Revision 4.40 Jun.27.2024

Table of Contents

Chapter 1 Introduction . . . 12
1.1 Overview . . . 12
1.2 Using this Manual . . . 12
1.3 Documentation Standard . . . 12
1.4 Introduction to FSP . . . 12
1.4.1 Purpose . . . 13
1.4.2 Quality . . . 13
1.4.3 Ease of Use . . . 13
1.4.4 Scalability . . . 13
1.4.5 Build Time Configurations . . . 13
1.4.6 e² studio IDE . . . 13
Chapter 2 Reference Materials . . . 14
2.1 Using Registers Directly . . . 14
2.1.1 Overview . . . 14
2.1.2 What's in an . . . 14
2.1.3 Where are iodefine files located? . . . 14
2.1.4 Using the register definitions . . . 14
2.1.5 Tips for writing hardware drivers . . . 16
2.2 FSP v4.0.0 FreeRTOS Stack Migration Guide . . . 17
2.2.1 Overview . . . 17
2.2.2 Stack Migration Steps . . . 17
2.2.3 List of Code Change Highlights . . . 19
2.3 Cortex-M85 Caches . . . 20
2.3.1 Overview . . . 20
2.3.2 CM85 Cache Features . . . 22
2.3.3 RA8 Cache Background Information . . . 22
2.3.4 Cache Maintenance . . . 23
2.3.5 Typical Cache Maintenance Scenarios . . . 24
2.3.6 Cache Functions and Macros . . . 26
2.3.7 Cache Details . . . 28
2.3.8 Other Information . . . 30
2.3.9 References . . . 34
Chapter 3 Starting Development . . . 37
3.1 Starting Development Introduction . . . 37
3.2 e² studio User Guide . . . 38
3.2.1 What is e² studio? . . . 38
3.2.2 e² studio Prerequisites . . . 40
3.2.2.1 Obtaining an RA MCU Kit . . . 40
3.2.2.2 PC Requirements . . . 40
3.2.2.3 Installing e² studio, platform installer and the FSP package . . . 40
3.2.2.4 Choosing a Toolchain . . . 40
3.2.2.5 Licensing . . . 41
3.2.3 What is a Project? . . . 41
3.2.4 Creating a Project . . . 43
3.2.4.1 Creating a New Project . . . 43
3.2.4.2 Selecting a Board and Toolchain . . . 44
3.2.4.3 Selecting Flat or Arm TrustZone Project . . . 45
3.2.4.4 Selecting a Project Template . . . 46
3.2.5 Configuring a Project . . . 49
3.2.5.1 Summary Tab . . . 49
3.2.5.2 Configuring the BSP . . . 50

3.2.5.3 Configuring Clocks . . . 51
3.2.5.4 Configuring Pins . . . 52
3.2.5.5 Configuring Interrupts from the Stacks Tab . . . 54
3.2.5.6 Viewing Event Links . . . 57
3.2.6 Adding Threads and Drivers . . . 57
3.2.6.1 Adding and Configuring HAL Drivers . . . 58
3.2.6.2 Adding Drivers to a Thread and Configuring the Drivers . . . 60
3.2.6.3 Configuring Threads . . . 64
3.2.7 Reviewing and Adding Components . . . 65
3.2.8 Writing the Application . . . 66
3.2.8.1 Coding Features . . . 66
3.2.8.2 HAL Modules in FSP: A Practical Description . . . 72
3.2.8.3 RTOS-Independent Applications . . . 73
3.2.8.4 RTOS Applications . . . 74
3.2.8.5 Additional Resources for Application Development . . . 76
3.2.9 Debugging the Project . . . 77
3.2.10 Modifying Toolchain Settings . . . 77
3.2.11 Creating RA project with Arm Compiler 6 in e² studio . . . 79
3.2.12 Importing an Existing Project into e² studio . . . 82
3.2.13 Using Semihosting in a Project . . . 86
3.3 Tutorial: Your First RA MCU Project - Blinky . . . 87
3.3.1 Tutorial Blinky . . . 87
3.3.2 What Does Blinky Do? . . . 87
3.3.3 Prerequisites . . . 87
3.3.4 Create a New Project for Blinky . . . 87
3.3.4.1 Details about the Blinky Configuration . . . 90
3.3.4.2 Configuring the Blinky Clocks . . . 91
3.3.4.3 Configuring the Blinky Pins . . . 91
3.3.4.4 Configuring the Parameters for Blinky Components . . . 91
3.3.4.5 Where is main()? . . . 91
3.3.4.6 Blinky Example Code . . . 91
3.3.5 Build the Blinky Project . . . 91
3.3.6 Debug the Blinky Project . . . 92
3.3.6.1 Debug prerequisites . . . 92
3.3.6.2 Debug steps . . . 93
3.3.6.3 Details about the Debug Process . . . 94
3.3.7 Run the Blinky Project . . . 95
3.4 Tutorial: Using HAL Drivers - Programming the WDT . . . 95
3.4.1 Application WDT . . . 95
3.4.2 Creating a WDT Application Using the RA MCU FSP and e² studio . . . 95
3.4.2.1 Using FSP and e² studio . . . 95
3.4.2.2 The WDT Application . . . 95
3.4.2.3 WDT Application flow . . . 96
3.4.3 Creating the Project with e² studio . . . 96
3.4.4 Configuring the Project with e² studio . . . 100
3.4.4.1 BSP Tab . . . 101
3.4.4.2 Clocks Tab . . . 101
3.4.4.3 Interrupts Tab . . . 102
3.4.4.4 Event Links Tab . . . 102
3.4.4.5 Pins Tab . . . 102
3.4.4.6 Stacks Tab . . . 102
3.4.4.7 Components Tab . . . 105
3.4.5 WDT Generated Project Files . . . 106
3.4.5.1 WDT hal_data.h . . . 108
3.4.5.2 WDT hal_data.c . . . 109

3.4.5.3 WDT main.c . . . 110
3.4.5.4 WDT hal_entry.c . . . 110
3.4.6 Building and Testing the Project . . . 113
3.5 Primer: Arm TrustZone Project Development . . . 114
3.5.1 Target Device . . . 115
3.5.2 Renesas Implementation of Arm TrustZone Technology . . . 115
3.5.2.1 Calling from Non-Secure to Secure . . . 116
3.5.2.2 Calling from Secure to Non-Secure . . . 116
3.5.3 Workflow . . . 117
3.5.3.1 Secure Project . . . 117
3.5.3.2 Non-Secure Project . . . 117
3.5.3.3 Flat Project . . . 117
3.5.4 RA Project Generator (PG) . . . 118
3.5.4.1 Secure Project Set Up . . . 119
3.5.4.2 RTOS Support in TrustZone Project . . . 120
3.5.4.3 Peripheral Security Attribution . . . 121
3.5.4.4 Non-Secure . . . 122
3.5.4.5 Flat Project Type . . . 122
3.5.4.6 Secure Connection to Non-Secure Project . . . 122
3.5.4.7 Debug Configurations . . . 123
3.5.5 Secure Projects . . . 124
3.5.5.1 Secure Clock . . . 124
3.5.5.2 Setting Drivers as NSC . . . 124
3.5.5.3 Guard Functions . . . 125
3.5.6 Non-Secure projects . . . 126
3.5.6.1 Clock Set Up . . . 126
3.5.6.2 Selecting NSC Drivers . . . 126
3.5.6.3 Locked Resources . . . 127
3.5.6.4 Locked Channels . . . 127
3.5.7 IDAU registers . . . 127
3.5.7.1 SCI Boot Mode . . . 129
3.5.7.2 DLM States . . . 130
3.5.7.3 Devices with Alternate DLM States . . . 131
3.5.7.4 Devices without DLM . . . 133
3.5.8 Debug . . . 133
3.5.8.1 Non-Secure Debug . . . 133
3.5.9 Debugger support . . . 134
3.5.10 Third-Party IDEs . . . 135
3.5.11 Renesas Flash Programmer (RFP) . . . 135
3.5.12 Glossary . . . 136
3.5.12.1 Configurator Icon Glossary . . . 137
3.6 RASC User Guide for MDK and IAR . . . 137
3.6.1 What is RASC? . . . 137
3.6.2 Using RA Smart Configurator with Keil MDK . . . 137
3.6.2.1 Prerequisites . . . 137
3.6.2.2 Create new RA project . . . 138
3.6.2.3 Modify existing RA project . . . 139
3.6.2.4 Build and Debug RA project . . . 140
3.6.2.5 Notes and Restrictions . . . 141
3.6.3 Using RA Smart Configurator with IAR EWARM . . . 141
3.6.3.1 Prerequisites . . . 141
3.6.3.2 Create new RA project . . . 141
3.6.3.3 Notes and Restrictions . . . 143
Chapter 4 FSP Architecture . . . 144

4.1 FSP Architecture Overview . . . 144
4.1.1 C99 Use . . . 144
4.1.2 Doxygen . . . 144
4.1.3 Weak Symbols . . . 144
4.1.4 Memory Allocation . . . 144
4.1.5 FSP Terms . . . 144
4.2 FSP Modules . . . 146
4.2.1 Module Sources . . . 147
4.2.2 Module Distribution . . . 147
4.2.3 Module Versioning . . . 147
4.3 FSP Stacks . . . 147
4.4 FSP Interfaces . . . 148
4.4.1 FSP Interface Enumerations . . . 149
4.4.2 FSP Interface Callback Functions . . . 149
4.4.3 FSP Interface Data Structures . . . 151
4.4.3.1 FSP Interface Configuration Structure . . . 151
4.4.3.2 FSP Interface API Structure . . . 152
4.4.3.3 FSP Interface Instance Structure . . . 154
4.5 FSP Instances . . . 155
4.5.1 FSP Instance Control Structure . . . 155
4.5.2 FSP Interface Extensions . . . 156
4.5.2.1 FSP Extended Configuration Structure . . . 156
4.5.3 FSP Instance API . . . 156
4.6 FSP API Standards . . . 156
4.6.1 FSP Function Names . . . 156
4.6.2 Use of const in API parameters . . . 157
4.6.3 FSP Version Information . . . 157
4.7 FSP Build Time Configurations . . . 157
4.8 FSP File Structure . . . 158
4.9 FSP TrustZone Support . . . 158
4.9.1 FSP TrustZone Projects . . . 158
4.9.2 Non-Secure Callable Guard Functions . . . 158
4.9.3 Callbacks in Non-Secure from Non-Secure Callable Modules . . . 159
4.9.4 Migrating TrustZone Project to newer FSP Version . . . 159
4.9.5 Additional TrustZone Information . . . 159
4.10 FSP Architecture in Practice . . . 159
4.10.1 FSP Connecting Layers . . . 159
4.10.2 Using FSP Modules in an Application . . . 160
4.10.2.1 Create a Module Instance in the RA Configuration Editor . . . 160
4.10.2.2 Use the Instance API in the Application . . . 160
Chapter 5 API Reference . . . 162
5.1 BSP . . . 163
5.1.1 BSP I/O access . . . 165
5.1.2 Common Error Codes . . . 179
5.1.3 MCU Board Support Package . . . 190
5.1.3.1 RA0E1 . . . 230
5.1.3.2 RA2A1 . . . 233
5.1.3.3 RA2A2 . . . 239
5.1.3.4 RA2E1 . . . 246
5.1.3.5 RA2E2 . . . 252
5.1.3.6 RA2E3 . . . 258
5.1.3.7 RA2L1 . . . 264
5.1.3.8 RA4E1 . . . 272
5.1.3.9 RA4E2 . . . 280
5.1.3.10 RA4M1 . . . 289

5.1.3.11 RA4M2 . . . 294
5.1.3.12 RA4M3 . . . 303
5.1.3.13 RA4T1 . . . 311
5.1.3.14 RA4W1 . . . 320
5.1.3.15 RA6E1 . . . 325
5.1.3.16 RA6E2 . . . 334
5.1.3.17 RA6M1 . . . 343
5.1.3.18 RA6M2 . . . 349
5.1.3.19 RA6M3 . . . 356
5.1.3.20 RA6M4 . . . 364
5.1.3.21 RA6M5 . . . 373
5.1.3.22 RA6T1 . . . 382
5.1.3.23 RA6T2 . . . 388
5.1.3.24 RA6T3 . . . 396
5.1.3.25 RA8D1 . . . 405
5.1.3.26 RA8M1 . . . 419
5.1.3.27 RA8T1 . . . 432
5.2 Modules . . . 445
5.2.1 Analog . . . 448
5.2.1.1 ADC (r_adc) . . . 449
5.2.1.2 ADC (r_adc_b) . . . 486
5.2.1.3 ADC (r_adc_d) . . . 525
5.2.1.4 Comparator, High-Speed (r_acmphs) . . . 546
5.2.1.5 Comparator, Low-Power (r_acmplp) . . . 553
5.2.1.6 DAC (r_dac) . . . 561
5.2.1.7 DAC8 (r_dac8) . . . 568
5.2.1.8 Operational Amplifier (r_opamp) . . . 574
5.2.1.9 SDADC Channel Configuration (r_sdadc) . . . 591
5.2.1.10 SDADC_B Channel Configuration (r_sdadc_b) . . . 613
5.2.2 AI . . . 630
5.2.2.1 Reality AI Data Collector (rm_rai_data_collector) . . . 631
5.2.2.2 Reality AI Data Shipper (rm_rai_data_shipper) . . . 641
5.2.3 Audio . . . 646
5.2.3.1 ADPCM Decoder (rm_adpcm_decoder) . . . 646
5.2.3.2 Audio Playback PWM (rm_audio_playback_pwm) . . . 650
5.2.4 Bootloader . . . 662
5.2.4.1 MCUboot Port (rm_mcuboot_port) . . . 662
5.2.5 CapTouch . . . 681
5.2.5.1 CTSU (r_ctsu) . . . 682
5.2.5.2 Touch (rm_touch) . . . 719
5.2.6 Connectivity . . . 739
5.2.6.1 Azure RTOS USBX Port (rm_usbx_port) . . . 744
5.2.6.2 CAN (r_can) . . . 850
5.2.6.3 CAN FD (r_canfd) . . . 888
5.2.6.4 CEC (r_cec) . . . 924
5.2.6.5 I2C Communication Device (rm_comms_i2c) . . . 935
5.2.6.6 I2C Master (r_iic_b_master) . . . 943
5.2.6.7 I2C Master (r_iic_master) . . . 957
5.2.6.8 I2C Master (r_iica_master) . . . 971
5.2.6.9 I2C Master (r_sau_i2c) . . . 983
5.2.6.10 I2C Master (r_sci_b_i2c) . . . 1000
5.2.6.11 I2C Master (r_sci_i2c) . . . 1013
5.2.6.12 I2C Slave (r_iic_b_slave) . . . 1026
5.2.6.13 I2C Slave (r_iic_slave) . . . 1038
5.2.6.14 I2C Slave (r_iica_slave) . . . 1049

5.2.6.15 I2S (r_ssi) ... 1060
5.2.6.16 I3C (r_i3c) ... 1075
5.2.6.17 LIN (r_sci_b_lin) ... 1117
5.2.6.18 SMBUS Communication Device (rm_comms_smbus) ... 1148
5.2.6.19 SMCI (r_sci_smci) ... 1158
5.2.6.20 SPI (r_sau_spi) ... 1171
5.2.6.21 SPI (r_sci_b_spi) ... 1185
5.2.6.22 SPI (r_sci_spi) ... 1196
5.2.6.23 SPI (r_spi) ... 1208
5.2.6.24 SPI (r_spi_b) ... 1226
5.2.6.25 UART (r_sau_uart) ... 1243
5.2.6.26 UART (r_sci_b_uart) ... 1259
5.2.6.27 UART (r_sci_uart) ... 1278
5.2.6.28 UART (r_uarta) ... 1298
5.2.6.29 UART Communication Device (rm_comms_uart) ... 1312
5.2.6.30 USB (r_usb_basic) ... 1319
5.2.6.31 USB Composite (r_usb_composite) ... 1381
5.2.6.32 USB HCDC (r_usb_hcdc) ... 1411
5.2.6.33 USB HHID (r_usb_hhid) ... 1460
5.2.6.34 USB HMSC (r_usb_hmsc) ... 1470
5.2.6.35 USB Host Vendor class (r_usb_hvnd) ... 1480
5.2.6.36 USB PCDC (r_usb_pcdc) ... 1493
5.2.6.37 USB PHID (r_usb_phid) ... 1503
5.2.6.38 USB PMSC (r_usb_pmsc) ... 1515
5.2.6.39 USB PPRN (r_usb_pprn) ... 1521
5.2.6.40 USB Peripheral Vendor class (r_usb_pvnd) ... 1529
5.2.6.41 USB_PCDC Communication Device (rm_comms_usb_pcdc) ... 1540
5.2.7 DSP ... 1548
5.2.7.1 CMSIS DSP H/W Acceleration (rm_cmsis_dsp) ... 1548
5.2.7.2 IIR Filter Accelerator (r_iirfa) ... 1550
5.2.8 Graphics ... 1558
5.2.8.1 Azure RTOS GUIX Port (rm_guix_port) ... 1559
5.2.8.2 Capture Engine Unit (r_ceu) ... 1567
5.2.8.3 D/AVE 2D Port Interface (r_drw) ... 1580
5.2.8.4 Graphics LCD (r_glcdc) ... 1582
5.2.8.5 JPEG Codec (r_jpeg) ... 1622

5.2.10.5 Low/Programmable Voltage Detection (r_lvd) ... 1736
5.2.10.6 Watchdog (r_wdt) ... 1744
5.2.11 Motor ... 1756
5.2.11.1 120-degree conduction control sensorless (rm_motor_120_control_sensorless) ... 1758
5.2.11.2 120-degree conduction control with Hall sensors (rm_motor_120_control_hall) ... 1776
5.2.11.3 ADC and PWM Modulation (rm_motor_driver) ... 1791
5.2.11.4 ADC and PWM modulation (rm_motor_120_driver) ... 1801

5.2.11.5 Motor 120 degree control (rm_motor_120_degree) . . . 1816
5.2.11.6 Motor Angle (rm_motor_estimate) . . . 1837
5.2.11.7 Motor Angle (rm_motor_sense_encoder) . . . 1847
5.2.11.8 Motor Angle and Speed Calculation with Hall sensors (rm_motor_sense_hall) . . . 1858
5.2.11.9 Motor Angle and Speed Calculation with induction sensor (rm_motor_sense_induction) . . . 1869
5.2.11.10 Motor Current Controller (rm_motor_current) . . . 1880
5.2.11.11 Motor Encoder Vector Control (rm_motor_encoder) . . . 1891
5.2.11.12 Motor Inertia estimate (rm_motor_inertia_estimate) . . . 1913
5.2.11.13 Motor Position Controller (rm_motor_position) . . . 1923
5.2.11.14 Motor Sensorless Vector Control (rm_motor_sensorless) . . . 1934
5.2.11.15 Motor Speed Controller (rm_motor_speed) . . . 1952
5.2.11.16 Motor Vector Control with hall sensors (rm_motor_hall) . . . 1964
5.2.11.17 Motor return origin (rm_motor_return_origin) . . . 1981
5.2.11.18 Motor vector control with induction sensor (rm_motor_induction) . . . 1990
5.2.12 Networking . . . 2011
5.2.12.1 AWS Cellular Interface on RYZ (rm_cellular_ryz_aws) [Deprecated] . . . 2014
5.2.12.2 AWS MQTT . . . 2021
5.2.12.3 AWS OTA PAL on MCUBoot (rm_aws_ota_pal_mcuboot) . . . 2028
5.2.12.4 AWS PKCS11 PAL on LittleFS (rm_aws_pkcs11_pal_littlefs) . . . 2031
5.2.12.5 AWS coreHTTP . . . 2031
5.2.12.6 Azure Embedded Wireless Framework RYZ Port (rm_azure_ewf_ryz) [Deprecated] . . . 2037
5.2.12.7 BLE Abstraction (rm_ble_abs) . . . 2043
5.2.12.8 BLE Driver (r_ble_balance) . . . 2080
5.2.12.9 BLE Driver (r_ble_compact) . . . 2083
5.2.12.10 BLE Driver (r_ble_extended) . . . 2086
5.2.12.11 BLE Mesh Network Modules . . . 2089
5.2.12.12 Cellular Comm Interface on UART (rm_cellular_comm_uart_aws) . . . 2651
5.2.12.13 DA16XXX Transport Layer (rm_at_transport_da16xxx_uart) . . . 2656
5.2.12.14 Ethernet (r_ether) . . . 2664
5.2.12.15 Ethernet (r_ether_phy) . . . 2689
5.2.12.16 FreeRTOS+TCP Wrapper to r_ether (rm_freertos_plus_tcp) . . . 2700
5.2.12.17 GTL BLE Abstraction (rm_ble_abs_gtl) . . . 2707
5.2.12.18 NetX Duo Ethernet Driver (rm_netxduo_ether) . . . 2715
5.2.12.19 NetX Duo WiFi Driver (rm_netxduo_wifi) . . . 2718

Chapter 1 Introduction

1.1 Overview

This manual describes how to use the Renesas Flexible Software Package (FSP) for writing applications for the RA microcontroller series.

1.2 Using this Manual

This manual provides a wide variety of information, so it can be helpful to know where to start. Here is a short description of each main section and how they can be used.

Starting Development - Provides a step by step guide on how to use e² studio and FSP to develop a project for RA MCUs. This is a good place to start to get up to speed quickly and efficiently.

FSP Architecture - Provides useful background material on key FSP concepts such as Modules, Stacks, and API standards. Reference this section to extend or refresh your knowledge of FSP concepts.

API Reference - Provides detailed information on each module and interface including features, API functions, configuration settings, usage notes, function prototypes and code examples. Board Support Package (BSP) related API functions are also included.

Note

Much of the information in the API Reference section is available from within the e² studio tool via the Developer Assistance feature. The information here can be referenced for additional details on API features.

1.3 Documentation Standard

Each Modules section user guide outlines the following:

- Features: A bullet list of high level features provided by the module.
- Configuration: A description of module specific configurations available in the RA Configuration editor.
- Usage Notes: Module specific documentation and limitations.
- Examples: Example code provided to help the user get started.
- API Reference: Usage notes for each API in the module, including the function prototype and hyperlinks to the interface documentation for parameter definitions.

Each Interfaces section user guide outlines the following:

- Detailed Description: A short description and summary of the interface functionality.
- Data Structures: A list and definition of each data structure used by the interface including the structure of the pointers that define the API and are shared by all modules that implement the interface.
- Typedefs: A list and description of the typedefs used by the interface.
- Enumerations: A list and description of the enumerations used by the interface.

1.4 Introduction to FSP

1.4.1 Purpose

The Renesas Flexible Software Package (FSP) is an optimized software package designed to provide easy to use, scalable, high quality software for embedded system design. The primary goal is to provide lightweight, efficient drivers that meet common use cases in embedded systems.

1.4.2 Quality

FSP code quality is enforced by peer reviews, automated requirements-based testing, and automated static analysis.

1.4.3 Ease of Use

FSP provides uniform and intuitive APIs that are well documented. Each module is supported with detailed user documentation including example code.

1.4.4 Scalability

FSP modules can be used on any MCU in the RA family, provided the MCU has any peripherals required by the module.

1.4.5 Build Time Configurations

FSP modules also have build time configurations that can be used to optimize the size of the module for the feature set required by the application.

1.4.6 e² studio IDE

FSP provides a host of efficiency enhancing tools for developing projects targeting the Renesas RA series of MCU devices. The e² studio IDE provides a familiar development cockpit from which the key steps of project creation, module selection and configuration, code development, code generation, and debugging are all managed.

Chapter 2 Reference Materials

This section contains miscellaneous reference materials.

Document	Summary
Using Registers Directly	Overview of register definition files and their use.
FSP v4.0.0 FreeRTOS Stack Migration Guide	Migration guide for FreeRTOS Network stack users moving to FSP v4.0.0.
Cortex-M85 Caches	Overview of the Cortex-M85 caches present in RA8 devices and when to perform cache maintenance.

2.1 Using Registers Directly

2.1.1 Overview

In some cases users may wish to utilize chip functionality that is not supported yet by FSP. While we encourage contacting us when new feature requests arise it takes time before any updates are made. In the meantime, it is recommended to use the register definition files accessed via renesas.h to add custom functionality as needed. Official ARM CMSIS documentation refers to this format of related register definition files as device header files. Within Renesas, these files are often referred to as an **IO define** or more commonly **iodefine**.

2.1.2 What's in an "iodefine"?

Iodefine files contain definitions for all the I/O registers on a device. For RA FSP, one iodefine header is provided per device group (RA6M3, RA2A1 etc.) that contains all the register definitions provided in the hardware manual for that group. These headers are accessed via renesas.h, which selects the appropriate file based on the MCU configured in the project.

Note

Prior to FSP 4.0.0 renesas.h contained a superset of all register definitions for RA MCUs. This became unsustainable as new device families were added and was confusing for users, so headers for each device were created and renesas.h was updated to serve as a selector.

2.1.3 Where are iodefine files located?

In RA FSP, iodefine files are stored in ra/fsp/src/bsp/cmsis/Device/RENESAS/Include. This includes both renesas.h as well as the device group specific iodefine headers.

2.1.4 Using the register definitions

Each peripheral register set is provided as a struct. In general, the template to follow is:

```
R_ + peripheral abbreviation + channel number + -> + register name [ + _b. + bitfield
name]
```

Basic register access

Registers are most commonly accessed whole. For example, say we want to read the counter on GPT channel 3:

```
uint32_t count = R_GPT3->GTCNT;
```

As shown in the template, the iodefines can also be used to access bitfields. For example, to start GPT channel 3:

```
R_GPT3->GTCR_b.CST = 1;
```

Bitfield macros

It is worth noting that each bitfield access will cause a full read-modify-write which cannot be combined by the compiler because the register definitions are by necessity volatile. This can be very size and speed inefficient, particularly when the peripheral is on a very slow clock. It is recommended to write whole registers wherever possible. This is made easier by macros that are provided alongside the register definitions.

Every bitfield has two associated macros: _Msk (bitfield mask) and _Pos (bit position). These macros can be used to manipulate whole registers instead of using bitfield access when multiple bitfields are modified simultaneously. For example, setting both GPT3 output pins to 100% duty cycle:

```
uint32_t gtuddtyc = R_GPT3->GTUDDTYC
gtuddtyc         &= ~(R_GPT0_GTUDDTYC_OADTY_Msk |
R_GPT0_GTUDDTYC_OBDTY_MSK)             // Mask off bits to clear
gtuddtyc         |= (3 << R_GPT0_GTUDDTYC_OADTY_Pos) | (3 <<
R_GPT0_GTUDDTYC_OBDTY_Pos); // Shift values to bitfield positions
R_GPT3->GTUDDTYC = gtuddtyc;
```

Note

The macros are all named with channel 0 due to internal process requirements; they can be used with all channels.

Arrays and clusters

Some registers are part of an array. These are typically listed in the manual using indexes like "n" or "m", but may occasionally be listed with individual numbers or letters. Accessing register arrays is just like accessing a regular array. For example, the GPT duty cycle registers are GTCCRA through GTCCRF. In the iodefine, they are accessed via the GTCCR array:

```
/* Set GTCCRB */
R_GPT3->GTCCR[1] = duty_cycle_b;
```

Note

Not all indices may be available in every array. Be sure to check the hardware manual to verify which registers are provided on the device in use.

Sometimes there are groups of registers that are repeated multiple times. These groups are called a **cluster**. Clusters are accessed similarly to arrays, except the actual registers are elements of the array values instead. For example, mailboxes in the CAN peripheral have several registers each:

```
/* Get data from mailbox 3 */
uint32_t mailbox = 3;
/* Get the frame data length code */
uint32_t data_length = R_CAN0->MB[mailbox].DL_b.DLC;
/* Get message data */
uint8_t data[8];
for (uint32_t i = 0U; i < data_length; i++)
{
    data[i] = p_reg->MB[mailbox].D[i]; // Copy receive data to buffer
}
```

2.1.5 Tips for writing hardware drivers

Channel register access

FSP drivers often calculate a register offset in the Open function. This is typically done by multiplying the channel by the offset between channels 0 and 1. For example, here is the calculation for GPT:

```
  /* Save register base address. */
  uint32_t base_address = (uint32_t) R_GPT0 + (p_cfg->channel * ((uint32_t) R_GPT1 -
(uint32_t) R_GPT0));
  p_instance_ctrl->p_reg = (R_GPT0_Type *) base_address;
```

When drivers need to support multiple channels of a peripheral it can be helpful to save the offset in a persistent variable or structure so that it only needs to be calculated once.

2.2 FSP v4.0.0 FreeRTOS Stack Migration Guide

Note

This guide only applies to users converting e² studio projects created with FSP v3.8.0 or earlier
Migration is only possible for network stacks using CoreMQTT and CoreHTTP modules. Stacks using deprecated MQTT Client and HTTP Client modules will not be able to be migrated over to FSP v4.0.0 and up.
See the following guide for migrating code from the deprecated Client libraries: https://aws.github.io/aws-iot-device-sdk-embedded-C/202103.00/docs/doxygen/output/html/mqtt_migration.html

2.2.1 Overview

This migration guide is for moving to the new FreeRTOS Network stacks introduced in FSP v4.0.0. It will describe steps for moving over stacks as well as changes to make code compile correctly.

2.2.2 Stack Migration Steps

Note

Perform all of the following steps before attempting to save the project. Failure to do so may cause unexpected errors in the configuration.xml.

1. Open project to be migrated in e² studio using FSP v4.0.0 or greater. The existing CoreMQTT/HTTP stack should still exist. Many of the stack components will have No Longer Supported in the display and have permanent constraint error messages on them:

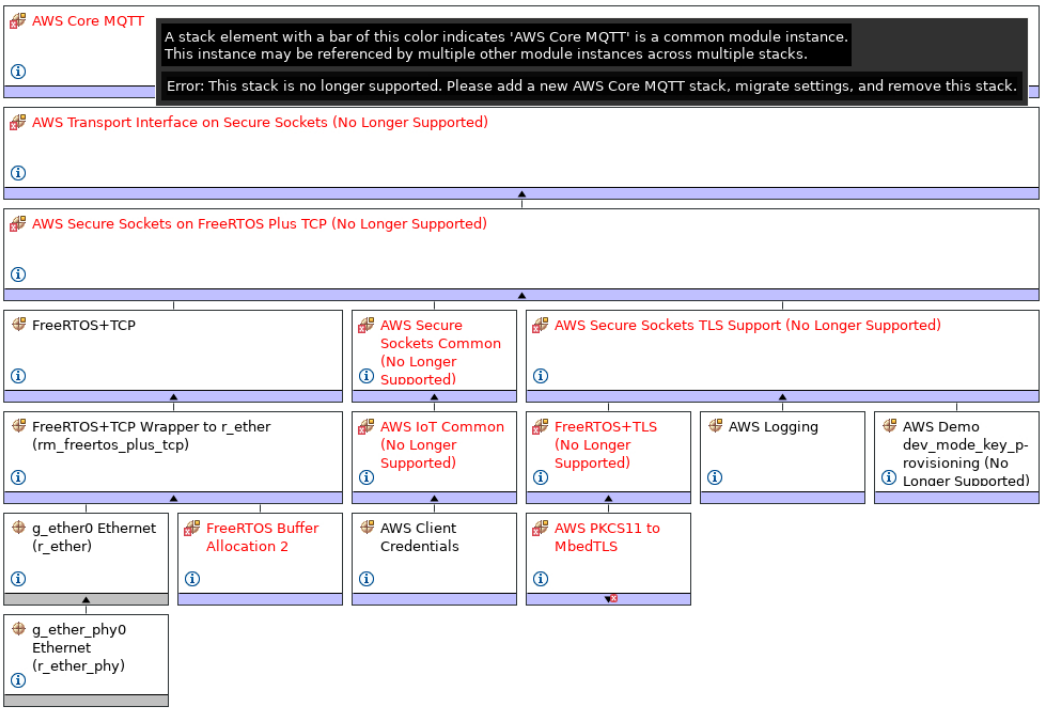

Figure 1: Old MQTT Stack

2. Add a new network stack (New Stack->Networking->AWS CoreHTTP or AWS CoreMQTT):

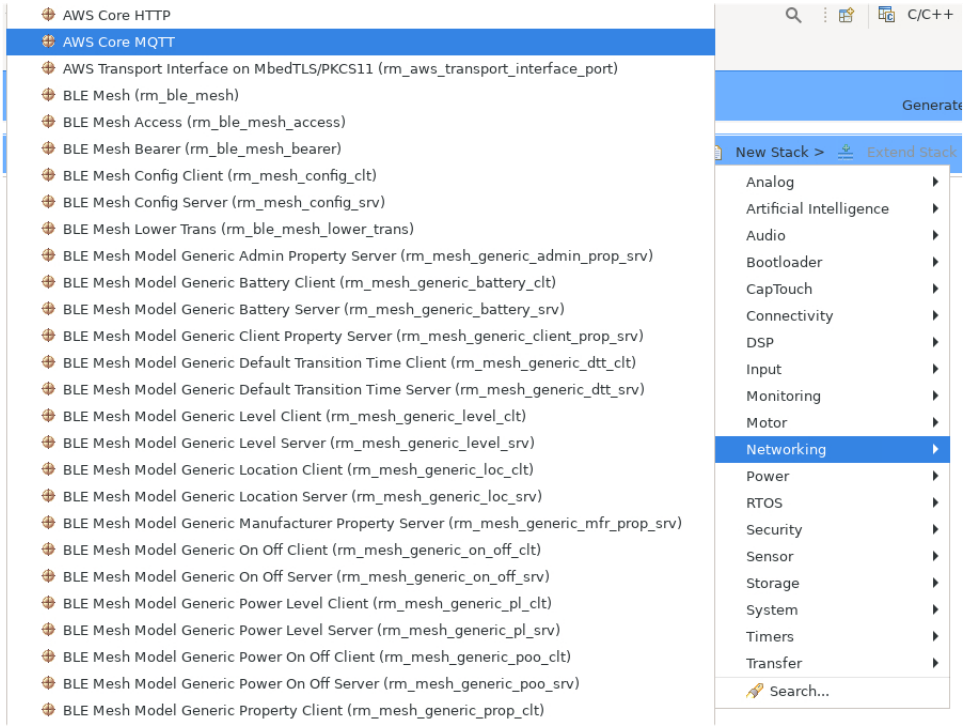

Figure 2: Add a New MQTT Stack

3. Choose a sockets wrapper for the new stack (Add Sockets Wrapper).

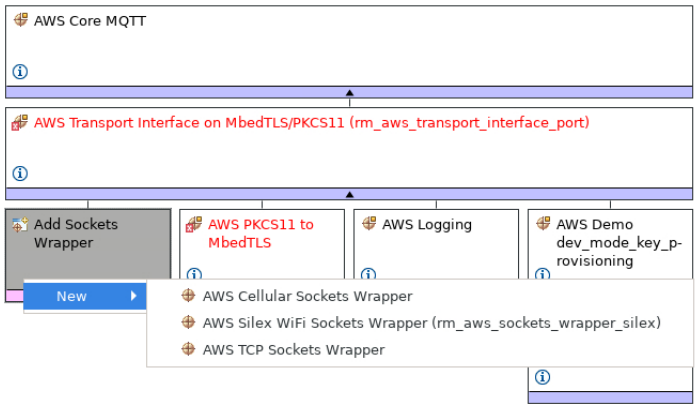

Figure 3: Add a Sockets Wrapper

4. The submodule for AWS PKCS11 to MbedTLS will likely be missing. Click Add FreeRTOS MbedTLS Port and use the existing instance:

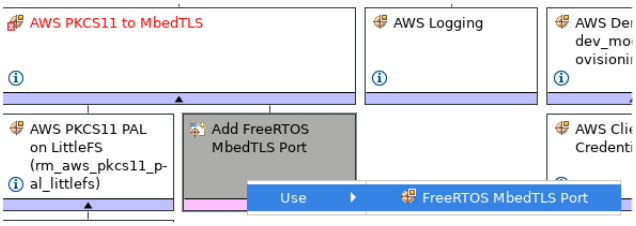

Figure 4: FreeRTOS MbedTLS Port

5. Got to the components tab and see if AWS MbedTLS FreeRTOS Port (AWS|Abstractions|FreeRTOS_Plus|utilities|mbedtls) is checked. If this component is not checked then check it so that appears like so:

Figure 5: FreeRTOS MbedTLS Port Component

6. Check that settings/properties are correct on the new stack. Common stack elements between the old and new stacks should already have previous settings.
7. Remove the old stack.
8. Save project and generate project content. See the next section for things to change in the code for successful compilation.

2.2.3 List of Code Change Highlights

This is a list of important changes from pre-4.0 code. For more detailed examples see CoreMQTT/HTTP examples and devassist.

- Any calls to SYSTEM_Init() should be removed. mbedtls_platform_setup() now does initialization that this IoT library function originally did.
- xLoggingTaskInitialize should no longer be called. Logging libraries which create a logging task no longer exist. Logging by default uses printf when enabled. The user can redefine vLoggingPrintf(const char * pcFormat, ...) and vLoggingPrint(const char * pcFormat) to change this behavior.
- The transport interface for CoreMQTT/HTTP will now need to be setup directly by creating a transport interface and setting the send and receive pointers to TLS_FreeRTOS_recv and TLS_FreeRTOS_send. See the examples and devassist for more info.
- The user will need to call TLS_FreeRTOS_Connect to connect to a server/endpoint before using CoreMQTT/HTTP APIs to communicate. TLS_FreeRTOS_Disconnect can be used to disconnect from a server/endpoint.

2.3 Cortex-M85 Caches

Note

This overview should be considered supplementary information only. Consult with the listed references (non-exhaustive) for detailed information on the CM85 caches, Renesas caches, and cache coherency. Cache coherency can be a difficult problem to understand and solve correctly.

2.3.1 Overview

When using any type of caches in a system, coherency must be considered. A cache may contain data that is different from the backing memory (e.g. SRAM, Flash, etc.), or contain data that is different from another cache, which would make the cache incoherent. Coherency can be maintained through hardware and/or software support. For Cortex-M devices like the RA8, coherency can only be achieved through manual software management, and no automatic hardware coherency support exists.

In the default configuration for RA8 devices, FSP always enables the Code Flash Cache (FCACHE) and CM85 Instruction Cache (I-Cache) and handles the coherency of these caches where it is required. FSP does not handle FCACHE or I-Cache coherency outside of FSP. FSP optionally allows the CM85 Data Cache (D-Cache) to be enabled in the BSP configuration settings, where it is disabled by default. If the D-Cache is enabled, additional coherency concerns will arise. **FSP does not currently handle any D-Cache coherency. This is a work in-progress. Drivers that will require D-Cache coherency support do not presently support it.**

If D-Cache is enabled, the most common coherency concern is when data is shared between the CPU and another bus master. The D-Cache and backing memory for the shared location (usually SRAM) can become incoherent. To properly manage coherency in this situation, do one of the following:

- Place the shared data in a non-cacheable region defined by the MPU or hardware.

  Using a non-cacheable region means there will be no cache maintenance required and no coherency issues because the shared data will not be cached. A non-cacheable region can

be defined in the MPU to contain the shared data. The non-cacheable region **MUST** be aligned to 32 bytes and be a length multiple of 32 bytes. This is required to meet MPU alignment and length requirements. FSP predefines the .nocache and .nocache_sdram uninitialized regions for this purpose, where data can be placed (see the BSP Usage Notes reference material). FSP configures and enables the MPU with these predefined regions at startup, if they have a non-zero size. Any address outside these regions will use the cacheability attributes defined by the default system address map. As an alternative, DTCM is always hardcoded as non-cacheable by the hardware and could contain the shared data. Using the MPU should be preferred, since DTCM can only be accessed through S-AHB by other bus masters and the access may contend with CPU access to DTCM.

- Place the shared data in a cache line aligned and padded cacheable region, and use the CMSIS cache maintenance functions.

  Using a cacheable region requires that the CMSIS cache maintenance functions be used to solve the coherency issues. The data **MUST** be aligned to 32 bytes and be a length multiple of 32 bytes. This is required to meet D-Cache line alignment and length requirements. **If data is not aligned and fit exactly to D-Cache lines, you will create rare and difficult bugs!** Use the CMSIS cache maintenance functions as required to manage the shared data coherency. When the D-Cache is enabled, FSP configures and enables the MPU at startup. Any address outside the predefined MPU regions will use the cacheability attributes defined by the default system address map. **Cacheable shared data cannot be pooled into a single aligned and padded region, like the non-cacheable region. Cacheable shared data must be aligned and padded to its own data cache lines.**

Less common coherency concerns include:

- FACI erasing and programming
  - FCACHE, I-Cache, and D-Cache can become incoherent if Code Flash or Data Flash changes
- Writing instructions into RAM using the CPU or a bus master
  - D-Cache and I-Cache can become incoherent if code in RAM changes
- MPU configuration changes
  - FCACHE, I-Cache, and D-Cache can become incoherent if the cacheability attributes of an address changes
- SAU (Security Attribution Unit) configuration changes
  - FCACHE, I-Cache, and D-Cache can become incoherent if the security attributes of an address changes
- Changing power modes
  - May be required to clean and invalidate caches before changing to a low power mode

These less common situations require careful consideration for cache maintenance. FSP handles some of these less common situations for FCACHE and I-Cache where it must, but it is not possible to cover all user behavior that may occur.

Other special cache concerns that are not specifically coherency related include:

- Reading and writing from CSC, SDRAM, and Standby SRAM which use write buffers
  - If a write or read is intended to force a write buffer to flush, or to force a bus access to occur, the D-Cache may stop that from occurring by processing the read or write if the address is cacheable
  - Standby SRAM requires a different procedure than CSC or SDRAM to clear its write buffer

- OSPI provides both a prefetch buffer for reading and a write buffer for writing on each of its channels
    - These buffers are optionally enabled individually, and may also be flushed individually
    - Cache interactions with these buffers during normal operation and during their flush procedures must be considered

2.3.2 CM85 Cache Features

The CM85 optionally implements an I-Cache and/or D-Cache, with several configurable properties. Renesas RA8 devices have an implementation as follows:

- I-Cache and D-Cache are both implemented with 16 KiB size each
- ECC is optionally enabled for the I-Cache and D-Cache with OFS1.INITECCEN
    - The OFS1_SEL register selects whether the Secure or Non-secure OFS1.INITECCEN option bit is used
    - The OFS1.INITECCEN option bit also enables ECC for the ITCM and DTCM
- Automatic hardware cache invalidation is enabled at reset for I-Cache and D-Cache
    - This can be controlled with CACHEDBGCR.L1RSTDIS for debugging, but generally there is no use case
- TrustZone is integrated, which means
    - CCR.xC is banked between Secure and Non-secure modes which means cache allocation can be controlled for each mode separately
    - There are eight Secure and Non-Secure MPU regions each which govern memory access in their respective modes
    - D-Cache maintenance from the Non-secure state is promoted to clean type maintenance, since both Secure and Non-secure data may be cached

2.3.3 RA8 Cache Background Information

CM85 Caches

The I-Cache and D-Cache are implemented inside of the CM85 by Arm. The CM85 has a Harvard design, where instruction fetches and data reads/writes are performed on separate interfaces. The I-Cache can only perform lookup and allocation for instruction fetches. The D-Cache can only perform lookup and allocation for data reads and writes.

Whether lookup of an address occurs in a cache depends on:

1. Cache lookups are enabled in the MSCR register.
2. The Shareability (Non-shareable) (D-Cache Only), Inner Cacheability (Cacheable), and Memory Type (Normal) as defined by the System Address Map or the Arm MPU (S or NS).
3. Any hardware cacheability caveats, where some addresses can never lookup in a cache, like ITCM and DTCM.

Whether allocation of an address occurs in a cache depends on:

1. Cache allocations are enabled in the CCR register (S or NS).
2. Cache lookups are allowed for that address.
3. Inner Cacheability (Read and/or Write Allocate) as defined by the System Address Map or the Arm MPU (S or NS).

The MSCR register controls whether lookups may occur for a cache, while the CCR register (S or NS) controls whether allocation may occur for a cache.

The system address map and Arm MPU (S or NS) define the memory type, shareability attributes, and cacheability attributes for an address. All three memory properties combine to define whether an address may lookup and allocate within one of the caches. The CM85 defines specific behaviors for some architecturally implementation defined or undefined behaviors regarding combinations of these three properties.

Both caches accept Inner cacheability attributes from the system address map and the Arm MPU (S or NS). The support of cacheability attributes varies depending on the cache and its configuration.

The I-Cache and D-Cache have different associativity, supported cache policies, supported memory attributes, and supported shareability attributes. Because of these variations, the behavior of I-Cache and D-Cache will be different even when accessing the same address.

Even when the Arm MPU (S or NS) is disabled, the default system address map will provide the memory type, shareability attributes, and cacheability attributes for an address. If the Arm MPU (S or NS) is enabled with no regions defined, it may be configured to use the default system address map as a background region.

Arm prescribes specific procedures for enabling and disabling the caches, and other cache maintenance operations that must be followed. There are I-Cache and D-Cache specific Arm architectural instructions that are used to perform these procedures. The Arm CMSIS library provides functions to perform these cache operations.

Renesas FCACHE

The FCACHE is implemented by Renesas and performs instruction prefetches, caches instruction fetches, and caches data reads from the CPU and other bus masters to **Code Flash** memory.

Cache maintenance for FCACHE is conducted through its peripheral registers.

In general, whether for the CM85 I-Cache or D-Cache, or Renesas FCACHE, cache maintenance is used to synchronize a given cache with the backing memory, and to synchronize caches with each other.

2.3.4 Cache Maintenance

The correct maintenance sequence must be followed to avoid caches reading stale data from each other or from backing memory.

Unlike the D-Cache, the I-Cache is a read-only interface which cannot be written with new instructions by the CPU. The only way for the CPU to see modified instructions while using I-Cache is through invalidation. Thus if instructions change, I-Cache maintenance is **always required** whether FCACHE maintenance is needed or not.

The D-Cache is a read and write interface. The CPU will write modified data into the D-Cache (if cacheable, and other properties are met), so any read back from the D-Cache will have the latest data. Thus if data changes, it *may* be necessary to perform D-Cache maintenance and possibly FCACHE maintenance depending on whether the data is shared between the CPU and another bus master or if the data is changed by FACI.

The word "shared" here does **not** mean "Shareability" as defined as an Arm memory attribute.

I-Cache and D-Cache cache lines are aligned to 32 bytes and are 32 bytes in length each. **For D-Cache specifically, where a cache line may become dirty when write-back is used, cacheable shared data written by a bus master cannot be allowed to mix on a write-back**

cache line with data that is unrelated. For simplicity, follow the most conservative rule of aligning and padding cacheable shared data to meet D-Cache line requirements.

CM85 has an erratum with write-back when D-Cache is enabled. FSP v5.3.0 has added the recommended workaround of using MSCR.FORCEWT to force all D-Cache access to write-through, even if an access specifies write-back. **Developers should write software as if write-back is being used for full compatability with data cache, which includes the above alignment and padding requirement.**

This guide describes common maintenance scenarios including write-back and write-through. **The write-through write policy does not obviate the need for using memory barriers on the CM85. The use of memory barriers is out-of-scope for this document.**

FSP handles some of these maintenance scenarios during startup and in the Flash HP driver.

2.3.5 Typical Cache Maintenance Scenarios

Note

Whether full or address-based cache maintenance can or should be used depends on the capabilities of the target cache (FCACHE has no address-based maintenance capability) and the particular application scenario.

I-Cache, FCACHE Enabled (Default Configuration)

Instructions Change

- Instructions Not Cacheable
  - No Maintenance Required (Not Cacheable)
- Instructions Cacheable
  - FACI Code Flash Program or Erase
    1. Invalidate FCACHE
    2. Invalidate I-Cache
  - FACI Data Flash Program or Erase
    1. Invalidate I-Cache
  - In RAM or Other
    - Written by CPU
      1. Invalidate I-Cache
    - Written by Bus Master
      1. Invalidate I-Cache

Data Change

- Data Not Cacheable
  - No Maintenance Required (Not Cacheable)
- Data Cacheable
  - FACI Code Flash Program or Erase
    1. Invalidate FCACHE
  - FACI Data Flash Program or Erase
    - No Maintenance Required (D-Cache Disabled)
  - In RAM or Other
    - No Maintenance Required (D-Cache Disabled)

Instructions and Data Change

- Instructions and Data Not Cacheable
  - No Maintenance Required (Not Cacheable)

- Instructions and Data Cacheable
    - FACI Code Flash Program or Erase
        1. Invalidate FCACHE
        2. Invalidate I-Cache
    - FACI Data Flash Program or Erase
        1. Invalidate I-Cache
    - In RAM or Other
        - Written by CPU
            1. Invalidate I-Cache
        - Written by Bus Master
            1. Invalidate I-Cache

D-Cache, I-Cache, FCACHE Enabled

Data Change

- Data Not Cacheable
    - No Maintenance Required (Not Cacheable)
- Data Cacheable
    - FACI Code Flash Program or Erase
        1. Invalidate FCACHE
        2. Clean And Invalidate D-Cache
    - FACI Data Flash Program or Erase
        1. Clean and Invalidate D-Cache
    - In RAM or Other
        - **Data Not Shared**
            - No Maintenance Required (Not Shared)
        - **Data Shared**
            - Written by CPU
                - Write Back

                  Area must be aligned and padded to D-Cache line requirements.

                    1. Clean D-Cache, After CPU Write
                - Write Through
                    - No Maintenance Required (Write Through)
            - Written by Bus Master
                - Write Back

                  Area must be aligned and padded to D-Cache line requirements.

                    - Buffer to be Written is Dirty (e.g. Stack or Heap Allocated Buffer May Be Dirty Already)
                        1. Invalidate D-Cache, Before and After Bus Master Write
                    - Buffer to be Written is Clean
                        1. Invalidate D-Cache, After Bus Master Write
                - Write Through

1. Invalidate D-Cache, After Bus Master Write

Instructions Change or Instructions and Data Change

- Instructions Not Cacheable or Instructions and Data Not Cacheable
  - No Maintenance Required (Not Cacheable)
- Instructions Cacheable or Instructions and Data Cacheable
  - FACI Code Flash Program or Erase
    1. Invalidate FCACHE
    2. Clean And Invalidate D-Cache
    3. Invalidate I-Cache
  - FACI Data Flash Program or Erase
    1. Clean And Invalidate D-Cache
    2. Invalidate I-Cache
  - In RAM or Other
    - Written by CPU
      - Write Back

        Area must be aligned and padded to D-Cache line requirements if shared with a bus master.

        1. Clean D-Cache, After CPU Write
        2. Invalidate I-Cache
      - Write Through
        1. Invalidate I-Cache
    - Written by Bus Master
      - Write Back

        Area must be aligned and padded to D-Cache line requirements as we assume it is shared with CPU here.

        - Buffer to be Written is Dirty (e.g. Stack or Heap Allocated Buffer May Be Dirty Already)
          1. Invalidate D-Cache, Before and After Bus Master Write
          2. Invalidate I-Cache
        - Buffer to be Written is Clean
          1. Invalidate D-Cache, After Bus Master Write
          2. Invalidate I-Cache
      - Write Through
        1. Invalidate D-Cache, After Bus Master Write
        2. Invalidate I-Cache

2.3.6 Cache Functions and Macros

Renesas BSP Configuration Macros

Macro	Purpose	Notes

BSP_CFG_DCACHE_ENABLED	Defaults to zero (disabled). If defined and non-zero, the FSP startup code in system.c will configure several predefined non-cacheable sections in the MPU if they are of non-zero size, enable the MPU, and enable the D-Cache.	This is normally configured in e2 Studio under the BSP->Cache settings->Data cache properties panel for the project.
BSP_CFG_ROM_REG_OFS1_INITECCEN	Defaults to zero (disabled). Sets the value of OFS1.INITECCEN for BSP_CFG_ROM_REG_OFS1, which controls whether ECC is enabled for caches and TCM.	This is normally configured in e2 Studio under the BSP->OFS1 register settings->Tightly Coupled Memory (TCM)/Cache ECC properties panel for the project.

CMSIS 6 I-Cache Functions

Function	Purpose	Notes
SCB_EnableICache	If I-Cache allocations are not already enabled, invalidate the entire I-Cache then enable I-Cache allocations with CCR.IC.	Will do nothing if I-Cache allocations are already enabled. FSP automatically enables the I-Cache at startup by directly setting CCR.IC instead of using this function.
SCB_DisableICache	Disable I-Cache allocations with CCR.IC, then invalidate the entire I-Cache.	
SCB_InvalidateICache	Invalidate the entire I-Cache.	This is safe to use at any time, because cache lines in the I-Cache can never be dirty. Used after modifying instructions anywhere in memory (e.g. Flash, RAM). FSP calls this function after initializing the predefined RAM code section during startup, and when exiting Code Flash program or erase mode in the Flash HP driver.
SCB_InvalidateICache_by_Addr	Loop to invalidate the instructions in the I-Cache, starting at a particular address and extending for the specified length in bytes.	This is safe to use at any time, because cache lines in the I-Cache can never be dirty. Can be used to more efficiently invalidate instructions at specific addresses. Will invalidate in increments of cache lines (32 bytes).

These functions can be safely interrupted and do not need to be guarded by critical sections. However, depending on the structure of the application logic, guarding the functions may be necessary. This must be analyzed for an individual scenario. See the CMSIS 6 API reference material

for further information.

CMSIS 6 D-Cache Functions

Function	Purpose	Notes
SCB_EnableDCache	If D-Cache allocations are not already enabled, loop to invalidate the entire D-Cache then enable D-Cache allocations with CCR.DC.	Will do nothing if D-Cache allocations are already enabled. FSP automatically calls this function at startup if BSP_CFG_DCACHE_ENABLED is defined and non-zero.
SCB_DisableDCache	Disable D-Cache allocations with CCR.DC, then loop to clean and invalidate the entire D-Cache.	
SCB_InvalidateDCache	Loop to invalidate the entire D-Cache.	This function should generally **not** be used, since no use case typically exists to invalidate the entire D-Cache.
SCB_CleanDCache	Loop to clean the entire D-Cache.	
SCB_CleanInvalidateDCache	Loop to clean and invalidate the entire D-Cache.	
SCB_InvalidateDCache_by_Addr	Loop to invalidate the data in the D-Cache, starting at a particular address and extending for the specified length in bytes.	Will invalidate in increments of cache lines (32 bytes).
SCB_CleanDCache_by_Addr	Loop to clean the data in the D-Cache, starting at a particular address and extending for the specified length in bytes.	Will clean in increments of cache lines (32 bytes).
SCB_CleanInvalidateDCache_by_Addr	Loop to clean and invalidate the data in the D-Cache, starting at a particular address and extending for the specified length in bytes.	Will clean and invalidate in increments of cache lines (32 bytes).

These functions can be safely interrupted and do not need to be guarded by critical sections. However, depending on the structure of the application logic, guarding the functions may be necessary. This must be analyzed for an individual scenario. See the CMSIS 6 API reference material for further information.

2.3.7 Cache Details

I-Cache Details

FSP I-Cache and FCACHE Behavior

Because of the simplicity of the I-Cache and FCACHE relative to the D-Cache and the critical

instruction execution performance enhancement that they provide, FSP always enables the I-Cache and the FCACHE. This is not configurable.

FSP automatically enables the I-Cache at startup for CM85 by directly setting CCR.IC. This method is used instead of the CMSIS 6 function, so that the I-Cache, branch prediction, and the low-overhead branch (LOB) extension may simultaneously be enabled. The automatic hardware cache invalidation of the CM85 ensures that cache lookups, allocations, and cache maintenance are no-op until the invalidation is finished, so immediately enabling the I-Cache is safe to do.

FSP invalidates the I-Cache using the CMSIS 6 functions:

- After initialzing the predefined RAM code section during startup
- After initializing the SAU for a Secure TZ application
- When exiting Code Flash program or erase mode in the Flash HP driver

The FCACHE is a Renesas cache, not an Arm cache, and it is controlled through its separate peripheral registers.

User Required I-Cache Maintenance

If instructions have changed outside of the control of FSP, it is user responsibility to perform I-Cache maintenance. This means instructions stored in *any* cacheable location, including internal flash, internal RAM, external flash, external RAM, etc. It is recommended to use the CMSIS 6 functions to perform I-Cache maintenance.

Users must also consider the interactions that D-Cache has with instruction modifications. For example, if the modified instructions are written to a cacheable location while D-Cache is enabled (e.g. RAM), those data writes may be cached. The D-Cache will need to be cleaned to guarantee that all data writes have been written back to guarantee their visibility to the I-Cache. D-Cache maintenance will also be needed if instructions change in Code or Data Flash via FACI and are cacheable, since D-Cache will cache instructions as data.

There is no hardware mechanism between the I-Cache and D-Cache in which they automatically share coherency, so coherency must be manually maintained by software as required.

D-Cache Details

FSP D-Cache Behavior

The D-Cache is a cache with more complex interactions than the I-Cache. Thus, FSP leaves the D-Cache disabled by default on RA8 projects. It can be enabled in e2 Studio under the BSP->Cache settings->Data cache properties panel for the project.

Presently, FSP does not support any D-Cache functionality except:

- Configuring the Arm MPU (S and NS) with two predefined no-cache sections if they are non-zero size
    - One in SRAM
    - One in SDRAM
- Enabling the Arm MPU (S and NS) after configuration
- Enabling D-Cache allocations (S or NS) with the CMSIS function

No FSP drivers are currently compatible with D-Cache enablement. This compatibility is a work in-progress.

User Required D-Cache Maintenance

Presently, D-Cache usage is fully in the realm of user responsibility. The user must perform all D-Cache maintenance as required, or must store data accordingly in the predefined non-cacheable regions or otherwise.

Affected Bus Masters

Coherency must be considered for these bus masters:

- CEU
- DMAC
- DRW
- DTC
- EDMAC
- GLCDC
- MIPI

Other Interactions that are not Bus Masters

Coherency must be considered for interactions with:

- FACI
- CSC
- SDRAM
- Standby SRAM
- OSPI
- Code in RAM (I-Cache and D-Cache are not automatically coherent)

FSP Predefined No-Cache Sections

The .nocache and .nocache_sdram sections are predefined for GCC, LLVM, and IAR compilers. These same sections exist for AC6 as .bss.nocache and .bss.nocache_sdram because of special naming restrictions with AC6 and uninitialized sections. These sections are **uninitialized** for all compilers, despite AC6 requiring a prefix of .bss.

Anything placed within them will be non-cacheable. Instruction fetches and data reads or writes to these sections will never lookup or allocate in their respective caches.

The FSP startup code configures these sections as non-cacheable using the MPU during startup, if the D-Cache is enabled via the BSP configuration. Otherwise, they are not configured by FSP in the MPU if the D-Cache is disabled. The predefined sections are aligned to 32 bytes and are padded to a minimum of 32 bytes in length. This meets both MPU region alignment and length requirements, and cache line alignment and length requirements. The MPU and cache line alignment and length requirements protect against inadvertent mixing of cacheable and non-cacheable data.

2.3.8 Other Information

Cache Maintenance when MPU Configuration Changes

If the Secure and/or Non-secure MPU configuration is changed, and the cacheability of an address changes, cache maintenance is required to synchronize the caches with the new memory attributes. If this is not done, a newly non-cacheable address may be left in the cache, and behavior when accessing the address is considered **undefined**.

Cache Maintenance when SAU Configuration Changes

If the SAU configuration is changed, and the security attributes of an address changes, cache maintenance is required to synchronize the caches with the new security attributes. If this is not done, cached data will be desynchronized with the new security attributes and may result in **undefined** behavior.

Cache Maintenance and TrustZone

Warning

> **If cacheable shared data is improperly structured by the Secure application and is not aligned and padded to match D-Cache line requirements, a clean and invalidate by set/way of the D-Cache by the Non-secure application, or an automatic D-Cache eviction by the Non-secure application, will cause data to be destroyed for the Secure application.** This consequence is additional to the bugs that the Secure application may trigger itself by improper data layout, D-Cache maintenance, and automatic D-Cache eviction.

The System Address Map and the MPU

The Armv8-M Architecture Reference Manual specifies a default system address map that defines the memory regions of the architecture and their various properties.

These properties include the memory type, shareability attributes, and cacheability attributes for the regions. When the MPU is disabled, this default system address map provides the system with default attributes for instruction fetches, data reads, and data writes to and from addresses. When the MPU is enabled, it can be used to override the default system address map entirely, or both may be used together by setting the MPU_CTRL.PRIVDEFENA bit. This bit allows instruction fetches or data reads and writes that do not correspond to a configured MPU region to hit the default system address map as a background region instead, so long as the access is Privileged. FSP does not support Unprivileged execution, so it always assumes Privileged execution state. Allowing the default system address map as a background region is the method that FSP uses to provide the predefined no-cache sections, by configuring the MPU for the no-cache sections while allowing all other memory accesses to rely on the default system address map. Configuring an MPU region involves specifying a 32 byte aligned start address and an inclusive ending address, and also specifying the various memory attributes of the region. The MPU region beginning address register will mask downward to align to a 32 byte boundary. i.e (address & ~0x1F) The MPU region ending address register will OR upward with 0x1F for the inclusive ending boundary. i.e. (address | 0x1F) Thus, the minimum size of an MPU region is 32 bytes and the size may only increase in 32 byte increments.

See the Armv8-M Memory Model and Memory Protection User Guide in the references section for a high-level introduction, and the Armv8-M Architecture Reference Manual for details.

Speculative Instruction Fetching and Data Reads

The CM85 may, with no deliberate software instruction, speculatively fetch instructions or read data from any memory location. Upon doing so, the instruction fetch or data read may enter the respective cache. The purpose of this speculative behavior is to predict the next instructions or data to be fetched, read, or written, which increases performance if the prediction is correct. **This may cause instructions or data to unexpectedly appear in cache, so speculation must be considered when solving for cache coherency.**

Cache Eviction

At any time, the I-Cache or D-Cache may evict cache lines. For I-Cache, this means invalidation of

the evicted line. For D-Cache, this means cleaning and invalidation of the evicted line, where cleaning occurs if the cache line is dirty. **D-Cache eviction of dirty lines may cause data to be unexpectedly written out to backing memory when write-back is used, and this must be considered when solving for cache coherency. For D-Cache aligned and padded buffers derived from areas like the stack or heap, one or more of the associated cache lines may already be dirty and require cleaning and/or invalidation before being used by a bus master.**

Example of D-Cache Eviction and Speculative Read Dangers

The CM85 will provide a SRAM buffer to the DMAC, the DMAC will write to the buffer, and the CM85 will read from the written buffer. I-Cache, D-Cache, and FCACHE are enabled. SRAM exists in the same "SRAM" region defined by the default system address map in the Armv8-M Architecture Reference Manual. SRAM is Normal memory, write-back, write-allocate, read-allocate, and non-shareable by the default system address map attributes.

The correct way to solve coherency in this situation using the two recommended solution options is:

1. The MPU is used to configure a non-cacheable region where the SRAM buffer is placed.
    - The MPU region is correctly aligned and padded to meet start and end address alignment requirements, and region attributes are correctly configured.
    - No additional effort is required.
    - FSP provides the predefined .nocache section that meets these requirements.
2. The SRAM buffer is left to its default attributes, making it cacheable.
    - Regardless of whether write-back or write-through is used, the buffer start must be aligned to a cache line and the buffer must be a length multiple of cache line size.
        - Unrelated data can never be mixed on cache lines if write-back is used. It is best to follow this strict guideline even when write-through is used.
    - The cache lines of the buffer may already be dirty, especially if the buffer is allocated in a stack or heap.
    - If write-back is used, cache maintenance is conducted in order.
        - Invalidate buffer.
        - CM85 provides buffer to DMAC and starts DMAC.
        - DMAC writes to buffer.
        - CM85 waits for DMAC to complete.
        - Invalidate buffer.
        - CM85 reads from buffer.
    - The first invalidation is to remove dirty lines, which may already exist from stack or heap allocation. The data does not need to be written back and can be discarded without a clean.
        - If this is not done, an eviction (effectively an automatic clean and invalidate by the hardware) will cause stale data to be written back to the buffer and destroy newly written DMAC data.
    - The second invalidation is to remove speculatively read cache lines, which may have been cached before the DMAC write completed.
        - If this is not done, the CM85 will read stale data from the buffer that has been prematurely cached.
    - Write-through may also use this sequence, although the first invalidate should be a no-op since no lines can be dirty and no stale data should be written back by an eviction.
    - The CMSIS cache maintenance functions should be used to perform cache maintenance, since they include necessary memory barriers.

The second solution is shown in the D-Cache Enabled scenarios here where write-back is used and a bus master performs writing.

Cache ECC with FSP

By default, FSP disables ECC for the caches and TCM with OFS1.INITECCEN. For best performance, it is recommended to keep ECC for cache and TCM disabled. If enabling is desired, please consult the reference material to understand the consequences of enabling ECC for cache and TCM, which are too numerous to describe here. The automatic hardware cache invalidation performed by the CM85 is compatible with ECC.

MPU Cacheability Attributes

- Cacheable or Non-Cacheable
- Allocation Policies
    - Read Allocate
    - Write Allocate
- Write Policy
    - Write Back or Write Through
- Transient or Non-Transient

For D-Cache, Shareable or Non-Shareable also affects whether an address is Cacheable or Non-Cacheable. A Shareable address is forced to Non-Cacheable for D-Cache. I-Cache is not influenced by the Shareability properties and will always follow the MPU cacheability attributes. The Transient attribute is of limited utility and can mostly be ignored. Clean cache lines that are marked Transient are preferred for eviction before clean cache lines marked Non-Transient. Dirty cache lines whether marked Transient or Non-Transient are evicted with the same priority.

See the CM85 Technical Reference Manual reference material for further information.

Cache Behavior with CCR and MSCR

x = [I, D]

CCR.xC (S or NS)	MSCR.xCACTIVE	Behavior
1	1	Allocate, Lookup
0	1	No Allocate, Lookup (Reset Behavior)
X	0	No Allocate, No Lookup

This behavior is applicable to Cortex-M55 and Cortex-M85. If you have previous experience with a Cortex-M7 device, this cache behavior is different since MSCR.xCACTIVE bits were introduced for CM55 and CM85. No CM7 or CM55 core is offered by any current RA devices. The new addition of the MSCR.xCACTIVE bits allow for cache power control, and by allowing a third cache behavioral state of lookups without allocation, cleaning the D-Cache after disabling it becomes less error prone since dirty cache lines cannot be made stale before being cleaned, by writes occurring after D-Cache is disabled like on CM7. The MSCR.xCACTIVE bits have a reset value of 1, so the caches are powered by default and lookups are possible. Until the automatic hardware cache invalidation which begins after reset finishes, lookups and allocations do not occur even if CCR.xC is set, and cache maintenance operations are no-op. The MSCR.xCACTIVE bits should generally never be cleared to 0.

Cache Errata

Consult the latest Renesas Technical Updates (TU) and Arm Cortex-M85 Errata documents.

These are example errata to demonstrate the possibility of issues with cache usage at the time of this writing.

```
Cortex-M85 AT640 and Cortex-M85 with FPU AT641
Software Developer Errata Notice
Date of issue: April 16, 2024
Document version: 14.0
Document ID: SDEN-2236668
2682779
After deactivating the instruction cache, self-modified code might not be executed
correctly
Fault Type: Programmer Category C
Fault Status: Present in r0p0, r0p1, r0p2. Fixed in r1p0
3175626
AXI hang due to dependency between read data channel and write response channel
Fault Type: Programmer Category B
Fault Status: Present in r0p0, r0p1, r0p2, r1p0. Fixed in r1p1
3190818
Under limited circumstances, LDM to normal non-cacheable AXI location cannot complete
Fault Type: Programmer Category B
Fault Status: Present in r0p0, r0p1, r0p2, and r1p0. Fixed in r1p1
```

Currently available RA8D1, RA8M1, and RA8T1 devices use the r0p2 variant of the core, so they are affected by these errata.

Erratum 2682779 should not require a workaround, since I-Cache will never be powered off in most circumstances.

FSP added workarounds for 3175626 and 3190818 in v5.3.0.

Chapter 3 Starting Development

3.1 Starting Development Introduction

The wealth of resources available to learn about and use e² studio and FSP can be overwhelming on first inspection, so this section provides a Starting Development Guide with a list of the most important initial steps. Following these highly recommended first 11 steps will bring you up to speed on the development environment in record time. Even experienced developers can benefit from the use of this guide, to learn the terminology that might be unfamiliar or different from previous environments.

1. Read the section What is e² studio?, up to but not including e² studio Prerequisites. This will provide a description of the various windows and views to use e² studio to create a project, add modules and threads, configure module properties, add code, and debug a project. It also describes how to use key coding 'accelerators' like Developer Assist (to drag and drop parameter populated API function calls right into your code), a context aware Autocomplete (to easily find and select from suggested enumerations, functions, types, and many other coding elements), and many other similar productivity enhancers.
2. Read the FSP Architecture, FSP Modules and FSP Stacks sections. These provide the basic background on how FSP modules and stacks are used to construct your application. Understanding their definitions and the theory behind how they combine will make it easier to develop with FSP.
3. Read a few Modules sections to see how to use API function calls, structures, enumerations, types and callbacks. These module guides provide the information you will use to implement your project code.
4. After you have a Kit and you have downloaded and installed e² studio and FSP, you can build and debug a simple project to test your installation, tool flow, and the kit. (If you do not have a Kit or have not yet installed the development software, use the links included in the e² studio Prerequisites for more information.) The simple Tutorial: Your First RA MCU Project - Blinky will Blink an LED on and off. Follow the instructions for importing and running this project in section Create a New Project for Blinky. It will use some of the key steps for managing projects within e² studio and is a good way to learn the basics.
5. Once you have successfully run Blinky you have a good starting point for using FSP for more complex projects. The Using HAL Drivers Tutorial, available at Tutorial: Using HAL Drivers - Programming the WDT, shows how to create a project from scratch, using FSP API functions. Do this next.
6. Several Hands-on Quick FSP Labs are available that cover key development topics with short 15-minute Do it Yourself (DiY) activities targeting the EK-RA6M3. Topics covered include code development accelerators like Developer Assistance, Autocomplete, Help, Visual Expressions and using Example Projects. The complete list of available Quick FSP Labs can be found here: https://en-support.renesas.com/knowledgeBase/category/31087/subcategory/31090. Doing a couple of these labs provides further details on using FSP, and is also good practice. Running these labs is highly recommended.
7. The balance of the FSP Architecture sections (that is, those not called out in step 2 above) contain additional reference material that may be helpful in the future. Scan them so you know what they contain, in case you need them.
8. The balance of the e² studio User Guide, starting with the What is a Project? section up to, but not including, Writing the Application section, provides a detailed description of each of

the key steps, windows, and entries used to create, manage, configure, build and debug a project. Much of this may be familiar after running through the tutorials and Quick Labs. However, it is important to have a good grasp of what each of the configuration tabs are used for as that is where the bulk of the project preparation work takes place prior to writing code. Skim over this section as it may help with any questions in the future.

9. Read the Writing the Application section to get a short introduction to the steps used when creating application code with FSP. It covers both RTOS-independent and RTOS-dependent applications. It also includes a short description for several of the code accelerators you should be familiar with by now. Using additional Quick FSP Labs is a good way to become familiar with the application development process and links to them are included in the appropriate places in this section. You can find the complete list of available Quick FSP Labs here: https://en-support.renesas.com/knowledgeBase/19308277.
10. Scan the Debugging the Project section to see the steps required to download and start a debug session.
11. Explore the additional material available on the following web pages and bookmark the resources that look most valuable to you:
    a. RA Landing Page: https://www.renesas.com/ra
    b. FSP Landing Page: https://www.renesas.com/fsp

3.2 e² studio User Guide

3.2.1 What is e² studio?

Renesas e² studio is a development tool encompassing code development, build, and debug. e² studio is based on the open-source Eclipse IDE and the associated C/C++ Development Tooling (CDT).

When developing for RA MCUs, e² studio hosts the Renesas Flexible Software Package (FSP). FSP provides a wide range of time saving tools to simplify the selection, configuration, and management of modules and threads, to easily implement complex applications. The time saving tools available in e² studio and FSP include the following:

- A Graphical User Interface (GUI) (see Adding Threads and Drivers) with numerous wizards for configuring and auto-generating code
- A context sensitive Autocomplete (see Tutorial: Using HAL Drivers - Programming the WDT) feature that provides intelligent options for completing a programming element
- A Developer Assistance tool for selection of and drag and drop placement of API functions directly in application code
- A Welcome Window with links to example projects, application notes and a variety of other self-help support resources
- An Information Icon from each module is provided in the graphic configuration viewer that links to specific design resources, including code 'cheat sheets' that provide useful starting points for common application implementations.

Figure 6: e² studio Splash Screen

e² studio organizes project work based on Perspectives, Views, Windows, Panes, and Pages (sometimes called Tabs). A window is a section of the e² studio GUI that presents information on a key topic. Windows often use tabs to select sub-topics. For example, an editor window might have a tab available for each open file, so it is easy to switch back and forth between them. A window Pane is a section of a window. Within a window, multiple Panes can be opened and viewed simultaneously, as opposed to a tabbed window, where only individual content is displayed. A memory-display Window, for example, might have multiple Panes that allow the data to be displayed in different formats, simultaneously. A Perspective is a collection of Views and Windows typical for a specific stage of development. The default perspectives are a C/C++ Perspective, an FSP Configuration Perspective and a Debug Perspective. These provide specific Views, Windows, Tabs, and Panes tailored for the common tasks needed during the specific development stage.

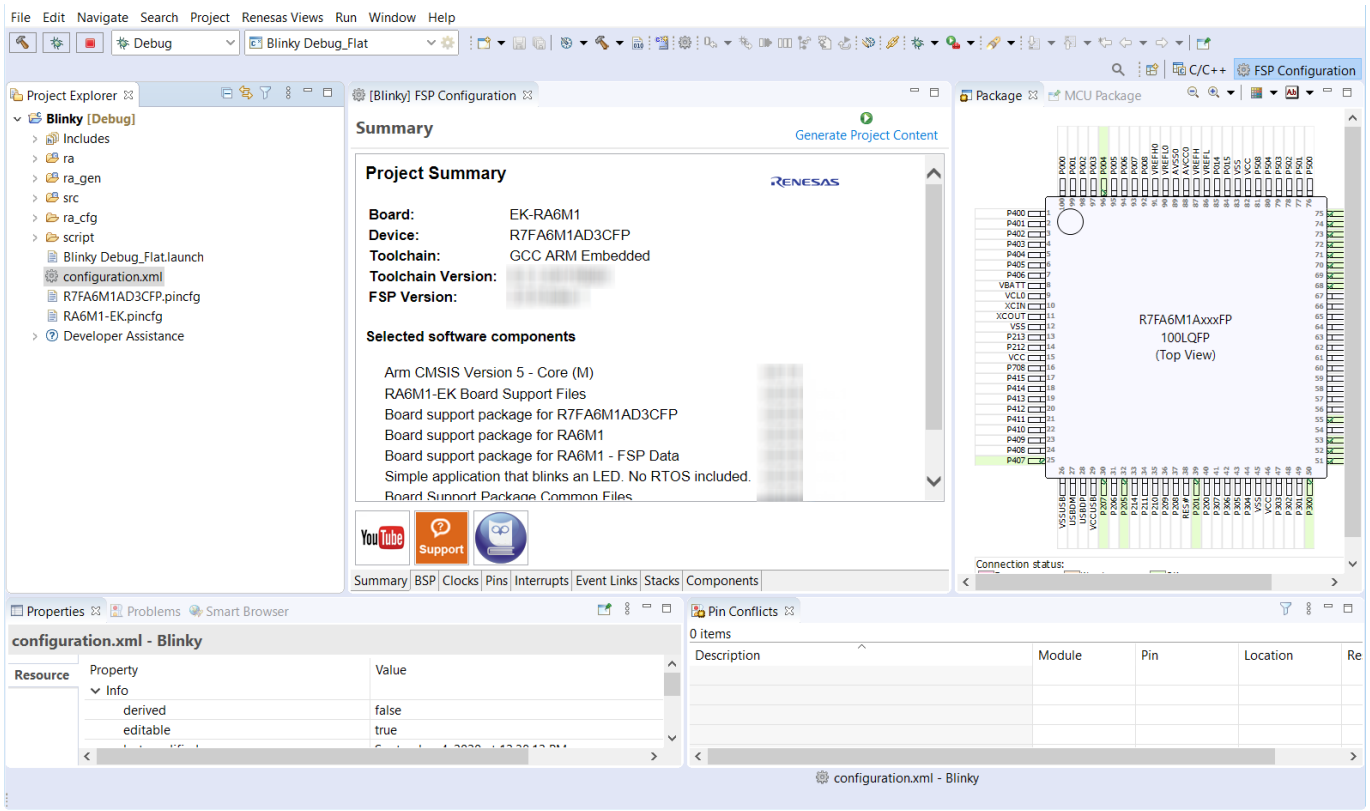

Figure 7: Default Perspective

In addition to managing project development, selecting modules, configuring them and simplifying code development, e² studio also hosts the engine for automatically generating code based on module selections and configurations. The engine continually checks for dependencies and automatically adds any needed lower level modules to the module stack. It also identifies any lower level modules that require configuration (for example, an interrupt that needs to have a priority assigned). It also provides a guide for selecting between multiple choices or options to make it easy to complete a fully functional module stack.

The Generate Project Content function takes the selected and configured modules and automatically generates the complete and correct configuration code. The code is added to the folders visible in the **Project Explorer** window in e² studio. The configuration.xml file in the project folder holds all the generated configuration settings. This file can be opened in the GUI-based RA Configuration editor to make further edits and changes. Once a project has been generated, you can go back and reconfigure any of the modules and settings if required using this editor.

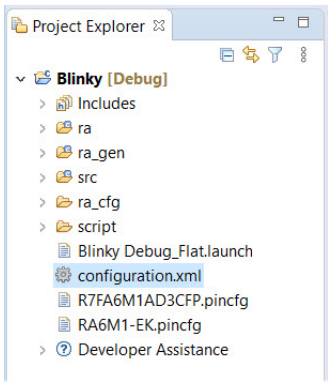

Figure 8: Project Explorer Window showing generated folders and configuration.xml file

3.2.2 e² studio Prerequisites

3.2.2.1 Obtaining an RA MCU Kit

To develop applications with FSP, start with one of the Renesas RA MCU Evaluation Kits. The Renesas RA MCU Evaluation Kits are designed to seamlessly integrate with e² studio.

Ordering information, Quick Start Guides, User Manuals, and other related documents for all RA MCU Evaluation Kits are available at https://www.renesas.com/ra.

3.2.2.2 PC Requirements

The following are the minimum PC requirements to use e² studio:

- Windows 10 with Intel i5 or i7, or AMD A10-7850K or FX
- Memory: 8-GB DDR3 or DDR4 DRAM (16-GB DDR4/2400-MHz RAM is preferred)
- Minimum 250-GB hard disk

3.2.2.3 Installing e² studio, platform installer and the FSP package

Detailed installation instructions for e² studio and FSP are available on the Renesas website https://www.renesas.com/fsp. Review the release notes for e² studio to ensure that the e² studio version supports the selected FSP version. The starting version of the installer includes all features of the RA MCUs.

3.2.2.4 Choosing a Toolchain

e² studio can work with several toolchains and toolchain versions such as the GNU Arm compiler, Arm AC6, and LLVM Embedded Toolchain for Arm. Versions of the GNU Arm and LLVM compilers verified for use with FSP are included in the e² studio installer.

3.2.2.5 Licensing

FSP licensing includes full source code, limited to Renesas hardware only.

3.2.3 What is a Project?

In e² studio, all FSP applications are organized in RA MCU projects. Setting up an RA MCU project involves:

1. Creating a Project
2. Configuring a Project

These steps are described in detail in the next two sections. When you have existing projects already, after you launch e² studio and select a workspace, all projects previously saved in the selected workspace are loaded and displayed in the **Project Explorer** window. Each project has an associated configuration file named configuration.xml, which is located in the project's root directory.

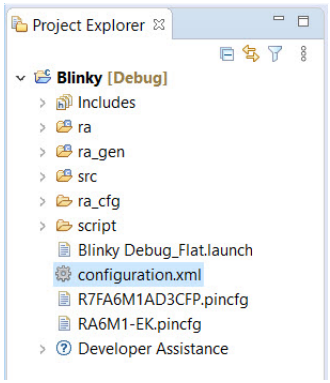

Figure 9: e² studio Project Configuration file

Double-click on the configuration.xml file to open the RA MCU Project Editor. To edit the project configuration, make sure that the **FSP Configuration** perspective is selected in the upper right hand corner of the e² studio window. Once selected, you can use the editor to view or modify the configuration settings associated with this project.

Figure 10: e² studio FSP Configuration Perspective

Note

Whenever the RA project configuration (that is, the configuration.xml file) is saved, a verbose RA Project Report file (ra_cfg.txt) with all the project settings is generated. The format allows differences to be easily viewed using a text comparison tool. The generated file is located in the project root directory.

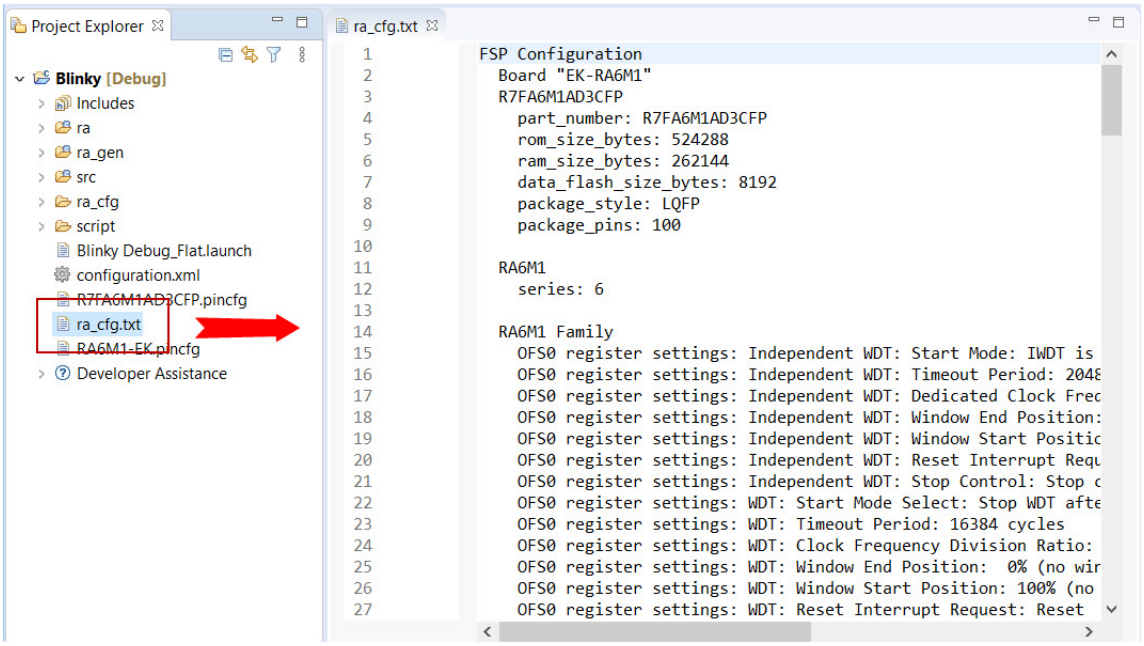

Figure 11: RA Project Report

The RA Project Editor has a number of tabs. The configuration steps and options for individual tabs are discussed in the following sections.

Note

The tabs available in the RA Project Editor depend on the e² studio version and the layout may vary slightly, however the functionality should be easy to follow..

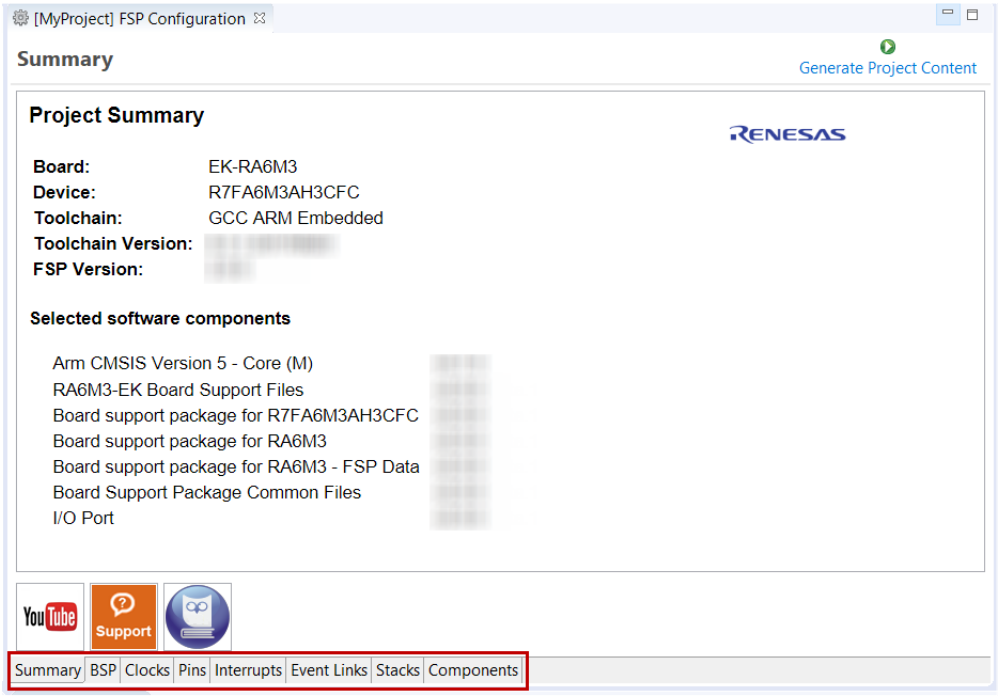

Figure 12: RA Project Editor tabs

- Click on the YouTube icon to visit the Renesas FSP playlist on YouTube
- Click on the Support icon to visit RA support pages at Renesas.com
- Click on the user manual (owl) icon to open the RA software package User's Manual

3.2.4 Creating a Project

During project creation, you specify the type of project, give it a project name and location, and configure the project settings for version, target board, whether an RTOS is included, the toolchain version, and the beginning template. This section includes easy-to-follow step-by-step instructions for all of the project creation tasks. Once you have created the project, you can move to configuring the project hardware (clocks, pins, interrupts) and the parameters of all the modules that are part of your application.

3.2.4.1 Creating a New Project

For RA MCU applications, generate a new project using the following steps:

1. Click on **File > New > RA C/C++ Project > Renesas RA**.

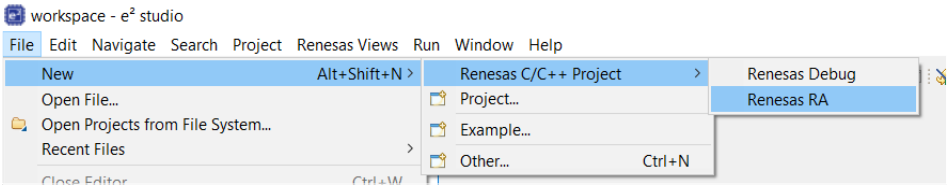

Figure 13: New RA MCU Project

Then click on the type of template for the type of project you are creating.

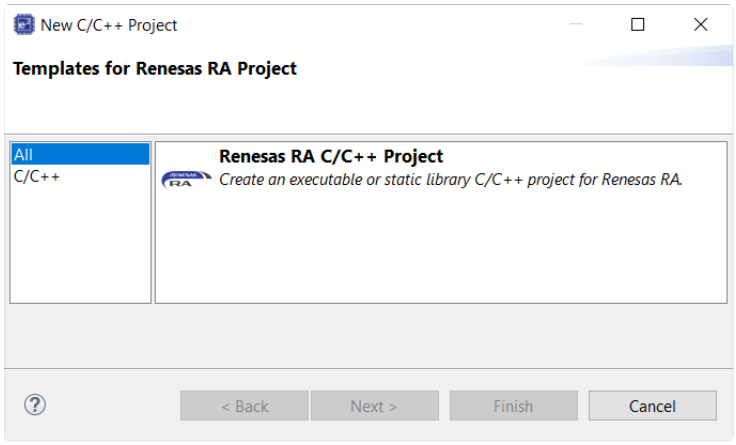

Figure 14: New Project Templates

2. Select a project name and location.

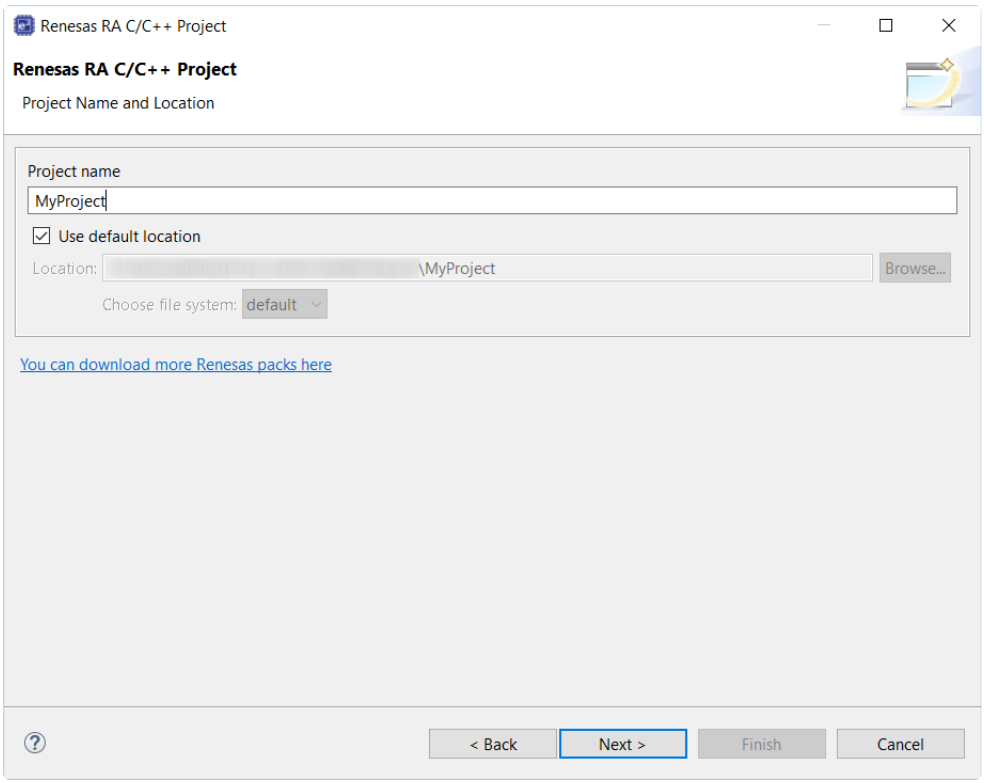

Figure 15: RA MCU Project Generator (Screen 1)

3. Click **Next**.

3.2.4.2 Selecting a Board and Toolchain

In the **Project Configuration** window select the hardware and software environment:

1. Select the **FSP version**.
2. Select the **Board** for your application. You can select an existing RA MCU Evaluation Kit or select **Custom User Board** for any of the RA MCU devices with your own BSP definition.
3. Select the **Device**. The **Device** is automatically populated based on the **Board** selection. Only change the **Device** when using the **Custom User Board (Any Device)** board selection.
4. To add threads, select **RTOS**, or **No RTOS** if an RTOS is not being used.
5. The **Toolchain** selection defaults to **GCC Arm Embedded**.
6. Select the **Toolchain version**. This should default to the installed toolchain version.
7. Select the **Debugger**. The J-Link Arm Debugger is preselected.

8. Click **Next**.

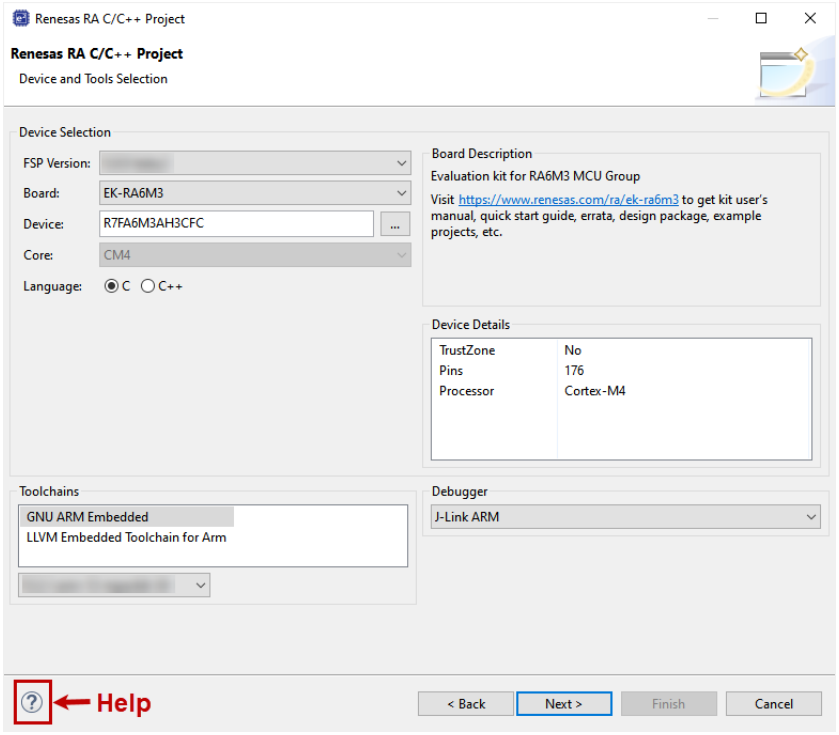

Figure 16: RA MCU Project Generator (Screen 2)

Note

*Click on the **Help** icon (?) for user guides, RA contents, and other documents.*

3.2.4.3 Selecting Flat or Arm TrustZone Project

If you selected a device or tool based on an Arm® Cortex®-M33, you next select whether to use Arm® TrustZone® technology in your project. For normal, non-TrustZone projects, select "Flat".

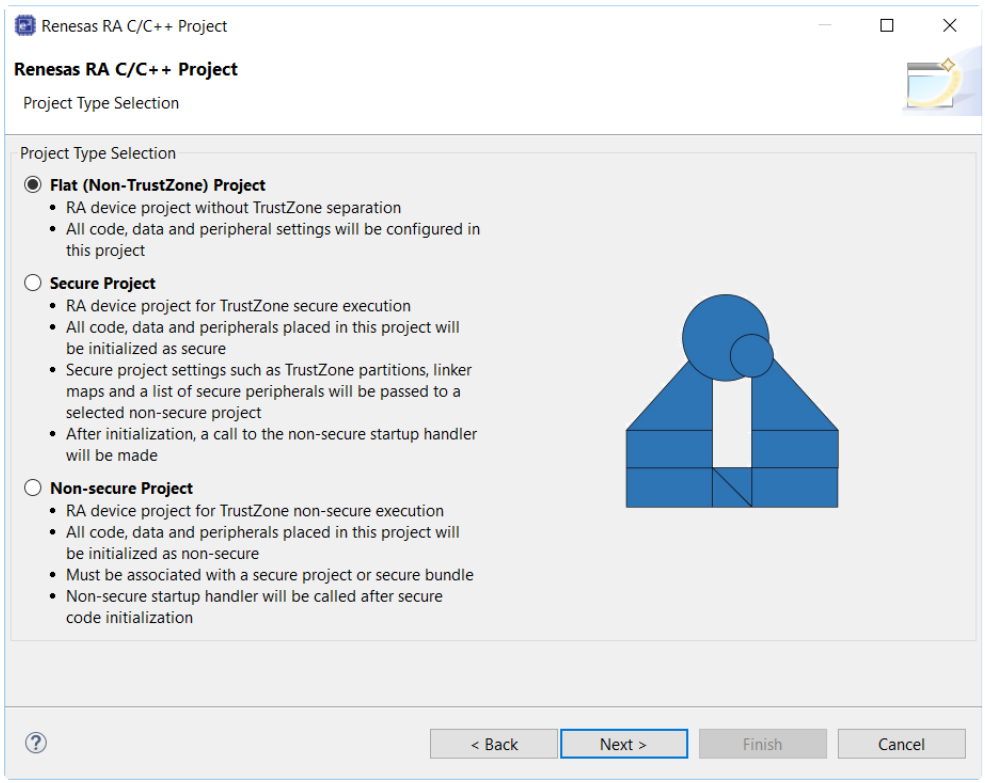

Figure 17: Flat, Secure, or Non-Secure Project

For more information on Arm TrustZone technology, see Primer: Arm TrustZone Project Development.

3.2.4.4 Selecting a Project Template

In the next window, select the buiild artifact and RTOS.

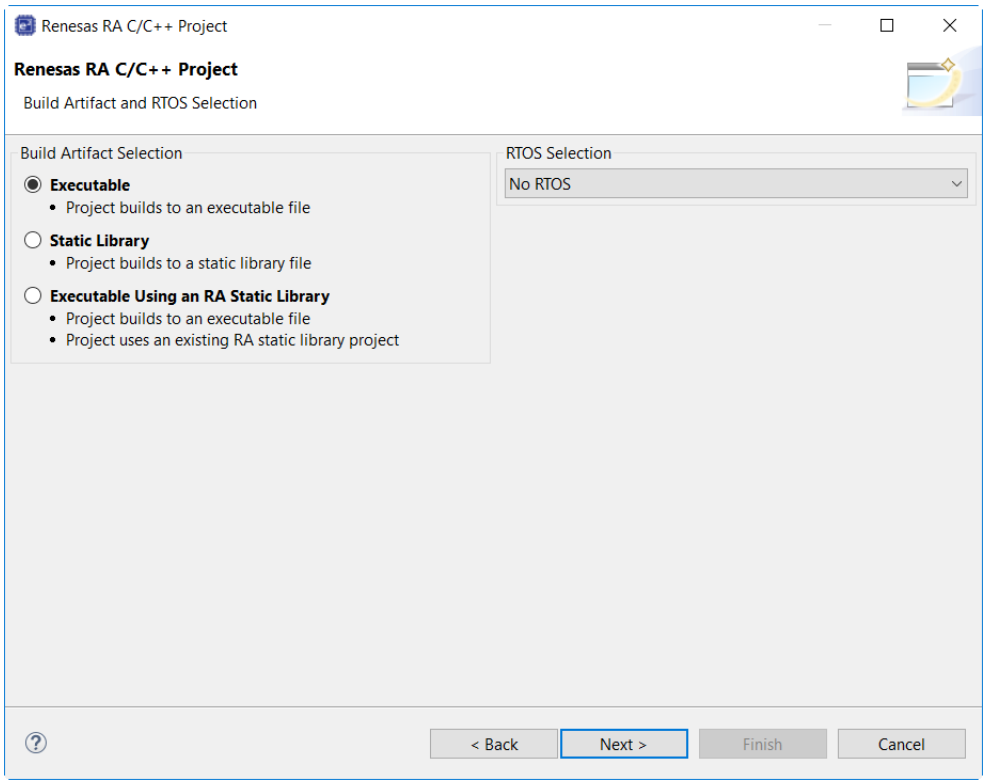

Figure 18: RA MCU Project Generator (Screen 3)

In the next window, select a project template from the list of available templates. By default, this screen shows the templates that are included in your current RA MCU pack. Once you have selected the appropriate template, click **Finish**.

Note

If you want to develop your own application, select the basic template for your board, ***Bare Metal - Minimal****.*

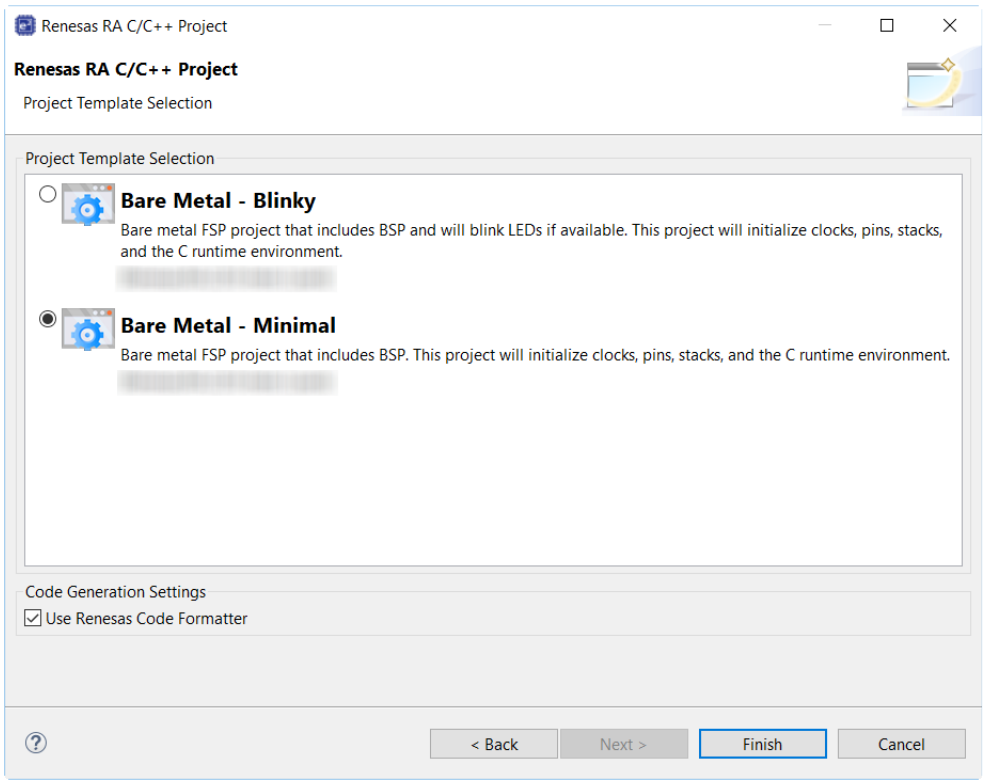

Figure 19: RA MCU Project Generator (Screen 4)

When the project is created, e² studio displays a summary of the current project configuration in the RA MCU Project Editor.

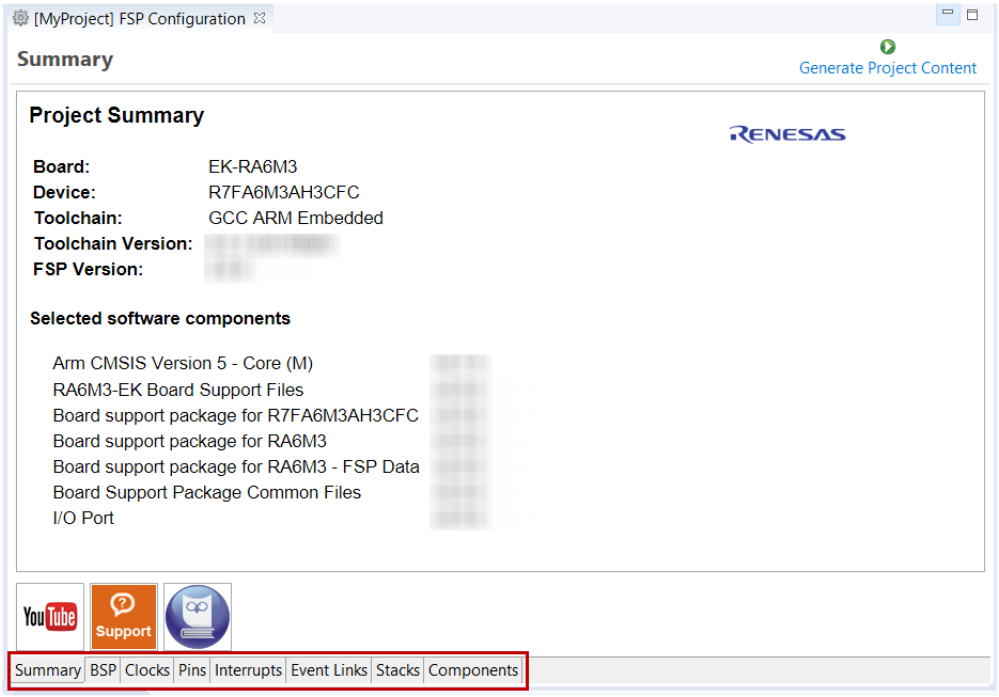

Figure 20: RA MCU Project Editor and available editor tabs

On the bottom of the RA MCU Project Editor view, you can find the tabs for configuring multiple aspects of your project:

- With the **Summary** tab, you can see all they key characteristics of the project: board, device, toolchain, and more.
- With the **BSP** tab, you can change board specific parameters from the initial project selection.
- With the **Clocks** tab, you can configure the MCU clock settings for your project.
- With the **Pins** tab, you can configure the electrical characteristics and functions of each port pin.
- With the **Interrupts** tab, you can add new user events/interrupts.
- With the **Event Links** tab, you can configure events used by the Event Link Controller.
- With the **Stacks** tab, you can add and configure FSP modules. For each module selected in this tab, the **Properties** window provides access to the configuration parameters, interrupt priorities, and pin selections.
- The **Components** tab provides an overview of the selected modules. Although you can also add drivers for specific FSP releases and application sample code here, this tab is normally only used for reference.

The functions and use of each of these tabs is explained in detail in the next section.

3.2.5 Configuring a Project

Each of the configurable elements in an FSP project can be edited using the appropriate tab in the RA Configuration editor window. Importantly, the initial configuration of the MCU after reset and before any user code is executed is set by the configuration settings in the **BSP**, **Clocks** and **Pins** tabs. When you select a project template during project creation, e² studio configures default values that are appropriate for the associated board. You can change those default values as needed. The following sections detail the process of configuring each of the project elements for each of the associated tabs.

3.2.5.1 Summary Tab

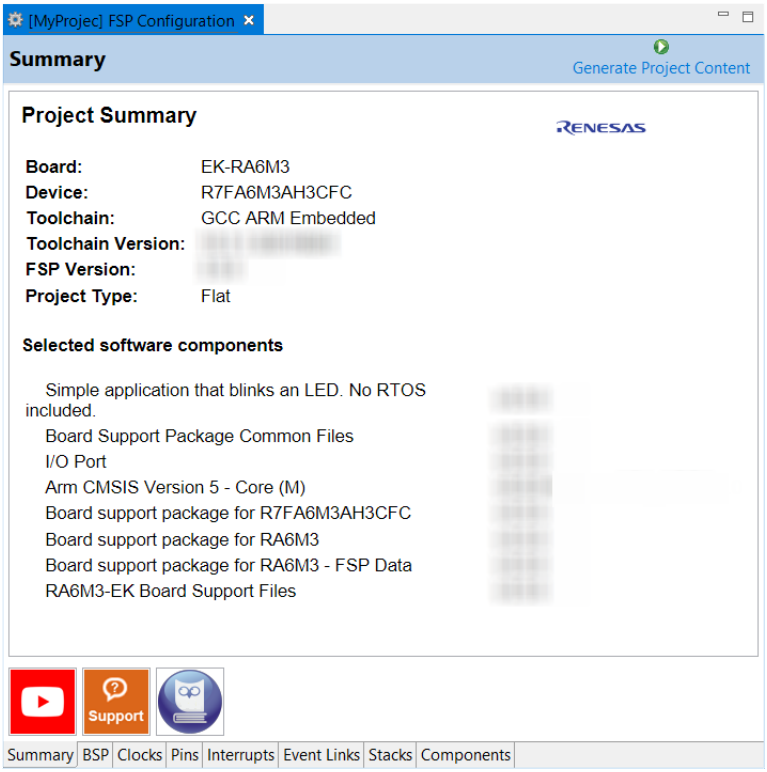

Figure 21: Configuration Summary tab

The **Summary** tab, seen in the above figure, identifies all the key elements and components of a project. It shows the target board, the device, toolchain and FSP version. Additionally, it provides a list of all the selected software components and modules used by the project. This is a more convenient summary view when compared to the **Components** tab.

The summary tab also includes handy icons with links to the Renesas YouTube channel, the Renesas support page and to the RA FSP User Manual that was downloaded during the installation process.

3.2.5.2 Configuring the BSP

The **BSP** tab shows the currently selected board (if any) and device. The Properties view is located in the lower left of the Project Configurations view as shown below.

Note

*If the Properties view is not visible, click **Window** > **Show View** > **Properties** in the top menu bar.*

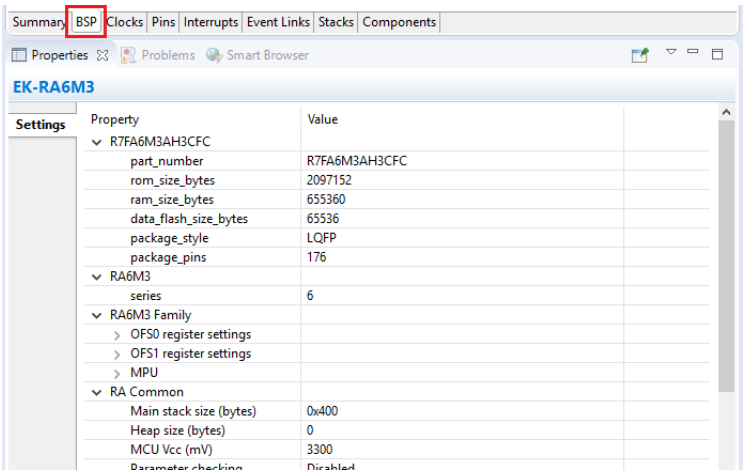

Figure 22: Configuration BSP tab

The **Properties** view shows the configurable options available for the BSP. These can be changed as required. The BSP is the FSP layer above the MCU hardware. e² studio checks the entry fields to flag invalid entries. For example, only valid numeric values can be entered for the stack size.

When you click the **Generate Project Content** button, the BSP configuration contents are written to ra_cfg/fsp_cfg/bsp/bsp_cfg.h

This file is created if it does not already exist.

Warning

Do not edit this file as it is overwritten whenever the **Generate Project Content** button is clicked.

3.2.5.3 Configuring Clocks

The **Clocks** tab presents a graphical view of the MCU's clock tree, allowing the various clock dividers and sources to be modified. If a clock setting is invalid, the offending clock value is highlighted in red. It is still possible to generate code with this setting, but correct operation cannot be guaranteed. In the figure below, the USB clock UCLK has been changed so the resulting clock frequency is 60 MHz instead of the required 48 MHz. This parameter is colored red.

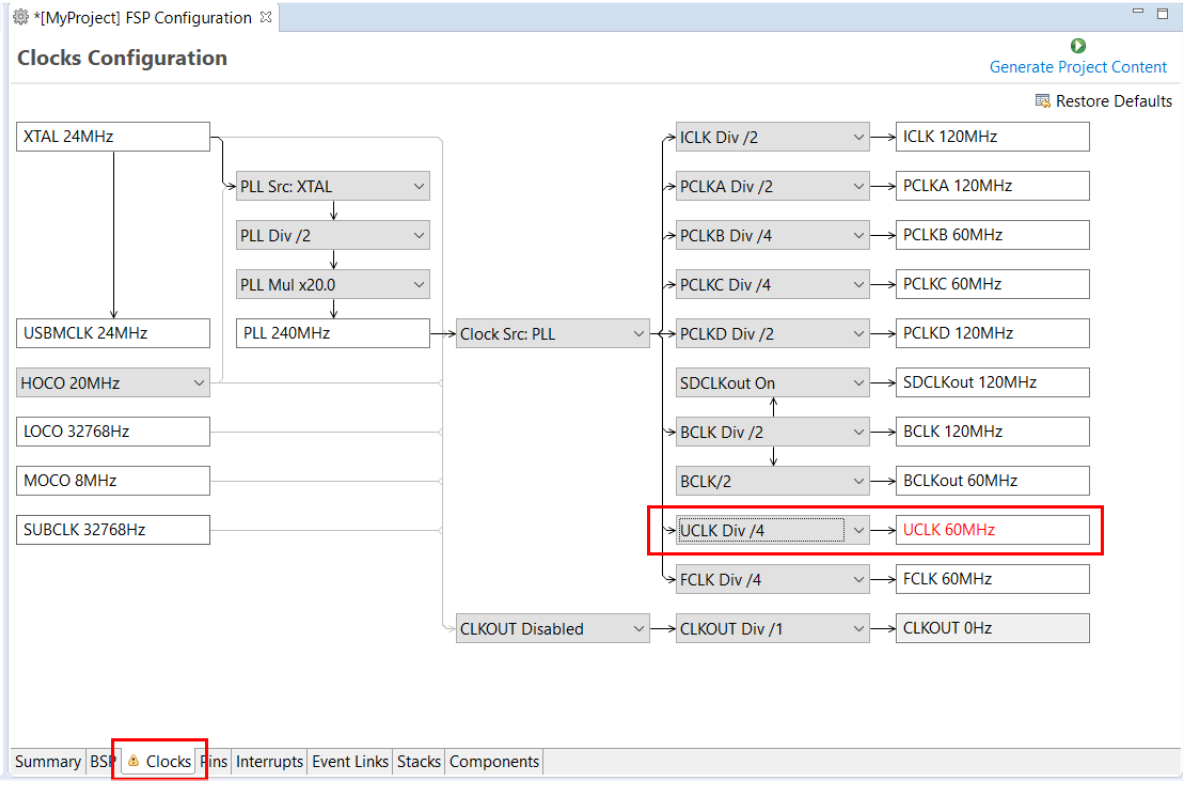

Figure 23: Configuration Clocks tab

When you click the **Generate Project Content** button, the clock configuration contents are written to: ra_gen/bsp_clock_cfg.h

This file will be created if it does not already exist.

Warning

Do not edit this file as it is overwritten whenever the **Generate Project Content** button is clicked.

3.2.5.4 Configuring Pins

The **Pins** tab provides flexible configuration of the MCU's pins. As many pins are able to provide multiple functions, they can be configured on a peripheral basis. For example, selecting a serial channel via the SCI peripheral offers multiple options for the location of the receive and transmit pins for that module and channel. Once a pin is configured, it is shown as green in the **Package** view.

Note

*If the **Package** view window is not open in e² studio, select **Window** > **Show View** > **Pin Configurator** > **Package** from the top menu bar to open it.*

The **Pins** tab simplifies the configuration of large packages with highly multiplexed pins by highlighting errors and presenting the options for each pin or for each peripheral. If you selected a project template for a specific board such as the EK-RA6M3, some peripherals connected on the board are preselected.

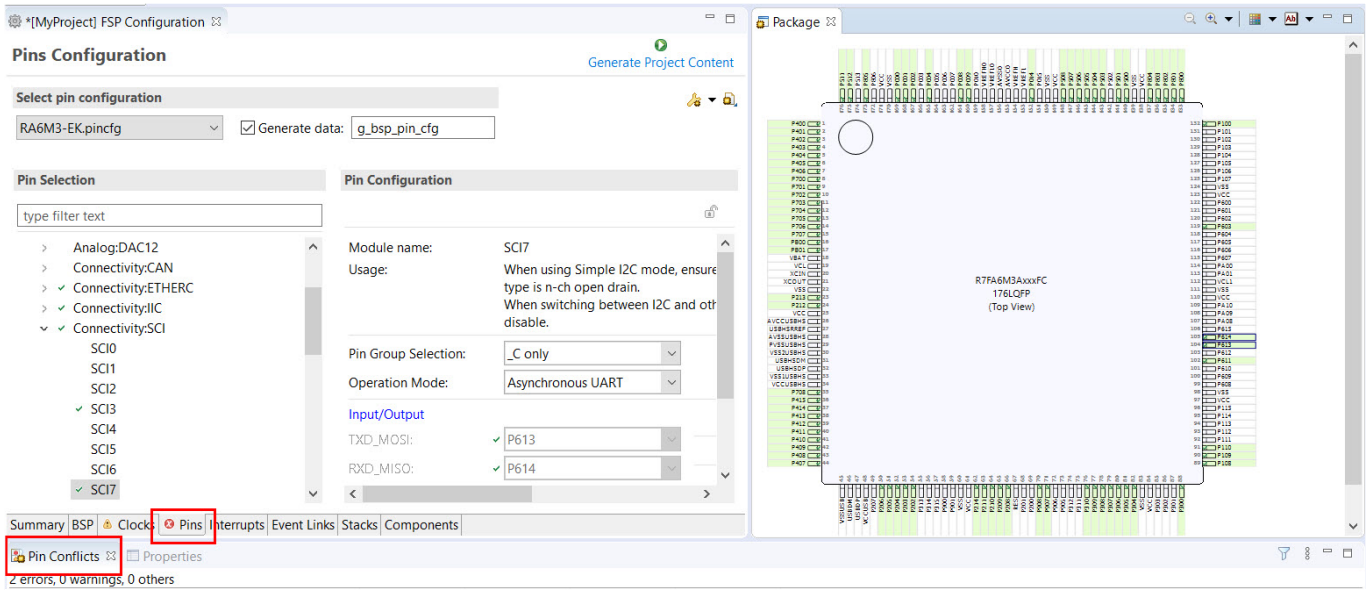

Figure 24: Pins Configuration

The pin configurator includes a built-in conflict checker, so if the same pin is allocated to another peripheral or I/O function the pin will be shown as red in the package view and also with white cross in a red square in the **Pin Selection** pane and **Pin Configuration** pane in the main **Pins** tab. The **Pin Conflicts** view provides a list of conflicts, so conflicts can be quickly identified and fixed.

In the example shown below, port P611 is already used by the CAC, and the attempt to connect this port to the Serial Communications Interface (SCI) results in a dangling connection error. To fix this error, select another port from the pin drop-down list or disable the CAC in the **Pin Selection** pane on the left side of the tab.

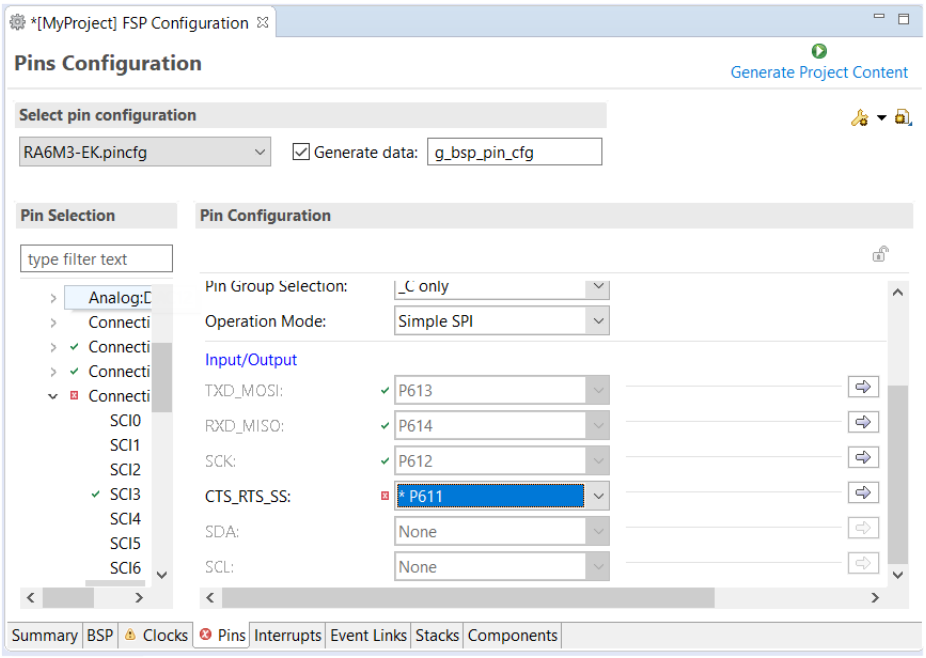

Figure 25: e² studio Pin configurator

The pin configurator also shows a package view and the selected electrical or functional characteristics of each pin.

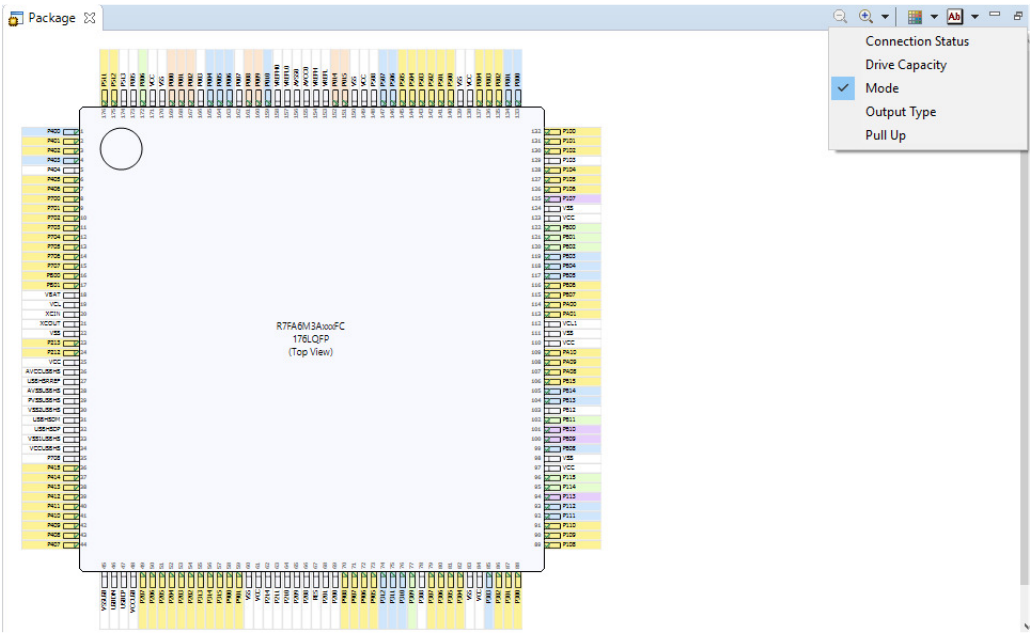

Figure 26: e² studio Pin configurator package view

When you click the **Generate Project Content** button, the pin configuration contents are written to: ra_gen\bsp_pin_cfg.h

This file will be created if it does not already exist.

Warning

Do not edit this file as it is overwritten whenever the **Generate Project Content** button is clicked.

To make it easy to share pinning information for your project, e² studio exports your pin configuration settings to a csv format and copies the csv file to ra_gen/<MCU package>.csv.

3.2.5.5 Configuring Interrupts from the Stacks Tab

You can use the **Properties** view in the **Stacks** tab to enable interrupts by setting the interrupt priority. Select the driver in the **Stacks** pane to view and edit its properties.

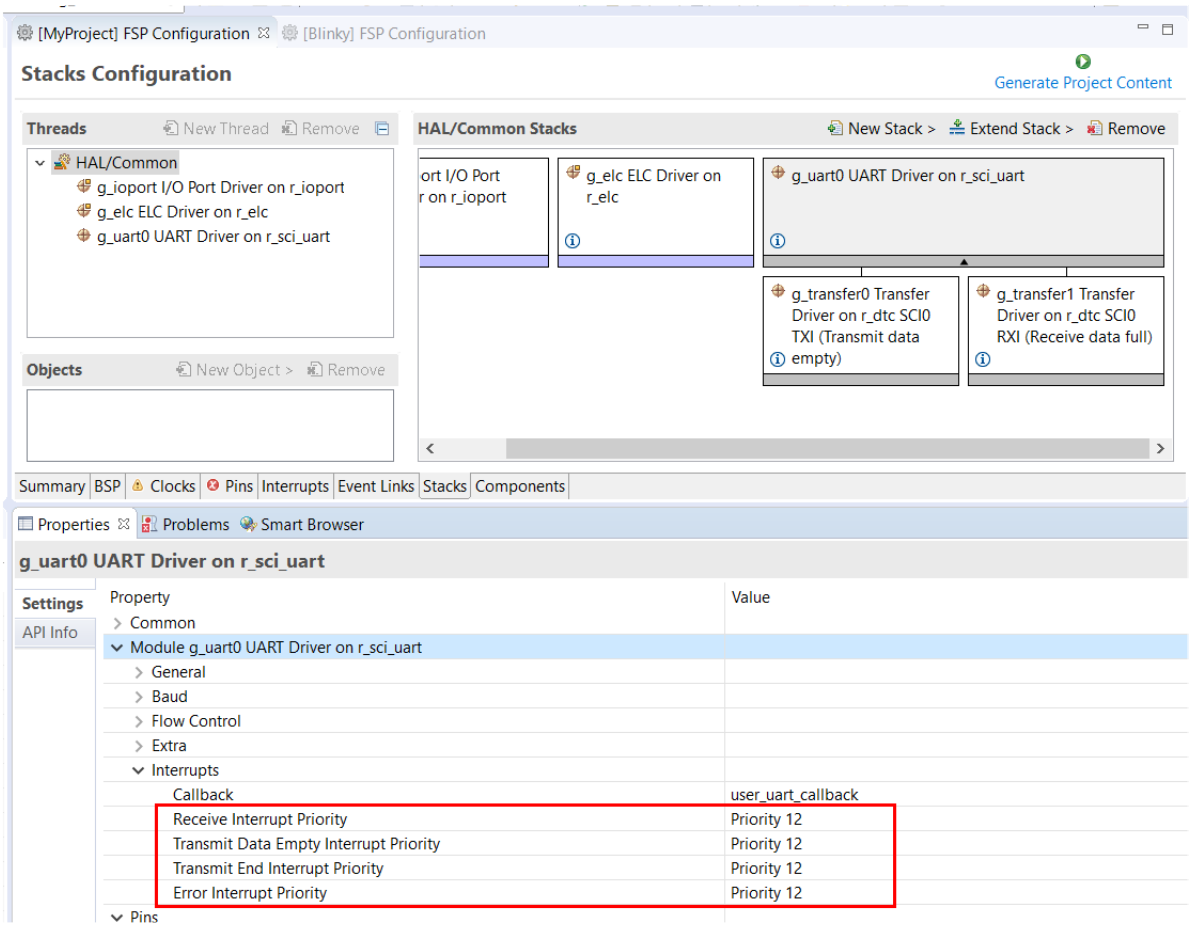

Figure 27: Configuring Interrupts in the Stacks tab

Creating Interrupts from the Interrupts Tab

On the **Interrupts** tab, the user can bypass a peripheral interrupt set by FSP by setting a user-defined ISR. This can be done by adding a new event via the **New User Event** button.

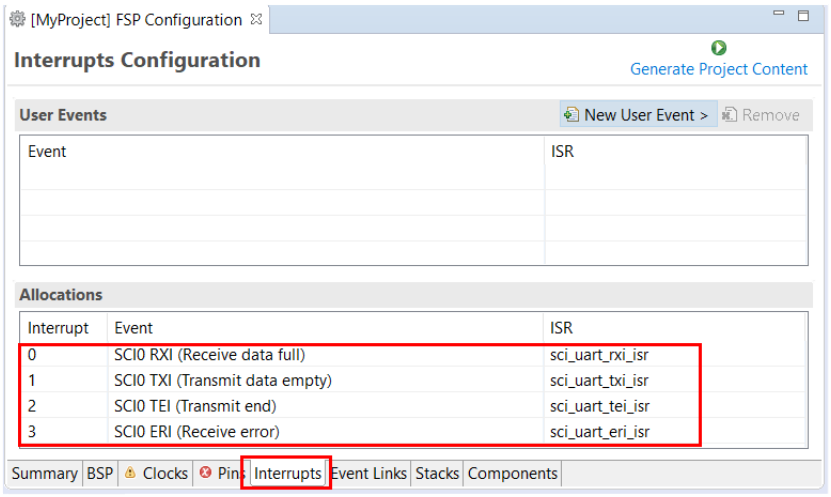

Figure 28: Configuring interrupt in Interrupt Tab

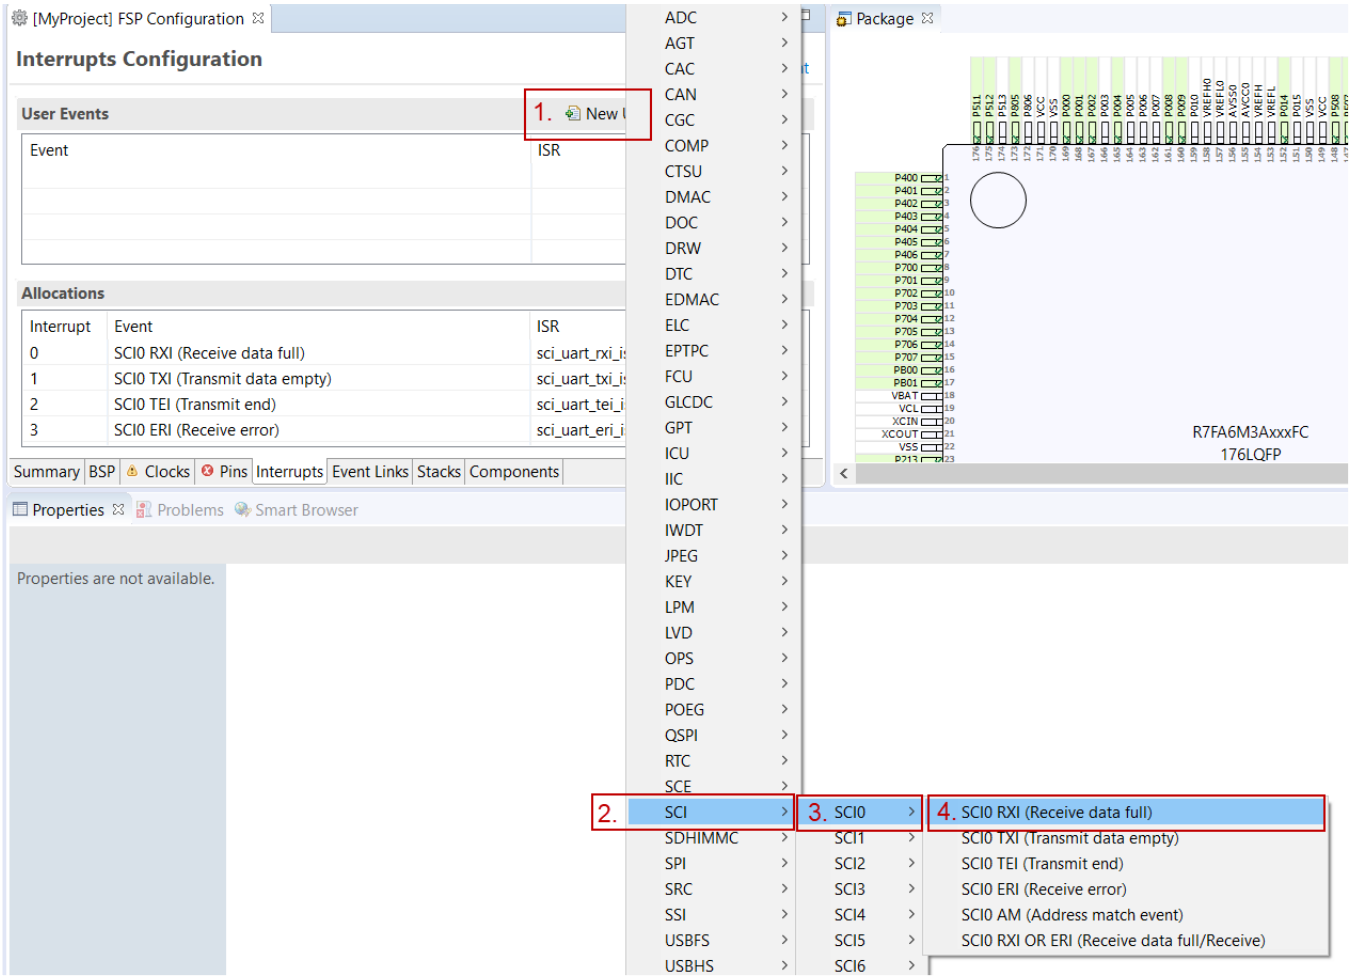

Figure 29: Adding user-defined event

Enter the name of ISR for the new user event.

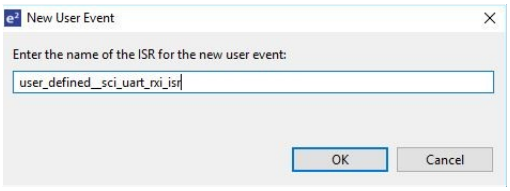

Figure 30: User-defined event ISR

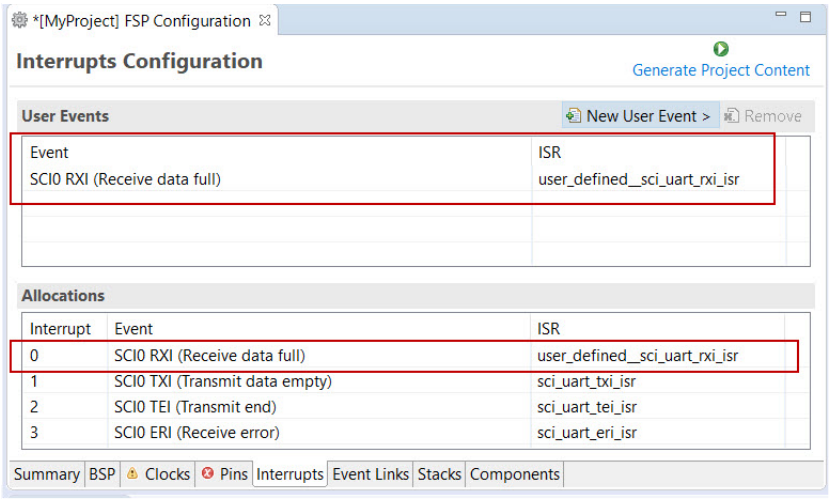

Figure 31: Using a user-defined event

3.2.5.6 Viewing Event Links

The Event Links tab can be used to view the Event Link Controller events. The events are sorted by peripheral to make it easy to find and verify them.

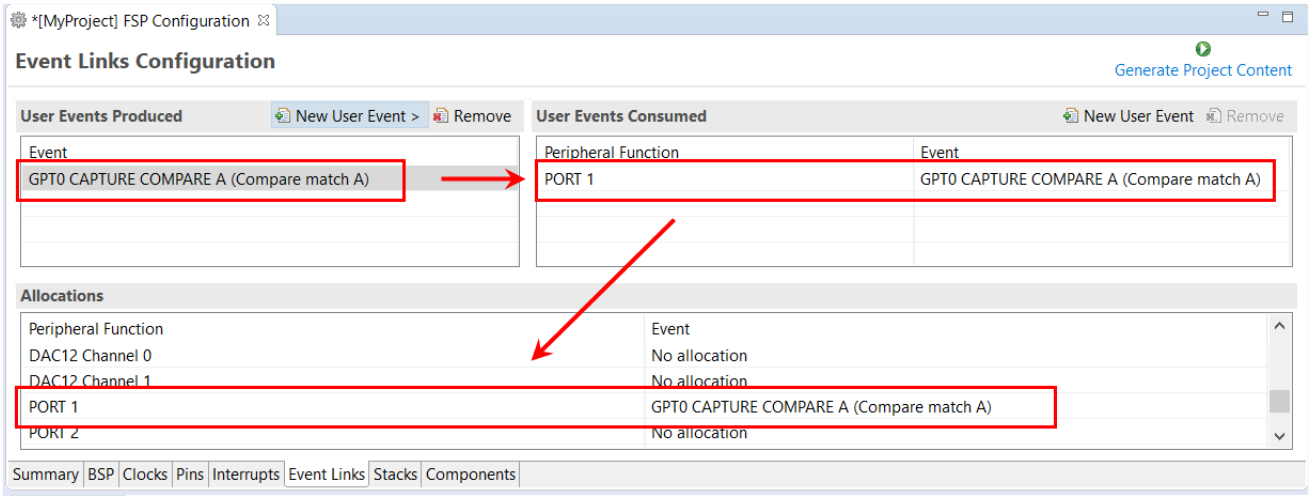

Figure 32: Viewing Event Links

Like the Interrupts tab, user-defined event sources and destinations (producers and consumers) can be defined by clicking the relevant **New User Event** button. Once a consumer is linked to a producer the link will appear in the **Allocations** section at the bottom.

Note

When selecting an ELC event to receive for a module (or when manually defining an event link), only the events that are made available by the modules configured in the project will be shown.

3.2.6 Adding Threads and Drivers

Every RTOS-based RA Project includes at least one RTOS Thread and a stack of FSP modules running

in that thread. The **Stacks** tab is a graphical user interface which helps you to add the right modules to a thread and configure the properties of both the threads and the modules associated with each thread. Once you have configured the thread, e² studio automatically generates the code reflecting your configuration choices.

For any driver, or, more generally, any module that you add to a thread, e² studio automatically resolves all dependencies with other modules and creates the appropriate stack. This stack is displayed in the Stacks pane, which e² studio populates with the selected modules and module options for the selected thread.

The default view of the **Stacks** tab includes a Common Thread called **HAL/Common**. This thread includes the driver for I/O control (IOPORT). The default stack is shown in the **HAL/Common Stacks** pane. The default modules added to the HAL/Common driver are special in that FSP only requires a single instance of each, which e² studio then includes in every user-defined thread by default.

In applications that do not use an RTOS or run outside of the RTOS, the HAL/Common thread becomes the default location where you can add additional drivers to your application.

For a detailed description on how to add and configure modules and stacks, see the following sections:

- Adding and Configuring HAL Drivers
- Adding Drivers to a Thread and Configuring the Drivers

Once you have added a module either to HAL/Common or to a new thread, you can access the driver's configuration options in the **Properties** view. If you added thread objects, you can access the objects configuration options in the **Properties** view in the same way.

You can find details about how to configure threads here: Configuring Threads

Note

Driver and module selections and configuration options are defined in the FSP pack and can therefore change when the FSP version changes.

3.2.6.1 Adding and Configuring HAL Drivers

For applications that run outside or without the RTOS, you can add additional HAL drivers to your application using the HAL/Common thread. To add drivers, follow these steps:

1. Click on the HAL/Common icon in the **Stacks** pane. The Modules pane changes to **HAL/Common Stacks**.

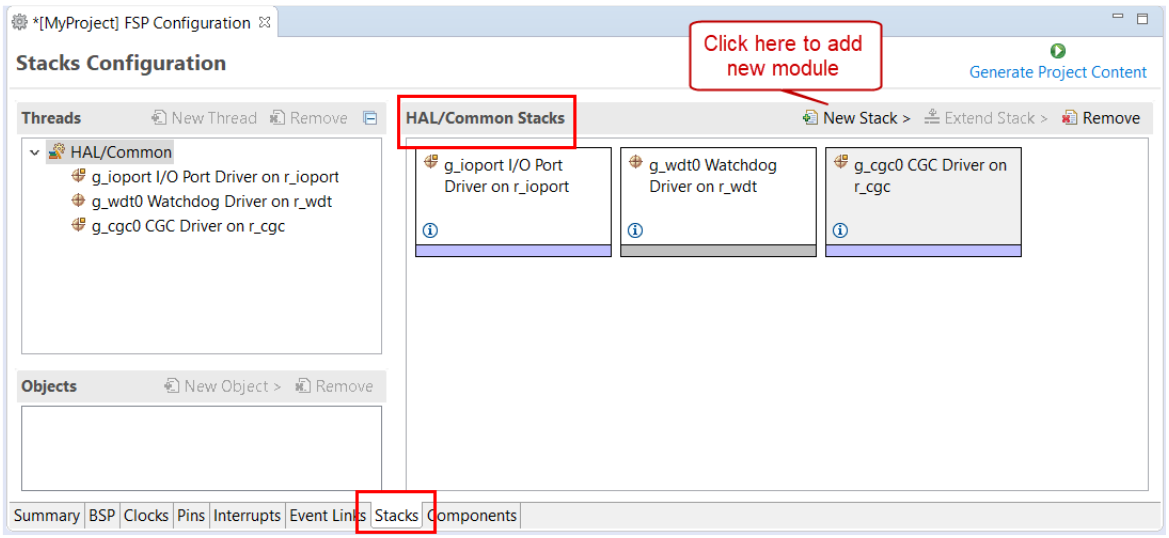

Figure 33: e² studio Project configurator - Adding drivers

2. Click **New Stack** to see a drop-down list of HAL level drivers available in FSP.

3. Select a driver from the menu **New Stack > Driver**.

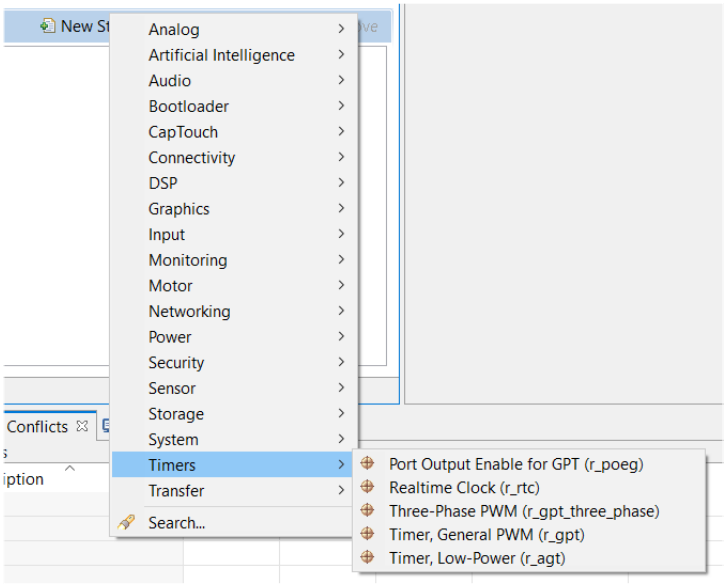

Figure 34: Select a driver

4. Select the driver module in the **HAL/Common Modules** pane and configure the driver properties in the **Properties** view.

e² studio adds the following files when you click the **Generate Project Content** button:

- The selected driver module and its files to the ra/fsp directory
- The main() function and configuration structures and header files for your application as shown in the table below.

File	Contents	Overwritten by Generate Project Content?
ra_gen/main.c	Contains main() calling generated and user code. When called, the BSP already has Initialized the MCU.	Yes
ra_gen/hal_data.c	Configuration structures for HAL Driver only modules.	Yes
ra_gen/hal_data.h	Header file for HAL driver only modules.	Yes
src/hal_entry.c	User entry point for HAL Driver only code. Add your code here.	No

The configuration header files for all included modules are created or overwritten in this folder: ra_cfg/fsp_cfg

3.2.6.2 Adding Drivers to a Thread and Configuring the Drivers

For an application that uses the RTOS, you can add one or more threads, and for each thread at least one module that runs in the thread. You can select modules from the Driver dropdown menu. To add modules to a thread, follow these steps:

1. In the **Threads** pane, click **New Thread** to add a Thread.

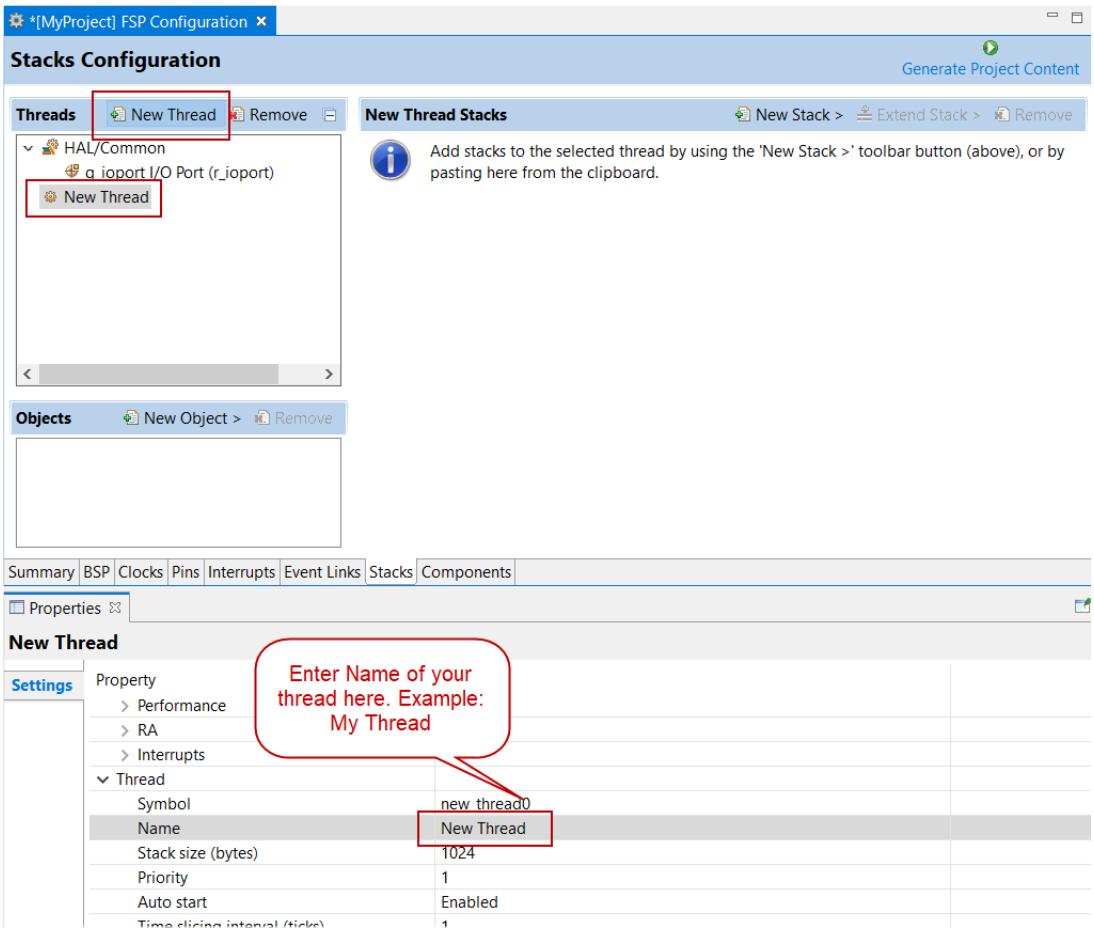

Figure 35: Adding a new RTOS Thread on the Stacks tab

2. In the **Properties** view, click on the **Name** and **Symbol** entries and enter a distinctive name and symbol for the new thread.

   Note

   *e² studio updates the name of the thread stacks pane to **My Thread Stacks**.*

3. In the **My Thread Stacks** pane, click on **New Stack** to see a list of modules and drivers. HAL-level drivers can be added here.

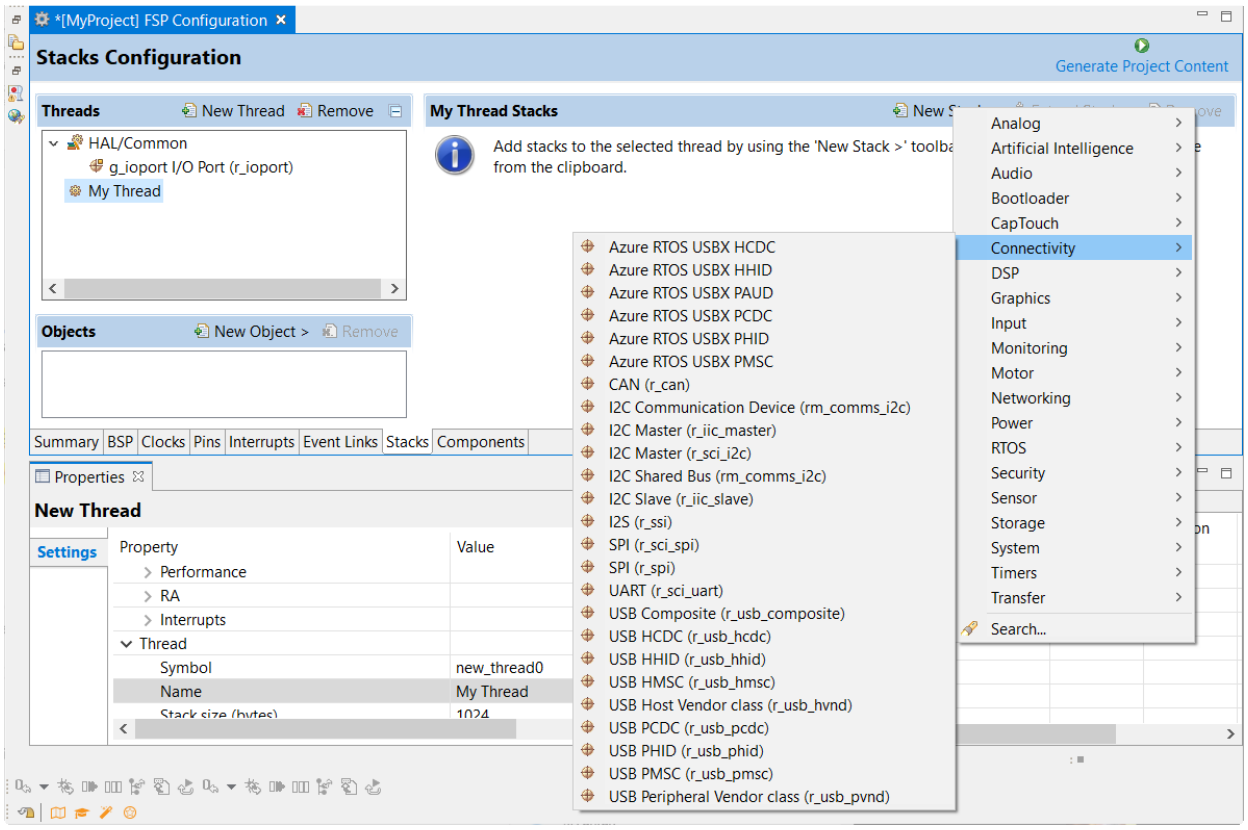

Figure 36: Adding Modules and Drivers to a thread

4. Select a module or driver from the list.

5. Click on the added driver and configure the driver as required by the application by updating the configuration parameters in the **Properties** view. To see the selected module or driver and be able to edit its properties, make sure the Thread containing the driver is highlighted in the **Threads** pane.

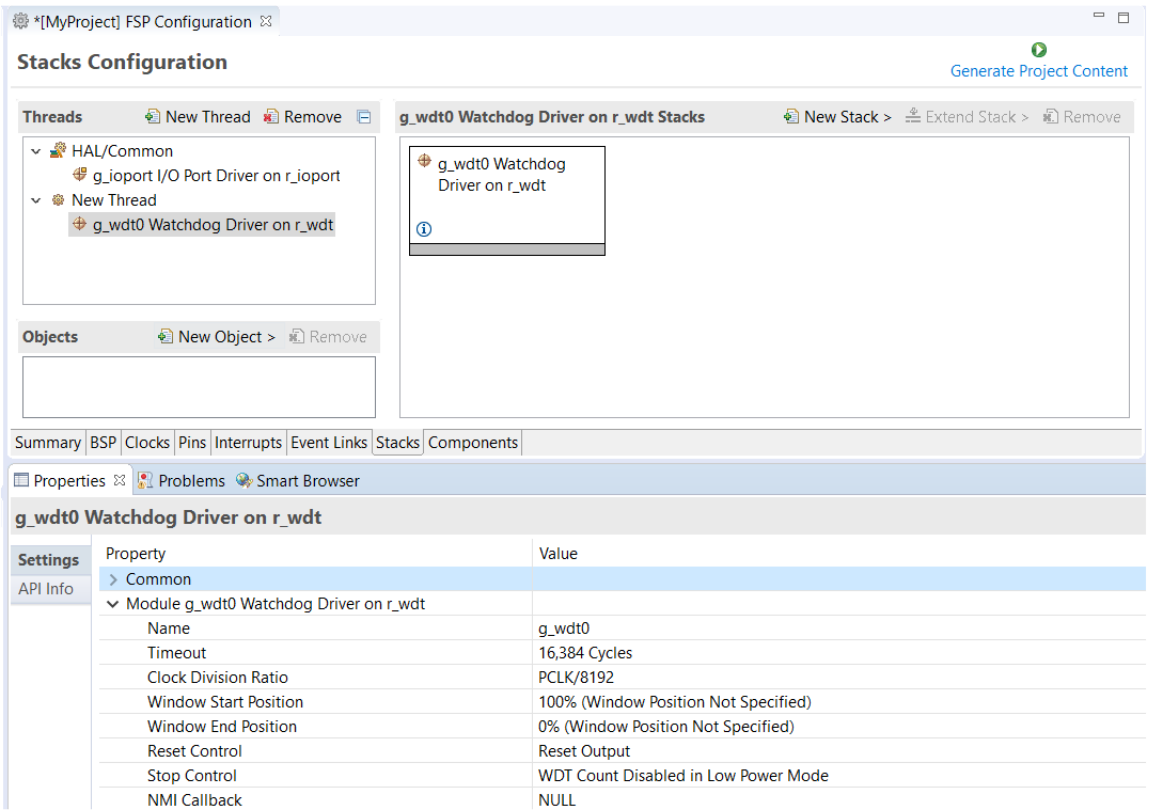

Figure 37: Configuring Module or Driver properties

6. If needed, add another thread by clicking **New Thread** in the **Threads** pane.

When you press the **Generate Project Content** button for the example above, e² studio creates the files as shown in the following table:

File	Contents	Overwritten by Generate Project Content?
ra_gen/main.c	Contains main() calling generated and user code. When called the BSP will have initialized the MCU.	Yes
ra_gen/my_thread.c	Generated thread "my_thread" and configuration structures for modules added to this thread.	Yes
ra_gen/my_thread.h	Header file for thread "my_thread"	Yes
ra_gen/hal_data.c	Configuration structures for HAL Driver only modules.	Yes
ra_gen/hal_data.h	Header file for HAL Driver only modules.	Yes
src/hal_entry.c	User entry point for HAL Driver only code. Add your code here.	No

src/my_thread_entry.c	User entry point for thread "my_thread". Add your code here.	No

The configuration header files for all included modules and drivers are created or overwritten in the following folders: ra_cfg/fsp_cfg/<header files>

3.2.6.3 Configuring Threads

If the application uses an RTOS, the **Stacks** tab can be used to simplify the creation of RTOS threads, semaphores, mutexes, and event flags.

The components of each thread can be configured from the **Properties** view as shown below.

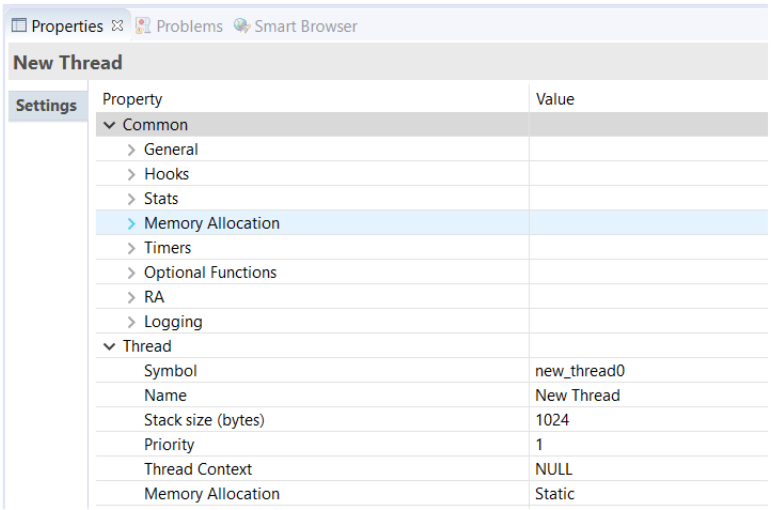

Figure 38: New Thread Properties

The **Properties** view contains settings common for all Threads (**Common**) and settings for this particular thread (**Thread**).

For this thread instance, the thread's name and properties (such as priority level or stack size) can be easily configured. e² studio checks that the entries in the property field are valid. For example, it will verify that the field **Priority**, which requires an integer value, only contains numeric values between 0 and 9.

To add RTOS resources to a Thread, select a thread and click on **New Object** in the Thread Objects pane. The pane takes on the name of the selected thread, in this case **My Thread Objects**.

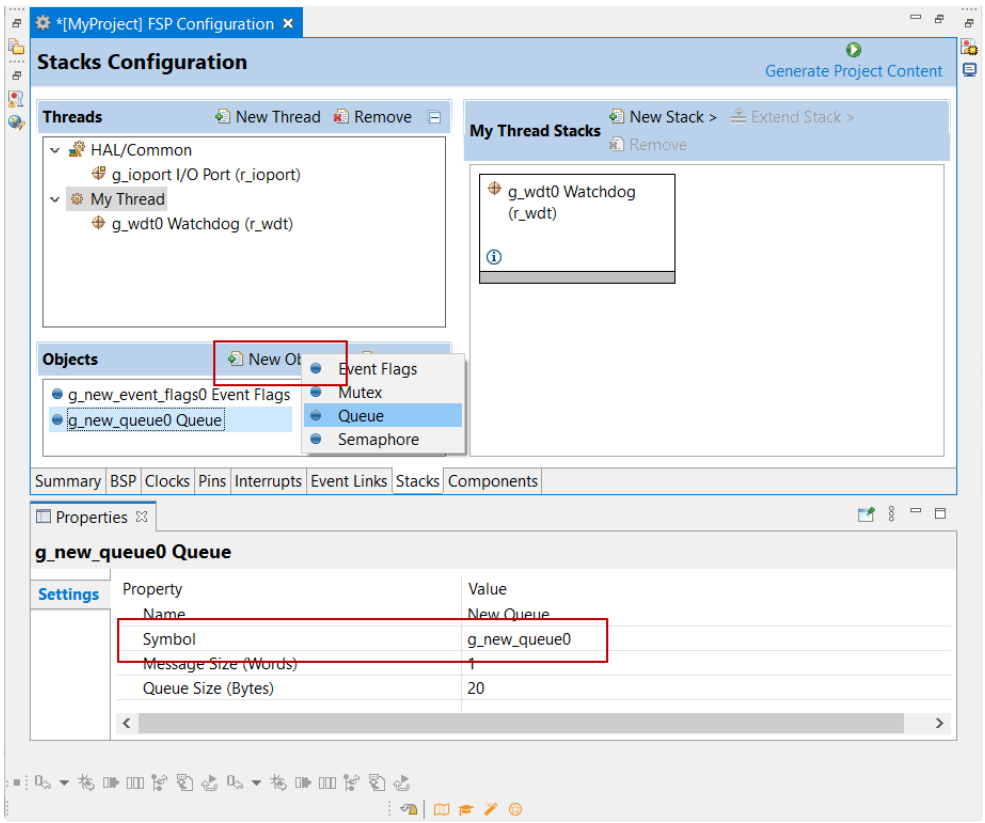

Figure 39: Configuring Thread Object Properties

Make sure to give each thread object a unique name and symbol by updating the **Name** and **Symbol** entries in the **Properties** view.

3.2.7 Reviewing and Adding Components

The **Components** tab enables the individual modules required by the application to be included or excluded. Modules common to all RA MCU projects are preselected (for example: **BSP > BSP > Board-specific BSP** and **HAL Drivers > all > r_cgc**). All modules that are necessary for the modules selected in the **Stacks** tab are included automatically. You can include or exclude additional modules by ticking the box next to the required component.

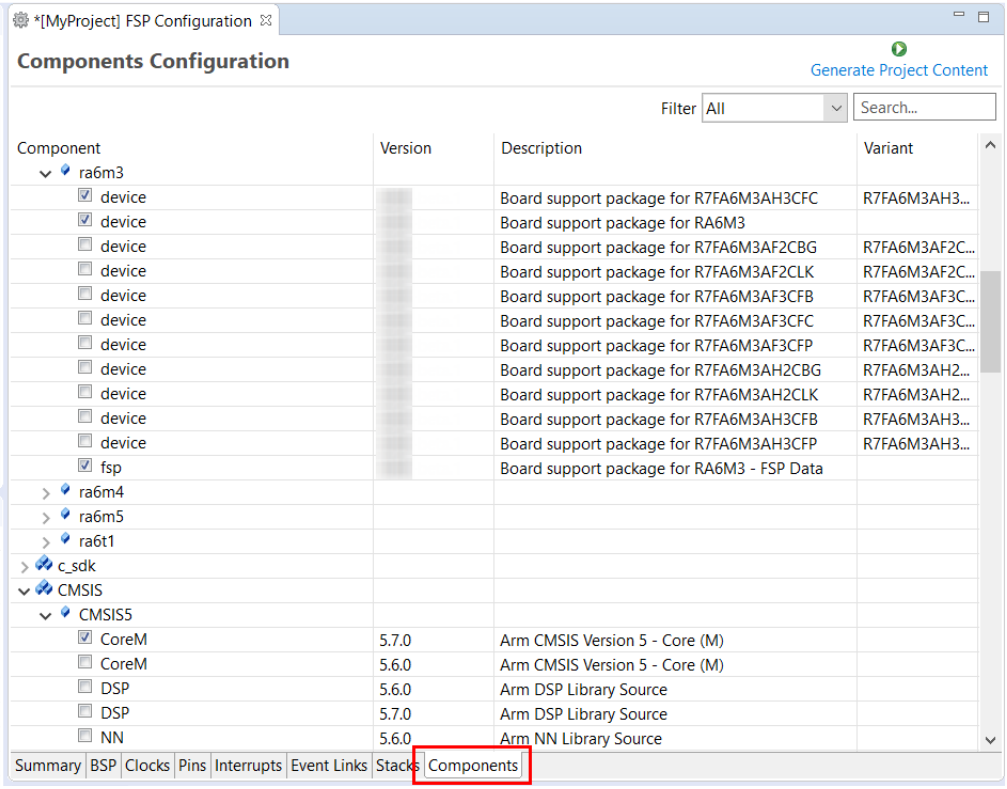

Figure 40: Components Tab

Clicking the **Generate Project Content** button copies the .c and .h files for each selected component into the following folders:

- ra/fsp/inc/api
- ra/fsp/inc/instances
- ra/fsp/src/bsp
- ra/fsp/src/<Driver_Name>

e² studio also creates configuration files in the ra_cfg/fsp_cfg folder with configuration options set in the **Stacks** tab.

3.2.8 Writing the Application

Once you have added Modules and drivers and set their configuration parameters in the **Stacks** tab, you can add the application code that calls the Modules and drivers.

Note

To check your configuration, build the project once without errors before adding any of your own application code.

3.2.8.1 Coding Features

e² studio provides several efficiency improving features that help write code. Review these features prior to digging into the code development step-by-step sections that follow.

Autocomplete

Autocomplete is a context aware coding accelerator that suggests possible completions for partially

typed-in code elements. If you can 'guess' the first part of a macro, for example, the Autocomplete function can suggest options for completing the rest of the macro.

In the following example, a macro related to a BSP_IO setting needs to be found. After typing BSP_IO_ in a source code file, pressing Ctrl + Space opens the Autocomplete list. This list shows a selection of context aware options for completing the macro. Scroll through the window to find the desired macro (in this case BSP_IO_LEVEL_HIGH) and click on it to add it to your code.

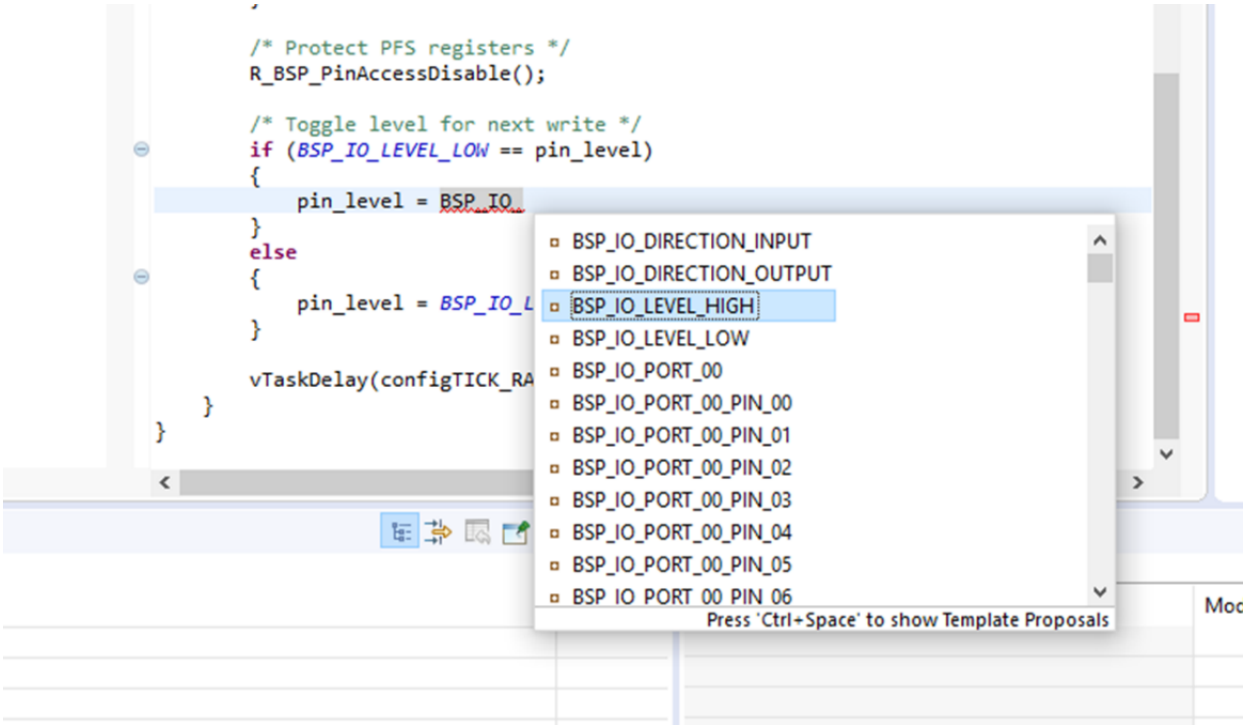

Figure 41: Autocomplete example

Other code elements can use autocomplete too. Some of the more common uses for Autocomplete include Enumerations, Types, and API functions - but try it in any situation you think the tool may have enough context to determine what you might be looking for.

For a hands-on experience using Autocomplete use the Quick FSP Labs for Creating Blinky from Scratch and Creating an RTC Blinky from Scratch. These 15-minute Do it Yourself labs take you through the step-by-step process of using Autocomplete, Developer Assistance, and the Help system.

Welcome Window

The e² studio Welcome window displays useful information and common links to assist in development. Check out these resources to see what is available. They are updated with each release, so check back to see what has been added after a new release.

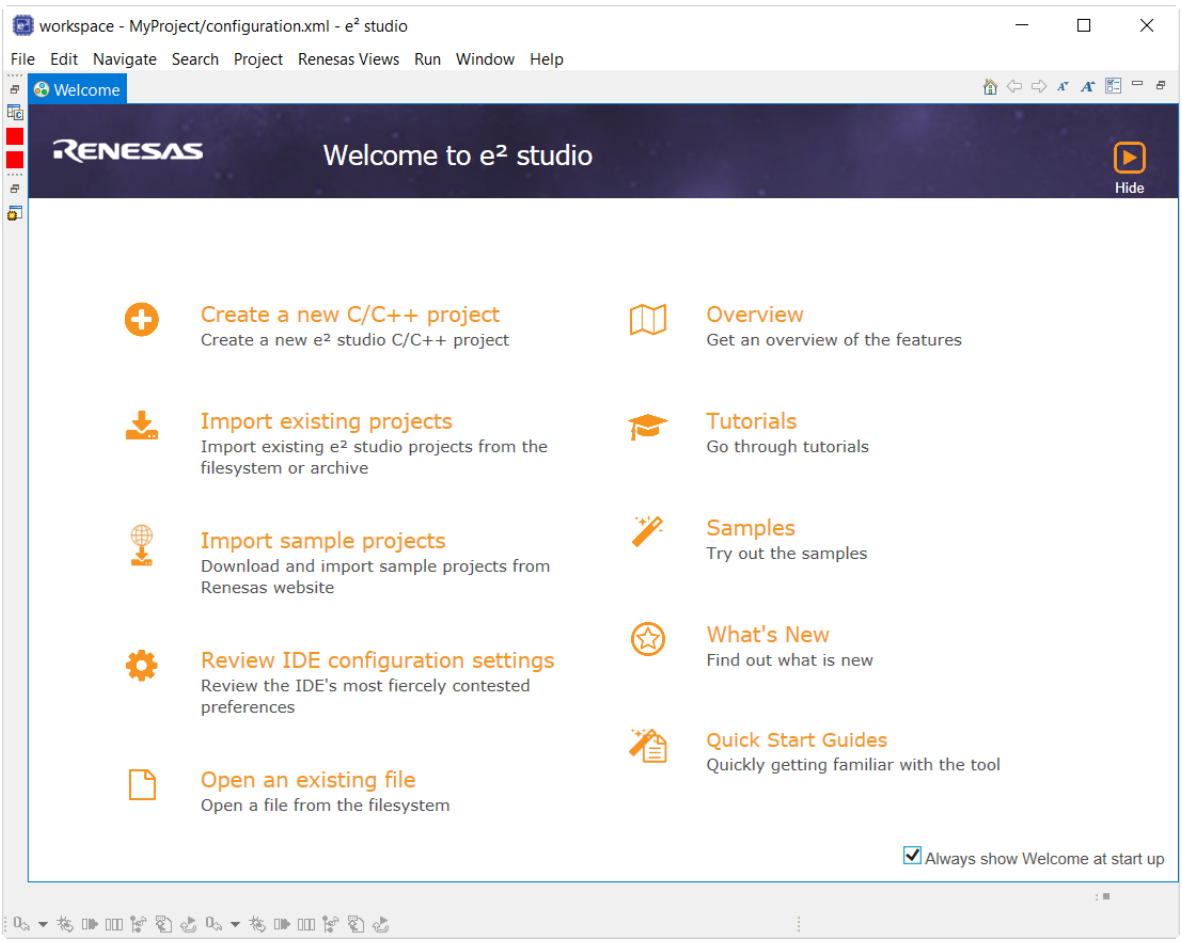

Figure 42: Welcome window

Cheat Sheets

Cheat sheets are macro driven illustrations of some common tasks. They show, step-by-step, what commands and menus are used. These will be populated with more examples on each release. Cheat Sheets are available from the **Help** menu.

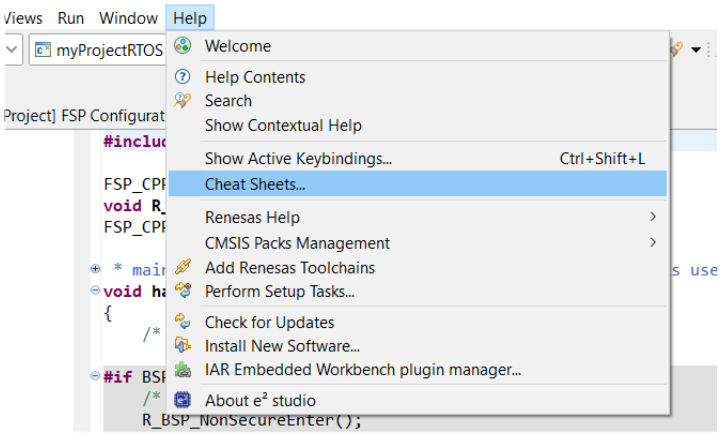

Figure 43: Cheat Sheets

Developer Assistance

FSP Developer Assistance provides developers with module and Application Programming Interface (API) reference documentation in e² studio. After configuring the threads and software stacks for an FSP project with the RA Configuration editor, Developer Assistance quickly helps you get started writing C/C++ application code for the project using the configured stack modules.

1. Expand the project explorer to view Developer Assistance

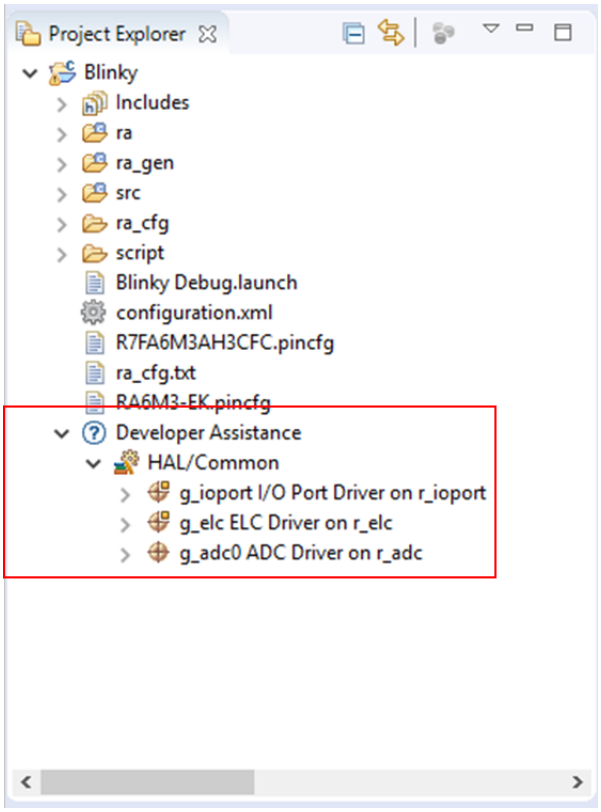

Figure 44: Developer Assistance

2. Expand a stack module to show its APIs

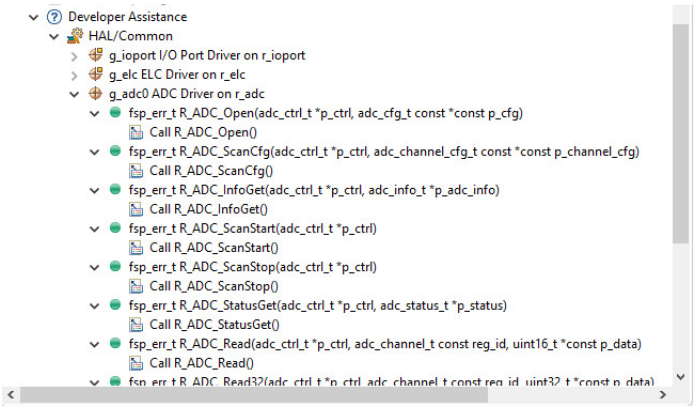

Figure 45: Developer Assistance APIs

3. Dragging and dropping an API from Develop Assistance to a source file helps to write source code quickly.

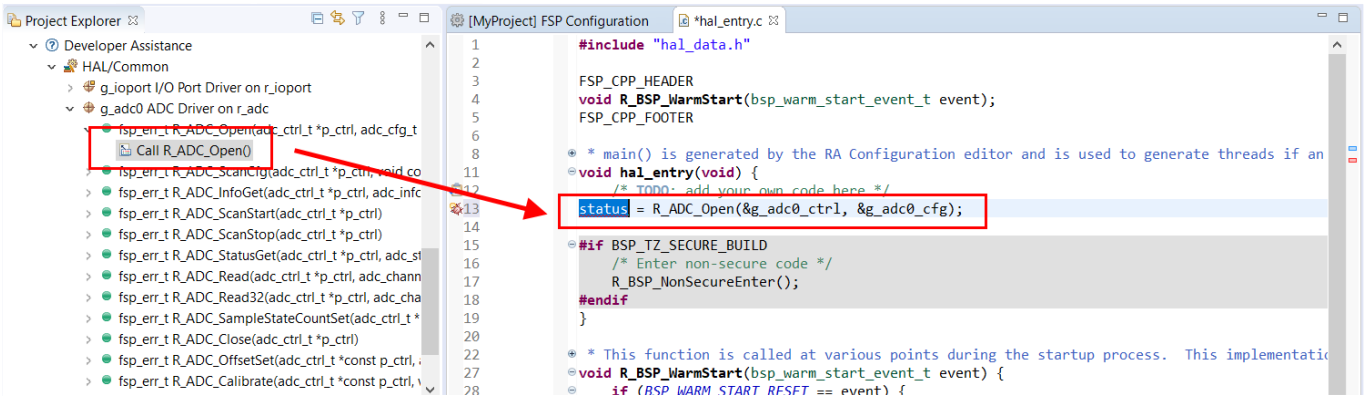

Figure 46: Dragging and Dropping an API in Developer Assistance

For a hands-on experience using Developer Assistance use the Quick FSP Labs for An Introduction to Developer Assistance, Creating Blinky from Scratch and Creating an RTC Blinky from Scratch. These 15-minute Do it Yourself labs take you through the step-by-step process of using Autocomplete, Developer Assistance, and the Help system.

Information Icon

Information icons are available on each module in the thread stack. Clicking on these icons opens a module folder on GitHub that contains additional information on the module. An example information Icon is shown below:

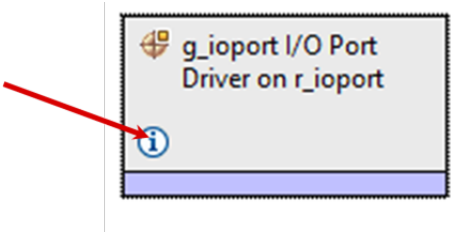

Figure 47: Information icon

IDE Help

A good source of additional information for many FSP topics is the Help system. To get to the Help system, click on **Help** and then select **Help Contents** as seen below.

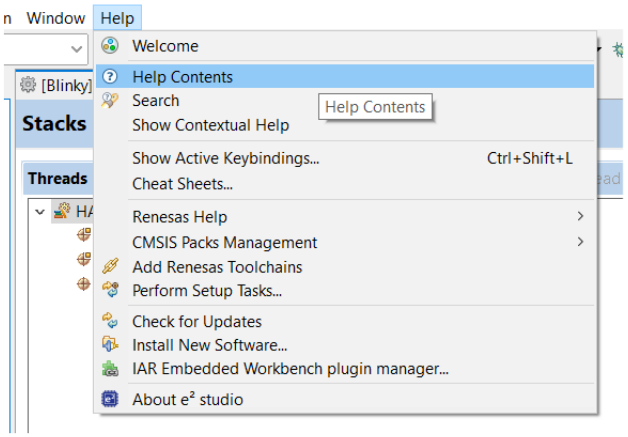

Figure 48: Opening the Help System

Once the Help system is open, select the **RA Contents** entry in the left side Guide-bar. Expand it to see the main RA Topics.

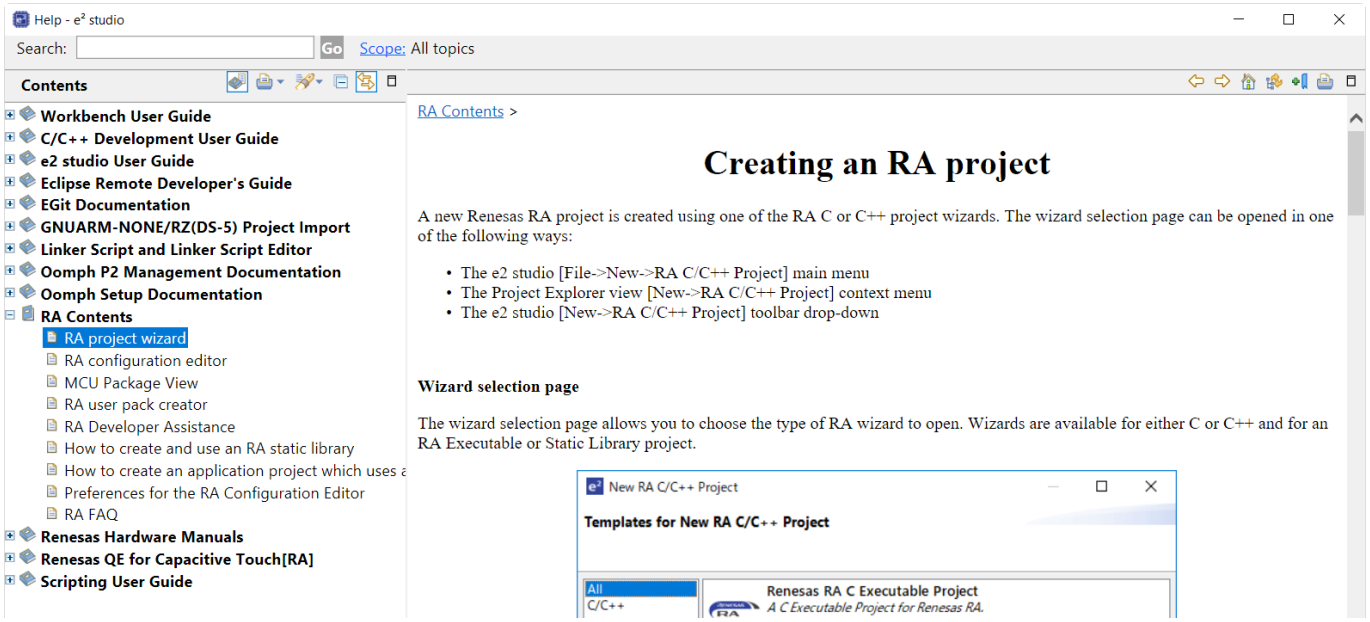

Figure 49: RA Content Help

You can also search for help topics by using the Search bar. Below is an example searching for Visual Expressions, a helpful feature in the e² studio debugger.

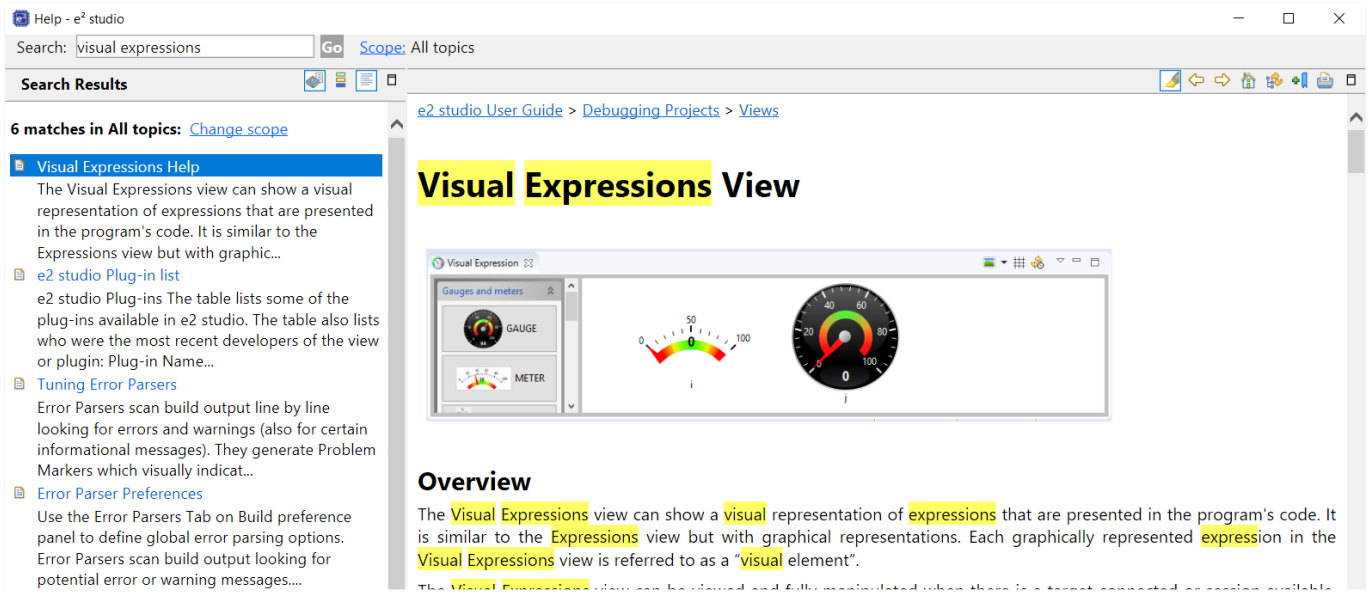

Figure 50: e² studio Help from the Search Bar

For a hands-on experience using the Help system use the Quick FSP Labs for An Introduction to Developer Assistance, Creating Blinky from Scratch and Creating an RTC Blinky from Scratch. These 15-minute Do it Yourself labs take you through the step-by-step process of using Autocomplete, Developer Assistance, and the Help system.

3.2.8.2 HAL Modules in FSP: A Practical Description

The FSP Architecture section describes FSP stacks, modules and interfaces in significant detail, providing an understanding of the theory behind them. The following sections provides a quick and practical introduction on how to use API functions when writing code and where in the API reference sections you can find useful API related information.

Introduction to HAL Modules

In FSP, HAL module drivers provide convenient API functions that access RA processor peripheral features. Module properties are defined in the RA GUI configurator, eliminating the tedious and error prone process of setting peripheral control registers. When configuration is complete, the generator automatically creates the code needed to implement the associated API functions. API functions are the main way a developer interacts with the target processor and peripherals.

HAL Driver API Function Call Formats

HAL driver API functions all have a similar format. They all start with "R_" to indicate they are HAL related functions. Next comes the module name followed by the function and any parameters. This format is illustrated below:

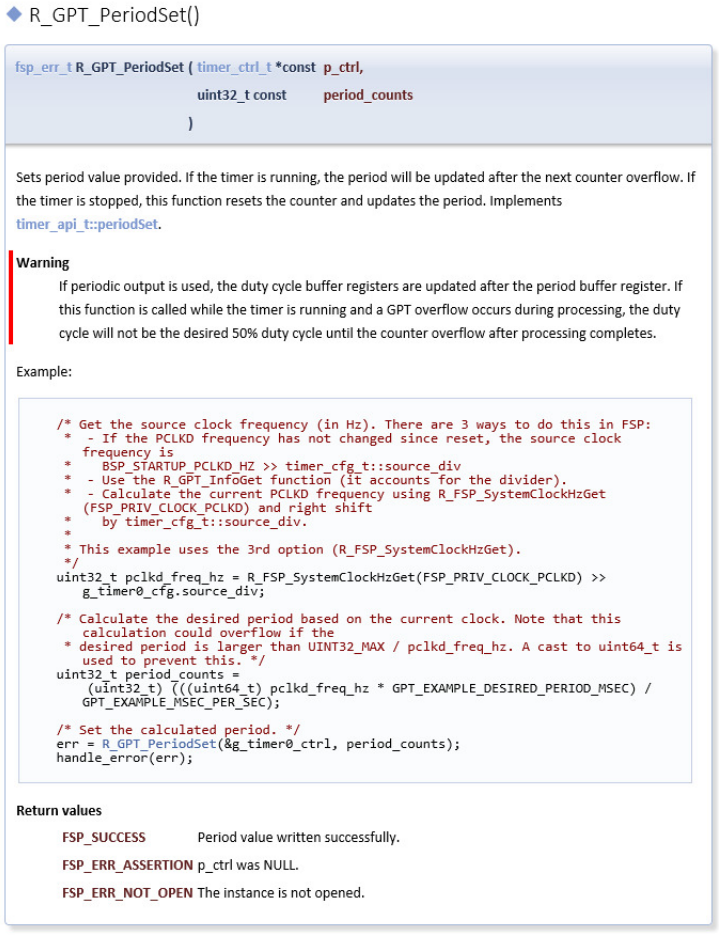
```
R_<module>_<function>(<parameters>);
```

Here are some examples:

```
status = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
status = R_GPT_Start(&g_timer0_ctrl);
status = R_GPT_PeriodSet(&g_timer0_ctrl, period);
status = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
status = R_ADC_InfoGet(&g_adc0_ctrl, &adc_info);
```

HAL Driver API Call Reference Information

Each HAL module has a useful API Reference section that includes key details on each function. The function prototype is presented first, showing the return type (usually fsp_status_t for HAL functions) and the function parameters. A short description and any warnings or notes follow the function definition. In some cases, a code snippet is included to illustrate use of the function. Finally, all possible return values are provided to assist in debugging and error management.



◆ R_GPT_PeriodSet()

```
fsp_err_t R_GPT_PeriodSet ( timer_ctrl_t *const  p_ctrl,
                            uint32_t const       period_counts
                          )
```

Sets period value provided. If the timer is running, the period will be updated after the next counter overflow. If the timer is stopped, this function resets the counter and updates the period. Implements timer_api_t::periodSet.

Warning

If periodic output is used, the duty cycle buffer registers are updated after the period buffer register. If this function is called while the timer is running and a GPT overflow occurs during processing, the duty cycle will not be the desired 50% duty cycle until the counter overflow after processing completes.

Example:

```
/* Get the source clock frequency (in Hz). There are 3 ways to do this in FSP:
 *  - If the PCLKD frequency has not changed since reset, the source clock
    frequency is
 *    BSP_STARTUP_PCLKD_HZ >> timer_cfg_t::source_div
 *  - Use the R_GPT_InfoGet function (it accounts for the divider).
 *  - Calculate the current PCLKD frequency using R_FSP_SystemClockHzGet
    (FSP_PRIV_CLOCK_PCLKD) and right shift
 *    by timer_cfg_t::source_div.
 *
 * This example uses the 3rd option (R_FSP_SystemClockHzGet).
 */
uint32_t pclkd_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) >>
    g_timer0_cfg.source_div;

/* Calculate the desired period based on the current clock. Note that this
    calculation could overflow if the
 * desired period is larger than UINT32_MAX / pclkd_freq_hz. A cast to uint64_t is
    used to prevent this. */
uint32_t period_counts =
    (uint32_t) (((uint64_t) pclkd_freq_hz * GPT_EXAMPLE_DESIRED_PERIOD_MSEC) /
    GPT_EXAMPLE_MSEC_PER_SEC);

/* Set the calculated period. */
err = R_GPT_PeriodSet(&g_timer0_ctrl, period_counts);
handle_error(err);
```

Return values

FSP_SUCCESS	Period value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

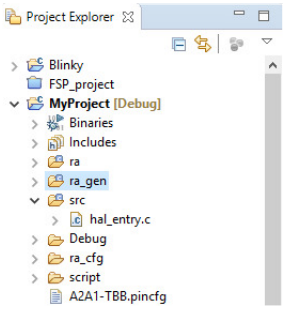
Figure 51: Module Api Reference Section Example

3.2.8.3 RTOS-Independent Applications

To write application code:

1. Add all drivers and modules in the **Stacks** tab and resolve all dependencies flagged by e² studio such as missing interrupts or drivers.
2. Configure the drivers in the **Properties** view.
3. In the Project Configuration view, click the **Generate Project Content** button.

4. In the **Project Explorer** view, double-click on the src/hal_entry.c file to edit the source file.



Note

All configuration structures necessary for the driver to be called in the application are initialized in ra_gen/hal_data.c.

Warning

Do not modify the files in the directory ra_gen. These files are overwritten every time you push the **Generate Project Content** button.

5. Add your application code here:

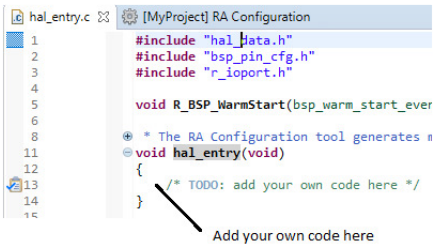


Figure 52: Adding user code to hal_entry.c

6. Build the project without errors by clicking on **Project > Build Project**.

The following tutorial shows how execute the steps above and add application code: Tutorial: Using HAL Drivers - Programming the WDT.

The WDT example is a HAL level application which does not use an RTOS. The user guides for each module also include basic application code that you can add to hal_entry.c.

3.2.8.4 RTOS Applications

To write RTOS-aware application code using RTOS, follow these steps:

1. Add a thread using the **Stacks** tab.
2. Provide a unique name for the thread in the **Properties** view for this thread.

3. Configure all drivers and resources for this thread and resolve all dependencies flagged by e² studio such as missing interrupts or drivers.
4. Configure the thread objects.
5. Provide unique names for each thread object in the **Properties** view for each object.
6. Add more threads if needed and repeat steps 1 to 5.
7. In the **RA Project Editor**, click the **Generate Project Content** button.

8. In the **Project Explorer** view, double-click on the src/my_thread_1_entry.c file to edit the source file.

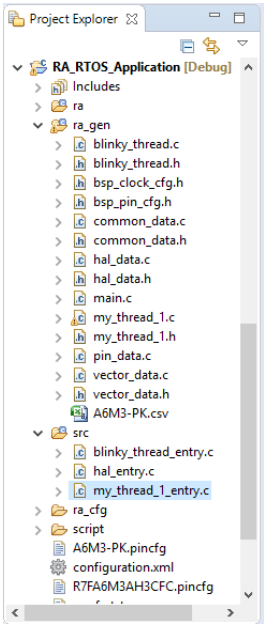

Figure 53: Generated files for an RTOS application

Note

All configuration structures necessary for the driver to be called in the application are initialized in ra_gen/my_thread_1.c and my_thread_2.c

Warning

Do not modify the files in the directory ra_gen. These files are overwritten every time you push the **Generate Project Content** button.

9. Add your application code here:

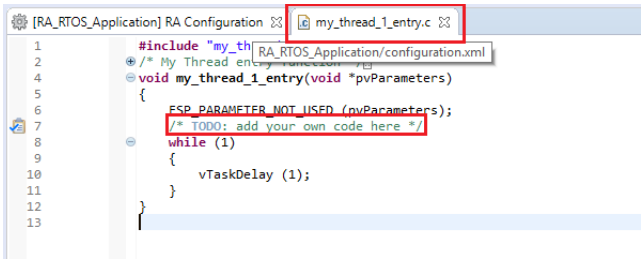

Figure 54: Adding user code to my_thread_1.entry

10. Repeat steps 1 to 9 for the next thread.

11. Build your project without errors by clicking on **Project > Build Project**.

3.2.8.5 Additional Resources for Application Development

Example Projects

A wide variety of Example Projects for FSP and RA MCUs is available on the GitHub site here: https://github.com/renesas/ra-fsp-examples. Example projects are organized by target kit so it is easy to find all the examples for your kit of choice.

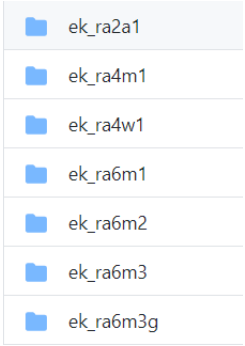

Figure 55: FSP Example Projects Organized by Kit

Projects are available as both downloadable zip files and as project source files. Typically, there is a project for each module. New example projects are being added periodically, so check back if a particular module isn't yet available.

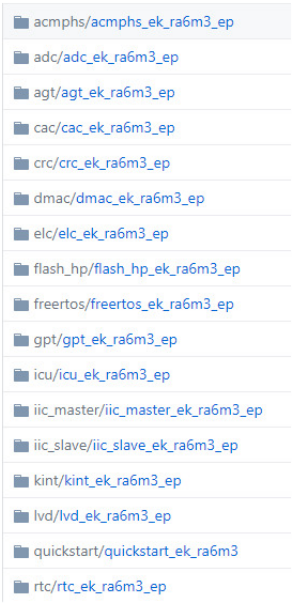

Figure 56: A Selection of Example Projects Available on GitHub

Quick Labs

A variety of Hands-on Do It Yourself labs are available on the Renesas RA and FSP Knowledge Base. Quick FSP Labs target the EK-RA6M3 kit and typically require only 15 minutes to complete. Each lab covers a couple related development tools and techniques like Autocomplete, Developer Assistance,

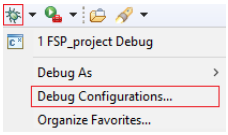
console I/O over RTT, and Visual Expressions, that can speed up the development process. A list of all available Quick Labs can be found here: https://en-support.renesas.com/knowledgeBase/19450948

3.2.9 Debugging the Project

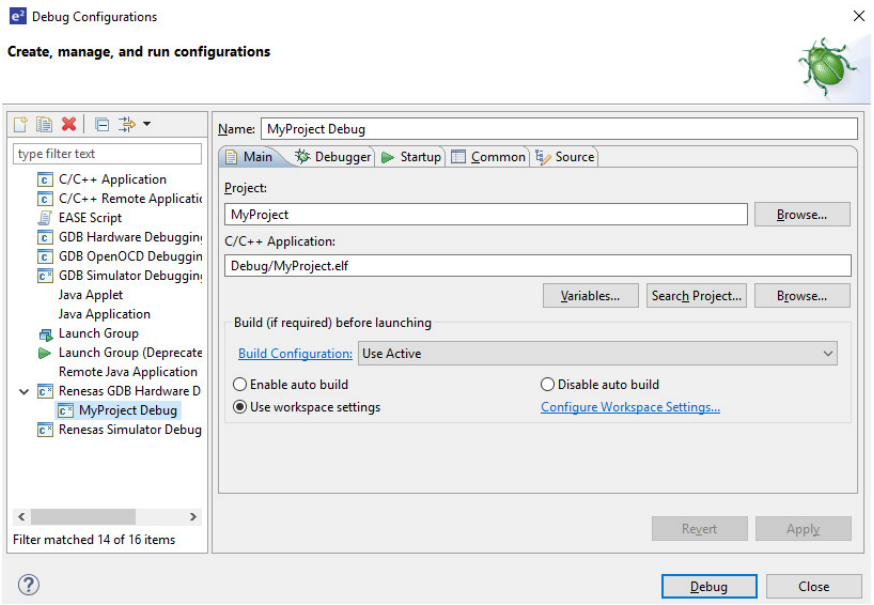
Once your project builds without errors, you can use the Debugger to download your application to the board and execute it.

To debug an application follow these steps:

1. On the drop-down list next to the debug icon, select **Debug Configurations**.



2. In the **Debug Configurations** view, click on your project listed as **MyProject Debug**.



3. Connect the board to your PC via either a standalone Segger J-Link debugger, a Segger J-Link On-Board (included on all RA EKs), or an E2 or E2 Lite and click **Debug**.

Note

For details on using J-Link and connecting the board to the PC, see the Quick Start Guide included in the RA MCU Kit.

3.2.10 Modifying Toolchain Settings

There are instances where it may be necessary to make changes to the toolchain being used (for example, to change optimization level of the compiler or add a library to the linker). Such modifications can be made from within e² studio through the menu **Project > Properties > C/C++ Build > Settings** when the project is selected. The following screenshots show the settings dialogs for the GNU Arm and LLVM toolchains. The dialog looks slightly different depending upon the toolchain being used.

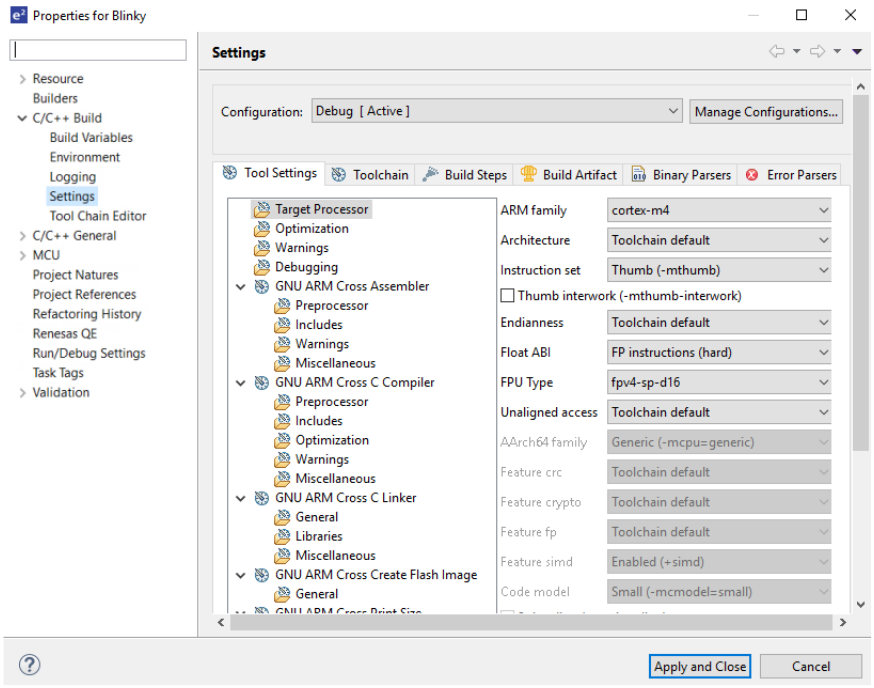


Figure 57: e² studio Project toolchain settings for GNU Arm

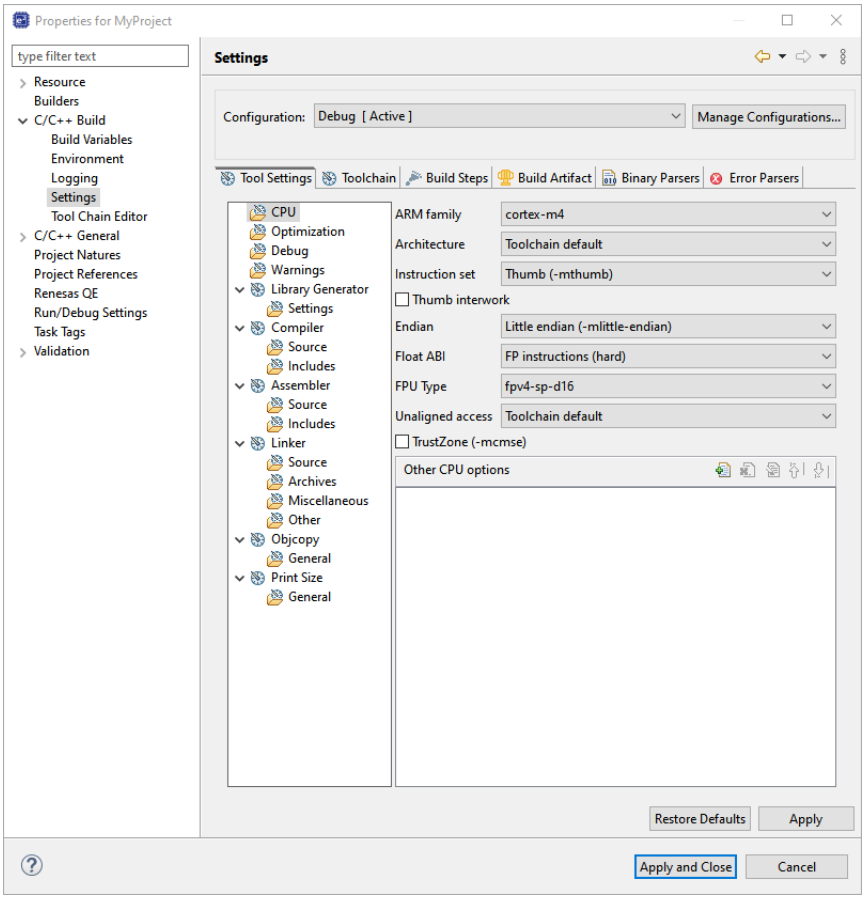

Figure 58: e² studio Project toolchain settings for LLVM

The scope for the settings is project scope which means that the settings are valid only for the project being modified.

The settings for the linker which control the location of the various memory sections are contained in a script file specific for the device being used. This script file is included in the project when it is created and is found in the script folder (for example, /script/a6m3.ld).

3.2.11 Creating RA project with Arm Compiler 6 in e² studio

e² studio does not include the Arm Compiler 6 (AC6) toolchain by default. Follow the steps below to integrate AC6 into e² studio and create an AC6 RA project.

Note

It is assumed that the user is already familiar with RA project creation in e² studio. e² studio does not include Arm Compiler 6 (AC6) toolchain by default.

Steps 1 through 8 describe the process for integrating Arm Compiler 6 into e² studio.

1. Download, install, and configure license for the AC6 toolchain (https://developer.arm.com/tools-and-software/embedded/arm-compiler/downloads/version-6).
2. Launch e² studio.
3. Go to **Window > Preferences > Toolchains**.

4. Click **Add**.

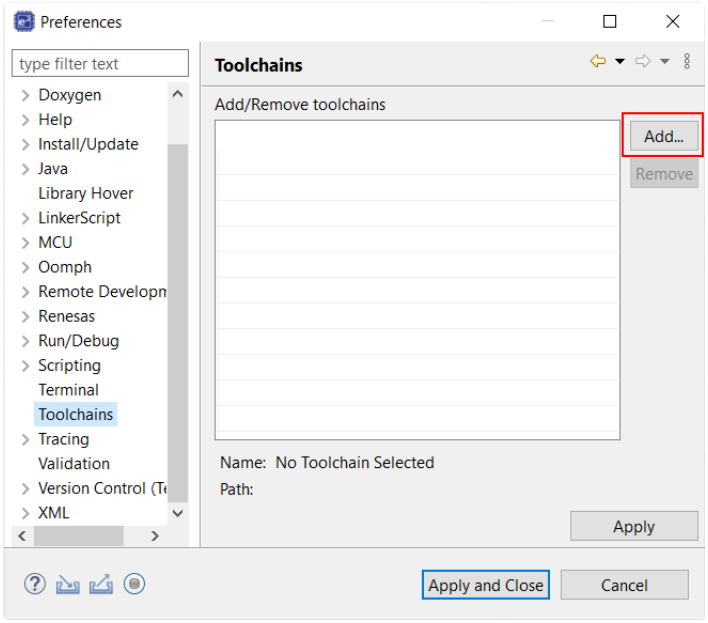

Figure 59: Add Toolchain

5. Browse to the path where AC6 toolchain is installed and select the \bin folder. Click **Next**.

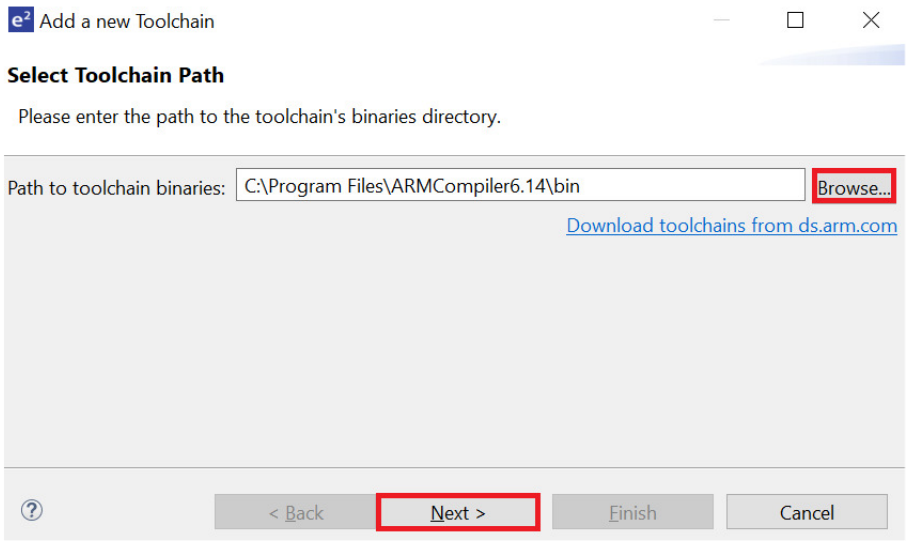

Figure 60: Browse to AC6 Compiler

6. Toolchain information in displayed. Click **Finish**.

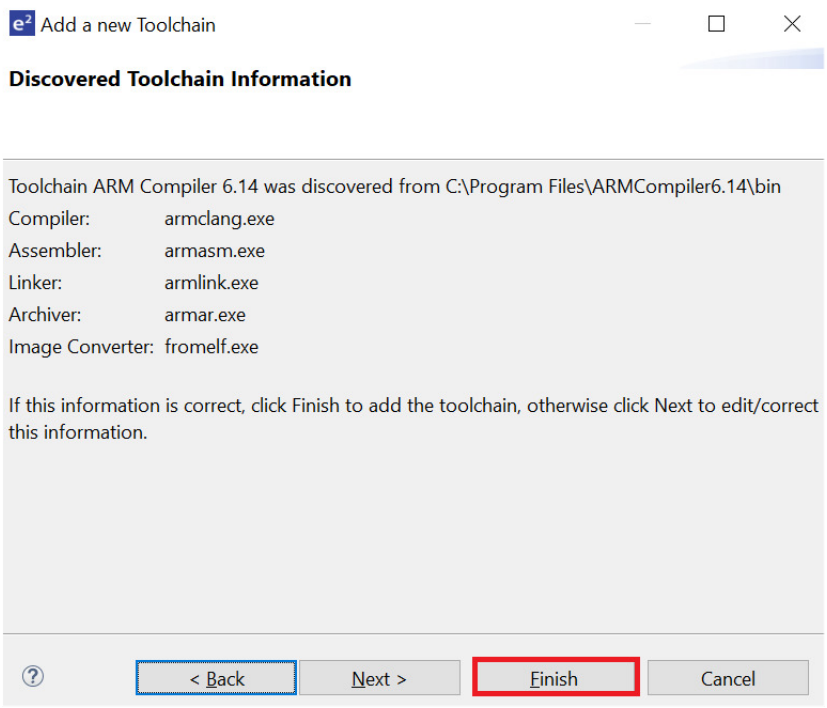

Figure 61: Toolchain Information

7. Click **Apply and Close**.

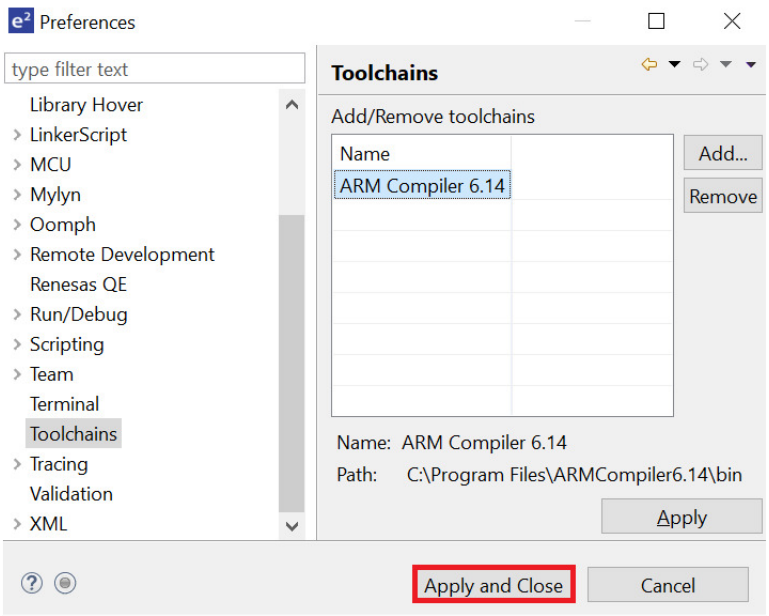

Figure 62: Apply and Close

8. Click **Restart Eclipse** when prompted.

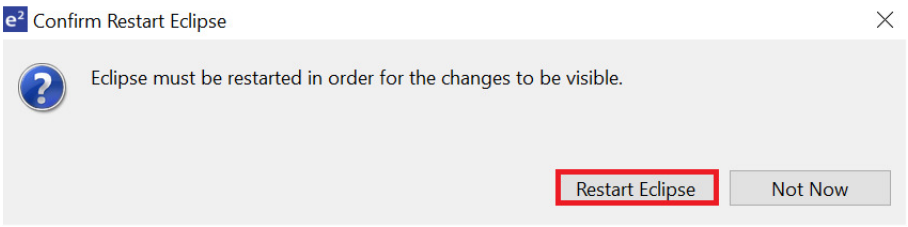

Figure 63: Restart Eclipse

9. When creating a new RA C/C++ project, select **ARM Compiler 6** included in the Toolchains section.

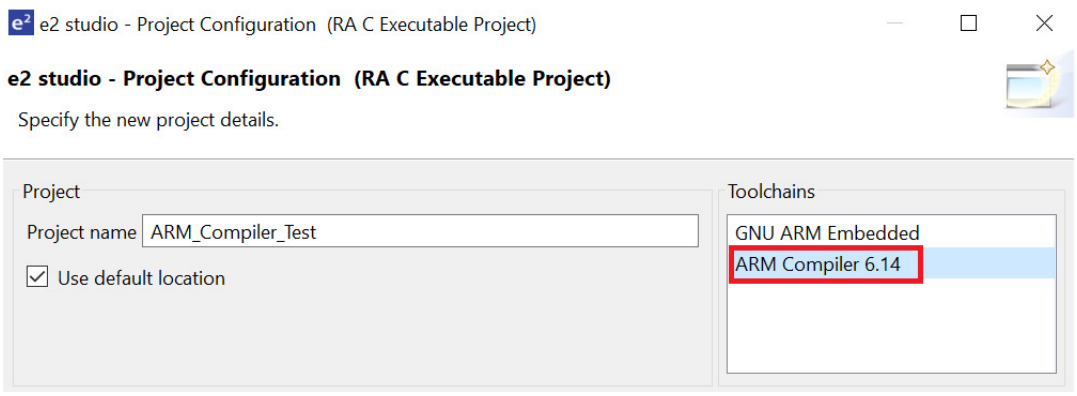

Figure 64: Select Arm Compiler

3.2.12 Importing an Existing Project into e² studio

1. Start by opening e² studio.
2. Open an existing Workspace to import the project and skip to step d. If the workspace doesn't exist, proceed with the following steps:

    a. At the end of e² studio startup, you will see the Workspace Launcher Dialog box as shown in the following figure.

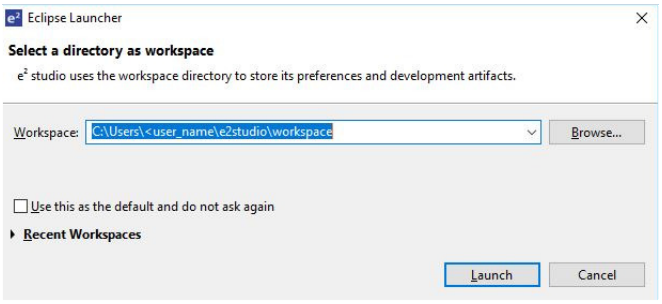

Figure 65: Workspace Launcher dialog

b. Enter a new workspace name in the Workspace Launcher Dialog as shown in the following figure. e² studio creates a new workspace with this name.

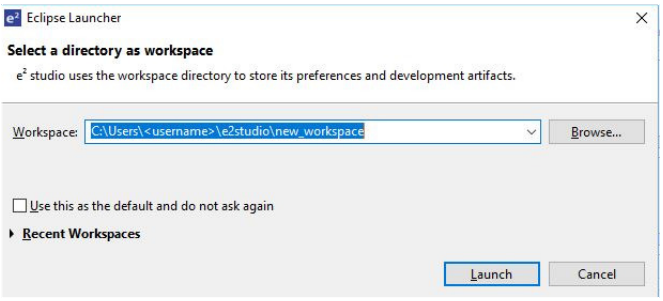

Figure 66: Workspace Launcher dialog - Select Workspace

c. Click **Launch**.

d. When the workspace is opened, you may see the Welcome Window. Click on the **Hide** arrow button to proceed past the Welcome Screen as seen in the following figure.

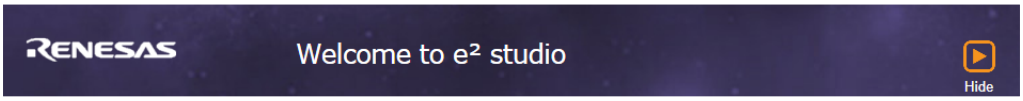

Figure 67: Workbench arrow button

3. You are now in the workspace that you want to import the project into. Click the **File** menu in the menu bar, as shown in the following figure.

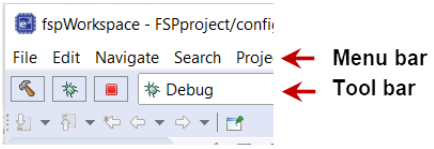

Figure 68: Menu and tool bar

4. Click **Import** on the **File** menu or in the menu bar, as shown in the following figure.

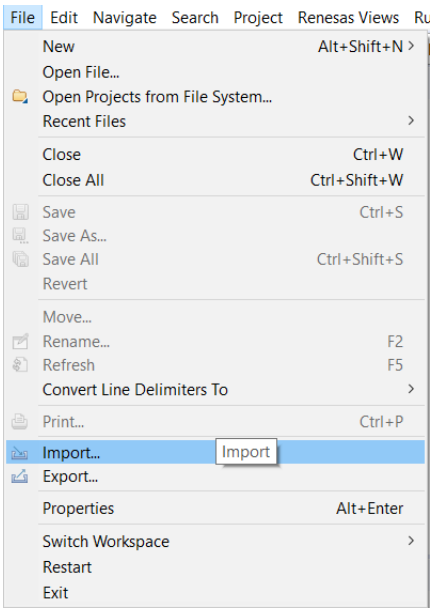

Figure 69: File drop-down menu

5. In the **Import** dialog box, as shown in the following figure, choose the **General** option, then **Existing Projects into Workspace**, to import the project into the current workspace.

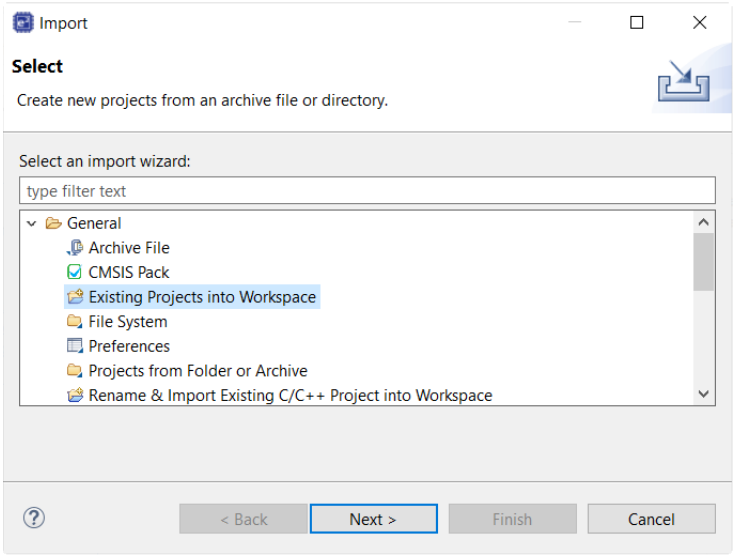

Figure 70: Project Import dialog with "Existing Projects into Workspace" option selected

6. Click **Next**.
7. To import the project, use either **Select archive file** or **Select root directory**.

    a. Click **Select archive file** as shown in the following figure.

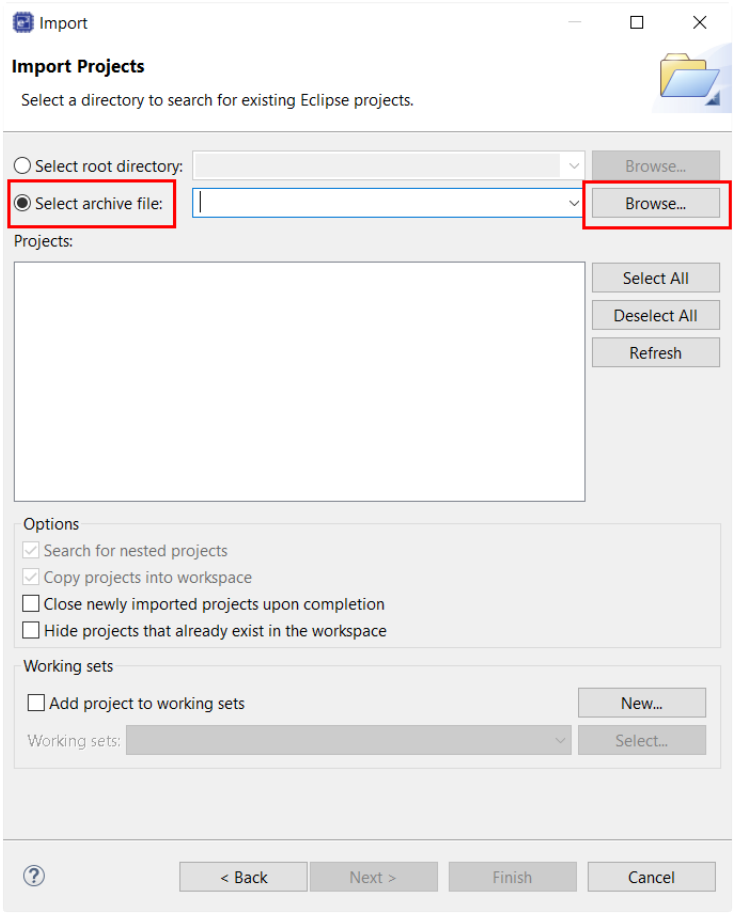

Figure 71: Import Existing Project dialog 1 - Select archive file

b. Click **Select root directory** as shown in the following figure.

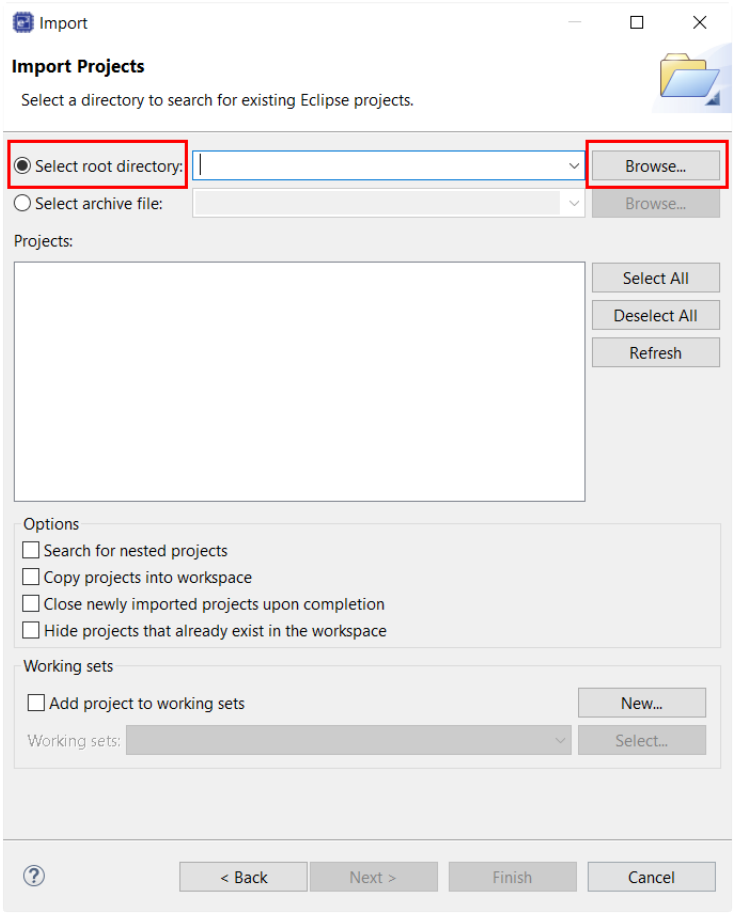

Figure 72: Import Existing Project dialog 1 - Select root directory

8. Click **Browse**.
9. For **Select archive file**, browse to the folder where the zip file for the project you want to import is located. For **Select root directory**, browse to the project folder that you want to import.
10. Select the file for import. In our example, it is CAN_HAL_MG_AP.zip or CAN_HAL_MG_AP.
11. Click **Open**.

12. Select the project to import from the list of **Projects**, as shown in the following figure.

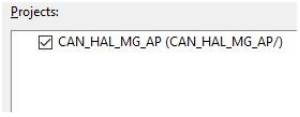

Figure 73: Import Existing Project dialog 2

13. Click **Finish** to import the project.

3.2.13 Using Semihosting in a Project

Note

printf requires use of the heap (BSP Tab -> Properties -> RA Common -> Heap size (bytes))

When using certain standard C I/O functions such as printf and scanf semihosting must be initialized

for them to work correctly with the **Renesas Debug Virtual Console**. In order to setup semihosting a call to initialise_monitor_handles should be added somewhere in your application before any semihosting related calls are made. Here is an example declaration and call:

```
extern void initialise_monitor_handles(void); /* Add this declaration before calling.
*/

initialise_monitor_handles(); /* Add this call to your application. */
```

3.3 Tutorial: Your First RA MCU Project - Blinky

3.3.1 Tutorial Blinky

The goal of this tutorial is to quickly get acquainted with the Flexible Platform by moving through the steps of creating a simple application using e² studio and running that application on an RA MCU board.

3.3.2 What Does Blinky Do?

The application used in this tutorial is Blinky, traditionally the first program run in a new embedded development environment.

Blinky is the "Hello World" of microcontrollers. If the LED blinks you know that:

- The toolchain is setup correctly and builds a working executable image for your chip.
- The debugger has installed with working drivers and is properly connected to the board.
- The board is powered up and its jumper and switch settings are probably correct.
- The microcontroller is alive, the clocks are running, and the memory is initialized.

The Blinky example application used in this tutorial is designed to run the same way on all boards offered by Renesas that hold the RA microcontroller. The code in Blinky is completely board independent. It does the work by calling into the BSP (board support package) for the particular board it is running on. This works because:

- Every board has at least one LED connected to a GPIO pin.
- That one LED is always labelled LED1 on the silk screen.
- Every BSP supports an API that returns a list of LEDs on a board, and their port and pin assignments.

3.3.3 Prerequisites

To follow this tutorial, you need:

- Windows based PC
- e² studio
- Flexible Software Package
- An RA MCU board kit

3.3.4 Create a New Project for Blinky

The creation and configuration of an RA MCU project is the first step in the creation of an application.

The base RA MCU pack includes a pre-written Blinky example application that is simple and works on all Renesas RA MCU boards.

Follow these steps to create an RA MCU project:

1. In e² studio, click **File > New > C/C++ Project > Renesas RA** and select **Renesas RA C/C++ Project**.
2. Assign a name to this new project. Blinky is a good name to use for this tutorial.

3. Click **Next**. The **Project Configuration** window shows your selection.

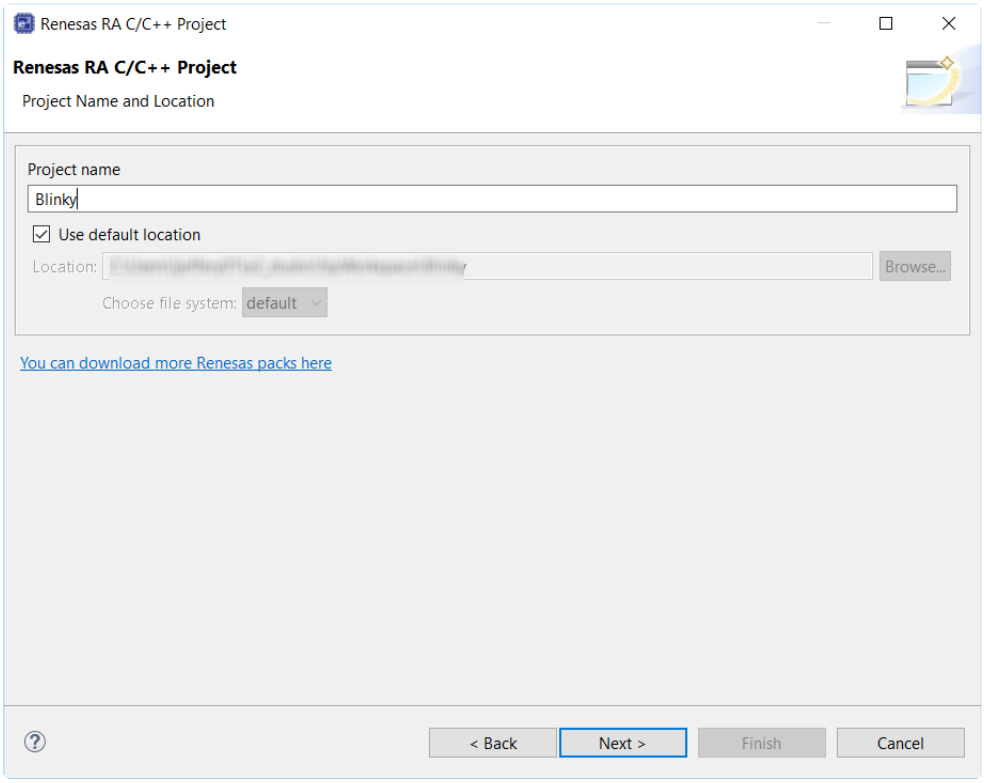

Figure 74: e² studio Project Configuration window (part 1)

4. Select the board support package by selecting the name of your board from the **Device Selection** drop-down list and click **Next**.

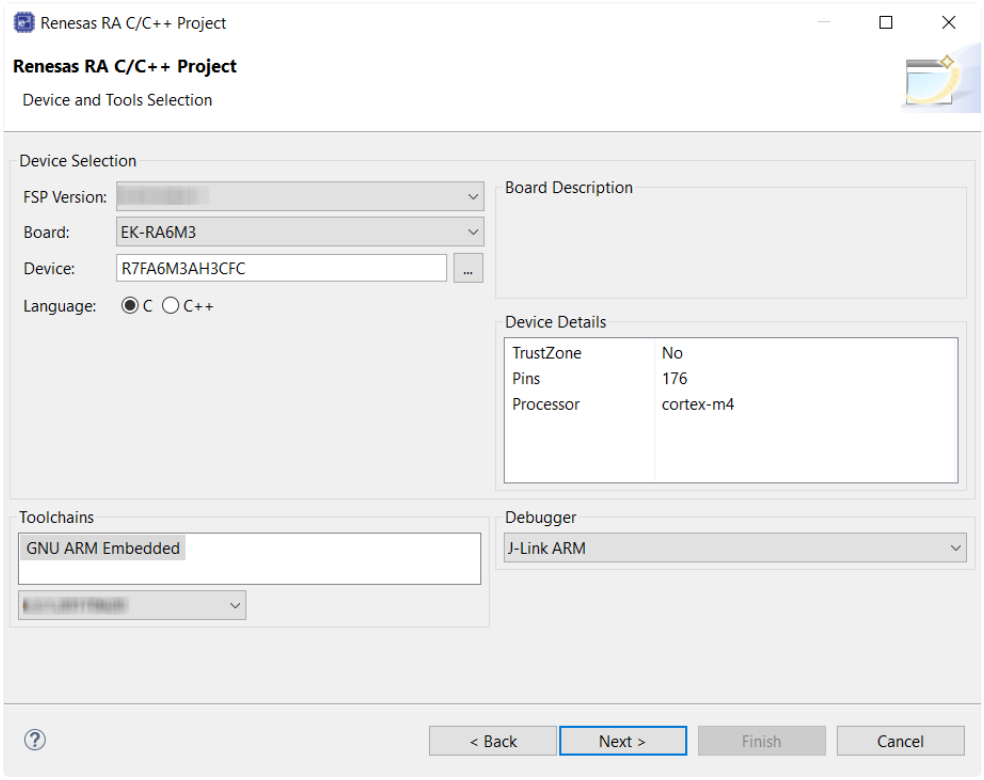

Figure 75: e² studio Project Configuration window (part 2)

5. Select the build artifact and RTOS.

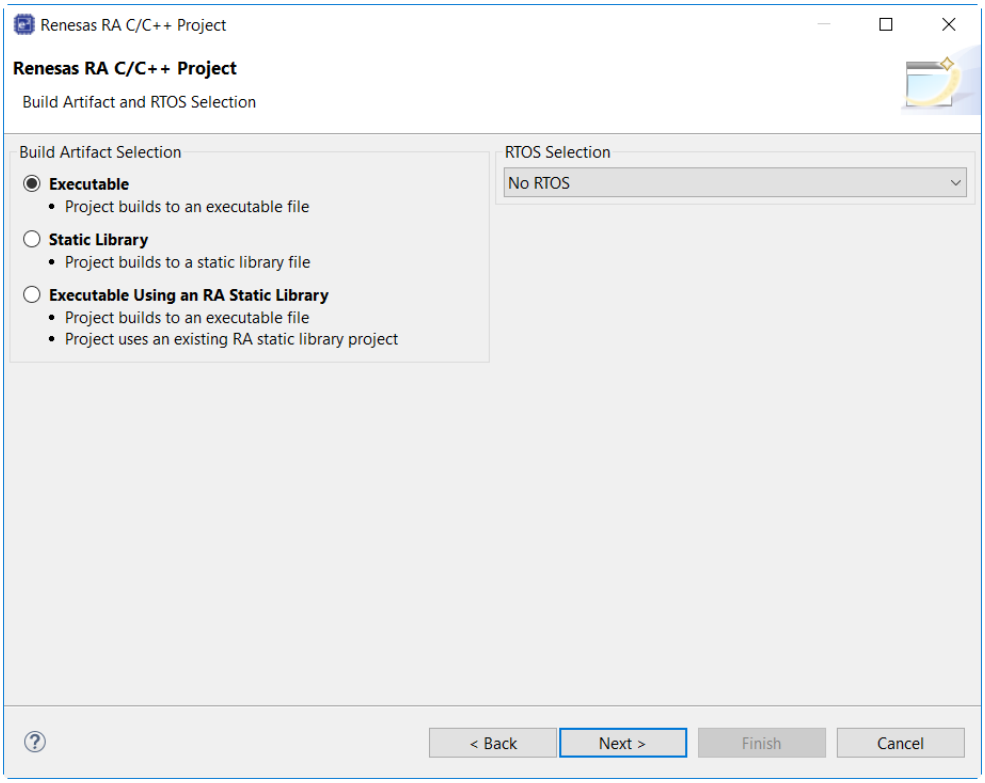

Figure 76: e² studio Project Configuration window (part 3)

6. Select the Blinky template for your board and click **Finish**.

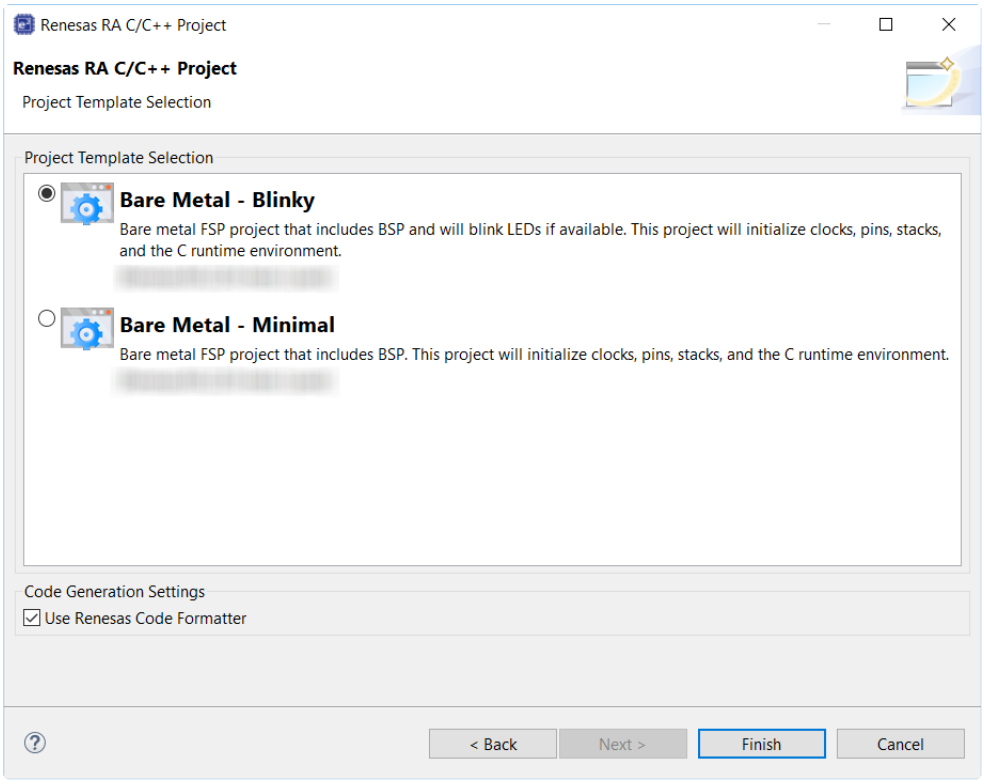

Figure 77: e² studio Project Configuration window (part 4)

Once the project has been created, the name of the project will show up in the **Project Explorer** window of e² studio. Now click the **Generate Project Content** button in the top right corner of the **Project Configuration** window to generate your board specific files.

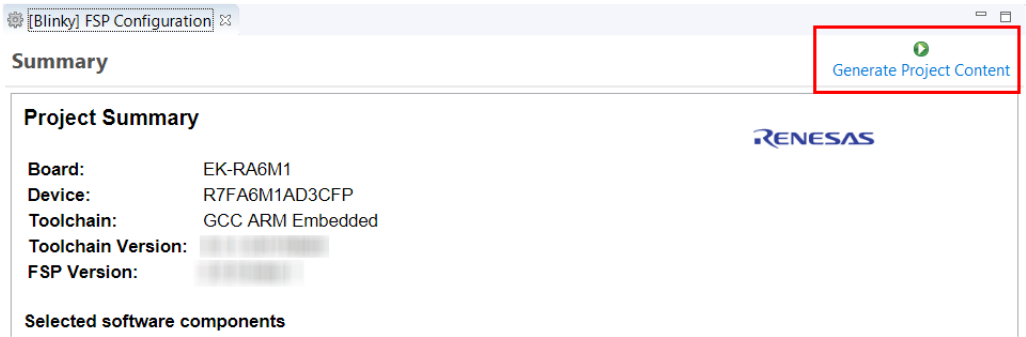

Figure 78: e² studio Project Configuration tab

Your new project is now created, configured, and ready to build.

3.3.4.1 Details about the Blinky Configuration

The **Generate Project Content** button creates configuration header files, copies source files from templates, and generally configures the project based on the state of the **Project Configuration** screen.

For example, if you check a box next to a module in the **Components** tab and click the **Generate Project Content** button, all the files necessary for the inclusion of that module into the project will be copied or created. If that same check box is then unchecked those files will be deleted.

3.3.4.2 Configuring the Blinky Clocks

By selecting the Blinky template, the clocks are configured by e² studio for the Blinky application. The clock configuration tab (see Configuring Clocks) shows the Blinky clock configuration. The Blinky clock configuration is stored in the BSP clock configuration file (see BSP Clock Configuration).

3.3.4.3 Configuring the Blinky Pins

By selecting the Blinky template, the GPIO pins used to toggle the LED1 are configured by e² studio for the Blinky application. The pin configuration tab shows the pin configuration for the Blinky application (see Configuring Pins). The Blinky pin configuration is stored in the BSP configuration file (see BSP Pin Configuration).

3.3.4.4 Configuring the Parameters for Blinky Components

The Blinky project automatically selects the following HAL components in the Components tab:

- r_ioport

To see the configuration parameters for any of the components, check the **Properties** tab in the HAL window for the respective driver (see Adding and Configuring HAL Drivers).

3.3.4.5 Where is main()?

The main function is located in < project >/ra_gen/main.c. It is one of the files that are generated during the project creation stage and only contains a call to hal_entry(). For more information on generated files, see Adding and Configuring HAL Drivers.

3.3.4.6 Blinky Example Code

The blinky application is stored in the hal_entry.c file. This file is generated by e² studio when you select the Blinky Project template and is located in the project's src/ folder.

The application performs the following steps:

1. Get the LED information for the selected board by bsp_leds_t structure.
2. Define the output level HIGH for the GPIO pins controlling the LEDs for the selected board.
3. Get the selected system clock speed and scale down the clock, so the LED toggling can be observed.
4. Toggle the LED by writing to the GPIO pin with R_BSP_PinWrite((bsp_io_port_pin_t) pin, pin_level);

3.3.5 Build the Blinky Project

Highlight the new project in the **Project Explorer** window by clicking on it and build it.

There are three ways to build a project:

1. Click on **Project** in the menu bar and select **Build Project**.
2. Click on the hammer icon.
3. Right-click on the project and select **Build Project**.

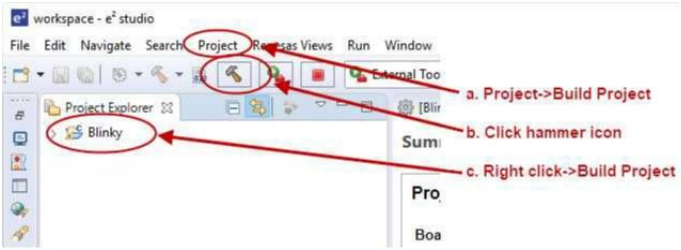

Figure 79: e² studio Project Explorer window

Once the build is complete a message is displayed in the build **Console** window that displays the final image file name and section sizes in that image.

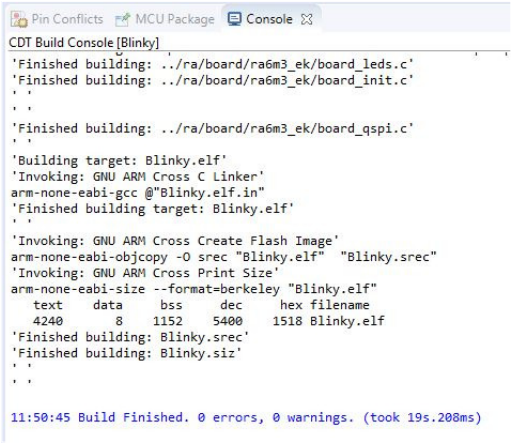

Figure 80: e² studio Project Build console

3.3.6 Debug the Blinky Project

3.3.6.1 Debug prerequisites

To debug the project on a board, you need

- The board to be connected to e² studio
- The debugger to be configured to talk to the board
- The application to be programmed to the microcontroller

Applications run from the internal flash of your microcontroller. To run or debug the application, the application must first be programmed to the microcontroller's flash. There are two ways to do this:

- JTAG debugger
- Built-in boot-loader via UART or USB

Some boards have an on-board JTAG debugger and others require an external JTAG debugger connected to a header on the board.

Refer to your board's user manual to learn how to connect the JTAG debugger to e² studio.

3.3.6.2 Debug steps

To debug the Blinky application, follow these steps:

1. Configure the debugger for your project by clicking **Run > Debugger Configurations ...**

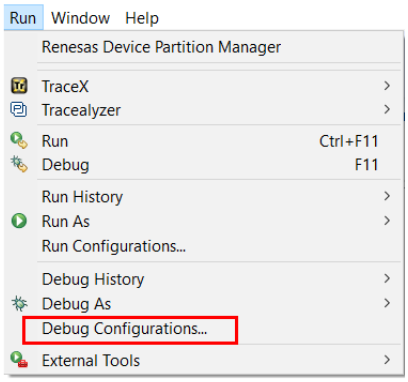

Figure 81: e² studio Debug icon

or by selecting the drop-down menu next to the bug icon and selecting **Debugger Configurations ...**

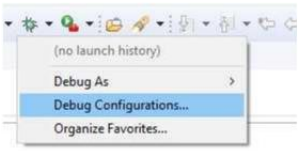

Figure 82: e² studio Debugger Configurations selection option

2. Select your debugger configuration in the window. If it is not visible then it must be created by clicking the **New** icon in the top left corner of the window. Once selected, the **Debug Configuration** window displays the Debug configuration for your Blinky project.

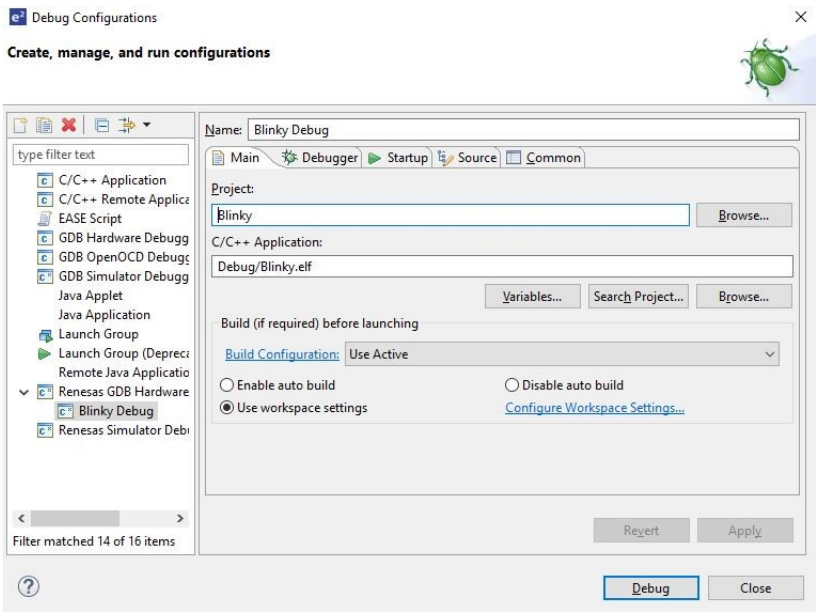

Figure 83: e² studio Debugger Configurations window with Blinky project

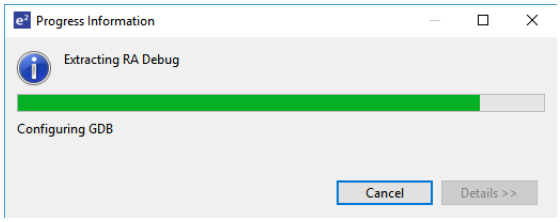
3. Click **Debug** to begin debugging the application.

4. Extracting RA Debug.



3.3.6.3 Details about the Debug Process

In debug mode, e² studio executes the following tasks:

1. Downloading the application image to the microcontroller and programming the image to the internal flash memory.
2. Setting a breakpoint at main().
3. Setting the stack pointer register to the stack.
4. Loading the program counter register with the address of the reset vector.
5. Displaying the startup code where the program counter points to.

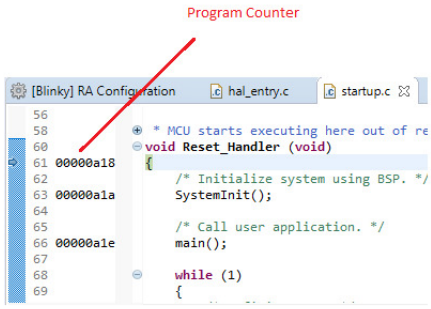


Figure 84: e² studio Debugger memory window

3.3.7 Run the Blinky Project

While in Debug mode, click **Run > Resume** or click on the **Play** icon twice.

Figure 85: e² studio Debugger Play icon

The LEDs on the board marked LED1, LED2, and LED3 should now be blinking.

3.4 Tutorial: Using HAL Drivers - Programming the WDT

3.4.1 Application WDT

This tutorial illustrates the creation of a simple application that uses the Watchdog Timer module to monitor program operation. The tutorial shows each step in the development process and in particular identifies the auto-generated files and project structure created when using FSP and its GUI based configurator. The level of detail provided here is more than is normally needed during development but can be helpful in explaining how FSP works behind the scenes to simplify your work.

This application makes use of the following FSP modules:

- MCU Board Support Package
- Watchdog (r_wdt)
- I/O Port (r_ioport)

3.4.2 Creating a WDT Application Using the RA MCU FSP and e² studio

3.4.2.1 Using FSP and e² studio

The Flexible Software Package (FSP) from Renesas provides a complete driver library for developing RA MCU applications. FSP provides Hardware Abstraction Layer (HAL) drivers, Board Support Package (BSP) drivers for the developer to use to create applications. FSP is integrated into Renesas e² studio based on eclipse providing build (editor, compiler and linker) and debug phases with an extended GNU Debug (GDB) interface.

3.4.2.2 The WDT Application

The flowchart for the WDT application is shown below.

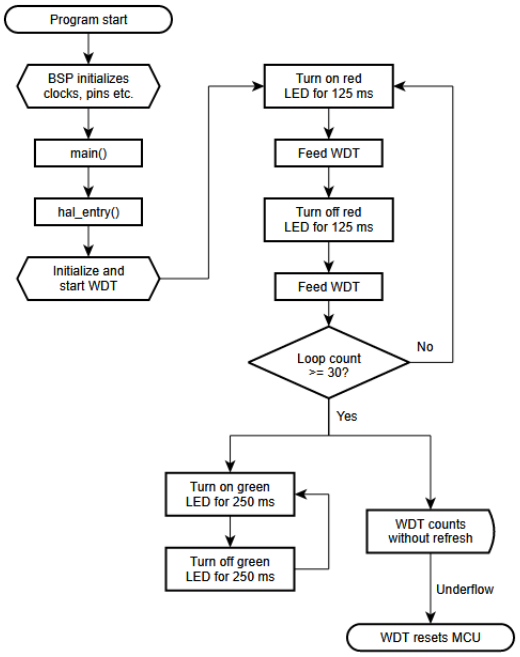

Figure 86: WDT Application flow diagram

3.4.2.3 WDT Application flow

The main sections of the WDT application are:

1. The BSP initializes the clocks, pins and other elements of the MCU readying the application to run.
2. main() calls hal_entry(). The function hal_entry() is created by FSP with a placeholder for user code. The code for the WDT is added to this function.
3. Initialize the WDT, but do not start it.
4. Start the WDT by refreshing it.
5. In the first loop the red LED flashes 30 times and refreshes the watchdog each time the LED state is changed.
6. In the second loop, the green LED flashes, but the program DOES NOT refresh the watchdog. After the watchdog timeout period the device will reset which can be observed by the red LED flashing again as the sequence repeats.

3.4.3 Creating the Project with e² studio

Start e² studio and choose a workspace folder in the Workspace Launcher. Configure a new RA MCU project as follows.

1. Select **File > New > RA C/C++ Project**. Then select the template for the project.

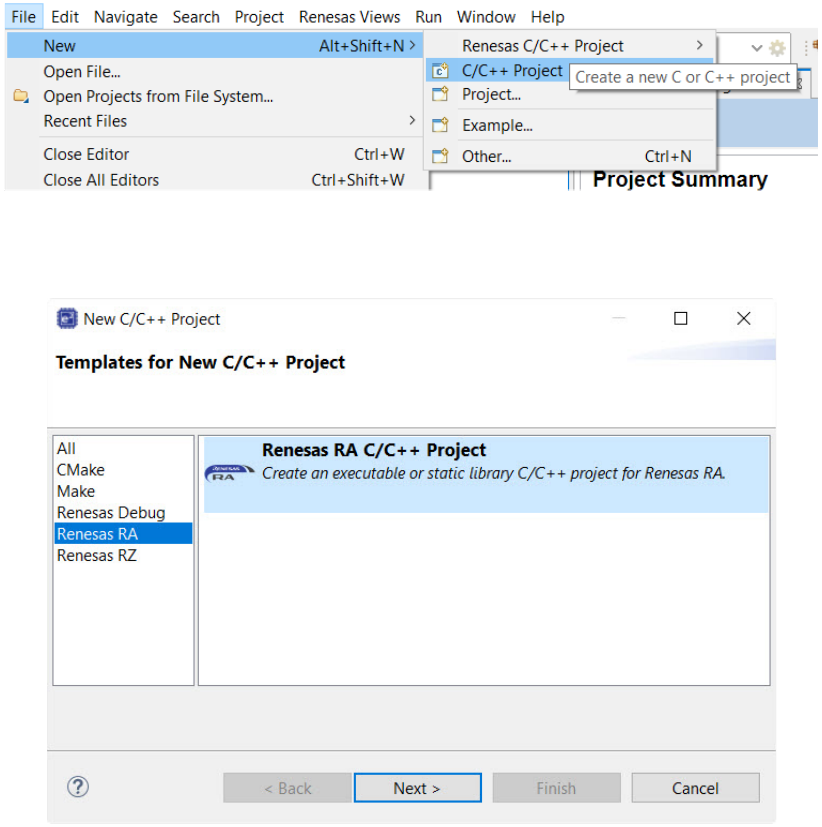

Figure 87: Creating a new project

2. In the e² studio Project **Configuration (RA Project)** window enter a project name, for example, WDT_Application. In addition, select the toolchain. If you want to choose new locations for the project unselect **Use default location**. Click **Next**.

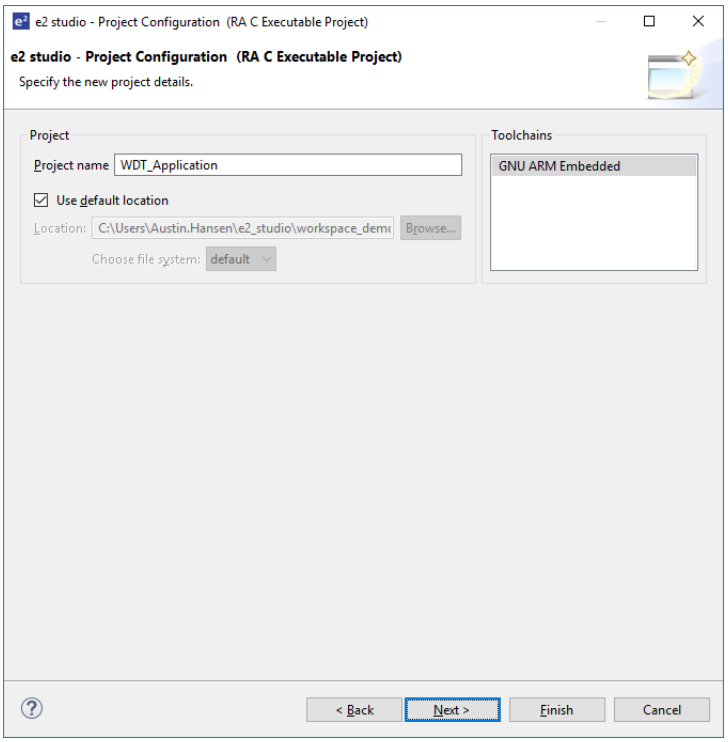

Figure 88: Project configuration (part 1)

3. This application runs on the EK-RA6M3 board. So, for the **Board** select **EK-RA6M3**.

   This will automatically populate the **Device** drop-down with the correct device used on this board. Select the **Toolchain** version. Select **J-Link ARM** as the **Debugger**. Click **Next** to configure the project.

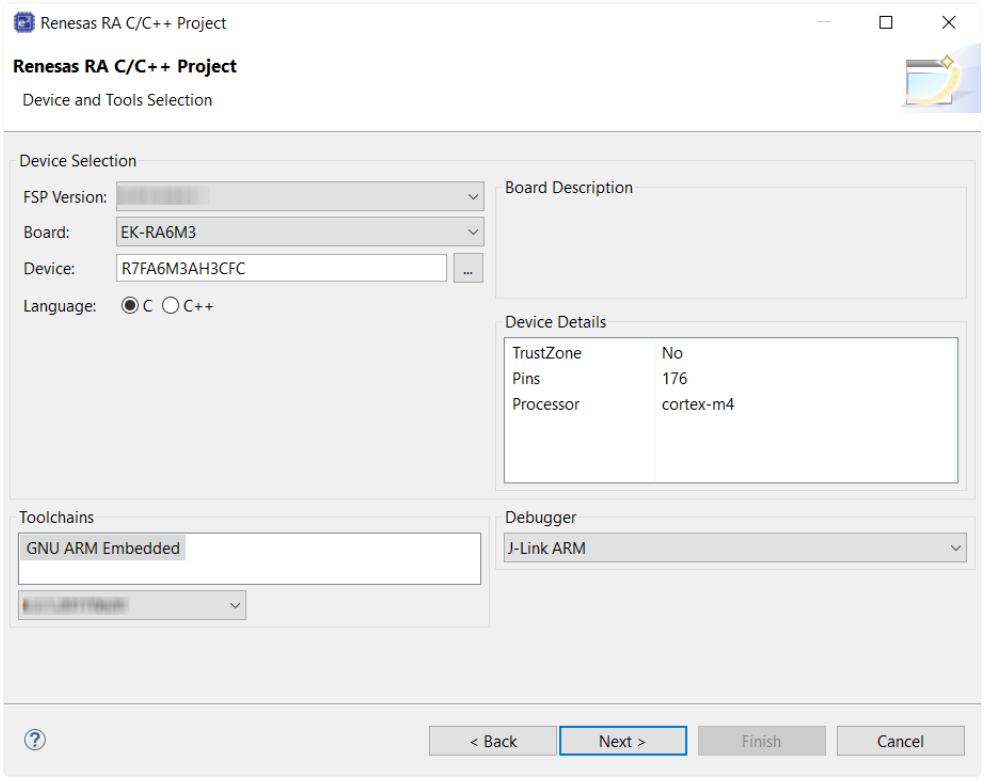

Figure 89: Project configuration (part 2)

The project template is now selected. As no RTOS is required select **Bare Metal - Blinky**.

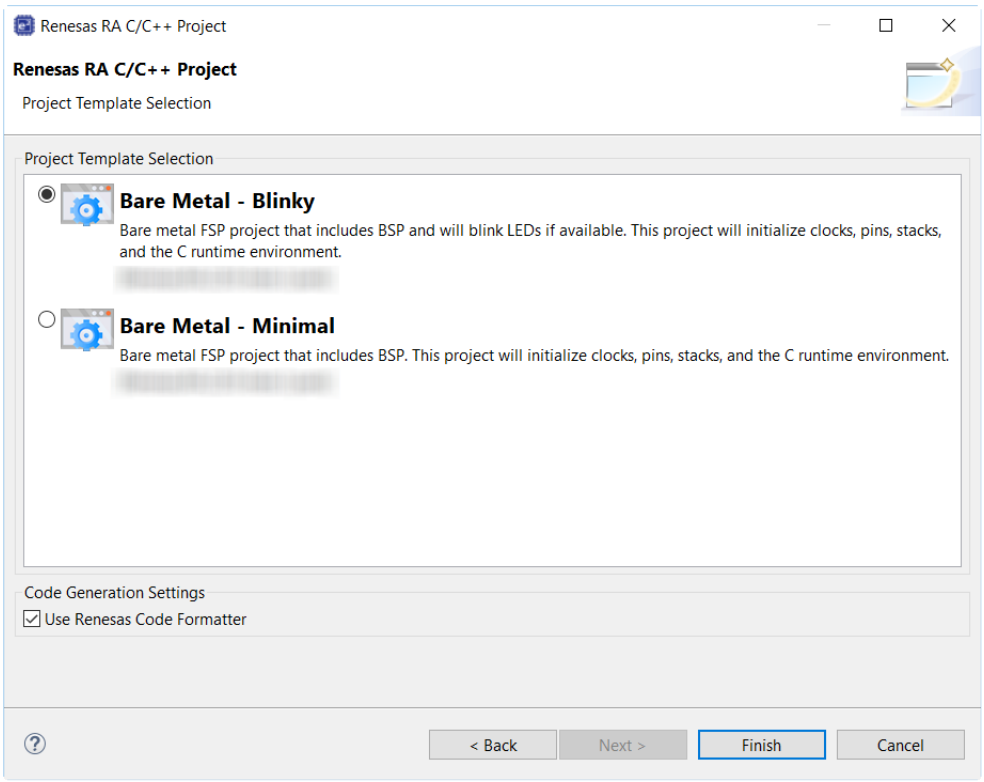

Figure 90: Project configuration (part 3)

4. Click **Finish**.

   e² studio creates the project and opens the **Project Explorer** and **Project Configuration Settings** views with the **Summary** page showing a summary of the project configuration.

3.4.4 Configuring the Project with e² studio

e² studio simplifies and accelerates the project configuration process by providing a GUI interface for selecting the options to configure the project.

e² studio offers a selection of perspectives presenting different windows to the user depending on the operation in progress. The default perspectives are **C/C++**, **FSP Configuration** and **Debug**. The perspective can be changed by selecting a new one from the buttons at the top right.

Figure 91: Selecting a perspective

The **C/C++** perspective provides a layout selected for code editing. The **FSP Configuration** perspective provides elements for configuring a RA MCU project, and the **Debug** perspective provides a view suited for debugging.

1. In order to configure the project settings ensure the **FSP Configuration** perspective is selected.
2. Ensure the **Project Configuration [WDT Application]** is open. It is already open if the Summary information is visible. To open the Project Configuration now or at any time make sure the **RA Configuration** perspective is selected and double-click on the configuration.xml file in the Project Explorer pane on the right side of e² studio.

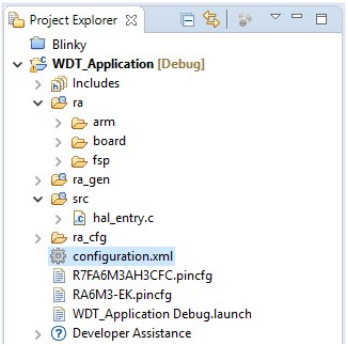

Figure 92: RA MCU Project Configuration Settings

At the base of the Project Configuration view there are several tabs for configuring the project. A project may require changes to some or all of these tabs. The tabs are shown below.

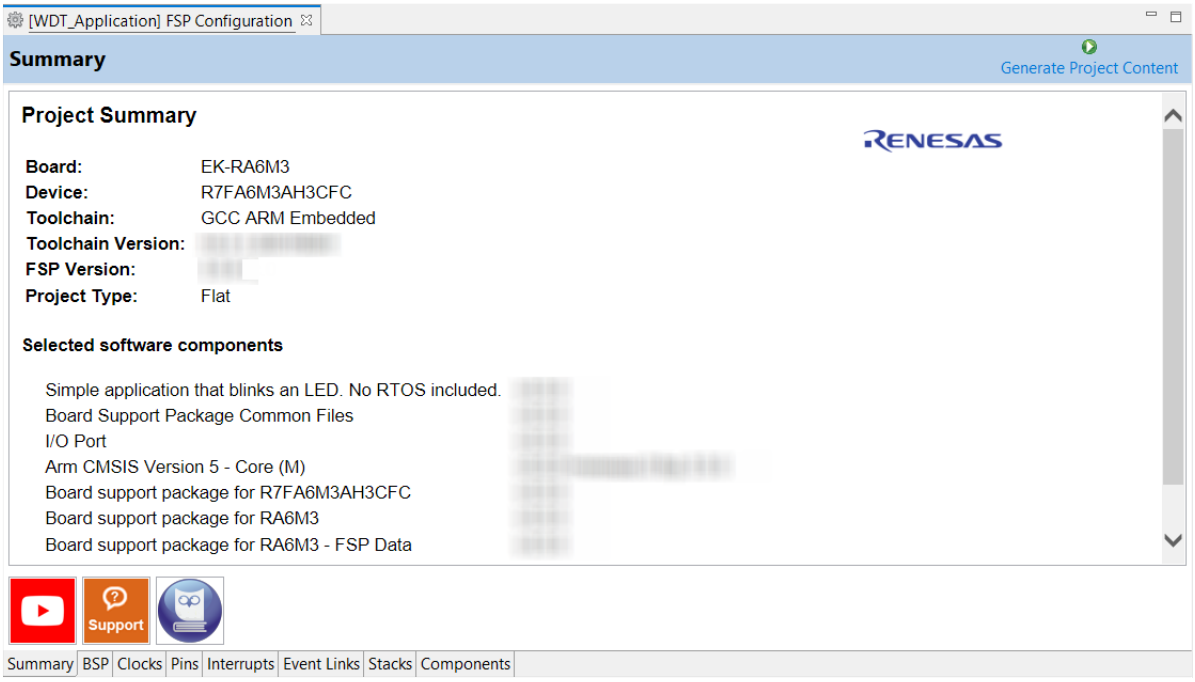

Figure 93: Project Configuration Tabs

3.4.4.1 BSP Tab

The **BSP** tab allows the Board Support Package (BSP) options to be modified from their defaults. For this particular WDT project no changes are required. However, if you want to use the WDT in auto-start mode, you can configure the settings of the OFS0 (Option Function Select Register 0) register in the **BSP** tab. See the RA Hardware User's Manual for details on the WDT autostart mode.

3.4.4.2 Clocks Tab

The **Clocks** tab presents a graphical view of the clock tree of the device. The drop-down boxes in the GUI enables configuration of the various clocks. The WDT uses PCLCKB. The default output frequency for this clock is 60 MHz. Ensure this clock is outputting this value.

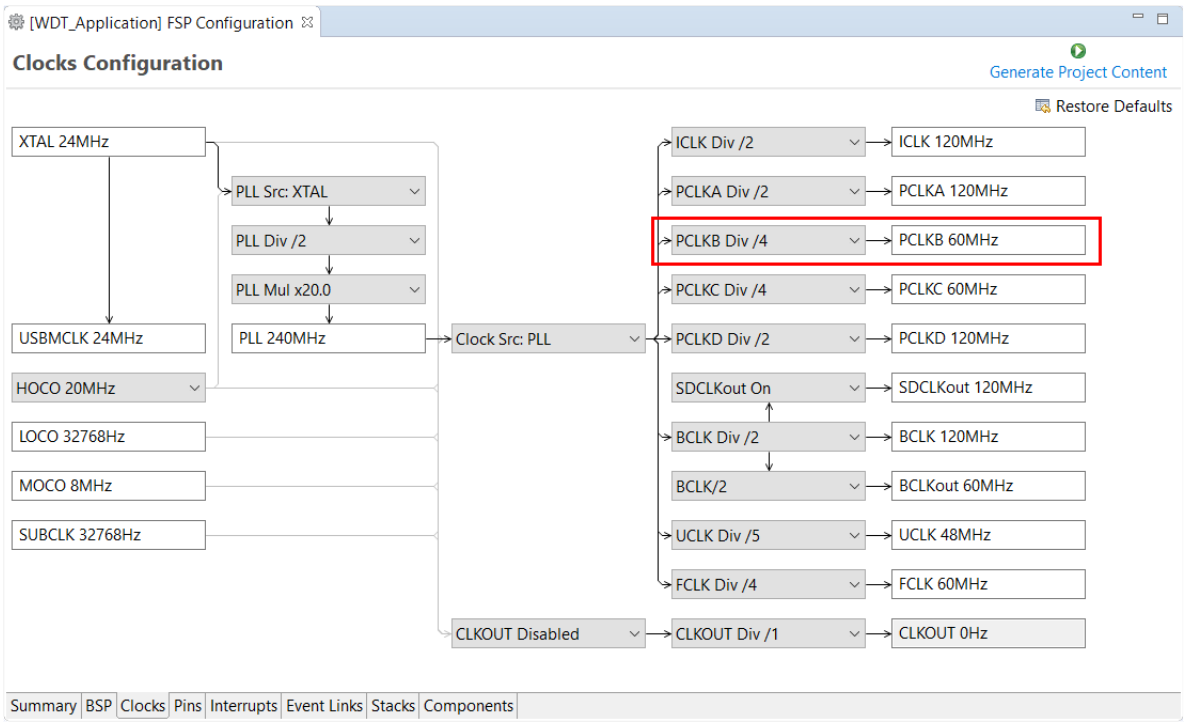

Figure 94: Clock configuration

3.4.4.3 Interrupts Tab

The **Interrupts** tab is used to add new user events or interrupts. No new interrupts or events are needed by the application, so no edits in this tab are required.

3.4.4.4 Event Links Tab

The **Event Links** tab is used to configure events used by the Event Link Controller (ELC). This project doesn't use the ELC, so no edits in this tab are required.

3.4.4.5 Pins Tab

The **Pins** tab provides a graphical tool for configuring the functionality of the pins of the device. For the WDT project no pin configuration is required. Although the project uses two LEDs connected to pins on the device, these pins are pre-configured as output GPIO pins by the BSP.

3.4.4.6 Stacks Tab

You can add any driver to the project using the **Stacks** tab. The HAL driver IO port pins are added automatically by e² studio when the project is configured. The WDT application uses no RTOS Resources, so you only need to add the HAL WDT driver.

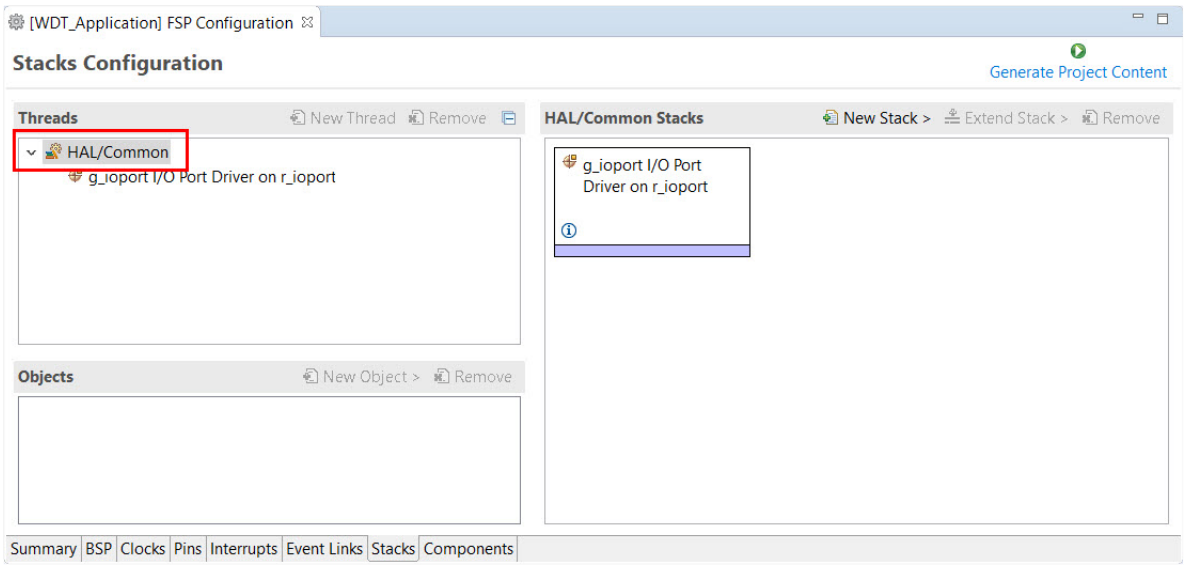

Figure 95: Stacks tab

1. Click on the **HAL/Common Panel** in the Threads Window as indicated in the figure above.

   The Stacks Panel becomes a **HAL/Common Stacks** panel and is populated with the modules preselected by e² studio.

2. Click on **New Stack** to find a pop-up window with the available HAL level drivers.
3. Select **WATCHDOG Driver on r_wdt**.

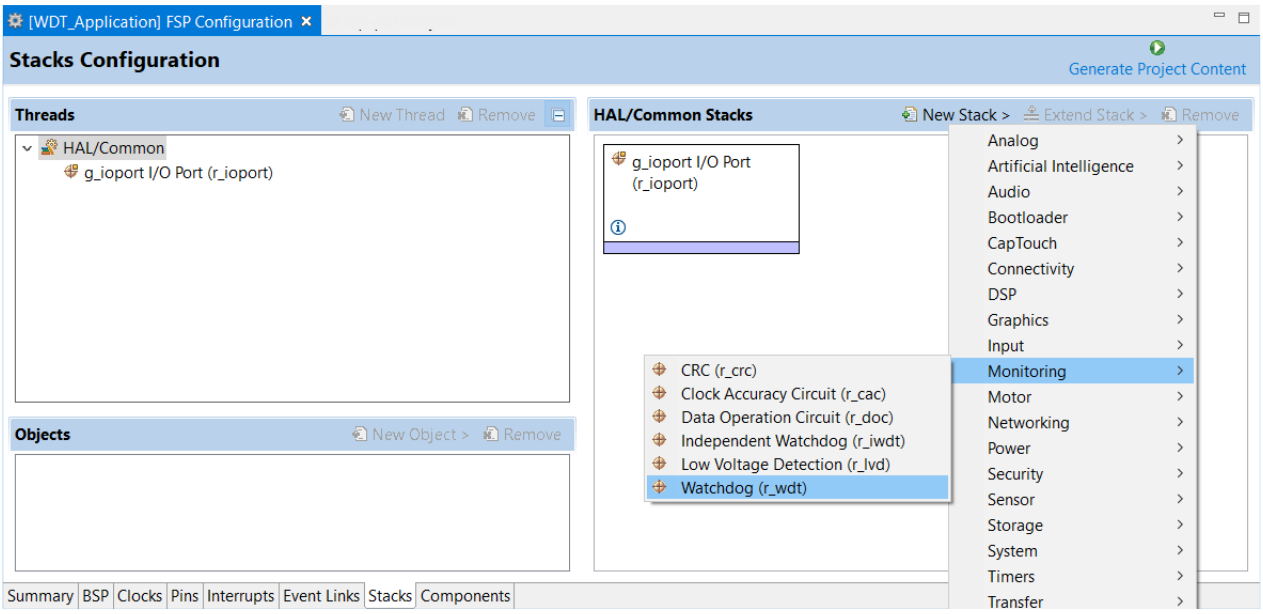

Figure 96: Module Selection

The selected HAL WDT driver is added to the **HAL/Common Stacks** Panel and the **Property** Window shows all configuration options for the selected module. The **Property** tab for the WDT should be visible at the bottom left of the screen. If it is not visible, check that the **FSP Configuration** perspective is selected.

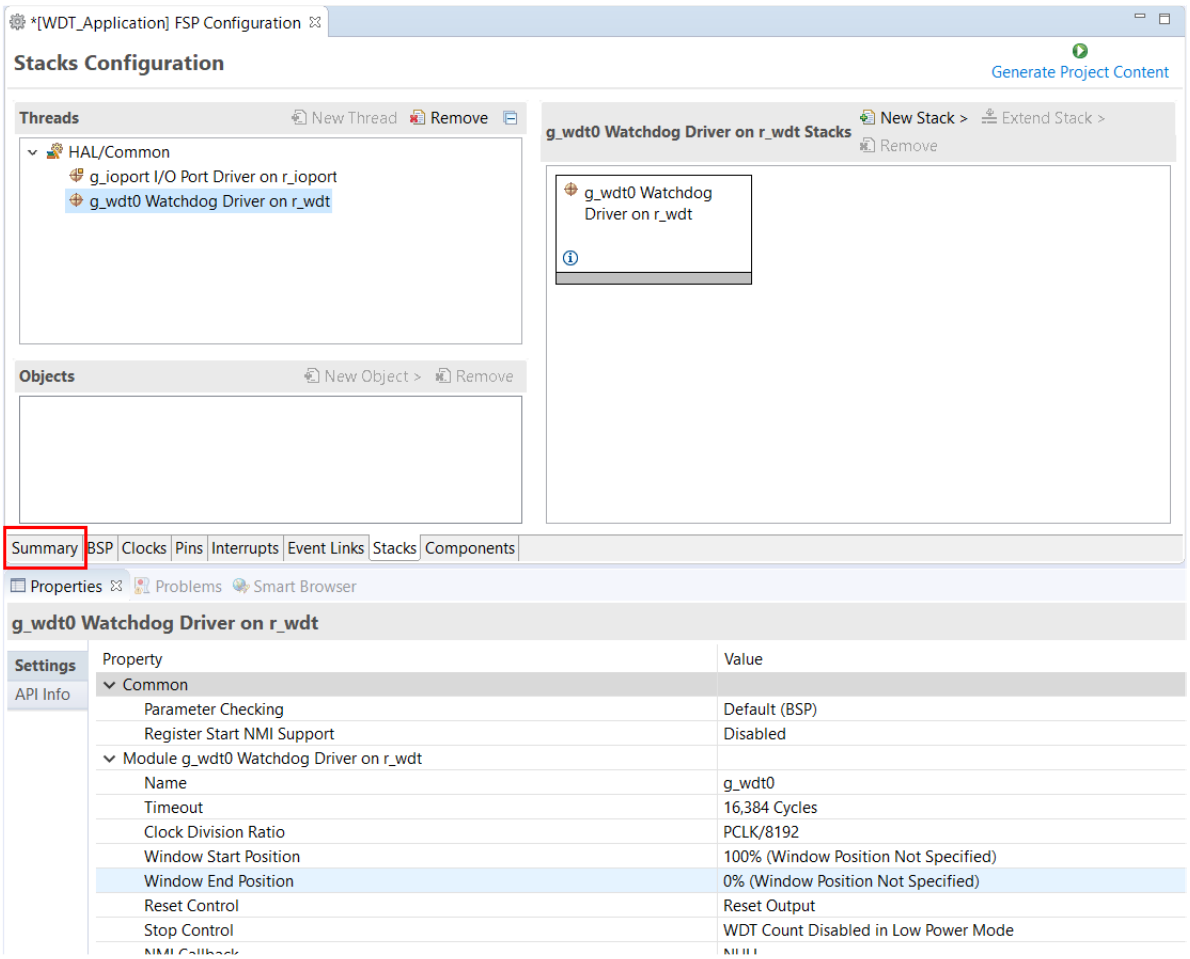

Figure 97: Module Properties

All parameters can be left with their default values.

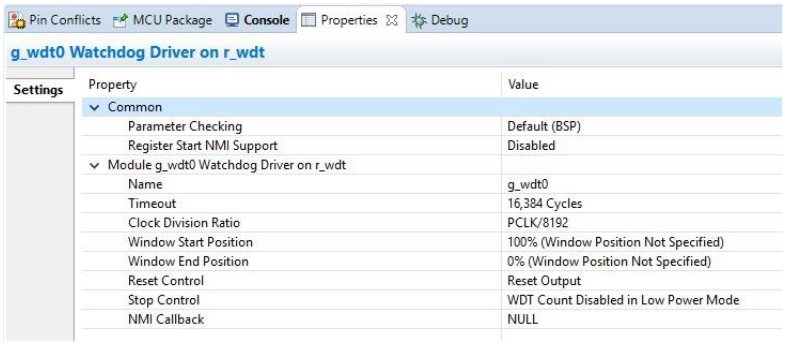

Figure 98: g_wdt WATCHDOG Driver on WDT properties

With PCLKB running at 60 MHz the WDT will reset the device 2.23 seconds after the last refresh.

WDT clock = 60 MHz / 8192 = 7.32 kHz

Cycle time = 1 / 7.324 kHz = 136.53 us

Timeout = 136.53 us x 16384 = 2.23 seconds

Save the **Project Configuration** file and click the **Generate Project Content** button in the top right corner of the **Project Configuration** pane.

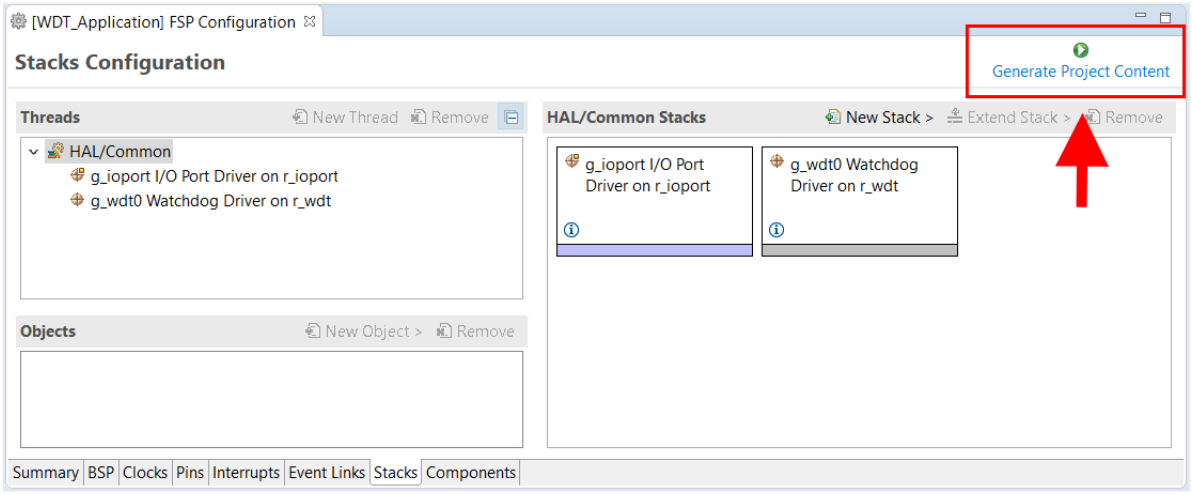

Figure 99: Generate Project Content button

e² studio generates the project files.

3.4.4.7 Components Tab

The components tab is included for reference to see which modules are included in the project. Modules are selected automatically in the Components view after they are added in the Stacks Tab.

For the WDT project ensure that the following modules are selected:

1. HAL_Drivers -> r_ioport
2. HAL_Drivers -> r_wdt

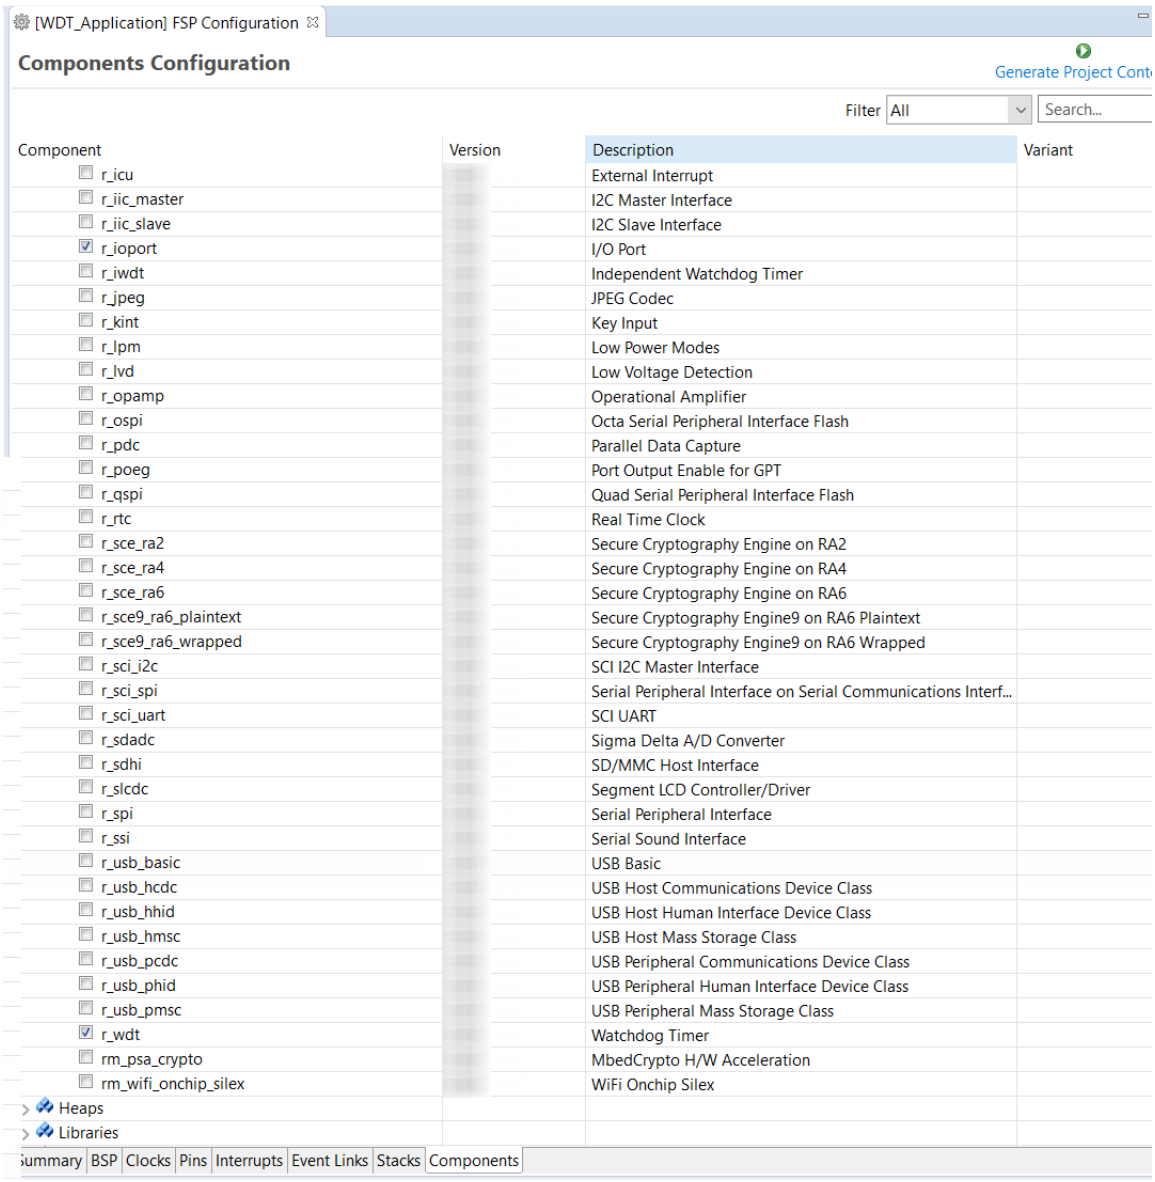

Figure 100: Component Selection

Note

The list of modules displayed in the Components tab depends on the installed FSP version.

3.4.5 WDT Generated Project Files

Clicking the Generate Project Content button performs the following tasks.

- r_wdt folder and WDT driver contents created at:

  ra/fsp/src

- r_wdt_api.h created in:

  ra/fsp/inc/api

- r_wdt.h created in:

  ra/fsp/inc/instances

The above files are the standard files for the WDT HAL module. They contain no specific project contents. They are the driver files for the WDT. Further information on the contents of these files can be found in the documentation for the WDT HAL module.

Configuration information for the WDT HAL module in the WDT project is found in:

ra_cfg/fsp_cfg/r_wdt_cfg.h

The above file's contents are based upon the **Common** settings in the **g_wdt WATCHDOG Driver on WDT Properties** pane.

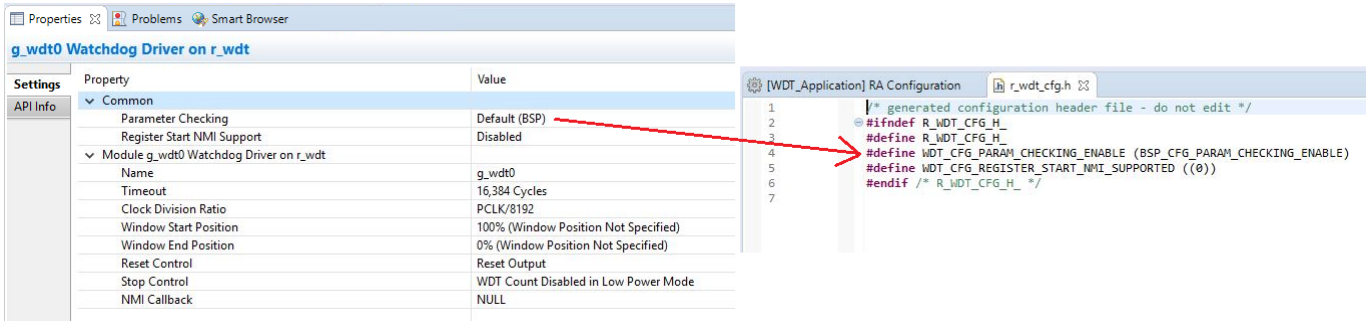

Figure 101: r_wdt_cfg.h contents

Warning

Do not edit any of these files as they are recreated every time the Generate Project Content button is clicked and so any changes will be overwritten.

The r_ioport folder is not created at ra/fsp/src as this module is required by the BSP and so already exists. It is included in the WDT project in order to include the correct header file in ra_gen/hal_data.c–see later in this document for further details. For the same reason the other IOPORT header files– ra/fsp/inc/api/r_ioport_api.handra/fsp/inc/instances/r_ioport.h–are not created as they already exist.

In addition to generating the HAL driver files for the WDT and IOPORT files e² studio also generates files containing configuration data for the WDT and a file where user code can safely be added. These files are shown below.

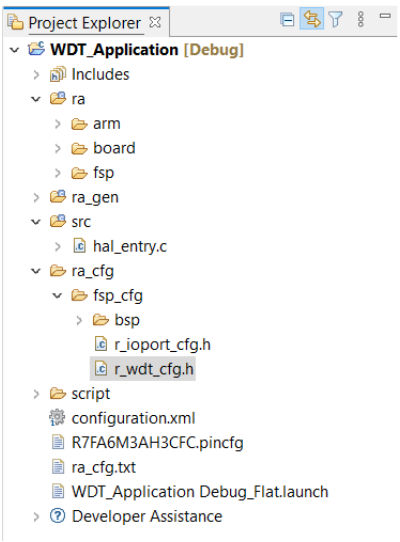

Figure 102: WDT project files

3.4.5.1 WDT hal_data.h

The contents of hal_data.h are shown below.

```
/* generated HAL header file - do not edit */
#ifndef HAL_DATA_H_
 #define HAL_DATA_H_
 #include <stdint.h>
 #include "bsp_api.h"
 #include "common_data.h"
 #include "r_wdt.h"
 #include "r_wdt_api.h"
 #ifdef __cplusplus
extern "C"
{
 #endif
extern const wdt_instance_t g_wdt0;
 #ifndef NULL
void NULL(wdt_callback_args_t * p_args);
 #endif
extern wdt_instance_ctrl_t g_wdt0_ctrl;
extern const wdt_cfg_t g_wdt0_cfg;
void hal_entry(void);
```

```
void g_hal_init(void);
 #ifdef __cplusplus
} /* extern "C" */
 #endif
#endif  /* HAL_DATA_H_ */
```

hal_data.h contains the header files required by the generated project. In addition this file includes external references to the **g_wdt0** instance structure which contains pointers to the configuration, control, api structures used for WDT HAL driver.

Warning

This file is regenerated each time Generate Project Content is clicked and must not be edited.

3.4.5.2 WDT hal_data.c

The contents of hal_data.c are shown below.

```
/* generated HAL source file - do not edit */
#include "hal_data.h"
wdt_instance_ctrl_t g_wdt0_ctrl;
const wdt_cfg_t g_wdt0_cfg =
{
    .timeout       = WDT_TIMEOUT_16384,
    .clock_division = WDT_CLOCK_DIVISION_8192,
    .window_start   = WDT_WINDOW_START_100,
    .window_end    = WDT_WINDOW_END_0,
    .reset_control = WDT_RESET_CONTROL_RESET,
    .stop_control   = WDT_STOP_CONTROL_ENABLE,
    .p_callback    = NULL,
};
/* Instance structure to use this module. */
const wdt_instance_t g_wdt0 =
{.p_ctrl = &g_wdt0_ctrl, .p_cfg = &g_wdt0_cfg, .p_api = &g_wdt_on_wdt};
void g_hal_init (void)
{
    g_common_init();
}
```

hal_data.c contains g_wdt0_ctrl which is the control structure for this instance of the WDT HAL driver. This structure should not be initialized as this is done by the driver when it is opened.

The contents of g_wdt0_cfg are populated in this file using the **Watchdog Driver on g_wdt0** pane in the Project Configuration **Stacks** tab. If the contents of this structure do not reflect the settings made in the IDE, ensure the **Project Configuration** settings are saved before clicking the **Generate Project Content** button.

Warning

This file is regenerated each time Generate Project Content is clicked and so should not be edited.

3.4.5.3 WDT main.c

Contains main() called by the BSP start-up code. main() calls hal_entry() which contains user developed code (see next file). Here are the contents of main.c.

```
/* generated main source file - do not edit*/
#include "hal_data.h"
int main (void)
{
    hal_entry();
 return 0;
}
```

Warning

This file is regenerated each time Generate Project Content is clicked and so should not be edited.

3.4.5.4 WDT hal_entry.c

This file contains the function hal_entry() called from main(). User developed code should be placed in this file and function.

For the WDT project edit the contents of this file to contain the code below. This code implements the flowchart in overview section of this document.

```
#include "hal_data.h"
#include "bsp_pin_cfg.h"
#include "r_ioport.h"
#define RED_LED_NO_OF_FLASHES 30
#define RED_LED_PIN BSP_IO_PORT_01_PIN_00
```

```
#define GREEN_LED_PIN BSP_IO_PORT_04_PIN_00
#define RED_LED_DELAY_MS 125
#define GREEN_LED_DELAY_MS 250
volatile uint32_t delay_counter;
volatile uint16_t loop_counter;
void R_BSP_WarmStart(bsp_warm_start_event_t event);
/*******************************************************************************
*******************************/
void hal_entry (void)
{
 /* Allow the WDT to run when the debugger is connected */
    R_DEBUG->DBGSTOPCR_b.DBGSTOP_WDT = 0;
 /* Open the WDT */
 R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);
 /* Start the WDT by refreshing it */
 R_WDT_Refresh(&g_wdt0_ctrl);
 /* Flash the red LED and feed the WDT for a few seconds */
 for (loop_counter = 0; loop_counter < RED_LED_NO_OF_FLASHES; loop_counter++)
    {
 /* Turn red LED on */
 R_IOPORT_PinWrite(&g_ioport_ctrl, RED_LED_PIN, BSP_IO_LEVEL_LOW);
 /* Delay */
 R_BSP_SoftwareDelay(RED_LED_DELAY_MS, BSP_DELAY_UNITS_MILLISECONDS);
 /* Refresh WDT */
 R_WDT_Refresh(&g_wdt0_ctrl);
 R_IOPORT_PinWrite(&g_ioport_ctrl, RED_LED_PIN, BSP_IO_LEVEL_HIGH);
 /* Delay */
 R_BSP_SoftwareDelay(RED_LED_DELAY_MS, BSP_DELAY_UNITS_MILLISECONDS);
 /* Refresh WDT */
 R_WDT_Refresh(&g_wdt0_ctrl);
    }
 /* Flash green LED but STOP feeding the WDT. WDT should reset the
  * device */
 while (1)
```

```
    {
 /* Turn green LED on */
 R_IOPORT_PinWrite(&g_ioport_ctrl, GREEN_LED_PIN, BSP_IO_LEVEL_LOW);
 /* Delay */
 R_BSP_SoftwareDelay(GREEN_LED_DELAY_MS, BSP_DELAY_UNITS_MILLISECONDS);
 /* Turn green off */
 R_IOPORT_PinWrite(&g_ioport_ctrl, GREEN_LED_PIN, BSP_IO_LEVEL_HIGH);
 /* Delay */
 R_BSP_SoftwareDelay(GREEN_LED_DELAY_MS, BSP_DELAY_UNITS_MILLISECONDS);
    }
}
/*******************************************************************************
*******************************/
void R_BSP_WarmStart (bsp_warm_start_event_t event)
{
 if (BSP_WARM_START_RESET == event)
    {
#if BSP_FEATURE_FLASH_LP_VERSION != 0
 /* Enable reading from data flash. */
       R_FACI_LP->DFLCTL = 1U;
 /* Would normally have to wait for tDSTOP(6us) for data flash recovery. Placing the
enable here, before clock and
  * C runtime initialization, should negate the need for a delay since the
initialization will typically take more than 6us. */
#endif
    }
 if (BSP_WARM_START_POST_C == event)
    {
 /* C runtime environment and system clocks are setup. */
 /* Configure pins. */
 R_IOPORT_Open(&IOPORT_CFG_CTRL, &IOPORT_CFG_NAME);
    }
}
```

The WDT HAL driver API functions are defined in r_wdt.h. The WDT HAL driver is opened through the open API call using the instance structure defined in r_wdt_api.h:

```
/* Open the WDT */
R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);
```

The first passed parameter is the pointer to the control structure g_wdt0_ctrl instantiated in hal_data.c. The second parameter is the pointer to the configuration data g_wdto_cfg instantiated in the same hal_data.c file.

The WDT is started and refreshed through the API call:

```
/* Start the WDT by refreshing it */
R_WDT_Refresh(&g_wdt0_ctrl);
```

Again the first (and only in this case) parameter passed to this API is the pointer to the control structure of this instance of the driver.

3.4.6 Building and Testing the Project

Build the project in e² studio by clicking **Build > Build Project** or by clicking the build icon. The project should build without errors.

To debug the project

1. Connect the USB cable between the target board debug port and host PC.
2. In the **Project Explorer** pane on the left side of e² studio, right-click on the WDT project **WDT_Application** and select **Debug As > Debug Configurations**.

3. Under **Renesas GDB Hardware Debugging** select **WDT_Application Debug** as shown below.

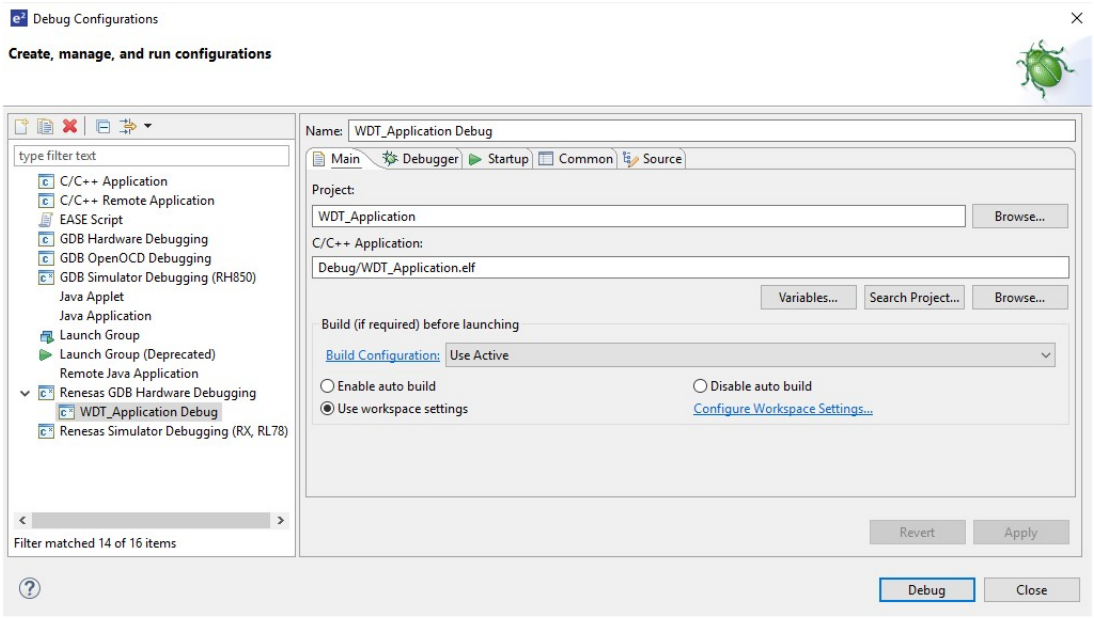

Figure 103: Debug configuration

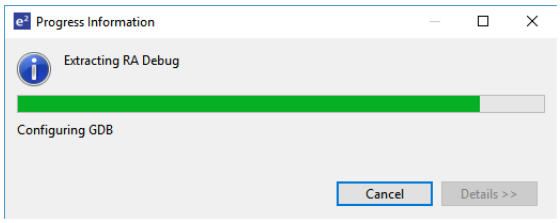
4. Click the **Debug** button. Click Yes to the debug perspective if asked.



5. The code should run the Reset_Handler() function.
6. Resume execution via **Run > Resume**. Execution will stop in main() at the call to hal_entry().
7. Resume execution again.

The red LED should start flashing. After 30 flashes the green LED will start flashing and the red LED will stop flashing.

While the green LED is flashing the WDT will underflow and reset the device resulting in the red LED to flash again as the sequence repeats.

1. Stop the debugger in e² studio via **Run > Terminate**.
2. Click the reset button on the target board. The LEDs begin flashing.

3.5 Primer: Arm TrustZone Project Development

This section will introduce the user to the tools supporting Arm® TrustZone® technology configuration for the RA Family of microcontrollers. It is intended to be read by development engineers implementing RA Arm TrustZone projects for the first time. It will introduce basic concepts

followed by workflow and tooling functions designed to simplify and accelerate their first Arm TrustZone development. A background knowledge of e² studio and RA device hardware is expected.

3.5.1 Target Device

RA Cortex®-M33 and Cortex®-M85 devices with Arm TrustZone security extension. As shown in the following table, most RA devices that include TrustZone support also support Device Lifecycle Management (DLM).

MCU Groups with TrustZone and DLM	MCU Groups with TrustZone and no DLM	MCU Groups with TrustZone and Alternate DLM
RA4E1, RA4M2, RA4M3, RA6E1, RA6M4, RA6M5, RA6T2	RA4E2, RA4T1, RA6E2, RA6T3	RA8M1

3.5.2 Renesas Implementation of Arm TrustZone Technology

The following section is supplied for reference only. For full details of TrustZone implementation, refer to Arm documentation (https://developer.arm.com/ip-products/security-ip/trustzone) and the MCU user manual.

Arm TrustZone technology divides the MCU and therefore the application into Secure and Non-Secure partitions. Secure applications can access both Secure and Non-Secure memory and resources. Non-Secure code can access Non-Secure memory and resources as well as Secure resources through a set of so-called veneers located in the Non-Secure Callable (NSC) region. This ensures a single access point for Secure code when called from the Non-Secure partition. The MCU starts up in the Secure partition by default. The security state of the CPU can be either Secure or Non-Secure.

The MCU code flash, data flash, and SRAM are divided into Secure (S) and Non-Secure (NS) regions. Code flash and SRAM include a further region known as Non-Secure Callable (NSC). The method to set these memory security attributes depends on whether the device supports DLM:

- For devices that support DLM, memory security attributes are set into the non-volatile memory through SCI or USB boot mode commands when the device lifecycle is Secure Software Debug (SSD) state. The memory security attributes are loaded into the Implementation Defined Attribution Unit (IDAU) peripheral and the memory controller before application execution and cannot be updated by application code.
- For devices that do not support DLM, memory security attributes are written to IDAU registers at startup by application code using secure accesses.

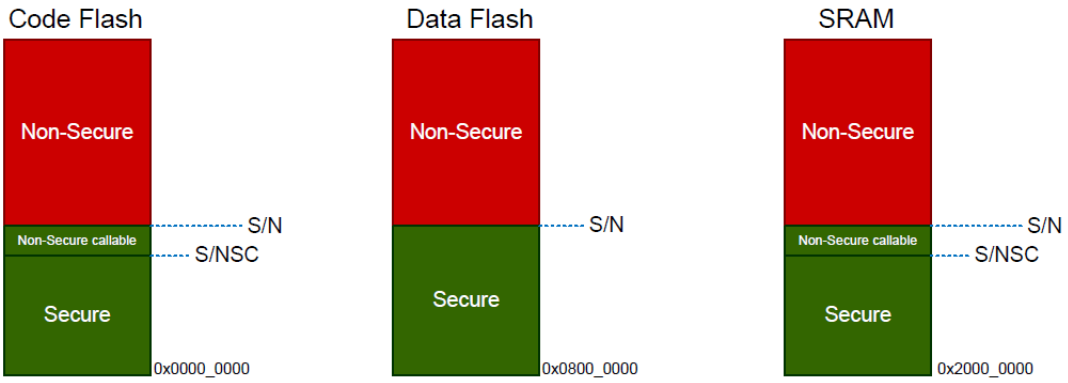


Figure 104: Secure and Non-Secure Regions

Note: All external memory accesses are considered to be Non-Secure.

Code Flash and SRAM can be divided into Secure, Non-Secure, and Non-Secure Callable. All secure memory accesses from the Non-Secure region MUST go through the Non-Secure Callable gateway and target a specific Secure Gateway (SG) assembler instruction. This forces access to Secure APIs at a fixed location and prevents calls to sub-functions and so on. Failing to target an SG instruction will generate a TrustZone exception.

TrustZone enabled compilers will manage generation of the NSC veneer automatically using CMSE extensions.

3.5.2.1 Calling from Non-Secure to Secure

A new instruction SG (Secure Gateway) has been added to the Armv8-M architecture. This MUST be the destination instruction for any branch within the Non-Secure Callable region. If an attempt is made to branch to any other instruction from the Non-Secure partition, a TrustZone exception will be thrown.

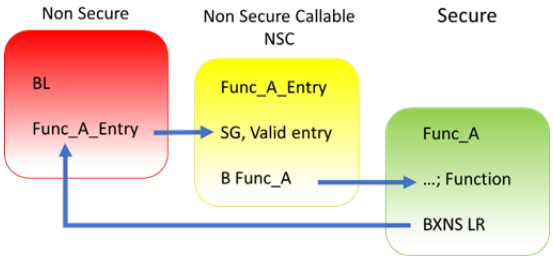

Figure 105: Calling from Non-Secure to Secure Functions

3.5.2.2 Calling from Secure to Non-Secure

Secure code uses B(L)XNS instructions to make direct calls to Non-Secure functions. While this is certainly possible, it can create a security vulnerability in the application. It is also challenging for the Secure application to determine the address of the non-secure function during build phase. From the RA Tools and FSP point view, calling directly from Secure to Non-Secure via FSP API is not supported.

Preference is for the Secure code to initialise as necessary from reset, then pass control to the Non-Secure partition. It will manage any data transfers and so forth via FSP call-backs as security checks. For example, secure data can be copied to Non-Secure RAM.

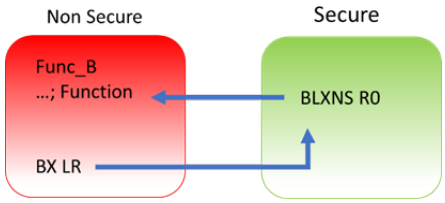

Figure 106: Calling from Secure to Non-Secure Functions

3.5.3 Workflow

Arm TrustZone MCU development normally consists of two projects within a workspace, Secure and Non-Secure. General project workflows are described in the following sections. The Renesas project generator also supports development with "Flat project" model with no Arm TrustZone awareness.

3.5.3.1 Secure Project

1. Start a new Secure project in e² studio.
2. Select and configure pins and drivers/stacks that need to be initialized and used in Secure mode. This should be kept to a minimum to reduce the security attack surface.
3. Expose top of stacks as Non-Secure Callable (NSC) ***if*** they need to be accessed from Non-Secure partition. Again, this should be kept to a minimum.
4. Generate project content and write Secure code such as key handling and opening drives as needed.
5. Modify/remove any unnecessary "Guard" functions as needed to control access via NSC.
6. Build project.
7. A Non-Secure project will be needed before debugging. If necessary, prepare a "dummy" Non-Secure project or replace R_BSP_NonSecureEnter(); with while(1); in hal_entry.c.

3.5.3.2 Non-Secure Project

1. Start a new Non-Secure project.
2. If you have access to the Secure project, choose this option. However, if you only have access to a device with pre-programmed Secure code (commonly referred to as provisioned device) choose "Secure Bundle".
3. Select and configure pins and drivers/stacks that need to be initialized and used in Non-Secure mode.
4. Note that you can add NSC drivers and stacks as needed.
5. Generate project content and write Non-Secure code as needed
6. Access NSC drivers and Stacks via Guard functions.
7. Build and debug project.

3.5.3.3 Flat Project

A flat project does not technically use Arm TrustZone as the developer has made a decision to place the entire application in Secure partition from restart.

Notes:

- Any code placed in external memory (such as OSPI or QSPI) will be Non-Secure.

- The Ethernet EDMAC is designed to be a Non-Secure bus master so associated Ethernet RAM buffers will be placed in Non-Secure RAM. The tooling will automatically manage this.

The workflow is as follows:

1. Start a new Flat project.
2. Select and configure pins and drivers/stacks as needed.
3. Generate project content and write code as needed.
4. Build and debug project.

3.5.4 RA Project Generator (PG)

The RA project generators have been created to help users through setting up new TrustZone enabled projects. User will be prompted for project settings such as Project Type (Secure, Non-Secure, or Flat), compiler, RTOS and debugger. Care is needed when setting up a TrustZone project to ensure that the connection between Secure and Non-Secure partitions are managed correctly.

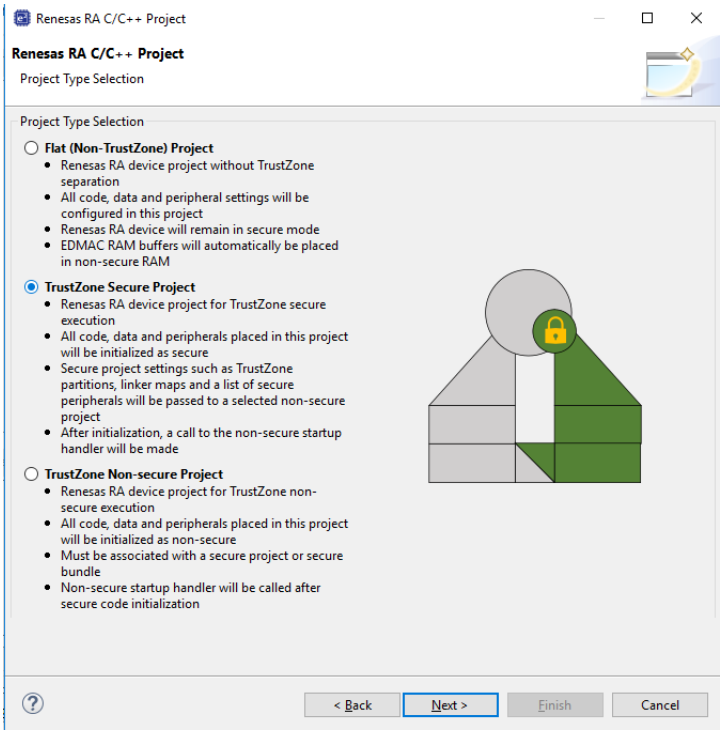

Figure 107: Secure Project (following Arm notation as green)

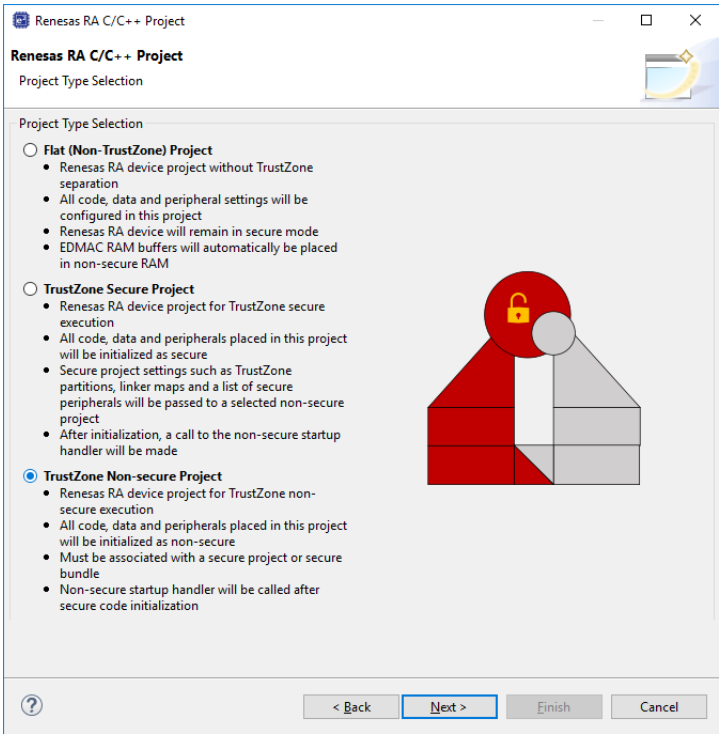

Figure 108: Non-Secure Project (following Arm notation as red)

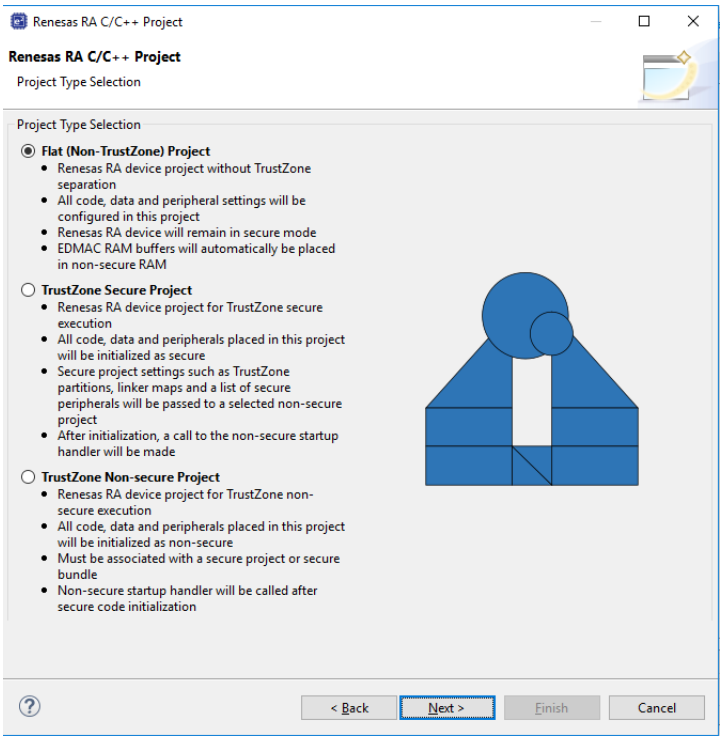

Figure 109: Flat Project

3.5.4.1 Secure Project Set Up

All code, data, and peripherals in this project will be configured as Secure using the device Peripheral

Security Attribution (PSA) registers. Although it is very application specific, we recommend keeping the Secure project code as small as possible to reduce the attack surface. For example, secure key handling may be the only application code in the secure project.

Necessary values to set up the TrustZone memory partition (IDAU registers) will be automatically calculated after the project is built to ensure they match the code and data size, keeping the attack surface as small as possible.

Typically, ANSI C start up code (clearing of RAM, variable initialisation, etc) , clock, and secure peripheral initialisation will occur in this project.

At the end of the Secure code, a call will be made to R_BSP_NonSecureEnter(); to pass control to the Non-Secure partition.

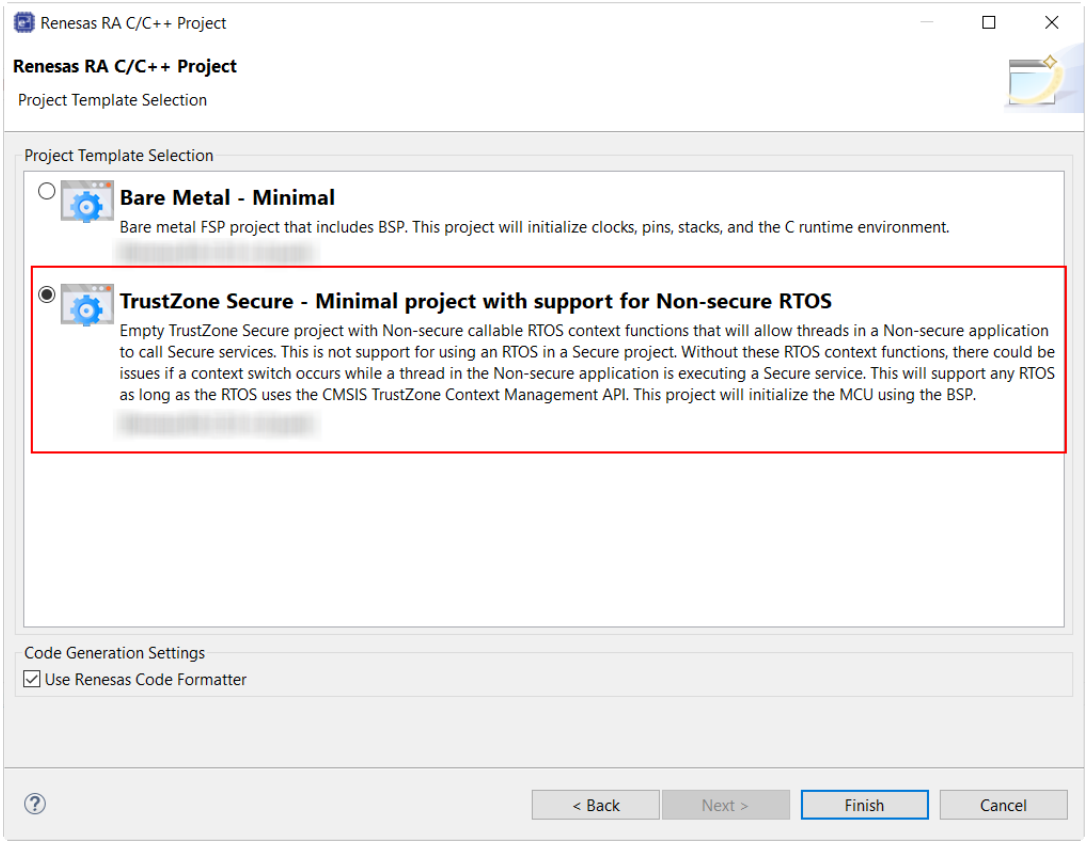
Non-Secure Callable (NSC) "Guard" functions are added to the project and expose selected modules to Non-Secure projects. User can add application-specific access checks as needed in these functions.

Output of this project type will be an elf file that must be either pre-programmed (provisioned) into a device or referenced by a Non-Secure project (via Secure bundle *.SBD) to build a final image.

This project type will NOT typically be debugged in isolation and will normally require a Non-Secure project such as a call to a R_BSP_NonSecureEnter() to be made. This can be replaced with while(1); if needed.

3.5.4.2 RTOS Support in TrustZone Project

Although the RTOS kernel and user tasks will reside in the Non-Secure partition, the Secure partition needs to allocate stack space and so on. It is essential when starting a new RTOS project that the TrustZone Secure RTOS-Minimal template is selected. This will add the Arm TrustZone Context RA Port as below.



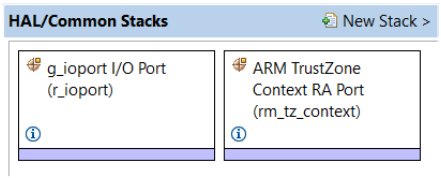


Figure 110: Secure RTOS-Minimal Template

3.5.4.3 Peripheral Security Attribution

Each peripheral can be configured to be Secure or Non-Secure. Peripherals are divided into two types.

Type-1 peripherals have one security attribute. Access to all registers is controlled by one security attribute. The Type-1 peripheral security attribute is set in the PSARx (x = B to E) register by the secure application.

Type-2 peripherals have the security attribute for each register or for each bit. Access to each register or bit field is controlled according to these security attributes. The Type-2 peripheral security attribute is set in the Security Attribution register in each module by the Secure application. For more information about the Security Attribution register, see sections in the Appropriate MCU's User's Manual for each peripheral.

Table 1. Secure and Non-Secure Peripherals

Type	Peripheral
Type 1	SCI, SPI, USBFS, CAN, IIC, SCE9, DOC, SDHI, SSIE, CTSU, CRC, CAC, TSN, ADC12, DAC12, POEG, AGT, GPT, RTC, IWDT, WDT
Type 2	System control (Resets, LVD, Clock Generation Circuit, Low Power Modes, Battery Backup Function), FLASH CACHE, SRAM controller, CPU CACHE, DMAC, DTC, ICU, MPU, BUS, Security setting, ELC, I/O ports
Always Non-Secure	CS Area Controller, QSPI, OSPI, ETHERC, EDMAC

FSP will initialise the arbitration registers during Secure project BSP start up. User code may also be written to set or clear further arbitration. However care must be taken not to undermine FSP.

3.5.4.4 Non-Secure

All code, data, and peripherals in this project will be configured as Non-Secure. This project type must be associated with a Secure project to enable access to secure code, peripherals, linker scripts and others.

3.5.4.5 Flat Project Type

All code, data, and peripherals are configured in a Secure single partition except for the EDMAC RAM buffers that will remain in the Non-Secure partition. Effectively, TrustZone is disabled.

3.5.4.6 Secure Connection to Non-Secure Project

When starting a new Non-Secure Project, the user will be prompted for either a Secure Project or Secure Bundle. In each case, details of the linker settings, Non-Secure Callable functions, and Secure peripherals will be read to enable the Non-Secure project setup.

Should the Secure project or bundle be rebuilt, the Non-Secure editor will detect this and prompt user to regenerate the Non-Secure project configuration.

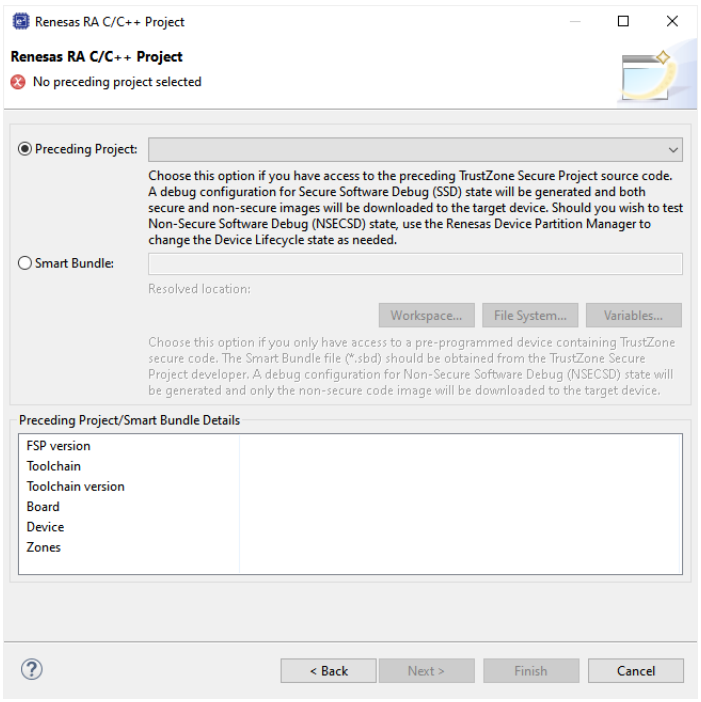

Figure 111: Secure Project or Bundle Selection

Secure Project (Combined)

A Secure project must reside in the same Workspace as the Non-Secure project and will typically be used when a design engineer has access to both the Secure and Non-Secure project sources. This is sometimes known as "Combined model".

A Secure .elf file will be referenced and included in the debug configuration for download to the target device. The development engineer will have visibility of Secure and Non-Secure project source code and configuration.

Secure Bundle (Split)

A Secure Bundle will ONLY include linker memory ranges, symbol references, and details of locked Secure peripheral configuration settings but no access to Secure source code (API header files will be included as necessary).

The Secure bundle file (*.SBD) must be supplied to the Non-Secure developer by the Secure project developer.

The development engineer will typically not have access to the Secure project or .elf file which MUST be pre-programmed or provisioned into the target MCU.

For devices that support DLM, the DLM state of the target device should then be switched to NSECSD (see section 6.2) before the device is provided to the non-secure developer.

This is often referred to as "Split model" where a basic security set up is developed by a Secure team and then passed to the Non-Secure team in the same facility or at a third party. The Non-Secure team has no access to the Secure source code and cannot directly access Secure peripherals, data, or APIs.

3.5.4.7 Debug Configurations

After each project type has been selected, a suitable debug configuration will be generated.

Non-Secure with Secure Project (Combined)

Both Secure and Non-Secure .elf files will be downloaded.

A debug configuration called <project name>_SSD will be generated.

Non-Secure with Secure Bundle (Split)

Only a Non-Secure elf will be downloaded. This configuration must be used with a pre-provisioned device (Secure project pre-programmed into MCU Flash).

A debug configuration called <project name>_NSECSD will be generated.

Flat Debug

A single .elf file will be downloaded.

A debug configuration called <project name>_FLAT will be generated.

3.5.5 Secure Projects

As mentioned, Secure code will be called immediately after device reset and run ANSI C start up, clock, interrupt vector table, and secure peripheral initialization before starting user code. All selected peripheral configuration settings will be automatically initialised as Secure.

3.5.5.1 Secure Clock

Device clock settings are the possible exception in that they will be initialised in the Secure project (to enable faster start up from reset) but can be set as Secure or Non-Secure as user application may need to change settings during execution (for low-power mode and so on). The Secure and Non-Secure FSP BSPs can both change the clock settings.

However, clock settings can be locked as Secure should the developer choose to do so.

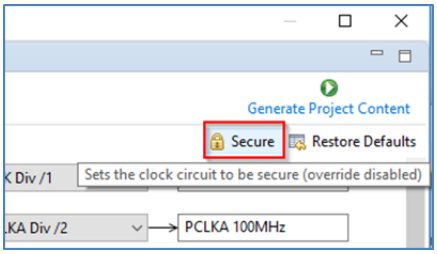

Figure 112: Secure Clock Setting

3.5.5.2 Setting Drivers as NSC

Some driver and middleware stacks in the Secure project may need to be accessed by the Non-Secure partition. To enable generation of NSC veneers, set "Non-Secure Callable" from the right-click context menu for the selected modules in the Configurator.

Note: It is only possible to "expose" top of stacks as NSC.

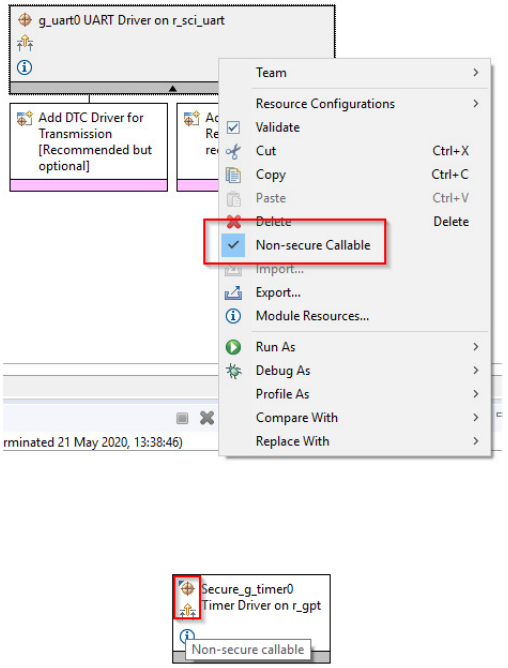

Figure 113: Generate NSC Veneers

The top of the stack will be marked with a new icon and tool tip to signify NSC access.

3.5.5.3 Guard Functions

Access to NSC drivers from a Non-Secure project is possible through the Guard APIs. FSP will automatically generate Guard functions for all the top of stack/driver APIs added to the project as Non-Secure Callable.

User can choose to add further levels of access control or delete guard function if they wish to only expose a limited range of APIs to a Non-Secure developer.

```
BSP_CMSE_NONSECURE_ENTRY fsp_err_t g_uart0_open_guard(
       uart_ctrl_t *const p_api_ctrl, uart_cfg_t const *const p_cfg) {
    /* User can add security checks here */
    FSP_PARAMETER_NOT_USED(p_api_ctrl);
    FSP_PARAMETER_NOT_USED(p_cfg);
    return R_SCI_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
}
```

For example, an SCI channel may be opened and configured for a desired baud rate by the Secure developer, but only enable the Write API to the Non-Secure developer. In which case, all but g_uart0_write_guard() could be deleted. CTRL structures are not required as they will be added on the Secure side.

For example, the call from the Non-Secure partition would be as follows:

```
err = g_uart0_open_guard(0,0);
```

3.5.6 Non-Secure projects

Configuration of the project can continue as for other RA devices, but certain resources will be locked if they have been previously set up as Secure.

The Non-Secure project will be called from the Secure project via R_BSP_NonSecureEnter();

3.5.6.1 Clock Set Up

You may recall that clocks can be set as Secure or Non-Secure. If they are set as Secure, settings will only be available to view, and user will not be able to change them. The Override button will be greyed. This is useful to preserve CGC sync with secure project by not overriding unless necessary. If it is NOT set as Secure, user can choose to override the initial Secure settings

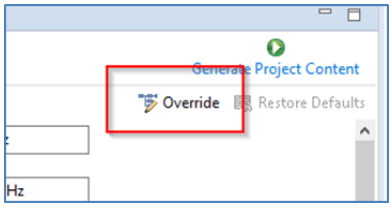

Figure 114: Clock Setting as Non-Secure

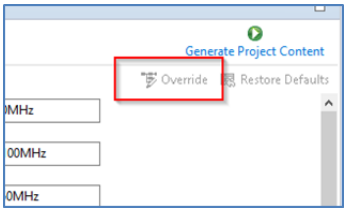

Figure 115: Clock Setting as Secure

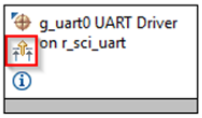
3.5.6.2 Selecting NSC Drivers

Drivers declared as NSC in a Secure project can be selected and added to Non-Secure project and will be decorated as before.



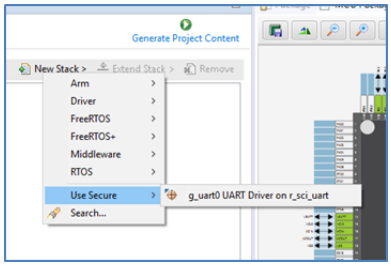


Figure 116: Selecting NSC Drivers

3.5.6.3 Locked Resources

When a NSC Secure driver is added to a Non-Secure project, the configuration settings are locked and are available for information only. A padlock is added for indication.

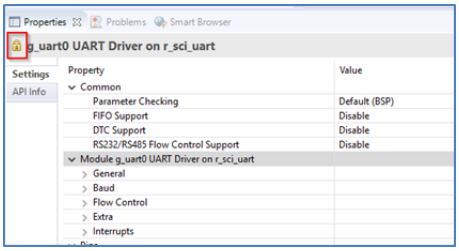

Figure 117: Locked Resources

3.5.6.4 Locked Channels

In a peripheral with multiple channels, for example, DMA, if a Non-Secure developer tries to select a channel that has already been defined as Secure, the following error message type will be displayed.

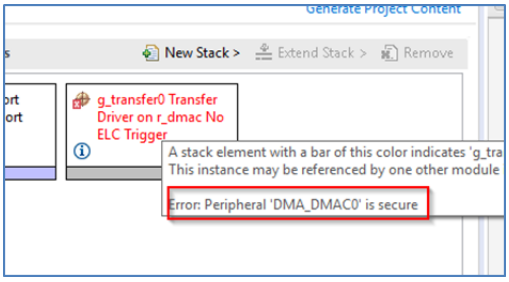

Figure 118: Error Message when Selecting a Secure Channel

3.5.7 IDAU registers

Renesas RA TrustZone-enabled devices include a set of registers known as Implementation Defined Attribution Unit (IDAU) that are used to set up partitions between Secure, Non-Secure Callable, and Non-Secure regions.

For devices that use DLM, the IDAU registers can only be programmed during MCU ***boot mode*** and NOT through the debug interfaces. Because of this, special debugger firmware has been developed to manage bringing the device up in SCI boot mode to set up the IDAU registers (automatically

drives MD pin) and then switch back to debug mode as needed.

Note: Please be aware of the extra signal connection (MD pin) needed on the debug interface connector. The Renesas Evaluation Kit (EK) for your selected device is a good reference.

Pin No.	SWD	JTAG	Serial Programming using SCI
1	VCC	VCC	VCC
2	P108/SWDIO	P108/TMS	NC
4	P300/SWCLK Wired OR with MD	P300/TCK Wired OR with MD	P201/MD
6	P109/SWO/TXD9	P109/TDO/TXD9	P109/TXD9
8	P110/RXD9	P110/TDI/RXD9	P110/RXD9
9	GNDdetect	GNDdetect	GNDdetect
10	nRESET	nRESET	nRESET
12	P214/TRACECLK	P214/TRACECLK	NC
14	P211/TRACEDATA[0]	P211/TRACEDATA[0]	NC
16	P210/TRACEDATA[1]	P210/TRACEDATA[1]	NC
18	P209/TRACEDATA[2]	P209/TRACEDATA[2]	NC
20	P208/TRACEDATA[3]	P208/TRACEDATA[3]	NC
3, 5, 15,17, 19	GND	GND	GND
7	NC	NC	NC
11, 13	NC	NC	NC

The e² studio build phase automatically extracts the IDAU partition register settings from the Secure .elf file and programs them into the device during debug connection, which can be observed in the console.

This is an important phase of TrustZone development as the Secure partitions should be set as small as possible to ensure that the security attack surface is as small as possible.

However, should the developer wish to make these partitions larger to accommodate, for example during field firmware updates, const or data arrays should be placed in the Secure project as needed.

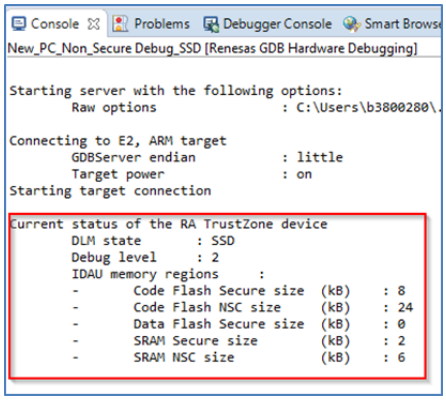

Figure 119: RA TrustZone Device Current Status

It is also possible to manually set up the partition registers through the Renesas Device Partition Manager.

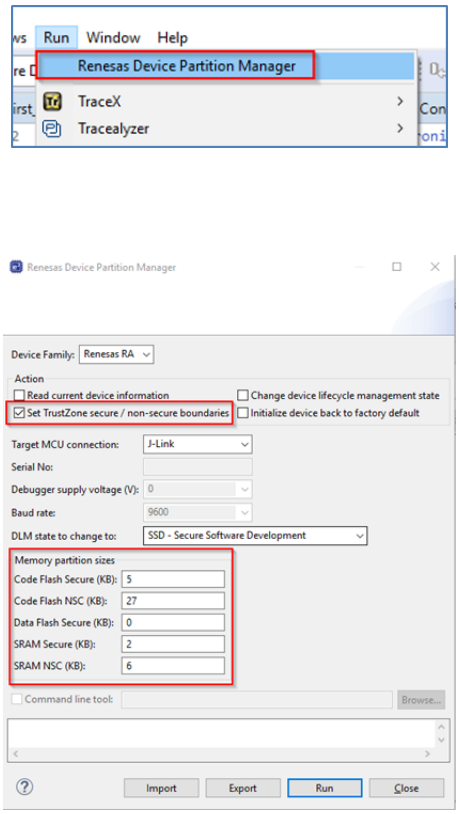

Figure 120: Renesas Device Partition Manager

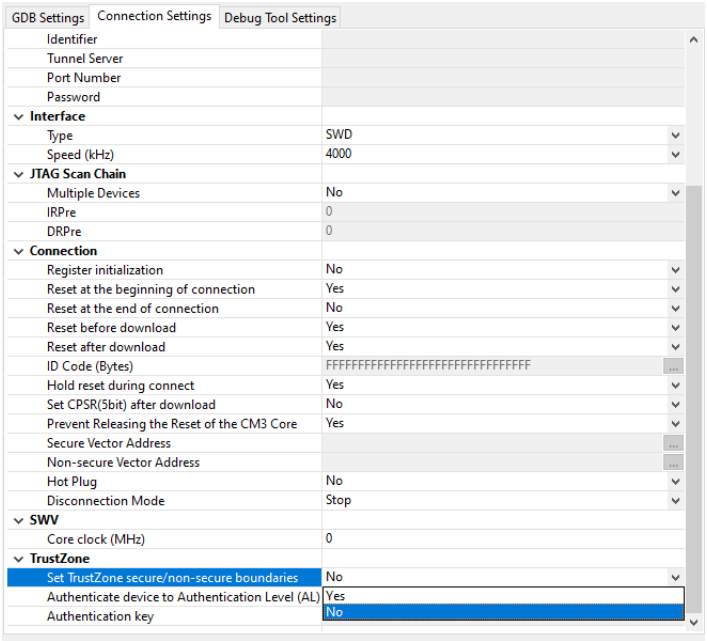
In e² studio, when manually setting partitions, make sure to disable setting partitions in the debug configuration to prevent the settings from being overridden when a debug session is launched.



3.5.7.1 SCI Boot Mode

Example of MD mode pin connection to debugger connector (from EK schematic).

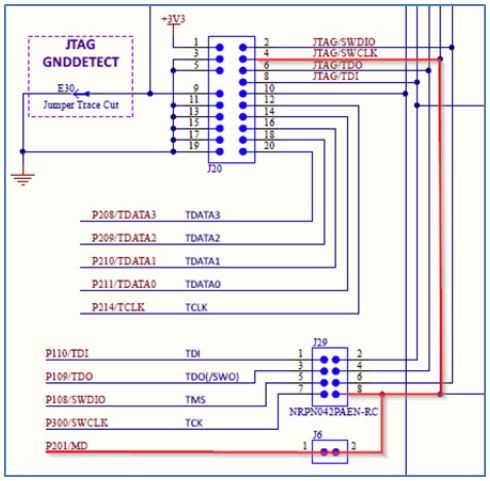


Figure 121: Example of MD Mode Pin Connection to Debugger Connector (from EK schematic

3.5.7.2 DLM States

Device lifecycle defines the current phase of the device and controls the capabilities of the debug interface, the serial programming interface and Renesas test mode. The following illustration shows the lifecycle definitions and capability in each lifecycle.

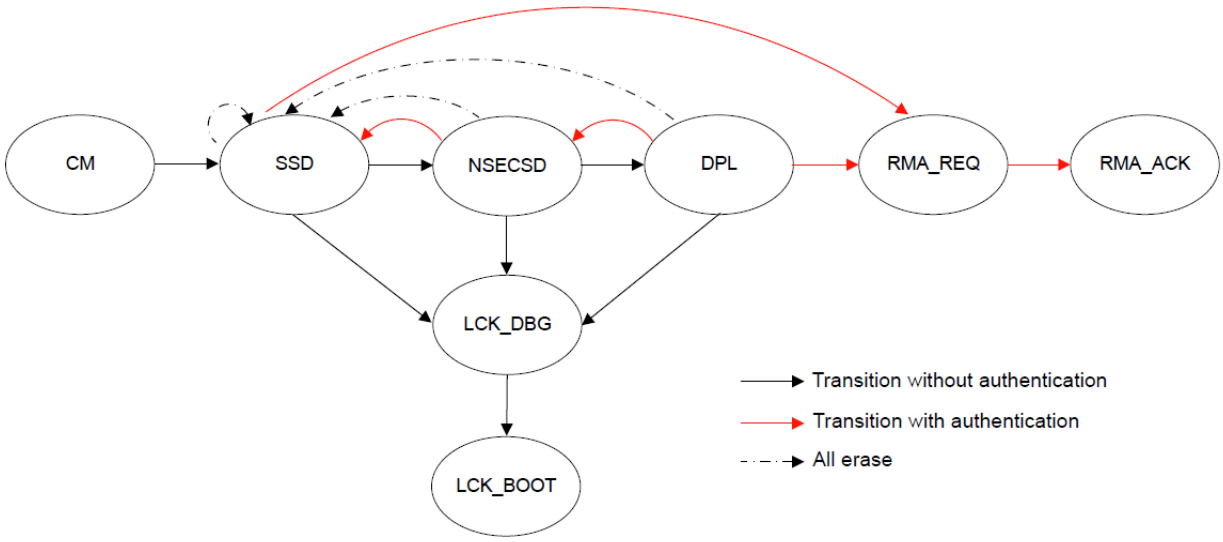

Figure 122: Lifecycle Stages

Note: All authentication key exchange and transitioning to LCK_DBG, LCK_BOOT, RMA_REQ is only managed by Renesas Flash Programmer (RFP) or other production programming tools, and NOT within e² studio.

Lifecycle	Definition	Debug level	Serial programming	Test mode
CM	"Chip Manufacturing" The state when the customer received the device.	DBG2	Available, cannot access code/data flash	Not available
SSD	"Secure Software Development" The secure part of application is being developed.	DBG2	Available can program/erase/read all code/data flash area	Not available
NSECSD	"Non-SECure Software Development" The non-secure part of application is being developed.	DBG1	Available can program/erase/read all code/data flash area	Not available
DPL	"DePLoyed" The device is in-field.	DBG0	Available cannot access code/data flash area	Not available
LCK_DBG	"LoCKed DeBuG" The debug interface is permanently disabled.	DBG0	Available cannot access code/data flash area	Not available
LCK_BOOT	"LoCKed BOOT interface" The debug interface and the serial programming interface are permanently disabled.	DBG0	Not available	Not available
RMA_REQ	"Return Material Authorization REQuest" Request for RMA. The customer must send the device to Renesas in this state.	DBG0	Available cannot access code/data flash area	Not available
RMA_ACK	"Return Material Authorization ACKnowledged" Failure analysis in Renesas	DBG2	Available cannot access code/data flash area	Available

Figure 123: Lifecycle Stages and Debug Levels

There are three debug access levels. The debug access level changes according to the lifecycle state.

- DBG2: The debugger connection is allowed, and no restriction to access memories and peripherals
- DBG1: The debugger connection is allowed, and restricted to access only Non-Secure memory regions and peripherals
- DBG0: The debugger connection is not allowed

State transitions can be performed using the Renesas Flash Programmer (RFP, see section below) or using the Renesas Device Partition Manager (limited number of states possible). It is possible to secure transitions between states using authentication keys. For more information on DLM states and transitions (device specific), please refer to device user manual.

3.5.7.3 Devices with Alternate DLM States

Some devices have an alternate implementation of Device Lifecycle Management (See Target Device). While the concept is the same, the DLM states are a little different. The following illustration shows the lifecycle definitions and capability in each lifecycle.

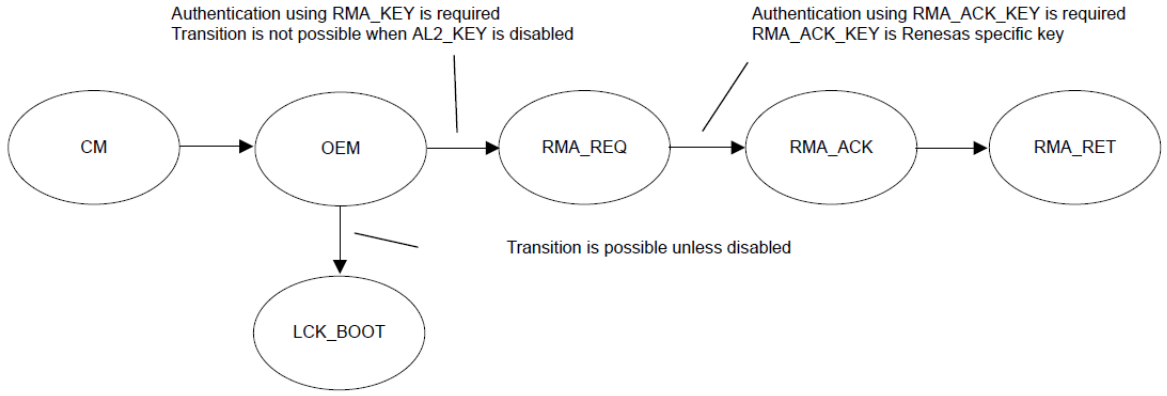

Figure 124: Lifecycle Stages

Note: All authentication key exchange and transitioning to LCK_BOOT, and RMA_REQ is only managed by Renesas Flash Programmer (RFP) or other production programming tools, and NOT within e² studio.

Lifecycle	Definition	Protection level	Debug function	Serial programming	Renesas test mode
CM	"Chip Manufacturing" The device is out of Renesas factory. The customer receives the device in this state.	PL2	Available in the secure and non-secure debug	Available Cannot access code/data flash area	Not available
OEM	"Original Equipment Manufacturer" The device is owned by the customer.	PL2 or PL1 or PL0	Depend on the authentication level		Not available
LCK_BOOT	"LoCKed BOOT interface" The debug interface and the serial programming interface are permanently disabled.	PL0	Not available	Not available	Not available
RMA_REQ	"Return Material Authorization REQuest" Request for RMA. The customer must send the device to Renesas in this state.	PL0	Not available	Available Cannot access code/data flash area	Not available
RMA_ACK	"Return Material Authorization ACKnowledged" Failure analysis in Renesas	PL2	Available in the secure and non-secure debug	Available Cannot access code/data flash area	Available
RMA_RET	"Return Material Authorization RETurn" The device is back to the customer. The device does not boot.	PL0	Not available	Not available	Not available

Figure 125: Lifecycle Stages and Debug Levels

There are three authentication levels. The available authentication levels change according to the lifecycle state and determine the memory and resources that are accessible by the debugger.

- AL2: The debugger connection is allowed, and no restriction to access memories and peripherals
- AL1: The debugger connection is allowed, and restricted to access only Non-Secure memory regions and peripherals
- AL0: The debugger connection is not allowed

State transitions can be performed using the Renesas Flash Programmer (RFP, see section below) or using the Renesas Device Partition Manager (limited number of states possible). It is possible to secure transitions between states using authentication keys. For more information on DLM states and transitions (device specific), please refer to device user manual.

In addition to having different DLM States, these devices also handle memory partitioning differently. Code Flash and Data Flash partitions are divided into secure and non-secure regions using SCI or USB boot mode commands. All other memory regions are set in IDAU and SAU registers in the secure application during the BSP startup procedure. All memory regions and peripherals that are configured as non-secure must be accessed using an aliased non-secure address. This non-secure address is calcualted by setting bit 28 in the address.

3.5.7.4 Devices without DLM

For devices that do not have DLM, the IDAU registers are programmed by secure application code at startup. Devices without DLM do not support IDAU register programming using boot mode commands.

3.5.8 Debug

By default, devices supporting DLM will be in SSD mode and so allow access to Secure and Non-Secure partitions. In this mode both Secure and Non-Secure .elf files will be downloaded.

The current debugger status is displayed in the lower left corner and includes the DLM state (SSD or NSECSD) and current partition (Secure, Non-Secure, or Non-Secure Callable) when the debugger is stopped, for example.

Figure 126: Current Debugger Status

3.5.8.1 Non-Secure Debug

Once the device is transitioned to NSECSD mode, only Non-Secure Flash, RAM and Peripherals can be accessed. In this mode, a Secure .elf must be pre-programmed (provisioned) into the device, and only a Non-Secure .elf file will be downloaded.

When in NSECSD mode access to Secure elements will be blocked and data displayed as ????????.

In NSECSD mode, it is not possible to set breakpoints on Secure code or data.

It is not possible to step into Secure code; the debugger will perform a step-over of any Secure function calls. Should the user press the Suspend button during execution, the debugger will stop at the next Non-Secure code access.

Assuming Secure memory region finishes at 32K (0x8000) in NSECSD debug mode (colour coding

added for indication only), memory will be displayed as shown in the following figure.

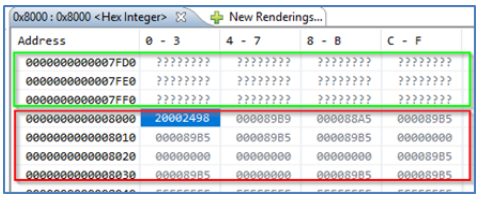

Figure 127: Memory Display in NSECSD Debug Mode

Disassembly will be displayed as shown in the following figure.

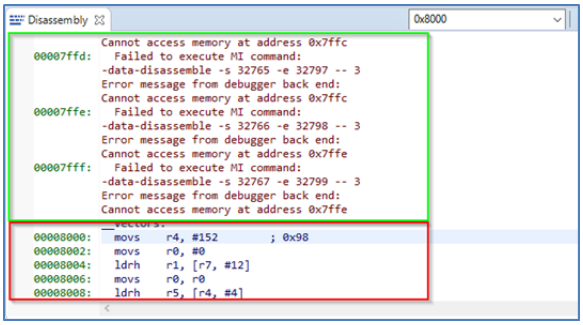

Figure 128: Disassembly Display in NSECSD Debug Mode

3.5.9 Debugger support

Renesas E2, E2 Lite, and SEGGER J-Link are supported in e² studio for TrustZone projects.

Debugger Support for TrustZone Projects

Feature	E2 Lite	E2	J-Link	J-Link OB	ULINK	IAR I-jet
JTAG	Yes	Yes	Yes	No	Yes	Yes
SWD	Yes	Yes	Yes	Yes	Yes	Yes
ETB trace	Yes	Yes	Yes	Yes	Yes	Yes
ETM trace	No	Yes	Yes	No	Yes	Yes
TrustZone partition programming	Yes	Yes	Yes	Yes	No	Yes
Non secure debug	Yes	Yes	Yes	Yes	No	Yes
e² studio	Yes	Yes	Yes	Yes	No	No
IAR EW Arm	Yes	Yes	Yes	Yes	No	Yes

Keil MDK	Under consideration	Under consideration	Yes	Yes	Yes	No

3.5.10 Third-Party IDEs

Third-party IDEs such as IAR Systems EWARM and Keil MDK (uVision) are supported by the RA Smart Configurator (RASC).

In general, RASC offers the same configurator functionality as e² studio documented above. Project generators are available to initialise workspaces in the target IDEs as well as setting up debug configurations and so forth. However, there are some limitations that need to be noted especially with regards to IDAU TrustZone partition register programming. See the specific RASC documentation for usage details.

3.5.11 Renesas Flash Programmer (RFP)

Updated versions of Renesas Flash Programmer (RFP) are available to support setting of partitions, DLM state and Authentication keys.

RFP can be downloaded free of charge on the Renesas web site.

A new mode has been added to Program Flash Options as shown in the following graphics.

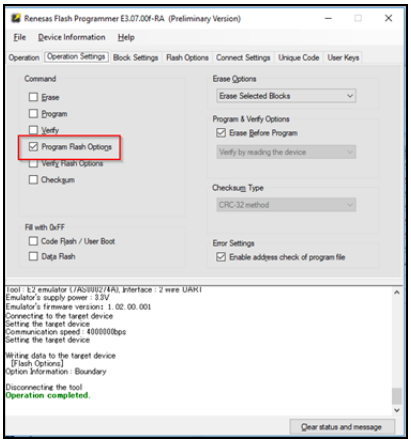

Figure 129: RFP Program Flash Options

Options to set partition boundaries are shown in the following figure.

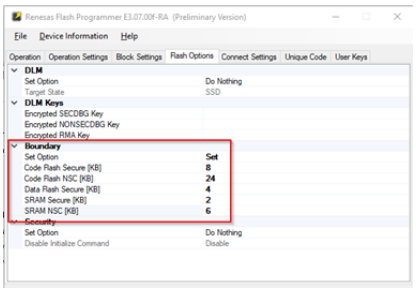

Figure 130: RFP Partition Boundaries

Options to set DLM state, Authentication keys, and Security settings are shown in the following figure.

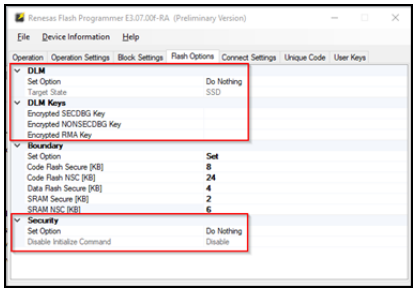

Figure 131: RFP DLM State, Authentication Keys, and Security Settings

Great care is needed here as some DLM states can **permanently** turn off debug and boot mode on the devices. Equally programming a security access authentication key can lead to permanently locked devices if the key is lost.

3.5.12 Glossary

IDAU

Implementation Defined Attribute Unit. Used to program TrustZone partitions.

NSECSD

Non-Secure Software Development mode

SSD

Secure Software Development mode

NSC

Non-Secure Callable. Special Secure memory region used for Veneer to allow access to Secure APIs from Non-Secure code.

Provisioned

Device with Secure code pre-programmed and DLM state set to **NSECSD**

Flat project

All code, data and peripherals are configured as secure with the exception of the EDMAC RAM buffer which are placed in Non-Secure RAM due to the configuration of the internal bus masters.

Veneer

Code that resides in Non-Secure Callable region

Combined model

Development engineer has access to both Secure and Non-Secure project and source code

Split model

Development Engineer has access to only the Non-Secure partition. No visibility of Secure source code. Secure code will be provisioned into device.

3.5.12.1 Configurator Icon Glossary

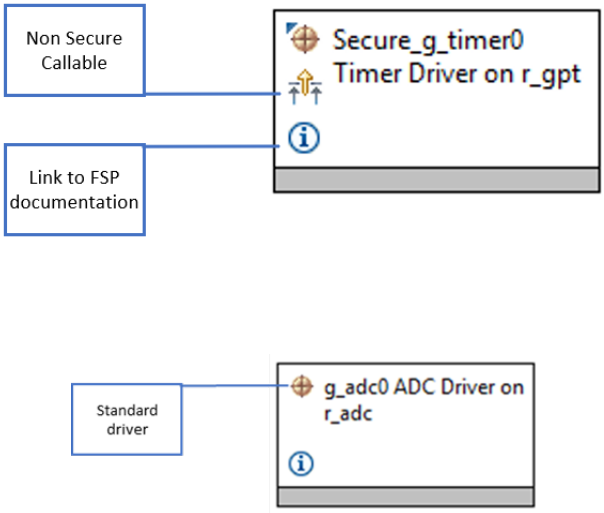

Figure 132: Configurator Icons

3.6 RASC User Guide for MDK and IAR

3.6.1 What is RASC?

The Renesas RA Smart Configurator (RASC) is a desktop application designed to configure device hardware such as clock set up and pin assignment as well as initialization of FSP software components for a Renesas RA microcontroller project when using a 3rd-party IDE and toolchain.

The RA Smart Configurator can currently be used with

1. Keil MDK and the Arm compiler toolchain.
2. IAR EWARM with IAR toolchain for Arm

Projects can be configured and the project content generated in the same way as in e² studio. Please refer to Configuring a Project section for more details.

3.6.2 Using RA Smart Configurator with Keil MDK

3.6.2.1 Prerequisites

- Keil MDK and Arm compiler are installed and licensed. Please refer to the RASC Release notes for the version to be installed.
- Import the RA device pack. Download the RA device pack archive file (ex: MDK_Device_Packs_2.x.x.zip) from the FSP GitHub release page. Extract the archive file to locate the RA device pack. To import the RA device pack, launch the PackInstaller.exe from <keil_mdk_install_dir>\UV4. Select the menu item **File > Import...** and browse to the

extracted .pack file.
- Verify that the latest updates for RA devices are included in Keil MDK. To verify, select the menu "Packs" in Pack Installer and verify that the menu item **Check for Updates on Launch** is selected. If not, select **Check for Updates on Launch** and relaunch Pack Installer.
- For flashing and debugging, the latest Segger J-Link DLL is installed into Keil MDK.
- Install RASC and FSP using the Platform Installer from the GitHub release page.

3.6.2.2 Create new RA project

The following steps are required to create an RA project using Keil MDK, RASC and FSP:

1. Start the RA Smart Configurator.

2. Enter a project folder and project name.

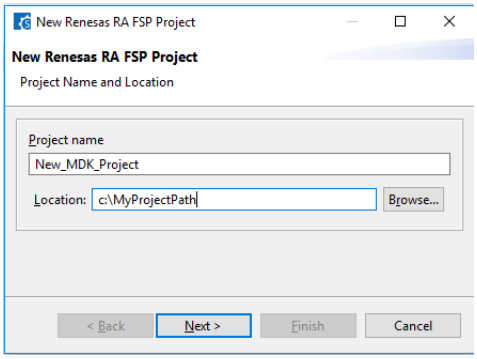

Figure 133: RASC project settings

3. Select the target device and IDE.

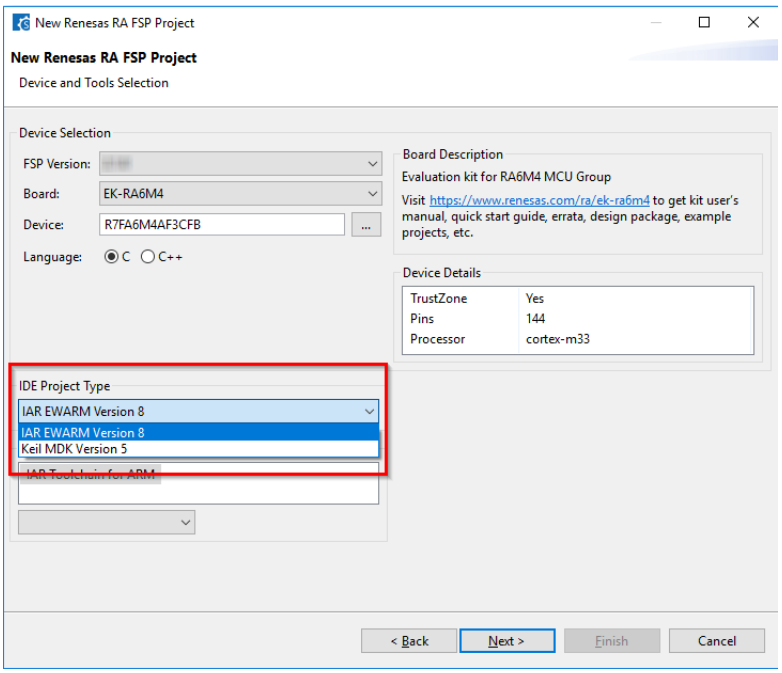

Figure 134: Target device and IDE selection

4. The rest of the project generator and FSP configuration is the same as e² studio. Please refer to the previous sections for details.
5. On completion of FSP configuration, press "Generate Project Content"

6. A new Keil MDK project file will be generated in the project path. Double click this file to open MDK and continue development as usual.

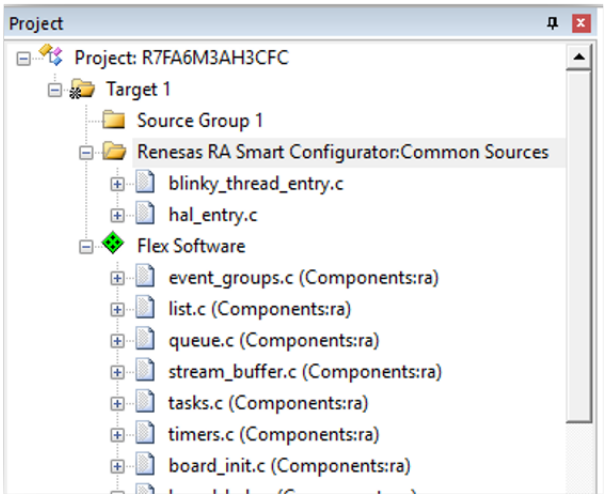

Figure 135: uVision project workspace with imported project data

3.6.2.3 Modify existing RA project

Once an initial project has been generated and configured, it is also possible to make changes using RASC as follows.

Note

This setup only needs to be done once per project.

Set up the following links to RASC:

1. In Keil MDK uVision, select **Tools > Customize Tools Menu...**.
2. Select the **new** icon and fill in the fields as follows for each tool:
    a. RA Smart Configurator:
        - Menu item name: Enter: RA Smart Configurator
        - Command: Select "..." and navigate to rasc.exe
        - Initial Folder: Enter: $P
        - Arguments: Enter: configuration.xml

    b. Device Partition Manager:
        - Menu item name: Enter: Device Partition Manager
        - Command: Select "..." and navigate to rasc.exe
        - Initial Folder: Enter: $P
        - Arguments: Enter: -application com.renesas.cdt.ddsc.dpm.ui.dpmapplication configuration.xml "$L%L"

To reconfigure an existing project select **Tools > RA Smart Configurator**

To reconfigure the TrustZone partitions select **Tools > Device Partition Manager**

3.6.2.4 Build and Debug RA project

The project can be built by selecting the menu item **Project > Build Target** or tool bar item **Rebuild** or the keyboard shortcut F7.

Assembler, Compiler, Linker and Debugger settings can be changed in **Options for Target** dialog, which can be launched using the menu item **Project > Options for Target**, the tool bar item **Options for Target** or the keyboard shortcut Alt+F7.

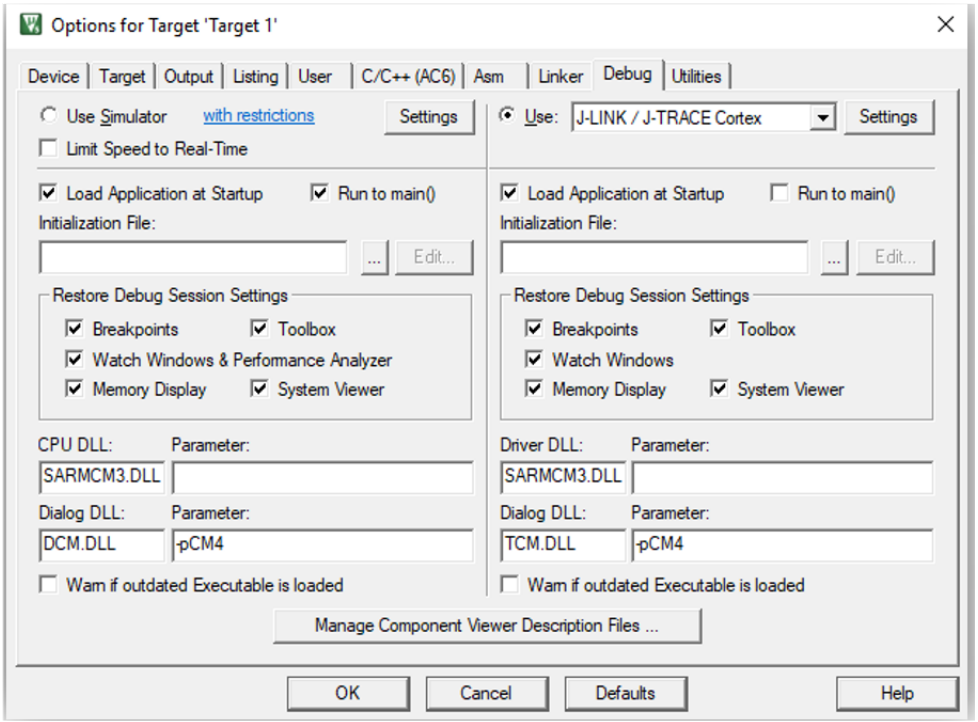

Figure 136: Options for Target

RASC will set up the uVision project to debug the selected device using J-Link or J-Link OB debugger by default.

A Debug session can be started or stopped by selecting the menu item **Debug > Start/Stop Debug Session** or keyboard shortcut CTRL+F5. When debugging for the first time, J-Link firmware update may be needed if requested by the tool.

Refer to the documentation from Keil to get more information on the debug features in uVision. Note that not all features supported by uVision debugger are implemented in the J-Link interface. Consult SEGGER J-Link documentation for more information.

3.6.2.5 Notes and Restrictions

1. **When debugging a TrustZone based project, the Secure project image MUST be downloaded before the Non Secure project.**

2. For TrustZone enabled devices, the user will need to manually set up the memory partitions using the "Renesas Device Partition Manager" from inside RASC before downloading.

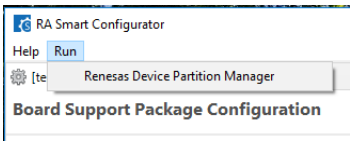

Figure 137: Renesas Device partition Manager

3. RA FSP contains a full set of drivers and middleware and may not be compatible with other CMSIS packs from Keil, Arm or third parties.
4. Flash programming is currently only supported through the debugger connection.

3.6.3 Using RA Smart Configurator with IAR EWARM

IAR Systems Embedded Workbench for Arm (EWARM) includes support for Renesas RA devices. These can be set up as bare metal designs within EWARM. However, most RA developers will want to integrate RA FSP drivers and middleware into their designs. RASC will facilitate this.

RASC generates a "Project Connection" file that can be loaded directly into EWARM to update project files.

3.6.3.1 Prerequisites

- IAR EWARM installed and licensed. Pleae refer to the Release notes for the version to be installed.
- RASC and FSP Installed

3.6.3.2 Create new RA project

The following steps are required to create an RA project using IAR EWARM, RASC and FSP:

1. Start the RA Smart Configurator.

2. Enter a project folder and project name.

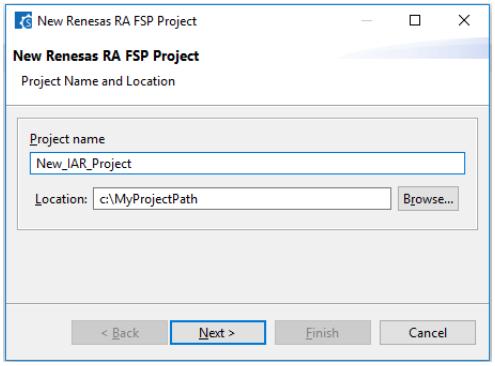

Figure 138: RASC project settings

3. Select the target device and IDE.

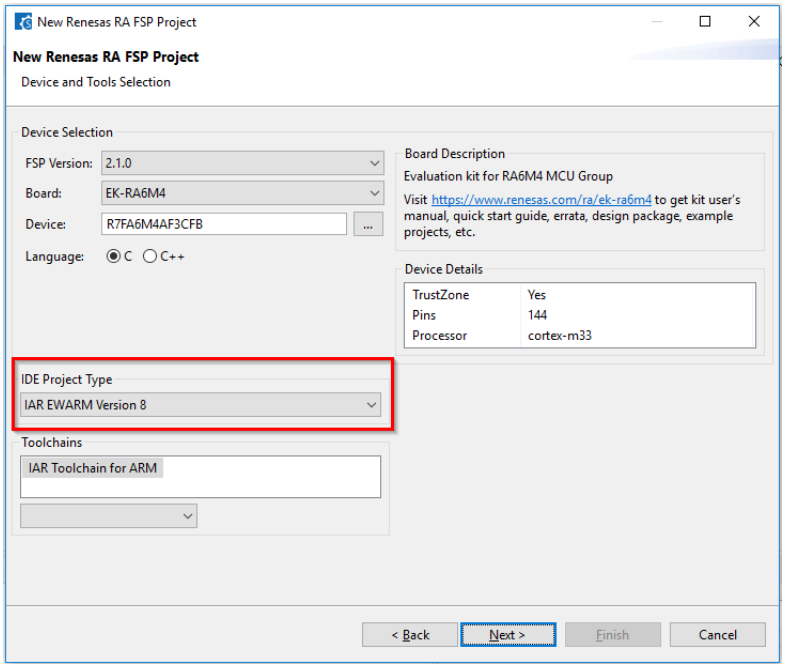

Figure 139: Target device and IDE selection

4. The rest of the project generator and FSP configuration operates the same as e² studio. Refer to the previous sections for details.
5. On completion of FSP configuration, press **Generate Project Content**.
6. A new IAR EWARM project file will be generated in the project path. Double click this file to open IAR EWARM and continue development as usual.
7. To Use RASC with EWARM, RASC needs to configured as a tool in EWARM by selecting the menu item **Tools > Configure Tools...**. Select **New** to create a new tool in the dialog shown and add the following information:
    - Menu Text: **RA Smart Configurator**
        a. Command: Select **Browse...** and navigate to rasc.exe in the installed RASC
        b. Argument: configuration.xml

        c. Initial Directory: $PROJ_DIR$
        d. Tool Available: Always
    - Menu Text: **Device Partition Manager**
        a. Command: Select **Browse...** and navigate to rasc.exe in the installed RASC
        b. Argument: -application com.renesas.cdt.ddsc.dpm.ui.dpmapplication configuration.xml "$TARGET_PATH$"
        c. Initial Directory: $PROJ_DIR$
        d. Tool Available: Always
8. RASC can now be re-launched from EWARM using the menu item **Tools > RA Smart Configurator**.
9. A Project connection needs to be set up in EWARM to build the project. Select **Project > Add Project Connection** in EWARM and select **IAR Project Connection**. Navigate to the project folder and select buildinfo.ipcf and click **Open**. The project can now build in EWARM.

3.6.3.3 Notes and Restrictions

When starting a TrustZone enabled debug session Partition sizes are checked automatically.

- If partition sizes are set correctly, the debug session will launch as normal.
- If partition sizes need to be changed, IAR EWARM will prompt to run the Renesas Device Partition Manager. Select **Yes**. The Device Partition Manager will start with the required partition sizes prefilled.
- Select **Set TrustZone secure / non-secure boundaries** as the only action.
- Enter debugger details, if required.
- Select **Run** to program the partitions.
- Return to the IDE and relaunch the debug session

Chapter 4 FSP Architecture

4.1 FSP Architecture Overview

This guide describes the Renesas Flexible Software Package (FSP) architecture and how to use the FSP Application Programming Interface (API).

4.1.1 C99 Use

FSP uses the ISO/IEC 9899:1999 (C99) C programming language standard. Specific features introduced in C99 that are used include standard integer types (stdint.h), booleans (stdbool.h), designated initializers, and the ability to intermingle declarations and code.

4.1.2 Doxygen

Doxygen is the default documentation tool used by FSP. You can find Doxygen comments throughout the FSP source.

4.1.3 Weak Symbols

Weak symbols are used occasionally in FSP. They are used to ensure that a project builds even when the user has not defined an optional function.

4.1.4 Memory Allocation

Dynamic memory allocation through use of the malloc() and free() functions are not used in FSP modules; all memory required by FSP modules is allocated in the application and passed to the module in a pointer. Exceptions are considered only for ports of 3rd party code that require dynamic memory.

4.1.5 FSP Terms

Term	Description	Reference
BSP	Short for Board Support Package. In FSP, the BSP provides just enough foundation to allow other FSP modules to work together without issue.	MCU Board Support Package

Module	Modules can be peripheral drivers, purely software, or anything in between. Each module consists of a folder with source code, documentation, and anything else that the customer needs to use the code effectively. Modules are independent units, but they may depend on other modules. Applications can be built by combining multiple modules to provide the user with the features they need.	FSP Modules
Driver	A driver is a specific kind of module that directly modifies registers on the MCU.	-
Interface	An interface contains API definitions that can be shared by modules with similar features. Interfaces are definitions only and do not add to code size.	FSP Interfaces
Stacks	The FSP architecture is designed such that modules work together to form a stack. A stack consists of a top level module and all its dependencies.	FSP Stacks
Module Instance	Single and independent instantiation of a module. An application may require two GPT timers. Each of these timers is a module instance of the r_gpt module.	-
Application	Code that is owned and maintained by the user. Application code may be based on sample application code provided by Renesas, but it is the responsibility of the user to maintain as necessary.	-

Callback Function	This term refers to a function that is called when an event occurs. As an example, suppose the user would like to be notified every second based on the RTC. As part of the RTC configuration, a callback function can be supplied that will be jumped to during each RTC interrupt. When a single callback services multiple events, the arguments contain the triggering event. Callback functions for interrupts should be kept short and handled carefully because when they are called the MCU is still inside of an interrupt, delaying any pending interrupts.	-

4.2 FSP Modules

Modules are the core building block of FSP. Modules can do many different things, but all modules share the basic concept of providing functionality upwards and requiring functionality from below.

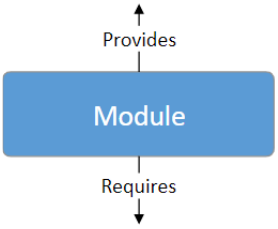

Figure 140: Modules

The amount of functionality provided by a module is determined based on functional use cases. Common functionality required by multiple modules is often placed into a self-contained submodule so it can be reused. Code size, speed and complexity are also considered when defining a module.

The simplest FSP application consists of one module with the Board Support Package (BSP) and the user application on top.

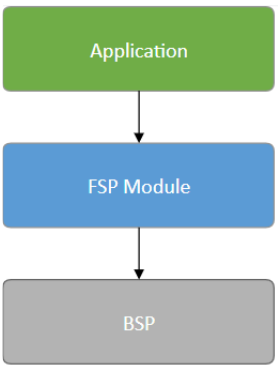

Figure 141: Module with application

The Board Support Package (BSP) is the foundation for FSP modules, providing functionality to determine the MCU used as well as configuring clocks, interrupts and pins. For the sake of clarity, the BSP will be omitted from further diagrams.

4.2.1 Module Sources

Some modules distributed alongside FSP originate from outside sources. A full list of sources for FSP modules, including versions and hyperlinks, can be found in the Third Party Software section of the release notes for each release.

4.2.2 Module Distribution

All modules distributed with FSP are packaged as CMSIS components in CMSIS packs. Each module consists of source files and a tooling support file used to integrate the module with e² studio or RASC. The tooling support file defines the configurations used to generate code in the ra_gen and ra_cfg folders.

4.2.3 Module Versioning

Module versions can be seen on the Components tab of the FSP Configuration editor. The FSP Configuration editor automatically selects compatible components.

All third party modules have a semantic version are versioned with their original semantic version plus added metadata fsp.<fsp_semantic_version>. The metadata is added to reflect the tooling support file added for the FSP configuration tool.

Third party modules versioned with +renesas.<counter> in the metadata have been forked and updated for FSP. If +renesas.<counter> is not in the metadata, the third party code is unchanged from its original source.

If changes are made to third party module source code to support FSP, the changes are pushed to a public Renesas GitHub fork of the original source. Links to Renesas forks are provided in the Third Party Software section of the release notes for each release.

Modules that originate from outside sources that do not have a semantic version are versioned with the FSP version.

All modules that are part of FSP or integrated with FSP are tested as a package. Mixing versions is not encouraged and may lead to support issues.

4.3 FSP Stacks

When modules are layered atop one another, an FSP stack is formed. The stacking process is performed by matching what one module provides with what another module requires. For example, the SPI module (SPI (r_spi)) requires a module that provides the transfer interface (Transfer Interface) to send or receive data without a CPU interrupt. The transfer interface requirement can be fulfilled by the DTC driver module (Transfer (r_dtc)).

Through this methodology the same code can be shared by several modules simultaneously. The example below illustrates how the same DTC module can be used with SPI (SPI (r_spi)), UART (UART (r_sci_uart)) and SDHI (SD/MMC (r_sdhi)).

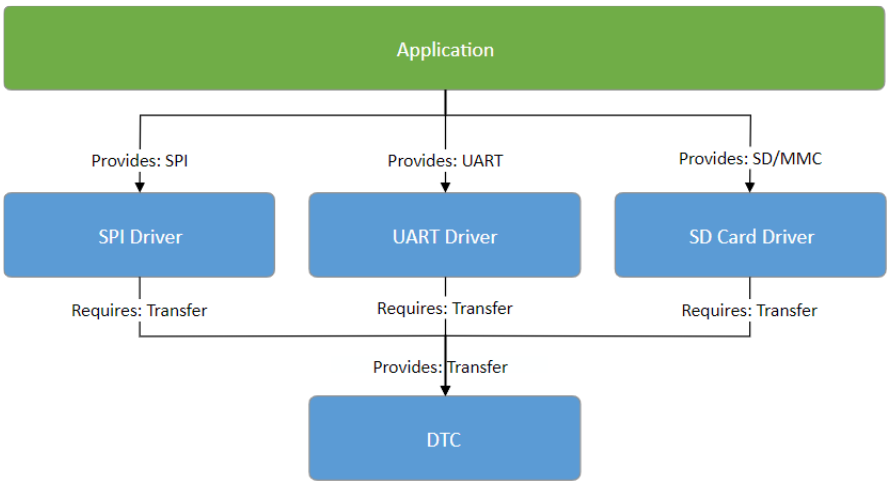

Figure 142: Stacks -- Shared DTC Module

The ability to stack modules ensures the flexibility of the architecture as a whole. If multiple modules include the same functionality issues arise when application features must work across different user designs. To ensure that modules are reusable, any dependent modules must be capable of being swapped out for other modules that provide the same features. The FSP architecture provides this flexibility to swap modules in and out through the use of FSP interfaces.

4.4 FSP Interfaces

At the architecture level, interfaces are the way that modules provide common features. This commonality allows modules that adhere to the same interface to be used interchangeably. Interfaces can be thought of as a contract between two modules - the modules agree to work together using the information that was established in the contract.

On RA hardware there is occasionally an overlap of features between different peripherals. For example, I2C communications can be achieved through use of the IIC peripheral or the SCI peripheral. However, there is a difference in the level of features provided by both peripherals; in I2C mode the SCI peripheral will only support a subset of the capabilities of the fully-featured IIC.

Interfaces aim to provide support for the common features that most users would expect. This means that some of the advanced features of a peripheral (such as IIC) might not be available in the interface. In most cases these features are still available through interface extensions.

In FSP design, interfaces are defined in header files. All interface header files are located in the folder

ra/fsp/inc/api and end with *_api.h. Interface extensions are defined in header files in the folder ra/fsp/inc/instances. The following sections detail what makes up an interface.

4.4.1 FSP Interface Enumerations

Whenever possible, interfaces use typed enumerations for function parameters and structure members.

```
typedef enum e_i2c_master_addr_mode
{
    I2C_MASTER_ADDR_MODE_7BIT = 1,    ///< Use 7-bit addressing mode
    I2C_MASTER_ADDR_MODE_10BIT = 2,    ///< Use 10-bit addressing mode
} i2c_master_addr_mode_t;
```

Enumerations remove uncertainty when deciding what values are available for a parameter. FSP enumeration options follow a strict naming convention where the name of the type is prefixed on the available options. Combining the naming convention with the autocomplete feature available in e² studio (Ctrl + Space) provides the benefits of rapid coding while maintaining high readability.

4.4.2 FSP Interface Callback Functions

Callback functions allow modules to asynchronously alert the user application when an event has occurred, such as when a byte has been received over a UART channel or an IRQ pin is toggled. FSP driver modules define and handle the interrupt service routines for RA MCU peripherals to ensure any required hardware procedures are implemented. The interrupt service routines in FSP modules then call the user-defined callbacks to allow the application to respond.

Callback functions must be defined in the user application. They always return void and take a structure for their one parameter. The structure is defined in the interface for the module and is named <interface>_callback_args_t. The contents of the structure may vary depending on the interface, but two members are common: event and p_context.

The event member is an enumeration defined in the interface used by the application to determine why the callback was called. Using the UART example, the callback could be triggered for many different reasons, including when a byte is received, all bytes have been transmitted, or a framing error has occurred. The event member allows the application to determine which of these three events has occurred and handle it appropriately.

The p_context member is used for providing user-specified data to the callback function. In many cases a callback function is shared between multiple channels or module instances; when the callback occurs, the code handling the callback needs context information so that it can determine which module instance the callback is for. For example, if the callback wanted to make an FSP API call in the callback, then at a minimum the callback will need a reference to the relevant control structure. To make this easy, the user can provide a pointer to the control structure as the p_context. When the callback occurs, the control structure is passed in the p_context element of the callback structure.

Callback functions are called from within an interrupt service routine. For this reason callback functions should be kept as short as possible so they do not affect the real time performance of the user's system. An example skeleton function for the flash interface callback is shown below.

```
void flash_callback (flash_callback_args_t * p_args)
{
 /* See what event caused this callback. */
 switch (p_args->event)
    {
 case FLASH_EVENT_ERASE_COMPLETE:
      {
 /* Handle event. */
 break;
       }
 case FLASH_EVENT_WRITE_COMPLETE:
      {
 /* Handle event. */
 break;
       }
 case FLASH_EVENT_BLANK:
      {
 /* Handle event. */
 break;
       }

      {
 /* Handle error. */
 break;
       }
 case FLASH_EVENT_ERR_CF_ACCESS:
      {
 /* Handle error. */
 break;
```

```
      }
 case FLASH_EVENT_ERR_CMD_LOCKED:
     {
 /* Handle error. */
 break;
      }
 case FLASH_EVENT_ERR_FAILURE:
     {
 /* Handle error. */
 break;
      }
 case FLASH_EVENT_ERR_ONE_BIT:
     {
 /* Handle error. */
 break;
      }
   }
}
```

When a module is not directly used in the user application (that is, it is not the top layer of the stack), its callback function will be handled by the module above. For example, if a module requires a UART interface module the upper layer module will control and use the UART's callback function. In this case the user would not need to create a callback function for the UART module in their application code.

4.4.3 FSP Interface Data Structures

At a minimum, all FSP interfaces include three data structures: a configuration structure, an API structure, and an instance structure.

4.4.3.1 FSP Interface Configuration Structure

The configuration structure is used for the initial configuration of a module during the <MODULE>_Open() call. The structure consists of members such as channel number, bitrate, and operating mode.

The configuration structure is used purely as an input into the module. It may be stored and referenced by the module, so the configuration structure and anything it references must persist as long as the module is open.

The configuration structure is allocated for each module instance in files generated by the RA Configuration editor.

When FSP stacks are used, it is also important to understand that configuration structures only have members that apply to the current interface. If multiple layers in the same stack define the same configuration parameters then it becomes difficult to know where to modify the option. For example, the baud rate for a UART is only defined in the UART module instance. Any modules that use the UART interface rely on the baud rate being provided in the UART module instance and do not offer it in their own configuration structures.

4.4.3.2 FSP Interface API Structure

All interfaces include an API structure which contains function pointers for all the supported interface functions. An example structure for the DAC is shown below.

```
typedef struct st_dac_api
{
    /** Initial configuration.
    *
    * @param[in] p_ctrl Pointer to control block. Must be declared by user. Elements
set here.
    * @param[in] p_cfg Pointer to configuration structure. All elements of this
structure must be set by user.
    */
    fsp_err_t (* open)(dac_ctrl_t * const p_ctrl, dac_cfg_t const * const p_cfg);
    /** Close the D/A Converter.
    *
    * @param[in] p_ctrl Control block set in @ref dac_api_t::open call for this
timer.
    */
    fsp_err_t (* close)(dac_ctrl_t * const p_ctrl);
    /** Write sample value to the D/A Converter.
    *
    * @param[in] p_ctrl Control block set in @ref dac_api_t::open call for this
timer.
    * @param[in] value Sample value to be written to the D/A Converter.
    */
    fsp_err_t (* write)(dac_ctrl_t * const p_ctrl, uint16_t value);
    /** Start the D/A Converter if it has not been started yet.
    *
    * @param[in] p_ctrl Control block set in @ref dac_api_t::open call for this
timer.
```

```
    */
    fsp_err_t (* start)(dac_ctrl_t * const p_ctrl);
    /** Stop the D/A Converter if the converter is running.
    *
    * @param[in] p_ctrl Control block set in @ref dac_api_t::open call for this
timer.
    */
    fsp_err_t (* stop)(dac_ctrl_t * const p_ctrl);
} dac_api_t;
```

The API structure is what allows for modules to easily be swapped in and out for other modules that are instances of the same interface. Let's look at an example application using the DAC interface above.

RA MCUs have an internal DAC peripheral. If the DAC API structure in the DAC interface is not used the application can make calls directly into the module. In the example below the application is making calls to the R_DAC_Write() function which is provided in the r_dac module.

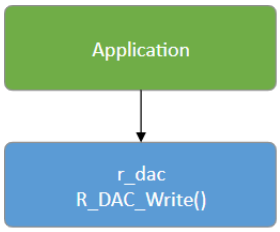

Figure 143: DAC Write example

Now let's assume that the user needs more DAC channels than are available on the MCU and decides to add an external DAC module named dac_external using I2C for communications. The application must now distinguish between the two modules, adding complexity and further dependencies to the application.

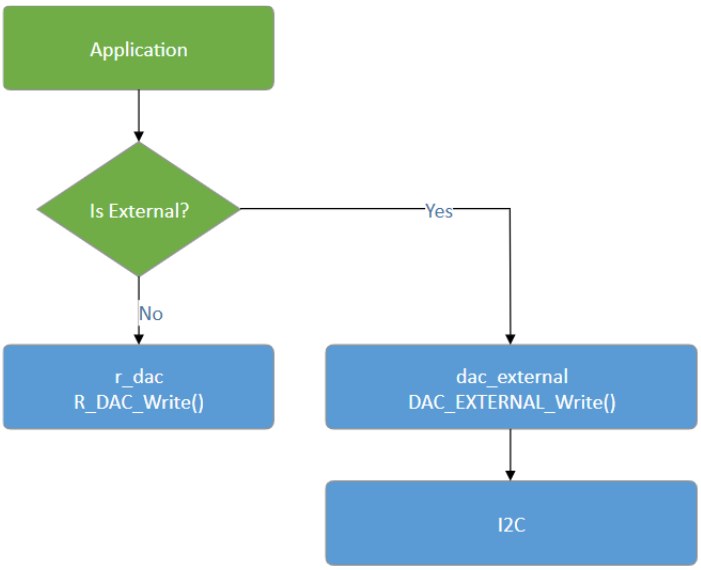

Figure 144: DAC Write with two write modules

The use of interfaces and the API structure allows for the use of an abstracted DAC. This means that no extra logic is needed if the user's dac_external module implements the FSP DAC interface, so the application no longer depends upon hard-coded module function names. Instead the application now depends on the DAC interface API which can be implemented by any number of modules.

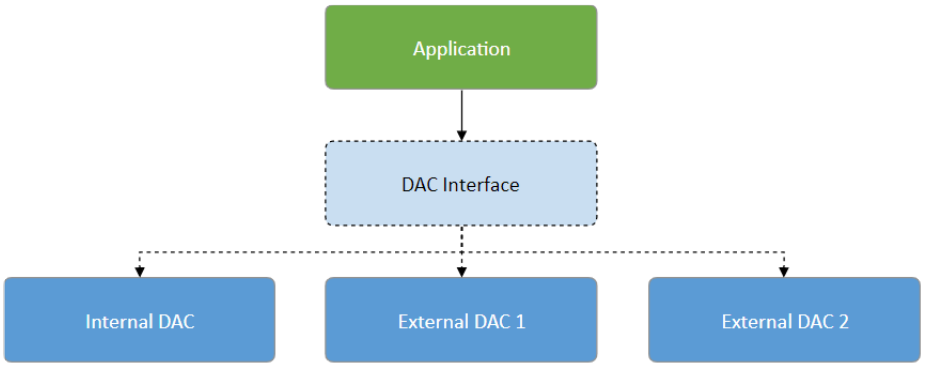

Figure 145: DAC Interface

4.4.3.3 FSP Interface Instance Structure

Every FSP interface also has an instance structure. The instance structure encapsulates everything required to use the module:

- A pointer to the instance API structure (FSP Instance API)
- A pointer to the configuration structure
- A pointer to the control structure

The instance structure is not required at the application layer. It is used to connect modules to their dependencies (other than the BSP).

Instance structures have a standardized name of <interface>_instance_t. An example from the Transfer Interface is shown below.

```
typedef struct st_transfer_instance
{
  transfer_ctrl_t     * p_ctrl; ///< Pointer to the control structure for this
instance
    transfer_cfg_t const * p_cfg;      ///< Pointer to the configuration structure
for this instance
    transfer_api_t const * p_api;      ///< Pointer to the API structure for this
instance
} transfer_instance_t;
```

Note that when an instance structure variable is declared, the API is the only thing that is instance specific, not *module instance* specific. This is because all module instances of the same module share the same underlying module source code. If SPI is being used on SCI channels 0 and 2 then both module instances use the same API while the configuration and control structures are typically different.

4.5 FSP Instances

While interfaces dictate the features that are provided, instances actually implement those features. Each instance is tied to a specific interface. Instances use the enumerations, data structures, and API prototypes from the interface. This allows an application that uses an interface to swap out the instance when needed.

On RA MCUs some peripherals are used to implement multiple interfaces. In the example below the IIC and SPI peripherals map to only one interface each while the SCI peripheral implements three interfaces.

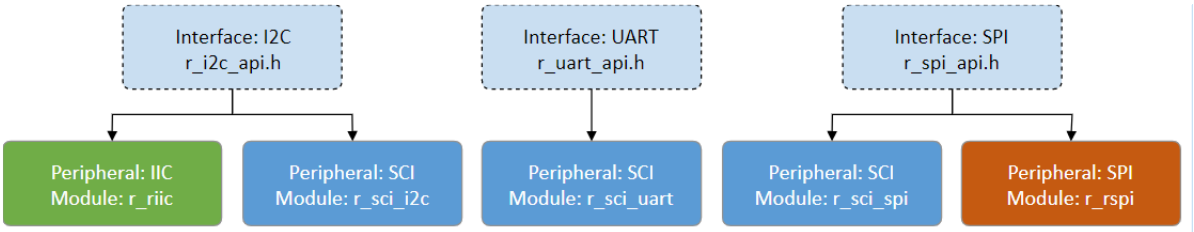

Figure 146: Instances

In FSP design, instances consist of the interface extension and API defined in the instance header file located in the folder ra/fsp/inc/instances and the module source ra/fsp/src/<module>.

4.5.1 FSP Instance Control Structure

The control structure is used as a unique identifier for the module instance and contains memory required by the module. Elements in the control structure are owned by the module and *must not be modified* by the application. The user allocates storage for a control structure, often as a global variable, then sends a pointer to it into the <MODULE>_Open() call for a module. At this point, the

module initializes the structure as needed. The user must then send in a pointer to the control structure for all subsequent module calls.

4.5.2 FSP Interface Extensions

In some cases, instances require more information than is provided in the interface. This situation can occur in the following cases:

- An instance offers extra features that are not common to most instances of the interface. An example of this is the start source selection of the GPT (Timer, General PWM (r_gpt)). The GPT can be configured to start based on hardware events such as a falling edge on a trigger pin. This feature is not common to all timers, so it is included in the GPT instance.
- An interface must be very generic out of necessity. As an interface becomes more generic, the number of possible instances increases. An example of an interface that must be generic is a block media interface that abstracts functions required by a file system. Possible instances include SD card, SPI Flash, SDRAM, USB, and many more.

The p_extend member provides this extension function.

Use of interface extensions is not always necessary. Some instances do not offer an extension since all functionality is provided in the interface. In these cases the p_extend member can be set to NULL. The documentation for each instance indicates whether an interface extension is available and whether it is mandatory or optional.

4.5.2.1 FSP Extended Configuration Structure

When extended configuration is required it can be supplied through the p_extend parameter of the interface configuration structure.

The extended configuration structure is part of the instance, but it is also still considered to be part of the configuration structure. All usage notes about the configuration structure described in FSP Interface Configuration Structure apply to the extended configuration structure as well.

The extended configuration structure and all typed structures and enumerations required to define it make up the interface extension.

4.5.3 FSP Instance API

Each instance includes a constant global variable tying the interface API functions to the functions provided by the module. The name of this structure is standardized as g_<interface>_on_<instance>. Examples include g_spi_on_spi, g_transfer_on_dtc, and g_adc_on_adc. This structure is available to be used through an extern in the instance header file (r_spi.h, r_dtc.h, and r_adc.h respectively).

4.6 FSP API Standards

4.6.1 FSP Function Names

FSP functions start with the uppercase module name (<MODULE>). All modules have <MODULE>_Open() and <MODULE>_Close() functions. The <MODULE>_Open() function must be called before any of the other functions.

Other functions that will commonly be found are <MODULE>_Read(), <MODULE>_Write(), <MODULE>_InfoGet(), and <MODULE>_StatusGet(). The <MODULE>_StatusGet() function provides

a status that could change asynchronously, while <MODULE>_InfoGet() provides information that cannot change after open or can only be updated by API calls. Example function names include:

- R_SPI_Read(), R_SPI_Write(), R_SPI_WriteRead()
- R_SDHI_StatusGet()
- R_RTC_CalendarAlarmSet(), R_RTC_CalendarAlarmGet()
- R_FLASH_HP_AccessWindowSet(), R_FLASH_HP_AccessWindowClear()

4.6.2 Use of const in API parameters

The const qualifier is used with API parameters whenever possible. An example case is shown below.

```
fsp_err_t R_FLASH_HP_Open(flash_ctrl_t * const p_api_ctrl, flash_cfg_t const * const
p_cfg);
```

In this example, flash_cfg_t is a structure of configuration parameters for the r_flash_hp module. The parameter p_cfg is a pointer to this structure. The first const qualifier on p_cfg ensures the flash_cfg_t structure cannot be modified by R_FLASH_HP_Open(). This allows the structure to be allocated as a const variable and stored in ROM instead of RAM.

The const qualifier after the pointer star for both p_ctrl and p_cfg ensures the FSP function does not modify the input pointer addresses. While not fool-proof by any means this does provide some extra checking inside the FSP code to ensure that arguments that should not be altered are treated as such.

4.6.3 FSP Version Information

The BSP provides a function R_FSP_VersionGet() which fills in a structure of type fsp_pack_version_t. This can be used to determine the FSP version at runtime.

There are also FSP_VERSION_* macros in fsp_version.h that can be used to determine the FSP version at build time.

4.7 FSP Build Time Configurations

All modules have a build-time configuration header file. Most configuration options are supplied at run time, though options that are rarely used or apply to all instances of a module may be moved to build time. The advantage of using a build-time configuration option is to potentially reduce code size reduction by removing an unused feature.

All modules have a build time option to enable or disable parameter checking for the module. FSP modules check function arguments for validity when possible, though this feature is disabled by default to reduce code size. Enabling it can help catch parameter errors during development and debugging. By default, each module's parameter checking configuration inherits the BSP parameter checking setting (set on the BSP tab of the RA Configuration editor). Leaving each module's parameter checking configuration set to Default (BSP) allows parameter checking to be enabled or disabled globally in all FSP code through the parameter checking setting on the BSP tab.

If an error condition can reasonably be avoided it is only checked in a section of code that can be disabled by disabling parameter checking. Most FSP APIs can only return FSP_SUCCESS if parameter checking is disabled. An example of an error that cannot be reasonably avoided is the "bus busy"

error that occurs when another master is using an I2C bus. This type of error can be returned even if parameter checking is disabled.

4.8 FSP File Structure

The high-level file structure of an FSP project is shown below.

```
ra_gen
ra
+---fsp
    +---inc
    |   +---api
    |   \---instances
    \---src
       +---bsp
       \---r_module
ra_cfg
+---fsp_cfg
    +---bsp
    +---driver
```

Directly underneath the base ra folder the folders are split into the source and include folders. Include folders are kept separate from the source for easy browsing and easy setup of include paths.

The ra_gen folder contains code generated by the RA Configuration editor. This includes global variables for the control structure and configuration structure for each module.

The ra_cfg folder is where configuration header files are stored for each module. See FSP Build Time Configurations for information on what is provided in these header files.

4.9 FSP TrustZone Support

TrustZone support for FSP is primarily handled in the RA Configuration Tool.

4.9.1 FSP TrustZone Projects

During development of a TrustZone project, users create an RA TrustZone Secure Project first, followed by an RA TrustZone Non-secure Project that is linked to the RA TrustZone Secure Project. Allocation of secure memory is handled automatically within the tooling. The non-secure project starts at the required alignment boundary beyond the memory taken by the secure project.

4.9.2 Non-Secure Callable Guard Functions

The tooling generates guard functions for any module marked as Non-secure Callable. These guard

functions are owned by the application once generated, so they can be modified as necessary by the secure application developer.

The default non-secure callable guard functions limit the configuration and control structure to the structures generated in the secure project. They also check any input pointers to ensure the caller does not overwrite secure memory.

4.9.3 Callbacks in Non-Secure from Non-Secure Callable Modules

If the non-secure project needs a callback function from a non-secure callable module, the callback can be registered after the module is opened using the callback_set() guard function.

4.9.4 Migrating TrustZone Project to newer FSP Version

The TrustZone projects can be migrated to newer FSP version as mentioned in the following resource.

- Migrating Projects to New FSP Version (Application Note)

Additional steps are required if newer FSP version introduces new guard function. In such case, simply migrating the project would result in the build failure for non secure project. Following extra steps are required:

- If xxx_guard.c file in src folder of secure project was not modified earlier
    1. Delete the xxx_guard.c file in secure project before generating the Project Files.
    2. Generate Project contents and build the secure project.
    3. Follow the steps in Application Note to migrate the Non-Secure project.
- If xxx_guard.c file in src folder of secure project was modified earlier
    1. Take the backup of existing xxx_guard.c file and delete it from src folder of secure project before generating the Project Files.
    2. Generate Project contents. It creates a new guard.c file. Compare the contents of the older file and newly generated guard.c file.
    3. Copy the modified code from the older file (i.e Security checks added by user) and add it to newly generated file.
    4. Follow the steps in Application Note to migrate the Non-Secure project.

4.9.5 Additional TrustZone Information

The following resources provide technical background, application notes and example projects that demonstrate key TrustZone concepts and implementation procedures.

- The Benefits of Using Arm® TrustZone® in Your Design (Brochure)
- RA Arm® TrustZone® Tooling Primer (Application Note)
- Renesas RA Family Security Design with Arm® TrustZone® - IP Protection (Application Note)
- Renesas RA Family Securing Data at Rest Using the Arm® TrustZone® (Application Note)

4.10 FSP Architecture in Practice

4.10.1 FSP Connecting Layers

FSP modules are meant to be both reusable and stackable. It is important to remember that modules are not dependent upon other modules, but upon other interfaces. The user is then free to fulfill the interface using the instance that best fits their needs.

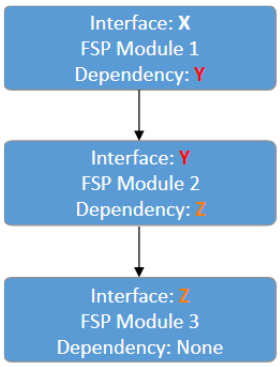

Figure 147: Connecting layers

In the image above interface Y is a dependency of interface X and has its own dependency on interface Z. Interface X only has a dependency on interface Y. Interface X has no knowledge of interface Z. This is a requirement for ensuring that layers can easily be swapped out.

4.10.2 Using FSP Modules in an Application

The typical use of an FSP module involves generating required module data then using the API in the application.

4.10.2.1 Create a Module Instance in the RA Configuration Editor

The RA Configuration editor (available both in the Renesas e² studio IDE as well as through the standalone RA Smart Configurator) provides a graphical user interface for setting the parameters of the interface and instance configuration structures. It also automatically includes those structures (once they are configured in the GUI) in application-specific header files that can be included in application code.

The RA Configuration editor allocates storage for the control structures, all required configuration structures, and the instance structure in generated files in the ra_gen folder. Use the **Properties** window to set the values for the members of the configuration structures as needed. Refer to the Configuration section of the module usage notes for documentation about the configuration options.

If the interface has a callback function option then the application must declare and define the function. The return value is always of type void and the parameter to the function is a typed structure of name <interface>_callback_args_t. Once the function has been defined, assign its name to the p_callback member of the configuration structure. Callback function names can be assigned through the **Properties** window for the selected module.

4.10.2.2 Use the Instance API in the Application

Call the module's <MODULE>_Open() function. Pass pointers to the generated control structure and configuration structure. The names of these structures are based on the 'Name' field provided in the configuration editor. The control structure is <Name>_ctrl and the configuration structure is <Name>_cfg. An example <MODULE>_Open() call for an r_rtc module instance named g_clock is:

```
R_RTC_Open(&g_clock_ctrl, &g_clock_cfg);
```

Note

Each layer in the FSP Stack is responsible for calling the API functions of its dependencies. This means that users are only responsible for calling the API functions at the layer at which they are interfacing. Using the example above of a SPI module with a DTC dependency, the application uses only SPI APIs. The application starts by calling R_SPI_Open(). Internally, the SPI module opens the DTC. It locates R_DTC_Open() by accessing the dependent transfer interface function pointers from the pointers DTC instances (spi_cfg_t::p_transfer_tx and spi_cfg_t::p_transfer_rx) to open the DTC.

Refer to the module usage notes for example code to help get started with any particular module.

Chapter 5 API Reference

This section includes the FSP API Reference for the Module and Interface level functions.

▼BSP	Common code shared by FSP drivers
BSP I/O access	This module provides basic read/write access to port pins
Common Error Codes	
►MCU Board Support Package	The BSP is responsible for getting the MCU from reset to the user's application. Before reaching the user's application, the BSP sets up the stacks, heap, clocks, interrupts, C runtime environment, and stack monitor
▼Modules	Modules are the smallest unit of software available in FSP. Each module implements one interface
►Analog	Analog Modules
►AI	Artifical Intelligence Modules
►Audio	Audio Modules

BSP_IO_PORT_11_PIN_08	IO port 11 pin 8.
BSP_IO_PORT_11_PIN_09	IO port 11 pin 9.
BSP_IO_PORT_11_PIN_10	IO port 11 pin 10.
BSP_IO_PORT_11_PIN_11	IO port 11 pin 11.
BSP_IO_PORT_11_PIN_12	IO port 11 pin 12.
BSP_IO_PORT_11_PIN_13	IO port 11 pin 13.
BSP_IO_PORT_11_PIN_14	IO port 11 pin 14.
BSP_IO_PORT_11_PIN_15	IO port 11 pin 15.
BSP_IO_PORT_12_PIN_00	IO port 12 pin 0.
BSP_IO_PORT_12_PIN_01	IO port 12 pin 1.

BSP_IO_PORT_12_PIN_02	IO port 12 pin 2.
BSP_IO_PORT_12_PIN_03	IO port 12 pin 3.
BSP_IO_PORT_12_PIN_04	IO port 12 pin 4.
BSP_IO_PORT_12_PIN_05	IO port 12 pin 5.
BSP_IO_PORT_12_PIN_06	IO port 12 pin 6.
BSP_IO_PORT_12_PIN_07	IO port 12 pin 7.
BSP_IO_PORT_12_PIN_08	IO port 12 pin 8.
BSP_IO_PORT_12_PIN_09	IO port 12 pin 9.
BSP_IO_PORT_12_PIN_10	IO port 12 pin 10.
BSP_IO_PORT_12_PIN_11	IO port 12 pin 11.
BSP_IO_PORT_12_PIN_12	IO port 12 pin 12.
BSP_IO_PORT_12_PIN_13	IO port 12 pin 13.
BSP_IO_PORT_12_PIN_14	IO port 12 pin 14.
BSP_IO_PORT_12_PIN_15	IO port 12 pin 15.
BSP_IO_PORT_13_PIN_00	IO port 13 pin 0.
BSP_IO_PORT_13_PIN_01	IO port 13 pin 1.
BSP_IO_PORT_13_PIN_02	IO port 13 pin 2.
BSP_IO_PORT_13_PIN_03	IO port 13 pin 3.
BSP_IO_PORT_13_PIN_04	IO port 13 pin 4.
BSP_IO_PORT_13_PIN_05	IO port 13 pin 5.
BSP_IO_PORT_13_PIN_06	IO port 13 pin 6.
BSP_IO_PORT_13_PIN_07	IO port 13 pin 7.
BSP_IO_PORT_13_PIN_08	IO port 13 pin 8.
BSP_IO_PORT_13_PIN_09	IO port 13 pin 9.

BSP_IO_PORT_13_PIN_10	IO port 13 pin 10.
BSP_IO_PORT_13_PIN_11	IO port 13 pin 11.
BSP_IO_PORT_13_PIN_12	IO port 13 pin 12.
BSP_IO_PORT_13_PIN_13	IO port 13 pin 13.
BSP_IO_PORT_13_PIN_14	IO port 13 pin 14.
BSP_IO_PORT_13_PIN_15	IO port 13 pin 15.
BSP_IO_PORT_14_PIN_00	IO port 14 pin 0.
BSP_IO_PORT_14_PIN_01	IO port 14 pin 1.
BSP_IO_PORT_14_PIN_02	IO port 14 pin 2.
BSP_IO_PORT_14_PIN_03	IO port 14 pin 3.
BSP_IO_PORT_14_PIN_04	IO port 14 pin 4.
BSP_IO_PORT_14_PIN_05	IO port 14 pin 5.
BSP_IO_PORT_14_PIN_06	IO port 14 pin 6.
BSP_IO_PORT_14_PIN_07	IO port 14 pin 7.
BSP_IO_PORT_14_PIN_08	IO port 14 pin 8.
BSP_IO_PORT_14_PIN_09	IO port 14 pin 9.
BSP_IO_PORT_14_PIN_10	IO port 14 pin 10.
BSP_IO_PORT_14_PIN_11	IO port 14 pin 11.
BSP_IO_PORT_14_PIN_12	IO port 14 pin 12.
BSP_IO_PORT_14_PIN_13	IO port 14 pin 13.
BSP_IO_PORT_14_PIN_14	IO port 14 pin 14.
BSP_IO_PORT_14_PIN_15	IO port 14 pin 15.

Function Documentation

◆ R_BSP_PinRead()

__STATIC_INLINE uint32_t R_BSP_PinRead (bsp_io_port_pin_t *pin*)

Read the current input level of the pin.

Parameters

[in]	pin	The pin

Return values

Current	input level

◆ R_BSP_PinWrite()

__STATIC_INLINE void R_BSP_PinWrite (bsp_io_port_pin_t *pin*, bsp_io_level_t *level*)

Set a pin to output and set the output level to the level provided. If PFS protection is enabled, disable PFS protection using R_BSP_PinAccessEnable() before calling this function.

Parameters

[in]	pin	The pin
[in]	level	The level

◆ R_BSP_PinCfg()

__STATIC_INLINE void R_BSP_PinCfg (bsp_io_port_pin_t *pin*, uint32_t *cfg*)

Configure a pin. If PFS protection is enabled, disable PFS protection using R_BSP_PinAccessEnable() before calling this function.

Parameters

[in]	pin	The pin
[in]	cfg	Configuration for the pin (PmnPFS register setting)

◆ R_BSP_PinAccessEnable()

__STATIC_INLINE void R_BSP_PinAccessEnable (void)

Enable access to the PFS registers. Uses a reference counter to protect against interrupts that could occur via multiple threads or an ISR re-entering this code.

◆ R_BSP_PinAccessDisable()

__STATIC_INLINE void R_BSP_PinAccessDisable (void)
Disable access to the PFS registers. Uses a reference counter to protect against interrupts that could occur via multiple threads or an ISR re-entering this code.

5.1.2 Common Error Codes

BSP

Detailed Description

All FSP modules share these common error codes.

Macros

#define	FSP_PARAMETER_NOT_USED(p)
#define	FSP_CPP_HEADER
#define	FSP_HEADER
#define	FSP_SECURE_ARGUMENT

Enumerations

enum	fsp_err_t

Macro Definition Documentation

◆ FSP_PARAMETER_NOT_USED

#define FSP_PARAMETER_NOT_USED (p)
This macro is used to suppress compiler messages about a parameter not being used in a function. The nice thing about using this implementation is that it does not take any extra RAM or ROM.

◆ FSP_CPP_HEADER

#define FSP_CPP_HEADER
Determine if a C++ compiler is being used. If so, ensure that standard C is used to process the API information.

◆ FSP_HEADER

#define FSP_HEADER
FSP Header and Footer definitions

◆ FSP_SECURE_ARGUMENT

#define FSP_SECURE_ARGUMENT
Macro to be used when argument to function is ignored since function call is NSC and the parameter is statically defined on the Secure side.

Enumeration Type Documentation

◆ fsp_err_t

enum fsp_err_t	
Common error codes	
Enumerator	
FSP_ERR_ASSERTION	A critical assertion has failed.
FSP_ERR_INVALID_POINTER	Pointer points to invalid memory location.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameter.
FSP_ERR_INVALID_CHANNEL	Selected channel does not exist.
FSP_ERR_INVALID_MODE	Unsupported or incorrect mode.
FSP_ERR_UNSUPPORTED	Selected mode not supported by this API.
FSP_ERR_NOT_OPEN	Requested channel is not configured or API not open.
FSP_ERR_IN_USE	Channel/peripheral is running/busy.
FSP_ERR_OUT_OF_MEMORY	Allocate more memory in the driver's cfg.h.
FSP_ERR_HW_LOCKED	Hardware is locked.
FSP_ERR_IRQ_BSP_DISABLED	IRQ not enabled in BSP.
FSP_ERR_OVERFLOW	Hardware overflow.
FSP_ERR_UNDERFLOW	

	Hardware underflow.
FSP_ERR_ALREADY_OPEN	Requested channel is already open in a different configuration.
FSP_ERR_APPROXIMATION	Could not set value to exact result.
FSP_ERR_CLAMPED	Value had to be limited for some reason.
FSP_ERR_INVALID_RATE	Selected rate could not be met.
FSP_ERR_ABORTED	An operation was aborted.
FSP_ERR_NOT_ENABLED	Requested operation is not enabled.
FSP_ERR_TIMEOUT	Timeout error.
FSP_ERR_INVALID_BLOCKS	Invalid number of blocks supplied.
FSP_ERR_INVALID_ADDRESS	Invalid address supplied.
FSP_ERR_INVALID_SIZE	Invalid size/length supplied for operation.
FSP_ERR_WRITE_FAILED	Write operation failed.
FSP_ERR_ERASE_FAILED	Erase operation failed.
FSP_ERR_INVALID_CALL	Invalid function call is made.
FSP_ERR_INVALID_HW_CONDITION	Detected hardware is in invalid condition.
FSP_ERR_INVALID_FACTORY_FLASH	Factory flash is not available on this MCU.
FSP_ERR_INVALID_STATE	API or command not valid in the current state.
FSP_ERR_NOT_ERASED	Erase verification failed.
FSP_ERR_SECTOR_RELEASE_FAILED	Sector release failed.
FSP_ERR_NOT_INITIALIZED	Required initialization not complete.
FSP_ERR_NOT_FOUND	The requested item could not be found.
FSP_ERR_NO_CALLBACK_MEMORY	Non-secure callback memory not provided for non-secure callback.
FSP_ERR_BUFFER_EMPTY	No data available in buffer.
FSP_ERR_INVALID_DATA	Accuracy of data is not guaranteed.

FSP_ERR_INTERNAL	Internal error.
FSP_ERR_WAIT_ABORTED	Wait aborted.
FSP_ERR_FRAMING	Framing error occurs.
FSP_ERR_BREAK_DETECT	Break signal detects.
FSP_ERR_PARITY	Parity error occurs.
FSP_ERR_RXBUF_OVERFLOW	Receive queue overflow.
FSP_ERR_QUEUE_UNAVAILABLE	Can't open s/w queue.
FSP_ERR_INSUFFICIENT_SPACE	Not enough space in transmission circular buffer.
FSP_ERR_INSUFFICIENT_DATA	Not enough data in receive circular buffer.
FSP_ERR_TRANSFER_ABORTED	The data transfer was aborted.
FSP_ERR_MODE_FAULT	Mode fault error.
FSP_ERR_READ_OVERFLOW	Read overflow.
FSP_ERR_SPI_PARITY	Parity error.
FSP_ERR_OVERRUN	Overrun error.
FSP_ERR_CLOCK_INACTIVE	Inactive clock specified as system clock.
FSP_ERR_CLOCK_ACTIVE	Active clock source cannot be modified without stopping first.
FSP_ERR_NOT_STABILIZED	Clock has not stabilized after its been turned on/off.
FSP_ERR_PLL_SRC_INACTIVE	PLL initialization attempted when PLL source is turned off.
FSP_ERR_OSC_STOP_DET_ENABLED	Illegal attempt to stop LOCO when Oscillation stop is enabled.
FSP_ERR_OSC_STOP_DETECTED	The Oscillation stop detection status flag is set.
FSP_ERR_OSC_STOP_CLOCK_ACTIVE	Attempt to clear Oscillation Stop Detect Status with PLL/MAIN_OSC active.

FSP_ERR_CLKOUT_EXCEEDED	Output on target output clock pin exceeds maximum supported limit.
FSP_ERR_USB_MODULE_ENABLED	USB clock configure request with USB Module enabled.
FSP_ERR_HARDWARE_TIMEOUT	A register read or write timed out.
FSP_ERR_LOW_VOLTAGE_MODE	Invalid clock setting attempted in low voltage mode.
FSP_ERR_PE_FAILURE	Unable to enter Programming mode.
FSP_ERR_CMD_LOCKED	Peripheral in command locked state.
FSP_ERR_FCLK	FCLK must be >= 4 MHz.
FSP_ERR_INVALID_LINKED_ADDRESS	Function or data are linked at an invalid region of memory.
FSP_ERR_BLANK_CHECK_FAILED	Blank check operation failed.
FSP_ERR_INVALID_CAC_REF_CLOCK	Measured clock rate < reference clock rate.
FSP_ERR_INVALID_RESULT	The result of one or more calculations was +/- infinity.
FSP_ERR_CLOCK_GENERATION	Clock cannot be specified as system clock.
FSP_ERR_INVALID_TIMING_SETTING	Invalid timing parameter.
FSP_ERR_INVALID_LAYER_SETTING	Invalid layer parameter.
FSP_ERR_INVALID_ALIGNMENT	Invalid memory alignment found.
FSP_ERR_INVALID_GAMMA_SETTING	Invalid gamma correction parameter.
FSP_ERR_INVALID_LAYER_FORMAT	Invalid color format in layer.
FSP_ERR_INVALID_UPDATE_TIMING	Invalid timing for register update.
FSP_ERR_INVALID_CLUT_ACCESS	Invalid access to CLUT entry.
FSP_ERR_INVALID_FADE_SETTING	Invalid fade-in/fade-out setting.
FSP_ERR_INVALID_BRIGHTNESS_SETTING	Invalid gamma correction parameter.
FSP_ERR_JPEG_ERR	JPEG error.

FSP_ERR_JPEG_SOI_NOT_DETECTED	SOI not detected until EOI detected.
FSP_ERR_JPEG_SOF1_TO_SOFF_DETECTED	SOF1 to SOFF detected.
FSP_ERR_JPEG_UNSUPPORTED_PIXEL_FORMAT	Unprovided pixel format detected.
FSP_ERR_JPEG_SOF_ACCURACY_ERROR	SOF accuracy error: other than 8 detected.
FSP_ERR_JPEG_DQT_ACCURACY_ERROR	DQT accuracy error: other than 0 detected.
FSP_ERR_JPEG_COMPONENT_ERROR1	Component error 1: the number of SOF0 header components detected is other than 1, 3, or 4.
FSP_ERR_JPEG_COMPONENT_ERROR2	Component error 2: the number of components differs between SOF0 header and SOS.
FSP_ERR_JPEG_SOF0_DQT_DHT_NOT_DETECTED	SOF0, DQT, and DHT not detected when SOS detected.
FSP_ERR_JPEG_SOS_NOT_DETECTED	SOS not detected: SOS not detected until EOI detected.
FSP_ERR_JPEG_EOI_NOT_DETECTED	EOI not detected (default)
FSP_ERR_JPEG_RESTART_INTERVAL_DATA_NUMBER_ERROR	Restart interval data number error detected.
FSP_ERR_JPEG_IMAGE_SIZE_ERROR	Image size error detected.
FSP_ERR_JPEG_LAST_MCU_DATA_NUMBER_ERROR	Last MCU data number error detected.
FSP_ERR_JPEG_BLOCK_DATA_NUMBER_ERROR	Block data number error detected.
FSP_ERR_JPEG_BUFFERSIZE_NOT_ENOUGH	User provided buffer size not enough.
FSP_ERR_JPEG_UNSUPPORTED_IMAGE_SIZE	JPEG Image size is not aligned with MCU.
FSP_ERR_CALIBRATE_FAILED	Calibration failed.
FSP_ERR_IIRFA_ECC_1BIT	1-bit ECC error detected
FSP_ERR_IIRFA_ECC_2BIT	2-bit ECC error detected
FSP_ERR_IP_HARDWARE_NOT_PRESENT	Requested IP does not exist on this device.
FSP_ERR_IP_UNIT_NOT_PRESENT	Requested unit does not exist on this device.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Requested channel does not exist on this

	device.
FSP_ERR_NO_MORE_BUFFER	No more buffer found in the memory block pool.
FSP_ERR_ILLEGAL_BUFFER_ADDRESS	Buffer address is out of block memory pool.
FSP_ERR_INVALID_WORKBUFFER_SIZE	Work buffer size is invalid.
FSP_ERR_INVALID_MSG_BUFFER_SIZE	Message buffer size is invalid.
FSP_ERR_TOO_MANY_BUFFERS	Number of buffer is too many.
FSP_ERR_NO_SUBSCRIBER_FOUND	No message subscriber found.
FSP_ERR_MESSAGE_QUEUE_EMPTY	No message found in the message queue.
FSP_ERR_MESSAGE_QUEUE_FULL	No room for new message in the message queue.
FSP_ERR_ILLEGAL_SUBSCRIBER_LISTS	Message subscriber lists is illegal.
FSP_ERR_BUFFER_RELEASED	Buffer has been released.
FSP_ERR_D2D_ERROR_INIT	D/AVE 2D has an error in the initialization.
FSP_ERR_D2D_ERROR_DEINIT	D/AVE 2D has an error in the initialization.
FSP_ERR_D2D_ERROR_RENDERING	D/AVE 2D has an error in the rendering.
FSP_ERR_D2D_ERROR_SIZE	D/AVE 2D has an error in the rendering.
FSP_ERR_ETHER_ERROR_NO_DATA	No Data in Receive buffer.
FSP_ERR_ETHER_ERROR_LINK	ETHERC/EDMAC has an error in the Auto-negotiation.
FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE	As a Magic Packet is being detected, and transmission/reception is not enabled.
FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL	Transmit buffer is not empty.
FSP_ERR_ETHER_ERROR_FILTERING	Detect multicast frame when multicast frame filtering enable.
FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION	ETHERC/EDMAC has an error in the phy communication.
FSP_ERR_ETHER_RECEIVE_BUFFER_ACTIVE	Receive buffer is active.

FSP_ERR_ETHER_PHY_ERROR_LINK	PHY is not link up.
FSP_ERR_ETHER_PHY_NOT_READY	PHY has an error in the Auto-negotiation.
FSP_ERR_QUEUE_FULL	Queue is full, cannot queue another data.
FSP_ERR_QUEUE_EMPTY	Queue is empty, no data to dequeue.
FSP_ERR_CTSU_SCANNING	Scanning.
FSP_ERR_CTSU_NOT_GET_DATA	Not processed previous scan data.
FSP_ERR_CTSU_INCOMPLETE_TUNING	Incomplete initial offset tuning.
FSP_ERR_CTSU_DIAG_NOT_YET	Diagnosis of data collected no yet.
FSP_ERR_CTSU_DIAG_LDO_OVER_VOLTAGE	Diagnosis of LDO over voltage failed.
FSP_ERR_CTSU_DIAG_CCO_HIGH	Diagnosis of CCO into 19.2uA failed.
FSP_ERR_CTSU_DIAG_CCO_LOW	Diagnosis of CCO into 2.4uA failed.
FSP_ERR_CTSU_DIAG_SSCG	Diagnosis of SSCG frequency failed.
FSP_ERR_CTSU_DIAG_DAC	Diagnosis of non-touch count value failed.
FSP_ERR_CTSU_DIAG_OUTPUT_VOLTAGE	Diagnosis of LDO output voltage failed.
FSP_ERR_CTSU_DIAG_OVER_VOLTAGE	Diagnosis of over voltage detection circuit failed.
FSP_ERR_CTSU_DIAG_OVER_CURRENT	Diagnosis of over current detection circuit failed.
FSP_ERR_CTSU_DIAG_LOAD_RESISTANCE	Diagnosis of LDO internal resistance value failed.
FSP_ERR_CTSU_DIAG_CURRENT_SOURCE	Diagnosis of Current source value failed.
FSP_ERR_CTSU_DIAG_SENSCLK_GAIN	Diagnosis of SENSCLK frequency gain failed.
FSP_ERR_CTSU_DIAG_SUCLK_GAIN	Diagnosis of SUCLK frequency gain failed.
FSP_ERR_CTSU_DIAG_CLOCK_RECOVERY	Diagnosis of SUCLK clock recovery function failed.
FSP_ERR_CTSU_DIAG_CFC_GAIN	Diagnosis of CFC oscillator gain failed.
FSP_ERR_CARD_INIT_FAILED	

	SD card or eMMC device failed to initialize.
FSP_ERR_CARD_NOT_INSERTED	SD card not installed.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low or another operation is ongoing.
FSP_ERR_CARD_NOT_INITIALIZED	SD card was removed.
FSP_ERR_CARD_WRITE_PROTECTED	Media is write protected.
FSP_ERR_TRANSFER_BUSY	Transfer in progress.
FSP_ERR_RESPONSE	Card did not respond or responded with an error.
FSP_ERR_MEDIA_FORMAT_FAILED	Media format failed.
FSP_ERR_MEDIA_OPEN_FAILED	Media open failed.
FSP_ERR_CAN_DATA_UNAVAILABLE	No data available.
FSP_ERR_CAN_MODE_SWITCH_FAILED	Switching operation modes failed.
FSP_ERR_CAN_INIT_FAILED	Hardware initialization failed.
FSP_ERR_CAN_TRANSMIT_NOT_READY	Transmit in progress.
FSP_ERR_CAN_RECEIVE_MAILBOX	Mailbox is setup as a receive mailbox.
FSP_ERR_CAN_TRANSMIT_MAILBOX	Mailbox is setup as a transmit mailbox.
FSP_ERR_CAN_MESSAGE_LOST	Receive message has been overwritten or overrun.
FSP_ERR_CAN_TRANSMIT_FIFO_FULL	Transmit FIFO is full.
FSP_ERR_WIFI_CONFIG_FAILED	WiFi module Configuration failed.
FSP_ERR_WIFI_INIT_FAILED	WiFi module initialization failed.
FSP_ERR_WIFI_TRANSMIT_FAILED	Transmission failed.
FSP_ERR_WIFI_INVALID_MODE	API called when provisioned in client mode.
FSP_ERR_WIFI_FAILED	WiFi Failed.
FSP_ERR_WIFI_SCAN_COMPLETE	Wifi scan has completed.

FSP_ERR_WIFI_AP_NOT_CONNECTED	WiFi module is not connected to access point.
FSP_ERR_WIFI_UNKNOWN_AT_CMD	DA16XXX Unknown AT command Error.
FSP_ERR_WIFI_INSUF_PARAM	DA16XXX Insufficient parameter.
FSP_ERR_WIFI_TOO_MANY_PARAMS	DA16XXX Too many parameters.
FSP_ERR_WIFI_INV_PARAM_VAL	DA16XXX Wrong parameter value.
FSP_ERR_WIFI_NO_RESULT	DA16XXX No result.
FSP_ERR_WIFI_RSP_BUF_OVFLW	DA16XXX Response buffer overflow.
FSP_ERR_WIFI_FUNC_NOT_CONFIG	DA16XXX Function is not configured.
FSP_ERR_WIFI_NVRAM_WR_FAIL	DA16XXX NVRAM write failure.
FSP_ERR_WIFI_RET_MEM_WR_FAIL	DA16XXX Retention memory write failure.
FSP_ERR_WIFI_UNKNOWN_ERR	DA16XXX unknown error.
FSP_ERR_CELLULAR_CONFIG_FAILED	Cellular module Configuration failed.
FSP_ERR_CELLULAR_INIT_FAILED	Cellular module initialization failed.
FSP_ERR_CELLULAR_TRANSMIT_FAILED	Transmission failed.
FSP_ERR_CELLULAR_FW_UPTODATE	Firmware is uptodate.
FSP_ERR_CELLULAR_FW_UPGRADE_FAILED	Firmware upgrade failed.
FSP_ERR_CELLULAR_FAILED	Cellular Failed.
FSP_ERR_CELLULAR_INVALID_STATE	API Called in invalid state.
FSP_ERR_CELLULAR_REGISTRATION_FAILED	Cellular Network registration failed.
FSP_ERR_BLE_FAILED	BLE operation failed.
FSP_ERR_BLE_INIT_FAILED	BLE device initialization failed.
FSP_ERR_BLE_CONFIG_FAILED	BLE device configuration failed.
FSP_ERR_BLE_PRF_ALREADY_ENABLED	BLE device Profile already enabled.
FSP_ERR_BLE_PRF_NOT_ENABLED	BLE device not enabled.

FSP_ERR_BLE_ABS_INVALID_OPERATION	Invalid operation is executed.
FSP_ERR_BLE_ABS_NOT_FOUND	Valid data or free space is not found.
FSP_ERR_CRYPTO_CONTINUE	Continue executing function.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Hardware resource busy.
FSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty.
FSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Invalid index.
FSP_ERR_CRYPTO_SCE_RETRY	Retry.
FSP_ERR_CRYPTO_SCE_VERIFY_FAIL	Verify is failed.
FSP_ERR_CRYPTO_SCE_ALREADY_OPEN	HW SCE module is already opened.
FSP_ERR_CRYPTO_NOT_OPEN	Hardware module is not initialized.
FSP_ERR_CRYPTO_UNKNOWN	Some unknown error occurred.
FSP_ERR_CRYPTO_NULL_POINTER	Null pointer input as a parameter.
FSP_ERR_CRYPTO_NOT_IMPLEMENTED	Algorithm/size not implemented.
FSP_ERR_CRYPTO_RNG_INVALID_PARAM	An invalid parameter is specified.
FSP_ERR_CRYPTO_RNG_FATAL_ERROR	A fatal error occurred.
FSP_ERR_CRYPTO_INVALID_SIZE	Size specified is invalid.
FSP_ERR_CRYPTO_INVALID_STATE	Function used in an valid state.
FSP_ERR_CRYPTO_ALREADY_OPEN	control block is already opened
FSP_ERR_CRYPTO_INSTALL_KEY_FAILED	Specified input key is invalid.
FSP_ERR_CRYPTO_AUTHENTICATION_FAILED	Authentication failed.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Failure to Init Cipher.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input date is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function call occurred.

FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	Hardware resource is busy.
FSP_ERR_CRYPTO_RSIP_FATAL	Hardware fatal error or unexpected return.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key type is illegal.
FSP_ERR_CRYPTO_RSIP_AUTHENTICATION	Authentication failed.
FSP_ERR_CRYPTO_COMMON_NOT_OPENED	Crypto Framework Common is not opened.
FSP_ERR_CRYPTO_HAL_ERROR	Cryoto HAL module returned an error.
FSP_ERR_CRYPTO_KEY_BUF_NOT_ENOUGH	Key buffer size is not enough to generate a key.
FSP_ERR_CRYPTO_BUF_OVERFLOW	Attempt to write data larger than what the buffer can hold.
FSP_ERR_CRYPTO_INVALID_OPERATION_MODE	Invalid operation mode.
FSP_ERR_MESSAGE_TOO_LONG	Message for RSA encryption is too long.
FSP_ERR_RSA_DECRYPTION_ERROR	RSA Decryption error.
FSP_ERR_SENSOR_INVALID_DATA	Data is invalid. *Note* *SF_CRYPTO APIs may return an error code starting from 0x10000 which is of Crypto module. Refer to sf_cryoto_err.h for Crypto error codes.*
FSP_ERR_SENSOR_IN_STABILIZATION	Sensor is stabilizing.
FSP_ERR_SENSOR_MEASUREMENT_NOT_FINISHED	Measurement is not finished.
FSP_ERR_COMMS_BUS_NOT_OPEN	Bus is not open.

5.1.3 MCU Board Support Package

Detailed Description

The BSP is responsible for getting the MCU from reset to the user's application. Before reaching the user's application, the BSP sets up the stacks, heap, clocks, interrupts, C runtime environment, and stack monitor.

- BSP Features
- BSP Clock Configuration
- System Interrupts
- Group Interrupts
- External and Peripheral Interrupts

- Software Delay
- Trignometric Function
- Digital Signal Processing with 32-bit Multiply-Accumulator
- Octal-SPI Clock Update
- Limited D-Cache Support
- Non-Cacheable Buffer Placement Example
- Configuration

Overview

BSP Features

BSP Clock Configuration

All system clocks are set up during BSP initialization based on the settings in bsp_clock_cfg.h. These settings are derived from clock configuration information provided from the RA Configuration editor **Clocks** tab.

- Clock configuration is performed prior to initializing the C runtime environment to speed up the startup process, as it is possible to start up on a relatively slow (that is, 32 kHz) clock.
- The BSP implements the required delays to allow the selected clock to stabilize.
- The BSP will configure the CMSIS SystemCoreClock variable after clock initialization with the current system clock frequency.

System Interrupts

As RA MCUs are based on the Arm Cortex-M architecture, the NVIC Nested Vectored Interrupt Controller (NVIC) handles exceptions and interrupt configuration, prioritization and interrupt masking. In the Arm architecture, the NVIC handles exceptions. Some exceptions are known as System Exceptions. System exceptions are statically located at the "top" of the vector table and occupy vector numbers 1 to 15. Vector zero is reserved for the MSP Main Stack Pointer (MSP). The remaining 15 system exceptions are shown below:

- Reset
- NMI
- Cortex-M4 Hard Fault Handler
- Cortex-M4 MPU Fault Handler
- Cortex-M4 Bus Fault Handler
- Cortex-M4 Usage Fault Handler
- Reserved
- Reserved
- Reserved
- Reserved
- Cortex-M4 SVCall Handler
- Cortex-M4 Debug Monitor Handler
- Reserved
- Cortex-M4 PendSV Handler
- Cortex-M4 SysTick Handler

NMI and Hard Fault exceptions are enabled out of reset and have fixed priorities. Other exceptions have configurable priorities and some can be disabled.

Group Interrupts

Group interrupt is the term used to describe the 12 sources that can trigger the Non-Maskable Interrupt (NMI). When an NMI occurs the NMI Handler examines the NMISR (status register) to determine the source of the interrupt. NMI interrupts take precedence over all interrupts, are usable only as CPU interrupts, and cannot activate the RA peripherals Data Transfer Controller (DTC) or Direct Memory Access Controller (DMAC).

Possible group interrupt sources include:

- IWDT Underflow/Refresh Error
- WDT Underflow/Refresh Error
- Voltage-Monitoring 1 Interrupt
- Voltage-Monitoring 2 Interrupt
- VBATT monitor Interrupt
- Oscillation Stop is detected
- NMI pin
- RAM Parity Error
- RAM ECC Error
- MPU Bus Slave Error
- MPU Bus Master Error
- MPU Stack Error
- TrustZone Filter Error A user may enable notification for one or more group interrupts by registering a callback using the BSP API function R_BSP_GroupIrqWrite(). When an NMI interrupt occurs, the NMI handler checks to see if there is a callback registered for the cause of the interrupt and if so calls the registered callback function.

External and Peripheral Interrupts

User configurable interrupts begin with slot 16. These may be external, or peripheral generated interrupts.

Although the number of available slots for the NVIC interrupt vector table may seem small, the BSP defines up to 512 events that are capable of generating an interrupt. By using Event Mapping, the BSP maps user-enabled events to NVIC interrupts. For an RA6M3 MCU, only 96 of these events may be active at any one time, but the user has flexibility by choosing which events generate the active event.

By allowing the user to select only the events they are interested in as interrupt sources, we are able to provide an interrupt service routine that is fast and event specific.

For example, on other microcontrollers a standard NVIC interrupt vector table might contain a single vector entry for the SCI0 (Serial Communications Interface) peripheral. The interrupt service routine for this would have to check a status register for the 'real' source of the interrupt. In the RA implementation there is a vector entry for each of the SCI0 events that we are interested in.

BSP Weak Symbols

You might wonder how the BSP is able to place ISR addresses in the NVIC table without the user having explicitly defined one. All that is required by the BSP is that the interrupt event be given a priority.

This is accomplished through the use of the 'weak' attribute. The weak attribute causes the declaration to be emitted as a weak symbol rather than a global. A weak symbol is one that can be overridden by an accompanying strong reference with the same name. When the BSP declares a function as weak, user code can define the same function and it will be used in place of the BSP function. By defining all possible interrupt sources as weak, the vector table can be built at compile time and any user declarations (strong references) will be used at runtime.

Weak symbols are supported for ELF targets and also for a.out targets when using the GNU assembler and linker.

Note that in CMSIS system.c, there is also a weak definition (and a function body) for the Warm Start callback function R_BSP_WarmStart(). Because this function is defined in the same file as the weak declaration, it will be called as the 'default' implementation. The function may be overridden by the user by copying the body into their user application and modifying it as necessary. The linker identifies this as the 'strong' reference and uses it.

Warm Start Callbacks

As the BSP is in the process of bringing up the board out of reset, there are three points where the user can request a callback. These are defined as the 'Pre Clock Init', 'Post Clock Init' and 'Post C' warm start callbacks.

As described above, this function is already weakly defined as R_BSP_WarmStart(), so it is a simple matter of redefining the function or copying the existing body from CMSIS system.c into the application code to get a callback. R_BSP_WarmStart() takes an event parameter of type bsp_warm_start_event_t which describes the type of warm start callback being made.

This function is not enabled/disabled and is always called for both events as part of the BSP startup. Therefore it needs a function body, which will not be called if the user is overriding it. The function body is located in system.c. To use this function just copy this function into your own code and modify it to meet your needs.

Sub Clock Stabilization Wait Callback

When Sub-Clock oscillator is populated in the application, the BSP startup code waits for some time(sub-clock stabilization time) to allow Sub-clock to stabilize. Enabling the watchdog (IWDT or WDT) timer with Auto start mode in an application using Sub-clock may cause system to generate Reset or NMI interrupt before reaching the application code if watchdog refresh register is not updated in the configured refresh Window. To overcome this problem a weakly defined callback R_BSP_SubClockStabilizeWait() can be overridden. Redefine the callback function in the application code and add code to update the watchdog refresh register. R_BSP_SubClockStabilizeWait() takes a parameter delay of type uint32_t which describes the time in milliseconds required to stabilize the sub-clock.

Sub Clock Stabilization Wait After Reset callback

After Power-On-Reset, the BSP startup code may have to wait for some time(sub-clock stabilization time) to allow Sub-clock to stabilize. This can cause problem to RTC in case device is to be reset frequently. If Sub-Clock registers are not initialized during a reset, BSP actually does not have to wait for Sub-clock to stabilize. To overcome this problem, a weakly defined callback R_BSP_SubClockStabilizeWaitAfterReset() is provided. Reimplement the callback function in the application code to determine whether BSP has to wait for stabilization time based on the current reset type. R_BSP_SubClockStabilizeWaitAfterReset() takes a parameter delay of type uint32_t which describes the time in milliseconds required to stabilize the sub-clock.

SDRAM Initialization

The BSP provides support for usage of external SDRAM modules on MCUs with SDRAM support. SDRAM is enabled and configured in the BSP tab of the RA configuration editor. The default location for initialization is in the 'Post C' warm start callback. If required, the call to R_BSP_SdramInit() can be moved anywhere after clock and pin initialization, but it must only be called once after reset. The BSP will not initialize any memory sections in the SDRAM. The user is responsible for initializing any code or data stored in SDRAM.

Before entering Software Standby or Deep Software Standby, the user must call R_BSP_SdramSelfRefreshEnable() to change from Auto-Refresh to Self-Refresh in order to perserve data during the low power state. No SDRAM access is allowed after this function is called. The user must not place FSP code or data or their wakeup interrupt handling functions into SDRAM to ensure there are no issues around transitions into and out of Software Standby since SDRAM access will be disabled then and trigger a fault if access is requested.

When resuming from Software Standby, the user must call R_BSP_SdramSelfRefreshDisable() to change from Self-Refresh to Auto-Refresh and restore SDRAM access.

When resuming operation after Deep Software Standby or another situation where there is already data present in the SDRAM modules that must be preserved, the user must call R_BSP_SdramInit(false) before pin initialization and then call R_BSP_SdramSelfRefreshDisable() after pins have been configured in order to resume operations with the SDRAM.

C Runtime Initialization

This BSP configuration allows the user to skip the FSP C runtime initialization code by setting the "C Runtime Initialization" to "Disabled" on the BSP tab of the RA Configuration editor. Disabling this option is useful in cases where a non-standard linker script is being used or other modifications to the runtime initialization are desired. If this macro is disabled, the user must use the 'Post Clock Init' event from the warm start (described above) to run their own runtime initialization code.

Heap Allocation

The relatively low amount of on-chip SRAM available and lack of memory protection in an MCU means that heap use must be very carefully controlled to avoid memory leaks, overruns and attempted overallocation. Further, many RTOSes provide their own dynamic memory allocation system. For these reasons the default heap size is set at 0 bytes, effectively disabling dynamic memory. If it is required for an application setting a positive value to the "Heap size (bytes)" option in the RA Common configurations on the **BSP** tab will allocate a heap.

Note

When using printf/sprintf (and other variants) to output floating point numbers a heap is required. A minimum size of 0x1000 (4096) bytes is recommended when starting development in this case.

Error Logging

When error logging is enabled, the error logging function can be redefined on the command line by defining FSP_ERROR_LOG(err) to the desired function call. The default function implementation is FSP_ERROR_LOG(err)=fsp_error_log(err, **FILE**, **LINE**). This implementation uses the predefined macros **FILE** and **LINE** to help identify the location where the error occurred. Removing the line from the function call can reduce code size when error logging is enabled. Some compilers may support other predefined macros like **FUNCTION**, which could be helpful for customizing the error logger.

Register Protection

The BSP register protection functions utilize reference counters to ensure that an application which has specified a certain register and subsequently calls another function doesn't have its register protection settings inadvertently modified.

Each time R_BSP_RegisterProtectDisable() is called, the respective reference counter is incremented.

Each time R_BSP_RegisterProtectEnable() is called, the respective reference counter is decremented.

Both functions will only modify the protection state if their reference counter is zero.

```
/* Enable writing to protected CGC registers */
R_BSP_RegisterProtectDisable(BSP_REG_PROTECT_CGC);
/* Insert code to modify protected CGC registers. */
/* Disable writing to protected CGC registers */
R_BSP_RegisterProtectEnable(BSP_REG_PROTECT_CGC);
```

Option-setting memory

Option-setting memory includes OFS registers OFS0 and OFS1, OSIS debugger ID code, and block protections settings BPS and PBPS. Option-setting memory is MCU specific, and not all MCUs implement all option-setting registers. Option-setting configurations available on the selected device are configurable in the BSP properties. These configurations are placed in sections to be loaded at the required flash address by the linker.

The ID code is a 16-byte value that can be used to protect the MCU from being connected to a debugger or from connecting in Serial Boot Mode. There are different settings that can be set for the

ID code; please refer to the hardware manual for your device for available options.

On MCUs that support TrustZone, option-setting registers are placed in a different locations for Non-Secure projects than for Secure or Flat projects. This is handled automatically by the BSP and linker scripts.

All *_SEL registers default to allowing both Secure and Non-Secure access unless otherwise noted here. If block protection is configured in a Secure project, the BSP sets the corresponding configuration to Secure access only by updating the corresponding *_SEL register. Similarly, the LVD related settings in the OFSn_SEL registers are automatically set to Secure if the corresponding LVD monitor is used in the Secure project.

TrustZone Security Attribution Registers

On MCUs that support TrustZone, Security Attribution Registers for modules used in the Secure project are configured to allow Secure access only as part of the startup code of the Secure project. This logic is skipped for Flat projects.

Software Delay

Implements a blocking software delay. A delay can be specified in microseconds, milliseconds or seconds. The delay is implemented based on the system clock rate.

```
 /* Delay at least 1 second. Depending on the number of wait states required for the
region of memory
  * that the software_delay_loop has been linked in this could take longer. The
default is 4 cycles per loop.
  * This can be modified by redefining DELAY_LOOP_CYCLES. BSP_DELAY_UNITS_SECONDS,
BSP_DELAY_UNITS_MILLISECONDS,
  * and BSP_DELAY_UNITS_MICROSECONDS can all be used with R_BSP_SoftwareDelay. */
 R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);
```

Trignometric Function

Implements Trignometric math inline functions utilizing TFU hardware. These functions can calculate sine, cosine, arctangent and hypotenuse. The trigonometric library functions sinf(), cosf(), atan2f(), and hypotf() can be mapped to respective TFU functions by enabling TFU Mathlib property in FSP Configuration tool. Extended functions sincosf() and atan2hypotf() are also available when the TFU Mathlib property is enabled in the RA Configuration editor.

TFU functions are not reentrant. Disable the TFU Mathlib property in RA Configuration editor if reentrant access to trigonometric library functions is required.

Note

Refer to the MCU hardware user's manual or datasheet to determine if it has TFU support.

Digital Signal Processing With 32-bit Multiply-Accumulator

Implements DSP (digital signal processing) functions via MACL (32-bit Multiply-Accumulator)

hardware. These functions will support CMSIS DSP APIs to perform the calculation, the activation of MACL can be controlled by stack MACL (rm_cmsis_dsp) in the RA Configuration editor.

When stack MACL (rm_cmsis_dsp) is added, the CMSIS DSP APIs will generate normal functions which overrides weak functions of Arm and use hardware for calculating. When stack MACL (rm_cmsis_dsp) is not added, CMSIS DSP APIs will perform the calculation by using software.

For examples, how to use the CMSIS DSP APIs refer to the link: https://github.com/ARM-software/CMSIS-DSP/tree/main/Examples/ARM.

CMSIS APIs supported by MACL list:

No	CMSIS DSP API	MACL BSP API	Description
1	arm_mult_q31	R_BSP_MaclMulQ31	Q31 vector multiplication
2	arm_scale_q31	R_BSP_MaclScaleQ31	Multiplies a Q31 vector by a scalar
3	arm_mat_mult_q31	R_BSP_MaclMatMultQ31	Q31 matrix multiplication
4	arm_mat_vec_mult_q31	R_BSP_MaclMatVecMulQ31	Q31 matrix and vector multiplication
5	arm_mat_scale_q31	R_BSP_MaclMatScaleQ31	Q31 matrix scaling
6	arm_biquad_cascade_df1_q31	R_BSP_MaclBiquadCsdDf1Q31	Processing function for the Q31 Biquad cascade filter
7	arm_conv_partial_q31	R_BSP_MaclConvPartialQ31	Partial convolution of Q31 sequences
8	arm_conv_q31	R_BSP_MaclConvQ31	Convolution of Q31 sequences
9	arm_correlate_q31	R_BSP_MaclCorrelateQ31	Correlation of Q31 sequences
10	arm_fir_decimate_q31	R_BSP_MaclFirDecimateQ31	Processing function for the Q31 FIR decimator
11	arm_fir_interpolate_q31	R_BSP_MaclFirInterpolateQ31	Processing function for the Q31 FIR interpolator
12	arm_fir_q31	R_BSP_MaclFirQ31	Processing function for Q31 FIR filter
13	arm_fir_sparse_q31	R_BSP_MaclFirSparseQ31	Processing function for the Q31 sparse FIR filter
14	arm_lms_norm_q31	R_BSP_MaclLmsNormQ31	Processing function for Q31 normalized LMS filter

15	arm_lms_q31	R_BSP_MaclLmsQ31	Processing function for Q31 LMS filter

Note

Refer to the MCU hardware user's manual or datasheet to determine if it has MACL support.

Critical Section Macros

Implements a critical section. Some MCUs (MCUs with the BASEPRI register) support allowing high priority interrupts to execute during critical sections. On these MCUs, interrupts with priority less than or equal to BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION are not serviced in critical sections. Interrupts with higher priority than BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION still execute in critical sections.

```
   FSP_CRITICAL_SECTION_DEFINE;
/* Store the current interrupt posture. */
FSP_CRITICAL_SECTION_ENTER;
/* Interrupts cannot run in this section unless their priority is less than
BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION. */
/* Restore saved interrupt posture. */
FSP_CRITICAL_SECTION_EXIT;
```

OctaClock Update

Supports changing the Octal-SPI Clock (OCTACLK) during runtime if supported by the MCU. The OCTACLK source and clock divisor can be updated. It is user's responsibility to ensure the selected clock source is running before attempting to update OCTACLK.

Sealing the Main Stack (TrustZone Secure Projects)

In TrustZone secure projects, the BSP seals the main stack by placing the value 0xFEF5EDA5 above the stack top. For more information, refer to section 3.5 "Sealing a Stack" in "Secure software guidelines for ARMv8-M": https://developer.arm.com/documentation/100720/0300.

Limited D-Cache Support

For MCUs with Cortex-M85 cores with D-Cache, limited support is available for enabling the D-Cache and automatically configuring predefined non-cacheable regions via the MPU during BSP initialization. For these MCUs, D-Cache is disabled by default because certain existing drivers do not support data coherency with D-Cache enabled. Enabling the D-Cache requires that data coherency be considered in any circumstance where a core interacts with other bus members.

Non-Cacheable Buffer Placement Example

The predefined non-cacheable regions configured by the MPU when D-Cache is enabled can be used to contain data that should not be cached, ensuring data coherency for that data. To use the

predefined non-cacheable regions, place the data into the corresponding non-cacheable section defined by the linker script for the chosen toolchain. The predefined non-cacheable regions are not initialized by the BSP.

Use one of the .nocache sections to place non-cacheable data.

```
uint8_t uncached_uninitialized_buffer_sram[1024] BSP_PLACE_IN_SECTION(".nocache");
```

Section names differ by data region and compiler. Names predefined by the BSP are shown below.

Region	Name (GCC, IAR, LLVM)	Name (AC6)
SRAM	.nocache	.bss.nocache
SDRAM	.nocache_sdram	.bss.nocache_sdram

Configuration

The BSP is heavily data driven with most features and functionality being configured based on the content from configuration files. Configuration files represent the settings specified by the user and are generated when the project is built and/or when the Generate Project Content button is clicked in the RA Configuration editor.

Build Time Configurations for fsp_common

The following build time configurations are defined in fsp_cfg/bsp/bsp_cfg.h:

Configuration	Options	Default	Description
Main stack size (bytes)	Value must be an integer multiple of 8 and between 8 and 0xFFFFFFFF	0x400	Set the size of the main program stack. NOTE: This entry is for the main stack. When using an RTOS, thread stacks can be configured in the properties for each thread.
Heap size (bytes)	Value must be 0 or an integer multiple of 8 between 8 and 0xFFFFFFFF.	0	The main heap is disabled by default. Set the heap size to a positive integer divisible by 8 to enable it. A minimum of 4K (0x1000) is recommended if standard library functions are to be used.

MCU Vcc (mV)	Value must between 0 and 5500 (5.5V)	3300	Some peripherals require different settings based on the supplied voltage. Entering Vcc here (in mV) allows the relevant driver modules to configure the associated peripherals accordingly.
Parameter checking	• Enabled • Disabled	Disabled	When enabled, parameter checking for the BSP is turned on. In addition, any modules whose parameter checking configuration is set to 'Default (BSP)' will perform parameter checking as well.
Assert Failures	• Return FSP_ERR_ASSERTION • Call fsp_error_log then Return FSP_ERR_ASSERTION • Use assert() to Halt Execution • Disable checks that would return FSP_ERR_ASSERTION	Return FSP_ERR_ASSERTION	Define the behavior of the FSP_ASSERT() macro.
Error Log	• No Error Log • Errors Logged via fsp_error_log	No Error Log	Specify error logging behavior.
Clock Registers not Reset Values during Startup	• Disabled • Enabled	Disabled	If enabled, registers are assumed to be set to their reset value during startup. Enable this if another application such as a bootloader or Secure project has already configured the clocks before the startup code runs.
Main Oscillator Populated	• Populated • Not Populated	Populated	Select whether or not there is a main oscillator (XTAL) on the board. This setting can be overridden in

			board_cfg.h.
PFS Protect	• Disabled • Enabled	Enabled	Keep the PFS registers locked when they are not being modified. If disabled they will be unlocked during startup.
C Runtime Initialization	• Enabled • Disabled	Enabled	Select if the C runtime initialization in the BSP is to be used. If disabled, use the BSP_WARM_START_POST_CLOCK event to run user defined equivalent.
Early BSP Initialization	• Enabled • Disabled	Disabled	Enable this option to use BSP functions before C runtime initialization (BSP_WARM_START_RESET or BSP_WARM_START_POST_CLOCK).
Main Oscillator Clock Source	• External Oscillator • Crystal or Resonator	Crystal or Resonator	Select the main oscillator clock source. This setting can be overridden in board_cfg.h
Subclock Populated	• Populated • Not Populated	Populated	Select whether or not there is a subclock crystal on the board. This setting can be overridden in board_cfg.h.
Subclock Drive (Drive capacitance availability varies by MCU)	• Standard/Normal mode • Low/Low power mode 1 • Low power mode 2 • Low power mode 3	Standard/Normal mode	Select the subclock oscillator drive capacitance. This setting can be overridden in board_cfg.h
Subclock Stabilization Time (ms)	Value must between 0 and 10000	1000	Select the subclock oscillator stabilization time. This is only used in the startup code if the subclock is selected as the system clock on the Clocks tab or if the HOCO FLL function is enabled. This setting can be overridden in

board_cfg.h

Macro Definition Documentation

◆ BSP_STACK_ALIGNMENT

#define BSP_STACK_ALIGNMENT
Stacks (and heap) must be sized and aligned to an integer multiple of this number.

◆ BSP_IRQ_DISABLED

#define BSP_IRQ_DISABLED
Used to signify that an ELC event is not able to be used as an interrupt.

◆ FSP_LOG_PRINT

#define FSP_LOG_PRINT (X)
Macro that can be defined in order to enable logging in FSP modules.

◆ FSP_RETURN

#define FSP_RETURN (err)
Macro to log and return error without an assertion.

◆ FSP_ERROR_LOG

#define FSP_ERROR_LOG (err)
This function is called before returning an error code. To stop on a runtime error, define fsp_error_log in user code and do required debugging (breakpoints, stack dump, etc) in this function.

◆ FSP_ASSERT

#define FSP_ASSERT (a)
Default assertion calls FSP_ERROR_RETURN if condition "a" is false. Used to identify incorrect use of API's in FSP functions.

◆ FSP_ERROR_RETURN

#define FSP_ERROR_RETURN (a, err)
All FSP error codes are returned using this macro. Calls FSP_ERROR_LOG function if condition "a" is false. Used to identify runtime errors in FSP functions.

◆ FSP_CRITICAL_SECTION_ENTER

#define FSP_CRITICAL_SECTION_ENTER
This macro temporarily saves the current interrupt state and disables interrupts.

◆ FSP_CRITICAL_SECTION_EXIT

#define FSP_CRITICAL_SECTION_EXIT
This macro restores the previously saved interrupt state, reenabling interrupts.

◆ FSP_INVALID_VECTOR

#define FSP_INVALID_VECTOR
Used to signify that the requested IRQ vector is not defined in this system.

◆ BSP_CFG_HANDLE_UNRECOVERABLE_ERROR

#define BSP_CFG_HANDLE_UNRECOVERABLE_ERROR (x)
In the event of an unrecoverable error the BSP will by default call the __BKPT() intrinsic function which will alert the user of the error. The user can override this default behavior by defining their own BSP_CFG_HANDLE_UNRECOVERABLE_ERROR macro.

◆ R_BSP_MODULE_START

#define R_BSP_MODULE_START (ip, channel)
Cancels the module stop state. **Parameters** ip — fsp_ip_t enum value for the module to be stopped channel — The channel. Use channel 0 for modules without channels.

◆ R_BSP_MODULE_STOP

#define R_BSP_MODULE_STOP (ip, channel)

Enables the module stop state.

Parameters

ip	fsp_ip_t enum value for the module to be stopped
channel	The channel. Use channel 0 for modules without channels.

Enumeration Type Documentation

◆ bsp_grp_irq_t

enum bsp_grp_irq_t	
Which interrupts can have callbacks registered.	
Enumerator	
BSP_GRP_IRQ_IWDT_ERROR	IWDT underflow/refresh error has occurred.
BSP_GRP_IRQ_WDT_ERROR	WDT underflow/refresh error has occurred.
BSP_GRP_IRQ_LVD1	Voltage monitoring 1 interrupt.
BSP_GRP_IRQ_LVD2	Voltage monitoring 2 interrupt.
BSP_GRP_IRQ_VBATT	VBATT monitor interrupt.
BSP_GRP_IRQ_OSC_STOP_DETECT	Oscillation stop is detected.
BSP_GRP_IRQ_NMI_PIN	NMI Pin interrupt.
BSP_GRP_IRQ_RAM_PARITY	RAM Parity Error.
BSP_GRP_IRQ_RAM_ECC	RAM ECC Error.
BSP_GRP_IRQ_MPU_BUS_SLAVE	MPU Bus Slave Error.
BSP_GRP_IRQ_MPU_BUS_MASTER	MPU Bus Master Error.
BSP_GRP_IRQ_MPU_STACK	MPU Stack Error.
BSP_GRP_IRQ_TRUSTZONE	MPU Stack Error.
BSP_GRP_IRQ_CACHE_PARITY	MPU Stack Error.
BSP_GRP_IRQ_IWDT_ERROR	IWDT underflow/refresh error has occurred.
BSP_GRP_IRQ_WDT_ERROR	WDT underflow/refresh error has occurred.
BSP_GRP_IRQ_LVD1	Voltage monitoring 1 interrupt.
BSP_GRP_IRQ_LVD2	Voltage monitoring 2 interrupt.
BSP_GRP_IRQ_OSC_STOP_DETECT	Oscillation stop is detected.
BSP_GRP_IRQ_NMI_PIN	NMI Pin interrupt.
BSP_GRP_IRQ_MPU_BUS_TZF	MPU Bus or TrustZone Filter Error.

BSP_GRP_IRQ_COMMON_MEMORY	SRAM ECC or SRAM Parity Error.
BSP_GRP_IRQ_LOCKUP	LockUp Error.
BSP_GRP_IRQ_IWDT_ERROR	IWDT underflow/refresh error has occurred.
BSP_GRP_IRQ_WDT_ERROR	WDT underflow/refresh error has occurred.
BSP_GRP_IRQ_LVD1	Voltage monitoring 1 interrupt.
BSP_GRP_IRQ_LVD2	Voltage monitoring 2 interrupt.
BSP_GRP_IRQ_OSC_STOP_DETECT	Oscillation stop is detected.
BSP_GRP_IRQ_NMI_PIN	NMI Pin interrupt.
BSP_GRP_IRQ_MPU_BUS_TZF	MPU Bus or TrustZone Filter Error.
BSP_GRP_IRQ_COMMON_MEMORY	SRAM ECC or SRAM Parity Error.
BSP_GRP_IRQ_LOCKUP	LockUp Error.
BSP_GRP_IRQ_IWDT_ERROR	IWDT underflow/refresh error has occurred.
BSP_GRP_IRQ_WDT_ERROR	WDT underflow/refresh error has occurred.
BSP_GRP_IRQ_LVD1	Voltage monitoring 1 interrupt.
BSP_GRP_IRQ_LVD2	Voltage monitoring 2 interrupt.
BSP_GRP_IRQ_OSC_STOP_DETECT	Oscillation stop is detected.
BSP_GRP_IRQ_NMI_PIN	NMI Pin interrupt.
BSP_GRP_IRQ_MPU_BUS_TZF	MPU Bus or TrustZone Filter Error.
BSP_GRP_IRQ_COMMON_MEMORY	SRAM ECC or SRAM Parity Error.
BSP_GRP_IRQ_LOCKUP	LockUp Error.

◆ bsp_delay_units_t

enum bsp_delay_units_t	
Available delay units for R_BSP_SoftwareDelay(). These are ultimately used to calculate a total # of microseconds	
Enumerator	
BSP_DELAY_UNITS_SECONDS	Requested delay amount is in seconds.
BSP_DELAY_UNITS_MILLISECONDS	Requested delay amount is in milliseconds.
BSP_DELAY_UNITS_MICROSECONDS	Requested delay amount is in microseconds.

◆ bsp_reg_protect_t

enum bsp_reg_protect_t	
The different types of registers that can be protected.	
Enumerator	
BSP_REG_PROTECT_CGC	Enables writing to the registers related to the clock generation circuit.
BSP_REG_PROTECT_OM_LPC_BATT	Enables writing to the registers related to operating modes, low power consumption, and battery backup function.
BSP_REG_PROTECT_LVD	Enables writing to the registers related to the LVD: LVCMPCR, LVDLVLR, LVD1CR0, LVD1CR1, LVD1SR, LVD2CR0, LVD2CR1, LVD2SR.
BSP_REG_PROTECT_SAR	Enables writing to the registers related to the security function.

◆ bsp_warm_start_event_t

enum bsp_warm_start_event_t	
Different warm start entry locations in the BSP.	
Enumerator	
BSP_WARM_START_RESET	Called almost immediately after reset. No C runtime environment, clocks, or IRQs.
BSP_WARM_START_POST_CLOCK	Called after clock initialization. No C runtime environment or IRQs.
BSP_WARM_START_POST_C	Called after clocks and C runtime environment have been set up.

◆ fsp_priv_source_clock_t

enum fsp_priv_source_clock_t	
Enumerator	
FSP_PRIV_CLOCK_HOCO	The high speed on chip oscillator.
FSP_PRIV_CLOCK_MOCO	The middle speed on chip oscillator.
FSP_PRIV_CLOCK_LOCO	The low speed on chip oscillator.
FSP_PRIV_CLOCK_MAIN_OSC	The main oscillator.
FSP_PRIV_CLOCK_SUBCLOCK	The subclock oscillator.
FSP_PRIV_CLOCK_PLL	The PLL output.
FSP_PRIV_CLOCK_PLL1P	The PLL1P output.
FSP_PRIV_CLOCK_PLL2	The PLL2 output.
FSP_PRIV_CLOCK_PLL2P	The PLL2P output.
FSP_PRIV_CLOCK_PLL1Q	The PLL1Q output.
FSP_PRIV_CLOCK_PLL1R	The PLL1R output.
FSP_PRIV_CLOCK_PLL2Q	The PLL2Q output.
FSP_PRIV_CLOCK_PLL2R	The PLL2R output.

◆ fsp_ip_t

enum fsp_ip_t	
Available modules.	
Enumerator	
FSP_IP_CFLASH	Code Flash.
FSP_IP_DFLASH	Data Flash.
FSP_IP_RAM	RAM.
FSP_IP_LVD	Low Voltage Detection.
FSP_IP_CGC	Clock Generation Circuit.
FSP_IP_LPM	Low Power Modes.
FSP_IP_FCU	Flash Control Unit.
FSP_IP_ICU	Interrupt Control Unit.
FSP_IP_DMAC	DMA Controller.
FSP_IP_DTC	Data Transfer Controller.
FSP_IP_IOPORT	I/O Ports.
FSP_IP_PFS	Pin Function Select.
FSP_IP_ELC	Event Link Controller.
FSP_IP_MPU	Memory Protection Unit.
FSP_IP_MSTP	Module Stop.
FSP_IP_MMF	Memory Mirror Function.
FSP_IP_KEY	Key Interrupt Function.
FSP_IP_CAC	Clock Frequency Accuracy Measurement Circuit.
FSP_IP_DOC	Data Operation Circuit.
FSP_IP_CRC	Cyclic Redundancy Check Calculator.

FSP_IP_SCI	Serial Communications Interface.
FSP_IP_IIC	I2C Bus Interface.
FSP_IP_SPI	Serial Peripheral Interface.
FSP_IP_CTSU	Capacitive Touch Sensing Unit.
FSP_IP_SCE	Secure Cryptographic Engine.
FSP_IP_SLCDC	Segment LCD Controller.
FSP_IP_AES	Advanced Encryption Standard.
FSP_IP_TRNG	True Random Number Generator.
FSP_IP_FCACHE	Flash Cache.
FSP_IP_SRAM	SRAM.
FSP_IP_ADC	A/D Converter.
FSP_IP_DAC	12-Bit D/A Converter
FSP_IP_TSN	Temperature Sensor.
FSP_IP_DAAD	D/A A/D Synchronous Unit.
FSP_IP_ACMPHS	High Speed Analog Comparator.
FSP_IP_ACMPLP	Low Power Analog Comparator.
FSP_IP_OPAMP	Operational Amplifier.
FSP_IP_SDADC	Sigma Delta A/D Converter.
FSP_IP_RTC	Real Time Clock.
FSP_IP_WDT	Watch Dog Timer.
FSP_IP_IWDT	Independent Watch Dog Timer.
FSP_IP_GPT	General PWM Timer.
FSP_IP_POEG	Port Output Enable for GPT.
FSP_IP_OPS	Output Phase Switch.

FSP_IP_AGT	Asynchronous General-Purpose Timer.
FSP_IP_CAN	Controller Area Network.
FSP_IP_IRDA	Infrared Data Association.
FSP_IP_QSPI	Quad Serial Peripheral Interface.
FSP_IP_USBFS	USB Full Speed.
FSP_IP_SDHI	SD/MMC Host Interface.
FSP_IP_SRC	Sampling Rate Converter.
FSP_IP_SSI	Serial Sound Interface.
FSP_IP_DALI	Digital Addressable Lighting Interface.
FSP_IP_ETHER	Ethernet MAC Controller.
FSP_IP_EDMAC	Ethernet DMA Controller.
FSP_IP_EPTPC	Ethernet PTP Controller.
FSP_IP_PDC	Parallel Data Capture Unit.
FSP_IP_GLCDC	Graphics LCD Controller.
FSP_IP_DRW	2D Drawing Engine
FSP_IP_JPEG	JPEG.
FSP_IP_DAC8	8-Bit D/A Converter
FSP_IP_USBHS	USB High Speed.
FSP_IP_OSPI	Octa Serial Peripheral Interface.
FSP_IP_CEC	HDMI CEC.
FSP_IP_TFU	Trigonometric Function Unit.
FSP_IP_IIRFA	IIR Filter Accelerator.
FSP_IP_CANFD	CAN-FD.
FSP_IP_ULPT	Ultra Low Power Timer ULPT.

FSP_IP_SAU	Serial Array Unit.
FSP_IP_IICA	Serial Interface IICA.
FSP_IP_UARTA	Serial Interface UARTA.
FSP_IP_TAU	Timer Array Unit.
FSP_IP_TML	32-bit Interval Timer
FSP_IP_MACL	32-bit Multiply-Accumulator
FSP_IP_USBCC	USB Type-C Controller.

◆ fsp_signal_t

enum fsp_signal_t	
Signals that can be mapped to an interrupt.	
Enumerator	
FSP_SIGNAL_ADC_COMPARE_MATCH	ADC COMPARE MATCH.
FSP_SIGNAL_ADC_COMPARE_MISMATCH	ADC COMPARE MISMATCH.
FSP_SIGNAL_ADC_SCAN_END	ADC SCAN END.
FSP_SIGNAL_ADC_SCAN_END_B	ADC SCAN END B.
FSP_SIGNAL_ADC_WINDOW_A	ADC WINDOW A.
FSP_SIGNAL_ADC_WINDOW_B	ADC WINDOW B.
FSP_SIGNAL_AES_RDREQ	AES RDREQ.
FSP_SIGNAL_AES_WRREQ	AES WRREQ.
FSP_SIGNAL_AGT_COMPARE_A	AGT COMPARE A.
FSP_SIGNAL_AGT_COMPARE_B	AGT COMPARE B.
FSP_SIGNAL_AGT_INT	AGT INT.
FSP_SIGNAL_CAC_FREQUENCY_ERROR	CAC FREQUENCY ERROR.
FSP_SIGNAL_CAC_MEASUREMENT_END	CAC MEASUREMENT END.

FSP_SIGNAL_CAC_OVERFLOW	CAC OVERFLOW.
FSP_SIGNAL_CAN_ERROR	CAN ERROR.
FSP_SIGNAL_CAN_FIFO_RX	CAN FIFO RX.
FSP_SIGNAL_CAN_FIFO_TX	CAN FIFO TX.
FSP_SIGNAL_CAN_MAILBOX_RX	CAN MAILBOX RX.
FSP_SIGNAL_CAN_MAILBOX_TX	CAN MAILBOX TX.
FSP_SIGNAL_CGC_MOSC_STOP	CGC MOSC STOP.
FSP_SIGNAL_LPM_SNOOZE_REQUEST	LPM SNOOZE REQUEST.
FSP_SIGNAL_LVD_LVD1	LVD LVD1.
FSP_SIGNAL_LVD_LVD2	LVD LVD2.
FSP_SIGNAL_VBATT_LVD	VBATT LVD.
FSP_SIGNAL_LVD_VBATT	LVD VBATT.
FSP_SIGNAL_ACMPHS_INT	ACMPHS INT.
FSP_SIGNAL_ACMPLP_INT	ACMPLP INT.
FSP_SIGNAL_CTSU_END	CTSU END.
FSP_SIGNAL_CTSU_READ	CTSU READ.
FSP_SIGNAL_CTSU_WRITE	CTSU WRITE.
FSP_SIGNAL_DALI_DEI	DALI DEI.
FSP_SIGNAL_DALI_CLI	DALI CLI.
FSP_SIGNAL_DALI_SDI	DALI SDI.
FSP_SIGNAL_DALI_BPI	DALI BPI.
FSP_SIGNAL_DALI_FEI	DALI FEI.
FSP_SIGNAL_DALI_SDI_OR_BPI	DALI SDI OR BPI.
FSP_SIGNAL_DMAC_INT	DMAC INT.

FSP_SIGNAL_DOC_INT	DOC INT.
FSP_SIGNAL_DRW_INT	DRW INT.
FSP_SIGNAL_DTC_COMPLETE	DTC COMPLETE.
FSP_SIGNAL_DTC_END	DTC END.
FSP_SIGNAL_EDMAC_EINT	EDMAC EINT.
FSP_SIGNAL_ELC_SOFTWARE_EVENT_0	ELC SOFTWARE EVENT 0.
FSP_SIGNAL_ELC_SOFTWARE_EVENT_1	ELC SOFTWARE EVENT 1.
FSP_SIGNAL_EPTPC_IPLS	EPTPC IPLS.
FSP_SIGNAL_EPTPC_MINT	EPTPC MINT.
FSP_SIGNAL_EPTPC_PINT	EPTPC PINT.
FSP_SIGNAL_EPTPC_TIMER0_FALL	EPTPC TIMER0 FALL.
FSP_SIGNAL_EPTPC_TIMER0_RISE	EPTPC TIMER0 RISE.
FSP_SIGNAL_EPTPC_TIMER1_FALL	EPTPC TIMER1 FALL.
FSP_SIGNAL_EPTPC_TIMER1_RISE	EPTPC TIMER1 RISE.
FSP_SIGNAL_EPTPC_TIMER2_FALL	EPTPC TIMER2 FALL.
FSP_SIGNAL_EPTPC_TIMER2_RISE	EPTPC TIMER2 RISE.
FSP_SIGNAL_EPTPC_TIMER3_FALL	EPTPC TIMER3 FALL.
FSP_SIGNAL_EPTPC_TIMER3_RISE	EPTPC TIMER3 RISE.
FSP_SIGNAL_EPTPC_TIMER4_FALL	EPTPC TIMER4 FALL.
FSP_SIGNAL_EPTPC_TIMER4_RISE	EPTPC TIMER4 RISE.
FSP_SIGNAL_EPTPC_TIMER5_FALL	EPTPC TIMER5 FALL.
FSP_SIGNAL_EPTPC_TIMER5_RISE	EPTPC TIMER5 RISE.
FSP_SIGNAL_FCU_FIFERR	FCU FIFERR.
FSP_SIGNAL_FCU_FRDYI	FCU FRDYI.

FSP_SIGNAL_GLCDC_LINE_DETECT	GLCDC LINE DETECT.
FSP_SIGNAL_GLCDC_UNDERFLOW_1	GLCDC UNDERFLOW 1.
FSP_SIGNAL_GLCDC_UNDERFLOW_2	GLCDC UNDERFLOW 2.
FSP_SIGNAL_GPT_CAPTURE_COMPARE_A	GPT CAPTURE COMPARE A.
FSP_SIGNAL_GPT_CAPTURE_COMPARE_B	GPT CAPTURE COMPARE B.
FSP_SIGNAL_GPT_COMPARE_C	GPT COMPARE C.
FSP_SIGNAL_GPT_COMPARE_D	GPT COMPARE D.
FSP_SIGNAL_GPT_COMPARE_E	GPT COMPARE E.
FSP_SIGNAL_GPT_COMPARE_F	GPT COMPARE F.
FSP_SIGNAL_GPT_COUNTER_OVERFLOW	GPT COUNTER OVERFLOW.
FSP_SIGNAL_GPT_COUNTER_UNDERFLOW	GPT COUNTER UNDERFLOW.
FSP_SIGNAL_GPT_AD_TRIG_A	GPT AD TRIG A.
FSP_SIGNAL_GPT_AD_TRIG_B	GPT AD TRIG B.
FSP_SIGNAL_OPS_UVW_EDGE	OPS UVW EDGE.
FSP_SIGNAL_ICU_IRQ0	ICU IRQ0.
FSP_SIGNAL_ICU_IRQ1	ICU IRQ1.
FSP_SIGNAL_ICU_IRQ2	ICU IRQ2.
FSP_SIGNAL_ICU_IRQ3	ICU IRQ3.
FSP_SIGNAL_ICU_IRQ4	ICU IRQ4.
FSP_SIGNAL_ICU_IRQ5	ICU IRQ5.
FSP_SIGNAL_ICU_IRQ6	ICU IRQ6.
FSP_SIGNAL_ICU_IRQ7	ICU IRQ7.
FSP_SIGNAL_ICU_IRQ8	ICU IRQ8.
FSP_SIGNAL_ICU_IRQ9	ICU IRQ9.

FSP_SIGNAL_ICU_IRQ10	ICU IRQ10.
FSP_SIGNAL_ICU_IRQ11	ICU IRQ11.
FSP_SIGNAL_ICU_IRQ12	ICU IRQ12.
FSP_SIGNAL_ICU_IRQ13	ICU IRQ13.
FSP_SIGNAL_ICU_IRQ14	ICU IRQ14.
FSP_SIGNAL_ICU_IRQ15	ICU IRQ15.
FSP_SIGNAL_ICU_SNOOZE_CANCEL	ICU SNOOZE CANCEL.
FSP_SIGNAL_IIC_ERI	IIC ERI.
FSP_SIGNAL_IIC_RXI	IIC RXI.
FSP_SIGNAL_IIC_TEI	IIC TEI.
FSP_SIGNAL_IIC_TXI	IIC TXI.
FSP_SIGNAL_IIC_WUI	IIC WUI.
FSP_SIGNAL_IOPORT_EVENT_1	IOPORT EVENT 1.
FSP_SIGNAL_IOPORT_EVENT_2	IOPORT EVENT 2.
FSP_SIGNAL_IOPORT_EVENT_3	IOPORT EVENT 3.
FSP_SIGNAL_IOPORT_EVENT_4	IOPORT EVENT 4.
FSP_SIGNAL_IOPORT_EVENT_B	IOPORT EVENT B.
FSP_SIGNAL_IOPORT_EVENT_C	IOPORT EVENT C.
FSP_SIGNAL_IOPORT_EVENT_D	IOPORT EVENT D.
FSP_SIGNAL_IOPORT_EVENT_E	IOPORT EVENT E.
FSP_SIGNAL_IWDT_UNDERFLOW	IWDT UNDERFLOW.
FSP_SIGNAL_JPEG_JDTI	JPEG JDTI.
FSP_SIGNAL_JPEG_JEDI	JPEG JEDI.
FSP_SIGNAL_KEY_INT	KEY INT.

FSP_SIGNAL_PDC_FRAME_END	PDC FRAME END.
FSP_SIGNAL_PDC_INT	PDC INT.
FSP_SIGNAL_PDC_RECEIVE_DATA_READY	PDC RECEIVE DATA READY.
FSP_SIGNAL_POEG_EVENT	POEG EVENT.
FSP_SIGNAL_QSPI_INT	QSPI INT.
FSP_SIGNAL_RTC_ALARM	RTC ALARM.
FSP_SIGNAL_RTC_PERIOD	RTC PERIOD.
FSP_SIGNAL_RTC_CARRY	RTC CARRY.
FSP_SIGNAL_SCE_INTEGRATE_RDRDY	SCE INTEGRATE RDRDY.
FSP_SIGNAL_SCE_INTEGRATE_WRRDY	SCE INTEGRATE WRRDY.
FSP_SIGNAL_SCE_LONG_PLG	SCE LONG PLG.
FSP_SIGNAL_SCE_PROC_BUSY	SCE PROC BUSY.
FSP_SIGNAL_SCE_RDRDY_0	SCE RDRDY 0.
FSP_SIGNAL_SCE_RDRDY_1	SCE RDRDY 1.
FSP_SIGNAL_SCE_ROMOK	SCE ROMOK.
FSP_SIGNAL_SCE_TEST_BUSY	SCE TEST BUSY.
FSP_SIGNAL_SCE_WRRDY_0	SCE WRRDY 0.
FSP_SIGNAL_SCE_WRRDY_1	SCE WRRDY 1.
FSP_SIGNAL_SCE_WRRDY_4	SCE WRRDY 4.
FSP_SIGNAL_SCI_AM	SCI AM.
FSP_SIGNAL_SCI_ERI	SCI ERI.
FSP_SIGNAL_SCI_RXI	SCI RXI.
FSP_SIGNAL_SCI_RXI_OR_ERI	SCI RXI OR ERI.
FSP_SIGNAL_SCI_TEI	SCI TEI.

FSP_SIGNAL_SCI_TXI	SCI TXI.
FSP_SIGNAL_SDADC_ADI	SDADC ADI.
FSP_SIGNAL_SDADC_SCANEND	SDADC SCANEND.
FSP_SIGNAL_SDADC_CALIEND	SDADC CALIEND.
FSP_SIGNAL_SDHIMMC_ACCS	SDHIMMC ACCS.
FSP_SIGNAL_SDHIMMC_CARD	SDHIMMC CARD.
FSP_SIGNAL_SDHIMMC_DMA_REQ	SDHIMMC DMA REQ.
FSP_SIGNAL_SDHIMMC_SDIO	SDHIMMC SDIO.
FSP_SIGNAL_SPI_ERI	SPI ERI.
FSP_SIGNAL_SPI_IDLE	SPI IDLE.
FSP_SIGNAL_SPI_RXI	SPI RXI.
FSP_SIGNAL_SPI_TEI	SPI TEI.
FSP_SIGNAL_SPI_TXI	SPI TXI.
FSP_SIGNAL_SRC_CONVERSION_END	SRC CONVERSION END.
FSP_SIGNAL_SRC_INPUT_FIFO_EMPTY	SRC INPUT FIFO EMPTY.
FSP_SIGNAL_SRC_OUTPUT_FIFO_FULL	SRC OUTPUT FIFO FULL.
FSP_SIGNAL_SRC_OUTPUT_FIFO_OVERFLOW	SRC OUTPUT FIFO OVERFLOW.
FSP_SIGNAL_SRC_OUTPUT_FIFO_UNDERFLOW	SRC OUTPUT FIFO UNDERFLOW.
FSP_SIGNAL_SSI_INT	SSI INT.
FSP_SIGNAL_SSI_RXI	SSI RXI.
FSP_SIGNAL_SSI_TXI	SSI TXI.
FSP_SIGNAL_SSI_TXI_RXI	SSI TXI RXI.
FSP_SIGNAL_TRNG_RDREQ	TRNG RDREQ.
FSP_SIGNAL_USB_FIFO_0	USB FIFO 0.

FSP_SIGNAL_USB_FIFO_1	USB FIFO 1.
FSP_SIGNAL_USB_INT	USB INT.
FSP_SIGNAL_USB_RESUME	USB RESUME.
FSP_SIGNAL_USB_USB_INT_RESUME	USB USB INT RESUME.
FSP_SIGNAL_WDT_UNDERFLOW	WDT UNDERFLOW.
FSP_SIGNAL_ULPT_COMPARE_A	ULPT COMPARE A.
FSP_SIGNAL_ULPT_COMPARE_B	ULPT COMPARE B.
FSP_SIGNAL_ULPT_INT	ULPT INT.

Function Documentation

◆ R_FSP_VersionGet()

fsp_err_t R_FSP_VersionGet (fsp_pack_version_t *const *p_version*)

Get the FSP version based on compile time macros.

Parameters

[out]	p_version	Memory address to return version information to.

Return values

FSP_SUCCESS	Version information stored.
FSP_ERR_ASSERTION	The parameter p_version is NULL.

◆ Reset_Handler()

BSP_SECTION_FLASH_GAP void Reset_Handler (void)

MCU starts executing here out of reset. Main stack pointer is set up already.

◆ Default_Handler()

BSP_SECTION_FLASH_GAP void Default_Handler (void)

Default exception handler.

◆ NMI_Handler()

BSP_SECTION_FLASH_GAP void NMI_Handler (void)
Non-maskable interrupt handler. This exception is defined by the BSP, unlike other system exceptions, because there are many sources that map to the NMI exception.

◆ SystemInit()

void SystemInit (void)
Initialize the MCU and the runtime environment.

◆ R_BSP_WarmStart()

void R_BSP_WarmStart (bsp_warm_start_event_t *event*)
This function is called at various points during the startup process. This function is declared as a weak symbol higher up in this file because it is meant to be overridden by a user implemented version. One of the main uses for this function is to call functional safety code during the startup process. To use this function just copy this function into your own code and modify it to meet your needs. **Parameters** [in] event — Where the code currently is in the start up process This function is called at various points during the startup process. This implementation uses the event that is called right before main() to set up the pins. **Parameters** [in] event — Where at in the start up process the code is currently at

◆ R_BSP_RegisterProtectEnable()

BSP_SECTION_FLASH_GAP void R_BSP_RegisterProtectEnable (bsp_reg_protect_t *regs_to_protect*)
Enable register protection. Registers that are protected cannot be written to. Register protection is enabled by using the Protect Register (PRCR) and the MPC's Write-Protect Register (PWPR). **Parameters** [in] regs_to_protect — Registers which have write protection enabled.

◆ R_BSP_RegisterProtectDisable()

BSP_SECTION_FLASH_GAP void R_BSP_RegisterProtectDisable (bsp_reg_protect_t *regs_to_unprotect*)

Disable register protection. Registers that are protected cannot be written to. Register protection is disabled by using the Protect Register (PRCR) and the MPC's Write-Protect Register (PWPR).

Parameters

[in]	regs_to_unprotect	Registers which have write protection disabled.

◆ R_BSP_IrqClearPending()

BSP_SECTION_FLASH_GAP void R_BSP_IrqClearPending (IRQn_Type *irq*)

Clear the interrupt status flag (IR) for a given interrupt and clear the NVIC pending interrupt.

Parameters

[in]	irq	Interrupt for which to clear the IR bit. Note that the enums listed for IRQn_Type are only those for the Cortex Processor Exceptions Numbers.

Warning

Do not call this function for system exceptions where the IRQn_Type value is < 0.

◆ R_BSP_IrqCfg()

BSP_SECTION_FLASH_GAP void R_BSP_IrqCfg (IRQn_Type const *irq*, uint32_t *priority*, void * *p_context*)

Sets the interrupt priority and context.

Parameters

[in]	irq	The IRQ to configure.
[in]	priority	NVIC priority of the interrupt
[in]	p_context	The interrupt context is a pointer to data required in the ISR.

Warning

Do not call this function for system exceptions where the IRQn_Type value is < 0.

◆ R_BSP_IrqEnableNoClear()

BSP_SECTION_FLASH_GAP void R_BSP_IrqEnableNoClear (IRQn_Type const *irq*)

Enable the IRQ in the NVIC (Without clearing the pending bit).

Parameters

[in]	irq	The IRQ to enable. Note that the enums listed for IRQn_Type are only those for the Cortex Processor Exceptions Numbers.

Warning

Do not call this function for system exceptions where the IRQn_Type value is < 0.

◆ R_BSP_IrqEnable()

BSP_SECTION_FLASH_GAP void R_BSP_IrqEnable (IRQn_Type const *irq*)

Clears pending interrupts in both ICU and NVIC, then enables the interrupt.

Parameters

[in]	irq	Interrupt for which to clear the IR bit and enable in the NVIC. Note that the enums listed for IRQn_Type are only those for the Cortex Processor Exceptions Numbers.

Warning

Do not call this function for system exceptions where the IRQn_Type value is < 0.

◆ R_BSP_IrqDisable()

BSP_SECTION_FLASH_GAP void R_BSP_IrqDisable (IRQn_Type const *irq*)

Disables interrupts in the NVIC.

Parameters

[in]	irq	The IRQ to disable in the NVIC. Note that the enums listed for IRQn_Type are only those for the Cortex Processor Exceptions Numbers.

Warning

Do not call this function for system exceptions where the IRQn_Type value is < 0.

◆ R_BSP_IrqCfgEnable()

BSP_SECTION_FLASH_GAP void R_BSP_IrqCfgEnable (IRQn_Type const *irq*, uint32_t *priority*, void * *p_context*)

Sets the interrupt priority and context, clears pending interrupts, then enables the interrupt.

Parameters

[in]	irq	Interrupt number.
[in]	priority	NVIC priority of the interrupt
[in]	p_context	The interrupt context is a pointer to data required in the ISR.

Warning

Do not call this function for system exceptions where the IRQn_Type value is < 0.

◆ R_BSP_SoftwareDelay()

BSP_SECTION_FLASH_GAP void R_BSP_SoftwareDelay (uint32_t *delay*, bsp_delay_units_t *units*)

Delay for at least the specified duration in units and return.

Parameters

[in]	delay	The number of 'units' to delay.
[in]	units	The 'base' (bsp_delay_units_t) for the units specified. Valid values are: BSP_DELAY_UNITS_SECONDS

		, BSP_DELAY_UNITS_MILLISECONDS, BSP_DELAY_UNITS_MICROSECONDS. For example: At 1 MHz one cycle takes 1 microsecond (.000001 seconds). At 12 MHz one cycle takes 1/12 microsecond or 83 nanoseconds. Therefore one run through bsp_prv_software_delay_loop() takes: ~ (83 * BSP_DELAY_LOOP_CYCLES) or 332 ns. A delay of 2 us therefore requires 2000ns/332ns or 6 loops.

The 'theoretical' maximum delay that may be obtained is determined by a full 32 bit loop count and the system clock rate. @120MHz: ((0xFFFFFFFF loops * 4 cycles /loop) / 120000000) = 143 seconds. @32MHz: ((0xFFFFFFFF loops * 4 cycles /loop) / 32000000) = 536 seconds

Note that requests for very large delays will be affected by rounding in the calculations and the actual delay achieved may be slightly longer. @32 MHz, for example, a request for 532 seconds will be closer to 536 seconds.

Note also that if the calculations result in a loop_cnt of zero, the bsp_prv_software_delay_loop() function is not called at all. In this case the requested delay is too small (nanoseconds) to be carried out by the loop itself, and the overhead associated with executing the code to just get to this point has certainly satisfied the requested delay.

Note

This function calls bsp_cpu_clock_get() which ultimately calls R_CGC_SystemClockFreqGet() and therefore requires that the BSP has already initialized the CGC (which it does as part of the Sysinit). Care should be taken to ensure this remains the case if in the future this function were to be called as part of the BSP initialization.
*This function will delay for **at least** the specified duration. Due to overhead in calculating the correct number of loops to delay, very small delay values (generally 1-5 microseconds) may be significantly longer than specified. Approximate overhead for this function is as follows:*

- *CM4: 20-50 cycles*
- *CM33: 10-60 cycles*
- *CM23: 75-200 cycles*

If more accurate microsecond timing must be performed in software it is recommended to use bsp_prv_software_delay_loop() directly. In this case, use BSP_DELAY_LOOP_CYCLES or BSP_DELAY_LOOPS_CALCULATE() to convert a calculated delay cycle count to a number of software delay loops.
Delays may be longer than expected when compiler optimization is turned off.

Warning

The delay will be longer than specified on CM23 devices when the core clock is greater than 32 MHz. Setting BSP_DELAY_LOOP_CYCLES to 6 will improve accuracy at 48 MHz but will result in shorter than expected delays at lower speeds.

◆ R_BSP_GroupIrqWrite()

BSP_SECTION_FLASH_GAP fsp_err_t R_BSP_GroupIrqWrite (bsp_grp_irq_t *irq*, void(*)(bsp_grp_irq_t irq) *p_callback*)

Register a callback function for supported interrupts. If NULL is passed for the callback argument then any previously registered callbacks are unregistered.

Parameters

[in]	irq	Interrupt for which to register a callback.
[in]	p_callback	Pointer to function to call when interrupt occurs.

Return values

FSP_SUCCESS	Callback registered
FSP_ERR_ASSERTION	Callback pointer is NULL

◆ R_BSP_SourceClockHzGet()

uint32_t R_BSP_SourceClockHzGet (fsp_priv_source_clock_t *clock*)

Gets the frequency of a source clock.

Parameters

[in]	clock	Pointer to Octaclk setting structure which provides information regarding Octaclk source and divider settings to be applied.

Returns

Frequency of requested clock in Hertz.

◆ R_FSP_CurrentIrqGet()

__STATIC_INLINE IRQn_Type R_FSP_CurrentIrqGet (void)

Return active interrupt vector number value

Returns

Active interrupt vector number value

◆ R_FSP_SystemClockHzGet()

__STATIC_INLINE uint32_t R_FSP_SystemClockHzGet (fsp_priv_clock_t *clock*)
Gets the frequency of a system clock. **Returns** Frequency of requested clock in Hertz.

◆ R_FSP_ClockDividerGet()

__STATIC_INLINE uint32_t R_FSP_ClockDividerGet (uint32_t *ckdivcr*)
Converts a clock's CKDIVCR register value to a clock divider (Eg: SPICKDIVCR). **Returns** Clock Divider

◆ R_BSP_UniqueIdGet()

__STATIC_INLINE bsp_unique_id_t const* R_BSP_UniqueIdGet (void)
Get unique ID for this device. **Returns** A pointer to the unique identifier structure

◆ R_BSP_FlashCacheDisable()

__STATIC_INLINE void R_BSP_FlashCacheDisable (void)
Disables the flash cache.

◆ R_BSP_FlashCacheEnable()

__STATIC_INLINE void R_BSP_FlashCacheEnable (void)
Enables the flash cache.

Variable Documentation

◆ BSP_SECTION_EARLY_INIT

uint32_t SystemCoreClock BSP_SECTION_EARLY_INIT

Detailed Description

Build Time Configurations for ra0e1_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

Configuration	Options	Default	Description
OFS0 register settings			
OFS0 register settings > Independent WDT			
Start Mode	• IWDT is Disabled • IWDT is automatically activated after a reset (Autostart mode)	IWDT is Disabled	
Timeout Period	• 128 cycles • 512 cycles • 1024 cycles • 2048 cycles	2048 cycles	
Dedicated Clock Frequency Divisor	• 1 • 16 • 32 • 64 • 128 • 256	128	
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)	
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)	
Reset Interrupt Request Select	• NMI request or interrupt request is enabled	Reset is enabled	

	• Reset is enabled		
Stop Control	• Counting continues • Stop counting when in Sleep, Snooze mode, or Software Standby	Stop counting when in Sleep, Snooze mode, or Software Standby	
OFS1 register settings			
Voltage Detection 0 Circuit Start	• Voltage monitor 0 reset is enabled after reset • Voltage monitor 0 reset is disabled after reset	Voltage monitor 0 reset is disabled after reset	
Voltage Detection 0 Level	• 3.88 V • 2.91 V • 2.62 V • 2.33 V • 1.86 V • 1.65 V	1.86 V	
Enable or disable Flash Read Protection	• Enabled • Disabled	Disabled	
Flash Read Protection Start	Value must be an integer between 0x01 and 0x3F (ROM)	0x01	
Flash Read Protection End	Value must be an integer between 0x01 and 0x3F	0x3F	
P206/RES pin selection	• PORT(P206) • RES input	RES input	
Enable inline BSP IRQ functions	• Enabled • Disabled	Disabled	Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return.
Main Oscillation Stabilization Time	• 2^8/X1 • 2^9/X1 • 2^10/X1 • 2^11/X1 • 2^13/X1 • 2^15/X1 • 2^17/X1 • 2^18/X1	2^18/X1	

Use Low Voltage Mode	Not Supported	config.bsp.low_voltage_mode.disabled	Use the low voltage mode. This limits the ICLK operating frequency to 4 MHz and requires all clock dividers to be at least 4 when oscillation stop detection is used.
ID Code Mode	• Unlocked (Ignore ID) • Locked with All Erase support • Locked	Unlocked (Ignore ID)	When set to 'Locked with All Erase support', the ID Code must be set in the debugger to read or write data to the MCU, but the All Erase command is still accepted regardless. When set to 'Locked', all erase/download/debug access is disabled unless the ID Code is provided.
ID Code (32 Hex Characters)	Value must be a 32 character long hex string	FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF	Set the ID Code for locking debug access. This setting is only used when the ID Code Mode is not set to Unlocked.
Fill Flash Gap	• Do not fill gap • Fill gap	Fill gap	A section of code flash exists between the end of the vector table (near the start of flash) and the ROM registers (at address 0x400). Selecting 'Fill gap' will fill this area with a preselected set functions in order to reduce the amount of code flash used by FSP. If you would like to fill this area with your own code or data, select 'Do not fill gap' and manually place items in the section '.flash_gap'.

OFS0 register settings > Independent WDT			
Start Mode	• IWDT is stopped after a reset • IWDT is automatically activated after a reset (Autostart mode)	IWDT is stopped after a reset	
Timeout Period	• 128 cycles • 512 cycles • 1024 cycles • 2048 cycles	2048 cycles	
Dedicated Clock Frequency Divisor	• 1 • 16 • 32 • 64 • 128 • 256	128	
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)	

Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)
Reset Interrupt Request Select	• NMI request or interrupt request is enabled • Reset is enabled	Reset is enabled
Stop Control	• Counting continues • Stop counting when in Sleep, Snooze mode, or Software Standby	Stop counting when in Sleep, Snooze mode, or Software Standby
OFS0 register settings > WDT		
Start Mode Select	• Automatically activate WDT after a reset (auto-start mode) • Stop WDT after a reset (register-start mode)	Stop WDT after a reset (register-start mode)
Timeout Period	• 1024 cycles • 4096 cycles • 8192 cycles • 16384 cycles	16384 cycles
Clock Frequency Division Ratio	• 4 • 64 • 128 • 512 • 2048 • 8192	128
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)

Reset Interrupt Request	• NMI • Reset	Reset	
Stop Control	• Counting continues • Stop counting when entering Sleep mode	Stop counting when entering Sleep mode	
OFS1 register settings			
Internal Clock Supply Architecture Type	• Type B • Type A	Type A	
Voltage Detection 0 Circuit Start	• Voltage monitor 0 reset is enabled after reset • Voltage monitor 0 reset is disabled after reset	Voltage monitor 0 reset is disabled after reset	
Voltage Detection 0 Level	• 3.84 V • 2.82 V • 2.51 V • 1.90 V • 1.70 V	1.90 V	
HOCO Oscillation Enable	• HOCO oscillation is enabled after reset • HOCO oscillation is disabled after reset	HOCO oscillation is enabled after reset	HOCO must be enabled out of reset because the MCU starts up in low voltage mode and the HOCO must be operating in low voltage mode.
MPU			
Enable or disable PC Region 0	• Enabled • Disabled	Disabled	
PC0 Start	Value must be an integer between 0 and 0x000FFFFC (ROM) or between 0x1FF00000 and 0x200FFFFC (RAM)	0x000FFFFC	
PC0 End	Value must be an integer between 0x00000003 and 0x000FFFFF (ROM) or between 0x1FF00003 and 0x200FFFFF (RAM)	0x000FFFFF	
Enable or disable PC Region 1	• Enabled • Disabled	Disabled	

PC1 Start	Value must be an integer between 0 and 0x000FFFFC (ROM) or between 0x1FF00000 and 0x200FFFFC (RAM)	0x000FFFFC
PC1 End	Value must be an integer between 0x00000003 and 0x000FFFFF (ROM) or between 0x1FF00003 and 0x200FFFFF (RAM)	0x000FFFFF
Enable or disable Memory Region 0	• Enabled • Disabled	Disabled
Memory Region 0 Start	Value must be an integer between 0 and 0x000FFFFC	0x000FFFFC
Memory Region 0 End	Value must be an integer between 0x00000003 and 0x000FFFFF	0x000FFFFF
Enable or disable Memory Region 1	• Enabled • Disabled	Disabled
Memory Region 1 Start	Value must be an integer between 0x1FF00000 and 0x200FFFFC	0x200FFFFC
Memory Region 1 End	Value must be an integer between 0x1FF00003 and 0x200FFFFF	0x200FFFFF
Enable or disable Memory Region 2	• Enabled • Disabled	Disabled
Memory Region 2 Start	Value must be an integer between 0x400C0000 and 0x400DFFFC or between 0x40100000 and 0x407FFFFC	0x407FFFFC
Memory Region 2 End	Value must be an integer between 0x400C0003 and 0x400DFFFF or between 0x40100003 and 0x407FFFFF	0x407FFFFF
Enable or disable Memory Region 3	• Enabled • Disabled	Disabled
Memory Region 3 Start	Value must be an	0x400DFFFC

	integer between 0x400C0000 and 0x400DFFFC or between 0x40100000 and 0x407FFFFC		
Memory Region 3 End	Value must be an integer between 0x400C0003 and 0x400DFFFF or between 0x40100003 and 0x407FFFFF	0x400DFFFF	
Enable inline BSP IRQ functions	• Enabled • Disabled	Disabled	Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return.
Use Low Voltage Mode	Not Supported	config.bsp.low_voltage_mode.disabled	Use the low voltage mode. This limits the ICLK operating frequency to 4 MHz and requires all clock dividers to be at least 4 when oscillation stop detection is used.
Main Oscillator Wait Time	• 2 cycles • 1024 cycles • 2048 cycles • 4096 cycles • 8192 cycles • 16384 cycles • 32768 cycles • 65536 cycles • 131072 cycles • 262144 cycles	262144 cycles	Number of cycles to wait for the main oscillator clock to stabilize.
ID Code Mode	• Unlocked (Ignore ID) • Locked with All Erase support • Locked	Unlocked (Ignore ID)	When set to 'Locked with All Erase support', the ID Code must be set in the debugger to read or write data to the MCU, but the All Erase command is still accepted regardless. When set to 'Locked', all erase/download/debug access is disabled unless the ID Code is provided.
ID Code (32 Hex Characters)	Value must be a 32 character long hex	FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF	Set the ID Code for locking debug access.

	string		This setting is only used when the ID Code Mode is not set to Unlocked.
Fill Flash Gap	• Do not fill gap • Fill gap	Do not fill gap	A section of code flash exists between the end of the vector table (near the start of flash) and the ROM registers (at address 0x400). Selecting 'Fill gap' will assume a compiler optimization for size and fill this area with a preselected set functions in order to reduce the amount of code flash used by FSP. If you would like to fill this area with your own code or data, select 'Do not fill gap' and manually place items in the section '.flash_gap'.

Enable or disable Memory Region 3	• Enabled • Disabled	Disabled	
Memory Region 3 Start	Value must be an integer between 0x400C0000 and 0x400DFFFC or between 0x40100000 and 0x407FFFFC	0x400DFFFC	
Memory Region 3 End	Value must be an integer between 0x400C0003 and 0x400DFFFF or between 0x40100003 and 0x407FFFFF	0x400DFFFF	
Power			
DC-DC Regulator	• Disabled • Enabled • Enabled at startup	Disabled	To use the DCDC regulator an external inductor and capacitor must be connected as specified in chapter 40

			of the RA2L1 manual. In addition the supply voltage must be above 2.4V and ICLK must be 2 MHz or higher. When set to 'Enabled at startup' the BSP will switch to the DCDC regulator during startup using the voltage range specified below.
DC-DC Supply Range	• 2.4V to 2.7V • 2.7V to 3.6V • 3.6V to 4.5V • 4.5V to 5.5V	2.7V to 3.6V	Set this to the expected MCU supply voltage (Vcc) at startup when using the DCDC regulator.
Enable inline BSP IRQ functions	• Enabled • Disabled	Disabled	Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return.
Use Low Voltage Mode	Not Supported	config.bsp.low_voltage_mode.disabled	Use the low voltage mode. This limits the ICLK operating frequency to 4 MHz and requires all clock dividers to be at least 4 when oscillation stop detection is used.
Main Oscillator Wait Time	• 2 cycles • 1024 cycles • 2048 cycles • 4096 cycles • 8192 cycles • 16384 cycles • 32768 cycles • 65536 cycles • 131072 cycles • 262144 cycles	262144 cycles	Number of cycles to wait for the main oscillator clock to stabilize.
ID Code Mode	• Unlocked (Ignore ID) • Locked with All Erase support • Locked	Unlocked (Ignore ID)	When set to 'Locked with All Erase support', the ID Code must be set in the debugger to read or write data to the MCU, but the All Erase command is still accepted regardless. When set to 'Locked', all

			erase/download/debug access is disabled unless the ID Code is provided.
ID Code (32 Hex Characters)	Value must be a 32 character long hex string	FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF	Set the ID Code for locking debug access. This setting is only used when the ID Code Mode is not set to Unlocked.
Fill Flash Gap	• Do not fill gap • Fill gap	Do not fill gap	A section of code flash exists between the end of the vector table (near the start of flash) and the ROM registers (at address 0x400). Selecting 'Fill gap' will assume a compiler optimization for size and fill this area with a preselected set functions in order to reduce the amount of code flash used by FSP. If you would like to fill this area with your own code or data, select 'Do not fill gap' and manually place items in the section '.flash_gap'.

Common macro for FSP header files. There is also a corresponding FSP_FOOTER macro at the end of this file.

Macros

Enumerator	
BSP_POWER_MODE_DCDC_2V4_TO_2V7	DCDC mode; 2.4V to 2.7V supply.
BSP_POWER_MODE_DCDC_2V7_TO_3V6	DCDC mode; 2.7V to 3.6V supply.
BSP_POWER_MODE_DCDC_3V6_TO_4V5	DCDC mode; 3.6V to 4.5V supply.
BSP_POWER_MODE_DCDC_4V5_TO_5V5	DCDC mode; 4.5V to 5.5V supply.
BSP_POWER_MODE_LDO	LDO mode.

Function Documentation

◆ R_BSP_PowerModeSet()

bsp_power_mode_t R_BSP_PowerModeSet (bsp_power_mode_t *mode*)

Select either the LDO or DCDC regulator and/or update the MCU supply voltage range. Returns the previously selected mode.

Note

DCDC mode has the following limitations:

- *Supply voltage must be 2.4V or greater*
- *Low- and Subosc-speed modes are not available*
- *Software Standby is not available Ensure these limitations are respected before entering DCDC mode. If supply voltage may drop below 2.4V during operation, configure a LVD channel to interrupt or reset the MCU near this threshold to switch back to the LDO.*

Switching to DCDC mode temporarily disables all interrupts and blocks for 22 microseconds; switching to LDO from DCDC temporarily disables all peripherals and interrupts and blocks for 60 microseconds.

If the supply voltage falls outside the range originally specified when starting the DCDC regulator, call this function again with the updated supply voltage.

Returns

The previously selected power mode.

BSP » MCU Board Support Package

Detailed Description

Build Time Configurations for ra4e1_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

Configuration	Options	Default	Description
Security			
Security > Exceptions			
Exception Response	• Non-Maskable Interrupt • Reset	Non-Maskable Interrupt	Configure the result of a TrustZone Filter exception. This exception is generated when a the TrustZone Filter detects access to a protected region. This setting is only valid when building projects with TrustZone.
BusFault, HardFault, and NMI Target	• Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit BFHFNMINS. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception. This setting is only valid when building projects with TrustZone.
Prioritize Secure Exceptions	• Enabled • Disabled	Disabled	Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct. This setting is only valid when building projects with TrustZone.

Security > SRAM Accessibility			
SRAM Protection	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAMPRCR is write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
SRAM ECC	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAM ECC registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Standby RAM	• Regions 7-0 are all Secure. • Region 7 is Non-secure. Regions 6-0 are Secure. • Regions 7-6 are Non-secure. Regions 5-0 are Secure. • Regions 7-5 are Non-secure. Regions 4-0 are Secure. • Regions 7-4 are Non-secure. Regions 3-0 are Secure. • Regions 7-3 are Non-secure. Regions 2-0 are Secure. • Regions 7-2 are Non-secure. Regions 1-0 are Secure. • Regions 7-1 are Non-secure. Region 0 is Secure. • Regions 7-0 are all Non-secure.	config.bsp.fsp.tz.stbramsar.both	Defines whether Standby RAM registers are accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Security > BUS Accessibility			
Bus Security Attribution	• Both Secure	Both Secure and Non-	Defines whether the

Register A	and Non-Secure State • Secure State	Secure State	Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Bus Security Attribution Register B	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
System Reset Request Accessibility	• Both Secure and Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use. This setting is only valid when building projects with TrustZone.
System Reset Status Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application. This setting is only valid when building projects with TrustZone.
Battery Backup Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the battery backup registers are accessible for the Non-secure application. If Secure State is selected, all battery backup registers are read only except for VBTBKRn

			registers which are both read and write protected. This setting is only valid when building projects with TrustZone.
Uninitialized Non-Secure Application Fallback	• Enable Uninitialized Non-Secure Application Fallback • Disable Uninitialized Non-Secure Application Fallback	Enable Uninitialized Non-Secure Application Fallback	If enabled, the secure application checks if the non-secure application has been programmed in non-secure flash before branching. If the non-secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state.
OFS0 register settings			
OFS0 register settings > Independent WDT			
Start Mode	• IWDT is stopped after a reset • IWDT is automatically activated after a reset (Autostart mode)	IWDT is stopped after a reset	
Timeout Period	• 128 cycles • 512 cycles • 1024 cycles • 2048 cycles	2048 cycles	
Dedicated Clock Frequency Divisor	• 1 • 16 • 32 • 64 • 128 • 256	128	
Window End Position	• 75% • 50% • 25%	0% (no window end position)	

	• 0% (no window end position)	
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)
Reset Interrupt Request Select	• NMI request or interrupt request is enabled • Reset is enabled	Reset is enabled
Stop Control	• Counting continues (Note: Device will not enter Deep Standby Mode when selected. Device will enter Software Standby Mode) • Stop counting when in Sleep, Snooze mode, or Software Standby	Stop counting when in Sleep, Snooze mode, or Software Standby
OFS0 register settings > WDT		
Start Mode Select	• Automatically activate WDT after a reset (auto-start mode) • Stop WDT after a reset (register-start mode)	Stop WDT after a reset (register-start mode)
Timeout Period	• 1024 cycles • 4096 cycles • 8192 cycles • 16384 cycles	16384 cycles
Clock Frequency Division Ratio	• 4 • 64 • 128 • 512 • 2048 • 8192	128
Window End Position	• 75% • 50%	0% (no window end position)

	• 25% • 0% (no window end position)	
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)
Reset Interrupt Request	• NMI • Reset	Reset
Stop Control	• Counting continues • Stop counting when entering Sleep mode	Stop counting when entering Sleep mode
OFS1_SEL register settings		
Voltage Detection 0 Level Security Attribution	• VDSEL setting loads from OFS1_SEC • VDSEL setting loads from OFS1	VDSEL setting loads from OFS1_SEC
Voltage Detection 0 Circuit Start Security Attribution	• LVDAS setting loads from OFS1_SEC • LVDAS setting loads from OFS1	LVDAS setting loads from OFS1_SEC
OFS1 register settings		
Voltage Detection 0 Circuit Start	• Voltage monitor 0 reset is enabled after reset • Voltage monitor 0 reset is disabled after reset	Voltage monitor 0 reset is disabled after reset
Voltage Detection 0 Level	• 2.94 V • 2.87 V • 2.80 V	2.80 V
HOCO Oscillation Enable	• HOCO oscillation is enabled after reset • HOCO oscillation is disabled after reset	HOCO oscillation is enabled after reset

Block Protection Settings (BPS)			
BPS	Refer to the RA Configuration tool for available options.	0U	Configure Block Protection Register
Permanent Block Protection Settings (PBPS)			
PBPS	Refer to the RA Configuration tool for available options.	0U	Configure Permanent Block Protection Register
Clocks			
HOCO FLL Function	• Enabled • Disabled	Disabled	Setting this option to Enabled improves HOCO accuracy significantly by using the subclock, but incurs certain restrictions. The FLL function requires the subclock oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization Time as well as the FLL Stabilization Time when setting up clocks at startup. When FLL is enabled Software Standby and Deep Software Standby modes are not available.
Enable inline BSP IRQ functions	• Enabled • Disabled	Enabled	Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return.
Main Oscillator Wait Time	• 3 cycles • 35 cycles • 67 cycles • 131 cycles • 259 cycles • 547 cycles • 1059 cycles • 2147 cycles	8163 cycles	Number of cycles to wait for the main oscillator clock to stabilize.

- 4291 cycles
- 8163 cycles

Detailed Description

Build Time Configurations for ra4e2_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

Configuration	Options	Default	Description
Security			
Security > Exceptions			
Exception Response	• Non-Maskable Interrupt • Reset	Non-Maskable Interrupt	Configure the result of a TrustZone Filter exception. This exception is generated when the TrustZone Filter detects access to a protected region. This setting is only valid when building projects with TrustZone.
BusFault, HardFault, and NMI Target	• Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit BFHFNMINS. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception. This setting is only valid when building projects with TrustZone.
Prioritize Secure Exceptions	• Enabled • Disabled	Disabled	Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct. This setting is only valid when building projects with TrustZone.

Security > SRAM Accessibility			
SRAM Protection	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAMPRCR is write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
SRAM ECC	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAM ECC registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Standby RAM	• Regions 7-0 are all Secure. • Region 7 is Non-secure. Regions 6-0 are Secure. • Regions 7-6 are Non-secure. Regions 5-0 are Secure. • Regions 7-5 are Non-secure. Regions 4-0 are Secure. • Regions 7-4 are Non-secure. Regions 3-0 are Secure. • Regions 7-3 are Non-secure. Regions 2-0 are Secure. • Regions 7-2 are Non-secure. Regions 1-0 are Secure. • Regions 7-1 are Non-secure. Region 0 is Secure. • Regions 7-0 are all Non-secure.	config.bsp.fsp.tz.stbramsar.both	Defines whether Standby RAM registers are accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Security > BUS Accessibility			
Bus Security Attribution	• Both Secure	Both Secure and Non-	Defines whether the

Register A	and Non-Secure State • Secure State	Secure State	Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Bus Security Attribution Register B	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
System Reset Request Accessibility	• Both Secure and Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use. This setting is only valid when building projects with TrustZone.
Cache Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Cache registers are write accessible for the Non-secure application. This setting is only valid when building protjects with TrustZone.
System Reset Status Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application. This setting is only valid when building projects with TrustZone.

Battery Backup Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the battery backup registers are accessible for the Non-secure application. If Secure State is selected, all battery backup registers are read only except for VBTBKRn registers which are both read and write protected. This setting is only valid when building projects with TrustZone.
Uninitialized Non-Secure Application Fallback	• Enable Uninitialized Non-Secure Application Fallback • Disable Uninitialized Non-Secure Application Fallback	Enable Uninitialized Non-Secure Application Fallback	If enabled, the secure application checks if the non-secure application has been programmed in non-secure flash before branching. If the non-secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state.
OFS0 register settings			
OFS0 register settings > Independent WDT			
Start Mode	• IWDT is stopped after a reset • IWDT is automatically activated after a reset (Autostart mode)	IWDT is stopped after a reset	
Timeout Period	• 128 cycles • 512 cycles • 1024 cycles • 2048 cycles	2048 cycles	

Dedicated Clock Frequency Divisor	• 1 • 16 • 32 • 64 • 128 • 256	128
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)
Reset Interrupt Request Select	• NMI request or interrupt request is enabled • Reset is enabled	Reset is enabled
Stop Control	• Counting continues (Note: Device will not enter Deep Standby Mode when selected. Device will enter Software Standby Mode) • Stop counting when in Sleep, Snooze mode, or Software Standby	Stop counting when in Sleep, Snooze mode, or Software Standby
OFS0 register settings > WDT		
Start Mode Select	• Automatically activate WDT after a reset (auto-start mode) • Stop WDT after a reset (register-start mode)	Stop WDT after a reset (register-start mode)
Timeout Period	• 1024 cycles • 4096 cycles • 8192 cycles • 16384 cycles	16384 cycles

Clock Frequency Division Ratio	• 4 • 64 • 128 • 512 • 2048 • 8192	128	
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)	
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)	
Reset Interrupt Request	• NMI • Reset	Reset	
Stop Control	• Counting continues • Stop counting when entering Sleep mode	Stop counting when entering Sleep mode	
OFS1 register settings			
Voltage Detection 0 Circuit Start	• Voltage monitor 0 reset is enabled after reset • Voltage monitor 0 reset is disabled after reset	Voltage monitor 0 reset is disabled after reset	
Voltage Detection 0 Level	• 2.94 V • 2.87 V • 2.80 V	2.80 V	
HOCO Oscillation Enable	• HOCO oscillation is enabled after reset • HOCO oscillation is disabled after reset	HOCO oscillation is disabled after reset	
Block Protection Settings (BPS)			
BPS0	• Flash Block 0 • Flash Block 1 • Flash Block 2	0U	Configure Block Protection Register 0

	• Flash Block 3 • Flash Block 4 • Flash Block 5 • Flash Block 6 • Flash Block 7 • Flash Block 8 • Flash Block 9		
Permanent Block Protection Settings (PBPS)			
PBPS0	• Flash Block 0 • Flash Block 1 • Flash Block 2 • Flash Block 3 • Flash Block 4 • Flash Block 5 • Flash Block 6 • Flash Block 7 • Flash Block 8 • Flash Block 9	0U	Configure Permanent Block Protection Register 0
Clocks			
HOCO FLL Function	• Enabled • Disabled	Disabled	Setting this option to Enabled improves HOCO accuracy significantly by using the subclock, but incurs certain restrictions. The FLL function requires the subclock oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization Time as well as the FLL Stabilization Time when setting up clocks at startup. When FLL is enabled Software Standby and Deep Software Standby modes are not available.
Enable inline BSP IRQ functions	• Enabled • Disabled	Enabled	Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return.

Startup C-Cache Line Size	• 32 Bytes • 64 Bytes	32 Bytes	Set the C-Cache line size configured during startup.
Main Oscillator Wait Time	• 3 cycles • 35 cycles • 67 cycles • 131 cycles • 259 cycles • 547 cycles • 1059 cycles • 2147 cycles • 4291 cycles • 8163 cycles	8163 cycles	Number of cycles to wait for the main oscillator clock to stabilize.
ID Code Mode	• Unlocked (Ignore ID) • Locked with All Erase support • Locked	Unlocked (Ignore ID)	When set to 'Locked with All Erase support', the ID Code must be set in the debugger to read or write data to the MCU, but the All Erase command is still accepted regardless. When set to 'Locked', all erase/download/debug access is disabled unless the ID Code is provided.
ID Code (32 Hex Characters)	Value must be a 32 character long hex string	FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF	Set the ID Code for locking debug access. This setting is only used when the ID Code Mode is not set to Unlocked.

BSP » MCU Board Support Package

Detailed Description

Build Time Configurations for ra4m1_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

Configuration	Options	Default	Description
OFS0 register settings			
OFS0 register settings > Independent WDT			
Start Mode	• IWDT is stopped after a reset • IWDT is automatically activated after a reset (Autostart mode)	IWDT is stopped after a reset	
Timeout Period	• 128 cycles • 512 cycles • 1024 cycles • 2048 cycles	2048 cycles	
Dedicated Clock	• 1	128	

Frequency Divisor	• 16 • 32 • 64 • 128 • 256	
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)
Reset Interrupt Request Select	• NMI request or interrupt request is enabled • Reset is enabled	Reset is enabled
Stop Control	• Counting continues • Stop counting when in Sleep, Snooze mode, or Software Standby	Stop counting when in Sleep, Snooze mode, or Software Standby
OFS0 register settings > WDT		
Start Mode Select	• Automatically activate WDT after a reset (auto-start mode) • Stop WDT after a reset (register-start mode)	Stop WDT after a reset (register-start mode)
Timeout Period	• 1024 cycles • 4096 cycles • 8192 cycles • 16384 cycles	16384 cycles
Clock Frequency Division Ratio	• 4 • 64 • 128 • 512 • 2048 • 8192	128
Window End Position	• 75%	0% (no window end

	• 50% • 25% • 0% (no window end position)	position)	
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)	
Reset Interrupt Request	• NMI • Reset	Reset	
Stop Control	• Counting continues • Stop counting when entering Sleep mode	Stop counting when entering Sleep mode	
OFS1 register settings			
Voltage Detection 0 Circuit Start	• Voltage monitor 0 reset is enabled after reset • Voltage monitor 0 reset is disabled after reset	Voltage monitor 0 reset is disabled after reset	
Voltage Detection 0 Level	• 3.84 V • 2.82 V • 2.51 V • 1.90 V • 1.70 V	1.90 V	
HOCO Oscillation Enable	HOCO oscillation is enabled after reset	HOCO oscillation is enabled after reset	HOCO must be enabled out of reset because the MCU starts up in low voltage mode and the HOCO must be operating in low voltage mode.
MPU			
Enable or disable PC Region 0	• Enabled • Disabled	Disabled	
PC0 Start	Value must be an integer between 0 and 0x00FFFFFC (ROM) or between 0x1FF00000 and 0x200FFFFC (RAM)	0x00FFFFFC	
PC0 End	Value must be an integer between	0x00FFFFFF	

	0x00000003 and 0x00FFFFFF (ROM) or between 0x1FF00003 and 0x200FFFFF (RAM)	
Enable or disable PC Region 1	• Enabled • Disabled	Disabled
PC1 Start	Value must be an integer between 0 and 0x00FFFFFC (ROM) or between 0x1FF00000 and 0x200FFFFC (RAM)	0x00FFFFFC
PC1 End	Value must be an integer between 0x00000003 and 0x00FFFFFF (ROM) or between 0x1FF00003 and 0x200FFFFF (RAM)	0x00FFFFFF
Enable or disable Memory Region 0	• Enabled • Disabled	Disabled
Memory Region 0 Start	Value must be an integer between 0 and 0x00FFFFFC	0x00FFFFFC
Memory Region 0 End	Value must be an integer between 0x00000003 and 0x00FFFFFF	0x00FFFFFF
Enable or disable Memory Region 1	• Enabled • Disabled	Disabled
Memory Region 1 Start	Value must be an integer between 0x1FF00000 and 0x200FFFFC	0x200FFFFC
Memory Region 1 End	Value must be an integer between 0x1FF00003 and 0x200FFFFF	0x200FFFFF
Enable or disable Memory Region 2	• Enabled • Disabled	Disabled
Memory Region 2 Start	Value must be an integer between 0x400C0000 and 0x400DFFFC or between 0x40100000 and 0x407FFFFC	0x407FFFFC
Memory Region 2 End	Value must be an integer between 0x400C0003 and	0x407FFFFF

	0x400DFFFF or between 0x40100003 and 0x407FFFFF		
Enable or disable Memory Region 3	• Enabled • Disabled	Disabled	
Memory Region 3 Start	Value must be an integer between 0x400C0000 and 0x400DFFFC or between 0x40100000 and 0x407FFFFC	0x400DFFFC	
Memory Region 3 End	Value must be an integer between 0x400C0003 and 0x400DFFFF or between 0x40100003 and 0x407FFFFF	0x400DFFFF	
Enable inline BSP IRQ functions	• Enabled • Disabled	Enabled	Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return.
Use Low Voltage Mode	• Enabled • Disabled	Disabled	Use the low voltage mode. This limits the ICLK operating frequency to 4 MHz and requires all clock dividers to be at least 4.
Main Oscillator Wait Time	• 2 cycles • 1024 cycles • 2048 cycles • 4096 cycles • 8192 cycles • 16384 cycles • 32768 cycles • 65536 cycles • 131072 cycles • 262144 cycles	262144 cycles	Number of cycles to wait for the main oscillator clock to stabilize.
ID Code Mode	• Unlocked (Ignore ID) • Locked with All Erase support • Locked	Unlocked (Ignore ID)	When set to 'Locked with All Erase support', the ID Code must be set in the debugger to read or write data to the MCU, but the All Erase command is still accepted regardless. When set to 'Locked', all erase/download/debug

			access is disabled unless the ID Code is provided.
ID Code (32 Hex Characters)	Value must be a 32 character long hex string	FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF	Set the ID Code for locking debug access. This setting is only used when the ID Code Mode is not set to Unlocked.

Detailed Description

Build Time Configurations for ra4m2_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

Configuration	Options	Default	Description
Security			
Security > Exceptions			
Exception Response	• Non-Maskable Interrupt • Reset	Non-Maskable Interrupt	Configure the result of a TrustZone Filter exception. This exception is generated when the TrustZone Filter detects access to a protected region. This setting is only valid when building projects with TrustZone.
BusFault, HardFault, and NMI Target	• Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit BFHFNMINS. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception. This setting is only valid when building projects with TrustZone.
Prioritize Secure Exceptions	• Enabled • Disabled	Disabled	Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the

			prioritization of non-secure interrupts is correct. This setting is only valid when building projects with TrustZone.
Security > SRAM Accessibility			
SRAM Protection	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAMPRCR is write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
SRAM ECC	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAM ECC registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Standby RAM	• Regions 7-0 are all Secure. • Region 7 is Non-secure. Regions 6-0 are Secure. • Regions 7-6 are Non-secure. Regions 5-0 are Secure. • Regions 7-5 are Non-secure. Regions 4-0 are Secure. • Regions 7-4 are Non-secure. Regions 3-0 are Secure. • Regions 7-3 are Non-secure. Regions 2-0 are Secure. • Regions 7-2 are Non-secure. Regions 1-0 are Secure.	config.bsp.fsp.tz.stbramsar.both	Defines whether Standby RAM registers are accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.

	• Regions 7-1 are Non-secure. Region 0 is Secure. • Regions 7-0 are all Non-secure.		
Security > BUS Accessibility			
Bus Security Attribution Register A	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Bus Security Attribution Register B	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
System Reset Request Accessibility	• Both Secure and Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use. This setting is only valid when building projects with TrustZone.
Cache Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Cache registers are write accessible for the Non-secure application. This setting is only valid when building protjects with TrustZone.
System Reset Status	• Both Secure	Both Secure and Non-	Defines whether the

Accessibility	and Non-Secure State • Secure State	Secure State	reset status registers (RSTSRn) can be cleared from the Non-secure application. This setting is only valid when building projects with TrustZone.
Battery Backup Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the battery backup registers are accessible for the Non-secure application. If Secure State is selected, all battery backup registers are read only except for VBTBKRn registers which are both read and write protected. This setting is only valid when building projects with TrustZone.
Uninitialized Non-Secure Application Fallback	• Enable Uninitialized Non-Secure Application Fallback • Disable Uninitialized Non-Secure Application Fallback	Enable Uninitialized Non-Secure Application Fallback	If enabled, the secure application checks if the non-secure application has been programmed in non-secure flash before branching. If the non-secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state.

Detailed Description

Build Time Configurations for ra4t1_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

Configuration	Options	Default	Description
Security			

Security > Exceptions			
Exception Response	• Non-Maskable Interrupt • Reset	Non-Maskable Interrupt	Configure the result of a TrustZone Filter exception. This exception is generated when the TrustZone Filter detects access to a protected region. This setting is only valid when building projects with TrustZone.
BusFault, HardFault, and NMI Target	• Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit BFHFNMINS. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception. This setting is only valid when building projects with TrustZone.
Prioritize Secure Exceptions	• Enabled • Disabled	Disabled	Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct. This setting is only valid when building projects with TrustZone.
Security > SRAM Accessibility			
SRAM Protection	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAMPRCR is write accessible for the Non-secure application.

			This setting is only valid when building projects with TrustZone.
SRAM ECC	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAM ECC registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Standby RAM	• Regions 7-0 are all Secure. • Region 7 is Non-secure. Regions 6-0 are Secure. • Regions 7-6 are Non-secure. Regions 5-0 are Secure. • Regions 7-5 are Non-secure. Regions 4-0 are Secure. • Regions 7-4 are Non-secure. Regions 3-0 are Secure. • Regions 7-3 are Non-secure. Regions 2-0 are Secure. • Regions 7-2 are Non-secure. Regions 1-0 are Secure. • Regions 7-1 are Non-secure. Region 0 is Secure. • Regions 7-0 are all Non-secure.	config.bsp.fsp.tz.stbramsar.both	Defines whether Standby RAM registers are accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Security > BUS Accessibility			
Bus Security Attribution Register A	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application.

			This setting is only valid when building projects with TrustZone.
Bus Security Attribution Register B	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
System Reset Request Accessibility	• Both Secure and Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use. This setting is only valid when building projects with TrustZone.
Cache Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Cache registers are write accessible for the Non-secure application. This setting is only valid when building protjects with TrustZone.
System Reset Status Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application. This setting is only valid when building projects with TrustZone.
Battery Backup Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the battery backup registers are accessible for the Non-secure application. If Secure

			State is selected, all battery backup registers are read only except for VBTBKRn registers which are both read and write protected. This setting is only valid when building projects with TrustZone.
Uninitialized Non-Secure Application Fallback	• Enable Uninitialized Non-Secure Application Fallback • Disable Uninitialized Non-Secure Application Fallback	Enable Uninitialized Non-Secure Application Fallback	If enabled, the secure application checks if the non-secure application has been programmed in non-secure flash before branching. If the non-secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state.
OFS0 register settings			
OFS0 register settings > Independent WDT			
Start Mode	• IWDT is stopped after a reset • IWDT is automatically activated after a reset (Autostart mode)	IWDT is stopped after a reset	
Timeout Period	• 128 cycles • 512 cycles • 1024 cycles • 2048 cycles	2048 cycles	
Dedicated Clock Frequency Divisor	• 1 • 16 • 32 • 64 • 128	128	

	• 256	
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)
Reset Interrupt Request Select	• NMI request or interrupt request is enabled • Reset is enabled	Reset is enabled
Stop Control	• Counting continues (Note: Device will not enter Deep Standby Mode when selected. Device will enter Software Standby Mode) • Stop counting when in Sleep, Snooze mode, or Software Standby	Stop counting when in Sleep, Snooze mode, or Software Standby
OFS0 register settings > WDT		
Start Mode Select	• Automatically activate WDT after a reset (auto-start mode) • Stop WDT after a reset (register-start mode)	Stop WDT after a reset (register-start mode)
Timeout Period	• 1024 cycles • 4096 cycles • 8192 cycles • 16384 cycles	16384 cycles
Clock Frequency Division Ratio	• 4 • 64 • 128 • 512	128

	• 2048 • 8192		
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)	
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)	
Reset Interrupt Request	• NMI • Reset	Reset	
Stop Control	• Counting continues • Stop counting when entering Sleep mode	Stop counting when entering Sleep mode	
OFS1 register settings			
Voltage Detection 0 Circuit Start	• Voltage monitor 0 reset is enabled after reset • Voltage monitor 0 reset is disabled after reset	Voltage monitor 0 reset is disabled after reset	
Voltage Detection 0 Level	• 2.94 V • 2.87 V • 2.80 V	2.80 V	
HOCO Oscillation Enable	• HOCO oscillation is enabled after reset • HOCO oscillation is disabled after reset	HOCO oscillation is disabled after reset	
Block Protection Settings (BPS)			
BPS0	Refer to the RA Configuration tool for available options.	0U	Configure Block Protection Register 0
Permanent Block Protection Settings (PBPS)			
PBPS0	Refer to the RA Configuration tool for	0U	Configure Permanent Block Protection

	available options.		Register 0
Clocks			
HOCO FLL Function	• Enabled • Disabled	Disabled	Setting this option to Enabled improves HOCO accuracy significantly by using the subclock, but incurs certain restrictions. The FLL function requires the subclock oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization Time as well as the FLL Stabilization Time when setting up clocks at startup. When FLL is enabled Software Standby and Deep Software Standby modes are not available.
Enable inline BSP IRQ functions	• Enabled • Disabled	Enabled	Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return.
Startup C-Cache Line Size	• 32 Bytes • 64 Bytes	32 Bytes	Set the C-Cache line size configured during startup.
TFU Mathlib	• Disabled • Enabled	Enabled	If enabled, trigonometric library functions sinf, cosf, atan2f, and hypotf are replaced with hardware accelerated TFU functions. Disable this if reentrant access to these functions is required.
Main Oscillator Wait Time	• 3 cycles • 35 cycles • 67 cycles	8163 cycles	Number of cycles to wait for the main oscillator clock to

	• 131 cycles • 259 cycles • 547 cycles • 1059 cycles • 2147 cycles • 4291 cycles • 8163 cycles		stabilize.
ID Code Mode	• Unlocked (Ignore ID) • Locked with All Erase support • Locked	Unlocked (Ignore ID)	When set to 'Locked with All Erase support', the ID Code must be set in the debugger to read or write data to the MCU, but the All Erase command is still accepted regardless. When set to 'Locked', all erase/download/debug access is disabled unless the ID Code is provided.
ID Code (32 Hex Characters)	Value must be a 32 character long hex string	FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF	Set the ID Code for locking debug access. This setting is only used when the ID Code Mode is not set to Unlocked.

Detailed Description

Build Time Configurations for ra4w1_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

Configuration	Options	Default	Description
OFS0 register settings			
OFS0 register settings > Independent WDT			
Start Mode	• IWDT is stopped after a reset • IWDT is automatically activated after a reset (Autostart mode)	IWDT is stopped after a reset	
Timeout Period	• 128 cycles • 512 cycles • 1024 cycles • 2048 cycles	2048 cycles	
Dedicated Clock Frequency Divisor	• 1 • 16	128	

	• 32 • 64 • 128 • 256	
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)
Reset Interrupt Request Select	• NMI request or interrupt request is enabled • Reset is enabled	Reset is enabled
Stop Control	• Counting continues • Stop counting when in Sleep, Snooze mode, or Software Standby	Stop counting when in Sleep, Snooze mode, or Software Standby
OFS0 register settings > WDT		
Start Mode Select	• Automatically activate WDT after a reset (auto-start mode) • Stop WDT after a reset (register-start mode)	Stop WDT after a reset (register-start mode)
Timeout Period	• 1024 cycles • 4096 cycles • 8192 cycles • 16384 cycles	16384 cycles
Clock Frequency Division Ratio	• 4 • 64 • 128 • 512 • 2048 • 8192	128
Window End Position	• 75% • 50%	0% (no window end position)

	• 25% • 0% (no window end position)	
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)
Reset Interrupt Request	• NMI • Reset	Reset
Stop Control	• Counting continues • Stop counting when entering Sleep mode	Stop counting when entering Sleep mode
OFS1 register settings		
Voltage Detection 0 Circuit Start	• Voltage monitor 0 reset is enabled after reset • Voltage monitor 0 reset is disabled after reset	Voltage monitor 0 reset is disabled after reset
Voltage Detection 0 Level	• 2.82 V • 2.51 V • 1.90 V	1.90 V
HOCO Oscillation Enable	HOCO oscillation is enabled after reset	config.bsp.fsp.OFS1.hoco_osc.disabled
MPU		
Enable or disable PC Region 0	• Enabled • Disabled	Disabled
PC0 Start	Value must be an integer between 0 and 0x00FFFFFC (ROM) or between 0x1FF00000 and 0x200FFFFC (RAM)	0x00FFFFFC
PC0 End	Value must be an integer between 0x00000003 and 0x00FFFFFF (ROM) or between 0x1FF00003 and 0x200FFFFF (RAM)	0x00FFFFFF
Enable or disable PC Region 1	• Enabled • Disabled	Disabled
PC1 Start	Value must be an	0x00FFFFFC

	integer between 0 and 0x00FFFFFC (ROM) or between 0x1FF00000 and 0x200FFFFC (RAM)	
PC1 End	Value must be an integer between 0x00000003 and 0x00FFFFFF (ROM) or between 0x1FF00003 and 0x200FFFFF (RAM)	0x00FFFFFF
Enable or disable Memory Region 0	• Enabled • Disabled	Disabled
Memory Region 0 Start	Value must be an integer between 0 and 0x00FFFFFC	0x00FFFFFC
Memory Region 0 End	Value must be an integer between 0x00000003 and 0x00FFFFFF	0x00FFFFFF
Enable or disable Memory Region 1	• Enabled • Disabled	Disabled
Memory Region 1 Start	Value must be an integer between 0x1FF00000 and 0x200FFFFC	0x200FFFFC
Memory Region 1 End	Value must be an integer between 0x1FF00003 and 0x200FFFFF	0x200FFFFF
Enable or disable Memory Region 2	• Enabled • Disabled	Disabled
Memory Region 2 Start	Value must be an integer between 0x400C0000 and 0x400DFFFC or between 0x40100000 and 0x407FFFFC	0x407FFFFC
Memory Region 2 End	Value must be an integer between 0x400C0003 and 0x400DFFFF or between 0x40100003 and 0x407FFFFF	0x407FFFFF
Enable or disable Memory Region 3	• Enabled • Disabled	Disabled
Memory Region 3 Start	Value must be an integer between	0x400DFFFC

	0x400C0000 and 0x400DFFFC or between 0x40100000 and 0x407FFFFC		
Memory Region 3 End	Value must be an integer between 0x400C0003 and 0x400DFFFF or between 0x40100003 and 0x407FFFFF	0x400DFFFF	
Enable inline BSP IRQ functions	• Enabled • Disabled	Enabled	Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return.
Use Low Voltage Mode	• Enabled • Disabled	Disabled	Use the low voltage mode. This limits the ICLK operating frequency to 4 MHz and requires all clock dividers to be at least 4.
Main Oscillator Wait Time	• 2 cycles • 1024 cycles • 2048 cycles • 4096 cycles • 8192 cycles • 16384 cycles • 32768 cycles • 65536 cycles • 131072 cycles • 262144 cycles	262144 cycles	Number of cycles to wait for the main oscillator clock to stabilize.
ID Code Mode	• Unlocked (Ignore ID) • Locked with All Erase support • Locked	Unlocked (Ignore ID)	When set to 'Locked with All Erase support', the ID Code must be set in the debugger to read or write data to the MCU, but the All Erase command is still accepted regardless. When set to 'Locked', all erase/download/debug access is disabled unless the ID Code is provided.
ID Code (32 Hex Characters)	Value must be a 32 character long hex string	FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF	Set the ID Code for locking debug access. This setting is only used when the ID Code

Mode is not set to Unlocked.

Detailed Description

Build Time Configurations for ra6e1_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

Configuration	Options	Default	Description
Security			
Security > Exceptions			
Exception Response	• Non-Maskable Interrupt • Reset	Non-Maskable Interrupt	Configure the result of a TrustZone Filter exception. This exception is generated when a the TrustZone Filter detects access to a protected region. This setting is only valid when building projects with TrustZone.
BusFault, HardFault, and NMI Target	• Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit BFHFNMINS. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception. This setting is only valid when building projects with TrustZone.
Prioritize Secure Exceptions	• Enabled • Disabled	Disabled	Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct. This setting is only valid when building projects with TrustZone.

Security > SRAM Accessibility			
SRAM Protection	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAMPRCR is write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
SRAM ECC	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAM ECC registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Standby RAM	• Regions 7-0 are all Secure. • Region 7 is Non-secure. Regions 6-0 are Secure. • Regions 7-6 are Non-secure. Regions 5-0 are Secure. • Regions 7-5 are Non-secure. Regions 4-0 are Secure. • Regions 7-4 are Non-secure. Regions 3-0 are Secure. • Regions 7-3 are Non-secure. Regions 2-0 are Secure. • Regions 7-2 are Non-secure. Regions 1-0 are Secure. • Regions 7-1 are Non-secure. Region 0 is Secure. • Regions 7-0 are all Non-secure.	config.bsp.fsp.tz.stbramsar.both	Defines whether Standby RAM registers are accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Security > BUS Accessibility			
Bus Security Attribution	• Both Secure	Both Secure and Non-	Defines whether the

Register A	and Non-Secure State • Secure State	Secure State	Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Bus Security Attribution Register B	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
System Reset Request Accessibility	• Both Secure and Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use. This setting is only valid when building projects with TrustZone.
Cache Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Cache registers are write accessible for the Non-secure application. This setting is only valid when building protjects with TrustZone.
System Reset Status Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application. This setting is only valid when building projects with TrustZone.

Battery Backup Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the battery backup registers are accessible for the Non-secure application. If Secure State is selected, all battery backup registers are read only except for VBTBKRn registers which are both read and write protected. This setting is only valid when building projects with TrustZone.
Flash Bank Select Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the BANKSEL register is write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Uninitialized Non-Secure Application Fallback	• Enable Uninitialized Non-Secure Application Fallback • Disable Uninitialized Non-Secure Application Fallback	Enable Uninitialized Non-Secure Application Fallback	If enabled, the secure application checks if the non-secure application has been programmed in non-secure flash before branching. If the non-secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state.
OFS0 register settings			
OFS0 register settings > Independent WDT			
Start Mode	• IWDT is stopped after a reset • IWDT is automatically	IWDT is stopped after a reset	

	activated after a reset (Autostart mode)	
Timeout Period	• 128 cycles • 512 cycles • 1024 cycles • 2048 cycles	2048 cycles
Dedicated Clock Frequency Divisor	• 1 • 16 • 32 • 64 • 128 • 256	128
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)
Reset Interrupt Request Select	• NMI request or interrupt request is enabled • Reset is enabled	Reset is enabled
Stop Control	• Counting continues (Note: Device will not enter Deep Standby Mode when selected. Device will enter Software Standby Mode) • Stop counting when in Sleep, Snooze mode, or Software Standby	Stop counting when in Sleep, Snooze mode, or Software Standby
OFS0 register settings > WDT		
Start Mode Select	• Automatically activate WDT after a reset	Stop WDT after a reset (register-start mode)

	(auto-start mode) • Stop WDT after a reset (register-start mode)	
Timeout Period	• 1024 cycles • 4096 cycles • 8192 cycles • 16384 cycles	16384 cycles
Clock Frequency Division Ratio	• 4 • 64 • 128 • 512 • 2048 • 8192	128
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)
Reset Interrupt Request	• NMI • Reset	Reset
Stop Control	• Counting continues • Stop counting when entering Sleep mode	Stop counting when entering Sleep mode
OFS1_SEL register settings		
Voltage Detection 0 Level Security Attribution	• VDSEL setting loads from OFS1_SEC • VDSEL setting loads from OFS1	VDSEL setting loads from OFS1_SEC
Voltage Detection 0 Circuit Start Security Attribution	• LVDAS setting loads from OFS1_SEC • LVDAS setting loads from OFS1	LVDAS setting loads from OFS1_SEC
OFS1 register settings		
Voltage Detection 0	• Voltage monitor	Voltage monitor 0 reset

Circuit Start	0 reset is enabled after reset • Voltage monitor 0 reset is disabled after reset	is disabled after reset	
Voltage Detection 0 Level	• 2.94 V • 2.87 V • 2.80 V	2.80 V	
HOCO Oscillation Enable	• HOCO oscillation is enabled after reset • HOCO oscillation is disabled after reset	HOCO oscillation is enabled after reset	
Block Protection Settings (BPS)			
BPS0	Refer to the RA Configuration tool for available options.	0U	Configure Block Protection Register 0
BPS1	• Flash Block 32 • Flash Block 33 • Flash Block 34 • Flash Block 35 • Flash Block 36 • Flash Block 37	0U	Configure Block Protection Register 1
BPS2	Refer to the RA Configuration tool for available options.	0U	Configure Block Protection Register 2
Permanent Block Protection Settings (PBPS)			
PBPS0	Refer to the RA Configuration tool for available options.	0U	Configure Permanent Block Protection Register 0
PBPS1	• Flash Block 32 • Flash Block 33 • Flash Block 34 • Flash Block 35 • Flash Block 36 • Flash Block 37	0U	Configure Permanent Block Protection Register 1
PBPS2	Refer to the RA Configuration tool for available options.	0U	Configure Permanent Block Protection Register 2
Clocks			
HOCO FLL Function	• Enabled • Disabled	Disabled	Setting this option to Enabled improves

			HOCO accuracy significantly by using the subclock, but incurs certain restrictions. The FLL function requires the subclock oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization Time as well as the FLL Stabilization Time when setting up clocks at startup. When FLL is enabled Software Standby and Deep Software Standby modes are not available.
Enable inline BSP IRQ functions	• Enabled • Disabled	Enabled	Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return.
Startup C-Cache Line Size	• 32 Bytes • 64 Bytes	32 Bytes	Set the C-Cache line size configured during startup.
Dual Bank Mode	• Enabled • Disabled	Disabled	Enabling dual bank mode splits the flash into two banks that can be swapped by programming the BANKSEL non-volatile register. When enabled, one bank will start at address 0x0 and the other will start at 0x200000. Each bank contains exactly half the capacity of the entire code flash. When Dual Bank mode is enabled, Startup Program Protection and Block Swap functions cannot be used.

Main Oscillator Wait Time	• 3 cycles • 35 cycles • 67 cycles • 131 cycles • 259 cycles • 547 cycles • 1059 cycles • 2147 cycles • 4291 cycles • 8163 cycles	8163 cycles	Number of cycles to wait for the main oscillator clock to stabilize.

Build Time Configurations for ra6e2_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

Configuration	Options	Default	Description
Security			
Security > Exceptions			
Exception Response	• Non-Maskable Interrupt • Reset	Non-Maskable Interrupt	Configure the result of a TrustZone Filter exception. This exception is generated when the TrustZone Filter detects access to a protected region. This setting is only valid when building projects with TrustZone.
BusFault, HardFault, and NMI Target	• Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit BFHFNMINS. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception. This setting is only valid when building projects with TrustZone.
Prioritize Secure Exceptions	• Enabled • Disabled	Disabled	Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the

			prioritization of non-secure interrupts is correct. This setting is only valid when building projects with TrustZone.
Security > SRAM Accessibility			
SRAM Protection	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAMPRCR is write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
SRAM ECC	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAM ECC registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Standby RAM	• Regions 7-0 are all Secure. • Region 7 is Non-secure. Regions 6-0 are Secure. • Regions 7-6 are Non-secure. Regions 5-0 are Secure. • Regions 7-5 are Non-secure. Regions 4-0 are Secure. • Regions 7-4 are Non-secure. Regions 3-0 are Secure. • Regions 7-3 are Non-secure. Regions 2-0 are Secure. • Regions 7-2 are Non-secure. Regions 1-0 are Secure.	config.bsp.fsp.tz.stbramsar.both	Defines whether Standby RAM registers are accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.

	• Regions 7-1 are Non-secure. Region 0 is Secure. • Regions 7-0 are all Non-secure.		
Security > BUS Accessibility			
Bus Security Attribution Register A	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Bus Security Attribution Register B	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
System Reset Request Accessibility	• Both Secure and Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use. This setting is only valid when building projects with TrustZone.
Cache Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Cache registers are write accessible for the Non-secure application. This setting is only valid when building protjects with TrustZone.
System Reset Status	• Both Secure	Both Secure and Non-	Defines whether the

Accessibility	and Non-Secure State • Secure State	Secure State	reset status registers (RSTSRn) can be cleared from the Non-secure application. This setting is only valid when building projects with TrustZone.
Battery Backup Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the battery backup registers are accessible for the Non-secure application. If Secure State is selected, all battery backup registers are read only except for VBTBKRn registers which are both read and write protected. This setting is only valid when building projects with TrustZone.
Uninitialized Non-Secure Application Fallback	• Enable Uninitialized Non-Secure Application Fallback • Disable Uninitialized Non-Secure Application Fallback	Enable Uninitialized Non-Secure Application Fallback	If enabled, the secure application checks if the non-secure application has been programmed in non-secure flash before branching. If the non-secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state.

Voltage Detection 0 Level	• 2.94 V • 2.87 V • 2.80 V	2.80 V
HOCO Oscillation Enable	• HOCO oscillation is enabled after reset • HOCO oscillation is disabled after reset	HOCO oscillation is disabled after reset
MPU		
Enable or disable PC Region 0	• Enabled • Disabled	Disabled
PC0 Start	Value must be an integer between 0 and	0xFFFFFFFC

	0xFFFFFFFC	
PC0 End	Value must be an integer between 0x00000003 and 0xFFFFFFFF	0xFFFFFFFF
Enable or disable PC Region 1	• Enabled • Disabled	Disabled
PC1 Start	Value must be an integer between 0 and 0xFFFFFFFC	0xFFFFFFFC
PC1 End	Value must be an integer between 0x00000003 and 0xFFFFFFFF	0xFFFFFFFF
Enable or disable Memory Region 0	• Enabled • Disabled	Disabled
Memory Region 0 Start	Value must be an integer between 0 and 0x00FFFFFC	0x00FFFFFC
Memory Region 0 End	Value must be an integer between 0x00000003 and 0x00FFFFFF	0x00FFFFFF
Enable or disable Memory Region 1	• Enabled • Disabled	Disabled
Memory Region 1 Start	Value must be an integer between 0x1FF00000 and 0x200FFFFC	0x200FFFFC
Memory Region 1 End	Value must be an integer between 0x1FF00003 and 0x200FFFFF	0x200FFFFF
Enable or disable Memory Region 2	• Enabled • Disabled	Disabled
Memory Region 2 Start	Value must be an integer between 0x400C0000 and 0x400DFFFC or between 0x40100000 and 0x407FFFFC	0x407FFFFC
Memory Region 2 End	Value must be an integer between 0x400C0003 and 0x400DFFFF or between 0x40100003 and 0x407FFFFF	0x407FFFFF

Enable or disable Memory Region 3	• Enabled • Disabled	Disabled	
Memory Region 3 Start	Value must be an integer between 0x400C0000 and 0x400DFFFC or between 0x40100000 and 0x407FFFFC	0x400DFFFC	
Memory Region 3 End	Value must be an integer between 0x400C0003 and 0x400DFFFF or between 0x40100003 and 0x407FFFFF	0x400DFFFF	
Clocks			
HOCO FLL Function	• Enabled • Disabled	Disabled	Setting this option to Enabled improves HOCO accuracy significantly by using the subclock, but incurs certain restrictions. The FLL function requires the subclock oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization Time as well as the FLL Stabilization Time when setting up clocks at startup. When FLL is enabled Software Standby and Deep Software Standby modes are not available.
Enable inline BSP IRQ functions	• Enabled • Disabled	Enabled	Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return.
Main Oscillator Wait Time	• 35 cycles • 67 cycles • 131 cycles	8163 cycles	Number of cycles to wait for the main oscillator clock to

	• 259 cycles • 547 cycles • 1059 cycles • 2147 cycles • 4291 cycles • 8163 cycles		stabilize. Drive capability automatic switching function is by default disabled.
ID Code Mode	• Unlocked (Ignore ID) • Locked with All Erase support • Locked	Unlocked (Ignore ID)	When set to 'Locked with All Erase support', the ID Code must be set in the debugger to read or write data to the MCU, but the All Erase command is still accepted regardless. When set to 'Locked', all erase/download/debug access is disabled unless the ID Code is provided.
ID Code (32 Hex Characters)	Value must be a 32 character long hex string	FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF	Set the ID Code for locking debug access. This setting is only used when the ID Code Mode is not set to Unlocked.

Detailed Description

Build Time Configurations for ra6m2_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

Configuration	Options	Default	Description
SDRAM			
SDRAM > Timings			
tRAS (cycles)	• 1 cycles • 2 cycles • 3 cycles • 4 cycles • 5 cycles • 6 cycles • 7 cycles	6 cycles	Row Active Interval
tRCD (cycles)	• 1 cycles • 2 cycles • 3 cycles • 4 cycles	3 cycles	Row Column Latency
tRP (cycles)	• 1 cycles • 2 cycles • 3 cycles • 4 cycles	3 cycles	Row Precharge Interval

	• 5 cycles • 6 cycles • 7 cycles • 8 cycles		
tWR (cycles)	• 1 cycles • 2 cycles	2 cycles	Write Recovery Interval
tCL (cycles)	• 1 cycles • 2 cycles • 3 cycles	3 cycles	Column Latency
tRFC (cycles)	tRFC must be between 2 and 4096 cycles	937	Auto-Refresh Request Interval Setting
tREFW (cycles)	Refer to the RA Configuration tool for available options.	8 cycles	Auto-Refresh Cycle/Self-Refresh Clearing Cycle Count Setting.
SDRAM > Initialization			
Auto-Refresh Interval (ARFI)	Refer to the RA Configuration tool for available options.	10 cycles	Specifies the interval at which the auto-refresh commands are issued in the SDRAM initialization sequence.
Auto-Refresh Count (ARFC)	Refer to the RA Configuration tool for available options.	8 times	Specifies the number of times auto-refresh is to be performed in the SDRAM initialization sequence.
Precharge Cycle Count (PRC)	• 3 cycles • 4 cycles • 5 cycles • 6 cycles • 7 cycles • 8 cycles • 9 cycles • 10 cycles	3 cycles	Specifies the number of precharged cycles in the SDRAM initialization sequence.
SDRAM Support	• Enabled • Disabled	Disabled	If enabled, SDRAM will be initialized and configured by the BSP with the provided settings.
Address Multiplex Shift	• 8-bit shift • 9-bit shift • 10-bit shift • 11-bit shift	9-bit shift	Selects the size of the shift towards the lower half of the row address in row address/column address multiplexing.
Endian Mode	• Little Endian • Big Endian	Little Endian	Specifies the endianness of the SDRAM address space. See HWM for full list of constraints when using

			Big Endian.
Continuous Access Mode	• Enabled • Disabled	Enabled	If enabled, SDRAM continuous access mode will be enabled.
Bus Width	• 8-bit • 16-bit	16-bit	Specifies the data bus width for SDRAM.
OFS0 register settings			
OFS0 register settings > Independent WDT			
Start Mode	• IWDT is stopped after a reset • IWDT is automatically activated after a reset (Autostart mode)	IWDT is stopped after a reset	
Timeout Period	• 128 cycles • 512 cycles • 1024 cycles • 2048 cycles	2048 cycles	
Dedicated Clock Frequency Divisor	• 1 • 16 • 32 • 64 • 128 • 256	128	
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)	
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)	
Reset Interrupt Request Select	• NMI request or interrupt request is enabled • Reset is enabled	Reset is enabled	
Stop Control	• Counting continues (Note: Device will not enter	Stop counting when in Sleep, Snooze mode, or Software Standby	

	Deep Standby Mode when selected. Device will enter Software Standby Mode) • Stop counting when in Sleep, Snooze mode, or Software Standby	
OFS0 register settings > WDT		
Start Mode Select	• Automatically activate WDT after a reset (auto-start mode) • Stop WDT after a reset (register-start mode)	Stop WDT after a reset (register-start mode)
Timeout Period	• 1024 cycles • 4096 cycles • 8192 cycles • 16384 cycles	16384 cycles
Clock Frequency Division Ratio	• 4 • 64 • 128 • 512 • 2048 • 8192	128
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)
Reset Interrupt Request	• NMI • Reset	Reset
Stop Control	• Counting continues • Stop counting when entering Sleep mode	Stop counting when entering Sleep mode
OFS1 register settings		

Voltage Detection 0 Circuit Start	• Voltage monitor 0 reset is enabled after reset • Voltage monitor 0 reset is disabled after reset	Voltage monitor 0 reset is disabled after reset
Voltage Detection 0 Level	• 2.94 V • 2.87 V • 2.80 V	2.80 V
HOCO Oscillation Enable	• HOCO oscillation is enabled after reset • HOCO oscillation is disabled after reset	HOCO oscillation is disabled after reset
MPU		
Enable or disable PC Region 0	• Enabled • Disabled	Disabled
PC0 Start	Value must be an integer between 0 and 0xFFFFFFFC	0xFFFFFFFC
PC0 End	Value must be an integer between 0x00000003 and 0xFFFFFFFF	0xFFFFFFFF
Enable or disable PC Region 1	• Enabled • Disabled	Disabled
PC1 Start	Value must be an integer between 0 and 0xFFFFFFFC	0xFFFFFFFC
PC1 End	Value must be an integer between 0x00000003 and 0xFFFFFFFF	0xFFFFFFFF
Enable or disable Memory Region 0	• Enabled • Disabled	Disabled
Memory Region 0 Start	Value must be an integer between 0 and 0x00FFFFFC	0x00FFFFFC
Memory Region 0 End	Value must be an integer between 0x00000003 and 0x00FFFFFF	0x00FFFFFF

Enable or disable Memory Region 1	• Enabled • Disabled	Disabled	
Memory Region 1 Start	Value must be an integer between 0x1FF00000 and 0x200FFFFC	0x200FFFFC	
Memory Region 1 End	Value must be an integer between 0x1FF00003 and 0x200FFFFF	0x200FFFFF	
Enable or disable Memory Region 2	• Enabled • Disabled	Disabled	
Memory Region 2 Start	Value must be an integer between 0x400C0000 and 0x400DFFFC or between 0x40100000 and 0x407FFFFC	0x407FFFFC	
Memory Region 2 End	Value must be an integer between 0x400C0003 and 0x400DFFFF or between 0x40100003 and 0x407FFFFF	0x407FFFFF	
Enable or disable Memory Region 3	• Enabled • Disabled	Disabled	
Memory Region 3 Start	Value must be an integer between 0x400C0000 and 0x400DFFFC or between 0x40100000 and 0x407FFFFC	0x400DFFFC	
Memory Region 3 End	Value must be an integer between 0x400C0003 and 0x400DFFFF or between 0x40100003 and 0x407FFFFF	0x400DFFFF	
Clocks			
HOCO FLL Function	• Enabled • Disabled	Disabled	Setting this option to Enabled improves HOCO accuracy significantly by using the subclock, but incurs certain restrictions. The FLL function requires the subclock

			oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization Time as well as the FLL Stabilization Time when setting up clocks at startup. When FLL is enabled Software Standby and Deep Software Standby modes are not available.
Enable inline BSP IRQ functions	• Enabled • Disabled	Enabled	Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return.
Main Oscillator Wait Time	• 35 cycles • 67 cycles • 131 cycles • 259 cycles • 547 cycles • 1059 cycles • 2147 cycles • 4291 cycles • 8163 cycles	8163 cycles	Number of cycles to wait for the main oscillator clock to stabilize. Drive capability automatic switching function is by default disabled.
ID Code Mode	• Unlocked (Ignore ID) • Locked with All Erase support • Locked	Unlocked (Ignore ID)	When set to 'Locked with All Erase support', the ID Code must be set in the debugger to read or write data to the MCU, but the All Erase command is still accepted regardless. When set to 'Locked', all erase/download/debug access is disabled unless the ID Code is provided.
ID Code (32 Hex Characters)	Value must be a 32 character long hex string	FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF	Set the ID Code for locking debug access. This setting is only used when the ID Code Mode is not set to Unlocked.

BSP » MCU Board Support Package

Detailed Description

Build Time Configurations for ra6m4_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

Configuration	Options	Default	Description
Security			
Security > Exceptions			
Exception Response	• Non-Maskable Interrupt • Reset	Non-Maskable Interrupt	Configure the result of a TrustZone Filter exception. This exception is generated when the TrustZone Filter detects access to a protected region. This setting is only valid when building projects with TrustZone.
BusFault, HardFault, and NMI Target	• Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit BFHFNMINS. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception. This setting is only valid when building projects with

			TrustZone.
Prioritize Secure Exceptions	• Enabled • Disabled	Disabled	Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct. This setting is only valid when building projects with TrustZone.
Security > SRAM Accessibility			
SRAM Protection	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAMPRCR is write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
SRAM ECC	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAM ECC registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Standby RAM	• Regions 7-0 are all Secure. • Region 7 is Non-secure. Regions 6-0 are Secure. • Regions 7-6 are Non-secure. Regions 5-0 are Secure. • Regions 7-5 are Non-secure. Regions 4-0 are	config.bsp.fsp.tz.stbramsar.both	Defines whether Standby RAM registers are accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.

	Secure. • Regions 7-4 are Non-secure. Regions 3-0 are Secure. • Regions 7-3 are Non-secure. Regions 2-0 are Secure. • Regions 7-2 are Non-secure. Regions 1-0 are Secure. • Regions 7-1 are Non-secure. Region 0 is Secure. • Regions 7-0 are all Non-secure.		
Security > BUS Accessibility			
Bus Security Attribution Register A	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Bus Security Attribution Register B	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
System Reset Request Accessibility	• Both Secure and Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use. This setting is only valid when building

			projects with TrustZone.
Cache Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Cache registers are write accessible for the Non-secure application. This setting is only valid when building protjects with TrustZone.
System Reset Status Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application. This setting is only valid when building projects with TrustZone.
Battery Backup Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the battery backup registers are accessible for the Non-secure application. If Secure State is selected, all battery backup registers are read only except for VBTBKRn registers which are both read and write protected. This setting is only valid when building projects with TrustZone.
Flash Bank Select Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the BANKSEL register is write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Uninitialized Non-Secure Application Fallback	• Enable Uninitialized Non-Secure Application Fallback	Enable Uninitialized Non-Secure Application Fallback	If enabled, the secure application checks if the non-secure application has been programmed in non-

	• Disable Uninitialized Non-Secure Application Fallback		secure flash before branching. If the non-secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state.
OFS0 register settings			
OFS0 register settings > Independent WDT			
Start Mode	• IWDT is stopped after a reset • IWDT is automatically activated after a reset (Autostart mode)	IWDT is stopped after a reset	
Timeout Period	• 128 cycles • 512 cycles • 1024 cycles • 2048 cycles	2048 cycles	
Dedicated Clock Frequency Divisor	• 1 • 16 • 32 • 64 • 128 • 256	128	
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)	
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)	
Reset Interrupt Request Select	• NMI request or interrupt request is enabled	Reset is enabled	

	• Reset is enabled	
Stop Control	• Counting continues (Note: Device will not enter Deep Standby Mode when selected. Device will enter Software Standby Mode) • Stop counting when in Sleep, Snooze mode, or Software Standby	Stop counting when in Sleep, Snooze mode, or Software Standby
OFS0 register settings > WDT		
Start Mode Select	• Automatically activate WDT after a reset (auto-start mode) • Stop WDT after a reset (register-start mode)	Stop WDT after a reset (register-start mode)
Timeout Period	• 1024 cycles • 4096 cycles • 8192 cycles • 16384 cycles	16384 cycles
Clock Frequency Division Ratio	• 4 • 64 • 128 • 512 • 2048 • 8192	128
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)
Reset Interrupt Request	• NMI • Reset	Reset

Stop Control	• Counting continues • Stop counting when entering Sleep mode	Stop counting when entering Sleep mode
OFS1_SEL register settings		
Voltage Detection 0 Level Security Attribution	• VDSEL setting loads from OFS1_SEC • VDSEL setting loads from OFS1	VDSEL setting loads from OFS1_SEC
Voltage Detection 0 Circuit Start Security Attribution	• LVDAS setting loads from OFS1_SEC • LVDAS setting loads from OFS1	LVDAS setting loads from OFS1_SEC
OFS1 register settings		
Voltage Detection 0 Circuit Start	• Voltage monitor 0 reset is enabled after reset • Voltage monitor 0 reset is disabled after reset	Voltage monitor 0 reset is disabled after reset
Voltage Detection 0 Level	• 2.94 V • 2.87 V • 2.80 V	2.80 V
HOCO Oscillation Enable	• HOCO oscillation is enabled after reset • HOCO oscillation is disabled after reset	HOCO oscillation is disabled after reset

Block Protection Settings (BPS)

BPS0	Refer to the RA Configuration tool for available options.	0U	Configure Block Protection Register 0
BPS1	• Flash Block 32 • Flash Block 33 • Flash Block 34 • Flash Block 35 • Flash Block 36 • Flash Block 37	0U	Configure Block Protection Register 1

BPS2	Refer to the RA Configuration tool for available options.	0U	Configure Block Protection Register 2
Permanent Block Protection Settings (PBPS)			
PBPS0	Refer to the RA Configuration tool for available options.	0U	Configure Permanent Block Protection Register 0
PBPS1	• Flash Block 32 • Flash Block 33 • Flash Block 34 • Flash Block 35 • Flash Block 36 • Flash Block 37	0U	Configure Permanent Block Protection Register 1
PBPS2	Refer to the RA Configuration tool for available options.	0U	Configure Permanent Block Protection Register 2
Clocks			
HOCO FLL Function	• Enabled • Disabled	Disabled	Setting this option to Enabled improves HOCO accuracy significantly by using the subclock, but incurs certain restrictions. The FLL function requires the subclock oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization Time as well as the FLL Stabilization Time when setting up clocks at startup. When FLL is enabled Software Standby and Deep Software Standby modes are not available.
Enable inline BSP IRQ functions	• Enabled • Disabled	Enabled	Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return.

Startup C-Cache Line Size	• 32 Bytes • 64 Bytes	32 Bytes	Set the C-Cache line size configured during startup.
Dual Bank Mode	• Enabled • Disabled	Disabled	Enabling dual bank mode splits the flash into two banks that can be swapped by programming the BANKSEL non-volatile register. When enabled, one bank will start at address 0x0 and the other will start at 0x200000. Each bank contains exactly half the capacity of the entire code flash. When Dual Bank mode is enabled, Startup Program Protection and Block Swap functions cannot be used.
Main Oscillator Wait Time	• 3 cycles • 35 cycles • 67 cycles • 131 cycles • 259 cycles • 547 cycles • 1059 cycles • 2147 cycles • 4291 cycles • 8163 cycles	8163 cycles	Number of cycles to wait for the main oscillator clock to stabilize.

Detailed Description

Build Time Configurations for ra6m5_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

Configuration	Options	Default	Description
Security			
Security > Exceptions			
Exception Response	• Non-Maskable Interrupt • Reset	Non-Maskable Interrupt	Configure the result of a TrustZone Filter exception. This exception is generated when the TrustZone Filter detects access to a protected region. This setting is only valid when building projects with TrustZone.
BusFault, HardFault, and NMI Target	• Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit BFHFNMINS. Defines whether BusFault and

			NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception. This setting is only valid when building projects with TrustZone.
Prioritize Secure Exceptions	• Enabled • Disabled	Disabled	Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct. This setting is only valid when building projects with TrustZone.
Security > SRAM Accessibility			
SRAM Protection	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAMPRCR is write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
SRAM ECC	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAM ECC registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Standby RAM	• Regions 7-0 are all Secure. • Region 7 is Non-	config.bsp.fsp.tz.stbramsar.both	Defines whether Standby RAM registers are accessible for the

	secure. Regions 6-0 are Secure. • Regions 7-6 are Non-secure. Regions 5-0 are Secure. • Regions 7-5 are Non-secure. Regions 4-0 are Secure. • Regions 7-4 are Non-secure. Regions 3-0 are Secure. • Regions 7-3 are Non-secure. Regions 2-0 are Secure. • Regions 7-2 are Non-secure. Regions 1-0 are Secure. • Regions 7-1 are Non-secure. Region 0 is Secure. • Regions 7-0 are all Non-secure.		Non-secure application. This setting is only valid when building projects with TrustZone.
Security > BUS Accessibility			
Bus Security Attribution Register A	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Bus Security Attribution Register B	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
System Reset Request	• Both Secure	Secure State	Value for SCB->AIRCR

Accessibility	and Non-Secure State • Secure State		register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use. This setting is only valid when building projects with TrustZone.
Cache Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Cache registers are write accessible for the Non-secure application. This setting is only valid when building protjects with TrustZone.
System Reset Status Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application. This setting is only valid when building projects with TrustZone.
Battery Backup Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the battery backup registers are accessible for the Non-secure application. If Secure State is selected, all battery backup registers are read only except for VBTBKRn registers which are both read and write protected. This setting is only valid when building projects with TrustZone.
Flash Bank Select Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the BANKSEL register is write accessible for the Non-secure application.

			This setting is only valid when building projects with TrustZone.
Uninitialized Non-Secure Application Fallback	• Enable Uninitialized Non-Secure Application Fallback • Disable Uninitialized Non-Secure Application Fallback	Enable Uninitialized Non-Secure Application Fallback	If enabled, the secure application checks if the non-secure application has been programmed in non-secure flash before branching. If the non-secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state.
OFS0 register settings			
OFS0 register settings > Independent WDT			
Start Mode	• IWDT is stopped after a reset • IWDT is automatically activated after a reset (Autostart mode)	IWDT is stopped after a reset

Detailed Description

Build Time Configurations for ra6t2_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

Configuration	Options	Default	Description
Security			
Security > Exceptions			
Exception Response	• Non-Maskable Interrupt • Reset	Non-Maskable Interrupt	Configure the result of a TrustZone Filter exception. This exception is generated when a the TrustZone Filter detects access to a protected region. This setting is only valid when building projects with TrustZone.
BusFault, HardFault,	• Non-Secure	Secure State	Value for SCB->AIRCR

and NMI Target	State • Secure State		register bit BFHFNMINS. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception. This setting is only valid when building projects with TrustZone.
Prioritize Secure Exceptions	• Enabled • Disabled	Disabled	Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct. This setting is only valid when building projects with TrustZone.
Security > SRAM Accessibility			
SRAM Protection	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAMPRCR is write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
SRAM ECC	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAM ECC registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.

Standby RAM	• Regions 7-0 are all Secure. • Region 7 is Non-secure. Regions 6-0 are Secure. • Regions 7-6 are Non-secure. Regions 5-0 are Secure. • Regions 7-5 are Non-secure. Regions 4-0 are Secure. • Regions 7-4 are Non-secure. Regions 3-0 are Secure. • Regions 7-3 are Non-secure. Regions 2-0 are Secure. • Regions 7-2 are Non-secure. Regions 1-0 are Secure. • Regions 7-1 are Non-secure. Region 0 is Secure. • Regions 7-0 are all Non-secure.	config.bsp.fsp.tz.stbramsar.both	Defines whether Standby RAM registers are accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Security > BUS Accessibility			
Bus Security Attribution Register A	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Bus Security Attribution Register B	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application. This setting is only valid when building projects with

			TrustZone.
System Reset Request Accessibility	• Both Secure and Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use. This setting is only valid when building projects with TrustZone.
Cache Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Cache registers are write accessible for the Non-secure application. This setting is only valid when building protjects with TrustZone.
System Reset Status Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application. This setting is only valid when building projects with TrustZone.
Uninitialized Non-Secure Application Fallback	• Enable Uninitialized Non-Secure Application Fallback • Disable Uninitialized Non-Secure Application Fallback	Enable Uninitialized Non-Secure Application Fallback	If enabled, the secure application checks if the non-secure application has been programmed in non-secure flash before branching. If the non-secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state.
OFS0 register settings			

OFS0 register settings > Independent WDT

Start Mode	• IWDT is stopped after a reset • IWDT is automatically activated after a reset (Autostart mode)	IWDT is stopped after a reset
Timeout Period	• 128 cycles • 512 cycles • 1024 cycles • 2048 cycles	2048 cycles
Dedicated Clock Frequency Divisor	• 1 • 16 • 32 • 64 • 128 • 256	128
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)
Reset Interrupt Request Select	• NMI request or interrupt request is enabled • Reset is enabled	Reset is enabled
Stop Control	• Counting continues (Note: Device will not enter Deep Standby Mode when selected. Device will enter Software Standby Mode) • Stop counting when in Sleep, Snooze mode, or Software	Stop counting when in Sleep, Snooze mode, or Software Standby

	Standby	
OFS0 register settings > WDT		
Start Mode Select	• Automatically activate WDT after a reset (auto-start mode) • Stop WDT after a reset (register-start mode)	Stop WDT after a reset (register-start mode)
Timeout Period	• 1024 cycles • 4096 cycles • 8192 cycles • 16384 cycles	16384 cycles
Clock Frequency Division Ratio	• 4 • 64 • 128 • 512 • 2048 • 8192	128
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)
Reset Interrupt Request	• NMI • Reset	Reset
Stop Control	• Counting continues • Stop counting when entering Sleep mode	Stop counting when entering Sleep mode
OFS1_SEL register settings		
Voltage Detection 0 Level Security Attribution	• VDSEL setting loads from OFS1_SEC • VDSEL setting loads from OFS1	VDSEL setting loads from OFS1_SEC
Voltage Detection 0 Circuit Start Security Attribution	• LVDAS setting loads from OFS1_SEC	LVDAS setting loads from OFS1_SEC

	• LVDAS setting loads from OFS1	
PGA0 Pseudo-Differential Input Enable Security Attribution	• PGADEN.PGA0 setting loads from OFS1_SEC • PGADEN.PGA0 setting loads from OFS1	PGADEN.PGA0 setting loads from OFS1_SEC
PGA1 Pseudo-Differential Input Enable Security Attribution	• PGADEN.PGA1 setting loads from OFS1_SEC • PGADEN.PGA1 setting loads from OFS1	PGADEN.PGA1 setting loads from OFS1_SEC
PGA2 Pseudo-Differential Input Enable Security Attribution	• PGADEN.PGA2 setting loads from OFS1_SEC • PGADEN.PGA2 setting loads from OFS1	PGADEN.PGA2 setting loads from OFS1_SEC
PGA3 Pseudo-Differential Input Enable Security Attribution	• PGADEN.PGA3 setting loads from OFS1_SEC • PGADEN.PGA3 setting loads from OFS1	PGADEN.PGA3 setting loads from OFS1_SEC
OFS1 register settings		
Voltage Detection 0 Circuit Start	• Voltage monitor 0 reset is enabled after reset • Voltage monitor 0 reset is disabled after reset	Voltage monitor 0 reset is disabled after reset
Voltage Detection 0 Level	• 2.94 V • 2.87 V • 2.80 V	2.80 V
HOCO Oscillation Enable	• HOCO oscillation is enabled after reset • HOCO oscillation is disabled after reset	HOCO oscillation is disabled after reset
PGA0 Pseudo-Differential Input	• Disabled (single-ended input)	Disabled (single-ended input) after reset

Enable	after reset • Enabled after reset		
PGA1 Pseudo-Differential Input Enable	• Disabled (single-ended input) after reset • Enabled after reset	Disabled (single-ended input) after reset	
PGA2 Pseudo-Differential Input Enable	• Disabled (single-ended input) after reset • Enabled after reset	Disabled (single-ended input) after reset	
PGA3 Pseudo-Differential Input Enable	• Disabled (single-ended input) after reset • Enabled after reset	Disabled (single-ended input) after reset	
Block Protection Settings (BPS)			
BPS0	Refer to the RA Configuration tool for available options.	0U	Configure Block Protection Register 0
Permanent Block Protection Settings (PBPS)			
PBPS0	Refer to the RA Configuration tool for available options.	0U	Configure Permanent Block Protection Register 0
Enable inline BSP IRQ functions	• Enabled • Disabled	Enabled	Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return.
Startup C-Cache Line Size	• 32 Bytes • 64 Bytes	32 Bytes	Set the C-Cache line size configured during startup.
TFU Mathlib	• Disabled • Enabled	Enabled	If enabled, trigonometric library functions sinf, cosf, atan2f, and hypotf are replaced with hardware accelerated TFU functions. Disable this if reentrant access to these functions is required.
Main Oscillator Wait Time	• 3 cycles • 35 cycles • 67 cycles	8163 cycles	Number of cycles to wait for the main oscillator clock to

- 131 cycles
- 259 cycles
- 547 cycles
- 1059 cycles
- 2147 cycles
- 4291 cycles
- 8163 cycles

stabilize.

Detailed Description

Build Time Configurations for ra6t3_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

Configuration	Options	Default	Description
Security			
Security > Exceptions			
Exception Response	• Non-Maskable Interrupt • Reset	Non-Maskable Interrupt	Configure the result of a TrustZone Filter exception. This exception is generated when the TrustZone Filter detects access to a protected region. This setting is only valid when building projects with TrustZone.
BusFault, HardFault, and NMI Target	• Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit BFHFNMINS. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception. This setting is only valid when building projects with TrustZone.
Prioritize Secure Exceptions	• Enabled • Disabled	Disabled	Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct. This setting is only

			valid when building projects with TrustZone.
Security > SRAM Accessibility			
SRAM Protection	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAMPRCR is write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
SRAM ECC	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAM ECC registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Standby RAM	• Regions 7-0 are all Secure. • Region 7 is Non-secure. Regions 6-0 are Secure. • Regions 7-6 are Non-secure. Regions 5-0 are Secure. • Regions 7-5 are Non-secure. Regions 4-0 are Secure. • Regions 7-4 are Non-secure. Regions 3-0 are Secure. • Regions 7-3 are Non-secure. Regions 2-0 are Secure. • Regions 7-2 are Non-secure. Regions 1-0 are Secure. • Regions 7-1 are Non-secure. Region 0 is Secure. • Regions 7-0 are	config.bsp.fsp.tz.stbramsar.both	Defines whether Standby RAM registers are accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.

	all Non-secure.		
Security > BUS Accessibility			
Bus Security Attribution Register A	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Bus Security Attribution Register B	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
System Reset Request Accessibility	• Both Secure and Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use. This setting is only valid when building projects with TrustZone.
Cache Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Cache registers are write accessible for the Non-secure application. This setting is only valid when building protjects with TrustZone.
System Reset Status Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application.

			This setting is only valid when building projects with TrustZone.
Battery Backup Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the battery backup registers are accessible for the Non-secure application. If Secure State is selected, all battery backup registers are read only except for VBTBKRn registers which are both read and write protected. This setting is only valid when building projects with TrustZone.
Uninitialized Non-Secure Application Fallback	• Enable Uninitialized Non-Secure Application Fallback • Disable Uninitialized Non-Secure Application Fallback	Enable Uninitialized Non-Secure Application Fallback	If enabled, the secure application checks if the non-secure application has been programmed in non-secure flash before branching. If the non-secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state.
OFS0 register settings			
OFS0 register settings > Independent WDT			
Start Mode	• IWDT is stopped after a reset • IWDT is automatically activated after a reset (Autostart mode)	IWDT is stopped after a reset	

Timeout Period	• 128 cycles • 512 cycles • 1024 cycles • 2048 cycles	2048 cycles
Dedicated Clock Frequency Divisor	• 1 • 16 • 32 • 64 • 128 • 256	128
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)
Reset Interrupt Request Select	• NMI request or interrupt request is enabled • Reset is enabled	Reset is enabled
Stop Control	• Counting continues (Note: Device will not enter Deep Standby Mode when selected. Device will enter Software Standby Mode) • Stop counting when in Sleep, Snooze mode, or Software Standby	Stop counting when in Sleep, Snooze mode, or Software Standby
OFS0 register settings > WDT		
Start Mode Select	• Automatically activate WDT after a reset (auto-start mode) • Stop WDT after a reset (register-start mode)	Stop WDT after a reset (register-start mode)

Timeout Period	• 1024 cycles • 4096 cycles • 8192 cycles • 16384 cycles	16384 cycles
Clock Frequency Division Ratio	• 4 • 64 • 128 • 512 • 2048 • 8192	128
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)
Reset Interrupt Request	• NMI • Reset	Reset
Stop Control	• Counting continues • Stop counting when entering Sleep mode	Stop counting when entering Sleep mode
OFS1 register settings		
Voltage Detection 0 Circuit Start	• Voltage monitor 0 reset is enabled after reset • Voltage monitor 0 reset is disabled after reset	Voltage monitor 0 reset is disabled after reset
Voltage Detection 0 Level	• 2.94 V • 2.87 V • 2.80 V	2.80 V
HOCO Oscillation Enable	• HOCO oscillation is enabled after reset • HOCO oscillation is disabled after reset	HOCO oscillation is disabled after reset

Block Protection Settings (BPS)			
BPS0	Refer to the RA Configuration tool for available options.	0U	Configure Block Protection Register 0
Permanent Block Protection Settings (PBPS)			
PBPS0	Refer to the RA Configuration tool for available options.	0U	Configure Permanent Block Protection Register 0
Clocks			
HOCO FLL Function	• Enabled • Disabled	Disabled	Setting this option to Enabled improves HOCO accuracy significantly by using the subclock, but incurs certain restrictions. The FLL function requires the subclock oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization Time as well as the FLL Stabilization Time when setting up clocks at startup. When FLL is enabled Software Standby and Deep Software Standby modes are not available.
Enable inline BSP IRQ functions	• Enabled • Disabled	Enabled	Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return.
Startup C-Cache Line Size	• 32 Bytes • 64 Bytes	32 Bytes	Set the C-Cache line size configured during startup.
TFU Mathlib	• Disabled • Enabled	Enabled	If enabled, trigonometric library functions sinf, cosf, atan2f, and hypotf are replaced with hardware

			accelerated TFU functions. Disable this if reentrant access to these functions is required.
Main Oscillator Wait Time	• 3 cycles • 35 cycles • 67 cycles • 131 cycles • 259 cycles • 547 cycles • 1059 cycles • 2147 cycles • 4291 cycles • 8163 cycles	8163 cycles	Number of cycles to wait for the main oscillator clock to stabilize.
ID Code Mode	• Unlocked (Ignore ID) • Locked with All Erase support • Locked	Unlocked (Ignore ID)	When set to 'Locked with All Erase support', the ID Code must be set in the debugger to read or write data to the MCU, but the All Erase command is still accepted regardless. When set to 'Locked', all erase/download/debug access is disabled unless the ID Code is provided.
ID Code (32 Hex Characters)	Value must be a 32 character long hex string	FFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF	Set the ID Code for locking debug access. This setting is only used when the ID Code Mode is not set to Unlocked.

Detailed Description

Build Time Configurations for ra8d1_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

Configuration	Options	Default	Description
SDRAM			
SDRAM > Timings			
tRAS (cycles)	• 1 cycles • 2 cycles • 3 cycles • 4 cycles • 5 cycles • 6 cycles • 7 cycles	6 cycles	Row Active Interval
tRCD (cycles)	• 1 cycles • 2 cycles • 3 cycles • 4 cycles	3 cycles	Row Column Latency
tRP (cycles)	• 1 cycles	3 cycles	Row Precharge Interval

	• 2 cycles • 3 cycles • 4 cycles • 5 cycles • 6 cycles • 7 cycles • 8 cycles		
tWR (cycles)	• 1 cycles • 2 cycles	2 cycles	Write Recovery Interval
tCL (cycles)	• 1 cycles • 2 cycles • 3 cycles	3 cycles	Column Latency
tRFC (cycles)	tRFC must be between 2 and 4096 cycles	937	Auto-Refresh Request Interval Setting
tREFW (cycles)	Refer to the RA Configuration tool for available options.	8 cycles	Auto-Refresh Cycle/Self-Refresh Clearing Cycle Count Setting.
SDRAM > Initialization			
Auto-Refresh Interval (ARFI)	Refer to the RA Configuration tool for available options.	10 cycles	Specifies the interval at which the auto-refresh commands are issued in the SDRAM initialization sequence.
Auto-Refresh Count (ARFC)	Refer to the RA Configuration tool for available options.	8 times	Specifies the number of times auto-refresh is to be performed in the SDRAM initialization sequence.
Precharge Cycle Count (PRC)	• 3 cycles • 4 cycles • 5 cycles • 6 cycles • 7 cycles • 8 cycles • 9 cycles • 10 cycles	3 cycles	Specifies the number of precharged cycles in the SDRAM initialization sequence.
SDRAM Support	• Enabled • Disabled	Disabled	If enabled, SDRAM will be initialized and configured by the BSP with the provided settings.
Address Multiplex Shift	• 8-bit shift • 9-bit shift • 10-bit shift • 11-bit shift	9-bit shift	Selects the size of the shift towards the lower half of the row address in row address/column address multiplexing.
Endian Mode	• Little Endian • Big Endian	Little Endian	Specifies the endianness of the

			SDRAM address space. See HWM for full list of constraints when using Big Endian.
Continuous Access Mode	• Enabled • Disabled	Enabled	If enabled, SDRAM continuous access mode will be enabled.
Bus Width	• 8-bit • 16-bit • 32-bit	16-bit	Specifies the data bus width for SDRAM.
Security			
Security > Exceptions			
Exception Response	• Non-Maskable Interrupt • Reset	Non-Maskable Interrupt	Configure the result of a TrustZone Filter exception. This exception is generated when a the TrustZone Filter detects access to a protected region. This setting is only valid when building projects with TrustZone.
BusFault, HardFault, and NMI Target	• Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit BFHFNMINS. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception. This setting is only valid when building projects with TrustZone.
Prioritize Secure Exceptions	• Enabled • Disabled	Disabled	Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-

			secure interrupts is correct. This setting is only valid when building projects with TrustZone.
Security > SRAM Accessibility			
SRAM0 Protection	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAMCR0, SRAMECCRGN0, SRAMESCLR.CLR00, and SRAMESCLR.CLR01 are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
SRAM1 Protection	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAMCR1, and SRAMESCLR.CLR1 are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Standby SRAM Protection	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether STBRAMCR, and SRAMESCLR.CLRS are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Security > BUS Accessibility			
Bus Security Attribution Register A	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application. This setting is only valid when building

			projects with TrustZone.
Bus Security Attribution Register B	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Bus Security Attribution Register C	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the SDRAM/CSC Control registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
System Reset Request Accessibility	• Both Secure and Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use. This setting is only valid when building projects with TrustZone.
System Reset Status Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application. This setting is only valid when building projects with TrustZone.
Battery Backup Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the battery backup registers are accessible for the Non-secure application. If Secure State is selected, all battery backup

			registers are read only except for VBTBKRn registers which are both read and write protected. This setting is only valid when building projects with TrustZone.
Flash Bank Select Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the BANKSEL register is write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Graphics Power Domain Security Attribution	• Both Secure and Non-Secure State • Secure State	Secure State	Defines whether the PDCTRGD register is write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Uninitialized Non-Secure Application Fallback	• Enable Uninitialized Non-Secure Application Fallback • Disable Uninitialized Non-Secure Application Fallback	Enable Uninitialized Non-Secure Application Fallback	If enabled, the secure application checks if the non-secure application has been programmed in non-secure flash before branching. If the non-secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state.
OFS0 register settings			
OFS0 register settings > Independent WDT			
Start Mode	• IWDT is stopped after a	IWDT is stopped after a reset (Register-start	

	reset (Register-start mode) • IWDT is automatically activated after a reset (Autostart mode)	mode)
Timeout Period	• 128 cycles • 512 cycles • 1024 cycles • 2048 cycles	2048 cycles
Dedicated Clock Frequency Divisor	• 1 • 16 • 32 • 64 • 128 • 256	128
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)
Reset Interrupt Request Select	• NMI request or interrupt request is enabled • Reset is enabled	Reset is enabled
Stop Control	• Counting continues (Note: Device will not enter Deep Standby Mode when selected. Device will enter Software Standby Mode) • Stop counting when in Sleep, Deep Sleep, or Software Standby	Stop counting when in Sleep, Deep Sleep, or Software Standby

OFS0 register settings > WDT0

Start Mode Select	• Automatically activate WDT after a reset (auto-start mode) • Stop WDT after a reset (register-start mode)	Stop WDT after a reset (register-start mode)
Timeout Period	• 1024 cycles • 4096 cycles • 8192 cycles • 16384 cycles	16384 cycles
Clock Frequency Division Ratio	• 4 • 64 • 128 • 512 • 2048 • 8192	128
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)
Reset Interrupt Request	• NMI • Reset	Reset
Stop Control	• Counting continues • Stop counting when entering Sleep mode	Stop counting when entering Sleep mode
OFS1_SEL register settings		
Voltage Detection 0 Level Security Attribution	• VDSEL setting loads from OFS1_SEC • VDSEL setting loads from OFS1	VDSEL setting loads from OFS1_SEC
Voltage Detection 0 Circuit Start Security Attribution	• PVDAS setting loads from OFS1_SEC • PVDAS setting loads from OFS1	PVDAS setting loads from OFS1_SEC

Voltage Detection 0 Low Power Consumption Security Attribution	• PVDLPSEL setting loads from OFS1_SEC • PVDLPSEL setting loads from OFS1	PVDLPSEL setting loads from OFS1_SEC	
WDT/IWDT Software Debug Control Security Attribution	• SWDBG setting loads from OFS1_SEC • SWDBG setting loads from OFS1	SWDBG setting loads from OFS1_SEC	
Tightly Coupled Memory (TCM)/Cache ECC Security Attribution	• INITECCEN setting loads from OFS1_SEC • INITECCEN setting loads from OFS1	INITECCEN setting loads from OFS1_SEC	
OFS1 register settings			
Voltage Detection 0 Circuit Start	• Voltage monitor 0 reset is enabled after reset • Voltage monitor 0 reset is disabled after reset	Voltage monitor 0 reset is disabled after reset	
Voltage Detection 0 Level	• 2.85 V • 2.58 V • 2.15 V • 2.00 V • 1.90 V • 1.80 V • 1.70 V • 1.60 V	1.60 V	
Voltage Detection 0 Low Power Consumption	• Voltage monitor 0 Low Power Consumption Enabled • Voltage monitor 0 Low Power Consumption Disabled	Voltage monitor 0 Low Power Consumption Disabled	Enable or disable the low power consumption function of LVD0 during Deep Software Standby 1 and Deep Software Standby 2.
HOCO Oscillation Enable	• HOCO oscillation is enabled after reset • HOCO oscillation is disabled after reset	HOCO oscillation is disabled after reset	

WDT/IWDT Software Debug Control	• Enabled (WDT and IWDT operation is halted when the CPU is in the debug state) • Disabled (WDT and IWDT continue operating while the CPU is in the debug state)	Disabled (WDT and IWDT continue operating while the CPU is in the debug state)
Tightly Coupled Memory (TCM)/Cache ECC	• Enable ECC function for TCM and Cache • Disable ECC function for TCM and Cache	Disable ECC function for TCM and Cache
OFS2 register settings		
DCDC	• Disabled • Enabled	Enabled

Block Protection Settings (BPS)

BPS0	Refer to the RA Configuration tool for available options.	0U	Configure Block Protection Register 0
BPS1	Refer to the RA Configuration tool for available options.	0U	Configure Block Protection Register 1
BPS2	Refer to the RA Configuration tool for available options.	0U	Configure Block Protection Register 2
BPS3	Refer to the RA Configuration tool for available options.	0U	Configure Block Protection Register 3

Permanent Block Protection Settings (PBPS)

PBPS0	Refer to the RA Configuration tool for available options.	0U	Configure Permanent Block Protection Register 0
PBPS1	Refer to the RA Configuration tool for available options.	0U	Configure Permanent Block Protection Register 1
PBPS2	Refer to the RA Configuration tool for available options.	0U	Configure Permanent Block Protection Register 2

PBPS3	Refer to the RA Configuration tool for available options.	0U	Configure Permanent Block Protection Register 3

First Stage Bootloader (FSBL)

First Stage Bootloader (FSBL) > FSBL Control 0 (FSBLCTRL0)

FSBLEN	• Enabled • Disabled	Disabled	FSBL enable
FSBLSKIPSW	• Enabled • Disabled	Disabled	FSBL skip enable for software reset
FSBLSKIPDS	• Enabled • Disabled	Disabled	FSBL skip enable for deep software standby reset
FSBLCLK	• 120 MHz • 240 MHz	240 MHz	Clock frequency selection during FSBL execution.

First Stage Bootloader (FSBL) > FSBL Control 1 (FSBLCTRL1)

FSBLEXMDFSBLEN	• CRC boot without report • CRC boot with report measurement • Secure boot without report • Secure boot with report measurement	Secure boot with report measurement	FSBL execution mode

First Stage Bootloader (FSBL) > FSBL Control 2 (FSBLCTRL2)

PORTPN	Refer to the RA Configuration tool for available options.	PORTn15	FSBL error notification port pin number
PORTGN	Refer to the RA Configuration tool for available options.	None	FSBL error notification port group name

First Stage Bootloader (FSBL) > Code Certificates (SACCn)

SACC0	Must be an integer between 0 and 0xFFFFFFFF.	0xFFFFFFFF	Start address of code certificate 0
SACC1	Must be an integer between 0 and 0xFFFFFFFF.	0xFFFFFFFF	Start address of code certificate 1
FSBL Measurement Report Address (SAMR)	Must be an integer between 0 and 0xFFFFFFFF.	0xFFFFFFFF	Start address of measurement report

Clocks

HOCO FLL Function	• Enabled • Disabled	Disabled	Setting this option to Enabled improves HOCO accuracy significantly by using the subclock, but incurs certain restrictions. The FLL function requires the subclock oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization Time as well as the FLL Stabilization Time when setting up clocks at startup. When FLL is enabled Software Standby and Deep Software Standby modes are not available.
Clock Settling Delay	• Enabled • Disabled	Enabled	Setting this option to Enabled will insert delays for clocking scaling and transitions to ensure voltage supply stability. See the RA8D1 HWM (R01UH0995EJ0100) section 8.11.1 for details.
Sleep Mode Entry and Exit Delays	• Enabled • Disabled	Enabled	Setting this option to Enabled will insert delays before and after entering sleep modes to ensure voltage supply stability. This is not required if you do not intend to run CPUCLK over 100MHz. See RA8D1 HWM (R01UH0995EJ0100) Section 10.8.10 for details.
RTOS Sleep on Idle	• Enabled • Disabled	Disabled	Setting this option to Enabled will allow RTOS ports to enter

			CPU Sleep mode while idle. This should not be used when CPUCLK is configured over 120MHz. See RA8M1 HWM (R01UH0994EJ0100) Section 10.7.10 for details.
MSTP Change Delays	• Enabled • Disabled	Enabled	Setting this option to Enabled will insert delays after setting a MSTP bit to ensure voltage supply stability. This is not required if you do not intend to run CPUCLK over 120MHz. See RA8D1 HWM (R01UH0995EJ0100) Section 10.4 for details.
Settling Delay (us)	Unit must be a non-negative integer	150	Specifies the length of the delay to be used for the Clock settling, Sleep mode, and MSTP change delays.
Cache settings			
Data cache	• Enabled • Disabled	Disabled	Enable limited D-Cache support. See BSP usage notes for limitations.
Enable inline BSP IRQ functions	• Enabled • Disabled	Enabled	Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return.
Dual Bank Mode	• Enabled • Disabled	Disabled	Enabling dual bank mode splits the flash into two banks that can be swapped by programming the BANKSEL non-volatile register. When enabled, one bank will start at address 0x0 and the other will start at 0x200000. Each bank contains exactly half the capacity of the entire code flash. When Dual Bank mode is

			enabled, Startup Program Protection and Block Swap functions cannot be used.
Main Oscillator Wait Time	• 3 cycles • 35 cycles • 67 cycles • 131 cycles • 259 cycles • 547 cycles • 1059 cycles • 2147 cycles • 4291 cycles • 8163 cycles	8163 cycles	Number of cycles to wait for the main oscillator clock to stabilize.

Build Time Configurations for ra8m1_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

Configuration	Options	Default	Description
SDRAM			
SDRAM > Timings			
tRAS (cycles)	• 1 cycles • 2 cycles • 3 cycles • 4 cycles • 5 cycles • 6 cycles • 7 cycles	6 cycles	Row Active Interval
tRCD (cycles)	• 1 cycles • 2 cycles • 3 cycles • 4 cycles	3 cycles	Row Column Latency
tRP (cycles)	• 1 cycles • 2 cycles • 3 cycles • 4 cycles • 5 cycles • 6 cycles • 7 cycles • 8 cycles	3 cycles	Row Precharge Interval
tWR (cycles)	• 1 cycles • 2 cycles	2 cycles	Write Recovery Interval
tCL (cycles)	• 1 cycles • 2 cycles • 3 cycles	3 cycles	Column Latency
tRFC (cycles)	tRFC must be between 2 and 4096 cycles	937	Auto-Refresh Request Interval Setting
tREFW (cycles)	Refer to the RA Configuration tool for available options.	8 cycles	Auto-Refresh Cycle/Self-Refresh Clearing Cycle Count Setting.
SDRAM > Initialization			
Auto-Refresh Interval	Refer to the RA	10 cycles	Specifies the interval at

(ARFI)	Configuration tool for available options.		which the auto-refresh commands are issued in the SDRAM initialization sequence.
Auto-Refresh Count (ARFC)	Refer to the RA Configuration tool for available options.	8 times	Specifies the number of times auto-refresh is to be performed in the SDRAM initialization sequence.
Precharge Cycle Count (PRC)	• 3 cycles • 4 cycles • 5 cycles • 6 cycles • 7 cycles • 8 cycles • 9 cycles • 10 cycles	3 cycles	Specifies the number of precharged cycles in the SDRAM initialization sequence.
SDRAM Support	• Enabled • Disabled	Disabled	If enabled, SDRAM will be initialized and configured by the BSP with the provided settings.
Address Multiplex Shift	• 8-bit shift • 9-bit shift • 10-bit shift • 11-bit shift	9-bit shift	Selects the size of the shift towards the lower half of the row address in row address/column address multiplexing.
Endian Mode	• Little Endian • Big Endian	Little Endian	Specifies the endianness of the SDRAM address space. See HWM for full list of constraints when using Big Endian.
Continuous Access Mode	• Enabled • Disabled	Enabled	If enabled, SDRAM continuous access mode will be enabled.
Bus Width	• 8-bit • 16-bit • 32-bit	16-bit	Specifies the data bus width for SDRAM.
Security			
Security > Exceptions			
Exception Response	• Non-Maskable Interrupt • Reset	Non-Maskable Interrupt	Configure the result of a TrustZone Filter exception. This exception is generated when a the TrustZone Filter detects access to a protected region.

			This setting is only valid when building projects with TrustZone.
BusFault, HardFault, and NMI Target	• Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit BFHFNMINS. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception. This setting is only valid when building projects with TrustZone.
Prioritize Secure Exceptions	• Enabled • Disabled	Disabled	Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct. This setting is only valid when building projects with TrustZone.
Security > SRAM Accessibility			
SRAM0 Protection	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAMCR0, SRAMECCRGN0, SRAMESCLR.CLR00, and SRAMESCLR.CLR01 are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.

SRAM1 Protection	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAMCR1, and SRAMESCLR.CLR1 are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Standby SRAM Protection	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether STBRAMCR, and SRAMESCLR.CLRS are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Security > BUS Accessibility			
Bus Security Attribution Register A	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Bus Security Attribution Register B	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Bus Security Attribution Register C	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the SDRAM/CSC Control registers are write accessible for the Non-secure application. This setting is only valid when building projects with

			TrustZone.
System Reset Request Accessibility	• Both Secure and Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use. This setting is only valid when building projects with TrustZone.
System Reset Status Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application. This setting is only valid when building projects with TrustZone.
Battery Backup Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the battery backup registers are accessible for the Non-secure application. If Secure State is selected, all battery backup registers are read only except for VBTBKRn registers which are both read and write protected. This setting is only valid when building projects with TrustZone.
Flash Bank Select Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the BANKSEL register is write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Uninitialized Non-Secure Application Fallback	• Enable Uninitialized Non-Secure	Enable Uninitialized Non-Secure Application Fallback	If enabled, the secure application checks if the non-secure

	Application Fallback • Disable Uninitialized Non-Secure Application Fallback		application has been programmed in non-secure flash before branching. If the non-secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state.
OFS0 register settings			
OFS0 register settings > Independent WDT			
Start Mode	• IWDT is stopped after a reset (Register-start mode) • IWDT is automatically activated after a reset (Autostart mode)	IWDT is stopped after a reset (Register-start mode)	
Timeout Period	• 128 cycles • 512 cycles • 1024 cycles • 2048 cycles	2048 cycles	
Dedicated Clock Frequency Divisor	• 1 • 16 • 32 • 64 • 128 • 256	128	
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)	
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)	
Reset Interrupt	• NMI request or	Reset is enabled	

Request Select	interrupt request is enabled • Reset is enabled	
Stop Control	• Counting continues (Note: Device will not enter Deep Standby Mode when selected. Device will enter Software Standby Mode) • Stop counting when in Sleep, Deep Sleep, or Software Standby	Stop counting when in Sleep, Deep Sleep, or Software Standby
OFS0 register settings > WDT0		
Start Mode Select	• Automatically activate WDT after a reset (auto-start mode) • Stop WDT after a reset (register-start mode)	Stop WDT after a reset (register-start mode)
Timeout Period	• 1024 cycles • 4096 cycles • 8192 cycles • 16384 cycles	16384 cycles
Clock Frequency Division Ratio	• 4 • 64 • 128 • 512 • 2048 • 8192	128

PORTGN	Refer to the RA Configuration tool for available options.	None	FSBL error notification port group name
First Stage Bootloader (FSBL) > Code Certificates (SACCn)			
SACC0	Must be an integer between 0 and 0xFFFFFFFF.	0xFFFFFFFF	Start address of code certificate 0
SACC1	Must be an integer between 0 and 0xFFFFFFFF.	0xFFFFFFFF	Start address of code certificate 1
FSBL Measurement Report Address (SAMR)	Must be an integer between 0 and 0xFFFFFFFF.	0xFFFFFFFF	Start address of measurement report
Clocks			
HOCO FLL Function	• Enabled • Disabled	Disabled	Setting this option to Enabled improves HOCO accuracy significantly by using the subclock, but incurs certain restrictions. The FLL function requires the subclock oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization Time as well as the FLL Stabilization Time when setting up clocks at startup. When FLL is enabled Software Standby and Deep Software Standby modes are not available.
Clock Settling Delay	• Enabled • Disabled	Enabled	Setting this option to Enabled will insert delays for clocking scaling and transitions

			to ensure voltage supply stability. See the RA8M1 HWM (R01UH0994EJ0100) section 8.11.1 for details.
Sleep Mode Entry and Exit Delays	• Enabled • Disabled	Enabled	Setting this option to Enabled will insert delays before and after entering sleep modes to ensure voltage supply stability. This is not required if you do not intend to run CPUCLK over 120MHz. See RA8M1 HWM (R01UH0994EJ0100) Section 10.7.10 for details.
RTOS Sleep on Idle	• Enabled • Disabled	Disabled	Setting this option to Enabled will allow RTOS ports to enter CPU Sleep mode while idle. This should not be used when CPUCLK is configured over 120MHz. See RA8M1 HWM (R01UH0994EJ0100) Section 10.7.10 for details.
MSTP Change Delays	• Enabled • Disabled	Enabled	Setting this option to Enabled will insert delays after setting a MSTP bit to ensure voltage supply stability. This is not required if you do not intend to run CPUCLK over 120MHz. See RA8M1 HWM (R01UH0994EJ0100) Section 10.4 for details.
Settling Delay (us)	Unit must be a non-negative integer	150	Specifies the length of the delay to be used for the Clock settling, Sleep mode, and MSTP change delays.
Cache settings			
Data cache	• Enabled • Disabled	Disabled	Enable limited D-Cache support. See BSP usage

			notes for limitations.
Enable inline BSP IRQ functions	• Enabled • Disabled	Enabled	Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return.
Dual Bank Mode	• Enabled • Disabled	Disabled	Enabling dual bank mode splits the flash into two banks that can be swapped by programming the BANKSEL non-volatile register. When enabled, one bank will start at address 0x0 and the other will start at 0x200000. Each bank contains exactly half the capacity of the entire code flash. When Dual Bank mode is enabled, Startup Program Protection and Block Swap functions cannot be used.
Main Oscillator Wait Time	• 3 cycles • 35 cycles • 67 cycles • 131 cycles • 259 cycles • 547 cycles • 1059 cycles • 2147 cycles • 4291 cycles • 8163 cycles	8163 cycles	Number of cycles to wait for the main oscillator clock to stabilize.

Detailed Description

Build Time Configurations for ra8t1_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

Configuration	Options	Default	Description
SDRAM			
SDRAM > Timings			
tRAS (cycles)	• 1 cycles • 2 cycles • 3 cycles • 4 cycles • 5 cycles • 6 cycles • 7 cycles	6 cycles	Row Active Interval

tRCD (cycles)	• 1 cycles • 2 cycles • 3 cycles • 4 cycles	3 cycles	Row Column Latency
tRP (cycles)	• 1 cycles • 2 cycles • 3 cycles • 4 cycles • 5 cycles • 6 cycles • 7 cycles • 8 cycles	3 cycles	Row Precharge Interval
tWR (cycles)	• 1 cycles • 2 cycles	2 cycles	Write Recovery Interval
tCL (cycles)	• 1 cycles • 2 cycles • 3 cycles	3 cycles	Column Latency
tRFC (cycles)	tRFC must be between 2 and 4096 cycles	937	Auto-Refresh Request Interval Setting
tREFW (cycles)	Refer to the RA Configuration tool for available options.	8 cycles	Auto-Refresh Cycle/Self-Refresh Clearing Cycle Count Setting.
SDRAM > Initialization			
Auto-Refresh Interval (ARFI)	Refer to the RA Configuration tool for available options.	10 cycles	Specifies the interval at which the auto-refresh commands are issued in the SDRAM initialization sequence.
Auto-Refresh Count (ARFC)	Refer to the RA Configuration tool for available options.	8 times	Specifies the number of times auto-refresh is to be performed in the SDRAM initialization sequence.
Precharge Cycle Count (PRC)	• 3 cycles • 4 cycles • 5 cycles • 6 cycles • 7 cycles • 8 cycles • 9 cycles • 10 cycles	3 cycles	Specifies the number of precharged cycles in the SDRAM initialization sequence.
SDRAM Support	• Enabled • Disabled	Disabled	If enabled, SDRAM will be initialized and configured by the BSP with the provided settings.
Address Multiplex Shift	• 8-bit shift • 9-bit shift	9-bit shift	Selects the size of the shift towards the lower

	• 10-bit shift • 11-bit shift		half of the row address in row address/column address multiplexing.
Endian Mode	• Little Endian • Big Endian	Little Endian	Specifies the endianness of the SDRAM address space. See HWM for full list of constraints when using Big Endian.
Continuous Access Mode	• Enabled • Disabled	Enabled	If enabled, SDRAM continuous access mode will be enabled.
Bus Width	• 8-bit • 16-bit • 32-bit	16-bit	Specifies the data bus width for SDRAM.
Security			
Security > Exceptions			
Exception Response	• Non-Maskable Interrupt • Reset	Non-Maskable Interrupt	Configure the result of a TrustZone Filter exception. This exception is generated when a the TrustZone Filter detects access to a protected region. This setting is only valid when building projects with TrustZone.
BusFault, HardFault, and NMI Target	• Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit BFHFNMINS. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception. This setting is only valid when building projects with TrustZone.
Prioritize Secure Exceptions	• Enabled • Disabled	Disabled	Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then

			setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct. This setting is only valid when building projects with TrustZone.
Security > SRAM Accessibility			
SRAM0 Protection	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAMCR0, SRAMECCRGN0, SRAMESCLR.CLR00, and SRAMESCLR.CLR01 are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
SRAM1 Protection	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether SRAMCR1, and SRAMESCLR.CLR1 are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Standby SRAM Protection	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether STBRAMCR, and SRAMESCLR.CLRS are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Security > BUS Accessibility			
Bus Security Attribution Register A	• Both Secure and Non-Secure State	Both Secure and Non-Secure State	Defines whether the Slave Bus Control Registers

	• Secure State		(BUSSCNT<slave>) are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Bus Security Attribution Register B	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Bus Security Attribution Register C	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the SDRAM/CSC Control registers are write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
System Reset Request Accessibility	• Both Secure and Non-Secure State • Secure State	Secure State	Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use. This setting is only valid when building projects with TrustZone.
System Reset Status Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application. This setting is only valid when building projects with TrustZone.
Battery Backup	• Both Secure	Both Secure and Non-	Defines whether the

Accessibility	and Non-Secure State • Secure State	Secure State	battery backup registers are accessible for the Non-secure application. If Secure State is selected, all battery backup registers are read only except for VBTBKRn registers which are both read and write protected. This setting is only valid when building projects with TrustZone.
Flash Bank Select Accessibility	• Both Secure and Non-Secure State • Secure State	Both Secure and Non-Secure State	Defines whether the BANKSEL register is write accessible for the Non-secure application. This setting is only valid when building projects with TrustZone.
Uninitialized Non-Secure Application Fallback	• Enable Uninitialized Non-Secure Application Fallback • Disable Uninitialized Non-Secure Application Fallback	Enable Uninitialized Non-Secure Application Fallback	If enabled, the secure application checks if the non-secure application has been programmed in non-secure flash before branching. If the non-secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state.
OFS0 register settings			
OFS0 register settings > Independent WDT			
Start Mode	• IWDT is stopped after a reset (Register-start mode) • IWDT is automatically	IWDT is stopped after a reset (Register-start mode)	

	activated after a reset (Autostart mode)	
Timeout Period	• 128 cycles • 512 cycles • 1024 cycles • 2048 cycles	2048 cycles
Dedicated Clock Frequency Divisor	• 1 • 16 • 32 • 64 • 128 • 256	128
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)
Window Start Position	• 25% • 50% • 75% • 100% (no window start position)	100% (no window start position)
Reset Interrupt Request Select	• NMI request or interrupt request is enabled • Reset is enabled	Reset is enabled
Stop Control	• Counting continues (Note: Device will not enter Deep Standby Mode when selected. Device will enter Software Standby Mode) • Stop counting when in Sleep, Deep Sleep, or Software Standby	Stop counting when in Sleep, Deep Sleep, or Software Standby
OFS0 register settings > WDT0		
Start Mode Select	• Automatically activate WDT after a reset	Stop WDT after a reset (register-start mode)

	(auto-start mode) • Stop WDT after a reset (register-start mode)	
Timeout Period	• 1024 cycles • 4096 cycles • 8192 cycles • 16384 cycles	16384 cycles
Clock Frequency Division Ratio	• 4 • 64 • 128 • 512 • 2048 • 8192	128
Window End Position	• 75% • 50% • 25% • 0% (no window end position)	0% (no window end position)

First Stage Bootloader (FSBL)

First Stage Bootloader (FSBL) > FSBL Control 0 (FSBLCTRL0)

FSBLEN	• Enabled • Disabled	Disabled	FSBL enable
FSBLSKIPSW	• Enabled • Disabled	Disabled	FSBL skip enable for software reset
FSBLSKIPDS	• Enabled • Disabled	Disabled	FSBL skip enable for deep software standby reset
FSBLCLK	• 120 MHz • 240 MHz	240 MHz	Clock frequency selection during FSBL execution.

First Stage Bootloader (FSBL) > FSBL Control 1 (FSBLCTRL1)

FSBLEXMDFSBLEN	• CRC boot without report • CRC boot with report measurement • Secure boot without report • Secure boot with report measurement	Secure boot with report measurement	FSBL execution mode

First Stage Bootloader (FSBL) > FSBL Control 2 (FSBLCTRL2)

PORTPN	Refer to the RA Configuration tool for available options.	PORTn15	FSBL error notification port pin number
PORTGN	Refer to the RA Configuration tool for available options.	None	FSBL error notification port group name

First Stage Bootloader (FSBL) > Code Certificates (SACCn)

SACC0	Must be an integer between 0 and 0xFFFFFFFF.	0xFFFFFFFF	Start address of code certificate 0
SACC1	Must be an integer between 0 and 0xFFFFFFFF.	0xFFFFFFFF	Start address of code certificate 1
FSBL Measurement Report Address (SAMR)	Must be an integer between 0 and 0xFFFFFFFF.	0xFFFFFFFF	Start address of measurement report

Clocks

HOCO FLL Function	• Enabled • Disabled	Disabled	Setting this option to Enabled improves HOCO accuracy

			significantly by using the subclock, but incurs certain restrictions. The FLL function requires the subclock oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization Time as well as the FLL Stabilization Time when setting up clocks at startup. When FLL is enabled Software Standby and Deep Software Standby modes are not available.
Clock Settling Delay	• Enabled • Disabled	Enabled	Setting this option to Enabled will insert delays for clocking scaling and transitions to ensure voltage supply stability. See the RA8T1 HWM (R01UH0996EJ0100) section 8.11.1 for details.
Sleep Mode Entry and Exit Delays	• Enabled • Disabled	Enabled	Setting this option to Enabled will insert delays before and after entering sleep modes to ensure voltage supply stability. This is not required if you do not intend to run CPUCLK over 120MHz. See RA8T1 HWM (R01UH0996EJ0100) Section 10.7.10 for details.
RTOS Sleep on Idle	• Enabled • Disabled	Disabled	Setting this option to Enabled will allow RTOS ports to enter CPU Sleep mode while idle. This should not be used when CPUCLK is

			configured over 120MHz. See RA8M1 HWM (R01UH0994EJ0100) Section 10.7.10 for details.
MSTP Change Delays	• Enabled • Disabled	Enabled	Setting this option to Enabled will insert delays after setting a MSTP bit to ensure voltage supply stability. This is not required if you do not intend to run CPUCLK over 120MHz. See RA8T1 HWM (R01UH0996EJ0100) Section 10.4 for details.
Settling Delay (us)	Unit must be a non-negative integer	150	Specifies the length of the delay to be used for the Clock settling, Sleep mode, and MSTP change delays.
Cache settings			
Data cache	• Enabled • Disabled	Disabled	Enable limited D-Cache support. See BSP usage notes for limitations.
Enable inline BSP IRQ functions	• Enabled • Disabled	Enabled	Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return.
Dual Bank Mode	• Enabled • Disabled	Disabled	Enabling dual bank mode splits the flash into two banks that can be swapped by programming the BANKSEL non-volatile register. When enabled, one bank will start at address 0x0 and the other will start at 0x200000. Each bank contains exactly half the capacity of the entire code flash. When Dual Bank mode is enabled, Startup Program Protection and Block Swap functions

			cannot be used.
Main Oscillator Wait Time	• 3 cycles • 35 cycles • 67 cycles • 131 cycles • 259 cycles • 547 cycles • 1059 cycles • 2147 cycles • 4291 cycles • 8163 cycles	8163 cycles	Number of cycles to wait for the main oscillator clock to stabilize.

5.2 Modules

Detailed Description

Modules are the smallest unit of software available in FSP. Each module implements one interface.

For more information on FSP Modules and Interfaces review FSP Modules, FSP Stacks and FSP Interfaces in the FSP Architecture section of this manual.

Note

Not all modules are available for all MCUs. For more information, see the User's Manual for the specific MCU.

Organization of Module Sections

Each module within FSP has a detailed Users' Guide listed below. Each guide typically includes the following content:

- Functions: A list of all the API functions associated with the module
- Detailed Description: A short description of the module and the peripherals used
- Overview: An operational summary and a list of high level features provided by the module
- Configuration: A description of module specific settings available in the configuration tool including clock and pin configurations
- Usage Notes: Module specific documentation and limitations
- Examples: Illustrative code snippets that help the user better understand API use and operation
- Data Structure and Enumeration: Definitions for data structures, enumerations and similar elements used by the module API
- Function Documentation: Details on each API function, including the function prototype, a function summary, a simple use example, list of return values and links to documentation for any needed parameter definitions

5.2.1 Analog

Modules

Detailed Description

Analog Modules.

Modules

	ADC (r_adc) Driver for the ADC12, ADC14, and ADC16 peripherals on RA MCUs. This module implements the ADC Interface.
	ADC (r_adc_b) Driver for the ADC_B peripheral on RA MCUs. This module implements the ADC Interface.

	ADC (r_adc_d) Driver for ADC_D version of the ADC12 peripheral on RA MCUs. This module implements the ADC Interface.
	Comparator, High-Speed (r_acmphs) Driver for the ACMPHS peripheral on RA MCUs. This module implements the Comparator Interface.
	Comparator, Low-Power (r_acmplp) Driver for the ACMPLP peripheral on RA MCUs. This module implements the Comparator Interface.
	DAC (r_dac) Driver for the DAC12 peripheral on RA MCUs. This module implements the DAC Interface.
	DAC8 (r_dac8) Driver for the DAC8 peripheral on RA MCUs. This module implements the DAC Interface.
	Operational Amplifier (r_opamp) Driver for the OPAMP peripheral on RA MCUs. This module implements the OPAMP Interface.
	SDADC Channel Configuration (r_sdadc) Driver for the SDADC24 peripheral on RA MCUs. This module implements the ADC Interface.
	SDADC_B Channel Configuration (r_sdadc_b) Driver for the SDADC_B peripheral on RA MCUs. This module implements the ADC Interface.

5.2.1.1 ADC (r_adc)

Detailed Description

Driver for the ADC12, ADC14, and ADC16 peripherals on RA MCUs. This module implements the ADC Interface.

Overview

Features

The ADC module supports the following features:

- 12, 14, or 16 bit maximum resolution depending on the MCU
- Configure scans to include:
    - Multiple analog channels

    - Temperature sensor channel
    - Voltage sensor channel
- Configurable scan start trigger:
    - Software scan triggers
    - Hardware scan triggers (timer expiration, for example)
    - External scan triggers from the ADTRGn port pins
- Configurable scan mode:
    - Single scan mode, where each trigger starts a single scan
    - Continuous scan mode, where all channels are scanned continuously
    - Group scan mode, where channels are grouped into group A and group B. The groups can be assigned different start triggers, and group A can be given priority over group B. When group A has priority over group B, a group A trigger suspends an ongoing group B scan.
- Supports adding and averaging converted samples
- Optional callback when scan completes
- Sample and hold support
- Double-trigger support
- Hardware comparator with interrupt and event output

Configuration

Build Time Configurations for r_adc

The following build time configurations are defined in fsp_cfg/r_adc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Analog > ADC (r_adc)

This module can be added to the Stacks tab via New Stack > Analog > ADC (r_adc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_adc0	Module name
Unit	Unit must be a non-negative integer	0	Specifies the ADC Unit to be used.
Resolution	MCU Specific Options		Specifies the conversion resolution for this unit.
Alignment	MCU Specific Options		Specifies the conversion result alignment.

Clear after read	• Off • On	On	Specifies if the result register will be automatically cleared after the conversion result is read.
Mode	• Single Scan • Continuous Scan • Group Scan	Single Scan	Specifies the mode that this ADC unit is used in.
Double-trigger	• Disabled • Enabled • Enabled (extended mode)	Disabled	When enabled, the scan-end interrupt for Group A is only thrown on every second scan. Extended double-trigger mode (single-scan only) triggers on both ELC events, allowing (for example) a scan on two different timer compare match values. In group mode Group B is unaffected.
Input			
Input > Sample and Hold			
Sample and Hold Channels (Available only on selected MCUs)	• Channel 0 • Channel 1 • Channel 2		Specifies if this channel is included in the Sample and Hold Mask.
Sample Hold States (Applies only to channels 0, 1, 2)	Must be a valid non-negative integer with configurable value 4 to 255	24	Specifies the updated sample-and-hold count for the channel dedicated sample-and-hold circuit
Input > Window Compare			
Input > Window Compare > Window A			
Enable	• Disabled • Enabled	Disabled	Enable or disable comparison with Window A.
Channels to compare (channel availability varies by MCU and unit)	Refer to the RA Configuration tool for available options.		Select channels to be compared to Window A.
Channel comparison mode (channel availability varies by	Refer to the RA Configuration tool for available options.		Checking a box sets the comparison mode for that channel to

MCU and unit)			Greater Than or Inside Window depending on whether Window Mode is disabled or enabled (respectively). If left unchecked the comparison mode will likewise be Less Than or Outside Window (respectively).
Lower Reference	Must be a positive 16-bit integer.	0	Set the lower comparison value.
Upper Reference	Must be a positive 16-bit integer.	0	Set the upper comparison value.
Input > Window Compare > Window B			
Enable	• Disabled • Enabled	Disabled	Enable or disable comparison with Window B.
Channel to compare (channel availability varies by MCU and unit)	Refer to the RA Configuration tool for available options.	Channel 0	Select a channel to be compared to Window B.
Comparison mode	• Less Than or Outside Window • Greater Than or Inside Window	module.driver.adc.compare.window_b.mode	Select the comparison mode for Window B. For each option, the first condition applies when Window Mode is disabled and the second option applies when Window Mode is enabled.
Lower Reference	Must be a positive 16-bit integer.	0	Set the lower comparison value.
Upper Reference	Must be a positive 16-bit integer.	0	Set the upper comparison value.
Window Mode	• Disabled • Enabled	Disabled	When disabled, ADC values will be compared only with the lower reference on each comparator. When enabled, both the lower and upper reference values will be used to create a comparison window.
Event Output	• OR • XOR • AND	OR	Select how comparison results should be composited for event output.

Channel Scan Mask (channel availability varies by MCU)	Refer to the RA Configuration tool for available options.		In Normal mode of operation, this bitmask field specifies the channels that are enabled in that ADC unit. In group mode, this field specifies which channels belong to group A.
Group B Scan Mask (channel availability varies by MCU)	Refer to the RA Configuration tool for available options.		In group mode, this field specifies which channels belong to group B.
Add/Average Count	MCU Specific Options		Specifies if addition or averaging needs to be done for any of the channels in this unit.
Reference Voltage control	MCU Specific Options		Specify VREFH/VREFADC output voltage control.
Addition/Averaging Mask (channel availability varies by MCU and unit)	Refer to the RA Configuration tool for available options.		Select channels to include in the Addition/Averaging Mask
Interrupts			
Normal/Group A Trigger	MCU Specific Options		Specifies the trigger type to be used for this unit. Triggers that specify ADC Unit must be selected for correct ADC unit to operate correctly.
Group B Trigger	MCU Specific Options		Specifies the trigger for Group B scanning in group scanning mode. This event is also used to trigger Group A in extended double-trigger mode. Triggers that specify ADC Unit must be selected for correct ADC unit to operate correctly.
Group Priority (Valid only in Group Scan Mode)	• Group A cannot interrupt Group B • Group A can interrupt Group B; Group B scan restarts at next	Group A cannot interrupt Group B	Determines whether an ongoing group B scan can be interrupted by a group A trigger, whether it should abort on a group A trigger, or if it should pause to

	trigger • Group A can interrupt Group B; Group B scan restarts immediately • Group A can interrupt Group B; Group B scan restarts immediately and scans continuously		allow group A scan and restart immediately after group A scan is complete.
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the ADC scan completes.
Scan End Interrupt Priority	MCU Specific Options		Select scan end interrupt priority.
Scan End Group B Interrupt Priority	MCU Specific Options		Select group B scan end interrupt priority.
Window Compare A Interrupt Priority	MCU Specific Options		Select Window Compare A interrupt priority.
Window Compare B Interrupt Priority	MCU Specific Options		Select Window Compare B interrupt priority.
Extra			
ADC Ring Buffer	MCU Specific Options		ADC Ring Buffer to be used only with DMAC transfers, keep this property disabled for normal ADC operations. When enabled, ADC converted data is stored in ADBUF registers in place of ADDR registers. The read API will not read from this location for normal ADC operations.

Clock Configuration

The ADC clock is PCLKC if the MCU has PCLKC, or PCLKD otherwise.

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA0E1	ICLK
RA2A1	PCLKD
RA2A2	PCLKD
RA2E1	PCLKD
RA2E2	PCLKD
RA2E3	PCLKD
RA2L1	PCLKD
RA4E1	PCLKC
RA4E2	PCLKC
RA4M1	PCLKC
RA4M2	PCLKC
RA4M3	PCLKC
RA4T1	PCLKC
RA4W1	PCLKC
RA6E1	PCLKC
RA6E2	PCLKC
RA6M1	PCLKC
RA6M2	PCLKC
RA6M3	PCLKC
RA6M4	PCLKC
RA6M5	PCLKC
RA6T1	PCLKC
RA6T3	PCLKC
RA8D1	PCLKC
RA8M1	PCLKC
RA8T1	PCLKC

The ADC clock must be at least 1 MHz when the ADC is used. Many MCUs also have PCLK ratio restrictions when the ADC is used. For details on PCLK ratio restrictions, reference the footnotes in the second table of the Clock Generation Circuit chapter of the MCU User's Manual (for example, Table 9.2 "Specifications of the clock generation circuit for the internal clocks" in the RA6M3 manual R01UH0886EJ0100).

Pin Configuration

The ANxxx pins are analog input channels that can be used with the ADC.

ADTRG0 and ADTRG1 can be used to start scans with an external trigger for unit 0 and 1 respectively. When external triggers are used, ADC scans begin on the falling edge of the ADTRG pin.

Usage Notes

Sample Hold

Enabling the sample and hold functionality reduces the maximum scan frequency because the sample and hold time is added to each scan. Refer to the hardware manual for details on the sample and hold time.

ADC Operational Modes

The driver supports three operation modes: single-scan, continuous-scan, and group-scan modes. In each mode, analog channels are converted in ascending order of channel number, followed by scans of the temperature sensor and voltage sensor if they are included in the mask of channels to scan.

Single-scan Mode

In single scan mode, one or more specified channels are scanned once per trigger.

Continuous-scan Mode

In continuous scan mode, a single trigger is required to start the scan. Scans continue until R_ADC_ScanStop() is called.

Note

1) To help ensure a responsive system, developers should consider system clock speed, ADCLK speed, and callback processing time. In particular, using a scan-end callback with a high scan rate relative to core clocks (for example, in continuous scan mode) may result in constant or high-frequency interrupts and is not recommended.
2) On some MCUs, scanning the temperature sensor or internal reference voltage in continuous or group scan modes is prohibited. Check the "ADC12 specifications" section of the device's User Manual to see if this restriction applies.

Group-scan Mode

Group-scan mode allows the application to allocate channels to one of two groups (A and B). Conversion begins when the specified ELC start trigger for that group is received.

With the priority configuration parameter, you can optionally give group A priority over group B. If group A has priority over group B, a group B scan is interrupted when a group A scan trigger occurs. The following options exist for group B when group A has priority:

- To restart the interrupted group B scan after the group A scan completes.
- To wait for another group B trigger and forget the interrupted scan.
- To continuously scan group B and suspend scanning group B only when a group A trigger is received.

  Note

  If this option is selected, group B scanning begins immediately after R_ADC_ScanCfg(). Group A scan triggers must be enabled by R_ADC_ScanStart() and can be disabled by R_ADC_ScanStop(). Group B scans can only be disabled by reconfiguring the group A priority to a different mode.

Double-triggering

When double-triggering is enabled a single channel is selected to be scanned twice before an interrupt is thrown. The first scan result when using double-triggering is always saved to the selected channel's data register. The second result is saved to the data duplexing register (ADC_CHANNEL_DUPLEX).

Double-triggering uses Group A; only one channel can be selected when enabled. No other scanning is possible on Group A while double-trigger mode is selected. In addition, any special ADC channels (such as temperature sensors or voltage references) are not valid double-trigger channels.

When extended double-triggering is enabled, both ADC input (ELC) events are routed to Group A. The interrupt is still thrown after every two scans regardless of the triggering event(s). While the first and second scan are saved to the selected ADC data register and the ADC duplexing register as before, scans associated with event A and B are additionally copied into duplexing register A and B, respectively (ADC_CHANNEL_DUPLEX_A and ADC_CHANNEL_DUPLEX_B).

When Interrupts Are Not Enabled

If interrupts are not enabled, the R_ADC_StatusGet API can be used to poll the ADC to determine when the scan has completed. The read API function is used to access the converted ADC result. This applies to both normal scans and calibration scans for MCUs that support calibration.

Window Compare Function

The ADC contains comparators that allow scan data to be compared to user-provided reference values. When a value meets the configured condition an interrupt and/or an ELC event can be produced.

Each unit has two configurable comparison units, Window A and Window B. Window A allows for configuring multiple simultaneous channels to compare while Window B only allows one channel at a time.

The window compare function can be configured both through the RA Configuration tool and at runtime by providing a pointer to an adc_window_cfg_t struct to adc_channel_cfg_t::p_window_cfg when calling R_ADC_ScanCfg. The available comparison modes are shown below:

Window setting	Channel mode 0	Channel mode 1
Disabled	Scan < Low Ref	Scan > Low Ref
Enabled	(Scan < Low Ref) OR (Scan > High Ref)	Low Ref < Scan < High Ref

Note

The window setting applies to all channels configured on a unit.

Sample-State Count Setting

The application program can modify the setting of the sample-state count for analog channels by calling the R_ADC_SampleStateCountSet() API function. The application program only needs to modify the sample-state count settings from their default values to increase the sampling time. This can be either because the impedance of the input signal is too high to secure sufficient sampling time under the default setting or if the ADCLK is too slow. To modify the sample-state count for a given channel, set the channel number and the number of states when calling the

R_ADC_SampleStateCountSet() API function. Valid sample state counts are 7-255.

Note

Although the hardware supports a minimum number of sample states of 5, some MCUs require 7 states, so the minimum is set to 7. At the lowest supported ADC conversion clock rate (1 MHz), these extra states will lead to, at worst case, a 2 microsecond increase in conversion time. At 60 MHz the extra states will add 33.4 ns to the conversion time.

If the sample state count needs to be changed for multiple channels, the application program must call the R_ADC_SampleStateCountSet() API function repeatedly, with appropriately modified arguments for each channel.

If the ADCLK frequency changes, the sample states may need to be updated.

Sample States for Temperature Sensor and Internal Voltage Reference

Sample states for the temperature sensor and the internal reference voltage are calculated during R_ADC_ScanCfg() based on the ADCLK frequency at the time. The sample states for the temperature sensor and internal voltage reference cannot be updated with R_ADC_SampleStateCountSet(). If the ADCLK frequency changes, call R_ADC_ScanCfg() before using the temperature sensor or internal reference voltage again to ensure the sampling time for the temperature sensor and internal voltage reference is optimal.

Selecting Reference Voltage

The ADC high-potential and low-potential reference voltages may be configured for selected MCU's. Please refer to the RA Configuration editor in e² studio for further details.

Note

When using VREFADC, a stabilization time of 1500us is required after call for R_ADC_Open(). Consult Section 32.6 "Selecting Reference Voltage" in the RA2A1 User's Manual (R01UH0888EJ0100) for details.
When the internal reference voltage is selected as the high-potential reference voltage, the Low-power A/D Conversion mode will automatically be selected. Consult Section 29.6 "Selecting Reference Voltage" in the RA2E1 User's Manual (R01UH0852EJ0110) for details.

Using the Temperature Sensor with the ADC

The ADC HAL module supports reading the data from the on-chip temperature sensor. The value returned from the sensor can be converted into degrees Celsius or Fahrenheit in the application program using the following formula, T = (Vs - V1)/slope + T1, where:

- T: Measured temperature (degrees C)
- Vs: Voltage output by the temperature sensor at the time of temperature measurement (Volts)
- T1: Temperature experimentally measured at one point (degrees C)
- V1: Voltage output by the temperature sensor at the time of measurement of T1 (Volts)
- T2: Temperature at the experimental measurement of another point (degrees C)
- V2: Voltage output by the temperature sensor at the time of measurement of T2 (Volts)
- Slope: Temperature gradient of the temperature sensor (V/degrees C); slope = (V2 - V1)/(T2 - T1)

Note

The slope value can be obtained from the hardware manual for each device in the Electrical Characteristics Chapter - TSN Characteristics Table, Temperature slope entry.

Reading CTSU TSCAP with ADC

Some MCUs support reading CTSU TSCAP with ADC. CTSU TSCAP is connected to ADC0 channel 16. Use existing enums for channel 16 to set sample states for the sensor connected to CTSU TSCAP, enable scanning of CTSU TSCAP, and read results for CTSU TSCAP.

Usage Notes for ADC16

Calibration

Calibration is required to use the ADC16 peripheral. When using this driver on an MCU that has ADC16, call R_ADC_Calibrate() after open, and prior to any other function.

Range of ADC16 Results

The range of the ADC16 is from 0 (lowest) to 0x7FFF (highest) when used in single-ended mode. This driver only supports single ended mode.

Limitations

Developers should be aware of the following limitations when using the ADC:

- When using the Window Compare function:
  - Only Single Scan mode may be configured when match or mismatch ELC events are used.
  - When one compare window is configured to check the temperature sensor or voltage reference the other window cannot be used.
  - Both windows cannot reference the same channel.
  - When using ADC in Snooze Mode, both Window A and Window B must be enabled.

Examples

Basic Example

This is a basic example of minimal use of the ADC in an application.

```
/* A channel configuration is generated by the RA Configuration editor based on the
options selected. If additional
 * configurations are desired additional adc_channel_cfg_t elements can be defined
and passed to R_ADC_ScanCfg. */
const adc_channel_cfg_t g_adc0_channel_cfg =
{
    .scan_mask          = ADC_MASK_CHANNEL_0 | ADC_MASK_CHANNEL_1,
    .scan_mask_group_b = 0,
    .priority_group_a   = (adc_group_a_t) 0,
    .add_mask          = 0,
    .sample_hold_mask   = 0,
    .sample_hold_states = 0,
```

```
};
void adc_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable channels. */
    err = R_ADC_ScanCfg(&g_adc0_ctrl, &g_adc0_channel_cfg);
    assert(FSP_SUCCESS == err);
 /* In software trigger mode, start a scan by calling R_ADC_ScanStart(). In other
modes, enable external
  * triggers by calling R_ADC_ScanStart(). */
    (void) R_ADC_ScanStart(&g_adc0_ctrl);
 /* Wait for conversion to complete. */
 adc_status_t status;
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
 while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
    {
       (void) R_ADC_StatusGet(&g_adc0_ctrl, &status);
    }
 /* Read converted data. */
    uint16_t channel1_conversion_result;
    err = R_ADC_Read(&g_adc0_ctrl, ADC_CHANNEL_1, &channel1_conversion_result);
    assert(FSP_SUCCESS == err);
}
```

Temperature Sensor Example

This example shows how to calculate the MCU temperature using the ADC and the temperature sensor.

```
#define ADC_EXAMPLE_CALIBRATION_DATA_RA6M1 (0x7D5)
#define ADC_EXAMPLE_VCC_MICROVOLT (3300000)
```

```
#define ADC_EXAMPLE_TEMPERATURE_RESOLUTION (12U)
#define ADC_EXAMPLE_REFERENCE_CALIBRATION_TEMPERATURE (127)
void adc_temperature_example (void)
{
 /* The following example calculates the temperature on an RA6M1 device using the
data provided in the section
  * 44.3.1 "Preparation for Using the Temperature Sensor" of the RA6M1 manual
R01UH0884EJ0100. */
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable temperature sensor. */
    err = R_ADC_ScanCfg(&g_adc0_ctrl, &g_adc0_channel_cfg);
    assert(FSP_SUCCESS == err);
 /* In software trigger mode, start a scan by calling R_ADC_ScanStart(). In other
modes, enable external
  * triggers by calling R_ADC_ScanStart(). */
    (void) R_ADC_ScanStart(&g_adc0_ctrl);
 /* Wait for conversion to complete. */
 adc_status_t status;
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
 while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
    {
       (void) R_ADC_StatusGet(&g_adc0_ctrl, &status);
    }
 /* Read converted data. */
    uint16_t temperature_conversion_result;
    err = R_ADC_Read(&g_adc0_ctrl, ADC_CHANNEL_TEMPERATURE,
&temperature_conversion_result);
    assert(FSP_SUCCESS == err);
 /* If the MCU does not provide calibration data, use the value in the hardware
manual or determine it
```

```
  * experimentally. */
 /* Get Calibration data from the MCU if available. */
    int32_t    reference_calibration_data;
 adc_info_t adc_info;
    (void) R_ADC_InfoGet(&g_adc0_ctrl, &adc_info);
    reference_calibration_data = (int32_t) adc_info.calibration_data;
 /* NOTE: The slope of the temperature sensor varies from sensor to sensor. Renesas
recommends calculating
  * the slope of the temperature sensor experimentally.
  *
  * This example uses the typical slope provided in Table 52.38 "TSN characteristics"
in the RA6M1 manual
  * R01UM0011EU0050. */
    int32_t slope_uv_per_c = BSP_FEATURE_ADC_TSN_SLOPE;
 /* Formula for calculating temperature copied from section 44.3.1 "Preparation for
Using the Temperature Sensor"
  * of the RA6M1 manual R01UH0884EJ0100:
  *
  * In this MCU, the TSCDR register stores the temperature value (CAL127) of the
temperature sensor measured
  * under the condition Ta = Tj = 127 C and AVCC0 = 3.3 V. By using this value as the
sample measurement result
  * at the first point, preparation before using the temperature sensor can be
omitted.
  *
  * If V1 is calculated from CAL127,
  * V1 = 3.3 * CAL127 / 4096 [V]
  *
  * Using this, the measured temperature can be calculated according to the following
formula.
  *
  * T = (Vs - V1) / Slope + 127 [C]
  * T: Measured temperature (C)
  * Vs: Voltage output by the temperature sensor when the temperature is measured (V)
```

```
  * V1: Voltage output by the temperature sensor when Ta = Tj = 127 C and AVCC0 = 3.3
V (V)
  * Slope: Temperature slope given in Table 52.38 / 1000 (V/C)
  */
    int32_t v1_uv = (ADC_EXAMPLE_VCC_MICROVOLT >> ADC_EXAMPLE_TEMPERATURE_RESOLUTION)
*
                    reference_calibration_data;
    int32_t vs_uv = (ADC_EXAMPLE_VCC_MICROVOLT >> ADC_EXAMPLE_TEMPERATURE_RESOLUTION)
*
                    temperature_conversion_result;
    int32_t temperature_c = (vs_uv - v1_uv) / slope_uv_per_c +
ADC_EXAMPLE_REFERENCE_CALIBRATION_TEMPERATURE;
 /* Expect room temperature, break if temperature is outside the range of 20 C to 25
C. */
 if ((temperature_c < 20) || (temperature_c > 25))
    {
       __BKPT(0);
    }
}
```

Double-Trigger Example

This example demonstrates reading data from a double-trigger scan. A flag is used to wait for a callback event. Two scans must occur before the callback is called. These results are read via R_ADC_Read using the selected channel enum value as well as ADC_CHANNEL_DUPLEX.

```
volatile bool scan_complete_flag = false;
void adc_callback (adc_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
    scan_complete_flag = true;
}
void adc_double_trigger_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize the module. */
```

```
    err = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable double-trigger channel. */
    err = R_ADC_ScanCfg(&g_adc0_ctrl, &g_adc0_channel_cfg);
    assert(FSP_SUCCESS == err);
 /* Enable scan triggering from ELC events. */
    (void) R_ADC_ScanStart(&g_adc0_ctrl);
 /* Wait for conversion to complete. Two scans must be triggered before a callback
occurs. */
    scan_complete_flag = false;
 while (!scan_complete_flag)
    {
 /* Wait for callback to set flag. */
    }
 /* Read converted data from both scans. */
    uint16_t channel1_conversion_result_0;
    uint16_t channel1_conversion_result_1;
    err = R_ADC_Read(&g_adc0_ctrl, ADC_CHANNEL_1, &channel1_conversion_result_0);
    assert(FSP_SUCCESS == err);
    err = R_ADC_Read(&g_adc0_ctrl, ADC_CHANNEL_DUPLEX,
&channel1_conversion_result_1);
    assert(FSP_SUCCESS == err);
}
```

ADC-DMAC Repeat-Block Transfer Example

This example demonstrates writing multiple data from DAC peripheral to ADC channels and storing the data in memory through DMAC using Repeat-Block Transfer mode. It creates single block to multiple ring buffer type of transfer topology. Ping-Pong mechanism is used to read the data from memory in between the transfers. This example is valid only for MCUs that have ADBUF.

```
#define ADC_DMAC_EXAMPLE_DATA_LOW (0U)

Window Compare Example

This example shows how to configure the window compare function at runtime as well as how to handle events and obtain comparison results through a callback.

```
adc_window_cfg_t g_adc0_window_cfg =
{
 /* Enable Window A and Window B; enable Window mode */
    .compare_cfg       =
       (adc_compare_cfg_t) (ADC_COMPARE_CFG_A_ENABLE | ADC_COMPARE_CFG_B_ENABLE |
ADC_COMPARE_CFG_WINDOW_ENABLE),
 /* Compare scan values from Channels 0 and 1 */
    .compare_mask       = ADC_MASK_CHANNEL_0 | ADC_MASK_CHANNEL_1,
 /* Set Channel 1 condition to be inside the window instead of outside */
    .compare_mode_mask = ADC_MASK_CHANNEL_1,
 /* Set reference voltage levels for Window A */
    .compare_ref_low = ADC_SCAN_MAX / 3,
    .compare_ref_high = ADC_SCAN_MAX * 2 / 3,
 /* Configure Window B to compare Channel 2 (inside window) */
    .compare_b_channel = ADC_WINDOW_B_CHANNEL_2,
    .compare_b_mode    = ADC_WINDOW_B_MODE_GREATER_THAN_OR_INSIDE,
 /* Set reference voltage levels for Window B */
```

```
    .compare_b_ref_low = ADC_SCAN_MAX / 4,
    .compare_b_ref_high = ADC_SCAN_MAX * 3 / 4,
};
void adc0_callback (adc_callback_args_t * p_args)

Data Structure Documentation

◆ adc_sample_state_t

struct adc_sample_state_t		
ADC sample state configuration		
Data Fields		
adc_sample_state_reg_t	reg_id	Sample state register ID.
uint8_t	num_states	Number of sampling states for conversion. Ch16-20/21 use the same value.

◆ adc_window_cfg_t

struct adc_window_cfg_t		
ADC Window Compare configuration		
Data Fields		
uint32_t	compare_mask	Channel mask to compare with Window A.
uint32_t	compare_mode_mask	Per-channel condition mask for Window A.
adc_compare_cfg_t	compare_cfg	Window Compare configuration.
uint16_t	compare_ref_low	Window A lower reference value.
uint16_t	compare_ref_high	Window A upper reference value.
uint16_t	compare_b_ref_low	Window B lower reference value.
uint16_t	compare_b_ref_high	Window A upper reference value.
adc_window_b_channel_t	compare_b_channel	Window B channel.
adc_window_b_mode_t	compare_b_mode	Window B condition setting.

◆ adc_extended_cfg_t

struct adc_extended_cfg_t		
Extended configuration structure for ADC.		
Data Fields		
adc_add_t	add_average_count	Add or average samples.
adc_clear_t	clearing	Clear after read.
adc_start_source_t	trigger	Trigger source for ADC.
adc_start_source_t	trigger_group_b	Trigger source for ADC group B; valid only for group mode.

adc_double_trigger_t	double_trigger_mode	Double-trigger mode setting.
adc_vref_control_t	adc_vref_control	VREFADC output voltage control.
uint8_t	enable_adbuf	Enable ADC Ring Buffer, Valid only to use along with DMAC transfer.
IRQn_Type	window_a_irq	IRQ number for Window Compare A interrupts.
IRQn_Type	window_b_irq	IRQ number for Window Compare B interrupts.
uint8_t	window_a_ipl	Priority for Window Compare A interrupts.
uint8_t	window_b_ipl	Priority for Window Compare B interrupts.

◆ adc_channel_cfg_t

struct adc_channel_cfg_t		
ADC channel(s) configuration		
Data Fields		
uint32_t	scan_mask	Channels/bits: bit 0 is ch0; bit 15 is ch15.
uint32_t	scan_mask_group_b	Valid for group modes.
uint32_t	add_mask	Valid if add enabled in Open().
adc_window_cfg_t *	p_window_cfg	Pointer to Window Compare configuration.
adc_group_a_t	priority_group_a	Valid for group modes.
uint8_t	sample_hold_mask	Channels/bits 0-2.
uint8_t	sample_hold_states	Number of states to be used for sample and hold. Affects channels 0-2.

◆ adc_instance_ctrl_t

struct adc_instance_ctrl_t
ADC instance control block. DO NOT INITIALIZE. Initialized in adc_api_t::open().

Enumeration Type Documentation

◆ adc_mask_t

enum adc_mask_t

For ADC Scan configuration adc_channel_cfg_t::scan_mask, adc_channel_cfg_t::scan_mask_group_b, adc_channel_cfg_t::add_mask and adc_channel_cfg_t::sample_hold_mask. Use bitwise OR to combine these masks for desired channels and sensors.

Enumerator	
ADC_MASK_OFF	No channels selected.
ADC_MASK_CHANNEL_0	Channel 0 mask.
ADC_MASK_CHANNEL_1	Channel 1 mask.
ADC_MASK_CHANNEL_2	Channel 2 mask.
ADC_MASK_CHANNEL_3	Channel 3 mask.
ADC_MASK_CHANNEL_4	Channel 4 mask.
ADC_MASK_CHANNEL_5	Channel 5 mask.
ADC_MASK_CHANNEL_6	Channel 6 mask.
ADC_MASK_CHANNEL_7	Channel 7 mask.
ADC_MASK_CHANNEL_8	Channel 8 mask.
ADC_MASK_CHANNEL_9	Channel 9 mask.
ADC_MASK_CHANNEL_10	Channel 10 mask.
ADC_MASK_CHANNEL_11	Channel 11 mask.
ADC_MASK_CHANNEL_12	Channel 12 mask.
ADC_MASK_CHANNEL_13	Channel 13 mask.
ADC_MASK_CHANNEL_14	Channel 14 mask.
ADC_MASK_CHANNEL_15	Channel 15 mask.
ADC_MASK_CHANNEL_16	Channel 16 mask.
ADC_MASK_CHANNEL_17	Channel 17 mask.
ADC_MASK_CHANNEL_18	Channel 18 mask.

ADC_MASK_CHANNEL_19	Channel 19 mask.
ADC_MASK_CHANNEL_20	Channel 20 mask.
ADC_MASK_CHANNEL_21	Channel 21 mask.
ADC_MASK_CHANNEL_22	Channel 22 mask.
ADC_MASK_CHANNEL_23	Channel 23 mask.
ADC_MASK_CHANNEL_24	Channel 24 mask.
ADC_MASK_CHANNEL_25	Channel 25 mask.
ADC_MASK_CHANNEL_26	Channel 26 mask.
ADC_MASK_CHANNEL_27	Channel 27 mask.
ADC_MASK_CHANNEL_28	Channel 28 mask.
ADC_MASK_TEMPERATURE	Temperature sensor channel mask.
ADC_MASK_VOLT	Voltage reference channel mask.
ADC_MASK_SENSORS	All sensor channel mask.

◆ adc_add_t

enum adc_add_t	
ADC data sample addition and averaging options	
Enumerator	
ADC_ADD_OFF	Addition turned off for channels/sensors.
ADC_ADD_TWO	Add two samples.
ADC_ADD_THREE	Add three samples.
ADC_ADD_FOUR	Add four samples.
ADC_ADD_SIXTEEN	Add sixteen samples.
ADC_ADD_AVERAGE_TWO	Average two samples.
ADC_ADD_AVERAGE_FOUR	Average four samples.
ADC_ADD_AVERAGE_EIGHT	Average eight samples.
ADC_ADD_AVERAGE_SIXTEEN	Add sixteen samples.

◆ adc_clear_t

enum adc_clear_t	
ADC clear after read definitions	
Enumerator	
ADC_CLEAR_AFTER_READ_OFF	Clear after read off.
ADC_CLEAR_AFTER_READ_ON	Clear after read on.

◆ adc_vref_control_t

enum adc_vref_control_t	
Enumerator	
ADC_VREF_CONTROL_VREFH	VREFAMPCNT reset value. VREFADC Output voltage is Hi-Z.
ADC_VREF_CONTROL_1_5V_OUTPUT	BGR turn ON. VREFADC Output voltage is 1.5 V.
ADC_VREF_CONTROL_2_0V_OUTPUT	BGR turn ON. VREFADC Output voltage is 2.0 V.
ADC_VREF_CONTROL_2_5V_OUTPUT	BGR turn ON. VREFADC Output voltage is 2.5 V.
ADC_VREF_CONTROL_AVCC0_AVSS0	High potential is AVCC0, low potential is AVSS0.
ADC_VREF_CONTROL_VREFH0_AVSS0	High potential is VREFH0, low potential is AVSS0.
ADC_VREF_CONTROL_IVREF_AVSS0	High potential is internal reference voltage, low potential is AVSS0. When the high potential is set to the internal reference voltage, wait 5 us after R_ADC_Open() to start an ADC measurement.
ADC_VREF_CONTROL_AVCC0_VREFL0	High potential is AVCC0, low potential is VREFL0.
ADC_VREF_CONTROL_VREFH0_VREFL0	High potential is VREFH0, low potential is VREFL0.
ADC_VREF_CONTROL_IVREF_VREFL0	High potential is internal reference voltage, low potential is VREFL0. When the high potential is set to the internal reference voltage, wait 5 us after R_ADC_Open() to start an ADC measurement.

◆ adc_sample_state_reg_t

enum adc_sample_state_reg_t	
ADC sample state registers	
Enumerator	
ADC_SAMPLE_STATE_CHANNEL_0	Sample state register channel 0.
ADC_SAMPLE_STATE_CHANNEL_1	Sample state register channel 1.
ADC_SAMPLE_STATE_CHANNEL_2	Sample state register channel 2.
ADC_SAMPLE_STATE_CHANNEL_3	Sample state register channel 3.
ADC_SAMPLE_STATE_CHANNEL_4	Sample state register channel 4.
ADC_SAMPLE_STATE_CHANNEL_5	Sample state register channel 5.
ADC_SAMPLE_STATE_CHANNEL_6	Sample state register channel 6.
ADC_SAMPLE_STATE_CHANNEL_7	Sample state register channel 7.
ADC_SAMPLE_STATE_CHANNEL_8	Sample state register channel 8.
ADC_SAMPLE_STATE_CHANNEL_9	Sample state register channel 9.
ADC_SAMPLE_STATE_CHANNEL_10	Sample state register channel 10.
ADC_SAMPLE_STATE_CHANNEL_11	Sample state register channel 11.
ADC_SAMPLE_STATE_CHANNEL_12	Sample state register channel 12.
ADC_SAMPLE_STATE_CHANNEL_13	Sample state register channel 13.
ADC_SAMPLE_STATE_CHANNEL_14	Sample state register channel 14.
ADC_SAMPLE_STATE_CHANNEL_15	Sample state register channel 15.
ADC_SAMPLE_STATE_CHANNEL_16_TO_31	Sample state register channel 16 to 31.

◆ adc_compare_cfg_t

enum adc_compare_cfg_t
ADC comparison settings

◆ adc_window_b_channel_t

enum adc_window_b_channel_t
ADC Window B channel

◆ adc_window_b_mode_t

enum adc_window_b_mode_t
ADC Window B comparison mode

◆ adc_group_a_t

enum adc_group_a_t	
ADC action for group A interrupts group B scan. This enumeration is used to specify the priority between Group A and B in group mode.	
Enumerator	
ADC_GROUP_A_PRIORITY_OFF	Group A ignored and does not interrupt ongoing group B scan.
ADC_GROUP_A_GROUP_B_WAIT_FOR_TRIGGER	Group A interrupts Group B(single scan) which restarts at next Group B trigger.
ADC_GROUP_A_GROUP_B_RESTART_SCAN	Group A interrupts Group B(single scan) which restarts immediately after Group A scan is complete.
ADC_GROUP_A_GROUP_B_CONTINUOUS_SCAN	Group A interrupts Group B(continuous scan) which continues scanning without a new Group B trigger.

◆ adc_double_trigger_t

enum adc_double_trigger_t	
ADC double-trigger mode definitions	
Enumerator	
ADC_DOUBLE_TRIGGER_DISABLED	Double-triggering disabled.
ADC_DOUBLE_TRIGGER_ENABLED	Double-triggering enabled.
ADC_DOUBLE_TRIGGER_ENABLED_EXTENDED	Double-triggering enabled on both ADC ELC events.

◆ adc_start_source_t

enum adc_start_source_t	
ADC Trigger synchronous start source Note: not all sources are available for all MCUs or channels. See User Manual for more information.	
Enumerator	
ADC_START_SOURCE_DISABLED	ELC/GPT Start source disabled (For use with software start)
ADC_START_SOURCE_ASYNC_EXTERNAL	External Trigger Input.
ADC_START_SOURCE_ELC_AD0	ELC_AD0 (Converter 0 and Converter 1)
ADC_START_SOURCE_ELC_AD1	ELC_AD1 (Converter 0 and Converter 1)
ADC_START_SOURCE_ELC_AD01	ELC_AD0 and ELC_AD1 (Converter 0) also ELC_AD0 and ELC_AD1 (Converter 1)
ADC_START_SOURCE_GPT_A0_A4	GTADTRA0 (Converter 0) and GTADTRA4 (Converter 1)
ADC_START_SOURCE_GPT_B0_B4	GTADTRB0 (Converter 0) and GTADTRB4 (Converter 1)
ADC_START_SOURCE_GPT_A1_A5	GTADTRA1 (Converter 0) and GTADTRB5 (Converter 1)
ADC_START_SOURCE_GPT_B1_B5	GTADTRB1 (Converter 0) and GTADTRB5 (Converter 1)
ADC_START_SOURCE_GPT_A2_A6	GTADTRA2 (Converter 0) and GTADTRA6 (Converter 1)

ADC_START_SOURCE_GPT_B2_B6	GTADTRB2 (Converter 0) and GTADTRB6 (Converter 1)
ADC_START_SOURCE_GPT_A3_A7	GTADTRA3 (Converter 0) and GTADTRA7 (Converter 1)
ADC_START_SOURCE_GPT_B3_B7	GTADTRB3 (Converter 0) and GTADTRB7 (Converter 1)
ADC_START_SOURCE_GPT_AB0_AB4	GTADTRA/B0 (Converter 0) and GTADTRA/B4 (Converter 1)
ADC_START_SOURCE_GPT_AB1_AB5	GTADTRA/B1 (Converter 0) and GTADTRA/B5 (Converter 1)
ADC_START_SOURCE_GPT_AB2_AB6	GTADTRA/B2 (Converter 0) and GTADTRA/B6 (Converter 1)
ADC_START_SOURCE_GPT_AB3_AB7	GTADTRA/B3 (Converter 0) and GTADTRA/B7 (Converter 1)

Function Documentation

◆ R_ADC_Open()

fsp_err_t R_ADC_Open (adc_ctrl_t * *p_ctrl*, adc_cfg_t const *const *p_cfg*)

Sets the operational mode, trigger sources, interrupt priority, and configurations for the peripheral as a whole. If interrupt is enabled, the function registers a callback function pointer for notifying the user whenever a scan has completed.

Return values

FSP_SUCCESS	Module is ready for use.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_ALREADY_OPEN	The instance control structure has already been opened.
FSP_ERR_IRQ_BSP_DISABLED	A callback is provided, but the interrupt is not enabled.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The requested unit does not exist on this MCU.
FSP_ERR_INVALID_HW_CONDITION	The ADC clock must be at least 1 MHz

◆ R_ADC_ScanCfg()

fsp_err_t R_ADC_ScanCfg (adc_ctrl_t * *p_ctrl*, void const *const *p_channel_cfg*)

Configures the ADC scan parameters. Channel specific settings are set in this function. Pass a pointer to adc_channel_cfg_t to p_channel_cfg.

Note

This starts group B scans if adc_channel_cfg_t::priority_group_a is set to ADC_GROUP_A_GROUP_B_CONTINUOUS_SCAN.

Return values

FSP_SUCCESS	Channel specific settings applied.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ R_ADC_CallbackSet()

fsp_err_t R_ADC_CallbackSet (adc_ctrl_t *const *p_api_ctrl*, void(*)(adc_callback_args_t *) *p_callback*, void const *const *p_context*, adc_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements adc_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_ADC_ScanStart()

fsp_err_t R_ADC_ScanStart (adc_ctrl_t * *p_ctrl*)

Starts a software scan or enables the hardware trigger for a scan depending on how the triggers were configured in the R_ADC_Open call. If the unit was configured for ELC or external hardware triggering, then this function allows the trigger signal to get to the ADC unit. The function is not able to control the generation of the trigger itself. If the unit was configured for software triggering, then this function starts the software triggered scan.

Precondition

Call R_ADC_ScanCfg after R_ADC_Open before starting a scan.
On MCUs that support calibration, call R_ADC_Calibrate and wait for calibration to complete before starting a scan.

Return values

FSP_SUCCESS	Scan started (software trigger) or hardware triggers enabled.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit is not initialized.
FSP_ERR_IN_USE	Another scan is still in progress (software trigger).

◆ R_ADC_ScanGroupStart()

fsp_err_t R_ADC_ScanGroupStart (adc_ctrl_t * *p_ctrl*, adc_group_mask_t *group_id*)

adc_api_t::scanStart is not supported on the ADCH. Use scanStart instead.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.

◆ R_ADC_ScanStop()

fsp_err_t R_ADC_ScanStop (adc_ctrl_t * *p_ctrl*)

Stops the software scan or disables the unit from being triggered by the hardware trigger (ELC or external) based on what type of trigger the unit was configured for in the R_ADC_Open function. Stopping a hardware triggered scan via this function does not abort an ongoing scan, but prevents the next scan from occurring. Stopping a software triggered scan aborts an ongoing scan.

Return values

FSP_SUCCESS	Scan stopped (software trigger) or hardware triggers disabled.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit is not initialized.

◆ R_ADC_StatusGet()

fsp_err_t R_ADC_StatusGet (adc_ctrl_t * *p_ctrl*, adc_status_t * *p_status*)

Provides the status of any scan process that was started, including scans started by ELC or external triggers and calibration scans on MCUs that support calibration.

Return values

FSP_SUCCESS	Module status stored in the provided pointer p_status
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ R_ADC_Read()

fsp_err_t R_ADC_Read (adc_ctrl_t * *p_ctrl*, adc_channel_t const *reg_id*, uint16_t *const *p_data*)

Reads conversion results from a single channel or sensor.

Return values

FSP_SUCCESS	Data read into provided p_data.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit is not initialized.

◆ R_ADC_Read32()

fsp_err_t R_ADC_Read32 (adc_ctrl_t * *p_ctrl*, adc_channel_t const *reg_id*, uint32_t *const *p_data*)

Reads conversion results from a single channel or sensor register into a 32-bit result.

Return values

FSP_SUCCESS	Data read into provided p_data.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit is not initialized.

◆ R_ADC_SampleStateCountSet()

fsp_err_t R_ADC_SampleStateCountSet (adc_ctrl_t * *p_ctrl*, adc_sample_state_t * *p_sample*)

Sets the sample state count for individual channels. This only needs to be set for special use cases. Normally, use the default values out of reset.

Note

The sample states for the temperature and voltage sensor are set in R_ADC_ScanCfg.

Return values

FSP_SUCCESS	Sample state count updated.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_INITIALIZED	Unit is not initialized.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ R_ADC_InfoGet()

fsp_err_t R_ADC_InfoGet (adc_ctrl_t * *p_ctrl*, adc_info_t * *p_adc_info*)

Returns the address of the lowest number configured channel and the total number of bytes to be read in order to read the results of the configured channels and return the ELC Event name. If no channels are configured, then a length of 0 is returned.

Also provides the temperature sensor slope and the calibration data for the sensor if available on this MCU. Otherwise, invalid calibration data of 0xFFFFFFFF will be returned.

Note

In group mode, information is returned for group A only. Calculating information for group B is not currently supported.

Return values

FSP_SUCCESS	Information stored in p_adc_info.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ R_ADC_Close()

fsp_err_t R_ADC_Close (adc_ctrl_t * *p_ctrl*)

This function ends any scan in progress, disables interrupts, and removes power to the A/D peripheral.

Return values

FSP_SUCCESS	Module closed.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ R_ADC_Calibrate()

fsp_err_t R_ADC_Calibrate (adc_ctrl_t *const *p_ctrl*, void const * *p_extend*)

Initiates calibration of the ADC on MCUs that require calibration. This function must be called before starting a scan on MCUs that require calibration.

Calibration is complete when the callback is called with ADC_EVENT_CALIBRATION_COMPLETE or when R_ADC_StatusGet returns ADC_STATUS_IDLE. Reference Figure 32.35 "Software flow and operation example of calibration operation." in the RA2A1 manual R01UH0888EJ0100.

ADC calibration time: 12 PCLKB + 774,930 ADCLK. (Reference Table 32.16 "Required calibration time (shown as the number of ADCLK and PCLKB cycles)" in the RA2A1 manual R01UH0888EJ0100. The lowest supported ADCLK is 1MHz.

Calibration will take a minimum of 24 milliseconds at 32 MHz PCLKB and ADCLK. This wait could take up to 780 milliseconds for a 1 MHz PCLKD (ADCLK).

Parameters

[in]	p_ctrl	Pointer to the instance control structure
[in]	p_extend	Unused argument. Pass NULL.

Return values

FSP_SUCCESS	Calibration successfully initiated.
FSP_ERR_INVALID_HW_CONDITION	A scan is in progress or hardware triggers are enabled.
FSP_ERR_UNSUPPORTED	Calibration not supported on this MCU.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ R_ADC_OffsetSet()

fsp_err_t R_ADC_OffsetSet (adc_ctrl_t *const *p_ctrl*, adc_channel_t const *reg_id*, int32_t *offset*)

adc_api_t::offsetSet is not supported on the ADC.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.

5.2.1.2 ADC (r_adc_b)

Detailed Description

Driver for the ADC_B peripheral on RA MCUs. This module implements the ADC Interface.

Overview

Features

The ADC_B module supports the following features:

- 16 bit resolution
- Selectable data format (16, 14, 12, and 10-bit)
- Configurable high-speed and high-accuracy conversion methods
- Configure scans to include:
    - Multiple analog channels
    - Temperature sensor channel
    - Reference Voltage sensor channel
    - Self-Diagnostic channel
- Configurable scan start trigger:
    - Software scan triggers
    - Hardware scan triggers (timer expiration, for example)
    - External scan triggers from the ADTRGn port pins
- Configurable scan modes:
    - Single scan mode, where each trigger starts a single scan
    - Continuous scan mode, where all channels are scanned continuously
    - Synchronous scan mode, where A/D converters operate synchronously
- Variable sampling time
- Self-calibration
- Channel-dedicated sample-and-hold circuits
- Supports adding and averaging converted samples
- Limiter clip function
- User offset adjustment function
- User gain adjustment function
- Built-in FIFO
- Channel-dedicated programable gain amplifier (PGA):
    - Support single-ended or pseudo-differential input
    - 2.5x to 13.33x gain (1.5x to 5.56x for pseudo-differential inputs)
- Optional callback when scan completes, FIFO data is ready, an error occurrs, or other conditions are triggered.

Configuration

Virtual Channels and Scan Groups

A virtual channel is a group of registers that stores the A/D conversion configuration for a single analog pin. Each virtual channel has a number of options including the channel for conversion, settings for conversion, data processing method and so on.

To perform A/D conversion of an analog pin, the channel associated with the pin must first be assigned to a virtual channel. That virtual channel is then assigned to a scan group, which brings together one or more virtual channels to be converted in sequence with a specified conversion unit.

Note

Analog channels may be assigned to more than one virtual channel. However, a virtual channel can be assigned to only one scan group. When performing A/D conversion on one analog channel in different scan groups or when converting a channel several times within the same scan group, assign several virtual channels to one analog channel.
To avoid data being overwritten, when converting a channel multiple times within the same scan group use R_ADC_B_FifoRead() instead of R_ADC_B_Read().

Configuring a Scan

To perform A/D conversion of a scan group the following should be configured:

- Assign the analog channel for conversion to a virtual channel.
- Assign the virtual channel to a scan group.
- Assign the scan group to an A/D Converter.

Note

Up to 8 virtual channels can be assigned to a scan group. If more than 8 channels are assigned to a group, only the lowest 8 will be targeted for A/D conversion.

Build Time Configurations for r_adc_b

The following build time configurations are defined in fsp_cfg/r_adc_b_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	bsp	If selected, code for parameter checking is included in the build.

Note

The instance configurations available in this driver are too numerous to list here. Please refer to the RA Configuration editor in e² studio for further details.

Clock Configuration

The ADC_B conversion clock source may be configured to use PCLKC, PCLKA, or GPT with a selectable division ratio. The ADC_B clock may operate between 25 MHz at a minimum and 60 MHz at a maximum.

Pin Configuration

The ANxxx pins are analog input channels that can be used with the ADC_B.

ADTRG0 and ADTRG1 can be used to start scans with an external trigger. When external triggers are used, ADC_B scans begin on the falling edge of the ADTRG pin.

Usage Notes

Limitations

Developers should be aware of the following limitations when using R_ADC_B:

- Except for Group Priority Operation, if ADC0 or ADC1 are currently performing an A/D conversion operation, attempting to start another scan group that uses the same A/D converter will be ignored. This also applies to starting multiple groups at one time. When Group Priority Operation is not enabled, only the lowest numbered group will be started (for each ADC converter), other groups will be ignored.

Self-Calibration

Calibration is required to use this peripheral; call R_ADC_B_Calibrate() after R_ADC_B_ScanCfg() and prior to any other function. Self-Calibration should be performed any time ADC operating characteristics are modified, including after reset, releasing module-stop, when returning from software standby or deep software standby mode, each time the ADC ScanCfg function is called, and

any time ADC related clocks are updated.

Note

Self-calibration is a non-blocking operation. The application should wait for an ADC_EVENT_CALIBRATION_COMPLETE callback before using other ADC_B functionality. The self-calibration process will disable hardware triggers that were previously enabled.

ADC_B Operation Modes

The driver supports two primary operational modes, single-scan and continuous-scan. In single scan mode, one or more groups are scanned once per trigger. In continuous scan mode, one or more groups are started with a single trigger. Scans continue until R_ADC_B_ScanStop() is called. In each mode, analog groups and virtual channels are converted in ascending order.

Single Scan Mode

- Assign any selected analog input or analog channel to any scan group, and convert the selected analog input only once per scan group for each start condition.
- By selecting the scan start conditions for each scan group individually, A/D conversion for each scan group can be started at different times.

Continuous Scan Mode

- Assign any selected analog input or analog channel to any scan group and repeat A/D conversion in scan group units after the first start condition. Conversion continues until the driver is closed.

Background Continuous Scan Mode

- Assign any selected analog input or analog channel of the extended analog function to any scan group and repeat A/D conversion in scan group units after the first start condition. The A/D conversion is performed in the background until the driver is closed. In Background Continuous Scan Mode, if the A/D conversion data will be acquired at the point a start condition is entered.

Note

Background Continuous Scan Mode is only available for Hybrid Mode

Synchronous-Scan Mode

When synchronous operation is enabled all A/D conversions are guaranteed to begin and end based on a user-configured period. When both conversion units are selected for synchronous scan they run from the same period, allowing for consistent timing of simultaneous conversions. Consult section 36.3.17 "Synchronous Operation" in the RA6T2 User's Manual (R01UH0951EJ0100) for details.

ADC_B Conversion Methods

Note

The ADC peripheral supports specific high-speed, high-precision, and normal-precision channels. See Table 46.34 "A/D conversion characteristics" in the RA6T2 User's Manual (R01UH0951EJ0100) for details about what conversion methods are supported by specific physical channels.

Successive Approximation Register (SAR) Mode

- A/D Converter samples the signal source once, and convert by Successive Approximation Register method.
- Fast A/D conversion
- Up to 8 channels per 1 scan group.
- Support only single-ended input (excludeing Self-diagnosis function)
- Requires Digital Filter Selection to be disabled

Oversampling Mode

- A/D Converter oversamples the signal source, and converts analog to digital by Noise Shaping Successive Approximation Register method.
- High-accuracy A/D conversion
- Support up to 8 channels per 1 scan group
- Support single-ended input and differential input
- Requires Digital Filter Selection to be enabled

Hybrid Mode

- A/D Converter oversamples the signal source, and converts analog to digital by Noise Shaping Successive Approximation Register method.
- Background Continuous Scan Mode operation enables both high-precision A/D conversion and fast conversion.
- Support up to 4 channels per 1 scan group
- Support single-ended input and differential input
- Requires Digital Filter Selection to be enabled

Digital Filter Selection

The following characteristics of the digital filter for the A/D converter unit may be selected:

- Sinc3 Filter (Over Sampling = 8)
- Minimum Phase Filter (Group Delay < 5)

Note

The digital filter must be disabled for ADC units configured to use Successive Approximation Register (SAR) Mode
The digital filter must be enabled for ADC units configured to use Oversampling Mode or Hybrid Mode

Sample-and-Hold

Enabling sample-and-hold on one or more channels instructs the ADC to perform sampling on all channels as soon as a group scan is started. Internal circuitry holds the sampled voltages until the conversion unit is ready.

Note

Each sample-and-hold unit is connected to two analog channels (0/1, 2/3 etc). When this function is enabled on both members of a pair only one of the two may be scanned at a time.
Enabling sample-and-hold functionality reduces maximum scan frequency because the sample hold time is added to each scan. Refer to the hardware manual for details on the sample-and-hold time. Consult section 46.4 "ADC Characteristics" in the RA6T2 User's Manual (R01UH0951EJ0100) for details.
If you use the channel-dedicated sample-and-hold circuits in Hybrid mode, the virtual channels and the scan groups are constrained. A dummy channel must be configured as last within the group. The A/D conversion data of the channel used as the dummy conversion channel is not guaranteed. See Operation in Hybrid Mode with Channel-dedicated Sample-and-hold Curcuit section in the User Manual for more information.

Self-Diagnosis

ADC_B has a built-in self-diagnosis function that can be used to confirm the unit is working correctly. One of three self-diagnosis voltages can be converted and compared to reference values. A self-diagnosis conversion produces a signed data value indicating the ideal A/D converter result. Reference values for 16-bit data format are shown below.

Self-diagnosis mode	Expected reference data	Accuracy Error
Self-diagnosis mode 1	0x0000	A/D conversion result becomes +1 or more when a positive accuracy error occurs and -1 or less when a negative accuracy error occurs.
Self-diagnosis mode 1	0x8000	A/D conversion result becomes greater than or equal to reference data when an accuracy error occurs.
Self-diagnosis mode 1	0x7FFF	A/D conversion result becomes less than or equal to reference data when an accuracy error occurs.

Add/Average Funtion

The ADC can be configured to automatically add or average a number of conversions into a single result. When enabled only the result of the operation is returned.

Note

When the A/D-converted value addition/average function is used, overflow of conversion data may occur. However, in certain conditions overflow may not be detected. See the A/D Conversion Overflow section below for details.

Data Format

The A/D converter in this peripheral has a resolution of 16 bits. When 14-bit or 12-bit data format is selected, the lower 2 or 4 bits (respectively) of the A/D conversion result are extended for data processing, error calibration (Self-Calibration), gain/offset adjustment and the averaging function before rounding is applied.

Limiter Clip

The limit clipping function allows for setting upper and lower bounds on converted data. When the A/D conversion data exceeds the specified upper limit value, it is clipped to the upper limit value. If the A/D conversion data falls below the specified lower limit, it is clipped to the lower limit value.

The upper and lower limits are set in one of eight table entries. To perform limit clip functionality, each virtual channel may (optionally) have one of these entries assigned. Interrupts may be enabled for when limiter clip conditions are triggered.

Note

When 14-/12-/10-bit is selected as the data length of the A/D conversion data, the lower bits are cut based on the data-format selection. When 16-bit format is selected, the data length is not rounded.

Using the Temperature Sensor with the ADC_B

The ADC_B HAL module supports reading the data from the on-chip temperature sensor. The value returned from the sensor can be converted into degrees Celsius or Fahrenheit in the application program using the following formula:

T = (Vs - V1)/slope + T1

- T: Measured temperature (degrees C)
- Vs: Voltage output by the temperature sensor at the time of measurement (Volts)
- T1: Temperature experimentally measured at one point (degrees C)
- V1: Voltage output by the temperature sensor at the time of measurement of T1 (Volts)
- slope: Temperature gradient of the temperature sensor (V/degrees C), given as (V2 - V1) / (T2 - T1)
    - T2: Temperature at the experimental measurement of another point (degrees C)
    - V2: Voltage output by the temperature sensor at the time of measurement of T2 (Volts)

Note

The slope value can be obtained from the hardware manual for each device in the Electrical Characteristics Chapter - TSN Characteristics Table, Temperature slope entry.

User Offset and Gain

The user offset adjustment function adds or subtracts a constant value to or from the A/D conversion data. Virtual channels select an offset from a table of values specified by the user.

The user gain adjustment function multiplies the A/D conversion data by an arbitrary coefficient value. As with offset adjustment, virtual channels may select a gain value from a table specified by the user.

Note

When the offset or gain adjusting functions are used overflow of A/D conversion data may occur. See the A/D Conversion Overflow section below for details.
When 14-/12-/10-bit is selected as the data length of converted data the lower bits of offset values are cut based on the data-format selection.

FIFO

The FIFOs consist of 8 stages and can hold up to 8 A/D conversion data. One FIFO is implemented for each scan group. Each FIFO acts as a ring buffer and data will be lost if the FIFO is not read as needed. Interrupts may be enabled for a specific data storage threshold and on overrun.

Programmable Gain Amplifier

ADC has built-in Programmable Gain Amplifier (PGA). The PGA amplifies an external analog input signal and outputs it to A/D converter, Channel-dedicated sample-and-hold circuit, and High-Speed Analog Comparator (ACMPHS). PGA units are channel specific and utilize two analog input pins per unit. Please refer to the RA Configuration editor in e² studio or the hardware manual for further details.

Note

When PGA is used, the analog input pin assigned to PGAVSS pin cannot be input to A/D conversion or Channel-dedicated sample-and-hold circuit.

Single-ended input

In single-ended input mode, PGA amplifies the input from PGAIN pin with the specified gain, between ×2.000 to ×13.333. When operating the PGA in single-ended input mode, PGAIN should be connected to the signal source and PGAVSS should be connected to the analog ground (AVSS0). The input voltage to PGAIN must not exceed the range specified in the Electrical Characteristics.

Pseudo-differential input

In pseudo differential input mode, PGA amplifies the difference between PGAIN pin and PGAVSS pin with the specified gain and output the voltage obtained by adding the offset of 0.5 * AVcc. Settable gains are ×1.500, ×2.333, ×4.000, and ×5.667.

When operating the PGA in Pseudo Differential Input Mode, PGAIN should be connected to the signal source, and PGAVSS should be connected to the reference ground of the signal source. The inputs to PGAIN and PGAVSS pins must not exceed the range specified in the Electrical Characteristics.

When Interrupts Are Not Enabled

Interrupts are enabled by default. If scan-complete interrupts are disabled,@ ref R_ADC_B_StatusGet() can be used to poll the ADC_B driver to determine when the scan has completed. R_ADC_B_Read() is used to access the converted ADC_B result.

A/D Conversion Overflow

A/D conversion overflow is detected when converted data exceeds the range that can be handled in the specified data format. When overflow occurs, data is restricted to the upper or lower limit value of the specified data format. Overflow is detected in the following cases:

- When the input to the A/D converter exceeds VREFH0 or falls below VREFL0
- When overflow occurs by the internal processing (calculation) for the A/D conversion data due to the following: – Gain Error and Offset Error Calibration – User Gain/Offset adjustment function – When using A/D-Converted Value Addition/Averaging Function – Data Formatting Process

Examples

Basic Example

This is a basic example of minimal use of the ADC_B in an application.

```
/* A channel configuration is generated by the RA Configuration editor based on the
options selected. If additional
 * configurations are desired additional adc_channel_cfg_t elements can be defined
and passed to R_ADC_B_ScanCfg. */
extern const adc_b_scan_cfg_t g_adc_b0_scan_cfg;
void adc_b_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
```

```
    err = R_ADC_B_Open(&g_adc_b0_ctrl, &g_adc_b0_cfg);
    assert(FSP_SUCCESS == err);
 /* Enable channels. */
    err = R_ADC_B_ScanCfg(&g_adc_b0_ctrl, &g_adc_b0_scan_cfg);
    assert(FSP_SUCCESS == err);
    err = R_ADC_B_Calibrate(&g_adc_b0_ctrl, NULL);
    assert(FSP_SUCCESS == err);
 /* Wait for calibration to complete */
 adc_status_t status = {.state = ADC_STATE_CALIBRATION_IN_PROGRESS};
 while ((ADC_STATE_IDLE != status.state) &&
          (FSP_SUCCESS == err))
    {
 R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_MILLISECONDS);
       err = R_ADC_B_StatusGet(&g_adc_b0_ctrl, &status);
    }
    assert(FSP_SUCCESS == err);
 /* Start one or more scan groups by calling R_ADC_B_ScanGroupStart(). Alternatively,
all scan groups may be started
  * by calling R_ADC_B_ScanCfg(). */
    (void) R_ADC_B_ScanGroupStart(&g_adc_b0_ctrl, ADC_GROUP_MASK_0);
 /* Wait for conversion to complete. */
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
 while (ADC_STATE_IDLE != status.state)
    {
       (void) R_ADC_B_StatusGet(&g_adc_b0_ctrl, &status);
    }
 /* Read converted data. */
    uint16_t channel_0_conversion_result;
    err = R_ADC_B_Read(&g_adc_b0_ctrl, ADC_CHANNEL_0, &channel_0_conversion_result);
    assert(FSP_SUCCESS == err);
}
```

union adc_b_extended_cfg_t	__unnamed__	
uint32_t	calibration_adc_state	Calibration State register data.
uint32_t	calibration_sample_and_hold	Calibration Sample and Hold register data.
const adc_b_isr_cfg_t *	p_isr_cfg	Pointer to ISR configuration.
union adc_b_extended_cfg_t	__unnamed__	
uint8_t	sample_and_hold_enable_mask	Sample and Hold enable register data.
uint32_t	sample_and_hold_config_012	Sample and Hold configuration register data.
uint32_t	sample_and_hold_config_456	Sample and Hold configuration register data.
uint32_t	conversion_state	ADC 0/1 Successive Approximation Time Configuration.

int32_t	user_offset_tables[8]	User Offset Table register data.
uint32_t	user_gain_tables[8]	User Gain Table register data.
uint32_t	limiter_clip_interrupt_enable_mask	Limiter clip interrupt enable register data.
uint32_t	limiter_clip_tables[8]	Limiter clip Table register data.

◆ adc_b_instance_ctrl_t

struct adc_b_instance_ctrl_t	
ADC instance control block. DO NOT INITIALIZE. Initialized in adc_api_t::open().	
Data Fields	
adc_b_converter_state_t	adc_state
	ADC 0 converter State.
uint32_t	cached_adtrgenr
	Cached conversion peripheral trigger bits, used when starting and stopping scans.
uint32_t	cached_adsystr
	Cached conversion software start bits, used when starting and stopping scans.
uint32_t	trigger_disable_wait_cycles
	ADC clock cycles required to wait after disabling trigger input.
adc_cfg_t const *	p_cfg
	Boolean to verify that the Unit has been initialized.
void(*	p_callback)(adc_callback_args_t *)
	Pointer to callback that is called when an adc_b_event_t occurs.
adc_callback_args_t *	p_callback_memory
	Pointer to non-secure memory that can be used to pass arguments

	to a callback in non-secure memory.
void const *	p_context
	User defined context passed into callback function.
uint32_t	initialized
	Initialized status of ADC_B.
uint32_t	opened
	Open status of ADC_B.

Enumeration Type Documentation

◆ adc_b_clock_source_t

enum adc_b_clock_source_t	
ADC Clock source selection	
Enumerator	
ADC_B_CLOCK_SOURCE_PCLKC	ADC Clock Source PCLKC.
ADC_B_CLOCK_SOURCE_GPT	ADC Clock Source GPT.
ADC_B_CLOCK_SOURCE_PCLKA	ADC Clock Source PCLKA.

◆ adc_b_clock_divider_t

enum adc_b_clock_divider_t	
ADC clock divider selection	
Enumerator	
ADC_B_CLOCK_DIV_1	ADC Clock Division 1/1.
ADC_B_CLOCK_DIV_2	ADC Clock Division 1/2.
ADC_B_CLOCK_DIV_3	ADC Clock Division 1/3.
ADC_B_CLOCK_DIV_4	ADC Clock Division 1/4.
ADC_B_CLOCK_DIV_5	ADC Clock Division 1/5.
ADC_B_CLOCK_DIV_6	ADC Clock Division 1/6.
ADC_B_CLOCK_DIV_7	ADC Clock Division 1/7.
ADC_B_CLOCK_DIV_8	ADC Clock Division 1/8.

◆ adc_b_converter_mode_t

enum adc_b_converter_mode_t	
ADC_B Conversion Mode	
Enumerator	
ADC_B_CONVERTER_MODE_SINGLE_SCAN	Single scan mode.
ADC_B_CONVERTER_MODE_CONTINUOUS_SCAN	Continuous scan mode.
ADC_B_CONVERTER_MODE_BACKGROUND_SCAN	Background continuous scan mode (Valid for Hybrid mode only)

◆ adc_b_conversion_method_t

enum adc_b_conversion_method_t	
ADC_B Conversion Method	
Enumerator	
ADC_B_CONVERSION_METHOD_SAR	SAR conversion method.
ADC_B_CONVERSION_METHOD_OVERSAMPLE	Oversampling conversion method.
ADC_B_CONVERSION_METHOD_HYBRID	Hybrid conversion method.

◆ adc_b_data_format_t

enum adc_b_data_format_t	
ADC_B data data format definitions	
Enumerator	
ADC_B_DATA_FORMAT_16_BIT	16 bit adc_b data format
ADC_B_DATA_FORMAT_14_BIT	14 bit adc_b data format
ADC_B_DATA_FORMAT_12_BIT	12 bit adc_b data format
ADC_B_DATA_FORMAT_10_BIT	10 bit adc_b data format

◆ adc_b_virtual_channel_t

enum adc_b_virtual_channel_t	
ADC channels	
Enumerator	
ADC_B_VIRTUAL_CHANNEL_0	ADC B virtual channel 0.
ADC_B_VIRTUAL_CHANNEL_1	ADC B virtual channel 1.
ADC_B_VIRTUAL_CHANNEL_2	ADC B virtual channel 2.
ADC_B_VIRTUAL_CHANNEL_3	ADC B virtual channel 3.
ADC_B_VIRTUAL_CHANNEL_4	ADC B virtual channel 4.
ADC_B_VIRTUAL_CHANNEL_5	ADC B virtual channel 5.
ADC_B_VIRTUAL_CHANNEL_6	ADC B virtual channel 6.
ADC_B_VIRTUAL_CHANNEL_7	ADC B virtual channel 7.
ADC_B_VIRTUAL_CHANNEL_8	ADC B virtual channel 8.
ADC_B_VIRTUAL_CHANNEL_9	ADC B virtual channel 9.
ADC_B_VIRTUAL_CHANNEL_10	ADC B virtual channel 10.
ADC_B_VIRTUAL_CHANNEL_11	ADC B virtual channel 11.
ADC_B_VIRTUAL_CHANNEL_12	ADC B virtual channel 12.
ADC_B_VIRTUAL_CHANNEL_13	ADC B virtual channel 13.
ADC_B_VIRTUAL_CHANNEL_14	ADC B virtual channel 14.
ADC_B_VIRTUAL_CHANNEL_15	ADC B virtual channel 15.
ADC_B_VIRTUAL_CHANNEL_16	ADC B virtual channel 16.
ADC_B_VIRTUAL_CHANNEL_17	ADC B virtual channel 17.
ADC_B_VIRTUAL_CHANNEL_18	ADC B virtual channel 18.
ADC_B_VIRTUAL_CHANNEL_19	ADC B virtual channel 19.
ADC_B_VIRTUAL_CHANNEL_20	ADC B virtual channel 20.

ADC_B_VIRTUAL_CHANNEL_21	ADC B virtual channel 21.
ADC_B_VIRTUAL_CHANNEL_22	ADC B virtual channel 22.
ADC_B_VIRTUAL_CHANNEL_23	ADC B virtual channel 23.
ADC_B_VIRTUAL_CHANNEL_24	ADC B virtual channel 24.
ADC_B_VIRTUAL_CHANNEL_25	ADC B virtual channel 25.
ADC_B_VIRTUAL_CHANNEL_26	ADC B virtual channel 26.
ADC_B_VIRTUAL_CHANNEL_27	ADC B virtual channel 27.
ADC_B_VIRTUAL_CHANNEL_28	ADC B virtual channel 28.
ADC_B_VIRTUAL_CHANNEL_29	ADC B virtual channel 29.
ADC_B_VIRTUAL_CHANNEL_30	ADC B virtual channel 30.
ADC_B_VIRTUAL_CHANNEL_31	ADC B virtual channel 31.
ADC_B_VIRTUAL_CHANNEL_32	ADC B virtual channel 32.
ADC_B_VIRTUAL_CHANNEL_33	ADC B virtual channel 33.
ADC_B_VIRTUAL_CHANNEL_34	ADC B virtual channel 34.
ADC_B_VIRTUAL_CHANNEL_35	ADC B virtual channel 35.
ADC_B_VIRTUAL_CHANNEL_36	ADC B virtual channel 36.

◆ adc_b_channel_mask_t

enum adc_b_channel_mask_t	
ADC channel mask	
Enumerator	
ADC_B_CHANNEL_MASK_0	Channel 0.
ADC_B_CHANNEL_MASK_1	Channel 1.
ADC_B_CHANNEL_MASK_2	Channel 2.
ADC_B_CHANNEL_MASK_3	Channel 3.
ADC_B_CHANNEL_MASK_4	Channel 4.
ADC_B_CHANNEL_MASK_5	Channel 5.
ADC_B_CHANNEL_MASK_6	Channel 6.
ADC_B_CHANNEL_MASK_7	Channel 7.
ADC_B_CHANNEL_MASK_8	Channel 8.
ADC_B_CHANNEL_MASK_9	Channel 9.
ADC_B_CHANNEL_MASK_10	Channel 10.
ADC_B_CHANNEL_MASK_11	Channel 11.
ADC_B_CHANNEL_MASK_12	Channel 12.
ADC_B_CHANNEL_MASK_13	Channel 13.
ADC_B_CHANNEL_MASK_14	Channel 14.
ADC_B_CHANNEL_MASK_15	Channel 15.
ADC_B_CHANNEL_MASK_16	Channel 16.
ADC_B_CHANNEL_MASK_17	Channel 17.
ADC_B_CHANNEL_MASK_18	Channel 18.
ADC_B_CHANNEL_MASK_19	Channel 19.
ADC_B_CHANNEL_MASK_20	Channel 20.

ADC_B_CHANNEL_MASK_21	Channel 21.
ADC_B_CHANNEL_MASK_22	Channel 22.
ADC_B_CHANNEL_MASK_23	Channel 23.
ADC_B_CHANNEL_MASK_24	Channel 24.
ADC_B_CHANNEL_MASK_25	Channel 25.
ADC_B_CHANNEL_MASK_26	Channel 26.
ADC_B_CHANNEL_MASK_27	Channel 27.
ADC_B_CHANNEL_MASK_28	Channel 28.
ADC_B_CHANNEL_MASK_DIAGNOSIS	Self-Diagnosis Channel.
ADC_B_CHANNEL_MASK_TEMPERATURE	Temperature sensor channel.
ADC_B_CHANNEL_MASK_VOLT	Voltage Reference channel.
ADC_B_CHANNEL_MASK_DAC0	DAC 0 Channel.
ADC_B_CHANNEL_MASK_DAC1	DAC 1 Channel.
ADC_B_CHANNEL_MASK_DAC2	DAC 2 Channel.
ADC_B_CHANNEL_MASK_DAC3	DAC 3 Channel.

◆ adc_b_limit_clip_table_id_t

enum adc_b_limit_clip_table_id_t	
ADC limiter clipping table id selection options	
Enumerator	
ADC_B_LIMIT_CLIP_TABLE_SELECTION_NONE	Limiter Clip Disabled.
ADC_B_LIMIT_CLIP_TABLE_SELECTION_0	Limiter Clip Table 0.
ADC_B_LIMIT_CLIP_TABLE_SELECTION_1	Limiter Clip Table 1.
ADC_B_LIMIT_CLIP_TABLE_SELECTION_2	Limiter Clip Table 2.
ADC_B_LIMIT_CLIP_TABLE_SELECTION_3	Limiter Clip Table 3.
ADC_B_LIMIT_CLIP_TABLE_SELECTION_4	Limiter Clip Table 4.
ADC_B_LIMIT_CLIP_TABLE_SELECTION_5	Limiter Clip Table 5.
ADC_B_LIMIT_CLIP_TABLE_SELECTION_6	Limiter Clip Table 6.
ADC_B_LIMIT_CLIP_TABLE_SELECTION_7	Limiter Clip Table 7.

◆ adc_b_unit_id_t

enum adc_b_unit_id_t	
ADC unit selection options	
Enumerator	
ADC_B_UNIT_ID_0	ADC Unit ID 0.
ADC_B_UNIT_ID_1	ADC Unit ID 1.

◆ adc_b_unit_mask_t

enum adc_b_unit_mask_t	
ADC unit selection options	
Enumerator	
ADC_B_UNIT_MASK_0	ADC Unit Mask 0.
ADC_B_UNIT_MASK_1	ADC Unit Mask 1.
ADC_B_UNIT_MASK_UNDEFINED	ADC Unit Mask Unknown.

◆ adc_b_add_avg_mode_t

enum adc_b_add_avg_mode_t	
ADC data sample addition and averaging options	
Enumerator	
ADC_B_ADD_AVERAGE_OFF	Add/Average turned off for channels/sensors.
ADC_B_ADD_AVERAGE_ADDITION_ENABLE	Addition Mode Enabled.
ADC_B_ADD_AVERAGE_AVERAGE_ENABLE	Average Mode Enabled.

◆ adc_b_add_avg_count_t

enum adc_b_add_avg_count_t	
ADC data sample addition and averaging options	
Enumerator	
ADC_B_ADD_AVERAGE_1	Addition turned off for channels/sensors.
ADC_B_ADD_AVERAGE_2	Add/Average 2 samples.
ADC_B_ADD_AVERAGE_4	Add/Average 4 samples.
ADC_B_ADD_AVERAGE_8	Add/Average 8 samples.
ADC_B_ADD_AVERAGE_16	Add/Average 16 samples.
ADC_B_ADD_AVERAGE_32	Add/Average 32 samples.
ADC_B_ADD_AVERAGE_64	Add/Average 64 samples.
ADC_B_ADD_AVERAGE_128	Add/Average 128 samples.
ADC_B_ADD_AVERAGE_256	Add/Average 256 samples.
ADC_B_ADD_AVERAGE_512	Add/Average 512 samples.
ADC_B_ADD_AVERAGE_1024	Add/Average 1024 samples.

◆ adc_b_gpt_trigger_t

enum adc_b_gpt_trigger_t	
ADC GPT Trigger options	
Enumerator	
ADC_B_GPT_TRIGGER_NONE	GPT Trigger Disabled.
ADC_B_GPT_TRIGGER_A0	GPT Trigger A0.
ADC_B_GPT_TRIGGER_A1	GPT Trigger A1.
ADC_B_GPT_TRIGGER_A2	GPT Trigger A2.
ADC_B_GPT_TRIGGER_A3	GPT Trigger A3.
ADC_B_GPT_TRIGGER_A4	GPT Trigger A4.

ADC_B_GPT_TRIGGER_A5	GPT Trigger A5.
ADC_B_GPT_TRIGGER_A6	GPT Trigger A6.
ADC_B_GPT_TRIGGER_A7	GPT Trigger A7.
ADC_B_GPT_TRIGGER_A8	GPT Trigger A8.
ADC_B_GPT_TRIGGER_A9	GPT Trigger A9.
ADC_B_GPT_TRIGGER_B0	GPT Trigger B0.
ADC_B_GPT_TRIGGER_B1	GPT Trigger B1.
ADC_B_GPT_TRIGGER_B2	GPT Trigger B2.
ADC_B_GPT_TRIGGER_B3	GPT Trigger B3.
ADC_B_GPT_TRIGGER_B4	GPT Trigger B4.
ADC_B_GPT_TRIGGER_B5	GPT Trigger B5.
ADC_B_GPT_TRIGGER_B6	GPT Trigger B6.
ADC_B_GPT_TRIGGER_B7	GPT Trigger B7.
ADC_B_GPT_TRIGGER_B8	GPT Trigger B8.
ADC_B_GPT_TRIGGER_B9	GPT Trigger B9.

◆ adc_b_external_trigger_t

enum adc_b_external_trigger_t	
ADC External Trigger options	
Enumerator	
ADC_B_EXTERNAL_TRIGGER_NONE	External Trigger Disabled.
ADC_B_EXTERNAL_TRIGGER_ADTRG0	External Trigger ADTRG0 Selection.
ADC_B_EXTERNAL_TRIGGER_ADTRG1	External Trigger ADTRG1 Selection.

◆ adc_b_self_diagnosis_mode_t

enum adc_b_self_diagnosis_mode_t	
ADC Self-Diagnosis mode options	
Enumerator	
ADC_B_SELF_DIAGNOSIS_DISABLED	Self-Diagnosis Disabled.
ADC_B_SELF_DIAGNOSIS_MODE_1	Self-Diagnosis Mode 1.
ADC_B_SELF_DIAGNOSIS_MODE_2	Self-Diagnosis Mode 2.
ADC_B_SELF_DIAGNOSIS_MODE_3	Self-Diagnosis Mode 3.

◆ adc_b_sample_and_hold_mask_t

enum adc_b_sample_and_hold_mask_t	
ADC Sample-and-Hold unit enable mask	
Enumerator	
ADC_B_SAMPLE_AND_HOLD_MASK_NONE	Sample-and-Hold Disabled.
ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_0	Sample-and-Hold Unit 0.
ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_1	Sample-and-Hold Unit 1.
ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_2	Sample-and-Hold Unit 2.
ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_4	Sample-and-Hold Unit 3.
ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_5	Sample-and-Hold Unit 4.
ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_6	Sample-and-Hold Unit 5.

◆ adc_b_pga_gain_t

enum adc_b_pga_gain_t	
ADC PGA Gain	
Enumerator	
ADC_B_PGA_GAIN_DISABLED	PGA Gain Disabled.
ADC_B_PGA_GAIN_DIFFERENTIAL_1_500	PGA Gain Setting 1.500.
ADC_B_PGA_GAIN_DIFFERENTIAL_2_333	PGA Gain Setting 2.333.
ADC_B_PGA_GAIN_DIFFERENTIAL_4_000	PGA Gain Setting 4.000.
ADC_B_PGA_GAIN_DIFFERENTIAL_5_667	PGA Gain Setting 5.667.
ADC_B_PGA_GAIN_SINGLE_ENDED_2_500	PGA Gain Setting 2.500.
ADC_B_PGA_GAIN_SINGLE_ENDED_2_667	PGA Gain Setting 2.667.
ADC_B_PGA_GAIN_SINGLE_ENDED_2_857	PGA Gain Setting 2.857.
ADC_B_PGA_GAIN_SINGLE_ENDED_3_077	PGA Gain Setting 3.077.
ADC_B_PGA_GAIN_SINGLE_ENDED_3_333	PGA Gain Setting 3.333.
ADC_B_PGA_GAIN_SINGLE_ENDED_3_636	PGA Gain Setting 3.636.
ADC_B_PGA_GAIN_SINGLE_ENDED_4_000	PGA Gain Setting 4.000.
ADC_B_PGA_GAIN_SINGLE_ENDED_4_444	PGA Gain Setting 4.444.
ADC_B_PGA_GAIN_SINGLE_ENDED_5_000	PGA Gain Setting 5.000.
ADC_B_PGA_GAIN_SINGLE_ENDED_5_714	PGA Gain Setting 5.714.
ADC_B_PGA_GAIN_SINGLE_ENDED_6_667	PGA Gain Setting 6.667.
ADC_B_PGA_GAIN_SINGLE_ENDED_8_000	PGA Gain Setting 8.000.
ADC_B_PGA_GAIN_SINGLE_ENDED_10_000	PGA Gain Setting 10.000.
ADC_B_PGA_GAIN_SINGLE_ENDED_13_333	PGA Gain Setting 13.333.

◆ adc_b_digital_filter_selection_t

enum adc_b_digital_filter_selection_t	
ADC Digital Filter Selection	
Enumerator	
ADC_B_DIGITAL_FILTER_MODE_SINC3	Digital filter Sinc3 filter (Oversampling Rate = 8)
ADC_B_DIGITAL_FILTER_MODE_PHASE	Digital filter Minimum phase filter (Group delay < 2)

◆ adc_b_sampling_state_table_id_t

enum adc_b_sampling_state_table_id_t	
ADC Sampling State table selection options	
Enumerator	
ADC_B_SAMPLING_STATE_TABLE_0	Sampling State Table 0.
ADC_B_SAMPLING_STATE_TABLE_1	Sampling State Table 1.
ADC_B_SAMPLING_STATE_TABLE_2	Sampling State Table 2.
ADC_B_SAMPLING_STATE_TABLE_3	Sampling State Table 3.
ADC_B_SAMPLING_STATE_TABLE_4	Sampling State Table 4.
ADC_B_SAMPLING_STATE_TABLE_5	Sampling State Table 5.
ADC_B_SAMPLING_STATE_TABLE_6	Sampling State Table 6.
ADC_B_SAMPLING_STATE_TABLE_7	Sampling State Table 7.
ADC_B_SAMPLING_STATE_TABLE_8	Sampling State Table 8.
ADC_B_SAMPLING_STATE_TABLE_9	Sampling State Table 9.
ADC_B_SAMPLING_STATE_TABLE_10	Sampling State Table 10.
ADC_B_SAMPLING_STATE_TABLE_11	Sampling State Table 12.
ADC_B_SAMPLING_STATE_TABLE_12	Sampling State Table 13.
ADC_B_SAMPLING_STATE_TABLE_13	Sampling State Table 14.
ADC_B_SAMPLING_STATE_TABLE_14	Sampling State Table 15.
ADC_B_SAMPLING_STATE_TABLE_15	Sampling State Table 16.

◆ adc_b_user_gain_table_id_t

enum adc_b_user_gain_table_id_t	
ADC User Gain table options	
Enumerator	
ADC_B_USER_GAIN_TABLE_SELECTION_DISABLED	User Gain disabled.
ADC_B_USER_GAIN_TABLE_SELECTION_0	User Gain table 0.
ADC_B_USER_GAIN_TABLE_SELECTION_1	User Gain table 1.
ADC_B_USER_GAIN_TABLE_SELECTION_2	User Gain table 2.
ADC_B_USER_GAIN_TABLE_SELECTION_3	User Gain table 3.
ADC_B_USER_GAIN_TABLE_SELECTION_4	User Gain table 4.
ADC_B_USER_GAIN_TABLE_SELECTION_5	User Gain table 5.
ADC_B_USER_GAIN_TABLE_SELECTION_6	User Gain table 6.
ADC_B_USER_GAIN_TABLE_SELECTION_7	User Gain table 7.

◆ adc_b_user_offset_table_selection_id_t

enum adc_b_user_offset_table_selection_id_t	
ADC User Offset table options	
Enumerator	
ADC_B_USER_OFFSET_TABLE_SELECTION_DISABLED	User Offset disabled.
ADC_B_USER_OFFSET_TABLE_SELECTION_0	User Offset table 0.
ADC_B_USER_OFFSET_TABLE_SELECTION_1	User Offset table 1.
ADC_B_USER_OFFSET_TABLE_SELECTION_2	User Offset table 2.
ADC_B_USER_OFFSET_TABLE_SELECTION_3	User Offset table 3.
ADC_B_USER_OFFSET_TABLE_SELECTION_4	User Offset table 4.
ADC_B_USER_OFFSET_TABLE_SELECTION_5	User Offset table 5.
ADC_B_USER_OFFSET_TABLE_SELECTION_6	User Offset table 6.
ADC_B_USER_OFFSET_TABLE_SELECTION_7	User Offset table 7.

Function Documentation

◆ R_ADC_B_Open()

fsp_err_t R_ADC_B_Open (adc_ctrl_t * *p_ctrl*, adc_cfg_t const *const *p_cfg*)

Sets the operational mode, trigger sources, interrupt priority, and configurations for the peripheral as a whole. If provided, the function registers a callback function pointer for notifying the user whenever a scan has completed, error has occurred, FIFO read request is generated, or other ADC interrupt event occurrs. Implements adc_api_t::open.

Return values

FSP_SUCCESS	Module is ready for use.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_ALREADY_OPEN	The instance control structure has already been opened.

◆ R_ADC_B_ScanCfg()

fsp_err_t R_ADC_B_ScanCfg (adc_ctrl_t * *p_ctrl*, void const *const *p_scan_cfg*)

Configures the ADC_B scan parameters. Channel specific settings are set in this function. Pass a pointer to adc_b_scan_cfg_t to p_channel_cfg. Implements adc_api_t::scanCfg.

Note

This starts group B scans if adc_b_scan_cfg_t::priority_group_a is set to ADC_B_GROUP_A_GROUP_B_CONTINUOUS_SCAN.

Return values

FSP_SUCCESS	Channel specific settings applied.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_INVALID_STATE	Invalid Scan Configuration.
FSP_ERR_INVALID_CHANNEL	Invalid configured channel for group converter id.

◆ R_ADC_B_CallbackSet()

fsp_err_t R_ADC_B_CallbackSet (adc_ctrl_t *const *p_api_ctrl*, void(*)(adc_callback_args_t *) *p_callback*, void const *const *p_context*, adc_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements adc_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_ADC_B_ScanStart()

fsp_err_t R_ADC_B_ScanStart (adc_ctrl_t * *p_ctrl*)

Enables the hardware trigger for a scan depending on how the triggers were configured in the R_ADC_B_ScanCfg call. If the unit was configured for ELC, GPT, or external hardware triggering, then this function allows the trigger signal to get to the ADC unit. The function is not able to control the generation of the trigger itself. If the unit was configured for software triggering, This function was added to this ADC version for compatability with r_adc driver. For additional flexibility, it is recommended to use R_ADC_B_ScanGroupStart.

Precondition

Call R_ADC_B_ScanCfg after R_ADC_B_Open before starting a scan.
Call R_ADC_B_Calibrate and wait for calibration to complete before starting a scan.

Return values

FSP_SUCCESS	Scan started (software trigger) or hardware triggers enabled.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_INVALID_ARGUMENT	No hardware triggers configured for groups.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit not initialized.
FSP_ERR_INVALID_STATE	Calibration required.

◆ R_ADC_B_ScanGroupStart()

fsp_err_t R_ADC_B_ScanGroupStart (adc_ctrl_t * *p_ctrl*, adc_group_mask_t *group_mask*)

Starts a software scan or enables the hardware trigger for a scan depending on how triggers were configured. If the group was configured for ELC, GPT, or external hardware triggering then this function allows the trigger signal to get to the ADC unit. The function itself is not able to control the generation of peripheral triggers. If the unit was configured for software triggering, then this function starts the software triggered scan.

Note

Except for Group Priority Operation, if ADC0 or ADC1 are currently performing an A/D conversion operation, attempting to start another scan group that uses the same A/D converter will be ignored. This also applies to starting multiple groups at one time. When Group Priority Operation is not enabled, only the lowest numbered group will be started (for each ADC converter), other groups will be ignored.

Precondition

Call R_ADC_B_ScanCfg after R_ADC_B_Open before starting a scan.
Call R_ADC_B_Calibrate and wait for calibration to complete before starting a scan.

Return values

FSP_SUCCESS	Scan started (software trigger) or hardware triggers enabled.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_INVALID_ARGUMENT	An invalid group has been provided.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit not initialized.
FSP_ERR_INVALID_STATE	Calibration required.

◆ R_ADC_B_ScanStop()

fsp_err_t R_ADC_B_ScanStop (adc_ctrl_t * *p_ctrl*)

Disables the hardware trigger for a scan and immediately stops all active converters. This function will abortall active conversions.

Return values

FSP_SUCCESS	All scans stopped.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_INVALID_ARGUMENT	No hardware triggers configured for groups.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit not initialized.

◆ R_ADC_B_StatusGet()

fsp_err_t R_ADC_B_StatusGet (adc_ctrl_t * *p_ctrl*, adc_status_t * *p_status*)

Provides the status of any scan process that was started, including scans started by ELC or external triggers and calibration scans on MCUs that support calibration.

Return values

FSP_SUCCESS	Module status stored in the provided pointer p_status
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ R_ADC_B_Read()

fsp_err_t R_ADC_B_Read (adc_ctrl_t * *p_ctrl*, adc_channel_t const *channel_id*, uint16_t *const *p_data*)

Reads conversion results from a single channel or sensor.

Return values

FSP_SUCCESS	Data read into provided p_data.
FSP_ERR_INVALID_DATA	Accuracy of data cannot be guaranteed. ADC requires calibration or SAR timing settings are irregular.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit not initialized.
FSP_ERR_INVALID_CHANNEL	Invalid channel provided.

◆ R_ADC_B_Read32()

fsp_err_t R_ADC_B_Read32 (adc_ctrl_t * *p_ctrl*, adc_channel_t const *channel_id*, uint32_t *const *p_data*)

Reads conversion results from a single channel or sensor register into a 32-bit result.

Return values

FSP_SUCCESS	Data read into provided p_data.
FSP_ERR_INVALID_DATA	Accuracy of data cannot be guaranteed. ADC requires calibration or SAR timing settings are irregular.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit not initialized.
FSP_ERR_INVALID_CHANNEL	Invalid channel provided.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- adc_api_t::read

◆ R_ADC_B_FifoRead()

fsp_err_t R_ADC_B_FifoRead (adc_ctrl_t * *p_ctrl*, adc_group_mask_t const *group_mask*, adc_b_fifo_read_t *const *p_data*)

Reads conversion results from FIFO for the given group mask.

Return values

FSP_SUCCESS	Data read into provided p_data.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit not initialized.
FSP_ERR_INVALID_ARGUMENT	Invalid group provided.
FSP_ERR_UNDERFLOW	FIFO empty.

◆ R_ADC_B_InfoGet()

fsp_err_t R_ADC_B_InfoGet (adc_ctrl_t * *p_ctrl*, adc_info_t * *p_adc_info*)

Provides the temperature sensor slope and the calibration data for the sensor if available on this MCU. Otherwise, invalid calibration data of 0xFFFFFFFF will be returned.

Return values

FSP_SUCCESS	Info is read into p_adc_info.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit not initialized.

◆ R_ADC_B_Close()

fsp_err_t R_ADC_B_Close (adc_ctrl_t * *p_ctrl*)

This function ends any scan in progress, disables interrupts, and removes power to the A/D peripheral.

Return values

FSP_SUCCESS	Module closed.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ R_ADC_B_Calibrate()

fsp_err_t R_ADC_B_Calibrate (adc_ctrl_t *const *p_ctrl*, void const * *p_extend*)

Initiates calibration of the ADC_B. This function must be called before starting a scan and again whenever ADC_B configuration or state is changed.

Note

Self-calibration is a non-blocking operation. The application should wait for an ADC_EVENT_CALIBRATION_COMPLETE callback before using other ADC_B functionality. The self-calibration process will disable hardware triggers that were previously enabled.

Parameters

[in]	p_ctrl	Pointer to the instance control structure
[in]	p_extend	Unused argument.

Return values

FSP_SUCCESS	Calibration successfully initiated.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ R_ADC_B_OffsetSet()

fsp_err_t R_ADC_B_OffsetSet (adc_ctrl_t *const *p_ctrl*, adc_channel_t const *reg_id*, int32_t *offset*)

adc_api_t::offsetSet is not supported on the ADC_B.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.

5.2.1.3 ADC (r_adc_d)

Modules » Analog

Functions

fsp_err_t	R_ADC_D_Open (adc_ctrl_t *p_ctrl, adc_cfg_t const *const p_cfg)
fsp_err_t	R_ADC_D_ScanCfg (adc_ctrl_t *p_ctrl, void const *const p_channel_cfg)
fsp_err_t	R_ADC_D_CallbackSet (adc_ctrl_t *const p_api_ctrl,

	void(*p_callback)(adc_callback_args_t *), void const *const p_context, adc_callback_args_t *const p_callback_memory)

fsp_err_t	R_ADC_D_SnoozeModeExit (adc_ctrl_t *const p_ctrl)

Detailed Description

Driver for ADC_D version of the ADC12 peripheral on RA MCUs. This module implements the ADC Interface.

Overview

Features

The ADC module supports the following features:

- 8-, 10-, or 12-bit maximum resolution depending on the MCU
- Configure scans to include:
  - Single channel or Scan channels
  - Temperature sensor channel
  - Voltage sensor channel
- Configurable scan start trigger:
  - Software scan triggers with no-wait mode or wait mode
  - Hardware scan triggers with no-wait mode or wait mode (timer expiration, for

example)
- Configurable scan mode:
  - One-shot scan mode, where each trigger starts a single scan
  - Sequential scan mode, where all channels are scanned continuously
- Optional callback when scan completes
  - Generated an interrupt request when ADLL <= ADCRn <= ADUL
  - Generated an interrupt request when ADUL < ADCRn or ADLL > ADCRn
- Test mode support
  - Checking whether the ADC_D converter is operating normally

Configuration

Build Time Configurations for r_adc_d

The following build time configurations are defined in fsp_cfg/r_adc_d_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Internal Reference Voltage Support	• Enabled • Disabled	Disabled	Enable Internal Reference Voltage support for the ADC module.
Snooze Mode Support	• Enabled • Disabled	Disabled	Enable Snooze Mode Support.
Interrupt Support	• Enabled • Disabled	Enabled	Enable Scan End Interrupt support for the ADC module.

Configurations for Analog > ADC (r_adc_d)

This module can be added to the Stacks tab via New Stack > Analog > ADC (r_adc_d).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_adc0	Module name
Resolution	• 12-Bit • 10-Bit • 8-Bit	12-Bit	Specifies the conversion resolution for this unit.
Conversion operation	• One-shot • Sequential	One-shot	Specifies the conversion operation mode.
Operation trigger	• Wait • No-wait	Wait	Specifies the operation trigger mode.

Operation voltage	• Normal 1 • Normal 2 • Low voltage 1 • Low voltage 2	Normal 1	Specifies operation voltage mode.
Conversion Clock (fAD)	• PCLK • PCLK/2 • PCLK/4 • PCLK/8 • PCLK/16 • PCLK/32	PCLK	Specifies divider for conversion clock (fAD).
Input			
Channel Selection Mode	• Select • Scan	Select	Specifies the channel selection mode.
A/D Input channel	Refer to the RA Configuration tool for available options.	Channel 0 (channels 0-3 in scan mode)	Specifies the input channels.
Negative Side Reference Voltage	• VSS • VREFL0	VSS	Selection of the Negative Side Reference Voltage.
Positive Side Reference Voltage	• VCC • VREFH0 • Internal Reference Voltage	VCC	Selection of the Positive Side Reference Voltage.
Interrupts			
Interrupts > Conversion Result upper/lower bound value setting			
Generates an interrupt request (INTAD)	• The interrupt signal is output when the ADLL register <= the ADCRn register <= the ADUL register • The interrupt signal is output when the ADCRn register < the ADLL register or the ADUL register < the ADCRn register	The interrupt signal is output when the ADLL register <= the ADCRn register <= the ADUL register	Specify condition generates an interrupt(INTAD) after each time the ADC scan completes.
Upper bound (ADUL) value	Must be a valid integer	255	Specify the upper limit conversion value that corresponds to the condition to generate an interrupt request (INTAD).

Lower bound (ADLL) value	Must be a valid integer	0	Specify the lower limit conversion value that corresponds to the condition to generate an interrupt request (INTAD).
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the ADC scan completes.
Scan End Interrupt Priority	MCU Specific Options		Select scan end interrupt priority.
Start trigger source	MCU Specific Options		Specifies the trigger type to be used for this unit.

Clock Configuration

The ADC_D conversion clock source may be configured to use ICLK with a selectable division ratio.

The ADC_D clock must be at least 1 MHz when the ADC is used.

Pin Configuration

The ANxxx pins are analog input channels that can be used with the ADC_D.

Usage Notes

ADC_D Operational Conversion

The driver supports two operation conversion mode: One-shot scan and Sequential scan modes. For each time conversion, ADC peripheral only converts for each a pin or group of pins depending on channels selection mode, it can be changed to another pin or group of other pins by calling R_ADC_D_ScanCfg().

Oneshot-scan Mode

In One-shot scan mode, one or group specified channels are scanned once per trigger.

Sequential-scan Mode

In Sequential scan mode, a single trigger is required to start the scan. Scans continue until R_ADC_D_ScanStop() is called.

When Interrupt Is Not Enabled

If interrupts are not enabled, the R_ADC_D_StatusGet API can be used to poll the ADC to determine when the scan has completed. The read API function is used to access the converted ADC result.

When Interrupt Is Enabled

An interrupt is generated depend on setting condition of converted ADC result is in range or out of range of Upper Bound Value (ADUL) and Low Bound Value (ADLL). Please refer to "Figure ADRCK Bit Interrupt Signal Generation Range" in RA0E1 User's Manual (R01UH1040EJ0100).

Selecting Reference Voltage

The ADC_D positive and negative side reference voltages may be configured for selected MCU's. Please refer to the RA Configuration editor in e2 studio for further details.

Note

When the internal reference voltage is selected as the positive side reference voltage. Please refer condition as below

- *Select operation voltage is low-voltage mode 1 or 2.*
- *The conversion clock (fAD) must be range 1 to 2 MHZ.*
- *Do not setting select internal reference voltage or temperature sensor channel as an A/D conversion channel.*

Selecting Internal Reference Voltage or Temperature Sensor channel

When the internal reference voltage or temperature sensor output voltage is selected as the target for A/D conversion, please setting operation voltage is normal mode 2 or low-voltage mode 2.

Note

when using operation voltage is low-voltage mode 2, setting a conversion clock (fAD) is less than or equal 16 MHz.

Selecting Conversion Clock

Range for frequency of Conversion Clock (fAD) depends on frequency of ICK. Please refer table as below.

Frequency of ICLK	Frequency of Conversion Clock (fAD)
4 MHz < ICLK <= 32 MHz	ICLK to ICLK/32
1 MHz <= fCLK <= 4 MHz	ICLK to ICLK/4

Selecting Operation Voltage

The operation voltage is selectable depending on the analog input channel, VREFH0 voltage, operation mode, and ICLK. For detail, refer table A/D Conversion Time Selection in Section A/D Converter (ADC) in RA0E1 User's Manual (R01UH1040EJ0100).

Note

When operation voltage is low-voltage modes 1 or 2 in the Electrical Characteristics section in RA0E1 User's Manual (R01UH1040EJ0100), setting frequency of ICLK should be used with a frequency less than or equal 24 MHz.

ADC_D conversion in Test Mode

The conversion target for testing can be selected by using the **Input > A/D Input channel** property in the module configuration.

Note

For more details on the method of checking, refer to section 25.8 "Testing of the A/D Converter" in RA0E1 User's

Manual (R01UH1040EJ0100).

Using the Temperature Sensor with the ADC_D

The ADC_D HAL module supports reading the data from the on-chip temperature sensor. The value returned from the sensor can be converted into degrees Celsius or Fahrenheit in the application program using the following formula, T = (Vs - V1)/slope + T1, where:

- T: Measured temperature (degrees C)
- Vs: Voltage output by the temperature sensor at the time of temperature measurement (Volts)
- T1: Temperature experimentally measured at one point (degrees C)
- V1: Voltage output by the temperature sensor at the time of measurement of T1 (Volts)
- T2: Temperature at the experimental measurement of another point (degrees C)
- V2: Voltage output by the temperature sensor at the time of measurement of T2 (Volts)
- Slope: Temperature gradient of the temperature sensor (V/degrees C); slope = (V2 - V1)/(T2 - T1)

Note

The slope value can be obtained for each in the Electrical Characteristics Chapter - TSN Characteristics Table, Temperature slope entry.

For the setting flow, see section 25.6.5. "Example of Using the ADC12 when Selecting the Temperature Sensor Output Voltage or Internal Reference Voltage, and Software Trigger No-wait Mode and One-shot Conversion Mode" in RA0E1 User's Manual (R01UH1040EJ0100).

Examples

Basic Example

This is a basic example of minimal use of the ADC_D in an application.

```
/* A channel configuration is generated by the RA Configuration editor based on the
options selected. If additional
 * configurations are desired additional adc_d_channel_cfg_t elements can be defined
and passed to R_ADC_D_ScanCfg. */
adc_d_channel_cfg_t g_adc_d0_channel_cfg =
{
    .channel_input = ADC_CHANNEL_0,
};
void adc_d_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_ADC_D_Open(&g_adc_d0_ctrl, &g_adc_d0_cfg);
 /* Handle any errors. This function should be defined by the user. */
```

```
    assert(FSP_SUCCESS == err);
 /* Enable channels. */
    err = R_ADC_D_ScanCfg(&g_adc_d0_ctrl, &g_adc_d0_channel_cfg);
    assert(FSP_SUCCESS == err);
 /* In software trigger mode, start a scan by calling R_ADC_D_ScanStart(). In other
modes, enable hardware
  * triggers by calling R_ADC_D_ScanStart(). */
    (void) R_ADC_D_ScanStart(&g_adc_d0_ctrl);
 /* Wait for conversion to complete. */
 adc_status_t status;
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
 while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
    {
       (void) R_ADC_D_StatusGet(&g_adc_d0_ctrl, &status);
    }
 /* Read converted data. */
    uint16_t channel1_conversion_result;
    err = R_ADC_D_Read(&g_adc_d0_ctrl, ADC_CHANNEL_0, &channel1_conversion_result);
    assert(FSP_SUCCESS == err);
}
```

Temperature Sensor Example

This example shows how to calculate the MCU temperature using the ADC_D and the temperature sensor.

```
#define ADC_D_EXAMPLE_TEMPERATURE_VOLTAGE_V1 (1050000)
#define ADC_D_EXAMPLE_VCC_MICROVOLT (3300000)
#define ADC_D_EXAMPLE_TEMPERATURE_RESOLUTION (12)
#define ADC_D_EXAMPLE_ADC_TEST_TEMPERATURE_CELSIUS_T1 (25)
#define ADC_PRV_COEFFICIENT (0.5)
void adc_d_temperature_example (void)
{
 /* The following example calculates the temperature using the data provided in the
section
```

```
 * "Temperature Sensor (TSN)" in RA0E1 User's Manual (R01UH1040EJ0100). */
fsp_err_t err = FSP_SUCCESS;
/* Using normal mode 2 when configure temperature channel */
   g_adc_d0_cfg_extend.operation_voltage = ADC_D_VOLTAGE_MODE_NORMAL_2;
   g_adc_d0_cfg_extend.operation_trigger = ADC_D_TRIGGER_MODE_NO_WAIT;
/* Initializes the module. */
   err = R_ADC_D_Open(&g_adc_d0_ctrl, &g_adc_d0_cfg);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
/* Configure temperature channel */
   g_adc_d0_channel_cfg.channel_input = ADC_CHANNEL_TEMPERATURE;
/* Enable temperature sensor. */
   err = R_ADC_D_ScanCfg(&g_adc_d0_ctrl, &g_adc_d0_channel_cfg);
   assert(FSP_SUCCESS == err);
/* Start of A/D conversion */
   (void) R_ADC_D_ScanStart(&g_adc_d0_ctrl);
/* Wait for conversion to complete. */
adc_status_t status;
   status.state = ADC_STATE_SCAN_IN_PROGRESS;
while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
   {
      (void) R_ADC_D_StatusGet(&g_adc_d0_ctrl, &status);
   }
/* The 1st conversion result cannot be used. See Table 25.18 "Setup when temperature
sensor output voltage and
 * internal reference voltage is selected" in RA0E1 User's Manual (R01UH1040EJ0100).
*/
/* Start of A/D conversion */
   (void) R_ADC_D_ScanStart(&g_adc_d0_ctrl);
/* Wait for conversion to complete. */
   status.state = ADC_STATE_SCAN_IN_PROGRESS;
while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
   {
      (void) R_ADC_D_StatusGet(&g_adc_d0_ctrl, &status);
```

```
    }
 /* Read converted data. */
    uint16_t temperature_conversion_result;
    err = R_ADC_D_Read(&g_adc_d0_ctrl, ADC_CHANNEL_0,
&temperature_conversion_result);
    assert(FSP_SUCCESS == err);
 /* If the MCU does not provide calibration data, use the value in the hardware
manual or determine it
  * experimentally. */
 /* Get Calibration data from the MCU if available. */
 adc_info_t adc_info;
    (void) R_ADC_D_InfoGet(&g_adc_d0_ctrl, &adc_info);
 /* NOTE: The slope of the temperature sensor varies from sensor to sensor. Renesas
recommends calculating
  * the slope of the temperature sensor experimentally.
  *
  * This example uses the typical slope provided in Table "TSN characteristics" in
the user manual */
    int32_t slope_uv_per_c = BSP_FEATURE_ADC_TSN_SLOPE;
 /* Formula for calculating temperature copied from section "Temperature Sensor
(TSN)"
  * of the user manual:
  *
  * Using this, the measured temperature can be calculated according to the following
formula.
  *
  * T = (Vs - V1) / Slope + T1 [C]
  * T: Measured temperature (C)
  * Vs: Voltage output by the temperature sensor when the temperature is measured (V)
  * V1: Voltage output by T1(25 C) is 1.05 V. Refer table "TSN characteristics" in
the user manual
  * Slope: Temperature slope given in table "TSN characteristics" -3.3 mV/C
  * T1: Temperature of T1 is 25 C.Refer table "TSN characteristics" in the user
manual
```

```
 */
   int32_t v1_uv = ADC_D_EXAMPLE_TEMPERATURE_VOLTAGE_V1;
/* Refer to chapter "Input Voltage and Conversion Results" in the user manual */
   int32_t vs_uv =
      (int32_t) (((temperature_conversion_result - ADC_PRV_COEFFICIENT) *
ADC_D_EXAMPLE_VCC_MICROVOLT) /
                 ADC_D_EXAMPLE_TEMPERATURE_RESOLUTION);
   int32_t temperature_c =
      (int32_t) ((vs_uv - v1_uv) / slope_uv_per_c +
ADC_D_EXAMPLE_ADC_TEST_TEMPERATURE_CELSIUS_T1);
/* Expect room temperature, break if temperature is outside the range of 20 C to 25
C. */
if ((temperature_c < 20) || (temperature_c > 25))
   {
      __BKPT(0);
   }
}
```

Data Structure Documentation

◆ adc_d_channel_cfg_t

struct adc_d_channel_cfg_t
ADC_D channel(s) configuration

◆ adc_d_extended_cfg_t

struct adc_d_extended_cfg_t		
Extended configuration structure for ADC.		
Data Fields		
adc_d_channel_mode_t	channel_mode	ADC_D channels mode setting.
adc_d_voltage_mode_t	operation_voltage	Voltage mode setting.
adc_d_clock_div_t	conversion_clockdiv	Divider for conversion clock (fAD) setting.
adc_d_trigger_source_t	trigger_source	Trigger source hardware and software setting.
adc_d_trigger_mode_t	operation_trigger	Operation mode wait/no wait setting.
adc_d_conversion_mode_t	conversion_operation	Sequential/one-shot conversion setting.
adc_d_boundary_t	upper_lower_bound	Upper limit and lower limit conversion setting.
adc_d_negative_vref_t	negative_vref	Negative side reference voltage setting.
adc_d_positive_vref_t	positive_vref	Positive side reference voltage setting.
uint8_t	upper_bound_limit	Setting upper limit conversion value.
uint8_t	lower_bound_limit	Setting lower limit conversion value.

◆ adc_d_instance_ctrl_t

struct adc_d_instance_ctrl_t
ADC_D instance control block. DO NOT INITIALIZE. Initialized in adc_api_t::open().

Enumeration Type Documentation

◆ adc_d_channel_mode_t

enum adc_d_channel_mode_t	
ADC_D channels mode selection	
Enumerator	
ADC_D_CHANNEL_MODE_SELECT	Select mode.
ADC_D_CHANNEL_MODE_SCAN	Scan mode.

◆ adc_d_voltage_mode_t

enum adc_d_voltage_mode_t	
Operation voltage mode selection	
Enumerator	
ADC_D_VOLTAGE_MODE_NORMAL_1	Normal 1.
ADC_D_VOLTAGE_MODE_NORMAL_2	Normal 2.
ADC_D_VOLTAGE_MODE_LOW_1	Low voltage 1.
ADC_D_VOLTAGE_MODE_LOW_2	Low voltage 2.

◆ adc_d_clock_div_t

enum adc_d_clock_div_t	
Divider for Conversion Clock (fAD)	
Enumerator	
ADC_D_CLOCK_DIV_32	ADC_D clock division ICLK/32.
ADC_D_CLOCK_DIV_16	ADC_D clock division ICLK/16.
ADC_D_CLOCK_DIV_8	ADC_D clock division ICLK/8.
ADC_D_CLOCK_DIV_4	ADC_D clock division ICLK/4.
ADC_D_CLOCK_DIV_2	ADC_D clock division ICLK/2.
ADC_D_CLOCK_DIV_1	ADC_D clock division ICLK/1.

◆ adc_d_trigger_source_t

enum adc_d_trigger_source_t	
Selection trigger signal	
Enumerator	
ADC_D_TRIGGER_SOURCE_TAU0_TMI01	Timer channel 01 count or capture end interrupt signal.
ADC_D_TRIGGER_SOURCE_RTC_ALARM_OR_PERIOD	Realtime clock interrupt signal.
ADC_D_TRIGGER_SOURCE_TML0_ITL0	32-bit interval timer interrupt signal
ADC_D_TRIGGER_SOURCE_ELC	Event input from ELC.
ADC_D_TRIGGER_SOURCE_SOFTWARE	Software trigger, this option is controlled by bit ADCS, ADCE.

◆ adc_d_trigger_mode_t

enum adc_d_trigger_mode_t	
Select trigger mode	
Enumerator	
ADC_D_TRIGGER_MODE_NO_WAIT	Trigger no-wait mode.
ADC_D_TRIGGER_MODE_WAIT	Trigger wait mode.

◆ adc_d_conversion_mode_t

enum adc_d_conversion_mode_t	
Select conversion operation mode	
Enumerator	
ADC_D_CONVERSION_MODE_SEQUENTIAL	Continuous conversion mode.
ADC_D_CONVERSION_MODE_ONESHOT	Single conversion mode.

◆ adc_d_boundary_t

enum adc_d_boundary_t	
Select the upper limit and lower limit conversion result values	
Enumerator	
ADC_D_BOUNDARY_IN_RANGE	The interrupt signal (INTAD) is output in range ADLL and AULL.
ADC_D_BOUNDARY_OUT_OF_RANGE	The interrupt signal (INTAD) is output out of range ADLL and AULL.

◆ adc_d_negative_vref_t

enum adc_d_negative_vref_t	
The negative side reference voltage selection	
Enumerator	
ADC_D_NEGATIVE_VREF_VSS	Supplied from VSS.
ADC_D_NEGATIVE_VREF_VREFL0	Supplied from VREFL0.

◆ adc_d_positive_vref_t

enum adc_d_positive_vref_t	
The positive side reference voltage selection	
Enumerator	
ADC_D_POSITIVE_VREF_VCC	Supplied from VSS.
ADC_D_POSITIVE_VREF_VREFH0	Supplied from VREFH0.
ADC_D_POSITIVE_VREF_IVREF	Supplied from the internal reference voltage.

Function Documentation

◆ R_ADC_D_Open()

fsp_err_t R_ADC_D_Open (adc_ctrl_t * *p_ctrl*, adc_cfg_t const *const *p_cfg*)

Initialize the ADC_D peripheral. If interrupt is enabled, the function registers a callback function for notifying the user when a scan has completed. Implements adc_api_t::open.

Return values

FSP_SUCCESS	Module is ready for use.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_ALREADY_OPEN	The instance control structure has already been opened.
FSP_ERR_IRQ_BSP_DISABLED	A callback is provided, but the interrupt is not enabled.
FSP_ERR_INVALID_HW_CONDITION	Invalid configuration corresponds to condition HardWare UM.

◆ R_ADC_D_ScanCfg()

fsp_err_t R_ADC_D_ScanCfg (adc_ctrl_t * *p_ctrl*, void const *const *p_channel_cfg*)

Configures the ADC_D scan parameters. Channel specific settings are set in this function. Pass a pointer to adc_d_channel_cfg_t to p_channel_cfg.

Return values

FSP_SUCCESS	Channel specific settings applied.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_INVALID_HW_CONDITION	Invalid configuration corresponds to condition HardWare UM.
FSP_ERR_INVALID_STATE	Invalid Scan Configuration.
FSP_ERR_INVALID_CHANNEL	Channel is invalid.

◆ R_ADC_D_CallbackSet()

fsp_err_t R_ADC_D_CallbackSet (adc_ctrl_t *const *p_api_ctrl*, void(*)(adc_callback_args_t *) *p_callback*, void const *const *p_context*, adc_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements adc_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_ASSERTION	A required pointer is NULL.

◆ R_ADC_D_ScanStart()

fsp_err_t R_ADC_D_ScanStart (adc_ctrl_t * *p_ctrl*)

Starts a software scan or enables the hardware trigger no-wait mode for a scan depending on how the triggers were configured in the R_ADC_D_Open call. If the unit was configured for ELC or interrupt hardware triggering, then this function allows the trigger signal to get to the ADC_D. The function is not able to control the generation of the trigger itself. If the ADC_D was configured for software triggering, then this function starts the software triggered scan.

Precondition

Call R_ADC_D_ScanCfg after R_ADC_D_Open before starting a scan.

Return values

FSP_SUCCESS	Scan started (software trigger) or hardware triggers no-wait mode enabled.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	ADC_D is not open.
FSP_ERR_NOT_INITIALIZED	ADC_D is not initialized.

◆ R_ADC_D_ScanGroupStart()

fsp_err_t R_ADC_D_ScanGroupStart (adc_ctrl_t * *p_ctrl*, adc_group_mask_t *group_id*)

adc_api_t::scanStart is not supported on the ADC_D. Use scanStart instead.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.

◆ R_ADC_D_ScanStop()

fsp_err_t R_ADC_D_ScanStop (adc_ctrl_t * *p_ctrl*)

Disables the hardware trigger for a scan or select mode and immediately stops converters. This function will abort conversions.

Return values

FSP_SUCCESS	Scan stopped (software trigger) or hardware triggers disabled.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit is not initialized.

◆ R_ADC_D_StatusGet()

fsp_err_t R_ADC_D_StatusGet (adc_ctrl_t * *p_ctrl*, adc_status_t * *p_status*)

Provides the status of any scan process that was started, including scans started by ELC or interrupts triggers.

Note

In Hardware no-wait mode, ADCS retains the value 1 after conversion end.

Return values

FSP_SUCCESS	Module status stored in the provided pointer p_status.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	ADC_D is not open.

◆ R_ADC_D_Read()

fsp_err_t R_ADC_D_Read (adc_ctrl_t * *p_ctrl*, adc_channel_t const *reg_id*, uint16_t *const *p_data*)

Reads conversion results from a channel or sensor.

Return values

FSP_SUCCESS	Data read into provided p_data.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit is not initialized.
FSP_ERR_INVALID_MODE	Invalid configuration for channel_mode.

◆ R_ADC_D_Read32()

fsp_err_t R_ADC_D_Read32 (adc_ctrl_t * *p_ctrl*, adc_channel_t const *reg_id*, uint32_t *const *p_data*)

Reads conversion results from a select/scan channel or sensor register into a 32-bit result.

Return values

FSP_SUCCESS	Data read into provided p_data.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	ADC_D is not open.
FSP_ERR_NOT_INITIALIZED	ADC_D is not initialized.
FSP_ERR_INVALID_MODE	Invalid configuration for channel_mode.

◆ R_ADC_D_InfoGet()

fsp_err_t R_ADC_D_InfoGet (adc_ctrl_t * *p_ctrl*, adc_info_t * *p_adc_info*)

Get information of address ADCR to reading the data, determine the size of data that must be read, size data of each transfer, name of the ELC event for the peripheral, name of the peripheral in the ELC list

Return values

FSP_SUCCESS	Information stored in p_adc_info.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	ADC_D is not open.
FSP_ERR_NOT_INITIALIZED	ADC_D is not initialized.

◆ R_ADC_D_Close()

fsp_err_t R_ADC_D_Close (adc_ctrl_t * *p_ctrl*)

This function ends any scan or select mode in progress, disables interrupts, and removes power to the A/D peripheral.

Return values

FSP_SUCCESS	Module closed.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	ADC_D is not open.

◆ R_ADC_D_Calibrate()

fsp_err_t R_ADC_D_Calibrate (adc_ctrl_t *const *p_ctrl*, void const * *p_extend*)

adc_api_t::calibrate is not supported on the ADC_D.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.

◆ R_ADC_D_OffsetSet()

fsp_err_t R_ADC_D_OffsetSet (adc_ctrl_t *const *p_ctrl*, adc_channel_t const *reg_id*, int32_t *offset*)

adc_api_t::offsetSet is not supported on the ADC_D.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.

◆ R_ADC_D_SnoozeModePrepare()

fsp_err_t R_ADC_D_SnoozeModePrepare (adc_ctrl_t *const *p_ctrl*)

Prepare ADC_D to enter snooze mode via a hardware trigger. This function must be called immediately before entering software standby mode in order to allow the configured hardware trigger to transition the MCU from software standby mode to snooze mode and perform an ADC conversion.

Supported modes for requesting snooze mode via hardware trigger:

- channel_mode = ADC_D_CHANNEL_MODE_SELECT, conversion_operation = ADC_D_CONVERSION_MODE_ONESHOT
- channel_mode = ADC_D_CHANNEL_MODE_SCAN, conversion_operation = ADC_D_CONVERSION_MODE_ONESHOT

Parameters

[in]	p_ctrl	Pointer to the ADC control block

Return values

FSP_SUCCESS	ADC is configured to request Snooze mode.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	ADC_D is not open.
FSP_ERR_INVALID_MODE	ADC is in an invalid mode for requesting Snooze mode.

◆ R_ADC_D_SnoozeModeExit()

fsp_err_t R_ADC_D_SnoozeModeExit (adc_ctrl_t *const *p_ctrl*)
After exiting snooze mode, if the ADC_D module was in snooze mode, then this function must be called in order to restore ADC operation to normal mode.

Parameters

[in]	p_ctrl	Pointer to the ADC control block

Return values

FSP_SUCCESS	ADC is configured to request Snooze mode.
FSP_ERR_INVALID_MODE	ADC is in an invalid mode for requesting Snooze mode.

5.2.1.4 Comparator, High-Speed (r_acmphs)

Modules » Analog

Functions

fsp_err_t	R_ACMPHS_Open (comparator_ctrl_t *const p_ctrl, comparator_cfg_t const *const p_cfg)
fsp_err_t	R_ACMPHS_InfoGet (comparator_ctrl_t *const p_ctrl, comparator_info_t *const p_info)
fsp_err_t	R_ACMPHS_OutputEnable (comparator_ctrl_t *const p_ctrl)
fsp_err_t	R_ACMPHS_StatusGet (comparator_ctrl_t *const p_ctrl, comparator_status_t *const p_status)
fsp_err_t	R_ACMPHS_Close (comparator_ctrl_t *p_ctrl)

Detailed Description

Driver for the ACMPHS peripheral on RA MCUs. This module implements the Comparator Interface.

Overview

Features

The ACMPHS HAL module supports the following features:

- Callback on rising edge, falling edge or both
- Configurable debounce filter
- Option for comparator output on VCOUT, CMPOUTn[1], or CMPOUT012[1] pin
- ELC event output

Note

1. This output pin is not available on all MCUs.

Configuration

Build Time Configurations for r_acmphs

The following build time configurations are defined in fsp_cfg/r_acmphs_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Analog > Comparator, High-Speed (r_acmphs)

This module can be added to the Stacks tab via New Stack > Analog > Comparator, High-Speed (r_acmphs).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_comparator0	Module name.
Channel	Value must be a non-negative integer	0	Select the hardware channel.
Trigger Edge Selector	• Rising • Falling • Both Edge	Both Edge	The trigger specifies when a comparator callback event should occur. Unused if the interrupt priority is disabled or the callback is NULL.
Noise Filter	• No Filter • 8 • 16 • 32	No Filter	Select the PCLK divisor for the hardware digital debounce filter. Larger divisors provide a longer debounce and take longer for the output to update.
Maximum status retries (CMPMON)	Must be a valid non-negative integer between 2 and 32-bit maximum value	1024	Maximum number of status retries.

Output Polarity	• Not Inverted • Inverted	Not Inverted	When enabled comparator output is inverted. This affects the output read from R_ACMPHS_StatusGet() , the pin output level, and the edge trigger.
Pin Output	• Disabled • Enabled	Disabled	Turn this on to enable the CMPOUTn signal for this channel. The CMPOUTn signal for each channel is OR'd together and the result is output to VCOUT. More pin output options are available on select MCUs.
Callback	Name must be a valid C symbol	NULL	Define this function in the application. It is called when the Trigger event occurs.
Comparator Interrupt Priority	MCU Specific Options		Select the interrupt priority for the comparator interrupt.
Analog Input Voltage Source (IVCMP)	MCU Specific Options		Select the Analog input voltage source. Channel mentioned in the options represents channel in ACMPHS
Reference Voltage Input Source (IVREF)	MCU Specific Options		Select the Analog reference voltage source. Channel mentioned in the options represents channel in ACMPHS

Clock Configuration

The ACMPHS peripheral is clocked from PCLKB. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Pin Configuration

Comparator output can be enabled or disabled on each channel individually. The VCOUT pin is a logical OR of all comparator outputs.

The IVCMPn pins are used as comparator inputs. The IVREFn pins are used as comparator reference values.

Usage Notes

Noise Filter

When the noise filter is enabled, the ACMPHP0/ACMPHP1 signal is sampled three times based on the sampling clock selected. The filter clock frequency is determined by PCLKB and the comparator_filter_t setting.

Output Polarity

If output polarity is configured as "Inverted" then the VCOUT signal will be inverted and the R_ACMPHS_StatusGet() will return an inverted status.

Limitations

- Once the analog comparator is configured, the program must wait for the stabilization time to elapse before using the comparator.
- When the noise filter is not enabled the hardware requires software debouncing of the output (two consecutive equal values). This is automatically managed in R_ACMPHS_StatusGet but may result in delay or an API error in rare edge cases.
- Constraints apply on the simultaneous use of ACMPHS analog input and ADC analog input. Refer to the "Usage Notes" section in your MCU's User's Manual for the ADC unit(s) for more details.
- To allow ACMPHS0 to cancel Software Standby mode or enter Snooze, set the CSTEN bit to 1 and the CDFS bits to 00 in the CMPCTL0 register.

Examples

Basic Example

The following is a basic example of using the ACMPHS to detect when the analog voltage input to IVCMP rises above the analog voltage input to IVREF. A GPIO output acts as the comparator input and is externally connected to the IVCMP input of the ACMPHS. An analog voltage input should also be supplied to the IVREF input pin.

```
#define ADC_PGA_BYPASS_VALUE (0x9999)
/* Connect this control pin to the IVCMP input of the comparator. This can be any
GPIO pin
 * that is not input only. */
#define ACMPHS_EXAMPLE_CONTROL_PIN (BSP_IO_PORT_05_PIN_03)
volatile uint32_t g_comparator_events = 0U;
/* This callback is called when a comparator event occurs. */
void acmphs_example_callback (comparator_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
    g_comparator_events++;
}
void acmphs_example ()
```

```
{
 fsp_err_t err = FSP_SUCCESS;
 /* Disable pin register write protection, if enabled */
 R_BSP_PinAccessEnable();
 /*
  * Start with the IVCMP pin low. This example assumes the comparator is configured
to trigger
  * when the voltage of the analog input to IVCMP rises above voltage of the analog
input to
  * IVREF.
  */
    (void) R_BSP_PinWrite(ACMPHS_EXAMPLE_CONTROL_PIN, BSP_IO_LEVEL_LOW);
 /* Initialize the ACMPHS module */
    err = R_ACMPHS_Open(&g_comparator_ctrl, &g_comparator_cfg);
    assert(FSP_SUCCESS == err);
 /*
  * If an ADC PGA exists for the analog input pin, then the PGA must be manually
configured in order for the pin to be used as
  * an IVCMP input. This procedure is slightly different depending on the MCU (See
below).
  */
#if BSP_MCU_GROUP_RA6M3
 /* The following applies for MCUs with the ADC peripheral:
  *
  * Bypass the PGA on ADC unit 0.
  * (See Table 50.2 "Input source configuration of the ACMPHS" in the RA6M3 User's
Manual (R01UH0886EJ0100)) */
 R_BSP_MODULE_START(FSP_IP_ADC, 0);
    R_ADC0->ADPGACR   = ADC_PGA_BYPASS_VALUE;
    R_ADC0->ADPGADCR0 = 0;
#elif BSP_MCU_GROUP_RA6T2
 /* The following applies for MCUs with the ADC_B peripheral:
  *
  * Configure PGA on ADC unit 0.
```

```
  * (See Table 36.11 "PGA Settings and Available Related Functions" in the RA6T2
User's Manual (R01UH0951EJ0100)) */
 R_BSP_MODULE_START(FSP_IP_ADC, 0);
    R_ADC_B->ADPGACR[0] = R_ADC_B0_ADPGACR_PGAGEN_Msk;
#endif
 /* Wait for the minimum stabilization wait time before enabling output. */
 comparator_info_t info;
 R_ACMPHS_InfoGet(&g_comparator_ctrl, &info);
 R_BSP_SoftwareDelay(info.min_stabilization_wait_us, BSP_DELAY_UNITS_MICROSECONDS);
 /* Enable the comparator output */
    (void) R_ACMPHS_OutputEnable(&g_comparator_ctrl);
 /* Set the IVCMP pin high. */
    (void) R_BSP_PinWrite(ACMPHS_EXAMPLE_CONTROL_PIN, BSP_IO_LEVEL_HIGH);
 while (0 == g_comparator_events)
    {
 /* Wait for interrupt. */
    }
 comparator_status_t status;
 /* Check status of comparator, Status will be COMPARATOR_STATE_OUTPUT_HIGH */
    (void) R_ACMPHS_StatusGet(&g_comparator_ctrl, &status);
}
```

Function Documentation

◆ R_ACMPHS_Open()

fsp_err_t R_ACMPHS_Open (comparator_ctrl_t *const *p_ctrl*, comparator_cfg_t const *const *p_cfg*)

Configures the comparator and starts operation. Callbacks and pin output are not active until outputEnable() is called. comparator_api_t::outputEnable() should be called after the output has stabilized. Implements comparator_api_t::open().

Comparator inputs must be configured in the application code prior to calling this function.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An input pointer is NULL
FSP_ERR_INVALID_ARGUMENT	An argument is invalid. Window mode (COMPARATOR_MODE_WINDOW) and filter of 1 (COMPARATOR_FILTER_1) are not supported in this implementation.
FSP_ERR_ALREADY_OPEN	The control block is already open or the hardware lock is taken.

◆ R_ACMPHS_InfoGet()

fsp_err_t R_ACMPHS_InfoGet (comparator_ctrl_t *const *p_ctrl*, comparator_info_t *const *p_info*)

Provides the minimum stabilization wait time in microseconds. Implements comparator_api_t::infoGet().

Return values

FSP_SUCCESS	Information stored in p_info.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_ACMPHS_OutputEnable()

fsp_err_t R_ACMPHS_OutputEnable (comparator_ctrl_t *const *p_ctrl*)

Enables the comparator output, which can be polled using comparator_api_t::statusGet(). Also enables pin output and interrupts as configured during comparator_api_t::open(). Implements comparator_api_t::outputEnable().

Return values

FSP_SUCCESS	Comparator output is enabled.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_ACMPHS_StatusGet()

fsp_err_t R_ACMPHS_StatusGet (comparator_ctrl_t *const *p_ctrl*, comparator_status_t *const *p_status*)

Provides the operating status of the comparator. Implements comparator_api_t::statusGet().

Return values

FSP_SUCCESS	Operating status of the comparator is provided in p_status.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.
FSP_ERR_TIMEOUT	The debounce filter is off and 2 consecutive matching values were not read within 1024 attempts.

◆ R_ACMPHS_Close()

fsp_err_t R_ACMPHS_Close (comparator_ctrl_t * *p_ctrl*)

Stops the comparator. Implements comparator_api_t::close().

Return values

FSP_SUCCESS	Instance control block closed successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

5.2.1.5 Comparator, Low-Power (r_acmplp)

Modules » Analog

Functions

fsp_err_t	R_ACMPLP_Open (comparator_ctrl_t *const p_ctrl, comparator_cfg_t const *const p_cfg)
fsp_err_t	R_ACMPLP_InfoGet (comparator_ctrl_t *const p_ctrl, comparator_info_t *const p_info)
fsp_err_t	R_ACMPLP_OutputEnable (comparator_ctrl_t *const p_ctrl)
fsp_err_t	R_ACMPLP_StatusGet (comparator_ctrl_t *const p_ctrl, comparator_status_t *const p_status)
fsp_err_t	R_ACMPLP_Close (comparator_ctrl_t *p_ctrl)

Detailed Description

Driver for the ACMPLP peripheral on RA MCUs. This module implements the Comparator Interface.

Overview

Features

The ACMPLP HAL module supports the following features:

- Normal mode or window mode
- Callback on rising edge, falling edge or both
- Configurable debounce filter
- Option for comparator output on VCOUT pin
- ELC event output

Configuration

Build Time Configurations for r_acmplp

The following build time configurations are defined in fsp_cfg/r_acmplp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Reference Voltage Selection for ACMPLP1	• IVREF0 • IVREF1	IVREF1	ACMPLP1 may optionally be

(Standard mode only)			configured to use IVREF0 as a reference input instead of IVREF1. Note that if IVREF0 is selected, ACMPLP0 and ACMPLP1 must use the same setting for IVREF.

Configurations for Analog > Comparator, Low-Power (r_acmplp)

This module can be added to the Stacks tab via New Stack > Analog > Comparator, Low-Power (r_acmplp).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_comparator0	Module name.
Channel	Value must be a non-negative integer	0	Select the hardware channel.
Mode	• Standard • Window	Standard	In standard mode, comparator output is high if VCMP > VREF. In window mode, comparator output is high if VCMP is outside the range of VREF0 to VREF1.
Trigger	• Rising • Falling • Both Edge	Both Edge	The trigger specifies when a comparator callback event should occur. Unused if the interrupt priority is disabled or the callback is NULL.
Filter	• No sampling (bypass) • Sampling at PCLKB • Sampling at PCLKB/8 • Sampling at PCLKB/32	No sampling (bypass)	Select the PCLK divisor for the hardware digital debounce filter. Larger divisors provide a longer debounce and take longer for the output to update.
Output Polarity	• Not Inverted • Inverted	Not Inverted	When enabled comparator output is inverted. This affects the output read from R_ACMPLP_StatusGet(), the pin output level, and the edge trigger.
Pin Output (VCOUT)	• Disabled	Disabled	Turn this on to include

	• Enabled		the output from this comparator on VCOUT. The comparator output on VCOUT is OR'd with output from all other ACMPHS and ACMPLP comparators.
Vref (Standard mode only)	• Enabled • Disabled	Disabled	If reference voltage selection is enabled then internal reference voltage is used as comparator input
Callback	Name must be a valid C symbol	NULL	Define this function in the application. It is called when the Trigger event occurs.
Comparator Interrupt Priority	MCU Specific Options		Select the interrupt priority for the comparator interrupt.
Analog Input Voltage Source (IVCMP)	MCU Specific Options		Select the comparator input source. Only options for the configured channel are valid.
Reference Voltage Input Source (IVREF)	MCU Specific Options		Select the comparator reference voltage source. If channel 1 is seleected and the 'Reference Voltage Selection (ACMPLP1)' config option is set to IVREF0, select one of the Channel 0 options. In all other cases, only options for the configured channel are valid.

Clock Configuration

The ACMPLP peripheral is clocked from PCLKB. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Pin Configuration

Comparator output can be enabled or disabled on each channel individually. The VCOUT pin is a logical OR of all comparator outputs.

The CMPINn pins are used as comparator inputs. The CMPREFn pins are used as comparator reference values.

Usage Notes

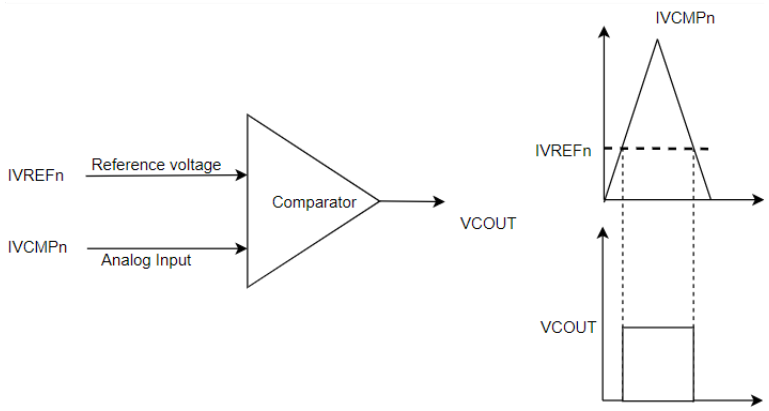

Figure 148: ACMPLP Standard Mode Operation

Noise Filter

When the noise filter is enabled, the ACMPLP0/ACMPLP1 signal is sampled three times based on the sampling clock selected. The filter clock frequency is determined by PCLKB and the comparator_filter_t setting.

Output Polarity

If output polarity is configured as "Inverted" then the VCOUT signal will be inverted and the R_ACMPLP_StatusGet() will return an inverted status.

Window Mode

In window mode, the comparator indicates if the analog input voltage falls within the window (low and high reference voltage) or is outside the window.

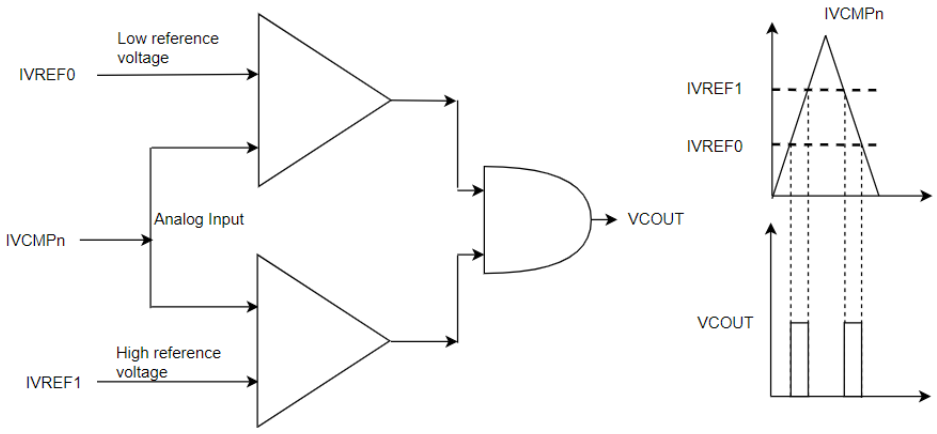

Figure 149: ACMPLP Window Mode Operation

Limitations

- Once the analog comparator is configured, the program must wait for the stabilization time to elapse before using the comparator.

- Low speed is not supported by the ACMPLP driver.

Examples

Basic Example

The following is a basic example of minimal use of the ACMPLP. The comparator is configured to trigger a callback when the input rises above the internal reference voltage (VREF). A GPIO output acts as the comparator input and is externally connected to the CMPIN input of the ACMPLP.

```
/* Connect this control pin to the VCMP input of the comparator. This can be any GPIO
pin
 * that is not input only. */
#define ACMPLP_EXAMPLE_CONTROL_PIN (BSP_IO_PORT_04_PIN_08)
volatile uint32_t g_comparator_events = 0U;
/* This callback is called when a comparator event occurs. */
void acmplp_example_callback (comparator_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
    g_comparator_events++;
}
void acmplp_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /* Disable pin register write protection, if enabled */
 R_BSP_PinAccessEnable();
 /* Start with the VCMP pin low. This example assumes the comparator is configured to
trigger
  * when VCMP rises above VREF. */
    (void) R_BSP_PinWrite(ACMPLP_EXAMPLE_CONTROL_PIN, BSP_IO_LEVEL_LOW);
 /* Initialize the ACMPLP module */
    err = R_ACMPLP_Open(&g_comparator_ctrl, &g_comparator_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Wait for the minimum stabilization wait time before enabling output. */
 comparator_info_t info;
 R_ACMPLP_InfoGet(&g_comparator_ctrl, &info);
 R_BSP_SoftwareDelay(info.min_stabilization_wait_us, BSP_DELAY_UNITS_MICROSECONDS);
```

```
/* Enable the comparator output */
   (void) R_ACMPLP_OutputEnable(&g_comparator_ctrl);
/* Set VCMP low. */
   (void) R_BSP_PinWrite(ACMPLP_EXAMPLE_CONTROL_PIN, BSP_IO_LEVEL_HIGH);
while (0 == g_comparator_events)
   {
/* Wait for interrupt. */
   }
comparator_status_t status;
/* Check status of comparator, Status will be COMPARATOR_STATE_OUTPUT_HIGH */
   (void) R_ACMPLP_StatusGet(&g_comparator_ctrl, &status);
}
```

Enumerations

enum	acmplp_input_t
enum	acmplp_reference_t

Enumeration Type Documentation

◆ acmplp_input_t

enum acmplp_input_t	
Enumerator	
ACMPLP_INPUT_AMPO	Not available on all MCUs.
ACMPLP_INPUT_CMPIN_1	Not available on all MCUs.

◆ acmplp_reference_t

enum acmplp_reference_t	
Enumerator	
ACMPLP_REFERENCE_CMPREF_1	Not available on all MCUs.

Function Documentation

◆ R_ACMPLP_Open()

fsp_err_t R_ACMPLP_Open (comparator_ctrl_t *const *p_ctrl*, comparator_cfg_t const *const *p_cfg*)

Configures the comparator and starts operation. Callbacks and pin output are not active until outputEnable() is called. comparator_api_t::outputEnable() should be called after the output has stabilized. Implements comparator_api_t::open().

Comparator inputs must be configured in the application code prior to calling this function.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An input pointer is NULL
FSP_ERR_INVALID_ARGUMENT	An argument is invalid. Window mode (COMPARATOR_MODE_WINDOW) and filter of 1 (COMPARATOR_FILTER_1) are not supported in this implementation. p_cfg->p_callback is not NULL, but ISR is not enabled. ISR must be enabled to use callback function.
FSP_ERR_ALREADY_OPEN	The control block is already open or the hardware lock is taken.
FSP_ERR_IN_USE	The channel is already in use.

◆ R_ACMPLP_InfoGet()

fsp_err_t R_ACMPLP_InfoGet (comparator_ctrl_t *const *p_ctrl*, comparator_info_t *const *p_info*)

Provides the minimum stabilization wait time in microseconds. Implements comparator_api_t::infoGet().

Return values

FSP_SUCCESS	Information stored in p_info.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_ACMPLP_OutputEnable()

fsp_err_t R_ACMPLP_OutputEnable (comparator_ctrl_t *const *p_ctrl*)

Enables the comparator output, which can be polled using comparator_api_t::statusGet(). Also enables pin output and interrupts as configured during comparator_api_t::open(). Implements comparator_api_t::outputEnable().

Return values

FSP_SUCCESS	Comparator output is enabled.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_ACMPLP_StatusGet()

fsp_err_t R_ACMPLP_StatusGet (comparator_ctrl_t *const *p_ctrl*, comparator_status_t *const *p_status*)

Provides the operating status of the comparator. Implements comparator_api_t::statusGet().

Return values

FSP_SUCCESS	Operating status of the comparator is provided in p_status.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_ACMPLP_Close()

fsp_err_t R_ACMPLP_Close (comparator_ctrl_t * *p_ctrl*)

Stops the comparator. Implements comparator_api_t::close().

Return values

FSP_SUCCESS	Instance control block closed successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

5.2.1.6 DAC (r_dac)

Modules » Analog

Functions

fsp_err_t	R_DAC_Open (dac_ctrl_t *p_api_ctrl, dac_cfg_t const *const p_cfg)
fsp_err_t	R_DAC_Write (dac_ctrl_t *p_api_ctrl, uint16_t value)
fsp_err_t	R_DAC_Start (dac_ctrl_t *p_api_ctrl)
fsp_err_t	R_DAC_Stop (dac_ctrl_t *p_api_ctrl)
fsp_err_t	R_DAC_Close (dac_ctrl_t *p_api_ctrl)

Detailed Description

Driver for the DAC12 peripheral on RA MCUs. This module implements the DAC Interface.

Overview

Features

The DAC module outputs one of 4096 voltage levels between the positive and negative reference voltages.

- Supports setting left-justified or right-justified 12-bit value format for the 16-bit input data registers
- Supports output amplifiers on selected MCUs
- Supports charge pump on selected MCUs
- Supports synchronization with the Analog-to-Digital Converter (ADC) module

Configuration

Note

For MCUs supporting more than one channel, the following configuration options are shared by all the DAC channels:

- *Synchronize with ADC*
- *Data Format*
- *Charge Pump*

Build Time Configurations for r_dac

The following build time configurations are defined in fsp_cfg/r_dac_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Analog > DAC (r_dac)

This module can be added to the Stacks tab via New Stack > Analog > DAC (r_dac). Non-secure

callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_dac0	Module name.
Channel	Value must be an integer greater than or equal to 0	0	Specify the hardware channel.
Synchronize with ADC	MCU Specific Options		Enable DA/AD synchronization.
Data Format	• Right Justified • Left Justified	Right Justified	Specify the DAC data format.
Output Amplifier	MCU Specific Options		Enable the DAC output amplifier.
Charge Pump (Requires MOCO active)	MCU Specific Options		Enable the DAC charge pump.
Internal Output	MCU Specific Options		Enable DAC output to internal modules.
ELC Trigger Source	MCU Specific Options		ELC event source that will trigger the DAC to start a conversion.
Reference Voltage	MCU Specific Options		Select the DAC reference voltage.

Clock Configuration

The DAC peripheral module uses PCLKB as its clock source.

Pin Configuration

The DAn pins are used as analog outputs. Each DAC channel has one output pin.

The AVCC0 and AVSS0 pins are power and ground supply pins for the DAC and ADC.

The VREFH and VREFL pins are top and ground voltage reference pins for the DAC and ADC.

Usage Notes

Charge Pump

The charge pump must be enabled when using DAC pin output while operating at AV_{CC} < 2.7V.

Note

The MOCO must be running to use the charge pump.
If the DAC output is to be routed to an internal signal, do not enable the charge pump.

Output to Internal Modules

The DAC output can be used as an analog input to other peripherals on the MCU (eg. ACMPHS, ADC) without outputting the voltage to an external pin.

On some MCUs this functionality must be enabled during configuration using dac_extended_cfg_t::internal_output_enabled. When internal output is enabled, the DAC output will be routed to internal modules. If the DAC output amplifier is enabled or when internal output is disabled, the output will be routed to the DAC output pin (DAn).

Synchronization with ADC

When ADC synchronization is enabled and an ADC conversion is in progress, if a DAC conversion is started it will automatically be delayed until after the ADC conversion is complete.

Limitations

- For MCUs supporting ADC unit 1:
  - Once synchronization between DAC and ADC unit 1 is turned on during R_DAC_Open synchronization cannot be turned off by the driver. In order to desynchronize DAC with ADC unit 1, manually clear DAADSCR.DAADST to 0 when the ADCSR.ADST bit is 0 and ADC unit 1 is halted.
  - The DAC module can only be synchronized with ADC unit 1.
  - For MCUs having more than 1 DAC channel, both channels are synchronized with ADC unit 1 if synchronization is enabled.

Examples

Basic Example

This is a basic example of minimal use of the R_DAC in an application. This example shows how this driver can be used for basic Digital to Analog Conversion operations.

```
void basic_example (void)
{
 fsp_err_t err;
    uint16_t value;
 /* Pin configuration: Output enable DA0 as Analog. */
 /* Initialize the DAC channel */
    err = R_DAC_Open(&g_dac_ctrl, &g_dac_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    value = (uint16_t) DAC_EXAMPLE_VALUE_ABC;
    err = R_DAC_Write(&g_dac_ctrl, value);
    assert(FSP_SUCCESS == err);
    err = R_DAC_Start(&g_dac_ctrl);
    assert(FSP_SUCCESS == err);
```

```
}
```

Data Structures

DAC_VREF_AVCC0_AVSS0	Select AVCC0/AVSS0.
DAC_VREF_IVREF_AVSS0	Select Internal reference voltage/AVSS0.
DAC_VREF_VREFH_VREFL	Select VREFH/VREFL.

Function Documentation

◆ R_DAC_Open()

fsp_err_t R_DAC_Open (dac_ctrl_t * *p_api_ctrl*, dac_cfg_t const *const *p_cfg*)

Perform required initialization described in hardware manual. Implements dac_api_t::open. Configures a single DAC channel, starts the channel, and provides a handle for use with the DAC API Write and Close functions. Must be called once prior to calling any other DAC API functions. After a channel is opened, Open should not be called again for the same channel without calling Close first.

Return values

FSP_SUCCESS	The channel was successfully opened.
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: 1. One or both of the following parameters may be NULL: p_api_ctrl or p_cfg 2. data_format value in p_cfg is out of range. 3. Extended configuration structure is set to NULL for MCU supporting charge pump.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel ID requested in p_cfg may not available on the devices.
FSP_ERR_ALREADY_OPEN	The control structure is already opened.

◆ R_DAC_Write()

fsp_err_t R_DAC_Write (dac_ctrl_t * *p_api_ctrl*, uint16_t *value*)

Write data to the D/A converter and enable the output if it has not been enabled.

Return values

FSP_SUCCESS	Data is successfully written to the D/A Converter.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

◆ R_DAC_Start()

fsp_err_t R_DAC_Start (dac_ctrl_t * *p_api_ctrl*)

Start the D/A conversion output if it has not been started.

Return values

FSP_SUCCESS	The channel is started successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_IN_USE	Attempt to re-start a channel.
FSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

◆ R_DAC_Stop()

fsp_err_t R_DAC_Stop (dac_ctrl_t * *p_api_ctrl*)

Stop the D/A conversion and disable the output signal.

Return values

FSP_SUCCESS	The control is successfully stopped.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

◆ R_DAC_Close()

fsp_err_t R_DAC_Close (dac_ctrl_t * *p_api_ctrl*)
Stop the D/A conversion, stop output, and close the DAC channel. **Return values** FSP_SUCCESS — The channel is successfully closed. FSP_ERR_ASSERTION — p_api_ctrl is NULL. FSP_ERR_NOT_OPEN — Channel associated with p_ctrl has not been opened.

5.2.1.7 DAC8 (r_dac8)

Modules » Analog

Functions

fsp_err_t	R_DAC8_Open (dac_ctrl_t *const p_ctrl, dac_cfg_t const *const p_cfg)
fsp_err_t	R_DAC8_Write (dac_ctrl_t *const p_ctrl, uint16_t value)
fsp_err_t	R_DAC8_Start (dac_ctrl_t *const p_ctrl)
fsp_err_t	R_DAC8_Stop (dac_ctrl_t *const p_ctrl)
fsp_err_t	R_DAC8_Close (dac_ctrl_t *const p_ctrl)

Detailed Description

Driver for the DAC8 peripheral on RA MCUs. This module implements the DAC Interface.

Overview

Features

The DAC8 module outputs one of 256 voltage levels between the positive and negative reference voltages. DAC8 on selected MCUs have below features

- Charge pump control
- Synchronization with the Analog-to-Digital Converter (ADC) module
- Multiple Operation Modes
  - Normal
  - Real-Time (Event Link)

Configuration

Note

For MCUs supporting more than one channel, the following configuration options are shared by all the DAC8 channels:

- *Synchronize with ADC*
- *Charge Pump*

Build Time Configurations for r_dac8

The following build time configurations are defined in fsp_cfg/r_dac8_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Analog > DAC8 (r_dac8)

This module can be added to the Stacks tab via New Stack > Analog > DAC8 (r_dac8).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_dac8_0	Module name.
Channel	Value must be an integer greater than or equal to 0	0	Specify the hardware channel.
D/A A/D Synchronous Conversion	MCU Specific Options		Synchronize the DAC8 update with the ADC to reduce interference with A/D conversions.
DAC Mode	MCU Specific Options		Select the DAC operating mode
Real-time Trigger Event	MCU Specific Options		Specify the event used to trigger conversion in Real-time mode. This setting is only valid when Real-time mode is enabled.
Charge Pump (Requires MOCO active)	MCU Specific Options		Enable the DAC charge pump.

Clock Configuration

The DAC8 peripheral module uses the PCLKB as its clock source.

Pin Configuration

The DA8_n pins are used as analog outputs. Each DAC8 channel has one output pin.

The AVCC0 and AVSS0 pins are power and ground supply and reference pins for the DAC8.

Usage Notes

Charge Pump

The charge pump must be enabled when using DAC8 pin output while operating at AV_{CC} < 2.7V.

Note

The MOCO must be running to use the charge pump.
If DAC8 output is to be routed to an internal signal, do not enable the charge pump.

Synchronization with ADC

When ADC synchronization is enabled and an ADC conversion is in progress, if a DAC8 conversion is started it will automatically be delayed until after the ADC conversion is complete.

Real-time Mode

When Real-time mode is selected, the DAC8 will perform a conversion each time the selected ELC event is received.

Limitations

- Synchronization between DAC8 and ADC is activated when calling R_DAC8_Open. At this point synchronization cannot be deactivated by the driver. In order to desynchronize DAC8 with ADC, manually clear DACADSCR.DACADST to 0 while the ADCSR.ADST bit is 0 and the ADC is halted.
- For MCUs having more than 1 DAC8 channel, both channels are synchronized with ADC if synchronization is enabled.

Examples

Basic Example

This is a basic example of minimal use of the R_DAC8 in an application. This example shows how this driver can be used for basic 8 bit Digital to Analog Conversion operations.

```
dac8_instance_ctrl_t g_dac8_ctrl;
dac_cfg_t g_dac8_cfg =
{
    .channel            = 0U,
    .ad_da_synchronized = false,
    .p_extend          = &g_dac8_cfg_extend
};
void basic_example (void)
{
```

```
fsp_err_t err;
   uint16_t value;
/* Pin configuration: Output enable DA8_0(RA2A1) as Analog. */
/* Initialize the DAC8 channel */
   err = R_DAC8_Open(&g_dac8_ctrl, &g_dac8_cfg);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
   value = (uint8_t) DAC8_EXAMPLE_VALUE_ABC;
/* Write value to DAC module */
   err = R_DAC8_Write(&g_dac8_ctrl, value);
   assert(FSP_SUCCESS == err);
/* Start DAC8 conversion */
   err = R_DAC8_Start(&g_dac8_ctrl);
   assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	dac8_instance_ctrl_t
struct	dac8_extended_cfg_t

Enumerations

enum	dac8_mode_t

Data Structure Documentation

◆ dac8_instance_ctrl_t

struct dac8_instance_ctrl_t
DAC8 instance control block. DO NOT INITIALIZE.

◆ dac8_extended_cfg_t

struct dac8_extended_cfg_t		
DAC8 extended configuration		
Data Fields		
bool	enable_charge_pump	Enable DAC charge pump.
dac8_mode_t	dac_mode	DAC mode.

Enumeration Type Documentation

◆ dac8_mode_t

enum dac8_mode_t	
Enumerator	
DAC8_MODE_NORMAL	DAC Normal mode.
DAC8_MODE_REAL_TIME	DAC Real-time (event link) mode.

Function Documentation

◆ R_DAC8_Open()

fsp_err_t R_DAC8_Open (dac_ctrl_t *const *p_ctrl*, dac_cfg_t const *const *p_cfg*)

Perform required initialization described in hardware manual.

Implements dac_api_t::open.

Configures a single DAC channel. Must be called once prior to calling any other DAC API functions. After a channel is opened, Open should not be called again for the same channel without calling Close first.

Return values

FSP_SUCCESS	The channel was successfully opened.
FSP_ERR_ASSERTION	One or both of the following parameters may be NULL: p_ctrl or p_cfg
FSP_ERR_ALREADY_OPEN	The instance control structure has already been opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	An invalid channel was requested.
FSP_ERR_NOT_ENABLED	Setting DACADSCR is not enabled when ADCSR.ADST = 0.

Note

This function is reentrant for different channels. It is not reentrant for the same channel.

◆ R_DAC8_Write()

fsp_err_t R_DAC8_Write (dac_ctrl_t *const *p_ctrl*, uint16_t *value*)

Write data to the D/A converter.

Return values

FSP_SUCCESS	Data is successfully written to the D/A Converter.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Channel associated with p_instance_ctrl has not been opened.
FSP_ERR_OVERFLOW	Data overflow when data value exceeds 8-bit limit.

◆ R_DAC8_Start()

fsp_err_t R_DAC8_Start (dac_ctrl_t *const *p_ctrl*)

Start the D/A conversion output.

Return values

FSP_SUCCESS	The channel is started successfully.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Channel associated with p_instance_ctrl has not been opened.
FSP_ERR_IN_USE	Attempt to re-start a channel.

◆ R_DAC8_Stop()

fsp_err_t R_DAC8_Stop (dac_ctrl_t *const *p_ctrl*)

Stop the D/A conversion and disable the output signal.

Return values

FSP_SUCCESS	The control is successfully stopped.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Channel associated with p_instance_ctrl has not been opened.

◆ R_DAC8_Close()

fsp_err_t R_DAC8_Close (dac_ctrl_t *const *p_ctrl*)
Stop the D/A conversion, stop output, and close the DAC channel. **Return values** FSP_SUCCESS — The channel is successfully closed. FSP_ERR_ASSERTION — p_ctrl is NULL. FSP_ERR_NOT_OPEN — Channel associated with p_instance_ctrl has not been opened.

Detailed Description

Driver for the OPAMP peripheral on RA MCUs. This module implements the OPAMP Interface.

Overview

The OPAMP HAL module provides a high level API for signal amplification applications and supports

the OPAMP peripheral available on RA MCUs.

Features

- Low power or high-speed mode
- Start by software or AGT compare match
- Stop by software or ADC conversion end (stop by ADC conversion end only supported on op-amp channels configured to start by AGT compare match)
- Trimming available on some MCUs (see hardware manual)

Configuration

Build Time Configurations for r_opamp

The following build time configurations are defined in fsp_cfg/r_opamp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Analog > Operational Amplifier (r_opamp)

This module can be added to the Stacks tab via New Stack > Analog > Operational Amplifier (r_opamp).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_opamp0	Module name.
AGT Start Trigger Configuration (N/A unless AGT Start Trigger is Selected for the Channel)	• AGT1 Compare Match Starts OPAMPs 0 and 2 if configured for AGT Start, AGT0 Compare Match Starts OPAMPs 1 and 3 if configured for AGT Start • AGT1 Compare Match Starts OPAMPs 0 and 1 if configured for AGT Start, AGT0 Compare Match Starts OPAMPs 2 and 3 if configured for AGT Start • AGT1 Compare	AGT1 Compare Match Starts all OPAMPs configured for AGT Start	Configure which AGT channel event triggers which op-amp channel. The AGT compare match event only starts the op-amp channel if the AGT Start trigger is selected in the Trigger configuration for the channel.

	Match Starts all OPAMPs configured for AGT Start		
Power Mode	MCU Specific Options		Configure the op-amp based on power or speed requirements. This setting affects the minimum required stabilization time. Middle speed is not available for all MCUs.
Trigger Channel 0	MCU Specific Options		Select the event triggers to start or stop op-amp channel 0. If the event trigger is selected for start, the start() API enables the event trigger for this channel. If the event trigger is selected for stop, the stop() API disables the event trigger for this channel.
Trigger Channel 1	MCU Specific Options		Select the event triggers to start or stop op-amp channel 1. If the event trigger is selected for start, the start() API enables the event trigger for this channel. If the event trigger is selected for stop, the stop() API disables the event trigger for this channel.
Trigger Channel 2	• Software Start Software Stop • AGT Start Software Stop • AGT Start ADC Stop	Software Start Software Stop	Select the event triggers to start or stop op-amp channel 2. If the event trigger is selected for start, the start() API enables the event trigger for this channel. If the event trigger is selected for stop, the stop() API disables the event trigger for this channel.
Trigger Channel 3	MCU Specific Options		Select the event triggers to start or stop op-amp channel 3. If the event trigger is

		selected for start, the start() API enables the event trigger for this channel. If the event trigger is selected for stop, the stop() API disables the event trigger for this channel.
OPAMP AMP0OS	MCU Specific Options	Select output to connect to AMP0O pin
OPAMP AMP0PS	MCU Specific Options	Select input to connect to AMP0+ pin
OPAMP AMP0MS	MCU Specific Options	Select input to connect to AMP0- pin
OPAMP AMP1PS	MCU Specific Options	Select input to connect to AMP1+ pin
OPAMP AMP1MS	MCU Specific Options	Select input to connect to AMP1- pin
OPAMP AMP2PS	MCU Specific Options	Select input to connect to AMP2+ pin
OPAMP AMP2MS	MCU Specific Options	Select input to connect to AMP2- pin

Clock Configuration

The OPAMP runs on PCLKB.

Pin Configuration

To use the OPAMP HAL module, the port pins for the channels receiving the analog input must be set as inputs on the **Pins** tab of the RA Configuration editor.

Refer to the most recent FSP Release Notes for any additional operational limitations for this module.

Usage Notes

Trimming the OPAMP

- On MCUs that support trimming, the op-amp trim register is set to the factory default after the Open API is called.
- This function allows the application to trim the operational amplifier to a user setting, which overwrites the factory default trim values.
- Supported on selected MCUs. See hardware manual for details.
- Not supported if configured for low power mode (OPAMP_MODE_LOW_POWER).
- This function is not reentrant. Only one side of one op-amp can be trimmed at a time. Complete the procedure for one side of one channel before calling the trim API with the command OPAMP_TRIM_CMD_START again.
    - The trim procedure works as follows:
    - Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_START.
    - Connect a fixed voltage to the Pch (+) input.

- Connect the Nch (-) input to the op-amp output to create a voltage follower.
- Ensure the op-amp is operating and stabilized.
- Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_START.
- Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
- Iterate over the following loop 5 times:
    - Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_NEXT_STEP.
    - Measure the op-amp output using the SAR ADC (referred to as B in the next step).
    - If A <= B, call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_CLEAR_BIT.
- Call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_START.
- Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
- Iterate over the following loop 5 times:
    - Call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_NEXT_STEP.
    - Measure the op-amp output using the SAR ADC (referred to as B in the next step).
    - If A <= B, call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_CLEAR_BIT.

Examples

Basic Example

This is a basic example of minimal use of the R_OPAMP in an application. The example demonstrates configuring OPAMP channel 0 for high speed mode, starting the OPAMP and reading the status of the OPAMP channel running. It also verifies that the stabilization wait time is the expected time for selected power mode

```
#define OPAMP_EXAMPLE_CHANNEL (0U)

void basic_example (void)

{

 fsp_err_t err;

 /* Initialize the OPAMP module. */

    err = R_OPAMP_Open(&g_opamp_ctrl, &g_opamp_cfg);

 /* Handle any errors. This function should be defined by the user. */

    assert(FSP_SUCCESS == err);

 /* Start the OPAMP module. */

    err = R_OPAMP_Start(&g_opamp_ctrl, 1 << OPAMP_EXAMPLE_CHANNEL);

    assert(FSP_SUCCESS == err);

 /* Look up the required stabilization wait time. */

 opamp_info_t info;

    err = R_OPAMP_InfoGet(&g_opamp_ctrl, &info);
```

```
    assert(FSP_SUCCESS == err);
 /* Wait for the OPAMP to stabilize. */
 R_BSP_SoftwareDelay(info.min_stabilization_wait_us, BSP_DELAY_UNITS_MICROSECONDS);
}
```

Trim Example

This example demonstrates the typical trimming procedure for opamp channel 0 using R_OPAMP_Trim() API.

```
#ifndef OPAMP_EXAMPLE_CHANNEL
 #define OPAMP_EXAMPLE_CHANNEL (0U)
#endif
#ifndef OPAMP_EXAMPLE_ADC_CHANNEL
 #define OPAMP_EXAMPLE_ADC_CHANNEL (ADC_CHANNEL_2)
#endif
#define ADC_SCAN_END_DELAY (100U)
#define OPAMP_TRIM_LOOP_COUNT (5)
#define ADC_SCAN_END_MAX_TIMEOUT (0xFFFF)
uint32_t          g_callback_event_counter = 0;
opamp_trim_args_t trim_args_ch =
{
    .channel = OPAMP_EXAMPLE_CHANNEL,
    .input   = OPAMP_TRIM_INPUT_PCH
};
/* This callback is called when ADC Scan Complete event is generated. */
void adc_callback (adc_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
    g_callback_event_counter++;
}
void trimming_example (void)
{
 fsp_err_t err;
 /* On RA2A1, configure negative feedback and put DAC12 signal on AMP0+ Pin. */
```

```
    g_opamp_cfg_extend.plus_input_select_opamp0 = OPAMP_PLUS_INPUT_AMPPS7;
    g_opamp_cfg_extend.minus_input_select_opamp0 = OPAMP_MINUS_INPUT_AMPMS7;
 /* Initialize the OPAMP module. */
    err = R_OPAMP_Open(&g_opamp_ctrl, &g_opamp_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the OPAMP module. */
    err = R_OPAMP_Start(&g_opamp_ctrl, 1 << OPAMP_EXAMPLE_CHANNEL);
    assert(FSP_SUCCESS == err);
 /* Look up the required stabilization wait time. */
 opamp_info_t info;
    err = R_OPAMP_InfoGet(&g_opamp_ctrl, &info);
    assert(FSP_SUCCESS == err);
 /* Wait for the OPAMP to stabilize. */
 R_BSP_SoftwareDelay(info.min_stabilization_wait_us, BSP_DELAY_UNITS_MICROSECONDS);
 /* Call trim() for the Pch (+) side input */
    trim_procedure(&trim_args_ch);
    assert(FSP_SUCCESS == err);
    trim_args_ch.input = OPAMP_TRIM_INPUT_NCH;
 /* Call trim() for the Nch (-) side input */
    trim_procedure(&trim_args_ch);
}
void trim_procedure (opamp_trim_args_t * trim_args)
{
 fsp_err_t err;
 /* Call trim() for the selected channel and input with command OPAMP_TRIM_CMD_START.
*/
    err = R_OPAMP_Trim(&g_opamp_ctrl, OPAMP_TRIM_CMD_START, trim_args);
    assert(FSP_SUCCESS == err);
 /* Measure the fixed voltage connected to the channel input using the SAR ADC and
save the value
  * (referred to as result_a later in this procedure). */
 /* Reset the ADC callback counter */
    g_callback_event_counter = 0;
```

```
   err = R_ADC_ScanStart(&g_adc_ctrl);
   assert(FSP_SUCCESS == err);
/* Wait for ADC scan complete flag */
   uint32_t timeout = ADC_SCAN_END_MAX_TIMEOUT;
while (g_callback_event_counter == 0 && timeout != 0)
   {
      timeout--;
   }
if (0 == timeout)
   {
      err = FSP_ERR_TIMEOUT;
     assert(FSP_SUCCESS == err);
   }
   uint16_t result_a;
   err = R_ADC_Read(&g_adc_ctrl, OPAMP_EXAMPLE_ADC_CHANNEL, &result_a);
   assert(FSP_SUCCESS == err);
/* Iterate over the following loop 5 times: */
/* Call trim() with command OPAMP_TRIM_CMD_NEXT_STEP for the selected channel and
given input. */
   uint8_t count = OPAMP_TRIM_LOOP_COUNT;
while (count > 0)
   {
      count--;
      err = R_OPAMP_Trim(&g_opamp_ctrl, OPAMP_TRIM_CMD_NEXT_STEP, trim_args);
     assert(FSP_SUCCESS == err);
/* Reset the ADC callback counter */
     g_callback_event_counter = 0;
/* Read converted value after trim completes. */
     err = R_ADC_ScanStart(&g_adc_ctrl);
     assert(FSP_SUCCESS == err);
/* Wait for ADC scan complete flag */
      timeout = ADC_SCAN_END_MAX_TIMEOUT;
while (g_callback_event_counter == 0 && timeout != 0)
     {
```

```
        timeout--;
     }
 if (0 == timeout)
     {
        err = FSP_ERR_TIMEOUT;
     assert(FSP_SUCCESS == err);
     }
      uint16_t result_b;
      err = R_ADC_Read(&g_adc_ctrl, OPAMP_EXAMPLE_ADC_CHANNEL, &result_b);
     assert(FSP_SUCCESS == err);
 /* Measure the op-amp output using the SAR ADC (referred to as result_b in the next
step). */
 /* If result_a <= result_b, call trim() for the selected channel and input with
command OPAMP_TRIM_CMD_CLEAR_BIT. */
 if (result_a <= result_b)
     {
           err = R_OPAMP_Trim(&g_opamp_ctrl, OPAMP_TRIM_CMD_CLEAR_BIT, trim_args);
     assert(FSP_SUCCESS == err);
     }
   }
}
```

struct opamp_extended_cfg_t

OPAMP configuration extension. This extension is required and must be provided in opamp_cfg_t::p_extend.

Data Fields

opamp_agt_link_t	agt_link	Configure which AGT links are paired to which channel. Only applies to channels if OPAMP_TRIGGER_AGT_START_SOFTWARE_STOP or OPAMP_TRIGGER_AGT_START_ADC_STOP is selected for the channel.
opamp_mode_t	mode	Low power, middle speed, or high speed mode.
opamp_trigger_t	trigger_channel_0	Start and stop triggers for channel 0.
opamp_trigger_t	trigger_channel_1	Start and stop triggers for channel 1.
opamp_trigger_t	trigger_channel_2	Start and stop triggers for channel 2.
opamp_trigger_t	trigger_channel_3	Start and stop triggers for channel 3.
opamp_plus_input_t	plus_input_select_opamp0	OPAMP0+ connection.
opamp_minus_input_t	minus_input_select_opamp0	OPAMP0- connection.
opamp_output_t	output_select_opamp0	OPAMP0O connection.
opamp_plus_input_t	plus_input_select_opamp1	OPAMP1+ connection.
opamp_minus_input_t	minus_input_select_opamp1	OPAMP1- connection.
opamp_plus_input_t	plus_input_select_opamp2	OPAMP2+ connection.
opamp_minus_input_t	minus_input_select_opamp2	OPAMP2- connection.

◆ opamp_instance_ctrl_t

struct opamp_instance_ctrl_t

OPAMP instance control block. DO NOT INITIALIZE. Initialized in opamp_api_t::open().

Macro Definition Documentation

◆ OPAMP_MASK_CHANNEL_0

#define OPAMP_MASK_CHANNEL_0
Version of code that implements the API defined in this file

Enumeration Type Documentation

◆ opamp_trigger_t

enum opamp_trigger_t	
Start and stop trigger for the op-amp.	
Enumerator	
OPAMP_TRIGGER_SOFTWARE_START_SOFTWARE_STOP	Start and stop with APIs.
OPAMP_TRIGGER_AGT_START_SOFTWARE_STOP	Start by AGT compare match and stop with API.
OPAMP_TRIGGER_AGT_START_ADC_STOP	Start by AGT compare match and stop after ADC conversion.

◆ opamp_agt_link_t

enum opamp_agt_link_t	
Which AGT timer starts the op-amp. Only applies to channels if OPAMP_TRIGGER_AGT_START_SOFTWARE_STOP or OPAMP_TRIGGER_AGT_START_ADC_STOP is selected for the channel. If OPAMP_TRIGGER_SOFTWARE_START_SOFTWARE_STOP is selected for a channel, then no AGT compare match event will start that op-amp channel.	
Enumerator	
OPAMP_AGT_LINK_AGT1_OPAMP_0_2_AGT0_OPAMP_1_3	OPAMP channel 0 and 2 are started by AGT1 compare match. OPAMP channel 1 and 3 are started by AGT0 compare match.
OPAMP_AGT_LINK_AGT1_OPAMP_0_1_AGT0_OPAMP_2_3	OPAMP channel 0 and 1 are started by AGT1 compare match. OPAMP channel 2 and 3 are started by AGT0 compare match.
OPAMP_AGT_LINK_AGT1_OPAMP_0_1_2_3	All OPAMP channels are started by AGT1 compare match.

◆ opamp_mode_t

enum opamp_mode_t	
Op-amp mode.	
Enumerator	
OPAMP_MODE_LOW_POWER	Low power mode.
OPAMP_MODE_MIDDLE_SPEED	Middle speed mode (not supported on all MCUs)
OPAMP_MODE_HIGH_SPEED	High speed mode.

◆ opamp_plus_input_t

enum opamp_plus_input_t	
Options to connect AMPnPS pins.	
Enumerator	
OPAMP_PLUS_INPUT_NONE	No Connection.
OPAMP_PLUS_INPUT_AMPPS0	Set AMPPS0. See hardware manual for channel specific options.
OPAMP_PLUS_INPUT_AMPPS1	Set AMPPS1. See hardware manual for channel specific options.
OPAMP_PLUS_INPUT_AMPPS2	Set AMPPS2. See hardware manual for channel specific options.
OPAMP_PLUS_INPUT_AMPPS3	Set AMPPS3. See hardware manual for channel specific options.
OPAMP_PLUS_INPUT_AMPPS7	Set AMPPS7. See hardware manual for channel specific options.

◆ opamp_minus_input_t

enum opamp_minus_input_t	
Options to connect AMPnMS pins.	
Enumerator	
OPAMP_MINUS_INPUT_NONE	No Connection.
OPAMP_MINUS_INPUT_AMPMS0	Set AMPMS0. See hardware manual for channel specific options.
OPAMP_MINUS_INPUT_AMPMS1	Set AMPMS1. See hardware manual for channel specific options.
OPAMP_MINUS_INPUT_AMPMS2	Set AMPMS2. See hardware manual for channel specific options.
OPAMP_MINUS_INPUT_AMPMS3	Set AMPMS3. See hardware manual for channel specific options.
OPAMP_MINUS_INPUT_AMPMS4	Set AMPMS4. See hardware manual for channel specific options.
OPAMP_MINUS_INPUT_AMPMS7	Set AMPMS7. See hardware manual for channel specific options.

◆ opamp_output_t

enum opamp_output_t	
Options to connect AMP0OS pin.	
Enumerator	
OPAMP_OUTPUT_NONE	No Connection.
OPAMP_OUTPUT_AMPOS0	Set AMPOS0. See hardware manual for channel specific options.
OPAMP_OUTPUT_AMPOS1	Set AMPOS1. See hardware manual for channel specific options.
OPAMP_OUTPUT_AMPOS2	Set AMPOS2. See hardware manual for channel specific options.
OPAMP_OUTPUT_AMPOS3	Set AMPOS3. See hardware manual for channel specific options.

Function Documentation

◆ R_OPAMP_Open()

fsp_err_t R_OPAMP_Open (opamp_ctrl_t *const *p_api_ctrl*, opamp_cfg_t const *const *p_cfg*)

Applies power to the OPAMP and initializes the hardware based on the user configuration. Implements opamp_api_t::open.

The op-amp is not operational until the opamp_api_t::start is called. If the op-amp is configured to start after AGT compare match, the op-amp is not operational until opamp_api_t::start and the associated AGT compare match event occurs.

Some MCUs have switches that must be set before starting the op-amp. These switches must be set in the application code after opamp_api_t::open and before opamp_api_t::start.

Example:

```
/* Initialize the OPAMP module. */
   err = R_OPAMP_Open(&g_opamp_ctrl, &g_opamp_cfg);
```

Return values

FSP_SUCCESS	Configuration successful.
FSP_ERR_ASSERTION	An input pointer is NULL.
FSP_ERR_ALREADY_OPEN	Control block is already opened.
FSP_ERR_INVALID_ARGUMENT	An attempt to configure OPAMP in middle speed mode on MCU that does not support middle speed mode.

◆ R_OPAMP_InfoGet()

fsp_err_t R_OPAMP_InfoGet (opamp_ctrl_t *const *p_api_ctrl*, opamp_info_t *const *p_info*)

Provides the minimum stabilization wait time in microseconds. Implements opamp_api_t::infoGet.

- Example:

```
/* Look up the required stabilization wait time. */
opamp_info_t info;
   err = R_OPAMP_InfoGet(&g_opamp_ctrl, &info);
   assert(FSP_SUCCESS == err);
/* Wait for the OPAMP to stabilize. */
R_BSP_SoftwareDelay(info.min_stabilization_wait_us,
BSP_DELAY_UNITS_MICROSECONDS);
```

Return values

FSP_SUCCESS	information on opamp_power_mode stored in p_info.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_OPAMP_Start()

fsp_err_t R_OPAMP_Start (opamp_ctrl_t *const *p_api_ctrl*, uint32_t const *channel_mask*)

If the OPAMP is configured for hardware triggers, enables hardware triggers. Otherwise, starts the op-amp. Implements opamp_api_t::start.

Some MCUs have switches that must be set before starting the op-amp. These switches must be set in the application code after opamp_api_t::open and before opamp_api_t::start.

Example:

```
/* Start the OPAMP module. */
   err = R_OPAMP_Start(&g_opamp_ctrl, 1 << OPAMP_EXAMPLE_CHANNEL);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Op-amp started or hardware triggers enabled successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.
FSP_ERR_INVALID_ARGUMENT	channel_mask includes a channel that does not exist on this MCU.

◆ R_OPAMP_Stop()

fsp_err_t R_OPAMP_Stop (opamp_ctrl_t *const *p_api_ctrl*, uint32_t const *channel_mask*)

Stops the op-amp. If the OPAMP is configured for hardware triggers, disables hardware triggers. Implements opamp_api_t::stop.

Return values

FSP_SUCCESS	Op-amp stopped or hardware triggers disabled successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.
FSP_ERR_INVALID_ARGUMENT	channel_mask includes a channel that does not exist on this MCU.

◆ R_OPAMP_StatusGet()

fsp_err_t R_OPAMP_StatusGet (opamp_ctrl_t *const *p_api_ctrl*, opamp_status_t *const *p_status*)

Provides the operating status for each op-amp in a bitmask. This bit is set when operation begins, before the stabilization wait time has elapsed. Implements opamp_api_t::statusGet.

Return values

FSP_SUCCESS	Operating status of each op-amp provided in p_status.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_OPAMP_Trim()

fsp_err_t R_OPAMP_Trim (opamp_ctrl_t *const *p_api_ctrl*, opamp_trim_cmd_t const *cmd*, opamp_trim_args_t const *const *p_args*)

On MCUs that support trimming, the op-amp trim register is set to the factory default after open(). This function allows the application to trim the operational amplifier to a user setting, which overwrites the factory default factory trim values.

Not supported on all MCUs. See hardware manual for details. Not supported if configured for low power mode (OPAMP_MODE_LOW_POWER).

This function is not reentrant. Only one side of one op-amp can be trimmed at a time. Complete the procedure for one side of one channel before calling trim() with command OPAMP_TRIM_CMD_START again.

Implements opamp_api_t::trim.

Reference: Section 37.9 "User Offset Trimming" RA2A1 hardware manual R01UM0008EU0130. The trim procedure works as follows:

- Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_START.
- Connect a fixed voltage to the Pch (+) input.
- Connect the Nch (-) input to the op-amp output to create a voltage follower.
- Ensure the op-amp is operating and stabilized.
- Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_START.
- Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
- Iterate over the following loop 5 times:
    - Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_NEXT_STEP.
    - Measure the op-amp output using the SAR ADC (referred to as B in the next step).
    - If A <= B, call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_CLEAR_BIT.
- Call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_START.
- Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
- Iterate over the following loop 5 times:
    - Call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_NEXT_STEP.

- Measure the op-amp output using the SAR ADC (referred to as B in the next step).
- If A <= B, call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_CLEAR_BIT.

Return values

FSP_SUCCESS	Conversion result in p_data.
FSP_ERR_UNSUPPORTED	Trimming is not supported on this MCU.
FSP_ERR_INVALID_STATE	The command is not valid in the current state of the trim state machine.
FSP_ERR_INVALID_ARGUMENT	The requested channel is not operating or the trim procedure is not in progress for this channel/input combination.
FSP_ERR_INVALID_MODE	Trim is not allowed in low power mode.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_OPAMP_Close()

fsp_err_t R_OPAMP_Close (opamp_ctrl_t *const *p_api_ctrl*)

Stops the op-amps. Implements opamp_api_t::close.

Return values

FSP_SUCCESS	Instance control block closed successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

Variable Documentation

◆ g_opamp_on_opamp

const opamp_api_t g_opamp_on_opamp

OPAMP Implementation of OPAMP interface.

fsp_err_t	R_SDADC_Close (adc_ctrl_t *p_ctrl)

Detailed Description

Driver for the SDADC24 peripheral on RA MCUs. This module implements the ADC Interface.

Overview

Features

The SDADC module supports the following features:

- 24 bit maximum resolution
- Configure scans to include:
  - Multiple analog channels
  - Outputs of OPAMP0 (P side) and OPAMP1 (N side) of SDADC channel 4
- Configurable scan start trigger:
  - Software scan triggers
  - Hardware scan triggers (timer expiration, for example)
- Configurable scan mode:
  - Single scan mode, where each trigger starts a single scan
  - Continuous scan mode, where all channels are scanned continuously
- Supports averaging converted samples
- Optional callback when single conversion, entire scan, or calibration completes
- Supports reading converted data
- Sample and hold support

Selecting an ADC

All RA MCUs have an ADC (r_adc). Only select RA MCUs have an SDADC. When selecting between them, consider these factors. Refer to the hardware manual for details.

	ADC	SDADC
Availability	Available on all RA MCUs.	Available on select RA MCUs.
Resolution	The ADC has a maximum resolution of 12, 14, or 16 bits depending on the MCU.	The SDADC has a maximum accuracy of 24 bits.
Number of Channels	The ADC has more channels than the SDADC.	The SDADC 5 channels, one of which is tied to OPAMP0 and OPAMP1.
Frequency	The ADC sampling time is shorter (more samples per second).	The SDADC sampling time is longer (fewer samples per second).
Settling Time	The ADC does not have a settling time when switching between channels.	The SDADC requires a settling time when switching between channels.

Configuration

Build Time Configurations for r_sdadc

The following build time configurations are defined in fsp_cfg/r_sdadc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Analog > ADC (r_sdadc)

This module can be added to the Stacks tab via New Stack > Analog > ADC (r_sdadc).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_adc0	Module name.
Mode	• Single Scan • Continuous Scan	Continuous Scan	In single scan mode, all channels are converted once per start trigger, and conversion stops after all enabled channels are scanned. In continuous scan mode, conversion starts after a start

			trigger, then continues until stopped in software.
Resolution	• 16 Bit • 24 Bit	24 Bit	Select 24-bit or 16-bit resolution.
Alignment	• Right • Left	Right	Select left or right alignment.
Trigger	MCU Specific Options		Select conversion start trigger. Conversion can be started in software, or conversion can be started when a hardware event occurs if the hardware event is linked to the SDADC peripheral using the ELC API.
Vref Source	• Internal • External	Internal	Vref can be source internally and output on the SBIAS pin, or Vref can be input from VREFI.
Vref Voltage	• 0.8 V • 1.0 V • 1.2 V • 1.4 V • 1.6 V • 1.8 V • 2.0 V • 2.2 V • 2.4 V	1.0 V	Select Vref voltage. If Vref is input externally, the voltage on VREFI must match the voltage selected within 3%.
Callback	Name must be a valid C symbol	NULL	Enter the name of the callback function to be called when conversion completes or a scan ends.
Conversion End Interrupt Priority	MCU Specific Options		[Required] Select the interrupt priority for the conversion end interrupt.
Scan End Interrupt Priority	MCU Specific Options		[Optional] Select the interrupt priority for the scan end interrupt.
Calibration End Interrupt Priority	MCU Specific Options		[Optional] Select the interrupt priority for the calibration end interrupt.

Configurations for Analog > SDADC Channel Configuration (r_sdadc)

Configuration	Options	Default	Description
Input	• Differential • Single Ended	Differential	Select differential or single-ended input.
Stage 1 Gain	• 1 • 2 • 3 • 4 • 8	1	Select the gain for stage 1 of the PGA. Must be 1 for single-ended input.
Stage 2 Gain	• 1 • 2 • 4 • 8	1	Select the gain for stage 2 of the PGA. Must be 1 for single-ended input.
Oversampling Ratio	• 64 • 128 • 256 • 512 • 1024 • 2048	256	Select the oversampling ratio for the PGA. Must be 256 for single-ended input.
Polarity (Valid for Single-Ended Input Only)	• Positive • Negative	Positive	Select positive or negative polarity for single-ended input. VBIAS (1.0 V typical) is connected on the opposite input.
Conversions to Average per Result	• Do Not Average (Interrupt after Each Conversion) • Average 8 • Average 16 • Average 32 • Average 64	Do Not Average (Interrupt after Each Conversion)	Select the number of conversions to average for each result. The ADC_EVENT_CONVERSION_END event occurs after each average, or after each individual conversion if averaging is disabled.
Invert (Valid for Negative Single-Ended Input Only)	• Result Not Inverted • Result Inverted	Result Not Inverted	Select whether to invert negative single-ended input. When the result is inverted, the lowest measurable voltage gives a result of 0, and the highest measurable voltage gives a result of 2^resolution - 1.
Number of Conversions Per Scan	Refer to the RA Configuration tool for available options.	1	Number of conversions on this channel before AUTOSCAN moves to the next channel. When all conversions of all channels are complete, the

ADC_EVENT_SCAN_END event occurs.

Clock Configuration

The SDADC clock clock is configurable on the clocks tab.

The SDADC clock must be 4 MHz when the SDADC is used.

Pin Configuration

The ANSDnP (n = 0-3) pins are analog input channels that can be used with the SDADC.

Usage Notes

Scan Procedure

In this document, the term "scan" refers to the AUTOSCAN feature of the SDADC, which works as follows:

1. Conversions are performed on enabled channels in ascending order of channel number. All conversions required for a single channel are completed before the sequencer moves to the next channel.
2. Conversions are performed at the rate (in Hz) of the SDADC oversampling clock frequency / oversampling ratio (configured per channel). FSP uses the normal mode SDADC oversampling clock frequency.
3. If averaging is enabled for the channel, the number of conversions to average are performed before each conversion end interrupt occurs.

4. If the number of conversions for the channel is more than 1, SDADC performs the number of conversions requested. These are performed consecutively. There is a settling time associated with switching channels. Performing all of the requested conversions for each channel at a time avoids this settling time after the first conversion.

   If averaging is enabled for the channel, each averaged result counts as a single conversion.

5. Continues to the next enabled channel only after completing all conversions requested.
6. After all enabled channels are scanned, a scan end interrupt occurs. The driver supports single-scan and continuous scan operation modes.
   - Single-scan mode performs one scan per trigger (hardware trigger or software start using R_SDADC_ScanStart).
   - In continuous scan mode, the scan is restarted after each scan completes. A single trigger is required to start continuous operation of the SDADC.

When Interrupts Are Not Enabled

If interrupts are not enabled, the R_SDADC_StatusGet() API can be used to poll the SDADC to determine when the scan has completed. The R_SDADC_Read() API function is used to access the converted SDADC result. This applies to both normal scans and calibration scans.

Calibration

Calibration is required to use the SDADC if any channel is configured for differential mode. Call R_SDADC_Calibrate() after open, and prior to any other function, then wait for a calibration complete

event before using the SDADC. R_SDADC_Calibrate() should not be called if all channels are configured for single-ended mode.

Examples

Basic Example

This is a basic example of minimal use of the SDADC in an application.

```
void sdadc_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_SDADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Calibrate all differential channels. */
 sdadc_calibrate_args_t calibrate_args;
    calibrate_args.mode    = SDADC_CALIBRATION_INTERNAL_GAIN_OFFSET;
    calibrate_args.channel = ADC_CHANNEL_0;
    err = R_SDADC_Calibrate(&g_adc0_ctrl, &calibrate_args);
    assert(FSP_SUCCESS == err);
 /* Wait for calibration to complete. */
 adc_status_t status;
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
 while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
    {
 R_SDADC_StatusGet(&g_adc0_ctrl, &status);
    }
 /* In software trigger mode, start a scan by calling R_SDADC_ScanStart(). In other
modes, enable external
  * triggers by calling R_SDADC_ScanStart(). */
    (void) R_SDADC_ScanStart(&g_adc0_ctrl);
 /* Wait for conversion to complete. */
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
 while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
    {
```

```
 R_SDADC_StatusGet(&g_adc0_ctrl, &status);
    }
 /* Read converted data. */
    uint32_t channel1_conversion_result;
 R_SDADC_Read32(&g_adc0_ctrl, ADC_CHANNEL_1, &channel1_conversion_result);
}
```

Using DTC or DMAC with the SDADC

If desired, the DTC or DMAC can be used to store each conversion result in a circular buffer. An example configuration is below.

```
/* Example DTC transfer settings to used with SDADC. */
/* The transfer length should match the total number of conversions per scan. This
example assumes the SDADC is
 * configured to scan channel 1 three times, then channel 2 and channel 4 once, for a
total of 5 conversions. */
#define SDADC_EXAMPLE_TRANSFER_LENGTH (5)
uint32_t g_sdadc_example_buffer[SDADC_EXAMPLE_TRANSFER_LENGTH];
transfer_info_t g_sdadc_transfer_info DTC_TRANSFER_INFO_ALIGNMENT =
{
    .transfer_settings_word_b.dest_addr_mode = TRANSFER_ADDR_MODE_INCREMENTED,
    .transfer_settings_word_b.repeat_area    = TRANSFER_REPEAT_AREA_DESTINATION,
    .transfer_settings_word_b.irq            = TRANSFER_IRQ_END,
    .transfer_settings_word_b.chain_mode     = TRANSFER_CHAIN_MODE_DISABLED,
    .transfer_settings_word_b.src_addr_mode = TRANSFER_ADDR_MODE_FIXED,
    .transfer_settings_word_b.mode           = TRANSFER_MODE_REPEAT,
 /* NOTE: The data transferred will contain a 24-bit converted value in bits 23:0.
Bit 24 contains a status flag
  * indicating if the result overflowed or not. Bits 27:25 contain the channel number
+ 1. The settings for
  * resolution and alignment and ignored when DTC or DMAC is used. */
    .transfer_settings_word_b.size           = TRANSFER_SIZE_4_BYTE,
 /* NOTE: It is strongly recommended to enable averaging on all channels or no
channels when using DTC with SDADC
```

```
  * because the result register is different when averaging is used. If averaging is
enabled on all channels,
  * set transfer_info_t::p_src to &R_SDADC->ADAR. */
    .p_src = (void const *) &R_SDADC0->ADCR,
    .p_dest = &g_sdadc_example_buffer[0],
    .length = SDADC_EXAMPLE_TRANSFER_LENGTH,
};
void sdadc_dtc_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_SDADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Calibrate all differential channels. */
 sdadc_calibrate_args_t calibrate_args;
    calibrate_args.mode    = SDADC_CALIBRATION_INTERNAL_GAIN_OFFSET;
    calibrate_args.channel = ADC_CHANNEL_0;
    err = R_SDADC_Calibrate(&g_adc0_ctrl, &calibrate_args);
    assert(FSP_SUCCESS == err);
 /* Wait for calibration to complete. */
 adc_status_t status;
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
 while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
    {
 R_SDADC_StatusGet(&g_adc0_ctrl, &status);
    }
 /* In software trigger mode, start a scan by calling R_SDADC_ScanStart(). In other
modes, enable external
  * triggers by calling R_SDADC_ScanStart(). */
    (void) R_SDADC_ScanStart(&g_adc0_ctrl);
 /* After each conversion, the converted data is transferred to the next index in
g_sdadc_example_buffer. After
  * the entire scan completes, the index in g_sdadc_example_buffer resets. The data
```

```
in g_sdadc_example_buffer
  * is:
  * - g_sdadc_example_buffer[0] = SDADC channel 1 conversion 0
  * - g_sdadc_example_buffer[1] = SDADC channel 1 conversion 1
  * - g_sdadc_example_buffer[2] = SDADC channel 1 conversion 2
  * - g_sdadc_example_buffer[3] = SDADC channel 2 conversion 0
  * - g_sdadc_example_buffer[4] = SDADC channel 4 conversion 0
  *//* At any point in the application after the first scan completes, the most
recent data for channel 2 can be read
  * from the buffer like this. Shifting removes the unrelated bits in the result
register and propagates the sign
  * bit so the value can be interpreted as a signed result. This assumes channel 2 is
configured in differential
  * mode. */
    int32_t channel_2_data = (int32_t) (g_sdadc_example_buffer[3] << 8) >> 8;
 FSP_PARAMETER_NOT_USED(channel_2_data);
}
```

◆ sdadc_extended_cfg_t

struct sdadc_extended_cfg_t		
SDADC configuration extension. This extension is required and must be provided in adc_cfg_t::p_extend.		
Data Fields		
uint8_t	conv_end_ipl	Conversion end interrupt priority.
IRQn_Type	conv_end_irq	
sdadc_vref_src_t	vref_src	Source of Vref (internal or external)

sdadc_vref_voltage_t	vref_voltage	Voltage of Vref, required for both internal and external Vref. If Vref is from an external source, the voltage must match the specified voltage within 3%.
sdadc_channel_cfg_t const *	p_channel_cfgs[SDADC_MAX_NUM_CHANNELS]	Configuration for each channel, set to NULL if unused.

◆ sdadc_instance_ctrl_t

struct sdadc_instance_ctrl_t
ADC instance control block. DO NOT INITIALIZE. Initialized in adc_api_t::open().

Enumeration Type Documentation

◆ sdadc_vref_src_t

enum sdadc_vref_src_t	
Source of Vref.	
Enumerator	
SDADC_VREF_SRC_INTERNAL	Vref is internally sourced, can be output as SBIAS.
SDADC_VREF_SRC_EXTERNAL	Vref is externally sourced from the VREFI pin.

◆ sdadc_vref_voltage_t

enum sdadc_vref_voltage_t	
Voltage of Vref.	
Enumerator	
SDADC_VREF_VOLTAGE_800_MV	Vref is 0.8 V.
SDADC_VREF_VOLTAGE_1000_MV	Vref is 1.0 V.
SDADC_VREF_VOLTAGE_1200_MV	Vref is 1.2 V.
SDADC_VREF_VOLTAGE_1400_MV	Vref is 1.4 V.
SDADC_VREF_VOLTAGE_1600_MV	Vref is 1.6 V.
SDADC_VREF_VOLTAGE_1800_MV	Vref is 1.8 V.
SDADC_VREF_VOLTAGE_2000_MV	Vref is 2.0 V.
SDADC_VREF_VOLTAGE_2200_MV	Vref is 2.2 V.
SDADC_VREF_VOLTAGE_2400_MV	Vref is 2.4 V (only valid for external Vref)

◆ sdadc_channel_input_t

enum sdadc_channel_input_t	
Per channel input mode.	
Enumerator	
SDADC_CHANNEL_INPUT_DIFFERENTIAL	Differential input.
SDADC_CHANNEL_INPUT_SINGLE_ENDED	Single-ended input.

◆ sdadc_channel_stage_1_gain_t

enum sdadc_channel_stage_1_gain_t	
Per channel stage 1 gain options.	
Enumerator	
SDADC_CHANNEL_STAGE_1_GAIN_1	Gain of 1.
SDADC_CHANNEL_STAGE_1_GAIN_2	Gain of 2.
SDADC_CHANNEL_STAGE_1_GAIN_3	Gain of 3 (only valid for stage 1)
SDADC_CHANNEL_STAGE_1_GAIN_4	Gain of 4.
SDADC_CHANNEL_STAGE_1_GAIN_8	Gain of 8.

◆ sdadc_channel_stage_2_gain_t

enum sdadc_channel_stage_2_gain_t	
Per channel stage 2 gain options.	
Enumerator	
SDADC_CHANNEL_STAGE_2_GAIN_1	Gain of 1.
SDADC_CHANNEL_STAGE_2_GAIN_2	Gain of 2.
SDADC_CHANNEL_STAGE_2_GAIN_4	Gain of 4.
SDADC_CHANNEL_STAGE_2_GAIN_8	Gain of 8.

◆ sdadc_channel_oversampling_t

enum sdadc_channel_oversampling_t	
Per channel oversampling ratio.	
Enumerator	
SDADC_CHANNEL_OVERSAMPLING_64	Oversampling ratio of 64.
SDADC_CHANNEL_OVERSAMPLING_128	Oversampling ratio of 128.
SDADC_CHANNEL_OVERSAMPLING_256	Oversampling ratio of 256.
SDADC_CHANNEL_OVERSAMPLING_512	Oversampling ratio of 512.
SDADC_CHANNEL_OVERSAMPLING_1024	Oversampling ratio of 1024.
SDADC_CHANNEL_OVERSAMPLING_2048	Oversampling ratio of 2048.

◆ sdadc_channel_polarity_t

enum sdadc_channel_polarity_t	
Per channel polarity, valid for single-ended input only.	
Enumerator	
SDADC_CHANNEL_POLARITY_POSITIVE	Positive-side single-ended input.
SDADC_CHANNEL_POLARITY_NEGATIVE	Negative-side single-ended input.

◆ sdadc_channel_average_t

enum sdadc_channel_average_t	
Per channel number of conversions to average before conversion end callback.	
Enumerator	
SDADC_CHANNEL_AVERAGE_NONE	Do not average (callback for each conversion)
SDADC_CHANNEL_AVERAGE_8	Average 8 samples for each conversion end callback.
SDADC_CHANNEL_AVERAGE_16	Average 16 samples for each conversion end callback.
SDADC_CHANNEL_AVERAGE_32	Average 32 samples for each conversion end callback.
SDADC_CHANNEL_AVERAGE_64	Average 64 samples for each conversion end callback.

◆ sdadc_channel_inversion_t

enum sdadc_channel_inversion_t	
Per channel polarity, valid for negative-side single-ended input only.	
Enumerator	
SDADC_CHANNEL_INVERSION_OFF	Do not invert conversion result.
SDADC_CHANNEL_INVERSION_ON	Invert conversion result.

◆ sdadc_channel_count_formula_t

enum sdadc_channel_count_formula_t

Select a formula to specify the number of conversions. The following symbols are used in the formulas:

- N: Number of conversions
- n: sdadc_channel_cfg_t::coefficient_n, do not set to 0 if m is 0
- m: sdadc_channel_cfg_t::coefficient_m, do not set to 0 if n is 0

Either m or n must be non-zero.

Enumerator	
SDADC_CHANNEL_COUNT_FORMULA_EXPONENTIAL	N = 32 * (2 ^ n - 1) + m * 2 ^ n.
SDADC_CHANNEL_COUNT_FORMULA_LINEAR	N = (32 * n) + m.

◆ sdadc_calibration_t

enum sdadc_calibration_t

Calibration mode.

Enumerator	
SDADC_CALIBRATION_INTERNAL_GAIN_OFFSET	Use internal reference to calibrate offset and gain.
SDADC_CALIBRATION_EXTERNAL_OFFSET	Use external reference to calibrate offset.
SDADC_CALIBRATION_EXTERNAL_GAIN	Use external reference to calibrate gain.

Function Documentation

◆ R_SDADC_Open()

fsp_err_t R_SDADC_Open (adc_ctrl_t * *p_ctrl*, adc_cfg_t const *const *p_cfg*)

Applies power to the SDADC and initializes the hardware based on the user configuration. As part of this initialization, the SDADC clock is configured and enabled. If an interrupt priority is non-zero, enables an interrupt which will call a callback to notify the user when a conversion, scan, or calibration is complete. R_SDADC_Calibrate() must be called after this function before using the SDADC if any channels are used in differential mode. Implements adc_api_t::open().

Note

This function delays at least 2 ms as required by the SDADC power on procedure.

Return values

FSP_SUCCESS	Configuration successful.
FSP_ERR_ASSERTION	An input pointer is NULL or an input parameter is invalid.
FSP_ERR_ALREADY_OPEN	Control block is already open.
FSP_ERR_IRQ_BSP_DISABLED	A required interrupt is disabled

◆ R_SDADC_ScanCfg()

fsp_err_t R_SDADC_ScanCfg (adc_ctrl_t * *p_ctrl*, void const *const *p_extend*)

Configures the enabled channels of the ADC. Pass a pointer to sdadc_scan_cfg_t to p_extend. Implements adc_api_t::scanCfg().

Return values

FSP_SUCCESS	Information stored in p_adc_info.
FSP_ERR_ASSERTION	An input pointer is NULL or an input parameter is invalid.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_SDADC_InfoGet()

fsp_err_t R_SDADC_InfoGet (adc_ctrl_t * *p_ctrl*, adc_info_t * *p_adc_info*)

Returns the address of the lowest number configured channel, the total number of results to be read in order to read the results of all configured channels, the size of each result, and the ELC event enumerations. Implements adc_api_t::infoGet().

Return values

FSP_SUCCESS	Information stored in p_adc_info.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_SDADC_ScanStart()

fsp_err_t R_SDADC_ScanStart (adc_ctrl_t * *p_ctrl*)

If the SDADC is configured for hardware triggers, enables hardware triggers. Otherwise, starts a scan. Implements adc_api_t::scanStart().

Return values

FSP_SUCCESS	Scan started or hardware triggers enabled successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.
FSP_ERR_IN_USE	A conversion or calibration is in progress.

◆ R_SDADC_ScanGroupStart()

fsp_err_t R_SDADC_ScanGroupStart (adc_ctrl_t * *p_ctrl*, adc_group_mask_t *group_id*)

adc_api_t::scanStart is not supported on the SDADC. Use scanStart instead.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.

◆ R_SDADC_ScanStop()

fsp_err_t R_SDADC_ScanStop (adc_ctrl_t * *p_ctrl*)

If the SDADC is configured for hardware triggers, disables hardware triggers. Otherwise, stops any in-progress scan started by software. Implements adc_api_t::scanStop().

Return values

FSP_SUCCESS	Scan stopped or hardware triggers disabled successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_SDADC_StatusGet()

fsp_err_t R_SDADC_StatusGet (adc_ctrl_t * *p_ctrl*, adc_status_t * *p_status*)

Returns the status of a scan started by software, including calibration scans. It is not possible to determine the status of a scan started by a hardware trigger. Implements adc_api_t::scanStatusGet().

Return values

FSP_SUCCESS	No software scan or calibration is in progress.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_SDADC_Read()

fsp_err_t R_SDADC_Read (adc_ctrl_t * *p_ctrl*, adc_channel_t const *reg_id*, uint16_t *const *p_data*)

Reads the most recent conversion result from a channel. Truncates 24-bit results to the upper 16 bits. Implements adc_api_t::read().

Note

The result stored in p_data is signed when the SDADC channel is configured in differential mode.
Do not use this API if the conversion end interrupt (SDADC0_ADI) is used to trigger the DTC unless the interrupt mode is set to TRANSFER_IRQ_EACH.

Return values

FSP_SUCCESS	Conversion result in p_data.
FSP_ERR_ASSERTION	An input pointer was NULL or an input parameter was invalid.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_SDADC_Read32()

fsp_err_t R_SDADC_Read32 (adc_ctrl_t * *p_ctrl*, adc_channel_t const *reg_id*, uint32_t *const *p_data*)

Reads the most recent conversion result from a channel. Implements adc_api_t::read32().

Note

The result stored in p_data is signed when the SDADC channel is configured in differential mode. When the SDADC is configured for 24-bit resolution and right alignment, the sign bit is bit 23, and the upper 8 bits are 0. When the SDADC is configured for 16-bit resolution and right alignment, the sign bit is bit 15, and the upper 16 bits are 0.
Do not use this API if the conversion end interrupt (SDADC0_ADI) is used to trigger the DTC unless the interrupt mode is set to TRANSFER_IRQ_EACH.

Return values

FSP_SUCCESS	Conversion result in p_data.
FSP_ERR_ASSERTION	An input pointer was NULL or an input parameter was invalid.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_SDADC_OffsetSet()

fsp_err_t R_SDADC_OffsetSet (adc_ctrl_t *const *p_ctrl*, adc_channel_t const *reg_id*, int32_t const *offset*)

Sets the offset. Offset is applied after stage 1 of the input channel. Offset can only be applied when the channel is configured for differential input. Implements adc_api_t::offsetSet().

Note: The offset is cleared if adc_api_t::calibrate() is called. The offset can be re-applied if necessary after the the callback with event ADC_EVENT_CALIBRATION_COMPLETE is called.

Parameters

[in]	p_ctrl	See p_instance_ctrl in adc_api_t::offsetSet().
[in]	reg_id	See reg_id in adc_api_t::offsetSet().
[in]	offset	Must be between -15 and 15, offset (mV) = 10.9376 mV * offset_steps / stage 1 gain.

Return values

FSP_SUCCESS	Offset updated successfully.
FSP_ERR_ASSERTION	An input pointer was NULL or an input parameter was invalid.
FSP_ERR_IN_USE	A conversion or calibration is in progress.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_SDADC_Calibrate()

fsp_err_t R_SDADC_Calibrate (adc_ctrl_t *const *p_ctrl*, void const * *p_extend*)

Requires sdadc_calibrate_args_t passed to p_extend. Calibrates the specified channel. Calibration is not required or supported for single-ended mode. Calibration must be completed for differential mode before using the SDADC. A callback with the event ADC_EVENT_CALIBRATION_COMPLETE is called when calibration completes. Implements adc_api_t::calibrate().

During external offset calibration, apply a differential voltage of 0 to ANSDnP - ANSDnN, where n is the input channel and ANSDnP is OPAMP0 for channel 4 and ANSDnN is OPAMP1 for channel 4. Complete external offset calibration before external gain calibration.

During external gain calibration apply a voltage between 0.4 V / total_gain and 0.8 V / total_gain. The differential voltage applied during calibration is corrected to a conversion result of 0x7FFFFF, which is the maximum possible positive differential measurement.

This function clears the offset value. If offset is required after calibration, it must be reapplied after calibration is complete using adc_api_t::offsetSet.

Return values

FSP_SUCCESS	Calibration began successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_IN_USE	A conversion or calibration is in progress.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_SDADC_Close()

fsp_err_t R_SDADC_Close (adc_ctrl_t * *p_ctrl*)

Stops any scan in progress, disables interrupts, and powers down the SDADC peripheral. Implements adc_api_t::close().

Note

This function delays at least 3 us as required by the SDADC24 stop procedure.

Return values

FSP_SUCCESS	Instance control block closed successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

5.2.1.10 SDADC_B Channel Configuration (r_sdadc_b)

Modules » Analog

Functions

fsp_err_t	R_SDADC_B_Open (adc_ctrl_t *p_ctrl, adc_cfg_t const *const p_cfg)

fsp_err_t	R_SDADC_B_Calibrate (adc_ctrl_t *const p_ctrl, void const *p_extend)
fsp_err_t	R_SDADC_B_Close (adc_ctrl_t *p_ctrl)

Detailed Description

Driver for the SDADC_B peripheral on RA MCUs. This module implements the ADC Interface.

Overview

Features

The SDADC_B module supports the following features:

- 24 bit maximum resolution
- Configure scans to include:
  - Multiple analog channels
- Configurable sampling mode:
  - 4 kHz sampling mode
  - 8 kHz sampling mode
  - 8 kHz/4 kHz Hybrid sampling mode
- Configurable Cut-off frequency of high-pass filter
- Configurable preamplifier gain for each channel
- Configurable phase adjustment for each channel

- Optional callback when conversion completes or zero-cross is detected
- Supports reading converted data
- Supports positive and negative input voltage

Selecting an ADC

All RA MCUs have an ADC (r_adc). Only select RA MCUs have an SDADC_B. When selecting between them, consider these factors. Refer to the hardware manual for details.

	ADC	SDADC_B
Availability	Available on all RA MCUs.	Available on select RA MCUs.
Resolution	The ADC has a maximum resolution of 12, 14, or 16 bits depending on the MCU.	The SDADC_B has a maximum accuracy of 24 bits.
Number of Channels	The ADC has 4 channels.	The SDADC_B has up to 7 channels.
Frequency	The ADC sampling time is shorter (more samples per second).	The SDADC sampling time is longer (fewer samples per second).

Configuration

Build Time Configurations for r_sdadc_b

The following build time configurations are defined in fsp_cfg/r_sdadc_b_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Clock Configuration

The SDADC_B clock is configurable on the clocks tab.

The SDADC_B clock must be 12 MHz, 12.8 MHz or 16 MHz when the SDADC_B is used.

Pin Configuration

The ANINn/ANIPn (n = 0-6) pins are analog input channels that can be used with the SDADC_B.

Virtual Channel Configuration

- When 8KHz/4KHz Hybrid Mode is enabled, selected Virtual Channels 0 to 3 are converted at an 8KHz rate and corresponding Virtual Channels 4 to 7 are converted at a 4KHz rate.
- In some locations, 4KHz Hybrid Mode conversions may be referred to 'Type 2'. All other conversions may be referred to as 'Type 1'. The SDADC_B driver abstracts 'Type 1' and 'Type 2' and populates the user callback arguments with a mask of converted channel IDs. It is the responsibility of the application to know the configuration of provided channel IDs.

- Configuration of enabled virtual channels corresponding to Sampling mode is subject to below constraints:
  - Analog input n (n = 0 to 3) must be configured for Virtual Channel m (m = 4 to 7) if corresponding Analog input n is configured for Virtual Channel n and Hybrid mode is enabled
  - Analog input 4 to 6 cannot be configured for Virtual Channel 4 to 6 when Hybrid mode is enabled
  - Virtual Channel 7 can only be configured when Hybrid mode is enabled

Usage Notes

Cut-off frequency of HPF

Cut-off frequency of HPF (High Pass Filter) is selectable by setting SDADHPFCR.COF bit. Value of cut-off frequency of HPF corresponding to each COF value is as below table:

COF	4 kHz sampling mode fos = 1.5 MHz	4 kHz sampling mode fos = 1.6 MHz	8 kHz sampling mode fos = 3.0 MHz	8 kHz sampling mode fos = 3.2 MHz	8 kHz/4 kHz hybrid sampling mode fos = 3.0 MHz	8 kHz/4 kHz hybrid sampling mode fos = 3.2 MHz
COF 0	0.607 Hz	0.647 Hz	1.214 Hz	1.295 Hz	1.214 Hz	1.295 Hz
COF 1	1.214 Hz	1.295 Hz	2.427 Hz	2.589 Hz	2.427 Hz	2.589 Hz
COF 2	2.427 Hz	2.589 Hz	4.855 Hz	5.179 Hz	4.855 Hz	5.179 Hz
COF 3	4.855 Hz	5.179 Hz	9.710 Hz	10.357 Hz	1.214 Hz (Type 1) 0.607 Hz (Type 2)	1.295 Hz (Type 1) 0.647 Hz (Type 2)

Channel ID used in driver

Channel ID input to R_SDADC_B_Read and R_SDADC_B_Read32 API and Channel Mask provided to user callback is the virtual channel ID and does not necessarily correspond to a physical input channel number. When Hybrid sampling mode is enabled, reading conversion result for channel 4 to 7 returns the 4 kHz conversion (Type 2) result of corresponding channel 0 to 3.

Scan Procedure

Operation of 24-bit Sigma-Delta A/D Converter is as below:

1. Conversions are performed on enabled channels in ascending order of channel number after software trigger is started using R_SDADC_B_ScanStart() API.
2. Conversions are performed at the rate (in Hz) of the SDADC_B sampling clock frequency.
3. The user callback function will be invoked after enabled channels are scanned.
4. If zero-cross detection interrupt is enabled, a zero-cross detection interrupt occurs in synchronization with the rising edge of the SDADC conversion end interrupt.

Triggering ELC Events with SDADC_B

- The interrupt signals SDADC_B can trigger the start of other peripherals. The Event Link Controller (r_elc) guide provides a list of all available peripherals.

Note

When using ELC events to directly read converted data, it is the responsibility of the application to ensure that the stabilization period of 80 conversions has passed since starting the converter by using R_SDADC_B_StatusGet() API.

Limitations

- After powering on, an internal setup time is necessary. During this time R_SDADC_B_StatusGet() will return ADC_STATE_CALIBRATION_IN_PROGRESS.
- SDADC_B does not operate in software standby mode. To reduce current comsumption, stop and close the SDADC_B module before entering software standby.
- After stopping the conversion using R_SDADC_B_ScanStop() API, it is necessary to wait at least 1.4us before performing conversion again.

Examples

Basic Example

This is a basic example of minimal use of the SDADC_B in an application.

```
void sdadc_b_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_SDADC_B_Open(&g_adc0_ctrl, &g_adc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* In software trigger mode, start a scan by calling R_SDADC_B_ScanStart(). In other
modes, enable external
  * triggers by calling R_SDADC_B_ScanStart(). */
    (void) R_SDADC_B_ScanStart(&g_adc0_ctrl);
 /* Wait for conversion to complete. */
 adc_status_t status;
    status.state = ADC_STATE_CALIBRATION_IN_PROGRESS;
 while (ADC_STATE_CALIBRATION_IN_PROGRESS == status.state)
    {
 R_SDADC_B_StatusGet(&g_adc0_ctrl, &status);
    }
 /* Read converted data. */
    uint32_t channel1_conversion_result;
 R_SDADC_B_Read32(&g_adc0_ctrl, ADC_CHANNEL_1, &channel1_conversion_result);
```

```
}
```

Using DTC or DMAC with the SDADC_B

If desired, the DTC or DMAC can be used to store each conversion result in a circular buffer. An example configuration is below.

```
/* Example DTC transfer settings to used with SDADC_B. */
/* The transfer length should match the total number of conversions per scan. This
example assumes the SDADC_B is
 * configured to scan all 7 channels. */
#define SDADC_B_EXAMPLE_TRANSFER_LENGTH (7)
uint32_t g_sdadc_b_example_buffer[SDADC_B_EXAMPLE_TRANSFER_LENGTH];
transfer_info_t g_sdadc_b_transfer_info DTC_TRANSFER_INFO_ALIGNMENT =
{
    .transfer_settings_word_b.dest_addr_mode = TRANSFER_ADDR_MODE_INCREMENTED,
    .transfer_settings_word_b.repeat_area    = TRANSFER_REPEAT_AREA_DESTINATION,
    .transfer_settings_word_b.irq            = TRANSFER_IRQ_END,
    .transfer_settings_word_b.chain_mode     = TRANSFER_CHAIN_MODE_DISABLED,
    .transfer_settings_word_b.src_addr_mode = TRANSFER_ADDR_MODE_FIXED,
    .transfer_settings_word_b.mode           = TRANSFER_MODE_REPEAT,
 /* NOTE: The data transferred will contain a 24-bit converted value in bits 23:0.
The settings for
  * resolution and alignment are ignored when DTC or DMAC is used. */
    .transfer_settings_word_b.size           = TRANSFER_SIZE_4_BYTE,
    .p_src = (void const *) &R_SDADC_B->SDADCR0,
    .p_dest = &g_sdadc_b_example_buffer[0],
    .length = SDADC_B_EXAMPLE_TRANSFER_LENGTH,
};
void sdadc_b_dtc_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_SDADC_B_Open(&g_adc0_ctrl, &g_adc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
```

```
    assert(FSP_SUCCESS == err);
 /* Start a scan by calling R_SDADC_B_ScanStart(). */
    (void) R_SDADC_B_ScanStart(&g_adc0_ctrl);
 /* Wait for conversion to complete. */
 adc_status_t status;
    status.state = ADC_STATE_CALIBRATION_IN_PROGRESS;
 while (ADC_STATE_CALIBRATION_IN_PROGRESS == status.state)
    {
 R_SDADC_B_StatusGet(&g_adc0_ctrl, &status);
    }
 /* After each conversion, the converted data is transferred to the next index in
g_sdadc_b_example_buffer. After
  * the entire scan completes, the index in g_sdadc_b_example_buffer resets. The data
in g_sdadc_b_example_buffer
  * is:
  * - g_sdadc_b_example_buffer[0] = SDADC_B channel 0
  * - g_sdadc_b_example_buffer[1] = SDADC_B channel 1
  * - g_sdadc_b_example_buffer[2] = SDADC_B channel 2
  * - g_sdadc_b_example_buffer[3] = SDADC_B channel 3
  * - g_sdadc_b_example_buffer[4] = SDADC_B channel 4
  * - g_sdadc_b_example_buffer[5] = SDADC_B channel 5
  * - g_sdadc_b_example_buffer[6] = SDADC_B channel 6
  *//* At any point in the application after the first scan completes, the most
recent data for channel 2 can be read
  * from the buffer like this. Conversion data is signed integer value. */
    int32_t channel_2_data = (int32_t) g_sdadc_b_example_buffer[2];
 FSP_PARAMETER_NOT_USED(channel_2_data);
}
```

◆ sdadc_b_scan_cfg_t

struct sdadc_b_scan_cfg_t		
SDADC_B active channel configuration.		
Data Fields		
union sdadc_b_scan_cfg_t	__unnamed__	
sdadc_b_cutoff_t	hpf_cutoff	Cut-off frequency of HPF.
sdadc_b_channel_gain_t	gain_setting[SDADC_B_MAX_NUM_CHANNELS - 1]	Gain setting.
sdadc_b_channel_hpf_t	hpf_setting[SDADC_B_MAX_NUM_CHANNELS]	High pass filter on-off.
uint16_t	phase_adjustment[SDADC_B_MAX_NUM_CHANNELS]	Phase adjustment for each channels.

◆ sdadc_b_extended_cfg_t

struct sdadc_b_extended_cfg_t
SDADC configuration extension. This extension is required and must be provided in adc_cfg_t::p_extend.
Data Fields

sdadc_b_oper_clk_t	oper_clk	Operating clock of the digital block.
sdadc_b_samp_mode_t	sampling_mode	Sampling mode select.
sdadc_b_scan_cfg_t const *	p_channel_cfg	Pointer to original channel config data.
uint8_t	conv_end_ipl	Conversion end interrupt priority.
IRQn_Type	conv_end_irq	Conversion type 1 end IRQ number.
IRQn_Type	conv_end_irq2	Conversion type 2 end IRQ number.
uint8_t	zc_ipl	Zero-cross detection 0 interrupt priority.
IRQn_Type	zc_irq	Zero-cross detection 0 IRQ number.
uint8_t	zc_ipl2	Zero-cross detection 1 interrupt priority.
IRQn_Type	zc_irq2	Zero-cross detection 1 IRQ number.
union sdadc_b_extended_cfg_t	__unnamed__	

◆ sdadc_b_instance_ctrl_t

struct sdadc_b_instance_ctrl_t		
SDADC instance control block. DO NOT INITIALIZE. Initialized in adc_api_t::open().		
Data Fields		
adc_cfg_t const *	p_cfg	
uint32_t	opened	Boolean to verify that the Unit has been initialized.
uint32_t	channel_mask	Channel mask to keep track of channels enabled in scanCfg.
struct sdadc_b_instance_ctrl_t	results	
uint32_t	setup_time_cnt	Period of 80 conversions for internal setup time.
uint8_t	calibration_complete	Calibration is completed if set.

Enumeration Type Documentation

◆ sdadc_b_oper_clk_t

enum sdadc_b_oper_clk_t	
Operating clock of the digital block.	
Enumerator	
SDADC_B_CLOCK_DISABLE	Disable operating clock.
SDADC_B_CLOCK_IS_12MHZ	Clock frequency is 12MHz or 12.8MHz.
SDADC_B_CLOCK_IS_16MHZ	Clock frequency is 16MHz.

◆ sdadc_b_channel_mode_t

enum sdadc_b_channel_mode_t	
Per channel operation mode.	
Enumerator	
SDADC_B_ELECTRIC_CHARGE_RESET	Electric charge reset.
SDADC_B_NORMAL_OPERATION	Normal operation.

◆ sdadc_b_channel_power_t

enum sdadc_b_channel_power_t	
Per channel power-on control.	
Enumerator	
SDADC_B_CHANNEL_POWER_OFF	Power off.
SDADC_B_CHANNEL_POWER_ON	Power on.

◆ sdadc_b_samp_mode_t

enum sdadc_b_samp_mode_t	
Sampling mode select.	
Enumerator	
SDADC_B_4KHZ_SAMPLING_MODE	4 kHz sampling mode
SDADC_B_8KHZ_SAMPLING_MODE	8 kHz sampling mode
SDADC_B_HYBRID_SAMPLING_MODE	8 kHz / 4 kHz hybird sampling mode

◆ sdadc_b_channel_gain_t

enum sdadc_b_channel_gain_t	
Per channel preamplifier gain options.	
Enumerator	
SDADC_B_CHANNEL_GAIN_1	Gain of 1.
SDADC_B_CHANNEL_GAIN_2	Gain of 2.
SDADC_B_CHANNEL_GAIN_4	Gain of 4.
SDADC_B_CHANNEL_GAIN_8	Gain of 8.
SDADC_B_CHANNEL_GAIN_16	Gain of 16.
SDADC_B_CHANNEL_GAIN_32	Gain of 32.

◆ sdadc_b_channel_hpf_t

enum sdadc_b_channel_hpf_t	
Per channel HPF bypass.	
Enumerator	
SDADC_B_CHANNEL_HPF_ENABLE	HPF enable.
SDADC_B_CHANNEL_HPF_DISABLE	HPF disable.

◆ sdadc_b_resolution_t

enum sdadc_b_resolution_t	
SDADC data resolution definitions	
Enumerator	
SDADC_B_RESOLUTION_24_BIT	24 bit resolution
SDADC_B_RESOLUTION_16_BIT	16 bit resolution

◆ sdadc_b_zc_channel_t

enum sdadc_b_zc_channel_t	
Zero-cross detection channel	
Enumerator	
SDADC_B_ZC_CHANNEL_2_OR_3	Detect channel 2 (ZCCTL0) or channel 3 (ZCCTL1)
SDADC_B_ZC_CHANNEL_1_OR_0	Detect channel 1 (ZCCTL0) or channel 0 (ZCCTL1)

◆ sdadc_b_zc_output_mode_t

enum sdadc_b_zc_output_mode_t	
Zero-cross detection output mode.	
Enumerator	
SDADC_B_ZC_PULSE_OUTPUT_MODE	Pulse output mode.
SDADC_B_ZC_LEVEL_OUTPUT_MODE	Level output mode.

◆ sdadc_b_zc_falling_edge_detection_t

enum sdadc_b_zc_falling_edge_detection_t	
Zero-cross detection output mode.	
Enumerator	
SDADC_B_ZC_FALLING_EDGE_DETECTION_DISABLE	Disabled.
SDADC_B_ZC_FALLING_EDGE_DETECTION_ENABLE	Enabled.

◆ sdadc_b_zc_rising_edge_detection_t

enum sdadc_b_zc_rising_edge_detection_t	
Zero-cross detection output mode.	
Enumerator	
SDADC_B_ZC_RISING_EDGE_DETECTION_DISABLE	Disabled.
SDADC_B_ZC_RISING_EDGE_DETECTION_ENABLE	Enabled.

◆ sdadc_b_cutoff_t

enum sdadc_b_cutoff_t	
HPF cut off. The enum value is to set to SDADHPFCR register. See Table 31.8 Cut-off frequency of HPF of the manual R01UH1005EJ0051	
Enumerator	
SDADC_B_CUTOFF_00B	Cut-off frequency 0.
SDADC_B_CUTOFF_01B	Cut-off frequency 1.
SDADC_B_CUTOFF_10B	Cut-off frequency 2.
SDADC_B_CUTOFF_11B	Cut-off frequency 3.

Function Documentation

◆ R_SDADC_B_Open()

fsp_err_t R_SDADC_B_Open (adc_ctrl_t * *p_ctrl*, adc_cfg_t const *const *p_cfg*)

Applies power to the SDADC_B and initializes the hardware based on the user configuration. Enabling interrupts which will call a callback to notify the user when a conversion is completed or a zero-cross is detected. Implements adc_api_t::open().

Return values

FSP_SUCCESS	Configuration successful.
FSP_ERR_ASSERTION	An input pointer is NULL or an input parameter is invalid.
FSP_ERR_ALREADY_OPEN	Control block is already open.
FSP_ERR_INVALID_CHANNEL	Invalid channel configuration

◆ R_SDADC_B_ScanCfg()

fsp_err_t R_SDADC_B_ScanCfg (adc_ctrl_t * *p_ctrl*, void const *const *p_extend*)

Configures the enabled channels of the ADC. Implements adc_api_t::scanCfg().

Note

This function is not compatible with Hybrid Mode operation.

Return values

FSP_SUCCESS	Information stored in p_adc_info.
FSP_ERR_ASSERTION	An input pointer is NULL or an input parameter is invalid.
FSP_ERR_NOT_OPEN	Instance control block is not open.
FSP_ERR_INVALID_MODE	Hybrid mode channel configuration is invalid
FSP_ERR_INVALID_CHANNEL	Invalid channel configuration
FSP_ERR_INVALID_STATE	Converter operation must be stopped before reconfiguring

◆ R_SDADC_B_InfoGet()

fsp_err_t R_SDADC_B_InfoGet (adc_ctrl_t * *p_ctrl*, adc_info_t * *p_adc_info*)

Returns the address of the lowest number configured channel, the total number of results to be read in order to read the results of all configured channels, the size of each result, and the ELC event enumerations. Implements adc_api_t::infoGet().

Return values

FSP_SUCCESS	Conversion is started successfully.
FSP_ERR_NOT_OPEN	Instance control block is not open.
FSP_ERR_ASSERTION	An input pointer is NULL or an input parameter is invalid.

◆ R_SDADC_B_ScanStart()

fsp_err_t R_SDADC_B_ScanStart (adc_ctrl_t * *p_ctrl*)

adc_api_t::scanStart().

Return values

FSP_SUCCESS	Conversion is started successfully.
FSP_ERR_NOT_OPEN	Instance control block is not open.
FSP_ERR_ASSERTION	An input pointer is NULL or an input parameter is invalid.

◆ R_SDADC_B_ScanGroupStart()

fsp_err_t R_SDADC_B_ScanGroupStart (adc_ctrl_t * *p_ctrl*, adc_group_mask_t *group_id*)

adc_api_t::scanGroupStart is not supported on the SDADC_B. Use scanStart instead.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.

◆ R_SDADC_B_ScanStop()

fsp_err_t R_SDADC_B_ScanStop (adc_ctrl_t * *p_ctrl*)

adc_api_t::scanStop().

Note

According to Hardware specification, after stopping the conversion, it is necessary to wait at least 1.4us before performing conversion again.

Return values

FSP_SUCCESS	Conversion is started successfully.
FSP_ERR_NOT_OPEN	Instance control block is not open.
FSP_ERR_ASSERTION	An input pointer is NULL or an input parameter is invalid.

◆ R_SDADC_B_StatusGet()

fsp_err_t R_SDADC_B_StatusGet (adc_ctrl_t * *p_ctrl*, adc_status_t * *p_status*)

Returns the status of a scan including calibration scans. Implements adc_api_t::scanStatusGet().

Return values

FSP_SUCCESS	Module status stored in the provided pointer p_status
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ R_SDADC_B_Read()

fsp_err_t R_SDADC_B_Read (adc_ctrl_t * *p_ctrl*, adc_channel_t const *reg_id*, uint16_t *const *p_data*)

Reads the most recent conversion result from a channel. Truncates 24-bit results to the upper 16 bits. When the SDADC_B is configured for 16-bit resolution, the sign bit is bit 15 and the upper 16 bits are 0. Implements adc_api_t::read().

Note

The result stored in p_data is signed.

Return values

FSP_SUCCESS	Conversion result in p_data.
FSP_ERR_ASSERTION	An input pointer was NULL or an input parameter was invalid.
FSP_ERR_NOT_OPEN	Instance control block is not open.
FSP_ERR_INVALID_DATA	Result buffer has not been updated with valid data.

◆ R_SDADC_B_Read32()

fsp_err_t R_SDADC_B_Read32 (adc_ctrl_t * *p_ctrl*, adc_channel_t const *reg_id*, uint32_t *const *p_data*)

Reads the most recent conversion result from a channel. Implements adc_api_t::read32().

Note

The result stored in p_data is signed.
When the SDADC is configured for 24-bit resolution, the upper 8 bits are sign extended.

Return values

FSP_SUCCESS	Conversion result in p_data.
FSP_ERR_ASSERTION	An input pointer was NULL or an input parameter was invalid.
FSP_ERR_NOT_OPEN	Instance control block is not open.
FSP_ERR_INVALID_DATA	Result buffer has not been updated with valid data.

◆ R_SDADC_B_OffsetSet()

fsp_err_t R_SDADC_B_OffsetSet (adc_ctrl_t *const *p_ctrl*, adc_channel_t const *reg_id*, int32_t const *offset*)

adc_api_t::offsetSet is not supported on the SDADC_B.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.

◆ R_SDADC_B_Calibrate()

fsp_err_t R_SDADC_B_Calibrate (adc_ctrl_t *const *p_ctrl*, void const * *p_extend*)

Calibration is performed automatically each time a scan is started. adc_api_t::calibrate is not supported on the SDADC_B.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.

◆ R_SDADC_B_Close()

fsp_err_t R_SDADC_B_Close (adc_ctrl_t * *p_ctrl*)

Stops any scan in progress, disables interrupts, and powers down the SDADC_B peripheral. Implements adc_api_t::close().

Return values

FSP_SUCCESS	Instance control block closed successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

Detailed Description

Middleware to implement the Data Collector for Reality AI applications. This module implements the Data Collector Interface.

Overview

Data Collector is to abstract the collection of data from sensors so that data samples are accumulated into fixed length frames before being made available to application. Support of "snapshot" mode and "data feed" mode are required to accommodate for background and cooperative data collection. Each mode supports 8 sensor channels maximally. Each sensor channel will be captured into a separate frame buffer. Frame buffers shall have the same amount of data samples, however, data type can be different(int32_t, float, uint8_t etc). Users have to make sure that frame buffers will be filled up at the same rate.

When all frame buffers are filled up, they will be provided to the application via data ready callback. After they are consumed, application has to release them by calling RM_RAI_DATA_COLLECTOR_BufferRelease(). For seamless operation, PING-PONG buffer will be used. Ideally buffers will be released before the other set of buffers are filled up. However, it is possible that frame buffers will overrun due to the fact that application may take longer time to process the data in some cases. If it happens, application will be notified with a buffer-overrun event via the error callback. No intervention is required from user side in this case. Buffer overrun will disappear when frame buffers are released. However, if not all sensor channels are configured to work at the same pace, application will get a buffer-out-of-sync error. Users have to reconfigure sensor channels and ensure all of them will work at the same pace. If sensor channels can't work at the same rate, then multiple data collector instances are required.

Features

- Snapshot mode and data feed mode are supported
- Maximally 8 sensors are supported for each mode
- Mix mode is supported(both snapshot mode and data feed mode are enabled)

Snapshot Mode

Snapshot mode will periodically pull data from the user-specified places and save to designated frame buffers. It requires a DTC module and a timer module. DTC will work in chain mode, which enables data collection from various, potentially non-linear and different-sized sources. Timer, either General PWM Timer (GPT) or Asynchronous General Purpose Timer, provides activation source for DTC to work periodically. To select this activation source, relevant interrupt has to be configured in the timer module. Application has to start the timer to enable DTC after sensor source addresses are registered.

Data Feed Mode

Data feed mode will require data producer to push data directly to the designated frame buffer whenever data is ready. Data can be pushed synchronously or asynchronously. Synchronous mode is for use cases that the data producer has a short amount of data to be copied to the frame buffer. Asynchronous mode is to use DTC/DMAC for data transfer. Application has to add DTC/DMAC modules and initialize transfer descriptors for asynchronous transfer.

Usage Notes

1. Do not use the DTC stack and timer stack of the data collector instance for data feed mode.
2. Users must take care to make sure all channels of a data collector instance will work at the same pace.

3. Priority Interrupt level of Timer stack in a Data collector instance must be higher (numerically lower) than that of RM COMMS USB PCDC GPT Overflow interrupt.

Configuration

Build Time Configurations for rm_rai_data_collector

The following build time configurations are defined in fsp_cfg/rm_rai_data_collector_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Max Number Of Channels	Value must be a positive integer less than or equal to 16	16	Max number of channels.

Configurations for AI > Data Collector (rm_rai_data_collector)

This module can be added to the Stacks tab via New Stack > AI > Data Collector (rm_rai_data_collector).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_rai_data_collector0	Module name.
ID	Value must be a positive integer.	0	Instance ID
Frame Buffer Length	Value must be a positive integer greater than 0	100	Length of frame buffers in data samples.
Data Ready Callback	Name must be a valid C symbol	rai_data_collector0_callback	Callback function on data ready.
Error Callback	Name must be a valid C symbol	rai_data_collector0_error_callback	Callback function for error events.
Data Feed Mode			
Data Feed Mode > Channel 0			
Name	Must be valid C variable name	dc0_data_feed_ch0	Channel name
Data Type	MCU Specific Options		Channel Data Type
Data Feed Mode > Channel 1			
Name	Must be valid C variable name	dc0_data_feed_ch1	Channel name
Data Type	MCU Specific Options		Channel Data Type

Data Feed Mode > Channel 2			
Name	Must be valid C variable name	dc0_data_feed_ch2	Channel name
Data Type	MCU Specific Options		Channel Data Type
Data Feed Mode > Channel 3			
Name	Must be valid C variable name	dc0_data_feed_ch3	Channel name
Data Type	MCU Specific Options		Channel Data Type
Data Feed Mode > Channel 4			
Name	Must be valid C variable name	dc0_data_feed_ch4	Channel name
Data Type	MCU Specific Options		Channel Data Type
Data Feed Mode > Channel 5			
Name	Must be valid C variable name	dc0_data_feed_ch5	Channel name
Data Type	MCU Specific Options		Channel Data Type
Data Feed Mode > Channel 6			
Name	Must be valid C variable name	dc0_data_feed_ch6	Channel name
Data Type	MCU Specific Options		Channel Data Type
Data Feed Mode > Channel 7			
Name	Must be valid C variable name	dc0_data_feed_ch7	Channel name
Data Type	MCU Specific Options		Channel Data Type
Channels	Value must be an integer between 0 and 8	0	Number of Data Feed Mode channels.
Snapshot Mode			
Snapshot Mode > Channel 0			
Name	Must be valid C variable name	dc0_snapshot_ch0	Channel name
Data Type	MCU Specific Options		Channel Data Type
Snapshot Mode > Channel 1			
Name	Must be valid C variable name	dc0_snapshot_ch1	Channel name
Data Type	MCU Specific Options		Channel Data Type
Snapshot Mode > Channel 2			
Name	Must be valid C	dc0_snapshot_ch2	Channel name

	variable name		
Data Type	MCU Specific Options		Channel Data Type
Snapshot Mode > Channel 3			
Name	Must be valid C variable name	dc0_snapshot_ch3	Channel name
Data Type	MCU Specific Options		Channel Data Type
Snapshot Mode > Channel 4			
Name	Must be valid C variable name	dc0_snapshot_ch4	Channel name
Data Type	MCU Specific Options		Channel Data Type
Snapshot Mode > Channel 5			
Name	Must be valid C variable name	dc0_snapshot_ch5	Channel name
Data Type	MCU Specific Options		Channel Data Type
Snapshot Mode > Channel 6			
Name	Must be valid C variable name	dc0_snapshot_ch6	Channel name
Data Type	MCU Specific Options		Channel Data Type
Snapshot Mode > Channel 7			
Name	Must be valid C variable name	dc0_snapshot_ch7	Channel name
Data Type	MCU Specific Options		Channel Data Type
Channels	Value must be an integer between 0 and 8	0	Number of snapshot mode channels.
DTC Transfer Count	Value must be a positive integer greater than 0	1	DTC transfer count on each activation

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Examples

Snapshot Mode Example

```
void rm_rai_data_collector_snapshot_mode_example ()
```

```
{
 fsp_err_t err;
    err = RM_RAI_DATA_COLLECTOR_Open(&g_dc_ctrl, &g_dc_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 for (uint8_t i = 0; i < DC_TEST_CHAN_COUNT; i++)
    {
 RM_RAI_DATA_COLLECTOR_SnapshotChannelRegister(&g_dc_ctrl, i, g_sensor_buf[i]);
      assert(FSP_SUCCESS == err);
    }
    err = RM_RAI_DATA_COLLECTOR_SnapshotStart(&g_dc_ctrl);
    assert(FSP_SUCCESS == err);
 do
    {
 /* Process error event */
 if (RAI_DATA_COLLECTOR_ERROR_TYPE_BUF_OUT_OF_SYNC & g_dc_error_event)
      {
 /* Error! Please reconfigure sensors to make sure they all work at the same pace.*/
            g_dc_error_event = RAI_DATA_COLLECTOR_ERROR_TYPE_NONE;
      }
 if (g_data_ready)
      {
 /* Process collected data saved in g_frame_buf. */
            do_data_process(g_data_ready_callback_arg.instance_id,
                            g_data_ready_callback_arg.frames,
                            g_data_ready_callback_arg.frame_buf_len,
                            g_data_ready_callback_arg.p_frame_buf);
            g_data_ready = false;
 /* Release buffer when done */
 RM_RAI_DATA_COLLECTOR_BufferRelease(&g_dc_ctrl);
      }
    } while (!g_exit);
    err = RM_RAI_DATA_COLLECTOR_SnapshotStop(&g_dc_ctrl);
    assert(FSP_SUCCESS == err);
```

```
    err = RM_RAI_DATA_COLLECTOR_Close(&g_dc_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	rai_data_collector_instance_ctrl_t

Data Structure Documentation

◆ rai_data_collector_instance_ctrl_t

struct rai_data_collector_instance_ctrl_t

RAI_DATA_COLLECTOR instance control block. Initialization occurs when RM_RAI_DATA_COLLECTOR_Open() is called.

Function Documentation

◆ RM_RAI_DATA_COLLECTOR_Open()

fsp_err_t RM_RAI_DATA_COLLECTOR_Open (rai_data_collector_ctrl_t *const *p_api_ctrl*, rai_data_collector_cfg_t const *const *p_cfg*)

Opens and configures the Data Collector module.

Implements rai_data_collector_api_t::open().

Return values

FSP_SUCCESS	Data Collector successfully configured.
FSP_ERR_ALREADY_OPEN	Module already open.
FSP_ERR_ASSERTION	One or more pointers point to NULL or callback is NULL.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_RAI_DATA_COLLECTOR_SnapshotChannelRegister()

fsp_err_t RM_RAI_DATA_COLLECTOR_SnapshotChannelRegister (rai_data_collector_ctrl_t *const *p_api_ctrl*, uint8_t *channel*, void const * *p_src*)

Config transfer src address for snapshot mode channel

Implements rai_data_collector_api_t::snapshotChannelRegister().

Return values

FSP_SUCCESS	Src addresses are set.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

◆ RM_RAI_DATA_COLLECTOR_BufferReset()

fsp_err_t RM_RAI_DATA_COLLECTOR_BufferReset (rai_data_collector_ctrl_t *const *p_api_ctrl*)

Reset to discard accumulated data and start with PING buffer.

Note

Application must stop data transfer on all channels first.

Implements rai_data_collector_api_t::bufferReset().

Return values

FSP_SUCCESS	Data Collector module internal buffers reset.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

◆ RM_RAI_DATA_COLLECTOR_BufferRelease()

fsp_err_t RM_RAI_DATA_COLLECTOR_BufferRelease (rai_data_collector_ctrl_t *const *p_api_ctrl*)

Release frame buffer

Implements rai_data_collector_api_t::bufferRelease().

Return values

FSP_SUCCESS	Buffer released.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

◆ RM_RAI_DATA_COLLECTOR_ChannelBufferGet()

fsp_err_t RM_RAI_DATA_COLLECTOR_ChannelBufferGet (rai_data_collector_ctrl_t *const *p_api_ctrl*, uint8_t *channel*, void ** *pp_buf*)

Get channel destination buffer address for asynchronous data transfer.

Implements rai_data_collector_api_t::channelBufferGet().

Return values

FSP_SUCCESS	Buffer avaialble.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

◆ RM_RAI_DATA_COLLECTOR_ChannelWrite()

fsp_err_t RM_RAI_DATA_COLLECTOR_ChannelWrite (rai_data_collector_ctrl_t *const *p_api_ctrl*, uint8_t *channel*, const void * *p_buf*, uint32_t *len*)

Synchronouse data transfer using CPU copy.

Implements rai_data_collector_api_t::channelWrite().

Return values

FSP_SUCCESS	Data copy completed.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

◆ RM_RAI_DATA_COLLECTOR_SnapshotStart()

fsp_err_t RM_RAI_DATA_COLLECTOR_SnapshotStart (rai_data_collector_ctrl_t *const *p_api_ctrl*)

Starts snapshot mode channels

Implements rai_data_collector_api_t::snapshotStart().

Return values

FSP_SUCCESS	Snapshot mode started.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.
FSP_ERR_UNSUPPORTED	No snapshot mode channel

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_RAI_DATA_COLLECTOR_SnapshotStop()

fsp_err_t RM_RAI_DATA_COLLECTOR_SnapshotStop (rai_data_collector_ctrl_t *const *p_api_ctrl*)

Stops snapshot mode channels

Implements rai_data_collector_api_t::snapshotStop().

Return values

FSP_SUCCESS	Snapshot mode stopped.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.
FSP_ERR_UNSUPPORTED	No snapshot mode channel

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_RAI_DATA_COLLECTOR_Close()

fsp_err_t RM_RAI_DATA_COLLECTOR_Close (rai_data_collector_ctrl_t *const *p_api_ctrl*)

Closes Data Collector module instance.

Implements rai_data_collector_api_t::close().

Return values

FSP_SUCCESS	Data Collector module closed.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

Detailed Description

Middleware to implement the Data Shipper for Reality AI applications. This module implements the Data Shipper Interface.

Overview

RAI Data Shipper is mainly for sending data collected by RAI Data Collector to PC so that they can be used for Reality AI model training. It utilizes the Communicatons Middleware Interface and all communications are fully asynchronous. The data being transported may be any combination of the following:

- Sensor data
- System events/errors
- Debug data and diagnostic information, including RAI runtime output

Sensor data is provided by Data Collector instance via the data ready callback. System events and debug data are prepared by application. A callback is used to notify application that communcation is finished. Sensor data buffers must be released if they are not used. Error flag will be set if there is any error during data transmission.

Note

Debug data, diagnostic information, and associated events are provided for debug purposes only and are not tracked by upstream Reality AI tools.

Features

1. The RAI Data Shipper module supports up to 8 Data Collector instances.
2. The RAI Data Shipper module supports the following interface:
    - RM_COMMS_UART with/without CRC-8
    - RM_COMMS_USB_PCDC with/without CRC-8

Configuration

Build Time Configurations for rm_rai_data_shipper

The following build time configurations are defined in fsp_cfg/rm_rai_data_shipper_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Max Number Of DC Instances	Value must be a positive integer that less than or equal to 8	8	Max number of DC instances to be sent.

Configurations for AI > Data Shipper (rm_rai_data_shipper)

This module can be added to the Stacks tab via New Stack > AI > Data Shipper (rm_rai_data_shipper).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rai_data_shipper0	Module name
Frame Rate Divider	Value must be non-negative	0	Skip write requests
Callback	Name must be a valid C symbol	rai_data_shipper0_callback	A user callback function on data sent or error.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Limitations

1. 2-way communication hasn't been supported yet - data is always sent from device to host.
2. Users shall take care to avoid race condition in the case of multiple data collector instances.
3. To use RM COMMS USB PCDC with Full Speed mode and DMA, frame buffer length needs to be multiple of 2 when 8-bit channel is used.
4. To use RM COMMS USB PCDC with High Speed mode and DMA, frame buffer length needs to be multiple of 2 when 16-bit channel is used. If 8-bit channel is used, its frame buffer length needs to be a multiple of 4.

Examples

Basic Example

This is a basic example of minimal use of the Data Shipper implementation in an application.

```
void RM_RAI_DATA_SHIPPER_example();
void data_shipper_callback(rai_data_shipper_callback_args_t * p_args);
extern rai_data_shipper_cfg_t g_ds_cfg;
extern rai_data_shipper_instance_t g_ds_ctrl;
static bool g_exit = false;
extern bool g_data_ready;
extern rai_data_collector_callback_args_t g_data_ready_callback_arg;
void RM_RAI_DATA_SHIPPER_example ()
{
 fsp_err_t err;
    err = RM_RAI_DATA_SHIPPER_Open(&g_ds_ctrl, &g_ds_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (!g_exit)
    {
 if (g_data_ready)
      {
 rai_data_shipper_write_params_t g_write_params;
           g_write_params.p_sensor_data = &g_data_ready_callback_arg;
 /* Application is responsible to initialize diagnostic information and events.- */
 /* Application has no diagnostic information/events to report. */
```

```
            g_write_params.diagnostic_data_len = 0;
            g_write_params.events              = 0;
            g_write_params.p_diagnostic_data   = NULL;
            err = RM_RAI_DATA_SHIPPER_Write(&g_ds_ctrl, &g_write_params);
      assert(FSP_SUCCESS == err);
            g_data_ready = false;
       }
    }
    err = RM_RAI_DATA_SHIPPER_Close(&g_ds_ctrl);
    assert(FSP_SUCCESS == err);
}
/* Called when all sensor data are sent or there is an error */
void data_shipper_callback (rai_data_shipper_callback_args_t * p_args)
{
 if (RM_COMMS_EVENT_ERROR == p_args->result)
    {
 /* Communication error */
    }
 /* Release sensor buffers if they are not being used by any other modules. */
 /* RM_RAI_DATA_COLLECTOR_BufferRelease(g_dc_ctrl); */
}
```

Data Structures

struct	rai_data_shipper_instance_ctrl_t

Data Structure Documentation

◆ rai_data_shipper_instance_ctrl_t

struct rai_data_shipper_instance_ctrl_t
RAI_DATA_SHIPPER instance control block. Initialization occurs when RM_RAI_DATA_SHIPPER_Open() is called.

Function Documentation

◆ RM_RAI_DATA_SHIPPER_Open()

fsp_err_t RM_RAI_DATA_SHIPPER_Open (rai_data_shipper_ctrl_t *const *p_api_ctrl*, rai_data_shipper_cfg_t const *const *p_cfg*)

Opens and configures the Data Shipper module.

Implements rai_data_shipper_api_t::open().

Return values

FSP_SUCCESS	Data Shipper successfully configured.
FSP_ERR_ALREADY_OPEN	Module already open.
FSP_ERR_ASSERTION	One or more pointers point to NULL or callback is NULL.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_RAI_DATA_SHIPPER_Read()

fsp_err_t RM_RAI_DATA_SHIPPER_Read (rai_data_shipper_ctrl_t *const *p_api_ctrl*, void *const *p_buf*, uint32_t *const *buf_len*)

Read data.

Implements rai_data_shipper_api_t::read().

Return values

FSP_ERR_UNSUPPORTED	Data Shipper module read not supported

◆ RM_RAI_DATA_SHIPPER_Write()

fsp_err_t RM_RAI_DATA_SHIPPER_Write (rai_data_shipper_ctrl_t *const *p_api_ctrl*, rai_data_shipper_write_params_t const * *p_write_params*)

Write data. Note this function may be called in ISR.

Implements rai_data_shipper_api_t::write().

Return values

FSP_SUCCESS	Tx buf list created and transmission starts, or write request skipped.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

◆ RM_RAI_DATA_SHIPPER_Close()

fsp_err_t RM_RAI_DATA_SHIPPER_Close (rai_data_shipper_ctrl_t *const *p_api_ctrl*)

Closes Data Shipper module instance.

Implements rai_data_shipper_api_t::close().

Return values

FSP_SUCCESS	Data Shipper module closed.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

5.2.3 Audio

Modules

Detailed Description

Audio Modules.

Modules

	ADPCM Decoder (rm_adpcm_decoder) Middleware to implement the ADPCM Audio Decoder. This module implements the ADPCM Decoder Interface.
	Audio Playback PWM (rm_audio_playback_pwm) Driver for the Audio Playback middleware on RA MCUs. This module implements the AUDIO PLAYBACK Interface.

5.2.3.1 ADPCM Decoder (rm_adpcm_decoder)

Modules » Audio

Functions

fsp_err_t	RM_ADPCM_DECODER_Open (adpcm_decoder_ctrl_t *p_ctrl,

	adpcm_decoder_cfg_t const *const p_cfg)
fsp_err_t	RM_ADPCM_DECODER_Decode (adpcm_decoder_ctrl_t *const p_ctrl, void const *p_src, void *p_dest, uint32_t src_len_bytes)
fsp_err_t	RM_ADPCM_DECODER_Reset (adpcm_decoder_ctrl_t *p_ctrl)
fsp_err_t	RM_ADPCM_DECODER_Close (adpcm_decoder_ctrl_t *p_ctrl)

Detailed Description

Middleware to implement the ADPCM Audio Decoder. This module implements the ADPCM Decoder Interface.

Overview

Features

The ADPCM Audio Decoder has the following key features:

- Decodes 4-bit ADPCM input to 16-bit PCM output

Configuration

Build Time Configurations for rm_adpcm_decoder

The following build time configurations are defined in fsp_cfg/rm_adpcm_decoder_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Audio > ADPCM Decoder (rm_adpcm_decoder)

This module can be added to the Stacks tab via New Stack > Audio > ADPCM Decoder (rm_adpcm_decoder).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_adpcm_decoder0	Module name.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Examples

Basic Example

This is a basic example of minimal use of the ADPCM Audio Decoder implementation in an application.

```
void rm_adpcm_decoder_example ()
{
 /* Open the ADPCM audio decoder instance. */
 fsp_err_t err = RM_ADPCM_DECODER_Open(&g_adpcmdec_ctrl, &g_adpcmdec_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Decode the data */
    err = RM_ADPCM_DECODER_Decode(&g_adpcmdec_ctrl, g_adpcm_stream1, g_pcm_stream,
ADPCM_BUFFER_SIZE_BYTES);
    assert(FSP_SUCCESS == err);
 /* Reset the ADPCM audio decoder instance before decoding a new stream. */
    err = RM_ADPCM_DECODER_Reset(&g_adpcmdec_ctrl);
    assert(FSP_SUCCESS == err);
 /* Decode the first chunk of ADPCM data */
    err = RM_ADPCM_DECODER_Decode(&g_adpcmdec_ctrl, g_adpcm_stream2, g_pcm_stream,
(ADPCM_BUFFER_SIZE_BYTES/2));
    assert(FSP_SUCCESS == err);
 /* Decode the second chunk of ADPCM data */
    err = RM_ADPCM_DECODER_Decode(&g_adpcmdec_ctrl,
&g_adpcm_stream2[ADPCM_BUFFER_SIZE_BYTES/2],
                                  g_pcm_stream, (ADPCM_BUFFER_SIZE_BYTES/2));
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	adpcm_decoder_instance_ctrl_t

Data Structure Documentation

◆ adpcm_decoder_instance_ctrl_t

struct adpcm_decoder_instance_ctrl_t

RM_ADPCM_DECODER instance control block. DO NOT INITIALIZE. Initialized in adpcm_decoder_api_t::open().

Function Documentation

◆ RM_ADPCM_DECODER_Open()

fsp_err_t RM_ADPCM_DECODER_Open (adpcm_decoder_ctrl_t * *p_ctrl*, adpcm_decoder_cfg_t const *const *p_cfg*)

Initializes ADPCM audio decoder device.

Implements adpcm_decoder_api_t::open().

Return values

FSP_SUCCESS	Module is ready for use.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_ALREADY_OPEN	The instance control structure has already been opened.

◆ RM_ADPCM_DECODER_Decode()

fsp_err_t RM_ADPCM_DECODER_Decode (adpcm_decoder_ctrl_t *const *p_ctrl*, void const * *p_src*, void * *p_dest*, uint32_t *src_len_bytes*)

Decodes 4bit ADPCM data to 16bit PCM data. It reads ADPCM data from area pointed by inputAddr pointer, decodes the number of samples specified and stores the decoded data in buffer pointed with outputAddr pointer.

Implements adpcm_decoder_api_t::decode().

Return values

FSP_SUCCESS	Decode operation successfully completed.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ RM_ADPCM_DECODER_Reset()

fsp_err_t RM_ADPCM_DECODER_Reset (adpcm_decoder_ctrl_t * *p_ctrl*)

This function resets the ADPCM decoder device.

Implements adpcm_decoder_api_t::reset().

Return values

FSP_SUCCESS	Module closed.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ RM_ADPCM_DECODER_Close()

fsp_err_t RM_ADPCM_DECODER_Close (adpcm_decoder_ctrl_t * *p_ctrl*)

This function closes the ADPCM decoder device.

Implements adpcm_decoder_api_t::close().

Return values

FSP_SUCCESS	Module closed.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

5.2.3.2 Audio Playback PWM (rm_audio_playback_pwm)

Modules » Audio

Functions

fsp_err_t	RM_AUDIO_PLAYBACK_PWM_Open (audio_playback_ctrl_t *const p_api_ctrl, audio_playback_cfg_t const *const p_cfg)
fsp_err_t	RM_AUDIO_PLAYBACK_PWM_Close (audio_playback_ctrl_t *const p_api_ctrl)
fsp_err_t	RM_AUDIO_PLAYBACK_PWM_Start (audio_playback_ctrl_t *const p_api_ctrl)
fsp_err_t	RM_AUDIO_PLAYBACK_PWM_Stop (audio_playback_ctrl_t *const p_api_ctrl)

fsp_err_t	RM_AUDIO_PLAYBACK_PWM_Play (audio_playback_ctrl_t *const p_api_ctrl, void const *const p_buffer, uint32_t length)

Detailed Description

Driver for the Audio Playback middleware on RA MCUs. This module implements the AUDIO PLAYBACK Interface.

Overview

Features

The Audio Playback with PWM middleware is used to play audio streams at user selected playback rate using Pulse Width Modulation hardware on GPT or AGT timers. This module can play 16-bit or 32-bit(available on selected MCUs) uncompressed, unsigned PCM audio stream when AGT is selected as PWM interface, and can play 32-bit uncompressed, unsigned PCM audio stream when GPT is used as PWM interface. Note some MCUs have 16-bit GPT timers/channels. In this case audio stream still needs to be 32 bits because the duty cycle register is 32-bit - just the upper 16 bits are ignored. The application code is expected to convert the signed PCM data to unsigned PCM data and scale it with the playback rate before starting the playback.

Configuration

Build Time Configurations for rm_audio_playback_pwm

The following build time configurations are defined in fsp_cfg/rm_audio_playback_pwm_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
DMAC Support	• Enabled • Disabled	Disabled	Select if DMAC will be used.

Configurations for Audio > Audio Playback PWM (rm_audio_playback_pwm)

This module can be added to the Stacks tab via New Stack > Audio > Audio Playback PWM (rm_audio_playback_pwm).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_rm_audio_playback0	Module name.
Playback Speed (Hz)	Must be an integer and greater than 0	44100	Enter playback sample rate in Hz.
Interrupts			
Callback	Name must be a valid	g_rm_audio_playback0_	A user callback

	C symbol	callback	function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the playback completes.
PWM Output Pin	• Pin A • Pin B	Pin A	Select which timer output pin should be used for audio output.

Clock Configuration

The Audio Playback with PWM module does not require a specific clock configuration.

Pin Configuration

Configure the PWM output pins for selected PWM HAL layer peripheral (AGT/GPT). One of the following pins needs to be selected and enabled as PWM output for selected channel n,

If GPT is used as PWM interface,

- GTIOCAn
- GTIOCBn

If AGT is used as PWM interface,

- AGTOAn
- AGTOBn

Usage Notes

DMAC/DTC Integration

DMAC/DTC is used as a lower level transfer instance with this module and is operated in Normal mode to transfer 16 bit or 32 bit data from the audio stream buffer to the PWM peripheral AGT or GPT respectively. Destination address for transfer instance needs to be the Duty Cycle setting register GTCCR for GPT as PWM driver or AGTMA/AGTCMB in case of AGT as PWM driver. The Audio Playback with PWM module internally configures 'Transfer Size' as 2 Bytes if AGT is used for PWM generation, otherwise it configures 'Transfer Size" as 4 Bytes if GPT or AGTW is used for PWM generation. Refer the hardware manual to check whether the MCU supports AGT or the AGTW peripheral.

Examples

Basic Example

This is a basic example of minimal use of the RM_AUDIO_PLAYBACK_PWM in an application. This example shows how this driver can be used for playing a 16 bit uncompressed PCM audio from a single input buffer.

```
int16_t play_buffer[AUDIO_EXAMPLE_LENGTH];
uint32_t g_audio_callback_counter = 0;
void g_audio_example_counter_callback (audio_playback_callback_args_t * p_args)
{
 if (AUDIO_PLAYBACK_EVENT_PLAYBACK_COMPLETE == (p_args->event))
    {
       g_audio_callback_counter++;
    }
}
void basic_example (void)
{
 fsp_err_t err;
 /* Initialize the Audio Playback module for playing an audio stream. */
    err = RM_AUDIO_PLAYBACK_PWM_Open(&g_audio_playback_pwm_ctrl,
&g_audio_playback_pwm_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set the 16 Bit PCM audio stream to play next */
    err = RM_AUDIO_PLAYBACK_PWM_Play(&g_audio_playback_pwm_ctrl, play_buffer,
AUDIO_EXAMPLE_LENGTH);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start to the play the selected audio stream*/
    err = RM_AUDIO_PLAYBACK_PWM_Start(&g_audio_playback_pwm_ctrl);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Wait till the playback is completed */
 while (g_audio_callback_counter == 0)
    {
       ;
    }
 /* Stop playing. */
    err = RM_AUDIO_PLAYBACK_PWM_Stop(&g_audio_playback_pwm_ctrl);
 /* Handle any errors. This function should be defined by the user. */
```

```
    assert(FSP_SUCCESS == err);
}
```

Streaming Example

This is an example of using Audio Playback module to play audio stream. This application uses a double buffer to store PCM sine wave data. It starts playing in the main loop, then loads the next buffer if it is ready in the callback. If the next buffer is not ready, a flag is set in the callback so the application knows to restart playing in the main loop. This example also demonstrates conversion of signed PCM format data to unsigned PWM format data along with scaling the data samples for optimum PWM wave generation.

```
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_AUDIO_SAMPLING_FREQUENCY_HZ (22050U)
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_PERIOD_VALUE_AT_22050HZ (0x11B7U)
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_SAMPLES_PER_CHUNK (1024U)
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_TONE_FREQUENCY_HZ (800U)
#define AUDIO_PLAYBACK_PWM_EXAMPLE_SAMPLES_TO_TRANSFER (1024U)
#define AUDIO_PLAYBACK_PWM_EXAMPLE_CONVERT_TO_PWM_SAMPLES (32768U)
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_DATA_BIT_SIZE (16U)
int16_t       g_stream_src[2][AUDIO_PLAYBACK_PWM_EXAMPLE_SAMPLES_TO_TRANSFER];
q15_t         g_pwm_sample[2][AUDIO_PLAYBACK_PWM_EXAMPLE_SAMPLES_TO_TRANSFER];
q15_t         g_pwm_scaled_sample[2][AUDIO_PLAYBACK_PWM_EXAMPLE_SAMPLES_TO_TRANSFER];
uint32_t      g_buffer_index          = 0;
volatile bool g_send_data_in_main_loop = true;
volatile bool g_data_ready = false;
/* Example callback called when Audio Playback is ready for more data. */
void rm_audio_playback_example_callback (audio_playback_callback_args_t * p_args)

◆ audio_playback_pwm_instance_ctrl_t

struct audio_playback_pwm_instance_ctrl_t	
AUDIO_PLAYBACK_PWM instance control block. DO NOT MODIFY. Initialization occurs when RM_AUDIO_PLAYBACK_PWM_Open() is called.	
Data Fields	
void(*	p_callback)(audio_playback_callback_args_t *p_args)
void *	p_context
audio_playback_cfg_t const *	p_cfg
	Pointer to the configuration structure.

uint32_t	open
	Used by driver to check if the control structure is valid.
timer_instance_t const *	p_lower_lvl_timer
	Timer API used to generate sampling frequency and GPT/AGT API used to access PWM hardware.
transfer_instance_t const *	p_lower_lvl_transfer
	Transfer API used to transfer data each sampling frequency.

Field Documentation

◆ p_callback

void(* audio_playback_pwm_instance_ctrl_t::p_callback) (audio_playback_callback_args_t *p_args)

Callback called when play is complete.

◆ p_context

void* audio_playback_pwm_instance_ctrl_t::p_context

Placeholder for user data. Passed to the user callback in audio_playback_callback_args_t.

Function Documentation

◆ RM_AUDIO_PLAYBACK_PWM_Open()

fsp_err_t RM_AUDIO_PLAYBACK_PWM_Open (audio_playback_ctrl_t *const *p_api_ctrl*, audio_playback_cfg_t const *const *p_cfg*)

Opens and configures the Audio Playback with PWM driver. Sets playback speed and transfer rate to read the audio buffer.

Example:

```
/* Initialize the Audio Playback module for playing an audio stream. */
   err = RM_AUDIO_PLAYBACK_PWM_Open(&g_audio_playback_pwm_ctrl,
&g_audio_playback_pwm_cfg);
```

Return values

FSP_SUCCESS	Audio Playback module successfully configured.
FSP_ERR_ALREADY_OPEN	Module already open.
FSP_ERR_ASSERTION	One or more pointers point to NULL or callback is NULL.

◆ RM_AUDIO_PLAYBACK_PWM_Close()

fsp_err_t RM_AUDIO_PLAYBACK_PWM_Close (audio_playback_ctrl_t *const *p_api_ctrl*)

Closes the module driver. Enables module stop mode.

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_NOT_OPEN	Driver not open.
FSP_ERR_ASSERTION	Pointer pointing to NULL.

Note

This function will close all the lower level HAL drivers as well.

◆ RM_AUDIO_PLAYBACK_PWM_Start()

fsp_err_t RM_AUDIO_PLAYBACK_PWM_Start (audio_playback_ctrl_t *const *p_api_ctrl*)

Start the PWM HAL driver (AGT or GPT) and timer HAL (AGT or GPT) drivers.

- Example:

```
/* Start to the play the selected audio stream*/
   err = RM_AUDIO_PLAYBACK_PWM_Start(&g_audio_playback_pwm_ctrl);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Audio playback hardware started successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver not open. This function calls • timer_api_t::start

◆ RM_AUDIO_PLAYBACK_PWM_Stop()

fsp_err_t RM_AUDIO_PLAYBACK_PWM_Stop (audio_playback_ctrl_t *const *p_api_ctrl*)

Stop the PWM HAL driver (AGT or GPT) and timer HAL driver (AGT or GPT).

- Example:

```
/* Stop playing. */
   err = RM_AUDIO_PLAYBACK_PWM_Stop(&g_audio_playback_pwm_ctrl);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Audio playback hardware stopped successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver not open. This function calls • timer_api_t::stop

◆ RM_AUDIO_PLAYBACK_PWM_Play()

fsp_err_t RM_AUDIO_PLAYBACK_PWM_Play (audio_playback_ctrl_t *const *p_api_ctrl*, void const *const *p_buffer*, uint32_t *length*)

Play a single audio buffer by input samples to the PWM HAL (AGT or GPT) at the sampling frequency configured by the timer.

- Example:

```
/* Set the 16 Bit PCM audio stream to play next */
   err = RM_AUDIO_PLAYBACK_PWM_Play(&g_audio_playback_pwm_ctrl, play_buffer,
AUDIO_EXAMPLE_LENGTH);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Buffer playback began successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl or p_buffer is NULL or buffer length is greater than 0x10000.
FSP_ERR_NOT_OPEN	Driver not open.. This function calls • transfer_api_t::reset

5.2.4 Bootloader

Modules

Detailed Description

Bootloader Modules.

Modules

	MCUboot Port (rm_mcuboot_port) MCUboot Port for RA MCUs.

5.2.4.1 MCUboot Port (rm_mcuboot_port)

Modules » Bootloader

MCUboot Port for RA MCUs.

Overview

Note

The MCUboot Port does not provide any interfaces to the user. Consult the MCUboot documentation at https://mcu-tools.github.io/mcuboot/ for further information.

Configuration

Build Time Configurations for MCUboot

The following build time configurations are defined in mcu-tools/include/mcuboot_config/mcuboot_config.h:

Configuration	Options	Default	Description
General			
Custom mcuboot_config.h	Manual Entry		Add a path to your custom mcuboot_config.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
Upgrade Mode	• Swap • Overwrite Only • Overwrite Only Fast • Direct XIP	Overwrite Only	Swap supports A/B image swapping with rollback. Other modes with simpler code path, which only supports overwriting the existing image with the update image (Overwrite Only) or running the newest image directly from its flash partition (Direct XIP), are also available.
Validate Primary Image	• Enabled • Disabled	Enabled	Always check the signature of the image in the primary slot before booting, even if no upgrade was performed. This is recommended if the boot time penalty is acceptable.

Downgrade Prevention (Overwrite Only)	• Enabled • Disabled	Disabled	Prevent downgrades by enforcing incrementing version numbers. When this option is set, any upgrade must have greater major version or greater minor version with equal major version. This mechanism only protects against some attacks against version downgrades (for example, a JTAG could be used to write an older version).
Number of Images Per Application	• 1 • 2 (TrustZone)	1	Number of separately updateable images.
Watchdog Feed	Manual Entry		This function might be implemented if the OS / HW watchdog is enabled while doing a swap upgrade and the time it takes for a swapping is long enough to cause an unwanted reset. If implementing this, the OS main.c must also enable the watchdog (if required)!
Measured Boot	• Enabled • Disabled	Disabled	Copies the boot data into the secure RAM, intended to be used by the secure App.
Data Sharing	• Enabled • Disabled	Disabled	Copies the user data into the secure RAM, intended to be used by the secure App.
Signing and Encryption Options			
Signing and Encryption Options > TrustZone			
Boot Record (Image 2)	String length must be 12 characters or less.		Create CBOR encoded boot record TLV for Image 2. Represents the role of the software component (e.g. CoFM for coprocessor firmware). [max. 12 characters]
Custom (Image 2)	Manual Entry	--confirm	Add any custom

			options to pass to imgtool.py here. --pad places a trailer on the image that indicates that the image should be considered an upgrade. Writing this image in the secondary slot will then cause the bootloader to upgrade to it. --confirm marks the image as confirmed, which causes the upgrade to be permanent.
Signature Type	• None • ECDSA P-256 • RSA 2048 • RSA 3072	ECDSA P-256	Configure the signature type.
Boot Record	String length must be 12 characters or less.		Create CBOR encoded boot record TLV. Represents the role of the software component (e.g. CoFM for coprocessor firmware). [max. 12 characters]
Custom	Manual Entry	--confirm	Add any custom options to pass to imgtool.py here. --pad places a trailer on the image that indicates that the image should be considered an upgrade. Writing this image in the secondary slot will then cause the bootloader to upgrade to it. --confirm marks the image as confirmed, which causes the upgrade to be permanent.
Python	Manual Entry	python	Name of the python command to use. Default is python, but can be updated to python3 for Linux or an absolute path if needed.
Encryption Scheme	• ECIES-P256 • RSA-OAEP (RSA	Encryption Disabled	Choose the encryption scheme.

2048 only)
- Encryption Disabled

Flash Layout

Flash Layout > TrustZone

Non-Secure Callable Region Size (Bytes)	Value must be an integer multiple of the 1024.	0x0	Size of the Non-Secure Callable region of the Secure image.
Non-Secure Flash Area Size (Bytes) (TrustZone Non-Secure)	Value must be an integer multiple of the largest erase size on the mcu.	0x0	Size of the Non-Secure region. This must be non-zero for all TrustZone projects to ensure memory is partitioned correctly, even if the Secure and Non-Secure regions are treated as a single image. If the Non-Secure region can be updated separately, this size must account for the header and trailer.
Non-Secure Callable RAM Region Size (Bytes)	Value must be an integer multiple of the 1024.	0x0	Size of the Non-Secure Callable RAM region of the Secure image.
Non-Secure RAM Region Size (Bytes) (TrustZone Non-Secure)	Value must be an integer multiple of the 8192.	0x0	Size of the Non-Secure RAM region. This must be non-zero for all TrustZone projects to ensure memory is partitioned correctly, even if the Secure and Non-Secure regions are treated as a single image.
Image 2 Header Size (Bytes)	Manual Entry	0x200	Size of the flash reserved for the application image header for Image 2.
Bootloader Flash Area Size (Bytes)	Value must be an integer multiple of the largest erase size on the mcu.	0x20000	Size of the flash reserved for the bootloader.
Image 1 Header Size (Bytes)	Manual Entry	0x200	Size of the flash reserved for the application image header. Must meet minimum VTOR

			alignment requirements for the core (0x200 for all RA MCUs).
Image 1 Flash Area Size (Bytes)	Value must be an integer multiple of the largest erase size on the mcu.	0x20000	Size of the application image 1, including the header and trailer. For TrustZone projects, enter the combined size of the Secure and Non-Secure Callable regions if the Non-Secure image can be updated separately, or enter the size of the entire image slot if Secure, Non-Secure Callable, and Non-Secure regions are updated as a single image.
Scratch Flash Area Size (Bytes)	Value must be an integer multiple of the largest erase size on the mcu.	0x0	Size of the scratch area. Only required for swap update method.
Data Sharing			
Maximum Measured Boot Record Size (Bytes)	Value must be an integer.	0x64	Maximum size of the boot record.
Shared Data Size (Bytes)	Value must be an integer.	0x380	Size of the shared RAM area. Required for Measured Boot.
Shared Data Address	Value must be an integer	0x20000000	Shared RAM start address. Required for Measured Boot.

Clock Configuration

- This module does not use peripheral clocks.
- For best performance it is recommended to use the fastest clock settings supported by the device in order to reduce boot times.
- **The bootloader must not disable the MOCO prior to calling the application. If the bootloader disables the MOCO, then operation cannot be guaranteed.**

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating an MCUboot Project

Start by creating a new project in e² studio or RASC. Select 'Flat (Non TrustZone) Project' template for non TrustZone based projects. For TrustZone based projects, select 'TrustZone Secure Project' template and set the clock circuit under the clocks tab to secure. On the Stacks tab, add New > Bootloader > MCUboot. Resolve any constraint errors and edit configurations as desired. Add either the example keys or generate your own key. The MCUboot key generation tool is provided at ra/mcu-tools/MCUboot/scripts/imgtool.py and documented at https://github.com/mcu-tools/mcuboot/blob/master/docs/imgtool.md. Install the following required python packages to use imgtool.py: https://github.com/mcu-tools/mcuboot/blob/master/scripts/requirements.txt.

In src/hal_entry.c, drag in Developer Assistance > HAL/Common > MCUboot > Quick Setup > Call Quick Setup. Add a call to mcuboot_quick_setup() in the application and make any desired updates.

Note

MCUboot will contain either the verification public key or its hash. During production it is necessary to permanently lock the flash region where MCUboot is programmed to prevent the keys or the code from being modified.

Getting Started: Signing Tool Prerequisite

To use the MCUboot signing tool, ensure you have Python 3.x installed on your system. Then install the Python packages required for the signing tool with the following command (modifying the path as needed depending on current directory):

pip3 install --user -r ra/mcu-tools/MCUboot/scripts/requirements.txt

Getting Started: Converting a Project to an MCUboot Image

MCUboot application images must execute from the image slot defined by the MCUboot project. They are also limited to a single downloadable flash region. All of this is handled by specifying a BootloaderDataFile in the FSP Configuration tool.

Any existing project can be converted to an MCUboot image.

1. If the project was created with a version prior to FSP v3.0.0, update the linker script to the v3.0.0 version before using it as an MCUboot application image.
2. Right click the project to convert in e² studio or RASC and select Properties.
3. Open C/C++ Build and select Build Variables.
4. Click Add...
5. For Variable Name, enter BootloaderDataFile. For Type, select File. Browse to the *.bld file created alongside the *.elf file for the associated MCUboot project.
6. Click OK, then Apply and Close.

To convert a TrustZone image, follow the steps above for both the Secure project and the Non-Secure project.

MCUboot application images must also be signed to work with MCUboot. At a minimum, this involves adding a SHA and MCUboot specific constant data called boot magic in the image trailer.

Signing can be done on the as a post-build step in e² studio. To sign the image as a post-build step:

1. If Linux is used to develop the application image, change the MCUboot property Signing > Python to python3.
2. Build the bootloader project to generate the *.bld file. Make sure to build the bootloader project on the same computer as the application image to ensure the path to the signing script is correct.

3. Define environment variables in the Properties of the application image project in e² studio.
    a. Right click the application image project, and select **Properties**.
    b. Select **C/C++ Build > Environment** on the left.
    c. Click **Add...**
    d. Define the following environment variables one at a time:
        - MCUBOOT_IMAGE_VERSION: Set to the version of the application image.
        - MCUBOOT_IMAGE_SIGNING_KEY: Set the path to the key used for signing. If signing is not required, do not set this variable. If example keys are used, set MCUBOOT_IMAGE_SIGNING_KEY as follows (replace <boot_project> with the bootloader project path):
            - ECC: <boot_project>/ra/mcu-tools/MCUboot/root-ec-p256.pem
            - RSA 2K: <boot_project>/ra/mcu-tools/MCUboot/root-rsa-2048.pem
            - RSA 3K: <boot_project>/ra/mcu-tools/MCUboot/root-rsa-3072.pem
        - MCUBOOT_IMAGE_ENC_KEY: Set the path to the key used for encryption. If encryption is not required, do not set this variable. If example keys are used, set MCUBOOT_IMAGE_ENC_KEY as follows (replace <boot_project> with the bootloader project path):
            - ECIES: <boot_project>/ra/mcu-tools/MCUboot/enc-ec256-pub.pem
            - RSA 2K: <boot_project>/ra/mcu-tools/MCUboot/enc-rsa2048-pub.pem
        - MCUBOOT_APP_BIN_CONVERTER: Optional. Set to path to objcopy, arm-none-eabi-objcopy, fromelf, or ielftool. Not required if one of these tools is on the path.
4. Build the project.
5. The signed image is output next to the application <project>.elf file with the name <project>bin.signed.

Getting Started: Download and Debug

For projects that do not use TrustZone, debug the MCUboot project using the default configuration. Before running, load the signed image to the address specified in the signing comment in ra_cfg/mcu-tools/include/mcuboot_config/mcuboot_config.h. This can be done with the Load Ancillary File button when debugging in e² studio. Upgrade images can be loaded to the upgrade image slots using the same method.

Note

e² studio projects targeting RA8 devices that do not use TrustZone must disable the "Set TrustZone secure/non-secure boundaries" setting (Debug Configurations > Debugger > Connection Settings > TrustZone > Set TrustZone secure/non-secure boundaries).

For TrustZone projects, debug using the Secure project to ensure the IDAU is partitioned correctly when debugging in e² studio. Make the following modifications before debugging in e² studio:

1. In the Debug Configurations for your project, on the Startup tab, click Add... to add the MCUboot project *.elf file (Image and Symbols), and optionally the Non-Secure project *.elf file.
2. For the Secure and Non-Secure project *.elf file, load Symbols Only.
3. After starting to debug, load the signed Secure image and the signed Non-Secure image into the addresses specified in the signing comment in ra_cfg/mcu-tools/include/mcuboot_config/mcuboot_config.h. This can be done with the Load Ancillary File button when debugging in e² studio. Upgrade images can be loaded to the upgrade image slots using the same method.

Confirming Upgrade in Swap Mode

In Swap Mode operation, if the upgrade image is signed with the –pad option, MCUboot will install that image as a temporary update where if nothing else is done, a reboot will cause MCUboot to revert to the image version that was swapped out during the upgrade. In order for the updated image to prevent this reversion and make the update permanent, the boot_set_confirmed() must be called from the application.

To avail this capability in the application image, from the Stacks tab, add New > Bootloader > MCUboot Image Utilities (Swap Mode). Resolve any constraint errors and edit configurations as desired.

In src/hal_entry.c, drag in Developer Assistance > HAL/Common > MCUboot Image Utilities > Quick Setup > Confirm Primary Image. Add a call to boot_set_confirmed() in the application and confirm the image in the primary slot.

XIP Mode operation

XIP mode is enabled selecting "Direct XIP" as the Upgrade Mode option in the configurator or by defining "MCUBOOT_DIRECT_XIP" in the mcuboot config file. The linker script defines the symbol "XIP_SECONDARY_SLOT_IMAGE" by default to 0. To link an application to the secondar slot in XIP mode, set XIP_SECONDARY_SLOT_IMAGE to 1 in the application linker script. Direct XIP mode does not support TrustZone projects.

Dual Bank operation

MCUboot can be used with Dual bank mode to leverage the advantages of dual bank flash operation. When Dual Bank mode is enabled, only the XIP upgrade mode can be used.

Note

Unlike in normal XIP Mode operation, the linker script symbol "XIP_SECONDARY_SLOT_IMAGE" must be undefined in Dual Bank mode. An example flash layout in this configuration for a 1 MB is shown below. Note that there are 2 copies of the bootloader, one in Bank 0 and another in Bank 1.

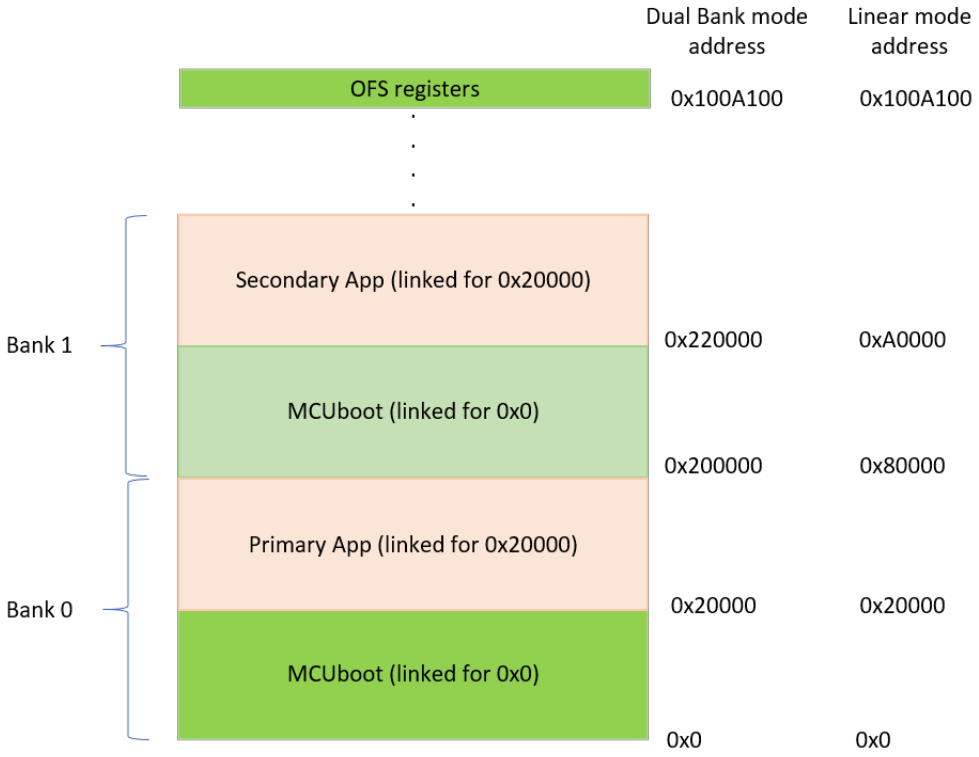

Figure 150: MCUboot Dual Bank layout for 1 MB Memory

For this example layout, the following files are generated when Dual Bank mode with XIP is enabled:

1. Bootloader Project: srec file linked to address 0 and includes the OFS region.
2. Application Project (Primary): signed bin file linked to address 0x20000.
3. Application Project (Secondary): signed bin file linked to address 0x20000.

In Dual Bank mode, the available flash memory is split into two halves and referred to as Bank 0 and 1. In this example Bank 0 would span from address 0x0 - 0x7FFFF and Bank 1 from 0x200000 - 0x27FFFF. In Linear mode, it is possible to program the Bank 1 area by programming to 0x80000 - 0xFFFFF.

Programming in Dual Bank Mode

The bootloader must be duplicated in Dual Bank mode. Bank 0 can be programmed using the srec file generated from the MCUboot project; this will also program the OFS region which contains the dual bank enable bit, so it must either be programmed last if each file is programmed independently. Another option is to combine all images: MCUboot in Bank 0, primary image, MCUboot in Bank 1 (no OFS), and secondary image (optional). To program MCUboot to Bank 1, offset MCUboot by half the flash size and cut off the OFS region (0x0100A100 to address 0x0100A2FF on CM33 MCUs that support dual bank). Using srec-cat for a 1 MB flash MCU (0x80000 flash per bank), an example command to create the bootloader image for Bank 1: "srec_cat MCUboot_dualbank.srec -crop 0 0x80000 -offset 0x80000 -o MCUboot_dualbank_offset.srec". The application project for Bank 1 can be similarly offset using srec_cat: "srec_cat app1.bin.signed -binary -offset 0xA0000 -o app1_offset.srec", where 0xA0000 is 0x80000 (half the flash) + 0x20000 (MCUboot size). The signed binary file for Bank 0 can be converted to srec format using srec_cat: "srec_cat app0.bin.signed -binary -offset 0x20000 -o app0.srec"

To combine all the files into one srec file, use "srec_cat MCUboot_dualbank.srec

MCUboot_dualbank_offset.srec app0.srec app1_offset.srec -o combined_srec".

External Memory Support

QSPI

QSPI support for secondary image storage can be enabled in the configurator. The bootloader expects the QSPI memory to be pre-configured by user code in the bootloader for read/write operation. The bootloader code operates under the assumption that the user has configured the QSPI in Extended-SPI mode and that R_QSPI_Open() has been called prior to invoking boot_go();. For example, on the EK_RA6M4 which has the MX25L25645G QSPI flash, after adding the QSPI module to the project, calling the following snippet will configure the QSPI for read/write operation:

```
/* Status Register (SREG) payload size */
# define SREG_SIZE 0x03
# define QSPI_COMMAND_WRITE_STATUS_REGISTER 0x01
# define QSPI_DEFAULT_SR1 0x40
# define QSPI_DEFAULT_SR2 0x00
/* Status register payload */
uint8_t   data_sreg[SREG_SIZE]                = {QSPI_COMMAND_WRITE_STATUS_REGISTER,
QSPI_DEFAULT_SR1, QSPI_DEFAULT_SR2};
R_QSPI_Open(&g_qspi0_ctrl, &g_qspi0_cfg);
/* Configure for Extended SPI Read/Write Mode */
R_QSPI_DirectWrite(&g_qspi0_ctrl, &(g_qspi0_cfg.write_enable_command), 1, false);
R_QSPI_DirectWrite(&g_qspi0_ctrl, data_sreg, SREG_SIZE, false);
```

For a more detailed example on how to initialize the QSPI device, refer to the QSPI module. The QSPI sector size must be the same as that of the MCU internal flash (BSP_FEATURE_FLASH_HP_CF_REGION1_BLOCK_SIZE) for swap mode operation.

OSPI_B

OSPI_B support for secondary image storage can be enabled in the configurator for RA8: The bootloader expects the OSPI memory to be pre-configured by user code in the bootloader for read/write operation. The bootloader code operates under the assumption that the user has initialized the OSPI_B by calling R_OSPI_B_Open() prior to invoking boot_go();.

MCUboot Memory Map

For single image projects with no external memory support, the default memory map looks like:

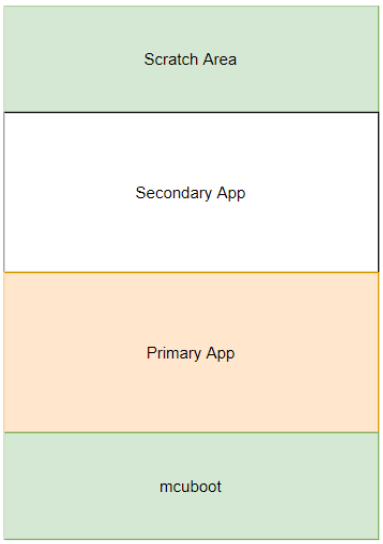

Figure 151: MCUboot Memory Map

For projects with 2 separately updateable images (used for TrustZone applications where the Secure and Non-Secure images can be updated separately), the default memory map with no external memory support looks like:

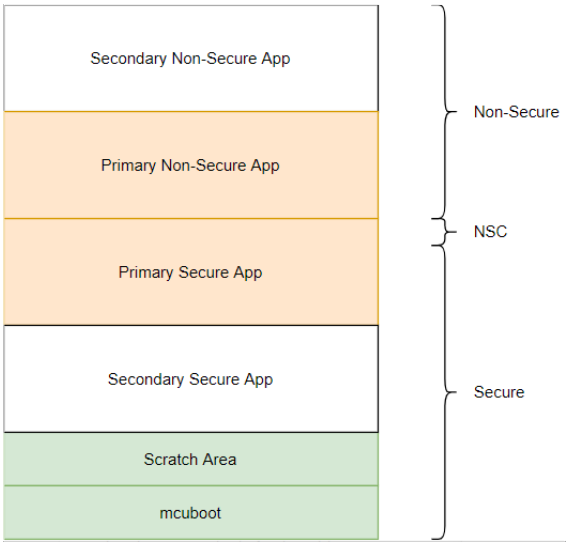

Figure 152: MCUboot Memory Map (TrustZone)

For single image projects with QSPI, the default memory map looks like:

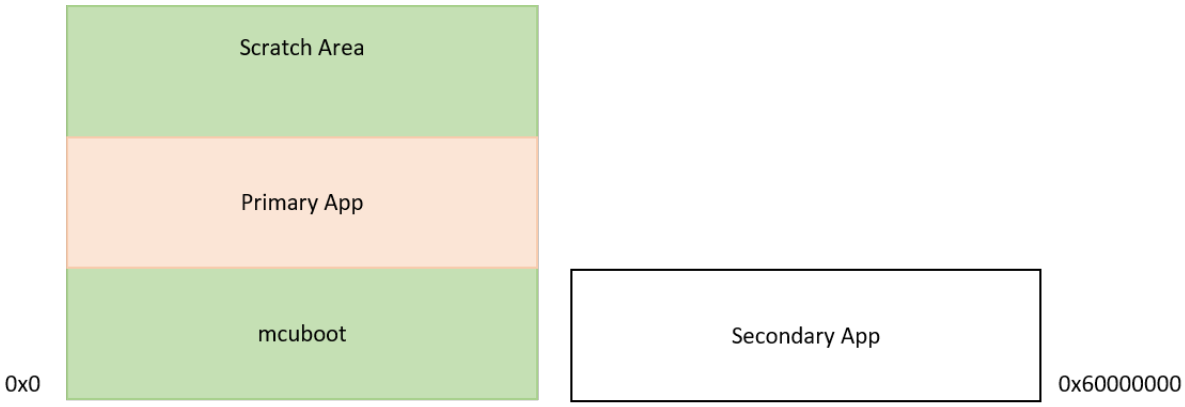

Figure 153: MCUboot Memory Map with QSPI

MCUboot verification options

MCUboot in FSP supports the following secure image verification options

1. Hash verification only (SHA256).
2. Hash and signature verification (ECDSA-P256, RSA-2048 and RSA-3072).
3. Hash, signature verification and image encryption (ECIES-P256 and RSA-OAEP-2048 with AES-128).
4. Hash and image encryption only.

MCUboot also supports signature verification using EdDSA-25519 and image encryption using AES-KW-128 and AES-KW-256 but those are currently not supported in FSP.

Limitations

MCUboot swap mode is not functional with OSPI_B external storage.

Notes

When encryption is enabled, MCUboot requires the image in the primary slot to be unencrypted. Only the image loaded in the secondary slot can be encrypted.

MCUboot Crypto Stack Options

The following crypto stacks can be used with MCUboot in FSP:

1. MbedTLS, which is hardware accelerated on all RA devices. On the RA2 which has an AES engine only, ECC/RSA/SHA operations are in software.
2. TinyCrypt (S/W Only) can be used with all devices.
3. TinyCrypt (H/W Accelerated) has AES operations accelerated for the RA2 family only. When using MCUboot without encryption there is no difference between using this or the S/W only version.
4. SCE9 Protected Mode on devices that have the SCE9 (eg: RA6M4, RA4M3, RA4M2)

MbedTLS provides the best performance for MCUBoot signature verification on the RA6 and RA4 devices but has a much larger code footprint compared to TinyCrypt. For RA2 devices TinyCrypt is the best option.

MCUboot boot time

The time from Reset to executing the application will depend on how quickly MCUboot finishes execution. This is dependent on a variety of factors including

1. The crypto algorithms chosen for image verification and whether hardware acceleration is enabled. Hardware accelerated SHA256 will be the fastest while encryption enabled modes will be the slowest.
2. The operating clock speeds.
3. Whether flash programming was required.

Reducing boot time on SCE9 devices

On devices that have the SCE9, it is possible to reduce the time taken for EC-P256 signature verification by setting the Initialization property for the SCE9 module to only initialize the crypto primitives required for EC-P256 verification. Note that this feature is only supported for EC-P256 currently. Enabling it for any other algorithm will cause a runtime failure.

Using SCE9 Protected Mode Crypto Stack

Using this crypto stack with MCUBoot provides additional security by ensuring that any keys that are used were securely provisioned for the specific device. The Application Note "Installing and Updating Secure Keys for RA Family" (R11AN0496) provides detailed steps on how to go about installing these keys. Since the section "Preparing Keys for Installation and Update Using RFP" document currently only provides information on how to install an AES key, this section will provide information on how to install an ECC public key. These steps can be used to install the public keys used for image verification or the keys used for image encryption.

Note

When using the SCE9 Protected Mode Stack with MCUboot it is required that the public keys in the format described in the "MCUboot Example Keys" module in the stack is also provided in the project.

Installing public keys used for signature verification

1. Generate an ECC key pair. There are various ways to do this but you can use openSSL to do so: "openssl ecparam -name secp256k1 -genkey -noout -out my_ecc_secp256k1_key.pem".
2. Once the key is generated, in order to install the public key using RFP (Renesas Flash Programmer) the user needs to have their own UFPK (User Factory Programming Key) and W-UFPK (Wrapped User Factory Programming Key). Refer to R11AN0496 on how to obtain these keys.
3. Once the UFPK and W-UFPK are available, we need to extract the public key from the pem file. The public key can be viewed by using "openssl ec -noout -text -in my_ecc_secp256k1_key.pem". Note that when the ECC public key is printed out this way, it will contain a 0x04 ASN.1 prefix at the start, which should be discarded.
4. Use the rfp-util.exe utility from the RFP installation folder to wrap the public key using the UFPK and W-UFPK into a format that can be installed by RFP and the factory bootloader on the MCU.
5. Use RFP as described in R11AN0496 to install the key to the location of mcuboot_sce9_key section.

These are examples that install the default keys provided with MCUboot in ra/mcu-tools/MCUboot/. The examples assume that UFPK and W-UFPK are already available.

```
  //Print out the EC-P256 Public Key using openSSL

C:\ openssl ec -noout -text -in root-ec-p256.pem
```

```
read EC key
Private-Key: (256 bit)

Examples

Basic Example

This is an example of using MCUboot in an application.

```
void rm_mcuboot_port_example (void)
{
#ifdef MCUBOOT_USE_MBED_TLS
 /* Initialize mbedtls. */
```

```
 mbedtls_platform_context ctx = {0};
    assert(0 == mbedtls_platform_setup(&ctx));
#elif defined(MCUBOOT_USE_TINYCRYPT)
 /* Initialize TinyCrypt port. */
    assert(FSP_SUCCESS == RM_TINCYRYPT_PORT_Init());
#else
 /* Initialize SCE9 Protected Mode driver. */
 sce_instance_ctrl_t sce_ctrl;
 const sce_cfg_t    sce_cfg =
    {.lifecycle = SCE_SSD};
    assert(FSP_SUCCESS == R_SCE_Open(&sce_ctrl, &sce_cfg));
#endif
 /* (Optional) To check for updates, call boot_set_pending. */
 bool update = 0;
 if (update)
    {
       boot_set_pending(0);
    }
 /* Verify the boot image and get its location. */
 struct boot_rsp rsp;
    assert(0 == boot_go(&rsp));
 /* Enter the application. */
    RM_MCUBOOT_PORT_BootApp(&rsp);
}
```

5.2.5 CapTouch

Modules

Detailed Description

CapTouch Modules.

Modules

	CTSU (r_ctsu)

	This HAL driver supports the Capacitive Touch Sensing Unit (CTSU). It implements the CTSU Interface.
	Touch (rm_touch) This module supports the Capacitive Touch Sensing Unit (CTSU). It implements the Touch Middleware Interface.

5.2.5.1 CTSU (r_ctsu)

Modules » CapTouch

Functions

fsp_err_t	R_CTSU_Open (ctsu_ctrl_t *const p_ctrl, ctsu_cfg_t const *const p_cfg) Opens and configures the CTSU driver module. Implements ctsu_api_t::open. More...
fsp_err_t	R_CTSU_ScanStart (ctsu_ctrl_t *const p_ctrl) This function should be called each time a periodic timer expires. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Before starting the next scan, first get the data with R_CTSU_DataGet(). If a different control block scan should be run, check the scan is complete before executing. Implements ctsu_api_t::scanStart. More...
fsp_err_t	R_CTSU_DataGet (ctsu_ctrl_t *const p_ctrl, uint16_t *p_data) This function gets the sensor values as scanned by the CTSU. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Implements ctsu_api_t::dataGet. More...
fsp_err_t	R_CTSU_OffsetTuning (ctsu_ctrl_t *const p_ctrl) This function tunes the offset register(SO). Call after the measurement is completed. If the return value is FSP_ERR_CTSU_INCOMPLETE_TUNING, tuning is not complete. Execute the measurement and this function call routine until the return value becomes FSP_SUCCESS. It is recommended to run this routine after R_CTSU_Open(). It can be recalled and tuned again. When the automatic judgement is enabled, after the offset tuning is completed,the baseline initialization bit flag is set. Implements ctsu_api_t::offsetTuning. More...

fsp_err_t	R_CTSU_ScanStop (ctsu_ctrl_t *const p_ctrl) This function scan stops the sensor as scanning by the CTSU. Implements ctsu_api_t::scanStop. More...
fsp_err_t	R_CTSU_CallbackSet (ctsu_ctrl_t *const p_api_ctrl, void(*p_callback)(ctsu_callback_args_t *), void const *const p_context, ctsu_callback_args_t *const p_callback_memory)
fsp_err_t	R_CTSU_Close (ctsu_ctrl_t *const p_ctrl) Disables specified CTSU control block. Implements ctsu_api_t::close. More...
fsp_err_t	R_CTSU_SpecificDataGet (ctsu_ctrl_t *const p_ctrl, uint16_t *p_specific_data, ctsu_specific_data_type_t specific_data_type) This function gets the sensor specific data values as scanned by the CTSU. Call this function after calling the R_CTSU_DataGet() function. More...
fsp_err_t	R_CTSU_DataInsert (ctsu_ctrl_t *const p_ctrl, uint16_t *p_insert_data) This function inserts the value of the second argument as the measurement result value. Call this function after calling the R_CTSU_DataInsert() function. Implements ctsu_api_t::dataInsert. More...
fsp_err_t	R_CTSU_Diagnosis (ctsu_ctrl_t *const p_ctrl) Diagnosis the CTSU peripheral. Implements ctsu_api_t::diagnosis. More...

Detailed Description

This HAL driver supports the Capacitive Touch Sensing Unit (CTSU). It implements the CTSU Interface .

Overview

The capacitive touch sensing unit HAL driver (r_ctsu) provides an API to control the CTSU peripheral. This module performs capacitance measurement based on various settings defined by the configuration. This module is configured via the QE for Capacitive Touch.

Features

- Supports multiple scan modes

    - Self-capacitance multi scan mode (CTSU2 support active shield)
    - Mutual-capacitance full scan mode
    - Mutual-capacitance parallel scan mode (CTSU2)
    - Current Measurement mode (CTSU2)
    - Diagnosis scan mode
- Scans may be started by software or an external trigger
- Returns measured capacitance data on scan completion
- Support DTC transfer of scanned data
- Supports TrustZone
- Corrects accuracy for temperature drift (CTSU2)

Configuration

Note

This module is configured via the QE for Capacitive Touch. For information on how to use the QE tool, once the tool is installed click Help -> Help Contents in e² studio and search for "QE".

Build Time Configurations for r_ctsu

The following build time configurations are defined in fsp_cfg/r_ctsu_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Support for using DTC	• Enabled • Disabled	Disabled	Enable DTC support for the CTSU module.
Interrupt priority level	MCU Specific Options		Priority level of all CTSU interrupt (CSTU_WR,CTSU_RD,CTSU_FN)

Configurations for CapTouch > CTSU (r_ctsu)

This module can be added to the Stacks tab via New Stack > CapTouch > CTSU (r_ctsu). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Scan Start Trigger	MCU Specific Options		CTSU Scan Start Trigger Select

Interrupt Configuration

The first R_CTSU_Open function call sets CTSU peripheral interrupts. The user should provide a callback function to be invoked at the end of the CTSU scan sequence. The callback argument will contain information about the scan status.

Clock Configuration

The CTSU peripheral module uses PCLKB as its clock source. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Note

The CTSU Drive pulse will be calculated and set by the tooling depending on the selected transfer rate.

Pin Configuration

The TSn pins are sensor pins for the CTSU.

The TSCAP pin is used for an internal low-pass filter and must be connected to an external decoupling capacitor.

Usage Notes

The CTSU module is a CTSU driver for the Touch module. The CTSU module assumes the access from the Touch middleware layer, and it is also accessible from an user application.
CTSU and CTSU2 are functionally different, so CTSU and CTSU2 are described in this application note as below.
Common description for CTSU and CTSU2 -> CTSU
Description only for CTSU -> CTSU1
Description only for CTSU2 -> CTSU2
Without mention, it means the common description for CTSU and CTSU2.

Functions

The CTSU module supports the following functions.

Measurements and Obtaining Data

Measurements can be started by a software trigger or by an external event triggered by the Event Link Controller (ELC).
As the measurement process is carried out by the CTSU2 peripheral, it does not use up main processor processing time.
The CTSU module processes INTCTSUWR and INTCTSURD if generated during a measurement. The data transfer controller (DTC) can also be used for these processes.
When the measurement complete interrupt (INTCTSUFN) process is complete, the application is notified in a callback function. Make sure you obtain the measurement results before the next measurement is started as internal processes are also executed when a measurement is completed.
Start the measurement with API function R_CTSU_ScanStart().
Obtain the measurement results with API function R_CTSU_DataGet().

Sensor ICO Correction function

The CTSU2 peripheral has a built-in correction circuit to handle the potential microvariations related to the manufacturing process of the sensor ICO MCU.
The module temporarily transitions to the correction process during initialization after power is turned on. In the correction process, the correction circuit is used to generate a correction coefficient (factor) to ensure accurate sensor measurement values.
When temperature correction is enabled, an external resistor connected to a TS terminal is used to periodically update the correction coefficient. By using an external resistor that is not dependent on temperature, you can even correct the temperature drift of the sensor ICO.

Initial Offset Adjustment

The CTSU2 peripheral was designed with a built-in offset current circuit in consideration of the amount of change in current due to touch. The offset current circuit cancels enough of the parasitic

capacitance for it to fit within the sensor ICO dynamic range.
This module automatically adjusts the offset current setting. As the adjustment uses the normal measurement process, the combination of R_CTSU_ScanStart() and R_CTSU_DataGet() or the combination of R_CTSU_ScanStart() and R_CTSU_OffsetTuning() must be repeated several times after startup. Because the ctsu_element_cfg_t member "so" is the starting point for adjustments, you can set the appropriate value for "so" in order to reduce the number of times the two functions must be run to complete the adjustment. Normally, the value used for "so" is a value adjusted by QE for Capacitive Touch.
R_CTSU_OffsetTuning() was added in FSP 3.8.0. This API can also be used for initial offset adjustment, and offset adjustment can be performed again at any time. See example code of R_CTSU_OffsetTuning() for details.

Mode	Default target value
Self-capacitance	15360 (37.5%)
Self-capacitance using active shield	6144 (15%)
Mutual-capacitance	10240 (20%)

The percentage is for the CCO's input limit. 100% is the measured value 40960.
The default target value is based on 526us(CTSU1) or 256us(CTSU2).
When the measurement time is changed, the target value is adjusted by the ratio with the base time.

Example of target value in combination of CTSUSNUM and CTSUSDPA.
CTSU1 (CTSU clock = 32MHz, Self-capacitance mode)

Target value	CTSUSNUM	CTSUSDPA	Measurement time
15360	0x3	0x7	526usec
30720	0x7	0x7	1052usec
30720	0x3	0xF	1052usec
7680	0x1	0x7	263usec
7680	0x3	0x3	263usec

The measurement time changes depending on the combination of CTSUSNUM and CTSUSDPA.
In the above table, CTSUPRRTIO is the recommended value of 3, and CSTUPRMODE is the recommended value of 2.
When changing CTSUPRRATIO and CTSUPRMODE from the recommended values, follow the Hardware Manual for the measurement time.

CTSU2 (Self-capacitance mode)

Target value	Target value (multi frequency)	CTSUSNUM	Measurement time
7680	15360 (128us + 128us)	0x7	128usec
15360	30720 (256us + 256us)	0xF	256usec

3840	7680 (64us + 64us)	0x3	64usec

The measurement time changes depending on CTSUSNUM.
If STCLK cannot be set to 0.5MHz, it will not support the table above.
When setting STCLK to other than 0.5MHz because the CTSU clock is not an integer, follow the hardware manual for the measurement time.

Random Pulse Frequency Measurement (CTSU1)

The CTSU1 peripheral measures at one drive frequency.
The drive frequency determines the amperage to the electrode and generally uses the value tuned with QE for Capacitive Touch.
The drive frequency is calculated as below.
It is determined by PCLK frequency input to CTSU, CTSU Count Source Select bit(CTSUCLK), and CTSU Sensor Drive pulse Division Control bit(CTSUSDPA). For example, If it is set PCLK =32MHz, CTSUCLK = PLCK/2, and CTSUSDPA = 1/16, then drive frequency is 0.5MHz. CTSUSDPA can change for each TS port.

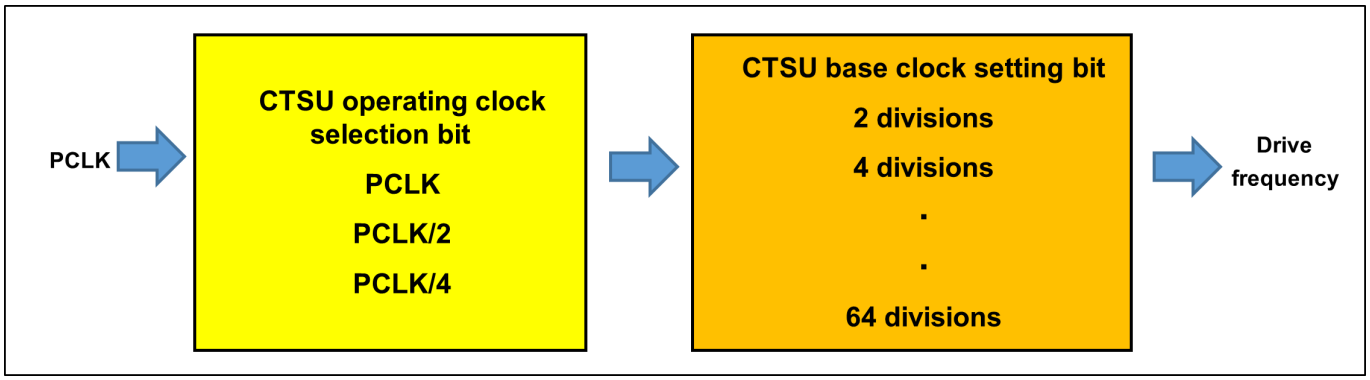

Figure 154: Drive Frequency Settings

The actual drive pulse is phase-shifted and frequency-spread with respect to the clock based on the drive frequency as a measure against external environmental noise. This module is fixed at initialization and sets the following.
CTSUSOFF = 0,CTSUSSMOD = 0,CTSUSSCNT = 3

Multi-frequency Measurements (CTSU2)

The CTSU2 peripheral can measure in one of four drive frequencies to avoid synchronous noise. With the default settings, the module takes measurements at three different frequencies. After standardizing the results obtained at the three frequencies in accordance with the first frequency reference value, the measured value is determined based on majority in a process referred to as "normalization."
The three values standardized to the first frequency reference value are called correction data. You can get the three correction data with R_CTSU_SpecificDataGet().

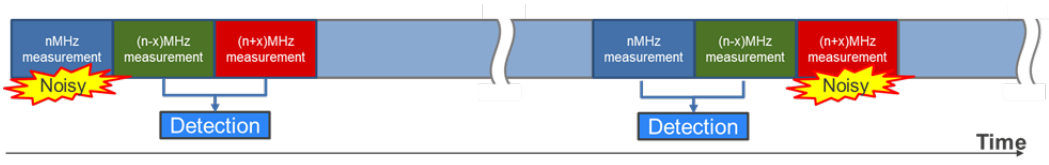

Figure 155: Multi-frequency Measurements

Drive frequency is determined based on the config settings. The module sets registers according to the config settings, and sets the three drive frequencies.
Drive frequency is calculated in the following equation:
(PCLKB frequency / CLK / STCLK) x SUMULTIn / 2 / SDPA : n = 0, 1, 2
The figure below shows the settings for generating a 2MHz drive frequency when the PCLKB frequency is 32 MHz. SDPA can be set for each touch interface configuration.

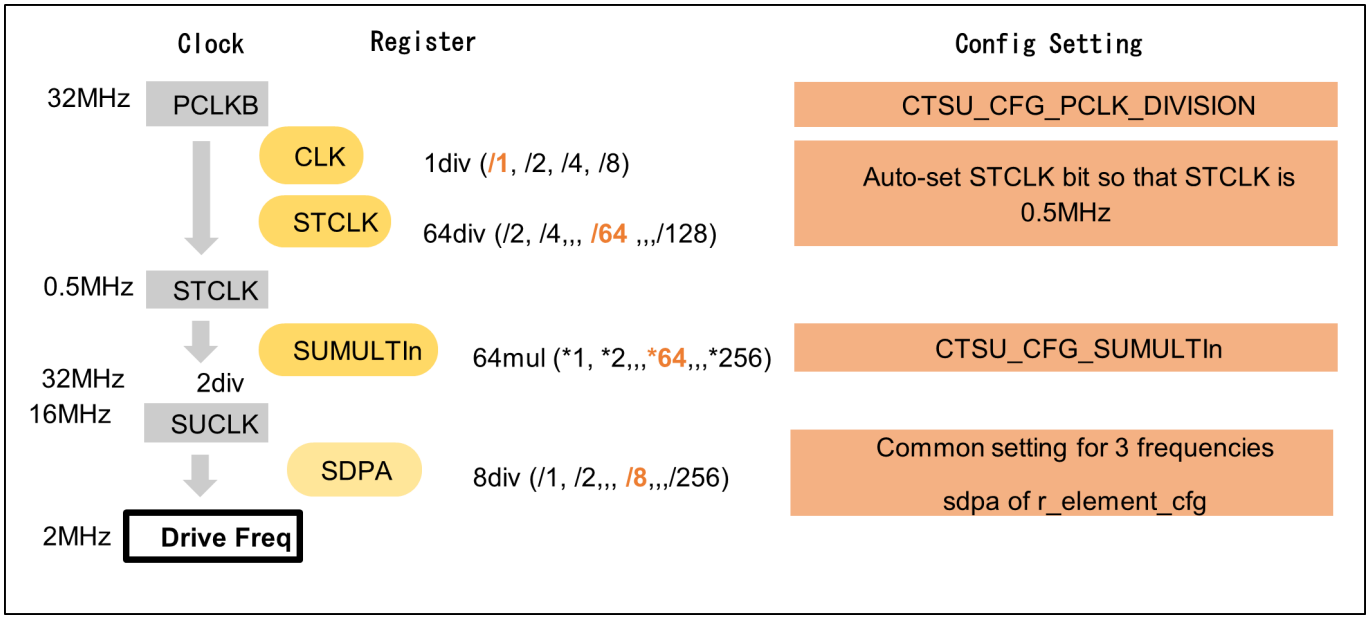

Figure 156: Drive Frequency Settings

Shield Function(CTSU2)

The CTSU2 peripheral has a built-in function that outputs a shield signal in phase with the drive pulse from the shield terminal and the non-measurement terminal in order to shield against external influences while suppressing any increase in parasitic capacitance. This function can only be used during self-capacitance measurements.
This module allows the user to set a shield for each touch interface configuration.
For example, for the electrode configuration shown in , the members of ctsu_cfg_t should be set as follows. Other members have been omitted for the example.
.txvsel = CTSU_TXVSEL_INTERNAL_POWER,
.txvsel2 = CTSU_TXVSEL_MODE,
.md = CTSU_MODE_SELF_MULTI_SCAN,
.posel = CTSU_POSEL_SAME_PULSE,
.ctsuchac0 = 0x0F,
.ctsuchtrc0 = 0x08,

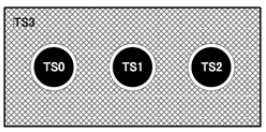

Figure 157: Example of Shield Electrode Structure

Measurement Error Message

When the CTSU2 peripheral detects an abnormal measurement, it sets the status register bit to 1. In the measurement complete interrupt process, the module reads ICOMP1, ICOMP0, and SENSOVF of the status register and notifies the results in the callback function. The status register is reset after the contents are read. For more details on abnormal measurements, refer to "member event" in the ctsu_callback_args_t callback function argument.

Moving Average

This function calculates the moving average of the measured results.
Set the number of times the moving average should be calculated in the config settings.

Diagnosis Function

The CTSU peripheral has a built-in function that diagnoses its own inner circuit. This diagnosis function provides the API for diagnosing the inner circuit.
The diagnostic requirements are different for CTSU1 and CTSU2 providing 5 types of diagnosis for CTSU1 and 9 types for CTSU2.
The diagnosis function is executed by calling the API function. This is executed independently from the other measurements and does not affect them.
To enable the diagnosis function, set CTSU_CFG_DIAG_SUPPORT_ENABLE to 1.
For CTSU1, a 27pF condenser should be connected externally.
For CTSU2, Diagnosis function uses the ADC module.
If an error occurs in the ADC module used for Diagnosis mode, return FSP_ERR_ABORTED as the return value of R_CTSU_DataGet().
If an ADC error is returned, exit the function so as not to measure or close the ADC.
See ADC (r_adc) for ADC module errors.
Please pay particular attention to the following three points.

1. Be sure to measure the ADC module when using the Diagnosis mode function of the CTSU module. Therefore, in order for the user to use it with Dignosis, please close the user's ADC. After closing, please use the Diagnosis mode function of the CTSU module.
2. When creating an application with RTOS, please be careful about the scheduling of the CTSU module's Diagnosis mode function task and the user's ADC task.
3. If FSP_ERR_ABORTED occurs, please call the user's ADC again when using the user's ADC.

Measurement Mode

This module supports all three modes offered by the CTSU2 peripheral: self-capacitance, mutual-capacitance, and current measurement modes. The temperature correction mode is also offered as a mode for updating the correction coefficient.

Self-capacitance Mode

The self-capacitance mode is used to measure the capacitance of each terminal (TS).
The CTSU2 peripheral measures the terminals in ascending order according to the TS numbers, then stores the data. For example, even if you want to use TS5, TS8, TS2, TS3 and TS6 in your application in that order, they will still be measured and stored in the order of TS2, TS3, TS5, TS6, and TS8. Therefore, you will need to reference buffer indexes [2], [4], [0], [1], and [3].

[CTSU1]
In default settings, the measurement period for each TS is wait-time plus approximately 526us.

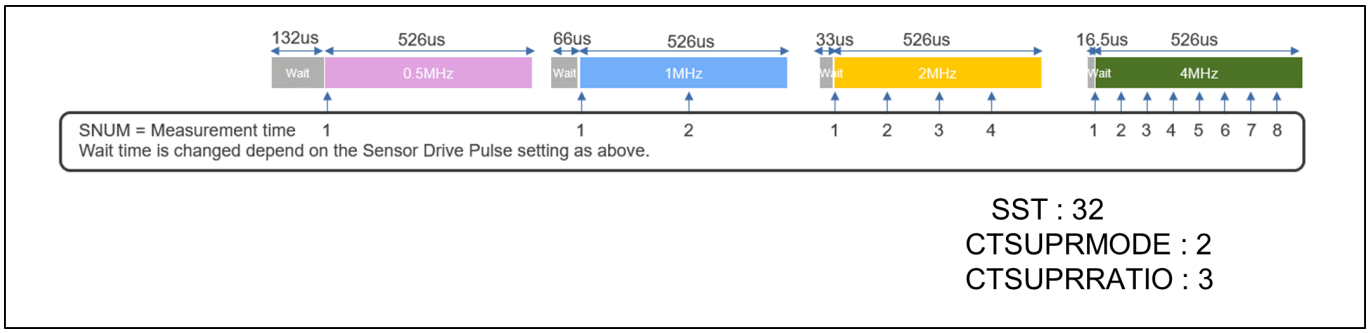

Figure 158: Self-capacitance Measurement Period (CTSU1)

[CTSU2]
In default settings, the measurement period for each TS is approximately 576us.

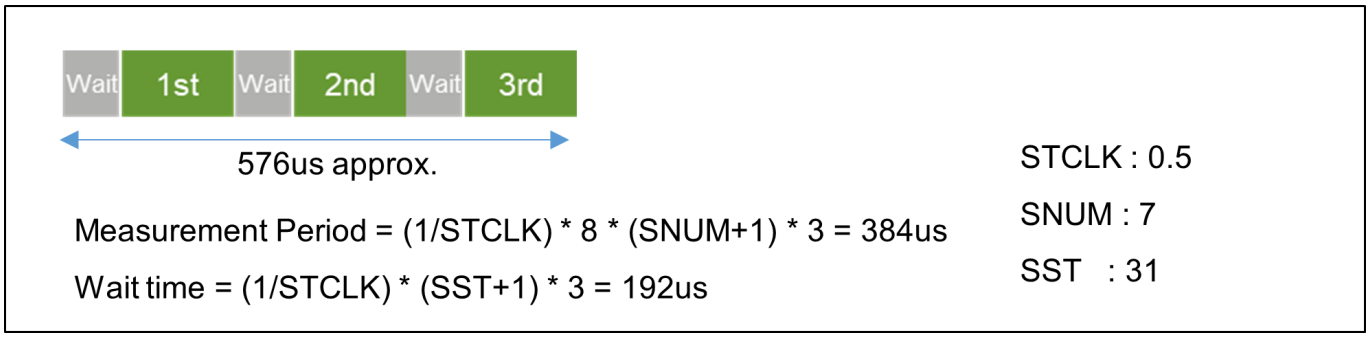

Figure 159: Self-capacitance Measurement Period (CTSU2)

Mutual-Capacitance Mode

The mutual-capacitance mode is used to measure the capacitance generated between the receive TS (Rx) and transmit TS (Tx), and therefore requires at least two terminals.
The CTSU2 peripheral measures all specified combinations of Rx and Tx. For example, when Rx is TS1 and TS3, and Tx is TS2, TS7 and TS4, the combinations are measured in the following order and the data is stored.
TS3-TS2, TS3-TS4, TS3-TS7, TS10-TS2, TS10-TS4, TS10-TS7
To measure the mutual-capacitance generated between electrodes, the CTSU2 peripheral performs the measurement process on the same electrode twice.
The mutual-capacitance is obtained by inverting the phase relationship of the pulse output and switched capacitor in the primary and secondary measurements, and calculating the difference between the two measurements. This module does not calculate the difference, but outputs the secondary measured result.
[CTSU1]
In default settings, the measurement period for each TS is twice of wait-time plus approximately 526us.
[CTSU2]
In default settings, the measurement period for each TS is approximately 1152us.

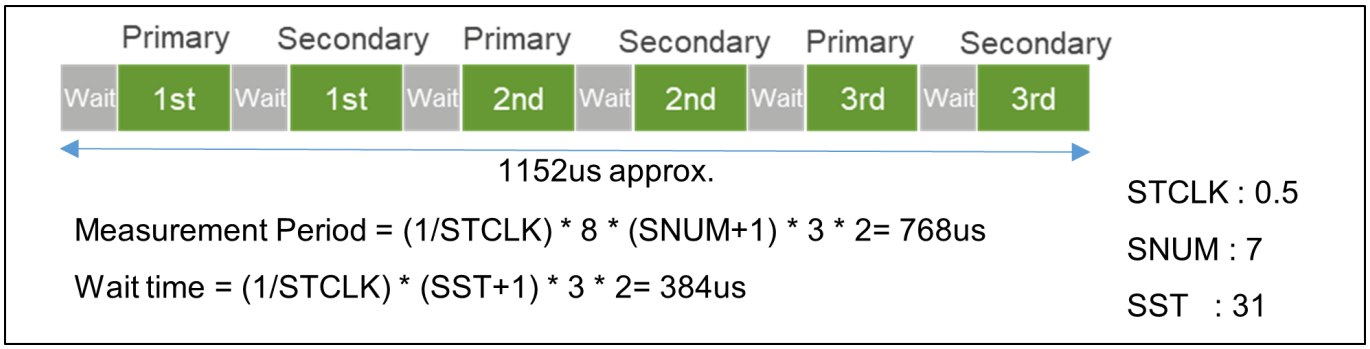

Figure 160: Mutual-capacitance Measurement Period

Mutual-capacitance parallel scan mode(CTSU2)

This mode provides fast measurement time by parallel scanning the RX lines with a CFC circuit. Operation is otherwise identical to normal CTSU mutual scanning.

- Scan Order
  - The hardware scans all RX pins simultaneously for each TX pin.
  - For example, if sensors TS10, TS11, and TS03 are specified as RX sensors, and sensors TS02, TS07, and TS04 are specified as TX sensors, the hardware will scan them in the following sensor-pair order:
    TS02-(TS03, TS10, TS11), TS04-(TS03, TS10, TS11), TS07-(TS03, TS10, TS11)
- Element
  - An element refers to the index of a sensor-pair within the scan order. Using the previous example, TS07-TS10 is element 7.
- Scan Time
  - Because the RX lines are scanned in parallel, CFC mutual-capacitance scan is the same amount of times faster than a basic mutual matrix scan as the number of RX lines. In other words, on a matrix with N receive lines, CFC mutual scanning is N times faster than basic mutual scanning. Set CTSU_MODE_MUTUAL_CFC_SCAN to "md" of ctsu_cfg_t.
    Also, add the number of matrix used for this measurement to CTSU_CFG_NUM_MUTUAL_ELEMENTS. In addition, set the number of CTSU_CFG_NUM_CFC and CTSU_CFG_NUM_CFC_TX.
    For details, refer to the configuration and sample application output by QE for Capacitive Touch.

Current Measurement Mode(CTSU2)

The current measurement mode is used to measure the minute current input to the TS terminal. The order of measurement and data storage is the same as that of the self-capacitance mode. As this does not involve the switched capacitor operation, the measurement is only performed once. The measurement period for one TS under default settings is approximately 256us. The current measurement mode requires a longer stable wait time than the other modes, so the SST is set to 63.

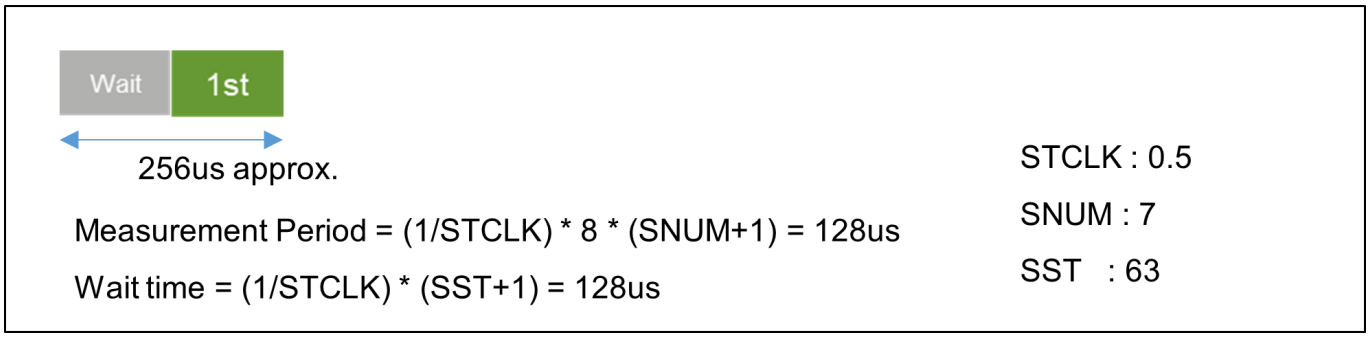

Figure 161: Current Measurement Period

Temperature Correction Mode(CTSU2)

The temperature correction mode is used to periodically update the correction coefficient using an external resistor connected to a TS terminal. This involves three processes as described below. Also refer to the timing chart in Figure of Temperature Correction Measurement Timing Chart.

1. Measure the correction circuit. One set comprises twelve measurements.

2. Measure the current when TSCAP voltage is applied to the external resistor to create a correction coefficient based on an external resistor that does not depend on temperature. Execute the next measurement after the previous measurement set is completed (as described in step 1).
3. Flow offset current to the external resistor and measure the voltage with the ADC. This will adjust the RTRIM register and handle the temperature drift of the internal reference resistor. In the config settings, set the number of times step 2 should be executed before carrying out this measurement.

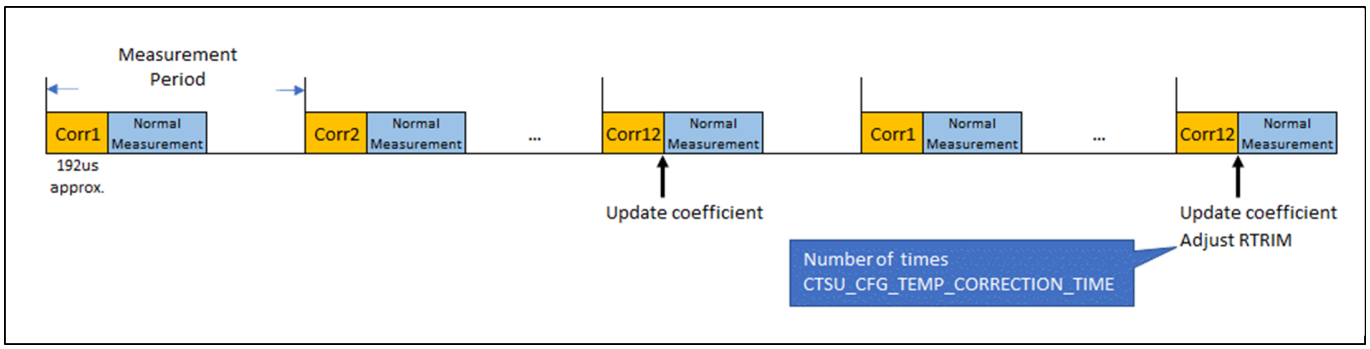

Figure 162: Temperature Correction Measurement Timing Chart

Temperature correction uses the ADC module.
If an error occurs in the ADC module used for temperature correction, return FSP_ERR_ABORTED as the return value of R_CTSU_DataGet().
If an ADC error is returned, exit the function so as not to measure or close the ADC.
See ADC (r_adc) for ADC module errors.
Please pay articular attention to the following three points.

1. When using the temperature correction of the CTSU module, be sure to measure the ADC

module. Therefore, please close the user's ADC for use in temperature correction. After closing, please use temperature correction of CTSU module.
2. When creating an RTOS, please be careful about the scheduling of the CTSU module's temperature correction task and the user's ADC task when creating an application.
3. If FSP_ERR_ABORTED occurs, please call the user's ADC again when using the user's ADC.

Diagnosis Mode

The diagnosis mode is a mode in which various internal measurement values are scanned by using this diagnosis function R_CTSU_Diagnosis().

Measurement Timing

Measurements are initiated by a software trigger or an external event which is triggered by the Event Link Controller (ELC).
The most common method is using a timer to carry out periodic measurements. Make sure to set the timer interval to allow the measurement and internal value update processes to complete before the next measurement period. The measurement period differs according to touch interface configuration and measurement mode.
The execution timing of software triggers and external triggers differ slightly.
Since a software trigger sets the start flag after setting the touch interface configuration with R_CTSU_ScanStart(), there is a slight delay after the timer event occurrence. However, as the delay is much smaller than the measurement period, a software trigger is recommended for most instances as it is easy to set.
An external trigger is recommended for applications in which this slight delay is not acceptable or that require low-power consumption operations. When using an external trigger with multiple touch interface configurations, use R_CTSU_ScanStart() to set another touch interface configuration after one measurement is completed.

TrustZone Support

In r_ctsu and rm_touch module, Non-Secure Callable Guard Functions are only generated from QE for Capacitive Touch. QE can be used for tuning in secure or flat project, but not in non-secure project. If you want to use in non-secure project, copy the output file from secure or flat project. Refer to QE Help for more information.

Data flow

The flow of storing data in RAM is as follows.

(CTSU1)

1. Read registers and stored in RAM as raw data.
2. ICO correction calculation of raw data and stored in RAM as correction data.
3. The correction data is calculated by moving average and stored in RAM as measurement results.

(CTSU2)

1. Reads a register and stores raw data measured at three different frequencies in RAM.
2. Three raw data is ICO-corrected, standardized to the fitst frequency reference value, and stored in RAM as three correction data.

3. Three correction data are calculated by majority decision and moving average, and stored in RAM as measurement results.

Add user's filter

There are two ways to add the user's filter.

1. Instead of filter calculation of R_CTSU_DataGet(), perform user filter calculation and use R_CTSU_DataInsert() to input user filter calculation result.
2. Using the correction data obtained by R_CTSU_SpecificDataGet(), instead of majority decision calculation and filter calculation of R_CTSU_DataGet(), perform user majority decision calculation & filter calculation and use R_CTSU_DataInsert() to input user majority decision calculation & filter calculation result.

Please check example.
User's filter additional Example

Examples

Basic Example

This is a basic example of minimal use of the CTSU in an application.

```
volatile bool g_scan_flag = false;
void ctsu_callback (ctsu_callback_args_t * p_args)
{
 if (CTSU_EVENT_SCAN_COMPLETE == p_args->event)
    {
       g_scan_flag = true;
    }
}
void ctsu_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS];
    err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (true)
    {
       err = R_CTSU_ScanStart(&g_ctsu_ctrl);
      assert(FSP_SUCCESS == err);
```

```
 while (!g_scan_flag)
      {
 /* Wait for scan end callback */
      }
       g_scan_flag = false;
       err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
 if (FSP_SUCCESS == err)
      {
 /* Application specific data processing. */
      }
    }
}
```

Multi-configuration Example

This is a optional example of using both Self-capacitance and Mutual-capacitance configurations in the same project.

```
void ctsu_optional_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS + (CTSU_CFG_NUM_MUTUAL_ELEMENTS * 2)];
    err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
    assert(FSP_SUCCESS == err);
    err = R_CTSU_Open(&g_ctsu_ctrl_mutual, &g_ctsu_cfg_mutual);
    assert(FSP_SUCCESS == err);
 while (true)
    {
 R_CTSU_ScanStart(&g_ctsu_ctrl);
 while (!g_scan_flag)
      {
 /* Wait for scan end callback */
      }
       g_scan_flag = false;
 R_CTSU_ScanStart(&g_ctsu_ctrl_mutual);
```

```
 while (!g_scan_flag)
      {
 /* Wait for scan end callback */
      }
       g_scan_flag = false;
       err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
      assert(FSP_SUCCESS == err);
 if (FSP_SUCCESS == err)
      {
 /* Application specific data processing. */
      }
       err = R_CTSU_DataGet(&g_ctsu_ctrl_mutual, data);
      assert(FSP_SUCCESS == err);
 if (FSP_SUCCESS == err)
      {
 /* Application specific data processing. */
      }
    }
}
```

Offset Adjustment Example

This is an example of offset adjustment using R_CTSU_OffsetTuning().
After completing R_CTSU_Open (), perform initial offset adjustment.
Offset adjustment is performed again when the parasitic capacitance changes significantly due to changes in the surrounding environment and the count value becomes an abnormal value.

```
void ctsu_offsettuning_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS];
    err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
    assert(FSP_SUCCESS == err);
 /* Initial offset tuning */
 do
    {
```

```
R_CTSU_ScanStart(&g_ctsu_ctrl);
while (!g_scan_flag)
     {
/* Wait for scan end callback */
     }
      g_scan_flag = false;
      err = R_CTSU_OffsetTuning(&g_ctsu_ctrl);
   } while (FSP_SUCCESS != err);
while (true)
   {
R_CTSU_ScanStart(&g_ctsu_ctrl);
while (!g_scan_flag)
     {
/* Wait for scan end callback */
     }
      g_scan_flag = false;
      err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
     assert(FSP_SUCCESS == err);
if (FSP_SUCCESS == err)
     {
/* Re-offset tuning is performed when the parasitic capacitance changes
significantly due   */
/* to changes in the surrounding environment and the count value becomes an abnormal
value. */
/*
       */
/* if (abnormal value detection
conditions)                                                  */
/* {
       */
/* Re-offset tuning */
do
     {
R_CTSU_ScanStart(&g_ctsu_ctrl);
```

```
 while (!g_scan_flag)
      {
 /* Wait for scan end callback */
      }
         g_scan_flag = false;
         err = R_CTSU_OffsetTuning(&g_ctsu_ctrl);
      } while (FSP_SUCCESS != err);
 /* }
        */
      }
    }
}
```

Diagnosis function Example

This is a Diagnosis function example of using the configuration in the basic example.

```
void ctsu_diag_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS];
    uint16_t dummy;
 R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
    assert(FSP_SUCCESS == err);
 R_CTSU_Open(&g_ctsu_ctrl_diagnosis, &g_ctsu_cfg_diagnosis);
    assert(FSP_SUCCESS == err);
 while (true)
    {
 R_CTSU_ScanStart(&g_ctsu_ctrl);
 while (!g_scan_flag)
      {
 /* Wait for scan end callback */
      }
       g_scan_flag = false;
       err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
```

```
     assert(FSP_SUCCESS == err);
 R_CTSU_ScanStart(&g_ctsu_ctrl_diagnosis);
 while (!g_scan_flag)
     {
 /* Wait for scan end callback */
     }
      g_scan_flag = false;
      err = R_CTSU_DataGet(&g_ctsu_ctrl_diagnosis, &dummy);
     assert(FSP_SUCCESS == err);
 if (FSP_SUCCESS == err)
     {
           err = R_CTSU_Diagnosis(&g_ctsu_ctrl_diagnosis);
     assert(FSP_SUCCESS == err);
 if (FSP_SUCCESS == err)
     {
 break;
     }
     }
   }
}
```

User's filter additional Example

This is a user's filter additiional example of using the configuration in the basic example.
To perform user's filter calculation, change the num_moving_average of the element in the target ctsu_cfg_t to 1.

Perform user filter calculation and use R_CTSU_DataInsert() to input user filter calculation result.

```
void ctsu_user_filter_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS];
    uint16_t filter_data[CTSU_CFG_NUM_SELF_ELEMENTS];
```

```
 /* If you want to make a touch judgment, call RM_TOUCH_Open()instead of the
following. */
    err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (true)
    {
 /* If you want to make a touch judgment, call RM_TOUCH_ScanStart()instead of the
following. */
       err = R_CTSU_ScanStart(&g_ctsu_ctrl);
      assert(FSP_SUCCESS == err);
 while (!g_scan_flag)
      {
 /* Wait for scan end callback */
      }
       g_scan_flag = false;
       err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
 if (FSP_SUCCESS == err)
      {
 /* User original function. */
            ctsu_user_filter(data, filter_data);
            err = R_CTSU_DataInsert(&g_ctsu_ctrl, filter_data);
      assert(FSP_SUCCESS == err);
 /* Call RM_TOUCH_DataGet() to make a touch decision. */
      }
    }
}
```

Using the correction data obtained by R_CTSU_SpecificDataGet(). Perform user majority decision calculation & filter calculation and use R_CTSU_DataInsert() to input user majority decision calculation & filter calculation result.

```
void ctsu_user_majority_decition_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
```

```
    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS];
    uint16_t corr_data[CTSU_CFG_NUM_SELF_ELEMENTS * CTSU_CFG_NUM_SUMULTI];
    uint16_t filter_data[CTSU_CFG_NUM_SELF_ELEMENTS];
 /* If you want to make a touch judgment, call RM_TOUCH_Open()instead of the
following. */
    err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (true)
    {
 /* If you want to make a touch judgment, call RM_TOUCH_ScanStart()instead of the
following. */
       err = R_CTSU_ScanStart(&g_ctsu_ctrl);
      assert(FSP_SUCCESS == err);
 while (!g_scan_flag)
      {
 /* Wait for scan end callback */
      }
       g_scan_flag = false;
       err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
 if (FSP_SUCCESS == err)
      {
            err = R_CTSU_SpecificDataGet(&g_ctsu_ctrl, corr_data,
CTSU_SPECIFIC_CORRECTION_DATA);
      assert(FSP_SUCCESS == err);
 /* User original function */
            ctsu_user_filter(corr_data, filter_data);
            err = R_CTSU_DataInsert(&g_ctsu_ctrl, filter_data);
      assert(FSP_SUCCESS == err);
 /* Call RM_TOUCH_DataGet() to make a touch decision. */
      }
    }
}
```

Data Structure Documentation

◆ ctsu_ctsuwr_t

struct ctsu_ctsuwr_t		
CTSUWR write register value		
Data Fields		
uint16_t	ctsussc	Copy from (ssdiv << 8) by Open API.
uint16_t	ctsuso0	Copy from ((snum << 10) | so) by Open API.
uint16_t	ctsuso1	Copy from (sdpa << 8) by Open API. ICOG and RICOA is set recommend value.

◆ ctsu_self_buf_t

struct ctsu_self_buf_t		
Scan buffer data formats (Self)		
Data Fields		
uint16_t	sen	Sensor counter data.
uint16_t	ref	Reference counter data (Not used)

◆ ctsu_mutual_buf_t

struct ctsu_mutual_buf_t

Scan buffer data formats (Mutual)		
Data Fields		
uint16_t	pri_sen	Primary sensor data.
uint16_t	pri_ref	Primary reference data (Not used)
uint16_t	snd_sen	Secondary sensor data.
uint16_t	snd_ref	Secondary reference data (Not used)

◆ ctsu_correction_info_t

struct ctsu_correction_info_t		
Correction information		
Data Fields		
ctsu_correction_status_t	status	Correction status.
ctsu_ctsuwr_t	ctsuwr	Correction scan parameter.
volatile ctsu_self_buf_t	scanbuf	Correction scan buffer.
uint16_t	first_val	1st correction value
uint16_t	second_val	2nd correction value
uint32_t	first_coefficient	1st correction coefficient
uint32_t	second_coefficient	2nd correction coefficient
uint32_t	ctsu_clock	CTSU clock [MHz].

◆ ctsu_instance_ctrl_t

struct ctsu_instance_ctrl_t	
CTSU private control block. DO NOT MODIFY. Initialization occurs when R_CTSU_Open() is called.	
Data Fields	
uint32_t	open
	Whether or not driver is open.
volatile ctsu_state_t	state
	CTSU run state.
ctsu_cap_t	cap
	CTSU Scan Start Trigger Select.

ctsu_md_t	md
	CTSU Measurement Mode Select(copy to cfg)
ctsu_tuning_t	tuning
	CTSU Initial offset tuning status.
uint16_t	num_elements
	Number of elements to scan.
uint16_t	wr_index
	Word index into ctsuwr register array.
uint16_t	rd_index
	Word index into scan data buffer.
uint8_t *	p_element_complete_flag
	Pointer to complete flag of each element. g_ctsu_element_complete_flag[] is set by Open API.
int32_t *	p_tuning_diff
	Pointer to difference from base value of each element. g_ctsu_tuning_diff[] is set by Open API.
uint16_t	average
	CTSU Moving average counter.
uint16_t	num_moving_average
	Copy from config by Open API.

uint8_t	ctsucr1
	Copy from (atune1 << 3, md << 6) by Open API. CLK, ATUNE0, CSW, and PON is set by HAL driver.
ctsu_ctsuwr_t *	p_ctsuwr
	CTSUWR write register value. g_ctsu_ctsuwr[] is set by Open API.
ctsu_self_buf_t *	p_self_raw
	Pointer to Self raw data. g_ctsu_self_raw[] is set by Open API.
uint16_t *	p_self_corr
	Pointer to Self correction data. g_ctsu_self_corr[] is set by Open API.
ctsu_data_t *	p_self_data
	Pointer to Self moving average data. g_ctsu_self_data[] is set by Open API.
ctsu_mutual_buf_t *	p_mutual_raw
	Pointer to Mutual raw data. g_ctsu_mutual_raw[] is set by Open API.
uint16_t *	p_mutual_pri_corr
	Pointer to Mutual primary correction data. g_ctsu_self_corr[] is set by Open API.
uint16_t *	p_mutual_snd_corr
	Pointer to Mutual secondary correction data. g_ctsu_self_corr[] is set by Open API.
ctsu_data_t *	p_mutual_pri_data

	Pointer to Mutual primary moving average data. g_ctsu_mutual_pri_data[] is set by Open API.
ctsu_data_t *	p_mutual_snd_data
	Pointer to Mutual secondary moving average data. g_ctsu_mutual_snd_data[] is set by Open API.
ctsu_correction_info_t *	p_correction_info
	Pointer to correction info.
ctsu_txvsel_t	txvsel
	CTSU Transmission Power Supply Select.
ctsu_txvsel2_t	txvsel2
	CTSU Transmission Power Supply Select 2 (CTSU2 Only)
uint8_t	ctsuchac0
	TS00-TS07 enable mask.
uint8_t	ctsuchac1
	TS08-TS15 enable mask.
uint8_t	ctsuchac2
	TS16-TS23 enable mask.
uint8_t	ctsuchac3
	TS24-TS31 enable mask.
uint8_t	ctsuchac4

	TS32-TS39 enable mask.
uint8_t	ctsuchtrc0
	TS00-TS07 mutual-tx mask.
uint8_t	ctsuchtrc1
	TS08-TS15 mutual-tx mask.
uint8_t	ctsuchtrc2
	TS16-TS23 mutual-tx mask.
uint8_t	ctsuchtrc3
	TS24-TS31 mutual-tx mask.
uint8_t	ctsuchtrc4
	TS32-TS39 mutual-tx mask.
uint16_t	self_elem_index
	self element index number for Current instance.
uint16_t	mutual_elem_index
	mutual element index number for Current instance.
uint16_t	ctsu_elem_index
	CTSU element index number for Current instance.
ctsu_cfg_t const *	p_ctsu_cfg
	Pointer to initial configurations.

IRQn_Type	write_irq
	Copy from config by Open API. CTSU_CTSUWR interrupt vector.
IRQn_Type	read_irq
	Copy from config by Open API. CTSU_CTSURD interrupt vector.
IRQn_Type	end_irq
	Copy from config by Open API. CTSU_CTSUFN interrupt vector.
void(*	p_callback)(ctsu_callback_args_t *)
	Callback provided when a CTSUFN occurs.
uint8_t	interrupt_reverse_flag
	Flag in which read interrupt and end interrupt are reversed.
ctsu_event_t	error_status
	error status variable to send to QE for serial tuning.
ctsu_callback_args_t *	p_callback_memory
	Pointer to non-secure memory that can be used to pass arguments to a callback in non-secure memory.
void const *	p_context
	Placeholder for user data.
bool	serial_tuning_enable
	Flag of serial tuning status.

uint16_t	serial_tuning_mutual_cnt
	Word index into ctsuwr register array.
uint16_t	tuning_self_target_value
	Target self value for initial offset tuning.
uint16_t	tuning_mutual_target_value
	Target mutual value for initial offset tuning.

Enumeration Type Documentation

◆ ctsu_state_t

enum ctsu_state_t	
CTSU run state	
Enumerator	
CTSU_STATE_INIT	Not open.
CTSU_STATE_IDLE	Opened.
CTSU_STATE_SCANNING	Scanning now.
CTSU_STATE_SCANNED	Scan end.

◆ ctsu_tuning_t

enum ctsu_tuning_t	
CTSU Initial offset tuning status	
Enumerator	
CTSU_TUNING_INCOMPLETE	Initial offset tuning incomplete.
CTSU_TUNING_COMPLETE	Initial offset tuning complete.

◆ ctsu_correction_status_t

enum ctsu_correction_status_t	
CTSU Correction status	
Enumerator	
CTSU_CORRECTION_INIT	Correction initial status.
CTSU_CORRECTION_RUN	Correction scan running.
CTSU_CORRECTION_COMPLETE	Correction complete.
CTSU_CORRECTION_ERROR	Correction error.

◆ ctsu_range_t

enum ctsu_range_t	
CTSU range definition	
Enumerator	
CTSU_RANGE_20UA	20uA mode
CTSU_RANGE_40UA	40uA mode
CTSU_RANGE_80UA	80uA mode
CTSU_RANGE_160UA	160uA mode
CTSU_RANGE_NUM	number of range

Function Documentation

◆ R_CTSU_Open()

fsp_err_t R_CTSU_Open (ctsu_ctrl_t *const *p_ctrl*, ctsu_cfg_t const *const *p_cfg*)

Opens and configures the CTSU driver module. Implements ctsu_api_t::open.

Example:

```
    err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
```

Return values

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

Note

In the first Open, measurement for correction works, and it takes several tens of milliseconds.

◆ R_CTSU_ScanStart()

fsp_err_t R_CTSU_ScanStart (ctsu_ctrl_t *const *p_ctrl*)

This function should be called each time a periodic timer expires. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Before starting the next scan, first get the data with R_CTSU_DataGet(). If a different control block scan should be run, check the scan is complete before executing. Implements ctsu_api_t::scanStart.

Example:

```
while (true)
   {
      err = R_CTSU_ScanStart(&g_ctsu_ctrl);
     assert(FSP_SUCCESS == err);
while (!g_scan_flag)
     {
/* Wait for scan end callback */
     }
      g_scan_flag = false;
      err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
if (FSP_SUCCESS == err)
     {
/* Application specific data processing. */
     }
   }
```

Return values

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance or other.
FSP_ERR_CTSU_NOT_GET_DATA	The previous data has not been retrieved by DataGet.

◆ R_CTSU_DataGet()

fsp_err_t R_CTSU_DataGet (ctsu_ctrl_t *const *p_ctrl*, uint16_t * *p_data*)

This function gets the sensor values as scanned by the CTSU. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Implements ctsu_api_t::dataGet.

Example:

```
while (true)
   {
      err = R_CTSU_ScanStart(&g_ctsu_ctrl);
     assert(FSP_SUCCESS == err);
while (!g_scan_flag)
     {
/* Wait for scan end callback */
     }
      g_scan_flag = false;
      err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
if (FSP_SUCCESS == err)
     {
/* Application specific data processing. */
     }
   }
```

Return values

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance.
FSP_ERR_CTSU_INCOMPLETE_TUNING	Incomplete initial offset tuning.
FSP_ERR_CTSU_DIAG_NOT_YET	Diagnosis of data collected no yet.
FSP_ERR_ABORTED	Operate error of Diagnosis ADC data collection ,since ADC use other

◆ R_CTSU_OffsetTuning()

fsp_err_t R_CTSU_OffsetTuning (ctsu_ctrl_t *const *p_ctrl*)

This function tunes the offset register(SO). Call after the measurement is completed. If the return value is FSP_ERR_CTSU_INCOMPLETE_TUNING, tuning is not complete. Execute the measurement and this function call routine until the return value becomes FSP_SUCCESS. It is recommended to run this routine after R_CTSU_Open(). It can be recalled and tuned again. When the automatic judgement is enabled, after the offset tuning is completed,the baseline initialization bit flag is set. Implements ctsu_api_t::offsetTuning.

Example:

```
/* Initial offset tuning */
do
   {
R_CTSU_ScanStart(&g_ctsu_ctrl);
while (!g_scan_flag)
     {
/* Wait for scan end callback */
     }
      g_scan_flag = false;
      err = R_CTSU_OffsetTuning(&g_ctsu_ctrl);
   } while (FSP_SUCCESS != err);
while (true)
   {
R_CTSU_ScanStart(&g_ctsu_ctrl);
while (!g_scan_flag)
     {
/* Wait for scan end callback */
     }
      g_scan_flag = false;
      err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
     assert(FSP_SUCCESS == err);
if (FSP_SUCCESS == err)
     {
/* Re-offset tuning is performed when the parasitic capacitance changes
significantly due   */
/* to changes in the surrounding environment and the count value becomes an abnormal
```

```
value. */
 /*
        */
 /* if (abnormal value detection
conditions)                                                */
 /* {
        */
 /* Re-offset tuning */
 do
     {
 R_CTSU_ScanStart(&g_ctsu_ctrl);
 while (!g_scan_flag)
     {
 /* Wait for scan end callback */
     }
        g_scan_flag = false;
        err = R_CTSU_OffsetTuning(&g_ctsu_ctrl);
     } while (FSP_SUCCESS != err);
 /* }
        */
     }
   }
```

Return values

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance.
FSP_ERR_CTSU_INCOMPLETE_TUNING	Incomplete initial offset tuning.

◆ R_CTSU_ScanStop()

fsp_err_t R_CTSU_ScanStop (ctsu_ctrl_t *const *p_ctrl*)

This function scan stops the sensor as scanning by the CTSU. Implements ctsu_api_t::scanStop.

Return values

FSP_SUCCESS	CTSU successfully scan stop.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ R_CTSU_CallbackSet()

fsp_err_t R_CTSU_CallbackSet (ctsu_ctrl_t *const *p_api_ctrl*, void(*)(ctsu_callback_args_t *) *p_callback*, void const *const *p_context*, ctsu_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements ctsu_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_CTSU_Close()

fsp_err_t R_CTSU_Close (ctsu_ctrl_t *const *p_ctrl*)

Disables specified CTSU control block. Implements ctsu_api_t::close.

Return values

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ R_CTSU_SpecificDataGet()

fsp_err_t R_CTSU_SpecificDataGet (ctsu_ctrl_t *const *p_ctrl*, uint16_t * *p_specific_data*, ctsu_specific_data_type_t *specific_data_type*)

This function gets the sensor specific data values as scanned by the CTSU. Call this function after calling the R_CTSU_DataGet() function.

By setting the third argument to CTSU_SPECIFIC_RAW_DATA, RAW data can be output from the second argument.

By setting the third argument to CTSU_SPECIFIC_CCO_CORRECTION_DATA, the cco corrected data can be output from the second argument.

By setting the third argument to CTSU_SPECIFIC_CORRECTION_DATA, the frequency corrected data can be output from the second argument.

By setting the third argument to CTSU_SPECIFIC_SELECTED_FREQ, Get bitmap of the frequency values used in majority decision from the second argument.(CTSU2 Only) The bitmap is shown as follows.

2bit	1bit	0bit
3rd frequency value	2nd frequency value	1st frequency value

Implements ctsu_api_t::specificDataGet.

Example:

```
            err = R_CTSU_SpecificDataGet(&g_ctsu_ctrl, corr_data,
CTSU_SPECIFIC_CORRECTION_DATA);
```

Return values

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance.
FSP_ERR_CTSU_INCOMPLETE_TUNING	Incomplete initial offset tuning.
FSP_ERR_NOT_ENABLED	CTSU_SPECIFIC_SELECTED_FREQ is not enabled in CTSU1.(CTSU2 Only)

◆ R_CTSU_DataInsert()

fsp_err_t R_CTSU_DataInsert (ctsu_ctrl_t *const *p_ctrl*, uint16_t * *p_insert_data*)

This function inserts the value of the second argument as the measurement result value. Call this function after calling the R_CTSU_DataInsert() function. Implements ctsu_api_t::dataInsert.

Example:

```
err = R_CTSU_DataInsert(&g_ctsu_ctrl, filter_data);
```

Return values

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance.
FSP_ERR_CTSU_INCOMPLETE_TUNING	Incomplete initial offset tuning.

◆ R_CTSU_Diagnosis()

fsp_err_t R_CTSU_Diagnosis (ctsu_ctrl_t *const *p_ctrl*)

Diagnosis the CTSU peripheral. Implements ctsu_api_t::diagnosis.

Example:

```
            err = R_CTSU_Diagnosis(&g_ctsu_ctrl_diagnosis);
        assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_NOT_GET_DATA	The previous data has not been retrieved by DataGet.
FSP_ERR_CTSU_DIAG_LDO_OVER_VOLTAGE	Diagnosis of LDO over voltage failed.
FSP_ERR_CTSU_DIAG_CCO_HIGH	Diagnosis of CCO into 19.2uA failed.
FSP_ERR_CTSU_DIAG_CCO_LOW	Diagnosis of CCO into 2.4uA failed.
FSP_ERR_CTSU_DIAG_SSCG	Diagnosis of SSCG frequency failed.
FSP_ERR_CTSU_DIAG_DAC	Diagnosis of non-touch count value failed.
FSP_ERR_CTSU_DIAG_OUTPUT_VOLTAGE	Diagnosis of LDO output voltage failed.
FSP_ERR_CTSU_DIAG_OVER_VOLTAGE	Diagnosis of over voltage detection circuit failed.
FSP_ERR_CTSU_DIAG_OVER_CURRENT	Diagnosis of over current detection circuit failed.
FSP_ERR_CTSU_DIAG_LOAD_RESISTANCE	Diagnosis of LDO internal resistance value failed.
FSP_ERR_CTSU_DIAG_CURRENT_SOURCE	Diagnosis of LDO internal resistance value failed.
FSP_ERR_CTSU_DIAG_SENSCLK_GAIN	Diagnosis of SENSCLK frequency gain failed.
FSP_ERR_CTSU_DIAG_SUCLK_GAIN	Diagnosis of SUCLK frequency gain failed.
FSP_ERR_CTSU_DIAG_CLOCK_RECOVERY	Diagnosis of SUCLK clock recovery function failed.
FSP_ERR_CTSU_DIAG_CFC_GAIN	Diagnosis of CFC oscillator gain failed.

5.2.5.2 Touch (rm_touch)

Modules » CapTouch

Functions

fsp_err_t	RM_TOUCH_Open (touch_ctrl_t *const p_ctrl, touch_cfg_t const *const p_cfg) Opens and configures the TOUCH Middle module. Implements touch_api_t::open. More...
fsp_err_t	RM_TOUCH_ScanStart (touch_ctrl_t *const p_ctrl) This function should be called each time a periodic timer expires. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Before starting the next scan, first get the data with RM_TOUCH_DataGet(). If a different control block scan should be run, check the scan is complete before executing. Implements touch_api_t::scanStart. More...
fsp_err_t	RM_TOUCH_DataGet (touch_ctrl_t *const p_ctrl, uint64_t *p_button_status, uint16_t *p_slider_position, uint16_t *p_wheel_position) Gets the 64-bit mask indicating which buttons are pressed. Also, this function gets the current position of where slider or wheel is being pressed. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Implements touch_api_t::dataGet. More...
fsp_err_t	RM_TOUCH_PadDataGet (touch_ctrl_t *const p_ctrl, uint16_t *p_pad_rx_coordinate, uint16_t *p_pad_tx_coordinate, uint8_t *p_pad_num_touch) This function gets the current position of pad is being pressed. Implements touch_api_t::padDataGet , g_touch_on_ctsu. More...
fsp_err_t	RM_TOUCH_ScanStop (touch_ctrl_t *const p_ctrl) Scan stop specified TOUCH control block. Implements touch_api_t::scanStop. More...

fsp_err_t	RM_TOUCH_SensitivityRatioGet (touch_ctrl_t *const p_ctrl, touch_sensitivity_info_t *p_touch_sensitivity_info) Get the touch sensitivity ratio. Implements touch_api_t::sensitivityRatioGet. More...
fsp_err_t	RM_TOUCH_ThresholdAdjust (touch_ctrl_t *const p_ctrl, touch_sensitivity_info_t *p_touch_sensitivity_info) Adjust the touch judgment threshold. Implements touch_api_t::thresholdAdjust. More...
fsp_err_t	RM_TOUCH_DriftControl (touch_ctrl_t *const p_ctrl, uint16_t input_drift_freq) Control drift correction. Implements touch_api_t::driftControl. More...

Detailed Description

This module supports the Capacitive Touch Sensing Unit (CTSU). It implements the Touch Middleware Interface.

Overview

The Touch Middleware uses the CTSU (r_ctsu) API and provides application-level APIs for scanning touch buttons, sliders, and wheels. This module is configured via the QE for Capacitive Touch.

Features

- Supports touch buttons (Self and Mutual), sliders, and wheels
- Can retrieve the status of up to 64 buttons at once
- Software and external triggering
- Callback on scan end
- Collects and calculates usable scan results:
  - Slider position from 1 to 100 (percent)
  - Wheel position from 1 to 360 (degrees)
- Dynamic touch-judgment-threshold adjustment
- Calculate the XY coordinates of the pad(CTSU2)
- Optional (build time) support for real-time monitoring functionality through the QE tool over UART
- Optional (build time) support for tuning function through the QE Standalone Version tool over UART
- TrustZone Support

Configuration

Note

This module is configured via the QE for Capacitive Touch. For information on how to use the QE tool, once the tool is installed click Help -> Help Contents in e² studio and search for "QE".

This module supports the QE monitor function. The monitor determines whether to use debugger or serial communications, determines the type of the information from QE and sends only the necessary information. This module supports the serial tuning function with the standalone version of QE. Generates a configuration configuration file by UART communication with QE.

Note

Multiple configurations can be defined within a single project allowing for different scan procedures or button layouts.

Build Time Configurations for rm_touch

The following build time configurations are defined in fsp_cfg/rm_touch_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Support for QE monitoring using UART	• Enabled • Disabled	Disabled	Enable SCI_UART support for QE monitoring.
Support for QE Tuning using UART	• Enabled • Disabled	Disabled	Enable SCI_UART support for QE Tuning.
Type of chattering suppression	• TypeA : Counter of exceed threshold is hold within hysteresis range • TypeB : Counter of exceed threshold is reset within hysteresis range.	TypeA : Counter of exceed threshold is hold within hysteresis range	TypeA of chattering suppression : Counter of exceed threshold is hold within hysteresis range. / TypeB of chattering suppression : Counter of exceed threshold is reset within hysteresis range.

Configurations for CapTouch > Touch (rm_touch)

This module can be added to the Stacks tab via New Stack > CapTouch > Touch (rm_touch). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description

Interrupt Configuration

Refer to the CTSU (r_ctsu) section for details.

Clock Configuration

Refer to the CTSU (r_ctsu) section for details.

Pin Configuration

Refer to the CTSU (r_ctsu) section for details.

Usage Notes

Measurements and Data Processing

The module determines whether the button has been touched based on the change in capacitance and detects the position of the slider or wheel. This requires continued periodic measurements of capacitance. When developing your application, make sure to periodically call RM_TOUCH_ScanStart() and RM_TOUCH_DataGet(). For more details, refer to the sample application.

Button Touch Determination

Creating reference value and threshold

A touch button is not a mechanical button in which the ON/OF state is switched by hardware. The ON/OFF state is determined via software.
First, a reference value is created based on measurement results in the non-touch state. The initial reference value is the first measured value. The threshold is then determined with an arbitrary offset. If a measured value exceeds the threshold, the button is determined to be in the ON state, if it does not exceed the threshold, it is in the OFF state.
Processing for self-capacitance and mutual capacitance are basically the same. However, because the amount of capacitance decreases when a mutual capacitance button is touched, the user needs to set the threshold based on decreasing measured values to determine the ON/OFF state.
You can set the threshold for each button separately in the configuration settings (threshold in touch_button_cfg_t). The following functions are also included to deal with issues such as chattering suppression and changes in the external environment which affect actual touch recognition.

Positive Noise Filter/Negative Noise Filter

As a chattering countermeasure, you can confirm the ON/OFF state after a set number of consecutive ON or OFF determinations.
In the configuration settings (on_freq and off_freq in touch_cfg_t) set the number of consecutive ON or OFF states. You can do this for all buttons in the touch interface configuration. Be aware that, although this is an effective solution to improving chattering, the greater the number of consecutive states, the slower the response to actual touch.

Hysteresis

This is another chattering countermeasure. Offset the constant to the threshold after the state goes to ON, and prevent chattering by using hysteresis as the OFF-to-ON and ON-to-OFF threshold.
You can set the hysteresis value for each button in the configuration settings (hysteresis in touch_button_cfg_t). The larger the hysteresis, the more effective the countermeasure is in suppressing chattering. However, keep in mind that this will make it more difficult to return the state from ON-to-OFF of OFF-to-ON.

Drift Correction Process

As a countermeasure for changes in the external environment, the drift correction process refreshes the reference value.
After averaging the measured value in the OFF state over a set period, if the button is in the touch OFF state after a set period, the reference value is refreshed. The drift correction is only executed in the OFF state and is cleared when touch ON is determined.
Set the period in the configuration settings (drift_freq in touch_cfg_t). You can do this for all buttons

in the touch interface configuration. This allows you to adjust the ability to determine the touch state despite changes in the external environment.

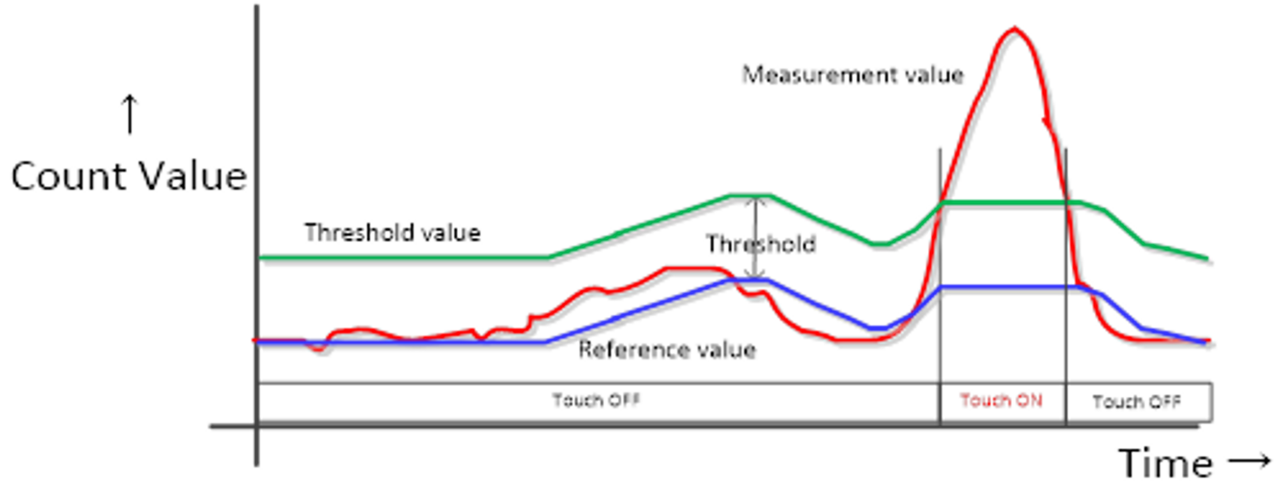

Figure 163: Button Touch Determination

Press and hold cancel

Strong noise or other sudden environment changes can disable the drift correction process, preventing return from the ON state. The press and hold cancel function implements the drift correction process and returns the button from the ON state by forcibly turning the state to OFF after a certain number of consecutive ON state periods.
Set the number of consecutive ON periods required for the press and hold cancel function to return the button to the OFF state in the configuration settings (cancel_freq in touch_cfg_t). You can do this for all buttons in the touch interface configuration.

Chattering suppression type (Build option)

This build option is a function to supplement the above functions (Positive Noise Filter/Negative Noise Filter and Hysteresis) for performing touch judgment.
This build option changes the processing method for Counter of exceed threshold to TypeA or TypeB.
TypeA of chattering suppression : Counter of exceed threshold is hold within hysteresis range.
TypeB of chattering suppression : Counter of exceed threshold is reset within hysteresis range.

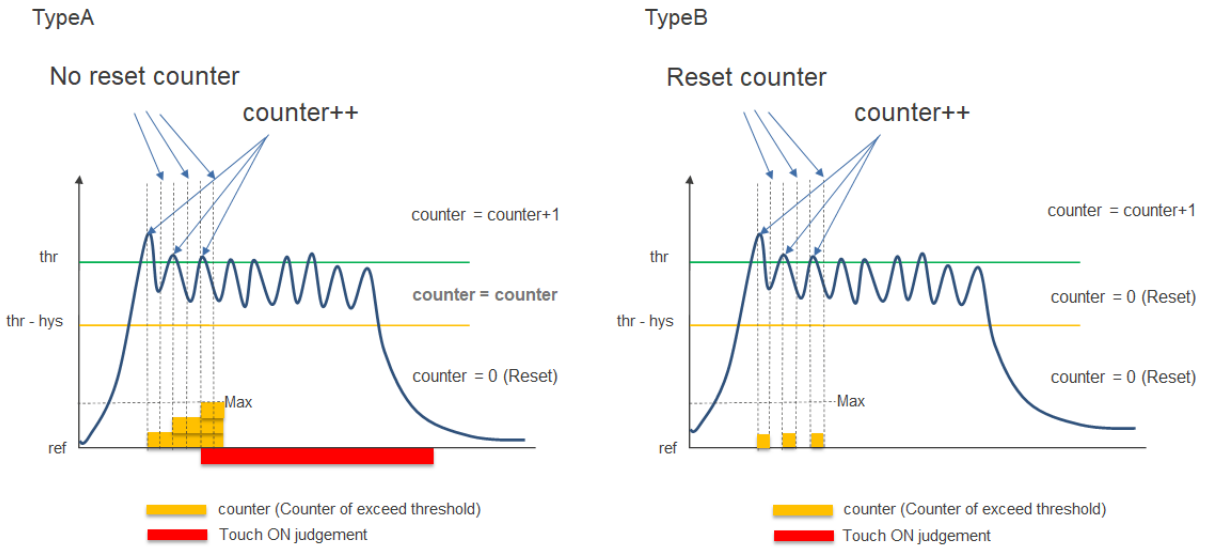

Figure 164: Chattering suppression type

Touch Position Detection of Slider/Wheel

Configure a slider with multiple terminals to be measured (TS) physically arranged in a straight line.
Configure a wheel with multiple terminals physically arranged in a circle.
The touch position is calculated from the measured values of the TS in the configuration. The calculation method for sliders and wheels is fundamentally the same.

1. Detect the maximum value (TS_MAX) among the terminals in the configuration.
2. Calculate the difference (d1, d2) between TS_MAX and the terminals on either side. (If the TS_MAX terminal is at one end of the slider, use the values of the two terminals to the right or left, accordingly.)
3. If the total of d1 and d2 exceeds the threshold, position calculation is initiated. If the total amount does not exceed the threshold, the position calculation process is ended.
4. With TS_MAX as the middle position, the ratio of d1 to d2 is used to calculate the position. The slider has a range of 1 to 100, and the while has a range of 1 to 360.

	Slider	Wheel
Electrode type	Self capacitance only	Self capacitance only
Number of electrodes	3-10	4+
Touch position output range	1-100	1-360
Default value (no touch)	0xFFFF	0xFFFF

Tuning the Touch Determination Adjustment

When QE tuning, a measurement is performed with a finger touching the button and the tuned parameters are output in the configuration file. The setting value of the threshold is 60% of the touch sensitivity between touch and non-touch state, and the setting value of the hysteresis coefficient is 5% of the threshold.
This module provides the functions for dynamic adjusting of these threshold and hysteresis coefficient.
They are two functions as below.

Adjusting the threshold and hysteresis coefficient to an arbitrary ratio.
Use RM_TOUCH_ThresholdAdjust().

When changing the touch determination threshold ratio from 60% QE set to 70% user specified, the touch determination thresholds are as below.
If you want to make this setting, set the member of the second argument as follows. It is also necessary to set the ratio of the amount of touch change and the hysteresis value.

*p_touch_sensitivity_ratio = 100,
old_threshold_ratio = 60,
new_threshold_ratio = 70,
new_hysteresis_ratio = 5

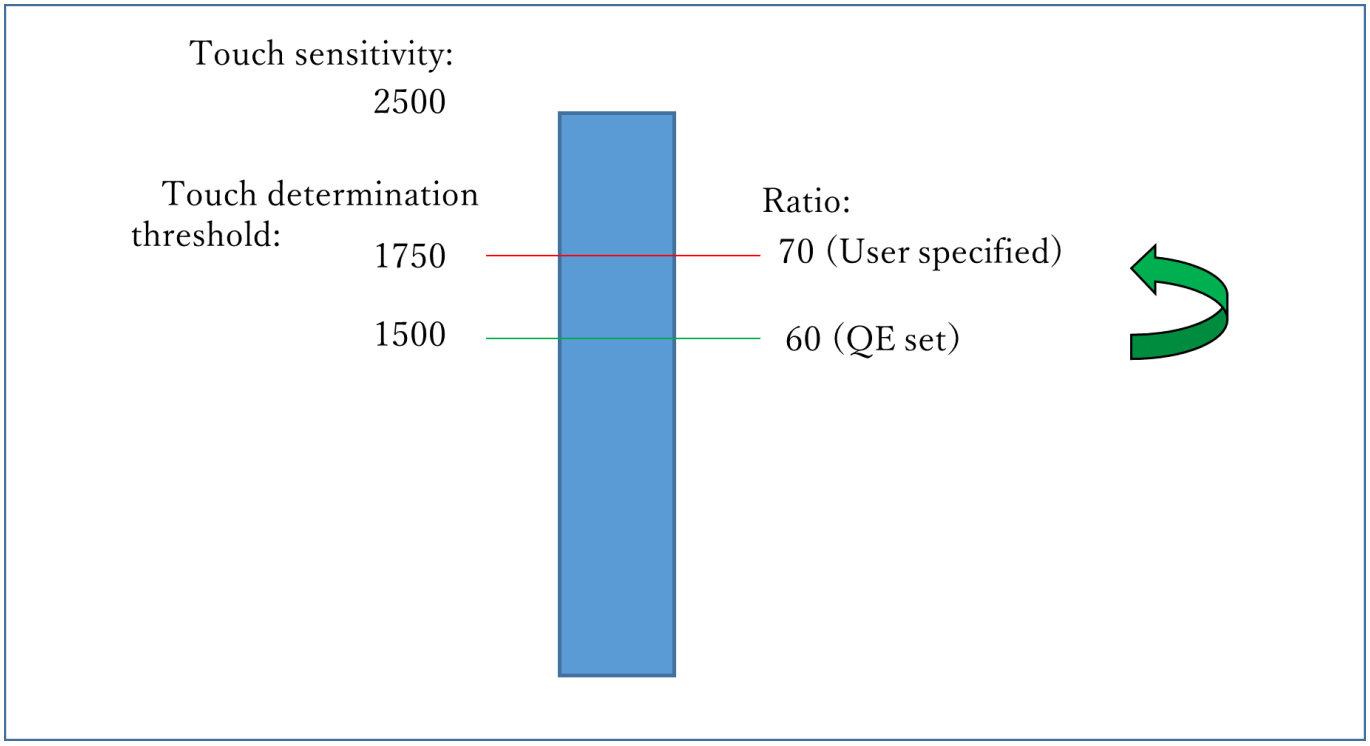

Figure 165: Example of changing the threshold ratio

Adjusting the threshold and hysteresis coefficient according to the current touch sensitivity.
Use RM_TOUCH_SensitivityRatioGet(), RM_TOUCH_ThresholdAdjust(), and RM_TOUCH_DriftControl().

When changing the kind of the overlay panel, the touch sensitivity differs from the one QE tuned. Wanting to use the software as it is without re-tuning. If you use a thicker overlay than that at QE tuning, the touch sensitivity decreases, and a touch may not be determined because of the same touch determination threshold. This function adjusts the touch determination threshold based on the ratio of the touch sensitivity after changing the overlay to the touch sensitivity at the QE tuning.

RM_TOUCH_SensitivityRatioGet() outputs the ratio of the current touch sensitivity assuming that the touch sensitivity at the QE setting is 100%.
The following figure shows the case where an overlay panel is thinner and the touch sensitivity increases.

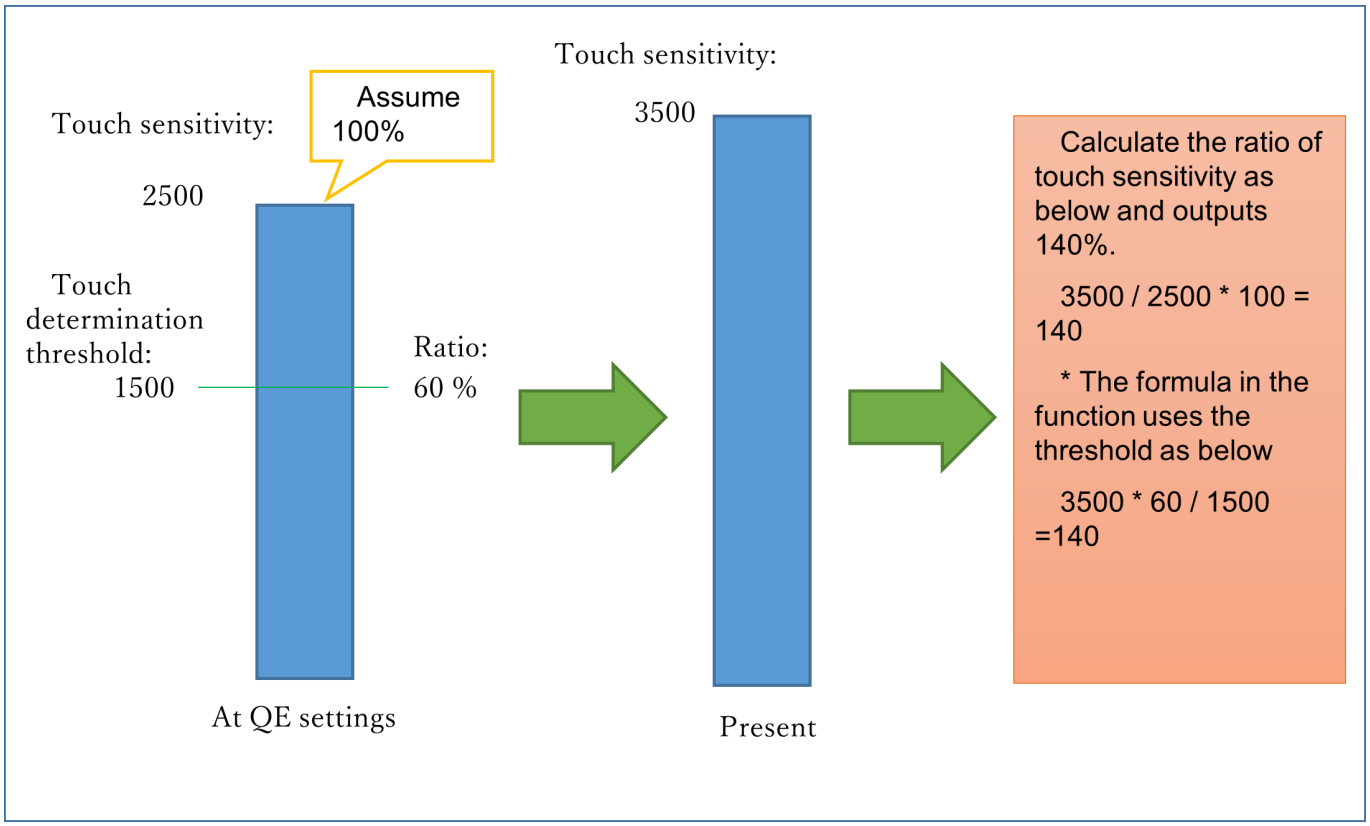

Figure 166: Example of increase touch sensitivity for thin overlay panels

Following figure shows the case where an overlay panel is thicker and the touch sensitivity decreases.

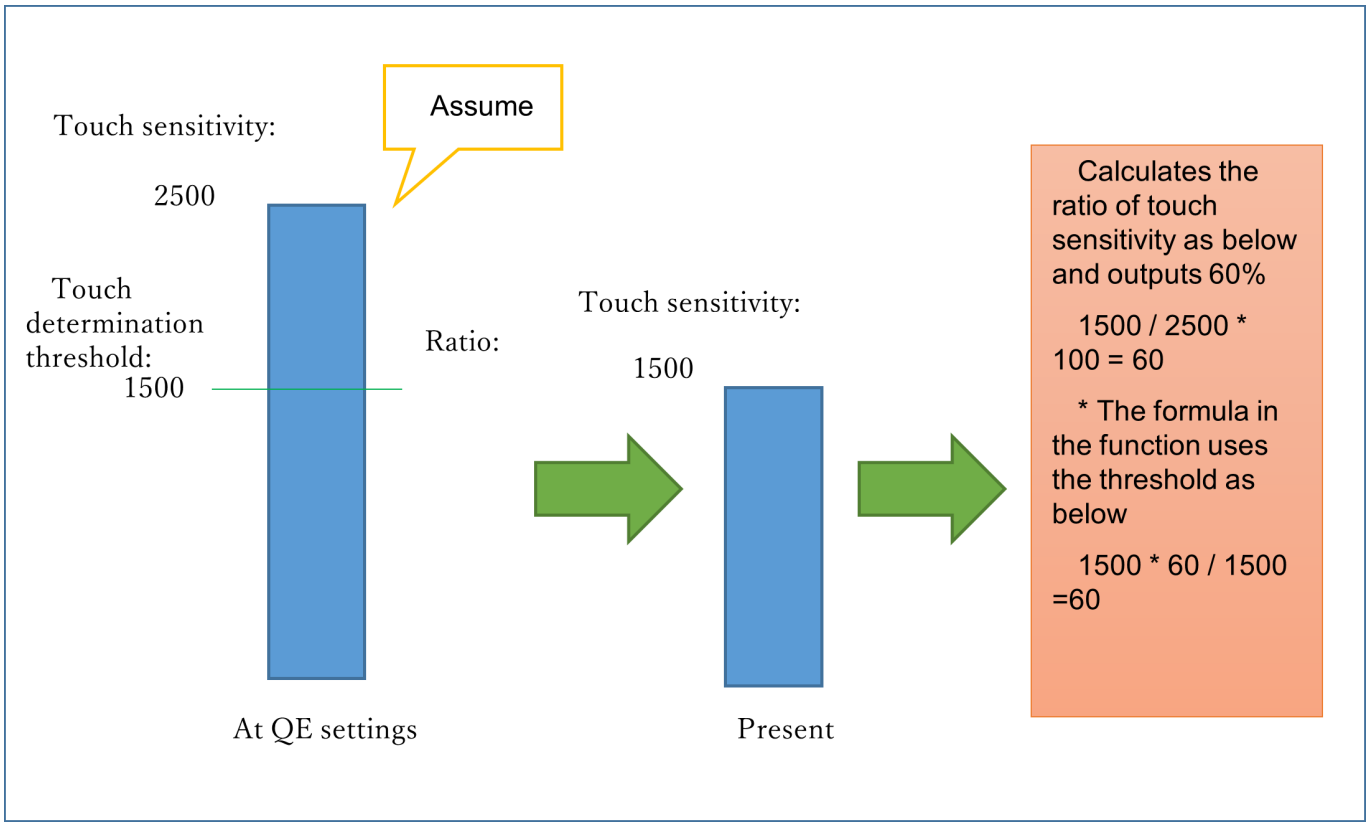

Figure 167: Example of decrease touch sensitivity for thicker overlay panels

RM_TOUCH_ThresholdAdjust() sets the new touch determination threshold and the hysteresis value by using the touch sensitivity ratio obtained with RM_TOUCH_SensitivityRatioGet() as arguments.

Example of calculation 1:
The touch sensitivity ratio is 140%, and the threshold set by QE is 1500.
Threshold = 140 * 1500 / 100 = 2100

*p_touch_sensitivity_ratio = 140,
old_threshold_ratio = 60,
new_threshold_ratio = 60,
new_hysteresis_ratio = 5

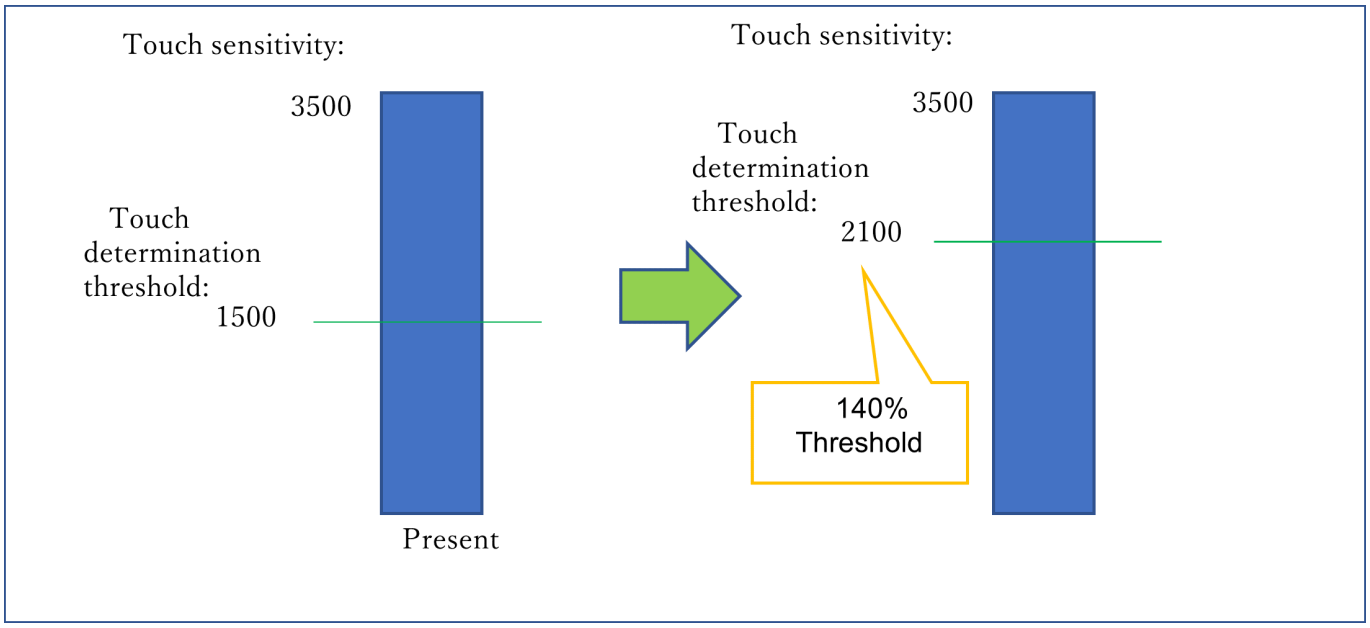

Figure 168: Example of calculation 1

Example of calculation 2:
The touch sensitivity ratio is 60%, and the threshold set by QE is 1500.
Threshold = 60 * 1500 / 100 = 900

*p_touch_sensitivity_ratio = 60,
old_threshold_ratio = 60,
new_threshold_ratio = 60,
new_hysteresis_ratio = 5

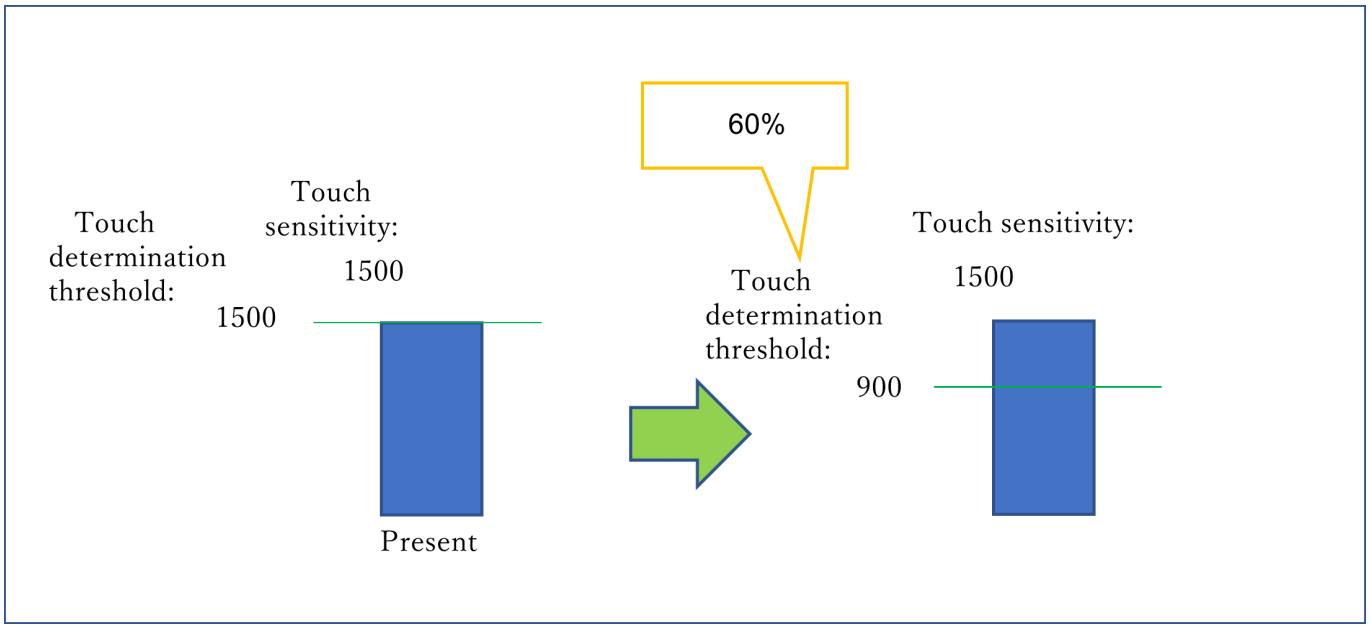

Figure 169: Example of calculation 2

RM_TOUCH_DriftContorol() set the second argument to 0 to stop the drift correction function.

When calculating the ratio of the touch change amount using RM_TOUCH_SensitivityRatioGet(), the touch change amount decreases due to the thick overlay, and the threshold value is not exceeded even if touched. Prevents the reference value from drifting.

Example of the application for adjustment using data flash without re-tuning or software rewriting

Enable UART communication to PC and 'tuning mode'. In tuning mode, the MCU transmits the ratio of the touch sensitivity in the touch state to the PC in real time. A user sends a command to decide the ratio while monitoring on the PC. The MCU stores the received ratio in the data flash. Make sure that the ratio stored in the data flash is read at the software activation, and the touch determination threshold is adjusted based on this stored value.

Pad

Configure a pad with multiple terminals physically arranged in cross.
The current position is Calculated from the measured values of the CTSU mutual scanning in the configuration.
Use RM_TOUCH_PadDataGet().
Pad is subject so some limitations:

	Pad
Electrode type	CFC mutual capacitance only
Number of electrodes	RX(TS-CFC)3+, TX(Any TS)3+
Touch position output range	rx_coodinate:(0 ~ rx_pixel), tx_coodinate:(0 ~ tx_pixsel)
Default value (no touch)	rx_coodinate:0xFFFF, tx_coodinate:0xFFFF
Pixel range	rx_pixel:(1 ~ 65535), tx_pixsel:(1 ~ 65535)

Pitch for each terminal can be set with QE. Pitch's default value is 64.
The relationship between pixel and pitch : Pixel = Pitch × number of TS - 1

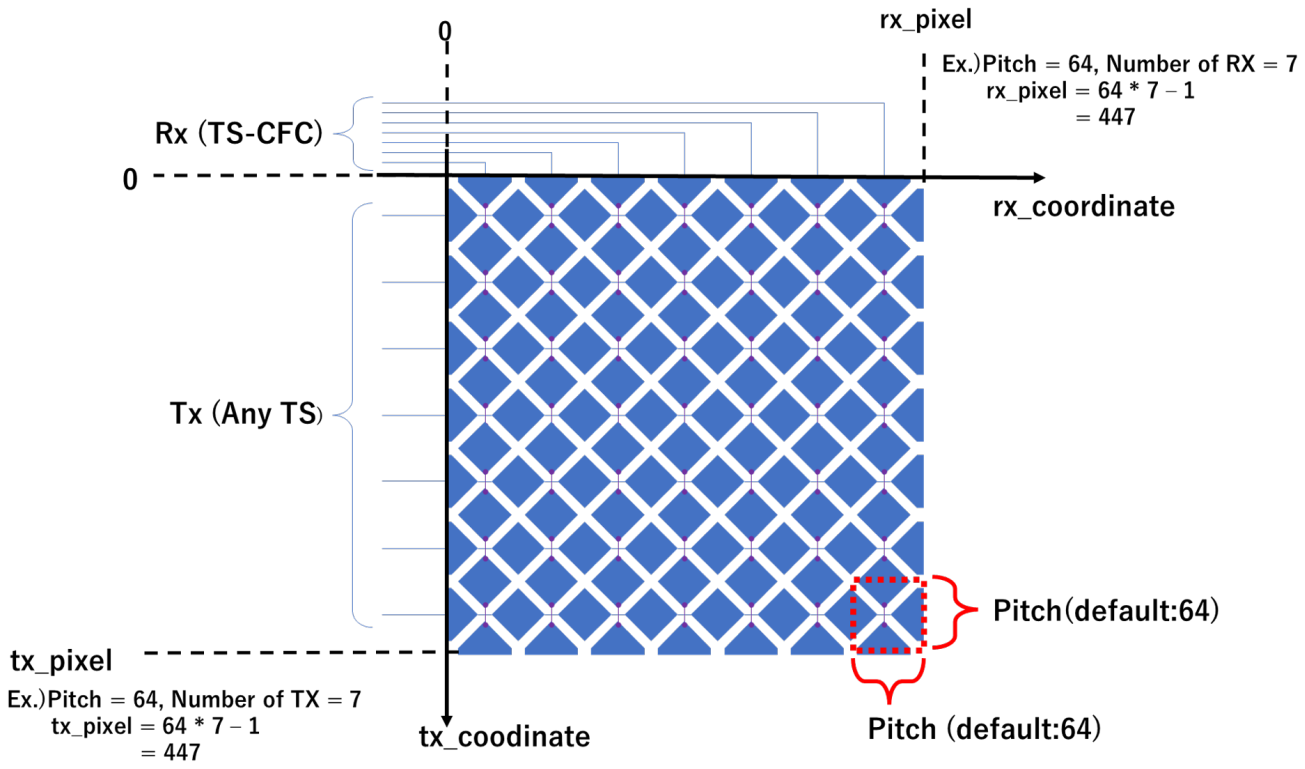

Figure 170: Example of Pad

TrustZone Support

In r_ctsu and rm_touch module, Non-Secure Callable Guard Functions are only generated from QE for Capacitive Touch. QE can be used for tuning in secure or flat project, but not in non-secure project. If you want to use in non-secure project, copy the output file from secure or flat project. Refer to QE Help for more information.

Examples

Basic Example

This is a basic example of minimal use of the TOUCH in an application.

```
void touch_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    err = RM_TOUCH_Open(&g_touch_ctrl, &g_touch_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (true)
    {
 RM_TOUCH_ScanStart(&g_touch_ctrl);
```

```
 while (0 == g_flag)
      {
 /* Wait scan end callback */
       }
       g_flag = 0;
       err = RM_TOUCH_DataGet(&g_touch_ctrl, &button, slider, wheel);
 if (FSP_SUCCESS == err)
      {
 /* Application specific data processing. */
       }
    }
}
```

Multi Mode Example

This is a optional example of using both Self-capacitance and Mutual-capacitance. Refer to the Multi Mode Example in CTSU usage notes.

```
void touch_optional_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    err = RM_TOUCH_Open(&g_touch_ctrl, &g_touch_cfg);
    assert(FSP_SUCCESS == err);
    err = RM_TOUCH_Open(&g_touch_ctrl_mutual, &g_touch_cfg_mutual);
    assert(FSP_SUCCESS == err);
 while (true)
    {
 RM_TOUCH_ScanStart(&g_touch_ctrl);
 while (0 == g_flag)
      {
 /* Wait scan end callback */
       }
       g_flag = 0;
 RM_TOUCH_ScanStart(&g_touch_ctrl_mutual);
 while (0 == g_flag)
```

```
     {
/* Wait scan end callback */
      }
      g_flag = 0;
      err = RM_TOUCH_DataGet(&g_touch_ctrl, &button, slider, wheel);
if (FSP_SUCCESS == err)
     {
/* Application specific data processing. */
      }
      err = RM_TOUCH_DataGet(&g_touch_ctrl_mutual, &button, slider, wheel);
if (FSP_SUCCESS == err)
     {
/* Application specific data processing. */
      }
   }
}
```

Data Structures

struct	touch_button_info_t
struct	touch_slider_info_t
struct	touch_wheel_info_t
struct	touch_pad_info_t
struct	touch_instance_ctrl_t

Data Structure Documentation

◆ touch_button_info_t

struct touch_button_info_t		
Information of button		
Data Fields		
uint64_t	status	Touch result bitmap.
uint16_t *	p_threshold	Pointer to Threshold value array. g_touch_button_threshold[] is set by Open API.

uint16_t *	p_hysteresis	Pointer to Hysteresis value array. g_touch_button_hysteresis[] is set by Open API.
uint16_t *	p_reference	Pointer to Reference value array. g_touch_button_reference[] is set by Open API.
uint16_t *	p_on_count	Continuous touch counter. g_touch_button_on_count[] is set by Open API.
uint16_t *	p_off_count	Continuous non-touch counter. g_touch_button_off_count[] is set by Open API.
uint32_t *	p_drift_buf	Drift reference value. g_touch_button_drift_buf[] is set by Open API.
uint16_t *	p_drift_count	Drift counter. g_touch_button_drift_count[] is set by Open API.
uint8_t	on_freq	Copy from config by Open API.
uint8_t	off_freq	Copy from config by Open API.
uint16_t	drift_freq	Copy from config by Open API.
uint16_t	cancel_freq	Copy from config by Open API.

◆ touch_slider_info_t

struct touch_slider_info_t		
Information of slider		
Data Fields		
uint16_t *	p_position	Calculated Position data. g_touch_slider_position[] is set by Open API.
uint16_t *	p_threshold	Copy from config by Open API. g_touch_slider_threshold[] is set by Open API.

◆ touch_wheel_info_t

struct touch_wheel_info_t		
Information of wheel		
Data Fields		
uint16_t *	p_position	Calculated Position data. g_touch_wheel_position[] is set by Open API.

uint16_t *	p_threshold	Copy from config by Open API. g_touch_wheel_threshold[] is set by Open API.

◆ touch_pad_info_t

struct touch_pad_info_t		
Information of pad		
Data Fields		
uint16_t *	p_rx_coordinate	RX coordinate.
uint16_t *	p_tx_coordinate	TX coordinate.
uint16_t *	p_num_touch	number of touch
uint16_t *	p_threshold	Coordinate calculation threshold value.
uint16_t *	p_base_buf	ScanData Base Value Buffer.
uint16_t *	p_rx_pixel	X coordinate resolution.
uint16_t *	p_tx_pixel	Y coordinate resolution.
uint8_t *	p_max_touch	Maximum number of touch judgments used by the pad.
int32_t *	p_drift_buf	Drift reference value. g_touch_button_drift_buf[] is set by Open API.
uint16_t *	p_drift_count	Drift counter. g_touch_button_drift_count[] is set by Open API.
uint8_t	num_drift	Copy from config by Open API.

◆ touch_instance_ctrl_t

struct touch_instance_ctrl_t		
TOUCH private control block. DO NOT MODIFY. Initialization occurs when RM_TOUCH_Open() is called.		
Data Fields		
uint32_t	open	Whether or not driver is open.
touch_button_info_t	binfo	Information of button.
touch_slider_info_t	sinfo	Information of slider.
touch_wheel_info_t	winfo	Information of wheel.
bool	serial_tuning_enable	Flag of serial tuning status.
touch_pad_info_t	pinfo	Information of pad.
touch_cfg_t const *	p_touch_cfg	Pointer to initial configurations.
ctsu_instance_t const *	p_ctsu_instance	Pointer to CTSU instance.

Function Documentation

◆ RM_TOUCH_Open()

fsp_err_t RM_TOUCH_Open (touch_ctrl_t *const *p_ctrl*, touch_cfg_t const *const *p_cfg*)

Opens and configures the TOUCH Middle module. Implements touch_api_t::open.

Example:

```
    err = RM_TOUCH_Open(&g_touch_ctrl, &g_touch_cfg);
```

Return values

FSP_SUCCESS	TOUCH successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

◆ RM_TOUCH_ScanStart()

fsp_err_t RM_TOUCH_ScanStart (touch_ctrl_t *const *p_ctrl*)

This function should be called each time a periodic timer expires. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Before starting the next scan, first get the data with RM_TOUCH_DataGet(). If a different control block scan should be run, check the scan is complete before executing. Implements touch_api_t::scanStart.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance or other.
FSP_ERR_CTSU_NOT_GET_DATA	The previous data has not been retrieved by DataGet.

◆ RM_TOUCH_DataGet()

fsp_err_t RM_TOUCH_DataGet (touch_ctrl_t *const *p_ctrl*, uint64_t * *p_button_status*, uint16_t * *p_slider_position*, uint16_t * *p_wheel_position*)

Gets the 64-bit mask indicating which buttons are pressed. Also, this function gets the current position of where slider or wheel is being pressed. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Implements touch_api_t::dataGet.

Note

FSP v4.0.0 or later,

- *The value of 'Secondary - Primary' is modified from uint16_t to int16_t. When the value of 'Secondary - Primary' is larger than 32767 and less than -32767, this API return FSP_ERR_INVALID_DATA.*
- *An upper limit is set for the value of Secondary. When the value of Secondary is larger than 45000, this API return FSP_ERR_INVALID_DATA.*

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_DATA	Accuracy of data is not guaranteed.
FSP_ERR_CTSU_SCANNING	Scanning this instance.
FSP_ERR_CTSU_INCOMPLETE_TUNING	Incomplete initial offset tuning.

◆ RM_TOUCH_PadDataGet()

fsp_err_t RM_TOUCH_PadDataGet (touch_ctrl_t *const *p_ctrl*, uint16_t * *p_pad_rx_coordinate*, uint16_t * *p_pad_tx_coordinate*, uint8_t * *p_pad_num_touch*)

This function gets the current position of pad is being pressed. Implements touch_api_t::padDataGet , g_touch_on_ctsu.

Note

FSP v4.0.0 or later,

- *The value of 'Secondary - Primary' is modified from uint16_t to int16_t. When the value of 'Secondary - Primary' is larger than 32767 and less than -32767, this API return FSP_ERR_INVALID_DATA.*
- *An upper limit is set for the value of Secondary. When the value of Secondary is larger than 45000, this API return FSP_ERR_INVALID_DATA.*

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_DATA	Accuracy of data is not guaranteed.
FSP_ERR_CTSU_SCANNING	Scanning this instance.

◆ RM_TOUCH_ScanStop()

fsp_err_t RM_TOUCH_ScanStop (touch_ctrl_t *const *p_ctrl*)

Scan stop specified TOUCH control block. Implements touch_api_t::scanStop.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_TOUCH_CallbackSet()

fsp_err_t RM_TOUCH_CallbackSet (touch_ctrl_t *const *p_api_ctrl*, void(*)(touch_callback_args_t *) *p_callback*, void const *const *p_context*, touch_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements touch_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ RM_TOUCH_Close()

fsp_err_t RM_TOUCH_Close (touch_ctrl_t *const *p_ctrl*)

Disables specified TOUCH control block. Implements touch_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_TOUCH_SensitivityRatioGet()

fsp_err_t RM_TOUCH_SensitivityRatioGet (touch_ctrl_t *const *p_ctrl*, touch_sensitivity_info_t * *p_touch_sensitivity_info*)

Get the touch sensitivity ratio. Implements touch_api_t::sensitivityRatioGet.

Return values

FSP_SUCCESS	Successfully touch sensitivity ratio got.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance.
FSP_ERR_CTSU_INCOMPLETE_TUNING	Incomplete initial offset tuning.

◆ RM_TOUCH_ThresholdAdjust()

fsp_err_t RM_TOUCH_ThresholdAdjust (touch_ctrl_t *const *p_ctrl*, touch_sensitivity_info_t * *p_touch_sensitivity_info*)

Adjust the touch judgment threshold. Implements touch_api_t::thresholdAdjust.

Return values

FSP_SUCCESS	Successfully touch judgment threshold was adjusted.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_TOUCH_DriftControl()

fsp_err_t RM_TOUCH_DriftControl (touch_ctrl_t *const *p_ctrl*, uint16_t *input_drift_freq*)

Control drift correction. Implements touch_api_t::driftControl.

Return values

FSP_SUCCESS	Successfully drift correction was controlled.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

5.2.6 Connectivity

Modules

Detailed Description

Connectivity Modules.

Modules

	Azure RTOS USBX Port (rm_usbx_port)
	CAN (r_can) Driver for the CAN peripheral on RA MCUs. This module implements the CAN Interface.
	CAN FD (r_canfd) Driver for the CANFD peripheral on RA MCUs. This module implements the CAN Interface.
	CEC (r_cec) Driver for the CEC peripheral on RA MCUs. This module implements the CEC Interface.
	I2C Communication Device (rm_comms_i2c) Middleware to implement the I2C communications interface. This module implements the Communicatons Middleware Interface.
	I2C Master (r_iic_b_master) I2C Driver for the IIC/I3C peripheral on RA MCUs. This module implements the I2C Master Interface.
	I2C Master (r_iic_master) Driver for the IIC peripheral on RA MCUs. This module implements the I2C Master Interface.
	I2C Master (r_iica_master) Driver for the IICA peripheral on RA MCUs. This module implements the I2C Master Interface.

	I2C Master (r_sau_i2c) Driver for the SAU peripheral on RA MCUs. This module implements the I2C Master Interface.
	I2C Master (r_sci_b_i2c) Driver for the SCI_B peripheral on RA MCUs. This module implements the I2C Master Interface.
	I2C Master (r_sci_i2c) Driver for the SCI peripheral on RA MCUs. This module implements the I2C Master Interface.
	I2C Slave (r_iic_b_slave) Driver for the IIC/I3C peripheral on RA MCUs. This module implements the I2C Slave Interface.
	I2C Slave (r_iic_slave) Driver for the IIC peripheral on RA MCUs. This module implements the I2C Slave Interface.
	I2C Slave (r_iica_slave) Driver for the IICA peripheral on RA MCUs. This module implements the I2C Slave Interface.
	I2S (r_ssi) Driver for the SSIE peripheral on RA MCUs. This module implements the I2S Interface.
	I3C (r_i3c) Driver for the I3C peripheral on RA MCUs. This module implements the I3C Interface.
	LIN (r_sci_b_lin) Driver for the SCI peripheral on RA MCUs. This module implements the LIN Interface.
	SMBUS Communication Device (rm_comms_smbus)

	Middleware to implement the SMBUS communications interface. This module implements the Communicatons Middleware Interface.
	SMCI (r_sci_smci) Driver for the SCI peripheral on RA MCUs. This module implements the SMCI Interface.
	SPI (r_sau_spi) Driver for the SAU peripheral on RA MCUs. This module implements the SPI Interface.
	SPI (r_sci_b_spi) Driver for the SCI peripheral on RA MCUs. This module implements the SPI Interface.
	SPI (r_sci_spi) Driver for the SCI peripheral on RA MCUs. This module implements the SPI Interface.
	SPI (r_spi) Driver for the SPI peripheral on RA MCUs. This module implements the SPI Interface.
	SPI (r_spi_b) Driver for the SPI peripheral on RA MCUs. This module implements the SPI Interface.
	UART (r_sau_uart) UART driver for the SAU peripheral on RA MCUs. This module implements the UART Interface.
	UART (r_sci_b_uart) Driver for the SCI peripheral on RA MCUs. This module implements the UART Interface.
	UART (r_sci_uart) Driver for the SCI peripheral on RA MCUs. This module implements

	the UART Interface.
	UART (r_uarta) Driver for the UARTA peripheral on RA MCUs. This module implements the UART Interface.
	UART Communication Device (rm_comms_uart) Middleware to implement a generic communications interface over UART. This module implements the Communicatons Middleware Interface.
	USB (r_usb_basic) Driver for the USB peripheral on RA MCUs. This module implements the USB Interface.
	USB Composite (r_usb_composite)
	USB HCDC (r_usb_hcdc) This module provides a USB Host Communications Device Class (HCDC) driver. It implements the USB HCDC Interface.
	USB HHID (r_usb_hhid) This module provides a USB Host Human Interface Device Class Driver (HHID). It implements the USB HHID Interface.
	USB HMSC (r_usb_hmsc) This module provides a USB Host Mass Storage Class (HMSC) driver. It implements the USB HMSC Interface.
	USB Host Vendor class (r_usb_hvnd)
	USB PCDC (r_usb_pcdc) This module provides a USB Peripheral Communications Device Class Driver (PCDC). It implements the USB PCDC Interface.
	USB PHID (r_usb_phid) This module is USB Peripheral Human Interface Device Class Driver (PHID). It implements the USB PHID Interface.

	USB PMSC (r_usb_pmsc) This module provides a USB Peripheral Mass Storage Class (PMSC) driver. It implements the USB PMSC Interface.
	USB PPRN (r_usb_pprn) This module is USB Peripheral Printer Device Class Driver (PPRN). It implements the USB PPRN Interface.
	USB Peripheral Vendor class (r_usb_pvnd)
	USB_PCDC Communication Device (rm_comms_usb_pcdc) Middleware to implement a generic communications interface over USB_PCDC. This module implements the Communicatons Middleware Interface.

5.2.6.1 Azure RTOS USBX Port (rm_usbx_port)

Modules » Connectivity

Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

Overview

This USB driver works by combining USBX and r_usb_basic module.

How to Configuration

Using a class other than Composite(Pereipheral), HMSC and OTG.

The following describes how to configure USBX using PCDC as an example.

- Select [New Stack]->[Connectivity]->[Azure RTOS PCDC]

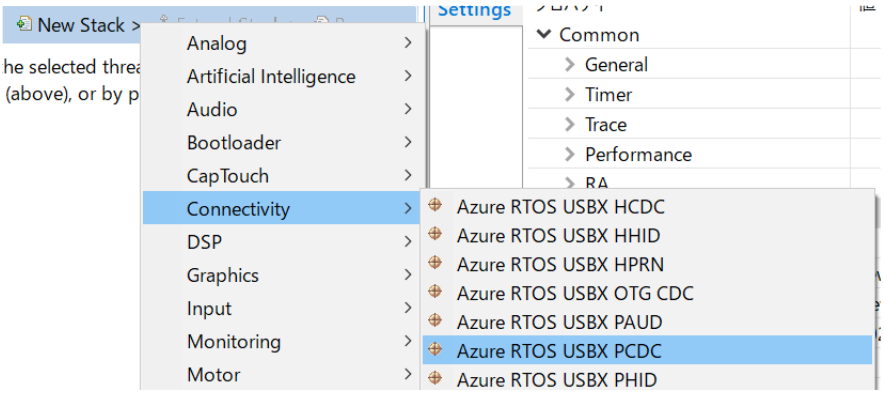

Figure 171: Select USB Device Class

- Select the USB pipe to use.

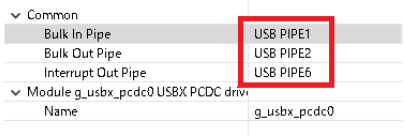

Figure 172: Select using USB Pipe

Using Composite (Peripheral)

- Select [New Stack]->[Connectivity]->[USB Composite]

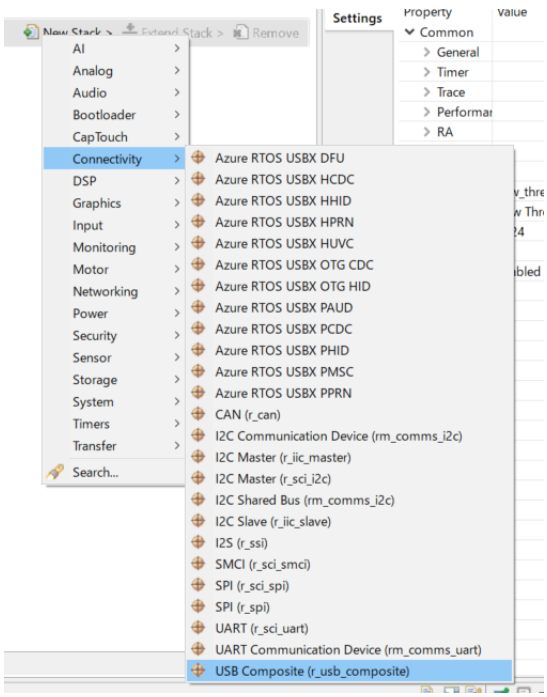

Figure 173: Select USB Composite

- The following is displayed when selecting [USB Composite].

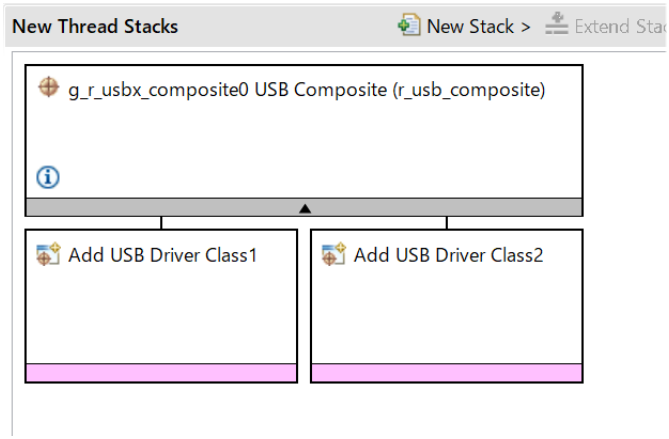

Figure 174: USB Composite Stack

- Select the supported 2 device classes as follows.

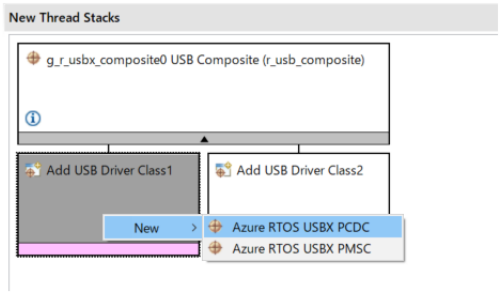

Figure 175: Select Device Classes

- Delete the "g_basic1" instance manually.

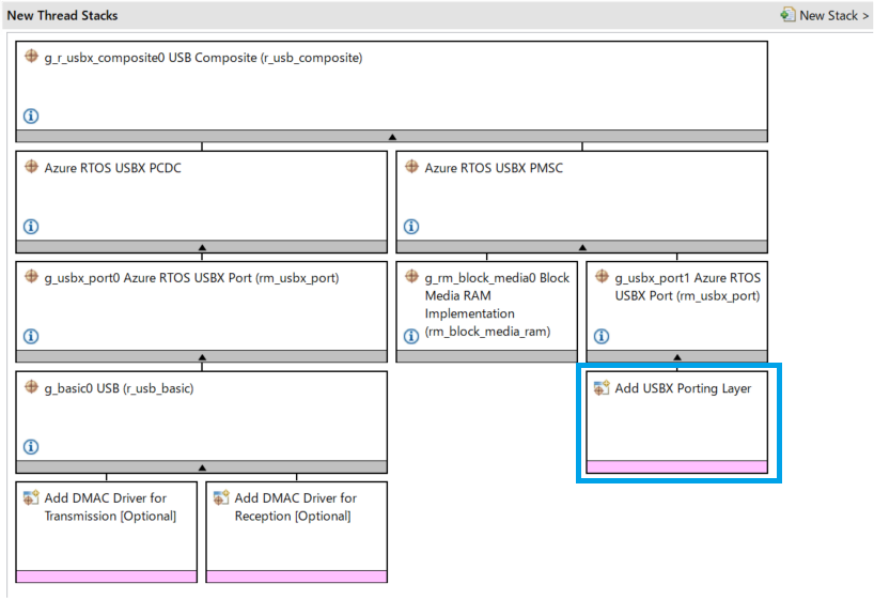

Figure 176: Delete USB Basic instance

Using HMSC.

Since HMSC is used in a different way from other USBX modules, the usage is described below.

- Select [New Stack]->[Storage]->[Azure RTOS FileX on USBX]

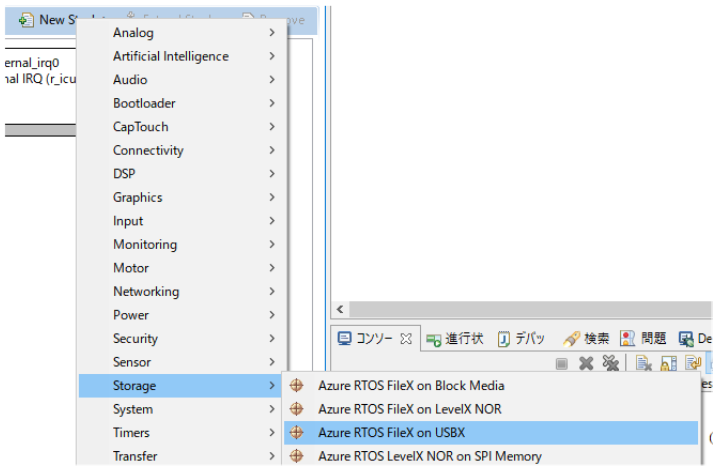

Figure 177: Select USB Device Class

- The following is displayed when selecting Filex on USBX.

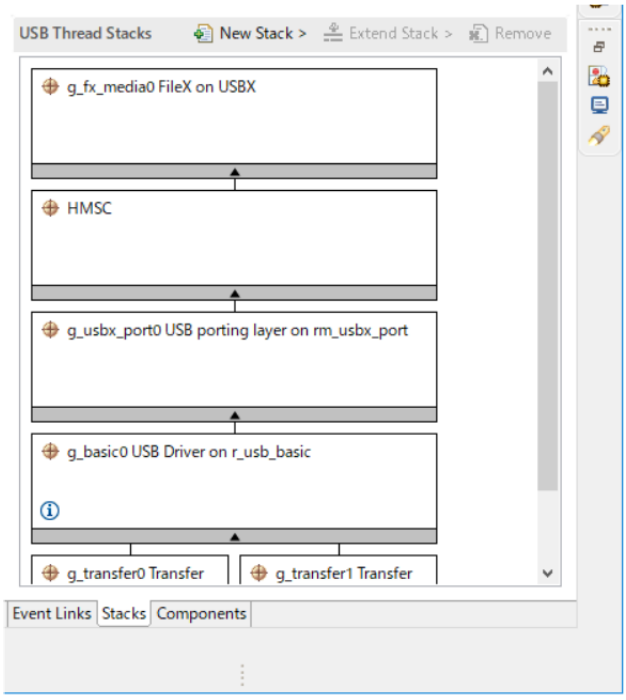

Figure 178: FileX on USBX Stack

Using OTG.

The following describes how to configure USBX OTG.

- When using CDC / HID class
    - [New Stack]->[Connectivity]->[Azure RTOS USBX OTG CDC] or [Azure RTOS USBX OTG HID])
- When using MSC class
    - [New Stack]->[Storage]->[Azure RTOS FileX on USBX])
    - [New]->[Azure RTOS USBX OTG MSC]

- Select [New Stack]->[Input] -> [External IRQ(r_icu)]

  Be sure to select "r_icu" in OTG. The "r_icu" is used to detect the attaching of A cable.

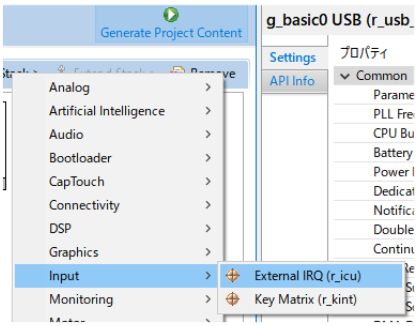

Figure 179: Select USB Device Class for OTG

- Be sure to set the following to each item in "r_icu".
    - Set "7" to "Channel" item.
    - Set "Both Edges" to "Trigger" item.
    - Set "Enabled" to "Digital Filtering" item.
    - Set "usb_otg_irq_callback" to "Callback" item.

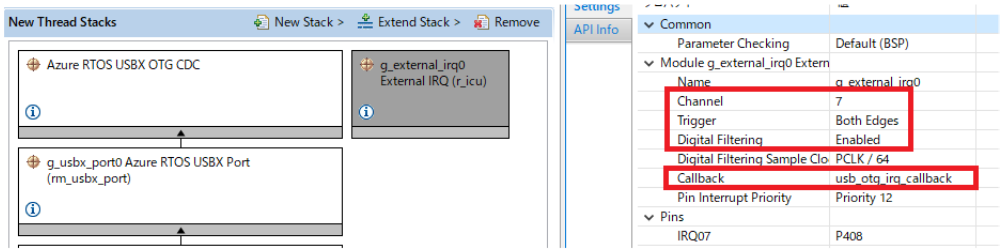

Figure 180: Select USB Device Class for OTG

- Be sure to set the following to each item in "r_usb_basic".
    - Set "Full Speed" to "USB Speed" item.
    - Set "USB_IP0 Port" to "USB Module Number".
    - Set "Not Supported" to "USBFS Resume Priority".

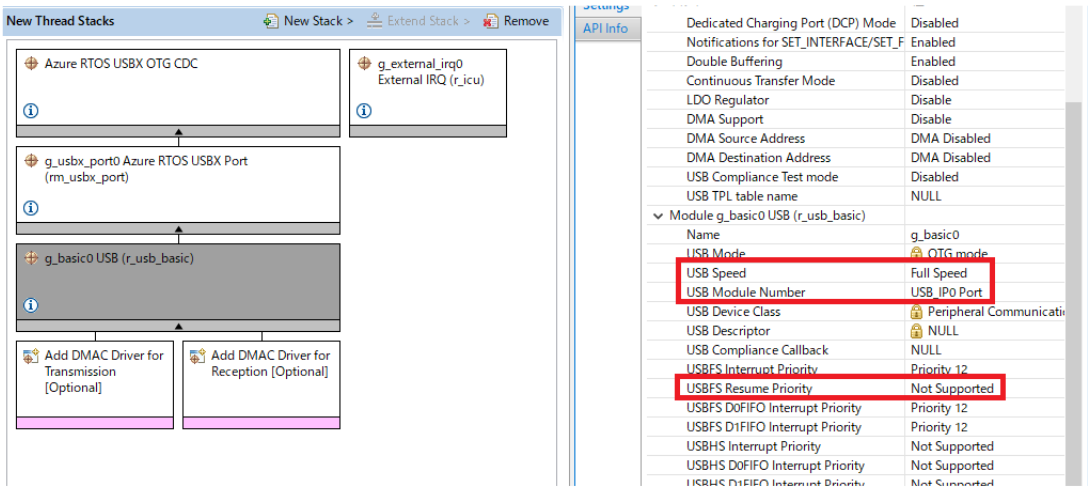

Figure 181: Select USB Device Class

- Set the following pins for USB (r_usb_basic)
  - VBUSEN
  - VBUS
  - EXICEN

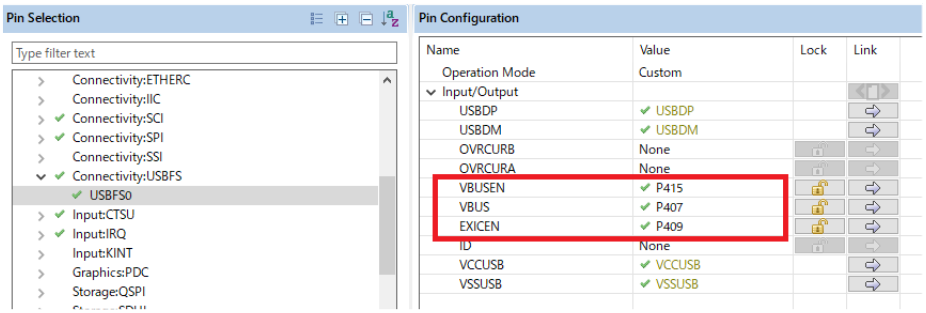

Figure 182: USB Pin Setting

- Set the following pins for IRQ (r_icu)
  - IRQ07

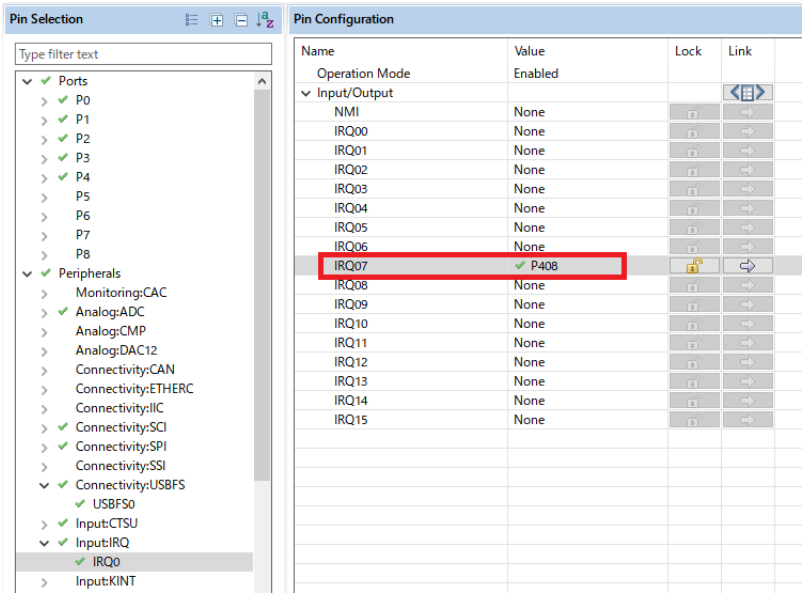

Figure 183: IRQ Pin Setting

Using Hub

- When the user uses the following device class, the user can use USB Hub.
  - Host Communication Device Class (HCDC)
  - Host Human Interface Device Class (HHID)
  - Host Mass Storage Class (HMSC)
  - Host Printer Class (HPRN)
- Also be sure to set the pipe number to the following items. Can not specify "NO USE" to the following items when using Hub.
  - Bulk In Pipe 2
  - Bulk Out Pipe 2
  - Interrupt In Pipe 2
  - Interrupt In PIpe 3

Note

- Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.
- The following are notes on using the ux_host_class_cdc_acm_read function or the ux_device_class_cdc_acm_read function
  - Please specify a multiple of MaxPacketSize to the 3rd argument(requested_length) since if the value of the 3rd argument is not multiple of MaxPacketSize, all data sent by USB Host or USB Peripheral may not be received correctly.
  - Please specify start address of the area allocated a size larger than 3rd argument(requested_length) to the 2nd argument(data_pointer or buffer).
- There is no stack for the Hub; please select the stack for USB Host even when using the Hub.
- Depending on the Hub used, it may be necessary to supply power to the Hub.
- HUVC does not support USB Hub.

HMSC uses FileX.

For more information on FileX, please refer to the following URL.

https://docs.microsoft.com/en-us/azure/rtos/filex/

OTG

- Be able to set UX_OTG_HOST_REQUEST_FLAG in USB Peripheral mode or call ux_host_stack_role_swap() function in USB Host mode when data other than control transfer is not being transferred.
- Register the callback function for the application using R_USB_OtgCallbackSet() function. This callback function is called when switching the operation mode(UX_OTG_MODE_IDLE/UX_OTG_MODE_SLAVE/UX_OTG_MODE_HOST).
- Use R_USB_OtgSRP() function when doing SRP(Session Request Protocol). The R_USB_OtgSRP() function does not support VBUS pulsing.
- After starting up MCU, USB is initialized as USB peripheral mode until connecting A cable.
- Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.
- When A cable is connected, USB module is initialized as USB Host mode.
- Call R_ICU_ExternalIrqOpen() and R_ICU_ExternalIrqEnable() function in the application program since the IRQ interrupt is used to detect attaching or detaching of A cable.
- Add the OTG descriptor in the configuration descriptor in each descriptor file.

Offset	Field	Size	Value	Description
0	bLength	1	5	Size of Descriptor
1	bDescriptor Type	1	9	OTG type = 9
2	bmAttribute	1	3 or 2	D1: HNP support D0: SRP support
3	bcdOTG	2	0x200	Binary Code Descimal

Known Issues

- There is compatibility issue for FileX on USBX stack in FSP 5.0.0 while importing from FSP 4.6.0 or earlier. Please refer to "GitHub Issue" about this workaround.

Limitations

- This USB driver does not support the multiple device class in Host mode.

- Please call the initialization function in the application program.

  Please be sure to call R_USB_Open() function after calling the following functions.

  - Peripheral
    - PCDC / PHID / PAUD / PPRN / DFU / OTG
      - ux_system_initialize
      - ux_device_stack_initialize
      - ux_device_stack_class_register
    - PMSC
      - ux_system_initialize
      - ux_device_stack_initialize
  - Host
    - HCDC / HHID / HPRN / HUVC / OTG

        - ux_system_initialize
        - ux_host_stack_initialize
    - HMSC
        - ux_system_initialize
        - ux_host_stack_initialize
        - fx_system_initialize
- Set the value for 1000 Ticks per second in the "Timer Ticks Per Second" item.

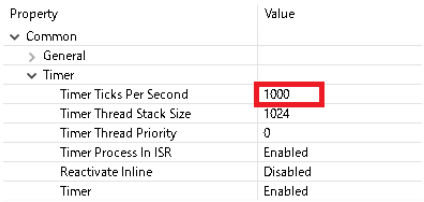

Figure 184: Specify value of Timer Ticks Per Second

- Set the Thread priority to a value of 21.

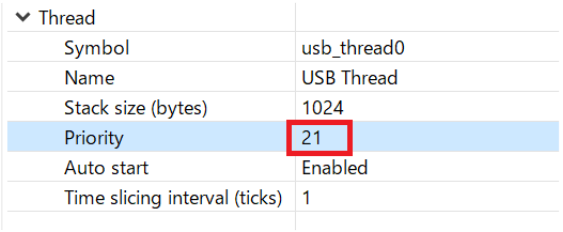

Figure 185: Specify value of Thread priority

- Call the following functions in the following order after calling the R_USB_Close() function.
    - Peripheral
        - PCDC / PHID / PPRN
            - ux_device_stack_class_unregister
            - ux_device_stack_uninitialize
        - PMSC
            - ux_device_stack_uninitialize
    - Host
        - ux_host_stack_uninitialize
- USBX Composite (Peripheral) supports the following composite device.
    - PCDC + PMSC
- USBX Composite (PCDC + PMSC) has the following notes.
    - When the user select "Safely Remove Hardware and Eject Media" on Windows and eject the mass storage (PMSC), the Windows Explorer for PMSC does not disappear. But PMSC driver works properly.
    - PMSC may not work properly when USBX Composite Device(PCDC+PMSC) is connected to linux machine (USB Host).If the user encounter this issue, please update Linux OS.
- The FAT file format that HMSC supports is FAT32, FAT16 and FAT12.
- When using USBX HMSC, please be sure to check the "fx" checkbox(red frame) of the pack the user is using in the "Components" tab(green frame) as shown below.

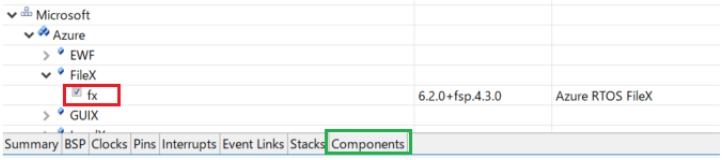

Figure 186: Check the fx checkbox

- When using USBX HPRN, if the internal buffer of the printer is full, USB data transfer speed drops significantly.
- When using USBX HHID, please use Wired device.
- USBX HUVC driver does not support Full-speed.
- USBX HUVC driver does not support the following APIs.
    - ux_host_class_video_transfer_buffers_add
    - ux_host_class_video_read
- Note the following when using *ux_host_class_video_transfer_buffer_add* fucntion (USBX HUVC API)
    - Please call *ux_host_class_video_transfer_buffer_add* fucntion after cofirming that the callback function for data reception completion is called when calling this API again. This callback function is registerd by *ux_host_class_video_transfer_callback_set* function in the application program.
    - Please specify a 4-byte alignment address for the 2nd argument (*buffer*) of *ux_host_class_video_transfer_buffer_add* fucntion when using DMA transfer.
- Note the following when using *ux_host_class_video_start* fucntion (USBX HUVC API)
    - Please be sure to confirm return value of the *ux_host_class_video_max_payload_get* function is less than or equal to 1024. If the return value is greater than 1024, start video streaming by referring to the following.

```
channel.ux_host_class_video_parameter_channel_bandwidth_selection = 1
024;
status = ux_host_class_video_ioctl(video, UX_HOST_CLASS_VIDEO_IOCTL_C
HANNEL_START, &channel);
```

- The USBHS module does not support the high-bandwidth isochronous transfer (image below), the maximum packet size for isochronous transfer is 1024 bytes and supports only one transaction per microframe.

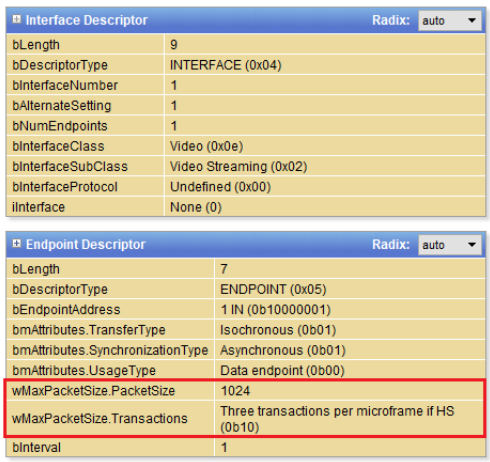

Figure 187: High Bandwidth Isochronous Transfer

- This module does not support the MCU(RA4M1 and RA2A1) since the RAM size is small.
- Please specify the correct framework size to the 2nd argument(device_framework_length_high_speed) and the 4th argument(device_framework_length_full_speed) in "ux_device_stack_initialize" function. If incorrect size is specified, USB driver does not work properly.
- The following is the limitation when using OTG.
    - The user can not use High-speed module(USB_IP1).
    - The DMA transfer is not supported.
    - The MSC is not supported.
    - The user can not use USB Hub.
- The followings are the limitation when using USB Hub.
    - The USB driver allocates USB PIPE9 for USB Hub. The user can not specify "USB PIPE9" when using USB Hub.
    - The user can not connect the Hub device under the Hub down port.
    - For HCDC, the user can not connect more than 2 CDC devices to USB Hub.
    - For HPRN, the user can not connect more than 2 PRN devices to USB Hub.
    - For HHID, the user can not connect more than 3 HID devices to USB Hub.
    - For HMSC, the user can not connect more than 3 MSC devices to USB Hub.
- The user can not use USB PIPE1, PIPE2, PIPE3, PIPE8 and PIPE9 when using the follwoing MCU.
    - RA6E2
    - RA4E2

- Please use USB Host DFU tool described in the chapter "USB Device DFU Class" in the following page.

  https://learn.microsoft.com/en-us/azure/rtos/usbx/usbx-device-stack-supplemental-2

- USBX DFU can upgrade the firmware only once after resetting MCU.
- USBX DFU does not support the upload feature.

- ux_device_class_cdc_acm_read() API, throughput/speed may be similar in following cases.

    - Read operation in double buffer mode when compared to single buffer mode.
    - Read operation in continuous transfer mode when compared to non-continious transfer mode.

  Because of the USBX CDC device stack limits the read transfer size buffer to single packet (ie. wMaxPacketSize as per Full-speed or High-speed USB port). Please refer Azure RTOS USBX documentation for more information.

- ux_host_class_cdc_acm_write() and ux_host_class_cdc_acm_read() API, throughput/speed on high-speed port may be similar for CPU read and write operation in double buffer mode when compared to single buffer mode because of the FSP driver limits the maximum transfer request length size to 512 bytes (UX_FSP_MAX_BULK_PAYLOAD).
- ux_host_class_cdc_acm_write() and ux_host_class_cdc_acm_read() API, throughput/speed may be less for DMA read and write operation when compared to CPU mode because of the FSP driver limits the maximum transfer request length size to 512 bytes(UX_FSP_MAX_BULK_PAYLOAD).
- ux_host_class_cdc_acm_write() and ux_host_class_cdc_acm_read() API, throughput/speed may be less for DMA read and write operation compared to USB FreeRTOS HCDC DMA because of the FSP driver limits the maximum transfer request length size to 512 bytes

(UX_FSP_MAX_BULK_PAYLOAD).

Descriptor

Templates for USBX descriptors can be found in ra/fsp/src/rm_usbx_port folder. Also, please be sure to use your vendor ID.
Change the descriptor.c.template file for each class as follows if High-speed mode is used.

- rm_usbx_pcdc_descriptor.c.template
  - Comment on lines 108 and 243.
  - Delete the "//" on lines 109 and 242.
- rm_usbx_pmsc_descriptor.c.template
  - Comment on lines 78 and 153.
  - Delete the "//" on lines 79 and 152.
- rm_usbx_paud_descriptor.c.template
  - Comment on lines 167 and 485.
  - Delete the "//" on lines 168 and 486.

There are two types of templates for PHID descriptor.
Keyboard templates should be referred to rm_usbx_phid_descriptor_keyboard.c.template.
Mouse templates should be referred to rm_usbx_phid_descriptor_mouse.c.template.

Examples

USBX PCDC Example

PCDC loopback example is as follows.

```
#define VALUE_105 (105)
#define VALUE_2 (2)
#define VALUE_103 (103)
#define VALUE_93 (93)
/**************************************************************************
 * Function Name : ux_cdc_device0_instance_activate

     }
     }
     }
    }
}
/***********************************************************************************
 * End of function usbx_pcdc_sample
 ***********************************************************************************/
```

USBX HCDC Example

The main functions of the HCDC loopback example are as follows:

1. Virtual UART control settings are configured by transmitting the class request SET_LINE_CODING to the CDC device.
2. Sends receive (Bulk In transfer) requests to a CDC peripheral device and receives data.
3. Loops received data back to the peripheral by means of Bulk Out transfers.

The main loop performs loopback processing in which data received from a CDC peripheral device is transmitted unaltered back to the peripheral.

```
 #define VALUE_100 (100)
UINT ux_host_usr_event_notification (ULONG event, UX_HOST_CLASS * host_class, VOID *
instance)
{
 FSP_PARAMETER_NOT_USED(host_class);

Detailed Description

Driver for the CAN peripheral on RA MCUs. This module implements the CAN Interface.

Overview

The Controller Area network (CAN) HAL module provides a high-level API for CAN applications and supports the CAN peripherals available on RA microcontroller hardware. A user-callback function must be defined that the driver will invoke when transmit, receive or error interrupts are received. The callback is passed a parameter which indicates the channel, mailbox and event as well as the received data (if available).

Features

- Supports both standard (11-bit) and extended (29-bit) messaging formats
- Supports speeds upto 1 Mbps
- Support for bit timing configuration as defined in the CAN specification
- Supports up to 32 transmit or receive mailboxes with standard or extended ID frames
- Optional support for a 4-stage transmit and receive FIFO
- Receive mailboxes can be configured to capture either data or remote CAN Frames
- Receive mailboxes can be configured to receive a range of IDs using mailbox masks
- Mailboxes can be configured with Overwrite or Overrun mode
- Supports a user-callback function when transmit, receive, or error interrupts are received

Configuration

Build Time Configurations for r_can

The following build time configurations are defined in fsp_cfg/r_can_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
FIFO Support	• Disabled • Enabled	Disabled	When FIFOs are enabled, a transmit FIFO replaces

			mailboxes 24-27 and a receive FIFO replaces mailboxes 28-31.

Configurations for Connectivity > CAN (r_can)

This module can be added to the Stacks tab via New Stack > Connectivity > CAN (r_can). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_can0	Module name.
Channel	Channel should be 0 or 1	0	Specify the CAN channel to use.
Clock Source	MCU Specific Options		Select the CAN clock source.
Overwrite/Overrrun Mode	• Overwrite Mode • Overrrun Mode	Overwrite Mode	Select whether receive mailbox will be overwritten or overrun if data is not read in time.
Global ID Mode	• Standard ID Mode • Extended ID Mode • Mixed ID Mode	Standard ID Mode	Select whether the driver will use CAN Standard IDs, Extended IDs or a mix of both.
Number of Mailboxes	• 4 Mailboxes • 8 Mailboxes • 16 Mailboxes • 24 Mailboxes • 32 Mailboxes	32 Mailboxes	Select 4, 8, 16, 24 or 32 mailboxes. In FIFO mailbox mode up to 24 mailboxes are available.
Baud Rate Settings			
Baud Rate Settings > Auto-generated Settings			
Sample-Point (%)	Must be a valid integer between 0 and 100. Ignore when Override Baud Settings is Enabled.	75	Sample-Point = (TSEG1 + 1) / (TSEG1 + TSEG2 + 1).
CAN Baud Rate (Hz)	Must be a valid integer configurable upto maximum 1MHz. Ignore when Override Baud Settings is Enabled.	500000	Specify baud rate in Hz. If the requested baud rate cannot be achieved, the settings with the largest possible baud rate that

			is less than or equal to the requested baud rate is used. If multiple combinations would result in the best baud rate, the combination with the least absolute error for the ratio is chosen. The theoretical calculated baud rate and ratio are printed in a comment in the generated can_bit_timing_cfg_t structure.
Baud Rate Settings > Override Auto-generated Settings			
Override Baud Settings	• Enabled • Disabled	Disabled	Override calculated baudrate parameters and instead use the ones specified below. This option ignores the parameters specified under Sample-Point (%) and CAN Baud Rate (Hz)
Baud Rate Prescaler	Value must be a non-negative integer between 1 and 1024.	1	Specify division value of baud rate prescaler (baud rate prescalar + 1).
Time Segment 1	Refer to the RA Configuration tool for available options.	4 Time Quanta	Select the time segment 1 value. (4-16). Check module usage notes for how to calculate this value.
Time Segment 2	• 2 Time Quanta • 3 Time Quanta • 4 Time Quanta • 5 Time Quanta • 6 Time Quanta • 7 Time Quanta • 8 Time Quanta	2 Time Quanta	Select the time segment 2 value (2-8). Check module usage notes for how to calculate this value.
Synchronization Jump Width	• 1 Time Quanta • 2 Time Quanta • 3 Time Quanta • 4 Time Quanta	1 Time Quanta	Select the Synchronization Jump Width value (1-4). Check module usage notes for how to calculate this value.
Interrupts			
Callback	Name must be a valid C symbol	can_callback	A user callback function. If this callback

			function is provided, it is called from the interrupt service routine (ISR) each time any interrupt occurs.
Interrupt Priority Level	MCU Specific Options		Transmit/Receive/Error interrupt priority.
Transmit FIFO Interrupt Mode	• Every Message • Empty	Every Message	Select whether the receive FIFO should throw an interrupt on every received message or when it becomes empty.
Input			
Input > Receive FIFO			
Input > Receive FIFO > Receive ID 1			
ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	0	Select the first ID for the receive FIFO, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs.
ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the receive FIFO is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Frame Type	• Data Mailbox • Remote Mailbox	Remote Mailbox	Select whether the receive FIFO is used to capture data frames or remote frames.
Mask	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	0x1FFFFFFF	Select the Mask for the receive FIFO. In Mixed ID Mode the Standard ID mask is the upper 11 bits of the full 29-bit mask value.
Input > Receive FIFO > Receive ID 2			
ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	0	Select the second ID for the receive FIFO, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using

			extended IDs.
ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the receive FIFO is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Frame Type	• Data Mailbox • Remote Mailbox	Remote Mailbox	Select whether the receive FIFO is used to capture data frames or remote frames.
Mask	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	0x1FFFFFFF	Select the Mask for the receive FIFO. In Mixed ID Mode the Standard ID mask is the upper 11 bits of the full 29-bit mask value.
Input > Mailbox 0-3 Group			
Input > Mailbox 0-3 Group > Mailbox ID			
Mailbox 0 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	0	Select the receive ID for mailbox 0, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Mailbox 1 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	1	Select the receive ID for mailbox 1, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Mailbox 2 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	2	Select the receive ID for mailbox 2, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Mailbox 3 ID	Value must be decimal	3	Select the receive ID

	or HEX integer of 0x1FFFFFFF or less.		for mailbox 3, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Input > Mailbox 0-3 Group > Mailbox ID Mode			
Mailbox 0 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 1 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 2 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 3 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Input > Mailbox 0-3 Group > Mailbox Type			
Mailbox 0 Type	• Receive Mailbox • Transmit Mailbox	Transmit Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 1 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.

Mailbox 2 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 3 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Input > Mailbox 0-3 Group > Mailbox Frame Type			
Mailbox 0 Frame Type	• Data Mailbox • Remote Mailbox	Remote Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 1 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 2 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 3 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 0-3 Group Mask	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	0x1FFFFFFF	Select the Mask for mailboxes 0-3. In Mixed ID Mode the Standard ID mask is the upper 11 bits of the full 29-bit mask value.
Input > Mailbox 4-7 Group			
Input > Mailbox 4-7 Group > Mailbox ID			
Mailbox 4 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	4	Select the receive ID for mailbox 4, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set

			as transmit type.
Mailbox 5 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	5	Select the receive ID for mailbox 5, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Mailbox 6 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	6	Select the receive ID for mailbox 6, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Mailbox 7 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	7	Select the receive ID for mailbox 7, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Input > Mailbox 4-7 Group > Mailbox ID Mode			
Mailbox 4 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 5 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 6 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID

			Mode is set to 'Mixed ID Mode'.
Mailbox 7 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Input > Mailbox 4-7 Group > Mailbox Type			
Mailbox 4 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 5 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 6 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 7 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Input > Mailbox 4-7 Group > Mailbox Frame Type			
Mailbox 4 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 5 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 6 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 7 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to

			capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 4-7 Group Mask	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	0x1FFFFFFF	>Select the Mask for mailboxes 4-7. In Mixed ID Mode the Standard ID mask is the upper 11 bits of the full 29-bit mask value.
Input > Mailbox 8-11 Group			
Input > Mailbox 8-11 Group > Mailbox ID			
Mailbox 8 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	8	Select the receive ID for mailbox 8, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Mailbox 9 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	9	Select the receive ID for mailbox 9, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Mailbox 10 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	10	Select the receive ID for mailbox 10, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Mailbox 11 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	11	Select the receive ID for mailbox 11, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.

Input > Mailbox 8-11 Group > Mailbox ID Mode

Mailbox 8 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 9 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 10 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 11 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.

Input > Mailbox 8-11 Group > Mailbox Type

Mailbox 8 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 9 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 10 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 11 Type	• Receive Mailbox • Transmit	Receive Mailbox	Select whether the mailbox is used for receive or transmit.

Mailbox

Input > Mailbox 8-11 Group > Mailbox Frame Type

Mailbox 8 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 9 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 10 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 11 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 8-11 Group Mask	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	0x1FFFFFFF	Select the Mask for mailboxes 8-11. In Mixed ID Mode the Standard ID mask is the upper 11 bits of the full 29-bit mask value.

Input > Mailbox 12-15 Group

Input > Mailbox 12-15 Group > Mailbox ID

Mailbox 12 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	12	Select the receive ID for mailbox 12, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Mailbox 13 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	13	Select the receive ID for mailbox 13, between 0 and 0x7ff when using standard IDs, between 0 and

			0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Mailbox 14 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	14	Select the receive ID for mailbox 14, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Mailbox 15 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	15	Select the receive ID for mailbox 15, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Input > Mailbox 12-15 Group > Mailbox ID Mode			
Mailbox 12 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 13 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 14 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 15 ID Mode	• Standard ID	Standard ID	Select whether the

	• Extended ID		mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Input > Mailbox 12-15 Group > Mailbox Type			
Mailbox 12 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 13 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 14 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 15 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Input > Mailbox 12-15 Group > Mailbox Frame Type			
Mailbox 12 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 13 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 14 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 15 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).

Mailbox 12-15 Group Mask	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	0x1FFFFFFF	Select the Mask for mailboxes 12-15. In Mixed ID Mode the Standard ID mask is the upper 11 bits of the full 29-bit mask value.

Input > Mailbox 16-19 Group

Input > Mailbox 16-19 Group > Mailbox ID

Mailbox 16 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	16	Select the receive ID for mailbox 16, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Mailbox 17 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	17	Select the receive ID for mailbox 17, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Mailbox 18 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	18	Select the receive ID for mailbox 18, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Mailbox 19 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	19	Select the receive ID for mailbox 19, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.

Input > Mailbox 16-19 Group > Mailbox ID Mode

Mailbox 16 ID Mode	• Standard ID	Standard ID	Select whether the

	• Extended ID		mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 17 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 18 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 19 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Input > Mailbox 16-19 Group > Mailbox Type			
Mailbox 16 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 17 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 18 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 19 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Input > Mailbox 16-19 Group > Mailbox Frame Type			

Mailbox 16 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 17 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 18 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 19 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 16-19 Group Mask	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	0x1FFFFFFF	Select the Mask for mailboxes 16-19. In Mixed ID Mode the Standard ID mask is the upper 11 bits of the full 29-bit mask value.

Input > Mailbox 20-23 Group

Input > Mailbox 20-23 Group > Mailbox ID

Mailbox 20 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	20	Select the receive ID for mailbox 20, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Mailbox 21 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	21	Select the receive ID for mailbox 21, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the

			mailbox is set as transmit type.
Mailbox 22 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	22	Select the receive ID for mailbox 22, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Mailbox 23 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	23	Select the receive ID for mailbox 23, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Input > Mailbox 20-23 Group > Mailbox ID Mode			
Mailbox 20 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 21 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 22 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 23 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages.

			This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Input > Mailbox 20-23 Group > Mailbox Type			
Mailbox 20 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 21 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 22 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 23 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Input > Mailbox 20-23 Group > Mailbox Frame Type			
Mailbox 20 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 21 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 22 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 23 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 20-23 Group Mask	Value must be decimal or HEX integer of	0x1FFFFFFF	Select the Mask for mailboxes 20-23. In

	0x1FFFFFFF or less.		Mixed ID Mode the Standard ID mask is the upper 11 bits of the full 29-bit mask value.
Input > Mailbox 24-27 Group			
Input > Mailbox 24-27 Group > Mailbox ID			
Mailbox 24 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	24	Select the receive ID for mailbox 24, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Mailbox 25 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	25	Select the receive ID for mailbox 25, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Mailbox 26 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	26	Select the receive ID for mailbox 26, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Mailbox 27 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	27	Select the receive ID for mailbox 27, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Input > Mailbox 24-27 Group > Mailbox ID Mode			
Mailbox 24 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or

			Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 25 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 26 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 27 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Input > Mailbox 24-27 Group > Mailbox Type			
Mailbox 24 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 25 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 26 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 27 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Input > Mailbox 24-27 Group > Mailbox Frame Type			
Mailbox 24 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to

			capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 25 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 26 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 27 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 24-27 Group Mask	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	0x1FFFFFFF	Select the Mask for mailboxes 24-27. In Mixed ID Mode the Standard ID mask is the upper 11 bits of the full 29-bit mask value.

Input > Mailbox 28-31 Group

Input > Mailbox 28-31 Group > Mailbox ID

Mailbox 28 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	28	Select the receive ID for mailbox 28, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Mailbox 29 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	29	Select the receive ID for mailbox 29, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.

Mailbox 30 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	30	Select the receive ID for mailbox 30, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Mailbox 31 ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	31	Select the receive ID for mailbox 31, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type.
Input > Mailbox 28-31 Group > Mailbox ID Mode			
Mailbox 28 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 29 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 30 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.
Mailbox 31 ID Mode	• Standard ID • Extended ID	Standard ID	Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID

			Mode is set to 'Mixed ID Mode'.
Input > Mailbox 28-31 Group > Mailbox Type			
Mailbox 28 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 29 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 30 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Mailbox 31 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Input > Mailbox 28-31 Group > Mailbox Frame Type			
Mailbox 28 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 29 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 30 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 31 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Mailbox 28-31 Group Mask	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	0x1FFFFFFF	Select the Mask for mailboxes 28-31. In Mixed ID Mode the Standard ID mask is

the upper 11 bits of the full 29-bit mask value.

Clock Configuration

The CAN peripheral uses the CANMCLK (main-clock oscillator) or PCLKB as its clock source (fCAN, CAN System Clock.) The default CAN configuration will provide a CAN bit rate of 500 Kbit using CANMCLK as the clock source. To set the PCLKB frequency, use the **Clocks** tab of the RA Configuration editor. To change the clock frequency at run-time, use the CGC Interface. Refer to the CGC module guide for more information on configuring clocks.

Warning

RA2 devices only support CANMCLK (MOSC/XTAL) for the CAN clock source. If MOSC is not used as the main clock source it will not be started automatically. In this case, be sure to start it before opening the CAN driver.

Clock Limitations

The following clock limitations apply when using the CAN peripheral:

- When using the main oscillator (CANMCLK) as the clock source:
  - fPCLKB >= fCANCLK (fCANCLK = XTAL / Baud Rate Prescaler)
  - The user application must start the main-clock oscillator (XTAL) at run-time using the CGC Interface if it has not already started (for example, if it is not used as the MCU clock source.)
- When using PCLKB as the clock source:
  - For RA6 and RA4 MCUs, the source of the peripheral module clocks must be PLL for the CAN HAL module.
- For RA4M1 and RA4W1 MCUs, the clock frequency ratio of PCLKA and PCLKB must be 2:1 when using the CAN HAL module. Operation is not guaranteed for other settings.
- For RA2 MCUs only CANMCLK (XTAL) may be used as a clock source. The clock frequency ratio of ICLK and PCLKB must be 2:1 when using the CAN HAL module. Operation is not guaranteed for other settings.

  Note

  When using CANMCLK (XTAL) as the CAN clock source while running at a reduced main clock speed (under 2x XTAL) be sure to confirm that the XTAL frequency divided by the baud rate prescaler is equal to or less than PCLKB.

Pin Configuration

The CAN peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. A CAN channel would consist of two pins - CRX and CTX for data transmission/reception.

Usage Notes

Bit Rate Calculation

For convenience, the baudrate of the CAN peripheral is automatically set through the RA Configuration editor using a best effort approach. If the auto-generated baud settings cause deviation that is not tolerable by the application, the user can override the auto-generated settings and put in manually calculated values through RA Configuration editor. For more details on how the baudrate is set refer to section 37.4 "Data Transfer Rate Configuration" of the RA6M3 User's Manual (R01UH0886EJ0100).

FIFO Support

When FIFO Support is enabled, mailboxes 24-27 form a 4-stage transmit FIFO and mailboxes 28-31 form a 4-stage receive FIFO. The receive FIFO supports two independent ID/mask settings for acceptance filtering.

Note

Only the base mailbox of each FIFO may be accessed. When writing to the TX FIFO it is recommended to use CAN_MAILBOX_ID_TX_FIFO.

Limitations

Developers should be aware of the following limitations when using CAN:

- The can_frame_t::id_mode field is only used when Global ID Mode is set to Mixed ID. It is ignored in all other modes.

Examples

Basic Example

This is a basic example of minimal use of the CAN in an application.

```
can_frame_t g_can_tx_frame;
can_frame_t g_can_rx_frame;
volatile bool     g_rx_flag = false;
volatile bool     g_tx_flag = false;
volatile bool     g_err_flag = false;
volatile uint32_t g_rx_id;
void can_callback (can_callback_args_t * p_args)
{
 switch (p_args->event)
    {
 case CAN_EVENT_RX_COMPLETE:    /* Receive complete event. */
      {
            g_rx_flag = true;
            g_rx_id   = p_args->frame.id;
 /* Read received frame */
            g_can_rx_frame = p_args->frame;
 break;
       }
 case CAN_EVENT_TX_COMPLETE:    /* Transmit complete event. */
```

```
     {
           g_tx_flag = true;
 break;
      }
 case CAN_EVENT_ERR_BUS_OFF:          /* Bus error event. (bus off) */
 case CAN_EVENT_ERR_PASSIVE:          /* Bus error event. (error passive) */
 case CAN_EVENT_ERR_WARNING:          /* Bus error event. (error warning) */
 case CAN_EVENT_BUS_RECOVERY:         /* Bus error event. (bus recovery) */
 case CAN_EVENT_MAILBOX_MESSAGE_LOST: /* Overwrite/overrun error */
     {
 /* Set error flag */
           g_err_flag = true;
 break;
      }
 default:
     {
 break;
      }
   }
}
void basic_example (void)
{
 fsp_err_t err;
   uint32_t i;
   uint32_t timeout_ms = CAN_BUSY_DELAY;
 /* Initialize the CAN module */
   err = R_CAN_Open(&g_can0_ctrl, &g_can0_cfg);
 /* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
   g_can_tx_frame.id              = CAN_DESTINATION_DEVICE_MAILBOX_NUMBER; /* CAN
Destination Device ID */
   g_can_tx_frame.type            = CAN_FRAME_TYPE_DATA;
   g_can_tx_frame.data_length_code = CAN_FRAME_TRANSMIT_DATA_BYTES;
 /* Write some data to the transmit frame */
```

```
for (i = 0; i < sizeof(g_can_tx_frame.data); i++)
   {
      g_can_tx_frame.data[i] = (uint8_t) i;
   }
/* Send data on the bus */
   g_tx_flag = false;
   g_err_flag = false;
   err = R_CAN_Write(&g_can0_ctrl, CAN_MAILBOX_NUMBER_31, &g_can_tx_frame);
   assert(FSP_SUCCESS == err);
/* Since there is nothing else to do, block until Callback triggers*/
while ((true != g_tx_flag) && timeout_ms)
   {
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
      timeout_ms--;
   }
if (true == g_err_flag)
   {
      __BKPT(0);
   }
}
```

External Loop-back Test

This example requires the CTX and CRX pins to be connected. If a CAN tranciever is onboard a 120 Ohm resistor should be connected across CANH and CANL instead. The mailbox numbers are arbitrarily chosen.

```
void can_external_loopback_example (void)
{
fsp_err_t            err;
   uint32_t             timeout_ms    = CAN_BUSY_DELAY;
can_operation_mode_t operation_mode = CAN_OPERATION_MODE_NORMAL;
can_test_mode_t      test_mode      = CAN_TEST_MODE_LOOPBACK_EXTERNAL;
int      diff = 0;
   uint32_t i    = 0;
   err = R_CAN_Open(&g_can0_ctrl, &g_can0_cfg);
```

```
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    err = R_CAN_ModeTransition(&g_can0_ctrl, operation_mode, test_mode);
    assert(FSP_SUCCESS == err);
 /* Clear the data part of receive frame */
    memset(g_can_rx_frame.data, 0, CAN_FRAME_TRANSMIT_DATA_BYTES);
 /* CAN Destination Device ID, in this case it is the same device with another
mailbox */
    g_can_tx_frame.id              = CAN_MAILBOX_NUMBER_4;
    g_can_tx_frame.type            = CAN_FRAME_TYPE_DATA;
    g_can_tx_frame.data_length_code = CAN_FRAME_TRANSMIT_DATA_BYTES;
 /* Write some data to the transmit frame */
 for (i = 0; i < sizeof(g_can_tx_frame.data); i++)
    {
       g_can_tx_frame.data[i] = (uint8_t) i;
    }
 /* Send data on the bus */
    g_rx_flag = false;
    g_err_flag = false;
    err = R_CAN_Write(&g_can0_ctrl, CAN_MAILBOX_NUMBER_31, &g_can_tx_frame);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((true != g_rx_flag) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;
    }
 if (true == g_err_flag)
    {
       __BKPT(0);
    }
 /* Verify received data */
    diff = memcmp(&g_can_rx_frame.data[0], &g_can_tx_frame.data[0],
CAN_FRAME_TRANSMIT_DATA_BYTES);
```

```
 if (0 != diff)
    {
       __BKPT(0);
    }
}
```

Data Structure Documentation

◆ can_mailbox_t

struct can_mailbox_t		
CAN Mailbox		
Data Fields		
uint32_t	mailbox_id	Mailbox ID.
can_id_mode_t	id_mode	Standard or Extended ID. Only used in Mixed ID mode.
can_frame_type_t	frame_type	Frame type for receive mailbox.

can_mailbox_send_receive_t	mailbox_type	Receive or Transmit mailbox type.

◆ can_fifo_interrupt_cfg_t

struct can_fifo_interrupt_cfg_t		
CAN FIFO interrupt configuration		
Data Fields		
can_fifo_interrupt_mode_t	fifo_int_mode	FIFO interrupts mode (RX and TX combined).
IRQn_Type	tx_fifo_irq	TX FIFO IRQ.
IRQn_Type	rx_fifo_irq	RX FIFO IRQ.

◆ can_rx_fifo_cfg_t

struct can_rx_fifo_cfg_t		
CAN RX FIFO configuration		
Data Fields		
uint32_t	rx_fifo_mask1	RX FIFO acceptance filter mask 1.
uint32_t	rx_fifo_mask2	RX FIFO acceptance filter mask 1.
can_mailbox_t	rx_fifo_id1	RX FIFO acceptance filter ID 1.
can_mailbox_t	rx_fifo_id2	RX FIFO acceptance filter ID 2.

◆ can_extended_cfg_t

struct can_extended_cfg_t		
CAN extended configuration		
Data Fields		
can_clock_source_t	clock_source	Source of the CAN clock.
uint32_t *	p_mailbox_mask	Mailbox mask, one for every 4 mailboxes.
can_mailbox_t *	p_mailbox	Pointer to mailboxes.
can_global_id_mode_t	global_id_mode	Standard or Extended ID mode.
uint32_t	mailbox_count	Number of mailboxes.
can_message_mode_t	message_mode	Overwrite message or overrun.
can_fifo_interrupt_cfg_t const *	p_fifo_int_cfg	Pointer to FIFO interrupt configuration.
can_rx_fifo_cfg_t *	p_rx_fifo_cfg	Pointer to RX FIFO configuration.

Enumeration Type Documentation

◆ can_status_t

enum can_status_t	
CAN Status	
Enumerator	
CAN_STATUS_NEW_DATA	New Data status flag.
CAN_STATUS_SENT_DATA	Sent Data status flag.
CAN_STATUS_RECEIVE_FIFO	Receive FIFO status flag.
CAN_STATUS_TRANSMIT_FIFO	Transmit FIFO status flag.
CAN_STATUS_NORMAL_MBOX_MESSAGE_LOST	Normal mailbox message lost status flag.
CAN_STATUS_FIFO_MBOX_MESSAGE_LOST	FIFO mailbox message lost status flag.
CAN_STATUS_TRANSMISSION_ABORT	Transmission abort status flag.
CAN_STATUS_ERROR	Error status flag.
CAN_STATUS_RESET_MODE	Reset mode status flag.
CAN_STATUS_HALT_MODE	Halt mode status flag.
CAN_STATUS_SLEEP_MODE	Sleep mode status flag.
CAN_STATUS_ERROR_PASSIVE	Error-passive status flag.
CAN_STATUS_BUS_OFF	Bus-off status flag.

◆ can_error_t

enum can_error_t	
CAN Error Code	
Enumerator	
CAN_ERROR_STUFF	Stuff Error.
CAN_ERROR_FORM	Form Error.
CAN_ERROR_ACK	ACK Error.
CAN_ERROR_CRC	CRC Error.
CAN_ERROR_BIT_RECESSIVE	Bit Error (recessive) Error.
CAN_ERROR_BIT_DOMINANT	Bit Error (dominant) Error.
CAN_ERROR_ACK_DELIMITER	ACK Delimiter Error.

◆ can_mailbox_number_t

enum can_mailbox_number_t
CAN Mailbox IDs (MB + FIFO)

◆ can_mailbox_send_receive_t

enum can_mailbox_send_receive_t	
CAN Mailbox type	
Enumerator	
CAN_MAILBOX_RECEIVE	Mailbox is for receiving.
CAN_MAILBOX_TRANSMIT	Mailbox is for sending.

◆ can_global_id_mode_t

enum can_global_id_mode_t	
Global CAN ID mode settings	
Enumerator	
CAN_GLOBAL_ID_MODE_STANDARD	Standard IDs of 11 bits used.
CAN_GLOBAL_ID_MODE_EXTENDED	Extended IDs of 29 bits used.
CAN_GLOBAL_ID_MODE_MIXED	Both Standard and Extended IDs used.

◆ can_message_mode_t

enum can_message_mode_t	
CAN Message Modes	
Enumerator	
CAN_MESSAGE_MODE_OVERWRITE	Receive data will be overwritten if not read before the next frame.
CAN_MESSAGE_MODE_OVERRUN	Receive data will be retained until it is read.

◆ can_clock_source_t

enum can_clock_source_t	
CAN Source Clock	
Enumerator	
CAN_CLOCK_SOURCE_PCLKB	PCLKB is the source of the CAN Clock.
CAN_CLOCK_SOURCE_CANMCLK	CANMCLK is the source of the CAN Clock.

◆ can_fifo_interrupt_mode_t

enum can_fifo_interrupt_mode_t
CAN FIFO Interrupt Modes

Function Documentation

◆ R_CAN_Open()

fsp_err_t R_CAN_Open (can_ctrl_t *const *p_api_ctrl*, can_cfg_t const *const *p_cfg*)

Open and configure the CAN channel for operation.

Example:

```
/* Initialize the CAN module */
   err = R_CAN_Open(&g_can0_ctrl, &g_can0_cfg);
```

Return values

FSP_SUCCESS	Channel opened successfully
FSP_ERR_ALREADY_OPEN	Driver already open.
FSP_ERR_CAN_INIT_FAILED	Channel failed to initialize.
FSP_ERR_ASSERTION	Null pointer presented.

◆ R_CAN_Close()

fsp_err_t R_CAN_Close (can_ctrl_t *const *p_api_ctrl*)

Close the CAN channel.

Return values

FSP_SUCCESS	Channel closed successfully.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_ASSERTION	Null pointer presented.

◆ R_CAN_Write()

fsp_err_t R_CAN_Write (can_ctrl_t *const *p_api_ctrl*, uint32_t *mailbox*, can_frame_t *const *p_frame*)

Write data to the CAN channel. Write up to eight bytes to the channel mailbox.

Example:

```
err = R_CAN_Write(&g_can0_ctrl, CAN_MAILBOX_NUMBER_31, &g_can_tx_frame);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_CAN_TRANSMIT_NOT_READY	Transmit in progress, cannot write data at this time.
FSP_ERR_CAN_TRANSMIT_FIFO_FULL	Transmit FIFO is full.
FSP_ERR_CAN_RECEIVE_MAILBOX	Mailbox is setup for receive and cannot send.
FSP_ERR_INVALID_ARGUMENT	Data length or frame type invalid.
FSP_ERR_ASSERTION	Null pointer presented

◆ R_CAN_Read()

fsp_err_t R_CAN_Read (can_ctrl_t *const *p_api_ctrl*, uint32_t *mailbox*, can_frame_t *const *p_frame*)

Read data from a mailbox or FIFO.

Note

This function is not supported.

Return values

FSP_ERR_UNSUPPORTED	Function not supported.

◆ R_CAN_ModeTransition()

fsp_err_t R_CAN_ModeTransition (can_ctrl_t *const *p_api_ctrl*, can_operation_mode_t *operation_mode*, can_test_mode_t *test_mode*)

CAN Mode Transition is used to change CAN driver state.

Example:

```
err = R_CAN_ModeTransition(&g_can0_ctrl, operation_mode, test_mode);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_ASSERTION	Null pointer presented

◆ R_CAN_InfoGet()

fsp_err_t R_CAN_InfoGet (can_ctrl_t *const *p_api_ctrl*, can_info_t *const *p_info*)

Get CAN state and status information for the channel.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_ASSERTION	Null pointer presented

◆ R_CAN_CallbackSet()

fsp_err_t R_CAN_CallbackSet (can_ctrl_t *const *p_api_ctrl*, void(*)(can_callback_args_t *) *p_callback*, void const *const *p_context*, can_callback_args_t *const *p_callback_memory*)
Updates the user callback with the option to provide memory for the callback argument structure. Implements can_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

fsp_err_t	R_CANFD_InfoGet (can_ctrl_t *const p_api_ctrl, can_info_t *const p_info)
fsp_err_t	R_CANFD_CallbackSet (can_ctrl_t *const p_api_ctrl, void(*p_callback)(can_callback_args_t *), void const *const p_context, can_callback_args_t *const p_callback_memory)

Detailed Description

Driver for the CANFD peripheral on RA MCUs. This module implements the CAN Interface.

Overview

The CANFD module can be used to communicate over CAN networks, optionally using Flexible Data (CAN-FD) to accelerate the data phase. A variety of message filtering and buffer options are available.

Features

Common Features

- Compatibility
  - Send and receive CAN 2.0 and CAN-FD frames on the same channel
  - Bitrate up to 1 Mbps with FD data phase speeds up to 5-8 Mbps
  - ISO 11898-1 Support
- Buffers
  - 32 global receive Message Buffers (RX MBs)
  - 2-8 global receive FIFOs (RX FIFOs)
  - 4-16 transmit Message Buffers (TX MBs) per channel
- Filtering
  - Each filter rule can be individually configured to accept messages based on:
    - ID
    - Standard or Extended ID (IDE bit)
    - Data or Remote Frame (RTR bit)
    - ID/IDE/RTR mask
    - Minimum DLC (data length) value
- Interrupts
  - Configurable Global RX FIFO Interrupt
    - Configurable per FIFO
    - Interrupt at a certain depth or on every received message
  - Configurable Common FIFO RX Interrupt
    - Configurable per FIFO
    - Interrupt at a certain depth or on every received message
  - Channel TX Interrupt
    - Interrupt on every transmitted message or when a Common FIFO is empty
  - Global Error
    - DLC Check
    - Message Lost
    - FD Payload Overflow
  - Channel Error
    - Bus Error
    - Error Warning
    - Error Passive
    - Bus-Off Entry
    - Bus-Off Recovery
    - Overload
    - Bus Lock
    - Arbitration Loss
    - Transmission Aborted

Per-MCU Specifications

	RA6M5	RA6T2	RA8M1

Channels	2	1	2
Max nominal bitrate	1 Mbps	1 Mbps	1 Mbps
Max data bitrate	5 Mbps	5 Mbps	8 Mbps
Filter rules	128	32	16/ch
TX message buffers	16/ch	4	4/ch
RX message buffers	32	32	16/ch
RX FIFOs	8	2	2/ch
RX Buffer RAM	4864 bytes	1216 bytes	1216 bytes
Common FIFOs	3/ch	1	1/ch

Note

Each message buffer comprises 12 header bytes plus data length (8-64 bytes). The above buffer RAM values therefore correspond to the following capacities:

	RA6M5	*RA6T2*	*RA8M1*
Max 64-byte storage	*64 messages*	*16 messages*	*16 messages*
Max 8-byte storage	*243 messages*	*60 messages*	*60 messages*

Each Common FIFO buffer can support the following message capacities:

	RA6M5	*RA6T2*	*RA8M1*
Maximum payload size	*64 bytes*	*64 bytes*	*64 bytes*
Maximum FIFO depth	*128 messages*	*48 messages*	*48 messages*

Configuration

Build Time Configurations for r_canfd

The following build time configurations are defined in fsp_cfg/r_canfd_cfg.h:

Configuration	Options	Default	Description
Global Error Interrupt			
Callback Channel	MCU Specific Options		Specify which channel callback should be called to handle global errors. When starting the driver this channel must be opened first.
Priority	MCU Specific Options		This interrupt is fired for each of the error sources selected below.
Sources	• DLC Check	0U	Select which errors

	• Message Lost • FD Payload Overflow		should trigger an interrupt.
Reception			
Reception > FIFOs			
Reception > FIFOs > FIFO 0			
Enable	• Enabled • Disabled	Enabled	Enable or disable RX FIFO 0.
Interrupt Mode	MCU Specific Options		Set the interrupt mode for RX FIFO 0. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below.
Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for RX FIFO 0. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Payload Size	MCU Specific Options		Select the message payload size for RX FIFO 0.
Depth	MCU Specific Options		Select the number of stages for RX FIFO 0.
Reception > FIFOs > FIFO 1			
Enable	• Enabled • Disabled	Disabled	Enable or disable RX FIFO 1.
Interrupt Mode	MCU Specific Options		Set the interrupt mode for RX FIFO 1. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below.
Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for RX FIFO 1. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Payload Size	MCU Specific Options		Select the message

			payload size for RX FIFO 1.
Depth	MCU Specific Options		Select the number of stages for RX FIFO 1.
Reception > FIFOs > FIFO 2			
Enable	• Enabled • Disabled	Disabled	Enable or disable RX FIFO 2.
Interrupt Mode	MCU Specific Options		Set the interrupt mode for RX FIFO 2. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below.
Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for RX FIFO 2. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Payload Size	MCU Specific Options		Select the message payload size for RX FIFO 2.
Depth	MCU Specific Options		Select the number of stages for RX FIFO 2.
Reception > FIFOs > FIFO 3			
Enable	• Enabled • Disabled	Disabled	Enable or disable RX FIFO 3.
Interrupt Mode	MCU Specific Options		Set the interrupt mode for RX FIFO 3. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below.
Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for RX FIFO 3. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Payload Size	MCU Specific Options		Select the message payload size for RX

			FIFO 3.
Depth	MCU Specific Options		Select the number of stages for RX FIFO 3.
Reception > FIFOs > FIFO 4			
Enable	• Enabled • Disabled	Disabled	Enable or disable RX FIFO 4.
Interrupt Mode	MCU Specific Options		Set the interrupt mode for RX FIFO 4. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below.
Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for RX FIFO 4. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Payload Size	MCU Specific Options		Select the message payload size for RX FIFO 4.
Depth	MCU Specific Options		Select the number of stages for RX FIFO 4.
Reception > FIFOs > FIFO 5			
Enable	• Enabled • Disabled	Disabled	Enable or disable RX FIFO 5.
Interrupt Mode	MCU Specific Options		Set the interrupt mode for RX FIFO 5. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below.
Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for RX FIFO 5. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Payload Size	MCU Specific Options		Select the message payload size for RX FIFO 5.

Depth	MCU Specific Options		Select the number of stages for RX FIFO 5.
Reception > FIFOs > FIFO 6			
Enable	• Enabled • Disabled	Disabled	Enable or disable RX FIFO 6.
Interrupt Mode	MCU Specific Options		Set the interrupt mode for RX FIFO 6. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below.
Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for RX FIFO 6. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Payload Size	MCU Specific Options		Select the message payload size for RX FIFO 6.
Depth	MCU Specific Options		Select the number of stages for RX FIFO 6.
Reception > FIFOs > FIFO 7			
Enable	• Enabled • Disabled	Disabled	Enable or disable RX FIFO 7.
Interrupt Mode	MCU Specific Options		Set the interrupt mode for RX FIFO 7. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below.
Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for RX FIFO 7. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Payload Size	MCU Specific Options		Select the message payload size for RX FIFO 7.
Depth	MCU Specific Options		Select the number of

			stages for RX FIFO 7.
Interrupt Priority	MCU Specific Options		This priority level will apply to all FIFO interrupts globally.
Reception > Message Buffers			
Number of Buffers	RX Message Buffer number must be an integer between 0 and 32.	0	Number of message buffers available for reception. As there is no interrupt for message buffer reception it is recommended to use RX FIFOs instead. Set this value to 0 to disable RX Message Buffers.
Payload Size	• 8 bytes • 12 bytes • 16 bytes • 20 bytes • 24 bytes • 32 bytes • 48 bytes • 64 bytes	8 bytes	Payload size for all RX Message Buffers.
Reception > Acceptance Filtering			
Channel 0 Rule Count	The number of AFL rules must be a positive integer.	32	Number of acceptance filter list rules dedicated to Channel 0.
Channel 1 Rule Count	The number of AFL rules must be a positive integer.	0	Number of acceptance filter list rules dedicated to Channel 1.
Flexible Data (FD)			
Protocol Exceptions	• Enabled (ISO 11898-1) • Disabled	Enabled (ISO 11898-1)	Select whether to enter the protocol exception handling state when a RES bit is sampled recessive as defined in ISO 11898-1.
Payload Overflow	• Reject • Truncate	Reject	Configure whether received messages larger than the destination buffer should be truncated or rejected.
Common FIFOs			

Common FIFOs > FIFO 0

Enable	• Enabled • Disabled	Disabled	Enable or disable Common FIFO 0.
Mode	• Receive • Transmit	Receive	Select the operation mode for Common FIFO 0.
RX Interrupt Enable	• Enabled • Disabled	Disabled	Enable to allow interrupts on message receiption for Common FIFO 0.
TX Interrupt Enable	• Enabled • Disabled	Disabled	Enable to allow interrupts on message transmission for Common FIFO 0.
Interrupt Mode	• Threshold • Every frame	Threshold	Set the interrupt mode for Common FIFO 0. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below or when all messages have been transmitted.
Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for Common FIFO 0. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Payload Size	MCU Specific Options		Select the message payload size for Common FIFO 0.
Depth	MCU Specific Options		Select the number of stages for Common FIFO 0.
TX Message Buffer	MCU Specific Options		Select the TX message buffer that participates in TX scans related to Common FIFO 0.
Interval TX Delay	TX delay must be an integer between 0 and 255.	0	Selects the delay between successive transmission for Common FIFO 0 in units of the Interval Timer Clock.
Interval Timer	• Reference clock	Reference clock	Select the source of the

	• Bit time clock		interval timer clock for Common FIFO 0. The reference clock can be scaled by x10 below.
Interval Timer Reference Clock Resolution	• x1 • x10	x1	Selects the timer resolution if the reference clock is selected as the timer source for Common FIFO 0.
Common FIFOs > FIFO 1			
Enable	• Enabled • Disabled	Disabled	Enable or disable Common FIFO 1.
Mode	• Receive • Transmit	Receive	Select the operation mode for Common FIFO 1.
RX Interrupt Enable	• Enabled • Disabled	Disabled	Enable to allow interrupts on message receiption for Common FIFO 1.
TX Interrupt Enable	• Enabled • Disabled	Disabled	Enable to allow interrupts on message transmission for Common FIFO 1.
Interrupt Mode	• Threshold • Every frame	Threshold	Set the interrupt mode for Common FIFO 1. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below or when all messages have been transmitted.
Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for Common FIFO 1. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Payload Size	MCU Specific Options		Select the message payload size for Common FIFO 1.
Depth	MCU Specific Options		Select the number of stages for Common FIFO 1.
TX Message Buffer	MCU Specific Options		Select the TX message

			buffer that participates in TX scans related to Common FIFO 1.
Interval TX Delay	TX delay must be an integer between 0 and 255.	0	Selects the delay between successive transmission for Common FIFO 1 in units of the Interval Timer Clock.
Interval Timer	• Reference clock • Bit time clock	Reference clock	Select the source of the interval timer clock for Common FIFO 1. The reference clock can be scaled by x10 below.
Interval Timer Reference Clock Resolution	• x1 • x10	x1	Selects the timer resolution if the reference clock is selected as the timer source for Common FIFO 1.
Common FIFOs > FIFO 2			
Enable	• Enabled • Disabled	Disabled	Enable or disable Common FIFO 2.
Mode	• Receive • Transmit	Receive	Select the operation mode for Common FIFO 2.
RX Interrupt Enable	• Enabled • Disabled	Disabled	Enable to allow interrupts on message receiption for Common FIFO 2.
TX Interrupt Enable	• Enabled • Disabled	Disabled	Enable to allow interrupts on message transmission for Common FIFO 2.
Interrupt Mode	• Threshold • Every frame	Threshold	Set the interrupt mode for Common FIFO 2. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below or when all messages have been transmitted.
Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for Common FIFO 2. This setting is only applicable when the

			Interrupt Mode is set to 'At Threshold Value'.
Payload Size	MCU Specific Options		Select the message payload size for Common FIFO 2.
Depth	MCU Specific Options		Select the number of stages for Common FIFO 2.
TX Message Buffer	MCU Specific Options		Select the TX message buffer that participates in TX scans related to Common FIFO 2.
Interval TX Delay	TX delay must be an integer between 0 and 255.	0	Selects the delay between successive transmission for Common FIFO 2 in units of the Interval Timer Clock.
Interval Timer	• Reference clock • Bit time clock	Reference clock	Select the source of the interval timer clock for Common FIFO 2. The reference clock can be scaled by x10 below.
Interval Timer Reference Clock Resolution	• x1 • x10	x1	Selects the timer resolution if the reference clock is selected as the timer source for Common FIFO 2.
Common FIFOs > FIFO 3			
Enable	• Enabled • Disabled	Disabled	Enable or disable Common FIFO 3.
Mode	• Receive • Transmit	Receive	Select the operation mode for Common FIFO 3.
RX Interrupt Enable	• Enabled • Disabled	Disabled	Enable to allow interrupts on message receiption for Common FIFO 3.
TX Interrupt Enable	• Enabled • Disabled	Disabled	Enable to allow interrupts on message transmission for Common FIFO 3.
Interrupt Mode	• Threshold • Every frame	Threshold	Set the interrupt mode for Common FIFO 3. Threshold mode will only fire an interrupt

			each time an incoming message crosses the threshold value set below or when all messages have been transmitted.
Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for Common FIFO 3. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Payload Size	MCU Specific Options		Select the message payload size for Common FIFO 3.
Depth	MCU Specific Options		Select the number of stages for Common FIFO 3.
TX Message Buffer	MCU Specific Options		Select the TX message buffer that participates in TX scans related to Common FIFO 3.
Interval TX Delay	TX delay must be an integer between 0 and 255.	0	Selects the delay between successive transmission for Common FIFO 3 in units of the Interval Timer Clock.
Interval Timer	• Reference clock • Bit time clock	Reference clock	Select the source of the interval timer clock for Common FIFO 3. The reference clock can be scaled by x10 below.
Interval Timer Reference Clock Resolution	• x1 • x10	x1	Selects the timer resolution if the reference clock is selected as the timer source for Common FIFO 3.
Common FIFOs > FIFO 4			
Enable	• Enabled • Disabled	Disabled	Enable or disable Common FIFO 4.
Mode	• Receive • Transmit	Receive	Select the operation mode for Common FIFO 4.
RX Interrupt Enable	• Enabled • Disabled	Disabled	Enable to allow interrupts on message

			receiption for Common FIFO 4.
TX Interrupt Enable	• Enabled • Disabled	Disabled	Enable to allow interrupts on message transmission for Common FIFO 4.
Interrupt Mode	• Threshold • Every frame	Threshold	Set the interrupt mode for Common FIFO 4. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below or when all messages have been transmitted.
Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for Common FIFO 4. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Payload Size	MCU Specific Options		Select the message payload size for Common FIFO 4.
Depth	MCU Specific Options		Select the number of stages for Common FIFO 4.
TX Message Buffer	MCU Specific Options		Select the TX message buffer that participates in TX scans related to Common FIFO 4.
Interval TX Delay	TX delay must be an integer between 0 and 255.	0	Selects the delay between successive transmission for Common FIFO 4 in units of the Interval Timer Clock.
Interval Timer	• Reference clock • Bit time clock	Reference clock	Select the source of the interval timer clock for Common FIFO 4. The reference clock can be scaled by x10 below.
Interval Timer Reference Clock Resolution	• x1 • x10	x1	Selects the timer resolution if the reference clock is selected as the timer source for Common

			FIFO 4.
Common FIFOs > FIFO 5			
Enable	• Enabled • Disabled	Disabled	Enable or disable Common FIFO 5.
Mode	• Receive • Transmit	Receive	Select the operation mode for Common FIFO 5.
RX Interrupt Enable	• Enabled • Disabled	Disabled	Enable to allow interrupts on message receiption for Common FIFO 5.
TX Interrupt Enable	• Enabled • Disabled	Disabled	Enable to allow interrupts on message transmission for Common FIFO 5.
Interrupt Mode	• Threshold • Every frame	Threshold	Set the interrupt mode for Common FIFO 5. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below or when all messages have been transmitted.
Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for Common FIFO 5. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Payload Size	MCU Specific Options		Select the message payload size for Common FIFO 5.
Depth	MCU Specific Options		Select the number of stages for Common FIFO 5.
TX Message Buffer	MCU Specific Options		Select the TX message buffer that participates in TX scans related to Common FIFO 5.
Interval TX Delay	TX delay must be an integer between 0 and 255.	0	Selects the delay between successive transmission for Common FIFO 5 in units of the Interval Timer Clock.

Interval Timer	• Reference clock • Bit time clock	Reference clock	Select the source of the interval timer clock for Common FIFO 5. The reference clock can be scaled by x10 below.
Interval Timer Reference Clock Resolution	• x1 • x10	x1	Selects the timer resolution if the reference clock is selected as the timer source for Common FIFO 5.
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Transmission Priority	• Message ID • Buffer Number	Buffer Number	Select how messages should be prioritized for transmission. In either case, lower numbers indicate higher priority.
DLC Check	• Disabled • Enabled • Enabled w/truncate	config.driver.canfd.dlc_check.disabled	When enabled received messages will be rejected if their DLC field is less than the value configured in the associated AFL rule. If 'Enabled w/truncate' is selected and a message passes the DLC check the DLC field is set to the value in the associated AFL rule and any excess data is discarded.
Interval Timer Prescaler	Timer prescaler must be an integer between 0 and 65535.	0	FIFO interval timer prescaler, required for Interval TX Delay.

Configurations for Connectivity > CAN FD (r_canfd)

This module can be added to the Stacks tab via New Stack > Connectivity > CAN FD (r_canfd). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_canfd0	Module name.
Channel	Channel should be 0 or 1	0	Specify the CAN channel to use.

Bitrate			
Bitrate > Automatic			
Nominal Rate (bps)	Must be a valid integer with a maximum of 1MHz.	500000	Specify nominal bitrate in bits per second.
FD Data Rate (bps)	Must be a valid integer with a minimum of 1MHz.	2000000	Specify data bitrate in bits per second. This value is not used when sending messages without the FD and BRS bits enabled and should be left at the default setting if only Classical CAN will be used.
Sample Point (%)	Must be a valid integer between 60 and 99.	75	Specify desired sample point.
Bitrate > Manual			
Bitrate > Manual > Nominal			
Prescaler (divisor)	Value must be a non-negative integer between 1 and 1024.	1	Specify clock divisor for nominal bitrate.
Time Segment 1 (Tq)	Value must be a non-negative integer between 2 and 256.	29	Select the Time Segment 1 value. Check module usage notes for how to calculate this value.
Time Segment 2 (Tq)	Value must be a non-negative integer between 2 and 128.	10	Select the Time Segment 2 value. Check module usage notes for how to calculate this value.
Sync Jump Width (Tq)	Value must be a non-negative integer between 1 and 128.	4	Select the Synchronization Jump Width value. Check module usage notes for how to calculate this value.
Bitrate > Manual > Data			
Prescaler (divisor)	Value must be a non-negative integer between 1 and 256.	1	Specify clock divisor for data bitrate.
Time Segment 1 (Tq)	Value must be a non-negative integer between 2 and 32.	5	Select the Time Segment 1 value. Check module usage notes for how to

			calculate this value.
Time Segment 2 (Tq)	Value must be a non-negative integer between 2 and 16.	2	Select the Time Segment 2 value. Check module usage notes for how to calculate this value.
Sync Jump Width (Tq)	Value must be a non-negative integer between 1 and 16.	1	Select the Synchronization Jump Width value. Check module usage notes for how to calculate this value.
Use manual settings	• Yes • No	No	Select whether or not to override automatic baudrate generation and instead use the values specified here.
Delay Compensation	• Enable • Disable	Enable	When enabled the CANFD module will automatically compensate for any transceiver or bus delay between transmitted and received bits. When manually supplying bit timing values with delay compensation enabled be sure the data prescaler is 2 or smaller for correct operation.
Interrupts			
Callback	Name must be a valid C symbol	canfd0_callback	A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time any interrupt occurs.
Channel Interrupt Priority Level	MCU Specific Options		Channel Error/Transmit interrupt priority.
Transmit Interrupts	MCU Specific Options		Select which TX Message Buffers should trigger an interrupt when transmission is complete.
Channel Error Interrupts	• Error Warning • Error Passive	0U	Select which channel error interrupt sources

	• Bus-Off Entry • Bus-Off Recovery • Overload		to enable.
Filter List Array	Name must be a valid C symbol	p_canfd0_afl	Acceptance Filter List (AFL) rule array symbol name.

Clock Configuration

The CANFD peripheral uses PLL or PLL2 as its clock source. The RA Configuration editor will attempt to get as close as possible to the supplied bitrate with the configured clock source. To achieve an exact bitrate the CANFD source clock or divisor may need to be adjusted to meet the criteria in the formula below:

```
bitrate = canfd_clock_hz / ((time_segment_1 + time_segment_2 + 1) * prescalar)
```

For CANFD, the possible values for each element are as follows:

Element	Min	Max (Nominal)	Max (Data)
Bitrate	-	1 Mbps	5-8 Mbps*
Time Segment 1	2 Tq	256 Tq	32 Tq
Time Segment 2	2 Tq	128 Tq	16 Tq
Sync Jump Width	1 Tq	Time Segment 2	Time Segment 2
Prescalar	1	1024	256

- RA6 devices support up to 5 Mbps; RA8 devices support up to 8 Mbps.

Use the **Clocks** tab of the RA Configuration editor to configure the CANFD clock source/divisor as well as to set the frequency of PLL or PLL2. To change the clock frequency at run-time, use the CGC Interface. Refer to the CGC module guide for more information on configuring clocks.

Pin Configuration

CANFD channels each control two pins: CRX (receive) and CTX (transmit).

Usage Notes

Buffers

The CANFD driver provides four types of buffers: Transmit Message Buffers (TX MBs), Receive Message Buffers (RX MBs), Receive FIFOs (RX FIFOs), and Common FIFOs (RX/TX Common FIFOs).

TX Message Buffers

TX MBs are used for transmission only. Refer to the hardware manual for your device for information on which TX MBs are available.

Note

The CANFD peripheral continually scans TX MBs for new data. Depending on the provided clock it may be possible to write to multiple TX MBs before transmission begins. In this case, messages will be sent in the priority specified by the Transmission Priority option in the RA Configuration editor.

RX Message Buffers

RX MBs are for reception only and may only hold one message at a time. The number of available RX MBs varies per device.

On RA6M5, RX MBs are shared between channels and no interrupts are provided. Use R_CANFD_InfoGet and R_CANFD_Read to poll and read them, respectively.

RX FIFOs

RX FIFOs provide interrupt-driven queue functionality for receiving messages. All FIFOs have the following capabilities:

- Up to 64 byte payloads
- Up to 128 messages (RA6M5) or 48 messages for all other MCUs.
- Interrupt events:
  - On every received frame OR when filled to a specified fraction of its capacity
  - When a message is overwritten (message received on full FIFO)

Once an interrupt is fired it will continue to fire until the FIFO is emptied and all messages have been passed to user code via the callback. When using the threshold interrupt mode a FIFO can be checked for data and read between interrupts by calling R_CANFD_InfoGet and R_CANFD_Read, respectively.

Note

On the RA6M5, FIFOs are shared across all channels.

RX Buffer Pool

The CANFD peripheral has a limited amount of buffer pool RAM available for allocating RX MBs and FIFO stages. The RA Configuration editor will provide a warning when the limit is exceeded.

The number of bytes used by RX MBs and individual FIFOs can be calculated as follows:

```
Total RX MB bytes used = (number of RX MBs enabled) * (RX MB payload size + 12 header bytes)
RX FIFO bytes used = (number of FIFO stages) * (FIFO payload size + 12 header bytes)
```

Common FIFOs

Common FIFOs provide interrupt-driven queue functionality for receiving or transmitting messages. Unlike RX FIFOs, Common FIFOs are individual to each channel. Refer to the hardware manual for your device for information on how many Common FIFOs are available. Common FIFOs support the following capabilities:

- Either TX or RX behavior can be configured.
  - Each Common FIFO can only be configured as one or the other. It cannot operate

in both TX and RX modes at the same time.
- Up to 64 byte payloads
- Up to 128 messages (RA6M5) or 48 messages on all other MCUs
- Interrupt events:
  - On every message received or when filled to a specified fraction of its capacity
  - On every message transmitted or when all messages have been transmitted and the FIFO is empty

Once an interrupt is fired it will continue to fire until the FIFO is emptied and all messages have been passed to user code via the callback. When using the threshold interrupt mode a FIFO can be checked for data and read between interrupts by calling R_CANFD_InfoGet and R_CANFD_Read, respectively.

Users should be aware of the total memory allocated in the internal CAN-FD RAM area for Common FIFOs. Allocating too many FIFOs or entries can lead to unexpected behavior.

Message Filtering (Acceptance Filter List)

To filter messages to the desired message buffer or FIFO the CANFD peripheral uses an Acceptance Filter List (AFL). Each entry in the AFL provides a rule to check a message against along with destination and other filtering information. When a message is received the CANFD peripheral internally checks against every configured AFL rule for the channel. If a match is found the message is transferred to the destination(s) specified in the rule. The default template with one entry is shown below:

```
static const canfd_afl_entry_t p_canfd0_afl[CANFD_CFG_AFL_CH0_RULE_NUM] =
{
    {
       .id =
      {
 /* Specify the ID, ID type and frame type to accept. */
            .id         = 0x00000000,
            .frame_type = CAN_FRAME_TYPE_DATA,
            .id_mode    = CAN_ID_MODE_EXTENDED,
       },
       .mask =
      {
 /* These values mask which ID/mode bits to compare when filtering messages. */
            .mask_id         = 0x1FFFFFFF,
            .mask_frame_type = 1,
            .mask_id_mode    = 1,
       },
       .destination =
      {
```

```
 /* If DLC checking is enabled any messages shorter than the below setting will be
rejected. */
            .minimum_dlc = CANFD_MINIMUM_DLC_0,
 /* Optionally specify a Receive Message Buffer (RX MB) to store accepted frames. RX
MBs do not have an
  * interrupt or overwrite protection and must be checked with R_CANFD_InfoGet and
R_CANFD_Read. */
            .rx_buffer    = CANFD_RX_MB_NONE,
 /* Specify which FIFO(s) to send filtered messages to. Multiple FIFOs can be OR'd
together. */
            .fifo_select_flags = CANFD_RX_FIFO_0,
       }
    }
};
```

AFL templates can be easily added to a project using the Developer Assistance feature in e² studio. Once the CANFD module is added to a project, drag and drop the elements circled below to build a filter list:

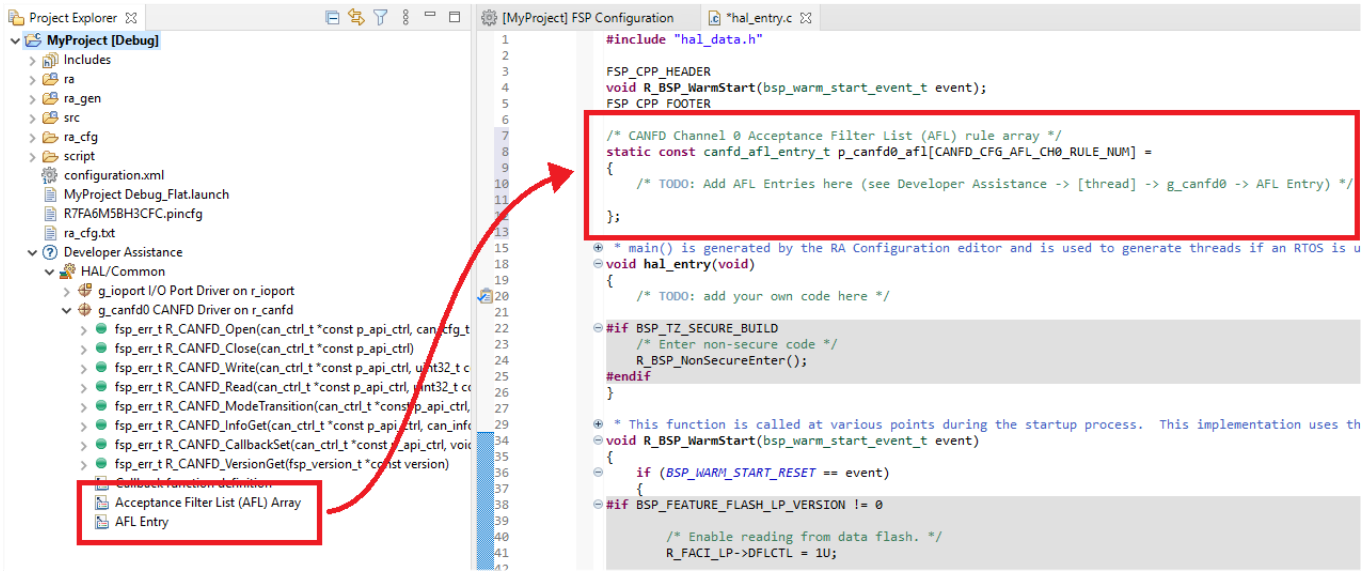

Figure 188: CANFD Developer Assistance AFL Templates

For an example configuration refer to the AFL Example below.

Flexible Data (FD)

Flexible Data is an extension of the CAN protocol allowing for messages up to 64 bytes and higher data bitrates, among other features. The CANFD driver supports the following:

- Sending and receiving FD messages
- Bitrate switching for data phase
- Manual and automatic setting of the error state (ESI) bit

To specify one or more of these options when transmitting set can_frame_t::options with combined values from canfd_frame_options_t. Received messages will automatically have this field filled, if applicable.

```
/* Configure a frame to write 64 bytes with bitrate switching (BRS) enabled */
   g_can_tx_frame.id              = CAN_EXAMPLE_ID;
   g_can_tx_frame.id_mode         = CAN_ID_MODE_STANDARD;
   g_can_tx_frame.type            = CAN_FRAME_TYPE_DATA;
   g_can_tx_frame.data_length_code = CAN_EXAMPLE_64_BYTES;
   g_can_tx_frame.options         = CANFD_FRAME_OPTION_FD | CANFD_FRAME_OPTION_BRS;
```

Note

When using bitrate switching be sure to configure the Data Bitrate as desired in the RA Configuration editor.

Bit Rate Calculation

For convenience, the baudrate of the CANFD peripheral is automatically set through the RA Configuration editor using a best effort approach.

Enabling Delay Compensation instructs the CANFD peripheral to measure TX to RX tranceiver delay and automatically adjust for it, improving the reliability of high-speed FD messages. This option may severely limit available bitrate settings depending on the source clock; it is highly recommended to check the generated values when enabled.

If the auto-generated baud settings cause deviation that is not tolerable by the application the user can override the auto-generated settings and put in manually calculated values through the RA Configuration editor. For more details on how the bitrate is calculated refer to the Clock Configuration section above.

Sync Jump Width

The Sync Jump Width option specifies the maximum number of time quanta that the sample point may be delayed by to account for differences in oscillators on the bus. It should be set to a value between 1 and the configured Time Segment 2 value depending on the maximum permissible clock error.

Error Handling

The CANFD peripheral provides two types of error interrupts: Channel and Global. As the names imply, each channel has its own Channel Error interrupt but there is only one Global Error interrupt. Only the configured channel will receive callbacks for Global Errors.

Error interrupt callbacks will pass either CAN_EVENT_ERR_CHANNEL or CAN_EVENT_ERR_GLOBAL in the can_callback_args_t::event field. A second field, can_callback_args_t::error, provides the actual error code as canfd_error_t. Cast to this enum to retrieve the error condition. See the callback in the Basic Example below for a demonstration.

DLC Checking

When DLC Checking is enabled messages are checked against the destination.minimum_dlc value of each AFL rule. If the data length of a message is less than this value the message will be rejected. When DLC checking is set to "Enabled w/truncate" in the RA Configuration editor any data in excess of the minimum DLC setting will be truncated and the DLC value for the frame will be set to match.

FD Payload Overflow

When an FD message is received with a DLC larger than the destination buffer an FD Payload Overflow interrupt is thrown (if configured). When Payload Overflow is set to "Truncate" the message will still be accepted but only data up to the buffer capacity will be preserved. The DLC value is unchanged in this case; any data beyond this value in the can_frame_t::data array should not be used.

Test Modes

The CANFD peripheral provides three basic test modes: Listen Only, Internal Loopback and External Loopback. Use R_CANFD_ModeTransition to switch to a test mode.

On some MCUs an additional "Internal Bus" test mode is available that allows connecting both CANFD channels together on an internal bus, effectively creating an internal CAN network. See the Internal Bus example below for details.

Limitations

Developers should be aware of the following limitations when using CANFD:

- On RA6M5, RX Message Buffers do not have an associated interrupt. To use them in an application one of the following is recommended:
  - Use R_CANFD_InfoGet to determine if any RX MBs have received data, then use R_CANFD_Read to obtain it
  - Select an RX FIFO as an additional destination for the relevant filter rules and configure the FIFO interrupt/callback as desired
- The CANFD peripheral has a limited amount of buffer pool RAM available for allocating RX MBs and FIFO stages. See the RX Buffer Pool section above for more information.
- When switching modes with R_CANFD_ModeTransition a delay of up to several CAN frames may be incurred. Consult Section 32.3.4.2 "Timing of Channel Mode Change" in the RA6M5 User's Manual (R01UH0891EJ0100) for details.
- Only one channel will receive callbacks for Global Errors. If a different channel is opened first these error interrupts will be suppressed until the specified handler channel is opened.

Examples

AFL Example

The below is an example Acceptance Filter List (AFL) declaration with two rules.

```
const canfd_afl_entry_t p_canfd0_afl[CANFD_CFG_AFL_CH1_RULE_NUM] =
```

```
{
 /* Store all data frames with at least 4 bytes from Standard IDs 0x40-0x4F in RX
FIFO 0 and RX FIFO 1 */
    {
       .id =
      {
            .id         = 0x40,
            .frame_type = CAN_FRAME_TYPE_DATA,
            .id_mode    = CAN_ID_MODE_STANDARD
       },
       .mask =
      {
            .mask_id         = 0x7F0,
            .mask_frame_type = 1,
            .mask_id_mode    = 1
       },
       .destination =
      {
            .minimum_dlc       = CANFD_MINIMUM_DLC_4,
            .rx_buffer         = CANFD_RX_MB_NONE,
            .fifo_select_flags = (canfd_rx_fifo_t) (CANFD_RX_FIFO_0 |
CANFD_RX_FIFO_1)
       }
    },
 /* Store all frames from Extended ID 0x1100 in RX FIFO 2 and RX MB 0 */
    {
       .id =
      {
            .id         = 0x1100,
            .frame_type = CAN_FRAME_TYPE_DATA, // This setting is ignored by the mask
            .id_mode    = CAN_ID_MODE_EXTENDED
       },
       .mask =
      {
```

```
            .mask_id         = 0x1FFFFFFF,
            .mask_frame_type = 0,
            .mask_id_mode    = 1
       },
       .destination =
      {
            .minimum_dlc       = CANFD_MINIMUM_DLC_0,
            .rx_buffer         = CANFD_RX_MB_0,
            .fifo_select_flags = CANFD_RX_FIFO_2
       }
    }
};
```

Basic Example

This is a basic example of minimal use of the CANFD module in an application.

Note

On RA6M5 it is recommended to use RX FIFOs for reception as there are no interrupts for RX message buffers.

```
#define CAN_EXAMPLE_ID (0x20)
can_frame_t g_can_tx_frame;
can_frame_t g_can_rx_frame;
volatile canfd_error_t g_err_status = (canfd_error_t) 0;
void canfd_callback (can_callback_args_t * p_args)
{
 switch (p_args->event)
    {
 case CAN_EVENT_RX_COMPLETE:    /* Receive complete event. */
      {
 /* Read received frame */
            memcpy(&g_can_rx_frame, &p_args->frame, sizeof(can_frame_t));
 /* Handle event */
 break;
       }
 case CAN_EVENT_TX_COMPLETE:    /* Transmit complete event. */
```

```
     {
 /* Handle event */
 break;
      }
 case CAN_EVENT_ERR_GLOBAL:                      /* Global error. */
 case CAN_EVENT_ERR_CHANNEL:                    /* Channel error. */
     {
 /* Get error status */
           g_err_status = (canfd_error_t) p_args->error; /* Check error code with
canfd_error_t. */
 /* Handle event */
 break;
      }
 default:
     {
 break;
      }
   }
}
void canfd_basic_example (void)
{
 fsp_err_t err;
 /* Initialize the CAN module */
   err = R_CANFD_Open(&g_canfd0_ctrl, &g_canfd0_cfg);
 /* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
 /* Setup frame to write to CAN ID 0x20 */
   g_can_tx_frame.id              = CAN_EXAMPLE_ID;
   g_can_tx_frame.id_mode         = CAN_ID_MODE_STANDARD;
   g_can_tx_frame.type            = CAN_FRAME_TYPE_DATA;
   g_can_tx_frame.data_length_code = 8;
   g_can_tx_frame.options         = 0;
 /* Write some data to the transmit frame */
 for (uint32_t i = 0; i < 8; i++)
```

```
    {
       g_can_tx_frame.data[i] = (uint8_t) i;
    }
 /* Send data on the bus */
    err = R_CANFD_Write(&g_canfd0_ctrl, CANFD_TX_MB_0, &g_can_tx_frame);
    assert(FSP_SUCCESS == err);
 /* Wait for a transmit callback event */
}
```

Flexible Data

This example demonstrates sending an FD message with bitrate switching over external loopback. The CTX and CRX pins must be connected when using external loopback, though if a CAN tranciever is onboard a 120 Ohm resistor should be connected across CANH and CANL instead.

```
#define CAN_EXAMPLE_64_BYTES 64
void canfd_fd_loopback_example (void)
{
 fsp_err_t err;
    err = R_CANFD_Open(&g_canfd0_ctrl, &g_canfd0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Switch to external loopback mode */
    err = R_CANFD_ModeTransition(&g_canfd0_ctrl, CAN_OPERATION_MODE_NORMAL,
CAN_TEST_MODE_LOOPBACK_EXTERNAL);
    assert(FSP_SUCCESS == err);
 /* Configure a frame to write 64 bytes with bitrate switching (BRS) enabled */
    g_can_tx_frame.id              = CAN_EXAMPLE_ID;
    g_can_tx_frame.id_mode         = CAN_ID_MODE_STANDARD;
    g_can_tx_frame.type            = CAN_FRAME_TYPE_DATA;
    g_can_tx_frame.data_length_code = CAN_EXAMPLE_64_BYTES;
    g_can_tx_frame.options         = CANFD_FRAME_OPTION_FD | CANFD_FRAME_OPTION_BRS;
 /* Write some data to the transmit frame */
 for (uint32_t i = 0; i < CAN_DATA_BUFFER_LENGTH; i++)
    {
       g_can_tx_frame.data[i] = (uint8_t) i;
```

```
    }
 /* Send data on the bus */
    err = R_CANFD_Write(&g_canfd0_ctrl, CANFD_TX_MB_0, &g_can_tx_frame);
    assert(FSP_SUCCESS == err);
 /* Wait for a transmit and/or receive callback event */
}
```

Internal Bus

In this example two CANFD channels are connected to the Internal Bus test mode. API error checking has been omitted for clarity.

Note

Internal Bus mode is only available on MCUs with more than one CANFD channel. In addition, use of Global Modes for any other purpose is not recommended without consulting the device User's Manual.

Data Structures

struct canfd_afl_entry_t
AFL Entry (based on R_CANFD_CFDGAFL_Type in renesas.h)

◆ canfd_global_cfg_t

struct canfd_global_cfg_t		
CANFD Global Configuration		
Data Fields		
uint32_t	global_interrupts	Global control options (CFDGCTR register setting)
uint32_t	global_config	Global configuration options (CFDGCFG register setting)
uint32_t	rx_fifo_config[8]	RX FIFO configuration (CFDRFCCn register settings)
uint32_t	rx_mb_config	Number and size of RX Message Buffers (CFDRMNB register setting)
uint8_t	global_err_ipl	Global Error interrupt priority.
uint8_t	rx_fifo_ipl	RX FIFO interrupt priority.
uint32_t	common_fifo_config[R_CANFD_NUM_COMMON_FIFOS]	Common FIFO configurations.

◆ canfd_extended_cfg_t

struct canfd_extended_cfg_t		
CANFD Extended Configuration		
Data Fields		
canfd_afl_entry_t const *	p_afl	AFL rules list.
uint64_t	txmb_txi_enable	Array of TX Message Buffer enable bits.
uint32_t	error_interrupts	Error interrupt enable bits.
can_bit_timing_cfg_t *	p_data_timing	FD Data Rate (when bitrate switching is used)
uint8_t	delay_compensation	FD Transceiver Delay Compensation (enable or disable)
canfd_global_cfg_t *	p_global_cfg	Global configuration (global error callback channel only)

Enumeration Type Documentation

◆ canfd_status_t

enum canfd_status_t	
CANFD Status	
Enumerator	
CANFD_STATUS_RESET_MODE	Channel in Reset mode.
CANFD_STATUS_HALT_MODE	Channel in Halt mode.
CANFD_STATUS_SLEEP_MODE	Channel in Sleep mode.
CANFD_STATUS_ERROR_PASSIVE	Channel in error-passive state.
CANFD_STATUS_BUS_OFF	Channel in bus-off state.
CANFD_STATUS_TRANSMITTING	Channel is transmitting.
CANFD_STATUS_RECEIVING	Channel is receiving.
CANFD_STATUS_READY	Channel is ready for communication.
CANFD_STATUS_ESI	At least one CAN-FD message was received with the ESI flag set.

◆ canfd_error_t

enum canfd_error_t	
CANFD Error Code	
Enumerator	
CANFD_ERROR_CHANNEL_BUS	Bus Error.
CANFD_ERROR_CHANNEL_WARNING	Error Warning (TX/RX error count over 0x5F)
CANFD_ERROR_CHANNEL_PASSIVE	Error Passive (TX/RX error count over 0x7F)
CANFD_ERROR_CHANNEL_BUS_OFF_ENTRY	Bus-Off State Entry.
CANFD_ERROR_CHANNEL_BUS_OFF_RECOVERY	Recovery from Bus-Off State.
CANFD_ERROR_CHANNEL_OVERLOAD	Overload.
CANFD_ERROR_CHANNEL_BUS_LOCK	Bus Locked.
CANFD_ERROR_CHANNEL_ARBITRATION_LOSS	Arbitration Lost.

CANFD_ERROR_CHANNEL_STUFF	Stuff Error.
CANFD_ERROR_CHANNEL_FORM	Form Error.
CANFD_ERROR_CHANNEL_ACK	ACK Error.
CANFD_ERROR_CHANNEL_CRC	CRC Error.
CANFD_ERROR_CHANNEL_BIT_RECESSIVE	Bit Error (recessive) Error.
CANFD_ERROR_CHANNEL_BIT_DOMINANT	Bit Error (dominant) Error.
CANFD_ERROR_CHANNEL_ACK_DELIMITER	ACK Delimiter Error.
CANFD_ERROR_GLOBAL_DLC	DLC Error.
CANFD_ERROR_GLOBAL_MESSAGE_LOST	Message Lost.
CANFD_ERROR_GLOBAL_PAYLOAD_OVERFLOW	FD Payload Overflow.
CANFD_ERROR_GLOBAL_TXQ_OVERWRITE	TX Queue Message Overwrite.
CANFD_ERROR_GLOBAL_TXQ_MESSAGE_LOST	TX Queue Message Lost.
CANFD_ERROR_GLOBAL_CH0_SCAN_FAIL	Channel 0 RX Scan Failure.
CANFD_ERROR_GLOBAL_CH1_SCAN_FAIL	Channel 1 RX Scan Failure.
CANFD_ERROR_GLOBAL_CH0_ECC	Channel 0 ECC Error.
CANFD_ERROR_GLOBAL_CH1_ECC	Channel 1 ECC Error.

◆ canfd_tx_buffer_t

enum canfd_tx_buffer_t
CANFD Transmit Buffer (MB + CFIFO)

◆ canfd_tx_mb_t

enum canfd_tx_mb_t
CANFD Transmit Message Buffer (TX MB)

◆ canfd_rx_buffer_t

enum canfd_rx_buffer_t
CANFD Receive Buffer (MB + FIFO + CFIFO)

◆ canfd_rx_mb_t

enum canfd_rx_mb_t
CANFD Receive Message Buffer (RX MB)

◆ canfd_rx_fifo_t

enum canfd_rx_fifo_t
CANFD Receive FIFO (RX FIFO)

◆ canfd_minimum_dlc_t

enum canfd_minimum_dlc_t
CANFD AFL Minimum DLC settings

◆ canfd_frame_options_t

enum canfd_frame_options_t	
CANFD Frame Options	
Enumerator	
CANFD_FRAME_OPTION_ERROR	Error state set (ESI).
CANFD_FRAME_OPTION_BRS	Bit Rate Switching (BRS) enabled.
CANFD_FRAME_OPTION_FD	Flexible Data frame (FDF).

Function Documentation

◆ R_CANFD_Open()

fsp_err_t R_CANFD_Open (can_ctrl_t *const *p_api_ctrl*, can_cfg_t const *const *p_cfg*)

Open and configure the CANFD channel for operation.

Example:

```
/* Initialize the CAN module */
   err = R_CANFD_Open(&g_canfd0_ctrl, &g_canfd0_cfg);
```

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ALREADY_OPEN	Driver already open.
FSP_ERR_IN_USE	Channel is already in use.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel does not exist on this MCU.
FSP_ERR_ASSERTION	A required pointer was NULL.
FSP_ERR_CAN_INIT_FAILED	The provided nominal or data bitrate is invalid.
FSP_ERR_CLOCK_INACTIVE	CANFD source clock is disabled (PLL or PLL2).

◆ R_CANFD_Close()

fsp_err_t R_CANFD_Close (can_ctrl_t *const *p_api_ctrl*)

Close the CANFD channel.

Return values

FSP_SUCCESS	Channel closed successfully.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_ASSERTION	Null pointer presented.

◆ R_CANFD_Write()

fsp_err_t R_CANFD_Write (can_ctrl_t *const *p_api_ctrl*, uint32_t *buffer*, can_frame_t *const *p_frame*)

Write data to the CANFD channel.

Example:

```
/* Send data on the bus */
   err = R_CANFD_Write(&g_canfd0_ctrl, CANFD_TX_MB_0, &g_can_tx_frame);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_CAN_TRANSMIT_NOT_READY	Transmit in progress, cannot write data at this time.
FSP_ERR_INVALID_ARGUMENT	Data length or buffer number invalid.
FSP_ERR_INVALID_MODE	An FD option was set on a non-FD frame.
FSP_ERR_ASSERTION	One or more pointer arguments is NULL.
FSP_ERR_UNSUPPORTED	FD is not supported on this MCU.

◆ R_CANFD_Read()

fsp_err_t R_CANFD_Read (can_ctrl_t *const *p_api_ctrl*, uint32_t *buffer*, can_frame_t *const *p_frame*)

Read data from a CANFD Message Buffer or FIFO.

Example: snippet r_canfd_example.c R_CANFD_Read

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_ARGUMENT	Buffer number invalid.
FSP_ERR_ASSERTION	p_api_ctrl or p_frame is NULL.
FSP_ERR_BUFFER_EMPTY	Buffer or FIFO is empty.

◆ R_CANFD_ModeTransition()

fsp_err_t R_CANFD_ModeTransition (can_ctrl_t *const *p_api_ctrl*, can_operation_mode_t *operation_mode*, can_test_mode_t *test_mode*)

Switch to a different channel, global or test mode.

Example:

```
/* Switch to external loopback mode */
   err = R_CANFD_ModeTransition(&g_canfd0_ctrl, CAN_OPERATION_MODE_NORMAL,
CAN_TEST_MODE_LOOPBACK_EXTERNAL);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_ASSERTION	Null pointer presented
FSP_ERR_INVALID_MODE	Cannot change to the requested mode from the current global mode.

◆ R_CANFD_InfoGet()

fsp_err_t R_CANFD_InfoGet (can_ctrl_t *const *p_api_ctrl*, can_info_t *const *p_info*)

Get CANFD state and status information for the channel.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_ASSERTION	Null pointer presented

◆ R_CANFD_CallbackSet()

fsp_err_t R_CANFD_CallbackSet (can_ctrl_t *const *p_api_ctrl*, void(*)(can_callback_args_t *) *p_callback*, void const *const *p_context*, can_callback_args_t *const *p_callback_memory*)
Updates the user callback with the option to provide memory for the callback argument structure. Implements can_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

5.2.6.4 CEC (r_cec)

Modules » Connectivity

Functions

fsp_err_t	R_CEC_Open (cec_ctrl_t *const p_ctrl, cec_cfg_t const *const p_cfg)

Detailed Description

Driver for the CEC peripheral on RA MCUs. This module implements the CEC Interface.

Overview

The HDMI CEC HAL module provides a high-level API for CEC applications and supports the CEC peripheral available on RA microcontroller hardware. A user-callback function must be defined that the driver will invoke when data received, transmission complete, or error interrupts are received. The callback is passed a parameter which indicates the event as well as received data (if available).

Features

- Conforms to High Definition Multimedia Interface (HDMI) Consumer Electronics Control (CEC) standard Ver. 1.4b.
- Full range of local address settings (TV, Recording Device, Playback Device, etc.)
- Data filtering based on matching destination address and local address.
- Supports a user-callback function (required), invoked when transmit, receive, or error interrupts are received.

Configuration

Build Time Configurations for r_cec

The following build time configurations are defined in fsp_cfg/r_cec_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
CEC Message Max Data Size	CEC message max data size must be a positive integer	14	Maximum Data Size for CEC Message Transmission/Reception.

Configurations for Connectivity > CEC (r_cec)

This module can be added to the Stacks tab via New Stack > Connectivity > CEC (r_cec). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_cec0	Module name
Control Configuration			
Clock Select	• PCLKB / 32 • PCLKB / 64 • PCLKB / 128 • PCLKB / 256 • PCLKB / 512 • PCLKB / 1024 • CECCLK • CECCLK / 256	PCLKB / 1024	CEC Clock Select Configuration
Ack Bit Timing Error	• Disabled	Enabled	CEC Ack Bit Timing

Enable	• Enabled		Error Enable
Signal-Free Time Bit Width	• 3-data bit width • 5-data bit width • 7-data bit width • Does not detect signal-free time.	7-data bit width	Signal-Free Time Data Bit Width Select
Start Bit Error Detection Enable	• Disabled • Enabled	Enabled	Enable to detect timing errors during start bit reception.
Bus Lock Detection Enable	• Disabled • Enabled	Enabled	Enable to detect sticking of receive data to high or low.
Digital Filter Enable	• Disabled • Enabled	Enabled	Enable to use a digital filter.
Long Bit Width Error Pulse Output Enable	• Disabled • Enabled	Disabled	Enable to output an error handling pulse when a long bit width error is detected.
Start Detection Reception Restart Enable	• Disabled • Enabled	Enabled	Enable to restart reception after a start bit error is detected.

Bit Width Timing

Bit Width Timing > Transmit

Start Bit Low Time	CEC transmission start bit low width setting must be a positive integer.	180	CEC transmission start bit low width setting (CEC Clock Cycles).
Start Bit Width Time	CEC transmission start bit high width setting must be a positive integer.	220	CEC transmission start bit high width setting (CEC Clock Cycles).
Logical Zero Low Time	CEC transmission logical zero low width setting must be a positive integer.	73	CEC transmission logical zero low width setting (CEC Clock Cycles).
Logical One Low Time	CEC transmission logical one low width setting must be a positive integer.	29	CEC transmission logical one low width setting (CEC Clock Cycles).
Overall Bit Width Time	CEC transmission overall data bit width time setting must be a positive integer.	117	CEC transmission overall data bit width time setting (CEC Clock Cycles).

Bit Width Timing > Receive

Data Sample Time	CEC reception data sampling time must be a positive integer.	49	CEC reception data sampling time setting (CEC Clock Cycles).
Data Bit Reference Width	CEC reception data bit reference width must be a positive integer.	117	CEC data bit reference width setting (CEC Clock Cycles).
Start Bit Low Min Time	CEC reception start bit minimum low width setting must be a positive integer.	171	CEC reception start bit minimum low width setting (CEC Clock Cycles). Not used when Start Bit Error Detection and restart Rx on Error are not enabled.
Start Bit Low Max Time	CEC reception start bit maximum low width setting must be a positive integer.	190	CEC reception start bit maximum low width setting (CEC Clock Cycles). Not used when Start Bit Error Detection and restart Rx on Error are not enabled.
Start Bit Min Time	CEC start bit minimum time setting must be a positive integer.	210	CEC start bit minimum time setting (CEC Clock Cycles). Not used when Start Bit Error Detection and restart Rx on Error are not enabled.
Start Bit Max Time	CEC reception start bit maximum time setting must be a positive integer.	229	CEC start bit maximum time setting (CEC Clock Cycles). Not used when Start Bit Error Detection and restart Rx on Error are not enabled.
Logical Zero Low Min Time	CEC reception logical zero minimum low width setting must be a positive integer.	64	CEC reception logical zero minimum low width setting (CEC Clock Cycles).
Logical Zero Low Max Time	CEC reception locical zero maximum low width setting must be a positive integer.	83	CEC reception logical zero maximum low width setting (CEC Clock Cycles).
Logical One Low Min Time	CEC reception logical one minimum low width setting must be a positive integer.	20	CEC reception logical one minimum low width setting (CEC Clock Cycles).
Logical One Low Max	CEC reception logical	39	CEC reception logical

Time	one maximum low width setting must be a positive integer.		one maximum low width (CEC Clock Cycles).
Overall Bit Width Min Time	CEC reception overall minimum bit width setting must be a positive integer.	100	CEC reception overall minimum bit width setting (CEC Clock Cycles).
Overall Bit Width Max Time	CEC reception overall maximum bit width setting must be a positive integer.	134	CEC reception overall maximum bit width setting (CEC Clock Cycles).
Interrupts			
Interrupt Priority Level	MCU Specific Options		Error/Data/Message interrupt priority level.
Callback Function	Callback Function must be a valid C symbol	g_rm_cec0_callback	Callback function
Communication Complete Interrupt Timing	• After Last Frame and Signal Free Time • After Last Frame • After Signal Free Time	After Last Frame and Signal Free Time	Communication Complete Interrupt (INTCE) Generation Timing Select
Address Mismatch Interrupt Enable	• Disabled • Enabled	Disabled	Enable to generate an interrupt when the addresses do not match.
Data Interrupt Timing Selection	• EOM timing (9th bit of data) • ACK Timing (10th bit of data)	EOM timing (9th bit of data)	INTDA reception interrupt timing selection (EOM or ACK).

Clock Configuration

The CEC peripheral uses the CECCLK or PCLKB as its clock source. To set the PCLKB frequency, use the Clocks tab of the RA Configuration editor.

Note

The selected clock and configured divider must be configured in the range of 23.4375 to 78.125 kHz.

Pin Configuration

A CEC channel uses one data pin - CECIO for data transmission and reception.

The output type for each pin should be set to **n-ch open drain** for most hardware designs. This can be configured in **Pins** tab of the RA Configuration editor by selecting the pin under Pin Selection->Ports.

Usage Notes

CEC Device Addresses

The CEC standard provides 13 device addresses that may be requested based on a device's primary function. Use R_CEC_MediaInit to request a specific address before starting communication with other devices.

Note

Address 0 is always the primary display (TV). Do not attempt to allocate this address unless your device is intended to function as a display.

Limitations

Developers should be aware of the following limitations when using the CEC module:

- R_CEC_MediaInit may return FSP_ERR_IN_USE for up to 45 milliseconds after R_CEC_Open while the hardware initializes.
- The CECIO pin must be set to n-ch open drain mode.

Examples

Basic Example

This is a basic example of minimal use of the CEC in an application.

```
/***********************************************************************************************
*********************************
 * Application defined callback
 * - May be assigned at compile-time via the e2 studio configuration tool or set at
run-time via R_CEC_CallbackSet()
 ***********************************************************************************************
*********************************/
void cec_callback (cec_callback_args_t * p_args)
{
 switch (p_args->event)
    {
 case CEC_EVENT_READY:
      {
 /* Application processing for address allocation success. */
 break;
       }
 case CEC_EVENT_TX_COMPLETE:
```

```
     {
 /* Any required processing after transmission has completed. */
 break;
      }
 case CEC_EVENT_ERR:
     {
 /* Error processing. See cec_error_t for possible errors. */
 break;
      }
 case CEC_EVENT_RX_DATA:
     {
 /* Application to store and process received data bytes. */
 break;
      }
 case CEC_EVENT_RX_COMPLETE:
     {
 /* Application processing for message reception complete. */
      }
   }
}
/***********************************************************************************
*********************************
 * Basic example
 ***********************************************************************************
*********************************/
#define CEC_TIMEOUT_MS (50)
#define CEC_MSG_STANDBY (0X36)  /* See CEC Specification for message definitions */
void basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the CEC module */
    err = R_CEC_Open(&g_cec0_ctrl, &g_cec0_cfg);
    assert(FSP_SUCCESS == err);
 /* Initialize the CEC module and allocate an address */
```

```
    uint32_t timeout_ms = CEC_TIMEOUT_MS;
 do
    {
 /* R_CEC_MediaInit may return FSP_ERR_IN_USE for up to 45 milliseconds after calling
R_CEC_Open */
       err = R_CEC_MediaInit(&g_cec0_ctrl, CEC_ADDR_TV);
 R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_MILLISECONDS);
    } while ((FSP_ERR_IN_USE == err) && --timeout_ms);
    assert(timeout_ms);
    assert(FSP_SUCCESS == err);
 /* Wait for local address allocation and CEC bus to be free */
    cec_status_t status;
    err = R_CEC_StatusGet(&g_cec0_ctrl, &status);
 while ((FSP_SUCCESS == err) && (CEC_STATE_READY != status.state))
    {
      err = R_CEC_StatusGet(&g_cec0_ctrl, &status);
      assert(FSP_SUCCESS == err);
    }
 cec_message_t cec_msg;
    uint8_t       total_transmit_size;
    cec_msg.destination = CEC_ADDR_BROADCAST;       /* For this example, send message
to all devices on the bus */
    cec_msg.opcode      = CEC_MSG_STANDBY;          /* Send Standby Request */
    memset(cec_msg.data, 0U, sizeof(cec_msg.data)); /* See CEC Specification for
other message data structures */
    total_transmit_size = 2U;                      /* Total message size, including
header, opcode, and data */
 /* Send asynchronous message.
  * - Application will then be free for other processing while message is being sent.
  * - Do not modify the message buffer until transmission has completed. */
    err = R_CEC_Write(&g_cec0_ctrl, &cec_msg, total_transmit_size);
    assert(FSP_SUCCESS == err);
}
```

Function Documentation

◆ R_CEC_Open()

fsp_err_t R_CEC_Open (cec_ctrl_t *const *p_ctrl*, cec_cfg_t const *const *p_cfg*)

Open and configure the CEC module for operation.

Example:

```
/* Open the CEC module */
   err = R_CEC_Open(&g_cec0_ctrl, &g_cec0_cfg);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	CEC Module opened successfully.
FSP_ERR_ALREADY_OPEN	Driver already open.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_IRQ_BSP_DISABLED	Interrupts are not enabled.

◆ R_CEC_MediaInit()

fsp_err_t R_CEC_MediaInit (cec_ctrl_t *const *p_ctrl*, cec_addr_t *local_address*)

Allocate provided CEC Local Address and Initialize the CEC module for operation.

Note

After calling R_CEC_Open this function may return FSP_ERR_IN_USE for up to 45 milliseconds.

Example:

```
/* Initialize the CEC module and allocate an address */
   uint32_t timeout_ms = CEC_TIMEOUT_MS;
do
   {
/* R_CEC_MediaInit may return FSP_ERR_IN_USE for up to 45 milliseconds after calling
R_CEC_Open */
      err = R_CEC_MediaInit(&g_cec0_ctrl, CEC_ADDR_TV);
R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_MILLISECONDS);
   } while ((FSP_ERR_IN_USE == err) && --timeout_ms);
   assert(timeout_ms);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	CEC Module Initialized successfully.
FSP_ERR_ASSERTION	An input argument is invalid or callback has not been set.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_IN_USE	HDMI CEC Bus is currently in use. Try again later.

◆ R_CEC_Close()

fsp_err_t R_CEC_Close (cec_ctrl_t *const *p_ctrl*)

Close the CEC module.

Return values

FSP_SUCCESS	CEC Module closed successfully.
FSP_ERR_ASSERTION	An input argument is invalid.

◆ R_CEC_Write()

fsp_err_t R_CEC_Write (cec_ctrl_t *const *p_ctrl*, cec_message_t const *const *p_message*, uint32_t *message_size*)

Write data to the CEC bus. Data transmission is asynchronous. Provided message buffer should not be modified until transmission is complete.

Data Transmission follows the pattern defined be the HDMI CEC Specification:

Data	Description	Size
Start Bit	Managed by Hardware, per config	N/A
Header Block	Source/Destination Identifier	1 Byte
Data Block 1	Opcode Value (Optional)	1 Byte
Data Block 2	Operands (Optional)	Variable (0-14 Bytes Typical)

Example:

```
cec_message_t cec_msg;
    uint8_t       total_transmit_size;
    cec_msg.destination = CEC_ADDR_BROADCAST;       /* For this example, send message
to all devices on the bus */
    cec_msg.opcode      = CEC_MSG_STANDBY;          /* Send Standby Request */
    memset(cec_msg.data, 0U, sizeof(cec_msg.data)); /* See CEC Specification for
other message data structures */
    total_transmit_size = 2U;                      /* Total message size, including
header, opcode, and data */
 /* Send asynchronous message.
  * - Application will then be free for other processing while message is being sent.
  * - Do not modify the message buffer until transmission has completed. */
    err = R_CEC_Write(&g_cec0_ctrl, &cec_msg, total_transmit_size);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_NOT_INITIALIZED	Module has not been successfully initialized.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_INVALID_SIZE	Invalid message size.
FSP_ERR_IN_USE	HDMI CEC Bus is currently in use. Try again

	later.

◆ R_CEC_StatusGet()

fsp_err_t R_CEC_StatusGet (cec_ctrl_t *const *p_ctrl*, cec_status_t *const *p_status*)

Provides the state and status information according to the provided CEC control instance.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_ASSERTION	An input argument is invalid.

◆ R_CEC_CallbackSet()

fsp_err_t R_CEC_CallbackSet (cec_ctrl_t *const *p_ctrl*, void(*)(cec_callback_args_t *) *p_callback*, void const *const *p_context*, cec_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements cec_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

Detailed Description

Middleware to implement the I2C communications interface. This module implements the Communicatons Middleware Interface.

Overview

Features

The implementation of the I2C communications interface has the following key features:

- Reading data from, writing data to I2C bus
- Writes to I2C bus, then reads with restart
- A single I2C bus used by multiple I2C devices

Configuration

Build Time Configurations for rm_comms_i2c

The following build time configurations are defined in fsp_cfg/rm_comms_i2c_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Connectivity > I2C Shared Bus (rm_comms_i2c)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Shared Bus (rm_comms_i2c).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_comms_i2c_bus0	Module name.
Bus Timeout	Value must be a non-negative integer less than or equal to 0xFFFFFFFF	0xFFFFFFFF	Set timeout for locking bus in using RTOS.
Semaphore for Blocking (RTOS only)	• Unuse • Use	Use	Set Semaphore for blocking in using RTOS.
Recursive Mutex for Bus (RTOS only)	• Unuse • Use	Use	Set Mutex for locking bus in using RTOS.
Channel	Manual Entry	0	IIC channel
Rate	• Standard • Fast-mode • Fast-mode plus	Standard	Transfer rate for lower level driver.

Configurations for Connectivity > I2C Communication Device (rm_comms_i2c)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Communication Device (rm_comms_i2c).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_comms_i2c_device0	Module name.
Semaphore Timeout (RTOS only)	Value must be a non-negative integer less than or equal to 0xFFFFFFFF	0xFFFFFFFF	Set timeout for blocking in using RTOS.
Slave Address	Value must be non-negative	0x00	Specify the slave address.
Address Mode	• 7-Bit • 10-Bit	7-Bit	Select the I2C address mode.
Callback	Name must be a valid C symbol	comms_i2c_callback	A user callback function can be provided.

Pin Configuration

This module uses SDA and SCL pins of I2C Master, SCI I2C, IICA Master and SAU I2C.

Usage Notes

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.
  If an RTOS is used and blocking and bus lock is enabled, RM_COMMS_I2C_Write(), RM_COMMS_I2C_Read() and RM_COMMS_I2C_WriteRead() cannot be called in callback.

Bus Initialization

The I2C communications interface expects a bus instance to be opened before opening any specific I2C comms device. The communications interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Examples

Basic Example

This is a basic example of minimal use of I2C communications implementation in an application.

```
void rm_comms_i2c_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend          =
(rm_comms_i2c_bus_extended_cfg_t *) g_comms_i2c_cfg.p_extend;
 i2c_master_instance_t          * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
#if BSP_CFG_RTOS
 /* Create a semaphore for blocking if a semaphore is not NULL */
 if (NULL != p_extend->p_blocking_semaphore)
    {
 #if BSP_CFG_RTOS == 1 // AzureOS
       tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
                           p_extend->p_blocking_semaphore->p_semaphore_name,
                           (ULONG) 0);
```

```
 #elif BSP_CFG_RTOS == 2 // FreeRTOS
       *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
            xSemaphoreCreateCountingStatic((UBaseType_t) 1,
                                           (UBaseType_t) 0,

p_extend->p_blocking_semaphore->p_semaphore_memory);
 #endif
    }
 /* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
 if (NULL != p_extend->p_bus_recursive_mutex)
    {
 #if BSP_CFG_RTOS == 1 // AzureOS
       tx_mutex_create(p_extend->p_bus_recursive_mutex->p_mutex_handle,
                       p_extend->p_bus_recursive_mutex->p_mutex_name,
                       TX_INHERIT);
 #elif BSP_CFG_RTOS == 2 // FreeRTOS
       *(p_extend->p_bus_recursive_mutex->p_mutex_handle) =
            xSemaphoreCreateRecursiveMutexStatic(p_extend->p_bus_recursive_mutex->p_m
utex_memory);
 #endif
    }
#endif
    err = RM_COMMS_I2C_Open(&g_comms_i2c_ctrl, &g_comms_i2c_cfg);
 /* Handle any errors. This function should be defined by the user. */
    handle_error(err);
 while (true)
    {
       g_flag = 0;
 /* Send data to an I2C device. */
 RM_COMMS_I2C_Write(&g_comms_i2c_ctrl, &write_data, 1);
 while (0 == g_flag)
      {
 /* Wait callback */
      }
```

```
      g_flag = 0;
 /* Receive data from an I2C device. */
 RM_COMMS_I2C_Read(&g_comms_i2c_ctrl, &read_data, 1);
 while (0 == g_flag)
     {
 /* Wait callback */
     }
   }
}
```

Data Structures

struct	rm_comms_i2c_instance_ctrl_t

Data Structure Documentation

◆ rm_comms_i2c_instance_ctrl_t

struct rm_comms_i2c_instance_ctrl_t	
Communications middleware control structure.	
Data Fields	
rm_comms_cfg_t const *	p_cfg
	middleware configuration.
rm_comms_i2c_bus_extended_cfg_t *	p_bus
	Bus using this device;.
void *	p_lower_level_cfg
	Used to reconfigure I2C driver.
uint32_t	open
	Open flag.
uint32_t	transfer_data_bytes

	Size of transfer data.
uint8_t *	p_transfer_data
	Pointer to transfer data buffer.
bool	smbus_operation
	SMBus operation on I2C bus.
void const *	p_context
	Pointer to the user-provided context.

Function Documentation

◆ RM_COMMS_I2C_Open()

fsp_err_t RM_COMMS_I2C_Open (rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_cfg_t const *const *p_cfg*)

Opens and configures the Communications Middle module. Implements rm_comms_api_t::open.

Example:

```
    err = RM_COMMS_I2C_Open(&g_comms_i2c_ctrl, &g_comms_i2c_cfg);
```

Return values

FSP_SUCCESS	Communications Middle module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_COMMS_BUS_NOT_OPEN	I2C driver is not open.

◆ RM_COMMS_I2C_Close()

fsp_err_t RM_COMMS_I2C_Close (rm_comms_ctrl_t *const *p_api_ctrl*)

Disables specified Communications Middle module. Implements rm_comms_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_COMMS_I2C_Read()

fsp_err_t RM_COMMS_I2C_Read (rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Performs a read from the I2C device. Implements rm_comms_api_t::read.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_COMMS_I2C_Write()

fsp_err_t RM_COMMS_I2C_Write (rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*)

Performs a write from the I2C device. Implements rm_comms_api_t::write.

Return values

FSP_SUCCESS	Successfully writing data .
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_COMMS_I2C_WriteRead()

fsp_err_t RM_COMMS_I2C_WriteRead (rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_write_read_params_t const *write_read_params*)

Performs a write to, then a read from the I2C device. Implements rm_comms_api_t::writeRead.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

I2C Driver for the IIC/I3C peripheral on RA MCUs. This module implements the I2C Master Interface.

Overview

The I2C master on IIC/I3C HAL module supports transactions with an I2C Slave device. Callbacks must be provided which are invoked when a transmit or receive operation has completed. The callback argument will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100-kHz transaction rate.
  - Fast Mode Support with up to 400-kHz transaction rate.
  - Fast Mode Plus Support with up to 1-MHz transaction rate.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
  - Optional (build time) DTC support for read and write respectively.
  - Optional (build time) support for 10-bit slave addressing.

Configuration

Build Time Configurations for r_iic_b_master

The following build time configurations are defined in fsp_cfg/r_iic_b_master_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
DTC on Transmission and Reception	• Enabled • Disabled	Disabled	If enabled, DTC instances will be included in the build for both transmission and reception.
10-bit slave addressing	• Enabled • Disabled	Disabled	If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode.

Configurations for Connectivity > I2C Master (r_iic_b_master)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r_iic_b_master). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description

Name	Name must be a valid C symbol	g_i2c_master0	Module name.
Channel	Value must be a non-negative integer	0	Specify the IIC channel.
Rate	• Standard • Fast-mode • Fast-mode plus	Standard	Select the transfer rate. If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate and duty cycle are printed in a comment in the generated iic_b_master_extended_cfg_t structure.
Custom Rate (bps)	Value must be a non-negative integer	0	Set a custom bitrate (bps). Set to 0 to use the maximum bitrate for the selected mode. Standard-mode: up to 100000; Fast-mode: up to 400000; Fast-mode plus: up to 1000000
Rise Time (ns)	Value must be a non-negative integer	120	Set the rise time (tr) in nanoseconds.
Fall Time (ns)	Value must be a non-negative integer	120	Set the fall time (tf) in nanoseconds.
Duty Cycle (%)	Value must be an integer between 0 and 100	50	Set the SCL duty cycle.
Slave Address	Value must be non-negative	0x00	Specify the slave address.
Address Mode	• 7-Bit • 10-Bit	7-Bit	Select the slave address mode. Ensure 10-bit slave addressing is enabled in the configuration to use 10-Bit setting here.
Timeout Mode	• Short Mode • Long Mode	Short Mode	Select the timeout mode to detect bus hang.

Timeout during SCL Low	• Enabled • Disabled	Enabled	Select if the timeout can occur when SCL is held low for a duration longer than what is set in the timeout mode.
Callback	Name must be a valid C symbol	g_iic_b_master0_callback	A user callback function must be provided. This will be called from the interrupt service routine (ISR) upon IIC transaction completion reporting the transaction status.
Interrupt Priority Level	MCU Specific Options		Select the interrupt priority level. This is set for TXI, RXI, TEI and ERI interrupts.

Clock Configuration

The I3C peripheral module uses the IICCLK or PCLKD (based on the MCU) as its clock source for the bus clock. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the clocks are configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

Pin Configuration

The I3C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Interrupt Configuration

- The IIC error (EEI), receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.
- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to different priority levels could result in improper operation.

IIC Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate.

  When the Custom Rate setting is set to 0 the bitrate is fixed to the maximum values shown below. Otherwise, the supplied value is used to generate bitrate settings.

  - Standard-mode (Sm) : up to 100 kbps
  - Fast-mode (Fm) : up to 400 kbps
  - Fast-mode Plus (Fm+) : up to 1 Mbps

- The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current IICCLK/PCLKD (based on the MCU) settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

Enabling DTC with the IIC

- DTC transfer support is configurable and is disabled from the build by default. IIC driver provides two DTC instances for transmission and reception respectively. The DTC instances can be enabled individually during configuration.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer Transfer (r_dtc)

Multiple Devices on the Bus

- A single IIC instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

Multi-Master Support

- If multiple masters are connected on the same bus, the I2C Master is capable of detecting bus busy state before initiating the communication.

Restart

- IIC master can hold the the bus after an I2C transaction by issuing a repeated start condition.

Examples

Basic Example

This is a basic example of minimal use of the r_iic_master in an application. This example shows how this driver can be used for basic read and write operations.

```
iic_b_master_instance_ctrl_t g_i2c_device_ctrl_1;
i2c_master_cfg_t g_i2c_device_cfg_1 =
{
    .channel       = I2C_CHANNEL,
    .rate          = I2C_MASTER_RATE_FAST,
    .slave         = I2C_SLAVE_EEPROM,
    .addr_mode    = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback    = i2c_callback,    // Callback
    .p_context    = &g_i2c_device_ctrl_1,
    .p_transfer_tx = NULL,
```

```
    .p_transfer_rx = NULL,
    .p_extend      = &g_iic_b_master_cfg_extend
};
void i2c_callback (i2c_master_callback_args_t * p_args)
{
    g_i2c_callback_event = p_args->event;
}
void basic_example (void)
{
 fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
 /* Initialize the IIC module */
    err = R_IIC_B_MASTER_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Write some data to the transmit buffer */
 for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
    {
       g_i2c_tx_buffer[i] = (uint8_t) i;
    }
 /* Send data to I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_IIC_B_MASTER_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
```

```
      __BKPT(0);
   }
 /* Read data back from the I2C slave */
   g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
   timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;
   err = R_IIC_B_MASTER_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
   assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/

}
```

Multiple Slave devices on the same channel (bus)

This example demonstrates how a single IIC driver can be used to communicate with different slave devices which are on the same channel.

Note

The callback function from the first example applies to this example as well.

```
iic_b_master_instance_ctrl_t g_i2c_device_ctrl_2;
i2c_master_cfg_t g_i2c_device_cfg_2 =
{
   .channel       = I2C_CHANNEL,
```

```
    .rate          = I2C_MASTER_RATE_STANDARD,
    .slave         = I2C_SLAVE_TEMP_SENSOR,
    .addr_mode    = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback    = i2c_callback,    // Callback
    .p_context    = &g_i2c_device_ctrl_2,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend      = &g_iic_b_master_cfg_extend
};
void single_channel_multi_slave (void)
{
 fsp_err_t err;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    err = R_IIC_B_MASTER_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Clear the recieve buffer */
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);
 /* Read data from I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_IIC_B_MASTER_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
 /* Send data to I2C slave on the same channel */
    err = R_IIC_B_MASTER_SlaveAddressSet(&g_i2c_device_ctrl_2,
```

```
I2C_SLAVE_DISPLAY_ADAPTER, I2C_MASTER_ADDR_MODE_7BIT);
    assert(FSP_SUCCESS == err);
    g_i2c_tx_buffer[0]   = 0xAA;       // NOLINT
    g_i2c_tx_buffer[1]   = 0xBB;       // NOLINT
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;
    err = R_IIC_B_MASTER_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
    assert(FSP_SUCCESS == err);
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
}
```

Function Documentation

◆ R_IIC_B_MASTER_Open()

fsp_err_t R_IIC_B_MASTER_Open (i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_cfg_t const *const *p_cfg*)

Opens the I2C device.

Return values

FSP_SUCCESS	Requested clock rate was set exactly.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel is not available on this MCU.
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Set the rate to fast mode plus on a channel which does not support it. 5. Invalid IRQ number assigned

◆ R_IIC_B_MASTER_Read()

fsp_err_t R_IIC_B_MASTER_Read (i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*, bool const *restart*)

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl, p_dest or bytes is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_IN_USE	Bus busy condition. Another transfer was in progress.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block.

◆ R_IIC_B_MASTER_Write()

fsp_err_t R_IIC_B_MASTER_Write (i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*, bool const *restart*)

Performs a write to the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_TX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl or p_src is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_IN_USE	Bus busy condition. Another transfer was in progress.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block.

◆ R_IIC_B_MASTER_Abort()

fsp_err_t R_IIC_B_MASTER_Abort (i2c_master_ctrl_t *const *p_api_ctrl*)

Safely aborts any in-progress transfer and forces the IIC peripheral into ready state.

Return values

FSP_SUCCESS	Channel was reset successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block.

Note

A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.

◆ R_IIC_B_MASTER_SlaveAddressSet()

fsp_err_t R_IIC_B_MASTER_SlaveAddressSet (i2c_master_ctrl_t *const *p_api_ctrl*, uint32_t const *slave*, i2c_master_addr_mode_t const *addr_mode*)

Sets address and addressing mode of the slave device. This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

Return values

FSP_SUCCESS	Address of the slave is set correctly.
FSP_ERR_ASSERTION	Pointer to control structure is NULL.
FSP_ERR_IN_USE	Another transfer was in-progress.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block.

◆ R_IIC_B_MASTER_CallbackSet()

fsp_err_t R_IIC_B_MASTER_CallbackSet (i2c_master_ctrl_t *const *p_api_ctrl*, void(*)(i2c_master_callback_args_t *) *p_callback*, void const *const *p_context*, i2c_master_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements i2c_master_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_IIC_B_MASTER_StatusGet()

fsp_err_t R_IIC_B_MASTER_StatusGet (i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_status_t * *p_status*)

Provides driver status.

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.

◆ R_IIC_B_MASTER_Close()

fsp_err_t R_IIC_B_MASTER_Close (i2c_master_ctrl_t *const *p_api_ctrl*)

Closes the I2C device. May power down IIC peripheral. This function will safely terminate any in-progress I2C transfers.

Return values

FSP_SUCCESS	Device closed without issue.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block.

Note

A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.

fsp_err_t	R_IIC_MASTER_Close (i2c_master_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the IIC peripheral on RA MCUs. This module implements the I2C Master Interface.

Overview

The I2C master on IIC HAL module supports transactions with an I2C Slave device. Callbacks must be provided which are invoked when a transmit or receive operation has completed. The callback argument will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100-kHz transaction rate.
  - Fast Mode Support with up to 400-kHz transaction rate.
  - Fast Mode Plus Support with up to 1-MHz transaction rate.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
  - Optional (build time) DTC support for read and write respectively.
  - Optional (build time) support for 10-bit slave addressing.

Configuration

Build Time Configurations for r_iic_master

The following build time configurations are defined in fsp_cfg/r_iic_master_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
DTC on Transmission and Reception	• Enabled • Disabled	Disabled	If enabled, DTC instances will be included in the build for both transmission and reception.
10-bit slave addressing	• Enabled • Disabled	Disabled	If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode.

Configurations for Connectivity > I2C Master (r_iic_master)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r_iic_master). Non-secure callable guard functions can be generated for this module by right clicking

the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_i2c_master0	Module name.
Channel	Value must be a non-negative integer	0	Specify the IIC channel.
Rate	• Standard • Fast-mode • Fast-mode plus	Standard	Select the transfer rate. If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate and duty cycle are printed in a comment in the generated iic_master_extended_cfg_t structure.
Custom Rate (bps)	Value must be a non-negative integer	0	Set a custom bitrate (bps). Set to 0 to use the maximum bitrate for the selected mode. Standard-mode: up to 100000; Fast-mode: up to 400000; Fast-mode plus: up to 1000000
Rise Time (ns)	Value must be a non-negative integer	120	Set the rise time (tr) in nanoseconds.
Fall Time (ns)	Value must be a non-negative integer	120	Set the fall time (tf) in nanoseconds.
Duty Cycle (%)	Value must be an integer between 0 and 100	50	Set the SCL duty cycle.
Slave Address	Value must be non-negative	0x00	Specify the slave address.
Address Mode	• 7-Bit • 10-Bit	7-Bit	Select the slave address mode. Ensure 10-bit slave addressing is enabled in the configuration to use 10-Bit setting here.

Timeout Mode	• Short Mode • Long Mode	Short Mode	Select the timeout mode to detect bus hang.
Timeout during SCL Low	• Enabled • Disabled	Enabled	Select if the timeout can occur when SCL is held low for a duration longer than what is set in the timeout mode.
Callback	Name must be a valid C symbol	NULL	A user callback function must be provided. This will be called from the interrupt service routine (ISR) upon IIC transaction completion reporting the transaction status.
Interrupt Priority Level	MCU Specific Options		Select the interrupt priority level. This is set for TXI, RXI, TEI and ERI interrupts.

Clock Configuration

The IIC peripheral module uses the PCLKB as its clock source. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the PCLKB is configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

Pin Configuration

The IIC peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Interrupt Configuration

- The IIC error (EEI), receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.
- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to different priority levels could result in improper operation.

IIC Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate.

  When the Custom Rate setting is set to 0 the bitrate is fixed to the maximum values shown below. Otherwise, the supplied value is used to generate bitrate settings.

  - Standard-mode (Sm) : up to 100 kbps

    - Fast-mode (Fm) : up to 400 kbps
    - Fast-mode Plus (Fm+) : up to 1 Mbps
- The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLKB settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

Enabling DTC with the IIC

- DTC transfer support is configurable and is disabled from the build by default. IIC driver provides two DTC instances for transmission and reception respectively. The DTC instances can be enabled individually during configuration.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer Transfer (r_dtc)

Multiple Devices on the Bus

- A single IIC instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

Multi-Master Support

- If multiple masters are connected on the same bus, the I2C Master is capable of detecting bus busy state before initiating the communication.

Restart

- IIC master can hold the the bus after an I2C transaction by issuing a repeated start condition.

Examples

Basic Example

This is a basic example of minimal use of the r_iic_master in an application. This example shows how this driver can be used for basic read and write operations.

```
iic_master_instance_ctrl_t g_i2c_device_ctrl_1;
i2c_master_cfg_t g_i2c_device_cfg_1 =
{
    .channel       = I2C_CHANNEL,
    .rate          = I2C_MASTER_RATE_FAST,
    .slave         = I2C_SLAVE_EEPROM,
    .addr_mode    = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback    = i2c_callback,    // Callback
    .p_context    = &g_i2c_device_ctrl_1,
```

```
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend      = &g_iic_master_cfg_extend
};
void i2c_callback (i2c_master_callback_args_t * p_args)
{
    g_i2c_callback_event = p_args->event;
}
void basic_example (void)
{
 fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
 /* Initialize the IIC module */
    err = R_IIC_MASTER_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Write some data to the transmit buffer */
 for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
    {
       g_i2c_tx_buffer[i] = (uint8_t) i;
    }
 /* Send data to I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_IIC_MASTER_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
```

```
    {
        __BKPT(0);
    }
 /* Read data back from the I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;
    err = R_IIC_MASTER_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }
 /* Verify the read data */
 if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
    {
        __BKPT(0);
    }
}
```

Multiple Slave devices on the same channel (bus)

This example demonstrates how a single IIC driver can be used to communicate with different slave devices which are on the same channel.

Note

The callback function from the first example applies to this example as well.

```
iic_master_instance_ctrl_t g_i2c_device_ctrl_2;
i2c_master_cfg_t g_i2c_device_cfg_2 =
{
```

```
    .channel       = I2C_CHANNEL,
    .rate          = I2C_MASTER_RATE_STANDARD,
    .slave         = I2C_SLAVE_TEMP_SENSOR,
    .addr_mode    = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback    = i2c_callback,    // Callback
    .p_context    = &g_i2c_device_ctrl_2,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend      = &g_iic_master_cfg_extend
};
void single_channel_multi_slave (void)
{
 fsp_err_t err;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    err = R_IIC_MASTER_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Clear the recieve buffer */
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);
 /* Read data from I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_IIC_MASTER_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
 /* Send data to I2C slave on the same channel */
```

```
    err = R_IIC_MASTER_SlaveAddressSet(&g_i2c_device_ctrl_2,
I2C_SLAVE_DISPLAY_ADAPTER, I2C_MASTER_ADDR_MODE_7BIT);
    assert(FSP_SUCCESS == err);
    g_i2c_tx_buffer[0]   = 0xAA;       // NOLINT
    g_i2c_tx_buffer[1]   = 0xBB;       // NOLINT
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms           = I2C_TRANSACTION_BUSY_DELAY;
    err = R_IIC_MASTER_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
    assert(FSP_SUCCESS == err);
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
}
```

uint8_t	brl_value	Low-level period of SCL clock.
uint8_t	sddl_value	
bool	dlcs_value	

◆ iic_master_instance_ctrl_t

struct iic_master_instance_ctrl_t
I2C control structure. DO NOT INITIALIZE.

◆ iic_master_extended_cfg_t

struct iic_master_extended_cfg_t		
R_IIC extended configuration		
Data Fields		
iic_master_timeout_mode_t	timeout_mode	Timeout Detection Time Select: Long Mode = 0 and Short Mode = 1.
iic_master_timeout_scl_low_t	timeout_scl_low	Allows timeouts to occur when SCL is held low.
iic_master_clock_settings_t	clock_settings	I2C Clock settings.
bool	smbus_operation	SMBus operation on I2C bus.

Enumeration Type Documentation

◆ iic_master_timeout_mode_t

enum iic_master_timeout_mode_t	
I2C Timeout mode parameter definition	
Enumerator	
IIC_MASTER_TIMEOUT_MODE_LONG	Timeout Detection Time Select: Long Mode -> TMOS = 0.
IIC_MASTER_TIMEOUT_MODE_SHORT	Timeout Detection Time Select: Short Mode -> TMOS = 1.

◆ iic_master_timeout_scl_low_t

enum iic_master_timeout_scl_low_t	
Enumerator	
IIC_MASTER_TIMEOUT_SCL_LOW_DISABLED	Timeout detection during SCL low disabled.
IIC_MASTER_TIMEOUT_SCL_LOW_ENABLED	Timeout detection during SCL low enabled.

Function Documentation

◆ R_IIC_MASTER_Open()

fsp_err_t R_IIC_MASTER_Open (i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_cfg_t const *const *p_cfg*)

Opens the I2C device.

Return values

FSP_SUCCESS	Requested clock rate was set exactly.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel is not available on this MCU.
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Set the rate to fast mode plus on a channel which does not support it. 5. Invalid IRQ number assigned

◆ R_IIC_MASTER_Read()

fsp_err_t R_IIC_MASTER_Read (i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*, bool const *restart*)

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl, p_dest or bytes is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_IN_USE	Bus busy condition. Another transfer was in progress.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block.

◆ R_IIC_MASTER_Write()

fsp_err_t R_IIC_MASTER_Write (i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*, bool const *restart*)

Performs a write to the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_TX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl or p_src is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_IN_USE	Bus busy condition. Another transfer was in progress.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block.

◆ R_IIC_MASTER_Abort()

fsp_err_t R_IIC_MASTER_Abort (i2c_master_ctrl_t *const *p_api_ctrl*)

Safely aborts any in-progress transfer and forces the IIC peripheral into ready state.

Return values

FSP_SUCCESS	Channel was reset successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block.

Note

A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.

◆ R_IIC_MASTER_SlaveAddressSet()

fsp_err_t R_IIC_MASTER_SlaveAddressSet (i2c_master_ctrl_t *const *p_api_ctrl*, uint32_t const *slave*, i2c_master_addr_mode_t const *addr_mode*)

Sets address and addressing mode of the slave device. This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

Return values

FSP_SUCCESS	Address of the slave is set correctly.
FSP_ERR_ASSERTION	Pointer to control structure is NULL.
FSP_ERR_IN_USE	Another transfer was in-progress.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block.

◆ R_IIC_MASTER_CallbackSet()

fsp_err_t R_IIC_MASTER_CallbackSet (i2c_master_ctrl_t *const *p_api_ctrl*, void(*)(i2c_master_callback_args_t *) *p_callback*, void const *const *p_context*, i2c_master_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements i2c_master_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_IIC_MASTER_StatusGet()

fsp_err_t R_IIC_MASTER_StatusGet (i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_status_t * *p_status*)

Provides driver status.

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.

◆ R_IIC_MASTER_Close()

fsp_err_t R_IIC_MASTER_Close (i2c_master_ctrl_t *const *p_api_ctrl*)
Closes the I2C device. May power down IIC peripheral. This function will safely terminate any in-progress I2C transfers.

Return values

FSP_SUCCESS	Device closed without issue.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block.

Note

A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.

fsp_err_t	R_IICA_MASTER_Close (i2c_master_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the IICA peripheral on RA MCUs. This module implements the I2C Master Interface.

Overview

The IICA master on IICA HAL module supports transactions with an IICA slave device. Callbacks must be provided which are invoked when a transmit or receive operation has completed. The callback argument will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100-kHz transaction rate.
  - Fast Mode Support with up to 400-kHz transaction rate.
  - Fast Mode Plus Support with up to 1-MHz transaction rate.
- IICA Master Read from a slave device.
- IICA Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.

Configuration

Build Time Configurations for r_iica_master

The following build time configurations are defined in fsp_cfg/r_iica_master_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
10-bit slave addressing	• Enabled • Disabled	Disabled	If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode.

Configurations for Connectivity > IICA Master (r_iica_master)

This module can be added to the Stacks tab via New Stack > Connectivity > IICA Master (r_iica_master).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_iica_master0	Module name.
Rate	• Standard • Fast-mode • Fast-mode plus	Standard	Select the transfer rate.

			If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate is printed in a comment in the generated iica_master_extended_cfg_t structure.
Signal Rising Time (us)	Must be a valid value	0	Set the SDA and SCL signal rising time in micro-seconds.
Signal Falling Time (us)	Must be a valid value	0	Set the SDA and SCL signal falling time in micro-seconds.
Duty Cycle (%)	Value must be an integer between 0 and 100	53	Set SCL high duty cycle.
Digital Filter	• Enabled • Disabled	Disabled	Configure digital filter.
Address Mode	• 7-Bit • 10-Bit	7-Bit	Select the slave address mode. Ensure 10-bit slave addressing is enabled in the configuration to use 10-Bit setting here.
Slave Address	Value must be a non-negative integer	0x00	Specify the slave address.
Communication reservation	• Enabled • Disabled	Disabled	Configure Communication Reservation.
Callback	Name must be a valid C symbol	iica_master_callback	A user callback function must be provided. This will be called from the interrupt service routine (ISR) upon IICA transaction completion reporting the transaction status.
IICA0 communication interrupt priority	MCU Specific Options		Select end of IICA0 communication interrupt priority.
SCLA Pin	• Disabled	Disabled	Specify SCLA pin

	• P100 • P110 • P212 • P914		setting for the MCU.
SDAA Pin	• Disabled • P101 • P109 • P213 • P913	Disabled	Specify SDAA pin setting for the MCU.

Clock Configuration

The IICA peripheral module uses the PCLKB as its clock source. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the PCLKB is configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

Pin Configuration

The IICA peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An IICA channel would consist of two pins - SDAA and SCLA for data/address and clock respectively.

Usage Notes

IICA Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLKB settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

Multiple Devices on the Bus

- A single IICA instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

Multi-Master Support

- If multiple masters are connected on the same bus, the I2C Master is capable of detecting bus busy state before initiating the communication.

Restart

- IICA master can hold the bus after an I2C transaction by issuing a repeated start condition.This will mimic a stop followed by start condition.

Limitations

- DTC not supported.
- Interrupt request is always generated on the falling edge of the 9th clock cycle.
- Master operation in multi-master system is not supported
- Please configure SDAA and SCLA pins in the IICA module. IICA pins must be set after IICA is enabled.
- Custom bitrate is not yet supported for IICA.

Examples

Basic Example

This is a basic example of minimal use of the r_iica_master in an application. This example shows how this driver can be used for basic read and write operations.

```
iica_master_instance_ctrl_t g_i2c_device_ctrl_1;
i2c_master_cfg_t g_i2c_device_cfg_1 =
{
    .channel       = I2C_CHANNEL,
    .rate          = I2C_MASTER_RATE_FAST,
    .slave         = I2C_SLAVE_EEPROM,
    .p_callback    = iica_master_callback, // Callback
    .p_context    = &g_i2c_device_ctrl_1,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend      = &g_iic_master_cfg_extend
};
void iica_master_callback (i2c_master_callback_args_t * p_args)
{
    g_i2c_callback_event = p_args->event;
}
void basic_example (void)
{
 fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
 /* Initialize the IIC module */
    err = R_IICA_MASTER_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Write some data to the transmit buffer */
 for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
    {
       g_i2c_tx_buffer[i] = (uint8_t) i;
```

```
    }
 /* Send data to I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_IICA_MASTER_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
 /* Read data back from the I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;
    err = R_IICA_MASTER_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
 /* Verify the read data */
 if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
```

```
    {
       __BKPT(0);
    }
}
```

Multiple Slave devices on the same channel (bus)

This example demonstrates how a single IICA driver can be used to communicate with different slave devices which are on the same channel.

Note

The callback function from the first example applies to this example as well.

```
iica_master_instance_ctrl_t g_i2c_device_ctrl_2;
i2c_master_cfg_t g_i2c_device_cfg_2 =
{
    .channel       = I2C_CHANNEL,
    .rate          = I2C_MASTER_RATE_STANDARD,
    .slave         = I2C_SLAVE_TEMP_SENSOR,
    .p_callback    = iica_master_callback, // Callback
    .p_context    = &g_i2c_device_ctrl_2,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend      = &g_iic_master_cfg_extend
};
void single_channel_multi_slave (void)
{
 fsp_err_t err;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    err = R_IICA_MASTER_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Clear the recieve buffer */
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);
 /* Read data from I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_IICA_MASTER_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
```

```
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
 /* Send data to I2C slave on the same channel */
    err = R_IICA_MASTER_SlaveAddressSet(&g_i2c_device_ctrl_2,
I2C_SLAVE_DISPLAY_ADAPTER, I2C_MASTER_ADDR_MODE_7BIT);
    assert(FSP_SUCCESS == err);
    g_i2c_tx_buffer[0]   = 0xAA;       // NOLINT
    g_i2c_tx_buffer[1]   = 0xBB;       // NOLINT
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms           = I2C_TRANSACTION_BUSY_DELAY;
    err = R_IICA_MASTER_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
    assert(FSP_SUCCESS == err);
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
}
```

◆ iica_master_comm_rez_t

enum iica_master_comm_rez_t
IICA communication reservation parameter definition

Function Documentation

◆ R_IICA_MASTER_Open()

fsp_err_t R_IICA_MASTER_Open (i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_cfg_t const *const *p_cfg*)
Opens the IICA device. **Return values** FSP_SUCCESS — Requested clock rate was set exactly. FSP_ERR_ALREADY_OPEN — Module is already open. FSP_ERR_IP_CHANNEL_NOT_PRESENT — Channel is not available on this MCU. FSP_ERR_ASSERTION — Parameter check failure due to one or more reasons below: 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Invalid IRQ number assigned

◆ R_IICA_MASTER_Read()

fsp_err_t R_IICA_MASTER_Read (i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*, bool const *restart*)

Performs a read from the IICA device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl, p_dest or bytes is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) for data transfer.
FSP_ERR_IN_USE	Bus busy condition. Another transfer was in progress.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IICA_MASTER_Open to initialize the control block.

◆ R_IICA_MASTER_Write()

fsp_err_t R_IICA_MASTER_Write (i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*, bool const *restart*)

Performs a write to the IICA device. The caller will be notifieEd when the operation has completed (successfully) by an I2C_MASTER_EVENT_TX_COMPLET in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl or p_src is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) for data transfer.
FSP_ERR_IN_USE	Bus busy condition. Another transfer was in progress.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IICA_MASTER_Open to initialize the control block.

◆ R_IICA_MASTER_Abort()

fsp_err_t R_IICA_MASTER_Abort (i2c_master_ctrl_t *const *p_api_ctrl*)

Safely aborts any in-progress transfer and forces the IICA peripheral into ready state.

Return values

FSP_SUCCESS	Channel was reset successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IICA_MASTER_Open to initialize the control block.

Note

A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.

◆ R_IICA_MASTER_SlaveAddressSet()

fsp_err_t R_IICA_MASTER_SlaveAddressSet (i2c_master_ctrl_t *const *p_api_ctrl*, uint32_t const *slave*, i2c_master_addr_mode_t const *addr_mode*)

Sets address and addressing mode of the slave device. This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

Return values

FSP_SUCCESS	Address of the slave is set correctly.
FSP_ERR_ASSERTION	Pointer to control structure is NULL.
FSP_ERR_IN_USE	Another transfer was in-progress.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IICA_MASTER_Open to initialize the control block.

◆ R_IICA_MASTER_CallbackSet()

fsp_err_t R_IICA_MASTER_CallbackSet (i2c_master_ctrl_t *const *p_api_ctrl*, void(*)(i2c_master_callback_args_t *) *p_callback*, void const *const *p_context*, i2c_master_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements i2c_master_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ R_IICA_MASTER_StatusGet()

fsp_err_t R_IICA_MASTER_StatusGet (i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_status_t * *p_status*)

Provides driver status.

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.

◆ R_IICA_MASTER_Close()

fsp_err_t R_IICA_MASTER_Close (i2c_master_ctrl_t *const *p_api_ctrl*)

Closes the IICA device. May power down IICA peripheral. This function will safely terminate any in-progress IICA transfers.

Return values

FSP_SUCCESS	Device closed without issue.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IICA_MASTER_Open to initialize the control block.

Note

A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.

fsp_err_t	R_SAU_I2C_Stop (sau_i2c_instance_ctrl_t *const p_ctrl)

Detailed Description

Driver for the SAU peripheral on RA MCUs. This module implements the I2C Master Interface.

Overview

The Simple I2C master on SAU HAL module supports transactions with an I2C Slave device. Callbacks must be provided which would be invoked when a transmission or receive has been completed. The callback arguments will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100 kHz transaction rate.
  - Fast Mode Support with up to 400 kHz transaction rate.
  - Fast Mode Plus Support with up to 1-MHz transaction rate.
- I2C Master Read from a slave device.

- I2C Master Write to a slave device.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
    - Optional (build time) DTC support for read and write respectively.

Configuration

Build Time Configurations for r_sau_i2c

The following build time configurations are defined in fsp_cfg/r_sau_i2c_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Enable Critical Section	• Enabled • Disabled	Disabled	Critical section needs to be enabled if multiple channels on the same SAU unit are configured for I2C
Manual Start-Stop	• Enabled • Disabled	Disabled	If enabled, users need to manually call the R_SAU_I2C_Start/R_SAU_I2C_Stop functions to generate the I2C start and stop conditions.
Enable Single Channel	• 00 • 20 • 11 • Disabled	Disabled	Enable single channel to reduce code size if only one channel (00, 11, or 20) is to be configured for SAU I2C.
I2C Restart	• Enable • Disable	Enable	Select whether to include code for the I2C restart (repeated start) condition in the build. Set to 'Disable' to reduce code size when all I2C slaves used by all SAU instances do not use I2C restart.
DTC Support	• Enable • Disable	Disable	Enable DTC support for the SAU I2C module.

Configurations for Connectivity > I2C Master (r_sau_i2c)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r_sau_i2c).

Configuration	Options	Default	Description

General

Name	Name must be a valid C symbol	g_i2c0	Module name.
Channel	MCU Specific Options		Select the SAU channel.
Operation clock	• CK0 • CK1	CK0	Select the I2C operation clock. Use the Clocks tab to set the operation clock divider.
Slave Address	Value must be a non-negative integer	0x00	Specify the slave address.
Rate	• Standard • Fast mode • Fast mode plus	Standard	Select the I2C data rate. If the requested rate cannot be achieved, adjust the operation clock frequency until the rate is achievable. The calculated rate is printed in a comment in the generated sau_i2c_extended_cfg_t structure.
Delay time (Microseconds)	Value must be a non-negative integer	5	Hold SDA (or SCK) for delay time to meet the I2C start (or stop) condition. Needs to be specified according to slave devices.
Callback	Name must be a valid C symbol	sau_i2c_master_callback	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Transfer end interrupt priority	MCU Specific Options		Select transfer end interrupt priority. This is set for TEI interrupt.
Custom Rate (bps)	Value must be a non-negative integer	0	Set a custom bitrate (bps). Set to 0 to use the maximum bitrate for the selected mode. Standard-mode: up to 100000; Fast-mode: up

to 400000; Fast-mode plus: up to 1000000

Clock Configuration

The SAU clock uses the system clock (ICLK) as its clock source.

A prescaler is applied to the ICLK in order to produce the operation clock frequency. The operation clock is used to generate the desired transfer period of the SAU module.

SAU operation clocks are shared among all channels within a SAU unit. Check the Hardware User's Manual for your MCU for available units and channels. SAU operation clock dividers are configurable in the Clocks tab.

The operation clock dividers are named SAU CKmn where m is the SAU unit, and n is the operation clock. For example, SAU CK01 applies to all SAU0 instances using CK1 as the operation clock (m=0, n=1).

Pin Configuration

The SAU I2C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Enabling Single Channel By User With The SAU I2C

- The Common > Single Channel property is used for reducing code size when only 1 SAU channel is to be configured for SAU I2C.
- Single Channel is configurable and disabled by default in the driver code.
- Note: Not all SAU channels are available on all pin layouts. Check the Hardware User Manual for your device to confirm available function assignment for each SAU channel.

Enabling Start/Stop Condition By User With The SAU I2C

- Manual triggering of I2C start/stop conditions is configurable and disabled by default.
- The delay time between the rising edge of SCL and the rising edge of SDA (stop condition) or the falling edge of SDA and the falling edge of SCL (start condition) is blocking. If blocking in the ISR for the length of the delay time is not suitable for the application, users can decide the appropriate calling time for start/stop conditions by enabling manual triggering and calling R_SAU_I2C_Start/R_SAU_I2C_Stop from the application context.
- When manual triggering is disabled, the driver will generate the stop condition after data transmission from the ISR context.

Interrupt Configuration

- Transmit end interrupt (TEI) for the selected channel used must be enabled in the properties of the selected device.

SAU I2C Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate and operating clock.

When the Custom Rate setting is set to 0 the bitrate is fixed to the maximum values shown below. Otherwise, the supplied value is used to generate bitrate settings.

    - Standard-mode (Sm) : up to 100 kbps
    - Fast-mode (Fm) : up to 400 kbps
    - Fast-mode Plus (Fm+) : up to 1 Mbps
- The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLK settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

Selecting Operation Clock Frequency

The relationship between operation clock frequency and bitrate is: bitrate = f_mck / [2 * (SDRmn.STCLK + 1)] where:

- SDRmn.STCLK is an integer in the range [1, 127] for SAU I2C
- f_mck is the operation clock (SAU CKmn) frequency

By plugging in the minimum and maximum SDRmn.STCLK values, the range of bitrates for a given operation clock frequency can be obtained.

Note that due to STCLK being set as discrete integers, the actual bitrate may not be exact. The actual bitrate and percent errors can be calculated by the formulas:

```
actual_bitrate = f_mck / [ 2 * (SDRmn.STCLK + 1) ]

percent_error = 100 * abs [(actual_bitrate - expected_bitrate) / expected_bitrate]
```

Using the fastest possible operation clock for the desired bitrate will result in the lowest deviation from the requested bitrate. Set the CKmn operation clock divider in the Clocks tab to select the desired operation clock frequency.

Enabling DTC with the SAU I2C

- DTC transfer support is configurable and is disabled from the build by default. The SAU I2C driver uses a single DTC instance for transmission and reception.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- If DTC is not used by any SAU instance, set Common > DTC Support to disabled to reduce code size.
- For further details on DTC please refer Transfer (r_dtc)

Multiple Channels Being Used In Same Unit

- When multiple channels on the same SAU unit are used for any serial function (I2C, UART, and/or SPI), then the Common > Enable Critical Section property needs to be set to enabled for all SAU serial drivers.
    - This is because some SAU registers are shared for SAU channels on the same unit. Therefore any read-modify-write operations to those registers must be protected by a critical section.

I2C Restart Support

- I2C Restart (repeated start) is required by some, but not all slave devices.
- If no slave devices used by any SAU I2C instance require repeated start, then the Common > I2C Restart property can be set to disabled to reduce code size.
- When I2C Restart is disabled, even if restart=true is passed to the read or write APIs, the restart condition is not issued.

Multiple Devices On The Bus

- A single SAU I2C instance can be used to communicate with multiple slave devices on the same channel by using the R_SAU_I2C_SlaveAddressSet API.

Limitations

- Overrun error detection is not supported
- SAU I2C does not support clock stretching, I2C slave mode, or arbitration loss detection

Examples

Basic Example

This is a basic example of minimal use of the r_sau_i2c in an application. This example shows how this driver can be used for basic read and write operations.

```
void basic_example (void)
{
 fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
 /* Initialize the I2C module */
    err = R_SAU_I2C_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Write some data to the transmit buffer */
 for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
    {
       g_i2c_tx_buffer[i] = (uint8_t) i;
    }
 /* Send data to I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_SAU_I2C_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
```

```
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
 /* Read data back from the I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms           = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SAU_I2C_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
 /* Verify the read data */
 if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
    {
       __BKPT(0);
    }
}
```

Enabling Start/Stop Condition By User

This example demonstrates how to write code for SAU I2C communication when the call start/stop condtion by user is enabled.

```
void manual_trigger_condition_example (void)
{
 fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
 /* Initialize the I2C module */
    err = R_SAU_I2C_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Write some data to the transmit buffer */
 for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
    {
       g_i2c_tx_buffer[i] = (uint8_t) i;
    }
 /* Send data to I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_SAU_I2C_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
    err = R_SAU_I2C_Start(&g_i2c_device_ctrl_1);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
```

```
    err = R_SAU_I2C_Stop(&g_i2c_device_ctrl_1);
    assert(FSP_SUCCESS == err);
 /* Read data back from the I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SAU_I2C_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
    err = R_SAU_I2C_Start(&g_i2c_device_ctrl_1);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;;
    }
    err = R_SAU_I2C_Stop(&g_i2c_device_ctrl_1);
    assert(FSP_SUCCESS == err);
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
 /* Verify the read data */
 if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
    {
       __BKPT(0);
    }
}
```

Multiple Slave Devices On The Same Channel (Bus)

This example demonstrates how a single SAU I2C driver can be used to communicate with different slave devices which are on the same channel.

```
void single_channel_multi_slave (void)
```

```
{
 fsp_err_t err;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SAU_I2C_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Clear the recieve buffer */
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);
 /* Read data from I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_SAU_I2C_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
 /* Send data to I2C slave on the same channel */
    err = R_SAU_I2C_SlaveAddressSet(&g_i2c_device_ctrl_2, I2C_SLAVE_DISPLAY_ADAPTER,
I2C_MASTER_ADDR_MODE_7BIT);
    assert(FSP_SUCCESS == err);
    g_i2c_tx_buffer[0]   = (uint8_t) I2C_EXAMPLE_DATA_1;
    g_i2c_tx_buffer[1]   = (uint8_t) I2C_EXAMPLE_DATA_2;
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms           = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SAU_I2C_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
    assert(FSP_SUCCESS == err);
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
```

```
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
      timeout_ms--;;
   }
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
   {
      __BKPT(0);
   }
}
```

Data Structures

struct	sau_i2c_clock_settings_t
struct	sau_i2c_instance_ctrl_t
struct	sau_i2c_extended_cfg_t

Enumerations

enum	sau_i2c_operation_clock_t

Data Structure Documentation

◆ sau_i2c_clock_settings_t

struct sau_i2c_clock_settings_t		
I2C clock settings		
Data Fields		
uint8_t	stclk	Bit rate register settings.
sau_i2c_operation_clock_t	operation_clock	I2C operating clock select.

◆ sau_i2c_instance_ctrl_t

struct sau_i2c_instance_ctrl_t	
I2C control structure. DO NOT INITIALIZE.	
Data Fields	
i2c_master_cfg_t const *	p_cfg
	Pointer to the configuration structure.
uint32_t	open
	Flag to determine if the device is open.

R_SAU0_Type *	p_reg
	Base register for this channel.
uint8_t *	p_buff
	Holds the data associated with the transfer.
uint32_t	total
	Holds the total number of data bytes to transfer.
uint32_t	loaded
	Tracks the number of data bytes written to the register.
volatile bool	read
	Holds the direction of the data byte transfer.
volatile bool	restart
	Holds whether or not the restart should be issued when done.
volatile bool	restarted
	Tracks whether or not a restart was issued during the previous transfer.
volatile bool	do_dummy_read
	Tracks whether a dummy read is issued on the first RX.
uint8_t	slave
	The address of the slave device.

◆ sau_i2c_extended_cfg_t

struct sau_i2c_extended_cfg_t		
SAU I2C extended configuration		
Data Fields		
sau_i2c_clock_settings_t	clock_settings	I2C clock settings.
uint8_t	delay_time	The delay time of the slave device.
uint8_t	i2c_unit	The SAU unit corresponding to the selected channel.

Enumeration Type Documentation

◆ sau_i2c_operation_clock_t

enum sau_i2c_operation_clock_t	
Operation clock	
Enumerator	
SAU_I2C_MASTER_OPERATION_CLOCK_CK0	Operating clock select CK0.
SAU_I2C_MASTER_OPERATION_CLOCK_CK1	Operating clock select CK1.

Function Documentation

◆ R_SAU_I2C_Open()

fsp_err_t R_SAU_I2C_Open (i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_cfg_t const *const *p_cfg*)

Opens the SAU device.

Return values

FSP_SUCCESS	Requested clock rate was set exactly.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Clock rate requested is greater than 400KHz 5. Invalid IRQ number assigned

◆ R_SAU_I2C_Read()

fsp_err_t R_SAU_I2C_Read (i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*, bool const *restart*)

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	The parameter p_api_ctrl, p_dest is NULL, bytes is 0.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_SAU_I2C_Write()

fsp_err_t R_SAU_I2C_Write (i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*, bool const *restart*)

Performs a write to the I2C device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C write operation will begin. The write operation is non-blocking and the caller will be notified when the operation has finished by an I2C_EVENT_TX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl, p_src is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_SAU_I2C_Abort()

fsp_err_t R_SAU_I2C_Abort (i2c_master_ctrl_t *const *p_api_ctrl*)

Aborts any in-progress transfer and forces the I2C peripheral into a ready state.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event.

Return values

FSP_SUCCESS	Transaction was aborted without issue.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_SAU_I2C_SlaveAddressSet()

fsp_err_t R_SAU_I2C_SlaveAddressSet (i2c_master_ctrl_t *const *p_api_ctrl*, uint32_t const *slave*, i2c_master_addr_mode_t const *addr_mode*)

Sets address of the slave device.

This function is used to set the device address of the slave without reconfiguring the entire bus.

Return values

FSP_SUCCESS	Address of the slave is set correctly.
FSP_ERR_ASSERTION	p_ctrl or address is NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.
FSP_ERR_IN_USE	An I2C Transaction is in progress.

◆ R_SAU_I2C_CallbackSet()

fsp_err_t R_SAU_I2C_CallbackSet (i2c_master_ctrl_t *const *p_api_ctrl*, void(*)(i2c_master_callback_args_t *) *p_callback*, void const *const *p_context*, i2c_master_callback_args_t *const *p_callback_memory*)

Updates the user callback.

Note

p_callback_memory is not used in this implementation and can be set to NULL.

Implements i2c_master_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ R_SAU_I2C_StatusGet()

fsp_err_t R_SAU_I2C_StatusGet (i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_status_t * *p_status*)

Provides driver status.

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.

◆ R_SAU_I2C_Close()

fsp_err_t R_SAU_I2C_Close (i2c_master_ctrl_t *const *p_api_ctrl*)

Closes the I2C device. Power down I2C peripheral.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event.

Return values

FSP_SUCCESS	Device closed without issue.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_SAU_I2C_Start()

fsp_err_t R_SAU_I2C_Start (sau_i2c_instance_ctrl_t *const *p_ctrl*)

This function starts/restarts the IIC condition.

Parameters

[in]	p_ctrl	Instance control structure.

◆ R_SAU_I2C_Stop()

fsp_err_t R_SAU_I2C_Stop (sau_i2c_instance_ctrl_t *const *p_ctrl*)

This function stops the IIC condition.

Parameters

[in]	p_ctrl	Instance control structure.

5.2.6.10 I2C Master (r_sci_b_i2c)

fsp_err_t	R_SCI_B_I2C_StatusGet (i2c_master_ctrl_t *const p_api_ctrl, i2c_master_status_t *p_status)
fsp_err_t	R_SCI_B_I2C_Close (i2c_master_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the SCI_B peripheral on RA MCUs. This module implements the I2C Master Interface.

Overview

The Simple I2C master on SCI_B HAL module supports transactions with an I2C Slave device. Callbacks must be provided which would be invoked when a transmission or receive has been completed. The callback arguments will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100 kHz transaction rate.
  - Fast Mode Support with up to 400 kHz transaction rate.
- SDA Delay in nanoseconds can be specified as a part of the configuration.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
  - Optional (build time) DTC support for read and write respectively.
  - Optional (build time) support for 10-bit slave addressing.

Configuration

Build Time Configurations for r_sci_b_i2c

The following build time configurations are defined in fsp_cfg/r_sci_b_i2c_cfg.h:

Configuration	Options	Default	Description

Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
DTC on Transmission and Reception	• Enabled • Disabled	Disabled	If enabled, DTC instances will be included in the build for both transmission and reception.
10-bit slave addressing	• Enabled • Disabled	Disabled	If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode.

Configurations for Connectivity > I2C Master (r_sci_b_i2c)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r_sci_b_i2c). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_i2c0	Module name.
Channel	Value must be an integer between 0 and 9	0	Select the SCI channel.
Slave Address	Value must be a hex value	0x00	Specify the slave address.
Address Mode	• 7-Bit • 10-Bit	7-Bit	Select the address mode.
Rate	• Standard • Fast-mode	Standard	Select the I2C data rate. If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate and SDA delay are printed in a comment in the generated sci_b_i2c_extended_cfg_t structure.

Custom Rate (bps)	Value must be a non-negative integer	0	Set a custom bitrate (bps). Set to 0 to use the maximum bitrate for the selected mode. Standard-mode: up to 100000; Fast-mode: up to 400000
SDA Output Delay (nano seconds)	Must be a valid non-negative integer with maximum configurable value of 300	300	Specify the SDA output delay in nanoseconds.
Noise Filter Clock Select	• The on-chip baud rate generator source clock divided by 1 • The on-chip baud rate generator source clock divided by 2 • The on-chip baud rate generator source clock divided by 4 • The on-chip baud rate generator source clock divided by 8	The on-chip baud rate generator source clock divided by 1	Select the on-chip baud rate generator source clock division setting for the digital noise filter
Clock Source	MCU Specific Options		Select the clock source for the SCI I2C module.
Bit Rate Modulation	• Enable • Disable	Enable	Enabling bitrate modulation reduces the percent error of the actual bitrate with respect to the requested baud rate. It does this by modulating the number of cycles per clock output pulse, so the clock is no longer a square wave.
Callback	Name must be a valid C symbol	sci_b_i2c_master_callback	A user callback function can be provided. If this callback function is provided, it will be called from the

		interrupt service routine (ISR).
Interrupt Priority Level	MCU Specific Options	Select the interrupt priority level. This is set for TXI, RXI (if used), TEI interrupts.
RX Interrupt Priority Level [Only used when DTC is enabled]	MCU Specific Options	Select the interrupt priority level. This is set for RXI only when DTC is enabled.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA6T2	PCLKA
RA8D1	PCLKA
RA8M1	PCLKA
RA8T1	PCLKA

The actual I2C transfer rate can be derived from either SCISPICLK or the peripheral clock (PCLK)[1], and will be calculated and set by the tooling depending on the selected transfer rate and the SDA delay. If the selected clock is configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

Note

1. See Figure 26.2 in the RA6T2 manual for more information.

Pin Configuration

The SCI_B I2C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Interrupt Configuration

- Receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.
- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to different priority levels could result in improper operation.

SCI_B I2C Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate and SDA Delay.

When the Custom Rate setting is set to 0 the bitrate is fixed to the maximum values shown below. Otherwise, the supplied value is used to generate bitrate settings.

  - Standard-mode (Sm) : up to 100 kbps
  - Fast-mode (Fm) : up to 400 kbps
- The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLK settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

Enabling DTC with the SCI_B I2C

- DTC transfer support is configurable and is disabled from the build by default. SCI_B I2C driver provides two DTC instances for transmission and reception respectively.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer Transfer (r_dtc)

Multiple Devices on the Bus

- A single SCI_B I2C instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

Restart

- SCI_B_I2C can hold the the bus after an I2C transaction by issuing a repeated start condition.

Examples

Basic Example

This is a basic example of minimal use of the r_sci_b_i2c in an application. This example shows how this driver can be used for basic read and write operations.

```
void basic_example (void)
{
 fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
 /* Initialize the I2C module */
    err = R_SCI_B_I2C_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Write some data to the transmit buffer */
 for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
```

```
    {
        g_i2c_tx_buffer[i] = (uint8_t) i;
    }
 /* Send data to I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_SCI_B_I2C_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }
 /* Read data back from the I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SCI_B_I2C_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }
```

```
 /* Verify the read data */
 if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
    {
       __BKPT(0);
    }
}
```

Multiple Slave devices on the same channel (bus)

This example demonstrates how a single SCI_B I2C driver can be used to communicate with different slave devices which are on the same channel.

```
void single_channel_multi_slave (void)
{
 fsp_err_t err;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SCI_B_I2C_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Clear the recieve buffer */
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);
 /* Read data from I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_SCI_B_I2C_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
```

```
 /* Send data to I2C slave on the same channel */
    err = R_SCI_B_I2C_SlaveAddressSet(&g_i2c_device_ctrl_2,
I2C_SLAVE_DISPLAY_ADAPTER, I2C_MASTER_ADDR_MODE_7BIT);
    assert(FSP_SUCCESS == err);
    g_i2c_tx_buffer[0]   = (uint8_t) I2C_EXAMPLE_DATA_1;
    g_i2c_tx_buffer[1]   = (uint8_t) I2C_EXAMPLE_DATA_2;
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms           = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SCI_B_I2C_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
    assert(FSP_SUCCESS == err);
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
}
```

Function Documentation

◆ R_SCI_B_I2C_Open()

fsp_err_t R_SCI_B_I2C_Open (i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_cfg_t const *const *p_cfg*)

Opens the I2C device.

Return values

FSP_SUCCESS	Requested clock rate was set exactly.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel is not available on this MCU.
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Clock rate requested is greater than 400KHz 5. Invalid IRQ number assigned

◆ R_SCI_B_I2C_Read()

fsp_err_t R_SCI_B_I2C_Read (i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*, bool const *restart*)

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	The parameter p_ctrl, p_dest is NULL, bytes is 0.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ R_SCI_B_I2C_Write()

fsp_err_t R_SCI_B_I2C_Write (i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*, bool const *restart*)

Performs a write to the I2C device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C write operation will begin. When no callback is provided by the user, this function performs a blocking write. Otherwise, the write operation is non-blocking and the caller will be notified when the operation has finished by an I2C_EVENT_TX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_ctrl, p_src is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ R_SCI_B_I2C_Abort()

fsp_err_t R_SCI_B_I2C_Abort (i2c_master_ctrl_t *const *p_api_ctrl*)

Aborts any in-progress transfer and forces the I2C peripheral into a ready state.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

FSP_SUCCESS	Transaction was aborted without issue.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ R_SCI_B_I2C_SlaveAddressSet()

fsp_err_t R_SCI_B_I2C_SlaveAddressSet (i2c_master_ctrl_t *const *p_api_ctrl*, uint32_t const *slave*, i2c_master_addr_mode_t const *addr_mode*)

Sets address and addressing mode of the slave device.

This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

Return values

FSP_SUCCESS	Address of the slave is set correctly.
FSP_ERR_ASSERTION	p_ctrl or address is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.
FSP_ERR_IN_USE	An I2C Transaction is in progress.

◆ R_SCI_B_I2C_CallbackSet()

fsp_err_t R_SCI_B_I2C_CallbackSet (i2c_master_ctrl_t *const *p_api_ctrl*, void(*)(i2c_master_callback_args_t *) *p_callback*, void const *const *p_context*, i2c_master_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements i2c_master_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SCI_B_I2C_StatusGet()

fsp_err_t R_SCI_B_I2C_StatusGet (i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_status_t * *p_status*)

Provides driver status.

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.

◆ R_SCI_B_I2C_Close()

fsp_err_t R_SCI_B_I2C_Close (i2c_master_ctrl_t *const *p_api_ctrl*)

Closes the I2C device. Power down I2C peripheral.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

FSP_SUCCESS	Device closed without issue.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the I2C Master Interface.

Overview

The Simple I2C master on SCI HAL module supports transactions with an I2C Slave device. Callbacks must be provided which would be invoked when a transmission or receive has been completed. The callback arguments will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100 kHz transaction rate.
  - Fast Mode Support with up to 400 kHz transaction rate.
- SDA Delay in nanoseconds can be specified as a part of the configuration.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
  - Optional (build time) DTC support for read and write respectively.
  - Optional (build time) support for 10-bit slave addressing.

Configuration

Build Time Configurations for r_sci_i2c

The following build time configurations are defined in fsp_cfg/r_sci_i2c_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
DTC on Transmission and Reception	• Enabled • Disabled	Disabled	If enabled, DTC instances will be included in the build for

			both transmission and reception.
10-bit slave addressing	• Enabled • Disabled	Disabled	If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode.

Configurations for Connectivity > I2C Master (r_sci_i2c)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r_sci_i2c). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_i2c0	Module name.
Channel	Value must be an integer between 0 and 9	0	Select the SCI channel.
Slave Address	Value must be a hex value	0x00	Specify the slave address.
Address Mode	• 7-Bit • 10-Bit	7-Bit	Select the address mode.
Rate	• Standard • Fast-mode	Standard	Select the I2C data rate. If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate and SDA delay are printed in a comment in the generated sci_i2c_extended_cfg_t structure.
Custom Rate (bps)	Value must be a non-negative integer	0	Set a custom bitrate (bps). Set to 0 to use the maximum bitrate for the selected mode. Standard-mode: up to 100000; Fast-mode: up

			to 400000
SDA Output Delay (nano seconds)	Must be a valid non-negative integer with maximum configurable value of 300	300	Specify the SDA output delay in nanoseconds.
Noise filter setting	• Use clock signal divided by 1 with noise filter • Use clock signal divided by 2 with noise filter • Use clock signal divided by 4 with noise filter • Use clock signal divided by 8 with noise filter	Use clock signal divided by 1 with noise filter	Select the sampling clock for the digital noise filter
Bit Rate Modulation	• Enable • Disable	Enable	Enabling bitrate modulation reduces the percent error of the actual bitrate with respect to the requested baud rate. It does this by modulating the number of cycles per clock output pulse, so the clock is no longer a square wave.
Callback	Name must be a valid C symbol	sci_i2c_master_callback	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Interrupt Priority Level	MCU Specific Options		Select the interrupt priority level. This is set for TXI, RXI (if used), TEI interrupts.
RX Interrupt Priority Level [Only used when DTC is enabled]	MCU Specific Options		Select the interrupt priority level. This is set for RXI only when DTC is enabled.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKB
RA2A2	PCLKB
RA2E1	PCLKB
RA2E2	PCLKB
RA2E3	PCLKB
RA2L1	PCLKB
RA4E1	PCLKA
RA4E2	PCLKA
RA4M1	PCLKA
RA4M2	PCLKA
RA4M3	PCLKA
RA4T1	PCLKA
RA4W1	PCLKA
RA6E1	PCLKA
RA6E2	PCLKA
RA6M1	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T1	PCLKA
RA6T3	PCLKA

The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate and the SDA delay. If the PCLK is configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

Pin Configuration

The SCI I2C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Interrupt Configuration

- Receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.

- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to different priority levels could result in improper operation.

SCI I2C Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate and SDA Delay.

  When the Custom Rate setting is set to 0 the bitrate is fixed to the maximum values shown below. Otherwise, the supplied value is used to generate bitrate settings.

  - Standard-mode (Sm) : up to 100 kbps
  - Fast-mode (Fm) : up to 400 kbps
- The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLK settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

Enabling DTC with the SCI I2C

- DTC transfer support is configurable and is disabled from the build by default. SCI I2C driver provides two DTC instances for transmission and reception respectively.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer Transfer (r_dtc)

Multiple Devices on the Bus

- A single SCI I2C instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

Restart

- SCI I2C master can hold the the bus after an I2C transaction by issuing Restart. This will mimic a stop followed by start condition.

Examples

Basic Example

This is a basic example of minimal use of the r_sci_i2c in an application. This example shows how this driver can be used for basic read and write operations.

```
void basic_example (void)
{

struct	sci_i2c_extended_cfg_t

Data Structure Documentation

◆ sci_i2c_clock_settings_t

struct sci_i2c_clock_settings_t

I2C clock settings		
Data Fields		
bool	bitrate_modulation	Bit-rate Modulation Function enable or disable.
uint8_t	brr_value	Bit rate register settings.
uint8_t	clk_divisor_value	Clock Select settings.
uint8_t	mddr_value	Modulation Duty Register settings.
uint8_t	cycles_value	SDA Delay Output Cycles Select.
uint8_t	snfr_value	Noise Filter Setting Register value.

◆ sci_i2c_instance_ctrl_t

struct sci_i2c_instance_ctrl_t
I2C control structure. DO NOT INITIALIZE.

◆ sci_i2c_extended_cfg_t

struct sci_i2c_extended_cfg_t		
SCI I2C extended configuration		
Data Fields		
sci_i2c_clock_settings_t	clock_settings	I2C Clock settings.

Function Documentation

◆ R_SCI_I2C_Open()

fsp_err_t R_SCI_I2C_Open (i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_cfg_t const *const *p_cfg*)

Opens the I2C device.

Return values

FSP_SUCCESS	Requested clock rate was set exactly.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel is not available on this MCU.
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Clock rate requested is greater than 400KHz 5. Invalid IRQ number assigned

◆ R_SCI_I2C_Read()

fsp_err_t R_SCI_I2C_Read (i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*, bool const *restart*)

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	The parameter p_ctrl, p_dest is NULL, bytes is 0.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ R_SCI_I2C_Write()

fsp_err_t R_SCI_I2C_Write (i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*, bool const *restart*)

Performs a write to the I2C device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C write operation will begin. When no callback is provided by the user, this function performs a blocking write. Otherwise, the write operation is non-blocking and the caller will be notified when the operation has finished by an I2C_EVENT_TX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_ctrl, p_src is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ R_SCI_I2C_Abort()

fsp_err_t R_SCI_I2C_Abort (i2c_master_ctrl_t *const *p_api_ctrl*)

Aborts any in-progress transfer and forces the I2C peripheral into a ready state.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

FSP_SUCCESS	Transaction was aborted without issue.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ R_SCI_I2C_SlaveAddressSet()

fsp_err_t R_SCI_I2C_SlaveAddressSet (i2c_master_ctrl_t *const *p_api_ctrl*, uint32_t const *slave*, i2c_master_addr_mode_t const *addr_mode*)

Sets address and addressing mode of the slave device.

This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

Return values

FSP_SUCCESS	Address of the slave is set correctly.
FSP_ERR_ASSERTION	p_ctrl or address is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.
FSP_ERR_IN_USE	An I2C Transaction is in progress.

◆ R_SCI_I2C_CallbackSet()

fsp_err_t R_SCI_I2C_CallbackSet (i2c_master_ctrl_t *const *p_api_ctrl*, void(*)(i2c_master_callback_args_t *) *p_callback*, void const *const *p_context*, i2c_master_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements i2c_master_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SCI_I2C_StatusGet()

fsp_err_t R_SCI_I2C_StatusGet (i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_status_t * *p_status*)

Provides driver status.

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.

◆ R_SCI_I2C_Close()

fsp_err_t R_SCI_I2C_Close (i2c_master_ctrl_t *const *p_api_ctrl*)

Closes the I2C device. Power down I2C peripheral.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

FSP_SUCCESS	Device closed without issue.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.

fsp_err_t R_IIC_B_SLAVE_Close (i2c_slave_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the IIC/I3C peripheral on RA MCUs. This module implements the I2C Slave Interface.

Overview

Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100-kHz transaction rate.
  - Fast Mode Support with up to 400-kHz transaction rate.
  - Fast Mode Plus Support with up to 1-MHz transaction rate.
- Reads data written by master device.
- Write data which is read by master device.
- Can accept 0x00 as slave address.
- Can be assigned a 10-bit address.
- Clock stretching is supported and can be implemented via callbacks.
- Provides Transmission/Reception transaction size in the callback.
- I2C Slave can notify the following events via callbacks: Transmission/Reception Request, Transmission/Reception Request for more data, Transmission/Reception Completion, Error Condition.
- Additional build-time features:
  - Optional (build time) DTC support for read and write respectively.

Configuration

Build Time Configurations for r_iic_b_slave

The following build time configurations are defined in fsp_cfg/r_iic_b_slave_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
DTC on Transmission and Reception	• Enabled • Disabled	Disabled	If enabled, DTC instances will be included in the build for both transmission and reception.

Configurations for Connectivity > I2C Slave (r_iic_b_slave)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Slave (r_iic_b_slave). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description

Interrupt Priority Level			
Transmit, Receive, and Transmit End	MCU Specific Options		Select the interrupt priority level. This is set for TXI, RXI, and TEI interrupts.
Error	MCU Specific Options		Select the interrupt priority level. This is set for ERI interrupt.
Name	Name must be a valid C symbol	g_i2c_slave0	Module name.
Channel	Value must be a non-negative integer	0	Specify the IIC channel.
Rate	• Standard • Fast-mode • Fast-mode plus	Standard	Select the transfer rate. If the delay for the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated delay is printed in a comment in the generated iic_b_slave_extended_cfg_t structure.
Internal Reference Clock	• I2C Clock / 1 • I2C Clock / 2 • I2C Clock / 4 • I2C Clock / 8 • I2C Clock / 16 • I2C Clock / 32 • I2C Clock / 64 • I2C Clock / 128	I2C Clock / 1	Select the internal reference clock for IIC slave. The internal reference clock is used only to determine the clock frequency of the noise filter samples. I2C Clock can be either IICCLK or PCLKD based on the MCU.
Digital Noise Filter Stage Select	Refer to the RA Configuration tool for available options.	3-stage filter	Select the number of digital filter stages for IIC Slave.
Slave Address	Value must be non-negative	0x08	Specify the slave address.
General Call	• Enabled • Disabled	Disabled	Allows the slave to respond to general call address: 0x00.
Address Mode	• 7-Bit	7-Bit	Select the slave

	• 10-Bit		address mode.
Clock Stretching	• Enabled • Disabled	Disabled	Configure Clock Stretching.
Callback	Name must be a valid C symbol	g_iic_b_slave0_callback	A user callback function must be provided. This will be called from the interrupt service routine (ISR) to report I2C Slave transaction events and status.

Clock Configuration

The IIC/I3C peripheral module uses the IICCLK or PCLKD (based on the MCU) as its clock source for the bus clock. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the clocks are configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

Pin Configuration

The IIC/I3C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Interrupt Configuration

- The IIC error (EEI), receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel must be enabled in the properties of the selected device.
- The interrupt priority of ERI can be set higher than or equal to the interrupt priorities of RXI, TXI and TEI.
  Note
  : During master-write slave-read type of operations if the slave device requires to perform clock stretching after the last data byte is received, a higher priority ERI will ensure that the ongoing transaction is completed (by accepting the Stop/Restart condition from the master) before the next transaction is initiated.
  : To support clock stretching (Holding SCL low after the falling edge of the 9th clock cycle), 'Clock Stretching' configuration must be enabled.

Callback

- A callback function must be provided which will be invoked for the cases below:
  - An I2C Master initiates a transmission or reception: I2C_SLAVE_EVENT_TX_REQUEST; I2C_SLAVE_EVENT_RX_REQUEST
  - A Transmission or reception has been completed: I2C_SLAVE_EVENT_TX_COMPLETE; I2C_SLAVE_EVENT_RX_COMPLETE
  - An I2C Master is requesting to read or write more data: I2C_SLAVE_EVENT_TX_MORE_REQUEST; I2C_SLAVE_EVENT_RX_MORE_REQUEST
  - Error conditions: I2C_SLAVE_EVENT_ABORTED
  - An I2C Master initiates a general call by passing 0x00 as slave address:

I2C_SLAVE_EVENT_GENERAL_CALL

- The callback arguments will contain information about the transaction status/events, bytes transferred and a pointer to the user defined context.
- Clock stretching is enabled by the use of callbacks. This means that the IIC slave can hold the clock line SCL LOW to force the I2C Master into a wait state.
- The table below shows I2C Slave event handling expected in user code:

IIC Slave Callback Event	IIC Slave API expected to be called
I2C_SLAVE_EVENT_ABORTED	Handle event based on application
I2C_SLAVE_EVENT_RX_COMPLETE	Handle event based on application
I2C_SLAVE_EVENT_TX_COMPLETE	Handle event based on application
I2C_SLAVE_EVENT_RX_REQUEST	R_IIC_B_SLAVE_Read API. If the slave is a Write Only device call this API with 0 bytes to send a NACK to the master.
I2C_SLAVE_EVENT_TX_REQUEST	R_IIC_B_SLAVE_Write API
I2C_SLAVE_EVENT_RX_MORE_REQUEST	R_IIC_B_SLAVE_Read API. If the slave cannot read any more data call this API with 0 bytes to send a NACK to the master.
I2C_SLAVE_EVENT_TX_MORE_REQUEST	R_IIC_B_SLAVE_Write API
I2C_SLAVE_EVENT_GENERAL_CALL	R_IIC_B_SLAVE_Read

- If parameter checking is enabled and R_IIC_B_SLAVE_Read API is not called for I2C_SLAVE_EVENT_RX_REQUEST and/or I2C_SLAVE_EVENT_RX_MORE_REQUEST, the slave will send a NACK to the master and would eventually timeout.
- R_IIC_B_SLAVE_Write API is not called for I2C_SLAVE_EVENT_TX_REQUEST and/or I2C_SLAVE_EVENT_TX_MORE_REQUEST:
    - Slave timeout is less than Master timeout: The slave will timeout and release the bus causing the master to read 0xFF for every remaining byte.
    - Slave timeout is more than Master timeout: The master will timeout first followed by the slave.

IIC Slave Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current I2C Clock (IICCLK or PCLKD based on the MCU) settings is calculated and used.

Limitations

- When 'Clock Stretching' configuration is enabled, the receive operation will not utilize the double buffer arrangement in hardware for a continuous read. This means that the read operation would happen in single byte units such that the active master would send the next byte only when the slave has read the current byte of data.
- When DTC is enabled, the clock frequency supply for DTC must be configured greater than the "Internal Reference Clock" of the slave.

Examples

Basic Example

This is a basic example of minimal use of the R_IIC_B_SLAVE in an application. This example shows how this driver can be used for basic read and write operations.

```
iic_b_master_instance_ctrl_t g_i2c_master_ctrl;
i2c_master_cfg_t g_i2c_master_cfg =
{
    .channel       = I2C_MASTER_CHANNEL_2,
    .rate          = I2C_MASTER_RATE_STANDARD,
    .slave         = I2C_7BIT_ADDR_IIC_SLAVE,
    .addr_mode    = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback    = i2c_master_callback, // Callback
    .p_context    = &g_i2c_master_ctrl,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend      = &g_iic_master_cfg_extend_standard_mode
};
iic_b_slave_instance_ctrl_t g_i2c_slave_ctrl;
i2c_slave_cfg_t g_i2c_slave_cfg =
{
    .channel    = I2C_SLAVE_CHANNEL_0,
    .rate       = I2C_SLAVE_RATE_STANDARD,
    .slave      = I2C_7BIT_ADDR_IIC_SLAVE,
    .addr_mode = I2C_SLAVE_ADDR_MODE_7BIT,
    .p_callback = i2c_slave_callback, // Callback
    .p_context = &g_i2c_slave_ctrl,
    .p_extend   = &g_iic_slave_cfg_extend_standard_mode
};

uint8_t	digital_filter_stages	Number of digital filter stages based on brl_value.

◆ iic_b_slave_extended_cfg_t

struct iic_b_slave_extended_cfg_t		
R_IIC_SLAVE extended configuration		
Data Fields		
iic_b_slave_clock_settings_t	clock_settings	I2C Clock settings.

Function Documentation

◆ R_IIC_B_SLAVE_Open()

fsp_err_t R_IIC_B_SLAVE_Open (i2c_slave_ctrl_t *const *p_api_ctrl*, i2c_slave_cfg_t const *const *p_cfg*)

Opens the I2C slave device.

Return values

FSP_SUCCESS	I2C slave device opened successfully.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel is not available on this MCU.
FSP_ERR_INVALID_ARGUMENT	Error interrupt priority is lower than Transmit, Receive and Transmit End interrupt priority
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Set the rate to fast mode plus on a channel which does not support it. 5. Invalid IRQ number assigned 6. transfer instance in p_cfg is NULL when DTC support enabled

◆ R_IIC_B_SLAVE_Read()

fsp_err_t R_IIC_B_SLAVE_Read (i2c_slave_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Performs a read from the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C slave read operation will begin. The caller will be notified when the operation has finished by an I2C_SLAVE_EVENT_RX_COMPLETE in the callback. In case the master continues to write more data, an I2C_SLAVE_EVENT_RX_MORE_REQUEST will be issued via callback. In case of errors, an I2C_SLAVE_EVENT_ABORTED will be issued via callback.

Return values

FSP_SUCCESS	Function executed without issue
FSP_ERR_ASSERTION	p_api_ctrl, bytes or p_dest is NULL.
FSP_ERR_IN_USE	Another transfer was in progress.
FSP_ERR_NOT_OPEN	Device is not open.
FSP_ERR_INVALID_SIZE	Invalid size when reading data via DTC.

◆ R_IIC_B_SLAVE_Write()

fsp_err_t R_IIC_B_SLAVE_Write (i2c_slave_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*)

Performs a write to the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C slave write operation will begin. The caller will be notified when the operation has finished by an I2C_SLAVE_EVENT_TX_COMPLETE in the callback. In case the master continues to read more data, an I2C_SLAVE_EVENT_TX_MORE_REQUEST will be issued via callback. In case of errors, an I2C_SLAVE_EVENT_ABORTED will be issued via callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl or p_src is NULL.
FSP_ERR_IN_USE	Another transfer was in progress.
FSP_ERR_NOT_OPEN	Device is not open.
FSP_ERR_INVALID_SIZE	Invalid size when writing data via DTC.

◆ R_IIC_B_SLAVE_CallbackSet()

fsp_err_t R_IIC_B_SLAVE_CallbackSet (i2c_slave_ctrl_t *const *p_api_ctrl*, void(*)(i2c_slave_callback_args_t *) *p_callback*, void const *const *p_context*, i2c_slave_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements i2c_slave_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_IIC_B_SLAVE_Close()

fsp_err_t R_IIC_B_SLAVE_Close (i2c_slave_ctrl_t *const *p_api_ctrl*)
Closes the I2C device. **Return values** FSP_SUCCESS — Device closed successfully. FSP_ERR_NOT_OPEN — Device not opened. FSP_ERR_ASSERTION — p_api_ctrl is NULL.

Detailed Description

Driver for the IIC peripheral on RA MCUs. This module implements the I2C Slave Interface.

Overview

Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100-kHz transaction rate.
  - Fast Mode Support with up to 400-kHz transaction rate.
  - Fast Mode Plus Support with up to 1-MHz transaction rate.
- Reads data written by master device.

- Write data which is read by master device.
- Can accept 0x00 as slave address.
- Can be assigned a 10-bit address.
- Clock stretching is supported and can be implemented via callbacks.
- Provides Transmission/Reception transaction size in the callback.
- I2C Slave can notify the following events via callbacks: Transmission/Reception Request, Transmission/Reception Request for more data, Transmission/Reception Completion, Error Condition.
- Additional build-time features:
    - Optional (build time) DTC support for read and write respectively.

Configuration

Build Time Configurations for r_iic_slave

The following build time configurations are defined in fsp_cfg/r_iic_slave_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
DTC on Transmission and Reception	• Enabled • Disabled	Disabled	If enabled, DTC instances will be included in the build for both transmission and reception.

Configurations for Connectivity > I2C Slave (r_iic_slave)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Slave (r_iic_slave). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Interrupt Priority Level			
Transmit, Receive, and Transmit End	MCU Specific Options		Select the interrupt priority level. This is set for TXI, RXI, and TEI interrupts.
Error	MCU Specific Options		Select the interrupt priority level. This is set for ERI interrupt.
Name	Name must be a valid C symbol	g_i2c_slave0	Module name.
Channel	Value must be a non-negative integer	0	Specify the IIC channel.
Rate	• Standard • Fast-mode • Fast-mode plus	Standard	Select the transfer rate.

			If the delay for the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated delay is printed in a comment in the generated iic_slave_extended_cfg_t structure.
Internal Reference Clock	• PCLKB / 1 • PCLKB / 2 • PCLKB / 4 • PCLKB / 8 • PCLKB / 16 • PCLKB / 32 • PCLKB / 64 • PCLKB / 128	PCLKB / 1	Select the internal reference clock for IIC slave. The internal reference clock is used only to determine the clock frequency of the noise filter samples.
Digital Noise Filter Stage Select	• Disabled • Single-stage filter • 2-stage filter • 3-stage filter • 4-stage filter	3-stage filter	Select the number of digital filter stages for IIC Slave.
Slave Address	Value must be non-negative	0x08	Specify the slave address.
General Call	• Enabled • Disabled	Disabled	Allows the slave to respond to general call address: 0x00.
Address Mode	• 7-Bit • 10-Bit	7-Bit	Select the slave address mode.
Clock Stretching	• Enabled • Disabled	Disabled	Configure Clock Stretching.
Callback	Name must be a valid C symbol	NULL	A user callback function must be provided. This will be called from the interrupt service routine (ISR) to report I2C Slave transaction events and status.

Clock Configuration

The IIC peripheral module uses the PCLKB as its clock source. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the PCLKB is configured

in such a manner that the selected transfer rate cannot be achieved, an error will be returned.

Pin Configuration

The IIC peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Interrupt Configuration

- The IIC error (EEI), receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel must be enabled in the properties of the selected device.
- The interrupt priority of ERI can be set higher than or equal to the interrupt priorities of RXI, TXI and TEI.
  Note
  : During master-write slave-read type of operations if the slave device requires to perform clock stretching after the last data byte is received, a higher priority ERI will ensure that the ongoing transaction is completed (by accepting the Stop/Restart condition from the master) before the next transaction is initiated.
  : To support clock stretching (Holding SCL low after the falling edge of the 9th clock cycle), 'Clock Stretching' configuration must be enabled.

Callback

- A callback function must be provided which will be invoked for the cases below:
  - An I2C Master initiates a transmission or reception: I2C_SLAVE_EVENT_TX_REQUEST; I2C_SLAVE_EVENT_RX_REQUEST
  - A Transmission or reception has been completed: I2C_SLAVE_EVENT_TX_COMPLETE; I2C_SLAVE_EVENT_RX_COMPLETE
  - An I2C Master is requesting to read or write more data: I2C_SLAVE_EVENT_TX_MORE_REQUEST; I2C_SLAVE_EVENT_RX_MORE_REQUEST
  - Error conditions: I2C_SLAVE_EVENT_ABORTED
  - An I2C Master initiates a general call by passing 0x00 as slave address: I2C_SLAVE_EVENT_GENERAL_CALL
- The callback arguments will contain information about the transaction status/events, bytes transferred and a pointer to the user defined context.
- Clock stretching is enabled by the use of callbacks. This means that the IIC slave can hold the clock line SCL LOW to force the I2C Master into a wait state.
- The table below shows I2C Slave event handling expected in user code:

IIC Slave Callback Event	IIC Slave API expected to be called
I2C_SLAVE_EVENT_ABORTED	Handle event based on application
I2C_SLAVE_EVENT_RX_COMPLETE	Handle event based on application
I2C_SLAVE_EVENT_TX_COMPLETE	Handle event based on application
I2C_SLAVE_EVENT_RX_REQUEST	R_IIC_SLAVE_Read API. If the slave is a Write Only device call this API with 0 bytes to send a NACK to the master.

I2C_SLAVE_EVENT_TX_REQUEST	R_IIC_SLAVE_Write API
I2C_SLAVE_EVENT_RX_MORE_REQUEST	R_IIC_SLAVE_Read API. If the slave cannot read any more data call this API with 0 bytes to send a NACK to the master.
I2C_SLAVE_EVENT_TX_MORE_REQUEST	R_IIC_SLAVE_Write API
I2C_SLAVE_EVENT_GENERAL_CALL	R_IIC_SLAVE_Read

- If parameter checking is enabled and R_IIC_SLAVE_Read API is not called for I2C_SLAVE_EVENT_RX_REQUEST and/or I2C_SLAVE_EVENT_RX_MORE_REQUEST, the slave will send a NACK to the master and would eventually timeout.
- R_IIC_SLAVE_Write API is not called for I2C_SLAVE_EVENT_TX_REQUEST and/or I2C_SLAVE_EVENT_TX_MORE_REQUEST:
    - Slave timeout is less than Master timeout: The slave will timeout and release the bus causing the master to read 0xFF for every remaining byte.
    - Slave timeout is more than Master timeout: The master will timeout first followed by the slave.

IIC Slave Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLKB settings is calculated and used.

Limitations

- When 'Clock Stretching' configuration is enabled, the receive operation will not utilize the double buffer arrangement in hardware for a continuous read. This means that the read operation would happen in single byte units such that the active master would send the next byte only when the slave has read the current byte of data.
- When DTC is enabled, the clock frequency supply for DTC must be configured greater than the "Internal Reference Clock" of the slave.

Examples

Basic Example

This is a basic example of minimal use of the R_IIC_SLAVE in an application. This example shows how this driver can be used for basic read and write operations.

```
iic_master_instance_ctrl_t g_i2c_master_ctrl;

i2c_master_cfg_t g_i2c_master_cfg =

{

    .channel       = I2C_MASTER_CHANNEL_2,

    .rate          = I2C_MASTER_RATE_STANDARD,

    .slave         = I2C_7BIT_ADDR_IIC_SLAVE,

    .addr_mode    = I2C_MASTER_ADDR_MODE_7BIT,

    .p_callback    = i2c_master_callback, // Callback
```

```
    .p_context    = &g_i2c_master_ctrl,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend      = &g_iic_master_cfg_extend_standard_mode
};
iic_slave_instance_ctrl_t g_i2c_slave_ctrl;
i2c_slave_cfg_t g_i2c_slave_cfg =
{
    .channel    = I2C_SLAVE_CHANNEL_0,
    .rate       = I2C_SLAVE_RATE_STANDARD,
    .slave      = I2C_7BIT_ADDR_IIC_SLAVE,
    .addr_mode = I2C_SLAVE_ADDR_MODE_7BIT,
    .p_callback = i2c_slave_callback, // Callback
    .p_context = &g_i2c_slave_ctrl,
    .p_extend   = &g_iic_slave_cfg_extend_standard_mode
};

fsp_err_t R_IIC_SLAVE_Open (i2c_slave_ctrl_t *const *p_api_ctrl*, i2c_slave_cfg_t const *const *p_cfg*)

Opens the I2C slave device.

Return values

FSP_SUCCESS	I2C slave device opened successfully.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel is not available on this MCU.
FSP_ERR_INVALID_ARGUMENT	Error interrupt priority is lower than Transmit, Receive and Transmit End interrupt priority
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Set the rate to fast mode plus on a channel which does not support it. 5. Invalid IRQ number assigned 6. transfer instance in p_cfg is NULL when DTC support enabled

◆ R_IIC_SLAVE_Read()

fsp_err_t R_IIC_SLAVE_Read (i2c_slave_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Performs a read from the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C slave read operation will begin. The caller will be notified when the operation has finished by an I2C_SLAVE_EVENT_RX_COMPLETE in the callback. In case the master continues to write more data, an I2C_SLAVE_EVENT_RX_MORE_REQUEST will be issued via callback. In case of errors, an I2C_SLAVE_EVENT_ABORTED will be issued via callback.

Return values

FSP_SUCCESS	Function executed without issue
FSP_ERR_ASSERTION	p_api_ctrl, bytes or p_dest is NULL.
FSP_ERR_IN_USE	Another transfer was in progress.
FSP_ERR_NOT_OPEN	Device is not open.
FSP_ERR_INVALID_SIZE	Invalid size when reading data via DTC.

◆ R_IIC_SLAVE_Write()

fsp_err_t R_IIC_SLAVE_Write (i2c_slave_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*)

Performs a write to the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C slave write operation will begin. The caller will be notified when the operation has finished by an I2C_SLAVE_EVENT_TX_COMPLETE in the callback. In case the master continues to read more data, an I2C_SLAVE_EVENT_TX_MORE_REQUEST will be issued via callback. In case of errors, an I2C_SLAVE_EVENT_ABORTED will be issued via callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl or p_src is NULL.
FSP_ERR_IN_USE	Another transfer was in progress.
FSP_ERR_NOT_OPEN	Device is not open.
FSP_ERR_INVALID_SIZE	Invalid size when writing data via DTC.

◆ R_IIC_SLAVE_CallbackSet()

fsp_err_t R_IIC_SLAVE_CallbackSet (i2c_slave_ctrl_t *const *p_api_ctrl*, void(*)(i2c_slave_callback_args_t *) *p_callback*, void const *const *p_context*, i2c_slave_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements i2c_slave_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_IIC_SLAVE_Close()

fsp_err_t R_IIC_SLAVE_Close (i2c_slave_ctrl_t *const *p_api_ctrl*)

Closes the I2C device.

Return values

FSP_SUCCESS	Device closed successfully.
FSP_ERR_NOT_OPEN	Device not opened.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_iica_slave0	Module name.
Rate	• Standard • Fast-mode • Fast-mode plus	Standard	Select the transfer rate. If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate is printed in a comment in the generated iica_slave_extended_cfg_t structure.
Internal Reference Clock	• PCLKB / 1 • PCLKB / 2	PCLKB / 1	Select the internal reference clock for IICA slave.
Signal Rising Time (us)	Must be a valid value	0	Set the SDA and SCL signal rising time in micro-seconds.
Signal Falling Time (us)	Must be a valid value	0	Set the SDA and SCL signal falling time in micro-seconds.
Duty Cycle (%)	Value must be an integer between 0 and 100	53	Set SCL high duty cycle.
Digital Filter	• Enabled • Disabled	Disabled	Configure digital filter.
Slave Address	Value must be non-negative	0x08	Specify the slave address.
Callback	Name must be a valid C symbol	iica_slave_callback	A user callback function must be provided. This will be called from the interrupt service routine (ISR) to report IICA Slave transaction events and status.
IICA0 communication interrupt priority	MCU Specific Options		Select end of IICA0 communication interrupt priority.
SCLA Pin	• Disabled	Disabled	Specify SCLA pin

	• P100 • P110 • P212 • P914		setting for the MCU.
SDAA Pin	• Disabled • P101 • P109 • P213 • P913	Disabled	Specify SDAA pin setting for the MCU.

Clock Configuration

The IICA peripheral module uses the PCLKB as its clock source. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the PCLKB is configured in such a manner that the selected transfer rate cannot be achieved, an error will be returned.

Pin Configuration

The IICA peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An IICA channel would consist of two pins - SDAA and SCLA for data/address and clock respectively.

Usage Notes

Interrupt Configuration

- IICA0 communication interrupt must be enabled in the properties of the selected device.
  Note
  : During master-write slave-read type of operations if the slave device requires to perform clock stretching after the last data byte is received.
  : To support clock stretching (Holding SCL low after the falling edge of the 9th clock cycle), 'Clock Stretching' configuration must be enabled.

Callback

- A callback function must be provided which will be invoked for the cases below:
  - An I2C Master initiates a transmission or reception:
    I2C_SLAVE_EVENT_TX_REQUEST; I2C_SLAVE_EVENT_RX_REQUEST
  - A Transmission or reception has been completed:
    I2C_SLAVE_EVENT_TX_COMPLETE; I2C_SLAVE_EVENT_RX_COMPLETE
  - An I2C Master is requesting to read or write more data:
    I2C_SLAVE_EVENT_TX_MORE_REQUEST; I2C_SLAVE_EVENT_RX_MORE_REQUEST
  - Error conditions: I2C_SLAVE_EVENT_ABORTED
- The callback arguments will contain information about the transaction status/events, bytes transferred and a pointer to the user defined context.
- Clock stretching is enabled by the use of callbacks. This means that the IICA slave can hold the clock line SCL LOW to force the I2C Master into a wait state.
- The table below shows I2C Slave event handling expected in user code:

IICA Slave Callback Event	IICA Slave API expected to be called
I2C_SLAVE_EVENT_ABORTED	Handle event based on application

I2C_SLAVE_EVENT_RX_COMPLETE	Handle event based on application
I2C_SLAVE_EVENT_TX_COMPLETE	Handle event based on application
I2C_SLAVE_EVENT_RX_REQUEST	R_IICA_SLAVE_Read API. If the slave is a Write Only device call this API with 0 bytes to send a NACK to the master.
I2C_SLAVE_EVENT_TX_REQUEST	R_IICA_SLAVE_Write API
I2C_SLAVE_EVENT_RX_MORE_REQUEST	R_IICA_SLAVE_Read API. If the slave cannot read any more data call this API with 0 bytes to send a NACK to the master.
I2C_SLAVE_EVENT_TX_MORE_REQUEST	R_IICA_SLAVE_Write API

IICA Slave Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLKB settings is calculated and used.

Limitations

- DTC doesn't support IICA
- Extension code is not supported
- Please configure SDAA and SCLA pins in the IICA module. IICA pins must be set after IICA is enabled.

Examples

Basic Example

This is a basic example of minimal use of the R_IICA_SLAVE in an application. This example shows how this driver can be used for basic read and write operations.

```
sau_i2c_instance_ctrl_t g_i2c_master_ctrl;
i2c_master_cfg_t g_i2c_master_cfg =
{
    .channel       = I2C_MASTER_CHANNEL_20,
    .rate          = I2C_MASTER_RATE_STANDARD,
    .slave         = I2C_7BIT_ADDR_IIC_SLAVE,
    .p_callback    = iica_master_callback, // Callback
    .p_context    = &g_i2c_master_ctrl,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend      = &g_iic_master_cfg_extend_standard_mode
};
iica_slave_instance_ctrl_t g_i2c_slave_ctrl;
```

```
i2c_slave_cfg_t g_i2c_slave_cfg =
{
    .channel    = I2C_SLAVE_CHANNEL_0,
    .rate       = I2C_SLAVE_RATE_STANDARD,
    .slave      = I2C_7BIT_ADDR_IIC_SLAVE,
    .p_callback = iica_slave_callback, // Callback
    .p_context = &g_i2c_slave_ctrl,
    .p_extend   = &g_iic_slave_cfg_extend_standard_mode
};
void iica_master_callback (i2c_master_callback_args_t * p_args)
{
    g_i2c_master_callback_event = p_args->event;
}
void iica_slave_callback (i2c_slave_callback_args_t * p_args)

Function Documentation

◆ R_IICA_SLAVE_Open()

fsp_err_t R_IICA_SLAVE_Open (i2c_slave_ctrl_t *const *p_api_ctrl*, i2c_slave_cfg_t const *const *p_cfg*)

Opens the IICA slave device.

Return values

FSP_SUCCESS	IICA slave device opened successfully.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel is not available on this MCU.
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Invalid IRQ number assigned

◆ R_IICA_SLAVE_Read()

fsp_err_t R_IICA_SLAVE_Read (i2c_slave_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Performs a read from the IICA Master device.

This function will fail if there is already an in-progress IICA transfer on the associated channel. Otherwise, the IICA slave read operation will begin. The caller will be notified when the operation has finished by an I2C_SLAVE_EVENT_RX_COMPLETE in the callback. In case the master continues to write more data, an I2C_SLAVE_EVENT_RX_MORE_REQUEST will be issued via callback. In case of errors, an I2C_SLAVE_EVENT_ABORTED will be issued via callback.

Return values

FSP_SUCCESS	Function executed without issue
FSP_ERR_ASSERTION	p_api_ctrl, bytes or p_dest is NULL.
FSP_ERR_IN_USE	Another transfer was in progress.
FSP_ERR_NOT_OPEN	Device is not open.

◆ R_IICA_SLAVE_Write()

fsp_err_t R_IICA_SLAVE_Write (i2c_slave_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*)

Performs a write to the IICA Master device.

This function will fail if there is already an in-progress IICA transfer on the associated channel. Otherwise, the IICA slave write operation will begin. The caller will be notified when the operation has finished by an I2C_SLAVE_EVENT_TX_COMPLETE in the callback. In case the master continues to read more data, an I2C_SLAVE_EVENT_TX_MORE_REQUEST will be issued via callback. In case of errors, an I2C_SLAVE_EVENT_ABORTED will be issued via callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl or p_src is NULL.
FSP_ERR_IN_USE	Another transfer was in progress.
FSP_ERR_NOT_OPEN	Device is not open.

◆ R_IICA_SLAVE_CallbackSet()

fsp_err_t R_IICA_SLAVE_CallbackSet (i2c_slave_ctrl_t *const *p_api_ctrl*, void(*)(i2c_slave_callback_args_t *) *p_callback*, void const *const *p_context*, i2c_slave_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements i2c_slave_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ R_IICA_SLAVE_Close()

fsp_err_t R_IICA_SLAVE_Close (i2c_slave_ctrl_t *const *p_api_ctrl*)

Closes the IICA device.

Return values

FSP_SUCCESS	Device closed successfully.
FSP_ERR_NOT_OPEN	Device not opened.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.

Detailed Description

Driver for the SSIE peripheral on RA MCUs. This module implements the I2S Interface.

Overview

Features

The SSI module supports the following features:

- Transmission and reception of uncompressed audio data using the standard I2S protocol in master and slave modes
- Full-duplex I2S communication (channel 0 only)
- Integration with the DTC transfer module
- Internal connection to GPT timer output to generate the audio clock
- Callback function notification when all data is loaded into the SSI FIFO

Configuration

Build Time Configurations for r_ssi

The following build time configurations are defined in fsp_cfg/r_ssi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
DTC Support	• Enabled • Disabled	Enabled	If code for DTC transfer support is included in the build.

Configurations for Connectivity > I2S (r_ssi)

This module can be added to the Stacks tab via New Stack > Connectivity > I2S (r_ssi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_i2s0	Module name.
Channel	Value must be a non-negative integer	0	Specify the I2S channel.
Operating Mode (Master/Slave)	• Master Mode • Slave Mode	Master Mode	Select if the MCU is I2S master or slave.
Bit Depth	• 8 Bits • 16 Bits • 18 Bits • 20 Bits • 22 Bits • 24 Bits • 32 Bits	16 Bits	Select the bit depth of one sample of audio data.

Word Length	• 8 Bits • 16 Bits • 24 Bits • 32 Bits • 48 Bits • 64 Bits • 128 Bits • 256 Bits	16 Bits	Select the word length of audio data. Must be at least as large as Data bits.
WS Continue Mode	• Enabled • Disabled	Disabled	Enable WS continue mode to output the word select (WS) pin even when transmission is idle.
Bit Clock Source(available only in Master mode)	MCU Specific Options		Select External AUDIO_CLK for external signal to AUDIO_CLK input pin or Internal AUDIO_CLK for internal connection to MCU specific GPT channel. Please refer to the hardware manual for which GPT channel is connected to the internal signal
Bit Clock Divider(available only in Master mode)	Refer to the RA Configuration tool for available options.	Audio Clock / 1	Select divider used to generate bit clock from audio clock.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from all three interrupt service routines (ISR).
Transmit Interrupt Priority	MCU Specific Options		Select the transmit interrupt priority.
Receive Interrupt Priority	MCU Specific Options		Select the receive interrupt priority.
Idle/Error Interrupt Priority	MCU Specific Options		Select the Idle/Error interrupt priority.

Clock Configuration

The SSI peripheral runs on PCLKB. The PCLKB frequency can be configured on the **Clocks** tab of the RA Configuration editor. The SSI audio clock can optionally be supplied from an external source through the AUDIO_CLK pin in master mode.

Pin Configuration

The SSI uses the following pins:

- AUDIO_CLK (optional, master mode only): The AUDIO_CLK pin is used to supply the audio clock from an external source.
- SSIBCKn: Bit clock pin for channel n
- SSILRCKn/SSIFSn: Channel selection pin for channel n
- SSIRXD0: Reception pin for channel 0
- SSITXD0: Transmission pin for channel 0
- SSIDATA1: Transmission or reception pin for channel 1

Usage Notes

SSI Frames

An SSI frame is 2 samples worth of data. The frame boundary (end of previous frame, start of next frame) is on the falling edge of the SSILRCKn signal.

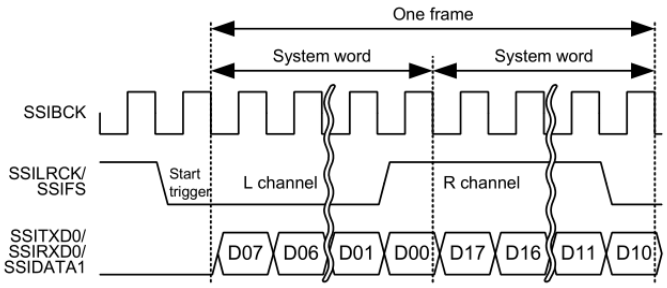

Figure 189: SSI Frame Diagram (8-bit word, 8-bit samples)

Note

If the word length is longer than the sample bit depth, padding bits (0) will be added after the sample.

Audio Data

Only uncompressed PCM data is supported.

Data arrays have the following size, alignment, and length based on the "Bit Depth" setting:

Bit Depth	Array Data Type	Required Alignment	Required Length (bytes)
8 Bits	8-bit integer	1 byte alignment	Multiple of 2
16 Bits	16-bit integer	2 byte alignment	Multiple of 4
18 Bits	32-bit integer, right justified	4 byte alignment	Multiple of 8
20 Bits	32-bit integer, right justified	4 byte alignment	Multiple of 8
22 Bits	32-bit integer, right justified	4 byte alignment	Multiple of 8
24 Bits	32-bit integer, right	4 byte alignment	Multiple of 8

	justified		
32 Bits	32-bit integer	4 byte alignment	Multiple of 8

Note

The length of the array must be a multiple of 2 when the data type is the recommended data type. The 2 represents the frame size (left and right channel) of I2S communication. The SSIE peripheral does not support odd read/write lengths in I2S mode.

Audio Clock

The audio clock is only required for master mode.

Audio Clock Frequency

The bit clock frequency is the product of the sampling frequency and channels and bits per system word:

bit_clock (Hz) = sampling_frequency (Hz) * channels * system_word_bits

I2S data always has 2 channels.

For example, the bit clock for transmitting 2 channels of 16-bit data (using a 16-bit system word) at 44100 Hz would be:

44100 * 2 * 16 = 1,411,200 Hz

The audio clock frequency is used to generate the bit clock frequency. It must be a multiple of the bit clock frequency. Refer to the Bit Clock Divider configuration for divider options. The input audio clock frequency must be:

audio_clock (Hz) = desired_bit_clock (Hz) * bit_clock_divider

To get a bit clock of 1.4 MHz from an audio clock of 2.8 MHz, select the divider Audio Clock / 2.

Audio Clock Source

The audio clock source can come from:

- An external source input to the AUDIO_CLK pin
- An internal connection to the GPT timer output

Note

When using the internal GPT timer output, Pin Output Support must be Enabled, and GTIOCA Output Enabled must be True.
See the SSIE section in the MCU hardware manual for information about which GPT channel may be used.

Limitations

Developers should be aware of the following limitations when using the SSI:

- When using channel 1, full duplex communication is not possible. Only tranmission or reception is possible.
- SSI must go idle before changing the communication mode (between read only, write only, and full duplex)

Examples

Basic Example

This is a basic example of minimal use of the SSI in an application.

```
#define SSI_EXAMPLE_SAMPLES_TO_TRANSFER (1024)
#define SSI_EXAMPLE_TONE_FREQUENCY_HZ (800)
int16_t g_src[SSI_EXAMPLE_SAMPLES_TO_TRANSFER];
int16_t g_dest[SSI_EXAMPLE_SAMPLES_TO_TRANSFER];
void ssi_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Create a stereo sine wave. Using formula sample = sin(2 * pi * tone_frequency * t
/ sampling_frequency) */
    uint32_t freq = SSI_EXAMPLE_TONE_FREQUENCY_HZ;
 for (uint32_t t = 0; t < SSI_EXAMPLE_SAMPLES_TO_TRANSFER / 2; t += 1)
    {
 float input = (((float) (freq * t)) * (float) (M_TWOPI)) /
SSI_EXAMPLE_AUDIO_SAMPLING_FREQUENCY_HZ;
       g_src[2 * t]    = (int16_t) ((INT16_MAX * sinf(input)));
       g_src[2 * t + 1] = (int16_t) ((INT16_MAX * sinf(input)));
    }
 /* Initialize the module. */
    err = R_SSI_Open(&g_i2s_ctrl, &g_i2s_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Transfer data. */
    (void) R_SSI_WriteRead(&g_i2s_ctrl,
                           (uint8_t *) &g_src[0],
                           (uint8_t *) &g_dest[0],
                           SSI_EXAMPLE_SAMPLES_TO_TRANSFER * sizeof(int16_t));
}
```

Streaming Example

This is an example of using SSI to stream audio data. This application uses a double buffer to store

PCM sine wave data. It starts transmitting in the main loop, then loads the next buffer if it is ready in the callback. If the next buffer is not ready, a flag is set in the callback so the application knows to restart transmission in the main loop.

This example also checks the return code of R_SSI_Write() because R_SSI_Write() can return an error if a transmit overflow occurs before the FIFO is reloaded. If a transmit overflow occurs before the FIFO is reloaded, the SSI will be stopped in the error interrupt, and it cannot be restarted until the I2S_EVENT_IDLE callback is received.

```
#define SSI_STREAMING_EXAMPLE_AUDIO_SAMPLING_FREQUENCY_HZ (22050)
#define SSI_STREAMING_EXAMPLE_SAMPLES_PER_CHUNK (1024)
#define SSI_STREAMING_EXAMPLE_TONE_FREQUENCY_HZ (800)
int16_t       g_stream_src[2][SSI_EXAMPLE_SAMPLES_TO_TRANSFER];
uint32_t      g_buffer_index          = 0;
volatile bool g_send_data_in_main_loop = true;
volatile bool g_data_ready = false;
/* Example callback called when SSI is ready for more data. */
void ssi_example_callback (i2s_callback_args_t * p_args)
{
 /* Reload the FIFO if we hit the transmit watermark or restart transmission if the
SSI is idle because it was
  * stopped after a transmit FIFO overflow. */
 if ((I2S_EVENT_TX_EMPTY == p_args->event) || (I2S_EVENT_IDLE == p_args->event))
    {
 if (g_data_ready)
      {
 /* Reload FIFO and handle errors. */
            ssi_example_write();
      }
 else
      {
 /* Data was not ready yet, send it in the main loop. */
            g_send_data_in_main_loop = true;
      }
    }
}
/* Load the transmit FIFO and check for error conditions. */
void ssi_example_write (void)
```

```
{
 /* Transfer data. This call is non-blocking. */
 fsp_err_t err = R_SSI_Write(&g_i2s_ctrl,
                             (uint8_t *) &g_stream_src[g_buffer_index][0],
                             SSI_STREAMING_EXAMPLE_SAMPLES_PER_CHUNK * sizeof
(int16_t));
 if (FSP_SUCCESS == err)
    {
 /* Switch the buffer after data is sent. */
       g_buffer_index = !g_buffer_index;
 /* Allow loop to calculate next buffer only if transmission was successful. */
       g_data_ready = false;
    }

Data Structures

struct	ssi_instance_ctrl_t
struct	ssi_extended_cfg_t

Enumerations

enum	ssi_audio_clock_t
enum	ssi_clock_div_t

Data Structure Documentation

◆ ssi_instance_ctrl_t

struct ssi_instance_ctrl_t
Channel instance control block. DO NOT INITIALIZE. Initialization occurs when i2s_api_t::open is called.

◆ ssi_extended_cfg_t

struct ssi_extended_cfg_t		
SSI configuration extension. This extension is optional.		
Data Fields		
ssi_audio_clock_t	audio_clock	Audio clock source, default is SSI_AUDIO_CLOCK_EXTERNAL.
ssi_clock_div_t	bit_clock_div	Select bit clock division ratio.

Enumeration Type Documentation

◆ ssi_audio_clock_t

enum ssi_audio_clock_t	
Audio clock source.	
Enumerator	
SSI_AUDIO_CLOCK_EXTERNAL	Audio clock source is the AUDIO_CLK input pin.
SSI_AUDIO_CLOCK_INTERNAL	Audio clock source is internal connection to a MCU specific GPT channel output.

◆ ssi_clock_div_t

enum ssi_clock_div_t	
Bit clock division ratio. Bit clock frequency = audio clock frequency / bit clock division ratio.	
Enumerator	
SSI_CLOCK_DIV_1	Clock divisor 1.
SSI_CLOCK_DIV_2	Clock divisor 2.
SSI_CLOCK_DIV_4	Clock divisor 4.
SSI_CLOCK_DIV_6	Clock divisor 6.
SSI_CLOCK_DIV_8	Clock divisor 8.
SSI_CLOCK_DIV_12	Clock divisor 12.
SSI_CLOCK_DIV_16	Clock divisor 16.
SSI_CLOCK_DIV_24	Clock divisor 24.
SSI_CLOCK_DIV_32	Clock divisor 32.
SSI_CLOCK_DIV_48	Clock divisor 48.
SSI_CLOCK_DIV_64	Clock divisor 64.
SSI_CLOCK_DIV_96	Clock divisor 96.
SSI_CLOCK_DIV_128	Clock divisor 128.

Function Documentation

◆ R_SSI_Open()

fsp_err_t R_SSI_Open (i2s_ctrl_t *const *p_ctrl*, i2s_cfg_t const *const *p_cfg*)

Opens the SSI. Implements i2s_api_t::open.

This function sets this clock divisor and the configurations specified in i2s_cfg_t. It also opens the timer and transfer instances if they are provided.

Return values

FSP_SUCCESS	Ready for I2S communication.
FSP_ERR_ASSERTION	The pointer to p_ctrl or p_cfg is null.
FSP_ERR_ALREADY_OPEN	The control block has already been opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel number is not available on this MCU.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::open

◆ R_SSI_Write()

fsp_err_t R_SSI_Write (i2s_ctrl_t *const *p_ctrl*, void const *const *p_src*, uint32_t const *bytes*)

Writes data buffer to SSI. Implements i2s_api_t::write.

This function resets the transfer if the transfer interface is used, or writes the length of data that fits in the FIFO then stores the remaining write buffer in the control block to be written in the ISR.

Write() cannot be called if another write(), read() or writeRead() operation is in progress. Write can be called when the SSI is idle, or after the I2S_EVENT_TX_EMPTY event.

Return values

FSP_SUCCESS	Write initiated successfully.
FSP_ERR_ASSERTION	The pointer to p_ctrl or p_src was null, or bytes requested was 0.
FSP_ERR_IN_USE	Another transfer is in progress, data was not written.
FSP_ERR_NOT_OPEN	The channel is not opened.
FSP_ERR_UNDERFLOW	A transmit underflow error is pending. Wait for the SSI to go idle before resuming communication.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

◆ R_SSI_Read()

fsp_err_t R_SSI_Read (i2s_ctrl_t *const *p_ctrl*, void *const *p_dest*, uint32_t const *bytes*)

Reads data into provided buffer. Implements i2s_api_t::read.

This function resets the transfer if the transfer interface is used, or reads the length of data available in the FIFO then stores the remaining read buffer in the control block to be filled in the ISR.

Read() cannot be called if another write(), read() or writeRead() operation is in progress. Read can be called when the SSI is idle, or after the I2S_EVENT_RX_FULL event.

Return values

FSP_SUCCESS	Read initiated successfully.
FSP_ERR_IN_USE	Peripheral is in the wrong mode or not idle.
FSP_ERR_ASSERTION	The pointer to p_ctrl or p_dest was null, or bytes requested was 0.
FSP_ERR_NOT_OPEN	The channel is not opened.
FSP_ERR_OVERFLOW	A receive overflow error is pending. Wait for the SSI to go idle before resuming communication.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

◆ R_SSI_WriteRead()

fsp_err_t R_SSI_WriteRead (i2s_ctrl_t *const *p_ctrl*, void const *const *p_src*, void *const *p_dest*, uint32_t const *bytes*)

Writes from source buffer and reads data into destination buffer. Implements i2s_api_t::writeRead.

This function calls R_SSI_Write and R_SSI_Read.

writeRead() cannot be called if another write(), read() or writeRead() operation is in progress. writeRead() can be called when the SSI is idle, or after the I2S_EVENT_RX_FULL event.

Return values

FSP_SUCCESS	Write and read initiated successfully.
FSP_ERR_IN_USE	Peripheral is in the wrong mode or not idle.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	The channel is not opened.
FSP_ERR_UNDERFLOW	A transmit underflow error is pending. Wait for the SSI to go idle before resuming communication.
FSP_ERR_OVERFLOW	A receive overflow error is pending. Wait for the SSI to go idle before resuming communication.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- transfer_api_t::reset

◆ R_SSI_Stop()

fsp_err_t R_SSI_Stop (i2s_ctrl_t *const *p_ctrl*)

Stops SSI. Implements i2s_api_t::stop.

This function disables both transmission and reception, and disables any transfer instances used.

The SSI will stop on the next frame boundary. Do not restart SSI until it is idle.

Return values

FSP_SUCCESS	I2S communication stop request issued.
FSP_ERR_ASSERTION	The pointer to p_ctrl was null.
FSP_ERR_NOT_OPEN	The channel is not opened.

Returns

See Common Error Codes or lower level drivers for other possible return codes.

◆ R_SSI_Mute()

fsp_err_t R_SSI_Mute (i2s_ctrl_t *const *p_ctrl*, i2s_mute_t const *mute_enable*)

Mutes SSI on the next frame boundary. Implements i2s_api_t::mute.

Data is still written while mute is enabled, but the transmit line outputs zeros.

Return values

FSP_SUCCESS	Transmission is muted.
FSP_ERR_ASSERTION	The pointer to p_ctrl was null.
FSP_ERR_NOT_OPEN	The channel is not opened.

◆ R_SSI_StatusGet()

fsp_err_t R_SSI_StatusGet (i2s_ctrl_t *const *p_ctrl*, i2s_status_t *const *p_status*)

Gets SSI status and stores it in provided pointer p_status. Implements i2s_api_t::statusGet.

Return values

FSP_SUCCESS	Information stored successfully.
FSP_ERR_ASSERTION	The p_instance_ctrl or p_status parameter was null.
FSP_ERR_NOT_OPEN	The channel is not opened.

◆ R_SSI_Close()

fsp_err_t R_SSI_Close (i2s_ctrl_t *const *p_ctrl*)

Closes SSI. Implements i2s_api_t::close.

This function powers down the SSI and closes the lower level timer and transfer drivers if they are used.

Return values

FSP_SUCCESS	Device closed successfully.
FSP_ERR_ASSERTION	The pointer to p_ctrl was null.
FSP_ERR_NOT_OPEN	The channel is not opened.

◆ R_SSI_CallbackSet()

fsp_err_t R_SSI_CallbackSet (i2s_ctrl_t *const *p_api_ctrl*, void(*)(i2s_callback_args_t *) *p_callback*, void const *const *p_context*, i2s_callback_args_t *const *p_callback_memory*)
Updates the user callback and has option of providing memory for callback structure. Implements i2s_api_t::callbackSet **Return values** FSP_SUCCESS — Callback updated successfully. FSP_ERR_ASSERTION — A required pointer is NULL. FSP_ERR_NOT_OPEN — The control block has not been opened. FSP_ERR_NO_CALLBACK_MEMORY — p_callback is non-secure and p_callback_memory is either secure or NULL.

fsp_err_t	R_I3C_Close (i3c_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the I3C peripheral on RA MCUs. This module implements the I3C Interface.

Overview

I3C is a communication protocol defined by MIPI that aims to improve on I2C by increasing the maximum transfer rate, as well as providing other features like "In-band Interrupts", "Dynamic Address Assignment", and a set of standard "Common Command Codes".

Features

- I3C Master Mode
- I3C Slave Mode
- Dynamic Address Assignment (ENTDAA/SETDASA)
- SDR Read/Write transfers
- HDR-DDR Read/Write Commands
- I2C Legacy Read/Write transfers
- In-Band Interrupts (Interrupt Requests, Hot-Join Requests)
- Common Command Codes
- Clock Stalling
- Timeout Detection

Master Mode

On an I3C bus, only one device may operate in master mode at a time. The current master is responsible for initiating I2C Legacy transfers, SDR transfers, Common Command Codes, and handling IBIs (Interrupt Requests, Hot-Join Requests). In order to perform these operations, the driver has an internal device table that is used for storing configuration information for each device on the bus (See i3c_device_table_cfg_t). Each entry in the device table contains the static or dynamic address of the device, and IBI permissions for accepting or rejecting IBI requests from the device. The device table has a limited number of entries as well as one extended device entry that only contains the static or dynamic address of a device (See below).

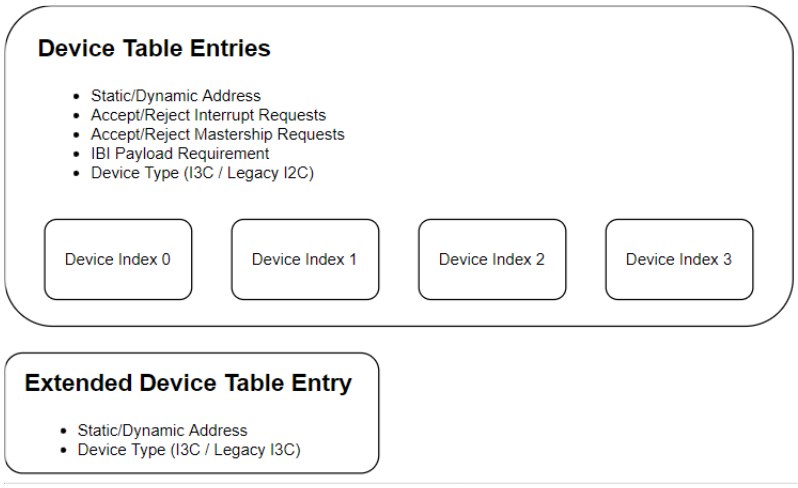

Figure 190: Master Device Table

In order to initiate I2C Legacy transfers, SDR transfers, or Common Command Codes, the master must select a device entry from the device table using i3c_api_t::deviceSelect. Once a device has been selected, all subsequent operations will be directed to the selected device until a new device is selected using i3c_api_t::deviceSelect.

The master may also receive IBI requests that are initiated by slave devices on the bus. If there is a payload, then the driver will write the data into a buffer that is provided by the application by calling i3c_api_t::ibiRead. If the application has not provided an IBI buffer prior to receiving an IBI, then the it will get a callback requesting an IBI buffer. Once the IBI is completed, the application will be notified by a callback.

Note

1. Even though there are only a limited number of device table entries and one extended device table entry, the application can operate on more devices by maintaining its own list of devices and updating the extended device entry as needed. Note however that devices defined in the extended device table entry will not be able to initiate IBI requests.

Main Master

The main master is responsible for configuring the dynamic address of all devices on the bus. The driver initiates this procedure by calling i3c_api_t::dynamicAddressAssignmentStart. Before starting address assignment, the application must configure the device table using i3c_api_t::masterDeviceTableSet.

Enter Dynamic Address Assignment (ENTDAA):

The application initiates the ENTDAA operation by calling i3c_api_t::dynamicAddressAssignmentStart with a starting index into the master device table and a count specifying the number of devices to configure. The master starts by sending the ENTDAA command. Every I3C device on the bus that has not already been initialized will acknowledge the command and attempt to write its Provisional ID, DCR, and BCR registers. The device with the smallest value in these registers will win arbitration and be assigned with the first dynamic address defined in the master device table. The master will then increment the index and repeat the process by assigning the dynamic address to the next device. The process continues until the specified number of devices have been initialized or until there are no more devices to configure.

Note

1. The IBI payload setting will automatically be updated in the master device table based on the BCR setting that was read during ENTDAA.
2. After each device successfully writes its Provisional ID, DCR, and BCR registers, the application will get a callback that will provide the value of the registers.
3. If the starting index is set to the extended device entry, then the device count must be set to 1.
4. The main master assigns its own dynamic address with i3c_api_t::deviceCfgSet.

Set Dynamic Address from Static Address (SETDASA):

The application initiates the SETDASA operation by calling i3c_api_t::dynamicAddressAssignmentStart with an index into the master device table. The master sends the SETDASA command to the static address defined in the given device table entry, and then assigns the associated dynamic address.

Note

1. Set the count to 0 when using SETDASA.

Slave Mode

In slave mode, the device configures its static address, Provisional ID, BCR, and DCR registers using i3c_api_t::deviceCfgSet, and then waits for the master to initiate communication. Prior to being assigned a dynamic address, the slave will operate as an I2C device using its static address. The application will receive a callback when the master assigns it a dynamic address, after which point, the slave will operate as an I3C device until it receives the RSTDAA command.

Depending on the capabilities defined in its BCR register, the slave may also initiate IBI Interrupt Requests, and Hot-Join Requests using i3c_api_t::ibiWrite

Configuration

Build Time Configurations for r_i3c

The following build time configurations are defined in fsp_cfg/r_i3c_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Unaligned Buffer Support	• Enabled • Disabled	Enabled	Unaligned buffer support may be optionally disabled for improved performance.
Master Support	• Enabled • Disabled	Enabled	If only slave mode is required, disable master support to decrease code size.
Slave Support	• Enabled • Disabled	Enabled	If only master mode is required, disable slave

			support to decrease code size.
Error Recovery Procedure	MCU Specific Options		There are two different chip versions of the RA2E2/RA2L2 MCU (Version 1 and Version 2). Each version requires a different procedure for recovering from errors.

Configurations for Connectivity > I3C (r_i3c)

This module can be added to the Stacks tab via New Stack > Connectivity > I3C (r_i3c).

Configuration	Options	Default	Description
Bitrate Settings			
Bitrate Settings > Standard Mode			
Bitrate Settings > Standard Mode > Open-Drain			
Logic High Period (ns)	Must be an integer greater than 0.	167	The Logic High period of SCL during Standard Mode Open Drain transfers.
Frequency	Must be an integer greater than 0.	1000000	The Frequency of SCL during Standard Mode Open Drain transfers.
Bitrate Settings > Standard Mode > Push-Pull			
Logic High Period (ns)	The Logic High Period must be greater than or equal to 24 Nanoseconds.	167	The Logic High period of SCL during Standard Mode Push Pull transfers.
Frequency	Push-Pull frequency must be greater than or equal to 10000 Hz.	3400000	The Frequency of SCL during Standard Mode Push-Pull transfers.
Bitrate Settings > Extended Mode			
Bitrate Settings > Extended Mode > Open-Drain			
Logic High Period (ns)	Must be an integer greater than 0.	167	The Logic High period of SCL during Extended Mode Open Drain transfers.
Frequency	Must be an integer greater than 0.	1000000	The Frequency of SCL during Extended Mode Open Drain transfers.
Bitrate Settings > Extended Mode > Push-Pull			
Logic High Period (ns)	The Logic High Period	167	The Logic High period

	must be greater than or equal to 24 Nanoseconds.		of SCL during Extended Mode Push Pull transfers.
Frequency	Push-Pull frequency must be greater than or equal to 10000 Hz.	3400000	The Frequency of SCL during Extended Mode Push-Pull transfers.
Bitrate Settings > Bus Timing			
Open Drain Rising Time (ns)	Rising time must be greater than or equal to 0 nanoseconds.	0	The Open Drain rising time in nanoseconds.
Open Drain Falling Time (ns)	Falling time must be greater than or equal to 0 nanoseconds.	0	The Open Drain falling time in nanoseconds.
Push-Pull Rising Time (ns)	Rising time must be greater than or equal to 0 nanoseconds.	0	The Push-Pull rising time in nanoseconds.
Push-Pull Falling Time (ns)	Falling time must be greater than or equal to 0 nanoseconds.	0	The Push-Pull rising time in nanoseconds.
Bitrate Settings > Clock Stalling			
Address Assignment Phase	• Enabled • Disabled	Disabled	Enable clock stalling during the Address Assignment Phase of ENTDAA.
Transition Phase	• Enabled • Disabled	Disabled	Enable clock stalling during the Transition Bit of a read transfer.
Parity Phase	• Enabled • Disabled	Disabled	Enable clock stalling during the Parity Bit of a write transfer.
Ack Phase	• Enabled • Disabled	Disabled	Enable clock stalling during the ACK phase of a transfer.
Time (us)	Must be greater than or equal to 0.	0	The amount of time to stall the clock during the Address Assignment Phase, Transition Phase, Parity Phase, and ACK Phase.
Master Mode			
ACK Hot-Join Requests	• Enabled • Disabled	Disabled	If enabled, the I3C instance will ACK Hot-Join Requests and notify the application.
Notify Rejected Hot-Join	• Enabled	Disabled	If enabled, the

Requests.	• Disabled		application will get a callback when an IBI Hot-Join Request is rejected.
Notify Rejected Mastership Requests.	• Enabled • Disabled	Disabled	If enabled, the application will get a callback when an IBI Mastership Request is rejected.
Notify Rejected Interrupt Requests.	• Enabled • Disabled	Disabled	If enabled, the application will get a callback when an IBI Interrupt Request is rejected.
Slave Mode			
Slave Mode > Command Response Info			
Slave Mode > Command Response Info > ENEC/DISEC			
In-Band Interrupts	• Enabled • Disabled	Disabled	Configure whether the slave can issue IBI requests.
Hot-Join Requests	• Enabled • Disabled	Disabled	Configure whether the slave can issue Hot-Join requests.
Slave Mode > Command Response Info > ENTASn			
Activity State	• Activity State 0 • Activity State 1 • Activity State 2 • Activity State 3	Activity State 0	Configure the starting activity state of the slave.
Slave Mode > Command Response Info > SETMWL/GETMWL			
Max Write Length	Write length must be in the range of [8, 65535].	65535	Set the max write length.
Slave Mode > Command Response Info > SETMRL/GETMRL			
Max Read Length	Read length must be in the range of [16, 65535].	65535	Set the max read length.
Max IBI Payload Length	Read length must be in the range of [0, 255].	0	Set the max IBI payload length, or set it to 0 for unlimited.
Slave Mode > Command Response Info > GETMXDS			
Write Data Rate	• FSCL_MAX • 8Mhz • 6Mhz • 4Mhz • 2Mhz	2Mhz	Set the max write data rate.

Read Data Rate	• FSCL_MAX • 8Mhz • 6Mhz • 4Mhz • 2Mhz	2Mhz	Set the max read data rate.
Clock to Data Turnaround Time	• 8 Nanoseconds • 9 Nanoseconds • 10 Nanoseconds • 11 Nanoseconds • 12 Nanoseconds • Greater than 12 Nanoseconds	8 Nanoseconds	Set the clock to data turnaround time.
Include Max Read Turnaround Time	• Enabled • Disabled	Disabled	Configure whether the Max Read Turnaround time will be transmitted.
Max Read Turnaround Time	Value must be in the range [0, 255].	0	Set max read turnaround time.
Slave Mode > Command Response Info > GETXTIME			
Frequency Byte	Value must be in the range [0, 255].	0	Set the internal oscillator frequency in increments of 0.5 Mhz.
Inaccuracy Byte	Value must be in the range [0, 255].	0	Set the oscillator inaccuracy byte in increments of 0.5%
Slave Mode > Command Response Info > GETCAP/GETHDRCAP			
HDR-DDR (Mode 0)	MCU Specific Options		Slave supports HDR-DDR (Mode 0)
HDR-TSP (Mode 1)	MCU Specific Options		Slave supports HDR-TSP (Mode 1)
HDR-TSL (Mode 2)	MCU Specific Options		Slave supports HDR-TSL (Mode 2)
Interrupts			
Interrupt Priority	MCU Specific Options		The interrupt priority of the RX, TX, RESPONSE, RCV_STATUS, and IBI ISRs.
Error and Event Interrupt Priority	MCU Specific Options		The interrupt priority of the EEI ISR which is used to notify the application when an Internal Error, HDR Exit Pattern, or Timeout is

			detected.
Name	Name must be a valid C symbol	g_i3c0	Module name.
Callback	Name must be a valid C symbol	g_i3c0_callback	A user callback function must be provided. This will be called in order to notify the application of I3C events and provide status information.
Callback Context	Name must be a valid C symbol	NULL	A pointer to additional application specific information that is provided to the callback.
Device Type	• Main Master • Slave	Slave	The role that the I3C instance will take on the I3C bus.
Bus Free Condition Detection Time (ns)	Must be greater than or equal to 38.4 nanoseconds.	38.4	The minimum period occurring after a STOP and before a START.
Bus Available Condition Detection Time (us)	Must be greater than or equal to 1 microsecond.	1	The minimum period occurring after the Bus Free Condition when Slaves can initiate IBI requests.
Bus Idle Condition Detection Time (us)	Must be greater than or equal to 1000 microseconds.	1000	The minimum period occurring after the Bus Available Condition when Slaves can initiate Hot-Join requests.
Timeout Detection	• Enabled • Disabled	Disabled	If enabled, the application will get a callback if SCL is stuck at a logic high or logic low level for more than 65535 cycles of the I3C source clock.

Clock Configuration

The following settings are used to configure the timing of SCL.

- Frequency of TCLK
- Standard Mode
    - Open Drain High Period (T_{HIGH})
    - Open Drain Frequency
    - Push-Pull High Period (T_{HIGH})
    - Push-Pull Frequency

- Extended Mode
  - Open Drain High Period (T_{HIGH})
  - Open Drain Frequency
  - Push-Pull High Period (T_{HIGH})
  - Push-Pull Frquency
- i3c_bitrate_mode_t (Set during i3c_api_t::deviceSelect)

The Standard and Extended Mode settings define two separate SCL configurations that can be selected at run-time using i3c_api_t::deviceSelect.

In addition to selecting between the Standard and Extended Mode settings, the base SCL period can also be multiplied using the following options:

- I3C_BITRATE_MODE_I3C_SDR2_STDBR_X2: Multiple the base Standard Open Drain and Push-Pull period by 2.
- I3C_BITRATE_MODE_I3C_SDR3_EXTBR_X2: Multiple the base Extended Open Drain and Push-Pull period by 2.
- I3C_BITRATE_MODE_I3C_SDR4_EXTBR_X4: Multiple the base Extended Open Drain and Push-Pull period by 4.

In order to get accurate frequency calculations, the Rising and Falling edges must be input into the calculation. These values will depend on the topology the I3C bus that will be different for every application.

Note

1. The Standard and Extended Open Drain period settings define the period to use during legacy I2C transfers (Only use the following i3c_bitrate_mode_t settings with I2C transfers: I3C_BITRATE_MODE_I2C_STDBR, I3C_BITRATE_MODE_I2C_EXTBR).
2. T_{HIGH} is defined in Figure 31 in the MIPI I3C Specification v1.0 and describes the Logic High period.
3. Depending on the MCU, TCLK is either derived from PCLKD or from a dedicated I3C Clock (I3CCLK).

Pin Configuration

The I3C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I3C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Read and Write in Slave Mode

In slave mode, calling read or write does not start a transfer. Instead, calling read or write will configure the driver to perform the next read or write transfer using the user provided buffer.

Provided that a transfer is not already in progress, i3c_api_t::read and i3c_api_t::write can be called to update the internal buffers even if the transfer has not been completed yet. Both the read and write buffers can be configured at the same time in order to prepare the driver for when the master initiates a read or a write transfer.

If there is no space remaining in a user configured read buffer, the application will get a I3C_EVENT_READ_BUFFER_FULL callback requesting for a new read buffer to be provided.

Event Status

When a write, read, ibiWrite, ibiRead or commandSend, operation is completed, the i3c_callback_args_t::event_status should be checked. The event_status will provide information about the success or failure of the operation.

The following are possible statuses:

- I3C_EVENT_STATUS_SUCCESS
- I3C_EVENT_STATUS_PARITY
- I3C_EVENT_STATUS_FRAME
- I3C_EVENT_STATUS_ADDRESS_HEADER
- I3C_EVENT_STATUS_NACK
- I3C_EVENT_STATUS_OVERFLOW
- I3C_EVENT_STATUS_ABORTED_TO_MASTER
- I3C_EVENT_STATUS_ABORTED

Note

In master mode, if the master issues a stop condition before the slave ends the transfer via the 'T' bit, the status will be I3C_EVENT_STATUS_ABORTED.
In slave mode, if the master issues a stop condition before the slave ends the transfer via the 'T' bit, the status will be I3C_EVENT_STATUS_ABORTED_TO_MASTER.

Direct Get Common Command Codes in Slave Mode

When an I3C slave receives a Command Code of type Direct Get, the response is automatically sent from the device Special Function Registers (SFR). The SFR contains information for each command code and can be configured during open (See i3c_extended_cfg_t::slave_command_response_info). This allows the slave to respond to Direct Get Command Codes much faster, and removes the burden of responding to these commands from the application.

The response to the GETSTATUS command can be configured at run-time using i3c_api_t::slaveStatusSet.

Disabling Unaligned Buffer Support

Support for performing read and write operations on unaligned buffers can be disabled in order to improve performance. When unaligned buffer support is disabled, all buffers passed to read, ibiRead, write, ibiWrite, and commandSend must be aligned to 4 bytes and the size of the buffers must be a multiple of 4 bytes.

In master mode, the value of the length passed to i3c_api_t::read and i3c_api_t::write sets the total length of the operation in bytes. During the read or write operation, the driver may read or write to the last word of memory during the operation. This means that the allocated memory for the buffer passed to read and write needs to be a multiple of 4 bytes even though the transfer length is not a multiple of 4 bytes.

In slave mode, the length passed to i3c_api_t::read must be a multiple of 4 bytes. The length passed to i3c_api_t::write sets the number of bytes that the slave will write. The size of the buffer passed to write still needs to be a multiple of 4 bytes.

Max Data Speed Limitation on RA2E2 MCUs

In Slave Mode, it is highly recommended that BCR[0] be set to '1' in order to indicate to the master that the device doesn't support the max data speed. The master is then required to use the GETMXDS command to get the device specific data speed limitations.

This will allow the slave to specify its maximum supported data rate for read/write, and the maximum read turnaround time (See GETMXDS in the MIPI I3C Specification v1.0).

Mixed Fast Bus

The MIPI I3C Specification v1.0 defines a Mixed Fast Bus as a bus that has legacy I2C devices that all have a 50ns Spike Filter.

On Mixed Fast Buses, SCL has the following constraints during I3C SDR transfers:

- SCL High Period: $t_{DIG\_H\_MIXED(MIN)}$ to $t_{DIG\_H\_MIXED(MAX)}$
- SCL Low Period: Up to $t_{DIG\_L(MAX)}$

In this case, configure the Extended Bitrate settings for I3C SDR transfers, and use the Standard Bitrate settings for I2C transfers.

Note

1. See section 5.1.2.4 in the MIPI I3C Specification v1.0.

Mixed Slow Bus

The MIPI I3C Specification v1.0 defines a Mixed Slow Bus as a bus that has legacy I2C devices that do not have a 50ns Spike Filter.

In this case, the SCL frequency is limited to I2C Fast Mode or I2C Fast Mode Plus.

Note

1. See section 5.1.2.4 in the MIPI I3C Specification v1.0.

RA2E2 MCU Version

There are two versions of the RA2E2. The version number can be identified by the part number or by reading the MCU Version Register.

Part Number	Chip Version
R7FA2E2A72DNK::HA0	Version 1
R7FA2E2A72DNK::HA1	Version 2
R7FA2E2A72DNK::AA0	Version 1
R7FA2E2A72DNK::AA1	Version 2

The I3C peripheral on the RA2E2 Version 1 has a hardware limitation related to using dynamic address assignment in slave mode. When the ENTDAA command is received, the peripheral will continue driving its PID, DCR, and BCR registers during arbitration even after its dynamic address has already been configured. This will prevent any other devices on the bus from being configured after the RA2E2 Version 1 device has been configured. One workaround for this limitation is to configure the Provisional ID to all '1's in order to ensure that the RA2E2 Version 1 device is configured last. If more than one RA2E2 Version 1 device is present on the same bus, consider initializing them using another method (Eg. SETDASA). **Note that this issue has been corrected on the RA2E2 Version 2 (Part numbers ending in #AA1 or #HA1).**

In addition to fixing this hardware limitation, the revised I3C peripheral on the RA2E2 version 2 also greatly simplifies the error recovery procedures. By default, the driver will automatically include the

error recovery procedures for both versions, however, it can be configured to only support version 1 or version 2 procedures in order to reduce code size.

Limitations

Developers should be aware of the following limitations when using the I3C:

- The MIPI Reserved area and Vendor Extension area of Command Codes are not supported.
- Mixed Fast Bus topology has the following limitation on RA2E2 MCUs. The minimum SCL high period (T_{DIG_H}) is 156 nanoseconds when PCLKD is 48 Mhz, and 120 nanoseconds when PCLKD is 64 Mhz. On a Mixed Fast Bus, the high period $T_{DIG\_HIGH\_MIXED}$ must be less than 45 nanoseconds in order to ensure that Legacy I2C devices do not interpret I3C signaling as valid I2C signaling (See Table 111 Push-Pull-Timing Parameters in the MIPI I3C Specification v1.1). This required high period cannot be achievable with RA2E2 MCUs.
- Secondary Master device role is not currently supported.

Examples

I3C Master Basic Example

This is a basic example of minimal use of the I3C Master in an application.

```
void i3c_master_basic_example (void)
{
 /* Initializes the module. */
 fsp_err_t status = R_I3C_Open(&g_i3c_ctrl, &g_i3c_cfg);
    assert(FSP_SUCCESS == status);
 static i3c_device_cfg_t master_device_cfg =
    {
 /* This is the Static I3C / I2C Legacy address defined by the device manufacturer.
*/
       .static_address = EXAMPLE_MASTER_STATIC_ADDRESS,
 /* If the device is a main master, it must configure its own dynamic address. */
       .dynamic_address = EXAMPLE_MASTER_DYNAMIC_ADDRESS,
    };
    status = R_I3C_DeviceCfgSet(&g_i3c_ctrl, &master_device_cfg);
    assert(FSP_SUCCESS == status);
 static i3c_device_table_cfg_t device_table_cfg =
    {
 /* This is the Static I3C / I2C Legacy address defined by the device manufacturer.
*/
       .static_address       = EXAMPLE_STATIC_ADDRESS,
```

```
 /* Dynamic address is not used in I2C. */
       .dynamic_address       = EXAMPLE_DYNAMIC_ADDRESS,
 /* This is the type of device. It may be either an I2C device or an I3C device. */
       .device_protocol       = I3C_DEVICE_PROTOCOL_I3C,
       .ibi_accept            = false,
 /* Depending on the device the IBI requests may have a data payload.
  * Note that this field will be automatically updated if the device is configured
using ENTDAA.
  */
       .ibi_payload          = false,
 /* Master requests cannot be accepted because Secondary Master is not supported. */
       .master_request_accept = false,
    };
 /* Set the device configuration in the master device table. */
    status = R_I3C_MasterDeviceTableSet(&g_i3c_ctrl, 0, &device_table_cfg);
    assert(FSP_SUCCESS == status);
 /* Enable the I3C device. */
    status = R_I3C_Enable(&g_i3c_ctrl);
    assert(FSP_SUCCESS == status);
 /* Start assigning dynamic addresses to devices on the bus using the ENTDAA command.
*/
    status = R_I3C_DynamicAddressAssignmentStart(&g_i3c_ctrl,
I3C_ADDRESS_ASSIGNMENT_MODE_ENTDAA, 0, 1);
    assert(FSP_SUCCESS == status);
 /* Wait for dynamic address assignment to complete. */
    i3c_app_event_wait(I3C_EVENT_ADDRESS_ASSIGNMENT_COMPLETE);
 /* Select the configured device and bitrate mode for the following operations. */
    status = R_I3C_DeviceSelect(&g_i3c_ctrl, 0, I3C_BITRATE_MODE_I3C_SDR0_STDBR);
    assert(FSP_SUCCESS == status);
 /* Start a write transfer. */
 static uint8_t p_write_buffer[] = {1, 2, 3, 4, 5};
    status = R_I3C_Write(&g_i3c_ctrl, p_write_buffer, sizeof(p_write_buffer), false);
    assert(FSP_SUCCESS == status);
 /* Wait for the write transfer to complete. */
```

```
    i3c_app_event_wait(I3C_EVENT_WRITE_COMPLETE);
 /* Start a read transfer. */
 static uint8_t p_read_buffer[16];
    status = R_I3C_Read(&g_i3c_ctrl, p_read_buffer, sizeof(p_read_buffer), false);
    assert(FSP_SUCCESS == status);
 /* Wait for the read transfer to complete. */
    i3c_app_event_wait(I3C_EVENT_READ_COMPLETE);
}
/* This function is called by the I3C driver from ISRs in order to notify the
application of I3C events. */
void i3c_master_basic_example_callback (i3c_callback_args_t const * const p_args)
{
 switch (p_args->event)
    {
 case I3C_EVENT_ENTDAA_ADDRESS_PHASE:
      {
 /* The device PID, DCR, and BCR registers will be available in
i3c_callback_args_t::p_slave_info. */
 break;
       }
 case I3C_EVENT_ADDRESS_ASSIGNMENT_COMPLETE:
      {
            i3c_app_event_notify(I3C_EVENT_ADDRESS_ASSIGNMENT_COMPLETE);
 break;
       }
 case I3C_EVENT_WRITE_COMPLETE:
      {
            i3c_app_event_notify(I3C_EVENT_WRITE_COMPLETE);
 break;
       }
 case I3C_EVENT_READ_COMPLETE:
      {
 /* The number of bytes read from the slave will be available in
i3c_callback_args_t::transfer_size. */
```

```
            i3c_app_event_notify(I3C_EVENT_READ_COMPLETE);
 break;
       }
 default:
      {
 break;
       }
    }
}
```

I3C Slave Basic Example

This is a basic example of minimal use of the I3C Slave in an application.

```
void i3c_slave_basic_example (void)
{
 /* Initializes the module. */
 fsp_err_t status = R_I3C_Open(&g_i3c_ctrl, &g_i3c_cfg);
    assert(FSP_SUCCESS == status);
 static i3c_device_cfg_t slave_device_cfg =
    {
 /* This is the Static I3C / I2C Legacy address defined by the device manufacturer.
*/
       .static_address = EXAMPLE_STATIC_ADDRESS,
 /* The dynamic address will be automatically updated when the master configures this
device using ENTDAA. */
       .dynamic_address = 0,
 /* Device Registers that are read by the master. */
       .slave_info      =
      {
            .bcr = EXAMPLE_BCR_SETTING,
            .dcr = EXAMPLE_DCR_SETTING,
            .pid =
      {
                0, 1, 2, 3, 4, 5
```

```
        }
      }
   };
 /* Set the device configuration for this device. */
   status = R_I3C_DeviceCfgSet(&g_i3c_ctrl, &slave_device_cfg);
   assert(FSP_SUCCESS == status);
 /* Enable Slave Mode. */
   status = R_I3C_Enable(&g_i3c_ctrl);
   assert(FSP_SUCCESS == status);
 static uint8_t p_read_buffer[EXAMPLE_READ_BUFFER_SIZE];
 static uint8_t p_write_buffer[EXAMPLE_WRITE_BUFFER_SIZE];
 /* Set the buffer for storing data received during a read transfer. */
   status = R_I3C_Read(&g_i3c_ctrl, p_read_buffer, sizeof(p_read_buffer), false);
   assert(FSP_SUCCESS == status);
 /* Wait for the master to complete a read transfer. */
   i3c_app_event_wait(I3C_EVENT_READ_COMPLETE);
 /* Set the write buffer that will be transmitted during a write transfer. */
   status = R_I3C_Write(&g_i3c_ctrl, p_write_buffer, sizeof(p_write_buffer), false);
   assert(FSP_SUCCESS == status);
 /* Wait for the master to complete a write transfer. */
   i3c_app_event_wait(I3C_EVENT_WRITE_COMPLETE);
}

i3c_callback_args_t::transfer_size. */
            i3c_app_event_notify(I3C_EVENT_READ_COMPLETE);
 break;
       }
 default:
      {
 break;
       }
    }
}
```

I3C Master In-band Interrupts Example

This is a basic example of reading In-band Interrupts in I3C Master mode.

```
void i3c_master_ibi_basic_example (void)
{
 static uint8_t p_ibi_read_buffer[EXAMPLE_READ_BUFFER_SIZE];
 /* Set the buffer for storing IBI data that is read from the slave. */
 fsp_err_t status = R_I3C_IbiRead(&g_i3c_ctrl, p_ibi_read_buffer, sizeof
(p_ibi_read_buffer));
    assert(FSP_SUCCESS == status);
 /* Wait for the ibiRead transfer to complete.
  * Note that the master does not need to wait for the IBI, and can start other
operations. */
    i3c_app_event_wait(I3C_EVENT_IBI_READ_COMPLETE);
}
void i3c_master_ibi_basic_example_callback (i3c_callback_args_t const * const p_args)
{
```

```
 switch (p_args->event)
    {
 case I3C_EVENT_IBI_READ_BUFFER_FULL:
      {
 /* If there is no user provided ibiRead buffer, or if the user provided ibiRead
buffer has been filled,
  * the driver will notify the application that the buffer is full. The application
may provide
  * a new read buffer by calling i3c_api_t::ibiRead. If no read buffer is provided,
then any remaining bytes
  * in the transfer will be dropped. */
            uint8_t * p_read_buffer = i3c_app_next_read_buffer_get();
 R_I3C_IbiRead(&g_i3c_ctrl, p_read_buffer, EXAMPLE_READ_BUFFER_SIZE);
 break;
       }
 case I3C_EVENT_IBI_READ_COMPLETE:
      {
 /* When an IBI is completed, the transfer_size, ibi_type, and ibi_address will be
available in p_args. */
 switch (p_args->ibi_type)
      {
 case I3C_IBI_TYPE_INTERRUPT:
      {
 /* Notify the application that an IBI was read. */
                  i3c_app_event_notify(I3C_EVENT_IBI_READ_COMPLETE);
 break;
         }
 case I3C_IBI_TYPE_HOT_JOIN:
      {
 /* If a Hot-Join event is received, then the master can initiate the dynamic address
assignment procedure. */
 R_I3C_DynamicAddressAssignmentStart(&g_i3c_ctrl, I3C_ADDRESS_ASSIGNMENT_MODE_ENTDAA,
0, 1);
 break;
```

```
        }
 default:
     {
 break;
        }
        }
      }
 default:
     {
 break;
      }
   }
}
```

I3C Slave In-band Interrupts Example

This is a basic example of writing In-band Interrupts in I3C Slave mode.

```
void i3c_slave_ibi_write_basic_example (void)
{
    uint8_t ibi_write_buffer[EXAMPLE_WRITE_BUFFER_SIZE] = {0};
 /* Initiate an In-band interrupt in slave mode.
  * Note: If the slave does not have an IBI payload or if it is a Hot-Join request,
the write buffer should be set
  * to NULL and the write length should be set to 0. */
 fsp_err_t status = R_I3C_IbiWrite(&g_i3c_ctrl, I3C_IBI_TYPE_INTERRUPT,
ibi_write_buffer, sizeof(ibi_write_buffer));
    assert(FSP_SUCCESS == status);
 /* Wait for the ibiWrite transfer to complete. */
    i3c_app_event_wait(I3C_EVENT_IBI_WRITE_COMPLETE);
}
void i3c_slave_ibi_write_basic_example_callback (i3c_callback_args_t const * const
p_args)
{
 switch (p_args->event)
```

```
   {
 case I3C_EVENT_IBI_WRITE_COMPLETE:
      {
 /* Notify the application that the IBI write is complete. */
           i3c_app_event_notify(I3C_EVENT_IBI_WRITE_COMPLETE);
 break;
       }
 default:
      {
 break;
       }
   }
}
```

I3C Master Common Command Codes Example

This is a basic example of sending Common Command Codes in I3C Master mode.

```
void i3c_master_ccc_example (void)
{
 static uint8_t command_buffer[EXAMPLE_READ_BUFFER_SIZE];
 /* Setup the command descriptor. */
 static i3c_command_descriptor_t command_descriptor =
   {
      .command_code = I3C_CCC_DIRECT_GETSTATUS,
 /* Set a buffer for storing the data read by the command. */
      .p_buffer    = command_buffer,
 /* The length for a GETSTATUS command is 2 bytes. */
      .length       = 2,
 /* Terminate the transfer with a STOP condition. */
      .restart      = false,
 /* The GETSTATUS command is a Direct Get Command so rnw should be true. */
      .rnw          = true,
   };
 /* Send the command. */
```

```
 fsp_err_t status = R_I3C_CommandSend(&g_i3c_ctrl, &command_descriptor);
    assert(FSP_SUCCESS == status);
 /* Wait for the command to complete. */
    i3c_app_event_wait(I3C_EVENT_COMMAND_COMPLETE);
 /* The command_buffer will have the status info that was read from the slave device.
*/
}
void i3c_master_ccc_example_callback (i3c_callback_args_t const * const p_args)
{
 switch (p_args->event)
    {
 case I3C_EVENT_COMMAND_COMPLETE:
      {
 /* Notify the application that the command is complete. */
            i3c_app_event_notify(I3C_EVENT_COMMAND_COMPLETE);
 break;
       }
 default:
      {
 break;
       }
    }
}
```

I3C Slave Common Command Codes Example

This is a basic example of receiving Common Command Codes in I3C Slave mode.

```
void i3c_slave_ccc_example (void)
{
 static uint8_t read_buffer[EXAMPLE_READ_BUFFER_SIZE];
 /* Broadcast and Direct Set commands will be read into the read_buffer the same way
that
  * a normal SDR Master Write / Slave Read transfer is read. */
 fsp_err_t status = R_I3C_Read(&g_i3c_ctrl, read_buffer, sizeof(read_buffer), false);
```

```
    assert(FSP_SUCCESS == status);
 /* Wait for the command to complete. */
    i3c_app_event_wait(I3C_EVENT_COMMAND_COMPLETE);
}
void i3c_slave_ccc_example_callback (i3c_callback_args_t const * const p_args)
{
 switch (p_args->event)
    {
 case I3C_EVENT_COMMAND_COMPLETE:
      {
 /* The command code and transfer size will be available in p_args.
  * If the command code is a Broadcast or Direct Set, then data will
  * be stored in the read buffer provided by i3c_api_t::read.
  * If the command code is a Direct Get, then the data will be automatically
  * sent from device SFR. */
            i3c_app_event_notify(I3C_EVENT_COMMAND_COMPLETE);
 break;
       }
 default:
      {
 break;
       }
    }
}
```

I3C HDR Command Example

This is a basic example of sending an HDR command

```
#define I3C_HDR_COMMAND_CODE (0x55)
#define I3C_HDR_COMMAND_LENGTH (16)
void i3c_hdr_command_example (void)
{
 static uint8_t command_buffer[EXAMPLE_READ_BUFFER_SIZE];
 /* Setup the command descriptor. */
```

```
 static i3c_command_descriptor_t command_descriptor =
    {
 /* Specify the command code for the HDR transfer. */
       .command_code = I3C_HDR_COMMAND_CODE,
 /* Set a buffer for writing command data. */
       .p_buffer    = command_buffer,
 /* The length for command (HDR commands must be a multiple of 2 bytes). */
       .length       = I3C_HDR_COMMAND_LENGTH,
 /* Terminate the transfer with a HDR-EXIT. */
       .restart      = false,
 /* Specify if this is a read/write command. */
       .rnw          = false,
    };
 /* Select the HDR mode for subsequent transfers. */
 fsp_err_t status = R_I3C_DeviceSelect(&g_i3c_ctrl, 0,
I3C_BITRATE_MODE_I3C_HDR_DDR_STDBR);
    assert(FSP_SUCCESS == status);
 /* Send the command. */
    status = R_I3C_CommandSend(&g_i3c_ctrl, &command_descriptor);
    assert(FSP_SUCCESS == status);
 /* Wait for the command to complete. */
    i3c_app_event_wait(I3C_EVENT_COMMAND_COMPLETE);
}
void i3c_hdr_command_example_callback (i3c_callback_args_t const * const p_args)
{
 switch (p_args->event)
    {
 case I3C_EVENT_COMMAND_COMPLETE:
      {
 /* Notify the application that the command is complete. */
            i3c_app_event_notify(I3C_EVENT_COMMAND_COMPLETE);
 break;
       }
 default:
```

```
      {
 break;
       }
    }
}
```

Data Structure Documentation

◆ i3c_clock_stalling_t

struct i3c_clock_stalling_t
Clock stalling settings.

Data Fields		
uint32_t	assigned_address_phase_enable: 1	Enable Clock Stalling during the address phase of the ENTDAA command.
uint32_t	transition_phase_enable: 1	Enable Clock Stalling during the transition bit in read transfers.
uint32_t	parity_phase_enable: 1	Enable Clock Stalling during the parity bit period in write transfers.
uint32_t	ack_phase_enable: 1	Enable Clock Stalling during the ACK/NACK phase.
uint16_t	clock_stalling_time	The amount of time to stall the clock in I3C source clock ticks.

◆ i3c_bitrate_settings_t

struct i3c_bitrate_settings_t		
Bitrate settings for configuring the SCL clock frequency.		
Data Fields		
uint32_t	stdbr	The standard bitrate settings.
uint32_t	extbr	The extended bitrate settings.
i3c_clock_stalling_t	clock_stalling	Clock Stalling settings (See Master Clock Stalling in the MIPI I3C Specification v1.0).

◆ i3c_ibi_control_t

struct i3c_ibi_control_t		
Settings for controlling the drivers behavior in response to IBIs.		
Data Fields		
uint32_t	hot_join_acknowledge: 1	If false, NACK all Hot Join requests.
uint32_t	notify_rejected_hot_join_requests: 1	Notify the application when an IBI Hot-Join request has been NACK'd.
uint32_t	notify_rejected_mastership_requests: 1	Notify the application when an IBI Mastership request has been NACK'd.
uint32_t	notify_rejected_interrupt_requests: 1	Notify the application when an IBI Interrupt request has been NACK'd.

◆ i3c_slave_command_response_info_t

struct i3c_slave_command_response_info_t

Default configuration settings for the slave response to Direct Get Common Command Codes.

Data Fields		
bool	inband_interrupt_enable	Enable IBI interrupts. Slave Event Settings (See ENEC and DISEC in the MIPI I3C Specification v1.0).
bool	mastership_request_enable	Enable Mastership requests.
bool	hotjoin_request_enable	Enable Hot-Join requests.
i3c_activity_state_t	activity_state	Starting Activity State (See ENTASn in the MIPI I3C Specification v1.0).
uint16_t	write_length	Max Write Length (See SETMWL and GETMWL in the MIPI I3C Specification v1.0).
uint16_t	read_length	Max Read Length (See SETMRL and GETMRL in the MIPI I3C Specification v1.0).
uint8_t	ibi_payload_length	Number of bytes that will be written by an IBI (See SETMRL and GETMRL in the MIPI I3C Specification v1.0).
i3c_data_rate_setting_t	write_data_rate	Max Write Data Rate. Max Data Rate Settings (See GETMXDS in the MIPI I3C Specification v1.0).
i3c_data_rate_setting_t	read_data_rate	Max Read Data Rate.
i3c_clock_data_turnaround_t	clock_data_turnaround	Max Data Speed Turnaround.
bool	read_turnaround_time_enable	Enable transmission of the of the Max Read Max Read Turnaround Time.
uint32_t	read_turnaround_time	Max Read Turnaround Time.
uint8_t	oscillator_frequency	This byte represents the Slave's internal oscillator frequency in increments of 0.5 MHz (500kHz), up to 127.5 MHz. (See GETXTIME in the MIPI I3C Specification v1.1).
uint8_t	oscillator_inaccuracy	Oscillator inaccuracy in 0.5% increments of 0% up to 25.5% (See GETXTIME in the MIPI I3C Specification v1.1).
bool	hdr_ddr_support	HDR-DDR mode is supported.

bool	hdr_tsp_support	HDR-TSP mode is supported.
bool	hdr_tsl_support	HDR-TSL mode is supported.

◆ i3c_instance_ctrl_t

struct i3c_instance_ctrl_t	
Channel control block. DO NOT INITIALIZE. Initialization occurs when i3c_api_t::open is called.	
Public Member Functions	
i3c_slave_info_t current_slave_info	BSP_ALIGN_VARIABLE (4)
	The last i3c_slave_info_t read during ENTDAA.
Data Fields	
uint32_t	open
	Indicates whether the open() API has been successfully called.
R_I3C0_Type *	p_reg
	Base register for this channel.
volatile uint32_t	internal_state
	Used to track the current state of the driver.
uint8_t	current_command_code
	The current Common Command Code that is being transferred.
uint32_t	device_index
	The device index selected using i3c_api_t::deviceSelect.
i3c_bitrate_mode_t	device_bitrate_mode
	Runtime bitrate settings to use for the next transfer.

uint32_t	next_word
	The next word that will be written to the FIFO.
uint32_t	ibi_next_word
	The next word that will be written to the IBI FIFO.
i3c_write_buffer_descriptor_t	write_buffer_descriptor
	Buffer descriptor for keeping track of a write transfer.
i3c_read_buffer_descriptor_t	read_buffer_descriptor
	Buffer descriptor for keeping track of a read transfer.
i3c_read_buffer_descriptor_t	ibi_buffer_descriptor
	Buffer descriptor for keeping track of an IBI read/write transfer.
volatile uint32_t	read_transfer_count_final
	The total number of bytes read during a read transfer.
volatile uint32_t	ibi_transfer_count_final
	The total number of bytes read during an IBI transfer.
i3c_cfg_t const *	p_cfg
	A pointer to the configuration structure provided during open.

◆ i3c_extended_cfg_t

struct i3c_extended_cfg_t
Extended configuration for r_i3c.
Data Fields

i3c_bitrate_settings_t	bitrate_settings	Bitrate settings configuring the frequency and duty cycle for SCL.
i3c_ibi_control_t	ibi_control	Configure the driver's behavior in response to IBIs.
uint32_t	bus_free_detection_time	The time in I3C reference clock ticks needed in order to detect the bus free condition (See "Bus Free Condition" in the MIPI I3C Specification v1.0).
uint32_t	bus_available_detection_time	The time in I3C reference clock ticks needed in order to detect the bus available condition (See "Bus Available Condition" in the MIPI I3C Specification v1.0).
uint32_t	bus_idle_detection_time	The time in I3C reference clock ticks needed in order to detect the bus idle condition (See "Bus Idle Condition" in the MIPI I3C Specification v1.0).
bool	timeout_detection_enable	Notify the application if SCL is stuck high or low.
i3c_slave_command_response_info_t	slave_command_response_info	Initial settings for configuring the slave's responses to received commands.
IRQn_Type	resp_irq	Response Queue Full IRQ number.
IRQn_Type	rx_irq	Receive FIFO Full IRQ number.
IRQn_Type	tx_irq	Transmit FIFO Empty IRQ number.
IRQn_Type	rcv_irq	Receive Status Queue Full IRQ number.
IRQn_Type	ibi_irq	IBI IRQ number.
IRQn_Type	eei_irq	EEI IRQ number.
uint8_t	ipl	Interrupt Priority for Resp, Rx, Tx, and RCV IRQs.
uint8_t	eei_ipl	Error and Event Interrupt Priority.

Macro Definition Documentation

◆ I3C_ERROR_RECOVERY_VERSION_1

#define I3C_ERROR_RECOVERY_VERSION_1
Support error recovery procedure for chip version 1. There are two different versions of the RA2E2 MCU and the error recovery procedure is different for each version.

◆ I3C_DEVICE_INDEX_EXTENDED_DEVICE

#define I3C_DEVICE_INDEX_EXTENDED_DEVICE
Index for selecting the device defined in the extended address table.

◆ I3C_EVENT_STATUS_SUCCESS

#define I3C_EVENT_STATUS_SUCCESS
The transfer was completed as expected. Event Status Provided by the callback.

Enumeration Type Documentation

◆ i3c_bitrate_mode_t

enum i3c_bitrate_mode_t	
Bitrate settings that can be selected at run-time using i3c_api_t::deviceSelect.	
Enumerator	
I3C_BITRATE_MODE_I2C_STDBR	Use standard period setting for subsequent I2C transfers.
I3C_BITRATE_MODE_I2C_EXTBR	Use extended period setting for subsequent I2C transfers.
I3C_BITRATE_MODE_I3C_SDR0_STDBR	Use standard period setting for subsequent I3C SDR transfers.
I3C_BITRATE_MODE_I3C_SDR1_EXTBR	Use extended period setting for subsequent I3C SDR transfers.
I3C_BITRATE_MODE_I3C_SDR2_STDBR_X2	Use standard period setting x 2 for subsequent I3C SDR transfers.
I3C_BITRATE_MODE_I3C_SDR3_EXTBR_X2	Use extended period setting x 2 for subsequent I3C SDR transfers.
I3C_BITRATE_MODE_I3C_SDR4_EXTBR_X4	Use extended period setting x 4 for subsequent I3C SDR transfers.
I3C_BITRATE_MODE_I3C_HDR_DDR_STDBR	Use standard period setting for subsequent I3C HDR-DDR transfers.

◆ i3c_activity_state_t

enum i3c_activity_state_t	
Supported activity states for ENTASn Command (See ENTASn in the MIPI I3C Specification v1.0).	
Enumerator	
I3C_ACTIVITY_STATE_ENTAS0	Activity Interval (1 microsecond).
I3C_ACTIVITY_STATE_ENTAS1	Activity Interval (100 microseconds).
I3C_ACTIVITY_STATE_ENTAS2	Activity Interval (2 milliseconds).
I3C_ACTIVITY_STATE_ENTAS3	Activity Interval (50 milliseconds).

◆ i3c_data_rate_setting_t

enum i3c_data_rate_setting_t	
Maximum Sustained Data Rate for non-CCC messages sent by Master Device to Slave Device (See GETMXDS in the MIPI I3C Specification v1.0).	
Enumerator	
I3C_DATA_RATE_SETTING_FSCL_MAX	There is no data rate limit.
I3C_DATA_RATE_SETTING_8MHZ	The max sustained data rate is 8 Mhz.
I3C_DATA_RATE_SETTING_6MHZ	The max sustained data rate is 6 Mhz.
I3C_DATA_RATE_SETTING_4MHZ	The max sustained data rate is 4 Mhz.
I3C_DATA_RATE_SETTING_2MHZ	The max sustained data rate is 2 Mhz.

◆ i3c_clock_data_turnaround_t

enum i3c_clock_data_turnaround_t	
Clock to Data Turnaround Time (See GETMXDS in the MIPI I3C Specification v1.0).	
Enumerator	
I3C_CLOCK_DATA_TURNAROUND_8NS	Clock to turnaround time is 8 nanoseconds or less.
I3C_CLOCK_DATA_TURNAROUND_9NS	Clock to turnaround time is 9 nanoseconds or less.
I3C_CLOCK_DATA_TURNAROUND_10NS	Clock to turnaround time is 10 nanoseconds or less.
I3C_CLOCK_DATA_TURNAROUND_11NS	Clock to turnaround time is 11 nanoseconds or less.
I3C_CLOCK_DATA_TURNAROUND_12NS	Clock to turnaround time is 12 nanoseconds or less.
I3C_CLOCK_DATA_TURNAROUND_EXTENDED	Clock to turnaround time is greater than 12 nanoseconds.

Function Documentation

◆ R_I3C_Open()

fsp_err_t R_I3C_Open (i3c_ctrl_t *const *p_api_ctrl*, i3c_cfg_t const *const *p_cfg*)

Configure an I3C instance. Implements i3c_api_t::open.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was invalid.
FSP_ERR_ALREADY_OPEN	Open has already been called for this instance.
FSP_ERR_UNSUPPORTED	A selected feature is not supported with the current configuration.

◆ R_I3C_Enable()

fsp_err_t R_I3C_Enable (i3c_ctrl_t *const *p_api_ctrl*)

Enable the I3C device.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_INVALID_MODE	This instance is already enabled.

◆ R_I3C_DeviceCfgSet()

fsp_err_t R_I3C_DeviceCfgSet (i3c_ctrl_t *const *p_api_ctrl*, i3c_device_cfg_t const *const *p_device_cfg*)

Set the configuration for this device.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_UNSUPPORTED	The device cannot be a secondary master if master support is disabled.

◆ R_I3C_MasterDeviceTableSet()

fsp_err_t R_I3C_MasterDeviceTableSet (i3c_ctrl_t *const *p_api_ctrl*, uint32_t *device_index*, i3c_device_table_cfg_t const *const *p_device_table_cfg*)

Configure an entry in the master device table. This function is called in master mode in order to configure the devices on the I3C bus. It may also be called in slave mode when the slave receives the DEFSVLS command.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_UNSUPPORTED	Mastership requests must be rejected is slave support is disabled.

◆ R_I3C_SlaveStatusSet()

fsp_err_t R_I3C_SlaveStatusSet (i3c_ctrl_t *const *p_api_ctrl*, i3c_device_status_t *status*)

Set the status returned to the master in response to a GETSTATUS command.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_INVALID_MODE	The instance is not in slave mode.
FSP_ERR_UNSUPPORTED	Slave support is disabled.

◆ R_I3C_DeviceSelect()

fsp_err_t R_I3C_DeviceSelect (i3c_ctrl_t *const *p_api_ctrl*, uint32_t *device_index*, uint32_t *bitrate_mode*)

In master mode, select the device for the next transfer. This function is not used in slave mode.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_INVALID_MODE	This operation is prohibited in slave mode.
FSP_ERR_UNSUPPORTED	Master support is disabled.

◆ R_I3C_DynamicAddressAssignmentStart()

fsp_err_t R_I3C_DynamicAddressAssignmentStart (i3c_ctrl_t *const *p_api_ctrl*, i3c_address_assignment_mode_t *address_assignment_mode*, uint32_t *starting_device_index*, uint32_t *device_count*)

Start the Dynamic Address Assignment Process. Implements i3c_api_t::dynamicAddressAssignmentStart.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL or invalid.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_INVALID_MODE	This operation is prohibited in slave mode.
FSP_ERR_IN_USE	The operation could not be completed because the driver is busy.
FSP_ERR_UNSUPPORTED	Master support is disabled.

◆ R_I3C_CommandSend()

fsp_err_t R_I3C_CommandSend (i3c_ctrl_t *const *p_api_ctrl*, i3c_command_descriptor_t const *const *p_command_descriptor*)

Send a broadcast or direct command to slave devices on the bus. Implements i3c_api_t::commandSend.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_IN_USE	The operation could not be completed because the driver is busy.
FSP_ERR_INVALID_MODE	This driver is not in master mode.
FSP_ERR_INVALID_ALIGNMENT	The buffer must be aligned to 4 bytes. If it is a read operation, the length also be a multiple of 4 bytes.
FSP_ERR_UNSUPPORTED	Master support must be enabled to call this function. Slave support must be enabled when sending the GETACCMST command.

◆ R_I3C_Write()

fsp_err_t R_I3C_Write (i3c_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_data*, uint32_t *length*, bool *restart*)

Set the write buffer for the transfer. In master mode, start the transfer. When the transfer is completed send a stop condition or a repeated-start. Implements i3c_api_t::write.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_IN_USE	The operation could not be completed because the driver is busy.
FSP_ERR_INVALID_MODE	This driver is disabled, or an invalid bitrate mode is selected.
FSP_ERR_INVALID_ALIGNMENT	The buffer must be aligned to 4 bytes.

◆ R_I3C_Read()

fsp_err_t R_I3C_Read (i3c_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_data*, uint32_t *length*, bool *restart*)

Set the read buffer for the transfer. In master mode, start the transfer. When the transfer is completed send a stop condition or a repeated-start. Implements i3c_api_t::read.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_IN_USE	The operation could not be completed because the driver is busy.
FSP_ERR_INVALID_MODE	This driver is disabled, or an invalid bitrate mode is selected.
FSP_ERR_INVALID_ALIGNMENT	The buffer must be aligned to 4 bytes and the length must be a multiple of 4 bytes.

◆ R_I3C_IbiWrite()

fsp_err_t R_I3C_IbiWrite (i3c_ctrl_t *const *p_api_ctrl*, i3c_ibi_type_t *ibi_type*, uint8_t const *const *p_data*, uint32_t *length*)

Initiate an IBI write operation (This function is only used in slave mode).

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_IN_USE	The operation could not be completed because the driver is busy.
FSP_ERR_INVALID_MODE	This function is only called in slave mode.
FSP_ERR_INVALID_ALIGNMENT	The buffer must be aligned to 4 bytes.
FSP_ERR_UNSUPPORTED	Slave supoprt is disabled.

◆ R_I3C_IbiRead()

fsp_err_t R_I3C_IbiRead (i3c_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_data*, uint32_t *length*)
Set the read buffer for storing received IBI data (This function is only used in master mode). **Return values** FSP_SUCCESS — Open successful. FSP_ERR_ASSERTION — An argument was NULL. FSP_ERR_NOT_OPEN — This instance has not been opened yet. FSP_ERR_INVALID_MODE — This function is only called in master mode. FSP_ERR_INVALID_ALIGNMENT — The buffer must be aligned to 4 bytes and the length must be a multiple of 4 bytes. FSP_ERR_UNSUPPORTED — Master support is disabled.

◆ R_I3C_Close()

fsp_err_t R_I3C_Close (i3c_ctrl_t *const *p_api_ctrl*)
Close the I3C instance. Implements i3c_api_t::close. **Return values** FSP_SUCCESS — Open successful. FSP_ERR_ASSERTION — An argument was NULL. FSP_ERR_NOT_OPEN — This instance has not been opened yet.

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the LIN Interface.

Overview

The Simple LIN on SCI_B HAL module supports Local Interface Network (LIN) transactions in master or slave mode. A callback must be provided, and is invoked when a transmission, reception, or other event has completed or occurred. The callback arguments contain information about the transaction status, bytes transferred and a pointer to the user defined context.

Features

- Half-duplex master or slave mode LIN communication
- Interrupt-driven data transmission and reception
- Generation of the sync (0x55) and Protected Identifier fields when in master mode
- Validation of the Protected Identifier field when in slave mode
- ID filtering support in slave mode
- Optional checksum generation/validation using classic or enhanced LIN checksum
- Invoking the user-callback function with an event code (RX/TX complete, error, etc)
- Auto synchronization is supported in slave mode
- Adjustable break field length
- Adjustable break field delimiter/stop bits length
- Noise cancellation
- Abort in-progress read/write operations
- Error notifications of parity error in protected identifier, framing error, overrun error, bus collision, and counter overflow error (counter overflow error applies in slave mode only)
- Operation clock selection (PCLK or SCISPI/SCICLK)
- Configuration of all available SCI_B channels with Simple LIN mode support

Configuration

Build Time Configurations for r_sci_b_lin

The following build time configurations are defined in fsp_cfg/r_sci_b_lin_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Checksum Support	• Enabled • Disabled	Enabled	When set to 'Disabled', code for checksum generation and validation is excluded from the build. This setting is applied globally to the project. Disable only when checksum generation and validation is not required for any LIN instance.
Auto Synchronization Support	• Enabled • Disabled	Disabled	When set to 'Disabled', code for auto synchronization is excluded from the build. This setting is applied globally to the project. Enable when at least one LIN slave instance is using auto synchronization.

Configurations for Connectivity > LIN (r_sci_b_lin)

This module can be added to the Stacks tab via New Stack > Connectivity > LIN (r_sci_b_lin). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_lin0	Module name.
Channel	MCU Specific Options		Select the LIN channel.
Mode	• Master • Slave	Master	Select the LIN operating mode (master or slave).
Extra			
Clock Source	MCU Specific Options		Select whether the peripheral clock (PCLK) or SCICLK/SCISPICLK is

			used as the baud rate generator.
Noise Filter	• Enable • Disable	Disable	Enable the digital noise filter on RXDn pin. The digital noise filter block in SCI consists of two-stage flipflop circuits.
Bus Conflict Detection	• Enable • Disable	Disable	Enable the bus conflict detection function. When enabled, the TXDn pin output and the RXDn pin input are sampled by the bus conflict detection clock set by Extra|Bus Conflict Clock Divider. This function only works during transmission.
Bus Conflict Clock Divider	• 1 • 2 • 4	2	Select the base clock divider for the sampling clock of the bus conflict detection circuit.
Baud			
Baud Rate	Value must be an integer greater than 0	19200	Enter the desired baud rate. If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical calculated baud rate and percent error are printed in a comment in the generated sci_b_lin_extended_cfg_t structure.
Auto Synchronization	• Disable • Enable	Disable	Enable LIN synchronization to the master's clock by measuring the effective edges of the input signal from the RXDn pin during reception of the sync byte.
Framing			
Framing > ID Filter (Slave Mode)			

Compare Data Mask	Value must be an integer between 0 and 255.	0	Select the bit mask to be applied before comparing the received PID to the selected compare data. This setting specifies which bits of the selected compare data must match. Set to 0 to disable the filter (allow all frame identifiers).
Priority Compare Data	Value must be an integer between 0 and 255.	0	Select the priority compare filter data.
Secondary Compare Data	Value must be an integer between 0 and 255.	0	Select the secondary compare filter data.
Compare Data Select	• Priority • Secondary • Both	Priority	Select the compare data to use. If 'both' is selected, the priority compare data is checked before the secondary compare data.
Priority Interrupt Bit Enable	• Enabled • Disabled	Disabled	Select whether to enable the Priority Interrupt Bit filter. When enabled, regardless of the Filter Data Select setting value, the bit specified by the Priority Interrupt Bit setting is compared with the corresponding bit in the Priority Compare Data Filter and if it matches, the identifier is allowed through the filter.
Priority Interrupt Bit	Value must be an integer between bit 0 (LSb) and bit 7 (MSb).	0	Select the priority interrupt bit (0-7) of the received PID to compare with the corresponding bit in the Priority Compare Data Filter.
Break Field Bits/Break Detection Threshold (bits)	Value must be an integer.	13	For master break field transmission, this configures the dominant period of the break field (in bits). For

			slave break field reception, this configures the break detection threshold in bits. Must be 13 bits or greater for master mode and 11 bits or greater for slave mode.
LIN Timer Divider	• 4 • 16 • 64	4	Set the LIN timer divider. The LIN timer is used for break field transmission and detection. Higher dividers make possible transmission/detection of more break field bits, but are less precise.
Break Field Delimiter/Stop Bits	• 1bit • 2bits	1bit	Select the recessive period (in bits) of the break field. This setting also selects the number of stop bits.
Interrupts			
Callback	Name must be a valid C symbol	sci_b_lin0_callback	A user callback function must be provided. It will be called from the interrupt service routine (ISR).
Receive Interrupt Priority	MCU Specific Options		Select the receive interrupt priority.
Transmit Data Empty Interrupt Priority	MCU Specific Options		Select the transmit interrupt priority.
Transmit End Interrupt Priority	MCU Specific Options		Select the transmit end interrupt priority.
Error Interrupt Priority	MCU Specific Options		Select the error interrupt priority.
Break Field Detection Interrupt Priority	MCU Specific Options		Select the break field detection interrupt priority (slave mode only).
Active Edge Detection Interrupt Priority	MCU Specific Options		Select the active edge detection interrupt priority.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA6T2	SCISPICLK
RA8D1	SCICLK
RA8M1	SCICLK
RA8T1	SCICLK

The clock source for the baud-rate clock generator can be selected from either SCISCPI/SCICLK or the peripheral clock (PCLK).

Note

1. See Figure 26.2 "Clock source selector block diagram" in the RA6T2 manual for more information.

Pin Configuration

This module uses TXD and RXD to communicate to external devices. Connect TXD and RXD to an on-board or external LIN transceiver for LIN bus communication.

An external pull up resistor is required on TXD in both master and slave mode.

Interrupt Configuration

- Receive buffer full (RXI), transmit buffer empty (TXI), transmit end (TEI), and error (ERI) interrupts for the selected channel used must be enabled in the properties of the selected device for both master and slave mode operation.
- Break field detect (BFD) must be enabled in the properties of the selected device for slave mode only.

Break Field Length/Detection Threshold Configuration

- When in master mode, this setting configures the low (dominant) time of the LIN break pattern.
- When in slave mode, this setting configures the break field detection threshold (number of bits that must be received to detect a break field).
- When configuring this setting in slave mode, take care to set the detection threshold less than the master break field length.
- The standard settings are 13 bits for master nodes and 11 bits for slave nodes, but alternate settings are supported.

Bus Conflict Detection Configuration

When Bus Conflict Detection is enabled, the TXDn pin output and the RXDn pin input are sampled by the selected bus conflict detection clock. When a mismatch occurs three times in a row, an SCIn_ERI interrupt is generated and transmission is stopped. This function only works during transmission.

Consideration of the specific application's LIN bus characteristics should be taken into account when enabling this function. If the bus collision sampling clock is too fast, the expected propagation delay through the transceiver may be erroneously detected as a bus collision (false positive). If the bus collision sampling clock is too slow, collisions may be missed (false negative).

When CCR2.ABCS = 1, setting the bus conflict clock divider to 4 is is prohibited by the SCI_B

hardware.

A LIN transceiver is required to detect bus collisions.

ID Filter Configuration

The SCI performs optional hardware PID filtering in slave mode. When enabled, only start frames with PIDs that pass through the filter are received and passed to the user callback. Other start frames are ignored.

An initial configuration of the filter settings can be applied in the properties view by selecting Framing -> ID Filter and choosing the desired settings. See sci_b_lin_id_filter_setting_t for the available filter settings, as well as the examples in this document. By default, filtering is disabled and all PIDs can be received.

The filter can be updated at runtime by using using R_SCI_B_LIN_IdFilterSet. The current filter settings can be viewed with R_SCI_B_LIN_IdFilterGet.

Usage Notes

LIN Transmission and Reception

SCI data reception is disabled until a break field is detected (slave mode) or a call to R_SCI_B_LIN_InformationFrameRead() is made (master and slave mode).

Slave Mode Transmission and Reception

The start frame is detected in slave mode only. Start frame reception is interrupt driven, and is enabled after a successful call to R_SCI_B_LIN_Open() in slave mode.

When the LIN break field is detected by the slave node, start frame reception begins without action from the application. When start frame reception completes, the user callback is called.

If the slave node needs to receive the information frame data, the slave node must call R_SCI_B_LIN_InformationFrameRead() before the first information data is received in order to receive the data. The user callback is called when reception is complete. It is permitted to call R_SCI_B_LIN_InformationFrameRead() from the callback context.

If the slave node needs to publish a response to the start frame, the slave node must call R_SCI_B_LIN_InformationFrameWrite() and provide the response data and the PID of the received header in the lin_transfer_params_t. The user callback is called when transmission is complete.

If the slave node neither needs to receive the information frame data, nor publish a response for a received start frame, no action is required to ignore the frame. Data reception is disabled until a new break field is detected.

Master Mode Transmission and Reception

The start frame is not detected in master mode. Information frame reception is enabled only after a call to R_SCI_B_LIN_InformationFrameRead().

The start frame is transmitted by calling R_SCI_B_LIN_StartFrameWrite(). The user callback is called when transmission is complete.

If the master node needs to receive the information frame data response, call R_SCI_B_LIN_InformationFrameRead() after start frame transmission has completed and before the first information frame data is received. It is permitted to call R_SCI_B_LIN_InformationFrameRead() from the callback context.

If the master node needs to publish a response to its own start frame, the master node must call R_SCI_B_LIN_InformationFrameWrite() only after start frame transmission has completed, and provide the response data and the PID of the transmitted header in the lin_transfer_params_t. The user callback is called when transmission is complete.

Timeouts/Errors

The application is responsible for managing timeouts in case R_SCI_B_LIN_InformationFrameRead() is called, but the data is not received in the expected time period. If a timeout occurs, R_SCI_B_LIN_CommunicationAbort() may be called to cancel a pending read.

When an error occurs, reception is stopped and the user callback is called with the relevant error code.

Checksum Generation and Validation

- The checksum calculation is performed in software for both checksum generation and validation.
- Checksum generation and validation are both optional.
- The LIN checksum may be generated by passing lin_transfer_params_t::LIN_CHECKSUM_TYPE_CLASSIC or lin_transfer_params_t::LIN_CHECKSUM_TYPE_ENHANCED when writing the information frame data.
- The LIN checksum may be validated by passing lin_transfer_params_t::LIN_CHECKSUM_TYPE_CLASSIC or lin_transfer_params_t::LIN_CHECKSUM_TYPE_ENHANCED when reading the information frame data.
- To skip driver checksum generation/validation, pass lin_transfer_params_t::LIN_CHECKSUM_TYPE_NONE to the read/write functions. Instead the checksum can be included as part of the information data buffer, or omitted entirely depending on the application's needs.
- The maximum number of information frame bytes that can be transmitted per frame is 255, including the checksum byte. Thus, when checksum generation/validation is requested in the transfer parameters, the maximum number of bytes that can be specified in transfer_params.num_bytes is 254. When checksum generation/validation is not requested in the transfer parameters, the maximum number of bytes that can be specified in transfer_params.num_bytes is 255.

Auto Synchronization

Auto synchronization is optional. When it is disabled, the baud rate and break field detection threshold set in open are never updated.

This feature works in slave mode only.

- Auto synchronization is not the same as automatic baud rate detection. Auto synchronization is used for correcting small clock drift/difference in baud rate between nodes.
- Auto synchronization performs small automatic baud rate adjustments to synchronize with the master's clock by measuring the effective edges of the input signal from the RXDn pin

during reception of the LIN sync byte.
- The sync byte is measured and the baud setting and break field detection threshold are re-adjusted for every LIN sync byte received.
- If reception of the sync byte fails, or the required register settings detected would not be possible in the hardware, the baud/timer settings are not updated, and auto synchronization will be re-attempted on the next received start frame.
- If two or more start frames are received consecutively and ignored by software (no call to R_SCI_B_LIN_InformationFrameRead), *and* there is no information frame transmission by any node on the bus between the start frames, auto synchronization is performed only on the first start frame. Following the transmission of the next information frame (by any node), auto synchronization will be re-attempted on the next received start frame.

Limitations

- DTC/DMAC is not supported
- Automatic baud rate detection is not supported
- The SCI_B provides an interface to the LIN Physical layer and does not implement the LIN Transport Layer or LIN Application Layer. The application is responsible for handling the frame scheduling table and monitoring for Transport Layer timeouts.

Examples

Basic LIN Master Read Example

The following demonstrates a basic example of frame reception for a LIN master.

```
void r_sci_b_lin_basic_master_read_example (void)
{
 /* Open the LIN instance with initial configuration. */
 fsp_err_t err = R_SCI_B_LIN_Open(&g_master_ctrl, &g_master_cfg);
    assert(FSP_SUCCESS == err);
 /* Send the LIN start frame */
    err = R_SCI_B_LIN_StartFrameWrite(&g_master_ctrl, FRAME_ID);
    assert(FSP_SUCCESS == err);
 /* Wait for start frame transmission to complete before starting a read of the
response */
 while (!g_start_frame_tx_complete)
    {
    }
 lin_transfer_params_t read_params =
    {
       .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
       .id            = FRAME_ID,
       .num_bytes    = TRANSFER_LENGTH,
```

```
      .p_information = g_rx_buf
   };
 /* Begin reception of the information frame data */
   err = R_SCI_B_LIN_InformationFrameRead(&g_master_ctrl, &read_params);
   assert(FSP_SUCCESS == err);
 /* Wait for information frame reception to complete. The application is responsible
for
  * timing out if data is not received within the expected time interval*/
 while (!g_information_frame_rx_complete)
   {
   }
 /* Close the driver */
   err = R_SCI_B_LIN_Close(&g_slave_ctrl);
   assert(FSP_SUCCESS == err);
}
void master_callback (lin_callback_args_t * p_args)
{
 /* Handle the LIN event */
 switch (p_args->event)
   {
 case LIN_EVENT_RX_INFORMATION_FRAME_COMPLETE:
     {
           g_information_frame_rx_complete = 1;
 break;
     }
 case LIN_EVENT_TX_START_FRAME_COMPLETE:
     {
           g_start_frame_tx_complete = 1;
 break;
     }
 case LIN_EVENT_TX_INFORMATION_FRAME_COMPLETE:
     {
           g_information_frame_tx_complete = 1;
 break;
```

```
     }
 case LIN_EVENT_ERR_INVALID_CHECKSUM:
 case LIN_EVENT_ERR_BUS_COLLISION_DETECTED:
 case LIN_EVENT_ERR_FRAMING:
 case LIN_EVENT_ERR_COUNTER_OVERFLOW:
 case LIN_EVENT_ERR_OVERRUN:
 case LIN_EVENT_ERR_PARITY:
 default:
     {
 /* Handle error */
     }
   }
}
```

Basic LIN Master Write Example

The following demonstrates a basic example of frame transmission for a LIN master.

```
void r_sci_b_lin_basic_master_write_example (void)
{
 /* Initialize transmit buffer to known data. */
 for (uint8_t i = 0; i < TRANSFER_LENGTH; i++)
   {
      g_tx_buf[i] = (uint8_t) ('A' + (i % 26));
   }
 /* Open the LIN instance with initial configuration. */
 fsp_err_t err = R_SCI_B_LIN_Open(&g_master_ctrl, &g_master_cfg);
   assert(FSP_SUCCESS == err);
 /* Send the LIN start frame: break, sync, and protected identifier */
   err = R_SCI_B_LIN_StartFrameWrite(&g_master_ctrl, FRAME_ID);
   assert(FSP_SUCCESS == err);
 /* Wait for start frame transmission to complete before sending the information
frame */
 while (!g_start_frame_tx_complete)
   {
```

```
    }
 lin_transfer_params_t write_params =
    {
       .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
       .id            = FRAME_ID,
       .num_bytes     = TRANSFER_LENGTH,
       .p_information = g_tx_buf
    };
 /* Send the LIN information frame */
    err = R_SCI_B_LIN_InformationFrameWrite(&g_master_ctrl, &write_params);
    assert(FSP_SUCCESS == err);
 /* Wait for information frame transmission to complete */
 while (!g_information_frame_tx_complete)
    {
    }
 /* Close the driver */
    err = R_SCI_B_LIN_Close(&g_master_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Basic LIN Slave Example

The following demonstrates a basic example of start frame reception and information frame response for a LIN slave.

```
void r_sci_b_lin_basic_slave_example (void)
{
 /* Initialize transmit buffer to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_tx_buf[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the LIN instance with initial configuration. */
 fsp_err_t err = R_SCI_B_LIN_Open(&g_slave_ctrl, &g_slave_cfg);
    assert(FSP_SUCCESS == err);
```

```
/* Wait for the header that this slave publishes the response to. */
for ( ; ; )
   {
if (g_start_frame_rx_complete)
     {
if (g_received_pid == FRAME_ID)
     {
/* Frame ID of interest received */
break;
     }
/* Ignore this header. No action required by slave. */
           g_start_frame_rx_complete = false;
     }
   }
lin_transfer_params_t write_params =
   {
      .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
      .id            = g_received_pid,
      .num_bytes    = TRANSFER_LENGTH,
      .p_information = g_tx_buf
   };
/* Send the LIN information frame response */
   err = R_SCI_B_LIN_InformationFrameWrite(&g_slave_ctrl, &write_params);
   assert(FSP_SUCCESS == err);
/* Wait for the response transmission to complete */
while (!g_information_frame_tx_complete)
   {
   }
/* Close the driver */
   err = R_SCI_B_LIN_Close(&g_slave_ctrl);
   assert(FSP_SUCCESS == err);
}
void slave_callback (lin_callback_args_t * p_args)
{
```

```
/* Handle the LIN event */
switch (p_args->event)
   {
case LIN_EVENT_RX_START_FRAME_COMPLETE:
     {
           g_start_frame_rx_complete = 1;
           g_received_pid            = p_args->pid;
break;
     }
case LIN_EVENT_RX_INFORMATION_FRAME_COMPLETE:
     {
           g_information_frame_rx_complete = 1;
break;
     }
case LIN_EVENT_TX_INFORMATION_FRAME_COMPLETE:
     {
           g_information_frame_tx_complete = 1;
break;
     }
default:
     {
/* Handle error */
     }
   }
}
```

Basic LIN Slave ID Filtering Example

The following example demonstrates a basic example of frame ID filtering.

```
#define BASIC_FILTER_MASK (0x30)
#define BASIC_PRIORITY_FILTER_DATA (0x20)
#define BASIC_SECONDARY_FILTER_DATA (0x00) // Don't-care value in this example
#define BASIC_PRIORITY_INTERRUPT_BIT (0) // Don't-care value in this example
void r_sci_b_lin_basic_id_filtering_example (void)
```

```
{
 /* Open the LIN instance with initial configuration. */
 fsp_err_t err = R_SCI_B_LIN_Open(&g_slave_ctrl, &g_slave_cfg);
    assert(FSP_SUCCESS == err);
 /* If the application is using dynamically assigned identifiers, perform
  * any required initial communications to get the identifiers for this slave */
 /* Configure filter to accept only frame IDs in the range 0x20-0x2F.
  *
  * The start frame is received only when the PID bits match the bits
  * specified by the filter.
  *
  * Example: If ID 0x24 is received (PID 0x64), the filter mask (0x30) is applied
  * first (0x64 & 0x30 = 0x20) and then the result is compared to the priority
  * compare data filter (0x20). Since the result matches the filter, the start
  * frame is received and the user callback is called. Otherwise, the SCI awaits
  * the next break field, and the callback is not called.
  *
  * Note: The most significant 2 bits of the PID are the parity bits, and are
  * masked off by the filter mask in this example.
  */
 sci_b_lin_id_filter_setting_t filter =
    {
        .compare_data_mask             = BASIC_FILTER_MASK,
        .priority_compare_data         = BASIC_PRIORITY_FILTER_DATA,
        .secondary_compare_data       = BASIC_SECONDARY_FILTER_DATA,
        .priority_interrupt_bit_select = BASIC_PRIORITY_INTERRUPT_BIT,
        .priority_interrupt_enable    = SCI_B_LIN_PRIORITY_INTERRUPT_BIT_DISABLE,
        .compare_data_select          = SCI_B_LIN_COMPARE_DATA_SELECT_PRIORITY,
    };
 /* Configure the ID filter */
    err = R_SCI_B_LIN_IdFilterSet(&g_slave_ctrl, &filter);
    assert(FSP_SUCCESS == err);
 /* Wait for a header frame which matches the filter */
 while (!g_start_frame_rx_complete)
```

```
    {
    }
 lin_transfer_params_t write_params =
    {
        .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
        .id            = g_received_pid,
        .num_bytes    = TRANSFER_LENGTH,
        .p_information = g_tx_buf
    };
 /* Send the LIN information frame response */
    err = R_SCI_B_LIN_InformationFrameWrite(&g_slave_ctrl, &write_params);
    assert(FSP_SUCCESS == err);
 /* Wait for the response transmission to complete */
 while (!g_information_frame_tx_complete)
    {
    }
 /* Close the driver */
    err = R_SCI_B_LIN_Close(&g_slave_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Advanced LIN Slave ID Filtering Example

The following example demonstrates an advanced example of frame ID filtering.

```
#define ADVANCED_FILTER_MASK (0x3E)
#define ADVANCED_PRIORITY_FILTER_DATA (0x20)
#define ADVANCED_SECONDARY_FILTER_DATA (0x08)
#define ADVANCED_PRIORITY_INTERRUPT_BIT (5)
void r_sci_b_lin_advanced_id_filtering_example (void)
{
 /* Open the LIN instance with initial configuration. */
 fsp_err_t err = R_SCI_B_LIN_Open(&g_slave_ctrl, &g_slave_cfg);
    assert(FSP_SUCCESS == err);
 /* If the application is using dynamically assigned identifiers, perform
```

```
 * any required initial communications to get the identifiers for this slave */
/* Configure filter to accept the following frame IDs:
 *
 * - Any ID in which bit 5 is set to 1 (0x20-0x3F).
 * - IDs 0x08 and 0x09
 *
 * The priority compare data filter is set to 0x20 (bit 5 set).
 * The priority interrupt bit select function is enabled for bit 5.
 *
 * The secondary compare data filter is be set to 0x08. This will allow
 * both 0x08 and 0x09 through the filter, even though bit 5 is not set for
 * those values (0x08 & 0x3E = 0x08 and 0x09 & 0x3E = 0x08). All other
 * identifiers are filtered out.
 */
sci_b_lin_id_filter_setting_t filter =
   {
      .compare_data_mask             = ADVANCED_FILTER_MASK,
      .priority_compare_data         = ADVANCED_PRIORITY_FILTER_DATA,
      .secondary_compare_data       = ADVANCED_SECONDARY_FILTER_DATA,
      .priority_interrupt_bit_select = ADVANCED_PRIORITY_INTERRUPT_BIT,
      .priority_interrupt_enable    = SCI_B_LIN_PRIORITY_INTERRUPT_BIT_ENABLE,
      .compare_data_select          = SCI_B_LIN_COMPARE_DATA_SELECT_BOTH,
   };
/* Configure the ID filter */
   err = R_SCI_B_LIN_IdFilterSet(&g_slave_ctrl, &filter);
   assert(FSP_SUCCESS == err);
/* Wait for a header frame which matches the filter */
while (!g_start_frame_rx_complete)
   {
   }
lin_transfer_params_t write_params =
   {
      .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
      .id            = g_received_pid,
```

```
        .num_bytes    = TRANSFER_LENGTH,
        .p_information = g_tx_buf
    };
 /* Send the LIN information frame response */
    err = R_SCI_B_LIN_InformationFrameWrite(&g_slave_ctrl, &write_params);
    assert(FSP_SUCCESS == err);
 /* Wait for the response transmission to complete */
 while (!g_information_frame_tx_complete)
    {
    }
 /* Close the driver */
    err = R_SCI_B_LIN_Close(&g_slave_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Data Structure Documentation

◆ sci_b_lin_timer_setting_t

struct sci_b_lin_timer_setting_t		
Register settings for configuring the LIN break field timer		
Data Fields		
uint8_t	__pad0__: 6	
uint8_t	tcss: 2	LIN timer count clock source selection.
uint16_t	bflw	Break field length setting (break field length is (bflw + 1) * clock of the timer)

◆ sci_b_lin_baud_setting_t

struct sci_b_lin_baud_setting_t		
Register settings for achieving a desired baud rate.		
Data Fields		
union sci_b_lin_baud_setting_t	__unnamed__	
sci_b_lin_timer_setting_t	timer_setting	Break field timer settings associated with this baud rate.

◆ sci_b_lin_id_filter_setting_t

struct sci_b_lin_id_filter_setting_t		
Parameters for configuring the ID filter settings		
Data Fields		
uint8_t	compare_data_mask	Bit mask applied before comparing the received PID to the compare data. Selects which bits of the selected compare data must match.
uint8_t	priority_compare_data	Priority/primary compare data
uint8_t	secondary_compare_data	Secondary compare data
uint8_t	priority_interrupt_bit_select: 3	Specify ONE of bits 0 to 7 of Control Field 1 as the priority interrupt bit. 0 is bit 0 of the PID, 1 is bit 1 of the PID, and so on.
uint8_t	priority_interrupt_enable: 1	Set to 1 to enable the priority interrupt bit filter specified by

		priority_interrupt_bit_select, 0 to disable. When this bit is 1, regardless of the compare_data_select setting value, the bit specified by priority_interrupt_bit_select is compared with the priority/primary comparison data for Control Field 1 (priority_compare_data).
uint8_t	compare_data_select: 2	Select the compare data for Control Field 1 (priority, secondary, or both). See sci_b_lin_compare_data_select_t
uint8_t	__pad0__: 2	

◆ sci_b_lin_baud_params_t

struct sci_b_lin_baud_params_t		
Parameters for baud and timer setting calculation		
Data Fields		
uint32_t	baudrate	Desired baudrate.
sci_b_lin_clock_source_t	clock_source	Peripheral clock source.
sci_b_lin_bus_conflict_clock_t	bus_conflict_clock	Bus collision clock divider.
uint16_t	break_bits	Master mode: Number of break field bits to transmit. Slave mode: Number of break field threshold bits.

◆ sci_b_lin_extended_cfg_t

struct sci_b_lin_extended_cfg_t		
SCI B LIN extended configuration		
Data Fields		
union sci_b_lin_extended_cfg_t	__unnamed__	
sci_b_lin_baud_setting_t	baud_setting	Register settings for a desired baud rate.
sci_b_lin_id_filter_setting_t	filter_setting	ID filter setting.
IRQn_Type	bfd_irq	Break field detect IRQ number.
IRQn_Type	aed_irq	Active edge detect IRQ number.
uint8_t	bfd_ipl	Break field detect interrupt priority.
uint8_t	aed_ipl	Active edge detect interrupt priority.

uint16_t	break_bits	Master mode: Number of break field bits to transmit. Slave mode: Number of break field threshold bits.

Enumeration Type Documentation

◆ sci_b_lin_priority_interrupt_bit_t

enum sci_b_lin_priority_interrupt_bit_t	
Priority interrupt bit options for ID filtering.	
Enumerator	
SCI_B_LIN_PRIORITY_INTERRUPT_BIT_DISABLE	Disable the priority interrupt bit.
SCI_B_LIN_PRIORITY_INTERRUPT_BIT_ENABLE	Enable the priority interrupt bit.

◆ sci_b_lin_compare_data_select_t

enum sci_b_lin_compare_data_select_t	
Compare Data Select options for ID filtering.	
Enumerator	
SCI_B_LIN_COMPARE_DATA_SELECT_PRIORITY	Select the priority/primary compare data filter as the compare data.
SCI_B_LIN_COMPARE_DATA_SELECT_SECONDARY	Select the secondary compare data filter as the compare data.
SCI_B_LIN_COMPARE_DATA_SELECT_BOTH	Select both the priority/primary compare data filter and the secondary compare data filter as the compare data. The priority filter will be checked first.

◆ sci_b_lin_clock_source_t

enum sci_b_lin_clock_source_t	
Source clock selection options for SCI.	
Enumerator	
SCI_B_LIN_CLOCK_SOURCE_SCISPICLK	SCISPI clock source.
SCI_B_LIN_CLOCK_SOURCE_SCICLK	SCI clock source.
SCI_B_LIN_CLOCK_SOURCE_PCLK	PCLK source.

◆ sci_b_lin_break_delimiter_bits_t

enum sci_b_lin_break_delimiter_bits_t	
Break field delimiter configuration.	
Enumerator	
SCI_B_LIN_BREAK_DELIMITER_BITS_1	1-bit recessive break field delimiter
SCI_B_LIN_BREAK_DELIMITER_BITS_2	2-bit recessive break field delimiter

◆ sci_b_lin_timer_divider_t

enum sci_b_lin_timer_divider_t	
LIN timer configuration, used for break field generation and detection.	
Enumerator	
SCI_B_LIN_TIMER_DIV_4	LIN timer frequency is TCLK/4.
SCI_B_LIN_TIMER_DIV_16	LIN timer frequency is TCLK/16.
SCI_B_LIN_TIMER_DIV_64	LIN timer frequency is TCLK/64.

◆ sci_b_lin_synchronization_t

enum sci_b_lin_synchronization_t	
Auto synchronization setting.	
Enumerator	
SCI_B_LIN_AUTO_SYNCHRONIZATION_DISABLE	Disable auto synchronization during sync byte reception.
SCI_B_LIN_AUTO_SYNCHRONIZATION_ENABLE	Enable auto synchronization during sync byte reception.

◆ sci_b_lin_noise_cancellation_t

enum sci_b_lin_noise_cancellation_t	
Noise cancellation configuration.	
Enumerator	
SCI_B_LIN_NOISE_CANCELLATION_DISABLE	Disable noise cancellation.
SCI_B_LIN_NOISE_CANCELLATION_ENABLE	Enable noise cancellation.

◆ e_sci_b_lin_bus_conflict_detection_t

enum e_sci_b_lin_bus_conflict_detection_t	
Bus conflict detection enable.	
Enumerator	
SCI_B_LIN_BUS_CONFLICT_DETECTION_DISABLE	Disable bus conflict detection.
SCI_B_LIN_BUS_CONFLICT_DETECTION_ENABLE	Enable bus conflict detection.

◆ sci_b_lin_bus_conflict_clock_t

enum sci_b_lin_bus_conflict_clock_t	
Bus conflict detection clock selection. Base clock: 1/16 period of 1 bit period when CCR2.ABCS = 0, 1/8 period of 1 bit period when CCR2.ABCS = 1	
Enumerator	
SCI_B_LIN_BUS_CONFLICT_DETECTION_BASE_CLOCK_DIV_1	Bus conflict detection clock is base clock.
SCI_B_LIN_BUS_CONFLICT_DETECTION_BASE_CLOCK_DIV_2	Bus conflict detection clock is base clock/2.
SCI_B_LIN_BUS_CONFLICT_DETECTION_BASE_CLOCK_DIV_4	Bus conflict detection clock is base clock/4. Setting prohibited when CCR2.ABCS = 1.

Function Documentation

◆ R_SCI_B_LIN_Open()

fsp_err_t R_SCI_B_LIN_Open (lin_ctrl_t *const *p_api_ctrl*, lin_cfg_t const *const *p_cfg*)

Configures the LIN driver channel based on the input configuration.

Implements lin_api_t::open.

Example:

```
/* Open the LIN instance with initial configuration. */
fsp_err_t err = R_SCI_B_LIN_Open(&g_master_ctrl, &g_master_cfg);
```

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to LIN control block or configuration structure is NULL.
FSP_ERR_INVALID_CHANNEL	The requested channel does not exist on this MCU or the channel does not support Simple LIN mode.
FSP_ERR_INVALID_ARGUMENT	Break field length setting or timer divisor is invalid.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.
FSP_ERR_INVALID_MODE	Setting not supported for selected mode

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ R_SCI_B_LIN_StartFrameWrite()

fsp_err_t R_SCI_B_LIN_StartFrameWrite (lin_ctrl_t *const *p_api_ctrl*, uint8_t const *id*)

Begins non-blocking transmission of a LIN start frame (break, sync and protected identifier).

On successful start frame transmission, the callback is called with event lin_event_t::LIN_EVENT_TX_START_FRAME_COMPLETE.

Implements lin_api_t::startFrameWrite.

Example:

```
/* Send the LIN start frame: break, sync, and protected identifier */
   err = R_SCI_B_LIN_StartFrameWrite(&g_master_ctrl, FRAME_ID);
```

Return values

FSP_SUCCESS	Start frame transmission started successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_ARGUMENT	ID out of range (unprotected ID must be less than 64)
FSP_ERR_INVALID_MODE	Function called by slave node (not supported for slave nodes)
FSP_ERR_IN_USE	A transmission or reception is currently in progress. Call R_SCI_B_LIN_CommunicationAbort to cancel it if desired, or wait for the current transfer operation to complete before starting a new one.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ R_SCI_B_LIN_InformationFrameWrite()

fsp_err_t R_SCI_B_LIN_InformationFrameWrite (lin_ctrl_t *const *p_api_ctrl*, const lin_transfer_params_t *const *p_transfer_params*)

Begins non-blocking transmission of a LIN information frame.

On successful information frame transmission, the callback is called with event lin_event_t::LIN_EVENT_TX_INFORMATION_FRAME_COMPLETE.

Implements lin_api_t::informationFrameWrite.

Example:

```
/* Send the LIN information frame */
   err = R_SCI_B_LIN_InformationFrameWrite(&g_master_ctrl, &write_params);
```

Return values

FSP_SUCCESS	Data transmission started successfully.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ASSERTION	Pointer to LIN control block, transfer parameters, or tx/rx buffer is NULL, or 0 bytes length provided
FSP_ERR_IN_USE	A transmission or reception is currently in progress. Call R_SCI_B_LIN_CommunicationAbort to cancel it if desired, or wait for the current transfer operation to complete before starting a new one.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ R_SCI_B_LIN_InformationFrameRead()

fsp_err_t R_SCI_B_LIN_InformationFrameRead (lin_ctrl_t *const *p_api_ctrl*, lin_transfer_params_t *const *p_transfer_params*)

Begins non-blocking information frame reception to receive user specified number of bytes into destination buffer pointer.

The checksum type specifies the checksum type used for validation. If a non-standard algorithm is used, or the application prefers to validate the checksum outside the driver, or the application prefers to skip checksum validation, specify lin_checksum_type_t::LIN_CHECKSUM_TYPE_NONE. If checksum validation is skipped, the lin_checksum_type_t::LIN_EVENT_ERR_INVALID_CHECKSUM event is not possible. When lin_checksum_type_t::LIN_CHECKSUM_TYPE_NONE is used, the number of bytes specified in the receive buffer length will be received (the driver will not expect to receive an additional 1 checksum byte), so if a non-standard checksum is used, sufficient space must be allocated in the write buffer and accounted for in the provided length.

On successful information frame reception, the callback is called with event lin_event_t::LIN_EVENT_RX_INFORMATION_FRAME_COMPLETE.

Implements lin_api_t::informationFrameRead.

Example:

```
/* Begin reception of the information frame data */
   err = R_SCI_B_LIN_InformationFrameRead(&g_master_ctrl, &read_params);
```

Return values

FSP_SUCCESS	Data reception started successfully.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ASSERTION	Pointer to LIN control block, transfer parameters, or tx/rx buffer is NULL, or 0 bytes length provided
FSP_ERR_IN_USE	A transmission or reception is currently in progress. Call R_SCI_B_LIN_CommunicationAbort to cancel it if desired, or wait for the current transfer operation to complete before starting a new one.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ R_SCI_B_LIN_CommunicationAbort()

fsp_err_t R_SCI_B_LIN_CommunicationAbort (lin_ctrl_t *const *p_api_ctrl*)

Cancels in progress information frame read or write, or start frame read or write. Break field reception cannot be cancelled. For slave nodes, reception of a new start frame reception is still enabled after a call to this function.

Implements lin_api_t::communicationAbort.

Return values

FSP_SUCCESS	Data transfer aborted successfully or no transfer was in progress.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ASSERTION	Pointer to LIN control block is NULL.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ R_SCI_B_LIN_CallbackSet()

fsp_err_t R_SCI_B_LIN_CallbackSet (lin_ctrl_t *const *p_api_ctrl*, void(*)(lin_callback_args_t *) *p_callback*, void const *const *p_context*, lin_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure.

Implements lin_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	Pointer to LIN control block or callback is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ R_SCI_B_LIN_BaudCalculate()

fsp_err_t R_SCI_B_LIN_BaudCalculate (sci_b_lin_baud_params_t const *const *p_baud_params*, sci_b_lin_baud_setting_t *const *p_baud_setting*)

Calculates baud rate and LIN timer (BFLW and TCSS) register settings. This function evaluates and determines the most accurate settings for the baud rate and timer related registers.

The LIN timer setting is used for break field transmission/detection. Because the timer setting is specified in terms of bits, and the duration of a bit varies depending on baud rate, the baud rate register settings and timer register settings are related. The smallest possible LIN timer divider which can achieve the desired break field bits setting at the configured baud rate is selected to provide the highest measurement accuracy.

The baud rate cannot be updated at runtime with this function. This function is provided to ease configuration of the initial baud settings.

Parameters

[in]	p_baud_params	Parameters required to calculate the baud rate
[out]	p_baud_setting	If calculation succeeds, contains computed values to achieve requested baud rate. If calculation fails, the input structure is not modified.

Return values

FSP_SUCCESS	Register settings updated in provided p_baud_setting
FSP_ERR_ASSERTION	p_baud_setting was NULL
FSP_ERR_INVALID_ARGUMENT	Cannot achieve combination of break field bits and baudrate with provided settings or p_baud_params->baudrate was 0 or p_baud_params->break_bits was 0

◆ R_SCI_B_LIN_IdFilterSet()

fsp_err_t R_SCI_B_LIN_IdFilterSet (lin_ctrl_t *const *p_api_ctrl*, sci_b_lin_id_filter_setting_t const *const *p_config*)

Set the the ID filter settings for filtering control field 1 (PID byte).

NOTE: Setting the ID filter will abort any in-progress LIN start frame reception, as the ID filter settings cannot be changed during reception of the start frame. The next start frame will be received with the new settings.

```
/* Configure the ID filter */
   err = R_SCI_B_LIN_IdFilterSet(&g_slave_ctrl, &filter);
```

Parameters

[in]	p_api_ctrl	Pointer to the LIN control block.
[in]	p_config	The ID filter settings to apply

Return values

FSP_SUCCESS	ID filter updated successfully.
FSP_ERR_ASSERTION	Pointer to LIN control block or p_config is NULL.
FSP_ERR_INVALID_MODE	Function called by master node (not supported for master nodes)
FSP_ERR_NOT_OPEN	The control block has not been opened.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ R_SCI_B_LIN_IdFilterGet()

fsp_err_t R_SCI_B_LIN_IdFilterGet (lin_ctrl_t *const *p_api_ctrl*, sci_b_lin_id_filter_setting_t *const *p_config*)

Returns the currently configured ID filter settings.

Parameters

[in]	p_api_ctrl	Pointer to the LIN control block.
[out]	p_config	The current ID filter settings

Return values

FSP_SUCCESS	ID filter updated successfully.
FSP_ERR_ASSERTION	Pointer to LIN control block or p_config is NULL.
FSP_ERR_INVALID_MODE	Function called by master node (not supported for master nodes)
FSP_ERR_NOT_OPEN	The control block has not been opened.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ R_SCI_B_LIN_Close()

fsp_err_t R_SCI_B_LIN_Close (lin_ctrl_t *const *p_api_ctrl*)

Closes the LIN driver.

Implements lin_api_t::close.

Example:

```
/* Close the driver */
   err = R_SCI_B_LIN_Close(&g_master_ctrl);
```

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to LIN control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

5.2.6.18 SMBUS Communication Device (rm_comms_smbus)

Modules » Connectivity

Functions

fsp_err_t	RM_COMMS_SMBUS_Open (rm_comms_ctrl_t *const p_api_ctrl, rm_comms_cfg_t const *const p_cfg) Opens and configures the SMBUS Comms module. Implements rm_comms_api_t::open. More...
fsp_err_t	RM_COMMS_SMBUS_Close (rm_comms_ctrl_t *const p_api_ctrl) Disables specified SMBUS Comms module. Implements rm_comms_api_t::close. More...
fsp_err_t	RM_COMMS_SMBUS_CallbackSet (rm_comms_ctrl_t *const p_api_ctrl, void(*p_callback)(rm_comms_callback_args_t *), void const *const p_context) Updates the SMBUS Comms callback. Implements rm_comms_api_t::callbackSet. More...
fsp_err_t	RM_COMMS_SMBUS_Read (rm_comms_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes) Performs a read from the SMBUS device. Implements rm_comms_api_t::read. More...
fsp_err_t	RM_COMMS_SMBUS_Write (rm_comms_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t const bytes) Performs a write from the SMBUS device. Implements rm_comms_api_t::write. More...
fsp_err_t	RM_COMMS_SMBUS_WriteRead (rm_comms_ctrl_t *const p_api_ctrl, rm_comms_write_read_params_t const write_read_params) Performs a write to, then a read from the SMBUS device. Implements rm_comms_api_t::writeRead. More...
void	rm_comms_smbus_transmission_callback (i2c_master_callback_args_t *p_args) Common callback function called in the I2C driver callback function when SMBus is used.

void	rm_comms_smbus_timeout_callback (timer_callback_args_t *p_args) Callback function called in the GPT driver callback function when SMBus is used.

Detailed Description

Middleware to implement the SMBUS communications interface. This module implements the Communicatons Middleware Interface.

Overview

The RM_COMMS_SMBUS module implements COMMS API for SMBUS interface.

Features

Supported SMBUS command:

- Send byte
- Receive byte
- Write byte
- Write word
- Read byte
- Read word
- Read block

Packet error check is supported by software CRC-8 (x^8 + x^2 + x + 1).

Supported RTOS (FreeRTOS and AzureOS).

Configuration

Build Time Configurations for rm_comms_smbus

The following build time configurations are defined in fsp_cfg/rm_comms_smbus_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Connectivity > SMBus Communication Device (rm_comms_smbus)

This module can be added to the Stacks tab via New Stack > Connectivity > SMBus Communication Device (rm_comms_smbus).

Configuration	Options	Default	Description
Name	Manual Entry	g_comms_smbus0	Module name.
Callback	Name must be a valid	comms_smbus_callbac	A user callback

	C symbol	k	function can be provided.
Semaphore Timeout (RTOS only)	Value must be a non-negative integer	0xFFFFFFFF	Timeout for semaphore operation in using RTOS.
Slave Address	Value must be non-negative	0x00	Specify the slave address.
CRC support	• Enable • Disable	Enable	Use CRC-8 algorithm to generate PEC byte for SMBus communication.

Pin Configuration

This module uses SDA and SCL pins of I2C Master

Usage Notes

If an RTOS is used, blocking and bus lock is available.

- If blocking of an SMBus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

If an RTOS is used and blocking and bus lock is enabled, RM_COMMS_SMBUS_Write(), RM_COMMS_SMBUS_Read() and RM_COMMS_SMBUS_WriteRead() cannot be called in callback.

Dependency module General PWM Timer (GPT) and Event Link Controller (ELC) need to be openned before opening SMBus comms device.

Protocol support by SMBUS API:

- RM_COMMS_SMBUS_Write(): Send byte, Write byte, Write word.
- RM_COMMS_SMBUS_Read(): Receive byte protocol.
- RM_COMMS_SMBUS_WriteRead(): Read byte, read word, block read.

Warning

The recommended frequency of PCLKB (when using r_iic_master) or I3CCLK (when using r_iic_b_master) is in range of 1 MHz - 86 MHz. If the frequency too high, the middleware will not able to meet the 300 ns of data hold time of SMBUS standard. On the contrary, the low frequency may cause the count of BRL smaller than SDA delay count which will lead to communication between devices might malfunction or falsely indicate a start or stop condition, depending on the bus state.

Bus Initialization

The SMBUS communications interface expects a bus instance to be opened before opening any specific SMBUS comms device. The communications interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate SMBUS Communication Device (rm_comms_smbus) open call.

Examples

Basic Example

This is a basic example of minimal use of SMBus communications implementation in an application.

```
void rm_comms_smbus_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the relevant drivers if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_bus       = (rm_comms_i2c_bus_extended_cfg_t
*) g_comms_smbus_cfg.p_extend;
 i2c_master_instance_t          * p_driver_iic = (i2c_master_instance_t *)
p_bus->p_driver_instance;
 elc_instance_t   * p_driver_elc               = (elc_instance_t *) p_bus->p_elc;
 timer_instance_t * p_driver_timer             = (timer_instance_t *) p_bus->p_timer;
    p_driver_iic->p_api->open(p_driver_iic->p_ctrl, p_driver_iic->p_cfg);
    p_driver_elc->p_api->open(p_driver_elc->p_ctrl, p_driver_elc->p_cfg);
    p_driver_timer->p_api->open(p_driver_timer->p_ctrl, p_driver_timer->p_cfg);
#if (BSP_CFG_RTOS != 0)
 /* Create a semaphore for blocking if a semaphore is not NULL */
 if (NULL != p_extend->p_blocking_semaphore)
    {
 #if (BSP_CFG_RTOS == 1) // AzureOS
       tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
                           p_extend->p_blocking_semaphore->p_semaphore_name,
                           (ULONG) 0);
 #elif (BSP_CFG_RTOS == 2) // FreeRTOS
       *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
            xSemaphoreCreateCountingStatic((UBaseType_t) 1,
                                           (UBaseType_t) 0,

p_extend->p_blocking_semaphore->p_semaphore_memory);
 #endif
    }
 /* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
 if (NULL != p_extend->p_bus_recursive_mutex)
    {
```

```
 #if (BSP_CFG_RTOS == 1) // AzureOS
       tx_mutex_create(p_extend->p_bus_recursive_mutex->p_mutex_handle,
                       p_extend->p_bus_recursive_mutex->p_mutex_name,
                       TX_INHERIT);
 #elif (BSP_CFG_RTOS == 2) // FreeRTOS
       *(p_extend->p_bus_recursive_mutex->p_mutex_handle) =
            xSemaphoreCreateRecursiveMutexStatic(p_extend->p_bus_recursive_mutex->p_m
utex_memory);
 #endif
    }
#endif
    err = RM_COMMS_SMBUS_Open(&g_comms_smbus_ctrl, &g_comms_smbus_cfg);
    assert(FSP_SUCCESS == err);
    err = RM_COMMS_SMBUS_CallbackSet(&g_comms_smbus_ctrl, comms_smbus_callback,
NULL);

bool	timer_is_enabled	Validate that external event triggers stop the timer is enabled.
uint8_t	write_buff[RM_COMMS_SMBUS_TRANSMISSION_MAX_BYTES]	Intermediate buffer.
uint8_t	receive_crc_seed	CRC seed value.
uint32_t	open	Open flag.

rm_comms_i2c_instance_ctrl_t *	p_comms_i2c_ctrl	Control block of rm_comms_i2c.
const void *	p_context	

Function Documentation

◆ RM_COMMS_SMBUS_Open()

fsp_err_t RM_COMMS_SMBUS_Open (rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_cfg_t const *const *p_cfg*)

Opens and configures the SMBUS Comms module. Implements rm_comms_api_t::open.

Return values

FSP_SUCCESS	Communications Middle module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_SMBUS_Close()

fsp_err_t RM_COMMS_SMBUS_Close (rm_comms_ctrl_t *const *p_api_ctrl*)

Disables specified SMBUS Comms module. Implements rm_comms_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_COMMS_SMBUS_CallbackSet()

fsp_err_t RM_COMMS_SMBUS_CallbackSet (rm_comms_ctrl_t *const *p_api_ctrl*, void(*)(rm_comms_callback_args_t *) *p_callback*, void const *const *p_context*)

Updates the SMBUS Comms callback. Implements rm_comms_api_t::callbackSet.

Return values

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_COMMS_SMBUS_Read()

fsp_err_t RM_COMMS_SMBUS_Read (rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Performs a read from the SMBUS device. Implements rm_comms_api_t::read.

Note

When Packet Error Check (PEC) is used, size of destination buffer and the number of reading bytes must have 1-byte in addition for PEC byte.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_SIZE	Read data size is invalid.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_SMBUS_Write()

fsp_err_t RM_COMMS_SMBUS_Write (rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*)

Performs a write from the SMBUS device. Implements rm_comms_api_t::write.

Return values

FSP_SUCCESS	Successfully writing data .
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_SIZE	Transfer data size is invalid.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_SMBUS_WriteRead()

fsp_err_t RM_COMMS_SMBUS_WriteRead (rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_write_read_params_t const *write_read_params*)

Performs a write to, then a read from the SMBUS device. Implements rm_comms_api_t::writeRead.

Note

When Packet Error Check (PEC) is used, size of destination buffer and the number of reading bytes must have 1-byte in addition for PEC byte.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_SIZE	Transfer data size is invalid.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the SMCI Interface.

Overview

Features

The SCI SMCI module supports the following features:

- Abort in-progress read/write operations
- Interrupt-driven data transmission and reception
- Invoking the user-callback function with an event code (RX/TX complete, RX char, error, etc)
- Transfer mode (normal and block) and data convention type change at run time.
- All channels with SMCI support shall be configurable by the driver
- Baud-rate (and ETU) calculation and change based on ISO7816 asynchronous parameters at run-time. ETU is 1/baud.
- Error notifications of parity error, error signal reception (guard time) and overrun.
- Clock output control

Configuration

Build Time Configurations for r_sci_smci

The following build time configurations are defined in fsp_cfg/r_sci_smci_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKB
RA2A2	PCLKB
RA2E1	PCLKB
RA2E2	PCLKB
RA2E3	PCLKB
RA2L1	PCLKB
RA4E1	PCLKA
RA4E2	PCLKA
RA4M1	PCLKA
RA4M2	PCLKA
RA4M3	PCLKA
RA4T1	PCLKA
RA4W1	PCLKA
RA6E1	PCLKA
RA6E2	PCLKA
RA6M1	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T1	PCLKA
RA6T3	PCLKA

The clock source for the baud-rate clock generator is the PCLK. It is scaled by the SMR_SMCI.CKS bits

to acheive the requested baud rate. This is done in R_SCI_SMCI_BaudSet routine.

Pin Configuration

This module uses TXDx and RXDx to communicate to external devices. TXDx and RXDx need to be tied together and pulled up to VCC externally via a pullup resistor and connected to the DATA line of a connected card.

The SmartCard clock signal is generated by the SMCI module on the SCKx pin. The clock frequency produced by the module is (baudrate * F) / D. The ISO specification defines the valid maximum frequency range as 4Mhz to 20MHz; only certain combinations of Fi, Di and f(max) are allowed.

When writing the application for the driver, the application developer must also allocate a software controlled Reset line via a GPIO. This will allow the reliable receipt of the ATR message. Optionally, VCC and VPP can also be controlled by a GPIO output, so that cold starts can be forced.

Usage Notes

The SMCI module is compliant to ISO7816-3. SMCI is a half duplex interface. Direct convention in T0 mode is the default. The driver supports both direct and indirect (inverted) modes of transmission. It also supports GSM mode in which the output clock can be enabled and disabled while the interface is still active. If it is known that the device connected is a device in inverse convention, the convention can be changed with smci_api_t::transferModeSet() after calling open.

The MCU creates the clock for the attached SMCI device based on the initial baudrate setting. Upon reset the SmartCard device advertises the Di and Fi parameters as well as the max clock speed it can handle. The Di and Fi parameters dictate at what rate the SmartCard device can sample the data line as a function of the supplied clock generated by the RA MCU. Only certain combinations of D and F are supported by the SMCI on SCI module. Only combinations where the the ratio of S=F/D corresponds to a value of S of 32, 64, 93, 128, 186, 256, 372, or 512 (for example see Table 27-9 RA4M2 Group User's Manual R01UH0892EJ0110 or the relevant section for the MCU being used).

The baud rate (1/ETU) can be changed while the device is open to allow for speed negotiation based on the attached device's capabilities.

The SMCI module does not contain a FIFO, and as such the receipt of multi-byte data has to be handled by interrupt initiated callback. The application developer must develop their callback so that the receipt of data is handled sufficiently without receiver overrun. If the read routine is called with a length=0, every receive interrupt will initiate a call to the user's callback. If the read is called with a non-zero length... the interrupt will fill the user's read buffer and initiate the callback after the last byte is complete. In many cases, the user can send an event from their callback so that the reading routine can wait for the event with a timeout. If a timeout occurs, the user can return the read state machine to an idle state by calling the read routine with a length of 0.

Limitations

Examples

SCI SMCI Example

```
uint8_t g_dest[TRANSFER_LENGTH];

uint8_t g_src[TRANSFER_LENGTH];

uint8_t g_out_of_band_received[TRANSFER_LENGTH];
```

```
uint32_t g_transfer_complete = 0;
uint32_t g_receive_complete = 0;
uint32_t g_out_of_band_index = 0;
void r_sci_smci_basic_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the smci instance with initial configuration. */
 fsp_err_t err = R_SCI_SMCI_Open(&g_smci0_ctrl, &g_smci0_cfg);
    assert(FSP_SUCCESS == err);
 /* Need to have clock on inorder to receive or transmit*/
 R_SCI_SMCI_ClockControl(&g_smci0_ctrl, true);
    err = R_SCI_SMCI_Read(&g_smci0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
    err = R_SCI_SMCI_Write(&g_smci0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
 while (!g_transfer_complete)
    {
    }
 while (!g_receive_complete)
    {
    }
}
void user_smci_callback (smci_callback_args_t * p_args)
{
 /* Handle the SMCI event */
 switch (p_args->event)
    {
 /* Received a character */
 case SMCI_EVENT_RX_CHAR:
      {
```

```
 /* Only put the next character in the receive buffer if there is space for it */
 if (sizeof(g_out_of_band_received) > g_out_of_band_index)
      {
 /* Write either the next one or two bytes depending on the receive data size */
                g_out_of_band_received[g_out_of_band_index++] = p_args->data;
      }
 break;
      }
 /* Receive complete */
 case SMCI_EVENT_RX_COMPLETE:
      {
            g_receive_complete = 1;
 break;
      }
 /* Transmit complete */
 case SMCI_EVENT_TX_COMPLETE:
      {
            g_transfer_complete = 1;
 break;
      }
 default:
      {
      }
    }
}
```

SCI SMCI Baud Set Example

```
#define SCI_SMCI_BAUDRATE_28800 (28800)
#define SCI_SMCI_BAUDRATE_ERROR_PERCENT_5 (5000)
void r_sci_smci_baud_example (void)
{
 smci_speed_params_t speed_settings;
 smci_baud_setting_t baud_setting;
    speed_settings.baudrate = SCI_SMCI_BAUDRATE_28800;
```

```
    speed_settings.fi       = SMCI_CLOCK_CONVERSION_INTEGER_512_5;
    speed_settings.di       = SMCI_BAUDRATE_ADJUSTMENT_INTEGER_4;
 fsp_err_t err = R_SCI_SMCI_BaudCalculate(&speed_settings,
SCI_SMCI_BAUDRATE_ERROR_PERCENT_5, &baud_setting);
    assert(FSP_SUCCESS == err);
    err = R_SCI_SMCI_BaudSet(&g_smci0_ctrl, (void *) &baud_setting);
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	sci_smci_instance_ctrl_t
struct	smci_baud_setting_t
struct	sci_smci_extended_cfg_t

Data Structure Documentation

◆ sci_smci_instance_ctrl_t

struct sci_smci_instance_ctrl_t
SMCI instance control block.

◆ smci_baud_setting_t

struct smci_baud_setting_t		
Register settings to achieve a desired baud rate in Smart Card mode		
Data Fields		
uint32_t	computed_baud_rate	
union smci_baud_setting_t	__unnamed__	
uint8_t	scmr_bcp2: 1	BCP2 setting in Smart Card Mode Register.
uint8_t	brr	Bit Rate Register setting.

◆ sci_smci_extended_cfg_t

struct sci_smci_extended_cfg_t		
SMCI on SCI device Configuration		
Data Fields		
smci_baud_setting_t *	p_smci_baud_setting	Register settings for a desired baud rate.

Function Documentation

◆ R_SCI_SMCI_Open()

fsp_err_t R_SCI_SMCI_Open (smci_ctrl_t *const *p_api_ctrl*, smci_cfg_t const *const *p_cfg*)

Configures the Smart Card Interface driver based on the input configurations. The interface stays in the clock-off state without enabling reception at the end of this function. ISO7816-3 default communication parameters are used to initial ize SMCI port speed and parameters, as the ATR message is always sent in that format. Only if Inverse convention is expected should the transfer mode be changed after reset. Implements smci_api_t::open

Parameters

[in,out]	p_api_ctrl	Pointer to SMCI control block that is to be opened
[in]	p_cfg	Pointer to the config structure that shall be used to set paramters of the SMCI baud calculations needed to be have done and set into p_cfg->p_extend->p_smci_baud_setting

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to SMCI control block or configuration structure is NULL.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The requested channel does not exist on this MCU.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ R_SCI_SMCI_Write()

fsp_err_t R_SCI_SMCI_Write (smci_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes*)

Transmits user specified number of bytes from the source buffer pointer. Implements smci_api_t::write

Parameters

[in,out]	p_api_ctrl	Pointer to SMCI control block that is to be opened
[in]	p_src	Pointer to buffer that will be written out
[in]	bytes	Number of bytes to be transferred

Return values

FSP_SUCCESS	Data transmission started successfully.
FSP_ERR_ASSERTION	Pointer to SMCI control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A SMCI transmission is in progress

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ R_SCI_SMCI_Read()

fsp_err_t R_SCI_SMCI_Read (smci_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Receives user specified number of bytes into destination buffer pointer. Receiving is done at the isr level as there is no FIFO. If 0 is passed in as the length, reception will always invoke the user callback. Implements smci_api_t::read

Parameters

[in,out]	p_api_ctrl	Pointer to SMCI control block that is to be opened
[in,out]	p_dest	Pointer to the buffer top be read into
[in]	bytes	Number of bytes to copy from the SMCI receive register

Return values

FSP_SUCCESS	Data reception successfully ends.
FSP_ERR_ASSERTION	Pointer to SMCI control block or read buffer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A previous read operation is still in progress.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ R_SCI_SMCI_TransferModeSet()

fsp_err_t R_SCI_SMCI_TransferModeSet (smci_ctrl_t *const *p_api_ctrl*, smci_transfer_mode_t const *const *p_transfer_mode_params*)

Updates the settings of block transfer mode and data transfer convention. The SCMR and SMR_SMCI registers will be set according to the input arguments of protocol type, data convention type, and mode. Implements smci_api_t::transferModeSet

Parameters

[in,out]	p_api_ctrl	Pointer to SMCI control block that is to be modified
[in]	p_transfer_mode_params	Pointer to SMCI settings like protocol, convention, and gsm_mode

Warning

This terminates any in-progress transmission and reception.

Return values

FSP_SUCCESS	Transfer mode and data transfer direction was successfully changed.
FSP_ERR_IN_USE	Unable to change transfer mode as device has clock off or is actively RX or TX
FSP_ERR_ASSERTION	Null pointer was passed as a parameter
FSP_ERR_NOT_OPEN	The control block has not been opened

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ R_SCI_SMCI_BaudSet()

fsp_err_t R_SCI_SMCI_BaudSet (smci_ctrl_t *const *p_api_ctrl*, void const *const *p_baud_setting*)

Updates the baud rate and clock output. p_baud_setting is a pointer to a smci_baud_setting_t structure that needs to have already been filled by R_SCI_SMCI_BaudCalculate Implements smci_api_t::baudSet

Warning

This terminates any in-progress transmission.

Parameters

[in,out]	p_api_ctrl	Pointer to SMCI control block that is to be modified
[in]	p_baud_setting	Pointer to baud setting information to be written to the SMCI hardware registers

Return values

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer to SMCI control block or p_baud_setting is NUL
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_INVALID_ARGUMENT	The p_baud_setting does not seem to be set correctly

◆ R_SCI_SMCI_StatusGet()

fsp_err_t R_SCI_SMCI_StatusGet (smci_ctrl_t *const *p_api_ctrl*, smci_status_t *const *p_status*)

Provides the state of the driver and the # of bytes received since read was called Implements smci_api_t::statusGet

Parameters

[in]	p_api_ctrl	Pointer to SMCI control block of this SMCI instance
[out]	p_status	Pointer structure that will be filled in with status info

Return values

FSP_SUCCESS	Information stored in provided p_info.
FSP_ERR_ASSERTION	Pointer to SMCI control block, or info structure is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SCI_SMCI_ClockControl()

fsp_err_t R_SCI_SMCI_ClockControl (smci_ctrl_t *const *p_api_ctrl*, bool *clock_enable*)

Enable or disable the clock signal that is provided by interface the baud rate. When the clock is enabled, reception is enabled at the end of this function. "Clock output control as defined in section 34.6.8 "Clock Output Control in Smart Card Interface Mode" in the RA6M3 manual R01UH0886EJ0100 or the relevant section for the MCU being used. Implements smci_api_t::clockControl

Warning

This terminates any in-progress transmission and reception.

Parameters

[in,out]	p_api_ctrl	Pointer to SMCI control block
[in]	clock_enable	true=Enable or false=disable the Smart Card Interface clock

Return values

FSP_SUCCESS	Clock output setting was successfully changed.
FSP_ERR_ASSERTION	Pointer to SMCI control block is NULL
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_INVALID_MODE	Clock cannot be disabled if GSM mode isnt active

◆ R_SCI_SMCI_CallbackSet()

fsp_err_t R_SCI_SMCI_CallbackSet (smci_ctrl_t *const *p_api_ctrl*, void(*)(smci_callback_args_t *) *p_callback*, void const *const *p_context*, smci_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements smci_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SCI_SMCI_Close()

fsp_err_t R_SCI_SMCI_Close (smci_ctrl_t *const *p_api_ctrl*)

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Implements smci_api_t::close

Parameters

[in]	p_api_ctrl	Pointer to SMCI control block that is reqested to close

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to SMCI control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SCI_SMCI_BaudCalculate()

fsp_err_t R_SCI_SMCI_BaudCalculate (smci_speed_params_t const *const *p_speed_params*, uint32_t *baud_rate_error_x_1000*, void *const *p_baud_setting*)

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers. And then updates the SCI registers.

Parameters

[in]	p_speed_params	structure including speed defining paramets, baud, F, D, and max frequency
[in]	baud_rate_error_x_1000	<baud_rate_percent_error> x 1000 required for module to function. Absolute max baud_rate_error is 20000 (20%) according to the ISO spec.
[out]	p_baud_setting	Baud setting information stored here if successful

Return values

FSP_SUCCESS	Baud rate setting calculation successful
FSP_ERR_ASSERTION	p_speed params or p_baud is a null pointer
FSP_ERR_INVALID_ARGUMENT	Baud rate is '0', freq is '0', or error in calculated baud rate is larger than 20%.

5.2.6.20 SPI (r_sau_spi)

fsp_err_t	R_SAU_SPI_CalculateBitrate (uint32_t bitrate, sau_spi_div_setting_t *sclk_div, uint8_t sau_unit, uint8_t channel)

Detailed Description

Driver for the SAU peripheral on RA MCUs. This module implements the SPI Interface.

Overview

Features

- Standard SPI Modes
  - Master or Slave Mode
  - Single Transfer Mode or Continuous Transfer Mode
  - Data Phase (DAPmn)
    - DAPmn=0 Data output starts from the start of the operation of the serial clock
    - DAPmn=1 Data output starts half a clock cycle before the start of the serial clock operation
  - Clock Phase (CKPmn)
    - CKPmn=0 Non-reverse
    - CKPmn=1 Reverse
  - MSB/LSB first
- DTC Support
- Callback Events
  - Transfer Complete

Configuration

- RX Overflow Error (The SAU shift register is copied to the data register before previous data was read)

Build Time Configurations for r_sau_spi

The following build time configurations are defined in fsp_cfg/r_sau_spi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Critical Section Guarding	• Enabled • Disabled	Disabled	Enable critical section guarding around peripheral configuration updates. This should be enabled if the R_SAU_I2C or R_SAU_UART module is being used simultaneously with this module.
Enable Single Channel	• 00 • 20 • 11 • Disabled	Disabled	Enable single channel to reduce code size if only one channel (00, 11, or 20) is to be configured for SAU SPI.
Transfer Operating Mode	• Reception • Transmission • Transmission/ Reception	Transmission/Reception	Select transfer operation mode.
DTC Support	• Enable • Disable	Disable	Enable DTC support for the SAU SPI module.

Configurations for Connectivity > SPI (r_sau_spi)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_sau_spi).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_spi0	Module name.
Channel	MCU Specific Options		Select the SAU

			channel.
Operating Mode	• Master • Slave	Master	Select the SPI operating mode.
Operation Clock	• CK0 • CK1	CK0	Select the operation clock. Use the Clocks tab to set the operation clock divider.
Transfer Mode	• Single transfer mode • Continuous transfer mode	Single transfer mode	Select transfer mode in transfer end interrupt. But buffer empty interrupt (in continuous transfer mode) cannot be selected in Slave Reception.
Bit Order	• MSB First • LSB First	MSB First	Select of data transfer sequence.
Data Phase	• Data sampling on odd edge, data variation on even edge • Data sampling on even edge, data variation on odd edge	Data sampling on odd edge, data variation on even edge	Select when data output shall start compared with the serial clock operation.
Clock Phase	• High when idle • Low when idle	High when idle	Select clock phase.
Bitrate	Value must be an integer greater than 0	500000	Enter the desired bitrate. If the requested bitrate cannot be achieved, adjust the operation clock frequency until the bitrate is achievable. The calculated bitrate is printed in a comment in the generated sau_spi_extended_cfg_t structure.
Callback	Name must be a valid C symbol	sau_spi_callback	A user callback function that is called from the sau

		spi interrupts when a transfer is completed or an error has occurred.
Transmit End Interrupt Priority	MCU Specific Options	Select the transmit end interrupt priority.

Clock Configuration

The SAU clock uses the system clock (ICLK) as its clock source.

A prescaler is applied to the ICLK in order to produce the operation clock frequency. The operation clock is used to generate the desired transfer period of the SAU module.

SAU operation clocks are shared among all channels within a SAU unit. Check the Hardware User's Manual for your MCU for available units and channels. SAU operation clock dividers are configurable in the Clocks tab.

The operation clock dividers are named SAU CKmn where m is the SAU unit, and n is the operation clock. For example, SAU CK01 applies to all SAU0 instances using CK1 as the operation clock (m=0, n=1).

Clock Phase/Polarity Configuration

The following table illustrates the settings of the Clock Phase/Polarity corresponding SCRmn register DCP[1:0] bits in the SAU SPI.

Clock Phase	Clock Polarity	DCP[1:0] Value
Data sampling on odd edge, data variation on even edge	High when idle	0b00
Data sampling on odd edge, data variation on even edge	Low when idle	0b01
Data sampling on even edge, data variation on odd edge	High when idle	0b10
Data sampling on even edge, data variation on odd edge	Low when idle	0b11

Pin Configuration

This module uses SCKmn, SOmn, and SImn pins to communicate with on board devices.

Note

At high bit rates, it might be necessary to configure the pins with IOPORT_CFG_DRIVE_HIGH.

Enabling DTC with the SAU SPI

- DTC transfer is disabled by default. When DTC is enabled, error event will not be handled until transfer is completed.
- For further details on DTC please refer Transfer (r_dtc)

Usage Notes

Enabling Single Channel By User With The SAU SPI

- The Common > Single Channel property is used for reducing code size when only 1 SAU channel is to be configured for SAU SPI.
- Single Channel is configurable and disabled by default in the driver code.
- Note: Not all SAU channels are available on all pin layouts. Check the Hardware User Manual for your device to confirm available function assignment for each SAU channel.

Transfer Complete Event

The transfer complete event is triggered when all of the data has been transferred. In slave mode if the SS pin is de-asserted then no transfer complete event is generated until the SS pin is asserted and the remaining data is transferred.

Performance

At high bit rates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in RX Overflow errors.

To improve performance at high bit rates, it is recommended that the instance be configured to service transfers using the DTC.

Slave Select Pin

- In master mode the slave select pin must be driven in software.
- In slave mode the hardware handles the slave select pin and will only transfer data when the SS pin is low.

Single Channel Use Case

If only SAU channel 00 is to be used for I2C or SPI or UART, enable single channel can reduce the code size.

Selecting Operation Clock Frequency

The relationship between operation clock frequency and bitrate is: bitrate = f_mck / [2 * (SDRmn.STCLK + 1)] where:

- SDRmn.STCLK is an integer in the range [0, 127] for SAU SPI
- f_mck is the operation clock (SAU CKmn) frequency

By plugging in the minimum and maximum SDRmn.STCLK values, the range of bitrates for a given operation clock frequency can be obtained.

Note that due to STCLK being set as discrete integers, the actual bitrate may not be exact. The actual bitrate and percent errors can be calculated by the formulas:

```
actual_bitrate = f_mck / [ 2 * (SDRmn.STCLK + 1) ]

percent_error = 100 * abs [(actual_bitrate - expected_bitrate) / expected_bitrate]
```

Using the fastest possible operation clock for the desired bitrate will result in the lowest deviation from the requested bitrate. Set the CKmn operation clock divider in the Clocks tab to select the desired operation clock frequency.

Runtime bitrate calculation

The function R_SAU_SPI_CalculateBitrate can be used at runtime to calculate alternate bitrate settings.

This function computes settings with both operation clocks CK0 and CK1. If valid settings are possible with both clocks, it selects the settings and clock that would produce the lowest error.

Set the divisors for CK0 and CK01 in the clocks tab such that all required bitrate settings for the application are possible. A large range of bitrates can be achieved by having one "slow" operation clock for low speed modes and one "fast" operation clock for high speed modes.

Limitations

- When multiple channels on the same SAU unit need to be used, and one is configured as I2C, then critical section property needs to be enabled.
- Continuous transfer mode will be deprecated.

Examples

Basic Example

This is a basic example of minimal use of the SAU_SPI in an application.

```
static volatile bool g_transfer_complete = false;
static void r_sau_spi_callback (spi_callback_args_t * p_args)
{
 if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
       g_transfer_complete = true;
    }
}
void sau_spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
 /* Configure Slave Select Line 1 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
 /* Configure Slave Select Line 2 */
```

```
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
fsp_err_t err = FSP_SUCCESS;
/* Initialize the SPI module. */
   err = R_SAU_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
/* Assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);
/* Start a write/read transfer */
   g_transfer_complete = false;
   err = R_SAU_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
   assert(FSP_SUCCESS == err);
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
   {
      ;
   }
/* De-assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
/* Wait for minimum time required between transfers. */
R_BSP_SoftwareDelay(NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);
/* Assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);
/* Start a write/read transfer */
   g_transfer_complete = false;
   err = R_SAU_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
   assert(FSP_SUCCESS == err);
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
   {
      ;
   }
```

```
 /* De-assert Slave Select Line 2 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}
```

Function Documentation

◆ R_SAU_SPI_Open()

fsp_err_t R_SAU_SPI_Open (spi_ctrl_t * *p_api_ctrl*, spi_cfg_t const *const *p_cfg*)

Initialize a channel for SPI communication mode. Implements spi_api_t::open.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enables the clock for the SAU channel.
- Initializes the associated registers with default value and the user-configurable options.
- Provides the channel handle for use with other API functions.

Parameters

p_api_ctrl	Pointer to the control structure.
p_cfg	Pointer to a configuration structure.

Return values

FSP_SUCCESS	Channel initialized successfully.
FSP_ERR_ASSERTION	An input parameter is invalid or NULL.
FSP_ERR_ALREADY_OPEN	The instance has already been opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel number is invalid.

◆ R_SAU_SPI_Read()

fsp_err_t R_SAU_SPI_Read (spi_ctrl_t *const *p_api_ctrl*, void * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width*)

Receive data from an SPI device. Implements spi_api_t::read.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission by writing data to the TXD register.
- Receive data from receive buffer full interrupt occurs and copy data to the buffer of destination.
- Complete data reception via receive buffer full interrupt and transmitting dummy data.

- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

	p_api_ctrl	Pointer to the control structure.
	p_dest	Pointer to the destination buffer.
[in]	length	The number of bytes to transfer.
[in]	bit_width	Data frame length (Set to SPI_BIT_WIDTH_7_BITS or SPI_BIT_WIDTH_8_BITS).

Return values

FSP_SUCCESS	Read operation successfully completed.
FSP_ERR_ASSERTION	One of the following invalid parameters passed: • Pointer p_api_ctrl is NULL • Bit width is not 8 bits • Length is equal to 0 • Pointer to destination is NULL
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_UNSUPPORTED	The given bit_width is not supported.
FSP_ERR_IN_USE	A transfer is already in progress.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reconfigure

◆ R_SAU_SPI_Write()

fsp_err_t R_SAU_SPI_Write (spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, uint32_t const *length*, spi_bit_width_t const *bit_width*)

Transmit data to a SPI device. Implements spi_api_t::write.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable interrupts.
- Start data transmission with data via transmit buffer empty interrupt.
- Copy data from source buffer to the SPI data register for transmission.
- Complete data transmission via transmit buffer empty interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

	p_api_ctrl	Pointer to the control structure.
	p_src	Pointer to the source buffer.
[in]	length	The number of bytes to transfer.
[in]	bit_width	Data frame length (Set to SPI_BIT_WIDTH_7_BITS or SPI_BIT_WIDTH_8_BITS).

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	One of the following invalid parameters passed: • Pointer p_api_ctrl is NULL • Pointer to source is NULL • Length is equal to 0 • Bit width is not equal to 8 bits
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_UNSUPPORTED	The given bit_width is not supported.
FSP_ERR_IN_USE	A transfer is already in progress.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reconfigure

◆ R_SAU_SPI_WriteRead()

fsp_err_t R_SAU_SPI_WriteRead (spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, void * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width*)

Simultaneously transmit data to SPI device while receiving data from SPI device (full duplex). Implements spi_api_t::writeRead.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission using transmit buffer empty interrupt (or by writing to the TDR register).
- Copy data from source buffer to the SPI data register for transmission.
- Receive data from receive buffer full interrupt and copy data to the destination buffer.
- Complete data transmission and reception via transmit end interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

	p_api_ctrl	Pointer to the control structure.
	p_src	Pointer to the source buffer.
	p_dest	Pointer to the destination buffer.
[in]	length	The number of bytes to transfer.
[in]	bit_width	Data frame length (Set to SPI_BIT_WIDTH_7_BITS or SPI_BIT_WIDTH_8_BITS).

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	One of the following invalid parameters passed: • Pointer p_api_ctrl is NULL • Pointer to source is NULL • Pointer to destination is NULL • Length is equal to 0 • Bit width is not equal to 8 bits
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_UNSUPPORTED	The given bit_width is not supported.
FSP_ERR_IN_USE	A transfer is already in progress.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reconfigure

◆ R_SAU_SPI_CallbackSet()

fsp_err_t R_SAU_SPI_CallbackSet (spi_ctrl_t *const *p_api_ctrl*, void(*)(spi_callback_args_t *) *p_callback*, void const *const *p_context*, spi_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements spi_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ R_SAU_SPI_Close()

fsp_err_t R_SAU_SPI_Close (spi_ctrl_t *const *p_api_ctrl*)

Disable the SAU channel and set the instance as not open. Implements spi_api_t::close.

Parameters

p_api_ctrl	Pointer to an opened instance.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

◆ R_SAU_SPI_CalculateBitrate()

fsp_err_t R_SAU_SPI_CalculateBitrate (uint32_t *bitrate*, sau_spi_div_setting_t * *sclk_div*, uint8_t *sau_unit*, uint8_t *channel*)

Calculate the register settings required to achieve the desired bitrate.

Note

This function calculates the bitrate settings with both operation clocks CK0 and CK1, then selects the operation clock and register setting combination that would produce the lowest error.

Parameters

[in]	bitrate	bitrate [bps]. For example, 250,000; 500,00; 16,000,000 (max), etc.
[out]	sclk_div	Pointer to sau_spi_div_setting_t used to configure baudrate settings.
	sau_unit	SAU unit.
	channel	SAU channel.

Return values

FSP_SUCCESS	Bitrate is calculated successfully.
FSP_ERR_ASSERTION	Bitrate is not achievable or not valid for the selected unit/channel.

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the SPI Interface.

Overview

Features

- Standard SPI Modes
  - Master or Slave Mode
  - Clock Polarity (CPOL)
    - CPOL=0 SCLK is low when idle
    - CPOL=1 SCLK is high when idle
  - Clock Phase (CPHA)
    - CPHA=0 Select data sampling on leading edge, data change on trailing edge
    - CPHA=1 Select data change on leading edge, data sampling on trailing edge
  - MSB/LSB first
- Configurable bit rate
- DTC Support
- Callback Events
  - Transfer Complete
  - RX Overflow Error (The SCI shift register is copied to the data register before previous data was read)

Configuration

Build Time Configurations for r_sci_b_spi

The following build time configurations are defined in fsp_cfg/r_sci_b_spi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
DTC Support	• Enabled • Disabled	Enabled	If support for transfering data using the DTC will be compiled in.

Configurations for Connectivity > SPI (r_sci_b_spi)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_sci_b_spi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_sci_spi0	Module name.
Channel	Value must be a non-negative integer	0	Select the SCI channel.
Operating Mode	• Master • Slave	Master	Select the SPI operating mode.
Clock Phase	• Data sampling on odd edge, data variation on even edge • Data sampling on even edge, data variation on odd edge	Data sampling on odd edge, data variation on even edge	Select the clock edge to sample data.
Clock Polarity	• Low when idle • High when idle	Low when idle	Select clock level when idle.
Mode Fault Error	• Enable • Disable	Disable	Detect master/slave mode conflicts.
Bit Order	• MSB First • LSB First	MSB First	Select the data bit order.
Clock Source	• PCLK • SCISPICLK	PCLK	Select whether the peripheral clock (PCLK) or SCISPICLK is used for generating the SCK frequency.
Callback	Name must be a valid C symbol	sci_b_spi_callback	A user callback function that is called from the sci_b_spi interrupts when a transfer is completed or an error has occurred.
Receive Interrupt Priority	MCU Specific Options		Select the receive interrupt priority.
Transmit Interrupt Priority	MCU Specific Options		Select the transmit interrupt priority.
Transmit End Interrupt Priority	MCU Specific Options		Select the transmit end interrupt priority.
Error Interrupt Priority	MCU Specific Options		Select the error

			interrupt priority.
Bitrate	Value must be an integer greater than 0	8000000	Enter the desired bitrate. If the requested bitrate cannot be achieved, the settings with the largest possible value that is less than or equal to the requested bitrate is used. The theoretical bitrate is printed in a comment in the generated sci_spi_extended_cfg_t structure.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA6T2	PCLKA
RA8D1	PCLKA
RA8M1	PCLKA
RA8T1	PCLKA

The SCI peripheral uses the SCISPICLK/SCICLK or PCLKA for communication and PCLKA for internal operations. Both can be configured via the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Pin Configuration

This module uses SCIn_MOSI, SCIn_MISO, SCIn_SPCK, and SCIn_SS pins to communicate with on board devices.

Note

At high bit rates, it might be necessary to configure the pins with IOPORT_CFG_DRIVE_HIGH.

Usage Notes

Transfer Complete Event

The transfer complete event is triggered when all of the data has been transfered. In slave mode if the SS pin is de-asserted then no transfer complete event is generated until the SS pin is asserted and the remaining data is transferred.

Performance

At high bit rates, interrupts may not be able to service transfers fast enough. In master mode this

means there will be a delay between each data frame. In slave mode this could result in RX Overflow errors.

In order to improve performance at high bit rates, it is recommended that the instance be configured to service transfers using the DTC.

Transmit From RXI Interrupt

After every byte, the SCI SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. Whenever possible, the SCI SPI module handles both interrupts in the receive buffer full interrupt. This improves performance when the DTC is not being used.

Slave Select Pin

- In master mode the slave select pin must be driven in software.
- In slave mode the hardware handles the slave select pin and will only transfer data when the SS pin is low.

Examples

Basic Example

This is a basic example of minimal use of the SCI_B_SPI module in an application.

```
static volatile bool g_transfer_complete = false;
static void r_sci_b_spi_callback (spi_callback_args_t * p_args)
{
 if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
       g_transfer_complete = true;
    }
}
void sci_b_spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
 /* Configure Slave Select Line 1 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
 /* Configure Slave Select Line 2 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize the SPI module. */
    err = R_SCI_B_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
```

```
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Assert Slave Select Line 1 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);
 /* Start a write/read transfer */
    g_transfer_complete = false;
    err = R_SCI_B_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
 /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
 while (false == g_transfer_complete)
    {
       ;
    }
 /* De-assert Slave Select Line 1 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
 /* Wait for minimum time required between transfers. */
 R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);
 /* Assert Slave Select Line 2 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);
 /* Start a write/read transfer */
    g_transfer_complete = false;
    err = R_SCI_B_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
 /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
 while (false == g_transfer_complete)
    {
       ;
    }
 /* De-assert Slave Select Line 2 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}
```

Data Structures

struct	sci_b_spi_div_setting_t

Data Structure Documentation

◆ sci_b_spi_div_setting_t

struct sci_b_spi_div_setting_t
Settings for adjusting the SPI CLK.

Function Documentation

◆ R_SCI_B_SPI_Open()

fsp_err_t R_SCI_B_SPI_Open (spi_ctrl_t * *p_api_ctrl*, spi_cfg_t const *const *p_cfg*)

Initialize a channel for SPI communication mode. Implements spi_api_t::open.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enables the clock for the SCI channel.
- Initializes the associated registers with default value and the user-configurable options.
- Provides the channel handle for use with other API functions.

Parameters

p_api_ctrl	Pointer to the control structure.
p_cfg	Pointer to a configuration structure.

Return values

FSP_SUCCESS	Channel initialized successfully.
FSP_ERR_ASSERTION	An input parameter is invalid or NULL.
FSP_ERR_ALREADY_OPEN	The instance has already been opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel number is invalid.

◆ R_SCI_B_SPI_Read()

fsp_err_t R_SCI_B_SPI_Read (spi_ctrl_t *const *p_api_ctrl*, void * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width*)

Receive data from an SPI device. Implements spi_api_t::read.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission by writing data to the TXD register.
- Receive data from receive buffer full interrupt occurs and copy data to the buffer of destination.
- Complete data reception via receive buffer full interrupt and transmitting dummy data.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

	p_api_ctrl	Pointer to the control structure.
	p_dest	Pointer to the destination buffer.
[in]	length	The number of bytes to transfer.
[in]	bit_width	Invalid for SCI_B_SPI (Set to SPI_BIT_WIDTH_8_BITS).

Return values

FSP_SUCCESS	Read operation successfully completed.
FSP_ERR_ASSERTION	One of the following invalid parameters passed: • Pointer p_api_ctrl is NULL • Bit width is not 8 bits • Length is equal to 0 • Pointer to destination is NULL
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_UNSUPPORTED	The given bit_width is not supported.
FSP_ERR_IN_USE	A transfer is already in progress.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reconfigure

◆ R_SCI_B_SPI_Write()

fsp_err_t R_SCI_B_SPI_Write (spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, uint32_t const *length*, spi_bit_width_t const *bit_width*)

Transmit data to a SPI device. Implements spi_api_t::write.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable interrupts.
- Start data transmission with data via transmit buffer empty interrupt.
- Copy data from source buffer to the SPI data register for transmission.
- Complete data transmission via transmit buffer empty interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

	p_api_ctrl	Pointer to the control structure.
	p_src	Pointer to the source buffer.
[in]	length	The number of bytes to transfer.
[in]	bit_width	Invalid for SCI_B_SPI (Set to SPI_BIT_WIDTH_8_BITS).

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	One of the following invalid parameters passed: • Pointer p_api_ctrl is NULL • Pointer to source is NULL • Length is equal to 0 • Bit width is not equal to 8 bits
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_UNSUPPORTED	The given bit_width is not supported.
FSP_ERR_IN_USE	A transfer is already in progress.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reconfigure

◆ R_SCI_B_SPI_WriteRead()

fsp_err_t R_SCI_B_SPI_WriteRead (spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, void * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width*)

Simultaneously transmit data to SPI device while receiving data from SPI device (full duplex). Implements spi_api_t::writeRead.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission using transmit buffer empty interrupt (or by writing to the TDR register).
- Copy data from source buffer to the SPI data register for transmission.
- Receive data from receive buffer full interrupt and copy data to the destination buffer.
- Complete data transmission and reception via transmit end interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

	p_api_ctrl	Pointer to the control structure.
	p_src	Pointer to the source buffer.
	p_dest	Pointer to the destination buffer.
[in]	length	The number of bytes to transfer.
[in]	bit_width	Invalid for SCI_B_SPI (Set to SPI_BIT_WIDTH_8_BITS).

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	One of the following invalid parameters passed: • Pointer p_api_ctrl is NULL • Pointer to source is NULL • Pointer to destination is NULL • Length is equal to 0 • Bit width is not equal to 8 bits
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_UNSUPPORTED	The given bit_width is not supported.
FSP_ERR_IN_USE	A transfer is already in progress.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reconfigure

◆ R_SCI_B_SPI_CallbackSet()

fsp_err_t R_SCI_B_SPI_CallbackSet (spi_ctrl_t *const *p_api_ctrl*, void(*)(spi_callback_args_t *) *p_callback*, void const *const *p_context*, spi_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements spi_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SCI_B_SPI_Close()

fsp_err_t R_SCI_B_SPI_Close (spi_ctrl_t *const *p_api_ctrl*)

Disable the SCI channel and set the instance as not open. Implements spi_api_t::close.

Parameters

p_api_ctrl	Pointer to an opened instance.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

◆ R_SCI_B_SPI_CalculateBitrate()

fsp_err_t R_SCI_B_SPI_CalculateBitrate (uint32_t *bitrate*, sci_b_spi_clock_source_t *clock_source*, sci_b_spi_div_setting_t * *sclk_div*)

Calculate the register settings required to achieve the desired bitrate.

Parameters

[in]	bitrate	bitrate [bps]. For example, 250,000; 500,00; 2,500,000 (max), etc.
	clock_source	clock source (PCLKA or SCISPICLK) used for bit rate calculation.
	sclk_div	Pointer to sci_b_spi_div_setting_t used to configure baudrate settings.

Return values

FSP_SUCCESS	Baud rate is set successfully.
FSP_ERR_ASSERTION	Baud rate is not achievable.

Note

The application must pause for 1 bit time after the BRR register is loaded before transmitting/receiving to allow time for the clock to settle.

fsp_err_t	R_SCI_SPI_WriteRead (spi_ctrl_t *const p_api_ctrl, void const *p_src, void *p_dest, uint32_t const length, spi_bit_width_t const bit_width)
fsp_err_t	R_SCI_SPI_CallbackSet (spi_ctrl_t *const p_api_ctrl, void(*p_callback)(spi_callback_args_t *), void const *const p_context, spi_callback_args_t *const p_callback_memory)

fsp_err_t	R_SCI_SPI_Close (spi_ctrl_t *const p_api_ctrl)
fsp_err_t	R_SCI_SPI_CalculateBitrate (uint32_t bitrate, sci_spi_div_setting_t *sclk_div, bool use_mddr)

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the SPI Interface.

Overview

Features

- Standard SPI Modes
  - Master or Slave Mode
  - Clock Polarity (CPOL)
    - CPOL=0 SCLK is low when idle
    - CPOL=1 SCLK is high when idle
  - Clock Phase (CPHA)
    - CPHA=0 Select data sampling on leading edge, data change on trailing edge
    - CPHA=1 Select data change on leading edge, data sampling on trailing edge
  - MSB/LSB first
- Configurable bit rate
- DTC Support
- Callback Events
  - Transfer Complete
  - RX Overflow Error (The SCI shift register is copied to the data register before previous data was read)

Configuration

Build Time Configurations for r_sci_spi

The following build time configurations are defined in fsp_cfg/r_sci_spi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
DTC Support	• Enabled • Disabled	Enabled	If support for transfering data using the DTC will be compiled in.

Configurations for Connectivity > SPI (r_sci_spi)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_sci_spi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_spi0	Module name.
Channel	Value must be a non-negative integer	0	Select the SCI channel.
Operating Mode	• Master • Slave	Master	Select the SPI operating mode.
Clock Phase	• Data sampling on odd edge, data variation on even edge • Data sampling on even edge, data variation on odd edge	Data sampling on odd edge, data variation on even edge	Select the clock edge to sample data.
Clock Polarity	• Low when idle • High when idle	Low when idle	Select clock level when idle.
Mode Fault Error	• Enable • Disable	Disable	Detect master/slave mode conflicts.
Bit Order	• MSB First • LSB First	MSB First	Select the data bit order.
Callback	Name must be a valid C symbol	sci_spi_callback	A user callback function that is called from the sci spi interrupts when a transfer is completed or an error has occurred.
Receive Interrupt Priority	MCU Specific Options		Select the receive interrupt priority.
Transmit Interrupt Priority	MCU Specific Options		Select the transmit interrupt priority.
Transmit End Interrupt Priority	MCU Specific Options		Select the transmit end interrupt priority.
Error Interrupt Priority	MCU Specific Options		Select the error interrupt priority.
Bitrate	Value must be an integer greater than 0	8000000	Enter the desired bitrate. If the requested bitrate cannot be achieved, the settings with the

			largest possible value that is less than or equal to the requested bitrate is used. The theoretical bitrate is printed in a comment in the generated sci_spi_extended_cfg_t structure.
Bitrate Modulation	• Disabled • Enabled	Disabled	Enabling bitrate modulation reduces the percent error of the actual bitrate with respect to the requested baud rate. It does this by modulating the number of cycles per clock output pulse, so the clock is no longer a square wave.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKB
RA2A2	PCLKB
RA2E1	PCLKB
RA2E2	PCLKB
RA2E3	PCLKB
RA2L1	PCLKB
RA4E1	PCLKA
RA4E2	PCLKA
RA4M1	PCLKA
RA4M2	PCLKA
RA4M3	PCLKA
RA4T1	PCLKA
RA4W1	PCLKA
RA6E1	PCLKA
RA6E2	PCLKA
RA6M1	PCLKA

RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T1	PCLKA
RA6T3	PCLKA

Pin Configuration

This module uses SCIn_MOSI, SCIn_MISO, SCIn_SPCK, and SCIn_SS pins to communicate with on board devices.

Note

At high bit rates, it might be necessary to configure the pins with IOPORT_CFG_DRIVE_HIGH.

Usage Notes

Transfer Complete Event

The transfer complete event is triggered when all of the data has been transfered. In slave mode if the SS pin is de-asserted then no transfer complete event is generated until the SS pin is asserted and the remaining data is transferred.

Performance

At high bit rates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in RX Overflow errors. In order to improve performance at high bit rates, it is recommended that the instance be configured to service transfers using the DTC.

Also note when using DTC for data transfer, SCI SPI can experience overrun error if the application makes heavy use of DMAC and/or another DTC instance. This is because DMAC has a higher priority over DTC in arbitration for the mastership of the DMA bus, and the arbitration between different triggers/transfers in DTC is done based on interrupt/trigger priority. Overrun error can be averted with one of the following options:

1. If SCI SPI uses DTC for data transfer, avoid the use of DMAC or another DTC instance in an application.
2. If DMAC/DTC is a must for other data transfers, avoid the use of DTC with SCI SPI.
3. Use the RSPI instead of SCI SPI. The RSPI hardware can handle overrun conditions.

Transmit From RXI Interrupt

After every byte, the SCI SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. Whenever possible, the SCI_SPI module handles both interrupts in the receive buffer full interrupt. This improves performance when the DTC is not being used.

Slave Select Pin

- In master mode the slave select pin must be driven in software.
- In slave mode the hardware handles the slave select pin and will only transfer data when

the SS pin is low.

Bit Rate Modulation

Depending on the peripheral clock frequency, the desired bit rate may not be achievable. With bit rate modulation, the device can remove a configurable number of input clock pulses to the internal bit rate counter in order to create the desired bit rate. This has the effect of changing the period of individual bits in order to achieve the desired average bit rate. For more information see section 34.9 Bit Rate Modulation Function in the RA6M3 manual.

Examples

Basic Example

This is a basic example of minimal use of the SCI_SPI in an application.

```
static volatile bool g_transfer_complete = false;
static void r_sci_spi_callback (spi_callback_args_t * p_args)
{
 if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
       g_transfer_complete = true;
    }
}
void sci_spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
 /* Configure Slave Select Line 1 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
 /* Configure Slave Select Line 2 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize the SPI module. */
    err = R_SCI_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Assert Slave Select Line 1 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);
 /* Start a write/read transfer */
```

```
    g_transfer_complete = false;
    err = R_SCI_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
 /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
 while (false == g_transfer_complete)
    {
       ;
    }
 /* De-assert Slave Select Line 1 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
 /* Wait for minimum time required between transfers. */
 R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);
 /* Assert Slave Select Line 2 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);
 /* Start a write/read transfer */
    g_transfer_complete = false;
    err = R_SCI_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
 /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
 while (false == g_transfer_complete)
    {
       ;
    }
 /* De-assert Slave Select Line 2 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}
```

Data Structures

struct	sci_spi_div_setting_t

Data Structure Documentation

◆ sci_spi_div_setting_t

struct sci_spi_div_setting_t

Settings for adjusting the SPI CLK.

Data Fields		
uint8_t	brr	
uint8_t	cks: 2	
uint8_t	mddr	Set to 0 to disable MDDR.

Function Documentation

◆ R_SCI_SPI_Open()

fsp_err_t R_SCI_SPI_Open (spi_ctrl_t * *p_api_ctrl*, spi_cfg_t const *const *p_cfg*)

Initialize a channel for SPI communication mode. Implements spi_api_t::open.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enables the clock for the SCI channel.
- Initializes the associated registers with default value and the user-configurable options.
- Provides the channel handle for use with other API functions.

Parameters

p_api_ctrl	Pointer to the control structure.
p_cfg	Pointer to a configuration structure.

Return values

FSP_SUCCESS	Channel initialized successfully.
FSP_ERR_ASSERTION	An input parameter is invalid or NULL.
FSP_ERR_ALREADY_OPEN	The instance has already been opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel number is invalid.

◆ R_SCI_SPI_Read()

fsp_err_t R_SCI_SPI_Read (spi_ctrl_t *const *p_api_ctrl*, void * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width*)

Receive data from an SPI device. Implements spi_api_t::read.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission by writing data to the TXD register.
- Receive data from receive buffer full interrupt occurs and copy data to the buffer of destination.
- Complete data reception via receive buffer full interrupt and transmitting dummy data.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

	p_api_ctrl	Pointer to the control structure.
	p_dest	Pointer to the destination buffer.
[in]	length	The number of bytes to transfer.
[in]	bit_width	Invalid for SCI_SPI (Set to SPI_BIT_WIDTH_8_BITS).

Return values

FSP_SUCCESS	Read operation successfully completed.
FSP_ERR_ASSERTION	One of the following invalid parameters passed: • Pointer p_api_ctrl is NULL • Bit width is not 8 bits • Length is equal to 0 • Pointer to destination is NULL
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_UNSUPPORTED	The given bit_width is not supported.
FSP_ERR_IN_USE	A transfer is already in progress.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reconfigure

◆ R_SCI_SPI_Write()

fsp_err_t R_SCI_SPI_Write (spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, uint32_t const *length*, spi_bit_width_t const *bit_width*)

Transmit data to a SPI device. Implements spi_api_t::write.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable interrupts.
- Start data transmission with data via transmit buffer empty interrupt.
- Copy data from source buffer to the SPI data register for transmission.
- Complete data transmission via transmit buffer empty interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

	p_api_ctrl	Pointer to the control structure.
	p_src	Pointer to the source buffer.
[in]	length	The number of bytes to transfer.
[in]	bit_width	Invalid for SCI_SPI (Set to SPI_BIT_WIDTH_8_BITS).

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	One of the following invalid parameters passed: • Pointer p_api_ctrl is NULL • Pointer to source is NULL • Length is equal to 0 • Bit width is not equal to 8 bits
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_UNSUPPORTED	The given bit_width is not supported.
FSP_ERR_IN_USE	A transfer is already in progress.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reconfigure

◆ R_SCI_SPI_WriteRead()

fsp_err_t R_SCI_SPI_WriteRead (spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, void * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width*)

Simultaneously transmit data to SPI device while receiving data from SPI device (full duplex). Implements spi_api_t::writeRead.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission using transmit buffer empty interrupt (or by writing to the TDR register).
- Copy data from source buffer to the SPI data register for transmission.
- Receive data from receive buffer full interrupt and copy data to the destination buffer.
- Complete data transmission and reception via transmit end interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

	p_api_ctrl	Pointer to the control structure.
	p_src	Pointer to the source buffer.
	p_dest	Pointer to the destination buffer.
[in]	length	The number of bytes to transfer.
[in]	bit_width	Invalid for SCI_SPI (Set to SPI_BIT_WIDTH_8_BITS).

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	One of the following invalid parameters passed: • Pointer p_api_ctrl is NULL • Pointer to source is NULL • Pointer to destination is NULL • Length is equal to 0 • Bit width is not equal to 8 bits
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_UNSUPPORTED	The given bit_width is not supported.
FSP_ERR_IN_USE	A transfer is already in progress.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reconfigure

◆ R_SCI_SPI_CallbackSet()

fsp_err_t R_SCI_SPI_CallbackSet (spi_ctrl_t *const *p_api_ctrl*, void(*)(spi_callback_args_t *) *p_callback*, void const *const *p_context*, spi_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements spi_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SCI_SPI_Close()

fsp_err_t R_SCI_SPI_Close (spi_ctrl_t *const *p_api_ctrl*)

Disable the SCI channel and set the instance as not open. Implements spi_api_t::close.

Parameters

p_api_ctrl	Pointer to an opened instance.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

◆ R_SCI_SPI_CalculateBitrate()

fsp_err_t R_SCI_SPI_CalculateBitrate (uint32_t *bitrate*, sci_spi_div_setting_t * *sclk_div*, bool *use_mddr*)

Calculate the register settings required to achieve the desired bitrate.

Parameters

[in]	bitrate	bitrate [bps]. For example, 250,000; 500,00; 2,500,000 (max), etc.
	sclk_div	Pointer to sci_spi_div_setting_t used to configure baudrate settings.
[in]	use_mddr	Calculate the divider settings for use with MDDR.

Return values

FSP_SUCCESS	Baud rate is set successfully.
FSP_ERR_ASSERTION	Baud rate is not achievable.

Note

The application must pause for 1 bit time after the BRR register is loaded before transmitting/receiving to allow time for the clock to settle.

Detailed Description

Driver for the SPI peripheral on RA MCUs. This module implements the SPI Interface.

Overview

Features

- Standard SPI Modes
  - Master or Slave Mode
  - 3-Wire (clock synchronous) or 4-Wire (SPI) Mode
  - Clock Polarity (CPOL)
    - CPOL=0 SCLK is low when idle
    - CPOL=1 SCLK is high when idle
  - Clock Phase (CPHA)
    - CPHA=0 Data Sampled on the even edge of SCLK (Master Mode Only)
    - CPHA=1 Data Sampled on the odd edge of SCLK
  - MSB/LSB first
  - 8-16 bit, 20-bit, 24-bit, and 32-bit data frames
    - Hardware endian swap in 16-bit and 32-bit modes
  - SSL level keep (burst transfer) supported if available
- Configurable bitrate
- Supports Full Duplex or Transmit Only Mode
- DTC Support
- DMAC Support
- Callback Events
  - Transfer Complete
  - RX Overflow Error (The SPI shift register is copied to the data register before previous data was read)
  - TX Underrun Error (No data to load into shift register for transmitting)
  - Parity Error (When parity is enabled and a parity error is detected)

Configuration

Build Time Configurations for r_spi

The following build time configurations are defined in fsp_cfg/r_spi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Enable Support for using a transfer API	• Enabled • Disabled	Enabled	If enabled, transfer instances will be included in the build for

			both transmission and reception.
Enable Transmitting from RXI Interrupt	• Enabled • Disabled	Disabled	If enabled, all operations will be handled from the RX (receive) interrupt. This setting only provides a performance boost when neither DTC nor DMAC is used. In addition, Transmit Only mode is not supported when this configuration is enabled.

Configurations for Connectivity > SPI (r_spi)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_spi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_spi0	Module name.
Channel	Value must be a non-negative integer	0	Select the SPI channel.
Receive Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Transmit Buffer Empty Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Transfer Complete Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Error Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Operating Mode	• Master • Slave	Master	Select the SPI operating mode.
Clock Phase	• Data sampling on odd edge, data variation on even edge • Data sampling on even edge, data variation on odd edge	Data sampling on odd edge, data variation on even edge	Select the clock edge to sample data.

Clock Polarity	• Low when idle • High when idle	Low when idle	Select clock level when idle.
Mode Fault Error	• Enable • Disable	Disable	Detect master/slave mode conflicts.
Bit Order	• MSB First • LSB First	MSB First	Select the data bit order.
Callback	Name must be a valid C symbol	spi_callback	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
SPI Mode	• SPI Operation • Clock Synchronous Operation	Clock Synchronous Operation	Select the clock sync mode.
Full or Transmit Only Mode	• Full Duplex • Transmit Only	Full Duplex	Select Full Duplex or Transmit Only Mode.
Slave Select Polarity	• Active Low • Active High	Active Low	Select the slave select active level.
Select SSL(Slave Select)	MCU Specific Options		Select which slave to use.
MOSI Idle State	• MOSI Idle Value Fixing Disable • MOSI Idle Value Fixing Low • MOSI Idle Value Fixing High	MOSI Idle Value Fixing Disable	Select the MOSI idle level if MOSI idle is enabled.
Parity Mode	• Disabled • Odd • Even	Disabled	Select the parity mode if parity is enabled.
Byte Swapping	• Disable • Enable	Disable	Select the byte swap mode for 16/32-Bit Data Frames.
Bitrate	Value must be an integer greater than 0	16000000	Enter the desired bitrate, change the bitrate to a value supported by MCU. If the requested bitrate cannot be achieved, the settings with the largest possible value that is less than or equal to the requested bitrate is used. The theoretical bitrate is

			printed in a comment in the generated spi_extended_cfg_t structure.
Clock Delay	• 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks	1 Clock	Configure the number of SPI clock cycles before each data frame.
SSL Negation Delay	• 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks	1 Clock	Configure the number of SPI clock cycles after each data frame.
Next Access Delay	• 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks	1 Clock	Configure the number of SPI clock cycles between each data frame.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKB
RA2A2	PCLKB
RA2E1	PCLKB
RA2E2	PCLKB
RA2E3	PCLKB
RA2L1	PCLKB
RA4E1	PCLKA
RA4E2	PCLKA
RA4M1	PCLKA
RA4M2	PCLKA
RA4M3	PCLKA

RA4T1	PCLKA
RA4W1	PCLKA
RA6E1	PCLKA
RA6E2	PCLKA
RA6M1	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T1	PCLKA
RA6T3	PCLKA

Pin Configuration

This module uses MOSI, MISO, RSPCK, and SSL pins to communicate with on board devices.

Note

At high bitrates, it might be nessecary to configure the pins with IOPORT_CFG_DRIVE_HIGH.

Usage Notes

Performance

At high bitrates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in TX Underrun and RX Overflow errors.

In order to improve performance at high bitrates, it is recommended that the instance be configured to service transfers using the DTC or DMAC.

Another way to improve performance is to transfer the data in 16/32 bit wide data frames when possible. A typical use-case where this is possible is when reading/writing to a block device.

Transmit From RXI Interrupt

After every data frame the SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. It is possible to configure the driver to handle transmit buffer empty interrupts in the receive buffer full isr. This only improves performance when neither the DTC nor DMAC is being used.

Note

Configuring the module to use an RX DTC/DMAC instance without also providing a TX DTC/DMAC instance results in an invalid configuration when RXI transmit is enabled.
Transmit Only mode is not supported when Transmit from RXI is enabled.

Clock Auto-Stopping

In master mode, if the Receive Buffer Full Interrupts are not handled fast enough, instead of

generating a RX Overflow error, the last clock cycle will be stretched until the receive buffer is read.

Parity Mode

When parity mode is configured, the LSB of each data frame is used as a parity bit. When odd parity is selected, the LSB is set such that there are an odd number of ones in the data frame. When even parity is selected, the LSB is set such that there are an even number of ones in the data frame.

Limitations

Developers should be aware of the following limitations when using the SPI:

- In master mode, the driver will only configure 4-Wire mode if the device supports SSL Level Keeping (SSLKP bit in SPCMD0) and will return FSP_ERR_UNSUPPORTED if configured for 4-Wire mode on devices without SSL Level Keeping. Without SSL Level Keeping, the SSL pin is toggled after every data frame. In most cases this is not desirable behavior so it is recommended that the SSL pin be driven in software if SSL Level Keeping is not present on the device.
- In order to use CPHA=0 setting in slave mode, the master must toggle the SSL pin after every data frame (Even if the device supports SSL Level Keeping). Because of this hardware limitation, the module will return FSP_ERR_UNSUPPORTED when it is configured to use CPHA=0 setting in slave mode.
- The module does not support communicating with multiple slaves using different SSL pins. In order to achieve this, the module must either be closed and re-opened to change the SSL pin or drive SSL in software. It is recommended that SSL be driven in software when controlling multiple slave devices.
- The SPI peripheral has a minimum 3 SPI CLK delay between each data frame.
- The behavior for Byte Swap operation is not guaranteed for data frames other than 8-bit, 16-bit and 32bit.

Examples

Basic Example

This is a basic example of minimal use of the SPI in an application.

```
static volatile bool g_transfer_complete = false;

void spi_basic_example (void)

{

    uint8_t tx_buffer[TRANSFER_SIZE];

    uint8_t rx_buffer[TRANSFER_SIZE];

 fsp_err_t err = FSP_SUCCESS;

 /* Initialize the SPI module. */

    err = R_SPI_Open(&g_spi_ctrl, &g_spi_cfg);

 /* Handle any errors. This function should be defined by the user. */

    assert(FSP_SUCCESS == err);

 /* Start a write/read transfer */
```

```
    err = R_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
 /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
 while (false == g_transfer_complete)
    {
       ;
    }
}
static void r_spi_callback (spi_callback_args_t * p_args)
{
 if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
       g_transfer_complete = true;
    }
}
```

Driving Software Slave Select Line

This is an example of communicating with multiple slave devices by asserting SSL in software.

```
void spi_software_ssl_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
 /* Configure Slave Select Line 1 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
 /* Configure Slave Select Line 2 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize the SPI module. */
    err = R_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Assert Slave Select Line 1 */
```

```
 R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);
 /* Start a write/read transfer */
    g_transfer_complete = false;
    err                 = R_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
 /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
 while (false == g_transfer_complete)
    {
       ;
    }
 /* De-assert Slave Select Line 1 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
 /* Wait for minimum time required between transfers. */
 R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);
 /* Assert Slave Select Line 2 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);
 /* Start a write/read transfer */
    g_transfer_complete = false;
    err                 = R_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
 /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
 while (false == g_transfer_complete)
    {
       ;
    }
 /* De-assert Slave Select Line 2 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}
```

Configuring the SPI Clock Divider Registers

This example demonstrates how to set the SPI clock divisors at runtime.

```
void spi_bitrate_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    g_spi_cfg.p_extend = &g_spi_extended_cfg;
 /* Configure SPI Clock divider to achieve largest bitrate less than or equal to the
desired bitrate. */
    err = R_SPI_CalculateBitrate(BITRATE, &(g_spi_extended_cfg.spck_div));
    assert(FSP_SUCCESS == err);
 /* Initialize the SPI module. */
    err = R_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	rspck_div_setting_t
struct	spi_extended_cfg_t
struct	spi_instance_ctrl_t

Enumerations

enum	spi_ssl_mode_t
enum	spi_communication_t
enum	spi_ssl_polarity_t
enum	spi_ssl_select_t
enum	spi_mosi_idle_value_fixing_t
enum	spi_parity_t
enum	spi_byte_swap_t
enum	spi_delay_count_t

Data Structure Documentation

◆ rspck_div_setting_t

struct rspck_div_setting_t		
SPI Clock Divider settings.		
Data Fields		
uint8_t	spbr	SPBR register setting.
uint8_t	brdv: 2	BRDV setting in SPCMD0.

◆ spi_extended_cfg_t

struct spi_extended_cfg_t		
Extended SPI interface configuration		
Data Fields		
spi_ssl_mode_t	spi_clksyn	Select spi or clock syn mode operation.
spi_communication_t	spi_comm	Select full-duplex or transmit-only communication.
spi_ssl_polarity_t	ssl_polarity	Select SSLn signal polarity.
spi_ssl_select_t	ssl_select	Select which slave to use: 0-SSL0, 1-SSL1, 2-SSL2, 3-SSL3.
spi_mosi_idle_value_fixing_t	mosi_idle	Select MOSI idle fixed value and selection.
spi_parity_t	parity	Select parity and enable/disable parity.
spi_byte_swap_t	byte_swap	Select byte swap mode.
rspck_div_setting_t	spck_div	Register values for configuring the SPI Clock Divider.
spi_delay_count_t	spck_delay	SPI Clock Delay Register Setting.
spi_delay_count_t	ssl_negation_delay	SPI Slave Select Negation Delay Register Setting.
spi_delay_count_t	next_access_delay	SPI Next-Access Delay Register Setting.

◆ spi_instance_ctrl_t

struct spi_instance_ctrl_t	
Channel control block. DO NOT INITIALIZE. Initialization occurs when spi_api_t::open is called.	
Data Fields	
uint32_t	open
	Indicates whether the open() API has been successfully called.

spi_cfg_t const *	p_cfg
	Pointer to instance configuration.
R_SPI0_Type *	p_regs
	Base register for this channel.
void const *	p_tx_data
	Buffer to transmit.
void *	p_rx_data
	Buffer to receive.
uint32_t	tx_count
	Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)
uint32_t	rx_count
	Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)
uint32_t	count
	Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)
spi_bit_width_t	bit_width
	Bits per Data frame (8-bit, 16-bit, 32-bit)

Enumeration Type Documentation

◆ spi_ssl_mode_t

enum spi_ssl_mode_t	
3-Wire or 4-Wire mode.	
Enumerator	
SPI_SSL_MODE_SPI	SPI operation (4-wire method)
SPI_SSL_MODE_CLK_SYN	Clock Synchronous operation (3-wire method)

◆ spi_communication_t

enum spi_communication_t	
Transmit Only (Half Duplex), or Full Duplex.	
Enumerator	
SPI_COMMUNICATION_FULL_DUPLEX	Full-Duplex synchronous serial communication.
SPI_COMMUNICATION_TRANSMIT_ONLY	Transit only serial communication.

◆ spi_ssl_polarity_t

enum spi_ssl_polarity_t	
Slave Select Polarity.	
Enumerator	
SPI_SSLP_LOW	SSLP signal polarity active low.
SPI_SSLP_HIGH	SSLP signal polarity active high.

◆ spi_ssl_select_t

enum spi_ssl_select_t	
The Slave Select Line	
Enumerator	
SPI_SSL_SELECT_SSL0	Select SSL0.
SPI_SSL_SELECT_SSL1	Select SSL1.
SPI_SSL_SELECT_SSL2	Select SSL2.
SPI_SSL_SELECT_SSL3	Select SSL3.

◆ spi_mosi_idle_value_fixing_t

enum spi_mosi_idle_value_fixing_t	
MOSI Idle Behavior.	
Enumerator	
SPI_MOSI_IDLE_VALUE_FIXING_DISABLE	MOSI output value=value set in MOIFV bit.
SPI_MOSI_IDLE_VALUE_FIXING_LOW	MOSIn level low during MOSI idling.
SPI_MOSI_IDLE_VALUE_FIXING_HIGH	MOSIn level high during MOSI idling.

◆ spi_parity_t

enum spi_parity_t	
Parity Mode	
Enumerator	
SPI_PARITY_MODE_DISABLE	Disable parity.
SPI_PARITY_MODE_ODD	Select even parity.
SPI_PARITY_MODE_EVEN	Select odd parity.

◆ spi_byte_swap_t

enum spi_byte_swap_t	
Byte Swapping Enable/Disable.	
Enumerator	
SPI_BYTE_SWAP_DISABLE	Disable Byte swapping for 16/32-Bit transfers.
SPI_BYTE_SWAP_ENABLE	Enable Byte swapping for 16/32-Bit transfers.

◆ spi_delay_count_t

enum spi_delay_count_t	
Delay count for SPI delay settings.	
Enumerator	
SPI_DELAY_COUNT_1	Set RSPCK delay count to 1 RSPCK.
SPI_DELAY_COUNT_2	Set RSPCK delay count to 2 RSPCK.
SPI_DELAY_COUNT_3	Set RSPCK delay count to 3 RSPCK.
SPI_DELAY_COUNT_4	Set RSPCK delay count to 4 RSPCK.
SPI_DELAY_COUNT_5	Set RSPCK delay count to 5 RSPCK.
SPI_DELAY_COUNT_6	Set RSPCK delay count to 6 RSPCK.
SPI_DELAY_COUNT_7	Set RSPCK delay count to 7 RSPCK.
SPI_DELAY_COUNT_8	Set RSPCK delay count to 8 RSPCK.

Function Documentation

◆ R_SPI_Open()

fsp_err_t R_SPI_Open (spi_ctrl_t * *p_api_ctrl*, spi_cfg_t const *const *p_cfg*)

This functions initializes a channel for SPI communication mode. Implements spi_api_t::open.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Configures the pperipheral registers acording to the configuration.
- Initialize the control structure for use in other SPI Interface functions.

Return values

FSP_SUCCESS	Channel initialized successfully.
FSP_ERR_ALREADY_OPEN	Instance was already initialized.
FSP_ERR_ASSERTION	An invalid argument was given in the configuration structure.
FSP_ERR_UNSUPPORTED	A requested setting is not possible on this device with the current build configuration.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel number is invalid.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls: transfer_api_t::open

Note

This function is reentrant.

◆ R_SPI_Read()

fsp_err_t R_SPI_Read (spi_ctrl_t *const *p_api_ctrl*, void * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width*)

This function receives data from a SPI device. Implements spi_api_t::read.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI read operation.

Return values

FSP_SUCCESS	Read operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control or destination parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ R_SPI_Write()

fsp_err_t R_SPI_Write (spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, uint32_t const *length*, spi_bit_width_t const *bit_width*)

This function transmits data to a SPI device using the TX Only Communications Operation Mode. Implements spi_api_t::write.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI write operation.

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control or source parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ R_SPI_WriteRead()

fsp_err_t R_SPI_WriteRead (spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, void * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width*)

This function simultaneously transmits and receive data. Implements spi_api_t::writeRead.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI writeRead operation.

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control, source or destination parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ R_SPI_CallbackSet()

fsp_err_t R_SPI_CallbackSet (spi_ctrl_t *const *p_api_ctrl*, void(*)(spi_callback_args_t *) *p_callback*, void const *const *p_context*, spi_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements spi_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SPI_Close()

fsp_err_t R_SPI_Close (spi_ctrl_t *const *p_api_ctrl*)

This function manages the closing of a channel by the following task. Implements spi_api_t::close.

Disables SPI operations by disabling the SPI bus.

- Disables the SPI peripheral.
- Disables all the associated interrupts.
- Update control structure so it will not work with SPI Interface functions.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	A required pointer argument is NULL.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

◆ R_SPI_CalculateBitrate()

fsp_err_t R_SPI_CalculateBitrate (uint32_t *bitrate*, rspck_div_setting_t * *spck_div*)

Calculates the SPBR register value and the BRDV bits for a desired bitrate. If the desired bitrate is faster than the maximum bitrate, than the bitrate is set to the maximum bitrate. If the desired bitrate is slower than the minimum bitrate, than an error is returned.

Parameters

[in]	bitrate	Desired bitrate
[out]	spck_div	Memory location to store bitrate register settings.

Return values

FSP_SUCCESS	Valid spbr and brdv values were calculated
FSP_ERR_UNSUPPORTED	Bitrate is not achievable

5.2.6.24 SPI (r_spi_b)

Modules » Connectivity

Functions

fsp_err_t	R_SPI_B_Open (spi_ctrl_t *p_api_ctrl, spi_cfg_t const *const p_cfg)
fsp_err_t	R_SPI_B_Read (spi_ctrl_t *const p_api_ctrl, void *p_dest, uint32_t const length, spi_bit_width_t const bit_width)
fsp_err_t	R_SPI_B_Write (spi_ctrl_t *const p_api_ctrl, void const *p_src, uint32_t const length, spi_bit_width_t const bit_width)
fsp_err_t	R_SPI_B_WriteRead (spi_ctrl_t *const p_api_ctrl, void const *p_src, void *p_dest, uint32_t const length, spi_bit_width_t const bit_width)
fsp_err_t	R_SPI_B_CallbackSet (spi_ctrl_t *const p_api_ctrl, void(*p_callback)(spi_callback_args_t *), void const *const p_context, spi_callback_args_t *const p_callback_memory)
fsp_err_t	R_SPI_B_Close (spi_ctrl_t *const p_api_ctrl)
fsp_err_t	R_SPI_B_CalculateBitrate (uint32_t bitrate, spi_b_clock_source_t clock_source, rspck_div_setting_t *spck_div)

Detailed Description

Driver for the SPI peripheral on RA MCUs. This module implements the SPI Interface.

Overview

Features

- Standard SPI Modes
  - Master or Slave Mode
  - 3-Wire (clock synchronous) or 4-Wire (SPI) Mode
  - Clock Polarity (CPOL)
    - CPOL=0 SCLK is low when idle
    - CPOL=1 SCLK is high when idle
  - Clock Phase (CPHA)
    - CPHA=0 Data Sampled on the even edge of SCLK (Master Mode Only)
    - CPHA=1 Data Sampled on the odd edge of SCLK
  - MSB/LSB first
  - 8- to 32-Bit data frames
    - Hardware endian swap in 16-Bit and 32-Bit mode
  - SSL level keep (burst transfer) supported
- Configurable bitrate
- Supports Full Duplex or Transmit Only Mode
- DTC Support
- Callback Events
  - Transfer Complete
  - RX Overflow Error (The SPI shift register is copied to the data register before previous data was read)
  - TX Underrun Error (No data to load into shift register for transmitting)
  - Parity Error (When parity is enabled and a parity error is detected)

Configuration

Build Time Configurations for r_spi_b

The following build time configurations are defined in fsp_cfg/r_spi_b_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Enable Support for using DTC	• Enabled • Disabled	Enabled	If enabled, DTC instances will be included in the build for both transmission and reception.
Enable Transmitting from RXI Interrupt	• Enabled • Disabled	Disabled	If enabled, all operations will be handled from the RX (receive) interrupt. This setting only provides a performance boost

			when DTC is not used. In addition, Transmit Only mode is not supported when this configuration is enabled.

Configurations for Connectivity > SPI (r_spi_b)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_spi_b). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_spi0	Module name.
Channel	Value must be a non-negative integer	0	Select the SPI channel.
Receive Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Transmit Buffer Empty Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Transfer Complete Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Error Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Operating Mode	• Master • Slave	Master	Select the SPI operating mode.
Clock Phase	• Data sampling on odd edge, data variation on even edge • Data sampling on even edge, data variation on odd edge	Data sampling on odd edge, data variation on even edge	Select the clock edge to sample data.
Clock Polarity	• Low when idle • High when idle	Low when idle	Select clock level when idle.
Mode Fault Error	• Enable • Disable	Disable	Detect master/slave mode conflicts.
Bit Order	• MSB First • LSB First	MSB First	Select the data bit order.
Callback	Name must be a valid	spi_callback	A user callback

	C symbol		function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
SPI Mode	• SPI Operation • Clock Synchronous Operation	Clock Synchronous Operation	Select the clock sync mode.
Communication Mode Select	• Full Duplex • Transmit Only	Full Duplex	Select Full Duplex or Transmit Only Mode.
Slave Select Polarity	• Active Low • Active High	Active Low	Select the slave select active level.
Select SSL(Slave Select)	• SSL0 • SSL1 • SSL2 • SSL3	SSL0	Select which slave to use.
MOSI Idle State	• MOSI Idle Value Fixing Disable • MOSI Idle Value Fixing Low • MOSI Idle Value Fixing High	MOSI Idle Value Fixing Disable	Select the MOSI idle level if MOSI idle is enabled.
Parity Mode	• Disabled • Odd • Even	Disabled	Select the parity mode if parity is enabled.
Byte Swapping	• Disable • Enable	Disable	Select the byte swap mode for 16/32-Bit Data Frames.
Clock Source	MCU Specific Options		Select the clock source for communication.
Bitrate	Value must be an integer greater than 0	16000000	Enter the desired bitrate, change the bitrate to a value supported by MCU. If the requested bitrate cannot be achieved, the settings with the largest possible value that is less than or equal to the requested bitrate is used. The theoretical bitrate is printed in a comment in the generated spi_extended_cfg_t structure.

Clock Delay	• 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks	1 Clock	Configure the number of SPI clock cycles before each data frame.
SSL Negation Delay	• 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks	1 Clock	Configure the number of SPI clock cycles after each data frame.
Next Access Delay	• 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks	1 Clock	Configure the number of SPI clock cycles between each data frame.

Clock Configuration

The SPI peripheral uses the SCISPICLK for communication and PCLKB for internal operations. Both can be configured via the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Pin Configuration

This module uses MOSI, MISO, RSPCK, and SSL pins to communicate with on board devices.

Note

At high bitrates it may be necessary to configure the pins with IOPORT_CFG_DRIVE_HIGH to maintain signal integrity.

Usage Notes

Performance

At high bitrates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in TX Underrun and RX Overflow errors.

In order to improve performance at high bitrates, it is recommended that the instance be configured to service transfers using the DTC.

Another way to improve performance is to transfer the data in 16/32 bit wide data frames when possible. A typical use-case where this is possible is when reading/writing to a block device.

Transmit From RXI Interrupt

After every data frame the SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. It is possible to configure the driver to handle transmit buffer empty interrupts in the receive buffer full ISR. This only improves performance when the DTC is not being used.

Note

Configuring the module to use RX DTC instance without also providing a TX DTC instance results in an invalid configuration when RXI transmit is enabled.
Transmit Only mode is not supported when Transmit from RXI is enabled.

Clock Auto-Stopping

In master mode, if the Receive Buffer Full Interrupts are not handled fast enough, instead of generating a RX Overflow error, the last clock cycle will be stretched until the receive buffer is read.

Parity Mode

When parity mode is configured, the LSB of each data frame is used as a parity bit. When odd parity is selected, the LSB is set such that there are an odd number of ones in the data frame. When even parity is selected, the LSB is set such that there are an even number of ones in the data frame.

Limitations

Developers should be aware of the following limitations when using the SPI:

- In master mode, the driver will only configure 4-Wire mode if the device supports SSL Level Keeping (SSLKP bit in SPCMD0) and will return FSP_ERR_UNSUPPORTED if configured for 4-Wire mode on devices without SSL Level Keeping. Without SSL Level Keeping, the SSL pin is toggled after every data frame. In most cases this is not desirable behavior so it is recommended that the SSL pin be driven in software if SSL Level Keeping is not present on the device.
- The module does not support communicating with multiple slaves using different SSL pins. In order to achieve this, the module must either be closed and re-opened to change the SSL pin or drive SSL in software. It is recommended that SSL be driven in software when controlling multiple slave devices.
- The SPI peripheral has a minimum 3 SPI CLK delay between each data frame.
- The behavior for Byte Swap operation is not guaranteed for data frames other than 8-bit, 16-bit and 32bit.

Examples

Basic Example

This is a basic example of minimal use of the SPI in an application.

```
static volatile bool g_transfer_complete = false;

void spi_basic_example (void)

{

    uint8_t tx_buffer[TRANSFER_SIZE];

    uint8_t rx_buffer[TRANSFER_SIZE];
```

```
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize the SPI module. */
    err = R_SPI_B_Open(&g_spi_ctrl, &g_spi_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start a write/read transfer */
    err = R_SPI_B_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
 /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
 while (false == g_transfer_complete)
    {
       ;
    }
}
static void r_spi_callback (spi_callback_args_t * p_args)
{
 if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
       g_transfer_complete = true;
    }
}
```

Driving Software Slave Select Line

This is an example of communicating with multiple slave devices by asserting SSL in software.

```
void spi_software_ssl_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
 /* Configure Slave Select Line 1 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
 /* Configure Slave Select Line 2 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
```

```
fsp_err_t err = FSP_SUCCESS;
/* Initialize the SPI module. */
   err = R_SPI_B_Open(&g_spi_ctrl, &g_spi_cfg);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
/* Assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);
/* Start a write/read transfer */
   g_transfer_complete = false;
   err                 = R_SPI_B_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);
   assert(FSP_SUCCESS == err);
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
   {
      ;
   }
/* De-assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
/* Wait for minimum time required between transfers. */
R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);
/* Assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);
/* Start a write/read transfer */
   g_transfer_complete = false;
   err                 = R_SPI_B_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);
   assert(FSP_SUCCESS == err);
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
   {
      ;
   }
/* De-assert Slave Select Line 2 */
```

```
 R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}
```

Configuring the SPI Clock Divider Registers

This example demonstrates how to set the SPI clock divisors at runtime.

```
void spi_bitrate_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    g_spi_cfg.p_extend = &g_spi_extended_cfg;
 /* Configure SPI Clock divider to achieve largest bitrate less than or equal to the
desired bitrate. */
    err = R_SPI_B_CalculateBitrate(BITRATE, SPI_B_CLOCK_SOURCE_SCISPICLK,
&(g_spi_extended_cfg.spck_div));
    assert(FSP_SUCCESS == err);
 /* Initialize the SPI module. */
    err = R_SPI_B_Open(&g_spi_ctrl, &g_spi_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
}
```

Data Structure Documentation

◆ rspck_div_setting_t

struct rspck_div_setting_t		
SPI Clock Divider settings.		
Data Fields		
uint8_t	spbr	SPBR register setting.
uint8_t	brdv: 2	BRDV setting in SPCMD0.

◆ spi_b_extended_cfg_t

struct spi_b_extended_cfg_t		
Extended SPI interface configuration		
Data Fields		
spi_b_ssl_mode_t	spi_clksyn	Select SPI or Clock Synchronous mode operation.
spi_b_communication_t	spi_comm	Select full-duplex or transmit-only communication.
spi_b_ssl_polarity_t	ssl_polarity	Select SSLn signal polarity.
spi_b_ssl_select_t	ssl_select	Select which slave to use: 0-SSL0, 1-SSL1, 2-SSL2, 3-SSL3.
spi_b_mosi_idle_value_fixing_t	mosi_idle	Select MOSI idle fixed value and selection.
spi_b_parity_t	parity	Select parity and enable/disable parity.
spi_b_byte_swap_t	byte_swap	Select byte swap mode.
spi_b_clock_source_t	clock_source	Communication clock source (TCLK).
rspck_div_setting_t	spck_div	Register values for configuring the SPI Clock Divider.
spi_b_delay_count_t	spck_delay	SPI Clock Delay Register Setting.
spi_b_delay_count_t	ssl_negation_delay	SPI Slave Select Negation Delay Register Setting.

spi_b_delay_count_t	next_access_delay	SPI Next-Access Delay Register Setting.

◆ spi_b_instance_ctrl_t

struct spi_b_instance_ctrl_t	
Channel control block. DO NOT INITIALIZE. Initialization occurs when spi_api_t::open is called.	
Data Fields	
uint32_t	open
	Indicates whether the open() API has been successfully called.
spi_cfg_t const *	p_cfg
	Pointer to instance configuration.
R_SPI_B0_Type *	p_regs
	Base register for this channel.
void const *	p_tx_data
	Buffer to transmit.
void *	p_rx_data
	Buffer to receive.
uint32_t	tx_count
	Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)
uint32_t	rx_count
	Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)
uint32_t	count
	Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)

spi_bit_width_t	bit_width
	Bits per Data frame (8-bit, 16-bit, 32-bit)

Enumeration Type Documentation

◆ spi_b_ssl_mode_t

enum spi_b_ssl_mode_t	
3-Wire or 4-Wire mode.	
Enumerator	
SPI_B_SSL_MODE_SPI	SPI operation (4-wire method)
SPI_B_SSL_MODE_CLK_SYN	Clock Synchronous operation (3-wire method)

◆ spi_b_communication_t

enum spi_b_communication_t	
Transmit Only (Half Duplex), or Full Duplex.	
Enumerator	
SPI_B_COMMUNICATION_FULL_DUPLEX	Full-Duplex synchronous serial communication.
SPI_B_COMMUNICATION_TRANSMIT_ONLY	Transit only serial communication.

◆ spi_b_ssl_polarity_t

enum spi_b_ssl_polarity_t	
Slave Select Polarity.	
Enumerator	
SPI_B_SSLP_LOW	SSLP signal polarity active low.
SPI_B_SSLP_HIGH	SSLP signal polarity active high.

◆ spi_b_ssl_select_t

enum spi_b_ssl_select_t	
The Slave Select Line	
Enumerator	
SPI_B_SSL_SELECT_SSL0	Select SSL0.
SPI_B_SSL_SELECT_SSL1	Select SSL1.
SPI_B_SSL_SELECT_SSL2	Select SSL2.
SPI_B_SSL_SELECT_SSL3	Select SSL3.

◆ spi_b_mosi_idle_value_fixing_t

enum spi_b_mosi_idle_value_fixing_t	
MOSI Idle Behavior.	
Enumerator	
SPI_B_MOSI_IDLE_VALUE_FIXING_DISABLE	MOSI output value=value set in MOIFV bit.
SPI_B_MOSI_IDLE_VALUE_FIXING_LOW	MOSIn level low during MOSI idling.
SPI_B_MOSI_IDLE_VALUE_FIXING_HIGH	MOSIn level high during MOSI idling.

◆ spi_b_parity_t

enum spi_b_parity_t	
Parity Mode	
Enumerator	
SPI_B_PARITY_MODE_DISABLE	Disable parity.
SPI_B_PARITY_MODE_ODD	Select even parity.
SPI_B_PARITY_MODE_EVEN	Select odd parity.

◆ spi_b_byte_swap_t

enum spi_b_byte_swap_t	
Byte Swapping Enable/Disable.	
Enumerator	
SPI_B_BYTE_SWAP_DISABLE	Disable Byte swapping for 16/32-Bit transfers.
SPI_B_BYTE_SWAP_ENABLE	Enable Byte swapping for 16/32-Bit transfers.

◆ spi_b_delay_count_t

enum spi_b_delay_count_t	
Delay count for SPI delay settings.	
Enumerator	
SPI_B_DELAY_COUNT_1	Set RSPCK delay count to 1 RSPCK.
SPI_B_DELAY_COUNT_2	Set RSPCK delay count to 2 RSPCK.
SPI_B_DELAY_COUNT_3	Set RSPCK delay count to 3 RSPCK.
SPI_B_DELAY_COUNT_4	Set RSPCK delay count to 4 RSPCK.
SPI_B_DELAY_COUNT_5	Set RSPCK delay count to 5 RSPCK.
SPI_B_DELAY_COUNT_6	Set RSPCK delay count to 6 RSPCK.
SPI_B_DELAY_COUNT_7	Set RSPCK delay count to 7 RSPCK.
SPI_B_DELAY_COUNT_8	Set RSPCK delay count to 8 RSPCK.

◆ spi_b_clock_source_t

enum spi_b_clock_source_t
SPI communication clock source.

Function Documentation

◆ R_SPI_B_Open()

fsp_err_t R_SPI_B_Open (spi_ctrl_t * *p_api_ctrl*, spi_cfg_t const *const *p_cfg*)

This functions initializes a channel for SPI communication mode. Implements spi_api_t::open.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Configures the peripheral registers according to the configuration.
- Initialize the control structure for use in other SPI Interface functions.

Return values

FSP_SUCCESS	Channel initialized successfully.
FSP_ERR_ALREADY_OPEN	Instance was already initialized.
FSP_ERR_ASSERTION	An invalid argument was given in the configuration structure.
FSP_ERR_UNSUPPORTED	A requested setting is not possible on this device with the current build configuration.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel number is invalid.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls: transfer_api_t::open

Note

This function is reentrant.

◆ R_SPI_B_Read()

fsp_err_t R_SPI_B_Read (spi_ctrl_t *const *p_api_ctrl*, void * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width*)

This function receives data from a SPI device. Implements spi_api_t::read.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI read operation.

Return values

FSP_SUCCESS	Read operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control or destination parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ R_SPI_B_Write()

fsp_err_t R_SPI_B_Write (spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, uint32_t const *length*, spi_bit_width_t const *bit_width*)

This function transmits data to a SPI device using the TX Only Communications Operation Mode. Implements spi_api_t::write.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI write operation.

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control or source parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ R_SPI_B_WriteRead()

fsp_err_t R_SPI_B_WriteRead (spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, void * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width*)

This function simultaneously transmits and receive data. Implements spi_api_t::writeRead.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI writeRead operation.

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control, source or destination parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ R_SPI_B_CallbackSet()

fsp_err_t R_SPI_B_CallbackSet (spi_ctrl_t *const *p_api_ctrl*, void(*)(spi_callback_args_t *) *p_callback*, void const *const *p_context*, spi_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements spi_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SPI_B_Close()

fsp_err_t R_SPI_B_Close (spi_ctrl_t *const *p_api_ctrl*)

This function manages the closing of a channel by the following task. Implements spi_api_t::close.

Disables SPI operations by disabling the SPI bus.

- Disables the SPI peripheral.
- Disables all the associated interrupts.
- Update control structure so it will not work with SPI Interface functions.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	A required pointer argument is NULL.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

◆ R_SPI_B_CalculateBitrate()

fsp_err_t R_SPI_B_CalculateBitrate (uint32_t *bitrate*, spi_b_clock_source_t *clock_source*, rspck_div_setting_t * *spck_div*)

Calculates the SPBR register value and the BRDV bits for a desired bitrate. If the desired bitrate is faster than the maximum bitrate, than the bitrate is set to the maximum bitrate. If the desired bitrate is slower than the minimum bitrate, than an error is returned.

Parameters

[in]	bitrate	Desired bitrate
[in]	clock_source	SPI communication clock source to be used
[out]	spck_div	Memory location to store bitrate register settings.

Return values

FSP_SUCCESS	Valid spbr and brdv values were calculated
FSP_ERR_UNSUPPORTED	Bitrate is not achievable

Detailed Description

UART driver for the SAU peripheral on RA MCUs. This module implements the UART Interface.

Overview

Features

The SAU UART module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Invoking the user-callback function with an event code (RX/TX complete, TX data empty, RX char, error, etc)
- Baud-rate change at run-time
- Integration with the DTC transfer module
- Abort in-progress read/write operations

Configuration

Build Time Configurations for r_sau_uart

The following build time configurations are defined in fsp_cfg/r_sau_uart_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Critical Section Guarding	• Enabled • Disabled	Disabled	Enable critical section guarding around peripheral configuration updates. This should be enabled if the R_SAU_I2C module is being used simultaneously with this module.

DTC Support	• Enable • Disable	Disable	Enable DTC support for the SAU_UART module.
Enable Single Channel	• Disable • Channel 0 • Channel 1 • Channel 2	Disable	Enable single channel to reduce code size if only channel 0, 1, or 2 is needed.
Enable Fixed Baudrate	• Enable • Disable	Enable	Disable baudrate calculation and setter functions to reduce code size.

Configurations for Connectivity > UART (r_sau_uart)

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r_sau_uart).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_uart0	Module name.
Channel	Value must be a non-negative integer	0	Select the UART channel.
Data Bits	• 7 bits • 8 bits • 9 bits	8 bits	Select the number of bits per word.
Parity	• None • Zero • Odd • Even	None	Select the parity mode.
Stop Bits	• 1 bit • 2 bits	1 bit	Select the number of stop bits. In receive, 2 bit is not available.
Bit Order	• LSB First • MSB First	LSB First	Select of data transfer sequence.
Baud			
Baud Rate	Value must be an integer greater than 0	115200	Enter the desired baud rate. If the requested baud rate cannot be achieved, adjust the operation clock frequency until the baud rate is achievable. The calculated baud rate is printed in a comment in the generated sau_uart_baudrate_setting_t

			structure.
Extra			
Operation Clock	• CKm0 • CKm1	CKm0	Select the operation clock. Use the Clocks tab to set the operation clock divider.
Tx Signal Level	• Standard • Inverted	Standard	Select the level of transmitted signal.
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Transmit End Interrupt Priority	MCU Specific Options		Select the transmit end interrupt priority.
Receive End Interrupt Priority	MCU Specific Options		Select the receive end interrupt priority.
Error Interrupt Priority	MCU Specific Options		Select the error interrupt priority.

Clock Configuration

The SAU clock uses the system clock (ICLK) as its clock source.

A prescaler is applied to the ICLK in order to produce the operation clock frequency. The operation clock is used to generate the desired transfer period of the SAU module.

SAU operation clocks are shared among all channels within a SAU unit. Check the Hardware User's Manual for your MCU for available units and channels. SAU operation clock dividers are configurable in the Clocks tab.

The operation clock dividers are named SAU CKmn where m is the SAU unit, and n is the operation clock. For example, SAU CK01 applies to all SAU0 instances using CK1 as the operation clock (m=0, n=1).

Pin Configuration

This module uses TXD and RXD to communicate to external devices.

Usage Notes

9-bit data transfers

- p_src: the address for the send data buffer. p_src in R_SAU_UART_Write must be aligned on a 16-bit boundary. (the data order in buffer: the lower 8-bits of the first number, the highest

1-bit of the first number, the lower 8-bits of the second number, the highest 1-bit of the second number, etc)
- byte: the size of send data buffer.

Selecting Operation Clock Frequency

The relationship between operation clock frequency and bitrate is: bitrate = f_mck / [2 * (SDRmn.STCLK + 1)] where:

- SDRmn.STCLK is an integer in the range [2, 127] for SAU UART
- f_mck is the operation clock (SAU CKmn) frequency

By plugging in the minimum and maximum SDRmn.STCLK values, the range of bitrates for a given operation clock frequency can be obtained.

Note that due to STCLK being set as discrete integers, the actual bitrate may not be exact. The actual bitrate and percent errors can be calculated by the formulas:

```
actual_bitrate = f_mck / [ 2 * (SDRmn.STCLK + 1) ]
percent_error = 100 * abs [(actual_bitrate - expected_bitrate) / expected_bitrate]
```

Using the fastest possible operation clock for the desired bitrate will result in the lowest deviation from the requested baud rate. Set the CKmn operation clock divider in the Clocks tab to select the desired operation clock frequency.

Example of Selecting Operation Clock Frequency

Suppose an example application with a 32MHz ICLK requires:

- 1 SAU0 UART0 instance running at 1000 bps
- 1 SAU0 UART1 instance running at 115200 bps

The following operation clocks could be used:

```
# Operation clock frequency of 250 kHz with 32 Mhz ICLK (32MHz/128=250 kHz)
bitrate_min = 250e3 / [ 2 * (127 + 1) ] = ~976 bps
bitrate_max = 250e3 / [ 2 * (2 + 1) ] = ~41,666 bps
# Operation clock frequency of 16 MHz with 32 MHz ICLK (32MHz/2=16 MHz)
bitrate_min = 16e6 / [ 2 * (127 + 1) ] = ~62,500 bps
bitrate_max = 16e6 / [ 2 * (2 + 1) ] = ~2,666,666 bps
```

An operation clock of 250 kHz works for UART0 because 1000 is in the range [976, 41.6k]. An operation clock of 16 MHz works for UART1 because 115200 is in the range [62.5k, 2.6M].

Applying the settings:

- Select CK0 for UART0 and CK1 for UART1 using the SAU UART "Extra > Operation Clock" property
- Set CK00 Div to /128 for SAU0, CK0 (UART0) in the Clocks tab
- Set CK01 Div to /2 for for SAU0, CK1 (UART1) in the Clocks tab

Runtime Baud Rate Change

In order to change the baud rate at runtime, "Common > Enable Fixed Baudrate" must be set to "Disabled" in the module properties.

If changing the baud rate is required at runtime, use a unique operation clock for each SAU instance. This is required because R_SAU_UART_BaudSet may change the operation clock divider. Since the operation clocks are shared between SAU channels on each SAU unit, changing a shared operation clock of one instance will cause an incorrect bitrate to be generated on the other instance(s).

If the system clock frequency is changed at runtime, this setting should be disabled, as the baud rate settings will need to be updated after the system clock change.

Limitations

- Reception is still enabled after uart_api_t::communicationAbort API is called. Any characters received after abort and before the next call to read will arrive via the callback function with event UART_EVENT_RX_CHAR.
- If 9-bit data length is specified at R_SAU_UART_Open call, p_src in R_SAU_UART_Write must be aligned on a 16-bit boundary.
- When multiple channels on the same SAU unit need to be used, and one is configured as UART, then critical section property needs to be enabled.

DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to R_SAU_UART_Read(). The logic required to combine bytes received through R_SAU_UART_Read() (UART_EVENT_RX_COMPLETE) and bytes received between calls (UART_EVENT_RX_CHAR) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.
- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer. uart_api_t::infoGet API can be used to get the max transfer size allowed.
- When using 9-bit reception with DTC, clear the upper 7 bits of data before processing the read data. The upper 7 bits contain status flags that are part of the register used to read data in 9-bit mode.

Examples

SAU UART Example

```
uint8_t g_dest[TRANSFER_LENGTH];

uint8_t g_src[TRANSFER_LENGTH];

uint8_t g_out_of_band_received[TRANSFER_LENGTH];

uint32_t g_transfer_complete = 0;

uint32_t g_receive_complete = 0;
```

```
uint32_t g_out_of_band_index = 0;
void r_sau_uart_basic_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the transfer instance with initial configuration. */
 fsp_err_t err = R_SAU_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_SAU_UART_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
    err = R_SAU_UART_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
 while (!g_transfer_complete)
    {
    }
 while (!g_receive_complete)
    {
    }
}
void example_callback (uart_callback_args_t * p_args)
{
 /* Handle the UART event */
 switch (p_args->event)
    {
 /* Received a character */
 case UART_EVENT_RX_CHAR:
      {
 /* Only put the next character in the receive buffer if there is space for it */
 if (sizeof(g_out_of_band_received) > g_out_of_band_index)
      {
 /* Write either the next one or two bytes depending on the receive data size */
```

```
 if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)
      {
                  g_out_of_band_received[g_out_of_band_index++] = (uint8_t)
p_args->data;
      }
 else
      {
                  uint16_t * p_dest = (uint16_t *)
&g_out_of_band_received[g_out_of_band_index];
                  *p_dest             = (uint16_t) p_args->data;
                  g_out_of_band_index += 2;
      }
      }
 break;
      }
 /* Receive complete */
 case UART_EVENT_RX_COMPLETE:
      {
            g_receive_complete = 1;
 break;
      }
 /* Transmit complete */
 case UART_EVENT_TX_COMPLETE:
      {
            g_transfer_complete = 1;
 break;
      }
 default:
      {
      }
   }
}
```

SAU UART Baud Set Example

```
#define SAU_UART_BAUDRATE_19200 (19200)
#define SAU_UART_BAUDRATE_ERROR_PERCENT_5 (5000)
void r_sau_uart_baud_example (void)
{
    sau_uart_baudrate_setting_t baud_setting;
    uint32_t baud_rate = SAU_UART_BAUDRATE_19200;
 fsp_err_t err = R_SAU_UART_BaudCalculate(&g_uart0_ctrl, baud_rate, &baud_setting);
    assert(FSP_SUCCESS == err);
    err = R_SAU_UART_BaudSet(&g_uart0_ctrl, (void *) &baud_setting);
    assert(FSP_SUCCESS == err);
}
```

	Base register for the transmit channel.
uint8_t	sau_unit
	SAU unit information.
uint8_t	sau_tx_channel
	SAU channel information.
uint8_t *	p_src
	Source buffer pointer.
uint32_t	tx_count
	Size of destination buffer pointer from transmit ISR.
uint8_t *	p_dest

	Destination buffer pointer.
uint32_t	rx_count
	Size of destination buffer pointer used for receiving data.

Enumeration Type Documentation

◆ sau_uart_data_sequence_t

enum sau_uart_data_sequence_t	
UART Data transfer sequence definition	
Enumerator	
SAU_UART_DATA_SEQUENCE_MSB	Data sequence MSB first.
SAU_UART_DATA_SEQUENCE_LSB	Data sequence LSB first.

◆ sau_operation_clock_t

enum sau_operation_clock_t	
UART operation clock selection definition	
Enumerator	
SAU_UART_OPERATION_CLOCK_CK0	Operating clock use CK0.
SAU_UART_OPERATION_CLOCK_CK1	Operating clock use CK1.

◆ sau_uart_transfer_mode_t

enum sau_uart_transfer_mode_t	
UART transfer mode selection definition	
Enumerator	
SAU_UART_TRANSFER_MODE_SINGLE	Single transfer mode.
SAU_UART_TRANSFER_MODE_CONTINUOUS	Continuous transfer mode.

◆ sau_uart_signal_level_t

enum sau_uart_signal_level_t	
UART data signal level definition	
Enumerator	
SAU_UART_SIGNAL_LEVEL_STANDARD	Uart data signal level standard.
SAU_UART_SIGNAL_LEVEL_INVERTED	Uart data signal level inverted.

Function Documentation

◆ R_SAU_UART_Open()

fsp_err_t R_SAU_UART_Open (uart_ctrl_t *const *p_api_ctrl*, uart_cfg_t const *const *p_cfg*)

Configures the UART driver based on the input configurations. If reception is enabled at compile time, reception is enabled at the end of this function. Implements uart_api_t::open

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to UART control block or configuration structure is NULL.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The requested channel does not exist on this MCU.
FSP_ERR_INVALID_ARGUMENT	Flow control is enabled but flow control pin is not defined or selected channel does not support "Hardware CTS and Hardware RTS" flow control.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::open

◆ R_SAU_UART_Close()

fsp_err_t R_SAU_UART_Close (uart_ctrl_t *const *p_api_ctrl*)

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements uart_api_t::close

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SAU_UART_Read()

fsp_err_t R_SAU_UART_Read (uart_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Receives user specified number of bytes into destination buffer pointer. Implements uart_api_t::read

Return values

FSP_SUCCESS	Data reception successfully ends.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Destination address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A previous read operation is still in progress.
FSP_ERR_UNSUPPORTED	current operation mode is transmission only.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

Note

If 9-bit data length is specified at R_SAU_UART_Open call, p_dest must be aligned 16-bit boundary.

◆ R_SAU_UART_Write()

fsp_err_t R_SAU_UART_Write (uart_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes*)

Transmits user specified number of bytes from the source buffer pointer. Implements uart_api_t::write

Return values

FSP_SUCCESS	Data transmission finished successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Source address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A UART transmission is in progress
FSP_ERR_UNSUPPORTED	SAU_UART_CFG_TX_ENABLE is set to 0

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

Note

If 9-bit data length is specified at R_SAU_UART_Open call, p_src must be aligned on a 16-bit boundary.

◆ R_SAU_UART_BaudSet()

fsp_err_t R_SAU_UART_BaudSet (uart_ctrl_t *const *p_api_ctrl*, void const *const *p_baud_setting*)

Updates the baud rate using the clock selected in Open. p_baud_setting is a pointer to a sau_uart_baudrate_setting_t structure. Implements uart_api_t::baudSet

Warning

This terminates any in-progress transmission.
This function may change the operation clock frequency. Select a unique operation clock for each SAU instance if using this function.

Return values

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer p_ctrl is NULL
FSP_ERR_INVALID_ARGUMENT	p_api_ctrl is empty.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_UNSUPPORTED	Fixed baud rate is enabled

◆ R_SAU_UART_CallbackSet()

fsp_err_t R_SAU_UART_CallbackSet (uart_ctrl_t *const *p_api_ctrl*, void(*)(uart_callback_args_t *) *p_callback*, void const *const *p_context*, uart_callback_args_t *const *p_callback_memory*)

Updates the user callback for callback structure. Implements uart_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	Pointer p_ctrl is NULL or p_callback_memory is not NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ R_SAU_UART_InfoGet()

fsp_err_t R_SAU_UART_InfoGet (uart_ctrl_t *const *p_api_ctrl*, uart_info_t *const *p_info*)

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements uart_api_t::infoGet

Return values

FSP_SUCCESS	Information stored in provided p_info.
FSP_ERR_INVALID_ARGUMENT	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SAU_UART_Abort()

fsp_err_t R_SAU_UART_Abort (uart_ctrl_t *const *p_api_ctrl*, uart_dir_t *communication_to_abort*)

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::communicationAbort

Return values

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::disable

◆ R_SAU_UART_ReadStop()

fsp_err_t R_SAU_UART_ReadStop (uart_ctrl_t *const *p_api_ctrl*, uint32_t * *remaining_bytes*)

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::readStop

Return values

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::disable

◆ R_SAU_UART_BaudCalculate()

fsp_err_t R_SAU_UART_BaudCalculate (sau_uart_instance_ctrl_t *const *p_ctrl*, uint32_t *baudrate*, sau_uart_baudrate_setting_t *const *p_baud_setting*)

Calculates baud rate register settings (SDR.STCLK) for the specified SAU unit.

Parameters

[in]	p_ctrl	Pointer to the SAU UART control block.
[in]	baudrate	Baud rate [bps]. For example, 19200, 57600, 115200, etc.
[out]	p_baud_setting	Baud setting information stored here if successful

Return values

FSP_SUCCESS	Baud rate is successfully calculated
FSP_ERR_UNSUPPORTED	Fixed baudrate is being used
FSP_ERR_ASSERTION	Null pointer
FSP_ERR_INVALID_ARGUMENT	Baud rate is not achievable with selected operation clock frequency

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the UART Interface.

Overview

Features

The SCI UART module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Invoking the user-callback function with an event code (RX/TX complete, TX data empty, RX char, error, etc)
- Baud-rate change at run-time
- Bit rate modulation and noise cancellation
- CTS/RTS hardware flow control (with an associated pin)
- RS-485 Half Duplex driver support with external RS-485 transceiver
- Integration with the DTC transfer module
- Abort in-progress read/write operations
- FIFO support on supported channels

Configuration

Build Time Configurations for r_sci_b_uart

The following build time configurations are defined in fsp_cfg/r_sci_b_uart_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
FIFO Support	• Enable • Disable	Disable	Enable FIFO support for the SCI_UART module.

DTC Support	• Enable • Disable	Disable	Enable DTC support for the SCI_UART module.
Flow Control Support	• Enable • Disable	Disable	Enable RS232 and RS-485 flow control support using a user provided pin.

Configurations for Connectivity > UART (r_sci_b_uart)

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r_sci_b_uart). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_uart0	Module name.
Channel	Value must be a non-negative integer	0	Select the SCI channel.
Data Bits	• 8bits • 7bits • 9bits	8bits	Select the number of bits per word.
Parity	• None • Odd • Even	None	Select the parity mode.
Stop Bits	• 1bit • 2bits	1bit	Select the number of stop bits.
Baud			
Baud Rate	Value must be an integer greater than 0	115200	Enter the desired baud rate. If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical calculated baud rate and percent error are printed in a comment in the generated sci_b_baud_setting_t structure.
Baud Rate Modulation	• Disabled • Enabled	Disabled	Enabling baud rate modulation reduces the percent error of the actual baud rate with respect to the

			requested baud rate. It does this by modulating the number of cycles per clock, so some bits are slightly longer than others.
Max Error (%)	Must be a valid non-negative integer with a maximum configurable value of 100	5	Maximum percent error allowed during baud calculation. This is used by the algorithm to determine whether or not to consider using less accurate alternative register settings. NOTE: The baud calculation does not show an error in the tool if this percent error was not achieved. The calculated percent error is recorded in a comment in the generated sci_b_baud_setting_t structure.
Flow Control			
CTS/RTS Selection	MCU Specific Options		Select either CTS or RTS function on the CTSn_RTSn pin of SCI channel n or select CTS function on CTSn pin and RTS function on CTSn_RTSn pin of SCI channel n (Available on selected MCUs and channels).
Software RTS Port	Refer to the RA Configuration tool for available options.	Disabled	Specify the flow control pin port for the MCU.
Software RTS Pin	Refer to the RA Configuration tool for available options.	Disabled	Specify the flow control pin for the MCU.
Extra			
Extra > RS-485			
DE Pin	• Disable • Enable	Disable	Enable or disable the DE pin for use in RS-485 half-duplex mode.

DE Pin Polarity	• Active Low • Active High	Active High	Select the polarity of the DE pin.
DE Pin Assertion Time	Must be a valid integer greater than 0 and less than or equal to 31.	1	Configure the time between assertion of the DE pin and the start of a write transfer. The time is specified in multiples of the SCI base clock period.
DE Pin Negation Time	Must be a valid integer greater than 0 and less than or equal to 31.	1	Configure the time between the end of a write transfer and the negation of the DE pin. The time is specified in multiples of the SCI base clock period.
Clock Source	• Internal Clock • Internal Clock With Output on SCK • External Clock 8x baud rate • External Clock 16x baud rate	Internal Clock	Selection of the clock source to be used in the baud-rate clock generator. When internal clock is used the baud rate can be output on the SCK pin.
Start bit detection	• Falling Edge • Low Level	Falling Edge	Start bit detected as falling edge or low level.
Noise Filter	• Enable • Disable	Disable	Enable the digital noise filter on RXDn pin. The digital noise filter block in SCI consists of two-stage flipflop circuits.
Receive FIFO Trigger Level	Refer to the RA Configuration tool for available options.	Max	Unused if the channel has no FIFO or if DTC is used for reception. Set to One to get a callback immediately when each byte is received. Set to Max to get a callback when FIFO is full or after 15 bit times with no data (fewer interrupts).
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be

		called from the interrupt service routine (ISR).
Receive Interrupt Priority	MCU Specific Options	Select the receive interrupt priority.
Transmit Data Empty Interrupt Priority	MCU Specific Options	Select the transmit interrupt priority.
Transmit End Interrupt Priority	MCU Specific Options	Select the transmit end interrupt priority.
Error Interrupt Priority	MCU Specific Options	Select the error interrupt priority.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA6T2	SCISPICLK
RA8D1	SCICLK
RA8M1	SCICLK
RA8T1	SCICLK

The clock source for the baud-rate clock generator can be selected from the internal clock, the external clock times 8 or the external clock times 16. The external clock is supplied to the SCK pin.

Pin Configuration

This module uses TXD and RXD to communicate to external devices. CTS or RTS can be controlled by the hardware. CTS or RTS or both (CTS and RTS) can be controlled by the hardware When the internal clock is the source for the baud-rate generator the SCK pin can be used to output a clock with the same frequency as the bit rate.

Usage Notes

- When configured for Hardware CTS and Software RTS the configured flow control pin will be used for RTS. The pin will be set high inside of the receive ISR while data is being read. It will be set low when all data is read.
- When configured for Hardware CTS and Hardware RTS the CSTn_RTSn pin will be used for RTS function and the CTSn pin will be used for CTS function on channel n.
- The driver will follow correct hardware flow control function when CTSn_RTSn pin is connected to CTSn pin when "Hardware CTS and Hardware RTS" flow control is selected. The data will still be transferred when CTSn_RTSn and CTSn are disconnected as the CTSn pin is internally pulled low on the hardware when CTSn pin is configured as a peripheral pin for SCI module. Do not configure CTSn pin if the hardware flow control is not desired.

Limitations

- Reception is still enabled after uart_api_t::communicationAbort API is called. Any characters

received after abort and before the next call to read will arrive via the callback function with event UART_EVENT_RX_CHAR.

DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to R_SCI_B_UART_Read(). The logic required to combine bytes received through R_SCI_B_UART_Read() (UART_EVENT_RX_COMPLETE) and bytes received between calls (UART_EVENT_RX_CHAR) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.
- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer. uart_api_t::infoGet API can be used to get the max transfer size allowed.
- When using 9-bit reception with DTC, clear the upper 7 bits of data before processing the read data. The upper 7 bits contain status flags that are part of the register used to read data in 9-bit mode.

Examples

SCI UART Example

```
uint8_t g_dest[TRANSFER_LENGTH];
uint8_t g_src[TRANSFER_LENGTH];
uint8_t g_out_of_band_received[TRANSFER_LENGTH];
uint32_t g_transfer_complete = 0;
uint32_t g_receive_complete = 0;
uint32_t g_out_of_band_index = 0;
void r_sci_b_uart_basic_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the transfer instance with initial configuration. */
 fsp_err_t err = R_SCI_B_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_SCI_B_UART_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
    err = R_SCI_B_UART_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
 while (!g_transfer_complete)
```

```
    {
    }
 while (!g_receive_complete)
    {
    }
}
void example_callback (uart_callback_args_t * p_args)
{
 /* Handle the UART event */
 switch (p_args->event)
    {
 /* Received a character */
 case UART_EVENT_RX_CHAR:
     {
 /* Only put the next character in the receive buffer if there is space for it */
 if (sizeof(g_out_of_band_received) > g_out_of_band_index)
     {
 /* Write either the next one or two bytes depending on the receive data size */
 if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)
     {
                 g_out_of_band_received[g_out_of_band_index++] = (uint8_t)
p_args->data;
     }
 else
     {
                 uint16_t * p_dest = (uint16_t *)
&g_out_of_band_received[g_out_of_band_index];
                 *p_dest             = (uint16_t) p_args->data;
                 g_out_of_band_index += 2;
     }
     }
 break;
     }
 /* Receive complete */
```

```
 case UART_EVENT_RX_COMPLETE:
      {
            g_receive_complete = 1;
 break;
      }
 /* Transmit complete */
 case UART_EVENT_TX_COMPLETE:
      {
            g_transfer_complete = 1;
 break;
      }
 default:
      {
      }
    }
}
```

SCI UART Baud Set Example

```
#define SCI_B_UART_BAUDRATE_19200 (19200)
#define SCI_B_UART_BAUDRATE_ERROR_PERCENT_5 (5000)
void r_sci_b_uart_baud_example (void)
{
 sci_b_baud_setting_t baud_setting;
    uint32_t             baud_rate                = SCI_B_UART_BAUDRATE_19200;
 bool                enable_bitrate_modulation = false;
    uint32_t             error_rate_x_1000         =
SCI_B_UART_BAUDRATE_ERROR_PERCENT_5;
 fsp_err_t err = R_SCI_B_UART_BaudCalculate(baud_rate, enable_bitrate_modulation,
error_rate_x_1000, &baud_setting);
    assert(FSP_SUCCESS == err);
    err = R_SCI_B_UART_BaudSet(&g_uart0_ctrl, (void *) &baud_setting);
    assert(FSP_SUCCESS == err);
}
```

Data Structure Documentation

◆ sci_b_uart_instance_ctrl_t

struct sci_b_uart_instance_ctrl_t
UART instance control block.

◆ sci_b_baud_setting_t

struct sci_b_baud_setting_t
Register settings to acheive a desired baud rate and modulation duty.

◆ sci_b_uart_rs485_setting_t

struct sci_b_uart_rs485_setting_t		
Configuration settings for controlling the DE signal for RS-485.		
Data Fields		
sci_b_uart_rs485_enable_t	enable	Enable the DE signal.
sci_b_uart_rs485_de_polarity_t	polarity	DE signal polarity.
uint8_t	assertion_time: 5	Time in baseclock units after assertion of the DE signal and

		before the start of the write transfer.
uint8_t	negation_time: 5	Time in baseclock units after the end of a write transfer and before the DE signal is negated.

◆ sci_b_uart_extended_cfg_t

struct sci_b_uart_extended_cfg_t		
UART on SCI device Configuration		
Data Fields		
sci_b_clk_src_t	clock	The source clock for the baud-rate generator. If internal optionally output baud rate on SCK.
sci_b_uart_start_bit_detect_t	rx_edge_start	Start reception on falling edge.
sci_b_uart_noise_cancellation_t	noise_cancel	Noise cancellation setting.
sci_b_baud_setting_t *	p_baud_setting	Register settings for a desired baud rate.
sci_b_uart_rx_fifo_trigger_t	rx_fifo_trigger	Receive FIFO trigger level, unused if channel has no FIFO or if DTC is used.
bsp_io_port_pin_t	flow_control_pin	UART Driver Enable pin.
sci_b_uart_flow_control_t	flow_control	CTS/RTS function of the SSn pin.
sci_b_uart_rs485_setting_t	rs485_setting	RS-485 settings.

Enumeration Type Documentation

◆ sci_b_clk_src_t

enum sci_b_clk_src_t	
Enumeration for SCI clock source	
Enumerator	
SCI_B_UART_CLOCK_INT	Use internal clock for baud generation.
SCI_B_UART_CLOCK_INT_WITH_BAUDRATE_OUTPUT	Use internal clock for baud generation and output on SCK.
SCI_B_UART_CLOCK_EXT8X	Use external clock 8x baud rate.
SCI_B_UART_CLOCK_EXT16X	Use external clock 16x baud rate.

◆ sci_b_uart_flow_control_t

enum sci_b_uart_flow_control_t	
UART flow control mode definition	
Enumerator	
SCI_B_UART_FLOW_CONTROL_RTS	Use CTSn_RTSn pin for RTS.
SCI_B_UART_FLOW_CONTROL_CTS	Use CTSn_RTSn pin for CTS.
SCI_B_UART_FLOW_CONTROL_HARDWARE_CTSRTS	Use CTSn pin for CTS, CTSn_RTSn pin for RTS.
SCI_B_UART_FLOW_CONTROL_CTSRTS	Use SCI pin for CTS, external pin for RTS.

◆ sci_b_uart_rx_fifo_trigger_t

enum sci_b_uart_rx_fifo_trigger_t	
Receive FIFO trigger configuration.	
Enumerator	
SCI_B_UART_RX_FIFO_TRIGGER_1	Callback after each byte is received without buffering.
SCI_B_UART_RX_FIFO_TRIGGER_2	Callback when FIFO having 2 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_3	Callback when FIFO having 3 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_4	Callback when FIFO having 4 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_5	Callback when FIFO having 5 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_6	Callback when FIFO having 6 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_7	Callback when FIFO having 7 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_8	Callback when FIFO having 8 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_9	Callback when FIFO having 9 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_10	Callback when FIFO having 10 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_11	Callback when FIFO having 11 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_12	Callback when FIFO having 12 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_13	Callback when FIFO having 13 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_14	Callback when FIFO having 14 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_MAX	Callback when FIFO is full or after 15 bit times with no data (fewer interrupts)

◆ sci_b_uart_start_bit_detect_t

enum sci_b_uart_start_bit_detect_t	
Asynchronous Start Bit Edge Detection configuration.	
Enumerator	
SCI_B_UART_START_BIT_LOW_LEVEL	Detect low level on RXDn pin as start bit.
SCI_B_UART_START_BIT_FALLING_EDGE	Detect falling level on RXDn pin as start bit.

◆ sci_b_uart_noise_cancellation_t

enum sci_b_uart_noise_cancellation_t	
Noise cancellation configuration.	
Enumerator	
SCI_B_UART_NOISE_CANCELLATION_DISABLE	Disable noise cancellation.
SCI_B_UART_NOISE_CANCELLATION_ENABLE	Enable noise cancellation.

◆ sci_b_uart_rs485_enable_t

enum sci_b_uart_rs485_enable_t	
RS-485 Enable/Disable.	
Enumerator	
SCI_B_UART_RS485_DISABLE	RS-485 disabled.
SCI_B_UART_RS485_ENABLE	RS-485 enabled.

◆ sci_b_uart_rs485_de_polarity_t

enum sci_b_uart_rs485_de_polarity_t	
The polarity of the RS-485 DE signal.	
Enumerator	
SCI_B_UART_RS485_DE_POLARITY_HIGH	The DE signal is high when a write transfer is in progress.
SCI_B_UART_RS485_DE_POLARITY_LOW	The DE signal is low when a write transfer is in progress.

Function Documentation

◆ R_SCI_B_UART_Open()

fsp_err_t R_SCI_B_UART_Open (uart_ctrl_t *const *p_api_ctrl*, uart_cfg_t const *const *p_cfg*)

Configures the UART driver based on the input configurations. If reception is enabled at compile time, reception is enabled at the end of this function. Implements uart_api_t::open

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to UART control block or configuration structure is NULL.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The requested channel does not exist on this MCU.
FSP_ERR_INVALID_ARGUMENT	Flow control is enabled but flow control pin is not defined.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::open

◆ R_SCI_B_UART_Close()

fsp_err_t R_SCI_B_UART_Close (uart_ctrl_t *const *p_api_ctrl*)

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements uart_api_t::close

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SCI_B_UART_Read()

fsp_err_t R_SCI_B_UART_Read (uart_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Receives user specified number of bytes into destination buffer pointer. Implements uart_api_t::read

Return values

FSP_SUCCESS	Data reception successfully ends.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Destination address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A previous read operation is still in progress.
FSP_ERR_UNSUPPORTED	SCI_B_UART_CFG_RX_ENABLE is set to 0

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

Note

If 9-bit data length is specified at R_SCI_B_UART_Open call, p_dest must be aligned 16-bit boundary.

◆ R_SCI_B_UART_Write()

fsp_err_t R_SCI_B_UART_Write (uart_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes*)

Transmits user specified number of bytes from the source buffer pointer. Implements uart_api_t::write

Return values

FSP_SUCCESS	Data transmission finished successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Source address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A UART transmission is in progress
FSP_ERR_UNSUPPORTED	SCI_B_UART_CFG_TX_ENABLE is set to 0

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

Note

If 9-bit data length is specified at R_SCI_B_UART_Open call, p_src must be aligned on a 16-bit boundary.

◆ R_SCI_B_UART_CallbackSet()

fsp_err_t R_SCI_B_UART_CallbackSet (uart_ctrl_t *const *p_api_ctrl*, void(*)(uart_callback_args_t *) *p_callback*, void const *const *p_context*, uart_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements uart_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SCI_B_UART_BaudSet()

fsp_err_t R_SCI_B_UART_BaudSet (uart_ctrl_t *const *p_api_ctrl*, void const *const *p_baud_setting*)

Updates the baud rate using the clock selected in Open. p_baud_setting is a pointer to a sci_b_baud_setting_t structure. Implements uart_api_t::baudSet

Warning

This terminates any in-progress transmission.

Return values

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL or the UART is not configured to use the internal clock.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SCI_B_UART_InfoGet()

fsp_err_t R_SCI_B_UART_InfoGet (uart_ctrl_t *const *p_api_ctrl*, uart_info_t *const *p_info*)

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements uart_api_t::infoGet

Return values

FSP_SUCCESS	Information stored in provided p_info.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SCI_B_UART_Abort()

fsp_err_t R_SCI_B_UART_Abort (uart_ctrl_t *const *p_api_ctrl*, uart_dir_t *communication_to_abort*)

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::communicationAbort

Return values

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::disable

◆ R_SCI_B_UART_ReadStop()

fsp_err_t R_SCI_B_UART_ReadStop (uart_ctrl_t *const *p_api_ctrl*, uint32_t * *remaining_bytes*)

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::readStop

Return values

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::disable

◆ R_SCI_B_UART_BaudCalculate()

fsp_err_t R_SCI_B_UART_BaudCalculate (uint32_t *baudrate*, bool *bitrate_modulation*, uint32_t *baud_rate_error_x_1000*, sci_b_baud_setting_t *const *p_baud_setting*)

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers.

Parameters

[in]	baudrate	Baud rate [bps]. For example, 19200, 57600, 115200, etc.
[in]	bitrate_modulation	Enable bitrate modulation
[in]	baud_rate_error_x_1000	Max baud rate error. At most <baud_rate_percent_error> x 1000 required for module to function. Absolute max baud_rate_error is 15000 (15%).
[out]	p_baud_setting	Baud setting information stored here if successful

Return values

FSP_SUCCESS	Baud rate is set successfully
FSP_ERR_ASSERTION	Null pointer
FSP_ERR_INVALID_ARGUMENT	Baud rate is '0', error in calculated baud rate is larger than requested max error, or requested max error in baud rate is larger than 15%.

5.2.6.27 UART (r_sci_uart)

Modules » Connectivity

Functions

fsp_err_t	R_SCI_UART_Abort (uart_ctrl_t *const p_api_ctrl, uart_dir_t communication_to_abort)
fsp_err_t	R_SCI_UART_ReadStop (uart_ctrl_t *const p_api_ctrl, uint32_t *remaining_bytes)
fsp_err_t	R_SCI_UART_BaudCalculate (uint32_t baudrate, bool bitrate_modulation, uint32_t baud_rate_error_x_1000, baud_setting_t *const p_baud_setting)

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the UART Interface.

Overview

Features

The SCI UART module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Invoking the user-callback function with an event code (RX/TX complete, TX data empty, RX char, error, etc)
- Baud-rate change at run-time
- Bit rate modulation and noise cancellation
- CTS/RTS hardware flow control (with an associated pin)
- RS-485 Half Duplex driver support with external RS-485 transceiver
- Integration with the DTC transfer module
- Abort in-progress read/write operations
- FIFO support on supported channels

Configuration

Build Time Configurations for r_sci_uart

The following build time configurations are defined in fsp_cfg/r_sci_uart_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
FIFO Support	• Enable • Disable	Disable	Enable FIFO support for the SCI_UART module.
DTC Support	• Enable • Disable	Disable	Enable DTC support for the SCI_UART module.
Flow Control Support	• Enable • Disable	Disable	Enable RS232 and RS-485 flow control support using a user provided pin.
RS-485 Support	• Enable • Disable	Disable	Enable support for controlling the RS-485 DE pin.

Configurations for Connectivity > UART (r_sci_uart)

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r_sci_uart). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_uart0	Module name.
Channel	Value must be a non-negative integer	0	Select the SCI channel.
Data Bits	• 8bits • 7bits • 9bits	8bits	Select the number of bits per word.
Parity	• None • Odd • Even	None	Select the parity mode.
Stop Bits	• 1bit • 2bits	1bit	Select the number of stop bits.
Baud			
Baud Rate	Value must be an integer greater than 0	115200	Enter the desired baud rate. If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical

			calculated baud rate and percent error are printed in a comment in the generated baud_setting_t structure. For RA4 and RA6 MCUs, refer the datasheet to calculate baud rate considering the SEMR.ABCSE bit restriction.
Baud Rate Modulation	• Disabled • Enabled	Disabled	Enabling baud rate modulation reduces the percent error of the actual baud rate with respect to the requested baud rate. It does this by modulating the number of cycles per clock, so some bits are slightly longer than others.
Max Error (%)	Must be a valid non-negative integer with a maximum configurable value of 100	5	Maximum percent error allowed during baud calculation. This is used by the algorithm to determine whether or not to consider using less accurate alternative register settings. NOTE: The baud calculation does not show an error in the tool if this percent error was not achieved. The calculated percent error is recorded in a comment in the generated baud_setting_t structure.
Flow Control			
CTS/RTS Selection	MCU Specific Options		Select either CTS or RTS function on the CTSn_RTSn pin of SCI channel n or select CTS function on CTSn pin and RTS function on

			CTSn_RTSn pin of SCI channel n (Available on selected MCUs and channels).
Software RTS Port	Refer to the RA Configuration tool for available options.	Disabled	Specify the flow control pin port for the MCU.
Software RTS Pin	Refer to the RA Configuration tool for available options.	Disabled	Specify the flow control pin for the MCU.
Extra			
Extra > RS-485			
DE Pin	• Disable • Enable	Disable	Enable or disable the DE pin for use in RS-485 half-duplex mode.
DE Pin Polarity	• Active Low • Active High	Active High	Select the polarity of the DE pin.
DE Port Number	Refer to the RA Configuration tool for available options.	Disabled	GPIO output port number to use for generating the DE signal.
DE Pin Number	Refer to the RA Configuration tool for available options.	Disabled	GPIO output pin number to use for generating the DE signal.
Clock Source	• Internal Clock • Internal Clock With Output on SCK • External Clock 8x baud rate • External Clock 16x baud rate	Internal Clock	Selection of the clock source to be used in the baud-rate clock generator. When internal clock is used the baud rate can be output on the SCK pin.
Start bit detection	• Falling Edge • Low Level	Falling Edge	Start bit detected as falling edge or low level.
Noise Filter	• Enable • Disable	Disable	Enable the digital noise filter on RXDn pin. The digital noise filter block in SCI consists of two-stage flipflop circuits.
Receive FIFO Trigger Level	Refer to the RA Configuration tool for available options.	Max	Unused if the channel has no FIFO or if DTC is used for reception. Set to One to get a callback immediately

			when each byte is received. Set to Max to get a callback when FIFO is full or after 15 bit times with no data (fewer interrupts).
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Receive Interrupt Priority	MCU Specific Options		Select the receive interrupt priority.
Transmit Data Empty Interrupt Priority	MCU Specific Options		Select the transmit interrupt priority.
Transmit End Interrupt Priority	MCU Specific Options		Select the transmit end interrupt priority.
Error Interrupt Priority	MCU Specific Options		Select the error interrupt priority.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKB
RA2A2	PCLKB
RA2E1	PCLKB
RA2E2	PCLKB
RA2E3	PCLKB
RA2L1	PCLKB
RA4E1	PCLKA
RA4E2	PCLKA
RA4M1	PCLKA
RA4M2	PCLKA
RA4M3	PCLKA
RA4T1	PCLKA
RA4W1	PCLKA

RA6E1	PCLKA
RA6E2	PCLKA
RA6M1	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T1	PCLKA
RA6T3	PCLKA

The clock source for the baud-rate clock generator can be selected from the internal clock, the external clock times 8 or the external clock times 16. The external clock is supplied to the SCK pin.

Pin Configuration

This module uses TXD and RXD to communicate to external devices. CTS or RTS or both (CTS and RTS) can be controlled by the hardware. Some MCUs support hardware flow control for both CTS and RTS on some channels. Some MCUs and channels support hardware flow control for either CTS or RTS but not both. If both are desired a GPIO pin can be used for RTS. When the internal clock is the source for the baud-rate generator the SCK pin can be used to output a clock with the same frequency as the bit rate.

Usage Notes

- When configured for Hardware CTS and Software RTS the configured flow control pin will be used for RTS. The pin will be set high inside of the receive ISR while data is being read. It will be set low when all data is read.
- When configured for Hardware CTS and Hardware RTS the CSTn_RTSn pin will be used for RTS function and the CTSn pin will be used for CTS function on channel n.
- The driver will follow correct hardware flow control function when CTSn_RTSn pin is connected to CTSn pin when "Hardware CTS and Hardware RTS" flow control is selected. The data will still be transferred when CTSn_RTSn and CTSn are disconnected as the CTSn pin is internally pulled low on the hardware when CTSn pin is configured as a peripheral pin for SCI module. Do not configure CTSn pin if the hardware flow control is not desired.

Limitations

- Reception is still enabled after uart_api_t::communicationAbort API is called. Any characters received after abort and before the next call to read will arrive via the callback function with event UART_EVENT_RX_CHAR.
- The R_SCI_UART_BaudCalculate() API is used to obtain the baud rate register settings for a specific baudrate. On RA4 and RA6 MCU groups, there is a restriction on SEMR.ABSCE bit for certain channels (refer to 'SEMR : Serial Extended Mode' Register section of MCU User Manual). The API does not enforce this restriction and it may return invalid settings.

DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to

R_SCI_UART_Read(). The logic required to combine bytes received through R_SCI_UART_Read() (UART_EVENT_RX_COMPLETE) and bytes received between calls (UART_EVENT_RX_CHAR) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.
- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer. uart_api_t::infoGet API can be used to get the max transfer size allowed.
- When using 9-bit reception with DTC, clear the upper 7 bits of data before processing the read data. The upper 7 bits contain status flags that are part of the register used to read data in 9-bit mode.

Examples

SCI UART Example

```
uint8_t g_dest[TRANSFER_LENGTH];
uint8_t g_src[TRANSFER_LENGTH];
uint8_t g_out_of_band_received[TRANSFER_LENGTH];
uint32_t g_transfer_complete = 0;
uint32_t g_receive_complete = 0;
uint32_t g_out_of_band_index = 0;
void r_sci_uart_basic_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the transfer instance with initial configuration. */
 fsp_err_t err = R_SCI_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_SCI_UART_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
    err = R_SCI_UART_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
 while (!g_transfer_complete)
    {
    }
 while (!g_receive_complete)
    {
```

```
    }
}
void example_callback (uart_callback_args_t * p_args)
{
 /* Handle the UART event */
 switch (p_args->event)
    {
 /* Received a character */
 case UART_EVENT_RX_CHAR:
      {
 /* Only put the next character in the receive buffer if there is space for it */
 if (sizeof(g_out_of_band_received) > g_out_of_band_index)
      {
 /* Write either the next one or two bytes depending on the receive data size */
 if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)
      {
                  g_out_of_band_received[g_out_of_band_index++] = (uint8_t)
p_args->data;
      }
 else
      {
                  uint16_t * p_dest = (uint16_t *)
&g_out_of_band_received[g_out_of_band_index];
                  *p_dest             = (uint16_t) p_args->data;
                  g_out_of_band_index += 2;
      }
      }
 break;
      }
 /* Receive complete */
 case UART_EVENT_RX_COMPLETE:
      {
            g_receive_complete = 1;
 break;
```

```
     }
 /* Transmit complete */
 case UART_EVENT_TX_COMPLETE:
     {
           g_transfer_complete = 1;
 break;
     }
 default:
     {
     }
   }
}
```

SCI UART Baud Set Example

```
#define SCI_UART_BAUDRATE_19200 (19200)
#define SCI_UART_BAUDRATE_ERROR_PERCENT_5 (5000)
void r_sci_uart_baud_example (void)
{
 baud_setting_t baud_setting;
    uint32_t       baud_rate                = SCI_UART_BAUDRATE_19200;
 bool          enable_bitrate_modulation = false;
    uint32_t       error_rate_x_1000         = SCI_UART_BAUDRATE_ERROR_PERCENT_5;
 fsp_err_t err = R_SCI_UART_BaudCalculate(baud_rate, enable_bitrate_modulation,
error_rate_x_1000, &baud_setting);
    assert(FSP_SUCCESS == err);
    err = R_SCI_UART_BaudSet(&g_uart0_ctrl, (void *) &baud_setting);
    assert(FSP_SUCCESS == err);
}
```

Data Structure Documentation

◆ sci_uart_instance_ctrl_t

struct sci_uart_instance_ctrl_t
UART instance control block.

◆ baud_setting_t

struct baud_setting_t		
Register settings to acheive a desired baud rate and modulation duty.		
Data Fields		
union baud_setting_t	__unnamed__	
uint8_t	cks: 2	CKS value to get divisor (CKS = N)
uint8_t	brr	Bit Rate Register setting.
uint8_t	mddr	Modulation Duty Register setting.

◆ sci_uart_rs485_setting_t

struct sci_uart_rs485_setting_t		
Configuration settings for controlling the DE signal for RS-485.		
Data Fields		
sci_uart_rs485_enable_t	enable	Enable the DE signal.
sci_uart_rs485_de_polarity_t	polarity	DE signal polarity.
bsp_io_port_pin_t	de_control_pin	UART Driver Enable pin.

◆ sci_uart_extended_cfg_t

struct sci_uart_extended_cfg_t		
UART on SCI device Configuration		
Data Fields		
sci_clk_src_t	clock	The source clock for the baud-rate generator. If internal optionally output baud rate on SCK.
sci_uart_start_bit_t	rx_edge_start	Start reception on falling edge.
sci_uart_noise_cancellation_t	noise_cancel	Noise cancellation setting.
baud_setting_t *	p_baud_setting	Register settings for a desired baud rate.
sci_uart_rx_fifo_trigger_t	rx_fifo_trigger	Receive FIFO trigger level, unused if channel has no FIFO or if DTC is used.
bsp_io_port_pin_t	flow_control_pin	UART Driver Enable pin.
sci_uart_flow_control_t	flow_control	CTS/RTS function of the SSn pin.
sci_uart_rs485_setting_t	rs485_setting	RS-485 settings.

Enumeration Type Documentation

◆ sci_clk_src_t

enum sci_clk_src_t	
Enumeration for SCI clock source	
Enumerator	
SCI_UART_CLOCK_INT	Use internal clock for baud generation.
SCI_UART_CLOCK_INT_WITH_BAUDRATE_OUTPUT	Use internal clock for baud generation and output on SCK.
SCI_UART_CLOCK_EXT8X	Use external clock 8x baud rate.
SCI_UART_CLOCK_EXT16X	Use external clock 16x baud rate.

◆ sci_uart_flow_control_t

enum sci_uart_flow_control_t	
UART flow control mode definition	
Enumerator	
SCI_UART_FLOW_CONTROL_RTS	Use SCI pin for RTS.
SCI_UART_FLOW_CONTROL_CTS	Use SCI pin for CTS.
SCI_UART_FLOW_CONTROL_CTSRTS	Use SCI pin for CTS, external pin for RTS.
SCI_UART_FLOW_CONTROL_HARDWARE_CTSRTS	Use CTSn_RTSn pin for RTS and CTSn pin for CTS. Available only for some channels on selected MCUs. See hardware manual for channel specific options.

◆ sci_uart_rx_fifo_trigger_t

enum sci_uart_rx_fifo_trigger_t	
Receive FIFO trigger configuration.	
Enumerator	
SCI_UART_RX_FIFO_TRIGGER_1	Callback after each byte is received without buffering.
SCI_UART_RX_FIFO_TRIGGER_2	Callback when FIFO having 2 bytes.
SCI_UART_RX_FIFO_TRIGGER_3	Callback when FIFO having 3 bytes.
SCI_UART_RX_FIFO_TRIGGER_4	Callback when FIFO having 4 bytes.
SCI_UART_RX_FIFO_TRIGGER_5	Callback when FIFO having 5 bytes.
SCI_UART_RX_FIFO_TRIGGER_6	Callback when FIFO having 6 bytes.
SCI_UART_RX_FIFO_TRIGGER_7	Callback when FIFO having 7 bytes.
SCI_UART_RX_FIFO_TRIGGER_8	Callback when FIFO having 8 bytes.
SCI_UART_RX_FIFO_TRIGGER_9	Callback when FIFO having 9 bytes.
SCI_UART_RX_FIFO_TRIGGER_10	Callback when FIFO having 10 bytes.
SCI_UART_RX_FIFO_TRIGGER_11	Callback when FIFO having 11 bytes.
SCI_UART_RX_FIFO_TRIGGER_12	Callback when FIFO having 12 bytes.
SCI_UART_RX_FIFO_TRIGGER_13	Callback when FIFO having 13 bytes.
SCI_UART_RX_FIFO_TRIGGER_14	Callback when FIFO having 14 bytes.
SCI_UART_RX_FIFO_TRIGGER_MAX	Callback when FIFO is full or after 15 bit times with no data (fewer interrupts)

◆ sci_uart_start_bit_t

enum sci_uart_start_bit_t	
Asynchronous Start Bit Edge Detection configuration.	
Enumerator	
SCI_UART_START_BIT_LOW_LEVEL	Detect low level on RXDn pin as start bit.
SCI_UART_START_BIT_FALLING_EDGE	Detect falling level on RXDn pin as start bit.

◆ sci_uart_noise_cancellation_t

enum sci_uart_noise_cancellation_t	
Noise cancellation configuration.	
Enumerator	
SCI_UART_NOISE_CANCELLATION_DISABLE	Disable noise cancellation.
SCI_UART_NOISE_CANCELLATION_ENABLE	Enable noise cancellation.

◆ sci_uart_rs485_enable_t

enum sci_uart_rs485_enable_t	
RS-485 Enable/Disable.	
Enumerator	
SCI_UART_RS485_DISABLE	RS-485 disabled.
SCI_UART_RS485_ENABLE	RS-485 enabled.

◆ sci_uart_rs485_de_polarity_t

enum sci_uart_rs485_de_polarity_t	
The polarity of the RS-485 DE signal.	
Enumerator	
SCI_UART_RS485_DE_POLARITY_HIGH	The DE signal is high when a write transfer is in progress.
SCI_UART_RS485_DE_POLARITY_LOW	The DE signal is low when a write transfer is in progress.

Function Documentation

◆ R_SCI_UART_Open()

fsp_err_t R_SCI_UART_Open (uart_ctrl_t *const *p_api_ctrl*, uart_cfg_t const *const *p_cfg*)

Configures the UART driver based on the input configurations. If reception is enabled at compile time, reception is enabled at the end of this function. Implements uart_api_t::open

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to UART control block or configuration structure is NULL.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The requested channel does not exist on this MCU.
FSP_ERR_INVALID_ARGUMENT	Flow control is enabled but flow control pin is not defined or selected channel does not support "Hardware CTS and Hardware RTS" flow control.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::open

◆ R_SCI_UART_Close()

fsp_err_t R_SCI_UART_Close (uart_ctrl_t *const *p_api_ctrl*)

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements uart_api_t::close

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SCI_UART_Read()

fsp_err_t R_SCI_UART_Read (uart_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Receives user specified number of bytes into destination buffer pointer. Implements uart_api_t::read

Return values

FSP_SUCCESS	Data reception successfully ends.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Destination address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A previous read operation is still in progress.
FSP_ERR_UNSUPPORTED	SCI_UART_CFG_RX_ENABLE is set to 0

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

Note

If 9-bit data length is specified at R_SCI_UART_Open call, p_dest must be aligned 16-bit boundary.

◆ R_SCI_UART_Write()

fsp_err_t R_SCI_UART_Write (uart_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes*)

Transmits user specified number of bytes from the source buffer pointer. Implements uart_api_t::write

Return values

FSP_SUCCESS	Data transmission finished successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Source address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A UART transmission is in progress
FSP_ERR_UNSUPPORTED	SCI_UART_CFG_TX_ENABLE is set to 0

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

Note

If 9-bit data length is specified at R_SCI_UART_Open call, p_src must be aligned on a 16-bit boundary.

◆ R_SCI_UART_CallbackSet()

fsp_err_t R_SCI_UART_CallbackSet (uart_ctrl_t *const *p_api_ctrl*, void(*)(uart_callback_args_t *) *p_callback*, void const *const *p_context*, uart_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements uart_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SCI_UART_BaudSet()

fsp_err_t R_SCI_UART_BaudSet (uart_ctrl_t *const *p_api_ctrl*, void const *const *p_baud_setting*)

Updates the baud rate using the clock selected in Open. p_baud_setting is a pointer to a baud_setting_t structure. Implements uart_api_t::baudSet

Warning

This terminates any in-progress transmission.

Return values

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL or the UART is not configured to use the internal clock.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	A restricted channel is selected.

◆ R_SCI_UART_InfoGet()

fsp_err_t R_SCI_UART_InfoGet (uart_ctrl_t *const *p_api_ctrl*, uart_info_t *const *p_info*)

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements uart_api_t::infoGet

Return values

FSP_SUCCESS	Information stored in provided p_info.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SCI_UART_Abort()

fsp_err_t R_SCI_UART_Abort (uart_ctrl_t *const *p_api_ctrl*, uart_dir_t *communication_to_abort*)

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::communicationAbort

Return values

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::disable

◆ R_SCI_UART_ReadStop()

fsp_err_t R_SCI_UART_ReadStop (uart_ctrl_t *const *p_api_ctrl*, uint32_t * *remaining_bytes*)

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::readStop

Return values

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::disable

◆ R_SCI_UART_BaudCalculate()

fsp_err_t R_SCI_UART_BaudCalculate (uint32_t *baudrate*, bool *bitrate_modulation*, uint32_t *baud_rate_error_x_1000*, baud_setting_t *const *p_baud_setting*)

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers.

Note

For limitations of this API, refer to the 'Limitations' section of r_sci_uart module in FSP User Manual.

Parameters

[in]	baudrate	Baud rate [bps]. For example, 19200, 57600, 115200, etc.
[in]	bitrate_modulation	Enable bitrate modulation
[in]	baud_rate_error_x_1000	Max baud rate error. At most <baud_rate_percent_error> x 1000 required for module to function. Absolute max baud_rate_error is 15000 (15%).
[out]	p_baud_setting	Baud setting information stored here if successful

Return values

FSP_SUCCESS	Baud rate is set successfully
FSP_ERR_ASSERTION	Null pointer
FSP_ERR_INVALID_ARGUMENT	Baud rate is '0', error in calculated baud rate is larger than requested max error, or requested max error in baud rate is larger than 15%.

fsp_err_t	R_UARTA_ReadStop (uart_ctrl_t *const p_api_ctrl, uint32_t *p_remaining_bytes)
fsp_err_t	R_UARTA_BaudCalculate (uint32_t baudrate, uint32_t baud_rate_percent_error_x1000, uarta_clock_source_t clock_source, uarta_baud_setting_t *const p_baud_setting)

Detailed Description

Driver for the UARTA peripheral on RA MCUs. This module implements the UART Interface.

Overview

Features

The UARTA module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Baud-rate change at run-time
- Integration with the DTC transfer module
- Abort in-progress read/write operations
- MSB or LSB first transfer selectable
- Inversion control of communication logic level provided

Configuration

Build Time Configurations for r_uarta

The following build time configurations are defined in fsp_cfg/r_uarta_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP)	Default (BSP)	If selected code for

	• Enabled • Disabled		parameter checking is included in the build.
DTC Support	• Enable • Disable	Disable	Enable DTC support for the UARTA module.
Receive Error Interrupt Mode	• Disabled • Enabled	Enabled	Selection receive interrupt mode . Disabled: The UARTA0_ERRI interrupt is generated when a reception error occurs. Enabled: The UARTA0_RXI interrupt is generated when a reception error occurs.

Configurations for Connectivity > UART (r_uarta)

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r_uarta).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_uart0	Module name.
Channel	Value must be a non-negative integer	0	Select the UARTA channel.
Data Bits	• 8bits • 7bits • 5bits	8bits	Select the number of bits per word.
Parity	• None • Zero • Odd • Even	None	Select the parity mode.
Stop Bits	• 1bit • 2bits	1bit	Select the number of stop bits. Note: For the receive data, only the first 1 bit of the stop bits is checked regardless of the stop bit length.
Baud			
Baud Rate	Value must be an integer greater than 0	115200	Enter the desired baud rate. If the requested baud rate cannot be achieved, the settings with the smallest percent error are used.

			The theoretical calculated baud rate and percent error are printed in a comment in the generated baud_setting_t structure.
Extra			
Transfer Order	• LSB first • MSB first	LSB first	Selection of the transmission/reception order.
Transfer level	• Positive logic • Negative logic	Positive logic	Selection of the transmission/reception level.
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Receive Interrupt Priority	MCU Specific Options		Select the receive interrupt priority.
Transmit Interrupt Priority	MCU Specific Options		Select the transmit interrupt priority.
Error Interrupt Priority	MCU Specific Options		Select the error interrupt priority.

Clock Configuration

The baud-rate clock generator can be selected from the clock source MOSC, HOCO, MOCO, SOSC/LOCO.

Pin Configuration

This module uses TXDA and RXDA pin to communicate to external devices.

Usage Notes

Limitations

- Reception is still enabled after uart_api_t::communicationAbort API is called. Any characters received after abort and before the next call to read will arrive via the callback function with event UART_EVENT_RX_CHAR.
- The UARTA module does not have CTS or RTS signals.

DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to R_UARTA_Read(). The logic required to combine bytes received through R_UARTA_Read() (UART_EVENT_RX_COMPLETE) and bytes received between calls (UART_EVENT_RX_CHAR) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.
- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer. uart_api_t::infoGet API can be used to get the max transfer size allowed.

Examples

UARTA Example

```
uint8_t g_dest[TRANSFER_LENGTH];
uint8_t g_src[TRANSFER_LENGTH];
uint8_t g_out_of_band_received[TRANSFER_LENGTH];
uint32_t g_transfer_complete = 0;
uint32_t g_receive_complete = 0;
uint32_t g_out_of_band_index = 0;
void r_uarta_basic_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the transfer instance with initial configuration. */
 fsp_err_t err = R_UARTA_Open(&g_uart0_ctrl, &g_uart0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_UARTA_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
    err = R_UARTA_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
 while (!g_transfer_complete)
    {
    }
 while (!g_receive_complete)
    {
    }
```

```
}
void example_callback (uart_callback_args_t * p_args)
{
 /* Handle the UART event */
 switch (p_args->event)
    {
 /* Received a character */
 case UART_EVENT_RX_CHAR:
      {
 /* Only put the next character in the receive buffer if there is space for it */
 if (sizeof(g_out_of_band_received) > g_out_of_band_index)
      {
 /* Write either the next one or two bytes depending on the receive data size */
 if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)
      {
                  g_out_of_band_received[g_out_of_band_index++] = (uint8_t)
p_args->data;
      }
 else
      {
                  uint16_t * p_dest = (uint16_t *)
&g_out_of_band_received[g_out_of_band_index];
                  *p_dest             = (uint16_t) p_args->data;
                  g_out_of_band_index += 2;
      }
      }
 break;
      }
 /* Receive complete */
 case UART_EVENT_RX_COMPLETE:
      {
            g_receive_complete = 1;
 break;
      }
```

```
 /* Transmit complete */
 case UART_EVENT_TX_COMPLETE:
      {
            g_transfer_complete = 1;
 break;
      }
 default:
      {
      }
    }
}
```

UARTA Baud Set Example

```
#define UARTA_BAUDRATE_19200 (19200)
#define UARTA_BAUDRATE_ERROR_PERCENT_4740 (4740)
void r_uarta_baud_example (void)
{
 uarta_baud_setting_t baud_setting;
    uint32_t             baud_rate         = UARTA_BAUDRATE_19200;
    uint32_t             error_rate_x_1000 = UARTA_BAUDRATE_ERROR_PERCENT_4740;
 uarta_clock_source_t clock_source      = UARTA_CLOCK_SOURCE_HOCO;
 fsp_err_t err = R_UARTA_BaudCalculate(baud_rate, error_rate_x_1000, clock_source,
&baud_setting);
    assert(FSP_SUCCESS == err);
    err = R_UARTA_BaudSet(&g_uart0_ctrl, (void *) &baud_setting);
    assert(FSP_SUCCESS == err);
}
```

Data Structures

Data Structure Documentation

◆ uarta_baud_setting_t

struct uarta_baud_setting_t		
Register settings to acheive a desired baud rate and modulation duty.		
Data Fields		
union uarta_baud_setting_t	__unnamed__	
uint8_t	brgca	Baud rate generator control setting.
uint16_t	delay_time	Delay time (us) required to enable TX at open.

◆ uarta_extended_cfg_t

struct uarta_extended_cfg_t		
UART on UARTA device Configuration		
Data Fields		
uarta_dir_bit_t	transfer_dir	Transmission/reception order configuration.
uarta_alv_bit_t	transfer_level	Transmission/reception level configuration.
uarta_baud_setting_t *	p_baud_setting	Register settings for a desired baud rate.

◆ uarta_instance_ctrl_t

struct uarta_instance_ctrl_t
UARTA instance control block.

Enumeration Type Documentation

◆ uarta_clock_source_t

enum uarta_clock_source_t	
Enumeration for UARTA clock source	
Enumerator	
UARTA_CLOCK_SOURCE_SOSC_LOCO	SOSC/LOCO.
UARTA_CLOCK_SOURCE_MOSC	MOSC.
UARTA_CLOCK_SOURCE_HOCO	HOCO.
UARTA_CLOCK_SOURCE_MOCO	MOCO.

◆ uarta_clock_div_t

enum uarta_clock_div_t	
Enumeration for UARTA clock divider	
Enumerator	
UARTA_CLOCK_DIV_1	fSEL/1
UARTA_CLOCK_DIV_2	fSEL/2
UARTA_CLOCK_DIV_4	fSEL/4
UARTA_CLOCK_DIV_8	fSEL/8
UARTA_CLOCK_DIV_16	fSEL/16
UARTA_CLOCK_DIV_32	fSEL/32
UARTA_CLOCK_DIV_64	fSEL/64
UARTA_CLOCK_DIV_COUNT	Total number of clock divider options.

◆ uarta_dir_bit_t

enum uarta_dir_bit_t	
Transmission/reception order configuration.	
Enumerator	
UARTA_DIR_BIT_MSB_FIRST	MSB first.
UARTA_DIR_BIT_LSB_FIRST	LSB first.

◆ uarta_alv_bit_t

enum uarta_alv_bit_t	
Transmission/reception level configuration.	
Enumerator	
UARTA_ALV_BIT_POSITIVE_LOGIC	Positive logic (wait state = high level, start bit = low level, stop bit = high level)
UARTA_ALV_BIT_NEGATIVE_LOGIC	Negative logic (wait state = low level, start bit = high level, stop bit = low level)

Function Documentation

◆ R_UARTA_Open()

fsp_err_t R_UARTA_Open (uart_ctrl_t *const *p_api_ctrl*, uart_cfg_t const *const *p_cfg*)

Configures the UARTA driver based on the input configurations. If transmission/reception is enabled at compile time, transmission/reception is enabled at the end of this function. Implements uart_api_t::open

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to UARTA control block or configuration structure is NULL.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The requested channel does not exist on this MCU.
FSP_ERR_INVALID_ARGUMENT	Invalid clock select (f_UTA0) and baudrate configuration.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::open

◆ R_UARTA_Close()

fsp_err_t R_UARTA_Close (uart_ctrl_t *const *p_api_ctrl*)

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements uart_api_t::close

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to UARTA control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_UARTA_Read()

fsp_err_t R_UARTA_Read (uart_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Receives user specified number of bytes into destination buffer pointer. Implements uart_api_t::read

Return values

FSP_SUCCESS	Data reception successfully ends.
FSP_ERR_ASSERTION	Pointer to UARTA control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A previous read operation is still in progress.
FSP_ERR_UNSUPPORTED	UARTA_CFG_RX_ENABLE is set to 0

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

◆ R_UARTA_Write()

fsp_err_t R_UARTA_Write (uart_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes*)

Transmits user specified number of bytes from the source buffer pointer. Implements uart_api_t::write

Return values

FSP_SUCCESS	Data transmission finished successfully.
FSP_ERR_ASSERTION	Pointer to UARTA control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A UARTA transmission is in progress
FSP_ERR_UNSUPPORTED	UART_CFG_TX_ENABLE is set to 0

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

◆ R_UARTA_CallbackSet()

fsp_err_t R_UARTA_CallbackSet (uart_ctrl_t *const *p_api_ctrl*, void(*)(uart_callback_args_t *) *p_callback*, void const *const *p_context*, uart_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements uart_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ R_UARTA_BaudSet()

fsp_err_t R_UARTA_BaudSet (uart_ctrl_t *const *p_api_ctrl*, void const *const *p_baud_setting*)

Updates the baud rate using the clock selected in Open. p_baud_setting is a pointer to a uarta_baud_setting_t structure. Implements uart_api_t::baudSet

Warning

This terminates any in-progress transmission.

Return values

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer to UARTA control block is NULL or the UART is not configured to use the internal clock.
FSP_ERR_INVALID_ARGUMENT	Invalid clock select (f_UTA0) and baudrate configuration.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_UARTA_InfoGet()

fsp_err_t R_UARTA_InfoGet (uart_ctrl_t *const *p_api_ctrl*, uart_info_t *const *p_info*)

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements uart_api_t::infoGet

Return values

FSP_SUCCESS	Information stored in provided p_info.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_UARTA_Abort()

fsp_err_t R_UARTA_Abort (uart_ctrl_t *const *p_api_ctrl*, uart_dir_t *communication_to_abort*)

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::communicationAbort

Return values

FSP_SUCCESS	UARTA transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UARTA control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls: transfer_api_t::disable

◆ R_UARTA_ReadStop()

fsp_err_t R_UARTA_ReadStop (uart_ctrl_t *const *p_api_ctrl*, uint32_t * *p_remaining_bytes*)

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::readStop

Return values

FSP_SUCCESS	UARTA transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UARTA control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls: transfer_api_t::disable

◆ R_UARTA_BaudCalculate()

fsp_err_t R_UARTA_BaudCalculate (uint32_t *baudrate*, uint32_t *baud_rate_percent_error_x1000*, uarta_clock_source_t *clock_source*, uarta_baud_setting_t *const *p_baud_setting*)

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers.

Parameters

[in]	baudrate	Baud rate [bps]. For example, 19200, 57600, 115200, etc.
[in]	baud_rate_percent_error_x1000	Max baud rate error. At most baud_rate_percent_error x 1000 required for module to function. Absolute max baud_rate_error is 4740 (4.74%).
[in]	clock_source	Clock Source. Required for module to generate baudrate. The clock sources can be select include UARTA_CLOCK_SOURCE_MOSC, UARTA_CLOCK_SOURCE_HOCO, UARTA_CLOCK_SOURCE_MOCO, UARTA_CLOCK_SOURCE_SOSC_LOCO.
[out]	p_baud_setting	Baud setting information stored here if successful

Return values

FSP_SUCCESS	Baud rate is set successfully
FSP_ERR_ASSERTION	Null pointer
FSP_ERR_INVALID_ARGUMENT	Argument is out of available range, baud rate is '0'.
FSP_ERR_INVALID_RATE	Baud rate error is outside the range or the baud rate could not be set given the current clock source.

5.2.6.29 UART Communication Device (rm_comms_uart)

Modules » Connectivity

Functions

fsp_err_t	RM_COMMS_UART_Open (rm_comms_ctrl_t *const p_api_ctrl, rm_comms_cfg_t const *const p_cfg) Opens and configures the UART Comms module. Implements rm_comms_api_t::open. More...
fsp_err_t	RM_COMMS_UART_Close (rm_comms_ctrl_t *const p_api_ctrl) Disables specified UART Comms module. Implements rm_comms_api_t::close. More...
fsp_err_t	RM_COMMS_UART_CallbackSet (rm_comms_ctrl_t *const p_api_ctrl, void(*p_callback)(rm_comms_callback_args_t *), void const *const p_context) Updates the UART Comms callback. Implements rm_comms_api_t::callbackSet. More...
fsp_err_t	RM_COMMS_UART_Read (rm_comms_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes) Performs a read from the UART device. Implements rm_comms_api_t::read. More...
fsp_err_t	RM_COMMS_UART_Write (rm_comms_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t const bytes) Performs a write to the UART device. Implements rm_comms_api_t::write. More...
fsp_err_t	RM_COMMS_UART_WriteRead (rm_comms_ctrl_t *const p_api_ctrl, rm_comms_write_read_params_t const write_read_params) Performs a write to, then a read from the UART device. Implements rm_comms_api_t::writeRead. More...

Detailed Description

Middleware to implement a generic communications interface over UART. This module implements the Communicatons Middleware Interface.

Overview

The RM_COMMS_UART module implements COMMS API for UART interface.

Features

The implementation of the UART communications interfacehas the following key features:

- Non-blocking API for bare metal
- Non-blocking and blocking API for RTOS

Configuration

Build Time Configurations for rm_comms_uart

The following build time configurations are defined in fsp_cfg/rm_comms_uart_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Connectivity > UART Communication Device (rm_comms_uart)

This module can be added to the Stacks tab via New Stack > Connectivity > UART Communication Device (rm_comms_uart).

Configuration	Options	Default	Description
RTOS			
Write Mutex	• Do Not Use • Use	Use	Lock device for writing in using RTOS.
Read Mutex	• Do Not Use • Use	Use	Lock device for reading in using RTOS.
Mutex Timeout	Value must be a non-negative integer	0xFFFFFFFF	Timeout for recursive mutex operation in using RTOS.
Write Semaphore	• Do Not Use • Use	Use	Block writing in using RTOS.
Read Semaphore	• Do Not Use • Use	Use	Block reading in using RTOS.
Semaphore Timeout	Value must be a non-negative integer	0xFFFFFFFF	Timeout for semaphore operation in using RTOS.
Name	Name must be a valid C symbol	g_comms_uart0	Module name.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided.

Usage Notes

Limitations

- RM_COMMS_API are not reentrant in non blocking mode
- When in blocking mode, RM_COMMS_UART_Write() and RM_COMMS_UART_Read() cannot be

called in callback.
- RM_COMMS_UART_WriteRead API is not implemented

Examples

Basic Example

This is a basic example of minimal use of UART communications implementation in an application.

```
void rm_comms_uart_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    err = RM_COMMS_UART_Open(&g_comms_uart_ctrl, &g_comms_uart_cfg);
 if (FSP_SUCCESS != err)
    {
 /* Handle any errors. */
    }
 while (true)
    {
 /* Send data. */
       g_err_flag = 0;
       g_tx_flag = 0;
       err       = RM_COMMS_UART_Write(&g_comms_uart_ctrl, g_tx_buf, TX_BUF_LEN);
 if (FSP_SUCCESS != err)
     {
 /* Handle any errors. */
     }
 while ((0 == g_tx_flag) && (0 == g_err_flag))
     {
 /* Wait callback */
     }
 /* Receive data. */
       g_err_flag = 0;
       g_rx_flag = 0;
       err       = RM_COMMS_UART_Read(&g_comms_uart_ctrl, g_rx_buf, RX_BUF_LEN);
 if (FSP_SUCCESS != err)
     {
```

```
 /* Handle any errors.*/
      }
 while ((0 == g_rx_flag) && (0 == g_err_flag))
      {
 /* Wait callback */
      }
    }
}
static void rm_comms_uart_callback (rm_comms_callback_args_t * p_args)
{
 if (p_args->event == RM_COMMS_EVENT_TX_OPERATION_COMPLETE)
    {
       g_tx_flag = 1;
    }
 else if (p_args->event == RM_COMMS_EVENT_RX_OPERATION_COMPLETE)
    {
       g_rx_flag = 1;
    }
 else
    {
       g_err_flag = 1;
    }
}
```

Data Structures

struct	rm_comms_uart_instance_ctrl_t

Data Structure Documentation

◆ rm_comms_uart_instance_ctrl_t

struct rm_comms_uart_instance_ctrl_t	
Communications middleware control structure.	
Data Fields	
uint32_t	open
	Open flag.

rm_comms_cfg_t const *	p_cfg
	Middleware configuration.
rm_comms_uart_extended_cfg_t const *	p_extend
	Pointer to extended configuration structure.
void(*	p_callback)(rm_comms_callback_args_t *p_args)
	Pointer to callback that is called when a uart_event_t occurs.
void const *	p_context
	Pointer to context passed into callback function.

Function Documentation

◆ RM_COMMS_UART_Open()

fsp_err_t RM_COMMS_UART_Open (rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_cfg_t const *const *p_cfg*)

Opens and configures the UART Comms module. Implements rm_comms_api_t::open.

Return values

FSP_SUCCESS	UART Comms module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_UART_Close()

fsp_err_t RM_COMMS_UART_Close (rm_comms_ctrl_t *const *p_api_ctrl*)

Disables specified UART Comms module. Implements rm_comms_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_UART_CallbackSet()

fsp_err_t RM_COMMS_UART_CallbackSet (rm_comms_ctrl_t *const *p_api_ctrl*,
void(*)(rm_comms_callback_args_t *) *p_callback*, void const *const *p_context*)

Updates the UART Comms callback. Implements rm_comms_api_t::callbackSet.

Return values

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_COMMS_UART_Read()

fsp_err_t RM_COMMS_UART_Read (rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*,
uint32_t const *bytes*)

Performs a read from the UART device. Implements rm_comms_api_t::read.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_UART_Write()

fsp_err_t RM_COMMS_UART_Write (rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*)

Performs a write to the UART device. Implements rm_comms_api_t::write.

Return values

FSP_SUCCESS	Successfully writing data .
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_UART_WriteRead()

fsp_err_t RM_COMMS_UART_WriteRead (rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_write_read_params_t const *write_read_params*)

Performs a write to, then a read from the UART device. Implements rm_comms_api_t::writeRead.

Return values

FSP_ERR_UNSUPPORTED	Not supported.

5.2.6.30 USB (r_usb_basic)

fsp_err_t	R_USB_PeriControlDataSet (usb_ctrl_t *const p_api_ctrl, uint8_t *p_buf, uint32_t size) Performs transfer processing for control transfer. More...
fsp_err_t	R_USB_PeriControlStatusSet (usb_ctrl_t *const p_api_ctrl,

	usb_setup_status_t status) Set the response to the setup packet. More...
fsp_err_t	R_USB_RemoteWakeup (usb_ctrl_t *const p_api_ctrl) Sends a remote wake-up signal to the connected Host. More...
fsp_err_t	R_USB_DriverActivate (usb_ctrl_t *const p_api_ctrl) Activate USB Driver for USB Peripheral BareMetal. More...
fsp_err_t	R_USB_CallbackMemorySet (usb_ctrl_t *const p_api_ctrl, usb_callback_args_t *p_callback_memory) Set callback memory to USB Driver for USB Peripheral BareMetal. More...
fsp_err_t	R_USB_ModuleNumberGet (usb_ctrl_t *const p_api_ctrl, uint8_t *module_number) This API gets the module number. More...
fsp_err_t	R_USB_ClassTypeGet (usb_ctrl_t *const p_api_ctrl, usb_class_t *class_type) This API gets the class type. More...
fsp_err_t	R_USB_DeviceAddressGet (usb_ctrl_t *const p_api_ctrl, uint8_t *device_address) This API gets the device address. More...
fsp_err_t	R_USB_PipeNumberGet (usb_ctrl_t *const p_api_ctrl, uint8_t *pipe_number) This API gets the pipe number. More...
fsp_err_t	R_USB_DeviceStateGet (usb_ctrl_t *const p_api_ctrl, uint16_t *state) This API gets the state of the device. More...
fsp_err_t	R_USB_DataSizeGet (usb_ctrl_t *const p_api_ctrl, uint32_t *data_size) This API gets the read data size. More...

fsp_err_t	R_USB_SetupGet (usb_ctrl_t *const p_api_ctrl, usb_setup_t *setup) This API gets the setup information. More...
fsp_err_t	R_USB_OtgCallbackSet (usb_ctrl_t *const p_api_ctrl, usb_otg_callback_t *p_callback) Set callback function to be called when the OTG role swap was completed on Azure RTOS. More...
fsp_err_t	R_USB_OtgSRP (usb_ctrl_t *const p_api_ctrl) Start the SRP processing for OTG on Azure RTOS. More...
fsp_err_t	R_USB_TypeCInfoGet (usb_ctrl_t *const p_api_ctrl, usb_typec_info_t *p_info) USB Type-C connect Information get. More...

Detailed Description

Driver for the USB peripheral on RA MCUs. This module implements the USB Interface.

Overview

The USB module operates in combination with the device class drivers provided by Renesas to form a complete USB stack.

Features

The USB module has the following key features:

- USB Host mode
  - Enumerates Low/Full/High-speed devices (see note below)
  - Automatic transfer error determination and retry
- USB Peripheral mode
  - Supports USB1.1/2.0/3.0 hosts
- Automatic processing of device connect/disconnect, suspend/resume, and USB bus reset
- Up to 10 pipes
  - Control transfers supported on pipe 0
  - Data transfer on pipes 1 to 9 (Bulk or Interrupt)
- Functions with or without an RTOS

Note

Supported speeds are dependent on the MCU.

Support Device Class

This driver supports the following device classes.

Host/Peripheral	Device Class	BareMetal	FreeRTOS	AzureRTOS
Host	HCDC (ACM)	Yes	Yes	Yes
	HCDC (ECM)	–	Yes	–
	HHID	Yes	Yes	Yes
	HMSC	Yes	Yes	Yes
	HPRN	–	–	Yes
	HUVC	–	–	Yes
	HVND	Yes	Yes	–
	HCDC+HMSC (Composite)	–	Yes	–
Peripheral	PCDC	Yes	Yes	Yes
	PHID	Yes	Yes	Yes
	PMSC	Yes	Yes	Yes
	PPRN	Yes	Yes	Yes
	PAUD	–	–	Yes
	DFU	–	–	Yes
	PVND	Yes	Yes	–
	PCDC+PMSC	Yes	Yes	Yes
	PHID+PMSC	Yes	Yes	–
	PCDC+PHID	Yes	Yes	–
	PCDC+PCDC	Yes	Yes	–
	PHID+PHID	Yes	Yes	–
	PCDC+PVND	Yes	Yes	–
Other	OTG (CDC)	–	–	Yes
	OTG (HID)	–	–	Yes
	OTG (MSC)	–	–	Yes

Configuration

Build Time Configurations for r_usb_basic

The following build time configurations are defined in fsp_cfg/r_usb_basic_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

PLL Frequency	MCU Specific Options		Specify the PLL frequency supplied to the USB module. This setting only applies to USB1 (not USB0).
CPU Bus Access Wait Cycles	MCU Specific Options		This setting controls the delay for consecutive USB peripheral register access. Set this value to a number of CPU cycles that is equivalent to 40.8ns or more.
Battery Charging	MCU Specific Options		Specify whether or not to include battery charging functionality.
Power IC Shutdown Polarity	MCU Specific Options		Select the polarity of the Shutdown signal on the power supply IC (if provided).
Dedicated Charging Port (DCP) Mode	MCU Specific Options		When enabled, USB communication is disabled and the port is used for charging only.
Notifications for SET_INTERFACE/SET_FEATURE/CLEAR_FEATURE	• Disabled • Enabled	Enabled	When enabled, the application will receive notifications for SET_INTERFACE, SET_FEATURE and CLEAR_FEATURE messages.
Double Buffering	• Disabled • Enabled	Enabled	When enabled, the FIFOs for Pipes 1-5 are double-buffered.
Continuous Transfer Mode	MCU Specific Options		Enable or disable continuous transfer mode.
LDO Regulator	MCU Specific Options		Enable or disable LDO regulator.
Type-C	MCU Specific Options		Enable or disable Type-C.
DMA Support	MCU Specific Options		Enable or disable DMA support for the USB module.
DMA Source Address	MCU Specific Options		Set this to match the speed mode when DMA is enabled. Otherwise,

			set to 'DMA Disabled'.
DMA Destination Address	MCU Specific Options		Set this to match the speed mode when DMA is enabled. Otherwise, set to 'DMA Disabled'.
USB Compliance Test mode	• Enabled • Disabled	Disabled	Display the information required to take the compliance test.
USB TPL table name	Enter the TPL table name.	NULL	Enter the name of the TPL Table.

Configurations for Connectivity > USB (r_usb_basic)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_basic0	Module name.
USB Mode	• Host mode • Peri mode • OTG mode	Host mode	Select the usb mode.
USB Speed	• Full Speed • Hi Speed • Low Speed	Full Speed	Select the USB speed.
USB Module Number	• USB_IP0 Port • USB_IP1 Port	USB_IP0 Port	Specify the USB module number to be used.
USB Device Class	Refer to the RA Configuration tool for available options.	Peripheral Communications Device Class	Select the USB device class.
USB Descriptor	USB Descriptor must be a valid C symbol.	g_usb_descriptor	Enter the name of the descriptor to be used. For how to create a descriptor structure, refer to the Descriptor definition chapter in the usb_basic manual. Specify NULL when using the Host class.
USB Compliance Callback	Compliance Callback must be a valid C symbol.	NULL	Set the callback for compliance tests here.
USBFS Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the main USBFS ISR.
USBFS Resume Priority	MCU Specific Options		Select the interrupt priority used by the USBFS Resume ISR.
USBFS D0FIFO	MCU Specific Options		Select the interrupt

Interrupt Priority			priority used by the USBFS D0FIFO.
USBFS D1FIFO Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the USBFS D1FIFO.
USBHS Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the main USBHS ISR.
USBHS D0FIFO Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the USBHS D0FIFO ISR.
USBHS D1FIFO Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the USBHS D1FIFO ISR.
USB Callback	Enter the address of the function.	NULL	A user callback function can be defined here.
USB Callback Context	Enter the address of the context.	NULL	Set the callback context here.

Clock Configuration

The USB module uses PLL as the clock source. The PLL frequency can be set in the **Clocks** tab of the configuration editor or by using the CGC Interface at run-time.

Note

When using HOCO as the PLL source on Cortex M33 parts the FLL function must be enabled for correct USB operation. Refer to the MCU Family -> Clocks group of the BSP properties in the RA configuration tool to adjust FLL settings.

Pin Configuration

In peripheral mode the USB_VBUS and/or USBHS_VBUS pins are used to detect the USB connection status (connected or disconnected) and should be connected to the USB VBUS signal.

Note

USB_VBUS and USBHS_VBUS are 5V-tolerant pins.

In host mode the USBHS_VBUSEN, USBHS_OVRCURA and USBHS_OVRCURB pins should be connected to the relevant pins of an external power supply IC, if available. These pins will be used to manage the USB VBUS supply.

DMA Configuration

When using DMA with USB the following properties must be configured for each DMAC module:

Config Name	Select Name	Description
Transfer Size	2 Bytes 4 Bytes	In FS mode, select "2 Bytes" In HS mode, select "4 Bytes"
Activation source	USBFS FIFO 0	USB FS Reception

USBFS FIFO 1	USB FS Transmission
USBHS FIFO 0	USB HS Reception
USBHS FIFO 1	USB HS Transmission

Descriptor definition

In Peripheral mode, the usb_descriptor_t structure stores descriptor information including the device and configuration descriptors. The values set in this structure are sent to the USB host as part of enumeration.

```
typedef struct usb_descriptor
{
    uint8_t *p_device;    /* Pointer to device descriptor */
    uint8_t *p_config_f; /* Pointer to full-speed configuration descriptor */
    uint8_t *p_config_h; /* Pointer to high-speed configuration descriptor (HS only)
*/
    uint8_t *p_qualifier; /* Pointer to device qualifier descriptor (HS only) */
    uint8_t **pp_string; /* Pointer to string descriptor table */
    uint8_t num_string;   /* Number of strings in table */
} usb_descriptor_t;
```

Note

Even in high-speed mode the full-speed configuration must be made available:

```
/* Example USB FS descriptor struct */
usb_descriptor_t g_usb_descriptor =
{
    smp_device,
    smp_config_f,
    NULL,
    NULL,
    smp_str_table,
    3,
};
/* Example USB HS descriptor struct */
usb_descriptor_t g_usb_descriptor =
{
    smp_device,
```

```
    smp_config_f,
    smp_config_h,
    smp_qualifier,
    smp_str_table,
    3,
};
```

String Descriptor

This USB driver requires string descriptors to be registered in the string descriptor table. Use the following format to define the elements:

```
/* String descriptor 0 is reserved for language ID information */
uint8_t str_descriptor_0[]
{
    0x04,      /* Length */
    0x03,      /* Descriptor type */
    0x09, 0x04 /* Language ID */
};
uint8_t str_descriptor_manufacturer[] =
{
    0x10,      /* Length */
    0x03,      /* Descriptor type */
 'R', 0x00,
 'E', 0x00,
 'N', 0x00,
 'E', 0x00,
 'S', 0x00,
 'A', 0x00,
 'S', 0x00
};
uint8_t str_descriptor_product[] =
{
    0x12,      /* Length */
    0x03,      /* Descriptor type */
```

```
 'C', 0x00,
 'D', 0x00,
 'C', 0x00,
 '_', 0x00,
 'D', 0x00,
 'E', 0x00,
 'M', 0x00,
 'O', 0x00
};
/* String descriptor table */
uint8_t * smp_str_table[] =
{
    str_descriptor_0,            /* Index: 0 */
    str_descriptor_manufacturer, /* Index: 1 */
    str_descriptor_product,      /* Index: 2 */
};
```

Note

Set the string index values in the device/configuration descriptors (iManufacturer, iConfiguration etc.) to the index of the desired string in the string descriptor table. For example, in the table below, the manufacturer is described in ***str_descriptor_manufacturer*** *and the value of iManufacturer in the device descriptor is* ***1****.*

Other Descriptors

Refer to the Universal Serial Bus Revision 2.0 specification (http://www.usb.org/developers/docs/) for details on how to construct the device, configuration and qualifier descriptors.

Usage Notes

Program Structure

USB applications (whether using an RTOS or not) should be written as an event-handling loop. Either a callback function (RTOS only) or R_USB_EventGet should be used to provide event data to the application loop where a switch statement handles the event.

Note

1.The USB_STATUS_CONFIGURED event should be confirmed before calling R_USB_Read or R_USB_Write.
2.When attaching or detaching USB cable, the suspend or resume event may be notified to the application program in USB peripheral mode. Please ignore these events since the notification of these events to the application program does not affect the operation.

Limitations

Developers should be aware of the following limitations when using the USB driver:

- The current USB driver does not support hub.
- In USB host mode, the module does not support suspend during data transfers. Execute suspend only after confirming that all transfers are complete.
- Multiconfigurations are not supported.
- This driver does not support CPU transfers using the D0FIFO/D1FIFO register.
- Only one device-class driver may be used at a time.
- The USB Hi-Speed module only supports Hi-Speed operation.
- In USB host mode, this USB driver does not support the composite device other than "HMSC + HCDC (for FreeRTOS)".
- The user can not specify DMA transfer to USB IP0 and IP1 modules at the same time when using USB multi-port feature. USB multi-port function: Simultaneous operation feature of USB Host and Peripheral.

Compliance Test

Please set as follows to the following items in RA configuration (r_usb_basic) when doing the compliance test.

1.USB Compliance Test mode Set "Enabled" in this item.

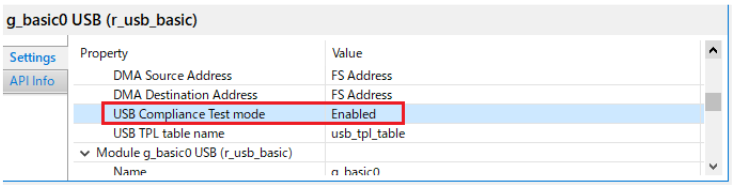

Figure 191: Compliance Test Setting

2.USB TPL table name. Set the start address of TPL(Target Peripheral List) defined in the application program.

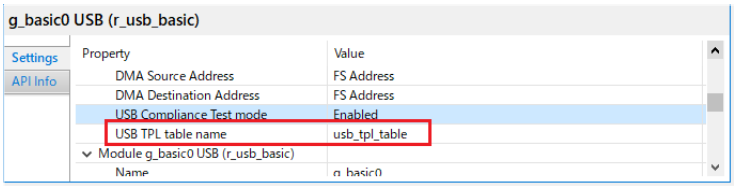

Figure 192: TPL Start Address Setting

Please refer to the following about how to define for TPL.
The following example is when two devices are set in TPL.

```
const uint16_t usb_tpl_table[] =

{

    2,                  /* Number of tpl */

    0,                  /* Reserved */
```

```
    0x0123, 0x4567,    /* Vendor ID, Product ID (1st device) */
    0x89ab, 0xcdef     /* Vendor ID, Product ID (2nd device) */
};
```

3.USB Compliance Callback Set the start address of the callback function defined in the application program.

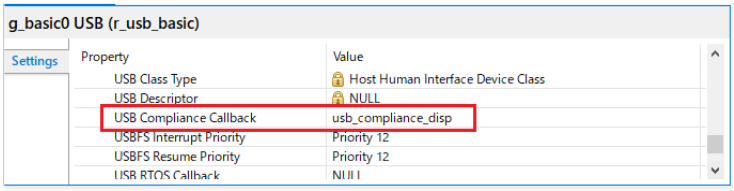

Figure 193: Compliance Callback Setting

The user needs to create this callback function by referring to the following.

```
void usb_compliance_disp (void * param)
{
    usb_compliance_t    *disp_data;
    uint8_t             print_data[32];
    disp_data = (usb_compliance_t*)param;
 switch(disp_data->status)
    {
 case USB_COMPLIANCETEST_ATTACH:           /* Device Attach Detection */
           display("\nATTACH \n");
 break;
 case USB_COMPLIANCETEST_DETACH:           /* Device Detach Detection */
           display("\nDETACH \n");
 break;
 case USB_COMPLIANCETEST_TPL:              /* TPL device connect */
           display("\nTPL PID:%04x VID:%04x \n",disp_data->pid, disp_data->vid);
 break;
 case USB_COMPLIANCETEST_NOTTPL:           /* Not TPL device connect */
           display("\nNOTPL PID:%04x VID:%04x \n",disp_data->pid, disp_data->vid);
 break;
 case USB_COMPLIANCETEST_HUB:              /* USB Hub connect */
```

```
            display("\nHub    \n");
 break;
 case USB_COMPLIANCETEST_OVRC:              /* over current */
 break;
 case USB_COMPLIANCETEST_NORES:              /* Responce Time out for Control Read
Transfer */
            display("\nNOTRESP \n");
 break;
 case USB_COMPLIANCETEST_SETUP_ERR:          /* Setup Transaction Error */
 break;
 default:
 break;
    }
} /* End of function usb_compliance_disp() */
```

Please replace the display function described in the example with the display function created by the customer.

Callback function for USB Peripheral

The user can get completed USB event using callback function in USB Peripheral for BareMetal.

- Please specify user callback function in the following item.

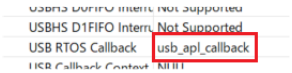

Figure 194: User Callback Function Setting

- Please call the *R_USB_DriverActivate* function using one of the following methods.
  - Infinite loop in user application program
  - Timer Interrupt (Add r_gpt module in user system)
- Please sepecify the area to store USB events to USB driver using *R_USB_CallbackMemorySet* function after calling *R_USB_Open* function.

```
usb_callback_args_t g_apl_usb_event_callback;
```

- Please allocate a buffer area such as a ring buffer to store USB event information in user application program.

```
#define BUFSIZE 10
```

```
usb_callback_args_t g_apl_usb_event_buffer[BUFSIZE];
```

- The USB driver calls the callback function when the USB event completes. USB event information is stored in the area indicated by the callback function argument.Copy the callback function argument to the ring buffer area or other area secured above.

```
g_apl_usb_event_buffer[g_apl_buffer_wp] = g_apl_usb_event_callback;
g_apl_buffer_wp++;
g_apl_buffer_wp %= BUFSIZE;
```

TrustZone

1. The USB driver for FreeRTOS cannot be allocated in Secure region.
2. Please place the descriptor file in Secure region when using Non-Secure Callable.
3. The user callback function should be specified using the *R_USB_Callback* function after calling the *R_USB_Open* function when using Non-Secure Callable.
4. For Non-Secure region, please do USB clock setting when creating Secure project.
5. Please do USB pin setting when creating USB driver project.

Support Composite Device

This driver for FreeRTOS supports the following compoiste device when this driver for FreeRTOS works in USB Host mode.

1. PCDC + PMSC

How to Configuration

- Add HMSC and HCDC stack as follow.

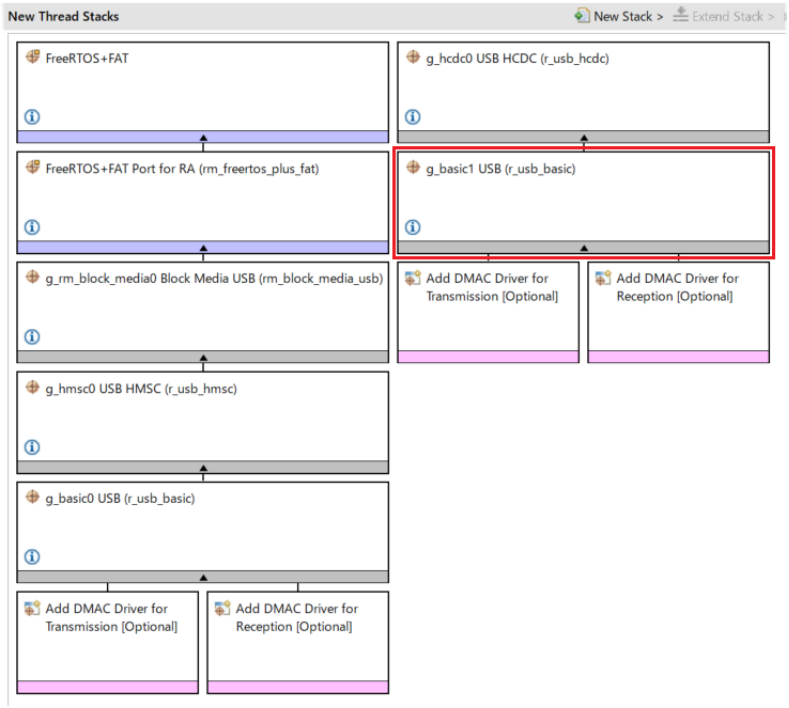

Figure 195: Add HMSC and HCDC Stack

- Delete the "g_basic1" instance manually since this instance is not used in composite device. (Refer to the red frame in the above figure.)

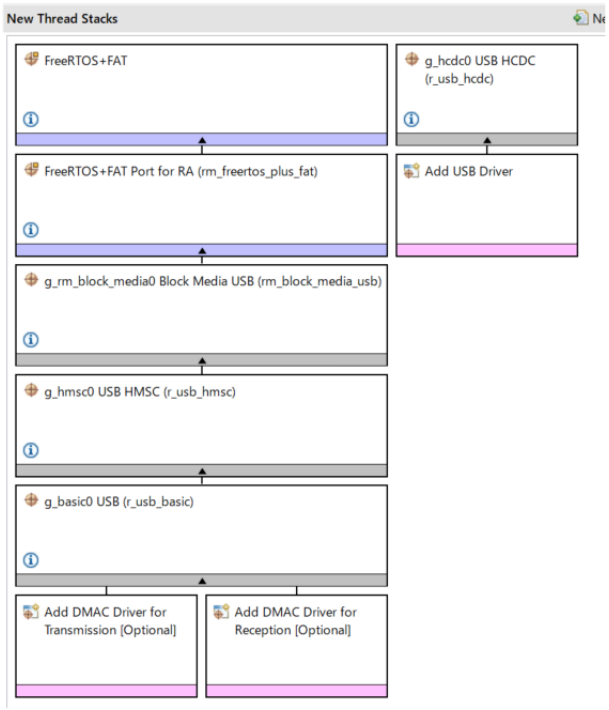

Figure 196: Delete g_basic1 instance

UCLK setting

Enable UCLK in "Clocks" tab on e² studio when using the following MCU.

1. RA6M4

Examples

USB Basic Example

This is a basic example of minimal use of the USB in an application.

```
void usb_basic_example (void)
{
    usb_event_info_t event_info;
 usb_status_t    event;
    g_usb_on_usb.open(&g_basic0_ctrl, &g_basic0_cfg);
    memset(&event_info, 0, sizeof(usb_event_info_t));
 /* Loop back between PC(TerminalSoft) and USB MCU */
 while (1)
    {
       g_usb_on_usb.eventGet(&event_info, &event);
 switch (event)
      {
 case USB_STATUS_CONFIGURED:
 case USB_STATUS_WRITE_COMPLETE:
                g_usb_on_usb.read(&g_basic0_ctrl, g_buf, DATA_LEN, USB_CLASS_PCDC);
 break;
 case USB_STATUS_READ_COMPLETE:
                g_usb_on_usb.write(&g_basic0_ctrl, g_buf, event_info.data_size,
USB_CLASS_PCDC);
 break;
 case USB_STATUS_REQUEST:   /* Receive Class Request */
 if (USB_PCDC_SET_LINE_CODING == (event_info.setup.request_type & USB_BREQUEST))
      {
                   g_usb_on_usb.periControlDataGet(&g_basic0_ctrl, (uint8_t *)
&g_line_coding, LINE_CODING_LENGTH);
      }
 else if (USB_PCDC_GET_LINE_CODING == (event_info.setup.request_type & USB_BREQUEST))
      {
```

```
                    g_usb_on_usb.periControlDataSet(&g_basic0_ctrl, (uint8_t *)
&g_line_coding, LINE_CODING_LENGTH);
      }
 else
      {
                    g_usb_on_usb.periControlStatusSet(&g_basic0_ctrl,
USB_SETUP_STATUS_ACK);
      }
 break;
 case USB_STATUS_SUSPEND:
 case USB_STATUS_DETACH:
 break;
 default:
 break;
      }
    }
} /* End of function usb_main() */
```

USB Host Composite (CDC+MSC) Example

```

Typedefs

typedef usb_event_info_t	usb_instance_ctrl_t

Typedef Documentation

◆ usb_instance_ctrl_t

typedef usb_event_info_t usb_instance_ctrl_t
USB private control block. DO NOT MODIFY. Initialization occurs when R_USB_Open is called.

Function Documentation

◆ R_USB_EventGet()

fsp_err_t R_USB_EventGet (usb_ctrl_t *const *p_api_ctrl*, usb_status_t * *event*)
Obtains completed USB related events. (OS-less Only) In USB host mode, the device address value of the USB device that completed an event is specified in the usb_ctrl_t structure member (address) specified by the event's argument. In USB peripheral mode, USB_NULL is specified in member (address). If this function is called in the RTOS execution environment, a failure is returned. **Return values** FSP_SUCCESS — Event Get Success. FSP_ERR_USB_FAILED — If called in the RTOS environment, an error is returned. ***Note*** *Do not use the same variable as the first argument of R_USB_Open for the first argument.* *Do not call this API in the interrupt function.*

◆ R_USB_Callback()

fsp_err_t R_USB_Callback (usb_callback_t * *p_callback*)

Register a callback function to be called upon completion of a USB related event. (RTOS only)

This function registers a callback function to be called when a USB-related event has completed. If this function is called in the OS-less execution environment, a failure is returned.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_ASSERTION	Parameter is NULL error.

Note

Do not call this API in the interrupt function.

◆ R_USB_Open()

fsp_err_t R_USB_Open (usb_ctrl_t *const *p_api_ctrl*, usb_cfg_t const *const *p_cfg*)

Applies power to the USB module specified in the argument (p_ctrl).

Return values

FSP_SUCCESS	Success in open.
FSP_ERR_USB_BUSY	Specified USB module now in use.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_Close()

fsp_err_t R_USB_Close (usb_ctrl_t *const *p_api_ctrl*)

Terminates power to the USB module specified in argument (p_ctrl). USB0 module stops when USB_IP0 is specified to the member (module), USB1 module stops when USB_IP1 is specified to the member (module).

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_NOT_OPEN	USB module is not open.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_Read()

fsp_err_t R_USB_Read (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *p_buf*, uint32_t *size*, uint8_t *destination*)

Bulk/Interrupt data transfer.

Requests USB data read (bulk/interrupt transfer). The read data is stored in the area specified by argument (p_buf). After data read is completed, confirm the operation by checking the return value (USB_STATUS_READ_COMPLETE) of the R_USB_GetEvent function. The received data size is set in member (size) of the usb_ctrl_t structure. To figure out the size of the data when a read is complete, check the return value (USB_STATUS_READ_COMPLETE) of the R_USB_GetEvent function, and then refer to the member (size) of the usb_crtl_t structure.

Return values

FSP_SUCCESS	Successfully completed (Data read request completed).
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_BUSY	Data receive request already in process for USB device with same device address.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

1. Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).
2. Allocate the following the storage area when using DMA transfer and specify the start address of the allocated storage area to the 2nd argument(p_buf).
(1). When using High-speed and enabling continuous transfer mode, allocate the storage area with a size that is a multiple of 2048.
(2). When using High-speed and disabling continuous transfer mode, allocate the storage area with a size that is a multiple of 512.
(3). When using Full-speed, allocate the storage area with a size that is a multiple of 64.
3. Specify the following address to the 2nd argument (p_buf) when using DMA transfer.
(1). When using High-speed module, specify start address of the buffer area aligned on 4-byte boundary.
(2). When using Full-speed module, specify start address of the buffer area aligned on 2-byte boundary.

◆ R_USB_Write()

fsp_err_t R_USB_Write (usb_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_buf*, uint32_t *size*, uint8_t *destination*)

Bulk/Interrupt data transfer.

Requests USB data write (bulk/interrupt transfer). Stores write data in area specified by argument (p_buf). Set the device class type in usb_ctrl_t structure member (type). Confirm after data write is completed by checking the return value (USB_STATUS_WRITE_COMPLETE) of the R_USB_GetEvent function. For sending a zero-length packet, please refer the following Note.

Return values

FSP_SUCCESS	Successfully completed. (Data write request completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_BUSY	Data write request already in process for USB device with same device address.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

1. The user needs to send the zero-length packet(ZLP) since this USB driver does not send the ZLP automatically. When sending a ZLP, the user sets USB_NULL in the third argument (size) of R_USB_Write function as follow. e.g)
R_USB_Write (&g_basic0_ctrl, &g_buf, USB_NULL);
2. Specify the following address to the 2nd argument (p_buf) when using DMA transfer.
(1). When using High-speed module, specify start address of the buffer area aligned on 4-byte boundary.
(2). When using Full-speed module, specify start address of the buffer area aligned on 2-byte boundary.
3. Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_Stop()

fsp_err_t R_USB_Stop (usb_ctrl_t *const *p_api_ctrl*, usb_transfer_t *direction*, uint8_t *destination*)

Requests a data read/write transfer be terminated when a data read/write transfer is being performed.

To stop a data read, set USB_TRANSFER_READ as the argument (type); to stop a data write, specify USB_WRITE as the argument (type).

Return values

FSP_SUCCESS	Successfully completed. (stop completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_BUSY	Stop processing is called multiple times.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_Suspend()

fsp_err_t R_USB_Suspend (usb_ctrl_t *const *p_api_ctrl*)

Sends a SUSPEND signal from the USB module assigned to the member (module) of the usb_crtl_t structure.

After the suspend request is completed, confirm the operation with the return value (USB_STATUS_SUSPEND) of the R_USB_EventGet function.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_BUSY	During a suspend request to the specified USB module, or when the USB module is already in the suspended state.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_Resume()

fsp_err_t R_USB_Resume (usb_ctrl_t *const *p_api_ctrl*)

Sends a RESUME signal from the USB module assigned to the member (module) of the usb_ctrl_tstructure.

After the resume request is completed, confirm the operation with the return value (USB_STATUS_RESUME) of the R_USB_EventGet function

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_BUSY	Resume already requested for same device address. (USB host mode only)
FSP_ERR_USB_NOT_SUSPEND	USB device is not in the SUSPEND state.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_VbusSet()

fsp_err_t R_USB_VbusSet (usb_ctrl_t *const *p_api_ctrl*, uint16_t *state*)

Specifies starting or stopping the VBUS supply.

Return values

FSP_SUCCESS	Successful completion. (VBUS supply start/stop completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_InfoGet()

fsp_err_t R_USB_InfoGet (usb_ctrl_t *const *p_api_ctrl*, usb_info_t * *p_info*, uint8_t *destination*)

Obtains completed USB-related events.

Return values

FSP_SUCCESS	Successful completion. (VBUS supply start/stop completed)
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ R_USB_PipeRead()

fsp_err_t R_USB_PipeRead (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *p_buf*, uint32_t *size*, uint8_t *pipe_number*)

Requests a data read (Bulk/Interrupt transfer) via the pipe specified in the argument.

The read data is stored in the area specified in the argument (p_buf). After the data read is completed, confirm the operation with the R_USB_GetEvent function return value(USB_STATUS_READ_COMPLETE). To figure out the size of the data when a read is complete, check the return value (USB_STATUS_READ_COMPLETE) of the R_USB_GetEvent function, and then refer to the member (size) of the usb_crtl_t structure.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

1. Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).
2. Allocate the following the storage area when using DMA transfer and specify the start address of the allocated storage area to the 2nd argument(p_buf).
(1). When using High-speed and enabling continuous transfer mode, allocate the storage area with a size that is a multiple of 2048.
(2). When using High-speed and disabling continuous transfer mode, allocate the storage area with a size that is a multiple of 512.
(3). When using Full-speed, allocate the storage area with a size that is a multiple of 64.
3. Specify the following address to the 2nd argument (p_buf) when using DMA transfer.
(1). When using High-speed module, specify start address of the buffer area aligned on 4-byte boundary.
(2). When using Full-speed module, specify start address of the buffer area aligned on 2-byte boundary.

◆ R_USB_PipeWrite()

fsp_err_t R_USB_PipeWrite (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *p_buf*, uint32_t *size*, uint8_t *pipe_number*)

Requests a data write (Bulk/Interrupt transfer).

The write data is stored in the area specified in the argument (p_buf). After data write is completed, confirm the operation with the return value (USB_STATUS_WRITE_COMPLETE) of the EventGet function. For sending a zero-length packet, please refer the following Note.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

1. The user needs to send the zero-length packet(ZLP) since this USB driver does not send the ZLP automatically. When sending a ZLP, the user sets USB_NULL in the third argument (size) of R_USB_PipeWrite function as follow.
e.g)
R_USB_PipeWrite (&g_basic0_ctrl, &g_buf, USB_NULL, pipe_number);
2. Specify the following address to the 2nd argument (p_buf) when using DMA transfer.
(1). When using High-speed module, specify start address of the buffer area aligned on 4-byte boundary.
(2). When using Full-speed module, specify start address of the buffer area aligned on 2-byte boundary.
3. Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_PipeStop()

fsp_err_t R_USB_PipeStop (usb_ctrl_t *const *p_api_ctrl*, uint8_t *pipe_number*)

Terminates a data read/write operation.

Return values

FSP_SUCCESS	Successfully completed. (Stop request completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_UsedPipesGet()

fsp_err_t R_USB_UsedPipesGet (usb_ctrl_t *const *p_api_ctrl*, uint16_t * *p_pipe*, uint8_t *destination*)

Gets the selected pipe number (number of the pipe that has completed initalization) via bit map information.

The bit map information is stored in the area specified in argument (p_pipe). Based on the information (module member and address member) assigned to the usb_ctrl_t structure, obtains the PIPE information of that USB device.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ R_USB_PipeInfoGet()

fsp_err_t R_USB_PipeInfoGet (usb_ctrl_t *const *p_api_ctrl*, usb_pipe_t * *p_info*, uint8_t *pipe_number*)

Gets the following pipe information regarding the pipe specified in the argument (p_ctrl) member (pipe): endpoint number, transfer type, transfer direction and maximum packet size.

The obtained pipe information is stored in the area specified in the argument (p_info).

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ R_USB_PullUp()

fsp_err_t R_USB_PullUp (usb_ctrl_t *const *p_api_ctrl*, uint8_t *state*)

This API enables or disables pull-up of D+/D- line.

Return values

FSP_SUCCESS	Successful completion. (Pull-up enable/disable setting completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_HostControlTransfer()

fsp_err_t R_USB_HostControlTransfer (usb_ctrl_t *const *p_api_ctrl*, usb_setup_t * *p_setup*, uint8_t * *p_buf*, uint8_t *device_address*)

Performs settings and transmission processing when transmitting a setup packet.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_PeriControlDataGet()

fsp_err_t R_USB_PeriControlDataGet (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *p_buf*, uint32_t *size*)

Receives data sent by control transfer.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_PeriControlDataSet()

fsp_err_t R_USB_PeriControlDataSet (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *p_buf*, uint32_t *size*)

Performs transfer processing for control transfer.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_PeriControlStatusSet()

fsp_err_t R_USB_PeriControlStatusSet (usb_ctrl_t *const *p_api_ctrl*, usb_setup_status_t *status*)

Set the response to the setup packet.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_RemoteWakeup()

fsp_err_t R_USB_RemoteWakeup (usb_ctrl_t *const *p_api_ctrl*)

Sends a remote wake-up signal to the connected Host.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_NOT_SUSPEND	Device is not suspended.
FSP_ERR_USB_BUSY	The device is in resume operation.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_DriverActivate()

fsp_err_t R_USB_DriverActivate (usb_ctrl_t *const *p_api_ctrl*)

Activate USB Driver for USB Peripheral BareMetal.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.

Note

Call this API in the in the infinite loop of the application program or a timer interrupt.

◆ R_USB_CallbackMemorySet()

fsp_err_t R_USB_CallbackMemorySet (usb_ctrl_t *const *p_api_ctrl*, usb_callback_args_t * *p_callback_memory*)

Set callback memory to USB Driver for USB Peripheral BareMetal.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.

Note

Call this API after calling R_USB_Open function.

◆ R_USB_ModuleNumberGet()

fsp_err_t R_USB_ModuleNumberGet (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *module_number*)

This API gets the module number.

Return values

FSP_SUCCESS	Successful completion.

◆ R_USB_ClassTypeGet()

fsp_err_t R_USB_ClassTypeGet (usb_ctrl_t *const *p_api_ctrl*, usb_class_t * *class_type*)

This API gets the class type.

Return values

FSP_SUCCESS	Successful completion.

Note

In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.
In the FreeRTOS, please specify one of the following to the 1st argument of this API.
1. The 1st argument of the callback function specified in Conguration.
2. The start address of the area where the structure area of the 1st argument was copied.

◆ R_USB_DeviceAddressGet()

fsp_err_t R_USB_DeviceAddressGet (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *device_address*)

This API gets the device address.

Return values

FSP_SUCCESS	Successful completion.

Note

In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.
In the FreeRTOS, please specify one of the following to the 1st argument of this API.
1. The 1st argument of the callback function specified in Conguration.
2. The start address of the area where the structure area of the 1st argument was copied.

◆ R_USB_PipeNumberGet()

fsp_err_t R_USB_PipeNumberGet (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *pipe_number*)

This API gets the pipe number.

Return values

FSP_SUCCESS	Successful completion.

Note

In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.
In the FreeRTOS, please specify one of the following to the 1st argument of this API.
1. The 1st argument of the callback function specified in Conguration.
2. The start address of the area where the structure area of the 1st argument was copied.

◆ R_USB_DeviceStateGet()

fsp_err_t R_USB_DeviceStateGet (usb_ctrl_t *const *p_api_ctrl*, uint16_t * *state*)

This API gets the state of the device.

Return values

FSP_SUCCESS	Successful completion.

Note

In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.
In the FreeRTOS, please specify one of the following to the 1st argument of this API.
1. The 1st argument of the callback function specified in Conguration.
2. The start address of the area where the structure area of the 1st argument was copied.

◆ R_USB_DataSizeGet()

fsp_err_t R_USB_DataSizeGet (usb_ctrl_t *const *p_api_ctrl*, uint32_t * *data_size*)

This API gets the read data size.

Return values

FSP_SUCCESS	Successful completion.

Note

In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.
In the FreeRTOS, please specify one of the following to the 1st argument of this API.
1. The 1st argument of the callback function specified in Conguration.
2. The start address of the area where the structure area of the 1st argument was copied.

◆ R_USB_SetupGet()

fsp_err_t R_USB_SetupGet (usb_ctrl_t *const *p_api_ctrl*, usb_setup_t * *setup*)

This API gets the setup information.

Return values

FSP_SUCCESS	Successful completion.

Note

In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.
In the FreeRTOS, please specify one of the following to the 1st argument of this API.
1. The 1st argument of the callback function specified in Conguration.
2. The start address of the area where the structure area of the 1st argument was copied.

◆ R_USB_OtgCallbackSet()

fsp_err_t R_USB_OtgCallbackSet (usb_ctrl_t *const *p_api_ctrl*, usb_otg_callback_t * *p_callback*)

Set callback function to be called when the OTG role swap was completed on Azure RTOS.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.

◆ R_USB_OtgSRP()

fsp_err_t R_USB_OtgSRP (usb_ctrl_t *const *p_api_ctrl*)

Start the SRP processing for OTG on Azure RTOS.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.

Note

Do not support the VBUS Pulsing since OTG 2.0 does not support the VBUS Pulsing..

◆ R_USB_TypeCInfoGet()

fsp_err_t R_USB_TypeCInfoGet (usb_ctrl_t *const *p_api_ctrl*, usb_typec_info_t * *p_info*)

USB Type-C connect Information get.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.

5.2.6.31 USB Composite (r_usb_composite)

Modules » Connectivity

Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

Overview

USB composite device works as a USB Peripheral by combining two peripheral device classes and r_usb_basic module.
This USB driver supports the following composite devices:

1. PCDC + PMSC
2. PCDC + PHID

3. PHID + PMSC
4. PCDC + PCDC
5. PHID + PHID
6. PCDC + PVND

How to Configuration

The following shows FSP configuration procedure for USB composite device.

- Select [New Stack]->[USB]->[USB Composite]

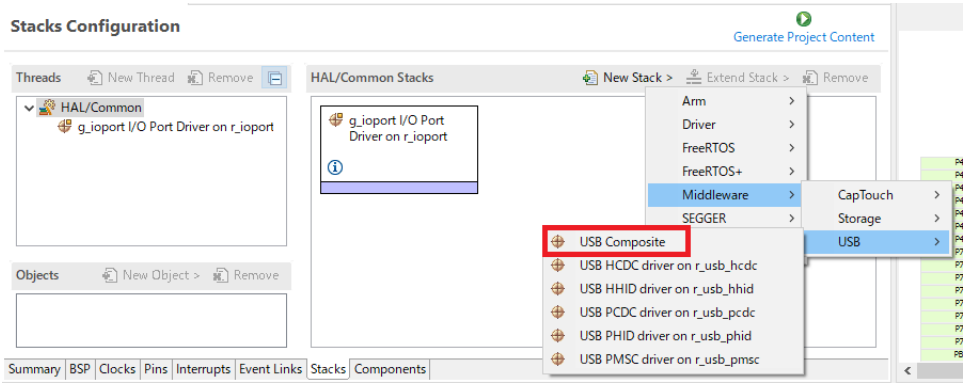

Figure 197: Select USB Composite

- The following is displayed when selecting [USB Composite].

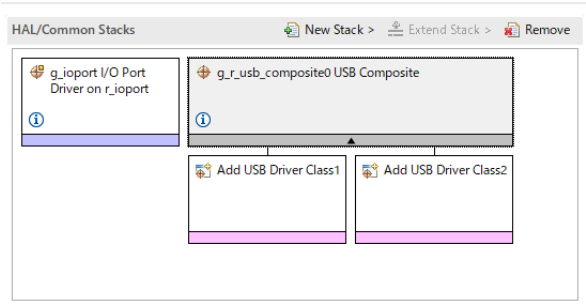

Figure 198: USB Composite Stack

- Select the supported 2 device classes as follows.

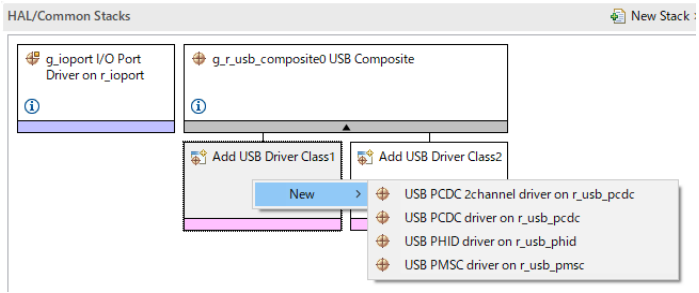

Figure 199: Select Device Classes

Note

1. *Be sure to select "USB PCDC driver on r_usb_pcdc" and "USB PCDC 2channel driver on r_usb_pcdc" when configurating for "PCDC + PCDC".*
2. *Be sure to select "USB PHID driver on r_usb_phid" and "USB PHID 2channel driver on r_usb_phid" when configurating for "PHID + PHID".*

- Select the supported 2 device classes as follows. The following is displayed when selecting 2 device classes.

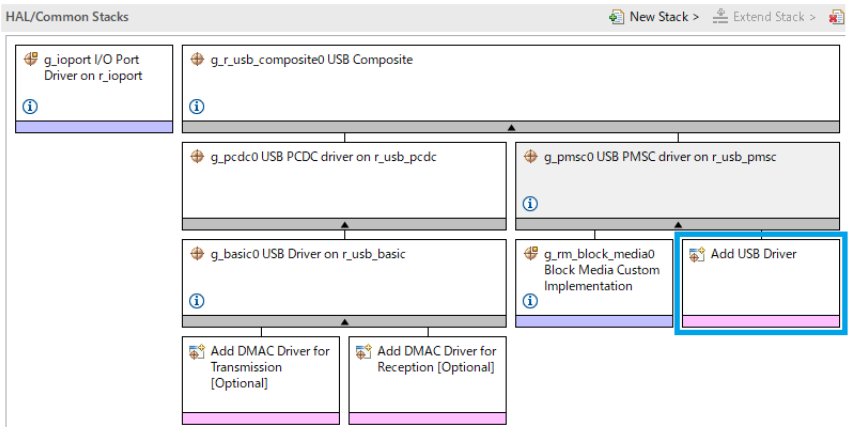

Figure 200: Delete USB Basic Instance

Note

1. *Delete the "g_basic1" instance manually since this instance is not used in composite device. (Refer to the blue frame in the above figure.)*
2. *The error is output when selecting the following device classes.*
    a. PMSC + PMSC

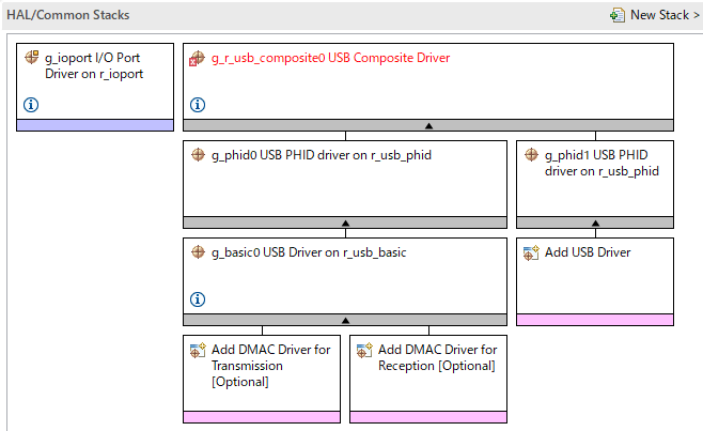

Figure 201: Device Class Selection Error

Limitations

- The following composite device is not suppored when using RA2A1(MCU).

- PMSC + PCDC
- PCDC + PCDC

- If you use PMSC, make sure to use usb_basic module with PMSC.

  There is a risk that the information on the PMSC storage media cannot be registered normally in the "USB Callback Context".

Notes

Please determine by the member "pipe" in "usb_event_info" structure when getting PCDC channel number which the write event is completed in PCDC + PCDC.
Don't refer to the member "type" in "usb_event_info" structure.

Descriptor

Templates for composite device descriptors can be found in ra/fsp/src/r_usb_composite folder. Also, please be sure to use your vendor ID.

1. r_usb_pcdc_pmsc_descriptor.c.template (for PCDC + PMSC)
2. r_usb_pcdc_phid_descriptor.c.template (for PCDC + PHID)
3. r_usb_phid_pmsc_descriptor.c.template (for PHID + PMSC)
4. r_usb_pcdc_pcdc_descriptor.c.template (for PCDC + PCDC)
5. r_usb_phid_phid_descriptor.c.template (for PHID + PHID)
6. r_usb_pcdc_pvnd_descriptor.c.template (for PCDC + PVND)

Examples

USB COMPOSITE Example

- PCDC + PHID

```
void main_task (void)
{
  #if (BSP_CFG_RTOS == 2)
    usb_event_info_t * p_mess;
  #endif
    usb_event_info_t usb_event;
 usb_status_t    event;
    uint8_t       * p_idle_value;
    uint8_t          sw_data;
    usb_info_t       info;
 fsp_err_t       ret_code = FSP_SUCCESS;
    uint8_t          send_data[16] BSP_ALIGN_VARIABLE(4);
```

```
   uint8_t          req_comp_flag = 0;
   uint8_t          count         = 0;
   g_usb_on_usb.open(&g_basic0_ctrl, &g_basic0_cfg);

Detailed Description

This module provides a USB Host Communications Device Class (HCDC) driver. It implements the USB HCDC Interface.

Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

Detailed Description

Overview

The r_usb_hcdc module, when used in combination with the r_usb_basic module, operates as a USB Host Communications Device Class (HCDC) driver. The HCDC conforms to the PSTN device subclass abstract control model of the USB Communications Device Class (CDC) specification and enables communication with a CDC peripheral device.

Features

The r_usb_hcdc module has the following key features:

- Checks for connected devices
- Implementation of communication line settings
- Acquisition of the communication line state
- Data transfer to and from a CDC peripheral device

Configuration

Build Time Configurations for r_usb_hcdc

The following build time configurations are defined in fsp_cfg/r_usb_hcdc_cfg.h:

Configuration	Options	Default	Description
Target Peripheral Device Class ID	• CDC class supported device • Vendor class device	CDC class supported device	Specify the device class ID of the CDC device to be connected.
Bulk Input Transfer Pipe	• USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5	USB PIPE4	Select the USB pipe to use for bulk input transfers.
Bulk Output Transfer Pipe	• USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5	USB PIPE5	Select the USB pipe to use for bulk output transfers.
Interrupt In Pipe	• USB PIPE6 • USB PIPE7 • USB PIPE8 • USB PIPE9	USB PIPE6	Select the USB pipe to use for interrupts.

Configurations for Connectivity > USB HCDC (r_usb_hcdc)

This module can be added to the Stacks tab via New Stack > Connectivity > USB HCDC (r_usb_hcdc).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_hcdc0	Module name.

Note

Refer to the USB (r_usb_basic) module for hardware configuration options.

Clock Configuration

Refer to the USB (r_usb_basic) module.

Pin Configuration

Refer to the USB (r_usb_basic) module.

Usage Notes

Communications Device Class (CDC), PSTN and ACM

This software conforms to the Abstract Control Model (ACM) subclass of the Communications Device Class specification as defined in the "USB Communications Class Subclass Specification for PSTN Devices", Revision 1.2. The Abstract Control Model subclass is a technology that bridges the gap between USB devices and earlier modems (employing RS-232C connections) enabling use of application programs designed for older modems.

Basic Functions

The main functions of HCDC are the following:

- Verify connected devices
- Make communication line settings
- Acquire the communication line state
- Transfer data to and from the CDC peripheral device

Abstract Control Model Class Requests - Host to Device

This driver supports the following class requests:

Request	Code	Description
SendEncapsulatedCommand	0x00	Transmits an AT command as defined by the protocol used by the device (normally 0 for USB).
GetEncapsulatedResponse	0x01	Requests a response to a command transmitted by SendEncapsulatedCommand.
SetCommFeature	0x02	Enables or disables features such as device-specific 2-byte code and country setting.
GetCommFeature	0x03	Acquires the enabled/disabled state of features such as device-specific 2-byte code and country setting.
ClearCommFeature	0x04	Restores the default enabled/disabled settings of features such as device-specific 2-byte code and country

		setting.
SetLineCoding	0x20	Makes communication line settings (communication speed, data length, parity bit, and stop bit length).
GetLineCoding	0x21	Acquires the communication line setting state.
SetControlLineState	0x22	Makes communication line control signal (RTS, DTR) settings.
SendBreak	0x23	Transmits a break signal.

Note

For more information about Abstract Control Model requests, refer to Table 11 "Requests - Abstract Control Model" in the "USB Communications Class Subclass Specification for PSTN Devices", Revision 1.2.

The expected data format for each command is shown below followed by dependent structures.

bmRequestType	bRequest	wValue	wIndex	wLength	Data
0x21	SEND_ENCAPSULATED_COMMAND (0x00)	0x0000	0x0000	Data length	usb_hcdc_encapsulated_t
0x21	GET_ENCAPSULATED_RESPONSE (0x01)	0x0000	0x0000	Data length	usb_hcdc_encapsulated_t
0x21	SET_COMM_FEATURE (0x02)	usb_hcdc_feature_selector_t	0x0000	Data length	usb_hcdc_commfeature_t
0x21	GET_COMM_FEATURE (0x03)	usb_hcdc_feature_selector_t	0x0000	Data length	usb_hcdc_commfeature_t
0x21	CLEAR_COMM_FEATURE (0x04)	usb_hcdc_feature_selector_t	0x0000	Data length	None
0x21	SET_LINE_CODING (0x20)	0x0000	0x0000	0x0000	usb_hcdc_linecoding_t
0xA1	GET_LINE_CODING (0x21)	0x0000	0x0000	0x0007	usb_hcdc_linecoding_t
0x21	SET_CONTROL_LINE_STATE (0x22)	usb_hcdc_controllinestate_t	0x0000	0x0000	None
0x21	SEND_BREAK (0x23)	usb_hcdc_breakduration_t	0x0000	0x0000	None

ACM Notifications from Device to Host

The following class notifications are supported:

Notification	Code	Description
RESPONSE_AVAILABLE	0x01	Response to GET_ENCAPSULATED_RESPONSE
SERIAL_STATE	0x20	Notification of serial line state

The data types returned are as follows:

bmRequestType	bRequest	wValue	wIndex	wLength	Data
0xA1	RESPONSE_AVAILABLE (0x01)	0x0000	0x0000	0x0000	None
0xA1	SERIAL_STATE (0x20)	0x0000	0x0000	0x0002	usb_hcdc_serialstate_t

Note

The host is notified with SERIAL_STATE whenever a change in the UART port state is detected.

Limitations

This driver is subject to the following limitations:

- Suspend is not supported when a data transfer is in progress. Confirm that data transfer has completed before executing suspend.
- Use of compound USB devices with CDC class support is not supported.
- This module must be incorporated into a project using r_usb_basic and does not provide any public APIs.
- This driver does not support Low-speed.
- This driver does not support simultaneous operation with the other device class.
- CDC-ECM requires a TCP/IP driver for USB driver on the upper layer.
- The user needs to support the porting layer for TCP/IP when using CDC-ECM.
- CDC-ECM works on FreeRTOS.
- CDC-ECM was evaluated using the following USB to Ethernet adapter.
    - UGREEN USB to Ethernet Adapater RJ45 (Manufacture: Ugreen Group Limited, Item modle number: 50922)

Examples

USB HCDC Loopback Example

The main functions of the HCDC loopback example are as follows:

1. Virtual UART control settings are configured by transmitting the class request SET_LINE_CODING to the CDC device.
2. Sends receive (Bulk In transfer) requests to a CDC peripheral device and receives data.
3. Loops received data back to the peripheral by means of Bulk Out transfers.

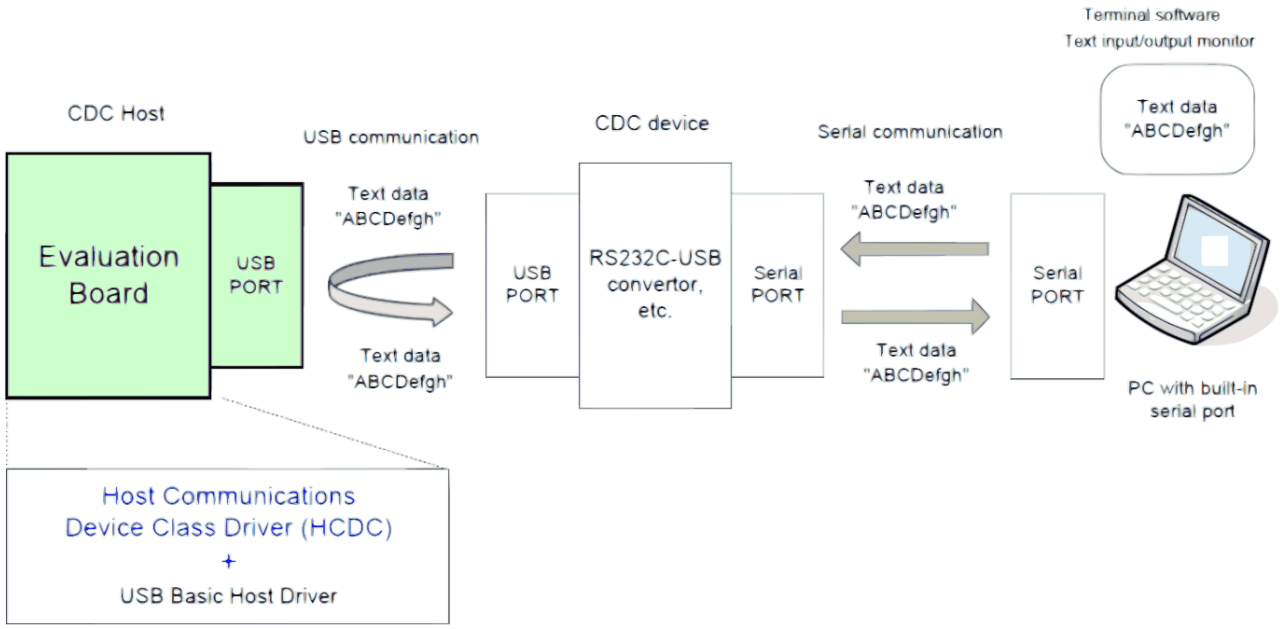

Figure 202: Data Transfer (Loopback)

The main loop performs loopback processing in which data received from a CDC peripheral device is transmitted unaltered back to the peripheral.

Function Documentation

◆ R_USB_HCDC_ControlDataRead()

fsp_err_t R_USB_HCDC_ControlDataRead (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *p_buf*, uint32_t *size*, uint8_t *device_address*)

Read Control Data.(CDC Interrupt IN data)

Return values

FSP_SUCCESS	Successfully completed (Data read request completed).
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_BUSY	Data receive request already in process for USB device with same device address.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

1. Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_HCDC_SpecificDeviceRegister()

fsp_err_t R_USB_HCDC_SpecificDeviceRegister (usb_ctrl_t *const *p_api_ctrl*, uint16_t *vendor_id*, uint16_t *product_id*)

Register the specified vendor class device in the device table.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_HCDC_DeviceInfoGet()

fsp_err_t R_USB_HCDC_DeviceInfoGet (usb_ctrl_t *const *p_api_ctrl*, usb_hcdc_device_info_t * *p_info*, uint8_t *device_address*)

Get the VID, PID and subclass code of the connected device.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

(1). Interrupt function.
(2). Callback function (for RTOS).

5.2.6.33 USB HHID (r_usb_hhid)

Modules » Connectivity

Functions

fsp_err_t	R_USB_HHID_TypeGet (usb_ctrl_t *const p_api_ctrl, uint8_t *p_type, uint8_t device_address) Get HID protocol.(USB Mouse/USB Keyboard/Other Type.) More...
fsp_err_t	R_USB_HHID_MaxPacketSizeGet (usb_ctrl_t *const p_api_ctrl, uint16_t *p_size, uint8_t direction, uint8_t device_address) Obtains max packet size for the connected HID device. The max packet size is set to the area. Set the direction (USB_HID_IN/USB_HID_OUT). More...

Detailed Description

This module provides a USB Host Human Interface Device Class Driver (HHID). It implements the USB HHID Interface.

Overview

The r_usb_hhid module combines with the r_usb_basic module to provide a USB Host Human Interface Device Class (HHID) driver. The HHID driver conforms to the USB Human Interface Device

class specifications and implements communication with a HID device.

Features

The r_usb_hhid module has the following key features:

- Data communication with a connected HID device (USB mouse, keyboard etc.)
- Issuing of HID class requests to a connected HID device
- Supports Interrupt OUT transfer

Configuration

Build Time Configurations for r_usb_hhid

The following build time configurations are defined in fsp_cfg/r_usb_hhid_cfg.h:

Configuration	Options	Default	Description
Interrupt In Pipe	• USB PIPE6 • USB PIPE7 • USB PIPE8 • USB PIPE9	USB PIPE6	Select the pipe number to use for input interrupt events.
Interrupt Out Pipe	• USB PIPE6 • USB PIPE7 • USB PIPE8 • USB PIPE9	USB PIPE9	Select the pipe number to use for output interrupt events.

Configurations for Connectivity > USB HHID (r_usb_hhid)

This module can be added to the Stacks tab via New Stack > Connectivity > USB HHID (r_usb_hhid). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_hhid0	Module name.

Clock Configuration

Refer to the USB (r_usb_basic) module.

Pin Configuration

Refer to the USB (r_usb_basic) module.

Usage Notes

Note

This driver is not guaranteed to provide USB HID operation in all scenarios. The developer must verify correct operation when connected to the targeted USB peripherals.

Class Requests

The class requests supported by this driver are shown below:

Request	Code	Description
USB_GET_REPORT	0x01	Receives a report from the HID device.
USB_SET_REPORT	0x09	Sends a report to the HID device.
USB_GET_IDLE	0x02	Receives a duration (time) from the HID device.
USB_SET_IDLE	0x0A	Sends a duration (time) to the HID device.
USB_GET_PROTOCOL	0x03	Reads a protocol from the HID device.
USB_SET_PROTOCOL	0x0B	Sends a protocol to the HID device.
USB_GET_REPORT_DESCRIPTOR	0x06	Requests a report descriptor.
USB_GET_HID_DESCRIPTOR	0x06	Requests a HID descriptor.

Data Format

The boot protocol data format of data received from the keyboard or mouse through interrupt-IN transfers is shown below:

offset	Keyboard (8 Bytes)	Mouse (3 Bytes)
0 (Top Byte)	Modifier keys	b0 : Button 1 b1 : Button 2 b2 : Button 3 b3-b7 : Reserved
+1	Reserved	X displacement
+2	Keycode 1	Y displacement
+3	Keycode 2	-
+4	Keycode 3	-
+5	Keycode 4	-
+6	Keycode 5	-
+7	Keycode 6	-

Limitations

- The HID driver does not analyze the report descriptor. This driver determines the report format from the interface protocol.
- This driver does not support DMA transfers.
- This driver does not support High-speed.
- The transfer rates of Full-speed and Low-speed are the same when the max packet sizes of Full-speed and Low-speed are the same.

- This driver does not support simultaneous operation with the other device class.

Examples

USB HHID Example

The main functions of the application are as follows:

1. Performs enumeration and initialization of HID devices.
2. Transfers data to and from a connected HID device (mouse or keyboard). Data received from the device is read and discarded.
3. When an RTOS is used, the USB driver calls the callback (usb_apl_callback) in order to pass events to the main loop through a queue.

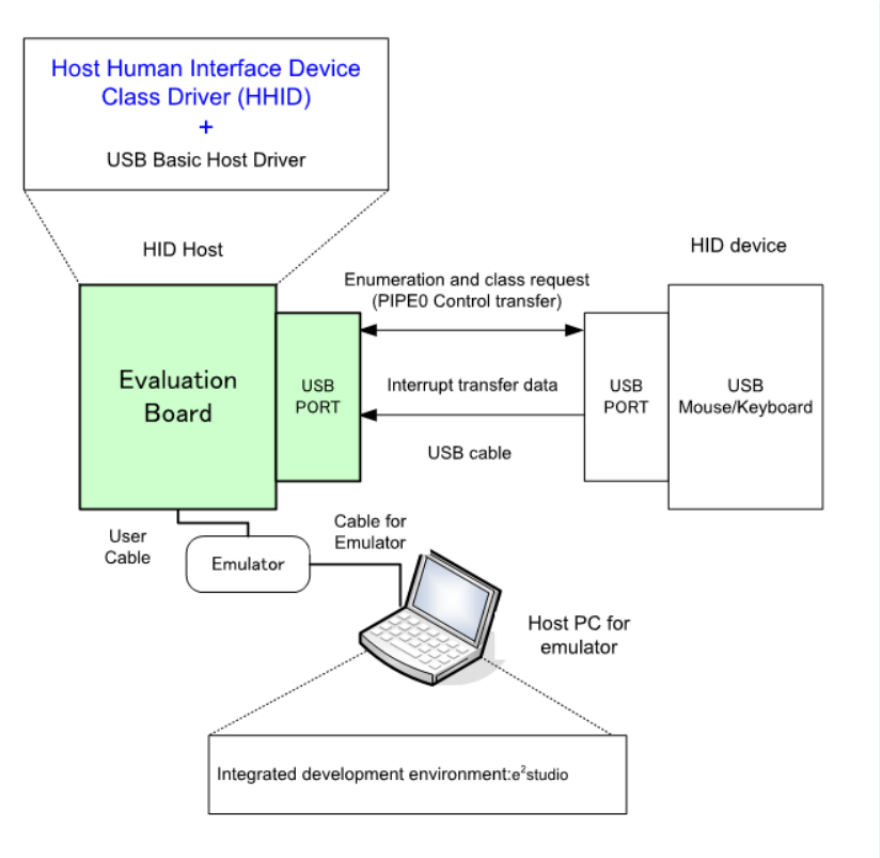

Figure 203: Example Operating Environment

Application Processing (for RTOS)

The main loop performs processing to receive data from the HID device as part of the main routine. An overview of the processing performed by the loop is shown below.

1. When a USB-related event has completed, the USB driver calls the callback function (usb_apl_callback). In the callback function (usb_apl_callback), the application task (APL) is notified of the USB completion event using the real-time OS functionality.
2. In APL, information regarding the USB completion event was notified from the callback function is retrieved using the real-time OS functionality.
3. If the USB completion event (the event member of the usb_ctrl_t structure) retrieved in step

2 above is USB_STATUS_CONFIGURED, APL sends the class request (SET_PROTOCOL) to the HID device.
4. If the USB completion event (the event member of the usb_ctrl_t structure) retrieved in step 2 above is USB_STATUS_REQUEST_COMPLETE, APL performs a data reception request to receive data transmitted from the HID device by calling the R_USB_Read function.
5. The above processing is repeated.

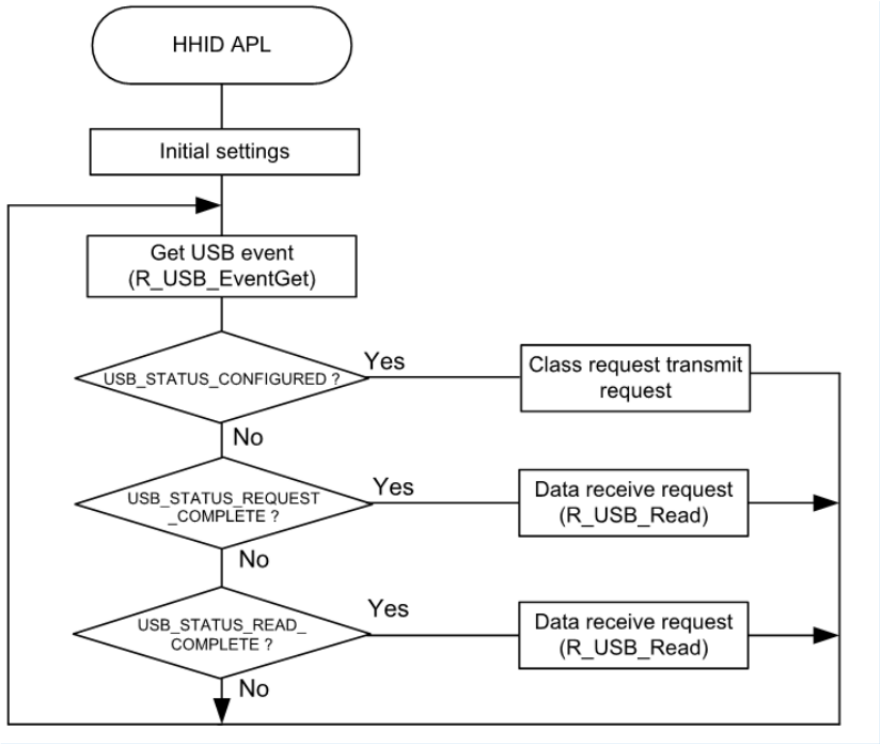

Figure 204: Main Loop (Normal mode)

Application Processing (for Non-OS)

The main loop performs processing to receive data from the HID device as part of the main routine. An overview of the processing of the main loop is presented below.

1. When the R_USB_GetEvent function is called after an HID device attaches to the USB host and enumeration completes, USB_STATUS_CONFIGURED is set as the return value. When the APL confirms USB_STATUS_CONFIGURED, it calls the R_USB_Write function to request transmission of data to the HID device.
2. When the R_USB_GetEvent function is called after sending of class request SET_PROTOCOL to the HID device has completed, USB_STATUS_REQUEST_COMPLETE is set as the return value. When the APL confirms USB_STATUS_REQUEST_COMPLETE, it calls the R_USB_Read function to make a data receive request for data sent by the HID device.
3. When the R_USB_GetEvent function is called after reception of data from the HID device has completed, USB_STATUS_READ_COMPLETE is set as the return value. When the APL confirms USB_STATUS_READ_COMPLETE, it calls the R_USB_Read function to make a data receive request for data sent by the HID device.
4. The processing in step 3, above, is repeated.

◆ R_USB_HHID_TypeGet()

fsp_err_t R_USB_HHID_TypeGet (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *p_type*, uint8_t *device_address*)
Get HID protocol.(USB Mouse/USB Keyboard/Other Type.)

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ R_USB_HHID_MaxPacketSizeGet()

fsp_err_t R_USB_HHID_MaxPacketSizeGet (usb_ctrl_t *const *p_api_ctrl*, uint16_t * *p_size*, uint8_t *direction*, uint8_t *device_address*)

Obtains max packet size for the connected HID device. The max packet size is set to the area. Set the direction (USB_HID_IN/USB_HID_OUT).

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

Detailed Description

This module provides a USB Host Mass Storage Class (HMSC) driver. It implements the USB HMSC Interface.

Overview

The r_usb_hmsc module, when used in combination with the r_usb_basic module, operates as a USB Host Mass Storage Class (HMSC) driver. It is built on the USB Mass Storage Class Bulk-Only Transport (BOT) protocol. It is possible to communicate with BOT-compatible USB storage devices by combining this module with a file system and storage device driver.

Note

This module should be used in combination with the FreeRTOS+FAT File System.

Features

The r_usb_hmsc module has the following key features:

- Checking of connected USB storage devices to determine whether or not operation is supported
- Storage command communication using the BOT protocol
- Support for SFF-8070i (ATAPI) USB mass storage subclass
- Sharing of a single pipe for IN/OUT directions or multiple devices
- Supports up to 4 connected USB storage devices

Known Issues

- Users can not use TrustZone features that use Non-secure Callable.

Class Requests

The class requests supported by this driver are shown below.

Request	Description
GetMaxLun	Gets the maximum number of units that are supported.
MassStorageReset	Cancels a protocol error.

Storage Commands

This driver supports the following storage commands:

- TEST_UNIT_READY
- MODE_SELECT10
- MODE_SENSE10

- PREVENT_ALLOW
- READ_FORMAT_CAPACITY
- READ10
- WRITE10

Configuration

Refer to the USB (r_usb_basic) module.

Clock Configuration

Refer to the USB (r_usb_basic) module.

Pin Configuration

Refer to the USB (r_usb_basic) module.

Usage Notes

Warning

Due to the wide variety of USB mass storage device implementations, this driver is not guaranteed to work with all devices. When implementing the driver it is important to verify correct operation with the mass storage devices that the end user is expected to use.

Multi Port

This driver supports simultaneous operation with Peripheral Communication Device Class(PCDC). If the user are using MCU that supports 2 USB modules, such as RA6M3, the user can run HMSC on one USB module and PCDC on the other. This driver does not support simultaneous operation using device classes other than PCDC.

For Bare Metal

1. To use FreeRTOS+FAT without FreeRTOS, copy FreeRTOSConfigMinimal.h to one of your project's include paths and rename it FreeRTOSConfig.h.
2. In RA configurator, enter the appropriate values in the Main stack size and Heap size fields. The figure below is an example of the RA6M3-EK board.

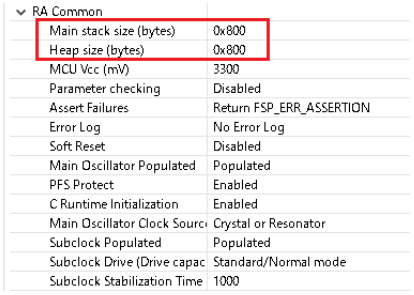

Figure 206: BSP Setting

1. In the Bare Metal version, specify "NULL" in the Callback item.

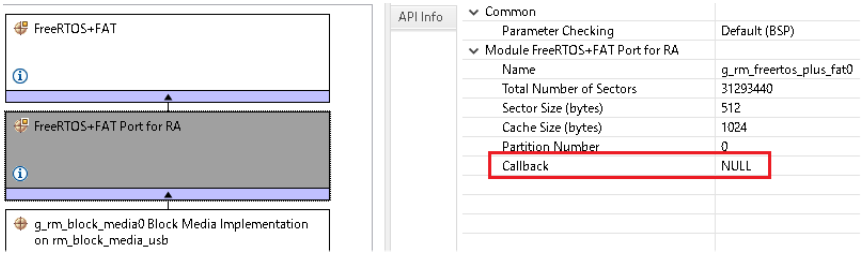

Figure 207: For Bare Metal Setting

Limitations

1. Some MSC devices may be unable to connect because they are not recognized as storage devices.
2. MSC devices that return values of 1 or higher in response to the GetMaxLun command (mass storage class command) are not supported.
3. A maximum of 4 USB storage devices can be connected.
4. Only USB storage devices with a sector size of 512 bytes can be connected.
5. A device that does not respond to the READ_CAPACITY command operates as a device with a sector size of 512 bytes.
6. The continuous transfer mode cannot be used when using DMA.
7. This module must be incorporated into a project using r_usb_basic and does not provide any public APIs.
8. This driver does not support Low-speed.

Examples

USB HMSC Example

Example Operating Environment

The following shows an example operating environment for the HMSC.

Refer to the associated instruction manuals for details on setting up the evaluation board and using the emulator, etc.

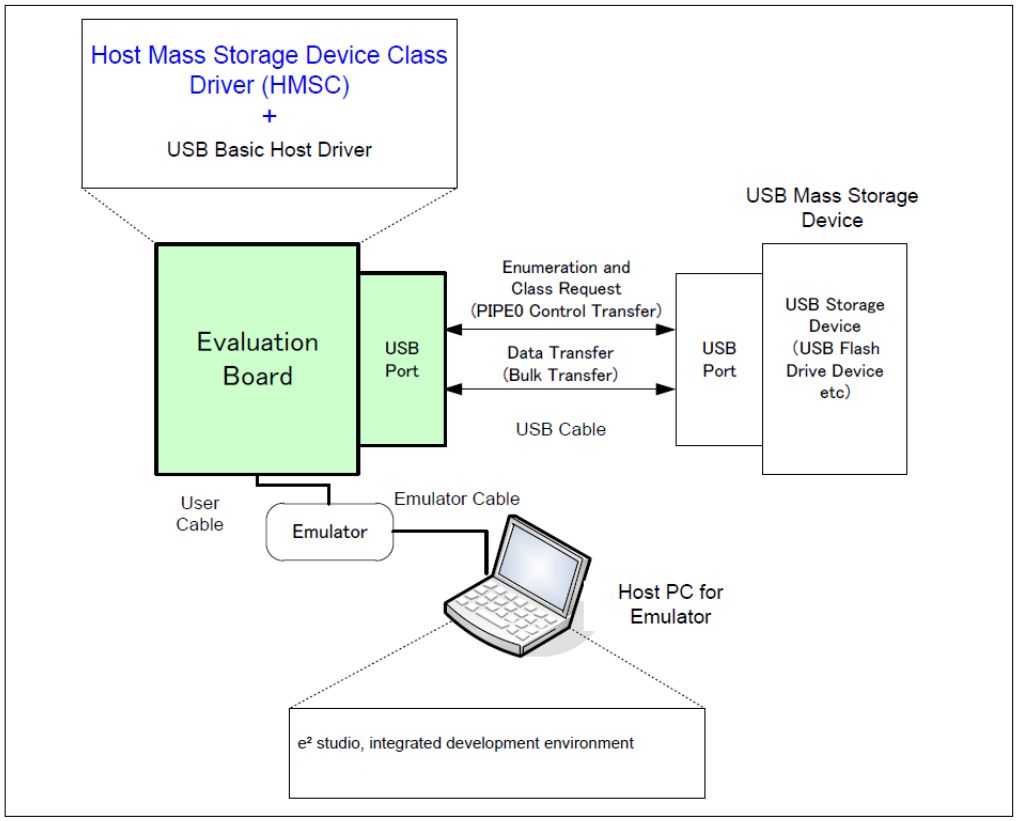

Figure 208: Example Operating Environment

Application Specifications

The main functions of the application are as follows:

1. Performs enumeration and drive recognition processing on MSC devices.
2. After the above processsing finisihes, the application writes the file to the MSC device once.
3. After writing the above file, the APL repeatedly reads the file. It continues to read the file repeatedly until the switch is pressed again.

Application Processing (for RTOS)

This application has two tasks. An overview of the processing in these two tasks is provided below.

usb_apl_task

1. After start up, MCU pin setting, USB controller initialization, and application program initialization are performed.
2. The MSC device is attached to the kit. When enumeration and drive recognition processing have completed, the USB driver calls the callback function (usb_apl_callback). In the callback function (usb_apl_callback), the application task is notified of the USB completion event using the FreeRTOS functionality.
3. In the application task, information regarding the USB completion event about which notification was received from the callback function is retrieved using the real-time OS functionality.
4. If the USB completion event (the event member of the usb_ctrl_t structure) retrieved in step 2 above is USB_STS_CONFIGURED then, based on the USB completion event, the MSC

device is mounted and the file is written to the MSC device.

5. If the USB completion event (the event member of the usb_ctrl_t structure) retrieved in step 2 above is USB_STS_DETACH, the application initializes the variables for state management.

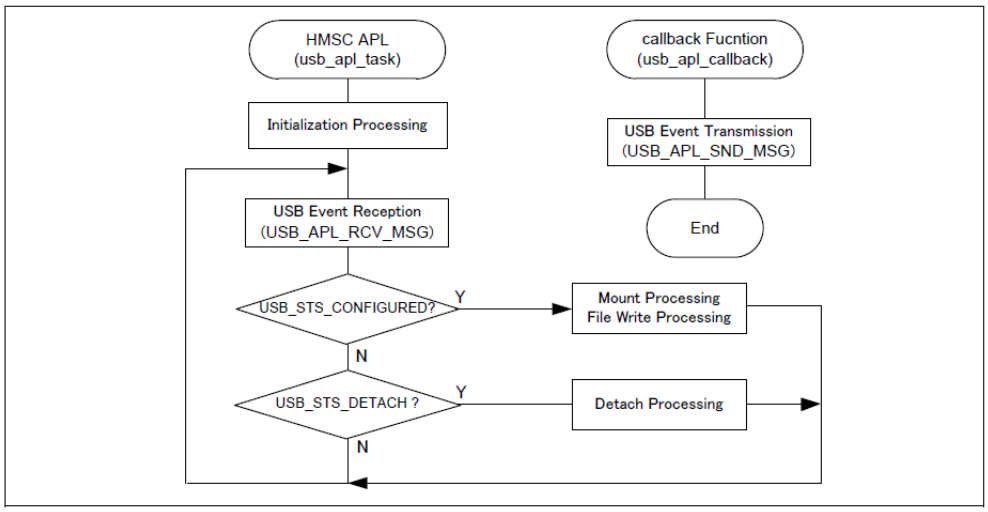

Figure 209: usb_apl_task

file_read_task

Of the application tasks usb_apl_task and file_read_task, file_read_task is processed while usb_apl_task is in the wait state. This task performs file read processing on the file that was written to the MSC device.

Function Documentation

◆ R_USB_HMSC_StorageCommand()

fsp_err_t R_USB_HMSC_StorageCommand (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *buf*, uint8_t *command*, uint8_t *destination*)

Processing for MassStorage(ATAPI) command.

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ R_USB_HMSC_DriveNumberGet()

fsp_err_t R_USB_HMSC_DriveNumberGet (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *p_drive*, uint8_t *destination*)

Get number of Storage drive.

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ R_USB_HMSC_StorageReadSector()

fsp_err_t R_USB_HMSC_StorageReadSector (uint16_t *drive_number*, uint8_t *const *buff*, uint32_t *sector_number*, uint16_t *sector_count*)

Read sector information.

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

The address specified in the argument buff must be 4-byte aligned.

◆ R_USB_HMSC_StorageWriteSector()

fsp_err_t R_USB_HMSC_StorageWriteSector (uint16_t *drive_number*, uint8_t const *const *buff*, uint32_t *sector_number*, uint16_t *sector_count*)

Write sector information.

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

The address specified in the argument buff must be 4-byte aligned.

◆ R_USB_HMSC_SemaphoreGet()

fsp_err_t R_USB_HMSC_SemaphoreGet (void)

Get a semaphore. (RTOS only)

If this function is called in the OS less execution environment, a failure is returned.

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.

◆ R_USB_HMSC_SemaphoreRelease()

fsp_err_t R_USB_HMSC_SemaphoreRelease (void)

Release a semaphore. (RTOS only)

If this function is called in the OS less execution environment, a failure is returned.

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.

5.2.6.35 USB Host Vendor class (r_usb_hvnd)

Modules » Connectivity

Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

Overview

USB Host Vendor class works by combining r_usb_basic module.

How to Configuration

The following shows FSP configuration procedure for USB Host Vendor class.

- Select [New Stack]->[Middleware]->[USB]->[USB Host Vendor class driver on r_usb_hvnd].

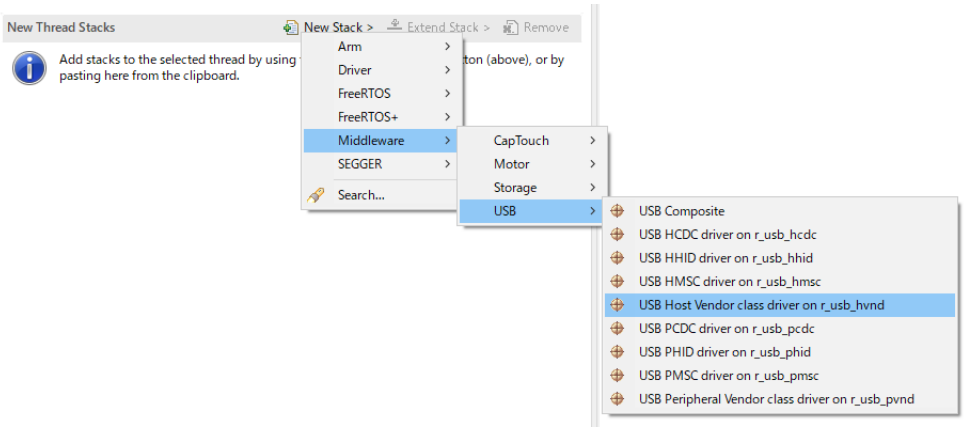

Figure 210: Select USB Host Vendor Class

- The following is displayed when selecting [USB Host Vendor class driver on r_usb_hvnd]. The user does not specify USB pipe number in Vendor class.

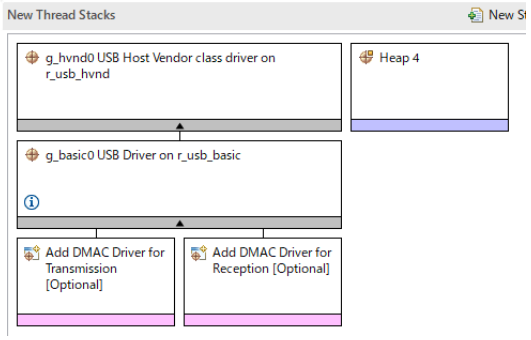

Figure 211: USB Host Vendor Class Stack

API

Use the following APIs in Host Vendor class application program.

- For Data Transfer
  Use the following APIs for data transfer for Bulk transfer or Interrupt transfer.

  1. R_USB_PipeRead()
  2. R_USB_PipeWrite()
  3. R_USB_PipeStop()

- For Control Transfer
  Use the following API for the class request processing.

  1. R_USB_HostControlTransfer()

- For USB Pipe Information
  The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class. Use the following APIs to get the allocated USB pipe information.

  1. R_USB_UsedPipesGet()
  2. R_USB_PipeInfoGet()

USB PIPE Allocation

The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class.
The USB PIPE related to the Endpoint Descriptor are allocated in order from USB PIPE1 according to the description order of the Endpoint Descriptor.

Examples

This application program processes the follwoing after the enumeration completes with USB device.

1. Getting USB Pipe Infomattion
2. Vendor Class Request Processing
3. Loopback processing of bulk transfer and interrupt transfer.

5.2.6.36 USB PCDC (r_usb_pcdc)

Modules » Connectivity

This module provides a USB Peripheral Communications Device Class Driver (PCDC). It implements the USB PCDC Interface.

Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

Detailed Description

Overview

The r_usb_pcdc module combines with the r_usb_basic module to provide a USB Peripheral Communications Device Class (PCDC) driver. The PCDC driver conforms to Abstract Control Model of the USB Communications Device Class (CDC) specification and enables communication with a CDC host device.

Features

The r_usb_pcdc module has the following key features:

- Data transfer to and from a USB host
- Response to CDC class requests
- Supports CDC notifications

Configuration

Build Time Configurations for r_usb_pcdc

The following build time configurations are defined in fsp_cfg/r_usb_pcdc_cfg.h:

Configuration	Options	Default	Description
Bulk In Pipe	• USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5	USB PIPE4	Select the USB pipe to use for bulk input transfers.
Bulk Out Pipe	• USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5	USB PIPE5	Select the USB pipe to use for bulk output transfers.
Interrupt In Pipe	• USB PIPE6 • USB PIPE7 • USB PIPE8 • USB PIPE9	USB PIPE6	Select the USB pipe to use for interrupts.

Configurations for Connectivity > USB PCDC (r_usb_pcdc)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PCDC (r_usb_pcdc).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_pcdc0	Module name.

Note

Refer to the USB (r_usb_basic) module for hardware configuration options.

Clock Configuration

Refer to the USB (r_usb_basic) module.

Pin Configuration

Refer to the USB (r_usb_basic) module.

Usage Notes

Abstract Control Model Overview

The Abstract Control Model subclass of CDC is a technology that bridges the gap between USB devices and earlier modems (employing RS-232C connections), enabling use of application programs designed for older modems.

Class Requests (Host to Peripheral)

This driver notifies the application when receiving the following class requests:

Request	Code	Description
SetLineCoding	0x20	Sets communication line settings (bitrate, data length, parity, and stop bit length)
GetLineCoding	0x21	Acquires the communication line setting state
SetControlLineState	0x22	Set communication line control signals (RTS, DTR)

Note

For details concerning the Abstract Control Model requests, refer to Table 11 "Requests - Abstract Control Model" in the "USB Communications Class Subclass Specification for PSTN Devices", Revision 1.2.

Data Format of Class Requests

The data format of supported class requests is described below:

bmRequestType	bRequest	wValue	wIndex	wLength	Data
0x21	SET_LINE_CODING (0x20)	0x0000	0x0000	0x0007	usb_pcdc_linecoding_t
0xA1	GET_LINE_CODING (0x21)	0x0000	0x0000	0x0007	usb_pcdc_linecoding_t
0x21	SET_CONTROL_LINE_STATE (0x22)	usb_pcdc_ctrlinestate_t	0x0000	0x0000	None

Class Notifications (Peripheral to Host)

The following class notifications are supported:

Notification	Code	Description
SERIAL_STATE	0x20	Notification of serial line state

The data types returned are as follows:

bmRequestType	bRequest	wValue	wIndex	wLength	Data

0xA1	SERIAL_STATE (0x20)	0x0000	0x0000	0x0002	usb_serial_state_bitmap_t

Note

The host is notified with SERIAL_STATE whenever a change in the UART port state is detected. This driver will automatically detect overrun, parity and framing errors. A state notification is performed when a transition from normal to error state is detected.

Virtual COM-port Usage

When connected to a PC the CDC device can be used as a virtual COM port. After enumeration, the CDC class requests GetLineCoding and SetControlLineState are executed by the target, and the CDC device is registered in Windows Device Manager as a virtual COM device.

Registering the CDC device as a virtual COM-port in Windows Device Manager enables data communication with the CDC device via a terminal app such as PuTTY. When changing settings of the serial port in the terminal application, the UART setting is propagated to the firmware via the class request SetLineCoding.

Data input (or file transmission) from the terminal app window is transmitted to the board using endpoint 2 (EP2); data from the board side is transmitted to the PC using EP1.

When the last packet of data received is the maximum packet size, and the terminal determines that there is continuous data, the received data may not be displayed in the terminal. If the received data is smaller than the maximum packet size, the data received up to that point is displayed in the terminal.

Multi Port

This driver supports simultaneous operation with Host Mass Storage Class(HMSC). If the user are using MCU that supports 2 USB modules, such as RA6M3, the user can run PCDC on one USB module and HMSC on the other. This driver does not support simultaneous operation using device classes other than HMSC.

Limitations

- This module must be incorporated into a project using r_usb_basic and does not provide any public APIs.
- This driver does not support Low-speed.
- Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.

Examples

USB PCDC Loopback Example

The main functions of the PCDC loopback example are as follows:

1. Receives virtual UART configuration data from the host terminal
2. Loops all other received data back to the host terminal

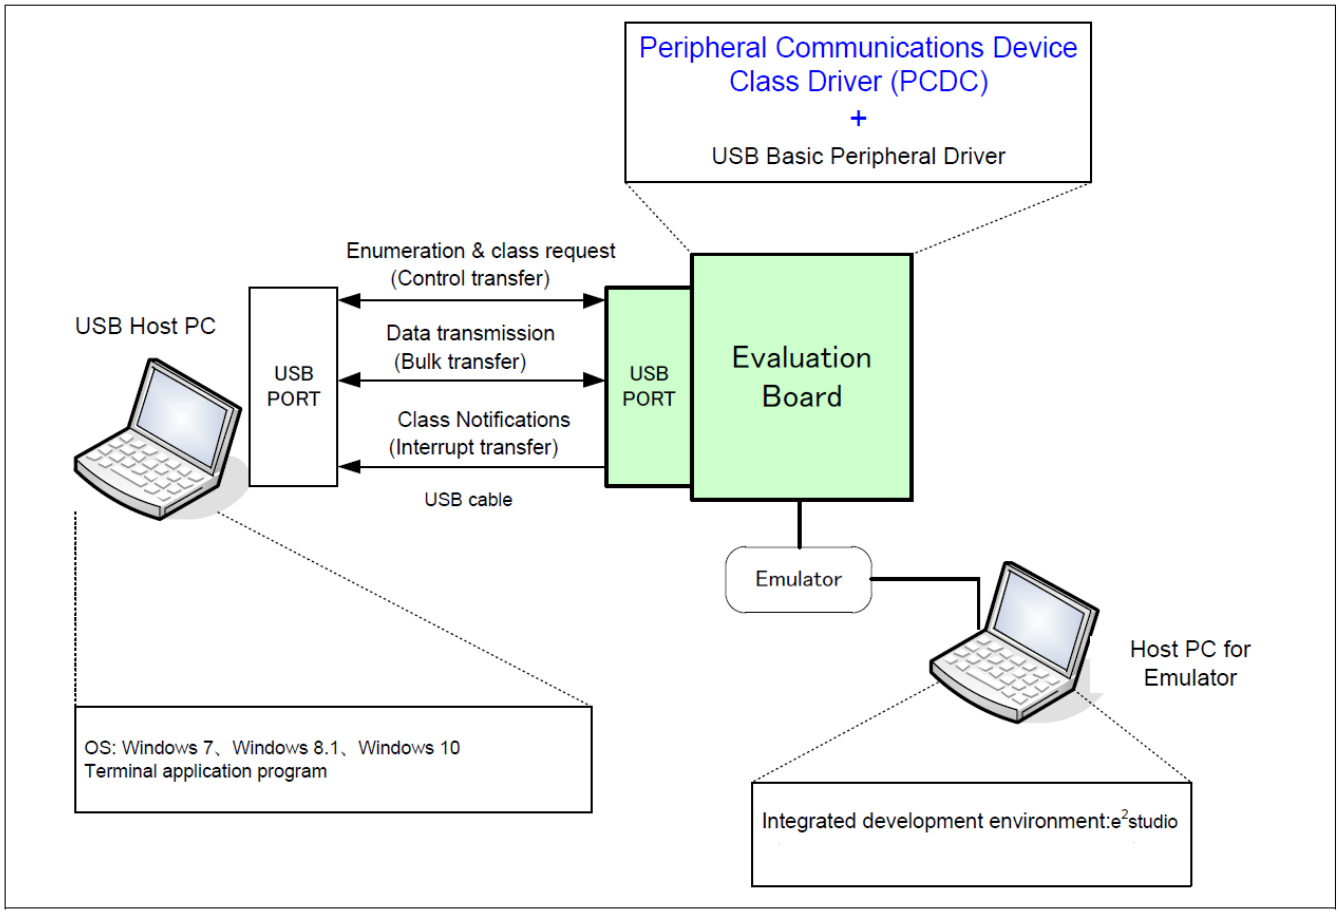

Figure 212: Example Operating Environment

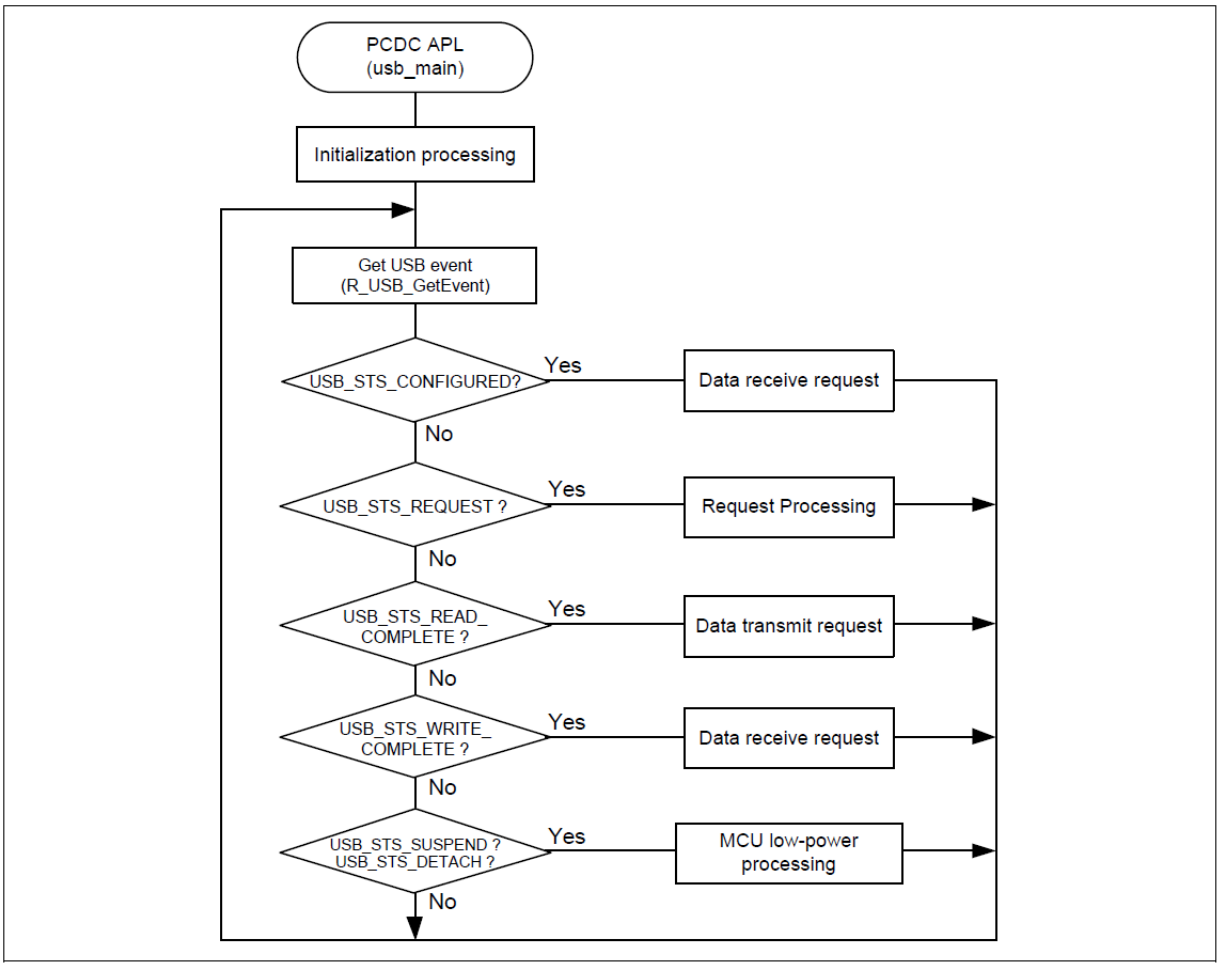

Figure 213: Main Loop processing (Echo mode)
