPF input is in an RGB format, this setting is not used. A value from H'00000000 to H'FFFFFFFF can be specified. Refer to Figure 25.26 in section 25.2.7.13 for settings.

25.2.7.17 RPFn Source Chroma Address Registers 1 (VI6_RPFn_SRCM_ADDR_C1)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ ADDR_C1 [31:0]	H'0000 0000	R/W	Source Image C Plane Storing Address 1 These bits specify in 1-byte units the start address of the Cr plane when a planar YCbCr format shown in Table 25.18 is read by the RPFn. This setting is not used when the RPF input is in YCbCr format that is not a planar format or in an RGB format. A value from H'00000000 to H'FFFFFFFF can be specified. Refer to Figure 25.26 in section 25.2.7.13 for settings.

25.2.7.18 RPFn Source α Address Registers (VI6_RPFn_SRCM_ADDR_AI)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ ADDR_AI [31:0]	H'0000 0000	R/W	Source Image α Plane Storing Address These bits specify in 1-byte units the start address of the α plane of the source image read by the RPFn. Specify in the same way as the start address of the picture plane. When the α plane is not read from the source area, these bits do not need to be set. A value from H'00000000 to H'FFFFFFFF can be specified. Refer to Figure 25.26 in section 25.2.7.13 for settings.

25.2.8 WPF Control Registers

25.2.8.1 WPFn-Source-RPF Registers (VI6_WPFn_SRCRPF)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	VIR_ACT[1:0]		—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RPF4_ACT[1:0]		RPF3_ACT[1:0]		RPF2_ACT[1:0]		RPF1_ACT[1:0]		RPF0_ACT[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29, 28	VIR_ACT [1:0]	00	R/W	Virtual RPF Start Enable in BRU These bits enable start of the virtual RPF in the BRU as the source RPF for the WPFn when the WPFn is started. For details of the virtual RPF, refer to the following. Section 25.2.16.1, BRU Input Control Register (VI6_BRU_INCTRL) Section 25.2.16.2, Size Register of BRU Input Virtual RPF (VI6_BRU_VIRRPF_SIZE) Section 25.2.16.3, Display Location Register of BRU Input Virtual RPF (VI6_BRU_VIRRPF_LOC) Section 25.2.16.4, Color Information Register of BRU Input Virtual RPF (VI6_BRU_VIRRPF_COL) Note that the virtual RPF is in the BRU as shown in Figure 25.44 and there are no register bits for DPR setting related to the virtual RPF. 00: The virtual RPF in the BRU is not started. 01: The virtual RPF in the BRU is started as a sub layer source RPF for the WPFn. 10: The virtual RPF in the BRU is started as the master-layer source RPF for the WPFn. 11: Setting prohibited
27 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	RPF4_ACT [1:0]	00	R/W	RPFn Start Enable (RPFn_ACT, n = 0 to 4) These bits enable start of RPFn as the source RPF for the WPFn when the WPFn is started. When RPFn is not started by any of the WPF0 to WPF3, set the VI6_DPR_RPFn_ROUTE.RT_RPFn bits to 63 (H'3F). 00: RPFn is not started. 01: RPFn is started as a sub layer source RPF for the WPFn. 10: RPFn is started as the master-layer source RPF for the WPFn. 11: Setting prohibited
7, 6	RPF3_ACT [1:0]	00	R/W	
5, 4	RPF2_ACT [1:0]	00	R/W	
3, 2	RPF1_ACT [1:0]	00	R/W	
1, 0	RPF0_ACT [1:0]	00	R/W	

When the WPFn is started through the VSP1 start register n (VI6_CMDn: n = 0, 1, 2, 3), the RPF and virtual RPF in the BRU specified as the source RPF in this register are also started to supply data to the VSP1 internal modules.

Note the following when specifying the source RPF.

1. Each source RPF can be assigned to only one target WPFn; a single RPF cannot be assigned as the source RPF for multiple WPFs. For example, when setting VI6_WPF0_SRCRPF to H'00000008 and VI6_WPF1_SRCRPF to H'00000004 is attempted, the VSP1 will not operate correctly (these settings are prohibited) because RPF1 is assigned as both the master-layer source RPF for WPF0 and a sub layer source RPF for WPF1.
2. When blending or ROP operation is applied to multiple images through the BRU, multiple source RPFs are necessary for one WPF. When multiple source RPFs are used, images should be classified into a master layer and sub layers; assign one of the source RPFs as the master-layer source RPF and other RPFs as sub layer source RPFs. Do not assign all RPFs as sub layer source RPFs (VI6_WPF1_SRCRPF = H'00000015) or two or more RPFs as the master-layer source RPF (VI6_WPF3_SRCRPF = H'0000025A) (such settings are prohibited).
3. When the BRU is not used, there should be only one source RPF for one WPF. In this case, the source RPF should be assigned as the master-layer source RPF.
4. Calculate the master layer and sub layer sizes as described in section 25.1.5. When the BRU is used and the SRU or UDS is used between the RPF and BRU, the master layer and sub layer sizes may have been upscaled or downscaled before input to the BRU with respect to the sizes output from the source RPF. When determining the relative locations among layers for blending or ROP operation, take account of the size of each image input to the BRU. In particular, be careful not to place the entire sub layer outside the master layer as explained in the description of the HCOORD and VCOORD bits in VI6_RPFn_LOC in section 25.2.7.5.

25.2.8.2 WPFn Horizontal Input Size Clipping Registers (VI6_WPFn_HSZCLIP)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	HCEN	—	—	—	—	HCL_OFST[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	HCL_SIZE[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	HCEN	0	R/W	Horizontal Size Clipping Enable/Disable Enables or disables clipping of the horizontal size of the WPFn input image. 0: Horizontal size clipping is disabled 1: Horizontal size clipping is enabled
27 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	HCL_OFST [7:0]	H'00	R/W	Horizontal Size Clipping Offset Value Setting These bits specify the offset size (pixels) from the left end of the image in horizontal size clipping when the HCEN bit is 1 (Figure 25.27). The left side of the image input to the WPF is cut off for the size specified in these bits. When the HCEN bit is 0, this setting is ignored. A value from 0 to 255 can be specified. (HCL_OFST + HCL_SIZE) should not exceed the horizontal size of the WPF input. If the setting shown in the bottom example in Figure 25.27 is made, VSP1 does not operate correctly.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	HCL_SIZE [11:0]	H'000	R/W	Horizontal Clipping Size Setting When the HCEN bit is 1, these bits specify the clipping size for horizontal clipping processing. Through this processing, the area of the horizontal size specified through the HCL_SIZE bits starting from the offset position specified through the HCL_OFST bits is determined as the valid image area. Accordingly, the right-side pixels beyond the (HCL_OFST + HCL_SIZE) size in the WPFn input image are discarded. When the HCEN bit is 0, this setting is ignored. A value from 1 to 2,048 can be specified. (HCL_OFST + HCL_SIZE) should not exceed the horizontal size of the WPF input. If the setting shown in the bottom example in Figure 25.27 is made, VSP1 does not operate correctly. Note: When the WPFn output format is YCbCr4:2:2 or YCbCr4:2:0, specify an even value in these bits.

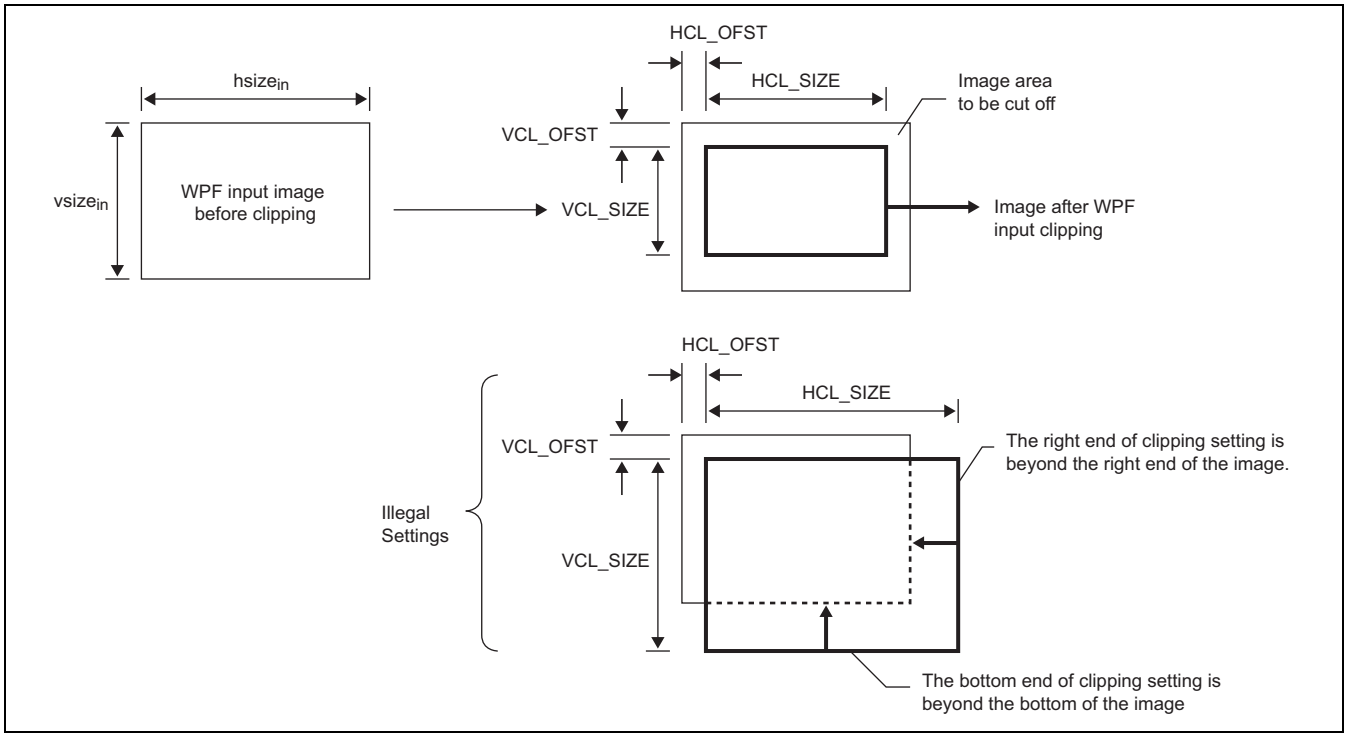


Figure 25.27 Image Clipping in WPF Input Section

25.2.8.3 WPFn Vertical Input Size Clipping Registers (VI6_WPFn_VSZCLIP)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	VCEN	—	—	—	—	VCL_OFST[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	VCL_SIZE[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	VCEN	0	R/W	Vertical Size Clipping Enable/Disable Enables or disables clipping of the vertical size of the WPFn input image. 0: Vertical size clipping is disabled 1: Vertical size clipping is enabled
27 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	VCL_OFST [7:0]	H'00	R/W	Vertical Size Clipping Offset Value Setting These bits specify the offset size (pixels) from the top end of the image in vertical size clipping when the VCEN bit is 1 (Figure 25.27). The top of the image input to the WPF is cut off for the size specified in these bits. When the VCEN bit is 0, this setting is ignored. A value from 0 to 255 can be specified. (VCL_OFST + VCL_SIZE) should not exceed the vertical size of the WPF input. If the setting shown in the bottom example in Figure 25.27 is made, VSP1 does not operate correctly.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	VCL_SIZE [11:0]	H'000	R/W	Vertical Clipping Size Setting When the VCEN bit is 1, these bits specify the clipping size for vertical clipping processing. Through this processing, the area of the vertical size specified through the VCL_SIZE bits starting from the offset position specified through the VCL_OFST bits is determined as the valid image area. Accordingly, the bottom pixels beyond the (VCL_OFST + VCL_SIZE) size in the WPFn input image are discarded. When the VCEN bit is 0, this setting is ignored. A value from 1 to 2,048 can be specified. (VCL_OFST + VCL_SIZE) should not exceed the vertical size of the WPF input. If the setting shown in the bottom example in Figure 25.27 is made, VSP1 does not operate correctly. Note: When the WPFn output format is YCbCr4:2:0, specify an even value in these bits.

25.2.8.4 WPFn Output Format Registers (VI6_WPFn_OUTFMT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PDV[7:0]								PXA	—	—	—	—	—	—	FLP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPYCS	SPUVS	DITH[1:0]		WRTM[2:0]			CSC	—	WRFMT[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	PDV[7:0]	H'00	R/W	PAD Value in Output Packed Data These bits specify the value to be stored in the bit field indicated as PAD or P in the output formats shown in Table 25.23. To store this value in PAD, specify 0 in the PXA bit. A value from 0 to 255 can be specified.
23	PXA	0	R/W	PAD Data Select Selects the value to be stored in the bit field indicated as PAD or P in the packed RGB output formats shown in Table 25.23. Both the value specified in the PDV bits and the α data input from the DPR to WPF are eight bits, but some of the PAD and P bit fields shown in Table 25.23 are four bits or one bit. When the target bit field is not eight bits, the number of bits in the PDV value and the α data input from the DPR to WPF is reduced according to the VI6_WPFn_RNDCTRL.ABRM setting. For bit count reduction, refer to Figure 25.28 and the description of VI6_WPFn_RNDCTRL.ABRM. 0: The value specified in the PDV bits is stored in the PAD shown in Table 25.23. 1: The α value output from DPR in pixel units is stored in the PAD shown in Table 25.23.
22 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	FLP	0	R/W	Vertical flipping Select This bit selects the vertical flipping processing to be applied to the WPFn output image. Figure 25.29 shows the correspondence between the original image and the vertical flipping result according to this setting. 0: No vertical flipping 1: vertical flipping Flipping can be specified only in WPF0. In other channels, always specify 0 in these bits. Note that the destination address setting should be changed according to the setting of these bits. For details, refer to section 25.2.8.9. When the LIF module is used (VI6_LIF_CTRL.LIF_EN = 1), set 0 to FLP.

Bit	Bit Name	Initial Value	R/W	Description
15	SPYCS	0	R/W	WPF Output Mode Setting 1 When the output format is YUY2, set this bit to 1 and set the WRFMT bits to 71 (H'47). When the output format is YVYU, set this bit and the SPUVS bit to 1 and set the WRFMT bits to 71 (H'47). In other cases, set this bit to 0.
14	SPUVS	0	R/W	WPF Output Mode Setting 2 When the output format is NV61, set this bit to 1 and set the WRFMT bits to 65 (H'41). When the output format is NV21, set this bit to 1 and set the WRFMT bits to 66 (H'42). When the output format is YVYU, set this bit and the SPYCS bit to 1 and set the WRFMT bits to 71 (H'47). In other cases, set this bit to 0.
13, 12	DITH[1:0]	00	R/W	Dithering Enable/Disable When the output format specified through the WRFMT bits is RGB with 18 bpp (262,144 colors) or less, the color reduction processing is applied to match the number of colors. The color reduction processing may generate the artifacts of pseudo gradation, which can be suppressed through dithering. The DITH bits enable or disable dithering during color reduction. When the output format specified through the WRFMT bits is YCbCr, specify 0 in these bits. And when VI6_WPFn_OUTFMT.CSC is set to 1, specify 0 in these bits even in the case that the output format specified through the WRFMT bits is RGB. 00: Dithering is disabled 11: Dithering is enabled 01, 10: Setting prohibited
11 to 9	WRTM[2:0]	000	R/W	CSC Conversion Expression Setting These bits select the expression for color space conversion. The conversion direction is RGB to YCbCr when the format specified in the WRFMT bits is RGB, or YCbCr to RGB when the format is YCbCr. 000: BT.601 YCbCr [16,235/240] ↔ RGB [0,255] 001: BT.601 YCbCr [0,255] ↔ RGB [0,255] 010: BT.709 YCbCr [16,235/240] ↔ RGB [0,255] 011: BT.709 YCbCr [16,235/240] ↔ RGB [16,235] 100 to 111: Setting prohibited
8	CSC	0	R/W	Color Space Conversion Setting Enables or disables YCbCr ↔ RGB color space conversion to be executed in the WPFn. The characteristics of color space conversion are determined by the WRTM setting. There are some points to be noted about the relationship between the CSC setting and output format (WRFMT). For details refer to section 25.2.7.3, RPFn Input Format Registers (VI6_RPFn_INFMT). 0: Color space is not converted. 1: Color space is converted.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
6 to 0	WRFMT[6:0]	H'00	R/W	WPF Output Image Format Setting These bits select the format of the image output from the WPFn to the external memory from among those listed in Table 25.23 and Table 25.24. Notes: 1. Number of output pixels When YCbCr4:2:2 is specified through WRFMT, the horizontal size of the output image should be a multiple of 2 pixels. When YCbCr4:2:0 is specified, the vertical and horizontal sizes of the output image should be multiples of 2 pixels. Specify an appropriate data flow of the source RPF → DPR → target WPF so that the size of the image input to the target WPF satisfies the above restrictions. In particular, when the data flow includes a module or a function that modifies (upscales, downscales, or clips) the image size, take special care about the module or function settings. 2. Output lines in YCbCr4:2:0 In the YCbCr4:2:0 output format, the number of chrominance lines in the vertical direction is one-half the number of luminance lines. For this reason, the WPF outputs only even-numbered chrominance lines (lines 0, 2, 4, 6, ...) (conversion from (A) to (B) in Figure 25.30). When vertical flipping is also specified through the FLP bits, the flipping processing is executed last and the chrominance line locations are inverted (lines 1, 3, 5, 7, …) in the output image ((C) in Figure 25.30).

Table 25.24 Packed YCbCr Formats for WPF Output

WRFMT [6:0]	Packed YCbCr Output Format	Reference
H'40	YCbCr4:4:4 semi-planar	Figure 25.19
H'41	YCbCr4:2:2 semi-planar (NV16, NV61*1)	
H'42	YCbCr4:2:0 semi-planar (NV12, NV21*1)	
H'43 to H'45	Reserved	—
H'46	YCbCr4:4:4 interleaved	Figure 25.20
H'47	YCbCr4:2:2 interleaved type 0 (UYVY, YUY2*2, YVYU*3)	
H'48	YCbCr4:2:2 interleaved type 1	
H'49	YCbCr4:2:0 interleaved	
H'4A	YCbCr4:4:4 planar	Figure 25.21
H'4B	YCbCr4:2:2 planar (YV16)	
H'4C	YCbCr4:2:0 planar (YV12, YU12)	
H'4D to H'7F	Reserved	—

Notes: 1. When the output format is NV61 or NV21, set SPUVS (bit 14) to 1.
2. When the output format is YUY2, set SPYCS (bit 15) to 1.
3. When the output format is YVYU, set SPUVS (bit 14) to 1 and SPYCS (bit 15) to 1.

For details of each YCbCr format, refer to Figure 25.19, Figure 25.20, and Figure 25.21. In these figures, registers for the RPF are indicated; read them as registers for the WPF as follows.

(RPF registers in the figures)	→	(Corresponding WPF registers)
VI6_RPFn_SRCM_ADDR_Y.SRCM_ADDR_Y	→	VI6_WPFn_DSTM_ADDR_Y.DSTM_ADDR_Y
VI6_RPFn_SRCM_ADDR_C0.SRCM_ADDR_C0	→	VI6_WPFn_DSTM_ADDR_C0.DSTM_ADDR_C0
VI6_RPFn_SRCM_ADDR_C1.SRCM_ADDR_C1	→	VI6_WPFn_DSTM_ADDR_C1.DSTM_ADDR_C1

25.2.8.5 WPFn Data Swapping Registers (VI6_WPFn_DSWAP)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	P_LLS	P_LWS	P_WDS	P_BTS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	P_LLS	0	R/W	WPF Output Data Swapping in LONG LWORD Units 0: Data swapping in LONG LWORD (64-bit) units is disabled 1: Data swapping in LONG LWORD (64-bit) units is enabled This should be set to 1in most cases, but when data has been swapped in 64-bit units by another data processing channel, specify 0
2	P_LWS	0	R/W	WPF Output Data Swapping in Longword Units 0: Data swapping in longword (32-bit) units is disabled 1: Data swapping in longword (32-bit) units is enabled This should be set to1 in most cases, but when data has been swapped in 32-bit units by another data processing channel, specify 0
1	P_WDS	0	R/W	WPF Output Data Swapping in Word Units The effect of this bit setting is the same as data swapping in the RPF; refer to Table 25.20. 0: Data swapping in word (16-bit) units is disabled 1: Data swapping in word (16-bit) units is enabled
0	P_BTS	0	R/W	WPF Output Data Swapping in Byte Units The effect of this bit setting is the same as data swapping in the RPF; refer to Table 25.20. 0: Data swapping in byte (8-bit) units is disabled 1: Data swapping in byte (8-bit) units is enabled

25.2.8.6 WPFn Rounding Control Registers (VI6_WPFn_RNDCTRL)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	CBRM	—	—	ABRM[1:0]		ATHRESH[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	CLMD[1:0]		—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	CBRM	0	R/W	Bit Count Reduction Method Selection for Data Storage in Packed RGB This bit specifies the method for reducing the number of bits when data is stored in the bit fields indicated as R, G, and B in Table 25.23 and the target bit fields are not eight bits. 0: Bit count conversion: The lower-order bits are truncated 1: Bit count conversion: Rounding (rounding off)
27, 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25, 24	ABRM[1:0]	00	R/W	Bit Count Reduction Method Selection for Data Storage in PAD These bits specify the method for reducing the number of bits when the data selected through VI6_WPFn_OUTFMT.PXA is stored in the bit fields indicated as PAD or P in Table 25.23 and the target bit field is four bits or one bit. A value of B'10 can be specified only when the packed RGB format specified through VI6_WPFn_OUTFMT.WRFMT includes a 1-bit P field. In this case, when the data selected through VI6_WPFn_OUTFMT.PXA is greater than the ATHRESH value, 1 is stored in the P field; when the selected data is not greater than the ATHRESH value, 0 is stored. 00: Bit count conversion: The lower-order bits are truncated 01: Bit count conversion: Rounding (rounding off) 10: Bit count conversion: Comparison with the threshold value (this setting is allowed only when the storage field is one bit) 11: Setting prohibited
23 to 16	ATHRESH [7:0]	H'00	R/W	Threshold for Conversion to 1-Bit α Data These bits specify the threshold value used for conversion from 8-bit α data to one bit when the ABRM bits are set to B'10. When the 8-bit α value before bit count reduction is equal to or smaller than the ATHRESH value, 0 is stored as the reduced 1-bit α data. In other cases, 1 is stored as the 1-bit α data. A value from 0 to 255 can be specified.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
13, 12	CLMD[1:0]	00	R/W	Color Data Clipping These bits specify the method for clipping the YCbCr color data output from the WPF. When RGB color data is output from the WPF, specify 0 in these bits. 00: Output value is not clipped (0 to 255) 01: Output value is clipped: YCbCr mode 1 (16 to 235 (Y), 16 to 240 (Cb/Cr)) 10: Output value is clipped: YCbCr mode 2 (Y/Cb/Cr = 1 to 254) 11: Setting prohibited
11 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

25.2.8.7 WPFn Destination Y Plane Memory Stride Registers (VI6_WPFn_DSTM_STRIDE_Y)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PICT_STRD_Y[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	PICT_STRD_Y [15:0]	H'0000	R/W	Memory Stride of Destination Picture Y/RGB Plane These bits specify in 1-byte units the memory stride of the destination picture in the external memory to be written to by the WPFn as shown in Figure 25.31. A value from H'0000 to H'FFFF can be specified.

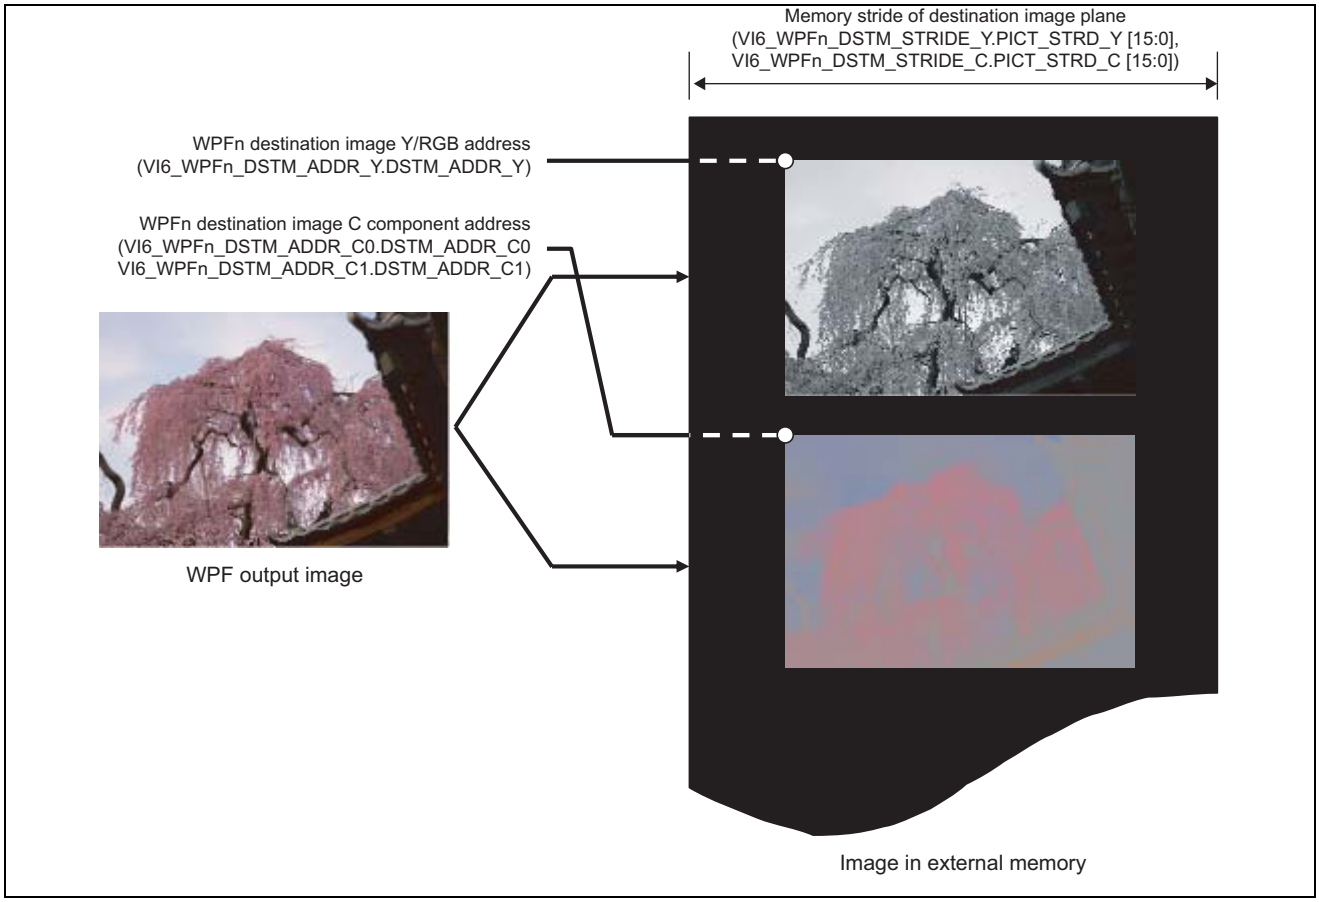

Figure 25.31 Writing Image Data to Destination Area in WPFn

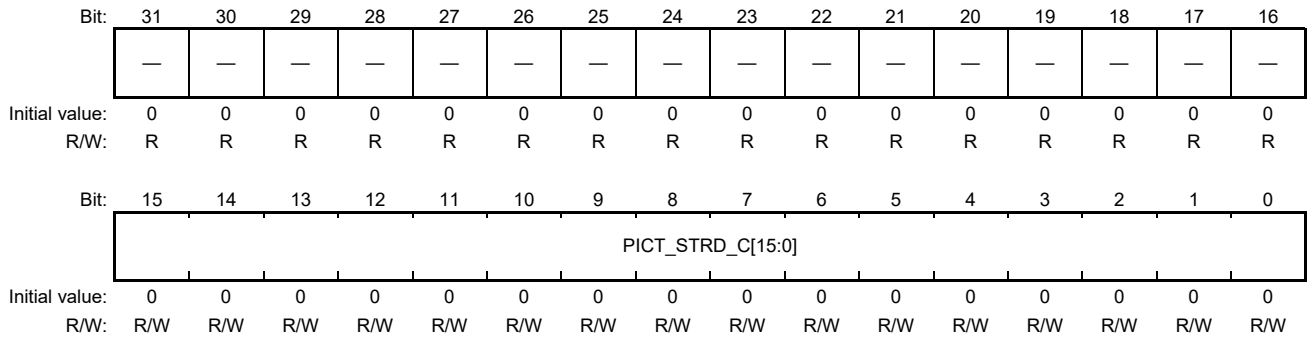
25.2.8.8 WPFn Destination C Plane Memory Stride Registers (VI6_WPFn_DSTM_STRIDE_C)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	PICT_STRD_C [15:0]	H'0000	R/W	Memory Stride of Destination Picture C Plane These bits specify in 1-byte units the memory stride for the C plane of the destination picture in the external memory to be written to by the WPFn as shown in Figure 25.31. When the WPFn outputs images in an RGB format, this setting is not used. When the WPFn outputs images in YCbCr planar format, this setting is applied to both the Cb and Cr planes. A value from H'0000 to H'FFFF can be specified.

25.2.8.9 WPFn Destination Y/RGB Address Registers (VI6_WPFn_DSTM_ADDR_Y)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DSTM_ADDR_Y[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DSTM_ADDR_Y[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ ADDR_Y [31:0]	H'0000 0000	R/W	Destination Image Y/RGB Plane Storing Address These bits specify in 1-byte units the address for storing the destination-image Y plane or packed RGB plane to be written to by the WPFn in the method described later. A value from H'00000000 to H'FFFFFFFF can be specified.

(Destination Address Specification Method)

When flipping is not used, the start address of a frame (address FHA shown in Figure 25.32) should be specified as the destination address. When flipping is used, the destination address is not the frame head address (FHA); one of addresses A0 to A1 shown in Figure 25.32 should be selected according to the combination of desired and flipping (VI6_WPFn_OUTFMT.FLP setting).

To strictly define locations A0 to A1, let the memory stride (VI6_WPFn_DSTM_STRIDE_Y/C setting) be S as shown in Figure 25.32). Calculate the destination address (one of A0 to A1) using the formula shown in Table 25.25 and specify it in the destination address storing register.

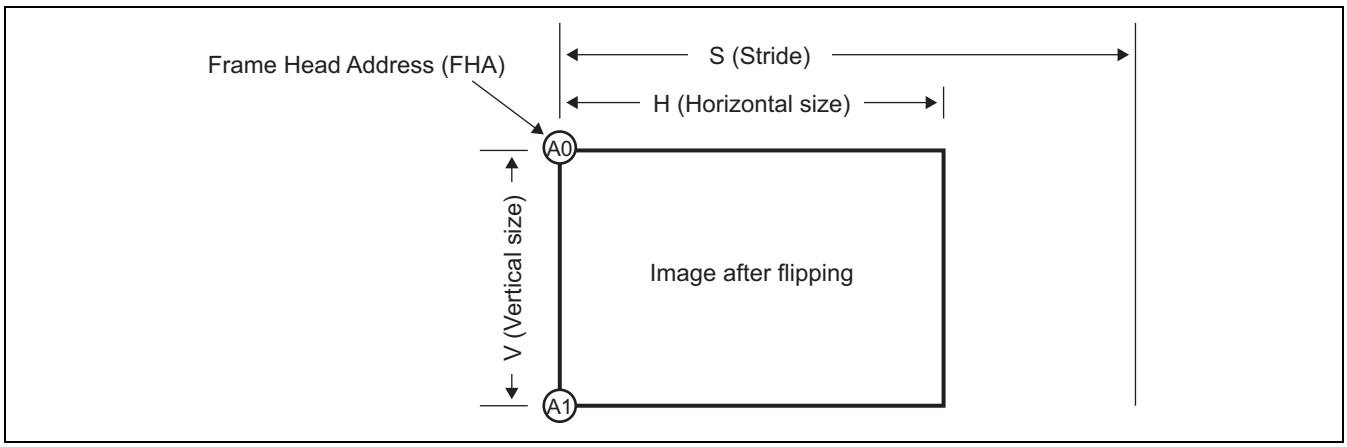


Figure 25.32 Location of Destination Address to be Specified for Vertical Flipping

Table 25.25 Destination Address A_0, and A_1 Calculation Formulas

VI6_WPFn_OUTFMT.FLP Setting	Formula for Calculating Address to be Set in VI6_WPFn_DSTM_ADDR_Y, VI6_WPFn_DSTM_ADDR_C0, and VI6_WPFn_DSTM_ADDR_C1
0	$A_0 = FHA$
1	$A_1 = FHA + (V \times L - 1) \times S$

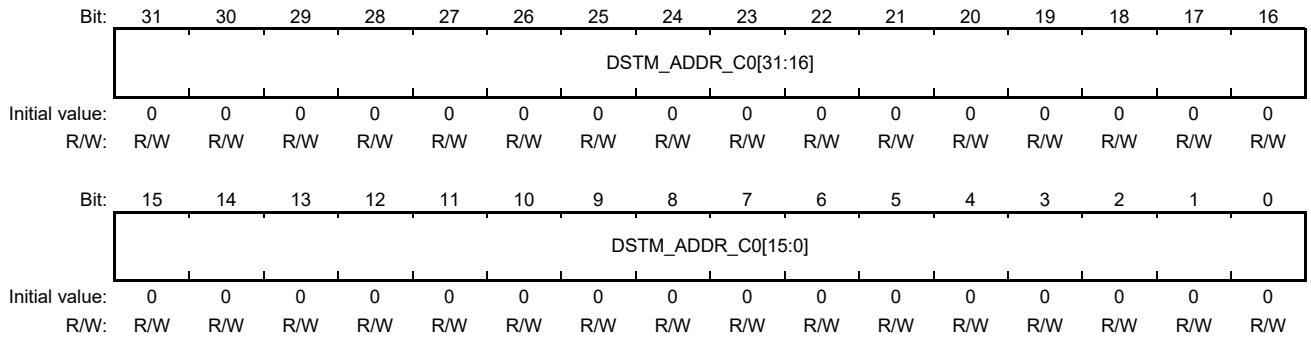
Table 25.25a Value of L according to VI6_WPFn_OUTFMT.WRFMT Setting (for RGB and Luminance Y Address Calculation)

VI6_WPFn_OUTFMT.WRFMT	L
73	0.5
0 to 2, 4 to 35, 64 to 66, 70 to 72, or 74 to 76	1

Table 25.25b Value of L according to VI6_WPFn_OUTFMT.WRFMT Setting (for Chrominance C0 and C1 Address)

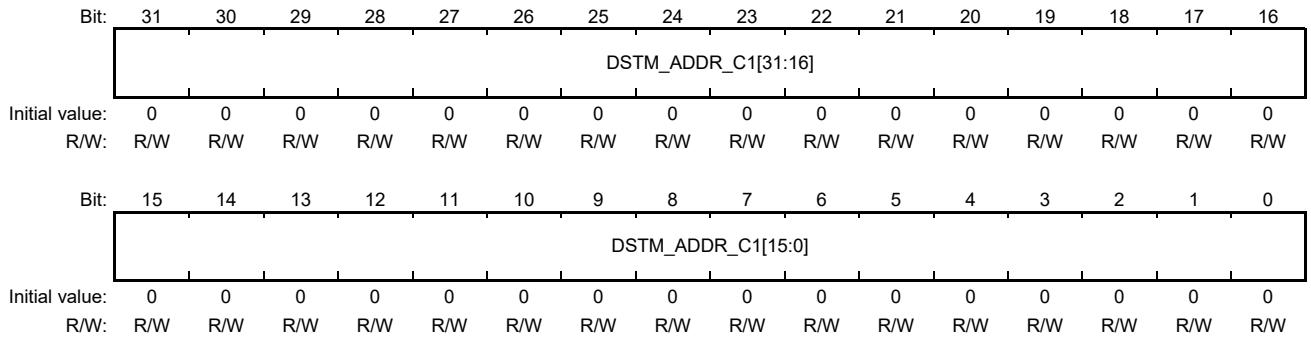
VI6_WPFn_OUTFMT.WRFMT	L
70 to 73	Not defined
66, 76	0.5
64 to 65, 74 to 75	1

25.2.8.10 WPFn Destination Chroma Address Registers 0 (VI6_WPFn_DSTM_ADDR_C0)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ ADDR_C0 [31:0]	H'0000 0000	R/W	Destination Image C Plane Storing Address 0 These bits specify in 1-byte units the address for storing the destination-image C plane to be written to by the WPFn. Refer to the description of VI6_WPFn_DSTM_ADDR_Y for settings. Here, the C plane indicates the combined CbCr plane when a semi-planar format is selected from the packed YCbCr formats shown in Table 25.24 or the Cb plane when a planar format is selected. When an interleaved format is selected or the output is in an RGB format, this setting is not used. A value from H'00000000 to H'FFFFFFFF can be specified. Refer to Figure 25.32 in section 25.2.8.9 for settings.

25.2.8.11 WPFn Destination Chroma Address Registers 1 (VI6_WPFn_DSTM_ADDR_C1)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ ADDR_C1 [31:0]	H'0000 0000	R/W	Destination Image C Plane Storing Address 1 These bits specify in 1-byte units the address for storing the Cr plane when the WPFn outputs images to the external memory in YCbCr planar format shown in Table 25.24. Refer to the description of VI6_WPFn_DSTM_ADDR_Y for settings. This setting is not used when the WPF outputs in YCbCr format that is not a planar format or in an RGB format. A value from H'00000000 to H'FFFFFFFF can be specified. Refer to Figure 25.32 in section 25.2.8.9 for settings.

25.2.8.12 WPF0 LIF Write Back Control Registers (VI6_WPF0_WRBCK_CTRL)

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	WBMD[1:0]	00	R/W	Display Data Write Back Control This bit is used for selecting the write back mode when the value of VI6_LIF_CTRL.LIF_EN bit is set to 1. 00: Write Back Disabled 01: Write Back Enabled

25.2.9 DPR Control Registers

25.2.9.1 Concept of DPR Settings

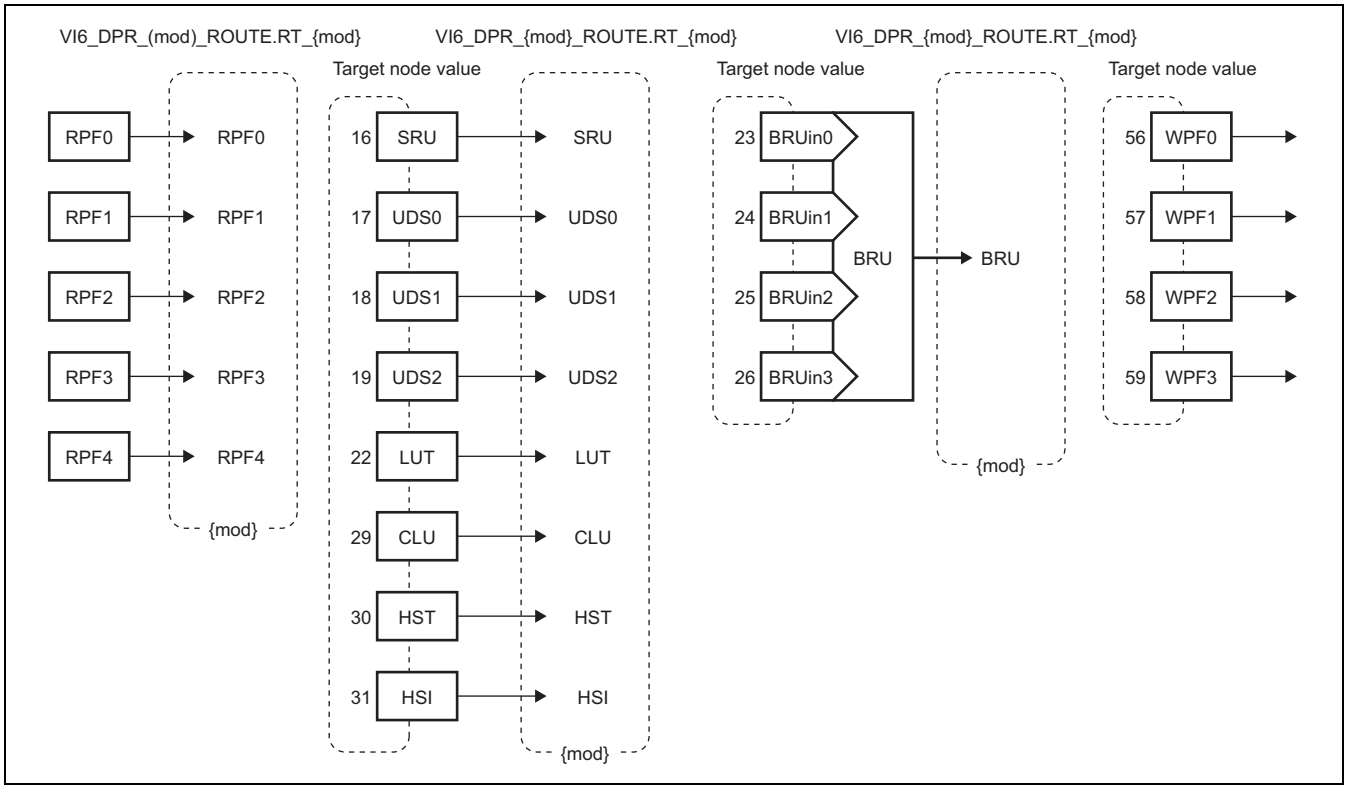

Figure 25.33 Node Register Names and Target Node Values on Data Path Router

In the VSP1 internal data path, the order of processes can be specified as desired. The module for performing each process has a unique node value. Set each bit field in VI6_DPR_*_ROUTE to an appropriate node value shown in Figure 25.33 to specify the target node to be connected behind each module.

For DPR settings, all of the following restrictions should be observed. If any of them is violated, even the WPF paths operating correctly at that time will be affected as well as the WPF paths connected through the DPR, and correct operation will not be guaranteed (for example, if a restriction is violated for the DPR setting related to WPF2, even WPF0 and WPF1 that are operating correctly will be affected).

1. Specify 63 for the output node values of all RPFs and processing modules that are not used in the DPR. Here, make sure that no module is connected to a module for which 63 is specified as the node value.
2. When specifying a value other than 63 for an output node value in the DPR, make sure that valid inputs (RPF0 to RPF4 or virtual RPF) and a target WPF are determined.
3. When a certain module is not implemented due to the LSI-specific restrictions described in Table 25.1 to Table 25.2, specify 63 for the corresponding VI6_DPR_*_ROUTE.RT_*.
4. Only one module can be connected to each module; specifying the same target node value for two or more modules is prohibited.
5. Desired modules can be connected between each RPF and BRU input port, but all RPFs specified as the sources for a BRU input port should have the same target WPF.
6. Make appropriate routing or RPF register settings so that the color space formats (RGB/YCbCr) for all BRU input ports are the same.
7. Connect data paths appropriately so that each of UDS0 to UDS2 is used only once throughout all paths from RPFn (n = 0 to 4) to WPFn (n = 0 to 3). Connecting UDS0 to UDS2 in serial is prohibited even when there is another module between them.

8. When the BRU is connected between RPFn and WPFn, any of UDS0 to UDS2 can be connected in parallel with each path from RPFn to BRU input ports 0 to 3. Note that when any of UDS0 to UDS2 is connected before BRU input ports 0 to 3, UDS0 to UDS2 cannot be used behind the BRU. In such a parallel UDS connection, the performance may be degraded. For details, contact a Renesas Electronics sales representative.
9. Do not connect the output of any module as the input to the same module (in the BRU case, any input port) even when there is another module between the output and input (creating a loop is prohibited).
10. Each node can be used only once throughout all paths from RPFn to WPFn. When a module shown in Figure 25.33 is assigned in one RPF → WPF path, it cannot be used in another RPF → WPF path.
11. While a WPF is operating, modifying the DPR connection settings in VI6_DPR_*_ROUTE is prohibited for modules used by the WPF but allowed for modules not used by the WPF. Be careful not to accidentally modify the settings of the modules included in the WPF path that is operating.

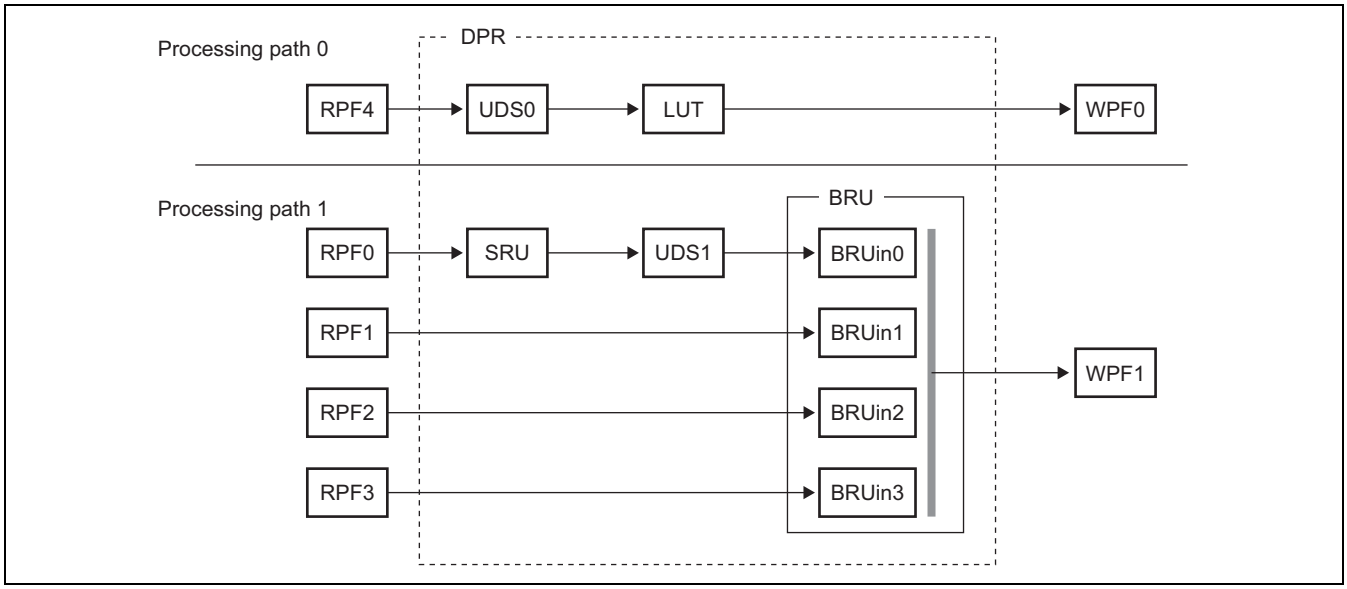

Figure 25.34 Examples of Internal Data Path Routing

Figure 25.34 shows examples of internal data path routing. Path 0 is assigned to WPF0 (RPF4 is the source RPF), and path 1 is assigned to WPF1 (RPF0 to RPF3 are the source RPFs). Each path has the configuration shown in Figure 25.34. Path 0 performs UDS and LUT processing (e.g., up/down scaling and γ correction). Path 1 performs super resolution processing and scaling for input 0 (RPF0) and then applies blending or raster operation between the resultant data and input data 1 to 3 (RPF1 to RPF3). The VI6_ DPR_*_ROUTE settings for these examples are shown in Table 25.26. The bit fields for the modules that are not used in the examples should be set to 63.

Table 25.26 VI6_DPR_*_ROUTE Register Settings in Connection Examples Shown in Figure 25.34

Register Name	Setting	
VI6_DPR_RPF0_ROUTE	16	(To SRU)
VI6_DPR_RPF1_ROUTE	24	(To BRUin1)
VI6_DPR_RPF2_ROUTE	25	(To BRUin2)
VI6_DPR_RPF3_ROUTE	26	(To BRUin3)
VI6_DPR_RPF4_ROUTE	17	(To UDS0)
VI6_DPR_SRU_ROUTE	18	(To UDS1)
VI6_DPR_UDS0_ROUTE	22	(To LUT)
VI6_DPR_UDS1_ROUTE	23	(To BRUin0)
VI6_DPR_UDS2_ROUTE	63	(UNUSED)
VI6_DPR_LUT_ROUTE	56	(To WPF0)
VI6_DPR_CLU_ROUTE	63	(UNUSED)
VI6_DPR_HST_ROUTE	63	(UNUSED)
VI6_DPR_HSI_ROUTE	63	(UNUSED)
VI6_DPR_BRU_ROUTE	57	(To WPF1)

Although both examples shown in Figure 25.34 include operation in image processing modules, connect the RPF to the WPF directly when only image format conversion or packed format conversion is required.

25.2.9.2 RPFn Routing Register (VI6_DPR_RPFn_ROUTE: n = 0, 1, 2, 3, 4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

	—	—	FP_WPFn[5:0]						—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 8	FP_WPFn [5:0]	H'00	R/W	WPFn Internal Operation Timing Setting Specify 5.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

25.2.9.4 {mod} Routing Register (VI6_DPR_{mod}_ROUTE: {mod} = SRU, UDSn, LUT, CLU, HST, HSI, BRU)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	FXA[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	FP[5:0]						—	—	RT[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	FXA[7:0]	H'00	R/W	Fixed α Output Value for {mod} The {mod} does not support input/output of the α value. The α value input to the {mod} is discarded, and the fixed α value specified in these bits is always output from the {mod}. A value from 0 to 255 can be specified. These bits are valid for SRU, LUT, CLU, HST and HSI modules. For UDSn, and BRU modules, these bits are reserved.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 8	FP[5:0]	H'00	R/W	{mod} Internal Operation Timing Setting Specify 0.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	RT[5:0]	H'00	R/W	{mod}Target Node Value These bits specify the target node value for the {mod}. When using the {mod}, refer to Figure 25.33 for settings. When not using the {mod}, specify 63.

25.2.9.5 {mod} Sampling Point Register (VI6_DPR_{mod}_SMPPT: {mod} = HGO, HGT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TGW[2:0]			—	—	PT[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 8	TGW[2:0]	000	R/W	Target WPF Index for {mod} These bits are used for specifying the target WPF index of {mod}. If {mod} is not used, set B'111 to these bits.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	PT[5:0]	H'00	R/W	Target Node Index for {mod} Histogram Sampling {mod} generates the histogram for the target node specified by these bits. For example, if these bits are set to 0, {mod} module generates the histogram for the output data of RPF0. Refer to Table 25.27 for the target node index which can be used for {mod}. If {mod} is not used, set 63 to these bits.

Table 25.27 Target Node Index for {mod} Module

Node Index	Module for Histogram Generation
0 to 4	RPF0 to 4
16	SRU
17 to 19	UDS0 to 2
22	LUT
27	BRU
29	CLU
30	HST
31	HSI
55	LIF*

Note: * Do not set the value 55 to PT in case of LIF write back is used (i.e. VI6_WPF0_WRBACK_CTRL.WBMD [1:0] = 1).

25.2.10 SRU Control Registers

25.2.10.1 Super Resolution Control Register 0 (VI6_SRU_CTRL0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	SRU_PARAM0[8:0]								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	SRU_PARAM1[4:0]					—	SRU_MODE[2:0]			SRU_ PARAM2	SRU_ PARAM3	SRU_ PARAM4	SRU_ EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24 to 16	SRU_PARAM0 [8:0]	H'000	R/W	Super Resolution Parameter 0 Specify an appropriate value shown in Table 25.28; do not specify any other value.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	SRU_PARAM1 [4:0]	00000	R/W	Super Resolution Parameter 1 Specify an appropriate value shown in Table 25.28; do not specify any other value.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 4	SRU_MODE [2:0]	000	R/W	Super Resolution Mode Setting These bits specify a super resolution mode. In super resolution without scaling, the output size is the same as the input size. In super resolution with double scale-up, the output size is twice the input size. 000: Super resolution without scaling 100: Super resolution with double scale-up Other settings are prohibited.
3	SRU_PARAM2	0	R/W	Super Resolution Parameter 2 This parameter setting depends on the color space of the image input to the SRU. Specify an appropriate value shown in Table 25.29; do not specify any other value.
2	SRU_PARAM3	0	R/W	Super Resolution Parameter 3 Specify an appropriate value shown in Table 25.29; do not specify any other value.
1	SRU_PARAM4	0	R/W	Super Resolution Parameter 4 This parameter setting depends on the color space of the image input to the SRU. Specify an appropriate value shown in Table 25.29; do not specify any other value.

Bit	Bit Name	Initial Value	R/W	Description
0	SRU_EN	0	R/W	Super Resolution Processing Enable/Disable Enables or disables super resolution processing. This setting has the highest priority over all other SRU registers. 0: Super resolution processing is disabled (input goes through the SRU without change) 1: Super resolution processing is enabled

YCbCr format is recommended for the super resolution processing. If the super resolution processing is applied to an RGB-format image, adverse effects such as color blur may be generated; when using an RGB format, evaluate the image quality carefully before applying the processing to practical use.

To execute the super resolution processing in YCbCr format, set up the RPF and DPR appropriately so that YCbCr-format image data is input to the SRU. Specifically, make the RPFn output YCbCr-format image data and send the output data to the SRU through the DPR. For details of RPFn input/output settings, refer to section 25.2.7.3. For DPR settings, refer to sections 25.2.9.1 to 25.2.9.4.

Table 25.28 Super Resolution Parameter Setting 1

		VI6_SRU_CTRL0			VI6_SRU_CTRL1	VI6_SRU_CTRL2		
Intensity		SRU _MODE	SRU _PARAM0	SRU _PARAM1	SRU _PARAM5	SRU _PARAM6	SRU _PARAM7	SRU _PARAM8
Weak	1	0 or 4	256	4	H'7FF	24	40	255
	2	0 or 4	256	4	H'7FF	8	16	255
	3	0 or 4	384	5	H'7FF	36	60	255
	4	0 or 4	384	5	H'7FF	12	27	255
	5	0 or 4	511	6	H'7FF	48	80	255
Strong	6	0 or 4	511	6	H'7FF	16	36	255

Table 25.29 Super Resolution Parameter Setting 2

Color Space of SRU Input Image	SRU_PARAM2	SRU_PARAM3	SRU_PARAM4
YCbCr*	0	1	0
RGB	1	1	1

Note: * YCbCr format is recommended for the image input to the SRU.

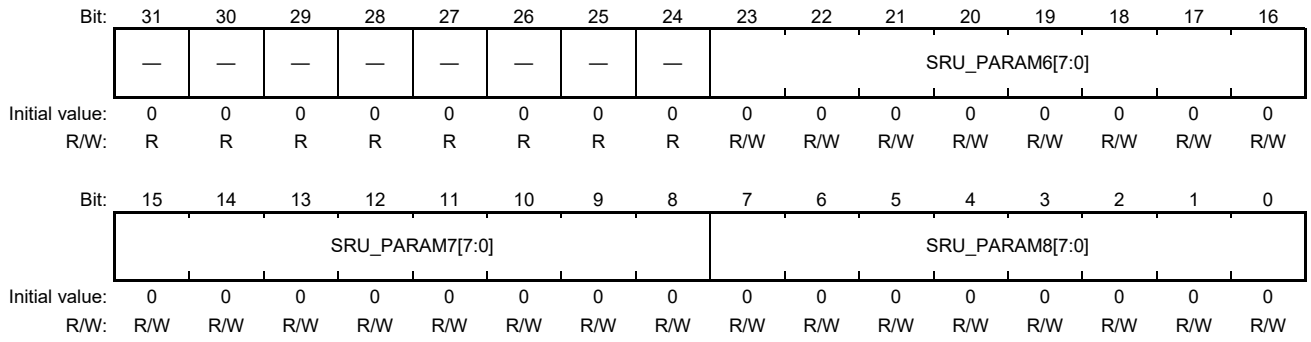
25.2.10.2 Super Resolution Control Register 1 (VI6_SRU_CTRL1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SRU_PARAM5[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SRU_PARAM5 [10:0]	H'000	R/W	Super Resolution Parameter 5 Specify an appropriate value shown in Table 25.28; do not specify any other value.

25.2.10.3 Super Resolution Control Register 2 (VI6_SRU_CTRL2)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	SRU_PARAM6 [7:0]	H'00	R/W	Super Resolution Parameter 6 Specify an appropriate value shown in Table 25.28; do not specify any other value.
15 to 8	SRU_PARAM7 [7:0]	H'00	R/W	Super Resolution Parameter 7 Specify an appropriate value shown in Table 25.28; do not specify any other value.
7 to 0	SRU_PARAM8 [7:0]	H'00	R/W	Super Resolution Parameter 8 Specify an appropriate value shown in Table 25.28; do not specify any other value.

25.2.11 UDS Control Registers

25.2.11.1 Scaling Control Registers (VI6_UDSn_CTRL)

Note: n = 0 for this product.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	AMD	FMD	BLADV	—	—	AON	ATHON	—	—	—	BC	NE_A	NE_RCR	NE_GY	NE_BCB
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TDIPC	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30	AMD	0	R/W	Pixel Count at Scale-Up Specifies the number of pixels generated through scale-up in the UDS. This bit setting is ignored for scale-down. 0: Pixel count after scale-up is 1 + ⟨(n – 1) × scale-up factor⟩ 1: Pixel count after scale-up is ⟨n × scale-up factor⟩ Note: n: Number of pixels input to UDS
29	FMD	0	R/W	Padding for Insufficient Clipping Size When the scaling filter outputs an image that is smaller than the clipping size (VI6_UDSn_CLIP_SIZE), pixels are interpolated to match the clipping size. This bit specifies the pixel filling method. 0: Pixels are filled by copying pixels at the right edge and the bottom edge. 1: Pixels are filled with the color specified by VI6_UDSn_FILL_COLOR.
28	BLADV	0	R/W	Bilinear or Nearest Neighbor Interpolation Characteristic Control Controls the characteristics of bilinear or nearest neighbor interpolation. Setting this bit to 1 improves the aliasing characteristics at × 1/2 to 1/8 scaling (VI6_UDS_SCALE.VMANT/HMANT = 2 to 8). Note that the apparent resolution around edges may deteriorate. In multi-tap mode, this control is not available; to use this control, set the BC bit to 0.
27, 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	AON	0	R/W	Scale-Up/Down of α Plane These bits specify whether to enable or disable scale-up/-down of the α plane when scaling up/down in the RGB format. When the AON bit is set to 0, the UDS outputs the value of the VI6_UDSn_ALPVAL. ALPH_VAL0 bits as a fixed α value. 0: α scale-up/-down is not performed 1: α scale-up/-down is performed

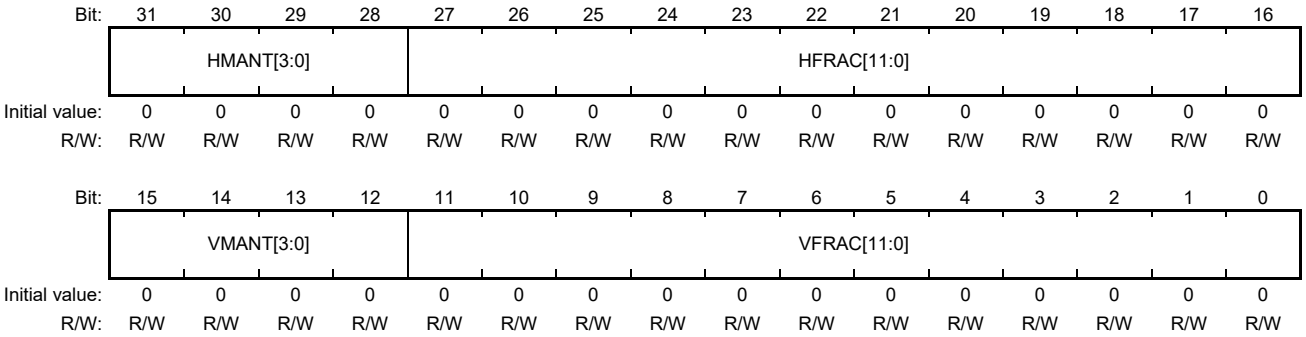
Bit	Bit Name	Initial Value	R/W	Description
24	ATHON	0	R/W	α Output Data Threshold Comparison Enable/Disable Enables or disables comparison with the α output data threshold. When this bit is 1, the output α value is replaced according to the VI6_UDSn_ALPTH and VI6_UDSn_ALPVAL values. When the AON bit is 0 (scale-up/-down of the α plane is disabled), this bit setting has no effect. 0: α output data threshold comparison is disabled 1: α output data threshold comparison is enabled
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	BC	0	R/W	Pixel Component Interpolation Method at Scale-Up/Down Specifies the method for interpolating pixel components at scale-up/-down. 0: Bilinear or nearest neighbor interpolation method is used 1: Interpolation method equivalent to 4 to 17 taps in accordance with the scaling factor is used (multi-tap mode) Note that the α component is interpolated by the method specified in the NE_A bit instead of the multi-tap method. When the BC and AON bits are both set to 1, the scaling shall be scale-up, no scaling, or scale-down with scaling factor 1/1 to 1/2.
19	NE_A	0	R/W	α Interpolation Method Specifies the interpolation method of the α plane. When the AON bit is 0 (scale-up/-down of the α plane is disabled), this bit setting has no effect. 0: Bilinear method 1: Nearest neighbor method*
18	NE_RCR	0	R/W	R/Cr Interpolation Method When Bilinear/Nearest Neighbor Interpolation is Selected Specifies the interpolation method of the R/Cr component when bilinear/nearest neighbor interpolation is selected (BC = 0). 0: Bilinear method 1: Nearest neighbor method*
17	NE_GY	0	R/W	G/Y Interpolation Method When Bilinear/Nearest Neighbor Interpolation is Selected Specifies the interpolation method of the G/Y component when bilinear/nearest neighbor interpolation is selected (BC = 0). 0: Bilinear method 1: Nearest neighbor method*
16	NE_BCB	0	R/W	B/Cb Interpolation Method When Bilinear/Nearest Neighbor Interpolation is Selected Specifies the interpolation method of the B/Cb component when bilinear/nearest neighbor interpolation is selected (BC = 0). 0: Bilinear method 1: Nearest neighbor method*
15 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1	TDIPC	0	R/W	2D-IPC function Enable/Disable Select 0: 2D IPC function Disable 1: 2D IPC function Enable UDSn execute 2D IPC function based on this bit and the setting of VI6_UDSn_IPC register. See section 25.2.11.6, 2D IPC Setting Register (VI6_UDSn_IPC) for more details.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Note: * This method can be used only when the scale-up/-down factor is 1/1 to 1/4.

25.2.11.2 Scaling Factor Registers (VI6_UDSn_SCALE)

Note: n = 0 for this product.



Bit	Bit Name	Initial Value	R/W	Description
31 to 28	HMANT[3:0]	H'0	R/W	Multiplier (Integral Part) of Horizontal Scaling Factor These bits specify the integral part of the horizontal scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from H'0 to H'F can be specified. Select a value within the range shown in Table 25.30.
27 to 16	HFRAC[11:0]	H'000	R/W	Multiplier (Fractional Part) of Horizontal Scaling Factor These bits specify the fractional part of the horizontal scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from H'100 to H'FFF can be specified when an image is upscaled (the HMANT value is 0) in the horizontal direction. A value from H'000 to H'FFF can be specified when an image is downscaled (the HMANT value is not 0) in the horizontal direction. Select a value within the range shown in Table 25.30.
15 to 12	VMANT[3:0]	H'0	R/W	Multiplier (Integral Part) of Vertical Scaling Factor These bits specify the integral part of the vertical scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from H'0 to H'F can be specified. Select a value within the range shown in Table 25.30.
11 to 0	VFRAC[11:0]	H'000	R/W	Multiplier (Fractional Part) of Vertical Scaling Factor These bits specify the fractional part of the vertical scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from H'100 to H'FFF can be specified when an image is upscaled (the VMANT value is 0) in the vertical direction. A value from H'000 to H'FFF can be specified when an image is downscaled (the VMANT value is not 0) in the vertical direction. Select a value within the range shown in Table 25.30.

The HMANT and HFRAC bits set the scale-up/-down factor for an image in the horizontal direction, and the VMANT and VFRAC bits set the scale-up/-down factor for an image in the vertical direction. The UDS operation switches between horizontal scale-up and horizontal scale-down according to the HMANT and HFRAC bit settings, as shown in

Table 25.30. (Setting a value outside the ranges of Table 25.30 in UDS operation is prohibited). Table 25.30 is for the horizontal direction, but it is similar for the vertical direction. In this case, replace HMANT with VMANT and HFRAC with VFRAC when reading.

Note that settings for scaling in the horizontal direction and settings for scaling in the vertical direction can be made independently. Therefore, a setting for scale-up in the horizontal direction and scale-down in the vertical direction is possible. In such a case, because the formula (described later) for obtaining the image size after scale-up/-down is different between scale-up and scale-down, a formula matching the scale-up or scale-down operation should be selected independently for the horizontal direction and vertical direction.

Table 25.30 Switching of Horizontal Scale-Up/Down Operation According to HMANT and HFRAC Bit Settings

HMANT	HFRAC	UDS Operation
H'0	H'100 to H'FFF	Scale-up
