Descriptor

A template for PCDC descriptors can be found in ra/fsp/src/r_usb_pcdc/r_usb_pcdc_descriptor.c.template. Also, please be sure to use your vendor ID.

5.2.6.37 USB PHID (r_usb_phid)

Modules » Connectivity

This module is USB Peripheral Human Interface Device Class Driver (PHID). It implements the USB PHID Interface.

Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

Detailed Description

Overview

The r_usb_phid module combines with the r_usb_basic module to provide a USB Peripheral Human Interface Device Class (PHID) driver. The PHID driver conforms to the USB Human Interface Device class specifications and implements communication with a HID host.

Features

The r_usb_phid module has the following functions:

- Data transfer to and from a USB host
- Response to HID class requests
- Response to function references from the HID host

Note

This driver is not guaranteed to provide USB HID operation in all scenarios. The developer must verify correct operation when connected to the targeted USB hosts.

Configuration

Build Time Configurations for r_usb_phid

The following build time configurations are defined in fsp_cfg/r_usb_phid_cfg.h:

Configuration	Options	Default	Description
Interrupt In Pipe	• USB PIPE6 • USB PIPE7 • USB PIPE8 • USB PIPE9	USB PIPE6	Select the pipe number for input interrupt events.
Interrupt Out Pipe	• USB PIPE6 • USB PIPE7 • USB PIPE8 • USB PIPE9	USB PIPE7	Select the pipe number for output interrupt events.

Configurations for Connectivity > USB PHID (r_usb_phid)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PHID (r_usb_phid).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_phid0	Module name.

Clock Configuration

Refer to the USB (r_usb_basic) module.

Pin Configuration

Refer to the USB (r_usb_basic) module.

Usage Notes

Class Requests (Host to Peripheral)

This driver notifies the application when receiving the following class requests:

Request	Code	Description
Get_Report	0x01	Receives a report from the HID host
Set_Report	0x09	Sends a report to the HID host
Get_Idle	0x02	Receives a duration (time) from the HID host
Set_Idle	0x0A	Sends a duration (time) to the HID host
Get_Protocol	0x03	Reads a protocol from the HID host
Set_Protocol	0x0B	Sends a protocol to the HID host
Get_Descriptor	0x06	Transmits a report or HID

descriptor

The data format of supported class requests is described below:

bmRequestType	bRequest	wValue	wIndex	wLength	Data
0xA1	GET_REPORT (0x01)	ReportType & ReportID	Interface	ReportLength	Report
0x21	SET_REPORT (0x09)	ReportType & ReportID	Interface	ReportLength	Report
0xA1	GET_IDLE (0x02)	0 & ReportID	Interface	1	Idle rate
0x21	SET_IDLE (0x0A)	Duration & ReportID	Interface	0	Idle rate
0xA1	GET_PROTOCOL (0x03)	0	Interface	0	0 (Boot) or 1 (Report)
0x21	SET_PROTOCOL (0x0B)	0 (Boot) or 1 (Report)	Interface	0	Not applicable

Limitations

- This driver does not support USB Hi-speed mode.
- This driver does not support USB Low-speed mode.
- This driver does not support DMA transfers.
- This driver does not support simultaneous operation with USB Host device class.
- Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.

Examples

5.2.6.38 USB PMSC (r_usb_pmsc)

Modules » Connectivity

This module provides a USB Peripheral Mass Storage Class (PMSC) driver. It implements the USB PMSC Interface.

Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

Detailed Description

Overview

The r_usb_pmsc module combines with the r_usb_basic module to provide USB Peripheral It operates as a Mass Storage class driver (hereinafter referred to as PMSC).
The USB peripheral mass storage class driver (PMSC) comprises a USB mass storage class bulk-only transport (BOT) protocol.
When combined with a USB peripheral control driver and media driver, it enables communication with a USB host as a BOT-compatible storage device.

Features

The r_usb_pmsc module has the following key features:

- Storage command control using the BOT protocol
- Supports only SFF-8070i (ATAPI) Interface Sub-Class
- Response to mass storage device class requests from a USB host

Configuration

Build Time Configurations for r_usb_pmsc

The following build time configurations are defined in fsp_cfg/r_usb_pmsc_cfg.h:

Configuration	Options	Default	Description
Bulk Input Transfer Pipe	• USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5	USB PIPE4	Select the USB pipe to use for bulk input transfers.
Bulk Output Transfer Pipe	• USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5	USB PIPE5	Select the USB pipe to use for bulk output transfers.
Vendor Information	Vendor Information must be 8 bytes long; pad with spaces if shorter.	Vendor	Specify the vendor information field (part of the Inquiry command response).
Product Information	Product Information must be 16 bytes long; pad with spaces if shorter.	Mass Storage	Specify the product information field (part of the Inquiry command response).
Product Revision Level	Product Revision Level must be 4 bytes long; pad with spaces if shorter.	1.00	Specify the product revision level field (part of the Inquiry command response).
Sector size	• 512 • 4096	512	Specifies the sector size.
Number of Transfer Sectors	Please enter a number between 1 and 255.	8	Specify the maximum sector size to request with one data transfer.

Configurations for Connectivity > USB PMSC (r_usb_pmsc)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PMSC (r_usb_pmsc).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_pmsc0	Module name.

Refer to the USB (r_usb_basic) module for hardware configuration options.

Clock Configuration

Refer to the USB (r_usb_basic) module.

Pin Configuration

Refer to the USB (r_usb_basic) module.

Usage Notes

Class Requests

The class requests supported by this driver are shown below.

Request	Code	Description
Bulk-Only Mass Storage Reset	0xFF	Resets the connection interface to the mass storage device.
Get Max Logical Unit Number	0xFE	Reports the logical numbers supported by the device.

Storage Commands

This driver supports the following storage commands.

Command	Code	Description
TEST_UNIT_READY	0x00	Checks the state of the peripheral device.
REQUEST_SENSE	0x03	Gets the error information of the previous storage command execution result.
INQUIRY	0x12	Gets the parameter information of the logical unit.
READ_FORMAT_CAPACITY	0x23	Gets the formattable capacity.
READ_CAPACITY	0x25	Gets the capacity information of the logical unit.
READ10	0x28	Reads data.
WRITE10	0x1A	Writes data.
MODE_SENSE10	0x5A	Gets the parameters of the logical unit.

Note

A STALL or FAIL error is sent to the host upon receipt of any command not listed in the above table.

BOT Protocol Overview

BOT (USB MSC Bulk-Only Transport) is a transfer protocol that encapsulates command, data, and status (results of commands) using only two endpoints (one bulk in and one bulk out). The ATAPI storage commands and the response status are embedded in a Command Block Wrapper (CBW) and a Command Status Wrapper (CSW). The below image shows an overview of how the BOT protocol progresses with command and status data flowing between USB host and peripheral.

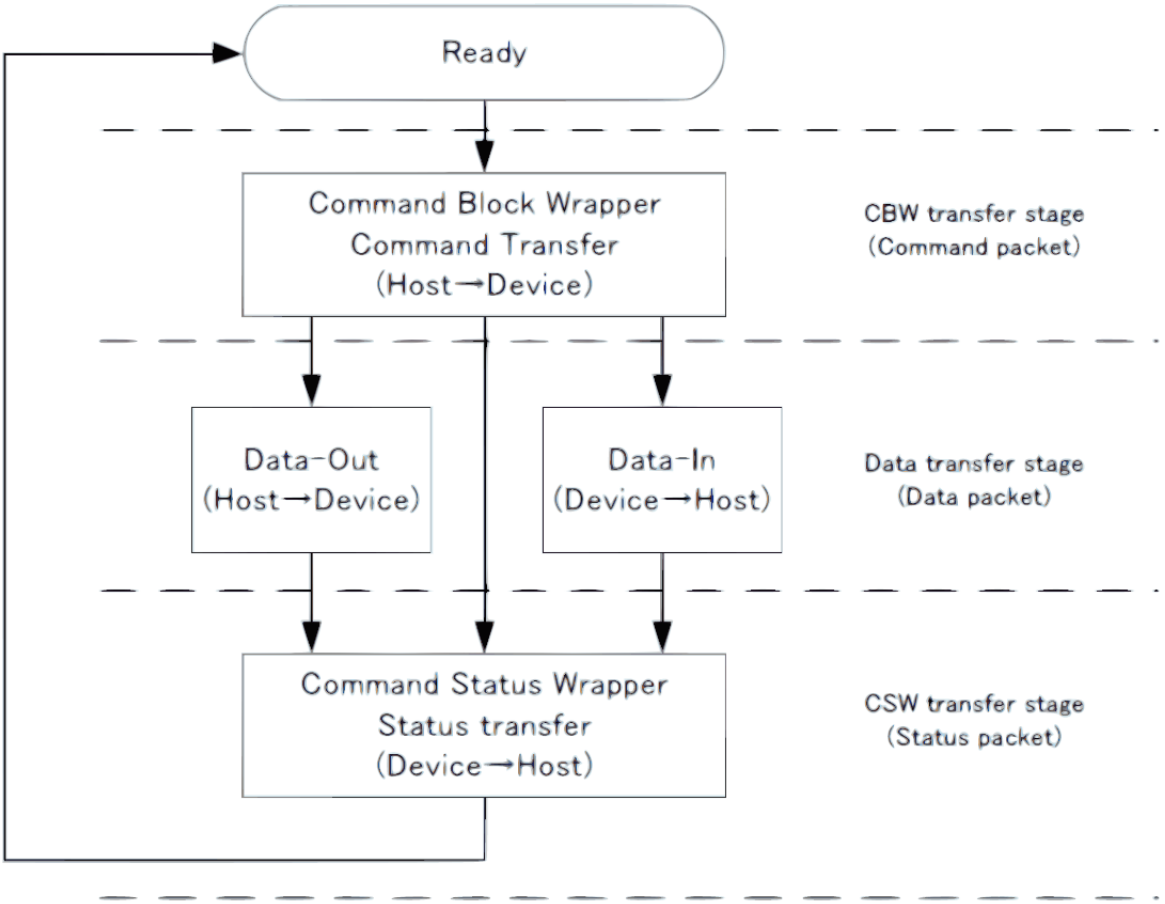

Figure 217: BOT protocol Overview

Block Media Interface

PMSC implements a block media interface to enable access to higher-level modules. If the block media interface supports multiple media, users can select any media to access.

Note

When the user develops the storage media driver, be sure to define the instance named "g_rm_block_media0".

Limitations

1. The driver always returns 0 in response to the GetMaxLun command.
2. The driver supports a sector size of 512 bytes only.
3. The only media currently supported by the block media interface is an SD card. The card must be inserted before initializing the driver.
4. When using DMA for Hi-Speed transfers continuous transfer mode must not be used in the USB Basic driver.
5. The storage area must be formatted before use.
6. When using the SD/MMC Block Media Implementation (rm_block_media_sdmmc), "Card Detection" must be set to "Not Used" in the SD/MMC Host Interface (r_sdhi) settings.
7. The driver does not support Low-speed.
8. This driver does not support simultaneous operation with USB Host device class.
9. Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.

Examples

USB PMSC Example

In this example, when the evaluation board is connected to the host PC it is recognized as a removable disk and reading/writing files is possible. The FAT type is either FAT12, FAT16, or FAT32 depending on the size of the media used.

5.2.6.39 USB PPRN (r_usb_pprn)

Modules » Connectivity

This module is USB Peripheral Printer Device Class Driver (PPRN). It implements the USB PPRN Interface.

Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

Detailed Description

Overview

The r_usb_pprn module combines with the r_usb_basic module to provide a USB Peripheral Printer Device Class (PPRN) driver. The PPRN driver conforms to the USB Printer Device class specifications and implements communication with a printer host.

Features

The r_usb_pprn module has the following functions:

- Data transfer to and from a USB host
- Response to the printer class requests

- Response to function references from the printer host

Note

This driver is not guaranteed to provide USB printer operation in all scenarios. The developer must verify correct operation when connected to the targeted USB hosts.

Configuration

Build Time Configurations for r_usb_pprn

The following build time configurations are defined in fsp_cfg/r_usb_pprn_cfg.h:

Configuration	Options	Default	Description
Bulk In Pipe	• USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5	USB PIPE4	Select the USB pipe to use for bulk in transfer.
Bulk Out Pipe	• USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5	USB PIPE5	Select the USB pipe to use for bulk out transfer.

Configurations for Connectivity > USB PPRN (r_usb_pprn)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PPRN (r_usb_pprn).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_pprn0	Module name.

Clock Configuration

Refer to the USB (r_usb_basic) module.

Pin Configuration

Refer to the USB (r_usb_basic) module.

Usage Notes

Class Requests (Host to Peripheral)

This driver notifies the application when receiving the following class requests:

Request	Code	Description
GET_DEVICE_ID	0x00	Get IEEE 1284 Device ID String
GET_PORT_STATUS	0x01	Get Printer's Status

SOFT_RESET	0x02	Flushes all buffers and resets the Bulk OUT and Bulk IN pipes

The data format of supported class requests is described below:

bmRequestType	bRequest	wValue	wIndex	wLength	Data
0xA1	GET_DEVICE_ID (0x00)	Config Index	Interface Alternate Setting	Maximum Length	1284 Device ID String
0xA1	GET_PORT_STATUS (0x01)	0	Interface	1	Printer Status
0x21	SOFT_RESET (0x02)	0	Interface	0	None

Limitations

- This driver does not support USB Low-speed mode.
- This driver does not support simultaneous operation with USB Host device class.
- Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.

USB PPRN Example

This is a minimal example for implementing PPRN in bare metal and FreeRTOS application.

Descriptors

A template for PPRN descriptors can be found in ra/fsp/src/r_usb_pprn folder. Be sure to replace the vendor ID with your own.

5.2.6.40 USB Peripheral Vendor class (r_usb_pvnd)

Modules » Connectivity

Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

Overview

USB Peripheral Vendor class works by combining r_usb_basic module.

How to Configuration

The following shows FSP configuration procedure for USB Peripheral Vendor class.

- Select [New Stack]->[Middleware]->[USB]->[USB Peripheral Vendor class driver on r_usb_pvnd].

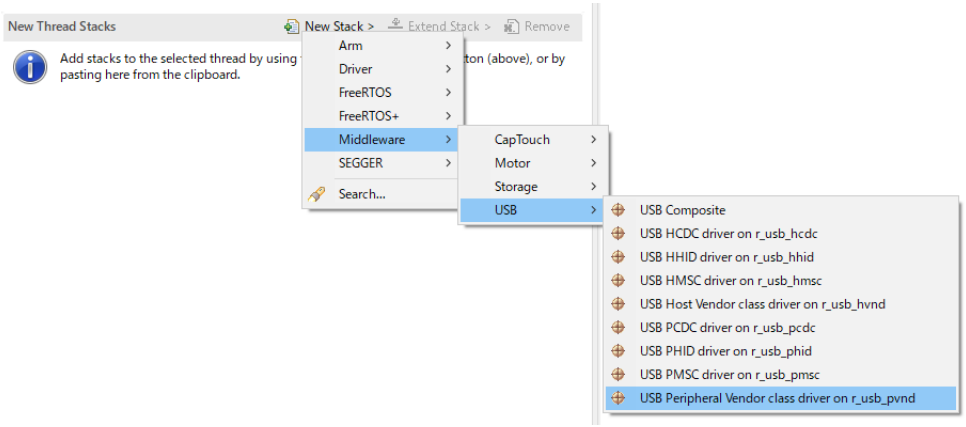

Figure 219: Select USB Peripheral Vendor Class

- The following is displayed when selecting [USB Peripheral Vendor class driver on r_usb_pvnd]. The user does not specify USB pipe number in Vendor class.

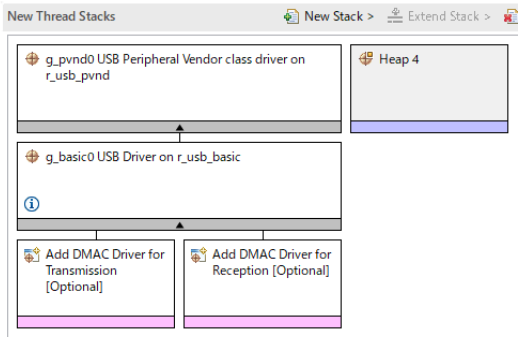

Figure 220: USB Peripheral Vendor Class Stack

API

Use the following APIs in Peripheral Vendor class application program.

- For Data Transfer
  Use the following APIs for data transfer for Bulk transfer or Interrupt transfer.

  1. R_USB_PipeRead()

2. R_USB_PipeWrite()
3. R_USB_PipeStop()

- For Control Transfer
  Use the following API for the class request processing.

  1. R_USB_PeriControlDataGet()
  2. R_USB_PeriControlDataSet()
  3. R_USB_PeriControlStatusSet()

- For USB Pipe Information
  The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class. Use the following APIs to get the allocated USB pipe information.

  1. R_USB_UsedPipesGet()
  2. R_USB_PipeInfoGet()

USB PIPE Allocation

The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class.
The USB PIPE related to the Endpoint Descriptor are allocated in order from USB PIPE1 according to the description order of the Endpoint Descriptor.
FSP driver pipe configuration behaviors for the PVND Class, when it is used with the Composite PCDC+PVND Class is mentioned below.

- In Composite PCDC+PVND class, PCDC class interface is placed next to the PVND class interface in descriptor file. PVND Class Pipe configurations are as follows.
  - FSP driver(PVND) allocates Pipes in order from USB PIPE1 according to the order of the endpoint in descriptor(Bulk transfer).
  - FSP driver(PVND) allocates Pipes in order(decremental order) from USB PIPE9 according to the order of the endpoint in descriptor(Interrupt transfer).
  - PCDC and PVND must always use different USB PIPEs.

For example:

- In the Composite PCDC+PVND class, if there are 3 number of bulk transfers endpoints and one Interrupt transfer endpoint in descriptor file for PVND class and for this configuration FSP driver configures USB PIPE1, USB PIPE2 and USB PIPE3 for bulk data transfer and USB PIPE9 for Interrupt data transfer.
- Since hardware support total 5 number of Bulk transfer pipe configuration. So, in this scenario, for the PCDC class we have configurable USB PCDC Stack property to select available Pipes(USB PIPE 4 and USB PIPE 5 for Bulk and USB PIPE 6 for Interrupt transfer) from USB PCDC Stack configurator.

Limitaions

- Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.

Descriptor

Template for Vendor class descriptor can be found in ra/fsp/src/r_usb_pvnd folder. Also, please be sure to use your vendor ID.

Examples

This application program processes the follwoing after the enumeration completes with USB device.

1. Getting USB Pipe Infomattion
2. Vendor Class Request Processing
3. Loopback processing of bulk transfer and interrupt transfer.

Detailed Description

Middleware to implement a generic communications interface over USB_PCDC. This module implements the Communicatons Middleware Interface.

Overview

The RM_COMMS_USB_PCDC module implements COMMS API for USB_PCDC interface.

Features

The implementation of the USB_PCDC communications interfacehas the following key features:

- Non-blocking API for bare metal
- Non-blocking and blocking API for RTOS

Configuration

Build Time Configurations for rm_comms_usb_pcdc

The following build time configurations are defined in fsp_cfg/r_usb_pcdc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Bulk In Pipe	• USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5	USB PIPE4	Select the USB pipe to use for bulk input transfers.
Bulk Out Pipe	• USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5	USB PIPE5	Select the USB pipe to use for bulk output transfers.
Interrupt In Pipe	• USB PIPE6 • USB PIPE7 • USB PIPE8 • USB PIPE9	USB PIPE6	Select the USB pipe to use for interrupts.

Configurations for Connectivity > USB PCDC Communication Device (rm_comms_usb_pcdc)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PCDC Communication Device (rm_comms_usb_pcdc).

Configuration	Options	Default	Description
RTOS			
Write Mutex	• Do Not Use • Use	Use	Lock device for writing in using RTOS.
Read Mutex	• Do Not Use • Use	Use	Lock device for reading in using RTOS.
Mutex Timeout	Value must be a non-negative integer	0xFFFFFFFF	Timeout for recursive mutex operation in using RTOS.
Write Semaphore	• Do Not Use • Use	Use	Block writing in using RTOS.
Read Semaphore	• Do Not Use • Use	Use	Block reading in using RTOS.

Semaphore Timeout	Value must be a non-negative integer	0xFFFFFFFF	Timeout for semaphore operation in using RTOS.
Name	Name must be a valid C symbol	g_comms_usb_pcdc0	Module name.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided.

Usage Notes

Limitations

- RM_COMMS_API are not reentrant in non blocking mode
- When in blocking mode, RM_COMMS_USB_PCDC_Write() and RM_COMMS_USB_PCDC_Read() cannot be called in callback.
- RM_COMMS_USB_PCDC_WriteRead API is not implemented

Examples

Basic Example

This is a basic example of minimal use of USB_PCDC communications implementation in an application.

```
void rm_comms_usb_pcdc_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    err = RM_COMMS_USB_PCDC_Open(&g_comms_usb_pcdc_ctrl, &g_comms_usb_pcdc_cfg);
 if (FSP_SUCCESS != err)
    {
 /* Handle any errors. */
    }
 while (true)
    {
 /* Send data. */
       g_err_flag = 0;
       g_tx_flag = 0;
       err       = RM_COMMS_USB_PCDC_Write(&g_comms_usb_pcdc_ctrl, g_tx_buf,
TX_BUF_LEN);
 if (FSP_SUCCESS != err)
     {
```

```
 /* Handle any errors. */
      }
 while ((0 == g_tx_flag) && (0 == g_err_flag))
      {
 /* Wait callback */
      }
 /* Receive data. */
       g_err_flag = 0;
       g_rx_flag = 0;
       err       = RM_COMMS_USB_PCDC_Read(&g_comms_usb_pcdc_ctrl, g_rx_buf,
RX_BUF_LEN);
 if (FSP_SUCCESS != err)
      {
 /* Handle any errors.*/
      }
 while ((0 == g_rx_flag) && (0 == g_err_flag))
      {
 /* Wait callback */
      }
    }
}
static void rm_comms_usb_pcdc_callback (rm_comms_callback_args_t * p_args)
{
 if (p_args->event == RM_COMMS_EVENT_TX_OPERATION_COMPLETE)
    {
       g_tx_flag = 1;
    }
 else if (p_args->event == RM_COMMS_EVENT_RX_OPERATION_COMPLETE)
    {
       g_rx_flag = 1;
    }
 else
    {
       g_err_flag = 1;
```

```
    }
}
```

Data Structures

struct	rm_comms_usb_pcdc_instance_ctrl_t

Data Structure Documentation

◆ rm_comms_usb_pcdc_instance_ctrl_t

struct rm_comms_usb_pcdc_instance_ctrl_t	
Communications middleware control structure.	
Data Fields	
uint32_t	open
	Open flag.
rm_comms_cfg_t const *	p_cfg
	Middleware configuration.
rm_comms_usb_pcdc_extended_cfg_t const *	p_extend
	Pointer to extended configuration structure.
usb_callback_args_t *	p_usb_args
	Pointer to usb callback args.
void(*	p_callback)(rm_comms_callback_args_t *p_args)
	Pointer to callback that is called when a usb_status_t occurs.
void const *	p_context
	Pointer to context passed into callback function.

Function Documentation

◆ RM_COMMS_USB_PCDC_Open()

fsp_err_t RM_COMMS_USB_PCDC_Open (rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_cfg_t const *const *p_cfg*)

Opens and configures the USB PCDC Comms module. Implements rm_comms_api_t::open.

Return values

FSP_SUCCESS	USB PCDC Comms module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_USB_PCDC_Close()

fsp_err_t RM_COMMS_USB_PCDC_Close (rm_comms_ctrl_t *const *p_api_ctrl*)

Disables specified USB PCDC Comms module. Implements rm_comms_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_USB_PCDC_CallbackSet()

fsp_err_t RM_COMMS_USB_PCDC_CallbackSet (rm_comms_ctrl_t *const *p_api_ctrl*, void(*)(rm_comms_callback_args_t *) *p_callback*, void const *const *p_context*)

Updates the USB PCDC Comms callback. Implements rm_comms_api_t::callbackSet.

Return values

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_COMMS_USB_PCDC_Read()

fsp_err_t RM_COMMS_USB_PCDC_Read (rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Performs a read from the USB PCDC device. Implements rm_comms_api_t::read.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_USB_PCDC_Write()

fsp_err_t RM_COMMS_USB_PCDC_Write (rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*)

Performs a write to the USB PCDC device. Implements rm_comms_api_t::write.

Return values

FSP_SUCCESS	Successfully writing data .
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_USB_PCDC_WriteRead()

fsp_err_t RM_COMMS_USB_PCDC_WriteRead (rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_write_read_params_t const *write_read_params*)
Performs a write to, then a read from the USB device. Implements rm_comms_api_t::writeRead. **Return values** FSP_ERR_UNSUPPORTED — Not supported.

◆ rm_comms_usb_pcdc_notify_application()

void rm_comms_usb_pcdc_notify_application (rm_comms_usb_pcdc_instance_ctrl_t const * *p_ctrl*, rm_comms_event_t *event*)
(end addtogroup RM_COMMS_USB_PCDC)

5.2.7 DSP

Modules

Detailed Description

DSP Modules.

Modules

	CMSIS DSP H/W Acceleration (rm_cmsis_dsp) Middleware to implement Arm CMSIS DSP by using 32-bit Multiply-Accumulator (MACL).
	IIR Filter Accelerator (r_iirfa) Driver for the IIRFA peripheral on RA MCUs. This module implements the IIR Interface.

5.2.7.1 CMSIS DSP H/W Acceleration (rm_cmsis_dsp)

Modules » DSP

Middleware to implement Arm CMSIS DSP by using 32-bit Multiply-Accumulator (MACL).

Overview

The 32-bit Multiply-Accumulator (MACL) provides hardware acceleration for calculation of CMSIS DSP functions. After initializing this module, refer to the Arm documentation to use the file system: https://www.keil.com/pack/doc/CMSIS/DSP/html/index.html

Features

The MACL module supports the following features:

No	MACL API	Feature
1	arm_mult_q31	Q31 vector multiplication
2	arm_scale_q31	Multiplies a Q31 vector by a scalar
3	arm_mat_mult_q31	Q31 matrix multiplication
4	arm_mat_vec_mult_q31	Q31 matrix and vector multiplication
5	arm_mat_scale_q31	Q31 matrix scaling
6	arm_biquad_cascade_df1_q31	Processing function for the Q31 Biquad cascade filter
7	arm_conv_partial_q31	Partial convolution of Q31 sequences
8	arm_conv_q31	Convolution of Q31 sequences
9	arm_correlate_q31	Correlation of Q31 sequences
10	arm_fir_decimate_q31	Processing function for the Q31 FIR decimator
11	arm_fir_interpolate_q31	Processing function for the Q31 FIR interpolator
12	arm_fir_q31	Processing function for Q31 FIR filter
13	arm_fir_sparse_q31	Processing function for the Q31 sparse FIR filter
14	arm_lms_norm_q31	Processing function for Q31 normalized LMS filter
15	arm_lms_q31	Processing function for Q31 LMS filter

Note

The MACL hardware acceleration when executing 5 APIs including arm_scale_q31, arm_mat_scale_q31, arm_correlate_q31, arm_fir_q31, and arm_lms_q31 with 1-element input on IAR compiler will not be better than ARM CMSIS software. The MACL hardware is useful when executing with larger amounts of input.

Configuration

CMSIS DSP Acceleration Configuration

To enable hardware acceleration for Arm CMSIS DSP, the stack "Arm CMSIS6 DSP Acceleration" of CMSIS DSP must be filled with MACL (rm_cmsis_dsp). Otherwise the CMSIS DSP functions will perform the calculation by using software. This can be done at the Stack Configuration.

Usage Notes

Hardware Support

MACL module is required for using this middleware. Refer to the MCU hardware user's manual or datasheet to determine if it has MACL support.

Examples

Basic Example

About examples, how to use the CMSIS DSP APIs refer to the link: https://github.com/ARM-software/CMSIS-DSP/tree/main/Examples/ARM.

5.2.7.2 IIR Filter Accelerator (r_iirfa)

Modules » DSP

Functions

fsp_err_t	R_IIRFA_Open (iir_ctrl_t *const p_api_ctrl, iir_cfg_t const *const p_cfg)
fsp_err_t	R_IIRFA_Filter (iir_ctrl_t *const p_api_ctrl, float const *p_data_in, float *p_data_out, uint16_t const num_samples)
fsp_err_t	R_IIRFA_Configure (iir_ctrl_t *const p_api_ctrl, iir_filter_cfg_t const *const p_filter_cfg)
fsp_err_t	R_IIRFA_StatusGet (iir_ctrl_t *const p_api_ctrl, iir_status_t *const p_status)
fsp_err_t	R_IIRFA_Close (iir_ctrl_t *const p_api_ctrl)
__STATIC_INLINE float	R_IIRFA_SingleFilter (iir_ctrl_t *const p_api_ctrl, float data_in)

Detailed Description

Driver for the IIRFA peripheral on RA MCUs. This module implements the IIR Interface.

Overview

The IIR Filter Accelerator (IIRFA) provides hardware acceleration for calculation of single-precision floating point direct form 2 biquad IIR filters. Up to 32 biquad stages can be configured at a time.

Features

The IIRFA module supports the following features:

- Up to 16 different concurrent configurations/channels
- 32 biquad filter stages (shared between all channels)
- Runtime filter configuration
- ECC error detection for coefficient and delay data
    - 1-bit error correction, 2-bit error detection

Configuration

Build Time Configurations for r_iirfa

The following build time configurations are defined in fsp_cfg/r_iirfa_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Polling Mode	• Enabled • Disabled	Enabled	When enabled the IIRFA driver will poll for completion before reading the output register. This prevents IIRFA operations from delaying global interrupt processing at the cost of slower filter performance.
Software Loop Unroll Depth	Refer to the RA Configuration tool for available options.	1 Sample	Select the number of samples to process for every loop. This setting generally only affects filters that use 1 biquad stage.
ECC Support	• Disabled • Enabled • Enabled (no writeback)	Enabled	Select whether to detect ECC errors. When set to 'Enabled (no writeback)' 1-bit ECC errors will not be corrected.
Rounding Mode	• Nearest • Toward zero	Nearest	Select how to round calculation results.

Configurations for DSP > IIR Filter Accelerator (r_iirfa)

This module can be added to the Stacks tab via New Stack > DSP > IIR Filter Accelerator (r_iirfa). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_iirfa0	Module name.
Channel	Value must be an integer between 0 and 15	0	Select the IIRFA channel.

Clock Configuration

The clock source for the IIRFA peripheral is ICLK.

Pin Configuration

IIRFA does not have any pin connections.

Filter Configuration

Before using IIRFA to filter data the coefficients and state variables must be initialized. See the Filter Configuration example for how to initialize an iir_filter_cfg_t struct to pass to R_IIRFA_Configure.

Note

There are 32 total biquad stages in the peripheral shared across all channels. Channels may not select the same stages, so it is important to choose iir_filter_cfg_t::stage_base and iir_filter_cfg_t::stage_num carefully to ensure no overlap.

Usage Notes

Maximizing Performance

The optimum configuration for IIRFA is dependent on the application. It is recommended to consider the following in regards to your project to determine what settings may be ideal.

Regardless of configuration, each filter stage takes 2 ICLK cycles to process per sample and an additional 5 cycles to write state values back to registers. This means single-sample operations only take 2 cycles per stage while multi-sample operations take 7. Additional overhead cycles are required to load and store each sample. The following suggestions may improve performance:

- Either process more data at a time with R_IIRFA_Filter or only one sample at a time using R_IIRFA_SingleFilter
- Use the unrolled software loop option
    - Provide data in a multiple of the unroll depth
- Disable polling (see warning)

Polling Mode

By default, the driver will poll a status flag for completion after writing input data to IIRFA. Disabling polling significantly improves performance when using a low number of stages, but may cause higher global interrupt latency during processing.

Note

If only one stage is used it is recommended to disable polling as IIRFA will typically execute faster than code resulting in no wait cycles. If polling must be used with a one stage filter, please note that in some situations the Arm CMSIS DSP Library functions arm_biquad_cascade_df2T_init_f32 and arm_biquad_cascade_df2T_f32 may provide better performance. It up to the user to evaluate performance within their own project.

Warning

When polling is disabled, filter operation works by writing a value to IIRCHnINP then immediately reading IIRCHnOUT. While this maximizes performance, the core will wait for output data to become available before continuing execution. **While execution waits for IIRCHnOUT no interrupts will be processed by the core.** The maximum wait time for a 32-stage filter may be up to approximately 64 ICLK cycles for single sample processing or 224 ICLK cycles for multi-sample processing (decreasing linearly with the number of stages used).

Single Sample Processing

In applications such as motor control where each sample needs immediate processing, the inline function R_IIRFA_SingleFilter is provided. This function has no parameter checking, takes one sample, and returns a filtered sample. Polling is supported by this function (if configured).

ECC Errors

If configured, R_IIRFA_Filter will return an error if a 1- or 2-bit ECC error has occurred.

1-bit errors are automatically corrected unless writeback is disabled. 2-bit errors cannot be automatically corrected. Reset the coefficient and filter data by calling R_IIRFA_Configure if a non-correctable ECC error is reported.

Limitations

- A total of 32 stages may be configured at any one time across all channels.
- When polling is disabled core execution is halted while waiting for data to become available. (See warning)

Examples

Filter Configuration

Below is an example of how to initialize a filter configuration to pass to R_IIRFA_Configure.

```
#define FILTER_STAGE_NUM (2)
/* Biquad coefficients (4th order Butterworth 200Hz lowpass on 44.1KHz input) */
iir_filter_coeffs_t gp_iirfa0_filter_coeffs[FILTER_STAGE_NUM] =
{
    {
        .b0 = 1.000000000F,
        .b1 = 2.000000000F,
```

```
        .b2 = 1.000000000F,
        .a1 = -1.947914029F,
        .a2 = 0.948705125F,
    },
    {
        .b0 = 1.000000000F,
        .b1 = 2.000000000F,
        .b2 = 1.000000000F,
        .a1 = -1.977625722F,
        .a2 = 0.978428884F,
    },
};
/* Biquad state data (clear to start) */
iir_filter_state_t gp_iirfa0_filter_state[FILTER_STAGE_NUM] = {0};
/* Filter configuration */
iir_filter_cfg_t g_iirfa0_filter_cfg =
{
    .p_filter_coeffs = gp_iirfa0_filter_coeffs, // Pointer to filter coefficient
array
    .p_filter_state = gp_iirfa0_filter_state, // Pointer to filter state data array
    .stage_base      = 0,                     // Which hardware biquad stage to
start allocation from (0-31)
    .stage_num       = 2,                     // Number of stages to allocate
};
```

Software Example

The following is a basic example of configuring and using a filter with IIRFA.

```
#define NUM_SAMPLES (128)
#define TWO_PI (2.0F * (float) M_PI)
float gp_data_in[NUM_SAMPLES];
float gp_data_out[NUM_SAMPLES];
void iirfa_filter_example (void)
{
```

```
fsp_err_t err;
/* Initialize the IIRFA module */
   err = R_IIRFA_Open(&g_iirfa0_ctrl, &g_iirfa0_cfg);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
/* Initialize filter coefficients and state variables */
   err = R_IIRFA_Configure(&g_iirfa0_ctrl, &g_iirfa0_filter_cfg);
   assert(FSP_SUCCESS == err);
/* Get input data to be filtered */
   get_input_data(gp_data_in);
/* Filter data */
   err = R_IIRFA_Filter(&g_iirfa0_ctrl, gp_data_in, gp_data_out, NUM_SAMPLES);
/* R_IIRFA_Filter will return FSP_ERR_INVALID_RESULT when one or more calculations
results in infinity. */
if (FSP_ERR_INVALID_RESULT == err)
   {
/* Handle error */
   }
else
   {
     assert(FSP_SUCCESS == err);
   }
}
```

Data Structures

struct	iirfa_instance_ctrl_t

Data Structure Documentation

◆ iirfa_instance_ctrl_t

struct iirfa_instance_ctrl_t
IIRFA instance control block.

Function Documentation

◆ R_IIRFA_Open()

fsp_err_t R_IIRFA_Open (iir_ctrl_t *const *p_api_ctrl*, iir_cfg_t const *const *p_cfg*)

Prepare an IIR channel for filtering.

Return values

FSP_SUCCESS	The channel was successfully opened.
FSP_ERR_ASSERTION	One or both of the parameters was NULL.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	An invalid channel was selected.
FSP_ERR_ALREADY_OPEN	The instance is already opened.

◆ R_IIRFA_Filter()

fsp_err_t R_IIRFA_Filter (iir_ctrl_t *const *p_api_ctrl*, float const * *p_data_in*, float * *p_data_out*, uint16_t const *num_samples*)

Start a filter operation on the specified data.

Return values

FSP_SUCCESS	Data has been successfully filtered.
FSP_ERR_ASSERTION	One of the provided pointers is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.
FSP_ERR_INVALID_ARGUMENT	num_samples is zero.
FSP_ERR_INVALID_RESULT	The result of one or more calculations was +/- infinity.
FSP_ERR_NOT_INITIALIZED	The filter is not configured.
FSP_ERR_IIRFA_ECC_1BIT	A 1-bit ECC error was detected.
FSP_ERR_IIRFA_ECC_2BIT	A 2-bit ECC error was detected.

◆ R_IIRFA_Configure()

fsp_err_t R_IIRFA_Configure (iir_ctrl_t *const *p_api_ctrl*, iir_filter_cfg_t const *const *p_filter_cfg*)

Configure filter coefficients and state values.

Return values

FSP_SUCCESS	Configuration successful.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.
FSP_ERR_INVALID_ARGUMENT	Invalid filter stage selection.
FSP_ERR_IN_USE	One or more requested filter stages are currently in use.

◆ R_IIRFA_StatusGet()

fsp_err_t R_IIRFA_StatusGet (iir_ctrl_t *const *p_api_ctrl*, iir_status_t *const *p_status*)

Read the current filter state variables.

Return values

FSP_SUCCESS	Information read successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.

◆ R_IIRFA_Close()

fsp_err_t R_IIRFA_Close (iir_ctrl_t *const *p_api_ctrl*)

Stop filter operations and close the channel instance.

Return values

FSP_SUCCESS	The channel is successfully closed.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.

◆ R_IIRFA_SingleFilter()

__STATIC_INLINE float R_IIRFA_SingleFilter (iir_ctrl_t *const *p_api_ctrl*, float *data_in*)
Perform a single inline filter operation. ***Note*** *This function is intended to be used in performance-critical applications. As such, no parameter checking or error validation is provided.*

5.2.8 Graphics

Modules

Detailed Description

Graphics Modules.

Modules

	Azure RTOS GUIX Port (rm_guix_port)
	Capture Engine Unit (r_ceu) Driver for the CEU peripheral on RA MCUs. This module implements the CAPTURE Interface.
	D/AVE 2D Port Interface (r_drw) Driver for the DRW peripheral on RA MCUs. This module is a port of D/AVE 2D.
	Graphics LCD (r_glcdc) Driver for the GLCDC peripheral on RA MCUs. This module implements the Display Interface.
	JPEG Codec (r_jpeg) Driver for the JPEG peripheral on RA MCUs. This module implements the JPEG Codec Interface.
	MIPI Display Serial Interface (r_mipi_dsi) Driver for the MIPI DSI peripheral on RA MCUs. This module implements the Display Interface.

	Parallel Data Capture (r_pdc) Driver for the PDC peripheral on RA MCUs. This module implements the CAPTURE Interface.
	SEGGER emWin RA Port (rm_emwin_port) SEGGER emWin port for RA MCUs.
	Segment LCD (r_slcdc) Driver for the SLCDC peripheral on RA MCUs. This module implements the SLCDC Interface.

5.2.8.1 Azure RTOS GUIX Port (rm_guix_port)

Modules » Graphics

Functions

UINT	rm_guix_port_hw_initialize (GX_DISPLAY *p_display)

Detailed Description

Overview

The Azure RTOS GUIX Port module provides the configuration and hardware acceleration support necessary for use of GUIX on RA products. The port provides full integration with the graphics peripherals (GLCDC, DRW and JPEG).

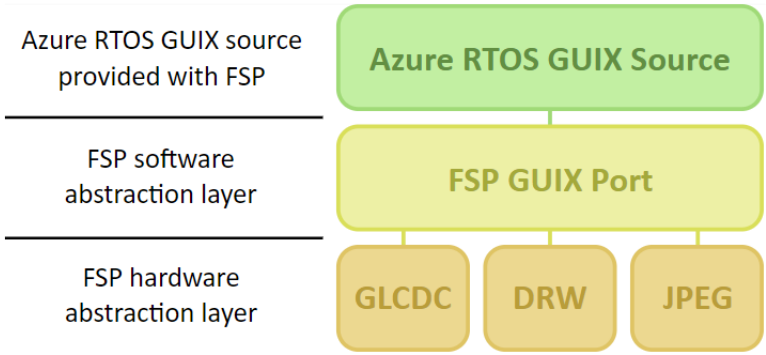

Figure 221: Azure RTOS GUIX Port Block Diagram

Note

This port layer primarily enables hardware acceleration and background handling of many display operations and does not contain code intended to be directly called by the user. For information about how to use GUIX and GUIX

Studio (including example code) please consult the Azure RTOS GUIX documentation.

Hardware Acceleration

The following functions are currently performed with hardware acceleration:

- DRW Engine (D/AVE 2D Port Interface (r_drw))
  - Drawing bitmaps
  - 8, 4 and 1bpp uncompressed and compressed (RLE) font rendering
  - Line and shape drawing
  - Anti-aliased operations
    - Circle stroke and fill
    - Polygon stroke and fill
    - Lines and arcs
- JPEG Codec (r_jpeg)
  - JPEG decoding
- Graphics LCD (r_glcdc)
  - Brightness, contrast and gamma correction
  - Pixel format conversion (framebuffer to LCD)

Configuration

Build Time Configurations for gx

The following build time configurations are defined in fsp_cfg/azure/gx/gx_user.h:

Configuration	Options	Default	Description
Hardware Acceleration			
JPEG Codec Support	MCU Specific Options		Select whether or not to use the JPEG Codec for hardware acceleration.
DRW Engine Support	• Enabled • Disabled	Enabled	Select whether or not to use the DRW Engine for hardware acceleration.
Max DRW Operations	Value must be a positive integer	30	Specifies the maximum number of DRW operations before flushing the display list. Reducing this value may reduce the peak heap used by the application but may reduce performance.
Internal Thread			
Stack Size	Value must be greater than zero	4096	GUIX internal thread stack size in bytes. Must be greater than zero.

Priority	Value must be between 0 to 31	30	Priority of the GUIX Internal Thread. The value must be between 0 to 31.
Time Slice	Value must be in range 0 to 0xFFFFFFFF	10	Time Slice value of the GUIX Internal Thread. The value must be between 0 (TX_NO_TIME_SLICE) to 0xFFFFFFFF.
System Timer (ms)	Value must be greater than or equal to 10	20	GUIX system timer period (GX_SYSTEM_TIMER_MS). This value will be internally converted to RTOS ticks and will be rounded down to the next smallest multiple of the RTOS tick period (1000 / TX_TIMER_TICKS_PER_SECOND).
Multithread Support	• Disabled • Enabled	Enabled	Must be enabled if GUIX functions are called from multiple threads. Set to Disabled when calling GUIX from only one thread to reduce system overhead.
UTF8 Support	• Disabled • Enabled	Enabled	Select whether to enable or disable support for UTF8 characters.
Event Queue Size	Value must be greater than zero	48	Maximum number of events in the GUIX event queue.
Enable GX_WIDGET User Data	• Enabled • Disabled	Disabled	Set to Enabled to to use the gx_widget_user_data member in the GX_WIDGET structure.

Build Time Configurations for rm_guix_port

The following build time configurations are defined in fsp_cfg/middleware/rm_guix_port_cfg.h:

Configuration	Options	Default	Description
DRW Buffer Cache	• Enabled • Disabled	Enabled	Enabling this option significantly improves DRW Engine

			performance. Set to Disabled only if Display underflow events are triggered under high graphics load.

Configurations for Graphics > Azure RTOS GUIX Port (rm_guix_port)

Configuration	Options	Default	Description
Display Rotation			
Screen Orientation	• None • CW (90 degrees) • FLIP (180 degrees) • CCW (270 degrees)	None	Select the display orientation specified in the GUIX Studio project. The Canvas Buffer must be enabled when rotating 180 degrees (FLIP).
Use Canvas Buffer	• Enabled • Disabled	Disabled	When screen rotation is set to 180 degrees (FLIP), a canvas buffer must be used. The canvas buffer size will be the same as a frame buffer for the display module.
Canvas Buffer Memory Section	This property must be a valid section name	bss	Specify the memory section where the GUIX Canvas Buffer will be allocated.
JPEG Decoding			
Work Buffer Size	Must be a positive integer greater than 0	0xC800	Specify the JPEG work buffer size in bytes. A larger buffer can reduce JPEG decode/draw times. The buffer will not be allocated if JPEG Codec support is disabled. Unless you are sure of the subsampling used in and the size of the input JPEG images it is recommended to allocate at least 16 framebuffer lines of memory.
Buffer Memory Section	This property must be a valid section name	bss	Specify the memory section where the JPEG Work Buffer will be allocated.

Name	Name must be a valid C symbol	g_rm_guix_port0	Module name.
Target Display Layer	• Graphics Layer 1 • Graphics Layer 2	Graphics Layer 1	Specify which graphics screen to inherit the buffer and display dimensions from.
Callback Function	Must be a valid C symbol	NULL	If a callback function is provided it will be called when Display events occur.

Hardware Configuration

No clocks or pins are directly required by this module. Please consult the submodules' documentation for their requirements.

Usage Notes

Getting Started

To get started with GUIX in an RA project the following must be performed:

1. In e² studio, open the RA Configuration editor for your GUIX project
2. Select or create a thread
3. Add GUIX to your project in the Stacks view by clicking **New Stack -> Azure RTOS -> GUIX**
4. Ensure the configuration options for GUIX and the port layer are set as necessary for your application
5. Set the proporties for the GLCDC module to match the timing and memory requirements of your display panel
6. Set the input color format in the GLCDC module (Input -> Graphics Layer * -> General -> Color format) and the output color format in the JPEG Codec module if applicable (Decode -> Output color format) per your project specification
7. Click the BSP tab in the configuration editor and confirm the heap size in the Properties pane is sufficient (see Note below)
8. Click Generate Project Content to save and commit configuration changes
9. Drop the Quick Setup entry in Developer Assistance into the desired thread entry C file and update the items marked with TODO as necessary
10. Call the Quick Setup function from the thread entry function (or where desired)

At this point the project is now ready to build and run your GUIX Studio project. Please refer to the documentation for Azure RTOS GUIX and GUIX Studio for details on how to create and edit a GUI application.

Note

It is recommended to start with 8K-32K of heap to begin development. Actual heap use is typically far lower than this but must be characterized by the developer.

Using Hardware Acceleration

In most cases there is no need to perform additional configuration to ensure the DRW Engine is used. However, there are some guidelines that should be followed:

- Avoid transparent pixelmaps in 8-bit display mode as they are rendered in software. In particular, ensure PNGs to be used in 8bpp GUIX Studio projects are saved without transparency data if no transparency is needed.
- The following items may require a large heap to draw successfully:
  - Polygons (more sides = more heap)
  - Filled arcs and ellipses (more framebuffer lines occupied = more heap)
  - gx_canvas_pixelmap_tile (more tiles = more heap)
- When using hardware acceleration, images used for tile fill of shapes must have dimensions that are a power of 2. This limitation does not apply to gx_canvas_pixelmap_tile as well as certain arc/ellipse fill functions as GUIX manually draws pixelmaps to fill these shapes (at the expense of heap space).

Examples

Basic Example

This is a basic example demonstrating how to get GUIX up and running given an existing GUIX Studio project. A template for this code is available in Developer Assistance for the GUIX Port module.

Note

GUIX manages the GLCDC, DRW and JPEG Codec submodules internally; they do not need to be opened directly.

```
GX_WINDOW_ROOT * p_window_root;
void guix_user_start (void)
{
 /* Initialize GUIX */
    gx_system_initialize();
 /* Configure GUIX Studio project main display and get a pointer to the root window
*/
    gx_studio_display_configure(MAIN_DISPLAY,
 rm_guix_port_hw_initialize,
                                MAIN_DISPLAY_LANGUAGE_ENGLISH,
                                MAIN_DISPLAY_THEME,
                                &p_window_root);
 /* Set pointer to the first buffer generated by the configuration
(rm_guix_port_canvas) */
    gx_canvas_memory_define(p_window_root->gx_window_root_canvas,
                            rm_guix_port_canvas,

p_window_root->gx_window_root_canvas->gx_canvas_memory_size);
 /* Create and show the root window in the GUIX Studio project */
```

```
    gx_studio_named_widget_create("root_widget_name", (GX_WIDGET *) p_window_root,
GX_NULL);
    gx_widget_show(p_window_root);
 /* Start GUIX */
    gx_system_start();
 /* GUIX will continue to run in its own thread */
}
```

Data Structures

struct	rm_guix_port_callback_args_t

Enumerations

enum	rm_guix_port_device_t
enum	rm_guix_port_event_t

Data Structure Documentation

◆ rm_guix_port_callback_args_t

struct rm_guix_port_callback_args_t		
Callback arguments for the FSP GUIX Port		
Data Fields		
rm_guix_port_device_t	device	Device code.
rm_guix_port_event_t	event	Event code of the low level hardware.
uint32_t	error	Error code if RM_GUIX_PORT_EVENT_ERROR.

Enumeration Type Documentation

◆ rm_guix_port_device_t

enum rm_guix_port_device_t	
Low level device code for the GUIX	
Enumerator	
RM_GUIX_PORT_DEVICE_NONE	Non hardware.
RM_GUIX_PORT_DEVICE_DISPLAY	Display device.
RM_GUIX_PORT_DEVICE_DRW	2D Graphics Engine
RM_GUIX_PORT_DEVICE_JPEG	JPEG Codec.

◆ rm_guix_port_event_t

enum rm_guix_port_event_t	
Display event codes	
Enumerator	
RM_GUIX_PORT_EVENT_ERROR	Low level driver error occurs.
RM_GUIX_PORT_EVENT_DISPLAY_VSYNC	Display interface VSYNC.
RM_GUIX_PORT_EVENT_UNDERFLOW	Display interface underflow.

Function Documentation

◆ rm_guix_port_hw_initialize()

UINT rm_guix_port_hw_initialize (GX_DISPLAY * *p_display*)

Callback function to be passed to gx_studio_display_configure in order to start hardware modules.

Example:

```
 /* Configure GUIX Studio project main display and get a pointer to the root window
*/
    gx_studio_display_configure(MAIN_DISPLAY,
 rm_guix_port_hw_initialize,
                                MAIN_DISPLAY_LANGUAGE_ENGLISH,
                                MAIN_DISPLAY_THEME,
                                &p_window_root);
```

Note

This function should only be called by GUIX.

Return values

GX_SUCCESS	Device driver setup is successfully done.
GX_FAILURE	Device driver setup failed.

5.2.8.2 Capture Engine Unit (r_ceu)

Modules » Graphics

Functions

fsp_err_t	R_CEU_Open (capture_ctrl_t *const p_ctrl, capture_cfg_t const *const p_cfg)
fsp_err_t	R_CEU_Close (capture_ctrl_t *const p_ctrl)
fsp_err_t	R_CEU_CaptureStart (capture_ctrl_t *const p_ctrl, uint8_t *const p_buffer)
fsp_err_t	R_CEU_CallbackSet (capture_ctrl_t *const p_ctrl, void(*p_callback)(capture_callback_args_t *), void const *const p_context, capture_callback_args_t *const p_callback_memory)
fsp_err_t	R_CEU_StatusGet (capture_ctrl_t *const p_ctrl, capture_status_t *p_status)

Detailed Description

Driver for the CEU peripheral on RA MCUs. This module implements the CAPTURE Interface.

Overview

The CEU peripheral supports interfacing with external cameras by accepting timing and data signals in order to capture incoming data. A callback is invoked for each V-Sync event, frame of data accepted, or when certain errors occurr.

Features

- Supports 8 or 16-bit camera bus
- Capture images up to 5 MP (2560x1920)
- Capture incoming data directly into a user defined memory location without the need for DTC/DMAC
- Capture specified size 'raw' image data using Data Synchronous Fetch mode (e.g. RGB565, YUV422, etc.)
- Capture binary image data using Data Enable fetch mode (e.g. JPEG)
- Perform basic timing signal validation

Configuration

Build Time Configurations for r_ceu

The following build time configurations are defined in fsp_cfg/r_ceu_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Graphics > Capture Engine Unit (r_ceu)

This module can be added to the Stacks tab via New Stack > Graphics > Capture Engine Unit (r_ceu). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_ceu0	Module name.
Input			
Input > Data Bus Specifications			
Data Bus Size	• 8-bit • 16-bit	8-bit	Data bus-width of CEU physical connection.
HSYNC Polarity	• High • Low	High	Specify the active polarity of the HSYNC signal.
VSYNC Polarity	• High	High	Specify the active

	• Low		polarity of the VSYNC signal.
Input > Capture Specifications			
Input > Capture Specifications > Sample Points			
Data Sample Point	• Rising edge of the camera clock • Falling edge of the camera clock	Rising edge of the camera clock	Specify the external camera clock transition state for fetching the image data (D15 to D0) from the external module.
H-Sync Sample Point	• Rising edge of the camera clock • Falling edge of the camera clock	Rising edge of the camera clock	Specify the external camera clock transition state for capturing H-Sync from the external module.
V-Sync Sample Point	• Rising edge of the camera clock • Falling edge of the camera clock	Rising edge of the camera clock	Specify the external camera clock transition state for capturing V-Sync from the external module.
Horizontal capture resolution	Value must be an integer.	640	Specify the number of horizontal pixels to capture.
Vertical capture resolution	Value must be an integer.	480	Specify the number of vertical pixels to capture.
Horizontal pixel offset	Value must be an integer.	0	Number of pixels from H-sync signal up to the start of a valid data period.
Vertical pixel offset	Value must be an integer.	0	Specify the vertical line to start capturing image data.
Capture Mode	• Data Synchronous Fetch • Data Enable Fetch	Data Synchronous Fetch	Capture mode of incoming data.
Output			
Output > Buffer			
Data Enable Buffer Size	Value must be a positive integer.	0	Specify size of image region available for use by CEU data bus. (Only applicable to Data Enable Fetch capture

			mode)
Byte Swapping	• Swap 8-bit units • Swap 16-bit units • Swap 32-bit units		Byte swapping configuration. Bytes may be swapped in 8-bit, 16-bit, or 32-bit units.
Burst Transfer Mode	• Transfer in 32-byte units • Transfer in 64-byte units • Transfer in 128-byte units • Transfer in 256-byte units	Transfer in 256-byte units	Specify the unit for transferring data to the bus bridge module.
Interrupts			
Interrupts > Selectable CEU Events			
One-Frame Capture End Event	• Enabled • Disabled	Enabled	Capturing one frame from an external module has finished.
Horizontal Sync Event	• Enabled • Disabled	Disabled	Horizontal sync signal was input from an external module.
Vertical Sync Event	• Enabled • Disabled	Enabled	Vertical sync signal was input from an external module.
CRAM Buffer Overflow Error	• Enabled • Disabled	Enabled	Data overflowed in the CRAM write buffer.
H-Sync Validation Error	• Enabled • Disabled	Disabled	The number of configured H-sync cycles is different than the H-sync cycles input from the external module.
V-Sync Validation Error	• Enabled • Disabled	Disabled	The number of configured V-sync cycles is different than the V-sync cycles input from the external module.
V-Sync Error	• Enabled • Disabled	Enabled	V-sync has been input while CEU holds data (insufficient vertical-sync front porch).
No H-Sync error	• Enabled • Disabled	Enabled	No H-sync signal was input.
No V-Sync error	• Enabled • Disabled	Enabled	No V-sync signal was input.

Callback	Name must be a valid C symbol.	g_ceu0_user_callback	A user callback function must be provided. This callback is invoked for every successful frame capture as well as other status or error conditions.
Callback Context	Name must be a valid C symbol.	NULL	Pointer to the context structure to be passed through the callback argument.
CEU Interrupt Priority	MCU Specific Options		Select the CEU interrupt priority.

Clock Configuration

The CEU peripheral is clocked both from PCLKA and externally, from the camera module (VIO_CLK). The external input clock (VIO_CLK) should have a frequency at most the same as the CEU operating clock (PCLKA) frequency, with jitter on both sides included. The PCLKA frequency may be set using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Note

At least 10 external clock cycles (VIO_CLK) must elapse after opening the CEU module, before starting a capture.

Pin Configuration

The VIO_CLK pin is a clock input to the MCU and should be connected to the clock output from the camera. The VIO_HD and VIO_VD pins must be connected to the horizontal and vertical sync signal output of the camera respectively. The VIO_D0 to VIO_D15 pins are the data bus input pins and should be connected to the relevant output pins of the camera. For 8-bit camera data bus VIO_D0 to VIO_D7 should be used.

Note

Camera control and serial communication pins must be configured separately and are not controlled by this module.

Capture Resolution

- For Data Synchronous Fetch mode, caputure size is calculated using the configured Horizontal Resolution, Vertical Resolution, and Bytes Per Pixel.
- For Data Enable Fetch mode, the capture size is controlled by the external module and is defined as a period from a VD rising edge to the VD falling edge. For this mode Horizontal Resolution and Vertical Resolution are not used. However, the maximum capture size is configured using the 'Data Enable Buffer Size' option, which is uesd to configure the maximum write 'Firewall Address' location.

Note

For Data Enable Fetch mode, the external module must transmit data in 4-byte units.

Capture Offset

The blanking period from a horizontal or vertical sync signal differs among external modules. Therefore, the capture start location must be specified in terms of external cycles from the sync

signal so that an image can be captured from the valid image area. Some external modules output a horizontal sync signal as a data enable signal. In this case, there is no blanking period so the configured offsets must be cleared to 0.

- The horizontal capture start location must be specified in terms of the number of pixels from a hoizontal sync signal.
- The vertical capture start location must be specified in terms of the number of H-cycles from a vertical sync signal.

Note

Capture offset is not used when Data Enable Fetch mode is configured.

Usage Notes

Interrupt Configuration

- CEU V-sync, capture-end, and error interrupts are used by this module for reporting capture status and error events such as overrun, vertical line number setting and other capture errors.

Note

If both a capture complete event and capture error event occur simultaneously, the capture complete event should be disregarded.

CEU Setup With External Camera

- Ensure that the memory pointed to by p_buffer is both valid and large enough to store a complete image.
- When Data Synchronous Fetch mode is configured, the amount of space required (in bytes) may be calculated as size (bytes) = image width (pixels) * image height (lines) * number of bytes per pixel.
- Ensure that the capture buffer address is 4-byte aligned and the buffer size is divisible by 32 bytes.

Note

Any required configuration for external cameras must be performed by the application.

Examples

Basic Example

This is a basic example of minimal use of the CEU in an application. This example shows how this driver can be used for capturing data from an external I/O device such as an image sensor.

```
bool g_ceu_capture_error;
bool g_ceu_capture_complete;
void ceu_minimal_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    g_ceu_capture_error    = false;
```

```
    g_ceu_capture_complete = false;
    err = R_CEU_Open(&g_ceu0_ctrl, &g_ceu0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_CEU_CaptureStart(&g_ceu0_ctrl, g_user_buffer);
    assert(FSP_SUCCESS == err);
 while (!g_ceu_capture_complete && !g_ceu_capture_error)
    {
 /* Wait for capture to complete. */
    }
/* Process image here if capture was successful. */
    err = R_CEU_Close(&g_ceu0_ctrl);
    assert(FSP_SUCCESS == err);
}
void ceu_callback (capture_callback_args_t * p_args)
{
 /* Multiple event flags may be set simultaneously */
 if (p_args->event & (uint32_t) ~(CEU_EVENT_HD | CEU_EVENT_VD | CEU_EVENT_FRAME_END))
    {
 /* Error processing should occur first. Application should not process complete
event if error occurred. */
       g_ceu_capture_error = true;
    }
 else
    {
 if (p_args->event & CEU_EVENT_VD)
      {
 /* Capture has started. Process V-Sync event. */
      }
 if (p_args->event & CEU_EVENT_FRAME_END)
      {
 /* Capture is complete and no error has occurred */
            g_ceu_capture_complete = true;
      }
    }
```

```
}
```

Data Structures

struct	ceu_byte_swapping_t
struct	ceu_edge_info_t
struct	ceu_extended_cfg_t
struct	ceu_instance_ctrl_t

Enumerations

enum	ceu_capture_mode_t
enum	ceu_data_bus_size_t
enum	ceu_hsync_polarity_t
enum	ceu_vsync_polarity_t
enum	ceu_burst_transfer_mode_t
enum	ceu_event_t
enum	ceu_capture_format_t

Data Structure Documentation

◆ ceu_byte_swapping_t

struct ceu_byte_swapping_t		
Swap bits configuration		
Data Fields		
uint8_t	swap_8bit_units: 1	Byte swapping in 8-bit units.
uint8_t	swap_16bit_units: 1	Byte swapping in 16-bit units.
uint8_t	swap_32bit_units: 1	Byte swapping in 32-bit units.

◆ ceu_edge_info_t

struct ceu_edge_info_t		
Edge information for latching signals		
Data Fields		
uint8_t	dsel: 1	Sets the edge for fetching the image data (D15 to D0) from an external module.

uint8_t	hdsel: 1	Sets the edge for capturing hd from external module.
uint8_t	vdsel: 1	Sets the edge for capturing vd from external module.

◆ ceu_extended_cfg_t

struct ceu_extended_cfg_t		
Extended configuration structure for CEU.		
Data Fields		
ceu_capture_format_t	capture_format	Capture format for incoming data.
ceu_data_bus_size_t	data_bus_width	Size of camera data bus.
ceu_edge_info_t	edge_info	
ceu_hsync_polarity_t	hsync_polarity	Polarity of HSYNC input.
ceu_vsync_polarity_t	vsync_polarity	Polarity of VSYNC input.
uint32_t	image_area_size	Image capture size. Used when setting firewall address for Data Enable Fetch mode.
ceu_byte_swapping_t	byte_swapping	Controls byte swapping in 8-bit, 16-bit and 32-bit units.
ceu_burst_transfer_mode_t	burst_mode	Bus transfer data size.
uint32_t	interrupts_enabled	Enabled interrupt events bit mask.
uint8_t	ceu_ipl	PDC interrupt priority.
IRQn_Type	ceu_irq	PDC IRQ number.

◆ ceu_instance_ctrl_t

struct ceu_instance_ctrl_t
CEU instance control block. DO NOT INITIALIZE.

Enumeration Type Documentation

◆ ceu_capture_mode_t

enum ceu_capture_mode_t	
Capture mode	
Enumerator	
CEU_CAPTURE_MODE_SINGLE	Single image capture.
CEU_CAPTURE_MODE_CONTINUOUS	Continuous image capture.

◆ ceu_data_bus_size_t

enum ceu_data_bus_size_t	
Data bus width	
Enumerator	
CEU_DATA_BUS_SIZE_8_BIT	Data bus is 8-bit.
CEU_DATA_BUS_SIZE_16_BIT	Data bus is 16-bit.

◆ ceu_hsync_polarity_t

enum ceu_hsync_polarity_t	
Polarity of input HSYNC signal	
Enumerator	
CEU_HSYNC_POLARITY_HIGH	HSYNC signal is active high.
CEU_HSYNC_POLARITY_LOW	HSYNC signal is active low.

◆ ceu_vsync_polarity_t

enum ceu_vsync_polarity_t	
Polarity of input VSYNC signal	
Enumerator	
CEU_VSYNC_POLARITY_HIGH	VSYNC signal is active high.
CEU_VSYNC_POLARITY_LOW	VSYNC signal is active low.

◆ ceu_burst_transfer_mode_t

enum ceu_burst_transfer_mode_t	
Enumerator	
CEU_BURST_TRANSFER_MODE_X1	Transferred to the bus in 32-byte units */.
CEU_BURST_TRANSFER_MODE_X2	Transferred to the bus in 64-byte units */.
CEU_BURST_TRANSFER_MODE_X4	Transferred to the bus in 128-byte units */.
CEU_BURST_TRANSFER_MODE_X8	Transferred to the bus in 256-byte units */.

◆ ceu_event_t

enum ceu_event_t	
Enumerator	
CEU_EVENT_FRAME_END	Frame end event (CPE)
CEU_EVENT_HD	(Not Used) HD received (HD)
CEU_EVENT_VD	VD received (VD)
CEU_EVENT_CRAM_OVERFLOW	Data overflowed in the CRAM buffer (CDTOF)
CEU_EVENT_HD_MISMATCH	HD mismatch (IGHS)
CEU_EVENT_VD_MISMATCH	VD mismatch (IGVS)
CEU_EVENT_VD_ERROR	Invalid VD condition (VBP)
CEU_EVENT_FIREWALL	Data write address exceeds firewall (FWF)
CEU_EVENT_HD_MISSING	HD was expected but not input (NHD)
CEU_EVENT_VD_MISSING	VD was expected but not input (NVD)

◆ ceu_capture_format_t

enum ceu_capture_format_t	
Capture mode for CEU.	
Enumerator	
CEU_CAPTURE_FORMAT_DATA_SYNCHRONOUS	Raw formatted data.
CEU_CAPTURE_FORMAT_DATA_ENABLE	JPG formatted data.

Function Documentation

◆ R_CEU_Open()

fsp_err_t R_CEU_Open (capture_ctrl_t *const *p_ctrl*, capture_cfg_t const *const *p_cfg*)

CEU module initialization.

Implements capture_api_t::open

The function provides initial configuration for the CEU module. Further initialization may be performed in capture_api_t::captureStart. This function should be called once prior to calling any other CEU API functions. After the CEU is opened the Open function should not be called again without first calling the Close function.

Example:

```
err = R_CEU_Open(&g_ceu0_ctrl, &g_ceu0_cfg);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	One or more parameters is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ R_CEU_Close()

fsp_err_t R_CEU_Close (capture_ctrl_t *const *p_ctrl*)

Stops and closes the transfer interface.

Implements capture_api_t::close

Stops any active captures, clears internal driver state-data, disables interrupts, and powers off the CEU peripheral.

Example:

```
err = R_CEU_Close(&g_ceu0_ctrl);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	One or more parameters is NULL.
FSP_ERR_NOT_OPEN	Open has not been successfully called.

◆ R_CEU_CaptureStart()

fsp_err_t R_CEU_CaptureStart (capture_ctrl_t *const *p_ctrl*, uint8_t *const *p_buffer*)

Starts a capture.

Implements capture_api_t::captureStart.

Sets up the interface to transfer data from the CEU into the specifiec buffer. Configures the CEU settings as previously set by the capture_api_t::open API. When a capture is complete the callback registered during capture_api_t::open API call or by capture_api_t::callbackSet API will be called.

Example:

```
err = R_CEU_CaptureStart(&g_ceu0_ctrl, g_user_buffer);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	One or more parameters is NULL.
FSP_ERR_NOT_OPEN	Open has not been successfully called.
FSP_ERR_INVALID_ADDRESS	Invalid buffer address alignment.
FSP_ERR_IN_USE	CEU is already in use.
FSP_ERR_NOT_INITIALIZED	Callback function has not been set

◆ R_CEU_CallbackSet()

fsp_err_t R_CEU_CallbackSet (capture_ctrl_t *const *p_ctrl*, void(*)(capture_callback_args_t *) *p_callback*, void const *const *p_context*, capture_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure.

Implements capture_api_t::callbackSet.

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	One or more parameters is NULL.
FSP_ERR_NOT_OPEN	Open has not been successfully called.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_CEU_StatusGet()

fsp_err_t R_CEU_StatusGet (capture_ctrl_t *const *p_ctrl*, capture_status_t * *p_status*)

Provides the ceu operating status.

Implements capture_api_t::statusGet.

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	One or more parameters is NULL.
FSP_ERR_NOT_OPEN	Open has not been successfully called.

5.2.8.3 D/AVE 2D Port Interface (r_drw)

Modules » Graphics

Driver for the DRW peripheral on RA MCUs. This module is a port of D/AVE 2D.

Overview

Note

The D/AVE 2D Port Interface (D1 layer) is a HAL layer for the D/AVE D2 layer API and does not provide any interfaces to the user. Consult the TES Dave2D Driver Documentation for further information on using the D2 API.

For cross-platform compatibility purposes the D1 and D2 APIs are not bound by FSP coding guidelines for function names and general module functionality.

Configuration

Build Time Configurations for r_drw

The following build time configurations are defined in fsp_cfg/r_drw_cfg.h:

Configuration	Options	Default	Description
Allow Indirect Mode	• Enabled • Disabled	Enabled	Enable indirect mode to allow no-copy mode for d2_adddlist (see the TES Dave2D Driver Documentation for details).
Memory Allocation	• Default • Custom	Default	Set Memory Allocation to Default to use built-in dynamic memory allocation for the D2 heap. This will use an RTOS heap if configured; otherwise, standard C malloc and free will be used. Set to Custom to define your own allocation scheme for the D2 heap. In this case, the developer will need to define the following functions: void * d1_malloc(size_t size) void d1_free(void * ptr)

Configurations for Graphics > D/AVE 2D Port Interface (r_drw)

This module can be added to the Stacks tab via New Stack > Graphics > D/AVE 2D Port Interface (r_drw).

Configuration	Options	Default	Description
D2 Device Handle Name	Name must be a valid C symbol	d2_handle0	Set the name for the d2_device handle used when calling D2 layer functions.
DRW Interrupt Priority	MCU Specific Options		Select the DRW_INT (display list

completion) interrupt priority.

Heap Size

The D1 port layer allows the D2 driver to allocate memory as needed. There are three ways the driver can accomplish this:

1. Allocate memory using the main heap
2. Allocate memory using a heap provided by an RTOS
3. Allocate memory via user-provided functions

When the "Memory Allocation" configuration option is set to "Default" the driver will use an RTOS implementation if available and the main heap otherwise. Setting the option to "Custom" allows the user to define their own scheme using the following prototypes:

```
void * d1_malloc(size_t size);

void d1_free(void * ptr);
```

Warning

If there is no RTOS-based allocation scheme the main heap will be used. Be sure that it is enabled by setting the "Heap size (bytes)" property under RA Common on the **BSP** tab of the RA Configuration editor.

Note

It is recommended to add 32KB of additional heap space for the D2 driver until the actual usage can be determined in your application.

Interrupt

The D1 port includes one interrupt to handle various events like display list completion or bus error. This interrupt is managed internally by the D2 driver and no callback function is available.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the DRW engine:

- The DRW module supports two additional interrupt types - bus error and render complete. These interrupts are not needed for D2 layer operation and thus are not supported.
- If the DRW module is stopped during rendering the render will continue once the module is started again. If this behavior is undesirable in your application it is recommended to call d2_flushframe before stopping the peripheral.

5.2.8.4 Graphics LCD (r_glcdc)

Modules » Graphics

Functions

fsp_err_t	R_GLCDC_Open (display_ctrl_t *const p_api_ctrl, display_cfg_t const *const p_cfg)
fsp_err_t	R_GLCDC_Close (display_ctrl_t *const p_api_ctrl)
fsp_err_t	R_GLCDC_Start (display_ctrl_t *const p_api_ctrl)
fsp_err_t	R_GLCDC_Stop (display_ctrl_t *const p_api_ctrl)
fsp_err_t	R_GLCDC_LayerChange (display_ctrl_t const *const p_api_ctrl, display_runtime_cfg_t const *const p_cfg, display_frame_layer_t layer)
fsp_err_t	R_GLCDC_BufferChange (display_ctrl_t const *const p_api_ctrl, uint8_t *const framebuffer, display_frame_layer_t layer)
fsp_err_t	R_GLCDC_ColorCorrection (display_ctrl_t const *const p_api_ctrl, display_correction_t const *const p_correction)
fsp_err_t	R_GLCDC_ClutUpdate (display_ctrl_t const *const p_api_ctrl, display_clut_cfg_t const *const p_clut_cfg, display_frame_layer_t layer)
fsp_err_t	R_GLCDC_ClutEdit (display_ctrl_t const *const p_api_ctrl, display_frame_layer_t layer, uint8_t index, uint32_t color)
fsp_err_t	R_GLCDC_ColorKeySet (display_ctrl_t const *const p_api_ctrl, display_colorkeying_layer_t key_cfg, display_frame_layer_t layer)
fsp_err_t	R_GLCDC_StatusGet (display_ctrl_t const *const p_api_ctrl, display_status_t *const p_status)

Detailed Description

Driver for the GLCDC peripheral on RA MCUs. This module implements the Display Interface.

Overview

The GLCDC is a multi-stage graphics output peripheral designed to automatically generate timing and data signals for LCD panels. As part of its internal pipeline the two internal graphics layers can be repositioned, alpha blended, color corrected, dithered and converted to and from a wide variety of pixel formats.

Features

The following features are available:

Feature	Options
Input color formats	ARGB8888, ARGB4444, ARGB1555, RGB888 (32-bit), RGB565, CLUT 8bpp, CLUT 4bpp, CLUT 1bpp
Output color formats	RGB888, RGB666, RGB565, Serial RGB888 (8-bit parallel)
Correction processes	Alpha blending, positioning, brightness and contrast, gamma correction, dithering
Timing signals	Dot clock, Vsync, Hsync, Vertical and horizontal data enable (DE)
Maximum resolution	Up to 2038 x 2043 pixels (dependent on sync signal width)
Maximum dot clock	60MHz for serial RGB mode, 54MHz otherwise
Internal clock divisors	1-9, 12, 16, 24, 32
Interrupts	Line detect (Vblank), Layer 1 underflow, Layer 2 underflow
Other functions	Byte-order and endianness control, line repeat function

Configuration

Build Time Configurations for r_glcdc

The following build time configurations are defined in fsp_cfg/r_glcdc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected, code for parameter checking is included in the build.
Color Correction	• On • Off	Off	If selected, code to adjust brightness, contrast and gamma settings is included in the build. When disabled all color correction configuration options are ignored.

Configurations for Graphics > Graphics LCD (r_glcdc)

This module can be added to the Stacks tab via New Stack > Graphics > Graphics LCD (r_glcdc).

Configuration	Options	Default	Description
General			

Name	Name must be a valid C symbol	g_display0	Module name.
Interrupts			
Callback Function	Name must be a valid C symbol	NULL	A user callback function can be defined here.
Line Detect Interrupt Priority	MCU Specific Options		Select the line detect (Vsync) interrupt priority.
Underflow 1 Interrupt Priority	MCU Specific Options		Select the underflow interrupt priority for layer 1.
Underflow 2 Interrupt Priority	MCU Specific Options		Select the underflow interrupt priority for layer 2.
Input			
Input > Graphics Layer 1			
Input > Graphics Layer 1 > General			
Enabled	• Yes • No	Yes	Specify Used if the graphics layer 1 is used. If so a framebuffer will be automatically generated based on the specified height and horizontal stride.
Horizontal size	Value must be an integer from 16 to 2040	480	Specify the number of horizontal pixels.
Vertical size	Value must be an integer from 16 to 2043	854	Specify the number of vertical pixels.
Horizontal position	Must be a valid non-negative integer with a maximum configurable value of 4091	0	Specify the horizontal offset in pixels of the graphics layer from the background layer.
Vertical position	Must be a valid non-negative integer with a maximum configurable value of 4094	0	Specify the vertical offset in pixels of the graphics layer from the background layer.
Color format	• ARGB8888 (32-bit) • RGB888 (32-bit) • RGB565 (16-bit) • ARGB1555 (16-bit)	RGB565 (16-bit)	Specify the graphics layer Input format. If selecting CLUT formats, you must write the CLUT table data before starting output.

	• ARGB4444 (16-bit) • CLUT8 (8-bit) • CLUT4 (4-bit) • CLUT1 (1-bit)		
Line descending mode	• Enabled • Disabled	Disabled	Select Used if the framebuffer starts from the bottom of the line.
Input > Graphics Layer 1 > Framebuffer			
Framebuffer name	This property must be a valid C symbol	fb_background	Specify the name for the framebuffer for Layer 1.
Number of framebuffers	Must be a valid non-negative integer	2	Number of framebuffers allocated for Graphics Layer 1.
Section for framebuffer allocation	Manual Entry	.sdram	Specify the section in which to allocate the framebuffer. When Arm Compiler 6 is used to place this memory in on-chip SRAM, the section name must be .bss or start with .bss. to avoid consuming unnecessary ROM space.
Input > Graphics Layer 1 > Line Repeat			
Enable	• On • Off	Off	Select On if the display will be repeated from a smaller section of the framebuffer.
Repeat count	Must be a valid non-negative integer with a maximum configurable value of 65535 i.e (vertical size) x (lines repeat times) must be equal to the panel vertical size	0	Specify the number of times the image is repeated.
Input > Graphics Layer 1 > Fading			
Mode	• None • Fade-in • Fade-out	None	Select the fade method.
Speed	Value must be an integer from 0 to 255	0	Specify the number of frames for the fading transition to complete.
Input > Graphics Layer 2			

Input > Graphics Layer 2 > General

Enabled	• Yes • No	No	Specify Used if the graphics layer 2 is used. If so a framebuffer will be automatically generated based on the specified height and horizontal stride.
Horizontal size	Value must be be an integer from 16 to 2040	480	Specify the number of horizontal pixels.
Vertical size	Value must be be an integer from 16 to 2043	854	Specify the number of vertical pixels.
Horizontal position	Must be a valid non-negative integer with a maximum configurable value of 4091	0	Specify the horizontal offset in pixels of the graphics layer from the background layer.
Vertical position	Must be a valid non-negative integer with a maximum configurable value of 4094	0	Specify the vertical offset in pixels of the graphics layer from the background layer.
Color format	• ARGB8888 (32-bit) • RGB888 (32-bit) • RGB565 (16-bit) • ARGB1555 (16-bit) • ARGB4444 (16-bit) • CLUT8 (8-bit) • CLUT4 (4-bit) • CLUT1 (1-bit)	RGB565 (16-bit)	Specify the graphics layer Input format. If selecting CLUT formats, you must write the CLUT table data before starting output.
Line descending mode	• Enabled • Disabled	Disabled	Select Used if the framebuffer starts from the bottom of the line.

Input > Graphics Layer 2 > Framebuffer

Framebuffer name	This property must be a valid C symbol	fb_foreground	Specify the name for the framebuffer for Layer 2.
Number of framebuffers	Must be a valid non-negative integer	2	Number of framebuffers allocated for Graphics Layer 2.
Section for framebuffer allocation	Manual Entry	.sdram	Specify the section in which to allocate the framebuffer. When Arm Compiler 6 is used to

			place this memory in on-chip SRAM, the section name must be .bss or start with .bss. to avoid consuming unnecessary ROM space.
Input > Graphics Layer 2 > Line Repeat			
Enable	• On • Off	Off	Select On if the display will be repeated from a smaller section of the framebuffer.
Repeat count	Must be a valid non-negative integer with a maximum configurable value of 65535 i.e (vertical size) x (lines repeat times) must be equal to the panel vertical size	0	Specify the number of times the image is repeated.
Input > Graphics Layer 2 > Fading			
Mode	• None • Fade-in • Fade-out	None	Select the fade method.
Speed	Value must be an integer from 0 to 255	0	Specify the number of frames for the fading transition to complete.
Output			
Output > Timing			
Horizontal total cycles	Value must be an integer from 24 to 2047	559	Specify the total cycles in a horizontal line. Set to the number of cycles defined in the data sheet of LCD panel sheet in your system
Horizontal active video cycles	Value must be an integer from 16 to 2040	480	Specify the number of active video cycles in a horizontal line (including front and back porch). Set to the number of cycles defined in the data sheet of LCD panel sheet in your system.
Horizontal back porch cycles	Value must be an integer from 5 to 2029	5	Specify the number of back porch cycles in a horizontal line. Back porch starts from the

			beginning of Hsync cycles, which means back porch cycles contain Hsync cycles. Set to the number of cycles defined in the data sheet of LCD panel sheet in your system.
Horizontal sync signal cycles	Value must be an integer from 0 to 2046	2	Specify the number of Hsync signal assertion cycles. Set to the number of cycles defined in the data sheet of LCD panel sheet in your system.
Horizontal sync signal polarity	• Low active • High active	Low active	Select the polarity of Hsync signal to match your system.
Vertical total lines	Value must be an integer from 20 to 2047	894	Specify number of total lines in a frame (including front and back porch).
Vertical active video lines	Value must be an integer from 16 to 2043	854	Specify the number of active video lines in a frame.
Vertical back porch lines	Value must be an integer from 3 to 2030	20	Specify the number of back porch lines in a frame. Back porch starts from the beginning of Vsync lines, which means back porch lines contain Vsync lines.
Vertical sync signal lines	Value must be an integer from 0 to 2046	3	Specify the Vsync signal assertion lines in a frame.
Vertical sync signal polarity	• Low active • High active	Low active	Select the polarity of Vsync signal to match to your system.
Data Enable Signal Polarity	• Low active • High active	High active	Select the polarity of Data Enable signal to match to your system.
Sync edge	• Rising edge • Falling edge	Falling edge	Select the polarity of Sync signals to match to your system.
Output > Format			
Color format	• 24bits RGB888	24bits RGB888	Specify the graphics

	• 18bits RGB666 • 16bits RGB565 • 8bits serial		layer output format to match to your LCD panel.
Color order	• RGB • BGR	RGB	Select data order for output signal to LCD panel.
Endian	• Little endian • Big endian	Little endian	Select data endianness for output signal to LCD panel.
Output > Background			
Alpha	Value must be an integer from 0 to 255	255	Alpha component of the background color.
Red	Value must be an integer from 0 to 255	0	Red component of the background color.
Green	Value must be an integer from 0 to 255	0	Green component of the background color.
Blue	Value must be an integer from 0 to 255	0	Blue component of the background color.
CLUT			
Enabled	• Yes • No	No	Specify Used if selecting CLUT formats for a graphics layer input format. If used, a buffer (CLUT_buffer) will be automatically generated based on the selected pixel width.
Size	Must be a valid non-negative integer with a maximum configurable value of 256	256	Specify the number of entries for the CLUT source data buffer. Each entry consumes 4 bytes (1 word).
TCON			
Hsync pin select	• Not used • LCD_TCON0 • LCD_TCON1 • LCD_TCON2 • LCD_TCON3	LCD_TCON1	Select the TCON pin used for the Hsync signal to match to your system.
Vsync pin select	• Not used • LCD_TCON0 • LCD_TCON1 • LCD_TCON2 • LCD_TCON3	LCD_TCON0	Select TCON pin used for Vsync signal to match to your system.
Data enable (DE) pin select	• Not used • LCD_TCON0	LCD_TCON2	Select TCON pin used for DataEnable signal

	• LCD_TCON1 • LCD_TCON2 • LCD_TCON3		to match to your system.
Panel clock source	• Internal clock (GLCDCLK) • External clock (LCD_EXTCLK)	Internal clock (GLCDCLK)	Choose between an internal GLCDCLK generated from PCLKA or an external clock provided to the LCD_EXTCLK pin.
Panel clock division ratio	Refer to the RA Configuration tool for available options.	1/8	Select the clock source divider value.
Color Correction			
Color Correction > Brightness			
Enabled	• Yes • No	No	Enable brightness color correction.
Red channel	Value must be an integer from 0 to 1023	512	Red component of the brightness calibration. This value is divided by 512 to determine gain.
Green channel	Value must be an integer from 0 to 1023	512	Green component of the brightness calibration. This value is divided by 512 to determine gain.
Blue channel	Value must be an integer from 0 to 1023	512	Blue component of the brightness calibration. This value is divided by 512 to determine gain.
Color Correction > Contrast			
Enabled	• Yes • No	No	Enable contrast color correction.
Red channel gain	Value must be an integer from 0 to 255	128	Red component of the contrast calibration. This value is divided by 128 to determine gain.
Green channel gain	Value must be an integer from 0 to 255	128	Green component of the contrast calibration. This value is divided by 128 to determine gain.
Blue channel gain	Value must be an integer from 0 to 255	128	Blue component of the contrast calibration. This value is divided by 128 to determine gain.
Color Correction > Gamma			

Color Correction > Gamma > Tables

Color Correction > Gamma > Tables > Red

Color Correction > Gamma > Tables > Red > Gain

0	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
1	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
2	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
3	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
4	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
5	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
6	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
7	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
8	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).

9	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
10	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
11	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
12	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
13	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
14	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
15	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
Color Correction > Gamma > Tables > Red > Threshold			
1	Value must be an integer from 0 to 1023	64	Enter a threshold value between the surrounding values less than or equal to 1023.
2	Value must be an integer from 0 to 1023	128	Enter a threshold value between the surrounding values less than or equal to 1023.
3	Value must be an integer from 0 to 1023	192	Enter a threshold value between the surrounding values less than or equal to 1023.

4	Value must be an integer from 0 to 1023	256	Enter a threshold value between the surrounding values less than or equal to 1023.
5	Value must be an integer from 0 to 1023	320	Enter a threshold value between the surrounding values less than or equal to 1023.
6	Value must be an integer from 0 to 1023	384	Enter a threshold value between the surrounding values less than or equal to 1023.
7	Value must be an integer from 0 to 1023	448	Enter a threshold value between the surrounding values less than or equal to 1023.
8	Value must be an integer from 0 to 1023	512	Enter a threshold value between the surrounding values less than or equal to 1023.
9	Value must be an integer from 0 to 1023	576	Enter a threshold value between the surrounding values less than or equal to 1023.
10	Value must be an integer from 0 to 1023	640	Enter a threshold value between the surrounding values less than or equal to 1023.
11	Value must be an integer from 0 to 1023	704	Enter a threshold value between the surrounding values less than or equal to 1023.
12	Value must be an integer from 0 to 1023	768	Enter a threshold value between the surrounding values less than or equal to 1023.
13	Value must be an integer from 0 to 1023	832	Enter a threshold value between the surrounding values less than or equal to 1023.
14	Value must be an integer from 0 to 1023	896	Enter a threshold value between the surrounding values less than or equal to 1023.
15	Value must be an integer from 0 to 1023	960	Enter a threshold value between the surrounding values less than or equal to 1023.

Color Correction > Gamma > Tables > Green

Color Correction > Gamma > Tables > Green > Gain

0	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
1	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
2	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
3	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
4	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
5	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
6	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
7	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
8	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
9	Value must be an	1024	Enter a gain value from

	integer from 0 to 2047		0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
10	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
11	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
12	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
13	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
14	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
15	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
Color Correction > Gamma > Tables > Green > Threshold			
1	Value must be an integer from 0 to 1023	64	Enter a threshold value between the surrounding values less than or equal to 1023.
2	Value must be an integer from 0 to 1023	128	Enter a threshold value between the surrounding values less than or equal to 1023.
3	Value must be an integer from 0 to 1023	192	Enter a threshold value between the surrounding values less than or equal to 1023.
4	Value must be an	256	Enter a threshold value

	integer from 0 to 1023		between the surrounding values less than or equal to 1023.
5	Value must be an integer from 0 to 1023	320	Enter a threshold value between the surrounding values less than or equal to 1023.
6	Value must be an integer from 0 to 1023	384	Enter a threshold value between the surrounding values less than or equal to 1023.
7	Value must be an integer from 0 to 1023	448	Enter a threshold value between the surrounding values less than or equal to 1023.
8	Value must be an integer from 0 to 1023	512	Enter a threshold value between the surrounding values less than or equal to 1023.
9	Value must be an integer from 0 to 1023	576	Enter a threshold value between the surrounding values less than or equal to 1023.
10	Value must be an integer from 0 to 1023	640	Enter a threshold value between the surrounding values less than or equal to 1023.
11	Value must be an integer from 0 to 1023	704	Enter a threshold value between the surrounding values less than or equal to 1023.
12	Value must be an integer from 0 to 1023	768	Enter a threshold value between the surrounding values less than or equal to 1023.
13	Value must be an integer from 0 to 1023	832	Enter a threshold value between the surrounding values less than or equal to 1023.
14	Value must be an integer from 0 to 1023	896	Enter a threshold value between the surrounding values less than or equal to 1023.
15	Value must be an integer from 0 to 1023	960	Enter a threshold value between the surrounding values less than or equal to 1023.

Color Correction > Gamma > Tables > Blue

Color Correction > Gamma > Tables > Blue > Gain

0	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
1	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
2	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).

14	Value must be an integer from 0 to 1023	896	Enter a threshold value between the surrounding values less than or equal to 1023.
15	Value must be an integer from 0 to 1023	960	Enter a threshold value between the surrounding values less than or equal to 1023.

Red	• On • Off	Off	Enable gamma color correction for the red channel.
Green	• On • Off	Off	Enable gamma color correction for the green channel.
Blue	• On • Off	Off	Enable gamma color correction for the blue channel.
Table Mode	• Constant • Variable	Variable	Set to Constant to override the automatically-generated RAM gamma tables with a constant declaration using the provided values.
Process order	• Brightness/contrast first • Gamma first	Brightness/contrast first	Select the color correction processing order.
Dithering			
Enabled	• Yes • No	No	Enable dithering to reduce the effect of color banding.
Mode	• Truncate • Round off • 2x2 Pattern	Truncate	Select the dithering mode.
Pattern A	• Pattern 00 • Pattern 01 • Pattern 10 • Pattern 11	Pattern 11	Select the dithering pattern.
Pattern B	• Pattern 00 • Pattern 01 • Pattern 10 • Pattern 11	Pattern 11	Select the dithering pattern.
Pattern C	• Pattern 00 • Pattern 01 • Pattern 10 • Pattern 11	Pattern 11	Select the dithering pattern.
Pattern D	• Pattern 00 • Pattern 01 • Pattern 10 • Pattern 11	Pattern 11	Select the dithering pattern.

Clock Configuration

The peripheral clock for this module is PCLKA.

The dot clock is typically generated from the PLL with a maximum output frequency of 54 MHz in

most pixel formats (60 MHz for serial RGB). Optionally, a clock signal can be provided to the LCD_EXTCLK pin for finer framerate control (60 MHz maximum input). With either clock source dividers of 1-9, 12, 16, 24 and 32 may be used. Clocks must be initialized and settled prior to starting this module.

Pin Configuration

This module controls a variety of pins necessary for LCD data and timing signal output:

Pin Name	Function	Notes
LCD_EXTCLK	External clock signal input	The maximum input clock frequency is 60MHz.
LCD_CLK	Dot clock output	The maximum output frequency is 54MHz (60MHz in serial RGB mode).
LCD_DATAn	Pixel data output lines	Pin assignment and color order is based on the output block configuration. See the RA6M3 User's Manual (R01UH0886EJ0100) section 58.1.4 "Output Control for Data Format" for details.
LCD_TCONn	Panel timing signal output	These pins can be configured to output vertical and horizontal synchronization and data valid signals.

Note

There are two banks of pins listed for the GLCDC in the RA6M3 User's Manual (_A and _B). In most cases the _B bank will be used as _A conflicts with SDRAM pins. In either case, it is generally recommended to only use pins from only one bank at a time as this allows for superior signal routing both inside and outside the package. If _A and _B pins must be mixed be sure to note the timing precision penalty detailed in Table 60.33 in in the RA6M3 User's Manual.

Usage Notes

Overview

The GLCDC peripheral is a combination of several sub-peripherals that form a pixel data processing pipeline. Each block passes pixel data to the next but otherwise they are disconnected from one another - in other words, changing timing block parameters does not affect the output generation block configuration and vice versa.

Initial Configuration

During R_GLCDC_Open all configured parameters are set in the GLCDC peripheral fully preparing it for operation. Once opened, calling R_GLCDC_Start is typically all that is needed for basic operation. Background generation, timing and output parameters are not configurable at runtime, though layer control and color correction options can be altered.

Framebuffer Allocation

The framebuffer should be allocated in the highest-speed region available without displacing the stack, heap and other program-critical structures. Regardless of the placement two rules must be followed to ensure correct operation of the GLCDC:

- The framebuffer must be aligned on a 64-byte boundary
- The horizontal stride of the buffer must be a multiple of 64 bytes

Note

Framebuffers allocated through the RA Configuraton tool automatically follow the alignment and size requirements.

If your framebuffer will be placed in internal memory it is recommended to avoid any high-speed RAM regions as there is typically no speed advantage for doing so. In particular, it is important to ensure the framebuffer does not push the stack or any heaps outside of high-speed RAM areas to preserve CPU performance.

Graphics Layers and Timing Parameters

The GLCDC synthesizes graphics data through two configurable graphics layers onto a background layer. The background is used as a solid-color canvas upon which to composite data from the graphics layers. The two graphics layers are blended on top of each other (Layer 2 above Layer 1) and overlaid on the background layer based on their individual configuration. The placement of the layers (as well as LCD timing parameters) are detailed in Figure 1. The colors of the dimensions indicate which element of the display_cfg_t struct is being referenced - for example, the width of the background layer would be [display_cfg].output.htiming.display_cyc as shown in the figure below.

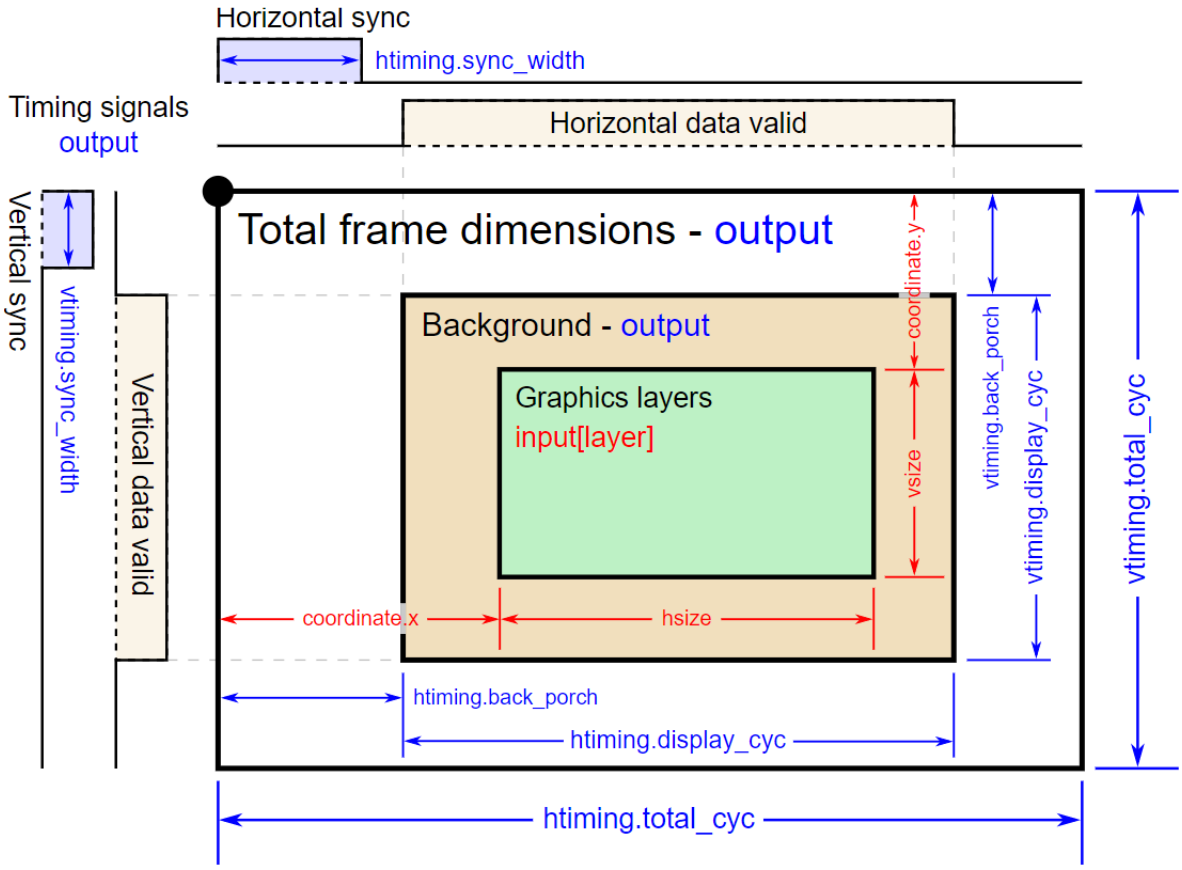

Figure 222: GLCDC layers and timing

Note

The data enable signal (if configured) is the logical AND of the horizontal and vertical data valid signals. In the GLCDC layers and timing figure, only one graphics layer is shown for simplicity. Additionally, in most applications the graphics layer(s) will be the same dimensions as the background layer.

Runtime Configuration Options

Note

All runtime configurations detailed below are also automatically configured during R_GLCDC_Open based on the options selected in the RA Configuration editor.

Blend processing

Control of layer positioning, alpha blending and fading is possible at runtime via R_GLCDC_LayerChange. This function takes a display_runtime_cfg_t parameter which contains the same input and layer elements as the display_cfg_t control block. Refer to the documentation for display_runtime_cfg_t as well as the Examples below to see what options are configurable.

Brightness and contrast

Brightness and contrast correction can be controlled through R_GLCDC_ColorCorrection. The display_correction_t parameter is used to control enabling, disabling and gain values for both corrections as shown below:

```
display_correction_t correction;
/* Brightness values are 0-1023 with +512 offset being neutral */
   correction.brightness.r = 512;
   correction.brightness.g = 512;
   correction.brightness.b = 512;
/* Contrast values are 0-255 representing gain of 0-2 (128 is gain of 1) */
   correction.contrast.r = 128;
   correction.contrast.g = 128;
   correction.contrast.b = 128;
/* Brightness and contrast correction can be enabled or disabled independent of one
another */
   correction.brightness.enable = true;
   correction.contrast.enable   = true;
/* Enable correction */
R_GLCDC_ColorCorrection(&g_disp_ctrl, &correction);
```

Color Look-Up Table (CLUT) Modes

The GLCDC supports 1-, 4- and 8-bit color look-up table (CLUT) formats for input pixel data. By using

these modes the framebuffer size in memory can be reduced significantly, allowing even high-resolution displays to be buffered in on-chip SRAM. To enable CLUT modes for a layer the color format must be set to a CLUT mode (either at startup or through R_GLCDC_LayerChange) in addition to filling the CLUT as appropriate via R_GLCDC_ClutUpdate as shown below:

```
/* Basic 4-bit (16-color) CLUT definition */
   uint32_t clut_4[16] =
   {
      0xFF000000,                  // Black
      0xFFFFFFFF,                  // White
      0xFF0000FF,                  // Blue
      0xFF0080FF,                  // Turquoise
      0xFF00FFFF,                  // Cyan
      0xFF00FF80,                  // Mint Green
      0xFF00FF00,                  // Green
      0xFF80FF00,                  // Lime Green
      0xFFFFFF00,                  // Yellow
      0xFFFF8000,                  // Orange
      0xFFFF0000,                  // Red
      0xFFFF0080,                  // Pink
      0xFFFF00FF,                  // Magenta
      0xFF8000FF,                  // Purple
      0xFF808080,                  // Gray
      0x00000000                    // Transparent
   };
/* Define the CLUT configuration */
display_clut_cfg_t clut_cfg =
   {
      .start = 0,
      .size   = 16,
      .p_base = clut_4
   };
/* Update the CLUT in the GLCDC */
R_GLCDC_ClutUpdate(&g_disp_ctrl, &clut_cfg, DISPLAY_FRAME_LAYER_1);
```

Note

If individual elements of the CLUT must be changed or if elements must be changed one at a time (for instance, when using emWin) it is recommended to use R_GLCDC_ClutEdit to avoid repeated memcpy operations.

Other Configuration Options

Gamma correction

Gamma correction is performed based on a gain curved defined in the RA Configuration editor. Each point on the curve is defined by a threshold and a gain value - each gain value represents a multiplier from 0x-2x (set as 0-2047) that sets the Y-value of the slope of the gain curve, while each threshold interval sets the X-value respectively. For a more detailed explanation refer to the RA6M3 User's Manual (R01UH0886EJ0100) Figure 58.12 "Calculation of gamma correction value" and the related description above it.

When setting threshold values three rules must be followed:

- Each threshold value must be greater than the previous value
- Threshold values must be greater than zero and less than 1024
- Threshold values can equal the previous value only if they are 1023 (maximum)

Note

Gamma correction can only be applied via R_GLCDC_Open.

Dithering

Dithering is a method of pixel blending that allows for smoother transitions between colors when using a limited palette. A full description of dithering is outside the scope of this document. For more information on the pattern settings and how to configure them refer to the RA6M3 User's Manual (R01UH0886EJ0100) Figure 58.13 "Configuration of dither correction block" and Figure 58.14 "Addition value selection method for 2x2 pattern dither".

Maximum Resolution

Though the GLCDC is capable of outputting resolutions in excess of HD, maximum clockspeeds and bus throughput limit what can be realistically achieved. Below is a table of maximum recommended widescreen resolutions at various input color depths **based on clock and bus limits at 60 FPS.**

Device	8bpp	16bpp	24/32bpp
RA6M3	960x540 (qHD)	800x480 (WVGA)	640x360 (nHD)
RA8	1920x1200 (WUXGA)	1280x800 (WXGA)	960x540 (qHD)

Note

The above values are estimated conservatively based on effective SDRAM bus throughput at a standard framerate. To calculate estimated maximum values for other situations the following equations can be used:
*bytes per frame = (SDCLK speed (Hz) * SDRAM bus width / 8) / framerate*
*width = sqrt(16/9 * (bytes per frame) / (pixel bit depth / 8))*
*height = 9/16 * width*
These equations provide values that are theoretically possible but may or may not be attainable depending on a number of other factors. It is the responsibility of the developer to test and confirm performance on each system to determine a suitable panel size for the application.

Limitations

Developers should be aware of the following limitations when using the GLCDC API:

- Due to a limitation of the GLCDC hardware, if the horizontal back porch is less than the number of pixels in a graphics burst read (64 bytes) for a layer and the layer is positioned at a negative X-value then the layer X-position will be locked to the nearest 64-byte boundary, rounded toward zero.
- The GLCDC peripheral offers a chroma-key function that can be used to perform a green-screen-like color replacement. This functionality is not exposed through the GLCDC API. See the descriptions for GR1_AB7/GR2_AB7 through GR1_AB9/GR2_AB9 in the device's User's Manual for further details.
- Use of R_GLCDC_ClutUpdate and R_GLCDC_ClutEdit may not be mixed on the same frame.

Examples

Basic Example

This is a basic example showing the minimum code required to initialize and start the GLCDC module. If the entire display can be drawn within the vertical blanking period no further code may be necessary.

```
void glcdc_init (void)
{
 fsp_err_t err;
 // Open the GLCDC driver
    err = R_GLCDC_Open(&g_disp_ctrl, &g_disp_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 // Start display output
    err = R_GLCDC_Start(&g_disp_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Layer Transitions

This example demonstrates how to set up and execute both a sliding and fading layer transition. This is most useful in static image transition scenarios as switching between two actively-drawing graphics layers may require up to four framebuffers to eliminate tearing.

```
volatile uint32_t g_vsync_count = 0;
/* Callback function for GLCDC interrupts */
static void glcdc_callback (display_callback_args_t * p_args)
{
 if (p_args->event == DISPLAY_EVENT_LINE_DETECTION)
    {
```

```
       g_vsync_count++;
    }
}
/* Simple wait that returns 1 if no Vsync happened within the timeout period */
uint8_t vsync_wait (void)
{
    uint32_t timeout_timer = GLCDC_VSYNC_TIMEOUT;
    g_vsync_count = 0;
 while (!g_vsync_count && --timeout_timer)
    {
 /* Spin here until DISPLAY_EVENT_LINE_DETECTION callback or timeout */
    }
 return timeout_timer ? 0 : 1;
}
/* Initiate a fade on Layer 2
 *
 * Parameters:
 * direction True for fade in, false for fade out
 * speed number of frames over which to fade
 */
void glcdc_layer_transition_fade (display_runtime_cfg_t * disp_rt_cfg, bool
direction, uint16_t speed)
{
 fsp_err_t err;
 if (direction)
    {
 /* Set the runtime struct to the desired buffer */
       disp_rt_cfg->input.p_base       = (uint32_t *) g_framebuffer_1;
       disp_rt_cfg->layer.fade_control = DISPLAY_FADE_CONTROL_FADEIN;
    }
 else
    {
       disp_rt_cfg->layer.fade_control = DISPLAY_FADE_CONTROL_FADEOUT;
    }
```

```
 /* Ensure speed is at least 1 frame */
 if (!speed)
    {
       speed = 1;
    }
 /* Set the fade speed to the desired change in alpha per frame */
    disp_rt_cfg->layer.fade_speed = UINT8_MAX / speed;
 /* Initiate the fade (will start on the next Vsync) */
    err = R_GLCDC_LayerChange(&g_disp_ctrl, disp_rt_cfg, DISPLAY_FRAME_LAYER_2);
    assert(FSP_SUCCESS == err);
}
/* Slide Layer 1 out to the left while sliding Layer 2 in from the right */
void glcdc_layer_transition_sliding (display_runtime_cfg_t * disp_rt_cfg_in,
display_runtime_cfg_t * disp_rt_cfg_out)
{
 fsp_err_t err;
 /* Set the config for the incoming layer to be just out of bounds on the right side
*/
    disp_rt_cfg_in->input.p_base       = (uint32_t *) g_framebuffer_1;
    disp_rt_cfg_in->layer.coordinate.x = DISPLAY_WIDTH;
 /* Move layer 1 out and layer 2 in at a fixed rate of 4 pixels per frame */
 for (int32_t x = disp_rt_cfg_in->layer.coordinate.x; x >= 0; x -= 4)
    {
 /* Wait for a Vsync before starting */
       vsync_wait();
 /* Set the X-coordinate of both layers then update them */
       disp_rt_cfg_out->layer.coordinate.x = (int16_t) (x - DISPLAY_WIDTH);
       disp_rt_cfg_in->layer.coordinate.x = (int16_t) x;
       err = R_GLCDC_LayerChange(&g_disp_ctrl, disp_rt_cfg_out, DISPLAY_FRAME_LAYER_1
);
      assert(FSP_SUCCESS == err);
       err = R_GLCDC_LayerChange(&g_disp_ctrl, disp_rt_cfg_in, DISPLAY_FRAME_LAYER_2
);
      assert(FSP_SUCCESS == err);
```

```
    }
}
```

Double-Buffering

Using a double-buffer allows one to be output to the LCD while the other is being drawn to memory, eliminating tearing and in some cases reducing bus load. The following is a basic example showing integration of the line detect (Vsync) interrupt to set the timing for buffer swapping and drawing.

```
/* User-defined function to draw the current display to a framebuffer */
void display_draw (uint8_t * framebuffer)
{
 FSP_PARAMETER_NOT_USED(framebuffer);
 /* Draw buffer here */
}
/* This function is an example of a basic double-buffered display thread */
void display_thread (void)
{
    uint8_t * p_framebuffer = NULL;
 fsp_err_t err;
 /* Initialize and start the R_GLCDC module */
    glcdc_init();
 while (1)
    {
 /* Swap the active framebuffer */
       p_framebuffer = (p_framebuffer == g_framebuffer_0) ? g_framebuffer_1 :
g_framebuffer_0;
 /* Draw the new framebuffer now */
       display_draw(p_framebuffer);
 /* Now that the framebuffer is ready, update the GLCDC buffer pointer on the next
Vsync */
       err = R_GLCDC_BufferChange(&g_disp_ctrl, p_framebuffer, DISPLAY_FRAME_LAYER_1
);
     assert(FSP_SUCCESS == err);
 /* Wait for a Vsync event */
       vsync_wait();
```

```
    }
}
```

GLCDC_OUTPUT_INTERFACE_FORMAT_RGB666	Output interface format RGB666.
GLCDC_OUTPUT_INTERFACE_FORMAT_RGB565	Output interface format RGB565.
GLCDC_OUTPUT_INTERFACE_FORMAT_SERIAL_RGB	Output interface format Serial RGB.

◆ glcdc_dithering_output_format_t

enum glcdc_dithering_output_format_t	
Dithering output format	
Enumerator	
GLCDC_DITHERING_OUTPUT_FORMAT_RGB888	Dithering output format RGB888.
GLCDC_DITHERING_OUTPUT_FORMAT_RGB666	Dithering output format RGB666.
GLCDC_DITHERING_OUTPUT_FORMAT_RGB565	Dithering output format RGB565.

Function Documentation

◆ R_GLCDC_Open()

fsp_err_t R_GLCDC_Open (display_ctrl_t *const *p_api_ctrl*, display_cfg_t const *const *p_cfg*)

Open GLCDC module. Implements display_api_t::open.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ALREADY_OPEN	Device was already open.
FSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
FSP_ERR_CLOCK_GENERATION	Dot clock cannot be generated from clock source.
FSP_ERR_INVALID_TIMING_SETTING	Invalid panel timing parameter.
FSP_ERR_INVALID_LAYER_SETTING	Invalid layer setting found.
FSP_ERR_INVALID_ALIGNMENT	Input buffer alignment invalid.
FSP_ERR_INVALID_GAMMA_SETTING	Invalid gamma correction setting found
FSP_ERR_INVALID_BRIGHTNESS_SETTING	Invalid brightness correction setting found

Note

PCLKA must be supplied to Graphics LCD Controller (GLCDC) and GLCDC pins must be set in IOPORT before calling this API.

◆ R_GLCDC_Close()

fsp_err_t R_GLCDC_Close (display_ctrl_t *const *p_api_ctrl*)

Close GLCDC module. Implements display_api_t::close.

Return values

FSP_SUCCESS	Device was closed successfully.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_NOT_OPEN	The function call is performed when the driver state is not equal to DISPLAY_STATE_CLOSED.
FSP_ERR_INVALID_UPDATE_TIMING	A function call is performed when the GLCDC is updating register values internally.

Note

This API can be called when the driver is not in DISPLAY_STATE_CLOSED state. It returns an error if the register update operation for the background screen generation block is being held.

◆ R_GLCDC_Start()

fsp_err_t R_GLCDC_Start (display_ctrl_t *const *p_api_ctrl*)

Start GLCDC module. Implements display_api_t::start.

Return values

FSP_SUCCESS	Device was started successfully.
FSP_ERR_NOT_OPEN	GLCDC module has not been opened.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.

Note

This API can be called when the driver is not in DISPLAY_STATE_OPENED status.

◆ R_GLCDC_Stop()

fsp_err_t R_GLCDC_Stop (display_ctrl_t *const *p_api_ctrl*)

Stop GLCDC module. Implements display_api_t::stop.

Return values

FSP_SUCCESS	Device was stopped successfully
FSP_ERR_ASSERTION	Pointer to the control block is NULL
FSP_ERR_INVALID_MODE	Function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING.
FSP_ERR_INVALID_UPDATE_TIMING	The function call is performed while the GLCDC is updating register values internally.

Note

This API can be called when the driver is in the DISPLAY_STATE_DISPLAYING state. It returns an error if the register update operation for the background screen generation blocks, the graphics data I/F blocks, or the output control block is being held.

◆ R_GLCDC_LayerChange()

fsp_err_t R_GLCDC_LayerChange (display_ctrl_t const *const *p_api_ctrl*, display_runtime_cfg_t const *const *p_cfg*, display_frame_layer_t *layer*)

Change layer parameters of GLCDC module at runtime. Implements display_api_t::layerChange.

Return values

FSP_SUCCESS	Changed layer parameters of GLCDC module successfully.
FSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
FSP_ERR_INVALID_MODE	A function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING.
FSP_ERR_INVALID_UPDATE_TIMING	A function call is performed while the GLCDC is updating register values internally.

Note

This API can be called when the driver is in DISPLAY_STATE_DISPLAYING state. It returns an error if the register update operation for the background screen generation blocks or the graphics data I/F block is being held.

◆ R_GLCDC_BufferChange()

fsp_err_t R_GLCDC_BufferChange (display_ctrl_t const *const *p_api_ctrl*, uint8_t *const *framebuffer*, display_frame_layer_t *layer*)

Change the framebuffer pointer for a layer. Implements display_api_t::bufferChange.

Return values

FSP_SUCCESS	Changed layer parameters of GLCDC module successfully.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_INVALID_MODE	A function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING.
FSP_ERR_INVALID_ALIGNMENT	The framebuffer pointer is not 64-byte aligned.
FSP_ERR_INVALID_UPDATE_TIMING	A function call is performed while the GLCDC is updating register values internally.

Note

This API can be called when the driver is in DISPLAY_STATE_OPENED state or higher. It returns an error if the register update operation for the background screen generation blocks or the graphics data I/F block is being held.

◆ R_GLCDC_ColorCorrection()

fsp_err_t R_GLCDC_ColorCorrection (display_ctrl_t const *const *p_api_ctrl*, display_correction_t const *const *p_correction*)

Perform color correction through the GLCDC module. Implements display_api_t::correction.

Return values

FSP_SUCCESS	Color correction by GLCDC module was performed successfully.
FSP_ERR_ASSERTION	Pointer to the control block or the display correction structure is NULL.
FSP_ERR_INVALID_MODE	Function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING.
FSP_ERR_INVALID_UPDATE_TIMING	A function call is performed while the GLCDC is updating registers internally.
FSP_ERR_UNSUPPORTED	Feature not supported with the current configuration.
FSP_ERR_INVALID_BRIGHTNESS_SETTING	Invalid brightness correction setting found

Note

This API can be called when the driver is in the DISPLAY_STATE_DISPLAYING state. It returns an error if the register update operation for the background screen generation blocks or the output control block is being held.

◆ R_GLCDC_ClutUpdate()

fsp_err_t R_GLCDC_ClutUpdate (display_ctrl_t const *const *p_api_ctrl*, display_clut_cfg_t const *const *p_clut_cfg*, display_frame_layer_t *layer*)

Write an entire color look-up table (CLUT) in the GLCDC module. Implements display_api_t::clut.

Return values

FSP_SUCCESS	CLUT written successfully.
FSP_ERR_ASSERTION	Pointer to the control block or CLUT source data is NULL.
FSP_ERR_INVALID_UPDATE_TIMING	R_GLCDC_ClutEdit was already used to edit the specified CLUT this frame.
FSP_ERR_INVALID_CLUT_ACCESS	Illegal CLUT entry or size is specified.

Note

This API can be called any time. The written data will be used after the next vertical sync event.

◆ R_GLCDC_ClutEdit()

fsp_err_t R_GLCDC_ClutEdit (display_ctrl_t const *const *p_api_ctrl*, display_frame_layer_t *layer*, uint8_t *index*, uint32_t *color*)

Update an element of a color look-up table (CLUT) in the GLCDC module. Implements display_api_t::clutEdit.

Return values

FSP_SUCCESS	CLUT element updated successfully.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.

Note

This API can be called any time. The written data will be used after the next vertical sync event.

◆ R_GLCDC_ColorKeySet()

fsp_err_t R_GLCDC_ColorKeySet (display_ctrl_t const *const *p_api_ctrl*, display_colorkeying_layer_t *key_cfg*, display_frame_layer_t *layer*)

Configuring color key is not supported for GLCDC.

Return values

FSP_ERR_UNSUPPORTED	

◆ R_GLCDC_StatusGet()

fsp_err_t R_GLCDC_StatusGet (display_ctrl_t const *const *p_api_ctrl*, display_status_t *const *p_status*)

Get status of GLCDC module. Implements display_api_t::statusGet.

Return values

FSP_SUCCESS	Got status successfully.
FSP_ERR_ASSERTION	Pointer to the control block or the status structure is NULL.

Note

The GLCDC hardware starts the fading processing at the first Vsync after the previous LayerChange() call is held. Due to this behavior of the hardware, this API may not return DISPLAY_FADE_STATUS_FADING_UNDERWAY as the fading status, if it is called before the first Vsync after LayerChange() is called. In this case, the API returns DISPLAY_FADE_STATUS_PENDING, instead of DISPLAY_FADE_STATUS_NOT_UNDERWAY.

5.2.8.5 JPEG Codec (r_jpeg)

fsp_err_t	R_JPEG_Close (jpeg_ctrl_t *p_api_ctrl)
fsp_err_t	R_JPEG_StatusGet (jpeg_ctrl_t *p_api_ctrl, jpeg_status_t *p_status)

Detailed Description

Driver for the JPEG peripheral on RA MCUs. This module implements the JPEG Codec Interface.

Overview

The JPEG Codec is a hardware block providing accelerated JPEG image encode and decode functionality independent of the CPU. Images can optionally be partially processed facilitating streaming applications.

Features

The JPEG Codec provides a number of options useful in a variety of applications:

- Basic encoding and decoding
- Streaming input and/or output
- Decoding JPEGs of unknown size
- Shrink (sub-sample) an image during the decoding process
- Rearrange input and output byte order (byte, word and/or longword swap)
- JPEG error detection

The specifications for the codec are as follows:

Feature	Options
Decompression input formats	Baseline JPEG Y'CbCr 4:4:4, 4:2:2, 4:2:0 and 4:1:1
Decompression output formats	ARGB8888, RGB565
Compression input formats	Raw Y'CbCr 4:2:2 only
Compression output formats	Baseline JPEG Y'CbCr 4:2:2 only
Byte reordering	Byte, halfword and/or word swapping on input and output
Interrupt sources	Image size acquired, input/output data pause, decode complete, error
Compatible image sizes	See Minimum Coded Unit (MCU) below

Configuration

Build Time Configurations for r_jpeg

The following build time configurations are defined in fsp_cfg/r_jpeg_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected, code for parameter checking is included in the build.
Decode Support	• Enabled • Disabled	Enabled	If selected, code for decoding JPEG images is included in the build.
Encode Support	• Enabled • Disabled	Disabled	If selected, code for encoding JPEG images is included in the build.

Configurations for Graphics > JPEG Codec (r_jpeg)

This module can be added to the Stacks tab via New Stack > Graphics > JPEG Codec (r_jpeg).

Configuration	Options	Default	Description

General			
Name	Name must be a valid C symbol	g_jpeg0	Module name.
Default mode	• Decode • Encode	Decode	Set the mode to use when calling R_JPEG_Open. This parameter is only used when both Encode and Decode support are enabled.
Decode			
Input byte order	MCU Specific Options		Select the byte order of the input data for decoding.
Output byte order	MCU Specific Options		Select the byte order of the output data for decoding.
Output color format	• ARGB8888 (32-bit) • RGB565 (16-bit)	RGB565 (16-bit)	Select the output pixel format for decode operations.
Output alpha (ARGB8888 only)	Value must be an 8-bit integer (0-255)	255	Specify the alpha value to apply to each output pixel when ARGB8888 format is chosen.
Callback	Name must be a valid C symbol	NULL	If a callback function is provided it will be called from the interrupt service routine (ISR) each time a related IRQ triggers.
Encode			
Horizontal resolution	Value cannot be greater than 65535 and must be a non-negative integer divisible by 16	480	Horizontal resolution of the raw image (in pixels). This value can be configured at runtime via R_JPEG_ImageSizeSet.
Vertical resolution	Value cannot be greater than 65535 and must be a non-negative integer divisible by 8	272	Vertical resolution of the raw image. This value can be configured at runtime via R_JPEG_ImageSizeSet.
Horizontal stride	Value cannot be greater than 65535 and must be a non-negative integer	480	Horizontal stride of the raw image buffer (in pixels). This value can be configured at

			runtime via R_JPEG_ImageSizeSet.
Input byte order	MCU Specific Options		Select the byte order of the input data for encoding.
Output byte order	MCU Specific Options		Select the byte order of the output data for encoding.
Reset interval	Value cannot be greater than 65535 and must be a non-negative integer	512	Set the number of MCUs between RST markers. A value of 0 will disable DRI and RST marker output.
Quality factor	Value must be between 1 and 100 and must be an integer	50	Set the quality factor for encoding (1-100). Lower values produce smaller images at the cost of image quality.
Callback	Name must be a valid C symbol	NULL	If a callback function is provided it will be called from the interrupt service routine (ISR) each time a related IRQ triggers.
Interrupts			
Decode Process Interrupt Priority	MCU Specific Options		Select the decompression interrupt priority.
Data Transfer Interrupt Priority	MCU Specific Options		Select the data transfer interrupt priority.

Clock Configuration

The peripheral clock for this module is PCLKA. No clocks are provided by this module.

Pin Configuration

This module does not have any input or output pin connections.

Usage Notes

Overview

The JPEG Codec contains both decode and encode hardware. While these two functions are largely independent in configuration only one can be used at a time.

To switch from decode to encode mode (or vice versa) use R_JPEG_ModeSet while the JPEG Codec is idle.

Status

The status value (jpeg_status_t) provided by the callback and by R_JPEG_StatusGet is a bitfield that encompasses all potential status indication conditions. One or more statuses can be set simultaneously.

Decoding Process

JPEG decoding can be performed in several ways depending on the application:

- To perform the simplest decode operation where all dimensions are known:
  - Set the input buffer, stride and output buffer then wait for a callback with status JPEG_STATUS_OPERATION_COMPLETE.
- To pause after decoding the JPEG header (in order to acquire image dimensions and secure an output buffer):
  - Call R_JPEG_InputBufferSet before setting the output buffer and wait for a callback with status JPEG_STATUS_IMAGE_SIZE_READY.
- To decode a partial JPEG image then pause until the next chunk is available:
  - Specify a size smaller than the full JPEG data when calling R_JPEG_InputBufferSet.
- To pause decoding once an output buffer is filled:
  - Specify a size smaller than the full decoded image when calling R_JPEG_OutputBufferSet.

The flowchart below illustrates the steps necessary to handle any decode operation. The statuses given in blue are part of jpeg_status_t with the JPEG_DECODE_STATUS prefix omitted.

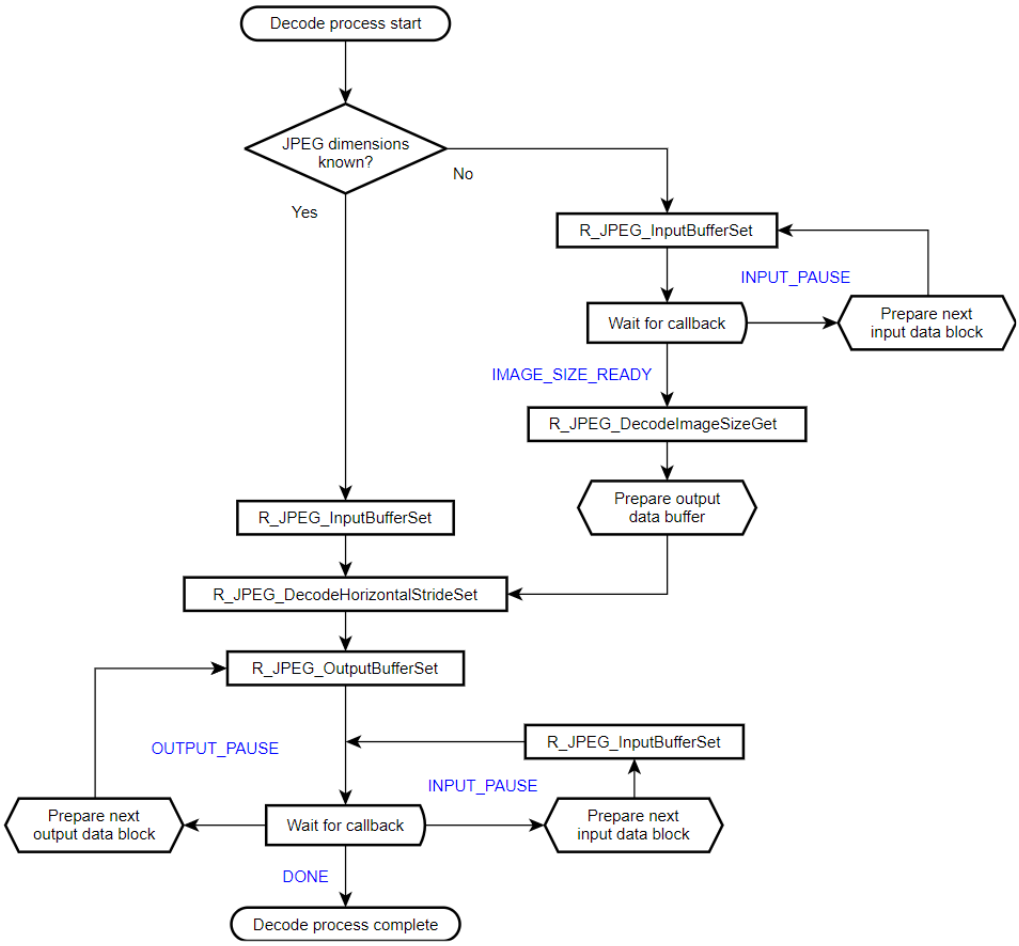

Figure 223: JPEG Decode Operational Flow

Encoding Process

As compared to decoding, encoding is fairly straightforward. The only option available is to stream input data if desired. The flowchart below details the steps needed to compress an image.

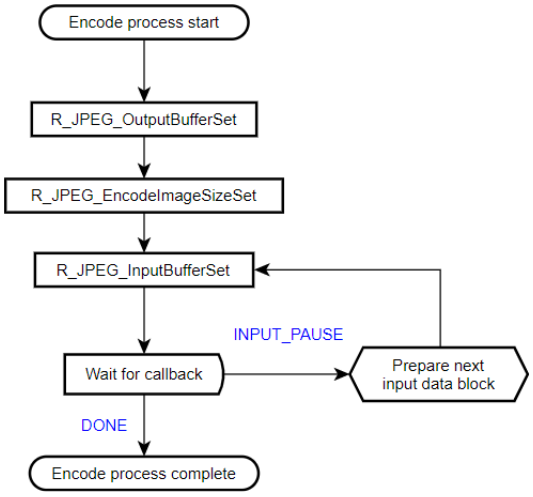

Figure 224: JPEG Encode Operational Flow

Handling Failed Operations

If an encode or decode operation fails or times out while the codec is running, the peripheral must be reset before it is used again. To reset the JPEG Codec simply close and re-open the module by calling R_JPEG_Close followed by R_JPEG_Open.

Limitations

Developers should be aware of the following limitations when using the JPEG API.

Minimum Coded Unit (MCU)

The JPEG Codec can only correctly process images that are an even increment of minimum coded units (MCUs). In other words, depending on the format the width and height of an image to be encoded or decoded must be divisible by the following:

Format	Horizontal	Vertical
Y'CbCr 4:4:4	8 pixels	8 lines
Y'CbCr 4:2:2	16 pixels	8 lines
Y'CbCr 4:1:1	32 pixels	8 lines
Y'CbCr 4:2:0	16 pixels	16 lines

Note

Because encoding is limited to Y'CbCr 4:2:2, raw pixel input data must always be in whole increments of 16x8 pixels.

Encoding Input Format

The encoding unit only supports Y'CbCr 4:2:2 input. Raw RGB888 data can be converted to this format as follows:

```
y =       (0.299000f * r) + (0.587000f * g) + (0.114000f * b);
cb = 128 - (0.168736f * r) - (0.331264f * g) + (0.500000f * b);
cr = 128 + (0.500000f * r) - (0.418688f * g) - (0.081312f * b);
```

While these equations are mathematically simple they do use the floating-point unit. To speed things up we can multiply the coefficients by 256 and divide the sum by 256...

```
y =       ((76.5440f * r) + (150.272f * g) + (29.1840f * b)) / 256;
cb = 128 - ((43.1964f * r) - (84.8036f * g) + (128.000f * b)) / 256;
cr = 128 + ((128.000f * r) - (107.184f * g) - (20.8159f * b)) / 256;
```

...which allows the formulas to be calculated entirely with shifts and addition (coefficients rounded to the nearest integer):

```
y =       (   (r << 6) + (r << 3) + (r << 2) + r
            + (g << 7) + (g << 4) + (g << 2) + (g << 1)
            + (b << 4) + (b << 3) + (b << 2) + b
           ) >> 8;
cb = 128 - (   (r << 5) + (r << 3) + (r << 1) + r
            + (g << 6) + (g << 4) + (g << 2) + g
            - (b << 7)
           ) >> 8;
cr = 128 + (   (r << 7)
            - (g << 6) - (g << 5) - (g << 3) - (g << 1) - g
            - (b << 4) - (b << 2) - b)
           ) >> 8;
```

To compose the final Y'CbCr 4:2:2 data the chroma of every two pixels must be averaged. **In addition, the JPEG Codec expects chrominance values to be in the range -127..127 instead of the standard 1..255.**

```
cb = (uint8_t) ((int8_t) ((cb0 + cb1 + 1) >> 1) - 128);
cr = (uint8_t) ((int8_t) ((cr0 + cr1 + 1) >> 1) - 128);
```

```
```

Finally, the below equation composes two 4:2:2 output pixels at a time with standard byte order (JPEG_DATA_ORDER_NORMAL):

```
   out = y0 + (cb << 8) + (y1 << 16) + (cr << 24);
```

Note

RGB565 pixels must be upscaled to RGB888 before using the above formulas. Refer to the below example on Y'CbCr Conversion for implementation details.

Examples

Basic Decode Example

This is a basic example showing the minimum code required to initialize the JPEG Codec and decode an image.

```
void jpeg_decode_basic (void)
{
 fsp_err_t err;
 /* Open JPEG Codec */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set input buffer */
    err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, JPEG_PTR, JPEG_SIZE_BYTES);
    assert(FSP_SUCCESS == err);
 /* Set horizontal stride of output buffer */
    err = R_JPEG_DecodeHorizontalStrideSet(&g_jpeg_ctrl, JPEG_HSIZE);
    assert(FSP_SUCCESS == err);
 /* Set output buffer */
    err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, decode_buffer, sizeof(decode_buffer));
    assert(FSP_SUCCESS == err);
 /* Wait for decode completion */
 jpeg_status_t status = (jpeg_status_t) 0;
 while (!(status & (JPEG_STATUS_OPERATION_COMPLETE | JPEG_STATUS_ERROR)))
    {
```

```
       err = R_JPEG_StatusGet(&g_jpeg_ctrl, &status);
      assert(FSP_SUCCESS == err);
    }
}
```

Streaming Input/Output Example

In this example JPEG data is read in 512-byte chunks. Decoding is paused when a chunk is read and once the JPEG header is decoded. The image is decoded 16 lines at a time.

Note

Streaming is always bypassed when a given buffer's size encompasses the entire input or output image, respectively. Though this example decodes via smaller chunks the input and output data are still contiguous for ease of demonstration. Refer to the comments for further insight as to how to implement streaming with different JPEG/output buffer size combinations.

```
#define JPEG_INPUT_SIZE_BYTES 512U
/* JPEG Codec status */
static volatile jpeg_status_t g_jpeg_status = JPEG_STATUS_NONE;
/* JPEG event flag */
static volatile uint8_t jpeg_event = 0;
/* Callback function for JPEG decode interrupts */
void jpeg_decode_callback (jpeg_callback_args_t * p_args)
{
 /* Get JPEG Codec status */
    g_jpeg_status = p_args->status;
 /* Set JPEG flag */
    jpeg_event = 1;
}
/* Simple wait that returns 1 if no event happened within the timeout period */
static uint8_t jpeg_event_wait (void)
{
    uint32_t timeout_timer = JPEG_EVENT_TIMEOUT;
 while (!jpeg_event && --timeout_timer)
    {
 /* Spin here until an event callback or timeout */
    }
    jpeg_event = 0;
```

```
 return timeout_timer ? 0 : 1;
}
/* Decode a JPEG image to a buffer using streaming input and output */
void jpeg_decode_streaming (void)
{
    uint8_t    * p_jpeg = (uint8_t *) JPEG_PTR;
 jpeg_status_t status = (jpeg_status_t) 0;
    uint8_t       timeout = 0;
 fsp_err_t    err;
 /* Number of input bytes to read at a time */
    uint32_t input_bytes = JPEG_INPUT_SIZE_BYTES;
 /* Open JPEG unit and start decode */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (!(status & JPEG_STATUS_ERROR) && !timeout)
    {
 /* Set the input buffer to read `input_bytes` bytes at a time */
       err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, p_jpeg, input_bytes);
     assert(FSP_SUCCESS == err);
 /* This delay is required for streaming input mode to function correctly.
  * (Without this delay the JPEG Codec will not correctly locate markers in the file
header.) */
 R_BSP_SoftwareDelay(10, BSP_DELAY_UNITS_MICROSECONDS);
 /* Wait for a callback */
       timeout = jpeg_event_wait();
 /* Get the status from the callback */
       status = g_jpeg_status;
 /* Break if the header has finished decoding */
 if (status & JPEG_STATUS_IMAGE_SIZE_READY)
     {
 break;
     }
 /* Move pointer to next block of input data (if needed) */
```

```
      p_jpeg = (uint8_t *) ((uint32_t) p_jpeg + input_bytes);
   }
/* Get image size */
   uint16_t horizontal;
   uint16_t vertical;
   err = R_JPEG_DecodeImageSizeGet(&g_jpeg_ctrl, &horizontal, &vertical);
   assert(FSP_SUCCESS == err);
/* Prepare output data buffer here if needed (already allocated in this example) */
   uint8_t * p_output = decode_buffer;
/* Set horizontal stride */
   err = R_JPEG_DecodeHorizontalStrideSet(&g_jpeg_ctrl, horizontal);
   assert(FSP_SUCCESS == err);
/* Calculate the number of bytes that will fit in the buffer (16 lines in this
example) */
   uint32_t output_size = horizontal * 16U * 4U;
/* Start decoding by setting the output buffer */
   err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, p_output, output_size);
   assert(FSP_SUCCESS == err);
while (!(status & JPEG_STATUS_ERROR) && !timeout)
   {
/* Wait for a callback */
      timeout = jpeg_event_wait();
/* Get the status from the callback */
      status = g_jpeg_status;
/* Break if decoding is complete */
if (status & JPEG_STATUS_OPERATION_COMPLETE)
     {
break;
     }
if (status & JPEG_STATUS_OUTPUT_PAUSE)
     {
/* Draw the JPEG work buffer to the framebuffer here (if needed) */
/* Move pointer to next block of output data (if needed) */
           p_output += output_size;
```

```
 /* Set the output buffer to the next 16-line block */
      err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, p_output, output_size);
      assert(FSP_SUCCESS == err);
      }
 if (status & JPEG_STATUS_INPUT_PAUSE)
      {
 /* Get next block of input data */
         p_jpeg = (uint8_t *) ((uint32_t) p_jpeg + input_bytes);
 /* Set the new input buffer pointer */
         err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, p_jpeg, input_bytes);
      assert(FSP_SUCCESS == err);
      }
    }
 /* Close driver to allow encode operations if needed */
    err = R_JPEG_Close(&g_jpeg_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Encode Example

This is a basic example showing the minimum code required to initialize the JPEG Codec and encode an image.

Note

This example assumes image dimensions are provided in the configuration. If this is not the case, R_JPEG_EncodeImageSizeSet must be used to set the size before calling R_JPEG_InputBufferSet.

```
void jpeg_encode_basic (void)
{
 fsp_err_t err;
 /* Open JPEG Codec */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set output buffer */
    err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, jpeg_buffer, sizeof(jpeg_buffer));
    assert(FSP_SUCCESS == err);
```

```
 /* Set input buffer */
    err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, RAW_YCBCR_IMAGE_PTR, IMAGE_SIZE_BYTES);
    assert(FSP_SUCCESS == err);
 /* Wait for decode completion */
 jpeg_status_t status = (jpeg_status_t) 0;
 while (!(status & JPEG_STATUS_OPERATION_COMPLETE))
    {
       err = R_JPEG_StatusGet(&g_jpeg_ctrl, &status);
      assert(FSP_SUCCESS == err);
    }
}
```

Streaming Encode Example

In this example the raw input data is provided in smaller chunks. This can help significantly reduce buffer size and improve throughput when streaming in raw data from an outside source.

```
/* Callback function for JPEG encode interrupts */
void jpeg_encode_callback (jpeg_callback_args_t * p_args)
{
 /* Get JPEG Codec status */
    g_jpeg_status = p_args->status;
 /* Set JPEG flag */
    jpeg_event = 1;
}
void jpeg_encode_streaming (void)
{
    uint8_t   timeout = 0;
    uint8_t * p_chunk = (uint8_t *) RAW_YCBCR_IMAGE_PTR;
 fsp_err_t err;
 /* Open JPEG Codec */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set output buffer */
```

```
   err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, jpeg_buffer, sizeof(jpeg_buffer));
   assert(FSP_SUCCESS == err);
/* Set the image size */
jpeg_encode_image_size_t image_size;
   image_size.horizontal_resolution    = X_RESOLUTION;
   image_size.vertical_resolution      = Y_RESOLUTION;
   image_size.horizontal_stride_pixels = H_STRIDE;
   err = R_JPEG_EncodeImageSizeSet(&g_jpeg_ctrl, &image_size);
   assert(FSP_SUCCESS == err);
/* Calculate the size of the input data chunk (16 lines in this example) */
   uint32_t chunk_size = H_STRIDE * 16U * YCBCR_BYTES_PER_PIXEL;
while (!timeout)
   {
/* Set the input buffer */
      err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, p_chunk, chunk_size);
     assert(FSP_SUCCESS == err);
/* Wait for a callback */
      timeout = jpeg_event_wait();
if (g_jpeg_status & JPEG_STATUS_OPERATION_COMPLETE)
     {
/* Encode complete */
break;
     }
if (g_jpeg_status & JPEG_STATUS_INPUT_PAUSE)
     {
/* Load next block of input data here (if needed) */
           p_chunk += chunk_size;
     }
   }
}
```

Y'CbCr Conversion

The below function is provided as a reference for how to convert RGB values to Y'CbCr for use with the JPEG Codec.

Note

This function is only partially optimized for clarity. Further appllication-specific size- or speed-based optimizations should be considered when implementing in an actual project.

```
#define RGB565_G_MASK 0x07E0
#define RGB565_B_MASK 0x001F
#define C_0 128
typedef enum e_pixel_format
{
    PIXEL_FORMAT_ARGB8888,
    PIXEL_FORMAT_RGB565
} pixel_format_t;
/* 5-bit to 8-bit LUT */
const uint8_t lut_32[] =
{
    0,   8,   16, 25, 33, 41, 49, 58,
    66, 74, 82, 90, 99, 107, 115, 123,
    132, 140, 148, 156, 165, 173, 181, 189,
    197, 206, 214, 222, 230, 239, 247, 255
};
/* 6-bit to 8-bit LUT */

```

Data Structures

struct	jpeg_instance_ctrl_t

Data Structure Documentation

◆ jpeg_instance_ctrl_t

struct jpeg_instance_ctrl_t		
JPEG Codec module control block. DO NOT INITIALIZE. Initialization occurs when jpep_api_t::open is called.		
Data Fields		
uint32_t	open	JPEG Codec driver status.
jpeg_status_t	status	JPEG Codec operational status.
fsp_err_t	error_code	JPEG Codec error code (if any).
jpeg_mode_t	mode	Current mode (decode or encode).
uint32_t	horizontal_stride_bytes	Horizontal Stride settings.

uint32_t	output_buffer_size	Output buffer size.
jpeg_cfg_t const *	p_cfg	JPEG Decode configuration struct.
void const *	p_extend	JPEG Codec hardware dependent configuration */.
jpeg_decode_pixel_format_t	pixel_format	Pixel format.
uint16_t	total_lines_decoded	Track the number of lines decoded so far.
jpeg_decode_subsample_t	horizontal_subsample	Horizontal sub-sample setting.
uint16_t	lines_to_encode	Number of lines to encode.
uint16_t	vertical_resolution	vertical size
uint16_t	total_lines_encoded	Number of lines encoded.

Function Documentation

◆ R_JPEG_Open()

fsp_err_t R_JPEG_Open (jpeg_ctrl_t *const *p_api_ctrl*, jpeg_cfg_t const *const *p_cfg*)

Initialize the JPEG Codec module.

Note

This function configures the JPEG Codec for operation and sets up the registers for data format and pixel format based on user-supplied configuration parameters. Interrupts are enabled to support callbacks.

Return values

FSP_SUCCESS	JPEG Codec module is properly configured and is ready to take input data.
FSP_ERR_ALREADY_OPEN	JPEG Codec is already open.
FSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
FSP_ERR_IRQ_BSP_DISABLED	JEDI interrupt does not have an IRQ number.
FSP_ERR_INVALID_ARGUMENT	(Encode only) Quality factor, horizontal resolution and/or vertical resolution are invalid.
FSP_ERR_INVALID_ALIGNMENT	(Encode only) The horizontal resolution (at 16bpp) is not divisible by 8 bytes.

◆ R_JPEG_OutputBufferSet()

fsp_err_t R_JPEG_OutputBufferSet (jpeg_ctrl_t * *p_api_ctrl*, void * *p_output_buffer*, uint32_t *output_buffer_size*)

Assign a buffer to the JPEG Codec for storing output data.

Note

In Decode mode, the number of image lines to be decoded depends on the size of the buffer and the horizontal stride settings. Once the output buffer size is known, the horizontal stride value is known, and the input pixel format is known (the input pixel format is obtained by the JPEG decoder from the JPEG headers), the driver automatically computes the number of lines that can be decoded into the output buffer. After these lines are decoded, the JPEG engine pauses and a callback function is triggered, so the application is able to provide the next buffer for the JPEG module to resume the operation.

The JPEG decoding operation automatically starts after both the input buffer and the output buffer are set and the output buffer is big enough to hold at least eight lines of decoded image data.

Return values

FSP_SUCCESS	The output buffer is properly assigned to JPEG codec device.
FSP_ERR_ASSERTION	Pointer to the control block or output_buffer is NULL or output_buffer_size is 0.
FSP_ERR_INVALID_ALIGNMENT	Buffer starting address is not 8-byte aligned.
FSP_ERR_NOT_OPEN	JPEG not opened.
FSP_ERR_JPEG_UNSUPPORTED_IMAGE_SIZE	The number of horizontal pixels exceeds horizontal memory stride.
FSP_ERR_JPEG_BUFFERSIZE_NOT_ENOUGH	Invalid buffer size.
FSP_ERR_IN_USE	The output buffer cannot be changed during codec operation.

◆ R_JPEG_InputBufferSet()

fsp_err_t R_JPEG_InputBufferSet (jpeg_ctrl_t *const *p_api_ctrl*, void * *p_data_buffer*, uint32_t *data_buffer_size*)

Assign an input data buffer to the JPEG codec for processing.

Note

After the amount of data is processed, the JPEG driver triggers a callback function with the flag JPEG_PRV_OPERATION_INPUT_PAUSE set. The application supplies the next chunk of data to the driver so processing can resume.
The JPEG decoding operation automatically starts after both the input buffer and the output buffer are set, and the output buffer is big enough to hold at least one line of decoded image data.

If zero is provided for the decode data buffer size the JPEG Codec will never pause for more input data and will continue to read until either an image has been fully decoded or an error condition occurs.

Note

When encoding images the minimum data buffer size is 8 lines by 16 Y'CbCr 4:2:2 pixels (256 bytes). This corresponds to one minimum coded unit (MCU) of the resulting JPEG output.

Return values

FSP_SUCCESS	The input data buffer is properly assigned to JPEG Codec device.
FSP_ERR_ASSERTION	Pointer to the control block is NULL, or the pointer to the input_buffer is NULL, or the input_buffer_size is 0.
FSP_ERR_INVALID_ALIGNMENT	Buffer starting address is not 8-byte aligned.
FSP_ERR_NOT_OPEN	JPEG not opened.
FSP_ERR_IN_USE	The input buffer cannot be changed while the codec is running.
FSP_ERR_INVALID_CALL	In encode mode the output buffer must be set first.
FSP_ERR_JPEG_IMAGE_SIZE_ERROR	The buffer size is smaller than the minimum coded unit (MCU).

◆ R_JPEG_DecodeLinesDecodedGet()

fsp_err_t R_JPEG_DecodeLinesDecodedGet (jpeg_ctrl_t * *p_api_ctrl*, uint32_t * *p_lines*)

Returns the number of lines decoded into the output buffer.

Note

Use this function to retrieve the number of image lines written to the output buffer after a partial decode operation. Combined with the horizontal stride settings and the output pixel format the application can compute the amount of data to read from the output buffer.

Return values

FSP_SUCCESS	Line count successfully returned.
FSP_ERR_ASSERTION	Pointer to the control block or p_lines is NULL.
FSP_ERR_NOT_OPEN	JPEG not opened.

◆ R_JPEG_DecodeImageSubsampleSet()

fsp_err_t R_JPEG_DecodeImageSubsampleSet (jpeg_ctrl_t *const *p_api_ctrl*, jpeg_decode_subsample_t *horizontal_subsample*, jpeg_decode_subsample_t *vertical_subsample*)

Configure horizontal and vertical subsampling.

Note

This function can be used to scale the output of decoded image data.

Return values

FSP_SUCCESS	Horizontal subsample value is properly configured.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_NOT_OPEN	JPEG not opened.

◆ R_JPEG_DecodeHorizontalStrideSet()

fsp_err_t R_JPEG_DecodeHorizontalStrideSet (jpeg_ctrl_t * *p_api_ctrl*, uint32_t *horizontal_stride*)

Configure horizontal stride setting for decode operations.

Note

If the image size is known prior to the open call and/or the output buffer stride is constant, pass the horizontal stride value in the jpeg_cfg_t structure. Otherwise, after the image size becomes available use this function to set the output buffer horizontal stride value.

Return values

FSP_SUCCESS	Horizontal stride value is properly configured.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_INVALID_ALIGNMENT	Horizontal stride is zero or is not 8-byte aligned.
FSP_ERR_NOT_OPEN	JPEG not opened.

◆ R_JPEG_DecodeImageSizeGet()

fsp_err_t R_JPEG_DecodeImageSizeGet (jpeg_ctrl_t * *p_api_ctrl*, uint16_t * *p_horizontal_size*, uint16_t * *p_vertical_size*)

Obtain the size of an image being decoded.

Return values

FSP_SUCCESS	The image size is available and the horizontal and vertical values are stored in the memory pointed to by p_horizontal_size and p_vertical_size.
FSP_ERR_ASSERTION	Pointer to the control block is NULL and/or size is not ready.
FSP_ERR_NOT_OPEN	JPEG is not opened.

◆ R_JPEG_DecodePixelFormatGet()

fsp_err_t R_JPEG_DecodePixelFormatGet (jpeg_ctrl_t * *p_api_ctrl*, jpeg_color_space_t * *p_color_space*)

Get the color format of the JPEG being decoded.

Return values

FSP_SUCCESS	The color format was successfully retrieved.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_NOT_OPEN	JPEG is not opened.

◆ R_JPEG_EncodeImageSizeSet()

fsp_err_t R_JPEG_EncodeImageSizeSet (jpeg_ctrl_t *const *p_api_ctrl*, jpeg_encode_image_size_t * *p_image_size*)

Set the image dimensions for an encode operation.

Note

Image dimensions must be set before setting the input buffer.

Return values

FSP_SUCCESS	Image size was successfully written to the JPEG Codec.
FSP_ERR_ASSERTION	Pointer to the control block or p_image_size is NULL.
FSP_ERR_INVALID_ALIGNMENT	Horizontal stride is not 8-byte aligned.
FSP_ERR_INVALID_ARGUMENT	Horizontal or vertical resolution is invalid or zero.
FSP_ERR_NOT_OPEN	JPEG not opened.
FSP_ERR_IN_USE	Image parameters cannot be changed while the codec is running.

◆ R_JPEG_ModeSet()

fsp_err_t R_JPEG_ModeSet (jpeg_ctrl_t *const *p_api_ctrl*, jpeg_mode_t *mode*)

Switch between encode and decode mode (or vice-versa).

Note

The codec must not be idle in order to switch modes.

Return values

FSP_SUCCESS	Mode changed successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_IN_USE	JPEG Codec is currently in use.
FSP_ERR_INVALID_ARGUMENT	(Encode only) Quality factor, horizontal resolution and/or vertical resolution are invalid.
FSP_ERR_INVALID_ALIGNMENT	(Encode only) The horizontal resolution (at 16bpp) is not divisible by 8 bytes.

◆ R_JPEG_Close()

fsp_err_t R_JPEG_Close (jpeg_ctrl_t * *p_api_ctrl*)

Cancel an outstanding JPEG codec operation and close the device.

Return values

FSP_SUCCESS	The JPEG unit is stopped and the driver is closed.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_NOT_OPEN	JPEG not opened.

◆ R_JPEG_StatusGet()

fsp_err_t R_JPEG_StatusGet (jpeg_ctrl_t * *p_api_ctrl*, jpeg_status_t * *p_status*)
Get the status of the JPEG codec. This function can also be used to poll the device. **Return values** FSP_SUCCESS — The status information is successfully retrieved. FSP_ERR_ASSERTION — Pointer to the control block or p_status is NULL. FSP_ERR_NOT_OPEN — JPEG is not opened.

Detailed Description

Driver for the MIPI DSI peripheral on RA MCUs. This module implements the Display Interface.

Overview

The MIPI DSI peripheral consists of the Display Serial Interface (DSI-2) Host, physical layer (D-PHY), and supporting sub-systems. Together, these form a high-speed graphics serial bus that formats data from the GLCDC layer and sends it to an external display. The DSI-2 and D-Phy support MIPI Alliance Specification 2 and 2.1 respectively.

Features

The following features are available:

Feature	Options
Pixel formats	RGB888, RGB666, RGB565
Number of lanes	Up to 2
Maximum resolution	See GLCDC specifications
Maximum bandwidth	Up to 750 Mbps per high-speed lane

Features:

- Supports up to 2 Lanes.
- Bidirectional LP mode transfer/receipt (LP-TX / LP-RX).
- Unidirectional High-Speed mode transfer (HS-TX).
- Data rates of up to 720 Mbps per lane.
- Ultra-Low-Power State (ULPS).
- Video input from GLCDC (RGB888, RGB666, RGB565).
- ECC/Checksum generation and verification for packets.
- Generation of scrambled packets.
- Automatic transition from HP to LP during blanking/porch periods.

Configuration

Build Time Configurations for r_mipi_dsi

The following build time configurations are defined in fsp_cfg/r_mipi_dsi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Graphics > MIPI Physical Layer (r_mipi_phy)

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_mipi_phy0	Module name.
Timing			

Timing > THSPREP			
ns	Value must be a number, greater than or equal to zero.	40	(Nanosecond portion) Duration of the data lane LP-00 state, immediately before entry to the HS-0 state (ns)
UI	Value must be a number, greater than or equal to zero.	5	(UI portion) Duration of the data lane LP-00 state, immediately before entry to the HS-0 state (UI)
Timing > THSZERO			
ns	Value must be a number, greater than or equal to zero.	140	(Nanosecond portion) Specify the data lane zero time before sending data (ns).
UI	Value must be a number, greater than or equal to zero.	10	(UI portion) Specify the data lane zero time before sending data (UI).
Timing > THSTRAIL			
ns	Value must be a number, greater than or equal to zero.	60	(Nanosecond portion) Specify the data lane trail time before exiting HS mode (ns).
UI	Value must be a number, greater than or equal to zero.	4	(UI portion) Specify the data lane trail time before exiting HS mode (UI).
Timing > TCLKPOST			
ns	Value must be a number, greater than or equal to zero.	60	(Nanosecond portion) Specify the duration after HS data lane trail time elapses before stopping the clock lane (ns).
UI	Value must be a number, greater than or equal to zero.	52	(UI portion) Specify the duration after HS data lane trail time elapses before stopping the clock lane (UI).
Timing > TCLKPRE			
ns	Value must be a number, greater than or equal to zero.	0	(Nanosecond portion) Specify the time clock is active before transitioning data lane

			into HS mode (ns).
UI	Value must be a number, greater than or equal to zero.	8	(UI portion) Specify the time clock is active before transitioning data lane into HS mode (UI).
Timing > TCLKPREP			
ns	Value must be a number, greater than or equal to zero.	75	(Nanosecond portion) Duration of the clock lane LP-00 state, immediately before entry to the HS-0 state (ns)
UI	Value must be a number, greater than or equal to zero.	0	(UI portion) Duration of the clock lane LP-00 state, immediately before entry to the HS-0 state (UI)
Timing > TLPX			
ns	Value must be a number, greater than or equal to zero.	60	(Nanosecond portion) Specify the time for the clock lane to exit low power mode (ns).
UI	Value must be a number, greater than or equal to zero.	0	(UI portion) Specify the time for the clock lane to exit low power mode (UI).
Timing > TCLKTRL			
ns	Value must be a number, greater than or equal to zero.	60	(Nanosecond portion) Specify the time after clock lane stop before exiting HS mode (ns).
UI	Value must be a number, greater than or equal to zero.	0	(UI portion) Specify the time after clock lane stop before exiting HS mode (UI).
Timing > TCLKZERO			
ns	Value must be a number, greater than or equal to zero.	230	(Nanosecond portion) Specify the time clock lane is zero before starting in HS mode (ns).
UI	Value must be a number, greater than or equal to zero.	0	(UI portion) Specify the time clock lane is zero before starting in HS mode (UI)

Timing > THSEXIT			
ns	Value must be a number, greater than or equal to zero.	100	(Nanosecond portion) Specify the data lane HS mode exit time (ns).
UI	Value must be a number, greater than or equal to zero.	0	(UI portion) Specify the data lane HS mode exit time (UI)
LP Clock Divider	Value must be an integer.	5	Specify the MIPI PHY LP clock division ratio (Resulting frequency must be from 2-17 MHz)
TINIT (ns)	Value must be a number, greater than or equal to zero.	600000	Minimum duration of the TINIT state (ns)
DSI PLL Frequency (MHz)	Value must be between 160 MHz and 1440.0 MHz.	1000.00	Specify the MIPI PHY PLL frequency in MHz.

Configurations for Graphics > MIPI Display (r_mipi_dsi)

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_mipi_dsi0	Module name.
Options			
LCD External Clock Hz	Value must be an integer.	0	Specify the GLCDC external clock frequency in Hz (Set to 0 when GLCDC clock source is set to Internal).
Data Scramble Enable	• Disable • Enable	Disable	Data Scramble Enable. Do not enable unless peripheral has data scramble function.
EoTP Enable	• Disable • Enable	Enable	Disable to support devices that do not support EoTP transmission.
ECC Check Enable	• Disable • Enable	Enable	ECC Check support enable.
CRC Enable	• Virtual Channel 0 • Virtual Channel 1 • Virtual Channel		

	2 • Virtual Channel 3		
Maximum Return Packet Size	Value must be an integer.	1	Specify the maximum return packet size to be received in LP-RX mode.
External Tearing Effect Detection Sense Select	• Rising Edge • Falling Edge	1	Specify the maximum return packet size to be received in LP-RX mode.
HS-TX Timeout Count (us)	Value must be an integer.	0	Set LP-RX Timeout (LRX-H_TO) value. (0 is disabled)
LP-RX Host Processor Timeout (us)	Value must be an integer.	0	Set LP-RX Timeout (LRX-H_TO) value. (0 is disabled)
Turnaround Acknowledge Timeout (us)	Value must be an integer.	0	Set Turnaround Acknowledge Timeout value. (0 is disabled)
Peripheral Response Timeout (us)	Value must be an integer.	0	Set Peripheral Response Timeout BTA value. (0 is disabled)
LP Write Response Timeout (us)	Value must be an integer.	0	Set Low Power Write Acknowledge Timeout value. (0 is disabled)
LP Read Response Timeout (us)	Value must be an integer.	0	Set Low Power Read Acknowledge Timeout value. (0 is disabled)
HS Write Response Timeout (us)	Value must be an integer.	0	Set High Speed Write Acknowledge Timeout value. (0 is disabled)
HS Read Response Timeout (us)	Value must be an integer.	0	Set High Speed Read Acknowledge Timeout value. (0 is disabled)
Low Power			
Ultra Low Power State Wakeup Period (us)	Value must be a positive integer or zero.	1000	Set ultra low power state wakeup period (us).
Clock Lane			
Continuous Mode	• Disable • Enable	Enable	Enable or disable continuous clock mode.
Data Lane			
Number of Data Lanes	Value must be an integer.	2	Specify the number of data lanes. Note: not

			all data lanes are capable of HS operation. See Usage Notes for additional information.
Video Mode			
Video Mode > Pixel Packet			
Sync Pulse	• HSE and VSE are not transmitted • HSE and VSE are transmitted	HSE and VSE are not transmitted	Select if HSE and VSE are transmitted. Disable for Burst Mode sequence or Non-Burst Mode with Sync Events.
Virtual Channel ID	Value must be an integer.	0	Select the video mode virtual channel ID.
Delay Override (0 to disable)	Value must be an integer.	0	Override FSP calculated delay value (not recommended for most users). Delay for DSI Host between first data reception from display module until DSI output begins. (Unit: 32xUI). Set to 0 to use FSP calculated value (recommended).
Prevent LP Transition	• No LP during the HSA period • No LP during the HBP period • No LP during the HFP period		Prevent LP transition during specified periods.
Interrupts			
dsi_seq0 Interrupt Priority	MCU Specific Options		Select the Low-Power Sequence command operation interrupt priority.
dsi_seq1 Interrupt Priority	MCU Specific Options		Select the High-Speed Sequence command operation interrupt priority.
dsi_vin1 Interrupt Priority	MCU Specific Options		Select the Video Input interrupt priority.
dsi_rcv Interrupt Priority	MCU Specific Options		Select the Receive interrupt priority.
dsi_ferr Interrupt Priority	MCU Specific Options		Select the Fatal Error interrupt priority.
dsi_ppi Interrupt	MCU Specific Options		Select the PHY-Protocol

Priority			Interface interrupt priority.
Receive Interrupt Enable	Refer to the RA Configuration tool for available options.	module.driver.mipi_dsi.rxie.btarend,module.driver.mipi_dsi.rxie.lrxhto,module.driver.mipi_dsi.rxie.tato,module.driver.mipi_dsi.rxie.rxresp,module.driver.mipi_dsi.rxie.rxeotp_msk,module.driver.mipi_dsi.rxie.rxte,module.driver.mipi_dsi.rxie.rxack,module.driver.mipi_dsi.rxie.extedet,module.driver.mipi_dsi.rxie.mlferr,module.driver.mipi_dsi.rxie.eccerrm,module.driver.mipi_dsi.rxie.unexerr,module.driver.mipi_dsi.rxie.wcerr,module.driver.mipi_dsi.rxie.crcerr,module.driver.mipi_dsi.rxie.iberr,module.driver.mipi_dsi.rxie.rxovferr,module.driver.mipi_dsi.rxie.prtoerr,module.driver.mipi_dsi.rxie.noreserr,module.driver.mipi_dsi.rxie.rsizeerr,module.driver.mipi_dsi.rxie.eccerrs,module.driver.mipi_dsi.rxie.rxake	Enable receive interrupts.
Fatal Error Interrupt Enable	• HS TX Timeout • LP-RX Host Processor Timeout • Turnaround Acknowledge Timeout • Escape mode Entry Error • LPDT Sync Error • Control Error • LP0 Contention Error • LP1 Contention Error	module.driver.mipi_dsi.ferrie.htxto,module.driver.mipi_dsi.ferrie.lrxhto,module.driver.mipi_dsi.ferrie.tato,module.driver.mipi_dsi.ferrie.escent,module.driver.mipi_dsi.ferrie.syncesc,module.driver.mipi_dsi.ferrie.ctrl,module.driver.mipi_dsi.ferrie.clp0,module.driver.mipi_dsi.ferrie.clp1	Enable Fatal Error interrupts.
Physical Lane Interrupt Enable	• Data Lane-0 Rx to Tx Transition • Data Lane-0 Tx to Rx Transition • Clock Lane		Enable Physical Lane interrupts.

	ULPS Enter • Clock Lane ULPS Exit • Clock Lane LP to HS Transition • Clock Lane HS to LP Transition • Data Lane ULPS Enter • Data Lane ULPS Exit		
Video Mode Interrupt Enable	• Video Mode Operation Start • Video Mode Operation Stop • Video Mode Operation Ready • Timing Error • Video Buffer Underflow Error • Video Buffer Overflow Error	module.driver.mipi_dsi.vmie.vbufudf,module.driver.mipi_dsi.vmie.vbufovf	Enable Video Mode interrupts.
Sequence Channel 0 Interrupt Enable	• All Actions Finish • All Descriptors Finish • Tx Internal Bus Error • Receive Fatal Error • Receive Fail • Receive Packet Data Fail • Receive Correctable Error Interrupt • Receive Acknowledge and Error Report Packet	module.driver.mipi_dsi.sqch0ie.aactfin,module.driver.mipi_dsi.sqch0ie.adesfin,module.driver.mipi_dsi.sqch0ie.txiberr,module.driver.mipi_dsi.sqch0ie.rxferr,module.driver.mipi_dsi.sqch0ie.rxfail,module.driver.mipi_dsi.sqch0ie.rxpfail,module.driver.mipi_dsi.sqch0ie.rxcorerr,module.driver.mipi_dsi.sqch0ie.rxake	Enable Sequence Channel 0 interrupts.
Sequence Channel 1 Interrupt Enable	• All Actions Finish • All Descriptors Finish • Packet Size Error • Tx Internal Bus Error • Receive Fatal Error • Receive Fail • Receive Packet	module.driver.mipi_dsi.sqch1ie.aactfin,module.driver.mipi_dsi.sqch1ie.adesfin,module.driver.mipi_dsi.sqch1ie.sizeerr,module.driver.mipi_dsi.sqch1ie.txiberr,module.driver.mipi_dsi.sqch1ie.rxferr,module.driver.mipi_dsi.sqch1ie.rxfail,module.driver.mipi_dsi.sqch1ie.rxpfail,module.	Enable Sequence Channel 1 interrupts.

	Data Fail • Receive Correctable Error Interrupt • Receive Acknowledge and Error Report Packet	driver.mipi_dsi.sqch1ie.rxcorerr,module.driver.mipi_dsi.sqch1ie.rxake	
Callback	Name must be a valid C symbol	mipi_dsi0_callback	A user callback function. If this callback function is provided it is called from the interrupt service routine (ISR) each time any interrupt occurs.
Callback Context	Name must be a valid C symbol	NULL	Pointer to the context structure to be passed through the callback argument.

Clock Configuration

The MIPI DSI D-PHY has a dedicated regulator (D-PHY LDO) and PLL (D-PHY PLL), which are managed by the driver. The D-PHY PLL frequency must be configured between 160 MHz and 1.44 GHz.

Note

The D-PHY High-Speed data transmission rate is determined by the following formula: Line rate [Mbps] = fDPHYPLL [MHz] / 2

Pin Configuration

Communication to the external display occurs via one or more data lanes and one clock lane. Each of these lanes has dedicated pins. Lane 0 is capable of low-power data transfer and bidirectional communication with a display. Lane 1 is capable of low-power or high-speed data transfer to the external display. Additionally, an optional tearing effect connection (DSI_TE) may be used with this module.

Usage Notes

Display Data

The DSI-2 Host consumes data from the GLCDC module and prepares it for output via the D-PHY and connections to the display.

MIPI DSI Operating Modes

MIPI DSI is capable of several operating modes: Non-Burst Mode with Sync Pulse, Non-Burst Mode with Sync Event, and Burst Mode. Each operational mode is achieved by configuring the peripheral with specific timimg and option settings.

Non-Burst Mode with Sync Pulse:

- GLCDC Video Clock bandwidth == MIPI Phy PLL bandwidth

- Sync Pulse is enabled (HSE and VSE are transmitted)

Non-Burst Mode with Sync Event:

- GLCDC Video Clock bandwidth == MIPI Phy PLL bandwidth
- Sync Pulse is disabled (HSE and VSE are not transmitted)

Burst Mode:

- GLCDC Video Clock bandwidth < MIPI Phy PLL bandwidth
- Sync Pulse is disabled (HSE and VSE are not transmitted)

For the purpose of this section:

- GLCDC Video Clock bandwidth is defined as: (Panel Clock MHz) * (Bits per pixel)
- MIPI Phy PLL bandwidth is defined as: (MIPI Phy PLL Clock MHz / 2) * (Number of MIPI data lanes) * 8 - (Configuration Dependent Transmission Overhead)

MIPI PHY Data Lanes

The DSI-2 Host supports two basic types of operations: Command Mode and Video Mode. While a data lane is in Low-Power (LP) operation, Command Mode may be used for bi-directional communication with a connected display using a pre-defined set of command descriptors.

Note

GLCDC Video Clock bandwidth must not exceed Data Bus bandwidth or MIPI Phy PLL bandwidth.

MIPI PHY Timing Configuration

The MIPI DSI D-PHY configuration controls timing aspects of Low Power (LP) and High Speed (HS) communication. Configure these values to match specifications listed in the datasheet for the display.

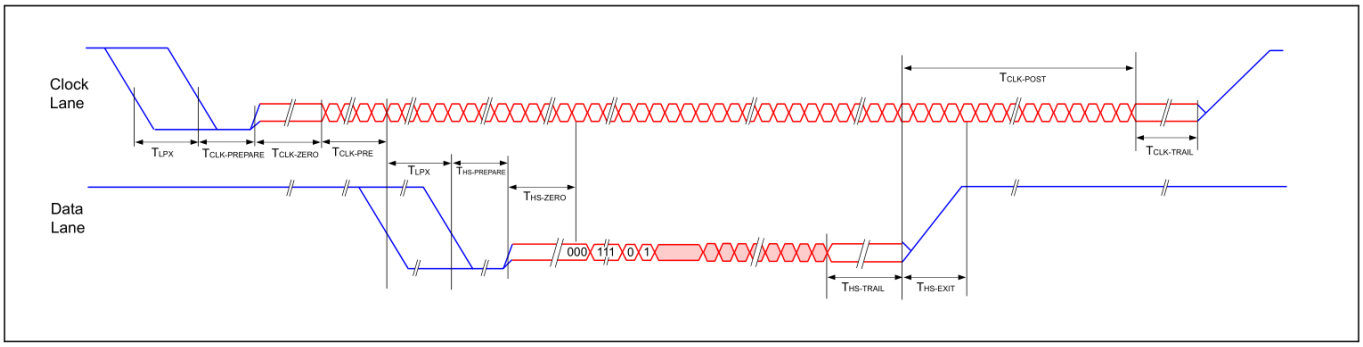

Figure 225: High-Speed data transmission in normal mode

Command Mode Operation

Two internal channels may be used for command mode operations, available for all physical lane configurations. Channel-0 supports only LP mode (LP-TX, LP-RX), while Channel-1 supports LP mode (LP-TX, LP-RX) and HS mode (HS-TX).

There are two basic packet formats, short and long. Each format may be transmitted in high-speed or low-power modes. Packets may be followed by a Bus Turn-Around (BTA) request for reading

information from the display. Once configured and started, video packets are transmitted automatically, until video output is stopped.

In addition to the full set of MIPI DSI commands, the application may trigger any of four special commands by setting flags in the message structure. These special commands are Reset Signal, Initial Skew Calibration, Periodic Skew Calibration, and No-Operation.

Note

For peripherals with more than one lane, physical Lane 0 is used for all peripheral-to-processor transmissions. Other lanes are unidirectional, from the host processor to the peripheral.

Acknowledge and Error Reporting

The application is notified of Acknowledge and Error Reporting (AwER) via an optional receive interrupt event. The most recent and accumulated AwER data may be retrieved by calling R_MIPI_DSI_StatusGet(). The application may send a MIPI_DSI_CMD_FLAG_BTA_NO_WRITE message with tx size of zero to request AwER from the peripheral.

Ultra-low Power State

Ultra-low Power State (ULPS) may be actived when HS and LP operations are not occurring. Clock and Data lanes may be transitioned into ULPS independently from each other.

Limitations

Developers should be aware of the following limitations when using the MIPI DSI API:

- MIPI DSI must be closed before transitioning MCU into low-power modes.
- Data bus bandwidth limitations should be considered when setting GLCDC and MIPI DSI clock speeds.
- When the MIPI DSI is used, voltage of VCC and AVCC_MIPI pin must be same and 3V or larger(VCC=AVCC_MIPI≧3V)

Interrupt Configuration

When enabled, Interrupts will invoke the configured callback function. Low-power and High-Speed command status should be determined by checking Sequence 0 and Sequence 1 events, respectively. See the DSI Error Handling section of the user manual for information about how to handle error events.

MIPI DSI Setup with External Display

Especially for use with display middleware such as emWin or GUIX, the callback will be invoked with post-open and pre-video-start events. Depending on your hardware, it may be necessary to use these events to configure the display.

Examples

Basic Example

This is a basic example showing the minimum code required to initialize and start the MIPI DSI module.

```
void mipi_dsi_minimal_example (void)
```

```
{
 fsp_err_t err = FSP_SUCCESS;
    err = R_MIPI_DSI_Open(&g_mipi_dsi0_ctrl, &g_mipi_dsi0_cfg);
    assert(FSP_SUCCESS == err);
 /* Application to perform display specific initialization. */
    uint8_t       cmd_tx_buffer[] = {0x30, 0x01}; // NOLINT(readability-magic-
numbers)
 mipi_dsi_cmd_t cmd             =
    {
       .channel    = 0,
       .cmd_id      = MIPI_DSI_CMD_ID_DCS_SHORT_WRITE_1_PARAM,
       .flags       = (mipi_dsi_cmd_flag_t) (MIPI_DSI_CMD_FLAG_LOW_POWER |
MIPI_DSI_CMD_FLAG_BTA_READ),
       .tx_len      = 1,
       .p_tx_buffer = cmd_tx_buffer,
    };
    err = R_MIPI_DSI_Command(&g_mipi_dsi0_ctrl, &cmd);
    assert(FSP_SUCCESS == err);
 /* Wait for tx/rx complete before sending additional messages */
 while (!message_tx_complete)
    {
       ;
    }
 while (!message_rx_complete)
    {
       ;
    }
    err = R_MIPI_DSI_Start(&g_mipi_dsi0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Trigger status message from peripheral by sending LP BTA
  * NOTE: This is requried for ack_err status data to be populated */
 mipi_dsi_cmd_t read_cmd = {0};
    read_cmd.cmd_id = MIPI_DSI_CMD_ID_DCS_READ;
    read_cmd.flags |= MIPI_DSI_CMD_FLAG_BTA_NO_WRITE | MIPI_DSI_CMD_FLAG_LOW_POWER;
```

```
    message_rx_complete = false;
    err                 = R_MIPI_DSI_Command(&g_mipi_dsi0_ctrl, &read_cmd);
    assert(FSP_SUCCESS == err);
 while (!message_rx_complete)
    {
       ;
    }
 /* Read peripheral and local MIPI DSI status
  * Note: peripheral ack_err status is cleared each time it is read using StatusGet
*/
 mipi_dsi_status_t status;
    err = R_MIPI_DSI_StatusGet(&g_mipi_dsi0_ctrl, &status);
    assert(FSP_SUCCESS == err);
    err = R_MIPI_DSI_Stop(&g_mipi_dsi0_ctrl);
    assert(FSP_SUCCESS == err);
    err = R_MIPI_DSI_UlpsEnter(&g_mipi_dsi0_ctrl, (mipi_dsi_lane_t)
(MIPI_DSI_LANE_CLOCK | MIPI_DSI_LANE_DATA_ALL));
    assert(FSP_SUCCESS == err);
    err = R_MIPI_DSI_UlpsExit(&g_mipi_dsi0_ctrl, (mipi_dsi_lane_t)
(MIPI_DSI_LANE_CLOCK | MIPI_DSI_LANE_DATA_ALL));
    assert(FSP_SUCCESS == err);
    err = R_MIPI_DSI_Close(&g_mipi_dsi0_ctrl);
    assert(FSP_SUCCESS == err);
}

Data Structures

struct	mipi_dsi_irq_cfg_t
struct	mipi_dsi_extended_cfg_t
struct	mipi_dsi_instance_ctrl_t

Data Structure Documentation

◆ mipi_dsi_irq_cfg_t

struct mipi_dsi_irq_cfg_t		
MIPI DSI interrupt configuration		
Data Fields		
uint8_t	ipl	Interrupt priority.

IRQn_Type	irq	Interrupt vector number.

◆ mipi_dsi_extended_cfg_t

struct mipi_dsi_extended_cfg_t		
Extended configuration structure for MIPI DSI.		
Data Fields		
mipi_dsi_irq_cfg_t	dsi_seq0	Sequence 0 interrupt.
mipi_dsi_irq_cfg_t	dsi_seq1	Sequence 1 interrupt.
mipi_dsi_irq_cfg_t	dsi_ferr	DSI Fatal Error interrupt.
mipi_dsi_irq_cfg_t	dsi_ppi	D-PHY PPI interrupt.
mipi_dsi_irq_cfg_t	dsi_rcv	Receive interrupt.
mipi_dsi_irq_cfg_t	dsi_vin1	Video Input Operation interrupt.
uint32_t	dsi_rxie	Receive interrupt enable configuration.
uint32_t	dsi_ferrie	Fatal error interrupt enable configuration.
uint32_t	dsi_plie	Physical lane interrupt enable configuration.
uint32_t	dsi_vmie	Video mode interrupt enable configuration.
uint32_t	dsi_sqch0ie	Sequence Channel 0 interrupt enable configuration.
uint32_t	dsi_sqch1ie	Sequence Channel 1 interrupt enable configuration.

◆ mipi_dsi_instance_ctrl_t

struct mipi_dsi_instance_ctrl_t	
MIPI DSI instance control block.	
Data Fields	
uint32_t	open
	Interface is open.
bool	data_ulps_active
	Data lane ULPS status.
bool	clock_ulps_active

	Data lane ULPS status.
mipi_dsi_lane_t	ulps_status
	Ultra-low Power State active status.
mipi_dsi_cfg_t const *	p_cfg
	Pointer to configuration structure used to open the interface.
void(*	p_callback)(mipi_dsi_callback_args_t *)
	Pointer to callback that is called when an adc_event_t occurs.
void const *	p_context
	Pointer to context to be passed into callback function.
mipi_dsi_callback_args_t *	p_callback_memory
	Pointer to non-secure memory that can be used to pass arguments to a callback in non-secure memory.

Function Documentation

◆ R_MIPI_DSI_Open()

fsp_err_t R_MIPI_DSI_Open (mipi_dsi_ctrl_t *const *p_api_ctrl*, mipi_dsi_cfg_t const *const *p_cfg*)

Initialize the MIPI DSI peripheral.

Return values

FSP_SUCCESS	The channel was successfully opened.
FSP_ERR_ASSERTION	One or both of the parameters was NULL.
FSP_ERR_ALREADY_OPEN	The instance is already opened.
FSP_ERR_INVALID_STATE	Display module must be opened before DSI.

◆ R_MIPI_DSI_Close()

fsp_err_t R_MIPI_DSI_Close (mipi_dsi_ctrl_t *const *p_api_ctrl*)

Close MIPI DSI and display data instances, disable interrupts, and power-off the module.

Return values

FSP_SUCCESS	The channel is successfully closed.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.
FSP_ERR_IN_USE	Operation in progress and must be stopped before closing.

◆ R_MIPI_DSI_Start()

fsp_err_t R_MIPI_DSI_Start (mipi_dsi_ctrl_t *const *p_api_ctrl*)

Start video output. Initialize Video Output Registers Perform sequence steps 3 to 5 from section 58.3.6.1 in RA8D1 hardware manual R01UH0995EJ0060.

Return values

FSP_SUCCESS	Data is successfully written to the D/A Converter.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.
FSP_ERR_IN_USE	The physical interface is currently in use.
FSP_ERR_INVALID_STATE	DSI is already in video mode.

◆ R_MIPI_DSI_Stop()

fsp_err_t R_MIPI_DSI_Stop (mipi_dsi_ctrl_t *const *p_api_ctrl*)

Stop video output.

Return values

FSP_SUCCESS	Data is successfully written to the D/A Converter.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.
FSP_ERR_IN_USE	DSI cannot be closed while ULPS is active.

◆ R_MIPI_DSI_UlpsEnter()

fsp_err_t R_MIPI_DSI_UlpsEnter (mipi_dsi_ctrl_t *const *p_api_ctrl*, mipi_dsi_lane_t *lane*)

Enter Ultra-low Power State (ULPS).

Return values

FSP_SUCCESS	Information read successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.
FSP_ERR_INVALID_MODE	Invalid mode for transition.

◆ R_MIPI_DSI_UlpsExit()

fsp_err_t R_MIPI_DSI_UlpsExit (mipi_dsi_ctrl_t *const *p_api_ctrl*, mipi_dsi_lane_t *lane*)

Exit Ultra-low Power State (ULPS).

Return values

FSP_SUCCESS	Information read successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.

◆ R_MIPI_DSI_Command()

fsp_err_t R_MIPI_DSI_Command (mipi_dsi_ctrl_t *const *p_api_ctrl*, mipi_dsi_cmd_t * *p_cmd*)

Send a command to the peripheral device.

Note

p_data will be used as either write data or a read buffer depending on the data id.
p_data memory must not be updated until sequence operation is complete if byte_count is greater than 16.

Return values

FSP_SUCCESS	Command(s) queued successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL. cmd_id specifies a long packet but p_data is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.
FSP_ERR_IN_USE	The physical interface is currently in use or video mode is in operation.
FSP_ERR_INVALID_POINTER	Invalid pointer provided
FSP_ERR_INVALID_ARGUMENT	Invalid message configuration
FSP_ERR_INVALID_CHANNEL	Invalid channel for provided message configuration

◆ R_MIPI_DSI_StatusGet()

fsp_err_t R_MIPI_DSI_StatusGet (mipi_dsi_ctrl_t *const *p_api_ctrl*, mipi_dsi_status_t * *p_status*)

Provide information about current MIPI DSI status.

Note: Acknowledge and Error Status is only cleared when read by calling this function.

Return values

FSP_SUCCESS	Information read successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.

Detailed Description

Driver for the PDC peripheral on RA MCUs. This module implements the CAPTURE Interface.

Overview

The PDC peripheral supports interfacing with external cameras by accepting timing and data signals in order to capture incoming data. A callback is invoked every time a frame of data is accepted.

Features

- Capture incoming data into a user defined buffer
- Data bytes per pixel can be configured
- Endianess of the incoming data can be specified
- Supports configuring capture width and height
- Supports configuring vertical and horizontal sync polarity
- Horizontal and Vertical position for image/data capture can be specified
- External clock to the camera module can be adjusted
- Choice between DMA and DTC to transfer out the captured data
- The specified user callback is invoked when a data frame is captured

Configuration

Build Time Configurations for r_pdc

The following build time configurations are defined in fsp_cfg/r_pdc_cfg.h:

Configuration	Options	Default	Description

Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Graphics > Parallel Data Capture (r_pdc)

This module can be added to the Stacks tab via New Stack > Graphics > Parallel Data Capture (r_pdc).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_pdc0	Module name.
Input			
Input > Signal polarity			
HSYNC	• High • Low	High	Specify the active polarity of the HSYNC signal.
VSYNC	• High • Low	High	Specify the active polarity of the VSYNC signal.
Input > Capture Specifications			
Number of pixels to capture horizontally	Value must be an integer greater than 0	640	Specify the number of horizontal pixels to capture.
Number of lines to capture vertically	Value must be an integer greater than 0	480	Specify the number of vertical pixels to capture.
Horizontal pixel to start capture from	Value must be an integer	0	Specify the horizontal pixel to start capturing image data from. Allows an image smaller than the native resolution of a camera to be captured.
Line to start capture from	Value must be an integer	0	Specify the vertical line to start capturing image data from. Allows an image smaller than the native resolution of a camera to be captured.
Bytes per pixel	Value must be an integer greater than 0	2	Specify the number of bytes per pixel of the captured image data.
Clock divider	• CLK/2	CLK/2	Specify the clock

	• CLK/4 • CLK/6 • CLK/8 • CLK/10 • CLK/12 • CLK/14 • CLK/16		divider for clock frequency of the clock input PCKO to the PDC peripheral.
Endianess	• Little • Big	Little	Specify the endianness of the captured image data.
Output			
Output > Buffer			
Number of image buffers	Value must be an integer greater than 0	1	Specify the number of buffers to create.
Interrupts			
Callback	Name must be a valid C symbol	g_pdc_user_callback	A user callback function must be provided. This callback is invoked for every successful frame capture and any error conditions
PDC Interrupt Priority	MCU Specific Options		Select the PDC interrupt priority.
DTC Interrupt Priority	MCU Specific Options		Select the DTC interrupt priority.

Clock Configuration

The PDC peripheral module uses the PCLKB as its clock source. The maximum clock to the camera module is PCLKB / 2.

Pin Configuration

The PCKO pin is a clock output and should be connected to the clock input of the camera. The PIXCLK pin is a clock input and should be connected to the output pixel clock of the camera. Likewise, the HSYNC and VSYNC pins must be connected to the horizontal and vertical sync signals of the camera, respectively. The PIXD0-PIXD7 pins are the 8-bit data bus input and should be connected to the relevant output pins of the camera.

Note

Camera control and serial communication pins must be configured separately and are not controlled by this module.

Usage Notes

Interrupt Configuration

- PDC error interrupts are used by this module for reporting errors such as overrun, underrun,

vertical line number setting and horizontal byte number setting errors.
- In addition to the PDC error interrupts, DMA or DTC interrupts are also used internally to perform data transfer from this peripheral to the specified image buffer.
- Receive data ready interrupt is used as activation source for DMA and DTC trigger.

Enabling Transfer Modules

- An option to select between DMAC or DTC is provided with DMA as the default transfer choice.
- For further details on DMA please refer Transfer (r_dmac)
- For further details on DTC please refer Transfer (r_dtc)

PDC setup with external camera

- Before configuring the external camera device the PDC Open API must be called in order to start clock output.
- Ensure that the memory pointed to by p_buffer is both valid and large enough to store a complete image.
- The amount of space required (in bytes) can be calculated as: size (bytes) = image width (pixels) * image height (lines) * number of bytes per pixel
- Ensure that the size above is divisible by and aligned to 32 bytes.

Examples

Basic Example

This is a basic example of minimal use of the PDC in an application. This example shows how this driver can be used for capturing data from an external I/O device such as an image sensor.

```
void g_pdc_user_callback (capture_callback_args_t * p_args)
{
 if (PDC_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
       g_capture_ready = true;
    }
}
void basic_example (void)
{
 fsp_err_t err;
 /* Initialize the PDC module */
    err = R_PDC_Open(&g_pdc0_ctrl, &g_pdc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize the camera module at this point. This implementation is camera vendor
specific. */
```

```
    camera_module_initialization();
 /* Initialize capture ready flag to false. This gets set to true in PDC callback
upon successful frame capture. */
    g_capture_ready = false;
    err = R_PDC_CaptureStart(&g_pdc0_ctrl, g_user_buffer);
    assert(FSP_SUCCESS == err);
    uint32_t timeout_ms = PDC_DELAY_MS;
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((true != g_capture_ready) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;;
    }
 if (0U == timeout_ms)
    {
       __BKPT(0);
    }
}
static void camera_module_initialization (void)
{
 /* Camera vendor specific initialization to be done here */
}
```

Data Structures

struct	pdc_extended_cfg_t
struct	pdc_instance_ctrl_t

Enumerations

enum	pdc_event_t
enum	pdc_clock_division_t
enum	pdc_endian_t
enum	pdc_hsync_polarity_t
enum	pdc_vsync_polarity_t

Data Structure Documentation

◆ pdc_extended_cfg_t

struct pdc_extended_cfg_t		
Extended configuration structure for PDC.		
Data Fields		
pdc_clock_division_t	clock_division	Clock divider.
pdc_endian_t	endian	Endian of capture data.
pdc_hsync_polarity_t	hsync_polarity	Polarity of HSYNC input.
pdc_vsync_polarity_t	vsync_polarity	Polarity of VSYNC input.
uint8_t	pdc_ipl	PDC interrupt priority.
uint8_t	transfer_req_ipl	Transfer interrupt priority.
IRQn_Type	pdc_irq	PDC IRQ number.
IRQn_Type	transfer_req_irq	Transfer request IRQ number.
transfer_instance_t const *	p_lower_lvl_transfer	Pointer to the transfer instance the PDC should use.

◆ pdc_instance_ctrl_t

struct pdc_instance_ctrl_t
PDC instance control block. DO NOT INITIALIZE.

Enumeration Type Documentation

◆ pdc_event_t

enum pdc_event_t	
PDC events	
Enumerator	
PDC_EVENT_TRANSFER_COMPLETE	Complete frame transferred by DMAC/DTC.
PDC_EVENT_RX_DATA_READY	Receive data ready interrupt.
PDC_EVENT_FRAME_END	Frame end interrupt.
PDC_EVENT_ERR_OVERRUN	Overrun interrupt.
PDC_EVENT_ERR_UNDERRUN	Underrun interrupt.
PDC_EVENT_ERR_V_SET	Vertical line setting error interrupt.
PDC_EVENT_ERR_H_SET	Horizontal byte number setting error interrupt.

◆ pdc_clock_division_t

enum pdc_clock_division_t	
Clock divider applied to PDC clock to provide PCKO output frequency	
Enumerator	
PDC_CLOCK_DIVISION_2	CLK / 2.
PDC_CLOCK_DIVISION_4	CLK / 4.
PDC_CLOCK_DIVISION_6	CLK / 6.
PDC_CLOCK_DIVISION_8	CLK / 8.
PDC_CLOCK_DIVISION_10	CLK / 10.
PDC_CLOCK_DIVISION_12	CLK / 12.
PDC_CLOCK_DIVISION_14	CLK / 14.
PDC_CLOCK_DIVISION_16	CLK / 16.

◆ pdc_endian_t

enum pdc_endian_t	
Endian of captured data	
Enumerator	
PDC_ENDIAN_LITTLE	Data is in little endian format.
PDC_ENDIAN_BIG	Data is in big endian format.

◆ pdc_hsync_polarity_t

enum pdc_hsync_polarity_t	
Polarity of input HSYNC signal	
Enumerator	
PDC_HSYNC_POLARITY_HIGH	HSYNC signal is active high.
PDC_HSYNC_POLARITY_LOW	HSYNC signal is active low.

◆ pdc_vsync_polarity_t

enum pdc_vsync_polarity_t	
Polarity of input VSYNC signal	
Enumerator	
PDC_VSYNC_POLARITY_HIGH	VSYNC signal is active high.
PDC_VSYNC_POLARITY_LOW	VSYNC signal is active low.

Function Documentation

◆ R_PDC_Open()

fsp_err_t R_PDC_Open (capture_ctrl_t *const *p_ctrl*, capture_cfg_t const *const *p_cfg*)

Powers on PDC, handles required initialization described in the hardware manual.

Implements capture_api_t::open.

The Open function provides initial configuration for the PDC module. It powers on the module and enables the PCLKO output and the PIXCLK input. Further initialization requires the PIXCLK input to be running in order to be able to reset the PDC as part of its initialization. This clock is input from a camera module and so the reset and further initialization is performed in capture_api_t::captureStart. This function should be called once prior to calling any other PDC API functions. After the PDC is opened the Open function should not be called again without first calling the Close function.

Example:

```
/* Initialize the PDC module */
   err = R_PDC_Open(&g_pdc0_ctrl, &g_pdc0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	One or more of the following parameters is NULL 1. p_cfg is NULL 2. p_api_ctrl is NULL 3. The pointer to the transfer interface in the p_cfg parameter is NULL 4. Callback parameter is NULL. 5. Invalid IRQ number assigned
FSP_ERR_INVALID_ARGUMENT	One or more of the following parameters is incorrect 1. bytes_per_pixel is zero 2. x_capture_pixels is zero 3. y_capture_pixels is zero 4. x_capture_start_pixel + x_capture_pixels is greater than 4095, OR 5. y_capture_start_pixel + y_capture_pixels is greater than 4095
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ R_PDC_Close()

fsp_err_t R_PDC_Close (capture_ctrl_t *const *p_ctrl*)

Stops and closes the transfer interface, disables and powers off the PDC, clears internal driver data and disables interrupts.

Implements capture_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	p_api_ctrl is NULL
FSP_ERR_NOT_OPEN	Open has not been successfully called.

◆ R_PDC_CaptureStart()

fsp_err_t R_PDC_CaptureStart (capture_ctrl_t *const *p_ctrl*, uint8_t *const *p_buffer*)

Starts a capture. Enables interrupts.

Implements capture_api_t::captureStart.

Sets up the transfer interface to transfer data from the PDC into the specified buffer. Configures the PDC settings as previously set by the capture_api_t::open API. These settings are configured here as the PIXCLK input must be active for the PDC reset operation. When a capture is complete the callback registered during capture_api_t::open API call will be called.

Example:

```
err = R_PDC_CaptureStart(&g_pdc0_ctrl, g_user_buffer);

assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Capture start successful.
FSP_ERR_ASSERTION	One or more of the following parameters is NULL 1. p_api_ctrl is NULL 2. p_buffer is NULL
FSP_ERR_NOT_OPEN	Open has not been successfully called.
FSP_ERR_IN_USE	PDC transfer is already in progress.
FSP_ERR_TIMEOUT	Reset operation timed out.
FSP_ERR_NOT_INITIALIZED	Callback function has not been set

◆ R_PDC_StatusGet()

fsp_err_t R_PDC_StatusGet (capture_ctrl_t *const *p_ctrl*, capture_status_t * *p_status*)

Provides the pdc operating status.

Implements capture_api_t::statusGet.

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	One or more parameters is NULL.
FSP_ERR_NOT_OPEN	Open has not been successfully called.

◆ R_PDC_CallbackSet()

fsp_err_t R_PDC_CallbackSet (capture_ctrl_t *const *p_ctrl*, void(*)(capture_callback_args_t *) *p_callback*, void const *const *p_context*, capture_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure.

Implements capture_api_t::callbackSet.

Return values

FSP_ERR_UNSUPPORTED	This is just a stub at present

5.2.8.8 SEGGER emWin RA Port (rm_emwin_port)

Modules » Graphics

SEGGER emWin port for RA MCUs.

Overview

The SEGGER emWin RA Port module provides the configuration and hardware acceleration support necessary for use of emWin on RA products. The port provides full integration with the graphics peripherals (GLCDC, DRW and JPEG) as well as FreeRTOS.

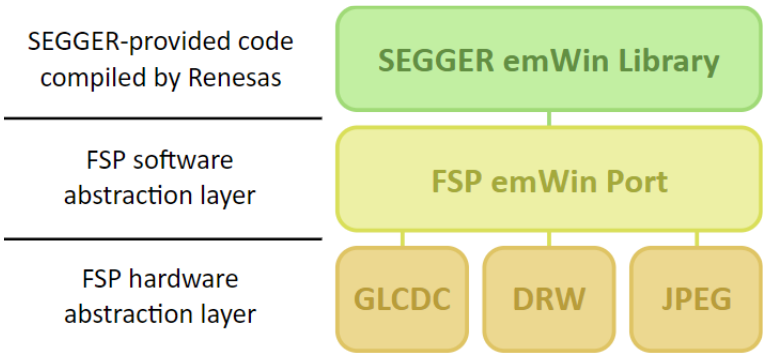

Figure 226: SEGGER emWin FSP Port Block Diagram

Note

This port layer primarily enables hardware acceleration and background handling of many display operations and does not contain code intended to be directly called by the user. Please consult the SEGGER emWin User Guide (UM03001) for details on how to use emWin in your project.

Hardware Acceleration

The following functions are currently performed with hardware acceleration:

- DRW Engine (r_drw)
  - Drawing bitmaps (ARGB8888 and RGB565)
  - 4bpp font rendering
  - Rectangle fill
  - Line and shape drawing
  - Anti-aliased operations
    - Circle stroke and fill
    - Polygon stroke and fill
    - Lines and arcs
- JPEG Codec (r_jpeg)
  - JPEG decoding
- Graphics LCD Controller (r_glcdc)
  - Brightness, contrast and gamma correction
  - Pixel format conversion (framebuffer to LCD)

Configuration

Build Time Configurations for rm_emwin_port

The following build time configurations are defined in fsp_cfg/rm_emwin_port_cfg.h:

Configuration	Options	Default	Description
Memory Allocation			
GUI Heap Size	Value must be a non-negative integer	32768	Set the size of the heap to be allocated for use exclusively by emWin.
Section for GUI Heap	Manual Entry	.noinit	Specify the section in which to allocate the GUI heap. When Arm

			Compiler 6 is used to place this memory in on-chip SRAM, the section name must be .bss or start with .bss. to avoid consuming unnecessary ROM space.
Maximum Layers	Value must be a non-negative integer	16	Set the maximum number of available display layers in emWin. This setting is not related to GLCDC Layer 1 or 2.
AA Font Conversion Buffer Size	Value must be a non-negative integer	400	Set the size of the conversion buffer for anti-aliased font glyphs. This should be set to the size (in bytes) of the largest AA character to be rendered.
LCD Settings			
Wait for Vertical Sync	• Enabled • Disabled	Enabled	When enabled emWin will wait for a vertical sync event each time the display is updated. If an RTOS is used the thread will yield; otherwise each frame will block until Vsync. WARNING: Disabling vertical sync will result in tearing. It is recommended to always leave this setting Enabled if an RTOS is used.
JPEG Decoding			
JPEG Decoding > General			
Input Alignment	• 8-byte aligned (faster) • Unaligned (slower)	8-byte aligned (faster)	Setting this option to 8-bit alignment can allow the hardware JPEG Codec to directly read JPEG data. This speeds up JPEG decoding operations and reduces RAM

			overhead, but all JPEG images must reside on an 8-byte boundary. When this option is enabled the input buffer is not allocated.
Double-Buffer Output	• Enabled • Disabled	Disabled	Enable this option to configure JPEG decoding operations to use a double-buffered output pipeline. This allows the JPEG to be rendered to the display at the same time as decoding at the cost of additional RAM usage. Enabling this option automatically allocates double the output buffer size.
Error Timeout	Value must be a non-negative integer	50	Set the timeout for JPEG decoding operations (in RTOS ticks) in the event of a decode error.
JPEG Decoding > Buffers			
Input Buffer Size	Value must be a non-negative integer	0x1000	Set the size of the JPEG decode input buffer (in bytes). This buffer is used to ensure 8-byte alignment of input data. Specifying a size smaller than the size of the JPEG to decode will use additional interrupts to stream data in during the decoding process.
Output Buffer Size	Value must be a non-negative integer	0x3C00	Set the size of the JPEG decode output buffer (in bytes). An output buffer smaller than the size of a decoded image will use additional interrupts to stream the data into a framebuffer. Unless you are sure of the subsampling used

			in and the size of the input JPEG images it is recommended to allocate at least 16 framebuffer lines of memory.
Section for Buffers	Manual Entry	.noinit	Specify the section in which to allocate the JPEG work buffers. When Arm Compiler 6 is used to place this memory in on-chip SRAM, the section name must be .bss or start with .bss. to avoid consuming unnecessary ROM space.

Hardware Configuration

No clocks or pins are directly required by this module. Please consult the submodules' documentation for their requirements.

Library Configuration

emWin is provided as a pre-compiled library. To maximize compatibility the build-time options are configured as follows:

```
#define GUI_OS (1) // Context switch support enabled
#define GUI_MAXTASK (1) // One task supported by default (can be increased at runtime
via GUITASK_SetMaxTask())
#define GUI_NUM_LAYERS (3) // Up to three displays supported
#define GUI_SUPPORT_TOUCH (1) // Support touch screens
#define GUI_SUPPORT_MOUSE (1) // Support a mouse
#define GUI_SUPPORT_MEMDEV (1) // Memory devices available
#define GUI_WINSUPPORT (1) // Window manager available
#define GUI_SUPPORT_BIDI (1) // Bidirectional text enabled
#define GUI_DEBUG_LEVEL (2) // Parameter and consistency checks enabled (no logging)
```

All other options are left at the default settings in GUI_ConfDefaults.h.

Usage Notes

Getting Started

To get started with emWin in an RA project the following must be performed:

1. Open the RA Configuration editor for your project
2. Add emWin to your project in the Stacks view by clicking **New Stack -> SEGGER -> SEGGER emWin**
3. Ensure the configuration options for emWin are set as necessary for your application
4. Set the proporties for the GLCDC module to match the timing and memory requirements of your display panel
5. Set the JPEG decode color depth to the desired value (if applicable)
6. Ensure interrupts on all modules are enabled:
    - GLCDC Vertical Position (Vpos) Interrupt
    - DRW Interrupt (if applicable)
    - JPEG Encode/Decode and Data Transfer Interrupts (if applicable)
7. Confirm stack and heap are configured as needed
    - When starting development a minimum stack of 0x1000 (4K) and heap of 0x4000 (16K) are recommended until actual usage can be characterized
8. Click Generate Project Content to save and commit configuration changes

At this point the project is now ready to build with emWin. Please refer to the SEGGER emWin User Guide (UM03001) as well as demo and sample code for details on how to create a GUI application.

Using Hardware Acceleration

In most cases there is no need to perform additional configuration to ensure the DRW Engine is used. However, there are some guidelines that should be followed depending on the item in question:

- Bitmaps:
    - ARGB8888, RGB888 and RGB565 bitmaps require no additional settings.
- Anti-aliased shapes:
    - Anti-aliased lines, circles, polygons, polygon outlines and arcs are rendered with the DRW Engine.
- Anti-aliased (4bpp) fonts:
    - Set the text mode to GUI_TM_TRANS or create the relevant widget with WM_CF_HASTRANS set.
    - Ensure the "AA Font Conversion Buffer Size" configuration option is set to a size equal to or greater than the size (in bytes) of the largest glyph.
- 8bpp palletized images:
    - When creating these images ensure transparency is not enabled as the SEGGER method for this is not compatible with the DRW Engine.
- RLE-encoded images:
    - Hardware acceleration is not available for SEGGER's RLE format.
- JPEG images:
    - Align any user-declared JPEG data to an 8-byte boundary. If 8-byte alignment cannot be guaranteed disable the **JPEG Decoding -> General -> Input Alignment** option in the RA Configuration.

Multi-thread Support

When the "Multi-thread Support" configuration is enabled, emWin can be called from multiple threads. This comes with advantages and disadvantages:

Advantages:

- High flexibility in development of applications
- Threads can pend and post on emWin events

Disadvantages:

- Slightly higher RAM/ROM use
- Large GUI projects can become difficult to debug

Note

Multi-thread support is independent of RTOS support. RTOS support is managed internally and cannot be manually configured.

Limitations

Developers should be aware of the following limitations when using SEGGER emWin with FSP:

- Hardware acceleration is not available when using color modes lower than 16 bits.
- Hardware acceleration is not available for SEGGER's RLE image format.
- Rotated screen modes are not supported.
- Because emWin is provided as a pre-compiled library the build-time options are fixed. See the Library Configuration section for the supplied configuration.

Examples

Basic Example

This is a basic example demonstrating a very simple emWin application. The screen is cleared to white and "Hello World!" is printed in the center.

Note

emWin manages the GLCDC, DRW and JPEG Codec submodules internally; they do not need to be opened directly.

```
#include "DIALOG.h"
#define COLOR_WHITE 0x00FFFFFFU
#define COLOR_BLACK 0x00000000U
#define GUI_DRAW_DELAY 100
static void _cbMain (WM_MESSAGE * pMsg)
{
    GUI_RECT Rect;
 switch (pMsg->MsgId)
    {
 case WM_CREATE:
      {
 break;
       }
 case WM_PAINT:
```

```
     {
 /* Clear background to white */
           GUI_SetBkColor(COLOR_WHITE);
           GUI_Clear();
 /* Draw "Hello World!" in black in the center */
           WM_GetClientRect(&Rect);
           GUI_SetColor(COLOR_BLACK);
           GUI_DispStringInRect("Hello World!", &Rect, GUI_TA_VCENTER |
GUI_TA_HCENTER);
 break;
      }
 default:
     {
           WM_DefaultProc(pMsg);
 break;
      }
   }
}
void emWinTask (void)
{
   int32_t xSize;
   int32_t ySize;
 /* Initialize emWin */
   GUI_Init();
 /* Get screen dimensions */
   xSize = LCD_GetXSize();
   ySize = LCD_GetYSize();
 /* Create main window */
   WM_CreateWindowAsChild(0, 0, xSize, ySize, WM_HBKWIN, WM_CF_SHOW, _cbMain, 0);
 /* Enter main drawing loop */
 while (1)
   {
      GUI_Delay(GUI_DRAW_DELAY);
   }
```

```
}
```

Note

For further example code please consult SEGGER emWin documentation, which can be downloaded here, as well as the Quick Start Guide and example project(s) provided with your Evaluation Kit (if applicable).

5.2.8.9 Segment LCD (r_slcdc)

Modules » Graphics

Functions

fsp_err_t	R_SLCDC_Open (slcdc_ctrl_t *const p_ctrl, slcdc_cfg_t const *const p_cfg)
fsp_err_t	R_SLCDC_Write (slcdc_ctrl_t *const p_ctrl, uint8_t const start_segment, uint8_t const *p_data, uint8_t const segment_count)
fsp_err_t	R_SLCDC_Modify (slcdc_ctrl_t *const p_ctrl, uint8_t const segment, uint8_t const data, uint8_t const data_mask)
fsp_err_t	R_SLCDC_Start (slcdc_ctrl_t *const p_ctrl)
fsp_err_t	R_SLCDC_Stop (slcdc_ctrl_t *const p_ctrl)
fsp_err_t	R_SLCDC_SetContrast (slcdc_ctrl_t *const p_ctrl, slcdc_contrast_t const contrast)
fsp_err_t	R_SLCDC_SetDisplayArea (slcdc_ctrl_t *const p_ctrl, slcdc_display_area_t const display_area)
fsp_err_t	R_SLCDC_Close (slcdc_ctrl_t *const p_ctrl)

Detailed Description

Driver for the SLCDC peripheral on RA MCUs. This module implements the SLCDC Interface.

Overview

The segment LCD controller (SLCDC) utilizes two to four reference voltages to provide AC signals for driving traditional segment LCD panels. Depending on the LCD and MCU package, up to 272 segments can be driven. A built-in link to the RTC allows for up to 152 segments to switch between two patterns at regular intervals. An on-chip boost driver can be used to provide configurable reference voltages up to 5.25V allowing for simple contrast adjustment.

Features

The SLCDC module can perform the following functions:

- Initialize, start and stop the SLCDC
- Set and modify the output pattern
- Blink between two patterns based on a periodic RTC interrupt signal
- Adjust display contrast (only when using internal voltage boosting)
- Select reference voltage mode: VL1 reference mode (1/3 or 1/4 Bias) and VL2 reference mode (1/3 Bias) can be selected at internal voltage boosting method, conventional VCC reference mode (1/3 Bias) and VL4 reference mode (1/3) Bias can be selected at capacitor split method

Configuration

Build Time Configurations for r_slcdc

The following build time configurations are defined in fsp_cfg/r_slcdc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Graphics > Segment LCD (r_slcdc)

This module can be added to the Stacks tab via New Stack > Graphics > Segment LCD (r_slcdc).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_slcdc0	Module Name
Clock			
Source	MCU Specific Options		Select the clock source.
Divisor	MCU Specific Options		Select the clock divisor.
Output			
Bias method	• 1/2 bias • 1/3 bias • 1/4 bias	1/2 bias	Select the bias method. This determines the number of voltage levels used to create the waveforms.
Timeslice	MCU Specific Options		Select the LCD time slice. The number of slices should match the number of common (COM) pins for your LCD panel.
Waveform	• Waveform A	Waveform A	Select the LCD

	• Waveform B		waveform.
Drive method	• External resistance division • Internal voltage boosting • Capacitor split	External resistance division	Select the LCD drive method.
Reference Voltage	MCU Specific Options		Select the LCD reference voltage.
Default contrast (if available)	MCU Specific Options		Select the default contrast level.

Valid Configurations

Though there are many setting combinations only a limited subset are supported by the SLCDC peripheral hardware:

Boards have feature Select reference voltage mode (see User's Manual (r01uh1005ej0050) for details)

Clock Configuration

User's Manual (r01uh1005ej0050): The SLCDC clock can be sourced from the main clock (MOSC), sub-clock (SOSC), HOCO, LOCO or MOCO. Dividers of 4 to 1024 are available for SOSC/LOCO and 256 to 1048576 are for MOSC/HOCO/MOCO. It is recommended to adjust the divisor such that the resulting clock provides a frame frequency of 32-128 Hz (some conditions have a frame frequency 24 to 128 Hz - see Table 36.10 in the User's Manual (r01uh1005ej0050) for details).

Others: The SLCDC clock can be sourced from the main clock (MOSC), sub-clock (SOSC), HOCO or LOCO. Dividers of 4 to 1024 are available for SOSC/LOCO and 256 to 524288 for MOSC/HOCO. It is recommended to adjust the divisor such that the resulting clock provides a frame frequency of 32-128 Hz.

Note

Make sure your desired source clock is enabled and running before starting SLCDC output.
Do not set the segment LCD clock over 512 Hz when using internal boost or capacitor split modes.

Pin Configuration

This module controls a variety of pins necessary for segment LCD voltage generation and signal output:

Pin Name	Function	Notes
SEGn	Segment data output	Connect these signals to the segment pins of the LCD.
COMn	Common signal output	Connect these signals to the common pins of the LCD.
VLn	Voltage reference	These pins should be connected to passive components based on the selected drive method (see section 45.7 "Supplying LCD Drive Voltages VL1, VL2, VL3, and VL4" in the RA4M1 User's Manual (R01UH0887EJ0100)).
CAPH, CAPL	Drive voltage generator capacitor	Connect a nonpolar 0.47uF capacitor across these pins when using internal boost or capacitor split modes. This pin is not needed when using

resistance division.

Interrupt Configuration

The SLCDC provides no interrupt signals.

Note

Blinking output timing is driven directly from the RTC periodic interrupt. Once the interrupt is enabled setting the display to SLCDC_DISP_BLINK will swap between A- and B-pattern each time it occurs. The ELC is not required for this functionality.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the SLCDC:

- Different packages provide different numbers of segment pins. Check the User's Manual for your device to confirm availability and mapping of segment signals.
- When using internal boost mode a delay of 5ms is required between calling R_SLCDC_Open and R_SLCDC_Start to allow the boost circuit to charge.
- When using the internal boost or capacitor split method do not set the segment LCD clock higher than 512 Hz.

Examples

Basic Example

Below is a basic example of minimal use of the SLCDC in an application. The SLCDC driver is initialized, output is started and a pattern is written to the segment registers.

```
void slcdc_init (void)
{
 fsp_err_t err;
 /* Open SLCDC driver */
    err = R_SLCDC_Open(&g_slcdc_ctrl, &g_slcdc_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* When using internal boost mode this delay is required to allow the boost circuit
to charge. See RA4M1 User's
  * Manual (R01UH0887EJ0100) 8.2.18 "Segment LCD Source Clock Control Register
(SLCDSCKCR)" for details. */
 R_BSP_SoftwareDelay(5, BSP_DELAY_UNITS_MILLISECONDS);
 /* Start SLCDC output */
    err = R_SLCDC_Start(&g_slcdc_ctrl);
```

```
    assert(FSP_SUCCESS == err);
 /* Write pattern to display */
    err = R_SLCDC_Write(&g_slcdc_ctrl, 0, segment_data, NUM_SEGMENTS);
    assert(FSP_SUCCESS == err);
}
```

Note

While the SLCDC is running, pattern data is constantly being output. No latching or buffering is required when writing or reading segment data.

Blinking Output

This example demonstrates how to set up blinking output using the RTC periodic interrupt. In this example it is assumed that the SLCDC has already been started.

```
void slcdc_blink (void)
{
 fsp_err_t err;
 /* Open RTC and set time/date */
    err = R_RTC_Open(&r_rtc_ctrl, &r_rtc_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    err = R_RTC_CalendarTimeSet(&r_rtc_ctrl, &g_rtc_time);
    assert(FSP_SUCCESS == err);
 /* Set RTC periodic interrupt to 2 Hz (display blink cycle will be 1 Hz) */
    err = R_RTC_PeriodicIrqRateSet(&r_rtc_ctrl,
RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_2_SECOND);
    assert(FSP_SUCCESS == err);
 /* Set display to blink */
    err = R_SLCDC_SetDisplayArea(&g_slcdc_ctrl, SLCDC_DISP_BLINK);
    assert(FSP_SUCCESS == err);
 /* Display will now continuously blink */
}
```

Data Structures

struct	slcdc_instance_ctrl_t

Data Structure Documentation

◆ slcdc_instance_ctrl_t

struct slcdc_instance_ctrl_t
SLCDC control block. DO NOT INITIALIZE. Initialization occurs when slcdc_api_t::open is called

Function Documentation

◆ R_SLCDC_Open()

fsp_err_t R_SLCDC_Open (slcdc_ctrl_t *const *p_ctrl*, slcdc_cfg_t const *const *p_cfg*)

Opens the SLCDC driver. Implements slcdc_api_t::open.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_UNSUPPORTED	Invalid display mode.

◆ R_SLCDC_Write()

fsp_err_t R_SLCDC_Write (slcdc_ctrl_t *const *p_ctrl*, uint8_t const *start_segment*, uint8_t const * *p_data*, uint8_t const *segment_count*)

Writes a sequence of display data to the segment data registers. Implements slcdc_api_t::write.

Return values

FSP_SUCCESS	Data was written successfully.
FSP_ERR_ASSERTION	Pointer to the control block or data is NULL.
FSP_ERR_INVALID_ARGUMENT	Segment index is (or will be) out of range.
FSP_ERR_NOT_OPEN	Device is not opened or initialized.

◆ R_SLCDC_Modify()

fsp_err_t R_SLCDC_Modify (slcdc_ctrl_t *const *p_ctrl*, uint8_t const *segment*, uint8_t const *data*, uint8_t const *data_mask*)

Modifies a single segment register based on a mask and the desired data. Implements slcdc_api_t::modify.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_INVALID_ARGUMENT	Invalid parameter in the argument.
FSP_ERR_NOT_OPEN	Device is not opened or initialized

◆ R_SLCDC_Start()

fsp_err_t R_SLCDC_Start (slcdc_ctrl_t *const *p_ctrl*)

Starts output of LCD signals. Implements slcdc_api_t::start.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_NOT_OPEN	Device is not opened or initialized

◆ R_SLCDC_Stop()

fsp_err_t R_SLCDC_Stop (slcdc_ctrl_t *const *p_ctrl*)

Stops output of LCD signals. Implements slcdc_api_t::stop.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_NOT_OPEN	Device is not opened or initialized

◆ R_SLCDC_SetContrast()

fsp_err_t R_SLCDC_SetContrast (slcdc_ctrl_t *const *p_ctrl*, slcdc_contrast_t const *contrast*)

Sets contrast to the specified level. Implements slcdc_api_t::setContrast.

Note

Contrast can be adjusted when the SLCDC is operating in internal boost mode only. The range of values is 0-5 when 1/4 bias setting is used and 0-15 otherwise. See RA4M1 User's Manual (R01UH0887EJ0100) section 45.2.4 "LCD Boost Level Control Register (VLCD)" for voltage levels at each setting.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_NOT_OPEN	Device is not opened or initialized
FSP_ERR_UNSUPPORTED	Unsupported operation

◆ R_SLCDC_SetDisplayArea()

fsp_err_t R_SLCDC_SetDisplayArea (slcdc_ctrl_t *const *p_ctrl*, slcdc_display_area_t const *display_area*)

Sets output to Waveform A, Waveform B or blinking output. Implements slcdc_api_t::setDisplayArea .

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_UNSUPPORTED	Pattern selection has no effect in 8-time-slice mode.
FSP_ERR_NOT_OPEN	Device is not opened or initialized.

◆ R_SLCDC_Close()

fsp_err_t R_SLCDC_Close (slcdc_ctrl_t *const *p_ctrl*)

Closes the SLCDC driver. Implements slcdc_api_t::close.

Return values

FSP_SUCCESS	Device was closed successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_NOT_OPEN	Device is not opened or initialized

5.2.9 Input

Modules

Detailed Description

Input Modules.

Modules

	External IRQ (r_icu) Driver for the ICU peripheral on RA MCUs. This module implements the External IRQ Interface.
	Key Matrix (r_kint) Driver for the KINT peripheral on RA MCUs. This module implements the Key Matrix Interface.

5.2.9.1 External IRQ (r_icu)

Modules » Input

Functions

fsp_err_t	R_ICU_ExternalIrqOpen (external_irq_ctrl_t *const p_api_ctrl, external_irq_cfg_t const *const p_cfg)
fsp_err_t	R_ICU_ExternalIrqEnable (external_irq_ctrl_t *const p_api_ctrl)

fsp_err_t	R_ICU_ExternalIrqDisable (external_irq_ctrl_t *const p_api_ctrl)
fsp_err_t	R_ICU_ExternalIrqCallbackSet (external_irq_ctrl_t *const p_api_ctrl, void(*p_callback)(external_irq_callback_args_t *), void const *const p_context, external_irq_callback_args_t *const p_callback_memory)
fsp_err_t	R_ICU_ExternalIrqClose (external_irq_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the ICU peripheral on RA MCUs. This module implements the External IRQ Interface.

Overview

The Interrupt Controller Unit (ICU) controls which event signals are linked to the NVIC, DTC, and DMAC modules. The R_ICU software module only implements the External IRQ Interface. The external_irq interface is for configuring interrupts to fire when a trigger condition is detected on an external IRQ pin.

Note

Multiple instances are used when more than one external interrupt is needed. Configure each instance with different channels and properties as needed for the specific interrupt.

Features

- Supports configuring interrupts for IRQ pins on the target MCUs
  - Enabling and disabling interrupt generation.
  - Configuring interrupt trigger on rising edge, falling edge, both edges, or low level signal.
  - Enabling and disabling the IRQ noise filter.
- Supports configuring a user callback function, which will be invoked by the HAL module when an external pin interrupt is generated.

Configuration

Build Time Configurations for r_icu

The following build time configurations are defined in fsp_cfg/r_icu_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Input > External IRQ (r_icu)

This module can be added to the Stacks tab via New Stack > Input > External IRQ (r_icu). Non-secure callable guard functions can be generated for this module by right clicking the module in the

RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_external_irq0	Module name.
Channel	Value must be a non-negative integer	0	Specify the hardware channel.
Trigger	MCU Specific Options		Select the signal edge or state that triggers an interrupt.
Digital Filtering	MCU Specific Options		Select if the digital noise filter should be enabled.
Digital Filtering Sample Clock (Only valid when Digital Filtering is Enabled)	MCU Specific Options		Select the clock divider for the digital noise filter.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided here. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the IRQn triggers
Pin Interrupt Priority	MCU Specific Options		Select the PIN interrupt priority.

Clock Configuration

The ICU peripheral module doesn't require any specific clock settings.

Note

The digital filter uses PCLKB as the clock source for sampling the IRQ pin.

Pin Configuration

The pin for the external interrupt channel must be configured as an input with IRQ Input Enabled.

Limitation

Pin configuration does not show conflicts when same IRQ is used by multiple pins.

Usage Notes

Digital Filter

The digital filter is used to reject trigger conditions that are too short. The trigger condition must be longer than three periods of the filter clock. The filter clock frequency is determined by PCLKB and

the external_irq_pclk_div_t setting.

MIN_PULSE_WIDTH = EXTERNAL_IRQ_PCLKB_DIV / PCLKB_FREQUENCY * 3

DMAC/DTC

When using an External IRQ pin to trigger a DMAC/DTC transfer, the External IRQ pin must be opened before the transfer instance is opened.

Examples

Basic Example

This is a basic example of minimal use of the ICU in an application.

```
#define ICU_IRQN_PIN BSP_IO_PORT_02_PIN_06
#define ICU_IRQN 6
/* Called from icu_irq_isr */
void external_irq_callback (external_irq_callback_args_t * p_args)
{
    (void) p_args;
    g_external_irq_complete = 1;
}
void simple_example ()
{
 /* Example Configuration */
 external_irq_cfg_t icu_cfg =
    {
       .channel          = ICU_IRQN,
       .trigger          = EXTERNAL_IRQ_TRIG_RISING,
       .filter_enable    = false,
       .clock_source_div = EXTERNAL_IRQ_CLOCK_SOURCE_DIV_1,
       .p_callback       = external_irq_callback,
       .p_context       = 0,
       .ipl             = 0,
       .irq             = (IRQn_Type) 0,
    };
 /* Configure the external interrupt. */
 fsp_err_t err = R_ICU_ExternalIrqOpen(&g_icu_ctrl, &icu_cfg);
```

```
    assert(FSP_SUCCESS == err);
 /* Enable the external interrupt. */
 /* Enable not required when used with ELC or DMAC. */
    err = R_ICU_ExternalIrqEnable(&g_icu_ctrl);
    assert(FSP_SUCCESS == err);
 while (0 == g_external_irq_complete)
    {
 /* Wait for interrupt. */
    }
}
```

Data Structures

struct	icu_instance_ctrl_t

Data Structure Documentation

◆ icu_instance_ctrl_t

struct icu_instance_ctrl_t	
ICU private control block. DO NOT MODIFY. Initialization occurs when R_ICU_ExternalIrqOpen is called.	
Data Fields	
uint32_t	open
	Used to determine if channel control block is in use.
IRQn_Type	irq
	NVIC interrupt number.
uint8_t	channel
	Channel.
void const *	p_context

Field Documentation

◆ p_context

void const* icu_instance_ctrl_t::p_context
Placeholder for user data. Passed to the user callback in external_irq_callback_args_t.

Function Documentation

◆ R_ICU_ExternalIrqOpen()

fsp_err_t R_ICU_ExternalIrqOpen (external_irq_ctrl_t *const *p_api_ctrl*, external_irq_cfg_t const *const *p_cfg*)

Configure an IRQ input pin for use with the external interrupt interface. Implements external_irq_api_t::open.

The Open function is responsible for preparing an external IRQ pin for operation.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	One of the following is invalid: • p_ctrl or p_cfg is NULL
FSP_ERR_ALREADY_OPEN	The channel specified has already been opened. No configurations were changed. Call the associated Close function to reconfigure the channel.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in p_cfg is not available on the device selected in r_bsp_cfg.h.
FSP_ERR_INVALID_ARGUMENT	p_cfg->p_callback is not NULL, but ISR is not enabled. ISR must be enabled to use callback function.
FSP_ERR_UNSUPPORTED	An input argument is not supported by selected mode.

Note

This function is reentrant for different channels. It is not reentrant for the same channel.

◆ R_ICU_ExternalIrqEnable()

fsp_err_t R_ICU_ExternalIrqEnable (external_irq_ctrl_t *const *p_api_ctrl*)

Enable external interrupt for specified channel at NVIC. Implements external_irq_api_t::enable.

Return values

FSP_SUCCESS	Interrupt Enabled successfully.
FSP_ERR_ASSERTION	The p_ctrl parameter was null.
FSP_ERR_NOT_OPEN	The channel is not opened.
FSP_ERR_IRQ_BSP_DISABLED	Requested IRQ is not defined in this system

◆ R_ICU_ExternalIrqDisable()

fsp_err_t R_ICU_ExternalIrqDisable (external_irq_ctrl_t *const *p_api_ctrl*)

Disable external interrupt for specified channel at NVIC. Implements external_irq_api_t::disable.

Return values

FSP_SUCCESS	Interrupt disabled successfully.
FSP_ERR_ASSERTION	The p_ctrl parameter was null.
FSP_ERR_NOT_OPEN	The channel is not opened.
FSP_ERR_IRQ_BSP_DISABLED	Requested IRQ is not defined in this system

◆ R_ICU_ExternalIrqCallbackSet()

fsp_err_t R_ICU_ExternalIrqCallbackSet (external_irq_ctrl_t *const *p_api_ctrl*, void(*)(external_irq_callback_args_t *) *p_callback*, void const *const *p_context*, external_irq_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements external_irq_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_ICU_ExternalIrqClose()

fsp_err_t R_ICU_ExternalIrqClose (external_irq_ctrl_t *const *p_api_ctrl*)
Close the external interrupt channel. Implements external_irq_api_t::close. **Return values** FSP_SUCCESS — Successfully closed. FSP_ERR_ASSERTION — The parameter p_ctrl is NULL. FSP_ERR_NOT_OPEN — The channel is not opened.

5.2.9.2 Key Matrix (r_kint)

Modules » Input

Functions

fsp_err_t	R_KINT_Open (keymatrix_ctrl_t *const p_api_ctrl, keymatrix_cfg_t const *const p_cfg)
fsp_err_t	R_KINT_Close (keymatrix_ctrl_t *const p_api_ctrl)
fsp_err_t	R_KINT_Enable (keymatrix_ctrl_t *const p_api_ctrl)
fsp_err_t	R_KINT_Disable (keymatrix_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the KINT peripheral on RA MCUs. This module implements the Key Matrix Interface.

Overview

The KINT module configures the Key Interrupt (KINT) peripheral to detect rising or falling edges on any of the KINT channels. When such an event is detected on any of the configured pins, the module generates an interrupt.

Features

- Detect rising or falling edges on KINT channels
- Callback for notifying the application when edges are detected on the configured channels

Configuration

Build Time Configurations for r_kint

The following build time configurations are defined in fsp_cfg/r_kint_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Input > Key Matrix (r_kint)

This module can be added to the Stacks tab via New Stack > Input > Key Matrix (r_kint).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_kint0	Module name.
Input			
Key Interrupt Flag Mask	MCU Specific Options		Select channels to enable.
Interrupts			
Trigger Type	• Falling Edge • Rising Edge	Rising Edge	Specifies if the enabled channels detect a rising edge or a falling edge. NOTE: either all channels detecting a rising edge or all channels detecting a falling edge.
Callback	Name must be a valid C symbol	kint_callback	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR) each time the IRQ triggers.
Key Interrupt Priority	MCU Specific Options		Select the key interrupt priority.

Clock Configuration

The KINT peripheral runs on PCLKB.

Pin Configuration

The KRn pins are key switch matrix row input pins.

Usage Notes

Connecting a Switch Matrix

The KINT module is designed to scan the rows of a switch matrix where each row is connected to a number of columns through switches. A periodic timer (or other mechanism) sets one column pin high at a time. Any switches that are pressed on the driven column cause a rising (or falling) edge on the row pin (KRn) causing an interrupt.

Note

In applications where multiple keys may be pressed at the same time it is recommended to put a diode inline with each switch to prevent ghosting.

Handling Multiple Pins

When an edge is detected on multiple pins at the same time, a single IRQ will be generated. A mask of all the pins that detected an edge will be passed to the callback.

Examples

Basic Example

This is a basic example of minimal use of the KINT in an application.

```
static volatile uint32_t g_channel_mask;
static volatile uint32_t g_kint_edge_detected = 0U;
/* Called from key_int_isr */
void r_kint_callback (keymatrix_callback_args_t * p_args)
{
    g_channel_mask       = p_args->channel_mask;
    g_kint_edge_detected = 1U;
}
void r_kint_example ()
{
 /* Configure the KINT. */
 fsp_err_t err = R_KINT_Open(&g_kint_ctrl, &g_kint_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable the KINT. */
    err = R_KINT_Enable(&g_kint_ctrl);
    assert(FSP_SUCCESS == err);
 while (0 == g_kint_edge_detected)
    {
```

```
 /* Wait for interrupt. */
    }
}
```

Data Structures

struct	kint_instance_ctrl_t

Data Structure Documentation

◆ kint_instance_ctrl_t

struct kint_instance_ctrl_t
Channel instance control block. DO NOT INITIALIZE. Initialization occurs when keymatrix_api_t::open is called.

Function Documentation

◆ R_KINT_Open()

fsp_err_t R_KINT_Open (keymatrix_ctrl_t *const *p_api_ctrl*, keymatrix_cfg_t const *const *p_cfg*)
Configure all the Key Input (KINT) channels and provides a handle for use with the rest of the KINT API functions. Implements keymatrix_api_t::open.

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	One of the following parameters may be NULL: p_cfg, or p_ctrl or the callback.
FSP_ERR_ALREADY_OPEN	The module has already been opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel mask is invalid.

◆ R_KINT_Close()

fsp_err_t R_KINT_Close (keymatrix_ctrl_t *const *p_api_ctrl*)
Clear the KINT configuration and disable the KINT IRQ. Implements keymatrix_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	The module is not opened.

◆ R_KINT_Enable()

fsp_err_t R_KINT_Enable (keymatrix_ctrl_t *const *p_api_ctrl*)
This function enables interrupts for the KINT peripheral after clearing any pending requests. Implements keymatrix_api_t::enable.

Return values

FSP_SUCCESS	Interrupt enabled successfully.
FSP_ERR_ASSERTION	The p_ctrl parameter was null.
FSP_ERR_NOT_OPEN	The peripheral is not opened.

◆ R_KINT_Disable()

fsp_err_t R_KINT_Disable (keymatrix_ctrl_t *const *p_api_ctrl*)
This function disables interrupts for the KINT peripheral. Implements keymatrix_api_t::disable.

Return values

FSP_SUCCESS	Interrupt disabled successfully.
FSP_ERR_ASSERTION	The p_ctrl parameter was null.
FSP_ERR_NOT_OPEN	The channel is not opened.

5.2.10 Monitoring

Modules

Detailed Description

Monitoring Modules.

Modules

	CRC (r_crc) Driver for the CRC peripheral on RA MCUs. This module implements the CRC Interface.
	Clock Accuracy Circuit (r_cac) Driver for the CAC peripheral on RA MCUs. This module implements the CAC Interface.

	Data Operation Circuit (r_doc) Driver for the DOC peripheral on RA MCUs. This module implements the DOC Interface.
	Independent Watchdog (r_iwdt) Driver for the IWDT peripheral on RA MCUs. This module implements the WDT Interface.
	Low/Programmable Voltage Detection (r_lvd) Driver for the LVD and PVD peripherals on RA MCUs. This module implements the Low Voltage Detection Interface.
	Watchdog (r_wdt) Driver for the WDT peripheral on RA MCUs. This module implements the WDT Interface.

Driver for the CRC peripheral on RA MCUs. This module implements the CRC Interface.

Overview

The CRC module provides a API to calculate 8, 16 and 32-bit CRC values on a block of data in memory or a stream of data over a Serial Communication Interface (SCI) channel using industry-standard polynomials.

Features

- CRC module supports the following 8 and 16 bit CRC polynomials which operates on 8-bit data in parallel
  - X^8+X^2+X+1 (CRC-8)
  - X^16+X^15+X^2+1 (CRC-16)
  - X^16+X^12+X^5+1 (CRC-CCITT)
- CRC module supports the following 32 bit CRC polynomials which operates on 32-bit data in parallel
  - X^32+X^26+X^23+X^22+X^16+X^12+X^11+X^10+X^8+X^7+X^5+X^4+X^2+X+ 1 (CRC-32)
  - X^32+ X^28+ X^27+ X^26+ X^25+ X^23+ X^22+ X^20+ X^19+ X^18+X^14+X^13+X^11+X^10+X^9+X^8+X^6+1 (CRC-32C)
- CRC module can calculate CRC with LSB first or MSB first bit order.

Configuration

Build Time Configurations for r_crc

The following build time configurations are defined in fsp_cfg/r_crc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Monitoring > CRC (r_crc)

This module can be added to the Stacks tab via New Stack > Monitoring > CRC (r_crc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_crc0	Module name.
CRC Polynomial	MCU Specific Options		Select the CRC polynomial.
Bit Order	MCU Specific Options		Select the CRC bit order.
Snoop Address	MCU Specific Options		Select the SCI register address CRC snoop

Clock Configuration

There is no clock configuration for the CRC module.

Pin Configuration

This module does not use I/O pins.

Usage Notes

CRC Snoop

The CRC snoop function monitors reads from and writes to a specified I/O register address and performs CRC calculation on the data read from and written to the register address automatically. Instead of calling R_CRC_Calculate on a block of data, R_CRC_SnoopEnable is called to start monitoring reads/writes and R_CRC_CalculatedValueGet is used to obtain the current CRC.

Note

Snoop mode is available for transmit/receive operations on SCI only.

Limitations

When using CRC32 polynomial functions the CRC module produces the same results as popular online CRC32 calculators, but it is important to remember a few important points.

- Online CRC32 calculators allow the input to be any number of bytes. The FSP CRC32 API function uses 32-bit words. This means the online calculations must be 'padded' to end on a 32-bit boundary.
- Online CRC32 calculators usually invert the output prior to presenting it as a result. It is up to the application program to include this step if needed.
- The seed value of 0xFFFFFFFF needs to be used by both the online calculator and the R_CRC module API (CRC32 polynomials)
- Make sure the bit orientation of the R_CRC CRC32 is set for LSB and that you have CRC32 selected and not CRC32C.
- Some online CRC tools XOR the final result with 0xFFFFFFFF.

Examples

Basic Example

This is a basic example of minimal use of the CRC module in an application.

```
void crc_example ()
{
    uint32_t length;
    uint32_t uint8_calculated_value;
    length = sizeof(g_data_8bit) / sizeof(g_data_8bit[0]);
 crc_input_t example_input =
    {
       .p_input_buffer = g_data_8bit,
       .num_bytes      = length,
```

```
      .crc_seed       = 0,
   };
 /* Open CRC module with 8 bit polynomial */
 R_CRC_Open(&crc_ctrl, &g_crc_test_cfg);
 /* 8-bit CRC calculation */
 R_CRC_Calculate(&crc_ctrl, &example_input, &uint8_calculated_value);
}
```

Snoop Example

This example demonstrates CRC snoop operation.

```
void crc_snoop_example ()
{
 /* Open CRC module with 8 bit polynomial */
 R_CRC_Open(&crc_ctrl, &g_crc_test_cfg);
 /* Open SCI Driver */
 /* Configure Snoop address and enable snoop mode */
 R_CRC_SnoopEnable(&crc_ctrl, 0);
 /* Perfrom SCI read/Write operation depending on the SCI snoop address configure */
 /* Read CRC value */
 R_CRC_CalculatedValueGet(&crc_ctrl, &g_crc_buff);
}
```

Data Structures

struct	crc_instance_ctrl_t

Data Structure Documentation

◆ crc_instance_ctrl_t

struct crc_instance_ctrl_t
Driver instance control structure.

Function Documentation

◆ R_CRC_Open()

fsp_err_t R_CRC_Open (crc_ctrl_t *const *p_ctrl*, crc_cfg_t const *const *p_cfg*)

Open the CRC driver module

Implements crc_api_t::open

Open the CRC driver module and initialize the driver control block according to the passed-in configuration structure.

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	p_ctrl or p_cfg is NULL.
FSP_ERR_ALREADY_OPEN	Module already open
FSP_ERR_UNSUPPORTED	Hardware not support this feature.

◆ R_CRC_Close()

fsp_err_t R_CRC_Close (crc_ctrl_t *const *p_ctrl*)

Close the CRC module driver.

Implements crc_api_t::close

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	The driver is not opened.

◆ R_CRC_Calculate()

fsp_err_t R_CRC_Calculate (crc_ctrl_t *const *p_ctrl*, crc_input_t *const *p_crc_input*, uint32_t * *calculatedValue*)

Perform a CRC calculation on a block of 8-bit/32-bit (for 32-bit polynomial) data.

Implements crc_api_t::calculate

This function performs a CRC calculation on an array of 8-bit/32-bit (for 32-bit polynomial) values and returns an 8-bit/32-bit (for 32-bit polynomial) calculated value

Return values

FSP_SUCCESS	Calculation successful.
FSP_ERR_ASSERTION	Either p_ctrl, inputBuffer, or calculatedValue is NULL.
FSP_ERR_INVALID_ARGUMENT	length value is NULL, or not 4-byte aligned when 32-bit CRC polynomial function is configured.
FSP_ERR_NOT_OPEN	The driver is not opened.

◆ R_CRC_CalculatedValueGet()

fsp_err_t R_CRC_CalculatedValueGet (crc_ctrl_t *const *p_ctrl*, uint32_t * *calculatedValue*)

Return the current calculated value.

Implements crc_api_t::crcResultGet

CRC calculation operates on a running value. This function returns the current calculated value.

Return values

FSP_SUCCESS	Return of calculated value successful.
FSP_ERR_ASSERTION	Either p_ctrl or calculatedValue is NULL.
FSP_ERR_NOT_OPEN	The driver is not opened.

◆ R_CRC_SnoopEnable()

fsp_err_t R_CRC_SnoopEnable (crc_ctrl_t *const *p_ctrl*, uint32_t *crc_seed*)

Configure the snoop channel and set the CRC seed.

Implements crc_api_t::snoopEnable

The CRC calculator can operate on reads and writes over any of the first ten SCI channels. For example, if set to channel 0, transmit, every byte written out SCI channel 0 is also sent to the CRC calculator as if the value was explicitly written directly to the CRC calculator.

Return values

FSP_SUCCESS	Snoop configured successfully.
FSP_ERR_ASSERTION	Pointer to control stucture is NULL
FSP_ERR_NOT_OPEN	The driver is not opened.
FSP_ERR_UNSUPPORTED	SNOOP operation is not supported.

◆ R_CRC_SnoopDisable()

fsp_err_t R_CRC_SnoopDisable (crc_ctrl_t *const *p_ctrl*)

Disable snooping.

Implements crc_api_t::snoopDisable

Return values

FSP_SUCCESS	Snoop disabled.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	The driver is not opened.
FSP_ERR_UNSUPPORTED	SNOOP operation is not supported.

5.2.10.2 Clock Accuracy Circuit (r_cac)

Modules » Monitoring

Functions

fsp_err_t	R_CAC_Open (cac_ctrl_t *const p_ctrl, cac_cfg_t const *const p_cfg)
fsp_err_t	R_CAC_StartMeasurement (cac_ctrl_t *const p_ctrl)
fsp_err_t	R_CAC_StopMeasurement (cac_ctrl_t *const p_ctrl)

fsp_err_t	R_CAC_Read (cac_ctrl_t *const p_ctrl, uint32_t *const p_counter)
fsp_err_t	R_CAC_CallbackSet (cac_ctrl_t *const p_ctrl, void(*p_callback)(cac_callback_args_t *), void const *const p_context, cac_callback_args_t *const p_callback_memory)
fsp_err_t	R_CAC_Close (cac_ctrl_t *const p_ctrl)

Detailed Description

Driver for the CAC peripheral on RA MCUs. This module implements the CAC Interface.

Overview

The interface for the clock frequency accuracy measurement circuit (CAC) peripheral is used to check a system clock frequency with a reference clock signal by counting the number of measurement clock edges that occur between two edges of the reference clock.

Features

- Supports clock frequency-measurement and monitoring based on a reference signal input
- Reference can be either an externally supplied clock source or an internal clock source
- An interrupt request may optionally be generated by a completed measurement, a detected frequency error, or a counter overflow.
- A digital filter is available for an externally supplied reference clock, and dividers are available for both internally supplied measurement and reference clocks.
- Edge-detection options for the reference clock are configurable as rising, falling, or both.

Configuration

Build Time Configurations for r_cac

The following build time configurations are defined in fsp_cfg/r_cac_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Monitoring > Clock Accuracy Circuit (r_cac)

This module can be added to the Stacks tab via New Stack > Monitoring > Clock Accuracy Circuit (r_cac). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_cac0	Module name.

Reference clock divider	• 32 • 128 • 1024 • 8192	32	Reference clock divider.
Reference clock source	MCU Specific Options		Reference clock source.
Reference clock digital filter	• Disabled • Sampling clock =Measuring freq • Sampling clock =Measuring freq/4 • Sampling clock =Measuring freq/16	Disabled	Reference clock digital filter.
Reference clock edge detect	• Rising • Falling • Both	Rising	Reference clock edge detection.
Measurement clock divider	• 1 • 4 • 8 • 32	1	Measurement clock divider.
Measurement clock source	MCU Specific Options		Measurement clock source.
Upper Limit Threshold	Value must be a non-negative integer, between 0 to 65535	0	Top end of allowable range for measurement completion.
Lower Limit Threshold	Value must be a non-negative integer, between 0 to 65535	0	Bottom end of allowable range for measurement completion.
Frequency Error Interrupt Priority	MCU Specific Options		CAC frequency error interrupt priority.
Measurement End Interrupt Priority	MCU Specific Options		CAC measurement end interrupt priority.
Overflow Interrupt Priority	MCU Specific Options		CAC overflow interrupt priority.
Callback	Name must be a valid C symbol	NULL	Function name for callback

Clock Configuration

The CAC measurement clock source can be configured as the following:

1. MAIN_OSC
2. SUBCLOCK
3. HOCO

4. MOCO
5. LOCO
6. PCLKB
7. IWDT

The CAC reference clock source can be configured as the following:

1. MAIN_OSC
2. SUBCLOCK
3. HOCO
4. MOCO
5. LOCO
6. PCLKB
7. IWDT
8. External Clock Source (CACREF)

Pin Configuration

The CACREF pin can be configured to provide the reference clock for CAC measurements.

Usage Notes

Measurement Accuracy

The clock measurement result may be off by up to one pulse depending on the phase difference between the edge detection circuit, digital filter, and CACREF pin signal, if applicable.

Frequency Error Interrupt

The frequency error interrupt is only triggered at the end of a CAC measurement. This means that there will be a measurement complete interrupt in addition to the frequency error interrupt.

Examples

Basic Example

This is a basic example of minimal use of the CAC in an application.

```
volatile uint32_t g_callback_complete;
void cac_basic_example ()
{
    g_callback_complete = 0;
 fsp_err_t err = R_CAC_Open(&g_cac_ctrl, &g_cac_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    (void) R_CAC_StartMeasurement(&g_cac_ctrl);
 /* Wait for measurement to complete. */
 while (0 == g_callback_complete)
```

```
    {
    }
    uint32_t value;
 /* Read the CAC measurement. */
    (void) R_CAC_Read(&g_cac_ctrl, &value);
}
/* Called when measurement is completed. */
static void r_cac_callback (cac_callback_args_t * p_args)
{
 if (CAC_EVENT_MEASUREMENT_COMPLETE == p_args->event)
    {
       g_callback_complete = 1U;
    }
}
```

Data Structures

struct	cac_instance_ctrl_t

Data Structure Documentation

◆ cac_instance_ctrl_t

struct cac_instance_ctrl_t
CAC instance control block. DO NOT INITIALIZE.

Function Documentation

◆ R_CAC_Open()

fsp_err_t R_CAC_Open (cac_ctrl_t *const *p_ctrl*, cac_cfg_t const *const *p_cfg*)
The Open function configures the CAC based on the provided user configuration settings. **Return values** FSP_SUCCESS — CAC is available and available for measurement(s). FSP_ERR_ASSERTION — An argument is invalid. FSP_ERR_ALREADY_OPEN — The CAC has already been opened. ***Note*** *There is only a single CAC peripheral.*

◆ R_CAC_StartMeasurement()

fsp_err_t R_CAC_StartMeasurement (cac_ctrl_t *const *p_ctrl*)

Start the CAC measurement process.

Return values

FSP_SUCCESS	CAC measurement started.
FSP_ERR_ASSERTION	NULL provided for p_instance_ctrl or p_cfg.
FSP_ERR_NOT_OPEN	R_CAC_Open() has not been successfully called.

◆ R_CAC_StopMeasurement()

fsp_err_t R_CAC_StopMeasurement (cac_ctrl_t *const *p_ctrl*)

Stop the CAC measurement process.

Return values

FSP_SUCCESS	CAC measuring has been stopped.
FSP_ERR_ASSERTION	NULL provided for p_instance_ctrl or p_cfg.
FSP_ERR_NOT_OPEN	R_CAC_Open() has not been successfully called.

◆ R_CAC_Read()

fsp_err_t R_CAC_Read (cac_ctrl_t *const *p_ctrl*, uint32_t *const *p_counter*)

Read and return the CAC status and counter registers.

Return values

FSP_SUCCESS	CAC read successful.
FSP_ERR_ASSERTION	An argument is NULL.
FSP_ERR_NOT_OPEN	R_CAC_Open() has not been successfully called.

◆ R_CAC_CallbackSet()

fsp_err_t R_CAC_CallbackSet (cac_ctrl_t *const *p_ctrl*, void(*)(cac_callback_args_t *) *p_callback*, void const *const *p_context*, cac_callback_args_t *const *p_callback_memory*)
Updates the user callback with the option to provide memory for the callback argument structure. Implements cac_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_CAC_Close()

fsp_err_t R_CAC_Close (cac_ctrl_t *const *p_ctrl*)
Release any resources that were allocated by the Open() or any subsequent CAC operations.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	NULL provided for p_instance_ctrl or p_cfg.
FSP_ERR_NOT_OPEN	R_CAC_Open() has not been successfully called.

5.2.10.3 Data Operation Circuit (r_doc)

Modules » Monitoring

Functions

fsp_err_t	R_DOC_Open (doc_ctrl_t *const p_api_ctrl, doc_cfg_t const *const p_cfg)
fsp_err_t	R_DOC_Close (doc_ctrl_t *const p_api_ctrl)
fsp_err_t	R_DOC_Read (doc_ctrl_t *const p_api_ctrl, uint32_t *p_result)
fsp_err_t	R_DOC_Write (doc_ctrl_t *const p_api_ctrl, uint32_t data)

fsp_err_t	R_DOC_CallbackSet (doc_ctrl_t *const p_api_ctrl, void(*p_callback)(doc_callback_args_t *), void const *const p_context, doc_callback_args_t *const p_callback_memory)

Detailed Description

Driver for the DOC peripheral on RA MCUs. This module implements the DOC Interface.

Overview

Features

The DOC HAL module peripheral is used to compare, add or subtract 16-bit or 32-bit[1] data and can detect the following events:

- Comparison Mode
  - Data is equal to the configured reference data setting.
  - Data is not equal to the configured reference data setting.
  - Data is less than the configured reference data setting[2].
  - Data is greater than the configured reference data setting[2].
  - Data is inside of a configurable pair of reference data settings[2].
  - Data is outside of a configurable pair of reference data settings[2].
- Addition Mode - Overflow of an addition operation
- Subtraction Mode - Underflow of a subtraction operation

A user-defined callback can be created to inform the CPU when any of above events occur.

Note

1. *Operating on 32-bit data is not supported on all MCUs.*
2. *This comparison mode is not supported on all MCUs.*

Configuration

Build Time Configurations for r_doc

The following build time configurations are defined in fsp_cfg/r_doc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Monitoring > Data Operation Circuit (r_doc)

This module can be added to the Stacks tab via New Stack > Monitoring > Data Operation Circuit (r_doc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description

Name	Name must be a valid C symbol	g_doc0	Module name.
Event	MCU Specific Options		Select the event that will trigger the DOC interrupt.
Bit Width	MCU Specific Options		The bit width for DOC operations.
Reference/Initial Data	Value must be an integer greater than or equal to 0.	0	Enter Initial Value for Addition/Subtraction or enter reference value for comparison.
Additional Reference Data	Value must be an integer greater than or equal to 0.	0	Additional reference data used for Window Compare modes.
Callback	Name must be a valid C symbol	NULL	A user callback function must be provided. This will be called from the interrupt service routine (ISR) when the configured DOC event occurs.
DOC Interrupt Priority	MCU Specific Options		Select the DOC interrupt priority.

Clock Configuration

The DOC HAL module does not require a specific clock configuration.

Pin Configuration

The DOC HAL module does not require and specific pin configurations.

Usage Notes

DMAC/DTC Integration

DOC can be used with Transfer (r_dmac) or Transfer (r_dtc) to write to the input register without CPU intervention. DMAC is more useful for most DOC applications because it can be started directly from software. To write DOC input data with DTC/DMAC, set transfer_info_t::p_dest to R_DOC->DODIR.

Examples

Basic Example

This is a basic example of minimal use of the R_DOC in an application. This example shows how this driver can be used for continuous 16 bit addition operation while reading the result at every overflow event.

```
#define DOC_EXAMPLE_VALUE 0xF000
```

```
uint32_t g_callback_event_counter = 0;
/* This callback is called when DOC overflow event occurs. It is registered in
doc_cfg_t when R_DOC_Open is
 * called. */
void doc_callback (doc_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
    g_callback_event_counter++;
}
void basic_example (void)
{
 fsp_err_t err;
 /* Initialize the DOC module for addition with initial value specified in
doc_cfg_t::doc_data. */
    err = R_DOC_Open(&g_doc_ctrl, &g_doc_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Write data to the DOC Data Input Register and read the result of addition from
status register when an
  * interrupt occurs. */
 for (int i = 0; i < 5; i++)
    {
       err = R_DOC_Write(&g_doc_ctrl, DOC_EXAMPLE_VALUE);
      assert(FSP_SUCCESS == err);
 if (g_callback_event_counter >= 1)
      {
            uint32_t result;
 /* Read the result of the operation */
            err = R_DOC_Read(&g_doc_ctrl, &result);
      assert(FSP_SUCCESS == err);
       }
    }
}
```

Function Documentation

◆ R_DOC_Open()

fsp_err_t R_DOC_Open (doc_ctrl_t *const *p_api_ctrl*, doc_cfg_t const *const *p_cfg*)

Opens and configures the Data Operation Circuit (DOC) in comparison, addition or subtraction mode and sets initial data for addition or subtraction, or reference data for comparison.

Example:

```
/* Initialize the DOC module for addition with initial value specified in
doc_cfg_t::doc_data. */
    err = R_DOC_Open(&g_doc_ctrl, &g_doc_cfg);
```

Return values

FSP_SUCCESS	DOC successfully configured.
FSP_ERR_ALREADY_OPEN	Module already open.
FSP_ERR_ASSERTION	One or more pointers point to NULL or callback is NULL or the interrupt vector is invalid.

◆ R_DOC_Close()

fsp_err_t R_DOC_Close (doc_ctrl_t *const *p_api_ctrl*)

Closes the module driver. Enables module stop mode.

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_NOT_OPEN	Driver not open.
FSP_ERR_ASSERTION	Pointer pointing to NULL.

Note

This function will disable the DOC interrupt in the NVIC.

◆ R_DOC_Read()

fsp_err_t R_DOC_Read (doc_ctrl_t *const *p_api_ctrl*, uint32_t * *p_result*)

Returns the result of addition/subtraction.

Example:

```
          uint32_t result;
/* Read the result of the operation */
          err = R_DOC_Read(&g_doc_ctrl, &result);
     assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Status successfully read.
FSP_ERR_NOT_OPEN	Driver not open.
FSP_ERR_ASSERTION	One or more pointers point to NULL.

◆ R_DOC_Write()

fsp_err_t R_DOC_Write (doc_ctrl_t *const *p_api_ctrl*, uint32_t *data*)

Writes to the DODIR - DOC Input Register.

Example:

```
      err = R_DOC_Write(&g_doc_ctrl, DOC_EXAMPLE_VALUE);
     assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Values successfully written to the registers.
FSP_ERR_NOT_OPEN	Driver not open.
FSP_ERR_ASSERTION	One or more pointers point to NULL.

◆ R_DOC_CallbackSet()

fsp_err_t R_DOC_CallbackSet (doc_ctrl_t *const *p_api_ctrl*, void(*)(doc_callback_args_t *) *p_callback*, void const *const *p_context*, doc_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements doc_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

5.2.10.4 Independent Watchdog (r_iwdt)

fsp_err_t	R_IWDT_CallbackSet (wdt_ctrl_t *const p_ctrl, void(*p_callback)(wdt_callback_args_t *), void const *const p_context, wdt_callback_args_t *const p_callback_memory)

Detailed Description

Driver for the IWDT peripheral on RA MCUs. This module implements the WDT Interface.

Overview

The independent watchdog timer is used to recover from unexpected errors in an application. The timer must be refreshed periodically in the permitted count window by the application. If the count is allowed to underflow or refresh occurs outside of the valid refresh period, the IWDT resets the device or generates an NMI.

Features

The IWDT HAL module has the following key features:

- When the IWDT underflows or is refreshed outside of the permitted refresh window, one of the following events can occur:
  - Resetting of the device
  - Generation of an NMI
- The WDT supports following modes:[1]
  - In auto start mode, the WDT begins counting at reset.
  - In register start mode, the WDT can be started from the application[1].

Selecting a Watchdog

RA MCUs have two watchdog peripherals: the watchdog timer (WDT) and the independent watchdog timer (IWDT). When selecting between them, consider these factors:

	WDT	IWDT
Start Mode	The WDT can be started from the application (register start mode) or configured by hardware to start automatically (auto start mode).	On most of MCUs, the IWDT can only be configured by hardware to start automatically[1].
Clock Source	The WDT runs off a peripheral clock.	The IWDT has its own clock source which improves safety.

Note

1. Refer to the MCU hardware user's manual or datasheet to determine if IWDT supports register start mode.

Configuration

When using register start mode, configure the watchdog timer on the Stacks tab.

Note

*When using auto start mode, configurations on the **Stacks** tab are ignored. Configure the watchdog using the OFS settings on the BSP tab. These settings include the following:*

- *Start Mode*
- *Timeout Period*
- *Dedicated Clock Frequency Divisor*
- *Window End Position*
- *Window Start Position*
- *Reset Interrupt Request Select*
- *Stop Control*

Review the OFS0 properties window to see additional details.

Build Time Configurations for r_iwdt

The following build time configurations are defined in fsp_cfg/r_iwdt_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Register Start NMI Support	MCU Specific Options		If enabled, code for NMI support in register start mode is included in the build.

Configurations for Monitoring > Independent Watchdog (r_iwdt)

This module can be added to the Stacks tab via New Stack > Monitoring > Independent Watchdog (r_iwdt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_wdt0	Module name.
Timeout	MCU Specific Options		Select the independent watchdog timeout in cycles.
Clock Division Ratio	MCU Specific Options		Select the independent watchdog clock divisor.
Window Start Position	MCU Specific Options		Select the allowed independent watchdog refresh start point in %.
Window End Position	MCU Specific Options		Select the allowed independent watchdog refresh end point in %.
Reset Control	MCU Specific Options		Select what happens when the independent watchdog timer expires.
Stop Control	MCU Specific Options		Select the independent watchdog state in low power mode.
NMI callback	Name must be a valid C symbol	NULL	A user callback function can be provided here. If this callback function is

provided, it is called from the interrupt service routine (ISR) when the watchdog triggers.

Clock Configuration

The IWDT clock is based on the IWDTCLK frequency. You can set the IWDTCLK frequency divider using the **BSP** tab of the RA Configuration editor.

Pin Configuration

This module does not use I/O pins.

Usage Notes

NMI Interrupt

The independent watchdog timer uses the NMI, which is enabled by default. No special configuration is required. When the NMI is triggered, the callback function registered during open is called.

Note

When using the IWDT in software start mode with NMI and the timer underflows, the IWDT status must be reset by calling R_IWDT_StatusClear before restarting the timer via R_IWDT_Refresh.

Period Calculation

The IWDT operates from IWDTCLK. With a IWDTCLK of 15000 Hz, the maximum time from the last refresh to device reset or NMI generation will be just below 35 seconds as detailed below.

IWDTCLK = 15000 Hz
Clock division ratio = IWDTCLK / 256
Timeout period = 2048 cycles
WDT clock frequency = 15000 Hz / 256 = 58.59 Hz
Cycle time = 1 / 58.59 Hz = 17.067 ms
Timeout = 17.067 ms x 2048 cycles = 34.95 seconds

Limitations

Developers should be aware of the following limitations when using the IWDT:

- When using a J-Link debugger the IWDT counter does not count and therefore will not reset the device or generate an NMI. To enable the watchdog to count and generate a reset or NMI while debugging, add this line of code in the application:

```
/* (Optional) Enable the IWDT to count and generate NMI or reset when the
 * debugger is connected. */
   R_DEBUG->DBGSTOPCR_b.DBGSTOP_IWDT = 0;
```

- If the IWDT is configured to stop the counter in low power mode, then your application must restart the watchdog by calling R_IWDT_Refresh() after the MCU wakes from low power mode.

Examples

IWDT Basic Example

This is a basic example of minimal use of the IWDT in an application.

```
void iwdt_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* In auto start mode, the IWDT starts counting immediately when the MCU is powered
on. */
 /* Initializes the module. */
    err = R_IWDT_Open(&g_iwdt0_ctrl, &g_iwdt0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (true)
    {
 /* Application work here. */
 /* Refresh before the counter underflows to prevent reset or NMI based on the
setting. */
       (void) R_IWDT_Refresh(&g_iwdt0_ctrl);
    }
}
```

IWDT Advanced Example

This example demonstrates using a start window and gives an example callback to handle an NMI generated by an underflow or refresh error.

```
#define IWDT_TIMEOUT_COUNTS (2048U)
#define IWDT_MAX_COUNTER (IWDT_TIMEOUT_COUNTS - 1U)
#define IWDT_START_WINDOW_75 ((IWDT_MAX_COUNTER * 3) / 4)
/* Example callback called when a watchdog NMI occurs. */
void iwdt_callback (wdt_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
 fsp_err_t err = FSP_SUCCESS;
```

```
 /* (Optional) Determine the source of the NMI. */
 wdt_status_t status = WDT_STATUS_NO_ERROR;
    err = R_IWDT_StatusGet(&g_iwdt0_ctrl, &status);
    assert(FSP_SUCCESS == err);
 /* (Optional) Log source of NMI and any other debug information. */
 /* (Optional) Clear the error flags. */
    err = R_IWDT_StatusClear(&g_iwdt0_ctrl, status);
    assert(FSP_SUCCESS == err);
 /* (Optional) Issue a software reset to reset the MCU. */
    __NVIC_SystemReset();
}
void iwdt_advanced_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* (Optional) Enable the IWDT to count and generate NMI or reset when the
  * debugger is connected. */
    R_DEBUG->DBGSTOPCR_b.DBGSTOP_IWDT = 0;
 /* (Optional) Check if the IWDTRF flag is set to know if the system is
  * recovering from a IWDT reset. */
 if (R_SYSTEM->RSTSR1_b.IWDTRF)
    {
 /* Clear the flag. */
       R_SYSTEM->RSTSR1 = 0U;
    }
 /* Open the module. */
    err = R_IWDT_Open(&g_iwdt0_ctrl, &g_iwdt0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize other application code. */
 /* Do not call R_IWDT_Refresh() in auto start mode unless the
  * counter is in the acceptable refresh window. */
    (void) R_IWDT_Refresh(&g_iwdt0_ctrl);
 while (true)
    {
```

```
/* Application work here. */
/* (Optional) If there is a chance the application takes less time than
 * the start window, verify the IWDT counter is past the start window
 * before refreshing the IWDT. */
      uint32_t iwdt_counter = 0U;
do
     {
/* Read the current IWDT counter value. */
           err = R_IWDT_CounterGet(&g_iwdt0_ctrl, &iwdt_counter);
     assert(FSP_SUCCESS == err);
     } while (iwdt_counter >= IWDT_START_WINDOW_75);
/* Refresh before the counter underflows to prevent reset or NMI. */
      (void) R_IWDT_Refresh(&g_iwdt0_ctrl);
   }
}
```

Data Structures

struct	iwdt_instance_ctrl_t

Data Structure Documentation

◆ iwdt_instance_ctrl_t

struct iwdt_instance_ctrl_t	
IWDT control block. DO NOT INITIALIZE. Initialization occurs when wdt_api_t::open is called.	
Data Fields	
uint32_t	wdt_open
	Indicates whether the open() API has been successfully called.
void const *	p_context
	Placeholder for user data. Passed to the user callback in wdt_callback_args_t.
void(*	p_callback)(wdt_callback_args_t *p_args)
	Callback provided when a WDT NMI ISR occurs.

Function Documentation

◆ R_IWDT_Open()

fsp_err_t R_IWDT_Open (wdt_ctrl_t *const *p_api_ctrl*, wdt_cfg_t const *const *p_cfg*)

Register the IWDT NMI callback.

Example:

```
/* Initializes the module. */
   err = R_IWDT_Open(&g_iwdt0_ctrl, &g_iwdt0_cfg);
```

Return values

FSP_SUCCESS	IWDT successfully configured.
FSP_ERR_ASSERTION	Null Pointer.
FSP_ERR_NOT_ENABLED	An attempt to open the IWDT when the OFS0 register is not configured for auto-start mode.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_STATE	The security state of the NMI and the module do not match.

◆ R_IWDT_Refresh()

fsp_err_t R_IWDT_Refresh (wdt_ctrl_t *const *p_api_ctrl*)

Refresh the Independent Watchdog Timer. If the refresh fails due to being performed outside of the permitted refresh period the device will either reset or trigger an NMI ISR to run.

Example:

```
 /* Refresh before the counter underflows to prevent reset or NMI based on the
setting. */
      (void) R_IWDT_Refresh(&g_iwdt0_ctrl);
```

Return values

FSP_SUCCESS	IWDT successfully refreshed.
FSP_ERR_ASSERTION	One or more parameters are NULL pointers.
FSP_ERR_NOT_OPEN	The driver has not been opened. Perform R_IWDT_Open() first.

◆ R_IWDT_StatusGet()

fsp_err_t R_IWDT_StatusGet (wdt_ctrl_t *const *p_api_ctrl*, wdt_status_t *const *p_status*)

Read the IWDT status flags.

Indicates both status and error conditions.

Example:

```
/* (Optional) Determine the source of the NMI. */
wdt_status_t status = WDT_STATUS_NO_ERROR;
   err = R_IWDT_StatusGet(&g_iwdt0_ctrl, &status);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	IWDT status successfully read.
FSP_ERR_ASSERTION	Null pointer as a parameter.
FSP_ERR_NOT_OPEN	The driver has not been opened. Perform R_IWDT_Open() first.
FSP_ERR_UNSUPPORTED	This function is only valid if the IWDT generates an NMI when an error occurs.

Note

When the IWDT is configured to output a reset on underflow or refresh error reading the status and error flags serves no purpose as they will always indicate that no underflow has occurred and there is no refresh error. Reading the status and error flags is only valid when interrupt request output is enabled.

◆ R_IWDT_StatusClear()

fsp_err_t R_IWDT_StatusClear (wdt_ctrl_t *const *p_api_ctrl*, const wdt_status_t *status*)

Clear the IWDT status and error flags. Implements wdt_api_t::statusClear.

Example:

```
/* (Optional) Clear the error flags. */
   err = R_IWDT_StatusClear(&g_iwdt0_ctrl, status);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	IWDT flag(s) successfully cleared.
FSP_ERR_ASSERTION	Null pointer as a parameter.
FSP_ERR_NOT_OPEN	The driver has not been opened. Perform R_IWDT_Open() first.
FSP_ERR_UNSUPPORTED	This function is only valid if the IWDT generates an NMI when an error occurs.

Note

When the IWDT is configured to output a reset on underflow or refresh error reading the status and error flags serves no purpose as they will always indicate that no underflow has occurred and there is no refresh error. Reading the status and error flags is only valid when interrupt request output is enabled.

◆ R_IWDT_CounterGet()

fsp_err_t R_IWDT_CounterGet (wdt_ctrl_t *const *p_api_ctrl*, uint32_t *const *p_count*)

Read the current count value of the IWDT. Implements wdt_api_t::counterGet.

Example:

```
/* Read the current IWDT counter value. */
          err = R_IWDT_CounterGet(&g_iwdt0_ctrl, &iwdt_counter);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	IWDT current count successfully read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	The driver has not been opened. Perform R_IWDT_Open() first.

◆ R_IWDT_TimeoutGet()

fsp_err_t R_IWDT_TimeoutGet (wdt_ctrl_t *const *p_api_ctrl*, wdt_timeout_values_t *const *p_timeout*)

Read timeout information for the watchdog timer. Implements wdt_api_t::timeoutGet.

Return values

FSP_SUCCESS	IWDT timeout information retrieved successfully.
FSP_ERR_ASSERTION	One or more parameters are NULL pointers.
FSP_ERR_NOT_OPEN	The driver has not been opened. Perform R_IWDT_Open() first.

◆ R_IWDT_CallbackSet()

fsp_err_t R_IWDT_CallbackSet (wdt_ctrl_t *const *p_ctrl*, void(*)(wdt_callback_args_t *) *p_callback*, void const *const *p_context*, wdt_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements wdt_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

Modules » Monitoring

Functions

fsp_err_t	R_LVD_Open (lvd_ctrl_t *const p_api_ctrl, lvd_cfg_t const *const p_cfg)
fsp_err_t	R_LVD_StatusGet (lvd_ctrl_t *const p_api_ctrl, lvd_status_t *p_lvd_status)
fsp_err_t	R_LVD_StatusClear (lvd_ctrl_t *const p_api_ctrl)

fsp_err_t	R_LVD_CallbackSet (lvd_ctrl_t *const p_api_ctrl, void(*p_callback)(lvd_callback_args_t *), void const *const p_context, lvd_callback_args_t *const p_callback_memory)
fsp_err_t	R_LVD_Close (lvd_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the LVD and PVD peripherals on RA MCUs. This module implements the Low Voltage Detection Interface.

Note

In the below usage notes, "LVD" refers to both LVD and PVD.

Overview

The Low Voltage Detection module configures the voltage monitors to detect when a power supply pin or a voltage detector pin voltages crosses a specified threshold.

Features

The LVD HAL module supports the following functions:

- Five run-time configurable voltage monitors (Voltage Monitor 1, Voltage Monitor 2, LVD VBAT, LVD VRTC, EXLVD)
  - Configurable voltage threshold
  - Digital filter (Available on specific MCUs)
  - Support for both interrupt or polling
    - NMI or maskable interrupt can be configured (NMI support for Voltage Monitor 1 & Voltage Monitor 2 only).
  - Voltage monitor interrupt generation condition can be configured (rising, falling, or both edge event detection).
  - Support for resetting the MCU when V_{CC} falls below/rises above configured threshold.

Configuration

Build Time Configurations for r_lvd

The following build time configurations are defined in fsp_cfg/r_lvd_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Monitoring > Low/Programmable Voltage Detection (r_lvd)

This module can be added to the Stacks tab via New Stack > Monitoring > Low/Programmable

Voltage Detection (r_lvd). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_lvd0	Module name.
Monitor Number	MCU Specific Options		Select the LVD monitor.
Digital Filter	MCU Specific Options		Enable the digital filter and select the digital filter clock divider.
Voltage Threshold	MCU Specific Options		Select the low voltage detection threshold.
Detection Response	MCU Specific Options		Select what happens when the voltage crosses the threshold voltage.
Voltage Slope	MCU Specific Options		Select interrupt generation on rising voltage, falling voltage or both.
Negation Delay	MCU Specific Options		Negation of the monitor signal can either be delayed from the reset event or from voltage returning to normal range.
Monitor Interrupt Callback	Name must be a valid C symbol.	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR) each time the IRQ triggers.
LVD Monitor Interrupt Priority	MCU Specific Options		Select the LVD Monitor interrupt priority.

Clock Configuration

The LOCO clock must be enabled in order to use the digital filter.

Pin Configuration

To use LVD module, you need to switch pin funtion of EXLVDVBAT pin, VRTC pin, EXLVD pin to enable LVD function on this pin.

Usage Notes

Startup Edge Detection

If V_{CC} is below the threshold prior to configuring the voltage monitor for falling edge detection, the monitor will immediately detect the a falling edge condition. If V_{CC} is above the threshold prior to configuring the monitor for rising edge detection, the monitor will not detect a rising edge condition until V_{CC} falls below the threshold and then rises above it again.

Voltage Monitor 0

The LVD HAL module only supports configuring voltage monitor 1 and voltage monitor 2. Voltage monitor 0 can be configured by setting the appropriate bits in the OFS1 register. This means that voltage monitor 0 settings cannot be changed at runtime.

Voltage monitor 0 supports the following features

- Configurable Voltage Threshold (V_{DET0})
- Reset the device when V_{CC} falls below V_{DET0}

Limitations

- The digital filter must be disabled when using voltage monitors in Software Standby or Deep Software Standby.
- Deep Software Standby mode is not possible if the voltage monitor is configured to reset the MCU.
- Reset generated by the VCC-rise detection is supported only on devices with PVD.
- On RA0, when LVD0 is used the detection voltage of LVD1 must be higher than LVD0's. See the section "LVD1CR : Voltage Monitor 1 Circuit Control Register" of the RA0 Hardware User's Manual (r01uh1040ej0100).

Examples

Basic Example

This is a basic example of minimal use of the LVD in an application.

```
void basic_example (void)
{
 fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);
    assert(FSP_SUCCESS == err);
 while (1)
    {
 lvd_status_t status;
       err = R_LVD_StatusGet(&g_lvd_ctrl, &status);
     assert(FSP_SUCCESS == err);
 if (LVD_THRESHOLD_CROSSING_DETECTED == status.crossing_detected)
     {
           err = R_LVD_StatusClear(&g_lvd_ctrl);
```

```
     assert(FSP_SUCCESS == err);
 /* Do something */
      }
   }
}
```

Interrupt Example

This is a basic example of using a LVD instance that is configured to generate an interrupt.

```
void interrupt_example (void)
{
 fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);
 /* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
 while (1)
   {
 /* Application Process */
 /* Application will be interrupted when Vcc crosses the configured threshold. */
   }
}
/* Called when Vcc crosses configured threshold. */
void lvd_callback (lvd_callback_args_t * p_args)
{
 if (LVD_CURRENT_STATE_BELOW_THRESHOLD == p_args->current_state)
   {
 /* Do Something */
   }
}
```

Reset Example

This is a basic example of using a LVD instance that is configured to reset the MCU.

```
void reset_example (void)
{
```

```
 if (1U == R_SYSTEM->RSTSR0_b.LVD1RF)
    {
 /* The system is coming out of reset because Vcc crossed configured voltage
threshold. */
 /* Clear Voltage Monitor 1 Reset Detect Flag. */
       R_SYSTEM->RSTSR0_b.LVD1RF = 0;
    }
 fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (1)
    {
 /* Application Process */
 /* Application will reset when Vcc crosses the configured threshold. */
    }
}
```

Data Structures

struct	lvd_instance_ctrl_t

Data Structure Documentation

◆ lvd_instance_ctrl_t

struct lvd_instance_ctrl_t
LVD instance control structure

Function Documentation

◆ R_LVD_Open()

fsp_err_t R_LVD_Open (lvd_ctrl_t *const *p_api_ctrl*, lvd_cfg_t const *const *p_cfg*)

Initializes a voltage monitor and detector according to the passed-in configuration structure.

Parameters

[in]	p_api_ctrl	Pointer to the control structure for the driver instance
[in]	p_cfg	Pointer to the configuration structure for the driver instance

Note

Digital filter is not to be used with standby modes.
Startup time can take on the order of milliseconds for some configurations.

Example:

```
fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);
```

Return values

FSP_SUCCESS	Successful
FSP_ERR_ASSERTION	Requested configuration was invalid
FSP_ERR_ALREADY_OPEN	The instance was already opened
FSP_ERR_IN_USE	Another instance is already using the desired monitor
FSP_ERR_UNSUPPORTED	Digital filter was enabled on a device that does not support it

◆ R_LVD_StatusGet()

fsp_err_t R_LVD_StatusGet (lvd_ctrl_t *const *p_api_ctrl*, lvd_status_t * *p_lvd_status*)

Get the current state of the monitor (threshold crossing detected, voltage currently above or below threshold).

Parameters

[in]	p_api_ctrl	Pointer to the control structure for the driver instance
[out]	p_lvd_status	Pointer to status structure

Example:

```
err = R_LVD_StatusGet(&g_lvd_ctrl, &status);
```

Return values

FSP_SUCCESS	Successful
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_NOT_OPEN	Driver is not open

◆ R_LVD_StatusClear()

fsp_err_t R_LVD_StatusClear (lvd_ctrl_t *const *p_api_ctrl*)

Clears the latched status of the monitor.

Parameters

[in]	p_api_ctrl	Pointer to the control structure for the driver instance

Return values

FSP_SUCCESS	Successful
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_NOT_OPEN	Driver is not open

◆ R_LVD_CallbackSet()

fsp_err_t R_LVD_CallbackSet (lvd_ctrl_t *const *p_api_ctrl*, void(*)(lvd_callback_args_t *) *p_callback*, void const *const *p_context*, lvd_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements lvd_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_LVD_Close()

fsp_err_t R_LVD_Close (lvd_ctrl_t *const *p_api_ctrl*)

Disables the LVD peripheral. Closes the driver instance.

Parameters

[in]	p_api_ctrl	Pointer to the control block structure for the driver instance

Return values

FSP_SUCCESS	Successful
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_NOT_OPEN	Driver is not open

5.2.10.6 Watchdog (r_wdt)

Detailed Description

Driver for the WDT peripheral on RA MCUs. This module implements the WDT Interface.

Overview

The watchdog timer is used to recover from unexpected errors in an application. The watchdog timer must be refreshed periodically in the permitted count window by the application. If the count is allowed to underflow or refresh occurs outside of the valid refresh period, the WDT resets the device or generates an NMI.

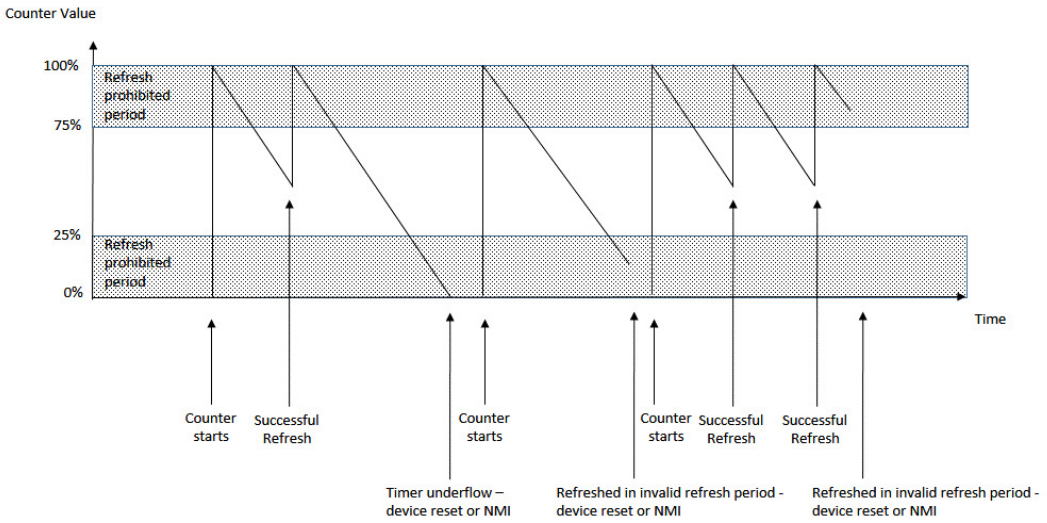

Figure 227: Watchdog Timer Operation Example

Features

The WDT HAL module has the following key features:

- When the WDT underflows or is refreshed outside of the permitted refresh window, one of the following events can occur:
  - Resetting of the device
  - Generation of an NMI
- The WDT has two supported modes:
  - In auto start mode, the WDT begins counting at reset.
  - In register start mode, the WDT can be started from the application.

Selecting a Watchdog

RA MCUs have two watchdog peripherals: the watchdog timer (WDT) and the independent watchdog timer (IWDT). When selecting between them, consider these factors:

	WDT	IWDT
Start Mode	The WDT can be started from the application (register start mode) or configured by hardware to start automatically (auto start mode).	The IWDT can only be configured by hardware to start automatically.
Clock Source	The WDT runs off a peripheral clock.	The IWDT has its own clock source which improves safety.

Configuration

When using register start mode, configure the watchdog timer on the Stacks tab.

Note

*When using auto start mode, configurations on the **Stacks** tab are ignored. Configure the watchdog using the OFS settings on the BSP tab.*

Build Time Configurations for r_wdt

The following build time configurations are defined in fsp_cfg/r_wdt_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Register Start NMI Support	• Enabled • Disabled	Disabled	If enabled, code for NMI support in register start mode is included in the build.

Configurations for Monitoring > Watchdog (r_wdt)

This module can be added to the Stacks tab via New Stack > Monitoring > Watchdog (r_wdt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_wdt0	Module name.
Timeout	• 1,024 Cycles • 4,096 Cycles • 8,192 Cycles • 16,384 Cycles	16,384 Cycles	Select the watchdog timeout in cycles.
Clock Division Ratio	• PCLK/4 • PCLK/64 • PCLK/128 • PCLK/512 • PCLK/2048 • PCLK/8192	PCLK/8192	Select the watchdog clock divisor.
Window Start Position	• 100 (Window Position Not Specified) • 75 • 50 • 25	100 (Window Position Not Specified)	Select the allowed watchdog refresh start point in %.
Window End Position	• 0 (Window Position Not Specified) • 25 • 50 • 75	0 (Window Position Not Specified)	Select the allowed watchdog refresh end point in %.
Reset Control	• Reset Output • NMI Generated	Reset Output	Select what happens when the watchdog timer expires.
Stop Control	• WDT Count Enabled in Low Power Mode • WDT Count Disabled in Low Power Mode	WDT Count Disabled in Low Power Mode	Select the watchdog state in low power mode.
NMI Callback	Name must be a valid C symbol	NULL	A user callback function must be provided if the WDT is configured to generate an NMI when the timer underflows or a refresh error occurs. If this callback function is provided, it will be called from the NMI handler each time the

watchdog triggers.

Clock Configuration

The WDT clock is based on the PCLKB frequency. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time. The maximum timeout period with PCLKB running at 60 MHz is approximately 2.2 seconds.

Pin Configuration

This module does not use I/O pins.

Usage Notes

NMI Interrupt

The watchdog timer uses the NMI, which is enabled by default. No special configuration is required. When the NMI is triggered, the callback function registered during open is called.

Note

When using the WDT in software start mode with NMI and the timer underflows, the WDT status must be reset by calling R_WDT_StatusClear before restarting the timer via R_WDT_Refresh.

Period Calculation

The WDT operates from PCLKB. With a PCLKB of 60 MHz, the maximum time from the last refresh to device reset or NMI generation will be just over 2.2 seconds as detailed below.

PLCKB = 60 MHz
Clock division ratio = PCLKB / 8192
Timeout period = 16384 cycles
WDT clock frequency = 60 MHz / 8192 = 7.324 kHz
Cycle time = 1 / 7.324 kHz = 136.53 us
Timeout = 136.53 us x 16384 cycles = 2.23 seconds

Limitations

Developers should be aware of the following limitations when using the WDT:

- When using a J-Link debugger the WDT counter does not count and therefore will not reset the device or generate an NMI. To enable the watchdog to count and generate a reset or NMI while debugging, add this line of code in the application:

```
/* (Optional) Enable the WDT to count and generate NMI or reset when the
 * debugger is connected. */
  R_DEBUG->DBGSTOPCR_b.DBGSTOP_WDT = 0;
```

- If the WDT is configured to stop the counter in low power mode, then your application must restart the watchdog by calling R_WDT_Refresh() after the MCU wakes from low power mode.

Examples

WDT Basic Example

This is a basic example of minimal use of the WDT in an application.

```
void wdt_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* In auto start mode, the WDT starts counting immediately when the MCU is powered
on. */
 /* Initializes the module. */
    err = R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* In register start mode, start the watchdog by calling R_WDT_Refresh. */
    err = R_WDT_Refresh(&g_wdt0_ctrl);
    assert(FSP_SUCCESS == err);
 while (true)
    {
 /* Application work here. */
 /* Refresh before the counter underflows to prevent reset or NMI. */
      err = R_WDT_Refresh(&g_wdt0_ctrl);
      assert(FSP_SUCCESS == err);
    }
}
```

WDT Advanced Example

This example demonstrates using a start window and gives an example callback to handle an NMI generated by an underflow or refresh error.

```
#define WDT_TIMEOUT_COUNTS (16384U)
#define WDT_MAX_COUNTER (WDT_TIMEOUT_COUNTS - 1U)
#define WDT_START_WINDOW_75 ((WDT_MAX_COUNTER * 3) / 4)
/* Example callback called when a watchdog NMI occurs. */
void wdt_callback (wdt_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
```

```
 fsp_err_t err = FSP_SUCCESS;
 /* (Optional) Determine the source of the NMI. */
 wdt_status_t status = WDT_STATUS_NO_ERROR;
    err = R_WDT_StatusGet(&g_wdt0_ctrl, &status);
    assert(FSP_SUCCESS == err);
 /* (Optional) Log source of NMI and any other debug information. */
 /* (Optional) Clear the error flags. */
    err = R_WDT_StatusClear(&g_wdt0_ctrl, status);
    assert(FSP_SUCCESS == err);
 /* (Register start mode) In register start mode, call R_WDT_Refresh() to
  * continue using the watchdog after an error. */
    err = R_WDT_Refresh(&g_wdt0_ctrl);
    assert(FSP_SUCCESS == err);
 /* (Optional) Issue a software reset to reset the MCU. */
    __NVIC_SystemReset();
}
void wdt_advanced_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* (Optional) Enable the WDT to count and generate NMI or reset when the
  * debugger is connected. */
    R_DEBUG->DBGSTOPCR_b.DBGSTOP_WDT = 0;
 /* (Optional) Check if the WDTRF flag is set to know if the system is
  * recovering from a WDT reset. */
 if (R_SYSTEM->RSTSR1_b.WDTRF)
    {
 /* Clear the flag. */
       R_SYSTEM->RSTSR1 = 0U;
    }
 /* Open the module. */
    err = R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize other application code. */
```

```
/* (Register start mode) Call R_WDT_Refresh() to start the WDT in register
 * start mode. Do not call R_WDT_Refresh() in auto start mode unless the
 * counter is in the acceptable refresh window. */
   err = R_WDT_Refresh(&g_wdt0_ctrl);
   assert(FSP_SUCCESS == err);
while (true)
   {
/* Application work here. */
/* (Optional) If there is a chance the application takes less time than
 * the start window, verify the WDT counter is past the start window
 * before refreshing the WDT. */
      uint32_t wdt_counter = 0U;
do
     {
/* Read the current WDT counter value. */
           err = R_WDT_CounterGet(&g_wdt0_ctrl, &wdt_counter);
     assert(FSP_SUCCESS == err);
     } while (wdt_counter >= WDT_START_WINDOW_75);
/* Refresh before the counter underflows to prevent reset or NMI. */
     err = R_WDT_Refresh(&g_wdt0_ctrl);
     assert(FSP_SUCCESS == err);
   }
}
```

Data Structures

struct	wdt_instance_ctrl_t

Data Structure Documentation

◆ wdt_instance_ctrl_t

struct wdt_instance_ctrl_t
WDT private control block. DO NOT MODIFY. Initialization occurs when R_WDT_Open() is called.

Function Documentation

◆ R_WDT_Open()

fsp_err_t R_WDT_Open (wdt_ctrl_t *const *p_ctrl*, wdt_cfg_t const *const *p_cfg*)

Configure the WDT in register start mode. In auto-start_mode the NMI callback can be registered. Implements wdt_api_t::open.

This function should only be called once as WDT configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
   err = R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);
```

Return values

FSP_SUCCESS	WDT successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_STATE	The security state of the NMI and the module do not match.

Note

In auto start mode the only valid configuration option is for registering the callback for the NMI ISR if NMI output has been selected.

◆ R_WDT_TimeoutGet()

fsp_err_t R_WDT_TimeoutGet (wdt_ctrl_t *const *p_ctrl*, wdt_timeout_values_t *const *p_timeout*)

Read timeout information for the watchdog timer. Implements wdt_api_t::timeoutGet.

Return values

FSP_SUCCESS	WDT timeout information retrieved successfully.
FSP_ERR_ASSERTION	Null Pointer.
FSP_ERR_NOT_OPEN	Instance control block is not initialized.

◆ R_WDT_Refresh()

fsp_err_t R_WDT_Refresh (wdt_ctrl_t *const *p_ctrl*)

Refresh the watchdog timer. Implements wdt_api_t::refresh.

In addition to refreshing the watchdog counter this function can be used to start the counter in register start mode.

Example:

```
/* Refresh before the counter underflows to prevent reset or NMI. */
     err = R_WDT_Refresh(&g_wdt0_ctrl);
     assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	WDT successfully refreshed.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance control block is not initialized.

Note

This function only returns FSP_SUCCESS. If the refresh fails due to being performed outside of the permitted refresh period the device will either reset or trigger an NMI ISR to run.

◆ R_WDT_StatusGet()

fsp_err_t R_WDT_StatusGet (wdt_ctrl_t *const *p_ctrl*, wdt_status_t *const *p_status*)

Read the WDT status flags. Implements wdt_api_t::statusGet.

Indicates both status and error conditions.

Example:

```
/* (Optional) Determine the source of the NMI. */
wdt_status_t status = WDT_STATUS_NO_ERROR;
   err = R_WDT_StatusGet(&g_wdt0_ctrl, &status);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	WDT status successfully read.
FSP_ERR_ASSERTION	Null pointer as a parameter.
FSP_ERR_NOT_OPEN	Instance control block is not initialized.
FSP_ERR_UNSUPPORTED	This function is only valid if the watchdog generates an NMI when an error occurs.

Note

When the WDT is configured to output a reset on underflow or refresh error reading the status and error flags serves no purpose as they will always indicate that no underflow has occurred and there is no refresh error. Reading the status and error flags is only valid when interrupt request output is enabled.

◆ R_WDT_StatusClear()

fsp_err_t R_WDT_StatusClear (wdt_ctrl_t *const *p_ctrl*, const wdt_status_t *status*)

Clear the WDT status and error flags. Implements wdt_api_t::statusClear.

Example:

```
/* (Optional) Clear the error flags. */
   err = R_WDT_StatusClear(&g_wdt0_ctrl, status);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	WDT flag(s) successfully cleared.
FSP_ERR_ASSERTION	Null pointer as a parameter.
FSP_ERR_NOT_OPEN	Instance control block is not initialized.
FSP_ERR_UNSUPPORTED	This function is only valid if the watchdog generates an NMI when an error occurs.

Note

When the WDT is configured to output a reset on underflow or refresh error reading the status and error flags serves no purpose as they will always indicate that no underflow has occurred and there is no refresh error. Reading the status and error flags is only valid when interrupt request output is enabled.

◆ R_WDT_CounterGet()

fsp_err_t R_WDT_CounterGet (wdt_ctrl_t *const *p_ctrl*, uint32_t *const *p_count*)

Read the current count value of the WDT. Implements wdt_api_t::counterGet.

Example:

```
/* Read the current WDT counter value. */
           err = R_WDT_CounterGet(&g_wdt0_ctrl, &wdt_counter);
     assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	WDT current count successfully read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Instance control block is not initialized.

◆ R_WDT_CallbackSet()

fsp_err_t R_WDT_CallbackSet (wdt_ctrl_t *const *p_ctrl*, void(*)(wdt_callback_args_t *) *p_callback*, void const *const *p_context*, wdt_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements wdt_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

Modules

Detailed Description

Motor Modules.

Modules

	120-degree conduction control sensorless (rm_motor_120_control_sensorless) Calculation process for the motor control on RA MCUs. This module implements the Motor 120-Degree Control Interface.
	120-degree conduction control with Hall sensors (rm_motor_120_control_hall) Calculation process for the motor control on RA MCUs. This module implements the Motor 120-Degree Control Interface.
	ADC and PWM Modulation (rm_motor_driver) Calculation process for the motor control on RA MCUs. This module implements the Motor driver Interface.

	ADC and PWM modulation (rm_motor_120_driver) Calculation process for the motor control on RA MCUs. This module implements the Motor 120-Degree Driver Interface.
	Motor 120 degree control (rm_motor_120_degree) Usual control of a SPM (Surface Permanent Magnet) motor on RA MCUs. This module implements the Motor 120 degree control (rm_motor_120_degree).
	Motor Angle (rm_motor_estimate) Calculation proccess for the motor control on RA MCUs. This module implements the Motor angle Interface.
	Motor Angle (rm_motor_sense_encoder) Calculation proccess for the motor control on RA MCUs. This module implements the Motor angle Interface.
	Motor Angle and Speed Calculation with Hall sensors (rm_motor_sense_hall) Calculation proccess for the motor control on RA MCUs. This module implements the Motor angle Interface.
	Motor Angle and Speed Calculation with induction sensor (rm_motor_sense_induction) Calculation proccess for the motor control on RA MCUs. This module implements the Motor angle Interface.
	Motor Current Controller (rm_motor_current) Calculation process for the motor control on RA MCUs. This module implements the Motor current Interface.
	Motor Encoder Vector Control (rm_motor_encoder) Control a SPM motor on RA MCUs. This module implements the Motor Encoder Vector Control (rm_motor_encoder).
	Motor Inertia estimate (rm_motor_inertia_estimate) Measurement and calculation proccess for the motor control on RA MCUs. This module implements the Motor Inertia Estimate Interface.

	Motor Position Controller (rm_motor_position) Calculation process for the motor control on RA MCUs. This module implements the Motor position Interface.
	Motor Sensorless Vector Control (rm_motor_sensorless) Usual control of a SPM motor on RA MCUs. This module implements the Motor Sensorless Vector Control (rm_motor_sensorless).
	Motor Speed Controller (rm_motor_speed) Calculation process for the motor control on RA MCUs. This module implements the Motor speed Interface.
	Motor Vector Control with hall sensors (rm_motor_hall) Usual control of a SPM motor on RA MCUs. This module implements the Motor Vector Control with hall sensors (rm_motor_hall).
	Motor return origin (rm_motor_return_origin) Search origin position proccess for the motor control on RA MCUs. This module implements the Motor Return Origin Function Interface.
	Motor vector control with induction sensor (rm_motor_induction) Control a SPM motor on RA MCUs. This module implements the Motor vector control with induction sensor (rm_motor_induction).

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor 120-Degree Control Interface.

Overview

The motor current is used to control the electric current of motor rotation in an appication. This module should be called cyclically after the A/D conversion of electric current of each phase in an application. This module calculates each phase voltage with input current reference, electric current and rotor angle.

Features

The motor 120 control sensorless module has below features.

- Calculate each phase(U/V/W) voltage.
- Decoupling control.
- Voltage error compensation.

Configuration

Build Time Configurations for rm_motor_120_control_sensorless

The following build time configurations are defined in fsp_cfg/rm_motor_120_control_sensorless_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > 120-degree conduction control sensorless (rm_motor_120_control_sensorless)

This module can be added to the Stacks tab via New Stack > Motor > 120-degree conduction control sensorless (rm_motor_120_control_sensorless).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_120_control_sensorless0	Module name.
Conduction type	• First 60 degree PWM • Complementary First 60 degree PWM	First 60 degree PWM	Select conduction type
Stop BEMF	Must be a valid non-negative value.	0.5	Value of stop motor BEMF (U+V+W)
Timeout counts (msec)	Must be a valid integer.	2000	Undetected time
Maximum voltage for BOOT (V)	Must be a valid non-negative value.	8.0	Maximum output voltage for boot mode (V)
Maximum voltage (V)	Must be a valid non-negative value.	20.0	Maximum output voltage (V)
Minimum voltage (V)	Must be a valid non-negative value.	3.0	Minimum output voltage (V)
Carrier frequency (kHz)	Must be a valid non-negative value.	20.0	PWM carrier frequency (kHz)
Adjusting angle	Manual Entry	0	Adjusting angle
Speed PI decimation	Must be a valid integer.	1	Speed PI control decimation count
Free run timer frequency (MHz)	Must be a valid integer.	120	Freerun timer frequency (MHz)
Speed LPF K	Must be a valid non-negative value.	1.0	Speed LPF parameter
Step of speed change	Must be a valid non-	0.2	Speed reference

	negative value.		change step
Boot reference voltage (V)	Must be a valid non-negative value.	3.0	Voltage reference for boot mode
Voltage lamping time	Must be a valid integer.	128	Voltage lamping time
Voltage constant adjust time	Must be a valid integer.	64	Voltage constant adjust time value (msec)
Open loop start speed (rpm)	Manual Entry	150	Open loop start speed (rpm)
Open loop mode2 speed (rpm)	Manual Entry	185	to mode2 change speed (rpm)
Open loop mode3 speed (rpm)	Manual Entry	1000	to mode3 change speed (rpm)
Open loop start voltage (V)	Must be a valid non-negative value.	3.0	start reference voltage (V)
Open loop mode1 speed rate	Must be a valid non-negative value.	0.25	increase rate of reference speed (rpm/control period)
Open loop mode2 voltage rate	Must be a valid non-negative value.	0.00285	increase rate of reference voltage (v/control period)
Open loop mode2 speed rate	Must be a valid non-negative value.	0.71	increase rate of reference speed (rpm/control period)
Open loop mode3 voltage rate	Must be a valid non-negative value.	0.002	increase rate of reference voltage (v/control period)
Open loop maximum voltage (V)	Must be a valid non-negative value.	6.5	openloop maximum voltage (V)
PI control KP	Must be a valid non-negative value.	0.02	PI control gain of proportional term
PI control KI	Must be a valid non-negative value.	0.004	PI control gain of integral term
PI control limit	Must be a valid non-negative value.	24.0	PI control limit of integral term
Motor Parameter			
Pole pairs	Must be a valid integer.	2	Pole pairs
Resistance (ohm)	Must be a valid non-negative value.	6.447	Resistance
Inductance of d-axis (H)	Must be a valid non-negative value.	0.0045	Inductance of d-axis
Inductance of q-axis (H)	Must be a valid non-negative value.	0.0045	Inductance of q-axis

Permanent magnetic flux (Wb)	Must be a valid non-negative value.	0.02159	Permanent magnetic flux
Motor Parameter > Rotor inertia (kgm^2)	Must be a valid non-negative value.	1.8	Rotor inertia
Interrupts			
Callback	Name must be a valid C symbol	NULL	callback function

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the period of current control with none-negative value.
- Set the reference voltage with none-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor 120 control sensorless in an application.

```
void motor_120_control_sensorless_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err =
RM_MOTOR_120_CONTROL_SENSORLESS_Open(g_motor_120_control_sensorless0.p_ctrl,
                                          g_motor_120_control_sensorless0.p_cfg);
    assert(FSP_SUCCESS == err);
 /* Set speed reference before motor run */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet(g_motor_120_control_sensorless0.p_ctrl,

DEF_120_CONTROL_SENSORLESSHALL_TEST_OVSPD_LIM);
 /* Start motor rotation */
```

```
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Run(g_motor_120_control_sensorless0.p_ctrl);
 /* Get current motor speed */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_speed);
 /* Get current */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_current_status);
 /* Get wait stop flag */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                                    &smpl_wait_stop_flag);
 /* Get timeout error flag */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                                         &smpl_timeout_error_fl
ag);
 /* Get pattern error flag */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                                         &smpl_pattern_error_fl
ag);
 /* Get voltage ref */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_voltage_ref);
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate
(g_motor_120_control_sensorless0.p_ctrl,
```

```
g_motor_120_control_sensorless0.p_cfg);
 /* Stop motor rotation */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Stop(g_motor_120_control_sensorless0.p_ctrl);
 /* Reset the process. */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Reset(g_motor_120_control_sensorless0.p_ctrl);
 /* Close the module. */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Close(g_motor_120_control_sensorless0.p_ctrl);
}
```

motor_120_control_timeout_error_flag_t	timeout_error_flag	Timeout error status.
motor_120_control_pattern_error_flag_t	pattern_error_flag	Bemf pattern error status.
motor_120_control_rotation_direction_t	direction	Rotational direction (0:CW ,1:CCW)
float	f4_ol_pattern_set_calc	Counts to change timing of open loop pattern.
float	f4_speed_calc_base	Base counts to calculate rotation speed.

float	f_rpm2rad	Translate value to radian/second to rpm.
float	f4_v_ref	Voltage reference (output of speed PI control)
uint32_t	u4_pwm_duty	PWM duty.
float	f4_ref_speed_rad	Motor speed reference.
float	f4_ref_speed_rad_ctrl	Motor speed reference for speed PI control.
float	f4_speed_rad	Motor speed.
uint32_t	u4_cnt_speed_pi	Counter for period of speed PI control.
motor_120_control_wait_stop_flag_t	flag_wait_stop	Flag for waiting for motor stop.
float	f4_vn_ad	Neutral voltage.
uint32_t	u4_cnt_adj_v	Voltage lamping count adjustment.
motor_120_control_sensorless_draw_in_position_t	flag_draw_in	Status of draw in a initial position.
motor_120_driver_phase_pattern_t	v_pattern	Voltage pattern.
uint32_t	u4_v_pattern_num	Selecting pattern number for openloop drive.
uint32_t	u4_bemf_signal	Pattern of BEMF.
uint32_t	u4_pre_bemf_signal	Previous pattern of BEMF.
motor_120_control_sensorless_pattern_change_flag_t	flag_pattern_change	Pattern change flag.
motor_120_control_speed_ref_t	flag_speed_ref	Speed reference flag.
motor_120_control_voltage_ref_t	flag_voltage_ref	Voltage reference flag.
uint32_t	u4_ol_signal	Pattern of BEMF.
uint32_t	u4_ol_pattern_set	Openloop frequency.
uint32_t	u4_cnt_ol_pattern_set	Counter for openloop pattern change.
uint32_t	u4_cnt_timeout	Counter for timeout error.
uint32_t	u4_bemf_timer_cnt	Value of timer counter.
uint32_t	u4_pre_bemf_timer_cnt	Previous value of timer counter.
int32_t	s4_timer_cnt_ave	Counts for 360 degrees.
uint32_t	u4_timer_cnt_buf[MOTOR_120_CONTROL_SENSORLESS_TIMES]	Counts for 60 degrees.

uint32_t	u4_timer_cnt_num	Array element number before 360 degrees.
uint32_t	u4_cnt_carrier	Counter for carrier interrupt.
uint32_t	u4_pre_cnt_carrier	Previous carrier interrupt count.
uint32_t	u4_angle_shift_cnt	Shift degrees count.
float	f4_pi_ctrl_err	PI control error.
float	f4_pi_ctrl_refi	PI control buffer of integral term.
motor_120_control_cfg_t const *	p_cfg	Pointer of configuration structure.
timer_direction_t	timer_direction	Hold timer direction.
timer_callback_args_t	timer_args	For call timer callbackSet function.

Enumeration Type Documentation

◆ motor_120_control_sensorless_draw_in_position_t

enum motor_120_control_sensorless_draw_in_position_t	
Draw in a initial position	
Enumerator	
MOTOR_120_CONTROL_SENSORLESS_DRAW_IN_POSITION_INIT	Inital parameter.
MOTOR_120_CONTROL_SENSORLESS_DRAW_IN_POSITION_1ST_TIME	Draw in a initial position of the 1st time.
MOTOR_120_CONTROL_SENSORLESS_DRAW_IN_POSITION_2ND_TIME	Draw in a initial position of the 2nd time.

◆ motor_120_control_sensorless_pattern_change_flag_t

enum motor_120_control_sensorless_pattern_change_flag_t	
Pattern change	
Enumerator	
MOTOR_120_CONTROL_SENSORLESS_PATTERN_CHANGE_FLAG_CLEAR	Inital parameter.
MOTOR_120_CONTROL_SENSORLESS_PATTERN_CHANGE_FLAG_SET	Voltage pattern change.

Function Documentation

◆ RM_MOTOR_120_CONTROL_SENSORLESS_Open()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Open (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_cfg_t const *const *p_cfg*)

Opens and configures the motor sensorless 120 detection module. Implements motor_120_control_api_t::open.

Example:

```
/* Initializes the module. */
   err =
RM_MOTOR_120_CONTROL_SENSORLESS_Open(g_motor_120_control_sensorless0.p_ctrl,
                                     g_motor_120_control_sensorless0.p_cfg);
```

Return values

FSP_SUCCESS	Motor driver successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_Close()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Close (motor_120_control_ctrl_t *const *p_ctrl*)

Disables specified motor sensorless 120 detection module. Implements motor_120_control_api_t::close.

Example:

```
/* Close the module. */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Close(g_motor_120_control_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_Run()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Run (motor_120_control_ctrl_t *const *p_ctrl*)

Run motor (Start motor rotation). Implements motor_120_control_api_t::run.

Example:

```
/* Start motor rotation */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Run(g_motor_120_control_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_Stop()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Stop (motor_120_control_ctrl_t *const *p_ctrl*)

Stop motor (Stop motor rotation). Implements motor_120_control_api_t::stop.

Example:

```
/* Stop motor rotation */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Stop(g_motor_120_control_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_Reset()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Reset (motor_120_control_ctrl_t *const *p_ctrl*)

Reset variables of motor sensorless 120 detection module. Implements motor_120_control_api_t::reset.

Example:

```
/* Reset the process. */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Reset(g_motor_120_control_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet (motor_120_control_ctrl_t *const *p_ctrl*, float const *speed_rpm*)

Set speed[rpm]. Implements motor_120_control_api_t::speedSet.

Example:

```
/* Set speed reference before motor run */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet(g_motor_120_control_sensorless0.p_ctrl,

DEF_120_CONTROL_SENSORLESSHALL_TEST_OVSPD_LIM);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet (motor_120_control_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm*)

Get speed. Implements motor_120_control_api_t::speedGet.

Example:

```
/* Get current motor speed */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_speed);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_driver_current_status_t *const *p_current_status*)

Get current. Implements motor_120_control_api_t::currentGet.

Example:

```
/* Get current */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_current_status);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_wait_stop_flag_t *const *p_flag*)

Get wait stop flag. Implements motor_120_control_api_t::waitStopFlagGet.

Example:

```
/* Get wait stop flag */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                                  &smpl_wait_stop_flag);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_timeout_error_flag_t *const *p_timeout_error_flag*)

Get timeout error flag. Implements motor_120_control_api_t::timeoutErrorFlagGet.

Example:

```
 /* Get timeout error flag */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                                    &smpl_timeout_error_fl
ag);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_pattern_error_flag_t *const *p_pattern_error_flag*)

Get pattern error flag. Implements motor_120_control_api_t::patternErrorFlagGet.

Example:

```
/* Get pattern error flag */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                                    &smpl_pattern_error_fl
ag);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_voltage_ref_t *const *p_voltage_ref*)

Get voltage ref. Implements motor_120_control_api_t::voltageRefGet.

Example:

```
/* Get voltage ref */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_voltage_ref);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_cfg_t const *const *p_cfg*)

Update the parameters of sensorless 120 detection module. Implements motor_120_control_api_t::parameterUpdate.

Example:

```
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate
(g_motor_120_control_sensorless0.p_ctrl,

g_motor_120_control_sensorless0.p_cfg);
```

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor 120-Degree Control Interface.

Overview

The motor current is used to control the electric current of motor rotation in an appication. This module should be called cyclically after the A/D conversion of electric current of each phase in an application. This module calculates each phase voltage with input current reference, electric current and rotor angle.

Features

The motor 120 control hall module has below features.

- Calculate each phase(U/V/W) voltage.
- Decoupling control.
- Voltage error compensation.

Configuration

Build Time Configurations for rm_motor_120_control_hall

The following build time configurations are defined in fsp_cfg/rm_motor_120_control_hall_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > 120-degree conduction control with Hall sensors

(rm_motor_120_control_hall)

This module can be added to the Stacks tab via New Stack > Motor > 120-degree conduction control with Hall sensors (rm_motor_120_control_hall).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_120_control_hall0	Module name.
Conduction type	• First 60 degree PWM • Complementary First 60 degree PWM	First 60 degree PWM	Select conduction type
Timeout counts (msec)	Must be a valid integer.	200	Counts to judge rotor unrotate
Maximum voltage (V)	Must be a valid non-negative value.	20.0	Maximum output voltage (V)
Minimum voltage (V)	Must be a valid non-negative value.	3.0	Minimum output voltage (V)
Speed PI decimation	Must be a valid integer.	0	Speed PI control decimation count
Freerun timer frequency (MHz)	Must be a valid integer.	120	Freerun timer frequency (MHz)
Speed LPF	Must be a valid non-negative value.	1.0	Speed LPF parameter
Step of speed reference change	Must be a valid non-negative value.	0.2	Speed ref change step
Start reference voltage (V)	Must be a valid non-negative value.	5.8	Reference voltage for boot mode (V)
Hall wait counts	Must be a valid integer.	12	Wait counts of hall interrupts to start speed calculation
Stop judge time	Must be a valid integer.	1000	Stop judge time
Minimum limit speed (rpm)	Must be a valid integer.	550	Minimum limit speed (rpm) (mechanical angle)
PI control KP	Must be a valid non-negative value.	0.02	PI control gain of proportional term
PI control KI	Must be a valid non-negative value.	0.0005	PI control gain of integral term
PI control limit	Must be a valid non-negative value.	24.0	PI control limit of integral term

Hall interrupt mask value	Must be a valid integer.	15	For limiting hall interrupt processing. Limited by the number of ADC interrupts
Motor Parameter			
Pole pairs	Must be a valid integer.	2	Pole pairs
Resistance (ohm)	Must be a valid non-negative value.	6.447	Resistance
Inductance of d-axis (H)	Must be a valid non-negative value.	0.0045	Inductance of d-axis
Inductance of q-axis (H)	Must be a valid non-negative value.	0.0045	Inductance of q-axis
Permanent magnetic flux (Wb)	Must be a valid non-negative value.	0.02159	Permanent magnetic flux
Motor Parameter > Rotor inertia (kgm^2)	Must be a valid non-negative value.	1.8	Rotor inertia
Interrupts			
Callback	Name must be a valid C symbol	NULL	Callback function
Hall sensor port U	Manual Entry	BSP_IO_PORT_04_PIN_11	Hall sensor port U
Hall sensor port V	Manual Entry	BSP_IO_PORT_04_PIN_10	Hall sensor port V
Hall sensor port W	Manual Entry	BSP_IO_PORT_04_PIN_09	Hall sensor port W

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

Depend on included ICU module.

Usage Notes

Limitations

- Set the period of current control with none-negative value.
- Set the reference voltage with none-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor 120 control hall in an application.

```
void motor_120_control_hall_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_120_CONTROL_HALL_Open(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);
    assert(FSP_SUCCESS == err);
 /* Set speed reference before motor run */
    (void) RM_MOTOR_120_CONTROL_HALL_SpeedSet(g_motor_120_control_hall0.p_ctrl,
DEF_120_CONTROL_HALL_TEST_SPEED_REF);
 /* Start motor rotation */
    (void) RM_MOTOR_120_CONTROL_HALL_Run(g_motor_120_control_hall0.p_ctrl);
 /* Get current motor speed */
    (void) RM_MOTOR_120_CONTROL_HALL_SpeedGet(g_motor_120_control_hall0.p_ctrl,
&smpl_speed);
 /* Get current */
    (void) RM_MOTOR_120_CONTROL_HALL_CurrentGet(g_motor_120_control_hall0.p_ctrl,
&smpl_current_status);
 /* Get wait stop flag */
    (void)
RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_wait_stop_flag);
 /* Get timeout error flag */
    (void)
RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_timeout_error_flag);
 /* Get pattern error flag */
    (void)
RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_pattern_error_flag);
 /* Get voltage ref */
    (void) RM_MOTOR_120_CONTROL_HALL_VoltageRefGet(g_motor_120_control_hall0.p_ctrl,
&smpl_voltage_ref);
    (void)
```

```
RM_MOTOR_120_CONTROL_HALL_ParameterUpdate(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);
 /* Stop motor rotation */
    (void) RM_MOTOR_120_CONTROL_HALL_Stop(g_motor_120_control_hall0.p_ctrl);
 /* Reset the process. */
    (void) RM_MOTOR_120_CONTROL_HALL_Reset(g_motor_120_control_hall0.p_ctrl);
 /* Close the module. */
    (void) RM_MOTOR_120_CONTROL_HALL_Close(g_motor_120_control_hall0.p_ctrl);
}
```

Data Structures

float	f4_ref_speed_rad	Motor speed reference.
float	f4_ref_speed_rad_ctrl	Motor speed reference for speed PI control.
float	f4_speed_rad	Motor speed.
uint32_t	u4_cnt_speed_pi	Counter for period of speed PI control.
motor_120_control_wait_stop_flag_t	flag_wait_stop	Flag for waiting for motor stop.
uint32_t	u4_cnt_wait_stop	Counter for waiting motor stop.
motor_120_driver_phase_pattern_t	v_pattern	Voltage pattern.
motor_120_control_speed_ref_t	flag_speed_ref	Speed reference flag.
motor_120_control_voltage_ref_t	flag_voltage_ref	Voltage reference flag.

uint32_t	u4_cnt_timeout	Counter for timeout error.
uint32_t	u4_hall_timer_cnt	Value of timer counter.
uint32_t	u4_pre_hall_timer_cnt	Previous value of timer counter.
int32_t	s4_timer_cnt_ave	Counts for 360 degrees.
uint32_t	u4_timer_cnt_buf[MOTOR_120_CONTROL_HALL_TIMES]	Counts for 60 degrees.
uint32_t	u4_timer_cnt_num	Array element number before 360 degrees.
float	f4_pi_ctrl_err	PI control error.
float	f4_pi_ctrl_refi	PI control buffer of integral term.
uint32_t	u4_hall_intr_cnt	For start timing of speed calculation.
uint32_t	u4_adc_interrupt_cnt	Number of ADC interrupt processing.
motor_120_control_cfg_t const *	p_cfg	Pointer of configuration structure.
timer_direction_t	timer_direction	Hold timer direction.
external_irq_callback_args_t	hall_interrupt_args	For call IRQ callbackSet function.
timer_callback_args_t	timer_args	For call timer callbackSet function.

Function Documentation

◆ RM_MOTOR_120_CONTROL_HALL_Open()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_Open (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_cfg_t const *const *p_cfg*)

Opens and configures the motor hall 120 detection module. Implements motor_120_control_api_t::open.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_120_CONTROL_HALL_Open(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);
```

Return values

FSP_SUCCESS	Motor 120 driver successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_HALL_Close()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_Close (motor_120_control_ctrl_t *const *p_ctrl*)

Disables specified motor hall 120 detection module. Implements motor_120_control_api_t::close.

Example:

```
/* Close the module. */
   (void) RM_MOTOR_120_CONTROL_HALL_Close(g_motor_120_control_hall0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_HALL_Run()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_Run (motor_120_control_ctrl_t *const *p_ctrl*)

Run motor (Start motor rotation). Implements motor_120_control_api_t::run.

Example:

```
/* Start motor rotation */
   (void) RM_MOTOR_120_CONTROL_HALL_Run(g_motor_120_control_hall0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_HALL_Stop()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_Stop (motor_120_control_ctrl_t *const *p_ctrl*)

Stop motor (Stop motor rotation). Implements motor_120_control_api_t::stop.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_120_CONTROL_HALL_Stop(g_motor_120_control_hall0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_HALL_Reset()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_Reset (motor_120_control_ctrl_t *const *p_ctrl*)

Reset variables of motor hall 120 detection module. Implements motor_120_control_api_t::reset.

Example:

```
/* Reset the process. */
   (void) RM_MOTOR_120_CONTROL_HALL_Reset(g_motor_120_control_hall0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_HALL_SpeedSet()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_SpeedSet (motor_120_control_ctrl_t *const *p_ctrl*, float const *speed_rpm*)

Set speed[rpm]. Implements motor_120_control_api_t::speedSet.

Example:

```
/* Set speed reference before motor run */
   (void) RM_MOTOR_120_CONTROL_HALL_SpeedSet(g_motor_120_control_hall0.p_ctrl,
DEF_120_CONTROL_HALL_TEST_SPEED_REF);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_HALL_SpeedGet()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_SpeedGet (motor_120_control_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm*)

Get speed. Implements motor_120_control_api_t::speedGet.

Example:

```
/* Get current motor speed */
   (void) RM_MOTOR_120_CONTROL_HALL_SpeedGet(g_motor_120_control_hall0.p_ctrl,
&smpl_speed);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_HALL_CurrentGet()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_CurrentGet (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_driver_current_status_t *const *p_current_status*)

Get current. Implements motor_120_control_api_t::currentGet.

Example:

```
/* Get current */
   (void) RM_MOTOR_120_CONTROL_HALL_CurrentGet(g_motor_120_control_hall0.p_ctrl,
&smpl_current_status);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_wait_stop_flag_t *const *p_flag*)

Get wait stop flag. Implements motor_120_control_api_t::waitStopFlagGet.

Example:

```
/* Get wait stop flag */
   (void)
RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_wait_stop_flag);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_timeout_error_flag_t *const *p_timeout_error_flag*)

Get timeout error flag. Implements motor_120_control_api_t::timeoutErrorFlagGet.

Example:

```
/* Get timeout error flag */
   (void)
RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_timeout_error_flag);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_pattern_error_flag_t *const *p_pattern_error_flag*)

Get pattern error flag. Implements motor_120_control_api_t::patternErrorFlagGet.

Example:

```
/* Get pattern error flag */
   (void)
RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_pattern_error_flag);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_HALL_VoltageRefGet()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_VoltageRefGet (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_voltage_ref_t *const *p_voltage_ref*)

Get voltage ref. Implements motor_120_control_api_t::voltageRefGet.

Example:

```
/* Get voltage ref */
   (void) RM_MOTOR_120_CONTROL_HALL_VoltageRefGet(g_motor_120_control_hall0.p_ctrl,
&smpl_voltage_ref);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_HALL_ParameterUpdate()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_ParameterUpdate (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_cfg_t const *const *p_cfg*)

Update the parameters of hall 120 detection module. Implements motor_120_control_api_t::parameterUpdate.

Example:

```
    (void)
RM_MOTOR_120_CONTROL_HALL_ParameterUpdate(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);
```

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor driver Interface.

Overview

The motor driver module is used to translate phase voltage to PWM duty and output PWM, and detect phase current and main line voltage. This module should be called cyclically at included A/D Conversion finish interrupt.

Features

The Motor Driver Module has below features.

- Calculate each phase(U/V/W) PWM duty according to reference and output PWM.
- Detect each phase current and main line voltage.
- Detect and correct A/D offset at phase current channel

Configuration

Build Time Configurations for rm_motor_driver

The following build time configurations are defined in fsp_cfg/rm_motor_driver_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
ADC_B Support	• Enabled • Disabled	Disabled	Select ADC_B module support.
Shared ADC support	• Enabled • Disabled	Disabled	Select Shared ADC support.
Supported Motor Number	Must be greater than 1.	1	

Configurations for Motor > ADC and PWM Modulation (rm_motor_driver)

This module can be added to the Stacks tab via New Stack > Motor > ADC and PWM Modulation (rm_motor_driver).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_driver0	Module name.
Shunt type	• 1 shunt • 2 shunt • 3 shunt	2 shunt	Select shunt type
Modulation method	• SVPWM • SPWM	SVPWM	Select PWM modulation method
PWM output port UP	Manual Entry	0	PWM output port UP
PWM output port UN	Manual Entry	0	PWM output port UN
PWM output port VP	Manual Entry	0	PWM output port VP
PWM output port VN	Manual Entry	0	PWM output port VN
PWM output port WP	Manual Entry	0	PWM output port WP
PWM output port WN	Manual Entry	0	PWM output port WN
PWM Timer Frequency (MHz)	Must be a valid non-negative value.	120	GPT PWM timer frequency
PWM Carrier Period (Microseconds)	Must be a valid non-negative value.	50	GPT PWM carrier period
Dead Time (Raw Counts)	Must be a valid non-negative value.	240	GPT PWM dead time
Current Range (A)	Must be a valid value	27.5F	Current range to measure(Maximum

			input current)
Voltage Range (V)	Must be a valid value	111.0F	Voltage range to measure(Maximum input Main Line Voltage)
Counts for current offset measurement	Must be a valid non-negative value.	500	How many times to measure current offset
A/D conversion channel for U Phase current	Value must be a supported channel number	0	Specify the A/D channel for U phase current (channel availability varies by MCU)
A/D conversion channel for W Phase current	Value must be a supported channel number	2	Specify the A/D channel for W phase current (channel availability varies by MCU)
A/D conversion channel for Main Line Voltage	Value must be a supported channel number	5	Specify the A/D channel for main line voltage (channel availability varies by MCU)
A/D conversion channel for V Phase current	Value must be a supported channel number	1	Specify the A/D channel for V phase current (channel availability varies by MCU)
A/D conversion channel for sin signal	Value must be a supported channel number	27	Specify the A/D channel for sin signal of induction sensor (channel availability varies by MCU)
A/D conversion channel for cos signal	Value must be a supported channel number	28	Specify the A/D channel for cos signal of induction sensor (channel availability varies by MCU)
Using ADC Scan Group	Manual Entry	0	For MCUs with ADC_B, select the scan group used.
A/D conversion unit for U Phase current	Manual Entry	0	Select the A/D conversion module for U phase current (only valid with adc module)
A/D conversion unit for W Phase current	Manual Entry	0	Select the A/D conversion module for W phase current (only valid with adc module)

A/D conversion unit for main line voltage	Manual Entry	0	Select the A/D conversion module for main line voltage (only valid with adc module)
A/D conversion unit for V Phase current	Manual Entry	0	Select the A/D conversion module for V phase current (only valid with adc module)
A/D conversion unit for sin signal	Manual Entry	0	Select the A/D conversion module for sin signal of induction sensor (only valid with adc module)
A/D conversion unit for cos signal	Manual Entry	0	Select the A/D conversion module for cos signal of induction sensor (only valid with adc module)
ADC interrupt module	• 1st • 2nd	1st	Select from which module ADC intterupt happens (only valid with adc module)
Adjustment value to current A/D	Must be a valid non-negative value.	20.0	Value to adjust 1shunt A/D double buffer
Minimum difference of PWM duty	Must be a valid non-negative value.	300	Minimum difference of PWM duty
Adjustment delay of A/D conversion	Must be a valid non-negative value.	240	Adjustment delay of A/D conversion
1shunt interrupt phase	• PHASE_U • PHASE_V • PHASE_W	PHASE_U	Select the phase which occures ADC end interrupt. (Only valid with 1shunt)
Input Voltage (V)	Must be a valid value	24.0F	Input voltage
Resolution of A/D conversion	Must be a valid Resolution of ADC.	0xFFF	Resolution of A/D conversion
Offset of A/D conversion for current	Must be a valid non-negative value.	0x745	Offset of A/D conversion for current
Conversion level of A/D conversion for voltage	Must be a valid value	0.66F	Conversion level of A/D conversion for voltage
GTIOCA Stop Level	• Pin Level Low • Pin Level High	Pin Level High	Select the behavior of the output pin when the timer is stopped.
GTIOCB Stop Level	• Pin Level Low • Pin Level High	Pin Level High	Select the behavior of the output pin when the timer is stopped.

Modulation			
Maximum Duty	Must be a valid value	0.9375F	Maximum duty of PWM
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at A/D conversion finish interrupt.

Clock Configuration

Set used clock with included GPT timer.

Pin Configuration

Depend on included GPT Three Phase Module and ADC Module.

Usage Notes

When shared ADC instance is used, please perform below sequence.

1. Add (New) shared ADC instance.
2. Set configurations of below ADC module for your use.
3. Select "Common | Shared ADC support" to "Enabled".

Limitations

Basically no limitation exists.

Examples

Basic Example

This is a basic example of minimal use of the Motor Driver in an application.

```
void motor_driver_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_DRIVER_Open(&g_motor_driver0.p_ctrl, &g_motor_driver0.p_cfg);
    assert(FSP_SUCCESS == err);
 /* Basically run this module at cyclic interrupt (e.g. included GPT PWM Carrier
intterupt).
  * This implementation is an example. */
 // while (true)
```

```
    {
 /* Application work here. */
 /* Get electric current, main line voltage and maximum voltage component */
       (void) RM_MOTOR_DRIVER_CurrentGet(&g_motor_driver0.p_ctrl, &f_get_iu,
&f_get_iw, &f_get_vdc, &f_get_va_max);
 /* Get the flag of A/D convderted current offset */
       (void) RM_MOTOR_DRIVER_FlagCurrentOffsetGet(&g_motor_driver0.p_ctrl,
&u1_get_flg_offset);
 // Perform current control process here
 /* Set phase voltage */
       (void) RM_MOTOR_DRIVER_PhaseVoltageSet(&g_motor_driver0.p_ctrl, 1.0F, 1.0F,
1.0F);
       (void) RM_MOTOR_DRIVER_ParameterUpdate(&g_motor_driver0.p_ctrl,
&g_motor_driver0.p_cfg);
    }
    (void) RM_MOTOR_DRIVER_Reset(&g_motor_driver0.p_ctrl);
 //

    (void) RM_MOTOR_DRIVER_Close(&g_motor_driver0.p_ctrl);
}
```

Data Structures

Enumeration Type Documentation

◆ motor_driver_select_adc_instance_t

enum motor_driver_select_adc_instance_t	
Support two ADC instance valid for adc	
Enumerator	
MOTOR_DRIVER_SELECT_ADC_INSTANCE_FIRST	Use first ADC instance.
MOTOR_DRIVER_SELECT_ADC_INSTANCE_SECOND	Use second ADC instanse.

◆ motor_driver_modulation_method_t

enum motor_driver_modulation_method_t	
Enumerator	
MOTOR_DRIVER_MODULATION_METHOD_SPWM	Sinusoidal pulse-width-modulation.
MOTOR_DRIVER_MODULATION_METHOD_SVPWM	Space vector pulse-width-modulation.

Function Documentation

◆ RM_MOTOR_DRIVER_Open()

fsp_err_t RM_MOTOR_DRIVER_Open (motor_driver_ctrl_t *const *p_ctrl*, motor_driver_cfg_t const *const *p_cfg*)

Opens and configures the Motor Driver module. Implements motor_driver_api_t::open.

Return values

FSP_SUCCESS	Motor Driver successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ RM_MOTOR_DRIVER_Close()

fsp_err_t RM_MOTOR_DRIVER_Close (motor_driver_ctrl_t *const *p_ctrl*)

Disables specified Motor Driver Module. Implements motor_driver_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_DRIVER_Reset()

fsp_err_t RM_MOTOR_DRIVER_Reset (motor_driver_ctrl_t *const *p_ctrl*)

Reset variables of Motor Driver Module. Implements motor_driver_api_t::reset.

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_DRIVER_PhaseVoltageSet()

fsp_err_t RM_MOTOR_DRIVER_PhaseVoltageSet (motor_driver_ctrl_t *const *p_ctrl*, float const *u_voltage*, float const *v_voltage*, float const *w_voltage*)

Set Phase Voltage Data to calculate PWM duty. Implements motor_driver_api_t::phaseVoltageSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_DRIVER_CurrentGet()

fsp_err_t RM_MOTOR_DRIVER_CurrentGet (motor_driver_ctrl_t *const *p_ctrl*, motor_driver_current_get_t *const *p_current_get*)

Get calculated phase Current, Vdc & Va_max data. Implements motor_driver_api_t::currentGet.

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_DRIVER_FlagCurrentOffsetGet()

fsp_err_t RM_MOTOR_DRIVER_FlagCurrentOffsetGet (motor_driver_ctrl_t *const *p_ctrl*, uint8_t *const *p_flag_offset*)

Get the flag of finish current offset detection. Implements motor_driver_api_t::flagCurrentOffsetGet .

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_DRIVER_CurrentOffsetRestart()

fsp_err_t RM_MOTOR_DRIVER_CurrentOffsetRestart (motor_driver_ctrl_t *const *p_ctrl*)

Restart the current offset detection. Implements motor_driver_api_t::currentOffsetRestart.

Return values

FSP_SUCCESS	Successfully restarted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_DRIVER_ParameterUpdate()

fsp_err_t RM_MOTOR_DRIVER_ParameterUpdate (motor_driver_ctrl_t *const *p_ctrl*, motor_driver_cfg_t const *const *p_cfg*)

Update the parameters of Driver Module. Implements motor_driver_api_t::parameterUpdate.

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

fsp_err_t	RM_MOTOR_120_DRIVER_ParameterUpdate (motor_120_driver_ctrl_t

*const p_ctrl, motor_120_driver_cfg_t const *const p_cfg)

Update the parameters of 120 driver module. Implements motor_120_driver_api_t::parameterUpdate. More...

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor 120-Degree Driver Interface.

Overview

The motor 120 degree driver module is used to translate phase voltage to PWM duty and output PWM, and detect phase current, voltage and main line voltage. This module should be called cyclically at included A/D conversion finish interrupt.

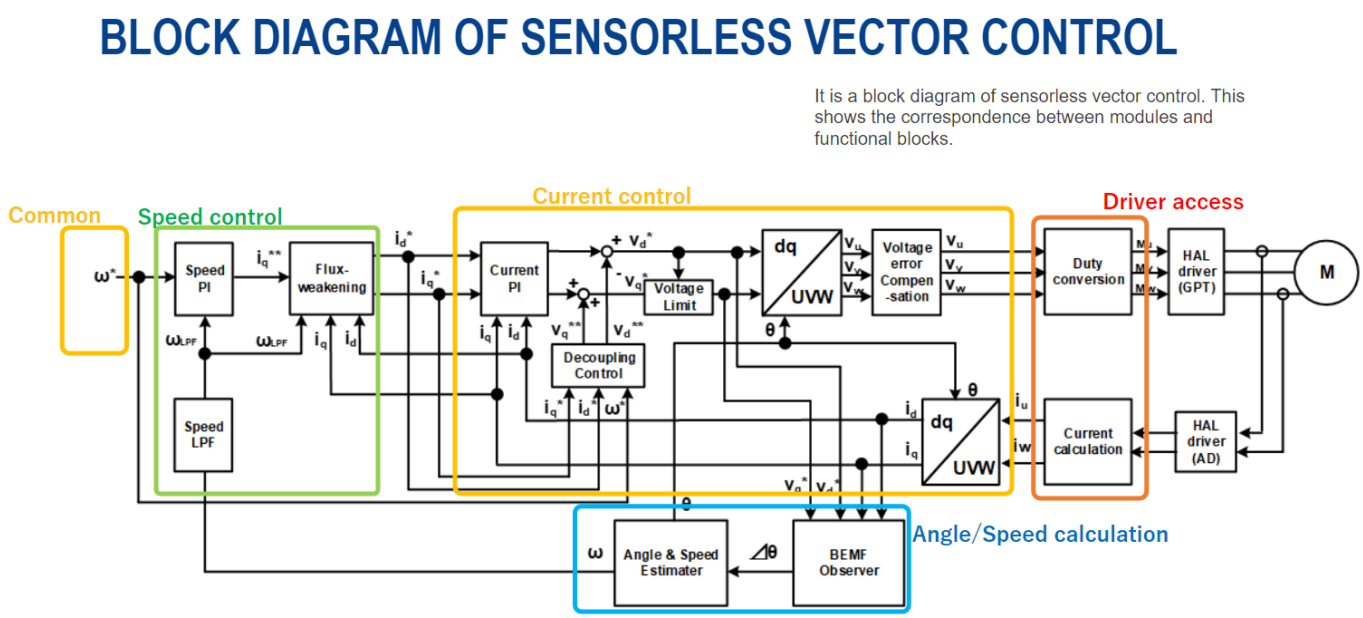

Figure 228: Image of Current Control Module(yellow block)

Features

The motor 120 degree driver module has below features.

- Calculate each phase(U/V/W) PWM duty according to reference and output PWM.
- Detect each phase current, phase voltage and main line voltage.
- Detect and correct A/D offset at phase current and voltage channel

Configuration

Build Time Configurations for rm_motor_120_driver

The following build time configurations are defined in fsp_cfg/rm_motor_120_driver_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
ADC_B Support	• Enabled • Disabled	Disabled	Select ADC_B module support.
Shared ADC support	• Enabled • Disabled	Disabled	Select Shared ADC support.
Support Motor Number	Must be greater than 1.	1	

Configurations for Motor > ADC and PWM modulation (rm_motor_120_driver)

This module can be added to the Stacks tab via New Stack > Motor > ADC and PWM modulation (rm_motor_120_driver).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_120_driver0	Module name.
120 degree control type	• Sensorless • Hall	Sensorless	120 degree control type
PWM output port UP	Manual Entry	BSP_IO_PORT_06_PIN_01	PWM output port UP
PWM output port UN	Manual Entry	BSP_IO_PORT_06_PIN_00	PWM output port UN
PWM output port VP	Manual Entry	BSP_IO_PORT_01_PIN_13	PWM output port VP
PWM output port VN	Manual Entry	BSP_IO_PORT_01_PIN_14	PWM output port VN
PWM output port WP	Manual Entry	BSP_IO_PORT_01_PIN_11	PWM output port WP
PWM output port WN	Manual Entry	BSP_IO_PORT_01_PIN_12	PWM output port WN
PWM timer frequency (MHz)	Must be a valid non-negative value.	120.0	GPT PWM timer frequency
PWM carrier period (Microseconds)	Must be a valid non-negative value.	50.0	GPT PWM carrier period
Dead time (Raw counts)	Must be a valid non-negative value.	240	GPT PWM dead time
Current range (A)	Must be a valid non-negative value.	27.5	Current range to measure(Maximum input current)
Voltage range (V)	Must be a valid non-	111.0	Voltage range to

	negative value.		measure(Maximum input main line voltage)
Resolution of A/D conversion	Must be a valid Resolution of ADC.	0xFFF	Resolution of A/D conversion
Offset of A/D conversion for current	Must be a valid non-negative value.	0x745	Offset of A/D conversion for current
Conversion level of A/D conversion for voltage	Must be a valid non-negative value.	0.66	Conversion level of A/D conversion for voltage
Counts for current offset measurement	Must be a valid non-negative value.	500	How many times to measure current offset
Input voltage	Must be a valid non-negative value.	24.0	Input voltage
A/D conversion channel for U phase current	Value must be a supported channel number	0	Specify the A/D channel for U phase current
A/D conversion channel for W phase current	Value must be a supported channel number	2	Specify the A/D channel for W phase current
A/D conversion channel for main line voltage	Value must be a supported channel number	5	Specify the A/D channel for main line voltage
A/D conversion channel for U phase voltage	Value must be a supported channel number	18	Specify the A/D channel for U phase voltage
A/D conversion channel for V phase voltage	Value must be a supported channel number	20	Specify the A/D channel for V phase voltage
A/D conversion channel for W phase voltage	Value must be a supported channel number	6	Specify the A/D channel for W phase voltage
A/D conversion unit for U phase current	Must be a valid non-negative value.	0	Specify the A/D unit for U phase current
A/D conversion unit for W phase current	Must be a valid non-negative value.	0	Specify the A/D unit for W phase current
A/D conversion unit for main line voltage	Must be a valid non-negative value.	0	Specify the A/D unit for main line voltage
A/D conversion unit for U phase voltage	Must be a valid non-negative value.	0	Specify the A/D unit for U phase voltage
A/D conversion unit for V phase voltage	Must be a valid non-negative value.	0	Specify the A/D unit for V phase voltage
A/D conversion unit for W phase voltage	Must be a valid non-negative value.	0	Specify the A/D unit for W phase voltage
GTIOCA stop level	• Pin Level Low	Pin Level High	Select the behavior of

	• Pin Level High		the output pin when the timer is stopped.
GTIOCB stop level	• Pin Level Low • Pin Level High	Pin Level High	Select the behavior of the output pin when the timer is stopped.
ADC interrupt module	• 1st • 2nd	1st	Select from which module ADC intterupt happens
Modulation			
Maximum duty	Must be a valid non-negative value.	0.9375	Maximum duty of PWM
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at A/D conversion finish interrupt.

Clock Configuration

Set used clock with included GPT timer.

Pin Configuration

Depend on included GPT three phase module and ADC module.

Usage Notes

Limitations

Basically no limitation exists.

Examples

Basic Example

This is a basic example of minimal use of the Motor 120 degree driver in an application.

```
void motor_120_driver_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_120_DRIVER_Open(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
 /* Start PWM output */
```

```
    err = RM_MOTOR_120_DRIVER_Run(&g_motor_120_driver0.p_ctrl);
    assert(FSP_SUCCESS == err);
 /* Basically run this module at cyclic interrupt (e.g. included GPT PWM carrier
intterupt).
  * This implementation is an example. */
 // while (true)
    {
 /* Application work here. */
 /* Caclutarion of current offset */
       (void) RM_MOTOR_120_DRIVER_CurrentOffsetCalc(&g_motor_120_driver0.p_ctrl);
 /* Get electric current, main line voltage and maximum voltage component */
       (void) RM_MOTOR_120_DRIVER_CurrentGet(&g_motor_120_driver0.p_ctrl,
&g_current_status);
 /* Get the flag of A/D convderted current offset */
       (void) RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet(&g_motor_120_driver0.p_ctrl,
&u1_get_flg_offset);
 // Perform current control process here
 /* Set phase voltage */
       (void) RM_MOTOR_120_DRIVER_PhaseVoltageSet(&g_motor_120_driver0.p_ctrl, 1.0F,
1.0F, 1.0F);
 /* Set phase pattern */
       (void) RM_MOTOR_120_DRIVER_PhasePatternSet(&g_motor_120_driver0.p_ctrl,
MOTOR_120_DRIVER_API_VP_ON_WN_PWM);
       (void) RM_MOTOR_120_DRIVER_ParameterUpdate(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
    }
    (void) RM_MOTOR_120_DRIVER_Stop(&g_motor_120_driver0.p_ctrl);
    (void) RM_MOTOR_120_DRIVER_Reset(&g_motor_120_driver0.p_ctrl);
 //

    (void) RM_MOTOR_120_DRIVER_Close(&g_motor_120_driver0.p_ctrl);
}
```

Function Documentation

◆ RM_MOTOR_120_DRIVER_Open()

fsp_err_t RM_MOTOR_120_DRIVER_Open (motor_120_driver_ctrl_t *const *p_ctrl*, motor_120_driver_cfg_t const *const *p_cfg*)

Opens and configures the motor 120 driver module. Implements motor_120_driver_api_t::open.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_120_DRIVER_Open(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
```

Return values

FSP_SUCCESS	Motor 120 driver successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_DRIVER_Close()

fsp_err_t RM_MOTOR_120_DRIVER_Close (motor_120_driver_ctrl_t *const *p_ctrl*)

Disables specified motor 120 driver module. Implements motor_120_driver_api_t::close.

Example:

```
   (void) RM_MOTOR_120_DRIVER_Close(&g_motor_120_driver0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_DRIVER_Run()

fsp_err_t RM_MOTOR_120_DRIVER_Run (motor_120_driver_ctrl_t *const *p_ctrl*)

Run motor (Start motor rotation). Implements motor_120_driver_api_t::run.

Example:

```
/* Start PWM output */
   err = RM_MOTOR_120_DRIVER_Run(&g_motor_120_driver0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_DRIVER_Stop()

fsp_err_t RM_MOTOR_120_DRIVER_Stop (motor_120_driver_ctrl_t *const *p_ctrl*)

Stop motor (Stop motor rotation). Implements motor_120_driver_api_t::stop.

Example:

```
   (void) RM_MOTOR_120_DRIVER_Stop(&g_motor_120_driver0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_DRIVER_Reset()

fsp_err_t RM_MOTOR_120_DRIVER_Reset (motor_120_driver_ctrl_t *const *p_ctrl*)

Reset variables of motor 120 driver module. Implements motor_120_driver_api_t::reset.

Example:

```
   (void) RM_MOTOR_120_DRIVER_Reset(&g_motor_120_driver0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_DRIVER_PhaseVoltageSet()

fsp_err_t RM_MOTOR_120_DRIVER_PhaseVoltageSet (motor_120_driver_ctrl_t *const *p_ctrl*, float const *u_voltage*, float const *v_voltage*, float const *w_voltage*)

Set phase voltage data to calculate PWM duty. Implements motor_120_driver_api_t::phaseVoltageSet.

Example:

```
 /* Set phase voltage */
      (void) RM_MOTOR_120_DRIVER_PhaseVoltageSet(&g_motor_120_driver0.p_ctrl, 1.0F,
1.0F, 1.0F);
```

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_DRIVER_PhasePatternSet()

fsp_err_t RM_MOTOR_120_DRIVER_PhasePatternSet (motor_120_driver_ctrl_t *const *p_ctrl*, motor_120_driver_phase_pattern_t const *pattern*)

Set phase voltage pattern. Implements motor_120_driver_api_t::phasePatternSet.

Example:

```
/* Set phase pattern */
      (void) RM_MOTOR_120_DRIVER_PhasePatternSet(&g_motor_120_driver0.p_ctrl,
MOTOR_120_DRIVER_API_VP_ON_WN_PWM);
```

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_DRIVER_CurrentGet()

fsp_err_t RM_MOTOR_120_DRIVER_CurrentGet (motor_120_driver_ctrl_t *const *p_ctrl*, motor_120_driver_current_status_t *const *p_current_status*)

Get calculated phase current, Vdc & Va_max data. Implements motor_120_driver_api_t::currentGet .

Example:

```
/* Get electric current, main line voltage and maximum voltage component */
      (void) RM_MOTOR_120_DRIVER_CurrentGet(&g_motor_120_driver0.p_ctrl,
&g_current_status);
```

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_DRIVER_CurrentOffsetCalc()

fsp_err_t RM_MOTOR_120_DRIVER_CurrentOffsetCalc (motor_120_driver_ctrl_t *const *p_ctrl*)

current offset detection. Implements motor_120_driver_api_t::currentOffsetCalc

Example:

```
/* Caclutarion of current offset */
      (void) RM_MOTOR_120_DRIVER_CurrentOffsetCalc(&g_motor_120_driver0.p_ctrl);
```

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet()

fsp_err_t RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet (motor_120_driver_ctrl_t *const *p_ctrl*, motor_120_driver_flag_offset_calc_t *const *p_flag_offset*)

Get the flag of finish current offset detection. Implements motor_120_driver_api_t::flagCurrentOffsetGet.

Example:

```
/* Get the flag of A/D convderted current offset */
      (void) RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet(&g_motor_120_driver0.p_ctrl,
&u1_get_flg_offset);
```

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_DRIVER_ParameterUpdate()

fsp_err_t RM_MOTOR_120_DRIVER_ParameterUpdate (motor_120_driver_ctrl_t *const *p_ctrl*, motor_120_driver_cfg_t const *const *p_cfg*)

Update the parameters of 120 driver module. Implements motor_120_driver_api_t::parameterUpdate.

Example:

```
      (void) RM_MOTOR_120_DRIVER_ParameterUpdate(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
```

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

Detailed Description

Usual control of a SPM (Surface Permanent Magnet) motor on RA MCUs. This module implements the Motor 120 degree control (rm_motor_120_degree).

Overview

The motor 120 degree control is used to control a motor rotation in an appication. This module is implemented with using a SPM motor. User can start/stop motor rotation simply.

Features

The motor 120 degree module has below features.

- Start/Stop a motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Target Hardware

The below figure shows examples of target hardware of this Motor 120-degree Module.

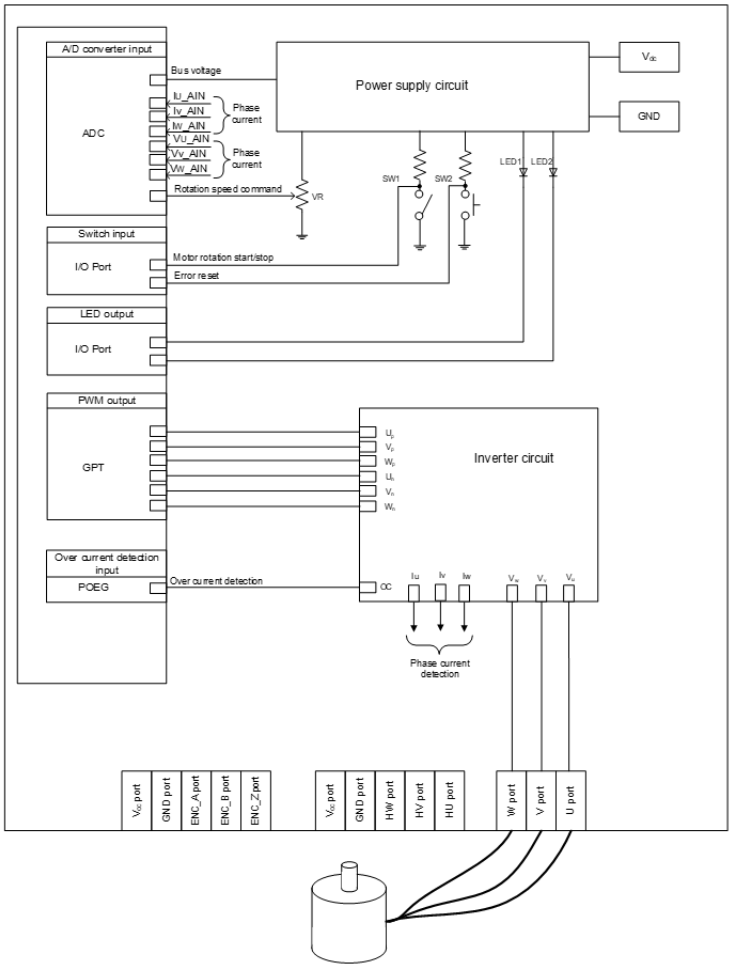

Figure 229: Example of target hardware of motor 120-degree sensorless

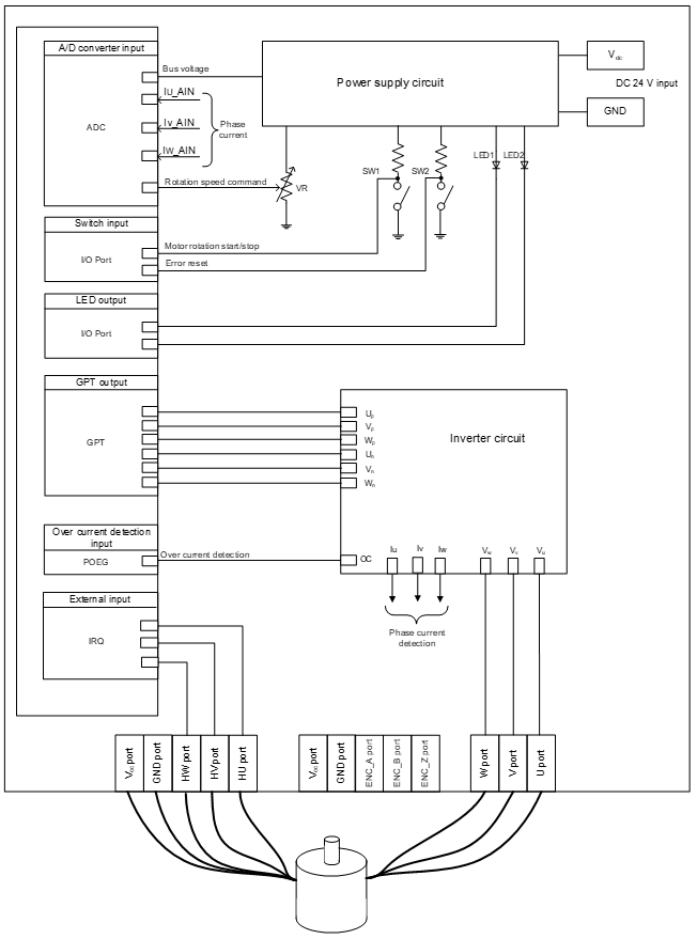

Figure 230: Example of target hardware of motor 120-degree with hall sensor

Modulation

The modulation factor "m" is defined as follows.

$$m = \frac{V}{E}$$

m : Modulation ratio V : Reference voltage E : Inverter input voltage

Figure 231: Modulation factor

State transition

The below figure shows a state transition diagram. Internal state is managed by "SYSTEM MODE".

		MODE		
		STOP	RUN	ERROR
EVENT	STOP	STOP	STOP	ERROR
	RUN	RUN	RUN	ERROR
	ERROR	ERROR	ERROR	ERROR
	RESET	STOP	RUN	STOP

Figure 232: State transition diagram

(1) SYSTEM MODE "SYSTEM MODE" indicates the operating states of the system. The state transits on occurrence of each event (EVENT). "SYSTEM MODE" has 3 states that are motor drive stop (INACTIVE), motor drive (ACTIVE), and abnormal condition (ERROR).

(2) EVENT When "EVENT" occurs in each "SYSTEM MODE", "SYSTEM MODE" changes as shown the table in above figure, according to that "EVENT". The occurrence factors of each event are shown below.

EVENT name	Occurrence factor
STOP	by user operation
RUN	by user operation
ERROR	when the system detects an error
RESET	by user operation

Flowchart

The below figures show flowcharts of motor 120-degree module.

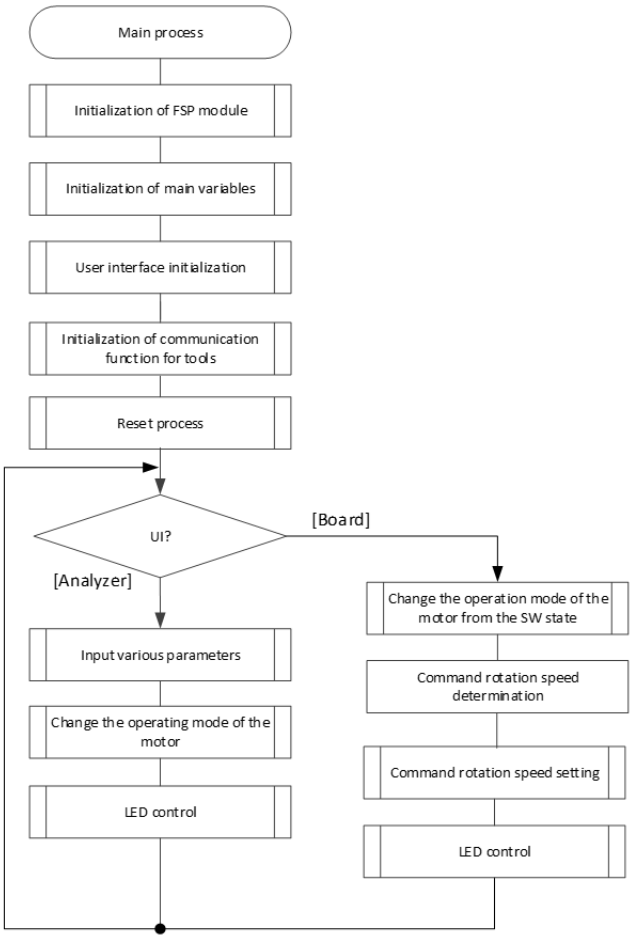

Figure 233: Main process

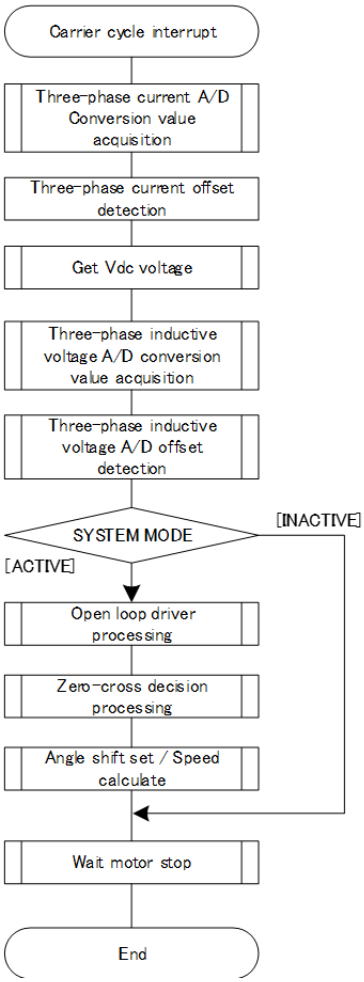

Figure 234: Current control process of 120-degree sensorless

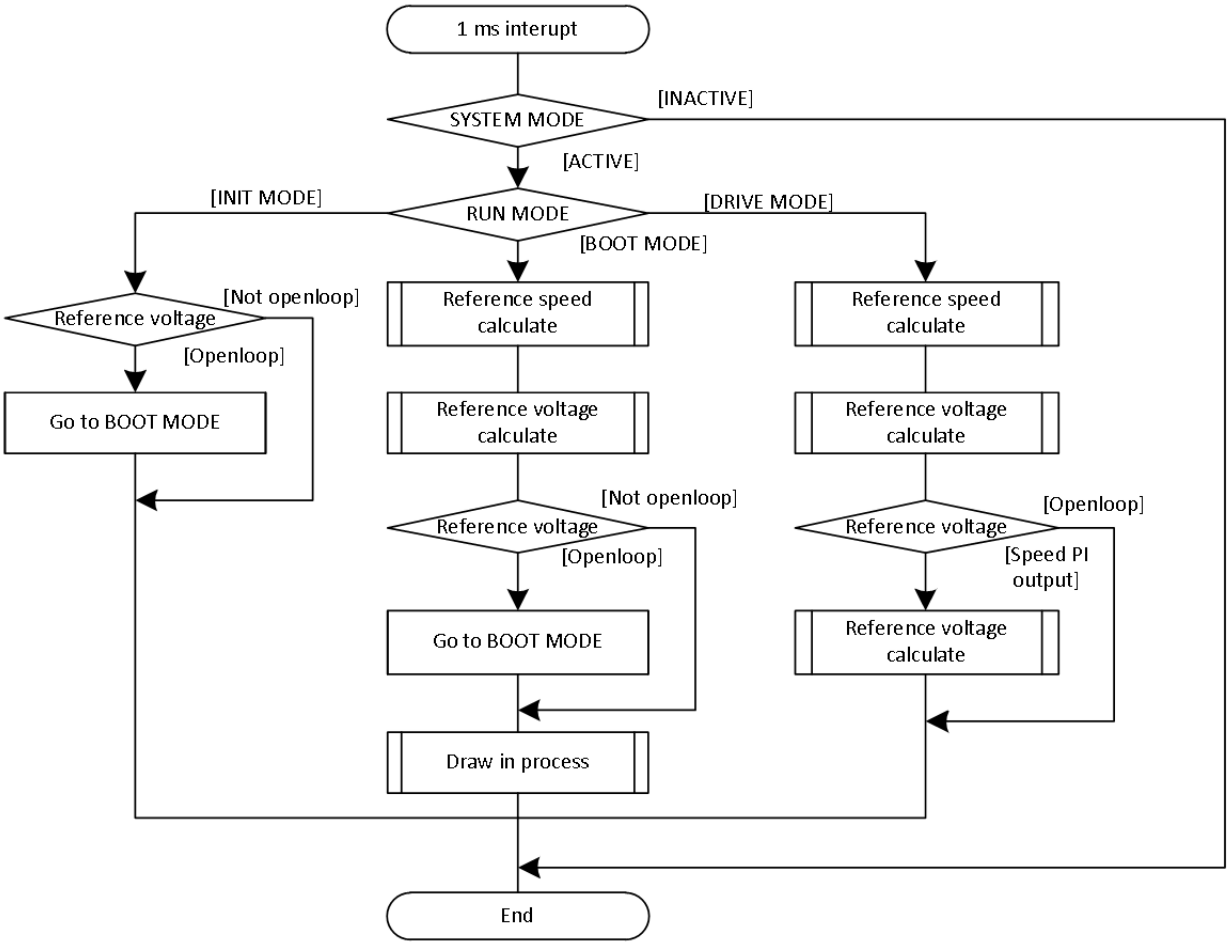

Figure 235: Speed control process of 120-degree sensorless

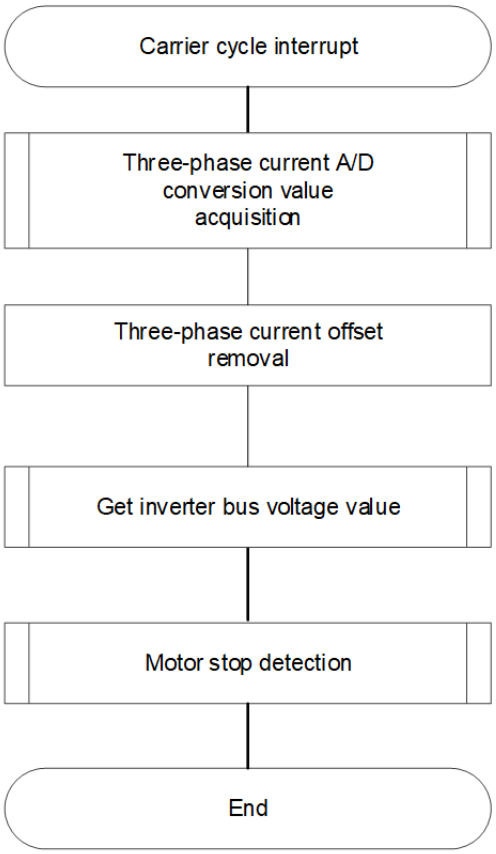

Figure 236: Current control process of 120-degree with hall sensor

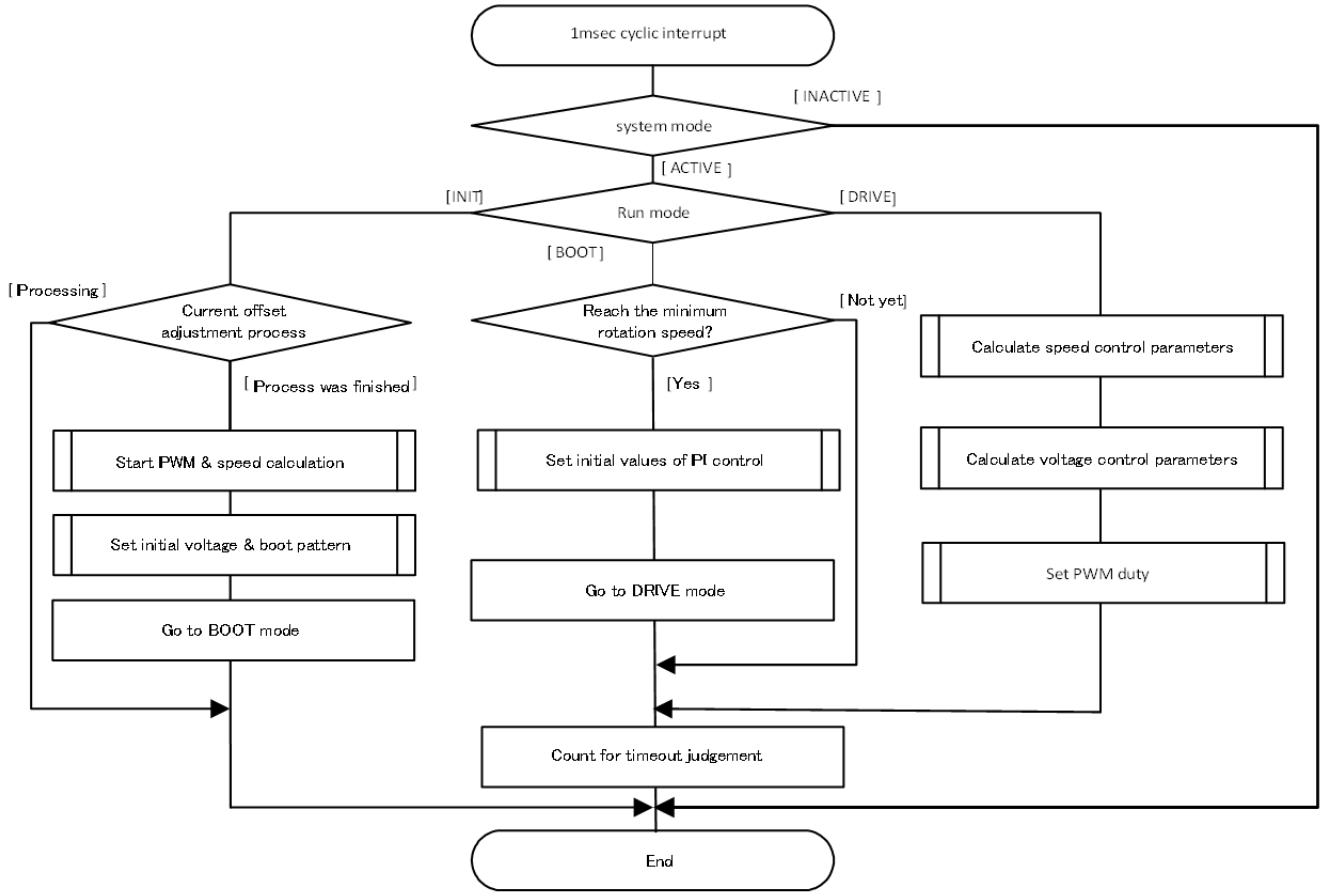

Figure 237: Speed control process of 120-degree with hall sensor

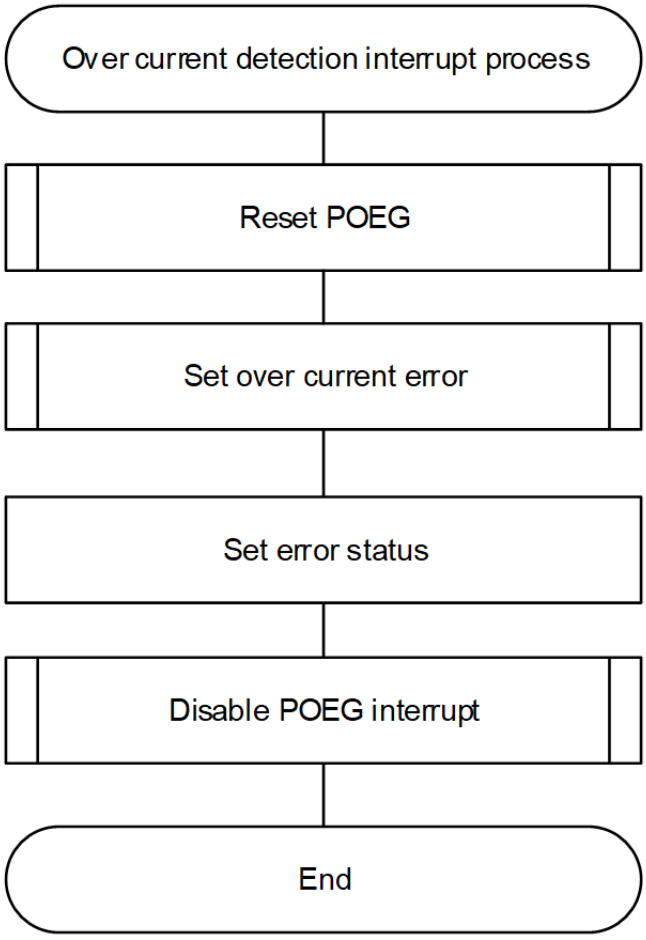

Figure 238: Over current detection interrupt process

Configuration

Build Time Configurations for rm_motor_120_degree

The following build time configurations are defined in fsp_cfg/rm_motor_120_degree_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor 120 degree control (rm_motor_120_degree)

This module can be added to the Stacks tab via New Stack > Motor > Motor 120 degree control (rm_motor_120_degree).

Configuration	Options	Default	Description
General			

Name	Name must be a valid C symbol	g_motor_120_degree0	Module name.
Limit of over current (A)	Must be a valid non-negative value.	4.0	Limit of over current.(Detection threshold)
Limit of over voltage (V)	Must be a valid non-negative value.	28.0	Limit of over voltage.(Detection threshold)
Limit of over speed (rpm)	Must be a valid non-negative value.	3000.0	Limit of over speed.(Detection threshold)
Limit of low voltage (V)	Must be a valid non-negative value.	14.0	Limit of low voltage.(Detection threshold)
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function.

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins. Please set used pins on configuration of each hardware modules.

Usage Notes

Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor 120 degree in an application.

```
void motor_120_degree_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_120_DEGREE_Open(g_motor_120_degree0.p_ctrl,
g_motor_120_degree0.p_cfg);
```

```
    assert(FSP_SUCCESS == err);
 /* Set speed reference before motor run */
    (void) RM_MOTOR_120_DEGREE_SpeedSet(g_motor_120_degree0.p_ctrl,
DEF_120_DEGREE_SPEED_REF);
 /* Start motor rotation */
    (void) RM_MOTOR_120_DEGREE_Run(g_motor_120_degree0.p_ctrl);
 /* Get current status */
    (void) RM_MOTOR_120_DEGREE_StatusGet(g_motor_120_degree0.p_ctrl, &smpl_status);
 /* Get current motor speed */
    (void) RM_MOTOR_120_DEGREE_SpeedGet(g_motor_120_degree0.p_ctrl, &smpl_speed);
 /* Get wait stop flag */
    (void) RM_MOTOR_120_DEGREE_WaitStopFlagGet(g_motor_120_degree0.p_ctrl,
&smpl_wait_stop_flag);
 /* Check error */
    (void) RM_MOTOR_120_DEGREE_ErrorCheck(g_motor_120_degree0.p_ctrl, &smpl_error);
 /* Stop motor rotation */
    (void) RM_MOTOR_120_DEGREE_Stop(g_motor_120_degree0.p_ctrl);
    (void) RM_MOTOR_120_DEGREE_ErrorSet(g_motor_120_degree0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
 /* Reset the process. */
    (void) RM_MOTOR_120_DEGREE_Reset(g_motor_120_degree0.p_ctrl);
 /* Close the module. */
    (void) RM_MOTOR_120_DEGREE_Close(g_motor_120_degree0.p_ctrl);
}
```

Function Documentation

◆ RM_MOTOR_120_DEGREE_Open()

fsp_err_t RM_MOTOR_120_DEGREE_Open (motor_ctrl_t *const *p_ctrl*, motor_cfg_t const *const *p_cfg*)

Configure the motor in register start mode. Implements motor_api_t::open.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_120_DEGREE_Open(g_motor_120_degree0.p_ctrl,
g_motor_120_degree0.p_cfg);
```

Return values

FSP_SUCCESS	Successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

Note

This function should only be called once as motor configuration registers can only be written to once so subsequent calls will have no effect.

◆ RM_MOTOR_120_DEGREE_Close()

fsp_err_t RM_MOTOR_120_DEGREE_Close (motor_ctrl_t *const *p_ctrl*)

Disables specified motor control block. Implements motor_api_t::close.

Example:

```
/* Close the module. */
   (void) RM_MOTOR_120_DEGREE_Close(g_motor_120_degree0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_120_DEGREE_Reset()

fsp_err_t RM_MOTOR_120_DEGREE_Reset (motor_ctrl_t *const *p_ctrl*)

Reset motor control block. Implements motor_api_t::reset.

Example:

```
/* Reset the process. */
   (void) RM_MOTOR_120_DEGREE_Reset(g_motor_120_degree0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_120_DEGREE_Run()

fsp_err_t RM_MOTOR_120_DEGREE_Run (motor_ctrl_t *const *p_ctrl*)

Run motor (Start motor rotation). Implements motor_api_t::run.

Example:

```
/* Start motor rotation */
   (void) RM_MOTOR_120_DEGREE_Run(g_motor_120_degree0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_120_DEGREE_Stop()

fsp_err_t RM_MOTOR_120_DEGREE_Stop (motor_ctrl_t *const *p_ctrl*)

Stop motor (Stop motor rotation). Implements motor_api_t::stop.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_120_DEGREE_Stop(g_motor_120_degree0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully stopped.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_120_DEGREE_ErrorSet()

fsp_err_t RM_MOTOR_120_DEGREE_ErrorSet (motor_ctrl_t *const *p_ctrl*, motor_error_t const *error*)

Set error information. Implements motor_api_t::errorSet.

Example:

```
    (void) RM_MOTOR_120_DEGREE_ErrorSet(g_motor_120_degree0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

FSP_SUCCESS	Successfully set error infomation.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_120_DEGREE_SpeedSet()

fsp_err_t RM_MOTOR_120_DEGREE_SpeedSet (motor_ctrl_t *const *p_ctrl*, float const *speed_rpm*)

Set speed reference[rpm]. Implements motor_api_t::speedSet.

Example:

```
 /* Set speed reference before motor run */
    (void) RM_MOTOR_120_DEGREE_SpeedSet(g_motor_120_degree0.p_ctrl,
DEF_120_DEGREE_SPEED_REF);
```

Return values

FSP_SUCCESS	Successfully set speed reference.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_120_DEGREE_StatusGet()

fsp_err_t RM_MOTOR_120_DEGREE_StatusGet (motor_ctrl_t *const *p_ctrl*, uint8_t *const *p_status*)

Get current control status. Implements motor_api_t::statusGet.

Example:

```
/* Get current status */
   (void) RM_MOTOR_120_DEGREE_StatusGet(g_motor_120_degree0.p_ctrl, &smpl_status);
```

Return values

FSP_SUCCESS	Successfully got current control status.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	Data received pointer is invalid.

Note

◆ RM_MOTOR_120_DEGREE_SpeedGet()

fsp_err_t RM_MOTOR_120_DEGREE_SpeedGet (motor_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm*)

Get rotational speed. Implements motor_api_t::speedGet.

Example:

```
/* Get current motor speed */
   (void) RM_MOTOR_120_DEGREE_SpeedGet(g_motor_120_degree0.p_ctrl, &smpl_speed);
```

Return values

FSP_SUCCESS	Successfully got rotational speed.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	Data received pointer is invalid.

Note

◆ RM_MOTOR_120_DEGREE_WaitStopFlagGet()

fsp_err_t RM_MOTOR_120_DEGREE_WaitStopFlagGet (motor_ctrl_t *const *p_ctrl*, motor_wait_stop_flag_t *const *p_flag_wait_stop*)

Get wait stop flag. Implements motor_api_t::waitStopFlagGet.

Example:

```
/* Get wait stop flag */
   (void) RM_MOTOR_120_DEGREE_WaitStopFlagGet(g_motor_120_degree0.p_ctrl,
&smpl_wait_stop_flag);
```

Return values

FSP_SUCCESS	Successfully got wait stop flag.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	Data received pointer is invalid.

Note

◆ RM_MOTOR_120_DEGREE_ErrorCheck()

fsp_err_t RM_MOTOR_120_DEGREE_ErrorCheck (motor_ctrl_t *const *p_ctrl*, uint16_t *const *p_error*)

Check the occurunce of error. Implements motor_api_t::errorCheck.

Example:

```
/* Check error */
   (void) RM_MOTOR_120_DEGREE_ErrorCheck(g_motor_120_degree0.p_ctrl, &smpl_error);
```

Return values

FSP_SUCCESS	Successfully error checke process.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	Data received pointer is invalid.

Note

◆ RM_MOTOR_120_DEGREE_PositionSet()

fsp_err_t RM_MOTOR_120_DEGREE_PositionSet (motor_ctrl_t *const *p_ctrl*, motor_speed_position_data_t const *const *p_position*)

Set position reference. Implements motor_api_t::positionSet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Note

◆ RM_MOTOR_120_DEGREE_AngleGet()

fsp_err_t RM_MOTOR_120_DEGREE_AngleGet (motor_ctrl_t *const *p_ctrl*, float *const *p_angle_rad*)

Set position reference. Implements motor_api_t::angleGet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Note

◆ RM_MOTOR_120_DEGREE_FunctionSelect()

fsp_err_t RM_MOTOR_120_DEGREE_FunctionSelect (motor_ctrl_t *const *p_ctrl*, motor_function_select_t const *function*)

Select using function. Implements motor_api_t::functionSelect.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Detailed Description

Calculation proccess for the motor control on RA MCUs. This module implements the Motor angle Interface.

Overview

The motor angle and speed estimation module is used to calculate rotor angle and rotational speed

in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application.

Features

The Motor Angle and Speed Estimation Module has below features.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

Configuration

Build Time Configurations for rm_motor_estimate

The following build time configurations are defined in fsp_cfg/rm_motor_estimate_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor Angle and Speed Estimation (rm_motor_estimate)

This module can be added to the Stacks tab via New Stack > Motor > Motor Angle and Speed Estimation (rm_motor_estimate).

Configuration	Options	Default	Description
Motor Parameter			
Pole pairs	Must be a valid non-negative value.	2	Pole pairs
Motor Parameter > Resistance[ohm]	Must be a valid value	8.5F	Resistance
Motor Parameter > Inductance of d-axis[H]	Must be a valid value	0.0045F	Inductance of d-axis
Motor Parameter > Inductance of q-axis[H]	Must be a valid value	0.0045F	Inductance of q-axis
Motor Parameter > Permanent magnetic flux[Wb]	Must be a valid value	0.02159F	Permanent magnetic flux
Motor Parameter > Rotor inertia[kgm^2]	Must be a valid value	0.0000028F	Rotor inertia
Motor Parameter > Nominal current[Arms]	Must be a valid value	1.67	Nominal current
Name	Name must be a valid C symbol	g_motor_angle0	Module name.
Openloop damping	• Disable • Enable	Enable	Openloop damping functionally enable or

			disable
Natural frequency of BEMF observer	Must be a valid value	1000.0F	Natural frequency of BEMF observer
Damping ratio of BEMF observer	Must be a valid value	1.0F	Damping ratio of BEMF observer
Natural frequency of PLL Speed estimate loop	Must be a valid value	20.0F	Natural frequency of PLL Speed estimate loop
Damping ratio of PLL Speed estimate loop	Must be a valid value	1.0F	Damping ratio of PLL Speed estimate loop
Control period	Must be a valid value	0.00005F	Control period

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the Motor Angle and Speed Estimation:

Examples

Basic Example

This is a basic example of minimal use of the Motor Angle and Speed Estimation in an application.

```
void motor_estimate_basic_example (void)
{
 fsp_err_t             err = FSP_SUCCESS;
 motor_angle_current_t smpl_current:
 motor_angle_voltage_reference_t smpl_voltage;
 /* Initializes the module. */
    err = RM_MOTOR_ESTIMATE_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
    assert(FSP_SUCCESS == err);
 /* Basically run this module at A/D conversion finish interrupt.
  * This implementation is an example. */
 while (true)
```

```
    {
 /* Application work here. */
 /* Set PI Control Flag before get Angle/Speed and Estimated Component */
       (void) RM_MOTOR_ESTIMATE_FlagPiCtrlSet(&g_mtr_angle0_ctrl, 1U);
       smpl_current.id = 1.0F;
       smpl_current.iq = 1.0F;
       smpl_voltage.vd = 10.0F;
       smpl_voltage.vq = 10.0F;
 /* Set Current and Speed data before get Angle/Speed and Estimated Component */
       (void) RM_MOTOR_ESTIMATE_CurrentSet(&g_mtr_angle0_ctrl, smpl_current,
smpl_voltage);
 /* Set Internal Speed Reference & damping speed data before get Angle/Speed and
Estimated Component */
       (void) RM_MOTOR_ESTIMATE_SpeedSet(&g_mtr_angle0_ctrl, 104.27F, 10.0F);
 /* Get Angle/Speed data */
       (void) RM_MOTOR_ESTIMATE_AngleSpeedGet(&g_mtr_angle0_ctrl, &f_get_angle,
&f_get_speed, &f_get_phase_err);
 /* Get Estimated Component */
       (void) RM_MOTOR_ESTIMATE_EstimatedComponentGet(&g_mtr_angle0_ctrl, &f_get_ed,
&f_get_eq);
    }
}
```

Function Documentation

◆ RM_MOTOR_ESTIMATE_Open()

fsp_err_t RM_MOTOR_ESTIMATE_Open (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg*)

Opens and configures the Angle Estimation module. Implements motor_angle_api_t::open.

Return values

FSP_SUCCESS	MTR_ANGL_EST successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

◆ RM_MOTOR_ESTIMATE_Close()

fsp_err_t RM_MOTOR_ESTIMATE_Close (motor_angle_ctrl_t *const *p_ctrl*)

Disables specified Angle Estimation module. Implements motor_angle_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_Reset()

fsp_err_t RM_MOTOR_ESTIMATE_Reset (motor_angle_ctrl_t *const *p_ctrl*)

Reset variables of Angle Estimation module. Implements motor_angle_api_t::reset.

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_CurrentSet()

fsp_err_t RM_MOTOR_ESTIMATE_CurrentSet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_current_t *const *p_st_current*, motor_angle_voltage_reference_t *const *p_st_voltage*)

Set d/q-axis Current Data & Voltage Reference. Implements motor_angle_api_t::currentSet.

Return values

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_SpeedSet()

fsp_err_t RM_MOTOR_ESTIMATE_SpeedSet (motor_angle_ctrl_t *const *p_ctrl*, float const *speed_ctrl*, float const *damp_speed*)

Set Speed Information. Implements motor_angle_api_t::speedSet.

Return values

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_FlagPiCtrlSet()

fsp_err_t RM_MOTOR_ESTIMATE_FlagPiCtrlSet (motor_angle_ctrl_t *const *p_ctrl*, uint32_t const *flag_pi*)

Set the flag of PI Control runs. Implements motor_angle_api_t::flagPiCtrlSet.

Return values

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_AngleSpeedGet()

fsp_err_t RM_MOTOR_ESTIMATE_AngleSpeedGet (motor_angle_ctrl_t *const *p_ctrl*, float *const *p_angle*, float *const *p_speed*, float *const *p_phase_err*)

Gets the current rotor's angle and rotation speed. Implements motor_angle_api_t::angleSpeedGet.

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_EstimatedComponentGet()

fsp_err_t RM_MOTOR_ESTIMATE_EstimatedComponentGet (motor_angle_ctrl_t *const *p_ctrl*, float *const *p_ed*, float *const *p_eq*)

Gets estimated d/q-axis component. Implements motor_angle_api_t::estimatedComponentGet.

Return values

FSP_SUCCESS	Successfully data gotten.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_ParameterUpdate()

fsp_err_t RM_MOTOR_ESTIMATE_ParameterUpdate (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg*)

Update the parameters of Angle&Speed Estimation. Implements motor_angle_api_t::parameterUpdate.

Return values

FSP_SUCCESS	Successfully data is update.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_InternalCalculate()

fsp_err_t RM_MOTOR_ESTIMATE_InternalCalculate (motor_angle_ctrl_t *const *p_ctrl*)

Calculate internal parameters. Implements motor_angle_api_t::internalCalculate.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_AngleAdjust()

fsp_err_t RM_MOTOR_ESTIMATE_AngleAdjust (motor_angle_ctrl_t *const *p_ctrl*)

Angle Adjustment Process. Implements motor_angle_api_t::angleAdjust.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_EncoderCyclic()

fsp_err_t RM_MOTOR_ESTIMATE_EncoderCyclic (motor_angle_ctrl_t *const *p_ctrl*)

Encoder Cyclic Process (Call in cyclic timer). Implements motor_angle_api_t::encoderCyclic.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_InfoGet()

fsp_err_t RM_MOTOR_ESTIMATE_InfoGet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_encoder_info_t *const *p_info*)

Gets information of Encoder Angle Module. Implements motor_angle_api_t::infoGet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_CyclicProcess()

fsp_err_t RM_MOTOR_ESTIMATE_CyclicProcess (motor_angle_ctrl_t *const *p_ctrl*)

Perform induction cyclic process. Implements motor_angle_api_t::cyclicProcess.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

◆ RM_MOTOR_ESTIMATE_SensorDataSet()

fsp_err_t RM_MOTOR_ESTIMATE_SensorDataSet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_ad_data_t *const *p_ad_data*)

Set sensor data. Implements motor_angle_api_t::sensorDataSet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Detailed Description

Calculation proccess for the motor control on RA MCUs. This module implements the Motor angle Interface.

Overview

The motor angle and speed calculation with an encoder module is used to calculate rotor angle and rotational speed in an application. This module is designed to be used with the motor current module (rm_motor_current).

Features

The motor angle and speed calculation with an encoder module has the features listed below.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

Configuration

Build Time Configurations for rm_motor_sense_encoder

The following build time configurations are defined in fsp_cfg/rm_motor_sense_encoder_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor Angle and Speed Calculation with encoder (rm_motor_sense_encoder)

This module can be added to the Stacks tab via New Stack > Motor > Motor Angle and Speed Calculation with encoder (rm_motor_sense_encoder).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_sense_encoder0	Module name.
Motor Parameter			
Pole pairs	Must be a valid non-negative value.	7	Pole pairs
Resistance (ohm)	Must be a valid non-negative value	0.453F	Resistance
Inductance of d-axis (H)	Must be a valid non-negative value	0.0009447F	Inductance of d-axis
Inductance of q-axis (H)	Must be a valid non-negative value	0.0009447F	Inductance of q-axis
Permanent magnetic flux (Wb)	Must be a valid non-negative value	0.006198F	Permanent magnetic flux
Motor Parameter > Rotor inertia (kgm^2)	Must be a valid non-negative value	0.00000962F	Rotor inertia
Control Type	• Speed • Position	Position	Select control Type
Period of Current control (kHz)	Must be a valid non-negative value	20.0F	Period of Current control
Period of Speed control	Must be a valid non-	0.0005F	Period of Speed control

(sec)	negative value		
PWM Carrier Frequency (kHz)	Must be a valid non-negative value	20.0F	PWM Carrier Frequency
Decimation of Interrupt	Must be a valid non-negative value.	0U	Decimation of Interrupt
Counts per Rotation	Must be a valid non-negative value.	1200U	Encoder Counts per One Rotation
Counts for Angle Adjust	Must be a valid non-negative value.	512U	Counts for Angle Adjust (as working time)
Zero speed counts	Must be a valid non-negative value.	20000000U	Threshold counts to judge zero speed
Occupancy Time	Must be a valid non-negative value	0.30F	Occupancy time of carrier interrup
Carrier Time	Must be a valid non-negative value	0.000013F	Processing time of carrier interrupt
Process Time	Must be a valid non-negative value	0.000001F	Processing time of encoder interrupt
Highspeed Change Margin (rpm)	Must be a valid non-negative value.	150U	Margin of toggle speed for high speed mode
LPF parameter for Highspeed Filter	Must be a valid non-negative value	0.1F	Highspeed mode speed LPF parameter
Counts to change speed	Must be a valid non-negative value.	8U	Counts for mode change of position speed calculation

Pin Configuration

Usage Notes

Limitations

Developers should be aware of the following limitations when using the motor angle and speed calculation with an encoder: all configurations should be set as positive values.

Examples

Basic Example

This is a basic example of minimal use of the motor angle and speed calculation with an encoder in an application.

```
void motor_sense_encoder_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
```

```
/* Initializes the module. */
   err = RM_MOTOR_SENSE_ENCODER_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
   assert(FSP_SUCCESS == err);
/* Basically run this module at A/D conversion finish interrupt.
 * This implementation is an example. */
// while (true)
   {
/* Application work here. */
/* Initialize motor with the encoder */
      (void) RM_MOTOR_SENSE_ENCODER_AngleAdjust(&g_mtr_angle0_ctrl);
/* Perform cyclic encoder process*/
      (void) RM_MOTOR_SENSE_ENCODER_CyclicProcess(&g_mtr_angle0_ctrl);
/* Calculate information with encoder signal input */
      (void) RM_MOTOR_SENSE_ENCODER_InternalCalculate(&g_mtr_angle0_ctrl);
/* Get angle/speed data */
      (void) RM_MOTOR_SENSE_ENCODER_AngleSpeedGet(&g_mtr_angle0_ctrl, &f_get_angle,
&f_get_speed, &f_get_phase_err);
/* Get calculated component */
      (void) RM_MOTOR_SENSE_ENCODER_InfoGet(&g_mtr_angle0_ctrl, &temp_info);
   }
/* Reset the module */
   (void) RM_MOTOR_SENSE_ENCODER_Reset(&g_mtr_angle0_ctrl);
/* Close the module */
   (void) RM_MOTOR_SENSE_ENCODER_Close(&g_mtr_angle0_ctrl);
}
```

Enumerations

enum	motor_sense_encoder_loop_t
enum	motor_sense_encoder_mode_t

Enumeration Type Documentation

◆ motor_sense_encoder_loop_t

enum motor_sense_encoder_loop_t	
Enumerator	
MOTOR_SENSE_ENCODER_LOOP_SPEED	Speed control mode.
MOTOR_SENSE_ENCODER_LOOP_POSITION	Position control mode.

◆ motor_sense_encoder_mode_t

enum motor_sense_encoder_mode_t	
Enumerator	
MOTOR_SENSE_ENCODER_MODE_INIT	Initialize mode (Start status)
MOTOR_SENSE_ENCODER_MODE_BOOT	Boot mode (Angle adjustment status)
MOTOR_SENSE_ENCODER_MODE_DRIVE	Drive mode (Normal work status)

Function Documentation

◆ RM_MOTOR_SENSE_ENCODER_Open()

fsp_err_t RM_MOTOR_SENSE_ENCODER_Open (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg*)

Opens and configures the Angle Encoder module. Implements motor_angle_api_t::open.

Return values

FSP_SUCCESS	Angle Encoder module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

◆ RM_MOTOR_SENSE_ENCODER_Close()

fsp_err_t RM_MOTOR_SENSE_ENCODER_Close (motor_angle_ctrl_t *const *p_ctrl*)

Disables specified Angle Encoder module. Implements motor_angle_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_ENCODER_Reset()

fsp_err_t RM_MOTOR_SENSE_ENCODER_Reset (motor_angle_ctrl_t *const *p_ctrl*)

Reset variables of Angle Encoder module. Implements motor_angle_api_t::reset.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_ENCODER_InternalCalculate()

fsp_err_t RM_MOTOR_SENSE_ENCODER_InternalCalculate (motor_angle_ctrl_t *const *p_ctrl*)

Calculate internal parameters. Implements motor_angle_api_t::internalCalculate.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_ENCODER_AngleSpeedGet()

fsp_err_t RM_MOTOR_SENSE_ENCODER_AngleSpeedGet (motor_angle_ctrl_t *const *p_ctrl*, float *const *p_angle*, float *const *p_speed*, float *const *p_phase_err*)

Gets the current rotor's angle and rotation speed. Implements motor_angle_api_t::angleSpeedGet.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_ENCODER_AngleAdjust()

fsp_err_t RM_MOTOR_SENSE_ENCODER_AngleAdjust (motor_angle_ctrl_t *const *p_ctrl*)

Angle Adjustment Process. Implements motor_angle_api_t::angleAdjust.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_ENCODER_EncoderCyclic()

fsp_err_t RM_MOTOR_SENSE_ENCODER_EncoderCyclic (motor_angle_ctrl_t *const *p_ctrl*)

Encoder Cyclic Process (Call in cyclic timer). Implements motor_angle_api_t::encoderCyclic.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_ENCODER_CyclicProcess()

fsp_err_t RM_MOTOR_SENSE_ENCODER_CyclicProcess (motor_angle_ctrl_t *const *p_ctrl*)

Perform cyclic process. Implements motor_angle_api_t::cyclicProcess.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_ENCODER_InfoGet()

fsp_err_t RM_MOTOR_SENSE_ENCODER_InfoGet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_encoder_info_t *const *p_info*)

Gets information of Encoder Angle Module. Implements motor_angle_api_t::infoGet.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_ENCODER_ParameterUpdate()

fsp_err_t RM_MOTOR_SENSE_ENCODER_ParameterUpdate (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg*)

Update the parameters of Angle&Speed calculation with an encoder. Implements motor_angle_api_t::parameterUpdate.

Return values

FSP_SUCCESS	Successfully data is update.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_ENCODER_CurrentSet()

fsp_err_t RM_MOTOR_SENSE_ENCODER_CurrentSet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_current_t *const *p_st_current*, motor_angle_voltage_reference_t *const *p_st_voltage*)

Set d/q-axis Current Data & Voltage Reference. Implements motor_angle_api_t::currentSet.

Return values

FSP_ERR_UNSUPPORTED	Motor sense encoder software currentSet is not supported.

◆ RM_MOTOR_SENSE_ENCODER_SpeedSet()

fsp_err_t RM_MOTOR_SENSE_ENCODER_SpeedSet (motor_angle_ctrl_t *const *p_ctrl*, float const *speed_ctrl*, float const *damp_speed*)

Set Speed Information. Implements motor_angle_api_t::speedSet.

Return values

FSP_ERR_UNSUPPORTED	Motor sense encoder software speedSet is not supported.

◆ RM_MOTOR_SENSE_ENCODER_FlagPiCtrlSet()

fsp_err_t RM_MOTOR_SENSE_ENCODER_FlagPiCtrlSet (motor_angle_ctrl_t *const *p_ctrl*, uint32_t const *flag_pi*)

Set the flag of PI Control runs. Implements motor_angle_api_t::flagPiCtrlSet.

Return values

FSP_ERR_UNSUPPORTED	Motor sense encoder software flagPiCtrlSet is not supported.

◆ RM_MOTOR_SENSE_ENCODER_EstimatedComponentGet()

fsp_err_t RM_MOTOR_SENSE_ENCODER_EstimatedComponentGet (motor_angle_ctrl_t *const *p_ctrl*, float *const *p_ed*, float *const *p_eq*)
Gets estimated d/q-axis component. Implements motor_angle_api_t::estimatedComponentGet. **Return values** FSP_ERR_UNSUPPORTED — Motor sense encoder software estimatedComponentGet is not supported.

◆ RM_MOTOR_SENSE_ENCODER_SensorDataSet()

fsp_err_t RM_MOTOR_SENSE_ENCODER_SensorDataSet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_ad_data_t *const *p_ad_data*)
Set sensor data. Implements motor_angle_api_t::sensorDataSet. **Return values** FSP_ERR_UNSUPPORTED — Unsupported.

Detailed Description

Calculation proccess for the motor control on RA MCUs. This module implements the Motor angle Interface.

Overview

The motor angle and speed calculation with hall sensors module is used to calculate rotor angle and rotational speed in an application. This module is designed to be used with the motor current module (rm_motor_current).

Features

The motor angle and speed calculation with hall sensors module has the features listed below.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

Configuration

Build Time Configurations for rm_motor_sense_hall

The following build time configurations are defined in fsp_cfg/rm_motor_sense_hall_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor Angle and Speed Calculation with Hall sensors (rm_motor_sense_hall)

This module can be added to the Stacks tab via New Stack > Motor > Motor Angle and Speed Calculation with Hall sensors (rm_motor_sense_hall).

Configuration	Options	Default	Description

General			
Name	Name must be a valid C symbol	g_motor_angle0	Module name.
Hall sensor			
U phase input port	Manual Entry	BSP_IO_PORT_12_PIN_04	Hall sensor port U
V phase input port	Manual Entry	BSP_IO_PORT_12_PIN_05	Hall sensor port V
W phase input port	Manual Entry	BSP_IO_PORT_11_PIN_01	Hall sensor port W
sensor pattern #1	Must be a valid integer	1	Hall sensor pattern #1
sensor pattern #2	Must be a valid integer	5	Hall sensor pattern #2
sensor pattern #3	Must be a valid integer	4	Hall sensor pattern #3
sensor pattern #4	Must be a valid integer	6	Hall sensor pattern #4
sensor pattern #5	Must be a valid integer	2	Hall sensor pattern #5
sensor pattern #6	Must be a valid integer	3	Hall sensor pattern #6
Process Frequency (kHz)	Must be a valid value	20.0F	Frequency to perform the process.
Correction parameter of rotor angle	Must be a valid value	0.0F	Correction parameter of rotor angle
Default counts of carrier interrupt	Must be a valid non-negative value.	300U	Default counts of carrier interrupt during a period of Hall signal change
Maximum counts of one rotation	Must be a valid non-negative value.	500U	Maximum counts of carrier interrupt during one rotor rotation
Target value for pseudo speed (rad/s)	Must be a valid non-negative value.	100.0	Target value for pseudo speed (rad/s).
Target time until the pseudo speed update reaches (msec)	Must be a valid non-negative value.	300.0	Target time until the pseudo speed update reaches (msec).
Rotation counts to start speed estimation	Must be a valid integer	2	Rotation counts to start of speed estimation.
Carrier counts at startup	Must be a valid integer	400	Carrier counts to wait the start timing of pseudo speed update
Speed to judge start	Must be a valid non-negative value.	250.0	Speed to judge start PI calculation.

Pin Configuration

Usage Notes

Limitations

Developers should be aware of the following limitations when using the motor angle and speed calculation with hall sensors: all configurations should be set as positive values.

Examples

Basic Example

This is a basic example of minimal use of the motor angle and speed calculation with hall sensors in an application.

```
void motor_sense_hall_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_SENSE_HALL_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
    assert(FSP_SUCCESS == err);
 /* Basically run this module at A/D conversion finish interrupt.
  * This implementation is an example. */
 // while (true)
    {
 /* Application work here. */
 /* Get angle/speed data */
       (void) RM_MOTOR_SENSE_HALL_AngleSpeedGet(&g_mtr_angle0_ctrl, &f_get_angle,
&f_get_speed, &f_get_phase_err);
    }
 /* Reset the module */
    (void) RM_MOTOR_SENSE_HALL_Reset(&g_mtr_angle0_ctrl);
 /* Close the module */
    (void) RM_MOTOR_SENSE_HALL_Close(&g_mtr_angle0_ctrl);
}
```

Data Structures

enum	motor_sense_hall_signal_status_t

Data Structure Documentation

◆ motor_sense_hall_input_t

struct motor_sense_hall_input_t		
This stucture is provided to receive speed information.		
Data Fields		
float	f4_ref_speed_rad_ctrl	Speed Reference [rad/sec].

◆ motor_sense_hall_extended_cfg_t

struct motor_sense_hall_extended_cfg_t		
Optional Motor sense hall extension data structure.		
Data Fields		
bsp_io_port_pin_t	port_hall_sensor_u	Hall U-signal input port.
bsp_io_port_pin_t	port_hall_sensor_v	Hall V-signal input port.
bsp_io_port_pin_t	port_hall_sensor_w	Hall W-signal input port.
uint8_t	u1_hall_pattern[MOTOR_SENSE_HALL_SPEED_COUNTS+1]	The order of hall signal pattern.
float	f_pwm_carrier_freq	PWM carrier frequency (or Decimated frequency at decimation of current process)
float	f_angle_correct	Coefficent to correct angle.
uint8_t	u1_trigger_hall_signal_count	Rotation counts to wait the stability.
float	f4_target_pseudo_speed_rad	Target value for pseudo speed estimates [radian/second].
float	f4_reach_time_msec	Time until the pseudo speed estimate reaches the target value [msec].
uint16_t	u2_trigger_carrier_count	Estimated speed 0 until this trigger.
uint16_t	u2_default_counts	Default counts for period of hall signal to reset.
uint16_t	u2_maximum_period	Maximum counts of hall signal period.

uint8_t	u1_hall_polepairs	Hall pole pairs.
float	f4_start_speed_rad	Speed to judge start [radian/second].

◆ motor_sense_hall_instance_ctrl_t

struct motor_sense_hall_instance_ctrl_t		
SENSE_HALL control block. DO NOT INITIALIZE. Initialization occurs when motor_angle_api_t::open is called.		
Data Fields		
uint32_t	open	
uint8_t	u1_hall_signal	Hall signal pattern.
uint8_t	u1_last_hall_signal	Last hall signal pattern.
motor_sense_hall_direction_t	direction	Rotation direction.
motor_sense_hall_direction_t	last_direction	Last rotation direction.
uint16_t	u2_carrier_count	Carrier count.
uint16_t	u2_hall_period[MOTOR_SENSE_HALL_SPEED_COUNTS]	Array of carrier count to calculate 2PI.
uint8_t	u1_period_counter	Counter for above array.
float	f_angle	Rotor angle [radian].
float	f_angle_per_count	Angle per 1 count.
float	f_calculated_speed	Calculated speed [radian/second].
uint8_t	u1_hall_signal_memory	Memorized hall signal at startup.
motor_sense_hall_signal_status_t	hall_signal_status	Hall signal status.
uint8_t	u1_hall_signal_count	Rotation counter.
float	f4_pseudo_speed_rad	Pseudo speed used for startup [radian/second].
float	f4_add_pseudo_speed_rad	Step of pseudo speed to update [radian/second].
uint16_t	u2_startup_carrier_count	Counter of carrier interrupt for startup.
motor_sense_hall_input_t	st_input	Input parameter structure.
uint8_t	u1_startup_flag	Flag for startup.
motor_angle_cfg_t const *	p_cfg	

Enumeration Type Documentation

◆ motor_sense_hall_direction_t

enum motor_sense_hall_direction_t	
Enumerator	
MOTOR_SENSE_HALL_DIRECTION_CW	Rotation direction clockwise.
MOTOR_SENSE_HALL_DIRECTION_CCW	Rotation direction counter clockwise.

◆ motor_sense_hall_signal_status_t

enum motor_sense_hall_signal_status_t	
Enumerator	
MOTOR_SENSE_HALL_SIGNAL_STATUS_INITIAL	Hall signal isn't captured. (Initial)
MOTOR_SENSE_HALL_SIGNAL_STATUS_CAPTURED	Hall signal is captured.

Function Documentation

◆ RM_MOTOR_SENSE_HALL_Open()

fsp_err_t RM_MOTOR_SENSE_HALL_Open (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg*)

Opens and configures the angle hall sensor module. Implements motor_angle_api_t::open.

Return values

FSP_SUCCESS	MTR_ANGL_EST successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ RM_MOTOR_SENSE_HALL_Close()

fsp_err_t RM_MOTOR_SENSE_HALL_Close (motor_angle_ctrl_t *const *p_ctrl*)

Disables specified Angle Estimation module. Implements motor_angle_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_HALL_Reset()

fsp_err_t RM_MOTOR_SENSE_HALL_Reset (motor_angle_ctrl_t *const *p_ctrl*)

Reset variables of Angle Estimation module. Implements motor_angle_api_t::reset.

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_HALL_CurrentSet()

fsp_err_t RM_MOTOR_SENSE_HALL_CurrentSet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_current_t *const *p_st_current*, motor_angle_voltage_reference_t *const *p_st_voltage*)

Set d/q-axis Current Data & Voltage Reference. Implements motor_angle_api_t::currentSet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

◆ RM_MOTOR_SENSE_HALL_SpeedSet()

fsp_err_t RM_MOTOR_SENSE_HALL_SpeedSet (motor_angle_ctrl_t *const *p_ctrl*, float const *speed_ctrl*, float const *damp_speed*)

Set Speed Information. Implements motor_angle_api_t::speedSet.

Return values

FSP_SUCCESS	Data get successfully.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_HALL_FlagPiCtrlSet()

fsp_err_t RM_MOTOR_SENSE_HALL_FlagPiCtrlSet (motor_angle_ctrl_t *const *p_ctrl*, uint32_t const *flag_pi*)

Set the flag of PI Control runs. Implements motor_angle_api_t::flagPiCtrlSet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

◆ RM_MOTOR_SENSE_HALL_AngleSpeedGet()

fsp_err_t RM_MOTOR_SENSE_HALL_AngleSpeedGet (motor_angle_ctrl_t *const *p_ctrl*, float *const *p_angle*, float *const *p_speed*, float *const *p_phase_err*)

Gets the current rotor's angle and rotation speed. Implements motor_angle_api_t::angleSpeedGet.

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is invalid.

◆ RM_MOTOR_SENSE_HALL_EstimatedComponentGet()

fsp_err_t RM_MOTOR_SENSE_HALL_EstimatedComponentGet (motor_angle_ctrl_t *const *p_ctrl*, float *const *p_ed*, float *const *p_eq*)

Gets estimated d/q-axis component. Implements motor_angle_api_t::estimatedComponentGet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

◆ RM_MOTOR_SENSE_HALL_ParameterUpdate()

fsp_err_t RM_MOTOR_SENSE_HALL_ParameterUpdate (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg*)

Update the parameters of Angle&Speed Estimation. Implements motor_angle_api_t::parameterUpdate.

Return values

FSP_SUCCESS	Successfully data is update.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_HALL_InternalCalculate()

fsp_err_t RM_MOTOR_SENSE_HALL_InternalCalculate (motor_angle_ctrl_t *const *p_ctrl*)

Calculate internal parameters. Implements motor_angle_api_t::internalCalculate.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

◆ RM_MOTOR_SENSE_HALL_AngleAdjust()

fsp_err_t RM_MOTOR_SENSE_HALL_AngleAdjust (motor_angle_ctrl_t *const *p_ctrl*)

Angle Adjustment Process. Implements motor_angle_api_t::angleAdjust.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

◆ RM_MOTOR_SENSE_HALL_EncoderCyclic()

fsp_err_t RM_MOTOR_SENSE_HALL_EncoderCyclic (motor_angle_ctrl_t *const *p_ctrl*)
Encoder Cyclic Process (Call in cyclic timer). Implements motor_angle_api_t::encoderCyclic. **Return values** FSP_ERR_UNSUPPORTED — Unsupported.

◆ RM_MOTOR_SENSE_HALL_InfoGet()

fsp_err_t RM_MOTOR_SENSE_HALL_InfoGet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_encoder_info_t *const *p_info*)
Gets information of Encoder Angle Module. Implements motor_angle_api_t::infoGet. **Return values** FSP_ERR_UNSUPPORTED — Unsupported.

Detailed Description

Calculation proccess for the motor control on RA MCUs. This module implements the Motor angle Interface.

Overview

The motor angle and speed calculation with induction sensor module is used to calculate rotor angle and rotational speed in an application. This module is designed to be used with the motor current module (rm_motor_current).

Features

The motor angle and speed calculation with induction sensor module has the features listed below.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

Configuration

Build Time Configurations for rm_motor_sense_induction

The following build time configurations are defined in fsp_cfg/rm_motor_sense_induction_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor Angle and Speed Calculation with induction sensor (rm_motor_sense_induction)

This module can be added to the Stacks tab via New Stack > Motor > Motor Angle and Speed Calculation with induction sensor (rm_motor_sense_induction).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_angle0	Module name.
Control type	• Speed • Position	Position	Select control Type
Frequency of current control (kHz)	Must be a valid non-negative value.	20.0	Frequency of current control
Decimation of Interrupt	Must be a valid integer.	1	Decimation of Interrupt
Counts to get signal	Must be a valid integer.	10	Counts to get analog input signal
Limit of signal error	Must be a valid integer.	100	Limit of signal error
Coefficent of speed LPF	Must be a valid value	0.07	Coefficient of speed LPF
A/D reference voltage	Must be a valid non-negative value.	3.3	Reference voltage of A/D converter
A/D conversion scale	Must be a valid non-negative value.	4095.0	Conversion scale of A/D converter
Openloop speed (rpm)	Must be a valid non-negative value.	6.0	Rotation speed at calibration openloop (rpm)
D-axis current at	Must be a valid non-	1.0	D-axis current at

openloop (A)	negative value.		calibration openloop (A)
Angle adjustment times	Must be a valid integer.	512	Times to get signal at angle adjustment
Calibration enable	• Disable • Enable	Enable	Select enable/disable of signal calibration
Induction sensor pole pairs	Must be a valid integer.	4	Induction sensor pole pairs
Motor pole pairs	Must be a valid integer.	4	Motor pole pairs

Clock Configuration

Pin Configuration

Usage Notes

Limitations

Developers should be aware of the following limitations when using the motor angle and speed calculation with induction sensor: all configurations should be set as positive values.

Examples

Basic Example

This is a basic example of minimal use of the motor angle and speed calculation with induction sensor in an application.

```
void motor_sense_encoder_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_SENSE_INDUCTION_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
    assert(FSP_SUCCESS == err);
 /* Basically run this module at A/D conversion finish interrupt.
  * This implementation is an example. */
 // while (true)
    {
 /* Application work here. */
 /* Initialize motor */
       (void) RM_MOTOR_SENSE_INDUCTION_AngleAdjust(&g_mtr_angle0_ctrl);
 /* Perform cyclic process*/
       (void) RM_MOTOR_SENSE_INDUCTION_CyclicProcess(&g_mtr_angle0_ctrl);
```

```
 /* Calculate information with induction sensor signal input */
       (void) RM_MOTOR_SENSE_INDUCTION_InternalCalculate(&g_mtr_angle0_ctrl);
 /* Get angle/speed data */
       (void) RM_MOTOR_SENSE_INDUCTION_AngleSpeedGet(&g_mtr_angle0_ctrl,
&f_get_angle, &f_get_speed, &f_get_phase_err);
    }
 /* Reset the module */
    (void) RM_MOTOR_SENSE_INDUCTION_Reset(&g_mtr_angle0_ctrl);
 /* Close the module */
    (void) RM_MOTOR_SENSE_INDUCTION_Close(&g_mtr_angle0_ctrl);
}
```

Enumerations

enum	motor_sense_induction_loop_t
enum	motor_sense_induction_calibration_t
enum	motor_sense_induction_mode_t

Enumeration Type Documentation

◆ motor_sense_induction_loop_t

enum motor_sense_induction_loop_t	
Enumerator	
MOTOR_SENSE_INDUCTION_LOOP_SPEED	Speed control mode.
MOTOR_SENSE_INDUCTION_LOOP_POSITION	Position control mode.

◆ motor_sense_induction_calibration_t

enum motor_sense_induction_calibration_t	
Enumerator	
MOTOR_SENSE_INDUCTION_CALIBRATION_DISABLE	Disable calibration.
MOTOR_SENSE_INDUCTION_CALIBRATION_ENABLE	Enable calibration.

◆ motor_sense_induction_mode_t

enum motor_sense_induction_mode_t	
Enumerator	
MOTOR_SENSE_INDUCTION_MODE_INIT	Initialize mode (Start status)
MOTOR_SENSE_INDUCTION_MODE_BOOT	Boot mode (Angle adjustment status)
MOTOR_SENSE_INDUCTION_MODE_DRIVE	Drive mode (Normal work status)

Function Documentation

◆ RM_MOTOR_SENSE_INDUCTION_Open()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_Open (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg*)

Opens and configures the Angle module. Implements motor_angle_api_t::open.

Return values

FSP_SUCCESS	Angle Induction module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

◆ RM_MOTOR_SENSE_INDUCTION_Close()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_Close (motor_angle_ctrl_t *const *p_ctrl*)

Disables specified Angle module. Implements motor_angle_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_Reset()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_Reset (motor_angle_ctrl_t *const *p_ctrl*)

Reset variables of Angle module. Implements motor_angle_api_t::reset.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_InternalCalculate()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_InternalCalculate (motor_angle_ctrl_t *const *p_ctrl*)

Calculate internal parameters. Implements motor_angle_api_t::internalCalculate.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_AngleSpeedGet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_AngleSpeedGet (motor_angle_ctrl_t *const *p_ctrl*, float *const *p_angle*, float *const *p_speed*, float *const *p_phase_err*)

Gets the current rotor's angle and rotation speed. Implements motor_angle_api_t::angleSpeedGet.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_AngleAdjust()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_AngleAdjust (motor_angle_ctrl_t *const *p_ctrl*)

Angle Adjustment Process. Implements motor_angle_api_t::angleAdjust.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_EncoderCyclic()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_EncoderCyclic (motor_angle_ctrl_t *const *p_ctrl*)

Encoder Cyclic Process (Call in cyclic timer). Implements motor_angle_api_t::encoderCyclic.

Return values

FSP_ERR_UNSUPPORTED	Motor sense induction software encoderCyclic is not supported.

◆ RM_MOTOR_SENSE_INDUCTION_CyclicProcess()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_CyclicProcess (motor_angle_ctrl_t *const *p_ctrl*)

Induction sensor Cyclic Process (Call in cyclic timer). Implements motor_angle_api_t::cyclicProcess.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_InfoGet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_InfoGet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_encoder_info_t *const *p_info*)

Gets information of Angle Module. Implements motor_angle_api_t::infoGet.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_CorrectReset()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_CorrectReset (motor_angle_ctrl_t *const *p_ctrl*)

Reset to restart calibration Angle module.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_ErrorGet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_ErrorGet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_error_t *const *p_error*)

Gets the error information about induction correction.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_ParameterUpdate()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_ParameterUpdate (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg*)

Update the parameters of angle & speed calculation. Implements motor_angle_api_t::parameterUpdate.

Return values

FSP_SUCCESS	Successfully data is update.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_SensorDataSet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_SensorDataSet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_ad_data_t *const *p_ad_data*)

Set A/D Converted Data. Implements motor_angle_api_t::sensorDataSet.

Return values

FSP_SUCCESS	Successfully data is update.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_CurrentSet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_CurrentSet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_current_t *const *p_st_current*, motor_angle_voltage_reference_t *const *p_st_voltage*)

Set d/q-axis Current Data & Voltage Reference. Implements motor_angle_api_t::currentSet.

Return values

FSP_ERR_UNSUPPORTED	Motor sense induction software currentSet is not supported.

◆ RM_MOTOR_SENSE_INDUCTION_SpeedSet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_SpeedSet (motor_angle_ctrl_t *const *p_ctrl*, float const *speed_ctrl*, float const *damp_speed*)

Set Speed Information. Implements motor_angle_api_t::speedSet.

Return values

FSP_ERR_UNSUPPORTED	Motor sense induction software speedSet is not supported.

◆ RM_MOTOR_SENSE_INDUCTION_FlagPiCtrlSet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_FlagPiCtrlSet (motor_angle_ctrl_t *const *p_ctrl*, uint32_t const *flag_pi*)

Set the flag of PI Control runs. Implements motor_angle_api_t::flagPiCtrlSet.

Return values

FSP_ERR_UNSUPPORTED	Motor sense induction software flagPiCtrlSet is not supported.

◆ RM_MOTOR_SENSE_INDUCTION_EstimatedComponentGet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_EstimatedComponentGet (motor_angle_ctrl_t *const *p_ctrl*, float *const *p_ed*, float *const *p_eq*)

Gets estimated d/q-axis component. Implements motor_angle_api_t::estimatedComponentGet.

Return values

FSP_ERR_UNSUPPORTED	Motor sense induction software estimatedComponentGet is not supported.

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor current Interface.

Overview

The motor current is used to control the electric current of motor rotation in an appication. This module should be called cyclically after the A/D conversion of electric current of each phase in an application. This module calculates each phase voltage with input current reference, electric current and rotor angle.

Features

The Motor Current Module has below features.

- Calculate each phase(U/V/W) voltage.
- Decoupling Control.
- Voltage Error Compensation.

Configuration

Build Time Configurations for rm_motor_current

The following build time configurations are defined in fsp_cfg/rm_motor_current_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled	Default (BSP)	If selected code for parameter checking is

• Disabled		included in the build.

Configurations for Motor > Motor Current Controller (rm_motor_current)

This module can be added to the Stacks tab via New Stack > Motor > Motor Current Controller (rm_motor_current).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_current0	Module name.
Sensor type	• Sensorless • Encoder • Induction • Hall	Sensorless	Select sensor type
Shunt type	• 1 shunt • 2 shunt • 3 shunt	2 shunt	Select shunt type
Current control decimation	Must be a valid non-negative value.	0	Decimation of current control.
PWM carrier frequency (kHz)	Must be a valid value	20.0F	PWM carrier frequency.
Input voltage (V)	Must be a valid value	24.0F	Input voltage for limitation of current PI control.
Sample delay compensation	• Disable • Enable	Enable	Select enable/disable sample delay compensation.
Period magnification value	Must be a valid non-negative value.	1.5	Period magnification value for sampling delay compensation.
Voltage error compensation	• Disable • Enable	Enable	Select enable/disable voltage error compensation.
Voltage error compensation table of voltage 1	Must be a valid value	0.672F	Voltage error compensation table of voltage.
Voltage error compensation table of voltage 2	Must be a valid value	0.945F	Voltage error compensation table of voltage.
Voltage error compensation table of voltage 3	Must be a valid value	1.054F	Voltage error compensation table of voltage.
Voltage error compensation table of voltage 4	Must be a valid value	1.109F	Voltage error compensation table of voltage.

Voltage error compensation table of voltage 5	Must be a valid value	1.192F	Voltage error compensation table of voltage.
Voltage error compensation table of current 1	Must be a valid value	0.013F	Voltage error compensation table of current.
Voltage error compensation table of current 2	Must be a valid value	0.049F	Voltage error compensation table of current.
Voltage error compensation table of current 3	Must be a valid value	0.080F	Voltage error compensation table of current.
Voltage error compensation table of current 4	Must be a valid value	0.184F	Voltage error compensation table of current.
Voltage error compensation table of current 5	Must be a valid value	0.751F	Voltage error compensation table of current.
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at A/D conversion finish interrupt.
Design Parameter			
Current PI loop omega (Hz)	Must be a valid value	300.0F	Current PI loop omega
Current PI loop zeta	Must be a valid value	1.0F	Current PI loop zeta
Motor Parameter			
Pole pairs	Must be a valid non-negative value.	2	Pole pairs
Resistance (ohm)	Must be a valid value	8.5F	Resistance
Inductance of d-axis (H)	Must be a valid value	0.0045F	Inductance of d-axis
Inductance of q-axis (H)	Must be a valid value	0.0045F	Inductance of q-axis
Permanent magnetic flux (Wb)	Must be a valid value	0.02159F	Permanent magnetic flux
Motor Parameter > Rotor inertia (kgm^2)	Must be a valid value	0.0000028F	Rotor inertia

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the Period of Current Control with none-negative value.
- Set the Reference Voltage with none-negative value.

Examples

Basic Example

This is a basic example of minimal use of the Motor Current in an application.

```
void motor_current_basic_example (void)
{
 motor_current_input_current_t temp_input_current;
 motor_current_input_voltage_t temp_input_voltage;
 motor_current_get_voltage_t   temp_get_voltage;
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_CURRENT_Open(g_test_motor_current.p_ctrl,
g_test_motor_current.p_cfg);
    assert(FSP_SUCCESS == err);
 /* Basically run this module at A/D conversion finish interrupt.
  * This implementation is an example. */
 // while (true)
    {
 /* Application work here. */
 /* Set current reference before get phase voltage */
       (void) RM_MOTOR_CURRENT_CurrentReferenceSet(g_test_motor_current.p_ctrl, 1.0F,
1.0F);
 /* Set speed and phase data before get phase voltage */
       (void) RM_MOTOR_CURRENT_SpeedPhaseSet(g_test_motor_current.p_ctrl, 104.72F,
1.0F);
       temp_input_current.iu    = 1.0F;
```

```
      temp_input_current.iv    = 1.0F;
      temp_input_current.iw    = 1.0F;
      temp_input_voltage.vdc    = 24.0F;
      temp_input_voltage.va_max = 24.0F;
 /* Set electric current and voltage before get phase voltage */
      (void) RM_MOTOR_CURRENT_CurrentSet(g_test_motor_current.p_ctrl,
temp_input_current, temp_input_voltage);
 /* Activate the process. */
      (void) RM_MOTOR_CURRENT_Run(g_test_motor_current.p_ctrl);
 /* Get d/q-axis current*/

}
```

Enumerations

enum	motor_current_shunt_type_t

Enumeration Type Documentation

◆ motor_current_shunt_type_t

enum motor_current_shunt_type_t	
Selection of shunt type	
Enumerator	
MOTOR_CURRENT_SHUNT_TYPE_1_SHUNT	Only use U phase current.
MOTOR_CURRENT_SHUNT_TYPE_2_SHUNT	Use U and W phase current.
MOTOR_CURRENT_SHUNT_TYPE_3_SHUNT	Use all phase current.

Function Documentation

◆ RM_MOTOR_CURRENT_Open()

fsp_err_t RM_MOTOR_CURRENT_Open (motor_current_ctrl_t *const *p_ctrl*, motor_current_cfg_t const *const *p_cfg*)

Opens and configures the Motor Current Module. Implements motor_current_api_t::open.

Return values

FSP_SUCCESS	Motor Current successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

◆ RM_MOTOR_CURRENT_Close()

fsp_err_t RM_MOTOR_CURRENT_Close (motor_current_ctrl_t *const *p_ctrl*)

Disables specified Motor Current Module. Implements motor_current_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_CURRENT_Reset()

fsp_err_t RM_MOTOR_CURRENT_Reset (motor_current_ctrl_t *const *p_ctrl*)

Reset variables of Motor Current Module. Implements motor_current_api_t::reset.

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_CURRENT_Run()

fsp_err_t RM_MOTOR_CURRENT_Run (motor_current_ctrl_t *const *p_ctrl*)

Run(Start) the Current Control. Implements motor_current_api_t::run.

Return values

FSP_SUCCESS	Successfully run.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_CURRENT_ParameterSet()

fsp_err_t RM_MOTOR_CURRENT_ParameterSet (motor_current_ctrl_t *const *p_ctrl*,
motor_current_input_t const *const *p_st_input*)

Set (Input) Parameter Data. Implements motor_current_api_t::parameterSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input argument error.

◆ RM_MOTOR_CURRENT_CurrentReferenceSet()

fsp_err_t RM_MOTOR_CURRENT_CurrentReferenceSet (motor_current_ctrl_t *const *p_ctrl*, float const *id_reference*, float const *iq_reference*)

Set Current Reference Data. Implements motor_current_api_t::currentReferenceSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_CURRENT_SpeedPhaseSet()

fsp_err_t RM_MOTOR_CURRENT_SpeedPhaseSet (motor_current_ctrl_t *const *p_ctrl*, float const *speed*, float const *phase*)

Set Current Speed & rotor phase Data. Implements motor_current_api_t::speedPhaseSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_CURRENT_CurrentSet()

fsp_err_t RM_MOTOR_CURRENT_CurrentSet (motor_current_ctrl_t *const *p_ctrl*, motor_current_input_current_t const *const *p_st_current*, motor_current_input_voltage_t const *const *p_st_voltage*)

Set d/q-axis Current & Voltage Data. Implements motor_current_api_t::currentSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_CURRENT_ParameterGet()

fsp_err_t RM_MOTOR_CURRENT_ParameterGet (motor_current_ctrl_t *const *p_ctrl*, motor_current_output_t *const *p_st_output*)

Get Output Parameters. Implements motor_current_api_t::parameterGet.

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_CURRENT_CurrentGet()

fsp_err_t RM_MOTOR_CURRENT_CurrentGet (motor_current_ctrl_t *const *p_ctrl*, float *const *p_id*, float *const *p_iq*)

Get d/q-axis Current. Implements motor_current_api_t::currentGet.

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_CURRENT_PhaseVoltageGet()

fsp_err_t RM_MOTOR_CURRENT_PhaseVoltageGet (motor_current_ctrl_t *const *p_ctrl*, motor_current_get_voltage_t *const *p_voltage*)

Gets the set phase voltage. Implements motor_current_api_t::phaseVoltageGet.

Return values

FSP_SUCCESS	Successful data calculation.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_CURRENT_ParameterUpdate()

fsp_err_t RM_MOTOR_CURRENT_ParameterUpdate (motor_current_ctrl_t *const *p_ctrl*, motor_current_cfg_t const *const *p_cfg*)
Update the parameters of Current Control. Implements motor_current_api_t::parameterUpdate. **Return values** FSP_SUCCESS — Successfully data was updated. FSP_ERR_ASSERTION — Null pointer. FSP_ERR_NOT_OPEN — Module is not open.

◆ rm_motor_current_encoder_cyclic()

void rm_motor_current_encoder_cyclic (motor_current_instance_t const * *p_ctrl*)

Detailed Description

Control a SPM motor on RA MCUs. This module implements the Motor Encoder Vector Control (rm_motor_encoder).

Overview

The motor encoder vector control is used to control motor rotation in an application. This module is meant to be used with Surface Permanent Magnet (SPM) motors and allows applications to start or stop motor rotation easily.

Features

The motor encoder module has below features.

- Start/stop motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Target Hardware

The below figure shows an example of target hardware of this Motor Encoder Module.

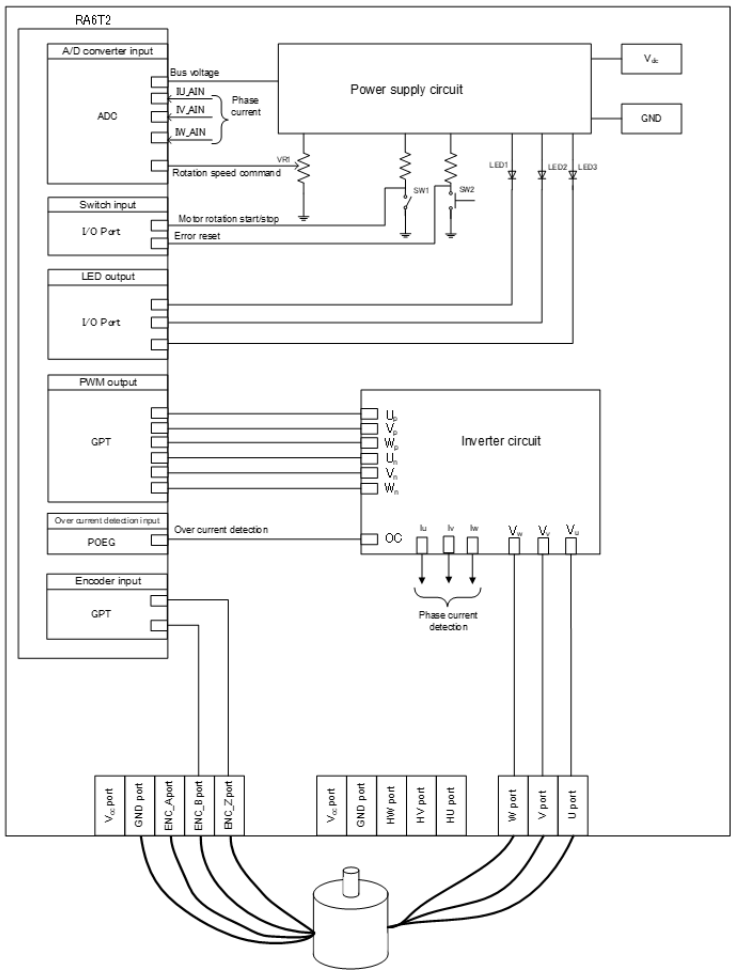

Figure 239: Example of target hardware of motor encoder module

Block Diagram

The below figure shows block diaram of encoder vector motor control.

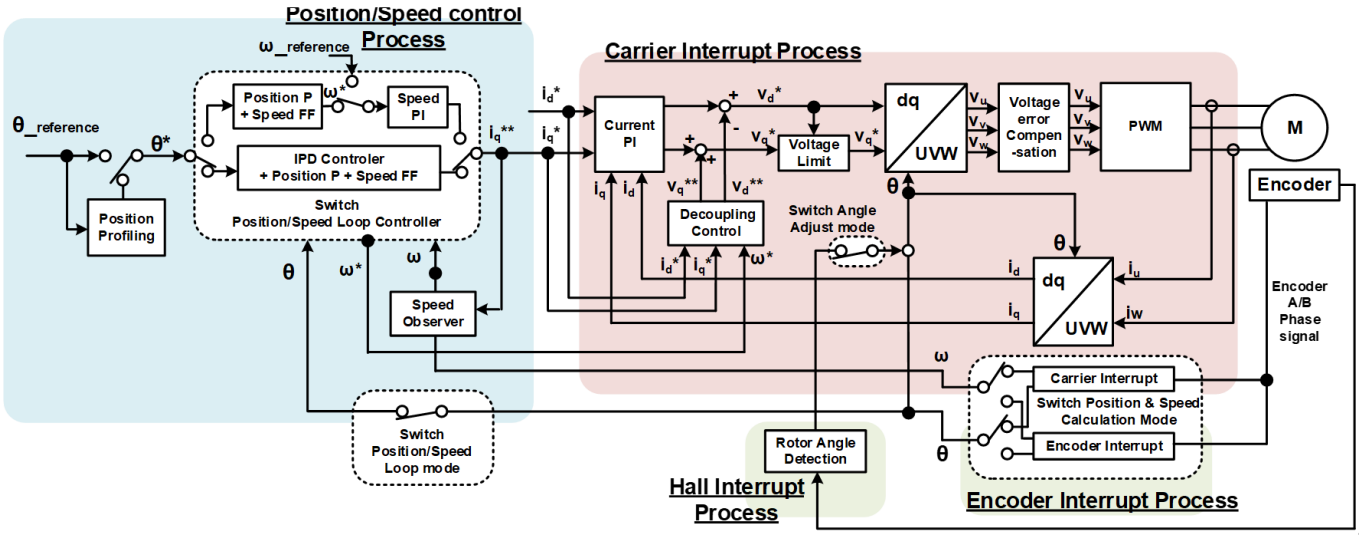

Figure 240: Block diagram of encoder vector control (PI feedback loop)

Modulation

- Sine wave modulation The modulation factor "m" is defined as follows.

$$m = \frac{V}{E}$$

m : Modulation ratio V : Reference voltage E : Inverter input voltage

Figure 241: Modulation factor

- Space vector modulation In vector control of a permanent magnet synchronous motor, generally, the desired voltage command value of each phase is generated sinusoidally. However, if the generated value is used as-is for the modulation wave for PWM generation, voltage utilization as applied to the motor (in terms of line voltage) is limited to a maximum of 86.7 percents with respect to inverter bus voltage. As such, as shown in the following expression, the average of the maximum and minimum values is calculated for the voltage command value of each phase, and the value obtained by subtracting the average from the voltage command value of each phase is used as the modulation wave. As a result, the maximum amplitude of the modulation wave is multiplied by (square root 3)/2, while voltage utilization becomes 100 percents and line voltage is unchanged.

$$\begin{pmatrix} V_u' \\ V_v' \\ V_w' \end{pmatrix} = \begin{pmatrix} V_u \\ V_v \\ V_w \end{pmatrix} + \Delta V \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$$

$$\because \Delta V = -\frac{V_{max}+V_{min}}{2},\ V_{max} = max\{V_u, V_v, V_w\},\ V_{min} = min\{V_u, V_v, V_w\}$$

V_u, V_v, V_w: Command values of U-, V-, and W-phases

V_u', V_v', V_w': Command values of U-, V-, and W-phases for PWM generation (modulation wave)

Figure 242: Space vector modulation

State transition

The below figure shows a state transition diagram. Internal state is managed by "SYSTEM MODE".

		MODE		
		STOP	RUN	ERROR
EVENT	STOP	STOP	STOP	ERROR
	RUN	RUN	RUN	ERROR
	ERROR	ERROR	ERROR	ERROR
	RESET	STOP	RUN	STOP

Figure 243: State transition diagram

(1) SYSTEM MODE "SYSTEM MODE" indicates the operating states of the system. The state transits on occurrence of each event (EVENT). "SYSTEM MODE" has 3 states that are motor drive stop (INACTIVE), motor drive (ACTIVE), and abnormal condition (ERROR).

(2) EVENT When "EVENT" occurs in each "SYSTEM MODE", "SYSTEM MODE" changes as shown the table in above figure, according to that "EVENT". The occurrence factors of each event are shown below.

EVENT name	Occurrence factor
STOP	by user operation
RUN	by user operation
ERROR	when the system detects an error
RESET	by user operation

Flowchart

The below figures show flowcharts of motor encoder module.

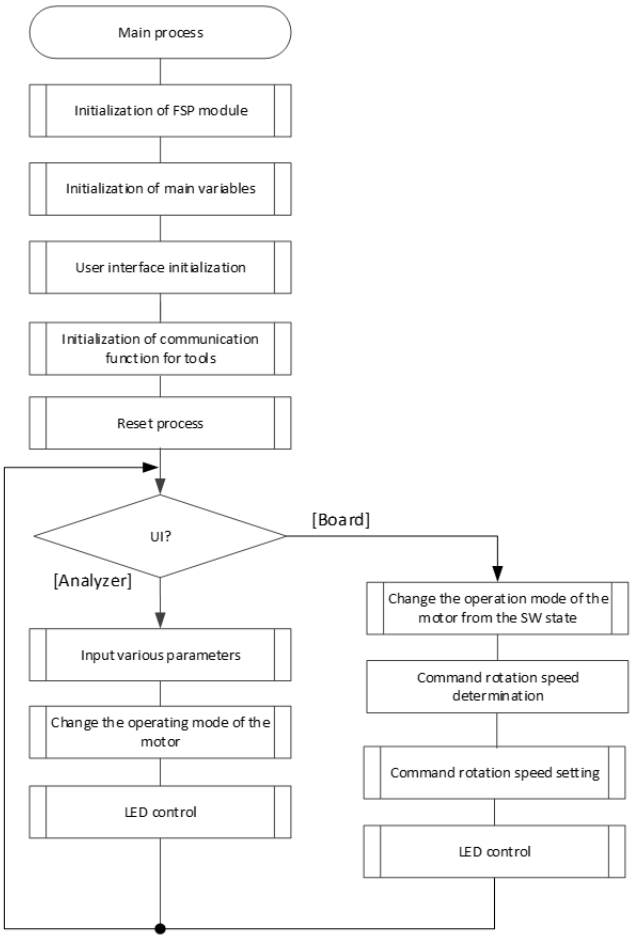

Figure 244: Main process

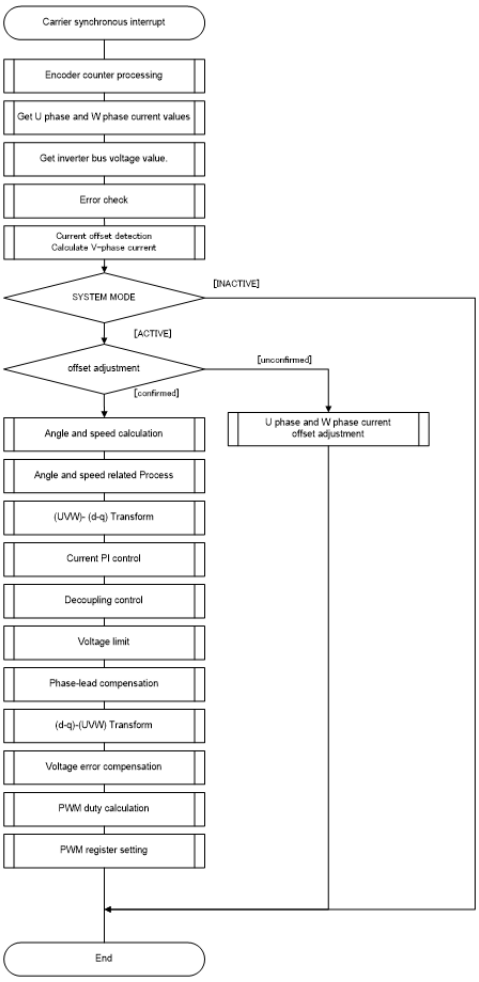

Figure 245: Current control process

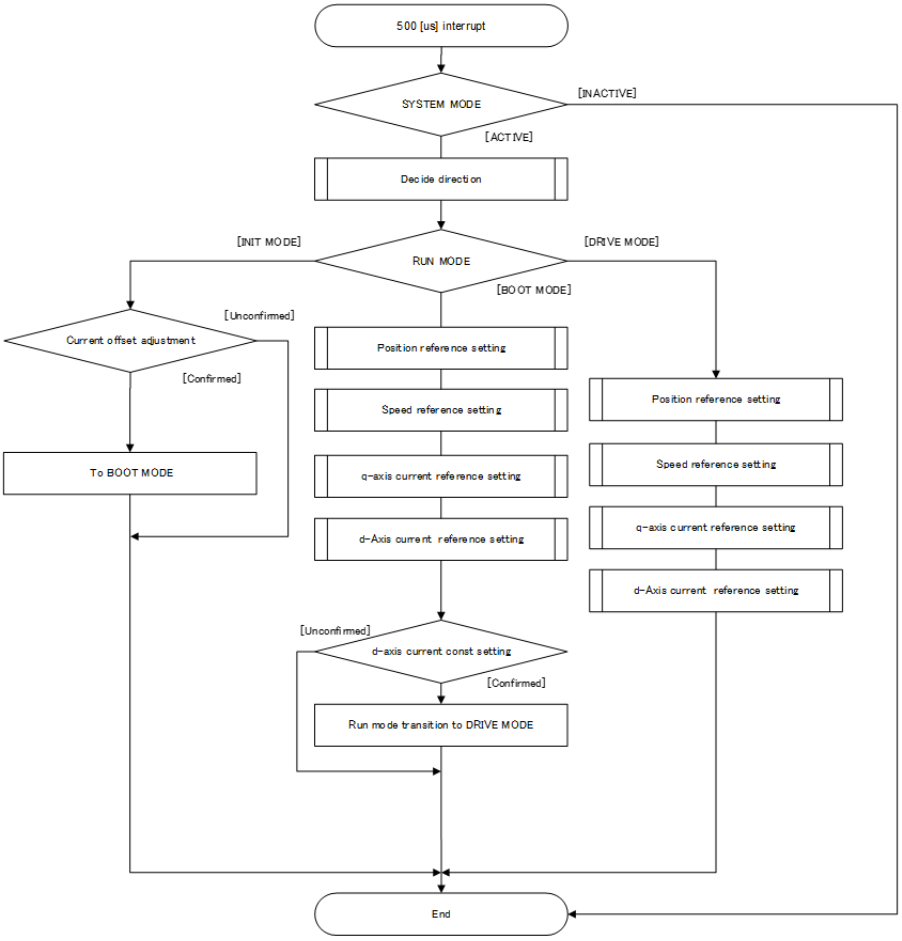

Figure 246: Speed control process

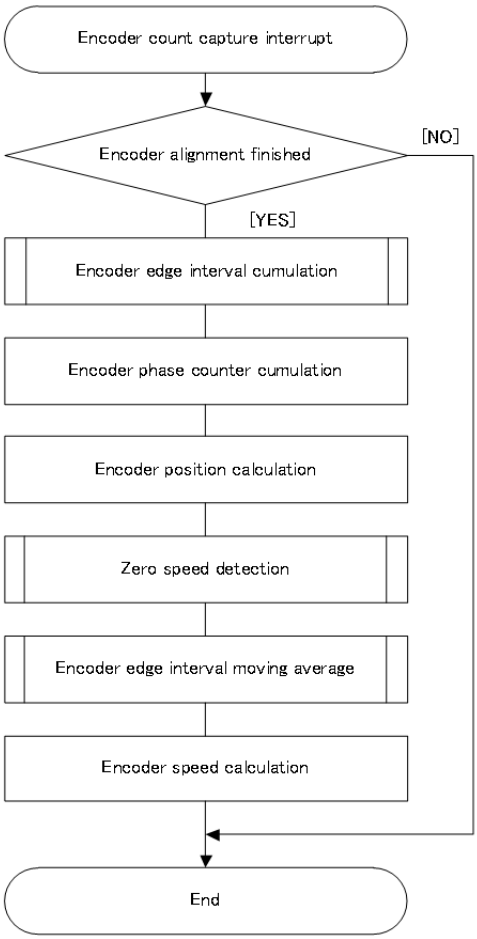

Figure 247: Encoder interrupt process

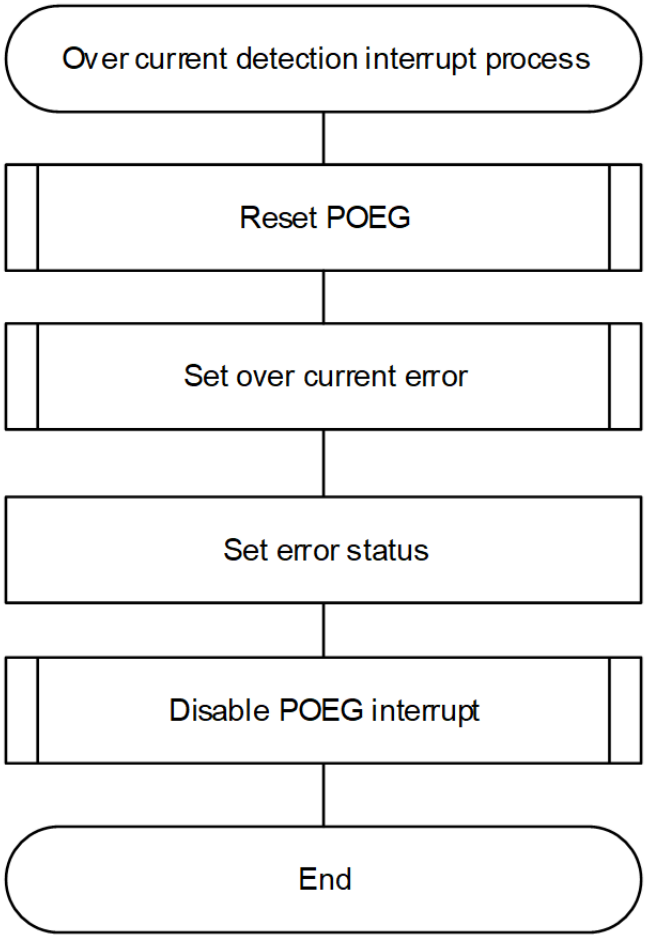

Figure 248: Over current detection interrupt process

Configuration

Build Time Configurations for rm_motor_encoder

The following build time configurations are defined in fsp_cfg/rm_motor_encoder_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor Encoder Vector Control (rm_motor_encoder)

This module can be added to the Stacks tab via New Stack > Motor > Motor Encoder Vector Control (rm_motor_encoder).

Configuration	Options	Default	Description
General			

Name	Name must be a valid C symbol	g_motor_encoder0	Module name.
Limit of over current (A)	Must be a valid value	2.0F	Limit of over current.(Detection threshold)
Limit of over voltage (V)	Must be a valid value	28.0F	Limit of over voltage.(Detection threshold)
Limit of over speed (rpm)	Must be a valid value	2100.0F	Limit of over speed.(Detection threshold)
Limit of low voltage (V)	Must be a valid value	18.0F	Limit of low voltage.(Detection threshold)
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt.

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins. Please set used pins on configuration of each hardware modules.

Usage Notes

Limitations

Examples

Basic Example

This is a basic example of minimal use of the motor encoder module in an application.

```
void motor_encoder_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_ENCODER_Open(g_motor_encoder0.p_ctrl, g_motor_encoder0.p_cfg);
    handle_error(err);
```

```
 /* Set speed reference before motor run */
    (void) RM_MOTOR_ENCODER_SpeedSet(g_motor_encoder0.p_ctrl,
RM_MOTOR_ENCODER_TEST_OVER_SPEED_LIMIT);
 /* Set position reference before motor run */
    (void) RM_MOTOR_ENCODER_PositionSet(g_motor_encoder0.p_ctrl, &g_posref_sample1);
 /* Start motor rotation */
    (void) RM_MOTOR_ENCODER_Run(g_motor_encoder0.p_ctrl);
 /* Get current status */
    (void) RM_MOTOR_ENCODER_StatusGet(g_motor_encoder0.p_ctrl, &smpl_status);
 /* Get current rotor angle */
    (void) RM_MOTOR_ENCODER_AngleGet(g_motor_encoder0.p_ctrl, &smpl_angle);
 /* Get current motor speed */
    (void) RM_MOTOR_ENCODER_SpeedGet(g_motor_encoder0.p_ctrl, &smpl_speed);
 /* Check error */
    (void) RM_MOTOR_ENCODER_ErrorCheck(g_motor_encoder0.p_ctrl, &smpl_error);
 /* Stop motor rotation */
    (void) RM_MOTOR_ENCODER_Stop(g_motor_encoder0.p_ctrl);
 /* Stop motor rotation */
    (void) RM_MOTOR_ENCODER_ErrorSet(g_motor_encoder0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
 /* Reset Speed Control */
    (void) RM_MOTOR_ENCODER_Reset(g_motor_encoder0.p_ctrl);
 /* Close Speed Control */
    (void) RM_MOTOR_ENCODER_Close(g_motor_encoder0.p_ctrl);
}
```

Enumerations

enum	motor_encoder_ctrl_t
enum	motor_encoder_ctrl_event_t

Enumeration Type Documentation

◆ motor_encoder_ctrl_t

enum motor_encoder_ctrl_t	
Enumerator	
MOTOR_ENCODER_CTRL_STOP	Stop mode.
MOTOR_ENCODER_CTRL_RUN	Run mode.
MOTOR_ENCODER_CTRL_ERROR	Error mode.

◆ motor_encoder_ctrl_event_t

enum motor_encoder_ctrl_event_t	
Enumerator	
MOTOR_ENCODER_CTRL_EVENT_STOP	Stop event.
MOTOR_ENCODER_CTRL_EVENT_RUN	Run event.
MOTOR_ENCODER_CTRL_EVENT_ERROR	Error event.
MOTOR_ENCODER_CTRL_EVENT_RESET	Reset event.

Function Documentation

◆ RM_MOTOR_ENCODER_Open()

fsp_err_t RM_MOTOR_ENCODER_Open (motor_ctrl_t *const *p_ctrl*, motor_cfg_t const *const *p_cfg*)

Configure the MOTOR in register start mode. Implements motor_api_t::open.

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_ENCODER_Open(g_motor_encoder0.p_ctrl, g_motor_encoder0.p_cfg);
```

Return values

FSP_SUCCESS	MOTOR successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

Note

◆ RM_MOTOR_ENCODER_Close()

fsp_err_t RM_MOTOR_ENCODER_Close (motor_ctrl_t *const *p_ctrl*)

Disables specified Motor Encoder Control block. Implements motor_api_t::close.

Example:

```
/* Close Speed Control */
   (void) RM_MOTOR_ENCODER_Close(g_motor_encoder0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_ENCODER_Reset()

fsp_err_t RM_MOTOR_ENCODER_Reset (motor_ctrl_t *const *p_ctrl*)

Reset Motor Encoder Control block. Implements motor_api_t::reset.

Example:

```
/* Reset Speed Control */
   (void) RM_MOTOR_ENCODER_Reset(g_motor_encoder0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_ENCODER_Run()

fsp_err_t RM_MOTOR_ENCODER_Run (motor_ctrl_t *const *p_ctrl*)

Run Motor (Start motor rotation). Implements motor_api_t::run.

Example:

```
/* Start motor rotation */
   (void) RM_MOTOR_ENCODER_Run(g_motor_encoder0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_ENCODER_Stop()

fsp_err_t RM_MOTOR_ENCODER_Stop (motor_ctrl_t *const *p_ctrl*)

Stop Motor (Stop motor rotation). Implements motor_api_t::stop.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_ENCODER_Stop(g_motor_encoder0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_ENCODER_ErrorSet()

fsp_err_t RM_MOTOR_ENCODER_ErrorSet (motor_ctrl_t *const *p_ctrl*, motor_error_t const *error*)

Set error information. Implements motor_api_t::errorSet.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_ENCODER_ErrorSet(g_motor_encoder0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_ENCODER_SpeedSet()

fsp_err_t RM_MOTOR_ENCODER_SpeedSet (motor_ctrl_t *const *p_ctrl*, float const *speed_rpm*)

Set speed reference[rpm]. Implements motor_api_t::speedSet.

Example:

```
/* Set speed reference before motor run */
   (void) RM_MOTOR_ENCODER_SpeedSet(g_motor_encoder0.p_ctrl,
RM_MOTOR_ENCODER_TEST_OVER_SPEED_LIMIT);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_ENCODER_PositionSet()

fsp_err_t RM_MOTOR_ENCODER_PositionSet (motor_ctrl_t *const *p_ctrl*,
motor_speed_position_data_t const *const *p_position*)

Set position reference[degree]. Implements motor_api_t::positionSet.

Example:

```
/* Set position reference before motor run */
   (void) RM_MOTOR_ENCODER_PositionSet(g_motor_encoder0.p_ctrl, &g_posref_sample1);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data set pointer is invalid..

Note

◆ RM_MOTOR_ENCODER_StatusGet()

fsp_err_t RM_MOTOR_ENCODER_StatusGet (motor_ctrl_t *const *p_ctrl*, uint8_t *const *p_status*)

Get current control status. Implements motor_api_t::statusGet.

Example:

```
/* Get current status */
   (void) RM_MOTOR_ENCODER_StatusGet(g_motor_encoder0.p_ctrl, &smpl_status);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_ENCODER_AngleGet()

fsp_err_t RM_MOTOR_ENCODER_AngleGet (motor_ctrl_t *const *p_ctrl*, float *const *p_angle_rad*)

Get current rotor angle. Implements motor_api_t::angleGet.

Example:

```
/* Get current rotor angle */
   (void) RM_MOTOR_ENCODER_AngleGet(g_motor_encoder0.p_ctrl, &smpl_angle);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_ENCODER_SpeedGet()

fsp_err_t RM_MOTOR_ENCODER_SpeedGet (motor_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm*)

Get rotational speed. Implements motor_api_t::speedGet.

Example:

```
/* Get current motor speed */
   (void) RM_MOTOR_ENCODER_SpeedGet(g_motor_encoder0.p_ctrl, &smpl_speed);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_ENCODER_ErrorCheck()

fsp_err_t RM_MOTOR_ENCODER_ErrorCheck (motor_ctrl_t *const *p_ctrl*, uint16_t *const *p_error*)

Check the occurunce of Error. Implements motor_api_t::errorCheck.

Example:

```
/* Check error */
   (void) RM_MOTOR_ENCODER_ErrorCheck(g_motor_encoder0.p_ctrl, &smpl_error);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_ENCODER_WaitStopFlagGet()

fsp_err_t RM_MOTOR_ENCODER_WaitStopFlagGet (motor_ctrl_t *const *p_ctrl*, motor_wait_stop_flag_t *const *p_flag*)

Get wait stop flag. Implements motor_api_t::waitStopFlagGet.

Example:

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Note

◆ RM_MOTOR_ENCODER_FunctionSelect()

fsp_err_t RM_MOTOR_ENCODER_FunctionSelect (motor_ctrl_t *const *p_ctrl*, motor_function_select_t const *function*)

Select using function. Implements motor_api_t::functionSelect.

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Mode unmatch

Note

◆ RM_MOTOR_ENCODER_InertiaEstimateStart()

fsp_err_t RM_MOTOR_ENCODER_InertiaEstimateStart (motor_ctrl_t *const *p_ctrl*)

Start inertia estimation function.

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Mode unmatch

Note

◆ RM_MOTOR_ENCODER_InertiaEstimateStop()

fsp_err_t RM_MOTOR_ENCODER_InertiaEstimateStop (motor_ctrl_t *const *p_ctrl*)

Stop(Cancel) inertia estimation function.

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Mode unmatch

Note

◆ RM_MOTOR_ENCODER_ReturnOriginStart()

fsp_err_t RM_MOTOR_ENCODER_ReturnOriginStart (motor_ctrl_t *const *p_ctrl*)

Start return origin function.

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Mode unmatch

Note

◆ RM_MOTOR_ENCODER_ReturnOriginStop()

fsp_err_t RM_MOTOR_ENCODER_ReturnOriginStop (motor_ctrl_t *const *p_ctrl*)
Stop(Cancel) return origin function. **Return values** FSP_SUCCESS — Successfully resetted. FSP_ERR_ASSERTION — Null pointer. FSP_ERR_NOT_OPEN — Module is not open. FSP_ERR_INVALID_MODE — Mode unmatch ***Note***

Detailed Description

Measurement and calculation proccess for the motor control on RA MCUs. This module implements the Motor Inertia Estimate Interface.

Overview

The motor inertia estimation module is used to measure and calculate rotor inertia in an application.

This module should be used with Renesas Motor Workbench (RMW) basically.

Features

The Motor Inertia Estimation Module has below features.

- Measurement process work automatically
- Calculate rotor inertia [kgm^2].

Configuration

Build Time Configurations for rm_motor_inertia_estimate

The following build time configurations are defined in fsp_cfg/rm_motor_inertia_estimate_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor inertia estimation (rm_motor_inertia_estimate)

This module can be added to the Stacks tab via New Stack > Motor > Motor inertia estimation (rm_motor_inertia_estimate).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_inertia_estimate0	Module name.
Moved position distance to measure (degree)	Must be set -360 to -10 or 10 to 360.	360	Moved position distance to measure inertia (degree)
Maximum speed (rpm)	Must be set over 60.	500	Maximum rotation speed (rpm)
Acceleration time	Must be a valid non-negative value.	0.3	Acceleration time
Motor inertia	Manual Entry	0.0000041	Motor inertia
Low threshold to judge speed	Must be set 0.1 to 0.5	0.1	Low threshold to judge speed reached
High threshold to judge speed	Must be set 0.5 to 0.9, and greater than low threshold	0.9	High threshold to judge speed reached
Time to wait moving stability (sec)	Must be a valid non-negative value.	0.8	Time to wait moving stability
Cyclic period of current control (sec)	Must be a valid non-negative value.	0.00005	Cyclic period of current control (sec)

Cyclic period of speed control (sec)	Must be a valid non-negative value.	0.0005	Cyclic period of speed control (sec)
Motor pole pairs	Must be a valid non-negative value.	4	Motor pole pairs
Motor magnet flux (Wb)	Must be a valid non-negative value.	0.00623	Motor magnet flux (Wb)
Interval time	Must be a valid non-negative value.	400.0	Interval time. Please set same value as Position control

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

Examples

Basic Example

This is a basic example of minimal use of the Motor Inertia Estimation in an application.

```
void motor_inertia_estimate_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_INERTIA_ESTIMATE_Open(&g_mtr_inertia_estimate0_ctrl,
&g_mtr_inertia_estimate0_cfg);
    assert(FSP_SUCCESS == err);
 /* Start process. */
    err = RM_MOTOR_INERTIA_ESTIMATE_Start(&g_mtr_inertia_estimate0_ctrl);
    temp_set_data.f_iq = 1.0F;
    temp_set_data.f_speed_radian_control = 1.04F;
    temp_set_data.s2_position_degree    = 180;
    temp_set_data.u1_position_state      = 0;
 /* Set data to the module. */
    err = RM_MOTOR_INERTIA_ESTIMATE_DataSet(&g_mtr_inertia_estimate0_ctrl,
```

```
&temp_set_data);
 /* Get information from the module. */
    err = RM_MOTOR_INERTIA_ESTIMATE_InfoGet(&g_mtr_inertia_estimate0_ctrl,
&temp_information);
 /* Stop process. */
    err = RM_MOTOR_INERTIA_ESTIMATE_Stop(&g_mtr_inertia_estimate0_ctrl);
 /* Close the module. */
    err = RM_MOTOR_INERTIA_ESTIMATE_Close(&g_mtr_inertia_estimate0_ctrl);
}
```

Data Structures

struct	motor_inertia_estimate_instance_ctrl_t

Data Structure Documentation

◆ motor_inertia_estimate_extended_cfg_t

struct motor_inertia_estimate_extended_cfg_t		
Extended configurations for motor inertia estimate		
Data Fields		
int16_t	s2_move_degree	Moving position reference [degree].
uint16_t	u2_J_max_speed_rpm	Maximum Speed [rpm].
float	f_accel_time	Acceleration time.
float	f_rotor_inertia	Initialized rotor inertia value.
float	f_judge_low_threshold	Low threshold to judge speed.
float	f_judge_high_threshold	High threshold to judge speed.
float	f_change_mode_time	Timing value to change internal mode.
float	f_current_ctrl_period	Period of current control [sec].
float	f_speed_ctrl_period	Period of speed control [sec].
uint8_t	u1_motor_polepairs	Motor pole pairs.
float	f_motor_m	Motor magnet flux [Wb].
float	f_position_interval	Interval counts for reference position change.

◆ motor_inertia_estimate_instance_ctrl_t

struct motor_inertia_estimate_instance_ctrl_t		
Inertia estimate instance control block		
Data Fields		
uint32_t	open	Used to determine if the module is configured.
motor_inertia_estimate_start_flag_t	start_flag	start/stop flag
motor_inertia_estimate_mode_t	mode	Internal mode.
uint8_t	u1_mode_count	Use to manage internal mode.
motor_inertia_estimate_period_t	speed_period	Measure period.
motor_inertia_estimate_period_t	speed_period_buffer	Buffer of measure period to be reffered by current cyclic.
uint32_t	u4_measure_count	Counter for speed control cycle.
uint32_t	u4_wait_count	Counter to wait change mode timing.
uint8_t	u1_position_move_mode	Position move mode (TRIANGLE/TRAPEZOID)
int16_t	s2_initial_position_degree	Initial position.
float	f_iq_ad	q-axis current [A]
float	f_summary_iq_ad	Summary of q-axis current.
float	f_position_mode_time	Summary of speed control period to judge the timing.
float	f_position_dt_time_sec	Differencial time of move.
int16_t	s2_position_reference_degree	Position reference [degree].
float	f_estimated_value	Estimated inertia.
float	f_inertia_value1	Buffer to calculate inertia 1.
float	f_inertia_value2	Buffer to calculate inertia 2.

Function Documentation

◆ RM_MOTOR_INERTIA_ESTIMATE_Open()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Open (motor_inertia_estimate_ctrl_t *const *p_ctrl*, motor_inertia_estimate_cfg_t const *const *p_cfg*)

Opens and configures the motor inertia estimate module. Implements motor_inertia_estimate_api_t::open.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_INERTIA_ESTIMATE_Open(&g_mtr_inertia_estimate0_ctrl,
&g_mtr_inertia_estimate0_cfg);
```

Return values

FSP_SUCCESS	Motor inertia estimate module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_INERTIA_ESTIMATE_Close()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Close (motor_inertia_estimate_ctrl_t *const *p_ctrl*)

Disables specified motor inertia estimate module. Implements motor_inertia_estimate_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MOTOR_INERTIA_ESTIMATE_Close(&g_mtr_inertia_estimate0_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_INERTIA_ESTIMATE_Start()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Start (motor_inertia_estimate_ctrl_t *const *p_ctrl*)

Start inertia estimation. Implements motor_inertia_estimate_api_t::start.

Example:

```
/* Start process. */
   err = RM_MOTOR_INERTIA_ESTIMATE_Start(&g_mtr_inertia_estimate0_ctrl);
```

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_INERTIA_ESTIMATE_Stop()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Stop (motor_inertia_estimate_ctrl_t *const *p_ctrl*)

Stop (Cancel) inertia estimation. Implements motor_inertia_estimate_api_t::stop.

Example:

```
/* Stop process. */
   err = RM_MOTOR_INERTIA_ESTIMATE_Stop(&g_mtr_inertia_estimate0_ctrl);
```

Return values

FSP_SUCCESS	Successfully stopped (canceled).
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_INERTIA_ESTIMATE_Reset()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Reset (motor_inertia_estimate_ctrl_t *const *p_ctrl*)

Reset variables of inertia estimate module. Implements motor_inertia_estimate_api_t::reset.

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_INERTIA_ESTIMATE_InfoGet()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_InfoGet (motor_inertia_estimate_ctrl_t *const *p_ctrl*, motor_inertia_estimate_info_t *const *p_info*)

Get information of inertia estimation. Implements motor_inertia_estimate_api_t::infoGet.

Example:

```
/* Get information from the module. */
   err = RM_MOTOR_INERTIA_ESTIMATE_InfoGet(&g_mtr_inertia_estimate0_ctrl,
&temp_information);
```

Return values

FSP_SUCCESS	Successfully get data.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Argument pointer is invalid.

◆ RM_MOTOR_INERTIA_ESTIMATE_DataSet()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_DataSet (motor_inertia_estimate_ctrl_t *const *p_ctrl*, motor_inertia_estimate_set_data_t *const *p_set_data*)

Set necessary data to inertia estimation. Implements motor_inertia_estimate_api_t::dataSet.

Example:

```
/* Set data to the module. */
   err = RM_MOTOR_INERTIA_ESTIMATE_DataSet(&g_mtr_inertia_estimate0_ctrl,
&temp_set_data);
```

Return values

FSP_SUCCESS	Successfully set data.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_INERTIA_ESTIMATE_SpeedCyclic()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_SpeedCyclic (motor_inertia_estimate_ctrl_t *const *p_ctrl*)

Cyclic process of inertia estimation at speed control period. Implements motor_inertia_estimate_api_t::speedCyclic.

Return values

FSP_SUCCESS	Successfully perform the process.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_INERTIA_ESTIMATE_CurrentCyclic()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_CurrentCyclic (motor_inertia_estimate_ctrl_t *const *p_ctrl*)

Cyclic process of inertia estimation at current control period (called at A/D conversion finish interrupt). Implements motor_inertia_estimate_api_t::currentCyclic.

Return values

FSP_SUCCESS	Successfully perform the process.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_INERTIA_ESTIMATE_ParameterUpdate()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_ParameterUpdate (motor_inertia_estimate_ctrl_t *const *p_ctrl*, motor_inertia_estimate_cfg_t const *const *p_cfg*)

Update the parameters of inertia estimate. Implements motor_inertia_estimate_api_t::parameterUpdate.

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor position Interface.

Overview

The motor position is used to control the position of motor rotor in an appication. This module should be called cyclically in an application (e.g. in cyclic timer interrupt). This module calculates speed reference with inputted position reference and current rotational speed.

Features

The Motor Position Module has below features.

- Calculate speed reference.

Configuration

Build Time Configurations for rm_motor_position

The following build time configurations are defined in fsp_cfg/rm_motor_position_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor Position Controller (rm_motor_position)

This module can be added to the Stacks tab via New Stack > Motor > Motor Position Controller (rm_motor_position).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_position0	Module name.
Position dead band	Must be a valid non-negative value.	1U	Ignored area of position control.
Position band limit	Must be a valid non-negative value.	3U	Ignored area of position control.
Speed feedforward ratio	Must be a valid value	0.8F	Speed feedforward ratio.
Encoder counts per one rotation	Must be a valid value	1200.0F	Encoder counts per one rotation.
Position omega	Must be a valid value	10.0F	Position control omega.
Period of speed control (sec)	Must be a valid value	0.0005F	Period of speed control.
IPD			
IPD LPF	• Disable • Enable	Disable	IPD LPF process enable or disable
Position Kp ratio	Must be a valid value	0.3F	Position Kp ratio.
Position feedforward	Must be a valid value	0.0F	Position feedforward

ratio			ratio.
Speed K ratio	Must be a valid value	2.0F	Speed K ratio
Error Limit #1	Must be a valid value	10.0F	Error limitation #1
Error limit #2	Must be a valid value	0.2F	Error limitation #2
LPF omega	Must be a valid value	500.0F	LPF omega.
LPF zeta	Must be a valid value	1.0F	LPF zeta.
Position Profiling			
Interval time	Must be a valid non-negative value.	400U	Interval time.
Accel time	Must be a valid value	0.3F	Accel time.
Maximum accel time (sec)	Must be a valid value	8117.96F	Maximum accelaration time (sec)
Accelaration maximum speed	Must be a valid value	2000.0F	Accelaration maximum speed.
Update step of timer	Must be a valid value	0.0005F	Update step of timer.
Motor Parameter			
Pole pair	Value must be non-negative	7	Pole pair
Resistance (ohm)	Must be a valid value	0.453F	Resistance
Inductance of d-axis (H)	Must be a valid value	0.0009447F	Inductance of d-axis
Inductance of q-axis (H)	Must be a valid value	0.0009447F	Inductance of q-axis
Permanent magnetic flux (Wb)	Must be a valid value	0.006198F	Permanent magnetic flux
Motor Parameter > Motor inertia (kgm^2)	Must be a valid value	0.00000962F	Motor inertia

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the period of speed control with non-negative value.
- Set the limit of speed change step with non-negative value.
- Set the maximum speed with non-negative value.

Examples

Basic Example

This is a basic example of using the Motor Position module in an application.

```
void motor_position_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_POSITION_Open(g_motor_position0.p_ctrl, g_motor_position0.p_cfg);
    handle_error(err);
 /* Set working mode */
    RM_MOTOR_POSITION_ModeSet(g_motor_position0.p_ctrl,
MOTOR_POSITION_CTRL_MODE_STEP);
 /* Set position reference */
 RM_MOTOR_POSITION_PositionReferenceSet(g_motor_position0.p_ctrl, 180U);
 /* Basically run this module at cyclic interrupt (e.g. AGT timer).
  * This implementation is an example. */
 // while (true)
    {
 /* Application work here. */
 /* Perform Position Control Process */
 RM_MOTOR_POSITION_PositionControl(g_motor_position0.p_ctrl);
 /* Perform Speed IPD Control Process */
 RM_MOTOR_POSITION_IpdSpeedPControl(g_motor_position0.p_ctrl, 0.0F, 0.0F,
&temp_iq_ref);
 /* Get Position */
 RM_MOTOR_POSITION_PositionGet(g_motor_position0.p_ctrl, &temp_position);
 /* Update parameters */
 RM_MOTOR_POSITION_ParameterUpdate(g_motor_position0.p_ctrl,
&g_motor_position0.p_cfg);
    }
 /* Reset Speed Control */
 RM_MOTOR_POSITION_Reset(g_motor_position0.p_ctrl);
 /* Close Speed Control */
```

```
 RM_MOTOR_POSITION_Close(g_motor_position0.p_ctrl);
}
```

Function Documentation

◆ RM_MOTOR_POSITION_Open()

fsp_err_t RM_MOTOR_POSITION_Open (motor_position_ctrl_t *const *p_ctrl*, motor_position_cfg_t const *const *p_cfg*)

Opens and configures the Motor Position Module. Implements motor_position_api_t::open.

Return values

FSP_SUCCESS	Motor Position Module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Set parameter is invalid.

◆ RM_MOTOR_POSITION_Close()

fsp_err_t RM_MOTOR_POSITION_Close (motor_position_ctrl_t *const *p_ctrl*)

Disables specified Motor Position Module. Implements motor_position_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_POSITION_Reset()

fsp_err_t RM_MOTOR_POSITION_Reset (motor_position_ctrl_t *const *p_ctrl*)

Reset the variables of Motor Position Module. Implements motor_position_api_t::reset.

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_POSITION_PositionGet()

fsp_err_t RM_MOTOR_POSITION_PositionGet (motor_position_ctrl_t *const *p_ctrl*, int16_t *const *p_position*)

Get Rotor Position Data [degree]. Implements motor_position_api_t::positionGet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ RM_MOTOR_POSITION_PositionSet()

fsp_err_t RM_MOTOR_POSITION_PositionSet (motor_position_ctrl_t *const *p_ctrl*, float const *position_rad*)

Set Position Data from Encoder [radian]. Implements motor_position_api_t::positionSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_POSITION_PositionReferenceSet()

fsp_err_t RM_MOTOR_POSITION_PositionReferenceSet (motor_position_ctrl_t *const *p_ctrl*, int16_t const *position_reference_deg*)

Set Position Reference Data [degree]. Implements motor_position_api_t::positionReferenceSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_POSITION_ControlModeSet()

fsp_err_t RM_MOTOR_POSITION_ControlModeSet (motor_position_ctrl_t *const *p_ctrl*, motor_position_ctrl_mode_t const *mode*)

Set Position Control Mode. Implements motor_position_api_t::controlModeSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_POSITION_PositionControl()

fsp_err_t RM_MOTOR_POSITION_PositionControl (motor_position_ctrl_t *const *p_ctrl*)

Calculates internal position reference.(Main process of Position Control) Implements motor_position_api_t::positionControl.

Return values

FSP_SUCCESS	Successful data calculation.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_POSITION_IpdSpeedPControl()

fsp_err_t RM_MOTOR_POSITION_IpdSpeedPControl (motor_position_ctrl_t *const *p_ctrl*, float const *ref_speed_rad*, float const *speed_rad*, float *const *p_iq_ref*)

Calculates the q-axis current reference by P control. Implements motor_position_api_t::ipdSpeedPControl.

Return values

FSP_SUCCESS	Successful data calculation.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ RM_MOTOR_POSITION_SpeedReferencePControlGet()

fsp_err_t RM_MOTOR_POSITION_SpeedReferencePControlGet (motor_position_ctrl_t *const *p_ctrl*, float *const *p_speed_ref*)

Get Speed Reference by P Control. Implements motor_position_api_t::speedReferencePControlGet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ RM_MOTOR_POSITION_SpeedReferenceIpdControlGet()

fsp_err_t RM_MOTOR_POSITION_SpeedReferenceIpdControlGet (motor_position_ctrl_t *const *p_ctrl*, float const *max_speed_rad*, float *const *p_speed_ref*)

Get Speed Reference by IPD Control. Implements motor_position_api_t::speedReferenceIpdControlGet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ RM_MOTOR_POSITION_SpeedReferenceFeedforwardGet()

fsp_err_t RM_MOTOR_POSITION_SpeedReferenceFeedforwardGet (motor_position_ctrl_t *const *p_ctrl*, float *const *p_speed_ref*)

Get Speed Reference by Feedforward. Implements motor_position_api_t::speedReferenceFeedforwardGet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ RM_MOTOR_POSITION_InfoGet()

fsp_err_t RM_MOTOR_POSITION_InfoGet (motor_position_ctrl_t *const *p_ctrl*, motor_position_info_t *const *p_info*)

Get position information.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ RM_MOTOR_POSITION_ParameterUpdate()

fsp_err_t RM_MOTOR_POSITION_ParameterUpdate (motor_position_ctrl_t *const *p_ctrl*, motor_position_cfg_t const *const *p_cfg*)
Update the parameters of Position Control Calculation. Implements motor_position_api_t::parameterUpdate.

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

Detailed Description

Usual control of a SPM motor on RA MCUs. This module implements the Motor Sensorless Vector Control (rm_motor_sensorless).

Overview

The motor sensorless vector control is used to control a motor rotation in an appication. This module is implemented with using SPM motor. User can start/stop motor rotation simply.

Features

The Motor Sensorless Module has below features.

- Start/Stop a motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Target Hardware

The below figure shows an example of target hardware of this Motor Sensorless Module.

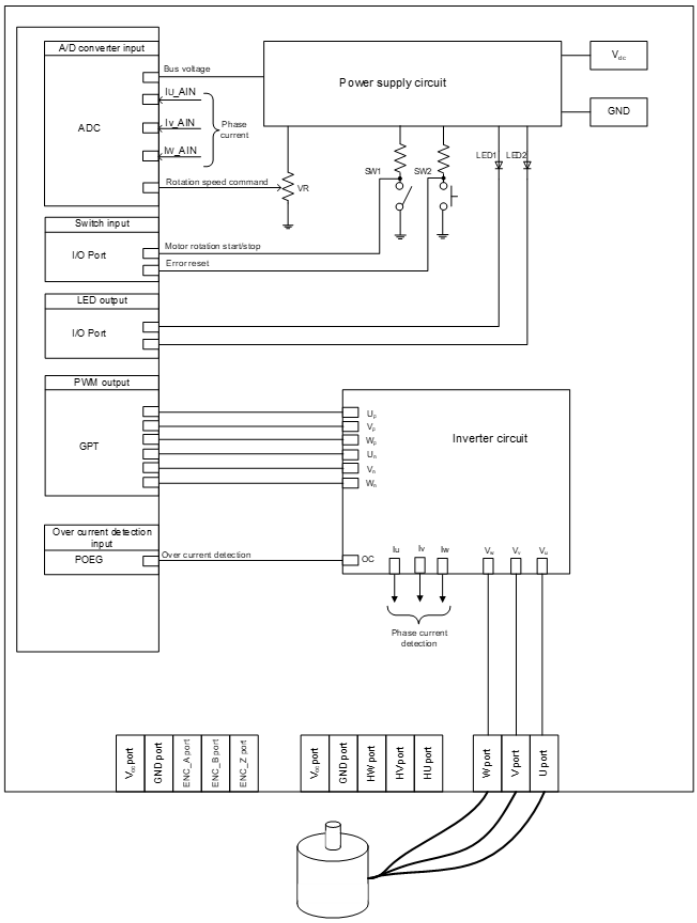

Figure 249: Example of target hardware of motor sensorless module

Block Diagram

The below figures show block diaram of sensorless vector motor control. The 1st shows as an open-loop state, 2nd as a PI feedback loop state.

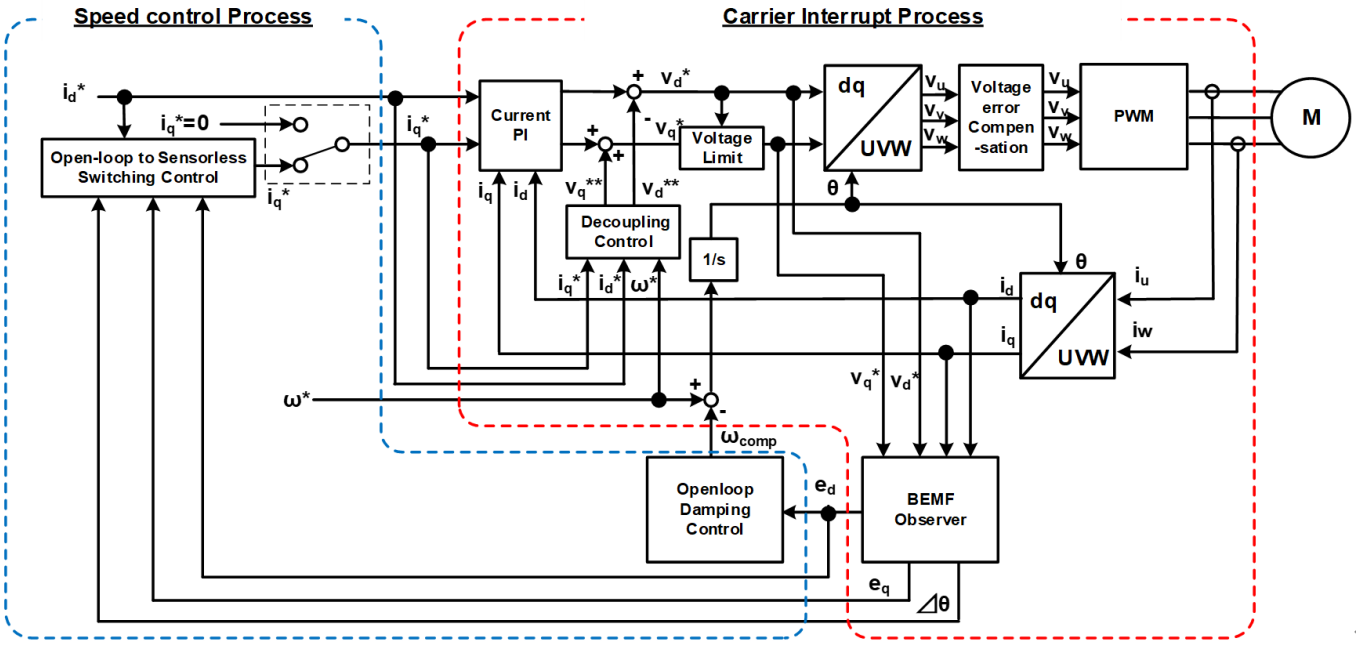

Figure 250: Block diagram of sensorless vector control (open-loop)

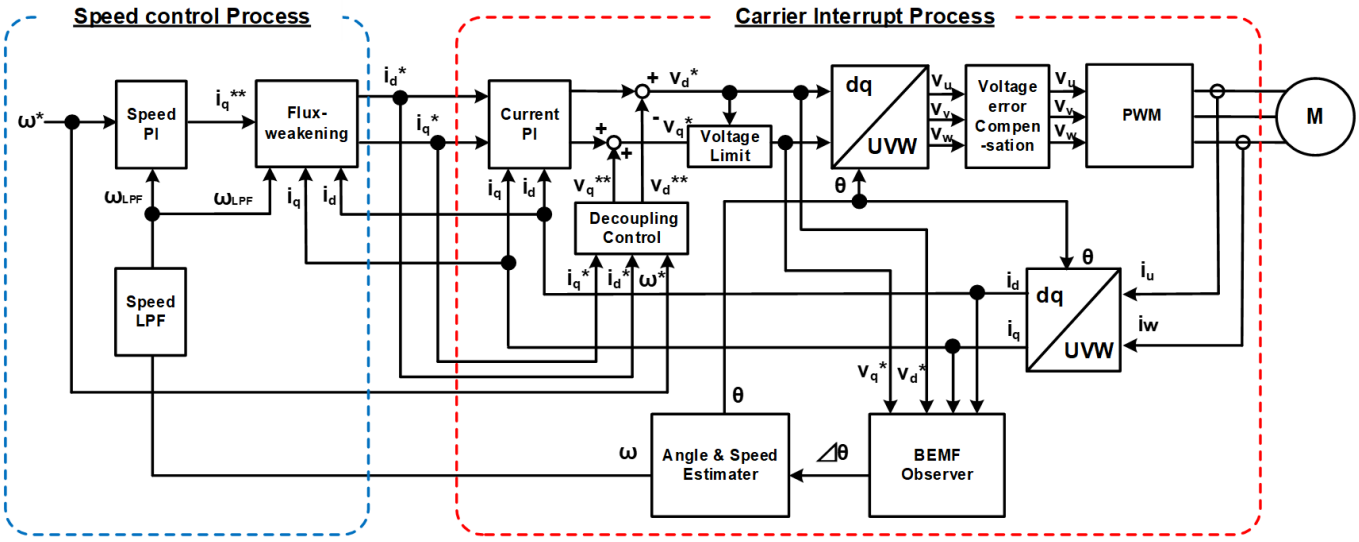

Figure 251: Block diagram of sensorless vector control (PI feedback loop)

Modulation

- Sine wave modulation The modulation factor "m" is defined as follows.

$$m = \frac{V}{E}$$

m : Modulation ratio V : Reference voltage E : Inverter input voltage

Figure 252: Modulation factor

- Space vector modulation In vector control of a permanent magnet synchronous motor, generally, the desired voltage command value of each phase is generated sinusoidally. However, if the generated value is used as-is for the modulation wave for PWM generation, voltage utilization as applied to the motor (in terms of line voltage) is limited to a maximum of 86.7 percents with respect to inverter bus voltage. As such, as shown in the following expression, the average of the maximum and minimum values is calculated for the voltage command value of each phase, and the value obtained by subtracting the average from the voltage command value of each phase is used as the modulation wave. As a result, the maximum amplitude of the modulation wave is multiplied by (square root 3)/2, while voltage utilization becomes 100 percents and line voltage is unchanged.

$$\begin{pmatrix} V_u' \\ V_v' \\ V_w' \end{pmatrix} = \begin{pmatrix} V_u \\ V_v \\ V_w \end{pmatrix} + \Delta V \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$$

$$\because \Delta V = -\frac{V_{max}+V_{min}}{2},\ V_{max} = max\{V_u, V_v, V_w\},\ V_{min} = min\{V_u, V_v, V_w\}$$

V_u, V_v, V_w: Command values of U-, V-, and W-phases

V_u', V_v', V_w': Command values of U-, V-, and W-phases for PWM generation (modulation wave)

Figure 253: Space vector modulation

State transition

The below figure shows a state transition diagram. Internal state is managed by "SYSTEM MODE".

		MODE		
		STOP	RUN	ERROR
EVENT	STOP	STOP	STOP	ERROR
	RUN	RUN	RUN	ERROR
	ERROR	ERROR	ERROR	ERROR
	RESET	STOP	RUN	STOP

Figure 254: State transition diagram

(1) SYSTEM MODE "SYSTEM MODE" indicates the operating states of the system. The state transits on occurrence of each event (EVENT). "SYSTEM MODE" has 3 states that are motor drive stop (INACTIVE), motor drive (ACTIVE), and abnormal condition (ERROR).

(2) EVENT When "EVENT" occurs in each "SYSTEM MODE", "SYSTEM MODE" changes as shown the table in above figure, according to that "EVENT". The occurrence factors of each event are shown below.

EVENT name	Occurrence factor
STOP	by user operation
RUN	by user operation
ERROR	when the system detects an error
RESET	by user operation

Flowchart

The below figures show flowcharts of motor sensorless module.

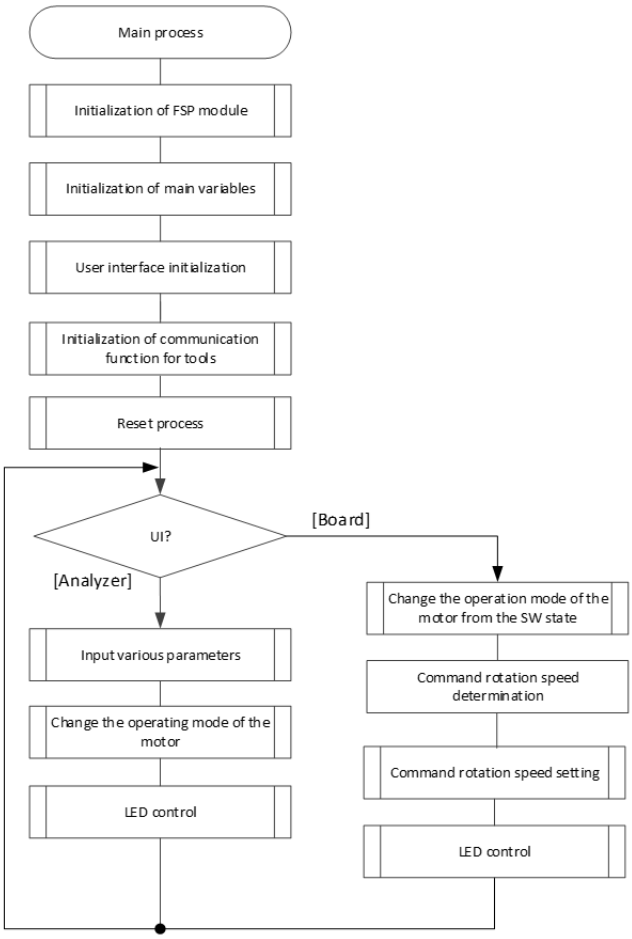

Figure 255: Main process

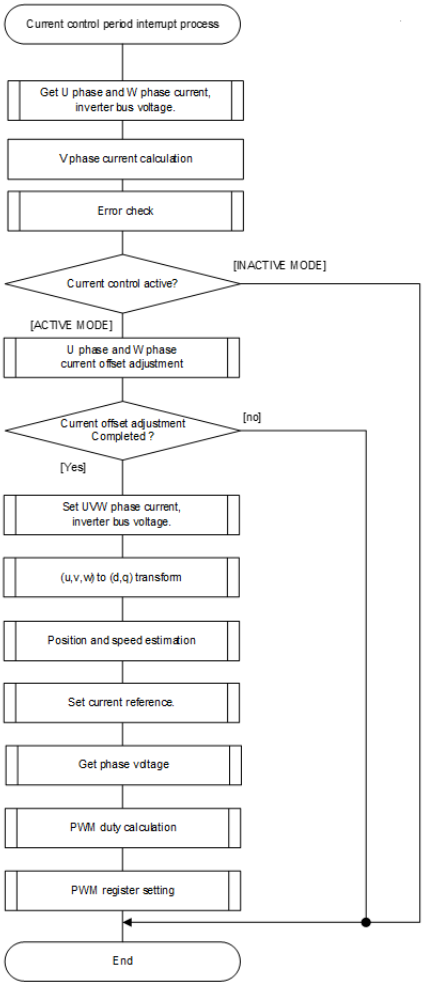

Figure 256: Current control process

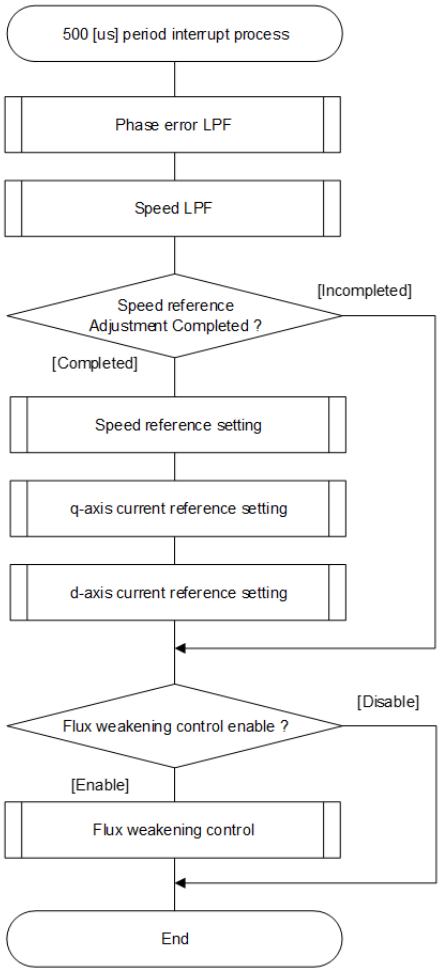

Figure 257: Speed control process

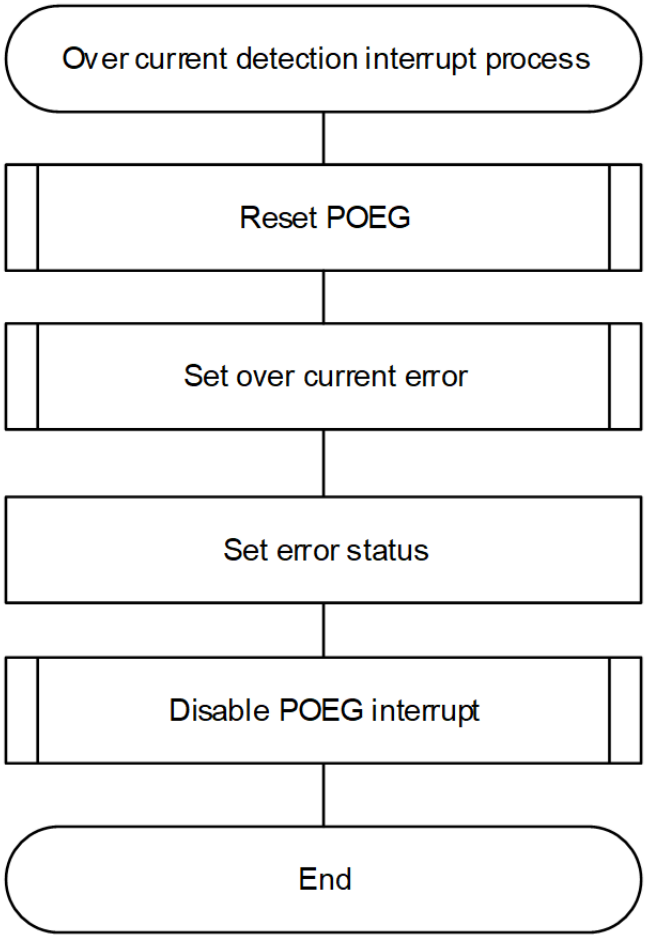

Figure 258: Over current detection interrupt process

Configuration

Build Time Configurations for rm_motor_sensorless

The following build time configurations are defined in fsp_cfg/rm_motor_sensorless_cfg.h:

Configuration	Options	Default	Description
Parameter checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor Sensorless Vector Control (rm_motor_sensorless)

This module can be added to the Stacks tab via New Stack > Motor > Motor Sensorless Vector Control (rm_motor_sensorless).

Configuration	Options	Default	Description
General			

Name	Name must be a valid C symbol	g_motor_sensorless0	Module name.
Limit of over current (A)	Must be a valid value	0.42F	Limit of over current.(Detection threshold)
Limit of over voltage (V)	Must be a valid value	28.0F	Limit of over voltage.(Detection threshold)
Limit of over speed (rpm)	Must be a valid value	3000.0F	Limit of over speed.(Detection threshold)
Limit of low voltage (V)	Must be a valid value	14.0F	Limit of low voltage.(Detection threshold)
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt.

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins. Please set used pins on configuration of each hardware modules.

Usage Notes

Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

Examples

Basic Example

This is a basic example of minimal use of the Motor Sensorless in an application.

```
void motor_sensorless_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
```

```
    err = RM_MOTOR_SENSORLESS_Open(g_motor_sensorless0.p_ctrl,
g_motor_sensorless0.p_cfg);
    assert(FSP_SUCCESS == err);
 /* Set speed reference before motor run */
    (void) RM_MOTOR_SENSORLESS_SpeedSet(g_motor_sensorless0.p_ctrl,
DEF_SENSORLESS_TEST_OVSPD_LIM);
 /* Start motor rotation */
    (void) RM_MOTOR_SENSORLESS_Run(g_motor_sensorless0.p_ctrl);
 /* Get current status */
    (void) RM_MOTOR_SENSORLESS_StatusGet(g_motor_sensorless0.p_ctrl, &smpl_status);
 /* Get current rotor angle */
    (void) RM_MOTOR_SENSORLESS_AngleGet(g_motor_sensorless0.p_ctrl, &smpl_angle);
 /* Get current motor speed */
    (void) RM_MOTOR_SENSORLESS_SpeedGet(g_motor_sensorless0.p_ctrl, &smpl_speed);
 /* Check error */
    (void) RM_MOTOR_SENSORLESS_ErrorCheck(g_motor_sensorless0.p_ctrl, &smpl_error);
 /* Stop motor rotation */
    (void) RM_MOTOR_SENSORLESS_Stop(g_motor_sensorless0.p_ctrl);
 /* Stop motor rotation */
    (void) RM_MOTOR_SENSORLESS_ErrorSet(g_motor_sensorless0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
 /* Reset Speed Control */
    (void) RM_MOTOR_SENSORLESS_Reset(g_motor_sensorless0.p_ctrl);
 /* Close Speed Control */
    (void) RM_MOTOR_SENSORLESS_Close(g_motor_sensorless0.p_ctrl);
}
```

Function Documentation

◆ RM_MOTOR_SENSORLESS_Open()

fsp_err_t RM_MOTOR_SENSORLESS_Open (motor_ctrl_t *const *p_ctrl*, motor_cfg_t const *const *p_cfg*)

Configure the MOTOR in register start mode. Implements motor_api_t::open.

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_SENSORLESS_Open(g_motor_sensorless0.p_ctrl,
g_motor_sensorless0.p_cfg);
```

Return values

FSP_SUCCESS	MOTOR successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

Note

◆ RM_MOTOR_SENSORLESS_Close()

fsp_err_t RM_MOTOR_SENSORLESS_Close (motor_ctrl_t *const *p_ctrl*)

Disables specified Motor Sensorless Control block. Implements motor_api_t::close.

Example:

```
/* Close Speed Control */
   (void) RM_MOTOR_SENSORLESS_Close(g_motor_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_SENSORLESS_Reset()

fsp_err_t RM_MOTOR_SENSORLESS_Reset (motor_ctrl_t *const *p_ctrl*)

Reset Motor Sensorless Control block. Implements motor_api_t::reset.

Example:

```
/* Reset Speed Control */
   (void) RM_MOTOR_SENSORLESS_Reset(g_motor_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_SENSORLESS_Run()

fsp_err_t RM_MOTOR_SENSORLESS_Run (motor_ctrl_t *const *p_ctrl*)

Run Motor (Start motor rotation). Implements motor_api_t::run.

Example:

```
/* Start motor rotation */
   (void) RM_MOTOR_SENSORLESS_Run(g_motor_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_SENSORLESS_Stop()

fsp_err_t RM_MOTOR_SENSORLESS_Stop (motor_ctrl_t *const *p_ctrl*)

Stop Motor (Stop motor rotation). Implements motor_api_t::stop.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_SENSORLESS_Stop(g_motor_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_SENSORLESS_ErrorSet()

fsp_err_t RM_MOTOR_SENSORLESS_ErrorSet (motor_ctrl_t *const *p_ctrl*, motor_error_t const *error*)

Set error information. Implements motor_api_t::errorSet.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_SENSORLESS_ErrorSet(g_motor_sensorless0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_SENSORLESS_SpeedSet()

fsp_err_t RM_MOTOR_SENSORLESS_SpeedSet (motor_ctrl_t *const *p_ctrl*, float const *speed_rpm*)

Set speed reference[rpm]. Implements motor_api_t::speedSet.

Example:

```
/* Set speed reference before motor run */
   (void) RM_MOTOR_SENSORLESS_SpeedSet(g_motor_sensorless0.p_ctrl,
DEF_SENSORLESS_TEST_OVSPD_LIM);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_SENSORLESS_StatusGet()

fsp_err_t RM_MOTOR_SENSORLESS_StatusGet (motor_ctrl_t *const *p_ctrl*, uint8_t *const *p_status*)

Get current control status. Implements motor_api_t::statusGet.

Example:

```
/* Get current status */
   (void) RM_MOTOR_SENSORLESS_StatusGet(g_motor_sensorless0.p_ctrl, &smpl_status);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_SENSORLESS_AngleGet()

fsp_err_t RM_MOTOR_SENSORLESS_AngleGet (motor_ctrl_t *const *p_ctrl*, float *const *p_angle_rad*)

Get current rotor angle. Implements motor_api_t::angleGet.

Example:

```
/* Get current rotor angle */
   (void) RM_MOTOR_SENSORLESS_AngleGet(g_motor_sensorless0.p_ctrl, &smpl_angle);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_SENSORLESS_SpeedGet()

fsp_err_t RM_MOTOR_SENSORLESS_SpeedGet (motor_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm*)

Get rotational speed. Implements motor_api_t::speedGet.

Example:

```
/* Get current motor speed */
   (void) RM_MOTOR_SENSORLESS_SpeedGet(g_motor_sensorless0.p_ctrl, &smpl_speed);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_SENSORLESS_ErrorCheck()

fsp_err_t RM_MOTOR_SENSORLESS_ErrorCheck (motor_ctrl_t *const *p_ctrl*, uint16_t *const *p_error*)

Check the occurunce of Error. Implements motor_api_t::errorCheck.

Example:

```
/* Check error */
   (void) RM_MOTOR_SENSORLESS_ErrorCheck(g_motor_sensorless0.p_ctrl, &smpl_error);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_SENSORLESS_PositionSet()

fsp_err_t RM_MOTOR_SENSORLESS_PositionSet (motor_ctrl_t *const *p_ctrl*, motor_speed_position_data_t const *const *p_position*)

Set position reference. Implements motor_api_t::positionSet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Note

◆ RM_MOTOR_SENSORLESS_WaitStopFlagGet()

fsp_err_t RM_MOTOR_SENSORLESS_WaitStopFlagGet (motor_ctrl_t *const *p_ctrl*, motor_wait_stop_flag_t *const *p_flag*)

Get wait stop flag. Implements motor_api_t::waitStopFlagGet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Note

◆ RM_MOTOR_SENSORLESS_FunctionSelect()

fsp_err_t RM_MOTOR_SENSORLESS_FunctionSelect (motor_ctrl_t *const *p_ctrl*, motor_function_select_t const *function*)
Select function. Implements motor_api_t::functionSelect. **Return values** FSP_ERR_UNSUPPORTED — Unsupported. ***Note***

5.2.11.15 Motor Speed Controller (rm_motor_speed)

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor speed Interface.

Overview

The motor speed is used to control the speed of motor rotation in an appication. This module should be called cyclically in an application (e.g. in cyclic timer interrupt). This module caliculates d/q-axis current reference with input speed reference, current rotational speed, and d/q-axis current.

Features

The motor speed module has below features.

- Calculate d/q-axis electric current reference.
- Flux weakening process at high speed rotation.
- Open loop damping control when using sensorless type.
- Low pass filter of input rotational speed.
- Speed observer function when using encoder type.

Configuration

Build Time Configurations for rm_motor_speed

The following build time configurations are defined in fsp_cfg/rm_motor_speed_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Position Support	• Enabled • Disabled	Disabled	Enable position algorithm support.

Configurations for Motor > Motor Speed Controller (rm_motor_speed)

This module can be added to the Stacks tab via New Stack > Motor > Motor Speed Controller (rm_motor_speed).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_speed0	Module name.
Speed control period (sec)	Must be a valid non-negative value	0.0005F	Period of speed control function.
Step of speed climbing (rpm)	Must be a valid non-negative value	0.5F	Step of speed change at start of open-loop.
Maximum rotational speed (rpm)	Must be a valid non-negative value.	2650.0F	Maximum rotational speed (Limit speed).
Speed LPF omega	Must be a valid non-negative value	10.0F	Design parameter for speed LPF.
Limit of q-axis current (A)	Must be a valid non-negative value	0.42F	Limit of q-axis current.
Step of speed feedback at open-loop	Must be a valid non-negative value	0.20F	Step of speed feedback at open-loop.
Natural frequency	Must be a valid non-negative value.	100.0F	Natural frequency for disturbance speed observer.
Open-loop damping	• Disable • Enable	Enable	Select enable/disable Open-loop damping control.
Flux weakening	• Disable • Enable	Disable	Select enable/disable flux weakening control.
Torque compensation for sensorless transition	• Disable • Enable	Enable	Select enable/disable torque compensation for sensorless

			transition.
Speed observer	• Disable • Enable	Enable	Select enable/disable Speed observer process.
Selection of speed observer	• Normal • Disturbance	Normal	Select speed observer type.
Control method	• PID • IPD	PID	Select the control method [PID or IPD].
Control type	• Sensoreless • Encoder • Induction • Hall	Sensoreless	
Open-Loop			
Step of d-axis current climbing	Must be a valid non-negative value	0.3F	Step of d-axis current climbing
Step of d-axis current descending	Must be a valid non-negative value	0.3F	Step of d-axis current descending
Step of q-axis current descending ratio	Must be a valid non-negative value	1.0F	Step of q-axis current descending ratio
Reference of d-axis current	Must be a valid non-negative value	0.3F	Reference of d-axis current
Threshold of speed control descending	Must be a valid value	600.0F	When rotational speed reaches this speed, d-axis current is controlled descending.
Threshold of speed control climbing	Must be a valid value	500.0F	Until rotational speed reaches this speed, d-axis current is controlled climbing.
Period between open-loop to BEMF (sec)	Must be a valid non-negative value	0.025F	Margin time between open-loop control changes to BEMF PI control.
Phase error(degree) to decide sensor-less switch timing	Must be a valid value	10.0F	Phase error(degree) to decide sensor-less switch timing.
Design parameter			
Speed PI loop omega	Must be a valid non-negative value	5.0F	Speed PI loop omega
Speed PI loop zeta	Must be a valid non-negative value	1.0F	Speed PI loop zeta
Estimated d-axis HPF omega	Must be a valid non-negative value	2.5F	HPF cutoff frequency for ed (Hz)
Open-loop damping	Must be a valid non-	1.0F	Damping ratio of open-

zeta	negative value		loop damping control
Cutoff frequency of phase error LPF	Must be a valid non-negative value	10.0F	Cutoff frequency of phase error LPF
Speed observer omega	Must be a valid non-negative value	200.0F	Speed observer loop omega
Speed observer zeta	Must be a valid non-negative value	1.0F	Speed observer loop zeta
Motor Parameter			
Pole pairs	Must be a valid non-negative value.	2	Pole pairs
Resistance (ohm)	Must be a valid non-negative value	8.5F	Resistance
Inductance of d-axis (H)	Must be a valid non-negative value	0.0045F	Inductance of d-axis
Inductance of q-axis (H)	Must be a valid non-negative value	0.0045F	Inductance of q-axis
Permanent magnetic flux (Wb)	Must be a valid non-negative value	0.02159F	Permanent magnetic flux
Motor Parameter > Rotor inertia (kgm^2)	Must be a valid non-negative value	0.0000028F	Rotor inertia
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at timer interrupt.
Input data	Name must be a valid C symbol	NULL	Structure for Speed control Input. If you set this content, Speed Control function read these data automatically. (No need to use Set API.)
Output data	Name must be a valid C symbol	NULL	Structure for Speed control Output. If you set this content, Speed Control function write need data automatically. (No need to use Get API.)

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the period of speed control with none-negative value.
- Set the limit of speed change step with none-negative value.
- Set the maximum speed with none-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor speed in an application.

```
void motor_speed_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_SPEED_Open(g_motor_speed0.p_ctrl, g_motor_speed0.p_cfg);
    handle_error(err);
 /* Set speed reference before get current reference */
    (void) RM_MOTOR_SPEED_SpeedReferenceSet(g_motor_speed0.p_ctrl, 104.72F);
 /* Set position reference before get current reference
  * (Basically Exclusive to SpeedReferenceSet. This is only sample,) */

Enumeration Type Documentation

◆ motor_speed_control_type_t

enum motor_speed_control_type_t	
Enumerator	
MOTOR_SPEED_CONTROL_TYPE_SENSORLESS	Sensorless type.
MOTOR_SPEED_CONTROL_TYPE_ENCODER	Encoder type.
MOTOR_SPEED_CONTROL_TYPE_HALL	Hall type.
MOTOR_SPEED_CONTROL_TYPE_INDUCTION	Induction type.

◆ motor_speed_openloop_damping_t

enum motor_speed_openloop_damping_t	
Enumerator	
MOTOR_SPEED_OPENLOOP_DAMPING_DISABLE	Disable openloop damping.
MOTOR_SPEED_OPENLOOP_DAMPING_ENABLE	Enable openloop damping.

◆ motor_speed_flux_weaken_t

enum motor_speed_flux_weaken_t	
Enumerator	
MOTOR_SPEED_FLUX_WEAKEN_DISABLE	Disable flux-weakening control.
MOTOR_SPEED_FLUX_WEAKEN_ENABLE	Enable flux-weakening control.

◆ motor_speed_less_switch_t

enum motor_speed_less_switch_t	
Enumerator	
MOTOR_SPEED_LESS_SWITCH_DISABLE	Disable soft switching between open-loop mode and normal field oriented control mode.
MOTOR_SPEED_LESS_SWITCH_ENABLE	Enable soft switching between open-loop mode and normal field oriented control mode.

◆ motor_speed_observer_switch_t

enum motor_speed_observer_switch_t	
Enumerator	
MOTOR_SPEED_OBSERVER_SWITCH_DISABLE	Disable speed observer.
MOTOR_SPEED_OBSERVER_SWITCH_ENABLE	Enable speed observer.

◆ motor_speed_observer_select_t

enum motor_speed_observer_select_t	
Enumerator	
MOTOR_SPEED_OBSERVER_SELECT_NORMAL	Normal speed observer.
MOTOR_SPEED_OBSERVER_SELECT_DISTURBANCE	Disturbance speed observer.

◆ motor_speed_ctrl_status_t

enum motor_speed_ctrl_status_t	
Enumerator	
MOTOR_SPEED_CTRL_STATUS_INIT	Speed control status is INIT.
MOTOR_SPEED_CTRL_STATUS_BOOT	Speed control status is BOOT.
MOTOR_SPEED_CTRL_STATUS_RUN	Speed control status is RUN.

Function Documentation

◆ RM_MOTOR_SPEED_Open()

fsp_err_t RM_MOTOR_SPEED_Open (motor_speed_ctrl_t *const *p_ctrl*, motor_speed_cfg_t const *const *p_cfg*)

Opens and configures the Motor Speed Module. Implements motor_speed_api_t::open.

Return values

FSP_SUCCESS	Motor Speed Module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

◆ RM_MOTOR_SPEED_Close()

fsp_err_t RM_MOTOR_SPEED_Close (motor_speed_ctrl_t *const *p_ctrl*)

Disables specified Motor Speed Module. Implements motor_speed_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SPEED_Reset()

fsp_err_t RM_MOTOR_SPEED_Reset (motor_speed_ctrl_t *const *p_ctrl*)

Reset the variables of Motor Speed Module. Implements motor_speed_api_t::reset.

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SPEED_Run()

fsp_err_t RM_MOTOR_SPEED_Run (motor_speed_ctrl_t *const *p_ctrl*)

Run(Start) the Motor Speed Control. Implements motor_speed_api_t::run.

Return values

FSP_SUCCESS	Successfully start.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SPEED_SpeedReferenceSet()

fsp_err_t RM_MOTOR_SPEED_SpeedReferenceSet (motor_speed_ctrl_t *const *p_ctrl*, float const *speed_reference_rpm*)

Set Speed Reference Data. Implements motor_speed_api_t::speedReferenceSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SPEED_PositionReferenceSet()

fsp_err_t RM_MOTOR_SPEED_PositionReferenceSet (motor_speed_ctrl_t *const *p_ctrl*, motor_speed_position_data_t const *const *p_position_data*)

Set Position Reference Data. Implements motor_speed_api_t::positionReferenceSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input structure pointer is NULL.

◆ RM_MOTOR_SPEED_ParameterSet()

fsp_err_t RM_MOTOR_SPEED_ParameterSet (motor_speed_ctrl_t *const *p_ctrl*, motor_speed_input_t const *const *p_st_input*)

Set Input parameters. Implements motor_speed_api_t::parameterSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ RM_MOTOR_SPEED_SpeedControl()

fsp_err_t RM_MOTOR_SPEED_SpeedControl (motor_speed_ctrl_t *const *p_ctrl*)

Calculates the d/q-axis current reference.(Main process of Speed Control) Implements motor_speed_api_t::speedControl.

Return values

FSP_SUCCESS	Successful data calculation.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SPEED_ParameterGet()

fsp_err_t RM_MOTOR_SPEED_ParameterGet (motor_speed_ctrl_t *const *p_ctrl*, motor_speed_output_t *const *p_st_output*)

Get Speed Control Parameters. Implements motor_speed_api_t::parameterGet.

Return values

FSP_SUCCESS	Successfully the flag is gotten.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ RM_MOTOR_SPEED_ParameterUpdate()

fsp_err_t RM_MOTOR_SPEED_ParameterUpdate (motor_speed_ctrl_t *const *p_ctrl*, motor_speed_cfg_t const *const *p_cfg*)
Update the parameters of Speed Control Calculation. Implements motor_speed_api_t::parameterUpdate. **Return values** FSP_SUCCESS — Successfully data was updated. FSP_ERR_ASSERTION — Null pointer. FSP_ERR_NOT_OPEN — Module is not open. FSP_ERR_INVALID_ARGUMENT — Configuration parameter error.

Detailed Description

Usual control of a SPM motor on RA MCUs. This module implements the Motor Vector Control with hall sensors (rm_motor_hall).

Overview

The motor vector control with hall sensors is used to control a motor rotation in an appication. This module is meant to be used with Surface Permanent Magnet (SPM) motors and allows applications to start or stop motor rotation easily.

Features

The motor vector control with hall sensors has below features.

- Start/Stop a motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Target Hardware

The below figure shows an example of target hardware of this Motor Hall Module.

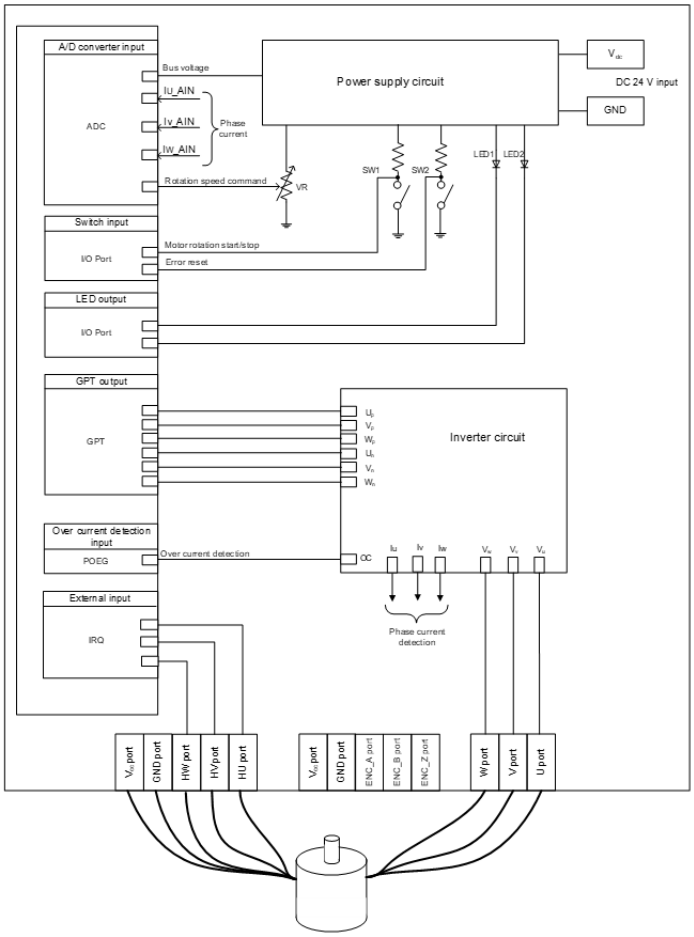

Figure 259: Example of target hardware of motor hall module

Block Diagram

The below figure shows block diaram of vector motor control with hall sensors.

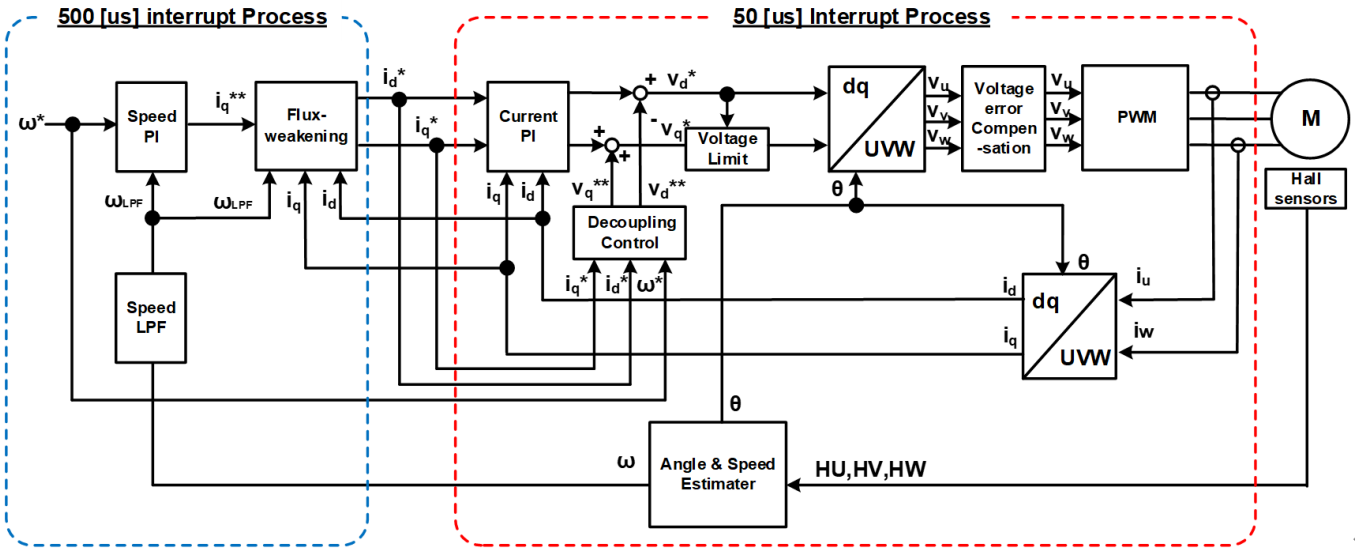

Figure 260: Block diagram of vector control with hall sensors

Modulation

- Sine wave modulation The modulation factor "m" is defined as follows.

$$m = \frac{V}{E}$$

m : Modulation ratio V : Reference voltage E : Inverter input voltage

Figure 261: Modulation factor

- Space vector modulation In vector control of a permanent magnet synchronous motor, generally, the desired voltage command value of each phase is generated sinusoidally. However, if the generated value is used as-is for the modulation wave for PWM generation, voltage utilization as applied to the motor (in terms of line voltage) is limited to a maximum of 86.7 percents with respect to inverter bus voltage. As such, as shown in the following expression, the average of the maximum and minimum values is calculated for the voltage command value of each phase, and the value obtained by subtracting the average from the voltage command value of each phase is used as the modulation wave. As a result, the maximum amplitude of the modulation wave is multiplied by (square root 3)/2, while voltage utilization becomes 100 percents and line voltage is unchanged.

$$\begin{pmatrix} V_u' \\ V_v' \\ V_w' \end{pmatrix} = \begin{pmatrix} V_u \\ V_v \\ V_w \end{pmatrix} + \Delta V \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$$

$$\because \Delta V = -\frac{V_{max}+V_{min}}{2},\ V_{max} = max\{V_u, V_v, V_w\},\ V_{min} = min\{V_u, V_v, V_w\}$$

V_u, V_v, V_w: Command values of U-, V-, and W-phases

V_u', V_v', V_w': Command values of U-, V-, and W-phases for PWM generation (modulation wave)

Figure 262: Space vector modulation

State transition

The below figure shows a state transition diagram. Internal state is managed by "SYSTEM MODE".

		MODE		
		STOP	RUN	ERROR
EVENT	STOP	STOP	STOP	ERROR
	RUN	RUN	RUN	ERROR
	ERROR	ERROR	ERROR	ERROR
	RESET	STOP	RUN	STOP

Figure 263: State transition diagram

(1) SYSTEM MODE "SYSTEM MODE" indicates the operating states of the system. The state transits on occurrence of each event (EVENT). "SYSTEM MODE" has 3 states that are motor drive stop (INACTIVE), motor drive (ACTIVE), and abnormal condition (ERROR).

(2) EVENT When "EVENT" occurs in each "SYSTEM MODE", "SYSTEM MODE" changes as shown the table in above figure, according to that "EVENT". The occurrence factors of each event are shown below.

EVENT name	Occurrence factor
STOP	by user operation
RUN	by user operation
ERROR	when the system detects an error
RESET	by user operation

Flowchart

The below figures show flowcharts of motor hall module.

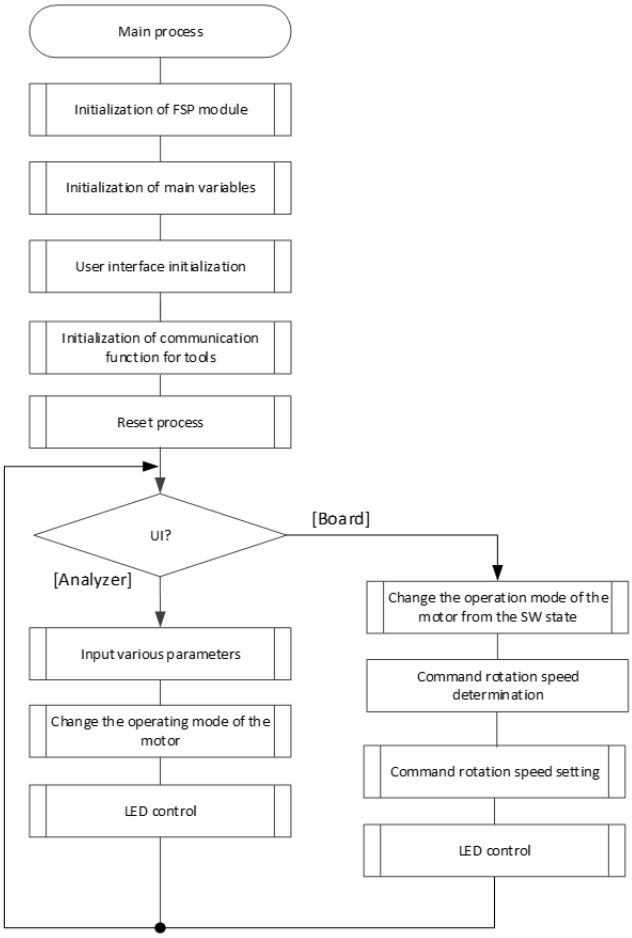

Figure 264: Main process

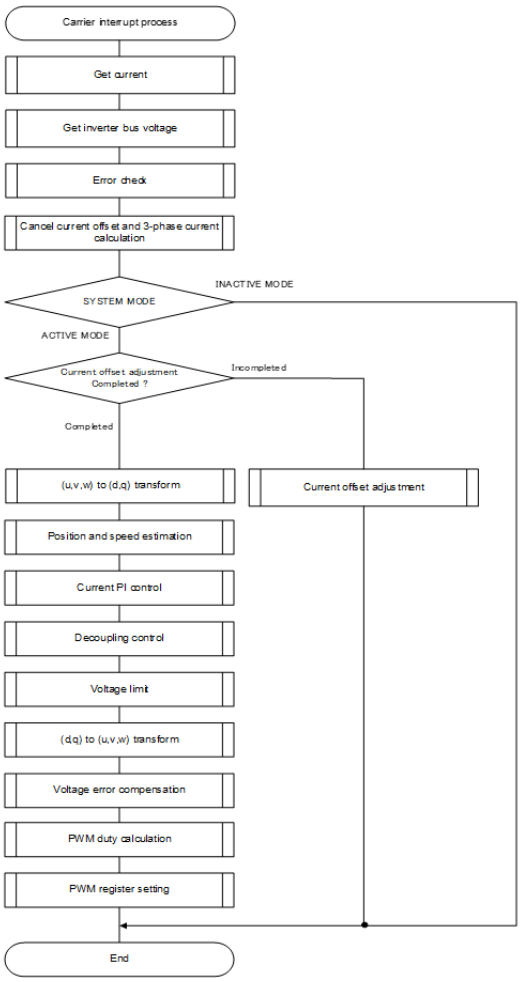

Figure 265: Current control process

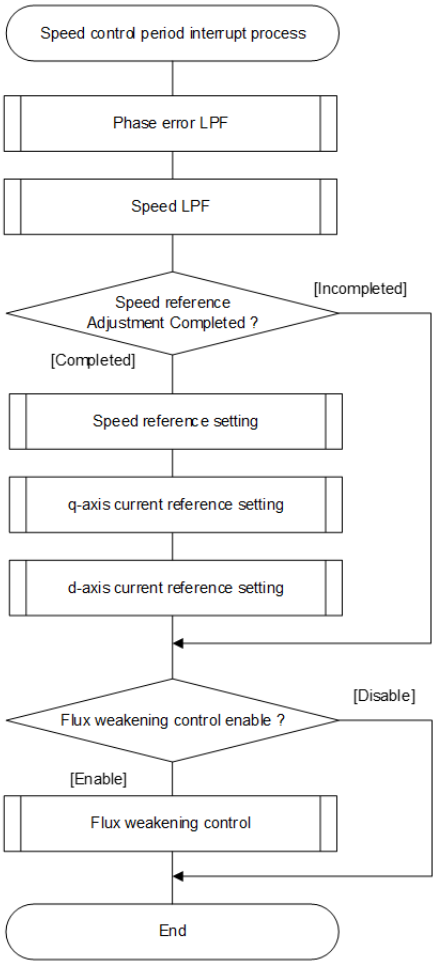

Figure 266: Speed control process

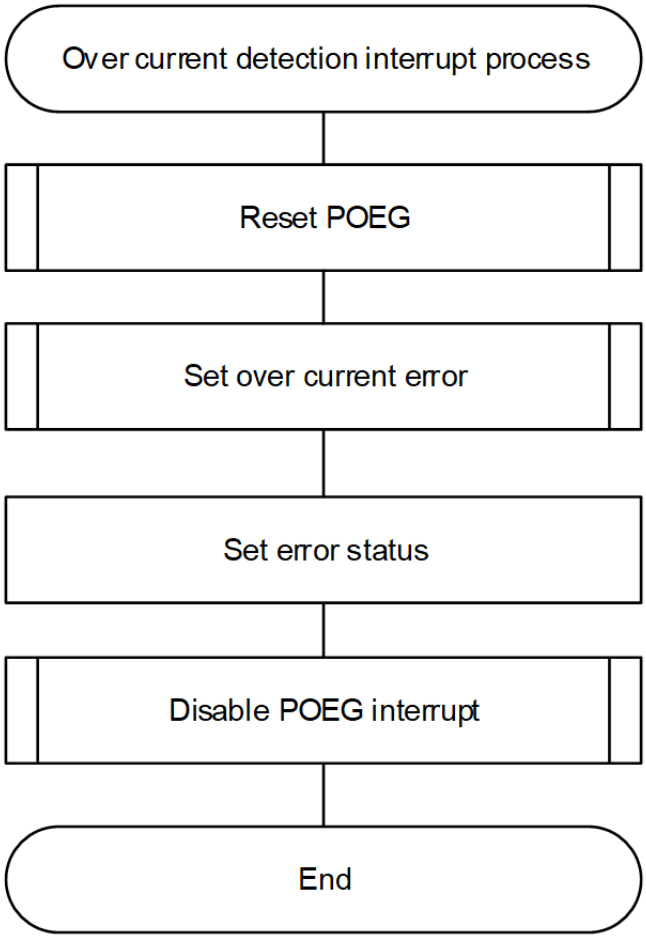

Figure 267: Over current detection interrupt process

Configuration

Build Time Configurations for rm_motor_hall

The following build time configurations are defined in fsp_cfg/rm_motor_hall_cfg.h:

Configuration	Options	Default	Description
Parameter checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor Vector Control with hall sensors(rm_motor_hall)

This module can be added to the Stacks tab via New Stack > Motor > Motor Vector Control with hall sensors(rm_motor_hall).

Configuration	Options	Default	Description
General			

Name	Name must be a valid C symbol	g_motor_hall0	Module name.
Limit of over current (A)	Must be a valid value	0.42F	Limit of over current.(Detection threshold)
Limit of over voltage (V)	Must be a valid value	28.0F	Limit of over voltage.(Detection threshold)
Limit of over speed (rpm)	Must be a valid value	3000.0F	Limit of over speed.(Detection threshold)
Limit of low voltage (V)	Must be a valid value	14.0F	Limit of low voltage.(Detection threshold)
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt.

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins. Please set used pins on configuration of each hardware modules.

Usage Notes

Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor vector control with hall sensors in an application.

```
void motor_hall_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
```

```
    err = RM_MOTOR_HALL_Open(g_motor_hall0_smpl.p_ctrl, g_motor_hall0_smpl.p_cfg);
    assert(FSP_SUCCESS == err);
 /* Set speed reference before motor run */
    (void) RM_MOTOR_HALL_SpeedSet(g_motor_hall0_smpl.p_ctrl,
DEF_HALL_TEST_OVSPD_LIM);
 /* Start motor rotation */
    (void) RM_MOTOR_HALL_Run(g_motor_hall0_smpl.p_ctrl);
 /* Get current status */
    (void) RM_MOTOR_HALL_StatusGet(g_motor_hall0_smpl.p_ctrl, &smpl_status);
 /* Get current rotor angle */
    (void) RM_MOTOR_HALL_AngleGet(g_motor_hall0_smpl.p_ctrl, &smpl_angle);
 /* Get current motor speed */
    (void) RM_MOTOR_HALL_SpeedGet(g_motor_hall0_smpl.p_ctrl, &smpl_speed);
 /* Check error */
    (void) RM_MOTOR_HALL_ErrorCheck(g_motor_hall0_smpl.p_ctrl, &smpl_error);
 /* Stop motor rotation */
    (void) RM_MOTOR_HALL_Stop(g_motor_hall0_smpl.p_ctrl);
 /* When error is detected with extra Hardware */
    (void) RM_MOTOR_HALL_ErrorSet(g_motor_hall0_smpl.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
 /* Reset motor control (Clear error status) */
    (void) RM_MOTOR_HALL_Reset(g_motor_hall0_smpl.p_ctrl);
 /* Close motor control */
    (void) RM_MOTOR_HALL_Close(g_motor_hall0_smpl.p_ctrl);
}
```

Function Documentation

◆ RM_MOTOR_HALL_Open()

fsp_err_t RM_MOTOR_HALL_Open (motor_ctrl_t *const *p_ctrl*, motor_cfg_t const *const *p_cfg*)

Configure the MOTOR HALL in register start mode. Implements motor_api_t::open.

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_HALL_Open(g_motor_hall0_smpl.p_ctrl, g_motor_hall0_smpl.p_cfg);
```

Return values

FSP_SUCCESS	MOTOR HALL successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

Note

◆ RM_MOTOR_HALL_Close()

fsp_err_t RM_MOTOR_HALL_Close (motor_ctrl_t *const *p_ctrl*)

Disables specified Motor Hall Control block. Implements motor_api_t::close.

Example:

```
/* Close motor control */
   (void) RM_MOTOR_HALL_Close(g_motor_hall0_smpl.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_HALL_Reset()

fsp_err_t RM_MOTOR_HALL_Reset (motor_ctrl_t *const *p_ctrl*)

Reset Motor Hall Control block. Implements motor_api_t::reset.

Example:

```
/* Reset motor control (Clear error status) */
   (void) RM_MOTOR_HALL_Reset(g_motor_hall0_smpl.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_HALL_Run()

fsp_err_t RM_MOTOR_HALL_Run (motor_ctrl_t *const *p_ctrl*)

Run Motor (Start motor rotation). Implements motor_api_t::run.

Example:

```
/* Start motor rotation */
   (void) RM_MOTOR_HALL_Run(g_motor_hall0_smpl.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_HALL_Stop()

fsp_err_t RM_MOTOR_HALL_Stop (motor_ctrl_t *const *p_ctrl*)

Stop Motor (Stop motor rotation). Implements motor_api_t::stop.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_HALL_Stop(g_motor_hall0_smpl.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_HALL_ErrorSet()

fsp_err_t RM_MOTOR_HALL_ErrorSet (motor_ctrl_t *const *p_ctrl*, motor_error_t const *error*)

Set error information. Implements motor_api_t::errorSet.

Example:

```
/* When error is detected with extra Hardware */
   (void) RM_MOTOR_HALL_ErrorSet(g_motor_hall0_smpl.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_HALL_SpeedSet()

fsp_err_t RM_MOTOR_HALL_SpeedSet (motor_ctrl_t *const *p_ctrl*, float const *speed_rpm*)

Set speed reference[rpm]. Implements motor_api_t::speedSet.

Example:

```
/* Set speed reference before motor run */
   (void) RM_MOTOR_HALL_SpeedSet(g_motor_hall0_smpl.p_ctrl,
DEF_HALL_TEST_OVSPD_LIM);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_HALL_StatusGet()

fsp_err_t RM_MOTOR_HALL_StatusGet (motor_ctrl_t *const *p_ctrl*, uint8_t *const *p_status*)

Get current control status. Implements motor_api_t::statusGet.

Example:

```
/* Get current status */
   (void) RM_MOTOR_HALL_StatusGet(g_motor_hall0_smpl.p_ctrl, &smpl_status);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_HALL_AngleGet()

fsp_err_t RM_MOTOR_HALL_AngleGet (motor_ctrl_t *const *p_ctrl*, float *const *p_angle_rad*)

Get current rotor angle. Implements motor_api_t::angleGet.

Example:

```
/* Get current rotor angle */
   (void) RM_MOTOR_HALL_AngleGet(g_motor_hall0_smpl.p_ctrl, &smpl_angle);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_HALL_SpeedGet()

fsp_err_t RM_MOTOR_HALL_SpeedGet (motor_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm*)

Get rotational speed. Implements motor_api_t::speedGet.

Example:

```
/* Get current motor speed */
   (void) RM_MOTOR_HALL_SpeedGet(g_motor_hall0_smpl.p_ctrl, &smpl_speed);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_HALL_ErrorCheck()

fsp_err_t RM_MOTOR_HALL_ErrorCheck (motor_ctrl_t *const *p_ctrl*, uint16_t *const *p_error*)

Check the occurunce of Error. Implements motor_api_t::errorCheck.

Example:

```
/* Check error */
   (void) RM_MOTOR_HALL_ErrorCheck(g_motor_hall0_smpl.p_ctrl, &smpl_error);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_HALL_PositionSet()

fsp_err_t RM_MOTOR_HALL_PositionSet (motor_ctrl_t *const *p_ctrl*, motor_speed_position_data_t const *const *p_position*)

Set position reference. Implements motor_api_t::positionSet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Note

◆ RM_MOTOR_HALL_WaitStopFlagGet()

fsp_err_t RM_MOTOR_HALL_WaitStopFlagGet (motor_ctrl_t *const *p_ctrl*, motor_wait_stop_flag_t *const *p_flag*)

Get wait stop flag. Implements motor_api_t::waitStopFlagGet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Note

◆ RM_MOTOR_HALL_FunctionSelect()

fsp_err_t RM_MOTOR_HALL_FunctionSelect (motor_ctrl_t *const *p_ctrl*, motor_function_select_t const *function*)
Select function. Implements motor_api_t::functionSelect. **Return values** FSP_ERR_UNSUPPORTED — Unsupported. ***Note***

5.2.11.17 Motor return origin (rm_motor_return_origin)

Modules » Motor

Functions

fsp_err_t	RM_MOTOR_RETURN_ORIGIN_Open (motor_return_origin_ctrl_t *const p_ctrl, motor_return_origin_cfg_t const *const p_cfg) Opens and configures the motor return origin module. Implements motor_return_origin_api_t::open. More...

Detailed Description

Search origin position proccess for the motor control on RA MCUs. This module implements the Motor Return Origin Function Interface.

Overview

The motor return origin module is used to search origin position in an application. This module should be used with Renesas Motor Workbench (RMW) basically.

Features

The Motor return origin module has below features.

- Search origin position automatically.

Configuration

Build Time Configurations for rm_motor_return_origin

The following build time configurations are defined in fsp_cfg/rm_motor_return_origin_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor return origin function (rm_motor_return_origin)

This module can be added to the Stacks tab via New Stack > Motor > Motor return origin function (rm_motor_return_origin).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_return_origin0	Module name.
Using mode	Search by pushing	Search by pushing	Select using mode
Search speed (rpm)	Must be a valid non-negative value.	10.0	Speed to search origin position (rpm)
Acceleration of speed (rpm/sec)	Must be set 1 to 10000.	10000.0	Acceleration of rotation speed at return moving (rpm/sec)
Cyclic period of speed control (sec)	Must be a valid non-negative value.	0.0005	Cyclic period of speed control (sec)
Maximum current (A)	Must be a valid non-negative value.	1.8	Maximum current (A). Please set to match used motor.
Percentage of current to judge pushing (%)	Must be a valid non-negative value.	30.0	Perentage of current to judge pushing (%)
Pushing time (sec)	Must be a valid non-negative value.	1.0	Time to push the stopper (sec)
Degree to judge none stopper	Must be set -360 to 360.	360.0	When the motor runs over this value, it is judged impossible to search the stopper.
Degree to return	Must be a valid non-negative value.	3.0	Degree to return from the stopper (degree)
Mechanical gear ratio	Must be a valid non-negative value.	1.0	Mechanical gear ratio

Clock Configuration

This module doesn't depend on clock setting.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

Examples

Basic Example

This is a basic example of minimal use of the Motor Return origin in an application.

```
void motor_return_origin_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_RETURN_ORIGIN_Open(&g_mtr_return_origin0_ctrl,
&g_mtr_return_origin0_cfg);
    assert(FSP_SUCCESS == err);
 /* Start process. */
    err = RM_MOTOR_RETURN_ORIGIN_Start(&g_mtr_return_origin0_ctrl);
    temp_set_data.f_iq             = 1.0F;
    temp_set_data.f_position_degree = 180.0F;
 /* Set data to the module. */
    err = RM_MOTOR_RETURN_ORIGIN_DataSet(&g_mtr_return_origin0_ctrl, &temp_set_data);
 /* Get information from the module. */
    err = RM_MOTOR_RETURN_ORIGIN_InfoGet(&g_mtr_return_origin0_ctrl, &temp_info);
 /* Stop process. */
    err = RM_MOTOR_RETURN_ORIGIN_Stop(&g_mtr_return_origin0_ctrl);
 /* Close the module. */
    err = RM_MOTOR_RETURN_ORIGIN_Close(&g_mtr_return_origin0_ctrl);
}
```

Data Structures

struct	motor_return_origin_extended_cfg_t
struct	motor_return_origin_pushing_t
struct	motor_return_origin_instance_ctrl_t

Data Structure Documentation

◆ motor_return_origin_extended_cfg_t

struct motor_return_origin_extended_cfg_t		
Extended configurations for return origin function		
Data Fields		
float	f_search_speed_rpm	Speed to search origin position [rpm].
float	f_return_accel_rpm	Acceleration speed when return [rpm/s].
float	f_speed_ctrl_period	Period of speed control [sec].
float	f_maximum_current	Maximum current [A].
float	f_current_limit_percent_push	Percentage of current at pushing.
float	f_pushing_time	Keep pushing time [sec].
float	f_over_degree	Angle to judge search impossible [degree].
float	f_return_degree	Return angle from pushing position [degree].
float	f_mechanical_gear_ratio	Mechanical gear ratio.

◆ motor_return_origin_pushing_t

struct motor_return_origin_pushing_t		
Variables for rerutn origin with pushing		
Data Fields		
uint32_t	u4_time_counter	Counter of speed cyclic (to judge the time)
float	f_sum_position	Summary of position data.
uint32_t	u4_sum_counter	Counter of summary.
float	f_move_amount	Movement amount [degree].
float	f_judge_iq	q-axis current to judge pushing
float	f_pushing_counts	Counts to measure pushing time.

◆ motor_return_origin_instance_ctrl_t

struct motor_return_origin_instance_ctrl_t
Return origin function instance control block
Data Fields

uint32_t	open	Used to determine if the module is configured.
motor_return_origin_start_flag_t	start_flag	start/stop flag
motor_return_origin_state_t	state	State number of return origin process.
int8_t	s1_direction	Moving direction.
float	f_angle_degree_on_edge	Rotor angle on the edge [degree].
float	f_current_speed	Current speed.
float	f_origin_position_angle_degree	Searched origin position [degree].
float	f_search_speed	Speed to search origin position [rad / sampling time].
float	f_accel_speed	Speed accelaration.
float	f_position_reference_degree	Position reference [degree].
motor_return_origin_pushing_t	st_pushing	Variables for pushing.
motor_return_origin_set_data_t	receive_data	Received data from speed(position) & current.
motor_return_origin_cfg_t const *	p_cfg	Pointer of configuration structure.

Function Documentation

◆ RM_MOTOR_RETURN_ORIGIN_Open()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_Open (motor_return_origin_ctrl_t *const *p_ctrl*, motor_return_origin_cfg_t const *const *p_cfg*)

Opens and configures the motor return origin module. Implements motor_return_origin_api_t::open .

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_RETURN_ORIGIN_Open(&g_mtr_return_origin0_ctrl,
&g_mtr_return_origin0_cfg);
```

Return values

FSP_SUCCESS	Motor return origin module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_RETURN_ORIGIN_Close()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_Close (motor_return_origin_ctrl_t *const *p_ctrl*)

Disables specified motor return origin module. Implements motor_return_origin_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MOTOR_RETURN_ORIGIN_Close(&g_mtr_return_origin0_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_RETURN_ORIGIN_Start()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_Start (motor_return_origin_ctrl_t *const *p_ctrl*)

Start return origin function. Implements motor_return_origin_api_t::start.

Example:

```
/* Start process. */
   err = RM_MOTOR_RETURN_ORIGIN_Start(&g_mtr_return_origin0_ctrl);
```

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_RETURN_ORIGIN_Stop()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_Stop (motor_return_origin_ctrl_t *const *p_ctrl*)

Stop (Cancel) return origin function. Implements motor_return_origin_api_t::stop.

Example:

```
/* Stop process. */
   err = RM_MOTOR_RETURN_ORIGIN_Stop(&g_mtr_return_origin0_ctrl);
```

Return values

FSP_SUCCESS	Successfully stopped (canceled).
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_RETURN_ORIGIN_Reset()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_Reset (motor_return_origin_ctrl_t *const *p_ctrl*)

Reset variables of return origin module. Implements motor_return_origin_api_t::reset.

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_RETURN_ORIGIN_InfoGet()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_InfoGet (motor_return_origin_ctrl_t *const *p_ctrl*, motor_return_origin_info_t *const *p_info*)

Get information of return origin. Implements motor_return_origin_api_t::infoGet.

Example:

```
/* Get information from the module. */
   err = RM_MOTOR_RETURN_ORIGIN_InfoGet(&g_mtr_return_origin0_ctrl, &temp_info);
```

Return values

FSP_SUCCESS	Successfully get data.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_RETURN_ORIGIN_DataSet()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_DataSet (motor_return_origin_ctrl_t *const *p_ctrl*, motor_return_origin_set_data_t *const *p_set_data*)

Set necessary data to return origin function. Implements motor_return_origin_api_t::dataSet.

Example:

```
/* Set data to the module. */
   err = RM_MOTOR_RETURN_ORIGIN_DataSet(&g_mtr_return_origin0_ctrl, &temp_set_data);
```

Return values

FSP_SUCCESS	Successfully set data.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_RETURN_ORIGIN_SpeedCyclic()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_SpeedCyclic (motor_return_origin_ctrl_t *const *p_ctrl*)

Cyclic process of return origin function at speed control period. (Called at timer interrupt.) Implements motor_return_origin_api_t::speedCyclic.

Return values

FSP_SUCCESS	Successfully perform the process.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_RETURN_ORIGIN_ParameterUpdate()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_ParameterUpdate (motor_return_origin_ctrl_t *const *p_ctrl*, motor_return_origin_cfg_t const *const *p_cfg*)

Update the parameters of return origin function. Implements motor_return_origin_api_t::parameterUpdate.

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

Detailed Description

Control a SPM motor on RA MCUs. This module implements the Motor vector control with induction sensor (rm_motor_induction).

Overview

The motor vector control with induction sensor is used to control motor rotation in an application. This module is meant to be used with Surface Permanent Magnet (SPM) motors and allows applications to start or stop motor rotation easily.

Features

The motor induction module has below features.

- Start/stop motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Target Hardware

The below figure shows an example of target hardware of this Motor Induction Module.

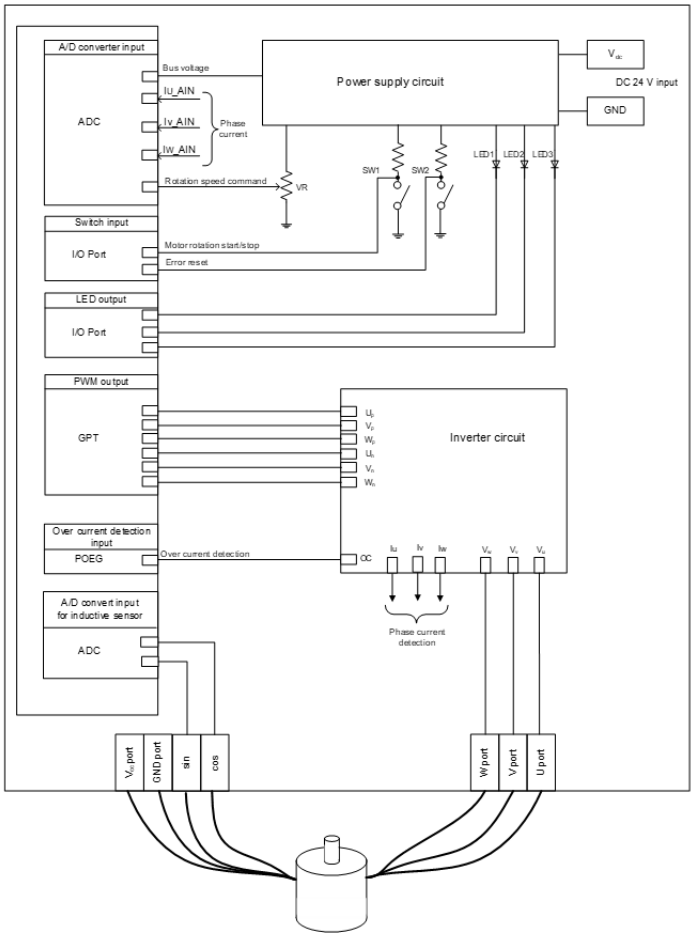

Figure 268: Example of target hardware of motor induction module

Block Diagram

The below figures show block diaram of vector motor control with using induction sensor.

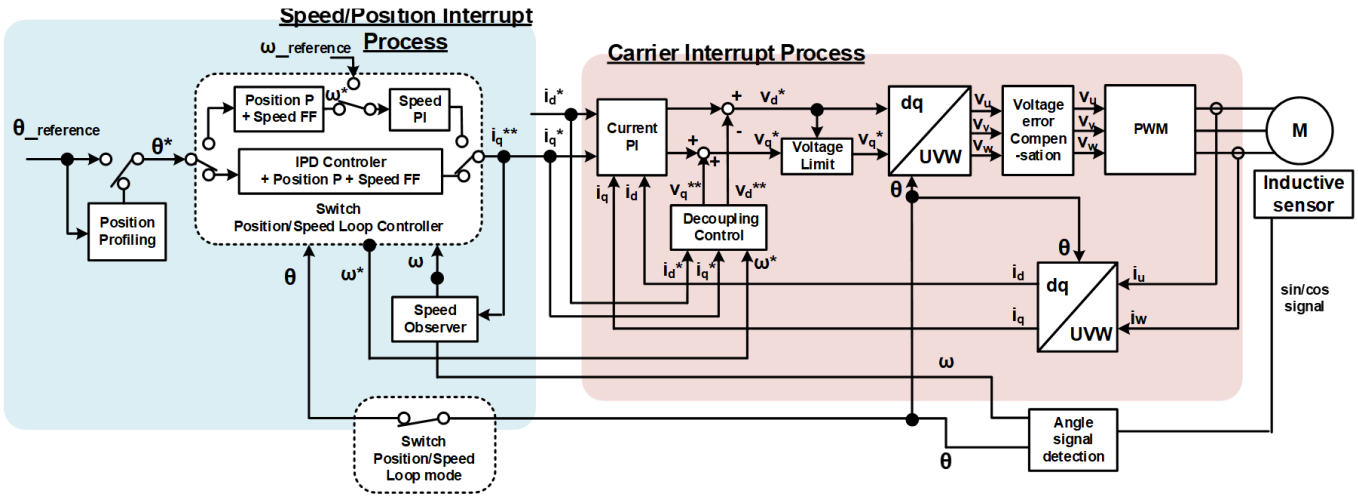

Figure 269: Block diagram of vector control with using induction sensor (PI feedback loop)

Modulation

- Sine wave modulation The modulation factor "m" is defined as follows.

$$m = \frac{V}{E}$$

m : Modulation ratio V : Reference voltage E : Inverter input voltage

Figure 270: Modulation factor

- Space vector modulation In vector control of a permanent magnet synchronous motor, generally, the desired voltage command value of each phase is generated sinusoidally. However, if the generated value is used as-is for the modulation wave for PWM generation, voltage utilization as applied to the motor (in terms of line voltage) is limited to a maximum of 86.7 percents with respect to inverter bus voltage. As such, as shown in the following expression, the average of the maximum and minimum values is calculated for the voltage command value of each phase, and the value obtained by subtracting the average from the voltage command value of each phase is used as the modulation wave. As a result, the maximum amplitude of the modulation wave is multiplied by (square root 3)/2, while voltage utilization becomes 100 percents and line voltage is unchanged.

$$\begin{pmatrix} V_u' \\ V_v' \\ V_w' \end{pmatrix} = \begin{pmatrix} V_u \\ V_v \\ V_w \end{pmatrix} + \Delta V \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$$

$$\because \Delta V = -\frac{V_{max}+V_{min}}{2} \ , \ V_{max} = max\{V_u, V_v, V_w\} \ , \ V_{min} = min\{V_u, V_v, V_w\}$$

V_u, V_v, V_w: Command values of U-, V-, and W-phases

V_u', V_v', V_w': Command values of U-, V-, and W-phases for PWM generation (modulation wave)

Figure 271: Space vector modulation

State transition

The below figure shows a state transition diagram. Internal state is managed by "SYSTEM MODE".

		MODE		
		STOP	RUN	ERROR
EVENT	STOP	STOP	STOP	ERROR
	RUN	RUN	RUN	ERROR
	ERROR	ERROR	ERROR	ERROR
	RESET	STOP	RUN	STOP

Figure 272: State transition diagram

(1) SYSTEM MODE "SYSTEM MODE" indicates the operating states of the system. The state transits on occurrence of each event (EVENT). "SYSTEM MODE" has 3 states that are motor drive stop (INACTIVE), motor drive (ACTIVE), and abnormal condition (ERROR).

(2) EVENT When "EVENT" occurs in each "SYSTEM MODE", "SYSTEM MODE" changes as shown the table in above figure, according to that "EVENT". The occurrence factors of each event are shown below.

EVENT name	Occurrence factor
STOP	by user operation
RUN	by user operation
ERROR	when the system detects an error
RESET	by user operation

Flowchart

The below figures show flowcharts of motor induction module.

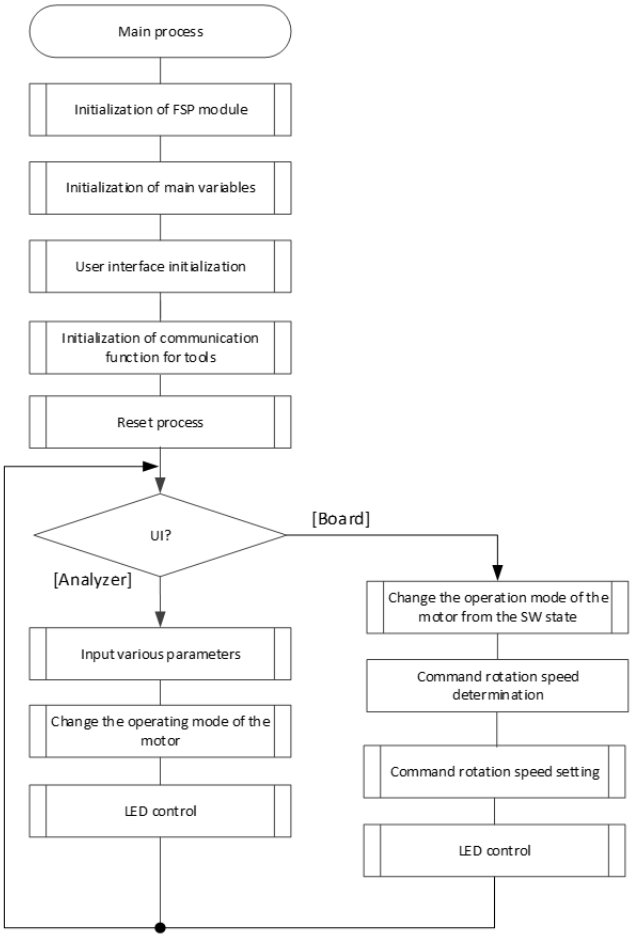

Figure 273: Main process

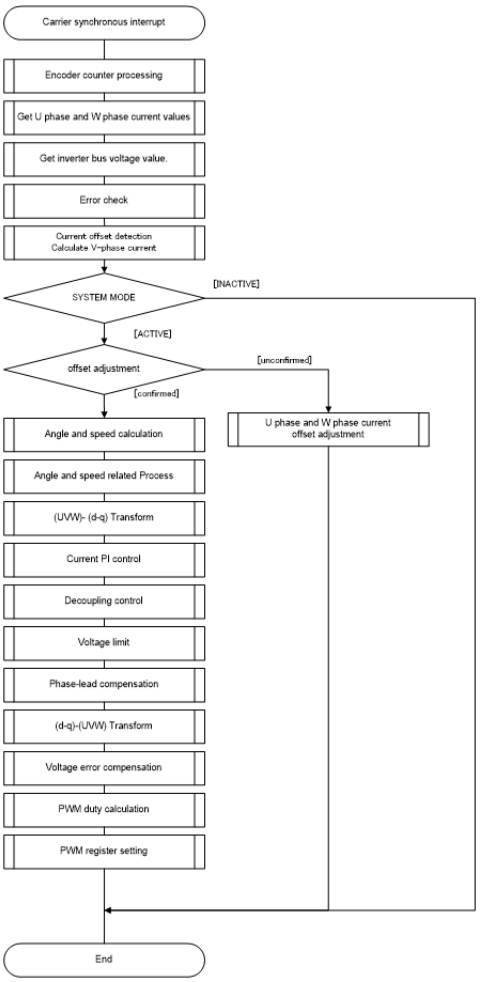

Figure 274: Current control process

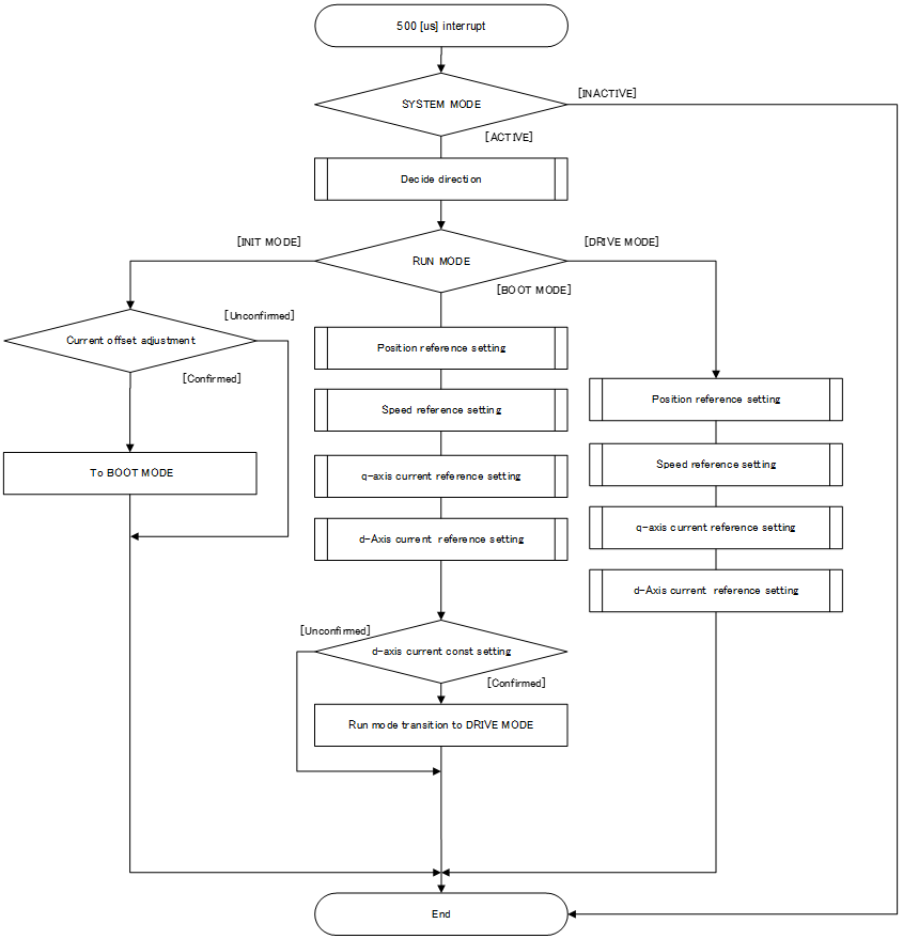

Figure 275: Speed control process

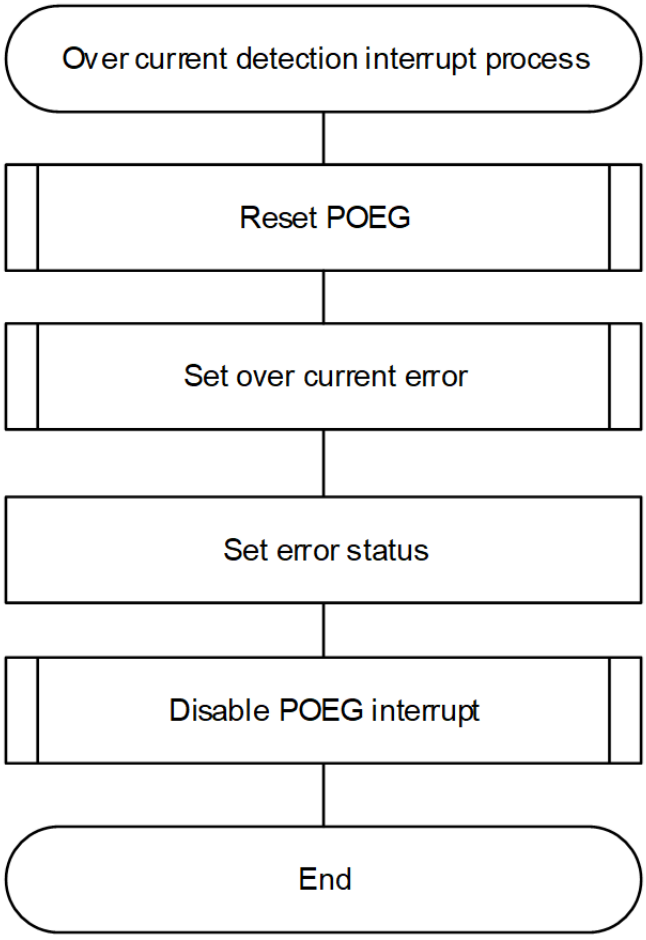

Figure 276: Over current detection interrupt process

Configuration

Build Time Configurations for rm_motor_induction

The following build time configurations are defined in fsp_cfg/rm_motor_induction_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor vector control with induction sensor (rm_motor_induction)

This module can be added to the Stacks tab via New Stack > Motor > Motor vector control with induction sensor (rm_motor_induction).

Configuration	Options	Default	Description
General			

Name	Name must be a valid C symbol	g_motor_induction0	Module name.
Limit of over current (A)	Must be a valid value	2.0F	Limit of over current.(Detection threshold)
Limit of over voltage (V)	Must be a valid value	28.0F	Limit of over voltage.(Detection threshold)
Limit of over speed (rpm)	Must be a valid value	3000.0F	Limit of over speed.(Detection threshold)
Limit of low voltage (V)	Must be a valid value	18.0F	Limit of low voltage.(Detection threshold)
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt.

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins. Please set used pins on configuration of each hardware modules.

Usage Notes

Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor induction module in an application.

```
void motor_induction_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
```

```
    err = RM_MOTOR_INDUCTION_Open(g_motor_induction0_smpl.p_ctrl,
g_motor_induction0_smpl.p_cfg);
    handle_error(err);
 /* Set speed reference before motor run */
    (void) RM_MOTOR_INDUCTION_SpeedSet(g_motor_induction0_smpl.p_ctrl,
RM_MOTOR_INDUCTION_TEST_OVER_SPEED_LIMIT);
 /* Set position reference before motor run */
    (void) RM_MOTOR_INDUCTION_PositionSet(g_motor_induction0_smpl.p_ctrl,
&g_posref_sample1);
 /* Start motor rotation */
    (void) RM_MOTOR_INDUCTION_Run(g_motor_induction0_smpl.p_ctrl);
 /* Get current status */
    (void) RM_MOTOR_INDUCTION_StatusGet(g_motor_induction0_smpl.p_ctrl,
&smpl_status);
 /* Get current rotor angle */
    (void) RM_MOTOR_INDUCTION_AngleGet(g_motor_induction0_smpl.p_ctrl, &smpl_angle);
 /* Get current motor rotational speed */
    (void) RM_MOTOR_INDUCTION_SpeedGet(g_motor_induction0_smpl.p_ctrl, &smpl_speed);
 /* Check error */
    (void) RM_MOTOR_INDUCTION_ErrorCheck(g_motor_induction0_smpl.p_ctrl,
&smpl_error);
 /* Stop motor rotation */
    (void) RM_MOTOR_INDUCTION_Stop(g_motor_induction0_smpl.p_ctrl);
 /* If need, set extra error status */
    (void) RM_MOTOR_INDUCTION_ErrorSet(g_motor_induction0_smpl.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
 /* Reset motor control */
    (void) RM_MOTOR_INDUCTION_Reset(g_motor_induction0_smpl.p_ctrl);
 /* Close motor control */
    (void) RM_MOTOR_INDUCTION_Close(g_motor_induction0_smpl.p_ctrl);
}
```

Enumerations

enum	motor_induction_ctrl_t

enum	motor_induction_ctrl_event_t

Enumeration Type Documentation

◆ motor_induction_ctrl_t

enum motor_induction_ctrl_t	
Enumerator	
MOTOR_INDUCTION_CTRL_STOP	Stop mode.
MOTOR_INDUCTION_CTRL_RUN	Run mode.
MOTOR_INDUCTION_CTRL_ERROR	Error mode.

◆ motor_induction_ctrl_event_t

enum motor_induction_ctrl_event_t	
Enumerator	
MOTOR_INDUCTION_CTRL_EVENT_STOP	Stop event.
MOTOR_INDUCTION_CTRL_EVENT_RUN	Run event.
MOTOR_INDUCTION_CTRL_EVENT_ERROR	Error event.
MOTOR_INDUCTION_CTRL_EVENT_RESET	Reset event.

Function Documentation

◆ RM_MOTOR_INDUCTION_Open()

fsp_err_t RM_MOTOR_INDUCTION_Open (motor_ctrl_t *const *p_ctrl*, motor_cfg_t const *const *p_cfg*)

Configure the MOTOR in register start mode. Implements motor_api_t::open.

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_INDUCTION_Open(g_motor_induction0_smpl.p_ctrl,
g_motor_induction0_smpl.p_cfg);
```

Return values

FSP_SUCCESS	MOTOR successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

Note

◆ RM_MOTOR_INDUCTION_Close()

fsp_err_t RM_MOTOR_INDUCTION_Close (motor_ctrl_t *const *p_ctrl*)

Disables specified Motor Induction Control block. Implements motor_api_t::close.

Example:

```
/* Close motor control */
   (void) RM_MOTOR_INDUCTION_Close(g_motor_induction0_smpl.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_INDUCTION_Reset()

fsp_err_t RM_MOTOR_INDUCTION_Reset (motor_ctrl_t *const *p_ctrl*)

Reset Motor Induction Control block. Implements motor_api_t::reset.

Example:

```
/* Reset motor control */
   (void) RM_MOTOR_INDUCTION_Reset(g_motor_induction0_smpl.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_INDUCTION_Run()

fsp_err_t RM_MOTOR_INDUCTION_Run (motor_ctrl_t *const *p_ctrl*)

Run Motor (Start motor rotation). Implements motor_api_t::run.

Example:

```
/* Start motor rotation */
   (void) RM_MOTOR_INDUCTION_Run(g_motor_induction0_smpl.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_INDUCTION_Stop()

fsp_err_t RM_MOTOR_INDUCTION_Stop (motor_ctrl_t *const *p_ctrl*)

Stop Motor (Stop motor rotation). Implements motor_api_t::stop.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_INDUCTION_Stop(g_motor_induction0_smpl.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_INDUCTION_ErrorSet()

fsp_err_t RM_MOTOR_INDUCTION_ErrorSet (motor_ctrl_t *const *p_ctrl*, motor_error_t const *error*)

Set error information. Implements motor_api_t::errorSet.

Example:

```
/* If need, set extra error status */
   (void) RM_MOTOR_INDUCTION_ErrorSet(g_motor_induction0_smpl.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_INDUCTION_SpeedSet()

fsp_err_t RM_MOTOR_INDUCTION_SpeedSet (motor_ctrl_t *const *p_ctrl*, float const *speed_rpm*)

Set speed reference[rpm]. Implements motor_api_t::speedSet.

Example:

```
/* Set speed reference before motor run */
   (void) RM_MOTOR_INDUCTION_SpeedSet(g_motor_induction0_smpl.p_ctrl,
RM_MOTOR_INDUCTION_TEST_OVER_SPEED_LIMIT);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_INDUCTION_PositionSet()

fsp_err_t RM_MOTOR_INDUCTION_PositionSet (motor_ctrl_t *const *p_ctrl*, motor_speed_position_data_t const *const *p_position*)

Set position reference[degree]. Implements motor_api_t::positionSet.

Example:

```
/* Set position reference before motor run */
   (void) RM_MOTOR_INDUCTION_PositionSet(g_motor_induction0_smpl.p_ctrl,
&g_posref_sample1);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data set pointer is invalid..

Note

◆ RM_MOTOR_INDUCTION_StatusGet()

fsp_err_t RM_MOTOR_INDUCTION_StatusGet (motor_ctrl_t *const *p_ctrl*, uint8_t *const *p_status*)

Get current control status. Implements motor_api_t::statusGet.

Example:

```
/* Get current status */
   (void) RM_MOTOR_INDUCTION_StatusGet(g_motor_induction0_smpl.p_ctrl,
&smpl_status);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_INDUCTION_AngleGet()

fsp_err_t RM_MOTOR_INDUCTION_AngleGet (motor_ctrl_t *const *p_ctrl*, float *const *p_angle_rad*)

Get current rotor angle. Implements motor_api_t::angleGet.

Example:

```
/* Get current rotor angle */
   (void) RM_MOTOR_INDUCTION_AngleGet(g_motor_induction0_smpl.p_ctrl, &smpl_angle);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_INDUCTION_SpeedGet()

fsp_err_t RM_MOTOR_INDUCTION_SpeedGet (motor_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm*)

Get rotational speed. Implements motor_api_t::speedGet.

Example:

```
/* Get current motor rotational speed */
   (void) RM_MOTOR_INDUCTION_SpeedGet(g_motor_induction0_smpl.p_ctrl, &smpl_speed);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_INDUCTION_ErrorCheck()

fsp_err_t RM_MOTOR_INDUCTION_ErrorCheck (motor_ctrl_t *const *p_ctrl*, uint16_t *const *p_error*)

Check the occurunce of Error. Implements motor_api_t::errorCheck.

Example:

```
/* Check error */
   (void) RM_MOTOR_INDUCTION_ErrorCheck(g_motor_induction0_smpl.p_ctrl,
&smpl_error);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_INDUCTION_WaitStopFlagGet()

fsp_err_t RM_MOTOR_INDUCTION_WaitStopFlagGet (motor_ctrl_t *const *p_ctrl*, motor_wait_stop_flag_t *const *p_flag*)

Get wait stop flag. Implements motor_api_t::waitStopFlagGet.

Example:

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Note

◆ RM_MOTOR_INDUCTION_FunctionSelect()

fsp_err_t RM_MOTOR_INDUCTION_FunctionSelect (motor_ctrl_t *const *p_ctrl*, motor_function_select_t const *function*)

Select using function. Implements motor_api_t::functionSelect.

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Mode unmatch

Note

◆ RM_MOTOR_INDUCTION_InertiaEstimateStart()

fsp_err_t RM_MOTOR_INDUCTION_InertiaEstimateStart (motor_ctrl_t *const *p_ctrl*)

Start inertia estimation function.

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Mode unmatch

Note

◆ RM_MOTOR_INDUCTION_InertiaEstimateStop()

fsp_err_t RM_MOTOR_INDUCTION_InertiaEstimateStop (motor_ctrl_t *const *p_ctrl*)

Stop(Cancel) inertia estimation function.

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Mode unmatch

Note

◆ RM_MOTOR_INDUCTION_ReturnOriginStart()

fsp_err_t RM_MOTOR_INDUCTION_ReturnOriginStart (motor_ctrl_t *const *p_ctrl*)

Start return origin function.

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Mode unmatch

Note

◆ RM_MOTOR_INDUCTION_ReturnOriginStop()

fsp_err_t RM_MOTOR_INDUCTION_ReturnOriginStop (motor_ctrl_t *const *p_ctrl*)
Stop(Cancel) return origin function. **Return values** FSP_SUCCESS — Successfully resetted. FSP_ERR_ASSERTION — Null pointer. FSP_ERR_NOT_OPEN — Module is not open. FSP_ERR_INVALID_MODE — Mode unmatch ***Note***

5.2.12 Networking

Modules

Detailed Description

Networking Modules.

Modules

	AWS Cellular Interface on RYZ (rm_cellular_ryz_aws) [Deprecated] Middleware implementing the AWS Cellular API for RYZ cellular modems.
	AWS MQTT This module provides the AWS MQTT integration documentation.
	AWS OTA PAL on MCUBoot (rm_aws_ota_pal_mcuboot) AWS OTA PAL layer implementation for downloading firmware updates.
	AWS PKCS11 PAL on LittleFS (rm_aws_pkcs11_pal_littlefs) PKCS#11 PAL LittleFS layer implementation for use by FreeRTOS TLS.

	AWS coreHTTP This module provides the AWS coreHTTP library.
	Azure Embedded Wireless Framework RYZ Port (rm_azure_ewf_ryz) [Deprecated]
	BLE Abstraction (rm_ble_abs) Middleware for the Bluetooth peripheral on RA MCUs. This module implements the BLE ABS Interface.
	BLE Driver (r_ble_balance) Driver for the Radio peripheral on RA MCUs. This module implements the BLE Interface.
	BLE Driver (r_ble_compact) Driver for the Radio peripheral on RA MCUs. This module implements the BLE Interface.
	BLE Driver (r_ble_extended) Driver for the Radio peripheral on RA MCUs. This module implements the BLE Interface.
	BLE Mesh Network Modules BLE Mesh Network Modules.
	Cellular Comm Interface on UART (rm_cellular_comm_uart_aws) Middleware implementing the AWS Cellular Comm Interface for the FSP UART API.
	DA16XXX Transport Layer (rm_at_transport_da16xxx_uart) Transport layer implementation for linking DA16XXX Drivers with Communications layer.
	Ethernet (r_ether) Driver for the Ethernet peripheral on RA MCUs. This module implements the Ethernet Interface.

	Ethernet (r_ether_phy) The Ethernet PHY module (r_ether_phy) provides an API for standard Ethernet PHY communications applications that use the ETHERC peripheral. It implements the Ethernet PHY Interface.
	FreeRTOS+TCP Wrapper to r_ether (rm_freertos_plus_tcp) Middleware for using TCP on RA MCUs.
	GTL BLE Abstraction (rm_ble_abs_gtl) Middleware for the Bluetooth peripheral on RA MCUs. This module implements the BLE ABS Interface.
	NetX Duo Ethernet Driver (rm_netxduo_ether)
	NetX Duo WiFi Driver (rm_netxduo_wifi)
	On Chip HTTP Client on DA16XXX (rm_http_onchip_da16xxx) HTTP client implementation using the DA16XXX WiFi module on RA MCUs.
	On Chip MQTT Client on DA16XXX (rm_mqtt_onchip_da16xxx) MQTT client implementation using the DA16XXX WiFi module on RA MCUs.
	PTP (r_ptp) Driver for the PTP peripheral on RA MCUs. This module implements the PTP Interface.
	SPP BLE Abstraction (rm_ble_abs_spp) Middleware for the Bluetooth peripheral on RA MCUs. This module implements the BLE ABS Interface.
	WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx) Wifi and Socket implementation using the DA16XXX WiFi module on RA MCUs.
	WiFi Onchip Silex Driver using r_sci_uart (rm_wifi_onchip_silex) Wifi and Socket implementation using the Silex SX-ULPGN WiFi

	module on RA MCUs.

5.2.12.1 AWS Cellular Interface on RYZ (rm_cellular_ryz_aws) [Deprecated]

Modules » Networking

Middleware implementing the AWS Cellular API for RYZ cellular modems.

Note

RYZ cellular modules are deprecated and will be removed from FSP in a future release.

Overview

See AWS documentation for how the Cellular API works: https://www.freertos.org/Documentation/api-ref/cellular/index.html

Features

The following RYZ modems are supported by this port:

- RYZ014A (https://www.renesas.com/us/en/products/interface-connectivity/wireless-communications/cellular-iot-modules/ryz014a-lte-cat-m1-cellular-iot-module)
- RYZ024A (https://www.renesas.com/us/en/products/interface-connectivity/wireless-communications/cellular-iot-modules/ryz024a-lte-cat-m1-cellular-iot-module-global-deployment)

Please see the data sheets for hardware configuration for modems. Some notable differences between the two are:

- RYZ014A default baud is 921600. RYZ024A default baud is 115200.
- RYZ014A reset pin has to be toggled high to reset the modem. RYZ024A is the opposite and has to be toggled low.
- RYZ024A doesn't support AT+CREG. AT+CEREG should be used instead.

All APIs are supported by the RYZ port with the exception of the following RAT APIs:

- Cellular_SetRatPriority
- Cellular_GetRatPriority

The following URCs are supported by the RYZ port:

- CEREG (Cellular_RegisterUrcNetworkRegistrationEventCallback)
- SYSSTART (Cellular_RegisterModemEventCallback)
- SHUTDOWN (Cellular_RegisterModemEventCallback)
- SQNSRING (Cellular_SocketRegisterDataReadyCallback)

Support for other RYZ URCs can be possibly added by request in future releases.

Limitations

- RYZ024A doesn't support AT+CREG. API implementations don't use AT+CREG and use AT+CEREG instead.
- This module does not handle the RYZ reset pin. The user should manually configure this pin in order to reset the module.
- The RYZ can only be used in buffer reception mode, not transparent mode. When calling Cellular_SocketConnect only CELLULAR_ACCESSMODE_BUFFER is supported.
- The AWS Cellular APIs don't currently allow the local port to be set for UDP. It can be set by modifying the localPort field in CellularSocketHandle_t after calling Cellular_CreateSocket but before calling Cellular_SocketConnect.

Configuration

AWS Cellular Interface

Build Time Configurations for source

The following build time configurations are defined in aws/cellular_interface/cellular_config.h:

Configuration	Options	Default	Description
Mobile Country Code Max Size	Value must be a positive integer	3	Mobile country code max size.
Mobile Network Node Max Size	Value must be a positive integer	3	Mobile network code max size.
Integrated Circuit Card Identity Max Size	Value must be a positive integer	20	Integrated circuit card identity max size.
International Mobile Subscriber Identity Max Size	Value must be a positive integer	15	International Mobile Subscriber Identity max size.
Firmware Version Max Size	Value must be a positive integer	32	Cellular module firmware version max size.
Hardware Version Max Size	Value must be a positive integer	12	Cellular module hardware version max size.
Serial Number Max Size	Value must be a positive integer	12	Cellular module serial number max size.
International Mobile Equipment Identity Max Size	Value must be a positive integer	15	International Mobile Equipment Identity number max size.
Registered Network operator Name Max Size	Value must be a positive integer	32	Registered network operator name max size.
Access Point Name Max Size	Value must be a positive integer	64	Access point name max size.
Packet Data Network Username Max Size	Value must be a positive integer	32	Packet data network username max size.

Packet Data Network Password Max Size	Value must be a positive integer	32	Packet data network password max size.
Data Network IP Address Max Size	Value must be a positive integer	40	Cellular data network IP address max size.
AT Command Max Size	Value must be a positive integer	200	Cellular AT command max size.
Max Number of Sockets	Value must be a positive integer	6	Cellular module number of socket max size.
Manufacturer ID Max Size	Value must be a positive integer	20	Cellular module manufacturer ID max size.
Model ID Max Size	Value must be a positive integer	10	Model ID max size.
EDRX List Max Size	Value must be a positive integer	4	EDRX list max size.
PDN Context ID Min Value	Value must be a positive integer	1	PDN context ID min value.
PDN Context ID Max Value	Value must be a positive integer	16	PDN context ID max value.
RAT Priority Count	Value must be a positive integer	3	RAT (radio access technology) priority count.
Socket Max Send Data Length (bytes)	Value must be in the range 1 - 1500	1460	Socket max send data length.
Socket Max Receive Data Length (bytes)	Value must be in the range 1 - 1500	1500	Socket max receive data length.
GetHostByName Support	• Enabled (default) • Disabled	Enabled (default)	Enables/disable GetHostByName.
Comm Interface Send Timeout (ms)	Value must be a positive integer	1000	Cellular comm interface receive timeout in ms.
Comm Interface Receive Timeout (ms)	Value must be a positive integer	50	Cellular comm interface receive timeout in ms.
Static Allocation Context	• Enabled • Disabled (default)	Disabled (default)	Use statically allocated context.
Comm Interface Static Allocation Context	• Enabled • Disabled (default)	Disabled (default)	Use statically allocated context for comm interface.
Default RAT	• GSM • WCDMA	CATM1	Default Radio Access Technology.

	• EDGE • HSDPA • HSUPA • HSDPAHSUPA • LTE • CATM1 • NBIOT		
GSM Support	• Enabled • Disabled (default)	Disabled (default)	This should be disabled when a modem doesn't support GSM or the AT+CGREG command.
Static Socket Context	• Enabled • Disabled (default)	Disabled (default)	Use statically allocated socket.
AT Command Timeout (ms)	Value must be a positive integer	5000	Cellular common AT command timeout.
AT Command Raw Timeout (ms)	Value must be a positive integer	5000	Cellular AT command raw timeout.
AT Command Response prefix length	Value must be a positive integer	5000	Cellular AT command response prefix string length.

RYZ Cellular Interface Port

Configurations for Networking > AWS Cellular Interface on RYZ (rm_cellular_ryz_aws) [Deprecated]

This module can be added to the Stacks tab via New Stack > Networking > AWS Cellular Interface on RYZ (rm_cellular_ryz_aws) [Deprecated].

Configuration	Options	Default	Description
Module Reset Pin (Port Number)	Refer to the RA Configuration tool for available options.	00	Specify the reset control port for the RYZ module. This property is only used in devassist.
Module Reset Pin (Pin Number)	Refer to the RA Configuration tool for available options.	00	Specify the reset control pin for the RYZ module. This property is only used in devassist.

Examples

Basic Example

```
void rm_cellular_ryz_aws_basic_example (void)
{
```

```
    CellularHandle_t       cellular_handle = NULL;
    CellularSimCardStatus_t sim_card_status;
 /* Initialize Cellular Modem. */
    CellularError_t err = Cellular_Init(&cellular_handle,
&g_cellular_comm_interface_on_uart);
    assert(CELLULAR_SUCCESS == err);
 /* Get the SIM card status */
    err = Cellular_GetSimCardStatus(cellular_handle, &sim_card_status);
    assert(CELLULAR_SUCCESS == err);
    assert(CELLULAR_SIM_CARD_INSERTED == sim_card_status.simCardState);
}
```

Socket Example

```
#define SOCKET_EXAMPLE_BUFFER_SIZE (256)
#define SOCKET_EXAMPLE_TIMEOUT (UINT32_MAX)
#define SOCKET_EXAMPLE_IP ("255.255.255.255")
#define SOCKET_EXAMPLE_PORT (80)
uint32_t g_recv_event_count = 0;
void socket_example_data_ready_callback (CellularSocketHandle_t socketHandle, void *
pCallbackContext)
{
 FSP_PARAMETER_NOT_USED(socketHandle);
 FSP_PARAMETER_NOT_USED(pCallbackContext);
    g_recv_event_count++;
}
void rm_cellular_ryz_aws_socket_example (void)
{
    CellularHandle_t       cellular_handle = NULL;
 char                  * p_data          = "hello_world";
 char                   recv_buffer[SOCKET_EXAMPLE_BUFFER_SIZE] = "\0";
    uint32_t               sent_data_length    = 0;
    uint32_t               received_data_length = 0;
    uint32_t               timeout_ms          = SOCKET_EXAMPLE_TIMEOUT;
    CellularSocketHandle_t socket_handle;
```

```
    CellularSocketAddress_t socket_address =
    {
       .ipAddress =
      {
            CELLULAR_IP_ADDRESS_V4,
            SOCKET_EXAMPLE_IP
       },
       .port      = SOCKET_EXAMPLE_PORT
    };
 /* Initialize Cellular Modem. */
    CellularError_t err = Cellular_Init(&cellular_handle,
&g_cellular_comm_interface_on_uart);
    assert(CELLULAR_SUCCESS == err);
 /* Create a TCP socket */
    err = Cellular_CreateSocket(cellular_handle,
                                1,
                                CELLULAR_SOCKET_DOMAIN_AF_INET,
                                CELLULAR_SOCKET_TYPE_STREAM,
                                CELLULAR_SOCKET_PROTOCOL_TCP,
                                &socket_handle);
    assert(CELLULAR_SUCCESS == err);
 /* Register the data ready callback */
    err = Cellular_SocketRegisterDataReadyCallback(cellular_handle,
                                                   socket_handle,
                                                   socket_example_data_ready_callback
,
                                                   NULL);
    assert(CELLULAR_SUCCESS == err);
    g_recv_event_count = 0;
 /* Connect the TCP socket */
    err = Cellular_SocketConnect(cellular_handle, socket_handle,
CELLULAR_ACCESSMODE_BUFFER, &socket_address);
    assert(CELLULAR_SUCCESS == err);
 /* Send data over the socket */
```

```
    err = Cellular_SocketSend(cellular_handle, socket_handle, (uint8_t *) p_data,
strlen(p_data), &sent_data_length);
    assert(CELLULAR_SUCCESS == err);
    assert(strlen(p_data) == sent_data_length);
 /* Wait for data ready callback */
    timeout_ms = SOCKET_EXAMPLE_TIMEOUT;
 while (timeout_ms > 0)
    {
 if (g_recv_event_count > 0)
     {
 break;
      }
 R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_MILLISECONDS);
      timeout_ms--;
    }
    assert(0 != timeout_ms);
 /* Receive data back */
    err = Cellular_SocketRecv(cellular_handle,
                              socket_handle,
                              (uint8_t *) recv_buffer,
                              SOCKET_EXAMPLE_BUFFER_SIZE,
                              &received_data_length);
    assert(CELLULAR_SUCCESS == err);
 /* Close the socket */
    err = Cellular_SocketClose(cellular_handle, socket_handle);
    assert(CELLULAR_SUCCESS == err);
}
```

Setting UDP local port

```
#define UDP_EXAMPLE_IP ("255.255.255.255")
#define UDP_EXAMPLE_REMOTE_PORT (80)
#define UDP_EXAMPLE_LOCAL_PORT (5000)
void rm_cellular_ryz_aws_udp_local_port_set_example (void)
{
```

```
    CellularHandle_t       cellular_handle = NULL;
    CellularSocketHandle_t socket_handle   = NULL;
    CellularSocketAddress_t socket_address =
    {
       .ipAddress =
      {
            CELLULAR_IP_ADDRESS_V4,
            UDP_EXAMPLE_IP
       },
       .port      = UDP_EXAMPLE_REMOTE_PORT
    };
 /* Initialize Cellular Modem. */
    CellularError_t err = Cellular_Init(&cellular_handle,
&g_cellular_comm_interface_on_uart);
    assert(CELLULAR_SUCCESS == err);
 /* Create a UDP socket */
    err = Cellular_CreateSocket(cellular_handle,
                                1,
                                CELLULAR_SOCKET_DOMAIN_AF_INET,
                                CELLULAR_SOCKET_TYPE_DGRAM,
                                CELLULAR_SOCKET_PROTOCOL_UDP,
                                &socket_handle);
    assert(CELLULAR_SUCCESS == err);
 /* Set the local port */
    socket_handle->localPort = UDP_EXAMPLE_LOCAL_PORT;
 /* Connect the UDP socket */
    err = Cellular_SocketConnect(cellular_handle, socket_handle,
CELLULAR_ACCESSMODE_BUFFER, &socket_address);
    assert(CELLULAR_SUCCESS == err);
}
```

5.2.12.2 AWS MQTT

Modules » Networking

This module provides the AWS MQTT integration documentation.

Overview

The AWS MQTT library can connect to either AWS or a third party MQTT broker such as Mosquitto. The documentation for the library can be found at the following link: coreMQTT.

Features

- MQTT connections over TLS to an AWS IoT Endpoint or Mosquitto server

Configuration

Memory Usage

The AWS CoreMQTT library relies heavily on dynamic memory allocation for thread/task creation as well as other uses. Depending on the configuration it may be required to provide as much as 110k heap. To decrease this it is recommended to tweak the thread stack configuration values based on usage. Notable values are:

FreeRTOS Thread

- General|Minimal Stack Size

FreeRTOS Plus TCP

- Stack size in words (not bytes)

Usage Notes

- A transport interface is required to use the CoreMQTT library (https://www.freertos.org/network-interface.html).
- For FSP, a transport interface over MbedTLS is provided. This transport interface can connect to RA ethernet, WiFi, and cellular modules via sockets wrappers for each module.
- TLS_FreeRTOS_Connect should be used before calling any CoreMQTT APIs. See the example for more information.

Limitations

- aws_clientcredential.h and aws_clientcredential_keys.h need to be added manually.
- MbedTLS must be initialized and key provisioning must be done before starting a secure connection.

Examples

Connection example using MbedTLS/PKCS11 Transport Interface

```
#define EXAMPLE_PDN_CONTEXT_NUMBER (1)

#define EXAMPLE_TIMEOUT_MS (5000)

#define EXAMPLE_DISABLE_SNI (false)

#define EXAMPLE_MQTT_HOST ("mqtt_host_server")
```

```
#define EXAMPLE_MQTT_HOST_PORT (8883)
#define EXAMPLE_MQTT_SEND_TIMEOUT (5000)
#define EXAMPLE_MQTT_RECEIVE_TIMEOUT (5000)
#define EXAMPLE_MQTT_TOPIC ("example_topic")
#define EXAMPLE_MQTT_CLIENT_IDENTIFIER ("client_id")
#define EXAMPLE_MQTT_KEEP_ALIVE_SECONDS (60)
#define EXAMPLE_MQTT_PAYLOAD ("helloworld")

5.2.12.3 AWS OTA PAL on MCUBoot (rm_aws_ota_pal_mcuboot)

Modules » Networking

AWS OTA PAL layer implementation for downloading firmware updates.

Overview

This module provides the hardware port layer for the AWS IoT Over-the-air Update Library. Refer to the AWS OTA documentation: https://docs.aws.amazon.com/freertos/latest/userguide/integrate-ota-agent.html.

Configuration

Build Time Configurations for rm_aws_ota_pal_mcuboot

The following build time configurations are defined in fsp_cfg/rm_aws_ota_pal_mcuboot_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Filepath to Slot ID Callback Function	Must be a valid C symbol	NULL	Callback function for determining which Slot ID the image should be downloaded to.
OTA code signing signature algorithm	sig-sha256-ecdsa	sig-sha256-ecdsa	Code signing algorithm used by AWS to sign the downloaded image.

Configurations for Storage > AWS OTA PAL (rm_aws_ota_pal_mcuboot)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_aws_ota_pal_mcuboot0	Module name.

Common AWS Configuration

Build Time Configurations for source

The following build time configurations are defined in aws/ota_config.h:

Configuration	Options	Default	Description
Version			
Major	Value must be a non-negative integer	0	Major Version number used when updating.
Minor	Value must be a non-negative integer	0	Minor Version number used when updating.
Build	Value must be a non-negative integer	1	Build Version number used when updating.
Custom ota_config.h	Manual Entry		Add a path to your custom ota_config.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
Log2 File Block Size	Value must be a non-negative integer	11	Log base 2 of the size of the file data block message (excluding the header). e.g. 11: 2^11 = 2048bytes
Self Test Response Wait (ms)	Value must be a non-negative integer	16000	Milliseconds to wait for the self test phase to succeed before we force reset.
File Request Wait (ms)	Value must be a non-negative integer	10000	Milliseconds to wait before requesting data blocks from the OTA service if nothing is

			happening.
Max Thingname Length	Value must be a non-negative integer	64	The maximum allowed length of the thing name used by the OTA agent.
Max Num Blocks Request	Value must be a non-negative integer	1	The maximum number of data blocks requested from OTA streaming service.
Max Num Request Momentum	Value must be a non-negative integer	32	The maximum number of requests allowed to send without a response before we abort.
Ota Update Status Frequency	Value must be a non-negative integer	64	How frequently the device will report its OTA progress to the cloud.
Max Num OTA Data Buffers	Value must be a non-negative integer	1	The number of data buffers reserved by the OTA agent.
Allow Downgrade	• Allowed • Disallowed	Disallowed	Flag to enable booting into updates that have an identical or lower version than the current version.
Ota Firmware Update File Type ID	Value must be a non-negative integer	0	The file type id received in the job document.
Enabled Control Protocol	OTA Control Over MQTT	OTA Control Over MQTT	The protocol selected for OTA control operations.
Enabled Data Protcols	• OTA Data Over MQTT • OTA Data Over HTTP • OTA Data Over MQTT and HTTP	OTA Data Over MQTT	The protocol selected for OTA data operations.
OTA Primary Data Protocol	• OTA Data Over MQTT • OTA Data Over HTTP	OTA Data Over MQTT	The preferred protocol selected for OTA data operations.
OTA Events Polling Timeout (ms)	Value must be a non-negative integer	1000	The polling timeout (milliseconds) to receive messages from event queue.

Usage Notes

The current implementation utilizes MCUboot Port (rm_mcuboot_port) for switching images.

Limitations

- Currently only the only supported signature method is sig-sha256-ecdsa.

5.2.12.4 AWS PKCS11 PAL on LittleFS (rm_aws_pkcs11_pal_littlefs)

Modules » Networking

PKCS#11 PAL LittleFS layer implementation for use by FreeRTOS TLS.

Overview

Note

The PKCS#11 PAL LittleFS Interface does not provide any interfaces to the user. Consult the AWS documentation for more info: https://docs.aws.amazon.com/freertos/latest/portingguide/afr-porting-pkcs.html.

Configuration

There is no user configuration for this module

Usage Notes

The current implementation utilizes LittleFS on Flash (rm_littlefs_flash) for storage.

Limitations

- Credential access is not limited in any way.

5.2.12.5 AWS coreHTTP

Modules » Networking

This module provides the AWS coreHTTP library.

Overview

The AWS coreHTTP library can be used to send HTTP and HTTPS requests. The documentation for the library can be found at the following link: coreHTTP.

Features

- Secure and Non-secure HTTP requests
- Mutually authenticated connections

Configuration

Memory Usage

The AWS coreHTTP stack relies on dynamic memory allocation for thread/task creation as well as other uses. It is recommended to tweak the thread stack configuration values based on usage. Notable values are:

FreeRTOS Thread

- General|Minimal Stack Size
- Memory Allocation|Total Heap Size

FreeRTOS Plus TCP

- Stack size in words (not bytes)

Usage Notes

- A transport interface is required to use the CoreHTTP library (https://www.freertos.org/network-interface.html).
- For FSP, a transport interface over MbedTLS is provided. This transport interface can connect to RA ethernet, WiFi, and cellular modules via sockets wrappers for each module.
- TLS_FreeRTOS_Connect should be used before calling any CoreHTTP APIs. See the example for more information.

Limitations

- MbedTLS must be initialized and key provisioning must be done before starting a secure connection.

Examples

HTTPS GET request

```

    assert(HTTPSuccess == xHTTPStatus);
    TLS_FreeRTOS_Disconnect(&xNetworkContext);
 /* The HTTPS request has completed. The result is stored in xResponse. */
}
```

5.2.12.6 Azure Embedded Wireless Framework RYZ Port (rm_azure_ewf_ryz) [Deprecated]

Modules » Networking

Note

RYZ cellular modules are deprecated and will be removed from FSP in a future release.
The Azure Embedded Wireless Framework is still in beta and not all APIs may be fully implemented yet.

Overview

This documentation is for the RYZ014A/RYZ024A ports of the Azure Embedded Wireless Framework.

- For more information on the framework see the documenation: https://azure.github.io/embedded-wireless-framework/html/index.html.
    - There are also various examples available for the RA6M4_EK: https://github.com/Azure/embedded-wireless-framework/tree/main/examples/EK-RA6M4.
- For more RYZ014A hardware information including pin and baud rate info please see the RYZ014A page: https://www.renesas.com/us/en/products/interface-connectivity/wireless-communications/cellular-iot-modules/ryz014a-lte-cat-m1-cellular-iot-module.
- For more RYZ024A hardware information including pin and baud rate info please see the RYZ024A page: https://www.renesas.com/us/en/products/interface-connectivity/wireless-communications/cellular-iot-modules/ryz024a-lte-cat-m1-cellular-iot-module-global-deployment.

Features

- Various APIs to control/access RYZ modem features via AT commands.
- Raw AT command APIs
- IPv4 sockets using TCP/UDP
- The EWF framework is usable standalone with bare metal and ThreadX.
- The framework can also be used with NetX when coupled with a EWF NetX middleware layer.

Limitations

The following are the limitations of the Azure EWF Library:

- DTC is not supported. The lower level interface using R_UART relies on processing data one byte at a time via the interrupt callback and UART_EVENT_RX_CHAR.
- Server mode sockets should be supported but have not been fully tested due to APN limitations.
- There are potential issues when using the default (-Os) optimization or above with AC6. All files under embedded_wireless_framework should be set to compile with no optimization (-O0) when using AC6.
- nx_ip_status_check does not currently work for the EWF middleware.
- When using socket send functions (ewf_adapter_tcp_send and ewf_adapter_udp_send) the RYZ port is limited to sending only 1460 bytes at a time. Data sent using these functions

should be broken into 1460 byte chunks or less.
    - When using NetX the packet size for the driver packet pool should be set to 1460 bytes or less. Using larger packet sizes will work but the NetX Middleware Driver will potentially break up the packets inefficiently.

Unsupported NetX Duo Features

These features are handled directly on the RYZ hardware or are not supported yet in the EWF library. NetX APIs for these features should not be used:

- IPv6 functionality (the EWF library doesn't yet support IPv6)
- ARP is handled directly by the cellular modem
- DHCP is handled directly by the cellular modem.

Configuration

The RYZ014A port for the Embedded Wireless Framework can be added to the Stacks tab via New Stack > Networking > Azure EWF Adapter on RYZ014A.

The RYZ024A port for the Embedded Wireless Framework can be added to the Stacks tab via New Stack > Networking > Azure EWF Adapter on RYZ024A.

Build Time Configurations for Common

The following build time configurations are defined in fsp_cfg/azure/ewf/ewf.config.h:

Configuration	Options	Default	Description
Parameter Checking	• Enabled • Disabled	Enabled	This enables checking of function parameters. When this is disabled, parameter checking code is not present and the footprint is reduced
Enable Logging	• Enabled • Disabled	Disabled	This enables logging and the compilation of debug code. When disabled, logging and debug code is not present and the footprint is reduced.
Verbose Logging	• Enabled • Disabled	Disabled	This enables verbose logging. Verbose logging will only work if a EWF Log Function is set and logging is enabled.
EWF Log Function	Manual Entry	printf(__VA_ARGS__)	Function the library uses for standard log messages when logging is enabled.
EWF Log Error Function	Manual Entry	printf(__VA_ARGS__)	Function the library

uses for error log messages when logging is enabled.

Usage Notes

The basic setup for the library is as follows:

Note

The message allocator (EWF_ALLOCATOR_THREADX_STATIC_DECLARE) should be at least 1500 bytes for RYZ

1. Declare an allocator, interface, and adapter using appropriate macros (EWF_ALLOCATOR_THREADX_STATIC_DECLARE/EWF_ALLOCATOR_MEMORY_POOL_STATIC_DECLARE/EWF_ALLOCATOR_C_HEAP_STATIC_DECLARE, EWF_INTERFACE_RA_UART_STATIC_DECLARE, EWF_ADAPTER_RENESAS_RYZ014_STATIC_DECLARE/EWF_ADAPTER_RENESAS_RYZ024A_STATIC_DECLARE).
2. Start the adapter with ewf_adapter_start.
3. Setup modem service if necessary with functions from ewf_adapter_api_modem.h and other included api_modem_* files.
4. Set functionality with ewf_adapter_modem_functionality_set.
5. Wait for network registration (can use ewf_adapter_modem_network_registration_check to wait).
6. Do a service activate to set desired PDP context with ewf_adapter_modem_packet_service_activate. This should be called regardless of whether context is already activated as it sets an internal library context number for functions like ewf_adapter_get_ipv4_address.
7. Call other network functions as needed from desired headers (i.e. TCP functions are in ewf_adapter_api_tcp.h).

When using NetX Duo the following must be done:

- Before creating an IP instance make sure that the modem adapter is started and connected to a network.
- After creating an IP instance the adapter pointer has to be stored manually to the IP instance: g_ip.nx_ip_interface->nx_interface_additional_link_info = adapter_ptr;.
- After creating an IP instance the gateway address should be set to the IP of the modem in order to satisfy NetX Duo's internal routing algorithms (packets are actually routed by the modem hardware): nx_ip_gateway_address_set(&g_ip, RM_NETXDUO_TESTS_IP_ADDR);.

Examples

Basic TCP Socket Example

Note

The user should choose the relevant EWF_ALLOCATOR and EWF_ADAPTER macros from this example to use based on the hardware and RTOS being used

```
#define EWF_LOG_BUFFER_SIZE (256)

#define EWF_MODEM_NETWORK_WAIT_TIME_SECONDS (30)

#define EWF_HTTP_GET_SERVER "www.microsoft.com"
```

```
#define EWF_HTTP_GET "GET / HTTP/1.1\r\nHost:www.microsoft.com\r\n\r\n"
#define EWF_HTTP_PORT (80)
ewf_allocator * message_allocator_ptr = NULL;
ewf_interface * interface_ptr         = NULL;
ewf_adapter   * adapter_ptr          = NULL;
char ewf_log_buffer[EWF_LOG_BUFFER_SIZE];
void rm_azure_ewf_ryz_example ()
{
 static uint8_t buffer[2048];       // NOLINT
    uint32_t       buffer_length = sizeof(buffer);
 /* Azure library has macros to declare/allocate structs and pointers.
  * Different ones should be used depending on Adapter and whether the library is
being used on bare metal or ThreadX */
 /* This is for the memory allocator using ThreadX block pools */
    EWF_ALLOCATOR_THREADX_STATIC_DECLARE(message_allocator_ptr, message_allocator,
12, 2048);
 /* This is for the memory allocator using static memory on bare metal */
    EWF_ALLOCATOR_MEMORY_POOL_STATIC_DECLARE(message_allocator_ptr,
message_allocator, 12, 2048);
 /* This is for the memory allocator using the heap on bare metal */
    EWF_ALLOCATOR_C_HEAP_STATIC_DECLARE(message_allocator_ptr, message_allocator, 12,
2048);

Detailed Description

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the BLE ABS Interface .

Overview

This module provides BLE GAP functionality that complies with the Bluetooth Core Specification version 5.0 specified by the Bluetooth SIG. This module is configured via the QE for BLE. QE for BLE provides standard services defined by standardization organization and custom services defined by user. Bluetooth LE Profile API Document User's Manual describes the APIs for standard services.

Features

The Bluetooth Low Energy (BLE) Abstraction module supports the following features:

- following GAP Role support
  - Central: The device that sends a connection request to the Peripheral device.
  - Peripheral: The device that accepts a connection request from Central and establishes a connection.
  - Observer : The device that scans for advertising.
  - Broadcaster : The device that sends advertising.
- LE 2M PHY
  - BLE communication is supported on the 2 Msym/s PHY.
- LE Coded PHY -Supports BLE communication on the Coded PHY. This enables communication over longer distances than 1M PHY and 2M PHY.
- LE Advertising Extensions
  - Up to four independent adverts can be executed simultaneously.
  - The size of Advertising Data/Scan Response Data has been expanded to a maximum of 1650 bytes.
  - Periodic Advertising is available.
- LE Channel Selection Algorithm #2
  - With the hopping channel selection algorithm added in Version 5.0, the machine that selects the channel It is possible.
- High Duty Cycle Non-Connectable Advertising
  - The ability to support non-connectable advertising with a minimum interval of up to 20 msec.
- LE Secure Connections
  - Elliptic curve Diffie-Hellman key sharing (ECDH) for pairing with passive eavesdropping support.
- Link Layer privacy
  - This feature avoids being tracked by other BLE devices by periodically changing the Bluetooth device address.
- Link Layer Extended Scanner Filter policies
  - Scan Filter support for Resolvable private addresses.
- LE Data Packet Length Extension
  - This function expands the packet size of BLE data communications. It is possible to scale up to 251 bytes.
- LE L2CAP Connection Oriented Channel Support
  - The ability to support communication using the L2CAP credit based flow control channel.
- Low Duty Cycle Directed Advertising
  - The ability to support the advertising of the Low Duty Cycle for reconnecting to a known device.

- LE Link Layer Topology
  - It supports both Master and Slave roles and can operate as Master when connected to one remote device and as Slave when connected to another remote device.
- LE Ping
  - This function checks whether the link is maintained or not by requesting the transmission of packets containing MIC after link encryption.

BLE Library Configuration

There are three types of BLE Protocol Stacks, and the functions provided are different depending on the type of BLE Protocol Stack you select.

BLE library feature	Extended	Balance	Compact
GAP Role	Central Peripheral Observer Broadcaster	Central Peripheral Observer Broadcaster	Peripheral Broadcaster
LE 2M PHY	Yes	Yes	No
LE Coded PHY	Yes	Yes	No
LE Advertising Extensions	Yes	No	No
LE Channel Selection Algorithm #2	Yes	Yes	No
High Duty Cycle Non-Connectable Advertising	Yes	Yes	Yes
LE Secure Connections	Yes	Yes	Yes
Link Layer privacy	Yes	Yes	Yes
Link Layer Extended Scanner Filter policies	Yes	Yes	No
LE Data Packet Length Extension	Yes	Yes	Yes
LE L2CAP Connection Oriented Channel Support	Yes	No	No
Low Duty Cycle Directed Advertising	Yes	Yes	Yes
LE Link Layer Topology	Yes	Yes	No
LE Ping	Yes	Yes	Yes
32-bit UUID Support in LE	Yes	Yes	Yes

Target Devices

The BLE Abstraction module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_abs

The following build time configurations are defined in fsp_cfg/rm_ble_abs_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enable • Disable	Default (BSP)	Specify whether to include code for API parameter checking. Valid settings include.
Debug Public Address	Must be a valid device address	FF:FF:FF:50:90:74	Public Address of firmware initial value.
Debug Random Address	Must be a valid device address	FF:FF:FF:FF:FF:FF	Random Address of firmware initial value.
Maximum number of connections	Value must be an integer between 1 and 7, and lower than the value defined in ble module.	7	Maximum number of connections.
Maximum connection data length	Value must be an integer between 27 and 251, and lower than the value defined in ble module.	251	Maximum connection data length.
Maximum advertising data length	Value must be an integer between 31 and 1650, and lower than the value defined in ble module.	1650	Maximum advertising data length.
Maximum advertising set number	Value must be an integer between 1 and 4, and lower than the value defined in ble module.	4	Maximum advertising set number.
Maximum periodic sync set number.	Value must be an integer between 1 and 2, and lower than the value defined in ble module.	2	Maximum periodic sync set number.
Store Security Data	• Disable • Enable	Disable	Store Security Data in DataFlash.
Data Flash Block for Security Data	Value must be an integer between 0 and 7, and lower than the value defined in ble	0	Data Flash Block for Security Data Management.

	module.		
Remote Device Bonding Number	Value must be an integer between 1 and 7, and lower than the value defined in ble module.	7	Number of remote device bonding information.
Connection Event Start Notify	• Disable • Enable	Disable	Set Connection event start notify enable/disable.
Connection Event Close Notify	• Disable • Enable	Disable	Set Connection event close notify enable/disable.
Advertising Event Start Notify	• Disable • Enable	Disable	Set Advertising event start notify enable/disable.
Advertising Event Close Notify	• Disable • Enable	Disable	Set Advertising event close notify enable/disable.
Scanning Event Start Notify	• Disable • Enable	Disable	Set Scanning event start notify enable/disable.
Scanning Event Close Notify	• Disable • Enable	Disable	Set Scanning event close notify enable/disable.
Initiating Event Start Notify	• Disable • Enable	Disable	Set Initiating event start notify enable/disable.
Initiating Event Close Notify	• Disable • Enable	Disable	Set Initiating event close notify enable/disable.
RF Deep Sleep Start Notify	• Disable • Enable	Disable	Set RF_DEEP_SLEEP start notify enable/disable.
RF Deep Sleep Wakeup Notify	• Disable • Enable	Disable	Set RF_DEEP_SLEEP wakeup notify enable/disable.
Bluetooth dedicated clock	Value must be an integer between 0 and 15, and lower than the value defined in ble module.	6	Load capacitance adjustment.
DC-DC converter	• Disable • Enable	Disable	Set DC-DC converter for RF part.
Slow Clock Source	• Use RF_LOCO • Use External 32.768kHz	Use RF_LOCO	Set slow clock source for RF part.

MCU CLKOUT Port	• P109 • P205	P109	When BLE_ABS_CFG_RF_EXTERNAL_32K_ENABLE = 1, Set port of MCU CLKOUT.
MCU CLKOUT Frequency Output	• MCU CLKOUT frequency 32.768kHz • MCU CLKOUT frequency 16.384kHz	MCU CLKOUT frequency 32.768kHz	When BLE_ABS_CFG_RF_EXTERNAL_32K_ENABLE = 1, set frequency output from CLKOUT of MCU part.
Sleep Clock Accuracy(SCA)	Value must be an integer between 0 and 500, and lower than the value defined in ble module.	250	When BLE_ABS_CFG_RF_EXTERNAL_32K_ENABLE = 1, set Sleep Clock Accuracy(SCA) for RF slow clock.
Transmission Power Maximum Value	• max +0dBm • max +4dBm	max +4dBm	Set transmission power maximum value.
Transmission Power Default Value	• High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm) • Mid 0dBm(Transmission Power Maximum Value = +0dBm) / 0dBm(Transmission Power Maximum Value = +4dBm) • Low -18dBm(Transmission Power Maximum Value = +0dBm) / -20dBm(Transmission Power Maximum Value = +4dBm)	High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm)	Set default transmit power. Default transmit power is dependent on the configuration of Maximum transmission power(BLE_ABS_CFG_RF_DEF_TX_POW).
CLKOUT_RF Output	• No output • 4MHz output • 2MHz output • 1MHz output	No output	Set CLKOUT_RF output setting.
RF_DEEP_SLEEP Transition	• Disable • Enable	Enable	Set RF_DEEP_SLEEP transition.
MCU Main Clock Frequency	Value must be an integer between 1000	8000	Set MCU Main Clock Frequency (kHz). Set

	and 20000, and lower than the value defined in ble module.		clock source according to your board environment. HOCO: don't care. / Main Clock: 1000 to 20000 kHz / PLL Circuit: 4000 to 12500 kHz
Code Flash(ROM) Device Data Block	Value must be an integer between -1 and 255, and lower than the value defined in ble module.	255	Device specific data block on Code Flash (ROM).
Device Specific Data Flash Block	Value must be an integer between -1 and 7, and lower than the value defined in ble module.	-1	Device specific data block on E2 Data Flash.
MTU Size Configured	Value must be an integer between 23 and 247, and lower than the value defined in ble module.	247	MTU Size configured by GATT MTU exchange procedure.
Timer Slot Maximum Number	Value must be an integer between 1 and 10, and lower than the value defined in ble module.	10	The maximum number of timer slot.

Configurations for Networking > BLE Abstraction (rm_ble_abs)

This module can be added to the Stacks tab via New Stack > Networking > BLE Abstraction (rm_ble_abs).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_ble_abs0	Module name.
Gap callback	Name must be a valid C symbol	gap_cb	A user callback function must be provided if the BLE_ABS is configured to generate a GAP. If QE is used, set to NULL.
Vendor specific callback	Name must be a valid C symbol	vs_cb	A user callback function must be provided if the BLE_ABS is configured to generate a Vendor Specific. If QE is used,

			set to NULL.
GATT server callback parameter	Name must be a valid C symbol	gs_abs_gatts_cb_param	Set GATT server callback parameter. If QE is used, set to NULL.
GATT server callback number	Must be a valid number	2	The number of GATT Server callback functions.
GATT client callback parameter	Name must be a valid C symbol	gs_abs_gattc_cb_param	Set GATT client callback parameter. If QE is used, set to NULL.
GATT client callback number	Must be a valid number	2	The number of GATT Server callback functions.
Security			
Pairing parameters	Name must be a valid C symbol	gs_abs_pairing_param	Set pairing parameters.
IO capabilities of local device.	• BLE_GAP_IOCAP_DISPLAY_ONLY • BLE_GAP_IOCAP_DISPLAY_YESNO • BLE_GAP_IOCAP_KEYBOARD_ONLY • BLE_GAP_IOCAP_NOINPUT_NOOUTPUT • BLE_GAP_IOCAP_KEYBOARD_DISPLAY	BLE_GAP_IOCAP_NOINPUT_NOOUTPUT	Select IO capabilities of local device.
MITM protection policy.	• BLE_GAP_SEC_MITM_BEST_EFFORT • BLE_GAP_SEC_MITM_STRICT	BLE_GAP_SEC_MITM_BEST_EFFORT	Select MITM protection policy.
Determine whether to accept only Secure Connections or not.	• BLE_GAP_SC_BEST_EFFORT • BLE_GAP_SC_STRICT	BLE_GAP_SC_BEST_EFFORT	Select determine whether to accept only Secure Connections or not.
Type of keys to be distributed from local device.	• BLE_GAP_KEY_DIST_ENCKEY • BLE_GAP_KEY_DIST_IDKEY • BLE_GAP_KEY_DIST_SIGNKEY		Select type of keys to be distributed from local device.
Type of keys which	• BLE_GAP_KEY_D		Set type of keys which

local device requests a remote device to distribute.	IST_ENCKEY • BLE_GAP_KEY_DIST_IDKEY • BLE_GAP_KEY_DIST_SIGNKEY		local device requests a remote device to distribute.
Maximum LTK size.	Valid range is 7 - 16	16	Set Maximum LTK size.
Interrupts			
Callback provided when an ISR occurs	Name must be a valid C symbol	NULL	Callback provided when BLE ABS ISR occurs

Clock Configuration

Note

System clock (ICLK): 8 MHz or more
Peripheral module clock A (PCLKA): 8MHz or more
The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.
It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.

Pin Configuration

This module does not use I/O pins.

Stack Size Configuration

Note

When you use BLE on RTOS environment, make sure that thread stack size must be 0x1000 or more which call R_BLE_Execute.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the BLE_ABS:

Examples

BLE_ABS Basic Example

This is a basic example of minimal use of the BLE_ABS in an application.

```
#define BLE_ABS_EVENT_FLAG_STACK_ON (0x01 << 0)
#define BLE_ABS_EVENT_FLAG_CONN_IND (0x01 << 1)
#define BLE_ABS_EVENT_FLAG_ADV_ON (0x01 << 2)
#define BLE_ABS_EVENT_FLAG_ADV_OFF (0x01 << 3)
#define BLE_ABS_EVENT_FLAG_DISCONN_IND (0x01 << 4)
#define BLE_ABS_EVENT_FLAG_RSLV_LIST_CONF_COMP (0x01 << 5)
```

```
#define BLE_ABS_EXAMPLE_SHORTENED_LOCAL_NAME 'E', 'x', 'a', 'm', 'p', 'l', 'e'
#define BLE_ABS_EXAMPLE_COMPLETE_LOCAL_NAME 'T', 'E', 'S', 'T', '_', 'E', 'x', 'a',
'm', 'p', 'l', 'e'
#define BLE_ABS_EXAMPLE_SLOW_ADVERTISING_INTERVAL (0x00000640)
void ble_abs_peripheral_example (void)
{
 fsp_err_t         err    = FSP_SUCCESS;

Data Structures

struct	abs_advertising_parameter_t
struct	abs_scan_parameter_t
struct	ble_abs_instance_ctrl_t

Typedefs

typedef void(*	ble_abs_timer_cb_t) (uint32_t timer_hdl)

Enumerations

enum	e_ble_timer_type_t

Data Structure Documentation

◆ abs_advertising_parameter_t

struct abs_advertising_parameter_t		
advertising set parameters structure		
Data Fields		
union abs_advertising_parameter_t	advertising_parameter	Advertising parameters.
uint32_t	advertising_status	Advertising status.
ble_device_address_t	remote_device_address	Remote device address for direct advertising.

◆ abs_scan_parameter_t

struct abs_scan_parameter_t		
scan parameters structure		
Data Fields		
ble_abs_scan_parameter_t	scan_parameter	Scan parameters.
ble_abs_scan_phy_parameter_t	scan_phy_parameter_1M	1M phy parameters for scan.
ble_abs_scan_phy_parameter_t	scan_phy_parameter_coded	Coded phy parameters for scan. */.
uint32_t	scan_status	

◆ ble_abs_instance_ctrl_t

struct ble_abs_instance_ctrl_t
BLE ABS private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_ABS_Open() is called.

Data Fields		
uint32_t	open	Indicates whether the open() API has been successfully called.
void const *	p_context	Placeholder for user data. Passed to the user callback in ble_abs_callback_args_t.
ble_gap_application_callback_t	abs_gap_callback	GAP callback function.
ble_vendor_specific_application_callback_t	abs_vendor_specific_callback	Vendor specific callback function.
ble_abs_delete_bond_application_callback_t	abs_delete_bond_callback	Delete bond information callback function.
uint32_t	connection_timer_handle	Cancel a request for connection timer.
uint32_t	advertising_timer_handle	Advertising timer for legacy advertising.
uint32_t	scan_timer_handle	Scan interval timer.
abs_advertising_parameter_t	advertising_sets[BLE_MAX_NO_OF_ADV_SETS_SUPPORTED]	Advertising set information.
abs_scan_parameter_t	abs_scan	Scan information.
st_ble_dev_addr_t	loc_bd_addr	Local device address.
uint8_t	privacy_mode	Privacy mode.
uint32_t	set_privacy_status	Local privacy status.
ble_abs_timer_t	timer[BLE_ABS_CFG_TIMER_NUMBER_OF_SLOT]	
uint8_t	local_irk[BLE_GAP_IRK_SIZE]	
ble_abs_identity_address_info_t	identity_address_info	
uint32_t	current_timeout_ms	Current timeout.
uint32_t	elapsed_timeout_ms	Elapsed timeout.
ble_abs_cfg_t const *	p_cfg	Pointer to the BLE ABS configuration block.

Typedef Documentation

◆ ble_abs_timer_t

typedef void(* ble_abs_timer_cb_t) (uint32_t timer_hdl)
The timer callback invoked when the timer expired.

Enumeration Type Documentation

◆ e_ble_timer_type_t

enum e_ble_timer_type_t	
The timer type.	
Enumerator	
BLE_TIMER_ONE_SHOT	One shot timer type
BLE_TIMER_PERIODIC	Periodic timer type

Function Documentation

◆ RM_BLE_ABS_Open()

fsp_err_t RM_BLE_ABS_Open (ble_abs_ctrl_t *const *p_ctrl*, ble_abs_cfg_t const *const *p_cfg*)

Host stack is initialized with this function. Before using All the R_BLE APIs, it's necessary to call this function. A callback functions are registered with this function. In order to receive the GAP, GATT, Vendor specific event, it's necessary to register a callback function. The result of this API call is notified in BLE_GAP_EVENT_STACK_ON event. Implements ble_abs_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
```

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_ALREADY_OPEN	Requested channel is already open in a different configuration.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameter.
FSP_ERR_INVALID_MODE	Invalid mode during open call

Host stack is initialized with this function. Before using All the R_BLE APIs, it's necessary to call this function. A callback functions are registered with this function. In order to receive the GAP, GATT, Vendor specific event, it's necessary to register a callback function. The result of this API call is notified in BLE_GAP_EVENT_STACK_ON event. Implements ble_abs_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
```

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_ALREADY_OPEN	Requested channel is already open in a different configuration.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameter.
FSP_ERR_INVALID_MODE	Invalid mode during open call

Host stack is initialized with this function. Before using All the R_BLE APIs, it's necessary to call this function. A callback functions are registered with this function. In order to receive the GAP, GATT, Vendor specific event, it's necessary to register a callback function. The result of this API call is notified in BLE_GAP_EVENT_STACK_ON event. Implements ble_abs_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
```

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_INVALID_CHANNEL	The channel number is invalid.
FSP_ERR_ALREADY_OPEN	Requested channel is already open in a different configuration.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameter.

◆ RM_BLE_ABS_Close()

fsp_err_t RM_BLE_ABS_Close (ble_abs_ctrl_t *const *p_ctrl*)

Close the BLE channel. Implements ble_abs_api_t::close.

Example:

```
/* Close BLE driver */
   err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
```

Return values

FSP_SUCCESS	Channel closed successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_NOT_OPEN	Control block not open.

Example:

```
/* Close BLE driver */
   err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
```

Return values

FSP_SUCCESS	Channel closed successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_NOT_OPEN	Control block not open.

Example:

```
/* Close BLE driver */
   err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
```

Return values

FSP_SUCCESS	Channel closed successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_NOT_OPEN	Control block not open.

◆ RM_BLE_ABS_Reset()

fsp_err_t RM_BLE_ABS_Reset (ble_abs_ctrl_t *const *p_ctrl*, ble_event_cb_t *init_callback*)

This function is not implemented. To perform this function call R_BLE_Close followed by R_BLE_Open. Implements ble_abs_api_t::reset.

Return values

FSP_ERR_UNSUPPORTED	Function is not supported

BLE is reset with this function. The process is carried out in the following order. R_BLE_Close() -> R_BLE_GAP_Terminate() -> R_BLE_Open() -> R_BLE_SetEvent(). The init_cb callback initializes the others (Host Stack, timer, etc...). Implements ble_abs_api_t::reset.

Return values

FSP_SUCCESS	Channel closed successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_NOT_OPEN	Control block not open.

◆ RM_BLE_ABS_StartLegacyAdvertising()

fsp_err_t RM_BLE_ABS_StartLegacyAdvertising (ble_abs_ctrl_t *const *p_ctrl*, ble_abs_legacy_advertising_parameter_t const *const *p_advertising_parameter*)

Start Legacy Advertising after setting advertising parameters, advertising data and scan response data. The legacy advertising uses the advertising set whose advertising handle is 0. The advertising type is connectable and scannable(ADV_IND). The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements ble_abs_api_t::startLegacyAdvertising

Example:

```
/* Start advertising. */
    err = RM_BLE_ABS_StartLegacyAdvertising(&g_ble_abs0_ctrl,
&legacy_advertising_parameter);
```

Return values

FSP_SUCCESS	Operation succeeded
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_STATE	Host stack hasn't been initialized.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The advertising parameter is out of range.

Start Legacy Advertising after setting advertising parameters, advertising data and scan response data. The legacy advertising uses the advertising set whose advertising handle is 0. The advertising type is connectable and scannable(ADV_IND). The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements ble_abs_api_t::startLegacyAdvertising

Example:

```
/* Start advertising. */
    err = RM_BLE_ABS_StartLegacyAdvertising(&g_ble_abs0_ctrl,
&legacy_advertising_parameter);
```

Return values

FSP_SUCCESS	Operation succeeded
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_STATE	Host stack hasn't been initialized.

FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The advertising parameter is out of range.

Start Legacy Advertising after setting advertising parameters, advertising data and scan response data. The legacy advertising uses the advertising set whose advertising handle is 0. The advertising type is connectable and scannable(ADV_IND). The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements ble_abs_api_t::startLegacyAdvertising

Example:

```
/* Start advertising. */
   err = RM_BLE_ABS_StartLegacyAdvertising(&g_ble_abs0_ctrl,
&legacy_advertising_parameter);
```

Return values

FSP_SUCCESS	Operation succeeded
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_STATE	Host stack hasn't been initialized.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The advertising parameter is out of range.

◆ RM_BLE_ABS_StartExtendedAdvertising()

fsp_err_t RM_BLE_ABS_StartExtendedAdvertising (ble_abs_ctrl_t *const *p_ctrl*, ble_abs_extend_advertising_parameter_t const *const *p_advertising_parameter*)

Start Extended Advertising after setting advertising parameters, advertising data. The extended advertising uses the advertising set whose advertising handle is 1. The advertising type is connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements ble_abs_api_t::startExtendedAdvertising

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_UNSUPPORTED	Subordinate modules do not support this feature.

Start Extended Advertising after setting advertising parameters, advertising data. The extended advertising uses the advertising set whose advertising handle is 1. The advertising type is connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements ble_abs_api_t::startExtendedAdvertising

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_INVALID_STATE	Host stack hasn't been initialized.
FSP_ERR_INVALID_ARGUMENT	The advertising parameter is out of range.
FSP_ERR_UNSUPPORTED	Subordinate modules do not support this feature.

◆ RM_BLE_ABS_StartNonConnectableAdvertising()

fsp_err_t RM_BLE_ABS_StartNonConnectableAdvertising (ble_abs_ctrl_t *const *p_ctrl*, ble_abs_non_connectable_advertising_parameter_t const *const *p_advertising_parameter*)

Start Non-Connectable Advertising after setting advertising parameters, advertising data. The non-connectable advertising uses the advertising set whose advertising handle is 2. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements ble_abs_api_t::startNonConnectableAdvertising.

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_UNSUPPORTED	Feature not yet supported.

Start Non-Connectable Advertising after setting advertising parameters, advertising data. The non-connectable advertising uses the advertising set whose advertising handle is 2. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements ble_abs_api_t::startNonConnectableAdvertising.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_INVALID_STATE	Host stack hasn't been initialized.
FSP_ERR_INVALID_ARGUMENT	The advertising parameter is out of range.

◆ RM_BLE_ABS_StartPeriodicAdvertising()

fsp_err_t RM_BLE_ABS_StartPeriodicAdvertising (ble_abs_ctrl_t *const *p_ctrl*, ble_abs_periodic_advertising_parameter_t const *const *p_advertising_parameter*)

Start Periodic Advertising after setting advertising parameters, periodic advertising parameters, advertising data and periodic advertising data. The periodic advertising uses the advertising set whose advertising handle is 3. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements ble_abs_api_t::startPeriodicAdvertising

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_UNSUPPORTED	Subordinate modules do not support this feature.

Start Periodic Advertising after setting advertising parameters, periodic advertising parameters, advertising data and periodic advertising data. The periodic advertising uses the advertising set whose advertising handle is 3. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements ble_abs_api_t::startPeriodicAdvertising

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The advertising parameter is out of range.
FSP_ERR_UNSUPPORTED	This feature is not supported in this configuration.

◆ RM_BLE_ABS_StartScanning()

fsp_err_t RM_BLE_ABS_StartScanning (ble_abs_ctrl_t *const *p_ctrl*, ble_abs_scan_parameter_t const *const *p_scan_parameter*)

Start scanning after setting scan parameters. The scanner address type is Public Identity Address. Fast scan is followed by slow scan. The end of fast scan or slow scan is notified with BLE_GAP_EVENT_SCAN_TO event. If fast_period is 0, only slow scan is carried out. If scan_period is 0, slow scan continues. Implements ble_abs_api_t::startScanning.

Example:

```
/* Start scanning. */
   err = RM_BLE_ABS_StartScanning(&g_ble_abs0_ctrl, &scan_parameter);
```

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_scan_parameter is specified as NULL.
FSP_ERR_UNSUPPORTED	Function is not supported

Start scanning after setting scan parameters. The scanner address type is Public Identity Address. Fast scan is followed by slow scan. The end of fast scan or slow scan is notified with BLE_GAP_EVENT_SCAN_TO event. If fast_period is 0, only slow scan is carried out. If scan_period is 0, slow scan continues. Implements ble_abs_api_t::startScanning.

Example:

```
/* Start scanning. */
   err = RM_BLE_ABS_StartScanning(&g_ble_abs0_ctrl, &scan_parameter);
```

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_scan_parameter is specified as NULL.
FSP_ERR_UNSUPPORTED	Function is not supported

Start scanning after setting scan parameters. The scanner address type is Public Identity Address. Fast scan is followed by slow scan. The end of fast scan or slow scan is notified with BLE_GAP_EVENT_SCAN_TO event. If fast_period is 0, only slow scan is carried out. If scan_period is 0, slow scan continues. Implements ble_abs_api_t::startScanning.

Example:

```
/* Start scanning. */
   err = RM_BLE_ABS_StartScanning(&g_ble_abs0_ctrl, &scan_parameter);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_scan_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The scan parameter is out of range.
FSP_ERR_IN_USE	This API is called in scanning.
FSP_ERR_BLE_ABS_NOT_FOUND	Usable timer slot not found.
FSP_ERR_UNSUPPORTED	This feature is not supported in this configuration.

◆ RM_BLE_ABS_CreateConnection()

fsp_err_t RM_BLE_ABS_CreateConnection (ble_abs_ctrl_t *const *p_ctrl*, ble_abs_connection_parameter_t const *const *p_connection_parameter*)

Request create connection. The initiator address type is Public Identity Address. The scan interval is 60ms and the scan window is 30ms in case of 1M PHY or 2M PHY. The scan interval is 180ms and the scan window is 90ms in case of coded PHY. The Minimum CE Length and the Maximum CE Length are 0xFFFF. When the request for a connection has been received by the Controller, BLE_GAP_EVENT_CREATE_CONN_COMP event is notified. When a link has beens established, BLE_GAP_EVENT_CONN_IND event is notified. Implements ble_abs_api_t::createConnection.

Example:

```
/* Create connection with remote device. */

   err = RM_BLE_ABS_CreateConnection(&g_ble_abs0_ctrl, &g_connection_parameter);
```

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_connection_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The create connection parameter is out of range.
FSP_ERR_UNSUPPORTED	Function is not supported

Request create connection. The initiator address type is Public Identity Address. The scan interval is 60ms and the scan window is 30ms in case of 1M PHY or 2M PHY. The scan interval is 180ms and the scan window is 90ms in case of coded PHY. The Minimum CE Length and the Maximum CE Length are 0xFFFF. When the request for a connection has been received by the Controller, BLE_GAP_EVENT_CREATE_CONN_COMP event is notified. When a link has beens established, BLE_GAP_EVENT_CONN_IND event is notified. Implements ble_abs_api_t::createConnection.

Example:

```
/* Create connection with remote device. */
   err = RM_BLE_ABS_CreateConnection(&g_ble_abs0_ctrl, &g_connection_parameter);
```

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_connection_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The create connection parameter is out of range.
FSP_ERR_UNSUPPORTED	Function is not supported

Request create connection. The initiator address type is Public Identity Address. The scan interval is 60ms and the scan window is 30ms in case of 1M PHY or 2M PHY. The scan interval is 180ms and the scan window is 90ms in case of coded PHY. The Minimum CE Length and the Maximum CE Length are 0xFFFF. When the request for a connection has been received by the Controller, BLE_GAP_EVENT_CREATE_CONN_COMP event is notified. When a link has beens established, BLE_GAP_EVENT_CONN_IND event is notified. Implements ble_abs_api_t::createConnection.

Example:

```
/* Create connection with remote device. */
   err = RM_BLE_ABS_CreateConnection(&g_ble_abs0_ctrl, &g_connection_parameter);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_connection_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The create connection parameter is out of range.
FSP_ERR_IN_USE	This API is called while creating a link by previous API call.
FSP_ERR_BLE_ABS_NOT_FOUND	Couldn't find a valid timer.
FSP_ERR_UNSUPPORTED	This feature is not supported in this configuration.

◆ RM_BLE_ABS_SetLocalPrivacy()

fsp_err_t RM_BLE_ABS_SetLocalPrivacy (ble_abs_ctrl_t *const *p_ctrl*, uint8_t const *const *p_lc_irk*, uint8_t *privacy_mode*)

Generate a IRK, add it to the resolving list, set privacy mode and enable RPA function. Register vendor specific callback function, if IRK is generated by this function. After configuring local device privacy, BLE_GAP_ADDR_RPA_ID_PUBLIC is specified as own device address in theadvertising/scan/create connection API. Implements ble_abs_api_t::setLocalPrivacy

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_ARGUMENT	The privacy_mode parameter is out of range.
FSP_ERR_UNSUPPORTED	Function is not supported

Generate a IRK, add it to the resolving list, set privacy mode and enable RPA function. Register vendor specific callback function, if IRK is generated by this function. After configuring local device privacy, BLE_GAP_ADDR_RPA_ID_PUBLIC is specified as own device address in theadvertising/scan/create connection API. Implements ble_abs_api_t::setLocalPrivacy

Example:

```
/* Set local privacy. */
   err = RM_BLE_ABS_SetLocalPrivacy(&g_ble_abs0_ctrl, p_local_irk, privacy_mode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_ARGUMENT	The privacy_mode parameter is out of range.

◆ RM_BLE_ABS_StartAuthentication()

fsp_err_t RM_BLE_ABS_StartAuthentication (ble_abs_ctrl_t *const *p_ctrl*, uint16_t *connection_handle*)

Start pairing or encryption. If pairing has been done, start encryption. The pairing parameters are configured by RM_BLE_ABS_Open() or R_BLE_GAP_SetPairingParams(). If the pairing parameters are configure by RM_BLE_ABS_Open(),

- bonding policy is that bonding information is stored.
- Key press notification is not supported. Implements ble_abs_api_t::startAuthentication.

Example:

```
/* Start authentication with remote device. */
   err = RM_BLE_ABS_StartAuthentication(&g_ble_abs0_ctrl, g_connection_handle);
```

Return values

FSP_ERR_ASSERTION	p_instance_ctrl or connection_handle are specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_UNSUPPORTED	Function is not supported

Start pairing or encryption. If pairing has been done, start encryption. The pairing parameters are configured by RM_BLE_ABS_Open() or R_BLE_GAP_SetPairingParams(). If the pairing parameters are configure by RM_BLE_ABS_Open(),

- bonding policy is that bonding information is stored.
- Key press notification is not supported. Implements ble_abs_api_t::startAuthentication.

Example:

```
/* Start authentication with remote device. */
   err = RM_BLE_ABS_StartAuthentication(&g_ble_abs0_ctrl, g_connection_handle);
```

Return values

FSP_ERR_ASSERTION	p_instance_ctrl or connection_handle are specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_UNSUPPORTED	Function is not supported

Start pairing or encryption. If pairing has been done, start encryption. The pairing parameters are configured by RM_BLE_ABS_Open() or R_BLE_GAP_SetPairingParams(). If the pairing parameters are configure by RM_BLE_ABS_Open(),

- bonding policy is that bonding information is stored.
- Key press notification is not supported. Implements ble_abs_api_t::startAuthentication.

Example:

```
/* Start authentication with remote device. */
   err = RM_BLE_ABS_StartAuthentication(&g_ble_abs0_ctrl, g_connection_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl or connection_handle are specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_ARGUMENT	The connection handle parameter is out of range.

◆ RM_BLE_ABS_DeleteBondInformation()

fsp_err_t RM_BLE_ABS_DeleteBondInformation (ble_abs_ctrl_t *const *p_ctrl*, ble_abs_bond_information_parameter_t const *const *p_bond_information_parameter*)

Delete bonding information from BLE stack and storage. Implements ble_abs_api_t::deleteBondInformation.

Example:

```
/* Delete bonding information. */
   err = RM_BLE_ABS_DeleteBondInformation(&g_ble_abs0_ctrl,
&g_bond_information_parameter);
```

Return values

FSP_SUCCESS	Operation was successful
FSP_ERR_ASSERTION	The parameter p_instance_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_bond_information_parameter is NULL.
FSP_ERR_NOT_OPEN	Control block not open.

Delete bonding information from BLE stack and storage. Implements ble_abs_api_t::deleteBondInformation.

Example:

```
/* Delete bonding information. */
   err = RM_BLE_ABS_DeleteBondInformation(&g_ble_abs0_ctrl,
&g_bond_information_parameter);
```

Return values

FSP_SUCCESS	Operation was successful
FSP_ERR_ASSERTION	The parameter p_instance_ctrl is NULL.

FSP_ERR_INVALID_POINTER	The parameter p_bond_information_parameter is NULL.
FSP_ERR_NOT_OPEN	Control block not open.

Delete bonding information from BLE stack and storage. Implements ble_abs_api_t::deleteBondInformation.

Example:

```
/* Delete bonding information. */
   err = RM_BLE_ABS_DeleteBondInformation(&g_ble_abs0_ctrl,
&g_bond_information_parameter);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_instance_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_bond_information_parameter is NULL.
FSP_ERR_NOT_OPEN	Control block not open.

◆ RM_BLE_ABS_ImportKeyInformation()

fsp_err_t RM_BLE_ABS_ImportKeyInformation (ble_abs_ctrl_t *const *p_ctrl*, ble_device_address_t * *p_local_identity_address*, uint8_t * *p_local_irk*, uint8_t * *p_local_csrk*)

Import key information to BLE stack and storage. Implements ble_abs_api_t::importKeyInformation.

Example:

```
/* Import local key information. */
   err = RM_BLE_ABS_ImportKeyInformation(&g_ble_abs0_ctrl, &local_identity_address,
local_irk, local_csrk);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_instance_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_local_identity_address, p_local_irk or p_local_csrk is NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_HW_CONDITION	Failure to access internal storage.
FSP_ERR_UNSUPPORTED	Not supported in this configuration.

◆ RM_BLE_ABS_ExportKeyInformation()

fsp_err_t RM_BLE_ABS_ExportKeyInformation (ble_abs_ctrl_t *const *p_ctrl*, ble_device_address_t * *p_local_identity_address*, uint8_t * *p_local_irk*, uint8_t * *p_local_csrk*)

Export key information to BLE stack and storage. Implements ble_abs_api_t::exportKeyInformation.

Example:

```
/* Export local key information. */
   err = RM_BLE_ABS_ExportKeyInformation(&g_ble_abs0_ctrl, &local_identity_address,
local_irk, local_csrk);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_instance_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_local_identity_address, p_local_irk or p_local_csrk is NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_BUFFER_EMPTY	Dynamic memory allocation failed.
FSP_ERR_OUT_OF_MEMORY	Failure to access internal storage.
FSP_ERR_NOT_INITIALIZED	Not initialized internal storage.
FSP_ERR_UNSUPPORTED	Not supported in this configuration.

5.2.12.8 BLE Driver (r_ble_balance)

Modules » Networking

Driver for the Radio peripheral on RA MCUs. This module implements the BLE Interface.

Overview

The Bluetooth Low Energy (BLE) library in Balance configuration (r_ble) provides an API to control the Radio peripheral. This module is configured via the QE for BLE. QE for BLE provides standard services defined by standardization organization and custom services defined by user. Bluetooth LE Profile API Document User's Manual describes the APIs for standard services.

Features

- Common
  - Open/Close the BLE protocol stack.
  - Execute the BLE job.

    - Add an event in the BLE protocol stack internal queue.
- GAP
    - Initialization of the Host stack.
    - Start/Stop Advertising.
    - Start/Stop Scan.
    - Connect/Disconnect a link.
    - Initiate/Respond a pairing request.
- GATT Common
    - Get MTU size.
- GATT Server
    - Initialization of GATT Server.
    - Notification/Indication.
- GATT Client
    - Discovery services, characteristics.
    - Read/Write characteristic.
- Vendor Specific
    - DTM.
    - Set/Get transmit power.
    - Set/Get BD_ADDR.

Supported functions

The supported functions are listed in the table below. Choose the configuration that best suits the functions that target system requires.

BLE library feature	Extended	Balance	Compact
Common API	Supported	**Supported**	Supported
GAP API	Supported	***1 Limited**	*1 *2 Limited
GATT Common API	Supported	**Supported**	Supported
GATT Client API	Supported	**Supported**	Supported
GATT Client API	Supported	**Supported**	Supported
L2CAP API	Supported	**Not Supported**	Not supported
Vendor Specific API	*3 Limited	***3 Limited**	*3 Limited

Note

1. *This configuration dose not support LE Advertising Extensions functionality APIs.*
2. *This configuration dose not support Central and Observer functionality APIs.*
3. *This configuration dose not support vender specific firmware update functionality APIs.*

Target Devices

The Renesas BLE Library supports the following devices.

- RA4W1

Configuration

Clock Configuration

Note

System clock (ICLK): 8 MHz or more
Peripheral module clock A (PCLKA): 8MHz or more
The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.
It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Figure shows the software structure of the BLE FSP module.

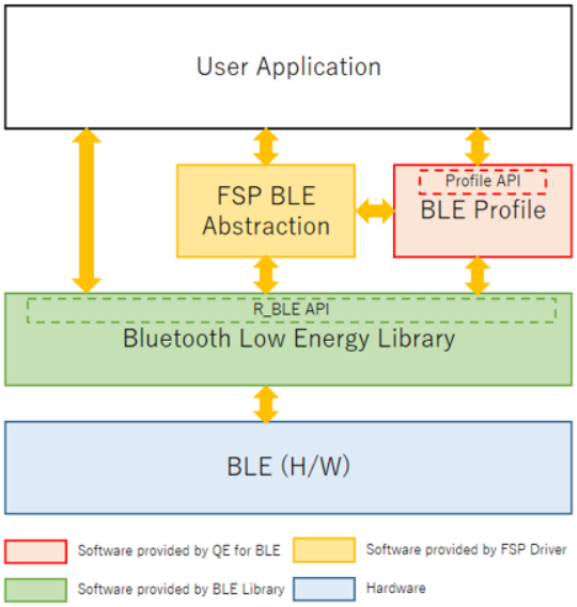

Figure 277: BLE software structure

The BLE FSP module consists of the BLE library.
The BLE Application uses the BLE functions via the R_BLE API provided by the BLE Library.
The QE for BLE generates the source codes (BLE base skeleton program) as a base for the BLE Application and the BLE Profile codes including the Profile API.

Initialize the BLE protocol stack

Note

It takes around 250msec to initialize BLE protocol stack.
R_BLE_Open API will be occupied MCU resources during the initialization.

Limitations

Developers should be aware of the following limitations when using the ble:

Note

- This configuration dose not support LE Advertising Extensions functionality APIs.

If those functionalities need your system, select BLE Driver (r_ble_extended) configration.
- This configuration dose not support L2CAP functionality APIs.
If those functionalities need your system, select BLE Driver (r_ble_extended) configration.
- This configuration dose not support vender specific firmware update functionality APIs.
Those APIs are only supported by SPP BLE Abstraction (rm_ble_abs_spp) module.

Limitations on FreeRTOS environment

Developers should be aware of the following limitations when using the ble on FreeRTOS environment: When use deep sleep, sleep mode or standby mode, there is following two wake up option from RF module.

- Using Semaphore
- Using Event Groups

Note

Event Groups is processing as a delay handler by timer task.
Therefore, if blocked by interrupts or if the timer task is blocked by another high-priority task, the existing connection will be broken.

5.2.12.9 BLE Driver (r_ble_compact)

Modules » Networking

Driver for the Radio peripheral on RA MCUs. This module implements the BLE Interface.

Overview

The Bluetooth Low Energy (BLE) library in Compact configuration (r_ble) provides an API to control the Radio peripheral. This module is configured via the QE for BLE. QE for BLE provides standard services defined by standardization organization and custom services defined by user. Bluetooth LE Profile API Document User's Manual describes the APIs for standard services.

Features

- Common
  - Open/Close the BLE protocol stack.
  - Execute the BLE job.
  - Add an event in the BLE protocol stack internal queue.
- GAP
  - Initialization of the Host stack.
  - Start/Stop Advertising.
  - Initiate/Respond a pairing request.
- GATT Common
  - Get MTU size.
- GATT Server
  - Initialization of GATT Server.
  - Notification/Indication.
- GATT Client
  - Discovery services, characteristics.

- Read/Write characteristic.
- Vendor Specific
  - DTM.
  - Set/Get transmit power.
  - Set/Get BD_ADDR.

Supported functions

The supported functions are listed in the table below. Choose the configuration that best suits the functions that target system requires.

BLE library feature	Extended	Balance	Compact
Common API	Supported	Supported	**Supported**
GATT Common API	Supported	*1 Limited	***1 *2 Limited**
GATT Common API	Supported	Supported	**Supported**
GATT Server API	Supported	Supported	**Supported**
GATT Client API	Supported	Supported	**Supported**
L2CAP API	Supported	Not supported	**Not supported**
Vendor Specific API	*3 Limited	*3 Limited	***3 Limited**

Note

1. This configuration dose not support LE Advertising Extensions functionality APIs.
2. This configuration dose not support Central and Observer functionality APIs.
3. This configuration dose not support vender specific firmware update functionality APIs.

Target Devices

The Renesas BLE Library supports the following devices.

- RA4W1

Configuration

Clock Configuration

Note

System clock (ICLK): 8 MHz or more
Peripheral module clock A (PCLKA): 8MHz or more
The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.
It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Figure shows the software structure of the BLE FSP module.

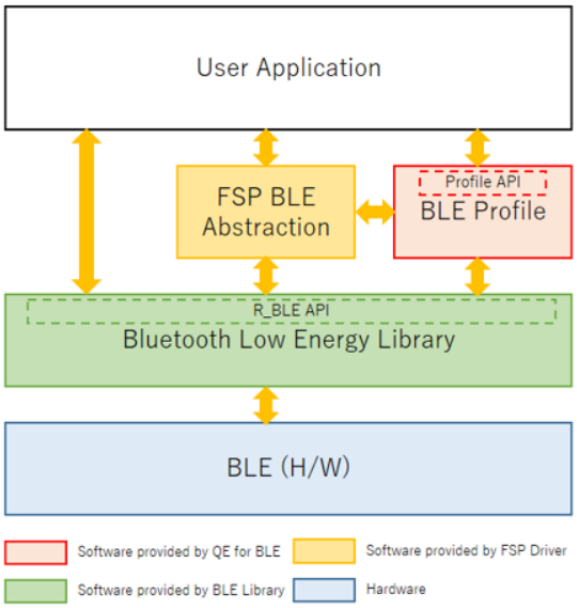

Figure 278: BLE software structure

The BLE FSP module consists of the BLE library.
The BLE Application uses the BLE functions via the R_BLE API provided by the BLE Library.
The QE for BLE generates the source codes (BLE base skeleton program) as a base for the BLE Application and the BLE Profile codes including the Profile API.

Initialize the BLE protocol stack

Note

It takes around 250msec to initialize BLE protocol stack.
R_BLE_Open API will be occupied MCU resources during the initialization.

Limitations

Developers should be aware of the following limitations when using the ble:

Note

- This configuration dose not supports LE Advertising Extensions functionality APIs.
If those functionalities need your system, select BLE Driver (r_ble_extended) configration.
- This configuration dose not supports Central and Observer functionality APIs.
If those functionalities need your system, select BLE Driver (r_ble_extended) or BLE Driver (r_ble_balance) configration.
- This configuration dose not supports L2CAP functionality APIs.
If those functionalities need your system, select BLE Driver (r_ble_extended) configration.
- This configuration dose not supports vender specific firmware update functionality APIs.
Those APIs are only supported by SPP BLE Abstraction (rm_ble_abs_spp) module.

Limitations on FreeRTOS environment

Developers should be aware of the following limitations when using the ble on FreeRTOS environment: When use deep sleep, sleep mode or standby mode, there is following two wake up option from RF module.

- Using Semaphore
- Using Event Groups

Note

Event Groups is processing as a delay handler by timer task.
Therefore, if blocked by interrupts or if the timer task is blocked by another high-priority task, the existing connection will be broken.

5.2.12.10 BLE Driver (r_ble_extended)

Modules » Networking

Driver for the Radio peripheral on RA MCUs. This module implements the BLE Interface.

Overview

The Bluetooth Low Energy (BLE) library in Extended configuration (r_ble) provides an API to control the Radio peripheral. This module is configured via the QE for BLE. QE for BLE provides standard services defined by standardization organization and custom services defined by user. Bluetooth LE Profile API Document User's Manual describes the APIs for standard services.

Features

- Common
  - Open/Close the BLE protocol stack.
  - Execute the BLE job.
  - Add an event in the BLE protocol stack internal queue.
- GAP
  - Initialization of the Host stack.
  - Start/Stop Advertising (Support LE Advertising Extensions).
  - Start/Stop Scan.
  - Connect/Disconnect a link.
  - Initiate/Respond a pairing request.
- GATT Common
  - Get MTU size.
- GATT Server
  - Initialization of GATT Server.
  - Notification/Indication.
- GATT Client
  - Discovery services, characteristics.
  - Read/Write characteristic.
- L2CAP
  - Credit-based flow control transaction.
- Vendor Specific
  - DTM.
  - Set/Get transmit power.
  - Set/Get BD_ADDR.

Supported functions

The supported functions are listed in the table below. Choose the configuration that best suits the functions that target system requires.

BLE library feature	Extended	Balance	Compact
Common API	**Supported**	Supported	Supported
GAP API	**Supported**	*1 Limited	*1 *2 Limited
GATT Common API	**Supported**	Supported	Supported
GATT Server API	**Supported**	Supported	Supported
GATT Client API	**Supported**	Supported	Supported
L2CAP API	**Supported**	Not supported	Not supported
Vendor Specific API	***3 Limited**	*3 Limited	*3 Limited

Note

1. This configuration dose not support LE Advertising Extensions functionality APIs.
2. This configuration dose not support Central and Observer functionality APIs.
3. This configuration dose not support vender specific firmware update functionality APIs.

Target Devices

The Renesas BLE Library supports the following devices.

- RA4W1

Configuration

Clock Configuration

Note

System clock (ICLK): 8 MHz or more
Peripheral module clock A (PCLKA): 8MHz or more
The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.
It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Figure shows the software structure of the BLE FSP module.

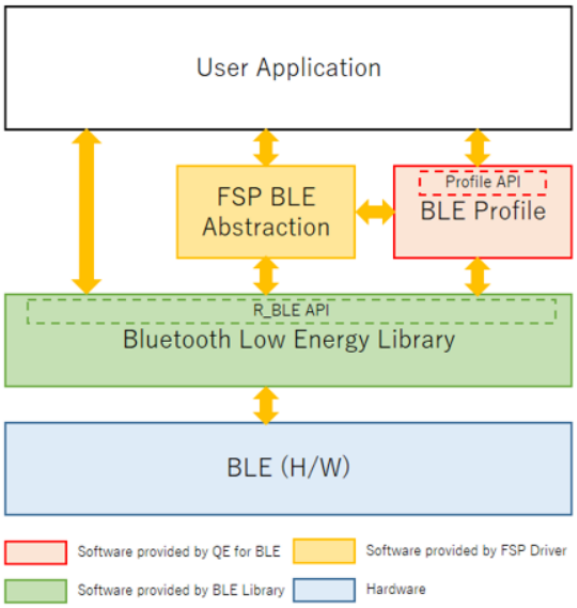

Figure 279: BLE software structure

The BLE FSP module consists of the BLE library.
The BLE Application uses the BLE functions via the R_BLE API provided by the BLE Library.
The QE for BLE generates the source codes (BLE base skeleton program) as a base for the BLE Application and the BLE Profile codes including the Profile API.

Initialize the BLE protocol stack

Note

It takes around 250msec to initialize BLE protocol stack.
R_BLE_Open API will be occupied MCU resources during the initialization.

Limitations

Developers should be aware of the following limitations when using the ble:

Note

- This configuration dose not support vender specific firmware update functionality APIs.
Those APIs are only supported by SPP BLE Abstraction (rm_ble_abs_spp) module.

Limitations on FreeRTOS environment

Developers should be aware of the following limitations when using the ble on FreeRTOS environment: When use deep sleep, sleep mode or standby mode, there is following two wake up option from RF module.

- Using Semaphore
- Using Event Groups

Note

Event Groups is processing as a delay handler by timer task.
Therefore, if blocked by interrupts or if the timer task is blocked by another high-priority task, the existing connection will be broken.

5.2.12.11 BLE Mesh Network Modules

Modules » Networking

Detailed Description

BLE Mesh Network Modules.

Modules

BLE Mesh Network (rm_ble_mesh)
BLE Mesh Network Access (rm_ble_mesh_access)
BLE Mesh Network Bearer (rm_ble_mesh_bearer)
BLE Mesh Network Bearer Platform (rm_mesh_bearer_platform)
BLE Mesh Network Config Client (rm_mesh_config_clt)
BLE Mesh Network Config Server (rm_mesh_config_srv)
BLE Mesh Network Generic Admin Property Server (rm_mesh_generic_admin_prop_srv)
BLE Mesh Network Generic Battery Client (rm_mesh_generic_battery_clt)
BLE Mesh Network Generic Battery Server (rm_mesh_generic_battery_srv)
BLE Mesh Network Generic Client Property Server (rm_mesh_generic_client_prop_srv)
BLE Mesh Network Generic Default Transition Time Client (rm_mesh_generic_dtt_clt)
BLE Mesh Network Generic Default Transition Time Server (rm_mesh_generic_dtt_srv)
BLE Mesh Network Generic Level Client (rm_mesh_generic_level_clt)
BLE Mesh Network Generic Level Server (rm_mesh_generic_level_srv)
BLE Mesh Network Generic Location Client (rm_mesh_generic_loc_clt)

	BLE Mesh Network Generic Location Server (rm_mesh_generic_loc_srv)
	BLE Mesh Network Generic Manufacturer Property Server (rm_mesh_generic_mfr_prop_srv)
	BLE Mesh Network Generic On Off Client (rm_mesh_generic_on_off_clt)
	BLE Mesh Network Generic On Off Server (rm_mesh_generic_on_off_srv)
	BLE Mesh Network Generic Power Level Client (rm_mesh_generic_pl_clt)
	BLE Mesh Network Generic Power Level Server (rm_mesh_generic_pl_srv)
	BLE Mesh Network Generic Power On Off Client (rm_mesh_generic_poo_clt)
	BLE Mesh Network Generic Power On Off Server (rm_mesh_generic_poo_srv)
	BLE Mesh Network Generic Property Client (rm_mesh_generic_prop_clt)
	BLE Mesh Network Generic User Property Server (rm_mesh_generic_user_prop_srv)
	BLE Mesh Network Health Client (rm_mesh_health_clt)
	BLE Mesh Network Health Server (rm_mesh_health_srv)
	BLE Mesh Network Light Control Client (rm_mesh_light_ctl_clt)
	BLE Mesh Network Light Control Server (rm_mesh_light_ctl_srv)

fsp_err_t	RM_BLE_MESH_ConvertTransitionTimeToMs (rm_ble_mesh_ctrl_t *const p_ctrl, uint8_t transition_time, uint32_t *const p_transition_time_in_ms)

Detailed Description

Overview

Bluetooth Mesh defines a managed-flood-based mesh network. Any device in the network can send a message at any time as long as there is a sufficient density of devices that are listening and relaying messages. See sample application document and start up guide for information on how to create a BLE MESH application.

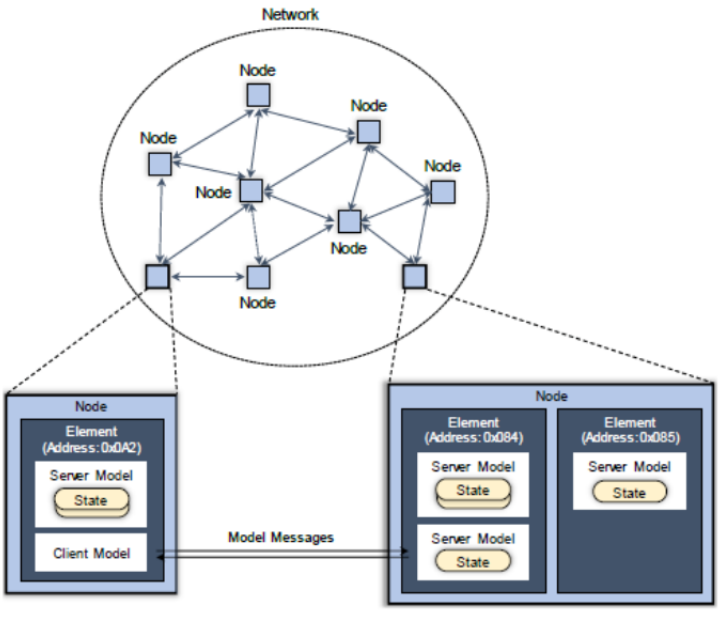

Figure 280: Overview Of Bletooth Mesh

Features

The BLE Mesh middleware has the following features:

- Supports one-to-one and one-to-many message transmission
- Supports relay messages to other nodes
- Supports secure message transmission against the following attack
    - Wiretap attack
    - Man-in-the-middle attack
    - Replay attack
    - Trash-can attack
    - Brute Force Key attack
- Supports following optional features
    - Supports Relay feature
    - Supports Proxy feature
    - Supports Friend feature
    - Supports Low Power feature

Target Devices

The BLE Mesh Network module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enable • Disable	Default (BSP)	Specify whether to include code for API parameter checking. Valid settings include.

Configurations for Networking > BLE Mesh Network modules > BLE Mesh (rm_ble_mesh)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh (rm_ble_mesh).

Configuration	Options	Default	Description
General			
Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Bearer			
Network Interface Number	Invalid Network Interface Number	2	Network interfaces number.
Provisioning Interface	Invalid Provisioning	2	Provisioning interfaces

Number	Interface Number		number.
Provisioning			
Unprovisioned Device Beacon Timeout in Milliseconds	Invalid Unprovisioned Device Beacon Timeout in Milliseconds	200	Unprovisioned device beacon timeout in milliseconds.
Network			
Network Cache Size	Invalid Network Cache Size	10	Network cache size.
Network Sequence Number Cache Size	Invalid Network Sequence Number Cache Size	32	Network sequence number cache size.
Maximum Number of Subnet	Invalid Maximum Number of Subnets	4	Maximum number of subnets
Maximum Number of Device Key	Invalid Maximum Number of Device Keys	4	Maximum number of device keys.
Proxy Filter List Size	Invalid Proxy Filter List Size	2	Maximum number of addresses present in each proxy filter list.
Network Sequence Number Block Size	Invalid Network Sequence Number Block Size	2048	The distance between the network sequence numbers, for every persistent storage write.
Network Transmit Count for Network Packets	Invalid Network Transmit Count for Network Packets	1	Network transmit count for network packets.
Network Interval Steps for Network Packets	Invalid Network Interval Steps for Network Packets	4	Network interval steps for network packets.
Network Transmit Count for Relayed Packets	Invalid Network Transmit Count for Relayed Packets	0	Network transmit count for relayed packets.
Network Interval Steps for Relayed Packets	Invalid Network Interval Steps for Relayed Packets	9	Network interval steps for relayed packets.
Proxy ADV Network ID Timeout for Each Subnet in Milliseconds.	Invalid Proxy ADV Network ID Timeout	100	Proxy ADV network ID timeout for each subnet in milliseconds.
Proxy ADV Node Identity Timeout for Each Subnet in Milliseconds	Invalid Proxy ADV Node Identity Timeout for Each Subnet in Milliseconds	300	Proxy ADV node identity timeout for each subnet in milliseconds.
Proxy ADV Node Identity Overall Time Period in Seconds	Invalid Proxy ADV Node Identity Overall Time Period in Seconds	60	Proxy ADV node identity overall time period in seconds.

Maximum Number of Queued Messages for Transmission	Invalid Maximum Number of Queued Messages for Transmission	64	Maximum number of queued messages for transmission.
Transport			
Maximum Number of LPN	Invalid Maximum Number of LPNs	1	Maximum number of LPNs.
Replay Protection Cache Size	Invalid Replay Protection Cache Size	10	Replay protection cache size.
Reassembled Cache Size	Invalid Reassembled Cache Size	8	Reassembled cach size.
Friend Poll Retry Count	Invalid Friend Poll Retry Count	10	Friend poll retry count.
Maximum Number of Segmentation and Reassembly Context	Invalid Maximum Number of Segmentation and Reassembly Context	8	Number of segmentation and reassembly contexts.
Lower Transport Segment Transmission Timeout in Milliseconds	Invalid Lower Transport Segment Transmission Timeout in Milliseconds	300	Lower transport segment transmission timeout in milliseconds.
Lower Transport Segment Re-Transmission Count	Invalid Lower Transport Segment Re-Transmission Count	2	Lower transport segment re-transmission count.
Lower Transport Acknowledgement Timeout in Milliseconds	Invalid Lower Transport Acknowledgement Timeout in Milliseconds	200	Lower transport acknowledgement timeout in milliseconds.
Lower Transport Incomplete Timeout in Seconds	Invalid Lower Transport Incomplete Timeout in Seconds	20	Lower transport incomplete timeout in seconds.
Friendship Receive Window	Invalid Friendship Receive Window	100	Friendship receive window.
Maximum Number of Friend Message Queue	Invalid Maximum Number of Friend Messages Queue	15	Maximum number of messages that the friend is capabale to queue for a single Low Power Node.
Maximum Number of Friend Subscription List	Invalid Maximum Number of Friend Subscription List	8	Maximum number of subscription addresses that the friend is capable to store for a single Low Power Node.
Friend Clear Confirmation Timeout in Milliseconds	Invalid Friend Clear Confirmation Timeout in Milliseconds	1000	Friend clear confirmation timeout in milliseconds.
Friend Clear Retry	Invalid Friend Clear	5	Friend clear retry

Count	Retry Count		count.
Friendship Retry Timeout in Milliseconds	Invalid Friendship Retry Timeout in Milliseconds	1200	Friendship retry timeout in milliseconds.
Access			
Maximum Number of Element	Invalid Maximum Number of Element	4	Maximum number of elements.
Maximum Number of Model	Invalid Maximum Number of Model	60	Maximum number of models.
Maximum Number of Application	Invalid Maximum Number of Application	8	Maximum number of applications (keys) the device can store information about.
Maximum Number of Virtual Address	Invalid Maximum Number of Virtual Address	8	Maximum number of virtual addresses the device can store information about.
Maximum Number of Non-Virtual Address	Invalid Maximum Number of Non-Virtual Address	8	Maximum number of non-virtual addresses the device can store information about.
Maximum Number of Transition Timers	Invalid Maximum Number of Transition Timers	5	Maximum number of transition timers.
Maximum Number of Periodic Step Timers	Invalid Maximum Number of Periodic Step Timers	5	Maximum number of periodic step timers.
Foundation			
Config Server Secure Network Beacon Interval	Invalid Config Server Secure Network Beacon Interval	10	Config server secure network beacon interval.
Maximum Number of Health Server Instance	Invalid Maximum Number of Health Server Instance	2	Maximum number of health server instances.
Model			
Maximum Number of Light Lightness Controller Server Instance	Invalid Maximum Number of Light Lightness Controller Server Instance	1	Maximum number of light lightness controller server instances.
ID			
Company ID	Invalid Company ID	0x0036	Company ID.
Product ID	Invalid Product ID	0x0001	Product ID.
Vendor ID	Invalid Vendor ID	0x0100	Vendor ID.
Platform			

Platform > Storage			
Block Number	Invalid Block Number	5	Block number.
Platform > Memory Pool			
Memory Pool Size	Invalid Memory Pool Size	0x4000	Memory pool size.
Platform > Logging			
Packet Bitfield	• Network • Lower Trans • Upper Trans • Access		Specifies if this is included in the packet_bitfield mask.
Module Info Bitfield	• Network • Lower Trans • Upper Trans • Access		Specifies if this is included in the module information bitfield mask.
Generic Log Bitfield	• Network • Lower Trans • Upper Trans • Access		Specifies if this is included in the generic log bitfield mask.
function	Name Must Be a Valid C Symbol	NULL	

Clock Configuration

Note

System clock (ICLK): 8 MHz or more
Peripheral module clock A (PCLKA): 8MHz or more
The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.
It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Mesh System Architecture

Purpose of each layer is,

Model layer

Model is a standardized typical functionality so that nodes perform operations in accordance with application scenario.

Foundation Model layer

Foundation Models are models to configure and manage operations of elements.

Access layer

The access layer defines how higher layer applications can use the upper transport layer.

Upper transport layer

The upper transport layer encrypts, decrypts, and authenticates application data and is designed to provide confidentiality of access messages.

Lower transport layer

The lower transport layer defines how upper transport layer messages are segmented and reassembled into multiple Lower Transport PDUs to deliver large upper transport layer messages to other nodes.

Network layer

The network layer defines how transport messages are addressed towards one or more elements.

Bearer layer

The bearer layer defines how network messages are transported between nodes.

Device Life Cycle

The device not joined in the mesh network is an Unprovisioned Device and the device joined in the mesh network is called a Node.

- Unprovisioned Device
  Unprovisioned device cannot send or receive mesh messages. However, it will advertise its presence to the provisioner. By the provisioner, Unprovisioned Devices are invited to join the mesh network and become nodes(Provisioning).
- Node
  Nodes can send and receive mesh messages. It is managed by the configuration client through the mesh network, which configures how the nodes communicate. The configuration client can also remove a Node from the mesh network, which will return the node to an Unprovisioned Device.

To communicate with other nodes by using Models, each node needs Configuration. By Configuration process, information required for Model operation such as Application Keys, Publish Address, Subscription Address is configured. Following shows a typical lifecycle of a node.

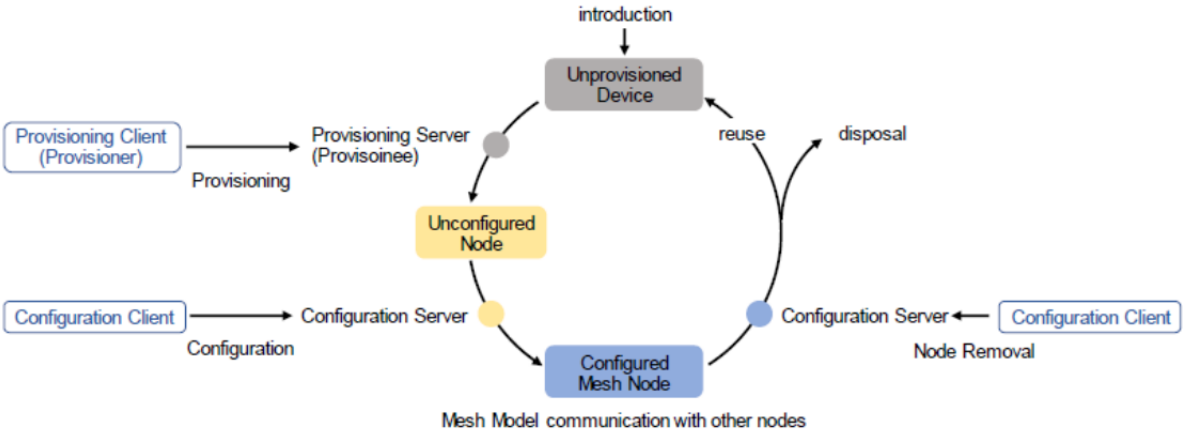

Figure 281: Device Life Cycle Image

Newly introduced device is provisioned by Provisioner and joins a network. Furthermore, this device is configured by Configuration Client and becomes to be able to communicate with other nodes with Mesh Model. Generally, Configuration Client is a smart phone or other mobile computing device. Configuration Client removes a node from a network by sending Config Node Reset message. Besides, Configuration Client updates encryption keys used in the network, and the removed node becomes unable to communicate with other nodes.

Examples

BLE_MESH Basic Example

This is a basic example of minimal use of the BLE_MESH in an application.

Data Structures

struct	rm_ble_mesh_instance_ctrl_t

Data Structure Documentation

◆ rm_ble_mesh_instance_ctrl_t

struct rm_ble_mesh_instance_ctrl_t
RM_BLE_MESH_BEARER private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_BEARER_Open() is called.

Function Documentation

◆ RM_BLE_MESH_Open()

fsp_err_t RM_BLE_MESH_Open (rm_ble_mesh_ctrl_t *const *p_ctrl*, rm_ble_mesh_cfg_t const *const *p_cfg*)

Open ble mesh middleware. API to initialize Mesh Stack. This is the first API that the application should call before any other API. This function initializes all the internal stack modules and data structures.
Implements rm_ble_mesh_api_t::open.
Example:
`/* Open the module. */`
`err = RM_BLE_MESH_Open(&g_ble_mesh0_ctrl, &g_ble_mesh0_cfg);`
Return values
FSP_SUCCESS — Module opened successfully.
FSP_ERR_ASSERTION — Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN — Module is already open.

◆ RM_BLE_MESH_Close()

fsp_err_t RM_BLE_MESH_Close (rm_ble_mesh_ctrl_t *const *p_ctrl*)

Close ble mesh middleware. API to turn off Bluetooth Hardware. This API should be called after RM_BLE_MESH_Open.

Implements rm_ble_mesh_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_Close(&g_ble_mesh0_ctrl);
```

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_StartTransitionTimer()

fsp_err_t RM_BLE_MESH_StartTransitionTimer (rm_ble_mesh_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_state_transition_t const *const *p_transition*, uint16_t *const *p_transition_time_handle*)

To start transition timer. API to start a transition timer.

Implements rm_ble_mesh_api_t::startTransitionTimer.

Example:

```
/* Start transition timer. */
   err = RM_BLE_MESH_StartTransitionTimer(&g_ble_mesh0_ctrl, &transition,
&transition_time_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_transition is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.

◆ RM_BLE_MESH_StopTransitionTimer()

fsp_err_t RM_BLE_MESH_StopTransitionTimer (rm_ble_mesh_ctrl_t *const *p_ctrl*, uint16_t *transition_time_handle*)

To stop transition timer. API to stop a transition timer.

Implements rm_ble_mesh_api_t::stopTransitionTimer.

Example:

```
/* Stop transition timer. */
   err = RM_BLE_MESH_StopTransitionTimer(&g_ble_mesh0_ctrl, transition_time_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_GetRemainingTransitionTime()

fsp_err_t RM_BLE_MESH_GetRemainingTransitionTime (rm_ble_mesh_ctrl_t *const *p_ctrl*, uint16_t *transition_time_handle*, uint8_t *const *p_remaining_transition_time*)

To get remaining Transition Time. API to get remaining Transition Time.

Implements rm_ble_mesh_api_t::getRemainingTransitionTime.

Example:

```
/* Get remaining transition time. */
   err = RM_BLE_MESH_GetRemainingTransitionTime(&g_ble_mesh0_ctrl,
transition_time_handle, &remaining_transition_time);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_remaining_transition_time is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_GetRemainingTransitionTimeWithOffset()

fsp_err_t RM_BLE_MESH_GetRemainingTransitionTimeWithOffset (rm_ble_mesh_ctrl_t *const *p_ctrl*, uint16_t *transition_time_handle*, uint32_t *offset_in_ms*, uint8_t *const *p_remaining_transition_time*)

To get remaining Transition Time, with offset. API to get remaining Transition Time with offset in ms.

Implements rm_ble_mesh_api_t::getRemainingTransitionTimeWithOffset.

Example:

```
/* Get remaining transition time with offset. */
   err = RM_BLE_MESH_GetRemainingTransitionTimeWithOffset(&g_ble_mesh0_ctrl,
                                                          transition_time_handle,
                                                          offset_in_ms,

&remaining_transition_time);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_remaining_transition_time is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ConvertTransitionTimeFromMs()

fsp_err_t RM_BLE_MESH_ConvertTransitionTimeFromMs (rm_ble_mesh_ctrl_t *const *p_ctrl*, uint32_t *transition_time_in_ms*, uint8_t *const *p_transition_time*)

To convert transition time from milisecond. API to convert transition timer in milisecond to Generic Default Transition Time state format.

Implements rm_ble_mesh_api_t::convertTransitionTimeFromMs.

Example:

```
/* Convert transition time from milliseconds. */
   err = RM_BLE_MESH_ConvertTransitionTimeFromMs(&g_ble_mesh0_ctrl,
transition_time_in_ms, &transition_time);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_transition_time is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ConvertTransitionTimeToMs()

fsp_err_t RM_BLE_MESH_ConvertTransitionTimeToMs (rm_ble_mesh_ctrl_t *const *p_ctrl*, uint8_t *transition_time*, uint32_t *const *p_transition_time_in_ms*)

To convert transition time to milisecond. API to convert Generic Default Transition Time state format to required transition time value in miliseconds.

Implements rm_ble_mesh_api_t::convertTransitionTimeToMs.

Example:

```
/* Convert transition time to milliseconds. */
   err = RM_BLE_MESH_ConvertTransitionTimeToMs(&g_ble_mesh0_ctrl, transition_time,
&transition_time_in_ms);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_transition_time_in_ms is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Overview

Target Devices

The BLE Mesh Network Access module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_access

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_access_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Access (rm_ble_mesh_access)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Access (rm_ble_mesh_access).

Configuration	Options	Default	Description

General

Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh_access0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Location Descriptor	Invalid Descriptor	0	Location descriptor.
Element Number	Invalid Descriptor	0	Element number to register the model.

Data Structures

struct	rm_ble_mesh_access_instance_ctrl_t

Data Structure Documentation

◆ rm_ble_mesh_access_instance_ctrl_t

struct rm_ble_mesh_access_instance_ctrl_t
RM_BLE_MESH_ACCESS private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_ACCESS_Open() is called.

Function Documentation

◆ RM_BLE_MESH_ACCESS_Open()

fsp_err_t RM_BLE_MESH_ACCESS_Open (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_cfg_t const *const *p_cfg*)

Open access middleware. This routine creates a new node in the device. This can be used by the application to create extra nodes if required in addition to the default primary node. And this routine registers an element that can be populated with the models information to a specific node in the device identified by the node id.

Implements rm_ble_mesh_access_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_ACCESS_Open(&g_ble_mesh_access0_ctrl, &g_ble_mesh_access0_cfg);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_Close()

fsp_err_t RM_BLE_MESH_ACCESS_Close (rm_ble_mesh_access_ctrl_t *const *p_ctrl*)

Close access middleware. Implements rm_ble_mesh_access_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_ACCESS_Close(&g_ble_mesh_access0_ctrl);
```

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_ACCESS_RegisterModel()

fsp_err_t RM_BLE_MESH_ACCESS_RegisterModel (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_t const *const *p_model*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

Register a model with the access layer. This routine registers a model associated with an element with the access layer.

Implements rm_ble_mesh_access_api_t::registerModel.

Example:

```
/* Register a model with the access layer. */
   err = RM_BLE_MESH_ACCESS_RegisterModel(&g_ble_mesh_access0_ctrl, &model,
&model_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_model and p_model_handle are NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetElementHandle()

fsp_err_t RM_BLE_MESH_ACCESS_GetElementHandle (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *elem_addr*, rm_ble_mesh_access_element_handle_t *const *p_handle*)

Get element handle. This routine searches for the element handle associated with specific element address.

Implements rm_ble_mesh_access_api_t::getElementHandle.

Example:

```
/* Get element handle. */
   err = RM_BLE_MESH_ACCESS_GetElementHandle(&g_ble_mesh_access0_ctrl, elem_addr,
&elem_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ADDRESS	Invalid source address.

◆ RM_BLE_MESH_ACCESS_GetElementHandleForModelHandle()

fsp_err_t RM_BLE_MESH_ACCESS_GetElementHandleForModelHandle (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, rm_ble_mesh_access_element_handle_t *const *p_elem_handle*)

Get element handle for a given model handle. This routine searches for the element handle associated with specific model handle.

Implements rm_ble_mesh_access_api_t::getElementHandleForModelHandle.

Example:

```
/* Get element handle for a given model handle. */
   err = RM_BLE_MESH_ACCESS_GetElementHandleForModelHandle(&g_ble_mesh_access0_ctrl,
model_handle, &elem_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_elem_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetModelHandle()

fsp_err_t RM_BLE_MESH_ACCESS_GetModelHandle (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_element_handle_t *elem_handle*, rm_ble_mesh_access_model_id_t *model_id*, rm_ble_mesh_access_model_handle_t *const *p_handle*)

Get model handle. This routine searches for the model handle associated with specific model ID.

Implements rm_ble_mesh_access_api_t::getModelHandle.

Example:

```
/* Get model handle. */
   err = RM_BLE_MESH_ACCESS_GetModelHandle(&g_ble_mesh_access0_ctrl, elem_handle,
model_id, &model_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_Publish()

fsp_err_t RM_BLE_MESH_ACCESS_Publish (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t const *const *p_handle*, rm_ble_mesh_access_req_msg_raw_t const *const *p_publish_message*, uint8_t *reliable*)

API to publish access layer message. This routine publishes Access Layer message to the publish address associated with the model.

Implements rm_ble_mesh_access_api_t::publish.

Example:

```
/* Publish access layer message. */
   err = RM_BLE_MESH_ACCESS_Publish(&g_ble_mesh_access0_ctrl, &model_handle,
&publish_message, reliable);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle and p_publish_message are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_ACCESS_ReliablePublish()

fsp_err_t RM_BLE_MESH_ACCESS_ReliablePublish (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t const *const *p_handle*, rm_ble_mesh_access_req_msg_raw_t const *const *p_publish_message*, uint32_t *rsp_opcode*)

API to reliably publish Access layer message. This routine reliably publishes Access Layer message to the publish address associated with the model.

Implements rm_ble_mesh_access_api_t::reliablePublish.

Example:

```
/* Reliably publish access layer message. */
   err = RM_BLE_MESH_ACCESS_ReliablePublish(&g_ble_mesh_access0_ctrl, &model_handle,
&req_msg_raw, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle and p_publish_message are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_ACCESS_Reply()

fsp_err_t RM_BLE_MESH_ACCESS_Reply (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_req_msg_context_t const *const *p_req_msg_context*, uint8_t *ttl*, rm_ble_mesh_access_req_msg_raw_t const *const *p_req_msg_raw*)

API to reply to Access Layer message. This routine replies to Access Layer message.

Implements rm_ble_mesh_access_api_t::reply.

Example:

```
/* Reply to access layer message. */
   err = RM_BLE_MESH_ACCESS_Reply(&g_ble_mesh_access0_ctrl, &req_msg_context, ttl,
&req_msg_raw);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_req_msg_context and p_req_msg_raw are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_ACCESS_ReplyAndPublish()

fsp_err_t RM_BLE_MESH_ACCESS_ReplyAndPublish (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_req_msg_context_t const *const *p_req_msg_context*, rm_ble_mesh_access_req_msg_raw_t const *const *p_req_msg_raw*, rm_ble_mesh_access_publish_setting_t const *const *p_publish_setting*)

API to reply to Access Layer message and optionally also to publish. This routine replies to Access Layer message and also publish if requested by application.

Implements rm_ble_mesh_access_api_t::replyAndPublish.

Example:

```
/* Reply to access layer message. */
   err =
RM_BLE_MESH_ACCESS_ReplyAndPublish(&g_ble_mesh_access0_ctrl, &req_msg_context,
&req_msg_raw, &publish_setting);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_req_msg_context and p_req_msg_raw are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_ACCESS_SendPdu()

fsp_err_t RM_BLE_MESH_ACCESS_SendPdu (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_pdu_t const *const *p_pdu*, uint8_t *reliable*)

API to send access PDUs. This routine sends transport PDUs to peer device.

Implements rm_ble_mesh_access_api_t::sendPdu.

Example:

```
/* Send Access PDUs. */
   err = RM_BLE_MESH_ACCESS_SendPdu(&g_ble_mesh_access0_ctrl, &pdu, reliable);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_pdu is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_GetCompositionData()

fsp_err_t RM_BLE_MESH_ACCESS_GetCompositionData (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_buffer_t *const *p_buffer*)

Get composition data.

Implements rm_ble_mesh_access_api_t::getCompositionData.

Example:

```
/* Get composition data. */
   err = RM_BLE_MESH_ACCESS_GetCompositionData(&g_ble_mesh_access0_ctrl, &buffer);
```

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_buffer is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_Reset()

fsp_err_t RM_BLE_MESH_ACCESS_Reset (rm_ble_mesh_access_ctrl_t *const *p_ctrl*)

To reset a node. This routine resets a node (other than a Provisioner) and removes it from the network.

Implements rm_ble_mesh_access_api_t::reset.

Example:

```
/* Reset a node. */
   err = RM_BLE_MESH_ACCESS_Reset(&g_ble_mesh_access0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetElementCount()

fsp_err_t RM_BLE_MESH_ACCESS_GetElementCount (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *const *p_count*)

To get the number of elements in local node. This routine retrieves the number of elements in local node.

Implements rm_ble_mesh_access_api_t::getElementCount.

Example:

```
/* Get the number of elements in local node. */
   err = RM_BLE_MESH_ACCESS_GetElementCount(&g_ble_mesh_access0_ctrl, &count);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_count is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_SetPrimaryUnicastAddress()

fsp_err_t RM_BLE_MESH_ACCESS_SetPrimaryUnicastAddress (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*)

To set primary unicast address. This routine sets primary unicast address.

Implements rm_ble_mesh_access_api_t::setPrimaryUnicastAddress.

Example:

```
/* Set primary unicast address. */
   err = RM_BLE_MESH_ACCESS_SetPrimaryUnicastAddress(&g_ble_mesh_access0_ctrl,
addr);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ADDRESS	Invalid source address.

◆ RM_BLE_MESH_ACCESS_GetPrimaryUnicastAddress()

fsp_err_t RM_BLE_MESH_ACCESS_GetPrimaryUnicastAddress (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *const *p_addr*)

To get primary unicast address. This routine gets primary unicast address.

Implements rm_ble_mesh_access_api_t::getPrimaryUnicastAddress.

Example:

```
/* Get primary unicast address. */
   err = RM_BLE_MESH_ACCESS_GetPrimaryUnicastAddress(&g_ble_mesh_access0_ctrl,
&addr);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_addr is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_SetDefaultTtl()

fsp_err_t RM_BLE_MESH_ACCESS_SetDefaultTtl (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *ttl*)

To set default TTL. This routine sets default TTL.

Implements rm_ble_mesh_access_api_t::setDefaultTtl.

Example:

```
/* Set default TTL. */
   err = RM_BLE_MESH_ACCESS_SetDefaultTtl(&g_ble_mesh_access0_ctrl, ttl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetDefaultTtl()

fsp_err_t RM_BLE_MESH_ACCESS_GetDefaultTtl (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t const *const *p_ttl*)

To get default TTL. This routine gets default TTL.

Implements rm_ble_mesh_access_api_t::getDefaultTtl.

Example:

```
/* Get default TTL. */
   err = RM_BLE_MESH_ACCESS_GetDefaultTtl(&g_ble_mesh_access0_ctrl, &ttl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_ttl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_SetIvIndex()

fsp_err_t RM_BLE_MESH_ACCESS_SetIvIndex (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint32_t *iv_index*, uint8_t *iv_update_flag*)

To set IV Index. This routine sets IV Index.

Implements rm_ble_mesh_access_api_t::setIvIndex.

Example:

```
/* Set IV Index. */
   err = RM_BLE_MESH_ACCESS_SetIvIndex(&g_ble_mesh_access0_ctrl, iv_index,
iv_update_flag);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.
FSP_ERR_IN_USE	Resource is busy.

◆ RM_BLE_MESH_ACCESS_GetIvIndex()

fsp_err_t RM_BLE_MESH_ACCESS_GetIvIndex (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint32_t *const *p_iv_index*, uint8_t *const *p_iv_update_flag*)

To get IV Index. This routine gets IV Index.

Implements rm_ble_mesh_access_api_t::getIvIndex.

Example:

```
/* Get IV Index. */
   err = RM_BLE_MESH_ACCESS_GetIvIndex(&g_ble_mesh_access0_ctrl, &iv_index,
&iv_update_flag);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_iv_index and p_iv_update_flag are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetIvIndexByIvi()

fsp_err_t RM_BLE_MESH_ACCESS_GetIvIndexByIvi (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *ivi*, uint32_t *const *p_iv_index*)

To get IV Index by IVI. This routine gets IV Index based on the IVI in the received packet.

Implements rm_ble_mesh_access_api_t::getIvIndexByIvi.

Example:

```
/* Get IV Index by IVI. */
   err = RM_BLE_MESH_ACCESS_GetIvIndexByIvi(&g_ble_mesh_access0_ctrl, ivi,
&iv_index);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_iv_index is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_SetFeaturesField()

fsp_err_t RM_BLE_MESH_ACCESS_SetFeaturesField (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *enable*, uint8_t *feature*)

To enable/disable a feature. This routine enables/disables a feature field.

Implements rm_ble_mesh_access_api_t::setFeaturesField.

Example:

```
/* Enable/Disable a feature. */
   err = RM_BLE_MESH_ACCESS_SetFeaturesField(&g_ble_mesh_access0_ctrl, enable,
features);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetFeaturesField()

fsp_err_t RM_BLE_MESH_ACCESS_GetFeaturesField (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *const *p_enable*, uint8_t *feature*)

To get state of a feature. This routine gets the state of a feature field.

Implements rm_ble_mesh_access_api_t::getFeaturesField.

Example:

```
/* Get state of a feature. */
   err = RM_BLE_MESH_ACCESS_GetFeaturesField(&g_ble_mesh_access0_ctrl, &enable,
features);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_enable is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetFeatures()

fsp_err_t RM_BLE_MESH_ACCESS_GetFeatures (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *const *p_features*)

To get state of all features. This routine gets the state of all features.

Implements rm_ble_mesh_access_api_t::getFeatures.

Example:

```
/* Get state of all features. */
   err = RM_BLE_MESH_ACCESS_GetFeatures(&g_ble_mesh_access0_ctrl, &features);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_features is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetFriendshipRole()

fsp_err_t RM_BLE_MESH_ACCESS_GetFriendshipRole (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *const *p_friend_role*)

To get friendship role of the node. This routine gets the current friendship role of the node.

Implements rm_ble_mesh_access_api_t::getFriendshipRole.

Example:

```
/* Get friendship role of the node. */
   err = RM_BLE_MESH_ACCESS_GetFriendshipRole(&g_ble_mesh_access0_ctrl,
&friend_role);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_friend_role is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_SetFriendshipRole()

fsp_err_t RM_BLE_MESH_ACCESS_SetFriendshipRole (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *friend_role*)

To set friendship role of the node. This routine sets the current friendship role of the node.

Implements rm_ble_mesh_access_api_t::setFriendshipRole.

Example:

```
/* Set friendship role of the node. */
   err = RM_BLE_MESH_ACCESS_SetFriendshipRole(&g_ble_mesh_access0_ctrl,
friend_role);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_AddDeviceKey()

fsp_err_t RM_BLE_MESH_ACCESS_AddDeviceKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t const *const *p_dev_key*, rm_ble_mesh_network_address_t *uaddr*, uint8_t *num_elements*)

To add Device Key. This routine adds Device Key entry, along with corresponding Primary Device Address and Number of elements.

Implements rm_ble_mesh_access_api_t::addDeviceKey.

Example:

```
/* Add Device Key. */
   err = RM_BLE_MESH_ACCESS_AddDeviceKey(&g_ble_mesh_access0_ctrl, &dev_key, uaddr,
num_elements);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_dev_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OVERFLOW	Device key table is full.

◆ RM_BLE_MESH_ACCESS_GetDeviceKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetDeviceKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *dev_key_index*, uint8_t **const *p_dev_key*)

To get Device Key. This routine gets Device Key entry.

Implements rm_ble_mesh_access_api_t::getDeviceKey.

Example:

```
/* Get Device Key. */
   err = RM_BLE_MESH_ACCESS_GetDeviceKey(&g_ble_mesh_access0_ctrl, dev_key_index,
p_dev_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_dev_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_RemoveAllDeviceKeys()

fsp_err_t RM_BLE_MESH_ACCESS_RemoveAllDeviceKeys (rm_ble_mesh_access_ctrl_t *const *p_ctrl*)

To remove all Device Keys. This routine removes all Device Keys from table.

Implements rm_ble_mesh_access_api_t::removeAllDeviceKeys.

Example:

```
/* Remove all Device Keys. */
   err = RM_BLE_MESH_ACCESS_RemoveAllDeviceKeys(&g_ble_mesh_access0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetProvisionedDeviceList()

fsp_err_t RM_BLE_MESH_ACCESS_GetProvisionedDeviceList (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_provisioned_device_entry_t const *const *p_prov_dev_list*, uint16_t *const *p_num_entries*)

To get list of Provisioned Device List. This routine returns list of Provisioned Devices from the Device Key Table.

Implements rm_ble_mesh_access_api_t::getProvisionedDeviceList.

Example:

```
/* Get list of provisioned device list. */
   err = RM_BLE_MESH_ACCESS_GetProvisionedDeviceList(&g_ble_mesh_access0_ctrl,
&prov_dev_list, &num_entries);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_prov_dev_list and p_num_entries are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetDeviceKeyHandle()

fsp_err_t RM_BLE_MESH_ACCESS_GetDeviceKeyHandle (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *prim_elem_uaddr*, rm_ble_mesh_access_device_key_handle_t *const *p_handle*)

To get device key handle. This routine returns Device Key Handle for a given Primary Element Address entry in Device Key Table.

Implements rm_ble_mesh_access_api_t::getDeviceKeyHandle.

Example:

```
/* Get Device Key handle. */
   err = RM_BLE_MESH_ACCESS_GetDeviceKeyHandle(&g_ble_mesh_access0_ctrl,
prim_elem_uaddr, &handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetAppKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_appkey_handle_t *appkey_handle*, uint8_t **const *p_app_key*, uint8_t *const *p_aid*)

To get AppKey. This routine gets AppKey along with AID entry.

Implements rm_ble_mesh_access_api_t::getAppKey.

Example:

```
/* Get AppKey. */
   err = RM_BLE_MESH_ACCESS_GetAppKey(&g_ble_mesh_access0_ctrl, appkey_handle,
p_app_key, &aid);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_app_key and p_aid are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_AddUpdateNetkey()

fsp_err_t RM_BLE_MESH_ACCESS_AddUpdateNetkey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint16_t *netkey_index*, uint32_t *opcode*, uint8_t const *const *p_net_key*)

To add/update NetKey. This routine adds/updates NetKey entry. Each NetKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::addUpdateNetkey.

Example:

```
/* Add/Update NetKey. */
   err = RM_BLE_MESH_ACCESS_AddUpdateNetkey(&g_ble_mesh_access0_ctrl, netkey_index,
opcode, &net_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_net_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_AddFriendSecurityCredential()

fsp_err_t RM_BLE_MESH_ACCESS_AddFriendSecurityCredential (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *friend_index*, rm_ble_mesh_access_friend_security_credential_info_t *info*)

To add Security Credential of a LPN or the Friend. This routine adds NID, privacy and encryption keys associated with a friendship.

Implements rm_ble_mesh_access_api_t::addFriendSecurityCredential.

Example:

```
/* Add security credential of a LPN or the friend. */
   err =
RM_BLE_MESH_ACCESS_AddFriendSecurityCredential(&g_ble_mesh_access0_ctrl,
subnet_handle, friend_index, info);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_DeleteFriendSecurityCredential()

fsp_err_t RM_BLE_MESH_ACCESS_DeleteFriendSecurityCredential (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *friend_index*)

To delete the Security Credential of a LPN or the Friend. This routine deletes NID, privacy and encryption keys associated with a friendship.

Implements rm_ble_mesh_access_api_t::deleteFriendSecurityCredential.

Example:

```
/* Delete the security credential of a LPN or the Friend. */
   err = RM_BLE_MESH_ACCESS_DeleteFriendSecurityCredential(&g_ble_mesh_access0_ctrl,
subnet_handle, friend_index);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_FindSubnet()

fsp_err_t RM_BLE_MESH_ACCESS_FindSubnet (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint16_t *netkey_index*, rm_ble_mesh_network_subnet_handle_t *const *p_subnet_handle*)

To find a Subnet associated with the NetKey. This routine finds a Subnet based on the NetKey entry. Each NetKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::findSubnet.

Example:

```
/* Find a subnet associated with the NetKey. */
   err = RM_BLE_MESH_ACCESS_FindSubnet(&g_ble_mesh_access0_ctrl, netkey_index,
&subnet_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_subnet_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_FindMasterSubnet()

fsp_err_t RM_BLE_MESH_ACCESS_FindMasterSubnet (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *friend_subnet_handle*, rm_ble_mesh_network_subnet_handle_t *const *p_master_subnet_handle*)

To find the Master Subnet associated with the friend security credential, identified by Friend Subnet Handle. This routine finds the Master Subnet based on the friend security credential, identified by Friend Subnet Handle.

Implements rm_ble_mesh_access_api_t::findMasterSubnet.

Example:

```
/* Close the module. */
   err =
RM_BLE_MESH_ACCESS_FindMasterSubnet(&g_ble_mesh_access0_ctrl, friend_subnet_handle,
&master_subnet_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_master_subnet_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_DeleteNetKey()

fsp_err_t RM_BLE_MESH_ACCESS_DeleteNetKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*)

To delete NetKey. This routine deletes a NetKey entry. Each NetKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::deleteNetKey.

Example:

```
/* Delete NetKey. */
   err = RM_BLE_MESH_ACCESS_DeleteNetKey(&g_ble_mesh_access0_ctrl, subnet_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetNetKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetNetKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t *const *p_net_key*)

To get NetKey. This routine fetches a NetKey entry. Each NetKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::getNetKey.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_ACCESS_GetNetKey(&g_ble_mesh_access0_ctrl, subnet_handle,
&net_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_net_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_GetNetKeyIndexList()

fsp_err_t RM_BLE_MESH_ACCESS_GetNetKeyIndexList (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint16_t *const *p_netkey_count*, uint16_t *const *p_netkey_index_list*)

To get list of all known NetKeys. This routine returns a list of known NetKey Indices.

Implements rm_ble_mesh_access_api_t::getNetKeyIndexList.

Example:

```
/* Get list of all known NetKeys. */
   err = RM_BLE_MESH_ACCESS_GetNetKeyIndexList(&g_ble_mesh_access0_ctrl,
&netkey_count, &netkey_index_list);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_netkey_count and p_netkey_index_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_LookUpNid()

fsp_err_t RM_BLE_MESH_ACCESS_LookUpNid (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *nid*, rm_ble_mesh_network_subnet_handle_t *const *p_subnet_handle*, rm_ble_mesh_access_associated_keys_t *const *p_key_set*)

To search for NID. This routine searches for matching NID in subnet table.

Implements rm_ble_mesh_access_api_t::lookUpNid.

Example:

```
/* Search for NID. */
   err = RM_BLE_MESH_ACCESS_LookUpNid(&g_ble_mesh_access0_ctrl, nid, &subnet_handle,
&key_set);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_subnet_handle and p_key_set are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_LookUpNetworkId()

fsp_err_t RM_BLE_MESH_ACCESS_LookUpNetworkId (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t const *const *p_network_id*, rm_ble_mesh_network_subnet_handle_t *const *p_subnet_handle*, rm_ble_mesh_access_associated_keys_t *const *p_key_set*)

To search for Network ID. This routine searches for matching Network ID in subnet table.

Implements rm_ble_mesh_access_api_t::lookUpNetworkId.

Example:

```
/* Search for NID. */
   err = RM_BLE_MESH_ACCESS_LookUpNid(&g_ble_mesh_access0_ctrl, nid, &subnet_handle,
&key_set);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_network_id, p_subnet_handle and p_key_set are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_LookUpAid()

fsp_err_t RM_BLE_MESH_ACCESS_LookUpAid (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *aid*, rm_ble_mesh_network_appkey_handle_t *const *p_appkey_handle*, uint8_t *const *p_app_key*)

To search for AID. This routine searches for matching NID in subnet table.

Implements rm_ble_mesh_access_api_t::lookUpAid.

Example:

```
/* Search for AID. */
   err = RM_BLE_MESH_ACCESS_LookUpAid(&g_ble_mesh_access0_ctrl, aid, &appkey_handle,
&app_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_appkey_handle and p_app_key are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_SetProvisioningData()

fsp_err_t RM_BLE_MESH_ACCESS_SetProvisioningData (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_data_t const *const *p_prov_data*)

Set Provisioning Data. This routine configures the provisioning data with Access Layer.

Implements rm_ble_mesh_access_api_t::setProvisioningData.

Example:

```
/* Set provisioning data. */
   err = RM_BLE_MESH_ACCESS_SetProvisioningData(&g_ble_mesh_access0_ctrl,
&prov_data);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_prov_data is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetSubnetNid()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetNid (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_nid*)

To get NID associated with a subnet. This routine fetches the NID associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetNid.

Example:

```
/* Get NID associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetNid(&g_ble_mesh_access0_ctrl, subnet_handle,
&nid);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_nid is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetSubnetPrivacyKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetPrivacyKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_privacy_key*)

To get Privacy Key associated with a subnet. This routine fetches the Privacy Key associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetPrivacyKey.

Example:

```
/* Get Privacy Key associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetPrivacyKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &privacy_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_privacy_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetSubnetNetworkId()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetNetworkId (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_network_id*)

To get Network ID associated with a subnet. This routine fetches the Netowrk ID associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetNetworkId.

Example:

```
/* Get Network ID associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetNetworkId(&g_ble_mesh_access0_ctrl,
subnet_handle, &network_id);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_network_id is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetSubnetBeaconKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetBeaconKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_beacon_key*)

To get Beacon Key associated with a subnet. This routine fetches the Beacon Key associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetBeaconKey.

Example:

```
/* Get Beacon Key associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetBeaconKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &beacon_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_beacon_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetSubnetIdentityKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetIdentityKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_identity_key*)

To get Identity Key associated with a subnet. This routine fetches the Identity Key associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetIdentityKey.

Example:

```
/* Get Identity Key associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetIdentityKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &identity_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_identity_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetSubnetEncryptionKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetEncryptionKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_encrypt_key*)

To get Encryption Key associated with a subnet. This routine fetches the Encryption Key associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetEncryptionKey.

Example:

```
/* Get Encryption Key associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetEncryptionKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &encrypt_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_encrypt_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetNodeIdentity()

fsp_err_t RM_BLE_MESH_ACCESS_GetNodeIdentity (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t *const *p_id_state*)

To get Node Identity. This routine gets Node Identity State of a node

Implements rm_ble_mesh_access_api_t::getNodeIdentity.

Example:

```
/* Get node identity. */
   err = RM_BLE_MESH_ACCESS_GetNodeIdentity(&g_ble_mesh_access0_ctrl, subnet_handle,
&id_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_id_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_SetNodeIdentity()

fsp_err_t RM_BLE_MESH_ACCESS_SetNodeIdentity (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t *const *p_id_state*)

To set Node Identity. This routine sets Node Identity State of a node.

Implements rm_ble_mesh_access_api_t::setNodeIdentity.

Example:

```
/* Set node identity. */
   err = RM_BLE_MESH_ACCESS_SetNodeIdentity(&g_ble_mesh_access0_ctrl, subnet_handle,
&id_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_id_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_GetKeyRefreshPhase()

fsp_err_t RM_BLE_MESH_ACCESS_GetKeyRefreshPhase (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t *const *p_key_refresh_state*)

To get Key Refresh Phase. This routine gets Key Refresh Phase State of a node

Implements rm_ble_mesh_access_api_t::getKeyRefreshPhase.

Example:

```
/* Get key refresh phase. */
   err = RM_BLE_MESH_ACCESS_GetKeyRefreshPhase(&g_ble_mesh_access0_ctrl,
subnet_handle, &key_refresh_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_key_refresh_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_SetKeyRefreshPhase()

fsp_err_t RM_BLE_MESH_ACCESS_SetKeyRefreshPhase (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t const *const *p_key_refresh_state*)

To set Key Refresh Phase. This routine sets Key Refresh Phase State of a node.

Implements rm_ble_mesh_access_api_t::setKeyRefreshPhase.

Example:

```
/* Set key refresh phase. */
   err = RM_BLE_MESH_ACCESS_SetKeyRefreshPhase(&g_ble_mesh_access0_ctrl,
subnet_handle, &key_refresh_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_key_refresh_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_SetTransmitState()

fsp_err_t RM_BLE_MESH_ACCESS_SetTransmitState (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *tx_state_type*, uint8_t *tx_state*)

To set Network/Relay Transmit state. This routine sets Network/Relay Transmit state.

Implements rm_ble_mesh_access_api_t::setTransmitState.

Example:

```
/* Set network/relay transmit state. */
   err = RM_BLE_MESH_ACCESS_SetTransmitState(&g_ble_mesh_access0_ctrl,
tx_state_type, tx_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetTransmitState()

fsp_err_t RM_BLE_MESH_ACCESS_GetTransmitState (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *tx_state_type*, uint8_t *const *p_tx_state*)

To get Network/Relay Transmit state. This routine gets Network/Relay Transmit state.

Implements rm_ble_mesh_access_api_t::getTransmitState.

Example:

```
/* Get network/relay transmit state. */
   err = RM_BLE_MESH_ACCESS_GetTransmitState(&g_ble_mesh_access0_ctrl,
tx_state_type, &tx_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_tx_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_AddAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_AddAppKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *appkey_index*, uint8_t const *const *p_app_key*)

To add AppKey. This routine adds AppKey entry. Each AppKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::addAppKey.

Example:

```
/* Add AppKey. */
   err = RM_BLE_MESH_ACCESS_AddAppKey(&g_ble_mesh_access0_ctrl, subnet_handle,
appkey_index, &app_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_app_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_UpdateAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_UpdateAppKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *appkey_index*, uint8_t const *const *p_app_key*)

To update AppKey. This routine updates AppKey entry. Each AppKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::updateAppKey.

Example:

```
/* Update AppKey. */
   err = RM_BLE_MESH_ACCESS_UpdateAppKey(&g_ble_mesh_access0_ctrl, subnet_handle,
appkey_index, &app_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_app_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_DeleteAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_DeleteAppKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *appkey_index*, uint8_t const *const *p_app_key*)

To delete AppKey. This routine deletes AppKey entry. Each AppKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::deleteAppKey.

Example:

```
/* Delete AppKey. */
   err = RM_BLE_MESH_ACCESS_DeleteAppKey(&g_ble_mesh_access0_ctrl, subnet_handle,
appkey_index, &app_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_app_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetAppKeyHandle()

fsp_err_t RM_BLE_MESH_ACCESS_GetAppKeyHandle (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *appkey_index*, uint8_t const *const *p_app_key*, rm_ble_mesh_network_appkey_handle_t *const *p_appkey_handle*)

To get AppKey Handle for a given AppKey Index. This routine gets AppKey Handle for a given AppKey Index. Each AppKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::getAppKeyHandle.

Example:

```
/* Get AppKey handle for a given AppKey index. */
   err = RM_BLE_MESH_ACCESS_GetAppKeyHandle(&g_ble_mesh_access0_ctrl,
                                            subnet_handle,
                                            appkey_index,
                                            &app_key,
                                            &appkey_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_appkey_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_GetAppKeyIndexList()

fsp_err_t RM_BLE_MESH_ACCESS_GetAppKeyIndexList (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *const *p_appkey_count*, uint16_t *const *p_appkey_index_list*)

To get list of all known AppKeys. This routine returns a list of known AppKey Indices associated with a subnet.

Implements rm_ble_mesh_access_api_t::getAppKeyIndexList.

Example:

```
/* Get list of all known AppKeys. */
   err = RM_BLE_MESH_ACCESS_GetAppKeyIndexList(&g_ble_mesh_access0_ctrl,
                                               subnet_handle,
                                                &appkey_count,
                                                &appkey_index_list);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_appkey_count and p_appkey_index_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_BindModelWithAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_BindModelWithAppKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, uint16_t *appkey_index*)

To bind a model with an AppKey. This routine binds a model with an AppKey.

Implements rm_ble_mesh_access_api_t::bindModelWithAppKey.

Example:

```
/* Bind a model with an AppKey. */
   err = RM_BLE_MESH_ACCESS_BindModelWithAppKey(&g_ble_mesh_access0_ctrl,
model_handle, appkey_index);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_UnbindModelWithAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_UnbindModelWithAppKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, uint16_t *appkey_index*)

To unbind a model with an AppKey. This routine unbinds a model with an AppKey.

Implements rm_ble_mesh_access_api_t::unbindModelWithAppKey.

Example:

```
/* Unbind a model with an AppKey. */
   err = RM_BLE_MESH_ACCESS_UnbindModelWithAppKey(&g_ble_mesh_access0_ctrl,
model_handle, appkey_index);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_GetModelAppKeyList()

fsp_err_t RM_BLE_MESH_ACCESS_GetModelAppKeyList (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, uint16_t *const *p_appkey_count*, uint16_t *const *p_appkey_index_list*)

To get list of all AppKeys associated with a model. This routine returns a list of known AppKey Indices associated with a model.

Implements rm_ble_mesh_access_api_t::getModelAppKeyList.

Example:

```
/* Get list of all AppKeys associated with a model. */
   err = RM_BLE_MESH_ACCESS_GetModelAppKeyList(&g_ble_mesh_access0_ctrl,
                                               model_handle,
                                               &appkey_count,
                                               &appkey_index_list);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_appkey_count and p_appkey_index_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_SetModelPublication()

fsp_err_t RM_BLE_MESH_ACCESS_SetModelPublication (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, rm_ble_mesh_access_publish_info_t *const *p_publish_info*)

To set Publication information associated with a model. This routine sets Publication information associated with a model.

Implements rm_ble_mesh_access_api_t::setModelPublication.

Example:

```
/* Set publication information associated with a model. */
   err = RM_BLE_MESH_ACCESS_SetModelPublication(&g_ble_mesh_access0_ctrl,
model_handle, &publish_info);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_publish_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_SetModelPublicationPeriodDivisor()

fsp_err_t RM_BLE_MESH_ACCESS_SetModelPublicationPeriodDivisor (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, uint8_t *period_divisor*)

To set Publication Fast Period Divisor information associated with a model. This routine sets Publication Fast Period Divisor information associated with a model.

Implements rm_ble_mesh_access_api_t::setModelPublicationPeriodDivisor.

Example:

```
/* Set publication fast period divisor information associated with a model. */
   err =
RM_BLE_MESH_ACCESS_SetModelPublicationPeriodDivisor(&g_ble_mesh_access0_ctrl,
model_handle, period_divisor);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetModelPublication()

fsp_err_t RM_BLE_MESH_ACCESS_GetModelPublication (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, rm_ble_mesh_access_publish_info_t *const *p_publish_info*)

To get Publication information associated with a model. This routine returns Publication information associated with a model.

Implements rm_ble_mesh_access_api_t::getModelPublication.

Example:

```
/* Get publication information associated with a model. */
   err = RM_BLE_MESH_ACCESS_GetModelPublication(&g_ble_mesh_access0_ctrl,
model_handle, &publish_info);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_publish_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_AddModelSubscription()

fsp_err_t RM_BLE_MESH_ACCESS_AddModelSubscription (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, rm_ble_mesh_access_address_t const *const *p_sub_addr*)

To add an address to a model subscription list. This routine adds an address to a subscription list of a model.

Implements rm_ble_mesh_access_api_t::addModelSubscription.

Example:

```
/* Add an address to a model subscription list. */
   err = RM_BLE_MESH_ACCESS_AddModelSubscription(&g_ble_mesh_access0_ctrl,
model_handle, &sub_addr);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_sub_addr is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_DeleteModelSubscription()

fsp_err_t RM_BLE_MESH_ACCESS_DeleteModelSubscription (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, rm_ble_mesh_access_address_t const *const *p_sub_addr*)

To delete an address to a model subscription list. This routine deletes an address to a subscription list of a model.

Implements rm_ble_mesh_access_api_t::deleteModelSubscription.

Example:

```
/* Delete an address to a model subscription list. */
   err = RM_BLE_MESH_ACCESS_DeleteModelSubscription(&g_ble_mesh_access0_ctrl,
model_handle, &sub_addr);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_sub_addr is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_DeleteAllModelSubscription()

fsp_err_t RM_BLE_MESH_ACCESS_DeleteAllModelSubscription (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*)

To discard a model subscription list. This routine discards a subscription list of a model.

Implements rm_ble_mesh_access_api_t::deleteAllModelSubscription.

Example:

```
/* Discard a model subscription list. */
   err = RM_BLE_MESH_ACCESS_DeleteAllModelSubscription(&g_ble_mesh_access0_ctrl,
model_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_GetModelSubscriptionList()

fsp_err_t RM_BLE_MESH_ACCESS_GetModelSubscriptionList (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, uint16_t *const *p_sub_addr_count*, uint16_t *const *p_sub_addr_list*)

To get list of subscription addresses of a model. This routine returns a list of subscription addresses of a model.

Implements rm_ble_mesh_access_api_t::getModelSubscriptionList.

Example:

```
/* Get list of subscription addresses of a model. */
   err = RM_BLE_MESH_ACCESS_GetModelSubscriptionList(&g_ble_mesh_access0_ctrl,
                                                     model_handle,
                                                         &sub_addr_count,
                                                         &sub_addr_list);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_sub_addr_count and p_sub_addr_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_GetAllModelSubscriptionList()

fsp_err_t RM_BLE_MESH_ACCESS_GetAllModelSubscriptionList (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint16_t *const *p_sub_addr_count*, uint16_t *const *p_sub_addr_list*)

To get list of subscription addresses of all the models. This routine returns a consolidated list of subscription addresses of all the models.

Implements rm_ble_mesh_access_api_t::getAllModelSubscriptionList.

Example:

```
/* Get list of subscription addresses of all the models. */
   err = RM_BLE_MESH_ACCESS_GetAllModelSubscriptionList(&g_ble_mesh_access0_ctrl,
&sub_addr_count, &sub_addr_list);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_sub_addr_count and p_sub_addr_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_IsValidElementAddress()

fsp_err_t RM_BLE_MESH_ACCESS_IsValidElementAddress (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*)

To check if valid element address to receive a packet. This routine checks if destination address in a received packet matches with any of the known element address of local or friend device.

Implements rm_ble_mesh_access_api_t::isValidElementAddress.

Example:

```
/* Check if valid element address to receive a packet. */
   err = RM_BLE_MESH_ACCESS_IsValidElementAddress(&g_ble_mesh_access0_ctrl, addr);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.

◆ RM_BLE_MESH_ACCESS_IsFixedGroupAddressToBeProcessed()

fsp_err_t RM_BLE_MESH_ACCESS_IsFixedGroupAddressToBeProcessed (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*)

To check if Fixed Group Address in receive packet to be processed. This routine checks if destination address in a received packet as a Fixed Group Address to be processed.

Implements rm_ble_mesh_access_api_t::isFixedGroupAddressToBeProcessed.

Example:

```
/* Check if fixed group address in receive packet to be processed. */
   err =
RM_BLE_MESH_ACCESS_IsFixedGroupAddressToBeProcessed(&g_ble_mesh_access0_ctrl, addr);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_IsValidSubscriptionAddress()

fsp_err_t RM_BLE_MESH_ACCESS_IsValidSubscriptionAddress (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*)

To check if valid subscription address to receive a packet. This routine checks if destination address in a received packet matches with any of the known subscription address of local or friend device.

Implements rm_ble_mesh_access_api_t::isValidSubscriptionAddress.

Example:

```
/* Check if valid subscription address to receive a packet. */
   err = RM_BLE_MESH_ACCESS_IsValidSubscriptionAddress(&g_ble_mesh_access0_ctrl,
addr);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_EnableIvUpdateTestMode()

fsp_err_t RM_BLE_MESH_ACCESS_EnableIvUpdateTestMode (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_iv_update_test_mode_t *mode*)

To set the IV Update Test Mode feature. This routine is used to set the IV Update Test Mode flag.

Implements rm_ble_mesh_access_api_t::enableIvUpdateTestMode.

Example:

```
/* Set the IV update test mode feature. */
   err = RM_BLE_MESH_ACCESS_EnableIvUpdateTestMode(&g_ble_mesh_access0_ctrl, mode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Overview

Target Devices

The BLE Mesh Network Bearer module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_bearer

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_bearer_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Bearer (rm_ble_mesh_bearer)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Bearer (rm_ble_mesh_bearer).

Configuration	Options	Default	Description
General			
Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh_bearer0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.

Data Structures

struct	rm_ble_mesh_bearer_instance_ctrl_t

Data Structure Documentation

◆ rm_ble_mesh_bearer_instance_ctrl_t

struct rm_ble_mesh_bearer_instance_ctrl_t
RM_BLE_MESH_BEARER private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_BEARER_Open() is called.

Function Documentation

◆ RM_BLE_MESH_BEARER_Open()

fsp_err_t RM_BLE_MESH_BEARER_Open (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, rm_ble_mesh_bearer_cfg_t const *const *p_cfg*)

Open bearer middleware.

Implements rm_ble_mesh_bearer_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_BEARER_Open(&g_ble_mesh_bearer0_ctrl, &g_ble_mesh_bearer0_cfg);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.

◆ RM_BLE_MESH_BEARER_Close()

fsp_err_t RM_BLE_MESH_BEARER_Close (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*)

Close bearer middleware. Implements rm_ble_mesh_bearer_api_t::close.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_BEARER_Close(&g_ble_mesh_bearer0_ctrl);
```

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_BEARER_RegisterInterface()

fsp_err_t RM_BLE_MESH_BEARER_RegisterInterface (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, rm_ble_mesh_bearer_type_t *brr_type*, rm_ble_mesh_bearer_ntf_callback_result_t(*)(rm_ble_mesh_bearer_ntf_callback_args_t *p_args) *p_callback*)

Register interface with Bearer Layer. This routine registers interface with the Bearer Layer. Bearer Layer supports single Application, hence this rouine shall be called once.

Implements rm_ble_mesh_bearer_api_t::registerInterface.

Example:

```
/* Register Bearer interface. */
   err = RM_BLE_MESH_BEARER_RegisterInterface(&g_ble_mesh_bearer0_ctrl, brr_type,
rm_ble_mesh_bearer_ntf_callback);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_BEARER_RegisterBeaconHandler()

fsp_err_t RM_BLE_MESH_BEARER_RegisterBeaconHandler (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, rm_ble_mesh_bearer_beacon_type_t *bcon_type*, void(*)(rm_ble_mesh_bearer_beacon_callback_args_t *p_args) *p_handler*)

Register beacon interface with Bearer Layer. This routine registers interface with the Bearer Layer to process Beacons. Bearer Layer supports single Application, hence this rouine shall be called once.

Implements rm_ble_mesh_bearer_api_t::registerBeaconHandler.

Example:

```
/* Register beacon handler. */
   err = RM_BLE_MESH_BEARER_RegisterBeaconHandler(&g_ble_mesh_bearer0_ctrl,
RM_BLE_MESH_BEARER_TYPE_BCON,
                                                  rm_ble_mesh_bearer_beacon_callback
);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_BEARER_AddBearer()

fsp_err_t RM_BLE_MESH_BEARER_AddBearer (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, rm_ble_mesh_bearer_type_t *brr_type*, rm_ble_mesh_bearer_info_t const *const *p_brr_info*, rm_ble_mesh_bearer_handle_t *const *p_brr_handle*)

Add a bearer to Bearer Layer. This routine adds a bearer that is setup by the application for use by the Mesh Stack. Bearer Layer supports single Application, hence this rouine shall be called once.

Implements rm_ble_mesh_bearer_api_t::addBearer.

Example:

```
/* Add Bearer. */
   err = RM_BLE_MESH_BEARER_AddBearer(&g_ble_mesh_bearer0_ctrl,
RM_BLE_MESH_BEARER_TYPE_BCON, &brr_info, &brr_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_brr_info and p_brr_handle are NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_BEARER_RemoveBearer()

fsp_err_t RM_BLE_MESH_BEARER_RemoveBearer (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, rm_ble_mesh_bearer_type_t *brr_type*, rm_ble_mesh_bearer_handle_t const *const *p_brr_handle*)

Remove a bearer from Bearer Layer. This routine removes a bearer from the Mesh Stack. Bearer Layer supports single Application, hence this rouine shall be called once.

Implements rm_ble_mesh_bearer_api_t::removeBearer.

Example:

```
/* Remove Bearer. */
   err = RM_BLE_MESH_BEARER_RemoveBearer(&g_ble_mesh_bearer0_ctrl,
RM_BLE_MESH_BEARER_TYPE_BCON, &brr_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_brr_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_BEARER_ObserveBeacon()

fsp_err_t RM_BLE_MESH_BEARER_ObserveBeacon (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, uint8_t *bcon_type*, uint8_t *enable*)

Observe on/off for the beacon type. This routine sends enables/disables the observation procedure for the given beacon type.

Implements rm_ble_mesh_bearer_api_t::observeBeacon.

Example:

```
/* Observe beacon. */
   err = RM_BLE_MESH_BEARER_ObserveBeacon(&g_ble_mesh_bearer0_ctrl, bcon_type,
enable);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_BEARER_BcastUnprovisionedBeacon()

fsp_err_t RM_BLE_MESH_BEARER_BcastUnprovisionedBeacon (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, uint8_t *type*, uint8_t const *const *p_dev_uuid*, uint16_t *oob_info*, rm_ble_mesh_buffer_t const *const *p_uri*)

API to send unprovisioned device beacon. This routine sends Unprovisioned Device Beacon.

Implements rm_ble_mesh_bearer_api_t::bcastUnprovisionedBeacon.

Example:

```
/* Broadcast unprovisioned beacon. */
   err = RM_BLE_MESH_BEARER_BcastUnprovisionedBeacon(&g_ble_mesh_bearer0_ctrl, type,
&dev_uuid, oob_info, &uri);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_dev_uuid and p_uri are NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_BEARER_BroadcastBeacon()

fsp_err_t RM_BLE_MESH_BEARER_BroadcastBeacon (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, uint8_t *type*, uint8_t const *const *p_packet*, uint16_t *length*)

API to broadcast a beacon. This routine sends the beacon of given type on Adv and GATT bearers.

Implements rm_ble_mesh_bearer_api_t::broadcastBeacon.

Example:

```
/* Broadcast beacon. */
   err = RM_BLE_MESH_BEARER_BroadcastBeacon(&g_ble_mesh_bearer0_ctrl, type, &packet,
length);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_packet is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_BEARER_StartProxyAdv()

fsp_err_t RM_BLE_MESH_BEARER_StartProxyAdv (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, uint8_t *type*, uint8_t const *const *p_data*, uint16_t *datalen*)

API to send proxy device ADV. This routine sends Proxy Device ADV.

Implements rm_ble_mesh_bearer_api_t::startProxyAdv.

Example:

```
/* Start proxy advertising. */
   err = RM_BLE_MESH_BEARER_StartProxyAdv(&g_ble_mesh_bearer0_ctrl, type, &data,
length);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_data is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_BEARER_SendPdu()

fsp_err_t RM_BLE_MESH_BEARER_SendPdu (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, rm_ble_mesh_bearer_handle_t const *const *p_brr_handle*, rm_ble_mesh_bearer_type_t *brr_type*, rm_ble_mesh_buffer_t const *const *p_buffer*)

Send a bearer PDU. This routine sends a PDU from the Mesh stack to over the bearer indicated by the bearer handle.

Implements rm_ble_mesh_bearer_api_t::sendPdu.

Example:

```
/* Send common Bearer PDUs. */
   err = RM_BLE_MESH_BEARER_SendPdu(&g_ble_mesh_bearer0_ctrl, &brr_handle,
RM_BLE_MESH_BEARER_TYPE_BCON, &buffer);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_brr_handle and p_buffer are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_BEARER_GetPacketRssi()

fsp_err_t RM_BLE_MESH_BEARER_GetPacketRssi (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, uint8_t * *p_rssi_value*)

Get the RSSI of current received packet being processed. This routine returns the RSSI value of the received packet in its context when called from the Mesh stack.

Implements rm_ble_mesh_bearer_api_t::getPacketRssi.

Example:

```
/* Get the RSSI of current received packet being processed. */
   err = RM_BLE_MESH_BEARER_GetPacketRssi(&g_ble_mesh_bearer0_ctrl, &rssi_value);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_rssi_value is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_BEARER_Sleep()

fsp_err_t RM_BLE_MESH_BEARER_Sleep (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*)

Put the bearer to sleep. This routine requests the underlying bearer interface to sleep. Default bearer interface is that of advertising bearer.

Implements rm_ble_mesh_bearer_api_t::sleep.

Example:

```
/* Put the bearer to sleep. */
   err = RM_BLE_MESH_BEARER_Sleep(&g_ble_mesh_bearer0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_BEARER_Wakeup()

fsp_err_t RM_BLE_MESH_BEARER_Wakeup (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, uint8_t *mode*)

Wakeup the bearer. This routine requests the underlying bearer interface to wakeup. Default bearer interface is that of advertising bearer.

Implements rm_ble_mesh_bearer_api_t::wakeup.

Example:

```
/* Wakeup the bearer. */
   err = RM_BLE_MESH_BEARER_Wakeup(&g_ble_mesh_bearer0_ctrl, mode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Overview

Target Devices

The BLE Mesh Network Bearer Platform module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_bearer_platform

The following build time configurations are defined in fsp_cfg/rm_mesh_bearer_platform_cfg.h:

Configuration	Options	Default	Description
Debug Public Address	Must be a valid device address	FF:FF:FF:50:90:74	Public Address of firmware initial value.
Debug Random Address	Must be a valid device address	FF:FF:FF:FF:FF:FF	Random Address of firmware initial value.
Maximum number of	Value must be an	7	Maximum number of

connections	integer between 1 and 7, and lower than the value defined in ble module.		connections.
Maximum connection data length	Value must be an integer between 27 and 251, and lower than the value defined in ble module.	251	Maximum connection data length.
Maximum advertising data length	Value must be an integer between 31 and 1650, and lower than the value defined in ble module.	1650	Maximum advertising data length.
Maximum advertising set number	Value must be an integer between 1 and 4, and lower than the value defined in ble module.	4	Maximum advertising set number.
Maximum periodic sync set number.	Value must be an integer between 1 and 2, and lower than the value defined in ble module.	2	Maximum periodic sync set number.
Store Security Data	• Disable • Enable	Disable	Store Security Data in DataFlash.
Data Flash Block for Security Data	Value must be an integer between 0 and 7, and lower than the value defined in ble module.	0	Data Flash Block for Security Data Management.
Remote Device Bonding Number	Value must be an integer between 1 and 7, and lower than the value defined in ble module.	7	Number of remote device bonding information.
Connection Event Start Notify	• Disable • Enable	Disable	Set Connection event start notify enable/disable.
Connection Event Close Notify	• Disable • Enable	Disable	Set Connection event close notify enable/disable.
Advertising Event Start Notify	• Disable • Enable	Disable	Set Advertising event start notify enable/disable.
Advertising Event Close Notify	• Disable • Enable	Disable	Set Advertising event close notify enable/disable.

Scanning Event Start Notify	• Disable • Enable	Disable	Set Scanning event start notify enable/disable.
Scanning Event Close Notify	• Disable • Enable	Disable	Set Scanning event close notify enable/disable.
Initiating Event Start Notify	• Disable • Enable	Disable	Set Initiating event start notify enable/disable.
Initiating Event Close Notify	• Disable • Enable	Disable	Set Initiating event close notify enable/disable.
RF Deep Sleep Start Notify	• Disable • Enable	Disable	Set RF_DEEP_SLEEP start notify enable/disable.
RF Deep Sleep Wakeup Notify	• Disable • Enable	Disable	Set RF_DEEP_SLEEP wakeup notify enable/disable.
Bluetooth dedicated clock	Value must be an integer between 0 and 15, and lower than the value defined in ble module.	6	Load capacitance adjustment.
DC-DC converter	• Disable • Enable	Disable	Set DC-DC converter for RF part.
Slow Clock Source	• Use RF_LOCO • Use External 32.768kHz	Use RF_LOCO	Set slow clock source for RF part.
MCU CLKOUT Port	• P109 • P205	P109	When MESH_BEARER_PLATFORM_CFG_RF_EXTERNAL_32K_ENABLE = 1, Set port of MCU CLKOUT.
MCU CLKOUT Frequency Output	• MCU CLKOUT frequency 32.768kHz • MCU CLKOUT frequency 16.384kHz	MCU CLKOUT frequency 32.768kHz	When MESH_BEARER_PLATFORM_CFG_RF_EXTERNAL_32K_ENABLE = 1, set frequency output from CLKOUT of MCU part.
Sleep Clock Accuracy(SCA)	Value must be an integer between 0 and 500, and lower than the value defined in ble module.	250	When MESH_BEARER_PLATFORM_CFG_RF_EXTERNAL_32K_ENABLE = 1, set Sleep Clock Accuracy(SCA) for RF slow clock.
Transmission Power Maximum Value	• max +0dBm • max +4dBm	max +4dBm	Set transmission power maximum value.

Transmission Power Default Value	• High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm) • Mid 0dBm(Transmission Power Maximum Value = +0dBm) / 0dBm(Transmission Power Maximum Value = +4dBm) • Low -18dBm(Transmission Power Maximum Value = +0dBm) / -20dBm(Transmission Power Maximum Value = +4dBm)	High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm)	Set default transmit power. Default transmit power is dependent on the configuration of Maximum transmission power(MESH_BEARER_PLATFORM_CFG_RF_MAX_TX_POW).
CLKOUT_RF Output	• No output • 4MHz output • 2MHz output • 1MHz output	No output	Set CLKOUT_RF output setting.
RF_DEEP_SLEEP Transition	• Disable • Enable	Enable	Set RF_DEEP_SLEEP transition.
MCU Main Clock Frequency	Value must be an integer between 1000 and 20000, and lower than the value defined in ble module.	8000	Set MCU Main Clock Frequency (kHz). Set clock source according to your board environment. HOCO: don't care. / Main Clock: 1000 to 20000 kHz / PLL Circuit: 4000 to 12500 kHz
Code Flash(ROM) Device Data Block	Value must be an integer between -1 and 255, and lower than the value defined in ble module.	255	Device specific data block on Code Flash (ROM).
Device Specific Data Flash Block	Value must be an integer between -1 and 7, and lower than the value defined in ble module.	-1	Device specific data block on E2 Data Flash.

MTU Size Configured	Value must be an integer between 23 and 247, and lower than the value defined in ble module.	247	MTU Size configured by GATT MTU exchange procedure.
Timer Slot Maximum Number	Value must be an integer between 1 and 10, and lower than the value defined in ble module.	10	The maximum number of timer slot.

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Bearer Platform (rm_mesh_bearer_platform)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Bearer Platform (rm_mesh_bearer_platform).

Configuration	Options	Default	Description
General			
Name	Name Must Be a Valid C Symbol	g_rm_mesh_bearer_platform0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Device Address Type	Invalid Device Address Type	0	Select device address type (public : 0, random : 1).
GATT Server Callback Number	Invalid Callback Number	1	Number of GATT server callback.
GATT Client Callback Number	Invalid Callback Number	1	Number of GATT client callback.
Vender Specific Callback	Name Must Be a Valid C Symbol.	NULL	Vendor specific callback function name.

Data Structures

struct	rm_mesh_bearer_platform_instance_ctrl_t
struct	rm_mesh_bearer_platform_extended_cfg_t

Typedefs

typedef void(*	rm_mesh_bearer_platform_gatt_iface_cb_t) (uint8_t event_name, uint8_t event_param, uint16_t conn_hdl, st_ble_dev_addr_t *peer_addr) Callback function for GATT interface event. More...

Enumerations

enum	rm_mesh_bearer_platform_interface_event_t

Data Structure Documentation

◆ rm_mesh_bearer_platform_instance_ctrl_t

struct rm_mesh_bearer_platform_instance_ctrl_t

RM_BLE_MESH_BEARER private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_BEARER_Open() is called.

◆ rm_mesh_bearer_platform_extended_cfg_t

struct rm_mesh_bearer_platform_extended_cfg_t

Bearer port extension for renesas BLE stack.

Typedef Documentation

◆ rm_mesh_bearer_platform_gatt_iface_cb_t

typedef void(* rm_mesh_bearer_platform_gatt_iface_cb_t) (uint8_t event_name, uint8_t event_param, uint16_t conn_hdl, st_ble_dev_addr_t *peer_addr)

Callback function for GATT interface event.

Parameters

event_name	The event defined by rm_mesh_bearer_platform_interface_event_t
event_param	The mode of GATT connection rm_mesh_bearer_platform_gatt_mode_t
conn_hdl	The connection handle
peer_addr	Pointer to the connected device address

Enumeration Type Documentation

◆ rm_mesh_bearer_platform_interface_event_t

enum rm_mesh_bearer_platform_interface_event_t	
GATT Interface Events	
Enumerator	
RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_UP	The event GATT Bearer BLE Link Layer connected
RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_DOWN	The event GATT Bearer BLE Link Layer disconnected
RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_ENABLE	The event GATT Bearer service enabled for communication
RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_DISABLE	The event GATT Bearer service disabled for communication
RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_NOT_FOUND	The event discovery process is not completed
RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_SCAN	The event that connectable device having Mesh GATT Service is found
RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_CANCEL	The Event GATT/BLE link layer connection creation is canceled

Function Documentation

◆ RM_MESH_BEARER_PLATFORM_Open()

fsp_err_t RM_MESH_BEARER_PLATFORM_Open (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, rm_mesh_bearer_platform_cfg_t const *const *p_cfg*)

Open Bearer Platform middleware. Initialize underlying BLE Protocol Stack to use as a Mesh Bearer. API to initialize underlying BLE Protocol Stack to use as a Mesh Bearer. Completion of the initialization is notified by the callback function.

Implements rm_mesh_bearer_platform_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_BEARER_PLATFORM_Open(&g_mesh_bearer_platform0_ctrl,
&g_mesh_bearer_platform0_cfg);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_MESH_BEARER_PLATFORM_Close()

fsp_err_t RM_MESH_BEARER_PLATFORM_Close (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*)

Close Bearer Platform middleware. Terminate BLE stack.

Implements rm_mesh_bearer_platform_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_BEARER_PLATFORM_Close(&g_mesh_bearer_platform0_ctrl);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MESH_BEARER_PLATFORM_Setup()

fsp_err_t RM_MESH_BEARER_PLATFORM_Setup (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*)

Register ADV bearer with Mesh stack and start scan. API to register ADV bearer with Mesh stack. After registering, this routine starts Scan.

Parameters

[in]	p_ctrl	rm_mesh_bearer_platform control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_BEARER_PLATFORM_CallbackSet()

fsp_err_t RM_MESH_BEARER_PLATFORM_CallbackSet (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, rm_mesh_bearer_platform_gatt_iface_cb_t *callback*)

Register callback function to receive GATT interface events. API to register callback function to receive GATT interface events.

Parameters

[in]	p_ctrl	rm_mesh_bearer_platform control block.
[in]	callback	Callback function.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_BEARER_PLATFORM_SetGattMode()

fsp_err_t RM_MESH_BEARER_PLATFORM_SetGattMode (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, rm_mesh_bearer_platform_gatt_mode_t *mode*)

Set GATT Bearer mode.

Parameters

[in]	p_ctrl	rm_mesh_bearer_platform control block.
[in]	mode	GATT interface mode, either RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION or RM_MESH_BEARER_PLATFORM_GATT_MODE_PROXY.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_BEARER_PLATFORM_GetGattMode()

fsp_err_t RM_MESH_BEARER_PLATFORM_GetGattMode (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, rm_mesh_bearer_platform_gatt_mode_t * *p_mode*)

Get current GATT Bearer mode.

Parameters

[in]	p_ctrl	rm_mesh_bearer_platform control block.
[in]	p_mode	GATT interface mode, either RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION or RM_MESH_BEARER_PLATFORM_GATT_MODE_PROXY.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_mode is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_BEARER_PLATFORM_SetScanResponseData()

fsp_err_t RM_MESH_BEARER_PLATFORM_SetScanResponseData (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, uint8_t * *p_data*, uint8_t *len*)

Set scan response data in connectable and scannable undirected advertising event. API to Set Scan Response Data in Connectable and scannable undirected Advertising event. Scan Response Data can be used for indicating additional information such as << Complete Local Name>>.

Implements rm_mesh_bearer_platform_api_t::setScanResponseData.

Example:

```
 /* Set scan response data in connectable and scannable undirected advertising
event.. */
    err = RM_MESH_BEARER_PLATFORM_SetScanResponseData(&g_mesh_bearer_platform0_ctrl,
&data, length);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_data is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MESH_BEARER_PLATFORM_ScanGattBearer()

fsp_err_t RM_MESH_BEARER_PLATFORM_ScanGattBearer (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, rm_mesh_bearer_platform_state_t *state*, rm_mesh_bearer_platform_gatt_mode_t *mode*)

Manage reporting connectable device having Mesh GATT service. API to manage reporting connectable device having Mesh GATT service.

Parameters

[in]	p_ctrl	rm_mesh_bearer_platform control block.
[in]	state	Notification configuration flag; enable if RM_MESH_BEARER_PLATFORM_STATE_ENABLE, or disable if RM_MESH_BEARER_PLATFORM_STATE_DISABLE.
[in]	mode	GATT interface mode, either RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION or RM_MESH_BEARER_PLATFORM_GATT_MODE_PROXY.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_BEARER_PLATFORM_Connect()

fsp_err_t RM_MESH_BEARER_PLATFORM_Connect (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, uint8_t * *p_remote_address*, uint8_t *address_type*, rm_mesh_bearer_platform_gatt_mode_t *mode*)

Request to create connection. API to request to Create Connection. Completion of the establishing a connection is notified by RM_BLE_MESH_BEARER_IFACE_UP. After establishing a connection, RM_MESH_BEARER_PLATFORM_DiscoverService() is invoked automatically.

Implements rm_mesh_bearer_platform_api_t::connect.

Example:

```
/* Request to create connection. */
   err = RM_MESH_BEARER_PLATFORM_Connect(&g_mesh_bearer_platform0_ctrl,
                                         &remote_address,
                                         bearer_address_type,
RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_remote_address is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MESH_BEARER_PLATFORM_DiscoverService()

fsp_err_t RM_MESH_BEARER_PLATFORM_DiscoverService (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, uint16_t *handle*, rm_mesh_bearer_platform_gatt_mode_t *mode*)

Start service discovery for Mesh GATT service. API to start Service Discovery for Mesh GATT Service. If Mesh GATT Service specified by the "mode" argument, this routine enables Notification of the Mesh GATT Service by invoking RM_MESH_BEARER_PLATFORM_ConfigureNotification().

Implements rm_mesh_bearer_platform_api_t::discoverService.

Example:

```
/* Start service discovery for Mesh GATT service. */
   err = RM_MESH_BEARER_PLATFORM_DiscoverService(&g_mesh_bearer_platform0_ctrl,
                                                 handle,
RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MESH_BEARER_PLATFORM_ConfigureNotification()

fsp_err_t RM_MESH_BEARER_PLATFORM_ConfigureNotification (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, uint16_t *handle*, rm_mesh_bearer_platform_state_t *state*, rm_mesh_bearer_platform_gatt_mode_t *mode*)

Configure GATT notification of Mesh GATT service. API to configure GATT Notification of Mesh GATT Service.

Implements rm_mesh_bearer_platform_api_t::configureNotification.

Example:

```
/* Configure GATT notification of Mesh GATT service. */
   err =
RM_MESH_BEARER_PLATFORM_ConfigureNotification(&g_mesh_bearer_platform0_ctrl,
                                              handle,
 RM_MESH_BEARER_PLATFORM_STATE_ENABLE,
 RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MESH_BEARER_PLATFORM_Disconnect()

fsp_err_t RM_MESH_BEARER_PLATFORM_Disconnect (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, uint16_t *handle*)

Terminate Connection. API to terminate connection.

Implements rm_mesh_bearer_platform_api_t::disconnect.

Example:

```
/* Terminate Connection. */
   err = RM_MESH_BEARER_PLATFORM_Disconnect(&g_mesh_bearer_platform0_ctrl, handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Overview

Target Devices

The BLE Mesh Network Config Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_config_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_config_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Config Client (rm_mesh_config_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Config Client (rm_mesh_config_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh config client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_config_clt0	Module name.

Data Structures

struct	rm_mesh_config_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_config_clt_instance_ctrl_t

struct rm_mesh_config_clt_instance_ctrl_t
BLE mesh config instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_CONFIG_CLT_Open() is called.

Function Documentation

◆ RM_MESH_CONFIG_CLT_Open()

fsp_err_t RM_MESH_CONFIG_CLT_Open (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_config_client_cfg_t const *const *p_cfg*)

Open Configuration Client middleware. This is to initialize Configuration Client model and to register with Access layer.

Implements rm_ble_mesh_config_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_CONFIG_CLT_Open(&g_mesh_config_clt0_ctrl, &g_mesh_config_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_CONFIG_CLT_Close()

fsp_err_t RM_MESH_CONFIG_CLT_Close (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

Close Configuration Client middleware.

Implements rm_ble_mesh_config_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_CONFIG_CLT_Close(&g_mesh_config_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_CONFIG_CLT_SetServer()

fsp_err_t RM_MESH_CONFIG_CLT_SetServer (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *server_addr*, uint8_t * *p_dev_key*)

This is to sets the information about server which is to be configured.

Implements rm_ble_mesh_config_client_api_t::setServer.

Example:

```
/* Sets the information about server which is to be configured. */
   err = RM_MESH_CONFIG_CLT_SetServer(&g_mesh_config_clt0_ctrl, server_addr,
&dev_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.

◆ RM_MESH_CONFIG_CLT_SendReliablePdu()

fsp_err_t RM_MESH_CONFIG_CLT_SendReliablePdu (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_config_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_CONFIG_CLT_SendReliablePdu(&g_mesh_config_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_BeaconGet()

fsp_err_t RM_MESH_CONFIG_CLT_BeaconGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Beacon Get is an acknowledged message used to get the current Secure Network Beacon state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_BeaconSet()

fsp_err_t RM_MESH_CONFIG_CLT_BeaconSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Beacon Set is an acknowledged message used to set the current Secure Network Beacon state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_beacon_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_CompositionDataGet()

fsp_err_t RM_MESH_CONFIG_CLT_CompositionDataGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Composition Data Get is an acknowledged message used to read one page of the Composition Data.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_composition_data_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_DefaultTtlGet()

fsp_err_t RM_MESH_CONFIG_CLT_DefaultTtlGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

Config Default TTL Get is an acknowledged message used to get the current Default TTL state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_DefaultTtlSet()

fsp_err_t RM_MESH_CONFIG_CLT_DefaultTtlSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Default TTL Set is an acknowledged message used to set the Default TTL state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_default_ttl_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_GattProxyGet()

fsp_err_t RM_MESH_CONFIG_CLT_GattProxyGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config GATT Proxy Get is an acknowledged message used to get the GATT Proxy state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_GattProxySet()

fsp_err_t RM_MESH_CONFIG_CLT_GattProxySet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config GATT Proxy Set is an acknowledged message used to set the GATT Proxy state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_gatt_proxy_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_RelayGet()

fsp_err_t RM_MESH_CONFIG_CLT_RelayGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Relay Get is an acknowledged message used to get the current Relay and Relay Retransmit states of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_RelaySet()

fsp_err_t RM_MESH_CONFIG_CLT_RelaySet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Relay Set is an acknowledged message used to set the current Relay and Relay Retransmit states of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_relay_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelPublicationGet()

fsp_err_t RM_MESH_CONFIG_CLT_ModelPublicationGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Publication Get is an acknowledged message used to get the publish address and parameters of an outgoing message that originates from a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_publication_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelPublicationSet()

fsp_err_t RM_MESH_CONFIG_CLT_ModelPublicationSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Publication Set is an acknowledged message used to set the Model Publication state of an outgoing message that originates from a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_publication_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelPublicationVaddrSet()

fsp_err_t RM_MESH_CONFIG_CLT_ModelPublicationVaddrSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Publication Set is an acknowledged message used to set the Model Publication state of an outgoing message that originates from a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_publication_virtual_address_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionAdd()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionAdd (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Subscription Add is an acknowledged message used to add an address to a Subscription List of a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_add_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrAdd()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrAdd (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Subscription Add is an acknowledged message used to add an address to a Subscription List of a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_virtual_address_add_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionDelete()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionDelete (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Subscription Delete is an acknowledged message used to delete a subscription address from the Subscription List of a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_delete_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrDelete()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrDelete (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Subscription Delete is an acknowledged message used to delete a subscription address from the Subscription List of a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_virtual_address_delete_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionOverwrite()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionOverwrite (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Subscription Overwrite is an acknowledged message used to discard the Subscription List and add an address to the cleared Subscription List of a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_overwrite_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrOverwrite()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrOverwrite (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Subscription Overwrite is an acknowledged message used to discard the Subscription List and add an address to the cleared Subscription List of a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_virtual_address_overwrite_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionDeleteAll()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionDeleteAll (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Subscription Delete All is an acknowledged message used to discard the Subscription List of a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_delete_all_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_SigModelSubscriptionGet()

fsp_err_t RM_MESH_CONFIG_CLT_SigModelSubscriptionGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config SIG Model Subscription Get is an acknowledged message used to get the list of subscription addresses of a model within the element. This message is only for SIG Models.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_sig_model_subscription_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_VendorModelSubscriptionGet()

fsp_err_t RM_MESH_CONFIG_CLT_VendorModelSubscriptionGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config SIG Model Subscription Get is an acknowledged message used to get the list of subscription addresses of a model within the element. This message is only for Vendor Models.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_vendor_model_subscription_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NetkeyAdd()

fsp_err_t RM_MESH_CONFIG_CLT_NetkeyAdd (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config NetKey Add is an acknowledged message used to add a NetKey to a NetKey List on a node. The added NetKey is then used by the node to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_netkey_add_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NetkeyUpdate()

fsp_err_t RM_MESH_CONFIG_CLT_NetkeyUpdate (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config NetKey Update is an acknowledged message used to update a NetKey on a node. The updated NetKey is then used by the node to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends, as defined by the Key Refresh procedure.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_netkey_update_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NetkeyDelete()

fsp_err_t RM_MESH_CONFIG_CLT_NetkeyDelete (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config NetKey Delete is an acknowledged message used to delete a NetKey on a NetKey List from a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_netkey_delete_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NetkeyGet()

fsp_err_t RM_MESH_CONFIG_CLT_NetkeyGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config NetKey Get is an acknowledged message used to report all NetKeys known to the node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_AppkeyAdd()

fsp_err_t RM_MESH_CONFIG_CLT_AppkeyAdd (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config AppKey Add is an acknowledged message used to add an AppKey to the AppKey List on a node and bind it to the NetKey identified by NetKeyIndex. The added AppKey can be used by the node only as a pair with the specified NetKey. The AppKey is used to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_appkey_add_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_AppkeyUpdate()

fsp_err_t RM_MESH_CONFIG_CLT_AppkeyUpdate (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config AppKey Update is an acknowledged message used to update an AppKey value on the AppKey List on a node. The updated AppKey is used by the node to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends, as defined by the Key Refresh procedure.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_appkey_update_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_AppkeyDelete()

fsp_err_t RM_MESH_CONFIG_CLT_AppkeyDelete (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config AppKey Delete is an acknowledged message used to delete an AppKey from the AppKey List on a node

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_appkey_delete_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_AppkeyGet()

fsp_err_t RM_MESH_CONFIG_CLT_AppkeyGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The AppKey Get is an acknowledged message used to report all AppKeys bound to the NetKey.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_appkey_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NodeIdentityGet()

fsp_err_t RM_MESH_CONFIG_CLT_NodeIdentityGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Node Identity Get is an acknowledged message used to get the current Node Identity state for a subnet.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_node_id_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NodeIdentitySet()

fsp_err_t RM_MESH_CONFIG_CLT_NodeIdentitySet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Node Identity Set is an acknowledged message used to set the current Node Identity state for a subnet.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_node_id_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelAppBind()

fsp_err_t RM_MESH_CONFIG_CLT_ModelAppBind (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model App Bind is an acknowledged message used to bind an AppKey to a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_app_bind_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelAppUnbind()

fsp_err_t RM_MESH_CONFIG_CLT_ModelAppUnbind (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model App Unbind is an acknowledged message used to remove the binding between an AppKey and a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_app_unbind_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_SigModelAppGet()

fsp_err_t RM_MESH_CONFIG_CLT_SigModelAppGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config SIG Model App Get is an acknowledged message used to request report of all AppKeys bound to the SIG Model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_sig_model_app_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_VendorModelAppGet()

fsp_err_t RM_MESH_CONFIG_CLT_VendorModelAppGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Vendor Model App Get is an acknowledged message used to request report of all AppKeys bound to the Vendor Model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_vendor_model_app_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NodeReset()

fsp_err_t RM_MESH_CONFIG_CLT_NodeReset (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Node Reset is an acknowledged message used to reset a node (other than a Provisioner) and remove it from the network.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_FriendGet()

fsp_err_t RM_MESH_CONFIG_CLT_FriendGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Friend Get is an acknowledged message used to get the current Friend state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_FriendSet()

fsp_err_t RM_MESH_CONFIG_CLT_FriendSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Friend Set is an acknowledged message used to set the Friend state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_friend_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_KeyrefreshPhaseGet()

fsp_err_t RM_MESH_CONFIG_CLT_KeyrefreshPhaseGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Key Refresh Phase Get is an acknowledged message used to get the current Key Refresh Phase state of the identified network key.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_key_refresh_phase_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_KeyrefreshPhaseSet()

fsp_err_t RM_MESH_CONFIG_CLT_KeyrefreshPhaseSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Key Refresh Phase Set is an acknowledged message used to set the current Key Refresh Phase state of the identified network key.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_key_refresh_phase_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_HeartbeatPublicationGet()

fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatPublicationGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Heartbeat Publication Get is an acknowledged message used to get the current Heartbeat Publication state of an element.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_HeartbeatPublicationSet()

fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatPublicationSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Heartbeat Publication Set is an acknowledged message used to set the current Heartbeat Publication state of an element.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_heartbeat_publication_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_HeartbeatSubscriptionGet()

fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatSubscriptionGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Heartbeat Subscription Get is an acknowledged message used to get the current Heartbeat Subscription state of an element.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_HeartbeatSubscriptionSet()

fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatSubscriptionSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Heartbeat Publication Set is an acknowledged message used to set the current Heartbeat Subscription state of an element.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_heartbeat_subscription_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_LpnPolltimeoutGet()

fsp_err_t RM_MESH_CONFIG_CLT_LpnPolltimeoutGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Low Power Node PollTimeout Get is an acknowledged message used to get the current value of PollTimeout timer of the Low Power node within a Friend node. The message is sent to a Friend node that has claimed to be handling messages by sending ACKs On Behalf Of (OBO) the indicated Low Power node. This message should only be sent to a node that has the Friend feature supported and enabled.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_low_power_node_polling_timeout_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NetworkTransmitGet()

fsp_err_t RM_MESH_CONFIG_CLT_NetworkTransmitGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Network Transmit Get is an acknowledged message used to get the current Network Transmit state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NetworkTransmitSet()

fsp_err_t RM_MESH_CONFIG_CLT_NetworkTransmitSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Network Transmit Set is an acknowledged message used to set the current Network Transmit state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_network_transmit_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Config Server (rm_mesh_config_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_CONFIG_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_CONFIG_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)

fsp_err_t	RM_MESH_CONFIG_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Config Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_config_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_config_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Config Server (rm_mesh_config_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Config Server (rm_mesh_config_srv).

Configuration	Options	Default	Description
Interrupts			
Callback	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh config client ISR occurs
Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic admin property server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_config_srv0	Module name.

Data Structures

struct	rm_mesh_config_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_config_srv_instance_ctrl_t

struct rm_mesh_config_srv_instance_ctrl_t

BLE mesh config instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_CONFIG_SRV_Open() is called.

Function Documentation

◆ RM_MESH_CONFIG_SRV_Open()

fsp_err_t RM_MESH_CONFIG_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize configuration server model. This is to initialize configuration server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_CONFIG_SRV_Open(&g_mesh_config_srv0_ctrl, &g_mesh_config_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_CONFIG_SRV_Close()

fsp_err_t RM_MESH_CONFIG_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate configuration server model. This is to terminate configuration server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_CONFIG_SRV_Close(&g_mesh_config_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_CONFIG_SRV_StateUpdate()

fsp_err_t RM_MESH_CONFIG_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_CONFIG_SRV_StateUpdate(&g_mesh_config_srv0_ctrl, &state);
```

Return values

FSP_ERR_UNSUPPORTED	This function is unsupported.

BLE Mesh Network Generic Admin Property Server (rm_mesh_generic_admin_prop_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_GENERIC_ADMIN_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)

fsp_err_t	RM_MESH_GENERIC_ADMIN_PROP_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)

fsp_err_t	RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Admin Property Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_admin_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_admin_prop_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Admin Property Server (rm_mesh_generic_admin_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Admin Property Server (rm_mesh_generic_admin_prop_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic admin property server ISR occurs
Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic admin property server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_admin_prop_srv0	Module name.

Data Structures

struct	rm_mesh_generic_admin_prop_srv_info_t

struct	rm_mesh_generic_admin_prop_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_admin_prop_srv_info_t

struct rm_mesh_generic_admin_prop_srv_info_t		
Generic Admin Property is a state representing a device property of an element that can be read or written		
Data Fields		
uint16_t	property_id	Admin Property ID field is a 2-octet Assigned Number value referencing a device property
uint8_t	user_access	Admin User Access field is an enumeration indicating whether the device property can be read or written as a Generic User Property
uint8_t *	property_value	Admin Property Value field is a conditional field
uint16_t	property_value_len	

◆ rm_mesh_generic_admin_prop_srv_instance_ctrl_t

struct rm_mesh_generic_admin_prop_srv_instance_ctrl_t
BLE mesh generic admin prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_ADMIN_PROP_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_ADMIN_PROP_SRV_Open()

fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Admin_Property Server model. This is to initialize Generic_Admin_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err =
RM_MESH_GENERIC_ADMIN_PROP_SRV_Open(&g_mesh_generic_admin_prop_srv0_ctrl,
&g_mesh_generic_admin_prop_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_ADMIN_PROP_SRV_Close()

fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Admin_Property Server model. This is to terminate Generic_Admin_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_ADMIN_PROP_SRV_Close(&g_mesh_generic_admin_prop_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err =
RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate(&g_mesh_generic_admin_prop_srv0_ctrl,
&state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Generic Battery Client (rm_mesh_generic_battery_clt)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_GENERIC_BATTERY_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_GENERIC_BATTERY_CLT_Close

	(rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle)
fsp_err_t	RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode)
fsp_err_t	RM_MESH_GENERIC_BATTERY_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Battery Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_battery_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_battery_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Battery Client (rm_mesh_generic_battery_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Battery Client (rm_mesh_generic_battery_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic battery client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_battery_clt0	Module name.

Data Structures

struct	rm_mesh_generic_battery_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_battery_clt_instance_ctrl_t

struct rm_mesh_generic_battery_clt_instance_ctrl_t
BLE mesh generic battery instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_BATTERY_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_BATTERY_CLT_Open()

fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic Battery Client middleware. This is to initialize Generic_Battery Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_BATTERY_CLT_Open(&g_mesh_generic_battery_clt0_ctrl,
&g_mesh_generic_battery_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_BATTERY_CLT_Close()

fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic Battery Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_BATTERY_CLT_Close(&g_mesh_generic_battery_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Battery client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic battery client model. */
   err =
RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle(&g_mesh_generic_battery_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err =
RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu(&g_mesh_generic_battery_clt0_ctrl,
                                            req_opcode,
                                            p_parameter,
                                            rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_BATTERY_CLT_Get()

fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Battery Get message is an acknowledged message used to get the Generic Battery state of an element. The response to the Generic Battery Get message is a Generic Battery Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_battery_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

fsp_err_t	RM_MESH_GENERIC_BATTERY_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Battery Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_battery_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_battery_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Battery Server (rm_mesh_generic_battery_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Battery Server (rm_mesh_generic_battery_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic battery server ISR occurs
Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic battery server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_battery_srv0	Module name.

Data Structures

struct	rm_mesh_generic_battery_srv_info_t
struct	rm_mesh_generic_battery_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_battery_srv_info_t

struct rm_mesh_generic_battery_srv_info_t

Generic Battery state is a set of four values representing the state of a battery

Data Fields		
uint8_t	generic_battery_level	Generic Battery Level state is a value ranging from 0 percent through 100 percent
uint32_t	generic_battery_time_to_discharge	Generic Battery Time to Discharge state is a 24-bit unsigned value ranging from 0 through 0xFFFFFF
uint32_t	generic_battery_time_to_charge	Generic Battery Time to Charge state is a 24-bit unsigned value ranging from 0 through 0xFFFFFF
uint8_t	generic_battery_flags	Generic Battery Flags state is a concatenation of four 2-bit bit fields: Presence, Indicator, Charging, and Serviceability

◆ rm_mesh_generic_battery_srv_instance_ctrl_t

struct rm_mesh_generic_battery_srv_instance_ctrl_t
BLE mesh generic_battery instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_BATTERY_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_BATTERY_SRV_Open()

fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Battery Server model. This is to initialize Generic_Battery Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_BATTERY_SRV_Open(&g_mesh_generic_battery_srv0_ctrl,
&g_mesh_generic_battery_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_BATTERY_SRV_Close()

fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Battery Server model. This is to terminate Generic_Battery Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_BATTERY_SRV_Close(&g_mesh_generic_battery_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_BATTERY_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_BATTERY_SRV_StateUpdate(&g_mesh_generic_battery_srv0_ctrl,
&state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_GENERIC_CLIENT_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_GENERIC_CLIENT_PROP_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)

fsp_err_t	RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Client Property Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_client_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_client_prop_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Client Property Server (rm_mesh_generic_client_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Client Property Server (rm_mesh_generic_client_prop_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic client property server ISR occurs
Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic client property server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_client_prop_srv0	Module name.

Data Structures

struct	rm_mesh_generic_client_prop_srv_instance_ctrl_t

Data Structure Documentation

◆ **rm_mesh_generic_client_prop_srv_instance_ctrl_t**

struct rm_mesh_generic_client_prop_srv_instance_ctrl_t
BLE mesh generic client prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_CLIENT_PROP_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_CLIENT_PROP_SRV_Open()

fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Client_Property Server model. This is to initialize Generic_Client_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_CLIENT_PROP_SRV_Open(&g_mesh_generic_client_prop_srv0_ctrl,
                                              &g_mesh_generic_client_prop_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_CLIENT_PROP_SRV_Close()

fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Client_Property Server model. This is to terminate Generic_Client_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err =
RM_MESH_GENERIC_CLIENT_PROP_SRV_Close(&g_mesh_generic_client_prop_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err =
RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate(&g_mesh_generic_client_prop_srv0_ctrl,
&state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Default Transition Time Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_dtt_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_dtt_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Default Transition Time Client (rm_mesh_generic_dtt_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Default Transition Time Client (rm_mesh_generic_dtt_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic default transition time

			client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_dtt_clt0	Module name.

Data Structures

struct	rm_mesh_generic_dtt_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_dtt_clt_instance_ctrl_t

struct rm_mesh_generic_dtt_clt_instance_ctrl_t
BLE mesh generic dtt instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_DTT_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_DTT_CLT_Open()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic Default Transition Time Client middleware. This is to initialize Generic_Default_Transition_Time Client model and to register with Access layer.
Implements rm_ble_mesh_model_client_api_t::open.
Example:
`/* Open the module. */`
`err = RM_MESH_GENERIC_DTT_CLT_Open(&g_mesh_generic_dtt_clt0_ctrl, &g_mesh_generic_dtt_clt0_cfg);`
Return values
FSP_SUCCESS — Model opened successfully.
FSP_ERR_ASSERTION — Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN — Model is already open.
FSP_ERR_NOT_FOUND — The number of models has exceeded the limit.
FSP_ERR_ABORTED — Model initialization is failed.

◆ RM_MESH_GENERIC_DTT_CLT_Close()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic Default Transition Time Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_DTT_CLT_Close(&g_mesh_generic_dtt_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_DTT_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Default_Transition_Time client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic default transition time client model. */
   err = RM_MESH_GENERIC_DTT_CLT_GetModelHandle(&g_mesh_generic_dtt_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_GENERIC_DTT_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands */
   err = RM_MESH_GENERIC_DTT_CLT_SendReliablePdu(&g_mesh_generic_dtt_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_DTT_CLT_Get()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Default Transition Time Get is an acknowledged message used to get the Generic Default Transition Time state of an element. The response to the Generic Default Transition Time Get message is a Generic Default Transition Time Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_dtt_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_DTT_CLT_Set()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Default Transition Time Set is an acknowledged message used to set the Generic Default Transition Time state of an element. The response to the Generic Default Transition Time Set message is a Generic Default Transition Time Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_dtt_clt control block.
[in]	p_parameter	Pointer to transition time.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_DTT_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Default Transition Time Set Unacknowledged is an unacknowledged message used to set the Generic Default Transition Time state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_dtt_clt control block.
[in]	p_parameter	Pointer to transition time.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Generic Default Transition Time Server (rm_mesh_generic_dtt_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_GENERIC_DTT_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_GENERIC_DTT_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_GENERIC_DTT_SRV_GetTime

	(rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_mesh_generic_dtt_srv_transtion_time_info_t *const p_info)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Default Transition Time Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_dtt_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_dtt_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Default Transition Time Server (rm_mesh_generic_dtt_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Default Transition Time Server (rm_mesh_generic_dtt_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided When Tmeout Occurs	Name must Be a Valid C Symbol	NULL	Callback provided when mesh generic default transition time server ISR occurs
Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic default transition time server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_dtt_srv0	Module name.

Data Structures

struct	rm_mesh_generic_dtt_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_dtt_srv_instance_ctrl_t

struct rm_mesh_generic_dtt_srv_instance_ctrl_t
BLE mesh generic dtt instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_DTT_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_DTT_SRV_Open()

fsp_err_t RM_MESH_GENERIC_DTT_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Default_Transition_Time Server model. This is to initialize Generic_Default_Transition_Time Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_DTT_SRV_Open(&g_mesh_generic_dtt_srv0_ctrl,
&g_mesh_generic_dtt_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_DTT_SRV_Close()

fsp_err_t RM_MESH_GENERIC_DTT_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Default_Transition_Time Server model. This is to terminate Generic_Default_Transition_Time Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_DTT_SRV_Close(&g_mesh_generic_dtt_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_DTT_SRV_GetTime()

fsp_err_t RM_MESH_GENERIC_DTT_SRV_GetTime (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_mesh_generic_dtt_srv_transtion_time_info_t *const *p_info*)

API to get default transition time. This is to get default transition time.

Parameters

[in]	p_ctrl	rm_mesh_generic_dtt_srv control block.
[in]	p_info	rm_mesh_generic_dtt_srv status information.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

BLE Mesh Network Generic Level Client (rm_mesh_generic_level_clt)

Modules » Networking » BLE Mesh Network Modules

fsp_err_t	RM_MESH_GENERIC_LEVEL_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_GENERIC_LEVEL_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle)
fsp_err_t	RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode)
fsp_err_t	RM_MESH_GENERIC_LEVEL_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_GENERIC_LEVEL_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_LEVEL_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_LEVEL_CLT_DeltaSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_LEVEL_CLT_DeltaSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_LEVEL_CLT_MoveSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_LEVEL_CLT_MoveSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Level Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_level_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_level_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Level Client (rm_mesh_generic_level_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Level Client (rm_mesh_generic_level_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic level client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_level_clt0	Module name.

Data Structures

struct	rm_mesh_generic_level_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_level_clt_instance_ctrl_t

struct rm_mesh_generic_level_clt_instance_ctrl_t
BLE mesh generic level instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_LEVEL_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_LEVEL_CLT_Open()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic_Level Client middleware. This is to initialize Generic_Level Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_LEVEL_CLT_Open(&g_mesh_generic_level_clt0_ctrl,
&g_mesh_generic_level_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_Close()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Level Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_LEVEL_CLT_Close(&g_mesh_generic_level_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Level client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle().

Example:

```
/* Get the handle of generic level client model. */
   err = RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle(&g_mesh_generic_level_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err =
RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu(&g_mesh_generic_level_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_Get()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Level Get is an acknowledged message used to get the Generic Level state of an element. The response to the Generic Level Get message is a Generic Level Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_Set()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Level Set is an acknowledged message used to set the Generic Level state of an element to a new absolute value. The response to the Generic Level Set message is a Generic Level Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Level Set Unacknowledged is an unacknowledged message used to set the Generic Level state of an element to a new absolute value.

Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_DeltaSet()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_DeltaSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Delta Set is an acknowledged message used to set the Generic Level state of an element by a relative value. The message is transactional, it supports changing the state by a cumulative value with a sequence of messages that are part of a transaction. The response to the Generic Delta Set message is a Generic Level Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_DeltaSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_DeltaSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Delta Set Unacknowledged is an unacknowledged message used to set the Generic Level state of an element by a relative value.

Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_MoveSet()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_MoveSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Move Set is an acknowledged message used to start a process of changing the Generic Level state of an element with a defined transition speed. The response to the Generic Move Set message is a Generic Level Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_MoveSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_MoveSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Move Set Unacknowledged is an unacknowledged message used to start a process of changing the Generic Level state of an element with a defined transition speed.

Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Generic Level Server (rm_mesh_generic_level_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_GENERIC_LEVEL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_GENERIC_LEVEL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)

fsp_err_t	RM_MESH_GENERIC_LEVEL_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Level Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_level_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_level_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Level Server (rm_mesh_generic_level_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Level Server (rm_mesh_generic_level_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided Shen Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic level server ISR occurs
Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic level server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_level_srv0	Module name.

Data Structures

struct	rm_mesh_generic_level_srv_info_t
struct	rm_mesh_generic_level_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_level_srv_info_t

struct rm_mesh_generic_level_srv_info_t		
Generic Level state is a 16-bit signed integer (2-s complement) representing the state of an element		
Data Fields		
uint16_t	level	Generic Level
uint32_t	delta_level	Delta Level
uint16_t	move_level	Move Level
uint8_t	tid	
uint8_t	transition_time	
uint8_t	delay	
uint16_t	target_level	Target Level

◆ rm_mesh_generic_level_srv_instance_ctrl_t

struct rm_mesh_generic_level_srv_instance_ctrl_t
BLE mesh generic level instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_LEVEL_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_LEVEL_SRV_Open()

fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Level Server model. This is to initialize Generic_Level Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_LEVEL_SRV_Open(&g_mesh_generic_level_srv0_ctrl,
&g_mesh_generic_level_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_LEVEL_SRV_Close()

fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Level Server model. This is to terminate Generic_Level Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_LEVEL_SRV_Close(&g_mesh_generic_level_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_LEVEL_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_BATTERY_SRV_StateUpdate(&g_mesh_generic_battery_srv0_ctrl,
&state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Generic Location Client (rm_mesh_generic_loc_clt)

fsp_err_t	RM_MESH_GENERIC_LOC_CLT_LocationGlobalSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_LOC_CLT_LocationLocalGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_GENERIC_LOC_CLT_LocationLocalSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_LOC_CLT_LocationLocalSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Location Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_loc_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_loc_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic

Location Client (rm_mesh_generic_loc_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Location Client (rm_mesh_generic_loc_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic location client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_loc_clt0	Module name.

Data Structures

struct	rm_mesh_generic_loc_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_loc_clt_instance_ctrl_t

struct rm_mesh_generic_loc_clt_instance_ctrl_t
BLE mesh generic loc instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_LOC_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_LOC_CLT_Open()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic_Location Client middleware. This is to initialize Generic_Location Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_LOC_CLT_Open(&g_mesh_generic_loc_clt0_ctrl,
&g_mesh_generic_loc_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_LOC_CLT_Close()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Location Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_LOC_CLT_Close(&g_mesh_generic_loc_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_LOC_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Location client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic_location client model. */
   err = RM_MESH_GENERIC_LOC_CLT_GetModelHandle(&g_mesh_generic_loc_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_GENERIC_LOC_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands */
   err = RM_MESH_GENERIC_LOC_CLT_SendReliablePdu(&g_mesh_generic_loc_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LOC_CLT_LocationGlobalGet()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationGlobalGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Location Global Get message is an acknowledged message used to get the selected fields of the Generic Location state of an element. The response to the Generic Location Global Get message is a Generic Location Global Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LOC_CLT_LocationGlobalSet()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationGlobalSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Location Global Set is an acknowledged message used to set the selected fields of the Generic Location state of an element. The response to the Generic Location Global Set message is a Generic Location Global Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.
[in]	p_parameter	Pointer to Generic Location Global Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LOC_CLT_LocationGlobalSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationGlobalSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Location Global Set Unacknowledged is an unacknowledged message used to set the selected fields of the Generic Location state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.
[in]	p_parameter	Pointer to Generic Location Global Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LOC_CLT_LocationLocalGet()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationLocalGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Location Local Get message is an acknowledged message used to get the selected fields of the Generic Location state of an element. The response to the Generic Location Local Get message is a Generic Location Local Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LOC_CLT_LocationLocalSet()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationLocalSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Location Local Set is an acknowledged message used to set the selected fields of the Generic Location state of an element. The response to the Generic Location Local Set message is a Generic Location Local Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.
[in]	p_parameter	Pointer to Generic Location Local Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LOC_CLT_LocationLocalSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationLocalSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Location Local Set Unacknowledged is an unacknowledged message used to set the selected fields of the Generic Location state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.
[in]	p_parameter	Pointer to Generic Location Local Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Location Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_loc_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_loc_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Location Server (rm_mesh_generic_loc_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Location Server (rm_mesh_generic_loc_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic location server ISR occurs
Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic location server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_loc_srv0	Module name.

Data Structures

struct	rm_mesh_generic_loc_srv_global_info_t
struct	rm_mesh_generic_loc_srv_local_info_t

struct	rm_mesh_generic_loc_srv_state_info_t
struct	rm_mesh_generic_loc_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_loc_srv_global_info_t

struct rm_mesh_generic_loc_srv_global_info_t		
Generic Global Location state defines location information of an element		
Data Fields		
uint32_t	global_latitude	Global Coordinates (Latitude)
uint32_t	global_longitude	Global Coordinates (Longitude)
uint16_t	global_altitude	Global Altitude

◆ rm_mesh_generic_loc_srv_local_info_t

struct rm_mesh_generic_loc_srv_local_info_t		
Generic Local Location state defines location information of an element		
Data Fields		
uint16_t	local_north	Local Coordinates (North)
uint16_t	local_east	Local Coordinates (East)
uint16_t	local_altitude	Local Altitude
uint8_t	floor_number	Floor Number
uint16_t	uncertainty	Uncertainty

◆ rm_mesh_generic_loc_srv_state_info_t

struct rm_mesh_generic_loc_srv_state_info_t		
Generic Location state is a composite state that includes a Generic Location Global state and a Generic Location Local state		
Data Fields		
rm_mesh_generic_loc_srv_global_info_t	global_location	Global Location
rm_mesh_generic_loc_srv_local_info_t	local_location	Local Location

◆ rm_mesh_generic_loc_srv_instance_ctrl_t

struct rm_mesh_generic_loc_srv_instance_ctrl_t
BLE mesh generic loc instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_LOC_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_LOC_SRV_Open()

fsp_err_t RM_MESH_GENERIC_LOC_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Location Server model and to initialize Generic_Location_Setup Server model. This is to initialize Generic_Location Server model and to register with Access layer. And this is to initialize Generic_Location_Setup Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_LOC_SRV_Open(&g_mesh_generic_loc_srv0_ctrl,
&g_mesh_generic_loc_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_LOC_SRV_Close()

fsp_err_t RM_MESH_GENERIC_LOC_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Location Server model. This is to terminate Generic_Location Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_LOC_SRV_Close(&g_mesh_generic_loc_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_LOC_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_LOC_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_LOC_SRV_StateUpdate(&g_mesh_generic_loc_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LOC_SRV_SetupServerStateUpdate()

fsp_err_t RM_MESH_GENERIC_LOC_SRV_SetupServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_generic_loc_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Generic Manufacturer Property Server (rm_mesh_generic_mfr_prop_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_GENERIC_MFR_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_GENERIC_MFR_PROP_SRV_Close

	(rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Manufacturer Property Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_mfr_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_mfr_prop_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Manufacturer Property Server (rm_mesh_generic_mfr_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Manufacturer Property Server (rm_mesh_generic_mfr_prop_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic manufacturer property server ISR occurs
Callback Provided When an Timeout ISR Occurs	Name Must be a Valid C Symbol	NULL	Callback provided when mesh generic manufacturer property server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_mfr_prop_srv0	Module name.

Data Structures

struct	rm_mesh_generic_mfr_prop_srv_info_t
struct	rm_mesh_generic_mfr_prop_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_mfr_prop_srv_info_t

struct rm_mesh_generic_mfr_prop_srv_info_t		
Generic Manufacturer Property is a state representing a device property of an element that is programmed by a manufacturer and can be read		
Data Fields		
uint16_t	property_id	Manufacturer Property ID field is a 2-octet Assigned Number value that references a device property
uint8_t	user_access	Manufacturer User Access field is an enumeration indicating whether or not the device property can be read as a Generic User Property
uint8_t *	property_value	Manufacturer Property Value field is a conditional field
uint16_t	property_value_len	

◆ rm_mesh_generic_mfr_prop_srv_instance_ctrl_t

struct rm_mesh_generic_mfr_prop_srv_instance_ctrl_t
BLE mesh generic mfr prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_MFR_PROP_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_MFR_PROP_SRV_Open()

fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Manufacturer_Property Server model. This is to initialize Generic_Manufacturer_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_MFR_PROP_SRV_Open(&g_mesh_generic_mfr_prop_srv0_ctrl,
&g_mesh_generic_mfr_prop_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_MFR_PROP_SRV_Close()

fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Manufacturer_Property Server model. This is to terminate Generic_Manufacturer_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_MFR_PROP_SRV_Close(&g_mesh_generic_mfr_prop_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err =
RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate(&g_mesh_generic_mfr_prop_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Generic On Off Client (rm_mesh_generic_on_off_clt)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_GENERIC_ON_OFF_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)

fsp_err_t	RM_MESH_GENERIC_ON_OFF_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic On Off Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_on_off_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_on_off_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic On Off Client (rm_mesh_generic_on_off_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic On Off Client (rm_mesh_generic_on_off_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic on off client ISR occurs

Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_on_off_clt0	Module name.

Data Structures

struct	rm_mesh_generic_on_off_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_on_off_clt_instance_ctrl_t

struct rm_mesh_generic_on_off_clt_instance_ctrl_t

BLE mesh generic on off instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_ON_OFF_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_ON_OFF_CLT_Open()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic_Onoff Client middleware. This is to initialize Generic_Onoff Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_ON_OFF_CLT_Open(&g_mesh_generic_on_off_clt0_ctrl,
&g_mesh_generic_on_off_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_ON_OFF_CLT_Close()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Onoff Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_ON_OFF_CLT_Close(&g_mesh_generic_on_off_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Onoff client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic on_off client model. */
   err = RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle(&g_mesh_generic_on_off_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_GENERIC_ON_OFF_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err =
RM_MESH_GENERIC_ON_OFF_CLT_SendReliablePdu(&g_mesh_generic_on_off_clt0_ctrl,
                                           req_opcode,
                                           p_parameter,
                                           rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_ON_OFF_CLT_Get()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Generic OnOff Get is an acknowledged message used to get the Generic OnOff state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_on_off_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_ON_OFF_CLT_Set()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Generic OnOff Set is an acknowledged message used to get the Generic OnOff state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_on_off_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_generic_on_off_set_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_ON_OFF_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Generic OnOff Set is an unacknowledged message used to get the Generic OnOff state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_on_off_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_generic_on_off_set_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Overview

Target Devices

The BLE Mesh Network Generic On Off Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_on_off_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_on_off_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic On Off Server (rm_mesh_generic_on_off_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic On Off Server (rm_mesh_generic_on_off_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic on off server ISR occurs
Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic on off server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_on_off_srv0	Module name.

Data Structures

struct	rm_mesh_generic_on_off_srv_info_t
struct	rm_mesh_generic_on_off_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_on_off_srv_info_t

struct rm_mesh_generic_on_off_srv_info_t		
Generic OnOff state is a Boolean value that represents the state of an element		
Data Fields		
uint8_t	onoff	Generic On/Off
uint8_t	target_onoff	Target On/Off - Used in response path
uint8_t	last_onoff	Last On/Off
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

◆ rm_mesh_generic_on_off_srv_instance_ctrl_t

struct rm_mesh_generic_on_off_srv_instance_ctrl_t
BLE mesh generic on off instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_ON_OFF_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_ON_OFF_SRV_Open()

fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Onoff Server model. This is to initialize Generic_Onoff Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_ON_OFF_SRV_Open(&g_mesh_generic_on_off_srv0_ctrl,
&g_mesh_generic_on_off_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_ON_OFF_SRV_Close()

fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Onoff Server model. This is to terminate Generic_Onoff Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_ON_OFF_SRV_Close(&g_mesh_generic_on_off_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate(&g_mesh_generic_on_off_srv0_ctrl,
&state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ rm_mesh_generic_pl_clt_instance_ctrl_t

struct rm_mesh_generic_pl_clt_instance_ctrl_t
BLE mesh generic pl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_PL_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_PL_CLT_Open()

fsp_err_t RM_MESH_GENERIC_PL_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic_Power_Level Client middleware. This is to initialize Generic_Power_Level Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_PL_CLT_Open(&g_mesh_generic_pl_clt0_ctrl,
&g_mesh_generic_pl_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_PL_CLT_Close()

fsp_err_t RM_MESH_GENERIC_PL_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Power_Level Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_PL_CLT_Close(&g_mesh_generic_pl_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_PL_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_PL_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Power_Level client model. Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic power level client model. */
   err = RM_MESH_GENERIC_PL_CLT_GetModelHandle(&g_mesh_generic_pl_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_GENERIC_PL_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_PL_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands. Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_GENERIC_PL_CLT_SendReliablePdu(&g_mesh_generic_pl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_LevelGet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_LevelGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Power Level Get message is an acknowledged message used to get the Generic Power Actual state of an element. The response to the Generic Power Level Get message is a Generic Power Level Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_LevelSet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_LevelSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Power Level Set is an acknowledged message used to set the Generic Power Actual state of an element. The response to the Generic Power Level Set message is a Generic Power Level Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_LevelSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PL_CLT_LevelSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Power Level Set Unacknowledged is an unacknowledged message used to set the Generic Power Actual state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_LastGet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_LastGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Power Last Get is an acknowledged message used to get the Generic Power Last state of an element. The response to a Generic Power Last Get message is a Generic Power Last Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_DefaultGet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Power Default Get is an acknowledged message used to get the Generic Power Default state of an element. The response to a Generic Power Default Get message is a Generic Power Default Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_DefaultSet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Power Default Set is an acknowledged message used to set the Generic Power Default state of an element. The response to the Generic Power Default Set message is a Generic Power Default Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_DefaultSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PL_CLT_DefaultSetUnacknowledged (
rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Power Default Set Unacknowledged is an unacknowledged message used to set the Generic Power Default state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_RangeGet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_RangeGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Power Range Get is an acknowledged message used to get the Generic Power Range state of an element. The response to the Generic Power Range Get message is a Generic Power Range Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_RangeSet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_RangeSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Power Range Set is an acknowledged message used to set the Generic Power Range state of an element. The response to the Generic Power Range Set message is a Generic Power Range Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_RangeSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PL_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Power Range Set Unacknowledged is an unacknowledged message used to set the Generic Power Range state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Generic Power Level Server (rm_mesh_generic_pl_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Power Level Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_pl_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_pl_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power Level Server (rm_mesh_generic_pl_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power Level Server (rm_mesh_generic_pl_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power level server ISR occurs
Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power level server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_pl_srv0	Module name.

Data Structures

struct	rm_mesh_generic_pl_srv_actual_state_info_t
struct	rm_mesh_generic_pl_srv_last_state_info_t

struct	rm_mesh_generic_pl_srv_default_state_info_t
struct	rm_mesh_generic_pl_srv_range_state_info_t
struct	rm_mesh_generic_pl_srv_state_info_t
struct	rm_mesh_generic_pl_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_pl_srv_actual_state_info_t

struct rm_mesh_generic_pl_srv_actual_state_info_t		
Generic Power Actual state determines the linear percentage of the maximum power level of an element, representing a range from 0 percent through 100 percent		
Data Fields		
uint16_t	power_actual	Generic Power Actual
uint8_t	tid	
uint16_t	power_target	Generic Power Target - Used only in response path
uint8_t	transition_time	Transition Time - Used in request path Used as Remaining Time in response path
uint8_t	delay	
uint16_t	transition_time_handle	Transition Timer Handle

◆ rm_mesh_generic_pl_srv_last_state_info_t

struct rm_mesh_generic_pl_srv_last_state_info_t		
Generic Power Last state is a 16-bit value representing a percentage ranging from (1/65535) percent to 100 percent		
Data Fields		
uint16_t	power_last	Generic Power Last

◆ rm_mesh_generic_pl_srv_default_state_info_t

struct rm_mesh_generic_pl_srv_default_state_info_t		
Generic Power Default state is a 16-bit value ranging from 0 through 65535		
Data Fields		
uint16_t	power_default	Generic Power Default

◆ rm_mesh_generic_pl_srv_range_state_info_t

struct rm_mesh_generic_pl_srv_range_state_info_t

Generic Power Range state determines the minimum and maximum power levels of an element relative to the maximum power level an element can output		
Data Fields		
uint16_t	power_range_min	Generic Power Range - Minimum
uint16_t	power_range_max	Generic Power Range - Maximum
uint8_t	status	Status - Used only in the response path

◆ rm_mesh_generic_pl_srv_state_info_t

struct rm_mesh_generic_pl_srv_state_info_t		
Generic Power Level state is a composite state that includes a Generic Power Actual state, a Generic Power Last state, a Generic Power Default state, and a Generic Power Range state		
Data Fields		
rm_mesh_generic_pl_srv_actual_state_info_t	generic_power_actual	Generic Power Actual
rm_mesh_generic_pl_srv_last_state_info_t	generic_power_last	Generic Power Last
rm_mesh_generic_pl_srv_default_state_info_t	generic_power_default	Generic Power Default
rm_mesh_generic_pl_srv_range_state_info_t	generic_power_range	Generic Power Range

◆ rm_mesh_generic_pl_srv_instance_ctrl_t

struct rm_mesh_generic_pl_srv_instance_ctrl_t
BLE mesh generic pl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_PL_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_PL_SRV_Open()

fsp_err_t RM_MESH_GENERIC_PL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Power_Level Server model and to initialize Generic_Power_Level_Setup Server model. This is to initialize Generic_Power_Level Server model and to register with Access layer. And this is to initialize Generic_Power_Level_Setup Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_PL_SRV_Open(&g_mesh_generic_pl_srv0_ctrl,
&g_mesh_generic_pl_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_PL_SRV_Close()

fsp_err_t RM_MESH_GENERIC_PL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Power_Level Server model. This is to terminate Generic_Power_Level Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_PL_SRV_Close(&g_mesh_generic_pl_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_PL_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_PL_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_PL_SRV_StateUpdate(&g_mesh_generic_pl_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_SRV_SetupServerStateUpdate()

fsp_err_t RM_MESH_GENERIC_PL_SRV_SetupServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Power On Off Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_poo_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_poo_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power On Off Client (rm_mesh_generic_poo_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power On Off Client (rm_mesh_generic_poo_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power on off client ISR occurs

Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_poo_clt0	Module name.

Data Structures

struct	rm_mesh_generic_poo_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_poo_clt_instance_ctrl_t

struct rm_mesh_generic_poo_clt_instance_ctrl_t

BLE mesh generic poo instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_POO_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_POO_CLT_Open()

fsp_err_t RM_MESH_GENERIC_POO_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic_Power_Onoff Client middleware. This is to initialize Generic_Power_Onoff Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_POO_CLT_Open(&g_mesh_generic_poo_clt0_ctrl,
&g_mesh_generic_poo_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_POO_CLT_Close()

fsp_err_t RM_MESH_GENERIC_POO_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Power_Onoff Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_POO_CLT_Close(&g_mesh_generic_poo_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_POO_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_POO_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Power_Onoff client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic power on off client model. */
   err = RM_MESH_GENERIC_POO_CLT_GetModelHandle(&g_mesh_generic_poo_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_GENERIC_POO_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_POO_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_GENERIC_POO_CLT_SendReliablePdu(&g_mesh_generic_poo_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_POO_CLT_OnpowerupGet()

fsp_err_t RM_MESH_GENERIC_POO_CLT_OnpowerupGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic OnPowerUp Get is an acknowledged message used to get the Generic OnPowerUp state of an element. The response to the Generic OnPowerUp Get message is a Generic OnPowerUp Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_poo_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_POO_CLT_OnpowerupSet()

fsp_err_t RM_MESH_GENERIC_POO_CLT_OnpowerupSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic OnPowerUp Set is an acknowledged message used to set the Generic OnPowerUp state of an element. The response to the Generic OnPowerUp Set message is a Generic OnPowerUp Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_poo_clt control block.
[in]	p_parameter	Pointer to Generic OnPowerUp Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_POO_CLT_OnpowerupSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_POO_CLT_OnpowerupSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic OnPowerUp Set Unacknowledged is an unacknowledged message used to set the Generic OnPowerUp state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_poo_clt control block.
[in]	p_parameter	Pointer to Generic OnPowerUp Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Generic Power On Off Server (rm_mesh_generic_poo_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_GENERIC_POO_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_GENERIC_POO_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)

fsp_err_t	RM_MESH_GENERIC_POO_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)
fsp_err_t	RM_MESH_GENERIC_POO_SRV_SetupServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Power On Off Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_poo_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_poo_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power On Off Server (rm_mesh_generic_poo_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power On Off Server (rm_mesh_generic_poo_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power on off server ISR occurs
Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power on off server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_poo_srv0	Module name.

Data Structures

struct	rm_mesh_generic_poo_srv_on_power_up_state_info_t
struct	rm_mesh_generic_poo_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_poo_srv_on_power_up_state_info_t

struct rm_mesh_generic_poo_srv_on_power_up_state_info_t		
Generic OnPowerUp state is an enumeration representing the behavior of an element when powered up		
Data Fields		
uint8_t	onpowerup	Generic OnPowerUp

◆ rm_mesh_generic_poo_srv_instance_ctrl_t

struct rm_mesh_generic_poo_srv_instance_ctrl_t
BLE mesh generic poo instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_POO_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_POO_SRV_Open()

fsp_err_t RM_MESH_GENERIC_POO_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Power_Onoff Server model and to initialize Generic_Power_Onoff_Setup Server model. This is to initialize Generic_Power_Onoff Server model and to register with Access layer. And this is to initialize Generic_Power_Onoff_Setup Server model and to register with Access layer.
 	
Implements rm_ble_mesh_model_server_api_t::open.
 	
Example:
`/* Open the module. */`
`err = RM_MESH_GENERIC_POO_SRV_Open(&g_mesh_generic_poo_srv0_ctrl, &g_mesh_generic_poo_srv0_cfg);`
 	
Return values
FSP_SUCCESS — Model opened successfully.
FSP_ERR_ASSERTION — Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN — Model is already open.
FSP_ERR_NOT_FOUND — The number of models has exceeded the limit.
FSP_ERR_ABORTED — Model initialization is failed.

◆ RM_MESH_GENERIC_POO_SRV_Close()

fsp_err_t RM_MESH_GENERIC_POO_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Power_Onoff Server model. This is to terminate Generic_Power_Onoff Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_POO_SRV_Close(&g_mesh_generic_poo_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_POO_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_POO_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_POO_SRV_StateUpdate(&g_mesh_generic_poo_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_POO_SRV_SetupServerStateUpdate()

fsp_err_t RM_MESH_GENERIC_POO_SRV_SetupServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_generic_poo_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Generic Property Client (rm_mesh_generic_prop_clt)

fsp_err_t	RM_MESH_GENERIC_PROP_CLT_AdminPropertySet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_AdminPropertySetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertiesGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertyGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySetUnacknowle

	dged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_ClientPropertiesGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Property Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_prop_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_prop_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Property Client (rm_mesh_generic_prop_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Property Client (rm_mesh_generic_prop_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic property client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_prop_clt0	Module name.

Data Structures

struct	rm_mesh_generic_prop_clt_instance_ctrl_t

Data Structure Documentation

◆ **rm_mesh_generic_prop_clt_instance_ctrl_t**

struct rm_mesh_generic_prop_clt_instance_ctrl_t

BLE mesh generic prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_PROP_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_PROP_CLT_Open()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic_Property Client middleware. This is to initialize Generic_Property Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_PROP_CLT_Open(&g_mesh_generic_prop_clt0_ctrl,
&g_mesh_generic_prop_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_PROP_CLT_Close()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Property Client middleware. Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_PROP_CLT_Close(&g_mesh_generic_prop_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_PROP_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Property client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic property client model. */
   err = RM_MESH_GENERIC_PROP_CLT_GetModelHandle(&g_mesh_generic_prop_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_GENERIC_PROP_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_GENERIC_PROP_CLT_SendReliablePdu(&g_mesh_generic_prop_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_UserPropertiesGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertiesGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic User Properties Get is an acknowledged message used to get the list of Generic User Property states of an element. The response to the Generic User Properties Get message is a Generic User Properties Status message. The message has no parameters.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_UserPropertyGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertyGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic User Property Get is an acknowledged message used to get the Generic User Property state of an element. The response to the Generic User Property Get message is a Generic User Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic User Property Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_UserPropertySet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertySet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic User Property Set is an acknowledged message used to set the Generic User Property state of an element. The response to the Generic User Property Set message is a Generic User Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic User Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_UserPropertySetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertySetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic User Property Set Unacknowledged is an unacknowledged message used to set the Generic User Property state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic User Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_AdminPropertiesGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertiesGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Admin Properties Get is an acknowledged message used to get the list of Generic Admin Property states of an element. The response to the Generic Admin Properties Get message is a Generic Admin Properties Status message. The message has no parameters.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_AdminPropertyGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertyGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Admin Property Get is an acknowledged message used to get the Generic Admin Property state of an element. The response to the Generic Admin Property Get message is a Generic Admin Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Admin Property Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_AdminPropertySet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertySet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Admin Property Set is an acknowledged message used to set the Generic Admin Property state of an element. The response to the Generic Admin Property Set message is a Generic Admin Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Admin Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_AdminPropertySetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertySetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Admin Property Set Unacknowledged is an unacknowledged message used to set the Generic Admin Property state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Admin Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertiesGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertiesGet (
rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Manufacturer Properties Get is an acknowledged message used to get the list of Generic Manufacturer Property states of an element. The response to the Generic Manufacturer Properties Get message is a Generic Manufacturer Properties Status message. The message has no parameters.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertyGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertyGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Manufacturer Property Get is an acknowledged message used to get the Generic Manufacturer Property state of an element. The response to the Generic Manufacturer Property Get message is a Generic Manufacturer Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Manufacturer Property Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Manufacturer Property Set is an acknowledged message used to set the Generic Manufacturer Property User Access state of an element. The response to the Generic Manufacturer Property Set message is a Generic Manufacturer Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Manufacturer Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Generic Manufacturer Property Set Unacknowledged is an unacknowledged message used to set the Generic Manufacturer Property User Access state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Manufacturer Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_ClientPropertiesGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_ClientPropertiesGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Client Properties Get is an acknowledged message used to get the list of Generic Client Property states of an element. The response to the Generic Client Properties Get message is a Generic Client Properties Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Client Properties Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Generic User Property Server (rm_mesh_generic_user_prop_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_GENERIC_USER_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_GENERIC_USER_PROP_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)

fsp_err_t	RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic User Property Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_user_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_user_prop_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic User Property Server (rm_mesh_generic_user_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic User Property Server (rm_mesh_generic_user_prop_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic user property server ISR occurs
Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic user property server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_user_prop_srv0	Module name.

Data Structures

struct	rm_mesh_generic_user_prop_srv_info_t
struct	rm_mesh_generic_user_prop_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_user_prop_srv_info_t

struct rm_mesh_generic_user_prop_srv_info_t		
Generic User Property is a state representing a device property of an element		
Data Fields		
uint16_t	property_id	User Property ID field is a 2-octet Assigned Number value referencing a device property
uint8_t	user_access	User Access field is an enumeration indicating whether the device property can be read or written as a Generic User Property
uint8_t *	property_value	User Property Value field is a conditional field
uint16_t	property_value_len	

◆ rm_mesh_generic_user_prop_srv_instance_ctrl_t

struct rm_mesh_generic_user_prop_srv_instance_ctrl_t
BLE mesh generic user prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_USER_PROP_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_USER_PROP_SRV_Open()

fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_User_Property Server model. This is to initialize Generic_User_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_USER_PROP_SRV_Open(&g_mesh_generic_user_prop_srv0_ctrl,
&g_mesh_generic_user_prop_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_USER_PROP_SRV_Close()

fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_User_Property Server model. This is to terminate Generic_User_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_USER_PROP_SRV_Close(&g_mesh_generic_user_prop_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err =
RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate(&g_mesh_generic_user_prop_srv0_ctrl,
&state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Health Client (rm_mesh_health_clt)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_HEALTH_CLIENT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_HEALTH_CLIENT_Close (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)

fsp_err_t	RM_MESH_HEALTH_CLIENT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle)
fsp_err_t	RM_MESH_HEALTH_CLIENT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode)

fsp_err_t	RM_MESH_HEALTH_CLIENT_FaultTest (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_HEALTH_CLIENT_FaultTestUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_HEALTH_CLIENT_PeriodGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_HEALTH_CLIENT_PeriodSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_HEALTH_CLIENT_PeriodSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_HEALTH_CLIENT_AttentionGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_HEALTH_CLIENT_AttentionSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_HEALTH_CLIENT_AttentionSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Health Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_health_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_health_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Health Client (rm_mesh_health_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Health Client (rm_mesh_health_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh health client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_health_clt0	Module name.

Data Structures

struct	rm_mesh_health_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_health_clt_instance_ctrl_t

struct rm_mesh_health_clt_instance_ctrl_t
BLE mesh health client instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_HEALTH_CLIENT_Open() is called.

Function Documentation

◆ RM_MESH_HEALTH_CLIENT_Open()

fsp_err_t RM_MESH_HEALTH_CLIENT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Health Client middleware. This is to initialize Health Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_HEALTH_CLIENT_Open(&g_mesh_health_clt0_ctrl,
&g_mesh_health_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_HEALTH_CLIENT_Close()

fsp_err_t RM_MESH_HEALTH_CLIENT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Health Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_HEALTH_CLIENT_Close(&g_mesh_health_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_HEALTH_CLIENT_GetModelHandle()

fsp_err_t RM_MESH_HEALTH_CLIENT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Health client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of health client model. */
   err = RM_MESH_HEALTH_CLIENT_GetModelHandle(&g_mesh_health_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_HEALTH_CLIENT_SendReliablePdu()

fsp_err_t RM_MESH_HEALTH_CLIENT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to set the handle of Health client model.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_HEALTH_CLIENT_SendReliablePdu(&g_mesh_health_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_FaultGet()

fsp_err_t RM_MESH_HEALTH_CLIENT_FaultGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Fault Get is an acknowledged message used to get the current Registered Fault state identified by Company ID of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_fault_get_clear_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_FaultClearUnacknowledged()

fsp_err_t RM_MESH_HEALTH_CLIENT_FaultClearUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Fault Clear Unacknowledged is an unacknowledged message used to clear the current Registered Fault state identified by Company ID of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_fault_get_clear_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_FaultClear()

fsp_err_t RM_MESH_HEALTH_CLIENT_FaultClear (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Fault Clear is an acknowledged message used to clear the current Registered Fault state identified by Company ID of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_fault_get_clear_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_FaultTest()

fsp_err_t RM_MESH_HEALTH_CLIENT_FaultTest (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Fault Test is an acknowledged message used to invoke a self-test procedure of an element. The procedure is implementation specific and may result in changing the Health Fault state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_fault_test_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_FaultTestUnacknowledged()

fsp_err_t RM_MESH_HEALTH_CLIENT_FaultTestUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Fault Test Unacknowledged is an unacknowledged message used to invoke a self-test procedure of an element. The procedure is implementation specific and may result in changing the Health Fault state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_fault_test_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_PeriodGet()

fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Health Period Get is an acknowledged message used to get the current Health Period state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_PeriodSetUnacknowledged()

fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Period Set Unacknowledged is an unacknowledged message used to set the current Health Period state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_period_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_PeriodSet()

fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Period Set is an acknowledged message used to set the current Health Period state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_period_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_AttentionGet()

fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Health Attention Get is an acknowledged message used to get the current Attention Timer state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_AttentionSet()

fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Attention Set is an acknowledged message used to set the Attention Timer state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_attention_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_AttentionSetUnacknowledged()

fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Attention Set Unacknowledged is an unacknowledged message used to set the Attention Timer state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_attention_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Health Server (rm_mesh_health_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_HEALTH_SERVER_Open (rm_ble_mesh_health_server_ctrl_t *const p_ctrl, rm_ble_mesh_health_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_HEALTH_SERVER_Close (rm_ble_mesh_health_server_ctrl_t *const p_ctrl)

fsp_err_t	RM_MESH_HEALTH_SERVER_ReportFault (rm_ble_mesh_health_server_ctrl_t *const p_ctrl, const rm_ble_mesh_access_model_handle_t *const model_handle, uint8_t test_id, uint16_t company_id, uint8_t fault_code)
fsp_err_t	RM_MESH_HEALTH_SERVER_PublishCurrentStatus (rm_ble_mesh_health_server_ctrl_t *const p_ctrl, uint8_t *status, uint16_t length)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Health Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_health_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_health_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Health Server (rm_mesh_health_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Health Server (rm_mesh_health_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh health server ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_health_srv0	Module name.
Company ID	Invalid Company Id	0	Select company id.
Number of Self Tests	Invalid Number of Self Tests	0	Select number of self tests.
Self Tests	Name Must Be a Valid C Symbol	NULL	Self test

Data Structures

struct	rm_mesh_health_server_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_health_server_instance_ctrl_t

struct rm_mesh_health_server_instance_ctrl_t
BLE mesh health server instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_HEALTH_SERVER_Open() is called.

Function Documentation

◆ RM_MESH_HEALTH_SERVER_Open()

fsp_err_t RM_MESH_HEALTH_SERVER_Open (rm_ble_mesh_health_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_health_server_cfg_t const *const *p_cfg*)

API to initialize Health Server model. This is to initialize Health Server model and to register with Access layer.

Implements rm_ble_mesh_health_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_HEALTH_SERVER_Open(&g_mesh_health_srv0_ctrl,
&g_mesh_health_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_HEALTH_SERVER_Close()

fsp_err_t RM_MESH_HEALTH_SERVER_Close (rm_ble_mesh_health_server_ctrl_t *const *p_ctrl*)

API to terminate Health Server model. This is to terminate Health Server model and to register with Access layer.

Implements rm_ble_mesh_health_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_HEALTH_SERVER_Close(&g_mesh_health_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_HEALTH_SERVER_ReportFault()

fsp_err_t RM_MESH_HEALTH_SERVER_ReportFault (rm_ble_mesh_health_server_ctrl_t *const *p_ctrl*, const rm_ble_mesh_access_model_handle_t *const *model_handle*, uint8_t *test_id*, uint16_t *company_id*, uint8_t *fault_code*)

API to report self-test fault. This is to report fault observed during self-test procedure.

Parameters

[in]	p_ctrl	rm_mesh_health_srv control block.
[in]	model_handle	Model Handle identifying the Health Server model instance.
[in]	test_id	Identifier of the self-test.
[in]	company_id	Company Identifier.
[in]	fault_code	Fault value indicating the error.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_MESH_HEALTH_SERVER_PublishCurrentStatus()

fsp_err_t RM_MESH_HEALTH_SERVER_PublishCurrentStatus (rm_ble_mesh_health_server_ctrl_t *const *p_ctrl*, uint8_t * *status*, uint16_t *length*)

API to publish current status.

Parameters

[in]	p_ctrl	rm_mesh_health_srv control block.
[in]	status	Current status.
[in]	length	Length of status.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Light Control Client (rm_mesh_light_ctl_clt)

fsp_err_t	RM_MESH_LIGHT_CTL_CLT_TemperatureRangeGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Control Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_ctl_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_ctl_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light Control Client (rm_mesh_light_ctl_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light Control Client (rm_mesh_light_ctl_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light control client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_ctl_clt0	Module name.

Data Structures

struct	rm_mesh_light_ctl_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_ctl_clt_instance_ctrl_t

struct rm_mesh_light_ctl_clt_instance_ctrl_t
BLE mesh light ctl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_CTL_CLT_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_CTL_CLT_Open()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Light_Ctl Client middleware. This is to initialize Light_Ctl Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_CTL_CLT_Open(&g_mesh_light_ctl_clt0_ctrl,
&g_mesh_light_ctl_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_CTL_CLT_Close()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Light_Ctl Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_CTL_CLT_Close(&g_mesh_light_ctl_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_CTL_CLT_GetModelHandle()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Light_Ctl client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of light ctl client model. */
   err = RM_MESH_LIGHT_CTL_CLT_GetModelHandle(&g_mesh_light_ctl_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_LIGHT_CTL_CLT_SendReliablePdu()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_LIGHT_CTL_CLT_SendReliablePdu(&g_mesh_light_ctl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_Get()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light CTL Get is an acknowledged message used to get the Light CTL state of an element. The response to the Light CTL Get message is a Light CTL Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_Set()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light CTL Set is an acknowledged message used to set the Light CTL Lightness state, Light CTL Temperature state, and the Light CTL Delta UV state of an element. The response to the Light CTL Set message is a Light CTL Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light CTL Set Unacknowledged is an unacknowledged message used to set the Light CTL Lightness state, Light CTL Temperature state, and the Light CTL Delta UV state of an element

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureGet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light CTL Temperature Get is an acknowledged message used to get the Light CTL Temperature state of an element. The response to the Light CTL Temperature Get message is a Light CTL Temperature Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureSet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light CTL Temperature Set is an acknowledged message used to set the Light CTL Temperature state and the Light CTL Delta UV state of an element. The response to the Light CTL Temperature Set message is a Light CTL Temperature Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Temperature Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light CTL Temperature Set Unacknowledged is an unacknowledged message used to set the Light CTL Temperature state and the Light CTL Delta UV state of an element

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Temperature Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_DefaultGet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light CTL Default Get is an acknowledged message used to get the Light CTL Temperature Default and Light CTL Delta UV Default states of an element. The response to the Light CTL Default Get message is a Light CTL Default Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_DefaultSet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light CTL Default Set is an acknowledged message used to set the Light CTL Temperature Default state and the Light CTL Delta UV Default state of an element. The response to the Light CTL Set message is a Light CTL Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_DefaultSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light CTL Default Set Unacknowledged is an unacknowledged message used to set the Light CTL Temperature Default state and the Light CTL Delta UV Default state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureRangeGet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light CTL Temperature Range Get is an acknowledged message used to get the Light CTL Temperature Range state of an element. The response to the Light CTL Temperature Range Get message is a Light CTL Temperature Range Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light CTL Temperature Range Set Unacknowledged is an unacknowledged message used to set the Light CTL Temperature Range state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Temperature Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light CTL Temperature Range Set is an acknowledged message used to set the Light CTL Temperature Range state of an element. The response to the Light CTL Temperature Range Get message is a Light CTL Temperature Range Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Temperature Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Light Control Server (rm_mesh_light_ctl_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_LIGHT_CTL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)

fsp_err_t	RM_MESH_LIGHT_CTL_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)
fsp_err_t	RM_MESH_LIGHT_CTL_SRV_TemperatureServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Control Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_ctl_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_light_ctl_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light Control Server (rm_mesh_light_ctl_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light Control Server (rm_mesh_light_ctl_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light control server ISR occurs
Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light control server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_ctl_srv0	Module name.

Data Structures

struct	rm_mesh_light_ctl_srv_info_t

struct	rm_mesh_light_ctl_srv_default_info_t
struct	rm_mesh_light_ctl_srv_temperature_info_t
struct	rm_mesh_light_ctl_srv_temperature_range_info_t
struct	rm_mesh_light_ctl_srv_extended_cfg_t
struct	rm_mesh_light_ctl_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_ctl_srv_info_t

struct rm_mesh_light_ctl_srv_info_t		
Light CTL state is a composite state that includes the Light CTL Lightness, the Light CTL Temperature and the Light CTL Delta UV states		
Data Fields		
uint16_t	ctl_lightness	Light CTL Lightness
uint16_t	target_ctl_lightness	Target Light CTL Lightness - Used in response path
uint16_t	ctl_temperature	Light CTL Temperature
uint16_t	target_ctl_temperature	Terget Light CTL Temperature - Used in response path
uint16_t	ctl_delta_uv	Light CTL Delta UV
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

◆ rm_mesh_light_ctl_srv_default_info_t

struct rm_mesh_light_ctl_srv_default_info_t		
Light CTL Default state is a composite state that includes the Light CTL Lightness, the Light CTL Temperature and the Light CTL Delta UV states		
Data Fields		
uint16_t	ctl_lightness	Light CTL Lightness
uint16_t	ctl_temperature	Light CTL Temperature
uint16_t	ctl_delta_uv	Light CTL Delta UV

◆ rm_mesh_light_ctl_srv_temperature_info_t

struct rm_mesh_light_ctl_srv_temperature_info_t		
Light CTL Temperature state is a composite state that includes the Light CTL Temperature and the Light CTL Delta UV states		
Data Fields		
uint16_t	ctl_temperature	Light CTL Temperature
uint16_t	target_ctl_temperature	Target Light CTL Temperature - Used in response path
uint16_t	ctl_delta_uv	Light CTL Delta UV
uint16_t	target_ctl_delta_uv	Target Light CTL Delta UV - Used in response path
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path

◆ rm_mesh_light_ctl_srv_temperature_range_info_t

struct rm_mesh_light_ctl_srv_temperature_range_info_t		
Light CTL Temperature Range state determines the minimum and maximum color temperatures of tunable white light an element is capable of emitting		
Data Fields		
uint16_t	ctl_temperature_range_min	CTL Temperature Range Min
uint16_t	ctl_temperature_range_max	CTL Temperature Range Max
uint8_t	status	Status - Used in response path

◆ rm_mesh_light_ctl_srv_extended_cfg_t

struct rm_mesh_light_ctl_srv_extended_cfg_t		
BLE mesh light ctl extension for BLE mesh light ctl.		
Data Fields		
rm_ble_mesh_access_instance_t const *	p_temperature_access_instance	Pointer to access instance for temperature model.

◆ rm_mesh_light_ctl_srv_instance_ctrl_t

struct rm_mesh_light_ctl_srv_instance_ctrl_t
BLE mesh light ctl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_CTL_SRV_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_CTL_SRV_Open()

fsp_err_t RM_MESH_LIGHT_CTL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Light_Ctl Server model and to initialize Light_Ctl_Temperature Server model. This is to initialize Light_Ctl Server model and to register with Access layer. And this is to initialize Light_Ctl_Temperature Server model and to register with Access layer. Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_CTL_SRV_Open(&g_mesh_light_ctl_srv0_ctrl,
&g_mesh_light_ctl_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_CTL_SRV_Close()

fsp_err_t RM_MESH_LIGHT_CTL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Light_Ctl Server model. This is to terminate Light_Ctl Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_CTL_SRV_Close(&g_mesh_light_ctl_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_CTL_SRV_StateUpdate()

fsp_err_t RM_MESH_LIGHT_CTL_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_LIGHT_CTL_SRV_StateUpdate(&g_mesh_light_ctl_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_SRV_TemperatureServerStateUpdate()

fsp_err_t RM_MESH_LIGHT_CTL_SRV_TemperatureServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Light Hsl Client (rm_mesh_light_hsl_clt)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_LIGHT_HSL_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_LIGHT_HSL_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)

fsp_err_t	RM_MESH_LIGHT_HSL_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle)
fsp_err_t	RM_MESH_LIGHT_HSL_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode)

	p_parameter)
fsp_err_t	RM_MESH_LIGHT_HSL_CLT_SaturationGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_LIGHT_HSL_CLT_SaturationSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_HSL_CLT_SaturationSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Hsl Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_hsl_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_hsl_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light HSL Client (rm_mesh_light_hsl_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light HSL Client (rm_mesh_light_hsl_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light HSL client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_hsl_clt0	Module name.

Data Structures

struct	rm_mesh_light_hsl_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_hsl_clt_instance_ctrl_t

struct rm_mesh_light_hsl_clt_instance_ctrl_t
BLE mesh light hsl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_HSL_CLT_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_HSL_CLT_Open()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Light_Hsl Client middleware. This is to initialize Light_Hsl Client model and to register with Access layer.
 	
Implements rm_ble_mesh_model_client_api_t::open.
 	
Example:
`/* Open the module. */`
`err = RM_MESH_LIGHT_HSL_CLT_Open(&g_mesh_light_hsl_clt0_ctrl, &g_mesh_light_hsl_clt0_cfg);`

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_HSL_CLT_Close()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Light_Hsl Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_HSL_CLT_Close(&g_mesh_light_hsl_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_HSL_CLT_GetModelHandle()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Light_Hsl client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of light hsl client model. */
   err = RM_MESH_LIGHT_HSL_CLT_GetModelHandle(&g_mesh_light_hsl_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_LIGHT_HSL_CLT_SendReliablePdu()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_LIGHT_HSL_CLT_SendReliablePdu(&g_mesh_light_hsl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_Get()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light HSL Get is an acknowledged message used to get the Light HSL Lightness, Light HSL Hue, and Light HSL Saturation states of an element. The response to the Light HSL Get message is a Light HSL Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_Set()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light HSL Set Unacknowledged is an unacknowledged message used to set the Light HSL Lightness state, Light HSL Hue state, and the Light HSL Saturation state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light HSL Set is an acknowledged message used to set the Light HSL Lightness state, Light HSL Hue state, and the Light HSL Saturation state of an element. The response to the Light HSL Set message is a Light HSL Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_TargetGet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_TargetGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light HSL Target Get is an acknowledged message used to get the target Light HSL Lightness, Light HSL Hue, and Light HSL Saturation states of an element. The response to the Light HSL Target Get message is a Light HSL Target Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_DefaultGet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light HSL Default Get is an acknowledged message used to get the Light Lightness Default, the Light HSL Hue Default, and Light HSL Saturation Default states of an element. The response to the Light HSL Default Get message is a Light HSL Default Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_DefaultSet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light HSL Default Set is an acknowledged message used to set the Light Lightness Default, the Light HSL Hue Default, and Light HSL Saturation Default states of an element. The response to the Light HSL Default Set message is a Light HSL Default Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_DefaultSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light HSL Default Set Unacknowledged is an unacknowledged message used to set the Light Lightness Default, the Light HSL Hue Default, and Light HSL Saturation Default states of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_RangeGet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_RangeGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light HSL Range Get is an acknowledged message used to get the Light HSL Hue Range and Light HSL Saturation Range states of an element. The response to the Light HSL Range Get message is a Light HSL Range Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_RangeSet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_RangeSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light HSL Range Set is an acknowledged message used to set the Light HSL Hue Range and Light HSL Saturation Range states of an element. The response to the Light HSL Range Set message is a Light HSL Range Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_RangeSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light HSL Range Set Unacknowledged is an unacknowledged message used to set the Light HSL Hue Range and Light HSL Saturation Range states of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_HueGet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_HueGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light HSL Hue Get is an acknowledged message used to get the Light HSL Hue state of an element. The response to the Light HSL Hue Get message is a Light HSL Hue Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_HueSet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_HueSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light HSL Hue Set is an acknowledged message used to set the target Light HSL Hue state of an element. The response to the Light HSL Hue Set message is a Light HSL Hue Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Hue Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_HueSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_HueSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light HSL Hue Set Unacknowledged is an unacknowledged message used to set the target Light HSL Hue state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Hue Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_SaturationGet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light HSL Saturation Get is an acknowledged message used to get the Light HSL Saturation state of an element. The response to the Light HSL Saturation Get message is a Light HSL Saturation Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_SaturationSet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light HSL Saturation Set is an acknowledged message used to set the target Light HSL Saturation state of an element. The response to the Light HSL Saturation Set message is a Light HSL Saturation Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Saturation Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_SaturationSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light HSL Saturation Set Unacknowledged is an unacknowledged message used to set the target Light HSL Saturation state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Saturation Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Light Hsl Server (rm_mesh_light_hsl_srv)

fsp_err_t	RM_MESH_LIGHT_HSL_SRV_SaturationServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Hsl Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_hsl_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_light_hsl_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light HSL Server (rm_mesh_light_hsl_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light HSL Server (rm_mesh_light_hsl_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light HSL server ISR occurs
Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light HSL server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_hsl_srv0	Module name.

Data Structures

struct	rm_mesh_light_hsl_srv_info_t

struct	rm_mesh_light_hsl_srv_target_info_t
struct	rm_mesh_light_hsl_srv_default_info_t
struct	rm_mesh_light_hsl_srv_hue_info_t
struct	rm_mesh_light_hsl_srv_saturation_info_t
struct	rm_mesh_light_hsl_srv_range_info_t
struct	rm_mesh_light_hsl_srv_extended_cfg_t
struct	rm_mesh_light_hsl_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_hsl_srv_info_t

struct rm_mesh_light_hsl_srv_info_t

Light HSL state is a composite state that includes the Light HSL Lighness, the Light HSL Hue and the Light HSL Saturation states

Data Fields

uint16_t	hsl_lightness	The perceived lightness of a light emitted by the element
uint16_t	target_hsl_lightness	Target Perceived lightness - used in the response path
uint16_t	hsl_hue	The 16-bit value representing the hue
uint16_t	target_hsl_hue	Target hue - used in the response path
uint16_t	hsl_saturation	The saturation of a color light
uint16_t	target_hsl_saturation	Target saturation - used in the response path
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

◆ rm_mesh_light_hsl_srv_target_info_t

struct rm_mesh_light_hsl_srv_target_info_t

Light HSL Target state is a composite state that includes the Light HSL Lighness, the Light HSL Hue and the Light HSL Saturation states		
Data Fields		
uint16_t	hsl_lightness	The perceived lightness of a light emitted by the element
uint16_t	hsl_hue	The 16-bit value representing the hue
uint16_t	hsl_saturation	The saturation of a color light

◆ rm_mesh_light_hsl_srv_default_info_t

struct rm_mesh_light_hsl_srv_default_info_t		
Light HSL Default state is a composite state that includes the Light HSL Lighness, the Light HSL Hue and the Light HSL Saturation states		
Data Fields		
uint16_t	hsl_lightness	The perceived lightness of a light emitted by the element
uint16_t	hsl_hue	The 16-bit value representing the hue
uint16_t	hsl_saturation	The saturation of a color light

◆ rm_mesh_light_hsl_srv_hue_info_t

struct rm_mesh_light_hsl_srv_hue_info_t		
Light HSL Hue		
Data Fields		
uint16_t	hsl_hue	The 16-bit value representing the hue

◆ rm_mesh_light_hsl_srv_saturation_info_t

struct rm_mesh_light_hsl_srv_saturation_info_t		
Light HSL Saturation		
Data Fields		
uint16_t	hsl_saturation	The saturation of a color light

◆ rm_mesh_light_hsl_srv_range_info_t

struct rm_mesh_light_hsl_srv_range_info_t		
Light HSL Range state is a composite state that includes Minimum and Maximum of the Light HSL Hue and the Light HSL Saturation states		
Data Fields		
uint16_t	hue_range_min	The value of the Hue Range Min field of the Light HSL Hue

		Range state
uint16_t	hue_range_max	The value of the Hue Range Max field of the Light HSL Hue Range state
uint16_t	saturation_range_min	The value of the Saturation Range Min field of the Light HSL Saturation Range state
uint16_t	saturation_range_max	The value of the Saturation Range Max field of the Light HSL Saturation Range state
uint8_t	status	Status - Used only in response path

◆ rm_mesh_light_hsl_srv_extended_cfg_t

struct rm_mesh_light_hsl_srv_extended_cfg_t		
BLE mesh light hsl extension for BLE mesh light hsl.		
Data Fields		
rm_ble_mesh_access_instance_t const *	p_hue_access_instance	Pointer to access instance for hue model.
rm_ble_mesh_access_instance_t const *	p_saturation_access_instance	Pointer to access instance for saturation model.

◆ rm_mesh_light_hsl_srv_instance_ctrl_t

struct rm_mesh_light_hsl_srv_instance_ctrl_t
BLE mesh light hsl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_HSL_SRV_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_HSL_SRV_Open()

fsp_err_t RM_MESH_LIGHT_HSL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Light_Hsl Server/Light_Hsl_Hue Server/Light_Hsl_Saturation Server model.

1. This is to initialize Light_Hsl Server model and to register with Access layer.
2. This is to initialize Light_Hsl_Hue Server model and to register with Access layer.
3. This is to initialize Light_Hsl_Saturation Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_HSL_SRV_Open(&g_mesh_light_hsl_srv0_ctrl,
&g_mesh_light_hsl_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_HSL_SRV_Close()

fsp_err_t RM_MESH_LIGHT_HSL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Light_Hsl Server model. This is to terminate Light_Hsl Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_HSL_SRV_Close(&g_mesh_light_hsl_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_HSL_SRV_StateUpdate()

fsp_err_t RM_MESH_LIGHT_HSL_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_LIGHT_HSL_SRV_StateUpdate(&g_mesh_light_hsl_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_SRV_HueServerStateUpdate()

fsp_err_t RM_MESH_LIGHT_HSL_SRV_HueServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_SRV_SaturationServerStateUpdate()

fsp_err_t RM_MESH_LIGHT_HSL_SRV_SaturationServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Light Lightness Client (rm_mesh_light_lightness_clt)

Modules » Networking » BLE Mesh Network Modules

fsp_err_t	RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Lightness Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_lightness_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_lightness_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Client (rm_mesh_light_lightness_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Client (rm_mesh_light_lightness_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light lightness client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_lightness_clt0	Module name.

Data Structures

struct	rm_mesh_light_lightness_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_lightness_clt_instance_ctrl_t

struct rm_mesh_light_lightness_clt_instance_ctrl_t
BLE mesh light lightness instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_LIGHTNESS_CLT_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_Open()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Light_Lightness Client middleware. This is to initialize Light_Lightness Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_LIGHTNESS_CLT_Open(&g_mesh_light_lightness_clt0_ctrl,
&g_mesh_light_lightness_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_Close()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Light_Lightness Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_LIGHTNESS_CLT_Close(&g_mesh_light_lightness_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Light_Lightness client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of light lightness client model. */
   err =
RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle(&g_mesh_light_lightness_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err =
RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu(&g_mesh_light_lightness_clt0_ctrl,
                                            req_opcode,
                                            p_parameter,
                                            rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_Get()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light Lightness Get is an acknowledged message used to get the Light Lightness Actual state of an element. The response to the Light Lightness Get message is a Light Lightn

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_Set()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light Lightness Set is an acknowledged message used to set the Light Lightness Actual state of an element. The response to the Light Lightness Set message is a Light Lightness Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light Lightness Set Unacknowledged is an unacknowledged message used to set the Light Lightness Actual state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_LinearGet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LinearGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light Lightness Linear Get is an acknowledged message used to get the Light Lightness Linear state of an element. The response to the Light Lightness Linear Get message is a Light Lightness Linear Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light Lightness Linear Set is an acknowledged message used to set the Light Lightness Linear state of an element. The response to the Light Lightness Linear Set message is a Light Lightness Linear Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Linear Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light Lightness Linear Set Unacknowledged is an unacknowledged message used to set the Light Lightness Linear state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Linear Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_LastGet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LastGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light Lightness Last Get is an acknowledged message used to get the Light Lightness Last state of an element. The response to the Light Lightness Last Get message is a Light Lightness Last Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultGet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light Lightness Default Get is an acknowledged message used to get the Light Lightness Default state of an element. The response to the Light Lightness Default Get message is a Light Lightness Default Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light Lightness Default Set is an acknowledged message used to set the Light Lightness Default state of an element. The response to the Light Lightness Default Set message is a Light Lightness Default Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light Lightness Default Set Unacknowledged is an unacknowledged message used to set the Light Lightness Default state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_RangeGet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light Lightness Range Get is an acknowledged message used to get the Light Lightness Range state of an element. The response to the Light Lightness Range Get message is a Light Lightness Range Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light Lightness Range Set is an acknowledged message used to set the Light Lightness Range state of an element. The response to the Light Lightness Range Get message is a Light Lightness Range Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light Lightness Range Set Unacknowledged is an unacknowledged message used to set the Light Lightness Range state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Data Structure Documentation

◆ rm_mesh_light_lightness_srv_linear_info_t

struct rm_mesh_light_lightness_srv_linear_info_t		
Light Lightness Linear state represents the lightness of a light on a linear scale		
Data Fields		
uint16_t	lightness_linear	Light Lightness Linear
uint16_t	lightness_target	Light Lightness Target - Used in response path.
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path

◆ rm_mesh_light_lightness_srv_actual_info_t

struct rm_mesh_light_lightness_srv_actual_info_t		
Light Lightness Actual state represents the lightness of a light on a perceptually uniform lightness scale		
Data Fields		
uint16_t	lightness_actual	Light Lightness Actual
uint16_t	lightness_target	Light Lightness Target - Used in response path.
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

◆ rm_mesh_light_lightness_srv_last_info_t

struct rm_mesh_light_lightness_srv_last_info_t		
Light Lightness Last state represents the lightness of a light on a perceptually uniform lightness scale		
Data Fields		
uint16_t	lightness_last	Light Lightness Last

◆ rm_mesh_light_lightness_srv_default_info_t

struct rm_mesh_light_lightness_srv_default_info_t		
Light Lightness Default state is a value ranging from 0x0000 to 0xFFFF, representing a default lightness level for the Light Lightness Actual state		
Data Fields		
uint16_t	lightness_default	Light Lightness Default

◆ rm_mesh_light_lightness_srv_range_info_t

struct rm_mesh_light_lightness_srv_range_info_t		
Light Lightness Range state determines the minimum and maximum lightness of an element		
Data Fields		
uint16_t	lightness_range_min	Light Lightness Range Min
uint16_t	lightness_range_max	Light Lightness Range Max

◆ rm_mesh_light_lightness_srv_info_t

struct rm_mesh_light_lightness_srv_info_t		
Light Lightness state is a composite state that includes the Light Lightness Linear, the Light Lightness Actual, the Light Lightness Last, and the Light Lightness Default states		
Data Fields		
rm_mesh_light_lightness_srv_linear_info_t	light_lightness_linear	Light Lightness Linear state represents the lightness of a light on a linear scale
rm_mesh_light_lightness_srv_actual_info_t	light_lightness_actual	Light Lightness Actual state represents the lightness of a light on a perceptually uniform lightness scale
rm_mesh_light_lightness_srv_last_info_t	light_lightness_last	Light Lightness Last state represents the lightness of a light on a perceptually uniform lightness scale
rm_mesh_light_lightness_srv_default_info_t	light_lightness_default	Light Lightness Default state is a value ranging from 0x0000 to 0xFFFF, representing a default lightness level for the Light Lightness Actual state

rm_mesh_light_lightness_srv_range_info_t	light_lightness_range	Light Lightness Range state.
uint8_t	range_status	Status field used only for the Range Status

◆ rm_mesh_light_lightness_srv_instance_ctrl_t

struct rm_mesh_light_lightness_srv_instance_ctrl_t
BLE mesh light lightness instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_LIGHTNESS_SRV_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_LIGHTNESS_SRV_Open()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Light_Lightness Server model and to initialize Light_Lightness_Setup Server model. This is to initialize Light_Lightness Server model and to register with Access layer. And this is to initialize Light_Lightness_Setup Server model and to register with Access layer. Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_LIGHTNESS_SRV_Open(&g_mesh_light_lightness_srv0_ctrl,
&g_mesh_light_lightness_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_SRV_Close()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Light_Lightness Server model. This is to terminate Light_Lightness Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_LIGHTNESS_SRV_Close(&g_mesh_light_lightness_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_LIGHTNESS_SRV_StateUpdate()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_LIGHT_LIGHTNESS_SRV_StateUpdate(&g_mesh_light_lightness_srv0_ctrl,
&state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_SRV_SetupServerStateUpdate()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_SetupServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

fsp_err_t	RM_MESH_LIGHT_LC_CLT_PropertySetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Location Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_lc_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_lc_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Controller Client (rm_mesh_light_lc_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Controller Client (rm_mesh_light_lc_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light lightness controller client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_lc_clt0	Module name.

Data Structures

struct	rm_mesh_light_lc_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_lc_clt_instance_ctrl_t

struct rm_mesh_light_lc_clt_instance_ctrl_t
BLE mesh light lc instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_LC_CLT_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_LC_CLT_Open()

fsp_err_t RM_MESH_LIGHT_LC_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Light_Lc Client middleware. This is to initialize Light_Lc Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_LC_CLT_Open(&g_mesh_light_lc_clt0_ctrl,
&g_mesh_light_lc_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_LC_CLT_Close()

fsp_err_t RM_MESH_LIGHT_LC_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Light_Lc Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_LC_CLT_Close(&g_mesh_light_lc_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_LC_CLT_GetModelHandle()

fsp_err_t RM_MESH_LIGHT_LC_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Light_Lc client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of light lc client model. */
   err = RM_MESH_LIGHT_LC_CLT_GetModelHandle(&g_mesh_light_lc_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_LIGHT_LC_CLT_SendReliablePdu()

fsp_err_t RM_MESH_LIGHT_LC_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_LIGHT_LC_CLT_SendReliablePdu(&g_mesh_light_lc_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_ModeGet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_ModeGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light LC Mode Get is an acknowledged message used to get the Light LC Mode state of an element. The response to the Light LC Mode Get message is a Light LC Mode Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_ModeSet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_ModeSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC Mode Set is an acknowledged message used to set the Light LC Mode state of an element. The response to the Light LC Mode Set message is a Light LC Mode Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Mode Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_ModeSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LC_CLT_ModeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC Mode Set Unacknowledged is an unacknowledged message used to set the Light LC Mode state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Mode Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_OmGet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_OmGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light LC OM Get is an acknowledged message used to get the Light LC Occupancy Mode state of an element. The response to the Light LC OM Get message is a Light LC OM Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_OmSet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_OmSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC OM Set is an acknowledged message used to set the Light LC Occupancy Mode state of an element. The response to the Light LC OM Set message is a Light LC OM Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC OM Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_OmSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LC_CLT_OmSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC OM Set Unacknowledged is an unacknowledged message used to set the Light LC Occupancy Mode state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC OM Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_LightOnOffGet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_LightOnOffGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light LC Light OnOff Get is an acknowledged message used to get the Light LC Light OnOff state of an element. The response to the Light LC Light OnOff Get message is a Light LC Light OnOff Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_LightOnOffSet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_LightOnOffSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC Light OnOff Set is an acknowledged message used to set the Light LC Light OnOff state of an element. The response to the Light LC Light OnOff Set message is a Light LC Light OnOff Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Light OnOff Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_LightOnOffSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LC_CLT_LightOnOffSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC Light OnOff Set Unacknowledged is an unacknowledged message used to set the Light LC Light OnOff state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Light OnOff Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_PropertyGet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertyGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light LC Property Get is an acknowledged message used to get the Light LC Property state of an element. The response to the Light LC Property Get message is a Light LC Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Property Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_PropertySet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertySet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC Property Set is an acknowledged message used to set the Light LC Property state of an element. The response to the Light LC Property Set message is a Light LC Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_PropertySetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertySetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC Property Set Unacknowledged is an unacknowledged message used to set the Light LC Property state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

fsp_err_t	RM_MESH_LIGHT_LC_SRV_GetCurrentScenario (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_mesh_light_lc_srv_scenario_t *const p_scenario)
fsp_err_t	RM_MESH_LIGHT_LC_SRV_ReportOccupancy (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_LIGHT_LC_SRV_ReportLightOnOff (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_mesh_light_lc_srv_light_state_t state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Location Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_lc_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_light_lc_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Controller Server (rm_mesh_light_lc_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Controller Server (rm_mesh_light_lc_srv).

Configuration	Options	Default	Description
Interrupts			

Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light lightness controller server ISR occurs
Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light lightness controller server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_lc_srv0	Module name.

Data Structures

struct	rm_mesh_light_lc_srv_scenario_t
struct	rm_mesh_light_lc_srv_mode_info_t
struct	rm_mesh_light_lc_srv_om_info_t
struct	rm_mesh_light_lc_srv_light_onoff_info_t
struct	rm_mesh_light_lc_srv_property_id_info_t
struct	rm_mesh_light_lc_srv_property_info_t
struct	rm_mesh_light_lc_srv_extended_callback_args_t
struct	rm_mesh_light_lc_srv_instance_ctrl_t

Enumerations

enum	rm_ble_mesh_light_lc_srv_event_t
enum	rm_ble_mesh_light_lc_srv_state_t
enum	rm_mesh_light_lc_srv_light_state_t

Data Structure Documentation

◆ rm_mesh_light_lc_srv_scenario_t

struct rm_mesh_light_lc_srv_scenario_t		
Light LC Server State Info		
Data Fields		
rm_ble_mesh_light_lc_srv_state_t	state	Light LC Server Current Scenario
uint32_t	remaining_time_in_ms	Remaining Time in current scenario

uint8_t	occupancy_mode	Light LC Occupancy Mode Value
uint8_t	mode	Light LC Mode Value
rm_mesh_light_lc_srv_light_state_t	present_light_state	Current Light LC ONOFF State
rm_mesh_light_lc_srv_light_state_t	target_light_state	Target Light LC ONOFF State

◆ rm_mesh_light_lc_srv_mode_info_t

struct rm_mesh_light_lc_srv_mode_info_t		
Light LC Mode state		
Data Fields		
uint8_t	present_mode	Light LC Mode state - present
uint8_t	target_mode	Light LC Mode state - target

◆ rm_mesh_light_lc_srv_om_info_t

struct rm_mesh_light_lc_srv_om_info_t		
Light LC Occupancy Mode state		
Data Fields		
uint8_t	present_mode	Light LC Occupancy Mode state - present
uint8_t	target_mode	Light LC Occupancy Mode state - target

◆ rm_mesh_light_lc_srv_light_onoff_info_t

struct rm_mesh_light_lc_srv_light_onoff_info_t		
Light LC Light OnOff State		
Data Fields		
uint8_t	present_light_onoff	Light LC Light OnOff State
uint8_t	target_light_onoff	Light LC Light OnOff State
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

◆ rm_mesh_light_lc_srv_property_id_info_t

struct rm_mesh_light_lc_srv_property_id_info_t

Property ID identifying a Light LC Property		
Data Fields		
uint16_t	property_id	Property ID identifying a Light LC Property

◆ rm_mesh_light_lc_srv_property_info_t

struct rm_mesh_light_lc_srv_property_info_t		
Light LC Property state		
Data Fields		
uint16_t	property_id	Property ID identifying a Light LC Property
uint8_t *	property_value	Raw value for the Light LC Property
uint16_t	property_value_len	

◆ rm_mesh_light_lc_srv_extended_callback_args_t

struct rm_mesh_light_lc_srv_extended_callback_args_t		
Light LC Property state		
Data Fields		
rm_ble_mesh_access_model_handle_t *	p_handle	Access model handle.
rm_ble_mesh_light_lc_srv_event_t	event_type	Application events defined for Light LC Server Model.
uint8_t *	p_event_data	Event data.
uint16_t	event_data_length	Event data length.

◆ rm_mesh_light_lc_srv_instance_ctrl_t

struct rm_mesh_light_lc_srv_instance_ctrl_t
BLE mesh light lc instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_LC_SRV_Open() is called.

Enumeration Type Documentation

◆ rm_ble_mesh_light_lc_srv_event_t

enum rm_ble_mesh_light_lc_srv_event_t	
Light LC light event	
Enumerator	
RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_OFF	Light LC Server Event Off.
RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_STANDBY	Light LC Server Event Standby.
RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_FADE_ON	Light LC Server Event Fade On.
RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_RUN	Light LC Server Event Run.
RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_FADE	Light LC Server Event Fade.
RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_PROLONG	Light LC Server Event Prolong.
RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_FADE_STANDBY_AUTO	Light LC Server Event Standby Auto.
RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_FADE_STANDBY_MANUAL	Light LC Server Event Standby Manual.

◆ rm_ble_mesh_light_lc_srv_state_t

enum rm_ble_mesh_light_lc_srv_state_t	
Light LC state	
Enumerator	
RM_MESH_LIGHT_LC_SRV_STATE_OFF	Light LC Server State Off.
RM_MESH_LIGHT_LC_SRV_STATE_STANDBY	Light LC Server State Standby.
RM_MESH_LIGHT_LC_SRV_STATE_FADE_ON	Light LC Server State Fade On.
RM_MESH_LIGHT_LC_SRV_STATE_RUN	Light LC Server State Run.
RM_MESH_LIGHT_LC_SRV_STATE_FADE	Light LC Server State Fade.
RM_MESH_LIGHT_LC_SRV_STATE_PROLONG	Light LC Server State Prolong.
RM_MESH_LIGHT_LC_SRV_STATE_FADE_STANDBY_AUTO	Light LC Server State Standby Auto.
RM_MESH_LIGHT_LC_SRV_STATE_FADE_STANDBY_MANUAL	Light LC Server State Standby Manual.

◆ rm_mesh_light_lc_srv_light_state_t

enum rm_mesh_light_lc_srv_light_state_t	
Light LC light state	
Enumerator	
RM_MESH_LIGHT_LC_SRV_LIGHT_STATE_OFF	Light state Off.
RM_MESH_LIGHT_LC_SRV_LIGHT_STATE_ON	Light state ON.

Function Documentation

◆ RM_MESH_LIGHT_LC_SRV_Open()

fsp_err_t RM_MESH_LIGHT_LC_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Light_Lc Server model. This is to initialize Light_Lc Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_LC_SRV_Open(&g_mesh_light_lc_srv0_ctrl,
&g_mesh_light_lc_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_LC_SRV_Close()

fsp_err_t RM_MESH_LIGHT_LC_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Light_Lc Server model. This is to terminate Light_Lc Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_LC_SRV_Close(&g_mesh_light_lc_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_LC_SRV_StateUpdate()

fsp_err_t RM_MESH_LIGHT_LC_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_LIGHT_LC_SRV_StateUpdate(&g_mesh_light_lc_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_SRV_SetTimeProperty()

fsp_err_t RM_MESH_LIGHT_LC_SRV_SetTimeProperty (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_device_property_t *property*, uint32_t *time_in_ms*)

API to set Light LC Sever Specific Time Properties. This is to update the Light LC Module with any Light Control Time Properties values. Typically these LC Time properties will be needed to be updated or informed to the Light LC Module during Power-Up, Scene Recall/Restore related scenario or when ever the Local application desires to enforce an update in these device properties values. Currently this interface handles only Time related Device Properties of Light LC Module like:
RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_OCCUPANCY_DELAY
RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_FADE_ON
RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_RUN_ON
RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_FADE
RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_PROLONG
RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_FADE_STANDBY_AUTO
RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_FADE_STANDBY_MANUAL

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	property	LC Server Device Property ID
[in]	time_in_ms	Related Device Property Value time in milliseconds

Example:

```
/* Set Light LC Sever Specific Time Properties. */
   err = RM_MESH_LIGHT_LC_SRV_SetTimeProperty(&g_mesh_light_lc_srv0_ctrl, property, time_in_ms);
```

Return values

FSP_SUCCESS	Set the Light Control Time Properties values successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_MESH_LIGHT_LC_SRV_SetScenario()

fsp_err_t RM_MESH_LIGHT_LC_SRV_SetScenario (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_mesh_light_lc_srv_scenario_t const *const *p_scenario*)

API to locally trigger the Light LC Server state machine from the application. This typically is used in Power-Up or Scene Recall/Restore Scenario where the Application could trigger the Light LC Server from any desired LC State.

Example:

```
/* Trigger to Recall/Restore the scenario. */
   err = RM_MESH_LIGHT_LC_SRV_SetScenario(&g_mesh_light_lc_srv0_ctrl, &scenario);
```

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_scenario	Pointer to rm_mesh_light_lc_srv_scenario_t where Light LC Server State Informations are present

Return values

FSP_SUCCESS	Updated scenario successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_scenario is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_MESH_LIGHT_LC_SRV_GetCurrentScenario()

fsp_err_t RM_MESH_LIGHT_LC_SRV_GetCurrentScenario (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_mesh_light_lc_srv_scenario_t *const *p_scenario*)

API to fetch the Light LC Server state machine related information from the Light LC Server Module. This typically is used in Power-Up or Scene Recall/Restore Scenario where the Application uses this to fetch and persistently store the Light LC State related details.

Example:

```
/* Fetch the current scenario. */
   err = RM_MESH_LIGHT_LC_SRV_GetCurrentScenario(&g_mesh_light_lc_srv0_ctrl,
&scenario);
```

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_scenario	Pointer to rm_mesh_light_lc_srv_scenario_t where Light LC Server State Informations are present

Return values

FSP_SUCCESS	Fetch information successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_scenario is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_LC_SRV_ReportOccupancy()

fsp_err_t RM_MESH_LIGHT_LC_SRV_ReportOccupancy (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to report any occupancy to Light LC Server Model.

Example:

```
/* Reports any occupancy. */
   err = RM_MESH_LIGHT_LC_SRV_ReportOccupancy(&g_mesh_light_lc_srv0_ctrl);
```

Parameters

[in]	p_ctrl	Pointer to control structure.

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_LC_SRV_ReportLightOnOff()

fsp_err_t RM_MESH_LIGHT_LC_SRV_ReportLightOnOff (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_mesh_light_lc_srv_light_state_t *state*)

API to report any Light ON or OFF to Light LC Server Model. There could be many triggering factors to this Light related ON/OFF events from the upper layer. This API could be used for the following scenarios

1. Manual/Physical trigger of Light ON/OFF
2. State Binding with Generic ON/OFF
3. Trigger of Light ON/OFF due to Ambient Light Sensor values

Example:

```
/* Reports any Light ON or OFF. */
   err = RM_MESH_LIGHT_LC_SRV_ReportLightOnOff(&g_mesh_light_lc_srv0_ctrl, state);
```

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	state	Desired state value of Light LC ONOFF.

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

fsp_err_t	RM_MESH_LIGHT_XYL_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Xyl Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_xyl_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_xyl_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light XYL Client (rm_mesh_light_xyl_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light XYL Client (rm_mesh_light_xyl_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light XYL client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_xyl_clt0	Module name.

Data Structures

struct	rm_mesh_light_xyl_clt_instance_ctrl_t

Data Structure Documentation

◆ **rm_mesh_light_xyl_clt_instance_ctrl_t**

struct rm_mesh_light_xyl_clt_instance_ctrl_t
BLE mesh light xyl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_XYL_CLT_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_XYL_CLT_Open()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Light_Xyl Client middleware. This is to initialize Light_Xyl Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_XYL_CLT_Open(&g_mesh_light_xyl_clt0_ctrl,
&g_mesh_light_xyl_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_XYL_CLT_Close()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Light_Xyl Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_XYL_CLT_Close(&g_mesh_light_xyl_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_XYL_CLT_GetModelHandle()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Light_Xyl client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of light xyl client model. */
   err = RM_MESH_LIGHT_XYL_CLT_GetModelHandle(&g_mesh_light_xyl_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_LIGHT_XYL_CLT_SendReliablePdu()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_LIGHT_XYL_CLT_SendReliablePdu(&g_mesh_light_xyl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_Get()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light xyL Get is an acknowledged message used to get the Light xyL Lightness, Light xyL x, and Light xyL y states of an element. Upon receiving a Light xyL Get message, the element shall respond with a Light xyL Status message. The response to the Light xyL Get message is a Light xyL Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_Set()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light xyL Set is an acknowledged message used to set the Light xyL Lightness, Light xyL x state, and the Light xyL y states of an element. The response to the Light xyL Set message is a Light xyL Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light xyL Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light xyL Set Unacknowledged is an unacknowledged message used to set the Light xyL Lightness, Light xyL x, and the Light xyL y states of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light xyL Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_TargetGet()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_TargetGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light xyL Target Get is an acknowledged message used to get the target Light xyL Lightness, Light xyL x, and Light xyL y states of an element. The response to the Light xyL Target Get message is a Light xyL Target Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_DefaultGet()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light xyL Default Get is an acknowledged message used to get the Light Lightness Default, the Light xyL x Default, and Light xyL y Default states of an element. The response to the Light xyL Default Get message is a Light xyL Default Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_DefaultSet()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light xyL Default Set is an acknowledged message used to set the Light Lightness Default, the Light xyL x Default, and Light xyL y Default states of an element. The response to the Light xyL Default Set message is a Light xyL Default Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light HSL Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_DefaultSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light xyL Default Set Unacknowledged is an unacknowledged message used to set the Light Lightness Default, the Light xyL x Default, and Light xyL y Default states of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light HSL Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_RangeGet()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_RangeGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light xyL Range Get is an acknowledged message used to get the Light xyL x Range and Light xyL y Range states of an element. The response to the Light xyL Range Get message is a Light xyL Range Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_RangeSet()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_RangeSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light xyL Range Set is an acknowledged message used to set the Light xyL x Range and Light xyL y Range states of an element. The response to the Light xyL Range Set message is a Light xyL Range Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light xyL Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_RangeSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light xyL Range Set Unacknowledged is an unacknowledged message used to set the Light xyL x Range and Light xyL y Range states of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light xyL Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Light Xyl Server (rm_mesh_light_xyl_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_LIGHT_XYL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_LIGHT_XYL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Xyl Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_xyl_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_light_xyl_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light XYL Server (rm_mesh_light_xyl_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light XYL Server (rm_mesh_light_xyl_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light XYL server ISR occurs
Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light XYL server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_xyl_srv0	Module name.

Data Structures

struct	rm_mesh_light_xyl_srv_info_t
struct	rm_mesh_light_xyl_srv_target_info_t
struct	rm_mesh_light_xyl_srv_default_info_t
struct	rm_mesh_light_xyl_srv_range_info_t

struct	rm_mesh_light_xyl_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_xyl_srv_info_t

struct rm_mesh_light_xyl_srv_info_t		
Light xyL state is a composite state that includes the xyL Lightness, the Light xyL x and the Light xyL y states		
Data Fields		
uint16_t	xyl_lightness	The perceived lightness of a light emitted by the element
uint16_t	target_xyl_lightness	Target perceived lightness - used in response path
uint16_t	xyl_x	The 16-bit value representing the x coordinate of a CIE1931 color light
uint16_t	target_xyl_x	Target x coordinate - used in response path
uint16_t	xyl_y	The 16-bit value representing the y coordinate of a CIE1931 color light
uint16_t	target_xyl_y	Target y coordinate - used in response path
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

◆ rm_mesh_light_xyl_srv_target_info_t

struct rm_mesh_light_xyl_srv_target_info_t		
Light xyL target state is a composite state that includes the xyL Lightness, the Light xyL x and the Light xyL y states		
Data Fields		
uint16_t	xyl_lightness	The perceived lightness of a light emitted by the element
uint16_t	xyl_x	The 16-bit value representing the x coordinate of a CIE1931 color light
uint16_t	xyl_y	The 16-bit value representing

		the y coordinate of a CIE1931 color light

◆ rm_mesh_light_xyl_srv_default_info_t

struct rm_mesh_light_xyl_srv_default_info_t		
Light xyL default state is a composite state that includes the xyL Lightness, the Light xyL x and the Light xyL y states		
Data Fields		
uint16_t	xyl_lightness	The perceived lightness of a light emitted by the element
uint16_t	xyl_x	The 16-bit value representing the x coordinate of a CIE1931 color light
uint16_t	xyl_y	The 16-bit value representing the y coordinate of a CIE1931 color light

◆ rm_mesh_light_xyl_srv_range_info_t

struct rm_mesh_light_xyl_srv_range_info_t		
Light xyL Range state determines the minimum and maximum values of the Light xyL x and syL y state of an element		
Data Fields		
uint16_t	xyl_x_range_min	The minimum value of a Light xyL x state of an element
uint16_t	xyl_x_range_max	The maximum value of a Light xyL x state of an element
uint16_t	xyl_y_range_min	The minimum value of a Light xyL y state of an element
uint16_t	xyl_y_range_max	The maximum value of a Light xyL y state of an element
uint8_t	status	Status - Used in the response path

◆ rm_mesh_light_xyl_srv_instance_ctrl_t

struct rm_mesh_light_xyl_srv_instance_ctrl_t
BLE mesh light xyl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_XYL_SRV_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_XYL_SRV_Open()

fsp_err_t RM_MESH_LIGHT_XYL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Light_Xyl Server model. This is to initialize Light_Xyl Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_XYL_SRV_Open(&g_mesh_light_xyl_srv0_ctrl,
&g_mesh_light_xyl_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_XYL_SRV_Close()

fsp_err_t RM_MESH_LIGHT_XYL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Light_Xyl Server model. This is to terminate Light_Xyl Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_XYL_SRV_Close(&g_mesh_light_xyl_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_XYL_SRV_StateUpdate()

fsp_err_t RM_MESH_LIGHT_XYL_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_LIGHT_XYL_SRV_StateUpdate(&g_mesh_light_xyl_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Lower Trans (rm_ble_mesh_lower_trans)

fsp_err_t	RM_BLE_MESH_LOWER_TRANS_ReinitReplayCache (rm_ble_mesh_lower_trans_ctrl_t *const p_ctrl)
fsp_err_t	RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits (rm_ble_mesh_lower_trans_ctrl_t *const p_ctrl)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Lower Trans module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_lower_trans

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_lower_trans_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Lower Trans (rm_ble_mesh_lower_trans)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Lower Trans (rm_ble_mesh_lower_trans).

Configuration	Options	Default	Description
General			
Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh_lower_trans0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the

			hardware.
Notification Enable	• Enabled • Disabled	Disabled	Whether to enable the notification or not.
Callback	Name Must Be a Valid C Symbol	NULL	Callback function name.

Data Structures

struct	rm_ble_mesh_lower_trans_instance_ctrl_t

Data Structure Documentation

◆ rm_ble_mesh_lower_trans_instance_ctrl_t

struct rm_ble_mesh_lower_trans_instance_ctrl_t
RM_BLE_MESH_LOWER_TRANS private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_LOWER_TRANS_Open() is called.

Function Documentation

◆ RM_BLE_MESH_LOWER_TRANS_Open()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_Open (rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_lower_trans_cfg_t const *const *p_cfg*)

Register Inerface with Lower Transport Layer. This routine registers interface with the Lower Transport Layer. Transport Layer supports single Application, hence this rouine shall be called once.

Implements rm_ble_mesh_lower_trans_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_LOWER_TRANS_Open(&g_ble_mesh_lower_trans0_ctrl,
&g_ble_mesh_lower_trans0_cfg);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_LOWER_TRANS_Close()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_Close (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*)

Unregister Inerface with Lower Transport Layer. Implements rm_ble_mesh_lower_trans_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_LOWER_TRANS_Close(&g_ble_mesh_lower_trans0_ctrl);
```

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_LOWER_TRANS_SendPdu()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_SendPdu (rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_lower_trans_transmit_setting_t const *const *p_transmit_setting*, rm_ble_mesh_buffer_t const *const *p_buffer*, rm_ble_mesh_lower_trans_reliable_t *reliable*)

API to send transport PDUs. This routine sends transport PDUs to peer device.

Implements rm_ble_mesh_lower_trans_api_t::sendPdu.

Example:

```
/* Send transport PDUs. */
   err = RM_BLE_MESH_LOWER_TRANS_SendPdu(&g_ble_mesh_lower_trans0_ctrl,
                                         &transmit_setting,
                                         &buffer,
RM_BLE_MESH_LOWER_TRANS_RELIABLE_ENABLE);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_transmit_setting and p_buffer are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_LOWER_TRANS_ClearSarContexts()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_ClearSarContexts (rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*)

To clear all segmentation and reassembly contexts. This routine clears all segmentation and reassembly contexts.

Implements rm_ble_mesh_lower_trans_api_t::clearSarContexts.

Example:

```
/* Clear all segmentation and reassembly contexts. */
   err = RM_BLE_MESH_LOWER_TRANS_ClearSarContexts(&g_ble_mesh_lower_trans0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_LOWER_TRANS_ClearSubnetSarContexts()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_ClearSubnetSarContexts (rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*)

To clear all segmentation and reassembly contexts for a given subnet. This routine clears all segmentation and reassembly contexts.

Implements rm_ble_mesh_lower_trans_api_t::clearSubnetSarContexts.

Example:

```
/* Clear all segmentation and reassembly contexts for a given subnet. */
   err =
RM_BLE_MESH_LOWER_TRANS_ClearSubnetSarContexts(&g_ble_mesh_lower_trans0_ctrl,
subnet_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_LOWER_TRANS_ReinitReplayCache()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_ReinitReplayCache (rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*)

To reinitialize all Lower Transport replay cache entries. This routine clears and reinitializes all Transport Replay Cache Entries. This needs to be invoked by the upper layer when the Network moves to a newer IV Index (Normal State) and the Sequence numbers are reset.

Implements rm_ble_mesh_lower_trans_api_t::reinitReplayCache.

Example:

```
/* Reinitialize all Lower Transport replay cache Entries. */
   err = RM_BLE_MESH_LOWER_TRANS_ReinitReplayCache(&g_ble_mesh_lower_trans0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits (rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*)

To trigger any LTRN pending transmissions. Trigger pending transmits is an interface to check for pending segments in the tx queue and schedule for transmission, which is mainly used by the LPN operation.

Implements rm_ble_mesh_lower_trans_api_t::triggerPendingTransmits.

Example:

```
/* Trigger any Lower Transport pending transmissions. */
   err =
RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits(&g_ble_mesh_lower_trans0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

fsp_err_t	RM_BLE_MESH_NETWORK_GetSeqNumberState (rm_ble_mesh_network_ctrl_t *const p_ctrl, rm_ble_mesh_network_seq_number_state_t *const p_seq_num_state)
fsp_err_t	RM_BLE_MESH_NETWORK_SetSeqNumberState (rm_ble_mesh_network_ctrl_t *const p_ctrl, rm_ble_mesh_network_seq_number_state_t const *const p_seq_num_state)
fsp_err_t	RM_BLE_MESH_NETWORK_ResetNetCache (rm_ble_mesh_network_ctrl_t *const p_ctrl)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Network module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_network

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_network_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Network (rm_ble_mesh_network)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Network (rm_ble_mesh_network).

Configuration	Options	Default	Description
General			
Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh_network0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Ignore Netcache Wrapping	• Processed • Dropped	Dropped	Ignore netcache wrapping.
RX Callback Event Enable	• Enabled • Disabled	Disabled	Whether to enable the RX callback event or

			not.
TX Callback Event Enable	• Enabled • Disabled	Disabled	Whether to enable the TX callback event or not.
Callback	Name Must Be a Valid C Symbol	NULL	Callback function name.

Data Structures

struct	rm_ble_mesh_network_instance_ctrl_t

Data Structure Documentation

◆ rm_ble_mesh_network_instance_ctrl_t

struct rm_ble_mesh_network_instance_ctrl_t

RM_BLE_MESH_NETWORK private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_NETWORK_Open() is called.

Function Documentation

◆ RM_BLE_MESH_NETWORK_Open()

fsp_err_t RM_BLE_MESH_NETWORK_Open (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_cfg_t const *const *p_cfg*)

Register Inerface with Network Layer. This routine registers interface with the Network Layer. Network Layer supports only one upper layer, hence this routine shall be called once.

Implements rm_ble_mesh_network_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_NETWORK_Open(&g_ble_mesh_network0_ctrl,
&g_ble_mesh_network0_cfg);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ RM_BLE_MESH_NETWORK_Close()

fsp_err_t RM_BLE_MESH_NETWORK_Close (rm_ble_mesh_network_ctrl_t *const *p_ctrl*)

Unregister Inerface with Network Layer. Implements rm_ble_mesh_network_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_NETWORK_Close(&g_ble_mesh_network0_ctrl);
```

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_BroadcastSecureBeacon()

fsp_err_t RM_BLE_MESH_NETWORK_BroadcastSecureBeacon (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*)

API to send Secure Network Beacon. This routine sends Secure Network Beacon for the given subnet handle.

Implements rm_ble_mesh_network_api_t::broadcastSecureBeacon.

Example:

```
/* Send secure network beacon. */
   err = RM_BLE_MESH_NETWORK_BroadcastSecureBeacon(&g_ble_mesh_network0_ctrl,
subnet_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_NETWORK_SendPduOnInterface()

fsp_err_t RM_BLE_MESH_NETWORK_SendPduOnInterface (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_route_info_t const *const *p_route_info*, rm_ble_mesh_network_header_t const *const *p_header*, rm_ble_mesh_buffer_t const *const *p_buffer*)

Extension API to send Network PDUs on selected network interfaces. This routine sends NETWORK PDUs on all or selected Network Interfaces.

Implements rm_ble_mesh_network_api_t::sendPduOnInterface.

Example:

```
/* Send network PDUs on selected network interfaces. */
   err = RM_BLE_MESH_NETWORK_SendPduOnInterface(&g_ble_mesh_network0_ctrl,
&route_info, &header, &buffer);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_route_info, p_header and p_buffer are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_NETWORK_GetAddressType()

fsp_err_t RM_BLE_MESH_NETWORK_GetAddressType (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*, rm_ble_mesh_network_address_type_t *const *p_type*)

To get address type. This routine is to get address type for a given address.

Implements rm_ble_mesh_network_api_t::getAddressType.

Example:

```
/* Get address type. */
   err = RM_BLE_MESH_NETWORK_GetAddressType(&g_ble_mesh_network0_ctrl, addr, &type);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_type is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_FetchProxyState()

fsp_err_t RM_BLE_MESH_NETWORK_FetchProxyState (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_gatt_proxy_state_t *const *p_proxy_state*)

Check if the proxy module is ready to handle proxy messages/events. This routine returns the current state of the Proxy. The valid states of proxy are:

1. RM_BLE_MESH_NETWORK_GATT_PROXY_STATE_NULL - If no callback registered by Upper Layers
2. RM_BLE_MESH_NEgTWORK_GATT_PROXY_STATE_READY - If callback registered and Proxy not connected
3. RM_BLE_MESH_NETWORK_GATT_PROXY_STATE_CONNECTED - if callback registered and Proxy connected

Implements rm_ble_mesh_network_api_t::fetchProxyState.

Example:

```
/* Check if the proxy module is ready to handle proxy messages/events. */
   err = RM_BLE_MESH_NETWORK_FetchProxyState(&g_ble_mesh_network0_ctrl,
&proxy_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_proxy_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_SetProxyFilter()

fsp_err_t RM_BLE_MESH_NETWORK_SetProxyFilter (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_route_info_t const *const *p_route_info*, rm_ble_mesh_proxy_filter_type_t *type*)

Set proxy server's filter type. This function is used by the Proxy Client to set the filter type on the Proxy Server.

Implements rm_ble_mesh_network_api_t::setProxyFilter.

Example:

```
/* Set proxy server's filter type. */
   err = RM_BLE_MESH_NETWORK_SetProxyFilter(&g_ble_mesh_network0_ctrl, &route_info,
filter_type);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_route_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_ConfigProxyFilter()

fsp_err_t RM_BLE_MESH_NETWORK_ConfigProxyFilter (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_route_info_t const *const *p_route_info*, rm_ble_mesh_proxy_config_opcode_t *opcode*, rm_ble_mesh_network_proxy_address_list_t *const *p_addr_list*)

Add or Delete/Remove addresses to/from proxy filter list. This function is used by the Proxy Client to add/delete Addresses to/from the Proxy Server's filter List.

Implements rm_ble_mesh_network_api_t::configProxyFilter.

Example:

```
/* Add or delete/remove addresses to/from proxy filter list. */
   err = RM_BLE_MESH_NETWORK_ConfigProxyFilter(&g_ble_mesh_network0_ctrl,
&route_info, opcode, &addr_list);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_route_info and p_addr_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_StartProxyServerAdv()

fsp_err_t RM_BLE_MESH_NETWORK_StartProxyServerAdv (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, rm_ble_mesh_network_gatt_proxy_adv_mode_t *proxy_adv_mode*)

Start connectable advertisements for a proxy server. This function is used by the Proxy Server to start Connectable Undirected Advertisements.

Implements rm_ble_mesh_network_api_t::startProxyServerAdv.

Example:

```
/* Start connectable advertisements for a proxy server. */
   err = RM_BLE_MESH_NETWORK_StartProxyServerAdv(&g_ble_mesh_network0_ctrl,
subnet_handle, proxy_adv_mode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The internal parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_NETWORK_StopProxyServerAdv()

fsp_err_t RM_BLE_MESH_NETWORK_StopProxyServerAdv (rm_ble_mesh_network_ctrl_t *const *p_ctrl*)

Stop connectable advertisements for a proxy server. This function is used by the Proxy Server to stop Connectable Undirected Advertisements.

Implements rm_ble_mesh_network_api_t::stopProxyServerAdv.

Example:

```
/* Stop connectable advertisements for a proxy server. */
   err = RM_BLE_MESH_NETWORK_StopProxyServerAdv(&g_ble_mesh_network0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_AllocateSeqNumber()

fsp_err_t RM_BLE_MESH_NETWORK_AllocateSeqNumber (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, uint32_t *const *p_seq_num*)

To allocate sequence number. This function is used to allocate Sequence Number.

Implements rm_ble_mesh_network_api_t::allocateSeqNumber.

Example:

```
/* Allocate sequence number. */
   err = RM_BLE_MESH_NETWORK_AllocateSeqNumber(&g_ble_mesh_network0_ctrl, &seq_num);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_seq_num is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_GetSeqNumberState()

fsp_err_t RM_BLE_MESH_NETWORK_GetSeqNumberState (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_seq_number_state_t *const *p_seq_num_state*)

To get current sequence number state. This function is used to get current Sequence Number state.

Implements rm_ble_mesh_network_api_t::getSeqNumberState.

Example:

```
/* Get current sequence number state. */
   err = RM_BLE_MESH_NETWORK_GetSeqNumberState(&g_ble_mesh_network0_ctrl,
&seq_num_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_seq_num_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_SetSeqNumberState()

fsp_err_t RM_BLE_MESH_NETWORK_SetSeqNumberState (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_seq_number_state_t const *const *p_seq_num_state*)

To set current sequence number state. This function is used to get current Sequence Number state, which acquiring lock. Used from persistent storage.

Implements rm_ble_mesh_network_api_t::setSeqNumberState.

Example:

```
/* Set current sequence number state. */
   err = RM_BLE_MESH_NETWORK_SetSeqNumberState(&g_ble_mesh_network0_ctrl,
&seq_num_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_seq_num_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_ResetNetCache()

fsp_err_t RM_BLE_MESH_NETWORK_ResetNetCache (rm_ble_mesh_network_ctrl_t *const *p_ctrl*)

To reinitialize all Network Layer cache entries. This routine clears and reinitializes all Network Cache Entries. This needs to be invoked by the upper layer when the Network moves to a newer IV Index (Normal State) and the Sequence numbers are reset.

Implements rm_ble_mesh_network_api_t::resetNetCache.

Example:

```
/* Reinitialize all Network Layer cache entries. */
   err = RM_BLE_MESH_NETWORK_ResetNetCache(&g_ble_mesh_network0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Overview

Target Devices

The BLE Mesh Network Provision module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_provision

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_provision_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Provision (rm_ble_mesh_provision)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Provision (rm_ble_mesh_provision).

Configuration	Options	Default	Description
General			
Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh_provision0	Module name.
Provision Capabilities			
Number of Elements	Invalid Number of Elements	1	Provision capabilities number of elements.
Supported Algorithms	Invalid Supported Algorithms	0	Provision capabilities supported algorithms.
Public Key Type	Invalid Public Key Type	0	Provision capabilities public key type.
Static OOB Type	Invalid Static OOB Type	0	Provision capabilities static OOB type.
Output OOB Action	Invalid Output OOB Action	0	Provision capabilities output OOB action.
Output OOB Size	Invalid Output OOB Size	0	Provision capabilities output OOB size.
Input OOB Action	Invalid Input OOB Action	0	Provision capabilities input OOB action.
Input OOB Size	Invalid Input OOB Size	0	Provision capabilities iutput OOB size.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Provision Callback	Name Must Be a Valid C Symbol.	NULL	Provision callback function name.

Data Structures

struct	rm_ble_mesh_provision_instance_ctrl_t

Data Structure Documentation

◆ rm_ble_mesh_provision_instance_ctrl_t

struct rm_ble_mesh_provision_instance_ctrl_t
RM_BLE_MESH_PROVISION private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_PROVISION_Open() is called.

Function Documentation

◆ RM_BLE_MESH_PROVISION_Open()

fsp_err_t RM_BLE_MESH_PROVISION_Open (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_cfg_t const *const *p_cfg*)

Open access middleware. This function registers the provisioning capabilities of the application along with the application callback to notify events during the provisioning procedure.

Implements rm_ble_mesh_provision_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_PROVISION_Open(&g_ble_mesh_provision0_ctrl,
&g_ble_mesh_provision0_cfg);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_PROVISION_Close()

fsp_err_t RM_BLE_MESH_PROVISION_Close (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*)

Close access middleware. Implements rm_ble_mesh_provision_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_PROVISION_Close(&g_ble_mesh_provision0_ctrl);
```

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_PROVISION_Setup()

fsp_err_t RM_BLE_MESH_PROVISION_Setup (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_role_t *role*, rm_ble_mesh_provision_device_info_t *info*, uint16_t *timeout*)

Setup the device for provisioning. This function configures the device to get in a provisionable state by specifying the role, bearer and creating a context.

Implements rm_ble_mesh_provision_api_t::setup.

Example:

```
/* Setup the device for provisioning. */
   err = RM_BLE_MESH_PROVISION_Setup(&g_ble_mesh_provision0_ctrl, role, info,
timeout);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	The parameter info->p_device is NULL.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_PROVISION_Bind()

fsp_err_t RM_BLE_MESH_PROVISION_Bind (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_device_info_t *info*, uint8_t *attention*, rm_ble_mesh_provision_handle_t *const *p_handle*)

Bind to the peer device for provisioning. This function establishes a provisioning link with the peer device and exchanges the capabilities for provisioning.

Implements rm_ble_mesh_provision_api_t::bind.

Example:

```
/* Bind to the peer device for provisioning. */
   err = RM_BLE_MESH_PROVISION_Bind(&g_ble_mesh_provision0_ctrl, info, attention,
&provision_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_PROVISION_SendPdu()

fsp_err_t RM_BLE_MESH_PROVISION_SendPdu (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_handle_t const *const *p_handle*, rm_ble_mesh_provision_pdu_type_t *type*, rm_ble_mesh_buffer_t *pdu_data*)

Send provisioning PDUs to the peer. This function is used by the provisioning application to send the provisioning PDUs to the peer device during the procedure.

Implements rm_ble_mesh_provision_api_t::sendPdu.

Example:

```
/* Send provisioning PDUs to the peer. */
   err = RM_BLE_MESH_PROVISION_SendPdu(&g_ble_mesh_provision0_ctrl,
&provision_handle, type, pdu_data);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_UNSUPPORTED	The pdu type is not supported.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_PROVISION_SetAuthVal()

fsp_err_t RM_BLE_MESH_PROVISION_SetAuthVal (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_handle_t const *const *p_handle*, rm_ble_mesh_buffer_t *auth_value*)

Set the display authval. This function shall be used by the provisioning application to set the authval being displayed to the user on receiving RM_BLE_MESH_PROVISION_EVENT_TYPE_OOB_DISPLAY event with the respective OOB Action and Size.

Implements rm_ble_mesh_provision_api_t::setAuthVal.

Example:

```
rm_ble_mesh_buffer_t auth_value = {.payload = NULL, .length = 0};;

/* Set the display authval. */

   err = RM_BLE_MESH_PROVISION_SetAuthVal(&g_ble_mesh_provision0_ctrl,
&provision_handle, auth_value);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_PROVISION_Abort()

fsp_err_t RM_BLE_MESH_PROVISION_Abort (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*,
rm_ble_mesh_provision_handle_t const *const *p_handle*,
rm_ble_mesh_provision_link_close_reason_t *reason*)

Abort the provisioning procedure. This API can be used by the application to abort the ongoing provisioning procedure. This routine closes the provisioning link with the reason as specified.

Implements rm_ble_mesh_provision_api_t::abort.

Example:

```
/* Abort the provisioning procedure. */
   err = RM_BLE_MESH_PROVISION_Abort(&g_ble_mesh_provision0_ctrl, &provision_handle,
reason);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_PROVISION_GetLocalPublicKey()

fsp_err_t RM_BLE_MESH_PROVISION_GetLocalPublicKey (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t *const *p_public_key*)

Utility API to get current ECDH public key to be used for provisioning. This API can be used by the application to fetch the current ECDH P256 Public Key which is to be used for the Provisioning Procedure.

Implements rm_ble_mesh_provision_api_t::getLocalPublicKey.

Example:

```
/* Get current ECDH Public Key to be used for Provisioning. */
   err = RM_BLE_MESH_PROVISION_GetLocalPublicKey(&g_ble_mesh_provision0_ctrl,
&public_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_public_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_PROVISION_SetLocalPublicKey()

fsp_err_t RM_BLE_MESH_PROVISION_SetLocalPublicKey (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t const *const *p_public_key*)

Utility API to set current ECDH public key to be used for provisioning. This API can be used by the application to fetch the current ECDH P256 Public Key which is to be used for the Provisioning Procedure.

Implements rm_ble_mesh_provision_api_t::setLocalPublicKey.

Example:

```
/* Set current ECDH Public Key to be used for Provisioning. */
   err = RM_BLE_MESH_PROVISION_SetLocalPublicKey(&g_ble_mesh_provision0_ctrl,
&public_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_public_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_PROVISION_GenerateRandomizedNumber()

fsp_err_t RM_BLE_MESH_PROVISION_GenerateRandomizedNumber (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t *const *p_key*)

Utility API to generate 128bits (16 bytes) randomized number to be used for provisioning. The randomized number can be used for UUID, Net Key and Application Key.

Implements rm_ble_mesh_provision_api_t::generateRandomizedNumber.

Example:

```
/* Generate 128bits (16 bytes) randomized number. */
   err = RM_BLE_MESH_PROVISION_GenerateRandomizedNumber(&g_ble_mesh_provision0_ctrl,
p_net_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_PROVISION_SetOobPublicKey()

fsp_err_t RM_BLE_MESH_PROVISION_SetOobPublicKey (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t const *const *p_key*, uint8_t *size*)

Utility API to set device out of band public key for provisioning.

Implements rm_ble_mesh_provision_api_t::setOobPublicKey.

Example:

```
/* Set device out of band public key. */
   err = RM_BLE_MESH_PROVISION_SetOobPublicKey(&g_ble_mesh_provision0_ctrl,
p_public_key, size);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_key is NULL.
FSP_ERR_INVALID_ARGUMENT	The parameter size is more than 64.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_PROVISION_SetOobAuthInfo()

fsp_err_t RM_BLE_MESH_PROVISION_SetOobAuthInfo (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t const *const *p_auth_info*, uint8_t *size*)

Utility API to set device out of band authentication information for provisioning.

Implements rm_ble_mesh_provision_api_t::setOobAuthInfo.

Example:

```
/* Set device out of band authentication information. */
   err = RM_BLE_MESH_PROVISION_SetOobAuthInfo(&g_ble_mesh_provision0_ctrl,
p_auth_info, size);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_auth_info is NULL.
FSP_ERR_INVALID_ARGUMENT	The parameter size is more than 16.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_PROVISION_GenerateEcdhKey()

fsp_err_t RM_BLE_MESH_PROVISION_GenerateEcdhKey (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t *const *p_public_key*)

Utility API to generate ECDH public key to be used for provisioning.

Implements rm_ble_mesh_provision_api_t::generateEcdhKey.

Example:

```
/* Generate ECDH Public Key for Provisioning. */
   err = RM_BLE_MESH_PROVISION_GenerateEcdhKey(&g_ble_mesh_provision0_ctrl,
&public_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_public_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

BLE Mesh Network Scene Client (rm_mesh_scene_clt)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_SCENE_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_SCENE_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_SCENE_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle)
fsp_err_t	RM_MESH_SCENE_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode)
fsp_err_t	RM_MESH_SCENE_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_SCENE_CLT_Recall (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_SCENE_CLT_RecallUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_SCENE_CLT_RegisterGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_SCENE_CLT_Store (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_SCENE_CLT_StoreUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_SCENE_CLT_Delete (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_SCENE_CLT_DeleteUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Scene Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_scene_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_scene_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Scene Client (rm_mesh_scene_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Scene Client (rm_mesh_scene_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scene client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_scene_clt0	Module name.

Data Structures

struct	rm_mesh_scene_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_scene_clt_instance_ctrl_t

struct rm_mesh_scene_clt_instance_ctrl_t
BLE mesh scene instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SCENE_CLT_Open() is called.

Function Documentation

◆ RM_MESH_SCENE_CLT_Open()

fsp_err_t RM_MESH_SCENE_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

open Scene Client middleware. This is to initialize Scene Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_SCENE_CLT_Open(&g_mesh_scene_clt0_ctrl, &g_mesh_scene_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_SCENE_CLT_Close()

fsp_err_t RM_MESH_SCENE_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Scene Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SCENE_CLT_Close(&g_mesh_scene_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SCENE_CLT_GetModelHandle()

fsp_err_t RM_MESH_SCENE_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Scene client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of scene client model. */
   err = RM_MESH_SCENE_CLT_GetModelHandle(&g_mesh_scene_clt0_ctrl, &model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_SCENE_CLT_SendReliablePdu()

fsp_err_t RM_MESH_SCENE_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_SCENE_CLT_SendReliablePdu(&g_mesh_scene_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_Get()

fsp_err_t RM_MESH_SCENE_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Scene Get is an acknowledged message used to get the current status of a currently active scene of an element. The response to the Scene Get message is a Scene Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_Recall()

fsp_err_t RM_MESH_SCENE_CLT_Recall (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Recall is an acknowledged message that is used to recall the current state of an element from a previously stored scene. The response to the Scene Recall message is a Scene Status message.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Recall message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_RecallUnacknowledged()

fsp_err_t RM_MESH_SCENE_CLT_RecallUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Recall Unacknowledged is an unacknowledged message used to recall the current state of an element from a previously stored Scene.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Recall message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_RegisterGet()

fsp_err_t RM_MESH_SCENE_CLT_RegisterGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Scene Register Get is an acknowledged message used to get the current status of the Scene Register of an element. The response to the Scene Register Get message is a Scene Register Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_Store()

fsp_err_t RM_MESH_SCENE_CLT_Store (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Store is an acknowledged message used to store the current state of an element as a Scene, which can be recalled later. The response to the Scene Store message is a Scene Register Status message.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Store message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_StoreUnacknowledged()

fsp_err_t RM_MESH_SCENE_CLT_StoreUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Store Unacknowledged is an unacknowledged message used to store the current state of an element as a Scene, which can be recalled later.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Store message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_Delete()

fsp_err_t RM_MESH_SCENE_CLT_Delete (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Delete is an acknowledged message used to delete a Scene from the Scene Register state of an element. The response to the Scene Delete message is a Scene Register Status message.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Delete parameter.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_DeleteUnacknowledged()

fsp_err_t RM_MESH_SCENE_CLT_DeleteUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Delete Unacknowledged is an unacknowledged message used to delete a scene from the Scene Register state of an element.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Delete parameter.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Scene Server (rm_mesh_scene_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_SCENE_SRV_Close (rm_ble_mesh_scene_server_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_SCENE_SRV_StateUpdate

	(rm_ble_mesh_scene_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Scene Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_scene_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_scene_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Scene Server (rm_mesh_scene_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Scene Server (rm_mesh_scene_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scene server ISR occurs
Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scene server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_scene_srv0	Module name.
Model Handle	Invalid Model Handle	0	Select model handle.
Setup Server Handle	Invalid Setup Server Handle	0	Select setup server handle.

Data Structures

struct	rm_mesh_scene_srv_number_info_t
struct	rm_mesh_scene_srv_status_info_t

struct	rm_mesh_scene_srv_register_status_info_t
struct	rm_mesh_scene_srv_ext_tid_and_transition_info_t
struct	rm_mesh_scene_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_scene_srv_number_info_t

struct rm_mesh_scene_srv_number_info_t		
The state to identify a scene		
Data Fields		
uint16_t	number	The number to identify a scene

◆ rm_mesh_scene_srv_status_info_t

struct rm_mesh_scene_srv_status_info_t		
The current status of a currently active scene		
Data Fields		
uint8_t	status_code	Status Code
uint16_t	current_scene	Scene Number of a current scene.
uint16_t	target_scene	Scene Number of a target scene.
uint8_t	remaining_time	

◆ rm_mesh_scene_srv_register_status_info_t

struct rm_mesh_scene_srv_register_status_info_t		
The current status of scene register		
Data Fields		
uint8_t	status_code	Status Code
uint16_t	current_scene	Scene Number of a current scene.
uint16_t *	scenes	A list of scenes stored within an element
uint16_t	scenes_count	

◆ rm_mesh_scene_srv_ext_tid_and_transition_info_t

struct rm_mesh_scene_srv_ext_tid_and_transition_info_t
TID and Transition is a structure which contains Transaction ID (TID) as mandatory field. Other two fields, Transition Time and Delay are optional.

TID field is a transaction identifier indicating whether the message is a new message or a retransmission of a previously sent message.

If present, the Transition Time field identifies the time that an element will take to transition to the target state from the present state.

The Delay field shall be present when the Transition Time field is present. It identifies the message execution delay, representing a time interval between receiving the message by a model and executing the associated model behaviors.

◆ rm_mesh_scene_srv_instance_ctrl_t

struct rm_mesh_scene_srv_instance_ctrl_t
BLE mesh scene instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SCENE_SRV_Open() is called.

Function Documentation

◆ RM_MESH_SCENE_SRV_Open()

fsp_err_t RM_MESH_SCENE_SRV_Open (rm_ble_mesh_scene_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_scene_server_cfg_t const *const *p_cfg*)

API to initialize Scene Server model. This is to initialize Scene Server model and to register with Access layer.
Implements rm_ble_mesh_model_server_api_t::open.
Example:
`/* Open the module. */`
`err = RM_MESH_SCENE_SRV_Open(&g_mesh_scene_srv0_ctrl, &g_mesh_scene_srv0_cfg);`

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_SCENE_SRV_Close()

fsp_err_t RM_MESH_SCENE_SRV_Close (rm_ble_mesh_scene_server_ctrl_t *const *p_ctrl*)

API to terminate Scene Server model. This is to terminate Scene Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SCENE_SRV_Close(&g_mesh_scene_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SCENE_SRV_StateUpdate()

fsp_err_t RM_MESH_SCENE_SRV_StateUpdate (rm_ble_mesh_scene_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_SCENE_SRV_StateUpdate(&g_mesh_scene_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Scheduler Client (rm_mesh_scheduler_clt)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_SCHEDULER_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_SCHEDULER_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_SCHEDULER_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl,

	rm_ble_mesh_access_model_handle_t *const p_model_handle)
fsp_err_t	RM_MESH_SCHEDULER_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode)
fsp_err_t	RM_MESH_SCHEDULER_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_SCHEDULER_CLT_ActionGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_SCHEDULER_CLT_ActionSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_SCHEDULER_CLT_ActionSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Scheduler Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_scheduler_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_scheduler_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Scheduler Client (rm_mesh_scheduler_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Scheduler Client (rm_mesh_scheduler_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scheduler

			client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_scheduler_clt0	Module name.

Data Structures

struct	rm_mesh_scheduler_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_scheduler_clt_instance_ctrl_t

struct rm_mesh_scheduler_clt_instance_ctrl_t
BLE mesh scheduler instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SCHEDULER_CLT_Open() is called.

Function Documentation

◆ RM_MESH_SCHEDULER_CLT_Open()

fsp_err_t RM_MESH_SCHEDULER_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Scheduler Client middleware. This is to initialize Scheduler Client model and to register with Access layer.
Implements rm_ble_mesh_model_client_api_t::open.
Example:
`/* Open the module. */`
`err = RM_MESH_SCHEDULER_CLT_Open(&g_mesh_scheduler_clt0_ctrl, &g_mesh_scheduler_clt0_cfg);`
Return values
FSP_SUCCESS — Model opened successfully.
FSP_ERR_ASSERTION — Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN — Model is already open.
FSP_ERR_NOT_FOUND — The number of models has exceeded the limit.
FSP_ERR_ABORTED — Model initialization is failed.

◆ RM_MESH_SCHEDULER_CLT_Close()

fsp_err_t RM_MESH_SCHEDULER_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Scheduler Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SCHEDULER_CLT_Close(&g_mesh_scheduler_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SCHEDULER_CLT_GetModelHandle()

fsp_err_t RM_MESH_SCHEDULER_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Scheduler client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of scheduler client model. */
   err = RM_MESH_SCHEDULER_CLT_GetModelHandle(&g_mesh_scheduler_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_SCHEDULER_CLT_SendReliablePdu()

fsp_err_t RM_MESH_SCHEDULER_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_SCHEDULER_CLT_SendReliablePdu(&g_mesh_scheduler_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCHEDULER_CLT_Get()

fsp_err_t RM_MESH_SCHEDULER_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Scheduler Get is an acknowledged message used to get the current Schedule Register state of an element. The response to the Scheduler Get message is a Scheduler Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_scheduler_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCHEDULER_CLT_ActionGet()

fsp_err_t RM_MESH_SCHEDULER_CLT_ActionGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scheduler Action Get is an acknowledged message used to report the action defined by the entry of the Schedule Register state of an element, identified by the Index field. The response to the Scheduler Action Get message is a Scheduler Action Status message.

Parameters

[in]	p_ctrl	rm_mesh_scheduler_clt control block.
[in]	p_parameter	Pointer to Scheduler Action Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCHEDULER_CLT_ActionSet()

fsp_err_t RM_MESH_SCHEDULER_CLT_ActionSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scheduler Action Set is an acknowledged message used to set the entry of the Schedule Register state of an element, identified by the Index field. The response to the Scheduler Action Set message is a Scheduler Action Status message.

Parameters

[in]	p_ctrl	rm_mesh_scheduler_clt control block.
[in]	p_parameter	Pointer to Scheduler Action Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCHEDULER_CLT_ActionSetUnacknowledged()

fsp_err_t RM_MESH_SCHEDULER_CLT_ActionSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scheduler Action Set Unacknowledged is an unacknowledged message used to set the entry of the Schedule Register state of an element, identified by the Index field.

Parameters

[in]	p_ctrl	rm_mesh_scheduler_clt control block.
[in]	p_parameter	Pointer to Scheduler Action Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Scheduler Server (rm_mesh_scheduler_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_SCHEDULER_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_SCHEDULER_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_SCHEDULER_SRV_StateUpdate

	(rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Scheduler Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_scheduler_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_scheduler_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Scheduler Server (rm_mesh_scheduler_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Scheduler Server (rm_mesh_scheduler_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scheduler server ISR occurs
Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scheduler server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_scheduler_srv0	Module name.

Data Structures

struct	rm_mesh_scheduler_srv_schedules_info_t
struct	rm_mesh_scheduler_srv_entry_index_info_t
struct	rm_mesh_scheduler_srv_entry_info_t
struct	rm_mesh_scheduler_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_scheduler_srv_schedules_info_t

struct rm_mesh_scheduler_srv_schedules_info_t		
The current Schedule Register state of an element.		
Data Fields		
uint16_t	schedules	Bit field indicating defined Actions in the Schedule Register

◆ rm_mesh_scheduler_srv_entry_index_info_t

struct rm_mesh_scheduler_srv_entry_index_info_t		
The entry index of the Schedule Register state		
Data Fields		
uint8_t	index	Index of the Schedule Register entry

◆ rm_mesh_scheduler_srv_entry_info_t

struct rm_mesh_scheduler_srv_entry_info_t		
The entry of the Schedule Register state		
Data Fields		
uint8_t	index	Index of the Schedule Register entry
uint8_t	year	Scheduled year for the action
uint16_t	month	Scheduled month for the action
uint8_t	day	Scheduled day of the month for the action
uint8_t	hour	Scheduled hour for the action
uint8_t	minute	Scheduled minute for the action
uint8_t	second	Scheduled second for the action
uint8_t	dayofweek	Schedule days of the week for the action
uint8_t	action	Action to be performed at the scheduled time
uint8_t	transition_time	Transition time for this action
uint16_t	scene_number	Scene number to be used for some actions

◆ rm_mesh_scheduler_srv_instance_ctrl_t

struct rm_mesh_scheduler_srv_instance_ctrl_t
BLE mesh scheduler instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SCHEDULER_SRV_Open() is called.

Function Documentation

◆ RM_MESH_SCHEDULER_SRV_Open()

fsp_err_t RM_MESH_SCHEDULER_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Scheduler Server model. This is to initialize Scheduler Server model and to register with Access layer.
Implements rm_ble_mesh_model_server_api_t::open.
Example:
`/* Open the module. */`
`err = RM_MESH_SCHEDULER_SRV_Open(&g_mesh_scheduler_srv0_ctrl, &g_mesh_scheduler_srv0_cfg);`
Return values
FSP_SUCCESS — Model opened successfully.
FSP_ERR_ASSERTION — Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN — Model is already open.
FSP_ERR_NOT_FOUND — The number of models has exceeded the limit.
FSP_ERR_ABORTED — Model initialization is failed.

◆ RM_MESH_SCHEDULER_SRV_Close()

fsp_err_t RM_MESH_SCHEDULER_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Scheduler Server model. This is to terminate Scheduler Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SCHEDULER_SRV_Close(&g_mesh_scheduler_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SCHEDULER_SRV_StateUpdate()

fsp_err_t RM_MESH_SCHEDULER_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_SCHEDULER_SRV_StateUpdate(&g_mesh_scheduler_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Sensor Client (rm_mesh_sensor_clt)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_SENSOR_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_SENSOR_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_SENSOR_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl,

The BLE Mesh Network Sensor Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_sensor_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_sensor_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Sensor Client (rm_mesh_sensor_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Sensor Client (rm_mesh_sensor_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh sensor client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_sensor_clt0	Module name.

Data Structures

struct	rm_mesh_sensor_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_sensor_clt_instance_ctrl_t

struct rm_mesh_sensor_clt_instance_ctrl_t
BLE mesh sensor instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SENSOR_CLT_Open() is called.

Function Documentation

◆ RM_MESH_SENSOR_CLT_Open()

fsp_err_t RM_MESH_SENSOR_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Sensor Client middleware. This is to initialize Sensor Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_SENSOR_CLT_Open(&g_mesh_sensor_clt0_ctrl, &g_mesh_sensor_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_SENSOR_CLT_Close()

fsp_err_t RM_MESH_SENSOR_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Sensor Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SENSOR_CLT_Close(&g_mesh_sensor_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SENSOR_CLT_GetModelHandle()

fsp_err_t RM_MESH_SENSOR_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Sensor client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of sensor client model. */
   err = RM_MESH_SENSOR_CLT_GetModelHandle(&g_mesh_sensor_clt0_ctrl, &model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_SENSOR_CLT_SendReliablePdu()

fsp_err_t RM_MESH_SENSOR_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_SENSOR_CLT_SendReliablePdu(&g_mesh_sensor_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_DescriptorGet()

fsp_err_t RM_MESH_SENSOR_CLT_DescriptorGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Descriptor Get is an acknowledged message used to get the Sensor Descriptor state of all sensors within an element. The response to a Sensor Descriptor Get message is a Sensor Descriptor Status message.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Descriptor Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_Get()

fsp_err_t RM_MESH_SENSOR_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Get is an acknowledged message used to get the Sensor Data state. The response to the Sensor Get message is a Sensor Status message.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_ColumnGet()

fsp_err_t RM_MESH_SENSOR_CLT_ColumnGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Column Get is an acknowledged message used to get the Sensor Series Column state. The response to the Sensor Column Get message is a Sensor Column Status message

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Column Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_SeriesGet()

fsp_err_t RM_MESH_SENSOR_CLT_SeriesGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Series Get is an acknowledged message used to get a sequence of the Sensor Series Column states. The response to the Sensor Series Get message is a Sensor Series Status message.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Series Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_CadenceGet()

fsp_err_t RM_MESH_SENSOR_CLT_CadenceGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Cadence Get is an acknowledged message used to get the Sensor Cadence state of an element. The response to the Sensor Cadence Get message is a Sensor Cadence Status message.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Cadence Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_CadenceSet()

fsp_err_t RM_MESH_SENSOR_CLT_CadenceSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Cadence Set is an acknowledged message used to set the Sensor Cadence state of an element. The response to the Sensor Cadence Set message is a Sensor Cadence Status message.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Cadence Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_CadenceSetUnacknowledged()

fsp_err_t RM_MESH_SENSOR_CLT_CadenceSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Cadence Set Unacknowledged is an unacknowledged message used to set the Sensor Cadence state of an element.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Cadence Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_SettingsGet()

fsp_err_t RM_MESH_SENSOR_CLT_SettingsGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Settings Get is an acknowledged message used to get the list of Sensor Setting states of an element. The response to the Sensor Settings Get message is a Sensor Settings Status message

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Settings Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_SettingGet()

fsp_err_t RM_MESH_SENSOR_CLT_SettingGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Setting Get is an acknowledged message used to get the Sensor Setting state of an element. The response to the Sensor Setting Get message is a Sensor Setting Status message.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Settings Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_SettingSet()

fsp_err_t RM_MESH_SENSOR_CLT_SettingSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Setting Set is an acknowledged message used to set the Sensor Setting state of an element. The response to the Sensor Setting Set message is a Sensor Setting Status message.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Settings Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_SettingSetUnacknowledged()

fsp_err_t RM_MESH_SENSOR_CLT_SettingSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Setting Set Unacknowledged is an unacknowledged message used to set the Sensor Setting state of an element.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Settings Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Sensor Server (rm_mesh_sensor_srv)

fsp_err_t	RM_MESH_SENSOR_SRV_SetupServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Sensor Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_sensor_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_sensor_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Sensor Server (rm_mesh_sensor_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Sensor Server (rm_mesh_sensor_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh sensor server ISR occurs
Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh sensor server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_sensor_srv0	Module name.

Data Structures

struct	rm_mesh_sensor_srv_descriptor_info_t
struct	rm_mesh_sensor_srv_settings_info_t

struct	rm_mesh_sensor_srv_setting_info_t
struct	rm_mesh_sensor_srv_cadence_info_t
struct	rm_mesh_sensor_srv_data_info_t
struct	rm_mesh_sensor_srv_series_column_info_t
struct	rm_mesh_sensor_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_sensor_srv_descriptor_info_t

struct rm_mesh_sensor_srv_descriptor_info_t

Sensor Descriptor state represents the attributes describing the sensor data

Data Fields

uint16_t	sensor_property_id	Sensor Property ID field is a 2-octet value referencing a device property that describes the meaning and the format of data reported by a sensor
uint16_t	sensor_positive_tolerance	Sensor Positive Tolerance field is a 12-bit value representing the magnitude of a possible positive error associated with the measurements that the sensor is reporting
uint16_t	sensor_negative_tolerance	Sensor Negative Tolerance field is a 12-bit value representing the magnitude of a possible negative error associated with the measurements that the sensor is reporting
uint8_t	sensor_sampling_function	Sensor Sampling Function field specifies the averaging operation or type of sampling function applied to the measured value
uint8_t	sensor_measurement_period	Sensor Measurement Period field specifies a uint8 value n that represents the averaging time span, accumulation time, or measurement period in seconds over which the measurement is taken
uint8_t	sensor_update_interval	measurement reported by a sensor is internally refreshed at

		the frequency indicated in the Sensor Update Interval field
uint8_t	status	Status - used in response to indicate if other fields to be included

◆ rm_mesh_sensor_srv_settings_info_t

struct rm_mesh_sensor_srv_settings_info_t		
Sensor Settings state controls parameters of a sensor		
Data Fields		
uint16_t	sensor_property_id	Property ID of a sensor
uint16_t *	setting_property_ids	Property ID of a setting within a sensor
uint16_t	setting_property_ids_count	

◆ rm_mesh_sensor_srv_setting_info_t

struct rm_mesh_sensor_srv_setting_info_t		
Sensor Setting state controls parameters of a sensor		
Data Fields		
uint16_t	sensor_property_id	Property ID of a sensor
uint16_t	sensor_setting_property_id	Property ID of a setting within a sensor
uint8_t	sensor_setting_access	Read/Write access rights for the setting
uint8_t *	sensor_setting_raw	Raw value of a setting within a sensor
uint16_t	sensor_setting_raw_len	
uint8_t	status	

◆ rm_mesh_sensor_srv_cadence_info_t

struct rm_mesh_sensor_srv_cadence_info_t		
Sensor Cadence state controls the cadence of sensor reports		
Data Fields		
uint16_t	sensor_property_id	Property ID of a sensor
uint8_t	fast_cadence_period_divisor	Divisor for the Publish Period
uint8_t	status_trigger_type	Defines the unit and format of the Status Trigger Delta fields
uint8_t *	status_trigger_delta_down	Delta down value that triggers a status message
uint16_t	status_trigger_delta_down_len	

uint8_t *	status_trigger_delta_up	Delta up value that triggers a status message
uint16_t	status_trigger_delta_up_len	
uint8_t	status_min_interval	Minimum interval between two consecutive Status messages APPLICATION NOTE: The Current Sensor Server Model implementation does not inherantly check for the time interval between two consecutive status messages. The application layer which manages the data for the Sensor Server Model holds the responsibility for interleaving consecutive status messages with the configured Minimum time interval for statuses.
uint8_t *	fast_cadence_low	Low value for the fast cadence range
uint16_t	fast_cadence_low_len	
uint8_t *	fast_cadence_high	High value for the fast cadence range
uint16_t	fast_cadence_high_len	
uint8_t	status	Status - used in response path

◆ rm_mesh_sensor_srv_data_info_t

struct rm_mesh_sensor_srv_data_info_t		
The Sensor Data state is a sequence of one or more pairs of Sensor Property ID and Raw Value fields, with each Raw Value field size and representation defined by the characteristics referenced by the Sensor Property ID		
Data Fields		
uint16_t	property_id_1	ID of the 1st device property of the sensor
uint8_t *	raw_value_1	Raw Value field with a size and representation defined by the 1st device property
uint16_t	raw_value_1_len	
uint16_t	property_id_2	ID of the 2nd device property of the sensor
uint8_t *	raw_value_2	Raw Value field with a size and representation defined by the 2nd device property
uint16_t	raw_value_2_len	

uint16_t	property_id_n	ID of the nth device property of the sensor
uint8_t *	raw_value_n	Raw Value field with a size and representation defined by the nth device property
uint16_t	raw_value_n_len	
uint8_t	status	Status - used in response path

◆ rm_mesh_sensor_srv_series_column_info_t

struct rm_mesh_sensor_srv_series_column_info_t		
Values measured by sensors may be organized as arrays (and represented as series of columns, such as histograms		
Data Fields		
uint16_t	sensor_property_id	Property describing the data series of the sensor
uint8_t *	sensor_raw_value_x	Raw value representing the left corner of a column on the X axis
uint16_t	sensor_raw_value_x_len	
uint8_t *	sensor_column_width	Raw value representing the width of the column
uint16_t	sensor_column_width_len	
uint8_t *	sensor_raw_value_y	Raw value representing the height of the column on the Y axis
uint16_t	sensor_raw_value_y_len	
uint8_t	status	Status - used in response path

◆ rm_mesh_sensor_srv_instance_ctrl_t

struct rm_mesh_sensor_srv_instance_ctrl_t
BLE mesh sensor instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SENSOR_SRV_Open() is called.

Function Documentation

◆ RM_MESH_SENSOR_SRV_Open()

fsp_err_t RM_MESH_SENSOR_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Sensor Server model and to initialize Sensor_Setup Server model. This is to initialize Sensor Server model and to register with Access layer. And this is to initialize Sensor_Setup Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_SENSOR_SRV_Open(&g_mesh_sensor_srv0_ctrl, &g_mesh_sensor_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_SENSOR_SRV_Close()

fsp_err_t RM_MESH_SENSOR_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Sensor Server model. This is to terminate Sensor Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SENSOR_SRV_Close(&g_mesh_sensor_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SENSOR_SRV_StateUpdate()

fsp_err_t RM_MESH_SENSOR_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_SENSOR_SRV_StateUpdate(&g_mesh_sensor_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_SRV_SetupServerStateUpdate()

fsp_err_t RM_MESH_SENSOR_SRV_SetupServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_sensor_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Time Client (rm_mesh_time_clt)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_TIME_CLT_TaiUtcDeltaGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_TIME_CLT_TaiUtcDeltaSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_TIME_CLT_RoleGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_TIME_CLT_RoleSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Time Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_time_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_time_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Time Client (rm_mesh_time_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Time Client (rm_mesh_time_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh time client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_time_clt0	Module name.

Data Structures

struct	rm_mesh_time_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_time_clt_instance_ctrl_t

struct rm_mesh_time_clt_instance_ctrl_t
BLE mesh time instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_TIME_CLT_Open() is called.

Function Documentation

◆ RM_MESH_TIME_CLT_Open()

fsp_err_t RM_MESH_TIME_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Time Client middleware. This is to initialize Time Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_TIME_CLT_Open(&g_mesh_time_clt0_ctrl, &g_mesh_time_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_TIME_CLT_Close()

fsp_err_t RM_MESH_TIME_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Time Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_TIME_CLT_Close(&g_mesh_time_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_TIME_CLT_GetModelHandle()

fsp_err_t RM_MESH_TIME_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Time client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of time client model. */
   err = RM_MESH_TIME_CLT_GetModelHandle(&g_mesh_time_clt0_ctrl, &model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_TIME_CLT_SendReliablePdu()

fsp_err_t RM_MESH_TIME_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_TIME_CLT_SendReliablePdu(&g_mesh_time_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_Get()

fsp_err_t RM_MESH_TIME_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Time Get is a message used to get the Time state of neighbor nodes. The response to the Time Get message is a Time Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_Set()

fsp_err_t RM_MESH_TIME_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Time Set is an acknowledged message used to set the Time state of an element. The response to the Time Set message is a Time Status message.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.
[in]	p_parameter	Pointer to Time Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_ZoneGet()

fsp_err_t RM_MESH_TIME_CLT_ZoneGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Time Zone Get is an acknowledged message used to get the Time Zone Offset Current state, the Time Zone Offset New state , and the TAI of Zone Change state. The response to the Time Zone Get message is a Time Zone Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_ZoneSet()

fsp_err_t RM_MESH_TIME_CLT_ZoneSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Time Zone Set is an acknowledged message used to set the Time Zone Offset New state and the TAI of Zone Change state.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.
[in]	p_parameter	Pointer to Time Zone Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_TaiUtcDeltaGet()

fsp_err_t RM_MESH_TIME_CLT_TaiUtcDeltaGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

TAI-UTC Delta Get is an acknowledged message used to get the TAI-UTC Delta Current state, the TAI-UTC Delta New state, and the TAI of Delta Change state. The response to the TAI-UTC Delta Get message is a TAI-UTC Delta Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_TaiUtcDeltaSet()

fsp_err_t RM_MESH_TIME_CLT_TaiUtcDeltaSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

TAI-UTC Delta Set is an acknowledged message used to set the TAI-UTC Delta New state and the TAI of Delta Change state.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.
[in]	p_parameter	Pointer to TAI-UTC Delta Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_RoleGet()

fsp_err_t RM_MESH_TIME_CLT_RoleGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Time Role Get is an acknowledged message used to get the Time Role state of an element. The response to the Time Role Get message is a Time Role Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_RoleSet()

fsp_err_t RM_MESH_TIME_CLT_RoleSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Time Role Set is an acknowledged message used to set the Time Role state of an element. The response to the Time Role Set message is a Time Role Status message.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.
[in]	p_parameter	Pointer to Time Role Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Time Server (rm_mesh_time_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_TIME_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_TIME_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_TIME_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t

	*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Time Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_time_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_time_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Time Server (rm_mesh_time_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Time Server (rm_mesh_time_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh time server ISR occurs
Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh time server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_time_srv0	Module name.

Data Structures

struct	rm_mesh_time_srv_info_t
struct	rm_mesh_time_srv_zone_info_t
struct	rm_mesh_time_srv_tai_utc_delta_info_t
struct	rm_mesh_time_srv_role_info_t
struct	rm_mesh_time_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_time_srv_info_t

struct rm_mesh_time_srv_info_t		
Mesh defines times based on International Atomic Time (TAI). The base representation of times is the number of seconds after 00:00:00 TAI on 2000-01-01 (that is, 1999-12-31T23:59:28 UTC)		
Data Fields		
uint8_t	tai_seconds[5]	Current TAI time in seconds since the epoch.
uint8_t	subsecond	The sub-second time in units of 1/256s.
uint8_t	uncertainty	Estimated uncertainty in 10-millisecond steps.
uint8_t	time_authority	0 = No Time Authority. The element does not have a trusted OOB source of time, such as GPS or NTP. 1 = Time Authority. The element has a trusted OOB source of time, such as GPS or NTP or a battery-backed, properly initialized RTC.
uint16_t	tai_utc_delta	Current difference between TAI and UTC in seconds
uint8_t	time_zone_offset	The local time zone offset in 15-minute increments

◆ rm_mesh_time_srv_zone_info_t

struct rm_mesh_time_srv_zone_info_t		
Time Zone		
Data Fields		
uint8_t	time_zone_offset_current	Current local time zone offset. Meaningful only in 'Time Zone Status' response.
uint8_t	time_zone_offset_new	Upcoming local time zone offset.
uint8_t	tai_of_zone_change[5]	Absolute TAI time when the Time Zone Offset will change from Current to New.

◆ rm_mesh_time_srv_tai_utc_delta_info_t

struct rm_mesh_time_srv_tai_utc_delta_info_t
TAI-UTC Delta

Data Fields		
uint16_t	tai_utc_delta_current	Current difference between TAI and UTC in seconds. Meaningful only in 'TAI-UTC Delta Status' response.
uint16_t	tai_utc_delta_new	Upcoming difference between TAI and UTC in seconds.
uint8_t	padding	Always 0b0. Other values are Prohibited.
uint8_t	tai_of_delta_change[5]	TAI Seconds time of the upcoming TAI-UTC Delta change

◆ rm_mesh_time_srv_role_info_t

struct rm_mesh_time_srv_role_info_t		
The Time Role state of an element		
Data Fields		
uint8_t	role	Time Role

◆ rm_mesh_time_srv_instance_ctrl_t

struct rm_mesh_time_srv_instance_ctrl_t
BLE mesh time instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_TIME_SRV_Open() is called.

Function Documentation

◆ RM_MESH_TIME_SRV_Open()

fsp_err_t RM_MESH_TIME_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Time Server model. This is to initialize Time Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_TIME_SRV_Open(&g_mesh_time_srv0_ctrl, &g_mesh_time_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_TIME_SRV_Close()

fsp_err_t RM_MESH_TIME_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Time Server model. This is to terminate Time Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_TIME_SRV_Close(&g_mesh_time_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_TIME_SRV_StateUpdate()

fsp_err_t RM_MESH_TIME_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_TIME_SRV_StateUpdate(&g_mesh_time_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Upper Trans (rm_ble_mesh_upper_trans)

Modules » Networking » BLE Mesh Network Modules

fsp_err_t	RM_BLE_MESH_UPPER_TRANS_SetHeartbeatPublication (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_upper_trans_heartbeat_publication_info_t *const p_info)
fsp_err_t	RM_BLE_MESH_UPPER_TRANS_GetHeartbeatPublication (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_upper_trans_heartbeat_publication_info_t *const p_info)
fsp_err_t	RM_BLE_MESH_UPPER_TRANS_SetHeartbeatSubscription (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_upper_trans_heartbeat_subscription_info_t *const p_info)
fsp_err_t	RM_BLE_MESH_UPPER_TRANS_GetHeartbeatSubscription (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, rm_ble_mesh_upper_trans_heartbeat_subscription_info_t *const p_info)
fsp_err_t	RM_BLE_MESH_UPPER_TRANS_TriggerHeartbeat (rm_ble_mesh_upper_trans_ctrl_t *const p_ctrl, uint8_t change_in_feature_bit)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Upper Trans module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_upper_trans

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_upper_trans_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Upper Trans (rm_ble_mesh_upper_trans)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Upper Trans (rm_ble_mesh_upper_trans).

Configuration	Options	Default	Description
General			

Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh_upper_trans0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Control Message Event Enable	• Enabled • Disabled	Disabled	Whether to enable the control message event or not.
Access Message Event Enable	• Enabled • Disabled	Disabled	Whether to enable the access message event or not.
Callback	Name Must Be a Valid C Symbol	NULL	Callback function name.

Data Structures

struct	rm_ble_mesh_upper_trans_instance_ctrl_t

Data Structure Documentation

◆ rm_ble_mesh_upper_trans_instance_ctrl_t

struct rm_ble_mesh_upper_trans_instance_ctrl_t
RM_BLE_MESH_UPPER_TRANS private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_UPPER_TRANS_Open() is called.

Function Documentation

◆ RM_BLE_MESH_UPPER_TRANS_Open()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_Open (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_cfg_t const *const *p_cfg*)

Register Inerface with Transport Layer. This routine registers interface with the Transport Layer. Transport Layer supports single Application, hence this rouine shall be called once.

Implements rm_ble_mesh_upper_trans_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_UPPER_TRANS_Open(&g_ble_mesh_upper_trans0_ctrl,
&g_ble_mesh_upper_trans0_cfg);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ RM_BLE_MESH_UPPER_TRANS_Close()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_Close (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*)

Unregister Inerface with Transport Layer. Implements rm_ble_mesh_upper_trans_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_UPPER_TRANS_Close(&g_ble_mesh_upper_trans0_ctrl);
```

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_UPPER_TRANS_SendAccessPdu()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_SendAccessPdu (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_access_layer_pdu_t const *const *p_access_layer_pdu*, rm_ble_mesh_lower_trans_reliable_t *reliable*)

API to send Access Layer PDUs. This routine sends Access Layer PDUs to peer device.

Implements rm_ble_mesh_upper_trans_api_t::sendAccessPdu.

Example:

```
/* Send Access Layer PDUs. */
   err = RM_BLE_MESH_UPPER_TRANS_SendAccessPdu(&g_ble_mesh_upper_trans0_ctrl,
                                               &access_layer_pdu,
RM_BLE_MESH_LOWER_TRANS_RELIABLE_ENABLE);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_access_layer_pdu is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_UPPER_TRANS_SendControlPdu()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_SendControlPdu (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_control_pdu_t const *const *p_control_pdu*)

API to send transport Control PDUs. This routine sends transport Control PDUs to peer device.

Implements rm_ble_mesh_upper_trans_api_t::sendControlPdu.

Example:

```
/* Send Upper Transport control PDUs. */
   err = RM_BLE_MESH_UPPER_TRANS_SendControlPdu(&g_ble_mesh_upper_trans0_ctrl,
&control_pdu);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_control_pdu is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_UPPER_TRANS_LpnSetupFriendship()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnSetupFriendship (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_friendship_setting_t const *const *p_setting*)

API to setup Friendship. This routine is used by the device acting as a low power node to setup a friendship procedure to any available friend nodes.

Implements rm_ble_mesh_upper_trans_api_t::lpnSetupFriendship.

Example:

```
/* Setup friendship. */
   err = RM_BLE_MESH_UPPER_TRANS_LpnSetupFriendship(&g_ble_mesh_upper_trans0_ctrl,
&setting);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_setting is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_UPPER_TRANS_LpnClearFriendship()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnClearFriendship (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*)

API to terminate friendship. This routine is used by the device acting as a low power node terminate friendship with an active Friend node.

Implements rm_ble_mesh_upper_trans_api_t::lpnClearFriendship.

Example:

```
/* Terminate friendship. */
   err = RM_BLE_MESH_UPPER_TRANS_LpnClearFriendship(&g_ble_mesh_upper_trans0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_UPPER_TRANS_LpnManageSubscription()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnManageSubscription (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_control_opcode_t *action*, uint16_t const *const *p_addr_list*, uint16_t *count*)

API to manage friend subscription list. This routine is used by the device acting as a low power node add/remove addresses to/from the friends subscription list.

Implements rm_ble_mesh_upper_trans_api_t::lpnManageSubscription.

Example:

```
/* Manage friend subscription list. */
   err =
RM_BLE_MESH_UPPER_TRANS_LpnManageSubscription(&g_ble_mesh_upper_trans0_ctrl,
 RM_BLE_MESH_UPPER_TRANS_CONTROL_OPCODE_FRIEND_POLL,
                                                &addr_list,
                                                count);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_addr_list is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.

◆ RM_BLE_MESH_UPPER_TRANS_LpnPoll()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnPoll (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*)

To trigger Friend Poll from application. This routine enables the application to trigger a Friend Poll even before the expiry of an active poll period configured during the friendship establishment. The poll peroid will get reset at this point.

Implements rm_ble_mesh_upper_trans_api_t::lpnPoll.

Example:

```
/* Trigger friend poll from application. */
   err = RM_BLE_MESH_UPPER_TRANS_LpnPoll(&g_ble_mesh_upper_trans0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_UPPER_TRANS_IsValidLpnElementAddress()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_IsValidLpnElementAddress (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*, rm_ble_mesh_lower_trans_lpn_handle_t *const *p_lpn_handle*)

To check if address matches with any of the LPN. This routine checks if destination address in a received packet matches with any of the known element address of LPN.

Implements rm_ble_mesh_upper_trans_api_t::isValidLpnElementAddress.

Example:

```
/* Check if address matches with any of the LPN. */
   err =
RM_BLE_MESH_UPPER_TRANS_IsValidLpnElementAddress(&g_ble_mesh_upper_trans0_ctrl, addr,
&lpn_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_lpn_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_UPPER_TRANS_IsValidLpnSubscriptionAddress()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_IsValidLpnSubscriptionAddress (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*, rm_ble_mesh_lower_trans_lpn_handle_t *const *p_lpn_handle*)

To check if valid subscription address of an LPN to receive a packet. This routine checks if destination address in a received packet matches with any of the known subscription address of an LPN.

Implements rm_ble_mesh_upper_trans_api_t::isValidLpnSubscriptionAddress.

Example:

```
/* Check if valid subscription address of an LPN to receive a packet. */
   err =
RM_BLE_MESH_UPPER_TRANS_IsValidLpnSubscriptionAddress(&g_ble_mesh_upper_trans0_ctrl,
addr, &lpn_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_lpn_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_UPPER_TRANS_GetLpnPolltimeout()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetLpnPolltimeout (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *lpn_addr*, uint32_t *const *p_poll_timeout*)

To get Poll Timeout of an LPN. This routine checks if LPN address is valid and then returns Poll Timeout configured for the LPN.

Implements rm_ble_mesh_upper_trans_api_t::getLpnPolltimeout.

Example:

```
/* Get poll timeout of an LPN. */
   err = RM_BLE_MESH_UPPER_TRANS_GetLpnPolltimeout(&g_ble_mesh_upper_trans0_ctrl,
addr, &poll_timeout);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_poll_timeout is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_UPPER_TRANS_GetFriendshipInfo()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetFriendshipInfo (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_friend_role_t *role*, uint16_t *lpn_index*, rm_ble_mesh_upper_trans_friendship_info_t *const *p_node*)

To get the LPN node information. This routine fetches the node information of the LPN element at the given index

Implements rm_ble_mesh_upper_trans_api_t::getFriendshipInfo.

Example:

```
/* Get the LPN node information. */
   err = RM_BLE_MESH_UPPER_TRANS_GetFriendshipInfo(&g_ble_mesh_upper_trans0_ctrl,
RM_BLE_MESH_UPPER_TRANS_FRIEND_ROLE_FRIEND,
                                                   lpn_index,
                                                   &node);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_node is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_UPPER_TRANS_LpnRegisterSecurityUpdate()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnRegisterSecurityUpdate (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t *flag*, uint32_t *ivindex*)

To add the security update information. This routine updates the security state of the network to all the active LPN elements. This will be forwarded to the elements when it polls for the next packet available.

Implements rm_ble_mesh_upper_trans_api_t::lpnRegisterSecurityUpdate.

Example:

```
/* Add the security update information. */
   err =
RM_BLE_MESH_UPPER_TRANS_LpnRegisterSecurityUpdate(&g_ble_mesh_upper_trans0_ctrl,
subnet_handle, flag, ivindex);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_UPPER_TRANS_ClearAllLpn()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_ClearAllLpn (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*)

To clear information related to all LPNs. This routine clears information related to all LPNs.

Implements rm_ble_mesh_upper_trans_api_t::clearAllLpn.

Example:

```
/* Clear information related to all LPNs. */
   err = RM_BLE_MESH_UPPER_TRANS_ClearAllLpn(&g_ble_mesh_upper_trans0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_UPPER_TRANS_SetHeartbeatPublication()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_SetHeartbeatPublication (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_heartbeat_publication_info_t *const *p_info*)

To set the Heartbeat publication data. This routine configures the Heartbeat publication information

Implements rm_ble_mesh_upper_trans_api_t::setHeartbeatPublication.

Example:

```
/* Set the heartbeat publication data. */
   err =
RM_BLE_MESH_UPPER_TRANS_SetHeartbeatPublication(&g_ble_mesh_upper_trans0_ctrl,
&ut_hp_info);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_UPPER_TRANS_GetHeartbeatPublication()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetHeartbeatPublication (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_heartbeat_publication_info_t *const *p_info*)

To get the Heartbeat publication data. This routine retrieves the Heartbeat publication information

Implements rm_ble_mesh_upper_trans_api_t::getHeartbeatPublication.

Example:

```
 /* Get the heartbeat publication data. */
    err =
RM_BLE_MESH_UPPER_TRANS_GetHeartbeatPublication(&g_ble_mesh_upper_trans0_ctrl,
&ut_hp_info);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_UPPER_TRANS_SetHeartbeatSubscription()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_SetHeartbeatSubscription (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_heartbeat_subscription_info_t *const *p_info*)

To set the Heartbeat subscription data. This routine configures the Heartbeat subscription information

Implements rm_ble_mesh_upper_trans_api_t::setHeartbeatSubscription.

Example:

```
 /* Set the heartbeat subscription data. */
    err =
RM_BLE_MESH_UPPER_TRANS_SetHeartbeatSubscription(&g_ble_mesh_upper_trans0_ctrl,
&ut_hs_info);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ADDRESS	Invalid source address.

◆ RM_BLE_MESH_UPPER_TRANS_GetHeartbeatSubscription()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetHeartbeatSubscription (
rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*,
rm_ble_mesh_upper_trans_heartbeat_subscription_info_t *const *p_info*)

To get the Heartbeat subscription data. This routine retrieves the Heartbeat subscription information

Implements rm_ble_mesh_upper_trans_api_t::getHeartbeatSubscription.

Example:

```
/* Get the heartbeat subscription data. */
   err =
RM_BLE_MESH_UPPER_TRANS_GetHeartbeatSubscription(&g_ble_mesh_upper_trans0_ctrl,
&ut_hs_info);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_UPPER_TRANS_TriggerHeartbeat()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_TriggerHeartbeat (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, uint8_t *change_in_feature_bit*)

To trigger Heartbeat send on change in feature. This routine triggers the Heartbeat send on change in state of supported features.

Implements rm_ble_mesh_upper_trans_api_t::triggerHeartbeat.

Example:

```
/* Trigger heartbeat send on change in feature. */
   err = RM_BLE_MESH_UPPER_TRANS_TriggerHeartbeat(&g_ble_mesh_upper_trans0_ctrl,
change_in_feature_bit);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_POINTER	The internal parameter is NULL.

5.2.12.12 Cellular Comm Interface on UART (rm_cellular_comm_uart_aws)

Modules » Networking

Functions

CellularCommInterfaceError_t	RM_CELLULAR_COMM_UART_AWS_Open (rm_cellular_comm_uart_aws_instance_ctrl_t *p_instance_ctrl, CellularCommInterfaceReceiveCallback_t receive_callback, void *pUserData)
CellularCommInterfaceError_t	RM_CELLULAR_COMM_UART_AWS_Send (CellularCommInterfaceHandle_t commInterfaceHandle, const uint8_t *pData, uint32_t dataLength, uint32_t timeoutMilliseconds, uint32_t *pDataSentLength)
CellularCommInterfaceError	RM_CELLULAR_COMM_UART_AWS_Receive

_t	(CellularCommInterfaceHandle_t commInterfaceHandle, uint8_t *pBuffer, uint32_t bufferLength, uint32_t timeoutMilliseconds, uint32_t *pDataReceivedLength)
CellularCommInterfaceError_t	RM_CELLULAR_COMM_UART_AWS_Close (CellularCommInterfaceHandle_t commInterfaceHandle)
void	comm_uart_aws_callback (uart_callback_args_t *p_args)

Detailed Description

Middleware implementing the AWS Cellular Comm Interface for the FSP UART API.

Overview

See AWS documentation for how the Cellular Comm Interface works:
https://www.freertos.org/Documentation/api-ref/cellular/cellular_porting.html#cellular_porting_comm_if

Configuration

Note

Using DTC with UART is recommended to reduce the number of interrupts in the system.

Build Time Configurations for rm_cellular_comm_uart_aws

The following build time configurations are defined in fsp_cfg/middleware/rm_cellular_comm_uart_aws_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	Selects if code for parameter checking is to be included in the build.
Receive Buffer	Size should be greater than zero	256	Temporary buffer for received bytes. When read function is called reamaining bytes will be read directly into buffer specified by read function argument.
Receive Transfer Size	Size should be greater than zero	512	The comm interface will break down UART reads into smaller read requests based on this number. For instance if this is set to 512 bytes then the interface will request 512 bytes at a time until the

			requested length is met or timeout. This is helpful for making use of DTC without having a long timeout period. AWS Cellular Interface Common->Comm Interface Receive Timeout is the timeout used for individual reads and should set accordingly based on this setting.

Configurations for Networking > Cellular Comm Interface on UART (rm_cellular_comm_uart_aws)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_cellular_comm_uart0	Module name.

Function Documentation

◆ **RM_CELLULAR_COMM_UART_AWS_Open()**

CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Open (rm_cellular_comm_uart_aws_instance_ctrl_t * *p_instance_ctrl*, CellularCommInterfaceReceiveCallback_t *receive_callback*, void * *pUserData*)

Implements open for CellularCommInterface_t

Parameters

[in]	receive_callback	Callback to call upon receiving data
[in]	pUserData	Pointer to user data to be passed through callback
[in]	p_instance_ctrl	Pointer to a rm_cellular_comm_uart_aws_instance_ctrl_t

Return values

IOT_COMM_INTERFACE_SUCCESS	Open succeeded
IOT_COMM_INTERFACE_BAD_PARAMETER	Bad parameter was passed in
IOT_COMM_INTERFACE_FAILURE	General failure
IOT_COMM_INTERFACE_DRIVER_ERROR	Lower level failure

◆ RM_CELLULAR_COMM_UART_AWS_Send()

CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Send (CellularCommInterfaceHandle_t *commInterfaceHandle*, const uint8_t * *pData*, uint32_t *dataLength*, uint32_t *timeoutMilliseconds*, uint32_t * *pDataSentLength*)

Implements send for CellularCommInterface_t. This function will block the calling thread until data is sent.

Parameters

[in]	commInterfaceHandle	CellularCommInterfaceHandle_t assigned in open
[in]	pData	Pointer to data to send
[in]	dataLength	Length of data to send
[in]	timeoutMilliseconds	Timeout in MS to wait for data to send
[in]	pDataSentLength	Actual length of data sent

Return values

IOT_COMM_INTERFACE_SUCCESS	Send succeeded
IOT_COMM_INTERFACE_BAD_PARAMETER	Bad parameter was passed in
IOT_COMM_INTERFACE_FAILURE	General failure
IOT_COMM_INTERFACE_DRIVER_ERROR	Lower level failure
IOT_COMM_INTERFACE_TIMEOUT	Send operation timed out

◆ RM_CELLULAR_COMM_UART_AWS_Receive()

CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Receive (CellularCommInterfaceHandle_t *commInterfaceHandle*, uint8_t * *pBuffer*, uint32_t *bufferLength*, uint32_t *timeoutMilliseconds*, uint32_t * *pDataReceivedLength*)

Implements receive for CellularCommInterface_t. This function will block the calling thread until data is received.

Parameters

[in]	commInterfaceHandle	CellularCommInterfaceHandle_t assigned in open
[in]	pBuffer	Pointer to buffer to receive to
[in]	bufferLength	Length of buffer
[in]	timeoutMilliseconds	Timeout in MS to wait for data reception
[in]	pDataReceivedLength	Actual length of data received

Return values

IOT_COMM_INTERFACE_SUCCESS	Receieve succeeded
IOT_COMM_INTERFACE_BAD_PARAMETER	Bad parameter was passed in
IOT_COMM_INTERFACE_FAILURE	General failure
IOT_COMM_INTERFACE_DRIVER_ERROR	Lower level failure

◆ RM_CELLULAR_COMM_UART_AWS_Close()

CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Close (CellularCommInterfaceHandle_t *commInterfaceHandle*)

Implements close for CellularCommInterface_t

Parameters

[in]	commInterfaceHandle	CellularCommInterfaceHandle_t assigned in open

Return values

IOT_COMM_INTERFACE_SUCCESS	Close succeeded
IOT_COMM_INTERFACE_BAD_PARAMETER	Bad parameter was passed in
IOT_COMM_INTERFACE_FAILURE	General failure

◆ comm_uart_aws_callback()

void comm_uart_aws_callback (uart_callback_args_t * *p_args*)
Callback for UART driver **Parameters** [in] p_args — Arguments from UART RX/TX callback

5.2.12.13 DA16XXX Transport Layer (rm_at_transport_da16xxx_uart)

Detailed Description

Transport layer implementation for linking DA16XXX Drivers with Communications layer.

Overview

This Transport Layer provides an abstraction interface between the DA16XXX driver and communications layers. Currently, the module supports only UART, but will support SPI in future.

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Features

- Configuring internal send/receive buffers.
- Providing thread-safe access to the communications interface (mutex) when sending AT commands.
- Implementing AT command send function based on user communication option (UART or SPI (future)). This function must be able to check the module response.
- Implement a receive function based on user communication option (UART or SPI (future)). Handles income data from the communications interface and stacks it on an internal buffer.

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Configuration

Build Time Configurations for rm_at_transport_da16xxx_uart

The following build time configurations are defined in fsp_cfg/rm_at_transport_da16xxx_uart_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Size of RX buffer for CMD Port	Manual Entry	3000	
Semaphore maximum timeout	Manual Entry	10000	
Number of retries for AT commands	Manual Entry	10	
Module Reset Port	Refer to the RA Configuration tool for available options.	06	Specify the module reset pin port for the MCU.
Module Reset Pin	Refer to the RA Configuration tool for available options.	03	Specify the module reset pin for the MCU.

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Interrupt Configuration

Refer to UART (r_sci_uart).

Clock Configuration

Refer to UART (r_sci_uart).

Pin Configuration

Refer to UART (r_sci_uart).

Usage Notes

- This module is not designed to be used directly, users will access this module via the DA16XXX driver

Limitations

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Data Structures

struct	at_transport_da16xxx_extended_cfg_t
struct	at_transport_da16xxx_instance_ctrl_t

Data Structure Documentation

◆ at_transport_da16xxx_extended_cfg_t

struct at_transport_da16xxx_extended_cfg_t		
User configuration structure, used in open function		
Data Fields		
const uint32_t	num_uarts	Number of UART interfaces to use.
const uart_instance_t *	uart_instances[AT_TRANSPORT_DA16XXX_CFG_MAX_NUMBER_UART_PORTS]	SCI UART instances.
const bsp_io_port_pin_t	reset_pin	Reset pin used for module.

◆ at_transport_da16xxx_instance_ctrl_t

struct at_transport_da16xxx_instance_ctrl_t	
AT_TRANSPORT_DA16XXX private control block. DO NOT MODIFY.	
Data Fields	
at_transport_da16xxx_cfg_t const *	p_cfg
	Pointer to initial configurations.

uint32_t	num_uarts
	number of UARTS currently used for communication with module
uint32_t	curr_cmd_port
	Current UART instance index for AT commands.
uint32_t	open
	Flag to indicate if transport instance has been initialized.
uint8_t	cmd_rx_queue_buf [AT_TRANSPORT_DA16XXX_CFG_CMD_RX_BUF_SIZE]
	Command port receive buffer used by byte queue // FreeRTOS.
StreamBufferHandle_t	socket_byteq_hdl
	Socket stream buffer handle.
StaticStreamBuffer_t	socket_byteq_struct
	Structure to hold stream buffer info.
SemaphoreHandle_t	tx_sem
	Transmit binary semaphore handle.
SemaphoreHandle_t	rx_sem
	Receive binary semaphore handle.
SemaphoreHandle_t	uart_tei_sem [AT_TRANSPORT_DA16XXX_CFG_MAX_NUMBER_UART_PORTS]
	UART transmission end binary semaphore.

uart_instance_t *	uart_instance_objects [AT_TRANSPORT_DA16XXX_CFG_MAX_NUMBER_UART_PORTS]
	UART instance object.
const bsp_io_port_pin_t	reset_pin
	Reset pin used for module.
bool(*	p_callback)(at_transport_da16xxx_callback_args_t *p_args)
	Pointer to callback function.
void const *	p_context
	Pointer to the user-provided context.

Function Documentation

◆ rm_at_transport_da16xxx_uart_callback()

void rm_at_transport_da16xxx_uart_callback (uart_callback_args_t * *p_args*)

UART Callback routine.

Parameters

[in]	p_args	Pointer to uart callback structure.

◆ rm_at_transport_da16xxx_uartOpen()

fsp_err_t rm_at_transport_da16xxx_uartOpen (at_transport_da16xxx_ctrl_t *const *p_ctrl*, at_transport_da16xxx_cfg_t const *const *p_cfg*)

Opens and configures the WIFI_DA16XXX Middleware module.

Parameters

[in]	p_ctrl	Pointer to Transport layer instance control structure.
[in]	p_cfg	Pointer to pin configuration structure.

Return values

FSP_SUCCESS	WIFI_DA16XXX successfully configured.
FSP_ERR_ASSERTION	The parameter p_cfg or p_instance_ctrl is NULL.
FSP_ERR_OUT_OF_MEMORY	There is no more heap memory available.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_WIFI_INIT_FAILED	WiFi module initialization failed.

◆ rm_at_transport_da16xxx_uart_atCommandSendThreadSafe()

fsp_err_t rm_at_transport_da16xxx_uart_atCommandSendThreadSafe (at_transport_da16xxx_ctrl_t *const *p_ctrl*, at_transport_da16xxx_data_t * *p_at_cmd*)

Send an AT command with testing for return response.

Parameters

[in]	p_ctrl	Pointer to Transport layer instance control structure.
[in]	p_at_cmd	Pointer to AT command data structure.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.

◆ rm_at_transport_da16xxx_uart_atCommandSend()

fsp_err_t rm_at_transport_da16xxx_uart_atCommandSend (at_transport_da16xxx_ctrl_t *const *p_ctrl*, at_transport_da16xxx_data_t * *p_at_cmd*)

Send and receive an AT command with testing for return. Thread-Safe

Parameters

[in]	p_ctrl	Pointer to Transport layer instance control structure.
[in]	p_at_cmd	Pointer to Transport layer instance data structure.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	Assertion error occurred.

◆ rm_at_transport_da16xxx_uart_giveMutex()

fsp_err_t rm_at_transport_da16xxx_uart_giveMutex (at_transport_da16xxx_ctrl_t *const *p_ctrl*, uint32_t *mutex_flag*)

Give the mutex for the send basic call.

Parameters

[in]	p_ctrl	Pointer to Transport layer instance control structure.
[in]	mutex_flag	Flags for the mutex.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred giving the mutex.

◆ rm_at_transport_da16xxx_uart_takeMutex()

fsp_err_t rm_at_transport_da16xxx_uart_takeMutex (at_transport_da16xxx_ctrl_t *const *p_ctrl*, uint32_t *mutex_flag*)

Take the mutex for the send basic call.

Parameters

[in]	p_ctrl	Pointer to Transport layer instance control structure.
[in]	mutex_flag	Flags for the mutex.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred taking the mutex.

◆ rm_at_transport_da16xxx_uart_bufferRecv()

size_t rm_at_transport_da16xxx_uart_bufferRecv (at_transport_da16xxx_ctrl_t *const *p_ctrl*, const char * *p_data*, uint32_t *length*, uint32_t *rx_timeout*)

Receive data from stream buffer.

Parameters

[in]	p_ctrl	Pointer to Transport layer instance control structure.
[in]	p_data	Pointer to data.
[in]	length	Data length.
[in]	rx_timeout	Timeout for receiving data on the buffer.

Return values

Number	of bytes pulled from Streambuffer
FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	Assertion error occurred.
FSP_ERR_INVALID_DATA	Accuracy of data is not guaranteed

◆ rm_at_transport_da16xxx_statusGet()

fsp_err_t rm_at_transport_da16xxx_statusGet (at_transport_da16xxx_ctrl_t *const *p_ctrl*, at_transport_da16xxx_status_t * *p_status*)

Gets the status of the configured DA16xxx transport.

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.

◆ rm_at_transport_da16xxx_uartClose()

fsp_err_t rm_at_transport_da16xxx_uartClose (at_transport_da16xxx_ctrl_t *const *p_ctrl*)

Closes the AT Transport DA16XXX Middleware module.

Parameters

[in]	p_ctrl	Pointer to Transport layer instance control structure.

Return values

FSP_SUCCESS	WIFI_DA16XXX successfully configured.
FSP_ERR_ASSERTION	The parameter p_cfg or p_instance_ctrl is NULL.
FSP_ERR_NOT_OPEN	The Transport layer instance is not open.

fsp_err_t	R_ETHER_WakeOnLANEnable (ether_ctrl_t *const p_ctrl) The setting of ETHERC is changed from normal sending and receiving mode to magic packet detection mode. Implements ether_api_t::wakeOnLANEnable. More...
fsp_err_t	R_ETHER_Read (ether_ctrl_t *const p_ctrl, void *const p_buffer, uint32_t *const length_bytes) Receive Ethernet frame. Receives data to the location specified by the pointer to the receive buffer. In zero copy mode, the address of the receive buffer is returned. In non zero copy mode, the received data in the internal buffer is copied to the pointer passed by the argument. Implements ether_api_t::read. More...
fsp_err_t	R_ETHER_Write (ether_ctrl_t *const p_ctrl, void *const p_buffer, uint32_t const frame_length) Transmit Ethernet frame. Transmits data from the location specified by the pointer to the transmit buffer, with the data size equal to the specified frame length. In the non zero copy mode, transmits data after being copied to the internal buffer. Implements ether_api_t::write. More...
fsp_err_t	R_ETHER_TxStatusGet (ether_ctrl_t *const p_ctrl, void *const p_buffer_address)
fsp_err_t	R_ETHER_CallbackSet (ether_ctrl_t *const p_api_ctrl, void(*p_callback)(ether_callback_args_t *), void const *const p_context, ether_callback_args_t *const p_callback_memory)

Detailed Description

Driver for the Ethernet peripheral on RA MCUs. This module implements the Ethernet Interface.

Overview

This module performs Ethernet frame transmission and reception using an Ethernet controller and an Ethernet DMA controller.

Features

The Ethernet module supports the following features:

- Transmit/receive processing
- Optional zero-copy buffering
- Callback function with returned event code
- Magic packet detection mode support
- Auto negotiation support
- Flow control support
- Multicast filtering support
- Broadcast filtering support
- Promiscuous mode support

Configuration

Build Time Configurations for r_ether

The following build time configurations are defined in fsp_cfg/r_ether_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
ET0_LINKSTA Pin Status Flag	• Fall -> Rise • Rise -> Fall	Fall -> Rise	Specify the polarity of the link signal output by the PHY-LSI. When 0 is specified, link-up and link-down correspond respectively to the fall and rise of the LINKSTA signal. When 1 is specified, link-up and link-down correspond respectively to the rise and fall of the LINKSTA signal.
Link Signal Change Flag	• Unused • Used	Unused	Use LINKSTA signal for detect link status changes 0 = unused (use PHY-LSI status register) 1 = use (use LINKSTA signal)

Interrupt event backward compatibility	• Do not keep compatibility • Keep compatibility	Keep compatibility	Keep backword compatibility of interrupt events. 0 = Do not keep compatibility, use separate events for each cause of interrupt. 1 = Keep compatibility, use common events for all interrupts.

Configurations for Networking > Ethernet (r_ether)

This module can be added to the Stacks tab via New Stack > Networking > Ethernet (r_ether). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_ether0	Module name.
Channel	0	0	Select the ether channel number.
MAC address	Must be a valid MAC address	00:11:22:33:44:55	MAC address of this channel.
Zero-copy Mode	• Disable • Enable	Disable	Enable or disable zero-copy mode.
Flow control functionality	• Disable • Enable	Disable	Enable or disable flow control.
Filters			
Multicast Mode	• Disable • Enable	Enable	Enable or disable multicast frame reception.
Promiscuous Mode	• Disable • Enable	Disable	Enable this option to receive packets addressed to other NICs.
Broadcast filter	Must be a valid non-negative integer with maximum configurable value of 65535.	0	Limit of the number of broadcast frames received continuously
Buffers			
Number of TX buffer	Must be an integer from 1 to 8	1	Number of transmit buffers
Number of RX buffer	Must be an integer	1	Number of receive

	from 1 to 8		buffers
Allocate RX buffer	• Disable • Enable	Enable	Allocates the RX buffer when generating the configuration structure
Buffer size	Must be at least 1514 which is the maximum Ethernet frame size.	1514	Size of Ethernet buffer
Padding size	• Disable • 1 Byte • 2 Bytes • 3 Bytes	Disable	The padding size that is automatically inserted into the received packets
Padding offset	Must be less than 64 bytes.	0	The offset into a receive buffer to insert padding bytes.
Interrupts			
EESR event	Refer to the RA Configuration tool for available options.	module.driver.ether.eesr_event_mask.rfof,module.driver.ether.eesr_event_mask.rde,module.driver.ether.eesr_event_mask.fr,module.driver.ether.eesr_event_mask.tc,module.driver.ether.eesr_event_mask.tfuf,module.driver.ether.eesr_event_mask.tde	Select event list for each bit of EESR.
ECSR event	• ICD • MPD • LCHNG • PSRTO • BFR		Select event list for each bit of ECSR.
Interrupt priority	MCU Specific Options		Select the EDMAC interrupt priority.
Callback	Name must be a valid C symbol	NULL	Callback provided when an ISR occurs

Interrupt Configuration

The first R_ETHER_Open function call sets EINT interrupts. The user could provide callback function which would be invoked when EINT interrupt handler has been completed. The callback arguments will contain information about a channel number, the ETHERC and EDMAC status, the event code, and a pointer to the user defined context.

Callback Configuration

The user could provide callback function which would be invoked when either a magic packet or a link signal change is detected. When the callback function is called, a variable in which the channel

number for which the detection occurred and a constant shown in Table 2.4 are stored is passed as an argument. If the value of this argument is to be used outside the callback function, its value should be copied into, for example, a global variable.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA4E2	PCLKA
RA4T1	PCLKA
RA6E1	PCLKA
RA6E2	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T3	PCLKA

Note

1. *When using ETHERC, the PCLKA frequency is in the range 12.5 MHz <= PCLKA <= 120 MHz.*
2. *When using ETHERC, PCLKA = ICLK.*

Pin Configuration

To use the Ethernet module, input/output signals of the peripheral function have to be allocated to pins with the multi-function pin controller (MPC). Please perform the pin setting before calling the R_ETHER_Open function.

Usage Notes

Ethernet Frame Format

The Ethernet module supports the Ethernet II/IEEE 802.3 frame format.

Frame Format for Data Transmission and Reception

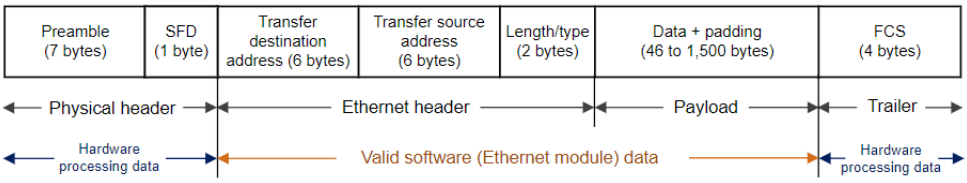

Figure 282: Frame Format Image

The preamble and SFD signal the start of an Ethernet frame. The FCS contains the CRC of the

Ethernet frame and is calculated on the transmitting side. When data is received the CRC value of the frame is calculated in hardware, and the Ethernet frame is discarded if the values do not match. When the hardware determines that the data is normal, the valid range of receive data is: (transmission destination address) + (transmission source address) + (length/type) + (data).

PAUSE Frame Format

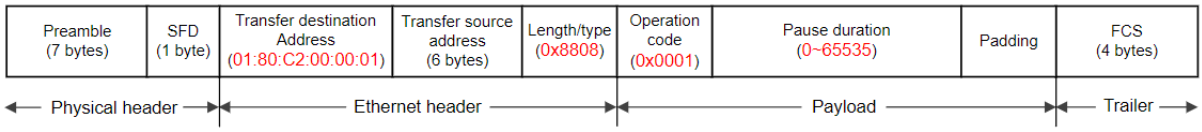

Figure 283: Pause Frame Format Image

The transmission destination address is specified as 01:80:C2:00:00:01 (a multicast address reserved for PAUSE frames). At the start of the payload the length/type is specified as 0x8808 and the operation code as 0x0001. The pause duration in the payload is specified by the value of the automatic PAUSE (AP) bits in the automatic PAUSE frame setting register (APR), or the manual PAUSE time setting (MP) bits in the manual PAUSE frame setting register (MPR).

Magic Packet Frame Format

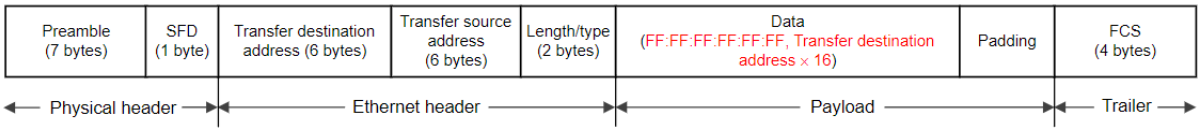

Figure 284: Magic Packet Frame Format Image

In a Magic Packet, the value FF:FF:FF:FF:FF:FF followed by the transmission destination address repeated 16 times is inserted somewhere in the Ethernet frame data.

Limitations

Memory alignment limitation for Ethernet buffer

The Ethernet Driver has several alignment constraints:

- 16-byte alignment for the descriptor
- 32-byte aligned read buffer for R_ETHER_RxBufferUpdate when zero copy mode is enabled

Functional limitations in TrustZone Security Extensions

The Ethernet Driver has several security constraints:

MCU	Has Security Extension	Support Flat project	Support TrustZone project	
			Secure	Non-Secure
RA6M2	-	x	-	-
RA6M3	-	x	-	-
RA6M4	- *1	x	-	x

RA6M5	- *1	x	-	x
RA8M1	x	x	x	x

Note

1. ETHERC/EDMAC is always Non-secure peripheral in this MCU.

Examples

ETHER Basic Example

This is a basic example of minimal use of the ETHER in an application.

Note

In this example zero-copy mode is disabled and there are no restrictions on buffer alignment.

```

Data Structure Documentation

◆ ether_instance_descriptor_t

struct ether_instance_descriptor_t
EDMAC descriptor as defined in the hardware manual. Structure must be packed at 1 byte.

◆ ether_extended_cfg_t

struct ether_extended_cfg_t		
ETHER extension configures the buffer descriptor for ETHER.		
Data Fields		
ether_instance_descriptor_t *	p_rx_descriptors	Receive descriptor buffer pool.
ether_instance_descriptor_t *	p_tx_descriptors	Transmit descriptor buffer pool.
uint32_t	eesr_event_filter	Filter for EESR related event.
uint8_t	ecsr_event_filter	Filter for ECSR related event.

◆ ether_instance_ctrl_t

struct ether_instance_ctrl_t	
ETHER control block. DO NOT INITIALIZE. Initialization occurs when ether_api_t::open is called.	
Data Fields	
uint32_t	open
	Used to determine if the channel is configured.
ether_cfg_t const *	p_ether_cfg
	Pointer to initial configurations.
ether_instance_descriptor_t *	p_rx_descriptor
	Pointer to the currently referenced transmit descriptor.
ether_instance_descriptor_t *	p_tx_descriptor
	Pointer to the currently referenced receive descriptor.

void *	p_reg_etherc
	Base register of ethernet controller for this channel.
void *	p_reg_edmac
	Base register of EDMA controller for this channel.
ether_previous_link_status_t	previous_link_status
	Previous link status.
ether_link_change_t	link_change
	status of link change
ether_magic_packet_t	magic_packet
	status of magic packet detection
ether_link_establish_status_t	link_establish_status
	Current Link status.

Enumeration Type Documentation

◆ ether_previous_link_status_t

enum ether_previous_link_status_t	
Enumerator	
ETHER_PREVIOUS_LINK_STATUS_DOWN	Previous link status is down.
ETHER_PREVIOUS_LINK_STATUS_UP	Previous link status is up.

◆ ether_link_change_t

enum ether_link_change_t	
Enumerator	
ETHER_LINK_CHANGE_NO_CHANGE	Link status is no change.
ETHER_LINK_CHANGE_LINK_DOWN	Link status changes to down.
ETHER_LINK_CHANGE_LINK_UP	Link status changes to up.

◆ ether_magic_packet_t

enum ether_magic_packet_t	
Enumerator	
ETHER_MAGIC_PACKET_NOT_DETECTED	Magic packet is not detected.
ETHER_MAGIC_PACKET_DETECTED	Magic packet is detected.

◆ ether_link_establish_status_t

enum ether_link_establish_status_t	
Enumerator	
ETHER_LINK_ESTABLISH_STATUS_DOWN	Link establish status is down.
ETHER_LINK_ESTABLISH_STATUS_UP	Link establish status is up.

◆ ether_eesr_event_mask_t

enum ether_eesr_event_mask_t	
Event mask for EESR register	
Enumerator	
ETHER_EESR_EVENT_MASK_CERF	CERF event.
ETHER_EESR_EVENT_MASK_PRE	PRE event.
ETHER_EESR_EVENT_MASK_RTSF	RTSF event.
ETHER_EESR_EVENT_MASK_RTLF	RTLF event.

ETHER_EESR_EVENT_MASK_RRF	PRF event.
ETHER_EESR_EVENT_MASK_RMAF	RMAF event.
ETHER_EESR_EVENT_MASK_TRO	TRO event.
ETHER_EESR_EVENT_MASK_CD	CD event.
ETHER_EESR_EVENT_MASK_DLC	DLC event.
ETHER_EESR_EVENT_MASK_CND	CND event.
ETHER_EESR_EVENT_MASK_RFOF	RFOF event.
ETHER_EESR_EVENT_MASK_RDE	RDE event.
ETHER_EESR_EVENT_MASK_FR	FR event.
ETHER_EESR_EVENT_MASK_TFUF	TFUF event.
ETHER_EESR_EVENT_MASK_TDE	TDE event.
ETHER_EESR_EVENT_MASK_TC	TC event.
ETHER_EESR_EVENT_MASK_ECI	ECI event.
ETHER_EESR_EVENT_MASK_ADE	ADE event.
ETHER_EESR_EVENT_MASK_RFCOF	RFCOF event.
ETHER_EESR_EVENT_MASK_RABT	RABT event.
ETHER_EESR_EVENT_MASK_TABT	TABT event.
ETHER_EESR_EVENT_MASK_TWB	TWB event.

◆ ether_ecsr_event_mask_t

enum ether_ecsr_event_mask_t	
Event mask for ECSR register	
Enumerator	
ETHER_ECSR_EVENT_MASK_ICD	ICD event.
ETHER_ECSR_EVENT_MASK_MPD	MPD event.
ETHER_ECSR_EVENT_MASK_LCHNG	LCHNG event.
ETHER_ECSR_EVENT_MASK_PSRTO	PSRTO event.
ETHER_ECSR_EVENT_MASK_BFR	BFR event.

Function Documentation

◆ R_ETHER_Open()

fsp_err_t R_ETHER_Open (ether_ctrl_t *const *p_ctrl*, ether_cfg_t const *const *p_cfg*)

After ETHERC, EDMAC and PHY-LSI are reset in software, an auto negotiation of PHY-LSI is begun. Afterwards, the link signal change interrupt is permitted. Implements ether_api_t::open.

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.
FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION	Initialization of PHY-LSI failed.
FSP_ERR_INVALID_CHANNEL	Invalid channel number is given.
FSP_ERR_INVALID_POINTER	Pointer to extend config structure or MAC address is NULL.
FSP_ERR_INVALID_ARGUMENT	Interrupt is not enabled.
FSP_ERR_ETHER_PHY_ERROR_LINK	Initialization of PHY-LSI failed.

◆ R_ETHER_Close()

fsp_err_t R_ETHER_Close (ether_ctrl_t *const *p_ctrl*)

Disables interrupts. Removes power and releases hardware lock. Implements ether_api_t::close.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_ETHER_BufferRelease()

fsp_err_t R_ETHER_BufferRelease (ether_ctrl_t *const *p_ctrl*)

Move to the next buffer in the circular receive buffer list. Implements ether_api_t::bufferRelease.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE	As a Magic Packet is being detected, transmission and reception is not enabled.

◆ R_ETHER_RxBufferUpdate()

fsp_err_t R_ETHER_RxBufferUpdate (ether_ctrl_t *const *p_ctrl*, void *const *p_buffer*)

Change the buffer pointer of the current rx buffer descriptor. Implements ether_api_t::rxBufferUpdate.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	A pointer argument is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	The pointer of buffer is NULL or not aligned on a 32-bit boundary.
FSP_ERR_INVALID_MODE	Driver is configured to non zero copy mode.
FSP_ERR_ETHER_RECEIVE_BUFFER_ACTIVE	All descriptor is active.

◆ R_ETHER_LinkProcess()

fsp_err_t R_ETHER_LinkProcess (ether_ctrl_t *const *p_ctrl*)

The Link up processing, the Link down processing, and the magic packet detection processing are executed. Implements ether_api_t::linkProcess.

Return values

FSP_SUCCESS	Link is up.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_LINK	Link is down.
FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION	When reopening the PHY interface initialization of the PHY-LSI failed.
FSP_ERR_ALREADY_OPEN	When reopening the PHY interface it was already opened.
FSP_ERR_INVALID_CHANNEL	When reopening the PHY interface an invalid channel was passed.
FSP_ERR_INVALID_POINTER	When reopening the PHY interface the MAC address pointer was NULL.
FSP_ERR_INVALID_ARGUMENT	When reopening the PHY interface the interrupt was not enabled.
FSP_ERR_ETHER_PHY_ERROR_LINK	Initialization of the PHY-LSI failed.

◆ R_ETHER_WakeOnLANEnable()

fsp_err_t R_ETHER_WakeOnLANEnable (ether_ctrl_t *const *p_ctrl*)

The setting of ETHERC is changed from normal sending and receiving mode to magic packet detection mode. Implements ether_api_t::wakeOnLANEnable.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_PHY_ERROR_LINK	Initialization of PHY-LSI failed.

◆ R_ETHER_Read()

fsp_err_t R_ETHER_Read (ether_ctrl_t *const *p_ctrl*, void *const *p_buffer*, uint32_t *const *length_bytes*)

Receive Ethernet frame. Receives data to the location specified by the pointer to the receive buffer. In zero copy mode, the address of the receive buffer is returned. In non zero copy mode, the received data in the internal buffer is copied to the pointer passed by the argument. Implements ether_api_t::read.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_NO_DATA	There is no data in receive buffer.
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE	As a Magic Packet is being detected, transmission and reception is not enabled.
FSP_ERR_ETHER_ERROR_FILTERING	Multicast Frame filter is enable, and Multicast Address Frame is received.
FSP_ERR_INVALID_POINTER	Value of the pointer is NULL.

◆ R_ETHER_Write()

fsp_err_t R_ETHER_Write (ether_ctrl_t *const *p_ctrl*, void *const *p_buffer*, uint32_t const *frame_length*)

Transmit Ethernet frame. Transmits data from the location specified by the pointer to the transmit buffer, with the data size equal to the specified frame length. In the non zero copy mode, transmits data after being copied to the internal buffer. Implements ether_api_t::write.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE	As a Magic Packet is being detected, transmission and reception is not enabled.
FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL	Transmit buffer is not empty.
FSP_ERR_INVALID_POINTER	Value of the pointer is NULL.
FSP_ERR_INVALID_ARGUMENT	Value of the send frame size is out of range.

◆ R_ETHER_TxStatusGet()

fsp_err_t R_ETHER_TxStatusGet (ether_ctrl_t *const *p_ctrl*, void *const *p_buffer_address*)

Provides status of Ethernet driver in the user provided pointer. Implements ether_api_t::txStatusGet.

Return values

FSP_SUCCESS	Transmit buffer address is stored in provided p_buffer_address.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	p_status is NULL.
FSP_ERR_NOT_FOUND	Transmit buffer address has been overwritten in transmit descriptor.

◆ R_ETHER_CallbackSet()

fsp_err_t R_ETHER_CallbackSet (ether_ctrl_t *const *p_api_ctrl*, void(*)(ether_callback_args_t *) *p_callback*, void const *const *p_context*, ether_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements ether_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

fsp_err_t	R_ETHER_PHY_Write (ether_phy_ctrl_t *const p_ctrl, uint32_t reg_addr, uint32_t data) Write data to register of PHY-LSI . Implements ether_phy_api_t::write. More...

Detailed Description

The Ethernet PHY module (r_ether_phy) provides an API for standard Ethernet PHY communications applications that use the ETHERC peripheral. It implements the Ethernet PHY Interface.

Overview

The Ethernet PHY module is used to setup and manage an external Ethernet PHY device for use with the on-chip Ethernet Controller (ETHERC) peripheral. It performs auto-negotiation to determine the optimal connection parameters between link partners. Once initialized the connection between the external PHY and the onboard controller is automatically managed in hardware.

Features

The Ethernet PHY module supports the following features:

- Auto negotiation support
- Flow control support
- Link status check support

Configuration

Build Time Configurations for r_ether_phy

The following build time configurations are defined in fsp_cfg/r_ether_phy_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
KSZ8091RNB Target	• Disabled • Enabled	Disabled	Select whether to use KSZ8091RNB Phy LSI or not.
KSZ8041 Target	• Disabled • Enabled	Disabled	Select whether to use KSZ8041 Phy LSI or not.
DP83620 Target	• Disabled • Enabled	Disabled	Select whether to use DP83620 Phy LSI or not.
ICS1894 Target	• Disabled • Enabled	Disabled	Select whether to use ICS1894 Phy LSI or not.
User Own Target	• Disabled • Enabled	Disabled	Select whether to use User own Phy LSI or not.
Reference Clock	• Default • Enabled • Disabled	Default	Select whether to use the RMII reference clock. Selecting 'Default' will automatically choose the correct option when using a Renesas development board.
Reference Clock	• Default • Enabled • Disabled	Default	Select whether to use the RMII reference clock. Selecting 'Default' will automatically choose the correct option when using a Renesas development board.
Automatic Phy LSI Initialization	• Enabled • Disabled	Enabled	Select whether to initialize the Ethernet Phy LSI in the open function.

Configurations for Networking > Ethernet (r_ether_phy)

This module can be added to the Stacks tab via New Stack > Networking > Ethernet (r_ether_phy). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_ether_phy0	Module name.

Channel	• 0 • 1	0	Select the Ethernet controller channel number.
PHY-LSI Address	Specify a value between 0 and 31.	0	Specify the address of the PHY-LSI used.
PHY-LSI Reset Completion Timeout	Specify a value between 0x1 and 0xFFFFFFFF.	0x00020000	Specify the number of times to read the PHY-LSI control register while waiting for reset completion. This value should be adjusted experimentally based on the PHY-LSI used.
Select MII type	• MII • RMII	RMII	Specify whether to use MII or RMII.
Phy LSI type	• Kit Component • DEFAULT • KSZ8091RNB • KSZ8041 • DP83620 • ICS1894 • User own PHY	Kit Component	Select the Phy LSI target. Selecting 'Kit Component' will automatically choose the correct option when using a Renesas development board.
Port Custom Init Function	Name must be a valid C symbol	NULL	Set the initial function of the PHY-LSI, When using your own PHY-LSI.
Port Custom Link Partner Ability Get Function	Name must be a valid C symbol	NULL	Set the link partner ability get function of the PHY-LSI, When using your own PHY-LSI.
MII/RMII Register Access Wait-time	Specify a value between 0x1 and 0x7FFFFFFF.	8	Specify the bit timing for MII/RMII register accesses during PHY initialization. This value should be adjusted experimentally based on the PHY-LSI used.
Flow Control	• Disable • Enable	Disable	Select whether to enable or disable flow control.

Usage Notes

Note

See the example below for details on how to initialize the Ethernet PHY module.

Accessing the MII and RMII Registers

Use the PIR register to access the MII and RMII registers in the PHY-LSI. Serial data in the MII and RMII management frame format is transmitted and received through the ET0_MDC and ET0_MDIO pins controlled by software.

MII and RMII management frame format

The below table lists the MII and RMII management frame formats.

Access type	MII and RMII management frame							
	Item	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
	Number of bits	32	2	2	5	5	2	16	1
Read		1...1	01	10	00001	RRRRR	Z0	DDDDDDDDDDDDDDDD	Z
Write		1...1	01	01	00001	RRRRR	10	DDDDDDDDDDDDDDDD	Z

Note

- PRE (preamble): Send 32 consecutive 1s.
- ST (start of frame): Send 01b.
- OP (operation code): Send 10b for read or 01b for write.
- PHYAD (PHY address): Up to 32 PHY-LSIs can be connected to one MAC. PHY-LSIs are selected with these 5 bits. When the PHY-LSI address is 1, send 00001b.
- REGAD (register address): One register is selected from up to 32 registers in the PHY-LSI. When the register address is 1, send 00001b.
- TA (turnaround): Use 2-bit turnaround time to avoid contention between the register address and data during a read operation.
Send 10b during a write operation. Release the bus for 1 bit during a read operation (Z is output).
(This is indicated as Z0 because 0 is output from the PHY-LSI on the next clock cycle.)
- DATA (data): 16-bit data. Sequentially send or receive starting from the MSB.
- IDLE (IDLE condition): Wait time before inputting the next MII or RMII management format. Release the bus during a write
operation (Z is output). No control is required, because a bus was already released during a read operation.

Limitations

- The r_ether_phy module may need to be customized for PHY devices other than the ones currently supported. Use the existing code as a starting point for creating a custom implementation. Supported PHY devices are as follows.
  - KSZ8091RNB
  - KSZ8041
  - DP83620
  - ICS1894

Examples

ETHER PHY Basic Example

This is a basic example of minimal use of the ETHER PHY in an application.

```
void ether_phy_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    g_ether_phy0_ctrl.open   = 0U;
    g_ether_phy0_cfg.channel = 0;
 /* Initializes the module. */
    err = R_ETHER_PHY_Open(&g_ether_phy0_ctrl, &g_ether_phy0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start auto negotiation. */
    err = R_ETHER_PHY_StartAutoNegotiate(&g_ether_phy0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Polling until link is established. */
 while (FSP_SUCCESS != R_ETHER_PHY_LinkStatusGet(&g_ether_phy0_ctrl))
    {
 /* Do nothing */
    }
 /* Get link partner ability from phy interface. */
    err = R_ETHER_PHY_LinkPartnerAbilityGet(&g_ether_phy0_ctrl,
                                            &g_ether_phy0_line_speed_duplex,
                                            &g_ether_phy0_local_pause,
                                            &g_ether_phy0_partner_pause);
    assert(FSP_SUCCESS == err);
 /* Check current link status. */
    err = R_ETHER_PHY_LinkStatusGet(&g_ether_phy0_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	ether_phy_instance_ctrl_t
struct	ether_phy_extended_cfg_t

Enumerations

enum	ether_phy_interface_status_t

Data Structure Documentation

◆ ether_phy_instance_ctrl_t

struct ether_phy_instance_ctrl_t		
ETHER PHY control block. DO NOT INITIALIZE. Initialization occurs when ether_phy_api_t::open is called.		
Data Fields		
uint32_t	open	Used to determine if the channel is configured.
ether_phy_cfg_t const *	p_ether_phy_cfg	Pointer to initial configurations.
volatile uint32_t *	p_reg_pir	Pointer to ETHERC peripheral registers.
uint32_t	local_advertise	Capabilities bitmap for local advertising.
ether_phy_interface_status_t	interface_status	Initialized status of ETHER PHY interface.

◆ ether_phy_extended_cfg_t

struct ether_phy_extended_cfg_t	
ETHER PHY extended configuration.	
Data Fields	
void(*	p_target_init)(ether_phy_instance_ctrl_t *p_instance_ctrl)
	Pointer to callback that is called to initialize the target.
bool(*	p_target_link_partner_ability_get)(ether_phy_instance_ctrl_t *p_instance_ctrl, uint32_t line_speed_duplex)
	Pointer to callback that is called to get the link partner ability.

Enumeration Type Documentation

◆ ether_phy_interface_status_t

enum ether_phy_interface_status_t	
Initialization state for read/write	
Enumerator	
ETHER_PHY_INTERFACE_STATUS_UNINITIALIZED	ETHER PHY interface is uninitialized.
ETHER_PHY_INTERFACE_STATUS_INITIALIZED	ETHER PHY interface is initialized.

Function Documentation

◆ R_ETHER_PHY_Open()

fsp_err_t R_ETHER_PHY_Open (ether_phy_ctrl_t *const *p_ctrl*, ether_phy_cfg_t const *const *p_cfg*)

Resets Ethernet PHY device. Implements ether_phy_api_t::open.

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.
FSP_ERR_INVALID_CHANNEL	Invalid channel number is given.
FSP_ERR_INVALID_POINTER	Pointer to p_cfg is NULL.
FSP_ERR_TIMEOUT	PHY-LSI Reset wait timeout.
FSP_ERR_INVALID_ARGUMENT	Register address is incorrect
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized.

◆ R_ETHER_PHY_Close()

fsp_err_t R_ETHER_PHY_Close (ether_phy_ctrl_t *const *p_ctrl*)

Close Ethernet PHY device. Implements ether_phy_api_t::close.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_ETHER_PHY_StartAutoNegotiate()

fsp_err_t R_ETHER_PHY_StartAutoNegotiate (ether_phy_ctrl_t *const *p_ctrl*)

Starts auto-negotiate. Implements ether_phy_api_t::startAutoNegotiate.

Return values

FSP_SUCCESS	ETHER_PHY successfully starts auto-negotiate.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_INVALID_ARGUMENT	Register address is incorrect
FSP_ERR_INVALID_POINTER	Pointer to read buffer is NULL.
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized

◆ R_ETHER_PHY_LinkPartnerAbilityGet()

fsp_err_t R_ETHER_PHY_LinkPartnerAbilityGet (ether_phy_ctrl_t *const *p_ctrl*, uint32_t *const *p_line_speed_duplex*, uint32_t *const *p_local_pause*, uint32_t *const *p_partner_pause*)

Reports the other side's physical capability. Implements ether_phy_api_t::linkPartnerAbilityGet.

Return values

FSP_SUCCESS	ETHER_PHY successfully get link partner ability.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_INVALID_POINTER	Pointer to arguments are NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_ETHER_PHY_ERROR_LINK	PHY-LSI is not link up.
FSP_ERR_ETHER_PHY_NOT_READY	The auto-negotiation isn't completed
FSP_ERR_INVALID_ARGUMENT	Status register address is incorrect
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized

◆ R_ETHER_PHY_LinkStatusGet()

fsp_err_t R_ETHER_PHY_LinkStatusGet (ether_phy_ctrl_t *const *p_ctrl*)

Returns the status of the physical link. Implements ether_phy_api_t::linkStatusGet.

Return values

FSP_SUCCESS	ETHER_PHY successfully get link partner ability.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_ETHER_PHY_ERROR_LINK	PHY-LSI is not link up.
FSP_ERR_INVALID_ARGUMENT	Status register address is incorrect
FSP_ERR_INVALID_POINTER	Pointer to read buffer is NULL.
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized

◆ R_ETHER_PHY_ChipInit()

fsp_err_t R_ETHER_PHY_ChipInit (ether_phy_ctrl_t *const *p_ctrl*, ether_phy_cfg_t const *const *p_cfg*)

Initialize Ethernet PHY device. Implements ether_phy_api_t::chipInit.

Return values

FSP_SUCCESS	PHY device initialized successfully.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block or configuration structure is NULL.
FSP_ERR_INVALID_ARGUMENT	Address or data is not a valid size.
FSP_ERR_INVALID_POINTER	Pointer to p_cfg is NULL.
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_TIMEOUT	PHY-LSI Reset wait timeout.

◆ R_ETHER_PHY_Read()

fsp_err_t R_ETHER_PHY_Read (ether_phy_ctrl_t *const *p_ctrl*, uint32_t *reg_addr*, uint32_t *const *p_data*)

Read data from register of PHY-LSI . Implements ether_phy_api_t::read.

Return values

FSP_SUCCESS	ETHER_PHY successfully read data.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_INVALID_POINTER	Pointer to read buffer is NULL.
FSP_ERR_INVALID_ARGUMENT	Address is not a valid size
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized

◆ R_ETHER_PHY_Write()

fsp_err_t R_ETHER_PHY_Write (ether_phy_ctrl_t *const *p_ctrl*, uint32_t *reg_addr*, uint32_t *data*)

Write data to register of PHY-LSI . Implements ether_phy_api_t::write.

Return values

FSP_SUCCESS	ETHER_PHY successfully write data.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_INVALID_ARGUMENT	Address or data is not a valid size
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized

5.2.12.16 FreeRTOS+TCP Wrapper to r_ether (rm_freertos_plus_tcp)

Modules » Networking

Middleware for using TCP on RA MCUs.

Overview

FreeRTOS Plus TCP is a TCP stack created for use with FreeRTOS.

This module provides the NetworkInterface required to use FreeRTOS Plus TCP with the Ethernet (r_ether) driver.

Please refer to the FreeRTOS Plus TCP documentation for further details.

Configuration

Build Time Configurations for FreeRTOS_Plus_TCP

The following build time configurations are defined in aws/FreeRTOSIPConfig.h:

Configuration	Options	Default	Description
Print debug messages	• Disable • Enable	Disable	If ipconfigHAS_DEBUG_PRINTF is set to 1 then FreeRTOS_debug_printf should be defined to the function used to print out the debugging messages.
Backward Compatible Mode	• No • Yes	Yes	Run the code in backward compatible

			mode
Enable IPV6	• Disable • Enable	Disable	Stack supports handling IPv6 packets (including handling IPv6 header, ND, RA, and so on) when enabled
Print info messages	• Disable • Enable	Disable	Set to 1 to print out non debugging messages, for example the output of the FreeRTOS_netstat() command, and ping replies. If ipconfigHAS_PRINTF is set to 1 then FreeRTOS_printf should be set to the function used to print out the messages.
Byte order of the target MCU	pdFREERTOS_LITTLE_ENDIAN	pdFREERTOS_LITTLE_ENDIAN	Define the byte order of the target MCU
IP/TCP/UDP checksums	• Disable • Enable	Enable	If the network card/driver includes checksum offloading (IP/TCP/UDP checksums) then set ip configDRIVER_INCLUDED_RX_IP_CHECKSUM to 1 to prevent the software stack repeating the checksum calculations.
Receive Block Time	Value must be a non-negative integer	10000	Amount of time FreeRTOS_recv() will block for. The timeouts can be set per socket, using setsockopt().
Send Block Time	Value must be a non-negative integer	10000	Amount of time FreeRTOS_send() will block for. The timeouts can be set per socket, using setsockopt().
DNS caching	• Disable • Enable	Enable	DNS caching
DNS Request Attempts	Value must be an integer	2	When a cache is present, ipconfigDNS_REQUEST_ATTEMPTS can be kept low and also DNS may use small

			timeouts.
IP stack task priority	Only symbols, numbers and arithmetic operators are valid.	configMAX_PRIORITIES - 2	Set the priority of the task that executes the IP stack.
Stack size in words (not bytes)	Only symbols, numbers and arithmetic operators are valid.	configMINIMAL_STACK_SIZE * 5	The size, in words (not bytes), of the stack allocated to the FreeRTOS+TCP stack.
Network Events call vApplicationIPNetworkEventHook	• Disable • Enable	Enable	vApplicationIPNetworkEventHook is called when the network connects or disconnects.
Max UDP send block time	Only symbols, numbers and arithmetic operators are valid.	15000 / portTICK_PERIOD_MS	Max UDP send block time
Use DHCP	• Disable • Enable	Enable	If ipconfigUSE_DHCP is 1 then FreeRTOS+TCP will attempt to retrieve an IP address, netmask, DNS server address and gateway address from a DHCP server.
DHCP Register Hostname	• Disable • Enable	Enable	Register hostname when using DHCP
DHCP Uses Unicast	• Disable • Enable	Enable	DHCP uses unicast.
DHCP callback function	• Disable • Enable	Disable	Provide an implementation of the DHCP callback function (xApplicationDHCPHook)
Interval between transmissions	Only symbols, numbers and arithmetic operators are valid.	120000 / portTICK_PERIOD_MS	When ipconfigUSE_DHCP is set to 1, DHCP requests will be sent out at increasing time intervals until either a reply is received from a DHCP server and accepted, or the interval between transmissions reaches ipconfigMAXIMUM_DISCOVER_TX_PERIOD.
ARP Cache Entries	Value must be an integer	6	The maximum number of entries that can exist in the ARP table at any

			one time
ARP Request Retransmissions	Value must be an integer	5	ARP requests that do not result in an ARP response will be re-transmitted a maximum of ipconfigMAX_ARP_RETRANSMISSIONS times before the ARP request is aborted.
Maximum time before ARP table entry becomes stale	Value must be an integer	150	The maximum time between an entry in the ARP table being created or refreshed and the entry being removed because it is stale
Use string for IP Address	• Disable • Enable	Enable	Take an IP in decimal dot format (for example, "192.168.0.1") as its parameter FreeRTOS_inet_addr_quick() takes an IP address as four separate numerical octets (for example, 192, 168, 0, 1) as its parameters
Total number of available network buffers	Value must be an integer	10	Define the total number of network buffer that are available to the IP stack
Set the maximum number of events	Only symbols, numbers and arithmetic operators are valid.	ipconfigNUM_NETWORK_BUFFER_DESCRIPTORS + 5	Set the maximum number of events that can be queued for processing at any one time. The event queue must be a minimum of 5 greater than the total number of network buffers
Enable FreeRTOS_sendto() without calling Bind	• Enable • Disable	Disable	Set to 1 then calling FreeRTOS_sendto() on a socket that has not yet been bound will result in the IP stack automatically binding the socket to a port number from the range socketAUTO_PORT_ALLOCATION_START_NUMB

			ER to 0xffff. If ipconfigALLOW_SOCKET_SEND_WITHOUT_BIND is set to 0 then calling FreeRTOS_sendto() on a socket that has not yet been bound will result in the send operation being aborted.
TTL values for UDP packets	Value must be an integer	128	Define the Time To Live (TTL) values used in outgoing UDP packets
TTL values for TCP packets	Value must be an integer	128	Defines the Time To Live (TTL) values used in outgoing TCP packets
Use TCP and all its features	• Disable • Enable	Enable	Use TCP and all its features
Let TCP use windowing mechanism	• Disable • Enable	Disable	Let TCP use windowing mechanism
Maximum number of bytes the payload of a network frame can contain	Value must be an integer	1500	Maximum number of bytes the payload of a network frame can contain
Basic DNS client or resolver	• Disable • Enable	Enable	Set ipconfigUSE_DNS to 1 to include a basic DNS client/resolver. DNS is used through the FreeRTOS_gethostbyname() API function.
Reply to incoming ICMP echo (ping) requests	• Disable • Enable	Enable	If ipconfigREPLY_TO_INCOMING_PINGS is set to 1 then the IP stack will generate replies to incoming ICMP echo (ping) requests.
FreeRTOS_SendPingRequest() is available	• Disable • Enable	Disable	If ipconfigSUPPORT_OUTGOING_PINGS is set to 1 then the FreeRTOS_SendPingRequest() API function is available.
FreeRTOS_select() (and associated) API function is available	• Disable • Enable	Disable	If ipconfigSUPPORT_SELECT_FUNCTION is set to 1 then the FreeRTOS_select() (and associated) API function is available
Filter out non Ethernet	• Disable	Enable	If ipconfigFILTER_OUT_

II frames.	• Enable		NON_ETHERNET_II_FRAMES is set to 1 then Ethernet frames that are not in Ethernet II format will be dropped. This option is included for potential future IP stack developments
Responsibility of the Ethernet interface to filter out packets	• Disable • Enable	Disable	If ipconfigETHERNET_DRIVER_FILTERS_FRAME_TYPES is set to 1 then it is the responsibility of the Ethernet interface to filter out packets that are of no interest.
Access 32-bit fields in the IP packets	Value must be an integer	2	To access 32-bit fields in the IP packets with 32-bit memory instructions, all packets will be stored 32-bit-aligned, plus 16-bits. This has to do with the contents of the IP-packets: all 32-bit fields are 32-bit-aligned, plus 16-bit
Size of the pool of TCP window descriptors	Value must be an integer	240	Define the size of the pool of TCP window descriptors
Size of Rx buffer for TCP sockets	Value must be an integer	3000	Define the size of Rx buffer for TCP sockets
Size of Tx buffer for TCP sockets	Value must be an integer	3000	Define the size of Tx buffer for TCP sockets
TCP keep-alive	• Disable • Enable	Enable	TCP keep-alive is avaiable or not
TCP keep-alive interval	Value must be an integer	120	TCP keep-alive interval in second
The socket semaphore to unblock the MQTT task (USER_SEMAPHORE)	• Disable • Enable	Disable	The socket semaphore is used to unblock the MQTT task
The socket semaphore to unblock the MQTT task (WAKE_CALLBACK)	• Disable • Enable	Enable	The socket semaphore is used to unblock the MQTT task
The socket semaphore to unblock the MQTT task (USE_CALLBACKS)	• Disable • Enable	Disable	The socket semaphore is used to unblock the MQTT task
The socket semaphore	• Disable	Disable	The socket semaphore

to unblock the MQTT task (TX_DRIVER)	• Enable		is used to unblock the MQTT task
The socket semaphore to unblock the MQTT task (RX_DRIVER)	• Disable • Enable	Disable	The socket semaphore is used to unblock the MQTT task
Possible optimisation for expert users	• Disable • Enable	Disable	Possible optimisation for expert users - requires network driver support. It is is useful when there is high network traffic. If non-zero value then instead of passing received packets into the IP task one at a time the network interface can chain received packets together and pass them into the IP task in one go. If set to 0 then only one buffer will be sent at a time.

Usage Notes

In order to use the NetworkInterface implementation provided by Renesas for RA devices:

- Configure an r_ether instance and provide a pointer to the instance of the NetworkInterface as follows:

```
/* Reference used by the NetworkInterface to access the ethernet instance. */
extern ether_instance_t const * gp_freertos_ether;
...
/* Make it reference the configured ether instance. */
ether_instance_t const * gp_freertos_ether = &g_ether_instance;
```

- Some of the stack initialisation APIs have been deprecated as of FreeRTOS V4.0.0 onwards. Please refer to FreeRTOS+TCP Networking Tutorial: Initializing the TCP/IP Stack for the new APIs supporting IPv6, Multiple Endpoints and Multiple interfaces. To use the deprecated APIs please set it to "Yes" for the stack property "Common|Backward Compatible Mode".

Note

The MAC address passed to FreeRTOS_FillEndPoint must match the MAC address configured in the r_ether instance.
g_ether_instance must have vEtherISRCallback configured as the callback.
The xApplicationGetRandomNumber and ulApplicationGetNextSequenceNumber functions should be implemented in systems using FreeRTOS Plus TCP without Secure Sockets.
To connect to a server using an IP address the macro ipconfigINCLUDE_FULL_INET_ADDR must be set to 1.

Limitations

- Zero-copy is not currently supported by the NetworkInterface.

5.2.12.17 GTL BLE Abstraction (rm_ble_abs_gtl)

Modules » Networking

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the BLE ABS Interface .

Overview

This module provides BLE GAP functionality that complies with the Bluetooth Core Specification version 5.0 specified by the Bluetooth SIG. This module is configured via the QE for BLE. QE for BLE provides standard and custom services defined by the user.

The module supports the Renesas Electronics DA14531 and DA14535 Bluetooth® Low Energy 5 Modules. The rm_ble_abs_gtl driver interfaces with the DA14531/DA14535 module over UART.

Features

The Bluetooth® Low Energy Abstraction module with GTL supports the following features:

- Common functionality
  - Boot from host or DA14531/DA14535 flash.
  - Use 1-wire (default) or 2-wire UART for booting.
  - Open/Close the BLE protocol stack.
- The following GAP Role support
  - Peripheral: The device that accepts a connection request from Central and establishes a connection.
- GAP functionality
  - Initialize the Host stack.
  - Setting address.
  - Start/Stop Advertising.
  - Connect/Disconnect a link.
- GATT Common functionality
  - Get MTU Size.
- GATT Server functionality
  - Initialization of GATT Server.
  - Loading of Profile definition.
  - Notification of characteristics modification.
  - Read/Write of GATT Profile from host.

Configuration

Pin Configuration

Pins used by the BLE driver to control the DA14531/DA14535 module:

- Reset Pin : Active low reset line for DA14531/DA14535 module.
- UART Interface : RX/TX Pins

Usage Notes

Getting Started Guide

The below guide walks users through building a fully working solution that allows booting from the host via 1-wire UART in order to run a BLE application from the RA MCU using the GTL interface.

https://lpccs-docs.renesas.com/DA1453x-FSP_BLE_Framework/UM-B-172/index.html

Addresses

When using a public BD address the address pre-programmed into the DA14531/DA14535 will be used and can't be overridden.

A random address can be set by calling the R_BLE_VS_SetBdAddr function before the R_BLE_GAP_Init function is called.

Heap Requirements

Ensure the BSP heap size is set to at least 2K bytes.

When using FreeRTOS ensure the heap 4 size is set to a minimum of 2K bytes.

Module Firmware Compatibility

This middleware module is compatible with GTL binary version 6.0.22 and later. You must ensure that the DA14531/DA14535 Module (or PMOD) you are using contains this version (or later) firmware or that you use the boot from host feature and have the host MCU load the binary into the DA14531/DA14535. Note that DA14531 and DA14535 are not firmware compatible even though the GTL API is the same.

Instructions detailing how to upgrade the firmware in a DA14531 Module can be found here:

https://lpccs-docs.renesas.com/US159-DA14531EVZ_Firmware_Upgrade/index.html

The GTL binary file can be downloaded using the tool described in the above instructions, or by using the following link:

https://www.renesas.com/us/en/document/swo/fsp-gtl-binary-us159-da14531evz-pmod-programming?r=1564826

Limitations

Developers should be aware of the following limitations when using the BLE_ABS:

Following a power on reset, the R_BLE_VS_GetRand function always returns the same number. Subsequent calls to this function produce random numbers.

Service and characteristic write callback functions, created when using the QE Tool are not supported

The boot from host feature currently supports 1-wire and 2-wire UART operation. If using a 1-wire boot from host the UART RX and TX pins on the host RA MCU must be tied together using a 1K ohm resistor in order to boot the DA14531/DA14535 - this resistor can remain in place after the boot operation has been completed. Boot from host using 2-wire UART is not supported when using a DA14531MOD module because not all the required pins are exposed. Boot from host using 2-wire UART is supported when a DA14535PMOD with SmartBoot (UM-B-171) is already flashed in DA14535. In this case the same pins used for GTL communication are also used for 2-wire boot.

Currently supported rm_ble_abs_gtl interface functions:

- RM_BLE_ABS_Open
- RM_BLE_ABS_Close
- RM_BLE_ABS_StartLegacyAdvertising

Currently supported r_ble_api interface functions:

- R_BLE_Open
- R_BLE_Close
- R_BLE_Execute
- R_BLE_IsTaskFree
- R_BLE_GetVersion
- R_BLE_GAP_Init
- R_BLE_GAP_Terminate
- R_BLE_GAP_UpdConn
- R_BLE_GAP_SetDataLen
- R_BLE_GAP_Disconnect
- R_BLE_GAP_GetVerInfo
- R_BLE_GAP_ReadRssi
- R_BLE_GAP_ReadChMap
- R_BLE_GAP_SetAdvParam
- R_BLE_GAP_SetAdvSresData
- R_BLE_GAP_StartAdv
- R_BLE_GAP_StopAdv
- R_BLE_GAP_GetRemainAdvBufSize
- R_BLE_GAP_GetRemDevInfo
- R_BLE_GATTS_SetDbInst
- R_BLE_GATT_GetMtu
- R_BLE_GATTS_RegisterCb
- R_BLE_GATTS_DeregisterCb
- R_BLE_GATTS_Notification
- R_BLE_GATTS_Indication
- R_BLE_GATTS_GetAttr
- R_BLE_GATTS_SetAttr
- R_BLE_GATTC_RegisterCb
- R_BLE_GATTC_DeregisterCb
- R_BLE_GATTC_ReqExMtu
- R_BLE_GATTC_DiscAllPrimServ
- R_BLE_GATTC_DiscIncServ
- R_BLE_GATTC_ReadChar
- R_BLE_GATTC_WriteCharWithoutRsp
- R_BLE_GATTC_SignedWriteChar
- R_BLE_GATTC_WriteChar
- R_BLE_GATTC_WriteLongChar
- R_BLE_GATTC_ExecWrite
- R_BLE_VS_Init

- R_BLE_VS_GetBdAddr
- R_BLE_VS_SetBdAddr
- R_BLE_VS_GetRand

Currently supported callback events:

- BLE_GAP_EVENT_STACK_ON
- BLE_GAP_EVENT_STACK_OFF
- BLE_GAP_EVENT_CONN_IND
- BLE_GAP_EVENT_DISCONN_IND
- BLE_GAP_EVENT_DATA_LEN_CHG
- BLE_GAP_EVENT_CONN_PARAM_UPD_COMP
- BLE_GAP_EVENT_ADV_ON
- BLE_GAP_EVENT_ADV_OFF
- BLE_GAP_EVENT_SET_DATA_LEN_COMP
- BLE_GAP_EVENT_LOC_VER_INFO
- BLE_GAP_EVENT_RSSI_RD_COMP
- BLE_GAP_EVENT_CH_MAP_RD_COMP
- BLE_GAP_EVENT_GET_REM_DEV_INFO
- BLE_GATTS_EVENT_WRITE_RSP_COMP
- BLE_GATTS_EVENT_HDL_VAL_CNF
- BLE_GATTS_EVENT_DB_ACCESS_IND
- BLE_GATTC_EVENT_EX_MTU_RSP
- BLE_GATTC_EVENT_PRIM_SERV_16_DISC_IND
- BLE_GATTC_EVENT_PRIM_SERV_128_DISC_IND
- BLE_GATTC_EVENT_ALL_PRIM_SERV_DISC_COMP

Examples

BLE_ABS_GTL Basic Example

This is a basic example of minimal use of the BLE_ABS_GTL in an application.

```
/* The callback is called when peripheral event occurs. */
void gap_peripheral_cb (uint16_t type, ble_status_t result, st_ble_evt_data_t *
p_data)
{
 FSP_PARAMETER_NOT_USED(result);
 FSP_PARAMETER_NOT_USED(p_data);
 switch (type)
    {
 case BLE_GAP_EVENT_STACK_ON:
      {
            g_ble_event_flag = g_ble_event_flag | BLE_ABS_EVENT_FLAG_STACK_ON;
 break;
       }
```

```
 case BLE_GAP_EVENT_ADV_ON:
      {
 st_ble_gap_adv_set_evt_t * p_gap_adv_set_evt_param = (st_ble_gap_adv_set_evt_t *)
p_data->p_param;
            g_advertising_handle = p_gap_adv_set_evt_param->adv_hdl;
            g_ble_event_flag    |= BLE_ABS_EVENT_FLAG_ADV_ON;
 break;
       }
 case BLE_GAP_EVENT_ADV_OFF:
      {
            g_ble_event_flag |= BLE_ABS_EVENT_FLAG_ADV_OFF;
 break;
       }
 case BLE_GAP_EVENT_CONN_IND:
      {
            g_ble_event_flag |= BLE_ABS_EVENT_FLAG_CONN_IND;
 break;
       }
      {
 /* Do nothing. */
 break;
        }
 default:
 break;
    }
}
```

```
#define BLE_ABS_EVENT_FLAG_STACK_ON (0x01 << 0)
#define BLE_ABS_EVENT_FLAG_CONN_IND (0x01 << 1)
#define BLE_ABS_EVENT_FLAG_ADV_ON (0x01 << 2)
#define BLE_ABS_EVENT_FLAG_ADV_OFF (0x01 << 3)
#define BLE_ABS_EVENT_FLAG_DISCONN_IND (0x01 << 4)

5.2.12.18 NetX Duo Ethernet Driver (rm_netxduo_ether)

Modules » Networking

Overview

This module provides a NetX Duo driver that is implemented using the Ethernet Interface.

Please refer to the NetXDuo documentation for further details.

Features

- Packet Types Supported
  - ARP
  - IPv4
  - IPv6
- Link status callback
- Configurable IP MTU

Configuration

Configurations for Networking > NetX Duo Ethernet Driver (rm_netxduo_ether)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_netxduo_ether_0	Module name.
IP MTU	Value must be in the range [576, 1500]	1500	IP MTU

bytes.

Usage Notes

Calculating the Packet Size for an IP instance

In order to ensure that there is enough space to store an entire Ethernet frame, the packet pool used for receiving packets must have a payload size that is 32 bytes larger than the configured ether_cfg_t::ether_buffer_size. The extra 32 bytes is needed in order to ensure that the allocated packets are properly aligned to 32 bytes.

ether_cfg_t::ether_buffer_size is calcualted from the IP MTU using the following formula:

ceil((rm_netxduo_ether_cfg_t::mtu + Ethernet Header (14) + Padding Bytes (2)) / 32) * 32

Examples

Basic Example

This is a basic example of minimal use of the NetX Duo Ether Driver in an application.

```
#define NETXDUO_EXAMPLE_IP_STACK_SIZE (2048U)
#define NETXDUO_EXAMPLE_ARP_CACHE_SIZE (2048U)
#define NETXDUO_EXAMPLE_PACKET_SIZE (1568U)
#define NETXDUO_EXAMPLE_PACKET_NUM (100U)
#define NETXDUO_EXAMPLE_PACKET_POOL_SIZE ((sizeof(NX_PACKET) +
NETXDUO_EXAMPLE_PACKET_SIZE) * \
  NETXDUO_EXAMPLE_PACKET_NUM)
#define NETXDUO_EXAMPLE_MAC_ADDRESS_MSW (0)
#define NETXDUO_EXAMPLE_MAC_ADDRESS_LSW (0)
static NX_IP g_ip;
static NX_PACKET_POOL g_packet_pool;
static uint8_t g_ip_stack_memory[NETXDUO_EXAMPLE_IP_STACK_SIZE]
BSP_ALIGN_VARIABLE(4);
static uint8_t g_packet_pool_memory[NETXDUO_EXAMPLE_PACKET_POOL_SIZE]
BSP_ALIGN_VARIABLE(4);

BSP_ALIGN_VARIABLE(4);
static void rm_netxduo_ether0 (NX_IP_DRIVER * driver_req_ptr)
{
 /* Pass the driver request and ethernet driver configuration to the NetX Duo Ether
```

```
Driver. */
    rm_netxduo_ether(driver_req_ptr, &g_netxduo_ether_instance);
}
void rm_netxduo_ether_example ()
{
    UINT status;
    nx_system_initialize();
 /* Create a packet pool for the IP instance. */
    status = nx_packet_pool_create(&g_packet_pool,
 "Packet Pool",
                                   NETXDUO_EXAMPLE_PACKET_SIZE,
                                   &g_packet_pool_memory[0],
                                   NETXDUO_EXAMPLE_PACKET_POOL_SIZE);
    assert(NX_SUCCESS == status);
 /* Create an IP instance using the rm_netxduo_ether driver and packet pool instance.
*/
    status = nx_ip_create(&g_ip,
 "IP Instance",
                          IP_ADDRESS(192, 168, 1, 2),
                          IP_ADDRESS(255, 255, 255, 0),
                          &g_packet_pool,
                          rm_netxduo_ether0,
                          &g_ip_stack_memory[0],
 sizeof(g_ip_stack_memory),
                          0);
    assert(NX_SUCCESS == status);
 /* Enable all modules that are required by the application. */
    status = nx_arp_enable(&g_ip, g_ip_arp_cache_memory, sizeof
(g_ip_arp_cache_memory));
    assert(NX_SUCCESS == status);
    status = nx_tcp_enable(&g_ip);
    assert(NX_SUCCESS == status);
    status = nx_icmp_enable(&g_ip);
    assert(NX_SUCCESS == status);
```

```
}
```

Changing MAC address Example

This is an example of changing the MAC address after an IP instance has already been created.

```
void rm_netxduo_ether_change_mac_address_example ()
{
    ULONG driver_status;
    UINT status;
 /* Disable the link. */
    status = nx_ip_driver_interface_direct_command(&g_ip, NX_LINK_DISABLE, 0,
&driver_status);
    assert(NX_SUCCESS == status);
 /* Update the MAC address. */
    status = nx_ip_interface_physical_address_set(&g_ip,
                                                  0,
                                                  NETXDUO_EXAMPLE_MAC_ADDRESS_MSW,
                                                  NETXDUO_EXAMPLE_MAC_ADDRESS_LSW,
                                                  NX_TRUE);
    assert(NX_SUCCESS == status);
 /* Re-enable the link. */
    status = nx_ip_driver_interface_direct_command(&g_ip, NX_LINK_ENABLE, 0,
&driver_status);
    assert(NX_SUCCESS == status);
}
```

5.2.12.19 NetX Duo WiFi Driver (rm_netxduo_wifi)

Modules » Networking

Overview

This module provides a NetX Duo driver that is implemented using the rm_wifi_onchip_silex driver.

Please refer to the NetXDuo documentation for further details.

Features

- Packet Types Supported
  - TCP/IPv4
  - UDP
- Configurable IP MTU

Configuration

Build Time Configurations for rm_netxduo_wifi

The following build time configurations are defined in fsp_cfg/middleware/rm_netxduo_wifi_cfg.h:

Configuration	Options	Default	Description
IP MTU (bytes)	Value must be in the range [576, 1500] bytes.	1500	IP MTU

Usage Notes

Connecting to a Wireless Network

NetX Duo does not support connecting to a wireless network directly and instead the driver functions should be called directly to establish a connection.

- rm_wifi_onchip_silex_open() should be called to initialize the WiFi module driver.
- rm_wifi_onchip_silex_scan() should be used to scan for access points.
- rm_wifi_onchip_silex_connect() should be used before opening a NetX IP instance in order to connect it to a network.
- rm_wifi_onchip_silex_network_info_get() should be used after an access point connection has been established to get DHCP acquired IP address, subnet mask, and gateway.

Unsupported NetX Duo Features

These features are currently not supported due to lack of support in the rm_wifi_onchip_silex driver or in the WiFi module hardware/firmware:

- IPv6 functionality
- TCP/UDP server mode
- ARP is handled directly by the WiFi module
- DHCP is always enabled on module by the rm_wifi_onchip_silex driver, thus the software DHCP stack is unsupported.
- The source port will not be used when binding a TCP or UDP socket. Applications should set the source port to NX_ANY_PORT.

On Module Alternatives

Instead of using NetX Duo Software Addons the following features can be performed directly on the WiFi module by calling the appropriate function instead if desired:

- DNS: The user can preform a DNS lookup by calling rm_wifi_onchip_silex_dns_query().

- ICMP: The user can perform a ping by calling rm_wifi_onchip_silex_ping().
- SNTP: The WiFi module has multiple public APIs for time related functions:
  - RM_WIFI_ONCHIP_SILEX_EpochTimeGet()
  - RM_WIFI_ONCHIP_SILEX_LocalTimeGet()
  - RM_WIFI_ONCHIP_SILEX_SntpEnableSet()
  - RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet()
  - RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet()

Examples

Basic Example

This is a basic example of minimal use of the NetX Duo WiFi Driver in an application.

```
#define NETXDUO_EXAMPLE_IP_STACK_SIZE (2048U)
#define NETXDUO_EXAMPLE_ARP_CACHE_SIZE (2048U)
#define NETXDUO_EXAMPLE_PACKET_SIZE (1568U)
#define NETXDUO_EXAMPLE_PACKET_NUM (100U)
#define NETXDUO_EXAMPLE_PACKET_POOL_SIZE ((sizeof(NX_PACKET) +
NETXDUO_EXAMPLE_PACKET_SIZE) * \
  NETXDUO_EXAMPLE_PACKET_NUM)
#define NETXDUO_EXAMPLE_SSID "ssidName"
#define NETXDUO_EXAMPLE_PASSWORD "password"
static NX_IP g_ip0;
static NX_PACKET_POOL g_packet_pool0;
static uint8_t g_ip0_stack_memory[NETXDUO_EXAMPLE_IP_STACK_SIZE]
BSP_ALIGN_VARIABLE(4);
static uint8_t g_packet_pool0_pool_memory[NETXDUO_EXAMPLE_PACKET_POOL_SIZE]
BSP_ALIGN_VARIABLE(4);
extern wifi_onchip_silex_cfg_t g_wifi_onchip_silex_cfg;
void rm_netxduo_wifi_example ()
{
    UINT      status;
 fsp_err_t err;
    nx_system_initialize();
 /* Open WiFi module */
    err = rm_wifi_onchip_silex_open(&g_wifi_onchip_silex_cfg);
    assert(FSP_SUCCESS == err);
 /* Connect to desired AP */
```

```
    err = rm_wifi_onchip_silex_connect(NETXDUO_EXAMPLE_SSID, eWiFiSecurityWPA2,
NETXDUO_EXAMPLE_PASSWORD);
    assert(FSP_SUCCESS == err);
 /* Create a packet pool for the IP instance. */
    status = nx_packet_pool_create(&g_packet_pool0,
 "Packet Pool",
                                   NETXDUO_EXAMPLE_PACKET_SIZE,
                                   &g_packet_pool0_pool_memory[0],
                                   NETXDUO_EXAMPLE_PACKET_POOL_SIZE);
    assert(NX_SUCCESS == status);
 /* Create an IP instance using the rm_netxduo_wifi driver and packet pool instance.
*/
    status = nx_ip_create(&g_ip0,
 "IP Instance",
                          IP_ADDRESS(192, 168, 1, 2),
                          IP_ADDRESS(255, 255, 255, 0),
                          &g_packet_pool0,
                          rm_netxduo_wifi,
                          &g_ip0_stack_memory[0],
 sizeof(g_ip0_stack_memory),
                          0);
    assert(NX_SUCCESS == status);
 /* Enable all modules that are required by the application. */
    status = nx_tcp_enable(&g_ip0);
    assert(NX_SUCCESS == status);
    status = nx_udp_enable(&g_ip0);
    assert(NX_SUCCESS == status);
}
```

TLS Example

This is a basic example of connecting a TLS socket.

```
#define NETXDUO_EXAMPLE_CRYPTO_METADATA_BUFFER_SIZE (18000U)
#define NETXDUO_EXAMPLE_TLS_PACKET_REASSEMBLY_BUFFER_SIZE (4000U)
```

```
#define NETXDUO_EXAMPLE_PORT (3005U)
#define NETXDUO_EXAMPLE_SERVER_PORT (9050U)
#define NETXDUO_EXAMPLE_IP IP_ADDRESS(1, 2, 3, 5)
NX_SECURE_TLS_CRYPTO       g_nx_crypto_tls_test_ciphers;

NETXDUO_EXAMPLE_SERVER_PORT, NX_WAIT_FOREVER);
    assert(NX_SUCCESS == status);
 /* Start the TLS Session using the connected TCP socket. This function will
  * ascertain from the TCP socket state that this is a TLS Client session. */
    status = nx_secure_tls_session_start(&tls_session, p_socket, NX_WAIT_FOREVER);
    assert(NX_SUCCESS == status);
}
```

UDP Example

This is a basic example of connecting a UDP socket.

```
#define NETXDUO_TESTS_SOCKET_TIMEOUT (3000)
#define NETXDUO_TESTS_UDP_TX_PORT (5000)
#define NETXDUO_TESTS_SERVER_IP (0xC0A80064)
void rm_netxduo_wifi_udp_example (void)
{
    NX_UDP_SOCKET udp_client_socket;
 /* IP Address of the remote socket. */
    NXD_ADDRESS g_ip_address = NETXDUO_TESTS_SERVER_IP;
 /* Create the socket. */
    nx_udp_socket_create(&g_ip, &udp_client_socket, "Socket 0", NX_IP_NORMAL,
NX_FRAGMENT_OKAY, 0, 5);
 /* Bind to the UDP port. */
    nx_udp_socket_bind(&udp_client_socket, NETXDUO_TESTS_UDP_TX_PORT,
TX_WAIT_FOREVER);
    NX_PACKET * p_nx_packet = NX_NULL;
 /* Allocate a packet for message data */
    nx_packet_allocate(&g_packet_pool0, &p_nx_packet, NX_UDP_PACKET,
NETXDUO_TESTS_SOCKET_TIMEOUT)
 /* Append message data to packet */
    nx_packet_data_append(&p_nx_packet, "Hello World", 12, &g_packet_pool0,
NX_WAIT_FOREVER);
 /* Send UDP message to server */
    nx_udp_socket_send(&udp_client_socket, &p_nx_packet, &g_ip_address,
NETXDUO_TESTS_UDP_TX_PORT);
    NX_PACKET * p_nx_packet_recv;
 /* Receive any response from UDP server */
    nx_udp_socket_receive(&udp_client_socket, &p_nx_packet_recv,
NETXDUO_TESTS_SOCKET_TIMEOUT);
 /* Unbind and delete the udp socket. */
    nx_udp_socket_unbind(&udp_client_socket);
    nx_udp_socket_delete(&udp_client_socket);
}
```

5.2.12.20 On Chip HTTP Client on DA16XXX (rm_http_onchip_da16xxx)

Modules » Networking

Functions

fsp_err_t	RM_HTTP_DA16XXX_Open (http_onchip_da16xxx_instance_ctrl_t *p_ctrl, http_onchip_da16xxx_cfg_t const *const p_cfg)
fsp_err_t	RM_HTTP_DA16XXX_Send (http_onchip_da16xxx_instance_ctrl_t *p_ctrl, http_onchip_da16xxx_request_t *p_request, http_onchip_da16xxx_buffer_t *p_buffer)
fsp_err_t	RM_HTTP_DA16XXX_Close (http_onchip_da16xxx_instance_ctrl_t *p_ctrl)

Detailed Description

HTTP client implementation using the DA16XXX WiFi module on RA MCUs.

Overview

This Middleware module supplies an implementation for the HTTP Client on the DA16XXX module. The network stack is run on the DA16XXX and this module inherits and extends the core functionality from the DA16XXX WiFi driver. The DA16XXX HTTP module only supports FreeRTOS currently (Microsoft Azure support expected in future release).

The DA16XXX module supports the following modules:

- DA16200
- DA16600

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Features

The HTTP Onchip da16xxx Middleware driver supplies these features:

- Supports sending a request header (GET, PUT, and POST) to an HTTP server and receiving a response header
- Supports unsecure and secure connection via TLS encryption
- Supports parsing of the response header and returning to the user
- Supports other optional configurations such as Server Name Indication (SNI) and ALPNs

Configuration

Build Time Configurations for rm_http_onchip_da16xxx

The following build time configurations are defined in fsp_cfg/rm_http_onchip_da16xxx_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Interrupt Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Clock Configuration

Refer to UART (r_sci_uart).

Pin Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx)

Usage Notes

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

- When the user intends to use secure TLS in their application, they need to provide certificates (root certificate authority, client certificate, and private key) in a header file
- The user must provide certificate macro names in the FSP Configurator properties, as well as the name of the header file (to link the module, certificates, and header together)
- If the user provides these credentials in the Configurator, they must create a new header file in their /src/ folder with the same name as they provided in the Configurator properties. When the code is generated, a build error will occur if the header file is not created

Limitations

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

- This module is not a standalone module - ensure that the WiFi module APIs are invoked first to configure the DA16XXX module and connect to an Access Point before using the HTTP module
- Ensure that DA16XXX SDK version v3.2.6 or later is being used, where the default buffer size for incoming TLS is 6KB and outgoing TLS is 4KB. Using earlier versions may result in failure to connect to an HTTP server with TLS (unless buffer size settings are altered manually)

Examples

Basic Example

This is a basic example of minimal use of HTTP Middleware in an application.

```
void http_onchip_basic_example (void)
```

```
{
 WIFIReturnCode_t wifi_err;
 fsp_err_t       http_err;
 /* Setup Access Point connection parameters */
 WIFINetworkParams_t net_params =
    {
       .ucChannel                  = 0,
       .xPassword.xWPA.cPassphrase = WIFI_PWD,
       .ucSSID                     = WIFI_SSID,
       .xPassword.xWPA.ucLength = sizeof(WIFI_PWD),
       .ucSSIDLength            = sizeof(WIFI_SSID),
       .xSecurity               = eWiFiSecurityWPA2,
    };
 /* Open connection to the Wifi Module */
    wifi_err = WIFI_On();
    assert(eWiFiSuccess == wifi_err);
 /* Connect to the Access Point */
    wifi_err = WIFI_ConnectAP(&net_params);
    assert(eWiFiSuccess == wifi_err);
 /* Initialize the HTTP Client connection */
    http_err = RM_HTTP_DA16XXX_Open(&g_rm_http_onchip_da16xxx_instance,
&g_http_onchip_da16xxx_cfg);
    assert(FSP_SUCCESS == http_err);
 /* Initialize the HTTP Client connection */
    http_err = RM_HTTP_DA16XXX_Send(&g_rm_http_onchip_da16xxx_instance, &test_req,
&user_buf);
    assert(FSP_SUCCESS == http_err);
 /* Close the HTTP Client module */
    http_err = RM_HTTP_DA16XXX_Close(&g_rm_http_onchip_da16xxx_instance);
    assert(FSP_SUCCESS == http_err);
}
```

Data Structures

struct	http_onchip_da16xxx_request_t

struct	http_onchip_da16xxx_buffer_t
struct	http_onchip_da16xxx_cfg_t
struct	http_onchip_da16xxx_instance_ctrl_t

Macros

#define	HTTP_ONCHIP_DA16XXX_MAX_ALPN Maximum number of ALPNs supported by DA16XXX.
#define	HTTP_ONCHIP_DA16XXX_MAX_SNI_LEN Maximum length of SNI supported by DA16XXX.
#define	HTTP_ONCHIP_DA16XXX_MAX_GET_LEN Maximum length of HTTP GET request.

Enumerations

enum	http_onchip_da16xxx_method_t
enum	http_onchip_da16xxx_tls_auth_t

Data Structure Documentation

◆ http_onchip_da16xxx_request_t

struct http_onchip_da16xxx_request_t		
HTTP Request Buffer		
Data Fields		
const char *	p_http_endpoint	Defines the URL to send HTTP requests to.
const char *	p_request_body	Pointer to optional buffer for body.
http_onchip_da16xxx_method_t	method	Request method to be used.
uint32_t	length	Length of optional body buffer.

◆ http_onchip_da16xxx_buffer_t

struct http_onchip_da16xxx_buffer_t		
HTTP User Buffers		
Data Fields		
char *	p_request_buffer	User HTTP request buffer.

uint32_t	req_length	Size of HTTP request buffer.
char *	p_response_buffer	User HTTP request buffer.
uint32_t	resp_length	Size of HTTP request buffer.

◆ http_onchip_da16xxx_cfg_t

struct http_onchip_da16xxx_cfg_t		
HTTP Configuration		
Data Fields		
at_transport_da16xxx_instance_t const *	p_transport_instance	
const char *	p_alpns[HTTP_ONCHIP_DA16XXX_MAX_ALPN]	Buffer for storing ALPN names.
uint8_t	alpn_count	ALPN Protocols count. Max value is 3.
const char *	p_sni_name	Pointer to Server Name Indication.
http_onchip_da16xxx_tls_auth_t	tls_level	Set TLS Authentication Level (0, 1, or 2)
const char *	p_root_ca	String representing a trusted server root certificate.
uint32_t	root_ca_size	Size associated with root CA Certificate.
const char *	p_client_cert	String representing a Client certificate.
uint32_t	client_cert_size	Size associated with Client certificate.
const char *	p_client_private_key	String representing Client Private Key.
uint32_t	private_key_size	Size associated with Client Private Key.

◆ http_onchip_da16xxx_instance_ctrl_t

struct http_onchip_da16xxx_instance_ctrl_t		
HTTP_ONCHIP_DA16XXX private control block. DO NOT MODIFY.		
Data Fields		
uint32_t	open	Flag to indicate if HTTP has been opened.
http_onchip_da16xxx_cfg_t const *	p_cfg	Pointer to p_cfg for HTTP.

Enumeration Type Documentation

◆ http_onchip_da16xxx_method_t

enum http_onchip_da16xxx_method_t	
HTTP Request Method	
Enumerator	
HTTP_ONCHIP_DA16XXX_GET	Value converted to "get" string.
HTTP_ONCHIP_DA16XXX_POST	Value converted to "post" string.
HTTP_ONCHIP_DA16XXX_PUT	Value converted to "put" string.

◆ http_onchip_da16xxx_tls_auth_t

enum http_onchip_da16xxx_tls_auth_t	
HTTP TLS Authentication Level	
Enumerator	
HTTP_ONCHIP_DA16XXX_TLS_VERIFY_NONE	TLS verification is not used.
HTTP_ONCHIP_DA16XXX_TLS_VERIFY_OPTIONAL	TLS verification is optional.
HTTP_ONCHIP_DA16XXX_TLS_VERIFY_REQUIRED	TLS verification is required.

Function Documentation

◆ RM_HTTP_DA16XXX_Open()

fsp_err_t RM_HTTP_DA16XXX_Open (http_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, http_onchip_da16xxx_cfg_t const *const *p_cfg*)

Initialize the DA16XXX on-chip HTTP Client service.

Parameters

[in]	p_ctrl	Pointer to HTTP Client instance control structure.
[in]	p_cfg	Pointer to HTTP Client configuration structure.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	Parameter checking was unsuccessful.
FSP_ERR_INVALID_ARGUMENT	Data size is too large or NULL.
FSP_ERR_ALREADY_OPEN	The instance has already been opened.

◆ RM_HTTP_DA16XXX_Send()

fsp_err_t RM_HTTP_DA16XXX_Send (http_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, http_onchip_da16xxx_request_t * *p_request*, http_onchip_da16xxx_buffer_t * *p_buffer*)

Send the HTTP request with the configured buffers.

Parameters

[in]	p_ctrl	Pointer to HTTP Client instance control structure.
[in]	p_request	Pointer to HTTP request control structure.
[in]	p_buffer	Pointer to HTTP user buffer struct for request and response.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	Parameter checking was unsuccessful.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_INVALID_ARGUMENT	Data size is too large.
FSP_ERR_INVALID_DATA	Data was not received correctly.

◆ RM_HTTP_DA16XXX_Close()

fsp_err_t RM_HTTP_DA16XXX_Close (http_onchip_da16xxx_instance_ctrl_t * *p_ctrl*)

Close the DA16XXX HTTP Client service.

Parameters

[in]	p_ctrl	Pointer to HTTP Client instance control structure.

Return values

FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	Parameter checking was unsuccessful.

Detailed Description

MQTT client implementation using the DA16XXX WiFi module on RA MCUs.

Overview

This Middleware module supplies an implementation for the MQTT Client on the DA16XXX module. The network stack is run on the DA16XXX and this module inherits and extends the core functionality from the DA16XXX WiFi driver. The DA16XXX MQTT module only supports FreeRTOS currently (Microsoft Azure support expected in future release).

The DA16XXX module supports the following modules:

- DA16200
- DA16600

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Features

The MQTT Onchip da16xxx Middleware driver supplies these features:

- Supports connect/disconnect to an MQTT broker via hostname, port, and user credentials
- Supports unsecure and secure connection via TLS encryption
- Supports the MQTT subscribe/publish model for multiple topics
- Supports other optional configurations such as MQTT v3.1.1, Quality-of-service (QoS) level, TLS cipher suites, and ALPNs

Configuration

Build Time Configurations for rm_mqtt_onchip_da16xxx

The following build time configurations are defined in fsp_cfg/rm_mqtt_onchip_da16xxx_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Size of MQTT RX buffer	Must be an integer greater than 0	512	Size in bytes of the MQTT buffer used for receiving subscribed data. Must be an integer greater than 0.
Size of MQTT TX buffer	Must be an integer greater than 200 and less than 2064	512	Size in bytes of the MQTT buffer used for sending commands and publishing data. Maximum publishing length is 2063 bytes

Configurations for Networking > MQTT Client on DA16XXX (rm_mqtt_onchip_da16xxx)

This module can be added to the Stacks tab via New Stack > Networking > MQTT Client on DA16XXX (rm_mqtt_onchip_da16xxx).

Configuration	Options	Default	Description
Certificates			
MQTT Certificates Header File	Must be a valid C symbol		Name of header file that will contain certificates (macros). User must create header file if this field is populated.
Root CA	Must be a valid C symbol	ROOT_CA	Links to user-defined macro of the same name for Root CA which user must define in application header.

Client Certificate	Must be a valid C symbol	CLIENT_CERT	Links to user-defined macro of the same name for client certificate which user must define in application header.
Private Key	Must be a valid C symbol	PRIVATE_KEY	Links to user-defined macro of the same name for private key which user must define in application header.
ALPN			
ALPN 1	Manual Entry		Select Application Layer Protocol Negotiations (ALPNs)
ALPN 2	Manual Entry		Select Application Layer Protocol Negotiations (ALPNs)
ALPN 3	Manual Entry		Select Application Layer Protocol Negotiations (ALPNs)
Interrupts			
Callback	Must be a valid C symbol	mqtt0_callback	A user callback function. This callback function must be provided. It is called from the MQTT Receive function to process subscribed MQTT messages.
Use MQTT protocol v3.1.1	• Disabled • Enabled	Enabled	
MQTT Receive Maximum Timeout (ms)	Timeout must be an integer greater than 0 and less than 65535	10	Timeout for the MQTT Receive function to check the buffer for incoming MQTT messages in milliseconds.
MQTT Transit Maximum Timeout (ms)	Timeout must be an integer greater than 0 and less than 65535	10	Timeout for publishing MQTT messages in milliseconds.
Clean Session	• Disabled • Enabled	Enabled	
Keep Alive (s)	Must be an integer greater than 0 and less than 65535	60	MQTT ping period to check if connection is still active.
Client Identifier	Manual Entry		

Host Name (or IP address)	Manual Entry		
MQTT Port	Must be an integer greater than 0 and less than 65535	8883	
MQTT User Name	Must be a valid C symbol		
MQTT Password	Must be a valid C symbol		
Last Will Topic	Manual Entry		Topic for MQTT Last Will message.
Last Will Message	Manual Entry		Payload for MQTT Last Will message.
Server Name Indication (SNI)	Manual Entry		
Last Will QoS	• 0 • 1 • 2	0	Quality-of-Service for MQTT Last Will message.
TLS Cipher Suites	Refer to the RA Configuration tool for available options.	0U	Select TLS Cipher Suites

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Note: This module provides the basic configurations in the FSP Configurator required to connect to an MQTT broker such as credential information (user, password, client key, etc.), publish/subscribe topics, and optional configurations as required. The user can then copy these configurations to a new structure if they want to connect to a new endpoint/make changes to the configurations dynamically.

Interrupt Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Clock Configuration

Refer to UART (r_sci_uart).

Pin Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx)

Usage Notes

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

- This module is not a standalone module - ensure that the WiFi module APIs are invoked first to configure the DA16XXX module and connect to an Access Point before using the MQTT

module where the default buffer size for incoming TLS is 6KB and outgoing TLS is 4KB.
- When the user intends to use secure TLS in their application, they need to provide certificates (root certificate authority, client certificate, and private key) in a header file
- The user must provide certificate macro names in the FSP Configurator properties, as well as the name of the header file (to link the module, certificates, and header together)
- If the user provides these credentials in the Configurator, they must create a new header file in their /src/ folder with the same name as they provided in the Configurator properties. When the code is generated, a build error will occur if the header file is not created
- If only using username and password, these fields can be left blank (default), and a header file does not need to be created

Limitations

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

- Ensure that DA16XXX SDK version v3.2.6 or later is being used, where the default buffer size for incoming TLS is 6KB and outgoing TLS is 4KB. Using earlier versions may result in failure to connect to an MQTT broker with TLS (unless buffer size settings are altered manually)
- For publish/subscribe topics, a separate QoS level cannot be set per topic - only one QoS level can be set which applies to all messages
- Currently the module only supports unsecured MQTT with username/password or secure MQTT/TLS with certificates (root CA, client certificate, and private key). The module does not accept username/password with certificates.

Examples

Basic Example

This is a basic example of minimal use of MQTT Middleware in an application.

```
void mqtt_onchip_basic_example (void)
{
 WIFIReturnCode_t wifi_err;
 fsp_err_t       mqtt_err;
 /* Setup Access Point connection parameters */
 WIFINetworkParams_t net_params =
    {
       .ucChannel                  = 0,
       .xPassword.xWPA.cPassphrase = WIFI_PWD,
       .ucSSID                     = WIFI_SSID,
       .xPassword.xWPA.ucLength = sizeof(WIFI_PWD),
       .ucSSIDLength            = sizeof(WIFI_SSID),
       .xSecurity               = eWiFiSecurityWPA2,
    };
```

```
 /* Open connection to the Wifi Module */
    wifi_err = WIFI_On();
    assert(eWiFiSuccess == wifi_err);
 /* Connect to the Access Point */
    wifi_err = WIFI_ConnectAP(&net_params);
    assert(eWiFiSuccess == wifi_err);
 /* Initialize the MQTT Client connection */
    mqtt_err = RM_MQTT_DA16XXX_Open(&g_rm_mqtt_onchip_da16xxx_instance,
&g_mqtt_onchip_da16xxx_cfg);
    assert(FSP_SUCCESS == mqtt_err);
 /* Subscribe to MQTT topics to be received */
    mqtt_err = RM_MQTT_DA16XXX_Subscribe(&g_rm_mqtt_onchip_da16xxx_instance,
subTopics, 1);
    assert(FSP_SUCCESS == mqtt_err);
 /* Connect to the MQTT Broker */
    mqtt_err = RM_MQTT_DA16XXX_Connect(&g_rm_mqtt_onchip_da16xxx_instance,
CONNECT_TIMEOUT);
    assert(FSP_SUCCESS == mqtt_err);
 /* Publish data to the MQTT Broker */
    mqtt_err = RM_MQTT_DA16XXX_Publish(&g_rm_mqtt_onchip_da16xxx_instance,
&pubTopics[0]);
    assert(FSP_SUCCESS == mqtt_err);
 /* Loop to receive data from the MQTT Broker */
 do
    {
 RM_MQTT_DA16XXX_Receive(&g_rm_mqtt_onchip_da16xxx_instance,
&g_mqtt_onchip_da16xxx_cfg);
 R_BSP_SoftwareDelay(CONNECT_TIMEOUT, BSP_DELAY_UNITS_MILLISECONDS);
    } while (cb_flag == 0);
 /* Disconnect from the MQTT Broker */
    mqtt_err = RM_MQTT_DA16XXX_Disconnect(&g_rm_mqtt_onchip_da16xxx_instance);
    assert(FSP_SUCCESS == mqtt_err);
 /* Close the MQTT Client module */
    mqtt_err = RM_MQTT_DA16XXX_Close(&g_rm_mqtt_onchip_da16xxx_instance);
```

```
    assert(FSP_SUCCESS == mqtt_err);
}
```

Data Structures

#define	MQTT_ONCHIP_DA16XXX_MAX_PUBMSG_LEN Maximum total length for message supported by DA16XXX.
#define	MQTT_ONCHIP_DA16XXX_MAX_PUBTOPICMSG_LEN Maximum total length for message + topic supported by DA16XXX.
#define	MQTT_ONCHIP_DA16XXX_SUBTOPIC_MAX_CNT

	Maximum number of subscription topics allowed.

Enumerations

enum	mqtt_onchip_da16xxx_qos_t
enum	mqtt_onchip_da16xxx_tls_cipher_suites_t

Data Structure Documentation

◆ mqtt_onchip_da16xxx_sub_info_t

struct mqtt_onchip_da16xxx_sub_info_t		
MQTT SUBSCRIBE packet parameters		
Data Fields		
mqtt_onchip_da16xxx_qos_t	qos	Quality of Service for subscription.
const char *	p_topic_filter	Topic filter to subscribe to.
uint16_t	topic_filter_length	Length of subscription topic filter.

◆ mqtt_onchip_da16xxx_pub_info_t

struct mqtt_onchip_da16xxx_pub_info_t		
MQTT PUBLISH packet parameters		
Data Fields		
mqtt_onchip_da16xxx_qos_t	qos	Quality of Service for subscription.
const char *	p_topic_name	Topic name on which the message is published.
uint16_t	topic_name_Length	Length of topic name.
const char *	p_payload	Message payload.
uint32_t	payload_length	Message payload length.

◆ mqtt_onchip_da16xxx_callback_args_t

struct mqtt_onchip_da16xxx_callback_args_t		
MQTT Packet info structure to be passed to user callback		
Data Fields		
uint8_t *	p_data	Payload received from subscribed MQTT topic.
const char *	p_topic	Topic to which the message payload belongs to.

uint32_t	data_length	Length of the MQTT payload.
void const *	p_context	Placeholder for user data.

◆ mqtt_onchip_da16xxx_cfg_t

struct mqtt_onchip_da16xxx_cfg_t	
MQTT Configuration	
Data Fields	
const uint8_t	use_mqtt_v311
	Flag to use MQTT v3.1.1.
const uint16_t	rx_timeout
	MQTT Rx timeout in milliseconds.
const uint16_t	tx_timeout
	MQTT Tx timeout in milliseconds.
void(*	p_callback)(mqtt_onchip_da16xxx_callback_args_t *p_args)
	Location of user callback.
void const *	p_context
	Placeholder for user data. Passed to the user callback in mqtt_onchip_da16xxx_callback_args_t.
uint8_t	clean_session
	Whether to establish a new, clean session or resume a previous session.
uint8_t	alpn_count
	ALPN Protocols count. Max value is 3.
const char *	p_alpns [MQTT_ONCHIP_DA16XXX_MAX_ALPN]

	ALPN Protocols.
uint8_t	tls_cipher_count
	TLS Cipher suites count. Max value is 17.
uint16_t	keep_alive_seconds
	MQTT keep alive period.
const char *	p_client_identifier
	MQTT Client identifier. Must be unique per client.
uint16_t	client_identifier_length
	Length of the client identifier.
const char *	p_host_name
	MQTT endpoint host name.
uint16_t	mqtt_port
	MQTT Port number.
const char *	p_mqtt_user_name
	MQTT user name. Set to NULL if not used.
uint16_t	user_name_length
	Length of MQTT user name. Set to 0 if not used.
const char *	p_mqtt_password
	MQTT password. Set to NULL if not used.

uint16_t	password_length
	Length of MQTT password. Set to 0 if not used.
const char *	p_root_ca
	String representing a trusted server root certificate.
uint32_t	root_ca_size
	Size associated with root CA Certificate.
const char *	p_client_cert
	String representing a Client certificate.
uint32_t	client_cert_size
	Size associated with Client certificate.
const char *	p_client_private_key
	String representing Client Private Key.
uint32_t	private_key_size
	Size associated with Client Private Key.
const char *	p_will_topic
	String representing Will Topic.
const char *	p_will_msg
	String representing Will Message.

const char *	p_sni_name
	Server Name Indication.
mqtt_onchip_da16xxx_qos_t	will_qos_level
	Will Topic QoS level.
mqtt_onchip_da16xxx_tls_cipher_suites_t	p_tls_cipher_suites [MQTT_ONCHIP_DA16XXX_TLS_CIPHER_MAX_CNT]
	TLS Cipher suites supported.

◆ mqtt_onchip_da16xxx_instance_ctrl_t

struct mqtt_onchip_da16xxx_instance_ctrl_t		
MQTT_ONCHIP_DA16XXX private control block. DO NOT MODIFY.		
Data Fields		
uint8_t	cmd_tx_buff[MQTT_ONCHIP_DA16XXX_CFG_CMD_TX_BUF_SIZE]	Command send buffer.
uint8_t	cmd_rx_buff[MQTT_ONCHIP_DA16XXX_CFG_CMD_RX_BUF_SIZE]	Command receive buffer.
uint32_t	open	Flag to indicate if MQTT has been opened.
bool	is_mqtt_connected	Flag to track MQTT connection status.
mqtt_onchip_da16xxx_cfg_t const *	p_cfg	Pointer to p_cfg for MQTT.

Enumeration Type Documentation

TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384	TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384 protocol.

Function Documentation

◆ RM_MQTT_DA16XXX_Open()

fsp_err_t RM_MQTT_DA16XXX_Open (mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, mqtt_onchip_da16xxx_cfg_t const *const *p_cfg*)

Initialize the DA16XXX on-chip MQTT Client service.

Parameters

[in]	p_ctrl	Pointer to MQTT Client instance control structure.
[in]	p_cfg	Pointer to MQTT Client configuration structure.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The p_cfg instance is NULL.
FSP_ERR_INVALID_ARGUMENT	Data size is too large or NULL.
FSP_ERR_ALREADY_OPEN	The instance has already been opened.

◆ RM_MQTT_DA16XXX_Disconnect()

fsp_err_t RM_MQTT_DA16XXX_Disconnect (mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*)

Disconnect from DA16XXX MQTT Client service.

Parameters

[in]	p_ctrl	Pointer to MQTT Client instance control structure.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The p_ctrl instance is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened or the client is not connected.

◆ RM_MQTT_DA16XXX_Connect()

fsp_err_t RM_MQTT_DA16XXX_Connect (mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, uint32_t *timeout_ms*)

Configure and connect the DA16XXX MQTT Client service.

Parameters

[in]	p_ctrl	Pointer to MQTT Client instance control structure.
[in]	timeout_ms	Timeout in milliseconds.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The p_ctrl is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_IN_USE	The MQTT client is already connected.
FSP_ERR_INVALID_DATA	Response does not contain Connect status.

◆ RM_MQTT_DA16XXX_Publish()

fsp_err_t RM_MQTT_DA16XXX_Publish (mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, mqtt_onchip_da16xxx_pub_info_t *const *p_pub_info*)

Publish a message for a given MQTT topic.

Parameters

[in]	p_ctrl	Pointer to MQTT Client instance control structure.
[in]	p_pub_info	MQTT Publish packet parameters.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The p_ctrl, p_pub_info is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened or the client is not connected.
FSP_ERR_INVALID_DATA	Data size is too large.

◆ RM_MQTT_DA16XXX_Subscribe()

fsp_err_t RM_MQTT_DA16XXX_Subscribe (mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, mqtt_onchip_da16xxx_sub_info_t *const *p_sub_info*, size_t *subscription_count*)

Subscribe to DA16XXX MQTT topics.

Parameters

[in]	p_ctrl	Pointer to MQTT Client instance control structure.
[in]	p_sub_info	List of MQTT subscription info.
[in]	subscription_count	Number of topics to subscribe to.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The p_ctrl, p_sub_info is NULL or subscription_count is 0.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_INVALID_DATA	Data size is too large.

◆ RM_MQTT_DA16XXX_UnSubscribe()

fsp_err_t RM_MQTT_DA16XXX_UnSubscribe (mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, mqtt_onchip_da16xxx_sub_info_t *const *p_sub_info*)

Unsubscribe from DA16XXX MQTT topics.

Parameters

[in]	p_ctrl	Pointer to MQTT Client instance control structure.
[in]	p_sub_info	List of MQTT subscription info.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The p_ctrl, p_sub_info is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened or the client is not connected.
FSP_ERR_INVALID_DATA	Data size is too large.

◆ RM_MQTT_DA16XXX_Receive()

fsp_err_t RM_MQTT_DA16XXX_Receive (mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, mqtt_onchip_da16xxx_cfg_t const *const *p_cfg*)

Receive data subscribed to on DA16XXX MQTT Client service.

Parameters

[in]	p_ctrl	Pointer to MQTT Client instance control structure.
[in]	p_cfg	Pointer to MQTT Client configuration structure.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	The p_ctrl, p_textstring, p_ip_addr is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened or the client is not connected.
FSP_ERR_INVALID_DATA	Receive function did not receive valid publish data.

◆ RM_MQTT_DA16XXX_Close()

fsp_err_t RM_MQTT_DA16XXX_Close (mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*)

Close the DA16XXX MQTT Client service.

Parameters

[in]	p_ctrl	Pointer to MQTT Client instance control structure.

Return values

FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	The p_ctrl, p_textstring, p_ip_addr is NULL.

Detailed Description

Driver for the PTP peripheral on RA MCUs. This module implements the PTP Interface.

Overview

PTP allows for multiple devices on a network to synchronize their clocks with very high precision. The PTP peripheral generates and processes PTP messages automatically. In slave mode, it also corrects the local time in order to adjust for any offset from the master clock time.

Features

- Ordinary clock
  - Master mode
  - Slave mode
- Peer-to-peer
- End-to-end
- Frame fromats
  - Ethernet II frames
  - IEEE802.3 + LLC + SNAP frames
  - IPv4 + UDP
- Clock correction modes
  - Mode 1: Add the offsetFromMaster value to the local time whenever it is updated.
  - Mode 2: Calculate a clock gradient and continuously adjust the local time in order to minimize the offsetFromMaster value.

Configuration

Build Time Configurations for r_ptp

The following build time configurations are defined in fsp_cfg/r_ptp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Networking > PTP (r_ptp)

This module can be added to the Stacks tab via New Stack > Networking > PTP (r_ptp).

Configuration	Options	Default	Description
Clock Properties			
Priority 1	Value must in the range [0,255].	128	Priority1 field advertised in generated announce packets.
Class	Value must in the range [0,255].	248	Class field advertised in generated announce packets.
Accuracy	Value must in the range [0,255].	0xFE	Accuracy field advertised in generated announce packets.
Variance	Value must in the range [0,65535].	0xFFFF	Variance field advertised in generated announce packets.
Priority 2	Value must in the range [0,255].	128	Priority2 field advertised in generated announce packets.
Time Source	Value must in the range [0,255].	160	Time Source field advertised in generated announce packets.
Ethernet			
Multicast Filter MAC address	Must be a valid MAC address	01:1B:19:00:00:00	In Multicast Filtered mode, only multicast addresses that match this address are received by the ETHERC EDMAC.
Primary Destination MAC address	Must be a valid MAC address	01:1B:19:00:00:00	The destination MAC address for primary PTP messages.
PDelay Destination MAC address	Must be a valid MAC address	01:80:C2:00:00:0E	The destination MAC address for PDelay messages.

IP			
Primary Destination IP address	Must be a valid IP address	224.0.1.129	The destination IPv4 address for primary messages.
PDelay Destination IP address	Must be a valid IP address	224.0.0.107	The destination IPv4 address for PDelay messages.
Event Message TOS	Value must in the range [0,255].	0	The IP packet TOS for event messages.
General Message TOS	Value must in the range [0,255].	0	The IP packet TOS for general messages.
Primary Message TTL	Value must in the range [0,255].	1	The IP packet TTL for primary messages.
PDelay Message TTL	Value must in the range [0,255].	1	The IP packet TTL for p_delay messages.
Event Port	Value must in the range [0,65535].	319	The UDP port for event messages.
General Port	Value must in the range [0,65535].	320	The UDP port for general messages.
Synchronization Detection			
Threshold (Nanoseconds)	Value must be greater than 0.	1000000	The minimum offsetFromMaster value required in order to synchronize with the master clock.
Count	Value must in the range [0,15].	5	The number of times the calculated offsetFromMaster value must be less than the threshold in order to synchronize with the master clock.
Synchronization Lost Detection			
Threshold (Nanoseconds)	Value must be greater than 0.	10000000	The minimum offsetFromMaster value required in order to lose synchronization with the master clock.
Count	Value must in the range [0,15].	5	The number of times the calculated offsetFromMaster value must be greater than the threshold in order to lose synchronization with the master.

Interrupts			
Callback	Name must be a valid C symbol	ptp0_user_callback	Called when a STCA/SYNFP event occurs, a PTP message is received, or if a Pulse Timer event occurs.
MINT Interrupt priority	MCU Specific Options		Select the EPTPC MINT interrupt priority.
Pulse Timer Interrupt priority	MCU Specific Options		Select the EPTPC IPLS priority.
Name	Name must be a valid C symbol	g_ptp0	Module name.
Ethernet PHY Interface Type	• MII • RMII	RMII	The interface type used to communicate with the Ethernet PHY.
Frame Filter	• Extended Promiscuous Mode • Unicast and Multicast • Unicast and Multicast Filtered • Unicast	Unicast	Selects how packets are filtered based on their destination MAC address. Packets that pass the filter are transferred to the ETHERC EDMAC.
Frame Format	• Ethernet II • Ethernet II | IPv4 | UDP • IEEE802.3 | LLC | SNAP • IEEE802.3 | LLC | SNAP | IPv4 | UDP	Ethernet II	The format of the frames that encapsulate the PTP messages.
Clock Domain	Value must in the range [0,255].	0	The PTP clock will only respond to clocks in its domain.
Clock Domain Filter	• Enable • Disable	Enable	Filter out PTP messages from other clock domains.
Buffer Size	Value must in the range [64,1536].	1536	The maximum Ethernet packet size that can be transmitted or received by the application from the EDMAC.
Number of transmit buffers	Value must in the range [1,16].	4	The number of transmit buffers in the packet queue.
Number of receive	Value must in the	4	The number of receive

buffers	range [1,16].		buffers in the packet queue.
Announce message interval.	MCU Specific Options		The period of time between generated announce messages.
Sync message interval.	MCU Specific Options		The period of time between generated sync messages.
Delay_req message interval.	MCU Specific Options		The period of time between generated delay_req messages.
Message timeout	Value must be greater than 0.	4000	The time in milliseconds needed to generate timeout events after not receiving a sync or delay_resp message.
Clock Source	• PCLKA / 1 • PCLKA / 2 • PCLKA / 3 • PCLKA / 4 • PCLKA / 5 • PCLKA / 6 • REF50CK0	PCLKA / 6	The STCA clock source must be 20Mhz, 25Mhz, 50Mhz, or 100Mhz. When REF50CK0 is selected, the STCA frequency is 25Mhz.
Clock Correction Mode	• Clock Correction Mode 1 • Clock Correction Mode 2	Clock Correction Mode 1	Clock correction mode 1 corrects the local clock using the current offsetFromMaster value. Clock correction mode 2 calculates a clock gradient in order to continuously correct the local clock.
Gradient Worst10 Interval	Value must in the range [0,255].	32	The number of sync messages to use when calculating the worst10 gradient values (Only applies to clock correction mode 2).

Clock Configuration

The STCA input clock can be the following clock sources:

- PCLKA / 1
- PCLKA / 2
- PCLKA / 3
- PCLKA / 4
- PCLKA / 5
- PCLKA / 6
- REF50CK0

The STCA input clock is restricted to the following frequencies:

- 20 Mhz
- 25 Mhz
- 50 Mhz
- 100 Mhz

When REF50CK0 is selected, the input clock frequency is 25 Mhz.

Pin Configuration

The PTP module requires the Ethernet (r_ether) instance in order to initialize the Ethernet PHY. This means that the ETHERC pins must be configured.

Usage Notes

PTP Port State

The current PTP port state determines which messages need to be generated and processed by the PTP peripheral. It is the application's responsibility to determine what the current state of the PTP port should be.

The following messages can be generated by the PTP peripheral:

- Announce
- Sync
- Delay_req
- Delay_resp
- PDelay_req
- PDelay_resp

The following messages can be processed by the PTP peripheral:

- Sync
- Follow_up
- Delay_req
- Delay_resp
- PDelay_req
- PDelay_resp
- PDelay_resp_follow_up

The application must receive the following messages in order to determine the current state of its PTP port:

- Announce
- Management
- Signaling

The following messages can only be sent manually:

- Management
- Signaling

The PTP API defines the following states:

State	Generated Messages	Processed Messages	Received Messages
Disabled	N/A	N/A	N/A
Passive	N/A	N/A	Announce, Signaling, Management
E2E/P2P Slave	Delay_req/(PDelay_req, PDelay_resp)	Sync, Follow_up, Delay_resp/(PDelay_req, PDelay_resp)	Announce, Signaling, Management
E2E/P2P Master	Announce, Sync, Delay_resp/(PDelay_req, PDelay_resp)	delay_req/(PDelay_req, PDelay_resp)	Announce, Signaling, Management

Pulse Timers

Pulse Timers are configurable timers used to generate interrupts and ELC events. Each pulse timer has a configurable start time, pulse, and period. At the start of each timer period, a rising edge occurs. After the pulse time has elapsed, a falling edge occurs. ELC events and IRQs can be generated on rising and/or falling edges for each Pulse Timer. There are two types of interrupts generated by each Pulse Timer; MINT and IPLS.

ELC Events

Pulse timers may be configured to generate the following ELC events:

- EPTPC_TIMERn_RISE - Generated on the rising edge of pulse timer channel n[1].
- EPTPC_TIMERn_FALL - Generated on the falling edge of pulse timer channel n[1].

Note

1. n = [0,5] corresponds to the channel of the pulse timer.

MINT Interrupts

MINT IRQs are only generated on the rising edge of a Pulse Timer channel. The callback will provide the channel number of the pulse timer that caused the interrupt.

IPLS Interrupts

Each Pulse Timer channel can be configured as a source for generating IPLS IRQs. All of the pulse timers that are selected as IPLS sources are OR'd together and rising and falling edge IRQs can be generated from the resulting signal. Below is an example of a resulting signal from two IPLS sources. Unlike MINT interrupts, IPLS interrupts do not provide any information about which Pulse Timer caused the IRQ because the IRQs from all the Pulse Timers are OR'd together.

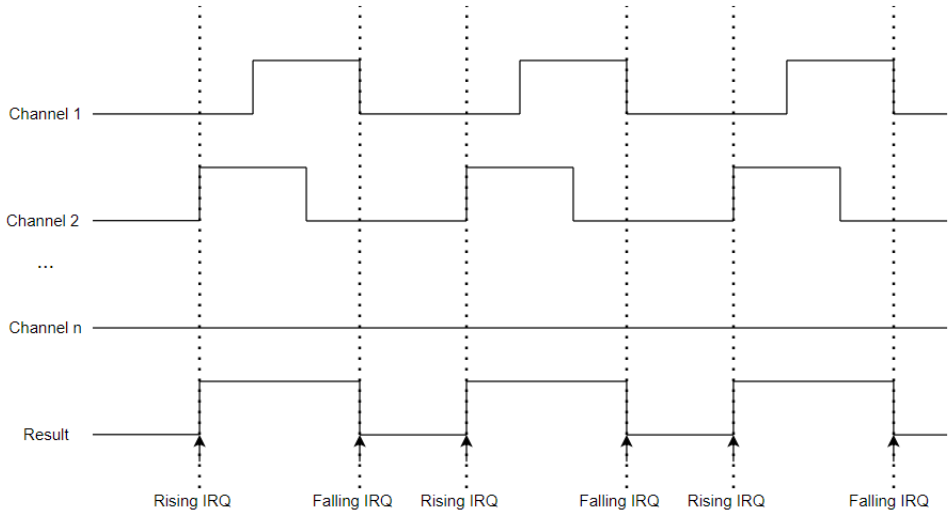

Figure 285: IPLS IRQ Generation

Ethernet Frame Filter

The PTP driver can filter Ethernet frames that are received by Ethernet (r_ether). There are four different filtering modes:

- Extended Promiscuous - All Ethernet frames are received by Ethernet (r_ether).
- Unicast and Multicast - All Unicast frames destined for the PTP and Multicast frames are received by Ethernet (r_ether).
- Unicast and Multicast Filtered - All Unicast frames destined for the PTP are received by Ethernet (r_ether). All multicast frames that match ptp_synfp_cfg_t::p_multicast_addr_filter are received by Ethernet (r_ether).
- Unicast - Only Unicast frames destined for the PTP are received by Ethernet (r_ether).

Limitations

Developers should be aware of the following limitations when using the PTP:

- PTP will not automatically initialize Ethernet (r_ether). This provides flexibility by allowing PTP to be used alongside 3rd party IP stacks (Eg. FreeRTOS+TCP Wrapper to r_ether (rm_freertos_plus_tcp)), however this means the application must execute the Ethernet (r_ether) link process in order to use PTP.
- The driver will not detect announce message timeouts. This functionality must be handled by the application.
- When IP + UDP frame format is selected, the driver will not automatically join the multicast group. This must be done by the application.
- In order to call PTP API functions from ISRs, the MINT and IPLS interrupt priorities must be configured to be lower than BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION. This is to guarantee that PTP register accesses are atomic.
- When IEEE802.3 | LLC | SNAP | IP | UDP or IEEE802.3 | LLC | SNAP Frame Format is selected, the PTP peripheral sets the OUI field in the SNAP frame to the first 3 bytes of the **MAC address** configured in the Ethernet (r_ether) module's configuration property. In order for the PID field of SNAP to be interpreted as EtherType, the OUI field should be set to '0'.

Examples

Slave Mode

This is a basic example of minimal use of PTP in slave mode.

```
volatile bool g_first_announce_message_received = false;
volatile bool g_sync_acquired = false;
void slave_mode_basic_example (void)
{
 /* The PTP Instance must be opened before R_ETHER is opened. */
 fsp_err_t err = R_PTP_Open(&g_ptp_ctrl, &g_ptp_cfg);
    assert(FSP_SUCCESS == err);
 /* Configure the PTP MAC address. */
    err = R_PTP_MacAddrSet(&g_ptp_ctrl, g_ptp_mac_address);
    assert(FSP_SUCCESS == err);
 /* Configure the PTP Local Clock ID (Usually generated from MAC address). */
    err = R_PTP_LocalClockIdSet(&g_ptp_ctrl, g_ptp_clock_id);
    assert(FSP_SUCCESS == err);
 /* Open the r_ether_api instance. */
    err = R_ETHER_Open(&g_ether_ctrl, &g_ether_cfg);
    assert(FSP_SUCCESS == err);
 /* Wait for the link to be established. */
 do
    {
       err = R_ETHER_LinkProcess(&g_ether_ctrl);
    } while (FSP_SUCCESS != err);
 /* Set the PTP instance to passive state and listen for announce message. */
    err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_PASSIVE);
    assert(FSP_SUCCESS == err);
 /* Wait for the first announce message (This will provide the master clock ID). */
    uint32_t timeout = EXAMPLE_TIMEOUT;
 while (!g_first_announce_message_received && --timeout)
    {
 R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);
    }
    assert(0U != timeout);
 /* When a master clock is found, change to the slave state to start synchronizing
```

```
 * the local clock to the master clock. */
   err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_E2E_SLAVE);
   assert(FSP_SUCCESS == err);
/* Wait for local clock to be synchronized with the master clock. */
   timeout = EXAMPLE_TIMEOUT;
while (!g_sync_acquired && --timeout)
   {
R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);
   }
   assert(0U != timeout);
/* The local clock is now synchronized with the grand master clock. */
}
/* Callback called whenever a PTP event occurs. */
void g_ptp_slave_callback_example (ptp_callback_args_t * p_args)
{
switch (p_args->event)
   {
case PTP_EVENT_SYNC_ACQUIRED:
     {
/* The offsetFromMaster value is now within the configured threshold to be
 * synchronized with the master clock.
 */
           g_sync_acquired = true;
break;
     }
case PTP_EVENT_MESSAGE_RECEIVED:
     {
static ptp_message_t g_current_master_announce_message;
switch (p_args->p_message->header.message_type)
     {
case PTP_MESSAGE_TYPE_ANNOUNCE:
     {
                int8_t comparison = 0;
if (!g_first_announce_message_received)
```

```
     {
 /* If this is the first announce packet, immediately switch to this master clock. */
                       comparison = 1;
                       g_first_announce_message_received = true;
     }
 else
     {
 /*
  * Run the "Best Master Clock Algorithm" to determine if the clock defined in this
announce
  * packet is better than the current master clock.
  */
 fsp_err_t err = R_PTP_BestMasterClock(&g_current_master_announce_message,
                                                        p_args->p_message,
                                                        &comparison);
     assert(FSP_SUCCESS == err);
     }
 if (1 == comparison)
     {
 /* Save the message as the new master announce message. */
                       g_current_master_announce_message = *p_args->p_message;
 /* Set the master clock ID and sourcePortID in the PTP instance so that it
  * synchronizes with the new best master clock.
  */
 fsp_err_t err = R_PTP_MasterClockIdSet(&g_ptp_ctrl,
                                                          g_current_master_annou
nce_message.header.clock_id,
                                                          g_current_master_annou
nce_message.header.source_port_id);
     assert(FSP_SUCCESS == err);
     }
 break;
     }
 default:
```

```
     {
 break;
     }
     }
 break;
     }
 default:
     {
 break;
     }
   }
}
```

Master Mode

This is a basic example of minimal use of PTP in master mode.

```
#define PTP_EXAMPLE_CURRENT_UTC_OFFSET (37)
void master_mode_basic_example (void)
{
 /* The PTP Instance must be opened before R_ETHER is opened. */
 fsp_err_t err = R_PTP_Open(&g_ptp_ctrl, &g_ptp_cfg);
    assert(FSP_SUCCESS == err);
 /* Configure the PTP MAC address. */
    err = R_PTP_MacAddrSet(&g_ptp_ctrl, g_ptp_mac_address);
    assert(FSP_SUCCESS == err);
 /* Configure the PTP Local Clock ID (Usually generated from MAC address). */
    err = R_PTP_LocalClockIdSet(&g_ptp_ctrl, g_ptp_clock_id);
    assert(FSP_SUCCESS == err);
 /* Get the current time from an external time source (Eg. RTC). */
 ptp_time_t current_time;
    get_current_time_example(&current_time);
 /* Set the PTP local time to the current time. */
    err = R_PTP_LocalClockValueSet(&g_ptp_ctrl, &current_time);
    assert(FSP_SUCCESS == err);
```

```
 /* Set the currentUtcOffset field in announce messages. */
    err = R_PTP_CurrentUtcOffsetSet(&g_ptp_ctrl, PTP_EXAMPLE_CURRENT_UTC_OFFSET);
    assert(FSP_SUCCESS == err);
 /* Set message flags in announce messages to indicate that the current UTC offset is
valid and that the PTP timescale is used. */
 ptp_message_flags_t flags;
    flags.value = 0;
    flags.value_b.currentUtcOffsetValid = 1;
    flags.value_b.ptpTimescale          = 1;
    err = R_PTP_MessageFlagsSet(&g_ptp_ctrl, PTP_MESSAGE_TYPE_ANNOUNCE, flags);
    assert(FSP_SUCCESS == err);
 /* Open the r_ether_api instance. */
    err = R_ETHER_Open(&g_ether_ctrl, &g_ether_cfg);
    assert(FSP_SUCCESS == err);
 /* Wait for the link to be established. */
 do
    {
       err = R_ETHER_LinkProcess(&g_ether_ctrl);
    } while (FSP_SUCCESS != err);
 /* Set the PTP instance to passive state and listen for announce message. */
    err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_E2E_MASTER);
    assert(FSP_SUCCESS == err);
 /*
  * The master clock is now operational and will automatically generate announce and
sync messages
  * as well as respond to delay_req messages.
  */
}
```

Send PTP Messages

This is a basic example of how to send PTP messages.

```
#define PTP_MANAGEMENT_ACTION_GET (0U)
#define PTP_TLV_TYPE_MANAGEMENT (1U)
```

```
#define PTP_TLV_MANAGEMENT_ID_CLOCK_DESCRIPTION (1U)
static uint32_t g_transmit_complete = 0U;
void send_message_example (void)
{
 static ptp_message_t message;
 static uint8_t       p_tlv_data[6];
    memset(&message, 0, sizeof(ptp_message_t));
 /* Fill in the required fields for the message header (Note that appropriate fields
will be endian swapped). */
    message.header.message_type = PTP_MESSAGE_TYPE_MANAGEMENT;
    message.header.version      = 2;
 /* The message length is the total number of bytes in the PTP message (Including the
message header). */
    message.header.message_length = (uint16_t) (sizeof(ptp_message_header_t) +
 sizeof(ptp_message_management_t) +
 sizeof(p_tlv_data));
    memcpy(message.header.clock_id, g_ptp_clock_id, sizeof(g_ptp_clock_id));
    message.header.control_field = PTP_CTRL_FIELD_MANAGEMENT;
 /* Fill in the required fields for the management message. */
    memcpy(message.management.target_clock_id, g_target_clock_id, sizeof
(g_target_clock_id));
    message.management.target_port_id         = 1;
    message.management.starting_boundary_hops = 1;
    message.management.boundary_hops          = 1;
    message.management.action                = PTP_MANAGEMENT_ACTION_GET;
 /*
  * Fill in TLV data (Note that TLV data is big endian).
  *
  * Type (Management)
  */
    p_tlv_data[0] = 0;
    p_tlv_data[1] = PTP_TLV_TYPE_MANAGEMENT;
 /* Length */
    p_tlv_data[2] = 0;
```

```
    p_tlv_data[3] = 2;
 /* Management ID (Clock Description) */
    p_tlv_data[4] = 0;
    p_tlv_data[5] = PTP_TLV_MANAGEMENT_ID_CLOCK_DESCRIPTION;
 /* Send the message. */
 fsp_err_t err = R_PTP_MessageSend(&g_ptp_ctrl, &message, p_tlv_data, sizeof
(p_tlv_data));
    assert(FSP_SUCCESS == err);
    uint32_t timeout = EXAMPLE_TIMEOUT;
 while (0U == g_transmit_complete && --timeout)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MICROSECONDS);
    }
}
/* Callback called whenever a PTP event occurs. */
void g_ptp_send_message_callback_example (ptp_callback_args_t * p_args)
{
 switch (p_args->event)
    {
 case PTP_EVENT_MESSAGE_TRANSMIT_COMPLETE:
     {
           g_transmit_complete = 1U;
 break;
     }
 case PTP_EVENT_MESSAGE_RECEIVED:
     {
 switch (p_args->p_message->header.message_type)
     {
 case PTP_MESSAGE_TYPE_MANAGEMENT:
     {
 /* Handle the response message. */
 break;
     }
 default:
```

```
      {
 break;
      }
      }
      }
 default:
      {
 break;
      }
    }
}
```

Data Structures

struct	ptp_instance_ctrl_t

Data Structure Documentation

◆ ptp_instance_ctrl_t

struct ptp_instance_ctrl_t		
PTP instance control block.		
Data Fields		
uint32_t	open	Marks if the instance has been opened.
uint32_t	tx_buffer_write_index	Index into the descriptor list to write the next packet.
uint32_t	tx_buffer_complete_index	Index into the descriptor list of the last transmitted packet.
uint32_t	rx_buffer_index	Index into the descriptor of the last received packet.
uint32_t	tslatr	Keep track of whether tslatr was set.
ptp_cfg_t const *	p_cfg	Pointer to the configuration structure.

Function Documentation

◆ R_PTP_Open()

fsp_err_t R_PTP_Open (ptp_ctrl_t *const *p_ctrl*, ptp_cfg_t const *const *p_cfg*)

This function initializes PTP. Implements ptp_api_t::open.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Configures the peripheral registers acording to the configuration.
- Initialize the control structure for use in other PTP Interface functions.

Return values

FSP_SUCCESS	The instance has been successfully configured.
FSP_ERR_ALREADY_OPEN	Instance was already initialized.
FSP_ERR_NOT_OPEN	The EDMAC instance was not opened correctly.
FSP_ERR_ASSERTION	An invalid argument was given in the configuration structure.

◆ R_PTP_MacAddrSet()

fsp_err_t R_PTP_MacAddrSet (ptp_ctrl_t *const *p_ctrl*, uint8_t const *const *p_mac_addr*)

This function sets the MAC address for the PTP instance. Implements ptp_api_t::macAddrSet.

Note

This function may only be called while the PTP instance is in ptp_port_state_t::PTP_PORT_STATE_DISABLE.

Return values

FSP_SUCCESS	The MAC address has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_INVALID_MODE	The instance is not in the correct state.

◆ R_PTP_IpAddrSet()

fsp_err_t R_PTP_IpAddrSet (ptp_ctrl_t *const *p_ctrl*, uint32_t *ip_addr*)

This function sets the IP address for the PTP instance. Implements ptp_api_t::ipAddrSet.

Note

This function may only be called while the PTP instance is in ptp_port_state_t::PTP_PORT_STATE_DISABLE.

Return values

FSP_SUCCESS	The IP address has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_INVALID_MODE	The configured ptp_synfp_cfg_t::frame_format is not configured to use IP packets, or the instance is not in the correct state.

◆ R_PTP_LocalClockIdSet()

fsp_err_t R_PTP_LocalClockIdSet (ptp_ctrl_t *const *p_ctrl*, uint8_t const *const *p_clock_id*)

This function sets the local clock ID for the PTP instance. Implements ptp_api_t::localClockIdSet.

Note

This function may only be called while the PTP instance is in ptp_port_state_t::PTP_PORT_STATE_DISABLE.
Typically the clock ID is derived from the MAC address (E.g. {b1,b2,b3,0xFF,0xFE,b4,b5,b6}).

Return values

FSP_SUCCESS	The local clock ID has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_INVALID_MODE	The instance is not in the correct state.

◆ R_PTP_MasterClockIdSet()

fsp_err_t R_PTP_MasterClockIdSet (ptp_ctrl_t *const *p_ctrl*, uint8_t const *const *p_clock_id*, uint16_t *port_id*)

This function sets the master clock ID and port ID that the local clock will synchronize with. Implements ptp_api_t::masterClockIdSet.

Return values

FSP_SUCCESS	The master clock ID and port ID have been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL

◆ R_PTP_MessageFlagsSet()

fsp_err_t R_PTP_MessageFlagsSet (ptp_ctrl_t *const *p_ctrl*, ptp_message_type_t *message_type*, ptp_message_flags_t *flags*)

This function sets the flags field for the given message type. Implements ptp_api_t::messageFlagsSet.

Return values

FSP_SUCCESS	The master clock ID and port ID have been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ R_PTP_CurrentUtcOffsetSet()

fsp_err_t R_PTP_CurrentUtcOffsetSet (ptp_ctrl_t *const *p_ctrl*, uint16_t *offset*)

This function sets the currentUtcOffset value in announce messages. ptp_api_t::currentUtcOffsetSet .

Return values

FSP_SUCCESS	The currentUtcOffset has been updated.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ R_PTP_PortStateSet()

fsp_err_t R_PTP_PortStateSet (ptp_ctrl_t *const *p_ctrl*, uint32_t *state*)

This function changes the current state of the PTP instance. Implements ptp_api_t::portStateSet.

Return values

FSP_SUCCESS	The instance will transition to the new state.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL

◆ R_PTP_MessageSend()

fsp_err_t R_PTP_MessageSend (ptp_ctrl_t *const *p_ctrl*, ptp_message_t const *const *p_message*, uint8_t const *const *p_tlv_data*, uint16_t *tlv_data_size*)

This function sends a PTP message. ptp_api_t::messageSend.

Return values

FSP_SUCCESS	The packet has been written to the transmit descriptor.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.
FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL	There is no space for the packet in the transmit queue.

◆ R_PTP_LocalClockValueSet()

fsp_err_t R_PTP_LocalClockValueSet (ptp_ctrl_t *const *p_ctrl*, ptp_time_t const *const *p_time*)

This function sets the local clock value. Implements ptp_api_t::localClockValueSet.

Return values

FSP_SUCCESS	The local clock value has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ R_PTP_LocalClockValueGet()

fsp_err_t R_PTP_LocalClockValueGet (ptp_ctrl_t *const *p_ctrl*, ptp_time_t *const *p_time*)

This function gets the local clock value. Implements ptp_api_t::localClockValueGet.

Return values

FSP_SUCCESS	The local clock value has been written in p_time.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL

◆ R_PTP_PulseTimerCommonConfig()

fsp_err_t R_PTP_PulseTimerCommonConfig (ptp_ctrl_t *const *p_ctrl*, ptp_pulse_timer_common_cfg_t *const *p_timer_cfg*)

This function configures IPLS IRQ settings that are common to all pulse timer channels. Implements ptp_api_t::pulseTimerCommonConfig.

Return values

FSP_SUCCESS	The pulse timer has been enabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ R_PTP_PulseTimerEnable()

fsp_err_t R_PTP_PulseTimerEnable (ptp_ctrl_t *const *p_ctrl*, uint32_t *channel*, ptp_pulse_timer_cfg_t *const *p_timer_cfg*)

This function enables a pulse timer channel. Implements ptp_api_t::pulseTimerEnable.

Return values

FSP_SUCCESS	The pulse timer has been enabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.
FSP_ERR_INVALID_ARGUMENT	The start time must be set to a value that is later than current time.

◆ R_PTP_PulseTimerDisable()

fsp_err_t R_PTP_PulseTimerDisable (ptp_ctrl_t *const *p_ctrl*, uint32_t *channel*)

This function disables a pulse timer channel. Implements ptp_api_t::pulseTimerDisable.

Return values

FSP_SUCCESS	The pulse timer has been disabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ R_PTP_Close()

fsp_err_t R_PTP_Close (ptp_ctrl_t *const *p_ctrl*)

Disable the PTP instance. Implements ptp_api_t::close.

Return values

FSP_SUCCESS	The pulse timer has been disabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ R_PTP_BestMasterClock()

fsp_err_t R_PTP_BestMasterClock (ptp_message_t const *const *p_announce1*, ptp_message_t const *const *p_announce2*, int8_t *const *p_comparison*)

This function compares two clocks to determine which one is the better master clock.

p_comparison:

- Set to -1 if p_announce1 defines the best master clock.
- Set to 1 if p_announce2 defines the best master clock.
- Set to 0 if p_announce1 and p_announce2 define the same clock.

Return values

FSP_SUCCESS	The valid result has been written to p_use_announce_clock.
FSP_ERR_ASSERTION	An argument was NULL.

5.2.12.23 SPP BLE Abstraction (rm_ble_abs_spp)

Modules » Networking

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the BLE ABS Interface .

Overview

This module provides BLE GAP functionality that complies with the Bluetooth Core Specification version 5.0 specified by the Bluetooth SIG. This module is configured via the QE for BLE. QE for BLE provides standard and custom services defined by the user.

The module supports the Renesas Electronics RYZ012 Bluetooth® Low Energy 5 Module. The rm_ble_abs_spp driver interfaces with the RYZ012 module over UART or SPI.

Features

The Bluetooth Low Energy (BLE) Abstraction module with SPP supports the following features:

- Common functionality
  - Open/Close the BLE protocol stack.
  - Setting Transmit Power Level.
- The following GAP Role support
  - Peripheral: The device that accepts a connection request from Central and establishes a connection.
- GAP functionality
  - Initialize the Host stack.
  - Setting address.
  - Start/Stop Advertising.
  - Connect/Disconnect a link.
- GATT Common functionality
  - Get MTU Size.
- GATT Server functionality
  - Initialization of GATT Server.
  - Loading of Profile definition.
  - Notification of characteristics modification.
  - Read/Write of GATT Profile from host.
- Selectable Communication Interfaces
  - SPI Interface
  - UART Interface

Target Devices

The BLE Abstraction module supports the following devices.

- RA6 line of devices using the RYZ012 module
- RA4 Line of devices using the RYZ012 module

Configuration

Build Time Configurations for rm_ble_abs_spp

The following build time configurations are defined in fsp_cfg/rm_ble_abs_spp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enable • Disable	Default (BSP)	Specify whether to include code for API parameter checking.
Reset Port	Refer to the RA Configuration tool for available options.	03	Specify the module reset pin port for the MCU.
Reset Pin	Refer to the RA Configuration tool for available options.	10	Specify the module reset pin for the MCU.
UART/SPI Select Port (PB5)	Refer to the RA Configuration tool for available options.	03	Specify the module PB5 (UART/SPI select) port for the MCU.
UART/SPI Select Pin (PB5)	Refer to the RA Configuration tool for available options.	11	Specify the module PB5 (UART/SPI select) pin for the MCU.
SPI Software SSL Port	Refer to the RA Configuration tool for available options.	Disabled	Specify the port to use for controlling SSL using the ioport module.
SPI Software SSL Pin	Refer to the RA Configuration tool for available options.	Disabled	Specify the pin to use for controlling SSL using the ioport module.
Transmit Power Level (in dBm)	Refer to the RA Configuration tool for available options.	4.57	Specify the module transmit power in dBm.

Configurations for Networking > SPP BLE Abstraction (rm_ble_abs_spp)

This module can be added to the Stacks tab via New Stack > Networking > SPP BLE Abstraction (rm_ble_abs_spp).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_ble_abs0	Module name.
GAP callback	Name must be a valid C symbol	gap_cb	If QE is used, set to "gap_cb".
Vendor specific callback	Name must be a valid C symbol	vs_cb	If QE is used, set to "vs_cb".
GATT server callback parameter	Name must be a valid C symbol	gs_abs_gatts_cb_param	If QE is used, set to "gs _abs_gattc_cb_param".
GATT server callback number	Must be a valid number	2	The number of GATT Server callback functions.

GATT client callback parameter	Name must be a valid C symbol	gs_abs_gattc_cb_param	Set GATT client callback parameter. If QE is used, set to "gs_abs_gattc_cb_param".
GATT client callback number	Must be a valid number	2	The number of GATT Server callback functions.

Pin Configuration

Pins used by the BLE driver to control the RYZ012 module:

- Reset Pin : Active low reset line for RYZ012 module
- UART/SPI Select Pin : Allows selection between UART or SPI for module communication. UART is selected with output low and SPI with output high.
- UART Interface : RX/TX Pins
- SPI Interface : MOSI/MISO/SCK/SSL Pins
  - Data Ready Pin : When the SPI Interface is selected as the communication interface, the Data Ready pin is asserted in order to notify the MCU that there is data ready to be read.
  - Software SSL Pin : Can be optionally configured in order to drive the SSL Pin using software instead of hardware[1].

Note

1. The software SSL Pin is required when using the SPI (r_sci_spi) driver.
2. When using software SSL, the pin must be configured as "Output mode (Initial High)" in the pin configuration editor in addition to being configured in the "stacks" tab.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the BLE_ABS:

Currently supported rm_ble_abs_spp interface functions:

- RM_BLE_ABS_Open
- RM_BLE_ABS_Close
- RM_BLE_ABS_StartLegacyAdvertising

Currently supported r_ble_spp_api interface functions:

- R_BLE_Open
- R_BLE_Close
- R_BLE_SetEvent
- R_BLE_GAP_Init
- R_BLE_GAP_StopAdv
- R_BLE_GAP_SetAdvSresData
- R_BLE_GAP_StartAdv
- R_BLE_GAP_SetAdvParam
- R_BLE_GATT_GetMtu
- R_BLE_GATTS_SetDbInst
- R_BLE_GATTS_Init
- R_BLE_GATTS_GetAttr

- R_BLE_GATTS_SetAttr
- R_BLE_GATTS_Notification
- R_BLE_GATTS_Indication
- R_BLE_GATTS_RegisterCb
- R_BLE_GATTC_Init
- R_BLE_GATTC_RegisterCb
- R_BLE_VS_SetBdAddr
- R_BLE_VS_SetTxPower

Currently supported callback events:

- BLE_GAP_EVENT_CONN_IND
- BLE_GAP_EVENT_DISCONN_IND
- BLE_GAP_EVENT_ADV_ON
- BLE_GAP_EVENT_ADV_OFF
- BLE_GATTC_EVENT_CONN_IND
- BLE_GATTS_EVENT_CONN_IND
- BLE_GATTC_EVENT_DISCONN_IND
- BLE_GATTS_EVENT_DISCONN_IND
- BLE_GATTS_EVENT_WRITE_RSP_COMP

Transmit Power

Specific Operational Use Conditions for RYZ012 BLE module:

Please consult the laws and regulations of the region(s) in which the device will be used to verify the information below before using this device.

North America (FCC) The module must not be operated at power levels above 10.0 dBm. Host devices that need higher output power may not be marketed without prior re-certification.

Europe (RED) The module must not be operated at power levels above 8.4 dBm. Host devices that need higher output power may not be marketed in regions covered by RED regulation without prior re-certification.

Japan (MIC) The module must be operated at power level 4.5 dBm. Host devices that need to change output power may not be marketed without prior re-certification.

The current default level used in the e² studio Configurator is 4.57 dBm for the transmit power level.

Examples

BLE_ABS_SPP Basic Example

This is a basic example of minimal use of the BLE_ABS_SPP in an application.

```
/* The callback is called when peripheral event occurs. */
void gap_peripheral_cb (uint16_t type, ble_status_t result, st_ble_evt_data_t *
p_data)
{
 FSP_PARAMETER_NOT_USED(result);
```

```
 FSP_PARAMETER_NOT_USED(p_data);
 switch (type)
    {
 case BLE_GAP_EVENT_STACK_ON:
     {
           g_ble_event_flag = g_ble_event_flag | BLE_ABS_EVENT_FLAG_STACK_ON;
 break;
      }
 case BLE_GAP_EVENT_ADV_ON:
     {
 st_ble_gap_adv_set_evt_t * p_gap_adv_set_evt_param = (st_ble_gap_adv_set_evt_t *)
p_data->p_param;
           g_advertising_handle = p_gap_adv_set_evt_param->adv_hdl;
           g_ble_event_flag    |= BLE_ABS_EVENT_FLAG_ADV_ON;
 break;
      }
 case BLE_GAP_EVENT_ADV_OFF:
     {
           g_ble_event_flag |= BLE_ABS_EVENT_FLAG_ADV_OFF;
 break;
      }
 case BLE_GAP_EVENT_CONN_IND:
     {
           g_ble_event_flag |= BLE_ABS_EVENT_FLAG_CONN_IND;
 break;
      }
     {
 /* Do nothing. */
 break;
        }
 default:
 break;
    }
}
```

```
#define BLE_ABS_EVENT_FLAG_STACK_ON (0x01 << 0)

BLE_ABS_SPP Firmware Update Example

This is a basic example of performing a firmware update.

```
void ble_abs_firmware_update_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the module. */
    err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
    assert(FSP_SUCCESS == err);
 /* Complete the firmware update (This function blocks until the procedure has
completed). */
    ble_status_t status = R_BLE_VS_UpdateModuleFirmware(g_firmware_image,
g_firmware_image_size);
    assert(BLE_SUCCESS == status);
```

```
 /* Close the module. */
    err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
    assert(FSP_SUCCESS == err);
 /* The RYZ012 is now using the updated firmware. Call open to re-initialize the
module using the new firmware. */
}
```

BLE_ABS_SPP Firmware Update Asynchronous Example

This is an example of performing a firmware update using the asynchronous API.

```
volatile uint32_t g_firmware_update_complete = 0;
void vs_cb (uint16_t type, ble_status_t result, st_ble_vs_evt_data_t * p_data)
{
 FSP_PARAMETER_NOT_USED(p_data);
 if (BLE_SUCCESS != result)
    {
 /* Stop the firmware update process if there was an error. */
 return;
    }
 static uint16_t index = 0;
 switch (type)
    {
 /* The response to the START_FW_UPDATE command was received (Fall through to send
the next data frame). */
 case BLE_VS_EVENT_START_FW_UPDATE_COMP:
 /* The response to the SEND_FW_DATA command was received. */
 case BLE_VS_EVENT_SEND_FW_DATA_COMP:
     {
 if (BLE_VS_EVENT_START_FW_UPDATE_COMP == index)
     {
                index = 0;
        }
           uint16_t length          = 0;
           uint8_t * p_firmware_data = NULL;
```

```
 /*
  * Get next firmware data frame.
  * Note that app_data_frame_get() is an application defined function.
  */
            app_data_frame_get(index, &p_firmware_data, &length);
 if (length > 0)
      {
 /* Send the firmware data frame. */
 R_BLE_VS_SendFirmwareData(index, length, p_firmware_data);
                index++;
         }
 else
      {
 /* The previously completed data frame was the last data frame. Send the firmware
update end command. */
 R_BLE_VS_EndFirmwareUpdate(index - 1);
         }
 break;
       }
 /* The response to the END_FW_UPDATE command was received. */
 case BLE_VS_EVENT_END_FW_UPDATE_COMP:
      {
 /* After the BLE_VS_EVENT_END_FW_UPDATE_COMP command is sent, send the restart
command. */
 R_BLE_VS_RestartModule();
 break;
       }
 /* The module has finished restarting and the MODULE_READY event has been received.
*/
 case BLE_VS_EVENT_MODULE_READY_COMP:
      {
 /* Firmware update process has completed. */
            g_firmware_update_complete = 1;
 break;
```

```
      }
 default:
     {
 break;
      }
   }
}
void ble_abs_firmware_update_async_example (void)

Detailed Description

Wifi and Socket implementation using the DA16XXX WiFi module on RA MCUs.

Overview

This Middleware module currently supplies an implementation for using the DA16XXX module in two different configurations.

The first is for the FreeRTOS WiFi interface, where the network stack is located on the MCU using a socket interface, and the DA16XXX Wi-Fi module provides a connection to the internet. This configuration requires FreeRTOS to be used.

The second configuration is for use with the DA16XXX on-chip MQTT and HTTP client modules, where the network stack is located on the DA16XXX module. In this configuration, this Middleware driver supports FreeRTOS as well as Baremetal (Microsoft Azure support expected in future release).

DA16XXX is a low power Wi-Fi networking SoC that delivers a dramatic breakthrough in battery life even for devices that are continuously connected to the Wi-Fi network. The module comes readily equipped with radio certification for Japan, North America and Europe. More information about this module can be found at the DA16XXX Web Site

The DA16XXX module supports the following modules:

- DA16200
- DA16600 (currently Wi-Fi features only)

Features

The WiFi Onchip da16xxx Middleware driver supplies these features:

- Supports connect/disconnect to a b/g/n (2.4GHz) WiFi Access Point using Open, WPA, and WPA2 security. Encryption types can be either TKIP, or CCMP(AES).
- Supports retrieval of the module device MAC address.
- Once connected you can acquire the assigned module device IP.
- Supports a WiFi network scan capability to get a list of local Access Points.
- Supports a Ping function to test network connectivity.

- Supports a DNS Query call to retrieve the IPv4 address of a supplied URL.
- Supports TCP client sockets.
- Drive supports 1 UART for interfacing with the DA16XXX module.

Configuration

Build Time Configurations for rm_wifi_da16xxx

The following build time configurations are defined in fsp_cfg/rm_wifi_da16xxx_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Enable DA16600 Support	• Enabled • Disabled	Disabled	Enabled if using the DA16600 module
Check Minimum SDK Version	• Disabled • Enabled	Enabled	Enable or disable comparing the current DA16XXX module's SDK version to the minimum required
Number of supported socket instances (not used with on-chip APIs)	1	1	Enable number of socket instances
Size of RX buffer for socket (not used with on-chip APIs)	Manual Entry	8192	
Size of TX buffer for CMD Port	Manual Entry	1500	
Size of RX buffer for CMD Port	Manual Entry	3000	
Enable SNTP Client	• Enabled • Disabled	Disabled	Should the SNTP client of the module be enabled

Configurations for Networking > WiFi DA16XXX Framework Driver (rm_wifi_da16xxx)

Configuration	Options	Default	Description
Country code in ISO 3166-1 alpha-2 standard	Manual Entry	US	
SNTP server IPv4 address	Must be a valid IPv4 address	0.0.0.0	
SNTP Timezone UTC Offset in Hours	Refer to the RA Configuration tool for available options.	0	Value in hours from 12 to -12

Note: It is suggested that when using the DA16XXX module that DTC and FIFO are enabled in the UART configuration to facilitate a more reliable data transfer between module and MCU.

Note: If you wish to use flow control then you must enable flow control in the RA Configuration editor. This can be found in the UART setting. It is advantageous to use flow control all the time since it allows the hardware to gate the flow of data across the serial bus. Without hardware flow control for faster data rate you will most likely see an overflow condition between MCU and the module device.

Note: Higher baud rates are supported in the RA Configuration editor and should be changed in the first UART configuration. There is no need to change the second UART baud rate since it is only used as an AT command channel.

Note: It is a good idea to also enable the FIFO in the UART configuration settings if you plan to use higher baud rates.

Interrupt Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Clock Configuration

Refer to UART (r_sci_uart).

Pin Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx)

Usage Notes

- When the DA16XXX Wi-Fi configures the UART baud rate on the DA16XXX module based on the user settings in the UART driver configuration properties, the UART Baud rate settings will be stored in the NVM memory of the DA16XXX. After reboot, the DA16XXX comes up with the previously updated UART baud rate settings.
- When using the DA16600 Pmod module, make sure that the SDK has been updated to the latest version that supports AT commands. The default SDK that comes from the factory doesn't support the AT command interface, which will cause the WIFI_On() API to fail. This is not required for the DA16200 Pmod module.

Limitations

- WiFi AP connections do not currently support WEP security.
- The default UART baud rate supported by v3.2.1 Wi-Fi SDK is 115200 and v3.2.4 Wi-Fi SDK is 230400. User needs to explicitly configure the default UART baud settings in the UART driver configurator properties based on the version of Wi-Fi SDK used in their testing.
- In v3.2.1 Wi-Fi SDK, the daylight savings time setting is disabled by default. The user needs to mandatorily set the following parameters such as minutes = 0, daylight savings to disable when calling RM_WIFI_DA16XXX_SntpTimeZoneSet() API.
- Network connection parameters SSID and Passphrase for the Access Point can not contain any commas. This is a current limitation of the da16xxx module firmware. The rm_wifi_da16xxx_connect() function will return an error if a comma is detected.
- Wi-Fi AP Scanning is currently limited to max of 10 Access Points.

Examples

Basic Example

This is a basic example of minimal use of WiFi Middleware in an application.

```
void wifi_basic_example (void)
{
 WIFIReturnCode_t wifi_err;
 /* Setup Access Point connection parameters */
 WIFINetworkParams_t net_params =
    {
       .ucChannel                  = 0,
       .xPassword.xWPA.cPassphrase = "password",
       .ucSSID                     = "access_point_ssid",
       .xPassword.xWPA.ucLength = 8,
       .ucSSIDLength            = 17,
       .xSecurity               = eWiFiSecurityWPA2,
    };
    memset(scan_data, 0, sizeof(WIFIScanResult_t) * MAX_WIFI_SCAN_RESULTS);
    memset(g_socket_recv_buffer, 0, sizeof(uint8_t) * SX_WIFI_SOCKET_RX_BUFFER_SIZE);
 /* Open connection to the Wifi Module */
    wifi_err = WIFI_On();
    assert(eWiFiSuccess == wifi_err);
 /* Connect to the Access Point */
    wifi_err = WIFI_ConnectAP(&net_params);
    assert(eWiFiSuccess == wifi_err);
 /* Get address assigned by AP */
 WIFIIPConfiguration_t ipInfo;
    wifi_err = WIFI_GetIPInfo(&ipInfo);
    assert(eWiFiSuccess == wifi_err);
 /* Ping an address accessible on the network */
    uint8_t       ip_address[4] = {216, 58, 194, 174}; // NOLINT
 const uint16_t ping_count    = 3;
 const uint32_t intervalMS    = 100;
    wifi_err = WIFI_Ping(&ip_address[0], ping_count, intervalMS);
```

```
    assert(eWiFiSuccess == wifi_err);
 /* Scan the local Wifi network for other APs */
    wifi_err = WIFI_Scan(&scan_data[0], MAX_WIFI_SCAN_RESULTS);
    assert(eWiFiSuccess == wifi_err);
 /* Shutdown the WIFI */
 WIFI_Off();
}
```

SNTP example

An example of using Simple Network Time Protocol (SNTP) on WiFi in an application.

```
#define RM_WIFI_DA16XXX_TEMP_BUFFER_SIZE (64)
/*
 * Example of the use of SNTP with Wifi. Example gets the epoch time and local
 * system time strings. It is also demonstrated how the user will need to disconnect
 * from the access point to make changes to the SNTP configuration during runtime.
 *
 * Function assumes that the SNTP has been enabled and configured with proper
 * SNTP server address. For brevity error checking has not been implemented.
 *
 */
void wifi_sntp_example (void)
{
 /* Setup Access Point connection parameters */
 WIFINetworkParams_t net_params =
    {
       .ucSSID                    = "access_point_ssid",
       .ucSSIDLength              = 17,
       .xPassword.xWPA.cPassphrase = "password",
       .xPassword.xWPA.ucLength    = 8,
       .ucChannel                 = 0,
       .xSecurity                 = eWiFiSecurityWPA2
    };
    uint8_t local_time[RM_WIFI_DA16XXX_TEMP_BUFFER_SIZE];
```

```
    time_t current_sys_time = 0;
 // SNTP IP address
    uint8_t ip_address_sntp_server_valid[4] = {216, 239, 35, 0}; // NOLINT : Static
IP address
    memset(local_time, 0, sizeof(local_time));
 /* Open connection to the Wifi Module */
 WIFI_On();
 /* Connect to the Access Point */
 WIFI_ConnectAP(&net_params);
 /* Get the local time string */
 RM_WIFI_DA16XXX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));
 /* Disconnect from the access point to make changes to the SNTP configuration */
 WIFI_Disconnect();
 /* Change the IP address of the server */
 RM_WIFI_DA16XXX_SntpServerIpAddressSet((uint8_t *) ip_address_sntp_server_valid);
 /* Change the timezone to PST with daylight saving enabled */
 RM_WIFI_DA16XXX_SntpTimeZoneSet(-8, 0, WIFI_DA16XXX_SNTP_DAYLIGHT_SAVINGS_DISABLE);
 /* Connect back to the access point */
 WIFI_ConnectAP(&net_params);
 /* Get the local time string in format [DayOfWeek Month DayOfMonth Year
Hour:Minute:Second] */
 RM_WIFI_DA16XXX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));
 /* Disconnect from the Access Point and shutdown the WIFI module*/
 WIFI_Disconnect();
 WIFI_Off();
}
```

Data Structures

struct	wifi_da16xxx_cfg_t
struct	da16xxx_socket_t
struct	wifi_da16xxx_instance_ctrl_t

Enumerations

enum	wifi_da16xxx_sntp_enable_t

enum	da16xxx_socket_status_t
enum	da16xxx_socket_rw
enum	da16xxx_recv_state
enum	wifi_da16xxx_sntp_daylight_savings_enable_t

Data Structure Documentation

◆ wifi_da16xxx_cfg_t

struct wifi_da16xxx_cfg_t		
User configuration structure, used in open function		
Data Fields		
at_transport_da16xxx_instance_t const *	p_transport_instance	
const uint32_t	num_sockets	Number of sockets to initialize.
const uint8_t *	country_code	Country code defined in ISO3166-1 alpha-2 standard.
const uint8_t *	sntp_server_ip	The SNTP server IP address string.
const int32_t	sntp_utc_offset_in_hours	Timezone offset in secs (-43200 - 43200)
void const *	p_context	User defined context passed into callback function.
void const *	p_extend	Pointer to extended configuration by instance of interface.

◆ da16xxx_socket_t

struct da16xxx_socket_t		
DA16XXX Wifi internal socket instance structure		
Data Fields		
uint8_t	remote_ipaddr[4]	Remote IP address.
int	remote_port	Remote Port.
int	socket_recv_data_len	Data length of incoming socket data.
int	socket_type	Socket type (TCP Server | TCP Client | UDP)
uint32_t	socket_status	Current socket status.

uint32_t	socket_recv_error_count	Socket receive error count.
uint32_t	socket_create_flag	Flag to determine in socket has been created.
uint32_t	socket_read_write_flag	flag to determine if read and/or write channels are active.
da16xxx_recv_state	socket_recv_state	Incoming Socket data header information.
StreamBufferHandle_t	socket_byteq_hdl	Socket stream buffer handle.
StaticStreamBuffer_t	socket_byteq_struct	Structure to hold stream buffer info.
uint8_t	socket_recv_buff[WIFI_DA16XXX_CFG_MAX_SOCKET_RX_SIZE]	Socket receive buffer used by byte queue.

◆ wifi_da16xxx_instance_ctrl_t

struct wifi_da16xxx_instance_ctrl_t		
WIFI_DA16XXX private control block. DO NOT MODIFY.		
Data Fields		
wifi_da16xxx_cfg_t const *	p_wifi_da16xxx_cfg	Pointer to initial configurations.
uint32_t	num_creatable_sockets	Number of simultaneous sockets supported.
uint32_t	curr_socket	Current Socket index for AT commands.
uint32_t	open	Flag to indicate if wifi instance has been initialized.
uint8_t	is_sntp_enabled	Flag to indicate Enable/Disable of SNTP Client.
uint8_t	cmd_tx_buff[WIFI_DA16XXX_CFG_CMD_TX_BUF_SIZE]	Command send buffer.
uint8_t	cmd_rx_buff[WIFI_DA16XXX_CFG_CMD_RX_BUF_SIZE]	Command receive buffer.
volatile uint32_t	curr_socket_index	Currently active socket instance.
uint8_t	curr_ipaddr[4]	Current IP address of module.
uint8_t	curr_subnetmask[4]	Current Subnet Mask of module.
uint8_t	curr_gateway[4]	Current GAteway of module.
da16xxx_socket_t	sockets[WIFI_DA16XXX_CFG_NUM_CREATEABLE_SOCKETS]	Internal socket instances.

Enumeration Type Documentation

◆ wifi_da16xxx_sntp_enable_t

enum wifi_da16xxx_sntp_enable_t
DA16XXX WiFi module enable/disable for SNTP

◆ da16xxx_socket_status_t

enum da16xxx_socket_status_t
DA16XXX Wifi socket status types

◆ da16xxx_socket_rw

enum da16xxx_socket_rw
DA16XXX socket shutdown channels

◆ da16xxx_recv_state

enum da16xxx_recv_state
DA16XXX socket receive state

◆ wifi_da16xxx_sntp_daylight_savings_enable_t

enum wifi_da16xxx_sntp_daylight_savings_enable_t
DA16XXX WiFi module enable/disable for SNTP Daylight

Function Documentation

◆ RM_WIFI_DA16XXX_SntpServerIpAddressSet()

fsp_err_t RM_WIFI_DA16XXX_SntpServerIpAddressSet (uint8_t * *p_server_ip_addr*)

Set the SNTP Client Server IP Address

Parameters

[in]	p_server_ip_addr	Pointer to IP address of SNTP server in byte array format.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_ASSERTION	The parameter p_server_ip_addr is NULL.

Update the SNTP Server IP Address

◆ RM_WIFI_DA16XXX_SntpEnableSet()

fsp_err_t RM_WIFI_DA16XXX_SntpEnableSet (wifi_da16xxx_sntp_enable_t *enable*)

Set the SNTP Client to Enable or Disable

Parameters

[in]	enable	Flag to indicate enable/disable for SNTP support.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

Enable or Disable the SNTP Client Service

◆ RM_WIFI_DA16XXX_SntpTimeZoneSet()

fsp_err_t RM_WIFI_DA16XXX_SntpTimeZoneSet (int *utc_offset_in_hours*, uint32_t *minutes*, wifi_da16xxx_sntp_daylight_savings_enable_t *daylightSavingsEnable*)

Set the SNTP Client Timezone

Parameters

[in]	utc_offset_in_hours	Timezone in UTC offset in hours
[in]	minutes	Number of minutes used for timezone offset from GMT.
[in]	daylightSavingsEnable	Enable/Disable daylight saving in the timezone calculation.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Parameter passed into function was invalid.

Update the SNTP Timezone

◆ RM_WIFI_DA16XXX_LocalTimeGet()

fsp_err_t RM_WIFI_DA16XXX_LocalTimeGet (uint8_t * *p_local_time*, uint32_t *size_string*)

Get the current local time based on current timezone in a string . Exp: YYYY-MM-DD,HOUR:MIN:SECS

Parameters

[out]	p_local_time	Returns local time in string format.
[in]	size_string	Size of p_local_time string buffer.The size of this string needs to be at least 25 bytes

Return values

FSP_SUCCESS	Successfully returned the local time string.
FSP_ERR_ASSERTION	The parameter local_time or p_instance_ctrl is NULL.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_SIZE	String size value passed in exceeds maximum.

Get the current local time based on current timezone in a string format

◆ RM_WIFI_DA16XXX_GenericAtSendRcv()

fsp_err_t RM_WIFI_DA16XXX_GenericAtSendRcv (char const *const *at_string*, char *const *response_buffer*, uint32_t *length*)

Sends any AT command compatible with the DA16XXX module. Provide optional buffer to receive the response.

Parameters

[in]	at_string	Input AT command string from the user.
[in]	response_buffer	Optional buffer for receiving the response.
[in]	length	Size of optional buffer.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input was not a valid AT command.

Send a generic AT command to the DA16XXX and optionally receive a response

5.2.12.25 WiFi Onchip Silex Driver using r_sci_uart (rm_wifi_onchip_silex)

Detailed Description

Wifi and Socket implementation using the Silex SX-ULPGN WiFi module on RA MCUs.

Overview

This Middleware module supplies an implementation for the FreeRTOS WiFi interface and AzureRTOS NetxDuo WiFi interface using the Silex SX-ULPGN module.

You can find specifics about the WiFi and Secure Socket interface APIs supported by this module at these web sites: Wifi API.

The SX-ULPGN is a low-power, compact IEEE 802.11b/g/n 2.4GHz 1x1 Wireless LAN module equipped with the Qualcomm® QCA4010 Wireless SOC. The module comes readily equipped with radio certification for Japan, North America and Europe. More information about this module can be found at the Silex Web Site

Features

The WiFi Onchip Silex Middleware driver supplies these features:

- Supports connect/disconnect to a b/g/n (2.4GHz) WiFi Access Point using Open, WPA, and WPA2 security. Encryption types can be either TKIP, or CCMP(AES).
- Supports retrieval of the module device MAC address.
- Once connected you can acquire the assigned module device IP.
- Supports a WiFi network scan capability to get a list of local Access Points.
- Supports a Ping function to test network connectivity.
- Supports a DNS Query call to retrieve the IPv4 address of a supplied URL.
- Supports both TCP and UDP client sockets.
- Drive supports 1 or 2 UARTs for interfacing with the SX-ULPGN module. The second UART is considered optional.

Configuration

Build Time Configurations for rm_wifi_onchip_silex

The following build time configurations are defined in fsp_cfg/rm_wifi_onchip_silex_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Number of supported socket instances	Refer to the RA Configuration tool for available options.	1	Enable number of socket instances
Size of RX buffer for socket	Manual Entry	4096	

Size of TX buffer for CMD Port	Manual Entry	1500	
Size of RX buffer for CMD Port	Manual Entry	3000	
Semaphore maximum timeout	Manual Entry	10000	
Number of retries for AT commands	Manual Entry	10	
Module Reset Port	Refer to the RA Configuration tool for available options.	06	Specify the module reset pin port for the MCU.
Module Reset Pin	Refer to the RA Configuration tool for available options.	03	Specify the module reset pin for the MCU.
Enable SNTP Client	• Enabled • Disabled	Disabled	Should the SNTP client of the module be enabled

Configurations for Networking > WiFi Onchip Silex Driver using UART (rm_wifi_onchip_silex)

Configuration	Options	Default	Description
SNTP server IPv4 address	Must be a valid IPv4 address	0.0.0.0	
SNTP Timezone Offset from UTC Hours	Must be between 12 and -12 hours	0	Value in hours from 12 to -12
SNTP Timezone Offset from UTC Minutes	Must be between 0 and 59 minutes	0	Value in minutes from 0 to 59
Use Daylight Savings Time	• Enabled • Disabled	Disabled	Specify if daytime savings should be used for local time calulation

Note: It is suggested that when using the Silex Module that DTC and FIFO are enabled in the UART configuration to facilitate a more reliable data transfer between module and MCU.

Note: If you wish to use flow control then you must enable flow control in the RA Configuration editor. This can be found in the UART setting. It is advantageous to use flow control all the time since it allows the hardware to gate the flow of data across the serial bus. Without hardware flow control for faster data rate you will most likely see an overflow condition between MCU and the module device.

Note: Higher baud rates are supported in the RA Configuration editor and should be changed in the first UART configuration. There is no need to change the second UART baud rate since it is only used as an AT command channel.

Note: It is a good idea to also enable the FIFO in the UART configuration settings if you plan to use higher baud rates.

Interrupt Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip Silex Driver using r_sci_uart (rm_wifi_onchip_silex).

Clock Configuration

Refer to UART (r_sci_uart).

Pin Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip Silex Driver using r_sci_uart (rm_wifi_onchip_silex)

Usage Notes

Limitations

- WiFi AP connections do not currently support WEP security.
- When operating with a single UART only single socket connections are possible. To support multiple sockets two UART channels must be connected to the module. When using the Renesas-provided SX-ULPGN PMOD board the second UART channel is on pins 9 and 10 of the PMOD header.
- Network connection parameters SSID and Passphrase for the Access Point can not contain any commas. This is a current limitation of the Silex module firmware. The rm_wifi_onchip_silex_connect() function will return an error if a comma is detected.
- When operating with a single UART and there is an active socket connection you cannot call WIFI_Scan(), WIFI_Ping(), WIFI_GetMAC(), or WIFI_GetIPInfo(). Calling one of these function will return an error code in this situation. These commands are blocked in the one UART case during an active socket connection because they could cause data loss. To avoid this limitation please configure the hardware to use both UARTs.
- The Silex WiFi modules SNTP support requires all configuration changes to made when the WiFi is disconnected from an Access Point. This is a limitation of the Silex module firmware. If changes to the default SNTP settings are required then the application will have to close the current AP connection, make the necessary SNTP changes, and then re-establish the original connection.

Examples

Basic Example

This is a basic example of minimal use of WiFi Middleware in an application.

```
void wifi_onchip_basic_example (void)
{
 WIFIReturnCode_t wifi_err;
 /* Setup Access Point connection parameters */
 WIFINetworkParams_t net_params =
    {
       .ucChannel                  = 0,
```

```
      .xPassword.xWPA.cPassphrase = "password",
      .ucSSID                     = "access_point_ssid",
      .xPassword.xWPA.ucLength = 8,
      .ucSSIDLength            = 17,
      .xSecurity               = eWiFiSecurityWPA2,
   };
   memset(scan_data, 0, sizeof(WIFIScanResult_t) * MAX_WIFI_SCAN_RESULTS);
   memset(g_socket_recv_buffer, 0, sizeof(uint8_t) * SX_WIFI_SOCKET_RX_BUFFER_SIZE);
/* Open connection to the Wifi Module */
   wifi_err = WIFI_On();
   assert(eWiFiSuccess == wifi_err);
/* Connect to the Access Point */
   wifi_err = WIFI_ConnectAP(&net_params);
   assert(eWiFiSuccess == wifi_err);
/* Get address assigned by AP */
WIFIIPConfiguration_t ipInfo;
   wifi_err = WIFI_GetIPInfo(&ipInfo);
   assert(eWiFiSuccess == wifi_err);
/* Ping an address accessible on the network */
   uint8_t       ip_address[4] = {216, 58, 194, 174}; // NOLINT
const uint16_t ping_count    = 3;
const uint32_t intervalMS    = 100;
   wifi_err = WIFI_Ping(&ip_address[0], ping_count, intervalMS);

/* Scan the local Wifi network for other APs */
   wifi_err = WIFI_Scan(&scan_data[0], MAX_WIFI_SCAN_RESULTS);
   assert(eWiFiSuccess == wifi_err);
/* Shutdown the WIFI */
WIFI_Off();
}
```

SNTP example

An example of using Simple Network Time Protocol (SNTP) on WiFi in an application.

```
#define RM_WIFI_ONCHIP_SILEX_TEMP_BUFFER_SIZE (64)
/*
 * Example of the use of SNTP with Wifi. Example gets the epoch time and local
 * system time strings. It is also demonstrated how the user will need to disconnect
 * from the access point to make changes to the SNTP configuration during runtime.
 *
 * Function assumes that the SNTP has been enabled and configured with proper
 * SNTP server address. For brevity error checking has not been implemented.
 *
 */
void wifi_onchip_sntp_example (void)
{
 /* Setup Access Point connection parameters */
 WIFINetworkParams_t net_params =
    {
       .ucSSID                   = "access_point_ssid",
       .ucSSIDLength             = 17,
       .xPassword.xWPA.cPassphrase = "password",
       .xPassword.xWPA.ucLength    = 8,
       .ucChannel                = 0,
       .xSecurity                = eWiFiSecurityWPA2
    };
    uint8_t local_time[RM_WIFI_ONCHIP_SILEX_TEMP_BUFFER_SIZE];
    time_t current_sys_time = 0;
 // SNTP IP address
    uint8_t ip_address_sntp_server_valid[4] = {216, 239, 35, 0}; // NOLINT : Static
IP address
    memset(local_time, 0, sizeof(local_time));
 /* Open connection to the Wifi Module */
 WIFI_On();
 /* Connect to the Access Point */
 WIFI_ConnectAP(&net_params);
 /* Get the Epoch time in seconds since Jan 1, 1970 UTC */
 RM_WIFI_ONCHIP_SILEX_EpochTimeGet(&current_sys_time);
```

```
 /* Get the local time string */

Data Structure Documentation

◆ wifi_onchip_silex_cfg_t

struct wifi_onchip_silex_cfg_t		
User configuration structure, used in open function		
Data Fields		
const uint32_t	num_uarts	Number of UART interfaces to use.
const uint32_t	num_sockets	Number of sockets to initialize.
const bsp_io_port_pin_t	reset_pin	Reset pin used for module.
const uart_instance_t *	uart_instances[WIFI_ONCHIP_SILEX_CFG_MAX_NUMBER_UART_PORTS]	SCI UART instances.
const wifi_onchip_silex_sntp_enable_t	sntp_enabled	Enable/Disable the SNTP Client.
const uint8_t *	sntp_server_ip	The SNTP server IP address string.
const int32_t	sntp_timezone_offset_from_utc_hours	Timezone offset from UTC in (+/-) hours.
const uint32_t	sntp_timezone_offset_from_utc_minutes	Timezone offset from UTC in minutes.
const wifi_onchip_silex_sntp_daylight_savings_enable_t	sntp_timezone_use_daylight_savings	Enable/Disable use of daylight saving time.
void const *	p_context	User defined context passed into callback function.
void const *	p_extend	Pointer to extended configuration by instance of interface.

◆ ulpgn_socket_t

struct ulpgn_socket_t		
Silex ULPGN Wifi internal socket instance structure		
Data Fields		
StreamBufferHandle_t	socket_byteq_hdl	Socket stream buffer handle.
StaticStreamBuffer_t	socket_byteq_struct	Structure to hold stream buffer info.
uint8_t	socket_recv_buff[WIFI_ONCHIP_SILEX_CFG_MAX_SOCKET_RX_SIZE]	Socket receive buffer used by byte queue.
uint32_t	socket_status	Current socket status.

uint32_t	socket_recv_error_count	Socket receive error count.
uint32_t	socket_create_flag	Flag to determine in socket has been created.
uint32_t	socket_read_write_flag	flag to determine if read and/or write channels are active.

◆ wifi_onchip_silex_instance_ctrl_t

struct wifi_onchip_silex_instance_ctrl_t		
WIFI_ONCHIP_SILEX private control block. DO NOT MODIFY.		
Data Fields		
uint32_t	open	Flag to indicate if wifi instance has been initialized.
wifi_onchip_silex_cfg_t const *	p_wifi_onchip_silex_cfg	Pointer to initial configurations.
bsp_io_port_pin_t	reset_pin	Wifi module reset pin.
uint32_t	num_uarts	number of UARTS currently used for communication with module
uint32_t	tx_data_size	Size of the data to send.
uint32_t	num_creatable_sockets	Number of simultaneous sockets supported.
uint32_t	curr_cmd_port	Current UART instance index for AT commands.
uint32_t	curr_data_port	Current UART instance index for data.
uint8_t	cmd_rx_queue_buf[WIFI_ONCHIP_SILEX_CFG_CMD_RX_BUF_SIZE]	Command port receive buffer used by byte queue // FreeRTOS.
StreamBufferHandle_t	socket_byteq_hdl	Socket stream buffer handle.
StaticStreamBuffer_t	socket_byteq_struct	Structure to hold stream buffer info.
volatile uint32_t	curr_socket_index	Currently active socket instance.
uint8_t	cmd_tx_buff[WIFI_ONCHIP_SILEX_CFG_CMD_TX_BUF_SIZE]	Command send buffer.
uint8_t	cmd_rx_buff[WIFI_ONCHIP_SILEX_CFG_CMD_RX_BUF_SIZE]	Command receive buffer.
uint32_t	at_cmd_mode	Current command mode.
uint8_t	curr_ipaddr[4]	Current IP address of module.
uint8_t	curr_subnetmask[4]	Current Subnet Mask of module.

uint8_t	curr_gateway[4]	Current GAteway of module.
SemaphoreHandle_t	tx_sem	Transmit binary semaphore handle.
SemaphoreHandle_t	rx_sem	Receive binary semaphore handle.
uint8_t	last_data[WIFI_ONCHIP_SILEX_RETURN_TEXT_LENGTH]	Tailing buffer used for command parser.
uart_instance_t *	uart_instance_objects[WIFI_ONCHIP_SILEX_CFG_MAX_NUMBER_UART_PORTS]	UART instance objects.
SemaphoreHandle_t	uart_tei_sem[WIFI_ONCHIP_SILEX_CFG_MAX_NUMBER_UART_PORTS]	UART transmission end binary semaphore.
ulpgn_socket_t	sockets[WIFI_ONCHIP_SILEX_CFG_NUM_CREATEABLE_SOCKETS]	Internal socket instances.

Enumeration Type Documentation

◆ sx_ulpgn_socket_status_t

enum sx_ulpgn_socket_status_t
Silex ULPGN Wifi socket status types

◆ sx_ulpgn_socket_rw

enum sx_ulpgn_socket_rw
Silex socket shutdown channels

◆ wifi_onchip_silex_sntp_enable_t

enum wifi_onchip_silex_sntp_enable_t
Silex WiFi module enable/disable for SNTP

◆ wifi_onchip_silex_sntp_daylight_savings_enable_t

enum wifi_onchip_silex_sntp_daylight_savings_enable_t
Silex WiFi module enable/disable for SNTP

Function Documentation

◆ rm_wifi_onchip_silex_open()

fsp_err_t rm_wifi_onchip_silex_open (wifi_onchip_silex_cfg_t const *const *p_cfg*)

Opens and configures the WIFI_ONCHIP_SILEX Middleware module.

Parameters

[in]	p_cfg	Pointer to pin configuration structure.

Return values

FSP_SUCCESS	WIFI_ONCHIP_SILEX successfully configured.
FSP_ERR_ASSERTION	The parameter p_cfg or p_instance_ctrl is NULL.
FSP_ERR_OUT_OF_MEMORY	There is no more heap memory available.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ rm_wifi_onchip_silex_close()

fsp_err_t rm_wifi_onchip_silex_close ( )

Disables WIFI_ONCHIP_SILEX.

Return values

FSP_SUCCESS	WIFI_ONCHIP_SILEX closed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

◆ rm_wifi_onchip_silex_disconnect()

fsp_err_t rm_wifi_onchip_silex_disconnect ( )

Disconnects from connected AP.

Return values

FSP_SUCCESS	WIFI_ONCHIP_SILEX disconnected successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

◆ rm_wifi_onchip_silex_socket_connected()

fsp_err_t rm_wifi_onchip_silex_socket_connected (fsp_err_t * *p_status*)

Check if a specific socket instance is connected.

Parameters

[out]	p_status	Pointer to integer holding the socket connection status.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	The parameter p_status is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.

◆ rm_wifi_onchip_silex_network_info_get()

fsp_err_t rm_wifi_onchip_silex_network_info_get (uint32_t * *p_ip_addr*, uint32_t * *p_subnet_mask*, uint32_t * *p_gateway*)

Return the network information for the connection to the access point.

Parameters

[out]	p_ip_addr	Pointer to integer holding the IP address.
[out]	p_subnet_mask	Pointer to integer holding the subnet mask.
[out]	p_gateway	Pointer to integer holding the gateway.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	A parameter pointer is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_WIFI_AP_NOT_CONNECTED	No connection to access point has happened.

◆ rm_wifi_onchip_silex_connect()

fsp_err_t rm_wifi_onchip_silex_connect (const char * *p_ssid*, WIFISecurity_t *security*, const char * *p_passphrase*)

Connects to the specified Wifi Access Point.

Parameters

[in]	p_ssid	Pointer to SSID of Wifi Access Point.
[in]	security	Security type to use for connection.
[in]	p_passphrase	Pointer to the passphrase to use for connection.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The parameter p_ssid or p_passphrase is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_INVALID_ARGUMENT	No commas are accepted in the SSID or Passphrase.

◆ rm_wifi_onchip_silex_mac_addr_get()

fsp_err_t rm_wifi_onchip_silex_mac_addr_get (uint8_t * *p_macaddr*)

Get MAC address.

Parameters

[out]	p_macaddr	Pointer array to hold mac address.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The parameter p_macaddr is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_scan()

fsp_err_t rm_wifi_onchip_silex_scan (WIFIScanResult_t * *p_results*, uint32_t *maxNetworks*)

Get the information about local Wifi Access Points.

Parameters

[out]	p_results	Pointer to a structure array holding scanned Access Points.
[in]	maxNetworks	Size of the structure array for holding APs.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The parameter p_results or p_instance_ctrl is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_ping()

fsp_err_t rm_wifi_onchip_silex_ping (uint8_t * *p_ip_addr*, uint32_t *count*, uint32_t *interval_ms*)

Ping an IP address on the network.

Parameters

[in]	p_ip_addr	Pointer to IP address array.
[in]	count	Number of pings to attempt.
[in]	interval_ms	Interval between ping attempts.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The parameter p_ip_addr is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_ip_addr_get()

fsp_err_t rm_wifi_onchip_silex_ip_addr_get (uint32_t * *p_ip_addr*)

Get the assigned module IP address.

Parameters

[out]	p_ip_addr	Pointer an array to hold the IP address.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The parameter p_ip_addr is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_avail_socket_get()

fsp_err_t rm_wifi_onchip_silex_avail_socket_get (uint32_t * *p_socket_id*)

Get the next available socket ID.

Parameters

[out]	p_socket_id	Pointer to an integer to hold the socket ID.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	The parameter p_socket_id is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_WIFI_FAILED	Error occured in the execution of this function

◆ rm_wifi_onchip_silex_socket_status_get()

fsp_err_t rm_wifi_onchip_silex_socket_status_get (uint32_t *socket_no*, uint32_t * *p_socket_status*)

Get the socket status.

Parameters

[in]	socket_no	Socket ID number.
[out]	p_socket_status	Pointer to an integer to hold the socket status

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	The parameter p_instance_ctrl or p_socket_status is NULL. The value of socket_no is greater than/equal num_creatable_sockets.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_tcp_shutdown()

int32_t rm_wifi_onchip_silex_tcp_shutdown (uint32_t *socket_no*, uint32_t *shutdown_channels*)

Shutdown portion of a socket

Parameters

[in]	socket_no	Socket ID number.
[in]	shutdown_channels	Specify if read or write channel is shutdown for socket

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	The parameter p_instance_ctrl is NULL. The value of socket_no is greater than/equal num_creatable_sockets.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_socket_create()

fsp_err_t rm_wifi_onchip_silex_socket_create (uint32_t *socket_no*, uint32_t *type*, uint32_t *ipversion*)

Create a new socket instance.

Parameters

[in]	socket_no	Socket ID number.
[in]	type	Socket type.
[in]	ipversion	Socket IP type.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The p_instance_ctrl is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_tcp_connect()

fsp_err_t rm_wifi_onchip_silex_tcp_connect (uint32_t *socket_no*, uint32_t *ipaddr*, uint32_t *port*)

Connect to a specific IP and Port using socket.

Parameters

[in]	socket_no	Socket ID number.
[in]	ipaddr	IP address for socket connection.
[in]	port	Port number for socket connection.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_udp_connect()

fsp_err_t rm_wifi_onchip_silex_udp_connect (uint32_t *socket_no*, uint32_t *ipaddr*, uint32_t *port*, uint32_t *type*)

Connect to a specific IP and Port using UDP socket.

Parameters

[in]	socket_no	Socket ID number.
[in]	ipaddr	IP address for socket connection. 0 if type is server.
[in]	port	Port number for socket connection.
[in]	type	Type of UDP connection. Can be client or server.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_send()

int32_t rm_wifi_onchip_silex_send (uint32_t *socket_no*, const uint8_t * *p_data*, uint32_t *length*, uint32_t *timeout_ms*)

Send data over TCP to a server.

Parameters

[in]	socket_no	Socket ID number.
[in]	p_data	Pointer to data to send.
[in]	length	Length of data to send.
[in]	timeout_ms	Timeout to wait for transmit end event

Return values

FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The p_instance_ctrl or parameter p_data is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_recv()

int32_t rm_wifi_onchip_silex_recv (uint32_t *socket_no*, uint8_t * *p_data*, uint32_t *length*, uint32_t *timeout_ms*)

Receive data over TCP from a server.

Parameters

[in]	socket_no	Socket ID number.
[out]	p_data	Pointer to data received from socket.
[in]	length	Length of data array used for receive.
[in]	timeout_ms	Timeout to wait for data to be received from socket.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	The p_instance_ctrl or parameter p_data is NULL.

◆ rm_wifi_onchip_silex_socket_disconnect()

fsp_err_t rm_wifi_onchip_silex_socket_disconnect (uint32_t *socket_no*)

Disconnect a specific socket connection.

Parameters

[in]	socket_no	Socket ID to disconnect

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_INVALID_ARGUMENT	Bad parameter value was passed into function.

◆ rm_wifi_onchip_silex_dns_query()

fsp_err_t rm_wifi_onchip_silex_dns_query (const char * *p_textstring*, uint8_t * *p_ip_addr*)

Initiate a DNS lookup for a given URL.

Parameters

[in]	p_textstring	Pointer to array holding URL to query from DNS.
[out]	p_ip_addr	Pointer to IP address returned from look up.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The p_instance_ctrl, p_textstring, p_ip_addr is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_INVALID_ARGUMENT	The URL passed in is to long.

◆ RM_WIFI_ONCHIP_SILEX_EpochTimeGet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_EpochTimeGet (time_t * *p_utc_time*)

This will retrieve time info from an NTP server at the address entered via an during configuration. If the server isn't set or the client isn't enabled, then it will return an error. The date/time is retrieved as the number of seconds since 00:00:00 UTC January 1, 1970

Parameters

[out]	p_utc_time	Returns the epoch time in seconds.

Return values

FSP_SUCCESS	Successfully retrieved the system time from module.
FSP_ERR_ASSERTION	The parameter utc_time or p_instance_ctrl is NULL.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

Get the current system time as the number of seconds since epoch 1970-01-01 00:00:00 UTC

◆ RM_WIFI_ONCHIP_SILEX_LocalTimeGet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_LocalTimeGet (uint8_t * *p_local_time*, uint32_t *size_string*)

Get the current local time based on current timezone in a string . Exp: Wed Oct 15 1975 07:06:00

Parameters

[out]	p_local_time	Returns local time in string format.
[in]	size_string	Size of p_local_time string buffer.The size of this string needs to be at least 25 bytes

Return values

FSP_SUCCESS	Successfully returned the local time string.
FSP_ERR_ASSERTION	The parameter local_time or p_instance_ctrl is NULL.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_SIZE	String size value passed in exceeds maximum.

Get the current local time based on current timezone in a string format

◆ RM_WIFI_ONCHIP_SILEX_SntpEnableSet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpEnableSet (wifi_onchip_silex_sntp_enable_t *enable*)

Set the SNTP Client to Enable or Disable

Parameters

[in]	enable	Can be set to enable/disable for SNTP support.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

Enable or Disable the SNTP Client Service

◆ RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet (uint8_t * *p_ip_address*)

Set the SNTP Client Server IP Address

Parameters

[in]	p_ip_address	Pointer to IP address of SNTP server in byte array format.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_ASSERTION	The parameter p_ip_address or p_instance_ctrl is NULL.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

Update the SNTP Server IP Address

◆ RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet (int32_t *hours*, uint32_t *minutes*, wifi_onchip_silex_sntp_daylight_savings_enable_t *daylightSavingsEnable*)

Set the SNTP Client Timezone

Parameters

[in]	hours	Number of hours (+/-) used for timezone offset from GMT.
[in]	minutes	Number of minutes used for timezone offset from GMT.
[in]	daylightSavingsEnable	Enable/Disable daylight saving in the timezone calculation.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Parameter passed into function was invalid.

Update the SNTP Timezone

5.2.13 Power

Modules

Detailed Description

Power Modules.

Modules

Low Power Modes (r_lpm)

Driver for the LPM peripheral on RA MCUs. This module implements the Low Power Modes Interface.

5.2.13.1 Low Power Modes (r_lpm)

Modules » Power

Functions

fsp_err_t	R_LPM_Open (lpm_ctrl_t *const p_api_ctrl, lpm_cfg_t const *const p_cfg)
fsp_err_t	R_LPM_LowPowerReconfigure (lpm_ctrl_t *const p_api_ctrl, lpm_cfg_t const *const p_cfg)
fsp_err_t	R_LPM_LowPowerModeEnter (lpm_ctrl_t *const p_api_ctrl)
fsp_err_t	R_LPM_IoKeepClear (lpm_ctrl_t *const p_api_ctrl)
fsp_err_t	R_LPM_Close (lpm_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the LPM peripheral on RA MCUs. This module implements the Low Power Modes Interface.

Overview

The low power modes driver is used to configure and place the device into the desired low power mode. Various sources can be configured to wake from standby, request snooze mode, end snooze mode or end deep standby mode.

Features

The LPM HAL module has the following key features:

- Supports the following low power modes:
  - Deep Software Standby mode (On supported MCUs)
  - Deep Sleep (On supported MCUs)
  - Software Standby mode
  - Sleep mode
  - Snooze mode (On supported MCUs)
- Supports reducing power consumption when in deep software standby mode through internal power supply control and by resetting the states of I/O ports.
- Supports disabling and enabling the MCU's other hardware peripherals

Configuration

Build Time Configurations for r_lpm

The following build time configurations are defined in fsp_cfg/r_lpm_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP)	Default (BSP)	If selected code for

	• Enabled • Disabled		parameter checking is included in the build.
Standby Limit	• Enabled • Disabled	Disabled	If enabled, standby configuration only applies in R_LPM_LowPowerModeEnter. Otherwise, standby configuration applies to any WFI call.

Configurations for Power > Low Power Modes (r_lpm)

This module can be added to the Stacks tab via New Stack > Power > Low Power Modes (r_lpm). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_lpm0	Module name.
Low Power Mode	MCU Specific Options		Power mode to be entered.
Output port state in standby and deep standby	MCU Specific Options		Select the state of output pins during standby. Applies to address output, data output, and other bus control output pins.
Supply of SOSC clock to peripheral function in standby	MCU Specific Options		If enabled, SOSC clock is provided to peripheral functions in Software Standby and Snooze modes.
Startup speed of the HOCO in Standby and Snooze modes	MCU Specific Options		If enabled, the HOCO enters high-speed startup mode, shortening standby release time, and snooze transition time.
Flash mode in sleep or snooze	MCU Specific Options		Select flash mode in sleep mode or in snooze mode.
Deep Sleep and Standby Options			
Deep Sleep and Standby Options > Snooze Options (Not available on every MCU)			
Snooze Request Source	MCU Specific Options		Select the event that will enter snooze.
Snooze End Sources	MCU Specific Options		Enable wake from

		snooze from these sources.
DTC state in Snooze Mode	MCU Specific Options	Enable wake from snooze from this source.
Snooze Cancel Source	MCU Specific Options	Select an interrupt source to cancel snooze.
Wake Sources	MCU Specific Options	Enable wake from deep sleep and standby from these Sources.
RAM Retention Control (Not available on every MCU)		
RAM retention in Standby mode	MCU Specific Options	Select the memory regions that are retained in standby mode.
TCM retention in Deep Sleep and Standby modes	MCU Specific Options	Select if Tightly Coupled Memory (TCM) is retained in deep sleep and standby modes.
Standby RAM retention in Standby and Deep Standby modes	MCU Specific Options	Select if Standby RAM is retained in standby and deep standby modes.
Oscillator LDO Control (Not available on every MCU)		
PLL1 LDO State in standby mode	MCU Specific Options	Select the state PLL1 LDO state in standby mode.
PLL2 LDO State in standby mode	MCU Specific Options	Select the state PLL2 LDO state in standby mode.
HOCO LDO State in standby mode	MCU Specific Options	Select the state HOCO LDO state in standby mode.
Deep Standby Options (Not available on every MCU)		
I/O Port Retention	MCU Specific Options	Select the state of the IO Pins after exiting deep standby mode.
Power-Supply Control	MCU Specific Options	Select the state of the internal power supply in deep standby mode.
Cancel Sources	MCU Specific Options	Enable wake from deep standby using these sources.

Cancel Edges	MCU Specific Options	Falling edge trigger is default. Select sources to enable wake from deep standby with rising edge.

Clock Configuration

This module does not have any selectable clock sources.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Sleep Mode

At power on, by default sleep is set as the low-power mode. Sleep mode is the most convenient low-power mode available, as it does not require any special configuration (other than configuring and enabling a suitable interrupt or event to wake the MCU from sleep) to return to normal program-execution mode. The states of the SRAM, the processor registers, and the hardware peripherals are all maintained in sleep mode, and the time needed to enter and wake from sleep is minimal. Any interrupt causes the MCU device to wake from sleep mode, including the SysTick interrupt used by the RTOS scheduler.

Deep Sleep Mode

Deep sleep mode is similar to sleep mode with the exception that DTC and DMAC are stopped, access to TCM memory is not available, and only a subset of interrupts are available for waking the CPU.

Software Standby Mode

In software-standby mode, the CPU, as well as most of the on-chip peripheral functions and all of the internal oscillators, are stopped. The contents of the CPU internal registers and SRAM data, the states of on-chip peripheral functions, and I/O Ports are all retained. Software-standby mode allows significant reduction in power consumption, because most of the oscillators are stopped in this mode. Like sleep mode, standby mode requires an interrupt or event be configured and enabled to wake up.

Snooze Mode

Snooze mode can be used with some MCU peripherals to execute basic tasks while keeping the MCU in a low-power state. Many core peripherals and all clocks can be selected to run during Snooze, allowing for more flexible low-power configuration than Software Standby mode. To enable Snooze, select "Software Standby mode with Snooze mode enabled" for the "Low Power Mode" configuration option. Snooze mode settings (including entry/exit sources) are available under "Standby Options".

Deep Software Standby Mode

The MCU always wakes from Deep Software Standby Mode by going through reset, either by the

negation of the reset pin or by one of the wakeup sources configurable in the "Deep Standby Options" configuration group.

The Reset Status Registers can be used to determine if the reset occurred after coming out of deep software standby. For example, R_SYSTEM->RSTSR0_b.DPSRSTF is set to 1 after a deep software standby reset.

I/O Port Retention can be enabled to maintain I/O port configuration across a deep software standby reset. Retention can be cancelled through the R_LPM_IoKeepClear API.

Limitations

Developers should be aware of the following limitations when using the LPM:

- Flash stop (code flash disable) is not supported. See the section "Flash Operation Control Register (FLSTOP)" of the RA2/RA4 Family Hardware User's Manual.
- Reduced SRAM retention area in software standby mode is not supported. See the section "Power Save Memory Control Register (PSMCR)" of the RA4 Hardware User's Manual.
- Only one Snooze Request Source can be used at a time.
- When using Snooze mode with SCI0 RXD as the snooze source the system clock must be HOCO and the MOCO, Main Oscillator and PLL clocks must be turned off.
- If the main oscillator or PLL with main oscillator source is used for the system clock, the wake time from standby mode can be affected by the Main Oscillator Wait Time Setting in the MOSCWTCR register. This register setting is available to be changed through the Main Oscillator Wait Time setting in the CGC module properties. See the "Wakeup Timing and Duration" table in Electrical Characteristics for more information.
- When using the DC-DC regulator (where available), the MCU will temporarily switch to the LDO if Software Standby or Snooze is requested and back again when it is cancelled. Switching to the LDO incurs a 60 microsecond critical section wherein all interrupts AND peripherals are stopped. Switching back to DCDC from the LDO incurs an additional 22 microsecond critical section (peripherals running).
- On RA8, there are delays inserted before and after switching to a lower power mode based on BSP configuration options and current CPUCLK speed. These delays do not disable interrupts for the entire delay as required by the RA8 Hardware Manual. Interrupts should be disabled by the application when possible before sleeping to meet the requirements, or the control of interrupts and the delay should be managed by the user to ensure the requirement is fully met.

Examples

LPM Sleep Example

This is a basic example of minimal use of the LPM in an application. The LPM instance is opened and the configured low-power mode is entered.

```
void r_lpm_sleep (void)
{
 fsp_err_t err = R_LPM_Open(&g_lpm_ctrl, &g_lpm_cfg_sleep);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    err = R_LPM_LowPowerModeEnter(&g_lpm_ctrl);
```

```
    assert(FSP_SUCCESS == err);
}
```

LPM Deep Software Standby Example

```
void r_lpm_deep_software_standby (void)
{
 fsp_err_t err;
#if !BSP_MCU_GROUP_RA0E1
 /* Check the Deep Software Standby Reset Flag. If it is set, then the MCU is exiting
  * Deep Software Standby mode. */
 if (1U == R_SYSTEM->RSTSR0_b.DPSRSTF)
    {
 /* Clear the IOKEEP bit to allow I/O Port use.
  * Note that this function should be called before opening the LPM driver. */
       err = R_LPM_IoKeepClear(&g_lpm_ctrl);
      assert(FSP_SUCCESS == err);
    }
#endif
    err = R_LPM_Open(&g_lpm_ctrl, &g_lpm_cfg_deep_software_standby);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Add user code here. */
 /* Reconfigure the module to set the IOKEEP bit before entering deep software
standby. */
    err = R_LPM_LowPowerReconfigure(&g_lpm_ctrl, &g_lpm_cfg_deep_software_standby);
    assert(FSP_SUCCESS == err);
    err = R_LPM_LowPowerModeEnter(&g_lpm_ctrl);
 /* Code after R_LPM_LowPowerModeEnter when using Deep Software Standby never be
executed.
  * Deep software standby exits by resetting the MCU. */
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	lpm_instance_ctrl_t

Data Structure Documentation

◆ lpm_instance_ctrl_t

struct lpm_instance_ctrl_t
LPM private control block. DO NOT MODIFY. Initialization occurs when R_LPM_Open() is called.

Function Documentation

◆ R_LPM_Open()

fsp_err_t R_LPM_Open (lpm_ctrl_t *const *p_api_ctrl*, lpm_cfg_t const *const *p_cfg*)

Perform any necessary initialization

Return values

FSP_SUCCESS	LPM instance opened
FSP_ERR_ASSERTION	Null Pointer
FSP_ERR_ALREADY_OPEN	LPM instance is already open
FSP_ERR_UNSUPPORTED	This MCU does not support Deep Software Standby
FSP_ERR_INVALID_ARGUMENT	One of the following: • Invalid snooze entry source • Invalid snooze end sources
FSP_ERR_INVALID_MODE	One of the following: • Invalid low power mode • Invalid DTC option for snooze mode • Invalid deep standby end sources • Invalid deep standby end sources edges • Invalid power supply option for deep standby • Invalid IO port option for deep standby • Invalid output port state setting for standby or deep standby • Invalid sources for wake from standby mode • Invalid power supply option for standby • Invalid IO port option for standby • Invalid standby end sources • Invalid standby end sources edges

◆ R_LPM_LowPowerReconfigure()

fsp_err_t R_LPM_LowPowerReconfigure (lpm_ctrl_t *const *p_api_ctrl*, lpm_cfg_t const *const *p_cfg*)

Configure a low power mode

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

Return values

FSP_SUCCESS	Low power mode successfuly applied
FSP_ERR_ASSERTION	Null Pointer
FSP_ERR_NOT_OPEN	LPM instance is not open
FSP_ERR_UNSUPPORTED	This MCU does not support Deep Software Standby
FSP_ERR_INVALID_ARGUMENT	One of the following: • Invalid snooze entry source • Invalid snooze end sources
FSP_ERR_INVALID_MODE	One of the following: • Invalid low power mode • Invalid DTC option for snooze mode • Invalid deep standby end sources • Invalid deep standby end sources edges • Invalid power supply option for deep standby • Invalid IO port option for deep standby • Invalid output port state setting for standby or deep standby • Invalid sources for wake from standby mode • Invalid power supply option for standby • Invalid IO port option for standby • Invalid standby end sources • Invalid standby end sources edges

◆ R_LPM_LowPowerModeEnter()

fsp_err_t R_LPM_LowPowerModeEnter (lpm_ctrl_t *const *p_api_ctrl*)

Enter low power mode (sleep/deep sleep/standby/deep standby) using WFI macro.

Function will return after waking from low power mode.

Return values

FSP_SUCCESS	Successful.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	LPM instance is not open
FSP_ERR_INVALID_MODE	One of the following: • HOCO was not system clock when using snooze mode with SCI0/RXD0. • HOCO was not stable when using snooze mode with SCI0/RXD0. • MOCO was running when using snooze mode with SCI0/RXD0. • MAIN OSCILLATOR was running when using snooze mode with SCI0/RXD0. • PLL was running when using snooze mode with SCI0/RXD0. • Unable to disable ocillator stop detect when using standby or deep standby.

◆ R_LPM_IoKeepClear()

fsp_err_t R_LPM_IoKeepClear (lpm_ctrl_t *const *p_api_ctrl*)

Clear the IOKEEP bit after deep software standby

Return values

FSP_SUCCESS	DPSBYCR_b.IOKEEP bit cleared Successfully.
FSP_ERR_UNSUPPORTED	Deep standby mode not supported on this MCU.

◆ **R_LPM_Close()**

fsp_err_t R_LPM_Close (lpm_ctrl_t *const *p_api_ctrl*)
Close the LPM Instance **Return values** FSP_SUCCESS — LPM driver closed FSP_ERR_NOT_OPEN — LPM instance is not open FSP_ERR_ASSERTION — Null Pointer

5.2.14 RTOS

Modules

Detailed Description

RTOS Modules.

Modules

Azure RTOS ThreadX Port (rm_threadx_port)

ThreadX port for RA MCUs.

FreeRTOS Port (rm_freertos_port)

FreeRTOS port for RA MCUs.

5.2.14.1 Azure RTOS ThreadX Port (rm_threadx_port)

Modules » RTOS

ThreadX port for RA MCUs.

Overview

Note

The ThreadX Port does not provide any interfaces to the user. Consult the ThreadX documentation at https://docs.microsoft.com/en-us/azure/rtos/threadx/ for further information.

Features

The RA ThreadX port supports the following features:

- Standard ThreadX configurations
- Hardware stack monitor

Configuration

Build Time Configurations for ThreadX

The following build time configurations are defined in fsp_cfg/azure/tx/tx_user.h:

Configuration	Options	Default	Description
General			
Custom tx_user.h	Manual Entry		Add a path to your custom tx_user.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
Error Checking	• Enabled • Disabled	Enabled	The ThreadX basic API error checking can be bypassed by compiling with the symbol TX_DISABLE_ERROR_CHECKING defined.
Max Priorities	Value must be a multiple of 32 and in range 32 to 1024 or empty	32	Define the priority levels for ThreadX. Legal values range from 32 to 1024 and MUST be evenly divisible by 32.
Minimum Stack	Value must be greater than 0 or empty	200	Define the minimum stack for a ThreadX thread on this processor. If the size supplied during thread creation is less than this value, the thread create call will return an error.
Stack Filling	• Enabled • Disabled	Enabled	Determine is stack filling is enabled. By default, ThreadX stack filling is enabled, which places an 0xEF pattern in each byte of each

			thread's stack. This is used by debuggers with ThreadX-awareness and by the ThreadX run-time stack checking feature.
Preemption Threshold	• Enabled • Disabled	Disabled	Determine if preemption-threshold should be disabled. By default, preemption-threshold is disabled. If the application does not use preemption-threshold, it may be disabled to reduce code size and improve performance.
Notify Callbacks	• Enabled • Disabled	Disabled	Determine if the notify callback option should be disabled. By default, notify callbacks are disabled. If the application does not use notify callbacks, they may be disabled to reduce code size and improve performance.
Inline Thread Resume Suspend	• Enabled • Disabled	Disabled	Determine if the tx_thread_resume and tx_thread_suspend services should have their internal code in-line. This results in a larger image, but improves the performance of the thread resume and suspend services.
Not Interruptable	• Enabled • Disabled	Disabled	Determine if the internal ThreadX code is non-interruptable. This results in smaller code size and less processing overhead, but increases the interrupt lockout time.
IAR Library Support	• Enabled • Disabled	Disabled	Enable IAR library support (IAR compiler only). When IAR Library Support is Enabled, enable the linker option

			--threaded_lib. In the IAR IDE, this can be enabled in Project > Options > General Options > Library Configuration > Enable thread support in library.
BSD Support	• Enabled • Disabled	Disabled	Defines TX_THREAD_EXTENSION_1 to bsd_err_no in order to support NXD BSD.
FileX Pointer	• Enabled • Disabled	Enabled	Determine if there is a FileX pointer in the thread control block. By default, the pointer is there for legacy/backwards compatibility. The pointer must also be there for applications using FileX. Disable this to save space in the thread control block.
Timer			
Timer Ticks Per Second	Value must be greater than 0 or empty	100	Define the number of times the system timer runs per second. Default is 100 ticks per second, which results in a tick every 10ms.
Timer Thread Stack Size	Value must be greater than 0 or empty	1024	Define the system timer thread's default stack size and priority. These are only applicable if TX_TIMER_PROCESS_IN_ISR is disabled.
Timer Thread Priority	Value must be greater than 0 or empty	0	Define the system timer thread's default stack size and priority. These are only applicable if TX_TIMER_PROCESS_IN_ISR is disabled.
Timer Process In ISR	• Enabled • Disabled	Enabled	Determine if timer expirations (application timers, timeouts, and tx_thread_sleep calls should be processed within the a system

			timer thread or directly in the timer ISR. When disabled, the timer thread is used. When enabled, timer expiration processing is done directly from the timer ISR, thereby eliminating the timer thread control block, stack, and context switching to activate it.
Reactivate Inline	• Enabled • Disabled	Disabled	Determine if in-line timer reactivation should be used within the timer expiration processing. By default, this is disabled and a function call is used. When enabled, reactivating is performed in-line resulting in faster timer processing but slightly larger code size.
Timer	• Enabled • Disabled	Enabled	Determine if no timer processing is required. This option will help eliminate the timer processing when not needed.
Trace			
Event Trace	• Enabled • Disabled	Disabled	Determine if the trace event logging code should be enabled. This causes slight increases in code size and overhead, but provides the ability to generate system trace information which is available for viewing in TraceX.
Trace Buffer Name	Name must be a valid C symbol	g_tx_trace_buffer	Name of trace buffer symbol, only used if Event Trace is enabled.
Memory section for Trace Buffer	Manual Entry	.bss	Specify the memory section where the Trace Buffer will be allocated, only used if Event Trace is enabled.

			To view TraceX data, export this buffer as raw binary data to a file (.trx extension recommended) and open it with Azure RTOS TraceX.
Trace Buffer Size	Value must be greater than 0	65536	Trace buffer size in bytes, only used if Event Trace is enabled
Trace Buffer Number of Registries	Value must be greater than 0	30	Number of registries available to TraceX, only used if Event Trace is enabled
Performance			
Block Pool Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers block pool performance information.
Byte Pool Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers byte pool performance information.
Event Flags Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers event flags performance information.
Mutex Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers mutex performance information.
Queue Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers queue performance information.
Semaphore Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers semaphore performance information.
Thread Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers thread performance information.
Timer Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers timer performance information.

RA		
Hardware Thread Stack Monitoring	MCU Specific Options	Use RA Hardware Stack Monitors to monitor thread stacks for overflow. Not available on MCUs that support PSPLIM.
Interrupts		
SysTick Interrupt Priority	MCU Specific Options	Select the Systick interrupt priority.
Maximum Interrupt Priority	MCU Specific Options	The maximum priority (lowest numerical value) an interrupt can have and use scheduler services. Interrupts with higher priority can interrupt most scheduler critical sections. Setting this to Priority 0 (highest) disables this feature. This feature is not available on MCUs that do not have the BASEPRI register.

Clock Configuration

The ThreadX port uses the SysTick timer as the system clock. The timer rate is configured in the ThreadX component under General > Timer Ticks Per Second.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Interrupt Priorities

When no threads are ready to run, the ThreadX port spins in the PendSV_Handler, which is fixed at the lowest interrupt priority. The MCU does not service any other interrupts of the lowest priority while no threads are ready to run.

To get around this limitation, the application can create an idle thread that is always ready to run. If the idle thread enters a lower power mode, make sure all interrupts that are required to resume the scheduler can wake the MCU in the configured power mode. If the application expects to wake after a certain number of ticks, the idle thread should not enter standby mode because the SysTick cannot wake the MCU from standby mode. See Low Power Modes (r_lpm) for more information regarding low power modes.

Warning

Do not attempt to wake a thread from an interrupt with the lowest available interrupt

priority unless the application has created an idle thread.

Hardware Stack Monitor

The hardware stack monitor generates an NMI if the PSP goes out of the memory area for the stack allocated for the current thread. A callback can be registered using R_BSP_GroupIrqWrite() to be called whenever a stack overflow or underflow of the PSP for a particular thread is detected.

Low Power Modes

The idle processing executes WFI() when no thread is ready to run. If the MCU is configured to enter software standby mode or deep software standby mode when the idle processing executes WFI(), the RA ThreadX port changes the low power mode to sleep mode so the idle processing can wake from SysTick. The low power mode settings are restored when the MCU wakes from sleep mode.

TrustZone Integration

When using an RTOS in a TrustZone project, Arm recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the thread has allocated a secure context (using tx_thread_secure_stack_allocate).

The secure context can be freed by deleting the thread or calling tx_thread_secure_stack_free.

Examples

Stack Monitor Example

This is an example of using the stack monitor in an application.

```
#if BSP_FEATURE_BSP_HAS_SP_MON
void stack_monitor_callback(bsp_grp_irq_t irq);
void stack_monitor_callback (bsp_grp_irq_t irq)
{
 FSP_PARAMETER_NOT_USED(irq);
 if (1U == R_MPU_SPMON->SP[0].CTL_b.ERROR)
    {
 /* Handle main stack monitor error here. */
    }
 if (1U == R_MPU_SPMON->SP[1].CTL_b.ERROR)
    {
 /* Handle process stack monitor error here. */
    }
}
void rm_threadx_port_stack_monitor_example (void)
{
```

```
 /* Register a callback to be called when the stack goes outside the allocated stack
area. */
 R_BSP_GroupIrqWrite(BSP_GRP_IRQ_MPU_STACK, stack_monitor_callback);
}
#else
/* Allocate stack space to return from UsageFault. */
uint32_t g_stack_overflow_exception_stack[8] BSP_ALIGN_VARIABLE(BSP_STACK_ALIGNMENT)
BSP_PLACE_IN_SECTION(
    BSP_SECTION_STACK);
/* MCUs that do not have an SPMON stack monitor use PSPLIM to detect stack overflows.
When a stack overflow error
 * occurs, the UsageFault_Handler fires if it has been enabled. */
void UsageFault_Handler (void)
{
 register uint32_t cfsr = SCB->CFSR;
 if (cfsr & SCB_CFSR_STKOF_Msk)
    {
 /* Update PSP and PSPLIM to point to an exception stack frame allocated for stack
overflows. */
 register uint32_t * p_exception_stack_frame = (uint32_t *)
(&g_stack_overflow_exception_stack);
       __set_PSP((uint32_t) p_exception_stack_frame);
       __set_PSPLIM((uint32_t) p_exception_stack_frame);
 /* Clear XPSR, only set T-bit. */
       p_exception_stack_frame[7] = 1U << 24;
 /* Set PC to stack overflow error while loop. When execution returns from the
UsageFault, it will go to the
  * stack_overflow_error_occurred function. It cannot return to the location where
the fault occurred because
  * the MCU does not save the exception stack frame to the stack when a stack
overflow error occurs. */
       p_exception_stack_frame[6] = (uint32_t) stack_overflow_error_occurred;
    }
 /* Clear flags. */
```

```
    SCB->CFSR = cfsr;
}
/* This function is called from UsageFault_Handler after a stack overflow occurs. */
void stack_overflow_error_occurred (void)
{
 /* When recovering from a stack overflow, move the thread to a while(1) loop. */
 while (1)
    {
 /* Do nothing. */
    }
}
void rm_threadx_port_stack_monitor_example (void)
{
 /* Enable usage fault. */
    SCB->SHCSR |= SCB_SHCSR_USGFAULTENA_Msk;
}
#endif
```

TrustZone Example

This is an example of calling tx_thread_secure_stack_allocate before calling any non-secure callable functions in a thread.

```
extern TX_THREAD * _tx_thread_current_ptr;
void rm_threadx_port_trustzone_thread_example (void)
{
 /* When ThreadX is used in a non-secure TrustZone application,
tx_thread_secure_stack_allocate must be called prior
  * to calling any non-secure callable function in a thread. The first parameter is a
pointer to the thread control block.
  * This function can be called when the thread is created or in the thread before an
non-secure callable function is
  * called. The second parameter is unused in the FSP implementation. */
    UINT status = tx_thread_secure_stack_allocate(_tx_thread_current_ptr, 0);
    assert(TX_SUCCESS == status);
```

```
    rm_threadx_port_nsc_function();
}
```

5.2.14.2 FreeRTOS Port (rm_freertos_port)

Modules » RTOS

FreeRTOS port for RA MCUs.

Overview

Note

The FreeRTOS Port does not provide any interfaces to the user. Consult the FreeRTOS documentation at https://www.freertos.org/Documentation for further information.

Features

The RA FreeRTOS port supports the following features:

- Standard FreeRTOS configurations
- Hardware stack monitor

Configuration

Note

The FreeRTOS Port and libraries use printf by default when logging is enabled. printf requires a heap (BSP Tab -> Properties -> RA Common -> Heap size (bytes)).

Build Time Configurations for all

The following build time configurations are defined in aws/FreeRTOSConfig.h:

Configuration	Options	Default	Description
General			
Custom FreeRTOSConfig.h	Manual Entry		Add a path to your custom FreeRTOSConfig.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
Use Preemption	• Enabled • Disabled	Enabled	Set to Enabled to use the preemptive RTOS scheduler, or Disabled

			to use the cooperative RTOS scheduler.
Use Port Optimised Task Selection	• Enabled • Disabled	Disabled	Some FreeRTOS ports have two methods of selecting the next task to execute - a generic method, and a method that is specific to that port. The Generic method: Is used when Use Port Optimized Task Selection is set to 0, or when a port specific method is not implemented. Can be used with all FreeRTOS ports. Is completely written in C, making it less efficient than a port specific method. Does not impose a limit on the maximum number of available priorities. A port specific method: Is not available for all ports. Is used when Use Port Optimized Task Selection is Enabled. Relies on one or more architecture specific assembly instructions (typically a Count Leading Zeros [CLZ] or equivalent instruction) so can only be used with the architecture for which it was specifically written. Is more efficient than the generic method. Typically imposes a limit of 32 on the maximum number of available priorities.
Use Tickless Idle	• Enabled • Disabled	Disabled	Set Use Tickless Idle to Enabled to use the low power tickless mode, or Disabled to keep the

			tick interrupt running at all times. Low power tickless implementations are not provided for all FreeRTOS ports.
Cpu Clock Hz	Manual Entry	SystemCoreClock	Enter the frequency in Hz at which the internal clock that drives the peripheral used to generate the tick interrupt will be executing - this is normally the same clock that drives the internal CPU clock. This value is required in order to correctly configure timer peripherals.
Tick Rate Hz	Value must be greater than 0	1000	The frequency of the RTOS tick interrupt. The tick interrupt is used to measure time. Therefore a higher tick frequency means time can be measured to a higher resolution. However, a high tick frequency also means that the RTOS kernel will use more CPU time so be less efficient. The RTOS demo applications all use a tick rate of 1000Hz. This is used to test the RTOS kernel and is higher than would normally be required. More than one task can share the same priority. The RTOS scheduler will share processor time between tasks of the same priority by switching between the tasks during each RTOS tick. A high tick rate frequency will therefore also have the effect of reducing the

			'time slice' given to each task.
Max Priorities	Must be an integer and greater than 0	5	The number of priorities available to the application tasks. Any number of tasks can share the same priority. Each available priority consumes RAM within the RTOS kernel so this value should not be set any higher than actually required by your application.
Minimal Stack Size	Must be an integer and greater than 0	128	The size of the stack used by the idle task. Generally this should not be reduced from the value set in the FreeRTOSConfig.h file provided with the demo application for the port you are using. Like the stack size parameter to the xTaskCreate() and xTaskCreateStatic() functions, the stack size is specified in words, not bytes. If each item placed on the stack is 32-bits, then a stack size of 100 means 400 bytes (each 32-bit stack item consuming 4 bytes).
Max Task Name Len	Must be an integer and greater than 0	16	The maximum permissible length of the descriptive name given to a task when the task is created. The length is specified in the number of characters including the NULL termination byte.
Use 16-bit Ticks	Disabled	Disabled	Time is measured in 'ticks' - which is the number of times the tick interrupt has executed since the

			RTOS kernel was started. The tick count is held in a variable of type TickType_t. Defining configUSE_16_BIT_TICKS as 1 causes TickType_t to be defined (typedef'ed) as an unsigned 16bit type. Defining configUSE_16_BIT_TICKS as 0 causes TickType_t to be defined (typedef'ed) as an unsigned 32bit type. Using a 16-bit type will greatly improve performance on 8- and 16-bit architectures, but limits the maximum specifiable time period to 65535 'ticks'. Therefore, assuming a tick frequency of 250Hz, the maximum time a task can delay or block when a 16bit counter is used is 262 seconds, compared to 17179869 seconds when using a 32-bit counter.
Idle Should Yield	• Enabled • Disabled	Enabled	This parameter controls the behaviour of tasks at the idle priority. It only has an effect if: The preemptive scheduler is being used. The application creates tasks that run at the idle priority. If Use Time Slicing is Enabled then tasks that share the same priority will time slice. If none of the tasks get preempted then it might be assumed that each task at a given priority will be

allocated an equal amount of processing time - and if the priority is above the idle priority then this is indeed the case. When tasks share the idle priority the behaviour can be slightly different. If Idle Should Yield is Enabled then the idle task will yield immediately if any other task at the idle priority is ready to run. This ensures the minimum amount of time is spent in the idle task when application tasks are available for scheduling. This behaviour can however have undesirable effects (depending on the needs of your application) as depicted below:

The diagram above shows the execution pattern of four tasks that are all running at the idle priority. Tasks A, B and C are application tasks. Task I is the idle task. A context switch occurs with regular period at times T0, T1, ..., T6. When the idle task yields task A starts to execute - but the idle task has already consumed some of the current time slice. This results in task I and task A effectively sharing the same time slice. The application tasks B and C therefore get more processing time than the application task A.

			This situation can be avoided by: If appropriate, using an idle hook in place of separate tasks at the idle priority. Creating all application tasks at a priority greater than the idle priority. Setting Idle Should Yield to Disabled. Setting Idle Should Yield to Disabled prevents the idle task from yielding processing time until the end of its time slice. This ensure all tasks at the idle priority are allocated an equal amount of processing time (if none of the tasks get pre-empted) - but at the cost of a greater proportion of the total processing time being allocated to the idle task.
Use Task Notifications	• Enabled • Disabled	Enabled	Setting Use Task Notifications to Enabled will include direct to task notification functionality and its associated API in the build. Setting Use Task Notifications to Disabled will exclude direct to task notification functionality and its associated API from the build. Each task consumes 8 additional bytes of RAM when direct to task notifications are included in the build.
Task Notification Array Entries	Must be an integer and greater than 0	1	Set the Task Notifications Array

			Entries to enter the size of array needed
Use Mutexes	• Enabled • Disabled	Disabled	Set to Enabled to include mutex functionality in the build, or Disabled to omit mutex functionality from the build. Readers should familiarise themselves with the differences between mutexes and binary semaphores in relation to the FreeRTOS functionality.
Use Recursive Mutexes	• Enabled • Disabled	Disabled	Set to Enabled to include recursive mutex functionality in the build, or Disabled to omit recursive mutex functionality from the build.
Use Counting Semaphores	• Enabled • Disabled	Enabled	Set to Enabled to include counting semaphore functionality in the build, or Disabled to omit counting semaphore functionality from the build.
Queue Registry Size	Value must be positive integer greater than or equal to 0	10	The queue registry has two purposes, both of which are associated with RTOS kernel aware debugging: It allows a textual name to be associated with a queue for easy queue identification within a debugging GUI. It contains the information required by a debugger to locate each registered queue and semaphore. The queue registry has no purpose unless you are using a RTOS kernel aware debugger. Registry

			Size defines the maximum number of queues and semaphores that can be registered. Only those queues and semaphores that you want to view using a RTOS kernel aware debugger need be registered. See the API reference documentation for vQueueAddToRegistry( ) and vQueueUnregisterQueue() for more information.
Use Queue Sets	• Enabled • Disabled	Disabled	Set to Enabled to include queue set functionality (the ability to block, or pend, on multiple queues and semaphores), or Disabled to omit queue set functionality.
Use Time Slicing	• Enabled • Disabled	Disabled	If Use Time Slicing is Enabled, FreeRTOS uses prioritised preemptive scheduling with time slicing. That means the RTOS scheduler will always run the highest priority task that is in the Ready state, and will switch between tasks of equal priority on every RTOS tick interrupt. If Use Time Slicing is Disabled then the RTOS scheduler will still run the highest priority task that is in the Ready state, but will not switch between tasks of equal priority just because a tick interrupt has occurred.
Use Newlib Reentrant	• Enabled • Disabled	Disabled	If Use Newlib Reentrant is Enabled then a newlib reent structure will be allocated for

			each created task. Note Newlib support has been included by popular demand, but is not used by the FreeRTOS maintainers themselves. FreeRTOS is not responsible for resulting newlib operation. User must be familiar with newlib and must provide system-wide implementations of the necessary stubs. Be warned that (at the time of writing) the current newlib design implements a system-wide malloc() that must be provided with locks.
Enable Backward Compatibility	• Enabled • Disabled	Disabled	The FreeRTOS.h header file includes a set of #define macros that map the names of data types used in versions of FreeRTOS prior to version 8.0.0 to the names used in FreeRTOS version 8.0.0. The macros allow application code to update the version of FreeRTOS they are built against from a pre 8.0.0 version to a post 8.0.0 version without modification. Setting Enable Backward Compatibility to Disabled in FreeRTOSConfig.h excludes the macros from the build, and in so doing allowing validation that no pre version 8.0.0 names are being used.
Num Thread Local Storage Pointers	Value must be positive integer greater than or equal to 0	5	Sets the number of indexes in each task's thread local storage array.
Stack Depth Type	Manual Entry	uint32_t	Sets the type used to

			specify the stack depth in calls to xTaskCreate(), and various other places stack sizes are used (for example, when returning the stack high water mark). Older versions of FreeRTOS specified stack sizes using variables of type UBaseType_t, but that was found to be too restrictive on 8-bit microcontrollers. Stack Depth Type removes that restriction by enabling application developers to specify the type to use.
Message Buffer Length Type	Manual Entry	size_t	FreeRTOS Message buffers use variables of type Message Buffer Length Type to store the length of each message. If Message Buffer Length Type is not defined then it will default to size_t. If the messages stored in a message buffer will never be larger than 255 bytes then defining Message Buffer Length Type to uint8_t will save 3 bytes per message on a 32-bit microcontroller. Likewise if the messages stored in a message buffer will never be larger than 65535 bytes then defining Message Buffer Length Type to uint16_t will save 2 bytes per message on a 32-bit microcontroller.
Library Max Syscall Interrupt Priority	MCU Specific Options		The highest interrupt priority that can be used by any interrupt service routine that

makes calls to interrupt safe FreeRTOS API functions. DO NOT CALL INTERRUPT SAFE FREERTOS API FUNCTIONS FROM ANY INTERRUPT THAT HAS A HIGHER PRIORITY THAN THIS! (higher priorities are lower numeric values)

Below is explanation for macros that are set based on this value from FreeRTOS website.

In the RA port, configKERNEL_INTERRUPT_PRIORITY is not used and the kernel runs at the lowest priority.

Note in the following discussion that only API functions that end in "FromISR" can be called from within an interrupt service routine.

configMAX_SYSCALL_INTERRUPT_PRIORITY sets the highest interrupt priority from which interrupt safe FreeRTOS API functions can be called.

A full interrupt nesting model is achieved by setting configMAX_SYSCALL_INTERRUPT_PRIORITY above (that is, at a higher priority level) than configKERNEL_INTERRUPT_PRIORITY. This means the FreeRTOS kernel does not completely disable interrupts, even inside critical sections. Further, this is achieved without the

disadvantages of a segmented kernel architecture.

Interrupts that do not call API functions can execute at priorities above configMAX_SYSCALL_INTERRUPT_PRIORITY and therefore never be delayed by the RTOS kernel execution.

A special note for Arm Cortex-M users: Please read the page dedicated to interrupt priority settings on Arm Cortex-M devices. As a minimum, remember that Arm Cortex-M cores use numerically low priority numbers to represent HIGH priority interrupts, which can seem counter-intuitive and is easy to forget! If you wish to assign an interrupt a low priority do NOT assign it a priority of 0 (or other low numeric value) as this can result in the interrupt actually having the highest priority in the system - and therefore potentially make your system crash if this priority is above config MAX_SYSCALL_INTERRUPT_PRIORITY.

The lowest priority on a Arm Cortex-M core is in fact 255 - however different Arm Cortex-M vendors implement a different number of priority bits and supply library functions that expect priorities to be specified in different ways. For example, on the RA6M3 the lowest

			priority you can specify is 15 - and the highest priority you can specify is 0.
Assert	Manual Entry	assert(x)	The semantics of the configASSERT() macro are the same as the standard C assert() macro. An assertion is triggered if the parameter passed into configASSERT() is zero. configASSERT() is called throughout the FreeRTOS source files to check how the application is using FreeRTOS. It is highly recommended to develop FreeRTOS applications with configASSERT() defined. The example definition (shown at the top of the file and replicated below) calls vAssertCalled(), passing in the file name and line number of the triggering configASSERT() call (__FILE__ and __LINE__ are standard macros provided by most compilers). This is just for demonstration as vAssertCalled() is not a FreeRTOS function, configASSERT() can be defined to take whatever action the application writer deems appropriate. It is normal to define configASSERT() in such a way that it will prevent the application from executing any further. This if for two reasons; stopping the application at the point

of the assertion allows the cause of the assertion to be debugged, and executing past a triggered assertion will probably result in a crash anyway.

Note defining configASSERT() will increase both the application code size and execution time. When the application is stable the additional overhead can be removed by simply commenting out the configASSERT() definition in FreeRTOSConfig.h.

/* Define configASSERT() to call vAssertCalled() if the assertion fails. The assertion
has failed if the value of the parameter passed into configASSERT() equals zero. */
#define configASSERT((x)) if((x) == 0) vAssertCalled(__FILE__, __LINE__)
If running FreeRTOS under the control of a debugger, then configASSERT() can be defined to just disable interrupts and sit in a loop, as demonstrated below. That will have the effect of stopping the code on the line that failed the assert test - pausing the debugger will then immediately take you to the offending line so you can see why it failed.

			/* Define configASSERT() to disable interrupts and sit in a loop. */ #define configASSERT((x)) if((x) == 0) { taskDISABLE_INTERRUPTS(); for(;;); }
Include Application Defined Privileged Functions	• Enabled • Disabled	Disabled	Include Application Defined Privileged Functions is only used by FreeRTOS MPU. If Include Application Defined Privileged Functions is Enabled then the application writer must provide a header file called "application_defined_privileged_functions.h", in which functions the application writer needs to execute in privileged mode can be implemented. Note that, despite having a .h extension, the header file should contain the implementation of the C functions, not just the functions' prototypes. Functions implemented in "application_defined_privileged_functions.h" must save and restore the processor's privilege state using the prvRaisePrivilege() function and portRESET_PRIVILEGE() macro respectively. For example, if a library provided print function accesses RAM that is outside of the control of the application writer, and therefore cannot be allocated to a memory protected user mode task, then the print function can

			be encapsulated in a privileged function using the following code:
			
			void MPU_debug_printf(const char *pcMessage)
			{
			/* State the privilege level of the processor when the function was called. */
			BaseType_t xRunningPrivileged = prvRaisePrivilege();
			
			/* Call the library function, which now has access to all RAM. */
			debug_printf(pcMessage);
			
			/* Reset the processor privilege level to its original value. */
			portRESET_PRIVILEGE(xRunningPrivileged);
			}
			This technique should only be use during development, and not deployment, as it circumvents the memory protection.

Hooks			
Use Idle Hook	• Enabled • Disabled	Enabled	Set to Enabled if you wish to use an idle hook, or Disabled to omit an idle hook.
Use Malloc Failed Hook	• Enabled • Disabled	Disabled	The kernel uses a call to pvPortMalloc() to allocate memory from the heap each time a task, queue or semaphore is created. The official FreeRTOS download includes four sample memory allocation schemes for this purpose. The schemes are

			implemented in the heap_1.c, heap_2.c, heap_3.c, heap_4.c and heap_5.c source files respectively. Use Malloc Failed Hook is only relevant when one of these three sample schemes is being used. The malloc() failed hook function is a hook (or callback) function that, if defined and configured, will be called if pvPortMalloc() ever returns NULL. NULL will be returned only if there is insufficient FreeRTOS heap memory remaining for the requested allocation to succeed. If Use Malloc Failed Hook is Enabled then the application must define a malloc() failed hook function. If Use Malloc Failed Hook is set to Dosab;ed then the malloc() failed hook function will not be called, even if one is defined. Malloc() failed hook functions must have the name and prototype shown below. void vApplicationMalloc FailedHook(void);
Use Daemon Task Startup Hook	• Enabled • Disabled	Disabled	If Use Timers and Use Daemon Task Startup Hook are both Enabled then the application must define a hook function that has the exact name and prototype as shown below. The hook function will be called exactly once when the RTOS daemon task

			(also known as the timer service task) executes for the first time. Any application initialisation code that needs the RTOS to be running can be placed in the hook function. void void vApplicationDaemonTaskStartupHook(void);
Use Tick Hook	• Enabled • Disabled	Disabled	Set to Enabled if you wish to use an tick hook, or Disabled to omit an tick hook.
Check For Stack Overflow	• Enabled • Disabled	Disabled	The stack overflow detection page describes the use of this parameter. This is not recommended for RA MCUs with hardware stack monitor support. RA MCU designs should enable the RA hardware stack monitor instead.
Stats			
Use Trace Facility	• Enabled • Disabled	Disabled	Set to Enabled if you wish to include additional structure members and functions to assist with execution visualisation and tracing.
Use Stats Formatting Functions	• Enabled • Disabled	Disabled	Set Use Trace Facility and Use Stats Formatting Functions to Enabled to include the vTaskList() and vTaskGetRunTimeStats() functions in the build. Setting either to Disabled will omit vTaskList() and vTaskGetRunTimeStates() from the build.
Generate Run Time Stats	• Enabled • Disabled	Disabled	The Run Time Stats page describes the use of this parameter.
Memory Allocation			

Clear Memory on Free	• Enabled • Disabled	Disabled	If set to 1, then blocks of memory allocated using pvPortMalloc() will be cleared when freed using vPortFree()
Support Static Allocation	• Enabled • Disabled	Enabled	If Support Static Allocation is Enabled then RTOS objects can be created using RAM provided by the application writer. If Support Static Allocation is Disabled then RTOS objects can only be created using RAM allocated from the FreeRTOS heap. If Support Static Allocation is left undefined it will default to 0. If Support Static Allocation is Enabled then the application writer must also provide two callback functions: vApplication GetIdleTaskMemory() to provide the memory for use by the RTOS Idle task, and (if Use Timers is Enabled) vAp plicationGetTimerTask Memory() to provide memory for use by the RTOS Daemon/Timer Service task. Examples are provided below. /* Support Static Allocation is Enabled, so the application must provide an implementation of vAp plicationGetIdleTaskMe mory() to provide the memory that is used by the Idle task. */ void vApplicationGetIdl eTaskMemory(StaticTask_t **ppxIdleT

askTCBBuffer,
StackType_t **ppxIdleT
askStackBuffer,
uint32_t
*pulIdleTaskStackSize)
{
/* If the buffers to be
provided to the Idle
task are declared
inside this
function then they
must be declared static
- otherwise they will be
allocated on
the stack and so not
exists after this
function exits. */
static StaticTask_t
xIdleTaskTCB;
static StackType_t
uxIdleTaskStack[config
MINIMAL_STACK_SIZE];

/* Pass out a pointer to
the StaticTask_t
structure in which the
Idle task's
state will be stored. */
*ppxIdleTaskTCBBuffer
=

/* Pass out the array
that will be used as the
Idle task's stack. */
*ppxIdleTaskStackBuffe
r = uxIdleTaskStack;

/* Pass out the size of
the array pointed to by
*ppxIdleTaskStackBuffe
r.
Note that, as the array
is necessarily of type
StackType_t,
configMINIMAL_STACK_
SIZE is specified in
words, not bytes. */
*pulIdleTaskStackSize
= configMINIMAL_STAC
K_SIZE;
}
/*-----------------------------
-----------------------------*/

/* Support Static

Allocation and Use
Timers are both
Enabled, so the
application must
provide an
implementation of vAp
plicationGetTimerTask
Memory()
to provide the memory
that is used by the
Timer service task. */
void vApplicationGetTi
merTaskMemory(
StaticTask_t **ppxTime
rTaskTCBBuffer,
StackType_t **ppxTime
rTaskStackBuffer,
uint32_t
*pulTimerTaskStackSiz
e)
{
/* If the buffers to be
provided to the Timer
task are declared
inside this
function then they
must be declared static
- otherwise they will be
allocated on
the stack and so not
exists after this
function exits. */
static StaticTask_t
xTimerTaskTCB;
static StackType_t
uxTimerTaskStack[con
figTIMER_TASK_STACK_
DEPTH];

/* Pass out a pointer to
the StaticTask_t
structure in which the
Timer
task's state will be
stored. */
*ppxTimerTaskTCBBuff
er =

/* Pass out the array
that will be used as the
Timer task's stack. */
*ppxTimerTaskStackBu
ffer =
uxTimerTaskStack;

			/* Pass out the size of the array pointed to by *ppxTimerTaskStackBuffer.
			Note that, as the array is necessarily of type StackType_t, configTIMER_TASK_STACK_DEPTH is specified in words, not bytes. */
			*pulTimerTaskStackSize = configTIMER_TASK_STACK_DEPTH;
			}
			
			Examples of the callback functions that must be provided by the application to supply the RAM used by the Idle and Timer Service tasks if Support Static Allocation is Enabled.
			
			See the Static Vs Dynamic Memory Allocation page for more information.

Support Dynamic Allocation	• Enabled • Disabled	Disabled	If Support Dynamic Allocation is Enabled then RTOS objects can be created using RAM that is automatically allocated from the FreeRTOS heap. If Support Dynamic Allocation is set to 0 then RTOS objects can only be created using RAM provided by the application writer. See the Static Vs Dynamic Memory Allocation page for more information.
Total Heap Size	Value must be positive integer greater than or equal to 0	1024	The total amount of RAM available in the FreeRTOS heap. This value will only be used if Support Dynamic Allocation is Enabled and the

			application makes use of one of the sample memory allocation schemes provided in the FreeRTOS source code download. See the memory configuration section for further details.
Application Allocated Heap	• Enabled • Disabled	Disabled	By default the FreeRTOS heap is declared by FreeRTOS and placed in memory by the linker. Setting Application Allocated Heap to Enabled allows the heap to instead be declared by the application writer, which allows the application writer to place the heap wherever they like in memory. If heap_1.c, heap_2.c or heap_4.c is used, and Application Allocated Heap is Enabled, then the application writer must provide a uint8_t array with the exact name and dimension as shown below. The array will be used as the FreeRTOS heap. How the array is placed at a specific memory location is dependent on the compiler being used - refer to your compiler's documentation. uint8_t ucHeap[configTOTAL_HEAP_SIZE];
Timers			
Use Timers	• Enabled • Disabled	Enabled	Set to Enabled to include software timer functionality, or Disabled to omit software timer functionality. See the

			FreeRTOS software timers page for a full description.
Timer Task Priority	Value must be positive integer greater than or equal to 0	3	Sets the priority of the software timer service/daemon task. See the FreeRTOS software timers page for a full description.
Timer Queue Length	Value must be a non-negative integer	10	Sets the length of the software timer command queue. See the FreeRTOS software timers page for a full description.
Timer Task Stack Depth	Value must be a non-negative integer	128	Sets the stack depth allocated to the software timer service/daemon task. See the FreeRTOS software timers page for a full description.
Optional Functions			
vTaskPrioritySet() Function	• Enabled • Disabled	Enabled	Include vTaskPrioritySet() function in build
uxTaskPriorityGet() Function	• Enabled • Disabled	Enabled	Include uxTaskPriorityGet() function in build
vTaskDelete() Function	• Enabled • Disabled	Enabled	Include vTaskDelete() function in build
vTaskSuspend() Function	• Enabled • Disabled	Enabled	Include vTaskSuspend() function in build
xResumeFromISR() Function	• Enabled • Disabled	Enabled	Include xResumeFromISR() function in build
vTaskDelayUntil() Function	• Enabled • Disabled	Enabled	Include vTaskDelayUntil() function in build
vTaskDelay() Function	• Enabled • Disabled	Enabled	Include vTaskDelay() function in build
xTaskGetSchedulerState() Function	• Enabled • Disabled	Enabled	Include xTaskGetSchedulerState() function in build
xTaskGetCurrentTaskHandle() Function	• Enabled • Disabled	Enabled	Include xTaskGetCurrentTaskHandle()

			function in build
uxTaskGetStackHighWaterMark() Function	• Enabled • Disabled	Disabled	Include uxTaskGetStackHighWaterMark() function in build
xTaskGetIdleTaskHandle() Function	• Enabled • Disabled	Disabled	Include xTaskGetIdleTaskHandle() function in build
eTaskGetState() Function	• Enabled • Disabled	Disabled	Include eTaskGetState() function in build
xEventGroupSetBitFromISR() Function	• Enabled • Disabled	Enabled	Include xEventGroupSetBitFromISR() function in build
xTimerPendFunctionCall() Function	• Enabled • Disabled	Disabled	Include xTimerPendFunctionCall() function in build
xTaskAbortDelay() Function	• Enabled • Disabled	Disabled	Include xTaskAbortDelay() function in build
xTaskGetHandle() Function	• Enabled • Disabled	Disabled	Include xTaskGetHandle() function in build
xTaskResumeFromISR() Function	• Enabled • Disabled	Enabled	Include xTaskResumeFromISR() function in build
RA			
Hardware Stack Monitor	• Enabled • Disabled	Disabled	Include RA stack monitor
Logging			
Print String Function	Manual Entry	vLoggingPrint(x)	
Logging Include Time and Task Name	• Disabled • Enabled	Disabled	
Debug Logging Name	Manual Entry	Log Name	
Logging Level	• LOG_NONE • LOG_ERROR • LOG_WARN • LOG_INFO • LOG_DEBUG	LOG_NONE	Set the logging level

Clock Configuration

The FreeRTOS port uses the SysTick timer as the system clock. The timer rate is configured in the FreeRTOS component under General > Tick Rate Hz.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Hardware Stack Monitor (PSPLIM)

A UsageFault is generated if PSP goes out of the memory area for the stack allocated for the current task. If UsageFault is not enabled, it is escalated to HardFault.

Hardware Stack Monitor (SPMON)

The hardware stack monitor generates an NMI if the PSP goes out of the memory area for the stack allocated for the current task. A callback can be registered using R_BSP_GroupIrqWrite() to be called whenever a stack overflow or underflow of the PSP for a particular thread is detected.

Stack Monitor Underflow Detection

By default the hardware stack monitor only checks for overflow of the process stack. To check for underflow define configRECORD_STACK_HIGH_ADDRESS as 1 on the command line.

Low Power Modes

When FreeRTOS is configured to use tickless idle, the idle task executes WFI() when no task is ready to run. If the MCU is configured to enter software standby mode or deep software standby mode when the idle task executes WFI(), the RA FreeRTOS port changes the low power mode to sleep mode so the idle task can wake from SysTick. The low power mode settings are restored when the MCU wakes from sleep mode.

TrustZone Integration

When using an RTOS in a TrustZone project, Arm recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the task has allocated a secure context (using portALLOCATE_SECURE_CONTEXT).

The secure context can be freed by deleting the thread or using the portCLEAN_UP_TCB(pxTCB) macro.

Examples

Stack Monitor Example

This is an example of using the stack monitor in an application.

```
#if BSP_FEATURE_BSP_HAS_SP_MON
void stack_monitor_callback (bsp_grp_irq_t irq)
{
 FSP_PARAMETER_NOT_USED(irq);
 if (1U == R_MPU_SPMON->SP[0].CTL_b.ERROR)
    {
 /* Handle main stack monitor error here. */
```

```
    }
 if (1U == R_MPU_SPMON->SP[1].CTL_b.ERROR)
    {
 /* Handle process stack monitor error here. */
    }
}
void rm_freertos_port_stack_monitor_example (void)
{
 /* Register a callback to be called when the stack goes outside the allocated stack
area. */
 R_BSP_GroupIrqWrite(BSP_GRP_IRQ_MPU_STACK, stack_monitor_callback);
}
#else
/* Allocate stack space to return from UsageFault. */
uint32_t g_stack_overflow_exception_stack[8] BSP_ALIGN_VARIABLE(BSP_STACK_ALIGNMENT)
BSP_PLACE_IN_SECTION(
    BSP_SECTION_STACK);
/* MCUs that do not have an SPMON stack monitor use PSPLIM to detect stack overflows.
When a stack overflow error
 * occurs, the UsageFault_Handler fires if it has been enabled. */
void UsageFault_Handler (void)
{
 register uint32_t cfsr = SCB->CFSR;
 if (cfsr & SCB_CFSR_STKOF_Msk)
    {
 /* Update PSP and PSPLIM to point to an exception stack frame allocated for stack
overflows. */
 register uint32_t * p_exception_stack_frame = (uint32_t *)
(&g_stack_overflow_exception_stack);
       __set_PSP((uint32_t) p_exception_stack_frame);
       __set_PSPLIM((uint32_t) p_exception_stack_frame);
 /* Clear XPSR, only set T-bit. */
       p_exception_stack_frame[7] = 1U << 24;
 /* Set PC to stack overflow error while loop. When execution returns from the
```

```
UsageFault, it will go to the
  * stack_overflow_error_occurred function. It cannot return to the location where
the fault occurred because
  * the MCU does not save the exception stack frame to the stack when a stack
overflow error occurs. */
       p_exception_stack_frame[6] = (uint32_t) stack_overflow_error_occurred;
    }
 /* Clear flags. */
    SCB->CFSR = cfsr;
}
/* This function is called from UsageFault_Handler after a stack overflow occurs. */
void stack_overflow_error_occurred (void)
{
 /* When recovering from a stack overflow, move the task to a while(1) loop. */
 while (1)
    {
 /* Do nothing. */
    }
}
void rm_freertos_port_stack_monitor_example (void)
{
 /* Enable usage fault. */
    SCB->SHCSR |= SCB_SHCSR_USGFAULTENA_Msk;
}
#endif
```

TrustZone Example

This is an example of calling portALLOCATE_SECURE_CONTEXT before calling any non-secure callable functions in a task.

```
void rm_freertos_port_trustzone_task_example (void)
{
 /* When FreeRTOS is used in a non-secure TrustZone application,
portALLOCATE_SECURE_CONTEXT must be called prior
```

```
  * to calling any non-secure callable function in a task. The parameter is unused in
the FSP implementation. */
    portALLOCATE_SECURE_CONTEXT(0);
    rm_freertos_port_nsc_function();
}
```

5.2.15 Security

Modules

Detailed Description

Security Modules.

Modules

	AWS Device Provisioning AWS Device Provisioning example software.
	Azure RTOS NetX Crypto HW Acceleration (rm_netx_secure_crypto) Hardware acceleration for the Netx Crypto implementation of the Microsoft Azure RTOS NetX Crypto API.
	Mbed Crypto H/W Acceleration (rm_psa_crypto) Hardware acceleration for the mbedCrypto implementation of the Arm PSA Crypto API.
	Renesas Secure IP (r_rsip_protected) Driver for the Renesas Secure IP on RA MPUs. This module implements the RSIP Interface.
	SCE Protected Mode Driver for the Secure Crypto Engine (SCE9) on RA MCUs.
	Secure Crypto Engine (r_sce_protected_cavp) Driver for the CAVP Certified Secure Crypto Engine (SCE) on RA MCUs.

	Secure Key Injection (r_rsip_key_injection) Driver for the Secure Key Injection on RA MCUs.
	Secure Key Injection (r_sce_key_injection) Driver for the Secure Key Injection on RA MCUs.
	TinyCrypt H/W Acceleration (rm_tinycrypt_port) AES128 Hardware acceleration for TinyCrypt on the RA2 family.

5.2.15.1 AWS Device Provisioning

Modules » Security

AWS Device Provisioning example software.

Overview

Terminology

The terminology defined below will be used in the following sections.

Term	Description
Service Provider	Entity that provides the cloud infrastructure and associated services, for example, AWS/Azure.
Device Manufacturer	Entity that provides the MCU, for example, Renesas.
OEM	Entity that uses the MCU to create a product.
Customer	End user of OEM product.

Device ID

For systems that intend to use Public Key Certificate (PKC), the Device ID is in the form of a key pair (RSA or ECC). A PKC comprises of a **public key**, metadata, and finally a signature over all that. This signature is generated by the entity that issues the certificate and is known as a CA (Certificate Authority). The most common format for a public certificate is the X.509 format which is typically PEM (base 64) encoded such that the certificate is human-readable. It can also be DER encoded which is binary encoding and thus not human readable. The **public key** portion of the Device ID is used for the Device Certificate.

Provisioning

Device Provisioning refers to the process by which a service provider links a certificate to a Device ID and thus a device. Depending on the provisioning model, an existing certificate from the device may be used or a new one will be issued at this stage. Provisioning (also referred to as Registration) occurs with respect to a particular service provider, for example, AWS or Azure. It is necessary that the certificate is issued by the service provider or a CA known to those providers. When a device is provisioned with AWS for example, the AWS IoT service associates the Device ID (and thus the device) with a specific certificate. The certificate will be programmed into the device and for all future transactions with AWS, the certificate will be used as the means of identifying the device. The public and private key are also stored on the MCU.

Provisioning Models

Provisioning services vary between service providers. There are essentially three general provisioning models.

1. Provisioning happens on the production line. This requires the provisioning Infrastructure to be present on the production line. This is the most secure model, but is expensive.
2. Devices are programmed with a shared credential that is linked into the code at build time and the provisioning occurs when a customer uses the device for the first time. The shared credential and a unique device serial number are used to uniquely identify the device during the provisioning process. So long as the product only has the shared credential, it will only operate with limited (as defined by certificate policy) functionality .Once the provisioning is done, then the device will be fully functional. This is the most common use case for consumer products where no sensitive information is being transmitted. AWS provides an example of this model.
3. Devices have no identity programmed in the factory; provisioning occurs through some other device like a smartphone which is already trusted by the service provider.

In all these cases, the Device Identity

1. Is unique to the device
2. Must have restricted access within the device
3. Can be used to issue more than one certificate and the certificates themselves have to be updatable in the field.

AWS uses the PKCS11 API to erase, store and retrieve certificates. These PKCS11 functions (Write, Read and Erase) are separated out into a Physical Abstraction Layer (PAL) which the OEM/Device Manufacturer is expected to implement for the type of memory that they intend to use. The internal rm_aws_pkcs11_pal_littlefs module implements these requirements on RA MCU data flash.

AWS Provisioning Example

AWS provides an **example** implementation to support device provisioning. This implementation uses the PKCS11 API to store device credentials into the PKCS11 defined memory. The implementation (aws_dev_mode_key_provisioning.c) exposes:

1. vAlternateKeyProvisioning()

This function requires that the device credentials be provided in PEM format. Using this example function as is in production is not recommended.

Note **vDevModeKeyProvisioning()** is no longer supported.

Credentials can be created as follows: *Create your own CA and use that to generate the device

certificate. This CA will have to be registered with the service provider with which the product will be used, for example Register your CA with AWS.

- Use AWS to generate the device certificate.

Examples

Basic Example

This is a basic example of provisioning a device using the AWS demo implementation.

```
#define keyCLIENT_CERTIFICATE_PEM \

    params.ulJITPCertificateLength   = 0;
    vAlternateKeyProvisioning(&params);
}
```

Limitations

The provisioning code is an example provided by AWS. It must be modified to meet product requirements.

5.2.15.2 Azure RTOS NetX Crypto HW Acceleration (rm_netx_secure_crypto)

Modules » Security

Detailed Description

Hardware acceleration for the Netx Crypto implementation of the Microsoft Azure RTOS NetX Crypto API.

Overview

Please refer to the NetXDuo - NetX Crypto documentation for further details.

HW Overview

Crypto Peripheral version	Devices
SCE9	RA6M4, RA4M3, RA4M2, RA6M5
SCE7	RA6M3, RA6M2, RA6M1, RA6T1
SCE5	RA4W1, RA4M1
SCE5B	RA6T2
AES Engine	RA2A1, RA2E1, RA2E2, RA2L1
RSIP7	RA8M1

Note

NetX Crypto hardware acceleration is unsupported on 'SCE5' and 'AES Engine' crypto peripherals listed above.

Features

This module provides SCE9 hardware support for the following NetX Crypto operations

- SHA256 calculation
- SHA224 calculation
- MAC Operations
  - HMAC with SHA224
  - HMAC with SHA256
- AES
  - Keybits - 128, 192, 256
    - Encryption and Decryption.
    - Chaining Modes: CBC, CTR, GCM mode

AES Chaining Mode	HW Acceleration
CBC	Fully accelerated
CTR	Fully accelerated
GCM	Encrypt - Fully accelerated; Decrypt - Only GHASH and block cipher unit is HW accelerated
CCM	Only block cipher unit is HW accelerated

- Random number generation
- ECC
  - ECDSA: Supported Curves - SECP384R1, SECP256R1.
  - ECDH: Supported Curves - SECP384R1, SECP256R1.
- RSA
  - Signature Generation - RSA 2048 (Plain or Wrapped private) key. (This can be used for decryption)
  - Signature Verification - RSA 2048, RSA 3072 and RSA 4096 keys. (This can be used for encryption)
  - Supported encoding scheme: PKCS1V15

This module provides SCE7 hardware support for the following NetX Crypto operations

- SHA256 calculation
- SHA224 calculation
- AES
  - Keybits - 128, 192, 256
    - Encryption and Decryption.
    - Chaining Modes: CBC, CTR, GCM mode

AES Chaining Mode	HW Acceleration
CBC	Fully accelerated
CTR	Fully accelerated
GCM	Only block cipher unit is HW accelerated
CCM	Only block cipher unit is HW accelerated

- ECC

    - ECDSA: Supported Curves - SECP384R1, SECP256R1.
    - ECDH: Supported Curves - SECP384R1, SECP256R1.
- RSA
    - Signature Generation - RSA 2048 (Plain or Wrapped private) key. (This can be used for decryption)
    - Signature Verification - RSA 2048. (This can be used for encryption)
    - Supported encoding scheme: PKCS1V15

Configuration

Build Time Configurations for rm_netx_secure_crypto_sw_port

The following build time configurations are defined in fsp_cfg/middleware/rm_netx_secure_crypto_cfg.h:

Configuration	Options	Default	Description
Standalone Usage	• Use Standalone Crypto Only • Use with TLS	Use Standalone Crypto Only	Defines NX_CRYPTO_STANDALONE_ENABLE.
Maximum RSA Modulus size (bits)	• 1024 • 2048 • 3072 • 4096	4096	

Build Time Configurations for rm_netx_secure_crypto

The following build time configurations are defined in fsp_cfg/middleware/rm_netx_secure_crypto_cfg.h:

Configuration	Options	Default	Description
Hardware Acceleration			
Hardware Acceleration > Hash			
SHA256/224	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_SHA256_ALT.
Hardware Acceleration > Cipher			
AES	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_AES_ALT
Hardware Acceleration > Public Key Cryptography (PKC)			
Hardware Acceleration > Public Key Cryptography (PKC) > ECC			
ECC	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_ECC_ALT
ECDSA Scratch Buffer Size (Bytes)	Value must be an integer	3016	Sets value of NX_CRYPTO_ECDSA_SCRATCH_BUFFER_SIZE

ECDH Scratch Buffer Size (Bytes)	Value must be an integer	2464	Sets value of NX_CRYPTO_ECDH_SCRATCH_BUFFER_SIZE
Hardware Acceleration > Public Key Cryptography (PKC) > RSA			
RSA	MCU Specific Options		Enables/Disables RSA HW support
RSA 2048 (HW)	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_2048_ALT to allow HW support
RSA 3072 Verify/Encryption (HW)	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_3072_ALT to allow HW support
RSA 4096 Verify/Encryption (HW)	MCU Specific Options		Enables RSA NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_4096_ALT to allow HW support
RSA Scratch Buffer Size (Bytes)	MCU Specific Options		Sets value of NX_CRYPTO_RSA_SCRATCH_BUFFER_SIZE
TRNG	• Enabled • Disabled	Enabled	Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_TRNG_ALT.
Standalone Usage	• Use Standalone Crypto Only • Use with TLS	Use Standalone Crypto Only	Defines NX_CRYPTO_STANDALONE_ENABLE.

Random Number Generator Configuration

To enable hardware acceleration for the TRNG, the macro NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_TRNG_ALT must be defined in the configuration file. By default TRNG is enabled which can be disabled using the RA Configuration editor.

Once enabled 'rand' function will be mapped to HW TRNG; the 'srand' function is not supported, any calls to this function will have no effect. Functionality to re-seed the HW TRNG is not supported by the existing implementation.

If disabled, both 'rand' and 'srand' will be mapped to the C Standard Library. This would require setting up the heap as 'rand' implementation calls 'malloc'.

SHA256 Configuration

To enable hardware acceleration for the SHA256/224 calculation, the macro NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_SHA256_ALT must be defined in the configuration file. By default SHA256 is enabled which can be disabled using the RA Configuration editor.

AES Configuration

To enable hardware acceleration for the AES128/192/256 operation, the macro NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_AES_ALT must be defined in the configuration file. By default AES is enabled which can be disabled using the RA Configuration editor.

ECC Configuration

To enable hardware acceleration for the ECDSA and ECDH for curves SECP384R1 and SECP256R1, the macro NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_ECC_ALT must be defined in the configuration file. By default ECC operations are enabled which can be disabled using the RA Configuration editor.

RSA Configuration

To enable hardware acceleration for the RSA Encrypt/Decrypt (or Sign/Verify) operation(s), the macro(s) below must be must be defined in the configuration file:

Configuration Macro	Feature / Operation
NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_2048_ALT	Signature Generation / Signature Verification (Encryption / Decryption)
NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_3072_ALT	Signature Verification (Encryption Only)
NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_4096_ALT	Signature Verification (Encryption Only)

By default RSA 2048 is enabled which can be disabled using the RA Configuration editor.

RSA software implementation is completely disabled when any of the above macros are enabled.

Usage Notes

Memory Alignment

Use 32bit aligned buffer pointers as arguments to APIs for best performance.

Hardware Initialization

_nx_crypto_initialize() must be invoked before using the NetX Crypto APIs to ensure that the SCE peripheral is initialized.

Memory Usage

Sufficient memory must be allocated to be used as 'crypto_metadata' for the chosen crypto operation(s). Refer Azure RTOS NetX Crypto API description for recommended 'crypto_metadata_size' based on selected crypto operations. Sufficient amount of memory must be allocated for the thread stack to support low level crypto operations when using this module in the standalone mode or through NetX Secure (TLS). A minimum stack of 0x1000 is required to use ECC and RSA. This is either the main stack in a bare metal application or the specific thread stack for an RTOS based application.

AES Usage

GCM mode

The first byte of the IV must indicate the length of the subsequent IV. For example if the IV is {0x00, 0x00, 0x00}, then the IV pointer passed to the _nx_crypto_method_aes_operation must store the IV as {0x03, 0x00, 0x00, 0x00}. Refer to the example code for actual usage.

CTR mode

For CTR mode the IV pointer must be as defined in Using Advanced Encryption Standard (AES) Counter Mode With IPsec Encapsulating Security Payload (ESP) under 'Figure 2. Counter Block Format'. The IV must be 8 bytes in length. The Nonce field in the reference above must be 4 bytes and should be passed to _nx_crypto_method_aes_operation through the key pointer stored after the actual AES key. For Example, if the AES 128-bit Plain Key is {0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00} and the Nonce is {0x01, 0x07, 0xBD, 0xFD}, the key passed to the _nx_crypto_method_aes_operation during Encryption/Decryption should be set as {0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x01, 0x07, 0xBD, 0xFD}. This format would also be valid for Wrapped keys where the Nonce is appended at the end of the actual Wrapped key. Refer to the example code for actual usage.

The 'Block Counter' field in the above reference is fixed to {0x00, 0x00, 0x00, 0x01} at the beginning and increments internally after every subsequent AES block is processed. Test vectors that have the initial Block Counter not set to {0x00, 0x00, 0x00, 0x01} cannnot be used in this implementation.

ECC Usage

ECC operations include ECDH and ECDSA. As a part of ECDSA operation the input message can be hashed before signing or verification, or the message digest can be provided directly. ECC Scratch buffer size can be optionally reduced as supported ECC computations are now done by the HW. This is controlled by NX_CRYPTO_ECDSA_SCRATCH_BUFFER_SIZE and NX_CRYPTO_ECDH_SCRATCH_BUFFER_SIZE macros for ECDSA and ECDH respectively.

Operation	Key Format
ECDSA Signature	Plain private key; Wrapped private key
ECDSA Signature-Verify	Uncompressed public key
Key Generation using ECDSA operation API	Wrapped private key; Uncompressed public key
ECDH private key import	Plain private key; Wrapped private key (Allows for Uncompressed and Formatted public key)
ECDH public key export	Uncompressed public key
ECDH setup	Uncompressed public key
ECDH shared secret calculate	Uncompressed public key
Key Generation using ECDH operation API	Wrapped private key; Uncompressed public key

Note:

- Uncompressed public key is of the form (0x04 || Qx || Qy). Refer Section 2.2. Subject Public Key under RFC5480
- Formatted public key is of the form (Key Info (4 bytes) || Qx || Qy || Key Info (16 bytes)). This is the key which is used internally by SCE peripheral.

RSA Usage

Wrapped Key Usage

To use the NetX Crypto stack with wrapped private keys (for signature generation/decryption), a dummy pointer (non-NULL) should be passed to the 'key' parameter during _nx_crypto_method_rsa_init API call. However, the 'key_size_in_bits' parameter should be equal to the intended RSA modulus length in bits. The actual wrapped key must be passed as the 'key' parameter to the _nx_crypto_method_rsa_operation API call with its length in bits passed through the 'key_size_in_bits' parameter.

For PKCS1V15 operation 'key' and 'key_size_in_bits' parameters of _nx_crypto_method_pkcs1_v1_5_init are unused. These can be passed as NULL and 0 respectively. The actual wrapped key must be passed as the 'key' parameter to the _nx_crypto_method_pkcs1_v1_5_operation API call and the intended modulus length in bits must be passed through the 'key_size_in_bits' parameter.

Software Implementation

The plaintext data passed in to the RSA encryption API must be 4-byte aligned. If it is not aligned then when the resultant encrypted data is decrypted using the decryption API, the unaligned data will be endian-swapped. For instance, if {0x01, 0x02,0x03, 0x04, 0x05} is passed as input data for encryption, when decrypted, the result will be {0x01, 0x02, 0x03, 0x04, 0x00, 0x00, 0x00, 0x05}. Note that this alignment of input data need not be taken care while using Hardware accelerated RSA.

Limitations

- Only little endian mode is supported.
- RSA CRT keys are not supported.
- ECJPAKE related operations are unsupported for NIST 224, 256 and 384 bit curves when HW ECC is eanbled.

Examples

Initialization Example

This example shows how to initialize the HW crypto engine. This step must be performed before any crypto algorithm is used.

```
/* Setup the platform; initialize the SCE and the TRNG */
   err = nx_crypto_initialize();
   assert(NX_CRYPTO_SUCCESS == err);
```

Hash Example

This is an example on calculating the SHA256 hash using the NetX Crypto API.

```
extern NX_CRYPTO_METHOD crypto_method_sha256;
const uint8_t NIST_SHA256ShortMsgLen200[] =
{
    0x2e, 0x7e, 0xa8, 0x4d, 0xa4, 0xbc, 0x4d, 0x7c, 0xfb, 0x46, 0x3e, 0x3f, 0x2c,
```

```
0x86, 0x47, 0x05,
    0x7a, 0xff, 0xf3, 0xfb, 0xec, 0xec, 0xa1, 0xd2, 00
};
const uint8_t NIST_SHA256ShortMsgLen200_expected[] =
{
    0x76, 0xe3, 0xac, 0xbc, 0x71, 0x88, 0x36, 0xf2, 0xdf, 0x8a, 0xd2, 0xd0, 0xd2,
0xd7, 0x6f, 0x0c,
    0xfa, 0x5f, 0xea, 0x09, 0x86, 0xbe, 0x91, 0x8f, 0x10, 0xbc, 0xee, 0x73, 0x0d,
0xf4, 0x41, 0xb9
};
void netx_secure_crypto_sha256_example (void)
{
 size_t   actual_hash_len = RM_NETX_SECURE_CRYPTO_EXAMPLE_SHA256_HASH_SIZE_BYTES;
    uint8_t actual_hash[RM_NETX_SECURE_CRYPTO_EXAMPLE_SHA256_HASH_SIZE_BYTES];
    uint8_t metadata[sizeof(NX_CRYPTO_SHA256)];
    uint32_t metadata_size = sizeof(NX_CRYPTO_SHA256);
 void   * handler       = NX_CRYPTO_NULL;
    uint32_t err          = NX_CRYPTO_SUCCESS;
 /* Setup the platform; initialize the SCE and the TRNG */
    err = nx_crypto_initialize();
    assert(NX_CRYPTO_SUCCESS == err);
 /* Nx Crypto SHA256 init */
    err = _nx_crypto_method_sha256_init(&crypto_method_sha256, NX_CRYPTO_NULL, 0,
&handler, metadata, metadata_size);
    assert(NX_CRYPTO_SUCCESS == err);
 /* Nx Crypto SHA256 operation - NX_CRYPTO_HASH_INITIALIZE */
    err = _nx_crypto_method_sha256_operation(NX_CRYPTO_HASH_INITIALIZE,
                                             handler,
                                             &crypto_method_sha256,
                                             NX_CRYPTO_NULL,
                                             0,
                                             NX_CRYPTO_NULL,
                                             0,
                                             NX_CRYPTO_NULL,
```

```
                                          NX_CRYPTO_NULL,
                                          0,
                                          metadata,
                                          metadata_size,
                                          NX_CRYPTO_NULL,
                                          NX_CRYPTO_NULL);
   assert(NX_CRYPTO_SUCCESS == err);
/* Nx Crypto SHA256 operation - NX_CRYPTO_HASH_UPDATE,
 * call this multiple times if needed to hash multiple data batches */
   err =
      _nx_crypto_method_sha256_operation(NX_CRYPTO_HASH_UPDATE,
                                         handler,
                                         &crypto_method_sha256,
                                         NX_CRYPTO_NULL,
                                         0,
                                         (uint8_t *) NIST_SHA256ShortMsgLen200,

Functions

int	mbedtls_platform_setup (mbedtls_platform_context *ctx)
void	mbedtls_platform_teardown (mbedtls_platform_context *ctx)
fsp_err_t	RM_PSA_CRYPTO_TRNG_Read (uint8_t *const p_rngbuf, uint32_t num_req_bytes, uint32_t *p_num_gen_bytes) Reads requested length of random data from the TRNG. Generate nbytes of random bytes and store them in p_rngbuf buffer. More...

Detailed Description

Hardware acceleration for the mbedCrypto implementation of the Arm PSA Crypto API.

Overview

Note

The PSA Crypto module does not provide any interfaces to the user. This release uses the mbedTLS version 3.5.0 which conforms to the PSA Crypto API 1.0 specification. Consult the Arm documentation at https://armmbed.github.io/mbed-crypto/psa/#application-programming-interface for further information. *FSP 3.0 onward adopts a change by Arm where mbedCrypto has been integrated back to MbedTLS and the term mbedCrypto has been deprecated. The mbedCrypto term in FSP now refers to the crypto portion of the MbedTLS module.*

HW Overview

Crypto Peripheral version	Devices
SCE9	RA6M4, RA4M3, RA4M2, RA6M5
SCE7	RA6M3, RA6M2, RA6M1, RA6T1
SCE5	RA4W1, RA4M1
SCE5B	RA6T2
AES Engine	RA2A1, RA2E1, RA2E2, RA2L1
TRNG	RA4E1, RA4E2, RA4T1, RA6E1, RA6E2, RA6T3
RSIP-E51A	RA8M1, RA8D1, RA8T1

Features

The PSA_Crypto module provides hardware support for the following PSA Crypto operations

- SHA256 calculation

- SHA224 calculation
- SHA512 calculation (Available only on RSIP7)
- SHA384 calculation (Available only on RSIP7)
- MAC Operations
- AES
    - Keybits - 128, 192, 256
    - Plain-Text Key Generation
    - Wrapped Key Generation
    - Encryption and Decryption with no padding and with PKCS7 padding.
    - CBC, CTR, CCM , XTS and GCM modes
    - MAC operations
    - Export and Import of Plaintext and Wrapped keys
- ECC
    - Curves:
        - SECP256R1
        - SECP256K1
        - Brainpool256R1
        - SECP384R1
        - Brainpool384R1
    - Plain-Text Key Generation (Unavailable on SCE9 and RSIP7)
    - Wrapped Key Generation (Available only on RSIP7) (Available only on RSIP7)
    - Signing and Verification
    - Export and Import of Plaintext keys
    - Export and Import of Wrapped keys generated by PSA.
    - ECDH Support
- RSA
    - Plain-Text Key Generation for RSA-2048. (Unavailable on SCE9 and RSIP7)
    - Wrapped Key Generation for RSA-2048. RSA-3072 and 4096 on RSIP7 only.
    - Signature Generation for RSA-2048. RSA-3072 and 4096 on RSIP7 only.
    - Verification for RSA-2048. RSA-3072 and 4096 on SCE9 and RSIP7 only.
    - Encryption and Decryption with PKCS1V15 and OAEP padding
    - Export and Import of Plaintext keys
    - Export and Import of Wrapped keys generated by PSA.
- Random number generation
- Persistent Key Storage

Configuration

Build Time Configurations for mbedCrypto

The following build time configurations are defined in arm/mbedtls/config.h:

Configuration	Options	Default	Description
Hardware Acceleration			
Hardware Acceleration > Key Format			
AES	MCU Specific Options		Select AES key formats used
ECC	MCU Specific Options		Select ECC key formats used
RSA	MCU Specific Options		Select RSA key formats used

Hardware Acceleration > Hash		
SHA256/224	MCU Specific Options	Defines MBEDTLS_SHA256_ALT and MBEDTLS_SHA256_PROCESS_ALT.
SHA512/384	MCU Specific Options	Defines MBEDTLS_SHA512_ALT and MBEDTLS_SHA512_PROCESS_ALT.
Hardware Acceleration > Cipher		
AES	MCU Specific Options	Defines MBEDTLS_AES_ALT, MBEDTLS_AES_SETKEY_ENC_ALT, MBEDTLS_AES_SETKEY_DEC_ALT, MBEDTLS_AES_ENCRYPT_ALT and MBEDTLS_AES_DECRYPT_ALT
Hardware Acceleration > Public Key Cryptography (PKC)		
Hardware Acceleration > Public Key Cryptography (PKC) > RSA 3072		
RSA 3072 > Key Generation	MCU Specific Options	Enables RSA 3072 Key Generation.
RSA 3072 > Signing	MCU Specific Options	Enables RSA 3072 Key Signing.
RSA 3072 > Verification	MCU Specific Options	Enables RSA 3072 Verify.
Hardware Acceleration > Public Key Cryptography (PKC) > RSA 4096		
RSA 4096 > Key Generation	MCU Specific Options	Enables RSA 4096 Key Generation.
RSA 4096 > Signing	MCU Specific Options	Enables RSA 4096 Key Signing.
RSA 4096 > Verification	MCU Specific Options	Enables RSA 4096 Verify.
ECC	MCU Specific Options	Defines MBEDTLS_ECP_ALT
ECDSA	MCU Specific Options	Defines MBEDTLS_ECDSA_SIGN_ALT and MBEDTLS_ECDSA_VERIFY_ALT
ECDH	MCU Specific Options	Defines MBEDTLS_ECDH_ALT
RSA	MCU Specific Options	Defines MBEDTLS_RSA_ALT. RSA 2048 Key

			Generation, Signing and Verification are also enabled.
TRNG	Enabled	Enabled	Defines MBEDTLS_ENTROPY_HARDWARE_ALT.
Crypto Engine Initialization	Enabled	Enabled	MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT
Platform

SHA256 Configuration

To enable hardware acceleration for the SHA256/224 calculation, the macro MBEDTLS_SHA256_ALT and MBEDTLS_SHA256_PROCESS_ALT must be defined in the configuration file. By default SHA256 is

enabled. SHA256 can be disabled, but SHA512 then needs to be enabled (software version) because the PSA implementation uses it for the entropy accumulator. This can be done using the RA Configuration editor.

AES Configuration

To enable hardware acceleration for the AES128/256 operation, the macro MBEDTLS_AES_SETKEY_ENC_ALT, MBEDTLS_AES_SETKEY_DEC_ALT, MBEDTLS_AES_ENCRYPT_ALT and MBEDTLS_AES_DECRYPT_ALT must be defined in the configuration file. By default AES is enabled. AES cannot be disabled because the PSA implementation requires it for the CTR_DRBG random number generator. This can be done using the RA Configuration editor.

Note

Only AES XTS 128 is currently supported. RA2 devices support acceleration for ECB part alone, while other devices support full AES XTS hardware acceleration.

ECC Configuration

To enable hardware acceleration for the ECC Key Generation operation, the macro MBEDTLS_ECP_ALT must be defined in the configuration file. For ECDSA, the macros MBEDTLS_ECDSA_SIGN_ALT and MBEDTLS_ECDSA_VERIFY_ALT must be defined. By default ECC, ECDSA and ECDHE are enabled. To disable ECC, undefine MBEDTLS_ECP_C, MBEDTLS_ECDSA_C and MBEDTLS_ECDH_C. This can be done using the RA Configuration editor.

RSA Configuration

To enable hardware acceleration for the RSA2048 operation, the macro MBEDTLS_RSA_ALT must be defined in the configuration file. By default RSA is enabled. To disable RSA, undefine MBEDTLS_RSA_C, MBEDTLS_PK_C, MBEDTLS_PK_PARSE_C, MBEDTLS_PK_WRITE_C. This can be done using the RA Configuration editor.

Wrapped Key Usage

To use the Secure Crypto Engine to generate and use wrapped keys, use PSA_KEY_TYPE_AES_WRAPPED or PSA_KEY_TYPE_ECC_KEY_PAIR_WRAPPED(curve) or PSA_KEY_TYPE_RSA_KEY_PAIR when setting the key type attribute. Setting the key's type attribute using this value will cause the SCE to use wrapped key mode for all operations related to that key. The user can use the export functionality to save the wrapped keys to user ROM and import it later for usage. This mode requires that Wrapped Key functionality for the algorithm is enabled in the project configuration.

Note

On the SCE9 devices, only the RSA public key can be exported. A file system must be used to store the internally generated private key.

Persistent Key Storage

Persistent key storage can be enabled by defining MBEDTLS_FS_IO, MBEDTLS_PSA_CRYPTO_STORAGE_C, and MBEDTLS_PSA_ITS_FILE_C. The key lifetime must also be specifed as PSA_KEY_LIFETIME_PERSISTENT. A lower level storage module must be added in the RA Configuration editor and initialized in the code before generating persistent keys. Persistent storage supports the use of plaintext and vendor keys. Refer to the lower level storage module documentation for information on how it should be initialized. To generate a persistent key the key must be assigned a unique id prior to calling generate using the psa_set_key_id api.

```
if (PSA_KEY_LIFETIME_IS_PERSISTENT(lifetime))
   {
/* Set the id to a positive integer. */
      psa_set_key_id(&attributes, (psa_key_id_t) 5);
   }
```

Platform Configuration

To run the mbedCrypto implementation of the PSA Crypto API on the MCU, the macro MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT must be defined in the configuration file. This enables code that will initialize the SCE. Parameter checking (General|MBEDTLS_CHECK_PARAMS) is enabled by default. To reduce code size, disable parameter checking.

Random Number Configuration

To run the mbedCrypto implementation of the PSA Crypto API on the MCU, the macro MBEDTLS_ENTROPY_HARDWARE_ALT must be defined in the configuration file. This enables using the TRNG as an entropy source. None of the other cryptographic operations (even in software only mode) will work without this feature.

Usage Notes

Hardware Initialization

mbedtls_platform_setup() must be invoked before using the PSA Crypto API to ensure that the SCE peripheral is initialized.

Memory Usage

In general, depending on the mbedCrypto features being used a heap size of 0x1000 to 0x5000 bytes is required. The total allocated heap should be the **sum** of the heap requirements of the individual algorithms:

Algorithm	Required Heap (bytes)
SHA256/224	None
AES	0x200
Hardware ECC	0x400
Software ECC	0x1800
RSA	0x1500

A minimum stack of 0x1000 is required where the module is used. This is either the main stack in a bare metal application or the task stack of the task used for crypto operations.

Limitations

- Only little endian mode is supported.

Stdio Buffering

The MBEDTLS_PLATFORM_SETBUF_MACRO was introduced in mbedTLS 3.2.1 to prevent stdio read/write functions from buffering stream data to reduce the likelihood of key leakage by setting the buffer argument in setbuf() to NULL. FSP uses a dummy_setbuf() function in rm_psa_crypto.c to prevent build errors; since FSP uses LittleFS by default (where the usage of a buffer is mandatory) this function does not perform any action. Setting the cache size in LittleFS to the minimum supported by the Data Flash (4) can minimize but not remove the likelihood of key data leakage. The dummy function can be replaced with a user-defined function by defining a different value for MBEDTLS_PLATFORM_SETBUF_MACRO_value in the FSP configurator.

SCE9 Usage

The SCE9 is used in Compatibility Mode for mbedCrypto acceleration. The crypto capabilities in this mode on the SCE9 are different which results in the below usage limitations with mbedCrypto:

- The module includes **both** wrapped and plaintext keys code irrespective of whether the application requires it.
- Plaintext key generation is not supported for RSA and ECC; only wrapped keys can be generated.
- If ECDH is used, only wrapped key will be generated on SCE9 and will not return an error even if the user context is somehow set for plain key. This may be relevant only if the psa_key_agreement() function with plaintext key on SCE9 is attempted.

Note

For a detailed description of the different SCE9 operating modes, refer to Application Note R11AN0498.

Using PSA Crypto with TrustZone

Unlike FSP drivers, PSA Crypto cannot be configured as Non-secure callable in the RA Configurator for a secure project. The reason for this is that in order to achieve the security objective of controlling access to protected keys, both the PSA Crypto code as well as the keys must be placed in the secure region. Since the PSA Crypto API requires access to the keys directly during initialization and later via a key handle, allowing non-secure code to use the API by making it Non-secure callable will require the keys to be stored in non-secure memory.

This section will provide a short explanation of how to add PSA Crypto to a secure project and have it usable by the non-secure project without exposing the keys. In this example the secure project will contain an RSA private key and the non-secure project is expected to be able to perform sign and verify operations using that key.

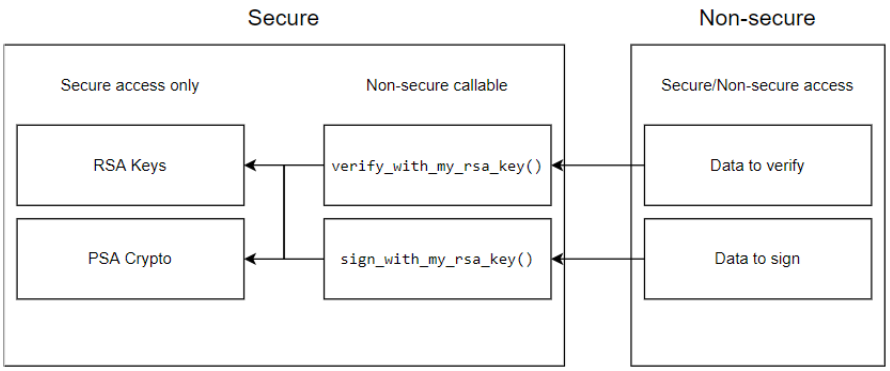

Figure 286: PSA Crypto Non-secure callable example

- Secure project
  - During secure project boot-up, psa_crypto_init() is called.
  - The RSA private key is programmed into secure flash either at the factory or by calling psa_generate_key() in persistent mode. Note that the data-flash area used by the LittleFS will have to be in the secure region if the key is generated as a persistent.
  - psa_import_key()/psa_open_key() are called with the resultant handle held in secure RAM.
  - The Non-secure callable section contains the following **user-defined** functions
  - verify_with_my_rsa_key(input_signature, input_hash, verification_result)
  - The implementation of this function in secure region will call psa_verify_hash() and return the result via verification_result.
  - sign_with_my_rsa_key(input_hash, output_signature)
  - The implementation of this function in secure region will call psa_sign_hash() and return the signature via output_signature.

- Non-secure project
  - Calls verify_with_my_rsa_key() to verify a signature. The implementation will use the public key that is present in the secure project.
  - Calls sign_with_my_rsa_key() to generate a signature. The implementation will use the private key that is present on the secure project.

For more details on how to add user-code to the Non-secure callable region refer to the "Security Design with Arm TrustZone - IP Protection (R11AN0467EU0100)" Application Note.

Examples

Hash Example

This is an example on calculating the SHA256 hash using the PSA Crypto API.

```
const uint8_t NIST_SHA256ShortMsgLen200[] =
{
    0x2e, 0x7e, 0xa8, 0x4d, 0xa4, 0xbc, 0x4d, 0x7c, 0xfb, 0x46, 0x3e, 0x3f, 0x2c,
0x86, 0x47, 0x05,
    0x7a, 0xff, 0xf3, 0xfb, 0xec, 0xec, 0xa1, 0xd2, 00
};
const uint8_t NIST_SHA256ShortMsgLen200_expected[] =
{
    0x76, 0xe3, 0xac, 0xbc, 0x71, 0x88, 0x36, 0xf2, 0xdf, 0x8a, 0xd2, 0xd0, 0xd2,
0xd7, 0x6f, 0x0c,
    0xfa, 0x5f, 0xea, 0x09, 0x86, 0xbe, 0x91, 0x8f, 0x10, 0xbc, 0xee, 0x73, 0x0d,
0xf4, 0x41, 0xb9
};
```

```

      debugger_break();
   }
else if (PSA_SUCCESS != psa_mac_verify_finish(&verify_operation, AES_CMAC_mac,
mac_ret))
   {
/* MAC verification failed */
      debugger_break();
   }
else
   {
/* All the operations succeeded for MAC verification */
   }
```

ECC Example

This is an example on using the PSA Crypto API to generate an ECC-P256R1 key, signing and verifying data after hashing it first using SHA256.

Note

Unlike RSA, ECDSA does not have any padding schemes. Thus the hash argument for the ECC sign operation MUST have a size larger than or equal to the curve size; i.e. for PSA_ECC_CURVE_SECP256R1 the payload size must be at least 256/8 bytes. nist.fips.186-4: " A hash function that provides a lower security strength than the security strength associated with the bit length of 'n' ordinarily should not be used, since this would reduce the security strength of the digital signature process to a level no greater than that provided by the hash function."

```
#define ECC_256_BIT_LENGTH 256
#define ECC_256_EXPORTED_SIZE 500
uint8_t exportedECC_SECP256R1Key[ECC_256_EXPORTED_SIZE];
size_t exportedECC_SECP256R1Keylength = 0;
```

```
void psa_ecc256R1_example (void)
{
/* This example generates an ECC-P256R1 keypair, performs signing and verification
operations.
 * It then exports the generated key into ASN1 DER format to a RAM array which can
then be programmed to flash.
 * It then re-imports that key, and performs signing and verification operations. */

RSA Example

This is an example on using the PSA Crypto API to generate an RSA2048 key, encrypting and decrypting multi-block data and using PKCS7 padding.

```
#define RSA_2048_BIT_LENGTH 2048
#define RSA_2048_EXPORTED_SIZE 1210
/* The RSA 2048 key pair export in der format is roughly as follows
 * RSA private keys:
 * RSAPrivateKey ::= SEQUENCE { ------------------------------------ 1 + 3
 * version Version, ------------------------------------- 1 + 1 + 1
 * modulus INTEGER, ---------------- n ------------------- 1 + 3 + 256 + 1
 * publicExponent INTEGER, ---------------- e ------------------- 1 + 4
 * privateExponent INTEGER, ---------------- d ------------------- 1 + 3 + 256 (276
for Wrapped)
 * prime1 INTEGER, ---------------- p ------------------- 1 + 3 + (256 / 2)
 * prime2 INTEGER, ---------------- q ------------------- 1 + 3 + (256 / 2)
 * exponent1 INTEGER, ---------------- d mod (p-1) --------- 1 + 2 + (256 / 2) (4 for
Wrapped)
 * exponent2 INTEGER, ---------------- d mod (q-1) --------- 1 + 2 + (256 / 2) (4 for
Wrapped)
 * coefficient INTEGER, ---------------- (inverse of q) mod p - 1 + 2 + (256 / 2) (4
for Wrapped)
 * otherPrimeInfos OtherPrimeInfos OPTIONAL ----------------------- 0 (not
supported)
 * }
 */

Function Documentation

◆ mbedtls_platform_setup()

int mbedtls_platform_setup (mbedtls_platform_context * *ctx*)

This function initializes the SCE and the TRNG. It **must** be invoked before the crypto library can be used. This implementation is used if MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT is defined.

Example:

```
mbedtls_platform_context ctx = {0};

/* Setup the platform; initialize the SCE and the TRNG */

if (PSA_SUCCESS != mbedtls_platform_setup(&ctx))
```

Return values

0	Initialization was successful.
MBEDTLS_ERR_PLATFORM_HW_ACCEL_FAILED	SCE Initialization error.

◆ mbedtls_platform_teardown()

void mbedtls_platform_teardown (mbedtls_platform_context * *ctx*)

This implementation is used if MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT is defined. It is intended to de-initialize any items that were initialized in the mbedtls_platform_setup() function, but currently is only a placeholder function.

Example:

```
/* De-initialize the platform. This is currently a placeholder function which does
not do anything. */

mbedtls_platform_teardown(&ctx);
```

Return values

N/A	

◆ RM_PSA_CRYPTO_TRNG_Read()

fsp_err_t RM_PSA_CRYPTO_TRNG_Read (uint8_t *const *p_rngbuf*, uint32_t *num_req_bytes*, uint32_t * *p_num_gen_bytes*)

Reads requested length of random data from the TRNG. Generate nbytes of random bytes and store them in p_rngbuf buffer.

Return values

FSP_SUCCESS	Random number generation successful
FSP_ERR_ASSERTION	NULL input parameter(s).
FSP_ERR_CRYPTO_UNKNOWN	An unknown error occurred.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- s_generate_16byte_random_data

Detailed Description

Driver for the Renesas Secure IP on RA MPUs. This module implements the RSIP Interface.

Overview

This module provides RSIP functions in protected mode.

HW Overview

Crypto Peripheral version	Devices
RSIP-E51A	RA8M1, RA8D1, RA8T1

Features

The RSIP module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/256bit
      - CBC 128/256bit
      - CTR 128/256bit
      - GCM 128/256bit
      - CCM 128/256bit
      - XTS 128/256bit
  - Asymmetric Encryption/Decryption
    - RSA
      - RSAES-PKCS1-V1_5 2048/3072/4096bit
      - RSAES-OAEP 2048/3072/4096bit
      - RSASSA-PKCS1-V1_5 2048/3072/4096bit
      - RSASSA-PSS 2048/3072/4096bit
    - ECC
      - ECDSA secp256r1/secp384r1/secp521r1
  - Hash Functions
    - SHA-2

        - SHA-256/384/512
    - RFC3394 Key Wrap/Unwrap
- Message Authentication Code
    - HMAC-SHA256/384/512bit
    - AES-CMAC 128/256bit
- Key Manage
    - Key Support
        - AES 128/256bit
        - RSA 2048/3072/4096bit
        - ECC secp256r1/secp384r1/secp521r1
        - HMAC-SHA256/384/512bit
- Random Number Generate

Supported algorithms

The following algorithms are available on each devices.

- RSIP-E51A: RA8M1, RA8D1, RA8T1

Symmetric Key

Key type (rsip_key_type_t)	RSIP-E51A
RSIP_KEY_TYPE_AES_128	Supported
RSIP_KEY_TYPE_AES_256	Supported
RSIP_KEY_TYPE_XTS_AES_128	Supported
RSIP_KEY_TYPE_XTS_AES_256	Supported
RSIP_KEY_TYPE_HMAC_SHA256	Supported
RSIP_KEY_TYPE_HMAC_SHA384	Supported
RSIP_KEY_TYPE_HMAC_SHA512	Supported

Asymmetric Key

Key pair type (rsip_key_pair_type_t)	Public key type (rsip_key_type_t)	Private key type (rsip_key_type_t)	RSIP-E51A
RSIP_KEY_PAIR_TYPE_ECC_SECP256R1	RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP256R1_PRIVATE	Supported
RSIP_KEY_PAIR_TYPE_ECC_SECP384R1	RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP384R1_PRIVATE	Supported
RSIP_KEY_PAIR_TYPE_ECC_SECP521R1	RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP521R1_PRIVATE	Supported
RSIP_KEY_PAIR_TYPE_RSA_2048	RSIP_KEY_TYPE_RSA_2048_PUBLIC	RSIP_KEY_TYPE_RSA_2048_PRIVATE	Supported
RSIP_KEY_PAIR_TYPE_RSA_3072	RSIP_KEY_TYPE_RSA_3072_PUBLIC	RSIP_KEY_TYPE_RSA_3072_PRIVATE	Supported
RSIP_KEY_PAIR_TYPE_RSA_4096	RSIP_KEY_TYPE_RSA_4096_PUBLIC	RSIP_KEY_TYPE_RSA_4096_PRIVATE	Supported

AES Block Cipher Mode of Operation

Cipher mode (rsip_aes_cipher_mode_t)	RSIP-E51A
RSIP_AES_CIPHER_MODE_ECB_ENC	Supported
RSIP_AES_CIPHER_MODE_ECB_DEC	Supported
RSIP_AES_CIPHER_MODE_CBC_ENC	Supported
RSIP_AES_CIPHER_MODE_CBC_DEC	Supported
RSIP_AES_CIPHER_MODE_CTR	Supported
RSIP_AES_CIPHER_MODE_XTS_ENC	Supported
RSIP_AES_CIPHER_MODE_XTS_DEC	Supported
AEAD mode (rsip_aes_aead_mode_t)	RSIP-E51A
RSIP_AES_AEAD_MODE_GCM_ENC	Supported
RSIP_AES_AEAD_MODE_GCM_DEC	Supported
RSIP_AES_AEAD_MODE_CCM_ENC	Supported
RSIP_AES_AEAD_MODE_CCM_DEC	Supported
MAC mode (rsip_aes_mac_mode_t)	RSIP-E51A
RSIP_AES_MAC_MODE_CMAC	Supported

Hash Function

Hash Function (rsip_hash_type_t)	RSIP-E51A
RSIP_HASH_TYPE_SHA256	Supported
RSIP_HASH_TYPE_SHA384	Supported
RSIP_HASH_TYPE_SHA512	Supported

Configuration

Build Time Configurations for r_rsip_e51a_protected

The following build time configurations are defined in fsp_cfg/r_rsip_cfg.h:

Configuration	Options	Default	Description
Selection of algorithms to enable			
AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the

			functions for which it works effectively.
AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-ECB CBC CTR	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused

			algorithms. This configuration is provided only for the functions for which it works effectively.
AES-GCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CMAC	Enabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP384R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the

			function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP521R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-2048	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-3072	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-4096	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.

SHA-1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-224	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is

			provided only for the functions for which it works effectively.
SHA-512_224	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_256	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA224	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by

			disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Security > RSIP Protected Mode (r_rsip)

This module can be added to the Stacks tab via New Stack > Security > RSIP Protected Mode (r_rsip).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_rsip	Module name.

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a RSIP Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > RSIP Protected Mode (r_rsip).

State Transition

This driver has the following states.

State Name	Details
STATE_INITIAL	Driver is not open.
STATE_MAIN	Ready to Compute.
STATE_AES	Computing AES (unauthenticated cipher)
STATE_AES_AEAD	Computing AES (AEAD).
STATE_AES_MAC	Computing AES (MAC).
STATE_SHA	Computing SHA.
STATE_HMAC	Computing HMAC.

There are two types of APIs provided by the RSIP driver for accelerating cryptographic operations: those that provide cryptographic operations in a single API and those that provide them in multiple APIs. In this document, the former is referred to as single-part operations and the latter as multi-part operations. Each corresponds to the following algorithms:

- Single-part operations: DRBG, Key management, ECC, RSA, SHA, HMAC
- Multi-part operations: AES, SHA, HMAC

Multi-part operations are APIs which split a single cryptographic operation into a sequence of separate steps (e.g. Init-Update-Finish). This enables fine control over the configuration of the cryptographic operation, and allows the message data to be processed in fragments instead of all at once.

Due to the above characteristics, it is necessary to manage the operational states in the multi-part operations.

Examples

AES cipher Example

This is an example of AES-CBC encryption/decryption.

```
void r_rsip_example_aes ()
{
 fsp_err_t            err;
 static const uint8_t plain[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4) =
    {
       0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
```

```
0x72, 0x6f, 0x6e,
       0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
    };
    uint8_t iv[RSIP_PRV_BYTE_SIZE_AES_BLOCK] BSP_ALIGN_VARIABLE(4) = {0};
    uint8_t cipher_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
    uint8_t plain_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
 /* Prepare wrapped key data area */
    uint8_t             wrapped_key[RSIP_BYTE_SIZE_WRAPPED_KEY_AES_256]
BSP_ALIGN_VARIABLE(4);
 rsip_wrapped_key_t * p_wrapped_key = (rsip_wrapped_key_t *) wrapped_key;
 /* Initialize the driver */
    err = R_RSIP_Open(&g_rsip_ctrl, &g_rsip_cfg);
    assert(FSP_SUCCESS == err);
 /* Generate a aes 256-bit key */
    err = R_RSIP_KeyGenerate(&g_rsip_ctrl, RSIP_KEY_TYPE_AES_256, p_wrapped_key);
    assert(FSP_SUCCESS == err);
 /* Generate a nonce */
    err = R_RSIP_RandomNumberGenerate(&g_rsip_ctrl, iv);
    assert(FSP_SUCCESS == err);
 /* Encrypt a plaintext */
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_ENC,
p_wrapped_key, iv);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, plain, cipher_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
 /* Decrypt a ciphertext using the same key */
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_DEC,
p_wrapped_key, iv);
```

```
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, cipher_calculated, plain_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl,
                                   cipher_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   plain_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
 /* Compare plain and plain_calculated */
    assert(0 == memcmp(plain, plain_calculated, RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2));
 /* Close the driver */
    err = R_RSIP_Close(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
}
```

AES-GCM Example

This is an example of AES-GCM encryption/decryption.

```
#define GCM_BLOCK_LEN (16)
#define GCM_TEXT_LEN (31)
#define GCM_NONCE_LEN (12)
#define GCM_AAD_LEN (8)
#define GCM_TAG_LEN (8)

/* Compare hash_1 and hash_2 */
    err = memcmp(hash_1, hash_2, HMAC_HASH_LEN);
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	rsip_instance_ctrl_t

Data Structure Documentation

◆ rsip_instance_ctrl_t

struct rsip_instance_ctrl_t
RSIP private control block. DO NOT MODIFY. Initialization occurs when R_RSIP_Open() is called.

Function Documentation

◆ R_RSIP_OTF_Init()

fsp_err_t R_RSIP_OTF_Init (rsip_ctrl_t *const *p_ctrl*, rsip_otf_channel_t const *channel*, rsip_wrapped_key_t *const *p_wrapped_key*, uint8_t const *const *p_seed*)

Initialize on-the-fly decryption on RSIP. Implements rsip_api_t::otfInit.

<Usage Precautions>

- Argument "channel" represents channel number to be used, and supports the features listed below.

Channel	Corresponding Parameter
CH-0	RSIP_OTF_CHANNEL_0
CH-1 (*)	RSIP_OTF_CHANNEL_1

(*) These features are not supported.

<Operational State>
This API can only be executed in the STATE_MAIN, and there are no state transitions.

Parameters

[in,out]	p_ctrl	Pointer to control block.
[in]	channel	Channel number.
[in]	p_wrapped_key	Pointer to wrapped AES key.
[in]	p_seed	Pointer to seed.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled or selected channel is invalid.
FSP_ERR_INVALID_ARGUMENT	Input key type is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Attention

This function is only part of on-the-fly decryption activation process and intended to be called from a higher level FSP module. Even if a user calls this function directly, the feature will not be enabled. The number of channels for the channel parameter is dependent on the hardware. RA8x1 supports only one channel, and channel parameter must always be set to RSIP_OTF_CHANNEL_0.

◆ R_RSIP_ECDSA_Sign()

fsp_err_t R_RSIP_ECDSA_Sign (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, uint8_t const *const *p_hash*, uint8_t *const *p_signature*)

Generates an ECDSA signature.

Implements rsip_api_t::ecdsaSign.

Conditions

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_ECC_SECP256R1_PRIVATE
- RSIP_KEY_TYPE_ECC_SECP384R1_PRIVATE
- RSIP_KEY_TYPE_ECC_SECP521R1_PRIVATE

Message hash p_hash should be computed in advance. In the case of hash length is less than the key length, padding is required to make it the same as the key length.

For secp521r1 operation, the length of p_hash must be set to 64 bytes.

For secp521r1 operation, the length of the argument p_signature must be set as 132 byte. Since 521 bit is not a 8-bit multiple, zero padding is required and the data format is as follows:

Data Format for secp521r1 (132 byte)			
zero padding (7 bit)	signature r (521 bit)	zero padding (7 bit)	signature s (521 bit)

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	• Input parameter is illegal. • Signature generation is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Section Supported Algorithms.

◆ R_RSIP_ECDSA_Verify()

fsp_err_t R_RSIP_ECDSA_Verify (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature*)

Verifies an ECDSA signature.

Implements rsip_api_t::ecdsaVerify.

Conditions

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC

Message hash p_hash should be computed in advance. In the case of hash length is less than the key length, padding is required to make it the same as the key length.

For secp521r1 operation, the length of p_hash must be set to 64 bytes.

For secp521r1 operation, the length of the argument p_signature must be set as 132 byte. Since 521 bit is not a 8-bit multiple, zero padding is required and the data format is as follows:

Data Format for secp521r1 (132 byte)			
zero padding (7 bit)	signature r (521 bit)	zero padding (7 bit)	signature s (521 bit)

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	• Input parameter is illegal. • Signature verification is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_RSA_Encrypt()

fsp_err_t R_RSIP_RSA_Encrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_plain*, uint8_t *const *p_cipher*)

Encrypts plaintext with raw RSA.

Implements rsip_api_t::rsaEncrypt.

Conditions

Key type of p_wrapped_public_key must be one of the following:
- RSIP_KEY_TYPE_RSA_2048_PUBLIC
- RSIP_KEY_TYPE_RSA_3072_PUBLIC
- RSIP_KEY_TYPE_RSA_4096_PUBLIC

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

This API provides RSA low-level primitives (RSAEP/RSAVP1). It should be used in conjunction with any padding scheme.

See also

Section Supported Algorithms.

◆ R_RSIP_RSA_Decrypt()

fsp_err_t R_RSIP_RSA_Decrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, uint8_t const *const *p_cipher*, uint8_t *const *p_plain*)

Decrypts ciphertext with raw RSA.

Implements rsip_api_t::rsaDecrypt.

Conditions

Key type of p_wrapped_private_key must be one of the following:
- RSIP_KEY_TYPE_RSA_2048_PRIVATE
- RSIP_KEY_TYPE_RSA_3072_PRIVATE
- RSIP_KEY_TYPE_RSA_4096_PRIVATE

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

This API provides RSA low-level primitives (RSADP/RSASP1). It should be used in conjunction with any padding scheme.

Section Supported Algorithms.

◆ R_RSIP_RSAES_PKCS1_V1_5_Encrypt()

fsp_err_t R_RSIP_RSAES_PKCS1_V1_5_Encrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_plain*, uint32_t const *plain_length*, uint8_t *const *p_cipher*)

Encrypts plaintext with RSAES-PKCS1-v1_5.

Implements rsip_api_t::rsaesPkcs1V15Encrypt.

Conditions

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PUBLIC
- RSIP_KEY_TYPE_RSA_3072_PUBLIC
- RSIP_KEY_TYPE_RSA_4096_PUBLIC

mLen (plain_length) and k (modulus length) must meet the following condition.

- mLen <= k - 11

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Section Supported Algorithms.

◆ R_RSIP_RSAES_PKCS1_V1_5_Decrypt()

fsp_err_t R_RSIP_RSAES_PKCS1_V1_5_Decrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, uint8_t const *const *p_cipher*, uint8_t *const *p_plain*, uint32_t *const *p_plain_length*, uint32_t const *plain_buffer_length*)

Decrypts with RSAES-PKCS1-v1_5.

Implements rsip_api_t::rsaesPkcs1V15Decrypt.

Conditions

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PRIVATE
- RSIP_KEY_TYPE_RSA_3072_PRIVATE
- RSIP_KEY_TYPE_RSA_4096_PRIVATE

plain_buffer_length must be greater than or equal to mLen(plaintext length).

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

This API skips the ciphertext length checking at RFC8017 (PKCS#1 v2.2) Section 7.2.2 Step 1.

Section Supported Algorithms.

◆ R_RSIP_RSAES_OAEP_Encrypt()

fsp_err_t R_RSIP_RSAES_OAEP_Encrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint8_t const *const *p_label*, uint32_t const *label_length*, uint8_t const *const *p_plain*, uint32_t const *plain_length*, uint8_t *const *p_cipher*)

Encrypts plaintext with RSAES-OAEP.

Implements rsip_api_t::rsaesOaepEncrypt.

Conditions

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PUBLIC
- RSIP_KEY_TYPE_RSA_3072_PUBLIC
- RSIP_KEY_TYPE_RSA_4096_PUBLIC

mLen (plain_length), hLen (hash length of hash_function), and k (modulus length) must meet the following condition.

- mLen <= k - 2 hLen - 2

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Argument mask_generation_function accepts any member of enumeration rsip_mgf_type_t.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Section Supported Algorithms.

◆ R_RSIP_RSAES_OAEP_Decrypt()

fsp_err_t R_RSIP_RSAES_OAEP_Decrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint8_t const *const *p_label*, uint32_t const *label_length*, uint8_t const *const *p_cipher*, uint8_t *const *p_plain*, uint32_t *const *p_plain_length*, uint32_t const *plain_buffer_length*)

Decrypts ciphertext with RSAES-OAEP.

Implements rsip_api_t::rsaesOaepDecrypt.

Conditions

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PRIVATE
- RSIP_KEY_TYPE_RSA_3072_PRIVATE
- RSIP_KEY_TYPE_RSA_4096_PRIVATE

hLen (hash length of hash_function) and k (modulus length) must meet the following condition.

- k >= 2 hLen + 2

plain_buffer_length must be greater than or equal to mLen(plaintext length).

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Argument mask_generation_function accepts any member of enumeration rsip_mgf_type_t.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

This API skips the ciphertext length checking at RFC8017 (PKCS#1 v2.2) Section 7.1.2 Step 1.

Section Supported Algorithms.

◆ R_RSIP_RSASSA_PKCS1_V1_5_Sign()

fsp_err_t R_RSIP_RSASSA_PKCS1_V1_5_Sign (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, rsip_hash_type_t const *hash_function*, uint8_t const *const *p_hash*, uint8_t *const *p_signature*)

Signs message with RSASSA-PKCS1-v1_5.

Implements rsip_api_t::rsassaPkcs1V15Sign.

Conditions

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PRIVATE
- RSIP_KEY_TYPE_RSA_3072_PRIVATE
- RSIP_KEY_TYPE_RSA_4096_PRIVATE

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Message hash p_hash should be computed in advance with hash_function.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Section Supported Algorithms.

◆ R_RSIP_RSASSA_PKCS1_V1_5_Verify()

fsp_err_t R_RSIP_RSASSA_PKCS1_V1_5_Verify (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_hash_type_t const *hash_function*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature*)

Verifies signature with RSASSA-PKCS1-v1_5.

Implements rsip_api_t::rsassaPkcs1V15Verify.

Conditions

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PUBLIC
- RSIP_KEY_TYPE_RSA_3072_PUBLIC
- RSIP_KEY_TYPE_RSA_4096_PUBLIC

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Message hash p_hash should be computed in advance with hash_function.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_RSASSA_PSS_Sign()

fsp_err_t R_RSIP_RSASSA_PSS_Sign (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint32_t const *salt_length*, uint8_t const *const *p_hash*, uint8_t *const

p_signature)

Signs message with RSASSA-PSS.

Implements rsip_api_t::rsassaPssSign.

Conditions

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PRIVATE
- RSIP_KEY_TYPE_RSA_3072_PRIVATE
- RSIP_KEY_TYPE_RSA_4096_PRIVATE

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Argument mask_generation_function accepts any member of enumeration rsip_mgf_type_t.

Message hash p_hash should be computed in advance with hash_function.

Salt length salt_length must be one of the following:

- Any member of enumeration rsip_rsa_salt_length_t
  - RSIP_RSA_SALT_LENGTH_AUTO
  - RSIP_RSA_SALT_LENGTH_HASH
  - RSIP_RSA_SALT_LENGTH_MAX
- Integers that satisfies the formula: sLen <= emLen - hLen - 2
  - sLen is salt_length
  - emLen is the same as modulus length
  - hLen is the hash length

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Section Supported Algorithms.

◆ R_RSIP_RSASSA_PSS_Verify()

fsp_err_t R_RSIP_RSASSA_PSS_Verify (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint32_t const *salt_length*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature*)

Verifies signature with RSASSA-PSS. Implements rsip_api_t::rsassaPssVerify.

Conditions

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PUBLIC
- RSIP_KEY_TYPE_RSA_3072_PUBLIC
- RSIP_KEY_TYPE_RSA_4096_PUBLIC

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Argument mask_generation_function accepts any member of enumeration rsip_mgf_type_t.

Message hash p_hash should be computed in advance with hash_function.

Salt length salt_length must be one of the following:

- Any member of enumeration rsip_rsa_salt_length_t
  - RSIP_RSA_SALT_LENGTH_AUTO
  - RSIP_RSA_SALT_LENGTH_HASH
  - RSIP_RSA_SALT_LENGTH_MAX
- Integers that satisfies the formula: sLen <= emLen - hLen - 2
  - sLen is salt_length
  - emLen is the same as modulus length
  - hLen is the hash length

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.

FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_AES_Cipher_Init()

fsp_err_t R_RSIP_AES_Cipher_Init (rsip_ctrl_t *const *p_ctrl*, rsip_aes_cipher_mode_t const *mode*, rsip_wrapped_key_t const *const *p_wrapped_key*, uint8_t const *const *p_initial_vector*)

Starts AES cipher operation in confidentiality mode (ECB/CBC/CTR) or XTS mode.

Implements rsip_api_t::aesCipherInit.

Conditions

Key type of p_wrapped_key must be one of the following:

- RSIP_KEY_TYPE_AES_128, RSIP_KEY_TYPE_AES_256
- RSIP_KEY_TYPE_XTS_AES_128, RSIP_KEY_TYPE_XTS_AES_256

Argument mode must be the following:

- AES key
  - RSIP_AES_CIPHER_MODE_ECB_ENC, RSIP_AES_CIPHER_MODE_ECB_DEC
  - RSIP_AES_CIPHER_MODE_CBC_ENC, RSIP_AES_CIPHER_MODE_CBC_DEC
  - RSIP_AES_CIPHER_MODE_CTR
- XTS-AES key
  - RSIP_AES_CIPHER_MODE_XTS_ENC, RSIP_AES_CIPHER_MODE_XTS_DEC

Argument p_initial_vector must be the following:

- [ECB] Not used
- [CBC] Raw initial vector
- [CTR] Raw nonce
- [XTS] Raw initial vector

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_AES
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_ARGUMENT	Input key type or mode is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_AES_Cipher_Update()

fsp_err_t R_RSIP_AES_Cipher_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_input*, uint8_t *const *p_output*, uint32_t const *length*)

Encrypts plaintext or decrypts ciphertext.

Implements rsip_api_t::aesCipherUpdate.

Conditions

Argument length must be the following:

- [ECB][CBC][CTR] 0 or a multiple of 16.
- [XTS] 0 or greater than or equal to 16.

Output length

Output length to p_output is length.

State transition

This API can only be executed in **STATE_AES**, and does not cause any state transitions.

In XTS mode, if once an integer other than 0 or a multiple of 16 is input, this API can no longer be called.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	Input length is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_Cipher_Finish()

fsp_err_t R_RSIP_AES_Cipher_Finish (rsip_ctrl_t *const *p_ctrl*)

Finishes AES operation.

Implements rsip_api_t::aesCipherFinish.

State transition

This API can only be executed in **STATE_AES**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_AEAD_Init()

fsp_err_t R_RSIP_AES_AEAD_Init (rsip_ctrl_t *const *p_ctrl*, rsip_aes_aead_mode_t *mode*, rsip_wrapped_key_t const *const *p_wrapped_key*, uint8_t const *const *p_nonce*, uint32_t const *nonce_length*)

Starts AES AEAD function.

Implements rsip_api_t::aesAeadInit.

Conditions

Key type of p_wrapped_key must be one of the following:

- RSIP_KEY_TYPE_AES_128
- RSIP_KEY_TYPE_AES_256

Argument mode accepts any member of enumeration rsip_aes_aead_mode_t.

Argument nonce_length must be the following:

- [GCM] Any length is accepted, but 12 bytes is generally recommended.
- [CCM] 7 to 13 bytes.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_AES_AEAD
Others	No change

The next callable API functions in STATE_AES_AEAD are as below.

- [GCM] R_RSIP_AES_AEAD_AADUpdate(), R_RSIP_AES_AEAD_Update(), R_RSIP_AES_AEAD_Finish() (encryption), R_RSIP_AES_AEAD_Verify() (decryption)
- [CCM] R_RSIP_AES_AEAD_LengthsSet()

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	nonce_length is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_ARGUMENT	Input key type is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_AES_AEAD_LengthsSet()

fsp_err_t R_RSIP_AES_AEAD_LengthsSet (rsip_ctrl_t *const *p_ctrl*, uint32_t const *total_aad_length*, uint32_t const *total_text_length*, uint32_t const *tag_length*)

Sets text and tag lengths for CCM mode.

Implements rsip_api_t::aesAeadLengthsSet.

Conditions

Argument total_aad_length must be equal to the length of AAD and must be 110 or less.

Argument total_test_length must be equal to the length of the plaintext or ciphertext.

Argument tag_length must be 4, 6, 8, 10, 12, 14, or 16.

State transition

This API can only be executed in **STATE_AES_AEAD**, and does not cause any state transitions.

The next callable API functions in STATE_AES_AEAD are as below.

- [CCM] R_RSIP_AES_AEAD_AADUpdate()

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_SIZE	Input length is illegal.
FSP_ERR_INVALID_STATE	Internal state is illegal.

Note

In GCM mode, this API must NOT be called. If called, FSP_ERR_INVALID_STATE will be returned. AAD length and text length are indeterminate and output tag length is fixed to 16 bytes.

◆ R_RSIP_AES_AEAD_AADUpdate()

fsp_err_t R_RSIP_AES_AEAD_AADUpdate (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_aad*, uint32_t const *aad_length*)

Inputs Additional Authentication Data (AAD).

Implements rsip_api_t::aesAeadAadUpdate.

State transition

This API can only be executed in **STATE_AES_AEAD**, and does not cause any state transitions.

- [GCM] R_RSIP_AES_AEAD_AADUpdate(), R_RSIP_AES_AEAD_Update(), R_RSIP_AES_AEAD_Finish() (encryption), R_RSIP_AES_AEAD_Verify() (decryption)
- [CCM] R_RSIP_AES_AEAD_AADUpdate() (AAD input is not completed), R_RSIP_AES_AEAD_Update() (AAD input is completed)

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	aad_length is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.

◆ R_RSIP_AES_AEAD_Update()

fsp_err_t R_RSIP_AES_AEAD_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_input*, uint32_t const *input_length*, uint8_t *const *p_output*, uint32_t *const *p_output_length*)

Encrypts plaintext or decrypts ciphertext.

Implements rsip_api_t::aesAeadUpdate.

Output length

Output length to p_output (p_output_length) is calculated text that has not yet been output in multiple of 16 bytes.

State transition

This API can only be executed in **STATE_AES_AEAD**, and does not cause any state transitions.

- [GCM] R_RSIP_AES_AEAD_Update(), R_RSIP_AES_AEAD_Finish() (encryption), R_RSIP_AES_AEAD_Verify() (decryption)
- [CCM] R_RSIP_AES_AEAD_Update() (text input is not completed), R_RSIP_AES_AEAD_Finish() (text input is completed, encryption), R_RSIP_AES_AEAD_Verify() (text input is completed, decryption)

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_SIZE	Input length is illegal.
FSP_ERR_INVALID_STATE	Internal state is illegal.

Note

In GCM mode, if this API is skipped, GMAC will be calculated. For detailed usage, refer to example code.

◆ R_RSIP_AES_AEAD_Finish()

fsp_err_t R_RSIP_AES_AEAD_Finish (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_output*, uint32_t *const *p_output_length*, uint8_t *const *p_tag*)

Finalizes an AES AEAD encryption.

Implements rsip_api_t::aesAeadFinish.

Output length

Output length to p_output (p_output_length) is the remaining calculated text length.

Output length to p_tag as below.

- [GCM] 16 bytes.
- [CCM] Input value as tag_length in R_RSIP_AES_AEAD_LengthsSet().

State transition

This API can only be executed in **STATE_AES_AEAD**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_AEAD_Verify()

fsp_err_t R_RSIP_AES_AEAD_Verify (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_output*, uint32_t *const *p_output_length*, uint8_t const *const *p_tag*, uint32_t const *tag_length*)

Finalizes an AES AEAD decryption.

If there is 16-byte fractional data indicated by the total data length of the value of p_cipher that was input by R_RSIP_AES_GCM_DecryptUpdate(), this API will output the result of decrypting that fractional data to p_cipher. Here, the portion that does not reach 16 bytes will be padded with zeros.

Implements rsip_api_t::aesAeadVerify.

Conditions

Argument tag_length must be as below.

- [GCM] 1 to 16 bytes.
- [CCM] Input value as tag_length in R_RSIP_AES_AEAD_LengthsSet().

Output length

Output length to p_output (p_output_length) is the remaining calculated text length.

State transition

This API can only be executed in **STATE_AES_AEAD**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	tag_length is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_AUTHENTICATION	Authentication is failed.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_MAC_Init()

fsp_err_t R_RSIP_AES_MAC_Init (rsip_ctrl_t *const *p_ctrl*, rsip_aes_mac_mode_t const *mode*, rsip_wrapped_key_t const *const p_wrapped_key*)

Starts an AES MAC operation.

Implements rsip_api_t::aesMacInit.

Conditions

Key type of p_wrapped_key must be one of the following:

- RSIP_KEY_TYPE_AES_128
- RSIP_KEY_TYPE_AES_256

Argument mode accepts any member of enumeration rsip_aes_aead_mode_t.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_AES_MAC
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

To calculate AES-GMAC, please use not R_RSIP_MAC_*() but R_RSIP_AEAD_*(). For detailed usage, refer to example code.

See also

Section Supported Algorithms.

◆ R_RSIP_AES_MAC_Update()

fsp_err_t R_RSIP_AES_MAC_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length*)

Inputs message.

Implements rsip_api_t::aesMacUpdate.

Inside this function, the data that is input by the user is buffered until the input value of p_message exceeds 16 bytes. If the input value, p_message, is not a multiple of 16 bytes, it will be padded within the function.

State transition

This API can only be executed in **STATE_AES_MAC**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

◆ R_RSIP_AES_MAC_SignFinish()

fsp_err_t R_RSIP_AES_MAC_SignFinish (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_mac*)

Outputs AES MAC.

Implements rsip_api_t::aesMacSignFinish.

Output length

Output length to p_mac is 16 bytes.

State transition

This API can only be executed in **STATE_AES_MAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_MAC_VerifyFinish()

fsp_err_t R_RSIP_AES_MAC_VerifyFinish (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_mac*, uint32_t const *mac_length*)

Verifies AES MAC.

Implements rsip_api_t::aesMacVerifyFinish.

Conditions

Argument mac_length must be as below.

- [CMAC] 2 to 16 bytes.

State transition

This API can only be executed in **STATE_AES_MAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	mac_length is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_AUTHENTICATION	Authentication is failed.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_Open()

fsp_err_t R_RSIP_Open (rsip_ctrl_t *const *p_ctrl*, rsip_cfg_t const *const *p_cfg*)

Enables use of Renesas Secure IP functionality.

Implements rsip_api_t::open.

State transition

This API can only be executed in **STATE_INITIAL**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Internal key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Hardware initialization is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption or hardware fault is detected.

Note

This version does not have an optional feature to disable TRNG initialization.

◆ R_RSIP_Close()

fsp_err_t R_RSIP_Close (rsip_ctrl_t *const *p_ctrl*)

Disables use of Renesas Secure IP functionality.

Implements rsip_api_t::close.

State transition

This API can be executed in **except STATE_INITIAL**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_INITIAL
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_RandomNumberGenerate()

fsp_err_t R_RSIP_RandomNumberGenerate (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_random*)

Generates a 128-bit random number.

Implements rsip_api_t::randomNumberGenerate.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KeyGenerate()

fsp_err_t R_RSIP_KeyGenerate (rsip_ctrl_t *const *p_ctrl*, rsip_key_type_t const *key_type*, rsip_wrapped_key_t *const *p_wrapped_key*)

Generates a wrapped symmetric key from a random number. In this API, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Implements rsip_api_t::keyGenerate.

Conditions

Argument key_type must be one of the following:

- RSIP_KEY_TYPE_AES_128, RSIP_KEY_TYPE_AES_256
- RSIP_KEY_TYPE_XTS_AES_128, RSIP_KEY_TYPE_XTS_AES_256
- RSIP_KEY_TYPE_HMAC_SHA256, RSIP_KEY_TYPE_HMAC_SHA384, RSIP_KEY_TYPE_HMAC_SHA512

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_KeyPairGenerate()

fsp_err_t R_RSIP_KeyPairGenerate (rsip_ctrl_t *const *p_ctrl*, rsip_key_pair_type_t const *key_pair_type*, rsip_wrapped_key_t *const *p_wrapped_public_key*, rsip_wrapped_key_t *const *p_wrapped_private_key*)

Generates a wrapped asymmetric key pair from a random number. In this API, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Implements rsip_api_t::keyPairGenerate.

Conditions

Argument key_pair_type must be one of the following:

- RSIP_KEY_PAIR_TYPE_ECC_SECP256R1, RSIP_KEY_PAIR_TYPE_ECC_SECP384R1, RSIP_KEY_PAIR_TYPE_ECC_SECP521R1,
- RSIP_KEY_PAIR_TYPE_RSA_2048, RSIP_KEY_PAIR_TYPE_RSA_3072, RSIP_KEY_PAIR_TYPE_RSA_4096

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms.

◆ R_RSIP_EncryptedKeyWrap()

fsp_err_t R_RSIP_EncryptedKeyWrap (rsip_ctrl_t *const *p_ctrl*, rsip_key_update_key_t const *const *p_key_update_key*, uint8_t const *const *p_initial_vector*, rsip_key_type_t const *key_type*, uint8_t const *const *p_encrypted_key*, rsip_wrapped_key_t *const *p_wrapped_key*)

Decrypts an encrypted user key with Key Update Key (KUK) and wrap it with the Hardware Unique Key (HUK).

Implements rsip_api_t::encryptedKeyWrap.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

See also

Section Supported Algorithms

◆ R_RSIP_RFC3394_KeyWrap()

fsp_err_t R_RSIP_RFC3394_KeyWrap (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_kek*, rsip_wrapped_key_t const *const *p_wrapped_target_key*, uint8_t *const *p_rfc3394_wrapped_target_key*)

This function provides Key Wrap algorithm compliant with RFC3394. Using p_wrapped_kek to wrap p_wrapped_target_key, and output the result to p_rfc3394_wrapped_target_key.
Implements rsip_api_t::rfc3394_KeyWrap.

<Usage Precautions>

- Argument "p_wrapped_kek" only supports the following key type.

Key Type of p_wrapped_kek	Corresponding Parameter
AES-128	RSIP_KEY_TYPE_AES_128

AES-256	RSIP_KEY_TYPE_AES_256

- Argument "p_wrapped_target_key" only supports the following key type.

Key Type of p_wrapped_target_key	Corresponding Parameter
AES-128	RSIP_KEY_TYPE_AES_128
AES-256	RSIP_KEY_TYPE_AES_256

<Operational State>
This API can only be executed in the STATE_MAIN, and there are no state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_ARGUMENT	Input key type or mode is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_RFC3394_KeyUnwrap()

fsp_err_t R_RSIP_RFC3394_KeyUnwrap (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_kek*, rsip_key_type_t const *key_type*, uint8_t const *const *p_rfc3394_wrapped_target_key*, rsip_wrapped_key_t *const *p_wrapped_target_key*)

This function provides Key Unwrap algorithm compliant with RFC3394. Using p_wrapped_kek to unwrap p_rfc3394_wrapped_target_key, and output the result to p_wrapped_target_key. Implements rsip_api_t::rfc3394_KeyUnwrap.

<Usage Precautions>

- Argument "p_wrapped_kek" only supports the following key type.

Key Type of p_wrapped_kek	Corresponding Parameter
AES-128	RSIP_KEY_TYPE_AES_128
AES-256	RSIP_KEY_TYPE_AES_256

- Argument "key_type" represents the key type of p_rfc3394_wrapped_target_key, and only supports the following key type.

Key Type of p_rfc3394_wrapped_target_key	Corresponding Parameter
AES-128	RSIP_KEY_TYPE_AES_128
AES-256	RSIP_KEY_TYPE_AES_256

<Operational State>
This API can only be executed in the STATE_MAIN, and there are no state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_ARGUMENT	Input key type or mode is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_InjectedKeyImport()

fsp_err_t R_RSIP_InjectedKeyImport (rsip_key_type_t const *key_type*, uint8_t const *const *p_injected_key*, rsip_wrapped_key_t *const *p_wrapped_key*, uint32_t const *wrapped_key_buffer_length*)

Generates structure data "rsip_wrapped_key_t" from injected key value. Refer "Key Size Table" for supported key types.

Implements rsip_api_t::injectedKeyImport.

State transition

This API can be executed in **any state** including STATE_INITIAL, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_UNSUPPORTED	Selected key type is not supported.
FSP_ERR_INVALID_SIZE	Buffer length is too short.

See also

Section Supported Algorithms

Note

Injected key value is not validated in this API.

See also

Section Supported Algorithms.

◆ R_RSIP_PublicKeyExport()

fsp_err_t R_RSIP_PublicKeyExport (rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t *const *p_raw_public_key*)

Exports public key parameters from a wrapped key.

Implements rsip_api_t::publicKeyExport.

Relative position of each elements in p_raw_public_key is shown in below:

- ECC (RSIP_KEY_TYPE_ECC_*) : Qx placed first and Qy placed after that.

bit length	Qx	Qy
256	0	32
384	0	48
521	0	66

- RSA (RSIP_KEY_TYPE_RSA_*) : n placed first and e placed after that.

modulus	n	e
1024	0	128
2048	0	256
3072	0	384
4096	0	512

State transition

This API can be executed in **any state** including STATE_INITIAL, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.

See also

Section Supported Algorithms.

◆ R_RSIP_SHA_Compute()

fsp_err_t R_RSIP_SHA_Compute (rsip_ctrl_t *const *p_ctrl*, rsip_hash_type_t const *hash_type*, uint8_t const *const *p_message*, uint32_t const *message_length*, uint8_t *const *p_digest*)

Generates SHA message digest.

Implements rsip_api_t::shaCompute.

Conditions

See R_RSIP_SHA_Init().

Output length

See R_RSIP_SHA_Finish().

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.

See also

Section Supported Algorithms.

◆ R_RSIP_SHA_Init()

fsp_err_t R_RSIP_SHA_Init (rsip_ctrl_t *const *p_ctrl*, rsip_hash_type_t const *hash_type*)

Starts SHA operation.

Implements rsip_api_t::shaInit.

Conditions

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_SHA
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.

See also

Section Supported Algorithms.

◆ R_RSIP_SHA_Update()

fsp_err_t R_RSIP_SHA_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length*)

Inputs SHA message.

Implements rsip_api_t::shaUpdate.

State transition

This API can only be executed in **STATE_SHA**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_SHA_Finish()

fsp_err_t R_RSIP_SHA_Finish (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_digest*)

Outputs SHA message digest.

Implements rsip_api_t::shaFinish.

Output length

Output length to p_digest depends on hash_function.

- 32 (RSIP_HASH_TYPE_SHA256)
- 48 (RSIP_HASH_TYPE_SHA384)
- 64 (RSIP_HASH_TYPE_SHA512)

State transition

This API can only be executed in **STATE_SHA**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_SHA_Suspend()

fsp_err_t R_RSIP_SHA_Suspend (rsip_ctrl_t *const *p_ctrl*, rsip_sha_handle_t *const *p_handle*)

Suspends SHA operation.

This API releases RSIP resource and outputs intermediate results. Therefore, it can be used in the following cases:

- Execute another cryptographic operations during inputting successive chunks of the message.
- Reuse intermediate results.

Implements rsip_api_t::shaSuspend.

State transition

This API can only be executed in **STATE_SHA**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_SHA_Resume()

fsp_err_t R_RSIP_SHA_Resume (rsip_ctrl_t *const *p_ctrl*, rsip_sha_handle_t const *const *p_handle*)

Resumes SHA operation suspended by R_RSIP_SHA_Suspend().

Implements rsip_api_t::shaResume.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_SHA
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

◆ R_RSIP_HMAC_Compute()

fsp_err_t R_RSIP_HMAC_Compute (rsip_ctrl_t *const *p_ctrl*, const rsip_wrapped_key_t * *p_wrapped_key*, uint8_t const *const *p_message*, uint32_t const *message_length*, uint8_t *const *p_mac*)

Generates HMAC.

Implements rsip_api_t::hmacCompute.

Conditions

See R_RSIP_HMAC_Init().

Output length

See R_RSIP_HMAC_SignFinish().

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_HMAC_Verify()

fsp_err_t R_RSIP_HMAC_Verify (rsip_ctrl_t *const *p_ctrl*, const rsip_wrapped_key_t * *p_wrapped_key*, uint8_t const *const *p_message*, uint32_t const *message_length*, uint8_t const *const *p_mac*, uint32_t const *mac_length*)

Verifies HMAC.

Implements rsip_api_t::hmacVerify.

Conditions

See R_RSIP_HMAC_Init() and R_RSIP_HMAC_VerifyFinish().

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	mac_length is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	MAC verification is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Section Supported Algorithms.

◆ R_RSIP_HMAC_Init()

fsp_err_t R_RSIP_HMAC_Init (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_key*)

Starts HMAC operation.

Implements rsip_api_t::hmacInit.

Conditions

Key type of p_wrapped_key must be one of the following:
- RSIP_KEY_TYPE_HMAC_SHA256, RSIP_KEY_TYPE_HMAC_SHA384, RSIP_KEY_TYPE_HMAC_SHA512

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_HMAC
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.

See also

Section Supported Algorithms.

◆ R_RSIP_HMAC_Update()

fsp_err_t R_RSIP_HMAC_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length*)

Inputs HMAC message.

Implements rsip_api_t::hmacUpdate.

State transition

This API can only be executed in **STATE_SHA**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_HMAC_SignFinish()

fsp_err_t R_RSIP_HMAC_SignFinish (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_mac*)

Outputs HMAC.

Implements rsip_api_t::hmacSignFinish.

Output length

Output length to p_mac depends on key type of p_wrapped_key.

- 32 (RSIP_KEY_TYPE_HMAC_SHA256)
- 48 (RSIP_KEY_TYPE_HMAC_SHA384)
- 64 (RSIP_KEY_TYPE_HMAC_SHA512)

State transition

This API can only be executed in **STATE_HMAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_HMAC_VerifyFinish()

fsp_err_t R_RSIP_HMAC_VerifyFinish (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_mac*, uint32_t const *mac_length*)

Verifies HMAC.

Implements rsip_api_t::hmacVerifyFinish.

Conditions

Argument mac_length depends on key type of p_wrapped_key. Usually the longest length is recommended.

- 4 to 32 (RSIP_KEY_TYPE_HMAC_SHA256)
- 4 to 48 (RSIP_KEY_TYPE_HMAC_SHA384)
- 4 to 64 (RSIP_KEY_TYPE_HMAC_SHA512)

State transition

This API can only be executed in **STATE_HMAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
FSP_ERR_INVALID_SIZE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	mac_length is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	MAC verification is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_HMAC_Suspend()

fsp_err_t R_RSIP_HMAC_Suspend (rsip_ctrl_t *const *p_ctrl*, rsip_hmac_handle_t *const *p_handle*)

Suspends HMAC operation.

This API releases RSIP resource and outputs intermediate results. Therefore, it can be used in the following cases:

- Execute another cryptographic operations during inputting successive chunks of the message.
- Reuse intermediate results.

Implements rsip_api_t::hmacSuspend.

State transition

This API can only be executed in **STATE_HMAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_HMAC_Resume()

fsp_err_t R_RSIP_HMAC_Resume (rsip_ctrl_t *const *p_ctrl*, rsip_hmac_handle_t const *const *p_handle*)

Resumes HMAC operation suspended by R_RSIP_HMAC_Suspend().

Implements rsip_api_t::hmacResume.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_HMAC
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

Detailed Description

Driver for the Secure Crypto Engine (SCE9) on RA MCUs.

Overview

This module provides SCE functions in protected mode.

Note

For a detailed description of the different SCE9 operating modes, refer to Application Note R11AN0498.

HW Overview

Crypto Peripheral version	Devices

SCE9 (Protected mode)	RA4M2, RA4M3, RA6M4, RA6M5

Features

The SCE module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/256bit
      - CBC 128/256bit
      - GCM 128/256bit
      - CCM 128/256bit
  - Asymmetric Encryption/Decryption
    - RSA
      - RSAES-PKCS1-V1_5 1024/2048bit
      - RSAES-PKCS1-V1_5 3072/4096bit (Encryption only)
      - RSASSA-PKCS1-V1_5 1024/2048bit
      - RSASSA-PKCS1-V1_5 3072/4096bit (Verification only)
    - ECC
      - ECDSA secp192r1/secp224r1/secp256r1/secp384r1
      - ECDH secp256r1
  - Hash Functions
    - SHA-2
      - SHA-256
- Message Authentication Code
  - HMAC-SHA256bit
  - AES-CMAC 128/256bit
- Key Support
  - AES 128/256bit
  - AES Key Wrap/Key Unwrap 128/256bit
  - RSA 1024/2048bit
  - RSA 3072/4096bit (public key only)
  - ECC secp192r1/secp224r1/secp256r1/secp384r1
  - HMAC-SHA256bit
- TRNG
- TLS
  - SSL / TLS support function (TLS1.2 compliant)

Configuration

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a SCE Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > SCE

Protected Mode. For information on how to install and update secure keys, refer to the Application Note R11AN0496.

Reducing intialization time

The SCE intialization sequence can be modified to support a smaller subset of features and allow for a shorter intialization period. This is particularly useful in cases where startup time is important and the cryptographic features that are required are known in advance. The current fast boot configuration option supports the cryptographic primitives requried by MCUBoot including:

- RSA 3K/4K signature verification
- ECC P256 signature verification
- SHA224/256 and GHASH calcuation

Limitations

Usage of R_SCE_ECDSA_secp384r1_SignatureGenerate/Verify

The SCE does not support SHA-384 in hardware, so the APIs listed below require the user to create a SHA-384 function for signature generation and verification. To use the APIs listed below, enable SCE_USER_SHA_384_ENABLED on RA Smart Configurator and prepare a function called SCE_USER_SHA_384_FUNCTION. The interface of SCE_USER_SHA_384_FUNCTION, which is called by the following APIs, is described below.

- R_SCE_ECDSA_secp384r1_SignatureGenerate()
- R_SCE_ECDSA_secp384r1_SignatureVerify()

SCE_USER_SHA_384_FUNCTION()

```
uint32_t SCE_USER_SHA_384_FUNCTION(uint8_t *message, uint8_t* digest, uint32_t
message_length)
```

SHA-384 hash calculation is performed for an area extending the number of bytes specified by the argument message_length from the address specified by the argument message. The calculation result should be stored at the address specified by the argument digest.

Parameters

message	[in] Start address of message
digest	[in,out] address for storing hash calculation result (48 bytes)
message_length	[in] Effective byte count of message

Return values

0	Hash value stored successfully.
others	Storing of hash value failed.

Examples

AES Example

This is an example of AES-256 encryption and decryption.

```
static uint8_t plain[BLOCK * 2] =
{
    0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
    0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
};
void r_sce_example_aes ()
{
 sce_aes_handle_t      handle;
 sce_aes_wrapped_key_t wrapped_key;
    uint8_t               cipher_calculated[32] = {0};
    uint8_t               plain_calculated[32] = {0};
    uint32_t             dummy;
 /* SCE power on */
 R_SCE_Open(&sce_ctrl, &sce_cfg);
 /* Generate a random key */
 R_SCE_AES256_WrappedKeyGenerate(&wrapped_key);
 /* Encrypt a plain text */
 R_SCE_AES256ECB_EncryptInit(&handle, &wrapped_key);
 R_SCE_AES256ECB_EncryptUpdate(&handle, plain, cipher_calculated, BLOCK * 2);
 R_SCE_AES256ECB_EncryptFinal(&handle, cipher_calculated, &dummy);
 /* Decrypt a cipher text using same key as Encryption */
 R_SCE_AES256ECB_DecryptInit(&handle, &wrapped_key);
 R_SCE_AES256ECB_DecryptUpdate(&handle, cipher_calculated, plain_calculated, BLOCK *
2);
 R_SCE_AES256ECB_DecryptFinal(&handle, plain_calculated, &dummy);
 /* SCE power off */
 R_SCE_Close(&sce_ctrl);
 /* Compare plain and plain_calculated */
 if (memcmp(plain, plain_calculated, BLOCK * 2))
    {
```

```
 while (1)
      {
 /* plain and plain_calculated are different (incorrect) */
       }
    }
 else
    {
 while (1)
      {
 /* plain and plain_calculated are the same (correct) */
       }
    }
}
```

ECC Example

This is an example of ECC secp-256 signature generate and verify.

```
uint8_t ecc256_data_msg[] =
{
 's', 'a', 'm', 'p', 'l', 'e'
};
void r_sce_example_ecc ()
{
 sce_ecc_wrapped_pair_key_t wrapped_pair_key;
 sce_ecdsa_byte_data_t      message_hash =
    {
       0
    };
 sce_ecdsa_byte_data_t signature;
    uint8_t               out_data[HW_SCE_ECDSA_DATA_BYTE_SIZE];
 fsp_err_t             return_code;
    message_hash.data_length = sizeof(ecc256_data_msg);
    message_hash.pdata       = (uint8_t *) ecc256_data_msg;
    signature.pdata          = out_data;
```

```
 /* SCE power on */
 R_SCE_Open(&sce_ctrl, &sce_cfg);
 /* Generate a random pair key */
 R_SCE_ECC_secp256r1_WrappedKeyPairGenerate(&wrapped_pair_key);
 /* Generate a Signature */
 R_SCE_ECDSA_secp256r1_SignatureGenerate(&message_hash, &signature,
&wrapped_pair_key.priv_key);
 /* Verify Signature and Public wrapped key */
    return_code = R_SCE_ECDSA_secp256r1_SignatureVerify(&signature, &message_hash,
&wrapped_pair_key.pub_key);
 /* SCE power off */
 R_SCE_Close(&sce_ctrl);
 if (FSP_SUCCESS != return_code)
    {
 while (1)
      {
 /* Verify Fail */
       }
    }
 else
    {
 while (1)
      {
 /* Verify Success */
       }
    }
}
```

RSA Example

This is an example of RSA-2048 encryption and decryption.

```
uint8_t rsa_msg[256] =
{
    0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07, 0x08, 0x09, 0x0a, 0x0b, 0x0c,
```

```

      }
   }
}
```

Data Structures

struct	sce_instance_ctrl_t

Data Structure Documentation

◆ sce_instance_ctrl_t

struct sce_instance_ctrl_t
SCE private control block. DO NOT MODIFY. Initialization occurs when R_SCE_Open() is called.

Function Documentation

◆ R_SCE_Open()

fsp_err_t R_SCE_Open (sce_ctrl_t *const *p_ctrl*, sce_cfg_t const *const *p_cfg*)

Enables use of SCE functionality.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to pin configuration structure.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	The error-detection self-test failed to terminate normally.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_RETRY	Indicates that an entropy evaluation failure occurred. Run the function again.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

Note

The valid pre-run state is SCE disabled. The pre-run state is SCE Disabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_Close()

fsp_err_t R_SCE_Close (sce_ctrl_t *const *p_ctrl*)

Stops supply of power to the SCE.

Parameters

[in]	p_ctrl	Pointer to control structure.

Return values

FSP_SUCCESS	Normal termination

Note

The pre-run state is any state. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_SoftwareReset()

fsp_err_t R_SCE_SoftwareReset (void)

Software reset to SCE.

Reverts the state to the SCE initial state.

Return values

FSP_SUCCESS	Normal termination

Note

The pre-run state is any state. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_RandomNumberGenerate()

fsp_err_t R_SCE_RandomNumberGenerate (uint32_t * *random*)

This API can generate 4 words random number.

Parameters

[in,out]	random	Stores 4words (16 bytes) random data.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128_WrappedKeyGenerate()

fsp_err_t R_SCE_AES128_WrappedKeyGenerate (sce_aes_wrapped_key_t * *wrapped_key*)

This API outputs 128-bit AES wrapped key from a random number.

This API generates a wrapped key from a random number in the SCE. Accordingly, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Parameters

[in,out]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_AES256_WrappedKeyGenerate()

fsp_err_t R_SCE_AES256_WrappedKeyGenerate (sce_aes_wrapped_key_t * *wrapped_key*)

This API outputs 256-bit AES wrapped key from a random number.

This API generates a wrapped key from a random number in the SCE. Accordingly, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Parameters

[in,out]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_AES128_EncryptedKeyWrap()

fsp_err_t R_SCE_AES128_EncryptedKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_aes_wrapped_key_t * *wrapped_key*)

This API wraps 128-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256_EncryptedKeyWrap()

fsp_err_t R_SCE_AES256_EncryptedKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_aes_wrapped_key_t * *wrapped_key*)

This API wraps 256-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128_RFC3394KeyWrap()

fsp_err_t R_SCE_AES128_RFC3394KeyWrap (sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, sce_aes_wrapped_key_t * *target_key*, uint32_t * *rfc3394_wrapped_key*)

This API wraps 128-bit AES key within the user routine.

Parameters

[in]	master_key	AES-128 key used for wrapping.
[in]	target_key_type	Selects key to be wrapped.
[in]	target_key	Key to be wrapped.
[out]	rfc3394_wrapped_key	Wrapped key.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

◆ R_SCE_AES256_RFC3394KeyWrap()

fsp_err_t R_SCE_AES256_RFC3394KeyWrap (sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, sce_aes_wrapped_key_t * *target_key*, uint32_t * *rfc3394_wrapped_key*)

This API wraps 256-bit AES key within the user routine.

Parameters

[in]	master_key	AES-256 key used for wrapping.
[in]	target_key_type	Selects key to be wrapped.
[in]	target_key	Key to be wrapped.
[out]	rfc3394_wrapped_key	Wrapped key.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

◆ R_SCE_AES128_RFC3394KeyUnwrap()

fsp_err_t R_SCE_AES128_RFC3394KeyUnwrap (sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, uint32_t * *rfc3394_wrapped_key*, sce_aes_wrapped_key_t * *target_key*)

This API unwraps 128-bit AES key within the user routine.

Parameters

[in]	master_key	AES-128 key used for unwrapping.
[in]	target_key_type	Selects key to be unwrapped.
[in]	rfc3394_wrapped_key	Wrapped key.
[out]	target_key	Key to be unwrapped.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

◆ R_SCE_AES256_RFC3394KeyUnwrap()

fsp_err_t R_SCE_AES256_RFC3394KeyUnwrap (sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, uint32_t * *rfc3394_wrapped_key*, sce_aes_wrapped_key_t * *target_key*)

This API unwraps 256-bit AES key within the user routine.

Parameters

[in]	master_key	AES-256 key used for unwrapping.
[in]	target_key_type	Selects key to be unwrapped.
[in]	rfc3394_wrapped_key	Wrapped key.
[out]	target_key	Key to be unwrapped.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

◆ R_SCE_SHA256HMAC_EncryptedKeyWrap()

fsp_err_t R_SCE_SHA256HMAC_EncryptedKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_hmac_sha_wrapped_key_t * *wrapped_key*)

This API wraps HMAC-SHA256 key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	HMAC-SHA256 wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA1024_WrappedKeyPairGenerate()

fsp_err_t R_SCE_RSA1024_WrappedKeyPairGenerate (sce_rsa1024_wrapped_pair_key_t * *wrapped_pair_key*)

This API outputs a wrapped key pair for a 1024-bit RSA public key and private key pair. These keys are generated from a random value produced internally by the SCE. Consequently, there is no need to input a user key. Dead copying of data can be prevented by encrypting the data using the wrapped key output by this API. A public wrapped key is generated by wrapped_pair_key->pub_key, and a private wrapped key is generated by wrapped_pair_key->priv_key. As the public key exponent, only 0x00010001 is generated.

Parameters

[in,out]	wrapped_pair_key	User key index for RSA 1024-bit public key and private key pair

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred. Key generation failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_WrappedKeyPairGenerate()

fsp_err_t R_SCE_RSA2048_WrappedKeyPairGenerate (sce_rsa2048_wrapped_pair_key_t * *wrapped_pair_key*)

This API outputs a wrapped key pair for a 2048-bit RSA public key and private key pair. These keys are generated from a random value produced internally by the SCE. Consequently, there is no need to input a user key. Dead copying of data can be prevented by encrypting the data using the wrapped key output by this API. A public wrapped key is generated by wrapped_pair_key->pub_key, and a private wrapped key is generated by wrapped_pair_key->priv_key. As the public key exponent, only 0x00010001 is generated.

Parameters

[in,out]	wrapped_pair_key	User key index for RSA 2048-bit public key and private key pair

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred. Key generation failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA1024_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA1024_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa1024_public_wrapped_key_t * *wrapped_key*)

This API wraps 1024-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA1024_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_RSA1024_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa1024_private_wrapped_key_t * *wrapped_key*)

This API wraps 1024-bit RSA private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA2048_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa2048_public_wrapped_key_t * *wrapped_key*)

This API wraps 2048-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_RSA2048_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa2048_private_wrapped_key_t * *wrapped_key*)

This API wraps 2048-bit RSA private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	2048-bit RSA private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA3072_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA3072_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa3072_public_wrapped_key_t * *wrapped_key*)

This API wraps 3072-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	3072-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA4096_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA4096_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa4096_public_wrapped_key_t * *wrapped_key*)

This API wraps 4096-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp192r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp192r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

[in,out]	wrapped_pair_key	Wrapped pair key for secp192r1 public key and private key pair

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp224r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp224r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

[in,out]	wrapped_pair_key	Wrapped pair key for secp224r1 public key and private key pair

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp256r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp256r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

[in,out]	wrapped_pair_key	Wrapped pair key for secp256r1 public key and private key pair

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp384r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp384r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

[in,out]	wrapped_pair_key	Wrapped pair key for secp384r1 public key and private key pair

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp192r1_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

This API wraps secp192r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp192r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp224r1_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

This API wraps secp224r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp224r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

This API wraps secp256r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp256r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

This API wraps secp384r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp384r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp192r1_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

This API wraps secp192r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp192r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp224r1_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

This API wraps secp224r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp224r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

This API wraps secp256r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp256r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

This API wraps secp384r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp384r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_RootCertificateRSA2048PublicKeyInstall()

fsp_err_t R_SCE_TLS_RootCertificateRSA2048PublicKeyInstall (uint8_t * *encrypted_provisioning_key*, uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_tls_ca_certification_public_wrapped_key_t * *wrapped_key*)

Generate TLS RSA Public key index data

Parameters

[in]	encrypted_provisioning_key	the provisioning key includes encrypted CBC/CBC-MAC key for user key
[in]	initial_vector	the initial_vector for user key CBC encrypt
[in]	encrypted_key	the user key encrypted with AES128-ECB mode
[out]	wrapped_key	the user Key Generation Information (141 words) of RSA2048 bit

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_ECC_secp256r1_EphemeralWrappedKeyPairGenerate()

fsp_err_t R_SCE_TLS_ECC_secp256r1_EphemeralWrappedKeyPairGenerate (sce_tls_p256_ecc_wrapped_key_t * *tls_p256_ecc_wrapped_key*, uint8_t * *ephemeral_ecdh_public_key*)

Generate TLS ECC key pair

Parameters

[in]	tls_p256_ecc_wrapped_key	P256 ECC key index for TLS
[in]	ephemeral_ecdh_public_key	ephemeral ECDH public key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Init()

fsp_err_t R_SCE_SHA256_Init (sce_sha_md5_handle_t * *handle*)

The R_SCE_SHA256_Init() function performs preparations for the execution of an SHA-256 hash calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_SHA256_Update() function and R_SCE_SHA256_Final() function.

Parameters

[in,out]	handle	SHA handler (work area)

Return values

FSP_SUCCESS	Normal termination

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Update()

fsp_err_t R_SCE_SHA256_Update (sce_sha_md5_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_SHA256_Update() function calculates a hash value based on the second argument, message, and the third argument, message_length, and writes the ongoing status to the first argument, handle. After message input is completed, call R_SCE_SHA256_Final().

Parameters

[in,out]	handle	SHA handler (work area)
[in]	message	message data area
[in]	message_length	message data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Final()

fsp_err_t R_SCE_SHA256_Final (sce_sha_md5_handle_t * *handle*, uint8_t * *digest*, uint32_t * *digest_length*)

Using the handle specified in the first argument, handle, the R_SCE_SHA256_Final() function writes the calculation result to the second argument, digest, and writes the length of the calculation result to the third argument, digest_length.

Parameters

[in,out]	handle	SHA handler (work area)
[in,out]	digest	hasha data area
[in,out]	digest_length	hash data length (32bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateInit()

fsp_err_t R_SCE_SHA256HMAC_GenerateInit (sce_hmac_sha_handle_t * *handle*, sce_hmac_sha_wrapped_key_t * *wrapped_key*)

The R_SCE_SHA256HMAC_GenerateInit() function uses the second argument wrapped_key to prepare for execution of SHA256-HMAC calculation, then writes the result to the first argument handle. The argument handle is used by the subsequent R_SCE_SHA256HMAC_GenerateUpdate() function or R_SCE_SHA256HMAC_GenerateFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handler (work area)
[in]	wrapped_key	MAC wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	An invalid MAC wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateUpdate()

fsp_err_t R_SCE_SHA256HMAC_GenerateUpdate (sce_hmac_sha_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_SHA256HMAC_GenerateUpdate() function uses the handle specified by the first argument handle, calculates a hash value from the second argument message and third argument message_length, then writes the intermediate result to the first argument handle. After message input finishes, call the R_SCE_SHA256HMAC_GenerateFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	message	Message area
[in]	message_length	Message length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateFinal()

fsp_err_t R_SCE_SHA256HMAC_GenerateFinal (sce_hmac_sha_handle_t * *handle*, uint8_t * *mac*)

The R_SCE_SHA256HMAC_GenerateFinal() function uses the handle specified by the first argument handle and writes the calculation result to the second argument mac.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in,out]	mac	HMAC area (32 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_VerifyInit()

fsp_err_t R_SCE_SHA256HMAC_VerifyInit (sce_hmac_sha_handle_t * *handle*, sce_hmac_sha_wrapped_key_t * *wrapped_key*)

The R_SCE_SHA256HMAC_VerifyInit() function uses the second argument wrapped_key to prepare for execution of SHA256-HMAC calculation, then writes the result to the first argument handle. The argument handle is used by the subsequent R_SCE_SHA256HMAC_VerifyUpdate() function or R_SCE_SHA256HMAC_VerifyFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handler (work area)
[in]	wrapped_key	MAC wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	An invalid MAC wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_VerifyUpdate()

fsp_err_t R_SCE_SHA256HMAC_VerifyUpdate (sce_hmac_sha_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_SHA256HMAC_VerifyUpdate() function uses the handle specified by the first argument handle, calculates a hash value from the second argument message and third argument message_length, then writes the intermediate result to the first argument handle. After message input finishes, call the R_SCE_SHA256HMAC_VerifyFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	message	Message area
[in]	message_length	Message length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_VerifyFinal()

fsp_err_t R_SCE_SHA256HMAC_VerifyFinal (sce_hmac_sha_handle_t * *handle*, uint8_t * *mac*, uint32_t *mac_length*)

The R_SCE_SHA256HMAC_VerifyFinal() function uses the handle specified by the first argument handle and verifies the mac value from the second argument mac and third argument mac_length. Input a value in bytes from 4 to 32 as mac_length.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	mac	HMAC area
[in]	mac_length	HMAC length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS1024_SignatureGenerate()

fsp_err_t R_SCE_RSASSA_PKCS1024_SignatureGenerate (sce_rsa_byte_data_t * *message_hash*, sce_rsa_byte_data_t * *signature*, sce_rsa1024_private_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS1024_SignatureGenerate() function generates, in accordance with RSASSA-PKCS1-V1_5, a signature from the message text or hash value that is input in the first argument, message_hash, using the private wrapped key input to the third argument, wrapped_key, and writes the signature text to the second argument, signature. When a message is specified in the first argument, message_hash->data_type, a hash value is calculated for the message as specified by the fourth argument, hash_type. When specifying a hash value in the first argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value

		• message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : data length
[in]	wrapped_key	Inputs the 1024-bit RSA private wrapped key.
[in]	hash_type	Only HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS1024_SignatureVerify()

fsp_err_t R_SCE_RSASSA_PKCS1024_SignatureVerify (sce_rsa_byte_data_t * *signature*, sce_rsa_byte_data_t * *message_hash*, sce_rsa1024_public_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS1024_SignatureVerify() function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument signature, and the message text or hash value input to the second argument, message_hash, using the public wrapped key input to the third argument, wrapped_key. When a message is specified in the second argument, message_hash->data_type, a hash value is calculated using the public wrapped key input to the third argument, wrapped_key, and as specified by the fourth argument, hash_type. When specifying a hash value in the second argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	signature	Signature text information to verify • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.
[in]	hash_type	Only

		HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS1024_Encrypt()

fsp_err_t R_SCE_RSAES_PKCS1024_Encrypt (sce_rsa_byte_data_t * *plain*, sce_rsa_byte_data_t * *cipher*, sce_rsa1024_public_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS1024_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

[in]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
