# **RENESAS** Synchronous Ethernet SETS for 10GbE and 40GbE

# IDT82V3910 Short Form Datasheet

# **FEATURES**

### HIGHLIGHTS

- Jitter generation <0.3 ps RMS (10 kHz to 20 MHz), meets jitter generation requirements of leading PHYs supporting 10GBASE-R, 10GBASE-W, 40GBASE-R, OC-192 and STM-64</li>
- Features 0.5 mHz to 35 Hz bandwidth
- Provides node clock for ITU-T G.8261/G.8262 Synchronous Ethernet (SyncE)
- Provides node clocks for Cellular and WLL base-station (GSM and 3G networks)
- Provides clocks for DSL access concentrators (DSLAM), especially for Japan TCM-ISDN network timing based ADSL equipments
- Provides clocks for 1 Gigabit, 10 Gigabit, and 40 Gigabit Ethernet
- Supports clock generation for IEEE-1588 applications

#### MAIN FEATURES

- Provides an integrated solution for Synchronous Equipment Timing Source, including Stratum 3, SMC, EEC-Option 1 and EEC-Option 2 Clocks
- Integrates T4 DPLL and T0 DPLL; T4 DPLL locks independently or locks to T0 DPLL
- Supports programmable DPLL bandwidth (0.5 mHz to 35 Hz) and damping factor (1.2 to 20 in 5 steps)
- Supports 1.1X10<sup>-5</sup> ppm absolute holdover accuracy and 4.4X10<sup>-8</sup> ppm instantaneous holdover accuracy
- Supports hitless reference switching to minimize phase transients on T0 DPLL output to be no more than 0.61 ns
- Integrates 2 jitter attenuating APLLs to generate ultra-low jitter clocks
  - Supports 3 clock modes: SONET, Ethernet, and Ethernet LAN-PHY
  - Supports up to two crystal connections, allowing each APLL to support up to two modes of operation
- Supports input and output clocks whose frequencies range from 1PPS to 644.53125 MHz
  - Includes 1PPS clock input and output
  - Provides IN1 and IN2 for 64 kHz + 8 kHz or 64 kHz + 8 kHz + 0.4 kHz composite clocks
  - Provides IN3, IN4, IN7~IN14 input CMOS clocks whose frequencies range from 1PPS to 156.25 MHz
  - Provides IN5 and IN6 input differential clocks whose frequencies range from 1PPS to 625 MHz

- Provides OUT1 to OUT5 output CMOS clocks whose frequency cover from 1PPS to 125 MHz
- Provides OUT6,OUT7,OUT10 and OUT11 output differential clocks whose frequency cover from 25 MHz to 644.53125 MHz
- Provides OUT8 for composite clocks and OUT9 for 1.544 MHz/ 2.048 MHz (BITS/SSU)
- Provides output clocks for BITS, GPS, 3G, GSM, etc.
- Provides a 1PPS, 2 kHz, 4 kHz, or 8 kHz frame sync input signal, and a 1PPS, 2 kHz or 8 kHz frame sync output signal
- Internal DCO can be controlled by an external processor to be used for IEEE-1588 clock generation
- · Supports programmable input-to-output phase offset adjustment
- Limits the phase and frequency offset of the outputs
- Supports Forced or Automatic operating mode switch controlled by an internal state machine. Automatic mode switch supports Free-Run, Locked and Holdover modes
- Supports manual and automatic selected input clock switch
- Supports automatic hitless selected input clock switch on clock failure
- Supports three types of input clock sources: recovered clock from STM-N or OC-n, PDH network synchronization timing and external synchronization reference timing
- Supports AMI, LVPECL/LVDS and CMOS input/output technologies
- Supports Master/Slave application (two chips used together) to enable system protection against single chip failure
- Supports Telcordia GR-1244-CORE, Telcordia GR-253-CORE, ITU-T G.812, ITU-T G.8262, ITU-T G.813 and ITU-T G.783 Recommendations

## **OTHER FEATURES**

- I2C Microprocessor interface
- IEEE 1149.1 JTAG Boundary Scan
- Single 3.3 V operation with 5 V tolerant CMOS I/Os
- 1mm ball pitch CABGA green package

# **APPLICATIONS**

- SMC / SEC (SONET / SDH equipment)
- EEC (Synchronous Ethernet equipment)
- Core and access IP switches / routers
- Gigabit and Terabit IP switches / routers
- Cellular and WLL base-station node clocks
- Broadband and multi-service access equipment

#### DESCRIPTION

The 82V3910 Synchronous Ethernet (SyncE) SETS meets the requirements of ITU-T G.8262/G.813 for EEC/SEC options 1 and 2; and it meets the requirements of Telcordia GR-253-CORE Stratum 3 (S3) and SONET Minimum Clock (SMC). The 82V3910 ultra-low jitter output clocks can be used to directly synchronize 10GBASE-R/10GBASE-W and OC-192/STM-64 PHYs and 40GBASE-R PHYs in Synchronous Ethernet and SONET/SDH equipment.

The Synchronous Equipment Timing Source (SETS) functions are provided by two independent digital PLLs (DPLLs), T0 and T4, each with embedded clock synthesizers. The T0 DPLL meets the network synchronization requirements for frequency accuracy, pull-in, hold-in, pullout, noise generation, noise tolerance, transient response and holdover performance. The T4 DPLL provides rate conversion functions that can be used, for example, to convert a recovered line clock to a 1.544 MHz, 2.048MHz or 64 kHz synchronization reference for external equipment.

The 82V3910 provides ten single ended reference inputs and two differential reference inputs that can operate at common Ethernet, SONET/ SDH and PDH frequencies and other frequencies. The device also provides two Alternate Mark Inversion (AMI) inputs for Composite Clock (CC) signals bearing 64 kHz, 8 kHz and 0.4 kHz synchronization information. The references are continually monitored for loss of signal and for frequency offset per user programmed thresholds. All of the references are available to both digital PLLs (DPLLs). The active reference for each DPLL is determined by forced selection or by automatic selection based on user programmed priorities and locking allowances and based on the reference monitors.

The 82V3910 can accept a clock reference and a phase locked external sync signal as a pair. The T0 DPLL can lock to the reference clock input and align its frame sync and multi-frame sync outputs with the paired external sync input. The device provides to two external sync inputs that can be associated with any of the twelve reference inputs to create up to two pairs. The external sync signals can have a frequency of 1 Hz, 2 kHz or 8 kHz. This feature enables the T0 DPLL to phase align its frame sync and multi-frame sync outputs with an external sync input without the need use a low bandwidth setting to lock directly to an external sync input.

Both DPLLs support four primary operating modes: Free-Run, Locked, Holdover and Digitally Controlled Oscillator (DCO) Control. In Free-Run mode the DPLLs generate clocks based on the master clock alone. In Locked mode the DPLLs filter reference clock jitter with the selected bandwidth. In Locked mode the long-term DPLL frequency accuracy is the same as the long term frequency accuracy of the selected input reference. In Holdover mode the DPLL uses frequency data acquired while in Locked mode to generate accurate frequencies when input references are not available. In DCO Control Mode the DPLL control loop is opened and the DCO can be used by an algorithm (e.g. IEEE 1588 clock servo) running on an external processor to synthesize clock signals.

The 82V3910 requires a 12.8 MHz master clock for its reference monitors and other digital circuitry. The frequency accuracy of the master clock determines the frequency accuracy of the DPLLs in Free-Run mode. The frequency stability of the master clock determines the frequency stability of the DPLLs in Free-Run mode and in Holdover mode.

The T0 DPLL can be configured with a range of selectable filtering bandwidths from 0.5 mHz to 35 Hz. The 15 mHz and lower bandwidths can be used to lock the T0 DPLL directly to a 1 pulse per second (PPS) reference. The 0.1 Hz bandwidth can be used for G.8262/G.813 Option 2 or Telcordia GR-253-CORE S3 or SMC applications. The bandwidths in the range 1.2 Hz to 8 Hz can be used for G.8262/G.813 Option 1 applications. The bandwidths 18 Hz and 35 Hz can be used in jitter attenuation and rate conversion applications.

The T4 DPLL can be configured with filtering bandwidths of 18Hz or 35 Hz.

The clocks synthesized by the 82V3910 DPLLs can be passed through either of the two independent voltage controlled crystal oscillator (VCXO) based jitter attenuating analog PLLs (APLLs). Both APLLs drive two independent dividers that have differential outputs. The APLLs use external crystal resonators with resonant frequencies equal to the APLL base frequency divided by 25. Both APLLs can be provisioned with one or two selectable crystal resonators to support up to two base frequencies per APLL. The output clocks generated by the APLLs exhibit jitter below 0.30ps RMS over the integration range 10 kHz to 20 MHz for most output frequencies.

Any of the 82V3910 DPLL clocks can be routed through a mux to any of five single ended outputs via independent output dividers. The output of the T0 DPLL can be routed through the two auto-dividers to the single ended frame sync output that operates at 8 kHz or 1 PPS,

# 2 PIN DESCRIPTION

Table 1: Pin Description

Name	Pin No.	I/O	Туре	Description <sup>1</sup>
				Global Control Signal
OSCI	A11	I	CMOS	OSCI: Crystal Oscillator Master Clock A nominal 12.8000 MHz clock provided by a crystal oscillator is input on this pin. It is the master clock for the device.
FF_SRCSW	A10	l pull-down	CMOS	FF_SRCSW: External Fast Selection Enable During reset, this pin determines the default value of the EXT_SW bit (b4, MON_SW_HS_CNFG). The EXT_SW bit determines whether the External Fast Selection is enabled. High: The default value of the EXT_SW bit (b4, MON_SW_HS_CNFG) is '1' (External Fast selection is enabled); Low: The default value of the EXT_SW bit (b4, MON_SW_HS_CNFG) is '0' (External Fast selection is disabled). After reset, this pin selects an input clock pair for the T0 DPLL if the External Fast selection is enabled: High: Pair IN3 / IN5 is selected. Low: Pair IN4 / IN6 is selected. After reset, the input on this pin takes no effect if the External Fast selection is disabled.
MS/SL	D6	l pull-up	CMOS	MS/SL: Master / Slave Selection This pin, together with the MS_SL_CTRL bit (b0, MS_SL_CTRL_CNFG), controls whether the device is configured as the Master or as the Slave. Refer to Chapter 3.14 Master / Slave Configuration for details. The signal level on this pin is reflected by the MASTER_SLAVE bit (b1, INPUT MODE_CNFG). High: The value of the MASTER_SLAVE bit is '1' Low: The value of the MASTER_SLAVE bit is '0'
SONET/SDH	E6	l pull-down	CMOS	SONET/SDH: SONET / SDH Frequency Selection During reset, this pin determines the default value of the IN_SONET_SDH bit (b2, INPUT MODE_CNFG): High: The default value of the IN_SONET_SDH bit is '1' (SONET); Low: The default value of the IN_SONET_SDH bit is '0' (SDH). After reset, the value on this pin takes no effect.
RST	H13	l pull-up	CMOS	RST: Reset A low pulse of at least 50 $\mu$ s on this pin resets the device. After this pin is high, the device will still be held in reset state for 500 ms (typical).
			Frame	Synchronization Input Signal
EX_SYNC1	F11	l pull-down	CMOS	EX_SYNC1: External Sync Input 1 A 2 kHz, 4 kHz, 8 kHz, or 1PPS signal is input on this pin.
EX_SYNC2	G11	l pull-down	CMOS	EX_SYNC2: External Sync Input 1 A 2 kHz, 4 kHz, 8 kHz, or 1PPS signal is input on this pin.
				Input Clock
IN1	A7	I	AMI	IN1: Input Clock 1 A 64 kHz + 8 kHz or 64 kHz + 8 kHz + 0.4 kHz composite clock is input on this pin.
IN2	B7	I	AMI	IN2: Input Clock 2 A 64 kHz + 8 kHz or 64 kHz + 8 kHz + 0.4 kHz composite clock is input on this pin.
IN3	H14	l pull-down	CMOS	IN3: Input Clock 3 A 1 PPS, 2 kHz, 4 kHz, N x 8 kHz <sup>3</sup> , 1.544 MHz (SONET) / 2.048 MHz (SDH), 6.25 MHz, 6.48 MHz, 10MHz, 19.44 MHz, 25MHz, 25.92 MHz, 38.88 MHz, 51.84 MHz, 77.76 MHz, 125MHz, 155.52 MHz or 156.25 MHz clock is input on this pin.

тск	B10	l pull-down	CMOS	TCK: JTAG Test Clock The clock for the JTAG test is input on this pin. TDI and TMS are sampled on the rising edge of TCK and TDO is updated on the falling edge of TCK. If TCK is idle at a low level, all stored-state devices contained in the test logic will indefinitely retain their state.
TDI	A8	l pull-up	CMOS	TDI: JTAG Test Data Input The test data is input on this pin. It is clocked into the device on the rising edge of TCK.
TDO/ T0_LOS_INT	B8	0	CMOS	TDO: JTAG Test Data Output The test data is output on this pin. It is clocked out of the device on the falling edge of TCK. TDO pin outputs a high impedance signal except during the process of data scanning. T0_LOS_INT: T0 LOS Interrupt This pin can indicate the interrupt of T0 selected input clock fail, as determined by the LOS FLAG_ON_TDO bit (b6, MON_SW_HS_CNFG). Refer to Chapter 3.8.1 Input Clock Validity for details.

# 2.1 RECOMMENDATIONS FOR UNUSED INPUT AND OUTPUT PINS

#### 2.1.1 INPUTS

#### **Control Pins**

All control pins have internal pull-ups or pull-downs; additional resistance is not required but can be added for additional protection. A  $1k\Omega$  resistor can be used.

#### Single-Ended Clock Inputs

For protection, unused single-ended clock inputs should be tied to ground.

#### **Differential Clock Inputs**

For applications not requiring the use of a differential input, both  $*_POS$  and  $*_NEG$  can be left floating. Though not required, but for additional protection, a  $1k\Omega$  resistor can be tied from \_POS to ground.

#### **XTAL Inputs**

For applications not requiring the use of a crystal oscillator input, both \_IN and \_OUT can be left floating. Though not required, but for additional protection, a  $1k\Omega$  resistor can be tied from \_IN to ground.

#### 2.1.2 OUTPUTS

#### Status Pins

For applications not requiring the use of a status pin, we recommend bringing outto a test point for debugging purposes.

#### Single-Ended Clock Outputs

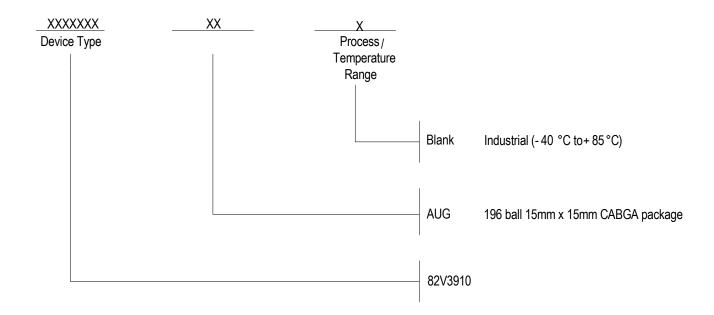

All unused single-ended clock outputs can be left floating, or can be broughtouttoatestpointfordebugging purposes.

#### **Differential Clock Outputs**

All unused differential outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.
