

ISLRTG4DEMO1Z

Renesas Radiation Hardened Power Solution for RTG4 FPGA

Over the last decade satellites and spacecrafts have seen an exponential increase in the need for on-board data processing and storage demands. Additionally, major satellite manufacturers have recently announced their latest satellites to be modular, fully digital and capable of in-orbit reconfigurability. To meet these demands, satellite and payload manufacturers are using high-end FPGAs, ASICs and processors. Microsemi's RTG4 FPGA is a radiation hardened FPGA that has comparable performance to commercial counterparts in demanding computing applications. The RTG4 requires a complex power solution with multiple low voltage supply rails that can deliver high currents and a need for power supply sequencing to eliminate high inrush currents.

In collaboration with Microchip and [Ibeos](#), Microsemi's RTG4 development board schematic and layout board were modified to replace the existing power solution that uses commercial grade products with Renesas Radiation Hardened power products as shown in [Figure 1](#). An image of the ISLRTG4DEMO1Z reference board is shown in [Figure 3](#). It has the same functionality as the Microchip RTG4 Development Kit but includes the space grade power solution from Renesas' Intersil family of power management ICs.

Features

- Radiation hardened QMLV power solution (MIL-PRF-38535)
- RTG4 footprint compatibility with spaceflight version
- 2x1GB DDR3 SDRAM
- 2GB SPI flash memory
- PCI express Gen1 x1 interface
- PCIe x4 edge connector
- One pair of SMA connectors for testing of the full-duplex SERDES channel
- Two FMC connectors with HPC/LPC pinout for expansion
- RJ45 interface for 10/100/1000 Ethernet
- USB Micro-AB connector
- Headers for SPI and GPIOs
- FTDI programmer interface to program the SPI flash
- JTAG programming interface
- RVI header for application programming and debug
- FlashPro programming header
- Embedded Trace Macro (ETM) cell header for debug
- Dual In-Line Package (DIP) switches for user applications
- Push button switches and LEDs for demo purposes
- Current measurement test points

Specifications

- Power Supply Input using DC Jack: 12V ±10%

1. Functional Description

The RTG4 development platform allow users to prototype and evaluate the performance of the FPGA in different applications. [Figure 1](#) shows a block diagram of the development board. The board includes two 1GB Double Data Rate 3 (DDR3) memories and two 1GB SPI flash memories. The board also has several standard and advanced peripherals, such as PCIe x4 edge connector, two FMC connectors for using several off-the-shelf daughter cards, USB, Philips inter-integrated circuit (I²C), gigabit Ethernet port, serial peripheral interface (SPI), and UART. Additionally, a FlashPro programmer is embedded on the board, which allows RTG4 FPGA programming through the JTAG interface.

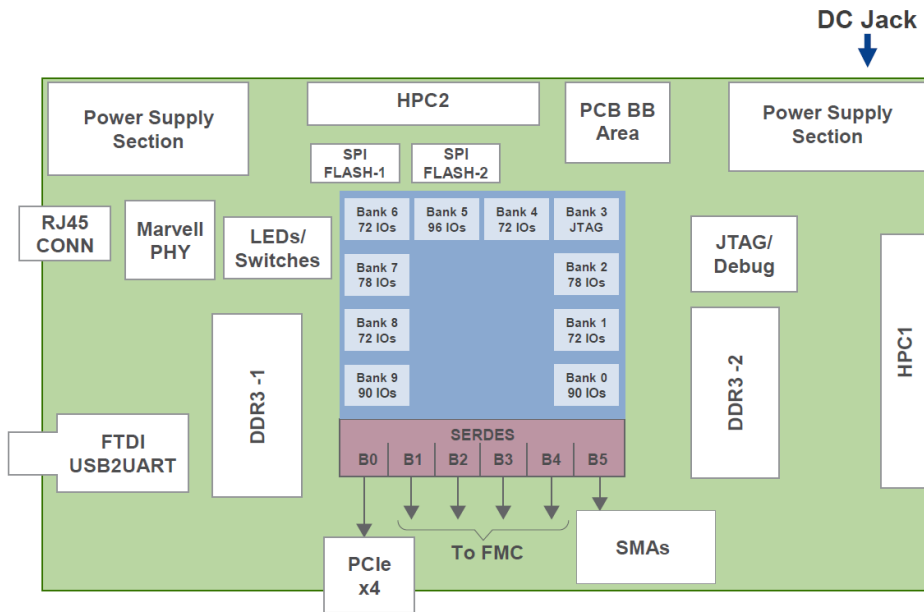

Figure 1. ISLRTG4DEMO1Z Block Diagram

1.1 Getting Started

Microchip provides demo platforms for evaluating various blocks of the Microsemi RTG4 FPGA. These platforms are published through their Demonstration Guides and can be found in the FPGA guide [repository](#).

Example Demonstration Guides include:

- DG0622: RTG4 FPGA PCIe Data Plane Demo using Two Channel Fabric DMA
- DG0624: RTG4 FPGA SERDES EPCS Protocol Design
- DG0625: Interfacing RTG4 FPGA with External DDR3 Memory
- DG0630: RTG4 FPGA DSP FIR Filter Demo Guide

Download these Demonstration Guides and follow the instructions within the guides to evaluate the Renesas ISLRTG4DEMO1Z development board. The Demonstration Guides reference jumper settings for setting up the original Microsemi RTG4 Development Kit. The jumper reference designators for the Renesas ISLRTG4DEMO1Z are the same, with J16 as the only omission. J16 for the Microsemi RTG4 Development Kit programs the DC/DC regulator that provides the core voltage either for 1.0V or 1.2V. J16 is not available on ISLRTG4DEMO1Z as the DC/DC regulator for the core voltage is fixed at 1.2V.

More information on the Microsemi RTG4 Development Kit, including the user guide and board design files are located on the Microsemi [website](#).

1.2 RTG4 Power Solution

[Table 1](#) summarizes the Renesas part numbers, descriptions, and operating conditions of the Synchronous Buck Regulators and LDOs used in the space grade design.

Table 1. Radiation Hardened Power Management IC Configuration

Part Number	Description	Input Voltage (V)	Output Name	Output Voltage (V)	Output Current (A)
ISL70003ASEH	Radiation and SEE Tolerant 3V to 13.2V, 9A Buck Regulator	12	5V Intermediate Rail	5	9
ISL70002SEH	Radiation Hardened and SEE Hardened 22A Synchronous Buck Regulator with Current Sharing	5	VDD Core	1.2	16
ISL75051ASEH	Power for eight corner PLLs, PLLs in SerDes PCIe/PCS blocks, and FDDR PLL.	5	VDDPLL & VPP	3.3	1
ISL70005SEH	Radiation Hardened Dual Output Point-of-Load, Integrated Synchronous Buck and Low Dropout Regulator	5	DDR VDDQ	1.5	3
		1.5	DDR VTT	0.75	±1
ISL70002SEH	Radiation Hardened and SEE Hardened 22A Synchronous Buck Regulator with Current Sharing	5	3.3V Intermediate Rail	3.3	10
ISL75051ASEH	3A, Radiation Hardened, Positive, Ultra-Low Dropout Regulator.	3.3	SERDES_x_Lyz_VDDAIO	1.2	3
ISL75051ASEH	3A, Radiation Hardened, Positive, Ultra-Low Dropout Regulator	3.3	SERDES_x_Lyz_VDDAPLL	2.5	2

In addition to the power management ICs in [Table 1](#), the ISL70321SEH quad power supply sequencer controls the power-up and power-down sequences of the power system. [Figure 2](#) color codes the connections from the ISL70321SEH enable outputs to the enable inputs of the various power management ICs.

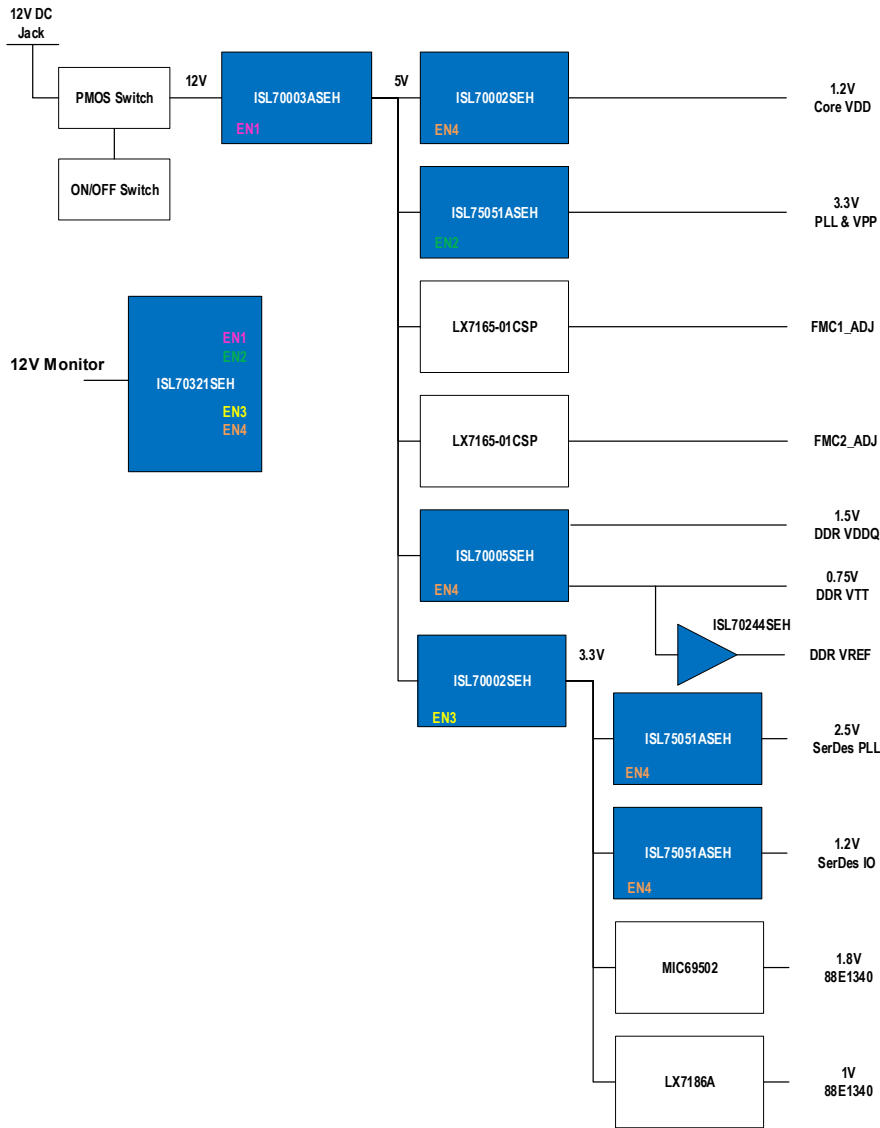

Figure 2. Renesas Space Grade Power Tree for the Microsemi RTG4

The following list summarizes the monitoring and control function of the ISL70321SEH:

- The 12V DC voltage is monitored by the ISL70321SEH and enables the ISL70003ASEH first when the voltage after the PMOS switch reaches 10V.
- When the 5V intermediate rail is up, the ISL75051ASEH is enabled to power the VPLL & VPP rail.
- When the VPLL & VPP rail is above the 3.1V, the ISL70002SEH is enabled to generate the 3.3V intermediate rail.
- When 3.3V is up, the regulators for the core VDD, DDR memory, and SerDes are enabled simultaneously.
- When the VDD rail is in proper regulation, the DONE signal from the ISL70321SEH is asserted high, which releases the RESET signal to the FPGA.

The final IC used in the power solution is the ISL70244SEH, a 19MHz radiation hardened 40V dual rail-to-rail input-output, low-power operational amplifier. The ISL70244SEH generates the DDR reference voltage in a buffer configuration with its input connected to the output of the LDO for the ISL70005SEH to achieve 50% tracking of the VDDQ rail. No changes have been made to the regulators for the FMC connectors or Ethernet PHY ICs.

Because there are no power-down requirements on the RTG4 FPGA, the reference board is set up to disable all regulators at the same time when the power switch is turned to the OFF state.

2. Board Design

Figure 4. ISLRTG4DEMO1Z Reference Design (Bottom)

2.1 Layout Guidelines

Careful consideration must be taken with regards to the layout for the power management ICs for FPGA reference designs. The resulting current transitions from one power device to another can cause voltage spikes across the interconnecting impedances and parasitic circuit elements. These voltage spikes can degrade efficiency, radiate noise into the circuit, and lead to device overvoltage stress. Component layout and printed circuit design minimizes these voltage spikes. Here are some guidelines to follow:

- At least two layers should be dedicated for the ground plane, this reference design uses six layers dedicated to ground.
- Use the top and bottom layers primarily for signals. However, you can also use these to increase the VIN, VOUT, and GND planes as needed.
- Keep the signal and power grounds for each IC separate but have them tied together in a low noise area of the PCB. Be mindful that the noise generated from the power stage does not disrupt the signal ground.
- Place ceramic bypass capacitors directly at the power supply input pins of the PMIC. These capacitors are necessary to filter out any high frequency noise on those respective lines.
- Keep signal traces as short as possible.

3. Typical Performance Graphs

Typical performance curves for Figure 63 through Figure 68 are derived from the datasheet of the associated part. Actual performance on the ISLRTG4DEMO1Z will be different because of the test conditions.
