
RTKA223011DR0080BU

Flyback Demonstration Board

The RAA223011 demonstration board (RTKA223011DR0080BU) is an offline flyback converter; it is designed to demonstrate a low-cost high performance isolated AC/DC conversion from a universal input of 85V_{AC} to 265V_{AC} directly to a 12V output with an output current up to 400mA.

The board uses primary side regulation without using an optocoupler. It has built-in overcurrent, short-circuit, input brownout, and over-temperature protection, and it is designed on a two layer PCB.

RTKA223011DR0080BU comes with a RAA223011 in a SOIC-8 package.

Features

- Universal input
- Primary side regulation
- Low cost components
- No audible noise

Specifications

This board is optimized for the following operating conditions:

- Input voltage: 85V_{AC} ~ 265V_{AC}
- Output voltage: 12V_{DC}
- Output current: 400mA max (at 230V_{AC} or higher)
- Output power: 4.7W
- Efficiency: >75% at 100% load; 70% to 75% at 50% load
- Operating temperature: -45°C to 65°C
- Board dimension: 25mm x 70mm.

1. Functional Description

The RTKA223011DR0080BU is an isolated flyback regulator with switching frequency up to 33kHz. Its input has a bridge rectifier. FR is a 1W fusible resistor providing input overcurrent protection and inrush current limiting.

C1, L1, C3, and C2 consist of the input filter that provides the energy buffer after rectification and reduces conducted EMI noises to the input. T1, D1, and COUT are the flyback converter components. D4, D3, D2, RFB1, CFB1, CFB2, and RFB2 provide the feedback signal to the IC by sampling the auxiliary winding voltage. D4 and R1 provide VCC biasing current after startup to increase the efficiency. R1 can be optional for low-cost low power applications. CVCC is the IC supply capacitor.

1.1 Recommended Equipment

- AC Power supply capable of generating AC voltage from 85V_{AC} to 265V_{AC} at 60Hz/50Hz with at least 100mA output current capability.
- Load resistor box with adjustable value of 30Ω and up or an electronic load than can emulate a resistor load or current load up to 400mA.
- Multi-meters to measure the output voltage and current.
- Power meter to measure the AC input power.

1.2 Setup and Configuration

1. Program the AC power supply with a voltage between 85V_{AC} and 265V_{AC} at the corresponding frequency of 60Hz or 50Hz.
2. While the AC power supply is off, connect the output cables of the AC power supply to the L and N terminal of the RTKA223011DR0080BU. An optional power meter can be added in between the AC power supply output and the input of the board.
3. Connect the load to the output terminals VOUT and GND.
4. Connect a voltage meter to VOUT and GND and connect a current meter between board outputs and the load.
5. Turn on AC power supply.

1.3 Transformer Design

The output voltage is sampled by the IC through the aux winding. To get good regulation, the aux winding voltage spikes caused by the leakage inductance should be reduced. So, transformer should be designed in a way to reduce aux winding leakage.

Dividing the secondary winding into two sections and winding the aux winding in between them will help improve the aux-secondary coupling. Other way is to use a long bobbin such that only single layer of each winding is required; and the aux winding is wound between the primary and the secondary. Another approach is to split the primary and the secondary into multiple sections and winding the auxiliary winding between them.
